DF091 STORED	LS PRESSURE REGULATION SOLENOID VALVE CIRCUIT CC.1 : Short circuit to +12 V CO.0 : Open circuit or short circuit to earth

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: – the computer fault memory has been cleared, – the ignition has been switched off and on again, – the engine has been started for **1 minute** in Neutral.

CC.1	***NOTES***	None

Switch off the ignition, disconnect the **8-track** connector under the automatic gearbox and **measure the resistance** of the winding of the LS pressure regulation solenoid valve between **track 6** and **track 2** on the solenoid valve side. If the resistance measured is not approximately **5.5 ± 0.5 Ω at 20°C**, remove the gearbox sump and take the same measurement directly from the solenoid valve. If the resistance is incorrect, replace the 3 solenoid valves (LS, LT and lock-up). If the resistance is correct, repair or replace the wiring in question.

Ensure continuity of the connections between:

Computer connector track 5 ⟶ Track 2 of the hydraulic unit 8-track connector.
Computer connector track 20 ⟶ Track 6 of the hydraulic unit 8-track connector.

Also check the insulation between these connections.

Ensure the insulation from **12 V** of the connections between:

Computer connector track 5 ⟶ Track 2 of the hydraulic unit 8-track connector.
Computer connector track 20 ⟶ Track 6 of the hydraulic unit 8-track connector.

Repair or replace the automatic gearbox wiring concerned if a fault occurs.

Check the connections on the automatic gearbox computer and the **8-track** connector.
Carry out the required operations.

If the fault persists after these tests, replace the 3 solenoid valves (lock-up, LS, LT).

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Finish the operation by checking with the diagnostic tool. Use the actuator sequential command in the **SCENARIO** menu.

GETtheMANUALS.org

DF091 **CONTINUED**	

CO.0	***NOTES***	**Special notes:** None.

Switch off the ignition, disconnect the **8-track** connector under the automatic gearbox and **measure the resistance** of the winding of LS pressure regulation solenoid valve between **track 6** and **track 2** on the solenoid valve side. If the resistance measured is not approximately **5.3 ± 0.3 Ω at 20°C**, remove the gearbox sump and perform the same measurement directly from the solenoid valve. If the resistance is incorrect, replace the 3 solenoid valves (LS, LT and lock-up). If the resistance is correct, repair or replace the wiring in question.

Ensure continuity of the connections between:

Computer connector track 5 ⟶ Track 2 of the hydraulic unit 8-track connector.
Computer connector track 20 ⟶ Track 6 of the hydraulic unit 8-track connector.

Also check the insulation between these connections.

Ensure the insulation against earth of the connections between:

Computer connector track 5 ⟶ Track 2 of the hydraulic unit 8-track connector.
Computer connector track 20 ⟶ Track 6 of the hydraulic unit 8-track connector.

Repair or replace the automatic gearbox wiring concerned if a fault occurs.

Check the connections on the automatic gearbox computer and the **8-track** connector.
Carry out the required operations.

If the fault persists after these tests, replace the 3 solenoid valves (lock-up, LS, LT).

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Finish the operation by checking with the diagnostic tool. Use the actuator sequential command in the **SCENARIO** menu.

GETtheMANUALS.org

DF092 **STORED**	LT PRESSURE REGULATION SOLENOID VALVE CIRCUIT CC.1 : Short circuit to +12 V CO.0 : Open circuit or short circuit to earth

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: – the computer fault memory has been cleared, – the ignition has been switched off and on again, – the engine has been started for **1 minute** in Neutral.

CC.1	***NOTES***	None

Switch off the ignition, disconnect the **6-track** connector under the automatic gearbox and **measure the resistance** of the winding of the LT pressure regulation solenoid valve between **track 4** and **track 1** on the solenoid valve side. If the resistance measured is not approximately **5.5 ± 0.5 Ω at 20°C**, remove the gearbox sump and take the same measurement directly from the solenoid valve. If the resistance is incorrect, replace the 3 solenoid valves (LS, LT and lock-up). If the resistance is correct, repair or replace the wiring in question.

Ensure continuity of the connections between:

Computer connector track 4 ⟶ Track 1 of the hydraulic unit 6-track connector.
Computer connector track 19 ⟶ Track 4 of the hydraulic unit 6-track connector.

Also check the insulation between these connections.

Ensure the insulation from **12 V** of the connections between:

Computer connector track 4 ⟶ Track 1 of the hydraulic unit 6-track connector.
Computer connector track 19 ⟶ Track 4 of the hydraulic unit 6-track connector.

Repair or replace the automatic gearbox wiring concerned if a fault occurs.

Check the connections on the automatic gearbox computer and the **6-track** connector.
Carry out the required operations.

If the fault persists after these tests, replace the 3 solenoid valves (lock-up, LS, LT).

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Finish the operation by checking with the diagnostic tool. Use the actuator sequential command in the **SCENARIO** menu.

GETtheMANUALS.org

DF092 **CONTINUED**	

CO.0	***NOTES***	**Special notes:** None.

Switch off the ignition, disconnect the **6-track** connector under the automatic gearbox and **measure the resistance** of the winding of LT pressure regulation solenoid valve between **track 4** and **track 1** on the solenoid valve side. If the resistance measured is not approximately **5.3 ± 0.3 Ω at 20°C**, remove the gearbox sump and perform the same measurement directly from the solenoid valve. If the resistance is incorrect, replace the 3 solenoid valves (LS, LT and lock-up). If the resistance is correct, repair or replace the wiring in question.

Ensure continuity of the connections between:

Computer connector track 4 → Track 1 of the hydraulic unit 6-track connector.
Computer connector track 19 → Track 4 of the hydraulic unit 6-track connector.

Also check the insulation between these connections.

Ensure the insulation against earth of the connections between:

Computer connector track 4 → Track 1 of the hydraulic unit 6-track connector.
Computer connector track 19 → Track 4 of the hydraulic unit 6-track connector.

Repair or replace the automatic gearbox wiring concerned if a fault occurs.

Check the connections on the automatic gearbox computer and the **6-track** connector.
Carry out the required operations.

If the fault persists after these tests, replace the 3 solenoid valves (lock-up, LS, LT).

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Finish the operation by checking with the diagnostic tool. Use the actuator sequential command in the **SCENARIO** menu.

GETtheMANUALS.org

DF093 STORED	ONE-TOUCH MANUAL CONTROL CIRCUIT 1.DEF : Consistency

NOTES	**Conditions for applying the fault finding strategy to the stored fault: ET069** and **ET070** closed with the lever in P, R, N, D position. The fault is declared present after the engine has been started and running for **45 seconds**.

Check that states **ET069** and **ET070** with the lever in position P or R or N are not closed. What is the representative state of a fault?

ET069	Ensure that the one-touch switch **6-track** connector is connected correctly and in good condition. – Check for **insulation** between **tracks A3 and A2** on the one-touch switch side. If there is continuity, replace the one-touch manual control switch. – **Ensure that there is continuity and insulation** from the earth between **track 41** on the computer side and **track A3** of the computer connector. Repair or replace the wiring.

ET070	Ensure that the one-touch switch **6-track** connector is connected correctly and in good condition. – Check for **insulation** between **tracks B3 and A2** on the one-touch switch side. If there is continuity, replace the one-touch manual control switch. – **Ensure that there is continuity and insulation** from the earth **between track 26** on the computer side and **track B3** of the computer connector. Repair or replace the wiring.

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Complete the operation by testing with the diagnostic tool.

GETtheMANUALS.org

DF094 **STORED**	MULTIFUNCTION SWITCH CIRCUIT 1.DEF : Consistency

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: – the computer fault memory has been cleared, – the ignition has been switched off and on again, – the engine has been started and running for **30 seconds**.
	Special notes: ignore the value indicating the lever position displayed on the instrument panel.

Check the fitting and setting of the multifunction switch on the automatic gearbox (consult the checking method).

Switch off the ignition and disconnect the **10-track** connector under the automatic gearbox.
Ensure that there is **an earth** on **track 10** of the multifunction switch connector.
For each locked position of the selector lever, check for the necessary continuity and insulation (see the table below).

Locked lever position	Assure continuity between	Assure insulation between
P	Tracks 6 and 7 / Track 10 Track 4 / Track 1	Tracks 5 and 8/Track 10 Track 2 / Track 3
D	Tracks 5 and 8/Track 10	Tracks 6 and 7 / Track 10 Track 4 / Track 1 Track 2 / Track 3
R	Tracks 6 and 5 / Track 10 Track 2 / Track 3	Tracks 3 and 7 / Track 10 Track 1 / Track 4
N	Tracks 5 and 7 / Track 10 Track 4 / Track 1	Tracks 8 and 6 / Track 10 Track 2 / Track 3

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Complete the operation by testing with the diagnostic tool.

GETtheMANUALS.org

DF094 **CONTINUED**	

If one of the insulation or continuity checks is not correct, replace the Multifunction switch (refer to the replacement method).

If the multifunction switch is not faulty, ensure continuity and insulation against earth on the following connections:

Computer connector track 35 → **Track 6 of the 10-track connector on the wiring harness side.**

Computer connector track 7 → **Track 5 of the 10-track connector on the wiring harness side.**

Computer connector track 21 → **Track 8 of the 10-track connector on the wiring harness side.**

Computer connector track 36 → **Track 7 of the 10-track connector on the wiring harness side.**

Also ensure insulation across all these connections.

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Complete the operation by testing with the diagnostic tool.

GETtheMANUALS.org

DF095 STORED	SELECTOR LEVER LOCK ELECTROMAGNET CIRCUIT CC.0 : Short circuit to earth CO.1 : Open circuit or short circuit to + 12 V

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: – the computer fault memory has been cleared, – the ignition has been switched off and on again, – the engine has been started for **30 seconds** in Park.

CO.1	***NOTES***	None

Switch off the ignition and disconnect the **6-track** connector in the central console. Check the wiring and condition of the connections. Measure the **resistance** of the winding of the lever locking electromagnet between **tracks B1 and B2** of the electromagnet connector. If the resistance measured is not approximately **37 ± 2 Ω at 20°C**, replace the electromagnet.

Check for **continuity and insulation** from **+ 12 volts** between **tracks 32** of the computer connector and **track B2** of the control lever connector.

Check for the presence of **+ 12 V on track B1** of the control lever connector.

If the fault persists, replace the electromagnet assembly and any connection wires.

CC.0	***NOTES***	None

Switch off the ignition and disconnect the 6-track connector in the central console. Check the wiring and condition of the connections. Measure the **resistance** of the winding of the lever locking electromagnet between **tracks B1 and B2** of the electromagnet connector. If the resistance measured is not approximately **37 ± 2 Ω at 20°C**, replace the electromagnet.

Check for **continuity and insulation** from **earth** on the connection between **track 32** of the computer connector and **track B2** of the electromagnet connector.

Ensure that**+ After ignition feed** is present on **track B1** of the electromagnet connector.

If the fault persists, replace the electromagnet assembly and any connection wires.

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Complete the operation by testing with the diagnostic tool.

GETtheMANUALS.org

DF096 STORED	COMPUTER SUPPLY VOLTAGE 1.DEF : Supply voltage too low

NOTES	Check the battery charge.

Check the automatic gearbox fuses.

Check for **continuity** between **tracks 29** of the computer connector and the **fuse board** connector and **track 30** of the computer connector and the **fuse board** connector.

Check the earth wiring tightness on the vehicle and the supplies.

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Complete the operation by testing with the diagnostic tool.

GETtheMANUALS.org

DF097 STORED	CONVERTER LOCK-UP 1.DEF : Clutch slippage 2.DEF : Clutch judder

NOTES	**Processing priority in the event of stacked faults:** Deal with fault **DF090** Converter lock-up solenoid valve circuit first if it is present.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present after a road test.

Switch off the ignition, disconnect the **6-track** connector under the automatic gearbox and **measure the resistance** of the winding of the lock-up solenoid valve between **earth** and **track 2** on the solenoid valve side. If the resistance measured is not approximately **5.3 ± 0.3 Ω at 20°C**, remove the gearbox sump and perform the same measurement directly from the solenoid valve. If the resistance is incorrect, replace the 3 solenoid valves (LS, LT and lock-up). If the resistance is correct, repair or replace the wiring in question.

If the fault persists after these checks, replace the hydraulic timing.

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Complete the operation by testing with the diagnostic tool.

GETtheMANUALS.org

DF098 TO DF103 STORED	CONSISTENCY BETWEEN SPEED AND 1/2/3/4/5 GEARS 1.DEF : Consistency

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after a road test.

Hydraulic or mechanical fault. Replace the gearbox.

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Complete the operation by testing with the diagnostic tool.

ET018	BRAKE PEDAL

NOTES	**Special notes:** Only carry out the checks if the depressed and released states are not consistent with the position of the pedal.

STATE 2 Released: Brake pedal depressed.

If brake lights operate:

Ensure the continuity of the connection between **track B3** of the brake light switch connector and **track 25** of the computer connector.

If the brake lights do not operate:

Check the condition and fitting of the brake light switch as well as the brake lights fuse.
Remove the brake pedal switch and check that it is operating correctly:

	Continuity between tracks:	Insulation between tracks:
Switch pressed (Brake pedal released)	**A1** and **B3**	**A3** and **B1**
Switch released (Brake pedal depressed)	**A3** and **B1**	**A1** and **B3**

Replace the switch if necessary.

Check/ensure the presence of **+ after ignition feed** on **tracks A1 and B1** of the brake switch connector.

AFTER REPAIR	Perform a road test then a new test with the diagnostic tool.

GETtheMANUALS.org

ET018 **CONTINUED**	

STATE 1 Depressed: Brake pedal released.

Check the condition and fitting of the brake light switch as well as the brake lights fuse.

Remove the brake pedal switch and check that it is operating correctly:

	Continuity between tracks:	Insulation between tracks:
Switch pressed (Brake pedal released)	**A1** and **B3**	**A3** and **B1**
Switch released (Brake pedal depressed)	**A3** and **B1**	**A1** and **B3**

Replace the switch if necessary.

Check/ensure the presence of **+ after ignition feed** on **tracks A1 and B1** of the brake switch connector.

Check for and ensure insulation from **12 V** on the connection between **track B3** of the brake light switch connector and **track 25** of the computer connector.

AFTER REPAIR	Perform a road test then a new test with the diagnostic tool.

GETtheMANUALS.org

ET005	KICK DOWN

NOTES	**Special notes:** None.

Check the changes to the pedal signal via **PR022**.

Correct information:

No **L**oad: Value between **0 and 16**

Full **L**oad: Value between **224 and 253**

If the value is incorrect, refer to the injection fault finding strategy for information on pedal position sensor faults.

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Complete the operation by testing with the diagnostic tool.

GETtheMANUALS.org

PR022	ACCELERATOR PEDAL POSITION

NOTES	**Special notes:** None.

Check the changes to the pedal signal via **PR022**.

Correct information:

No **L**oad: Value between **0 and 16**

Full **L**oad: Value between **224 and 253**

If the value is incorrect, refer to the injection fault finding strategy for information on pedal position sensor faults.

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Complete the operation by testing with the diagnostic tool.

GETtheMANUALS.org

REPLACING THE COMPUTER

After replacing the computer, it is important to test drive the vehicle performing all gear changes, both up and down, several times in order to store the new auto-adaptive parameter values.

SPECIAL FEATURES OF COMPONENT REPLACEMENT:

The SU1 2001 automatic gearbox computer uses auto-adaptive parameters for gear change management and the converter lock-up function.

These auto-adaptive parameters enable the pressure and refill intervals for the brakes and clutches to be optimised as a function of the specific mechanical/hydraulic characteristics of each automatic gearbox. Therefore, replacing any components that influence these parameters requires the stored values to be updated. Using the diagnostic tool, run command RZ005 to reset the auto-adaptives. After using this command, it is essential to test drive the vehicle performing all gear changes, both up and down, several times in order to store the new values.

Reset the auto-adaptive parameters after replacing the following components:
– Hydraulic distributor.
– Torque converter.
– Solenoid valves (EVS1, EVS2, EVS3, EVS4, EVS5).
– 3 solenoid valves (converter lock-up, LS pressure regulation, LT pressure regulation).
– Complete automatic gearbox.

GETtheMANUALS.org

CHART 1	No dialogue with the computer

NOTES	Only consult the customer complaint section after a complete check with the diagnostic tool and a conformity check.

Try to establish dialogue with a computer on another vehicle to make sure that the diagnostic tool is not faulty. If the tool is not causing the fault and dialogue cannot be established with any other computer on the same car, it may be that a faulty computer is disrupting diagnostic line **K**.

Disconnect the computers one at a time to locate the fault.

Check the battery voltage and carry out any operations necessary to obtain a correct voltage **(9.5. < battery voltage < 17.5 V).**

Check that the automatic gearbox supply fuse is present on the passenger compartment fuse board and in good condition.

Check that the computer connector is properly connected and check the condition of its wiring.

Check the automatic gearbox **earths**.

Check that the computer is correctly supplied:
– **Earths on tracks 1 and 15** of the 42-track computer connector.
– **+ after ignition on track 29** of the 42-track computer connector.

Check that the diagnostic socket is correctly supplied:
– + Before ignition feed on track 16
– Earths on track 5

Check / ensure continuity and the insulation of the connections between:

Computer connector track 8 ⟶ **Diagnostic socket track 7**

If dialogue is still not established after these various checks, replace the automatic gearbox computer.

AFTER REPAIR	Check using the diagnostic tool.

GETtheMANUALS.org

CHART 2	The starter motor does not engage, selector lever in position P and / or N

NOTES	Only consult the customer complaint section after a complete check with the diagnostic tool and a conformity check.

Switch on the diagnostic tool.
In **ET012**, check the consistency between the diagnostic tool display and the selector lever locked positions (with the ignition on and the engine stopped).

Is it consistent?

no

yes

Switch off the ignition and disconnect the multifunction switch 10-track connector under the automatic gearbox.
Press the starter and check to see if **12 volts** is present on track 1 of the connector on the vehicle wiring harness side.

Is there 12 volts present on track 1?

no → Ensure the continuity of the connection between **track 1** of the connector and the starter switch.
Ensure that the ignition switch is working properly.

yes

Switch off the ignition and check the continuity between tracks 1 and 4 of the multifunction switch on the gearbox side with the lever in P and N positions.
If continuity is not provided, replace the multifunction switch.
If continuity is correct, ensure there is continuity between track 4 of the connector on the vehicle wiring side and the starter.

Keep the starter pressed and move the selector lever with the brakes applied.

Does the engine start?

yes → Adjust the automatic gearbox control following the procedure described in the Workshop Repair Manual.

no

Check the multifunction switch mounting, the tightness of the two locking bolts on the gearbox control cable then adjust the control.
If the fault persists, replace the multifunction switch.

AFTER REPAIR	Perform a road test then check with the diagnostic tool.

GETtheMANUALS.org

CHART 3	The starter turns, the engine does not start, the instrument panel lights dim, selector lever in N.

NOTES	Only consult the customer complaint section after a complete check with the diagnostic tool and a conformity check.

With the handbrake released, does the vehicle start sluggishly when the starter is pressed?

no → Check the battery charge and the charge circuit operation.

yes ↓

Check the condition of the oil (colour, odour, etc.). Replace the automatic gearbox if the condition of the oil suggests there is an internal fault.

CHART 4	The starter motor engages when the selector lever is in positions other than P or N

NOTES	Only consult the customer complaint section after a complete check with the diagnostic tool and a conformity check.

In **ET012** or using the instrument panel display, check the consistency between the display and the selector lever locked positions (with the ignition on and the engine stopped).
Adjust the automatic gearbox if there is inconsistency.
Replace the multifunction switch if there is consistency (P/N switch faulty).

Adjusting and replacement methods are described in the Workshop Repair Manual.

AFTER REPAIR	Perform a road test then check with the diagnostic tool.

GETtheMANUALS.org

CHART 5	Vehicle advances or reverses with the lever in position N (more than it should when creeping with the oil under 60°C)

NOTES	Only consult the customer complaint section after a complete check with the diagnostic tool and a conformity check.

Using the instrument panel display, or in **ET012** on the diagnostic tool, check the consistency between the display and the selector lever locked positions (with the ignition on and the engine stopped).

Is it consistent?

no → Adjust the control following the recommendations given in the Workshop Repair Manual. Replace the multifunction switch if necessary.

yes ↓

Check the condition of the oil (colour, odour, etc.).

Does the condition of the oil suggest there is an internal fault with the automatic gearbox?

yes → Replace the automatic gearbox.

no ↓

The fault may have been misdiagnosed.

AFTER REPAIR	Perform a road test then check with the diagnostic tool.

GETtheMANUALS.org

CHART 6	Unexpected gear changes

NOTES	Only consult the customer complaint section after a complete check with the diagnostic tool and a conformity check.

Switch on the diagnostic tool.
Use function **ET013** during a road test, with the selector lever in D position.

Is the customer complaint reproduced?

- no → B
- yes ↓

Is dialogue lost when the fault appears?

- yes → Refer to the fault finding strategy relating to lack of dialogue with the tool (CHART 1).
- no ↓

Does state ET018 change when the fault appears, without depressing the brake pedal?

- yes → Adjust the brake switch and check the operation of the brake pedal spring.
- no ↓

Does the display for the selector lever position change when the fault appears? (position D disappears)

- no → B
- yes ↓

Check the adjustment of the external control.
If the fault persists, replace the multifunction switch.

AFTER REPAIR	Perform a road test then check with the diagnostic tool.

GETtheMANUALS.org

CHART 6 CONTINUED	

NOTES	Only consult the customer complaint section after a complete check with the diagnostic tool and a conformity check.

B

Check how the automatic transmission wiring is routed (high voltage interference).
Modify if necessary.

Check the load signal with the engine stopped.
Accelerate slowly and check the load change in **PR022**.

Is the load change regular?

no → Refer to the injection fault finding procedure and check the load potentiometer operation.

yes

Perform an injection operation check
Apply the checks outlined in the relevant fault finding procedure if there is a fault.

Check the engine speed signal in **PR006** during a road test at a regular speed.

Is the engine speed value constant?

no → Refer to the injection fault finding procedure and check the TDC sensor operation.

yes

The fault may have been misdiagnosed.

AFTER REPAIR	Perform a road test then check with the diagnostic tool.

GETtheMANUALS.org

CHART 7	No downchanging in full load position

NOTES	Only consult the customer complaint section after a complete check with the diagnostic tool and a conformity check.

Check the conformity and settings of the accelerator control (consult the Workshop Repair Manual).

Is the accelerator control correct?

no → Adjust the accelerator control again as shown in the Workshop Repair Manual.

yes ↓

Check the load signal with the engine stopped: Accelerate slowly and check the load change in **PR022**.

Is the load change regular?

no → Refer to the injection fault finding procedure and check the load potentiometer.

yes ↓

Check that **ET005** is operating:
Depress the accelerator pedal quickly.

Is ET005 active?

no → See **PR022** processing

yes ↓

The fault may have been misdiagnosed.

AFTER REPAIR	Perform a road test then check with the diagnostic tool.

GETtheMANUALS.org

CHART 8	Automatic gearbox operating faults

NOTES	Only consult the customer complaint section after a complete check with the diagnostic tool and a conformity check.

In **ET012** on the diagnostic tool or on the instrument panel display, check the consistency between the display and the selector lever locked positions (ignition on and engine stopped).

Is it consistent?

- no → Adjust the control following the recommendations given in the Workshop Repair Manual.
- yes ↓

Check the oil level and the condition of the oil (colour, odour, etc.).

Does the condition of the oil suggest there is an internal fault with the automatic gearbox?

- yes → Replace the automatic gearbox.
- no ↓

Top up if necessary. Start the engine.
With the brakes applied, put the selector lever into D and examine the vehicle speed signal in **PR105** while accelerating.

Does the vehicle speed information change?

- yes → Replace the automatic gearbox.
- no ↓

Fit a pressure gauge and check the line pressure with the engine at idle speed and the selector lever in N.

Is the pressure zero?

- yes → Replace the automatic gearbox.
- no ↓

With the engine at idle speed and the selector lever in N position, read the line pressure (correct values between 3.5 and 4.2).

(A)

AFTER REPAIR	Perform a road test then check with the diagnostic tool.

GETtheMANUALS.org

CHART 8
CONTINUED 1

NOTES	Only consult the customer complaint section after a complete check with the diagnostic tool and a conformity check.

(A)

Run the engine to obtain an oil temperature greater than **60°C** in **PR004**.
Move the lever into D with the engine at idle speed and the brakes applied.

Is the line pressure more than 0.2 bar below the pressure reading with the lever in N?

yes → Replace the automatic gearbox.

no

Refer to the procedure and the safety instructions in the Technical Note for carrying out a setting point check on the converter. Perform this check with the lever in D and then R, observing the line pressure and the engine speed.
Theoretical values of line pressure at the setting point:
- **12 bar in D (10.6 to 13.6),**
- **18 bar in R (16.3 to 20.5).**

Are the pressure values correct?

no → Replace the hydraulic distributor and the solenoid valves.
Replace the automatic gearbox if the pressure continues to be incorrect (pressure too low).

yes

Theoretical values of engine speed at the setting point:
- **G9T and P9X engines: 2403 ± 150 rpm**
- **F4Rt engines: 2661 ± 150 rpm**
- **V4Y engines: 2755 ± 150 rpm**

Is the setting point value correct?

no → Replace the torque converter
(a setting point at + **300 rpm** above the value requirements for an automatic gearbox replacement).
Replace the automatic gearbox if the setting point continues to be incorrect.
Note: a setting point which is too low may be linked to a lack of engine power.

yes

(B)

AFTER REPAIR	Perform a road test then check with the diagnostic tool.

GETtheMANUALS.org

CHART 8 CONTINUED 2	

NOTES	Only consult the customer complaint section after a complete check with the diagnostic tool and a conformity check.

B

Perform a road test observing the engine speed on the instrument panel and the indications given by the diagnostic tool in **ET012** (refer to the help section).

Does the engine speed change each time there is a gear change?

no → Replace the hydraulic distributor and the solenoid valves.

yes

The checks carried out have not provided any evidence of a fault and the automatic gearbox appears to be working correctly. If the vehicle does show the customer complaint selected, continue with the entire fault finding procedure.

AFTER REPAIR	Perform a road test then check with the diagnostic tool.

GETtheMANUALS.org

CHART 9	Reversing lights do not work (reverse gear works and the bulbs are sound)

NOTES	Only consult the customer complaint section after a complete check with the diagnostic tool and a conformity check.

Switch off the ignition and disconnect the 10-track connector under the automatic gearbox.
Switch the ignition back on and check to see if + after ignition feed is present on **track 3** of the connector on the vehicle wiring harness side.

Is there + after ignition present on track 3?

no → Ensure the continuity of the connection between **track 3** of the 10-track connector and the passenger compartment interconnection unit.

yes ↓

Switch off the ignition and check the continuity between **tracks 2** and **3** of the connector on the gearbox side with the lever in position R.
If there is no continuity, replace the multifunction switch. If continuity is correct, ensure that there is continuity between **track 2** of the connector on the vehicle wiring harness side and the reversing lights.
Also check the rear lights earth.

AFTER REPAIR	Perform a road test then check with the diagnostic tool.

GETtheMANUALS.org

CHART 10	Oil present under vehicle

NOTES	Only consult the customer complaint section after a complete check with the diagnostic tool and a conformity check.

Wash the automatic gearbox, top up the oil level using the procedure described in the Workshop Repair Manual, dust with talcum powder, run a fault finding test and locate the source of the leak.
Deal with the source of the leak and replace the faulty components.
Check the oil level.

AFTER REPAIR	Perform a road test then check with the diagnostic tool.

GETtheMANUALS.org

1. SCOPE OF THIS DOCUMENT

This document presents the fault finding procedure applicable to all computers with the following specifications:

Vehicle(s): **Vel Satis phase 1 & 2**
Espace IV phase 1
Engine type: **P9X701**
Function concerned: **Diesel injection**

Computer name: **DENSO Isuzu**
Program no.: **BF**
Vdiag no.: **04, 08, 0C**

2. PREREQUISITES FOR FAULT FINDING

Documentation type

Fault finding procedures (this manual):
– Assisted fault finding (integrated into the diagnostic tool), Dialogys.

Wiring Diagrams:
– "Wiring Diagrams" Technical Note for the vehicle (Visu-Schéma CD-ROM).

Type of diagnostic tools
– CLIP + CAN probe

Special tooling required

Special tooling required	
	Multimeter
Elé. 1681	Universal bornier

3. RECAP

Procedure

To run fault finding on the vehicle's computers, switch on the ignition in fault finding mode (forced + after ignition feed).

Proceed as follows:
– vehicle card in reader,
– press and hold start button (longer than **5 seconds**) with start-up conditions not fulfilled,
– connect the diagnostic tool and perform the required operations.

To **cut off + after ignition**, proceed as follows:
– disconnect the diagnostic tool,
– press the Start button twice briefly (less than **3 seconds**),
– ensure that the + after ignition feed has been cut off by checking that the computer indicator lights on the instrument panel have gone out.

GETtheMANUALS.org

Faults

Faults are declared as either present or stored (depending on whether they appeared in a certain context and have disappeared since, or whether they remain present but have not been diagnosed within the current context).

The **present** or **stored** status of faults should be taken into consideration when the **diagnostic tool** is switched on after the + after ignition feed (without any system components being active).

For a **present fault**, apply the procedure described in the **Interpretation of faults** section.

For a **stored fault**, note the faults displayed and apply the instructions in the **Notes** section.

If the fault is **confirmed** when the instructions in the Notes section are applied, the fault is present. Deal with the fault

If the fault is **not confirmed**, check:
- the electrical lines which correspond to the fault,
- the connectors for these lines (for oxidation, bent pins, etc.),
- the resistance of the component detected as faulty,
- the condition of the wires (melted or split insulation, wear).

Conformity check

The aim of the conformity check is to check data that does not produce a fault on the **diagnostic tool** because the data is inconsistent. Therefore, this stage is used to:

- carry out fault finding on faults that do not have a fault display, and which may correspond to a customer complaint.
- check that the system is operating correctly and that there is no risk of a fault recurring after repairs.

This section gives the fault finding procedures for statuses and parameters and the conditions for checking them.

If a status is not behaving normally or a parameter is outside the permitted tolerance values, consult the corresponding fault finding page.

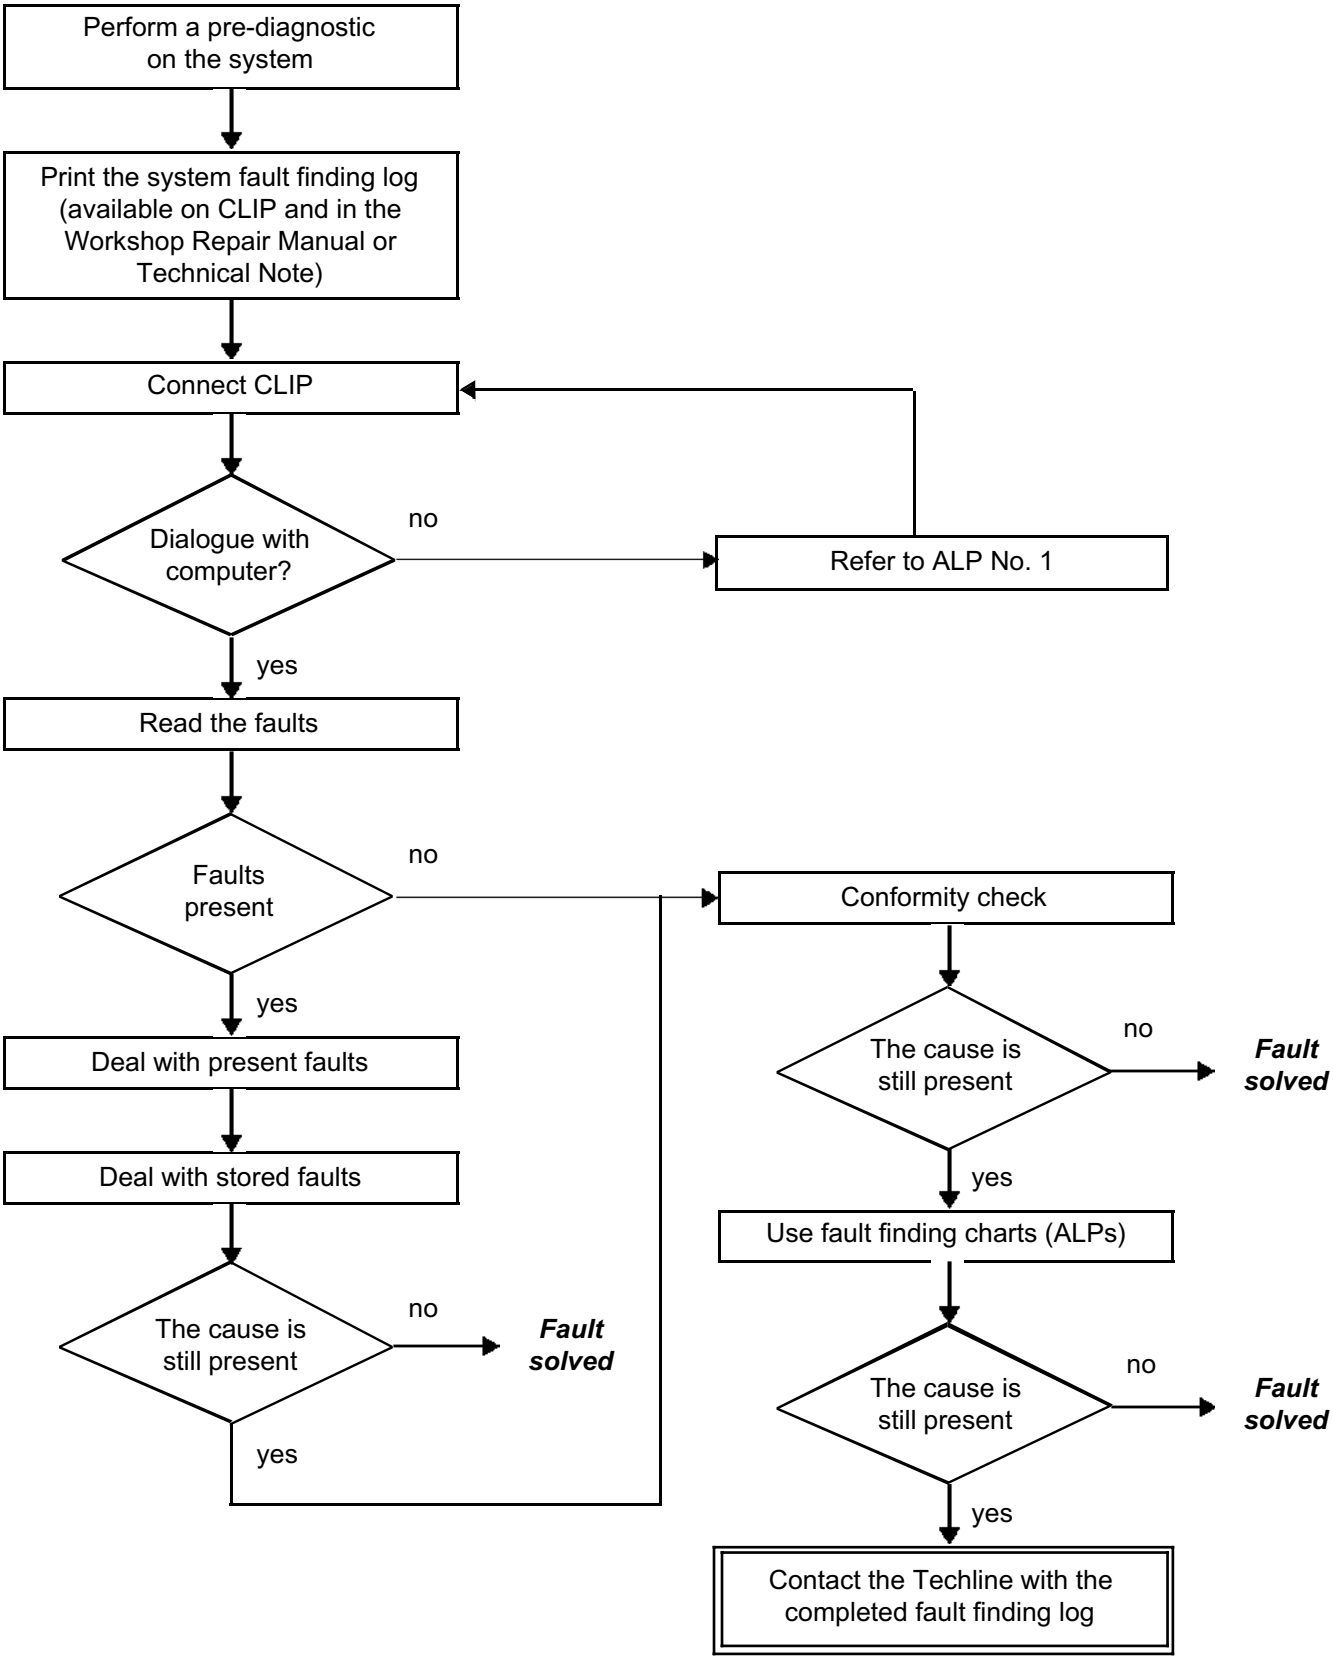
Customer complaints - Fault finding chart

If the test with the **diagnostic tool** is OK but the customer complaint is still present, the fault should be processed by **customer complaints**.

A synopsis of the general procedure to follow is provided on the following page in the form of a flow chart.

GETtheMANUALS.org

4. FAULT FINDING PROCEDURE



GETtheMANUALS.org

4. FAULT FINDING PROCEDURE (continued)

Wiring check

Fault finding problems
Disconnecting the connectors and/or manipulating the wiring harness may temporarily remove the cause of a fault.
Electrical measurements of voltage, resistance and insulation are generally correct, especially if the fault is not present when the analysis is made (stored fault).

Visual inspection
Look for damage under the bonnet and in the passenger compartment.
Carefully check the fuses, insulators and wiring harness routing.
Look for signs of oxidation.

Tactile inspection
While manipulating the wiring harness, use the diagnostic tool to note any change in fault status from stored to present.
Make sure that the connectors are properly locked.
Apply light pressure to the connectors.
Twist the wiring harness.
If there is a change in status, try to locate the source of the fault.

Inspection of each component
Disconnect the connectors and check the appearance of the clips and tabs, as well as the crimping (no crimping on the insulating section).
Make sure that the clips and tabs are properly locked in the sockets.
Check that no clips or tabs have been dislodged during connection.
Check the clip contact pressure using an appropriate model of tab.

Resistance check
Check the continuity of entire lines, then section by section.
Look for a short circuit to earth, to **+ 12 V** or to another wire.

If a fault is detected, repair or replace the wiring harness.

GETtheMANUALS.org

5. FAULT FINDING LOG

IMPORTANT

IMPORTANT
Any fault on a complex system requires thorough fault finding with the appropriate tools. The FAULT FINDING LOG, which should be completed during the procedure, enables you to keep track of the procedure which is carried out. It is an essential document when consulting the manufacturer.

IT IS THEREFORE MANDATORY TO FILL OUT A FAULT FINDING LOG EACH TIME FAULT FINDING IS CARRIED OUT.

You will always be asked for this log:

- when requesting technical assistance from Techline,
- for approval requests when replacing parts for which approval is mandatory,
- to be attached to monitored parts for which reimbursement is requested. The log is needed for warranty reimbursement, and enables better analysis of the parts removed.

6. SAFETY ADVICE

Safety rules must be observed during any work on a component to prevent any damage or injury:

- check the battery voltage to avoid incorrect operation of computer functions,
- Use the proper tools.

GETtheMANUALS.org

I - RISKS ASSOCIATED WITH CONTAMINATION

The high pressure direct injection system is highly sensitive to contamination. The risks associated with contamination are:
– damage to or destruction of the high pressure injection system,
– components jamming,
– components losing seal integrity.

All After-Sales operations must be performed under very clean conditions. This means that no impurities (particles a few microns in size) should have entered the system during dismantling.

The cleanliness principle must be applied from the filter to the injectors.

What are the sources of contamination?
– metal or plastic swarf,
– paint,
– fibres:
  – from cardboard,
  – from brushes,
  – from paper,
  – from clothing,
  – from cloths,
– foreign bodies such as hair,
– ambient air
– etc.

IMPORTANT
Cleaning the engine using a high pressure washer is prohibited because of the risk of damaging connections. In addition, moisture may collect in the connectors and create electrical connection faults.

II - NOTES TO BE FOLLOWED BEFORE ANY OPERATION

IMPORTANT
Before any work is carried out on the high pressure injection system, protect:
– the accessories and timing belts,
– the electrical accessories, (starter, alternator, electric power-assisted steering pump),
– the flywheel surface, to prevent any diesel from running onto the clutch friction plate.

Check that you have plugs for the unions to be opened (set of plugs available from the Parts Department). The plugs are single-use only. After use, they must be discarded (once used they are soiled and cleaning is not sufficient to make them reusable). Unused plugs must be discarded.

GETtheMANUALS.org

Check that you have hermetically resealable plastic bags for storing removed parts. Parts stored in this way will be less susceptible to the risk of contamination. The bags are to be used once only, and discarded after use.

Use lint-free cleaning cloths (cloth part number **77 11 211 707**). Using normal cloth or paper is prohibited. They are not lint-free and could contaminate the fuel circuit. Each cloth should only be used once.

Use fresh cleaning agent for each operation (used cleaning agent is contaminated). Pour it into an uncontaminated container.

For each operation, use a clean brush in good condition (the brush must not shed its bristles).

Use a brush and cleaning agent to clean the unions to be opened.

Blast compressed air over the cleaned parts (tools, workbench, the parts, unions and injection system zones). Check that no bristles remain.

Wash your hands before and during the operation if necessary.

When wearing leather protective gloves cover them with latex gloves to prevent contamination.

III - INSTRUCTIONS TO BE FOLLOWED DURING THE OPERATION

As soon as the circuit is open, all openings must be plugged to prevent impurities from entering the system. The plugs to be used are available from the Parts Department. The plugs must not be reused under any circumstances.

Seal the pouch shut, even if it has to be opened shortly afterwards. Ambient air carries contamination.

All components removed from the injection system must be stored in a hermetically sealed plastic bag once they have been plugged.

Using a brush, cleaning agent, air gun, sponge or normal cloth is strictly prohibited once the circuit has been opened. These items could allow contamination to enter the system.

A new component replacing an old one must not be removed from its packaging until it is to be fitted to the vehicle.

GETtheMANUALS.org

The high pressure injection system is designed to deliver a precise quantity of diesel fuel to the engine at a set moment.
It is fitted with a **121-track** computer made by **DENSO ISUZU**

The system comprises:
- a priming pump,
- a diesel filter fitted with a heater,
- a high pressure pump with two pumping pistons,
- two high pressure regulators attached to the pump,
- an injector rail,
- a diesel fuel pressure sensor built into the rail,
- a pressure limiter,
- six solenoid injectors,
- a diesel fuel temperature sensor,
- a coolant temperature sensor,
- an air inlet temperature sensor (Vdiag 04, 08 only),
- an oil temperature sensor (Vdiag 0C only),
- a cylinder reference sensor,
- a turbocharging pressure sensor,
- an exhaust gas recirculation solenoid valve,
- an accelerator pedal potentiometer,
- an atmospheric pressure sensor integrated into the injection computer,
- an injection computer,
- a flow sensor (fitted with an OBD air temperature sensor),
- a turbocharging limiter solenoid valve,
- a damper flap solenoid valve.

The "**common rail**" high pressure direct injection system works sequentially (based on the multipoint injection system for petrol engines).

This new injection system reduces operating noise, reduces the volume of pollutant gases and particles and produces high engine torque at low engine speeds thanks to a pre-injection procedure.

The high pressure pump generates the high pressure and transmits it to the injector rail. The actuators located on the pump control the quantity of diesel fuel supplied based on the demand determined by the computer. The rail supplies each injector through a steel pipe.

GETtheMANUALS.org

a) The computer:

This determines the injection pressure value necessary for the engine to operate correctly and then controls the pressure regulators. It checks that the pressure value is correct by analysing the value transmitted by the pressure sensor located on the rail.
It determines the injection timing required to deliver the right quantity of diesel fuel and the moment when injection should start.
Controls each injector electrically and individually after determining these two values.

The flow injected into the engine is determined by:
- the duration of injector control,
- the rail pressure (regulated by the computer),
- the injector opening and closing speed,
- the needle stroke (determined by a constant for the type of injector),
- the nominal hydraulic flow of the injector (specific to each injector),
- the pedal load,
- the engine speed.

The computer manages:
- idling regulation,
- exhaust gas flow reinjection to the inlet,
- the fuel supply (advance, flow and rail pressure),
- the fan unit control via the Switching and Protection Unit (centralised coolant temperature management function),
- the air conditioning (cold loop function),
- the cruise control/speed limiter function,
- pre-post heating control,
- fault warning lights via the multiplex network.

The high pressure pump supplies the rail whose pressure is controlled by the fuel flow actuator for filling and by the injector valves for discharging. This compensates for pressure drops. The flow actuator allows the high pressure pump to supply the exact quantity of diesel fuel required to maintain the pressure in the rail. This component minimises the heat generated and improves engine output.
In order to discharge the rail using the injector valves, the valves are controlled by brief electrical pulses which are:
- short enough not to open the injector (passing through the feedback circuit from the injectors),
- long enough to open the valves and discharge the rail.
- multiplexed connection between the vehicle's various computers.

The fault warning lights on the instrument panel are activated via the multiplex network.

The vehicle speed signal on the instrument panel is transmitted by the ABS system computer or the WHEEL SPEED computer via a wire connection and is then transmitted via the multiplex network by the instrument panel. The main users of the vehicle speed signal are the injection computer and the airbag computer.

Some vehicles have adopted a sensor for detecting water in the diesel fuel, located in the filter. If there is water in the fuel, the orange injection and pre/postheating warning light will come on.

GETtheMANUALS.org

WARNING
The engine must not operate with:
- diesel fuel containing more than 10 % diester,
- petrol, even in tiny quantities.

The system injects diesel fuel into the engine at a pressure of up to **1600 bar**. Before each operation, check that the injector rail is depressurised and that the fuel temperature is not too high.

When working on the high pressure injection system, you must follow the cleanliness guidelines and safety advice specified in this document.

Removal of the internal parts of the pump and injectors is prohibited. Only the fuel flow actuator and the diesel fuel temperature sensor can be replaced.

For safety reasons, it is strictly prohibited to undo a high pressure pipe union when the engine is running.

It is not possible to remove the pressure sensor from the fuel rail because this may cause circuit contamination faults. If the pressure sensor fails, replace the pressure sensor, the rail and the high pressure pipes.

Supplying + 12 V directly to any component in the system is prohibited.

Ultrasonic decoking and cleaning are prohibited.

Never start the engine unless the battery is connected correctly.

Disconnect the injection computer when carrying out any welding work on the vehicle.

GETtheMANUALS.org

b) Management of cruise control/speed limiter:

When activated, the cruise control function maintains the vehicle at a preselected speed, regardless of the driving conditions encountered. Using the control buttons, the driver can increase or reduce the vehicle speed.

The cruise control function can be deactivated either using the control buttons, or by switching off the cruise control function selection switch or when system events are detected (such as the brake pedal being depressed), or when system errors are detected such as an inconsistent vehicle speed or excessive vehicle deceleration.

The cruise control function can also be temporarily suspended when the driver wants to resume control of the vehicle and exceed the selected cruising speed by depressing the accelerator pedal which then exceeds the selected fuel flow. The cruising speed is resumed when the driver releases the accelerator pedal.

The cruise control function can be reactivated and the last cruising speed can be resumed after deactivating the function for whatever reason until the vehicle ignition is switched off (i.e. for as long as computer supply not cut off). The vehicle will then attempt to return to the cruising speed using a controlled vehicle acceleration rate.

When switched on (with the selection switch), the vehicle speed limiter function limits the vehicle speed to a preset value. The driver controls the vehicle in the normal way using the accelerator pedal until the limit speed is reached. If an attempt is made to exceed this speed, the system will ignore the pedal request and will control the vehicle speed in the same way as the cruise control function, provided that the driver keeps the accelerator pedal depressed.
As with the cruise control function, the limit speed can be altered using the control buttons by pressing briefly or pressing and holding.
For safety reasons, it is possible to exceed the limit speed by rapidly depressing the accelerator pedal. The vehicle speed is then controlled by the pedal according to the driver's request. The vehicle's speed limiter is reactivated when the vehicle speed drops below the limit speed again.

The driver has the following controls for the cruise control/speed limiter function:
- accelerator pedal,
- brake pedal,
- function selection switch for selecting speed limiter or cruise control operating mode,
- controls at the steering wheel.

GETtheMANUALS.org

Instrument panel display:

The computer manages the data display on the instrument panel relating to engine operation. This involves 5 functions:
– the EOBD (European On Board Diagnostic) MIL (Malfunction Indicator Lamp),
– pre-postheating,
– the coolant temperature,
– engine faults:
  - Level 1 (non critical fault)
  - Level 2 (emergency stop).

These five functions are represented by 4 warning lights and/or messages displayed by the trip computer.

Pre-postheating warning light:

Permanently on, supplied by + after ignition feed:
indicates preheating of the plugs (automatic timed operation lasting 3 to 6 seconds).

Temperature warning/emergency stop light (level 2):

This light is used as an operation indicator light and as a system fault warning light.
It switches on for 3 seconds when a voltage is applied (automatic test procedure controlled by the instrument panel).

Permanently on: this indicates engine overheating or a level 2 fault.

If the fault reaches a critical level, the injection cuts off automatically after a few seconds. In the event of overheating, it is up to the driver whether to stop the vehicle or continue driving.

OPERATION OF INSTRUMENT PANEL WARNING LIGHTS:

Orange SERVICE non-critical fault warning light (level 1):

This warning light comes on, **along with the "check injection" message**.

The driver should carry out repairs as soon as possible.

Red STOP emergency stop warning light (level 2):

This warning light comes on, **accompanied by the "faulty injection" message.**

The driver should carry out repairs as soon as possible.

Orange OBD excess pollution warning light:

This warning light is represented by an engine, and comes on for approximately 2 seconds when the ignition is switched on, and then goes out.

Continuous lighting: indicates a fault in an engine component preventing emission control standards being met.

The driver should carry out repairs as soon as possible.

COMPUTER REPLACEMENT OR REPROGRAMMING

The system can be programmed and reprogrammed via the diagnostic socket using the RENAULT CLIP diagnostic tool (**Consult Technical Note 3585A or follow the instructions provided by the diagnostic tool**).

IMPORTANT
- **switch on the diagnostic tool (mains or cigarette lighter supply),**
- **connect a battery charger,**
- **shut down all the electrical consumers (lights, interior lights, air conditioning, radio CD, etc.),**
- **wait for the engine to cool (engine coolant temperature below 60 ˚C and air temperature below 50 ˚C).**

Every time the computer has been reprogrammed or replaced
- **switch the ignition off and then on again.**
- **start and then stop the engine (for automatic programming) and wait 40 seconds.**
- **use the diagnostic tool to carry out the following procedures:**
  1.Use the **VP010 Write VIN** command.
  2. Carry out a road test followed by another check with the diagnostic tool.

IMPORTANT
It is not possible to try an injection computer coming from the Parts Department because it will no longer be possible to use it on another vehicle.

GETtheMANUALS.org

Summary of available settings

NOTES	The settings are made to inform the vehicle computer of the vehicle VIN and the engine idling speed.

VP010: Enter VIN
This setting allows the VIN to be entered in the injection computer.
Use this command each time the computer is replaced or (re)programmed.

VP007: Decrease idling speed
This setting is used to decrease the engine's idling speed by a maximum of 50 rpm, in 10 rpm steps.

VP011: Increase idling speed
This setting is used to increase the engine's idling speed by a maximum of 50 rpm, in 10 rpm steps.

VP036: Inhibit fuel supply
This command allows you to block the diesel circuit upstream of the injectors in order to carry out an engine cylinder compression test.

VP037: End fuel supply inhibition
This command restores fuel supply to the injectors.

DF001 PRESENT OR STORED	COOLANT TEMPERATURE SENSOR CIRCUIT CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 V DEF : Inconsistent data

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

CO.0	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – + after ignition feed present, – the coolant temperature sensor voltage is less than **0.12 V**.

Manipulate the wiring harness between the diesel computer and the coolant temperature sensor in order to detect a status change (present ↔ stored).
Look for possible damage to the harness, and check **the connection and the condition** of the coolant temperature sensor and its connections.
Repair if necessary.

If the fault is still present, check that the thermostat is working correctly.
Check the fill level and sealing of the cooling circuit (see **MR 353, MR 402 or MR 361 Mechanical, 19A, Cooling, Checks**).

Check for **insulation against earth, continuity and the absence of interference resistance** on the following connection:

Coolant temperature sensor **track 1** ⟶ **track B 99** of the diesel computer

Repair if necessary.

Check the **insulation from + 5 V and + 12 V, continuity and absence of interference resistance** on the following connection:

Coolant temperature sensor **track 2** ⟶ **track B 95** of the diesel computer

Repair if necessary.

Measure the **resistance** of the coolant temperature sensor between **tracks 1** and **2** of its connector.
Replace the sensor if the **resistance** is not:
3515 ± 200 Ω at 20 °C
992 ± 100 Ω at 50 °C
475 ± 50 Ω at 70 °C
244 ± 25 Ω at 90 °C

Clear the faults from memory and then start the engine.

If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF001 **CONTINUED 1**	

CC.1	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – + after ignition feed present, – the coolant temperature sensor voltage is greater than **4.9 V**.

Manipulate the wiring harness between the diesel computer and the coolant temperature sensor in order to detect a status change (present ↔ stored).
Look for possible damage to the harness, and check **the connection and the condition** of the coolant temperature sensor and its connections.
Repair if necessary.

If the fault is still present, check that the thermostat is working correctly.
Check the fill level and sealing of the cooling circuit (see **MR 353, MR 402 or MR 361 Mechanical, 19A, Cooling, Checks**).

Check for **insulation against earth, continuity and the absence of interference resistance** on the following connection:

Coolant temperature sensor **track 1** ⟶ **track B 99** of the diesel computer

Repair if necessary.

Check the **insulation from + 5 V and + 12 V, continuity and absence of interference resistance** on the following connection:

Coolant temperature sensor **track 2** ⟶ **track B 95** of the diesel computer

Repair if necessary.

Measure the **resistance** of the coolant temperature sensor between **tracks 1** and **2** of its connector.
Replace the sensor if the **resistance** is not:
3515 ± 200 Ω at 20 °C
992 ± 100 Ω at 50 °C
475 ± 50 Ω at 70 °C
244 ± 25 Ω at 90 °C

Clear the faults from memory and then start the engine.

If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF001 **CONTINUED 2**	

DEF	***NOTES***	**Priority when dealing with a number of faults:** Deal with **DF001 CC.0** and **CO.1** first if they are present or stored.
		Conditions for applying the fault finding procedure to stored faults: The fault is declared as present if: – following an engine start. – the battery voltage is low, – fault detection time between **14** and **19 min**.

Check the condition of the battery and the charging circuit (see **Technical Note 6014A Charging circuit check**). Check **the condition of the vehicle earths**.
Manipulate the wiring harness between the diesel computer and the coolant temperature sensor in order to detect a status change (present ↔ stored). Look for possible damage to the harness, and check **the connection and the condition** of the coolant temperature sensor and its connections. Repair if necessary.
If the fault is still present, check that the thermostat is working correctly. Check the fill level and sealing of the cooling circuit (see **MR 353, MR 402 or MR 361 Mechanical, 19A, Cooling, Checks**).
Check for **insulation against earth, continuity and the absence of interference resistance** on the following connection: Coolant temperature sensor **track 1** ⟶ **track B 99** of the diesel computer Repair if necessary.
Check the **insulation from + 5 V and + 12 V, continuity and absence of interference resistance** on the following connection: Coolant temperature sensor **track 2** ⟶ **track B 95** of the diesel computer Repair if necessary.
Measure the **resistance** of the coolant temperature sensor between **tracks 1** and **2** of its connector. Replace the sensor if the **resistance** is not: **3515 ± 200 Ω at 20 °C** **992 ± 100 Ω at 50 °C** **475 ± 50 Ω at 70 °C** **244 ± 25 Ω at 90 °C**
Clear the faults from memory and then start the engine.
If the conformity check does not detect the fault, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF003 PRESENT OR STORED	ATMOSPHERIC PRESSURE SENSOR CIRCUIT CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 V

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

CO.0	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the atmospheric pressure sensor voltage is less than **1.16 V**. – the engine is started, – Fault detection time **3 seconds**.

Clear the fault with the diagnostic tool.
If the fault is still present, deal with any other faults. If the fault is still present, **contact Techline**.

CC.1	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the atmospheric pressure sensor voltage is greater than **4.6 V**. – the engine is started, – Fault detection time **3 seconds**.

Clear the fault with the diagnostic tool.
If the fault is still present, deal with any other faults. If the fault is still present, **contact Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF015 STORED	MAIN RELAY control CIRCUIT CO : Open circuit CC.0 : Short circuit to earth

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the computer detects an open circuit on **track A 76** or absence of supply on **tracks A 1** and **A 2**, – the engine is switched off.
	Special notes: Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

Manipulate the wiring harness between the diesel computer and the main relay (injection locking relay) to detect a status change (present ↔ stored)
Look for possible damage to the harness, and check **the connection and the condition** of the main relay and its connections.
Repair if necessary.

Check the computer supply voltage **F1 (15A)** fuse, repair if necessary.

Check **the continuity** of the following line:

Main relay **track 15** ⟶ Diesel computer **track A 76**

Repair if necessary.

Check for **insulation from earth, continuity and the absence of interference resistance** on the following connections:

Main relay **track 13** ⟶ Diesel computer **track A 1**

Main relay **track 13** ⟶ Diesel computer **track A 2**

Repair if necessary.

Change over the main relay with another similar relay.
If the fault disappears, replace the relay.

Check for **+ 12 V** on **tracks 16** and **14** of the relay.
Repair if necessary.

Clear the fault memory and start the engine.
If the fault is still present, **contact Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF038 PRESENT OR STORED	COMPUTER 1.DEF: Internal electronic fault

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present if the computer detects an internal electrical malfunction.
	Special notes: Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

If the fault is **stored** or **present**, clear the fault from the computer memory.
Switch off the ignition, wait **40 s**, then switch the ignition on again and re-establish dialogue.

If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF039 PRESENT OR STORED	INLET AIR TEMPERATURE SENSOR CIRCUIT CO.0 : Short circuit to earth CC.1 : Short circuit or open circuit to + 12 V

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors. **Only affects the OBD air temperature sensor at the flow sensor.** **ONLY FOR VDIAG 04 AND 08**

CO.0	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the air temperature sensor voltage is less than **0.12 V**. – + after ignition feed present.

Move the wiring harness between the diesel computer and the air temperature sensor in order to detect a status change (present ↔ stored).
Look for possible damage to the harness, and check **the connection and the condition** of the air temperature sensor and its connections.
Repair if necessary.

Check for **insulation from earth, continuity and the absence of interference resistance** on the following connections:

Diesel computer **track A 11** ⟶ **Earth**

Repair if necessary.

Measure the **resistance** of the air temperature sensor between **tracks 1** and **2** of its connector.
Replace the sensor if the **resistance** is not:
5728 ± 300 Ω at 10 °C
3515 ± 200 Ω at 20 °C
2268 ± 100 Ω at 30 °C

If the fault is still present, deal with any other faults.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF039 **CONTINUED**	

		Priority when dealing with a number of faults: Deal with fault **DF001 Coolant temperature sensor circuit** first, if it is present or stored.
CC.1	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the air temperature sensor voltage is less than **4.9 V**. – + after ignition present, – engine coolant temperature above **- 25 ˚C**.

Move the wiring harness between the diesel computer and the air temperature sensor in order to detect a status change (present ↔ stored).
Look for possible damage to the harness, and check **the connection and the condition** of the air temperature sensor and its connections.
Repair if necessary.

Check the **insulation, continuity and absence of interference resistance** on the following connections:

Air temperature sensor **track 2** ⟶ Diesel computer **track A 11**

Air temperature sensor **track 1** ⟶ Diesel computer **track A 29**

Repair if necessary.

Measure the **resistance** of the air temperature sensor between **tracks 1** and **3** of its connector.
Replace the sensor if the **resistance** is not:
5728 ± 300 Ω at 10 ˚C
3515 ± 200 Ω at 20 ˚C
2268 ± 100 Ω at 30 ˚C

If the fault is still present, deal with any other faults.

If the fault is still present, contact the Techline.

Manipulate the wiring harness between the diesel computer and injector 3 to detect a change in status (present ↔ stored).
Look for any harness damage, and check **the condition and connection** of injector 3 and its connections.
Repair if necessary.

Check the **continuity, insulation from + 12 V and the absence of interference resistance** for the following connection:

Diesel computer **track B 95** ⟶ **track 2** of injector 3

Repair if necessary.

Check the **resistance** of the coil from injector 3 between **tracks 1** and **2** of the injector connector.
Replace the injector if there is a **short circuit (R = 0 Ω)** or an **open circuit (resistance = infinity)**.

Clear the fault memory and start the engine.
If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF042 **CONTINUED 1**	

CO	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the line voltage is greater than **4.8 V**. – ignition on, – the engine is stopped.

Manipulate the wiring harness between the diesel computer and injector 3 to detect a change in status (present ↔ stored).
Look for any harness damage, and check **the condition and connection** of injector 3 and its connections.
Repair if necessary.

Check for **insulation against earth, continuity and the absence of interference resistance** on the following connection:

Diesel computer **track B 91** ⟶ **track 1** of injector 3

Repair if necessary.

Check the **resistance** of the coil from injector 3 between **tracks 1** and **2** of the injector connector.
Replace the injector if there is a **short circuit (R = 0 Ω)** or an **open circuit (resistance = infinity)**.

Clear the fault memory and start the engine.
If the fault is still present**, contact the Techline**.

Manipulate the wiring harness between the diesel computer and the air flow sensor to detect a change in status (present '↔ stored).
Look for possible damage to the harness, and check **the condition and connection** of the air flow sensor and its connections.
Repair if necessary.

Check the **continuity, insulation from + 12 V and the absence of interference resistance** for the following connection:

Air flow sensor **track 5** ⟶ Diesel computer **track A 30**

Repair if necessary.

Check for **insulation against earth, continuity and the absence of interference resistance** on the following connection:

Air flow sensor **track 4** ⟶ Diesel computer **track A 26**

Repair if necessary.

Check **insulation from + 5 V, continuity and absence of interference resistance** on the following connection:

Air flow sensor **track 3** ⟶ Diesel computer **track A 11**

Repair if necessary.

Clear the faults from memory and then start the engine.
Check that the fault has disappeared.
If the fault reappears, replace the air flow sensor.

Clear the stored faults.
Restart the vehicle and wait **30 seconds**.

If the fault is still present, deal with any other faults.
Perform a new computer fault finding procedure; if the fault reappears contact the Techline.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF056 **CONTINUED 2**	

DEF	***NOTES***	**Priority when dealing with a number of faults:** Prioritise the other present or stored faults.
		Conditions for applying the fault finding procedure to stored faults: The fault is declared as present if: – engine speed between **650** and **1050 rpm** stabilised. – detection time greater than **5 seconds**.

Manipulate the wiring harness between the diesel computer and the air flow sensor to detect a change in status (present '↔ stored).
Look for possible damage to the harness, and check **the condition and connection** of the air flow sensor and its connections.
Repair if necessary.

Check the entire air inlet circuit:
– air inlet circuit sealing,
– air filter unit inlet not blocked and filter not clogged,
– no foreign bodies on the air flow sensor grille (visual inspection only).

IMPORTANT
Cleaning the grille with compressed air is prohibited.

Check that the air flow sensor is fitted correctly on the engine inlet air line.
If not, replace the air flow sensor.

Check the **insulation, continuity and absence of interference resistance** on the following connections:

Air flow sensor **track 5** → Diesel computer **track A 30**

Air flow sensor **track 4** → Diesel computer **track A 26**

Air flow sensor **track 3** → Diesel computer **track A 11**

Repair if necessary.

Clear the faults from memory and then start the engine.
Wait **30 seconds** then restart computer fault finding; if the fault reappears, check conformity of the engine with the different parameters.

If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF058 PRESENT OR STORED	OIL TEMPERATURE SENSOR CIRCUIT CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 V

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors. **FOR VDIAG OC ONLY.**

CO.0	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present if the voltage on the diagnostic line is less than **0.12 V**.

Manipulate the wiring harness between the diesel computer and the oil temperature sensor in order to detect a status change (present ↔ stored).
Look for possible damage to the harness, and check **the connection and the condition** of the oil temperature sensor and its connections.
Repair if necessary.

Check for **insulation against earth, continuity and the absence of interference resistance** on the following connection:

Diesel computer **track A 11** ⟶ **track 1** of the oil temperature sensor

Repair if necessary.

If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF058 **CONTINUED**	

CC.1	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present if the voltage on the diagnostic line is greater than **4.97 V**.

Manipulate the wiring harness between the diesel computer and the oil temperature sensor in order to detect a status change (present ↔ stored).
Look for possible damage to the harness, and check **the connection and the condition** of the oil temperature sensor and its connections.
Repair if necessary.

Check **insulation from + 5 V and + 12 V, continuity and absence of interference resistance** on the following connection:

Diesel computer **track A 29** ⟶ **track 2** of the oil temperature sensor

Repair if necessary.

If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF089 PRESENT OR STORED	INLET MANIFOLD PRESSURE SENSOR CIRCUIT CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 V DEF : Inconsistent data

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

CO.0	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the manifold pressure sensor voltage is less than **0.29 V**. – + after ignition on, – battery voltage is greater than **11.6 V**.

Manipulate the wiring harness between the diesel computer and the manifold pressure sensor to detect a change in status (present ↔ stored).
Look for possible damage to the harness, and check **the condition and connection** of the manifold pressure sensor and its connections.
Repair if necessary.

Check for **insulation from earth**, **continuity and the absence of interference resistance** on the following connections:

Manifold pressure sensor, **grey connector, track C** → Diesel computer **track B 93**

Manifold pressure sensor, **grey connector, track A** → Diesel computer **track B 98**

Repair if necessary.

Clear the fault memory and start the engine.
If the fault is still present, replace the manifold pressure sensor (see **MR 353, MR 402 or MR 361 Mechanical, 12A, Fuel mixture, Inlet manifold**).

Clear the fault memory and restart the engine.
If the fault is still present, apply **test 4 "Checking the turbocharging and air inlet circuit"**.
Repair if necessary.
If the fault is still present, apply **test 7: Variable geometry turbocharger command**.
Repair if necessary.
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF089 **CONTINUED 1**	

CC.1	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the manifold pressure sensor voltage is greater than **4.5 V**. – + after ignition on, – battery voltage is greater than **11.6 V**.

Measure the **feed** voltage of the turbocharger position feedback sensor using the diagnostic tool.
If the voltage is not between **3.4 V** and **4.5 V**, repair or replace the turbocharger feedback sensor if necessary (see **MR 353, MR 402 or MR 361 Mechanical, 12B, Turbocharging)**.

Start the engine and let it run at **idle speed at 90 ˚C**.
Check the **feed** voltage of the turbocharger position feedback sensor using the diagnostic tool. If the voltage is not between **0.45 V** and **0.55 V**, repair or replace the turbocharger feedback sensor if necessary (see **MR 353, MR 402 or MR 361 Mechanical, 12B, Turbocharging**).

Manipulate the wiring harness between the diesel computer and the manifold pressure sensor to detect a change in status (present ↔ stored).
Look for possible damage to the harness, and check **the condition and connection** of the manifold pressure sensor and its connections.
Repair if necessary.

Check the **continuity, insulation from + 12 V and the absence of interference resistance** for the following connection:

Manifold pressure sensor, **grey connector, track B** → Diesel computer **track B 87**

Repair if necessary.

Stop the engine and check for the presence of **+ 5 V** on **track C** of the pressure sensor with **+ after ignition** on.
If necessary replace the sensor.

Start the engine and wait a few minutes at idle speed at 80 ˚C:
Check the **value** of the **position** and **voltage** of the **EGR valve** using the diagnostic tool in the Parameters menu **PR136 EGR valve position** and **PR160 EGR potentiometer voltage**.
If the EGR valve position value is different from **0 ± 0.1mm** and the voltage is different from **4 ± 0.1 V**, replace the EGR valve.

Clear the fault memory and restart the engine.
If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF089 **CONTINUED 2**	

DEF	*NOTES*	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present: – if the manifold vacuum is **700 mbar** less than atmospheric pressure, see parameter **PR035 "Atmospheric pressure"**. – the engine speed is less than **1050 rpm**, – there is an atmospheric pressure signal without faults, – the fuel flow is less than **15 mm^3/stroke**, – with the vehicle stopped.

Manipulate the wiring harness between the diesel computer and the manifold pressure sensor to detect a change in status (present ↔ stored).
Look for possible damage to the harness, and check **the condition and connection** of the manifold pressure sensor and its connections.
Repair if necessary.

Check the **continuity and the absence of interference resistance** on the following connection:

Manifold pressure sensor, **grey connector, track A** → Diesel computer **track B 93**

Repair if necessary.

Check the **continuity and the absence of interference resistance** on the following connection:

Manifold pressure sensor, **grey connector, track C** → Diesel computer **track B 98**

Repair if necessary.

Check the **continuity and the absence of interference resistance** on the following connection:

Manifold pressure sensor, **grey connector, track B** → Diesel computer **track B 87**

Repair if necessary.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF089 **CONTINUED 3**	

Clear the fault memory and start the engine.
If the fault is still present, check the air supply circuit between the turbocharger and the inlet manifold.
Check the conformity, **with the engine running**, of **PR041 "Turbocharging pressure"** and **PR146 "Inlet air flow"**.
If the fault is still present, replace the manifold pressure sensor (see **MR 353 or MR 361 Mechanical, 12B, Turbocharging**).

Clear the fault memory and restart the engine.
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF098 PRESENT OR STORED	FUEL TEMPERATURE SENSOR CIRCUIT CC.1 : Short circuit to + 12 V CO.0 : Open circuit or short circuit to earth

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

CO.0	***NOTES***	**Priority when dealing with a number of faults:** Deal with **DF217 (DEF) Sensor supply voltage no. 2** first if it is present or stored.
		Conditions for applying the fault finding procedure to stored faults: The fault is declared as present if: – fuel temperature sensor voltage is less than **0.12 V**. – + after ignition feed present.

Manipulate the wiring harness between the diesel computer and the fuel temperature sensor in order to detect a status change (present ↔ stored).
Look for possible damage to the harness, and check **the connection and the condition** of the fuel temperature sensor and its connections.
Repair if necessary.

Check the **insulation, continuity and absence of interference resistance** on the following connections:

Fuel temperature sensor **track 1** ⟶ Diesel computer **track B 100**

Fuel temperature sensor **track 2** ⟶ **track B 95** of the diesel computer

Repair if necessary.

Check for **insulation against earth, continuity and the absence of interference resistance** on the following connection:

Fuel temperature sensor **track 2** ⟶ **Earth**

Replace the fuel temperature sensor, if necessary.

Measure the **resistance** of the coolant temperature sensor between **tracks 1** and **2** of its connector.
Replace the sensor if the **resistance** is not:
5728 ± 300 Ω at 10 ˚C
3515 ± 200 Ω at 20 ˚C
992 ± 100 Ω at 50 ˚C

If the fault is still present, deal with any other faults.

If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF098 **CONTINUED**	

		Priority when dealing with a number of faults: Deal with **DF217 (DEF) Sensor supply voltage no. 2** first if it is present or stored.
CC.1	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the fuel temperature sensor voltage is greater than **4.9 V**. – + after ignition feed present.

Manipulate the wiring harness between the diesel computer and the fuel temperature sensor in order to detect a status change (present ↔ stored). Look for possible damage to the harness, and check **the connection and the condition** of the fuel temperature sensor and its connections. Repair if necessary.
Check the **insulation from + 5 V and + 12 V, continuity and absence of interference resistance** on the following connection: Fuel temperature sensor **track 1** ⟶ Diesel computer **track B 100** Repair if necessary.
Check for **insulation against earth, continuity and the absence of interference resistance** on the following connection: Fuel temperature sensor **track 2** ⟶ Earth Replace the fuel temperature sensor, if necessary.
Measure the **resistance** of the fuel temperature sensor between **tracks 1** and **2** of its connector. Replace the sensor if the **resistance** is not: **5728 ± 300 Ω at 10 °C** **3515 ± 200 Ω at 20 °C** **992 ± 100 Ω at 50 °C**
If the fault is still present, deal with any other faults.
If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

DF112 PRESENT OR STORED	CYLINDER REFERENCE SENSOR CIRCUIT 1.DEF: Camshaft sensor in open circuit 2.DEF: Camshaft signal incoherence 3.DEF: Inconsistency with engine speed

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

1.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the computer only receives the signal from the crankshaft position sensor, – the computer receives no signal from the camshaft position sensor, – battery voltage is greater than **8 V**. – engine speed greater than **600 rpm**.

Manipulate the wiring harness between the diesel computer and the cylinder reference sensor to detect a change in status (present ↔ stored).
Look for possible damage to the harness, and check **the connection and the condition** of the cylinder reference sensor and its connections.
Repair if necessary.

Check for **insulation against earth, continuity and the absence of interference resistance** on the following connection:

Diesel computer **track B 102** ⟶ **track 1 of the cylinder reference sensor**

Repair if necessary.

Check for **insulation against earth, continuity and the absence of interference resistance** on the following connection:

Diesel computer **track B 103** ⟶ **track 2 of the cylinder reference sensor**

Repair if necessary.

Check for **insulation against earth, continuity and the absence of interference resistance** on the following connection:

Diesel computer **track B 110** ⟶ **track 1** of the engine speed sensor

Repair if necessary.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF112 **CONTINUED 1**	

Check for **insulation against earth, continuity and the absence of interference resistance** on the following connection:

Diesel computer **track B 111** ⟶ **track 2** of the engine speed sensor

Repair if necessary.

Check that the **shielding earth connection** of the camshaft position sensor's electric wiring harness is in **good condition**.

Measure the **resistance** of the **cylinder reference sensor** between **tracks 1 and 2**.
Replace the sensor if the **resistance** is not between **1850 Ω** and **2450 Ω**.

Clear the fault memory and start the engine.
If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF112 **CONTINUED 2**	

2.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the computer receives an incorrect signal from the camshaft position sensor (value other than **7 pulses per revolution** or signal interference), – the engine speed is greater than **670 rpm.**

Manipulate the wiring harness between the diesel computer and the cylinder reference sensor to detect a change in status (present ↔ stored).
Look for possible damage to the harness, and check **the connection and the condition** of the cylinder reference sensor and its connections.
Repair if necessary.

Check that the **shielding earth connection** of the camshaft position sensor's electric wiring harness is in **good condition**.

Check for **insulation against earth, continuity and the absence of interference resistance** on the following connection:

Diesel computer **track B 110** ⟶ **track 1** of the engine speed sensor

Repair if necessary.

Check for **insulation against earth, continuity and the absence of interference resistance** on the following connection:

Diesel computer **track B 111** ⟶ **track 2** of the engine speed sensor

Repair if necessary.

Measure the **resistance** of the **cylinder reference sensor** between **tracks 1 and 2**.
Replace the sensor if the **resistance** is not between **1850 Ω** and **2450 Ω**.

Clear the fault memory and start the engine.
If the fault is still present**, contact the Techline**.

Check for **insulation from + 12 V, continuity and absence of interference resistance** on the following connections:

Alternator **track 1** → preheating unit **track A 3**

Alternator **track 2** → preheating unit **track B 3**

Repair if necessary.

If the fault is still present, replace the preheating unit (see **MR 353, MR 402 or MR 361 Mechanical, 13C, Preheating, Pre-postheating unit**).

Clear the fault memory and start the engine.
If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF186 **CONTINUED 2**	

CO.1	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present if the control line voltage (**track A 68**) is greater than **4.7 V**.
		Special note: Run the **AC037 Preheating relay** command to check whether the relay is working.

Manipulate the wiring harness between the diesel computer and the preheating unit to detect a status change (present ↔ stored)
Look for possible damage to the harness, and check **the condition and connection** of the preheating unit and its connections.
Repair if necessary.

Check for **insulation against earth, continuity and the absence of interference resistance** on the following connection:

Preheating unit **track 8** → Diesel computer **track A 19**

Repair if necessary.

Check for **insulation from + 12 V, continuity and absence of interference resistance** on the following connections:

Alternator **track 1** → preheating unit **track A 3**

Alternator **track 2** → preheating unit **track B 3**

Repair if necessary.

Check the wiring harness and the condition between the preheating circuit **70 A** fuse and the preheating unit. Replace it if necessary.

If the fault is still present, replace the preheating unit (see **MR 353, MR 402 or MR 361 Mechanical, 13C, Preheating, Pre-postheating unit**).

Clear the fault memory and start the engine.
If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

DF196 **CONTINUED 2**	

CC	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present if the voltage on the potentiometer no. 1 signal line is greater than **3.6 V**.

Manipulate the wiring harness between the diesel computer and the accelerator potentiometer to detect a status change (present ↔ stored).
Look for any harness damage, and check **the condition and connection** of the accelerator potentiometer and its connections.
Repair if necessary.

Check the **continuity and the absence of interference resistance** on the following connection:

Accelerator potentiometer **track 2** ⟶ Diesel computer **track A 31**

If the fault is still present, check the **connection** and **the condition** of the intermediate **R262** connector.
Repair if necessary.

Check the **continuity, insulation from + 12 V and the absence of interference resistance** on the following connection:

Accelerator potentiometer **track 3** ⟶ Diesel computer **track A 27**

If the fault is still present, check the **connection** and **the condition** of the intermediate **R262** connector.
Repair if necessary.

Measure the **resistance** of pedal sensor no.1 between **tracks 4** and **2**.
Replace the accelerator potentiometer if the **resistance** is not **1200 ± 500 Ω**.
If necessary replace the sensor.

If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF197 PRESENT OR STORED	FUEL PRESSURE SIGNAL CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 V 1.DEF: Measured pressure too low 2.DEF: Measured pressure too high

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

CO.0	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present if the voltage on the fuel pressure signal line is greater than **4.7 V**.

Manipulate the wiring harness between the diesel computer and the fuel rail pressure sensor in order to detect a status change (present ↔ stored)
Look for possible damage to the harness, and check **the connection and the condition** of the fuel rail pressure sensor and its connections.
Repair if necessary.

Check for **insulation from earth**, **continuity and absence of interference resistance** on the fuel pressure signal connections:

Fuel pressure sensor **track 1** → Diesel computer **track B 106**

Fuel pressure sensor **track 1** → Diesel computer **track B 107**

Fuel pressure sensor **track 3** → Diesel computer **track B 98**

Repair if necessary.

Check for **earth** on the following connection:

Fuel pressure sensor **track 2** → Diesel computer **track B 87**

Repair if necessary.

If the fault is still present, replace the injection rail (see **MR 353, MR 402 or MR 361 Mechanical, 13B, Diesel injection, Injection rail**).
If the fault is still present, **contact Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF197 **CONTINUED 1**	

CC.1	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present if the voltage on the fuel pressure signal line is less than **0.7 V**.

Manipulate the wiring harness between the diesel computer and the fuel rail pressure sensor in order to detect a status change (present ↔ stored)
Look for possible damage to the harness, and check **the connection and the condition** of the fuel rail pressure sensor and its connections.
Repair if necessary.

Check the **insulation against + 5 and + 12 V, the continuity, and absence of interference resistance** on the fuel pressure signal connections:

Fuel pressure sensor **track 1** → Diesel computer **track B 106**

Fuel pressure sensor **track 1** → Diesel computer **track B 107**

Fuel pressure sensor **track 2** → Diesel computer **track B 87**

Repair if necessary.

Check for **+ 5 V** on the following connection:

Fuel pressure sensor **track 3** → Diesel computer **track B 98**

Repair if necessary.

If the fault is still present, replace the injection rail (see **MR 353, MR 402 or MR 361 Mechanical, 13B, Diesel injection, Injection rail**).
If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF197 **CONTINUED 2**	

1.DEF	***NOTES***	**Priorities when dealing with a number of faults:** Treat as a priority any other fault that is present or stored.
		Conditions for applying the fault finding procedure to stored faults: The fault is declared as present if: – there is no fuel pressure sensor short circuit or open circuit fault. – there is no power unit fault, – there is no rail pressure solenoid valve fault, – there is no fuel temperature fault. **During the starting phase:** – the rail pressure is greater than **150 bar**. – the engine speed is between **50** and **300 rpm**, – injection flow greater than **5 mm^3/stroke**. **Engine running:**- – the engine speed is between **500** and **5200 rpm**, – the fuel temperature less than **160 ˚C**, – pressure loop difference greater than **150 bar**.

Check the fuel pressure sensor connections.
Check the fuel pressure solenoid valve connections.
Check the engine management computer connections.
Repair if necessary.

Check the condition of the high pressure injection rail and make sure there is no leakage.
Check operation of the fuel pressure regulator (e.g., locked open).
a) For all Vdiags except VELSATIS Vdiag 04:
Check the **ET038 ENGINE** status and parameters **PR364 Fuel flow correction cylinder 1, PR405 Fuel flow correction cylinder 2, PR406 Fuel flow correction cylinder 3, PR365 Fuel flow correction cylinder 4, PR407 Fuel flow correction cylinder 5** and **PR408 Fuel flow correction cylinder 6**, see the conformity check in the **Fuel circuit** sub-function.
Replace the injection rail if necessary.
If the injectors are not faulty, first replace the regulator.
If the fault is still present, replace the high pressure pump (see **MR 353, MR 402, or MR 361 Mechanical, 13B, Diesel Injection, High pressure pump**).
b) For VELSATIS Vdiag 04:
Perform the conformity check in the **Fuel circuit** sub-function.

If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF197 **CONTINUED 3**	

2.DEF	***NOTES***	**Priorities when dealing with a number of faults:** Treat as a priority any other fault that is present or stored.
		Conditions for applying the fault finding procedure to stored faults: The fault is declared present: **Engine running:** – engine speed greater than **500 rpm**, – there is no fuel pressure sensor short circuit or open circuit fault. – there is no power unit fault, – **there is no rail pressure solenoid valve fault,** – there is no fuel temperature fault after acceleration.

Check the fuel pressure sensor connections.
Check the fuel pressure solenoid valve connections.
Check the engine management computer connections.
Repair if necessary.

Check the condition of the high pressure injection rail and make sure there is no leakage.
Check operation of the fuel pressure regulator (e.g., locked open).

– check the priming of the low pressure diesel circuit,
– also check the conformity of the diesel filter connections and that the diesel fuel is not saturated with water.
– check that there are no air bubbles between the filter and the low pressure pump,
– Check the seal of the low and high pressure diesel fuel circuits (visual inspection, odour, etc.): pump housing, overpressure valve, pipes, rail and injector unions, injector wells, etc.).

Step 1
– Check the connections of the following components:
- rail pressure sensor,
- fuel pressure regulator,
- computer,
- fuel temperature sensor,
- Also check the condition of the wiring harness (wear, pinching, etc.).

If all of the checks reveal no faults, proceed to stage 2.
Checking the fuel Low Pressure system:
Step 2
– Check the fuel level in the tank:
- Fill up if necessary and reproduce the fault. Otherwise, proceed to step 3.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF197 **CONTINUED 4**	

Step 3
– check that there are no fuel leaks (odour, etc.):
- repair if necessary, otherwise proceed to step 4.

Step 4
– check the sealing of the Low Pressure circuit:
- if there are air bubbles present or external leaks, check the filter bleed screw, and repair the leaks if necessary.
- if the pipes or hoses are worn or damaged, repair if necessary, otherwise proceed to step 5.

Step 5
– Check the fuel priming bulb:
- If the unit is compressed, check for the loss of load before the unit.
- if the engine is fitted with a priming pump, check the variation of flow in the fuel filter, otherwise go to step 6.

Step 6
– check the condition of the fuel filter:
- replace the filter if it is dirty. The fuel filter tank must be cleaned before the new filter is fitted, to prevent dust particles from being transferred to the high pressure pump and the high pressure circuit.

– ignition on, and engine stopped for over **1 minute**:
– display **PR038 Rail pressure**.
  – if the value is less than **50 bar**, the sensor is OK.
  – if not replace the rail pressure sensor.

For all Vdiags except VELSATIS Vdiag 04:
Check the **ET038 "ENGINE**" status and parameters **PR364 "Fuel flow correction cylinder 1", PR405 "Fuel flow correction cylinder 2", PR406 "Fuel flow correction cylinder 3", PR365 "Fuel flow correction cylinder 4", PR407 "Fuel flow correction cylinder 5"** and **PR408 "Fuel flow correction cylinder 6"**, see the conformity check in the **Fuel circuit** sub-function.

If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF198 PRESENT OR STORED	PEDAL SENSOR CIRCUIT GANG NO. 2 CO.0 : Open circuit or short circuit to earth CC : Short circuit

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

CO.0	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present if the voltage on the potentiometer no. 1 signal line is less than **0.17 V**.

Manipulate the wiring harness between the diesel computer and the accelerator potentiometer to detect a status change (present ↔ stored).
Look for any harness damage, and check **the condition and connection** of the accelerator potentiometer and its connections.
Repair if necessary.

Check the **continuity and the absence of interference resistance** on the following connection:

Accelerator potentiometer **track 5** ⟶ Diesel computer **track A 26**

Repair if necessary.

Check for insulation against earth, continuity and absence of interference resistance on the following connection:

Accelerator potentiometer **track 1** ⟶ Diesel computer **track A 11**

Repair if necessary.

Measure the **resistance** of pedal sensor no. 2 between **tracks 5** and **1**.
Replace the accelerator potentiometer if the **resistance** is not **1700 ± 500 Ω**.
If necessary replace the sensor.

If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF198 **CONTINUED**	

CC	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present if the voltage on the potentiometer no. 1 signal line is greater than **3.6 V**.

Manipulate the wiring harness between the diesel computer and the accelerator potentiometer to detect a status change (present ↔ stored).
Look for any harness damage, and check **the condition and connection** of the accelerator potentiometer and its connections.
Repair if necessary.

Check for insulation against earth, continuity and absence of interference resistance on the following connection:

Accelerator potentiometer **track 1** ⟶ Diesel computer **track A 11**

Repair if necessary.

Check the **continuity, insulation from + 12 V and the absence of interference resistance** for the following connection:

Accelerator potentiometer **track 6** ⟶ Diesel computer **track A 8**

Repair if necessary.

Measure the **resistance** of pedal sensor no. 2 between **tracks 5** and **1**.
Replace the accelerator potentiometer if the **resistance** is not **1700 ± 500 Ω**.
If necessary replace the sensor.

If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

CO.0	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present if the EGR position signal voltage is less than **1.1 V**.

Manipulate the wiring harness between the diesel computer and the EGR valve in order to detect a status change (present ↔ stored)
Look for possible damage to the wiring harness, check **the connection and the condition** of the EGR valve and its connections.
Repair if necessary.

Check for **insulation from earth, continuity and the absence of interference resistance** on the following connections:

EGR valve **track 1** → Diesel computer **track B 94**

EGR valve **track 3** → Diesel computer **track B 98**

Repair if necessary.

If the fault is still present, replace the EGR valve (see **MR 353, MR 402 or MR 361 Mechanical, 12A, Fuel mixture, Exhaust gas recirculation valve**).
If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF209 **CONTINUED**	

CC.1	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present if the EGR position signal voltage is greater than **4.7 V**.

Manipulate the wiring harness between the diesel computer and the EGR valve in order to detect a status change (present ↔ stored)
Look for possible damage to the wiring harness, check **the connection and the condition** of the EGR valve and its connections.
Repair if necessary.

Check the following connections for **insulation against + 12 V, continuity and absence of interference resistance**:

EGR valve **track 1** → Diesel computer **track B 94**

EGR valve **track 2** → Diesel computer **track B 87**

Repair if necessary.

Measure the **resistance** of the EGR valve between **tracks 4** and **5**.
Replace the EGR valve, if the resistance is not **6.8 ± 0.5 Ω at 20 °C**.
Measure the **resistance** of the EGR valve between **tracks 2** and **3**.
Replace the EGR valve if the resistance is not **5 ± 0.5 Ω at 20 °C**.
(see **MR 353, MR 402 Mechanical, 12A, Fuel mixture, Exhaust gas recirculation valve**).

If the fault is still present, replace the EGR valve (see **MR 353, MR 402 or MR 361 Mechanical, 12A, Fuel mixture, Exhaust gas recirculation valve**).
If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF216 PRESENT OR STORED	SENSOR FEED NO. 1 VOLTAGE DEF : Open circuit or short circuit to sensor power supply earth

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present when the computer detects an inconsistency in the power supply to its sensors. **Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

Sensor feed no. 1 is dedicated to the following components:
– fuel rail pressure sensor,
– gas recycling potentiometer,
– turbocharger pressure sensor,
– turbocharger position sensor.

Display parameter **PR215 Sensor power supply voltage no. 1**:
– If the voltage is less than **3.9 V** or greater than **4.1 V**, disconnect the sensors mentioned above one by one.

If, following disconnection, the voltage becomes normal again, replace the sensor concerned or repair the connection (wait a few seconds **between each disconnection** for the computer to make its measurement).
Clear the faults created by the multiple disconnections.
If, with sensors disconnected the voltage is still less than **3.9 V** or greater than **4.1 V**:
– check for **insulation against earth, continuity and the absence of interference resistance** on the following connection:

Injection computer **track B 98**
– Check the **insulation from + 5 V and + 12 V, continuity and absence of interference resistance** on the following connection:

Injection computer **track B 87**
– check for **+ 5 V** on **track B 98** of the injection computer and on each of its sensors.

If the fault is still present, check the computer connections.
If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF217 PRESENT OR STORED	SENSOR SUPPLY VOLTAGE No. 2 DEF: Open circuit or short circuit to sensor power supply earth

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present when the computer detects an inconsistency in the power supply to its sensors.
	Special notes: Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

Sensor supply no. 2 is dedicated to the following components:
– fuel temperature sensor,
– coolant temperature sensor,
– correction resistance of injectors 1 to 6.

If, with sensors disconnected, the voltage is still less than **3.9 V** or greater than **4.1 V** :
– Check the **insulation from + 5V and +12V, continuity and absence of interference resistance** on the following connection:

Injection computer **track B 95.**

If the fault is still present, check the computer connections.
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF218 PRESENT OR STORED	MICROCONTROLLER DEF: Internal electronic fault

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: – the computer detects an internal electronic fault, – + after ignition feed on.

Clear the faults from memory and then start the engine.
Switch off the ignition and wait 40 seconds. Switch on + after ignition again. Check for present faults and deal with them. Clear the faults.
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF262 PRESENT OR STORED	HEATER PLUG GROUP NO. 1 CIRCUIT DEF: Row 1 heater plugs in CO.0

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is considered present if: – the voltage on the diagnostic line is greater than **4.7 V**.
	Special note: – run the **A C037 Preheating relay** command to check whether the relay is working. – use bornier **Elé. 1681** for all operations on the engine management computer connectors.

Check the condition of the **70 A** fuse for the rear preheating circuit. Replace it if necessary.
Check the **condition** of the supply lines **tracks 6, 4 and 2** between the preheating unit and the back row plugs and check their **insulation to earth** and their **continuity**. Repair if necessary.
Check the **condition** of preheating unit supply line **track 1** from the battery, and check its continuity. If everything is correct, replace the preheating unit.
Check the **condition** and **resistance** of the back row heater plugs. Replace the heater plugs if the **resistance** is greater than **30 Ω**.
Clear the fault memory and start the engine. **If the fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF263 PRESENT OR STORED	HEATER PLUG GROUP NO. 2 CIRCUIT DEF : Heater plugs row 2 in CO.0

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is considered present if: – the voltage on the diagnostic line is greater than **4.7 V**.
	Special note: – run the **A C037 Preheating relay** command to check whether the relay is working. – use bornier **Elé. 1681** for all operations on the engine management computer connectors.

Check the condition of the **70 A** fuse for the front preheating circuit. Replace it if necessary.
Check the **condition** of the supply lines **tracks 7, 5 and 3** between the preheating unit and the front row plugs and check their **insulation to earth** and their **continuity**. Repair if necessary.
Check the **condition** of the preheating unit supply line **track 1** from the battery, and check its continuity. If everything is correct, replace the preheating unit.
Check the **condition** and **resistance** of the front row heater plugs. Replace the heater plugs if the **resistance** is greater than **30 Ω**.
Clear the fault memory and start the engine. **If the fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF264 PRESENT OR STORED	POWER UNIT 1.DEF: Insulation fault on the injector power lines

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is considered present if: – the engine speed is greater than **500 rpm**, – the battery voltage is greater than **11 V**, – an insulation fault appears on the injector power lines.
	Special notes: Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

Disconnect the connector from the Power Unit.

Check for **+ 12 V** on **track 1** of the **black connector** of the Power Unit.
Check for earth on **track 8** of the **black connector** of the Power Unit.
Repair or replace the Power Unit if necessary (see **MR 353, MR 402 or MR 361 Mechanical, 13B, Diesel Injection, Power computer**).

Check for **insulation against earth, continuity and the absence of interference resistance** on the following connection:

Diesel computer **track A 66** ⟶ Power Unit **grey connector, track 2**

Repair if necessary.

If the fault is still present, replace the Power Unit (see **MR 353, MR 402 or MR 361 Mechanical, 13B, Diesel injection, Power computer**).

Clear the fault memory and start the engine.
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF265 PRESENT OR STORED	INJECTOR NO. 1 DEF: Injector mechanical fault

NOTES	**Priority when dealing with a number of faults:** Deal with all other faults first if they are present or stored.
	Conditions for applying the fault finding procedure to stored faults: The fault is considered present if: – vehicle speed is zero, – engine speed is less than **850 rpm**, – the engine coolant temperature is greater than **70˚C**, – fault detection time is **10 seconds**.
	Special notes: Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

With the engine stopped, disconnect the connector from injector 1.
Measure the **resistance** of the injector 1 coil between **tracks 1** and **2** of the injector connector. Replace the injector if it is in **short circuit (R = 0 Ω)** or in **open circuit (resistance measurement = infinity).** Otherwise, **reconnect injector no. 1**. If **the fault is still present**, apply **test 10 Poor injector operation**.
Clear the fault memory and start the engine. **If the fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF266 PRESENT OR STORED	INJECTOR No.2 DEF: Injector mechanical fault

NOTES	**Priority when dealing with a number of faults:** Deal with all other faults first if they are present or stored.
	Conditions for applying the fault finding procedure to stored faults: The fault is considered present if: – vehicle speed is zero, – engine speed is less than **850 rpm**, – the engine coolant temperature is greater than **70˚C**, – fault detection time is **10 seconds**.
	Special notes: Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

With the engine stopped, disconnect the connector from injector 2.
Measure the **resistance** of injector 2 coil between **tracks 1** and **2** of the injector connector. Replace the injector if it is in **short circuit (R = 0 Ω)** or in **open circuit (resistance measurement = infinity).** Otherwise, **reconnect injector no. 2**. If **the fault is still present**, apply **test 10 Poor injector operation**.
Clear the fault memory and start the engine. **If the fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF267 PRESENT OR STORED	INJECTOR no. 3 DEF: Injector mechanical fault

NOTES	**Priority when dealing with a number of faults:** Deal with all other faults first if they are present or stored.
	Conditions for applying the fault finding procedure to stored faults: The fault is considered present if: – vehicle speed is zero, – engine speed is less than **850 rpm**, – the engine coolant temperature is greater than **70˚C**, – fault detection time is **10 seconds**.
	Special notes: Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

With the engine stopped, disconnect the connector from injector 3.
Measure the **resistance** of the coil for injector 3 between **tracks 1** and **2** of the injector connector. Replace the injector if it is in **short circuit (R = 0 Ω)** or in **open circuit (resistance measurement = infinity).** Otherwise, **reconnect injector no. 3**. If **the fault is still present**, apply **test 10 Poor injector operation**.
Clear the fault memory and start the engine. **If the fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF268 PRESENT OR STORED	INJECTOR no. 4 DEF : Injector mechanical fault

NOTES	**Priority when dealing with a number of faults:** Deal with all other faults first if they are present or stored.
	Conditions for applying the fault finding procedure to stored faults: The fault is considered present if: – vehicle speed is zero, – engine speed is less than **850 rpm**, – the engine coolant temperature is greater than **70˚C**, – fault detection time is **10 seconds**.
	Special notes: Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

With the engine stopped, disconnect the connector from injector 4.
Measure the **resistance** of the coil for injector 4 between **tracks 1** and **2** of the injector connector. Replace the injector if it is in **short circuit (R = 0 Ω)** or in **open circuit (resistance measurement = infinity).** Otherwise, **reconnect injector no. 4**. If **the fault is still present**, apply **test 10 Poor injector operation**.
Clear the fault memory and start the engine. **If the fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF269 PRESENT OR STORED	INJECTOR NO. 5 DEF: Injector mechanical fault

NOTES	**Priority when dealing with a number of faults:** Deal with all other faults first if they are present or stored.
	Conditions for applying the fault finding procedure to stored faults: The fault is considered present if: – vehicle speed is zero, – engine speed is less than **850 rpm**, – the engine coolant temperature is greater than **70˚C**, – fault detection time is **10 seconds**.
	Special notes: Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

Engine stopped, disconnect the connector from injector 5.
Measure the **resistance** of the coil for injector 5 between **tracks 1** and **2** of the injector connector. Replace the injector if it is in **short circuit (R = 0 Ω)** or in **open circuit (resistance measurement = infinity).** Otherwise, **reconnect injector no. 5**. If **the fault is still present**, apply **test 10 Poor injector operation**.
Clear the fault memory and start the engine. **If the fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF270 PRESENT OR STORED	INJECTOR NO. 6 DEF: Injector mechanical fault

NOTES	**Priority when dealing with a number of faults:** Deal with all other faults first if they are present or stored.
	Conditions for applying the fault finding procedure to stored faults: The fault is considered present if: – vehicle speed is zero, – engine speed is less than **850 rpm**, – the engine coolant temperature is greater than **70˚C**, – fault detection time is **10 seconds**.
	Special notes: Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

With the engine stopped, disconnect the connector from injector ?6?.
Measure the **resistance** of the coil for injector 6 between **tracks 1** and **2** of the injector connector. Replace the injector if it is in **short circuit (R = 0 Ω)** or in **open circuit (resistance measurement = infinity).** Otherwise, **reconnect injector no. 6**. If **the fault is still present**, apply **test 10 Poor injector operation**.
Clear the fault memory and start the engine. **If the fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF324 PRESENT OR STORED	OBD AIR TEMPERATURE SENSOR CIRCUIT CC.1: Short circuit to + 12 V CO.0: Open circuit or short circuit to earth

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors. **Does not involve the air inlet temperature sensor.** **ONLY FOR VDIAG 08 AND 0C**

CC.1	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present if the sensor voltage is greater than **4.9 V**.

Manipulate the wiring harness between the diesel computer and the OBD air temperature sensor to detect a change of status (present ´ stored).
Look for possible damage to the harness, and check the **connection** and **the condition** of the OBD air temperature sensor and its connections.
Repair if necessary.

Check for **the continuity, the absence of interference resistance and insulation against + 5 V and + 12 V** on the following connections:

Diesel computer **track B 109** ⟶ **track 1** of the OBD air temperature sensor

If the fault is still present, check **the connection** and **condition** of **intermediate connector R115**.
Repair if necessary.

Measure the **resistance** between **tracks 1** and **3** of the OBD air temperature sensor.
Replace the sensor if the **resistance** is not:
5516 ± 400 Ω at 0˚C
3728 ± 300 Ω at 10˚C
2515 ± 200 Ω at 20˚C

If the fault is still present, apply **test 5 Air flowmeter**.
Repair if necessary.
If the fault is still present, apply **test 4 Checking the turbocharging and air inlet circuit**.
Repair if necessary.
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF324 **CONTINUED**	

CO.0	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present if the sensor voltage is less than **0.12 V**.

Manipulate the wiring harness between the diesel computer and the OBD air temperature sensor to detect a change of status (present ↔ stored).
Look for possible damage to the harness, and check **the connection and the condition** of the OBD air temperature sensor and its connections.
Repair if necessary.

Check the **insulation against earth, continuity and the absence of interference resistance** on the following connection:

Diesel computer **track B 109** ⟶ **track 1** of the OBD air temperature sensor

If the fault is still present, check **the connection** and **condition** of **intermediate connector R115**.
Repair if necessary.

Check the **continuity and lack of interference resistance** of the connection:

Diesel computer **track A 11** ⟶ **track 3** of the OBD air temperature sensor

Repair if necessary.

Measure the **resistance** between **tracks 1** and **3** of the OBD air temperature sensor.
Replace the sensor if the **resistance** is not:
5516 ± 400 Ω at 0˚C
3728 ± 300 Ω at 10˚C
2515 ± 200 Ω at 20˚C

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF325 PRESENT OR STORED	EXHAUST GAS RECIRCULATION FUNCTION CC.1: Short circuit to + 12 V CO.0: Open circuit or short circuit to earth 1.DEF: Excessive EGR valve flow 2.DEF: Insufficient EGR valve flow 3.DEF: EGR valve position feedback loop error

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

CC.1	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is considered present if: – inconsistency with the EGR valve control voltage when it is operated, – the battery voltage is too low.

Manipulate the wiring harness between the diesel computer and the EGR valve to detect a change in status (present ⇔ stored).
Look for possible damage to the harness, and check **the connections and condition** of the EGR valve and its connections.
Repair if necessary.

Check the **insulation from + 5V and +12 V, continuity and absence of interference resistance** on the following connection:

Diesel computer **track B 115** → **track 4** of the EGR valve

Diesel computer **track B 87** → **track 2** of the EGR valve

Repair if necessary.

Measure the **resistance** of the EGR valve between **tracks 4** and **5**.
Replace the EGR valve if the resistance is not **6.8 ± 0.5 Ω at 20˚C**.
Measure the **resistance** of the EGR valve between **tracks 2** and **3**.
Replace the EGR valve if the resistance is not **5 ± 0.5 kΩ at 20˚C**.
(see **MR 353, MR 402 Mechanical, 12A, Fuel mixture, Exhaust gas recirculation valve**).

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF325 **CONTINUED 1**	

CO.0	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is considered present if: – with the engine running, – the battery voltage is too low.

Manipulate the wiring harness between the diesel computer and the EGR valve to detect a change in status (present ↔ stored).
Look for possible damage to the harness, and check **the connections and condition** of the EGR valve and its connections.
Repair if necessary.

Check the **insulation against earth, continuity and the absence of interference resistance** on the following connection:

Diesel computer **track B 115** ⟶ **track 4** of the EGR valve

Repair if necessary.

Measure the **resistance** of the EGR valve between **tracks 4** and **5**.
Replace the EGR valve if the resistance is not **6.8 ± 0.5 Ω at 20˚C**.
Measure the **resistance** of the EGR valve between **tracks 2** and **3**.
Replace the EGR valve if the resistance is not **5 ± 0.5 kΩ at 20˚C**.
(see **MR 353, MR 402 Mechanical, 12A, Fuel mixture, Exhaust gas recirculation valve**).

Check the **continuity and absence of interference resistance** of the connections::

Main relay **track 13** ⟶ **track 5** of the EGR valve

Diesel computer **tracks A 1** and **A 2** ⟶ **track 5** of the EGR valve

Ensure the presence of **+ 12 V** on **track A 1**
If the fault is still present, check **intermediate connector R 115** on **track 2**.
Repair if necessary.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF325 **CONTINUED 2**	

1.DEF ***2.DEF***	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present: – speed loop error less than **150 rpm**. – vehicle speed between **27 mph (45 km/h)** and **33 mph (55 km/h)**. – detection time **11 seconds**. – air intake temperature between **20** and **75˚C**, – if **1.DEF**: The difference between the EGR valve opening cyclic ratio and the EGR opening cyclic ratio setpoint is **greater than 20%**. – if **2.DEF**: The difference between the EGR valve opening cyclic ratio and the EGR valve opening cyclic ratio setpoint is **less than 29%**.
3.DEF		**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present: – with the engine running, – engine speed greater than **1700 rpm**, – detection time **11 seconds**. – engine coolant temperature between **70** and **100˚C**, – the recorded value of the EGR valve position and the estimated value of the EGR valve position is greater than **1 mm**, – the estimated value of the EGR valve position and the recorded value of the EGR valve position is greater than **4 mm**.

Manipulate the wiring harness between the diesel computer and the EGR valve to detect a change in status (present ↔ stored).
Look for possible damage to the harness, and check **the connections and condition** of the EGR valve and its connections.
Repair if necessary.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF325 **CONTINUED 3**	

Check that the EGR valve inlet duct and the inlet tracts on the manifold are not damaged (cracked manifold, pierced hoses), blocked or pinched. Check the extent of clogging of the EGR valve. Repair if necessary.
Clear the fault memory and start the engine. Repeat fault finding with the diagnostic tool. If the fault reappears, replace the EGR valve (see **MR 353, MR 402 or MR 361 Mechanical, 12A, Fuel mixture, Inlet manifold**).
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF374 PRESENT OR STORED	COMPUTER 1.DEF: Memory self-test

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present if the computer detects an internal electrical malfunction.
	Special notes: Use bornier **Elé. 1621** for all operations on the engine management computer connectors.

If the fault is **stored** or **present**, clear the fault from the computer memory.
Switch off the ignition, wait **40 s**, then switch the ignition on again and re-establish dialogue.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF767 PRESENT OR STORED	POWER UNIT 1.DEF: Loss of EDU power supply, injector control line CC.0 or CC.1

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is considered present if: – the engine speed is greater than **500 rpm**, – the battery voltage is greater than **11 V**, – the Power Unit loses its power supply, – or its injector control lines are short circuited to **earth** or to **+12 V**.
	Special notes: Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

Manipulate the wiring harness between the diesel computer and the Power Unit* to detect a change in status (present ↔ stored).
Look for possible damage to the harness, and check **the condition and connection** of the Power Unit and its connections.
Repair if necessary.

Check the **insulation from earth, continuity and the absence of interference resistance** on the following connections:

Diesel computer **track A 46** → **track 3** of the Power Unit
Diesel computer **track A 65** → **track 4** of the Power Unit
Diesel computer **track A 45** → **track 5** of the Power Unit
Diesel computer **track A 64** → **track 6** of the Power Unit
Diesel computer **track A 44** → **track 7** of the Power Unit
Diesel computer **track A 63** → **track 8** of the Power Unit

Repair if necessary.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF767 **CONTINUED**	

Check the **supply** of power to the Power Unit terminals. With the ignition on, check for **+ 12 V** on **track A 1** in contact and **track 1** of the Power Unit. Repair if necessary.
Check the **continuity, insulation from + 12 V and the absence of interference resistance** for the following connection: Diesel computer **track A 66** ⟶ **track 2** of the Power Unit Repair if necessary.
If the fault is still present, replace the Power Unit (see **MR 353, MR 402 or MR 361 Mechanical, 13B, Diesel injection, Power computer**).
Clear the fault memory and start the engine. **If the fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF768 PRESENT OR STORED	POWER UNIT 1.DEF: The diesel computer detects low power consumption by the Power Unit

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present: – if the diesel computer detects a low power consumption by the Power Unit, – at engine speeds above **500 rpm**, – If the battery voltage is greater than **11 V**; **Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

Manipulate the wiring harness between the diesel computer and the Power Unit to detect a change in status (present ↔ stored).
Look for possible damage to the harness, and check **the condition and connection** of the Power Unit connector and its connections.
Repair if necessary.

Check the **insulation and continuity** of the following connections:

Power Unit **track 1**	→	**track 4** of injectors no. 1 to 6
Power unit **track 7**	→	**track 3** of injectors no. 1
Power unit **track 6**	→	**track 3** of injectors no. 2
Power unit **track 5**	→	**track 3** of injectors no. 3
Power unit **track 4**	→	**track 3** of injectors no. 4
Power unit **track 3**	→	**track 3** of injectors no. 5
Power unit **track 2**	→	**track 3** of injectors no. 6

Power Unit = Injector control unit.
Repair if necessary.
If the connections are correct and the fault is still present, replace the Power Unit (see **MR 353, MR 402 or MR 361 Mechanical, 13B, Diesel injection, Power computer**).

Clear the fault memory and start the engine.
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF769 PRESENT OR STORED	OIL TEMPERATURE 1.DEF: Above maximum threshold

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present if the temperature is greater than **123˚C**.
	Special notes: Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

Manipulate the wiring harness between the diesel computer and the oil temperature sensor to detect a change of status (present ⇔ stored).
Look for possible damage to the harness, and check **the connection and the condition** of the oil temperature sensor and its connections.
Repair if necessary.

Measure the **resistance** between tracks **1** and **2** of the oil temperature sensor.
Replace the sensor if the **resistance** is not:
16100 ± 400 Ω at - 10˚C
9200 ± 300 Ω at 0˚C
3515 ± 200 Ω at 20˚C
1500 ± 100 Ω at 40˚C

If the fault is still present, check the engine cooling circuit (see **MR 353, MR 402 or MR 361 Mechanical, 19A, Cooling, Checks**).
Repair or replace the faulty components, if necessary.

If the fault is still present, contact the Techline.

GETtheMANUALS.org

NOTES	Only check conformity after a full check with the **diagnostic tool**. The values shown in this conformity check are given as a guide. **Test conditions: engine stopped, ignition on.**

MAIN SCREEN

Order	Function	Parameter or Status Check or Action	Display and notes	Fault finding
1	**Impact detected**	**ET077:** Impact detected	**NO**	If **YES**, switch off the ignition for **40 seconds**, then switch it back on so the engine can be restarted. Then clear any faults.
2	**Engine speed**	**PR145:** Engine speed	**Gives the engine's rotational speed in rpm. 0 rpm**	In the event of a fault apply the interpretation for **DF154 Flywheel signal sensor circuit**.
3	**Vehicle speed**	**PR155:** Vehicle speed	**Gives the vehicle speed in mph (km/h). 0 mph**	**Perform a fault finding procedure on the ABS computer.**
4	**Main relay**	**ET133:** Main relay control	**ACTIVE**	In the event of a fault, apply the interpretation of **DF015 Main relay control circuit**.
5	**Connection**	**ET226:** Injection/ multiplex network connection	**VALID**	In the event of a fault, test the multiplex network. Clear the faults.
6	**Computer feed voltage**	**PR071:** Computer feed voltage	**11 V < PR071 < 15 V**	In the event of a fault, apply the interpretation of fault **DF175 Supply**.
7	**Sensor supply voltages**	**PR215:** Sensor feed voltage no. 1	**4.9 V ± 0.1 V**	If only one gang responds after the pedal is depressed, change the pedal sensor. If the voltages measured do not correspond to ± **0.5 V**, replace the pedal sensor.

NOTES	The values indicated in this conformity check are only given as examples. It is therefore essential to refer to the Technical Note which deals with your vehicle. **Test conditions:** engine warm, idling at **80 ˚C**.

AIR CIRCUIT (TURBO/INLET) (CONTINUED 2)

Order	Function	Parameter or Status Check or Action		Display and notes	Fault finding
10	**Sensor voltages**	**PR083:**	Air temperature sensor voltage	**3.3 ± 0.1 V at 80 ˚C**	In the event of a fault, apply the interpretation of faults **DF039 Air inlet temperature sensor circuit** (Vdiag 04, 08 only) **and DF324 OBD air temperature sensor circuit** (Vdiag 0C only).
11		**PR079:**	Atmospheric pressure sensor voltage	**3.9 ± 0.1 V at 80 ˚C**	In the event of a fault, apply the interpretation for **DF003 Atmospheric pressure sensor circuit**.
12		**PR215:**	Sensor feed voltage no. 1	**4.9 ± 0.1 V**	If only one gang responds after the pedal is depressed, change the pedal sensor. If the voltages measured do not correspond to ± **0.5 V**, replace the pedal sensor.
13		**PR224:**	Turbocharging pressure sensor voltage	**1.96 ± 0.1 V at 80 ˚C**	In the event of a fault, apply the interpretation of **DF055 Turbocharging pressure regulation circuit**.
14		**PR345:**	Turbocharger wastegate potentiometer voltage	**PR345 = 0.45 V for PR346 = 10 mm**	
15		**PR225:**	Air flow sensor voltage	**3.29 ± 0.1 V at 80 ˚C**	In the event of a fault, apply the interpretation of **DF056 Air flow sensor circuit**.

GETtheMANUALS.org

NOTES	The values indicated in this conformity check are only given as examples. It is therefore essential to refer to the Technical Note which deals with your vehicle. **Test conditions:** engine warm, idling at **80 ˚C**.

FUEL CIRCUIT

Order	Function	Parameter or Status Check or Action		Display and notes	Fault finding
1	**Engine speed**	**PR145:**	Engine speed	**Gives the engine's rotational speed in rpm. 700 ± 50 rpm**	In the event of a fault apply the interpretation for **DF154 Flywheel signal sensor circuit**.
2	**Fuel temperature**	**PR063:**	Fuel temperature	**80 ± 5 ˚C**	In the event of a fault, apply the interpretation of **DF098 Fuel temperature sensor circuit**.
3	**Rail pressure**	**PR008:**	Rail pressure setpoint	During operation, parameter **PR213** should not exceed a **40 bar** difference at a stabilised idle speed. **PR213 = PR008 - PR038 ≈ 0 bar**	In the event of a fault, apply the interpretation of **DF208 "Fuel pressure solenoid valve circuit", or DF197 "Fuel pressure signal"**.
4		**PR038:**	Rail pressure		
5		**PR213:**	Rail pressure loop difference		
6	**Turbocharger**	**PR346:**	Turbocharger wastegate valve position	**PR346 = 10 mm at idling speed PR346 < 10 mm in deceleration**	In the event of a fault, apply the interpretation of **DF055 Turbocharging pressure regulation circuit**.
7	**Fuel flow**	**PR017:**	Fuel flow	**0 < X < 60 mm^3/stroke**	In the event of a fault, apply the interpretation of **DF197 "Fuel pressure signal"**
8	**Duration of injection**	**PR101:**	Duration of injection	**0 < X < 20000 µs**	

GETtheMANUALS.org

NOTES	The values indicated in this conformity check are only given as examples. It is therefore essential to refer to the Technical Note which deals with your vehicle. **Test conditions:** engine warm, idling at **80 ˚C**.

FUEL CIRCUIT (continued)

Order	Function	Parameter or Status Check or Action		Display and notes	Fault finding
9	**Sensor voltages**	**PR082:**	Fuel temperature sensor voltage	**1.62 ± 0.1 V at 80 ˚C**	In the event of a fault, apply the interpretation of **DF098 Fuel temperature sensor circuit**.
10		**PR223:**	Fuel pressure sensor voltage	**0.5 V < X < 2 V**	In the event of a fault, apply the interpretation of **DF208 Fuel pressure signal** and **DF197 Fuel pressure solenoid valve circuit**.
11	**Turbocharger potentiometer voltage**	**PR345:**	Turbocharger wastegate potentiometer voltage	**PR345 = 0.45 V for PR346 = 10 mm**	In the event of a fault, apply the interpretation of **DF055 Turbocharging pressure regulation circuit**.
12	**Fuel flow correction** (except for VELSATIS Vdiag 04)	**PR364:**	Cylinder no. 1 fuel flow correction	**± 1 mm^3/stroke**	If inconsistency, perform a check using **test 10 INCORRECT INJECTOR OPERATION**.
13		**PR405:**	Cylinder no. 2 fuel flow correction		
14		**PR406:**	Cylinder no. 3 fuel flow correction		
15		**PR365:**	Cylinder no. 4 fuel flow correction		
16		**PR407:**	Cylinder no. 5 fuel flow correction		
17		**PR408:**	Cylinder no. 6 fuel flow correction		

GETtheMANUALS.org

NOTES	The values indicated in this conformity check are only given as examples. It is therefore essential to refer to the Technical Note which deals with your vehicle. **Test conditions:** engine warm, idling at **80 ˚C**.

ANTI POLLUTION/OBD

Order	Function	Parameter or Status Check or Action	Display and notes	Fault finding
1	**Engine speed**	**PR145:** Engine speed	**Gives the engine's rotational speed in rpm.** **700 ± 50 rpm**	In the event of a fault apply the interpretation for **DF154 Flywheel signal sensor circuit**.
2	**EGR valve**	**PR136:** EGR position	**N = 700 rpm** When starting: **PR136 = 2 ± 0.1 mm** After a few minutes: **PR136 = 0 ± 0.1 mm**	In the event of a fault, apply the interpretation of **DF209 EGR valve position sensor circuit**.
3		**PR160:** EGR potentiometer voltage	**4 V ± 0.1 V**	
4	**Air flow**	**PR146:** Inlet air flow	N = 700 rpm and EGR = 3.2 mm: **PR146 = 42 kg/h ± 4.2** N = 700 rpm and EGR = 0 mm: **PR146 = 72.3 kg/h ± 7.2 kg/h** (To obtain EGR = 0 mm, depress the accelerator pedal **briefly** and release the pedal while displaying the **PR136 "EGR valve position"** parameter in the diagnostic tool, then freeze the image when parameter **PR136 = 0 mm**).	In the event of a fault, apply the interpretation of **DF056 Air flow sensor circuit**.
5		**PR225:** Air flow sensor voltage	**3.29 ± 0.1 V at 80 ˚C**	

GETtheMANUALS.org

NOTES	The values indicated in this conformity check are only given as examples. It is therefore essential to refer to the Technical Note which deals with your vehicle. **Test conditions:** engine warm, idling at **80 ˚C**.

EMISSION CONTROL/OBD (CONTINUED)

Order	Function	Parameter or Status Check or Action		Display and notes	Fault finding
6	**Combustion misfiring** (except for VELSATIS Vdiag 04)	**ET057:**	Misfiring on cylinder 1	**NOT DETECTED**	If inconsistency, perform a check using **test 10 INCORRECT INJECTOR OPERATION**. **IMPORTANT** To reinitialise this status, use **RZ007 Fault memory**.
7		**ET058:**	Misfiring on cylinder 2		
8		**ET059:**	Misfiring on cylinder 3		
9		**ET060:**	Misfiring on cylinder 4		
10		**ET061:**	Misfires in cylinder 5		
11		**ET062:**	Misfires in cylinder 6		
13	**OBD fault**	**ET148:**	OBD warning light activation request	**INACTIVE** **Warning light controlled by the engine injection computer: "allocated via the multiplex network".**	In the event of a fault with the interpretation of status **ET148 "OBD warning light activation request" ensure no faults are present**. If the fault is still present run fault finding on the instrument panel.

GETtheMANUALS.org

NOTES	The values indicated in this conformity check are only given as examples. It is therefore essential to refer to the Technical Note which deals with your vehicle. **Test conditions:** engine warm, idling at **80 ˚C**.

DRIVER PARAMETERS

Order	Function	Parameter or Status Check or Action		Display and notes	Fault finding
1	**Engine speed**	**PR145:**	Engine speed	**Gives the engine's rotational speed in rpm. 700 ± 50 rpm**	In the event of a fault apply the interpretation for **DF154 Flywheel signal sensor circuit**.
2	**Accelerator pedal**	**PR030:**	Accelerator pedal position	**0 %**	If only one gang responds after the pedal is depressed, change the pedal sensor. If the voltages measured do not correspond to ± **0.5 V**, replace the pedal sensor.
3		**PR147:**	Pedal potentiometer voltage gang 1	**No load: PR147 = 0.7 ± 0.1 V Full load: PR147 = 4.5 ± 0.1 V**	
4		**PR148:**	Pedal potentiometer voltage gang 2	**No load: PR148 = 0.35 ± 0.1 V Full load: PR148 = 2.2 ± 0.1 V**	
5		**PR342:**	Pedal sensor power supply gang 1	**4.9 ± 0.5 V**	
6	**Voltage**	**PR215:**	Sensor feed voltage no. 1	**4.9 ± 0.5 V**	
7	**Brake pedal**	**ET012:**	Primary brake contact	**RELEASED**	In the event of a fault, refer to the interpretation of status **ET012** Primary brake contact
8		**ET013:**	Secondary brake contact	**RELEASED**	In the event of a fault, refer to the interpretation of status **ET013 Secondary brake contact**.

GETtheMANUALS.org

NOTES	The values indicated in this conformity check are only given as examples. It is therefore essential to refer to the Technical Note which deals with your vehicle. **Test conditions:** engine warm, idling at **80 ˚C**.

IGNITION/PREHEATING

Order	Function	Parameter or Status Check or Action		Display and notes	Fault finding
1	**Engine**	**ET038:**	Engine (except for VELSATIS Vdiag 04)	**NORMAL**	If status **ET038** is **STATUS 1**, carry out a conformity check using the **Emission control/ OBD** function.
2	**Engine speed**	**PR145:**	Engine speed	**Gives the engine's rotational speed in rpm. 700 ± 50 rpm**	In the event of a fault apply the interpretation for **DF154 Flywheel signal sensor circuit**.
3	**Temperature**	**PR064:**	Coolant temperature	Check the values displayed by the sensors by referring to the "Glossary" section. **PR064 = 80 ˚C ± 5 ˚C**	If there is a fault use the interpretation for **DF001 Coolant temperature sensor circuit**.
4		**PR058:**	Air temperature		In the event of a fault, apply the interpretation of faults **DF039 Air inlet temperature sensor circuit** (Vdiag 04, 08 only) **and DF324 OBD air temperature sensor circuit** (Vdiag 0C only).
5	**Preheating**	**PR176:**	Preheating phase	**0 < X < 30 s**	In the event of a fault, refer to the interpretation of **ET134 Pre/postheating relay control**.
6		**ET134:**	Pre-postheating relay control	**ACTIVE** during the preheating phase, then **INACTIVE**	
7		**ET204:**	Control for preheating warning light	**ACTIVE** during the preheating phase, then **INACTIVE**	If there is a fault, consult the interpretation of status **ET204 Preheating warning light control**.
8	**Computer feed voltage**	**PR071:**	Computer feed voltage	**11 V < X < 15 V**	In the event of a fault, apply the interpretation of fault **DF175 "Supply"**.

GETtheMANUALS.org

NOTES	The values indicated in this conformity check are only given as examples. It is therefore essential to refer to the Technical Note which deals with your vehicle. **Test conditions:** engine warm, idling at **80 ˚C**.

ENGINE COOLING

Order	Function	Parameter or Status Check or Action		Display and notes	Fault finding
1	Temperature	**PR058:**	Air temperature	Check the values displayed by the sensors by referring to the "Glossaries". **PR064 ≈ PR066 ≈ PR063 ≈ 80 ˚C ± 5 ˚C**	In the event of a fault, apply the interpretation of faults **DF039 Air inlet temperature sensor circuit** (Vdiag 04, 08 only) **and DF324 OBD air temperature sensor circuit** (Vdiag 0C only).
2		**PR064:**	Coolant temperature		If there is a fault use the interpretation for **DF001 Coolant temperature sensor circuit**.
3		**PR066:**	Oil temperature		In the event of a fault, apply the interpretation of the **DF769 Oil temperature** (Vdiag 0C only).
4		**PR063:**	Fuel temperature		In the event of a fault, apply the interpretation of **DF098 Fuel temperature sensor circuit**.

GETtheMANUALS.org

NOTES	The values indicated in this conformity check are only given as examples. It is therefore essential to refer to the Technical Note which deals with your vehicle. **Test conditions:** engine warm, idling at **80 ˚C**.

ENGINE COOLING (CONTINUED 1)

Order	Function	Parameter or Status Check or Action	Display and notes	Fault finding
5	**Antipercolation device**	**ET273:** Anti-percolation	**INACTIVE**	In the event of a fault, refer to the interpretation of status **ET273** Anti-percolation
6	**Motor-driven fan assembly**	**ET143:** Low speed fan assembly relay control	**ACTIVE** for an engine operating temperature greater than **99 ˚C** and is stopped for a temperature lower than **96 ˚C**.	In the event of a fault, refer to the interpretation of **ET143 Low speed fan relay control**.
7		**ET144:** High-speed fan assembly relay control	**INACTIVE** for an engine operating temperature less than **102 ˚C** and stops for a temperature less than **99 ˚C**.	In the event of a fault, refer to the interpretation of **ET144 High speed fan relay control**.

GETtheMANUALS.org

GETtheMANUALS.org

ET003	ENGINE IMMOBILISER

NOTES	**Special note:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

ACTIVE	If status **ET003** is permanently **ACTIVE**, refer to the interpretation of the UCH fault finding note (see **87G, Connection unit**).
INACTIVE	When the ignition is switched on, and when driving, status **ET003** becomes **INACTIVE**. If this does not occur, refer to the interpretation of the UCH fault finding note (see **87G, Connection unit**).

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET012	PRIMARY BRAKE CONTACT

NOTES	**Special note:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

PRESSED

When the driver presses the brake pedal, status **ET012** becomes "**PRESSED**", and status **ET013 "Secondary brake contact"** becomes "**PRESSED**".

If the driver depresses the brake pedal and status **ET012** remains **RELEASED** and **the brake lights are operating**:
Check:
– the condition of the brake light switch contacts and connections.
– the **continuity and absence of interference resistance** on the following connection:

Diesel computer **track A 21** ⟶ brake switch **black connector, tracks B3 or 3**

Repair if necessary.

If the driver depresses the brake pedal and status **ET012** remains **PRESSED** and **the brake lights are not operating**:
Check:
– the condition of the bulbs, replace if necessary,
– the condition of the **F6 (20A)** fuse in the passenger compartment fuse box and relay,
– the presence of **+ 12 V** after ignition on **tracks A1** and **B1** or **track 2** of the switch,
– then remove the brake light switch and carry out the checks in the following table:

	Continuity between tracks	**Insulation between tracks**
Switch pressed (brake pedal released)	A1 and B3 Or 2 and 3	B1 and A3 Or 2 and 1
Switch released (brake pedal pressed)	B1 and A3 Or 2 and 1	A1 and B3 Or 2 and 3

If these checks are not in order, replace the brake light switch.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET012 CONTINUED	

RELEASED	When the driver releases the brake pedal, status **ET012** becomes **RELEASED**, and status **ET013 Secondary brake contact** becomes **RELEASED**. If this does not happen, check the condition and operation of the brake light switch by carrying out the checks associated with the **PRESSED** status.

Note:
The statuses **ET012 Primary brake contact** and **ET013 Secondary brake contact** are directly linked.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET013	SECONDARY BRAKE CONTACT

NOTES	**Special note:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

PRESSED

When the driver depresses the brake pedal, status **ET013** becomes "**PRESSED**", and status **ET012 "Primary brake contact"** becomes "**PRESSED**".

If the driver depresses the brake pedal and status **ET013** remains "**RELEASED**" and **the brake lights are operating**:
Check:
– the condition of the brake light switch contacts and connections.
– the **continuity and absence of interference resistance** on the following connection:

Diesel computer **track A 21** ⟶ brake switch **black connector, tracks B3 or 3**

Repair if necessary.

If the driver depresses the brake pedal and status **ET013** remains **PRESSED** and **the brake lights are not operating**:
Check:
– the condition of the bulbs, replace if necessary,
– the condition of the **F6 (20A)** fuse in the passenger compartment fuse box and relay,
– the presence of **+ 12 V** after ignition on **tracks A1** and **B1** or **track 2** of the switch,
– then remove the brake light switch and carry out the checks in the following table:

	Continuity between tracks	**Insulation between tracks**
Switch pressed (brake pedal released)	A1 and B3 Or 2 and 3	B1 and A3 Or 2 and 1
Switch released (brake pedal pressed)	B1 and A3 Or 2 and 1	A1 and B3 Or 2 and 3

If these checks are not in order, replace the brake light switch.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET013 CONTINUED	

RELEASED	When the driver releases the brake pedal, status **ET013** becomes **RELEASED**, and status **ET012 Primary brake contact** becomes **RELEASED**. If this does not happen, check the condition and operation of the brake light switch by carrying out the checks associated with the **PRESSED** status.

Note:
The statuses **ET012 Primary brake contact** and **ET013 Secondary brake contact** are directly linked.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

NOTES	**Special note:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

Except VELSATIS Vdiag 04

NORMAL	After starting the engine, status **ET038** becomes **NORMAL**. Run a multiplex network test (see **88B, Multiplex**).
STATUS 1:	Status **ET038** is permanently **STATUS 1** when the engine misfires (combustion fault). Perform a conformity check using the **Fuel circuit** sub-function. **Check:** – that the injectors are in good condition, – the compression rate, – the high pressure circuit sealing (leaks, etc.), – the other faults displayed by the diagnostic tool. If the fault is still present, contact Techline.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET042	CRUISE CONTROL/SPEED LIMITER

NOTES	**Special note:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

CRUISE CONTROL	When the driver presses the cruise control switch, status **ET042** must change to **CRUISE** and the **green** speed limiter warning light on the instrument panel must be displayed. Check the **insulation, continuity and absence of interference resistance** of the following connection: Diesel computer **track A 81** ⟶ **track A3** of the cruise control switch Repair if necessary.
	If the fault has still not been solved, look for possible damage to the wiring harness, check the **connections and condition** of the cruise control switch and its connections. Replace or repair if necessary. If the fault is still present, contact the Techline.

LIMITER	When the driver presses the cruise control switch, status **ET042** must change to **LIMIT** and the **orange** speed limiter warning light on the instrument panel must be displayed. Check the **insulation, continuity and absence of interference resistance** of the following connection: Diesel computer **track A 23** ⟶ **track B1** of the cruise control switch Repair if necessary.
	If the fault has still not been solved, look for possible damage to the wiring harness, check the **connections and condition** of the cruise control switch and its connections. Replace or repair if necessary. If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET077	IMPACT DETECTED

NOTES	**Special note:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

YES	If the vehicle has been involved in an accident, the injection computer receives the impact signal via the multiplex network and may switch off the ignition. Status **ET077** is **YES**. Switch off the ignition for **10 seconds**, then switch it back on, so the engine can be restarted. Test the multiplex network (see **88B, Multiplexing**) and deal with any faults present.
NO	Under normal operating conditions, status **ET077** is **NO** when the computer has received no impact signal.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET133	MAIN RELAY CONTROL

NOTES	**Special note:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

ACTIVE	Status **ET133** becomes **ACTIVE** when the main relay is supplied with power. If status **ET133** is permanently "**INACTIVE**", refer to the interpretation of fault **DF015 "Main relay control circuit"**.

INACTIVE	If status **ET133** is permanently "**INACTIVE**", refer to the interpretation of fault **DF015 "Main relay control circuit"**.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET134	PRE-POSTHEATING RELAY CONTROL

NOTES	**Special note:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

ACTIVE	When the ignition is switched on, status **ET134** becomes **ACTIVE** for a time that varies according to the engine coolant temperature. Both the relay and the heater plugs are then supplied. When the vehicle is started from cold, the injection computer always actuates the preheating unit to allow the vehicle to start more easily; the status becomes **ACTIVE** during the starting phase. After starting, the status should remain **ACTIVE** for a variable period depending on the engine coolant temperature. If the vehicle does not start and status **ET134** becomes "**ACTIVE**" when switching on the ignition or during the starting phase, a preheating connection or circuit component may be damaged.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET134 CONTINUED	

"ACTIVE" (CONTINUED)

Check:
– the **F12 (70A)** power fuse on the supply and power board,
– the **+ 12 V** feed to heater plugs after relay control, and the relay connections,
– the **continuity and absence of interference resistance** of the following connections:

Pre-postheating unit, white connector, **track 1**	→	Heater plug no. 1 **track 1**
Pre-postheating unit, purple connector, **track 1**	→	Heater plug no. 2 **track 1**
Pre-postheating unit, white connector, **track 2**	→	Heater plug no. 3 **track 1**
Pre-postheating unit, purple connector, **track 2**	→	Heater plug no. 4 **track 1**
Pre-postheating unit, white connector, **track 6**	→	Heater plug no. 5 **track 1**
Pre-postheating unit, purple connector, **track 6**	→	Heater plug no. 6 **track 1**

– the condition and correct connection of the contacts of the pre-postheating unit **R300** connector.

If the vehicle starts, the preheating has finished and status **ET134** remains "**ACTIVE**" during the engine operating phase, consult the interpretation of faults **DF186 "Heater plugs circuit", DF262 "Heater plugs no. 1 group circuit"** and **DF263 "Heater plugs no. 2 group circuit"**.

INACTIVE

If the vehicle does not start, the status remains **INACTIVE** and the preheating was not performed when the ignition was switched on or during the starting phase, check the following connections:

Diesel computer **track A 19**	→	Pre-postheating unit **green connector, track 8**
Diesel computer **track A 49**	→	Pre-postheating unit **green connector, track 9**
Diesel computer **track A 68**	→	Pre-postheating unit, purple connector, **track 9**

Repair if necessary.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET143	LOW-SPEED FAN ASSEMBLY RELAY CONTROL

NOTES	Apply the conformity check to see if the statuses are consistent with the operating programs of the system. If the vehicle is fitted with air conditioning, the fan assembly electrical circuit contains 2 relays. Fan assembly speed 1 relay will be run when the temperature of the engine coolant exceeds **96**˚ and will be dedicated to cooling of the engine as long as the engine coolant temperature does not exceed **99**˚. If the engine coolant temperature exceeds **99**˚, fan assembly speed 2 relay will be run and the engine cooling fan will run more quickly.

ACTIVE	When the coolant reaches **96 ˚C**, the diesel computer actuates the low speed fan relay and status **ET143** becomes **ACTIVE**. The relay then supplies the fan assembly and the cooling fan begins to turn. Run command **AC038 Low-speed fan assembly relay** and check visually that the cooling fan is turning. If this is not the case, carry out the following operations: – check the condition of the **F15 (60A)** fuse and the engine relay, – disconnect the low-speed and high-speed relays, check their operation and the condition of the connections. – repair if necessary, – Check for **+ 12 V** on **terminal 10** of the low-speed relay during its actuation, – then check the **continuity and the absence of interference resistance** of the following connection: Diesel computer **track A 18** ⟶ **track 11** of the low-speed relay

INACTIVE	If the engine temperature is lower than **96 ˚C**, the engine cooling fan cannot switch on and the low speed engine cooling fan relay cannot be run. Status **ET143** becomes **INACTIVE** when the control relay and the engine cooling fan are not supplied.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET144	HIGH-SPEED FAN ASSEMBLY RELAY CONTROL

NOTES	Apply the conformity check to see if the statuses are consistent with the operating programs of the system. If the vehicle is fitted with air conditioning, the fan assembly electrical circuit contains 2 relays. Fan assembly speed 2 relay will be actuated when the engine coolant temperature exceeds **99 ˚C** and will be dedicated to engine cooling as long as the engine coolant temperature does not exceed **102 ˚C**.

ACTIVE	When the coolant reaches **99 ˚C**, the diesel computer activates the high speed fan relay and status **ET144** becomes **ACTIVE**. The relay then supplies the fan assembly and the cooling fan begins to turn. Run command **AC039 High-speed fan assembly relay** and visually check that the cooling fan is turning. If this is not the case, carry out the following operations: – check the condition of the **F15 (60A)** fuse and the engine relay, – disconnect the fan unit relays, check their operation and the condition of the connections, – repair if necessary, – Check for the presence of **+ 12 V** on **terminal 6** of the fan unit and on **terminal 62** of the high speed relay when it is actuated, – then check the **continuity and absence of interference resistance** of the following connections: Diesel computer **track A 38** → **track 7** of the fan assembly relay Fan unit relay **track 7** → High speed relay **track 60**

INACTIVE	If the engine temperature is lower than **99 ˚C**, the engine cooling fan cannot switch on and the high speed engine cooling fan relay cannot be run. Status **ET144** becomes **INACTIVE** when the control relay and the engine cooling fan are not supplied.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET204	PREHEATING WARNING LIGHT CONTROL

NOTES	Apply the conformity check to see if the statuses are consistent with the operating programs of the system. Statuses **ET028 Level 1 fault warning light request** and **ET204 Preheating warning light control** are directly linked. If one is active, the other must assume the same status.

ACTIVE	Check that status **ET204** becomes **ACTIVE** and that the preheating warning light is activated when the ignition is switched on.
	Perform a fault finding procedure beforehand on the multiplex network.
	If the network is not correct (see **88B Multiplexing**).
	If the network diagnosis is OK, check:
	– the complete engine injection system,
	– deal with any faults,
	– If the fault is still present, check the preheating unit and the heater plugs using the following faults:
	  – **DF186 Heater plug circuit,**
	  – **DF262** Heater plug group no. 1 circuit
	  – **DF263 Heater plug group no. 2 circuit.**
	– check the preheating relay using command **AC037 Preheating relay**.
	– if the fault is still present, perform a fault finding procedure on the instrument panel (see **MR 353, MR 402 or MR 361 Mechanical, 83A, Instrument panel**),
	– If the fault is still present, contact the Techline.

INACTIVE	Status **ET204 "Preheating warning light control"** is "**INACTIVE**" when the preheating warning light is off.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET205	HEATING ELEMENT 1 RELAY CONTROL

NOTES	**Special note:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

ACTIVE

Status **ET205** becomes **ACTIVE** when the heating element no. 1 relay control is activated.
Where the heating element no. 1 relay is requested and status **ET205** is not **ACTIVE** when the ignition is switched on, a connection or circuit component of the heating element no. 1 relay may be damaged.

Check:
– the heating element no. 1 relay fuse **F14 (70 A)**,
– the heating element no. 1 relay mounting connections,
– the engine management computer connections,
– repair if necessary,
– check for **insulation from earth, continuity and absence of interference resistance** on the following connections:

Diesel computer **track A 1** → Heating element no. 1 relay **track 2**

Diesel computer **track A 2** → Heating element no. 1 relay **track 2**

– check the **continuity, insulation from + 12 V and the absence of interference resistance** for the following connection:

Diesel computer **track A 36** → Heating element no.1 relay **track 65**

INACTIVE

Status **ET205** becomes **INACTIVE** when the heating control is not activated.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET206	HEATING ELEMENT 2 RELAY CONTROL

NOTES	**Special note:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

ACTIVE

Status **ET206** becomes **ACTIVE** when the heating element no. 2 relay control is activated.
Where the heating element no. 2 relay is requested and status **ET206** is not **ACTIVE** when the ignition is switched on, a connection or circuit component of the heating element no. 2 relay may be damaged.

Check:
– the heating element no. 2 relay fuse **F13 (70 A)**,
– the heating element no. 2 relay mounting connections,
– the engine management computer connections,
– repair if necessary,
– check for **insulation from earth, continuity and absence of interference resistance** on the following connections:

Diesel computer **track A 1** → Heating element no. 2 relay **track 2**

Diesel computer **track A 2** → Heating element no. 2 relay **track 2**

– check the **continuity, insulation from + 12 V and the absence of interference resistance** for the following connection:

Diesel computer **track A 17** → Heating element no. 2 relay **track 3**

INACTIVE

Status **ET206** becomes **INACTIVE** when the heating control is not activated.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET207	HEATING ELEMENT No. 3 RELAY CONTROL

NOTES	**Special note:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

ACTIVE

Status **ET207** must be **ACTIVE** when the heating element no. 3 relay control is activated. Where the no. 3 relay is requested and status **ET207** is not **ACTIVE** when the ignition is switched on, a connection or circuit component of the heating element no. 3 relay may be damaged.

Check:
- the heating element no. 3 relay fuse **F14 (70 A)**,
- the heating element no. 3 relay mounting connections,
- the engine management computer connections,
- repair if necessary,
- check for **insulation from earth, continuity and absence of interference resistance** on the following connections:

  Diesel computer **track A 1** → Heating element no. 3 relay **track 2**

  Diesel computer **track A 2** → Heating element no. 3 relay **track 2**

- check the **continuity, insulation from + 12 V and the absence of interference resistance** for the following connection:

  Diesel computer **track A 56** → Heating element no. 3 relay **track 35**

INACTIVE

Status **ET207** becomes **INACTIVE** when the heating control is not engaged.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET273	ANTI-PERCOLATION

NOTES	**Special note:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

ACTIVE	Status **ET273** is "**ACTIVE**" when the engine management computer detects a high engine coolant temperature after the engine is stopped. The engine management program operates the fan to cool the engine and continuously checks the coolant temperature.
STANDBY	Status **ET273** is "**STANDBY**" when the engine has just been stopped. The status corresponds to an engine coolant temperature control phase after the engine has stopped. If the coolant temperature exceeds the maximum predefined threshold, status **ET273** becomes "**ACTIVE**". If the coolant temperature does not exceed the maximum predefined threshold in the set time, status **ET273 becomes INACTIVE**.
INACTIVE	Status **ET273** is "**INACTIVE**" when the engine coolant temperature is below the maximum threshold authorised by the engine management computer after the engine has stopped.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET276	HEATING ELEMENTS

NOTES	**Special note:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

Except VELSATIS Vdiag 04, but presence of heating elements on the vehicle

WITH	Status **ET276 Heating elements** is **WITH** when the vehicle is fitted with additional heating.
NONE	Status **ET276 Heating elements** is **WITHOUT** when the vehicle is not fitted with additional heating. If the vehicle is fitted with additional heating and heating element relays with status **ET276** set to **WITHOUT**, refer to the interpretation of the following statuses: **ET205 "Heating element no. 1 relay control",** **ET206 "Heating element no. 2 relay control",** **ET207 "Heating element no. 3 relay control".**

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET341	IMMOBILISER CODE PROGRAMMED

NOTES	**Special note:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

YES	Status **ET341** becomes **YES** if dialogue is possible between the UCH and the injection computer and the card code is recognised. Engine starting authorisation is only given if the code is recognised by the UCH computer, and status **ET003 Engine immobiliser** is **INACTIVE**.
NO	The code remains **NO** if dialogue between the UCH and the injection computer is not possible. Status **ET003 Engine immobiliser** is **ACTIVE**. The cause of the fault may be incorrect card programming (see **87G, Interconnection unit** and follow the **card programming** procedure. Where it does not stem from the card codes, perform a multiplex network test (see **88B, Multiplexing**). Where the fault finding procedure was performed by function, ensure that dialogue is present between the UCH, the Protection and Switching unit and the injection computer. If dialogue is not established, contact the Techline.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET413	CRUISE CONTROL/SPEED LIMITER FUNCTION

NOTES	**Special note:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

INACTIVE	Status **ET413** is **INACTIVE** when no cruise control function button has been pressed and parameter **PR178 Cruise control switch voltage** becomes **5 V**.

SUSPEND	Status **ET413** is "**SUSPEND**" when cruise control button "**0**" is pressed and parameter **PR178 "Cruise control switch voltage"** should be **0.1 V**. This button is situated to the right of the steering wheel. If status **ET413** does not change to **SUSPEND**, check the **R/0** cruise control button, and the condition of its connector. Repair if necessary. **To be able to remove the driver's airbag and carry out the measures in complete safety (**see **88C, Airbag and pretensioners).** Repair if necessary. Measure the **resistance** of the following connection, **after pressing the "0" button**: If the resistance is not approximately **0 Ω**, check the continuity of the connection when the button is not pressed. If there is continuity, replace the "R/0" control button. Measure the **resistance of the following connection, after pressing the "0"** button: Diesel computer **track A 10** ⟶ "R/0" button **track A2** Diesel computer **track A 11** ⟶ "R/0" button **track A1** If the connection is broken, repair it.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET413 CONTINUED 1	

RESUME

Status **ET413** is "**RESUME**" when cruise control button "**R**" is pressed and parameter **PR178 "Cruise control switch voltage"** should be **3.76 V**. This button is situated to the right of the steering wheel.
If status **ET413** does not change to **RESUME**, check the **R/0** cruise control button, and the condition of its connector. Repair if necessary.
To be able to remove the driver's airbag and carry out the measures in complete safety (see **88C, Airbag and pretensioners).**
Repair if necessary.
Measure the **resistance** of the following connection, **after pressing the "R" button**:
If the resistance is not approximately **900 Ω**, check the continuity of the connection when the button is not pressed.
If there is continuity, replace the "R/0" control button.

Measure the **resistance** of the following connection, **after pressing the R button**:

Diesel computer **track A 10** ⟶ "R/0" button **track A2**

Diesel computer **track A 11** ⟶ "R/0" button **track A1**

If the connection is broken, repair it.

PLUS

Status **ET413** is "**PLUS**" when cruise control button "**+**" is pressed and parameter **PR178 "Cruise control switch voltage"** should be **2.4 V**. This button is situated to the left of the steering wheel.
If status **ET413** does not change to **PLUS**, check the condition of the **+/-** cruise control button, and the condition of its connector. Repair if necessary.
To be able to remove the driver's airbag and carry out the measures in complete safety (see **88C, Airbag and pretensioners).**
Repair if necessary.
Measure the **resistance** of the following connection, **after pressing the "+" button**:
If the resistance is not approximately **300 Ω**, check the continuity of the connection when the button is not pressed.
If there is continuity, replace the "R/0" control button.

Measure the **resistance** of the following connection, after pressing the "**+**" button:

Diesel computer **track A 10** ⟶ "+/-" button **track A2**

Diesel computer **track A 11** ⟶ "+/-" button **track A1**

If the connection is broken, repair it.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET413 CONTINUED 2	

MINUS	Status **ET413** is "**MINUS**" when cruise control button "**-**" is pressed and parameter **PR178 "Cruise control switch voltage"** should be **1.3 V**. This button is situated to the left of the steering wheel. If status **ET413** does not change to **MINUS**, check the condition of the **+/-** cruise control button, and the condition of its connector. Repair if necessary. **Refer to the airbag technical note that applies to the vehicle to be able to remove the driver's airbag and carry out the measures in complete safety (see 88C, Airbag and pretensioners)**. Repair if necessary. Measure the **resistance** of the following connection, **after pressing the "-" button**: If the resistance is not approximately **100 Ω**, check the continuity of the connection when the button is not pressed. If there is continuity, replace the "R/0" control button. Measure the **resistance** of the following connection, **after pressing the "-" button**: Diesel computer **track A 10** ⟶ "+/-" button **track A2** Diesel computer **track A 11** ⟶ "+/-" button **track A1** If the connection is broken, repair it.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET556	DRIVER'S DEACTIVATION OF THE CRUISE CONTROL/SPEED LIMITER

NOTES	**Special notes:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

Note:
Cruise control can be activated when the vehicle speed exceeds **18 mph (30 km/h)**. Status **ET556** details 6 causes for cruise control deactivation.
IMPORTANT
To reinitialise the deactivations stored by the injection computer, use command RZ007 "Fault memory".

STATUS 1	**Brake pedal depressed**
	The cruise control function is deactivated each time the brake pedal is depressed. Status **ET556** becomes **STATUS 1**, when the vehicle is being driven, with cruise control active and the brake pedal depressed. If status **ET556** becomes "**STATUS 1**" without the brake pedal being depressed, consult the interpretation of statuses **ET012 "Primary brake contact"** and **ET013 "Secondary brake contact"**.

STATUS 2	**Traction control request**
	If the vehicle being diagnosed is fitted with traction control, the cruise control function is deactivated each time traction control is selected. Status **ET556** changes to **STATUS 2**, when driving, with cruise control active and traction control requested. If status **ET556** changes to **STATUS 2** without traction control request, refer to fault finding note relating to the vehicle's traction control system.

STATUS 3	**Suspend button pressed**
	Status **ET556** changes to **STATUS 3** when driving with Cruise control/Speed limiter active, if the driver presses the Cruise control/Speed limiter **0** button. If status **ET556** becomes **STATUS 3** without button **0** on the Cruise control/Speed limiter being pressed, consult the interpretation of status **ET413 Cruise control/Speed limiter function** and perform a fault finding procedure on control button **R/0** of the Cruise control/Speed limiter.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET556 CONTINUED	

STATUS 4	Clutch pedal depressed
	MANUAL GEARBOX ONLY The cruise control function is deactivated if the gearbox is no longer coupled to the engine (clutch pedal depressed). Status **ET556** becomes **STATUS 4** when driving, with cruise control active and the clutch pedal depressed. If status **ET556** becomes **STATUS 4** without the clutch pedal being depressed, consult the interpretation of status **ET233 Clutch pedal**.

STATUS 5	Gear lever in neutral position
	Status **ET556** changes to **STATUS 5**, when driving, with cruise control active and – if the driver puts the gear lever in neutral on a MANUAL GEARBOX without declutching or, – if gear lever is in neutral on an automatic transmission. This deactivates cruise control. If status **ET556** becomes **STATUS 5** without putting the gear lever in neutral on a manual gearbox without declutching, or without neutral on an automatic transmission, contact the Techline.

STATUS 6	Inconsistency between the request and the vehicle speed
	Status **ET556** changes to **STATUS 6** if the computer detects too great a difference between the speed requested by the driver and the vehicle speed. This may occur when driving, with cruise control active and where the difference between speeds is great. If status **ET556** changes to **STATUS 6** without a great difference in the speeds, contact the Techline.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET557	CRUISE CONTROL/SPEED LIMITER DEACTIVATION BY FUNCTION

NOTES	**Special notes:** Only perform these tests if the statuses do not correspond with the system programming functions.

Note:
Cruise control remains deactivated as long as the vehicle speed does not exceed **18 mph (30 km/h).** Status **ET557** details 4 causes for cruise control deactivation.
IMPORTANT
To reinitialise the deactivations stored by the injection computer, use command RZ007 "Fault memory".

STATUS 1	**Cruise control or speed limiter fault**
	If status **ET557** is "**STATUS 1**", refer to the interpretation of statuses **ET042 "Cruise control/speed limiter"** and **ET413 "Cruise control/speed limiter function"**, to test the components of the cruise control system and find the faulty one. If status **ET557** changes to **STATUS 1**, deal with the faults present or stored in the computer. If the fault is still present, contact Techline.

STATUS 2	**Fault detected by the injection computer**
	Status **ET557** changes to **STATUS 2** if the injection computer detects a fault on the injection system: – **faults in the engine speed sensor or camshaft,** – **accelerator pedal faults,** – **engine speed lower than 1000 rpm,** – **engine speed greater than 4700 rpm.** Carry out a multiplex network test, then an injection system test, and carry out fault finding on any faults. If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET557 CONTINUED	

STATUS 3	**Vehicle speed not refreshed**
	Status **ET557** becomes **STATUS 3** if the vehicle speed received by the computer does not vary. Carry out fault finding on the **ABS** computer. If faults are present (see **38C, Anti-lock braking system).** If the fault is still present, contact the Techline.

STATUS 4	**Invalid vehicle speed**
	Status **ET557** becomes **STATUS 4** if the vehicle speed received by the computer is invalid. Carry out fault finding on the **ABS** computer. If faults are present (see **38C, Anti-lock braking system).** If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

PR405	Fuel flow correction - cylinder 2 (except VELSATIS Vdiag 04)
PR406	Fuel flow correction - cylinder 3 (except VELSATIS Vdiag 04)
PR407	Fuel flow correction - cylinder 5 (except VELSATIS Vdiag 04)
PR408	Fuel flow correction - cylinder 6 (except VELSATIS Vdiag 04)

GETtheMANUALS.org

NOTES	Commands are run to check that certain components are working properly or to carry out a replacement.

Tool command	Diagnostic tool title
RZ007	Fault memory
AC029	High pressure circuit sealing test (except VELSATIS Vdiag 04)
AC031	No. 3 immersion-heater relay
AC037	Preheating relay
AC038	Low-speed fan assembly relay
AC039	High-speed fan assembly relay
AC047	OBD warning light
AC063	Heating element no. 1 relay
AC064	Heating element no. 2 relay
AC068	Injection fault warning light
AC069	Severe injection fault warning light
AC079	Actuator static test
VP007	Decrease idling speed
VP011	Increase idling speed
VP010	Enter VIN
VP036	Fuel supply inhibited
VP037	Lift fuel supply inhibition

GETtheMANUALS.org

AC029	HIGH PRESSURE CIRCUIT SEAL TEST

NOTES	**This command is not available on VELSATIS Vdiag 04.** Ignition on, engine off.

Test condition:
– engine running at idling speed,
– engine temperature greater than **80 ˚C**
– automatic transmission in neutral
– accelerator pedal signal **0 %**,
– vehicle speed **0 mph**.
The test lasts for **60 seconds**, the engine speed will reach **2000 rpm** and the rail pressure will reach a minimum of **1450 bar**.
Carry out a visual inspection of the high pressure injection circuit to detect any fuel leaks.

GETtheMANUALS.org

AC031	HEATING ELEMENT NO. 3 RELAY

NOTES	**No fault should be present or stored:** Carry out this fault finding procedure in the event of a malfunction detected in the actuator control menu or a fault in the passenger compartment heating/demisting system. Consult the **Wiring Diagrams** Technical Note for your vehicle to locate the fuses and relays (see **Technical Note 8247 or 8248, Wiring diagrams, 777**).

If heating element no. 3 relay does not operate during command **AC031**.
Check the connections of heating element no. 3 relay mounting.
Check the engine management computer connections.
Repair if necessary.

If the fault is still present, check as follows that this relay is controlled by the engine management computer:
– disconnect the heating element no. 3 relay, place the **50 Ω** and **100 Ω** resistor on its mounting in place of the coil and connect a voltmeter:
  positive terminal to **+ 12 V** battery,
  negative terminal on **track 37** of the heating element no. 3 relay mounting.
– clear the fault and run command **AC031**.
– if the voltmeter shows the correct battery voltage, replace heating element no. 3 relay.
– If the voltmeter does not indicate the battery voltage, contact your Techline.

If heating element no. 3 relay operates with command AC031, but there is still a passenger compartment heating/demisting fault. Check using the wiring diagram:
– the conformity of the heating element fuse,
– the presence of the **+ 12 V** battery feed on **track 35** of the heating element no. 3 relay mounting,
– the conformity of the heating element no. 3 relay,
– the conformity of the heating element resistance,
– the presence of earth at the water chamber (heating element mounting).
– Also check the level of the cooling circuit and that there are no leaks.
Carry out the necessary repairs.

GETtheMANUALS.org

AC037	PREHEATING RELAY

NOTES	This command is only carried out if the fault **DF186 Heater plugs circuit**, or **DF262 and DF263 Heater plugs 1 and 2 group circuit** is present or stored and if no other fault is present. Consult the **Wiring Diagrams** Technical Note for your vehicle to locate the fuses and relays (**Technical Note 8247 or 8248, Wiring diagrams, 777**).

Before applying the following fault finding procedure, check that the battery voltage is not below 12 V.

Step 1:
Using a multimeter fitted with a current clamp, group the 4 heater plug supply wires together.
Control the preheating relay using command **AC037** and measure the current used by the heater plugs.
If the current consumed is not between **60 A** and **80 A**, go to step 2.

Step 2:
Check the connections on the preheating unit, heater plugs and diesel computer.
Repair if necessary.
Measure **the resistance** of the heater plugs.
If the resistance is greater than **30 Ω**, replace the faulty plugs.

Check the **continuity** and **absence of interference resistance** of the following connections:

Pre-postheating unit, white connector, **track 1**	→	Heater plug no. 1 **track 1**
Pre-postheating unit, purple connector, **track 1**	→	Heater plug no. 2 **track 1**
Pre-postheating unit, white connector, **track 2**	→	Heater plug no. 3 **track 1**
Pre-postheating unit, purple connector, **track 2**	→	Heater plug no. 4 **track 1**
Pre-postheating unit, white connector, **track 6**	→	Heater plug no. 5 **track 1**
Pre-postheating unit, purple connector, **track 6**	→	Heater plug no. 6 **track 1**

Check the condition of the **F12 (70A)** fuse which supplies the preheating unit. Replace it if necessary.
Then check for **+ 12 V** on **track 3** of the preheating relay.

Check the **continuity** and **absence of interference resistance** of the following connections:

Diesel computer **track A 19**	→	Pre-postheating unit **green connector, track 8**
Diesel computer **track A 49**	→	Pre-postheating unit **green connector, track 9**
Diesel computer **track A 68**	→	Pre-postheating unit, purple connector, **track 9**

If the fault is still present, replace the pre-postheating unit.

GETtheMANUALS.org

AC038	LOW-SPEED FAN UNIT RELAY

NOTES	**No fault should be present or stored:** Perform this fault finding procedure if a malfunction is detected in the actuator command menu or after an engine cooling system or air conditioning fault.' Consult the **Wiring Diagrams** Technical Note for your vehicle to locate the fuses and relays (**Technical Note 8247 or 8248, Wiring diagrams, 777**).

If the low speed fan unit relay does not operate when command **AC038** is run:
Check the low speed fan relay mounting and the connections of the engine management computer.
Repair if necessary.

If the fault is still present, check that the relay is actuated by the engine management computer as follows:
– Disconnect the "low speed fan unit" relay and place a resistor of **50 Ω** to **100 Ω** on the relay mounting in place of the coil and link up a voltmeter as follows:
  positive terminal to **+ 12 V** battery,
  negative terminal on **track 11** of the "low-speed fan unit relay" mounting.
– clear the fault and run command **AC038**,
– if the voltmeter indicates the battery voltage, replace the relay,
– If the voltmeter does not indicate the battery voltage, contact your Techline.

Check that the low speed fan unit relay **coil** is not cut and that the contacts are operational.
Replace the relay if necessary.

If the "low speed fan unit" relay operates but there remains a fan unit triggering fault, check the following using the wiring diagram:
– the conformity of the fan unit fuse,
– the conformity of the "low speed fan unit" relay,
– the conformity of the low speed resistance,
– Check the **continuity, insulation from + 12 V and the absence of interference resistance** of the following connection:

Diesel computer **track A 18** ⟶ Low speed fan relay **track 11**

– check for **insulation from earth, continuity and absence of interference resistance** on the following connections:

Diesel computer **track A 1** ⟶ Low speed fan relay **track 10**

Diesel computer **track A 2** ⟶ Low speed fan relay **track 10**

Carry out the necessary repairs.

GETtheMANUALS.org

AC039	HIGH-SPEED FAN ASSEMBLY RELAY

NOTES	**No fault should be present or stored:** Perform this fault finding procedure if a malfunction is detected in the actuator command menu or after an engine cooling system or air conditioning fault.' Consult the **Wiring Diagrams** Technical Note for your vehicle to locate the fuses and relays (**Technical Note 8247 or 8248, Wiring diagrams, 777**).

If the high speed fan unit relay does not operate when command **AC039** is run:
Check the high speed fan unit relay mounting and the connections of the engine management computer.
Repair if necessary.

If the fault is still present, check that the relay is actuated by the engine management computer as follows:
– disconnect the "high speed fan assembly" relay, mount a resistor of **50 Ω** to **100 Ω** on the relay mounting in place of the coil, and connect a voltmeter as follows:
  positive terminal to **+ 12 V** battery,
  negative terminal on **track 11** of the "high speed fan assembly" relay mounting,
– clear the fault and run command **AC039**
– if the voltmeter indicates the battery voltage, replace the relay,
– If the voltmeter does not indicate the battery voltage, contact your Techline.

Check that the high speed fan unit relay **coil** is not cut and that the contacts are operational.
Replace the relay if necessary.

If the "high-speed fan unit" relay is actuated, but the fan still does not trigger, check the following using the wiring diagram:
– the conformity of the fan unit fuse,
– the conformity of the "high speed fan unit" relay,
– the conformity of the low speed resistance,
– Check the **insulation from + 12 V, continuity, and the absence of interference resistance** of the following connection:

Diesel computer **track A 38** → **track 7** of the fan assembly relay

Fan unit relay **track 7** → High speed relay **track 60**

– check for **insulation from earth, continuity and absence of interference resistance** on the following connections:

Diesel computer **track A 1** → Fan unit relay **track 6**

Fan unit relay **track 6** → High speed fan relay **track 62**

Diesel computer **track A 2** → Fan unit relay **track 6**

Fan unit relay **track 6** → High speed fan relay **track 62**

Carry out the necessary repairs.

GETtheMANUALS.org

AC063	HEATING ELEMENT RELAY NO. 1

NOTES	**No fault should be present or stored:** Carry out this fault finding procedure in the event of a malfunction detected in the actuator control menu or a fault in the passenger compartment heating/demisting system. Consult the **Wiring Diagrams** Technical Note for your vehicle to locate the fuses and relays (see **Technical Note 8247 or 8248, Wiring diagrams, 777**).

If the heating element no. 1 relay does not operate during command **AC063**:
Check the connections of the heating element no. 1 relay mounting.
Check the engine management computer connections.
Repair if necessary.

If the fault is still present, check as follows that this relay is controlled by the engine management computer:
– Disconnect the heating element no. 1 relay, place the **50 Ω** and **100 Ω** resistor on its mounting in place of the coil and connect a voltmeter:
  positive terminal to **+ 12 V** battery,
  negative terminal on **track 65** of the heating element no. 1 relay mounting,
– clear the fault and run command **AC063**,
– if the voltmeter shows the correct battery voltage, replace the heating element no. 1 relay.
– If the voltmeter does not indicate the battery voltage, contact your Techline.

If heating element no. 1 relay operates with command **AC063**, but there is still a passenger compartment heating/demisting fault. Check using the wiring diagram:
– the conformity of the heating element fuse,
– the presence of the **+ 12 V** battery on **track 63** of the heating element no.1 relay mounting,
– the conformity of the heating element no. 1 relay,
– the conformity of the heating element resistance,
– the presence of earth at the water chamber (heating element mounting).
– Also check the level of the cooling circuit and that there are no leaks.
Carry out the necessary repairs.

GETtheMANUALS.org

AC064	heating element RELAY NO. 2

NOTES	**No fault should be present or stored:** Carry out this fault finding procedure in the event of a malfunction detected in the actuator control menu or a fault in the passenger compartment heating/demisting system. Consult the **Wiring Diagrams** Technical Note for your vehicle to locate the fuses and relays (see **Technical Note 8247 or 8248, Wiring diagrams, 777**).

If heating element no. 2 relay does not operate during command **AC064**.
Check the connections of heating element no. 2 relay mounting.
Check the engine management computer connections.
Repair if necessary.

If the fault is still present, check as follows that this relay is controlled by the engine management computer:
– disconnect the heating element no. 2 relay, place the **50 Ω** and **100 Ω** resistor on its mounting in place of the coil and connect a voltmeter:
  positive terminal to **+ 12 V** battery,
  negative terminal on **track 3** of the additional heater no. 2 relay mounting,
– clear the fault and run command **AC064**.
– if the voltmeter shows the correct battery voltage, replace heating element no. 2 relay.
– If the voltmeter does not indicate the battery voltage, contact your Techline.

If heating element no. 2 relay operates with command **AC064**, but there is still a passenger compartment heating/demisting fault. Check using the wiring diagram:
– the conformity of the heating element fuse,
– the presence of the **+ 12 V** battery feed on **track 2**of the heating element no. 2 relay mounting,
– the conformity of the heating element relay no. 2,
– the conformity of the heating element resistance,
– the presence of earth at the water chamber (heating element mounting).
– Also check the level of the cooling circuit and that there are no leaks.
Carry out the necessary repairs.

GETtheMANUALS.org

AC068	INJECTION FAULT WARNING LIGHT

NOTES	Perform this fault finding in the event of a malfunction detected in the actuator command menu.

With the ignition on and the engine stopped, the **SERVICE** injection fault warning light should flash and the message **Check injection** be displayed on the instrument panel.

Check the instrument panel connections.
Check the engine management computer connections.
Repair if necessary.
Using the wiring diagram.
– check the **continuity and absence of interference resistance** on the following connection:

Diesel computer **track A 67** ⟶ Transparent connector on the instrument panel **track 16**

– Check for **+ 12 V** battery on **track 4** of the instrument panel black connector.

If the fault is still present, check that the warning light is actuated by the engine management computer as follows:
Disconnect the connector from the instrument panel and connect a voltmeter as follows:
– positive terminal on **+ 12 V**,
– negative terminal on **track 24**, transparent connector on the instrument panel.
Activate the warning light using command **AC068**.

- If the voltmeter shows the battery voltage, then check the instrument panel. Carry out the necessary repairs.
- If the voltmeter does not indicate the battery voltage, contact your Techline.

GETtheMANUALS.org

AC069	SEVERE INJECTION FAULT WARNING LIGHT

NOTES	Perform this fault finding in the event of a malfunction detected in the actuator command menu.

With the ignition on and the engine stopped, the **STOP** serious injection fault warning light should flash and the message **Injection fault: stop the engine** be displayed on the instrument panel.

Check the instrument panel connections.
Check the engine management computer connections.
Repair if necessary.
Using the wiring diagram.
– check the **continuity and absence of interference resistance** on the following connection:

Diesel computer **track A 67** → Transparent connector on the instrument panel **track 16**

– Check for **+ 12 V** battery on **track 4** of the instrument panel black connector.

If the fault is still present, check that the warning light is actuated by the engine management computer as follows:
Disconnect the connector from the instrument panel and connect a voltmeter as follows:
– positive terminal on **+ 12 V**,
– negative terminal on **track 24**, transparent connector on the instrument panel.
Activate the warning light using command **AC069**.

- If the voltmeter shows the battery voltage, then check the instrument panel. Carry out the necessary repairs.
- If the voltmeter does not indicate the battery voltage, contact your Techline.

GETtheMANUALS.org

AC079	ACTUATOR STATIC TEST

NOTES	Ignition on, engine off.

This command allows you to display faults on these actuators (if fault present) without starting the engine.
The diesel computer will carry out the following electrical checks:

- **turbocharger solenoid valve,**
- **EGR valve,**
- **the two rail pressure regulation solenoid valves,**
- **The 6 injectors.**

GETtheMANUALS.org

VP036	INHIBIT FUEL SUPPLY

NOTES	Ignition on, engine off.

This command allows the injectors to be locked, so that starting is not possible.
The command **VP036** enables the cylinder compression to be checked in complete safety.
Run command **VP036** and perform a vehicle starting sequence.
Check the cylinder compressions then, once this is done, reestablish control of the injectors using command **VP037 "Stop fuel supply inhibition"** or by switching of the ignition for more than **40 seconds**.

GETtheMANUALS.org

VP037	CANCEL FUEL SUPPLY INHIBITION

NOTES	Ignition on, engine off.

The command allows the supply to the injectors to be re-established, following an engine compression test.
Run command **VP037**, and try to start the vehicle.
If the vehicle does not start, start the procedure again.

GETtheMANUALS.org

NOTES	Only check the customer complaint after performing a complete check with the **diagnostic tool**.

THE ENGINE DOES NOT TURN OVER WHEN THE STARTER IS OPERATED	→ **ALP1**
THE ENGINE TURNS OVER TOO SLOWLY WHEN THE STARTER IS OPERATED	→ **ALP1**
THE ENGINE TURNS OVER BUT DOES NOT START	→ **ALP2**
THE ENGINE STARTS BUT DOES NOT ACCELERATE OR STALLS	→ **ALP2**
ENGINE BUCKING	→ **ALP3**
ROUGH IDLE	→ **ALP4**
OVERHEATING	→ **ALP5**
THE ENGINE DOES NOT REACH ITS OPERATING TEMPERATURE	→ **ALP6**
THE ENGINE TAKES TIME TO REACH ITS OPERATING TEMPERATURE	→ **ALP6**
EXCESSIVE FUEL CONSUMPTION	→ **ALP7**
LOSS OF POWER	→ **ALP7**
EXCESSIVE OIL CONSUMPTION	→ **ALP8**

GETtheMANUALS.org

NOTES	Only check the customer complaint after performing a complete check with the **diagnostic tool**.

MAJOR VIBRATIONS	→ **ALP9**
HEAVY BLACK SMOKE FROM EXHAUST	→ **ALP10**
HEAVY WHITE SMOKE FROM EXHAUST	→ **ALP11**
HEAVY BLUE SMOKE FROM EXHAUST	→ **ALP12**
NO DIALOGUE WITH ENGINE MANAGEMENT COMPUTER	→ **ALP13**

GETtheMANUALS.org

ALP1	**The engine does not turn over when the starter is operated** **The engine does not turn over when the starter is operated**

NOTES	In the event of a fault, perform a **multiplex network test** using the diagnostic tool, then if the test is OK, apply the conformity check before any operation on the diesel injection system.

Check **the battery charge**.
Check **the condition of the battery connections**.
Check that there is no corrosion on the engine earth straps.
Check for the presence of faults with the diagnostic tool, deal with these first.
Repair if necessary.

Check the starter motor connections.
Check that a **+ 12 V** voltage is present on the starter motor terminal during starter action.
Check starter motor operation.
Repair if necessary.

Check that oil is present in the crankcase to avoid any engine seizing.
Check that the crankshaft is not locked by performing a crankshaft rotation.

Permanent seizing may be due to:

1) Seizure of equipment driven by the accessories belt: remove the accessories belt and check that all the equipment driven by the accessories belt is rotating correctly.
2) Seizure of the crankshaft itself, due to filling of the cylinders with a fluid (diesel fuel, coolant, etc.): remove the heater plugs to check that there is no fluid inside the combustion chambers.
   The presence of diesel fuel in the combustion chambers may be due to a permanent opening of the injectors: check that the injector power unit (EDU*) is operating correctly.
   The presence of a fluid such as coolant fluid or engine oil shows failure of the cylinder head gasket or a crack in one of the components forming the cylinder head or the engine cylinders.
2) Destruction of the timing belt, causing damage to the timing system components.
3) Seizure of the automatic transmission: remove the transmission to check whether the flywheel is released again.
5) Damage to moving parts requiring replacement of the engine.

*EDU: Electronic Drive Unit

AFTER REPAIR	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

ALP2	The engine turns over but does not start The engine starts but does not accelerate or stalls

NOTES	In the event of a fault, perform a **multiplex network test** using the diagnostic tool; if this is OK, carry out a **UCH test** and **immobiliser** test.

– Check the operation of the pre-heating plugs.
– Check for fuel in the tank.
– Ensure that the correct fuel is being used. Run **test 12 Fuel conformity check**.

Remove the diesel filter and check its condition.
Check that there is no paraffin crystallised in the low pressure fuel pipes following freezing.
Rinse the fuel circuit and replace the fuel and the diesel filter if necessary.
If metal deposits are present at the bottom of the container, a serious fault in the injection system has occurred.
These particles may have entered the high pressure injection system and may foul the injectors, causing them to seize.
In this case, the entire injection system must be replaced (High Pressure Pump, Injection rail, Injectors, High pressure injector pipe, etc.).

Run fault finding on the diesel injection system using the diagnostic tool, deal with the other faults.

Check the condition of the air inlet circuit and make sure there is no obstruction in the inlet circuit.
Check for possible seizing of the turbocharger shaft.

Inhibit injection using command **VP036 Inhibit fuel supply**.
Measure the rail pressure using the parameter **PR038 Rail pressure** while the starter motor is operated (less than **10 seconds** per test).The pressure should be greater than **170 bar** and the engine speed signal should be greater than **250 rpm** at an air temperature of **20˚C**.
IMPORTANT
If the air temperature is less than **20˚C**, the engine speed signal should not be less than **250 rpm**.

AFTER REPAIR	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

ALP2 CONTINUED	

– Check the valve clearance,
– check the condition of the engine, measure the cylinder compression with a compression gauge.
The compression values recorded for each injector must be the same.
– The minimum compression limit must not be less than **20.4 kg/cm^2**.
(1 bar = 1.0197 kg/cm^2),
– if the compression test reveals a cylinder fault, carry out the necessary repairs,
– if the compression values are OK, check the conformity of the injector assembly using the procedure described in the **Workshop Repair Manual**.

If a mechanical operation has occurred beforehand on the injection pump, check the conformity of the pump pulley fitting (recommendation of target positioning).

For all Vdiags except VELSATIS Vdiag 04:
Check the fuel regulation injector by injector by performing **test: 10 Incorrect injector operation**.
If the customer complaint is still present, replace the injector.

AFTER REPAIR	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

ALP3	Engine hesitation

NOTES	In the event of a fault, perform a **multiplex network test** using the diagnostic tool, then if the test is OK, apply the conformity check before any operation on the diesel injection system.

– Check for fuel in the tank. – Ensure that the correct fuel is being used. Run **test 12 Fuel conformity check**.
Remove the diesel filter and check its condition. Check that there is no paraffin crystallised in the low pressure fuel pipes following freezing. Rinse the fuel circuit and replace the fuel and the diesel filter if necessary. If metal deposits are present at the bottom of the container, a serious fault in the injection system has occurred. These particles may have entered the high pressure injection system and may foul the injectors, causing them to seize. In this case, the entire injection system must be replaced (High Pressure Pump, Injection rail, Injectors, High pressure injector pipe, etc.).
Check the condition of the air inlet circuit and make sure there is no obstruction in the inlet circuit. Check for possible seizing of the turbocharger shaft.
Measure the rail pressure using parameter **PR038 Rail pressure** during the phases of engine hesitation. The rail pressure should have stable values for a stabilised engine speed, and the rail pressure loop difference should not exceed **± 40 bar**. If the fault is still present, run **test 3 Low pressure circuit check**. Rail pressure instability may be due to seizure of the regulation solenoid valves or a failure of the high pressure pump. If the fault is still present, run **test 11 High pressure pump**.
If the fault is still present, run **test 10 Poor injector operation**.

AFTER REPAIR	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

ALP4	Rough idle

NOTES	In the event of a fault, perform a **multiplex network test** using the diagnostic tool, then if the test is OK, apply the conformity check before any operation on the diesel injection system.

– Check for fuel in the tank. – Ensure that the correct fuel is being used. Run **test 12 Fuel conformity check**.
Check the condition of the air inlet circuit and make sure there is no obstruction in the inlet circuit. Check for possible seizing of the turbocharger shaft.
Check the resistance of the exhaust gas recirculation valve and check if the slide of the valve is seized.
Measure the rail pressure using parameter **PR038 Rail pressure** while the engine is running in an unstable manner; the rail pressure should have stable values for a stabilised engine speed, and the rail pressure variation should not exceed **± 40 bar**. Rail pressure instability may be due to seizing of the regulation solenoid valves or a failure of the high pressure pump. Remove the diesel filter and check its condition. Rinse the fuel circuit and replace the fuel and the diesel filter if necessary.
For all Vdiags except VELSATIS Vdiag 04: If the fault is still present, change the regulation solenoid valves or the diesel fuel pump or the injectors. Check status **ET038 Engine**, if **ET038** is **NORMAL**, check the statuses of the following combustion misfires: **ET057 Misfire on cylinder 1,** **ET058 Misfire on cylinder 2,** **E T059 Misfire on cylinder 3,** **ET060 Misfire on cylinder 4,** **ET274 Misfire on cylinder 5,** **ET275 Misfire on cylinder 6** using the diagnostic tool. If one of the misfire statuses is **DETECT** or **PRESENT**, run **TEST 10 Poor injector operation**. If the unstable idle speed fault is still present, check **the condition** and **correct operation** of the diesel fuel pump. Replace or repair if necessary.

***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

ALP5	Overheating

NOTES	In the event of a fault, perform a **multiplex network test** using the diagnostic tool, then if the test is OK, apply the conformity check before any operation on the diesel injection system.

Run fault finding on the injection computer using the diagnostic tool. Deal with all present faults. Using commands **A C038 Low speed fan relay** and **A C039 High speed fan relay** check that the cooling fan speeds are correct. Repair if necessary. Check that the cooling circuit is correctly filled.
Check correct opening of the thermostat (start of opening at **82˚C** - fully open at **88˚C**). For an engine temperature greater than **85˚C** the bottom hose of the cooling radiator should not be cold; replace the thermostat if necessary.
Check that the water pump is operating correctly by checking the presence of a coolant fluid return flow from the expansion bottle. In the event of a fault, check for possible clogging of the return path from the expansion bottle before performing a fault finding test for a water pump failure.
Compare the temperature values given by the injection coolant temperature sensor and the value given by an external temperature sensor. If the values are inconsistent, replace the coolant temperature sensor.
If the fault is still present, rinse the cooling circuit and check that the radiator is not clogged. Clean the front of the radiator with a high pressure cleaner to remove any dirt from the radiator fins. Replace the expansion bottle cap.

***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

ALP6	The engine does not reach its operating temperature The engine takes time to reach its operating temperature

NOTES	In the event of a fault, perform a **multiplex network test** using the diagnostic tool, then if the test is OK, apply the conformity check before any operation on the diesel injection system.

Run fault finding on the injection computer using the diagnostic tool. Process all the present or stored faults.
Check that the engine does reach its operating temperature during motorway driving.
Check that the themoplungers are operating correctly. Check their resistances and check that the 3 thermoplunger relays are supplied using the following commands: **AC063 Thermoplunger no.1 relay,** **AC064 Thermoplunger no.2 relay,** **AC031 Thermoplunger no.3 relay.** In the event of faults, check the operation of the thermoplunger plug relays, check the connection between the relay coils and the diesel computer, check the power supply to the relay terminals, and check the **continuity** of the power lines between the thermoplungers and their relays.
Engine cold or stopped for at least **6 hours**. Compare the temperature values given by the injection coolant temperature sensor and the value given by an external temperature sensor. If the values are inconsistent, replace the coolant temperature sensor.
If the value supplied by the injection coolant temperature sensor is correct, replace the thermostat.
Refer to **Technical Note 3175A, Cooling system, ALP7 There is no heating inside the vehicle**.

***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

ALP7	Excessively high fuel consumption Loss of power

NOTES	In the event of a fault, perform a **multiplex network test** using the diagnostic tool, then if the test is OK, apply the conformity check before any operation on the diesel injection system.

IMPORTANT In the event of the engine overheating (Oil temperature > 123˚C), the computer deliberately limits the engine power and vehicle speed without illuminating a warning light, see the interpretation of fault **DF769 Oil temperature**.
Check conformity of the tyres and their pressure.
Check that the vehicle is not equipped with external devices affecting its aerodynamics.
Look for possible fuel leaks: – Run **test 3 Low pressure circuit check**. Repair if necessary. – Run command **AC029 High pressure circuit sealing test (Except VELSATIS Vdiag 04)**. Carry out a visual inspection of the high pressure injection circuit to detect any fuel leaks. Repair if necessary.
Check the condition of the air filter and replace it if necessary.
Check that the entire inlet circuit is in good condition, free of leaks and is not clogged (hose and intercooler, air flowmeter clogging), apply **test 5 Air flowmeter**.
Check the air flow value using parameters **P R146 Inlet air flow** and **P R136 EGR valve position**. At a speed of **700 rpm** and with a coolant temperature of **80˚C**, check that the air flow is **42 kg/h ± 4.2 kg/h** at an EGR valve position of **3.2 mm** and **72.3 kg/h ± 7.2 kg/h** at an EGR valve position of **0 mm**.
Check that the engine does reach its operating temperature during motorway driving.
Reset the trip computer and perform a new test on the motorway and then in town, and estimate the vehicle's consumption from its average speed.

***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

ALP7 CONTINUED	

Check that the exhaust pipe is not blocked, apply **test 1 Exhaust system check**.
Check that the turbocharger operates correctly. – Run **test 7 Variable geometry turbocharger command** and – Run **test 8 Turbocharger rotating part**. Repair if necessary.
If the vehicle lacks power, run **test 11 High pressure pump**.
Run **TEST 10 Poor injector operation (Except VELSATIS Vdiag 04)**.
– Check the valve clearance, – check the condition of the engine, measure the cylinder compression with a compression gauge. The compression values recorded for each injector must be the same. – The minimum compression limit must not be less than **20.4 kg/cm^2**. **(1 bar = 1.0197 kg/cm^2)** – If the compression test reveals a cylinder fault, carry out the necessary repairs. – if the compression values are OK, check the conformity of the injector assembly using the procedure described in the **Workshop Repair Manual**.

***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

ALP8	Excessive oil consumption

NOTES	In the event of a fault, perform a **multiplex network test** using the diagnostic tool, then if the test is OK, apply the conformity check before any operation on the diesel injection system.

Check that the oil level is correct, and remove the excess if necessary. Check for possible external leaks. Repair if necessary.
Check the air circuit: – the condition of the air filter, – run **test 4 Air inlet circuit and turbocharging check**.
Check that the turbocharger operates correctly. Run **test 8 Turbocharger rotating part**.
Check the sealing of the engine block and turbocharger lubrication pipes, and the pipes and oil cooler. Repair if necessary.
Check that the oil breather pipes are not crushed or clogged.
Remove the inlet tract from the turbocharger inlet and outlet, and check that there is not a large quantity of oil in the turbocharger or in the inlet hoses. – A large quantity of oil in the turbocharger inlet hose is due to extensive oil evacuation via the oil breather (engine wear or breather clogged, etc.), – A large quantity of oil in the turbocharger outlet hose indicates failure of the turbine shaft sealing ring. Replace the turbocharger if necessary.
Check the correct condition of the heater plugs. Repair or replace the faulty components, if necessary.

***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

ALP9	Major vibration

NOTES	In the event of a fault, perform a **multiplex network test** using the diagnostic tool, then if the test is OK, apply the conformity check before any operation on the diesel injection system.

Run fault finding on the injection computer using the diagnostic tool. Process all the present or stored faults.
Check the condition and tightness of the engine mountings.
Check the accessories drive pulley. The rubber mounting bushes should be in perfect condition and the pulley should not warp during rotation; replace if necessary.
Remove the accessories belt and start the engine. If the vibration has disappeared, look for the faulty component among the accessories driven by the belt.
Remove the starter motor and check that the automatic transmission torque converter is correctly tightened.
Check timing belt adjustment.
If the fault is still present, change the regulation solenoid valves or the diesel fuel pump or the injectors. **For all Vdiags except VELSATIS Vdiag 04:** Check status **ET038 Engine**, if **ET038** is **NORMAL**, check the statuses of the following combustion misfires: **ET057 Misfire on cylinder 1,** **ET058 Misfire on cylinder 2,** **E T059 Misfire on cylinder 3,** **ET060 Misfire on cylinder 4,** **ET274 Misfire on cylinder 5,** **ET275 Misfire on cylinder 6** using the diagnostic tool. If one of the misfire statuses is **DETECT** or **PRESENT**, run **TEST 10 Poor injector operation**. If the unstable idle speed fault is still present, check **the condition** and **correct operation** of the diesel fuel pump. Replace or repair if necessary.

***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

ALP10	Heavy black smoke from exhaust

NOTES	If the vehicle has not been used for a long time, let the engine reach its operating temperature and, after first checking the coolant fluid level, carry out a road test.

Run fault finding on the diesel injection using a diagnostic tool. Deal with any fault detected.
Check that the whole inlet system is neither clogged nor leaky. Check the condition of the air filter and replace if necessary.
Check that the exhaust gas recirculation valve is not stuck open. Replace it, if necessary.
Remove the inlet hose from the turbocharger inlet and check that the turbine shaft rotates very freely. Check that the turbocharger axial and lateral play values are within tolerances.
Check for possible seizing of the turbocharger wastegate in the open position, and replace the turbocharger if necessary (turbocharger seizing may be due to poor lubrication of the bearings: check for possible clogging of the lubrication circuit and check the engine oil pressure). If the fault is still present, run **test 10 Incorrect operation of the injectors**.

***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

ALP11	Heavy white smoke from exhaust

NOTES	If the vehicle has not been used for a long time, let the engine reach its operating temperature and, after first checking the coolant fluid level, carry out a road test.

Check with the customer that the vehicle has not overheated recently.
Check the coolant fluid level. A sharp drop in this level is due to a cooling circuit leak or to fluid consumption by the engine at the cylinder head gasket. Apply **Technical Note 3175A, Cooling circuit, ALP3 Emission of smoke from the exhaust, white smoke, engine warm**.
Run the engine at idle speed until its operating temperature is reached, with the expansion bottle cap in place. If the vehicle emits white smoke from the exhaust, slowly loosen the expansion bottle cap to reduce the pressure in the cooling circuit. If the vehicle stops emitting smoke, one of the cylinder head gaskets is damaged. Replace both the cylinder head gaskets.
If not, check that there is no water in the diesel filter. Ensure that the correct fuel is being used. Run **test 12 Fuel conformity check**.

***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

ALP12	Heavy blue smoke from exhaust

NOTES	If the vehicle has not been used for a long time, let the engine reach its operating temperature and, after first checking the coolant fluid level, carry out a road test.

Run fault finding on the diesel injection using a diagnostic tool.
Deal with any fault detected.

Top up the oil level, and if the level is too high remove the excess.
If the level is too low, refer to **ALP8 Excessive oil consumption**.

Check that the oil breather pipes are not crushed or clogged.

Remove the inlet hose from the turbocharger inlet and outlet.
Check that there is not a large quantity of oil in the turbocharger or the inlet hoses.

- A large quantity of oil in the turbocharger inlet hose is due to extensive oil evacuation via the oil breather (engine "sealing ring" wear or breather clogged, etc.).
- A large quantity of oil in the turbocharger outlet hose indicates failure of the turbine shaft sealing ring. Replace the turbocharger if necessary.
- if the inlet system is clean, a small quantity of oil deposited on the walls of the inlet hoses is acceptable. The oil consumption is undoubtedly due to an engine internal failure, e.g. valve stem seal, oil scraper ring, etc.

***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

ALP 13	No dialogue with engine management computer

NOTES	In the event of a fault, perform a **multiplex network test** using the diagnostic tool.

Check that the tool is not the cause of the fault by trying to establish dialogue with a computer on another vehicle.
If the tool is not at fault, and dialogue cannot be established with any other computer on the same vehicle, it may be that a faulty computer is disrupting **line K**.
Trace which one through a process of elimination, successively disconnecting each computer.
Also check the battery voltage following interpretation of parameter **PR071 Computer supply voltage**.

Check the condition of the engine fuses in the engine fuse and relay box; refer to the **Wiring Diagrams** Technical Note for the vehicle.
Check the computer power supply on the connector side.
Check the earth connections.
Check the computer connector (crimping of wires to terminals, and condition of terminals).
If the connection or connections are faulty and if there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

Check the supply to the diagnostic socket:
+ Before ignition feed on **track 24**.
+ After ignition feed on **tracks 1 and 2**.
Earth on **tracks 4** and **5**.
Ensure **the continuity** and **the insulation** of the following connection:

Diesel computer **track A 50** ⟶ **track 7** of the diagnostic socket

If the connection or connections are faulty and if there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.
If dialogue is still impossible after these checks, replace the engine management computer.
If necessary, modify the configuration of the new computer to match the equipment options available on the vehicle.

***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

TEST1	Exhaust system check

Engine stopped: Check that the silencer outlet is not blocked.
Repair or replace the silencer, if necessary.

YES

Check the seal of the exhaust manifold on the contact surface between the turbocharger and the exhaust manifold.
Is the seal in order?

NO → Repair or replace the faulty part.

YES

Loosen the catalytic pre-converter at the turbocharger outlet.
Place a wooden block between the two parts.
Start the vehicle and check if the engine runs better.
Is the engine running normally?

NO → The exhaust pipe is correct.
Restart fault finding.

YES

Retighten the catalytic pre-converter.
Loosen and decouple or cut the catalytic converter at the catalytic pre-converter outlet.
Place a wooden block between the two parts if necessary.
Start the vehicle and check if the engine runs better.
Is the engine running normally?

NO → Replace the catalytic pre-converter.

YES

(A)

***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

TEST1 CONTINUED	

Retighten the catalytic converter.
Loosen, disconnect or cut the intermediate chamber on the catalytic converter side.
Place a wooden block between the two parts if necessary.
Start the vehicle and check if the engine runs better.
Is the engine running normally?

NO → Replace the catalytic converter.

YES

Retighten the intermediate chamber.
Loosen, disconnect or cut the silencer on the intermediate chamber side.
Place a wooden block between the two parts, if necessary.
Start the vehicle and check if the engine runs better.
Is the engine running normally?

NO → Replace the intermediate chamber.

YES

Replace the silencer.

AFTER REPAIR	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

TEST3	Low pressure circuit check

Ensure that the correct fuel is being used.
Run **test 12 Fuel conformity check**.

↓

Check the condition of all the low pressure diesel fuel pipes from the tank to the injection pump (the pipes should not be pinched).

↓

Check the condition of the priming bulb, and that it is working properly. Perform repairs if necessary and continue the test.

↓

If the fault is still present with a low fuel level, check the consistency of the actual fuel level and that indicated on the instrument panel.
– The transfer pump is supplied via a venturi valve located beneath it.
Check that the opening of the venturi is not blocked by dirt contained in the fuel tank.
Check the priming of the low pressure diesel circuit.

↓

Check the fuel filter:
- Conformity of the fuel filter (correct part number and RENAULT filter).
- Positioning and amount of clogging in the filter element.
- Positioning and condition of the seals.

↓

(A)

***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

TEST3 CONTINUED	

A

Fuel supply of the injection system with additional tank.

This operation aims to detect possible faults in the low pressure supply system of a vehicle by replacing it entirely with an additional tank.

Mode:

– Disconnect the diesel fuel supply pipe at the fuel filter inlet and seal it with a plug.
– Connect a pipe to the fuel filter inlet and insert the other end into a **clean** container which is approximately **5 litres** in volume.
– Disconnect the diesel return pipe to the injector and high pressure pump outlet union, and use a plug to block it.
– Connect a transparent pipe to the injector and high pressure pump outlet union, and insert the other end into the container.
– Fill the container with **clean** diesel fuel.
– Start the engine and let the system drain itself of its air (there must not be any air bubbles in the return pipe).

Is the customer complaint still present?

→ Low pressure circuit correct.
Reconnect the different low pressure circuit pipes and restart fault finding.

Are the low pressure circuit connections in order and in good condition?

→ Carry out the necessary repairs.
Low pressure circuit correct.
Reconnect the different low pressure circuit pipes and restart fault finding.

Low pressure circuit correct.
Restart fault finding.
END OF TEST.

***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

TEST4	Turbocharging and air inlet circuit check

Engine stopped: Check the low and high pressure air circuits for **leaks** (air leaks in or out, upstream or downstream of the turbocharger).

→ Check the parts that are abnormally greasy of the circuit and reveal a lack of tightness.
Check:
- the condition and fitting of the ducts (foreign bodies, clogged, disconnected, pinched, broken, holed, cut, tightness of the mounting bolts, etc.).
- the present and tightening of the clamps.
- the turbocharger pressure sensor is mounted correctly on the manifold.
- The pipes and the take-off point between the air duct and the turbocharging sensor.

Carry out the necessary repairs.

↓

Checking the air filter.

→ Check:
- That the air filter unit inlet and outlet are not blocked.
- That air filter unit is in good condition and is fitted correctly (not dislodged, broken, pierced; condition and positioning of the foam, etc.).
- The cleanliness, conformity and the absence of deformation of the filter element.
- The air flowmeter, run **test 5 Air flowmeter**.

←

Check:
- the condition of the damper valve (damper),
- the condition of the swirl flaps,
- the tightness of the mounting bolts,

Carry out the necessary repairs.
Replace if necessary.

→ Carry out a visual inspection of the EGR circuit sealing.
Replace if necessary.

←

Check the exhaust, run **test 1 Exhaust system check**.
Carry out the necessary repairs.

↓

→ Check the condition of the intercooler:
- clogging,
- leaks (vehicle stationary, stabilise the engine speed between **3500 rpm** and **4000 rpm** and check that there are no leaks).

Replace if necessary.

↓

Check that the turbocharging pressure sensor take-off point is not blocked.
Replace if necessary.
END OF TEST.

AFTER REPAIR	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

TEST5	Air flowmeter

Contamination of the grille
Visual inspection: remove the flowmeter; there should be no foreign bodies in the grilles (see **illustration no. 110734 test 5 continued**).
Do not clean the grilles using compressed air or any other procedure: this damages the sensors and creates variations from the values displayed on the CLIP tool.
Check the air circuit sealing upstream of the air flowmeter: ducts and air filter unit disconnected or pierced, presence of seals.
Replace the air flowmeter if necessary and clean upstream of this, if necessary.

↓

Damage to electrical components
Visual inspection: remove the flow sensor - the components should not be broken.
Replace the air flowmeter if necessary.

↓

Oxidation of the electrical components
Visual inspection: remove the air flow sensor connector, there should not be any green deposits on the electrical components.
Replace the air flowmeter if necessary.

↓

Clogging of the air flowmeter
Test:

- Check the conformity values, with a warm engine (coolant temperature: **80˚C**).
- During the **first 30 seconds** after starting.
- Engine speed: idling
- Air temperature between **30 and 70˚C**.
- **PR145 ENGINE SPEED = 700 rpm and PR136 EGR POSITION = 3.2 mm:**
  PR146 EGR POSITION = 42 kg/h ± 4.2 kg/h
- **PR145 "ENGINE SPEED" = 700 rpm and PR136 "EGR POSITION" = 0 mm:**
  PR146 EGR POSITION = 72.3 kg/h ± 7.2 kg/h

(To obtain **PR136 EGR POSITION = 0 mm**, depress the accelerator pedal **briefly** and release the pedal while displaying parameter **PR136 EGR position** in the **diagnostic tool** then freeze the image when the parameter **PR136 EGR POSITION = 0 mm**).

- Apply the procedure for **DF056 Air flow sensor circuit** for the checks on the air flowmeter.

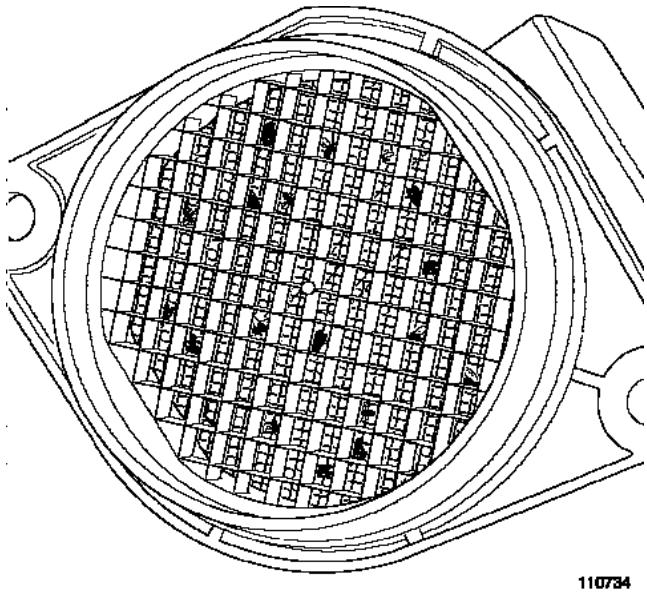
Replace the air flowmeter if necessary.
END OF TEST.

***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

TEST5 CONTINUED	

Contamination of the grille



***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

TEST7	Variable geometry turbocharger control

Start the engine and check that:
- **PR346 Turbocharger wastegate valve position ≈ 1.64 ± 0.1 mm**, warm engine,
- **PR345 Turbocharger wastegate potentiometer voltage ≈ 3.9 ± 0.1 V at 20˚C**,
- the variable geometry control moves easily.

↓

Does the variable geometry control move easily? — **NO** → Replace the turbocharger.

YES

↓

Stop the engine and check that:
- **PR346 Turbocharger wastegate valve position ≈ 10 mm at idle speed, < 10 mm during deceleration**,
- **PR345 Turbocharger wastegate potentiometer voltage ≈ 0.45 V with PR346 = 10 mm**,
- the variable geometry control moves easily.

↓

Does the variable geometry control move easily? — **NO** → Replace the turbocharger.

YES

↓

Stop the engine and check that:
- **PR346 Turbocharger wastegate valve position ≈ 10 mm at idle speed, < 10 mm during deceleration**,
- **PR345 Turbocharger wastegate potentiometer voltage ≈ 0.45 V with PR346 = 10 mm**,
- the variable geometry control moves easily.

↓

Continue the turbocharger test with **test 8 Rotating part of turbocharger**.

***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

TEST8	Rotating part of a turbocharger

With the engine cold and stopped, remove the air inlet duct from the turbocharger; check manually if the shaft of the turbine and of the compressor turns.
Does the shaft turn?

NO → Replace the turbocharger.

Seizing of the turbocharger may be caused by poor lubrication of the bearings. Check the lubrication circuit for any blockage and check the engine oil pressure. Apply the procedure described in **Technical Note 3938A, F9Q engine-Turbocharger failure** which can be applied to this engine.

YES

Visually check the condition of the compressor wheel then the turbine wheel (see illustrations **No. 110737 test 8 continued 1 and 110738 test 8 continued 2**).
Are the wheels in good condition?

NO

YES

Manually check the end float of the wheels (see illustration **no. 110880 test 8 continued 3**).
The significant end float is approximately **2 mm**.
Does the turbocharger have too much play in the shaft?

YES → Replace the turbocharger. Apply the procedure described in **Technical Note 3938A, F9Q engine-Turbocharger failure** which can be applied to this engine.

If the moving part is broken: apply the procedure described in **Technical Note 3938A, F9Q engine-Turbocharger failure** which can be applied to this engine.
IMPORTANT
Risk of destroying the new turbocharger and the engine if the air circuit is not cleaned and the oil and its filter are not replaced.

NO

The rotating section is in order.
Is there oil in the exhaust?

NO → **END OF TEST.**

YES

Replace the catalytic pre-converter.

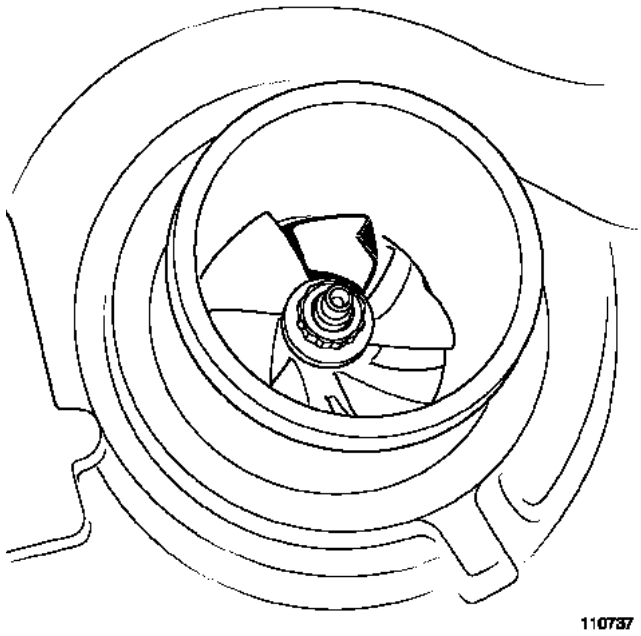
***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

TEST8 CONTINUED 1	

Information:
The operating play of the turbocharger bearings is approximately **25 µm** (micrometers or microns) between the shaft of the turbocharger and the internal mating face of the bearings and **75 µm** between the exterior part of the bearings and the bearing housing.
Risks:
In the event of destruction of the turbocharger bearings, the steel and bronze swarf from this destruction are evacuated through the turbocharger oil to the engine's oil sump. The swarf can, consequently, be returned to the oil circuit via the oil pump, then cause widespread contamination of the engine oil circuit. This causes abnormal wear on the crankshaft bearing bushings, the con rod bearing shells and the camshafts, etc.
In the event of the compressor wheel breaking, parts of the blades may be found in the intercooler or in the air circuit ducts. The turbine wheel could easily be found in the catalytic converter.

Deformed, twisted blade (“soft” foreign body)

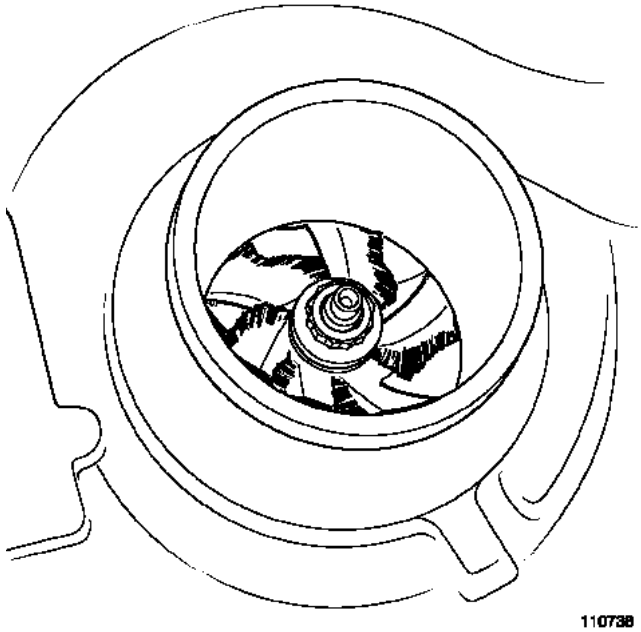


***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

TEST8 CONTINUED 2	

Broken blades (“hard” foreign body)



***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

TEST10	Incorrect injector operation

For all Vdiags except VELSATIS Vdiag 04:

PART A

CHECK THE INJECTOR FLOW CORRECTION: (INDIVIDUAL CORRECTION)
– In CLIP, choose the **Fuel circuit** sub-function.
– With the engine idling and the fuel temperature **> 50˚C**, display the flow correction values for each injector (individual correction), i.e.:
PR364 Cylinder no. 1 fuel flow correction;
PR405 Cylinder no. 2 fuel flow correction;
PR406 Cylinder no. 3 fuel flow correction;
PR365 Cylinder no. 4 fuel flow correction,
PR407 Cylinder no. 5 fuel flow correction,
PR408 Cylinder no. 6 fuel flow correction.
The **normal value** for flow correction for an injector is approximately **± 1 mm^3/stroke**. This tolerance may increase with time, but indicates an injector/cylinder fault if it exceeds **± 5 mm^3/stroke**.
1) If at least one of these values is > + 5 mm^3/stroke
– If the compression value recorded with the compression gauge reveals a faulty cylinder, carry out the necessary repairs and apply **Part C**.
– If the customer complaint is still present, replace the injector.
– Check the valve clearance.
– See paragraph **Part B**, for confirming the fault finding.
2) If at least one of these values is < - 5 mm^3/stroke
– Check the level and condition of the engine oil.
– Remove the injector which has the biggest negative value.
– Check the valve clearance.
– Replace the injector.
– See paragraph **Part B**, for confirming the fault finding.
3) If at least one of these values does not stabilise (at least 30 seconds after starting and when warm)
– Check the low pressure circuit with **test 3 Low pressure circuit check**.
– Ensure that the correct fuel is being used. Run **test 12 Fuel conformity check**.
– See paragraph **Part B**, for confirming the fault finding.

Note:
Before replacing an injector, check that its sealing washer is in place and in order.

IMPORTANT
When removing or refitting an injector, respect the cleanliness guidelines and safety advice (see **MR 353, MR 402 or MR 361 Mechanical, 13B, Diesel injection, Removal/refitting of injectors**).

***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

TEST10 CONTINUED	

PART B
Confirmation of flow correction check fault finding for each injector: (individual correction)
Clear the fault(s) and carry out a test with the **engine at idle speed** and the fuel temperature **> 50˚C**, check that no faults appear on the diagnostic tool and that the correction values do not reach **± 5 mm^3/stroke** to confirm the repair.
– If any other cylinders have injector flow correction values which exceed **± 5 mm^3/stroke**, follow the fault finding procedure described in **Part A**". Fuel regulation balance check for each injector (individual).

PART C
Injector nozzle sealing check:
– Check the level and condition of the engine oil:
– If there is diesel fuel contamination, the leaking injector nozzle will be "greasy".
– Disconnect the preheating relay.
– Check that these traces are not caused by rising engine oil, by checking the engine compression values.
– Check the condition of the heater plug: this must not be wet. If it is, change the defective injector.
– If the engine compression values are correct, locate the faulty injector by looking at the condition of the cylinders and the pistons across the heater plug wells (greasy cylinder, overheating, starting to incur damage, etc.).
– If the cylinder - piston examination is not conclusive, remove the injectors and change the one with the "greasy" nozzle.
– If the fault finding checks do not enable the engine to be repaired, contact the Techline.

Note:
Before replacing an injector, check that its sealing washer is in place and in order.

IMPORTANT
When removing or refitting an injector, respect the cleanliness guidelines and safety advice (see **MR 353, MR 402 or MR 361 Mechanical, 13B, Diesel injection, Removal/refitting of injectors**).

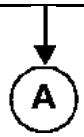
***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

TEST11	High pressure pump

Confirm the customer complaint:
Loss of power, sometimes with difficult starting from cold, before applying the test described below.
Are the following conditions confirmed?
– No fault code.
– No external leak from the fuel circuit.
– No air intake on the fuel circuit.
Check that there is no OTS to be carried out on the vehicle.
As AC029 "High pressure circuit sealing test" is not available on all VELSATIS Vdiag 04, this test may not succeed.

Stage 1: measure of the rail pressure:
– Carry out a road test and record the following parameters as soon as power is lost:
  – **PR145 Engine speed.**
  – **PR030 Accelerator pedal position.**
  – **PR038 Rail pressure.**
  – **PR008 Rail pressure setpoint.**
  – **PR213 Rail pressure loop difference.**
– Print the data found.

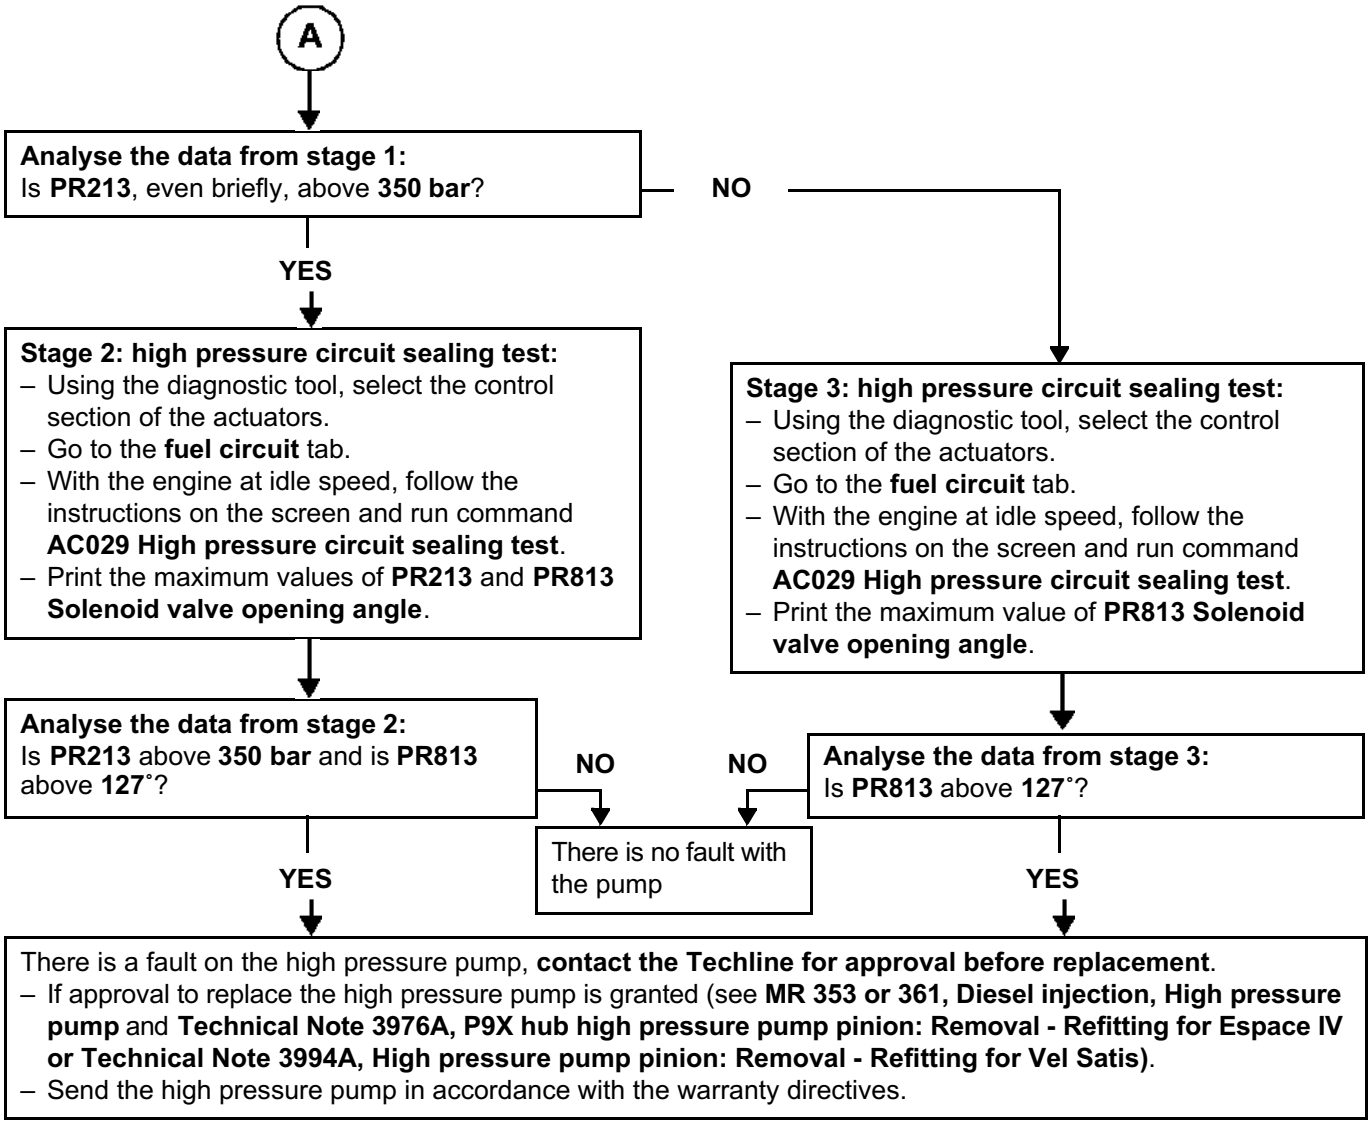


***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

TEST11

CONTINUED



***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

TEST12	Fuel conformity check

WARNING
During this operation, it is essential to:
– refrain from smoking or bringing incandescent objects close to the work area,
– guard against petrol splashes caused by the residual pressure in the pipes,
– wear safety goggles with side guards,
– wear leaktight gloves (Nitrile type).

IMPORTANT
– To avoid any corrosion or damage, protect the areas on which fuel is likely to run.
– To prevent impurities from entering the circuit, place protective plugs on all fuel circuit components exposed to the open air.

Preparations:
Weigh an empty **1300 ml plastic cup (part no. 77 11 171 413)** with its cover **(part no. 77 11 171 416)** using electronic scales such as those used in body paint workshops (example: **PANDA part no. 77 11 224 995**). Record the weight of the empty plastic cup.
This type of plastic cup is used to prepare paint.

Remove **1 L** of fuel **at the diesel filter outlet** (see **MR 353, 361 or 402, Mechanical, 19C, Tank, Fuel tank: Draining**), using a pneumatic transfer pump (**part no. 634-200**) and place it in the **1300 ml** plastic cup.
Cover the plastic cup with its cover and let it settle for approximately **2 minutes**.

,

Is the fuel cloudy or does it separate into two parts?

YES → Presence of water in diesel fuel, the fuel is not compliant. Drain the fuel circuit, including the tank (**MR353, 361 or 402, Mechanical, 19C, Tank, Fuel tank: Draining).**

NO ↓

AFTER REPAIR	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

TEST12 CONTINUED 1	

A

Weigh the diesel fuel and note the fuel weight after subtracting the weight of the empty plastic cup and its cover.
Does the fuel weight fall between the minimum and maximum weights given in the table below?

Calculated weight (g.)		Fuel temperature (˚C)
Minimum weight	Maximum weight	
821	846	13
821	846	14
820	845	15
819	844	16
819	844	17
818	843	18
817	842	19
816	841	20
816	841	21
815	840	22
814	839	23
814	839	24
813	838	25

Check the fuel temperature by immersing a thermometer in the plastic cup.

YES → B

NO → C

AFTER REPAIR	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

TEST12 CONTINUED 1	

B

End of test.

C

The fuel is not correct.
If the fuel weight is less than the minimum value then there is petrol in the diesel fuel.
If the fuel weight is greater than the minimum value then there is oil in the diesel fuel.
Drain the fuel circuit, including the tank (**MR353, 361 or 402, Mechanical, 19C, Tank, Fuel tank: Draining).**

Note:
If the weight measured reaches the limit values, the measurement can be performed with a **2230 ml plastic cup (part no.77 11 171 414)** and its cover **(part no.77 11 171 417):**
– Carry out a quick test drive in order to mix the fuel, then remove **2 l** of fuel.
– Perform the test again and check the results by multiplying the limit values by 2.

Contact the Techline if you have doubts or problems with the customer.

AFTER REPAIR	Carry out a road test, followed by a check with the fault finding tool.

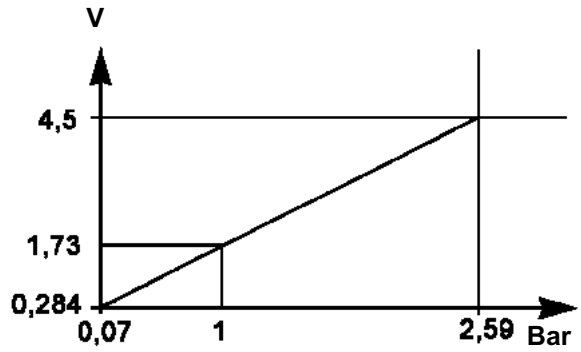
GETtheMANUALS.org

MANIFOLD/TURBOCHARGER PRESSURE SENSOR

Characteristics:	Pressure - Voltage transducer
Supply voltage:	**5 V ± 0.25 V**
Type of circuit:	Active circuit
System equipped:	Denso injection
Type of connector:	**3-track** (1 signal - 2 minus - 3 plus)

Description:
This sensor is used by the injection system to give a signal relating to the manifold pressure vacuum or the turbocharging pressure.
It uses a piezoelectric component which produces an electric voltage proportional to the stress applied to it (in this case, pressure).
This signal is very weak and is amplified by an internal electronic system which requires an external **5 V** feed supplied by the injection computer.

Checking the sensor:
The sensor delivers a voltage proportional to the inlet manifold vacuum:
2.59 bar absolute (**1.59 bar** relative) = **4.5 V**.
1 bar absolute (**0 bar** relative) = **1.73 V**.
0.07 bar absolute (**- 0.93 bar** relative) = **0.284 V**.



Check first that the sensor is correctly supplied with a voltage of **+ 5 V** with the sensor connected.
Use a multivac pump connected to the sensor's vacuum union to check that the signal does correspond to the graph. Disconnect **track 3** linking the computer to the sensor and connect the + lead of a multimeter (rated at between **5 and 10 V**) on **track 3** of the sensor and the - lead to **track 2** of the sensor (sensor earth still connected to the computer).
At atmospheric pressure, the voltage should be approximately equal to **1.73 V**.
At close to **2.59 bar** absolute, the voltage should be more or less equal to **4.5 V**.
At close to **0.07 bar** absolute, the voltage should be more or less equal to **0.284 V**.
If the voltages do not correspond to the pressures, replace the sensor.

GETtheMANUALS.org

AIR FLOW SENSOR

Characteristics:	Air flow - Voltage transducer
Supply voltage:	**12 V**
Type of circuit:	Active circuit
System equipped:	Denso injection
Type of connector:	**5-track** (**5**: signal; **3**: earth; **4**: + 5 V; **2**: + 12 V)

Description:
This sensor is used by the injection system to give a signal relating to the air flow circulating in the inlet circuit.
It uses a so-called "hot film" system, a ceramic insert onto which a heating resistor and a temperature sensor are screen-printed, which are placed in the middle of the air stream.
An electronic circuit heats the insert and monitors its temperature by means of its temperature sensor located away from the heating resistor.
The passage of air cools the ceramic wafer, and the electronic circuit will compensate for this cooling by increasing the current passing through the heating resistor so as to maintain its reference temperature.
This current, after being formatted by the flow sensor electronics, represents the air flow passing through the flow sensor.
A signal varying from **0** to **12 V** represents an air mass flow rate.
An external **12 V** power supply provided by the injection computer's safety relay is necessary for it to operate.

Checking the sensor:
Check that the grilles protecting the flow sensor are not clogged or damaged and check the cleanliness of the ceramic sensor located in the centre of the housing, which should be clean and must not be broken. Do not use detergent to clean the sensor (risk of damage).
The sensor cannot be dismantled; in case of doubt regarding its consistency, carry out a flow measurement.
Conditions:
Engine at operating temperature, exhaust gas recirculation valve and turbocharger wastegate disconnected and air conditioning off.
Perform a measurement at idling speed and then at a stabilised 3,000 rpm. Repeat this measurement with another flow sensor. The values should be more or less equivalent; if not, replace the flow sensor.
Average flow value at inlet according to the conditions set out above:
At idle speed (700 rpm): 70 kg/h
At 3000 rpm (stabilised): 320 kg/h

Note:
These values are typical for a new engine in operation and may only be used as an estimate.
To confirm the test, carry out a test with another flowmeter.

GETtheMANUALS.org

COOLANT TEMPERATURE SENSOR - INLET AIR - FUEL

IMPORTANT
Only affects the OBD air temperature sensor at the flow sensor.

Characteristics:	Temperature - resistance transducer
Resistance:	Depends on the temperature
Type of circuit:	Passive circuit
System equipped:	Denso injection
Type of connector:	**2 tracks**

Description:
This sensor is used by the injection system to give a signal representing a temperature of a component to which the sensor is attached.
This is a negative temperature coefficient resistor (the resistance drops when the temperature increases).
A circuit in the computer powers the sensor with a constant current and variation of the resistance causes variation of the voltage across the terminals of the sensor, this voltage being representative of the temperature.

Checking the sensor:
The presence of a yellow or transparent wax in the connector indicates that the sensor seal is broken; replace it and recheck the sealing.
Use a multimeter to first check the insulation of the sensor's two tracks from its metal base (if so equipped) or from engine earth.
The resistance should in this case be infinite; if this is not the case replace the sensor.
Using a multimeter, check the sensor's resistance in relation to the temperature.
This should be **3515 Ω ± 200 Ω at 20 °C**.
If the values do not correspond, replace the sensor.

GETtheMANUALS.org

ACCELERATOR POTENTIOMETER

Characteristics:	Position - resistance transducer
Supply voltage:	2 gangs, each at **+ 5 V ± 0.25 V**
Resistance:	Depends on the angle
Type of circuit:	Passive circuit
System equipped:	Denso injection
Type of connector:	**6 tracks**

Pin configuration:

Track 2 > potentiometer earth 1	**track 1 >** potentiometer earth 2
Track 4 > potentiometer supply 1	**track 5 >** potentiometer supply 2
Track 2 > potentiometer signal 1	**track 1 >** potentiometer signal 2

Description:
This sensor is equipped with two potentiometers (variable resistance) insulated from one another.
The position of the shaft causes a variation in the sensor's internal resistance.
The two gangs are not synchronous, gang 2 has a resistance value double that of gang 1.
These two gangs are used by the injection computer to check that the accelerator potentiometer is giving consistent signals.

Checking the sensor:
Use a multimeter to measure the resistance of the potentiometers,
– between **tracks 1** and **5**, the resistance should be **1700 ± 500 Ω**,
– between **tracks 2** and **6**, the resistance should be **1200 ± 500 Ω**,
If one of the gangs is not within these tolerances, replace the accelerator potentiometer.

MINIMUM value:
Gang 1 (from **13.6 % to 16.4 %** of Valim P1 (5 V) or **0.68 to 0.82 V**)
Gang 1 (from **5.2 % to 9.8 %** of Valim P2 (5 V) or **0.26 to 0.49 V**)

MAXIMUM value:
Gang 1 (from **83.6 % to 92.4 %** of Valim P1 (5 V) or **4.18 to 4.62 V**)
Gang 1 (from **40.7 % to 47.3 %** of Valim P2 (5 V) or **2.03 to 2.36 V**)

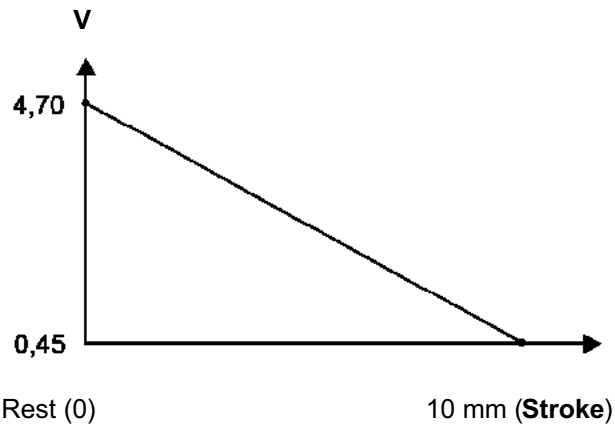
GETtheMANUALS.org

WASTEGATE POSITION SENSOR

Characteristics: Position - resistance transducer
Supply voltage: **5 V ± 0.25 V**
Type of circuit: Passive circuit
System equipped: Denso injection
Type of connector: **3-track** (1 signal - 2 minus - 3 plus)

Description:
This sensor is used by the injection system to give a signal relating to the turbocharger wastegate control position.
It uses a potentiometer powered externally by the injection computer at a voltage of **5 V**.
The sensor will thus generate a voltage proportional to its position.

Checking the sensor:
The sensor delivers a voltage proportional to the position of the wastegate rod:
End stop in rest position = **4.70 V**
10 mm of stroke = **0.45 V**



Check first that the sensor is correctly supplied with a voltage of **+ 5 V** with the sensor connected.
Use a multivac pump connected to the capsule's vacuum union and a rule to measure the rod travel.
Check that the signal corresponds to the graph.
Disconnect **track 1** linking the computer to the sensor and connect the + lead of a multimeter (rated at between **5 and 10 V**) to **track 1** of the sensor and the - lead to **track 2** of the sensor (sensor earth still connected to the computer).
If the voltages do not correspond to the position of the wastegate rod, replace the sensor.

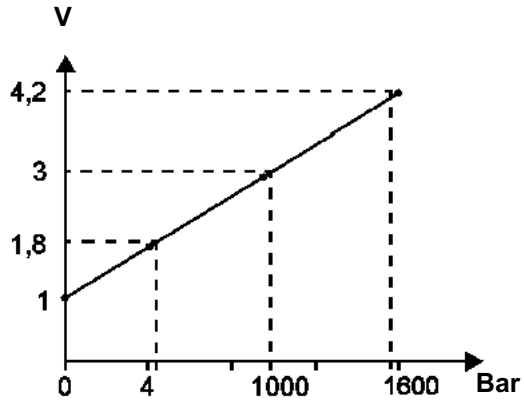
GETtheMANUALS.org

RAIL PRESSURE SENSOR

Characteristics:	Pressure - Voltage transducer
Supply voltage:	**5 V ± 0.25**
Type of circuit:	Active circuit
System equipped:	Denso injection
Type of connector:	**3-track** (1 signal - 2 minus - 3 plus)

Description:
This sensor is used by the injection system to give a signal relating to the rail pressure (fuel pressure in the common rail).
It uses a piezoelectric component which produces an electric voltage proportional to the stress applied to it (in this case, pressure).
This signal is very weak and is amplified by an internal electronic system which requires an external **5 V** feed supplied by the injection computer.

Checking the sensor:
The sensor delivers a voltage proportional to the rail pressure:
1600 bar = 4.20 V
0 bar = 1 V



The formula is as follows:
P being the pressure in bar: **(P/500) + 1 = U**
U being the signal pressure in volts: **(U - 1) x 500 = P**
Check first that the sensor is correctly supplied with a voltage of **+ 5 V** with the sensor connected.
Dump the pressure in the common rail and check that the sensor signal voltage is **1 V**.
If the voltage is not correct, replace the sensor.

GETtheMANUALS.org

P9X 701 engine speed:	– Idling speed	**700 ± 50 rpm**
	– No load maximum	**5,000 ± 80 rpm**
	– Injection order	**1-2-3-4-5-6**
	– Compression ratio	**18.5: 1**

GETtheMANUALS.org

1. SCOPE OF THIS DOCUMENT

This document presents the fault finding procedure applicable to all computers with the following specifications:

Vehicle: **Laguna II, VelSatis, Velsatis ph2, Espace IV**

Function concerned: **Diesel injection**

Computer name: **BOSCH EDC15C3**

Program No.: **CB**

Vdiag No.: **10, 14, 18, 1C**

2. PREREQUISITES FOR FAULT FINDING

Documentation type

Fault finding procedures (this document):
– Assisted fault finding (integrated into the diagnostic tool), Dialogys.
Wiring diagrams:
– Visu-Schéma (CD-ROM), paper.

Type of diagnostic tools

– **CLIP + multiplex line sensor**

Special tooling required

Special tooling required	
	Multimeter
Elé. 1681	Universal bornier

3. REMINDERS

Procedure

To run fault finding on the vehicle computers, switch on the ignition.

Connect the diagnostic tool and perform the required operations.

IMPORTANT
For the **Espace IV, Laguna II, Velsatis, Velsatis ph2** proceed as follows:
– vehicle card in reader,
– connect the diagnostic tool and perform the required operations.
For the **Velsatis ph2** proceed as follows:
– press the unlocking button on the card,
– insert the card in the reader,
– engage a gear,
– press the start button (interrupting the timed + after ignition feed mode),
– press the Start button for longer than 5 seconds until it flashes rapidly.
To **cut off + after ignition**, proceed as follows:
– disconnect the diagnostic tool,
– remove the card.

GETtheMANUALS.org

Faults

Faults are declared present or stored (depending on whether they appeared in a certain context and have disappeared since, or whether they remain present but are not diagnosed within the current context).

The **present** or **stored** status of faults should be taken into consideration when the diagnostic tool is switched on after the + after ignition feed (without any system components being active).

For a **present fault**, apply the procedure described in the **Interpretation of faults** section.

For a **stored fault**, note the faults displayed and apply the instructions in the **Notes** section.

If the fault is **confirmed** when the instructions in the Notes section are applied, the fault is present. Deal with the fault.

If the fault is **not confirmed**, check:
- the electrical lines which correspond to the fault,
- the connectors for these lines (for oxidation, bent pins, etc.),
- the resistance of the component detected as defective,
- the condition of the wires (melted or split insulation, wear).

Conformity check

The aim of the conformity check is to check data that does not produce a fault on the diagnostic tool because the data is inconsistent. Therefore, this stage is used to:
- carry out fault finding on faults that do not have a fault display, and which may correspond to a customer complaint.
- check that the system is operating correctly and that there is no risk of a fault recurring after repairs.

This section gives the fault finding procedures for statuses and parameters and the conditions for checking them.

If a status is not behaving normally or a parameter is outside the permitted tolerance values, consult the corresponding fault finding page.

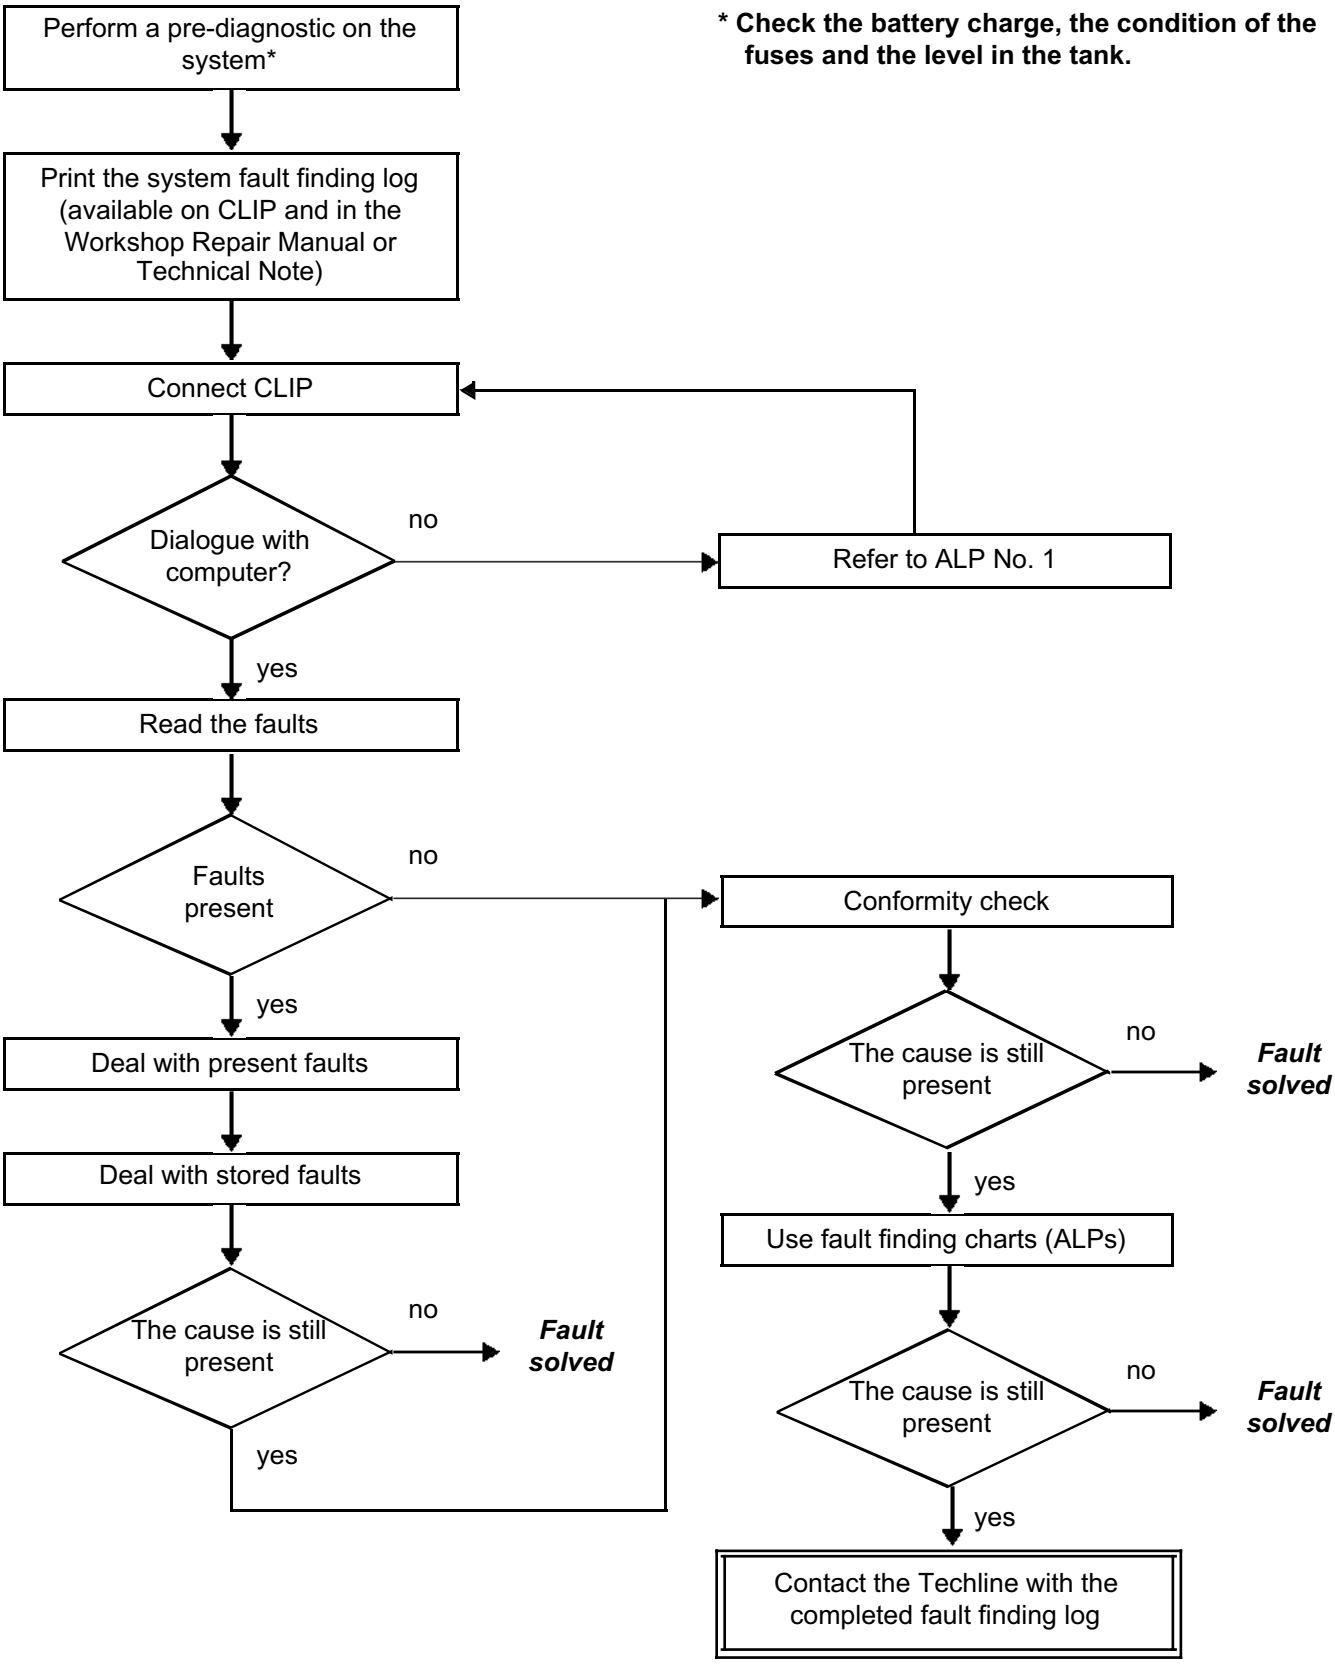
Customer complaints - Fault finding chart

If the test with the diagnostic tool is OK but the customer complaint is still present, the fault should be processed by **customer complaints**.

A synopsis of the general procedure to follow is provided on the following page in the form of a flow chart.

GETtheMANUALS.org

4. FAULT FINDING PROCEDURE



*** Check the battery charge, the condition of the fuses and the level in the tank.**

GETtheMANUALS.org

4. FAULT FINDING PROCEDURE (continued)

Wiring check

Fault finding problems
Disconnecting the connectors and/or manipulating the wiring harness may temporarily remove the cause of a fault.
Electrical measurements of voltage, resistance and insulation are generally correct, especially if the fault is not present when the analysis is made (stored fault).

Visual inspection
Look for damage under the bonnet and in the passenger compartment.
Carefully check the fuses, insulators and wiring harness routing.
Look for signs of oxidation.

Physical inspection
While manipulating the wiring harness, use the diagnostic tool to note any change in fault status from stored to present.
Make sure that the connectors are properly locked.
Apply light pressure to the connectors.
Twist the wiring harness.
If there is a change in status, try to locate the source of the fault.

Inspection of each component
Disconnect the connectors and check the appearance of the clips and tabs, as well as the crimping (no crimping on the insulating section).
Make sure that the clips and tabs are properly locked in the sockets.
Check that no clips or tabs have been dislodged during connection.
Check the clip contact pressure using an appropriate model of tab.

Resistance check
Check the continuity of entire lines, then section by section.
Look for a short circuit to earth, to **+ 12 V** or with another wire.

If a fault is detected, repair or replace the wiring harness.

GETtheMANUALS.org

5. FAULT FINDING LOG

IMPORTANT

IMPORTANT
Any fault on a complex system requires thorough fault finding with the appropriate tools. The FAULT FINDING LOG, which should be completed during the procedure, enables you to keep track of the procedure which is carried out. It is an essential document when consulting the manufacturer.

IT IS THEREFORE MANDATORY TO FILL OUT A FAULT FINDING LOG EACH TIME FAULT FINDING IS CARRIED OUT

You will always be asked for this log:

- when requesting technical assistance from Techline,
- for approval requests when replacing parts for which approval is mandatory,
- to be attached to monitored parts for which reimbursement is requested. The log is needed for warranty reimbursement, and enables better analysis of the parts removed.

6. SAFETY INSTRUCTIONS

Safety rules must be observed during any work on a component to prevent any damage or injury:
– check the battery voltage to avoid incorrect operation of computer functions,
– use the proper tools.

GETtheMANUALS.org

I - RISKS ASSOCIATED WITH CONTAMINATION

The high pressure direct injection system is highly sensitive to contamination. The risks associated with contamination are:
– damage to or destruction of the high pressure injection system,
– components jamming,
– components losing seal integrity.

All After-Sales operations must be performed under clean conditions. This means that no impurities (particles measuring a few microns) have entered the system during the removal-refitting procedures.

The cleanliness principle must be applied from the filter to the injectors.

What are the sources of contamination?
– metal or plastic swarf,
– paint,
– fibres:
    – from cardboard,
    – from brushes,
    – from paper,
    – from clothing,
    – from cloths.
– foreign bodies such as hair,
– ambient air,
– etc.

IMPORTANT
Cleaning the engine using a high pressure washer is prohibited because of the risk of damaging connections. In addition, moisture may collect in the connectors and create electrical connection faults.

II - Instructions to be followed before carrying out any work

IMPORTANT
Before any work is carried out on the high pressure injection system, protect:
– the accessories and timing belts,
– the electrical accessories, (starter, alternator, electric power-assisted steering pump),
– the flywheel surface, to prevent any diesel from running onto the clutch friction plate.

Check that you have plugs for the unions to be opened (set of plugs available from the Parts Department). The plugs are single-use only. After use, they must be discarded (once used they are soiled and cleaning is not sufficient to make them reusable). Unused plugs must be discarded.

GETtheMANUALS.org

Check that you have hermetically resealable plastic bags for storing removed parts. Parts stored in this way will be less susceptible to the risk of contamination. The bags are to be used once only, and discarded after use.

Obtain lint-free cleaning cloths (cloth part number **77 11 211 707**). Using normal cloth or paper is prohibited. They are not lint-free and could contaminate the fuel circuit. Each cloth should only be used once.

Use fresh cleaning agent for each operation (used cleaning agent is contaminated). Pour it into an uncontaminated container.

For each operation, use a clean brush in good condition (the brush must not shed its bristles).

Use a brush and cleaning agent to clean the unions to be opened.

Blast compressed air over the cleaned parts (tools, workbench, the parts, unions and injection system zones). Check that no bristles remain.

Wash your hands before and during the operation if necessary.

When wearing leather protective gloves cover them with latex gloves to prevent contamination.

III - Instructions to be followed when carrying out any work

As soon as the circuit is open, all openings must be plugged to prevent impurities from entering the system. The plugs to be used are available from the Parts Department. The plugs must not be reused under any circumstances.

Seal the pouch shut, even if it has to be opened shortly afterwards. Ambient air carries contamination.

All components removed from the injection system must be stored in a hermetically sealed plastic bag once they have been plugged.

Using a brush, cleaning agent, air gun, sponge or normal cloth is strictly prohibited once the circuit has been opened. These items could allow contamination to enter the system.

A new component replacing an old one must not be removed from its packaging until it is to be fitted to the vehicle.

GETtheMANUALS.org

The high pressure injection system is designed to deliver a precise quantity of diesel fuel to the engine at a set moment.

It is fitted with a **BOSCH 128-track** computer, **type EDC15C3**.

The system comprises:
- on engines fitted with a CP3 high pressure pump, a priming bulb or electric priming pump on the low pressure circuit,
- on engines fitted with a CP1 high pressure pump, an electric low pressure pump,
- a diesel filter,
- a CP1 or CP3 high pressure pump,
- a solenoid valve mounted to the pump that regulates the high pressure,
- an injector rail,
- a fuel pressure sensor built into the rail,
- four solenoid injectors,
- a diesel temperature sensor,
- a coolant temperature sensor,
- an upstream air temperature sensor,
- a cylinder reference sensor,
- an engine speed sensor,
- a turbocharger pressure sensor,
- an EGR solenoid valve,
- an accelerator pedal potentiometer,
- an atmospheric pressure sensor integrated into the injection computer,
- an air flowmeter,
- a turbocharging limiter solenoid valve,
- a damper valve or inlet flap solenoid valve,
- a swirl or turbulence flap solenoid valve.

The **common rail** direct high pressure injection system works sequentially (based on the petrol engine multipoint injection).

This injection system reduces operating noise, reduces the volume of pollutant gases and particles and produces high engine torque at low engine speeds thanks to a pre-injection procedure.

The high pressure pump generates the high pressure and transmits it to the injector rail. The actuator located on the pump controls the quantity of diesel fuel supplied, according to the requirement determined by the computer. The rail supplies each injector through a steel pipe.

GETtheMANUALS.org

Computer

This determines the injection pressure value necessary for the engine to operate correctly and controls the pressure regulator accordingly. It checks that the pressure value is correct by analysing the value transmitted by the pressure sensor mounted on the rail.
It determines the injection timing required to deliver the right quantity of diesel fuel and the moment when injection should start.
It electrically controls each injector individually after determining these two values.

The flow injected into the engine is determined by:
- the duration of injector control,
- the rail pressure (regulated by the computer),
- the needle stroke (determined by a constant for the type of injector),
- the nominal hydraulic flow of the injector (specific to each injector).

The computer manages:
- idling regulation,
- exhaust gas flow reinjection to the inlet,
- fuel supply check (advance, flow and rail pressure),
- the fan assembly control,
- the air conditioning (cold loop function),
- supply and control of the thermoplungers,
- the cruise control/speed limiter function,
- pre/postheating control,
- fault warning lights via the multiplex network.

The high pressure pump is supplied at low pressure by an integrated low pressure pump (transfer pump).
It supplies the rail, whose pressure is controlled by the fuel flow actuator for charging, and by the injector valves for discharging. This compensates for pressure drops. The flow actuator allows the high pressure pump to supply the exact quantity of diesel fuel required to maintain the pressure in the rail.
This component minimises the heat generated and improves engine output.
In order to discharge the rail using the injector valves, the valves are controlled by brief electrical pulses which are:
- short enough not to open the injector (passing through the feedback circuit from the injectors),
- long enough to open the valves and discharge the rail.

GETtheMANUALS.org

Renault vehicles are equipped with multiplex electronic systems. These systems enable dialogue between the various vehicle computers. As a result:

- the fault warning lights on the instrument panel are activated via the multiplex network,
- there is no vehicle speed sensor in the gearbox,
- the vehicle speed signal on the instrument panel is transmitted by the ABS computer to the injection computer via a wire connection and is then transmitted over the multiplex network by the instrument panel,
- the injection computer and the airbag computer are the main users of the vehicle speed signal.

Some vehicles have a presence sensor mounted in the filter for detecting water in the diesel. If there is water present in the diesel fuel, the injection and pre/postheating fault warning light comes on.

WARNING
The engine must not operate with:

- diesel fuel containing more than 10% diester,
- petrol, even in tiny quantities.

The system can inject diesel fuel into the engine at a pressure of up to **1350 bar**. Before each operation, check that the injector rail is depressurised and that the fuel temperature is not too high.
When working on the high pressure injection system, you must follow the cleanliness guidelines and safety advice specified in this document.

Dismantling the interior of the pump and injectors is forbidden. Only the fuel flow actuator, the diesel fuel temperature sensor and the venturi can be replaced.

For safety reasons, it is strictly prohibited to undo a high pressure pipe union when the engine is running.

It is not possible to remove the pressure sensor from the fuel rail because this may cause circuit contamination faults. If the pressure sensor fails, the pressure sensor, the rail and the five high pressure pipes must be replaced.

It is strictly forbidden to remove any injection pump pulley bearing the number 070 575. If the pump needs to be replaced, replace the pulley.

Supplying **+ 12 V** directly to any component of the system is prohibited.

Ultrasound descaling and cleaning are prohibited.

Never start the engine unless the battery is connected correctly.

Disconnect the injection computer when carrying out any welding work on the vehicle.

GETtheMANUALS.org

Cold loop air conditioning management

The air conditioning system is the cold loop type. The injection computer is responsible for:
- authorising requests for cold air according to refrigerant fluid pressure, engine coolant temperature and engine speed,
- requesting activation of the fan unit according to the vehicle speed, the refrigerant pressure and the engine coolant temperature.

The air conditioning system is authorise

d by the injection computer **2 to 8 seconds** after the engine is started.

Compressor activation may be inhibited in accordance with the following conditions.

Engine speed	Vehicle speed	Accelerator pedal unit
less than 3000 ± 100 rpm	less than 66 ± 1 mph (110 ± 2 km/h)	major change of position (rapid variation)
less than 2250 ± 100 rpm	less than 12 ± 2 mph (20 ± 3 km/h)	position greater than 46 ± 2 %
less than 675 ± 50 rpm	...	throttle release

Cruise control management

The cruise control function, when activated, maintains the vehicle at a preselected speed, regardless of the driving conditions encountered. Using the control buttons, the driver can increase or decrease the vehicle speed.

The cruise control function can be deactivated either using the control buttons, or by switching off the cruise control function selection switch or when system events are detected (such as the brake or clutch pedal being depressed), or when system errors are detected such as an inconsistent vehicle speed or excessive vehicle deceleration.

The cruise control function can also be temporarily suspended when the driver wants to resume control of the vehicle and exceed the selected cruising speed by depressing the accelerator pedal which then exceeds the selected fuel flow. The cruising speed is resumed when the driver releases the accelerator pedal.

It is possible to reactivate cruise control and to return to the last cruising speed after the function has been deactivated for whatever reason, during the same cycle of use (computer supply voltage not cut off). The vehicle will then attempt to return to the cruising speed using a controlled vehicle acceleration rate.

The driver has the following controls to operate the cruise control function:
- Accelerator pedal.
- Brake pedal.
- Clutch pedal.
- Function selector switch to select the cruise control operating mode.
- Instrument panel controls.

GETtheMANUALS.org

Indicator/warning light management

– **Instrument panel display**

The computer manages the data display on the instrument panel relating to engine operation. This includes 5 functions: OBD warning light, pre-postheating, coolant temperature and engine faults: Level 1 (non-critical fault) and Level 2 (emergency stop).
These five functions are represented by 3 indicator/warning lights or messages displayed by the trip computer.

– **Pre-postheating warning light**

This light is used both as an in-operation indicator light and as a system fault indicator:
– Continuously lit with + after ignition feed: indicates that the heater plugs are operating.
– Continuously lit, with the "faulty injection" message: indicates a Level 1 fault (indicating reduced operating efficiency and a restricted safety level. The user must carry out repairs as soon as possible).

– **Temperature/emergency stop warning light**

This indicator light is used both as an in-operation indicator light and as a system fault warning light. It lights up for **3 seconds** when the ignition is switched on (automatic test procedure managed by the instrument panel):
– Continuously lit: indicates engine overheating (the driver remains free to stop the vehicle or not).
– Continuously lit, with the "Engine stop" message: indicates a level 2 fault (In this case, injection is automatically shut off after a few seconds).

– **Excess pollution OBD orange warning light**

Symbolised by an engine, it lights up for approximately **3 seconds** when the ignition is switched on. This warning light may also come on when driving if the system detects an OBD fault.

GETtheMANUALS.org

Connector A (grey), 32 tracks

Track	Description
A1	Not used
A2	Programming* return signal
A3	Load potentiometer 2 earth
A4	Multiplex line L network signal (passenger compartment)
B1	Heated windscreen signal
B2	Programming* control
B3	Load potentiometer 1 earth
B4	Multiplex line H network signal (passenger compartment)
C1	Load potentiometer 1 signal

COMPUTER REPLACEMENT OR REPROGRAMMING

There are two steps that must be carried out when the computer is replaced or reprogrammed: **SC003 Save computer data** and **SC001 Write saved data**.

Use **SC003 before the computer is replaced or reprogrammed**. This enables certain data to be saved **in the diagnostic tool** so that the new computer* can be reconfigured like the old one. The data saved is: injector codes, EGR programming, vehicle options and idle speed correction.

Run **SC001 after the computer is replaced or reprogrammed**. It enables you to rewrite the data (saved by command **SC003**) to the new computer*.

If you cannot establish dialogue with the computer being replaced: you will not be able to save anything. After replacing the computer, reconfigure it manually according to its equipment level or parameters, using the special commands.

SC002: enter injector codes,

CF028: climate control,

CF030: thermoplungers,

VP007, VP011: Idle speed adjustment.

Exhaust gas recirculation valve data is programmed automatically the 1st time the new computer is switched on*.

* *new computer or exiting reprogramming!*

PROCEDURE

- **Before replacing or reprogramming the computer:**
  - Select **SC003 SAVE COMPUTER DATA**.
  - If the following message appears: **backup file exists, do you want to overwrite?**:

(this file corresponds to the last save carried out on the tool)

Select **YES**.

When the backup is complete, replace the computer or reprogram, then proceed to the next step.

- **After replacing or reprogramming the computer:**

Select **SC001 WRITE SAVED DATA**

Follow the instructions.

When the command is finished, switch off the ignition.

Wait for the immobiliser warning light to flash (a few seconds) and switch on the ignition again.

Establish dialogue and clear the fault memory.

End of procedure.

GETtheMANUALS.org

REPLACING THE EXHAUST GAS RECIRCULATION VALVE (EGR valve)

From Vdiag 14, the fault monitoring program on the exhaust gas recirculation valve has changed.

To do this, the computer must store the offset of the new valve (at 0 mph) and the offset measured when the ignition was last switched off (in the power-latch* phase), which corresponds to the valve closing. Using this data, the computer can detect whether the valve is clogged or seized.

When the valve is replaced, clear the stored offsets so that the program uses the new valve's offset value.

The data associated with this program is compiled in the **EMISSION CONTROL/OBD** function.
- **ET272 FIRST EGR OFFSET PROGRAMMING** = *Completed or not completed*.
- **PR128 FIRST EGR VALVE OFFSET** = 0.75 V < x < 1.5 V (manufacturing variance).
- **PR129 LAST EGR VALVE OFFSET** > or = **PR128**.
- **PR051 EGR VALVE POSITION FEEDBACK** (very close to **PR129**, when the valve is closed).

Programming **PR128** and **PR129** must be cleared every time the exhaust gas recirculation valve is replaced.

Procedure to be followed **after replacing the** exhaust gas recirculation valve:

Select the **CLEAR** menu, then **RZ002 EGR Adaptives**.

Note:
When the command has finished, the **EMISSION CONTROL/OBD function** *displays*:
ET272: not completed *PR128 and PR129 = 0.00 V* *PR022 = 0.75 V <x <1.5 V*

When the command is completed, switch off the ignition.
Wait for the end of the power latch*.

The offset is automatically reinitialised the next time the ignition is switched on.

Note:
When the reinitialisation is complete, the **EMISSION CONTROL/OBD** function displays:
ET272: completed *0.75 V < PR128 = PR129 = PR022 < 1.5 V*

End of operation.

* The immobiliser warning light will flash a few seconds after the ignition is switched off.

GETtheMANUALS.org

INJECTOR REPLACEMENT

- Please observe the cleanliness guidelines and safety advice.
- When fitting the injector, do not put any strain on it (see the procedure in the Repair Manual).
- The stored injector codes are displayed on the *Identification* screen and in the *CURRENT* column of the Special command: **SC002 ENTER INJECTOR CODES**.
- To find out if the IMA function is operational:

– **ET104 Injector code operation** on the main screen which displays **YES** if the computer includes IMA programming.

Procedure for programming the injector codes

– Read the **6-character* alphanumeric** code(s) etched on the upper section of the Bakelite body of the injector(s).
– Select **SC002 ENTER INJECTOR CODES**.
– On the CLIP tool, follow the instructions given when the help button (depicted as a book) is clicked on.
– When the command has finished, the modified code(s) is/are displayed in the **CURRENT** column.
– If necessary, clear fault **DF276 Injector code programming**: 1.DEF.

*Note:
– The letters **Q** and **J** and the numbers **0** and **9** are not used in IMA coding.
– Each code must be allocated to the cylinder on which the injector is fitted!
– Cylinder no. 1 is located at the flywheel end.

GETtheMANUALS.org

Summary of available configurations

NOTES	The configurations are performed to configure the vehicle computer according to the options available on the vehicle.

VP007: **Reducing the idling speed**

VP011: **Increasing the idling speed**

IMPORTANT
This configuration can lead to customer complaints if it is used incorrectly.

IMPORTANT

CF028: **Air conditioning**

This configuration is used to configure the computer for a vehicle fitted with air conditioning.

CF030: **Thermoplungers**

This configuration is used to configure the computer for a vehicle which is equipped with thermoplungers.

GETtheMANUALS.org

Summary of available configuration readings

NOTES	Configuration readings are used to check the status of the configurations made.

LC005: Gearbox type

(BVM or BVA) Manual or automatic
This configuration reading indicates whether the vehicle is fitted with a manual gearbox or automatic transmission.

LC009: Air conditioning

This configuration reading is directly linked to the CF028 configuration.

LC048: Turbulence flap option reading

WITH OR WITHOUT
This configuration reading shows whether the engine is fitted with turbulence flaps.

LC056: Thermoplungers

This configuration reading is directly linked to the CF030 configuration.

LC065: Water in diesel fuel sensor

WITH OR WITHOUT
This configuration reading indicates whether the engine is fitted with a water in diesel fuel detector.

GETtheMANUALS.org

DF001 PRESENT OR STORED	COOLANT TEMPERATURE SENSOR CIRCUIT CC.0: Short circuit to earth CO.1: Open circuit or short circuit to + 12 volts 1.DEF: Coolant operating temperature not attained

NOTES	**Conditions for applying the fault finding procedure to stored faults for CC.0 or CO.1:** If the fault is declared present after the fault is cleared and a delay of **1 min** with the engine running.
	Special notes: Use bornier **Elé. 1681** for all operations on the connectors of the engine management computer. Measure the actual temperature and compare it to the one displayed on the tool **PR064 Coolant temperature**.

CC.0	***NOTES***	None.

Check the coolant temperature sensor connections.
check the engine management computer connections.
Repair if necessary.

Measure the **resistance** of the coolant temperature sensor between terminals **2** and **3** of its connector.
Replace the sensor if the resistance is not: **2252 Ω ± 112 at + 25˚C**
811 Ω ± 39 at +50˚C
283 Ω ± 8 at 80˚C

Check the **insulation** to **earth** of the connection between:

Engine computer, **connector B track K3** → **track 3** coolant temperature sensor connector

Check **the continuity of the connection** between:

Engine computer **connector B track E1** → **track 2** coolant temperature sensor connector

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF001 **CONTINUED 1**	

CO.1	***NOTES***	None.

Check the coolant temperature sensor connections.
check the engine management computer connections.
Repair if necessary.

Measure the **resistance** of the coolant temperature sensor between terminals **2** and **3** of its connector.
Replace the sensor if the resistance is not: **2252 Ω ± 112 at + 25˚C**
811 Ω ± 39 at +50˚C
283 Ω ± 8 at 80˚C

Check the **insulation** to **earth** of the connection between:

Engine computer, **connector B track K3** → **track 3** coolant temperature sensor connector

Check **the continuity of the connection** between:

Engine computer **connector B track E1** → **track 2** coolant temperature sensor connector

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF001 **CONTINUED 2**	

1.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** If the fault is declared present after: – the engine is started, – a **4 minute** delay when the engine has been running.
		Special notes: Use a workshop temperature sensor to compare the values.

Check the coolant temperature sensor connections.
check the engine management computer connections.
Repair if necessary.

Measure the **resistance** of the coolant temperature sensor between terminals **2** and **3** of its connector.
Replace the sensor if the resistance is not: **2252 Ω ± 112 at + 25˚C**
811 Ω ± 39 at +50˚C
283 Ω ± 8 at 80˚C

G9T and F9Q engines:
Check the insulation to **earth** of the connection between:

Engine computer, **connector B track K3** ⟶ **track 3** coolant temperature sensor connector

Check the insulation from the **+ 12 V feed** of the connection between:

Engine computer, **connector B track E1** ⟶ **track 2** coolant temperature sensor connector

Check the **continuity and absence of interference resistance** on the following connections:

engine computer, **connector B track E1** ⟶ **track 2** coolant temperature sensor connector

engine computer, **connector B track K3** ⟶ **track 3** coolant temperature sensor connector

Carry out the required operations if the resistance is abnormally high.

If the fault is still present, check that the **thermostat** is working correctly.
Check that the cooling circuit is correctly filled and sealed.
If necessary, see the Workshop Repair Manual **MR 395 Mechanics, 19A Cooling, Removal - Refitting of thermostat**.
Carry out the necessary repairs.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF002 PRESENT OR STORED	AIR TEMPERATURE SENSOR CIRCUIT CC.0: Short circuit to earth CO.1: Open circuit or short circuit to + 12 V

NOTES	**Conditions for applying the fault finding procedure to stored faults:** If the fault is declared present after a delay of **2 minutes** with the engine running.
	Special notes: Use bornier **Elé. 1681** for all operations on the connectors of the engine management computer.

CC.0	***NOTES***	None.

Check the air flowmeter connections.
check the engine management computer connections.
Repair if necessary.

Measure the **resistance** of the air temperature sensor between **tracks 1 and 2** of the air flow sensor:
Replace the air flowmeter if the resistance is not: **3714 Ω ± 161 at + 10 °C**
2448 Ω ± 90 at + 20°C
1671 Ω ± 59 at + 30°C

With the air flow sensor disconnected, check **the insulation** in relation to **earth** of the connection between:

Engine computer, **connector B track D3** → **track 1** of the air flowmeter connector

Check **for + 5 V** on **track 3** of the air flowmeter connector.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF002 **CONTINUED**	

CO.1	***NOTES***	**Priority when dealing with a number of faults:** In the event of the simultaneous presence of fault **DF056 Air flow sensor circuit CO.0 or 2.DEF**, check that the air flow sensor connector is connected correctly.

Check the air flowmeter connections.
check the engine management computer connections.
Repair if necessary.

Measure the **resistance** of the air temperature sensor between **tracks 1 and 2** of the air flow sensor:
Replace the air flowmeter if the resistance is not: **3714 Ω ± 161 at + 10 ˚C**
2448 Ω ± 90 at + 20˚C
1671 Ω ± 59 at + 30˚C

Check **the continuity and insulation** from **+ 12 V** of the following connections:

Engine computer, **connector B track D3** → **track 1** air flowmeter connector

Engine computer, **connector C track A3** → **track 2** air flowmeter connector

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF017 PRESENT OR STORED	PRE-POSTHEATING UNIT CONTROL CIRCUIT CC.1: Short circuit to + 12 V CO.0: Open circuit or short circuit to earth

NOTES	**Conditions for applying the fault finding procedure to stored faults:** If the fault becomes present following actuation of the relay by the **AC037 Preheating relay** command.
	Special notes: Use bornier **Elé. 1681** for all operations on the connectors of the engine management computer.

CC.1	***NOTES***	None.

Check the pre-postheating unit connections.
check the engine management computer connections.
Repair if necessary.

Check **for insulation** from **+ 12 V** feed on the connection between:

Engine computer, **connector B track C3** → **track 8** of the preheating unit connector

Check **the continuity and absence of interference resistance** on the connection between:

Engine management computer, **connector B track B3** → **track 9** preheating unit connector

If the fault is still present, replace the pre-postheating unit.

CO.0	***NOTES***	None.

Check the pre-postheating unit connections.
check the engine management computer connections.
Repair if necessary.

Check **the continuity and insulation** to **earth** of the connection between:

Engine computer, **connector B track C3** → **track 8** of the preheating unit connector

Check the **continuity and absence of interference resistance** on the connection between:

Engine management computer, **connector B track B3** → **track 9** preheating unit connector

Check for **+ 12 V battery** on **track 3** of the preheating unit connector.
If the fault is still present, replace the pre-postheating unit.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF037 PRESENT OR STORED	ENGINE IMMOBILISER 2.DEF: Engine immobiliser code fault

NOTES	**Conditions for applying fault finding procedures to stored faults:** Apply the fault finding procedure whether the fault is present or stored.

1.DEF	***NOTES***	None.

Perform **fault finding on the multiplex network** in order to ascertain if there are any faulty multiplex connections. Repair if necessary (**see 88B, Multiplex**).

Using the diagnostic tool, check the **UCH** and ensure that it has **correctly learnt its immobiliser code**. **Reconfigure** the UCH if necessary.

Carry out a starting test: if the vehicle does not start, **switch off the ignition and wait 15 seconds** (self-supply period of the computer) then try to start the engine again.
If the fault is still present, repeat the operation three times.

If the fault is still present, contact the Techline.

2.DEF	***NOTES***	None.

Display status **ET341 Immobiliser code programmed**.
If the status is **NO**, Check the immobiliser function and repeat from the start.

If the status is **YES**, clear the fault from the computer memory.
Switch off the ignition, then switch it on again to initialise the computer.

If the fault recurs, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF038 PRESENT OR STORED	COMPUTER 1.DEF: Fault in EEPROM

NOTES	None.

If the fault is **stored** or **present**, clear the fault from the computer memory.
Switch off the ignition, wait until the end of power latch* then switch the ignition back on and re-establish dialogue.

If the fault recurs, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF040 PRESENT OR STORED	CYLINDER 1 INJECTOR CIRCUIT 1.DEF: Overcurrent on injector control current 2.DEF: Undercurrent on the injector control current

NOTES	**Conditions for applying the fault finding procedure to stored faults:** If the fault becomes present following an engine start.
	Special notes: Use bornier **Elé. 1681** for all operations on the connectors of the engine management computer.
	IMPORTANT – please observe the cleanliness guidelines and safety advice.

1.DEF	***NOTES***	None.

Check the connections on injector no 1.
check the engine management computer connections.
Repair if necessary.

Measure the **resistance** of injector no. 1.
Replace the injector if there is a **short circuit (R = 0 Ω)**.

Check the insulation between the following two connections:

Engine computer, connector **C track M1** → **track 2** of the injector no. 1 connector

Engine computer, connector **C track M3** → **track 1** of the injector no. 1 connector

Check insulation to **earth** of the following connection:

Engine computer, connector **C track M3** → **track 1** of the injector no. 1 connector

If the fault is still present: apply **test 10 Poor injector operation**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF040 **CONTINUED**	

2.DEF	***NOTES***	None.

Check the connections on injector no 1.
check the engine management computer connections.
Repair if necessary.

Measure the **resistance** of injector no. 1.
Replace the injector if it is **in short circuit (resistance is measured to infinity)**.

Check the continuity of the following connections:

Engine computer, connector **C track M1** → **track 2** of the injector no. 1 connector

Engine computer, connector **C track M3** → **track 1** of the injector no. 1 connector

If the fault is still present: apply **test 10 Poor injector operation**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF041 PRESENT OR STORED	CYLINDER 2 INJECTOR CIRCUIT 1.DEF: Overcurrent on injector control current 2.DEF: Undercurrent on the injector control current

NOTES	**Conditions for applying the fault finding procedure to stored faults:** If the fault becomes present following an engine start.
	Special notes: Use bornier **Elé. 1681** for all operations on the connectors of the engine management computer.
	IMPORTANT – please observe the cleanliness guidelines and safety advice.

1.DEF	***NOTES***	None.

Check the connections on injector no. 2.
check the engine management computer connections.
Repair if necessary.

Measure the **resistance** of injector no. 2.
Replace the injector if there is a **short circuit (R = 0 Ω)**.

Check the insulation between the following two connections:

Engine computer, **connector C track L4** → **track 2** of the injector no. 2 connector

Engine computer, **connector C track L3** → **track 1** of the injector no. 2 connector

Check insulation to **earth** of the following connection:

Engine computer, connector **C track L3** → **track 1** of the injector no. 2 connector

If the fault is still present: apply **test 10 Poor injector operation**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF046 PRESENT OR STORED	BATTERY VOLTAGE 1.DEF: Battery undervoltage 2.DEF: Battery voltage too high

NOTES	**Conditions for applying the fault finding procedure to stored faults:** If the fault is declared present after: – starting the engine, – a **30 second** delay with the engine running.
	Special notes: If necessary, carry out a complete check of the charging circuit, referring to **Technical Note 6014A Charge circuit fault finding**.

1.DEF	***NOTES***	None.

Reminder on computer operating voltage: **9 V < operating voltage < 14.5 V**.
– Using a voltmeter, take a reading of the battery voltage at its terminals.
– Then compare this with the value displayed on your diagnostic tool in the parameter menu **PR071 Computer supply voltage**.

If there is no difference:

Recharge and test the battery and replace it if it is defective.
Next check the charge circuit.

If there is a difference:
– Check the tightness and the condition of the battery terminals.
– Using the appropriate wiring diagram:

Check the **continuity and for the absence of interference resistance** on the following connections:

+ 12 V battery feed ⟶ tracks **M2** and **M3** of engine management computer connector **B** (via the engine fuse then the **normally open contact** of the central injection unit supply relay).

Battery earth ⟶ tracks **L3, L4, M4** of engine management computer connector **B**.

Carry out the necessary repairs.

2.DEF	***NOTES***	None.

Check the charging circuit, apply **Technical Note 6014A**.
Carry out the necessary repairs.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF056 PRESENT OR STORED	AIR FLOWMETER CIRCUIT CO.0: Open circuit or short circuit to earth CC.1: Short circuit to + 12 V 1.DEF: Sensor supply fault 2.DEF: Inconsistent data

NOTES	**Conditions for applying the fault finding procedure to stored faults:** If the fault becomes present after: – ignition is cut-off until the end of the power latch* phase, – the ignition is switched on, or – Vdiag 14, 18 and 1C: a delay of **1 minute** engine running at idle speed with a coolant temperature **> 60˚C**. – Vdiag 10: a delay of **5 minutes** engine running at idle speed with a coolant temperature **> 60˚C**.
	Special notes: Use bornier **Elé. 1681** for all operations on the connectors of the engine management computer.

CO.0	***NOTES***	**Priorities when dealing with a number of faults:** In the event of the simultaneous presence of fault **DF002 Air temperature sensor circuit CO.1**, check that the air flow sensor connector is connected correctly.

Check the air flowmeter connections.
check the engine management computer connections.
Repair if necessary.

Check the **continuity and insulation** to **earth** of the following connection:

Engine computer, **connector B track H4** ⟶ **track 5** of the air flow sensor connector

Check for the **+ 5 V** feed on **track 3** of the air flow sensor connector.
Check **the following insulations:**
- between **tracks 5 and 6** of the air flowmeter connector,
- between **tracks 2 and 5** of the air flow sensor connector.

Carry out the necessary repairs.

With the flow sensor **connected, the vehicle ignition on** and **the engine stopped**:
Check the voltage between **tracks 2** and **5** of the air flowmeter.
– If the voltage is not approximately **0.6 V ± 0.1**, replace the air flowmeter.

Remove the air flowmeter.
– Apply **test 5 Air flowmeter**.

***** The immobiliser warning light will flash a few seconds after the ignition is switched off.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF056 **CONTINUED 1**	

CC.1	***NOTES***	None.

Check the air flowmeter connections.
Check the engine management computer connections.
Repair if necessary.

Check **the insulation** against **+ 12 V** of the connection between:

Engine computer, **connector B track H4** → **track 5** of air flow sensor connector

Check the continuity of the following connection:

Engine computer, **connector C track A3** → **track 2** of the air flowmeter connector

If the fault is still present, replace the air flowmeter.

1.DEF	***NOTES***	**Priorities when dealing with a number of faults:** Use the interpretation of fault **DF216 Sensor feed voltage no. 1** first if it is present or stored.

Check the air flowmeter connections.
Check the engine management computer connections.
Repair if necessary.

Check the **insulation and continuity** of the connection between:

Engine computer, connector **B track G2** → **track 3** air flowmeter connector

Check the following **insulations**:
- between **tracks 3 and 6** of the air flow sensor connector,
- between **tracks 3 and 2** of the air flow sensor connector,
- between **tracks 3 and 4** of the air flow sensor connector.

Check for the **+ 12 V after relay** feed on **track 4** of the air flow sensor connector.
Check the presence of the following **earths:**

Electronic (coming from the electronic unit) → on **track 2** of the air flowmeter connector

Chassis (body) → on **track 6** of the air flowmeter connector

If the fault is still present, replace the air flowmeter.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF056 **CONTINUED 2**	

2.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** If the fault is declared present after: – starting the engine, an increase in temperature at idle speed exceeding **60˚C** followed by a delay of **40 seconds** or, – if it reappears as stored after clearing the fault, starting the engine, switching the ignition off, followed by the end of the power latch* phase and switching the ignition on.

Check the air flowmeter connections.
Check the engine management computer connections.
Repair if necessary.

Check **the continuity and insulation** of the connections between:

Engine computer, **connector B track G2** → **track 3** air flowmeter connector

Engine computer, **connector B track H4** → **track 5** of air flow sensor connector

Check for the **+ 5 V** feed on **track 3** of the air flow sensor connector.
Check for the **+ 12 V after relay** feed on **track 4** of the air flow sensor connector.
Check for **an earth** on **track 6** of the air flow sensor connector.
Use the interpretation of parameter **PR132 Air flow** explained in this note, at warm idle speed (coolant temperature > **80˚C**).
Carry out the necessary repairs.

● **Check the entire air inlet circuit:** apply **test 4**:
– Air filter unit inlet not blocked and filter not clogged.
– **No** foreign bodies on the air flow sensor grille (**visual inspection only**).
Otherwise, replace the air flowmeter.
– Oil vapour recirculation circuit connection conformity.
– **Low** and **high pressure** air circuit **sealed** and **not obstructed**: Pipes, mounting clamps present and tightened, turbocharger pressure sensor fitted, heat exchanger etc.

– Check that the damper valve is open (valve control **rests on the body** of the air vent unit).
– Check that the turbulence flap is in the rest position (**AC013 Turbulence flap**, step B), if fitted to the vehicle.
With the flow sensor **connected**, the vehicle **ignition on** and **engine stopped**:
– Check the voltage between **tracks** 2 and **5** of the air flow sensor,
If the value is not **0.6 V ± 0.1**, replace the air flow sensor.
Check the exhaust gas recirculation valve operation:
Apply **test 9**, part A.

* The immobiliser warning light will flash a few seconds after the ignition is switched off.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF057 PRESENT OR STORED	WATER IN DIESEL FUEL DETECTOR CIRCUIT 1.DEF: Open circuit on the line or water in diesel fuel

NOTES	**Fault finding procedure application conditions:** Present or stored fault. **IMPORTANT** **please observe the cleanliness guidelines and safety advice.**

Check that there is no water in the fuel filter. Bleed the fuel filter and the low and high pressure diesel circuit if necessary.
Check for **continuity and the absence of interference resistance** on the connection between:

Engine management computer, **connector A track H1** ⟶ **track 3** of the water detection sensor

– **Check the power supply** to the water detection sensor:

+ 12 V after relay ⟶ **track 1** of the water detection sensor

earth ⟶ **track 2** of the water detection sensor

– Carry out the necessary repairs.

A) Make sure the water in diesel fuel detection sensor is properly connected.
– If not, clear the fault.
– Carry out a road test (speed > **12 mph (20 km/h)** and engine speed > **1200 rpm**) for more than **30 seconds**.
– If the fault does not recur*, end the fault finding procedure.*
– If the fault does recur, go to **step B**.

B) If the sensor is correctly connected:
– Bleed the diesel filter unit ((For Vel-Satis ph1: see MR 353 Mechanical systems, 13A, Fuel supply), (for Vel-Satis ph2: see MR 402 Mechanical Systems, 13A, Fuel supply), (for Laguna II ph1: see MR 339 Mechanical Systems, 13A, Fuel supply - Diesel system), (for Espace IV ph1: see MR 361 Mechanical Systems,13A, Fuel Supply)).
– Clear the fault.
– Start the vehicle (engine speed > **750 rpm**) and wait **60 seconds** at idle speed to confirm the repair.
– If the fault does not recur*, end the fault finding procedure.*
– ensure that the correct fuel is being used.
– Run **test 12 Diesel fuel conformity check**.

See following page.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF057 **CONTINUED**	

If none of these checks reveal any faults:

– Replace the water detection sensor (see Workshop Repair Manual, section **13A**).
– Clear the fault.
– Start the vehicle (engine speed > 750 rpm) and wait **60 seconds** at idle speed to confirm the repair.

Note:
When the water level in the fuel filter unit is below the sensor electrodes, some driving conditions (turning, a slope) may cause ***erratic activation of the injection fault warning light*** *(in fact, the sensor's off-centre position in the fuel filter unit, combined with the driving condition factors, triggers the water detection, causing the light to come on).*

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF068 PRESENT OR STORED	SWIRL FLAP CONTROL CIRCUIT CC.1: Short circuit to + 12 V 1.DEF: Permanent low level 2.DEF: Inconsistency

NOTES	**Conditions for applying the fault finding procedure to CC.1 stored:** If the fault becomes present after running actuator command **AC013 Swirl flap**.
	Special notes: – Use bornier **Elé. 1681** for all operations on the connectors of the engine management computer.

CC.1	***NOTES***	None.

Check the swirl flap solenoid valve connections.
check the engine management computer connections.
Repair if necessary.

Measure the **resistance** of the swirl flap solenoid valve coil between **tracks 1** and **2**.
Replace the solenoid valve if its resistance is not approximately: **46 Ω ± 3 at + 25˚C**.

Check **the insulation** against **+ 12 V** of the connection between:

Engine management computer, **connector C** **Track H4** → **track 1** of the solenoid valve connector

If the fault is still present, replace the swirl flap solenoid valve.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF068 **CONTINUED 1**	

1.DEF	***NOTES***	None.

Check the swirl flap solenoid valve connections.
check the engine management computer connections.
Repair if necessary.

Measure the **resistance** of the swirl flap solenoid valve coil between **tracks 1** and **2**.
Replace the solenoid valve if its resistance is not approximately: **46 Ω ± 3 at + 25˚C**.

Check the **continuity** and **insulation** to **earth** of the connection between:

Engine management computer, **connector C** **Track H4** → **track 1** of the solenoid valve connector

If the fault is still present, replace the swirl flap solenoid valve.

2.DEF	***NOTES***	None.

Check the swirl flap solenoid valve connections.
check the engine management computer connections.
Repair if necessary.

Clear the stored fault.
Use actuator command **AC013 Swirl flap** and check that the flap is working properly.
If the fault reappears after the command, replace the swirl flap.
If the swirl flap is correct, check the conformity of the air inlet circuit: apply **test 4: Turbocharged air inlet circuit test**.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF070 STORED	CLUTCH SWITCH CIRCUIT 1.DEF: Inconsistency of the signal

1.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** If the fault becomes present during a road test at speeds above **60 mph (100 km/h))**.
		Special notes: Use bornier **Elé. 1681** bornier for all operations on the connector of the engine management computer.

Check the clutch switch connections.
check the engine management computer connections.
Repair if necessary.

Step 1

A) - Check status **ET233 CLUTCH PEDAL**. Depress the clutch pedal and note whether this status becomes **DEPRESSED**.

If it changes to DEPRESSED.

Clear the fault, switch off the ignition, wait for the end of the power latch* and switch on the ignition again. Carry out a road test and then take a fault reading. If the fault reappears, go to step 2. If not, end of fault finding.

If it does not change to DEPRESSED.

B) - Check the switch adjustment.

– Check **the continuity and insulation** to **earth** of the connection between:

Engine computer, **connector A track E2** ⟶ **track 1** clutch switch

– Check for an **earth** on **track B3** of the clutch switch.

Repair if necessary.

Check the operation of the clutch switch:

Closing of the contact between **tracks 1 and 2** when the clutch pedal is pressed.

Opening of the contact between **tracks 1 and 2** when the clutch pedal is released.

Replace the switch if necessary.

When repair is complete, return to step **A**.

Note:

Status **ET233 CLUTCH PEDAL** displays **NONE** if the vehicle is fitted with an automatic gearbox or a sequential gearbox.

Step 2

– If the fault recurs, contact the Techline.

* The immobiliser warning light will flash a few seconds after the ignition is switched off.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF098 PRESENT OR STORED	FUEL TEMPERATURE SENSOR CIRCUIT CC.0: Short circuit to earth CO.1: Open circuit or short circuit to + 12 V

NOTES	**Conditions for applying the fault finding procedure to stored faults:** If the fault is declared present after a delay of **2 minutes** with the engine running.
	Special notes: Use bornier **Elé. 1681** for all operations on the connectors of the engine management computer.

CC.0	***NOTES***	None.

Check the fuel temperature sensor connections.
check the engine management computer connections.
Repair if necessary.

Measure the **resistance** of the fuel temperature sensor between **tracks 1** and **2**:
Replace the sensor if its resistance is not: **3820 Ω ± 282 at + 10˚C**
2050 Ω ± 100 at + 25˚C
810 Ω ± 47 at + 50˚C

Check the **insulation** against **earth** of the connection between:

Engine computer, **connector B track J3** ⟶ **track 1** fuel temperature sensor connector

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF098 **CONTINUED**	

CO.1	***NOTES***	None.

Check the fuel temperature sensor connections.
Check the computer connections.
Repair if necessary.

Measure the **resistance** of the fuel temperature sensor between its **tracks 1 and 2**:
Replace the sensor if its resistance is not: **3820 Ω ± 282 at + 10˚C**
2050 Ω ± 100 at + 25˚C
810 Ω ± 47 at + 50˚C

Check **the continuity and insulation** from **+ 12 V** of the following connections:

Engine computer, connector **B track J3** → **track 1** fuel temperature sensor connector

Engine computer, connector **B track G1** → **track 2** fuel temperature sensor connector

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF176 PRESENT OR STORED	LOW-SPEED FAN ASSEMBLY CIRCUIT CC.1: Short circuit to + 12 V CO.0: Open circuit or short circuit to earth

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault reappears after: – clearing the fault from the memory, – actuation of the relay by the **AC038 Low speed fan assembly relay** command.
	Special notes: – Use bornier **Elé. 1681** for all operations on the connector of the engine management computer. – Please refer to the Technical Note **Wiring diagrams** for your vehicle to locate the fuses and relays concerned.

CC.1	***NOTES***	None.

Check the connections of the low-speed fan assembly relay mounting. check the engine management computer connections. Repair if necessary.
Measure **the resistance** of the low-speed fan assembly relay coil. Replace the relay if its resistance is not: **60 Ω± 5 at + 20˚C**.
Remove the low-speed relay and check **for insulation** from **+ 12 V** on the connection between: Engine computer, **connector C track A2** ⟶ **track 11** of the low speed fan assembly relay

CO.0	***NOTES***	None.

Check the connections of the low-speed fan assembly relay mounting. check the engine management computer connections. Repair if necessary.
Measure **the resistance** of the low-speed fan assembly relay coil. Replace the relay if its resistance is not: **60 Ω ± 5 at + 20˚C**.
Remove the low-speed relay and check **the continuity and insulation** to earth of the connection between: Engine computer, **connector C track A2** ⟶ **11** of the low speed fan assembly relay **Check for + 12 V after relay** feed on **track 10** of the low speed fan assembly relay.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF186 PRESENT OR STORED	HEATER PLUG CIRCUIT 1.DEF: Heater plug(s) faulty or in open circuit

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault reappears after: – clearing the fault from the memory, – controlling the heater plugs using command **AC037 Preheating relay**.
	Special notes: Use bornier **Elé. 1681** for all operations on the connectors of the engine management computer. – see the **Wiring diagrams** Technical Note for the vehicle to locate the fuses and relays concerned.
	IMPORTANT – please observe the cleanliness guidelines and safety advice.

1.DEF	***NOTES***	**Priority when dealing with a number of faults:** Firstly, deal with **DF216 Supply voltage No. 1 of the sensors** if this is present.

Check the pre-postheating unit connections.
Check the connections on all the heater plugs.
Repair if necessary.

– Measure **the resistance** of the heater plugs:
  Replace the plug if its resistance is **> 2 Ω**.
– Check the **continuity** of the following connections:

preheating unit **track 1** → **cylinder 3** heater plug

preheating unit **track 2** → **cylinder 4** heater plug

preheating unit **track 6** → **cylinder 1** heater plug

preheating unit **track 7** → **cylinder 2** heater plug

– **Check for** the **+ 12 V battery feed** on **track 3** of the preheating relay (via maxi fuse).
– Check the engine earthing.

See following page.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF186 **CONTINUED**	

check the engine management computer connections.
Check the **continuity and absence of interference resistance** on the connection (preheating relay unit control line) between:

Engine management computer, **connector B track B3** → **track 9** preheating unit connector

Check each heater plug current on F9Q engines:
– With the engine stopped, disconnect the coolant temperature sensor (change to defect mode).
– **Warning: defect mode causes the engine cooling fans to operate.**
– Start the engine.
– 5 to 10 seconds later, check the current in one heater plug with a current clamp (**Voltmeter/ammeter** menu on the Clip Technic tool or using a separate current clamp).
– Replace the heater plug if the current is **< 8.5 A** and **> 13 A**.
– Do the same for the three other heater plugs.
– Switch off the engine.
– Reconnect the coolant temperature sensor.
– Clear the faults.
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF192 PRESENT OR STORED	FUEL PRESSURE SENSOR CIRCUIT CC.0: Short circuit to earth CO.1: Open circuit or short circuit to + 12 V 1.DEF: Sensor supply fault

NOTES	**Conditions for applying the fault finding procedure to stored faults:** If the fault is declared present after a delay of **5 minutes** with the engine running.
	Special notes: Use bornier **Elé. 1681** for all operations on the connectors of the engine management computer.
	IMPORTANT – **Checks on the ohmmeter are not authorised for the fuel pressure sensor.** – please observe the cleanliness guidelines and safety advice.

CC.0	***NOTES***	None.

Check the fuel pressure sensor connections.
check the engine management computer connections.
Repair if necessary.

Check the **insulation** to **earth** of the connection between:

Engine computer, **connector B track D1** → **track 2** of the fuel pressure sensor connector

Check **the continuity of the connection** between:

Engine computer, **connector B track H2** → **track 3** of the fuel pressure sensor connector

If the fault is still present, replace the fuel pressure sensor.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF192 **CONTINUED 1**	

CC.1	***NOTES***	None.

Check the fuel pressure sensor connections.
check the engine management computer connections.
Repair if necessary.

Check **the continuity and the insulation** against **+12 V** of the connection between:

Engine management computer, connector **B** **track D1** → **track 2** of the fuel pressure sensor connector

Check **the continuity of the connection** between:

Engine management computer, connector **C** **track B3** → **track 1** of the fuel pressure sensor connector

If the fault is still present, replace the fuel pressure sensor.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF192 **CONTINUED 2**	

1. DEF	***NOTES***	**Priorities when dealing with a number of faults:** Firstly, apply the interpretation of the **DF216 Sensor supply voltage no. 1** fault, if it is present.

Check the fuel pressure sensor connections.
check the engine management computer connections.
Repair if necessary.

Check the **continuity and absence of interference resistance** on the following connections:

Engine computer, **connector B track D1** → **track 2** of the fuel pressure sensor connector

Engine computer, **connector B track H2** → **track 3** of the fuel pressure sensor connector

Engine computer, **connector C track B3** → **track 1** of the fuel pressure sensor connector

Carry out the necessary repairs.
If all these connections are correct, check there is a fuel pressure sensor power supply:

+ 5 V → **track 3** of the fuel pressure sensor connector

Earth → **track 1** of the fuel pressure sensor connector

If the connections and supplies are correct, replace the fuel pressure sensor.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF195 PRESENT OR STORED	CAMSHAFT SENSOR / ENGINE SPEED CONSISTENCY 1.DEF: Feed fault, signal interference, camshaft sensor internal fault 2.DEF: Absence of engine speed signal or interference on engine speed signal 3.DEF: Engine speed signal interference, broken tooth on flywheel or engine speed sensor internal fault 4.DEF: Absence of camshaft signal or timing fault (belt tension or setting)

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: – **10 seconds** with the starter active, or – a delay of **1 minute** with the engine running.
	Special notes: – Use bornier **Elé. 1681** for any operations on the computer connector. – Check the charge circuit (see **Technical Note 6014A Charge circuit fault finding**) and check the stability of the charging voltage using an oscilloscope. – Interference could be caused by the alternator or starter motor. If it is possible to start the vehicle by pushing it, one of these components could be involved.

1.DEF	***NOTES***	**Priorities when dealing with a number of faults:** Firstly, apply the interpretation of fault **DF046 Battery voltage**, if it is present.

Check **the continuity and presence** of feed between **tracks 1 and 3** of the **camshaft sensor** connector:

+ 12 V after relay ⟶ **Track 3** of the camshaft sensor connector

Earth ⟶ **track 1** of the camshaft sensor connector

Check **the continuity and absence of interference resistance** on the connection between:

Engine management computer, **connector C track K4** ⟶ **track 2** of the camshaft sensor connector

Repair if necessary.

Display the conformity of the camshaft signal using an oscilloscope: square pulse signal, amplitude: **battery voltage - 50 mV** (for your information, if V bat = 12.6 V, the amplitude is 12.54 V).
If the check reveals interference, check the conformity of the engine earths (oxidation, tightness, etc.).
If the fault is still present, check that the sensor is correctly fitted and in good condition (overheating).
If necessary replace the sensor.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF195 **CONTINUED 1**	

2.DEF	***NOTES***	None.

Check the **engine speed sensor** connections.
Check the engine management computer connections.
Repair if necessary.

Measure **the resistance** of the engine speed sensor between **tracks A and B on F9Q engines**.
Replace the sensor if its resistance is not **800 Ω ± 80 at + 20˚C**.
Measure **the resistance** of the engine speed sensor between **tracks 1 and 2 on G9T engines**.
Replace the sensor if its resistance is not **235 Ω ± 35 at + 23˚C**.

Check **the continuity** of the following connections **on F9Q engines**:

Engine computer, **connector B track G3** ⟶ **track A** of the engine speed sensor

Engine computer, **connector B track H3** ⟶ **track B** of the engine speed sensor

Check the **continuity** of the following connections on **G9T/G9U engines**:

Engine computer, **connector B track G3** ⟶ **track** 1 of the engine speed sensor

Engine computer, **connector B track H3** ⟶ **track 2** of the engine speed sensor

Check that the engine earthing is in order (oxidation, tightness, etc.).
Check the mounting, the air gap (if necessary refer to the information in the Workshop Repair Manuals for the vehicle) and the condition of the sensor (overheating).
During the starting phase, display **PR055 Engine speed** and check that there is no interference (micro-breaks).
Replace if necessary.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF195 **CONTINUED 2**	

3.DEF	***NOTES***	None.

Check the **engine speed sensor** connections.
Check the engine management computer connections.
Repair if necessary.

Measure **the resistance** of the engine speed sensor between **tracks A and B on F9Q engines**.
Replace the sensor if its resistance is not **800 Ω ± 80 at 20˚C**.
Measure the **resistance** of the engine speed sensor between **tracks 1 and 2 on G9T/G9U engines**.
Replace the sensor if its resistance is not **235 Ω ± 35 at + 23˚C**.

Check that the engine earthing is in order (oxidation, tightness, etc.).
Check **the continuity** of the following connections **on F9Q engines**:

Engine computer, **connector B track G3** ⟶ **track A** of the engine speed sensor

Engine computer, **connector B track H3** ⟶ **track B** of the engine speed sensor

Check the **continuity** of the following connections on **G9T/G9U engines**:

Engine computer, **connector B track G3** ⟶ **track** 1 of the engine speed sensor

Engine computer, **connector B track H3** ⟶ **track 2** of the engine speed sensor

Perform a visual inspection of the flywheel and the target (broken tooth, damaged tooth, warped flywheel).
Check that the engine speed signal is correct using an oscilloscope: no interference, broken tooth, etc.
Carry out the necessary repairs.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF195 **CONTINUED 3**	

4.DEF	***NOTES***	None.

Check the camshaft sensor connections.
Check the engine management computer connections.
Repair if necessary.

Check the **continuity** of the following connections:

Engine computer, **connector C track K4** → **track 2** of the camshaft sensor connector

Engine management computer, **connector C track C1** → **track 1** of the camshaft sensor connector

Check **for + 12 V after relay feed** on **track 3** of the camshaft sensor connector.

– Check the tension of the **timing belt**.
– Check the conformity of the camshaft sprocket/camshaft assembly.
– Check the timing adjustment.

On **G9T engines** and if working on the timing gear: **camshaft/high-pressure pump:**

– Make sure the high pressure pump sprocket has been properly refitted.

Carry out the necessary repairs.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF196 PRESENT OR STORED	PEDAL SENSOR CIRCUIT GANG 1 CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 V 1.DEF: Sensor supply fault 2.DEF: Inconsistent signal

NOTES	**Conditions for applying the fault finding procedure to stored faults:** If the fault is declared present following a series of actions on the accelerator pedal at full load or with no load.
	Special notes: Use bornier **Elé. 1681** for all operations on the connectors of the engine management computer. see the **Wiring diagrams** Technical Note for the vehicle to locate the **electrical connections and connectors** concerned.

CO.0	***NOTES***	**Priorities when dealing with a number of faults:** In the event of the simultaneous presence of fault **DF198 Pedal sensor circuit gang 2 CO.0**, check that the pedal sensor connector is connected correctly.

Check the pedal sensor connections.
Check the engine management computer connections.
Repair if necessary.

Measure the **resistance** of the pedal sensor gang 1 between **tracks 2 and 4**.
Replace the sensor if the resistance is not **1.2 kΩ ± 0.48 at + 20˚C**.

Check **the continuity and insulation** to **earth** of the connection between:

Engine computer, **connector A track C1** → **track 3** of the pedal sensor connector

Also check that this connection is **insulated** against the following connections:

Engine computer, **connector A track B3** → **track 2** of the pedal sensor connector

Engine computer, **connector A track A3** → **track 1** of the pedal sensor connector

Check **the continuity of the connection** between:

Engine computer, connector **A track E1** → **track 4 of the** pedal sensor connector

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF196 **CONTINUED 1**	

CC.1	***NOTES***	None.

Check the pedal sensor connections.
Check the engine management computer connections.
Repair if necessary.

Measure the **resistance** of the pedal sensor gang 1 between **tracks 2 and 4**.
Replace the sensor if the resistance is not **1.2 kΩ ± 0.48 at + 20˚C**.

Check **for insulation** from **+ 12 V** feed on the connection between:

Engine computer, **connector A track C1** → **track 3** of the pedal sensor connector

Check **the continuity of the connection** between:

Engine computer, **connector A track B3** → **track 2** of the pedal sensor connector

1.DEF	***NOTES***	**Priorities when dealing with a number of faults:** Use the interpretation of fault **DF216 Sensor feed voltage no. 1** first if it is present or stored.

Check the pedal sensor connections.
Check the engine management computer connections.
Repair if necessary.

– Check the **continuity and for the absence of interference resistance** on the following connections:

Engine computer, **connector A track E1** → **track 4 of the** pedal sensor connector

Engine computer, **connector A track C1** → **track 3** of the pedal sensor connector

Engine computer, **connector A track B3** → **track 2** of the pedal sensor connector

– Check **the insulation** between the following two connections:

Engine computer, **connector A track E1** → **track 4 of the** pedal sensor connector

Engine computer, **connector A track B3** → **track 2** of the pedal sensor connector

– Also check that they are insulated against **+ 12 V feed**.
– If the fault is still present, carry out an accelerator pedal sensor conformity check.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF196 **CONTINUED 2**	

2.DEF	***NOTES***	**Priority when dealing with a combination of faults:** Apply the interpretation of faults **DF 198 Pedal sensor circuit gang 2, 2.DEF and DEF 228 Brake signals** first if they are present or stored.

Check the pedal sensor connections.
Check the engine management computer connections.
Repair if necessary.

Check **the continuity** and **absence of interference resistance** on the following connection:

Engine computer, **connector A track C1** ⟶ **track 3** of the pedal sensor connector

Also **check the insulation from the + 12 V feed.**

If the fault is still present, go to the accelerator pedal sensor conformity check.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF197 PRESENT OR STORED	FUEL PRESSURE SIGNAL 1.DEF: Measured pressure too high 2.DEF: Measured pressure too low 3.DEF: Detection of leak at high pressure 4.DEF: Fuel overpressure 5.DEF: Pressure drop in the rail

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after a delay of **5 minutes** with the engine running at different speeds.
	Special notes: Use bornier **Elé. 1681** for all operations on the connectors of the engine management computer.
	IMPORTANT – **Checks on the ohmmeter are not authorised for the fuel pressure sensor.** – **Please observe the cleanliness guidelines and safety advice.**

1.DEF ***4.DEF***	***NOTES***	**Priority when dealing with a number of faults:** Treat as a priority any other fault that is present or stored.
		Special notes: If the fault follows a period of underpressure, a loop variation or an operation on the pump or unpriming at low pressure, **do not take the fault into account**. Clear the fault. Warm engine: start the engine and leave it running at idle speed **(1 minute)**. If the fault appears, perform the fault finding procedure explained below. Otherwise, carry out a road test at a speed above **3000 rpm** (stay above this value for at least **10 seconds** to display the fault). If the fault recurs, perform the fault finding procedure given below.

Check the fuel pressure sensor connections.
Check the fuel pressure solenoid valve connections.
Check the engine management computer connections.
Repair if necessary.
See following page.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF197 **CONTINUED 1**	

Check the following connection for **insulation, continuity and make sure there is no extraneous resistance**:

Engine computer, **connector B track L1** → **track 2** fuel pressure solenoid valve connector

Check **for insulation** against **+ 5 V** on the connection between:

Engine computer, **connector B track D1** → **track 2** fuel pressure sensor connector

Clear the fault.
– Use the **AC035 Fuel pressure solenoid valve** command:
You should be able to feel vibrations on the fuel pressure regulator. Otherwise, go to the fault finding procedure for **AC035**, step 1.
The presence of air in the circuit is likely to lead to this type of fault. Apply test 3.

With the CP3 high pressure pump, check that the **fuel priming pump** is not fed when the engine is running.
Check that there are no air bubbles in the diesel fuel low pressure circuit.
Check the pressure regulating solenoid valve using part B of **ALP7 Rough idle**.
If the fault is still present, replace the high pressure pump.

If the problem is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF197 **CONTINUED 2**	

2.DEF ***3.DEF*** ***5.DEF***	***NOTES***	**IMPORTANT** – **Please observe the cleanliness guidelines and safety advice.**

Check the fuel pressure sensor connections.
Check the fuel pressure solenoid valve connections.
Check the engine management computer connections.
Repair if necessary.

Check **for + 12 V after relay** feed on **track 1** of the fuel pressure solenoid valve.
Check the **insulation, continuity and absence of interference resistance** on the connections between:

Engine computer, **connector B track L1** → **track 2** fuel pressure solenoid valve connector

Engine computer, **connector B track D1** → **track 2** of the fuel pressure sensor connector

Use command **AC035 Fuel pressure solenoid valve**. You should be able to feel vibrations on the fuel pressure solenoid valve. If not, go to interpretation of commands **AC035**, step 1.

With the vehicle ignition on, and engine stopped for over **1 minute**:
– Display **PR038 Rail pressure**.
  – If the value is **less** than **30 bar**, the sensor is correct.
  – If not replace the fuel pressure sensor.

– **Detailed handling of fault finding on the hydraulic circuit:**

Step 1
– Check the connections of the following components:
  * Fuel pressure sensor.
  * Fuel pressure solenoid valve.
  * Computer.
  * Fuel temperature sensor.
  * Diesel fuel filter.
  * Also check the condition of the wiring (wear, kinks, etc.).
– Check that the seal is correctly fitted to the fuel pressure solenoid valve.
If all of the checks reveal no faults, proceed to step 2.

Perform checks on the hydraulic circuit (see following pages).

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF197 **CONTINUED 3**	

PLEASE OBSERVE THE CLEANLINESS GUIDELINES AND SAFETY ADVICE BEFORE ANY REMOVAL OPERATION.

Checking the fuel Low Pressure system:

Stage 2
Check the Low Pressure circuit: apply **test 3**.
* If the tubes or hoses are worn or damaged, repair them. Otherwise, proceed to stage 3.

Stage 3
– In the event of a correlation between the appearance of the fault and an operation on the fuel filter, rinse the bowl to remove any accumulated impurities.
– Check the condition of the fuel filter:
* If the filter is dirty, replace it. You must clean the fuel filter bowl before fitting the new filter to prevent contamination of the high pressure pump and the high pressure circuit. Go to stage 4.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF197 **CONTINUED 4**	

The low pressure circuit has been checked and no faults were detected, otherwise make the necessary repairs.

STAGE 4

– Clear the faults using the CLIP diagnostic tool.
– Start the engine.
– Display **PR038 Rail pressure**.

PR038 > 170 bar when starting?

NO → Check that there are no internal injector leaks using the procedure recommended in **test 10 Poor injector operation**.

Is one of the injectors faulty?

NO → Check that there are no internal leaks in the overpressure valve (with the CP3 high pressure pump only) using the procedure recommended in **test 11 Poor rail overpressure valve operation.**

YES → Replace the faulty injector.

Is the overpressure valve faulty?

NO → Replace* the CP3 high-pressure pump.

YES → Replace the faulty injector rail

YES

Raise the engine temperature so the diesel fuel reaches **50˚C**.
Road test:
Select 3rd or 4th gear, accelerate with your foot to the floor.

Does the engine stall or does the red fault warning light come on?

NO → Contact Techline.

YES → Replace* the CP3 high-pressure pump.

*Note:
Please observe all recommendations made in the repair procedures when removing mechanical and/or electrical components and **observe the cleanliness guidelines and safety advice**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF198 PRESENT OR STORED	PEDAL SENSOR CIRCUIT GANG 2 CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 V 1.DEF: Sensor supply fault 2.DEF: Consistency between gang 1 and gang 2

NOTES	**Conditions for applying the fault finding procedure to stored faults:** If the fault is declared present following a series of actions on the accelerator pedal at full load or with no load.
	Special notes: Use bornier **Elé. 1681** for all operations on the connectors of the engine management computer. see the **Wiring diagrams** Technical Note for the vehicle to locate the **electrical connections and connectors** concerned.

CO.0	***NOTES***	**Priorities when dealing with a number of faults:** In the event of the simultaneous presence of the **DF196 Pedal sensor circuit gang 1 CO.0** fault, check that the pedal sensor connector is connected correctly.

Check the pedal sensor connections.
Check the engine management computer connections.
Repair if necessary.

Measure the resistance of pedal sensor gang 2 between **tracks 1 and 5**.
Replace the sensor if the resistance is not: **1.7 kΩ ± 0.68 at + 20˚C**.

Check **the continuity of the connection** between:

Engine computer, **connector A track F1** → **track 6** of the pedal sensor connector

Also check **the insulation** of this connection to **earth** and to the following connections:

Engine computer, **connector A track B3** → **track 2** of the pedal sensor connector

Engine computer, **connector A track A3** → **track 1** of the pedal sensor connector

Check **the continuity of the connection** between:

Engine computer, **connector A track H2** → **track 5** of the pedal sensor connector

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF198 **CONTINUED 1**	

CC.1	***NOTES***	None.

Check the pedal sensor connections.
Check the engine management computer connections.
Repair if necessary.

Measure the resistance of pedal sensor gang 2 between **tracks 1 and 5**.
Replace the sensor if the resistance is not: **1.7 kΩ ± 0.68 at + 20˚C**.

Check **for insulation** from **+ 12 V** feed on the connection between:

Engine computer, **connector A track F1** ⟶ **track 6** of the pedal sensor connector

Check **the continuity of the connection** between:

Engine computer, **connector A track A3** ⟶ **track 1** of the pedal sensor connector

If the fault is still present, replace the pedal sensor.

1.DEF	***NOTES***	**Priorities when dealing with a number of faults:** Use the interpretation of fault **DF217 Sensor feed voltage No. 2** first if it is present or stored.

Check the pedal sensor connections.
Check the engine management computer connections.
Repair if necessary.

Check the **continuity and for the absence of interference resistance** on the following connections:

Engine computer, **connector A track F1** ⟶ **track 6** of the pedal sensor connector

Engine computer, **connector A track H2** ⟶ **track 5** of the pedal sensor connector

Engine computer, **connector A track A3** ⟶ **track 1** of the pedal sensor connector

Also check that they are insulated against **+ 12 V**.
Check the **insulation** from earth of the connection between:

Engine computer, **connector A track H2** ⟶ **track 5** of the pedal sensor connector

If the fault is still present, replace the pedal sensor.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF198 **CONTINUED 2**	

2.DEF	***NOTES***	None.

Check the pedal sensor connections.
Check the engine management computer connections.
Repair if necessary.

Check the **continuity and for the absence of interference resistance** on the following connections:

Engine computer, **connector A track E1** → **track 4 of the** pedal sensor connector

Engine computer, **connector A track C1** → **track 3** of the pedal sensor connector

Engine computer, **connector A track B3** → **track 2** of the pedal sensor connector

Engine computer, **connector A track H2** → **track 5** of the pedal sensor connector

Engine computer, **connector A track F1** → **track 6** of the pedal sensor connector

Engine computer, **connector A track A3** → **track 1** of the pedal sensor connector

Carry out the required operations if the resistance is abnormally high.
If the checks are correct, replace the accelerator pedal sensor.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF199 PRESENT OR STORED	TURBOCHARGER PRESSURE SENSOR CO.0: Open circuit or short circuit to earth CC.1: Short circuit to +12 V 1.DEF: Sensor supply fault 2.DEF: Consistency between the turbocharging pressure and the atmospheric pressure

NOTES	**Conditions for applying the fault finding procedure to stored faults:** If the fault is declared present after: – starting the engine or – a road test.
	Special notes: Use bornier **Elé. 1681** for all operations on the connectors of the engine management computer. see the **Wiring diagrams** Technical Note for the vehicle. **WARNING** On some G9 engines, the turbocharging pressure sensor and the air temperature sensor form a single component.

CO.0	***NOTES***	None.

Check the turbocharger pressure sensor connections.
Check the engine management computer connections.
Repair if necessary.

Check **the continuity and insulation** to **earth** of the connection between:

Engine computer, **connector B track C1** → **track B or 3** turbocharging pressure sensor connector

Also check the continuity of the connection between:

Engine computer, **connector B track J2** → **track C or 1** turbocharging pressure sensor connector

Tracks A, B and C of the turbocharging pressure sensor: F9Q 650, F9Q 750, F9Q 752, F9Q 754 engines. Tracks 1, 2 and 3 of the turbocharger pressure sensor: F9Q 751, F9Q 680, F9Q 820, G9T 702, G9T 703, G9T 742 and G9T 743 engines.

If the fault is still present, replace the turbocharger pressure sensor.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF199 **CONTINUED 1**	

CC.1	***NOTES***	**Special notes:** This fault appears when the turbocharging pressure is greater than the maximum value of the sensor.

Check the part number of the turbocharger pressure sensor in relation to the engine and the vehicle.
Check the turbocharger pressure sensor connections.
Check the engine management computer connections.
Repair if necessary.

Check **for insulation** from **+ 12 V** feed on the connection between:

Engine computer, **connector B track C1** → **track B or 3** turbocharging pressure sensor connector

Check **the continuity of the connection** between:

Engine computer, **connector C track A4** → **track A or 2** turbocharging pressure sensor connector

Tracks A, B and C of the turbocharging pressure sensor: F9Q 650, F9Q 750, F9Q 752, F9Q 754 engines.
Tracks 1, 2 and 3 of the turbocharger pressure sensor: F9Q 751, F9Q 680, F9Q 820, G9T 702, G9T 703, G9T 742 and G9T 743 engines.

If the fault is still present, refer to the interpretation of parameter **PR041 Turbocharging pressure**.
If **DF199** CC.1 is stored:
– Clear the fault.
– Carry out a road test at full throttle.
– If **DF199** CC.1 Present and then Stored: replace the turbocharging pressure sensor.
● **Check that the control rod of the turbocharger is not jammed:**
– **Apply test 6 for a turbocharger with fixed geometry.**
– **Apply test 7 for a turbocharger with variable geometry.**

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF199 **CONTINUED 2**	

1.DEF	***NOTES***	**Priorities when dealing with a number of faults:** Firstly, apply the interpretation of the **DF216 Sensor supply voltage no. 1** fault, if it is present or stored.

Check the turbocharger pressure sensor connections.
Check the engine management computer connections.
Repair if necessary.

Check the **insulation, continuity and the absence of interference resistance** on the connections between:

Engine computer, **connector B track C1** → **track B or 3** turbocharging pressure sensor connector

Engine computer, **connector C track A4** → **track A or 2** turbocharging pressure sensor connector

Engine computer, **connector B track J2** → **track C or 1** turbocharging pressure sensor connector

Tracks A, B and C of the turbocharging pressure sensor: F9Q 650, F9Q 750, F9Q 752, F9Q 754, F9Q 760, F9Q 762, F9Q 772 and G9T 710 engines.
Tracks 1, 2 and 3 of the turbocharging pressure sensor: F9Q 751, F9Q 680, F9Q 820, G9T 702, G9T 703, G9T 742, G9T 743 and G9U 730 engines.
If the fault is still present, refer to the interpretation of parameter **PR041 Turbocharging pressure**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF199 **CONTINUED 3**	

2.DEF	***NOTES***	**Priorities when dealing with a number of faults:** Firstly, apply the interpretation of the **DF200 Atmospheric pressure sensor** fault, if it is present.

Check the turbocharger pressure sensor connections.
Check the engine management computer connections.
Repair if necessary.

Check **the continuity and absence of interference resistance** on the connection between:

Engine computer, **connector B track C1** → **track B or 3** turbocharging pressure sensor connector

Carry out the required operations if the resistance is abnormally high.
Tracks A, B and C of the turbocharging pressure sensor: F9Q 650, F9Q 750, F9Q 752, F9Q 754 engines.
Tracks 1, 2 and 3 of the turbocharging pressure sensor: F9Q 751, F9Q 680, F9Q 820, G9T 702, G9T 703, G9T 742, G9T 743 and G9U 730 engines.
If the fault is still present:
Check the sensor mounting and the sealing ring on its seal or hoses (tightness of clip, etc.).
Check the inlet circuit sealing: apply **test 4**.
If the fault is still present, refer to the interpretation of parameter **PR041 Turbocharging pressure**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF200 PRESENT	ATMOSPHERIC PRESSURE SENSOR 1.DEF: Feed voltage too low 2.DEF: Feed voltage too high

1.DEF ***2.DEF***	***NOTES***	**Priorities when dealing with a number of faults:** Apply the interpretation of fault **DF216 Sensor supply voltage no. 1** first if it is present or stored.

The atmospheric pressure sensor is inside the engine management computer, and no repairs are possible. **Simply check that the** engine management computer **air inlet is not blocked**.
If the fault is **present**, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF207 PRESENT OR STORED	LOW PRESSURE PUMP RELAY CIRCUIT CC.1 : Short circuit to + 12 V CO.0 : Open circuit or short circuit to earth

NOTES	**Conditions for applying the fault finding procedure to stored faults:** If the fault is declared present after actuating the relay using command **AC034 Low pressure pump relay**.
	Special notes: Use bornier **Elé. 1681** for all operations on the connectors of the engine management computer.

CC.1	***NOTES***	None.

Check the fuel pump relay mounting connections.
Check the engine management computer connections.
Repair if necessary.

Remove the fuel pump relay and check it is correct:
– **Insulation** between **tracks 3 and 5** of the relay (rest position).
– Measure the resistance of the coil between **tracks 1 and 2**.
Replace the relay if the resistance is not: **90 Ω ± 5 at + 20˚C**.

Check **the condition** of the fuse: **FM3 (30 A) for F9Q 751, 752 and 754 engines**.
Check the **insulation** from **+ 12 V battery feed** and **12 V after relay** feed on the connections between:

Engine computer, **connector A track G1**	→	**track 50** of the fuel pump relay mounting (F9Q 751, 752 and 754)
12 V battery after fuse feed	→	**track 49** of the fuel pump relay mounting (F9Q 751, 752 and 754)
+ 12 V after relay	→	**track 52** of the fuel pump relay mounting (F9Q 751, 752 and 754)

If the fault is still present, change the **fuel pump relay**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF207 **CONTINUED**	

CO.0	***NOTES***	None.

Check the fuel pump relay mounting connections.
Check the engine management computer connections.
Repair if necessary.

Measure the resistance of the fuel pump relay coil between **tracks 1 and 2**.
Replace the relay if the resistance is not: **90 Ω ± 5 at + 20˚C**.

Check the **continuity** and **insulation from earth** of the connections between:

Engine computer, **connector A track G1** → **track 50** of the fuel pump relay mounting (F9Q 751, 752 and 754)

Check **for + 12 V after relay** feed → **track 52** of the fuel pump relay mounting (F9Q 751, 752 and 754)

If the fault is still present, change the **fuel pump relay**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF208 PRESENT OR STORED	FUEL PRESSURE SOLENOID VALVE CIRCUIT CC.1 : Short circuit to + 12 V CO.0 : Open circuit or short circuit to earth 1.DEF: Consistent after switching the ignition off

NOTES	**Conditions for applying the fault finding procedure to stored faults for CC.1 or CO.0:** The fault reappears after: – clearing the fault from the memory, – running of command **AC035 Fuel pressure solenoid valve**.
	Special notes: Use bornier **Elé. 1681** for all operations on the connectors of the engine management computer.

CC.1	***NOTES***	**IMPORTANT** – Please observe the cleanliness guidelines and safety advice.

Check the fuel pressure solenoid valve connections.
Check the engine management computer connections.
Repair if necessary.

Measure the **resistance** of the fuel pressure solenoid valve across **tracks 1 and 2**.
Replace the solenoid valve if this value is not:
- **3 Ω ± 0.5 at + 20˚C for CP3 high pressure pumps,**
- **2.5 Ω ± 0.5 at + 20˚C for CP1 high pressure pumps.**

With the fuel pressure solenoid valve connector disconnected, check the **insulation** to **+ 12 V** on the connection between:

Engine computer, **connector B track L1** ⟶ **track 2** fuel pressure solenoid valve connector

Check the **insulation** on this connection compared with that of the connection between:

Engine computer, **connector B track M2** ⟶ **track 1** fuel pressure solenoid valve connector

If the fault is still present, **replace the solenoid valve**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF208 **CONTINUED 1**	

CO.0	***NOTES***	**IMPORTANT** – Please observe the cleanliness guidelines and safety advice.

Check the fuel pressure solenoid valve connections.
Check the engine management computer connections.
Repair if necessary.

Measure the resistance of the fuel pressure solenoid valve across **tracks 1 and 2**.
Replace the solenoid valve if this value is not:
- **3 Ω ± 0.5 at + 20˚C for CP3 high pressure pumps,**
- **2.5 Ω ± 0.5 at + 20˚C for CP1 high pressure pumps.**

Check **the continuity and insulation** to **earth** of the connection between:

Engine computer, **connector B track L1** ⟶ **track 2** fuel pressure solenoid valve connector

Check **for + 12 V after relay** feed on **track 1** of the fuel pressure solenoid valve.
If the fault is still present, **replace the solenoid valve**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF208 **CONTINUED 2**	

1.DEF	***NOTES***	**Fault finding procedure application conditions:** If the fault reappears stored after: – the fault is cleared, – the power latch phase* has been completed several times, each preceded by an engine cycle: starting and accelerating > 2000 rpm. **Information on the setpoint:** Detection of this fault is performed during the power-latch* phase. Also, this detection follows a "counting strategy" and is therefore not performed each time the ignition is switched off. If it is detected during one power latch* phase, it will not necessarily be detected during the next power latch* phase. It is therefore necessary, after the fault is cleared, to perform several power latch* phases, each preceded by an engine running cycle (see the conditions above) to make it reappear. **Priorities when dealing with a number of faults:** Firstly, apply the interpretation of the **DF195 Engine speed/camshaft sensor consistency 2.DEF or 3.DEF** fault, if it is present. **IMPORTANT** – Please observe the cleanliness guidelines and safety advice.

* The immobiliser warning light will flash a few seconds after the ignition is switched off.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF208 **CONTINUED 3**	

On a vehicle fitted with a damper valve, check that this is working correctly using the interpretation of command **AC067 Damper valve**.

Check the fuel pressure solenoid valve connections.
Check the engine management computer connections.
Repair if necessary.

Measure **the resistance** of the fuel pressure solenoid valve across **tracks 1** and **2**.
Replace the solenoid valve if this value is not:
- **3 Ω ± 0.5 at + 20˚C for CP3 high pressure pumps,**
- **2.5 Ω ± 0.5 at + 20˚C for CP1 high pressure pumps.**

Check **the continuity and absence of interference resistance** on the connection between:

Engine computer, **connector B track L1** → **track 2** of the fuel pressure solenoid valve

Carry out the required operations if the resistance is abnormally high.

- Check **the continuity and absence of interference resistance** on **G9T - G9U engines**, on the connections between:

  Engine computer, **connector B track H3** → **track 2** engine speed sensor

  Engine computer, **connector B track G3** → **track 1** of the engine speed sensor

- Check **the continuity and absence of interference resistance** on **F9Q engines**, on the connections between:

  Engine computer, **connector B track H3** → **track B** of the engine speed sensor

  Engine computer, **connector B track G3** → **track A** of the engine speed sensor

Carry out the required operations if the resistance is abnormally high.
- Check earthing of the engine block.

If the fault is still present, refer to the interpretation of command **AC035 Fuel pressure solenoid valve**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF209 PRESENT OR STORED	EGR VALVE POSITION SENSOR CIRCUIT CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 V 1.DEF: Sensor supply fault 2.DEF: Offset too high: valve clogged, stuck open or abnormal 3.DEF: Valve jammed open 4.DEF: Valve damaged

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault reappears after: – the fault memory has been cleared, – the valve has been actuated by the **AC036 EGR valve** command.
	Special notes: Use bornier **Elé. 1681** for all operations on the connectors of the engine management computer.

CO.0	***NOTES***	**Priorities when dealing with a number of faults:** In the event of the simultaneous presence of the **DF325 Exhaust gas recirculation function, CO.0** fault, check that the exhaust gas recirculation valve connector is connected correctly.

Check the exhaust gas recirculation valve connections:
Check the engine management computer connections.
Repair if necessary.

Check **the continuity and insulation** to earth of the connection between:

Engine computer, **connector B track C2** → **track 6** of the exhaust gas recirculation valve connector

Check **the continuity of the connection** between:

Engine computer, **connector B track F2** → **track 2** of the exhaust gas recirculation valve connector

Also check for **+ 5 V** on **track 2** of the exhaust gas recirculation valve connector.

If the fault is still present, replace the exhaust gas recirculation valve (see **Replacement of components**).

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF209 **CONTINUED 1**	

CC.1	***NOTES***	None.

Check the exhaust gas recirculation valve connections:
Check the engine management computer connections.
Repair if necessary.

Check **for insulation** to **+ 12 V** feed on the connection between:

Engine computer, **connector B track C2** → **track 6** of the exhaust gas recirculation valve connector

Check **the continuity and absence of interference resistance** on the connection between:

Engine computer, **connector B track B2** → **track 4** of the exhaust gas recirculation valve connector

Also check for the computer earth on **track 4** of the exhaust gas recirculation valve connector.
If the fault is still present, replace the exhaust gas recirculation valve (see **Replacement of components**).

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF209 **CONTINUED 2**	

1.DEF	***NOTES***	**Priorities when dealing with a number of faults:** Firstly, apply the interpretation of the **DF216 Sensor supply voltage no. 1** fault, if it is present or stored.

Check the exhaust gas recirculation valve connections:
Check the engine management computer connections.
Repair if necessary.

With the connectors disconnected:
Check the **continuity and for the absence of interference resistance** on the following connections:

Engine computer, **connector B track F2** → **track 2** of the exhaust gas recirculation valve connector

Engine computer, **connector B track B2** → **track 4** of the exhaust gas recirculation valve connector

Engine computer, **connector B track C2** → **track 6** of the exhaust gas recirculation valve connector

Also check that they are **insulated** against **+ 12 V**.
If the fault is still present, check for:

+ 5 V on **track 2** of the exhaust gas recirculation valve connector.
Computer earth on **track 4** of the exhaust gas recirculation valve connector.

– If the supply is not correct, make the necessary repairs (harness, connectors, etc.).
– If the feed and the connections are correct, replace the exhaust gas recirculation valve (see **Replacement of components**).

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF209 **CONTINUED 3**	

2.DEF ***3.DEF*** ***4.DEF***	***NOTES***	None.

– Check the exhaust gas recirculation valve connections
(exhaust gas recirculation valve side).
– Check the engine management computer connections (computer side).
(no conducting particles or bent pins).
– Check for insulation **to + 5 V and + 12 V** on the following connection:

Engine management computer, **connector B track C2** → **track 6** of the exhaust gas recirculation valve connector

– Check the conformity of the power supply of the exhaust gas recirculation valve position sensor:
+ 5 V on **track 2** of the exhaust gas recirculation valve connector.
computer earth on **track 4** of the exhaust gas recirculation valve connector.
Carry out the necessary repairs.

● If this fault **is combined with engine faults** such as poor performance and/or fumes:
Apply **test 9**, part A.

● If this fault **is not combined with engine problems** such as poor performance and/or fumes:
– Run the **RZ002 EGR adaptives** command
– When the command has finished, switch off the ignition and wait until the end of the power latch*,
– Switch on the ignition again and then reinitialise dialogue using the diagnostic tool.
– Clear **DF209**.
– Start the engine.
– After a delay of **50 seconds**, accelerate **gently to 2500 rpm**, for **~ 5 seconds** then return to idle speed.
– Repeat this procedure **5** times.
– If the fault does not recur, end the fault finding procedure.
– If the fault recurs, replace the exhaust gas recirculation valve (see **Replacement of components**).

* Engine immobiliser indicator light flashes a few seconds after the ignition is switched off.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF210 PRESENT OR STORED	AFTER IGNITION KEY SIGNAL 1.DEF: Internal fault on channel after ignition

NOTES	**Priorities when dealing with a number of faults:** Firstly, apply the interpretation of the **DF222 Main relay** fault, if it is present or stored.

If the fault is **stored** or **present**, clear the fault from the computer memory.
Switch off the ignition, wait for the end of the power latch*, then switch on the ignition again. Start the engine and re-establish dialogue.
If the fault recurs, contact the Techline.

***** The immobiliser warning light will flash a few seconds after the ignition is switched off.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF213 STORED	FLYWHEEL SIGNAL INFORMATION INCONSISTENCY 1.DEF: Overspeed detected

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault reappears after: – clearing the fault from the memory, – the engine is started, – engine speed exceeding **~ 3500 rpm**.
	Special notes: This fault appears if the computer detects that the engine speed has exceeded the maximum. This could be linked to an incorrect manoeuvre, for example: abrupt downshifting from 5^{th} to 2^{nd} gear. Use bornier **Elé. 1681** for all operations on the connectors of the engine management computer.

Measure **the resistance** of the engine speed sensor between **tracks A and B on F9Q engines**.
Replace the sensor if its resistance is not: **800 Ω ± 80 at 20˚C.**
Measure the **resistance** of the engine speed sensor between **tracks 1 and 2 on G9T/G9U engines**.
Replace the sensor if its resistance is not: **235 Ω ± 35 at 23˚C.**

Check the conformity of the charging circuit (correct charging voltage and no interference).
Check that the engine and computer earths are correct (tightness, oxidation, etc.).
Check the **insulation** against the **+ 12 V** feed and **the earth** of the following connections **on F9Q engines**:

Engine computer, **connector B track G3** → **track A** of the engine speed sensor

Engine computer, **connector B track H3** → **track B** of the engine speed sensor

Check the **insulation** from **+ 12 V** feed and from **earth** of the following connections **on G9T/G9U engines**:

Engine computer, **connector B track G3** → **track** 1 of the engine speed sensor

Engine computer, **connector B track H3** → **track 2** of the engine speed sensor

If the fault is still present, replace the engine speed sensor.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF215 PRESENT OR STORED	ANALOGUE TO DIGITAL CONVERTER 1.DEF: Analogue/digital converter fault

NOTES	None.

If the fault is **stored** or **present**, clear the fault from the computer memory.
Switch off the ignition, wait for the end of the power latch*, then switch the ignition back on. Start the engine and re-establish dialogue.
If the fault recurs, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF216 PRESENT OR STORED	SENSOR FEED VOLTAGE No. 1 1.DEF: Sensor supply voltage 1 too low 2.DEF: Sensor feed voltage 1 too high

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault reappears after: – clearing the fault from the memory, – a delay of **1 minute** with the engine running.
	Special notes: – Use bornier **Elé. 1681** for all operations on the connectors of the engine management computer. – Use the **Wiring diagrams** Technical Note for the vehicle.

1.DEF	***NOTES***	None.

Note:
Feed no. 1 is for the following components:
– pedal sensor (gang 1),
– fuel pressure sensor,
– air flowmeter,
– exhaust gas recirculation valve,
– turbocharger pressure sensor (if fitted).

Display parameter **PR215 Sensor supply voltage no. 1**.
– If this voltage is below **4.9 V**, disconnect the connectors on all sensors referred to above one by one.
If, following disconnection, the voltage becomes normal again, replace the sensor concerned or repair the connection (wait a few seconds **between each disconnection** for the computer to make its measurement).
Clear the faults created by the multiple disconnections.
If, with all the sensors disconnected, the voltage is still **less than + 4.9 V**:
– check the insulation against earth of the **+5 V line** of each of these sensors.
– Also check the insulation between:
  – tracks **2 and 4** of the pedal sensor connector,
  – tracks **1 and 3** of the fuel pressure sensor connector,
  – tracks **2 and 3** of the air flow sensor connector.
  – tracks **2 and 4** of the exhaust gas recirculation valve connector,
  – tracks **1** and **2** or **A** and **C** of the turbocharger pressure sensor connector (depending on the engine).
Carry out the necessary repairs.
If the fault is still present, carefully examine the engine management computer connections (for conductive particles, bent pins).
If the problem is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF216 **CONTINUED**	

2.DEF	***NOTES***	None.

Note:
Feed no. 1 is for the following components:
– pedal sensor (gang 1),
– fuel pressure sensor,
– air flowmeter,
– exhaust gas recirculation valve,
– turbocharger pressure sensor (if fitted).

Display parameter **PR215 Sensor supply voltage no. 1**.
– If the voltage is above **5.1 V**, disconnect all the sensor connectors referred to above one by one.
If, following disconnection, the voltage becomes normal again, replace the sensor concerned or repair the connection (wait a few seconds **between each disconnection** for the computer to make its measurement).
Clear the faults created by the multiple disconnections.
If, with these sensors disconnected, the voltage is still greater than **+ 5.1 V**:
– Check the insulation to **+ 12 V** of the following connections:

Engine computer, **connector A track E1**	→	**track 4** of the pedal sensor connector
Engine computer, **connector B track H2**	→	**track 3** of the fuel pressure sensor connector
Engine computer, **connector B track G2**	→	**track 3** of the air flow sensor connector
Engine computer, **connector B track F2**	→	**track 2** of the exhaust gas recirculation valve connector
Engine computer, **connector B track J2**	→	**track 1 or C** of the turbocharger pressure sensor connector

Carry out the necessary repairs.
If the fault is still present, carefully examine the engine management computer connections (for conductive particles, bent pins).
If the problem is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF222 STORED	MAIN RELAY 1.DEF: Relay cut off too soon 2.DEF: Relay cut off too late

NOTES	**Fault finding procedure application conditions:** The fault reappears after: – the fault memory has been cleared, – the engine is started, – the ignition is switched off with loss of dialogue, – switching on the ignition, – establishing dialogue.
	Special notes: Use bornier **Elé. 1681** for all operations on the connectors of the engine management computer. Refer to the **Wiring diagrams** Technical Note for the vehicle to locate the connections and relays concerned.

1.DEF	***NOTES***	None.

Check the connections of the injection supply relay mounting.
Check the engine management computer connections.
Repair if necessary.

Check the tightness and the condition of the **+** and **-** battery terminals.

For F9Q 650, 680, 750, 751, 752, 754, 820, G9T 702, 703, 742 and 743 engines:
Check the **continuity** of the following connections:

Injection supply relay **track 13** → **tracks M2** and **M3, connector B** of the engine management computer

Injection supply relay **track 15** → **track D4, connector B** of the engine management computer

Check the conformity of the fuses concerned (crimping and condition of the wires on the terminals):
– For F9Q 650, 680, 750, 751, 752, 754, 820, G9T 702, 703, 742 and 743 engines: **FM3 (30 A)**.
Check the conformity of the impact sensor: incorrect contact (depending on equipment).
Check the conformity of the engine management computer earths:

Earth → **track L3, L4, M4, connector B** of the engine management computer

If the fault is still present, replace the injection feed relay.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF222 **CONTINUED 1**	

2.DEF	***NOTES***	None.

Check the main relay connections. Check the engine management computer connections. Repair if necessary.
Check the conformity of the main relay (relay removed): – Contact insulation between **tracks 13** and **16**. – Resistance of the coil between **tracks 14** and **15**. Replace the relay if its resistance is not: **60 Ω ± 5 at + 20˚C**.
For F9Q 650, 680, 750, 751, 752, 754, 820, G9T 702, 703, 742 and 743 engines: Check the **insulation** to **earth** of the following connection: Injection supply relay **track 15** ⟶ **track D4, connector B** of the engine management computer
If the fault is still present, replace the injection feed relay.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

NOTES	None.

If the fault is **stored** or **present**, clear the fault from the computer memory.
Switch off the ignition, wait for the end of the power latch*, then switch on the ignition again. Start the engine and re-establish dialogue.
If the fault recurs, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF226 PRESENT OR STORED	DAMPER VALVE CIRCUIT CC.1 : Short circuit to + 12 V CO.0 : Open circuit or short circuit to earth

NOTES	**Conditions for applying the fault finding procedure to stored faults:** If the fault becomes present after an **AC067 Damper valve** actuator command.
	Special notes: Use bornier **Elé. 1681** for all operations on the connectors of the engine management computer.

CC.1	***NOTES***	None.

Check the connections of the damper valve solenoid valve.
Check the engine management computer connections.
Repair if necessary.

Measure **the resistance** of the coil in the damper valve solenoid valve across **tracks 1** and **2**.
Replace the solenoid valve if the resistance is not: **46 Ω ± 3 at + 25˚C**.

Check **for insulation** from **+ 12 V** feed on the connection between:

Engine management computer, **connector C track F4** ⟶ **track 1** of the solenoid valve connector

If the fault is still present, replace the damper valve solenoid valve.

CO.0	***NOTES***	None.

Check the connections of the damper valve solenoid valve.
Check the engine management computer connections.
Repair if necessary.

Measure **the resistance** of the coil in the damper valve solenoid valve across **tracks 1** and **2**.
Replace the solenoid valve if the resistance is not: **46 Ω ± 3 at + 25˚C**.

Check **the continuity and insulation** to earth of the connection between:

Engine management computer, **connector C track F4** ⟶ **track 1** of the solenoid valve connector

Check **for + 12 Volts** on **track 2** of the connector on the damper valve solenoid valve.
If the fault is still present, replace the damper valve solenoid valve.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF227 PRESENT OR STORED	SWIRL FLAP CC.1 : Short circuit to + 12 V CO.0 : Open circuit or short circuit to earth 1.DEF: Jammed valve or jammed control solenoid valve

NOTES	**Conditions for applying the fault finding procedure to stored CC.1 or CO.O:** If the fault becomes present after running actuator command **AC013 Swirl flap**.
	Special notes: Use bornier **Elé. 1681** for all operations on the connectors of the engine management computer.

CC.1	***NOTES***	None.

Check the swirl solenoid valve connections.
Check the engine management computer connections.
Repair if necessary.

Measure the **resistance** of the swirl flap solenoid valve across **tracks 1** and **2**.
Replace the solenoid valve if its resistance is not approximately: **46 Ω ± 3 at + 25˚C**.

Check **for insulation** from **+ 12 V** feed on the connection between:

Engine management computer **connector C track H4** ⟶ **track 1** of the solenoid valve connector

If the fault is still present, replace the swirl flap solenoid valve.

CO.0	***NOTES***	None.

Check the swirl solenoid valve connections.
Check the engine management computer connections.
Repair if necessary.

Measure the **resistance** of the swirl flap solenoid valve across **tracks 1** and **2**.
Replace the solenoid valve if the resistance is not: **46 Ω ± 3 at + 25˚C**.

Check **the continuity and insulation** to **earth** of the connection between:

Engine management computer, **connector C track H4** ⟶ **track 1** of the solenoid valve connector

Check **for** the **+ 12 V feed** on **track 2** of the swirl flap solenoid valve connector.
If the fault is still present, replace the swirl flap solenoid valve.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF227 **CONTINUED**	

1.DEF	***NOTES***	**Priorities when dealing with a number of faults:** Use the interpretation of fault **DF056 Air flow sensor circuit** or **DF325 Exhaust gas recirculation function** or **DF301 Air inlet circuit** first if any one of the three is present or stored.
		Conditions for applying the fault finding procedure to 1.DEF stored: The fault reappears after: – the fault memory has been cleared, – a road test with engine speed **>3500 rpm**, fuel flow > **59 mm^3/stroke** and atmospheric pressure **> 996 hPa (996 mbar)** (minimum of **4 seconds** under these conditions to clear the fault).
		Special notes: Use bornier **Elé. 1681** for all operations on the connectors of the engine management computer.

Check the swirl solenoid valve connections.
Check the engine management computer connections.
Repair if necessary.

Measure the **resistance** of the swirl flap solenoid valve across **tracks 1** and **2**.
Replace the solenoid valve if the resistance is not: **46 Ω ± 3 at + 25˚C**.

Check **the continuity and absence of interference resistance** on the connection between:

Engine management computer **connector C track H4** ⟶ **track 1** turbulence flap solenoid valve connector

If these checks do not reveal any faults, refer to the interpretation of command **AC013 Swirl flap**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF228 PRESENT OR STORED	BRAKE SIGNALS 1.DEF: Consistency with redundant brakes

1.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** If the fault is declared present after the brake pedal has been depressed.
		Special notes: Use bornier **Elé. 1681** for all operations on the connectors of the engine management computer.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF228

CONTINUED 1

From the List of statuses menu, check **ET122** and **ET120** and check:

– brake pedal in rest position	**ET122**= **ABSENT**	and	**ET123**= **ABSENT**
– brake pedal depressed	**ET122** = **PRESENT**	and	**ET123** = **PRESENT**

*Has **ET122** been correctly recognised?*

NO

YES

*Has **ET123** been correctly recognised?* — **YES** → **Clear the fault End of fault finding procedure**

NO

Check the connections of the brake pedal switch, the ABS computer, the electronic stability program computer and the engine management computer.
Repair if necessary.
Check **for + 12 V** after ignition feed on **track 2 and 4** of the brake pedal switch connector and the condition of the fuses (F28 (20 A) and F21 (10 A)).
Disconnect the ABS/ESP (electronic stability program) computer and check the **continuity and insulation** from **+ 12 V** and from earth of the following connections:

Brake pedal switch connector **track 1** → **track 41** ABS/ESP computer connector

electronic stability program and ABS computer connector
Check that the brake pedal switch is working correctly:
– in rest position: infinite resistance between tracks **1 and 2**; depressed: continuity between tracks **1 and 2**.
Replace the switch if necessary.
If the fault is still present, run fault finding on the **Anti-lock Braking System - electronic stability program;** if no irregularity is detected, then run **multiplexed network fault finding**.

A

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF228 **CONTINUED 2**	

Check the brake pedal switch connections and the engine management computer connections. Repair if necessary.
Check the condition and adjustment of the brake pedal switch. Repair if necessary.
Check **for + 12 V** after ignition feed on **track 2 and 4** of the brake pedal switch connector and the condition of the fuses (F28 (20 A) and F21 (10 A)).
Disconnect the ABS/ESP (electronic stability program) computer and check the **continuity and insulation** from **+ 12 V** and from earth of the following connection:

Engine management computer, **connector A track F3** → **track 3** brake pedal switch connector

Check that the brake pedal switch is working correctly:
– in rest position: infinite resistance between tracks **1 and 2** ; depressed: continuity between tracks **1 and 2**.
Replace the switch if necessary.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF234 PRESENT OR STORED	CRUISE CONTROL/SPEED LIMITER 1.DEF: Cruise control switch voltage 2.DEF: Plausibility of deceleration 3.DEF: Plausibility of cruise control/speed limiter switch

1.DEF	***NOTES***	All operations on the connections beneath the steering wheel centre cover require the **air bag computer to be locked**.
		Special notes: see the **Wiring diagrams** Technical Note for your vehicle to locate the connections and connectors concerned.
		Conditions for applying the fault finding procedure to stored faults: If the fault recurs as present after: – the steering wheel controls being pressed.

Display **PR178 Cruise control switch voltage**. With no pressure on the steering wheel switches, the voltage shown should be: **4.9 V ± 0.2**.

If the voltage is not in this region, disconnect the steering wheel switch (black union **2 tracks** beneath the steering wheel centre cover) and display **PR178** again.
If the voltage changes to **4.9 V ± 0.2**, go to stage 1.
If the voltage does not change, check the engine management computer connections.
Repair if necessary. If the fault is still present, go to step **a**.

1 - Check the conformity of the steering wheel switches as follows: disconnect the black connector **2 tracks** under the central cover of the steering wheel (ohmmeter connected on the steering wheel switch side). The measure should indicate:

- **900 Ω (± 10 Ω)** when the **Resume** button is pressed.

(or the one-touch switch **R** on the right-hand side of the steering wheel)

- **0 Ω (0.8 Ω max)** when the **Suspend** button is pressed.

(or the one-touch switch **O** on the right-hand side of the steering wheel)

- **300 Ω (± 10 Ω)** when the **Set +** button is pressed.

(or the one-touch switch on the left of the steering wheel)

- **100 Ω (± 10 Ω)** when the **Set -** button is pressed.

(or the one-touch switch on the left of the steering wheel)

- **Infinite resistance** in rest position.

– **If the values are not correct**, replace the steering wheel switches.
– **If the values are correct**, make the same measurements from **connector A** of the engine management computer by connecting the ohmmeter between **tracks A2** and **B2 (steering wheel switch connected)**.

a - If the fault is still present, check the connection between the engine management computer and the connector under the steering wheel, using the relevant wiring diagram (line resistance, open circuit, short circuit, etc.). Carry out the necessary repairs.

b - If the values are correct, clear the fault, switch off the ignition, wait until the end of the power latch* phase and switch on the ignition again.

If the fault reappears (after pressing the steering wheel controls), contact the Techline.

* The immobiliser warning light will flash a few seconds after switching the ignition off.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF234 **CONTINUED 1**	

2.DEF	***NOTES***	**Priorities when dealing with a number of faults:** Deal with faults **DF196 Pedal sensor circuit gang 1 or DF198 Pedal sensor circuit gang 2** first if one of the two is present.

Check the conformity of the accelerator pedal sensor:
- **PR030 Accelerator pedal position,**
- **PR147 Pedal potentiometer voltage gang 1**
- **PR148 Pedal potentiometer voltage gang 2**
- **PR217 Pedal load (gang 1)**
- **PR218 Pedal load (gang 2)**

Check the engine management computer connections.
Repair if necessary.
Perform fault finding on the ABS system/electronic stability program.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF234 **CONTINUED 2**	

3.DEF	***NOTES***	None.

Check the connections of the on/off switch of the speed limiter/cruise control.
Check the engine management computer connections.
Repair if necessary.

Check the operation of the on/off switch of the speed limiter/cruise control using an ohmmeter:

Switch in rest position:
Insulation between tracks **A2 and A3**
Insulation between tracks **A2 and B1**

Switch on cruise-control position:
Insulation between tracks **A2 and B1**
Continuity across tracks **A2 and A3**

Switch on Speed limiter position:
Insulation between tracks **A2 and A3**
Continuity across tracks **A2 and B1**

If the on/off switch is incorrect, replace the switch.
If the on/off switch is correct, check **the continuity and the absence of interference resistance** on the following connections:

Engine computer **connector A track F2** → **track B1** of the cruise control/speed limiter on/off switch connector.

Engine computer **connector A track D2** → **track A3** of the cruise control/speed limiter on/off switch connector.

Also check the **insulation** between these two connections, as well as their insulation against the **+ 12 V** feed.
Carry out the necessary repairs.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF238 PRESENT OR STORED	THERMOPLUNGER No. 3 RELAY CIRCUIT CC.1 : Short circuit to + 12 V CO.0 : Open circuit or short circuit to earth

NOTES	**Conditions for applying the fault finding procedure to stored faults:** If the fault becomes present following activation of the relay using command **AC031 Thermoplunger no. 3 relay.**
	Special notes: Use bornier **Elé. 1681** for all operations on the connectors of the engine management computer.

CC.1	***NOTES***	None.

Check the connections of the thermoplunger no. **3** relay mounting on the engine fuse box.
Check the engine management computer connections.
Repair if necessary.

Check the conformity of the thermoplunger no. **3** relay (relay removed):
– **Insulation** between **tracks 34 and 33**.
– Measure the resistance of the relay coil between **tracks 37 and 35**.
Replace the relay if its resistance is not: **90 Ω ± 5 at + 20˚C**.

Check **for insulation** from **+ 12 V** feed on the connection between:

Engine computer, connector **C track E4** → **track 35** of the thermoplunger no.**3** relay mounting

Also check that this connection is **insulated** against the following connections:

thermoplunger no. **3** relay mounting **track 37** → **+ 12 V after relay**

thermoplunger no. **3** relay mounting **track 34** → **+ 12 V batteryafter fuse feed**

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF238 **CONTINUED 1**	

CO.0	***NOTES***	None.

Check the connections of the thermoplunger no. **3** relay mounting on the engine fuse box.
Check the engine management computer connections.
Repair if necessary.

Measure the **resistance** of the thermoplunger no. **3** relay coil between **tracks 37 and 35**.
Replace the relay if its resistance is not: **90 Ω ± 5 at + 20˚C**.

Check **the continuity and insulation** to **earth** of the connection between:

Engine computer, connector **C track E4** ⟶ **track 35** of the thermoplunger no.**3** relay mounting

Check **for** the **+ 12 V after relay** feed on **track 37** of the thermoplunger no. **3** relay mounting.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF239 PRESENT OR STORED	THERMOPLUNGER NO. 2 RELAY CIRCUIT CC.1 : Short circuit to + 12 V CO.0 : Open circuit or short circuit to earth

NOTES	**Conditions for applying the fault finding procedure to stored faults:** If the fault becomes present following an actuator command **AC064 Thermoplunger no. 2 relay**.
	Special notes: Use bornier **Elé. 1681** for all operations on the connectors of the engine management computer. The thermoplunger no. 2 relay supplies two thermoplungers in parallel. Refer to the **Wiring diagrams** Technical Note for the vehicle to locate the fuses and relays concerned.

CC.1	***NOTES***	None.

Check the thermoplunger no. **2** relay connections.
Check the engine management computer connections.
Repair if necessary.

Check the conformity of the thermoplunger no. **2** relay (relay removed):
– Insulation between **tracks 3 and 5**.
– Measure the resistance of the relay coil between **tracks 1 and 2**.
Replace the relay if its resistance is not: **90 Ω ± 5 at + 20˚C**.

For G9T 702 and 703 engines (Vel Satis):
Check **the insulation** against **+ 12 V** of the connection between:

Engine computer, connector **B track F3** → **track 3** thermoplunger no. **2** relay mounting

Also check that this connection is **insulated** against the following connections:

Thermoplunger no. **2** relay mounting, **track 2** → **+ 12 V after relay**

Thermoplunger no. **2** relay mounting, **track 1** → **+ 12 V battery after fuse feed**

For F9Q 650, 750, 751, 752, 754, G9T 702 and 703 engines (Laguna II):
Check **the insulation** against **+ 12 V** of the connection between:

Engine management computer, connector **B track G3** → **track 3** thermoplunger no. **2** relay mounting

Also check that this connection is **insulated** against the following connections:

Thermoplunger no. **2** relay mounting, **track 2** → **+ 12 V after relay**

Thermoplunger no. 2 relay mounting, track 1 → + 12 V battery after fuse feed

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF239 **CONTINUED**	

CO.0	***NOTES***	None.

Check the thermoplunger no. **2** relay connections. Check the engine management computer connections. Repair if necessary.
Measure **the resistance** of the thermoplunger no. **2** relay coil between **tracks 1 and 2**. Replace the relay if its resistance is not: **90 Ω ± 5 at + 20˚C**.
For G9T 702 and 703 engines (Vel Satis): Check **the continuity and insulation** to **earth** of the connection between: Engine computer, connector **B track F3** ⟶ **track 3** thermoplunger no. **2** relay mounting
For F9Q 650, 750, 751, 752, 754, G9T 702 and 703 engines (Laguna II): Check **the continuity and insulation** to **earth** of the connection between: Engine management computer, connector **B track G3** ⟶ **track 3** thermoplunger no. **2** relay mounting
Check for **+ 12 V after relay** feed on **track 1** (or other track depending on the engine; check CC.1 on the other tracks) of the thermoplunger no. **2** relay mounting.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF240 PRESENT OR STORED	THERMOPLUNGER NO. 1 RELAY CIRCUIT CC.1 : Short circuit to + 12 V CO.0 : Open circuit or short circuit to earth

NOTES	**Conditions for applying the fault finding procedure to stored faults:** If the fault recurs as present after: – actuator command **AC063 Thermoplunger no. 1 relay**.
	Special notes: Use bornier **Elé. 1681** for all operations on the connectors of the engine management computer. Refer to the **Wiring diagrams** Technical Note for the vehicle to locate the fuses and relays concerned.

CC.1	***NOTES***	None.

Check the thermoplunger no. **1** relay connections.
Check the engine management computer connections.
Repair if necessary.

Check the conformity of the thermoplunger no. **1** relay (relay removed):
– Insulation between **tracks 67 and 66** (in resting position).
– Resistance of the coil between **tracks 63 and 65**.
Replace the relay if its resistance is not: **90 Ω ± 5 at + 20˚C**.

Check **for insulation** from **+ 12 V** feed on the connection between:

Engine management computer, **connector C track J4** ⟶ **track 65** thermoplunger no. **1** relay mounting

Also check that this connection is **insulated** against the following connections:

Thermoplunger no. **1** relay mounting, **track 63** ⟶ **+ 12 V after relay**

Thermoplunger no. **1** relay mounting, **track 67** ⟶ **+ 12 V battery after fuse feed**

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF240 **CONTINUED**	

CO.0	***NOTES***	None.

Check the thermoplunger no. **1** relay connections.
Check the engine management computer connections.
Repair if necessary.

Check **for + 12 V after relay feed** on **track 63** (or another track depending on the engine; check CC.1 on the other tracks) of the thermoplunger no. **1** relay mounting.
Measure the **resistance** of the relay coil between **tracks 63 and 65**:
Replace the relay if its resistance is not: **90 Ω ± 5 at + 20˚C**.

Check **the continuity and insulation** to **earth** of the connection between:

Engine management computer, **connector C track J4** ⟶ **track 65** thermoplunger no. **1** relay mounting

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF253 STORED	FLOW DURING SELF TEST AFTER IGNITION IS SWITCHED OFF 1.DEF: Inconsistency with engine speed

1.DEF	***NOTES***	**Priorities when dealing with a number of faults:** Apply the interpretation of all other faults that are present or stored first.

The computer uses different strategies to switch off the engine. Either by setting the fuel flow to 0 (with the regulator) or by injector cut-out.
If during the power latch* phase, the speed does not fall below a certain value (**~ 300 rpm**) in a very short time (**< 2 seconds**) the fault will appear as stored.
Therefore all mechanical, hydraulic or other factors which could cause the engine to keep turning after the ignition has been switched off must be eliminated.
Check:
– that there are no leaks from the injector nozzles. See injector fault finding: apply **test 10**,
– the operation of the fuel pressure (or flow) solenoid valve. See **AC035 Fuel pressure solenoid valve** in the **Interpretation of commands** section,
– correct operation of the damper valve (if fitted to the vehicle). See **AC067 Damper valve** in the **Interpretation of commands** section.
Perform the necessary operations, clear the fault and then carry out the instructions again.
If the problem is still present, contact the Techline.

* The immobiliser warning light will flash a few seconds after switching the ignition off.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF276 PRESENT OR STORED	INJECTOR CODE PROGRAMMING 1.DEF: No code in memory 2.DEF: Internal electronic fault when writing

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault reappears after: – The fault has been cleared from memory. – The ignition has been switched off. – The end of the power latch* phase and switching the ignition on again.
	Special notes: If the fault is present, the injection flow rate will be limited, and the vehicle's power will be limited.
	IMPORTANT Please observe the cleanliness guidelines and safety advice.

1.DEF	***NOTES***	None.

This fault is **present** on all blank computers (new or after reprogramming).
– Program the injector codes using:
either command **SC002 Enter injector codes**
or the **SC001 Write saved data** command
(Consult the procedures defined in the **Interpretation of commands** section).
– After the codes have been written:
– Switch off the ignition.
– Wait for the end of the power latch* phase and switch on the ignition again.
– Establish dialogue and clear the fault memory.
– End of operation.

WARNING
If fault **DF276** is still present after the injector codes have been entered, check that power latch* occurs each time the ignition is switched off.
To check this, switch off the ignition and wait **10 seconds** until the immobiliser warning light flashes.
If the immobiliser warning light flashes immediately after the ignition is switched off, the power latch* is no longer effective and the injection computer cannot store the information (programming, configurations, etc.).
Repair if necessary.
If all these checks are ineffective and the fault is still present, contact the Techline.

***** The immobiliser warning light will flash a few seconds after the ignition is switched off.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF276 **CONTINUED**	

2.DEF	***NOTES***	None.

– Switch off the ignition.
– Wait for the end of the power latch* phase then switch on the ignition again.
– Establish dialogue.
If the fault was previously **stored**, clear the fault memory and end the procedure.
If the fault is still **present**, contact the Techline.

***** The immobiliser warning light will flash a few seconds after the ignition is switched off.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF301 PRESENT OR STORED	AIR INLET CIRCUIT CC.1 : Wastegate valve in short circuit to + 12 V CO.0 : Turbocharging solenoid valve in open circuit or short circuit to earth 1.DEF: Lack of air in the intake circuit 2.DEF: Turbocharging pressure too high

NOTES	**Conditions for applying the fault finding procedure to stored faults:** For **CC.1 or CO.0**, if the fault reappears after: – clearing the fault from the memory, – actuation of the valve by the **AC004 Turbocharging solenoid valve** command. For **1.DEF or 2.DEF**, if the fault is declared present after: – the engine is started, – a road test.
	Special notes: Use bornier **Elé. 1681** for all operations on the connectors of the engine management computer.

CC.1	***NOTES***	None.

Check the connections of the turbocharging pressure relief solenoid valve.
Check the engine management computer connections.
Repair if necessary.

Measure the **resistance** of the turbocharging pressure relief solenoid valve between **tracks 1 and 2**.
Replace the solenoid valve if its resistance is not:
15.4 Ω ± 0.7 at + 20˚C for a *Pierburg* solenoid valve.
16.5 Ω ± 1.6 at + 25˚C for a *Bitron* solenoid valve.

Check **for insulation** from **+ 12 V** feed on the connection between:

Engine computer, **connector B track L2** → **track 1** turbocharging pressure relief solenoid valve connector

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF301 **CONTINUED 1**	

CO.0	***NOTES***	None.

Check the connections of the turbocharging pressure relief solenoid valve.
Check the engine management computer connections.
Repair if necessary.

Measure the **resistance** of the turbocharging pressure relief solenoid valve between **tracks 1 and 2**.
Replace the solenoid valve if its resistance is not:
15.4 Ω ± 0.7 at + 20˚C for a *Pierburg* solenoid valve.
16.5 Ω ± 1.6 at + 25˚C for a *Bitron* solenoid valve.

Check **the continuity and insulation** to **earth** of the connection between:

Engine computer, **connector B track L2** → **track 1** of the turbocharging pressure relief solenoid valve connector

Check **for** the **+ 12 V after relay** feed on **track 2** of the turbocharging pressure relief solenoid valve connector.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF301 **CONTINUED 2**	

1.DEF	***NOTES***	**Priorities when dealing with a number of faults:** Apply the interpretation of the following faults first, if present or stored: – **DF301 Air inlet circuit: CO.0 or CC.1,** – **DF209 EGR valve position sensor circuit: 2.DEF or 3.DEF,** – **DF325 Exhaust gas recirculation function: CO.0 or 2.DEF,** – **DF199 Turbocharging pressure sensor: CO.0 or 2.DEF,** – **DF056 Air flow sensor circuit: 2.DEF.**

Check the connections of the turbocharging pressure relief solenoid valve.
Check the engine management computer connections.
Repair if necessary.
Check **the continuity and absence of interference resistance** on the connection between:

Engine computer, **connector B track L2** → **track 1** of the solenoid valve connector

12 V after injection relay → **track 2** of the solenoid valve connector

Measure the **resistance** of the turbocharging pressure relief solenoid valve between **tracks 1 and 2**.
Replace the solenoid valve if its resistance is not:
15.4 Ω ± 0.7 at + 20˚C for a *Pierburg* solenoid valve.
16.5 Ω ± 1.6 at + 25˚C for a *Bitron* solenoid valve.

Check the sealing of the high pressure air circuit:
Apply **test 4**.

Check the turbocharger: carry out **test 6** for a fixed geometry turbocharger, **test 7** for a variable geometry turbocharger, then **test 8** in both cases.

Check the exhaust gas recirculation circuit:
Apply **test 9**, part A.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF301 **CONTINUED 3**	

2.DEF	***NOTES***	**Priorities when dealing with a number of faults:** Firstly, apply the interpretation of the **DF199 Turbocharging pressure sensor, CC.1** fault, if it is present or stored.

Check the connections of the turbocharging pressure relief solenoid valve.
Check the engine management computer connections.
Repair if necessary.

Check **the resistance** of the turbocharging pressure relief solenoid valve between **tracks 1 and 2**:
Replace the solenoid valve if its resistance is not:
15.4 Ω ± 0.7 at + 20˚C for a *Pierburg* solenoid valve.
16.5 Ω ± 1.6 at + 25˚C for a *Bitron* solenoid valve.

Check the **continuity and absence of interference resistance** on the connection between:

Engine computer, **connector B track L2** ⟶ **track 1** of the turbocharging pressure relief solenoid valve connector

Check **for** the **+ 12 V after relay** feed on **track 2** of the turbocharging pressure relief connector.

● **Make sure the turbocharging pressure relief solenoid valve is not jammed open:**
– With the engine switched off, disconnect the input and output hoses of the solenoid valve.
With a *Pierburg* solenoid valve:
– Connect a vacuum pump to the inlet **union** and apply a vacuum.
– If the vacuum pressure **is not maintained**: replace the solenoid valve.
With a *Bitron* solenoid valve:
– Fit a plug to the solenoid valve outlet union.
– Connect a vacuum pump to the inlet **union** and apply a vacuum.
– If the vacuum **is maintained**: replace the solenoid valve.

● **Check that the control rod of the turbocharger is not jammed:**
– **Apply test 6 for a turbocharger with fixed geometry.**
– **Apply test 7 for a turbocharger with variable geometry.**

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF325 PRESENT OR STORED	EXHAUST GAS RECIRCULATION FUNCTION CC.1 : Short circuit to + 12 V CO.0 : Open circuit or short circuit to earth 1.DEF: Negative loop deviation 2.DEF: Positive loop deviation 3.DEF: Negative loop deviation 4.DEF: Positive loop deviation

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault reappears after: – clearing the fault from the memory, – the valve has been actuated by the **AC036 EGR valve** command.
	Special notes: Use bornier **Elé. 1681** for all operations on the connectors of the engine management computer.

CC.1	***NOTES***	None.

Check the exhaust gas recirculation valve connections:
Check the engine management computer connections.
Repair if necessary.

Measure **the resistances** of the exhaust gas recirculation valve (***Pierburg*** or ***Cooper*** type):
– between **tracks 1 and 5**: **from 7.5 Ω to 8.5 Ω at + 20˚C**.

– For a ***Pierburg*** type exhaust gas recirculation valve:
  – between **tracks 2 and 4**: **2400 Ω to 5600 Ω at + 20˚C**,
  – between **tracks 2 and 6**: **1900 Ω to 6400 Ω at + 20˚C**,
  – between **tracks 4 and 6**: **800 Ω to 3800 Ω at + 20˚C**.

If one of the resistances is not correct, replace the exhaust gas recirculation valve.

With the exhaust gas recirculation valve disconnected, check the **insulation** to **+ 12 V** of the connection between:

Engine computer, **connector B track M1** → **track 5** of the exhaust gas recirculation valve connector

If the fault persists, replace the exhaust gas recirculation valve. Refer to the **Replacement of components** section and follow the correct procedure to replace the exhaust gas recirculation valve.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF325 **CONTINUED 1**	

CO.0	***NOTES***	**Special notes:** In the event of the simultaneous presence of the **DF209 EGR valve position sensor circuit CO.0** fault, check that the exhaust gas recirculation valve connector is connected correctly.

Check the exhaust gas recirculation valve connections:
Check the engine management computer connections.
Repair if necessary.

Measure **the resistances** of the exhaust gas recirculation valve (***Pierburg*** or ***Cooper*** type):
– between **tracks 1 and 5**: **from 7.5 Ω to 8.5 Ω at + 20˚C**.

– For a ***Pierburg*** type exhaust gas recirculation valve:
  – between **tracks 2 and 4**: **2400 Ω to 5600 Ω at + 20˚C**.
  – between **tracks 2 and 6**: **1900 Ω to 6400 Ω at + 20˚C**.
  – between **tracks 4 and 6**: **800 Ω to 3800 Ω at + 20˚C**.

If one of the resistances is not correct, replace the exhaust gas recirculation valve.

Check **the continuity and insulation** to **earth** of the connection between:

Engine computer, **connector B track M1** ⟶ **track 5** exhaust gas recirculation valve connector

Check **for + 12 V after relay feed** on **track 1** of the exhaust gas recirculation valve connector.

If the fault persists, replace the exhaust gas recirculation valve. Refer to the **Replacement of components** section and follow the correct procedure to replace the exhaust gas recirculation valve.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF325 **CONTINUED 2**	

1.DEF ***2.DEF*** ***3.DEF*** ***4.DEF***	***NOTES***	**Priorities when dealing with a number of faults:** Apply the interpretation of fault **DF209 EGR valve position sensor circuit** first, then fault **DF056 air flowmeter circuit**, 1.DEF if they are present.

Check the exhaust gas recirculation valve connections:
Check the engine management computer connections.
Repair if necessary.

Check for leaks in the air inlet circuit (above all between the air flowmeter and the turbocharger: use **test 4**) and the exhaust gas recirculation circuit (use **test 9**, part A).
Check **the continuity and insulation** of the connections between:

Engine computer, **connector B track G2** → **track 3** air flowmeter connector

Engine computer, **connector B track H4** → **track 5** of air flow sensor connector

Check for the **+ 5 V** feed on **track 3** of the air flow sensor connector, with the vehicle with a + after ignition feed.
Check for the **+ 12 V after relay** feed on **track 4** of the air flow sensor connector.
Check for **an earth** on **track 6** of the air flow sensor connector.
Apply the interpretation of parameter **PR132 Air flow** explained in this note, at hot idle speed (coolant temperature > 80˚C).
Carry out the necessary repairs.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF374 PRESENT OR STORED	COMPUTER 1.DEF: Overvoltage in the capacitor controlling the injectors 2.DEF: Undervoltage in the capacitor controlling the injectors

NOTES	Check the conformity of the **+ 12 V battery feed** on **tracks M2 and M3, connector B** of the engine management computer (excess voltage or micro breaks). If necessary, check the charging circuit. (see **Technical Note 6014A Charging circuit fault finding**).

IMPORTANT
A badly insulated or incorrectly positioned engine wiring harness may be susceptible to disruption caused by the voltage supply to the starter. This "electrical interference" disrupts the engine speed signal and causes this fault. It is often intermittent but is always accompanied by failure of the engine to start.
In the starting phase, check with the oscilloscope that there is no interference on the engine speed signal during the first engine rotations.
In the event of interference:
- check that the engine wiring and starter motor are correctly positioned.
- check that the engine speed signal connection is correctly cabled.

If the fault is still present:
Carefully check the clips and tabs of the **connections for each injector**.
If the fault is still present:
Clear the fault from the computer memory.
Switch off the ignition, wait for the end of the power latch*, then switch the ignition back on.
Start the engine and re-establish dialogue:
If the fault recurs, contact the Techline.

***** The immobiliser warning light will flash a few seconds after the ignition is switched off.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF436 **STORED**	DETECTION OF ENGINE MISFIRING 1.DEF: Cylinder 1 injector 2.DEF : Cylinder 2 injector 3.DEF : Cylinder 3 injector 4.DEF : Cylinder 4 injector

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault reappears after: – the fault memory has been cleared, – starting the engine with a coolant temperature of 50 °C followed by a delay of **3 min** at idling speed.
	Priorities when dealing with a number of faults: Apply the interpretation of these faults first: **DF197 Fuel pressure signal**, present or stored. **DF040 Cylinder 1 injector circuit**, present or stored. **DF041 Cylinder 2 injector circuit**, present or stored. **DF042 Cylinder 3 injector circuit**, present or stored. **DF043 Cylinder 4 injector circuit**, present or stored. **Special notes:** Check the consistency between the stored injector codes and the ones engraved on each injector. Check the **insulation, continuity and the absence of interference resistance** by running **test 10**.

1.DEF ***2.DEF*** ***3.DEF*** ***4.DEF***	***NOTES***	**Before** replacing an injector, check that its sealing washer is in place and in good condition. **After** replacing an injector, follow the injector code programming procedure (see **Replacement of components** section).
		IMPORTANT To remove/refit injectors, obey the cleanliness guidelines and safety advice (defined in Section **13B** of the Workshop Repair Manual).

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

GETtheMANUALS.org

DF436 **CONTINUED**	

1) If a single cylinder is declared with misfiring status:
– Check the condition of the engine by performing the compression test using the Clip Technic tool or special tool.
  – If the 4 cylinders have the same stroke speed, replace the injector identified by the fault.
  – If there is a difference between the cylinders, check the compression of the cylinder concerned.
  – If a compression is not correct, make the necessary repairs.
  – If the compression is correct, replace the injector concerned*.
– After the operation, clear the fault and perform a test, **with the engine at idle speed**, and the engine **temperature > 50 ˚C** for **2 minutes** and check that no faults appear on the diagnostic tool to validate the repairs.

2) If several cylinders are declared with misfiring status:
  – Select **Sub-function: FUEL CIRCUIT** on the diagnostic tool.
  – **Engine at idle speed**, **engine coolant temperature > 50 ˚C** for **2 mins**, display the flow correction values for each injector:

- **PR364 Cylinder no. 1 fuel flow correction,**
- **PR365 Cylinder no. 4 fuel flow correction,**
- **PR405 Cylinder no. 4 fuel flow correction,**
- **PR406 Cylinder no. 3 fuel flow correction.**

The **normal value** for flow correction for an injector is approximately **± 1 mm^3/stroke**. This tolerance may increase with time, but indicates an injector/cylinder fault if it exceeds **± 5 mm^3/stroke**.

a) If at least one of these values = ± 5 mm^3/cp:
– Check the condition of the engine by performing the Check cylinder balance test.
  – If the 4 cylinders have the same stroke speed, replace the injector* with the largest correction.
  – If there is a difference between the cylinders, check the compression with the flow correction **furthest from the normal value**.
  – If the compression test reveals a cylinder fault, carry out the necessary repairs.
  – If the compression is correct, replace the injector of the cylinder concerned*.
– Clear the fault and perform a test with the **engine at idle speed**, and the **engine coolant temperature > 50˚C** for **2 minutes** and check that no faults appear on the diagnostic tool and that the correction values do not reach ± 5 mm^3/stroke to confirm the repair:
– If an(other) cylinder(s) is (are) still declared in misfiring status, repeat starting at **2** (or **1**).
– If the fault does not recur, end the fault finding procedure.

If the problem is still present, contact the Techline.

* To remove/refit injectors, obey the cleanliness guidelines and safety advice (defined in Section **13B** of the Workshop Repair Manual).

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a test with the **diagnostic tool**.

ET415	Deactivation of cruise control/speed limiter

GETtheMANUALS.org

ET001	COMPUTER + AFTER IGNITION FEED

"ABSENT"	***NOTES***	**Ignition on**

If the vehicle ignition is not switched on, the status **ET001** should be **ABSENT**.
As soon as the ignition is switched on, the computer should be supplied with power. Status **ET001** becomes **PRESENT**.
If this status remains locked on **ABSENT**, follow the procedure below:
– Check the condition of fuse **FM6** (**10A**) in the engine fuse and relay box.
– Check the continuity and for the absence of interference resistance between:

Black connector of the engine fuse and relay box **track 28** → Connector B brown **track E3** of the injection computer

Check the connections and the condition of the brown connector B contacts on the injection computer.
Repair if necessary.
If the fault is still present, contact the Techline.

"PRESENT"	***NOTES***	**Ignition on.**

Normal operating condition.
The computer is correctly supplied after the ignition has been switched on.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

ET003	ENGINE IMMOBILISER

"ACTIVE"	Refer to the UCH fault finding procedure (**see 87B Passenger compartment connection unit**).
"INACTIVE"	Refer to the UCH fault finding procedure (**see 87B Passenger compartment connection unit**).

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

ET004	AC AUTHORISED

"NO"	Status **ET004** should be **NO** when the climate control control button is not pressed. If this status remains **NO** despite the button being pressed, perform the following operations: Check **the continuity and absence of interference resistance** between: Injection computer grey connector **A**, **track G4** → Blue connector of the air conditioning control panel **track 5** If the fault is still present, refer to the fault finding note for climate control (**see 62B Climate control**).
"YES"	Status **ET004** is used to interpret a request for air conditioning. When the climate control button is pressed, status **ET004** changes to **YES**. If this does not happen, perform the following operations: Check the continuity and absence of interference resistance between: Injection computer grey connector **A**, **track G4** → Air conditioning control panel blue connector **track 5** If the fault is still present, refer to the fault finding note for climate control (**see 62B Climate control**).
NONE	If the vehicle is not fitted with air conditioning, status **ET004** will always remain **NONE**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

ET007	PRE-POSTHEATING UNIT CONTROL

"ACTIVE"	When the ignition is switched on, status **ET007** should be **ACTIVE** for a time that varies according to the engine coolant temperature. Both the relay and the heater plugs are then supplied. After starting the status should remain **ACTIVE** for a variable period according to the engine coolant temperature. This is called postheating. If the vehicle starts, postheating is completed and status **ET007** remains **ACTIVE** during the engine operating phase, refer to the interpretation of faults **DF017 Preheating unit control circuit** and **DF186 Heater plugs circuit**.
"INACTIVE"	If the vehicle does not start or the status remains **INACTIVE** and preheating has not been carried out when switching on the ignition or during the starting phase, check the following connections: Injection computer **track B3 brown connector B** → **track 9** preheating unit Injection computer **track C3 brown connector B** → **Track 8** preheating unit Repair if necessary.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

ET010	LOW PRESSURE PUMP RELAY CONTROL

"ACTIVE"	Status **ET010** must be **ACTIVE** when the injection computer activates the fuel pump relay. When the ignition is switched on, status **ET010** must be **ACTIVE**.

"INACTIVE"	Status **ET010** must be **INACTIVE** when the injection computer does not actuate the fuel pump relay. If when the ignition is switched on, status **ET010** remains **INACTIVE**, check the continuity and absence of interference resistance between: Injection computer black connector **C**, **track A1** → Fuel pump relay mounting **track B2** If the fault is still present, consult the interpretation of fault **DF207 Low pressure pump relay circuit**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

ET042	CRUISE CONTROL/SPEED LIMITER

LIMITER	Status **ET042** should display **LIMITING** when the Cruise control/Speed limiter button is set to the limiter position.
CRUISE CONTROL	Status **ET042** should display **CRUISE CONTROL** when the Cruise control/Speed limiter button is set to the cruise control position.

The Cruise control/Speed limiter button has 3 positions: speed limiter, cruise control and standby.

If the status is not working, apply the interpretation of fault **DF234 Cruise control/Speed limiter function**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

ET088	REQUEST TO START COMPRESSOR

"YES"	The status **ET088** is used to interpret a request for air conditioning. If the air conditioning button is pressed, status **ET088** changes to **YES**. If this does not happen, perform the following operations: Check the continuity and absence of interference resistance between: Injection computer **connector A track D3** → **Track 5** of the blue connector of the air conditioning control panel If the fault is still present, refer to the note regarding air conditioning.
"NO"	Status **ET088** should be **NO** when the air conditioning control button is not pressed. If this status remains **NO** despite the button being pressed, perform the following operations: Check **the continuity and absence of interference resistance** between: Injection computer **connector A track D3** → **Track 5** of the blue connector of the air conditioning control panel If the fault is still present, refer to the note regarding air conditioning.
NONE	If the vehicle is not fitted with air conditioning, status **ET088** will always remain **WITHOUT**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

ET104	INJECTOR CODE USE

"YES"	Status **ET104** should display **YES** when the injector codes have been entered.
"NO"	Status **ET104** should display **NO** when the injector codes have not been entered. In this case, the engine management computer uses prespecified values in its memory to control the injectors.

Check for any faults using the interpretation of fault **DF374 Computer**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

ET120	PRE-POSTHEATING SIGNAL

NOTES	Check the battery voltage.

ABSENT	Status **ET120** is **ABSENT** as soon as pre/postheating has ended. If status **ET120** continuously remains **PRESENT**, refer to fault **DF017 Preheating unit control circuit**.
PRESENT	Status **ET120** is **PRESENT** until pre/postheating ends.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

ET122	BRAKE CONTACT SIGNAL No. 1

PRESENT

When the driver depresses the brake pedal, status **ET122 Brake contact signal no. 1** must change to **PRESENT** and status **ET123 Brake contact signal no. 2** must change to **PRESENT**.
If the driver depresses the brake pedal fully and status **ET122** remains **ABSENT**, check that the brake lights at the rear of the vehicle have come on.
Check the condition of the brake light switch contacts and connections.
If the brake lights are working, check the continuity and absence of interference resistance between:

connector A track F3, Engine management computer → **track 3** brake pedal switch connector

Repair if necessary.
If the brake lights are not working:
– Check the condition of the bulbs, replace if necessary.
– Check the condition of the fuse (15 A or 20 A) in the passenger compartment relay and fuse box.
– Check for **+ 12 V** after ignition on track 2 and 4 of the switch.
– Then remove the brake light switch and carry out the checks in the following table:

	Continuity between tracks	**Insulation between tracks**
Switch pressed (Brake pedal released)	**4 and 3**	**1 and 2**
Switch released (Brake pedal depressed)	**1 and 2**	**4 and 3**

If these checks are not in order, replace the brake light switch.

ABSENT

When the driver releases the brake pedal, the status **ET122** must change to **ABSENT** and status **ET123** must change to **ABSENT**.
If this is not the case, check the condition and proper functioning of the brake light switch by performing the checks for the **PRESENT** part.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

ET123	BRAKE CONTACT No. 2 SIGNAL

PRESENT

When the driver depresses the brake pedal, status **ET122 Brake contact signal no. 1** must change to **PRESENT** and status **ET123 Brake contact signal no. 2** must change to **PRESENT**.
If the driver depresses the brake pedal firmly and status **ET123** remains **ABSENT**, check the illumination of the brake lights at the rear of the vehicle.
Check the condition of the brake light switch contacts and connections.
If the brake lights are working, check the continuity and the absence of interference resistance between:

connector A track F3, Engine management computer → **track 3** brake pedal switch connector

Repair if necessary.
If the brake lights are not working:
– Check the condition of the bulbs, replace if necessary.
– Check the condition of the fuse (15 A or 20 A) in the passenger compartment relay and fuse box.
– Check for **+ 12 V** after ignition on track 2 and 4 of the switch.
– Then remove the brake light switch and carry out the checks in the following table:

	Continuity between tracks	**Insulation between tracks**
Switch pressed (Brake pedal released)	**4 and 3**	**1 and 2**
Switch released (Brake pedal depressed)	**1 and 2**	**4 and 3**

If these checks are not in order, replace the brake light switch.

ABSENT

When the driver depresses the brake pedal, status **ET122 Brake contact signal no. 1** must change to **ABSENT** and status **ET123 Brake contact signal no. 2** must change to **ABSENT**.
If this is not the case, check the condition and correct operation of the brake light switch by carrying out the checks associated with **PRESENT** in the interpretation of **ET122**.

Note:
Status **ET122 Brake contact signal no. 1** must change to **ABSENT** if status **ET123 Brake contact signal no. 2** is **ABSENT**, these statuses are directly linked.
If this is not the case, carry out the above fault finding procedure.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

ET143	LOW-SPEED FAN ASSEMBLY RELAY CONTROL

NOTES	If the vehicle is fitted with air conditioning, the fan assembly electrical circuit includes **2 relays**. The low speed fan assembly relay will be run when the engine coolant temperature exceeds **99˚C** and will cool the engine as long as the engine coolant temperature does not exceed **102˚C**. If the temperature of the engine coolant exceeds **102˚C**, the high speed fan assembly relay will be run and the engine cooling fan will turn more quickly.

WARNING
If the vehicle is equipped with air conditioning, the engine cooling fan will run at low speed as soon as the computer actuates the air conditioning compressor.

"ACTIVE"	When the coolant reaches **99˚C**, the injection computer actuates the low speed fan assembly relay, and status **ET143** becomes **ACTIVE**. The relay then supplies the fan assembly and the cooling fan switches on. If status **ET143** is **ACTIVE**, but the cooling fan is not running, perform the following operations: – Check the condition of fuse **F2** (30 A) in the engine relay/fuse box. – Next, check for continuity and the absence of interference resistance between: Low-speed relay mounting **track 9** → **track 1** of the fan assembly resistor connector **track 2** of the cooling fan assembly resistance connector → **track 2** of the engine cooling fan black 2 track connector

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

ET143 **CONTINUED**	

"ACTIVE"	– Disconnect the low-speed and high-speed relays, check their operation and the condition of the connections. – Repair if necessary. – Check for **+ 12 V** on terminal 12 of the low-speed relay mounting while it is active. – Disconnect the black 2-track connector of the engine cooling fan and check the condition of the connections. – Repair if necessary. – Next, check **the continuity and absence of interference resistance** between: Injection computer connector **C track A2** → **track 11** of the fan assembly relay mounting **track 9** relay mounting → **track 1** of the fan assembly resistor connector **vehicle** earth → **track 1** of the 2-track black connector for the engine cooling fan
"INACTIVE"	If the engine temperature is lower than **99˚C**, the engine cooling fan must not switch on and the low speed fan assembly relay must not be run. Status **ET143** must therefore be **INACTIVE** when the control relay and the engine cooling fan are not supplied.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

ET144	HIGH-SPEED FAN ASSEMBLY RELAY CONTROL

NOTES	If the vehicle is not fitted with air conditioning, there is no low-speed fan assembly relay. The circuit therefore only contains a single control relay to supply the engine cooling fan. The engine cooling fan will thus have only one operating speed.

Vehicle without air conditioning

"ACTIVE"	When the coolant reaches **102˚C**, the injection computer actuates the fan assembly relay, and status **ET144** becomes **ACTIVE**. The relay then supplies the cooling fan. If status **ET144** is **ACTIVE**, but the cooling fan is not running, perform the following operations: – Disconnect the fan assembly relay, check it is operating properly, and the condition of the connections. – Repair if necessary. – Check for **+ 12 V** on terminal 8 of the relay mounting while it is active. – Next, check **the continuity and absence of interference resistance** between: Injection computer **connector A track B4** → **track 7** of the fan assembly relay mounting **track 5** relay mounting → **track 2** of the engine cooling fan black 2 track connector **vehicle** earth → **track 1** of the 2-track black connector for the engine cooling fan
"INACTIVE"	When the cooling request is no longer executed by the injection computer, status **ET144** becomes **INACTIVE**. The fan assembly should then switch off.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

ET144 **CONTINUED**	

Vehicle with air conditioning

"ACTIVE"	When the coolant reaches a temperature of **102 ˚C**, the injection computer commands the high speed relay, and status **ET144** becomes **ACTIVE**. The relay then supplies the cooling fan and this begins to turn. If status **ET144** is **ACTIVE**, but the cooling fan is not running, perform the following operations: Check the conformity of the fuses concerned (crimping and condition of the wires on the terminals): – Check for **+ 12 V** after ignition feed on terminal 1 or 8 of the high speed fan assembly relay mounting (**depending on the engine**). – Next, check **for continuity and the absence of interference resistance between**: Computer supply voltage relay mounting **track 13** → **track 6** of the high speed fan assembly relay mounting – Disconnect the high-speed fan assembly relay, check it is operating properly, and the condition of the connections. – Repair if necessary. – Next, check **for continuity and the absence of interference resistance between**: Injection computer **connector A track B4** → **Track 7** of the high speed fan assembly relay mounting relay mounting **track 5** → **track 2** of the engine cooling fan black 2 track connector **vehicle** earth → **track 1** of the 2-track black connector for the engine cooling fan
"INACTIVE"	When the cooling request is no longer executed by the injection computer, status **ET144** becomes **INACTIVE**. The engine cooling fan should then switch off.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

ET205	THERMOPLUNGER No.1 RELAY CONTROL

NOTES	Check the battery voltage.

"ACTIVE"	Status **ET205** displays **ACTIVE** when the computer controls thermoplunger no.1 relay. Refer to command **AC063 Thermoplunger no. 1 relay**.
"INACTIVE"	Status **ET205** displays **INACTIVE** when the thermoplunger no. 1 relay is not controlled. Refer to command **AC063 Thermoplunger no. 1 relay**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

ET206	THERMOPLUNGER No.2 RELAY CONTROL

NOTES	Check the battery voltage.

"ACTIVE"	Status **ET206** displays **ACTIVE** when the computer controls thermoplunger no.2 relay. Refer to command **AC064 Thermoplunger no. 2 relay**.
"INACTIVE"	Status **ET206** displays **INACTIVE** when the thermoplunger no. 2 relay is not controlled. Refer to command **AC064 Thermoplunger no. 2 relay**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

ET207	THERMOPLUNGER No. 3 RELAY CONTROL

NOTES	Check the battery voltage.

"ACTIVE"	Status **ET207** displays **ACTIVE** when the computer controls thermoplunger no.3 relay. Refer to command **AC031 Thermoplunger no. 3 relay**.
"INACTIVE"	Status **ET207** displays **INACTIVE** when the thermoplunger no. 3 relay is not controlled. Refer to command **AC031 Thermoplunger no. 3 relay**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

ET211	SWIRL FLAP CONTROL

NOTES	Check the battery voltage. Ignition on and engine stopped.

"ACTIVE"	Status **ET211** displays **ACTIVE** when the computer controls the swirl flap. Refer to command **AC013 Swirl flap**.
"INACTIVE"	Status **ET211** displays **INACTIVE** when the swirl flap is not controlled. Refer to command **AC013 Swirl flap**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

ET212	DAMPER VALVE CONTROL

NOTES	Check the battery voltage.

"ACTIVE"	Status **ET212** displays **ACTIVE** when the computer controls the damper valve. Refer to command **AC067 Damper valve**.
"INACTIVE"	Status **ET212** displays **INACTIVE** when the damper valve is not controlled. Refer to command **AC067 Damper valve**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

ET233	CLUTCH PEDAL

DEPRESSED	When the driver presses the clutch pedal, status **ET233 Clutch pedal** displays **DEPRESSED**.

RELEASED	When the driver is not pressing the clutch pedal, status **ET233 Clutch pedal** displays **RELEASED**. If **RELEASED** appears despite an action on the clutch pedal, perform the following operations: – Disconnect the clutch pedal switch, check the insulation between **tracks 1 and 2** in the pedal released position. – Repeat this operation with the pedal depressed, and check the continuity between the 2 tracks. If these 2 checks are not in order, replace the switch. Next, check for continuity and the absence of interference resistance between: **track 1** clutch pedal switch connector → **track E2** of grey **connector A** of the injection computer **track 2** of the clutch pedal switch → vehicle earth Also check: The condition of the contacts of the blue pedal/dashboard connectors on **track 1** and **2**. The condition of the contacts of the black engine/dashboard connectors in **track 4**

NONE	When the vehicle is fitted with an automatic transmission or a sequential gearbox, status **ET233 Clutch pedal** displays **NONE**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

ET238	SYNCHRONISATION

Synchronisation is carried out during the engine starting phase. It is established between the camshaft position sensor and the TDC sensor. This synchronisation, once performed, allows the computer to identify cylinder no. 1, and to recognise the exact position of the top dead centre of this cylinder.
Synchronisation also allows the computer to determine the injection programming.

STANDBY	Status **ET238** is **STANDBY** when the engine is stopped with + after ignition feed.
IN PROGRESS	Status **ET238** is **IN PROGRESS** when the engine is in the starting phase. When the computer is synchronising, it receives and interprets signals from the camshaft and crankshaft position sensors. If status **ET238** remains **IN PROGRESS** after an attempt at starting, refer to the interpretation of fault **DF195 Camshaft/engine speed consistency**.
PERFORMED	Status **ET238** is **DONE** when the engine is started. The computer has identified the cylinder no. 1 and has identified the exact top dead centre position. Injection phasing is now possible, and the engine should be working properly.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

ET272	FIRST EGR OFFSET PROGRAMMING

NOTES	Check the battery voltage.

PERFORMED	Status **ET272** displays **COMPLETED** when the computer has reinitialised the EGR valve after being replaced and the power-latch* phase.
NOT COMPLETED	Status **ET272** displays **NOT COMPLETED** when the computer has not yet reinitialised the position of the EGR valve after the valve replacement and command **RZ002 EGR adaptives**.

* The immobiliser warning light will flash a few seconds after switching the ignition off.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

ET341	IMMOBILISER CODE PROGRAMMED

"YES"	Status **ET341** is **YES** if dialogue is possible between the UCH computer and the injection computer and the key code is recognised. The engine is only authorised to start if the code is recognised by the UCH computer and if status **ET003 Immobiliser** is **INACTIVE**.
"NO"	Status **ET341** is **NO** if dialogue is not possible between the UCH computer and the injection computer (status **ET003 Immobiliser** remains **ACTIVE**). This fault may be caused by incorrect key programming or key programming not having been performed. In that case, refer to the fault finding note for the UCH and follow the key programming procedure. If the key programming is not the cause, test the multiplex network and check that the dialogue between the UCH and the injection computer is possible. If dialogue is not established, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

ET413	CRUISE CONTROL/SPEED LIMITER FUNCTION

NOTES	Cruise control remains deactivated as long as the vehicle does not exceed a vehicle speed **>18 mph (30 km/h)**.

"PLUS"	Status **ET413** displays **INCREASE** when the driver presses **+** located on the steering wheel spoke.
"MINUS"	Status **ET413** displays **DECREASE** when the driver presses **-** located on the steering wheel spoke.
"SUSPEND"	Status **ET413** displays **CANCEL** when the driver presses the cruise control or speed limiter stop switch.
"REACTIVATE"	Status **ET413** displays **RESUME** when the driver presses the cruise control or speed limiter resume switch.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

ET415	CRUISE CONTROL/SPEED LIMITER DEACTIVATION

NOTES	Status **ET415 Cruise control/Speed limiter deactivation** is directly linked to status **ET413 Cruise control/Speed limiter function** and status **ET042 Cruise control/ Speed limiter** Cruise control remains deactivated as long as the vehicle does not exceed a speed **>18 mph (30 km/h)**.

NONE	**The vehicle diagnosed is not fitted with cruise control.**
STATUS 1	**VEHICLE SPEED NOT REFRESHED**
	If the ABS computer stops sending a signal to the injection computer, the vehicle speed will be unknown. The cruise control will therefore be inactive and status **ET415** will remain **STATUS 1**.
STATUS 2	**INVALID VEHICLE SPEED**
	As long as the vehicle has not exceeded a speed of >18 mph (30 km/h), status **ET415** remains **STATUS 2**.
STATUS 3	**CRUISE CONTROL OR SPEED LIMITER FAULT**
	As soon as the cruise control or speed limiter suffers an electrical fault, the injection computer switches status **ET415** to **STATUS 3**.
STATUS 4	**INCONSISTENCY BETWEEN REQUEST AND VEHICLE SPEED**
	When the speed requested by the driver does not match the actual speed of the vehicle, the injection computer switches status **ET415** to **STATUS 4**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

ET415 **CONTINUED 1**	

STATUS 5	**FAULT DETECTED BY THE INJECTION COMPUTER**

As soon as a fault is detected by the injection computer, status **ET415** changes to **STATUS 5**.
- Faults on the accelerator pedal.
- Faults in the engine speed sensor or camshaft.
- Engine speed above 4700 rpm.
- Engine speed less than 1000 rpm.
- Carry out a multiplex network test, then an injection system test, and carry out fault finding on any faults.

If the fault is still present, contact the Techline.

STATUS 6	**GEAR LEVER IN NEUTRAL POSITION**

When the gear lever in neutral signal is registered by the injection computer, it changes status **ET415** to **STATUS 6**.

STATUS 7	**DISCONNECTION OF THE ENGINE/GEARBOX**

When the driver presses the clutch pedal, the injection computer switches status **ET415** to **STATUS 7**.

STATUS 8	**TRACTION CONTROL REQUEST**

When the ABS or ESP computer requests traction control, status **ET415** becomes **STATUS 8**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

ET415 **CONTINUED 2**	

STATUS 9	**BRAKE PEDAL DEPRESSED**
	As soon as the driver presses the brake pedal, the braking request is made and is sent via the ABS system computer. This signal deactivates the cruise control and status **ET415** becomes **STATUS 9**.
STATUS 10	**SUSPEND BUTTON PRESSED**
	When the driver presses the cruise control OFF switch, the injection computer changes status **ET415** to **STATUS 10**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

PR038	RAIL PRESSURE

NOTES	**There must be no present or stored faults**. Perform this fault finding procedure: – after an inconsistency appears on the parameter menu or, – following the execution of command **AC035 Fuel pressure solenoid valve** – after a customer complaint (starting faults, poor performance, stalling etc.).

ELECTRICAL CONFORMITY OF THE SENSOR:

Check for **continuity and absence of interference resistance** on the following connections:

Engine computer, **connector B track D1** → **track 2** rail pressure sensor connector

Engine computer, **connector B track H2** → **track 3** rail pressure sensor connector

Engine computer, **connector C track B3** → **track 1** of the rail pressure sensor connector

If all these connections are correct, check for a fuel pressure sensor supply:

+ 5 V → **track 3** of the rail pressure sensor connector

Earth → **track 1** of the rail pressure sensor connector

Check the low and high pressure diesel circuit sealing (visual checks, odours): on pump body, pressure release valve, pipes, rail and injector unions, injector wells, etc.
If all the above checks are correct:

– With the vehicle ignition on, and engine stopped for over **1 minute**:
  – Display **PR038**: if the value is **less** than **30 bar**, the sensor is correct.
  – if not replace the rail pressure sensor.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

PR041	TURBOCHARGING PRESSURE

NOTES	Perform this fault finding procedure: – after an inconsistency appears on the parameter menu or, – following fault **DF199 Turbocharging pressure sensor** or, – after a customer complaint (lack of performance, smoke, etc.).

With the vehicle ignition on and engine stopped:
– Remove the turbocharger pressure sensor.
– Sensor connected to the harness, not the value of **PR041**:
– If the value is not very close to **PR035 Atmospheric pressure**, maximum pressure difference between **PR035** and **PR041 Turbocharging pressure**, with the engine stopped, = **(± 50 hPa) ± 50 mbar**:
Check **the insulation and absence of interference resistance** on the signal line and the turbocharging pressure sensor power supply lines.
If the lines are correct, replace the turbocharging pressure sensor.
– Connect **a vacuum pump** or **pressure pump** to the turbocharger pressure sensor.
– Apply a pressure between **0.1** and **1.3 bar** (maximum pressure to be applied: **1300 hPa** or **1.3 bar**).
– Compare the pressure value displayed in the Parameter screen with that given by your vacuum pump:
If the difference* = **± 100 hPa** (or **± 0.1 bar)**, replace the turbocharging pressure sensor.
If there is no discrepancy, the turbocharging pressure sensor is correct.
– Refit the sensor and its seal, then apply the interpretation of the command **AC004 Turbocharging solenoid valve**.
*Note:
The diagnostic tool displays the **absolute pressure**, the pressure gauge for your vacuum pump displays the ***relative pressure***: the standard difference between these two measures is equal to atmospheric pressure, that is, **the value of PR035 Atmospheric pressure**.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

PR132	AIR FLOW

NOTES	**There must be no faults present.** Perform this fault finding procedure: – following detection of an inconsistency in the parameters menu, – or after a customer complaint (lack of power, smoke, etc.).

Check the air inlet circuit (from the air filter inlet to the inlet manifold tracts, run **test 4: Turbocharged air inlet circuit check**):
– air filter unit inlet not blocked and filter not clogged,
– **no** foreign bodies in the air flow sensor grille (**visual inspection only, apply test 5: Air flow sensor**),
– otherwise replace the flowmeter, check and clean the air filter,
– oil vapour recirculation circuit connected correctly,
– **no leaks** or **blockages** in the **low** and **high-pressure** air circuits: pipes, presence and tightness of the mounting clips, mounting of the turbocharger pressure sensor, intercooler, etc.
– check that the damper valve is open (**flap control rests on the body** of the air vent casing),
– check that the turbulence flap is in the rest position (**AC013 Turbulence flap**, step B), if fitted to the vehicle.
Carry out the necessary repairs.
Check the **electrical conformity of the air flow sensor feed**:

power circuit:**+ 12 V** → **track 4** and battery **earth** → **track 6**

sensor circuit: **+ 5 V** → **track 3** and computer **earth** → **track 2**

Check for **continuity, insulation and absence of interference resistance** on the connection between:

Engine management computer, **connector B** track H4 → **track 5** of the flow sensor connector

With the flow sensor **connected**, the vehicle **ignition on** and **engine stopped**:
– check the voltage between **tracks 2** and **5** of the flow sensor,
– If the value is not **0.6 V ± 0.1**, replace the flow sensor.
Check the exhaust gas recirculation valve operation:
Apply **test 9 Exhaust gas recirculation valve**, part A.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

SUMMARY OF AVAILABLE COMMANDS

NOTES	The commands are run to check the correct operation of certain components or to replace parts.

Tool command	Diagnostic tool title
SC001	Write saved data
SC002	Enter injector codes
SC003	Save computer data
RZ002	EGR programming adaptives
RZ003	Engine adaptives
RZ007	Fault memory
AC004	Turbocharging solenoid valve
AC013	Swirl flap
AC031	Thermoplunger No. 3 relay
AC034	Low-pressure pump relay
AC035	Fuel pressure solenoid valve
AC036	EGR valve
AC037	Preheating relay
AC038	Low speed fan assembly relay
AC039	High speed fan assembly relay
AC063	Thermoplunger no. 1 relay
AC064	Thermoplunger no. 2 relay
AC067	Damper valve
VP007	Decrease idling speed
VP010	Write VIN
VP011	Increase idling speed

GETtheMANUALS.org

SC001	WRITE SAVED DATA

NOTES	To use this command, first save the data with the **SC003 Save computer data** command. Writing is carried out after the computer has been reprogrammed or replaced.

Select scenario **SC001 Write saved data** in the diagnostic tool.
Validating this command writes the data saved using command **SC003 Save computer data**.
The data is as follows:

- Vehicle-specific idling.
- Options available on the vehicle and generated by the computer (e.g.: air conditioning).
- Fast idle speed if Commercial Vehicle.

They will configure the computer and will enable it to avoid:

- engine malfunction after reprogramming or replacing the computer,
- faulty interpretation of information provided by the CLIP tool.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

SC002	ENTER INJECTOR CODES

NOTES	This command is carried out after the replacement of one or more injectors.

To enter this data, select command **SC002 Enter injector codes** on the fault finding tool.
Procedure to be followed:
– Make a note of the 6-character alphanumeric codes engraved on the upper section of the injector bodies.
– Enter each injector code for the associated cylinder.
– Confirm the change of injector code configuration.
– When the command is completed, the modified codes appear in the current column.
– Check that the codes correspond to those read earlier.
If the codes entered appear in neither the current column nor the desired column, check the codes read and make sure the data has been entered correctly.
– Exit fault finding mode.
– Switch off the ignition and **wait for the end of the power latch***.
– Switch the ignition back on and check for faults.
– The **DF276 Injector code programming** should be stored.
If the **DF276** fault is still present, the command has not been executed correctly.
Start the procedure again and follow the instructions.
If this is still not effective, follow the procedure below:
A fault could cause **DF276** to be raised again and also incorrect confirmation of command **SC002**.
If the power latch* is not performed after the ignition is switched off, the injection computer will not store the new injector codes.
This can occur if the electrical wiring has been altered: alarm or accessories fitted to the vehicle.
Then check if the power latch* was executed correctly:
Switch off the ignition and check that the immobiliser warning light flashes **2 seconds** after switching the ignition off.
If the warning light flashes as soon as the ignition is switched off, the power latch* has not been executed and the command will not have been recognised.
If all these checks still do not enable the command to be confirmed, contact the Techline.

* The immobiliser warning light will flash a few seconds after switching the ignition off.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

SC003	SAVE COMPUTER DATA

NOTES	This save is performed before reprogramming or replacing the computer.

Select scenario **SC003 Save computer data** in the diagnostic tool.
Confirming this command saves the following vehicle-specific data:
- Vehicle-specific idling.
- Computer managed options available on the vehicle (e.g. air conditioning).
- Fast idle speed if Commercial Vehicle.

This information will be saved in the diagnostic tool.
Once the save is completed, use the **SC001 "Write saved data"** command to reparameterise the computer.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

RZ002	EGR ADAPTIVES

NOTES	This command is only executed after the exhaust gas recirculation valve has been replaced. Deal with all faults which do not involve the exhaust gas recirculation valve before programming the valve.

After having replaced the exhaust gas recirculation valve, erase the offsets in the memory so that the programming works with the offset value of the new valve.
Procedure to be followed after replacing the exhaust gas recirculation valve:
– Switch on the ignition.
– Connect the diagnostic tool and select the **Clear tab, RZ002 EGR adaptives**.
– Activate the **RZ002** command.
Once the command has finished, check the following parameters and statuses:
– **ET272 Programming first EGR offset:** not performed
– **PR128 EGR valve first offset** = 0.00 V
– **PR129 Last EGR valve offset** = 0.00 V
– **PR051 EGR valve position feedback** = 0.75 V < X < 1.5 V
– Exit fault finding mode and switch off the ignition.
– Then wait for the immobiliser warning light on the instrument panel to flash.
– You must then switch the ignition back on to initialise the new exhaust gas recirculation valve.
– When initialisation is complete, the EGR valve programming function displays:
ET272: Performed
0.75 V < PR128 = PR129 = PR051 < 1.5 V

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

AC004	TURBOCHARGING SOLENOID VALVE

NOTES	Perform this fault finding procedure: – following interpretation of an unresolved fault, or – after using the interpretation of **PR041 Turbocharging pressure** and/or following a customer complaint (lack of power, smoke, etc.).

The following procedure is for checking that the turbocharger and its control circuit are working properly.

Preliminary operation

Check the seal of the high pressure air circuit: run **test 4 Turbocharged air inlet circuit check**.
Pipe not joined or pierced, pressure sensor disconnected or poorly fitted (seal present), exchanger pierced.
To test the intercooler: stabilise the engine speed between **3500 and 4000 rpm** with the vehicle stopped and check that there are no leaks.

Measure the turbocharging pressure regulator resistance between **tracks 1 and 2**. Replace the regulator if its resistance is not:

- **15.4 Ω ± 0.7 at + 20˚C** for a ***PIERBURG*** solenoid valve
- **16.5 Ω ± 1.6 at + 25˚C** for a ***BITRON*** solenoid valve

Check for **continuity and for the absence of interference resistance** on the following connections:

Engine computer, **connector B track L2** → **track 1** of the turbocharging pressure regulator

+ 12 V after relay → **track 2** of the turbocharging pressure regulator

Turbocharger control circuit check

On **F9Q** engines, steps **1, 2, and 3** can be replaced by a visual inspection:
With the engine stopped, make sure that the control rod is in the resting position.
Start the engine and check that the control shaft moves to its upper stop (when the engine is stopped, the control shaft should return to its rest position).

1) Vacuum pressure control check:
Disconnect the solenoid valve inlet **hose** and connect it to a pressure gauge.
Start the engine and run it at a stable idle speed.
If the vacuum pressure does not reach **800 mbar ± 100**: check the vacuum pressure circuit from the vacuum pump.
Stop the engine, reconnect the inlet hoses and go to step **2 Solenoid valve control check**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

AC004 **CONTINUED 1**	

Turbocharger control circuit check (continued 1)
2) Solenoid valve control check:
Disconnect the solenoid valve outlet **hose**.
a) with a **PIERBURG** solenoid valve, start the engine and let it stabilise at idle speed.
Place your hand on the solenoid valve and block the outlet **union** with your thumb.
If you notice no solenoid valve vibration, go to **step 5 Computer output stage check, with the solenoid valve connected**)
b) with a **BITRON** solenoid valve, put a cap on the outlet **union**,
Connect a vacuum pump to the inlet **union** and apply a vacuum.
If the vacuum pressure is **maintained**, replace the solenoid valve
If not, reconnect the inlet **hoses**, remove the cap and fit the pressure gauge on the outlet **union**.
Start the engine:
If no vacuum pressure is measured, go to step **no. 5 Computer output stage check, with solenoid valve connected**.
3) Solenoid valve operation check:
Connect the pressure gauge to the solenoid valve outlet **union**.
Start the engine and run it at a stable idle speed.
G9T and G9U engines: if the vacuum does not reach **475 mbar ± 75**, replace the solenoid valve.
Engine F9Q: if the vacuum pressure does not reach **800 mbar ± 100**, replace the solenoid valve,
4) Check the operation of the turbocharger:
Engine stopped:
a) Connect a vacuum pump to the **hose** situated between the solenoid valve and the control diaphragm of the turbocharger.
Apply a vacuum pressure of **800 mbar ± 100:**
If there is a leak, replace the turbocharger (diaphragm cannot be separated from the turbocharger).
b) Check the travel and position of the control rod: run **test 6 Control of a fixed geometry turbocharger by vacuum** for a fixed geometry turbocharger, **test 7 Control of a variable geometry turbocharger** for a variable geometry turbocharger then **test 8 Rotating section of a turbocharger** in both cases.
c) Engine cold and stopped:
Remove the turbocharger air inlet duct and make sure that the compressor is turning freely on its axle.
d) If the fault is still present:
Check that the exhaust manifold is not leaking.
Check that the exhaust is not blocked: run **test 1 Exhaust pipe check**.
Carry out the necessary repairs.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

AC004 **CONTINUED 2**	

Turbocharger control circuit check (continued 2)
5) Check the output stage of the computer with the solenoid valve connected:
This operation **can only be carried out if** the checks indicated in **step no. 2** are **not conclusive**.
Vehicle with + after ignition, clear the faults displayed by the diagnostic tool.
Using a voltmeter:
Connect the voltmeter earth to **track 2** of the solenoid valve and the positive cable to **track 1**.
Activate the **AC004 Turbocharging solenoid valve** command:

➡ The voltmeter should display **ten cycles** of two successive voltages approximately equal to the product of the battery voltage and the Opening Cyclic Ratio in progress, that is: **~ 2.5 V** for an Opening Cyclic Ratio of **20 %**, then **~ 8.7 V** for an Opening Cyclic Ratio of **70 %**.

Either by oscilloscope (calibrated at **5 V/div** and time base of **1 ms/div)**:
Connect the oscilloscope earth lead to the battery earth and the positive test pin to **track 1** of the solenoid valve.
Activate the **AC004 Turbocharging solenoid valve** command:

➡ The oscilloscope should display a square wave signal of **12.5 V** at a frequency of **140 Hz** (with an Opening Cyclic Ratio passing successively from ~ 20 to ~ 70 %)

If the measurement is correct, replace the solenoid valve.
If the measurement does not show any control or continuous voltage, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

AC013	SWIRL FLAP

NOTES	Carry out this interpretation: – following **DF227 Turbulence flap (1.DEF)**, – or after a customer complaint (lack of performance).

Measure the **resistance** of the swirl flap solenoid valve between **tracks 1** and **2**.
Replace the solenoid valve if its resistance is not **46 Ω ± 3 at + 20˚C**.
Check for **continuity and for the absence of interference resistance** on the following connections:

Engine management computer, **connector C track H4** → **track 1** of the solenoid valve connector.

+ 12 V after relay (injection) → **track 2** solenoid valve connector.

A) Engine running at idle speed:
Check there is a vacuum pressure of **~ 900 mbar** in the solenoid valve inlet hose.
Make the necessary repairs (vacuum pressure circuit conformity and seal).
B) With the ignition on and engine switched off: check the solenoid valve for leaks.
Disconnect the solenoid valve inlet and outlet hoses,
Connect a vacuum pump to the inlet union and apply a vacuum pressure of **~ 900 mbar**
If there is a leak, replace the solenoid valve.
Activate the flap with command **AC013 Turbulence flap**.
If the solenoid valve opens (vacuum pump pressure gauge returns to atmospheric pressure), go to **step C**.
Otherwise, with the solenoid valve connected, check operation of the computer output stage with a voltmeter:

Voltmeter earth cable → **track 1** of the solenoid valve

Voltmeter positive lead → **track 2** of the solenoid valve

Clear any solenoid valve faults,
Activate the flap with command **AC013**:
The voltmeter should display **three** ON-OFF cycles: (**+ 12.5 V** then return to **0 V**).
If the measurement is correct, replace the solenoid valve.
If the measurement does not show **any lights**, contact the Techline.
C) Vehicle with ignition off:
Connect a vacuum pump to the valve control diaphragm and apply a negative pressure of **~ 900 mbar**:
If the diaphragm **does not maintain the vacuum pressure**, replace the air distributor (the diaphragm cannot be separated from it).
If the diaphragm **maintains the vacuum pressure** and **no movement*** of the flap is detected, replace the air distributor.
If the diaphragm **maintains the vacuum pressure** and **movement* of the flap is detected**, replace the solenoid valve (check first that no fault of the type **DF056 Air flow sensor circuit, DF325 Exhaust gas recirculation function** or **DF301 Air inlet circuit** is present or stored; if it is, deal with it first).

* *Clicking inside the air distributor when the control vacuum pressure is reached.*

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

AC031	THERMOPLUNGER No. 3 RELAY

NOTES	**There must be no present or stored faults.** Perform this fault finding procedure if there is a fault in the **command** menu, or a passenger compartment heating/demisting fault. Refer to the **Wiring diagrams** Technical Note for the vehicle to locate the fuses and relays concerned.

If the thermoplunger no. 3 relay does not operate when command **AC031 Thermoplunger no. 3 relay** is run.
Check the thermoplunger no. **3** relay mounting connections.
Check the engine management computer connections.
Repair if necessary.

If the fault is still present, check as follows that this relay is controlled by the engine management computer:
Disconnect the thermoplunger no. 3 relay, and fit a **50** to **100 Ω** resistor on the mounting instead of the coil and connect a voltmeter as follows:

- positive terminal to **+ 12 V** battery,
- negative terminal to **track 35** (depending on the engine) of the thermoplunger no. 3 relay mounting.

Clear the fault and activate the **AC031** command.
If the voltmeter indicates the battery voltage (two ON-OFF cycles of **2 seconds**), replace the thermoplunger no. 3 relay.
If the voltmeter does not show the battery voltage (two **2-second** ON-OFF cycles), contact the Techline.

If thermoplunger no. 3 relay operates with command AC031, but there is still a passenger compartment heating/demisting fault, check the following using the wiring diagram:
The conformity of the thermoplunger maxi-fuse.
The presence of the **+ 12 V battery** feed on **track 34** (depending on engine) of the thermoplunger no. **3** relay mounting.
The conformity of the thermoplunger no. **3** relay.
The continuity between **track 37** (depending on the engine) of the thermoplunger no. **3** relay mounting and the thermoplunger no. **4** supply terminal.
The conformity of the thermoplunger resistance: **0.45 Ω ± 0.05 at + 20˚C**.
The presence of the earth on the water chamber (thermoplunger mounting).
Also check the level of the cooling circuit and that there are no leaks.
Carry out the necessary repairs.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

AC034	LOW PRESSURE PUMP RELAY

NOTES	**There must be no present or stored faults.** Carry out this fault finding in the event of a high pressure pump supply fault. Refer to the **Wiring diagrams** Technical Note for the vehicle to locate the fuses and relays concerned.

If the low pressure pump relay is not working during command **AC034 Low pressure pump relay**.
Check the low-pressure pump relay mounting connections.
Check the engine management computer connections.
Repair if necessary.

If the vehicle is fitted with a **CP3** type high pressure pump, there are two possible scenarios:

- The vehicle is fitted with a priming pump which is required on starting. Command **AC034 Low pressure pump relay** must be working.
- The vehicle is fitted with a priming bulb required to bleed the low pressure circuit. Command **AC034 Low-pressure pump relay** is not useful.

If the vehicle is fitted with a **CP1** type high pressure pump, the low pressure circuit is ensured by a low pressure pump which continuously supplies the high pressure pump.
In this case command **AC034 Low pressure pump relay** must be working.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

AC035	FUEL PRESSURE SOLENOID VALVE

NOTES	Perform this fault finding procedure: – following interpretation of an unresolved fault – following detection of a fault in the Command menu, – following detection of an inconsistency in the Parameter menu, – following a customer complaint (starting problems, engine speed instability, injection noise).

Step 1
Measure the pressure regulator resistance between **tracks 1 and 2**.
If its resistance is not:
– **3 Ω ± 0.5 at + 20˚C for a CP3 high pressure pump**, replace the regulator.
– **2.5 Ω ± 0.5 at + 20˚C for a CP1 high pressure pump**, replace the regulator.

Check **the continuity and absence of interference resistance** on the connections between:

Engine computer, **connector B track L1** → **track 2** of the pressure solenoid valve connector

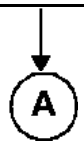
+ 12 V after relay → **track 1** of the pressure solenoid valve connector

Activate the **AC035 Fuel pressure solenoid valve** command, if a slight whistling and banging of the pressure regulator are perceptible, go to **step 2**. Otherwise, check the operation of the computer output stage:
Vehicle with + after ignition, clear the faults displayed by the diagnostic tool.
Either using an ammeter:
With the solenoid valve connected, connect the current clamp to the solenoid valve **track 1** connection (in the direction of the current): Activate command **AC035:**

➡ the ammeter should display ten successive cycles of two currents: **~ 0.6 A** then **~ 2 A**

Using a voltmeter:
With the solenoid valve connected, connect the voltmeter earth lead to **track 2** of the fuel pressure solenoid valve and the positive cable to **track 1**. Activate the **AC035** command.

➡ The voltmeter should display two successive voltages approximately equal to the battery voltage multiplied by the current opening cyclic ratio, i.e., alternately: **~ 3.15 V** for an opening cyclic ratio of **25%**, then **~ 9.45 V** for an opening cyclic ratio of **75%** (ten cycles).



AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

AC035 **CONTINUED 1**	

A

Step 1 (continued)
Either by oscilloscope (calibrated at **5 V/div** and time base of **1 ms/div**):
With the solenoid valve connected, reconnect the oscilloscope earth to the battery earth and the positive contact tip to **track 2** of the fuel pressure solenoid valve and run command **AC035 Fuel pressure solenoid valve**:

➡ the oscilloscope should display a square wave signal of **12.5 V** at a frequency of **185 Hz** (with an opening cyclic ratio alternating between **25** to **75%**).

If the measurement taken is correct:
– For engines fitted with a CP3 high pressure pump, replace the regulator.
– For engines fitted with a CP1 high-pressure pump, flush the CP1 high-pressure pump (apply **test 2 High-pressure pump flushing**) for a vehicle (Laguna II) fitted with F9Q 752/754 engines.
– If the measurement is not correct, contact the Techline.

Step 2, next page.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

AC035 **CONTINUED 2**	

Step 2
In the event of rail overpressure:
Check that there are no air bubbles in the diesel fuel low pressure circuit.
Check that the rail pressure sensor is operating correctly. Interpretation of parameter **PR038 Rail pressure**.
If these checks reveal no irregularities, replace the regulator.
In the event of rail underpressure:
Check that the rail pressure sensor is operating correctly. Interpretation of parameter **PR038 Rail pressure**.
Check the low pressure diesel circuit priming.
Check the conformity of the diesel filter connections.
Check the condition of the filter (clogging and water saturation).
Check that there are no air bubbles between the filter and the high pressure pump.
Check the low and high-pressure diesel fuel systems for leaks: use ALP6 **External leaks on the fuel circuit** fault finding chart (visual inspections, touch tests, odours, etc.) on:
pump body, pressure release valve, pipes, rail and injectors unions, injector wells, etc.
Check the conformity of the seal fitting on the pressure regulator.
Check the operation of the injectors: run **test 10 Poor injector operation** in this document.
Carry out the necessary repairs.

If the engine starts:
Clear any faults on the fuel pressure solenoid valve.
Check the pressure regulating solenoid valve using part B of the ALP7: **Rough idle**.
With the engine warm, leave it running at idle speed a few minutes **(3 to 5 minutes)**:
– If it stalls and the fault reappears, replace the regulator.
– If it does not stall, stabilise the engine speed at **2000 rpm (1 minute)** then accelerate under full load until it cuts out.
If the engine stalls, replace the high pressure pump.
If the engine does not startor there is no timing:
first replace the regulator and, if the fault is still present, replace the high pressure pump.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

AC036	EGR VALVE

NOTES	Perform this fault finding procedure: – after interpretation of **DF325 "Exhaust gas recirculation function"** fault (2.DEF) unresolved, – after a customer complaint (lack of performance, smoke).

Step 1
Measure **the resistances** of the exhaust gas recirculation valve (***Pierburg*** *or* ***Cooper*** type):
* between **tracks 1 and 5: from 7.5 Ω to 8.5 Ω at + 20˚C**.
* For the ***Pierburg*** exhaust gas recirculation valve:
between **tracks 2 and 4: 2400 Ω to 5600 Ω at + 20˚C**.
between **tracks 2 and 6: 1900 Ω to 6400 Ω at + 20˚C**.
between **tracks 4 and 6: 800 Ω to 3800 Ω at + 20˚C**.
If one of the resistances is not correct, replace the exhaust gas recirculation valve.
Check **the continuity and absence of interference resistance** on the connections between:

Engine computer, **connector B track M1** → **track 5** of the exhaust gas recirculation valve connector

+ 12 V after relay → **track 1** of the exhaust gas recirculation valve connector

If when activating the **AC036 EGR valve** command no valve movement is perceptible, check the operation of the computer output step:
Vehicle with + after ignition, clear the faults displayed by the diagnostic tool.
Either by oscilloscope (calibrated at **5 V/div** and time base of **2 ms/div**):
With the exhaust gas recirculation valve connected, connect the oscilloscope earth to battery earth with the positive test pin on **track 5** of the exhaust gas recirculation valve.
Activate the **AC036 EGR valve** command.
The oscilloscope should display a square pulse signal of **12.5 V** at a frequency of **140 Hz** (with an Opening Cyclic Ratio passing from **25** to **75%**).
Using a voltmeter:
With the exhaust gas recirculation valve connected, connect the voltmeter's earth lead to **track 5** of the exhaust gas recirculation valve and the positive lead to **track 1**. Run command **AC036 EGR valve**; the voltmeter should display two successive voltages approximately equal to the battery voltage multiplied by the current Opening Cyclic Ratio.
That is, successively: **3.15 V** for an Opening Cyclic Ratio of **25%** then **9.45 V** for an Opening Cyclic Ratio of **75%** (10 cycles).
Conclusion:
If the measurement is correct, go to **Step 2**.
If the oscilloscope (or the voltmeter) does not indicate the actuation or a continuous voltage, contact the Techline.

Step 2, next page.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

AC036 **CONTINUED**	

Step 2
Check that there are no leaks on the exhaust gas recirculation circuit.
Carry out the necessary repairs.
Check the exhaust gas recirculation valve operation:
Apply **test 9 Exhaust gas recirculation valve**, part A.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

AC037	PREHEATING RELAY

NOTES	This command is only executed if the **DF186 Heater plugs circuit** fault or the **DF017 Preheating unit control circuit** fault is present or stored and if no other fault is present. Carry out the procedure for these 2 faults first. Refer to the **Wiring diagrams** Technical Note for the vehicle to locate the fuses and relays concerned.

Before applying the following fault finding procedure, check that the battery voltage is not below 12 V. Otherwise, recharge the battery.

Step 1:

Using a multimeter fitted with an Amps clamp, group together the 4 supply wires for the heater plugs.
Run command **AC037 Preheating relay** and measure the current consumed by the 4 heater plugs.
If the current consumed is not between **60 A** and **80 A** inclusive, go to step 2, otherwise end of procedure.

Step 2:

Check the connections on the pre-postheating unit, heater plugs and injection computer.
Repair if necessary.
Measure **the resistance** of the heater plugs. If this resistance is **> 2** Ω, replace the defective plug(s).
Check **the continuity and for the absence of interference resistance** between:

preheating unit track 1 → cylinder 3 heater plug
preheating unit track 2 → cylinder 4 heater plug
preheating unit track 6 → cylinder 1 heater plug
preheating unit track 7 → cylinder 2 heater plug.

Check **the condition** of the supply fuse (70 A) for the preheating unit. Replace it if necessary.
Then check for the **+ 12 V feed** on **track 3** of the preheating relay connector.
Check **the continuity and for the absence of interference resistance** between:

Injection computer connector **B track B3** → **track 9** of the preheating unit connector
Injection computer connector **B track C3** → **track 8** of the preheating unit connector

If the fault is still present, replace the pre-postheating unit.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

AC038	LOW-SPEED FAN ASSEMBLY RELAY

NOTES	**There must be no present or stored faults.** Perform this fault finding procedure if a malfunction appears on the **command** menu or after an engine cooling system or air conditioning fault. Refer to the **Wiring diagrams** Technical Note for the vehicle to locate the fuses and relays concerned.

If, when running command **AC038, the low-speed fan assembly relay** does not operate:
Check the **low speed fan assembly** relay mounting and the connections of the engine management computer.
Repair if necessary.

If the fault is still present, check that the relay is actuated by the engine management computer as follows:
Disconnect the **low-speed fan assembly** relay, and fit a **50** to **100** Ω resistor on the relay mounting in place of the coil, and connect a voltmeter as follows:

- positive terminal to **+ 12 V** battery,
- negative terminal on **track 11** of the **low-speed fan assembly relay** mounting.

Clear the fault and run command **AC038**
If the voltmeter indicates the battery voltage (three **2-second** ON-OFF cycles), replace the relay.
If the voltmeter does not show the battery voltage (three **2 second** ON-OFF cycles), contact the techline.

If the **low-speed fan unit** relay is actuated but there remains a fan unit triggering fault, check the following using the wiring diagram:
The conformity of the fan assembly maxi-fuse.
The conformity of the low-speed fan assembly relay.

The continuity of the connection between **track 9** of the **low-speed fan assembly** relay mounting and **track 1** of the low-speed resistor,
The conformity of the low-speed resistor (resistance and connectors).
The continuity of the connection between **track 2** of the low speed resistor connector and **track 2** of the fan assembly connector.
The conformity of the fan assembly and the continuity of **track 1** to earth.
Carry out the necessary repairs.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

AC039	HIGH SPEED FAN ASSEMBLY RELAY

NOTES	**No fault should be present or stored:** Perform this fault finding procedure after a malfunction appears on the **command** menu or following an engine cooling fault. Refer to the **Wiring diagrams** Technical Note for the vehicle to locate the fuses and relays concerned.

If, when command **AC039 High-speed fan assembly** is run, the **high speed fan assembly relay** does not operate:
Check the **high speed fan assembly relay** mounting and the engine management computer connectors.
Repair if necessary.

If the fault is still present, check that the relay is actuated by the engine management computer as follows:
Disconnect the **high speed fan assembly** relay, place a **50** to **100 Ω** resistor on its mounting in place of the coil, and connect a voltmeter as follows:

- positive terminal to **+ 12 V** battery,
- negative terminal to **track 7** of the **high-speed fan assembly** relay mounting for engines.

Clear the fault and run command **AC039**
If the voltmeter indicates the battery voltage (three **2-second** ON-OFF cycles), replace the relay.
If the voltmeter does not show the battery voltage (three **2-second** ON-OFF cycles), contact the techline.

If the **high-speed fan assembly** relay is supplied using command **AC039,** but there is still a fan assembly activation fault, check the following using the wiring diagram:
The conformity of the fan assembly maxi-fuse.

The battery + feed of **track 8** of the **high-speed fan assembly** relay mounting.
the conformity of the **high-speed fan assembly relay**,
the continuity of the connection between **track 5** of the **high-speed** fan assembly relay and **track 2** of the fan assembly connector;
The conformity of the fan assembly.
The continuity of the connection between **track 1** of the fan assembly connector and **earth**.
Carry out the necessary repairs.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

AC063	THERMOPLUNGER No. 1 RELAY

NOTES	(check that the computer is correctly configured) **No fault should be present or stored:** Perform this fault finding procedure if there is a fault in the **command** menu, or a passenger compartment heating/demisting fault. Refer to the **Wiring diagrams** Technical Note for the vehicle to locate the fuses and relays concerned.

If the thermoplunger no. 1 **relay does not operate** during command **AC063 Thermoplunger no. 1 relay**:
Check the connections of the thermoplunger no. 1 relay mounting.
Check the engine management computer connections.
Repair if necessary.

If the fault is still present, check as follows that this relay is controlled by the engine management computer:
Disconnect thermoplunger no. 1 relay, and fit a **50 Ω** to **100** Ω resistor on the mounting instead of the coil and connect a voltmeter as follows:

- positive terminal to **+ 12 V** battery,
- negative terminal to **track 65** (depending on the engine) of the thermoplunger no. 1 relay mounting.

Clear the fault and actuate the relay using command **AC063**.
If the voltmeter indicates the battery voltage (two ON-OFF cycles of **2 seconds**), replace the thermoplunger no. 1 relay.
If the voltmeter does not show the battery voltage (two **2-second** ON-OFF cycles), contact the Techline.

If the thermoplunger no. 1 relay **is supplied**, but there is still a passenger compartment heating/demisting fault.
Check using the wiring diagram:
The conformity of the thermoplunger maxi-fuse.
The presence of **+ 12 V battery** feed on **track 67** (depending on the engine) of the thermoplunger no. 1 relay mounting.
The conformity of the thermoplunger no. 1 relay.
The continuity between **track 63** (depending on the engine) of the thermoplunger no. 1 relay mounting and supply terminal of thermoplunger no. 1.
The conformity of the thermoplunger resistance: **0.45 Ω ± 0.05 at + 20˚C**.
The presence of the earth on the water chamber (thermoplunger mounting).
Also check the level of the cooling circuit and that there are no leaks.
Carry out the necessary repairs.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

AC064	THERMOPLUNGER No. 2 RELAY

NOTES	(check that the computer is correctly configured) **No fault should be present or stored:** Perform this fault finding procedure if there is a fault in the **command** menu, or a passenger compartment heating/demisting fault.
	Special notes: The thermoplunger No. **2** relay supplies thermoplungers 2 and 3 in parallel. Refer to the **Wiring diagrams** Technical Note for the vehicle to locate the fuses and relays concerned.

If thermoplunger no. 2 relay **does not operate**, during command **AC064 Thermoplunger no. 2 relay**:
Check the connections of the **thermoplunger no. 2 relay** mounting.
Check the engine management computer connections.
Repair if necessary.

If the fault is still present, check as follows that this relay is controlled by the engine management computer:
Disconnect the thermoplunger no. 2 relay, and fit a **50** to **100 Ω** resistor on the mounting instead of the coil and connect a voltmeter as follows:

- positive terminal to **+ 12 V** battery,
- negative terminal to **track 3** (depending on the engine) of the thermoplunger no. 2 relay mounting.

Clear the fault and run command **AC064**.
If the voltmeter indicates the battery voltage (2 ON-OFF cycles of **2 seconds**), replace the thermoplunger no. 2 relay.
If the voltmeter does not show the battery voltage (two **2-second** ON-OFF cycles), contact the Techline.

If the thermoplunger no. 2 relay operates with command AC064, but there is still a passenger compartment heating/demisting fault. Check using the wiring diagram:
The conformity of the thermoplunger maxi-fuse.
The presence of the **+ 12 V battery feed** on **track 1** (depending on the engine) of the thermoplunger no. 2 relay mounting.
The conformity of the thermoplunger no. 2 relay.
The continuity between **track 2** of the thermoplunger no. 2 relay mounting and the supply terminals of thermoplungers **2 and 3** (except on the 16-seater Master bus, thermoplunger no. 2).
The conformity of the thermoplunger resistors: **0.45 Ω ± 0.05 at + 20˚C**.
The presence of the earth on the water chamber (thermoplunger mounting).
Also check the level of the cooling circuit and that there are no leaks.
Carry out the necessary repairs.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

AC067	DAMPER VALVE

NOTES	Carry out this interpretation: – after **DF056 Air flow sensor circuit**, 2.DEF, – in the case of incorrect operation detected in the **command** menu, – or after a customer complaint (starting faults, poor performance).

Measure the **resistance** of the damper valve solenoid valve between **tracks 1 and 2**.
Replace the solenoid valve if the resistance is not: **46 Ω ± 3 at + 25°C**.
Check **the continuity and absence of interference resistance** on the connections between:

Engine management computer **connector C track F4** ⟶ **track 1** of the damper valve solenoid valve connector

+ 12 V after relay ⟶ **track 2** of the damper valve solenoid valve connector

A) Engine running at idle speed:
Make sure there is a vacuum pressure of **~ 900 mbar** in the solenoid valve inlet hose.
Make the necessary repairs (vacuum pressure circuit conformity and seal).
B) With the vehicle ignition on, engine stopped:
Make sure the **damper valve** is **open**.
If not, clean or replace the air vent unit.
Disconnect the solenoid valve inlet and outlet hoses,
Connect a vacuum pump to the inlet union and apply vacuum pressure of **~ 900 mbar**.
If there is a leak, replace the solenoid valve.
Control the valve using command **AC067**.
If the solenoid valve opens (vacuum pump pressure gauge returns to atmospheric pressure), go to **step C**.
Otherwise, with the solenoid valve connected, check operation of the computer output stage with a voltmeter:

Voltmeter earth cable ⟶ **track 1** of the damper valve solenoid valve

Voltmeter positive lead ⟶ **track 2** of the damper valve solenoid valve connector

Clear any solenoid valve faults,
Actuate the valve via the **AC067** command:
The voltmeter should display **three cycles** of ON-OFF (**12.5 V** then return to **0 V**).
If the measurement is correct, replace the solenoid valve.
If the measurement does not show any lights, contact the Techline.
C) Vehicle with ignition off:
Connect a vacuum pump to the valve control diaphragm and apply a negative pressure of **~900 mbar**:
If the diaphragm **does not maintain the negative pressure**, replace the air vent unit (the diaphragm cannot be disconnected).
If the diaphragm **maintains the vacuum pressure** and **the flap does not move**, clean or replace the diffuser unit.
If the diaphragm **maintains the vacuum pressure** and **the flap moves** then operate it several times to ensure that there is no blockage.
Check for clogging of the air vent unit and its valve, and clean if necessary.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

VP007	DECREASING THE IDLE SPEED

NOTES	This decrease is possible with the engine at idle speed or stopped (+ after ignition feed switched on) If the adjustment was not made previously, then the idling speed default value is **PR190 Idle speed setpoint** (850 rpm ± 50). When computer data is backed up using command **SC003 Save computer data**, the special vehicle engine speed value is saved.

This command is used to decrease the engine's idle speed by - 50 rpm minimum and in stages of - 10 rpm.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

VP011	INCREASING THE IDLE SPEED

NOTES	This decrease is possible with the engine at idle speed or stopped (+ after ignition feed switched on) If the adjustment was not made previously, then the idling speed default value is **PR190 Idle speed setpoint** (850 rpm ± 50). When computer data is backed up using command **SC003 Save computer data**, the special vehicle engine speed value is saved.

This command is used to increase the engine's idle speed by + 50 rpm minimum and in increments of + 10 rpm.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition and carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

NOTES	Only refer to the customer complaints after performing a complete check using the **diagnostic tool**.

NO DIALOGUE WITH ENGINE MANAGEMENT COMPUTER →	**ALP1**
STARTING FAULT OR STARTING IMPOSSIBLE →	**ALP2**
INJECTION NOISE →	**ALP3**
POOR PERFORMANCE →	**ALP4**
IRREGULAR ENGINE OPERATION →	**ALP5**
EXTERNAL LEAKS FROM THE FUEL CIRCUIT →	**ALP6**
ROUGH IDLE →	**ALP7**
OIL LEAKS FROM THE TURBOCHARGER →	**ALP8**

GETtheMANUALS.org

ALP1	No dialogue with engine management computer

NOTES	None.

STEP 1

Check the conformity of the vehicle type and the domain selected on your tool.

Check that the tool is not faulty by trying to establish dialogue with a computer on another vehicle.

Check the supply to the diagnostic socket:

↪ + Before ignition on **track 16** / +After ignition on **track 1** / Earth on **tracks 4 and 5**

Check (according to wiring diagram and equipment):

– The conformity of the after ignition fuse.

– The conformity of the injection relay mounting supplies.

– The conformity of the impact sensor: continuity between **tracks 1 and 3** In rest position (before impact)

12 V battery ⟶ **track 3** (by fuse)

continuity between **track 3** and **track 1** of the injection relay

– **The conformity of the injection relay: 65 Ω ± 5** between **tracks 1 and 2**

infinite resistance between **tracks 3** and **5** (open contact)

resistance **< 0.2 Ω** between **tracks 3** and **5** (closed contact).

Disconnect the engine management computer and check that there are no conducting parts on the computer studs.

If this reveals any kind of impurity, rectify it and try to establish dialogue.

If the fault is still present, place bornier **Elé. 1681** on the engine wiring harness:

Check the **continuity and absence of interference resistance** on the following connections:

Engine management computer, **connector A track C3** ⟶ **Diagnostic socket track 7 (line K)**

Engine management computer, **connector A track D3** ⟶ **Diagnostic socket track 15 (line L, if wired)**

Ensure that the power supplies are in order:

Engine computer, **connector B track E3** ⟶ **+ After ignition feed**

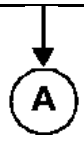
Engine computer, **connector A track D3** ⟶ **Earth**

By **putting a shunt** across **tracks 3 and 5** of the central injection unit feed relay mounting, check the continuity of the connection between:

Engine management computer, **connector B tracks M3 and M2** ⟶ **+ 12 V battery feed** (by test shunt)

Check the continuity of the connection between:

Engine management computer, **connector B track D4** ⟶ **track 2** of the central injection unit feed relay mounting



AFTER REPAIR	Carry out a road test followed by a complete check with the **diagnostic tool**.

GETtheMANUALS.org

ALP1 CONTINUED	

Try to start communication with another computer on the same vehicle.

➡ If dialogue can be established with **another computer on the same vehicle**, go to **step 2**.

➡ If dialogue cannot be established **with any other computer on the same vehicle**, the cause could be a faulty computer interfering on the **K and/or L lines.** To locate it, proceed by elimination by successively disconnecting all the computers connected to these lines (using wiring diagram and depending on equipment): Air conditioning, Airbag, ABS and ESP, UCH, instrument panel, central communication unit, parking proximity sensor. Try to establish dialogue after disconnecting each line:

If, after a disconnection, you manage to establish dialogue, perform the fault finding procedure for the computer concerned.

- ↪ If the fault is still present, reconnect the computers listed above and disconnect the engine management computer. Try to establish dialogue with another computer.
  If you manage to establish dialogue, go to **step 2.**
- ↪ If you still cannot establish dialogue, disconnect **all** the computers connected to lines **K and/or L** and check the insulation against **+ 12 V** and against earth on **track 7** and **track 15** of the **diagnostic socket**. Carry out the necessary repairs.

STEP 2

Contact Techline.

AFTER REPAIR	Carry out a road test followed by a complete check with the **diagnostic tool**.

GETtheMANUALS.org

ALP2	Starting difficult (or impossible)

NOTES	**Apply ALP2 after a complete check using the diagnostic tool.**

Is it difficult or impossible to start the engine?

impossible → B

difficult ↓

PART A:
Check the engine earths.
Ensure that engine speed reaches **250 rpm** with the starter motor, as displayed on the parameter screen (**PR055 Engine speed**).
If the engine speed is less than **250 rpm**, refer to Technical Note 6014A, Charging circuit check, 16A (formerly Technical Note 3455A), Starter motor fault finding, Starter motor (formerly Technical Note 3632A).
If the engine speed shown on CLIP is zero and the engine is running, measure the **resistance** of the engine speed sensor across **tracks 1 and 2 or A and B**:
Replace the sensor if its resistance is not: **800 Ω± 80 at + 20˚C on F9Q engine**
235 Ω ± 35 at + 23˚C on G9T - G9U engines

Check the **continuity** of the following connections on **G9T/G9U engines**:

Engine computer, **connector B track G3** → **track 1** of the engine speed sensor

Engine computer, **connector B track H3** → **track 2** of the engine speed sensor

Check the **continuity** of the following connections **on F9Q engines**:

Engine computer, **connector B track G3** → **track A** of the engine speed sensor

Engine computer, **connector B track H3** → **track B** of the engine speed sensor

Check that the engine earthing is in order (oxidation, tightness, etc.).
Check the mounting, the gap (if necessary refer to the information in the workshop repair manual for the vehicle) and the condition of the sensor (overheating).
Replace if necessary.
Check the synchronisation of the camshaft sensors and the engine speed sensors with the display of **ET238 Synchronisation**. If the synchronisation is not **COMPLETED**, refer to the checks described in **DF195 Camshaft/ engine speed consistency**.
Check the fuel circuit sealing: apply **test 3**.
If **test 3** is correct, see **DF197 Fuel pressure signal** 2.def, step 4.

AFTER REPAIR	Carry out a road test followed by a complete check with the **diagnostic tool**.

GETtheMANUALS.org

ALP2 CONTINUED 1	

Check that the heater plugs are actuated using the **AC037 Preheating relay** command.
Check the sealing and condition of the inlet circuit: apply **test 4**, follow the associated diagnostic procedure.
Check that there are no foreign bodies on the flow sensor grille: apply **test 5**, follow the associated diagnostic procedure.
Check the position of the exhaust gas recirculation valve: apply **test 9**.
Check that the exhaust is not blocked: apply **test 1**, follow the associated diagnostic procedure.
Check the consistency of the signal from the engine coolant temperature sensor.
Check that the pressure regulator is working properly (see command **AC035 Fuel pressure solenoid valve**).
Check that the injectors are working properly (return leakage too high, clogging, sticking): apply **test 10**.
Check the engine timing (and the position of the high pressure pump sprocket).
Check the balance of the compressions, according to the power consumption during the starting phase (**Compression test** menu on the CLIP Technic tool).

If you do not have the CLIP Technic tool, or in case of imbalance, use a compression gauge to perform the measurement (see procedure in the Workshop Repair Manual). after the operation, clear the faults caused by disconnecting the regulator and the heater plugs.

AFTER REPAIR	Carry out a road test followed by a complete check with the **diagnostic tool**.

GETtheMANUALS.org

ALP2

CONTINUED 2

B

Is there diesel in the tank?

NO → Fill the tank with diesel fuel. Bleed the low and high pressure diesel circuit.

YES

Does the starter motor work properly (Check that the engine speed reaches **> ~ 250 rpm** with the starter motor, **PR055 Engine speed**)

NO → Refer to Technical Note 6014A, Check the charging circuit, 16A (formerly Technical Note 3455A), Starter fault finding, starter (formerly Technical Note 3632A).

YES

Using the diagnostic tool, check the conformity of the immobiliser: **ET003 Immobiliser** must be **INACTIVE**.

ET003 not in order, or immobiliser warning light continuously lit

Consult the fault finding procedure for the immobiliser.

ET003 in order (immobiliser code warning light switched off)

continue the fault finding procedure with part a of this fault finding chart.

AFTER REPAIR	Carry out a road test followed by a complete check with the **diagnostic tool**.

GETtheMANUALS.org

ALP3	Injection noise

NOTES	**Apply ALP3 after a complete check using the diagnostic tool.**

If the injection noise occurs after starting from cold:

Check the low pressure diesel circuit priming.
Check the fuel heater supply.
Check the operation of the preheating system.
Check that fuel and engine temperatures are consistent.

If the injection noise occurs at idle speed:

Check the condition of the injector connector and pressure regulator terminals.
Check the conformity of the air flow signal: use the: **PR132 Air flow** diagnostics or apply **test 4**.

If the fault is still present, perform the injector fault finding procedure: apply **test 10**.

does the injection noise occur at all engine speeds?

Perform fault finding on the injectors: apply **test 10**.
Check the condition of the injector connector and pressure regulator terminals.
Ensure that the correct fuel is being used.
Apply **test 12 Diesel fuel conformity check**.

Check the conformity of the air flow signal: use the interpretation of the fault finding procedure **PR132 Air flow**.
If the customer complaint is still present:
Run command **AC035 Fuel pressure solenoid valve**.
Then apply the conformity check associated with this note, in order to check:
– the conformity of the fuel pressure: **PR038 Rail pressure**,
– the conformity of the fuel flow from the pump: **PR017 Fuel flow**.
If the fault is still present, contact the techline.

AFTER REPAIR	Carry out a road test followed by a complete check with the **diagnostic tool**.

GETtheMANUALS.org

ALP4	Poor performance

NOTES	**Apply ALP4 after a complete check using the diagnostic tool.**

IMPORTANT
In the event of the engine overheating to more than **119 ˚C**, the computer will voluntarily limit the fuel flow (warning light comes on after **115 ˚C**).
– Please observe the cleanliness guidelines and safety advice.

Is the poor performance accompanied by smoke? — **NO** → **A**

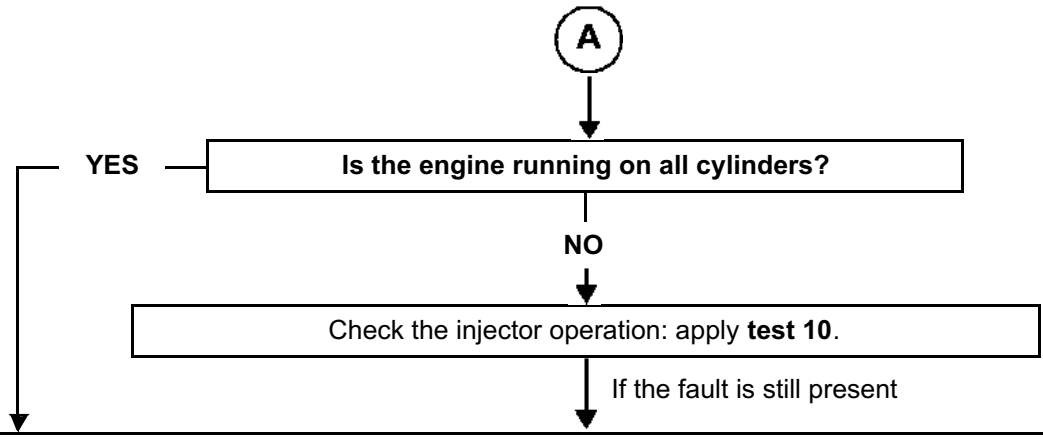
YES ↓

Check:
– that the correct fuel is being used.
– Apply **test 12 Diesel fuel conformity check**.
– The conformity of the assembly of the injectors (presence and **conformity of the sealing washer**).
Checking procedure:
– Take a straightedge approximately 40 cm long and place it on the 4 injectors. The straightedge should rest on the 4 injectors.
– If 1 injector protrudes, remove the injector and check that the washer is correct.
– If one injector does not touch the straightedge (clearance of more than 1 mm), remove the injector and check that the washer is present.
– Clean the injector well and the injector, refit the injector with its correct sealing washer.
– The sealing and condition of the inlet circuit: apply **test 4**.
– The condition of the air flow sensor: apply **test 5**.
– The turbocharger: apply **test 6** for a fixed geometry turbocharger, **test 7** for a variable geometry turbocharger then **test 8** in both cases.
Road test with another cotech:
– The engine must be warm.
– Select 3rd or 4th gear, accelerate with full load on the accelerator.
– Ask the cotech to display the following parameters:
PR209 Turbocharging pressure loop difference,
PR041 Turbocharging pressure,
PR132 Air flow,
PR055 Engine speed.
Check that the turbocharging pressure follows the increase in the engine speed and that the turbocharging pressure loop difference is low. Otherwise, replace the turbocharger.
Apply **test 9**, part A.

AFTER REPAIR	Carry out a road test then check with **the diagnostic tool**.

GETtheMANUALS.org

ALP4 CONTINUED	



Check the conformity of the accelerator pedal position sensor, the brake pedal sensor, the atmospheric pressure sensor, the exhaust gas recirculation valve and the damper valve.

– Check the consistency of the signal: of the air flowmeter, of the engine coolant temperature sensor, of the fuel temperature sensor and of the engine speed.

Check the connections, continuity and absence of interference resistance of the air flowmeter (apply **DF056 Air flowmeter circuit**, 2.def), the engine coolant temperature sensor (apply **DF001 Coolant temperature circuit**, 1.def), the fuel temperature sensor (apply **DF098 Fuel temperature sensor circuit**, CO.1) and the engine speed (apply **DF195 Camshaft sensor/engine speed consistency**, 2.def).

Check that the turbulence flap is open at rest position: command interpretation **AC013 Turbulence flap** (depending on features).

Check:
- That the diesel fuel filter is not clogged (see **DF197 Fuel pressure signal** 2.def, continued 2, for the check).
- that there are no leaks on the high and low pressure diesel circuits: apply **test 3**.
- That the oil vapour rebreathing system is connected.
- The flow regulator (jamming/sticking: apply command interpretation AC035 **Fuel pressure solenoid valve**).

– Check the timing adjustment (and the position of the high-pressure pump sprocket) (See procedure in the **Workshop Repair Manual if necessary**).

– Check the cylinder compressions (balance of the cylinder compressions with the compression test function on the CLIP Technic tool).

– Measure the engine compressions with the special tool (Refer to the procedure in the **Workshop Repair Manual if necessary**).

If the fault is still present, contact the techline.

AFTER REPAIR	Carry out a road test followed by a complete check with the **diagnostic tool**.

GETtheMANUALS.org

ALP5	Irregular engine operation

NOTES	**Follow ALP 5 after a complete check with the diagnostic tool.**

If the engine races during gear changes, check, if there is a floor carpet, that this is not blocking the accelerator pedal, the brake pedal or the clutch pedal, then check the conformity of the clutch switch and the conformity of the accelerator pedal sensor when the pedal is released.
Measure **the resistance** of the engine speed sensor between **tracks 1 and 2 or A and B**.
Replace the sensor if its resistance is not: **800 Ω± 80 at + 20˚C on F9Q engine**
235 Ω ± 35 at + 23˚C on G9T - G9U engines

Check the **continuity** of the following connections on G9T/G9U engines**:**

Engine computer, **connector B track G3** → **track 1** of the engine speed sensor

Engine computer, **connector B track H3** → **track 2** of the engine speed sensor

Check **the continuity** of the following connections on F9Q engines:

Engine computer, **connector B track G3** → **track A** of the engine speed sensor

Engine computer, **connector B track H3** → **track B** of the engine speed sensor

Check that the engine earthing is in order (oxidation, tightness, etc.).
Check the mounting, the gap (if necessary refer to the information in the workshop repair manual for the vehicle) and the condition of the sensor (overheating).
Replace if necessary.
Check the low pressure circuit: apply **test 3**.
– Check the pressure regulating solenoid valve using part B of **ALP7 Rough idle**.
approximately 1350 bar under load with foot hard down on the accelerator.
– Apply the method used for checking the air flow, explained in the Conformity check section.
– Check the turbocharger: apply **test 6** for a fixed geometry turbocharger, **test 7** for a turbocharger with variable geometry, then **test 8** in both cases.
– Use the procedure for checking the hydraulic circuit that is explained in the Conformity check.

If the fault is still present:
– Check the balance of the cylinders using the CLIP Technic function, **Compression test** physical measurements icon.
– Check the engine compressions with the special tool, if necessary.

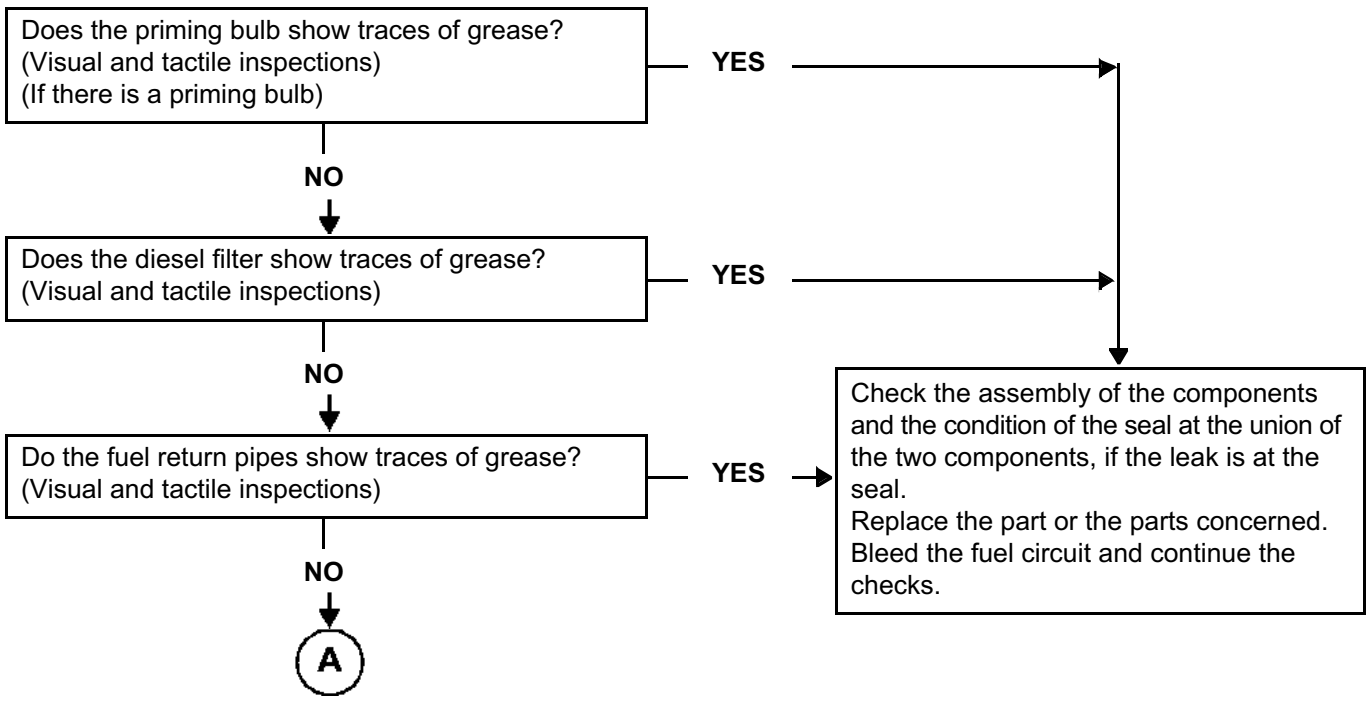
AFTER REPAIR	Carry out a road test followed by a complete check with the **diagnostic tool**.

GETtheMANUALS.org

ALP6	Fuel system leaks

NOTES	**Follow ALP 6 after a complete check with the diagnostic tool.** **IMPORTANT** **Please observe the cleanliness guidelines and safety advice.**

Procedure for checking for an external leak on the fuel circuit:
Clean away traces of grease with clean thinner and wipe the part or parts concerned with cleaning cloths.
Start the engine and increase the engine temperature until the diesel fuel reaches 50/60˚C.
Stop the engine and check for traces of grease on the part or parts concerned.
If this is the case, replace the part or parts concerned.
Bleed the fuel circuit and continue the checks.

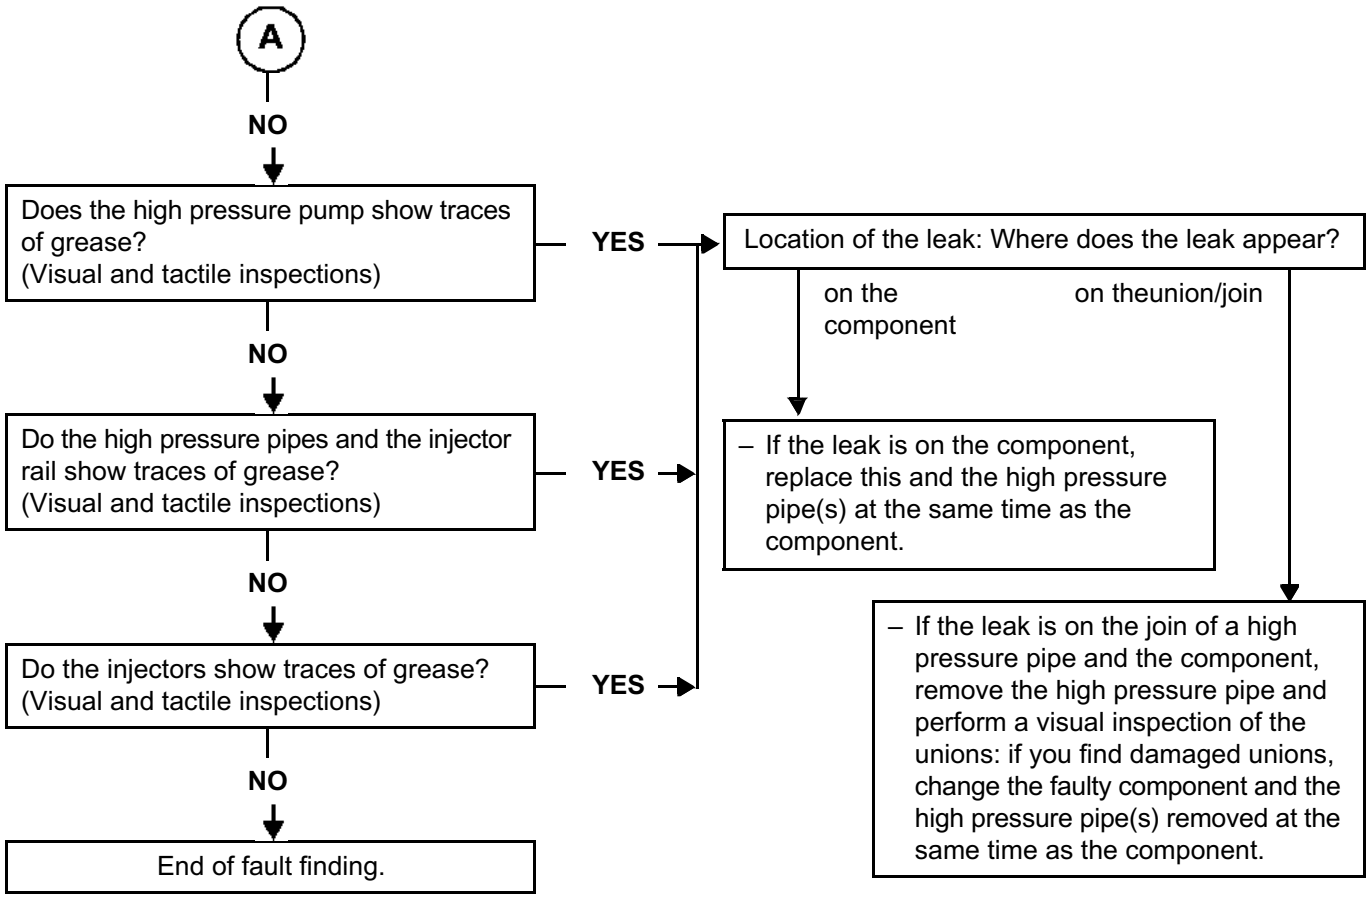


AFTER REPAIR	Carry out a road test followed by a complete check with the **diagnostic tool**.

GETtheMANUALS.org

ALP6

CONTINUED



Reminder:
Do not replace the rail, pump or injector unless the union is damaged during the visual inspections.
Bleed the fuel circuit and continue the checks.

AFTER REPAIR	Carry out a road test followed by a complete check with the **diagnostic tool**.

GETtheMANUALS.org

ALP7	Rough idle

NOTES	**Before analysing this customer complaint, check that there are no faults, and the conformity (or otherwise) of the parameters and statuses using the diagnostic tool.** **If the customer complaint is not eliminated, perform the following checks.**

Check the sealing and condition of the inlet circuit using **Test 4 Turbocharged air circuit test and Test 9 Exhaust gas recirculation valve.**

↓

Check the low pressure circuit, run **Test 3 Low pressure circuit check.**

↓

check the engine parameters:
– check the update of the engine management computer calibration (last calibration).
– Check the conformity of the **IMA** codes (using the **Identification screen** of the **CLIP diagnostic tool**).
– Check the charging circuit (see **Technical Note 6014A Checking the charging circuit**).

– To check the conformity of the engine speed signal, check:
* The wiring.
* The flywheel position and the condition of the flywheel teeth.
* The position and tightness of the engine speed sensor.

– Check the fuel flow correction from station to station: run **Test 10 Poor injector operation**.

↓

Check the connections and wiring of the injectors.
Check the connections and wiring from the engine management computer to the injectors.
Repair if necessary.

↓

Check the high pressure circuit (external leaks) (see the end of **ALP6 Fuel circuit external leaks**).

↓

(A)

AFTER REPAIR	Carry out a road test followed by a complete check with the **diagnostic tool**.

GETtheMANUALS.org

ALP7 CONTINUED	

Check the timing setting (and the position of the high pressure pump pinion)

Check the lower engine:
– Check the compressions using the CLIP Technique **diagnostic tool**, **Compression test** or the special tool.
– Check the engine mountings only if there is noise or excessive vibrations at idle speed.
If the checks are correct, contact the Techline.

AFTER REPAIR	Carry out a road test followed by a complete check with the **diagnostic tool**.

GETtheMANUALS.org

ALP8	Oil leaks from the turbocharger

NOTES	**Complete ALP8 after a complete check using the diagnostic tool.**

Clean the oily parts of the turbocharger, when cold, with cleaning cloths (part number: 77 11 211 707).

→ At idle speed, check if the turbocharger is leaking from the turbocharger oil supply inlet or outlet, from the turbine inlet or outlet or from the compressor and the rear plate of the compressor housing.

← If the leak is at the inlet or outlet of the turbocharger's oil supply.
Replace the seal of the leaky pipe or the pipes if necessary.

If the leak is at the inlet or outlet of the turbine* or of the compressor*.
Check manually if the end play is normal or excessive (see photograph on the next page).
Is the end float normal?

NO → Replace the turbocharger and check:
– that the turbocharger oil supply circuit is not blocked.
Perform an oil change and change the oil filter.
Change the air duct.
Empty and clean the intercooler and the air circuit ducts.

YES ↓

If the leak is on the rear plate (compressor housing).
Replace the turbocharger.

IMPORTANT
Risk of destroying the new turbocharger and the engine if the air circuit is not cleaned and the oil and its filter are not replaced.

*Note:
It is normal to find traces of oil at the turbocharger inlet and outlet, as the air passing through the compressor is loaded with oil from the engine rebreathing circuit.

The operating play of the turbocharger bearings is approximately 25 µm between the turbocharger shaft and the internal mating face of the bearings and 75 µm between the exterior part of the bearings and the bearing housing.
Risks:
In the event of destruction of the turbocharger bearings, the steel and bronze swarf from this destruction are evacuated through the turbocharger oil to the engine's oil sump. The swarf can, consequently, be returned to the oil circuit via the oil pump, then cause widespread contamination of the engine oil circuit. This causes abnormal wear on the crankshaft bearing bushings, the con rod bearing shells and the camshafts, etc.
In the event of the compressor wheel breaking, parts of the blades may be found in the intercooler or in the air circuit ducts. The turbine wheel could easily be found in the catalytic converter.

AFTER REPAIR	Carry out a road test followed by a complete check with the **diagnostic tool**.

GETtheMANUALS.org

TEST1	Exhaust system check

Engine stopped: Check that the silencer outlet is not blocked. Repair or replace the silencer, if necessary.

↓

Check the seal of the exhaust manifold on the contact surface between the turbocharger and the exhaust manifold.
Is the seal in order?

NO → Repair or replace the faulty part.

YES

↓

Loosen the catalytic pre-converter on the turbocharger side. Place a wooden block between the two parts.
Start the vehicle and check if the engine runs better.
Is the engine running normally?

NO → The exhaust pipe is not the cause of the fault; repeat the engine fault finding in the Customer complaints - Fault finding chart section.

YES

↓

Retighten the catalytic pre-converter.
Loosen the catalytic converter on the catalytic pre-converter side. Place a wooden block between the two parts.
Start the vehicle and check if the engine runs better.
Is the engine running normally?

NO → Replace the catalytic pre-converter.

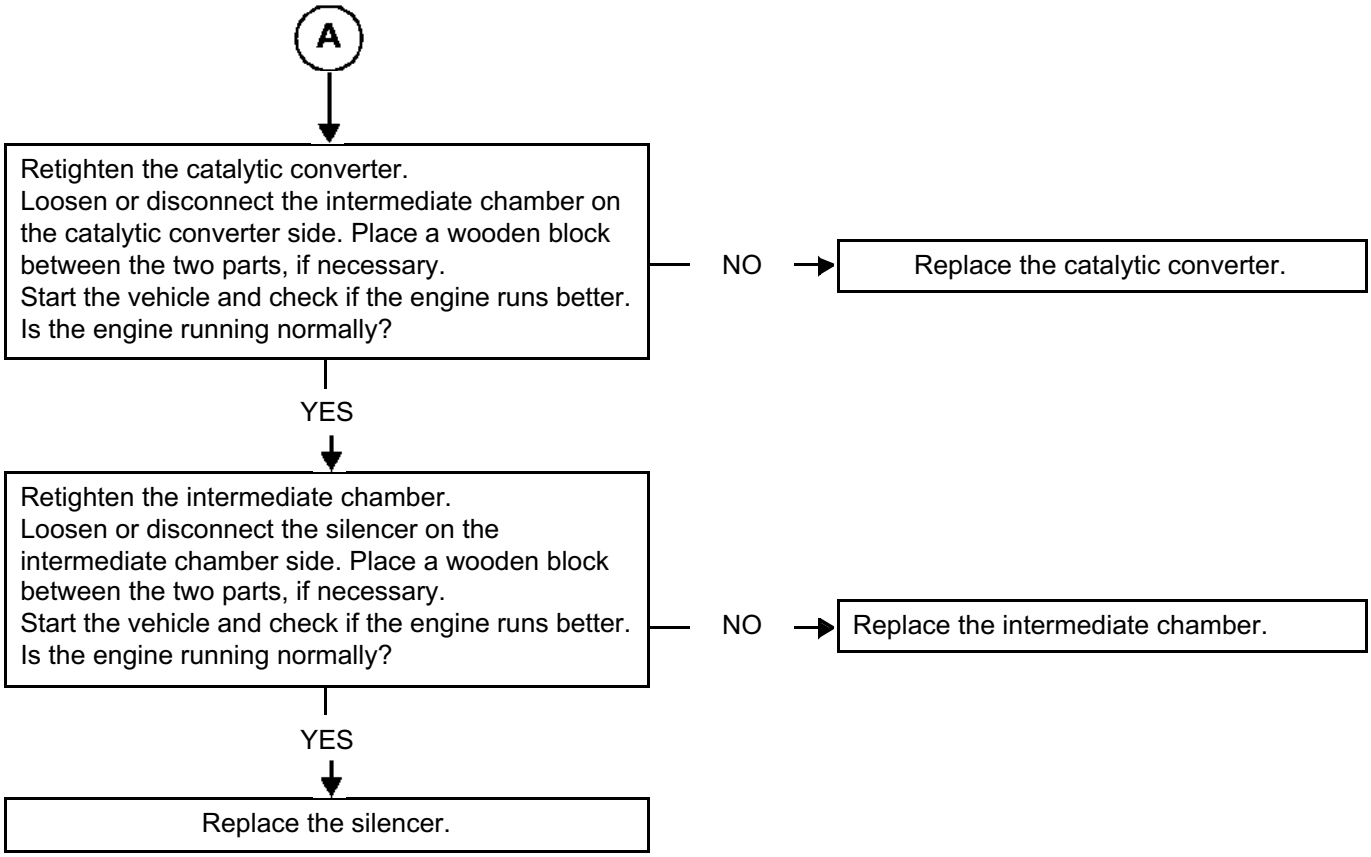
YES

↓

(A)

GETtheMANUALS.org

TEST1 CONTINUED	



GETtheMANUALS.org

TEST2	Flushing the high pressure pump

*For **CP1 pumps only**!*
This operation is designed to flush any particles likely to jam or upset operation of the pressure regulator, into the return circuit. The particles are then trapped by the fuel filter.
Rinsing requires simultaneously pressurising the high-pressure pump feed circuit and controlling the rail pressure regulation solenoid valve.
Procedure: (refer to the **Wiring diagrams** Technical Note for the vehicle)

- With the ignition off:
- Remove the low pressure pump relay.
- On the engine fuse box and relay, shunt the power circuit of the low pressure pump relay.
- Connect the diagnostic tool and switch on the ignition.
- Establish dialogue then go to command mode.
- Run command **AC035 Fuel pressure solenoid valve 3 to 5 times**.
- Switch off the ignition.
- Remove the shunt and replace the high pressure pump relay.
- Switch on the ignition again and establish dialogue.
- Clear the low pressure pump relay fault.
- Start the engine and record the rail pressure values.

If the operation has improved the rail pressure values:
Repeat the procedure to complete the flushing operation. During the road test to follow, put your foot to the floor several times to drive out any impurities to the tank.
End of operation.
If the operation has had no effect on the rail pressure values:
Repeat (or perform) the **AC035 step 2** fault finding procedure.

GETtheMANUALS.org

TEST3	Low pressure circuit check

High pressure pump? — CP1 → B

CP3 ↓

Check the fuel filter:
- Conformity of the fuel filter (correct part number and RENAULT filter).
- Positioning and amount of clogging in the filter element.
- Positioning and condition of the seals.
- **If there is metal swarf in the filter:**
  Replace the fuel filter, bleed the circuit and **continue the fault finding procedure**.

↓

Supplying the injection system with fuel from an additional tank.
This operation aims to detect possible faults in the low pressure supply system of a vehicle by replacing it entirely with an additional tank.
Mode:
- Disconnect the diesel fuel supply pipe at the fuel filter inlet and seal it with a plug.
- On vehicles fitted with an electric priming pump (no priming bulb), remove the pump feed relay.
- Connect a pipe to the fuel filter inlet and insert the other end in a **clean** container of approximately 5 litres.
- Disconnect the diesel return pipe at the diesel temperature sensor (pump return and injector return join), and block it using a plug.
- Connect a transparent pipe at the union of the diesel temperature sensor, and insert the other end in the container.
- Fill the container with **clean** diesel fuel.
- Start the engine and let the system drain itself of its air (there must not be any air bubbles in the return pipe).

↓

Is the customer complaint still present? — YES → If the low pressure circuit is in order, reconnect the various pipes making up the low pressure circuit and repeat the fault finding procedure in the fault finding chart or for the fault that referred you to this test.

NO ↓

Are the low pressure circuit connections in order and in good condition? — NO → Carry out the necessary repairs.

YES ↓

A

GETtheMANUALS.org

TEST3 CONTINUED 1	

(A)

Check the condition and operation of the priming bulb (depending on the engine), of the priming pump (depending on the engine). Perform repairs if necessary and continue the test.

If the fault is still present with a low fuel level, check the consistency of the actual fuel level and that indicated on the instrument panel.
– The transfer pump is supplied via a venturi valve located beneath it.
Check that the opening of the venturi (**6 to 8 mm** in diameter) is not blocked by dirt contained in the fuel tank.
Check the priming of the low pressure diesel circuit.

Ensure that the correct fuel is being used.
Apply **test 12 Diesel fuel conformity check.**

Special features of the low pressure circuit on vehicles fitted with a priming pump
This pump is only activated for a few seconds when the ignition is switched on and when starting.
– Check that the pump is working during these phases.
Carry out the necessary repairs.

Low pressure circuit correct.

GETtheMANUALS.org

TEST3 CONTINUED 2	

B (CP1)

Connect a 0 - 5 bar pressure gauge to the high pressure pump inlet (using a T-piece) and read the pressure with the engine running:
Follow the cleanliness instructions carefully.

Pressure > 1.5 bar. — YES → Pressure < 2 bar. — NO → Replace the fuel filter unit.

NO

YES

Connect the pressure gauge at the inlet of the filter and repeat the operation.

Low pressure circuit correct.

Pressure > 1.5 bar. — YES → Low pressure circuit correct upstream of the filter. Check the clogging of the filter and the pipe kinked at the filter outlet.

NO

Remove the pipe at the filter inlet.
Place a container here to catch the fuel.
Display the fuel flow with the ignition on:

If the fuel flow is approximately 1 litre per 30 seconds, the pump and the pipes of the circuit upstream from the pump are in order.
Otherwise, replace the fuel filter head.

C

GETtheMANUALS.org

TEST3 CONTINUED 3	

C

If the fault is still present with a low fuel level, check the consistency of the actual fuel level and that indicated on the instrument panel.
– The transfer pump is supplied via a venturi valve located beneath it.
Check that the opening of the venturi (**6 to 8 mm** in diameter) is not blocked by dirt from the fuel tank.

Ensure that the correct fuel is being used.
Apply **test 12 Diesel fuel conformity check.**
END **TEST 3**.

GETtheMANUALS.org

TEST4	Checking the turbocharged air inlet circuit

Engine stopped: Check the low and high-pressure air circuits for **leaks** (air leaks in or out, upstream or downstream of the turbocharger).

Check the parts that are abnormally greasy of the circuit and reveal a lack of tightness.
Check:
– The condition and fitting of the ducts (foreign bodies, clogged, disconnected, pinched, broken, holed, cut, tightness of the mounting bolts, etc.).
– the presence, condition and fitting of the seals.
– the present and tightening of the clamps.
– The fitting of the turbocharging pressure sensor.
Carry out the necessary repairs.

Checking the air filter.

Check:
– That the air filter unit inlet and outlet are not blocked.
– The condition and the assembly of the air filter unit (disconnected, broken, holes, etc.).
– The cleanliness, conformity and the absence of deformation of the filter element.
– The air flowmeter: apply **test 5**.
Carry out the necessary repairs.

If the engine is equipped accordingly, check:
– that the damper valve is open (**AC067 Damper valve**, step B).
– the condition of the damper valve:
– the tightness of the mounting bolts,
– cracks in the damper valve.
– that the turbulence flap is in the rest position (**AC013 Turbulence flap**, step B).
Carry out the necessary repairs.
Replace if necessary.

Check that there is no leakage on the exhaust manifold, in particular at the exhaust manifold / turbocharger interface.
Check the exhaust system: apply **test 1**.
Carry out the necessary repairs.

Check the condition of the intercooler:
– clogging,
– leaks (vehicle stationary, stabilise the engine speed between 3500 rpm and 4000 rpm and check that there are no leaks).
Replace if necessary.
END OF TEST.

GETtheMANUALS.org

TEST5	Air flowmeter

+ 12 V supply
(Refer to the **Wiring Diagrams Technical Note** for the vehicle to locate the **connections** and **connectors** concerned).

Check the **+ 12 V** supply on **track 4** of the air flowmeter.
If it is not correct, check **the continuity and absence of interference resistance** on the connection between the air flowmeter supply relay and **track 4** of the air flowmeter.
Carry out the necessary repairs.

Check the operation of the air flowmeter supply relay.
Replace the relay if necessary.
If not, check the supply to the air flowmeter supply relay.

If it does not conform, check **the continuity and absence of interference resistance** on the connections between the air flowmeter supply relay and between the fuse(s) and the battery.
Repair, if not correct.
If correct, check the fuse(s) concerned. Replace the fuse(s) if necessary.

↓

Contamination of the grilles
Visual inspection: remove the flowmeter; there should be no foreign bodies in the grilles (see illustration no. 110734 on the last page of this test).
Do not clean the grilles using compressed air or any other procedure: this damages the sensors and creates variations from the values displayed on the CLIP tool.
Check the air circuit sealing upstream of the air flow sensor: ducts and air filter unit disconnected or pierced, presence of seals.
Replace the air flowmeter if necessary and clean upstream of this, if necessary.

↓

Damage to electrical components
Visual inspection: remove the air flow sensor; components should not be broken (see diagram no. 110736 on the last page of this test).
Replace the air flowmeter if necessary.

↓

Oxidation of the electrical components
Visual inspection: remove the air flowmeter, there should not be any greenish deposits on the electrical components.
Replace the air flowmeter if necessary.

↓

Clogging of the air flowmeter
See following page.

GETtheMANUALS.org

TEST5 CONTINUED 1	

Clogging of the air flowmeter
Test:
– Check the values for conformity:
  * During the first 5 seconds after starting:
    – Coolant temperature: 80˚C.
    – Engine speed: idle speed (800 rpm for G9T 702 and F9Q 754 engines),
    – Air flow value: 59 kg/h ± 5 % for G9T 702 engines and 47 kg/h ± 5 % for F9Q 754 engines,
    – EGR valve opening cycle ratio*: 5%.
  * After the starting phase:
    – Coolant temperature: 80˚C.
    – Engine speed: idle speed (800 rpm for G9T 702 and F9Q 754 engines),
    – Air flow value: 33 kg/h ± 5 % for G9T 702 engines and 27 kg/h ± 5 % for F9Q 754 engines.
    – EGR valve opening cycle ratio*: between 35% and 45%.
– Refer to DF056 2.def, for the air flowmeter checks.
Replace the air flowmeter if necessary.

* OCR = Opening Cycle Ratio.

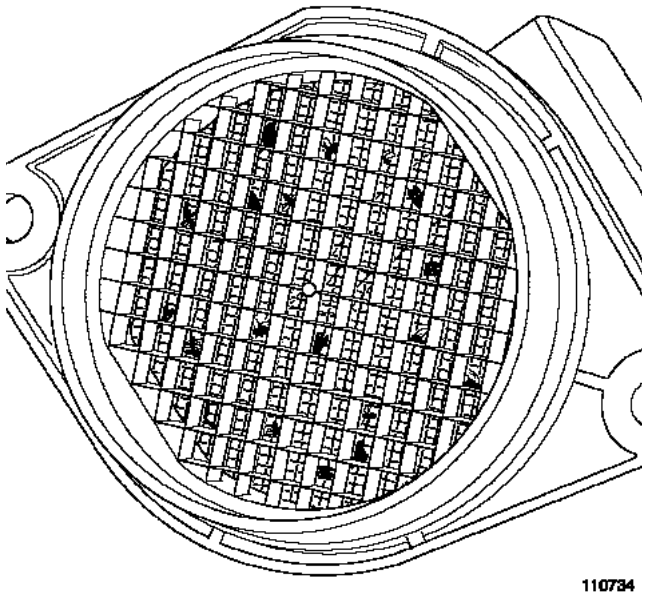
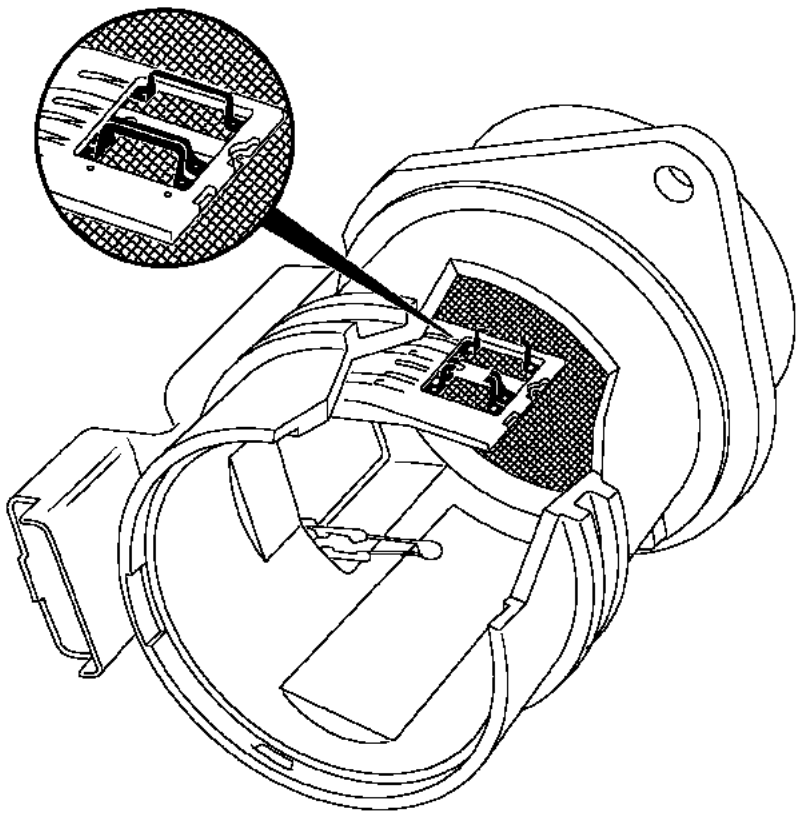
TEST5 CONTINUED 2	

Contamination of the grille



110734

Damage to the electrical sensors



110736

GETtheMANUALS.org

TEST6	Fixed geometry turbocharger vacuum control

Engine stopped:
Check manually if the rod of the regulation valve is blocked.
Is the rod jammed?

YES → Replace the turbocharger.

NO ↓

At idle speed, turbocharging solenoid valve control: 85% OCR*, disconnect the electrical connector of the solenoid valve and check at the same time if the wastegate control rod moves.
Does the rod of the wastegate move from end to end?

YES → The turbocharging control circuit is operating normally.

NO ↓

Check the condition of the wastegate valve connectors (corrosion, bent pins, etc.).
Measure the resistance of the solenoid valve between its tracks 1 and 2. It should be:
– 15.4 Ω ± 0.7 at + 20°C for a *Pierburg* solenoid valve,
– 16.5 Ω ± 1.6 at + 20°C for a *Bitron* solenoid valve.
Is the solenoid valve in order?

NO → Replace the turbocharging solenoid valve.

YES → Check the continuity and the + 12 V and earth insulation of the connection between track L2 of connector B of the engine management computer and track 1 of the turbocharging solenoid valve connector. Check the continuity and earth insulation of the connection between the 12 V feed after the injection relay and track 2 of the turbocharging solenoid valve connector.

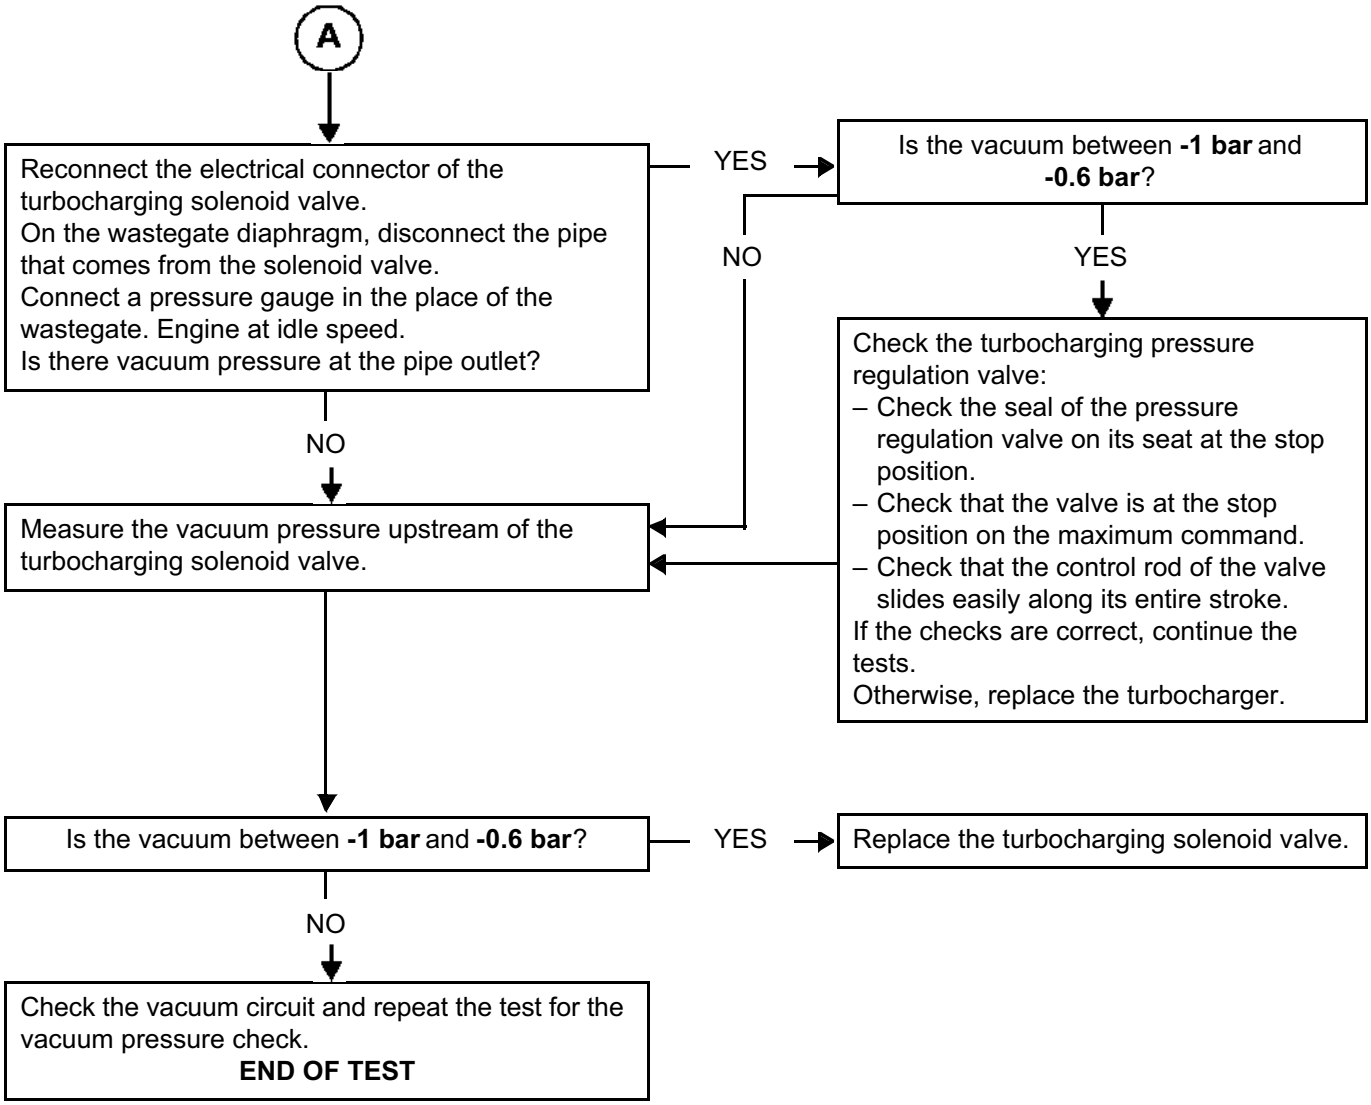
→ (A)

* OCR = Opening Cycle Ratio.

GETtheMANUALS.org

TEST6

CONTINUED



GETtheMANUALS.org

TEST7	Variable geometry turbocharger control

Engine stopped:
Check manually if the variable geometry control rod is jammed.
Is the rod jammed?

YES →
– Replace the turbocharger.
– Perform a visual inspection of the condition of the turbine and the compressor (see the illustrations of **test 8**).
If one of the 2 wheels is damaged, you should also replace the duct connected to the damaged wheel.

NO ↓

At idle speed, with turbocharging solenoid valve control: 85% OCR*, disconnect the electrical connector of the solenoid valve and check at the same time if the rod controlling the blades of the variable geometry turbocharger moves.
Does the rod move from end to end?

YES →
The turbocharging control circuit is operating normally.

NO ↓

Check the condition of the turbocharging solenoid valve connectors (corrosion, bent pins, etc.).
Measure the resistance of the turbocharging solenoid valve between its tracks 1 and 2.
It should be:
– 15.4 Ω ± 0.7 at + 20˚C for a *Pierburg* solenoid valve,
– 16.5 Ω ± 1.6 at + 20˚C for a *Bitron* solenoid valve.
Is the solenoid valve in order?

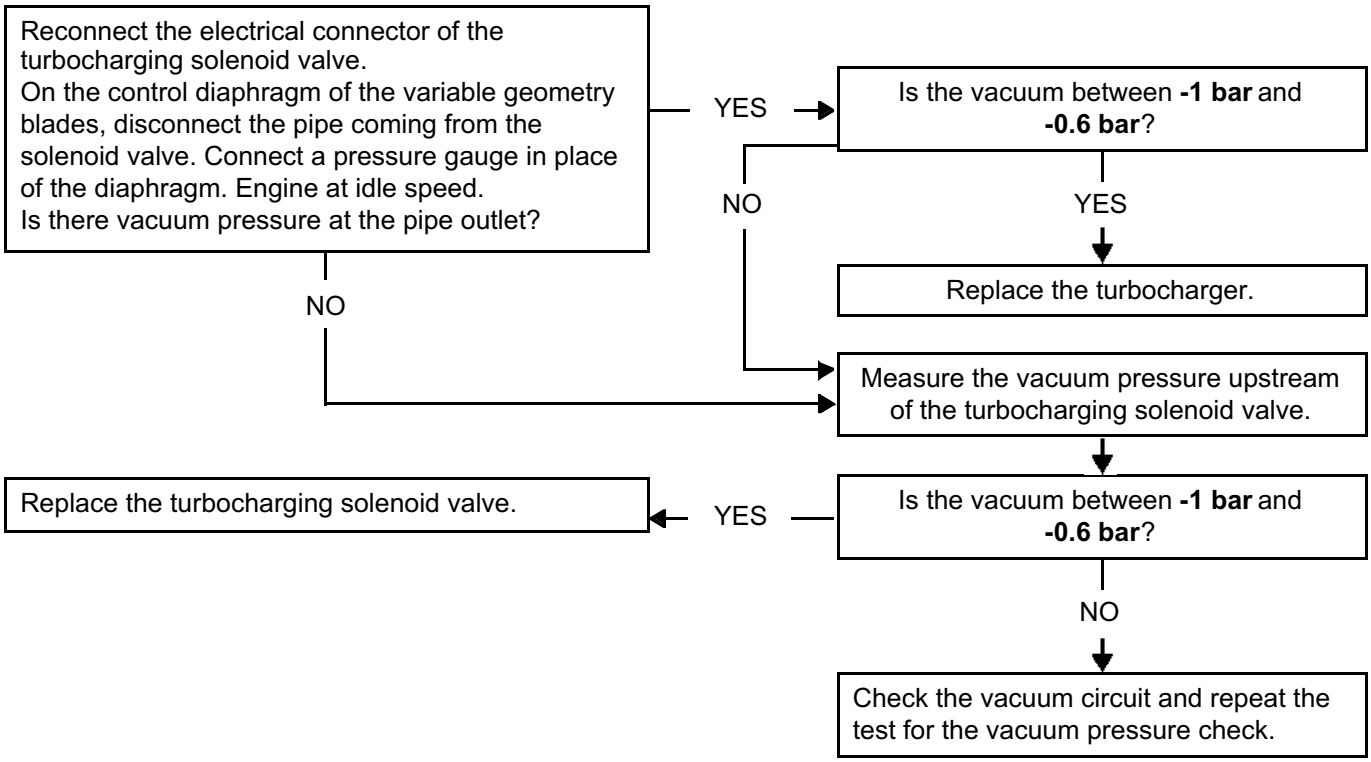
NO →
Replace the turbocharging solenoid valve.

YES →
Check the continuity and the + 12 V and earth insulation of the connection between track L2 of connector B of the engine management computer and track 1 of the turbocharging solenoid valve connector.
Check the continuity and earth insulation of the connection between the 12 V feed after the injection relay and track 2 of the turbocharging solenoid valve connector.
Repair, if necessary.

* OCR = Opening Cycle Ratio.

GETtheMANUALS.org

TEST7 CONTINUED	



GETtheMANUALS.org

TEST8	Rotating part of a turbocharger

With the engine cold and stopped, remove the air inlet duct from the turbocharger; check manually if the shaft of the turbine and of the compressor turns. Does the shaft turn?

NO → Replace the turbocharger.

The turbocharger could be sticking due to poor lubrication of the bearings. Check for possible clogging of the lubrication circuit and the engine oil pressure.
Perform an oil change and change the oil filter.

YES

Perform a visual inspection of the condition of the wheels (see the illustrations on the next page).
Are the wheels in good condition?

NO →
– Replace the turbocharger.
– Replace the duct connected to the damaged wheel.

YES

The rotating section is in order.

The operating play of the turbocharger bearings is approximately 25 μm (micrometers or microns) between the turbocharger shaft and the internal mating face of the bearings and 75 μm between the exterior part of the bearings and the bearing housing.

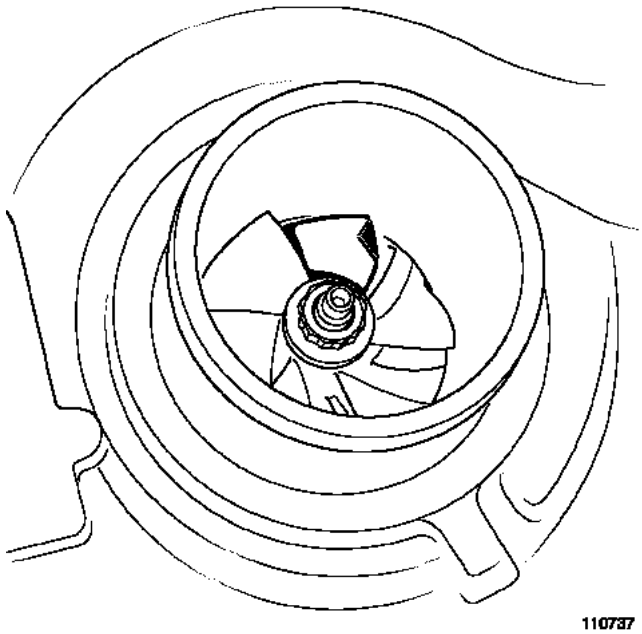
Risks:

In the event of destruction of the turbocharger bearings, the steel and bronze swarf from this destruction are evacuated through the turbocharger oil to the engine's oil sump. The swarf can, consequently, be returned to the oil circuit via the oil pump, then cause widespread contamination of the engine oil circuit. This causes abnormal wear on the crankshaft bearing bushings, the con rod bearing shells and the camshafts, etc.
In the event of the compressor wheel breaking, parts of the blades may be found in the intercooler or in the air circuit ducts. The turbine wheel could easily be found in the catalytic converter.

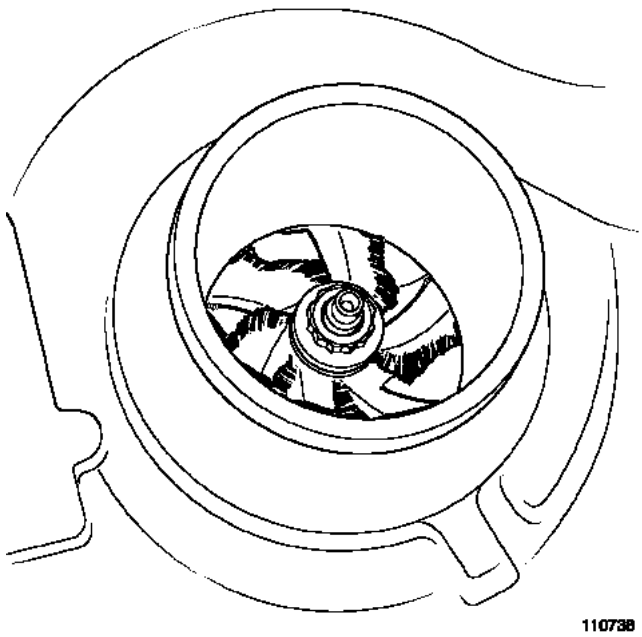
GETtheMANUALS.org

TEST8 **CONTINUED**	

Deformed, twisted blade (“soft” foreign body)



Broken blades (“hard” foreign body)

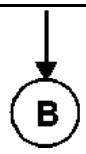


GETtheMANUALS.org

TEST9	Exhaust gas recirculation valve

PART A

Fault finding on the valve position
Or detection of a leak on the exhaust gas recirculation valve
Please observe the cleanliness guidelines and safety advice.
F9Q engine:
Clear the faults.
Use the **RZ002 "EGR adaptives"** command to try to reinitialise the operating values of the exhaust gas recirculation valve.
Switch off the ignition and wait for the engine immobiliser warning light to start flashing.
Switch the ignition back on and check for faults.
If the fault is still present:
– exit CLIP tool diagnostic mode,
– switch off the vehicle ignition,
– disconnect the exhaust gas recirculation valve connector,
– remove the exhaust gas recirculation valve using the special tool (refer to Workshop Repair Manual) and reconnect it after having removed it,
– check that no particles are blocking the movement of the exhaust gas recirculation valve flap,
– check that the exhaust gas recirculation valve is not stuck or jammed in one position,
– switch on the ignition again and return to fault finding mode using the CLIP tool,
– use the **AC036 EGR valve command with the valve removed**,
– check the movement of the valve with **PR220 EGR valve OCR*** (**0 to 2.5 mm** travel for an opening cyclic ratio of **40%** and when fully open, **~ 5 mm**, for an opening cyclic ratio of **95%**),
– check that the exhaust gas recirculation valve flap closes completely,
– if there was no displacement, or if the jamming of the exhaust gas recirculation valve cannot be solved, replace the exhaust gas recirculation valve and follow the procedure for replacing the exhaust gas recirculation valve (see **Replacement of components** section).
G9T engine:
Apply section C of this test.



GETtheMANUALS.org

TEST9 CONTINUED 1	

PART B

Exhaust gas recirculation valve potentiometer fault finding
Use the CLIP diagnostic tool to compare **PR051 EGR valve position feedback** and the setpoint voltage or OCR* and check if there are any drops in feedback (micro-breaks).

↓

Exhaust gas recirculation valve bushing fault finding
With the engine stopped and the ignition on, record the **PR051 EGR valve position feedback**; the voltage should be less than 1.5 V.
Remove the exhaust gas recirculation valve and perform a visual inspection: the exhaust gas recirculation valve should not have a cluster of soot between the base and the flap.
Clean the exhaust gas recirculation valve bushing and replace the exhaust gas recirculation valve if necessary, and follow the procedure for replacing the exhaust gas recirculation valve (see **Replacement of components** section).

↓

* OCR = Opening Cycle Ratio.

GETtheMANUALS.org

TEST9

CONTINUED 2

PART C

– Select **DF056 Air flow sensor circuit** or **DF325 Exhaust gas recirculation function**. If none of these faults appear on the CLIP diagnostic tool, end of **test 9**.
Otherwise, display the context of the fault selected.
– Bring up **PR235 EGR position voltage after programming** in the context of the appearance of the fault (select the fault to make the appearance conditions appear).
– Is **PR235 ≥ 1.8 V**?

YES

– Activate the **AC036 EGR Valve** command 4 times.
– Display **PR051 EGR valve position feedback**.
– Is **PR051 ≥ 1.5 V**?

YES

– Replace* the pipe and the exhaust gas recirculation valve according to the procedure described in the Workshop Repair Manual.
– For the valve, follow the procedure (see **Replacement of components**).
– Follow the recommendations of the **fault finding confirmation**.

NO

– Replace* the exhaust gas recirculation pipe according to the procedure described in the Workshop Repair Manual.
– **Do not replace the EGR valve.**
– Follow the recommendations of the **fault finding confirmation**

NO

– Activate the **AC036 EGR Valve** command 4 times.
– Display **PR051 EGR valve position feedback**.
– Subtract **PR235** from **PR051**
– Is the result ≥ **0.3 V**?

YES

– Activate the **AC036 EGR Valve** command 4 times.
– Display **PR051 EGR valve position feedback**.
– Is **PR051≥ 1.5 V**?

YES

– **Do not replace the exhaust gas recirculation pipe.**
– Replace* the exhaust gas recirculation valve and follow the procedure for replacing the exhaust gas recirculation valve in the **Replacement of components** section.
– Follow the recommendations of the **fault finding confirmation**.

NO

– **Do not replace the exhaust gas recirculation pipe.**
– **Do not replace the EGR valve.**
– Check the air circuit: apply **test 4**.

*** Please observe the cleanliness guidelines and safety advice.**

GETtheMANUALS.org

TEST9 **CONTINUED 3**	

Confirmation of the fault finding:
- Start the vehicle.
- Leave the engine at idle speed for **1 min**.
- Accelerate very slowly up to **1500 rpm for 2 minutes** until the exhaust gas recirculation function becomes active.
- Carry out a vehicle test at low speed, without accelerating heavily, then normally.
- Check the faults using the CLIP diagnostic tool. If the customer complaint or the faults recur, contact the Techline.

GETtheMANUALS.org

TEST10	Incorrect injector operation

Part A: Fuel regulation balance check for each injector (individual correction):

– In the **CLIP diagnostic tool**, choose the **Fuel circuit** sub-function.
– With the engine idling and the fuel temperature **> 50˚C**, display the flow correction values of each injector (individual correction), i.e.:
  – PR364 Cylinder no. 1 fuel flow correction.
  – PR405 Cylinder no. 2 fuel flow correction.
  – PR406 Cylinder no. 3 fuel flow correction.
  – PR365 Cylinder no. 4 fuel flow correction.

The normal flow correction **value** per injector is between **- 5 mg/stroke and + 5 mg/stroke without reaching these values**.

– If this has not already been carried out, check the injector connections and wiring.
– Check the connections and wiring of the engine management computer to the injectors.
– Repair if necessary.

– Check the **IMA** injector codes, by comparing the **IMA** engraved codes on the injectors (the **IMA** codes are read from left to right) and the **IMA** codes read with the **CLIP diagnostic tool**.
– If the **IMA** codes are correct, continue the fault finding procedure.
– If not, modify the incorrect **IMA** codes using command **SC002 Enter injector codes** (see **Interpretation of commands**).

To confirm the repair, refer to part B of test 10.

CASE no. 1: If at least one of these values is greater than or equal to + 5 mg/stroke

– Check the valve clearance.
– Check the engine condition and the compressions (using **the CLIP diagnostic tool** or using a compression gauge).
– If the compression test reveals a cylinder fault, carry out the necessary repairs.
– If the compression is correct, check that the injector is correctly fitted (see **MR 402 (Vel Satis ph2), 353 (Vel Satis), 361 (Espace IV) or 339 (Laguna II), Mechanical, 13B, Diesel injection, Injector**).

Ensure that each injector has only one heat protection washer.

Check the fuel regulation again for each injector (individual correction).

– Otherwise, replace the injector and check the presence of the sealing washer. Modify the **IMA** code using command **SC002 Enter injector codes** (see **Interpretation of commands**).
– Apply **Part B** of this test to confirm the fault finding.

CASE no. 2: If at least one of these values is less than or equal to - 5 mg/stroke

– Check the valve clearance.
– Check the level and condition of the engine oil.
– Remove the injector with the largest adjustment.
– If there is contamination via the diesel, check the condition of the cylinder concerned (cylinder, piston, valves). Use an endoscope if possible.
– Only replace the removed injector, and modify the **IMA** code using command **SC002 Enter injector codes** (see **Interpretation of commands**).
– Apply **Part B** of this test to confirm the fault finding.

AFTER REPAIR	Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

TEST10 CONTINUED 1	

CASE no. 3: If at least one of these values does not stabilise (20 seconds after starting)
– Check the low pressure circuit with **test 4 Low pressure circuit check**.
– Ensure that the correct fuel is being used.
– Apply **test 12 Diesel fuel conformity check.**
– Apply **Part B** of this test to confirm the fault finding.

CASE no. 4: If the fuel flow correction values are all correct ones (between - 5 mg/stroke and + 5 mg/stroke)
– Apply **Part C** of this test (**Fuel return flow measurement).**

IMPORTANT
When removing and refitting the injectors, observe the cleanliness guidelines and safety advice (see **MR 402 (Vel Satis ph2), 353 (Vel Satis), 361 (Espace IV) or 339 (Laguna II), Mechanical, 13B, Diesel injection, Injector**)

Part B: Confirmation of flow correction fault finding for each injector (individual correction):
Clear the faults and perform a test with the engine idling for at least **5 minutes**, fuel temperature **> 50˚C**.

Check that there are no faults on the **Clip diagnostic tool** and that the correction values do not reach ±**5 mg/st** to confirm the repair.
If the customer complaint is still present and the fuel flow correction values are all between **-5 mg/st and +5 mg/st**, apply **Part A: Fuel regulation balance check for each injector (individual)** of this test (**CASE no. 4**).

If one or more cylinders has an injector flow correction value which reaches ±**5 mg/st**, apply **Part A Fuel regulation balance check for each injector (individual)** of this test, as one or more injectors may be defective.

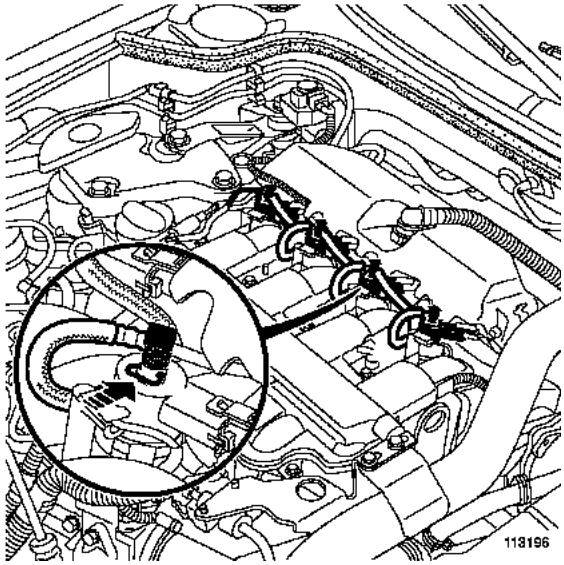
Part C: Measuring fuel return flow

1 - Fitting the tool:
Only carry out this part if PRO63 Fuel temperature is greater than 50˚C (see step 2 of Part C of this test).
Remove the engine undertray
Disconnect the entire fuel return pipe in accordance with the following procedure (do not remove the clips):
– press the clip,
pull vertically on the end piece (see arrow in illustration below) of the fuel return pipe.

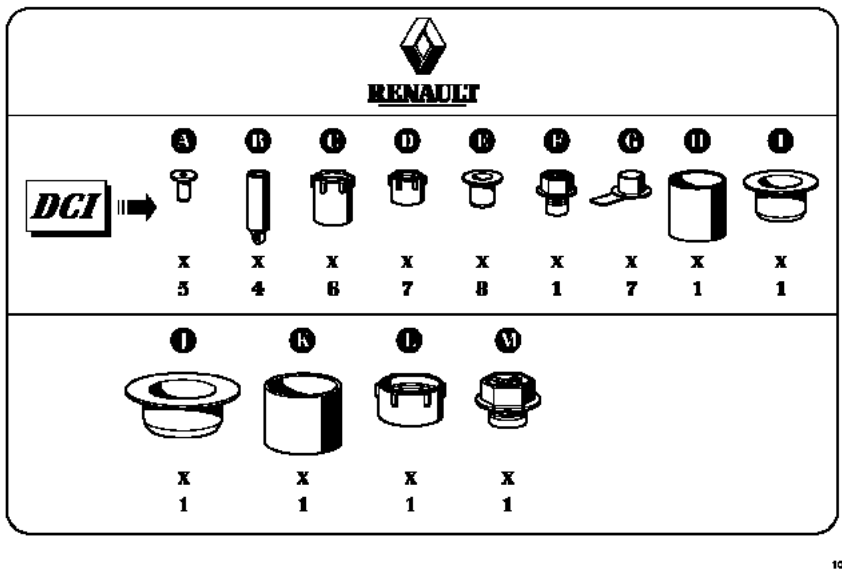
AFTER REPAIR	Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

TEST10 **CONTINUED 2**	



IMPORTANT
The end piece is fragile. Be careful not to break it by pulling it too hard. Replace all removed clips.

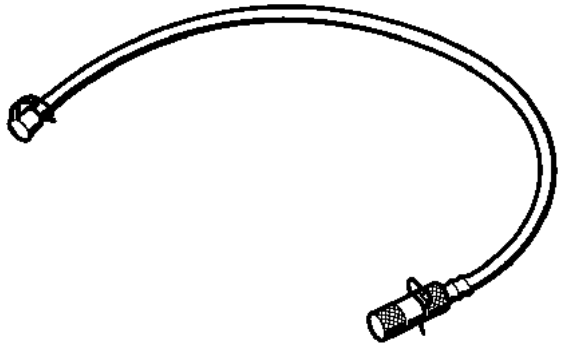


Fit the blanking plugs (**B**), from the kit **(part number 77 01 208 229)**, on the end pieces of the fuel return pipe.
If **Mot. 1760** is not fitted on the injectors immediately, place blanking plugs (**A**) on the injector fuel return openings.

AFTER REPAIR	Carry out a road test followed by another check with the **diagnostic tool**.

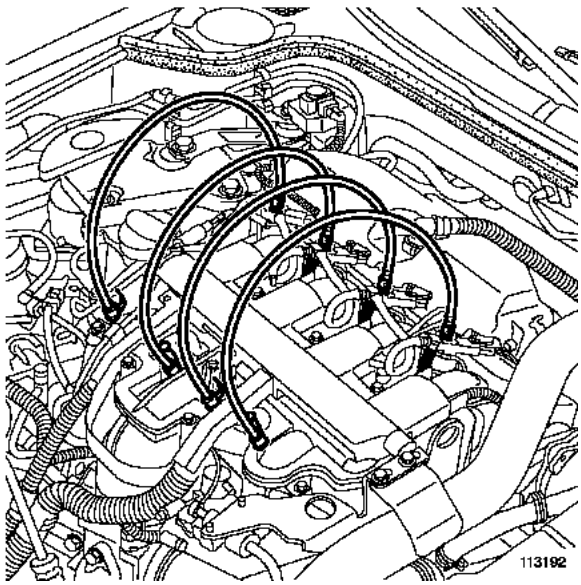
GETtheMANUALS.org

TEST10 **CONTINUED 3**	



113195

On the pipes of **Mot.1760** (see illustration 113195), remove the clips and the plugs from the end pieces (on the right in the diagram) and leave the plugs (on the left in the diagram) in place.



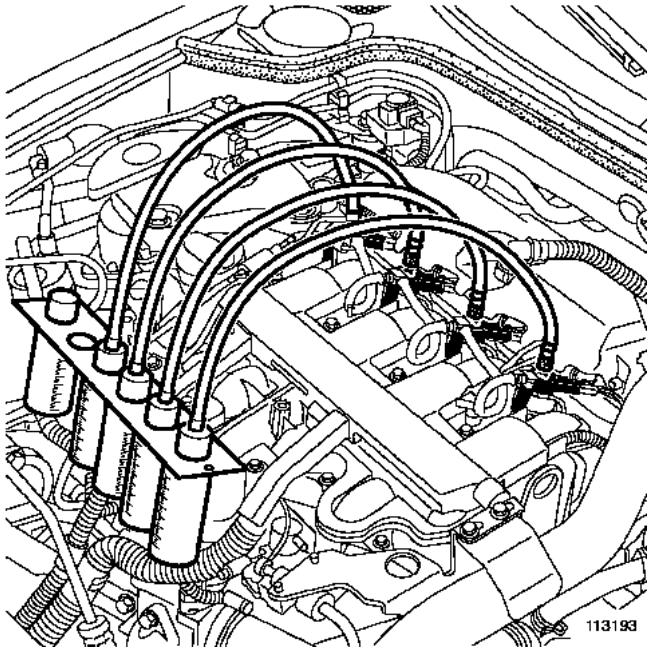
113192

Connect the pipes of tool **Mot.1760** to the injectors (without removing the clips on the injectors):
– press on the injector clip,
– insert the end piece into the injector fuel return opening.
– remember to fit the end piece plugs to the injector fuel return openings with the clips provided.
Remove the plugs left on the **Mot.1760**

AFTER REPAIR	Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

TEST10 **CONTINUED 4**	



Insert the ends of the pipes into the measuring cylinders of tool **Mot.1760**. The measuring cylinders are taken from tool **Mot. 1711.**

AFTER REPAIR	Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

TEST10 CONTINUED 5	

2 - Check the injector return flow balance:

Does the engine start?

NO →
- Fit **Mot. 1760** as shown in the tool fitting procedure.
- Start the vehicle or perform a **15 second** starting sequence (with ignition key).
- Measure the length travelled by the diesel fuel in the pipes of the **Mot. 1760**.
- Replace the injector if the length travelled by the fuel is more than **10 cm** compared with the average of the other three injectors.

YES ↓

- The injector return pipes must be fitted to the injectors.
- Start the engine.
- Display the **Fuel circuit** sub-function in the **CLIP diagnostic tool**.
- Raise the temperature of the engine.
- Read the diesel fuel temperature with **PR063 Fuel temperature** until a diesel fuel temperature greater than **50˚C** is reached.
- Switch off the engine.
- Fit **Mot. 1760** as shown in the installation procedure (see step 1).
- Check the value of the **PR038 Rail pressure**.
- Ask another Cotech to monitor the rise in fuel in the cans during engine turnover, as one of the cans will fill up quickly if one of the injectors is leaking.
- Start the engine.
- Accelerate the engine until the pressure in the rail is **550 bar**:
  * if the engine speed is **less than 3000 rpm**, maintain this pressure.
  * if the engine speed is **greater than 3000 rpm**, reduce the engine speed until the rail pressure is **500 bar** and maintain this pressure.
- Maintain these conditions for **1 min**.
- Release the accelerator pedal and maintain the idle speed for **10 seconds**.
- Switch off the engine.
- Measure the quantity of fuel contained in each measuring cylinder.
- Replace the injector if the quantity of fuel is more than **50 ml**.
- Remove **Mot. 1760** as shown in the **tool** removal procedure (see step 3).

3 - Removing the tool:

IMPORTANT
Use a cleaning cloth (part number **77 11 211 707**) to absorb fuel run-off.

Disconnect the pipe from an injector:
- press on the injector clip,
- pull vertically on the end piece of the pipe of tool **Mot.1760**, placing a wipe on the end piece to prevent run-off.

Lift the end piece vertically so that the fuel contained in the pipes flows into the measuring cylinders of tool **Mot.1760**.

Remove the other 3 pipes using the same procedure.

AFTER REPAIR	Carry out a road test followed by another check with the **diagnostic tool**.

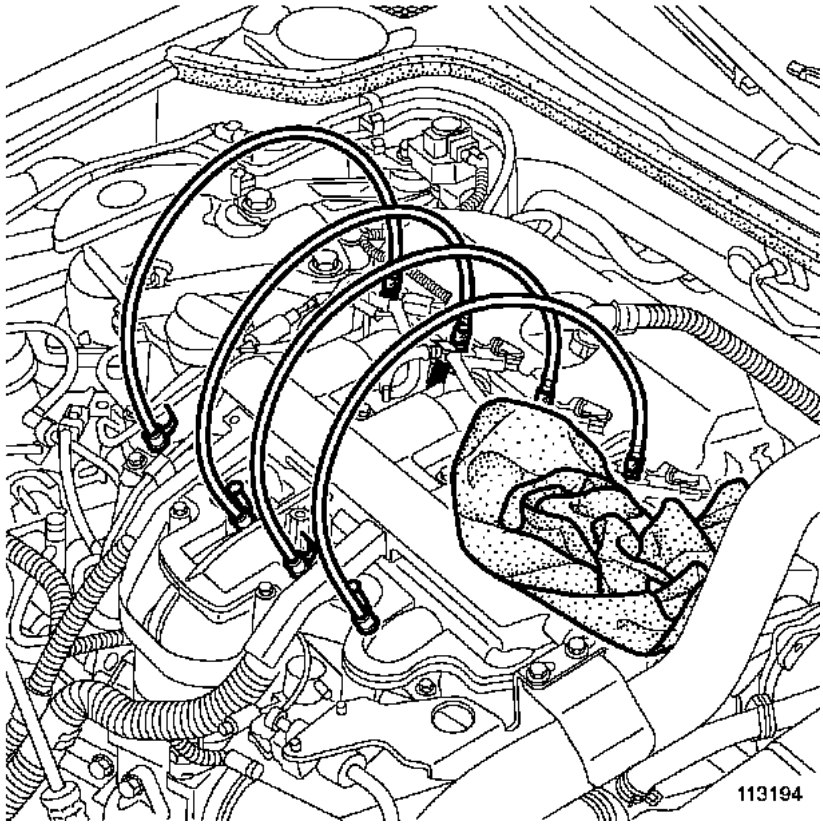
GETtheMANUALS.org

TEST10 **CONTINUED 6**	

Remove the plug welds from the fuel return pipe end pieces.

Connect the complete fuel return pipe to the injectors.

Wipe up any fuel run-off with a cleaning cloth (part number **77 11 211 707**).



End of test 10.

AFTER REPAIR	Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

TEST11	Incorrect operation of the rail overpressure valve

1) Overpressure valve return flow test:

Is the engine working?

YES

NO

– Fit the tool **Mot. 1760** as shown in the tool fitting procedure (see section 2).
– Perform a **15-second** starting sequence (with ignition key).
– Measure the length travelled by the diesel fuel in the pipes of **Mot. 1760**.
– Replace the overpressure valve if the diesel length travelled is greater than **10 cm**.

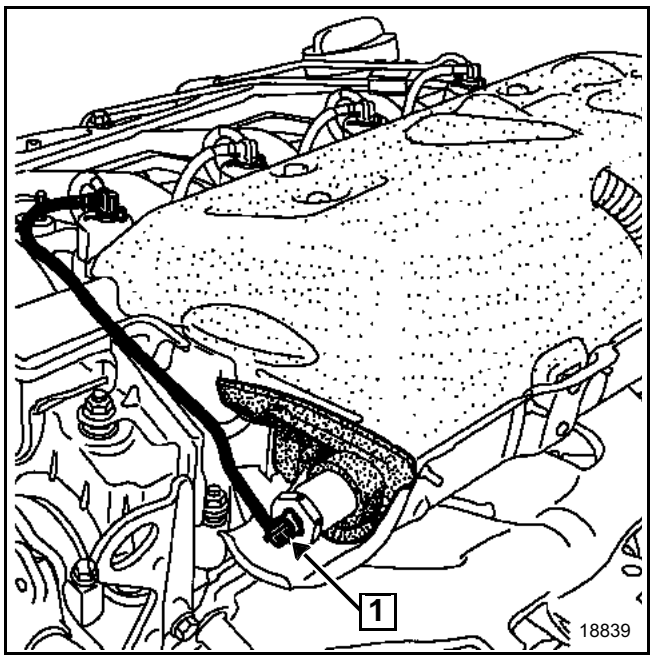
– Start the engine.
– Set the **diagnostic tool** to parameter reading mode.
– Raise the temperature of the engine.
– Read the diesel temperature using parameter **PR063 Fuel temperature**:
  * if the temperature varies rapidly: increase the fuel temperature to more than **50˚C**,
  * if the temperature does not vary on the diagnostic tool display or varies too slowly: carry out a road test (driving) for **15 minutes.**
– Switch off the engine.
– Fit the tool **Mot. 1760** as shown in the installation procedure (see section 2).
– Put the diagnostic tool in parameter reading mode and check **PR038 Rail pressure.**
– Ask another Cotech to monitor the rise in diesel fuel in the can during engine turnover, as the can will fill up quickly if the overpressure valve is leaking.
– Start the engine.
– Accelerate the engine until the pressure in the rail is **550 bar**:
  * if the engine speed is less than **3000 rpm**, maintain this pressure.
  * if the engine speed is greater than **3000 rpm**, reduce the engine speed until the rail pressure is **500 bar** and maintain this pressure.
– Maintain these conditions for **1 min**.
– Release the accelerator pedal and maintain the idle speed for **10 seconds**.
– Switch off the engine.
– Measure the quantity of fuel contained in the measuring cylinder.
– Replace the injector rail if the quantity of diesel fuel is greater than **5 ml**.
– Remove the tool **Mot. 1760** as shown in the tool removal procedure (see section 3).

GETtheMANUALS.org

TEST11 CONTINUED 1	

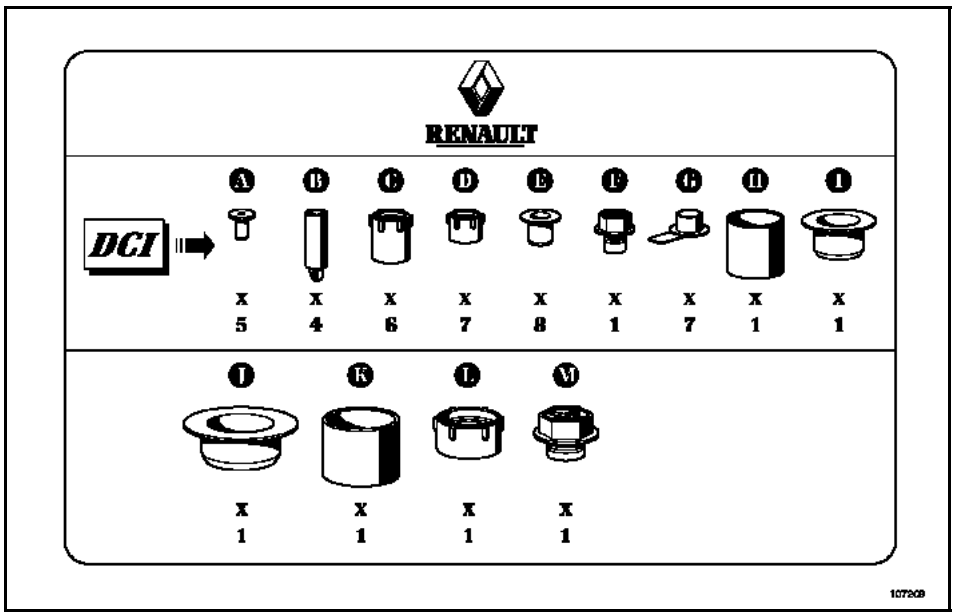
2) Fitting the tool

Remove the engine undertray.



Disconnect the return pipe from the rail overpressure valve according to the following procedure (do not remove the clips):
– press the clip,
– pull horizontally on the end piece (1) of the fuel return pipe.

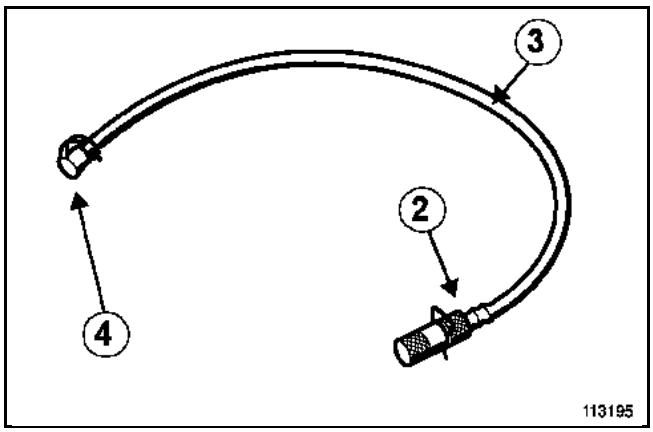
IMPORTANT
The end piece is fragile. Be careful not to break it by pulling it too hard. Replace all removed clips.



Fit the blanking plugs (**B**), from the kit **(part number 77 01 208 229)**, on the end pieces of the fuel return pipe.
If **Mot.1760** is not fitted immediately on the rail overpressure valve, place a blanking plug (**A**) on the fuel return opening of the rail overpressure valve.

GETtheMANUALS.org

TEST11 CONTINUED 2	



Remove the clip and the plug from the end piece (2) of the pipe (3) of tool **Mot. 1760,** leave the plug (4) in place.

Connect the pipe (3) to the rail overpressure valve (without removing the clip on the overpressure valve):
– press down on the clip (1) of the overpressure valve,
– insert the end piece (2) in the overpressure valve fuel return opening.
– do not forget to fit the end piece plug (2) to the overpressure valve fuel return opening using the clip supplied.

Remove the plug (4).

Insert the end of the pipe in the measuring cylinder of the tool **Mot. 1760**, the measuring cylinder is retrieved from the tool **Mot. 1711.**

Measure the return flow (see procedure in section 1 of the overpressure valve return flow test).

3) Removing the tool

IMPORTANT
Use a cleaning cloth (part number **77 11 211 707**) to absorb fuel run-off.

Disconnect the pipe (3) from the overpressure valve:
– press down on the clip (1) of the overpressure valve,
– pull horizontally on the end piece (2) of the pipe (3) of tool **Mot. 1760** while putting a cloth on the end piece (2) to avoid the drips.

Lift the end piece (2) vertically so that the fuel contained in the pipes flows into the measuring cylinder of the tool **Mot. 1760**.

Remove the plug from the fuel return pipe end piece (2).

Connect the complete fuel return pipe to the overpressure valve.

Wipe up any fuel run-off with a cleaning cloth (part number **77 11 211 707**).

GETtheMANUALS.org

TEST12	Diesel fuel conformity check

WARNING
During this operation, it is essential to:
– refrain from smoking or bringing incandescent objects close to the work area,
– protect yourself against fuel splashes due to residual pressure in the pipes,
– wear safety goggles with side guards,
– wear leaktight gloves (Nitrile type).

IMPORTANT
– To avoid any corrosion or damage, protect the areas on which fuel is likely to run.
– To prevent impurities from entering the circuit, place protective plugs on all fuel circuit components exposed to the open air.

Preparations:
Weigh an empty **1300 ml** plastic cup **(part no. 77 11 171 413)** with its cover **(part no. 77 11 171 416)** using electronic scales similar to those used in body paint workshops (example: **PANDA part no. 77 11 224 995**). Record the weight of the empty plastic cup.
This type of plastic cup is used to prepare paint.

Take a **1 l** fuel sample from the **diesel filter outlet** (see **MR 341, 364, 355 or 404, Mechanical, 19C, Tank, Fuel tank: Draining**) using a pneumatic transfer pump (**part no. 634-200**), and place it in the **1300 ml** plastic cup. Cover the plastic cup with its cover and let the fuel settle for approximately **2 minutes**.

Is the fuel cloudy or does it separate into two parts?

YES → The diesel fuel contains water and is not compliant.
Drain the fuel circuit, including the tank (see **MR 341, 364, 355 or 404, Mechanical, 19C, Tank, Fuel tank: Draining**).

NO → A

GETtheMANUALS.org

TEST12 CONTINUED 1	

A

Weigh the diesel fuel and note the fuel weight after subtracting the weight of the empty plastic cup and its cover.
Does the fuel weight fall between the minimum and maximum weights given in the table below?

Calculated weight (g.)		Fuel temperature (˚C)
Min. weight	Max. weight	
821	846	13
821	846	14
820	845	15
819	844	16
819	844	17
818	843	18
817	842	19
816	841	20
816	841	21
815	840	22
814	839	23
814	839	24
813	838	25

Check the fuel temperature by immersing a thermometer in the plastic cup.

YES → B

NO → C

GETtheMANUALS.org

TEST12 CONTINUED 2	

B
YES

End of test.

C
NO

The fuel is not correct.
If the fuel weight is less than the minimum value then there is petrol in the diesel fuel.
If the fuel weight is greater than the maximum value then there is oil in the diesel fuel.
Drain the fuel circuit, including the tank (see **MR 341, 364, 355 or 404, Mechanical, 19C, Tank, Fuel tank: Draining**).

Note:
If the measured weight reaches the limit values, the measurement can be performed with a **2230 ml** plastic cup (**part no. 77 11 171 414**) and its cover (**part no. 77 11 171 417**):
– Carry out a quick test drive in order to mix the fuel, then remove **2 l** of fuel.
– Perform the test again and check the results by multiplying the limit values by 2.

Contact the Techline if you have doubts or problems with the customer.

GETtheMANUALS.org

1. SCOPE OF THIS DOCUMENT

This document presents the fault finding procedure applicable to all computers with the following specifications:

Vehicle(s): ***Vel Satis phase 1 and phase 2, Laguna II phase 1 and phase 2.***

Engine type and suffix: **G9T600, 606**

Function concerned: **Diesel injection**

Computer name: **BOSCH EDC16 C3**

PROGRAM No.: **C1**

Vdiag No.: **08, 10, 14**

2. PREREQUISITES FOR FAULT FINDING

Documentation type

Fault finding procedures (this document):
– Assisted fault finding (integrated into the diagnostic tool), Dialogys.

Wiring Diagrams:
– Visu-Schéma (CD-ROM), paper.

Type of diagnostic tools

– **CLIP + multiplex line sensor**

Special tooling required

Special tooling required		
	Multimeter	
	Elé. 1674	**Clip + CAN probe**
	Elé. 1590	**Computer connection bornier**
Or	**Elé. 1681**	**Universal bornier**

3. REMINDERS

Procedure

To save energy, the **UCH** of **LAGUNA II phase 2 and VELSATIS phase 2 interrupts the + after ignition feed after 3 minutes**.

To run fault finding on a computer, it is possible to force the + after ignition feed on for 1 hour by applying the following procedure:
– press the unlocking button on the card,
– insert the card in the reader,
– press the Start button (interrupting the timed + after ignition feed mode),
– press and hold the start button for over 5 seconds until the engine immobiliser warning light starts to flash rapidly (4 Hz).

This forced + after ignition feed mode remains on for 1 hour.
Pressing the Start button or removing the card from the card reader cuts off the + after ignition feed but does not cut off the forced after ignition feed timed mode. Until one hour has elapsed, activating the + after ignition feed will restart forced + after ignition feed for the remaining time.

GETtheMANUALS.org

Faults

Faults are declared present or stored (depending on whether they appeared in a certain context and have disappeared since, or whether they remain present but are not diagnosed within the current context).

The **present** or **stored** status of the faults should be considered when the diagnostic tool is switched on after the + after ignition feed is switched on (with no system components being active).

For a **present fault**, apply the procedure described in the **Interpretation of faults** section.

For a **stored fault**, note the faults displayed and apply the **Notes** section.

If the fault is **confirmed** when the instructions are applied, the fault is present. Deal with the fault

If the fault is **not confirmed**, check:
- the electrical lines which correspond to the fault,
- the connectors for these lines (for oxidation, bent pins, etc.),
- the resistance of the component detected as faulty,
- the condition of the wires (melted or split insulation, wear).

Conformity check

The aim of the conformity check is to check data that does not produce a fault on the diagnostic tool because the data is inconsistent. Therefore, this stage is used to:
- carry out fault finding on faults that do not have a fault display, and which may correspond to a customer complaint.
- check that the system is operating correctly and that there is no risk of a fault recurring after repairs.

This section gives the fault finding procedures for statuses and parameters and the conditions for checking them.

If a status is not behaving normally or a parameter is outside the permitted tolerance values, consult the corresponding fault finding page.

Customer complaints - Fault finding chart

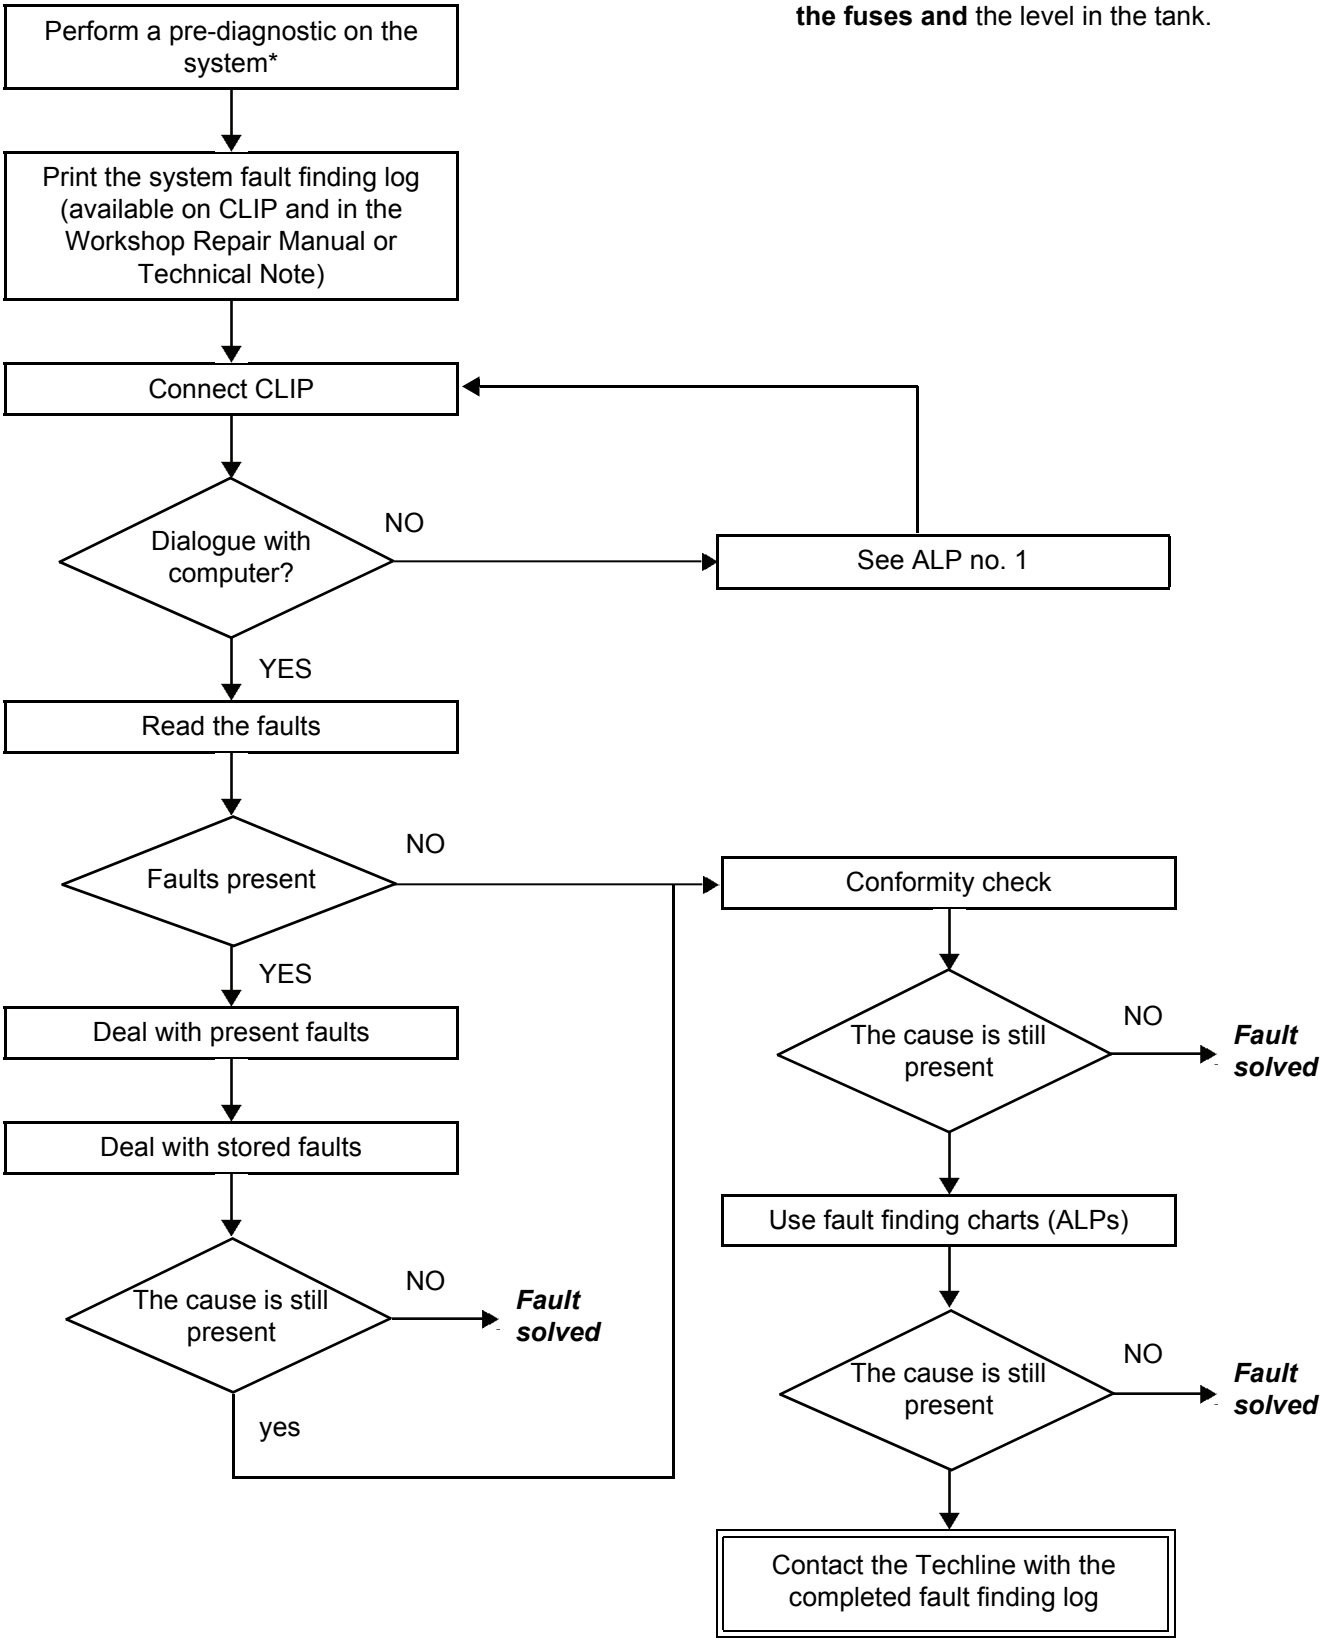
If the test with the diagnostic tool is OK but the customer complaint is still present, the fault should be processed by **Customer complaints**.

A synopsis of the general procedure to follow is provided on the following page in the form of a flow chart.

GETtheMANUALS.org

4. FAULT FINDING PROCEDURE

* **Check the battery charge, the condition of the fuses and** the level in the tank.



GETtheMANUALS.org

4. AULT FINDING PROCEDURE (continued)

Wiring check

Fault finding problems
Disconnecting the connectors and/or handling the wiring harness may temporarily remove, the cause of a fault.
Electrical measurements of voltage, resistance and insulation are generally correct, especially if the fault is not present when the analysis is made (stored fault).

Visual inspection
Look for damage under the bonnet and in the passenger compartment.
Carefully check the fuses, insulators and wiring harness routing.
Look for signs of oxidation.

Tactile inspection
While manipulating the wiring harness, use the diagnostic tool to note any change in fault status from stored to present.
Make sure that the connectors are properly locked.
Apply light pressure to the connectors.
Twist the wiring harness.
If there is a change in status, try to locate the source of the fault.

Inspection of each component
Disconnect the connectors and check the appearance of the clips and tabs, as well as the crimping (no crimping on the insulating section).
Make sure that the clips and tabs are properly locked in the sockets.
Check that no clips or tabs have been dislodged during connection.
Check the clip contact pressure using an appropriate model of tab.

Resistance check
Check the continuity of entire lines, then section by section.
Look for a short circuit to earth, to **+ 12 V** or with another wire.

If a fault is detected, repair or replace the wiring harness.

GETtheMANUALS.org

5. FAULT FINDING LOG

IMPORTANT

IMPORTANT
Any fault on a complex system requires thorough fault finding with the appropriate tools. The FAULT FINDING LOG, which should be completed during the procedure, enables you to keep track of the procedure which is carried out. It is an essential document when consulting the manufacturer.

IT IS THEREFORE ESSENTIAL THAT THE FAULT FINDING LOG IS FILLED OUT EVERY TIME IT IS REQUESTED BY TECHLINE OR THE WARRANT RETURNS DEPARTMENT.

You will always be asked for this log:

- when requesting technical assistance from Techline,
- for approval requests when replacing parts for which approval is mandatory,
- to be attached to monitored parts for which reimbursement is requested. The log is needed for warranty reimbursement, and enables better analysis of the parts removed.

6. SAFETY INSTRUCTIONS

Safety rules must be observed during any work on a component to prevent any damage or injury:

– check the battery voltage to avoid incorrect operation of computer functions,
– Use the proper tools.

7. CLEANLINESS ADVICE TO FOLLOW WHEN CARRYING OUT OPERATIONS ON THE HIGH PRESSURE DIRECT INJECTION SYSTEM

Risks relating to contamination

The system is highly sensitive to contamination. The risks associated with contamination are:

– damage to or destruction of the high pressure injection system and the engine,
– a component seizing or leaking.

All After-Sales operations must be performed under very clean conditions. This means that no impurities (particles a few microns in size) should be allowed to penetrate the system during dismantling or get into the circuits via the fuel unions.

The cleanliness principle must be applied from the filter to the injectors.

GETtheMANUALS.org

I - RISKS ASSOCIATED WITH CONTAMINATION

The high pressure direct injection system is highly sensitive to contamination. The risks associated with contamination are:
- damage to or destruction of the high pressure injection system,
- components jamming,
- components losing seal integrity.

All After-Sales operations must be performed under very clean conditions. This means that no impurities (particles a few microns in size) should have entered the system during dismantling.

The cleanliness principle must be applied from the filter to the injectors.

What are the sources of contamination?

- metal or plastic chips,
- paint,
- fibres:
  - from cardboard,
  - from brushes,
  - from paper,
  - from clothing,
  - from cloths,
- foreign bodies such as hair,
- ambient air
- etc.

IMPORTANT
Cleaning the engine using a high pressure washer is prohibited because of the risk of damaging connections. In addition, moisture may collect in the connectors and create electrical connection faults.

II - NOTES TO BE FOLLOWED BEFORE ANY OPERATION

IMPORTANT
Before any work is carried out on the high-pressure injection system, protect:
- the accessories and timing belts,
- the electrical accessories, (starter, alternator, electric power assisted steering pump),
- the flywheel surface, to prevent any diesel from running onto the clutch friction plate.

Check that you have plugs for the unions to be opened (set of plugs available from the Parts Department). The plugs are single-use only. After use, they must be discarded (once used they are soiled and cleaning is not sufficient to make them reusable). Unused plugs must be discarded.

GETtheMANUALS.org

Check that you have hermetically resealable plastic bags for storing removed parts. Stored parts will therefore be less subject to the risk of impurities. The bags are to be used once only, and discarded after use.

Use lint-free cleaning cloths (cloth part number **77 11 211 707**). Using normal cloth or paper is prohibited. They are not lint-free and could contaminate the fuel circuit. Each cloth should only be used once.

Use fresh cleaning agent for each operation (used cleaning agent is contaminated). Pour it into an uncontaminated container.

For each operation, use a clean brush in good condition (the brush must not shed its bristles).

Use a brush and cleaning agent to clean the unions to be opened.

Blast compressed air over the cleaned parts (tools, workbench, the parts, unions and injection system zones). Check that no bristles remain.

Wash your hands before and during the operation if necessary.

When wearing leather protective gloves cover them with latex gloves to prevent contamination.

III - INSTRUCTIONS TO BE FOLLOWED DURING THE OPERATION

As soon as the circuit is open, all openings must be plugged to prevent impurities from entering the system. The plugs to be used are available from the Parts Department. The plugs must not be reused under any circumstances.

Seal the pouch shut, even if it has to be opened shortly afterwards. Ambient air carries contamination.

All components removed from the injection system must be stored in a hermetically sealed plastic bag once they have been plugged.

Using a brush, cleaning agent, air gun, sponge or normal cloth is strictly prohibited once the circuit has been opened. These items could allow contamination to enter the system.

A new component replacing an old one must not be removed from its packaging until it is to be fitted to the vehicle.

GETtheMANUALS.org

System outline

The high pressure injection system is designed to deliver a precise quantity of diesel fuel to the engine at a set moment.

It is fitted with a **112-track BOSCH EDC16 C3 type computer**.

The system comprises:
- a priming bulb on the low pressure circuit,
- a diesel filter,
- a high pressure pump with a built-in low pressure pump (transfer pump),
- a high pressure regulator mounted on the pump,
- an injector rail,
- a diesel fuel pressure sensor built into the rail,
- four solenoid injectors,
- a diesel fuel temperature sensor,
- a coolant temperature sensor,
- a cylinder reference sensor,
- an engine speed sensor,
- a turbocharger pressure sensor,
- an accelerator pedal potentiometer,
- an exhaust gas recirculation valve,
- an atmospheric pressure sensor integrated into the injection computer,
- an air flowmeter with an air temperature sensor,
- a turbocharging pressure limitation solenoid valve,
- a damper valve,
- a particle filter,
- a particle filter differential pressure sensor,
- a particle filter upstream temperature sensor,
- a particle filter downstream temperature sensor (except Velsatis phase 2 vdiag 14).

The **Common rail** direct high pressure injection system works sequentially (based on the petrol engine multipoint injection function).

This injection system reduces operating noise, reduces the volume of pollutant gases and particles and produces high engine torque at low engine speeds thanks to a pre-injection procedure.
The high pressure pump generates the high pressure and transmits it to the injector rail. The actuator located on the pump controls the quantity of diesel fuel supplied, according to the request determined by the computer. The rail supplies each injector through a steel pipe.

GETtheMANUALS.org

a) The computer:

Determines the value of injection pressure necessary for the engine to operate correctly and then controls the pressure regulator.
Checks that the pressure value is correct by analysing the value transmitted by the pressure sensor located on the rail.
It determines the injection timing required to deliver the right quantity of diesel fuel and the moment when injection should start. Controls each injector electrically and individually after determining these two values.

The flow injected into the engine is determined by:
- the duration of injector control,
- the rail pressure (regulated by the computer),
- the injector opening and closing speed,
- the needle stroke (determined by a constant for the type of injector),
- the nominal hydraulic flow of the injector (specific to each injector).

The computer manages:
- idling regulation,
- exhaust gas flow reinjection to the inlet (EGR),
- fuel supply check (advance, flow and rail pressure),
- the fan assembly control,
- the air conditioning (cold loop function),
- the cruise control/speed limiter function,
- pre-post heating control,
- fault warning lights via the multiplex network.
- the operation of the catalysed particle filter.

The high pressure pump is supplied at low pressure by an integrated low pressure pump (transfer pump).
It supplies the rail, the pressure of which is controlled by the fuel flow actuator (MPROP) for charging, and for discharging by the injector valves. This compensates for pressure drops.
The flow actuator allows the high pressure pump to supply the exact quantity of diesel fuel required to maintain the pressure in the rail. This component minimises the heat generated and improves engine output.
In order to discharge the rail using the injector valves, the valves are controlled by brief electrical pulses which are:
- short enough not to open the injector (passing through the feedback circuit from the injectors),
- long enough to open the valves and discharge the rail.

GETtheMANUALS.org

b) Multiplex connection between the different vehicle computers.

The electronic system fitted in this vehicle is multiplexed.
This enables dialogue between the various vehicle computers. As a result:
- the fault warning lights on the instrument panel are lit by the multiplex network,
- vehicle faults are displayed by the multiplex network,
- the vehicle speed sensor on the gearbox is not needed.

The vehicle speed signal on the instrument panel is transmitted by the ABS computer via a wire connection, then sent out on the multiplex network by the instrument panel. The vehicle speed signal is used mainly by the injection computer and the airbag computer.

Some vehicles have adopted a sensor for detecting water in the diesel fuel, located in the filter. If there is water in the diesel fuel, the orange "Injection and pre-post heating" warning light will come on.

WARNING
The engine must not operate with:
- Diesel fuel containing more than 10 % diester,
- petrol, even in tiny quantities.

The system can inject diesel fuel into the engine at a pressure of up to **1600 bar**. Before each operation, check that the injector rail is depressurised and that the fuel temperature is not too high.

You must respect the cleanliness guidelines and safety advice specified in this document for any work on the high pressure injection system.
Removal of the internal parts of the pump and injectors is prohibited. Only the flow actuator, the diesel temperature sensor and the Venturi tube can be replaced.

For safety reasons, it is strictly prohibited to undo a high pressure pipe union when the engine is running.
It is not possible to remove the pressure sensor from the fuel rail because this may cause circuit contamination faults.
If the pressure sensor is faulty it must be replaced, along with the rail and the high pressure pipes.

It is strictly forbidden to remove any injection pump pulley bearing the number **070 575**. If the pump needs to be replaced, replace the pulley.
Supplying **+ 12 V** directly to any component in the system is prohibited.

Ultrasonic decoking and cleaning are prohibited.

Never start the engine unless the battery is connected correctly.
Disconnect the injection computer when carrying out any welding work on the vehicle.

GETtheMANUALS.org

c) Hosted functions:

Air conditioning management assistance:

In the case of vehicles with climate control, the EDC16 system has the option of deactivating the air conditioning via the UCH, under certain conditions of use:
- when requested by the driver,
- when starting the engine,
- if the engine overheats (in order to reduce the power the engine has to supply),
- when the engine speed is kept at a very high level (to protect the compressor),
- during transition phases (eg. high acceleration demand for overtaking, anti-stalling and moving off). These conditions are only taken into account if they do not occur repeatedly, so as to prevent system instabilities (erratic deactivation),
- when certain faults appear.

Management of the damper valve:

The damper valve currently has three functions:
- the valve closes in order to block the passage of air towards the cylinders to shut off the engine. The aim of this is to stop the engine as quickly as possible and to reduce instabilities as the engine is switched off.
- regulator valve: depending on the various engine functions, the damper valve closes by a few % in order to create a venturi effect in the EGR valve flow section. The aim of this is to accelerate the EGR gas flow rate and to reduce the emission of pollutants.
- regulatory function during the regeneration of the particle filter.

Thermoplunger management:

This vehicle is fitted with thermoplungers. They are managed and activated by the injection system. There are two types of program:
- controlled by the injection system during particle filter regeneration;
- passenger compartment function; the air conditioning requests the injection to activate one or more thermoplungers to raise the air temperature in the passenger compartment. The injection computer authorises the actuation or non-actuation of the thermoplungers according to the operating phases and the power requirements of the engine. The maximum number of thermoplungers that can be managed is four; their actuation depends mainly on the coolant temperature (< 15°C) and ambient air temperature (< 5°C).

GETtheMANUALS.org

Cruise control/speed limiter management:
The vehicle cruise control function, when activated, allows you to keep the vehicle speed at a selected value regardless of the driving conditions encountered.
Using the control buttons, the driver can increase or reduce the speed of the vehicle.

If the driver wishes to exceed the cruising speed, he may:
- depress the accelerator pedal and exceed the cruising speed (the vehicle will return to the initial cruising speed once the driver takes his foot off the pedal),
- press the system control buttons.

The cruise control function can be deselected either by:
- the system control buttons,
- deactivating the cruise control switch,
- when system events are detected, such as the brake pedal or clutch being depressed,
- when system errors are detected such as an inconsistent vehicle speed.

The cruise function can also be temporarily disabled when the driver wants to increase speed by depressing the accelerator pedal. The cruising speed is resumed when the driver releases the accelerator pedal.
The vehicle will attempt to reach the cruising speed at a controlled acceleration rate.

It is possible to reactivate the vehicle speed control and resume the last cruising speed after deactivation (computer feed not cut off).

When activated (using the selection switch) the vehicle speed limiter function limits the vehicle speed to a preselected value. The driver controls the vehicle in the normal way using the accelerator pedal until the limit speed is reached.

If an attempt is made to exceed this speed, the system ignores the pedal request and controls the vehicle speed in the same way as the cruise control function, provided that the driver keeps the accelerator pedal sufficiently depressed.
As with cruise control, the limit speed can be altered using the one-touch control buttons or by pressing and holding.

For safety reasons, it is possible to exceed the limit speed by depressing the accelerator pedal and exceeding the pedal position limit value. The vehicle speed is then totally controlled as a function of pedal position until the speed falls back below the limit speed when the speed limiter function will once again be reactivated.

If the driver wishes to exceed the cruising speed, he may:
- exceed the accelerator pedal's kickdown point,
- increase the limit speed by pressing or pressing and holding the limit speed switch.

The speed limiter function can be deselected either:
- the system control buttons,
- by switching off the speed limiter switch,
- when system events are detected, such as the brake pedal or clutch being depressed,
- when system errors are detected such as an inconsistent vehicle speed.

GETtheMANUALS.org

Exhaust gas recirculation management

The exhaust gas recirculation system comprises a direct current EGR valve controlled by an H bridge in the computer. This system has a built-in valve position feedback potentiometer.
The EGR valve is controlled in a closed loop on the change in the air flow measured by the flow sensor.
The potentiometer is used in the fault finding procedure for the EGR valve position.
An EGR by-pass is used to cool the exhaust fumes before they are redirected to the inlet, when the engine coolant temperature permits.

Particle filter management

The particle filter eliminates the emission of carbon particles, up until now, not removed from the exhaust fumes.

The particle filter is a porous structure containing channels arranged so as to force-filter the exhaust gases.

The particle filter consists of several components:
- an oxidation pre-catalytic converter after the turbocharger to achieve the HC/CO levels of the current standards,
- the particle filter located under the body,
- a differential pressure sensor to tell the computer the pressure upstream and downstream of the particle filter,
- a temperature sensor upstream and downstream of the particle filter (except VELSATIS phase 2 Vdiag 14 which is not fitted with a temperature sensor downstream of the particle filter).

While driving the particle filter fills with particles (soot) and, above a given mass of soot, it is necessary to clean it by the principle of regeneration.

This regeneration consists of burning the particles accumulated in the filter.

The differential pressure sensor informs the computer about the weight of the soot contained in the particle filter.

The computer then orders the regeneration. The engine combustion is then delayed to raise the exhaust gas temperature to between **550 and 650°C**.
This temperature allows the particles to be burned and the particle filter to be regenerated.

Regeneration may be automatically triggered when driving if the soot content is below:
- **45 g for Vdiag 08 and 10,**
- **48 g for Vdiag 14.**

If the weight of soot is greater than **45 g for Vdiag 08 and 10, or 48 g for Vdiag 14**, or if regeneration could not be carried out when driving, the user should request **After-Sales regeneration**.

This regeneration is carried out in the workshop. It is essential to follow the instructions given in the interpretation of the command (**SC017 Particle filter regeneration**) to carry out regeneration in complete safety (see **Technical Note 5040A**).

IMPORTANT
The particle filter must be replaced after a period of time which largely depends on the grade of engine oil used - this information is in the Driver's handbook.

After it has been replaced, it is essential to reconfigure certain parameters in the computer (see **SC036 Reinitialise programming**).

GETtheMANUALS.org

Warning light management:

Instrument panel display
The computer manages the data display on the instrument panel relating to engine operation. This involves six functions:
- the pre-postheating warning light,
- the coolant temperature warning light or warning message;
- the fault level 1 warning light (non-critical fault),
- the fault level 2 warning light (emergency stop),
- the OBD warning light (European On Board Diagnostic),
- particle filter warning message or light.

These six functions are represented by 4 or 5 warning lights and/or messages displayed by the trip computer.

A **3-second** visual inspection (automatic test procedure managed by the instrument panel) is carried out by the injection computer when the ignition is switched on.

Orange pre-post heating/non-critical fault SERVICE warning light (severity 1)
This light is used both as an in-operation indicator light and as a system fault indicator:
- Continuously lit with + after ignition feed:

Indicates preheating of the spark plugs.
- Continuously lit with **CHECK INJECTION or ELECTRONIC FAULT**:

Indicates a **level 1** fault (implies operation in injection system defect mode).
The driver should carry out repairs as soon as possible.

Temperature/red emergency STOP (level 2) warning light
This indicator light is used both as an in-operation indicator light and as a system fault warning light. Lights up for **3 seconds** when the ignition is switched on (automatic test procedure managed by the instrument panel):
- Continuously lit **or** alternately lit with **ENGINE OVERHEATING** message:

Indicates engine overheating (the driver is free to choose whether or not to stop the vehicle).
- Continuously lit with the **FAULTY INJECTION** message:

Indicates a **level 2** fault (In this case, the injection is automatically cut after a few seconds).
The driver should carry out repairs as soon as possible.

ORANGE OBD excess pollution warning light
An engine symbol accompanied by the message **CHECK EMISSION CONTROL**.
This warning light comes on if the system has one or more OBD faults.
This warning light is used to alert the driver of the existence of injection faults leading to excessive pollution or if the EOBD (European On Board Diagnostic) system is deactivated.
The injection computer requests activation of the OBD warning light for a present fault only after three successive driving cycles.
The **3 second** visual inspection when the ignition is switched on (automatic test procedure managed by the instrument panel) is carried out by the injection computer.

Special particle filter ORANGE warning light or warning message (depending on instrument panel)
This warning light or message warns the driver that the particle filter is full of particles (weight of soot greater than **40 g for Vdiag 08 and 10, or 42 g for Vdiag 14**, or that there are too many regeneration faults due to driving conditions which are unfavourable for regeneration). The driver must then drive as soon as possible at an average speed of 48 mph (80 km/h) subject to the road conditions and authorised speed limits.

WARNING

This warning light does not exist on the **LAGUNA II phase 1 and VELSATIS phase 1**.

This warning light is replaced by a **Regenerate particle filter** message displayed by the trip computer.

GETtheMANUALS.org

Management of the EOBD:

The **OBD (On Board Diagnostic)** system permits detection of any faults relating to the vehicle emission control system (OBD EURO IV emission control standards being exceeded).
This system should be active for the entire life of the vehicle.

1. OBD fault display conditions

An OBD fault will be detected after **3 driving cycles** and the following parameters will be registered in the computer:
- engine load,
- vehicle speed
- air temperature
- coolant temperature,
- turbocharging pressure,
- rail pressure,
- air flow,
- distance travelled in miles by the vehicle since activation of the **OBD** warning light.

It allows the driver to know whether the vehicle has a fault directly linked to the emission control system.

2. System faults displayed by the OBD

Only a few faults are indicated by the OBD system:
- **DF012 Sensor feed voltage no. 2.**
- **DF038 Computer in 6.DEF EEPROM fault.**
- **DF040 Cylinder 1 injector circuit in CO Open circuit.**
- **DF041 Cylinder 2 injector circuit in CO Open circuit.**
- **DF042 Cylinder 3 injector circuit in CO Open circuit.**
- **DF043 Cylinder 4 injector circuit in CO Open circuit.**
- **DF054 Turbocharging solenoid valve control circuit in CC.0 Short circuit to earth.**
- **DF209 EGR valve position sensor circuit.**
- **DF621 EGR valve jammed open.**

Some repair operations require programming to ensure that certain engine components function correctly. Follow the programming procedures (see Replacement of components), if replacing an exhaust gas recirculation valve or an injector.

3. OBD fault clearing conditions

An OBD fault is cleared in several steps.
The fault **present** in the diagnostic tool is not **stored** (following repair) until after 3 trips with the vehicle.
The OBD warning light will only light up after these 3 driving cycles.
The instrument panel warning light coming on does not automatically mean that the system has a fault.
In order that the OBD fault and the display parameters are cleared from the computer, the system needs to go through 40 engine heating cycles.
An engine heating cycle is a driving cycle during which:
- **the engine coolant temperature reaches at least 71.1°C,**
- **the engine coolant temperature varies by 22.2°C in relation to the engine starting temperature.**

If one of these conditions is not fulfilled, the OBD fault will still be present or stored on the injection computer.

COMPUTER REPLACEMENT OR REPROGRAMMING

IMPORTANT
- **Switch on the diagnostic tool (mains or cigarette lighter supply).**
- **Connect a battery charger.**
- **Switch off all electrical consumers (lights, interior lights, air conditioning, radio/CD, etc.).**
- **Wait for the engine to cool (engine coolant temperature < 60 °C and air temperature < 50 °C).**
- During (re)programming, the instrument panel screen may display **OIL PRESSURE FAULT**. Ignore this message and do not take any action in connection with it.

Two operations must be performed when replacing or reprogramming the computer:
SC003 Save computer data and SC001 Write saved data.
- Run command **SC003 before replacing or reprogramming** the computer. This enables certain data to be saved **in the diagnostic tool** so that the new computer* can be reconfigured like the old one. The saved data includes: injector codes, EGR programming, specific data for particle filter operation and vehicle options.
- Run command **SC001 after replacing or reprogramming** the computer. It enables you to rewrite the data (saved by command **SC003**) to the new computer*.

If you cannot establish dialogue with the computer being replaced: you will not be able to save anything.
After replacing the computer:
- Manually enter the IMA code for each injector by reading the injector codes (see **REPLACING INJECTORS**).
- Enter the data specific to particle filter operation by running **SC036 Reinitialise programming** and select **After replacing injection computer with no save option**.

Exhaust gas recirculation valve data is programmed automatically the 1st time the new computer is switched on*.

** New computer or reprogrammed computer.*

GETtheMANUALS.org

PROCEDURE

● **Before replacing or reprogramming the computer:**

– select **SC003 Save computer data**;
– if the following message appears: "**A saved file exists. Overwrite?**": (this file corresponds to the last save carried out on the tool),
– select **YES**,

When the backup is complete, replace the computer or reprogram, then proceed to the next step.

● **After replacing or reprogramming the computer:**

– select **SC001 Write saved data**, then follow the instructions given by the diagnostic tool,
– if the VIN has not been stored (see **Computer Identification** on the main screen), select **VP010 Enter VIN**,

When both these commands have finished:

– **switch off the ignition**, and wait for the following message to appear on the **diagnostic tool: "Loss of dialogue with the computer: EDC16 C3, check the connection of the tool and the computer supply voltage"** before switching the ignition back on,
– check the system faults, and clear any stored faults,
– if there are no stored faults, deal with present faults;
– clear the faults from the computer memory.

Carry out a road test followed by a complete check with the diagnostic tool.

IMPORTANT

– The injection computer retains the same immobiliser code for life.
– The system has no security code.
– It is not permitted to perform tests with computers borrowed from the Parts Department or from another vehicle which must then be returned.
– These computers are hard-coded.
– If the injection computer appears to be faulty, contact the Techline and refer to the fault finding log.

End of operation.

GETtheMANUALS.org

REPLACING THE INJECTORS

Note:
The IMA coding (individual injector correction) is a calibration made in production on **each injector** to **adjust the flow** accurately.
These correction values are etched on the Bakelite body of each injector (6 alphanumeric characters) and then entered into the computer which then controls each injector taking into account their **manufacturing variation**.

After replacing one or more injectors, re-enter the IMA codes.
The system must be configured via the diagnostic socket using the RENAULT CLIP diagnostic tool.

⟶ **PROCEDURE** to be followed **after one or more injectors have been replaced**:

IMPORTANT
Cylinder no. 1 is located **at the engine flywheel end**.
– make a note of the **IMA** code(s) engraved on the injector body,
– enter these codes in the computer using command **SC002 Enter injector codes**, then follow the instructions given by the diagnostic tool,
– once the command has finished,
– switch off the ignition,
– wait for the following message to appear on the **diagnostic tool: "Loss of dialogue with the computer: EDC16 C3, check the connection of the tool and the computer supply voltage"** before switching the ignition back on,
– return to fault finding mode,
– select the **Computer identification** function from the main screen,
– check that the injector codes entered into the computer match those found on the bodies of the injectors:
– if the codes do not match, restart the command **SC002 Enter injector codes** procedure.
– if the codes do match, check system faults and clear any stored faults;
– if there are no stored faults, deal with present faults;
– clear the faults from the computer memory.

Carry out a road test followed by a complete check with the diagnostic tool.

IMPORTANT
Engines can only operate correctly if the correct IMA codes have been entered.
If no codes have been entered or if an invalid code has been entered, fault DF276 Program injector code is present and the engine will be in defect mode (significant engine speed restriction).
If another injector's code has been entered, the system will accept it but will make the wrong correction. This could lead to engine damage, loss of performance and excessive pollution. Always use the correct injector codes for the engine cylinder/computer.

End of operation.

GETtheMANUALS.org

REPLACING THE EXHAUST GAS RECIRCULATION VALVE (EGR valve)

After the exhaust gas recirculation valve has been replaced, the computer must store the new valve's offset and the offset measured the last time the ignition was switched off, which is when the valve closed.
Using this data, the computer can detect whether the valve is clogged or seized.
When the valve is replaced, clear the stored offsets so that the program uses the new valve's offset value.

The data linked to this program is compiled in the **Emission control/OBD** sub-function.
- **PR128:** FIRST EGR VALVE OFFSET.
- **PR129:** LAST EGR VALVE OFFSET > or = **PR128 if the valve is new**.

Programming **PR128** and **PR129** must be cleared every time the exhaust gas recirculation valve is replaced.

⟶ **PROCEDURE** to be followed **after replacing** the exhaust gas recirculation valve:

– run command **SC036 Reinitialise programming**;
– select **EGR valve** as the type of operation, then follow the instructions given by the diagnostic tool,

Note:
When the reinitialisation is complete, the **Emission control/OBD** sub-function displays:
PR128 = PR129 > 100 %

– when the command is finished;
– switch off the ignition,
– wait for the following message to appear on the **diagnostic tool: "Loss of dialogue with the computer: EDC16 C3, check the connection of the tool and the computer supply voltage"** before switching the ignition back on,
When the ignition is next switched on again the new EGR valve offset is automatically reprogrammed.

Note:
When the new EGR valve offset has been reprogrammed, then the **Emission control/OBD** sub-function displays:
10 % < PR128 < 40 %
PR129 > 100 %

– start the vehicle to enable the latest EGR valve offset to be programmed,
– switch off the ignition,
– wait for the following message to appear on the **diagnostic tool: "Loss of dialogue with the computer: EDC16 C3, check the connection of the tool and the computer supply voltage"** before switching the ignition back on.
The last EGR valve offset reprogrammed is stored on the computer.

Note:
When the reprogramming of the last EGR valve offset has been done, then the **Emission control/OBD** sub-function displays:
10 % < PR128 < 40 %
10 % < PR129 < 40 %
and PR129 - PR128 ≥ -1 % and ≤ 5 %

– then check the system faults, and clear any stored faults;
– if there are no stored faults, deal with present faults;
– clear the faults from the computer memory.
Carry out a road test followed by a complete check with the diagnostic tool.

End of operation.

GETtheMANUALS.org

REPLACING THE DAMPER VALVE

After replacing the damper valve, reconfigure the computer.
The system must be configured via the diagnostic socket using the RENAULT CLIP tool.

- **PROCEDURE** to be followed **after the damper valve is replaced**:

– switch on the ignition,
– establish dialogue with the injection computer,
– run command **SC036 Reinitialise programming**;
– select **Damper valve** as the type of operation, then follow the instructions given by the diagnostic tool;
– **switch off the ignition,**
– wait for the following message to appear on the **diagnostic tool: "Loss of dialogue with the computer: EDC16 C3, check the connection of the tool and the computer supply voltage"** before switching the ignition back on,
– check that **PR420 Damper valve error counter = 0**;
– then check the system faults, and clear any stored faults;
– if there are no stored faults, deal with present faults;
– clear the faults from the computer memory.

Carry out a road test followed by a complete check with the diagnostic tool.

End of operation.

REPLACING THE PARTICLE FILTER:

After replacing the particle filter, reconfigure the computer.

The system must be configured via the diagnostic socket using the RENAULT CLIP tool.

- **PROCEDURE** to be followed **after the particle filter is replaced**:

– switch on the ignition,
– run command **SC036 Reinitialise programming**;
– select **After particle filter replacement** as the operation type, then follow the instructions,
– **switch off the ignition and wait** for the following message to appear on the **diagnostic tool: "Loss of dialogue with the computer: EDC16 C3, check the connection of the tool and the computer supply voltage",**
– **then switch on the ignition again,**
– **clear** the faults from the computer memory **(this operation must be carried out within 3 minutes of the ignition being switched on)**.

Carry out a road test followed by a complete check with the diagnostic tool.

End of operation.

DF001 PRESENT OR STORED	COOLANT TEMPERATURE SENSOR CIRCUIT CC.0 : short circuit to earth CO.1 : open circuit or short circuit on + 12 V

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present: – when an attempt is made to start the engine, – the engine is running
	Special notes: If the fault is present: – the coolant temperature: **PR064 Coolant temperature** is fixed at **119°C**, – the preheating phase is greater than **10 seconds**, – the low-speed fan unit (**motor-driven fan unit 1**) is continuously supplied, – if **motor-driven fan unit 1** is faulty, then **motor-driven fan unit 2** is activated on vehicles fitted with climate control. – the **level 1** warning light is lit. Use bornier **Elé. 1681** for all operations on the computer connectors.

Check the connections of the **coolant temperature sensor 4-track connector**.
Repair if necessary.
Measure the **resistance** of the **coolant temperature sensor** between **tracks 2 and 3** of its black connector.
Replace the sensor if its resistance is not approximately:

75780 ± 7000 Ω at - 40°C
12460 ± 1128 Ω at -10°C
2252 ± 112 Ω at 25°C
811.4 ± 39 Ω at 50°C
283 ± 8 Ω at 80°C
115 ± 3 Ω at 110°C
87 ± 2 Ω at 120°C

Check the injection computer connections.
Check the **insulation, continuity and the absence of interference resistance** on the following connections:
Injection computer brown 48-track connector B, **track F2** → **Track 3** coolant temperature sensor
Injection computer brown 48-track connector B, **track H1** → **Track 2** coolant temperature sensor
Repair if necessary.

If the fault is still present, replace the coolant temperature sensor.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF003 PRESENT OR STORED	ATMOSPHERIC PRESSURE SENSOR CIRCUIT 1.DEF : signal outside upper limit 2.DEF : signal outside lower limit 3.DEF : inconsistent signal

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after **the engine is started or** following a road test.
	Special notes: The atmospheric pressure sensor is integrated into the injection computer and cannot be separated.
	If the fault is present: – there is light smoke, – the atmospheric pressure value changes to safe mode, **PR035 Atmospheric pressure = 750 mbar**. – the **level 1** warning light is lit. Use bornier **Elé. 1681** for all operations on the computer connectors.

Disconnect the injection computer and check the condition of the contacts and connector.
Repair if necessary.
Display the value of parameter **PR041 Turbocharger pressure**.
If this value is stuck at 750 mbar, refer to interpretation of fault **DF004 Turbocharging pressure sensor circuit** .
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF004 PRESENT OR STORED	TURBOCHARGING PRESSURE SENSOR CIRCUIT CO.0 : open circuit or short circuit to earth CC.1 : short circuit to +12 V 1.DEF : inconsistent signal

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after starting the engine, or during a road test.
	Special notes: Use bornier **Elé. 1681** for any operations on the injection computer connectors. If the fault is present: – the EGR function is inhibited, – the turbocharging pressure sensor is in defect mode, **PR041 = 750 mbar**, If CO.0 or CC.1 is present the **level 1** warning light is lit.
	Order of priority in the event of more than one fault: Deal with fault **DF011 Sensor feed voltage no. 1** first if it is present or stored.
	IMPORTANT This fault can result in a rapid and significant fouling of the particle filter.

CO.0	***NOTES***	None.

Check the turbocharger pressure sensor connections.
Check the injection computer connections.
Repair if necessary.

Check **the continuity and insulation against earth** of the following connections:

- Injection computer brown 48-track connector B, **track K2** → **Track 3** turbocharger pressure sensor connector
- Injection computer brown 48-track connector B, **track G4** → **Track 1** turbocharger pressure sensor connector
- Injection computer brown 48-track connector B, **track D4** → **Track 2** turbocharger pressure sensor connector

Repair if necessary.

If the fault is still present, replace the turbocharging pressure sensor.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF004 **CONTINUED**	

CC.1	***NOTES***	None.

Check the turbocharger pressure sensor connections. Check the injection computer connections. Repair if necessary.
Check **the continuity and insulation against + 12 volts** of the following connections: Injection computer brown 48-track connector B, **track D4** ⟶ **Track 2** turbocharger pressure sensor connector Injection computer brown 48-track connector B, **track K2** ⟶ **Track 3** turbocharger pressure sensor connector Repair if necessary.
If the fault is still present, replace the turbocharging pressure sensor.

1.DEF	***NOTES***	None.

If it occurs with fault DF003, perform fault finding on parameter **PR041 Turbocharging pressure**. If the turbocharger pressure sensor is correct, contact the Techline
Check the turbocharger pressure sensor connections. Check the injection computer connections. Repair if necessary.
Check the **continuity and the absence of interference resistance** of the following connections: Injection computer brown 48-track connector B, **track G4** ⟶ **Track 1** turbocharger pressure sensor connector Injection computer brown 48-track connector B, **track D4** ⟶ **Track 2** turbocharger pressure sensor connector Injection computer brown 48-track connector B, **track K2** ⟶ **Track 3** turbocharger pressure sensor connector Repair if necessary.
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF005 PRESENT OR STORED	ENGINE SPEED SENSOR CIRCUIT 1.DEF : no signal 2.DEF : inconsistent signal

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present: – when an attempt is made to start the engine, – when the engine is running.
	Special notes: Use bornier **Elé. 1681** for all operations on the computer connectors. The engine speed sensor is consistent with the camshaft sensor. If the fault is present, it is impossible to start or stop the engine and the **level 2** warning light is lit.

Check the engine speed sensor connections.
Repair if necessary.
Check that the sensor is correctly mounted and that the flywheel target is not damaged.
Check that the gap between the engine speed sensor and the engine flywheel is **0.5 to 1.8 mm**.
Measure the engine speed sensor **resistance** between **terminals 1 and 2** of the black connector.
If the **coil resistance** is not **250 ± 50** Ω at an engine temperature of **20°C**, replace the engine speed sensor.

Check the injection computer connections.
Repair if necessary.

Check for **continuity and the absence of interference resistance** of the following connections:
Injection computer brown 48-track connector B, **track B1** → **Track 1** engine speed sensor
Injection computer brown 48-track connector B, **track C1** → **Track 2** engine speed sensor
Repair if necessary.
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF007 PRESENT OR STORED	RAIL PRESSURE SENSOR CIRCUIT CC.0 : short circuit to earth CO.1 : open circuit or short circuit on + 12 V 1.DEF : offset at minimum threshold 2.DEF : offset at maximum threshold

NOTES	**Priorities when dealing with a number of faults :** Deal with fault **DF013 Sensor supply voltage no. 3** first, if it is present or stored.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present after repeated engine starts or with the engine running.
	Special notes: Use bornier **Elé. 1681** for all operations on the computer connectors. If the fault is present, the engine stops immediately. If CO.1, 1.DEF is present the **level 2** fault warning light will be lit.

CC.0	***NOTES***	None.

Check the rail pressure sensor connectors. Check the injection computer connections. Repair if necessary.
Check the **continuity** and **insulation to earth** of the following connections: Injection computer brown 48-track connector B, **track G3** ⟶ **Track 2** rail pressure sensor Injection computer brown 48-track connector B, **track A4** ⟶ **Track 3** rail pressure sensor Repair if necessary.
If the fault is still present, replace the rail pressure sensor and tighten to **35 ± 5 Nm**. **Observe the safety advice in the Introduction.**

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF007 **CONTINUED**	

CO.1	***NOTES***	None.

Check the rail pressure sensor connectors.
Check the injection computer connections.
Repair if necessary.

Check **for continuity** and **insulation to + 12 V** on the following connections:
Injection computer brown 48-track connector B, **track G3** ⟶ **Track 2** rail pressure sensor
Injection computer brown 48-track connector B, **track C4** ⟶ **Track 1** rail pressure sensor
Injection computer brown 48-track connector B, **track A4** ⟶ **Track 3** rail pressure sensor
Repair if necessary.

If the fault is still present, replace the rail pressure sensor and tighten to **35 ± 5 Nm**.
Observe the safety advice in the Introduction.

1.DEF ***2.DEF***	***NOTES***	None.

Check the rail pressure sensor connectors.
Check the injection computer connections.
Repair if necessary.

Check for **continuity** and absence of **interference resistance** of the following connections:
Injection computer brown 48-track connector B, **track G3** ⟶ **Track 2** rail pressure sensor
Injection computer brown 48-track connector B, **track A4** ⟶ **Track 3** rail pressure sensor
Injection computer brown 48-track connector B, **track C4** ⟶ **Track 1** rail pressure sensor
Repair if necessary.

With the ignition on and the engine stopped for over 1 minute:
Display parameter **PR038 Rail pressure** in the **Fuel circuit, Engine management function** tab.
– If the value is below **50 bar**, the sensor is in order.
In this case, contact the Techline.
– If the pressure is above **50 bar**, replace the rail pressure sensor and tighten to **35 ± 5 Nm**.
Observe the safety advice in the **Introduction**.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF008 PRESENT OR STORED	PEDAL POTENTIOMETER CIRCUIT GANG 1 CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 volts 1.DEF : Inconsistent signal 2.DEF : Accelerator pedal sensor locked

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after a series of full load / no load actions on the accelerator pedal.
	Special notes: Turbocharging, heating element actuation and cruise control/speed limiter not authorised. If CO.0, CC.1, 1.DEF are present, the **level 1** warning light is lit. The engine speed is set at **1,400 rpm** if there is a fault on gang 1 and 2 of the pedal potentiometer and the engine torque is limited. Use bornier **Elé. 1681 or Elé. 1590** for any work on the computer connectors. If 2.DEF is present: the brake pedal has been depressed while the accelerator is depressed and jammed.
	Priorities when dealing with a number of faults : Deal with fault **DF011 Sensor supply voltage no. 1** first if it is present or stored.

WARNING
This fault may appear if the wiring harness has been damaged.
Follow the procedure described in the Wiring Check in the Introduction.
This check enables the condition and the conformity of the engine wiring harness to be checked.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF008 **CONTINUED 1**	

CO.0	***NOTES***	**Priorities when dealing with a number of faults :** If fault **DF009 Pedal potentiometer circuit gang 2** is present at the same time, check that the pedal sensor connector is connected correctly.

Check the pedal potentiometer connections.
Check the injection computer connections.
Repair if necessary.

Check the **continuity** and **insulation to earth** of the following connections:

Injection computer black 32-track connector A, **track H2** ⟶ **Track 3** pedal potentiometer connector

Injection computer black 32-track connector A, **track G2** ⟶ **Track 4** pedal potentiometer connector

Injection computer black 32-track connector A, **track H3** ⟶ **Track 2** pedal potentiometer connector

Repair if necessary.

Measure the **resistance** of the pedal potentiometer on **gang 1** between **tracks 4** and **2**.
Replace the pedal potentiometer if the resistance is not approximately **1.2 ± 0.1 kΩ**.

CC.1	***NOTES***	None.

Check the pedal potentiometer connections.
Check the injection computer connections.
Repair if necessary.

Check **for continuity** and **insulation to + 12 V** on the following connections:

Injection computer black 32-track connector A, **track H2** ⟶ **Track 3** pedal potentiometer connector

Injection computer black 32-track connector A, **track G2** ⟶ **Track 4** pedal potentiometer connector

Injection computer black 32-track connector A, **track H3** ⟶ **Track 2** pedal potentiometer connector

Repair if necessary.

Measure the **resistance** of the pedal potentiometer on **gang 1** between **tracks 4** and **2**.
Replace the pedal potentiometer if its resistance is not approximately: **1.2 ± 0.1 kΩ**.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF008 **CONTINUED 2**	

1.DEF	***NOTES***	None.

Check the pedal potentiometer connections.
Check the injection computer connections.
Repair if necessary.

Check for **continuity** and absence of **interference resistance** of the following connections:

- Injection computer black 32-track connector A, **track H2** → **Track 3** pedal potentiometer sensor
- Injection computer black 32-track connector A, **track G2** → **Track 4** pedal potentiometer sensor
- Injection computer black 32-track connector A, **track H3** → **Track 2** pedal potentiometer sensor
- Injection computer black 32-track connector A, **track F3** → **Track 6** pedal potentiometer sensor
- Injection computer black 32-track connector A, **track F2** → **Track 5** pedal potentiometer sensor
- Injection computer black 32-track connector A, **track F4** → **Track 1** pedal potentiometer sensor

If the fault is still present, replace the pedal potentiometer.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF008 **CONTINUED 3**	

2.DEF	***NOTES***	None.

This is a test procedure designed to detect an accelerator pedal that is jammed in the depressed position.
It monitors the accelerator pedal in relation to the brake pedal.
If the test procedure detects depression of the brake pedal over 600 ms, it registers a fault which is stored in the computer. While this fault is present (both pedals depressed simultaneously) the engine switches to safe mode and the engine speed is set at 1,400 rpm.
Once the fault is no longer present (e.g.. brake and accelerator pedals released) safe mode is deactivated and the engine immediately regains its ability to respond to speed/torque requests.
This fault may occur even if the accelerator pedal is not jammed, if there is driver error during use:
– “Heel-and-toe” type driving.
– Vehicle with driving school option.
The procedure in this case should be to clear the fault and take another reading.

Check the mechanical condition of the accelerator pedal:
– locked in full load position,
– with the pedal blocked by an external component.

Repair if necessary.

Vary the position of the pedal and refer to the conformity check in order to check the operating values of the accelerator pedal potentiometer.

If the values displayed are inconsistent, replace the accelerator pedal potentiometer.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF009 PRESENT OR STORED	PEDAL POTENTIOMETER CIRCUIT GANG 2 CO.0 : open circuit or short circuit to earth CC.1: short circuit to + 12 V 1.DEF : inconsistent signal

NOTES	**Priorities when dealing with a number of faults :** Deal with fault **DF012 Sensor feed no. 2 voltage** first, if it is present or stored.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present after a series of full-load/no-load actions on the accelerator pedal.
	Special notes: Turbocharging, heating element actuation and cruise control are not authorised. The **level 1** warning light is lit. The engine speed is fixed at **1400 rpm** if there is a fault on gangs 1 and 2 of the pedal potentiometer and the engine torque is limited. Use bornier **Elé. 1681** for all operations on the computer connectors.

WARNING
This fault may appear if the wiring harness has been damaged.
Follow the procedure described in the Wiring Check in the Introduction.
This check enables the condition and the conformity of the engine wiring harness to be checked.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF009 **CONTINUED 1**	

CO.0	***NOTES***	**Priorities when dealing with a number of faults :** If fault **DF008 Pedal potentiometer circuit track 1** is present at the same time, check that the sensor is connected correctly.

Check the pedal potentiometer connections.
Check the injection computer connections.
Repair if necessary.

Check the **continuity** and **insulation to earth** of the following connections:
Injection computer black 32-track connector A, **track F3** → **Track 6** pedal potentiometer connector
Injection computer black 32-track connector A, **track F2** → **Track 5** pedal potentiometer connector
Injection computer black 32-track connector A, **track F4** → **Track 1** pedal potentiometer connector
Repair if necessary.

Measure the **resistance** on the pedal potentiometer on **track 2** between **tracks 1** and **5**.
Replace the pedal potentiometer if the resistance is not approximately **1.7 ± 0.9 kΩ**.

CC.1	***NOTES***	**Priorities when dealing with a number of faults :** If fault **DF012 Sensor feed voltage no. 2** is present at the same time, if it is present or stored.

Check the pedal potentiometer connections.
Check the injection computer connections.
Repair if necessary.

Check **for continuity** and **insulation to + 12 V** on the following connections:
Injection computer brown 48-track connector B, **track F3** → **Track 6** pedal potentiometer connector
Injection computer brown 48-track connector B, **track F4** → **Track 1** pedal potentiometer connector
Repair if necessary.

Measure the **resistance** on the pedal potentiometer on **track 2** between **tracks 1** and **5**.
Replace the pedal potentiometer if the resistance is not approximately **1.7 ± 0.9 kΩ**.

Check the injection computer connections.
Repair if necessary.

Check for **continuity** and absence of **interference resistance** of the following connections:

- Injection computer black 32-track connector A, **track F3** → **Track 6** pedal potentiometer sensor
- Injection computer black 32-track connector A, **track F2** → **Track 5** pedal potentiometer sensor
- Injection computer black 32-track connector A, **track F4** → **Track 1** pedal potentiometer sensor
- Injection computer black 32-track connector A, **track H2** → **Track 3** pedal potentiometer sensor
- Injection computer black 32-track connector A, **track G2** → **Track 4** pedal potentiometer sensor
- Injection computer black 32-track connector A, **track H3** → **Track 2** pedal potentiometer sensor

Repair if necessary.
If the fault is still present, replace the pedal potentiometer.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF011 PRESENT OR STORED	SENSOR SUPPLY VOLTAGE NO. 1 1.DEF : Signal outside lower limit 2.DEF : Signal outside upper limit

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present following a road test or after attempting to start the engine several times.
	Special notes: If the fault is present: – the cruise control and heating elements are deactivated, – turbocharging is inhibited, – the engine speed is limited, – the **level 1** warning light is lit. Use bornier **Elé. 1681** for any operations on the injection computer connectors.

WARNING
This fault may appear if the wiring harness has been damaged.
Follow the procedure described in Wiring check in the Introduction.
This check enables the condition and the conformity of the engine wiring harness to be checked.

1.DEF ***2.DEF***	***NOTES***	**Priorities when dealing with a number of faults :** If fault **DF008 Pedal potentiometer circuit track 1** is present at the same time, check that the sensor is connected correctly.

The sensors connected to **supply no. 1** are:
– **turbocharger pressure sensor,**
– **accelerator pedal potentiometer sensor, gang 1,**
– **particle filter differential pressure sensor.**
To locate a faulty sensor and/or connection, disconnect one of these sensors then check whether the fault becomes stored.
If the fault remains present, repeat the operation with the other sensor (wait for a few seconds between disconnecting so that the computer can take its measurement).
If the fault is stored after a disconnection, replace the faulty sensor or repair its connection.
Clear the faults created by the multiple disconnections.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF011 **CONTINUED**	

If the fault is still present when both these sensors have been disconnected:
1. Check the **earth insulation** of the following connections:
Injection computer brown 48-track connector B,
track G4 ⟶ **Track 1** of the turbocharger pressure sensor
Injection computer brown 48-track connector B,
track K2 ⟶ **Track 3** of the turbocharger pressure sensor
Injection computer black 32-track connector A,
track H2 ⟶ **Track 3** of the accelerator pedal potentiometer gang 1
Injection computer black 32-track connector A,
track G2 ⟶ **Track** 4 of the accelerator pedal potentiometer gang 1
Injection computer brown 48-track connector B,
track G4 ⟶ **Track 1 of the particle filter differential pressure sensor**
Injection computer grey 32-track connector C,
track B2 ⟶ **Track 3 of the particle filter differential pressure sensor**

2. Check **the insulation from + 12 V** of the following connections:
Injection computer brown 48-track connector B,
track K2 ⟶ **Track 3** of the turbocharger pressure sensor
Injection computer brown 48-track connector B,
track D4 ⟶ **Track 2** of the turbocharger pressure sensor
Injection computer black 32-track connector A,
track H3 ⟶ **Track 2** of the accelerator pedal potentiometer gang 1
Injection computer black 32-track connector A,
track H2 ⟶ **Track 3** of the accelerator pedal potentiometer gang 1
Injection computer grey 32-track connector C,
track B2 ⟶ **Track 3 of the particle filter differential pressure sensor**
Injection computer grey 32-track connector C,
track F3 ⟶ **Track 2 of the particle filter differential pressure sensor**
Repair if necessary.

3. Check the **insulation** between the following connections **after disconnecting the sensors** and the injection computer:
– tracks **2** and 4 of the **pedal sensor gang 1** connector.
– tracks **1** and 2 of the **turbocharger pressure sensor** connector.
If these checks do not produce the correct results, replace the faulty sensor(s).
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF012 PRESENT OR STORED	SENSOR SUPPLY VOLTAGE No. 2 1.DEF : Signal outside lower limit 2.DEF : Signal outside upper limit

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present following a road test or after attempting to start the engine several times.
	Special notes: If the fault is present: – the EGR offset programming and heating element management functions are disabled, – cruise control is deactivated, – the engine speed is limited, – the **level 1** warning light is lit, – the OBD indicator light will come on after three consecutive cycles (starting + 5 seconds + switch off the ignition and wait for the following message to appear on the **diagnostic tool: "Loss of dialogue with the computer: EDC16 C3, check the tool connection and the computer supply"**). Use bornier **Elé. 1681** for any operations on the injection computer connectors.

WARNING
This fault may appear if the wiring harness has been damaged.
Follow the procedure described in Check wiring in the Introduction.
This check enables the condition and the conformity of the engine wiring harness to be checked.

The sensors connected to **feed no. 2** are:
– **EGR valve position sensor.**
– **Accelerator pedal potentiometer sensor gang 2.**
To locate a faulty sensor and/or connection, disconnect one of these sensors then check whether the fault becomes stored.
If the fault remains present, repeat the operation with the other sensors (wait for a few seconds between disconnecting so that the computer can take its measurement).
If the fault is stored after a disconnection, replace the faulty sensor or repair its connection.
Clear the faults created by the multiple disconnections.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF012 **CONTINUED**	

If the fault is still present when both these sensors have been disconnected:
1. Check the **earth insulation** of the following connections:
Injection computer brown 48-track connector B,
track F4 ⟶ **Track 2** of the EGR valve connector
Injection computer brown 48-track connector B,
track J2 ⟶ **Track 6** of the EGR valve connector
Injection computer black 32-track connector A,
track F2 ⟶ **Track 5** of the accelerator pedal potentiometer gang 2
Injection computer black 32-track connector A,
track F3 ⟶ **Track** 6 of the accelerator pedal potentiometer gang 2
Repair if necessary.

2. Check **the insulation from + 12 V** of the following connections:
Injection computer brown 48-track connector B,
track J2 ⟶ **Track 6** of the EGR valve connector
Injection computer grey 32-track connector C,
track C2 ⟶ **Track 4** of the EGR valve connector
Injection computer black connector A,
track F3 ⟶ **Track 6** of the accelerator pedal potentiometer gang 2
Injection computer black connector A,
track F4 ⟶ **Track 1** of the accelerator pedal potentiometer gang 2
Repair if necessary.

3. Check the **insulation** between the following connections **after disconnecting the sensors and the injection computer**:
– tracks **1** and **5** of the **pedal sensor gang 2** connector.
– tracks **2** and **4** of the **EGR valve position sensor connector**.
If these checks do not produce the correct results, replace the faulty sensor(s). If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF013 PRESENT OR STORED	SENSOR SUPPLY VOLTAGE No. 3 1.DEF : Signal outside lower limit 2.DEF : Signal outside upper limit

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present following a road test or after attempting to start the engine several times.
	Special notes: If the fault is present: – the EGR functions are disabled, – the engine speed is limited, – the engine stops. – the **level 2** warning light is lit. Use bornier **Elé. 1681** for any operations on the injection computer connectors.

WARNING
This fault may appear if the wiring harness has been damaged.
Follow the procedure described in Check wiring in the Introduction.
This check enables the condition and the conformity of the engine wiring harness to be checked.

The sensors connected to **supply no. 3** are:
– **rail pressure sensor,**
– **air flowmeter.**
To locate a faulty sensor and/or connection, disconnect one of these sensors then check whether the fault becomes stored.
If the fault remains present, repeat the operation with the other sensors (wait for a few seconds between disconnecting so that the computer can take its measurement).
If the fault is stored after a disconnection, replace the faulty sensor or repair its connection.
Clear the faults created by the multiple disconnections.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF013 **CONTINUED**	

If the fault is still present when both these sensors have been disconnected:
1. Check the **earth insulation** of the following connections:
- Injection computer brown 48-track connector B, **track G3** → **Track 2** of the rail pressure sensor
- Injection computer brown 48-track connector B, **track A4** → **Track 3** of the rail pressure sensor
- Injection computer brown 48-track connector B, **track G1** → **Track 5** of the air flowmeter
- Injection computer brown 48-track connector B, **track B4** → **Track 3** of the air flowmeter

Repair if necessary.

2. Check **the insulation from + 12 V** of the following connections:
- Injection computer brown connector B, **track G3** → **Track 2** of the rail pressure sensor
- Injection computer brown connector B, **track C4** → **Track 1** of the rail pressure sensor
- Injection computer brown connector B, **track G1** → **Track 5** of the air flowmeter
- Injection computer brown connector B, **track E2** → **Track 2** of the air flowmeter

Repair if necessary.

3. Check the **insulation** between the following connections **after disconnecting the sensors and the injection computer**:
– tracks **1** and **3** of the **rail pressure sensor**,
– tracks **2** and **3** of the **air flow sensor connector.**

If these checks do not produce the correct results, replace the faulty sensor(s).
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF015 PRESENT OR STORED	MAIN RELAY control CIRCUIT 1.DEF : relay cut out too soon 2.DEF : relay cut out too late

NOTES	**Conditions for applying the fault finding procedure to stored faults:** Only deal with this fault if it is stored.
	Special notes: Use bornier **Elé. 1681** for any operations on the injection computer connectors. If the fault is present, the level 1 warning light will be lit.

Check the condition of the main relay supply fuse **FM3 30A**.
Replace the fuse if necessary.
Check the injection computer connections, and the injection computer supply relay **R8**.
Repair if necessary.
Remove the **R8** relay and check it is working correctly.
If this relay is defective, replace it and clear the faults.
Check the condition and tightness of the battery terminals and its engine earth connection.
Check the **continuity** and **make sure there is no interference resistance** on the following connection:
Injection computer brown **48-track connector B, track E1** ⟶ **Relay mounting R8 track 15**
Repair if necessary.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF017 PRESENT OR STORED	PRE-POSTHEATING UNIT CONTROL CIRCUIT CC.1 : short circuit to +12 V CC.0 : open circuit or short circuit to earth CO : open circuit 1.DEF : Internal electronic fault

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after attempts have been made to start the engine.
	Special notes: If the fault is present, it is difficult or even impossible to start the vehicle when cold. Use bornier **Elé. 1681** for any operations on the injection computer connectors.

CC.1	***NOTES***	None.

Check the pre-postheating unit connections and the heating plug supply cables.
Check the injection computer connections.
Repair if necessary.

Check the condition of the **F2 (70A)** supply fuse on the power supply fuse board.
Check **the continuity and insulation against + 12 V** of the following connections:
Injection computer grey 32-track connector C, **track E2** ⟶ **Track 8** preheating unit
Injection computer grey 32-track connector C, **track A4** ⟶ **Track 9** preheating unit
Repair if necessary.
If the fault is still present, replace the pre-postheating unit.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF017 **CONTINUED**	

CC.0 ***CO***	***NOTES***	**Special notes:** If the pre-postheating unit has a short circuit to earth there is a risk that the heater plugs will be operated continuously. The heater plugs and the engine may be damaged.

Check the pre-postheating unit connections and the heating plug supply cables. Check the injection computer connections. Repair if necessary.
Check the condition of the **F2 (70A)** supply fuse on the power supply fuse board. Check **the continuity and insulation** from earth of the following connections: Injection computer grey 32-track connector C, **track A4** ⟶ **Track 9** preheating unit Injection computer grey 32-track connector C, **track E2** ⟶ **Track 8** preheating unit Repair if necessary.
If the fault is still present, replace the pre-postheating unit.

1.DEF	***NOTES***	None.

Check the pre-postheating unit connections and the heating plug supply cables. Check the injection computer connections. Repair if necessary.
Check the condition of the **F2 (70A)** supply fuse on the power supply fuse board. Check **the continuity and insulation** from earth of the following connections: Injection computer grey 32-track connector C, **track A4** ⟶ **Track 9** preheating unit Injection computer grey 32-track connector C, **track E2** ⟶ **Track 8** preheating unit Repair if necessary.
If the fault is still present, replace the pre-postheating unit.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF025 PRESENT OR STORED	PRE-POSTHEATING UNIT DIAGNOSTIC LINE

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present after several attempts have been made to start the engine.
	Special notes: It is difficult or even impossible to start the engine when cold. Use bornier **Elé. 1681** for any operations on the injection computer connectors.

Check the pre-postheating unit connections.
Check the connections on **all the heater plugs**.
Repair if necessary.

Check **the resistance** of the heater plugs:
Replace any plug with a resistance greater than **2 Ω at +20°C**.
Check the **continuity and absence of interference resistance** of the following connections:

preheating unit **track 1** → heater plug of **cylinder 3**
preheating unit **track 2** → heater plug of cylinder **1**
preheating unit **track 6** → heater plug of cylinder **4**
preheating unit **track 7** → heater plug of **cylinder 2**

Check for + 12 V on **track 3** of the preheating unit (by fuse F2, 70A).

If the fault is still present.
Check the injection computer connections.
Check the following connections for **continuity and make sure there is no extraneous resistance**:

Injection computer grey 32-track connector C, **track A4** → **Track 9** preheating unit connector
Injection computer grey 32-track connector C, **track E2** → **Track 8** preheating unit connector

If the fault is still present, replace the pre-postheating unit.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF037 PRESENT OR STORED	ENGINE IMMOBILISER

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after an attempt to start engine.
	Special notes: It is impossible to start the vehicle. Use bornier **Elé. 1681** for any operations on the injection computer connectors.

Check the UCH connections. Check the injection computer connections. Repair if necessary.
Carry out a multiplex network test and a complete fault finding procedure on the UCH. Refer to the UCH Technical Note if a fault is declared present. If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF038 PRESENT OR STORED	COMPUTER 1.DEF : permanent high signal 2.DEF : permanent low signal 3.DEF : configuration absent or incorrect 4.DEF : analogue/digital converter fault 5.DEF : disrupted communication 6.DEF : EEPROM fault 7.DEF : activation in Watchdog 8.DEF : signal outside upper limit 9.DEF : signal outside lower limit 10.DEF : injector control 11.DEF : injector control capacitor fault 12.DEF : injection fault when decelerating 13.DEF : initialisation fault 14.DEF : open circuit or internal electronic fault

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present after one attempt to start the engine, or with the engine running.
	Special notes: If 6.DEF, 8.DEF, 12.DEF is present, the **level 1** warning light is on. If one of the other faults is present, the **level 2** warning light comes on. If 6.DEF is still present, the **OBD** warning light will illuminate after three consecutive driving cycles (starting + 5 seconds + switch off the ignition and wait for the message to appear on the **diagnostic tool: "Loss of dialogue with the computer: EDC16 C3, check the tool connection and the computer supply"**). Use bornier **Elé. 1681 or Elé. 1590** for all operations on the injection computer connectors.
	Priority when dealing with a number of faults: Deal with fault **DF046 Battery voltage** first if it is present or stored.

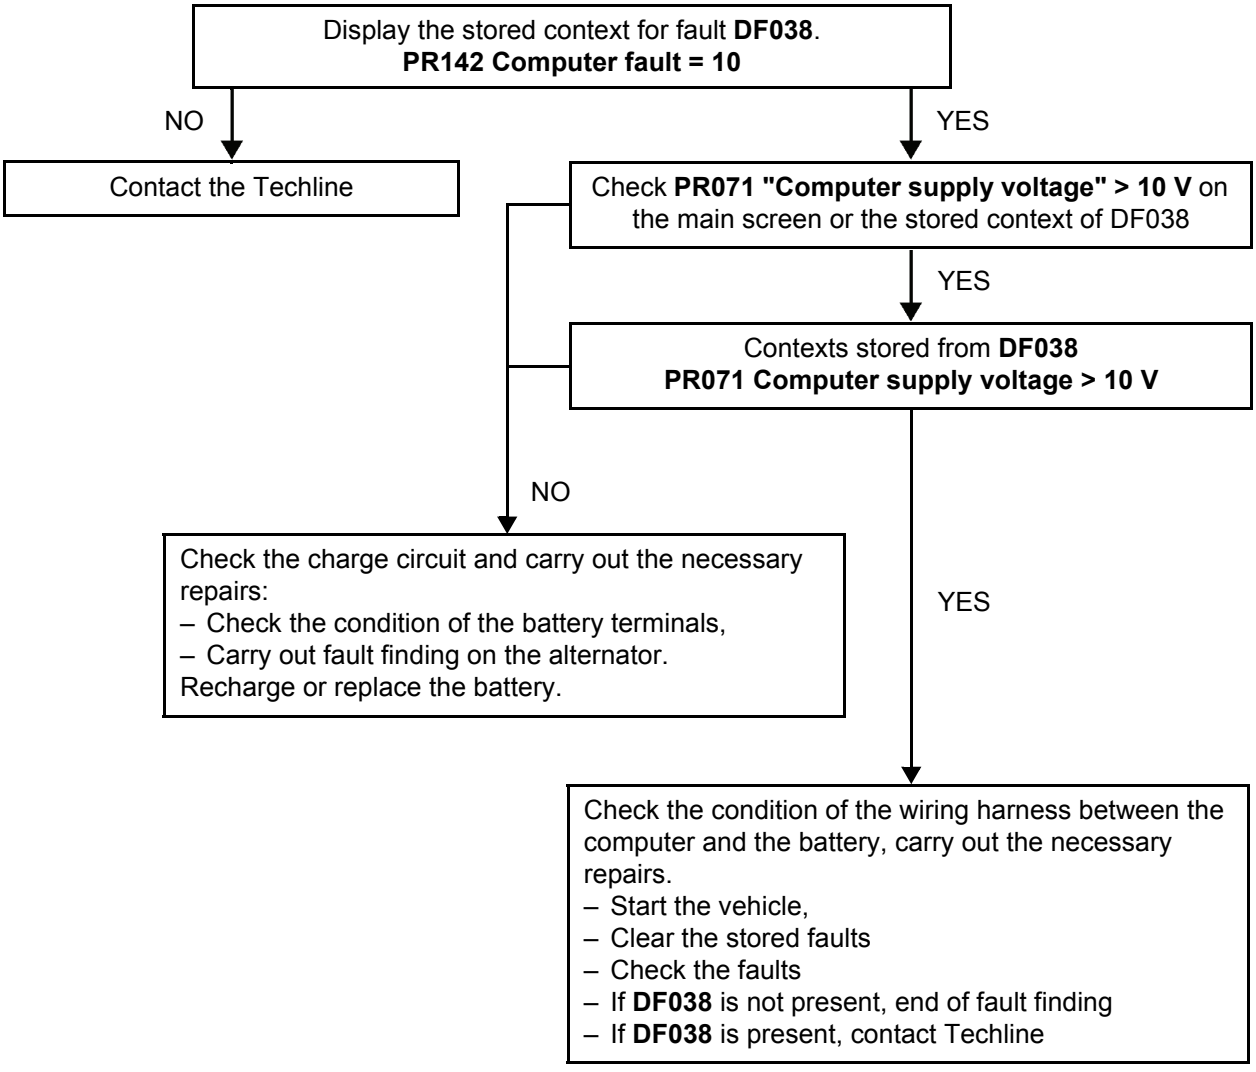
1.DEFto 10.DEF 12.DEF 13.DEF	***NOTES***	Check the injection computer connections and the **continuity** of all the supplies. Repair if necessary. Clear the faults. Switch off the ignition, and **wait** for the following message to appear on the **diagnostic tool: "Loss of dialogue with the computer: EDC16 C3, check the tool connection and the computer supply"** before switching the ignition back on. If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF038 **CONTINUED**	

11.DEF	***NOTES***	**IMPORTANT** **Only applies to LAGUNA II ph1 and VELSATIS ph1 and ph2.** If there are a number of faults, deal with the other system faults first.



AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF039 PRESENT OR STORED	INLET AIR TEMPERATURE SENSOR CIRCUIT CO.1 : open circuit or short circuit on + 12 V CC.0 : short circuit to earth

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present after one attempt to start the engine, or with the engine running.
	Special notes: If the fault is present: – the air temperature value enters defect mode, i.e. **PR058 Air temperature = 20°C**. – the EGR function is inhibited. Use bornier **Elé. 1681** for any operations on the injection computer connectors.

CO.1	***NOTES***	None.

Check the air flowmeter connections.
Check the injection computer connections.
Repair if necessary.
Check **the continuity** of the following connection:

Flowmeter **track 4** ⟶ **Track 5 injection relay mounting (Engine connection unit)**

Repair if necessary.
Check **the continuity and insulation against + 12 V** of the following connections:

Injection computer brown 48-track connector B, **track G2** ⟶ **Track 1** air flowmeter connector
Injection computer brown 48-track connector B, **track E2** ⟶ **Track 2** air flowmeter connector

Repair if necessary.

Measure the air temperature sensor resistance between **tracks 1** and **2** of the air flow sensor.
Replace the air flowmeter if the resistance displayed is not:

3714 Ω ± 161 at 10°C
2488 Ω ± 90 at 20°C
1671 Ω ± 59 at 30°C

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF039 **CONTINUED**	

CC.0	***NOTES***	None.

Check the air flowmeter connections.
Check the injection computer connections.
Repair if necessary.
Check the **continuity** and **insulation from earth** of the connections between:

Injection computer connector B,
brown 48-track, **track G2** → **Track 1** air flowmeter
Air flowmeter **track 4** → **Track 5 injection relay base (Engine connection unit)**

Injection computer connector B,
brown 48-track, **track B4** → **Track 3** air flowmeter

Repair if necessary.

Measure the resistance of the air temperature sensor integrated into the flow sensor between **tracks 1** and **2**.
Replace the air flowmeter if the resistance is not approximately:

3714 Ω ± 161 at 10°C
2488 Ω ± 90 at 20°C
1671 Ω ± 59 at 30°C

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF040 PRESENT OR STORED	CYLINDER 1 INJECTOR CIRCUIT CC.1 : short circuit to +12 V CO : open circuit CC : short circuit 1.DEF : injector control

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present after the engine has been started.
	Special notes: If CC.1, CC, or 1.DEF is present, the **level 2** warning light is lit. If CO is present the **level 1** warning light is lit. If CO is still present, the **OBD** warning light will illuminate after three consecutive driving cycles (starting + 5 seconds + switch off the ignition and wait for the message to appear on the **diagnostic tool: "Loss of dialogue with the computer: EDC16 C3, check the tool connection and the computer supply"**). If the fault is present, the injection on cylinder 1 is disabled. Use bornier **Elé. 1681 or Elé. 1590** for all operations on the injection computer connectors.
	IMPORTANT This fault can result in a rapid and significant fouling of the particle filter.

WARNING
This fault may appear if the wiring harness has been damaged.
Follow the procedure described in the Wiring Check in the Introduction.
This test enables the condition and the conformity of the engine wiring harness to be checked.

CC.1 ***CO*** ***CC*** ***1.DEF***	***NOTES***	None.

Check the connections on injector no 1. Check the injection computer connections.
Repair if necessary.

Disconnect injector No. 1.
Measure the **resistance** of injector no. 1 between **tracks 1** and **2**.
Replace the injector if there is a short **circuit (R = 0 Ω)** or an **open circuit (resistance = infinity)**. Otherwise **reconnect injector No. 1**.
Check the **continuity and absence of interference resistance** of the following connections:
Injection computer grey 32-track connector C, **track G3** ⟶ **Track 2** injector no. 1
Injection computer grey 32-track connector C, **track H1** ⟶ **Track 1** injector no. 1
If the fault is still present, carry out **test 10 INCORRECT INJECTOR OPERATION**.
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF041 PRESENT OR STORED	CYLINDER 2 INJECTOR CIRCUIT CC.1 : short circuit to +12 V CO : open circuit CC : short circuit 1.DEF : injector control

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present after the engine has been started.
	Special notes: If CC.1, CC, or 1.DEF is present, the **level 2** warning light is lit. If CO is present the **level 1** warning light is lit. If CO is still present, the **OBD** warning light will illuminate after three consecutive driving cycles (starting + 5 seconds + switch off the ignition and wait for the message to appear on the **diagnostic tool: "Loss of dialogue with the computer: EDC16 C3, check the tool connection and the computer supply"**). If the fault is present, the injection on cylinder 2 is disabled. Use bornier **Elé. 1681 or Elé. 1590** for all operations on the injection computer connectors.
	IMPORTANT This fault can result in a rapid and significant fouling of the particle filter.

WARNING
This fault may appear if the wiring harness has been damaged.
Follow the procedure described in the Wiring Check in the Introduction.
This test enables the condition and the conformity of the engine wiring harness to be checked.

CC.1 ***CO*** ***CC*** ***1.DEF***	***NOTES***	None.

Check the connections on injector no. 2. Check the injection computer connections.
Repair if necessary.

Disconnect injector no. 2.
Measure the **resistance** of injector no. 2 between **tracks 1** and **2**.
Replace the injector if there is a **short circuit (R = 0 Ω)** or an **open circuit (resistance = infinity)**. Otherwise **reconnect injector no. 2**.
Check the **continuity and absence of interference resistance** on the following connections:
Injection computer grey 32-track connector C, **track G4** ⟶ **Track 2** injector no. 2
Injection computer grey 32-track connector C, **track G2** ⟶ **Track 1** injector no. 2
If the fault is still present, carry out **test 10 INCORRECT INJECTOR OPERATION**.
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF042 PRESENT OR STORED	CYLINDER 3 INJECTOR CIRCUIT CC.1 : short circuit to +12 V CO : open circuit CC : short circuit 1.DEF : injector control

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present after the engine has been started.
	Special notes: If CC.1, CC, or 1.DEF is present, the **level 2** warning light is lit. If CO is present the **level 1** warning light is lit. If CO is still present, the **OBD** warning light will illuminate after three consecutive driving cycles (starting + 5 seconds + switch off the ignition and wait for the message to appear on the **diagnostic tool: "Loss of dialogue with the computer: EDC16 C3, check the tool connection and the computer supply"**). If the fault is present, the injection on cylinder 3 is disabled. Use bornier **Elé. 1681 or Elé. 1590** for all operations on the injection computer connectors.
	IMPORTANT This fault can result in a rapid and significant fouling of the particle filter.

WARNING
This fault may appear if the wiring harness has been damaged.
Follow the procedure described in the Wiring Check in the Introduction.
This test enables the condition and the conformity of the engine wiring harness to be checked.

CC.1 ***CO*** ***CC*** ***1.DEF***	***NOTES***	None.

Check the connections on injector no. 3. Check the injection computer connections.
Repair if necessary.

Disconnect injector no.3.
Measure the **resistance** of injector no. 3 between **tracks 1** and **2**.
Replace the injector if there is a **short circuit (R = 0 Ω)** or an **open circuit (resistance = infinity)**. Otherwise **reconnect injector no. 3**.
Check **the continuity and absence of interference resistance** of the following connections:
Injection computer grey 32-track connector C, **track H4** ⟶ **Track 2** injector no. 3
Injection computer grey 32-track connector C, **track H2** ⟶ **Track 1** injector no. 3
If the fault is still present, carry out **test 10 INCORRECT INJECTOR OPERATION**.
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF043 PRESENT OR STORED	CYLINDER 4 INJECTOR CIRCUIT CC.1 : short circuit to +12 V CO : open circuit CC : short circuit 1.DEF : injector control

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present after the engine has been started.
	Special notes: If CC.1, CC, or 1.DEF is present, the **level 2** warning light is lit. If CO is present the **level 1** warning light is lit. If CO is still present, the **OBD** warning light will illuminate after three consecutive driving cycles (starting + 5 seconds + switch off the ignition and wait for the message to appear on the **diagnostic tool: "Loss of dialogue with the computer: EDC16 C3, check the tool connection and the computer supply"**). If the fault is present, the injection on cylinder 4 is disabled. Use bornier **Elé. 1681 or Elé. 1590** for all operations on the injection computer connectors.
	IMPORTANT This fault can result in a rapid and significant fouling of the particle filter.

WARNING
This fault may appear if the wiring harness has been damaged.
Follow the procedure described in the Wiring Check in the Introduction.
This test enables the condition and the conformity of the engine wiring harness to be checked.

CC.1 ***CO*** ***CC*** ***1.DEF***	***NOTES***	None.

Check the connections to injector no. 4. Check the injection computer connections.
Repair if necessary.

Disconnect injector no. 4.
Measure the **resistance** of injector no. 4 between **tracks 1** and **2**.
Replace the injector if there is a short **circuit (R = 0 Ω)** or an **open circuit (resistance = infinity)**. Otherwise **reconnect injector no. 4**.
Check the **continuity and absence of interference resistance** on the following connections:
Injection computer grey 32-track connector C, **track H3** ⟶ **Track 2** injector no. 4
Injection computer grey 32-track connector C, **track G1** ⟶ **Track 1** injector no. 4
If the fault is still present, carry out **test 10 INCORRECT INJECTOR OPERATION**.
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF046 PRESENT OR STORED	BATTERY VOLTAGE 1.DEF : excess voltage 2.DEF : undervoltage 3.DEF : voltage outside tolerance range

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present following a road test or after attempting to start the engine.
	Special notes: Computer operating voltage: **9 V < operating voltage < 16 V**. If the battery voltage is too low this may cause the **level 1** fault warning light to come on. It is then not possible to start the engine. Use bornier **Elé. 1681** for any operations on the injection computer connectors.

1.DEF	***NOTES***	None.

Check the charge circuits:
– Battery condition
– Alternator condition (complete fault finding procedure)
Carry out the necessary repairs.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF046 **CONTINUED**	

2.DEF	***NOTES***	Use the Wiring diagrams Technical Note.
3.DEF		Use the Wiring diagrams Technical Note. Only VEL SATIS phase 2 Vdiag 14

With the ignition off, measure the voltage across the battery terminals.
If the voltage is below **11.5 V**, recharge and test the battery.
If necessary replace the battery, then check the charge circuit.
With the ignition on, and the starter operating, measure the battery voltage across the terminals.
If the voltage drops below **9.6 V**, check the tightness and condition of the battery terminals.
Recharge and test the battery.
If necessary replace the battery, then check the charge circuit.

If the starter is driving the engine correctly, but the fault is still present:
– Check **for + 12 V after ignition** on:
Track **G1** of the injection computer black connector **A**
Track **E1** of brown connector **B** from the injection computer
If there is no feed to these tracks, check the condition of fuse **FM3 (30A)** on the fuse board.
Replace if necessary.
– Check the condition of the injection computer supply voltage **relay R8**.
Repair the contacts or replace them if necessary.
– Check the **continuity and absence of interference resistance** of the following connections:
Track 15 of relay **R8** ⟶ **Track E1** of brown connector **B** of the injection computer
Track 13 of relay **R8** ⟶ **Track G1** of black connector **A** of the injection computer
Repair if necessary.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF047 PRESENT OR STORED	COMPUTER SUPPLY VOLTAGE 1.DEF : voltage outside tolerances

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after several starting attempts, or with the engine running.
	Special notes: Computer operating voltage: **9 V < operating voltage < 16 V**. If the battery voltage is too low this may cause the **level 1** fault warning light to come on. It is then not possible to start the engine. Use bornier **Elé. 1681** for any operations on the injection computer connectors.

Check the condition of the fuses **FM3 30A** and **FM6 10A**.
Replace if necessary.
Remove the computer supply relay **R8** and check that it is working properly. If it is faulty, replace it.
Check the **+ 12 V after ignition feed** to the following tracks:
– **Track G1** of the injection computer black connector A
– **Track D1** of the injection computer black connector A
If there is no feed on **track G1** of the injection computer black connector A, check **the continuity and make sure there is no interference resistance** between:

Track G1 ⟶ Relay mounting **R8 track 13**

Repair if necessary.
If there is no feed on **track D1** of the injection computer black connector A, check **the continuity and make sure there is no interference resistance** between:

Track D1 ⟶ Engine fuse and relay box **track 28**

Repair if necessary.

If all these checks have been carried out and there are no faulty components, check **the continuity and that there is no interference resistance** between:

Injection computer **brown connector B track E1** ⟶ Relay mounting **R8 track 15**

Repair if necessary.
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF050 PRESENT OR STORED	BRAKE SWITCH CIRCUIT 1.DEF : Open circuit or short circuit 2.DEF : Inconsistent signal

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present after the brake pedal is depressed, or during a road test.
	Special notes: If the fault is present, cruise control is deactivated. Use bornier **Elé. 1681** for any operations on the injection computer connectors.

WARNING
This fault may appear if the wiring harness has been damaged.
Follow the procedure described in the Wiring Check in the Introduction.
This check enables the condition and the conformity of the engine wiring harness to be checked.

1.DEF	***NOTES***	***IMPORTANT** Two types of switch are used. Only the track assignments are different: The first type uses tracks A1, B3, A3 and B1, The second uses tracks 1, 2, 3 and 4.

Check the brake pedal switch connections.
Check the condition and adjustment of the brake pedal switch.
Repair if necessary.

Check the continuity and the absence of interference resistance on the following connection:
Injection computer **black 32-track connector A, track E4** ⟶ **Track 3 or A3*** of the brake switch
Repair if necessary.
Check the conformity of the switch by consulting the interpretation of statuses **ET704 Brake switch no. 1** and **ET705 Brake switch no. 2**.
If the fault is still present, carry out fault finding on the ABS computer.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF050 **CONTINUED**	

2.DEF	***NOTES***	***IMPORTANT** Two types of switch are used. Only the track assignments are different: The first type uses tracks A1, B3, A3 and B1, The second uses tracks 1, 2, 3 and 4.

Check the brake pedal switch connections.
Check the condition and adjustment of the brake pedal switch.
Repair if necessary.

Check **the conformity of the** brake light switch:

Brake pedal released:	continuity between **tracks 3** and **4** or **A3** and **B1***
Brake pedal depressed:	infinite resistance between **tracks 1** and **2** or **A1** and **B3***
	infinite resistance between **tracks 3** and **4** or **A3** and **B1***
	continuity between **tracks 1** and **2** or **A1** and **B3***

Replace the switch if necessary.
Check the condition of fuse **1H (15A)** of the passenger compartment fuse and relay board.
Replace the fuse if necessary.
Check **the feeds** to the switch:

- **+12 V** after ignition ⟶ **track 2 or B3*** of the brake pedal switch connector
- **+12 V** battery ⟶ **track 4 or B1*** of the brake pedal switch connector (via the UCH)

Replace the switch if necessary.
Check **the continuity and insulation** of the following connections:

- Injection computer black 32-track connector **A**, **track E4** ⟶ **Track 3 or A3*** of the brake pedal switch connector

Repair if necessary.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF051 PRESENT OR STORED	CRUISE CONTROL/SPEED LIMITER FUNCTION 1.DEF : inconsistent signal 2.DEF : inconsistent vehicle speed 3.DEF : controls at the steering wheel

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present after the engine is started or following a road test.
	Special notes: The cruise control/speed limiter function is inhibited. Use bornier **Elé. 1681** for any operations on the injection computer connectors.

WARNING
This fault may appear if the wiring harness has been damaged.
Follow the procedure described in the Wiring Check in the Introduction.
This check enables the condition and the conformity of the engine wiring harness to be checked.

If the fault is declared present, refer to the section of the conformity check on the **Cruise control/Speed limiter**, and to the interpretation of statuses:
ET042 Cruise control/Speed limiter,
ET413 Cruise control/Speed limiter function,
ET556 Driver's deactivation of the cruise control/speed limiter,
ET557 Cruise control/speed limiter deactivation by function.

Check that by pressing the buttons the statuses change and that, with the ignition switched on, all the values are correct.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

DF053 PRESENT OR STORED	RAIL PRESSURE REGULATION FUNCTION CC.1 : short circuit to + 12 V CC.0 : short circuit to earth CO : open circuit 1.DEF : internal electronic fault 2.DEF : pressure measured too low 3.DEF : pressure measured too high 4.DEF : insufficient pressure 5.DEF : pressure < minimum 6.DEF : pressure > maximum 7.DEF : significant pump control

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present following a road test or after attempting to start the engine.
	Special notes: If the fault is present: – It is not possible to start the engine. – the level 2 warning light is lit. Use bornier **Elé. 1681** for any operations on the injection computer connectors.

CC.1	***NOTES***	None.

Check the rail pressure regulator connectors.
Check the injection computer connections.
Check the low pressure circuit and the fuel conformity by running **test 2 Low pressure circuit check and test 7 Diesel fuel conformity check**.
Check the injector return flow, run **test 10 Poor injector operation.**
Check the operation of the overpressure valve if fitted to the vehicle, run test **8 Incorrect operation of the overpressure valve**.
Repair if necessary.

Measure the **resistance** of the fuel temperature sensor between its **tracks 1** and **2**.
If the resistance is not: **3 Ω ± 0.4 at 20°C**, replace the fuel flow actuator.
Check **the continuity and the insulation against +12 V** of the following connection:
Injection computer brown 48-track connector **B**, **track M4** ⟶ **Track 2** of the fuel flow actuator

If the fault is still present replace the rail pressure regulator.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF053 **CONTINUED 1**	

CC.0 ***CO***	***NOTES***	None.

Check the fuel flow regulator connections. Check the injection computer connections. Check the low pressure circuit and the fuel conformity by running **test 2 Low pressure circuit check and test 7 Diesel fuel conformity check**. Check the injector return flow, run **test 10 Poor injector operation.** Check the operation of the overpressure valve if fitted to the vehicle, run test **8 Incorrect operation of the overpressure valve**. Repair if necessary.
Measure the **resistance** across **tracks 1** and **2** of the flow regulator. If the resistance is not: **3 Ω ± 0.4 at 20°C**, replace the fuel flow regulator. Check **the continuity and insulation** to earth of the following connection: Injection computer brown 48-track connector **B**, **track M4** ⟶ **Track 2** of the fuel flow regulator With the ignition on, check for the **+ 12 V** after relay feed on **track 1** of the fuel flow regulator.
If the fault is still present, replace the fuel flow regulator.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF053 **CONTINUED 2**	

1.DEF	***NOTES***	None.

Check the rail pressure regulator connectors.
Check the injection computer connections.
Check the low pressure circuit and the fuel conformity by running **test 2 Low pressure circuit check and test 7 Diesel fuel conformity check**.
Check the injector return flow, run **test 10 Poor injector operation.**
Check the operation of the overpressure valve if fitted to the vehicle, run test **8 Incorrect operation of the overpressure valve**.
Repair if necessary.

Measure the **resistance** across **tracks 1** and **2** of the flow regulator.
If the resistance is not: **3 Ω ± 0.4 at 20°C**, replace the fuel flow regulator.
Check continuity and make sure there is no interference resistance on the following connection:
Injection computer brown 48-track connector **B**, **track M4** ⟶ **Track 2** of the fuel flow regulator
With the ignition on, check for the **+ 12 V** after relay feed on **track 1** of the fuel flow regulator.

If the fault is still present, **check that the computer output is working correctly**.

● **Either using an ammeter:**
With the solenoid valve connected, connect the current clamp to the **track 1** connection of the solenoid valve (in the direction of the current).
Clear any fuel pressure solenoid valve fault, then run command **AC035 Fuel pressure solenoid valve** :
➡ The ammeter should display ten cycles of two successive currents: **~ 0.6 A** then **~ 2 A**

● **Using a voltmeter:**
With the solenoid valve connected, connect the voltmeter earth lead to **track 2** of the fuel pressure solenoid valve and the positive cable to **track 1**. Clear any fuel pressure solenoid valve fault, then run command **AC035 Fuel pressure solenoid valve** :
➡ The voltmeter should display two voltages in succession ~ = battery voltage X OCR* in progress,
That is, successively: **~ 3.15 V** for an OCR* of **25%** then **~ 9.45 V** for an OCR* of **75%** (ten cycles)

● **Or using an oscilloscope** (range **5 V**/div and time base **1 ms/div**):
With the solenoid valve connected, connect the oscilloscope earth to the battery earth and the positive test pin to **track 2** of the fuel pressure solenoid valve; clear any fuel pressure solenoid valve faults then run command **AC035 Fuel pressure solenoid valve**:
➡ the oscilloscope should display a square pulse signal with an amplitude of **12.5 V** at a frequency of **185 Hz** (with an OCR* alternating successively from **25 to 75%**).

*Opening cyclic ratio

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF053 **CONTINUED 3**	

2.DEF at 7.DEF	***NOTES***	None.

Check the operation of the overpressure valve if fitted to the vehicle, run test **8 Incorrect operation of the overpressure valve**.

In the event of rail overpressure:
Check the operation of the injectors: see **13B, Component testing, Test 10 Poor injector operation**.
Check that the rail pressure sensor is operating correctly using command **AC035 Fuel pressure solenoid valve**.
Display parameter **PR038 Rail pressure**, and refer to the conformity check to check the operating values.
If these checks do not reveal any faults, and if the fault is still present, replace the rail pressure regulator.

in the event of rail underpressure:
Check that the rail pressure sensor is operating correctly using command **AC035 Fuel pressure solenoid valve**.
Display parameter **PR038 Rail pressure** and refer to the conformity check to check the conformity of the operating values.
Check the low pressure diesel circuit priming.
Check the conformity of the diesel filter connections.
Check the condition of the filter (clogging and water saturation).
Check that there are no air bubbles between the filter and the high pressure pump.
Check the low and high pressure diesel fuel circuit sealing (visual inspections, odour, etc.): pump housing, pressure relief valve, pipes, rail and injector unions, injector wells, etc.
Check the conformity of the seal fitting on the pressure regulator.
Check the operation of the injectors: see **13B, Component testing, Test 10 Poor injector operation**.
Carry out the necessary operations.
If the fault is still present replace the rail pressure regulator.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF054 PRESENT OR STORED	TURBOCHARGING SOLENOID VALVE CONTROL CIRCUIT CC.1 : short circuit to + 12 V CC.0 : short circuit to earth CO : open circuit 1.DEF : internal electronic fault 2.DEF : signal incoherence 3.DEF : signal outside lower limit 4.DEF : signal outside upper limit 5.DEF : permanent high signal

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: – the engine is started, – a road test, – actuator command **AC004 Turbocharging solenoid valve**.
	Special notes: If the fault is present: – turbocharging is no longer authorised, – the EGR function is inhibited, – the level 1 warning light is lit, – the vehicle lacks performance. – the **OBD** indicator light will illuminate after three consecutive driving cycles (starting + 5 seconds + switch off the ignition and wait for the message to appear on the **diagnostic tool: "Loss of dialogue with the computer: EDC16 C3, check the tool connection and the computer supply"**). Use bornier **Elé. 1681** for any operations on the injection computer connectors.

CC.1	***NOTES***	None.

Check the turbocharging solenoid valve connections. Check the injection computer connections. Repair if necessary.
Measure the resistance of the turbocharging solenoid valve between **tracks 1** and **2**: If the resistance displayed is not **15.4 Ω ± 0.7 at 20°C**, replace the turbocharging solenoid valve
Check the **continuity and insulation from the + 12 V feed** of the following connection: Injection computer grey 32-track connector **C**, **track E1** ⟶ **Track 1** turbocharging solenoid valve Repair if necessary.
If the fault is still present, replace the turbocharging solenoid valve.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF054 **CONTINUED 1**	

CC.0 ***CO***	***NOTES***	None.

Check the turbocharging solenoid valve connections. Check the injection computer connections. Repair if necessary.
Measure the resistance of the turbocharging solenoid valve between **tracks 1** and **2**: If the resistance displayed is not **15.4 Ω ± 0.7 at 20°C**, replace the turbocharging solenoid valve.
Check the **continuity and insulation against earth** of the following connections: Injection computer grey 32-track connector **C**, **track E1** ⟶ **Track 1** turbocharging solenoid valve Check for + 12 V after relay feed on track 2 of the turbocharging solenoid valve connector. Repair if necessary.
If the fault is still present, replace the turbocharging solenoid valve.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF054 **CONTINUED 2**	

1.DEF to 5.DEF	***NOTES***	None.

Check the turbocharging solenoid valve connections.

Check the injection computer connections.

Repair if necessary.

Measure the resistance of the turbocharging solenoid valve between **tracks 1** and **2**:
If the resistance displayed is not **15.4 Ω ± 0.7 at 20°C**, replace the turbocharging solenoid valve.

Check **the continuity and insulation against earth** of the following connection:
Injection computer brown 48-track connector **B**, **track G4** ⟶ **Track 1** turbocharging solenoid valve

Check for + 12 V after relay feed on track 2 of the turbocharging solenoid valve connector.
If the fault is still present, **check that the computer output is working correctly**.
With the turbocharging solenoid valve connected:
Using a voltmeter:
– Connect the positive terminal of the voltmeter to **track 2** of the solenoid valve and the negative terminal to **track 1**,
– Clear any solenoid valve faults and run command **AC004 Turbocharger solenoid valve**.
– The voltmeter should display **ten cycles** of two successive voltages: **~ 2.5 V** (OCR of **20%**) then **~ 8.75 V** (OCR* of **70%**).
Using an oscilloscope (at 5 V/division range and 1 ms/division time base):
Connect the negative terminal of the oscilloscope to the battery earth and the positive **track 2** of the solenoid valve.
Clear any solenoid valve faults and run command **AC004 Turbocharging solenoid valve**.
– The oscilloscope should display a square wave signal with an amplitude of **12.5V** (equal to the battery voltage) at a frequency of **140 Hz** (with an OCR changing successively from **~ 20 to ~ 70%**).
– if the measurement is correct, replace the solenoid valve.
– if the measurement does not show any control or continuous voltage, contact the techline.

***Opening cyclic ratio**

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF055 PRESENT OR STORED	TURBOCHARGING PRESSURE REGULATION CIRCUIT 1.DEF : pressure too low 2.DEF : pressure too high

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: – the engine is started, – a road test.
	Special notes: If the fault is present: – turbocharging is no longer authorised, – the EGR function is inhibited, – the **level 1** warning light is illuminated. Use bornier **Elé. 1681** for any operations on the injection computer connectors.
	IMPORTANT The fault can result in a rapid and significant fouling of the particle filter.

1.DEF	***NOTES***	None.

Check the turbocharger pressure sensor connections.
Check the connections of the turbocharging pressure relief solenoid valve.
Check the injection computer connections.
Repair if necessary.

Check the sealing of the high pressure air circuit:
– disconnected or pierced pipes,
– pressure sensor disconnected or poorly fitted (seal present),
– intercooler pierced (to check the intercooler: with the vehicle stationary, stabilise the engine speed between 3,500 and 4,000 rpm and check that there are no leaks).

Check the conformity of the turbocharging pressure signal and apply test 5 and test 6.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF055 **CONTINUED 1**	

Check that the turbocharger and the control circuit are working:
– With the engine stopped, make sure that the control rod is in the resting position.
– Start the engine and make sure that the control rod operates to the upper stop.
(when the engine stops, the control rod should return to the rest position).
If the control rod does not move correctly, carry out the following checks:
1) Vacuum pressure command check:
– disconnect the solenoid valve inlet **hose** and connect it to a pressure gauge,
– start the engine and stabilise it at idle speed,
– If the vacuum does not reach **800 mbar ± 100**: check the vacuum pressure circuit from the vacuum pump,
– stop the engine, reconnect the inlet hose and proceed to step 2.
2) Solenoid valve control check:
– Disconnect the solenoid valve outlet **hose**,
– start the engine and stabilise it at idle speed,
– place your hand on the solenoid valve and block the outlet **connection** with your thumb,
– if there is no detectable vibration of the solenoid valve, check that the computer output is operating correctly (see **DF054 Turbocharging solenoid valve control circuit 1.DEF**).
3) Solenoid valve operation check:
– Attach the pressure gauge to the solenoid valve outlet **union**,
– start the engine and stabilise it at idle speed,
– if the vacuum pressure does not reach **800 mbar ± 100**, replace the solenoid valve.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF055 **CONTINUED 2**	

2.DEF	***NOTES***	**Priority when dealing with a number of faults:** Deal with fault **DF004 Turbocharger pressure sensor circuit** first if it is present or stored.

Check the turbocharger pressure sensor connections.
Check the connections of the turbocharging pressure relief solenoid valve.
Check the injection computer connections.
Repair if necessary.

Check the conformity of the turbocharging pressure signal (refer to the interpretation of parameter **PR041 Turbocharging pressure**).

Make sure the turbocharging pressure relief solenoid valve is not jammed open:
– With the engine switched off, disconnect the **inlet and outlet hoses** from the solenoid valve.
– connect a vacuum pump to the inlet **union** and apply a vacuum pressure.
– if the vacuum pressure **is not maintained**: replace the solenoid valve.

Check that the turbocharger control rod has not seized:
– with the engine stopped, make sure the turbocharger control rod is in the rest position.
– apply a vacuum pressure of **800 mbar ± 100**, to the hose connected to the turbocharger control diaphragm,
– If the diaphragm holds the vacuum pressure, check the movement and setting of the turbocharger control rod,
– Laguna ph1 (see **MR 339, 12, Turbocharging, Pressure adjustment**),
– Laguna ph2 (see **MR 395, 12B, Turbocharging, Turbocharging pressure regulation valve**),
– Velsatis (see **MR 353, 12B, Turbocharging, Turbocharging pressure regulation valve**).
If the control rod is seized, replace the turbocharger.
If the fault is still present, apply test 5 and test 6.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF056 PRESENT OR STORED	AIR FLOWMETER CIRCUIT CC.1 : short circuit to + 12 V CO.0 : open circuit or short circuit to earth 1.DEF : offset at minimum threshold 2.DEF : offset at maximum threshold 3.DEF : parameter at maximum limit 4.DEF : parameter at minimum limit

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after a road test.
	Special notes: Use bornier **Elé. 1681** for any operations on the injection computer connectors.

CC.1	***NOTES***	None.

Check the air flowmeter connections.
Check the injection computer connections.
Repair if necessary.

Check the continuity and the insulation to **+ 12 V** of the following connections:

Injection computer brown 48-track connector B, **track G2** → **Track 1** air flow sensor
Injection computer brown 48-track connector B, **track E2** → **Track 2** air flow sensor
Injection computer brown 48-track connector B, **track G1** → **Track 5** air flow sensor
Engine **earth** → **Track 6** air flow sensor

If the fault is still present, replace the air flowmeter.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF056 **CONTINUED 1**	

CO.0	***NOTES***	None.

Check that there is a + 5 V supply on track 3 of the air flowmeter.
Repair if necessary.
Check the air flowmeter connections.
Check the injection computer connections.
Repair if necessary.

Check the continuity and insulation **from earth** of the following connections:

Injection computer brown 48-track connector B, **track E2** → **Track 2** air flow sensor
Injection computer brown 48-track connector B, **track B4** → **Track 3** air flow sensor
Injection computer brown 48-track connector B, **track G1** → **Track 5** air flow sensor

Check for the presence of **+ 12 V after relay** on **track 4** of the air flow sensor connector.
Run **TEST 4 Air flowmeter**.
Repair if necessary.
If the fault is still present and remains present, replace the air flowmeter.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF056 **CONTINUED 2**	

1.DEF at 4.DEF	***NOTES***	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present after the ignition has been switched off for **1 minute**.

Check the air flowmeter connections.
Check the injection computer connections.
Repair if necessary.

Check the continuity and the absence of interference resistance on the following connections:

Injection computer brown 48-track connector B, **track B4** → **Track 3** air flow sensor
Injection computer brown 48-track connector B, **track G1** → **Track 5** air flow sensor
Earth → **Track 6** air flow sensor
Injection computer brown 48-track connector B, **track E2** → **Track 2** air flow sensor

Check for **+12 V after relay** on **track 4** of the air flow sensor connector.
Repair if necessary.
If the fault is still present, apply **test 3: Checking the turbocharged air inlet circuit** and **test 4: Air flow sensor**,
– check that the damper valve is open (valve control **pushing on the body** of the air vent unit)
– with the flow sensor **connected**, the vehicle **ignition on** and **engine stopped**:
– Check the voltage between **tracks 2** and **5** of the flowmeter:
If the value is not **0.6 V ± 0.1**, replace the air flow sensor.

● **Check the EGR valve is not jammed open:**
– Deal with any faults.
– Use the conformity check and the **EMISSION CONTROL/OBD** sub-function.

If these checks show that the valve is jammed or irrevocably seized, replace the EGR valve.
If no faults are revealed, but the fault is still present, replace the air flowmeter.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF057 PRESENT OR STORED	WATER IN DIESEL FUEL DETECTOR CIRCUIT

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the engine is started or following a road test.

Check the conformity and quality of the fuel by running **test 7 Diesel fuel conformity check**.
Check the sealing of the low pressure circuit and tank.

A) Make sure the water in diesel fuel detection sensor is properly connected.
– If not, clear the fault,
– Carry out a road test (**speed > 12 mph (20 km/h) and engine speed > 1200 rpm**) for more than **30 seconds**.
– If the fault does not reappear, end of fault finding procedure.
– If the fault does recur, go to **step B**.

B) If the sensor is properly connected:
– Bleed the diesel filter unit,
– Velsatis (see **MR 353, 13A, Fuel supply, Diesel filter**),
– Laguna phase 2 (see **MR 395, 13A, Fuel supply, Diesel filter**),
– Laguna phase 1 (see **MR 339, 13, Fuel supply, Diesel filter**),
– Clear the fault.
– Carry out a road test (**speed > 12 mph (20 km/h) and engine speed > 1200 rpm**) for more than **30 seconds**.
***If the fault does not recur**, end the fault finding procedure.*

C) If the fault recurs:
– Check for **continuity and the absence of interference resistance** on the connection between:
Injection computer grey 32-track connector C, track A2 ⟶ **Track 3** of the water detection sensor
Check the power supply to the water detection sensor:
+12 V after relay ⟶ **track 1** water detection sensor
earth ⟶ **track 2** water detection sensor
Carry out the necessary repairs.
If none of these checks reveal any faults:
– Replace the water detection sensor,
– Clear the fault.
– Carry out a road test (**speed > 12 mph (20 km/h) and engine speed > 1200 rpm**) for more than **30 seconds**, to confirm the repair.
Note:
If the level of water in the fuel filter unit is lower than the two electrodes on the sensor, certain driving conditions (on a bend, leaning) may cause the injection warning light **to light up erratically** .

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF069 PRESENT	IMPACT DETECTED SIGNAL

NOTES	**Fault finding procedure application conditions:** Only apply the procedure if the fault is present and if the vehicle does not start.
	Special notes: The fault appears when the injection computer receives a frontal impact signal from the Airbag computer via the multiplex network. As soon as the injection computer receives this signal, engine operation is inhibited and the level 2 warning light is lit. Use bornier **Elé. 1681** for any operations on the injection computer connectors.

If the vehicle has been involved in an accident:
Carry out any necessary repairs,
– clear the fault,
– switch off the ignition and wait for the message to appear on the **diagnostic tool: "Loss of dialogue with the computer: EDC16 C3, check the tool connection and the computer supply"**,
– wait for the engine immobiliser indicator light to flash,
– switch on the ignition,
If the fault does not reappear, end of fault finding procedure.
If the fault recurs, carry out fault finding on the **AIRBAG** computer.

If the vehicle has not been involved in an accident, carry out fault finding on the **AIRBAG** computer.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF070 PRESENT OR STORED	CLUTCH SWITCH CIRCUIT 1.DEF : no signal 2.DEF : inconsistent signal

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the clutch pedal is depressed, or during a road test.
	Special notes: Use bornier **Elé. 1681** for any operations on the injection computer connectors.

***IMPORTANT:**
Two types of switch are used. Only the track assignments are different:
– the first type uses tracks A1 and B3,
– the second uses tracks 1 and 2.

WARNING
This fault may appear if the wiring harness has been damaged.
Follow the procedure described in the Wiring Check in the Introduction.
This check enables the condition and the conformity of the engine wiring harness to be checked.

Check the conformity and adjustment of the clutch switch (position, connection).
– Display status **ET233 Clutch pedal** :
– when the clutch pedal is not being depressed status **ET233** should be **RELEASED**,
– when the clutch pedal is disengaged status **ET233** should be **DEPRESSED**,
If these checks are not OK, replace the clutch switch.

If these checks are correct:
Check the connections of the clutch pedal switch.
Check the injection computer connections.
Repair if necessary.

Check continuity and make sure there is no interference resistance on the following connection:
Injection computer black 32-track connector A, **track C4** ⟶ **Track 2 or A1*** Clutch pedal switch
Earth ⟶ **Track 1 or B3*** clutch pedal switch
Repair if necessary.
Repair if necessary.
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF091 PRESENT OR STORED	VEHICLE SPEED SIGNAL 1.DEF : inconsistent signal 2.DEF : signal outside upper limit 3.DEF : configuration absent or incorrect 4.DEF : multiplex line connection fault

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present during a road test.
	Special notes: Use bornier **Elé. 1681** for any operations on the injection computer connectors.

Check the ABS computer connections.
Check the injection computer connections.
Repair if necessary.
Carry out a fault finding procedure on the multiplex network and ABS.
Refer to the fault finding notes for the vehicle when dealing with any faults.
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF097 PRESENT OR STORED	CAMSHAFT SENSOR CIRCUIT 1.DEF : no signal 2.DEF : inconsistent signal

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present after the engine is started or following a road test. A drop in engine speed followed by nominal behaviour from the vehicle is possible.
	Special notes: Use bornier **Elé. 1681** for any operations on the injection computer connectors.

1.DEF ***2.DEF***	***NOTES***	**Priority when dealing with a number of faults:** Deal with fault **DF046 Battery voltage** first if it is present or stored.

Check the camshaft sensor connections.
Check the injection computer connections.
Check that the camshaft sensor is correctly positioned and mounted.
Also check the general condition, (damaged housing, heating up, etc.)
Carry out the necessary repairs.

Check **the continuity and absence of interference resistance** of the following connections:
Injection computer brown 48-track connector **B**, **track D1** ⟶ **Track 2** Camshaft sensor
Injection computer brown 48-track connector **B**, **track A1** ⟶ **Track 1** Camshaft sensor
With the ignition on and the camshaft sensor **connected**:
Use a voltmeter to measure the voltage between **tracks 1** and **3** of the camshaft sensor:
The voltage displayed should be equal to the battery voltage **0.08 V**)
– If the voltage is outside permitted tolerance values, take the measurement again on the connector, with the **camshaft sensor disconnected**,
– If the voltage is still outside the permitted tolerance values with the sensor disconnected, check **the continuity and absence of interference resistance** on the following connection:
Camshaft sensor, **track 3** ⟶ **+ after ignition feed after relay**
– If the measured voltage is correct with the sensor disconnected, measure the camshaft sensor resistance between tracks 2 and 3.
Replace the sensor if its resistance is not 10,250 ± 500 Ω at 20°C.
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF098 PRESENT OR STORED	FUEL TEMPERATURE SENSOR CIRCUIT CC.0 : short circuit to earth CO.1 : short circuit to + 12 V

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present after an attempt to start engine.
	Special notes: – use bornier **Elé. 1681** for any operations on the injection computer connectors, – the default value is 40°C.

CC.0	***NOTES***	None.

Check the fuel temperature sensor connectors.
Check the injection computer connections.
Repair if necessary.

Measure the fuel temperature sensor **resistance** across **tracks 1** and **2**.
Replace the fuel temperature sensor if the resistance is not approximately:

3820 Ω ± 282 Ω at 20°C
2050 Ω ± 100 Ω at 25°C
810 Ω ± 47 Ω at 50°C

Check the **continuity** and the **insulation** against earth of the following connection:
Injection computer brown 48-track connector **B**, **track H2** ⟶ **Track 1** fuel temperature sensor
Check the continuity and insulation from earth of the following connection:
Injection computer grey 32-track connector **C**, **track F1** ⟶ **Track 2** fuel temperature sensor
If the fault is still present, replace the fuel temperature sensor.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF098 **CONTINUED**	

CO.1	***NOTES***	None.

Check the fuel temperature sensor connectors.
Check the injection computer connections.
Repair if necessary.

Measure the fuel temperature sensor **resistance** across **tracks 1** and **2**.
Replace the fuel temperature sensor if the resistance is not approximately:

3820 Ω ± 282 Ω at 20°C
2050 Ω ± 100 Ω at 25°C
810 Ω ± 47 Ω at 50°C

Check the continuity, insulation, and the absence of interference resistance of the following connection:
Injection computer brown 48-track connector **B**, **track H2** ⟶ **Track 1** fuel temperature sensor
If the fault is still present, replace the fuel temperature sensor.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF114 PRESENT OR STORED	EGR SOLENOID VALVE CIRCUIT 1.DEF : excessive EGR valve flow

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: – the engine is started, – a road test.
	Special notes: If the fault is present: – the EGR function is inhibited. Use bornier **Elé. 1681** for any operations on the injection computer connectors.
	Priority when dealing with a number of faults: Apply the procedure for dealing with fault **DF272 EGR valve control circuit** first if it is present or stored.

Check the EGR valve connections.
Check the injection computer connections.
Repair if necessary.

Check the continuity and the absence of interference resistance on the following connections:
Injection computer brown 48-track connector **B**, **track C2** → **Track 1** EGR valve
Injection computer brown 48-track connector **B**, **track D2** → **Track 5** EGR valve

Measure the **resistance** of the EGR valve motor between **tracks 1** and **5**.
If the resistance displayed is not between 1 and 400 Ω, replace the exhaust gas recirculation valve.

When replacing the EGR valve, run command **SC036 Reinitialise programming** to initialise the EGR valve offsets

Check that there are no leaks on the EGR circuit (pipes pierced or damaged) and that the clamps are properly tightened.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF114 CONTINUED	

If the fault is still present, run command **SC036 Reset programming** and select **EGR valve** to reset the EGR valve offsets.
(see **Replacement of components**).
If the valve is jammed or irrevocably seized, replace the EGR valve.

WARNING
A programming procedure is required when the EGR valve is replaced.
Reinitialise the first EGR valve offset and last EGR valve offset parameters.
Refer to **Replacement of components** to carry out this programming.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF118 PRESENT OR STORED	EGR SOLENOID VALVE SERVO-CONTROL 1.DEF : insufficient EGR valve flow 2.DEF : excessive EGR valve flow

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: – the engine is started, – a road test.
	Special notes: If the fault is present: – the EGR function is inhibited, – possible fumes at the exhaust pipe. Use bornier **Elé. 1681** for any operations on the injection computer connectors.

Check the EGR valve connections.
Check the injection computer connections.
Repair if necessary.

Check the continuity and the absence of interference resistance on the following connections:
Injection computer brown 48-track connector **B**, **track C2** → **Track 1** EGR valve connector
Injection computer brown 48-track connector **B**, **track D2** → **Track 5** EGR valve connector

Measure the **resistance** of the EGR valve motor between **tracks 1** and **5**.
If the resistance displayed is not between 1 and 400 Ω, replace the EGR valve.

When replacing the EGR valve, run command **SC036 Reinitialise programming** to initialise the EGR valve offsets.

Check that there are no leaks on the EGR circuit (pipes pierced or damaged) and that the clamps are properly tightened.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF118 CONTINUED	

If the fault is still present, run command **SC036 Reset programming** and select **EGR valve** to reset the EGR valve offsets.
(see **Replacement of components**).
If the valve is jammed or irrevocably seized, replace the EGR valve.

WARNING
A programming procedure is required when the EGR valve is replaced. The EGR valve initial offset and EGR valve last offset parameters must be reinitialised. Refer to Replacement of components to carry out this programming.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF176 PRESENT OR STORED	LOW-SPEED FAN ASSEMBLY CIRCUIT CO : open circuit CC.0 : short circuit to earth CC.1 : short circuit to +12 V 1.DEF : signal incoherence

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present after: – an attempted start, or with engine running, – command **AC038 Low-speed fan unit** run.
	Special notes: Use bornier **Elé. 1681** for all operations on the computer connectors.

CO	***NOTES***	**None.**

Check the **+ 12 V** after relay feed to fan unit relay mounting **R09 track 10**.
Check the condition of the connections and the correct operation of relay **R09**
Replace it if necessary.
Check for **continuity and the absence of interference resistance** on the following connection:

Injection computer connector **C grey track B1** ⟶ Relay mounting **R09 track 11**

Repair if necessary.

CC.0	***NOTES***	None.

Check **the continuity and insulation from earth** of the following connection:

Injection computer supply relay mounting **R8 track 13** ⟶ Relay mounting of the low-speed fan unit **R09 track 10**

Repair if necessary.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF176 **CONTINUED**	

CC.1	***NOTES***	None.

Check the **continuity and insulation from the + 12 V feed** of the following connection:

Injection computer connector **C grey track B1** → Relay mounting **R09 track 11**

Repair if necessary.

1.DEF	***NOTES***	None.

Check the condition of the connections:
– on the low-speed fan unit relay connector,
– on the injection computer grey connector G.
Repair if necessary.
Check the following connections for **continuity and make sure there is no interference resistance**:

Injection computer connector **C grey track B1** → Relay mounting **R09 track 11**

Injection computer supply relay mounting **R8 track 13** → Relay mounting of the low-speed fan unit **R09 track 10**

Repair if necessary.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF177 PRESENT OR STORED	HIGH-SPEED FAN ASSEMBLY CIRCUIT CO : open circuit CC.0 : short circuit to earth CC.1 : short circuit to +12 V 1.DEF : signal incoherence

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: – an attempted start, or with engine running, – command **AC039 High-speed fan unit** run.
	Special notes: Use bornier **Elé. 1681** for all operations on the computer connectors.

CO	***NOTES***	None.

Check the **+ 12 V** after relay feed to fan unit relay mounting **R10 track 6**.
Check the condition of the connections and the correct operation of relay **R10**.
Replace it if necessary.
Check the following connection for **continuity and make sure there is no interference resistance**:

Injection computer connector **C grey track F2** ⟶ Relay mounting **R10 track 7**

Repair if necessary.

CC.0	***NOTES***	None.

Check **the continuity and insulation from earth** of the following connection:

Injection computer supply relay mounting **R8 track 13** ⟶ Low speed fan unit relay mounting **R10 track 6**

Repair if necessary

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF177 **CONTINUED**	

CC.1	***NOTES***	None.

Check the **continuity and insulation from the + 12 V feed** of the following connection:

Injection computer connector **C grey track B1** → Relay mounting **R10 track 7**

Repair if necessary.

1.DEF	***NOTES***	None.

Check the condition of the connections:
– on the fan unit relay R10 connector,
– on the injection computer grey connector G.
Repair if necessary.
Check the following connections for **continuity and make sure there is no interference resistance**:

Injection computer connector **C grey track F2** → Relay mounting **R10 track 7**

Injection computer supply relay mounting **R8** → Low speed fan unit relay mounting **R10 track 6 track 13**

Repair if necessary

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF195 **STORED**	CAMSHAFT SENSOR / ENGINE SPEED CONSISTENCY 1.DEF : inconsistent signal

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault becomes present after an attempt to start.
	Special notes: If the fault is **stored**, clear the fault from the computer memory. Switch off the ignition, start the engine and check that the fault does not reappear. Use bornier **Elé. 1590** for all operations on the injection computer connectors.

Check the engine **speed sensor** and **camshaft sensor** connectors.
Check the injection computer connections.
Repair if necessary.
Check the **continuity and the absence of interference resistance (connector disconnected)** on the following connections:

injection computer **connector B, track A1** ⟶ **track 1** of the camshaft sensor.
injection computer **connector B, track D1** ⟶ **track 2** of the camshaft sensor.
engine management computer **connector B, track B1** ⟶ **track 1** of the engine speed sensor.
engine management computer **connector B, track C1** ⟶ **track 2** of the engine speed sensor.

Repair if necessary.

With the ignition on and the camshaft sensor **connected**:
Use a voltmeter to measure the voltage between **tracks 1** and **3** of the camshaft sensor:
The voltage displayed should be equal to the battery voltage **0.08 V**)
– If the voltage is outside permitted tolerance values, take the measurement again on the connector, with the **camshaft sensor disconnected**,
– If the voltage is still outside permitted tolerance values with the sensor disconnected.
Check **for continuity and absence of interference resistance** on the following connection:

Camshaft sensor, **track 3** ⟶ **+ after ignition feed after relay**

– If the measured voltage is correct with the sensor disconnected.
Measure the camshaft sensor **resistance** between **tracks 1** and **3**.
Replace the sensor if its resistance is not **10,250 ± 500 Ω at 20°C**

Check that the engine speed sensor is correctly mounted and that the flywheel target is not damaged.
Check that the air gap between the engine speed sensor and the flywheel is **0.5 to 1.8 mm**.
Measure the **resistance** of the engine speed sensor between **tracks 1** and **2**.
Replace the sensor if its resistance is not **250 ± 50 Ω at 20°C**.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF209 PRESENT OR STORED	EGR POSITION SENSOR CIRCUIT CO.0 : open circuit or short circuit to earth CC.1 : Short circuit to +12 V

NOTES	**Conditions for applying the fault finding procedure to stored faults:** – the engine is started, – a road test.
	Special notes: If the fault is present: – the EGR offset fault finding function is deactivated and the OBD warning light will illuminate after three consecutive driving cycles (starting + 5 seconds + switch off the ignition and wait for the message to appear on the **diagnostic tool: "Loss of dialogue with the computer: EDC16 C3, check the tool connection and the computer supply"**). Use bornier **Elé. 1681** for any operations on the injection computer connectors.
	Priorities when dealing with a number of faults : Deal with fault **DF012 Sensor feed voltage no. 2** first, if it is present or stored.
	IMPORTANT This fault can result in a rapid and significant fouling of the particle filter. If the EGR valve needs to be replaced to resolve the fault, all faults must then be cleared.

WARNING
This fault may appear if the wiring harness has been damaged.
Follow the procedure described in the Wiring Check in the Introduction.
This check enables the condition and the conformity of the engine wiring harness to be checked.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF209 **CONTINUED 1**	

CO.0	***NOTES***	**None.**

Check the EGR valve connections.
Check the injection computer connections.
Repair if necessary.

Check the **continuity** and **insulation to earth** of the following connections:
Injection computer brown 48-track connector B, **track J2** ⟶ **Track 6** EGR valve
Injection computer brown 48-track connector B, **track F4** ⟶ **Track 2** EGR valve
Check the continuity of the following connection:
Injection computer grey 32-track connector C, **track C2** ⟶ **Track 4** EGR valve
Repair if necessary.

If the fault is still present, run command **SC036 Reset programming** and select **EGR valve** to reset the EGR valve offsets.
(see **Replacement of components**).
If the valve is jammed or irrevocably seized, replace the EGR valve.

WARNING
A programming procedure is required when the EGR valve is replaced. The EGR valve initial offset and EGR valve last offset parameters must be reinitialised. Refer to Replacement of components to carry out this programming.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF209 **CONTINUED 2**	

CC.1	***NOTES***	None.

Check the EGR valve connections.
Check the injection computer connections.
Repair if necessary.

Check **for continuity** and **insulation to + 12 V** on the following connections:
Injection computer brown 48-track connector B, **track J2** → **Track 6** EGR valve
Injection computer grey 32-track connector C, **track C2** → **Track 4** EGR valve
Injection computer brown 48-track connector B, **track F4** → **Track 2** EGR valve
Repair if necessary.

Ensure the presence of **+ 5 V** on **track 2** of the EGR valve.

If the fault is still present, run command **SC036 Reset programming** and select **EGR valve** to reset the EGR valve offsets.
(see **Replacement of components**).
If the valve is jammed or irrevocably seized, replace the EGR valve.

WARNING
A programming procedure is required when the EGR valve is replaced.
Reinitialise the first EGR valve offset and last EGR valve offset parameters.
Refer to the **Replacement of components** section to carry out this programming.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF226 PRESENT OR STORED	DAMPER VALVE CIRCUIT CC.1 : Short circuit to + 12 V. CC.0 : Short circuit to earth. CO : Open circuit. CC : Short circuit. 1.DEF : Internal electrical fault. 2.DEF : Unidentified electrical fault. 3.DEF : Value outside the limits.

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present after: – the engine is started – a road test – an actuator command **AC012 Damper valve** – switching off the ignition and waiting for the message to appear on the **diagnostic tool: "Loss of dialogue with the computer: EDC16 C3, check the tool connection and the computer supply"**.
	Special notes: If the fault is present: – it is difficult or even impossible to start the vehicle, – the engine stops noisily, – the **level 1** warning light is lit. Use bornier **Elé. 1681** for any operations on the injection computer connectors.
	IMPORTANT This fault can result in a rapid and significant fouling of the particle filter.

CC.1	***NOTES***	After any work on the damper valve, it is necessary to use **SC036 Reinitialise programming** and select **Damper valve**, then switch off the ignition and wait for the message to appear on the **diagnostic tool: "Loss of dialogue with the computer: EDC16 C3, check the tool connection and the computer supply"**.

Check the damper valve connections.
Check the injection computer connections.
Repair if necessary.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF226 **CONTINUED 1**	

Check **the continuity and insulation to + 12 V** on the following connections:

Earth ⟶ **Track 1** of the damper valve
Injection computer brown 48-track connector B, **track J4** ⟶ **Track 3** of the damper valve
Injection computer brown 48-track connector B, **track B2** ⟶ **Track 4** of the damper valve

Repair if necessary

If the fault is still present, replace the damper valve.

CO ***CC.0***	***NOTES***	After any work on the damper valve, use **SC036 Reinitialise programming** and select **Damper valve**, then switch off the ignition and wait for the message to appear on the **diagnostic tool: "Loss of dialogue with the computer: EDC16 C3, check the tool connection and the computer supply"**.

Check the damper valve connections.
Check the injection computer connections.
Repair if necessary.

Check the **continuity and insulation to earth** of the following connections:

Injection computer brown 48-track connector B, **track J4** ⟶ **Track 3** of the damper valve
Injection supply relay mounting, **Track 13** ⟶ **Track 2** of the damper valve
Injection computer brown 48-track connector B, **track B2** ⟶ **Track 4** of the damper valve

Repair if necessary.
If the fault is still present, replace the damper valve.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF226 **CONTINUED 2**	

CC	***NOTES***	After any work on the damper valve, use **SC036 Reinitialise programming** and select **Damper valve**, then switch off the ignition and wait for the message to appear on the **diagnostic tool: "Loss of dialogue with the computer: EDC16 C3, check the tool connection and the computer supply"**.

Check the damper valve connections.
Check the injection computer connections.
Repair if necessary.

Check for **continuity, insulation and the absence of interference resistance** on the following connections:

Earth → **Track 1** of the damper valve
Injection supply relay mounting, **Track 13** → **Track 2** of the damper valve
Injection computer brown 48-track connector B, **track J4** → **Track 3** of the damper valve
Injection computer brown 48-track connector B, **track B2** → **Track 4** of the damper valve

Repair if necessary.
If the fault is still present, replace the damper valve.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF226 **CONTINUED 3**	

1.DEF ***to 3.DEF***	***NOTES***	After any work on the damper valve, use **SC036 Reinitialise programming** and select **Damper valve**, then switch off the ignition and wait for the message to appear on the **diagnostic tool: "Loss of dialogue with the computer: EDC16 C3, check the tool connection and the computer supply"**.

Check the damper valve connections.
Check the injection computer connections.
Repair if necessary.

Check for **continuity, insulation and the absence of interference resistance** on the following connections:

Earth → **Track 1** of the damper valve
Injection supply relay mounting, **Track 13** → **Track 2** of the damper valve
Injection computer brown 48-track connector B, **track J4** → **Track 3** of the damper valve
Injection computer brown 48-track connector B, **track B2** → **Track 4** of the damper valve

Repair if necessary.

If the fault is still present, **check that the computer output is working correctly**.
Damper valve connected:
– connect the **negative** terminal of the voltmeter to **track 1** of the damper valve,
– connect the **positive** terminal of the voltmeter to **track 3** of the damper valve,
– use command **AC012 Damper valve** :
– The voltmeter should display **ten cycles** of two successive voltages: **~ 2.5 V** (OCR of **20%**) then **~ 8.75 V** (*OCR of **70%**).
If the voltmeter does not indicate any control while the command is running (ten 1-second cycles), contact the Techline.

*OCR: Opening Cyclic Ratio

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF227 PRESENT OR STORED	SWIRL FLAP CC.0 : short circuit to earth CC.1 : short circuit to +12 V

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the engine has been started.
	Special notes: Use bornier **Elé. 1681** for all operations on the computer connectors. This fault does not apply to VELSATIS PH2 Vdiag 14.

WARNING
The swirl flap is present but never controlled by the injection computer.
Never replace the swirl flap.

CC.1	***NOTES***	None.

Check the condition of the turbulence flap connector and repair if necessary.
Check **the continuity and insulation from + 12 V** of the following connection:
Swirl flap 2-track connector, **track 1** ⟶ Track **M1** brown connector **B** of the injection computer
Repair if necessary.

CC.0	***NOTES***	None.

Check the condition of the turbulence flap connector and repair if necessary.
Check **the continuity and insulation against earth** of the following connection:
Swirl flap 2-track connector, **track 2** ⟶ **+ after ignition feed** after relay
Repair if necessary.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF238 PRESENT OR STORED	THERMOPLUNGER No.3 RELAY CIRCUIT CO : open circuit CC.0 : short circuit to earth CC.1 : short circuit to +12 V 1.DEF : inconsistent signal

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is displayed as present following an engine start or following actuator command **AC031 Thermoplunger relay no. 3**.
	Special notes: Use bornier **Elé. 1681** for all operations on the computer connectors.

1.DEF ***CO***	***NOTES***	None.

Check for **+12 V after ignition feed** on relay mounting **R5 track 37**.
If there is no **+ 12 V** feed, refer to the fault interpretation **DF015 Main relay control circuit**.
Check the condition of the connectors of the thermoplunger **no. 3** relay (**R5**) and of the injection computer.
Repair if necessary.
Check the condition and the correct operation of the relay.**R5** Replace if defective.
Check for **continuity and the absence of interference resistance** on the following connection:
Injection computer connector **B track M3** ⟶ Relay mounting **R5 track 37**
Relay mounting **R5 track 35** ⟶ Relay mounting **R8 track 13**
Repair if necessary.

CC.0	***NOTES***	None.

Check the condition and the correct operation of the relay.**R5**
Replace if defective.
Check the **continuity, absence of interference resistance and the insulation** from earth of the following connection:
Relay mounting **R5 track 35** ⟶ Relay mounting **R8 track 13**
Repair if necessary.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF238 **CONTINUED**	

CC.1	***NOTES***	None.

Check the condition and the correct operation of the relay.**R5** Replace if defective.
Check the insulation from the + 12 V feed of the following connection:
Injection computer brown connector **B, track M3** ⟶ Relay mounting **R5 track 37**
Repair if necessary.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF239 PRESENT OR STORED	THERMOPLUNGER RELAY CIRCUIT N° 2 CO : open circuit CC.0 : short circuit to earth CC.1 : short circuit to +12 V 1.DEF : inconsistent signal

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is displayed as present after an engine start or actuator command **AC064 Thermoplunger no.2 relay**.
	Special notes: Use bornier **Elé. 1681** for all operations on the computer connectors.

1.DEF ***CO***	***NOTES***	None.

Check for **+12 V after ignition feed** on relay mounting **R11 track 3**.
If there is no **+ 12 V**, refer to the fault interpretation **DF125 Main relay control circuit**.
Check the condition of the connectors of thermoplunger **no. 2 relay (R11)** and of the injection computer.
Repair if necessary.
Check the condition and correct operation of relay **R11**. Replace if defective.
Check for **continuity and the absence of interference resistance** on the following connection:
Injection computer **grey connector C track A1** ⟶ Relay mounting **R11 track 2**
Relay mounting **R11 track 3** ⟶ Relay mounting **R8 track 13**
Repair if necessary.

CC.0	***NOTES***	None.

Check the condition and the correct operation of relay **R1.**
Check **insulation** against earth of the following connection:
Relay mounting **R11 track 3** ⟶ Relay mounting **R8 (injection computer supply relay) track 13**
Repair if necessary.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF239 **CONTINUED**

Repair if necessary.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF240 PRESENT OR STORED	THERMOPLUNGER N° 1 RELAY CIRCUIT CO : open circuit CC.0 : short circuit to earth CC.1 : short circuit to +12 V 1.DEF : inconsistent signal

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is displayed as present after an engine start or actuator command **AC063 Thermoplunger no. 1 relay**.
	Special notes: Use bornier **Elé. 1681** for all operations on the computer connectors.

1.DEF ***CO***	***NOTES***	None.

Check for **+ 12 V** after ignition feed on relay mounting **R1 track 63**.
If there is no **+ 12 V** feed, refer to the fault interpretation **DF015 Main relay control circuit**.
Check the condition of the connectors of the thermoplunger **no. 1** relay **(R1)** and of the injection computer.
Repair if necessary.
Check the condition and the correct operation of relay **R1.** Replace if necessary.
Check for **continuity and the absence of interference resistance** on the following connection:
Injection computer **brown connector B track K4** ⟶ Relay mounting **R1 track 63**
Relay mounting **R1 track 65** ⟶ Relay mounting **R8 track 13**
Repair if necessary.

CC.0	***NOTES***	None.

Check the condition and the correct operation of relay **R1.**
Replace if defective.
Check **insulation** against earth of the following connection:
Relay mounting **R1 track 65** ⟶ Relay mounting **R8 (injection computer supply relay) track 13**
Repair if necessary.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF240 **CONTINUED**	

CC.1	***NOTES***	None.

Check the condition and the correct operation of relay **R1.** Replace if defective.
Check the insulation from the + 12 V feed of the following connection:
Injection computer **brown connector B track K4** ⟶ Relay mounting **R1 track 63**
Repair if necessary.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF250 PRESENT OR STORED	ELECTRONIC STABILITY PROGRAM FUNCTION 1.DEF : CAN connection fault 2.DEF : inconsistent signal

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after a road test.

1.DEF ***2.DEF***	***NOTES***	None.

Carry out fault finding on the ABS computer.
Carry out a multiplex network test and a fault finding procedure on any faults.
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF272 PRESENT OR STORED	EGR VALVE CONTROL CIRCUIT 1.DEF : blocked valve open 2.DEF : blocked valve closed

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present after a road test.
	Special notes: The EGR function is deactivated if several faults with **DF226 Damper valve circuit** are present. If **1.DEF** is present, – the **level 1** warning light is lit, – the vehicle performance is reduced Use bornier **Elé. 1681 or Elé. 1590** for all operations on the injection computer connectors.

1.DEF ***2.DEF***	***NOTES***	None.

Check the EGR valve connections. Check the injection computer connections. Repair if necessary.
Check the continuity and the absence of interference resistance on the following connections: Injection computer brown 48-track connector **B**, **track C2** ⟶ **Track 1** EGR valve connector Injection computer brown 48-track connector **B**, **track D2** ⟶ **Track 5** EGR valve connector
Measure the **resistance** of the EGR valve motor between **tracks 1** and **5**. If the resistance displayed is not between 1 and 400 Ω, replace the EGR valve.
When replacing the EGR valve, run command **SC036 Reinitialise programming** to initialise the EGR valve offsets
Check that there are no leaks on the EGR circuit (pipes pierced or damaged) and that the clamps are properly tightened.

GETtheMANUALS.org

DF272 CONTINUED	

If the fault is still present, run command **SC036 Reset programming** and select **EGR valve** to reset the EGR valve offsets.
(see **Replacement of components**).
If the valve is jammed or irrevocably seized, replace the EGR valve.

WARNING
A programming procedure is required when the EGR valve is replaced.
Reinitialise the **first EGR valve offset** and **last EGR valve offset** parameters.
Refer to the **Replacement of components** section to carry out this programming.

GETtheMANUALS.org

DF276 PRESENT OR STORED	INJECTOR CODE PROGRAMMING 1.DEF : internal electronic fault during programming 2.DEF : no code stored

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present after: – replacing injector(s), – replacing and programming the injection computer.
	Special notes: If the fault is present: – the engine speed is limited, – the level 1 warning light is lit.

1.DEF	***NOTES***	**None.**

Program the injector codes using command **SC002 Enter injector codes**. Carry out the procedure described in the **Interpretation of commands** section.
If the fault is still **present** after switching off the ignition and waiting for the message to appear on the **diagnostic tool: "Loss of dialogue with the computer: EDC16 C3, check the tool connection and the computer supply"**, then re-establishing dialogue.
Follow the interpretation of command **SC002 Entering injector codes**. If the fault is still present, contact the techline. Otherwise clear the fault memory using **RZ007 Fault memory**.

2.DEF	***NOTES***	This fault appears on any blank computer (new or recently reprogrammed).

WARNING
A computer without the IMA option can be replaced by a computer with this option. The codes have therefore not been saved during command SC003 Save computer data. In this case, status ET104 Injector code operation becomes YES, fault DF276 Program injector codes will be present, and the engine operates in defect mode.
Program the injector codes using command **SC002 Enter injector codes**.
Carry out the procedure described in the **Interpretation of commands** section.
If the fault is still **present** after the ignition is switched off and after waiting for the **diagnostic tool message "No dialogue with the computer: EDC16 C3, check the tool connection and the computer supply"**, then a dialogue is established again,
Follow the interpretation of command **SC002 Entering injector codes**.
If the fault is still present, contact the techline.
Otherwise clear the fault memory using **RZ007 Fault memory**.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF304 PRESENT OR STORED	EGR BY-PASS CIRCUIT CO : open circuit CC.0 : short circuit to earth CC.1 : short circuit to +12 V 1.DEF : signal outside lower limit

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present after the engine has been started.
	Special notes: If the fault is present: – the exhaust fumes sent to the inlet are no longer cooled, – no customer complaint.

CO ***1.DEF***	***NOTES***	None.

Check the connectors of the EGR by-pass solenoid valve, and of the injection computer.
Repair if necessary.
Check the **continuity and the absence of interference resistance** of the following connections:
Injection computer brown 48-track connector **B**, **track L3** ⟶ **Track 1** by-pass solenoid valve connector
EGR by-pass solenoid valve connector **track 2** ⟶ Relay mounting R8 **track 13**
Repair if necessary.

CC.0	***NOTES***	None.

Check the **continuity, absence of interference resistance and the insulation** from earth of the following connection:
By-pass solenoid valve connector **track 2** ⟶ Relay mounting R8 **track 13**
Repair if necessary.

CC.1	***NOTES***	None.

Check the **continuity, absence of interference resistance and insulation** from + 12 V for the following connection:
Injection computer brown 48-track connector **B**, **track L3** ⟶ **Track 1** by-pass solenoid valve connector
Repair if necessary.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF308 PRESENT OR STORED	CLOGGED PARTICLE FILTER

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present after the engine is started or following a road test.
	Special notes: If the fault is present: – particle filter regeneration is inhibited, – the EGR function is inhibited, – the vehicle performance is reduced, – the **level 1** warning light is lit and a warning message (or light) is displayed on the instrument panel.
	Priorities when dealing with a number of faults : Firstly, deal with the following faults: – **DF315 Particle filter differential pressure sensor** if it is present. – **DF308** if **DF315** is stored. – **DF717 Particle filter upstream pressure** if it is present or stored. – **DF226 Damper valve circuit** if it is present or stored. – **DF272 EGR valve control circuit** if it is present or stored. – **DF309 Particle filter downstream temperature sensor** if it is present or stored. – **DF310 Particle filter upstream temperature sensor** if it is present or stored.

The fault appears if the weight of soot contained in the particle filter exceeds 45 g for Vdiag 08 and 10, or 48 g for Vdiag 14.
Check the air circuit. Run **test 3 Turbocharged air circuit check.**
Check that there are no leaks or blockages in the exhaust pipe.
Repair if necessary.
Carry out an After-Sales regeneration. Run command **SC017 Particle filter regeneration** (see **Interpretation of commands**).
Clear fault DF308 Present or Stored.
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF309 PRESENT OR STORED	PARTICLE FILTER DOWNSTREAM TEMPERATURE SENSOR CC.0 : Short circuit to earth CO.1 : Short circuit or open circuit to + 12 V 1.DEF : Signal outside upper limit

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault becomes present if: – ignition is on (**CC.0**), – following a road test, engine warm (**CO.1**).
	IMPORTANT **The particle filter downstream temperature sensor only measures temperatures greater than 50°C.** **This fault does not apply to VELSATIS phase 2 Vdiag 14.**

Check the condition of the particle filter downstream temperature sensor connector.
Check the condition of the injection computer connector.
If any connectors are faulty and there is a repair procedure (**see Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

Check the **continuity** and **insulation** from **+12 V** and from **earth** on the following connections:

Injection computer connector **B** brown 48-track, **track K3**	→	**track 2** particle filter downstream temperature sensor connector
injection computer grey connector **C**, **track E3**	→	**track 1** particle filter downstream temperature sensor connector

If any of the connections are faulty and there is a repair method (**see Technical Note 6015A, Electrical wiring repair, Wiring: precautions for repairs**), repair the wiring; otherwise replace the wiring.

If the fault is still present, replace the particle filter downstream temperature sensor.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF310 PRESENT OR STORED	PARTICLE FILTER UPSTREAM TEMPERATURE SENSOR CC.0 : Short circuit to earth CO.1 : Short circuit or open circuit to + 12 V 1.DEF : Signal outside upper limit

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault becomes present if: – ignition is on (**CC.0**), – following a road test, engine warm (**CO.1**).
	Special notes: If the fault is present: – particle filter regeneration is inhibited, – the **level 1** warning light is lit, – the **OBD** warning light will illuminate after three consecutive driving cycles (**starting + 5 seconds + switch off the ignition and wait** for the message to appear on the **diagnostic tool: "Loss of dialogue with the computer: EDC16 C3, check the tool connection and the computer supply"**).
	IMPORTANT: The particle filter upstream temperature sensor only measures temperatures greater than 50°C.

Check the condition of the particle filter upstream temperature sensor connector.
Check the condition of the engine management computer connector.
If one of the connectors is faulty and there is a repair procedure (**see Technical Note 6015A, Electrical wiring repair, Wiring: precautions for repair**), repair the connector, otherwise replace the wiring.

Check the **continuity** and **insulation** from **+12 V** and from **earth** on the following connections:

Injection computer, brown 48-track connector **B**, **track H3**	→	**track 2** particle filter upstream temperature sensor connector
Injection computer brown 48-track connector **B**, **track A1**	→	**track 1** particle filter upstream temperature sensor connector

If any of the connections are faulty and there is a repair method (**see Technical Note 6015A, Electrical wiring repair, Wiring: precautions for repairs**), repair the wiring; otherwise replace the wiring.

If the fault is still present, replace the particle filter upstream temperature sensor.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF311 PRESENT OR STORED	FAILED REGENERATIONS LIMIT EXCEEDED

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present after the engine is started or following a road test.
	Special notes: If the fault is present: – particle filter regenerations when driving are inhibited, – the **level 1** warning light is lit.
	Priorities when dealing with a number of faults: Firstly, deal with the following faults: – **DF308 Particle filter clogged** if it is present or stored. – **DF315 Particle filter differential pressure sensor** if it is present or stored. – **DF717 Particle filter upstream pressure** if it is present or stored. – **DF055 Turbocharging pressure regulation circuit** if it is present or stored. – **DF309 Particle filter downstream temperature sensor** if it is present or stored. – **DF310 Particle filter upstream temperature sensor** if it is present or stored. – **DF272 EGR valve control circuit** if it is present or stored.

The fault appears after 11 failed attempts at regeneration while driving.
Check the air circuit. Run **test 3 Turbocharged air circuit check**.
Check that there are no leaks or blockages in the exhaust pipe.
Repair if necessary.
– Carry out an After-Sales regeneration.
– Follow the procedure for command **SC017 Particle filter regeneration** (see **Interpretation of commands**).
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF312 PRESENT OR STORED	SPEED REQUEST

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present after the engine is started or following a road test.
	Special notes: If the fault is present, – the special **Regenerate particle filter** warning light is illuminated, or a warning message is displayed on the instrument panel. – The vehicle needs to be driven specially to activate particle filter regeneration during driving.
	Priorities when dealing with a number of faults: Firstly, deal with the following faults: – **DF308 Particle filter clogged** if it is present or stored, – **DF311 Failed regenerations limit exceeded** if it is present. – **DF315 Particle filter diff*. pressure sensor** if it is present or stored, – **DF717 Particle filter upstream pressure** if it is present or stored.

The fault appears:
– after 8 failed regeneration attempts when driving or if the weight of soot contained in the particle filter is above 42g for Vdiag 14 and 40 g for Vdiag 08 and 10.)
– if the weight of soot contained in the particle filter is above 42 g for Vdiag 14 and 40 g for Vdiag 08 and 10.

PART A

The flow chart on the following page allows analysis of the driving profile and the causes for this fault being activated

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF312 CONTINUED 1

Repair request with **DF312 Speed request** present or stored ONLY

Read the information in the **Particle filter history sub-function: PR784 to PR793 DF312 record No. 1 to No. 10**

PR784 to PR793 are all equal to 0 miles (0 km)?

yes

no

Among these parameters (PR784 to PR793):
– Find the parameter with the highest mileage: it is the **Mileage of the last DF312**.
– Note the parameter index on the order of repair with the relevant mileage value.
E.g.: PR787 = 2794 miles (4657 Km)

Read the information in the **Particle filter history** sub-function: **PR794** to **PR803 Regeneration failure records no. 1 to no. 10**

Is at least one PR794 to PR803 = 19,660 miles (32,766 km)?

yes

no

Identify the mileages from the values of **parameters PR794** to **PR803 Stored regeneration failures No. 1 to No. 10** that are between the **Mileage of the last DF312** and the **Mileage of the last DF312** - 120 miles (200 km). These are the **mileages of the last failures**.
Example: 2674 miles (4457 km) < PR801 = 2760 miles (4600 km) < 2794 miles (4657 km)

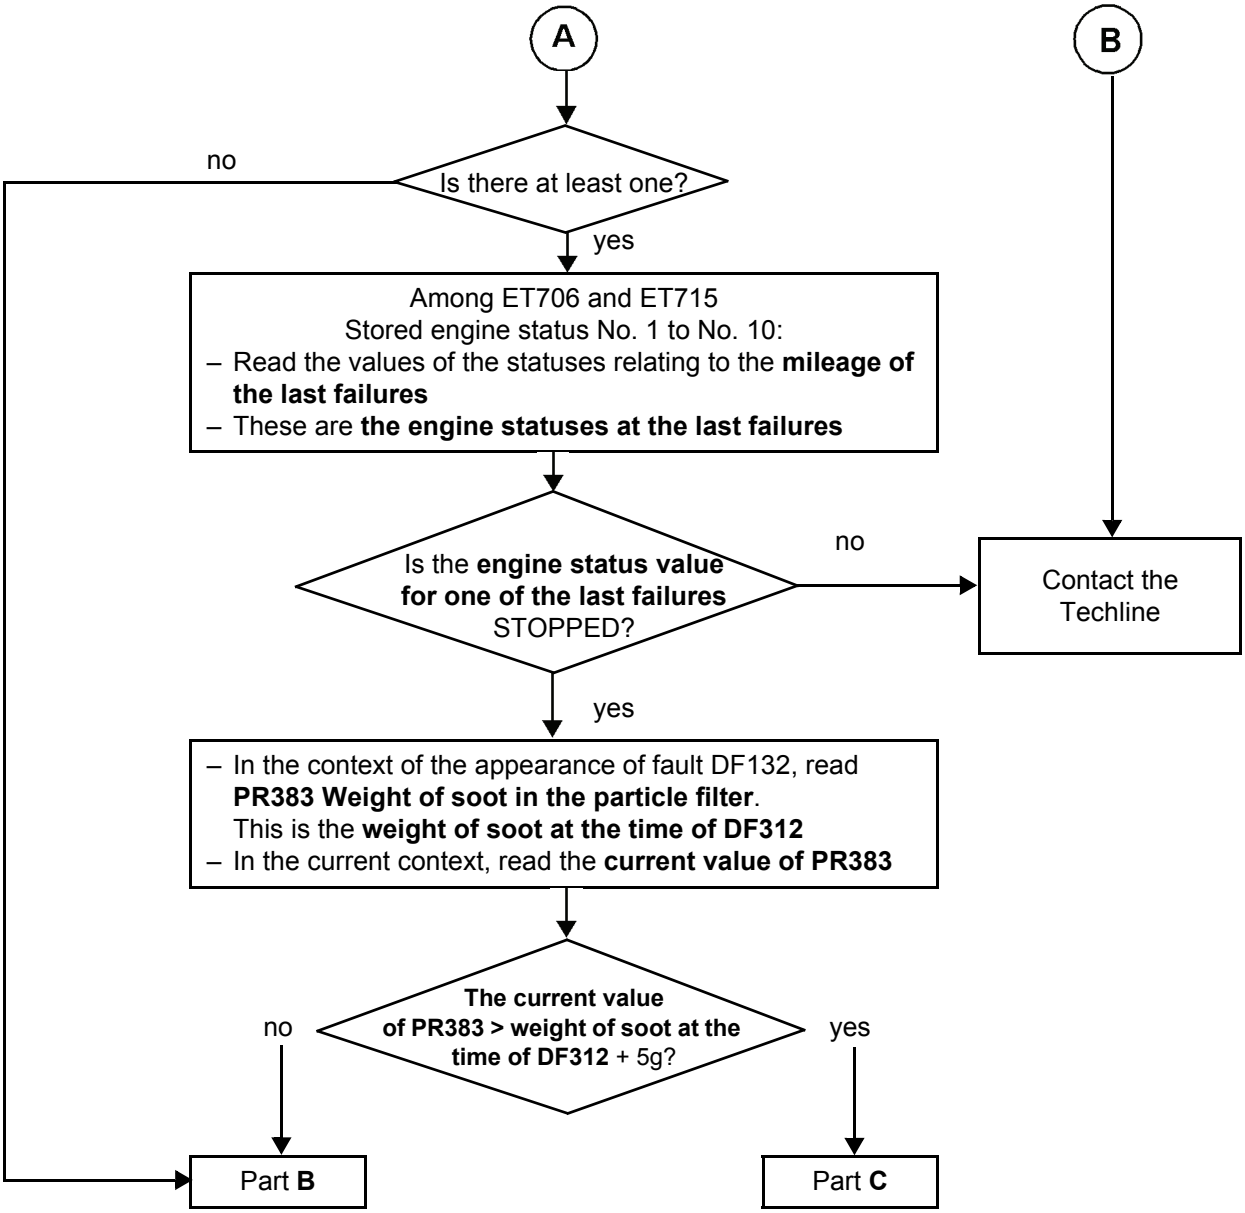
A

B

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF312
CONTINUED 2



AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF312 CONTINUED 3	

PART B

1 - **No particle filter regeneration.**

2 - Write on the order of repair the parameter and status relating to the last failure:

– Mileage of the last DF312.

– Mileage of the last failures.

– Engine statuses of the last failures.

E.g.: PR787 = 2794 miles (4657 km); PR801 = 2760 miles (4600 km); engine status = STOPPED

3 - **Interpretation of the values written on the repair order by the service advisor for the customer:**

Before the last occurrence **of the Particle Filter warning light or message** (which appeared at the **Mileage of the last DF312**), the customer had not adhered to the driving recommendations: the failure that occurred at the **Mileage of the last failure** is due to the engine being switched off.

4 - Explain to the customer the procedure to turn off the warning light, referring to the parameters written in the repair order: see **PART D**.

PART C

Check the air circuit. Run **test 3 Turbocharged air circuit check.**

1 - Carry out a regeneration in the Renault dealership with the **approval of the Techline**.

2 - Change the oil and replace the oil filter if a message on the diagnostic tool requests it.

3- Run command **SC036 Reinitialise programming** and select **After particle filter regeneration**.

4 - Explain to the customer the procedure for regeneration while driving to avoid unnecessary repairs: see **PART D**.

.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF312 CONTINUED 4	

PART D
Procedure to switch off the Particle filter message or warning light on the instrument panel.

Certain types of driving can result in the Particle filter message or warning light from being switched on and the fault **DF312 Speed request** to appear.
The fault appears:
- **after 8 failed regeneration attempts when driving or if the weight of soot contained in the particle filter is above 42g for Vdiag 14 and 40 g for Vdiag 08 and 10.)**
- **if the weight of soot contained in the particle filter is above 42 g for Vdiag 14 and 40 g for Vdiag 08 and 10.**

The customer must carry out a specific driving operation (cf. vehicle user manual) that consists of:
1. When the engine is warm, drive at a speed greater than **48 mph (80 km/h)** for **2 minutes** to trigger the regeneration procedure.
2. Continue to drive at an average speed of **48 mph (80 km/h)** until the Particle filter warning light or message on the instrument panel goes out. In order for the procedure to succeed, it is necessary to drive without stopping, without stopping the engine or to leave the engine running at idle speed for an extended period of time. The regeneration time depends on the vehicle and the driving conditions but should last for **20 minutes maximum**.
3. If regeneration fails when driving (the warning light does not go out or the SERVICE warning light comes on), check the air circuit. Run **test 3 Turbocharged air circuit check.** Check that there are no leaks or blockages in the exhaust pipe. Repair if necessary. Carry out particle filter regeneration within the Renault network. Run command **SC017 Particle filter regeneration** (see **Interpretation of commands**).

If the fault is still present, contact the Techline.
.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF315 PRESENT OR STORED	PARTICLE FILTER DIFFERENTIAL PRESSURE SENSOR CO : Open circuit CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 V 1.DEF : Inconsistency of the signal 2.DEF : Signal outside lower limit

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present after the engine is started or following a road test.
	Special notes: **If the fault is present:** – the **level 1** warning light is lit, – the **OBD** warning light will illuminate after three consecutive driving cycles (starting + 5 seconds + switch off the ignition and wait for the message to appear on the **diagnostic tool: "Loss of dialogue with the computer: EDC16 C3, check the tool connection and the computer supply"**), – the particle filter fault finding procedure is inhibited, – particle filter regeneration is inhibited.
	Priorities when dealing with a number of faults : **DF315 if it is present.** **DF308 Particle filter clogged if DF315 is stored and DF308 is present.** **DF011 Sensor feed voltage no. 1** if it is present or stored.

CC.1	***NOTES***	**None.**

Check the condition of the connectors on the differential pressure sensor and the injection computer.
If one of the connectors is faulty and there is a repair procedure (**see Technical Note 6015A, Electrical wiring repair, Wiring: precautions for repair**), repair the connector, otherwise replace the wiring.

Check the **insulation** of the following connections:

Injection computer connector **C track F3** → **track 2** particle filter differential pressure sensor connector

Injection computer connector **C track B2** → **track 3** particle filter differential pressure sensor connector

If any of the connections are faulty and there is a repair method (**see Technical Note 6015A, Electrical wiring repair, Wiring: precautions for repairs**), repair the wiring; otherwise replace the wiring.
If the fault is still present, replace the differential pressure sensor.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF315 **CONTINUED**	

CO.0 ***CO***	***NOTES***	**None**

Check the condition of the connectors on the differential pressure sensor and the injection computer.
If one of the connectors is faulty and there is a repair procedure (**see Technical Note 6015A, Electrical wiring repair, Wiring: precautions for repair**), repair the connector, otherwise replace the wiring.

Check the **continuity and insulation** from **earth** of the following connections:

Injection computer connector **C track F3** → **track 2** particle filter differential pressure sensor connector

Injection computer connector **B track B2** → **track 3** particle filter differential pressure sensor connector

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If the fault is still present, replace the differential pressure sensor.

1.DEF ***2.DEF***	***NOTES***	**None**

Check the condition of the pressure pipes on the differential pressure sensor.
Check that they are sealed and in the correct position.
Replace if necessary.

Check the **continuity and absence of interference resistance** of the following connections:

Injection computer connector **C track F3** → **track 2** particle filter differential pressure sensor connector

Injection computer connector **B track B2** → **track 3** particle filter differential pressure sensor connector

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If the fault is still present, replace the differential pressure sensor.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF619 PRESENT OR STORED	EGR VALVE JAMMED OPEN

NOTES	**Priorities when dealing with a number of faults:** **Deal with the following faults if they are present or stored:** **DF114 EGR solenoid valve circuit** **DF118 EGR solenoid valve servo-control** **DF209 EGR position sensor circuit** **DF272 EGR control circuit**
	Conditions for applying fault finding procedures to stored faults: The fault is declared present after: – A road test.
	Special notes: The EGR and turbocharging functions are inhibited. The **level 1** warning light is illuminated. Use bornier **Elé. 1681** for all operation at the level of the injection computer connectors.
	IMPORTANT This fault can result in a rapid and significant fouling of the particle filter. If the EGR valve needs to be replaced to resolve the fault, all faults must then be cleared.

Check the EGR valve connections.
Check the injection computer connections.
If the connector is faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF619 CONTINUED	

Check the continuity and insulation of the following connections:
- **3GC** between components **1460** and **120**,
- **3EL** between components **1460** and **120**,
- **3JM** between components **1460** and **120**.

Check the continuity and the insulation of each connection of the adapter attachment, if fitted to the vehicle.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If the fault is still present, replace the EGR valve.
When replacing the EGR valve, run command **SC036 Reinitialise programming** and select **EGR valve** to reinitialise the EGR valve offsets. (see **Replacement of components**).

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF620 PRESENT OR STORED	EGR VALVE FOULED

NOTES	**Priorities when dealing with a number of faults:** **Deal with the following faults if they are present or stored:** **DF114 EGR solenoid valve circuit** **DF118 EGR solenoid valve servo-control** **DF209 EGR position sensor circuit** **DF272 EGR control circuit**
	Conditions for applying fault finding procedures to stored faults: The fault is declared present after: – A road test.
	Special notes: The EGR and turbocharging functions are inhibited. The **level 1** warning light is illuminated. Use bornier **Elé. 1681** for all operation at the level of the injection computer connectors.
	IMPORTANT This fault can result in a rapid and significant fouling of the particle filter. If the EGR valve needs to be replaced to resolve the fault, all faults must then be cleared.

Check the EGR valve connections.
Check the injection computer connections.
If the connector is faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF620 CONTINUED	

Check the continuity and the insulation of the following connections:
- **3GC** between components **1460** and **120**,
- **3EL** between components **1460** and **120**,
- **3JM** between components **1460** and **120**.

Check the continuity and the insulation of each connection of the adapter attachment, if fitted to the vehicle.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If the fault is still present, replace the EGR valve.
When replacing the EGR valve, run command **SC036 Reinitialise programming** and select **EGR valve** to reinitialise the EGR valve offsets. (see **Replacement of components**).

If the fault is still present, contact the Techline.

GETtheMANUALS.org

DF621 PRESENT OR STORED	EGR VALVE JAMMED OPEN (OBD FAULT)

NOTES	**Priorities when dealing with a number of faults:** **Deal with the following faults if they are present or stored:** **DF114 EGR solenoid valve circuit** **DF118 EGR solenoid valve servo-control** **DF209 EGR position sensor circuit** **DF272 EGR control circuit**
	Conditions for applying fault finding procedures to stored faults: The fault is declared present after: – A road test.
	Special notes: The EGR and turbocharging functions are inhibited. The **OBD** warning light illuminates after three complete driving cycles (starting + **5 seconds** + switch off the ignition and wait for the message to appear on the **diagnostic tool**: **"Loss of dialogue with the computer: EDC16 C3, check the tool connection and the computer supply"**). Use bornier **Elé. 1681** for all operation at the level of the injection computer connectors.
	IMPORTANT This fault can result in a rapid and significant fouling of the particle filter. If the EGR valve needs to be replaced to resolve the fault, all faults must then be cleared.

Check the EGR valve connections.
Check the injection computer connections.
If the connector is faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF621 CONTINUED	

Check the continuity and insulation of the following connections:
- **3GC** between components **1460** and **120**,
- **3EL** between components **1460** and **120**,
- **3JM** between components **1460** and **120**.

Check the continuity and the insulation of each connection of the adapter attachment, if fitted to the vehicle.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If the fault is still present, replace the EGR valve.
When replacing the EGR valve, run command **SC036 Reinitialise programming** and select **EGR valve** to reinitialise the EGR valve offsets. (see **Replacement of components**).

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF717 PRESENT OR STORED	PARTICLE FILTER UPSTREAM PRESSURE 1.DEF : Inconsistent signal

NOTES	**Conditions for applying fault finding procedures to stored faults:** The fault is declared present after the engine is started or following a road test.
	Special notes: **If the fault is present:** – the **level 1** warning light is lit, – the **OBD** warning light will illuminate after three consecutive driving cycles (starting + 5 seconds + switch off the ignition and wait for the message to appear on the **diagnostic tool: "Loss of dialogue with the computer: EDC16 C3, check the tool connection and the computer supply"**), – the particle filter fault finding procedure is inhibited, – particle filter regeneration is inhibited,

Check the condition of the pressure pipe between the particle filter upstream take-off point and the differential pressure sensor.

Check that the pipe is not crushed, blocked or pierced.

Check that the differential pressure sensor is correctly positioned and connected **(see MR395 or 402, Mechanical, 19B, Exhaust, Particle filter pressure sensor: Removal - Refitting)**.

Replace the pressure pipe if necessary.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF953 PRESENT OR STORED	PARTICLE FILTER ABSENT 1.DEF : Faulty 2.DEF : Signal outside lower limit

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the engine is started or following a road test.
	Special notes: If the fault is present: – particle filter regeneration is inhibited, – blue/white smoke and black particles coming from the exhaust. – the **OBD** warning light illuminates after three consecutive driving cycles (start the engine **+ 5 seconds**, then switch off the ignition and wait for **40 seconds**).
	Priorities when dealing with a number of faults: Firstly, deal with the following faults: – **DF315 Particle filter differential pressure sensor** if it is present or stored, – **DF717 Particle filter upstream pressure** if present or stored
	IMPORTANT In the long term, this fault may lead to premature wear and a greater risk of turbocharger failure.

Check the condition of the connectors on the differential pressure sensor and the injection computer.
If one of the connectors is faulty and there is a repair procedure (**see Technical Note 6015A, Electrical wiring repair, Wiring: precautions for repair**), repair the connector, otherwise replace the wiring.

Check the particle filter is present.
If it is present,
Visually inspect the particle filter by placing the vehicle on a lift:
– not damaged (no abnormal welds, if necessary compare it with another vehicle fitted with particle filter),
– if it has After-Sales sleeves, as a result of a previous operation, check that the particle filter's contents have not been emptied when being removed.

If the particle filter is not working correctly or is absent:
– replace it.
– run command **SC036 Reinitialise programming** and select **After particle filter replacement** (see **Interpretation of commands**).

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

AIR CIRCULATION (TURBOCHARGING/INLET)

Order	Function	Parameter, Status Check or Action		Display and Notes	Fault finding
1	Engine running	**PR055:**	Engine speed	Indicates the engine's speed of rotation in rpm. **Ignition on:** **0 rpm**	In the event of a fault, refer to the interpretation for fault **DF005 Engine speed sensor circuit**.
2	Temperature	**PR058:**	Air temperature	Indicates the inlet air temperature **Default value: 20°C**	In the event of a fault, refer to the interpretation of fault **DF039 Inlet air temperature sensor circuit**
3	Turbocharging	**PR009:**	Turbocharging pressure setpoint	**790 < X < 1010 mbar**	None
		PR041:	Turbocharging pressure	**PR041 = PR035 ± 10 mbar**	In the event of a fault, consult the interpretation of **DF004 Turbocharging pressure sensor circuit**.
		PR209:	Turbocharging pressure loop difference	**X = PR009 - PR041 = ~ 0**	If **PR209** is significant, refer to the interpretation of the **AC004 Turbocharging solenoid valve** command.
		PR047:	Turbocharging pressure OCR	**X < 5%**	The opening cyclic ratio should be identical to the correction of the solenoid valve position
		PR011:	Turbocharging solenoid valve position sensor	**X < 5%**	

*OCR: Opening cycle ratio

FUEL CIRCUIT

Order	Function	Parameter, Status Check or Action		Display and Notes	Fault finding
1	Engine speed	**PR055:**	Engine speed	Shows the engine's speed of rotation RPM **Ignition on:** **0 rpm.**	In the event of a fault, refer to the interpretation for fault **DF005 Engine speed sensor circuit**.
2	Injector codes	**ET104:**	Injector code operation	**"YES"** Indicates whether the injector codes have been programmed	In the event of a fault, consult the interpretation of **DF276 Injector code programming**.
3	Temperature	**PR063:**	Fuel temperature	Indicates the fuel temperature **Default value: 100°C**	In the event of a fault, consult the interpretation of **DF098 Fuel temperature sensor circuit**.
4	Pressure	**PR008:**	Rail pressure setpoint	Indicates the theoretical pressure value for optimum engine operation **X = 250 ± 50 bar**	In the event of a fault, refer to the interpretation of fault **DF053 Rail pressure regulator function**.
		PR038:	Rail pressure	**X = 0 bar** **Default value:** **250 bar.**	In the event of a fault, consult the interpretation of fault **DF007 Rail pressure sensor circuit**.
		PR048:	Rail pressure regulation valve OCR	**X = 15%**	
		PR213:	Rail pressure loop difference	**X = PR008 - PR038**	The fuel pressure variation is the difference between the rail pressure and the rail pressure setpoint. In the event of a fault, consult the interpretation of fault **DF007 Rail pressure sensor circuit**.

GETtheMANUALS.org

NOTES	Only check conformity after a full check with the **diagnostic tool**. The values shown in this conformity check are given as a guide. Test conditions: **ENGINE OFF, IGNITION ON**.

FUEL CIRCUIT (continued)

Order	Function	Parameter, Status Check or Action		Display and Notes	Fault finding
5	Flow	**PR157:**	Fuel flow setpoint	**X = 0 < X < 60 mg/st**	None
		PR017:	Fuel flow	**PR017 = PR157**	None
		PR364:	Cylinder no. 1 fuel flow correction	**0.0 mg/st**	In the event of a fault, consult **TEST 10 Poor injector operation**.
		PR405:	Cylinder no. 2 fuel flow correction		
		PR406:	Cylinder no. 3 fuel flow correction		
		PR365:	Cylinder no. 4 fuel flow correction		
6	Rail current	**PR007:**	Rail pressure regulator current setpoint	**X = 400 ± 5 mA Default value: 1600 mA**	In the event of a fault, consult the interpretation of fault **DF007 Rail pressure sensor circuit**.
		PR006:	Rail pressure regulator current	**PR006 = PR007 ± 5 mA Default value: 1600 mA**	
7	Sensor voltage	**PR082:**	Fuel temperature sensor voltage	**1.8 < X < 4 V default value: 5 V**	In the event of a fault, consult the interpretation of faults **DF011 Sensor feed no. 1 voltage, DF012 Sensor feed no. 2 voltage and DF013 Sensor feed no. 3 voltage**.
		PR080:	Rail pressure sensor voltage	**0.5 V < X < 1 V Default value: 5 V**	

GETtheMANUALS.org

NOTES	Only carry out this conformity check after a full check with the diagnostic tool. The values shown in this conformity check are given as a guide. Test conditions: **ENGINE OFF, IGNITION ON**.

EMISSION CONTROL/OBD

Order	Function	Parameter, Status Check or Action		Display and Notes	Fault finding
1	Engine speed	**PR055:**	Engine speed	Indicates the engine's rotation speed in rpm	In the event of a fault, refer to the interpretation for fault **DF005 Engine speed sensor circuit**.
2	Exhaust gas recirculation	**ET651:**	EGR programming cu-off	**STATUS 16**	In the event of a fault, refer to the interpretation of **ET651 EGR programming cut-off**.
		PR005:	EGR valve opening setpoint	Gives a theoretical EGR valve opening value for optimum engine operation. **- 10 < X < 0%**	In the event of a fault, refer to fault interpretation **DF272 EGR control circuit**.
		PR051:	EGR valve position feedback	**- 10 < X < 0%**	In the event of a fault, refer to the interpretation of **DF118 EGR solenoid valve control**. The EGR valve position feedback loop difference must equal the difference between the EGR valve position and the position feedback.
		PR022:	EGR valve position feedback loop difference	**PR022 = PR005 - PR051**	
		PR128:	First EGR valve offset	**10% < X < 4% (average value)**	In the event of a fault, apply command **SC036 Reset programming and EGR valve**.
		PR129:	Last EGR valve offset	**10% < X < 4% (average value)**	
		PR587:	Cooling of recirculated exhaust gas	**INACTIVE if coolant temperature < 65°C**	In the event of a fault, consult the interpretation of fault **DF304 EGR by-pass circuit**.

NOTES	Only carry out this conformity check after a full check with the diagnostic tool. The values shown in this conformity check are given as a guide. Test conditions: **ENGINE OFF, IGNITION ON**.

EMISSION CONTROL/OBD (continued 1)

Order	Function	Parameter, Status Check or Action		Display and Notes	Fault finding
3	Air regulation	**PR171:**	Air flow setpoint for the EGR	**750 ± 200 mg/st**	In the event of a fault, consult the interpretation of parameter **DF056 Air flow sensor circuit**.
		PR132:	Air flow	**X = 0 kg/h**	
		PR146:	Inlet air flow	Shows the flow of air entering the engine in mg/st. **0 mg/st**	
		PR131:	EGR air flow variation	**PR131 = PR132 - PR171**	
		ET078:	Air regulation	**ACTIVE**	**If INACTIVE, switch off the ignition and wait 40 seconds before trying again.**
4	Sensor feed	**PR077:**	EGR valve position sensor voltage	**0.5 < X < 1.5 V** **default value: 0 V**	In the event of a fault, refer to the interpretation of fault **DF012 Sensor feed voltage no. 2**.
5	Coolant temperature	**PR064:**	Coolant temperature	Shows the engine coolant temperature in °C **Default value: 119°C.**	In the event of a fault, refer to the interpretation of **DF001 Coolant temperature sensor circuit**.

GETtheMANUALS.org

notes	Only carry out this conformity check after a complete check **with the diagnostic tool**. The values shown in this conformity check are given as a guide. Test conditions: **ENGINE OFF, IGNITION ON**.

PARTICLE FILTER SUB-FUNCTION

Function	Parameter, Status Check or Action		Display and Notes	Fault finding
Particle filter	**PR414:**	Particle filter differential pressure	**X = 0 ± 1 mbar**	In the event of a fault, consult the interpretation of **DF315 Particle filter differential pressure sensor**.
	PR385:	Exhaust pipe flow	When stationary **0 m^3/h**.	None
	PR383:	Weight of soot in the particle filter	**X < 45 g**	If the weight is greater than 45 g, consult the interpretation of **DF315 "Particle filter differential pressure sensor**.
	PR382:	Particle filter upstream temperature	**X ≈ 200°C**	In the event of a fault, consult the interpretation of **DF310 Particle filter upstream temperature sensor**.
	PR381:	Particle filter downstream temperature	**X ≈ 200°C**	In the event of a fault, consult the interpretation of **DF309 Particle filter downstream temperature sensor**.
	PR412:	Mileage at last successful regeneration	Value taken since the last dynamic regeneration (when driving)	If replacing the particle filter, run **SC036 Reinitialise programming**.
	PR415:	Time since last regeneration		
	PR391:	Mileage since particle filter replacement	Mileage counter since last particle filter replacement	
	PR1012:	Weight of soot after regeneration	Indicates the weight of soot remaining in the particle filter after running command **SC017 Particle filter regeneration**.	Consult the interpretation of **PR1012**.

GETtheMANUALS.org

NOTES	Only check conformity after a full check with the **diagnostic tool**. The values shown in this conformity check are given as a guide. Test conditions: **ENGINE OFF, IGNITION ON**.

PARTICLE FILTER HISTORY SUB-FUNCTION

Order	Function	Parameter, Status Check or Action		Display and Notes	Fault finding
1	Particle filter history	**PR784 to PR793:**	DF312 record No. 1 to DF312 record No. 10	Mileages of the last ten occurrences of **DF312 Speed request**	If **STOPPED**, refer to the interpretation of fault **DF312 Speed request**.
		PR794 to PR803:	Stored regeneration failure No. 1 to Stored regeneration failure No. 10	Mileage of the last ten regeneration failures	
		ET706 to ET715:	Stored engine status No. 1 to Stored engine status No. 10	This status indicates the stored engine status when there is a regeneration failure while driving: **NONE, + AFTER IGNITION FEED, RUNNING, STOPPED**.	
		PR816 to PR825:	Stored regeneration start No. 1 to Stored regeneration start No. 10	Distance of the last ten regeneration starts	Only interpret these parameters when interpreting **ALP 8 Particle filter warning light comes on too frequently**.
		ET742 to ET751:	Stored regeneration request status N°1 to Stored regeneration request status N°10	This status indicates the status of the regeneration request	Only interpret these statuses when interpreting **ALP 8 Particle filter warning light comes on too frequently**.

GETtheMANUALS.org

COLD LOOP

Order	Function	Parameter, Status Check or Action		Display and Notes	Fault finding
1	Engine	**PR055:**	Engine speed	Indicates the engine's rotation speed in rpm	In the event of a fault, refer to the interpretation for fault **DF005 Engine speed sensor circuit**.
2	Driver control	**ET088:**	Compressor actuation request	**INACTIVE**	If the air conditioning is authorised or the compressor is actuated (see **62A Air conditioning**).
		ET004:	Air conditioning authorisation	**NO**	
3	Air conditioning speed	**PR053:**	Speed requested by air conditioning	**N/A.**	This parameter is only valid when the engine has been started
4	Power	**PR125:**	Power consumed by the air conditioning compressor	**0 W**	None
5	Engine cooling	**ET143:**	Low-speed fan assembly relay control	With the ignition switched on < 80° **INACTIVE**	If the fan assemblies are supplied with the ignition on, the injection may be in defect mode. Carry out a system fault test and refer to the interpretation of any faults.
		ET144:	High-speed fan assembly relay control		
		ET014:	Check cooling fan 1	With the ignition switched on < 80° **STOPPED**	
		ET015:	Check fan assembly 2		

GETtheMANUALS.org

COLD LOOP (continued)

Order	Function	Parameter, Status Check or Action	Display and Notes	Fault finding
6	Coolant temperature	**PR064:** Coolant temperature	Shows the engine coolant temperature in °C **Default value: 119°C.**	In the event of a fault, refer to the interpretation of **DF001 Coolant temperature sensor circuit**.
7	Vehicle speed	**PR089:** Vehicle speed	Gives the vehicle speed in mph. This parameter is transmitted by the ABS computer. This signal is transmitted to the injection on the multiplex network.	In the event of a fault test the multiplex network. For the interpretation of possible faults (**see 38C, anti-lock braking system**).

GETtheMANUALS.org

NOTES	Only carry out this conformity check after a full check with the diagnostic tool. The values shown in this conformity check are given as a guide. Test conditions: **ENGINE OFF, IGNITION ON**.

DRIVER PARAMETERS

Order	Function	Parameter, Status Check or Action	Display and Notes	Fault finding
1	Engine	**PR055:** Engine speed	Indicates the engine's rotation speed in rpm	In the event of a fault, refer to the interpretation for fault **DF005 Engine speed sensor circuit**.
		PR190: Idle speed setpoint	Indicates the engine's rotational speed setpoint in rpm.	
2	Accelerator pedal position *	**PR030:** Accelerator pedal position	Indicates the accelerator pedal position. **If no pressure is being applied to the pedal PR030 = 0%**	In the event of a fault, refer to the interpretation of fault **DF008 Pedal potentiometer circuit gang 1** or **DF009 Pedal potentiometer circuit gang 2**.
3	Sensor feed	**PR147:** Pedal potentiometer voltage gang 1	Accelerator pedal released **0.75 < X < 0.80 V**	In the event of a fault, refer to the interpretation of fault **DF008 Pedal potentiometer voltage gang 1** or **DF009 Pedal potentiometer voltage gang 2**.
		PR148: Pedal potentiometer voltage gang 2	Accelerator pedal released **0.35 < X < 0.40 V**	

GETtheMANUALS.org

NOTES	Only carry out a conformity check after a **complete check** with the **diagnostic tool**. The values shown in this conformity check are given as a guide. Test conditions: **ENGINE OFF, IGNITION ON**.

DRIVER PARAMETERS (continued)

Order	Function	Parameter, Status Check or Action	Display and Notes	Fault finding
4	Brake contact	**ET704:** Brake switch no. 1	Indicates recognition of brake pedal contacts **INACTIVE**	In the event of a fault, consult the interpretation of status **ET704 Brake switch no. 1**.
		ET705: Brake switch no. 2		In the event of a fault, consult the interpretation of status **ET705 Brake switch no. 2**.
5	Clutch pedal	**ET233:** Clutch pedal	Indicates recognition of clutch pedal contacts **RELEASED**	In the event of a fault, consult the interpretation of status **ET233 Clutch pedal**.

(*) Pedal voltages - cold, ignition on (average values stated for information only).

Pedal load	0%	25%	50%	100%	120%
Voltage gang 1	**0.76 V**	**1.52 V**	**2.09 V**	**3.23 V**	**3.68 V**
Voltage gang 2	**0.37 V**	**0.74 V**	**1.02 V**	**1.56 V**	**1.79 V**

MAIN COMPUTER STATUSES AND PARAMETERS

Order	Function	Parameter, Status Check or Action		Display and Notes	Fault finding
1	Vehicle impact	**ET077:**	Impact detected	**NO**	In the event of a fault, refer to the interpretation of fault **DF069 Impact detected signal**.
2	Power supply	**ET001:**	Computer + after ignition feed	**PRESENT**	In the event of a fault, refer to the interpretation of **DF015 Main relay control circuit**.
		PR071:	Computer supply voltage	**9 V < X < 16 V**	In the event of a fault, carry out a fault finding procedure on the charging circuit and refer to the interpretation for **DF047 Computer supply voltage**.
		PR358:	Sensor reference voltage	**3.4 V < X <3.8 V**	None
3	Speed	**PR190:**	Engine idle speed setpoint.	Indicates the engine's rotational speed setpoint in rpm.	In the event of a fault, refer to the interpretation for fault **DF005 Engine speed sensor circuit**.
		PR055:	Engine speed	Indicates the engine's speed of rotation in rpm. **800 rpm**	
4	Injection configuration	**ET104:**	Injector code use	**YES**	This status indicates that the IMA function is activated. In the event of a fault, consult the interpretation of **DF276 Injector code programming**.

GETtheMANUALS.org

NOTES	Only carry out this conformity check after a full check with the diagnostic tool. The values shown in this conformity check are given as a guide. Test conditions: **Engine at idle speed, coolant temperature > 80°**.

MAIN COMPUTER STATUSES AND PARAMETERS (continued)

Order	Function	Parameter, Status Check or Action	Display and Notes	Fault finding
5	Pressure	**PR035:** Atmospheric pressure	Indicates the atmospheric pressure in mbar. The sensor is built into the computer. **Default value: 750 mbar.**	In the event of a fault, consult the interpretation of **DF003 Atmospheric pressure sensor circuit**.
		PR038: Rail pressure	**250 < X < 350 bar**	In the event of a fault, consult the interpretation of fault **DF007 Rail pressure sensor circuit**.
6	Temperature	**PR058:** Air temperature	Shows the inlet air temperature **Default value: 20°C**	In the event of a fault, refer to the interpretation for **DF039 Inlet air temperature circuit sensor**
		PR064: Coolant temperature	Shows the engine coolant temperature in °C **Default value: 119°C.**	In the event of a fault, refer to the interpretation of **DF001 Coolant temperature sensor circuit**.
7	Torque	**PR015:** Engine torque	**N/A.**	This parameter is only valid when the engine has been started
8	Speed signal	**PR089:** Vehicle speed	Indicates the vehicle speed in mph (km/h). This parameter is transmitted by the ABS computer. This signal is transmitted to the injection on the multiplex network.	In the event of a fault, carry out a multiplex network test, see **38C**, ABS note.

EMISSION CONTROL/OBD (continued 1)

Order	Function	Parameter, Status Check or Action		Display and Notes	Fault finding
3	Air regulation	**PR171:**	Air flow setpoint for the EGR	**750 ± 200 mg/st**	In the event of a fault, consult the interpretation of parameter **DF056 Air flow sensor circuit**.
		PR132:	Air flow	**Approximately 250 mg/stroke** engine warm at idle speed	
		PR146:	Inlet air flow	Indicates the flow of air entering the engine in mg/st. **0 mg/st**	
		PR131:	EGR air flow variation	**X = PR146 - PR171 should be close to 0 with ignition on**	
		ET078:	Air regulation	**ACTIVE**	**If INACTIVE, switch off the ignition and wait 1 minute before trying again.**
4	Sensor feed	**PR077:**	EGR valve position sensor voltage	**1.5 < X < 2.5 V default value: 0 V**	In the event of a fault, refer to the interpretation of fault **DF012 Sensor feed voltage no. 2**.
5	Coolant temperature	**PR064:**	Coolant temperature	Shows the engine coolant temperature in °C **Default value: 119°C.**	In the event of a fault, refer to the interpretation of **DF001 Coolant temperature sensor circuit**.

GETtheMANUALS.org

NOTES	Only check conformity after a full check with the **diagnostic tool**. The values shown in this conformity check are given as a guide. Test conditions: **ENGINE WARM AT IDLE SPEED, COOLANT TEMPERATURE > 80°C, NO ELECTRICAL CONSUMERS RUNNING**.

PARTICLE FILTER SUB-FUNCTION

Function	Parameter, Status Check or Action		Display and Notes	Fault finding
Particle filter	**PR414:**	Particle filter particle filter	**10 < X < 100 mbar**	In the event of a fault, consult the interpretation of **DF315 Particle filter differential pressure sensor**.
	PR385:	Exhaust pipe flow	Exhaust gas flow in m^3/h. **20 < X < 80 m^3/h**	None
	PR383:	Weight of soot in the particle filter	**X < 45 g**	If the weight is greater than 45 g, consult the interpretation of **DF315 Particle filter differential pressure sensor**.
	PR382:	Particle filter upstream temperature	**X ≈ 200°C**	In the event of a fault, consult the interpretation of **DF310 Particle filter upstream temperature sensor**.
	PR381:	Particle filter downstream temperature	**X ≈ 200°C**	In the event of a fault, consult the interpretation of **DF309 Particle filter downstream temperature sensor**.
	PR412:	Mileage at last successful regeneration	Value taken since the last dynamic regeneration (when driving)	If replacing the particle filter, run **SC036 Reinitialise programming**.
	PR415:	Time since last regeneration		
	PR391:	Mileage since particle filter replacement	Mileage counter since last particle filter replacement	
	PR1012:	Weight of soot after regeneration	Indicates the weight of soot remaining in the particle filter after running command **SC017 Particle filter regeneration**	Consult the interpretation of **PR1012**.

ET001	COMPUTER + AFTER IGNITION FEED

NOTES	**Special note:** Only apply the checks if the ABSENT and PRESENT statuses are not consistent with the system operating strategies.

ABSENT	***NOTES***	Ignition on

Check the condition and conformity of the **FM6 (10A)** supply fuse.
Repair if necessary

Check for the presence of an earth on the following connections:
Injection computer black 32-track connector A, **Track G4** ⟶ **battery earth**
Injection computer black 32-track connector A, **Track H4** ⟶ **battery earth**
Injection computer black 32-track connector A, **Track H1** ⟶ **battery earth**
Repair if necessary.
Check for **+ 12 V** on track **D1** of connector A of the injection computer.
If there is no voltage, check the continuity and insulation to **earth** of the following connection:
Injection computer black 32-track connector A, Track **D1** ⟶ **+ 12 V after ignition**
Repair if necessary.

PRESENT	***NOTES***	Ignition on

Normal operating conditions.
Check that the **+ 12 V ignition feed** is not there when the ignition is switched off.
Repair if necessary.

AFTER REPAIR	Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

ET003	ENGINE IMMOBILISER

NOTES	**Special note:** Only perform the tests if the statuses do not correspond with the system programming functions.

ACTIVE	***NOTES***	If status **ET003** is stuck at **ACTIVE**, refer to the UCH fault finding note.

INACTIVE	***NOTES***	When the ignition is switched on, and when driving, status **ET003** should be **INACTIVE**. If not, refer to the refer to the UCH fault finding note.

AFTER REPAIR	Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

ET004	AC AUTHORISED

NOTES	**Special note:** Only perform the tests if the statuses do not correspond with the system programming functions.

YES	The air conditioning authorisation only changes to **YES** if: – the air conditioning request has been made by the driver (air conditioning switch in **AC** or **AUTO** position with minimum ventilation), – the engine is not under full load, – the air conditioning system is not faulty.

NO	Status **ET004** remains at **NO** under the following conditions: – Vehicle stopped with the ignition on, – faults present in the air conditioning circuit, – no air conditioning request made by the driver, – engine under full load. If status **ET004** remains **NO** then the air conditioning should be authorised, check: – that the air conditioning compressor is activated correctly, – the air conditioning system feed fuses, – the presence of refrigerant in the air conditioning circuit, – that the refrigerant fluid pressure value is consistent at idle speed. If the fault is still present, check the air conditioning computer for faults (see **62A, Air conditioning**).

AFTER REPAIR	Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

ET007	PRE-POSTHEATING UNIT CONTROL

NOTES	**Special note:** Only perform these tests if the statuses do not correspond with the system programming functions.

YES	When the vehicle is started from cold, the injection computer controls the pre-postheating unit so that the vehicle can be started. Status **ET007** becomes **YES** a few seconds after the ignition is switched on and during pre/postheating. If the vehicle does not start and status **ET007** becomes **YES**, check: – the **F2 (70A)** supply fuse on the preheating unit, – the resistance of the heater plugs. Replace any heater plug whose resistance is not approximately 0.6 Ω. If the vehicle starts and status **ET007** remains **YES** during the engine operating phase, refer to the interpretation of faults: – **DF017 Preheating unit control circuit.** – **DF025 Pre-postheating unit diagnostic connection.**
NO	After the engine is started and the preheating phase, the injection computer should stop the pre-postheating unit operating. Status **ET007** should become **NO**. In the event that the vehicle does not start and status **ET007** remains **NO**, check the continuity and absence of interference resistance of the following connections: Injection computer **grey 32-track connector C, Track A4** ⟶ **Track 9** preheating unit Injection computer **grey 32-track connector C, Track E2** ⟶ **Track 8** preheating unit Repair if necessary. If the fault is still present, refer to the interpretation of faults: – **DF017 Preheating unit control circuit.** – **DF025 Pre-postheating unit diagnostic connection.**

AFTER REPAIR	Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

ET014	CHECK COOLING FAN 1

NOTES	**Special note:** **Only perform these tests if the statuses do not correspond with the system programming functions.**

Note:
Status ET014 Cooling fan 1 check and status ET143 Low speed fan unit relay control change their status at the same time.

RUNNING	The low-speed engine fan is supplied in three scenarios: – the engine coolant temperature is above **89°C**, – **the air conditioning is operating,** – the injection computer has system faults that could lead to the engine overheating. When the low-speed fan assembly is supplied: – status **ET014** becomes **RUNNING** – status **ET143 Low speed fan unit relay control** becomes **ACTIVE**.
	If the low-speed fan unit does not operate, refer to the test for status **ET413 Low speed fan unit control**.
STOPPED	The low-speed fan assembly stops when: – the engine coolant temperature is below **89°C**, – the air conditioning is not switched on by the driver.

AFTER REPAIR	Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

ET015	CHECK COOLING FAN 2

NOTES	**Special note:** **Only perform these tests if the statuses do not correspond with the system programming functions.**

Note:
Statuses ET015 Cooling fan 2 check and ET144 High speed fan unit relay control change their status at the same time.

RUNNING	The engine fan assembly can be supplied when: – the engine coolant temperature is above **99°C**. – the injection computer has system faults that could lead to the engine overheating. When the low-speed fan assembly is supplied: – status **ET015** becomes **RUNNING**, – status **ET144 High speed fan control relay** becomes **ACTIVE**.
	If the high-speed fan unit does not operate, refer to the test for status **ET144 High-speed fan unit relay control**.
STOPPED	The low-speed fan assembly stops when: – the engine coolant temperature is below **99°C**;

AFTER REPAIR	Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

ET038	ENGINE
STOPPED	Status **ET038** is STOPPED if the engine ignition is on but there has been no starter operation.
STALLED	Status **ET038** is STALLED when the engine has stalled. The vehicle is still under + after ignition feed.
RUNNING	Status **ET038** is RUNNING if the engine has started.
STARTING	Status **ET038** is Starter when the engine is in its starting phase.

AFTER REPAIR	Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

ET042	CRUISE CONTROL/SPEED LIMITER

NOTES	**Special note:** Only perform these tests if the statuses do not correspond with the system programming functions.

CRUISE CONTROL

Status **ET042** becomes **CRUISE CONTROL** when the **cruise control activation button** is pressed. This button is situated on the instrument panel, or on the centre console of the vehicle.
A **green** instrument panel warning light comes on when status **ET042** is at **CRUISE CONTROL**.
If status **ET042** does not change to **CRUISE CONTROL**, check the **ON/OFF** button of the cruise control, and the condition of its connector.
Repair if necessary.
Check **for continuity and make sure there is no interference resistance** on the following connection:
Injection computer black 32-track connector C, **track A2** ⟶ Cruise control on/off button 6-track connector **track A3**
Repair if necessary.

SPEED LIMITER

Status **ET042** becomes **SPEED LIMITER** when the **speed limiter activation button** is pressed. This button is situated on the instrument panel, or on the centre console of the vehicle.
A **yellow** instrument panel warning light lights when status **ET042** is **SPEED LIMITING**.
If status **ET042** does not change to **SPEED LIMITER**, check the **ON/OFF** button of the speed limiter, and the condition of its connector.
Repair if necessary.
Check **for continuity and make sure there is no interference resistance** on the following connection:
Injection computer black 32-track connector A **track C3** ⟶ Cruise control on/off button 6-track connector **track B1**
Repair if necessary.

AFTER REPAIR	Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

ET076	STARTING

NOTES	**Special note:** Only perform the tests if the statuses do not correspond with the system programming functions.

AUTHORISED	Starting the vehicle is authorised when the UCH authorises starting. Status **ET076** changes to **AUTHORISED** if the vehicle cards are recognised and the engine immobiliser is inactive.
PROHIBITED	If the card is not recognised by the UCH, starting the vehicle is not authorised. Status **ET076** is **PROHIBITED** and the vehicle cannot be started. Carry out fault finding on the UCH and refer to the relevant fault finding note for the vehicle to deal with any faults.

AFTER REPAIR	Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

ET077	IMPACT DETECTED

NOTES	**Special note:** Only perform the tests if the statuses do not correspond with the system programming functions.

YES	If the vehicle has been involved in an accident, the injection computer receives the impact signal via the multiplex network and may switch off the ignition. Status **ET077** is **YES**. Switch off the ignition for 10 seconds, then switch it back on, so the engine can be restarted. After the repair, clear the faults (even if no fault is displayed). Carry out a multiplex network test and deal with any faults.
NO	Under normal operating conditions, status **ET077** is **NO** when the computer has received no impact signal.

AFTER REPAIR	Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

ET088	REQUEST TO START COMPRESSOR
ACTIVE	The air conditioning request has been made by the driver when pressing one of the air conditioning controls (Auto or AC). Status **ET088 becomes ACTIVE** and the computer authorises or does not authorise air conditioning depending on the operating conditions. If status **ET088** does not become **ACTIVE** after the control button is operated, consult the vehicle's associated air conditioning fault finding note.
INACTIVE	When the driver deactivates the air conditioning, status **ET088** must become **INACTIVE**. If it does not, consult the vehicle's associated air conditioning fault finding note.

AFTER REPAIR	Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

ET104	INJECTOR CODE USE

NOTES	**Special note:** Only perform these tests if the statuses do not correspond with the system programming functions.

YES	When injector code programming is complete, status **ET104 Injector code operation** changes to **YES**.
NO	– If status **ET104 Injector code operation** is **NO**, program the injector codes using: either command **SC002 Enter injector codes** or command **SC001 Enter saved data** when **replacing with a blank computer or after reprogramming** (Consult the procedures defined in the **Interpretation of commands** section).
FAULTY	– If status **ET104 Injector code operation** is **NO**, program the injector codes using: either command **SC002 Enter injector codes** or command **SC001 Enter saved data** when **replacing with a blank computer or after reprogramming** (see the procedures defined in the **Interpretation of commands** section).

AFTER REPAIR	Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

ET122 **ET123**	BRAKE CONTACT SIGNAL No. 1 BRAKE CONTACT No. 2 SIGNAL

NOTES	**Special note:** **Only perform the tests if the statuses do not correspond with the system programming functions.**

Note:
Statuses ET122 and ET123 should change statuses at the same time. In the event of inconsistency, refer to the interpretation of fault DF050 Brake switch circuit.

***IMPORTANT:**
Two types of switch are used. Only the track assignments are different:
The first type uses tracks A1, B3, A3 and B1,
The second uses tracks 1, 2, 3 and 4.

INACTIVE
(Brake pedal depressed)

If the brake lights are working:
– check the continuity and make sure there is no interference resistance on the following connection:
Injection computer black 32-track **connector A track E4** ⟶ **Track 3 or A3***
Brake pedal switch
Repair if necessary.
If the brake lights are not operational, check:
– the condition and fitting of the brake switch,
– the condition and conformity of fuse 1H (15A),
– the conformity of the values in the following table:

	Continuity between tracks	**Insulation between tracks**
Switch pressed (Brake pedal released)	**3 and 4 or A3 and B1**	**1 and 2 or A1 and B3**
Switch released (Brake pedal depressed)	**1 and 2 or A1 and B3**	**3 and 4 or A3 and B1**

Replace the switch if the values obtained are not correct.

AFTER REPAIR	Carry out a road test followed by another check with the diagnostic tool.

EDC16_V08_ET122/EDC16_V10_ET122/EDC16_V14_ET122/EDC16_V08_ET123/EDC16_V10_ET123/EDC16_V14_ET123

GETtheMANUALS.org

ET122 **ET123** **CONTINUED**	

***IMPORTANT:**
Two types of switch are used. Only the track assignments are different:
The first type uses tracks A1, B3, A3 and B1,
The second uses tracks 1, 2, 3 and 4.

ACTIVE
(brake pedal released)

If the brake lights are working:
– check the continuity and make sure there is no interference resistance on the following connection:
Injection computer black 32-track **connector A track E4** ⟶ **Track 3 or A3***
Brake pedal switch
Repair if necessary.
If the brake lights are not working.
check the condition and fitting of the brake light switch and brake light fuse,
remove the brake light switch and check that it is operating correctly:

	Continuity between tracks	**Insulation between tracks**
Switch pressed (Brake pedal released)	**3 and 4 or A3 and B1**	**1 and 2 or A1 and B3**
Switch released (Brake pedal depressed)	**1 and 2 or A1 and B3**	**3 and 4 or A3 and B1**

Replace the switch if the values obtained are not correct.

AFTER REPAIR	Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

ET143	LOW-SPEED FAN ASSEMBLY RELAY CONTROL

NOTES	**Special note:** **Only perform these tests if the statuses do not correspond with the system programming functions.**

Note:
Status ET014 Cooling fan 1 check and status ET143 Low speed fan unit relay control change their status at the same time.

ACTIVE	The injection computer requests the activation of the low speed GMV when: – the engine coolant temperature is above **89°C**, – the injection computer has system faults that could lead to the engine overheating, – the air conditioning is switched on by the driver. When the high speed fan is supplied: – status **ET143 Low speed fan unit relay control** becomes **ACTIVE**, – status **ET014** becomes **RUNNING**. If the low-speed fan unit does not operate (see interpretation of faults, DF176 low-speed fan unit circuit).
STOPPED	The low-speed fan assembly stops when: – the engine coolant temperature is below **89°C**, – **no fault which could cause engine overheating is present in the injection system.** – **the air conditioning is not switched on by the driver.**

AFTER REPAIR	Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

ET144	HIGH-SPEED FAN ASSEMBLY RELAY CONTROL

NOTES	**Special note:** **Only perform these tests if the statuses do not correspond with the system programming functions.**

Note:
Statuses ET015 Cooling fan 2 check and ET144 High speed fan unit relay control change their status at the same time.

RUNNING	The injection computer requests the activation of the high speed GMV when: – the engine coolant temperature is above **99°C**. – the injection computer has system faults that could lead to the engine overheating. When the high speed fan is supplied: – status **ET144 High speed fan unit relay control** becomes **ACTIVE**, – status **ET015** becomes **RUNNING**. If the high-speed fan unit does not operate (see interpretation of faults, DF177 High-speed fan unit circuit).
STOPPED	The high-speed fan assembly stops when: – the engine coolant temperature is below **99°C**; – **no fault which could cause engine overheating is present in the injection system.**

AFTER REPAIR	Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

ET205 **ET206** **ET207**	THERMOPLUNGER No. 1, 2, 3 RELAY CONTROL

INACTIVE	Statuses **ET205, ET206, ET207** are **INACTIVE** when the ignition is on and the engine stopped, or when the engine is warm.

ACTIVE	Statuses **ET205, ET206, ET207** are **ACTIVE** when: – the engine has been started, – and the engine coolant temperature is low (**< 15°**), – and the air temperature is low (**< 5°**). This program allows the engine coolant to be heated and to enable the passenger compartment to be heated. To control the operation of the thermoplunger relays, run the following commands: **AC063 Heating element no. 1 relay** **AC064 Heating element no. 2 relay** **AC031 Heating element no. 3 relay** In the event of a fault, refer to the interpretation of faults: **DF238 Thermoplunger no. 3 relay circuit** **DF239 Thermoplunger no. 2 relay circuit** **DF240 Thermoplunger no. 1 relay circuit**

AFTER REPAIR	Carry out a road test followed by another check with the diagnostic tool.

EDC16_V08_ET206/EDC16_V10_ET206/EDC16_V14_ET206/
EDC16_V08_ET207/EDC16_V10_ET207/EDC16_V14_ET207

GETtheMANUALS.org

ET233	CLUTCH PEDAL

NOTES	**Special note:** Only perform these tests if the statuses do not correspond with the system programming functions.

***IMPORTANT:**
Two types of switch are used. Only the allocation of tracks is different:
The first type uses tracks A1 and B3,
The second uses tracks 1 and 2.

RELEASED and clutch pedal depressed

Check the condition and fitting of the clutch pedal switch.
Check the continuity and absence of interference resistance on the following connection:
Injection computer black 32-track connector A **track C4** ⟶ **Track 2 or A1***
Clutch switch
Check the presence of earth on track 1 or B3* of the clutch switch connector. Repair if necessary.
Remove the clutch pedal switch and check that it is functioning correctly.

	Continuity between tracks	**Insulation between tracks**
Switch pressed (Brake pedal released)	**1 and 2 or A1 and B3***	
Switch released (Brake pedal depressed)		**1 and 2 or A1 and B3***

Replace the clutch pedal switch if necessary.

DEPRESSED and clutch pedal released

Check the condition and fitting of the clutch pedal switch.
Remove the clutch pedal switch and check that it is functioning correctly.

	Continuity between tracks	**Insulation between tracks**
Switch pressed (Brake pedal released)	**1 and 2 or A1 and B3***	
Switch released (Brake pedal depressed)		**1 and 2 or A1 and B3***

Replace the switch if necessary.

AFTER REPAIR	Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

ET238	SYNCHRONISATION

NOTES	**Special note:** Only perform the tests if the statuses do not correspond with the system programming functions.

WARNING
Synchronisation is carried out during the engine starting phase. This is established between the camshaft position sensor and the TDC sensor.
Once this synchronisation has been carried out, it enables the computer to identify cylinder no. 1 and to calculate the precise position of the cylinder's Top Dead Centre.

NOT PERFORMED	When the engine is stopped but the ignition switched on, cylinder no. 1 is no longer indicated. Status **ET238** is **NOT DONE**; synchronisation between the crankshaft and the camshaft has not been carried out.
COMPLETED	Synchronisation is carried out during the engine starting phase. Cylinder No. 1 is indicated and synchronisation will be performed once the engine is started. Status **ET238** is **COMPLETED**. If after several attempts to start the engine status **ET238** remains **INACTIVE**, refer to the interpretation of the following faults: – **DF005 Engine speed sensor circuit.** – **DF097 Camshaft sensor circuit.** If the engine does not start, refer to **ALP 2 Starting faults** (see **Customer complaints**).

AFTER REPAIR	Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

ET341	IMMOBILISER CODE PROGRAMMED

NOTES	**Special note:** Only perform the tests if the statuses do not correspond with the system programming functions.

YES	Status **ET341** becomes YES if there is dialogue between the UCH and the injection computer and the card code is recognised. Engine starting authorisation is only given if the code is recognised by the UCH computer, and status **ET003 Engine immobiliser** is **INACTIVE**.
NO	The code remains **NO** if dialogue between the UCH and the injection computer is not possible. Status **ET003 Engine immobiliser** is **ACTIVE**. The cause of the fault may be incorrect card programming (in this case refer to the fault finding note and follow the UCH card programming procedure). If it is not caused by the card codes, carry out a multiplex network test (if the previous fault finding check was by function), and check that dialogue is established between the UCH and the injection computer. If dialogue is not established, contact the Techline.

AFTER REPAIR	Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

ET413	CRUISE CONTROL/SPEED LIMITER FUNCTION

NOTES	**Special notes:** Only perform these tests if the statuses do not correspond with the system programming functions.

INCREASE

Status **ET413** becomes INCREASE when the cruise control **+** button is pressed. This button is situated to the left of the steering wheel.
If status **ET413** does not become INCREASE, check the condition of the ± cruise control button and its connector. Repair if necessary.
To be able to remove the driver's airbag and carry out the measurements in complete safety (see 88C, Airbag and pretensioners).
Repair if necessary.
Measure **the resistance of the following connection, after pressing the "+" button**:
Injection computer black 32 track connector A **track D2** ⟶ **"±" button Track 2**
Injection computer black 32 track connector A **track D3** ⟶ **"±" button Track 1**
If the resistance is not approximately **300** Ω, check the continuity of the connection when the button is not pressed.
If there is continuity, replace the **+/-** control button.
If the connection is broken, repair it.

DECREASE

Status **ET413** becomes DECREASE when the **-** button for the cruise control is pressed. This button is situated to the left of the steering wheel.
If status **ET413** does not become DECREASE, check the condition of the ± cruise control button and its connector.
Repair if necessary.
To be able to remove the driver's airbag and carry out the measurements in complete safety (see 88C, Airbag and pretensioners).
Repair if necessary.
Measure the **resistance of the following connection, after pressing the - button**:
Injection computer black 32 track connector A **track D2** ⟶ **"±" button Track 2**
Injection computer black 32 track connector A **track D3** ⟶ **"±" button Track 1**
If the resistance is not approximately **100** Ω, check the continuity of the connection when the button is not pressed.
If there is continuity, replace the ± control button.
If the connection is broken, repair it.

AFTER REPAIR	Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

ET413 CONTINUED	

SUSPEND	Status **ET413** becomes CANCEL when the **0** cruise control button is pressed. This button is situated to the right of the steering wheel. If status **ET413** does not change to SUSPEND, check the **R/0** button of the cruise control, and the condition of its connector. Repair if necessary. **To be able to remove the driver's airbag and carry out the measurements in complete safety (see 88C, Airbag and pretensioners).** Repair if necessary. Measure the **resistance of the following connection, after pressing the 0 button**: Injection computer black 32 track connector A **track D2** ⟶ **"R/0" button Track 2** Injection computer black 32 track connector A **track D3** ⟶ **"R/0" button Track 1** If the resistance is not approximately **0** Ω, replace the **R/0** control button. If the connection is broken, repair it.
RESUME	Status **ET413** becomes RESTART when the **R** cruise control button is pressed. This button is situated to the right of the steering wheel. If status **ET413** does not change to RESUME, check the **R/0** button of the cruise control, and the condition of its connector. Repair if necessary. **To be able to remove the driver's airbag and carry out the measurements in complete safety (see 88C, Airbag and pretensioners).** Repair if necessary. Measure the **resistance of the following connection, after pressing the R button**: Injection computer black 32 track connector A **track D2** ⟶ **"R/0" button Track 2** Injection computer black 32 track connector A **track D3** ⟶ **"R/0" button Track 1** If the resistance is not approximately **900** Ω, check the continuity of the connection when the button is not pressed. If there is continuity, then replace the **R/0** control button. If the connection is broken, repair it.

AFTER REPAIR	Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

ET556	DRIVER'S DEACTIVATION OF THE CRUISE CONTROL/SPEED LIMITER

NOTES	**Special notes:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

Note:
Cruise control can be activated when the vehicle speed exceeds **18 mph (30 km/h)**.
Status **ET556** details 6 causes for cruise control deactivation.
IMPORTANT
To reinitialise the deactivations stored by the injection computer, use command RZ007 Fault memory.

STATUS 1	**Brake pedal depressed**
	The cruise control function is deactivated each time the brake pedal is depressed. Status **ET556** becomes **STATUS 1**, when the vehicle is being driven, with cruise control active and the brake pedal depressed. If status **ET556** becomes **STATUS 1** without depressing the brake pedal, consult the interpretation of statuses **ET704** and **ET705 Brake contact no.1 and no. 2.**

STATUS 2	**Traction control request**
	If the vehicle being diagnosed is fitted with traction control, the cruise control function is deactivated each time traction control is selected. Status **ET556** changes to **STATUS 2**, when driving, with cruise control active and traction control requested. If status **ET556** becomes **STATUS 2** with no traction control request (see **38C, Anti-lock Braking System**).

STATUS 3	**Suspend button pressed**
	Status **ET556** changes to **STATUS 3** when driving with Cruise control/Speed limiter active, if the driver presses the Cruise control/Speed limiter **0** button. If status **ET556** becomes **STATUS 3** without button **0** on the Cruise control/Speed limiter being pressed, consult the interpretation of status **ET413 Cruise control/Speed limiter function** and run fault finding on the **R/0** control button of the Cruise control/Speed limiter.

AFTER REPAIR	Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

ET556 CONTINUED	

STATUS 4	**Clutch pedal depressed**
	MANUAL GEARBOX ONLY The cruise control function is deactivated if the gearbox is no longer coupled to the engine (clutch pedal depressed). Status **ET556** becomes **STATUS 4** when driving, with cruise control active and the clutch pedal depressed. If status **ET556** becomes **STATUS 4** without the clutch pedal being depressed, consult the interpretation of status **ET233 Clutch pedal**.

STATUS 5	**Gear lever in neutral position**
	Status **ET556** changes to **STATUS 5**, when driving, with cruise control active and – if the driver puts the gear lever in neutral on a manual gearbox without declutching or, – if gear lever is in neutral on an automatic transmission. This deactivates cruise control. If status **ET556** becomes **STATUS 5** without putting the gear lever in neutral on a manual gearbox without declutching, or without neutral on an automatic transmission, contact the Techline.

STATUS 6	**Lack of correlation between the request and the vehicle speed**
	Status **ET556** changes to **STATUS 6** if the computer detects too great a difference between the speed requested by the driver and the vehicle speed. This may occur when driving, with cruise control active and where the difference between speeds is great. If status **ET556** changes to **STATUS 6** without a great difference in the speeds, contact the Techline.

AFTER REPAIR	Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

ET557	CRUISE CONTROL/SPEED LIMITER DEACTIVATION BY FUNCTION

NOTES	**Special notes:** Only perform these tests if the statuses do not correspond with the system programming functions.

Note:
Cruise control remains deactivated as long as the vehicle speed does not exceed **18 mph (30 km/h)**. Status **ET557** gives 3 causes of cruise control deactivation.
IMPORTANT
To reinitialise the deactivations stored by the injection computer, use command RZ007 Fault memory.

STATUS 1	**Cruise control or speed limiter fault**
	If status **ET557** is **STATUS 1**, refer to the interpretation of status **ET042 Cruise control/ speed limiter** and **ET413 Cruise control/speed limiter function**, to test the components of the cruise control system and find the faulty one. If status **ET557** changes to **STATUS 1**, deal with the faults present or stored in the computer. If the fault is still present, contact the Techline.

STATUS 2	**Fault detected by the injection computer**
	Status **ET557** changes to **STATUS 2** if the injection computer detects a fault on the injection system: – **faults in the engine speed sensor or camshaft,** – **accelerator pedal faults,** – **engine speed lower than 1000 rpm,** – **engine speed greater than 4700 rpm.** Carry out a multiplex network test, then an injection system test, and carry out fault finding on any faults. If the fault is still present, contact the Techline.

STATUS 3	**Invalid vehicle speed**
	Status **ET557** changes to **STATUS 3** if the vehicle speed received by the computer is invalid. Carry out fault finding on the **ABS** computer. If faults are present (see **38C, Anti-lock braking system**). If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

ET651	EGR PROGRAMMING CUT-OFF

NOTES	**Special notes:** Only perform these tests if the status does not correspond with the system programming functions.

NONE	**No EGR cut-off, the EGR valve is working properly in accordance with the computer programs.**
STATUS 1, 5, 6, 7, 9, 10, 12, 13, 15, 19 23, 24	Switch off the engine and wait for the following message to appear on the **diagnostic tool: Loss of dialogue with the computer: EDC16 C3, check the connection of the tool and the computer supply voltage.** Switch the ignition on and check for faults. Check the engine battery voltage with the engine switched off and the engine running. If no faults are present or stored, restart the vehicle and test at idle speed. **Do not accelerate too much or attain an engine speed that is too high.**
STATUS 3, 14, 16	Accelerate above idling speed for a few seconds.
STATUS 2	Check that the clutch pedal (**ET233 Clutch pedal**) is not depressed, and that the vehicle is completely stopped.
STATUS 4, 17	Check for present and stored faults, and repair.
STATUS 8	Reset the EGR offsets by referring to the interpretation of command **SC036 Reset programming** and select **EGR valve**.
STATUS 11, 22	Allow the engine to heat up until this cut-off disappears.
STATUS 18	Check that the regeneration of the particle filter in progress has completely finished.
STATUS 20	Allow the engine to cool until this cut-off disappears.
STATUS 21	Too low atmospheric pressure, the EGR valve is disabled.

AFTER REPAIR	Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

ET704 **ET705**	BRAKE SWITCH NO. 1 BRAKE SWITCH NO. 2

NOTES	**Special note:** Only perform the tests if the statuses do not correspond with the system programming functions.

Note:
Statuses **ET704 and ET705** should change status at the same time. In the event of inconsistency, refer to the interpretation of fault **DF050 Brake switch circuit**.

AFTER REPAIR	Carry out a road test followed by a **complete check** with the **diagnostic too**l.

GETtheMANUALS.org

ET704 **ET705** **CONTINUED**	

ACTIVE
or
INACTIVE

If the brake lights are working:
check the continuity and make sure there is no interference resistance on the following connection:
– Connection code **5A between components 160 and 120/645/119**.
If there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.
If the brake lights are not operational, check:
– the condition and fitting of the brake switch,
– the condition and conformity of the brake light fuse,
– the conformity of the values in the following table:
disconnect the switch and carry out the following checks:

For Vel satis without ESP

	Continuity between connections	Insulation between connections
Switch pressed (Brake pedal released)	**5A and SP13**	**65G and AP10**
Switch released (Brake pedal depressed)	**65G and AP10**	**5A and SP13**

For Vel satis with ESP

	Continuity between connections	Insulation between connections
Switch pressed (Brake pedal released)	**5A and SP13**	**65A and AP10**
Switch released (Brake pedal depressed)	**65A and AP10**	**5A and SP13**

For Laguna II

	Continuity between connections	Insulation between connections
Switch pressed (Brake pedal released)	**5A and SP13**	**65A and AP10**
Switch released (Brake pedal depressed)	**65A and AP10**	**5A and SP13**

AFTER REPAIR	Carry out a road test followed by a **complete check** with the **diagnostic too**l.

GETtheMANUALS.org

ET706 **ET707** **ET708** **ET709** **ET710** **ET711** **ET712** **ET713** **ET714** **ET715**	STORED ENGINE STATUS NO. 1 STORED ENGINE STATUS NO. 2 STORED ENGINE STATUS NO. 3 STORED ENGINE STATUS NO. 4 STORED ENGINE STATUS NO. 5 STORED ENGINE STATUS NO. 6 STORED ENGINE STATUS NO. 7 STORED ENGINE STATUS NO. 8 STORED ENGINE STATUS NO. 9 STORED ENGINE STATUS NO. 10

NOTES	**Special note:** Interpret these parameters only for **DF312 Speed request** if it is present or stored.

Each **STATUS** between **ET706** and **ET715** corresponds to the engine status during a regeneration failure for which the mileage is saved by **PR794 Saved regeneration failure no. 1 to PR803 Saved regeneration failure no. 10** (for example, **PR797 Saved regeneration failure no. 4 is related to ET709 Saved engine status no. 4**).

"RUNNING"	If the **STATUS** is **RUNNING**, the regeneration failed because: – the customer's driving did not generate enough heat, – an engine management system component is faulty.

"STOPPED"	If the **STATUS** is **STOPPED**, regeneration has failed due to engine cut-off.

+ APC	POWER LATCH

"NONE"	No failed regeneration is present.

AFTER REPAIR	Carry out a road test followed by a complete check with the **diagnostic tool**.

GETtheMANUALS.org

ET742 **ET743** **ET744** **ET745** **ET746** **ET747** **ET748** **ET749** **ET750** **ET751**	STORED REGEN. REQUEST STATUS No. 1 STORED REGEN. REQUEST STATUS No. 2 STORED REGEN. REQUEST STATUS No. 3 STORED REGEN. REQUEST STATUS No. 4 STORED REGEN. REQUEST STATUS No. 5 STORED REGEN. REQUEST STATUS No. 6 STORED REGEN. REQUEST STATUS No. 7 STORED REGEN. REQUEST STATUS No. 8 STORED REGEN. REQUEST STATUS No. 9 STORED REGEN. REQUEST STATUS No. 10

NOTES	**Special note:** These statuses are to be interpreted only for **ALP8 Particle filter warning light comes on too often**.

Statuses **ET742** to **ET751** correspond to the causes for the regeneration request. They are associated with the parameters **PR816 Stored regeneration start no.1** to **PR825 Stored regeneration restart no. 10** which contain the record of the vehicle mileage at the start of regeneration (e.g. **PR745 Stored regeneration start no. 4** is associated with **ET709 Stored regeneration request status no. 4**).

STATUS 1	**Request by weight of soot** Regeneration has been requested following measurement of the maximum weight of soot in the particle filter, without the particle filter warning light coming on.
STATUS 2	**Request by estimated weight of soot** Regeneration has been requested following an estimate of the maximum weight of soot in the particle filter, without the particle filter warning light coming on.
STATUS 3	**Request by distance travelled** Regeneration has been requested as the distance travelled since the last successful regeneration has reached the maximum authorised value (the particle filter warning light has not come on).
STATUS 4	**Request by number of failed regenerations or soot weight** This status corresponds to the appearance of **DF312 Speed request**. This corresponds to the maximum number of failed regenerations or to the maximum weight of soot in the particle filter, with the particle filter warning light coming on.

AFTER REPAIR	Carry out a road test followed by a complete check with the **diagnostic tool**.

NOTES	**Special note:** These parameters must only be interpreted for **DF312 Speed request** if it is present or stored.

These parameters can be used to find out the history of the last ten times the particle filter warning light has come on.

Each parameter from **PR784 to PR793** records the mileage when the particle filter warning light illuminates in association with **DF312 Speed request**.
Each time the particle filter warning light comes on, the vehicle mileage is stored in the following parameter (PR+1).

When all ten parameters have a value other than zero, and the particle filter warning light illuminates again, the mileage information for **PR784 DF312 record no. 1** is cleared and replaced by the new value.

AFTER REPAIR	Repeat the conformity check from the start.

NOTES	**Special note:** These parameters must only be interpreted for **DF312 Speed request** if it is present or stored.

These parameters are used so that the history of the last ten failed regenerations when driving is known.

each of these parameters contains the vehicle mileage during a failed particle filter regeneration when driving. each parameter relates to an engine status. The statuses and parameters are recorded simultaneously (for example, **PR797 Stored regeneration failure no. 4 is associated with ET709 Stored engine status no. 4**).

Each new recorded value is saved under the next PR (PR+1).

When all ten parameters have a value other than zero, and a regeneration failure occurs when driving, the mileage information for **PR794 Stored regeneration failure no. 1** is cleared and replaced with the new value.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

PR1012	WEIGHT OF SOOT AFTER REGENERATION

PARAMETER DEFINITION	This parameter indicates the weight of soot in g present in the particle filter after a regeneration.

NOTES	This parameter is to be consulted after using **SC017 Particle filter regeneration**.

Conformity check: Engine stopped and the ignition on, or the engine running and the engine coolant temperature > 80°C without electrical consumers

If **PR1012** is less than **15 g**, the particle filter regeneration completed correctly.
If **PR1012** is greater than **15 g**, a second particle filter regeneration must be performed using command **SC017 Particle filter regeneration**.

IMPORTANT:
Before performing a second After-Sales regeneration of the particle filter, the engine must be allowed to cool down for 2 hours with the bonnet open.
Do not perform a routine oil change before a second After-Sales regeneration (see **SC017 Particle filter regeneration**).

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

SC001	WRITE SAVED DATA

NOTES	All data must be saved with command **SC003 Save computer data** for this command to be run. Writing is carried out after the computer has been reprogrammed or replaced.

Validating this command writes the data saved using command **SC003 Save computer data**.
The data is as follows:
– vehicle-specific idling,
– options available on the vehicle and managed by the computer (example: air conditioning).
– injector calibration codes (if the vehicle is fitted with IMA),
– programming of exhaust gas recirculation valve data,
– the information required for the correct operation and maintenance of the particle filter.
they will configure the computer and will enable it to avoid:
– engine malfunction after reprogramming or replacing the computer,
– faulty interpretation of information provided by the clip tool.

GETtheMANUALS.org

SC002	ENTER INJECTOR CODES

NOTES	This command is run after replacing the injectors and only if the vehicle is IMA configured (**ET104 Injector code operation is YES**). If this command is not carried out, fault **DF276 Injector code programming** will be present.

WARNING
The letters **J and Q**, and figures **0 and 9** are **not used in IMA coding**.
If these characters are used the entry will be **invalid**.
Cylinder no. 1 is the cylinder located **at the engine flywheel end**.
Procedure to be followed:
– Read the **6-character** alphanumeric codes etched on the upper section of the injector bodies.
– Use command **SC002**.
– Select the cylinder number for the cylinder concerned in the **Desired**, column, then confirm.
– Enter the injector code noted for the cylinder.
– Enter the new codes for each cylinder, then confirm.
– When the command is completed, the modified codes appear in the **Current** column.
– Check that the codes correspond to those read earlier.
– If the codes entered appear in neither the **Current** column nor the **Desired** column, check the codes read and make sure the data has been entered correctly,
The possible confusions are:
figure 1 with letter I and L
figure 2 for the letter Z
figure 5 with the letter S
figure 6 for the letter G
figure 8 with the letter B
– Exit fault finding mode.
– Switch off the ignition and **wait** for the message to appear on the **diagnostic tool: "Loss of dialogue with the computer: EDC16 C3, check the tool connection and the computer supply"**.
– Switch the ignition back on and check for faults.
– **DF276 Injector code programming** should be stored.

If fault **DF276** is still present, the command has not been performed correctly.
Start the procedure again and follow the instructions.
If the codes are still not accepted, check that the computer has been put on standby correctly:
Switch off the ignition and **wait** for the message to appear on the **diagnostic tool: "Loss of dialogue with the computer: EDC16 C3, check the tool connection and the computer supply"**.
If the warning light flashes when the ignition is switched off, the computer has not been put on standby and the command will be ignored.
If all these checks still do not enable the command to be confirmed, contact the Techline.

* Computer on standby after switching the ignition off: approximately 1 minute.

GETtheMANUALS.org

SC003	SAVE COMPUTER DATA

NOTES	The data is saved before computer reprogramming or the computer is replaced.

On the CLIP tool, select the **SC003 Save computer data**.
If the following message appears:
"a saved file exists, do you want to overwrite this data?":
(this file corresponds to the last save carried out on the tool) select **YES**
Confirming this command saves the following vehicle-specific data:
– injector codes,
– the egr valve data programming;
– options available on the vehicle and managed by the computer (e.g.. air conditioning);
– specific data related to the operation of the particle filter.
This information will be saved in the CLIP tool.
When saving is finished, use command **SC001 Write saved data** in order to configure the new computer after programming or reprogramming.

GETtheMANUALS.org

SC017	PARTICLE FILTER REGENERATION

NOTES	Only run this command after interpreting the following faults: – **DF308 Clogged particle filter** – **DF311 Failed regenerations limit exceeded** – **DF312 Speed request**

WARNING
– **It is essential to observe the health and safety regulations (see Technical Note 5040A).**

SAFETY INSTRUCTIONS TO BE FOLLOWED:
The regeneration causes exhaust fumes and high temperatures.
The vehicle must be outside during regeneration.
If it is not possible to carry out regeneration outside, use an extractor fan which can withstand very high regeneration temperatures (**400°C at the exhaust outlet**).
Perform regeneration on a surface free from fire risks (oil, dry leaves, etc.). Nothing should be left in the vicinity of the exhaust pipe. Check that there are no leaks or blockages in the exhaust pipe. Repair if necessary.

IMPORTANT
– **Check the engine oil level before running the command to avoid any engine racing. The oil level must be between the minimum threshold and the middle level on the oil dipstick.**
– **Before performing a particle filter regeneration, it is essential to deactivate the air conditioning compressor (risk of engine damage) and all the electrical consumers.**

IF NECESSARY:
Regeneration can be stopped by briefly pressing the vehicle start button twice (less than **3 seconds**).
Switch off the ignition and wait for the message to appear on the diagnostic tool (maximum time **8 minutes**) **"Communication lost with computer: EDC16 C3, check the tool connection and the computer supply"** before switching the ignition back on.

PROCEDURE TO BE FOLLOWED:
To run this command, select the command mode on the diagnostic tool and select command **SC017 Particle filter regeneration**.

When regeneration is complete, a message will indicate whether the regeneration was successful, and which operations need to be carried out **(filter replacement, whether an oil service is required, etc.).**

GETtheMANUALS.org

SC017 **CONTINUED 1**	

DESCRIPTION OF THE PROCESS
Particle filter regeneration takes place in 3 stages (values given as a guide only):
– **Heating phase**: the engine speed is fixed or varies between **1000 rpm and 1650 rpm**.
This phase lasts at least **3 minutes**, until the coolant temperature exceeds **80°C**.
– **Regeneration phase**: the engine speed is fixed or varies between **1000 rpm and 1650 rpm**. Engine injection is retarded. The exhaust fumes rise in temperature and burn the soot retained in the particle filter. Then the combustion of the soot stored in the particle filter causes the **particle filter upstream temperature** to increase, possibly reaching **700°C** depending on the amount of soot in the filter. This phase lasts between **20 and 25 minutes**.
– **Cooling phase:** the engine speed decreases and varies between **1000 rpm and 1650 rpm**, then increases to **1750 rpm**. Engine injection returns to normal and the exhaust gases cool the particle filter. This phase lasts **3 minutes**. The engine speed returns to idle speed or remains fixed at **1500 rpm**

The procedure lasts at least **30 minutes**, and varies depending on the time taken to reach a coolant temperature of **80°C**.

CONFIRMING THE REGENERATION PROCESS:
At the end of regeneration, a message appears to announce whether the regeneration was successful:
● **Particle filter regeneration finished:**
Consult **PR1012 Weight of soot after regeneration**. If **PR1012** is less than **15 g**, the particle filter regeneration completed correctly. If **PR1012** is greater than **15 g**, a second particle filter regeneration must be performed using the command in **the diagnostic tool** and choose command **SC017**.

IMPORTANT:
Before performing a second After-Sales regeneration of the particle filter, the engine must be allowed to cool down for **2 hours** with the bonnet open.
Do not carry out the usual engine oil change before a second After-Sales regeneration.

● **Particle filter too full - replace the particle filter**: regeneration has failed. The weight of soot in the particle filter is so great that it is creating back-pressure. Deal with any faults that appear or replace the particle filter. Run command **SC036 Reinitialise programming** and select **After particle filter replacement**.

Explain to the customer the procedure for regeneration when driving to avoid unnecessary repairs: see **PART D** in the interpretation of **DF312 Speed request**.

● **Particle filter regeneration failed - run the test Temperature upstream of turbine too low**: the regeneration failed because the temperature upstream of the turbine is too low. Run **test 11 Temperature upstream of turbine too low**.

GETtheMANUALS.org

SC017 **CONTINUED 2**	

In all cases, carry out the following operations:
- switch off the ignition and wait for the message to appear on the **diagnostic tool** (maximum time **8 minutes**): **"Loss of communication with the computer: EDC16 C3, check the tool connection and the computer supply"**.
- switch on the ignition and establish dialogue with the injection computer,
- run command **SC036 Reinitialise programming**,
- depending on the operation performed, select **After particle filter regeneration with diag tool**, or **After particle filter replacement**
- switch off the ignition and wait for the message to appear on the **diagnostic tool** (maximum time **8 minutes**): **"Loss of communication with the computer: EDC16 C3, check the tool connection and the computer supply"**.
- **Then switch on the ignition again** and **clear** the **present** or **stored** faults from the computer memory **(operation to be carried out within 3 minutes of switching on the ignition)**.

If **DF308 Particle filter clogged** or **DF312 Speed request** is still present, contact Techline.

Note:
It is essential to change the **engine oil** and the **oil filter** in the following cases:
- following an After-Sales regeneration only if a message on the **CLIP diagnostic tool** requests it,
- following particle filter replacement,

after a second regeneration (when two successive regenerations).

GETtheMANUALS.org

SC036	REINITIALISE PROGRAMMING

NOTES	This command is used to reset the computer parameters according to the type of operation or component repaired or replaced from the following list: – the EGR valve, – the damper valve, – after particle filter replacement, – after particle filter regeneration with the **CLIP diagnostic tool**, – after replacing the injection computer without the possibility of saving. **Ignition on and engine stopped.**

To run this command, in the **CLIP diagnostic tool**, select scenario **SC036 Reinitialise programming**.
Procedure to be followed:
– on the main screen, select the component to reinitialise after an operation (removal/refitting, regeneration or replacement of component),
– select **YES** then **OK** to begin reinitialisation,
– select **Finish** on the **Configuration done** screen to return to the main screen,
– end of operation.

GETtheMANUALS.org

RZ005	PROGRAMMING

NOTES	This command is only executed after replacing the computer.

Command **RZ005** reconfigures the computer.
If the computer does not have any configuration data, use command **RZ005** to enter the vehicle options:
– air conditioning,
– thermoplunger,
– cruise control.
These options are detected by the computer even if command **RZ005** is not used.
The computer is configured as soon as the one of the vehicle's optional system components is operated.

GETtheMANUALS.org

AC004	TURBOCHARGING SOLENOID VALVE

NOTES	This command is run if a fault is detected in the turbocharging circuit.

This command checks that the turbocharger and the control circuit are working properly.

Introduction

1-Check the sealing of the high pressure air circuit:
Pipes not joined or pierced, pressure sensor disconnected or poorly fitted (seal present), intercooler pierced. To test the intercooler: stabilise the engine speed between **3,500** and **4,000 rpm** with the vehicle stopped and check that there are no leaks.
Check the resistance of the turbocharging limitation solenoid valve between **tracks 1 and 2**.
Replace the solenoid valve if its resistance is not **15.4 Ω ± 0.7 at 20°C**.
Check the injection computer connections.
Check for **continuity and make sure there is no interference resistance** on the following connection:
Injection computer grey 32-track connector **C track E1** ⟶ **Track 1** turbocharging solenoid valve
Repair if necessary.
Check for the presence of **+ 12 V** after relay on **track 2** of the turbocharging solenoid valve.

2 - Turbocharger control circuit check
- With the engine switched off, make sure the control rod is in the rest position,
- Start the engine and make sure that the control rod operates to the upper stop.
- (when the engine is switched off, the control rod should return to the rest position)
- If the control rod movements do not conform, carry out the following checks:

1) Vacuum pressure control check:
- Disconnect the solenoid valve inlet **hose** and connect it to a pressure gauge,
- Start the engine and stabilise it at idle speed,
- If the vacuum pressure does not reach **800 mbar ± 100**: check the vacuum pressure circuit from the vacuum pump.
- Stop the engine, reconnect the inlet hoses and go to step no. 2.

2) Solenoid valve control check:
- Disconnect the solenoid valve outlet **hoses**,
- Start the engine and stabilise it at idle speed,
- Place your hand on the solenoid valve and block the **outlet** union with your thumb,
- If you notice no solenoid valve vibration, check the operation of the computer output (**step 5**)

3) Solenoid valve operation check:
- Attach the pressure gauge to the **outlet** union of the solenoid valve,
- Start the engine and stabilise it at idle speed,

If the vacuum pressure does not reach **800 mbar ± 100**, replace the solenoid valve.

GETtheMANUALS.org

AC004 **CONTINUED**	

Turbocharger control circuit check (continued)

4) Turbocharger operation check:
a) Attach a vacuum pump to the **Hose** connected to the turbocharger control diaphragm,
Apply a vacuum of **800 ± 100 mbar**:
If there is a leak, replace the turbocharger (diaphragm included).
b) Check the movement and adjustment of the control rod (See **12B, turbocharging**).
If the control rod is sticking, replace the turbocharger.
c) Engine cold and stopped:
Remove the turbocharger inlet duct and check that the compressor turns freely on the axis.
d) If the fault is still present:
Check that the exhaust manifold is not leaking.
Check that the exhaust is not blocked.
Carry out the necessary repairs.
5) Computer output stage check (solenoid valve connected): This operation **can only be carried out if** the checks indicated in **step** no. 2 **are not conclusive**.
Either with the voltmeter: connect the voltmeter earth lead to **track 2** of the solenoid valve and the positive cable to **track 1**,
Clear any solenoid valve fault then run command **AC004:**
➡ The voltmeter should display **ten cycles** of two successive voltages ~ = battery voltage X current OCR*.
either: **~ 2.5 V** (OCR for **20%**) then **~ 8.7 V** (OCR for **70%**).
Or with the oscilloscope (at 5 V/division range and time base 1 ms/division): Connect the oscilloscope earth lead to the battery earth and the positive test pin to **track 2** of the solenoid valve,
Clear any solenoid valve faults, then run command **AC004**:
➡ the oscilloscope should display a square-wave signal of 12.5 volts amplitude at a frequency of 140 Hz (with an OCR going successively from ~20 à ~70 %).
if the measurement is correct, replace the solenoid valve.
if the measurement does not show any control or continuous voltage, contact the techline.

* Opening cyclic ratio

GETtheMANUALS.org

AC012	DAMPER VALVE

NOTES	Carry out this interpretation: – after fault **DF226 Damper valve**, – or after a customer complaint (starting faults, poor performance). Ignition on and engine stopped.

Check the **continuity, the insulation, and the absence of interference resistance** on the following connection:

Vehicle earth, **track 1** ⟶ **track 1** damper valve solenoid valve connector

+12 V after relay feed ⟶ **track 2** damper valve solenoid valve connector

Repair if necessary.

Check for **+12 V** on **track 2** of the damper valve solenoid valve connector.
Repair if necessary.

Check for **earth** on **track 1** of the damper valve solenoid valve connector. Repair if necessary.

Check that the **damper valve** is **open**.
If not, clean or replace the air vent unit.

Actuate the valve using command **AC012** and check the damper valve travel and rest position of the valve.
Check the operation of the computer output stage with a voltmeter:
Actuate the valve with command **AC012**.
If the solenoid valve opens (vacuum pump pressure gauge returns to atmospheric pressure), go to **step C**.

If not, with the solenoid valve connected, check the operation of the computer output stage using a voltmeter:

Negative lead of voltmeter ⟶ **track 1** of the damper valve solenoid valve

Positive lead of voltmeter ⟶ **track 2** of the damper valve solenoid valve

The voltmeter should display three **ON-OFF** cycles (**12.5 V** then return to **0 V**).
If the measurement is correct, replace the damper valve.
If the measurement does not show any operation, **contact the Techline**.

GETtheMANUALS.org

AC031	THERMOPLUNGER No. 3 RELAY (check that the computer is correctly configured)

NOTES	**No faults should be present or stored.** Perform this fault finding procedure if there is a fault in the **command** menu, or a passenger compartment heating/demisting fault. Refer to the **wiring diagrams** in the Technical Note for your vehicle to locate the relevant fuses and relays.

If the additional heater no. 3 **relay is not operating** during command **AC031**:
Check the **additional heater no. 3** relay mounting.
check the engine management computer connections.
Repair if necessary.

If the fault is still present, check that the relay is being controlled by the engine management computer as follows:
Disconnect the **additional heater no. 3 relay**, fit a resistor of **50 to 100** Ω on the mounting in place of the coil, and connect a voltmeter as follows:
Positive terminal to **+ 12 V** battery feed
Negative terminal to **track 2** of the **additional heater no. 3** relay mounting.
Clear the fault and actuate the relay using command **AC031**.
if the voltmeter shows the battery voltage (two **2-second** on-off cycles), replace the additional heater no. 3 relay.
If the voltmeter does not show the battery voltage (two **2-second** ON-OFF cycles), contact the Techline.

If the additional heater no. 3 **relay is fed** by command **AC031**, but there is still a fault with the passenger compartment heating and demisting, check, using a wiring diagram:
the conformity of the thermoplunger maxi-fuse, the presence of the **+ 12 V battery** on **track 3** of the additional heater no. 3 relay mounting,
the conformity of the additional heater no. 3 relay.
The continuity between **track 5** of the **additional heater no. 3** relay mounting and the supply terminal for thermoplunger 3.
the conformity of the thermoplunger resistance: **0.45 ± 0.05** Ω **at 20°C**,
the presence of earth at the water chamber (thermoplunger mounting).
Also check the level of the cooling circuit and that there are no leaks.
Carry out the necessary repairs.

GETtheMANUALS.org

AC035	FUEL PRESSURE SOLENOID VALVE

NOTES	This command enables the operation of the pressure regulator and the high-pressure injection circuit to be checked.

Step 1

Measure the pressure regulator resistance between **tracks 1** and **2**.
– Replace the regulator if its resistance is not approximately: **3 Ω ± 0.5 at 20°C**.
Check **the continuity and absence of interference resistance** of the following connections:
Injection computer, connector **B**
brown 48-track, track **M4** ⟶ **track 2** of the rail pressure regulator connector.
+ **12 V** after relay feed ⟶ **track 1** of the rail pressure regulator connector.
If, when running command **AC035**, you can hear a slight whistling noise and a crunching noise from the pressure regulator, go to **step 2**. Otherwise, ensure that the computer output stage is functioning correctly:

● **Using a voltmeter:**
With the solenoid valve connected, connect the voltmeter earth lead to **track 2** of the fuel pressure solenoid valve and the positive cable to **track 1**. Clear any fuel pressure solenoid valve faults, then run command **AC035**:

➡ The voltmeter should display two successive voltages: ~ 2.5 V for an OCR at 20 % then~ 8.75 V at an OCR at 70 % (ten cycles)

● **Or using an oscilloscope** (range 5 V/division and with time base 1 ms/division):
With the solenoid valve connected, connect the oscilloscope earth to the battery earth and the positive test pin to **track 2** of the fuel pressure solenoid valve; clear any fuel pressure solenoid valve faults then enter command **AC035**:

➡ The oscilloscope should display a square wave signal of 12.5 V in amplitude at a frequency of 185 Hz (with an OCR* passing successively from 20 to 70%).
if the measurement is correct, replace the regulator.
If the measurement is not correct, contact the Techline.

Step 2

-Next page-

* Opening cyclic ratio

GETtheMANUALS.org

AC035 **CONTINUED**	

Step 2

In the event of rail overpressure, check the operation of the injectors (see **Component testing** section, **Test 10 Poor injector operation**).
Check the operation of the rail pressure sensor (see Interpretation of faults **DF007 Rail pressure sensor circuit**). if these checks do not reveal any faults, and if the fault is still present, replace the rail pressure sensor.

in the event of rail underpressure:
Check that the rail pressure sensor is operating correctly:
Fault interpretation **DF007 Rail pressure sensor circuit**.
Check the low pressure diesel circuit priming.
Check the conformity of the diesel filter connections.
Check the condition of the filter (clogging and water saturation).
Check there are no air bubbles between the filter and the high pressure pump.
Check the low and high pressure diesel circuits sealing (visual checks, odour, etc.): pump casing, overpressure valve, pipes, rail and injector unions, injector wells, etc.).
Check the conformity of the seal fitting on the pressure regulator.
Check the operation of the injectors (see **Component testing, Test 10 Poor injector operation**).
Carry out the necessary repairs.

GETtheMANUALS.org

AC037	PREHEATING RELAY

NOTES	This command is only carried out if the fault **DF017 Heater plugs unit control circuit**, or **DF025 Preheating unit fault finding connection** is present or stored and if no other fault is present. Refer to the **Wiring diagrams** Technical Note for your vehicle to locate the relevant fuses and relays

Before applying the following fault finding procedure, check that the battery voltage is not below 12 V.

Step 1:

Using a multimeter fitted with an Amps clamp, group together the 4 supply wires for the heater plugs.
Actuate the preheating relay using the **AC037** command and measure the current used by the 4 heater plugs.
If the current drawn is not between **60 and 80A**, go to step 2, otherwise end fault finding.

Step 2:

Check the connections on the preheating unit, heater plugs and injection computer.
Repair if necessary.
Measure the resistance of the heater plugs. If this resistance is greater than **2** Ω replace the faulty plug(s).
Check the continuity and for the absence of interference resistance between:

- preheating unit **track 1** ⟶ heater plug of cylinder **3**
- preheating unit **track 2** ⟶ heater plug of cylinder **4**
- preheating unit **track 6** ⟶ heater plug of cylinder **1**
- preheating unit **track 7** ⟶ heater plug of cylinder **2**

Check the condition of the preheating unit supply fuse **F01 (70A)**. Replace it if necessary.
Then check for the **+ 12 V feed** on track **3** of the preheating relay connector.
Check the continuity and for the absence of interference resistance between:

- Injection computer connector **B track B3** ⟶ **track 9** of the preheating unit connector
- Injection computer connector **B track C3** ⟶ **track 8** of the preheating unit connector

If the fault is still present, replace the pre-postheating unit.

GETtheMANUALS.org

AC038	LOW-SPEED FAN ASSEMBLY RELAY

NOTES	**No faults should be present or stored.** Perform this fault finding procedure if a malfunction appears on the **command** menu or after an engine cooling system or air conditioning fault. Refer to the **wiring diagrams** in the Technical Note for your vehicle to locate the relevant fuses and relays.

If, when running command **AC038, the low speed fan unit relay does not work**:
Check the **low-speed fan unit** relay mounting and the connections of the engine management computer.
Repair if necessary.

If the fault is still present, check that the relay is actuated by the engine management computer as follows:
Disconnect the **low-speed fan assembly** relay, fit a **50 to 100** Ω resistor on the relay mounting in place of the coil, and connect a voltmeter as follows:
Positive terminal to **+ 12 V** battery feed
Negative terminal to **track 2** of the **low-speed fan assembly relay** mounting.
Clear the fault and run command **AC038**
If the voltmeter indicates the battery voltage (three **2-second** ON-OFF cycles), replace the relay.
If the voltmeter does not show the battery voltage (three **2 second** ON-OFF cycles), contact the techline.

If the low-speed fan assembly relay operates using command **AC038**, but there is still a fault with triggering the fan assembly, use the wiring diagram to check:
the conformity of the fan assembly maxi-fuse.
the conformity of the **low-speed fan unit** relay,
the continuity of the connection between **track 5** of the **low-speed fan assembly** relay mounting and **track 1** of the low-speed resistor,
the conformity of the low-speed resistance (resistor and connections),
the continuity of the connection between **track 2** of the low-speed resistor connector and **track 1** of the fan assembly connector,
the conformity of the fan assembly and the continuity between **track 2** and earth.
Carry out the necessary repairs.

GETtheMANUALS.org

AC039	HIGH SPEED FAN ASSEMBLY

NOTES	**No faults should be present or stored.** Perform this fault finding procedure after detecting a fault in the commands menu or following a problem of engine cooling. Refer to the **wiring diagrams** in the Technical Note for your vehicle to locate the relevant fuses and relays.

If, when running command **AC039 High-speed fan assembly relay does not operate**:
Perform a check on the **high speed fan assembly** relay mounting and the connections of the engine management computer.
Repair if necessary.

If the fault is still present, check that the relay is being controlled by the engine management computer as follows:
Disconnect the **high speed fan assembly** relay, fit a **50 to 100** Ω resistor on the mounting in place of the coil, and connect a voltmeter as follows:
Positive terminal to **+ 12 V** battery feed
Negative terminal to **track 2** of the **high-speed fan assembly** relay mounting.
Clear the fault and run command **AC039**.
If the voltmeter indicates the battery voltage (three **2-second** ON-OFF cycles), replace the relay.
If the voltmeter does not show the battery voltage (three **2 second** ON-OFF cycles), contact the techline.

If the **high-speed fan assembly** relay is supplied by command **AC039**, but there remains a fault with the triggering the fan assembly. Check using the wiring diagram:
the conformity of the fan assembly maxi-fuse.
for the + battery feed on **track 3** of the **high-speed fan assembly** relay mounting,
the conformity of the **high-speed fan assembly** relay,
the continuity of the connection between **track 5** of the **high-speed fan assembly** relay mounting and **track 1** of the fan assembly connector,
the conformity of the fan assembly,
the continuity of the connection between **track 2** of the fan unit connector and earth.
Carry out the necessary repairs.

GETtheMANUALS.org

AC063	THERMOPLUNGER No. 1 RELAY (check that the computer is correctly configured)

NOTES	**No faults should be present or stored.** Perform this fault finding procedure if there is a fault in the **command** menu, or a passenger compartment heating/demisting problem. Refer to the **wiring diagrams** in the Technical Note for your vehicle to locate the relevant fuses and relays.

If the **additional heater 1 relay does not work** when running command **AC063**:
Check the **additional heater 1** relay mounting.
Check the engine management computer connectors.
Repair if necessary.

if the fault is still present, check as follows that this relay is controlled by the engine management computer:
Disconnect the **additional heater no. 1** relay, fit a **50 to 100** Ω resistor on the mounting in place of the coil, and connect a voltmeter as follows:
Positive terminal to **+ 12 V** battery feed
Negative terminal to **track 2** of the **additional heater no. 1** relay mounting.
Clear the fault and actuate the relay using command **AC063**.
If the voltmeter shows the battery voltage (two 2-second ON-OFF **cycles**), replace the additional heater relay 1.
If the voltmeter does not show the battery voltage (two **2-second** ON-OFF cycles), contact the Techline.

If the **additional heater 1** relay is fed by command **AC063**, but there is still a fault with the passenger compartment heating and demisting, check using a wiring diagram:
the conformity of the thermoplunger maxi-fuse,
the presence of the **+12 V battery feed** on **track 3** of the **additional heater 1** relay mounting,
the conformity of the additional heater 1 relay,
the continuity between **track 5** of the "additional heater relay **1**" relay mounting and the supply terminal for thermoplunger 1.
the conformity of the thermoplunger resistance: **0.45 ± 0.05** Ω **at 20°C**,
the presence of earth at the water chamber (thermoplunger mounting).
Also check the level of the cooling circuit and that there are no leaks.
Carry out the necessary repairs.

GETtheMANUALS.org

AC064	THERMOPLUNGER No. 2 RELAY (check that the computer is correctly configured)

NOTES	**No faults should be present or stored.** Perform this fault finding procedure if there is a fault in the **command** menu, or a passenger compartment heating/demisting problem. Refer to the **wiring diagrams** in the Technical Note for your vehicle to locate the relevant fuses and relays.

If the additional heater relay 2 does not operate when running command **AC064**:
Check the **additional heating 2** relay mounting.
check the engine management computer connections.
Repair if necessary.

if the fault is still present, check as follows that this relay is controlled by the engine management computer:
Disconnect the **additional heater no. 2 relay**, and fit a **50 to 100** Ω resistor on the mounting in place of the coil and connect a voltmeter as follows:
Positive terminal to **+ 12 V** battery feed
Negative terminal to **track 2** of the **additional heater no. 2** relay mounting.
Clear the fault and actuate the relay using command **AC064**.
If the voltmeter shows the battery voltage (two 2-second ON-OFF **cycles**), replace the additional heater relay 1.
If the voltmeter does not show the battery voltage (two **2-second** ON-OFF cycles), contact the Techline.

If the **additional heater 2** relay is fed by command **AC064**, but there is still a fault with the passenger compartment heating and demisting, check, using a wiring diagram:
the conformity of the thermoplunger maxi-fuse,
the presence of the **+ 12 volts battery feed** on **track 3** of the **additional heater no. 2** relay mounting,
the conformity of the additional heater relay no. 2.
The continuity between **track 5** of the mounting for the **additional heater no. 2** relay and the supply terminal for thermoplunger **2,**
the conformity of the thermoplunger resistance: **0.45 ± 0.05** Ω **at 20°C**,
the presence of earth at the water chamber (thermoplunger mounting).
Also check the level of the cooling circuit and that there are no leaks.
Carry out the necessary repairs.

GETtheMANUALS.org

AC103	EGR BY-PASS

NOTES	This command is only carried out if a fault linked to the exhaust gas recirculation is present or stored.

This command allows the EGR by-pass solenoid valve function to be checked. Run command **AC103**.
The solenoid valve must actuated for 10 cycles.
Put your hand on the body of the solenoid valve to check its movement.
If no movement is detected:
Check the continuity and absence of interference resistance of the following connections:

Engine management computer connector **B track L3** ⟶ **track 1** of the solenoid valve
+12 V after relay feed ⟶ **track 2** of the solenoid valve

Repair if necessary.

Measure the resistance **between terminals 1 and 2 of the solenoid valve**.
Replace the solenoid valve if its resistance is not between **43 and 49** Ω.

GETtheMANUALS.org

VP036	INHIBIT FUEL SUPPLY

NOTES	This command restores fuel supply to the injectors. This command is carried out with the engine switched off, and ignition on.

This command allows the injectors to be locked, so that starting is not possible.
Command **VP036** enables you to test the engine compression safely.
Run command **VP036**, and try to start the vehicle.
If the vehicle does not start, check the engine compression and reestablish the injector actuation using command **VP037 Lift fuel supply inhibition**.

GETtheMANUALS.org

VP037	CANCEL FUEL SUPPLY INHIBITION

NOTES	This command restores fuel supply to the injectors. This command is carried out with the engine switched off, and ignition on.

The command allows the supply to the injectors to be re-established, following an engine compression test.
Run command **VP037**, and try to start the vehicle.
If the vehicle does not start, start the procedure again.

GETtheMANUALS.org

NO COMMUNICATION WITH THE COMPUTER	→ ALP1
STARTING DIFFICULT OR IMPOSSIBLE	→ ALP2
INJECTION NOISE	→ ALP3
POOR PERFORMANCE	→ ALP4
IRREGULAR ENGINE OPERATION	→ ALP5
ROUGH IDLE	→ ALP7
PARTICLE FILTER WARNING LIGHT COMES ON TOO OFTEN	→ ALP8

GETtheMANUALS.org

ALP1	No dialogue with engine management computer

NOTES	**Before dealing with this customer complaint, check that there are no faults, and the conformity (or otherwise) of the parameters and statuses using the diagnostic tool.** **If the customer complaint is not eliminated, perform the following checks.**

Check the conformity of the vehicle type and the domain selected on your tool!
Check that the tool is not faulty by trying to establish dialogue with a computer on another vehicle.
Check the condition of the main relay supply fuse **M3 30A**.
Replace it if necessary.
Remove the relay **R8** and check it is working correctly.
If this relay is defective, replace and retry to establish communication.
Check the continuity and absence of interference resistance on the following connection:
Injection computer **48-track** connector **B, Track E1** ⟶ Relay mounting **R8 track 15**
Check the supply to the diagnostic socket:
+ Before ignition feed on **track 16**/ + After ignition feed on **track 1**/ Earth on **tracks 4 and 5**
Check (according to wiring diagram and equipment):
the conformity of the + After ignition fuse.
the conformity of the injection relay mounting feeds,
the conformity of the injection relay: **65 Ω ± 5 Ω** between **tracks 1** and **2**
infinite resistance between **tracks 3** and **5** (open contact)
resistance **< 0.2** between **tracks 3** and **5** (closed contact)
Disconnect the engine management computer and check that there are no conducting parts on the computer studs. If this reveals any kind of impurity, rectify it and try to establish dialogue.
If the fault is still present:
Check **the continuity and absence of interference resistance** on the following connections:
Engine management computer, **connector A track B4** ⟶ Diagnostic socket **track 7 (line K)**
Ensure that the power supplies are in order:
Engine management computer, **connector A track D1** ⟶ **+ After ignition feed**
Engine management computer, **connector B tracks L3, L4, and M4** ⟶ **Earth**
By shunting the normally open injection relay contact, i.e. **tracks 3** and **5** of the relay mounting:
Engine management computer, **connector B tracks M3 and M2** ⟶ **+12 V battery feed** (via test shunt)
Check the continuity of the connection between:
Engine management computer, **connector B track E1** ⟶ **track 2** of the central injection unit supply relay mounting

AFTER REPAIR	Carry out a road test followed by a complete check with the diagnostic tool.

GETtheMANUALS.org

ALP1 CONTINUED	

Try to start communication with another computer on the same vehicle.

- ➡ If dialogue is established with **another computer on the same vehicle**, contact the Techline.
- ➡ If you cannot communicate with **another computer on the same vehicle**, it may be that a faulty computer is causing interference with the multiplex network.

To locate it, proceed by elimination, disconnecting all the computers linked to the multiplex network one by one (according to the wiring diagram and the equipment): air conditioning, airbag, ABS system, UCH, instrument panel. try to establish a dialogue between each disconnection:

If, after a disconnection, you manage to establish dialogue, perform the fault finding procedure for the computer concerned.

- ➡ If the fault is still present, reconnect the computers listed above and disconnect the engine management computer. try to establish dialogue with another computer.
- ➡ If you manage to establish dialogue, go to **step 2.**
- ➡ If you still cannot establish dialogue, disconnect **all** the computers connected to lines **K and/or L** and check the insulation against **+ 12 V** and against earth on **track 7** and **track 15** of the **diagnostic socket**. Carry out the necessary repairs.

If the fault is still present, contact the techline.

AFTER REPAIR	Carry out a road test followed by a complete check with the diagnostic tool.

GETtheMANUALS.org

ALP2	Starting faults (or starting impossible)

NOTES	**Before dealing with this customer complaint, check that there are no faults, and the conformity (or otherwise) of the parameters and statuses using the diagnostic tool.** **If the customer complaint is not eliminated, perform the following checks.**

impossible

A ← **Is it difficult or impossible to start the engine?**

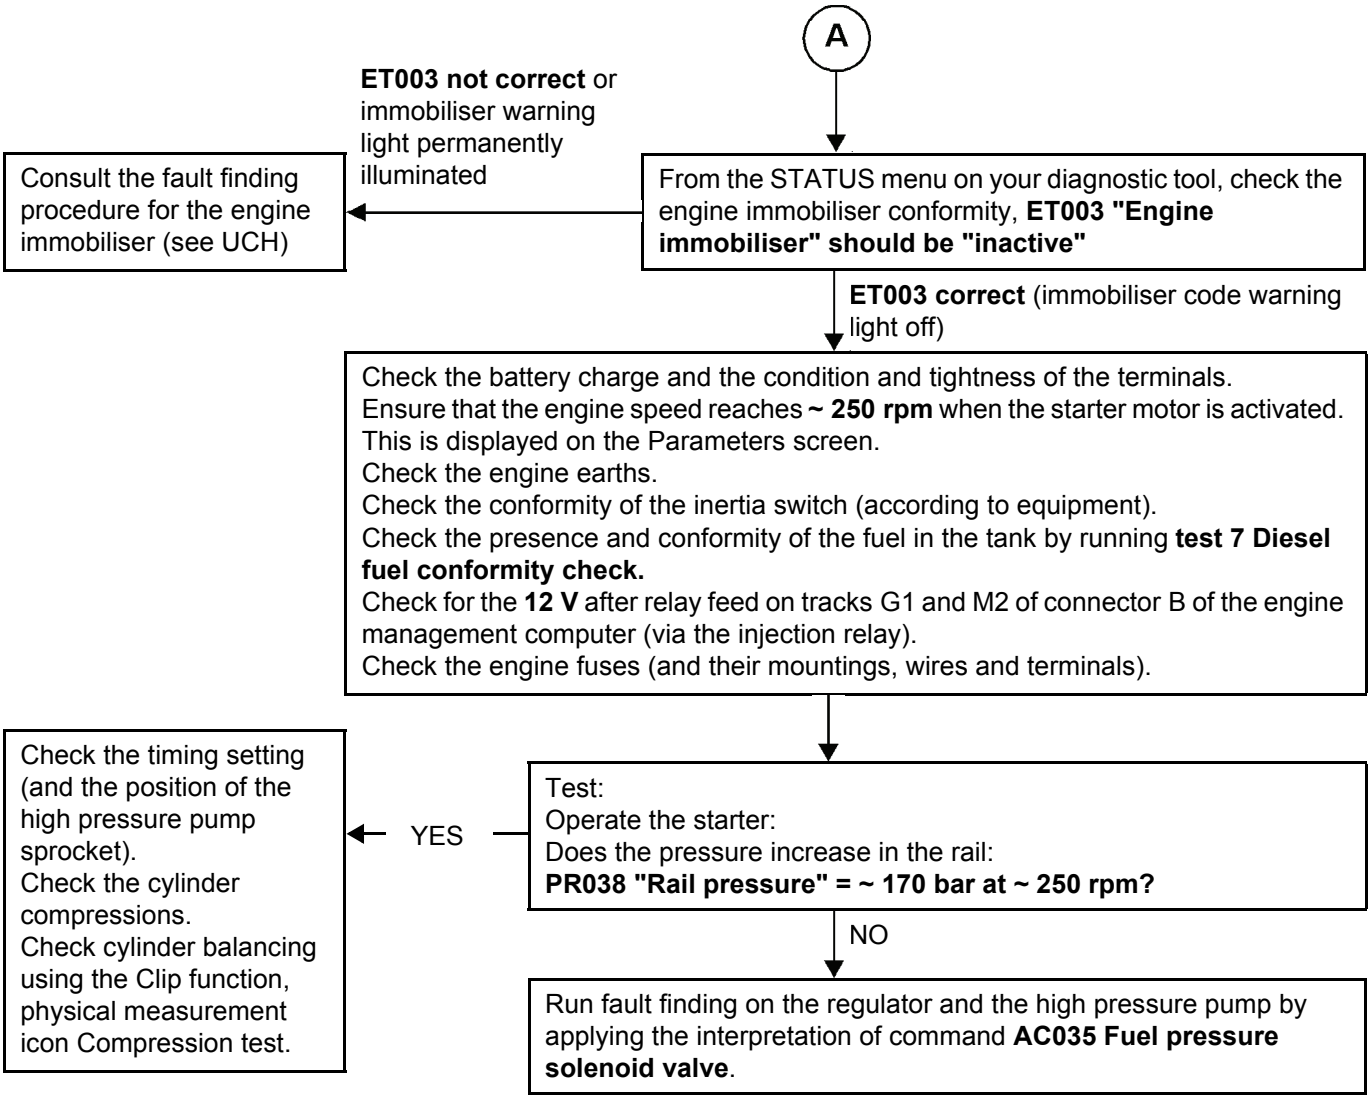
difficult ↓

Check the engine earths.
Make sure that the engine speed reaches **250 rpm** when the starter motor is operated, displayed in the parameter screen,
check the conformity of the fuel used by running **test 7 Diesel fuel conformity check**,
check the conformity of the fuel filter connections,
ensure that the fuel filter is not saturated with water.
check there are no air bubbles between the filter and the high pressure pump,
check the operation of the heater plugs and unit with command **AC037 Preheating relay**,
check the condition of the air filter (clogging),
check the sealing of the high pressure diesel fuel circuit; pump, pipes, unions (visual inspection + odours),
check the position of the EGR valve: jamming or mechanical seizure.
check the consistency of the signal from the engine coolant temperature sensor,
check the operation of the pressure regulator (refer to interpretation of the command **AC035 Fuel pressure solenoid valve**,
check the operation of the injectors (too much return leakage, clogging, seizing) consult Test 10 (see component test, Test 10 Poor injector operation),
check that the compressions are balanced in accordance with the power consumption in the starting phase (Compression test MENU on the CLIP tool).
In the event of an imbalance, use a compression gauge to complete the measurements.
after the operation, clear the faults caused by disconnecting the regulator and the heater plugs.

AFTER REPAIR	Carry out a road test followed by a complete check with the **diagnostic tool**.

GETtheMANUALS.org

ALP2 CONTINUED 1	



AFTER REPAIR	Carry out a road test followed by a complete check with the diagnostic tool.

GETtheMANUALS.org

ALP3	Injection noise

NOTES	**Before dealing with this customer complaint, check that there are no faults, and the conformity (or otherwise) of the parameters and statuses using the diagnostic tool.** **If the customer complaint is not ironed out, perform the following checks:**

If the injection noise occurs after starting from cold:
Check the low pressure diesel circuit priming.
Check the fuel heater supply.
Check the operation of the preheating system.
Check that fuel and engine temperatures are consistent.
If the complaint is still present, check the rail pressure (**PR038**) and apply interpretation of command **AC035 Fuel pressure solenoid valve.**.

If the injection noise occurs at idle speed:
Check the condition of the injector connector and pressure regulator terminals.
Check the conformity of the air flow signal (refer to parameter **PR132 Air flow**).
Check the condition of the EGR valve (clogging, blocked, seized).
If the complaint is still present, perform a fault finding procedure on the injectors with TEST 10 Poor injector operation.

does the injection noise occur at all engine speeds?
Run fault finding on the injectors (consult Test 10 Poor injector operation).
Check the condition of the injector connector and pressure regulator terminals.
Check the conformity of the fuel by running **test 7 Diesel fuel conformity check**.
Replace the diesel fuel if it does not match and bleed the low and high pressure circuits of diesel fuel.
Check the conformity of the air flow signal (use the interpretation of the fault finding procedure **PR132 Air flow**).
If the customer complaint is still present, check the rail pressure (PARAMETERS MENU) and apply the interpretation of command **AC035 Fuel pressure solenoid valve**.

If the injection noise occurs at transitional speed:
If the engine races when changing gear, check, if there is a floor carpet, whether the floor carpet is blocking the accelerator pedal, then the conformity of the clutch switch and the conformity of the accelerator pedal when released.
When changing gear during a road test, display parameter **PR017 Fuel flow**. If it varies, without notable influence on the rail pressure, apply command interpretation **AC035 Fuel pressure solenoid valve.**
If the complaint is still present, run fault finding on the injectors (consult the ALP for **TEST 10 Poor injector operation**).

AFTER REPAIR	Carry out a road test followed by a complete check with the diagnostic tool.

GETtheMANUALS.org

ALP4	Poor performance

NOTES	**Before dealing with this customer complaint, check that there are no faults, and the conformity (or otherwise) of the parameters and statuses using the diagnostic tool.** **If the customer complaint is not ironed out, perform the following checks:**

IMPORTANT
In the event of the engine overheating above **110°C**, the computer deliberately limits the fuel flow, and supplies the engine fan unit until the battery is completely discharged.

Is the poor performance accompanied by smoke?

NO

YES

Check:
– That the EGR valve is not stuck in the open position.
– That the injectors are properly mounted (presence and conformity of the sealing washer).

YES

Is the engine running on all cylinders?

NO

Check the operation of the injectors (see **TEST 1**).

If the fault is still present

Check conformity on the following components:
– accelerator pedal position sensor,
– brake pedal sensor,
– atmospheric pressure regulator,
– EGR valve.
Check the condition of the air filter,
Check the consistency of the signal:
– from the flow sensor or air temperature/pressure sensor/,
– from the coolant temperature sensor,
– from the fuel temperature sensor,
– from the engine speed sensor,
– from the swirl flap (depending on equipment).
Check there are no foreign bodies on the flow sensor grille (visual inspection only).

AFTER REPAIR	Carry out a road test followed by a complete check with the diagnostic tool.

GETtheMANUALS.org

ALP4 **CONTINUED**	

Check:
– that the diesel filter is not clogged,
– that there are no leaks in the low pressure and high pressure diesel fuel circuits,
– that the air inlet circuit is complete (sealed and not obstructed),
– that the oil vapour rebreathing system is connected,
– the flow regulator (jammed/seized, check the interpretation of command AC035 Fuel pressure solenoid valve,
– the turbo control (jammed/seized, check the interpretation of command AC004 Turbocharging solenoid valve,
– check the cylinder compression (Cylinder compression balance, with the **Compression test** function on the CLIP tool),
– Check that the exhaust pipe is not blocked.

AFTER REPAIR	Carry out a road test followed by a complete check with the diagnostic tool.

GETtheMANUALS.org

ALP5	Irregular engine operation

NOTES	**Before dealing with this customer complaint, check that there are no faults, and the conformity (or otherwise) of the parameters and statuses using the diagnostic tool.** **If the customer complaint is not ironed out, perform the following checks:**

If the engine bucks or races during gear changes, check the conformity of the clutch switch.
If the fault is still present:
Check the conformity of the fuel used by running **test 7 Diesel fuel conformity check**,
- check the priming of the low pressure fuel circuit,
- check the conformity of the low-pressure circuit connections
- check the conformity of the diesel filter and that it is not saturated with water (replace the filter if necessary),
- check that there are no air bubbles between the filter and the high pressure pump,
- check the conformity of the rail pressure (warm engine):
  ± 25 bar around the rail pressure value at idle speed, (the minimum to maximum variations in the rail pressure at idle speed should not exceed **50 bar**).
  ~ 1600 bar with full load on the accelerator.

In the event of an irregularity, apply command interpretation **AC035 Fuel pressure solenoid valve.**
Check the conformity of the air flow, apply the interpretation of parameter **PR132 Air flow.**
If the fault is still present:
- Check the operation of the injectors (see TEST 10 Poor injector operation).
- Check cylinder balancing using the CLIP function, physical measurement icon **Compression test**.
- Check the engine compressions with the special tool, if necessary.

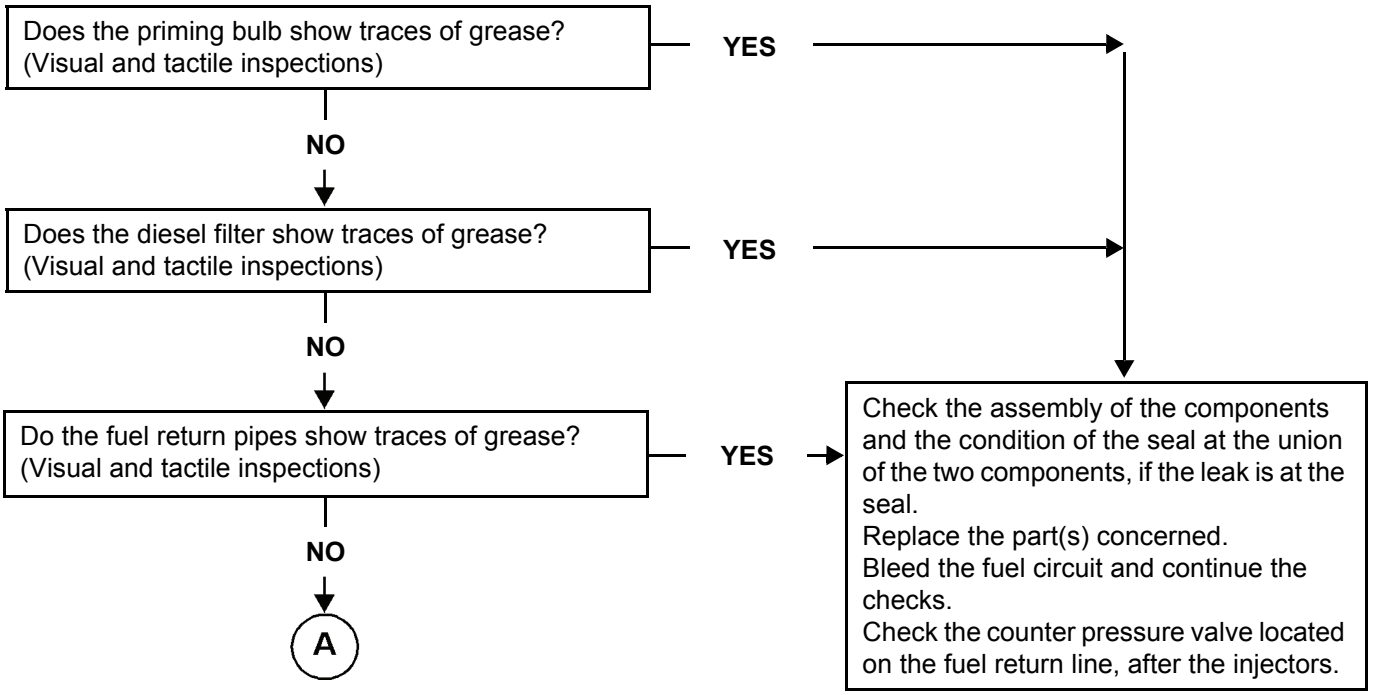
AFTER REPAIR	Carry out a road test followed by a complete check with the diagnostic tool.

GETtheMANUALS.org

ALP6	Fuel system leaks

NOTES	**Before dealing with this customer complaint, check that there are no faults, and the conformity (or otherwise) of the parameters and statuses using the diagnostic tool.** **If the customer complaint is not ironed out, perform the following checks:** **IMPORTANT** **Please observe the cleanliness guidelines and safety advice.**

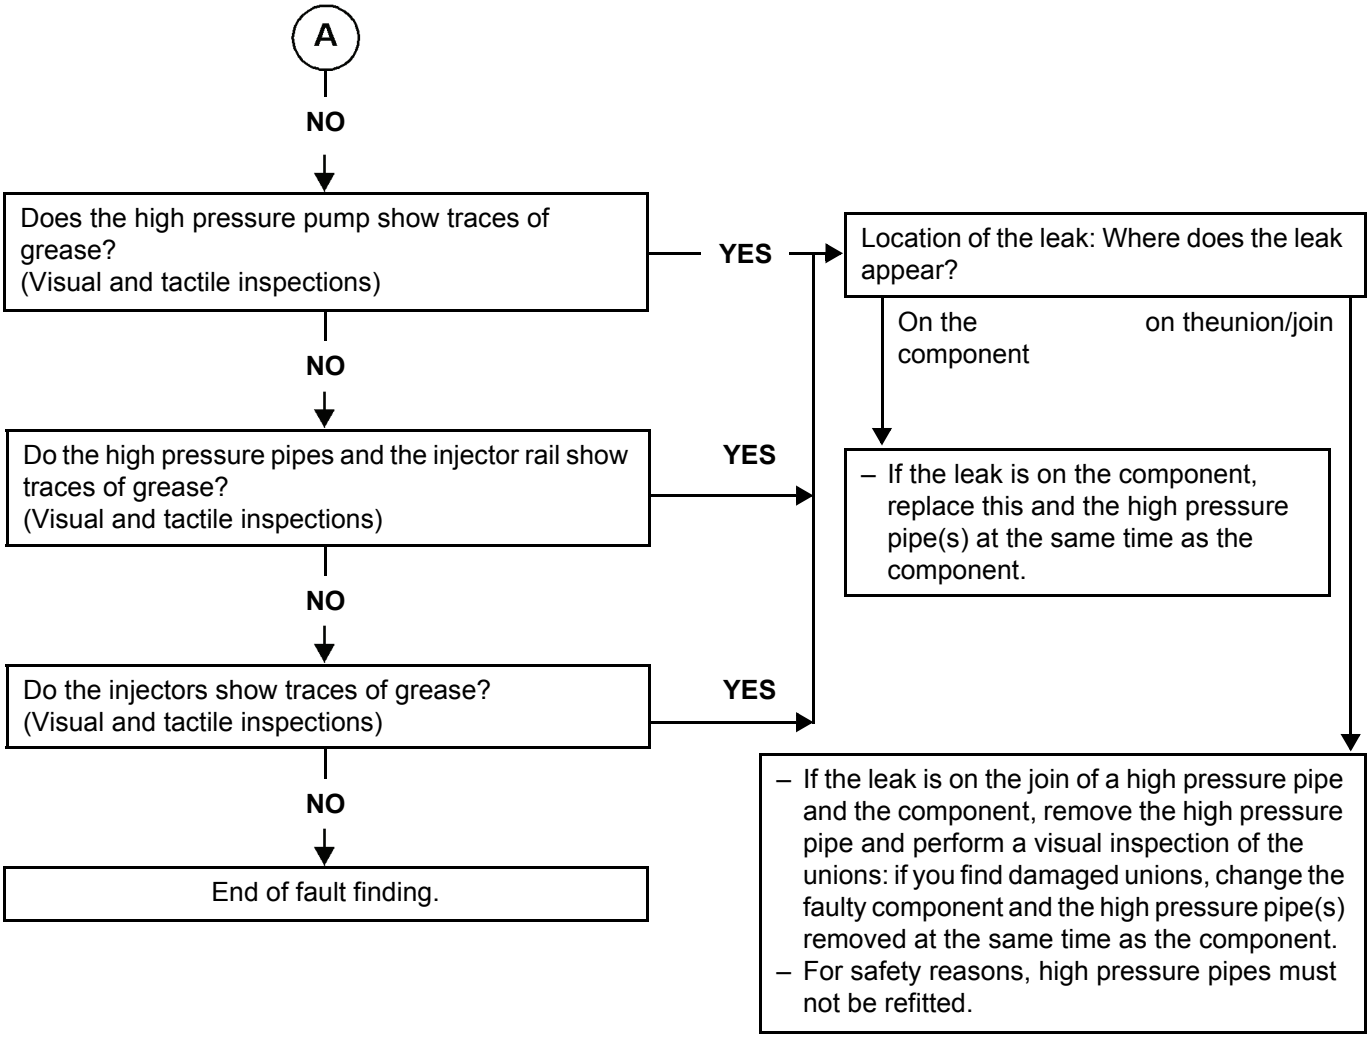
Procedure for checking for an external leak on the fuel circuit:
Clean away traces of grease with clean thinner and wipe the part or parts concerned with cleaning cloths.
Start the engine and increase the engine temperature until the diesel fuel reaches 40/50°C.
Stop the engine and check for traces of grease on the part or parts concerned.
If this is the case, replace the part or parts concerned.
Bleed the fuel circuit and continue the checks.



AFTER REPAIR	Carry out a road test followed by a complete check with the **diagnostic tool**.

GETtheMANUALS.org

ALP6 CONTINUED	



Reminder:
Only replace the rail, pump or injector if there is damage to the union and this damage is visible during checks.
Bleed the fuel circuit and continue the checks.

AFTER REPAIR	Carry out a road test followed by a complete check with the **diagnostic tool**.

GETtheMANUALS.org

ALP7	Rough idle

NOTES	**Before dealing with this customer complaint, check that there are no faults, and the conformity (or otherwise) of the parameters and statuses using the diagnostic tool.** **If the customer complaint is not eliminated, perform the following checks.**

Check the sealing and condition of the inlet circuit by running **Test 3 Turbocharged air inlet circuit check**.

↓

Check the low pressure circuit

↓

check the engine parameters:
– Check the update of the engine management computer calibration (last calibration).
– Check the conformity of the **IMA** codes (using the **Identification** screen on the **Clip diagnostic tool**).
– Check the charging circuit (see **Technical Note 6014A Checking the charging circuit**)
– To ensure the conformity of the engine speed signal, check:
  – The wiring.
  – The flywheel position and the condition of the flywheel teeth.
  – The position and tightness of the engine speed sensor.
– Check the fuel flow correction from station to station, run **Test 10 Poor injector operation**.

↓

Check the connections and wiring of the injectors.
Check the connections and wiring of the engine management computer to the injectors.
Repair if necessary.

↓

Check the high pressure circuit (external leaks) (see **ALP6 Fuel circuit leaks**).

↓

Check the engine timing (and the position of the high pressure pump sprocket).

↓

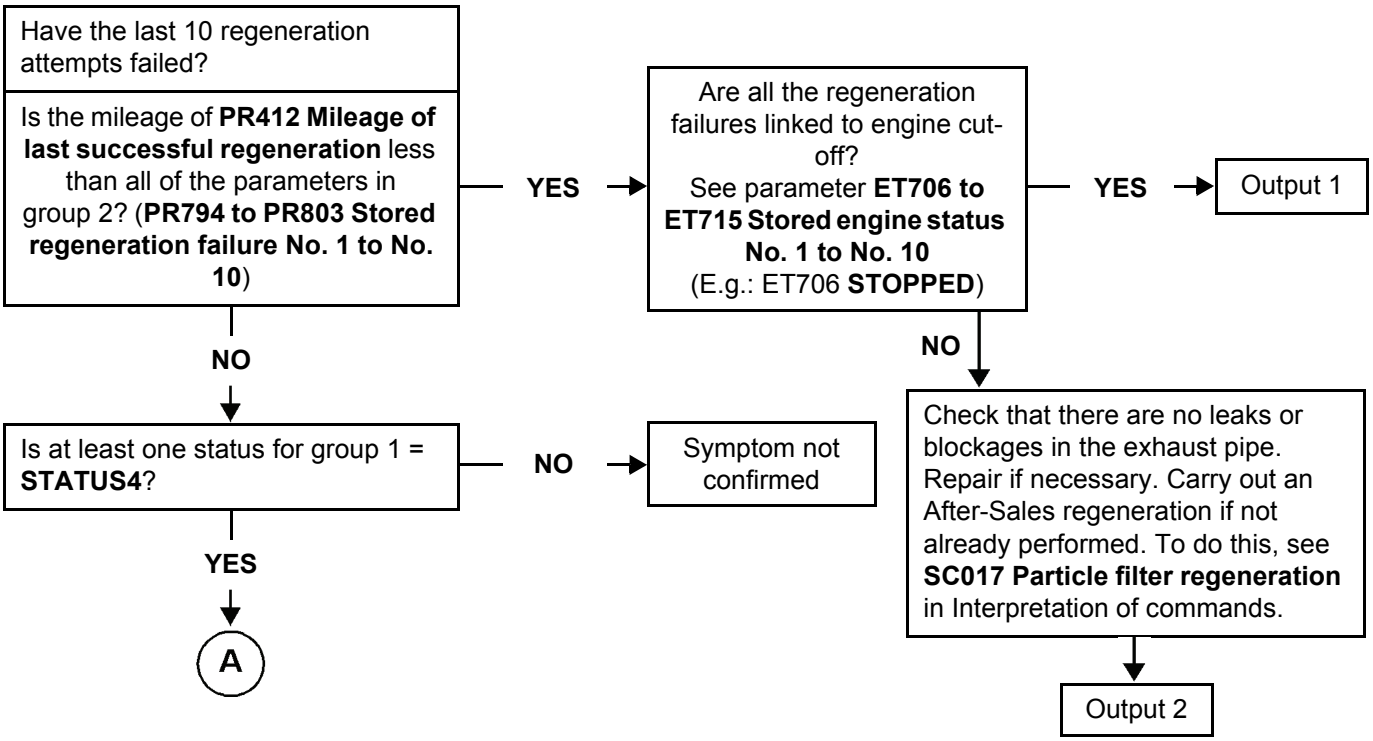
Check the lower engine:
– Check the compressions using the **Compression Test** on the **CLIP Technique diagnostic tool**, or the special tool.
– Only check the engine stand if there is noise or excessive vibration when idling.
If the checks are correct, contact the Techline.

AFTER REPAIR	Carry out a road test followed by a complete check with the **diagnostic tool**.

GETtheMANUALS.org

ALP8	Particle filter warning light comes on too often

NOTES	**Before dealing with this customer complaint, check that there are no faults except DF312 Speed request and the conformity (or otherwise) of the "parameters" and "status" using the diagnostic tool.** **Deal with the other faults first.** **If the customer complaint is not eliminated, perform the following checks.**



GETtheMANUALS.org

TEST1	Exhaust system check

Engine stopped: Check that the silencer outlet is not blocked. Repair or replace the silencer, if necessary.

↓

Check the seal of the exhaust manifold on the contact surface between the turbocharger and the exhaust manifold.
Is the seal in order?

NO → Repair or replace the faulty part.

YES

↓

Loosen the catalytic converter on the turbocharger side.
Place a wooden block between the two parts.
Start the vehicle and check if the engine runs better.
Is the engine running normally?

NO → The exhaust pipe is not the cause of the fault, repeat the engine fault finding (see Customer complaints - Fault finding chart (ALP)).

YES

↓

Retighten the catalytic converter.
Loosen or separate the particle filter on the catalytic converter side. Place a wooden block between the two parts if necessary.
Start the vehicle and check if the engine runs better.
Is the engine running normally?

NO → Replace the catalytic converter.

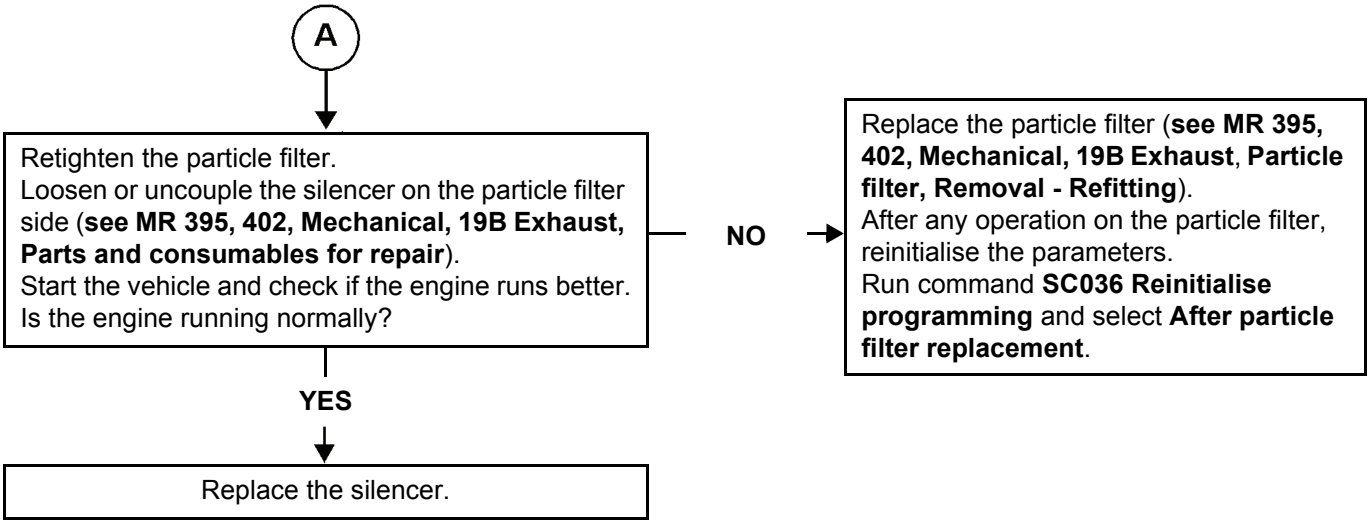
YES

↓

(A)

GETtheMANUALS.org

TEST1 CONTINUED	



GETtheMANUALS.org

TEST2	Low pressure circuit check

CP3 HIGH PRESSURE PUMP, M9R Engine

Check the fuel filter:
- Conformity of the fuel filter (correct part number and RENAULT filter),
- Positioning and clogging condition of the filter cartridge,
- Positioning and condition of the seals.
- **If there is metal swarf in the filter:**
  Replace the fuel filter, bleed the circuit and **continue the fault finding procedure**.

↓

Supplying the injection system with fuel from an additional tank.
This operation aims to detect possible faults in the low pressure supply system of a vehicle by replacing it entirely with an additional tank.
Mode:
- Disconnect the diesel fuel supply pipe at the fuel filter inlet and seal it with a plug.
- Connect a tube to the fuel filter inlet and insert the other end into a **clean** container which is approximately 5 litres in volume.
- Disconnect the diesel return pipe at the diesel temperature sensor (pump return and injector return join), and block it using a plug.
- Connect a transparent pipe to the union of the diesel temperature sensor, and insert the other end in the container.
- Fill the container with **clean** diesel fuel.
- Start the engine and let the system drain itself of its air (there must not be any air bubbles in the return pipe).

↓

Is the customer complaint still present? — **YES** → If the low pressure circuit is in order, reconnect the various low pressure circuit pipes and repeat the fault finding procedure in the fault finding chart (**ALP 2**) or for the fault which refers to this test.

NO

↓

Are the low pressure circuit connections in order and in good condition? — **NO** → Carry out the necessary repairs.

YES

↓

(A)

GETtheMANUALS.org

TEST2 CONTINUED	

(A)

Check the condition of the priming bulb, and that it is working properly. Perform repairs if necessary and continue the test.

↓

Check the condition of all the low pressure diesel pipes from the tank to the injection pump (in particular no pinching of pipes).

↓

If the fault is still present with a low fuel level, check the consistency of the actual fuel level and that indicated on the instrument panel.
– The transfer pump is supplied via a venturi valve located beneath it.
Check that the opening of the venturi (6 to 8 mm in diameter) is not blocked by dirt contained in the fuel tank.
Check the priming of the low pressure diesel circuit.

↓

Check the conformity of the fuel used by running **test 7 Diesel fuel conformity check**

↓

Low pressure circuit correct.
END OF TEST2.

GETtheMANUALS.org

TEST3	Checking the turbocharged air inlet circuit

Engine stopped: Check the low and high pressure air circuits for **leaks** (air leaks in or out, upstream or downstream of the turbocharger).

→ Check the parts that are abnormally greasy of the circuit and reveal a lack of tightness.
Check:
– the condition and fitting of the ducts (foreign bodies, clogged, disconnected, pinched, broken, holed, cut, tightness of the mounting bolts, etc.).
– the presence, condition and fitting of the seals.
– the present and tightening of the clamps.
– The fitting of the turbocharging pressure sensor.
– The pipes and the take-off point between the air duct and the turbocharging sensor.
Carry out the necessary repairs.

Checking the air filter.

→ Check:
– That the air filter unit inlet and outlet are not blocked.
– The condition and fitting of the air filter unit (disconnected, broken, perforated, etc.).
– The cleanliness, conformity and the absence of deformation of the filter element.
– The air flowmeter: run **test 4 Air flowmeter**.
Carry out the necessary repairs.

← Check:
– the condition of the damper valve.
– the tightness of the mounting bolts,
– cracks in the damper valve.
Carry out the necessary repairs.
Replace if necessary.

→ Check that there is no leak at the exhaust manifold, in particular at the exhaust manifold/turbocharger connection.
Check the exhaust: run **test 1 Exhaust pipe check**.
Carry out the necessary repairs.

↓ A

GETtheMANUALS.org

TEST3 CONTINUED	

A

Carry out a visual inspection of the EGR circuit sealing.
Note: the operating play in the EGR heat exchanger valve shaft produces small black marks due to a slight leak of no importance. Do not replace this part.
Replace if necessary.

Check the condition of the intercooler:
– clogging,
– leaks (vehicle stationary, stabilise the engine speed between 3500 rpm and 4000 rpm and check that there are no leaks).
Replace if necessary.

Check that the turbocharging pressure sensor take-off point is not blocked.
Replace if necessary.
END OF TEST3.

GETtheMANUALS.org

TEST4	Air flowmeter

POLLUTION OF THE GRILLES:
Visual inspection: remove the flow sensor; there must be no foreign bodies in the grilles.
Do not clean the grilles using compressed air or any other procedure: this damages the sensors and creates variations from the values displayed on the CLIP tool.
Check the sealing of the air circuit upstream of the air flowmeter:
disconnected or pierced pipes and air filter unit, seals present.
Replace the air flowmeter if necessary and clean upstream of this, if necessary.

↓

ELECTRICAL COMPONENT BREAKAGE:
Visual inspection:
dismantle the flow sensor, the components should not be broken.
Replace the air flowmeter if necessary.

↓

OXIDATION OF THE ELECTRICAL COMPONENTS:
Visual inspection:
dismantle the air flowmeter, there should not be any green deposits on the electrical components.
Replace the air flowmeter if necessary.

↓

CLOGGING OF THE AIR FLOWMETER:
Test:
– Check the values for conformity:
  * During the first 5 seconds after starting:
  – Coolant temperature: 80°C,
  – Engine speed: idle speed (800 ± 50 rpm);
  – Air flow measurement: 47 kg/h ± 10;
  – OCR* EGR valve: between - 10% and 0%.

* After the starting phase:
  – Coolant temperature: 80°C,
  – Engine speed: idle speed (800 ± 50 rpm);
  – Air flow measurement: 30 kg/h ± 5%;
  – EGR valve OCR*: between 10% and 40%.

– Refer to **DF056 Air flow sensor circuit** 2.def, for the air flow sensor checks.
Replace the air flowmeter if necessary.

* OCR = Opening Cycle Ratio.

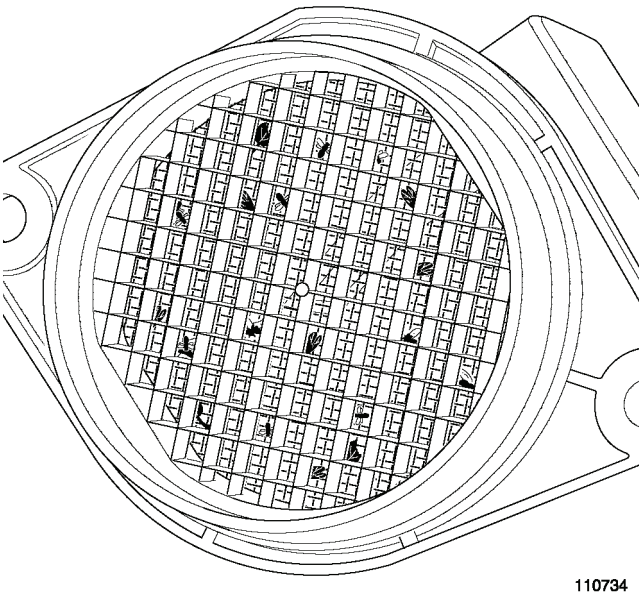
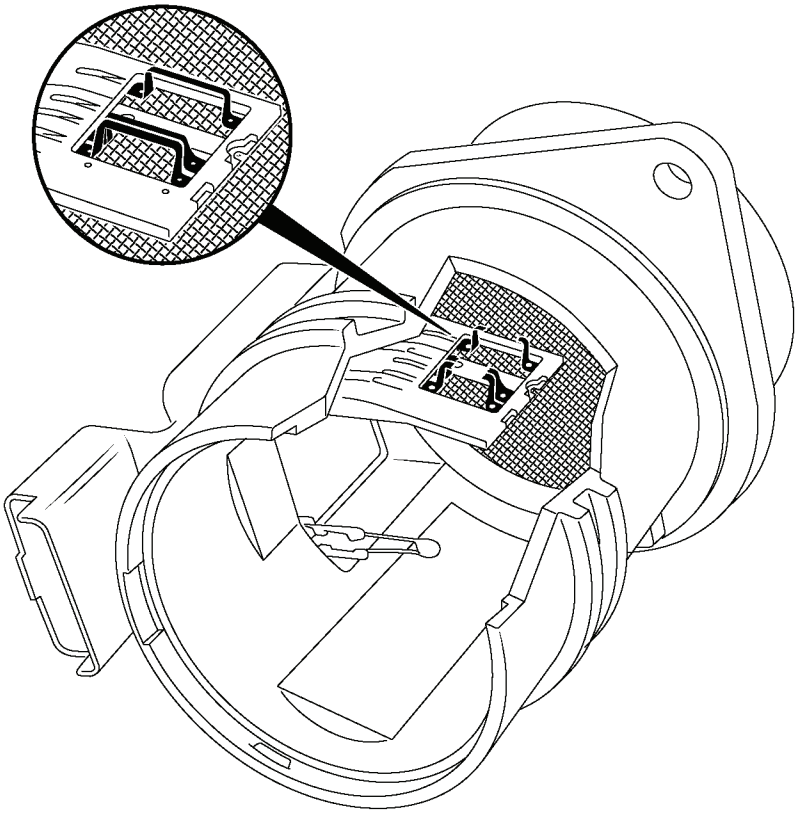
TEST4 CONTINUED	

Contamination of the grille



110734

Damage to the electrical sensors



110736

END OF TEST4.

GETtheMANUALS.org

TEST7	Diesel fuel conformity check

WARNING
During this operation, it is essential to:
– refrain from smoking or bringing incandescent objects close to the work area,
– guard against petrol splashes caused by the residual pressure in the pipes,
– wear safety goggles with side guards,
– wear leaktight gloves (Nitrile type).

IMPORTANT
– To avoid any corrosion or damage, protect the areas on which fuel is likely to run.
– To prevent impurities from entering the circuit, place protective plugs on all fuel circuit components exposed to the open air.

Preparations:
Weigh an empty **1300 ml plastic cup (part no. 77 11 171 413)** with its cover **(part no. 77 11 171 416)** using electronic scales such as those used in body paint workshops (example: **PANDA part no. 77 11 224 995**). Record the weight of the empty plastic cup.
This type of plastic cup is used to prepare paint.

Take a **1 l** fuel sample from the **diesel filter outlet** (see **MR339 (Laguna II ph1), Mechanical, 19, Tank, Fuel tank or MR353 (Vel Satis ph1), Mechanical, 19C, Tank, Draining the fuel tank** or **MR395 (Laguna II ph2) or MR402 (Vel Satis ph2), Mechanical, 19C, Tank, Fuel tank: Draining)**, using a pneumatic transfer pump (**part no. 634-200**) and place it in a **1300 ml** plastic cup.
Cover the plastic cup with its cover and let it settle for approximately**2 minutes**.

Is the fuel cloudy or does it separate into two parts?

YES → Presence of water in diesel fuel, the fuel is not compliant.
Drain the fuel circuit, including the tank (see **MR339 (Laguna II ph1), Mechanical, 19, Tank, Fuel tank or MR353 (Vel Satis ph1), Mechanical, 19C, Tank, Draining the fuel tank** or **MR395 (Laguna II ph2) or MR402 (Vel Satis ph2), Mechanical, 19C, Tank, Fuel tank: Draining**).

NO → A

GETtheMANUALS.org

TEST7 CONTINUED 1	

A

Weigh the diesel fuel and note the fuel weight after subtracting the weight of the empty plastic cup and its cover.
Does the fuel weight fall between the minimum and maximum weights given in the table below?

Calculated weight (g.)		Fuel temperature (°C)
Min. weight	Max. weight	
821	846	13
821	846	14
820	845	15
819	844	16
819	844	17
818	843	18
817	842	19
816	841	20
816	841	21
815	840	22
814	839	23
814	839	24
813	838	25

Check the fuel temperature by immersing a thermometer in the plastic cup.

YES

End of test.

NO

The fuel is not correct.
If the fuel weight is less than the minimum value then there is petrol in the diesel fuel.
If the fuel weight is greater than the maximum value then there is oil in the diesel fuel.
Drain the fuel circuit, including the tank (see MR339 (Laguna II ph1), Mechanical, 19, Tank, Fuel tank or MR353 (Vel Satis ph1), Mechanical, 19C, Tank, Draining the fuel tank or MR395 (Laguna II ph2) or MR402 (Vel Satis ph2), Mechanical, 19C, Tank, Fuel tank: Draining).

TEST7 CONTINUED 2	

Note:
If the weight measured reaches the limit values, the measurement can be performed with a **2230 ml plastic cup (part no. 77 11 171 414)** and its cover **(part no. 77 11 171 417):**
- Carry out a quick test drive in order to mix the fuel, then remove **2 l** of fuel.
- Perform the test again and check the results by multiplying the limit values by 2.

Contact the Techline if you have doubts or problems with the customer.

GETtheMANUALS.org

TEST8	Incorrect operation of the overpressure valve

Part 1. Overpressure valve return flow test:

Is the engine working?

YES

NO

– Fit **Mot. 1760** as shown in the tool fitting procedure (see part 2).
– Press the Start button (with card).
– Measure the length travelled by the diesel fuel in the pipes of the **Mot. 1760**.
– Replace the overpressure valve if the diesel length travelled is greater than **10 cm**.

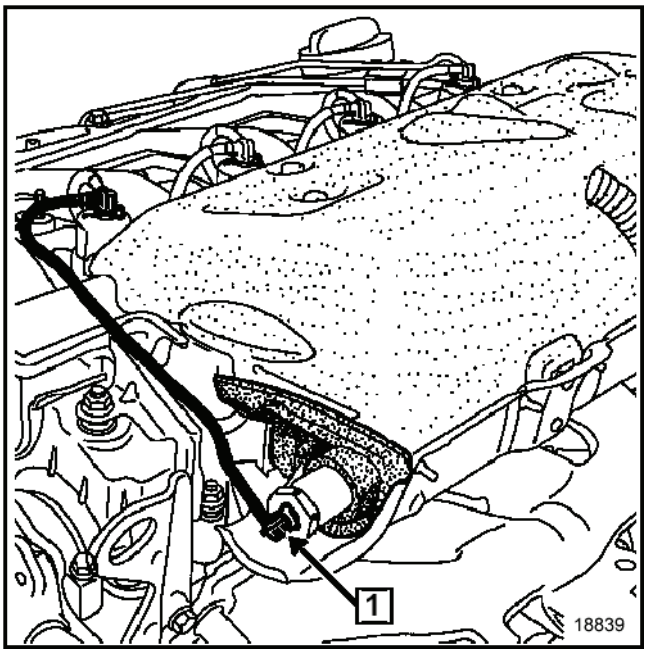
– The overpressure valve fuel return pipe must be fitted to the injector rail.
– Start the engine.
– Set the Clip diagnostic tool to parameter reading mode.
– Raise the temperature of the engine.
– Display parameter **PR063 Fuel temperature**. Increase the diesel temperature to **above 50°C**.
– Switch off the engine.

– Fit **Mot. 1760** as shown in the tool fitting procedure (see part 2).
– View parameter **PR038 Rail pressure**.
– Ask another Cotech to monitor the rise in fuel in the container during engine turnover, as the container will fill up quickly if the overpressure valve is leaking.
– Start the engine.
– Accelerate the engine until the pressure in the rail is **550 bar**:
  – if the engine speed is **less than 3000 rpm**, maintain this pressure,
  – if the engine speed is greater than **3000 rpm**, reduce the engine speed until the rail pressure is **500 bar** and maintain this pressure.
– Maintain these conditions for 1 min.
– Release the accelerator pedal and maintain the idle speed for **10 seconds**.
– Switch off the engine.
– Measure the length of diesel contained in the measuring cylinder.
– Replace the injector rail if the quantity of diesel is greater than **5 ml**.
– Remove **Mot. 1760** as shown in the tool removal procedure (see part 3).

GETtheMANUALS.org

TEST8 CONTINUED 1	

Part 2: Fitting the tool:



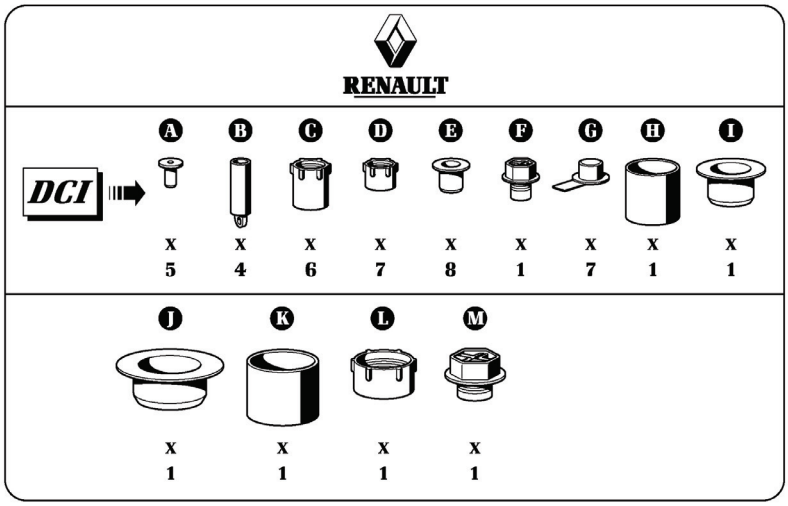
Remove the engine undertray.

Disconnect the overpressure valve fuel return pipe according to the following procedure (**do not remove the clips**):
– press the clip,
– pull vertically on the end piece (**1**) of the fuel return pipe.

IMPORTANT
The end piece is fragile. Be careful not to break it by pulling it too hard. Replace

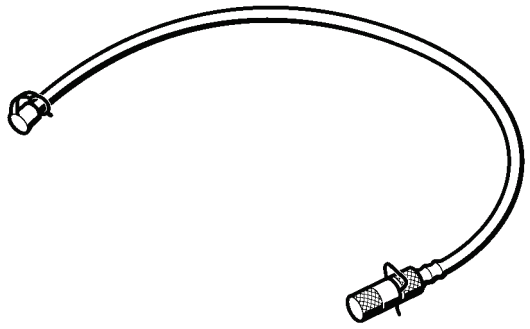
GETtheMANUALS.org

TEST8 CONTINUED 2	



107209

Fit blanking plugs **(B)**, from the kit (part number **77 01 208 209**), on the end pieces of the fuel return pipe. If **Mot. 1760** is not fitted immediately on the overpressure valve, place a blanking plug (**A**) on the overpressure valve fuel return opening.



113195

Shown above is the pipe (**Mot. 1760**) with the end piece (**2**) on the right and the plug (**4**) on the left.

Remove the clip and the plug from the end piece (**2**) of the pipe of **Mot. 1760**, leave the plug (**4**) in place.

GETtheMANUALS.org

TEST8 CONTINUED 3	

Connect the pipe of **Mot. 1760** to the rail overpressure valve (without removing the clip on the overpressure valve):
– press down on the clip (**1**) of the overpressure valve,
– insert the end piece (**2**) in the overpressure valve fuel return opening.
– do not forget to fit the end piece plug (**2**) to the overpressure valve fuel return opening using the clip supplied.

Remove the plug (**4**).
Insert the end of the pipe in the measuring cylinder of **Mot. 1760**, the measuring cylinder is taken from **Mot. 1711**.

Measure the return flow (see the procedure in **part 1** of this test).

Part 3: Removing the tool:

IMPORTANT
Use a cleaning cloth (part number **77 11 211 707**) to absorb fuel run-off.

Disconnect the pipe of **Mot. 1760** on the overpressure valve:
– press down on the clip (**1**) of the overpressure valve,
– pull horizontally on the end piece (**2**) of the pipe of **Mot. 1760** while putting a cloth on the end piece (**2**) to avoid the drips.

Lift the end piece (**2**) vertically so that the fuel contained in the pipes flows into the measuring cylinder of **Mot. 1760**.

Remove the plug from the fuel return pipe end piece (**2**).

Connect the complete fuel return pipe to the overpressure valve.

Wipe up any diesel run-off with a cleaning cloth (part number **77 11 211 707**).

GETtheMANUALS.org

TEST 10	Incorrect injector operation

Part A: Fuel regulation balance check for each injector (individual correction):
– In the **CLIP diagnostic tool**, choose the **Fuel circuit** subfunction.
– With the engine idling and the fuel temperature **> 50°C**, display the flow correction values for each injector (individual correction), i.e.:
  – **PR364 Cylinder no. 1 fuel flow correction.**
  – **PR405 Cylinder no. 2 fuel flow correction.**
  – **PR406 Cylinder no. 3 fuel flow correction.**
  – **PR365 Cylinder no. 4 fuel flow correction.**

The **normal value** for injector flow correction is between **-5 mg/st and +5 mg/st**.
Check the **IMA** injector codes, by comparing the **IMA** engraved codes on the injectors (the **IMA** codes are read from left to right) and the **IMA** codes read with the **Clip diagnostic tool**.
– If the **IMA** codes are correct, continue the fault finding procedure,
– If not, modify the incorrect **IMA** codes using command **SC002 Enter injector codes** (see **Interpretation of commands**).

To confirm the repair, refer to **part B** of **test 9**.

CASE No. 1: If at least one of these values is equal to or greater than + 5 mg/st
– Check the valve clearance.
– Check the condition of the engine and the compressions (using the **Clip diagnostic tool** or a compression gauge).
– If the compression test reveals a cylinder fault, carry out the necessary repairs.
– If the compression is correct, check that the injector is fitted correctly (see **MR 364 (Mégane II), 370 (Scénic II), or 395 (Laguna II), Mechanical, 13B, Diesel injection, Diesel injector: Removal - Refitting**)

In particular, check that each injector has one compression washer.
Check the fuel regulation again for each injector (individual correction).
If not, replace the injector and check for the sealing washer. Modify the **IMA** code using command **SC002 Enter injector codes** (see **Interpretation of commands**).
– Run **Part B** of this test to confirm the fault finding procedure.

CASE no. 2: If at least one of these values is less than or equal to - 5 mg/stroke
– Check the valve clearance.
– Check the level and condition of the engine oil.
– Remove the injector with the largest correction.
– If there is diesel fuel contamination, check the condition of the cylinder concerned (cylinder, piston, valves). Use an endoscope if possible.
– Only replace the removed injector, and modify the **IMA** code using command **SC002 Enter injector codes** (see **Interpretation of commands**).
– Run **Part B** of this test to confirm the fault finding procedure.

GETtheMANUALS.org

TEST 10 CONTINUED 1	

CASE No. 3: If at least one of these values does not stabilise (20 seconds after starting).
– Check the low pressure circuit with **test 2 Low pressure circuit check**.
– Check the conformity of the fuel by running **test 7 Diesel fuel conformity check**.
– Run **Part B** of this test to confirm the fault finding procedure.

CASE No. 4: If the fuel flow correction values are all correct (between - 5 mg/st and + 5 mg/st)
Run **Part C** of this test (**Fuel return flow measurement**).

IMPORTANT
For the removal - refitting of the injectors, observe the cleanliness and safety instructions (see **MR 364 (Mégane II), 370 (Scénic II), or 395 (Laguna II), Mechanical, 13B, Diesel injection, Diesel injector: Removal - Refitting**).

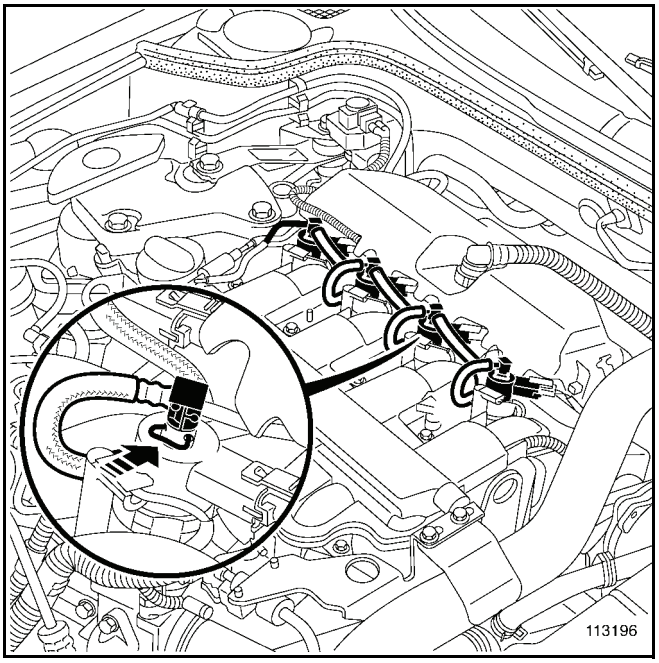
Part B: Confirmation of flow correction fault finding for each injector (individual correction):
Clear the faults and perform a test **with the engine idling** for at least **5 minutes**, fuel temperature **> 50 °C**.
Check that no fault appears on the **CLIP diagnostic tool** and that the corrective values do not reach **± 5 mg/stroke** to confirm the repair.
If the customer complaint is still present and the fuel flow correction values are between **-5 mg/st and +5 mg/st**, run **Part A: Fuel regulation balance check for each injector (individual)** of this test **(Case no. 4)**.
If one or more cylinders has an flow correction value for each injector that exceeds **±5 mg/st**, apply **Part A**: **Fuel regulation balance check for each injector (individual)** of this test.

GETtheMANUALS.org

TEST 10 CONTINUED 2	

Part C: Measuring fuel return flow

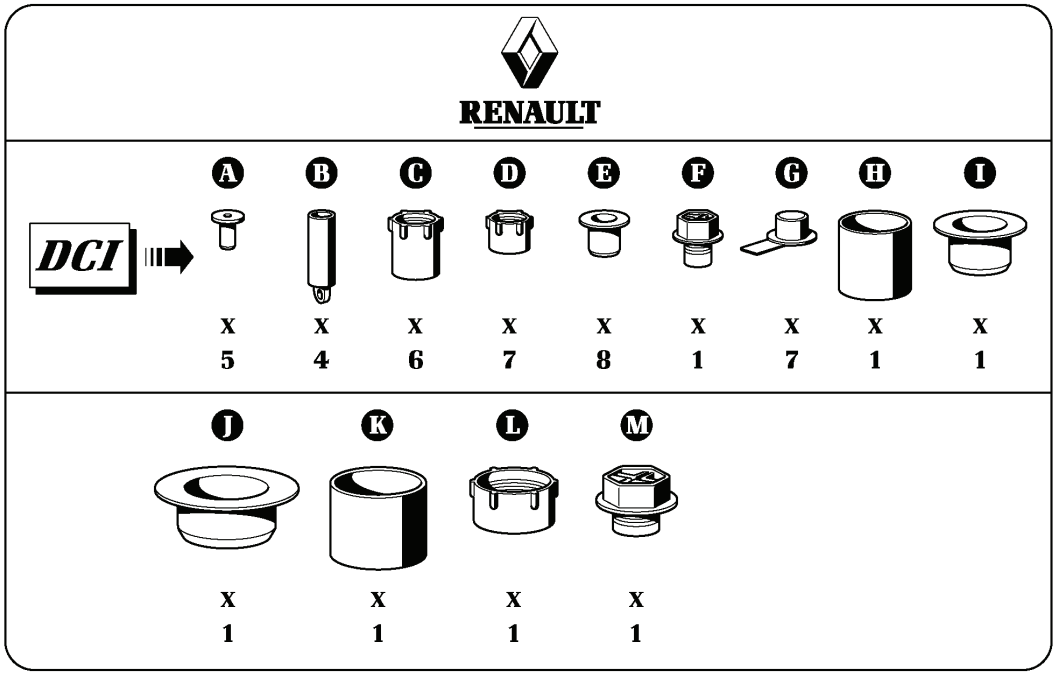
1 - Fitting the tool:
This part of the test should only be carried out if PR063 "Fuel temperature" is greater than 50°C (see step 2 of part C of this test).
Remove the engine undertray
Disconnect the entire fuel return pipe in accordance with the following procedure (do not remove the clips):
– press the clip,
– pull vertically on the end piece (see arrow) of the fuel return pipe.



IMPORTANT
The end piece is fragile. Be careful not to break it by pulling it too hard. Replace all removed clips.

GETtheMANUALS.org

TEST 10 CONTINUED 3	

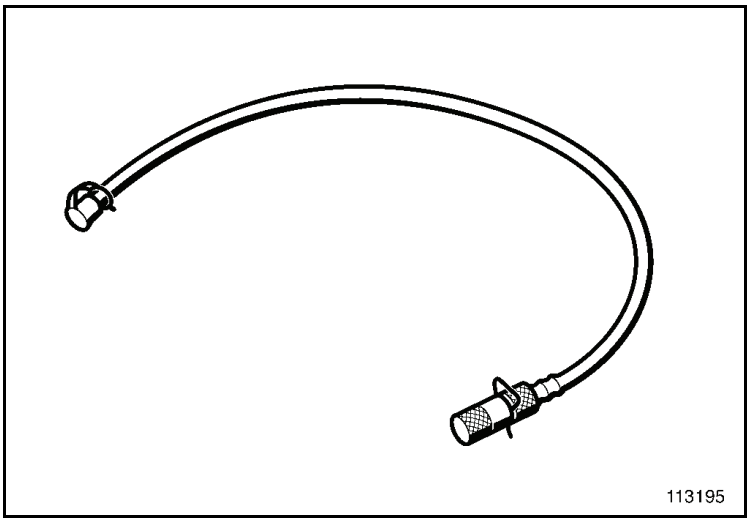


107209

Fit the blanking plugs (**B**), from the kit **(part number 77 01 208 229)**, on the end pieces of the fuel return pipe.
If **mot. 1760** is not fitted immediately on the injectors, put blanking plugs (**A**) on the fuel return openings of the injectors.

GETtheMANUALS.org

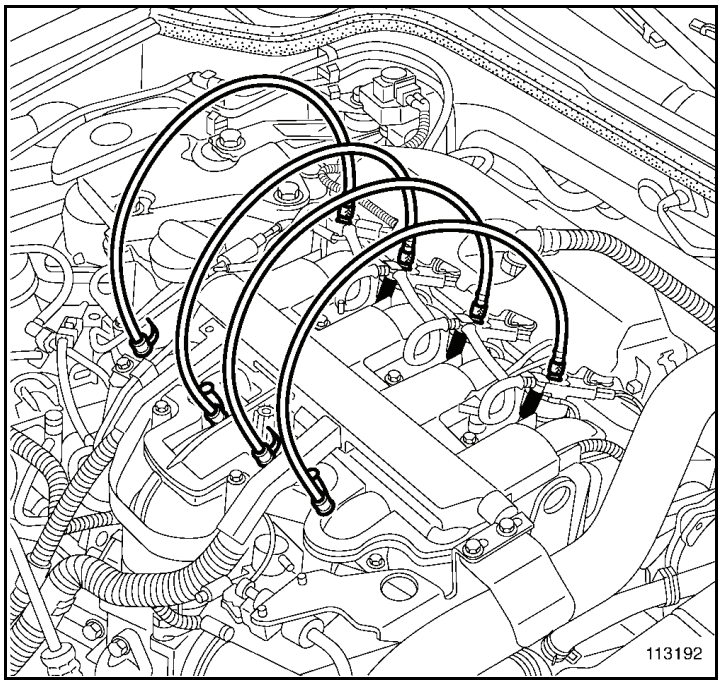
TEST 10 CONTINUED 4	



On the pipes of tool **mot. 1760** (see illustration **113195**), remove the clips and the plugs from the end pieces (on the right in the diagram) and leave the plugs (on the left in the diagram) in place.

GETtheMANUALS.org

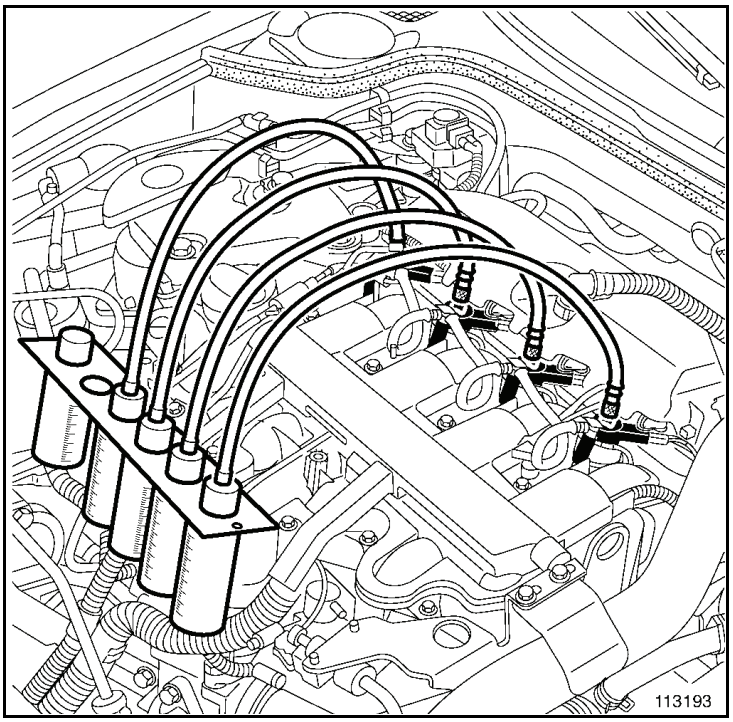
TEST 10 CONTINUED 5	



– Connect the pipes of tool **Mot. 1760** to the injectors (without removing the clips on the injectors):
– press on the injector clip,
– insert the end piece in the injector fuel return orifice,
– remember to fit the end piece plugs to the injector fuel return openings with the clips provided,
– remove the plugs left on tool **mot. 1760**

GETtheMANUALS.org

TEST 10 CONTINUED 6	



Insert the ends of the pipes into the measuring cylinders of tool **mot. 1760**. The measuring cylinders are taken from tool **mot. 1711.**

GETtheMANUALS.org

TEST 10 CONTINUED 7	

2 - Injector return flow balance check:

Does the engine start? — **NO** →
- Fit **Mot. 1760** as shown in the tool fitting procedure.
- Start the vehicle or do a starting sequence of **15 s** (with ignition key).
- Measure the length travelled by the diesel fuel in the pipes of the **Mot. 1760**.
- Replace the injector if the length travelled by the fuel is more than **10 cm** compared with the average of the other three injectors.

YES ↓

- The injector return pipes must be fitted to the injectors.
- Start the engine.
- Display the **Fuel circuit** sub-function in the **CLIP diagnostic tool**.
- Raise the temperature of the engine.
- Read the diesel fuel temperature with **PR063 Fuel temperature** until a diesel fuel temperature greater than **50°C** is reached
- Switch off the engine.
- Fit **Mot. 1760** as shown in the installation procedure (see step 1).
- Check the value of the **PR038 Rail pressure**.
- Ask another Cotech to monitor the rise in fuel in the cans during engine turnover, as one of the cans will fill up quickly if one of the injectors is leaking.
- Start the engine.
- Accelerate the engine until the pressure in the rail is **550 bar**:
  - if the engine speed is **less than 3000 rpm**, maintain this pressure,
  - if the engine speed is **greater than 3000 rpm**, reduce the engine speed until the rail pressure is **500 bar** and maintain this pressure.
- Maintain these conditions for **1 min**.
- Release the accelerator pedal and maintain the idle speed for **10 seconds**.
- Switch off the engine.
- Measure the quantity of fuel contained in each measuring cylinder.
- Replace the injector if the quantity of diesel fuel is **more than 50 ml**.
- Remove **Mot. 1760** as shown in the tool removal procedure (see step 3).

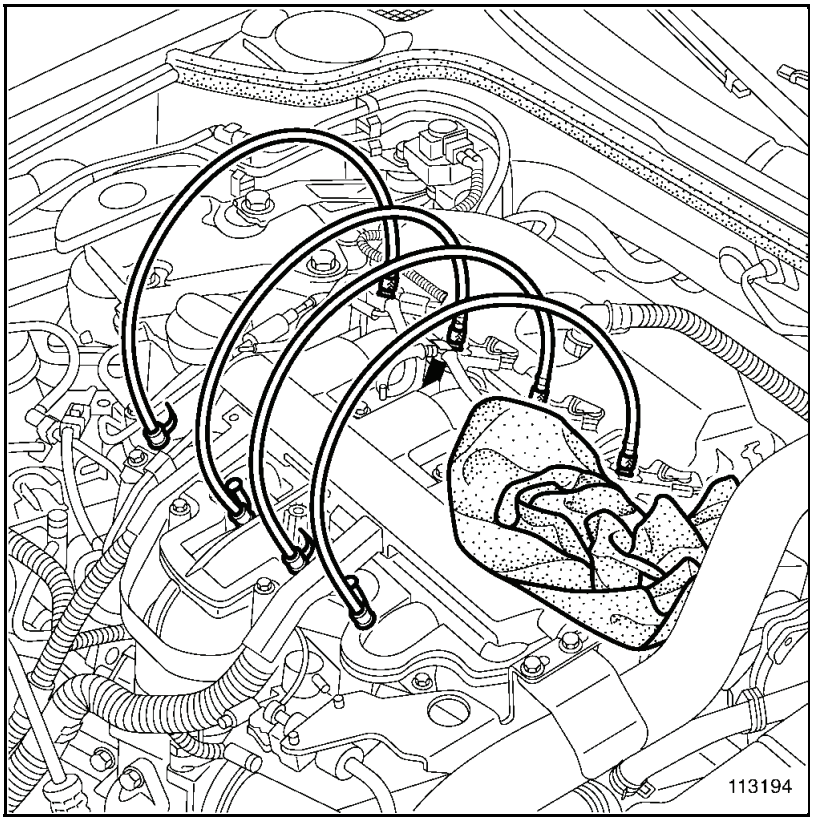
GETtheMANUALS.org

TEST 10 CONTINUED 8	

3 - Removing the tool:

IMPORTANT
Use a cleaning cloth (**part number 77 11 211 707**) to absorb fuel run-off.

Disconnect the pipe from an injector:
– press on the injector clip,
– pull vertically on the end piece of the pipe of tool **mot. 1760** while putting a cloth on the end piece to avoid drips.
Lift the end piece vertically so that the fuel contained in the pipes flows into the measuring cylinders of tool **mot. 1760**.
Remove the other 3 pipes using the same procedure.
Remove the plug welds from the fuel return pipe end pieces.
Connect the complete fuel return pipe to the injectors.
Wipe up any fuel run-off with a cleaning cloth (part number **77 11 211 707**).



End of test 10.

GETtheMANUALS.org

TEST11	Temperature upstream of turbine too low

Perform full fault finding on the injection computer using the diagnostic tool.
Are there any present or stored faults?

YES → Apply the procedure for dealing with the associated faults.

NO

Apply **test 1 Exhaust pipe check**
Is the exhaust pipe in order?

NO → Repair then carry out another particle filter regeneration.
Run command **SC017 Particle filter regeneration (see Interpretation of commands)**
– If the second regeneration is successful, it is essential to change the engine oil and replace the oil filter.
– If the second regeneration fails, contact the Techline.

YES

Run **test 3 Turbocharged air inlet circuit check**
Is the inlet circuit in order?

NO → Repair then carry out another particle filter regeneration.
Run command **SC017 Particle filter regeneration (see Interpretation of commands)**
– If the second regeneration is successful, it is essential to change the engine oil and replace the oil filter.
– If the second regeneration fails, contact the Techline.

YES

Run **test 4 Air flowmeter**
Is the air flow sensor correct?

NO → Repair then carry out another particle filter regeneration.
Run command **SC017 Particle filter regeneration (see Interpretation of commands)**
– If the second regeneration is successful, it is essential to change the engine oil and replace the oil filter.
– If the second regeneration fails, contact the Techline.

YES

Apply **test 10 Poor injector operation**.
Are the injectors correct?

NO → Repair then carry out another particle filter regeneration.
Run command **SC017 Particle filter regeneration (see Interpretation of commands)**
– If the second regeneration is successful, it is essential to change the engine oil and replace the oil filter.
– If the second regeneration fails, contact the Techline.

YES

Contact the Techline.

GETtheMANUALS.org

GENERAL APPROACH TO FAULT FINDING

To carry out the "SAGEM 2000 TURBO Vdiag 04" diagnostic test on the injection system, the following are required:

- **The wiring diagram of the function on the vehicle concerned.**
- **Diagnostic tools (Clip).**
- **Multimeter.**
- **Test bornier: Elé. 1590.**

1) Use one of the diagnostic tools to identify the system fitted to the vehicle (read the SAGEM 2000 TURBO Vdiag 04 computer family).

***Note*: If dialogue cannot be established with the computer, go straight to the Customer complaints section and refer to ALP 1: No dialogue with the computer.**

2) Search for fault finding documents corresponding to the system identified.

3) Read the faults stored in the computer memory and use the Interpretation of Faults section of the documents.

Reminder: *the interpretation of a fault should be considered when setting up the diagnostic tool after the engine has been switched off and on again.*
There are two types of interpretation of fault: present faults and stored faults.

- ***If the fault is declared present:***
  carry out fault finding directly.
- ***If the fault is declared stored:***
  follow the notes on the stored fault.
  If the fault does not switch to present, perform the fault finding procedure but do not replace the component.
  In both cases, finish the fault finding procedure by carrying out the instructions in the After Repair section.

GETtheMANUALS.org

4) **Carry out the conformity check *(to highlight possible faults not yet declared by the system's self-test procedure)* and apply the relevant fault finding techniques according to results.**

5) Validation of the repair (elimination of the sections on Customer complaints and Fault finding chart).

6) Use of the sections on Customer complaints and Fault finding chart, if the fault is still present.

IMPORTANT
Never drive the vehicle until having checked that no faults involving the THROTTLE VALVE are present.

CHARACTERISTICS OF THE BORNIER

Bornier Elé. 1590 consists of a 112-track fixed base connected to a printed circuit on which are arranged 112 copper plated areas numbered from 1 to 112.

Using the wiring diagrams, the tracks connecting the component(s) to be tested can be easily identified.

IMPORTANT
*** All checks using the Elé 1590 bornier must be performed with the battery disconnected.**
*** The bornier is designed to be used with an ohmmeter only. Under no circumstances should 12 V be applied to the test points.**

DF001 PRESENT OR STORED	COOLANT TEMPERATURE SENSOR CIRCUIT DEF : Unidentified electrical fault

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the fan has been activated with the engine running. **IMPORTANT** *If the fault is stored, do not clear it; there may be an **OBD fault** (On Board Diagnostic).* *In the event of a short circuit to + 12 V, there is risk of damage to the component.*

Check **the cleanliness and condition** of the coolant temperature sensor and its connections.
Clean or replace as necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connections:

Computer track F2, connector B → **Coolant temperature sensor, track 2**
Computer track F4, connector B → **Coolant temperature sensor, track 1**

Repair if necessary.

Check **the resistance** of the air temperature sensor (see the values in the **Help** section).
If necessary replace the sensor.

If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF002 PRESENT OR STORED	AIR TEMPERATURE SENSOR CIRCUIT DEF : Unidentified electrical fault

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the fan has been activated with the engine running. **IMPORTANT** *If the fault is stored, do not clear it; there may be an* **OBD fault** *(On Board Diagnostic).* In the event of a short circuit to + 12 V, there is risk of damage to the component.

Check **the cleanliness and condition** of the air temperature sensor and its connections.
Clean or replace as necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connections:

Computer track E3, connector B → Air temperature sensor, track 2
Computer track E2, connector B → Air temperature sensor, track 1

Repair if necessary.

Check **the resistance** of the air temperature sensor (see the values in the **Help** section).
If necessary replace the sensor.

If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF008 PRESENT OR STORED	PEDAL POTENTIOMETER CIRCUIT GANG 1 CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 volts

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault appears after the accelerator pedal goes from no load to full load. **IMPORTANT** If the fault is stored, do not clear it; there may be an **OBD fault** (On Board Diagnostic).

Check that the pedal mechanism has not seized.

Check the **cleanliness and condition** of the pedal potentiometer and its connections.
Clean or replace as necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the insulation, **continuity and the absence of interference resistance** on the following connections:

Computer track H3, connector A → **Pedal potentiometer gang 1, track 2**
Computer track G2, connector A → **Pedal potentiometer gang 1, track 4**
Computer track H2, connector A → **Pedal potentiometer gang 1, track 3**

Repair if necessary.

Check that **track 1** of the pedal potentiometer **correctly follows its resistive curve** (see the values in the **Help** section).
Replace the pedal potentiometer if necessary.

If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF009 PRESENT OR STORED	PEDAL POTENTIOMETER CIRCUIT GANG 2 CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 V.

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault appears after the accelerator pedal goes from no load to full load. **WARNING** *If the fault is stored, do not clear it; there may be an **OBD fault** (On Board Diagnostic).*

Check that the pedal mechanism has not seized.

Check the **cleanliness and condition** of the pedal potentiometer and its connections.
Clean or replace as necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connections:

Computer track F4, connector A → Pedal potentiometer gang 2, track 1
Computer track F2, connector A → Pedal potentiometer gang 2, track 5
Computer track F3, connector A → Pedal potentiometer gang 2, track 6

Repair if necessary.

Check that **gang 2** of the pedal potentiometer **correctly follows its resistive curve** (see the values in the **Help** section).
Replace the pedal potentiometer if necessary.

If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF037 PRESENT OR STORED	ENGINE IMMOBILISER DEF : Unidentified electrical fault

NOTES	**None.**

Test the multiplex network (see 88B, Multiplexing).
If the fault is still present, run fault finding on the Engine immobiliser system (see 82A, Engine immobiliser).

AFTER REPAIR	Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

NOTES	**None.**

1.DEF **2.DEF**	Computer defective or not to specification. Contact the Techline.

3.DEF **4.DEF**	Use the following procedure: – Switch the ignition on and establish dialogue with the computer. – Clear the computer memory. – Switch the ignition off and wait for loss of dialogue with the computer. – Switch the ignition on and establish dialogue with the computer. If the computer fault is still present, carry out this procedure again. If the computer fault is still present after the fifth clearing attempt, contact the Techline.

AFTER REPAIR	After the computer has been replaced, carry out a road test and check using the diagnostic tool that there are no FAULTS and that STATUSES and PARAMETERS are correct.

GETtheMANUALS.org

DF040 PRESENT OR STORED	CYLINDER 1 INJECTOR CIRCUIT CO : Open circuit CC.0 : Short circuit to earth CC.1 : Short circuit to + 12 V DEF : Unidentified electrical fault

NOTES	***If the faults DF084 Actuator relay control circuit or DF175 Power supply are present or stored, deal with them first.*** **Conditions for applying the fault finding procedure to stored faults:** The fault appears after the engine has been running for a timed period of **10 seconds**.
	WARNING *If the fault is stored, do not clear it; there may be an **OBD fault** (On Board Diagnostic).*

Check **the cleanliness and condition** of the cylinder 1 injector and its connections.
Clean or replace as necessary.

Check, with the ignition on, for **+ 12 V on track 1 of the injector 1 connector.**

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connection:

Injection computer track L4, connector B ⟶ Cylinder 1 injector, track 2

Repair if necessary.

Check the **resistance of the cylinder 1 injector** (see the value in the **Help** section).
Replace the injector if necessary.

In the fault is still present, replace the injector.

If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF041 PRESENT OR STORED	CYLINDER 2 INJECTOR CIRCUIT CO : Open circuit CC.0 : Short circuit to earth CC.1 : Short circuit to + 12 V DEF : Unidentified electrical fault

NOTES	***If the faults DF084 Actuator relay control circuit or DF175 Power supply are present or stored, deal with them first.*** **Conditions for applying the fault finding procedure to stored faults:** The fault appears after the engine has been running for a timed period of **10 seconds**.
	WARNING *If the fault is stored, do not clear it; there may be an **OBD fault** (On Board Diagnostic).*

Check **the cleanliness and condition of the cylinder 2 injector** and its connections.
Clean or replace as necessary.

Check, with the ignition on, for **+ 12 V on track 1 of the injector 2 connector.**

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connection:

Injection computer track L3, connector B ⟶ Cylinder 2 injector, track 2

Repair if necessary.

Check the **resistance of the cylinder 2 injector** (see the value in the **Help** section).
Replace the injector if necessary.

In the fault is still present, replace the injector.

If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF042 PRESENT OR STORED	CYLINDER 3 INJECTOR CIRCUIT CO : Open circuit CC.0 : Short circuit to earth CC.1 : Short circuit to + 12 volts DEF : Unidentified electrical fault

NOTES	***If the faults DF084 Actuator relay control circuit or DF175 Power supply are present or stored, deal with them first.*** **Conditions for applying the fault finding procedure to stored faults:** The fault appears after the engine has been running for a timed period of **10 seconds**. **IMPORTANT** *If the fault is stored, do not clear it; there may be an **OBD fault** (On Board Diagnostic).*

Check **the cleanliness and condition of the cylinder 3 injector** and its connections.
Clean or replace as necessary.

With the ignition switched on, check for **+ 12 V on track 1 of the injector 3 connector**.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connection:

Injection computer track L2, connector B ⟶ Cylinder 3 injector, track 2

Repair if necessary.

Check the **resistance of the cylinder 3 injector** (see the value in the **Help** section).
Replace the injector if necessary.

In the fault is still present, replace the injector.

If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF043 PRESENT OR STORED	CYLINDER 4 INJECTOR CIRCUIT CO : Open circuit CC.0 : Short circuit to earth CC.1 : Short circuit to + 12 V DEF : Unidentified electrical fault

NOTES	***If the faults DF084 Actuator relay control circuit or DF175 Power supply are present or stored, deal with them first.*** **Conditions for applying the fault finding procedure to stored faults:** The fault appears after the engine has been running for a timed period of **10 seconds**. **IMPORTANT** *If the fault is stored, do not clear it; there may be an **OBD fault** (On Board Diagnostic).*

Check **the cleanliness and condition** of the cylinder 4 injector and its connections.
Clean or replace as necessary.

With the ignition switched on, check for **+ 12 V on track 1 of the injector 4 connector**.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connection:

Injection computer track M2, connector B ⟶ **Cylinder 4 injector, track 2**

Repair if necessary.

Check the **resistance of the cylinder 4 injector** (see the value in the **Help** section).
Replace the injector if necessary.

In the fault is still present, replace the injector.

If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF081 PRESENT OR STORED	CANISTER BLEED SOLENOID VALVE CIRCUIT CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 V DEF : Unidentified electrical fault

NOTES	***If the faults DF084 Actuator relay control circuit or DF175 Power supply are present or stored, deal with them first.*** **Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the ignition has been switched on.
	IMPORTANT *If the fault is stored, do not clear it; there may be an **OBD fault** (On Board Diagnostic).*

Check **the cleanliness and condition** of the fuel vapour absorber bleed solenoid valve and its connections.
Clean or replace as necessary.

With the ignition on, check for **+ 12 V** on the fuel vapour absorber bleed solenoid valve.
Repair if necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connection:

Computer track E1, connector C ⟶ **Fuel vapour absorber bleed valve, track 2**

Repair if necessary.

Check the **resistance** of the fuel vapour absorber bleed solenoid valve (see value in the **Help** section).
Replace the fuel vapour absorber bleed solenoid valve if necessary.

If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF082 PRESENT OR STORED	UPSTREAM OXYGEN SENSOR HEATING CIRCUIT CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 V DEF : Unidentified electrical fault 1.DEF: Oxygen sensor heater power not correct

NOTES	***If the faults DF084 Actuator relay control circuit or DF175 Power supply are present or stored, deal with them first.*** **Conditions for applying the fault finding procedure to stored faults:** The fault appears after the engine has been running for a timed period of **10 seconds**.
	IMPORTANT *If the fault is stored, do not clear it; there may be an **OBD fault** (On Board Diagnostic).*

Check the **cleanliness and condition** of the upstream oxygen sensor and its connections.
Clean or replace as necessary.

Check for the **+ 12 V feed on track A** of the upstream oxygen sensor connector with the ignition on.
Repair if necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connection:

Computer track G1, connector C ⟶ **Upstream oxygen sensor, track B**

Repair if necessary.

Check the heating **resistance** of the upstream oxygen sensor (see the value in the **Help** section).
Replace the upstream oxygen sensor if necessary.

If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF083 PRESENT OR STORED	DOWNSTREAM OXYGEN SENSOR HEATING CIRCUIT CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 volts DEF : Unidentified electrical fault 1.DEF: Oxygen sensor heater power not correct

NOTES	***If the faults DF084 Actuator relay control circuit or DF175 Power supply are present or stored, deal with them first.*** **Conditions for applying the fault finding procedure to stored faults:** The fault appears after the engine has been running for a timed period of **10 seconds**.
	IMPORTANT *If the fault is stored, do not clear it; there may be an **OBD fault** (On Board Diagnostic).*

Check **the cleanliness and condition** of the downstream oxygen sensor and its connections.
Clean or replace as necessary.

Check for **+ 12 V feed** on track A of the downstream oxygen sensor connector with the ignition on.
Repair if necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connection:

Computer track G3, connector C ⟶ **Downstream oxygen sensor, track B**

Repair if necessary.

Check the heating **resistance** of the downstream oxygen sensor (see the value in the **Help** section).
Replace the downstream oxygen sensor if necessary.

If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF084 PRESENT OR STORED	ACTUATOR CONTROL RELAY CIRCUIT CC.1 : Short circuit to + 12 V

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the ignition has been switched on.

Check the **condition and cleanliness** of the vehicle's battery and earth leads. Repair if necessary.
Check **the two supply fuses** of the actuator relays. Replace if necessary.
Check **the cleanliness and condition** of the actuator relay and its connections. Clean or replace as necessary.
Check **the resistance** of the actuator relay across **tracks 1 and 2** (see the value in the **Help** section). Replace the actuator relay, if necessary.
Check for **12 V on track 1** of the actuator relay, connector end. Repair if necessary.
Disconnect the battery. Disconnect the computer. Check the **cleanliness and condition** of the connections. Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connection: **Injection computer track D4, connector B ⟶ Actuator relay, track 2** Repair if necessary.
If the fault persists, replace the actuator relay.
If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF085 PRESENT OR STORED	FUEL PUMP CONTROL RELAY CIRCUIT CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 volts DEF : Unidentified electrical fault

NOTES	***If the faults DF084 Actuator relay control circuit or DF175 Power supply are present or stored, deal with them first.*** **Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the ignition has been switched on.
	IMPORTANT *If the fault is stored, do not clear it; there may be an **OBD fault** (On Board Diagnostic).*

Check **the supply fuse** of the fuel pump relay.
Replace the fuse if necessary.

Disconnect the relay.
Check the **cleanliness and condition** of the fuel pump relay and its connections.
Clean or replace as necessary.

With the ignition on, check for **+ 12 V on track 1** of the fuel pump relay, connector end.
Repair if necessary.

Check **the resistance** of the fuel pump relay on **tracks 1 and 2.**
(See the value in the **Help** section).
Replace the fuel pump relay if necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connection:

Computer track D1, connector C ⟶ **Fuel pump relay, track 2**

Repair if necessary.

If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF090 PRESENT OR STORED	VEHICLE SPEED SENSOR CIRCUIT DEF : Unidentified electrical fault

NOTES	**IMPORTANT** *If the fault is stored, do not clear it; there may be an **OBD fault** (On Board Diagnostic).*

Test the multiplex network (see 88B, Multiplexing).

If the fault persists, perform a fault finding test on the ESP/ABS systems.

(see 38C, Anti-lock braking system.)

AFTER REPAIR	Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF092 PRESENT OR STORED	UPSTREAM OXYGEN SENSOR CIRCUIT DEF : Unidentified electrical fault

NOTES	***If faults DF084 Actuator relay control circuit, DF082 Upstream oxygen sensor heating circuit or DF175 Power supply are present, deal with them first.*** **Conditions for applying the fault finding procedure to stored faults:** The fault is declared present with the engine running after **5 minutes** in richness regulation.
	IMPORTANT *If the fault is stored, do not clear it; there may be an **OBD fault** (On Board Diagnostic).*

Check **the cleanliness and condition** of the upstream oxygen sensor connections.
Clean or replace as necessary.

With the ignition on, check for **+ 12 Volts** on the upstream oxygen sensor.
Repair if necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connections:

Computer track C1, connector C ⟶ Oxygen sensor, track D
Computer track B1, connector C ⟶ Oxygen sensor, track C

Repair if necessary.

If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF093 PRESENT OR STORED	DOWNSTREAM OXYGEN SENSOR CIRCUIT DEF : Unidentified electrical fault

NOTES	***If faults DF084 Actuator relay control circuit, DF175 Power supply or DF083 Downstream oxygen sensor heating circuit are present, deal with them first.*** **Conditions for applying the fault finding procedure to stored faults.** The fault is declared as present in one of the following cases: – A road test driving smoothly after the fan has come into operation and the double richness ratio loop **ET056** is active. – A road test driving smoothly after the fan has come into operation, followed immediately by a road test on a slope in no load conditions (deceleration phase). **IMPORTANT** *If the fault is stored, do not clear it; there may be an **OBD fault** (On Board Diagnostic).*

Check **the cleanliness, connection and condition** of the downstream oxygen sensor connections.
Clean or replace as necessary.

With the ignition on, check for **+ 12 Volts** on the downstream oxygen sensor.
Repair if necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connections:

Computer track A2, connector C → Oxygen sensor, track C
Computer track B2, connector C → Oxygen sensor, track D

Repair if necessary.

If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF095 PRESENT OR STORED	THROTTLE POTENTIOMETER CIRCUIT GANG 1 CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 V

NOTES	**SAFETY INSTRUCTION:** **never drive the vehicle until having checked that no faults involving the throttle valve are present.**
	Conditions for applying the fault finding procedure to stored faults: The fault appears after a change in the engine speed.
	IMPORTANT *If the fault is stored, do not clear it; there may be an **OBD fault** (On Board Diagnostic).*

Check the **cleanliness and condition** of the throttle potentiometer and its connections.
Clean or replace as necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connections:

Computer track G4, connector B → Throttle potentiometer gang 1, track 1
Computer track G3, connector B → Throttle potentiometer gang 1, track 2
Computer track G2, connector B → Throttle potentiometer gang 1, track 5

Repair if necessary.

Check **the cleanliness** of the throttle, and **correct rotation** of the throttle valve.
Check that **gang 1** of the throttle potentiometer **correctly follows its resistive curve** (see the values in the **Help** section).
Replace the throttle valve if necessary.

If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.
	If the throttle valve has been replaced, reinitialise the programming (RZ019 Reinitialising programming).

GETtheMANUALS.org

DF096 PRESENT OR STORED	THROTTLE POTENTIOMETER CIRCUIT GANG 2 CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 V

NOTES	**SAFETY INSTRUCTION:** **never drive the vehicle until having checked that no faults involving the throttle valve are present.**
	Conditions for applying the fault finding procedure to stored faults: The fault appears after a change in the engine speed.
	IMPORTANT *If the fault is stored, do not clear it; there may be an **OBD fault** (On Board Diagnostic).*

Check the **cleanliness and condition** of the throttle potentiometer and its connections.
Clean or replace as necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the insulation, **continuity and the absence of interference resistance** on the following connections:

Computer track D3, connector B ⟶ Throttle potentiometer gang 2, track 6
Computer track G2, connector B ⟶ Throttle potentiometer gang 2, track 5
Computer track G4, connector B ⟶ Throttle potentiometer gang 2, track 1

Repair if necessary.

Check **the cleanliness** of the throttle, and **correct rotation** of the throttle valve.
Check that **track 2** of the throttle potentiometer **correctly follows its resistive curve** (see the values in the **Help** section).
Replace the throttle valve if necessary.

If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.
	If the throttle valve has been replaced, reinitialise the programming (RZ019 Reinitialising programming).

GETtheMANUALS.org

DF123 PRESENT OR STORED	POLLUTANT MISFIRES

NOTES	***Deal first with faults relating to the petrol supply system, the ignition or the flywheel sensor.*** **Refer to statuses ET057 Misfiring on cylinder 1, ET058 Misfiring on cylinder 2, ET059 Misfiring on cylinder 3 and ET060 Misfiring on cylinder 4 to find the cylinder or cylinders with combustion misfires.**

Misfiring on one cylinder	The fault is due to a component that can only affect one cylinder: – Check the injector of the cylinder concerned. – Check the condition and conformity of the spark plugs. – Check the pencil coil of the cylinder concerned. – Check the cylinder compression – Check the valve setting.
Misfiring on cylinders 1 and 4 or 2 and 3	The fault is due to a component that affects a pair of cylinders: – Check the ignition coil circuit concerned. To do this, apply the fault finding procedure **DF361 Ignition coil 1-4 circuit, DF362 Ignition coil 2-3 circuit** – Check the condition and conformity of the spark plugs.
Misfiring on all four cylinders	The fault is due to a component affecting all the cylinders at once: – Check that the correct fuel is being used, – Check the condition and conformity of the spark plugs.

If the fault is still present, carry out the following checks:
– Check the flywheel sensor.
– Check the condition and cleanness of the flywheel.
– Check the mounting of the flywheel sensor.
– Check the Sensor/Flywheel air gap.
– Check the whole petrol supply circuit.
– Check the whole ignition system.
– Check the hydraulic tappets if there is camshaft noise.
– Check the pinking sensor fitting.

AFTER REPAIR	Check that all faults have been dealt with. After carrying out all the tests, clear the stored faults. It is not necessary to clear the programming. Checking that the system has been properly repaired: – No remaining electrical faults. – Programming should have been carried out. – The engine should be warm (minimum **75 °C**). – Run the engine at idle speed with all electrical consumers drawing power for **15 minutes**. If the fault reappears, continue the fault finding procedure.

GETtheMANUALS.org

DF124 PRESENT OR STORED	DESTRUCTIVE MISFIRE

NOTES	***Deal first with faults relating to the petrol supply system, the ignition or the flywheel sensor.*** **Refer to statuses ET057 Misfiring on cylinder 1, ET058 Misfiring on cylinder 2, ET059 Misfiring on cylinder 3 and ET060 Misfiring on cylinder 4 to find out how many cylinders have combustion misfires.**

Misfiring on one cylinder	The fault is due to a component that can only affect one cylinder: – Check the injector of the cylinder concerned. – Check the condition and conformity of the spark plugs. – Check the pencil coil of the cylinder concerned. – Check the cylinder compression – Check the valve setting.
Misfiring on cylinders 1 and 4 or 2 and 3	The fault is due to a component that affects a pair of cylinders: – Check the ignition coil circuit concerned. To do this, apply the fault finding procedure **DF361 Ignition coil 1-4 circuit, DF362 Ignition coil 2-3 circuit** – Check the condition and conformity of the spark plugs.
Misfiring on all four cylinders	The fault is due to a component affecting all the cylinders at once: – Check that the correct fuel is being used, – Check the condition and conformity of the spark plugs.

If the fault is still present, carry out the following checks:
– Check the flywheel sensor.
– Check the condition and cleanness of the flywheel.
– Check the mounting of the flywheel sensor.
– Check the Sensor/Flywheel air gap.
– Check the whole petrol supply circuit.
– Check the whole ignition system.
– Check the hydraulic tappets if there is camshaft noise.
– Check the pinking sensor fitting.

AFTER REPAIR	Check that all faults have been dealt with. After carrying out all the tests, clear the stored faults. It is not necessary to clear the programming. Checking that the system has been properly repaired: – No remaining electrical faults. – Programming should have been carried out. – The engine should be warm (minimum **75 °C**). – Run the engine at idle speed with all electrical consumers drawing power for **15 minutes**. If the fault reappears, continue the fault finding procedure.

GETtheMANUALS.org

DF175 PRESENT OR STORED	SUPPLY DEF : + 12 volts electrical fault after actuator relay

NOTES	***If fault DF084 Actuator relay control circuit is present, deal with it first.*** **Conditions for applying the fault finding procedure to stored faults:** The fault appears after: – the ignition is switched off and dialogue is lost, – the ignition is switched on and dialogue is established.

Disconnect the actuator relay.
Check **the cleanliness and condition** of the actuator relay and its connections.
Clean or replace as necessary.

With the ignition on, check for **12 V on track 3** of the actuator relay.
If **12 volts** is not present, check the supply fuse.
Check the insulation and continuity of the wire.

Check **the resistance** of the actuator relay across **tracks 1 and 2** (see the value in the **Help** section).
Replace the relay if necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connection:

Computer track G2, connector C ⟶ **Injection actuator relay, track 5**

Repair if necessary.

If that does not work, replace the actuator relay.

If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF176 PRESENT OR STORED	LOW-SPEED FAN UNIT CIRCUIT CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 V DEF : Unidentified electrical fault

NOTES	***If fault DF001 Coolant temperature sensor circuit is present, deal with it first.*** **Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the cooling system temperature has reached between **99 °C** and **101 °C**.

Check **the cleanliness and condition** of the low-speed fan relay and its connections. Clean or replace as necessary.
With the ignition on, check for **+ 12 V on track 1** of the relay. Repair if necessary.
Check **the resistance** of the low-speed fan relay across **tracks 1 and 2** (see the value in the **Help** section). Replace the low-speed fan relay if necessary.
Disconnect the battery. Disconnect the computer. Check the **cleanliness and condition** of the connections. Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connection: **Computer connector C track F1** ⟶ **Low-speed fan assembly relay, track 2** Repair if necessary.
If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF177 PRESENT OR STORED	HIGH-SPEED FAN UNIT CIRCUIT CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 V DEF : Unidentified electrical fault

NOTES	***If fault DF001 Coolant temperature sensor circuit is present, deal with it first.*** **Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the temperature of the cooling system has reached **103 °C**.

Check **the cleanliness and condition** of the high-speed fan relay and its connections. Clean or replace as necessary.
With the ignition on, check for **+ 12 V on track 1** of the relay. Repair if necessary.
Check **the resistance** of the high-speed fan relay across **tracks 1 and 2** (see the value in the **Help** section). Replace the high-speed fan relay if necessary.
Disconnect the battery. Disconnect the computer. Check the **cleanliness and condition** of the connections. Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connection: **Computer track F2, connector C ⟶ High-speed fan assembly relay, track 2** Repair if necessary.
If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF199 PRESENT OR STORED	TURBOCHARGING PRESSURE SENSOR DEF : Unidentified electrical fault

NOTES	***If faults DF084 Actuator relay control circuit, DF175 Power supply, DF569 Turbocharging circuit or DF571 Turbocharging valve are present, deal with them first.*** **Conditions for applying the fault finding procedure to stored faults:** The fault appears after: – the ignition is switched off and dialogue is lost, – the ignition has been switched on again and dialogue re-established, – a **10 second** delay at idle speed.
	IMPORTANT *If the fault is stored, do not clear it; there may be an **OBD fault** (On Board Diagnostic).*

Check **the cleanliness and condition** of the turbocharging pressure sensor and its connections.
Clean or replace as necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the insulation, **continuity and the absence of interference resistance** on the following connections:

Computer track E1, connector B ⟶ Pressure sensor, track 2 or A
Computer track F1, connector B ⟶ Pressure sensor, track 3 or B
Computer track G1, connector B ⟶ Pressure sensor, track 1 or C

(See the connector track numbers on the corresponding wiring diagram).
Repair if necessary.

If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF232 PRESENT OR STORED	REFRIGERANT PRESSURE SENSOR CIRCUIT DEF : Unidentified electrical fault

NOTES	**None.**

Test the multiplex network (see 88B, Multiplexing).

If the fault is not solved, run fault finding on the air conditioning system (see 62A, Air conditioning, 62B, Climate control or 62C, Non regulated climate control).

AFTER REPAIR	Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF328 PRESENT OR STORED	THROTTLE POTENTIOMETER CIRCUIT 1.DEF: Consistency between gang 1 and gang 2

NOTES	**SAFETY ADVICE:** **Never drive the vehicle without having made sure that there are no throttle valve faults present.**
	If faults DF095 Throttle potentiometer circuit gang 1 or ***DF096 Throttle potentiometer circuit gang 2 are present, deal with these first.*** **Conditions for applying the fault finding procedure to stored faults:** The fault appears after a change in the engine speed.
	IMPORTANT *If the fault is stored, do not clear it; there may be an* ***OBD fault*** *(On Board Diagnostic).*

Check **the cleanliness and condition** of the throttle valve and its connections.
Clean or replace as necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the insulation, **continuity and the absence of interference resistance** on the following connections:

Computer track G4, connector B → Throttle potentiometer, track 1
Computer track G3, connector B → Throttle potentiometer, track 2
Computer track G2, connector B → Throttle potentiometer, track 5
Computer track D3, connector B → Throttle potentiometer, track 6

Repair if necessary.

Check **the cleanliness** of the throttle, and **correct rotation** of the throttle valve.
Check that gangs 1 and 2 of the throttle potentiometer **correctly follow their resistive curves** (see values in the **Help** section).
Replace the throttle valve if necessary.

If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.
	If the throttle valve has been replaced, reinitialise the programming (RZ019 Reinitialising programming).

GETtheMANUALS.org

DF329 PRESENT OR STORED	PRESSURE SENSOR CIRCUIT DEF : Unidentified electrical fault

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault appears after: – the ignition is switched off and dialogue is lost; – the ignition has been switched on again and dialogue re-established, – a **10 second** delay at idle speed. **IMPORTANT** *If the fault is stored, do not clear it; there may be an **OBD fault** (On Board Diagnostic).*

Check **the cleanliness and condition** of the manifold pressure sensor and its connections.
Clean or replace as necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connections:

Computer track H2, connector B → Pressure sensor, track 1 or C
Computer track H3, connector B → Pressure sensor, track 3 or B
Computer track H4, connector B → Pressure sensor, track 2 or A

Repair if necessary.

If the fault is still present, replace the manifold pressure sensor.

If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF330 PRESENT OR STORED	PINKING SENSOR CIRCUIT DEF : Unidentified electrical fault

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present following a road test with engine warm and at high engine speed.
	IMPORTANT *If the fault is stored, do not clear it; there may be an **OBD fault** (On Board Diagnostic).*

Check **the cleanliness and condition** of the pinking sensor and its connections.
Clean or replace as necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connections:

Computer track A2, connector B → Pinking sensor, track 2
Computer track B2, connector B → Pinking sensor, track 1
Computer track C2, connector B → Pinking sensor screening

Repair if necessary.

Check **the conformity** of the fuel in the fuel tank.

Check **the conformity** of the spark plugs.

Check the pinking sensor **fitting**.

If the fault is still present, replace the pinking sensor.

If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF332 PRESENT OR STORED	INJECTION CONNECTION → Air conditioning

NOTES	**None.**

Test the multiplex network.

(see 88B, Multiplexing).

If the fault does not disappear, carry out fault finding on the Air conditioning system.

(see 62B Climate control, 62A Air conditioning or 62C Non regulated climate control).

AFTER REPAIR	Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF336 PRESENT OR STORED	FLYWHEEL SIGNAL INFORMATION 1.DEF: Flywheel ring fault 2.DEF: No tooth signal

NOTES	***If the fault DF329 Pressure sensor circuit is present, prioritise it.*** **Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the starter motor has been operated for **10 seconds** or after a time delay of **2 minutes** with the engine running.
	IMPORTANT *If the fault is stored, do not clear it; there may be an **OBD fault** (On Board Diagnostic).*

Check **the positioning** of the flywheel signal sensor.

Check **the cleanliness and condition** of the flywheel signal sensor and its connections.
Check the condition of the cable.
Clean or replace as necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connections:

Computer track E4, connector B → Flywheel signal sensor, track 2
Computer track F3, connector B → Flywheel signal sensor, track 1

Repair if necessary.

Check the **resistance of the flywheel signal sensor** (see the value in the **Help** section).
If necessary replace the sensor.

Check **the cleanliness and condition** of the engine flywheel.

Note: if ring gear fitting has been modified, carry out programming again.

If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF361 PRESENT OR STORED	IGNITION COIL 1-4 CIRCUIT CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 V DEF : Unidentified electrical fault

NOTES	***If faults DF084 Actuator relay control circuit DF175 Power supply or DF085 Fuel pump relay control circuit are present, deal with them first.*** **Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the starter has been in operation for **10 seconds** or after the engine has been running for **10 seconds**. **IMPORTANT** *If the fault is stored, do not clear it; there may be an **OBD fault** (On Board Diagnostic).*

Disconnect the connectors from the pencil coils of cylinders 1 and 4.
Check **the cleanliness and condition** of the pencil coils and their connections.
Clean or replace as necessary.

Check **the primary and secondary resistances** of the pencil coils on cylinders 1 and 4 (see the values in the **Help** section).
Replace a pencil coil if necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connections:

Computer track H2, connector C → **Coil 1, track 2**
Coil 1, track 1 → **Coil 4, track 2**

Repair if necessary.

Check the fuel pump relay supply fuse (this relay also supplies the ignition coils).

Check the **continuity and insulation** of the wiring between coil 4 and the fuel pump relay (this relay supplies the ignition coils).

Check **the electrical resistance** of the fuel pump relay (see the value in the **Help** section).
Replace the relay if necessary.

Check the **cleanliness and condition** of the fuel pump relay connections.
Clean or replace as necessary.

Check **the insulation and continuity** of the wiring between track 3 of the relay and the fuel supply fuse.
Repair if necessary.

If the fault is still present, replace the faulty pencil coil.

If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF362 PRESENT OR STORED	IGNITION COIL 2-3 CIRCUIT CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 V DEF : Unidentified electrical fault

NOTES	***If faults DF084 Actuator relay control circuit DF175 Power supply or DF085 Fuel pump relay control circuit are present, deal with them first.*** **Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the starter has been in operation for **10 seconds** or after the engine has been running for **10 seconds**. **IMPORTANT** *If the fault is stored, do not clear it; there may be an **OBD fault** (On Board Diagnostic).*

Disconnect the connectors from pencil coils 2 and 3.
Check **the cleanliness and condition** of the pencil coils and their connections.
Clean or replace as necessary.

Check **the primary and secondary resistances** of the pencil coils on cylinders 2 and 3.
(See the values in the **Help** section).
Replace a pencil coil if necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connections:

Computer track H3, connector C → **Coil 2, track 2**
Coil 2, track 1 → **Coil 3, track 2**

Repair if necessary.

Check the fuel pump relay supply fuse (this relay also supplies the ignition coils).

Check the **continuity and insulation** of the line between coil 3 and the fuel pump relay (this relay supplies the ignition coils).

Check **the electrical resistance** of the fuel pump relay (see the value in the **Help** section).
Replace the relay if necessary.

Check the **cleanliness and condition** of the fuel pump relay connections.
Clean or replace as necessary.

Check **the insulation and continuity** of the line between **track 3** of the relay and supply fuse.
Repair if necessary.

If the fault is still present, replace the faulty pencil coil.

If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF390 PRESENT OR STORED	OXYGEN SENSOR OPERATING FAULT

NOTES	**Deal with the other faults first (except for DF394 Catalytic converter operating fault).**

Check **the cleanliness, condition and tightness** of the upstream oxygen sensor.

If the vehicle is driven frequently in town, **carry out the unclogging procedure**.

Check that **there are no leaks** in the exhaust system, from the manifold to the catalytic converter.

Check:
- the condition of the air filter,
- that the air inlet system is not blocked,
- the condition and conformity of the spark plugs,
- the sealing between the throttle valve and inlet manifold,
- the manifold pressure sensor sealing,
- the fuel vapour absorber bleed, which should not be jammed open,
- that there are no leaks in the fuel vapour absorber bleed circuit,
- the brake servo system sealing,
- the turbocharger safety valve circuit sealing,
- the cylinder head oil vapour recovery system sealing,
- the sealing between the inlet manifold and cylinder head,
- the fuel flow rate and pressure,
- the exhaust pipe sealing between the cylinder head and catalytic converter,
- that the catalytic converter and the exhaust system are not blocked.

If the idling speed is not stable, **check**:
- the timing adjustment,
- the hydraulic tappets if there is camshaft noise,
- the cylinder compression.

Drive the vehicle to check the repair.

If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF394 PRESENT OR STORED	CATALYTIC CONVERTER OPERATING FAULT

NOTES	***Deal with the other faults first.*** ***There must be no other injection system fault, either present or stored.***

If the vehicle is driven frequently in town, **carry out the unclogging procedure** (oxygen sensors and catalytic converter clogging).

Check that the exhaust pipe is completely **leak free**.

Check **the cleanliness, condition and tightness** of the downstream oxygen sensor.
Check **the cleanliness and condition** of the downstream oxygen sensor connections.
Clean or replace as necessary.

Check that the downstream oxygen sensor is operating correctly.
Check the condition of **ET053 Downstream O_2 sensor heating** and parameter **PR099 Downstream oxygen sensor voltage of the downstream oxygen sensor**.
Refer to the values in the **Conformity check** section.
If one of the values is not correct, carry out fault finding for **ET053 Downstream O_2 sensor heating** or **PR099 Downstream oxygen sensor voltage**.

Check that the upstream oxygen sensor is operating correctly.
Check the status of **ET052 Upstream O_2 sensor heating** and parameter **PR098 Upstream oxygen sensor voltage**.
Refer to the values in the **Conformity check** section.
If one of the values is not correct, carry out fault finding for **ET052 Upstream O_2 sensor heating** or **PR098 Upstream oxygen sensor voltage**.

If the oxygen sensors are operating perfectly well, then the catalytic converter has undoubtedly been damaged. (see the next page to determine the cause of the damage).

AFTER REPAIR	Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF394 **CONTINUED**	

NOTES	

Before replacing the catalytic converter, determine the cause of the damage, otherwise the new catalytic converter may be damaged.

Remove the catalytic converter.

Various things may destroy a catalytic converter:
- **deformation** (impact),
- **thermal shock** (cold water splashed onto a hot catalytic converter can damage it),
- **defective injector or ignition:** the catalytic converter is damaged by contact with petrol (coil fault, coil control fault, injector jammed open),
- **injector leak**,
- **abnormal oil or coolant consumption** (defective cylinder head gasket),
- **use of a fuel additive** or other equivalent product (obtain information from the customer because this type of product can contaminate the catalytic converter and render it useless sooner or later).

Refer to the history of work carried out on the vehicle or, if this is not possible, ask the customer if the vehicle has had injection or ignition faults.

If the cause of the catalytic converter damage has been found and the fault has disappeared, replace the catalytic converter.

If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF398 **PRESENT**	FUEL CIRCUIT OPERATING FAULT OBD : OBD fault 1.OBD: OBD fault detected when driving

NOTES	**Deal first with any faults relating to the ignition or fuel circuit, if they are present.**

Carry out a complete check on the petrol supply system.
Check the cleanliness of the petrol tank if necessary.
If the fault does not disappear, deal with the other faults then go to the conformity check.

AFTER REPAIR	Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF399 PRESENT	IMMOBILISER CODE NOT PROGRAMMED

NOTES	***If fault DF038 Computer is present, deal with it first.***

Test the multiplex network (see 88B, Multiplexing).
If the fault does not disappear, carry out fault finding on the Immobiliser system (see 82A Engine Immobiliser).

AFTER REPAIR	Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF405 PRESENT OR STORED	PEDAL POTENTIOMETER CIRCUIT 1.DEF: Consistency between gang 1 and gang 2

NOTES	*If faults DF008 Pedal potentiometer circuit gang 1 or* ***DF009 Pedal potentiometer circuit gang 2 are present, deal with these first.*** **Conditions for applying the fault finding procedure to stored faults.** The fault is declared as present in one of the following cases: – when the ignition is switched on without the accelerator pedal being depressed during the **first 10 seconds**, – when the pedal potentiometer is gently shifted from no load to full load, – when the accelerator is in the full load position for **10 seconds**. **IMPORTANT** *If the fault is stored, do not clear it; there may be an* ***OBD fault*** *(On Board Diagnostic).*

Check that the pedal mechanism has not seized.

Check the **cleanliness and condition** of the pedal potentiometer and its connections.
Clean or replace as necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the insulation, **continuity and the absence of interference resistance** on the following connections:

Computer track H3, connector A → Pedal potentiometer, track 2
Computer track G2, connector A → Pedal potentiometer, track 4
Computer track H2, connector A → Pedal potentiometer, track 3
Computer track F4, connector A → Pedal potentiometer, track 1
Computer track F2, connector A → Pedal potentiometer, track 5
Computer track F3, connector A → Pedal potentiometer, track 6

Repair if necessary.

Check that **gangs 1 and 2 of the pedal potentiometer** correctly follow their resistive curves.
(See the values in the **Help** section).
Replace the pedal potentiometer if necessary.

If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF408 PRESENT OR STORED	HEATED WINDSCREEN DEF : Unidentified electrical fault

NOTES	**None.**

Test the multiplex network (see **88B, Multiplexing**).

If the fault has not been solved, run fault finding on the Air conditioning system (see 62A, Air conditioning, 62B, Climate control or 62C, Non regulated climate control).

AFTER REPAIR	Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF411 PRESENT OR STORED	BRAKE PEDAL SENSOR CIRCUIT 1.DEF: Fault on one of the two brake pedal switches 2.DEF: Fault on both brake pedal switches

NOTES	***It is essential that the ABS is not faulty when carrying out this test.*** **Fault finding conditions for stored faults:** The fault is declared present after the brake pedal has been depressed and held down.

Check **the cleanliness and condition** of the double-contact switch and its connections.
Clean or replace as necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connection:

Computer track E4, connector A ⟶ **Brake light switch, track B3**

Repair if necessary.

If the fault does not disappear, process the other faults then go to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF412 PRESENT OR STORED	ACCELERATOR PEDAL/MOTORISED THROTTLE VALVE CIRCUIT DEF : Consistency between the pedal position and the position of the motorised throttle 1.DEF: Fault on + 5 Volt power supply 2.DEF: Fault on potentiometer supply 1 3.DEF: Fault on potentiometer supply 2

NOTES	**SAFETY ADVICE:** **Never drive the vehicle without having made sure that there are no throttle valve faults present.**
	If faults DF328 Throttle potentiometer circuit, DF095 Throttle potentiometer circuit gang 1, DF096 Throttle potentiometer circuit gang 2, DF008 Pedal potentiometer circuit gang 1, DF009 Pedal potentiometer circuit gang 2, DF405 Pedal potentiometer circuit or DF413 Motorised throttle are present, deal with them first. **Conditions for applying the fault finding procedure to stored faults:** The fault appears after a change in the engine speed.
	IMPORTANT *If the fault is stored, do not clear it; there may be an **OBD fault** (On Board Diagnostic).*

Check the **cleanliness and condition** of the pedal potentiometer and its connections. Clean or replace as necessary.
Check **the cleanliness, connection and condition** of the motorised throttle and its connections. Clean or replace as necessary.
Check **the cleanliness** of the throttle, and **correct rotation** of the throttle valve. Check that gangs 1 and 2 of the throttle potentiometer **correctly follow their resistive curves** (see values in the **Help** section). Replace the throttle valve if necessary.
Check **the electrical resistance** of the throttle motor (see the value in the **Help** section). Replace the throttle valve if necessary.
Check that **the resistances of the pedal potentiometer, gangs 1 and 2,** correctly follow their resistive curves. (See the values in the **Help** section). Replace the pedal potentiometer if necessary.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.
	If the throttle valve has been replaced, reinitialise the programming (RZ019 Reinitialising programming).

GETtheMANUALS.org

DF412 **CONTINUED**	

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connections:

- **Computer track H3, connector A → Pedal potentiometer, track 2**
- **Computer track G2, connector A → Pedal potentiometer, track 4**
- **Computer track H2, connector A → Pedal potentiometer, track 3**
- **Computer track F4, connector A → Pedal potentiometer, track 1**
- **Computer track F2, connector A → Pedal potentiometer, track 5**
- **Computer track F3, connector A → Pedal potentiometer, track 6**
- **Computer track M3, connector B → Motorised throttle, track 3**
- **Computer track M4, connector B → Motorised throttle, track 4**
- **Computer track G4, connector B → Motorised throttle potentiometer, track 1**
- **Computer track D3, connector B → Motorised throttle potentiometer, track 6**
- **Computer track G2, connector B → Motorised throttle potentiometer, track 5**
- **Computer track G3, connector B → Motorised throttle potentiometer, track 2**

Repair if necessary.

If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.
	If the throttle valve has been replaced, reinitialise the programming (RZ019 Reinitialising programming).

JSAA5041.0

GETtheMANUALS.org

DF413 PRESENT OR STORED	MOTORISED THROTTLE DEF : Unidentified electrical fault 1.DEF: Motorised throttle servo control fault 2.DEF: Motorised throttle limit search fault 3.DEF: Motorised throttle control general fault 4.DEF: PROGRAMMING 5.DEF: PROGRAMMING 6.DEF: Motorised throttle limit search fault 7.DEF: Motorised throttle valve flap oscillations 8.DEF: Motorised throttle servo control fault

NOTES	**SAFETY ADVICE:** **Never drive the vehicle without having made sure that there are no throttle valve faults present.** **Conditions for applying the fault finding procedure to stored faults:** The fault appears after a change in the engine speed. **IMPORTANT** *If the fault is stored, do not clear it; there may be an **OBD** (On Board Diagnostic) fault.*

Check **the cleanliness and condition** of the throttle valve and its connections.
Clean or replace as necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connections:

Computer track M3, connector B → Motorised throttle, track 3
Computer track M4, connector B → Motorised throttle, track 4
Computer track G4, connector B → Motorised throttle, track 1

Repair if necessary.

Check the **electrical resistance** of the throttle motor (see the value in the **Help** section).
Replace the throttle valve if necessary.

Check **the cleanliness** of the throttle valve and that the throttle **rotates correctly**.
Clean or replace as necessary.

If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.
	If the throttle valve has been replaced, reinitialise the programming (RZ019 Reinitialising programming).

GETtheMANUALS.org

DF414 PRESENT OR STORED	THERMOPLUNGER 1 RELAY CONTROL CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 V DEF : Unidentified electrical fault

NOTES	***If faults DF002 Air temperature sensor circuit, DF001 Coolant temperature sensor circuit, DF084 Actuator relay control circuit or DF175 Power supply are present, deal with them first.*** **Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the ignition has been switched on.

Check **the cleanliness and condition** of thermoplunger relay 1 and its connections.
Clean or replace as necessary.

Check **the resistance of thermoplunger** relay 1 (see the value in the **Help** section).
Replace the relay if necessary.

With the ignition on, check for **+ 12 V on track 1** of the No. 1 thermoplunger relay.
Repair the wiring up to the fuse if necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connection:

Injection computer track D2, connector C ⟶ **Thermoplunger no. 1 relay, track 65**

Repair if necessary.

If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF415 PRESENT OR STORED	THERMOPLUNGER 2 RELAY CONTROL CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 V DEF : Unidentified electrical fault

NOTES	***If faults DF002 Air temperature sensor circuit, DF001 Coolant temperature sensor circuit, DF084 Actuator relay control circuit or DF175 Power supply are present, deal with them first.*** **Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the ignition has been switched on.

Check **the cleanliness and condition** of thermoplunger 2 relay and its connections. Clean or replace as necessary.
Check **the resistance of thermoplunger** relay 2 (see the value in the **Help** section). Replace the relay if necessary.
Check for **+ 12 V after ignition on track 1** of thermoplunger relay 2. Repair the wiring up to the fuse if necessary.
Disconnect the battery. Disconnect the computer. Check the **cleanliness and condition** of the connections. Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connection: **Injection computer track J4, connector B ⟶ Thermoplunger no. 2 relay, track 3** Repair if necessary.
If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF437 PRESENT OR STORED	ENGINE TORQUE MODULATION

NOTES	**None.**

Test the multiplex network.

(see 88B, Multiplexing).

If the fault does not disappear, carry out fault finding on the Automatic gearbox system.

(see 23A Automatic gearbox).

AFTER REPAIR	Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF455 PRESENT OR STORED	LOW FUEL LEVEL SIGNAL

NOTES	**IMPORTANT** *If the fault is stored, do not clear it; there may be an **OBD fault** (On Board Diagnostic).*

Test the multiplex network.

(see 88B, Multiplexing).

If the fault does not disappear, carry out fault finding on the Instrument panel system.

(see 83A Instrument panel).

AFTER REPAIR	Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF488 PRESENT OR STORED	EXHAUST AIR INJECTION OPERATING FAULT

NOTES	***If faults DF084 Actuator relay control circuit DF175 Power supply or DF547 Air pump relay circuit are present, deal with them first.*** ***Check that there are no present or stored faults relating to the oxygen sensors or the catalytic converter.*** **Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the fan has been activated while the engine is running.
	WARNING *If the fault is stored, do not clear it; there may be an **OBD fault** (On Board Diagnostic).*

Check the **+ battery supply fuse** of the air pump relay and its connections. Clean or replace as necessary.
Disconnect the relay. Check the **cleanliness and condition** of the air pump relay and its connections. Clean or replace as necessary.
With the ignition on, check for **+ 12 V on track 1** of the air pump relay, connector end. Repair if necessary.
Check **the resistance** of the air pump relay on **tracks 1 and 2.** (See the value in the **Help** section). Replace the air pump relay if necessary.
Disconnect the air pump motor connector. Check the cleanliness and condition of the connections. Clean or replace as necessary. Check the **insulation, continuity and absence of interference resistance** on the connections between: **Track 5 of the air pump relay ⟶ Air pump relay connector, track 1** **Earth ⟶ Air pump relay connector, track 2** Repair if necessary.
Check **the resistance** of the air pump motor (check the value in the **Help** section). Replace the air pump motor if necessary.
Check the absence of leaks in the air circuit between the air pump and the exhaust.
If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF491 PRESENT OR STORED	ELECTRONIC STABILITY PROGRAM (ESP)

NOTES	**None.**

Test the multiplex network.

(see 88B, Multiplexing).

If the fault has not been resolved, carry out a fault finding procedure on the ESP/ABS systems.

(see 38C, Anti-lock braking system.)

AFTER REPAIR	Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF492 PRESENT OR STORED	CRUISE CONTROL /SPEED LIMITER DEF : Unidentified electrical fault 1.DEF: Inconsistency

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after a road test using the cruise control then the speed limiter function.
	WARNING **It is necessary to remove the airbag in order to remove or check the Cruise control/speed limiter control switches.** **See the Workshop Repair Manual, section 88 wiring Airbag.**

DEF	Check **the cleanliness and condition** of the incrementing switches at the steering wheel and their connections. Clean or replace as necessary.
	Check for **earth** on the incrementing switches at the steering wheel. Repair if necessary.
	Disconnect the battery. Disconnect the computer. Check the **cleanliness and condition** of the connections. Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connections: **Computer track D2, connector A → Steering wheel control, track A2** **Computer track D3, connector A → Steering wheel control, track A1** Repair if necessary.
	If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF492 **CONTINUED**	

1.DEF	Check the **cleanliness and condition** of the cruise control/speed limiter selector switch and its connections. Clean or replace as necessary.
	With the ignition on, check for **+ 12 V** on the cruise control/speed limiter selector switch. (See the connector track number on the relevant wiring diagram). Repair if necessary.
	Disconnect the battery. Disconnect the computer. Check the **cleanliness and condition** of the connections. Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connections: **Computer track A2, connector A → Cruise control or speed limiter on/off switch, track A3** **Computer track C3, connector A → Cruise control or speed limiter on/off switch, track B1** Repair if necessary.
	If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.

JSAA5041.0

GETtheMANUALS.org

DF504 PRESENT OR STORED	AUTOMATIC TRANSMISSION

NOTES	**IMPORTANT** *If the fault is stored, do not clear it; there may be an **OBD fault** (On Board Diagnostic).*

Test the multiplex network.

(see 88B, Multiplexing).

If the fault does not disappear, carry out fault finding on the Automatic gearbox system.

(see 23A, Automatic gearbox).

AFTER REPAIR	Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF547 PRESENT OR STORED	AIR PUMP RELAY CIRCUIT CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 V DEF : Unidentified electrical fault

NOTES	***If the faults DF084 Actuator relay control circuit or DF175 Power supply are present or stored, deal with them first.*** **Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the ignition has been switched on.
	WARNING *If the fault is stored, do not clear it; there may be an **OBD fault** (On Board Diagnostic).*

Check the **cleanliness and condition** of the air pump relay and its connections.
Clean or replace as necessary.

Check **the resistance** of the air pump relay on **tracks 1 and 2** (see the value in the **Help** section).
Replace the relay if necessary.

With the ignition on, check for **12 V on track 1** on the connector end of the air pump relay.
Repair if necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connection:

Injection computer track B2, connector A ⟶ **Air pump relay, track 2**

Repair if necessary.

If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF569 PRESENT OR STORED	TURBOCHARGING SYSTEM DEF : Unidentified electrical fault

NOTES	***If faults DF329 Pressure sensor circuit, DF084 Actuator relay control circuit, DF175 Power supply, DF570 Coolant pump relay, DF571 Turbocharging valve, DF199 Turbocharging pressure valve or DF582 Pressure consistency are present, deal with them first.*** **Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after a road test. **WARNING** *If the fault is stored, do not clear it; there may be an **OBD fault** (On Board Diagnostic).*

Check the cleanliness of the air filter.
Replace the filter if necessary.
Check that the air inlet system is not blocked.

The turbocharging system must be perfectly sealed, from the exhaust manifold to the turbocharger, from the turbocharger to the heat exchanger and from the heat exchanger to the throttle valve.
Check that there are no air leaks:
– around the turbocharger pressure sensor,
– around the air temperature sensor.

Check absence of leaks in the wastegate capsule pressure circuit connected to the turbocharger system.

Check that the air-air heat exchanger is not clogged (presence of oil).
If there is oil in the heat exchanger, the turbocharger is certainly damaged.

Using a pressure/vacuum pump, check that the turbocharger protection and wastegate capsule diaphragms do not leak.

Check that the wastegate solenoid valve is not jammed (mechanically seized).
To do this, activate the wastegate solenoid valve **AC151 Turbocharging valve**.
The solenoid valve should click.
If the solenoid valve does not click, run the **DF571 Turbocharging valve** fault finding procedure.

If no fault is found in the turbocharging system, there must be a **mechanical fault** with the turbocharger.
Test the turbocharger.

If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF570 PRESENT OR STORED	COOLANT PUMP RELAY CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 V DEF : Unidentified electrical fault.

NOTES	***If fault DF084 Actuator relay control circuit or DF175 Power supply are present, deal with them first.*** **Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the ignition has been switched on.

Check the **cleanliness and condition** of the coolant pump relay and its connections.
Clean or replace as necessary.

Check **the resistance** of the relay on **tracks 1 and 2** (see the value in the **Help** section).
Replace the relay if necessary.

With the ignition on, check for **12 V on track 1** on the connector end of the relay.
Repair if necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
for the bornier, check the insulation, **continuity and the absence of interference resistance** on the following connection:

Injection computer track C2, connector C ⟶ **Coolant pump relay, track 60**

Repair if necessary.

If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF571 PRESENT OR STORED	TURBOCHARGING VALVE CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 V DEF : Unidentified electrical fault

NOTES	***If the faults DF084 Actuator relay control circuit or DF175 Power supply are present or stored, deal with them first.*** **Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the ignition has been switched on.
	WARNING *If the fault is stored, do not clear it; there may be an **OBD fault** (On Board Diagnostic).*

Check **the cleanliness and condition** of the wastegate solenoid valve and its connections.
Clean or replace as necessary.

With the ignition on, check for **+ 12 V** on the solenoid valve.
Repair if necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
for the bornier, check the insulation, **continuity and the absence of interference resistance** on the following connection:

Computer track D4, connector C ⟶ **Turbocharging solenoid valve, track 1**

Repair if necessary.

Check the **resistance** of the turbocharging solenoid valve (see the value in the **Help** section).
Replace the solenoid valve, if necessary.

If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF582 PRESENT OR STORED	PRESSURE CONSISTENCY 1.DEF : Consistency between the turbocharging pressure and the atmospheric pressure

NOTES	***If faults DF329 Pressure sensor circuit, DF084 Actuator relay control circuit, DF175 Power supply, DF569 Turbocharging circuit, DF570 Coolant pump relay, DF571 Turbocharging valve, or DF199 Turbocharging pressure valve are present, deal with them first.*** **Conditions for applying the fault finding procedure to stored faults:** The fault appears after: – the ignition is switched off and dialogue is lost; – the ignition has been switched on again and dialogue re-established, – a **10 second** delay at idle speed. **WARNING** *If the fault is stored, do not clear it; there may be an **OBD fault** (On Board Diagnostic).*

Check **the cleanliness and condition** of the manifold pressure sensor and the turbocharging pressure sensor.
Check **the cleanliness and condition** of their connections.
Clean or replace as necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the insulation, **continuity and the absence of interference resistance** on the following connections:

Computer track H2, connector B	→	**Manifold pressure sensor, track 1 or C**
Computer track H3, connector B	→	**Manifold pressure sensor, track 3 or B**
Computer track H4, connector B	→	**Manifold pressure sensor, track 2 or A**
Computer track E1, connector B	→	**Turbocharging pressure sensor, track 2 or A**
Computer track F1, connector B	→	**Turbocharging pressure sensor, track 3 or B**
Computer track G1, connector B	→	**Turbocharging pressure sensor, track 1 or C**

Repair if necessary.

If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF586 PRESENT OR STORED	INJECTION CONNECTION ↔ INSTRUMENT PANEL 1.DEF: Multiplex

NOTES	**None.**

Test the multiplex network.

(see 88B, Multiplexing).

If the fault does not disappear, carry out fault finding on the Instrument panel system.

(see 83A Instrument panel).

AFTER REPAIR	Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF612 PRESENT OR STORED	OIL VAPOUR ANTI-ICING RESISTOR CIRCUIT CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 V DEF : Unidentified electrical fault

NOTES	***If faults DF002 Air temperature sensor circuit, DF001 Coolant temperature sensor circuit, DF084 Actuator relay control circuit or DF175 Power supply are present, deal with them first.*** **Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the ignition has been switched on.

Check the **cleanliness and condition** of the anti-icing resistor relay connections.
Clean or replace as necessary.

Check the **electrical resistance** of the anti-icing resistor relay (see the value in the **Help** section).
Replace the relay if necessary.

With the ignition on, check for **+ 12 V on track 1** of the anti-icing resistor relay.
Repair if necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connection:

Injection computer track B3, connector A ⟶ **Anti-icing resistance relay, track 2**

Repair if necessary.

If the fault has still not disappeared, process the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair: – continue to deal with the fault if it is present, – ignore the fault if it is stored. Deal with any other faults. After carrying out all the tests, clear the stored faults.

GETtheMANUALS.org

DF617 PRESENT OR STORED	VACUUM PUMP RELAY CIRCUIT C.O.0 : Open circuit or short circuit to earth. CC.1 : Short circuit to + 12 V

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present with the engine running or on running **AC198 Vacuum pump relay**.

Handle the harness to detect any change of condition.
Search for any other potential damage to the harness, and check the connection, cleanliness and condition of the vacuum pump relay.
Repair if necessary.

If the fault is still present, check for **+ 12 V** on the connector end of vacuum pump relay track 1, then check earth on the connector end of vacuum pump relay track 2.
Repair if necessary.

In the fault is still present, disconnect the battery and then the computer.
Check **the insulation, continuity and absence of interference resistance** on the following connections:

Actuator relay → **Track 1 of the vacuum pump relay, track 5**

Track 2 of vacuum pump relay → **Track E2, connector C of the computer**

Repair if necessary.

If the fault persists, replace the sensor.

If the fault persists, deal with the other faults then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF618 PRESENT OR STORED	VACUUM PUMP/PRESSURE SWITCH SYSTEM

NOTES	**If faults DF199 Turbocharging pressure sensor, DF569 Turbocharging circuit, DF582 Pressure consistency, DF411 Brake pedal sensor circuit or DF617 Vacuum pump relay circuit are present, deal with them first.**

Handle the harness to detect any change of condition.
Search for any other potential damage to the harness, check the connection, cleanliness and condition of the pressure switch.
Check the brake servo connection and the state of the pipe between the pump and brake servo.
Repair if necessary.

If the fault is still present, run **AC198 Vacuum pump relay**: the vacuum makes a noise.
If not, check 20A vacuum pump relay fuse.
Replace it if necessary.

In the fault is still present, check for + 12 V at the fuse.
Refer to the vehicle wiring diagram and repair if necessary.

In the fault is still present, check for + 12 V on the connector end of vacuum pump relay track 3, then check earth on the connector of vacuum pump relay track A2.
Repair if necessary.

If the fault is still present, **check the insulation, continuity and absence of interference resistance** on the following connections:

Vacuum pump relay fuse → **Track 3 of the vacuum pump relay**

Track 5 of the vacuum pump relay → **Track A1** of the vacuum pump

Track A2 of the vacuum pump → **Earth**

Repair if necessary.

In the fault is still present, apply the **ET551 Mastervac pressure switch signal**.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

ET003	ENGINE IMMOBILISER

NOTES	**None.**

Test the multiplex network. **(see 88B, Multiplexing).**
If the fault does not disappear, carry out fault finding on the Immobiliser system. **(see 82A Engine immobliser.)**

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET052	UPSTREAM O2 SENSOR HEATING

NOTES	There must be no present or stored faults.

Check the **cleanliness and condition** of the upstream oxygen sensor and its connections. Clean or replace as necessary.
Check the **heating resistance** of the upstream oxygen sensor (see the value in the **Help** section). Replace the upstream oxygen sensor if necessary.
Check for **+ 12 V feed on track A** of the upstream oxygen sensor connector with the ignition on. Repair if necessary.
Disconnect the battery. Disconnect the computer. Check the **cleanliness and condition** of the connections. Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connection: **Computer track G1, connector C** ⟶ **Upstream oxygen sensor, track A** Repair if necessary.
If the fault is still present, replace the upstream oxygen sensor.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET053	DOWNSTREAM O_2 SENSOR HEATING

NOTES	There must be no present or stored faults.

Check **the cleanliness and condition** of the downstream oxygen sensor and its connections. Clean or replace as necessary.
Check the **heating resistance** of the downstream oxygen sensor (see the value in the **Help** section). Replace the downstream oxygen sensor if necessary.
Check for **+ 12 V feed on track A** of the downstream oxygen sensor connector with the ignition on. Repair if necessary.
Disconnect the battery. Disconnect the computer. Check the **cleanliness and condition** of the connections. Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connection: **Computer track G3, connector C** ⟶ **Downstream oxygen sensor, track B** Repair if necessary.
If the fault is still present, replace the downstream oxygen sensor.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET054	IDLE SPEED REGULATION

NOTES	There must be no present or stored faults.

Check parameters PR421 Inlet manifold vacuum, PR064 Coolant temperature, PR058 Air temperature, PR429 Measured throttle position and PR030 Accelerator pedal position.
Check that all these parameters are perfectly correct.

Check:
– the engine oil level (too high ⇒ splashing),
– that the exhaust pipe is not blocked (catalytic converter damaged),
– the cleanliness and conformity of the air filter,
– that the air inlet system is not blocked,
– that the throttle valve is not clogged,
– the condition and conformity of the spark plugs,
– the fuel circuit sealing,
– the fuel flow rate and pressure,
– the condition and cleanliness of the injectors,
– the engine compression,
– the timing adjustment,
– the hydraulic tappets if there is camshaft noise.

Check:
– the engine oil level (too high ⇒ oil combustion),
– that the restrictions are present in the oil vapour rebreathing circuit,
– the sealing between the throttle valve and inlet manifold,
– the manifold pressure sensor sealing,
– the fuel vapour absorber bleed, which should not be jammed open,
– that there are no leaks in the fuel vapour absorber bleed circuit,
– the brake servo system sealing,
– that there are no leaks in the turbocharger safety valve circuit,
– the sealing between the inlet manifold and cylinder head,
– the oil vapour recovery circuit sealing between the inlet manifold and cylinder head,
– the fuel flow rate and pressure,
– the condition and cleanliness of the injectors,
– the engine compression,
– the timing adjustment,
– the hydraulic tappets if there is camshaft noise.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET062	FLYWHEEL SIGNAL

NOTES	There must be no present or stored faults.

Check **the cleanliness and condition** of the target sensor, the cable and its connections.
Clean or replace as necessary.

Check that the engine flywheel is **mounted correctly**.
Check the **air gap** between the sensor and the flywheel.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connections:

Computer track E4, connector B → **Track B, TDC sensor**
Computer track F3, connector B → **Track A, TDC sensor**

Repair if necessary.

Check **the electrical resistance** of the sensor (see the value in the **Help** section).
If necessary replace the sensor.

If there is still a fault, **check the cleanliness and condition** of the flywheel.

If the fault persists, replace the sensor.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET143	LOW-SPEED FAN ASSEMBLY RELAY CONTROL

NOTES	There must be no present or stored faults.

Check the cleanliness and general condition of the fan assembly (no hard point).
Check **the cleanliness and condition** of the low-speed fan relay and its connections. Clean or replace as necessary.
Disconnect the low-speed fan relay. Check for **+ 12 V on track 3** on the connector end of the relay. With the ignition on, check for **+ 12 V on track 1** of the relay, connector end. Repair if necessary.
Check **the resistance of the low-speed fan relay** across **tracks 1 and 2** (see the value in the **Help** section). Replace the low-speed fan relay if necessary.
Disconnect the battery. Disconnect the computer. Check the **cleanliness and condition** of the connections. Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connection: Computer connector **C track F1** ⟶ **Low-speed fan assembly relay, track 11** Repair if necessary.
Disconnect the low-speed fan relay. Check **the insulation, the continuity and the absence of interference resistance** of the connection between **track 5** of the relay and the fan assembly. Repair if necessary.
Check **the insulation, continuity and absence of interference resistance** on the fan unit's earth connection. Repair if necessary.
If that still does not work, replace the fan assembly.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET144	HIGH-SPEED FAN ASSEMBLY RELAY CONTROL

NOTES	There must be no present or stored faults.

Check the cleanliness and general condition of the fan assembly (no hard point).
Check **the cleanliness and condition** of the high-speed fan relay and its connections. Clean or replace as necessary.
Disconnect the high-speed fan relay. Check for **+ 12 V on track 3** of the relay, connector end. With the ignition on, check for **+ 12 V on track 1** of the relay, connector end. Repair if necessary.
Check **the resistance of the high-speed fan relay** across **tracks 1 and 2** (see the value in the **Help** section). Replace the high-speed fan relay if necessary.
Disconnect the battery. Disconnect the computer. Check the **cleanliness and condition** of the connections. Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connection: **Computer track F2, connector C ⟶ High speed fan assembly relay, track 7** Repair if necessary.
Disconnect the high-speed fan relay. Check **the insulation, continuity and absence of interference resistance** on the connection between track 5 of the relay and the high-speed fan. Repair if necessary.
Check **the insulation, continuity and absence of interference resistance** on the fan unit's earth connection. Repair if necessary.
If that still does not work, replace the fan assembly.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET215	REDUNDANT BRAKE PEDAL

NOTES	There must be no present or stored faults.

Test the multiplex network.

(see 88B, Multiplexing).

If the fault has not been resolved, carry out a fault finding procedure on the ESP/ABS systems.

(see 38 C Anti-lock braking system.)

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET233	CLUTCH PEDAL

NOTES	

Check that the pedal assembly is in good condition.
Check **the cleanliness and condition** of the clutch pedal switch and its connections. Clean or replace as necessary.
Check for the presence of earth on the clutch pedal switch. Repair if necessary.
Disconnect the battery. Disconnect the computer. Check the **cleanliness and condition** of the connections. Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connection: **Computer track C4, connector A ⟶ Clutch pedal switch, track B3** Repair if necessary.
If that still does not work, replace the switch.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET237	BRAKE PEDAL

NOTES	There must be no present or stored faults.

Check that the pedal assembly is in good condition.
Check **the cleanliness and condition** of the dual-contact brake switch and its connections. Replace as necessary.
Disconnect the battery. Disconnect the computer. Check the **cleanliness and condition** of the connections. Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connection: **Computer track E4, connector A ⟶ Brake pedal, track B3** Repair if necessary.
If that still does not work, replace the switch.
Refer to the ABS fault finding procedure if necessary.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET300	MIXTURE CONTROL

NOTES	There must be no present or stored faults.

Check the **cleanliness and condition** of the upstream oxygen sensor and its connections.
Clean or replace as necessary.

Check the **heating resistance** of the upstream oxygen sensor (see the value in the **Help** section).
Replace the upstream oxygen sensor if necessary.

Check the **resistance of the upstream oxygen sensor signal circuit (check the value in the Help section)**.
Replace the upstream oxygen sensor if necessary.

With the ignition on, check for **+ 12 Volts on the** upstream oxygen sensor connector.
Repair if necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the insulation, **continuity and the absence of interference resistance** on the following connections:

Computer track C1, connector C → **Upstream oxygen sensor, track D**
Computer track B1, connector C → **Upstream oxygen sensor, track C**
Computer track G1, connector C → **Upstream oxygen sensor, track B**

Repair if necessary.

Check **the condition and fitting** of the upstream oxygen sensor.

If the vehicle is driven frequently in town, **carry out the unclogging procedure**.

Check:
– the condition of the air filter,
– that the air inlet system is not blocked,
– the condition and conformity of the spark plugs,
– the sealing between the throttle valve and inlet manifold,
– the manifold pressure sensor sealing,
– the fuel vapour absorber bleed, which should not be jammed open,
– that there are no leaks in the fuel vapour absorber bleed circuit,
– the brake servo system sealing,
– the turbocharger safety valve circuit sealing,
– the cylinder head oil vapour recovery system sealing,
– the sealing between the inlet manifold and cylinder head,
– the exhaust pipe sealing between the cylinder head and catalytic converter,
– the fuel flow rate and pressure.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET300 **CONTINUED**	

If the idling speed is not stable, **check**:
– the timing adjustment,
– the hydraulic tappets if there is camshaft noise,
– the cylinder compression.

Drive the vehicle to check the repair.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET413	CRUISE CONTROL/SPEED LIMITER FUNCTION

NOTES	There must be no present or stored faults.
	WARNING **It is necessary to remove the airbag in order to remove or check the Cruise control/speed limiter control switches.** **See the Workshop Repair Manual, section 88C Airbag.**

Check **the cleanliness, connection and condition of the** of the cruise control/speed limiter start switch and the connection and condition of its connector.
Replace as necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connections:

Computer track A2, connector A → On/Off switch, track A3
Computer track C3, connector A → On/Off switch, track B1

Repair if necessary.

If the fault is still present, replace the switch.

Check **the cleanliness, connection and condition** of the incrementing switches on the steering wheel and their connectors.
Replace as necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connections:

Computer track D2, connector A → Steering wheel control, track A2
Computer track D3, connector A → Steering wheel control, track A1

Repair if necessary.

If the fault is still present, replace the faulty switch.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

PR030	ACCELERATOR PEDAL POSITION

NOTES	There must be no present or stored faults.

Check that the pedal mechanism has not seized.

Check the **cleanliness and condition** of the pedal potentiometer connections.
Clean or replace as necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connections:

- **Computer track H3, connector A → Pedal potentiometer, track 2**
- **Computer track G2, connector A → Pedal potentiometer, track 4**
- **Computer track H2, connector A → Pedal potentiometer, track 3**
- **Computer track F4, connector A → Pedal potentiometer, track 1**
- **Computer track F2, connector A → Pedal potentiometer, track 5**
- **Computer track F3, connector A → Pedal potentiometer, track 6**

Repair if necessary.

Check that **the resistances of pedal potentiometer gangs 1 and 2** correctly follow their curves of resistance (see the values in the **Help** section).
Replace the pedal potentiometer if necessary.

If the fault is still present, replace the pedal potentiometer.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

PR041	TURBOCHARGING PRESSURE

NOTES	There must be no present or stored faults.

Check **the cleanliness and condition** of the turbocharging pressure sensor and its connections.
Clean or replace as necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connections:

Computer track E1, connector B → Pressure sensor, track 2
Computer track F1, connector B → Pressure sensor, track 3
Computer track G1, connector B → Pressure sensor, track 1

Repair if necessary.

If the fault is still present, replace the sensor.

If the fault persists, carry out the following checks:

Check the cleanliness of the air filter.
Replace the filter if necessary.
Check that the air inlet system is not blocked.

The turbocharging system must be perfectly sealed, from the exhaust manifold to the turbocharger, from the turbocharger to the heat exchanger and from the heat exchanger to the throttle valve.
Check that there are no air leaks:
– around the turbocharger pressure sensor,
– around the air temperature sensor.

Check absence of leaks in the wastegate capsule pressure circuit connected to the turbocharger system.

Check that the air-air heat exchanger is not clogged (presence of oil).
If there is oil in the heat exchanger, the turbocharger is certainly damaged.

Using a pressure/vacuum pump, check that the turbocharger protection and turbocharging valve capsule diaphragms do not leak.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

PR041 **CONTINUED**	

Check that the wastegate solenoid valve is not jammed (mechanically seized).
To do this, run the wastegate solenoid valve command **AC151 Turbocharging valve**.
This command is used to listen to the solenoid valve.
If the solenoid valve does not click, run the **DF571 Turbocharging valve** Turbocharging valve fault finding procedure.

If no fault is found in the turbocharging system, there must be a **mechanical fault** with the turbocharger.
Test the turbocharger.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

PR058	AIR TEMPERATURE

NOTES	There must be no present or stored faults.

Check **the cleanliness and condition** of the air temperature sensor and its connections.
Clean or replace as necessary.

Check the **resistance** of the manifold air temperature sensor at various temperatures (see the values in the **Help** section).
Replace the air temperature sensor, if necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connections:

Computer track E3, connector B → **Air temperature sensor, track 2**
Computer track E2, connector B → **Air temperature sensor, track 1**

Repair if necessary.

If the fault persists, replace the sensor.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

PR064	COOLANT TEMPERATURE

NOTES	There must be no present or stored faults.

Check **the cleanliness and condition** of the coolant temperature sensor and its connections.
Clean or replace as necessary.

Check the **resistance** of the coolant temperature sensor at various temperatures (see the values in the **Help** section).
Replace the coolant temperature sensor, if necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connections:

Computer track F2, connector B → **Coolant temperature sensor, track B2**
Computer track F4, connector B → **Coolant temperature sensor, track B1**

Repair if necessary.

If the fault persists, replace the sensor.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

PR071	COMPUTER SUPPLY VOLTAGE

NOTES	There must be no present or stored faults. **No electrical consumers.**

Ignition on	**If the voltage is minimum:** Check the battery and the charge circuit.
	If the voltage is maximum: Check that the charging voltage is correct with and without electrical consumers switched on.

At idle speed	**If the voltage is minimum:** Check the battery and the charge circuit.
	If the voltage is maximum: Check that the charging voltage is correct with and without electrical consumers switched on.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

PR098	UPSTREAM OXYGEN SENSOR VOLTAGE

NOTES	There must be no present or stored faults.

Check **the cleanliness and condition** of the upstream oxygen sensor connections. Replace the connector if necessary.
With the ignition on, check for **+ 12 Volts** on the upstream oxygen sensor. Repair if necessary.
Disconnect the battery. Disconnect the computer. Check the **cleanliness and condition** of the connections. Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connections: **Computer track C1, connector C → Upstream oxygen sensor, track C** **Computer track B1, connector C → Upstream oxygen sensor, track D** Repair if necessary.
Check **the fitting** of the upstream oxygen sensor.
If the vehicle is driven frequently in town, **carry out the unclogging procedure**.
Check that **there are no leaks** in the exhaust system, from the manifold to the catalytic converter.
Replace the upstream oxygen sensor.
If the fault persists, carry out the checks on the following page.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

PR098 **CONTINUED**	

Check:
- the condition of the air filter,
- that the air inlet system is not blocked,
- the condition and conformity of the spark plugs,
- that the catalytic converter is not clogged,
- the sealing between the throttle valve and inlet manifold,
- the manifold pressure sensor sealing,
- the fuel vapour absorber bleed, which should not be jammed open,
- that there are no leaks in the fuel vapour absorber bleed circuit,
- the brake servo system sealing,
- the turbocharger safety valve circuit sealing,
- the cylinder head oil vapour recovery system sealing,
- the sealing between the inlet manifold and cylinder head,
- the exhaust pipe sealing between the cylinder head and catalytic converter,
- the fuel flow rate and pressure.

If the idling speed is not stable, **check**:
- the timing adjustment,
- the cylinder compression.

If the fault is still present, replace the upstream oxygen sensor.

Drive the vehicle to check the repair.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

PR099	DOWNSTREAM OXYGEN SENSOR VOLTAGE

NOTES	There must be no present or stored faults.

Check **the cleanliness and condition** of the downstream oxygen sensor connections. Replace the connector if necessary.
With the ignition on, check for **+ 12 V** on the downstream oxygen sensor. Repair if necessary.
Disconnect the battery. Disconnect the computer. Check the **cleanliness and condition** of the connections. Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connections: **Computer track B2, connector C → Downstream oxygen sensor, track D** **Computer track A2, connector C → Downstream oxygen sensor, track C** Repair if necessary.
Check **the fitting** of the downstream oxygen sensor.
If the vehicle is driven frequently in town, **carry out the unclogging procedure** (oxygen sensors and catalytic converter clogging).
Check that the exhaust pipe is completely **leak free**.
Replace the downstream oxygen sensor.
If the fault is still present, the catalytic converter is certainly damaged. Carry out the checks on the following page.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

PR099 **CONTINUED**	

If the catalytic converter is defective, determine the cause of the destruction, otherwise the new catalytic converter may be damaged in turn.

Remove the catalytic converter.

Various things may destroy a catalytic converter:
- **deformation** (impact),
- **thermal shock** (cold water splashed onto a hot catalytic converter can damage it),
- **defective injector or ignition:** the catalytic converter is damaged by contact with petrol (coil fault, coil control fault, injector jammed open),
- **injector leak,**
- **abnormal oil or coolant consumption** (defective cylinder head gasket),
- **use of a fuel additive** or other equivalent product (obtain information from the customer because this type of product can contaminate the catalytic converter and render it useless sooner or later).

Look up the service history of the vehicle or, if this is not possible, ask the customer if the vehicle has had injection or ignition faults.

If the cause of the catalytic converter damage has been found and the fault has disappeared, replace the catalytic converter.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

PR421	MANIFOLD PRESSURE

NOTES	There must be no present or stored faults.

Check **the cleanliness and condition** of the manifold pressure sensor and its connections.
Clean or replace as necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connections:

Computer track H2, connector B → Pressure sensor, track 1
Computer track H3, connector B → Pressure sensor, track 3
Computer track H4, connector B → Pressure sensor, track 2

Repair if necessary.

If the fault is still present, replace the manifold pressure sensor.

If the fault is still present, carry out the following checks:

The inlet line must be perfectly sealed, from the throttle valve to the cylinder head.

Check:
– the condition of the air filter,
– that the air inlet system is not blocked,
– the sealing between the throttle valve and inlet manifold,
– the manifold pressure sensor sealing,
– the fuel vapour absorber bleed, which should not be jammed open,
– that there are no leaks in the fuel vapour absorber bleed circuit,
– the brake servo system sealing,
– the turbocharger safety valve circuit sealing,
– the cylinder head oil vapour recovery system sealing,
– the sealing between the inlet manifold and cylinder head,
– the exhaust pipe sealing between the cylinder head and catalytic converter.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

PR427	AVERAGE PINKING SIGNAL

NOTES	There must be no present or stored faults.

The pinking sensor must not supply a zero signal, proving that it is recording the mechanical vibrations of the engine.
Check that the fuel in the fuel tank is of the correct type.
Check the condition and conformity of the spark plugs.
Check the pinking sensor **fitting**.
Check **the cleanliness and condition** of the pinking sensor and its connections. Clean or replace as necessary.
Disconnect the battery. Disconnect the computer. Check the **cleanliness and condition** of the connections. Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connections: **Computer track A2, connector B → Pinking sensor, track 2** **Computer track B2, connector B → Pinking sensor, track 1** **Computer track C2, connector B → Pinking sensor screening** Repair if necessary.
If the fault is still present, replace the pinking sensor.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

PR429	MEASURED THROTTLE POSITION

NOTES	**SAFETY ADVICE:** **Never drive the vehicle without having made sure that there are no throttle valve faults present.**
	There must be no present or stored faults.

Check that there are no **foreign bodies** in the throttle valve.
Check manually that the throttle has no hard point at any stage in its rotation.

Check the **cleanliness and condition** of the throttle potentiometer connections.
Clean or replace as necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connections:

- **Computer track G4, connector B** → **Throttle potentiometer, track 1**
- **Computer track D3, connector B** → **Throttle potentiometer, track 6**
- **Computer track G2, connector B** → **Throttle potentiometer, track 5**
- **Computer track G3, connector B** → **Throttle potentiometer, track 2**

Repair if necessary.

Check that the **resistances of tracks 1 and 2 of the throttle potentiometer** follow their curves correctly, by moving the throttle from no load to full load (check the values in the **Help** section).
Replace the throttle valve if necessary.

AFTER REPAIR	**If the throttle valve has been replaced, reinitialise the programming (RZ019 Reinitialising programming).** Repeat the conformity check from the start.

GETtheMANUALS.org

AC015	FUEL PUMP RELAY

NOTES	There must be no present or stored faults.

IF THE RELAY DOES NOT CLICK	Check **the supply fuse** of the fuel pump relay. Replace the fuse if necessary.
	Check **the cleanliness and condition** of the fuel pump relay connector. Replace the connector if necessary.
	Disconnect the relay. With the ignition on, check for **+ 12 V on track 1** of the fuel pump relay, connector end. Repair if necessary.
	Check **the resistance** of the fuel pump relay on **tracks 1 and 2** (see the value in the **Help** section). Replace the fuel pump relay if necessary.
	Disconnect the battery. Disconnect the computer. Check the **cleanliness and condition** of the connections. Use the universal bornier to check the **insulation, continuity and the absence of interference resistance** on the following connection: **Computer track D1, connector C ⟶ Fuel pump relay, track 2** Repair if necessary.
	If the fault persists, replace the relay.
IF THE PUMP DOES NOT OPERATE	Disconnect the fuel pump. Check the **cleanliness and condition** of the connections. With the ignition on, check for **+ 12 V** on the connector. Check for **earth** on the connector. Repair if necessary.
	If the fault is still present, replace the fuel pump.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC017	CANISTER BLEED SOLENOID VALVE

NOTES	There must be no present or stored faults.

Check **the cleanliness and condition** of the fuel vapour absorber bleed solenoid valve connector. Replace the connector if necessary.
With the ignition on, check for **+ 12 V on the fuel vapour absorber bleed solenoid valve**. Repair if necessary.
Check the **resistance of the fuel vapour absorber bleed solenoid valve** (see value in the **Help** section). Replace the solenoid valve, if necessary.
Disconnect the battery. Disconnect the computer. Check the **cleanliness and condition** of the connections. Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connection: **Computer track E1, connector C** ⟶ **Fuel vapour absorber bleed solenoid valve, track 2** Repair if necessary.
If the fault is still present, replace the solenoid valve.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC027	MOTORISED THROTTLE

NOTES	**SAFETY ADVICE: never drive the vehicle without ensuring that there are no throttle valve faults.**
	There must be no present or stored faults.

Check **the cleanliness** of the throttle valve and that the throttle **rotates correctly**.
Clean or replace as necessary.

Check the **cleanliness and condition** of the connections.
Clean or replace as necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connections:

Computer track M3, connector B → Motorised throttle, track 4
Computer track M4, connector B → Motorised throttle, track 3
Computer track G4, connector B → Motorised throttle, track 1

Repair if necessary.

Check **the electrical resistance** of the throttle motor (see the value in the **Help** section).
Replace the throttle valve if necessary.

If the fault is still present, replace the throttle valve.

AFTER REPAIR	**If the throttle valve has been replaced, reinitialise the programming (RZ019 Reinitialising programming).** Repeat the conformity check from the start.

GETtheMANUALS.org

AC038	LOW-SPEED FAN ASSEMBLY RELAY

NOTES	There must be no present or stored faults.

Check the **cleanliness and condition** of the fan assembly. Check that the fan blade has not seized.
Check the **cleanliness and condition** of the low-speed fan relay connector. Replace the connector if necessary.
Disconnect the low-speed fan relay. With the ignition on, check for **+ 12 V on track 1** of the relay. Repair if necessary.
Check **the resistance of the low-speed fan relay** across **tracks 1 and 2** (see the value in the **Help** section). Replace the low-speed fan relay if necessary.
Disconnect the battery. Disconnect the computer. Check the **cleanliness and condition** of the connections. Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connection: Computer connector **C track F1** ⟶ **Low-speed fan assembly relay, track 2** Repair if necessary.
Check **the insulation, the continuity and the absence of interference resistance** of the connection between **track 5** of the relay and the fan assembly. Repair if necessary.
Check **the insulation, continuity and absence of interference resistance** on the fan unit's earth connection. Repair if necessary.
If that still does not work, replace the relay or the fan assembly.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC039	HIGH-SPEED FAN ASSEMBLY RELAY

NOTES	There must be no present or stored faults.

Check the **cleanliness and condition** of the fan assembly. Check that the fan blade has not seized.
Check **the cleanliness and condition** of the high-speed fan relay connector. Replace the connector if necessary.
Disconnect the high-speed fan relay. With the ignition on, check for **+ 12 V on track 1** of the relay. Repair if necessary.
Check **the resistance of the high-speed fan relay** across **tracks 1 and 2** (see the value in the **Help** section). Replace the high-speed fan relay if necessary.
Disconnect the battery. Disconnect the computer. Check the **cleanliness and condition** of the connections. Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connection: **Computer track F2, connector C** ⟶ **High-speed fan assembly relay, track 2** Repair if necessary.
Check **the insulation, the continuity and the absence of interference resistance** of the connection between **track 5** of the relay and the fan assembly. Repair if necessary.
Check **the insulation, continuity and absence of interference resistance** on the fan unit's earth connection. Repair if necessary.
If that still does not work, replace the relay or the fan assembly.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC063	THERMOPLUNGER RELAY NO. 1

NOTES	There must be no present or stored faults.

Check **the cleanliness and condition** of thermoplunger relay 1 and its connections. Clean or replace as necessary.
Check **the resistance of thermoplunger** relay 1 (see the value in the **Help** section). Replace the relay if necessary.
With the ignition on, check for **+ 12 V on track 1** of thermoplunger relay 1. Repair the wiring up to the fuse if necessary.
Disconnect the battery. Disconnect the computer. Check the **cleanliness and condition** of the connections. Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connection: **Injection computer track D2, connector C** ⟶ **Thermoplunger no. 1 relay, track 65** Repair if necessary.
If the fault persists, replace the relay.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC070	CLIMATE CONTROL COMPRESSOR

NOTES	There must be no present or stored faults.

Check **the cleanliness and condition** of the compressor connections.
Check that the wire connection to the compressor **is not broken** anywhere.
Repair if necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connection:

Computer track F3, connector C ⟶ **Connection unit track 20, ECH 26-track connector**

Repair if necessary.

If the command still does not operate, run a fault finding procedure on the **Air conditioning** system.
(see **62A, Air conditioning, 62B, Climate control or 62C, Non regulated climate control**).

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC149	THERMOPLUNGER RELAY NO. 2

NOTES	There must be no present or stored faults.

Check **the cleanliness and condition** of thermoplunger relay 2 and its connections. Clean or replace as necessary.
Check **the resistance of thermoplunger** 2 relay (see the value in the **Help** section). Replace the relay if necessary.
Check for **+ 12 V after ignition on track 1** of thermoplunger relay 2. Repair the wiring up to the fuse if necessary.
Disconnect the battery. Disconnect the computer. Check the **cleanliness and condition** of the connections. Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connection: **Injection computer track J4, connector B** ⟶ **Thermoplunger no. 2 relay, track 3** Repair if necessary.
If the fault persists, replace the relay.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC151	TURBOCHARGING VALVE

NOTES	There must be no present or stored faults.

Check **the cleanliness and condition** of the solenoid valve and its connections. Clean or replace as necessary.
With the ignition on, check for **+ 12 V** on the solenoid valve. Repair if necessary.
Disconnect the battery. Disconnect the computer. Check the **cleanliness and condition** of the connections. Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connections: **Computer track D4, connector C ⟶ Turbocharging solenoid valve, track 1** Repair if necessary.
Check the **resistance** of the turbocharging solenoid valve (see the value in the **Help** section). Replace the solenoid valve, if necessary.
If the fault persists, replace the solenoid valve.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC195	ELECTRIC COOLANT PUMP

NOTES	There must be no present or stored faults.

IF THE RELAY DOES NOT CLICK	Check the **cleanliness and condition** of the coolant pump relay connections. Clean or replace as necessary.
	Check for **+ 12 V on track 5** of the coolant pump relay, connector end. Repair if necessary. Check, with the ignition on, for **+ 12 volts on track 1** of the coolant pump relay, connector end.
	Check **the resistance** of the coolant pump relay on **tracks 1 and 2.** (See the value in the **Help** section). Replace the fuel pump relay if necessary.
	Disconnect the battery. Disconnect the computer. Check the **cleanliness and condition** of the connections. Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connection: **Computer track C2, connector C** → **Coolant pump relay, track 2** Repair if necessary.
	If the fault persists, replace the relay.

IF THE PUMP DOES NOT OPERATE	Disconnect the coolant pump. Check the **cleanliness and condition** of the connections. Clean or replace as necessary.
	Disconnect the battery. Check the **insulation, continuity and absence of interference resistance** on the following connection: **Coolant pump relay connector, track 3** → **Coolant pump connector, track 2** Repair if necessary.
	Check for **earth** on the connector. Repair if necessary.
	If the fault persists, replace the coolant pump.

AFTER REPAIR	Repeat the conformity check from the start.

JSAA5041.0

GETtheMANUALS.org

AC196	OIL VAPOUR ANTI-ICING RESISTOR

NOTES	There must be no present or stored faults.

IF THE RELAY DOES NOT CLICK	Check the **cleanliness and condition** of the anti-icing resistor relay connections. Clean or replace as necessary.
	Check the **electrical resistance** of the anti-icing resistor relay (see the value in the **Help** section). Replace the relay if necessary.
	With the ignition on, check for **+ 12 V on track 1** of the anti-icing resistor relay. Repair if necessary.
	Disconnect the battery. Disconnect the computer. Check the **cleanliness and condition** of the connections. Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following connection: **Injection computer track B3, connector A ⟶ Anti-icing resistance relay, track 2** Repair if necessary.
	If the relay still does not click when activated, replace the relay.
IF THERE IS NO + 12 V OR EARTH AT THE CONNECTOR	Check **the insulation, continuity and absence of interference resistance** of the connection between **track 5** of the relay and track 2 of the anti-icing resistor. Repair if necessary.
	Check **insulation, continuity and absence of interference resistance** on the anti-icing resistor earth connection. Repair if necessary.
	If that still does not work, replace the anti-icing resistor.

AFTER REPAIR	Repeat the conformity check from the start.

THE ENGINE WILL NOT START	→ **ALP 2**
IDLING SPEED FAULTS	→ **ALP 3**
FAULTS WHILE DRIVING	→ **ALP 4**

AFTER REPAIR	Carry out a check using the diagnostic tool.

JSAA5041.0

GETtheMANUALS.org

ALP 1	No dialogue with the computer

NOTES	None

Test the diagnostic tool on another vehicle in perfect working order.
Check that the sensor's green warning light comes on.
If communication with the second vehicle is impossible, follow the instructions in the **CLIP diagnostic tool test** section.
If communication with the second vehicle is impossible, follow the instructions in the **Vehicle check** section.

DIAGNOSTIC TOOL CHECK	Check **the cleanliness** and **condition** of the diagnostic socket contacts on the vehicle. Check the condition of the cable from the diagnostic socket to the sensor, and the cleanliness and condition of the connections. Check the sensor connections. Check the condition of the cable from the CLIP diagnostic tool to the sensor as well as the condition and cleanliness of the connections. Check the cleanliness and condition of the CLIP socket. If the fault is still present, contact the Techline.
VEHICLE CHECK	Check the **electrical voltage** of the battery. Check the **condition and cleanliness** of the battery terminals. Check the **condition** of the battery earth cable and ensure that there is **good electrical connection** with the bodywork.
	Check **the cleanliness and good connection** of the injection computer earth to the bodywork.
	Check the after ignition supply **fuses FM3 10A and FM6 10A** of the injection computer and the condition and cleanliness of the contacts.

AFTER REPAIR	Carry out a check using the diagnostic tool.

ALP 1 CONTINUED	

VEHICLE CHECK

Use the Universal bornier to check the following tracks on the **vehicle diagnostic socket**:

Track 1	→	**+ After ignition**
Track 16	→	**+ Battery feed**
Tracks 4 and 5	→	**Earth**

Disconnect the battery and the injection computer.
Check the cleanliness and condition of the computer connections.
Use the universal bornier to check the continuity of the CAN communication lines:

Injection computer, track A4 connector A	→	**Vehicle diagnostic socket track 6**
Injection computer, track A3 connector A	→	**Vehicle diagnostic socket track 14**

Disconnect the computer **earth** terminal from the negative battery terminal.
Check **the continuity and insulation** of the following tracks:

Injection computer track H1 connector C	→	**Earth terminal**
Injection computer track M1 connector B	→	**Earth terminal**
Injection computer track G4 connector A	→	**Earth terminal**
Injection computer track H4 connector A	→	**Earth terminal**

Check **the continuity and insulation** of the following tracks:

Injection computer track G2 Connector C	→	**Track 13 of the injection locking relay**

Check for **+ after ignition feed on tracks 14 and 16 of the injection locking relay**.

AFTER REPAIR	Carry out a check using the diagnostic tool.

JSAA5041.0

GETtheMANUALS.org

ALP 2	The vehicle will not start

NOTES	
	Follow ALP 2 after a complete check with the diagnostic tool. *(Use the relevant section in the Repair Manual to carry out certain operations).*
	SAFETY ADVICE: **Never drive the vehicle without ensuring that there are no throttle valve faults.**

If the starter motor does not engage, there may be an engine immobiliser fault. Carry out a fault finding procedure on the UCH.
Check the condition of the battery. Check the cleanliness, condition and tightness of the battery terminals. Check that the battery is correctly earthed to the vehicle bodywork. Check that the battery + leads are correctly connected.
Check that the starter motor is properly connected. Check that the starter operates correctly.
Check the condition and conformity of the spark plugs. Check the mounting, cleanliness and condition of the flywheel signal sensor. Check the flywheel signal sensor air gap. Check the condition of the flywheel.
Check that the air filter is not clogged. Check that the air inlet system is not blocked.
Check that there is fuel in the tank (fuel sender fault). Check that the tank vent is not blocked. Check that the fuel is of the correct type. Check that there are no leaks in the fuel system, from the tank to the injectors. Check that no hoses are pinched (especially after a removal operation). Check the fuel flow rate and pressure. Check the operation of the injectors and that they do not leak.
Check that the exhaust system is not blocked and the catalytic converter not clogged.
Check the timing adjustment.
Check the engine compressions.
Check the hydraulic tappets if there is camshaft noise.

AFTER REPAIR	Carry out a check using the diagnostic tool.

GETtheMANUALS.org

ALP 3	Idle speed faults

NOTES	
	Work through ALP 3 after complete checking using the diagnostic tool. *(Use the relevant section in the Workshop Repair Manual as a guide in carrying out certain operations).*
	SAFETY ADVICE: **Never drive the vehicle without ensuring that there are no throttle valve faults.**

Check that the oil level is not too high.
Check the condition of the pencil coils and the cleanliness of their connections. Check the electrical resistance of the pencil coil secondary circuits. Check the condition and conformity of the spark plugs. Check the mounting, cleanliness and condition of the flywheel signal sensor. Check the flywheel signal sensor air gap. Check the condition and cleanliness of the flywheel.
Check that the air filter is not clogged. Check that the air inlet system is not blocked. Check that the throttle valve is not clogged.
Check inlet system sealing, from the throttle to the cylinder head. Check that the fuel vapour absorber bleed is not disconnected or jammed open. Check that there are no leaks in the fuel vapour absorber bleed circuit. Check that there are no leaks in the braking assistance system. Check that there are no leaks in the turbocharger safety valve system. Check that there are no leaks in the oil vapour recovery circuit (manifold/cylinder head). Check that there are no leaks around the manifold pressure sensor.
Check that the tank vent is not blocked. Check that the fuel is of the correct type. Check that there are no leaks in the fuel system, from the tank to the injectors. Check that no hoses are pinched (especially after a removal operation). Check the fuel flow rate and pressure. Check that the injectors are working properly.
Check that the exhaust system is not blocked and the catalytic converter not clogged.
Check the timing adjustment.
Check the engine compressions.
Check the hydraulic tappets if there is camshaft noise.

AFTER REPAIR	Carry out a check using the diagnostic tool.

GETtheMANUALS.org

ALP 4	Faults when driving

NOTES	
	Work through ALP 4 after complete checking using the diagnostic tool. *(Use the relevant section in the Workshop Repair Manual as a guide in carrying out certain operations).*
	SAFETY ADVICE: **Never drive the vehicle without ensuring that there are no throttle valve faults.**

Check that the oil level is not too high.
Check the condition of the pencil coils and the cleanliness of their connections. Check the electrical resistance of the pencil coil secondary circuits. Check the condition and conformity of the spark plugs. Check the mounting, cleanliness and condition of the flywheel signal sensor. Check the flywheel signal sensor air gap. Check the condition and cleanliness of the flywheel.
Check that the air filter is not clogged. Check that the air inlet system is not blocked. Check inlet system sealing, from the throttle to the cylinder head.
Check that the fuel vapour absorber bleed is not disconnected or jammed open. Check that there are no leaks in the fuel vapour absorber bleed circuit. Check that there are no leaks in the braking assistance system. Check that there are no leaks in the turbocharger safety valve system. Check that there are no leaks in the oil vapour recovery system (manifold/cylinder head). Check that there are no leaks around the manifold pressure sensor. Check that the throttle valve is not clogged.
Lack of power may be due to a fault in the turbocharging system. The turbocharging system must be perfectly sealed: Check there are no leaks from the exhaust manifold to the turbocharger. Check there are no leaks from the turbocharger to the heat exchanger. Check there are no leaks from the heat exchanger to the throttle valve. Check there are no leaks around the turbocharging pressure sensor and the air temperature sensor. Check absence of leaks in the wastegate capsule pressure circuit connected to the turbocharger system. Check that the air-air heat exchanger is not clogged (presence of oil). If there is oil in the heat exchanger, the turbocharger is certainly damaged. Check that the pressure capsule which controls the turbocharging valve is not leaking. Check that the turbocharger protection vacuum capsule is not leaking. Carry out all the recommended checks on the turbocharger.

AFTER REPAIR	Carry out a check using the diagnostic tool.

GETtheMANUALS.org

ALP 4 CONTINUED	

Check that the tank vent is not blocked. Check that the fuel is of the correct type. Check that there are no leaks in the fuel system, from the tank to the injectors. Check that no hoses are pinched (especially after a removal operation). Check the fuel flow rate and pressure. Check that the injectors are working properly.
Check that the exhaust system is not blocked and the catalytic converter not clogged.
Check the timing adjustment.
Check the engine compressions.
Check the hydraulic tappets if there is camshaft noise.

AFTER REPAIR	Carry out a check using the diagnostic tool.

GETtheMANUALS.org

1. SCOPE OF THIS DOCUMENT

This document presents the fault finding procedure applicable to all computers with the following specifications:

Vehicles: **Espace IV phase 1 / phase 2**
Velsatis phase 1 / phase 2

Engines concerned: **V4Y 701, 711 and 715**

Function concerned: **Petrol injection**

Name of computer: **EWR 20 injection**

Program No.: **61**

Vdiag No.: **04, 08, 0C, 10**

2. PREREQUISITES FOR FAULT FINDING

Documentation type

Fault finding procedures (this manual):
– Assisted fault finding (integrated into the diagnostic tool), Dialogys.

Wiring Diagrams:
– Visu-Schema (CD-ROM).

Type of diagnostic tools
– **CLIP + sensor**

Special tooling required

Special tooling required	
	Multimeter
Elé. 1681	Universal bornier

3. RECAP

Procedure

To save energy, the UCH of the vehicle interrupts the + after ignition feed after 3 minutes.

When performing fault finding on a computer, it is possible to force the + after ignition feed for 1 hour by applying the following procedure:
– Press the card unlocking button,
– insert the card in the reader,
– press the Start button (interrupting the timed + after ignition feed mode),
– press and hold the Start button for over 5 seconds until the engine immobiliser warning light starts to flash rapidly (4 Hz).

This forced + after ignition feed mode remains active for 1 hour.
– Pressing the Start button or removing the card from the reader cuts off the forced + after ignition feed but does not cut off the timed forced + after ignition feed mode. As long as one hour has not elapsed the + after ignition feed function restarts the forced + after ignition feed for the remaining time.

GETtheMANUALS.org

Faults

Faults are declared as either present or stored (depending on whether they appeared in a certain context and have disappeared since, or whether they remain present but have not been diagnosed within the current context).

The **present** or **stored** status of faults should be taken into consideration when the diagnostic tool is switched on after the + after ignition feed (without any system components being active).

For a **present fault**, apply the procedure described in the **Interpretation of faults** section.

For a **stored fault**, note the faults displayed and apply the instructions in the **Notes** section.

If the fault is **confirmed** when the instructions in the Notes section are applied, the fault is present. Deal with the fault

If the fault is **not confirmed**, check:
- the electrical lines which correspond to the fault,
- the connectors for these lines (for oxidation, bent pins, etc.),
- the resistance of the component detected as faulty,
- the condition of the wires (melted or split insulation, wear).

Conformity check

The aim of the conformity check is to check data that does not produce a fault on the diagnostic tool because the data is inconsistent. Therefore, this stage is used to:
- carry out fault finding on faults that do not have a fault display, and which may correspond to a customer complaint.
- check that the system is operating correctly and that there is no risk of a fault recurring after repairs.

This section gives the fault finding procedures for statuses and parameters and the conditions for checking them.

If a status is not behaving normally or a parameter is outside the permitted tolerance values, consult the corresponding fault finding page.

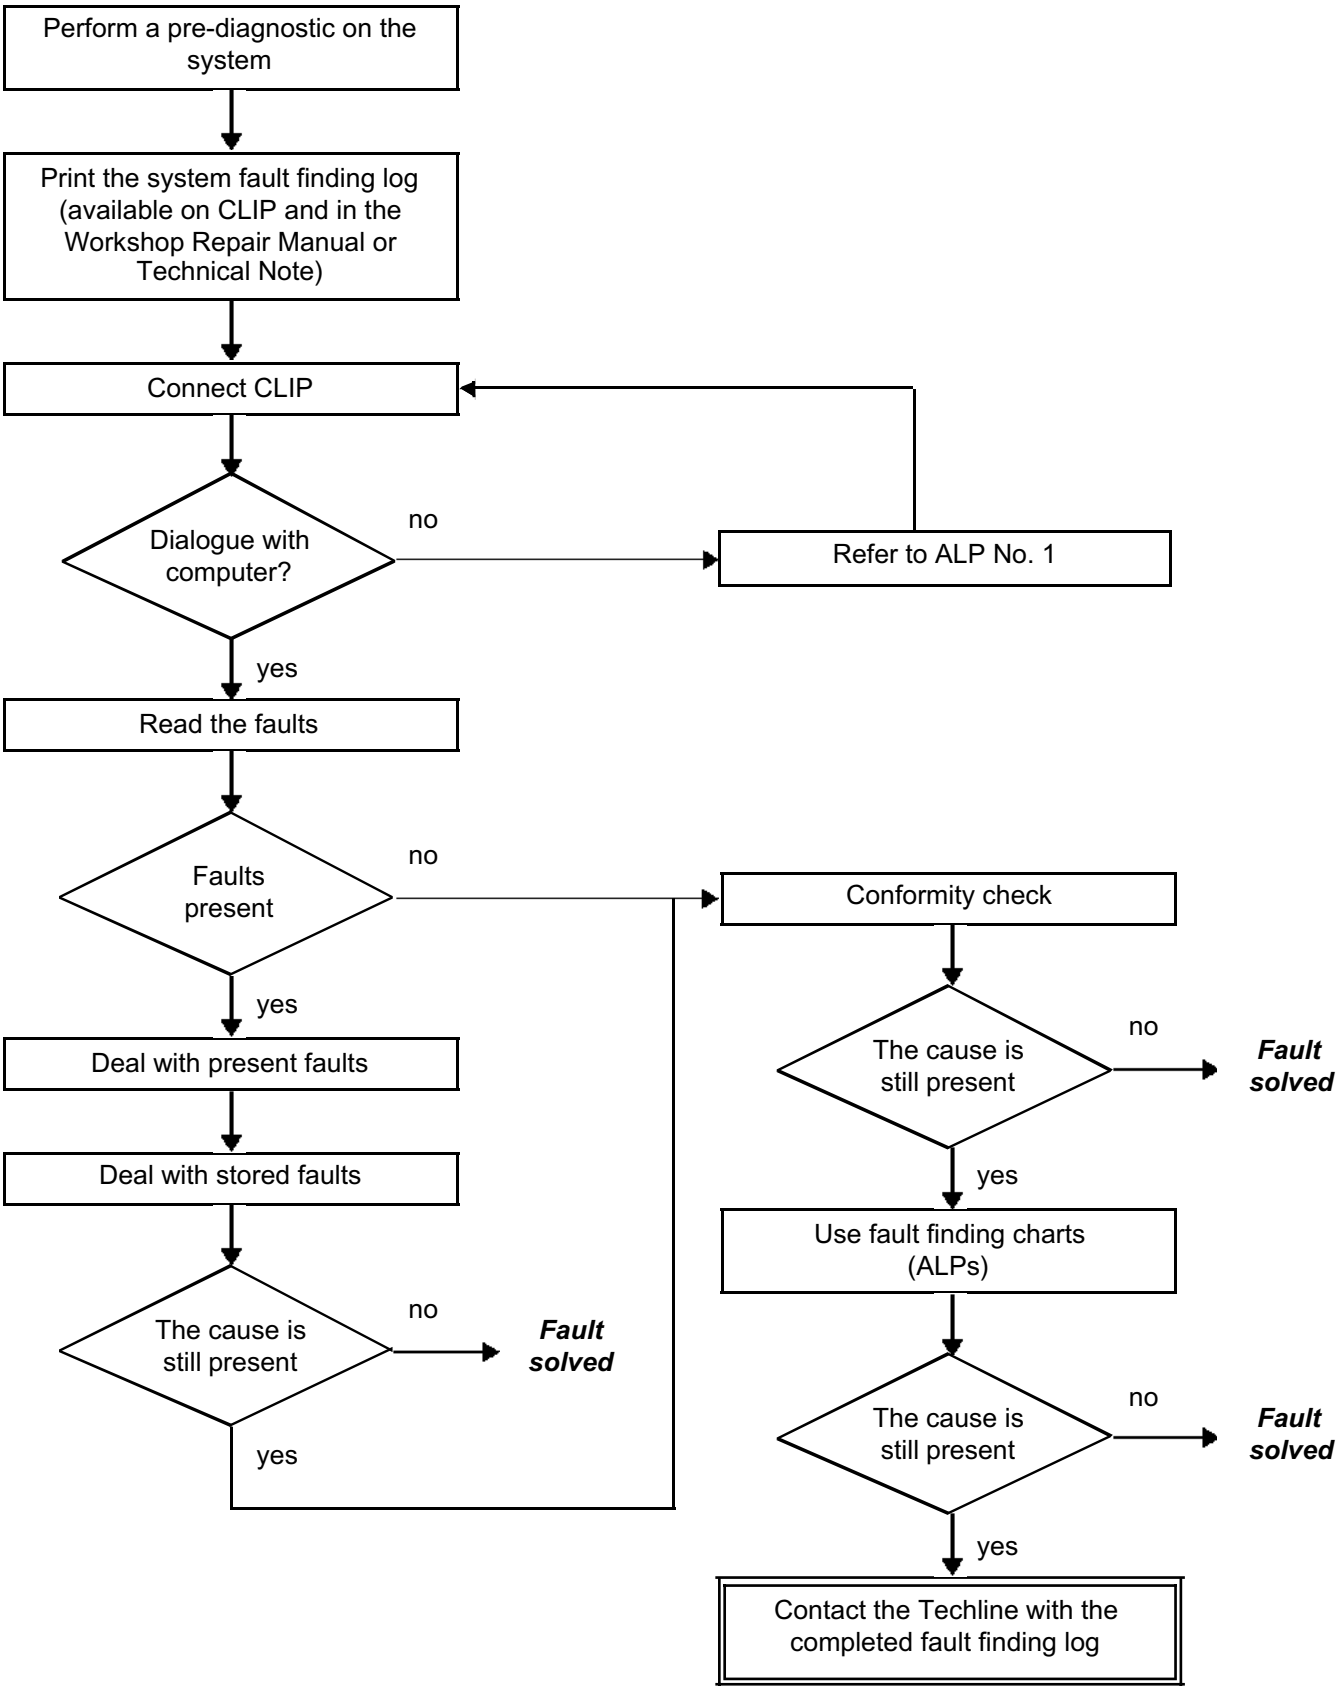
Customer complaints - Fault finding chart

If the test with the diagnostic tool is OK but the customer complaint is still present, the fault should be processed by **customer complaint**.

A synopsis of the general procedure to follow is provided on the following page in the form of a flow chart.

GETtheMANUALS.org

4. FAULT FINDING PROCEDURE



GETtheMANUALS.org

4. FAULT FINDING PROCEDURE (continued)

Wiring check

Fault finding problems
Disconnecting the connectors and/or manipulating the wiring harness may temporarily remove the cause of a fault.
Electrical measurements of voltage, resistance and insulation are generally correct, especially if the fault is not present when the analysis is made (stored fault).

Visual inspection
Look for damage under the bonnet and in the passenger compartment.
Carefully check the fuses, insulators and wiring harness routing.
Look for signs of oxidation.

Physical inspection
While manipulating the wiring harness, use the diagnostic tool to note any change in fault status from stored to present.
Make sure that the connectors are properly locked.
Apply light pressure to the connectors.
Twist the wiring harness.
If there is a change in status, try to locate the source of the fault.

Inspection of each component
Disconnect the connectors and check the appearance of the clips and tabs, as well as the crimping (no crimping on the insulating section).
Make sure that the clips and tabs are properly locked in the sockets.
Check that no clips or tabs have been dislodged during connection.
Check the clip contact pressure using an appropriate model of tab.

Resistance check
Check the continuity of entire lines, then section by section.
Look for a short circuit to earth, to **+ 12 V** or to another wire.

If a fault is detected, repair or replace the wiring harness.

GETtheMANUALS.org

5. FAULT FINDING LOG

IMPORTANT

IMPORTANT
Any fault on a complex system requires thorough fault finding with the appropriate tools. The FAULT FINDING LOG, which should be completed during the procedure, enables you to keep track of the procedure which is carried out. It is an essential document when consulting the manufacturer.

IT IS THEREFORE MANDATORY TO FILL OUT A FAULT FINDING LOG EACH TIME FAULT FINDING IS CARRIED OUT.

You will always be asked for this log:

- when requesting technical assistance from Techline,
- for approval requests when replacing parts for which approval is mandatory,
- to be attached to monitored parts for which reimbursement is requested. The log is needed for warranty reimbursement, and enables better analysis of the parts removed.

6. SAFETY ADVICE

Safety rules must be observed during any work on a component to prevent any damage or injury:

- check the battery voltage to avoid incorrect operation of computer functions,
- use the proper tools.

GETtheMANUALS.org

V4Y injection system details:

IMPORTANT
A computer is matched to the engine and the vehicle on which it is installed. It is prohibited to try a computer on another vehicle then return it to the original vehicle.

1. Motorised throttle valve

1.1 General

In the motorised throttle valve system there are no adjustments between the acquisition of the real value with the potentiometers, and the mechanical position of the throttle valve. An adjustment must therefore be made in the injection computer.
During this operation, the position of the lower mechanical stop and the **stand-by throttle position are programmed**, and the potentiometer amplifier is balanced.
The programmed values are stored in the computer memory. The sequence of **programming the end stops** and **storing programmed values** equates to **initialising** the motorised throttle valve. The springs of the motorised throttle are also tested.
The above initialisation process runs automatically and independently when the ignition is switched on, but only under certain initial conditions. It may also run several times when the ignition is on.

1.2 Throttle programming procedure

Programming should be performed at least once correctly during the vehicle life cycle, that is, when switching on for the first time (original initialisation), and then **each time either the computer or the motorised throttle valve is replaced**. After the throttle valve is replaced and before reprogramming, the **programming must be cleared**.
Switch on the ignition for approximately **30 seconds**, then switch off and wait for the end of power-latch.
Switch the ignition on again, start the engine and check that the engine responds correctly to movements of the accelerator pedal.

2. Warning light management

Management of the operation of warning lights and injection information is incorporated in the instrument panel.
In the event of a fault, refer to section **83A, Instrument panel**.
– The OBD (On Board Diagnostic) warning light (orange engine icon) signals that the pollution threshold has been exceeded.

Each time the ignition is switched on, the OBD warning light comes on to permit a visual inspection. This light goes out **3 seconds** after starting the engine.
In normal operation, if the warning light is lit continuously, the injection system is exceeding the pollution threshold due to an OBD fault (misfiring, ageing of the oxygen sensors or a fault on the fuel supply) or an electrical fault leading to an OBD fault (injector, coil, etc.). Flashing of this warning light signifies a risk of catalytic converter damage.

GETtheMANUALS.org

3. Climate control computer - injection computer connection

The injection computer is connected to the CLIMATE CONTROL computer via the multiplex link:
When the **CLIMATE CONTROL** switch is turned on, the CLIMATE CONTROL computer requests compressor operation.
The injection computer authorises or inhibits the compressor clutch and if necessary imposes a fast idle speed which increases in increments of **50 rpm**.

Compressor operation programming

During certain operating phases, the injection computer disables the compressor:
– for 3 seconds after the engine has been started, if the throttle position is more than approximately 67˚ (acceleration at a value below 54˚), for 5 seconds if use is made of the power assisted steering at the same moment as the demand for climate control, if the coolant temperature is more than **115 ˚C** and if the engine speed is above **5400 rpm** (acceleration at an engine speed below **4900 rpm**).

1. COMPUTER REPLACEMENT AND PROGRAMMING OR REPROGRAMMING OPERATIONS

The system can be reprogrammed via the diagnostic socket using the **RENAULT CLIP** diagnostic tool (see **Technical Note 3585A**)

While the computer is being reprogrammed the fan assemblies are triggered automatically.

IMPORTANT
- **Switch on the diagnostic tool (mains or cigarette lighter feed).**
- **Connect a battery charger.**
- **Switch off all electrical consumers (lights, interior lighting, air conditioning, radio, etc.).**
- **Wait for the engine to cool (engine coolant temperature below 60 ˚C and air temperature below 50 ˚C).**

After any computer reprogramming operation:
- **Switch the ignition off and then on again.**
- **Use the diagnostic tool to carry out the following steps:**
- **Run** command **VP020 Enter VIN**.
- Following programming or reprogramming, faults may appear in the injection computer; run command **RZ007 Fault memory** to clear these faults.
- Program the throttle stops. (see **Configurations and programming: 1.**)
- Program the air path. (see **Configurations and programming: 2.**)
- **IMPORTANT: NEVER** run command **RZ019 Reinitialise programming**.This would erase the engine parameter programming.
- Carry out a road test followed by a complete test with the diagnostic tool.

IMPORTANT
Never drive the vehicle without having programmed the throttle stops.
It is forbidden to perform tests with computers borrowed from the Parts Department or from another vehicle which must then be returned.
These computers are hard-coded.
If the injection computer is defective, contact Techline and refer to the "fault finding log".

2. REPLACING THE MOTORISED THROTTLE VALVE

When replacing the throttle valve, program the throttle stops and the air path. (see **Configurations and programming: 2**)

3. REPLACING THE FLOWMETER

When replacing the flowmeter, program the air path. (see **Configurations and programming: 2.**)

4. REPLACING OR DISCONNECTING THE BATTERY

When replacing or disconnecting the battery, program the air path. (see **Configurations and programming: 2**.)

GETtheMANUALS.org

CONFIGURATIONS AND PROGRAMMING

1. Programming the throttle stops.

After replacing the computer or the motorised throttle valve, switch on the ignition, wait **30 seconds** so that the computer can program the upper and lower stops, then switch off the ignition and wait **30 seconds** for the computer to store the programmed stops. Check the programming with **ET051 Programming throttle stops: Performed**.

2. Programming the air path.

Use procedure 1 or 2 to program the air path.

Preliminary conditions: (procedures 1 and 2)

1 No present or stored faults in the injection computer (otherwise deal with the present faults or clear the stored faults by running command **RZ007 Fault memory**.)
2 The battery voltage should be above **13V** (battery charger required for the manual procedure, as the engine is off)
3 The coolant temperature should be between **70 and 97 ˚C**
4 The gear lever should be in neutral or Park position
5 All electrical consumers should be off (air conditioning unit, heating devices, headlights, de-icing)
6 The cooling fan should not be running.
7 The steering wheel should be in the centre position **(close to 0˚)**
8 The vehicle speed is zero (stationary).

Procedure 1 (with routine):

1 Clear **RZ032 Program air path**
2 With the engine running, run command **VP070 Program air path**
3 Wait for the command to finish.
4 Check status **ET802 Air path programming**
If **ET802 Air path programming** is **Completed**:
– Check that the idle speed is between **600-700 rpm**.
– If **ET802 Air path programming** is **NOT Completed**:
– Check that the throttle valve is completely closed with the ignition off,
– Check the cleanliness and conformity of the air inlet circuit,
– Restart from step **1)** or carry out **procedure 2**.

Procedure 2 (Manual): (to be used if Procedure 1 does not work)

1 Clear **RZ032 Program air path**
2 Switch off the ignition and wait **10 seconds** (for powerlatch).
3 Switch on the ignition, leaving the accelerator pedal **released** for at least **2 seconds**.
4 **Depress the accelerator pedal 5 times at "full load"** in less than **6 seconds**
5 Release the accelerator pedal **completely** for at least **5 seconds**.
6 **Depress the accelerator pedal once at "full load"** for **20 seconds**.
7 Release the accelerator pedal **completely** and start the engine within **10 seconds**.
8 Allow the engine to run for **20 seconds**.
9 Check status **ET802 Air path programming**
If **ET802 Air path programming** is **Completed**:
– Check that the idle speed is between **600-700 rpm**.
If **ET802 Air path programming** is **NOT Completed**:
– Check that the throttle valve is completely closed with the ignition off,
– Check the cleanliness and conformity of the air inlet circuit,
– Restart from step **1)** or contact the **Techline**

DF001 PRESENT OR STORED	COOLANT TEMPERATURE SENSOR CIRCUIT CC.O : Short circuit to earth CO.0 : Open circuit or short circuit to earth CO.1 : Open circuit or short circuit to +12 V 1.DEF : Inconsistent signal

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present following a variation in coolant temperature (Fan unit triggered).

Check the **connection and condition of the coolant temperature sensor connector**.
Replace the connector if necessary.

Check the **resistance of the coolant temperature sensor** (value zero or infinity = total breakdown of the sensor).
Replace the coolant temperature sensor if the resistance is not:

2480 Ω ± 248 Ω at 20˚C
1750 Ω ± 175 Ω at 30˚C

Check **the insulation, continuity and absence of interference resistance** on the following connections:

Injection computer, connector A, track 36 → **Track 1 of the coolant temperature sensor**

Injection computer, connector A, track 15 → **Track 2 of the coolant temperature sensor**

Repair if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF002 PRESENT OR STORED	AIR TEMPERATURE SENSOR CIRCUIT CC.1 : Short circuit to + 12 V CO.0 : Open circuit or short circuit to earth CO.1 : Open circuit or short circuit to +12 V 1.DEF: Inconsistent signal

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present following a variation in air temperature (Fan unit triggered).

Check the **condition and connection of the connector**.
Replace the connector if necessary.

Check the **resistance of the air temperature sensor**.
Replace the air temperature sensor if the resistance is not:

2420 Ω ± 242 Ω at 20˚C.
1050 Ω ± 105 Ω at 40˚C.
600 Ω ± 60 Ω at 60˚C.
400 Ω ± 40 Ω at 80˚C.

After replacing the throttle valve, program the air line. (See Replacement of components, Configurations and programming)

Check **the insulation, continuity and absence of interference resistance** on the following connections:

Injection computer, connector A, track 17 → **Track 5 of the flowmeter**

Injection computer, connector A, track 75 → **track 3 of the flowmeter**

Repair if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF008 PRESENT OR STORED	PEDAL POTENTIOMETER CIRCUIT GANG 1 CO.0 : Open circuit or short circuit to earth 1.DEF: Inconsistency of the signal

NOTES	**Priority for dealing with a combination of faults:** Deal first with faults **DF425 First sensor reference voltage or DF009 Pedal potentiometer circuit gang 2** if they are present or stored.

Check the **condition and connection of the connector**.
Replace the connector if necessary.

Check the **resistance of accelerator pedal position potentiometer 1**.
Replace the potentiometer if the resistance is not 1.2 kΩ ± 0.5 kΩ between tracks 2 and 4 of the pedal potentiometer.

Check **the insulation, continuity and absence of interference resistance** on the following connections:

- **Injection computer, connector A, track 37** → **track 2 of the accelerator pedal position potentiometer 1**
- **Injection computer, connector A, track 38** → **track 3 of the accelerator pedal position potentiometer 1**
- **Injection computer, connector A, track 43** → **track 4 of the accelerator pedal position potentiometer 1**

Repair if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF009 PRESENT OR STORED	PEDAL POTENTIOMETER CIRCUIT GANG 2 CO.0 : Open circuit or short circuit to earth 1.DEF: Inconsistency of the signal

NOTES	**Priority for dealing with a combination of faults:** Deal with the **DF425 First sensor reference voltage fault** first if it is present or stored. If faults **DF333 Injection → Automatic transmission connection** and **DF491 Electronic Stability Program (ESP)** are also present, check the computer earth lines on **tracks 115 and 116** (see **ALP 1**). Repair them if necessary. Switch off the ignition and wait for an end of dialogue to confirm the fault.

Check the **condition and connection of the connector**.
Replace the connector if necessary.

Check the **resistance of accelerator pedal position potentiometer 2**.
Replace the potentiometer if the resistance is not **1.7 kΩ ± 0.7 kΩ** between **tracks 1 and 5** of the pedal potentiometer.

Check **the insulation, continuity and absence of interference resistance** on the following connections:

Injection computer, connector A, track 24	→	**Track 5 of the accelerator pedal position potentiometer 2**
Injection computer, connector A, track 39	→	**Track 6 of the accelerator pedal position potentiometer 2**
Injection computer, connector A, track 40	→	**Track 1 of the accelerator pedal position potentiometer 2**

Repair if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF023 PRESENT OR STORED	COOLANT TEMPERATURE OVERHEATING WARNING LIGHT CIRCUIT

NOTES	None.

Run a multiplex network test (see **88B, Multiplex**).
Carry out fault finding on the Instrument panel system (see **83A, Instrument panel**).

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF038 PRESENT OR STORED	COMPUTER 1.DEF: Internal command module: RAM (Random Access Memory) error

NOTES	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Use the following procedure:
– Switch on the ignition.
– Clear the stored fault on the injection computer using the diagnostic tool.
– Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end.
– Switch on the ignition and establish dialogue with the injection computer.
If the computer fault is still present, contact the Techline.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF056 PRESENT OR STORED	AIR FLOWMETER CIRCUIT CO.0 : Open circuit or short circuit to earth CO.1 : Short circuit or open circuit to + 12 V 1.DEF: Inconsistency of the signal

NOTES	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Check **the connection and condition** of the air flow sensor connector. Replace the connector if necessary.

Check that the sensor is **pneumatically connected**. Repair if necessary.

Check that the **inlet circuit has no leaks**.
Repair if necessary.

Check the **flowmeter resistance between track 1 and track 3**.
Replace the flowmeter if the resistance is not **2420 Ω ± 242 Ω**.

After the flowmeter has been replaced, program the air line. (See Replacement of components, Configurations and programming)

Check **the insulation, continuity and absence of interference resistance** on the following connections:

Injection computer, connector A, track 43 → **Track 2 of the flowmeter**

Injection computer, connector A, track 56 → **Track 1 of the flowmeter**

Injection computer, connector A, track 75 → **Track 3 of the flowmeter**

Main relay track 3 → **Track 4 of the flowmeter**

Repair if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF059 PRESENT OR STORED	COMBUSTION MISFIRES ON CYLINDER 1

NOTES	**Special note:** Indicates that the fault is confined to this cylinder. Priority for dealing with a combination of faults: – If the following faults: **DF059 Misfiring on cylinder 1;** **DF060 Misfiring on cylinder 2;** **DF061 Misfiring on cylinder 3;** **DF062 Misfiring on cylinder 4;** **DF063 Misfiring on cylinder 5;** **DF064 Misfiring on cylinder 6;** are all present, carry out procedure **DF436 Combustion misfire fault finding**. – If the fault is confined to this cylinder, deal with fault **DF436: Detection of misfires** first.

Check:
– condition and connection of the injector,
– condition of the pipe supplying fuel to the injector,
– condition and type of spark plug,
– the operation of the coil following fault procedure **DF345 Ignition coil circuit**,
– compression.
Repair if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF060 PRESENT OR STORED	COMBUSTION MISFIRING ON CYLINDER 2

NOTES	**Special note:** Indicates that the fault is confined to this cylinder. Priority for dealing with a combination of faults: – If the following faults: **DF059 Misfiring on cylinder 1;** **DF060 Misfiring on cylinder 2;** **DF061 Misfiring on cylinder 3;** **DF062 Misfiring on cylinder 4;** **DF063 Misfiring on cylinder 5;** **DF064 Misfiring on cylinder 6;** are all present, carry out procedure **DF436 Combustion misfire fault finding**. – If the fault is confined to this cylinder, deal with fault **DF436: Detection of misfires** first.

Check:
– condition and connection of the injector,
– condition of the pipe supplying fuel to the injector,
– condition and type of spark plug,
– the operation of the coil following fault procedure **DF345 Ignition coil circuit**,
– compression.
Repair if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

NOTES	None.

Run a multiplex network test (see **88B, Multiplex**).
Carry out fault finding on ABS and ESP system (see **38C, ABS**).

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF106 PRESENT OR STORED	CRUISE CONTROL/SPEED LIMITER SELECTOR SWITCH ON STEERING WHEEL

NOTES	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Check the **condition and connection** of the function selector switch connector.
Repair if necessary.

Check **the insulation, continuity and absence of interference resistance** on the following connections:

Track 55, injection computer connector A → **Function selector switch**

Injection computer, connector A, track 54 → **Function selector switch**

Repair if necessary.

If the problem persists, replace the switch on the steering wheel.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF116 PRESENT OR STORED	MULTIPLEX NETWORK

NOTES	None.

Carry out a fault finding procedure on the multiplex network (see **88B Multiplex network**).

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF151 PRESENT OR STORED	MAIN RELAY CIRCUIT CO.0 : Open circuit or short circuit to earth

NOTES	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Check **the condition of the battery and the vehicleearths**.
Repair if necessary.

Check the **connection and condition of the main relay connector**.
Repair if necessary.

Check the **main relay coil**.
Replace the relay if necessary.

Check **for 12 V on tracks 1 and 5 of the main relay**.
Repair the wiring up to the fuse if necessary.

Check **the insulation, continuity and absence of interference resistance** on the following connections:

Injection computer, connector A, track 44 ⟶ **Track 2 of the main relay**

Injection computer, connector B, track 120 ⟶ **Track 3 of the main relay**

Repair if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF154 PRESENT OR STORED	FLYWHEEL SIGNAL SENSOR CIRCUIT 1.DEF: No signal 2.DEF: Inconsistent signal

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present when the engine is running.
	Special note: In the event of flywheel signal loss, the OBD warning light is illuminated: injection in defect mode.
	Use the Wiring Diagrams Technical Note, ESPACE 4 ph I / II / VELSATIS ph I / II.

Test the battery and run fault finding on the charging circuit (**see Technical Note 6014A, Checking the charging circuit**).
Check the **cleanliness** and **condition** of the flywheel signal sensor connectors. Repair if necessary.
Check that the injection computer connector is clean and in good condition. Repair if necessary.
With the ignition on, check for a voltage of between **4.5 and 6 volts** on connection **3FB** of the flywheel signal sensor, **component code 149**. Repair if necessary.
Use the universal bornier to check the insulation and continuity of the following connections: Between the injection computer, **component code 120** and the **flywheel signal sensor, component code 149**. **– connection code 3BL** **– connection code 3FB** **– connection code 3BG** If there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.
If the fault is still present, replace the flywheel signal sensor.
If the problem is still present, contact the Techline.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF200 PRESENT OR STORED	ATMOSPHERIC PRESSURE SENSOR CO.0 : Open circuit or short circuit to earth CO.1 : Short circuit or open circuit to + 12 V 1.DEF: Inconsistency of the signal

NOTES	**Priority for dealing with a combination of faults:** Apply the procedure for dealing with faults **DF328 Throttle potentiometer circuit or DF008 Throttle potentiometer circuit gang 1** first if they are present or stored.
	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Check the **connection and condition of the atmospheric pressure sensor connector**.
Replace the connector if necessary.

Check that the pressure sensor is **pneumatically connected**.
Repair if necessary.

Check **the insulation, continuity and absence of interference resistance** on the following connections:

- **Injection computer, connector A, track 43** → **Track C of the manifold pressure sensor**
- **Injection computer, connector A, track 22** → **Manifold pressure sensor, track B**
- **Injection computer, connector A, track 62** → **Manifold pressure sensor, track A**

Repair if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF301 PRESENT OR STORED	AIR INLET CIRCUIT CO.0 : Open circuit or short circuit to earth

NOTES	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Check the **connection and condition of the variable inlet solenoid valve connector**.
Repair if necessary.

With the ignition switched on, check for **12 V** on track A1 of the variable inlet solenoid valve. Repair the line to the main relay if necessary.

Check **the insulation, continuity and the absence of interference resistance** of the following connections:

Injection computer, connector A, track 7 ⟶ **Track 2 of the variable inlet solenoid valve**

Repair if necessary.

If necessary, replace the variable inlet solenoid valve.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF328 PRESENT OR STORED	THROTTLE POTENTIOMETER CIRCUIT CO.0 : Open circuit or short circuit to earth CO.1 : Short circuit or open circuit to + 12 V 1.DEF: Inconsistency of the signal 2.DEF: Signal outside lower limit

NOTES	**Priority for dealing with a combination of faults:** Deal first with the **DF425 First sensor reference voltage fault** if it is present or stored.
	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Check **the connection and condition** of the throttle potentiometer connector.
Replace the connector if necessary.

Check **the insulation, continuity and the absence of interference resistance** of the following connections:

- **Injection computer, connector A, track 24** → **Track A1 of the throttle potentiometer**
- **Injection computer, connector A, track 19** → **Track A2 of the throttle potentiometer**
- **Injection computer, connector A, track 20** → **Track A4 of the throttle potentiometer**
- **Injection computer, connector A, track 23** → **Track A5 of the throttle potentiometer**

Repair if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF330 PRESENT OR STORED	PINKING SENSOR CIRCUIT CO.0: Open circuit or short circuit to earth CO.1: Short circuit or open circuit to + 12 V

NOTES	None.

Check the **connection and condition of the pinking sensor connector**.
Replace the connector if necessary.

Check the **tightness of the pinking sensor** on the engine block.
Repair if necessary.

Check **the insulation, continuity and the absence of interference resistance** of the following connections:

Injection computer, connector A, track 16 → **Track 1 of the pinking sensor**

Injection computer, connector A, track 35 → **Track 2 of the pinking sensor**

Earth → **Pinking sensor screening**

Repair if necessary.

If everything is correct, replace the pinking sensor.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF333 PRESENT OR STORED	INJECTION → AUTOMATIC TRANSMISSION CONNECTION 1.DEF: No signal

NOTES	**Priority for dealing with a combination of faults:** Deal with faults **DF009 Pedal potentiometer circuit gang 2 or DF491 Electronic Stability Program (ESP)** first if they are present or stored; check the computer earth lines on **tracks 115** and **116** using the **ALP 1** procedure.
	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Run a multiplex network test (see **88B, Multiplexing**).
Carry out fault finding on the automatic transmission (see **23A, Automatic transmission**).

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF345 PRESENT OR STORED	IGNITION COIL CIRCUIT

NOTES	**Conditions for detecting the fault by injection computer:** Engine operating with starter motor activated or running for 10 seconds. **If one cylinder is misfiring, look for faults on that cylinder first.** Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Check the **connection and condition of the coil connectors**.
Replace the connector(s) if necessary.

Check the **tightness of the pinking sensor** on the engine block.
Repair if necessary.

Check **the insulation, continuity and the absence of interference resistance** of the following connections:

- **Injection computer, connector B, track 92** → **track 1 of coil 1**
- **Injection computer, connector B, track 93** → **track 1 of coil 2**
- **Injection computer, connector B, track 94** → **track 1 of coil 3**
- **Injection computer, connector B, track 95** → **track 1 of coil 4**
- **Injection computer, connector B, track 84** → **Track 1 of coil 5**
- **Injection computer, connector B, track 85** → **track 1 of coil 6**

Repair if necessary.

With the ignition on, check for **12 V on track A3 of each coil**.
Repair if necessary.

If everything is correct:
– check that the spark plugs are in good condition,
– fit the spark plugs and connect them to their coils; place the plugs in contact with a reliable earth and activate the starter motor to check that all the coils give a good spark.

Replace any non-conforming spark plug(s).

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF374 PRESENT OR STORED	COMPUTER 1.DEF: Internal electrical fault

NOTES	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Use the following procedure:
– Switch on the ignition.
– Clear the stored fault on the injection computer using the diagnostic tool.
– Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end.
– Switch on the ignition and establish dialogue with the injection computer.
If the computer fault is still present, contact the Techline.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF379 PRESENT OR STORED	CYLINDER 1 INJECTOR CONTROL 1.DEF: Open circuit or short circuit

NOTES	**Conditions for detecting the fault:** Run the engine. If the fuel pump does not operate, run the **AC015 Fuel pump relay** fault finding check first, because a fuel pump relay fault can cause this fault to occur.
	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Check the **injector 1 resistance.**
Replace the injector if the resistance is not 15 Ω ± 0.8 Ω at 20˚C.

While the starter motor is operating, check for **12 V** on injector 1.
If necessary, repair the line up to the fuel pump relay.

Check the **insulation, continuity and the absence of interference resistance** of the following connection:

Injection computer, connector B, track 106 ⟶ **Track 2 of injector 1**

Repair if necessary.

Note:
If all the injectors are faulty, check that the fuel pump relay is not defective.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF380 PRESENT OR STORED	CYLINDER 2 INJECTOR CONTROL 1.DEF: Open circuit or short circuit

NOTES	**Conditions for detecting the fault:** Run the engine. If the fuel pump does not operate, run the **AC015 Fuel pump relay** fault finding check first, because a fuel pump relay fault can cause this fault to occur.
	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Check the **injector 1 resistance.**
Replace the injector if the resistance is not 15 Ω ± 0.8 Ω at 20˚C.

While the starter motor is operating, check for **12 V** on injector 2.
If necessary, repair the line up to the fuel pump relay.

Check the **insulation, continuity and the absence of interference resistance** of the following connection:

Injection computer, connector B, track 107 ⟶ **Track 2 of injector 2**

Repair if necessary.

Note:
If all the injectors are faulty, check that the fuel pump relay is not defective.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF381 PRESENT OR STORED	CYLINDER 3 INJECTOR CONTROL 1.DEF: Open circuit or short circuit

NOTES	**Conditions for detecting the fault:** Run the engine. If the fuel pump does not operate, run the **AC015 Fuel pump relay** fault finding check first, because a fuel pump relay fault can cause this fault to occur.
	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Check the **resistance of injector 3**.
Replace the injector if the resistance is not 15 Ω ± 0.8 Ω at 20˚C.

While the starter motor is operating, check for **12 V** on injector 3.
If necessary, repair the line up to the fuel pump relay.

Check the **insulation, continuity and the absence of interference resistance** of the following connection:

Injection computer, connector B, track 108 ⟶ **Track 2 of injector 3**

Repair if necessary.

Note:
If all the injectors are faulty, check that the fuel pump relay is not defective.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF382 PRESENT OR STORED	CYLINDER 4 INJECTOR CONTROL 1.DEF: Open circuit or short circuit

NOTES	**Conditions for detecting the fault:** Run the engine. If the fuel pump does not operate, run the **AC015 Fuel pump relay** fault finding check first, because a fuel pump relay fault can cause this fault to occur.
	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Check the **resistance of injector 4**.
Replace the injector if the resistance is not 15 Ω ± 0.8 Ω at 20˚C.

While the starter motor is operating, check for **12 V** on injector 4.
If necessary, repair the line up to the fuel pump relay.

Check the **insulation, continuity and the absence of interference resistance** of the following connection:

Injection computer, connector B, track 100 ⟶ **Track 2 of injector 4**

Repair if necessary.

Note:
If all the injectors are faulty, check that the fuel pump relay is not defective.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF411 PRESENT OR STORED	BRAKE PEDAL SENSOR CIRCUIT 1.DEF: Inconsistency of the signal

NOTES	When running this fault finding check, the ABS/ESP computer must not be faulty. If fault **DF116: Multiplex network** is present, deal with it first. Switch off the ignition and wait for an end of dialogue to confirm the fault.

Check the **connection and condition of the brake pedal switch connector**. Replace the connector if necessary.
Check the **operation of the brake pedal switch**. Replace the switch if necessary.
Check the **insulation, continuity and the absence of interference resistance** of the following connection: **Injection computer, connector A, track 11** ⟶ **Track 3 of the brake pedal switch connector** Repair if necessary.
Check the connection between the brake pedal sensor and the ABS computer (see **38C, ABS system**).

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF413 PRESENT OR STORED	MOTORISED THROTTLE 1.DEF: Motorised throttle: closed

NOTES	**Priority for dealing with a combination of faults:** – Deal first with fault **DF413 Motorised throttle** if it is present and check the computer earth lines on tracks **118** and **121** using the **ALP 1** procedure. – Deal with fault **DF487 Programming throttle stops** first if it is present. Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Check the **connection and condition of the motorised throttle connector**.
Repair if necessary.

Check **the insulation, continuity and the absence of interference resistance** of the following connections:

Injection computer, connector A, track 62 → **track 6 of the motorised throttle valve**

Injection computer, connector A, track 1 → **track 3 of the motorised throttle valve**

Repair if necessary.

If everything is correct, replace the motorised throttle body.

After replacing the throttle valve, program the air path. (See Replacement of components, Configurations and programming)

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF425 PRESENT OR STORED	FIRST SENSOR REFERENCE VOLTAGE 1.DEF: Open circuit or short circuit

NOTES	This fault takes priority over the following faults: **DF328 Throttle potentiometer circuit;** **DF008 Pedal potentiometer circuit gang 1;** **DF009 Pedal potentiometer circuit gang 2;** **DF200 Atmospheric pressure sensor;** **DF579 Power-assisted steering pressure sensor circuit;** **DF106 Cruise control/speed limiter selector switches on steering wheel** **DF056 Air flowmeter circuit.** Check that parameter **PR071: Computer supply voltage** matches the battery voltage. If the voltage shown by parameter **PR071** is greater than the battery voltage, there is a short circuit to earth. If the voltage shown by parameter **PR071** is less than the battery voltage, there is a short circuit to + 12 V. Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Check the condition of the connectors for the following components:
– accelerator pedal potentiometer,
– flow sensor,
– power-assisted steering pressure sensor,
– manifold pressure sensor,
– throttle valve potentiometer.
Replace the connector(s) if necessary.

To check if the fault changes from present to stored, disconnect the following sensors, **one** by **one**:
– accelerator pedal potentiometer,
– flow sensor,
– power-assisted steering pressure sensor,
– manifold pressure sensor,
– throttle valve potentiometer.
If necessary, deal with the fault that applies to the sensor.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF425 **CONTINUED**	

Check **the insulation, continuity and the absence of interference resistance** of the following connections:

- **Injection computer, connector A, track 43** → **track 1 of the throttle potentiometer**
- **Injection computer, connector A, track 43** → **track C of the manifold pressure sensor**
- **Injection computer, connector A, track 43** → **track 2 of the flowmeter**
- **Injection computer, connector A, track 43** → **track 3 of the power-assisted steering pressure sensor**
- **Injection computer, connector A, track 43** → **track 4 of the accelerator pedal potentiometer**
- **Injection computer, connector A, track 24** → **track 5 of the accelerator pedal potentiometer**

Repair if necessary.

If the fault has still not been solved, deal with the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF429 PRESENT OR STORED	CRUISE CONTROL FUNCTION CO.0: Open circuit or short circuit to earth 1.DEF: Inconsistency of the signal 1.DEF: Internal electronic fault

NOTES	**Priority for dealing with a combination of faults:** Firstly, deal with the following faults: **DF333 Injection → automatic transmission connection,** **DF090 Vehicle speed sensor circuit,** **DF411 Brake pedal sensor circuit,** **DF116 Multiplex network,** **DF491 Electronic Stability Program (ESP),** **DF502 Cruise control or speed limiter button,** **DF411 Brake pedal sensor circuit,** **DF106 Cruise control/speed limiter selector switches on steering wheel** if they are present or stored, as these are the probable cause of this fault.

WARNING
This fault may appear if the wiring harness has been damaged.
Follow the procedure described in the Wiring Check in the Introduction.
This check enables the condition and the conformity of the engine wiring harness to be checked.

If fault **DF429 Vehicle speed regulator function** is declared present, refer to section on **Cruise control/Speed limiter** conformity check, and Interpretation of statuses **ET042 Cruise control/Speed limiter and ET415 Speed regulator deactivation**.
Check that by pressing the buttons the statuses change and that, with the ignition switched on, all the values are correct.
If the fault is still present, contact the Techline.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF431 PRESENT OR STORED	CYLINDER 5 INJECTOR CONTROL 1.DEF: Open circuit or short circuit

NOTES	**Conditions for detecting the fault:** Run the engine. If the fuel pump does not operate, run the **AC015 Fuel pump relay** fault finding check first, because a fuel pump relay fault can cause this fault to occur.
	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Check the **resistance of injector 5**.
Replace the injector if the resistance is not 15 Ω ± 0.8 Ω at 20˚C.

While the starter motor is operating, check for **12 V** on injector 5.
If necessary, repair the line up to the fuel pump relay.

Check the **insulation, continuity and the absence of interference resistance** of the following connection:

Injection computer, connector B, track 99 → **Track 2 of injector 5**

Repair if necessary.

Note:
If all the injectors are faulty, check that the fuel pump relay is not defective.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF432 PRESENT OR STORED	CYLINDER 6 INJECTOR CONTROL 1.DEF: Open circuit or short circuit

NOTES	**Conditions for detecting the fault:** Run the engine. If the fuel pump does not operate, run the **AC015 Fuel pump relay** fault finding check first, because a fuel pump relay fault can cause this fault to occur.
	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Check the **resistance of injector 6**.
Replace the injector if the resistance is not 15 Ω ± 0.8 Ω at 20˚C.

While the starter motor is operating, check for **12 V** on injector 6.
If necessary, repair the line up to the fuel pump relay.

Check the **insulation, continuity and the absence of interference resistance** of the following connection:

Injection computer, connector B, track 98 → **Track 2 of injector 6**

Repair if necessary.

Note:
If all the injectors are faulty, check that the fuel pump relay is not defective.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF436 PRESENT OR STORED	DETECTION OF ENGINE MISFIRING

NOTES	**Priority for dealing with a combination of faults:** Firstly, deal with the following faults: **DF379 Cylinder 1 injector control,** **DF380 Cylinder 2 injector control,** **DF381 Cylinder 3 injector control,** **DF382 Cylinder 4 injector control,** **DF431 Cylinder 5 injector control,** **DF432 Cylinder 6 injector control,** if they are present or stored. If one or more of the following faults: **DF059 Combustion misfire in cylinder 1,** **DF060 Misfiring on cylinder 1;** **DF061 Misfiring on cylinder 1;** **DF062 Misfiring on cylinder 1;** **DF063 Misfiring on cylinder 1;** **DF064 Misfiring on cylinder 1;** are present or stored**,** deal with them separately. If none or all six of the above-mentioned faults occur, follow this fault finding procedure.

For each cylinder, check the:
– condition and connection of the injector,
– condition and type of spark plug,
– operation of the coil following fault procedure **DF345 Ignition coil circuit**,
– compression.
Repair if necessary.

Check the engine target.
Repair if necessary.

Check the fuel system:
– the condition of the fuel filter,
– the fuel flow rate and pressure.
– the condition of the fuel pump,
– the conformity of the fuel,
– the cleanliness of the tank.
Repair if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF439 PRESENT OR STORED	IDLE SPEED REGULATION 1.DEF: Lower end stop 2.DEF: Top end stop CO.0: Open circuit or short circuit to earth

NOTES	**Priority for dealing with a combination of faults:** Deal with fault **DF413 Motorised throttle** first if it is present and check the computer earth lines on tracks **118** and **121** using procedure **ALP 1 (see ALPs)**. Deal with any present faults relating to the motorised throttle or the accelerator pedal.

Check that status **ET051: Throttle stop programming** is **DONE** and that status **ET278: Throttle position: no load** is recognised and ACTIVE.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF448 PRESENT OR STORED	UPSTREAM OXYGEN SENSOR NO. 1 CO: Open circuit CC.0: Short circuit to earth CO.1: Short circuit or open circuit to + 12 V 1.DEF: Inconsistency of the signal

NOTES	None.

Check the **connection and condition of upstream oxygen sensor connector no. 1**.
Repair if necessary.

Make sure that there is **no air intake**.

If the vehicle is used frequently in town, **decoke the engine.**

Check **the insulation, continuity and the absence of interference resistance** of the following connections:

Injection computer, connector A, track 78 → **Track 4 of the oxygen sensor**

Injection computer, connector A, track 59 → **Track 1 of the oxygen sensor**

Repair if necessary.

Replace the oxygen sensor if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF449 PRESENT OR STORED	UPSTREAM OXYGEN SENSOR NO. 2 CO: Open circuit CC.0: Short circuit to earth CO.1: Short circuit or open circuit to + 12 V 1.DEF: Inconsistency of the signal

NOTES	None.

Check the **connection and condition of upstream oxygen sensor connector no. 2**.
Repair if necessary.

Make sure that there is **no air intake**.

If the vehicle is used frequently in town, **decoke the engine.**

Check **the insulation, continuity and the absence of interference resistance** of the following connections:

Injection computer, connector A, track 79 → **Track 4 of the oxygen sensor**

Injection computer, connector A, track 60 → **Track 1 of the oxygen sensor**

Repair if necessary.

Replace the oxygen sensor if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF450 PRESENT OR STORED	DOWNSTREAM OXYGEN SENSOR NO. 1 CO.0: Open circuit or short circuit to earth CO.1: Short circuit or open circuit to + 12 V 1.DEF: Inconsistency of the signal

NOTES	None.

Check the **connection and condition of downstream oxygen sensor connector no. 1**.
Repair if necessary.

Make sure that there is **no air intake**.

If the vehicle is used frequently in town, **decoke the engine.**

Check **the insulation, continuity and the absence of interference resistance** of the following connections:

Injection computer, connector A, track 76 → **Track 4 of the oxygen sensor**

Injection computer, connector A, track 57 → **Track 1 of the oxygen sensor**

Repair if necessary.

Replace the oxygen sensor if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF451 PRESENT OR STORED	DOWNSTREAM OXYGEN SENSOR NO. 2 CO.0: Open circuit or short circuit to earth CO.1: Short circuit or open circuit to + 12 V 1.DEF: Inconsistency of the signal

NOTES	None.

Check the **connection and condition of downstream oxygen sensor connector no. 2**.
Repair if necessary.

Make sure that there is **no air intake**.

If the vehicle is used frequently in town, **decoke the engine.**

Check **the insulation, continuity and the absence of interference resistance** of the following connections:

Injection computer, connector A, track 77 → **Track 4 of the oxygen sensor**

Injection computer, connector A, track 58 → **Track 1 of the oxygen sensor**

Repair if necessary.

Replace the oxygen sensor if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF466 PRESENT OR STORED	UPSTREAM OXYGEN SENSOR NO. 1 HEATING CO.1: Short circuit or open circuit to + 12 V CO.0: Open circuit or short circuit to earth

NOTES	None.

Check the **connection and condition of upstream oxygen sensor connector no. 1**.
Repair if necessary.

Check the **oxygen sensor heater resistance**.
Replace the sensor if the resistance is not approximately 4 Ω ± 1 Ω.

Check for **12 V on the oxygen sensor**.
Repair the line if necessary.

Check the **insulation, continuity and the absence of interference resistance** of the following connection:

Injection computer, connector B, track 109 ⟶ **Track 2 of the oxygen sensor**

Repair if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF467 PRESENT OR STORED	UPSTREAM OXYGEN SENSOR NO. 2 HEATING CO.1: Short circuit or open circuit to + 12 V CO.0: Open circuit or short circuit to earth

NOTES	None.

Check the **connection and condition of upstream oxygen sensor connector no. 2**. Repair if necessary.
Check the **oxygen sensor heater resistance**. Replace the sensor if the resistance is not approximately 4 Ω ± 1 Ω.
Check for **12 V on the oxygen sensor**. Repair the line if necessary.
Check the **insulation, continuity and the absence of interference resistance** of the following connection: **Injection computer, connector B, track 110 ⟶ track 2 of the oxygen sensor** Repair if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF468 PRESENT OR STORED	DOWNSTREAM OXYGEN SENSOR NO. 1 HEATING CO.1: Short circuit or open circuit to + 12 V CO.0: Open circuit or short circuit to earth

NOTES	None.

Check the **connection and condition of downstream oxygen sensor connector no. 1**.
Repair if necessary.

Check the **oxygen sensor heater resistance**.
Replace the sensor if the resistance is not approximately 4 Ω ± 1 Ω.

Check for **12 V on the oxygen sensor**.
Repair the line if necessary.

Check the **insulation, continuity and the absence of interference resistance** on the following connection:

Injection computer, connector B, track 101 ⟶ **Track 2 of the oxygen sensor**

Repair if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF469 PRESENT OR STORED	DOWNSTREAM OXYGEN SENSOR NO. 2 HEATING CO.1: Short circuit or open circuit to + 12 V CO.0: Open circuit or short circuit to earth

NOTES	None.

Check the **connection and condition of downstream oxygen sensor connector no. 2**.
Repair if necessary.

Check the **oxygen sensor heater resistance**.
Replace the sensor if the resistance is not approximately 4 Ω ± 1 Ω.

Check for **12 V on the oxygen sensor**.
Repair the line if necessary.

Check the **insulation, continuity and the absence of interference resistance** of the following connection:

Injection computer, connector B, track 102 ⟶ **Track 2 of the oxygen sensor**

Repair if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF470 PRESENT OR STORED	BANK A FUEL SUPPLY

NOTES	None.

– Check the fitting and condition of the air filter.
– Check the condition of the air inlet circuit.

Check:
– the fuel filter,
– the condition of the fuel pump,
– the fuel flow rate and pressure,
– the condition of the fuel pressure regulator,
– the condition of the fuel circuit pipes,
– the condition of the injector rails,
– the condition of the injectors (leaks, etc.),
– the cleanliness of the tank.
Repair or replace defective component(s) if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF471 PRESENT OR STORED	BANK B FUEL SUPPLY

NOTES	None.

– Check the fitting and condition of the air filter.
– Check the condition of the air inlet circuit.

Check:
– the fuel filter,
– the condition of the fuel pump,
– the fuel flow rate and pressure,
– the condition of the fuel pressure regulator,
– the condition of the fuel circuit pipes,
– the condition of the injector rails,
– the condition of the injectors (leaks, etc.),
– the cleanliness of the tank.
Repair or replace defective component(s) if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF479 PRESENT OR STORED	THROTTLE VALVE SERVO

NOTES	**Priority for dealing with a combination of faults:** If fault **DF439: Idle speed regulation** is present, deal with it first. Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Check the **connection and condition of the connector** of the motorised throttle safety relay. Replace the connector if necessary.

Check for **+ 12 V** on track 5 of the motorised throttle safety relay. Repair the line up to the fuse if necessary.

With the ignition switched on, check for + 12 V on track 1 of the motorised throttle safety relay. Repair the line up to the main relay if necessary.

Check **the continuity on tracks 42 and 40** of the motorised throttle safety relay. Replace the relay if necessary.

Check **the insulation, continuity and the absence of interference resistance** of the following connections:

Injection computer, connector A, track 5 → **Motorised throttle safety relay track 38**

Injection computer, connector A, track 63 → **Motorised throttle safety relay, track 40**

Repair if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF487 PRESENT OR STORED	THROTTLE STOP PROGRAMMING

NOTES	**Priority for dealing with a combination of faults:** If fault **DF328: Throttle potentiometer circuit** is present, deal with it first.

Throttle stop programming has not been completed. The fault may be present following an inconsistency in the throttle position.
Carry out throttle stop programming (see **Configurations and programming**).

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF491 PRESENT OR STORED	ELECTRONIC STABILITY PROGRAM (ESP) 1.DEF: No signal

NOTES	**Priority for dealing with a combination of faults:** If faults **DF333 Injection → automatic transmission connection and DF009 Pedal potentiometer circuit gang 2** are also present, check the computer earth lines on **tracks 115 and 116** using the **ALP 1 (see Fault finding charts) procedure**. Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Run a multiplex network test (see **88B, Multiplex network**).
Carry out fault finding on ABS and ESP system (see **38C, ABS**).

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF502 PRESENT OR STORED	CRUISE CONTROL OR SPEED LIMITER BUTTON 1.DEF: Inconsistency of the signal

NOTES	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Check **the connection and condition** of the cruise control/speed limiter switch connector. Repair if necessary.

Check **the insulation, continuity and the absence of interference resistance** of the following connections:

Injection computer, connector A, track 29 → **Speed limiter track switch**

Injection computer, connector A, track 30 → **Cruise control track switch**

Repair if necessary.

If everything is correct, replace the switch.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF508 PRESENT OR STORED	MOTORISED THROTTLE VALVE CONTROL 1.DEF: Throttle position error

NOTES	Switch off the ignition and wait for an end of dialogue to confirm the fault.

Check the **connection and condition of the motorised throttle connector**.
Replace the connector if necessary.

Check the condition of the motorised throttle body and that nothing is mechanically impeding the throttle movement.
Repair if necessary.

Check **the insulation, continuity and the absence of interference resistance** of the following connections:

Injection computer, connector A, track 24 → **Track 1 of the throttle potentiometer**

Injection computer, connector A, track 19 → **Track 2 of the throttle potentiometer**

Injection computer, connector A, track 20 → **Track 4 of the throttle potentiometer**

Injection computer, connector A, track 23 → **Track 5 of the throttle potentiometer**

Injection computer, connector A, track 62 → **Track 6 of the motorised throttle valve**

Injection computer, connector A, track 1 → **Track 3 of the motorised throttle valve**

Repair if necessary.

Using the conformity check, check **parameters PR538 Measured throttle voltage gang 2 and PR539 Measured throttle voltage gang 1** for throttle potentiometer output voltages.
Replace if not correct.

After replacing the throttle valve, program the air path. (See Replacement of components, Configurations and programming)

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF536 PRESENT OR STORED	CANISTER SOLENOID VALVE CONTROL CIRCUIT CO.0: Open circuit or short circuit to earth CO.1: Short circuit or open circuit to + 12 V

NOTES	If the fuel pump does not operate, run the **AC015 Fuel pump relay** fault finding check first, because a fuel pump relay fault can cause this fault to occur. Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Check the **connection and condition of the canister bleed solenoid valve connector**.
Replace the connector if necessary.

Check the **resistance of the fuel vapour absorber bleed solenoid valve**.
Replace the valve if the resistance is not 8 Ω ± 0.4 Ω.

With the starter operating, check for **12 V on track A1 of the fuel vapour absorber bleed solenoid valve**.
If necessary, repair the line up to the fuel pump relay.

Check the **insulation, continuity and the absence of interference resistance** of the following connection:

Injection computer, connector B, track 89 ⟶ **Track 2 of the canister bleed solenoid valve**

Repair if necessary.

Using the conformity check, check **parameters PR538 Measured throttle voltage gang 2 and PR539 Measured throttle voltage gang 1** for throttle potentiometer output voltages.
Replace if not correct.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF567 PRESENT OR STORED	COMPUTER 1.DEF: Internal command module: ROM (Read Only Memory) error

NOTES	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Use the following procedure:
– Switch on the ignition.
– Clear the stored fault on the injection computer using the diagnostic tool.
– Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end.
– Switch on the ignition and establish dialogue with the injection computer.
If the computer fault is still present, contact the Techline.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF579 PRESENT OR STORED	POWER-ASSISTED STEERING PRESSURE SENSOR CIRCUIT 1.DEF: Open circuit or short circuit CO.0: Open circuit or short circuit to earth

NOTES	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Check **the condition and the connection** of the power-assisted steering pressure sensor connector.
Repair if necessary.

Check **the insulation, continuity and the absence of interference resistance** of the following connections:

- **Injection computer, connector A, track 62** → **Track A1 of the power-assisted steering pressure sensor**
- **Injection computer, connector A, track 18** → **Track A2 of the power-assisted steering pressure sensor**
- **Injection computer, connector A, track 43** → **Track A3 of the power-assisted steering pressure sensor**

Repair if necessary.

If everything is correct, replace the sensor.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF588 PRESENT OR STORED	CAMSHAFT No. 1 DEPHASER CONTROL

NOTES	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

With the ignition on, check for **12 V on track A2 of the camshaft dephaser solenoid valve**.
Repair if necessary.

Check the **insulation, continuity and the absence of interference resistance** of the following connection:

Injection computer, connector B, track 103 → **Track 2 of the camshaft dephaser solenoid valve**

Repair if necessary.

Note:
If a solenoid valve remains jammed open, the engine idle speed will probably be unstable.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF589 PRESENT OR STORED	CAMSHAFT No. 2 DEPHASER CONTROL

NOTES	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

With the ignition on, check for **12 V on track A2 of the camshaft dephaser solenoid valve**.
Repair if necessary.

Check the **insulation, continuity and the absence of interference resistance** of the following connection:

Injection computer, connector B, track 104 → **Track 2 of the camshaft dephaser solenoid valve, bank B**

Repair if necessary.

Note:
If a solenoid valve remains jammed open, the engine idle speed will probably be unstable.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF592 PRESENT OR STORED	No.1 CAMSHAFT SENSOR CIRCUIT 1.DEF: Inconsistency of the signal 2.DEF: No signal

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present when the engine is running.
	Special note: OBD warning light lit: injection in defect mode.
	Use the Wiring Diagrams Technical Note, ESPACE 4 ph I / II / VELSATIS ph I / II.

Check that the camshaft sensor is correctly pushed into its housing.
Check that the camshaft sensor and its connectors are **clean** and **in good condition**.
Repair if necessary.

Check that the injection computer connector is clean and in good condition.
Repair if necessary.

With the ignition on, check for a voltage of between **4.5 and 6 volts** on connection **3FB** of the camshaft position sensor, **component number 1305**.
Repair if necessary.

Use the universal bornier to check the **insulation and continuity** of the following connections:
Between the injection computer, **component code 120** and the camshaft position sensor, **component code 1305**.
– connection code 3UY
– connection code 3FB
– connection code 3UM
If there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

If the fault is still present, replace the camshaft sensor.

If the problem is still present, contact the Techline.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF593 PRESENT OR STORED	CAMSHAFT SENSOR CIRCUIT No.2 1.DEF: Inconsistency of the signal 2.DEF: No signal

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present when the engine is running.
	Special note: OBD warning light lit: injection in defect mode.
	Use the Wiring Diagrams Technical Note, ESPACE 4 ph I / II / VELSATIS ph I / II.

Check that the camshaft sensor is correctly pushed into its housing.
Check that the camshaft sensor and its connectors are **clean** and **in good condition**.
Repair if necessary.

Check that the injection computer connector is clean and in good condition.
Repair if necessary.

With the ignition on, check for a voltage of between **4.5 and 6 volts** on connection **3FB** of the camshaft position sensor, **component number 1306**.
Repair if necessary.

Use the universal bornier to check the **insulation and continuity** of the following connections:
Between the injection computer, **component code 120** and the camshaft position sensor, **component code 1306**.
– connection code 3VA
– connection code 3FB
– connection code 3UP
If there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

If the fault is still present, replace the camshaft sensor.

If the problem is still present, contact the Techline.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF594 PRESENT OR STORED	ROW 1 RICHNESS REGULATION 1.DEF: Inconsistency of the signal

NOTES	**Priority for dealing with a combination of faults:** Firstly, deal with the following faults: **DF056 Air flow sensor circuit,** **DF379 Cylinder 1 injector control,** **DF381 Cylinder 3 injector control,** **DF431 Cylinder 5 injector control,** **DF448 Upstream oxygen sensor no. 1;** **DF470 Fuel supply row A** and/or **DF471 Fuel supply row B** if they are present. Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Check that there are no **air leaks on the exhaust system**.
If the vehicle is driven frequently in town, **decoke the engine.**
Check the oxygen sensors using the fault procedures: **DF448 Upstream oxygen sensor no. 1;** **DF450 Downstream oxygen sensor no. 1;** **DF466 Upstream oxygen sensor no. 1 heating;** **DF468 Downstream oxygen sensor no. 1 heating.**
If the fault has still not been solved, deal with the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF595 PRESENT OR STORED	ROW 2 RICHNESS REGULATION 1.DEF: Inconsistency of the signal

NOTES	**Priority for dealing with a combination of faults:** Firstly, deal with the following faults: **DF589 Camshaft no. 2 dephaser control;** **DF380 Cylinder 2 injector control;** **DF382 Cylinder 4 injector control;** **DF432 Cylinder 6 injector control;** **DF448 Upstream oxygen sensor no. 1;** **DF470 Fuel supply row A** and/or **DF471 Fuel supply row B** if they are present.

Check that there are no **air leaks on the exhaust system**.
If the vehicle is driven frequently in town, **decoke the engine**.
Check the oxygen sensors using the fault procedures: **DF449 Upstream oxygen sensor no. 2;** **DF451 Downstream oxygen sensor no. 2;** **DF467 Upstream oxygen sensor no. 2 heating;** **DF469 Downstream oxygen sensor no. 2 heating.**
If the fault has still not been solved, deal with the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF596 PRESENT OR STORED	DETECTION OF OVERHEATING

NOTES	Indicates engine overheating or a coolant temperature fault. When the fault is present, the engine will not exceed **2000 rpm**.

Check the coolant temperature sensor circuit using fault procedure **DF002 Air temperature sensor circuit**.
Check the condition of the cooling system and run the engine until the fan starts to operate to see if the fault recurs.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF610 PRESENT OR STORED	FAULT ON ONE OF THE 2 CRUISE CONTROL/SPEED LIMITER BRAKE CONTACTS 1.DEF: Fault on one of the two brake pedal contacts

NOTES	When running this fault finding check, the ABS/ESP computer must not be faulty. **Priority for dealing with a combination of faults:** Deal with fault **DF116 Multiplex network** first if it is present. Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present: – with the engine running, – With the brake pedal depressed, – With cruise control ON.

Check that the pedal assembly is in good condition.
Check **the cleanliness** and **condition** of the dual-contact brake switch and its connections.
Repair if necessary.

Check the **operation of the brake pedal switch**.
Replace the switch if necessary.

Check the **insulation, continuity and the absence of interference resistance** of the following connection:

Injection computer, connector A, track 11 ⟶ **Brake pedal switch**

Repair if necessary.

Check the connection between the brake pedal sensor and the Anti-lock braking system computer (see **38C, Anti-lock braking system**).

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF611 PRESENT OR STORED	FAULT ON THE 2 CRUISE CONTROL/SPEED LIMITER BRAKE CONTACTS 1.DEF: Fault on both brake pedal contacts

NOTES	When running this fault finding check, the ABS/ESP computer must not be faulty. **Priority for dealing with a combination of faults:** Deal with fault **DF116 Multiplex network** first if it is present. Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present: – with the engine running, – With the brake pedal depressed, – With the cruise control ON with a cruising speed set.

Check that the pedal assembly is in good condition.
Check **the cleanliness** and **condition** of the dual-contact brake switch and its connections.
Repair if necessary.

Check the **operation of the brake pedal switch**.
Replace the switch if necessary.

Check the **insulation, continuity and the absence of interference resistance** of the following connection:

Injection computer, connector A, track 11 ⟶ **Brake pedal switch**

Repair if necessary.

Check the connection between the brake pedal sensor and the Anti-lock braking system computer (see **38C, Anti-lock braking system**).

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF648 PRESENT OR STORED	COMPUTER 1.DEF: Fault in EEPROM

NOTES	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Use the following procedure:
– Switch on the ignition.
– Clear the stored fault on the injection computer using the diagnostic tool.
– Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end.
– Switch on the ignition and establish dialogue with the injection computer.
If the computer fault is still present, contact the Techline.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF989 PRESENT OR STORED	CATALYTIC PRE-CONVERTER No. 1

NOTES	**Apply this fault finding procedure whether the fault is present or stored.** Indicates lack of correlation between signals before and after the catalytic pre-converter, received by the two oxygen sensors on the front row.

Check that there are no **air leaks on the exhaust system**. Repair if necessary.
Visually check the condition of the catalytic pre-converter. A deformity may be causing it to malfunction. **Visually check for signs of thermal shock.**
A warm catalytic pre-converter may be damaged if it comes into contact with cold water.
Check that there has not been any **excessive consumption of oil** or **coolant**. Ask the customer if he has used an additive or other products of this kind. Such products can block the catalytic pre-converter, and damage its short or long term performance.
Check if the engine has been misfiring. This could damage the catalytic pre-converter.
Check the **driving noise**during a road test.
If the cause of the damage is identified, the catalytic pre-converter may be replaced. **If the catalytic pre-converter is replaced without finding the cause, the new catalytic pre-converter may be damaged very quickly.**

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF990 PRESENT OR STORED	CATALYTIC PRE-CONVERTER No. 2

NOTES	**Apply this fault finding procedure whether the fault is present or stored.** Indicates lack of correlation between signals before and after the catalytic pre-converter, received by the two oxygen sensors on the back row.

Check that there are no **air leaks on the exhaust system**. Repair if necessary.
Visually check the condition of the catalytic pre-converter. A deformity may be causing it to malfunction. **Visually check for signs of thermal shock.**
A warm catalytic pre-converter may be damaged if it comes into contact with cold water.
Check that there has not been any **excessive consumption of oil** or **coolant**. Ask the customer if he has used an additive or other products of this kind. Such products can block the catalytic pre-converter, and damage its short or long term performance.
Check if the engine has been misfiring. This could damage the catalytic pre-converter.
Check the **driving noise**during a road test.
If the cause of the damage is identified, the catalytic pre-converter may be replaced. **If the catalytic pre-converter is replaced without finding the cause, the new catalytic pre-converter may be damaged very quickly.**

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

NOTES	Only carry out a conformity check after a **complete check** with the **diagnostic tool**. The values indicated in this conformity check are given as examples. **Application conditions:** Engine stopped, **ignition on**.

GETtheMANUALS.org

ET042	CRUISE CONTROL/SPEED LIMITER

NOTES	**Special note:** Only perform these tests if the statuses do not correspond with the system programming functions.

CRUISE CONTROL

Status **ET042** changes to "**CRUISE CONTROL**" when the **cruise control activation button** is pressed. This button is situated on the instrument panel, or on the centre console of the vehicle.
A **green** instrument panel warning light comes on when status **ET042** is at "**CRUISE CONTROL**".
If status **ET042** does not change to "**CRUISE CONTROL**", check the "**ON/OFF**" button of the cruise control, and the condition of its connector.
Repair if necessary.
Check **for continuity and make sure there is no interference resistance** on the following connection:

Track 30, injection computer connector A ⟶ **track A3** of the 6-track connector Cruise control start/stop button

Repair if necessary.

SPEED LIMITER

Status **ET042** changes to "**CRUISE CONTROL**" when the **cruise control activation button** is pressed. This button is situated on the instrument panel, or on the centre console of the vehicle.
A **yellow** instrument panel warning light comes on when status **ET042** is "**SPEED LIMITING**".
If status **ET042** does not change to "**CRUISE CONTROL**", check the "**ON/OFF**" button of the cruise control, and the condition of its connector.
Repair if necessary.
Check **for continuity and make sure there is no interference resistance** on the following connection:

Track 29, injection computer connector A ⟶ **track B1** of the 6-track connector Cruise control start/stop button

Repair if necessary.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET143	LOW-SPEED FAN UNIT RELAY CONTROL

NOTES	There should be no fault detected on the coolant temperature sensor circuit when this fault finding procedure is being carried out.

Check:
– condition of the low-speed fan unit,
– that the low-speed fan resistance is correct,
– cleanness of the low-speed fan earth,
– low-speed fan feed,
  – feed line between the low-speed fan and the low-speed fan relay.

Repair if necessary.

Check **the connection and condition of the low-speed fan unit relay connector**.
Replace the connector if necessary.

Disconnect the low-speed fan relay. With the ignition on, check for the presence of **+ 12 V on track 1 of the relay**.
Repair if necessary.

Check the **continuity of the relay coil**.
Replace the low-speed fan relay if necessary.

Connect the bornier in place of the computer and check the **insulation, continuity and the absence of interference resistance** on the connection between:

Track 64, injection computer connector A ⟶ **Low-speed fan relay**

Repair if necessary.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET144	HIGH-SPEED FAN UNIT RELAY CONTROL

NOTES	There should be no fault detected on the coolant temperature sensor circuit when this fault finding procedure is being carried out.

Check:
– condition of the high-speed fan unit,
– that the high-speed fan resistance is correct,
– cleanness of the high-speed fan earth,
– high-speed fan feed,
  – feed line between the high-speed fan and the high-speed fan relay.

Repair if necessary.

Check **the connection and condition of the high-speed fan unit relay connector**.
Replace the connector if necessary.

Disconnect the high-speed fan relay. With the ignition on, check for the presence of **+ 12 V on track 1 of the relay**.
Repair if necessary.

Check the **continuity of the relay coil**.
Replace the high-speed fan relay if necessary.

Connect the bornier in place of the computer and check the **insulation, continuity and the absence of interference resistance** on the connection between:

Track 64, injection computer connector A ⟶ **High-speed fan relay**

Repair if necessary.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET413	CRUISE CONTROL/SPEED LIMITER FUNCTION

NOTES	**Special notes:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

INCREASE

Status **ET413** changes to "**INCREASE**" when the "**+**" button for the cruise control is pressed.
This button is situated to the left of the steering wheel.
If status **ET413** does not change to "**INCREASE**", check the condition of the "±" cruise control button and its connector. Repair if necessary.
To be able to remove the driver's airbag and carry out the measures in complete safety (see 88C, Airbag and pretensioners).
Repair if necessary.

Measure **the resistance of the following connection, after pressing the "+" button**:

Track 55, injection computer connector A ⟶ **Track** A1 "±" button

If the resistance is not approximately **300 Ω**, check the continuity of the connection when the button is not pressed.
If there is continuity, replace the "±" control button.
If the connection is broken, repair it.

DECREASE

Status **ET413** changes to "**DECREASE**" when the cruise control "**-**" button is pressed.
This button is situated to the left of the steering wheel.
If status **ET413** does not change to "**DECREASE**", check the condition of the "**±**" cruise control button and its connector. Repair if necessary.
To be able to remove the driver's airbag and carry out the measures in complete safety (see 88C, Airbag and pretensioners).
Repair if necessary.

Measure **the resistance of the following connection after pressing the "-" button**:

Track 55, injection computer connector A ⟶ **Track** A2 "±" button

If the resistance is not approximately **100 Ω**, check the continuity of the connection when the button is not pressed.
If there is continuity, replace the "**±**" control button.
If the connection is broken, repair it.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET413 **CONTINUED**	

SUSPEND	Status **ET413** changes to "SUSPEND" when the "**0**" cruise control button is pressed. This button is situated to the right of the steering wheel. If status **ET413** does not change to "SUSPEND", check the condition of the "**R/0**" cruise control button and its connector. Repair if necessary. **Refer to the airbag Technical Note associated with the vehicle, in order to remove the driver's airbag, and carry work out safely.** Repair if necessary. Measure the **resistance of the following connection, after pressing the "0" button**: **Track 55**, injection computer connector A ⟶ **Track A2,** "**R/0**" button If the resistance is not approximately **0 Ω**, replace the "**R/0**" control button. If the connection is broken, repair it.

RESUME	Status **ET413** changes to "RESUME" when the "**R**" cruise control button is pressed. This button is situated to the right of the steering wheel. If status **ET413** does not change to "RESUME", check the condition of the "**R/0**" cruise control button and its connector. Repair if necessary. **Refer to the airbag fault finding note associated with the vehicle, in order to remove the driver's airbag, and carry work out safely.** Repair if necessary. Measure the **resistance of the following connection, after pressing the "R" button**: **Track 55**, injection computer connector A ⟶ **Track A2,** "**R/0**" button If the resistance is not approximately **900 Ω**, check the continuity of the connection when the button is not pressed. If there is continuity, then replace the "**R/0**" control button. If the connection is broken, repair it.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET556	DRIVER DEACTIVATION OF THE CRUISE CONTROL/SPEED LIMITER

NOTES	**Special notes:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

Note:
Cruise control can be activated when the vehicle speed exceeds **18 mph (30 km/h)**. Status **ET556** details 6 causes for cruise control deactivation.
NOTE
To reinitialise the deactivations stored by the injection computer, use command RZ007 "Fault memory".

STATUS 1	**Brake pedal depressed**
	The cruise control function is deactivated each time the brake pedal is depressed. Status **ET556** changes to "**STATUS 1**", when driving, with cruise control active and the brake pedal depressed. If status **ET556** changes to "**STATUS 1**" without depressing the brake pedal, refer to interpretation of fault **DF411 "Brake pedal sensor circuit**".

STATUS 2	**Traction control request**
	If the vehicle being diagnosed is fitted with traction control, the cruise control function is deactivated each time traction control is selected. Status **ET556** changes to "**STATUS 2**", when driving, with cruise control active and traction control requested. If status **ET556** changes to "**STATUS 2**" without traction control request, refer to fault finding note relating to the vehicle's traction control system.

STATUS 3	**Suspend button pressed**
	Status **ET556** changes to "**STATUS 3**" when driving, with Cruise control/Speed limiter active, if the driver presses the "**0**" button on the Cruise control/Speed limiter. If status **ET556** changes to "**STATUS 3**" without pressing the "**0**" button on the Cruise control/Speed limiter, consult the interpretation of status **ET413 "Cruise control/speed limiter function**" and run fault finding on the "**R/0**" control button of the Cruise control/ Speed limiter.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET556 CONTINUED	

STATUS 5	**Gear lever in neutral position**
	Status **ET556** changes to "**STATUS 5**", when driving, with cruise control active and – if gear lever is in neutral on an automatic transmission. This deactivates cruise control. If status **ET556** changes to "**STATUS 5**" or out of neutral on an automatic transmission, contact the Techline.

STATUS 6	**Inconsistency between the request and the vehicle speed**
	Status **ET556** changes to "**STATUS 6**" if the computer detects too great a difference between the speed requested by the driver and the vehicle speed. This may occur when driving, with cruise control active and where the difference between speeds is great. If status **ET556** changes to "**STATUS 6**" without a great difference in the speeds, contact the Techline.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET557	CRUISE CONTROL/SPEED LIMITER DEACTIVATION BY FUNCTION

NOTES	**Special notes:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

Note:
Cruise control remains deactivated as long as the vehicle speed does not exceed **18 mph (30 km/h).** Status **ET557** details 4 causes for cruise control deactivation.
NOTE
To reinitialise the deactivations stored by the injection computer, use command RZ007 "Fault memory".

STATUS 1	**Cruise control or speed limiter fault**
	If status **ET557** is "**STATUS 1**", refer to the interpretation of status **ET042** "**Cruise control/speed limiter**" and **ET413** "**Cruise control/speed limiter function**", to test the components of the cruise control system and find the faulty one. If status **ET557** changes to "**STATUS 1**", deal with the faults present or stored in the computer. If the fault is still present, contact the Techline.

STATUS 2	**Fault detected by the injection computer**
	Status **ET557** changes to "**STATUS 2**" if the injection computer detects a fault on the injection system: – **faults in the engine speed sensor or camshaft,** – **accelerator pedal faults,** – **engine speed lower than 1000 rpm,** – **engine speed greater than 4700 rpm.** Carry out a multiplex network test, then an injection system test, and carry out fault finding on any faults. If the fault is still present, contact the Techline.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET557 CONTINUED	

STATUS 3	**Invalid vehicle speed**
	Status **ET557** changes to "**STATUS 3**" if the vehicle speed received by the computer is invalid. Carry out fault finding on the **ABS** computer. If faults are present (see **38C, Anti-lock braking system).** If the fault is still present, contact the Techline.

STATUS 4	**Automatic transmission in defect mode.**
	Status **ET557** changes to "**STATUS 4**" if there is a fault in the automatic transmission system. Carry out fault finding on the **automatic transmission** computer. If there are faults (**see 23A, Automatic transmission**). If the fault is still present, contact the Techline.

AFTER REPAIR	Repeat the conformity check from the start.

AC015	FUEL PUMP RELAY

NOTES	Malfunctioning of the fuel pump relay could lead to the appearance of faults relating to the injectors and the fuel vapour absorber bleed solenoid valve.

Check the **condition and connection** of the fuel pump relay connector. Repair if necessary.
Check the continuity of the fuel pump relay **control coil**. Replace the relay if necessary.
Check for **12 V** on **track 3** of the fuel pump relay connector. Repair the wiring up to the fuse if necessary.
With the ignition switched on, check **for 12 V** on **track 2** of the fuel pump relay connector. Repair the wiring up to the fuse if necessary.
Check **the continuity and insulation** of the following connections: **Injection computer, connector B, track 96** → **Fuel pump relay track 1** **Petrol pump** → **Fuel pump relay track 5** Repair if necessary.
If the fault persists, change the petrol pump.

AFTER REPAIR	Carry out another fault finding check on the system.

GETtheMANUALS.org

NOTES	Only refer to these customer complaints after performing a complete check with the diagnostic tool.

NO DIALOGUE WITH THE COMPUTER	→ **ALP 1**
STARTING FAULTS	→ **ALP 2**
IDLING SPEED FAULTS	→ **ALP 3**
FAULTS WHILE DRIVING	→ **ALP 4**

GETtheMANUALS.org

ALP 1	No dialogue with the computer

NOTES	Check the battery voltage.

Ensure that the diagnostic tool is not the cause of the fault by using it to establish dialogue with a computer on another vehicle.
Check the connection between the diagnostic tool and the diagnostic socket (condition of the lead).
Check the injection, engine and passenger compartment fuses.
Repair if necessary.

Check for **+ 12 V** on **track 16** and for **an earth** on tracks **4** and **5** of the diagnostic socket.
Repair if necessary.

Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following **connections**:

Track 2 injection computer connector A	→	**Earth**
Track 4, injection computer connector A	→	**Earth**
Injection computer, connector B, track 115	→	**Earth**
Injection computer, connector B, track 116	→	**Earth**
Injection computer, connector B, track 118	→	**Earth**
Injection computer, connector B, track 121	→	**Earth**
Track 14, injection computer connector A	→	**Track 7 diagnostic socket**
Track 9, injection computer connector A	→	**+ After ignition**
Injection computer, connector B, track 113	→	**Fuse**
Track 44, injection computer connector A	→	**Main relay**
Injection computer, connector B, track 117	→	**Main relay**
Injection computer, connector B, track 119	→	**Main relay**
Injection computer, connector B, track 120	→	**Main relay**

Check the resistance and operation of the main relay control coil.
Replace the relay if necessary.

AFTER REPAIR	Carry out a complete check with the diagnostic tool.

GETtheMANUALS.org

ALP 2	Starting faults

NOTES	Only check the customer complaint after performing a **complete check with the diagnostic tool**.

Check the reliability of the starter motor.
Check that there is fuel present (the fuel gauge may be faulty). Check that the fuel is of the correct type.
Check that no hoses are pinched (especially after a removal operation). Check the condition of the fuel filter. Check the condition of the tank. Check that the tank vent is not blocked.
Check the petrol pump electrical supply. Check that the impact sensor is operating correctly.
Check the idle speed regulation valve. Tap gently to release the valve.
Disconnect the pipe connecting the canister bleed solenoid valve to the inlet manifold. Plug the pipe to prevent an air leak. If there is no longer any disturbance, the canister bleed is at fault.
Check condition of spark plugs and ignition coils. Check that these elements are correct for the vehicle.
Check that the exhaust system is not blocked and that the catalytic converters are not clogged.
Check the engine compressions.
Check the condition of the flywheel.
Check the timing gear setting.

AFTER REPAIR	Carry out a complete check with the diagnostic tool.

GETtheMANUALS.org

ALP 3	Idle speed faults

NOTES	Only check the customer complaint after performing a **complete check with the diagnostic tool**.

Check that there is fuel present (the fuel gauge may be faulty). Check that the fuel is of the correct type.
Check that no hoses are pinched (especially after a removal operation). Check the condition of the fuel filter. Check the condition of the tank. Check that the tank fresh air vent is not blocked.
Check that no hoses are pinched (especially after a removal operation). Check the condition of the fuel filter. Check the condition of the tank. Check that the tank vent is not blocked.
Check the connection and condition of the idle speed regulation stepper motor connector. Replace the connector if necessary.
Check the idle speed regulation valve. Tap gently to release the valve.
Check that the camshaft dephaser solenoid valves are not jammed in the open position.
Disconnect the pipe connecting the canister bleed solenoid valve to the inlet manifold. Plug the pipe to prevent an air leak. If there is no longer any disturbance, the canister bleed is at fault.
Check condition of spark plugs and ignition coils. Check that these elements are correct for the vehicle.

AFTER REPAIR	Carry out a complete check with the diagnostic tool.

GETtheMANUALS.org

ALP 4	Faults when driving

NOTES	Only check the customer complaint after performing a **complete check with the diagnostic tool**.

Check that there is fuel present (the fuel gauge may be faulty). Check that the fuel is of the correct type.
Check that no hoses are pinched (especially after a removal operation). Check the condition of the fuel filter. Check the condition of the tank. Check that the tank fresh air vent is not blocked.
Check that no hoses are pinched (especially after a removal operation). Check the condition of the fuel filter. Check the condition of the tank. Check that the tank vent is not blocked.
Check the connection and condition of the idle speed regulation stepper motor connector. Replace the connector if necessary.
Check the idle speed regulation valve. Tap gently to release the valve.
Check that the camshaft dephaser solenoid valves are not jammed in the open position.
Disconnect the pipe connecting the canister bleed solenoid valve to the inlet manifold. Plug the pipe to prevent an air leak. If there is no longer any disturbance, the canister bleed is at fault.
Check condition of spark plugs and ignition coils. Check that these elements are correct for the vehicle.

AFTER REPAIR	Carry out a complete check with the diagnostic tool.

GETtheMANUALS.org

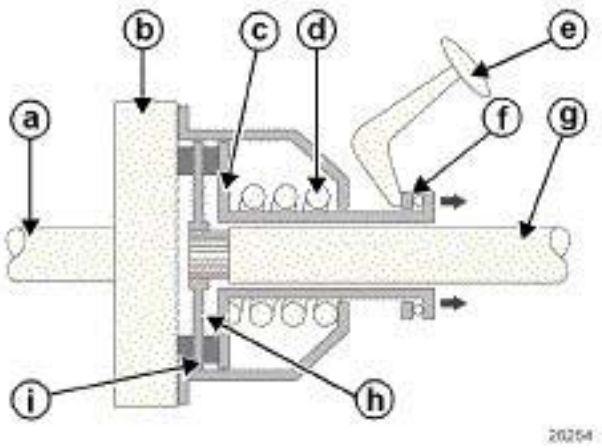
The clutch is a system which enables mechanical action to be either linked or not to an end component.
It is made up of an assembly of parts located between the engine and the transmission components.
It ensures the following functions:

- **When engaged: transmits the power provided.**
- **When disengaged: this transmission is interrupted.**
- **Between the two positions: the transmission of power is gradually restarted.**

There are different types of clutch:

- **Depending on number of discs:**
  - **dry single disc clutch,**
  - **dry double disc clutch with single control,**
  - **double disc clutch with separate control (double),**
  - **wet or dry multidisc clutch.**

- **Depending on type of control:**
  - **manual control,**
  - **hydraulic control,**
  - **electric control with electronic servo.**



a : crankshaft
b : flywheel
c : pressure plate
d : spring
e : clutch pedal
f : clutch thrust bearing
g : gearbox input shaft
h : clutch plate
i : clutch plate pad

The system is made up of the flywheel (b) (attached to the engine) (the bolts in the centre are screwed into the crankshaft (a)).
The clutch plate is attached to the gearbox.
The outermost part is called the friction or pad. The pressure plate ensures that the clutch plate is held against the flywheel when the clutch is engaged, as this is what ensures that they turn at exactly the same speed, one driving the other.
The pressure plate springs are pushed in by the clutch thrust bearing.
When the clutch control (hydraulic, or cable operated) is activated, the clutch plates move apart and less and less movement is transmitted, leaving the gearbox free of the engine. This, for example, allows the vehicle remain stationary without stalling the engine, or a gear to be changed.
The opposite action involves gradually releasing the clutch control, so that the engine and gearbox are reconnected. This manoeuvre is called "slipping the clutch".

GETtheMANUALS.org

Customer complaint: the clutch pedal remains depressed after use.

Use the fault finding chart (see next page) in the following cases:

- **The pedal remains depressed, without the vehicle moving, with the engine running or stationary:**
  - **either after making several successive manoeuvres,**
  - **or after leaving the foot down on the pedal using moderate force for a reasonably prolonged period.**

The function temporarily returns to normal after releasing the pedal manually.

- **The pedal remains depressed only after reasonably prolonged use of the vehicle, particularly in heavy traffic.**

The function temporarily returns to normal after releasing the pedal manually.

- **The pedal remains depressed immediately after each manoeuvre. There is little or no force felt from the pedal and returning the pedal manually does not stop the fault from recurring.**

- **After a prolonged stop in the disengaged position, first gear engaged (stop at traffic lights, for example), the vehicle has a tendency to creep forward after a certain amount of time. If the pedal is released, it does not return.**

GETtheMANUALS.org

NOTES	– Check that the customer has not topped up the brake fluid level. – Check the condition of the brake pads before topping up the brake fluid.

Check the area surrounding the pedals, on the passenger compartment side.

Is the floor carpet or another foreign body blocking the travel of the clutch pedal?

YES → Disengage the pedal and check that the customer complaint is no longer present.

NO → Check the return spring and the pushrod for the pedals.

Are there any anomalies?

YES → Repair the anomaly and check that the customer complaint is no longer present.

NO → Check the level of hydraulic fluid

Is the level below the take-off point supplying the master cylinder?

NO → A

YES → Check the sealing of the hydraulic circuit pipes

Are there any leaks around the unions or pipes?

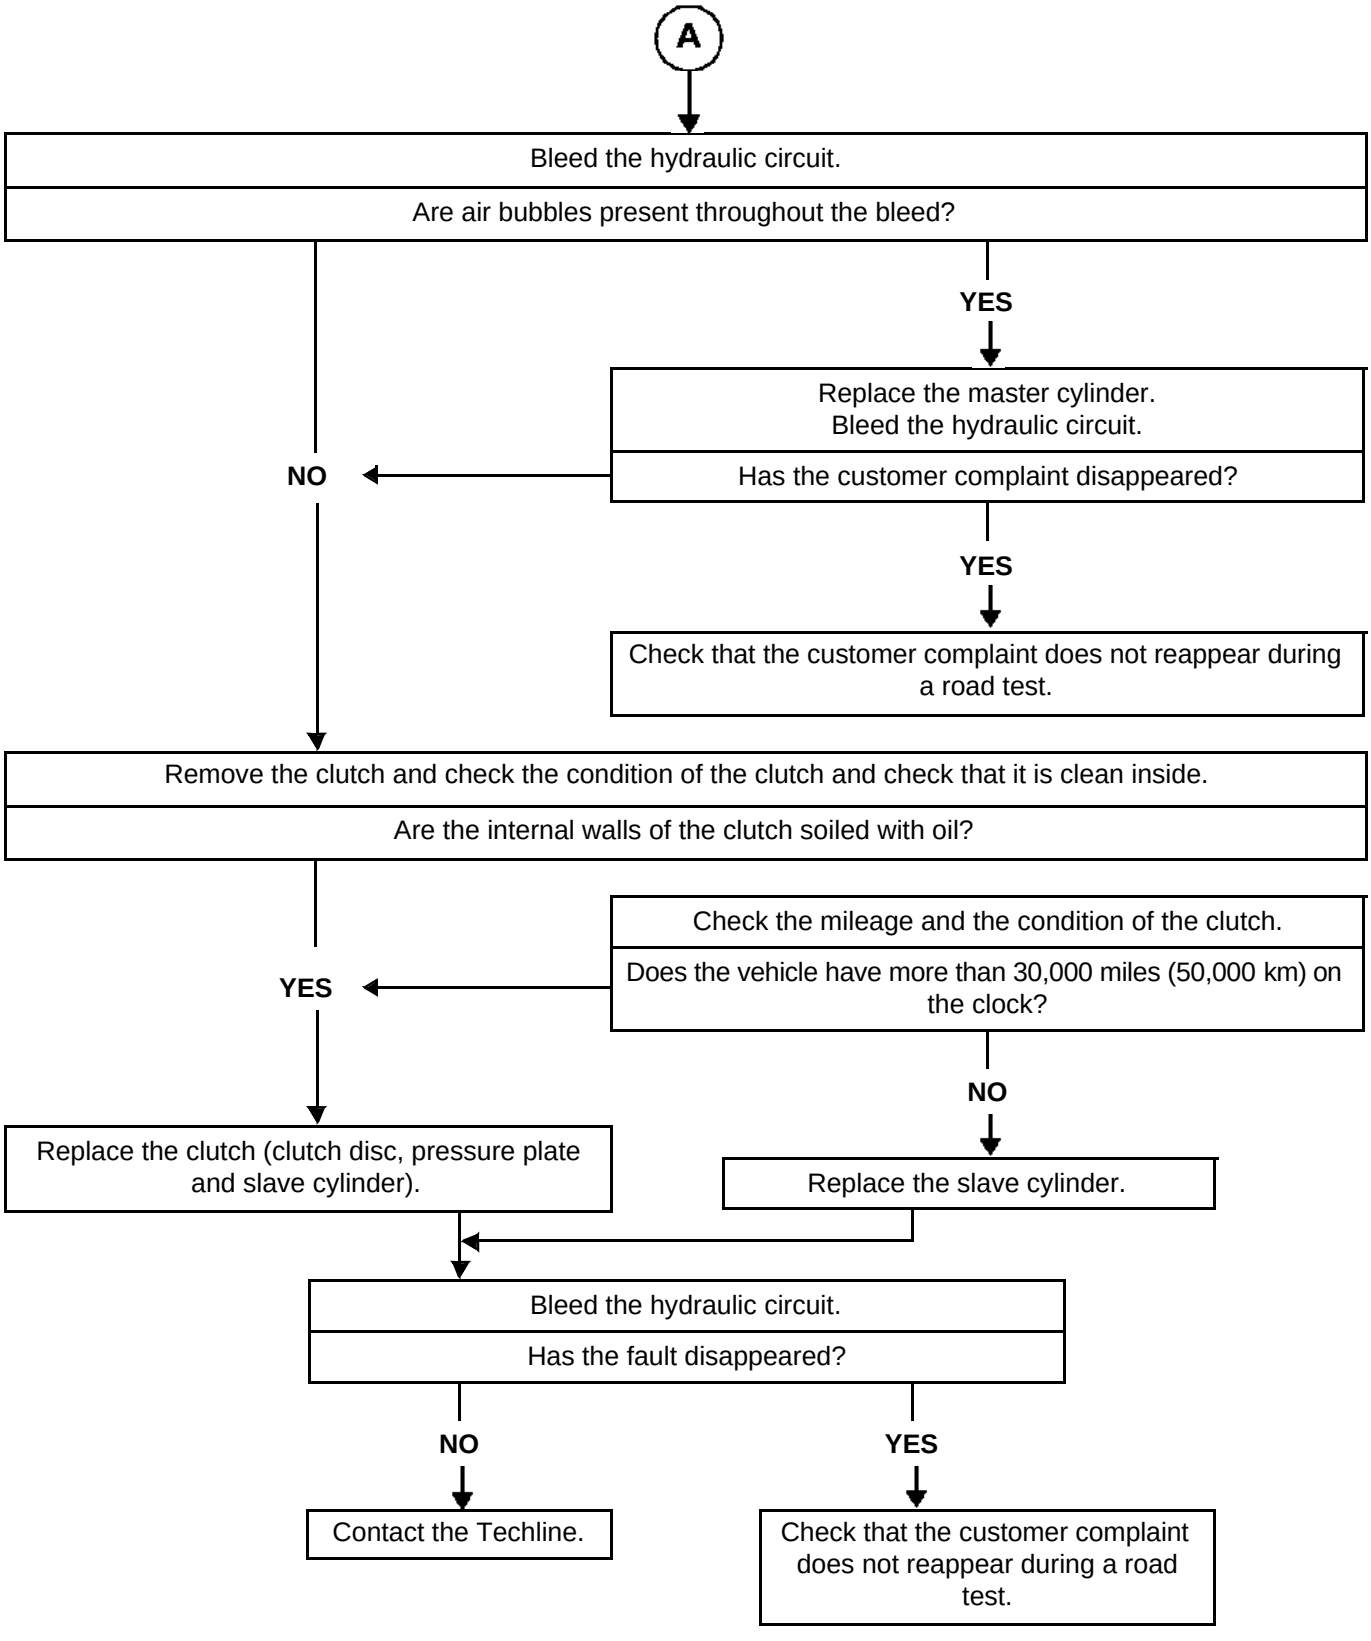
NO → A

YES → Carry out the necessary repairs

NO → A

GETtheMANUALS.org

NOTES	– Check that the customer has not topped up the brake fluid level. – Check the condition of the brake pads before topping up the brake fluid.



GETtheMANUALS.org

1. SCOPE OF THIS DOCUMENT

This document presents the fault finding procedure applicable to all computers with the following specifications:

Vehicle(s): **Vel Satis**	*Name of computer:* **SSPP**
Function concerned: **Tyre pressure monitor**	*VDIAG No.:* **04**

2. PREREQUISITES FOR FAULT FINDING

Documentation type

Fault finding procedures (this document):
– Assisted fault finding (integrated into **the diagnostic tool**), Dialogys.
– Mechanical Workshop Repair Manual No. 339.

Wiring diagrams:
– Visu-Schéma (CD-ROM), paper.

Type of diagnostic tools

– **CLIP**

Special tooling required

Special tooling required	
Multimeter	
Elé. 1603	**Reference terminal**
Elé. 1607	**Valve exciter**
	Pressure gauge
	Tyre inflation system

GETtheMANUALS.org

3. REMINDERS

Faults are displayed as present or stored (they appeared in a certain context and have since disappeared, or they are still present but cannot be diagnosed in the current context).

The **present** or **stored** status of faults should be taken into consideration when the **diagnostic tool** is used after the + after ignition feed has come on (without operating any system components).

For a **present fault**, apply the procedure described in the **Interpretation of faults** section.

For a **stored fault**, note the faults displayed and apply the **Notes** section.

If the fault is **confirmed** when the notes are applied, the fault is present. Deal with the fault.

If the fault is **not confirmed**, check:
- the electrical lines which correspond to the fault,
- the connectors on these lines (corrosion, bent pins, etc.),
- the resistance of the component detected as defective,
- the condition of the wires (melted or cut insulation, wear).

Conformity check

The aim of the conformity check is to check the statuses and parameters that do not produce a fault display on **the diagnostic tool** when they are inconsistent. Therefore, this stage is used to:
- carry out fault finding on faults that do not have a fault display, and which may correspond to a customer complaint,
- check that the system is operating correctly and that there is no risk of a fault recurring after repair.

The conformity check is a fault finding procedure carried out using the interpretation of statuses and parameters.

If a status does not function normally or a parameter is outside the permitted tolerance values, consult the corresponding fault finding page (see interpretation of statuses and parameters).

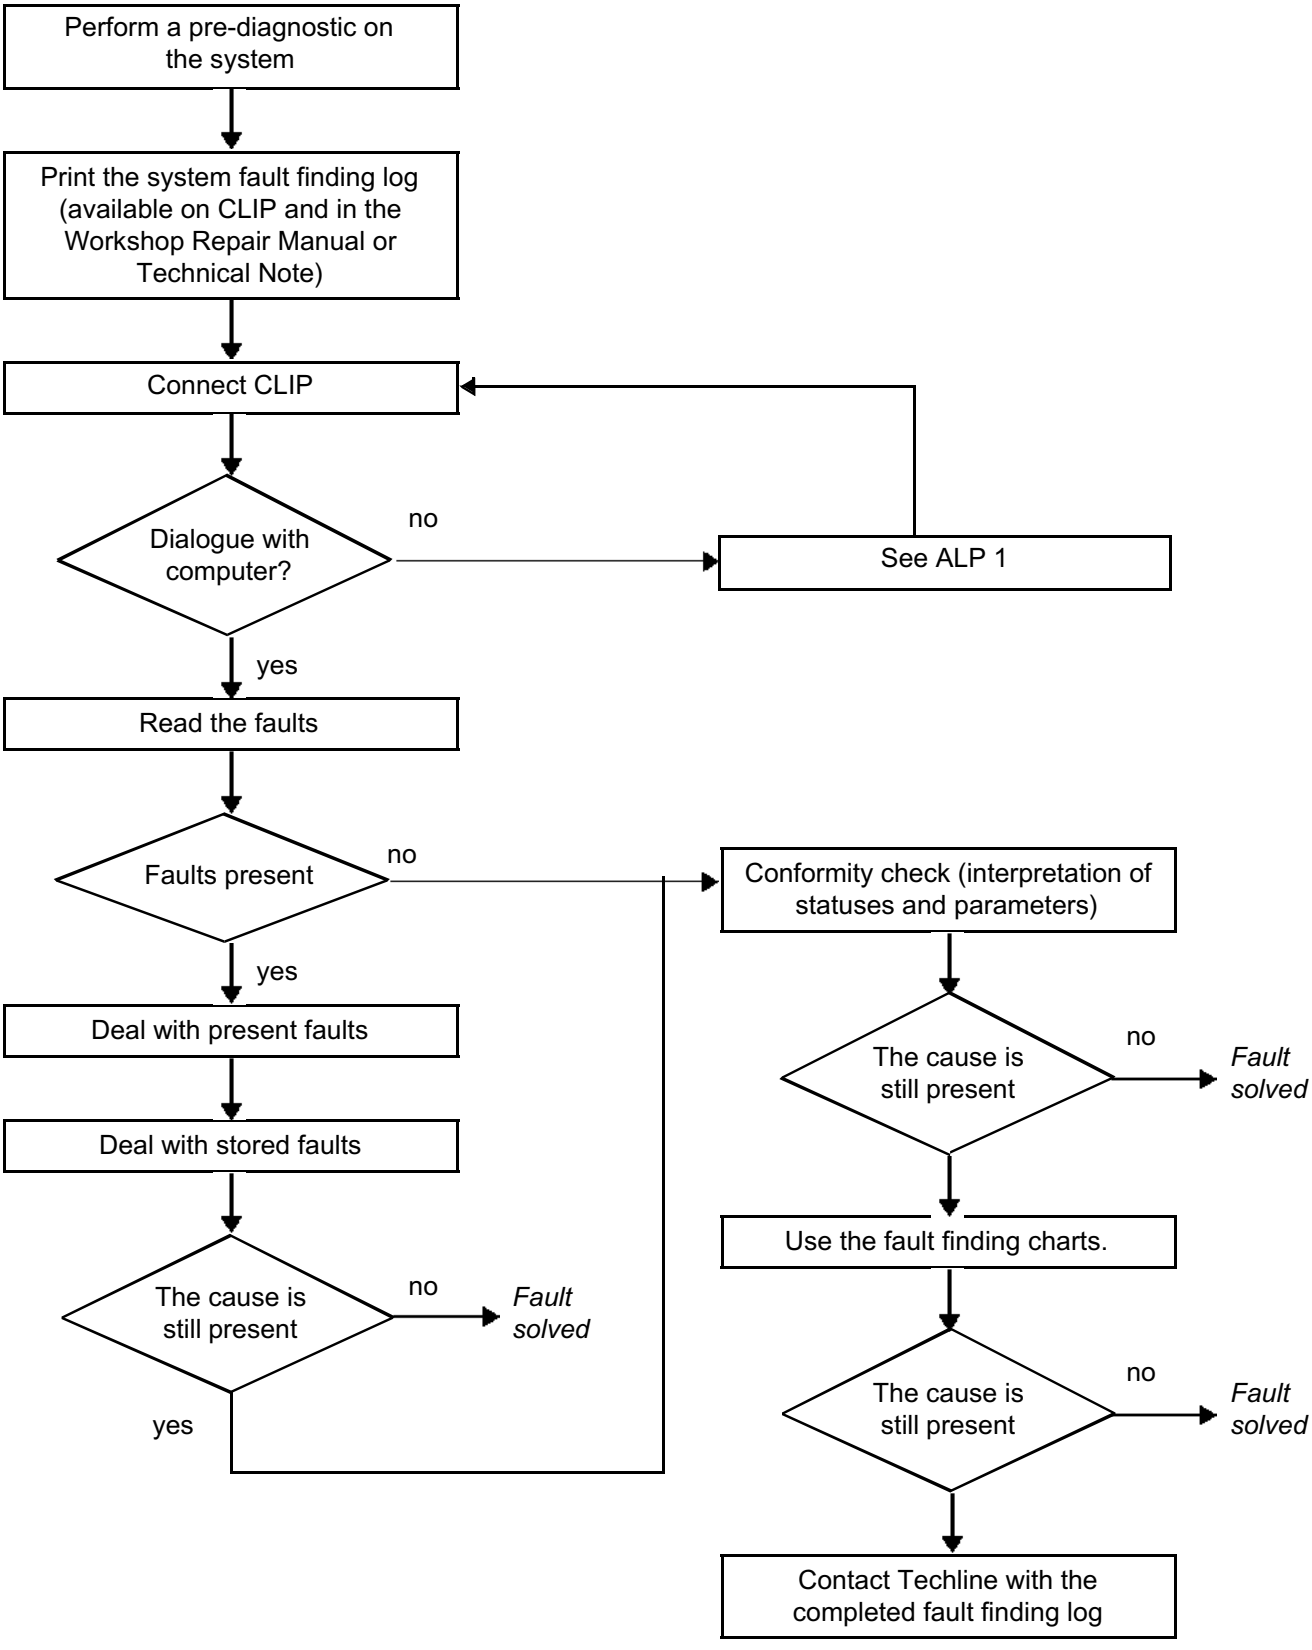
Customer complaints - Fault finding chart

If **the diagnostic tool** check is correct, but the customer complaint is still present, it should be dealt with by **customer complaints**.

A summary of the overall procedure to follow is provided on the following page in the form of a flow chart.

GETtheMANUALS.org

4. FAULT FINDING PROCEDURE



GETtheMANUALS.org

5. FAULT FINDING LOG

IMPORTANT

IMPORTANT
Any fault on a complex system requires thorough fault finding with the appropriate tools. The FAULT FINDING LOG, which should be completed during the procedure, enables you to keep track of the procedure which is carried out. It is an essential document when consulting the manufacturer.

IT IS THEREFORE ESSENTIAL THAT THE FAULT FINDING LOG IS FILLED OUT EVERY TIME IT IS REQUESTED BY TECHLINE OR THE WARRANTY RETURNS DEPARTMENT.

You will always be asked for this report:

- when requesting technical assistance from the Techline.
- For certification requests when replacing parts that must be certified.
- to be attached to monitored parts for which reimbursement is requested. The log is needed for warranty reimbursement, and enables better analysis of the parts removed.

6. SAFETY INSTRUCTIONS

All work on components requires safety rules to be followed to prevent damage or injury:

– Check the battery voltage to avoid incorrect operation of computer functions.
– Use the appropriate tools.

GETtheMANUALS.org

PREDIAGNOSTICS

Steps to take before entering fault finding mode with the tool:

– Are the wheels concerned fitted with SSPP valves, or were they at the time of the incident?
– Check the position of the wheels on the vehicle (valve colour code). If the wheels are not in their original position, return the rings to their original location, then program the valve codes (see **Fault finding - Help**)
– Do the tyre dimensions correspond to the original dimensions of the tyres fitted on the vehicle?
– Check the tyre pressure with a pressure gauge. Do they correspond to the pressures noted on the door or in the driver's handbook for that size of tyres?
– Check that the vehicle is not affected by a Special Technical Operation (wheels flashing on the display).

SYSTEM COMPOSITION

The tyre pressure monitoring system consists of the following components:
– four pressure sensors built into the valves (one per tyre), but not into the spare wheel,
– A specific computer that decodes signals from the sensors, then determines what message to display,
– a display built into the instrument panel or offset on the Carminat screen,
– an underbody aerial (receiver).

SYSTEM OPERATION

– The sensors are activated after approximately **1 minute** of driving above **18 mph (30 km/h)**.
– When the vehicle is being driven, the sensors transmit a signal every minute, but measure every **10 seconds** if the pressure difference between two signals exceeds **84 mbar**.
– The sensors go into standby mode after approximately **2 minutes** at a speed below **18 mph (30 km/h)**.
– In standby mode, the sensors transmit every **60 minutes** unless they detect a pressure difference between two measurements exceeding **84 mbar**, in which case they transmit every **15 minutes**.
– Conditions for accessing programming mode: no special conditions required; the exciter simply has to put the valves into programming mode.
– Condition for exiting programming mode: automatic after a signal from the valve.
– The tyres are considered cold after the vehicle has been stationary for **1 hour and 45 minutes.**
– Alert thresholds:
– overinflation when cold = recommended pressure **+ 700 mbar** during eight cold starts
– overinflation when hot = recommended pressure **+ 850 mbar**
– underinflation = recommended pressure **- 400 mbar** during eight cold starts
– serious underinflation = recommended pressure **- 600 mbar**
– imbalance = difference in pressure between the left-hand and right-hand wheels on the same axle greater than **500 mbar**
– unsuitable pressures for speed warning = at least one wheel's pressure when cold below the recommended high speed pressure **- 400 mbar** and vehicle speed has been above **114 mph (190 km/h)** (as a guide) for at least **3 minutes**.
– The minimum leak detection time is **15 minutes**.
– Information messages given to the driver and warning light (see **Customer complaints**.)
– Command **VP017 Modification of the activation threshold** allows the following modifications to be made:
– change the underinflation threshold of one or more tyres from **300 to 400 mbar** for the user warning display. This command provides more leeway if inflation is a little low when cold. Repeating this command does not change the underinflation threshold again.

GETtheMANUALS.org

WHEEL ROTATION

Each sensor is marked with a different colour: When a valve or tyre is replaced, be sure to use the correct colours:
– green = front left,
– yellow = front right,
– red = rear left,
– black = rear right.
Swapping the wheels without programming the valve codes is prohibited. If the wheels are swapped over on the vehicle, it is essential to replace the valve rings in the locations described above.

WINTER AND SUMMER TYRES

Customers have a choice between two sets of tyres. A **winter** and a **summer set**. The first time the set is changed, the valves must be configured with the diagnostic tool. With that, the SSPP computer has two sets of codes stored, and when the tyres are changed again, the proper set is selected automatically the first time the vehicle is driven. The tyres in each set (summer or winter) must absolutely be installed in the place that matches the valve colour code; if not, reprogram the valve codes and put the coloured rings in the location specified on the label on the driver's door.

Establish dialogue between the SSPP computer and the diagnostic tool (CLIP or NXR).

Connect the cable to the diagnostic socket (it is not necessary to switch on the ignition).

CLIP
Switch on the diagnostic tool.
Select vehicle type and carry out the multiplex network test,
Select the TYRE section,
Follow the fault finding procedure described previously.

GETtheMANUALS.org

Fault	Title
DF003	Front left wheel sensor
DF004	Front right wheel sensor
DF005	Rear right wheel sensor
DF006	Left rear wheel sensor
DF008	Summer set valve codes fault
DF009	Winter set valve codes fault
DF010	Vehicle speed signal
DF014	Tyre Pressure Monitor audible warning
DF015	Programming the valve codes
DF016	Tyre pressure monitor receiver

GETtheMANUALS.org

DF003 **DF004** **DF005** **DF006** **PRESENT** **or** **STORED**	FRONT LEFT-HAND WHEEL VALVE SENSOR FRONT RIGHT-HAND WHEEL VALVE SENSOR REAR RIGHT-HAND WHEEL VALVE SENSOR REAR LEFT-HAND WHEEL VALVE SENSOR 1.DEF: No signal from the valve

NOTES	**Priorities when dealing with a number of faults:** Deal with fault: **DF016 Tyre pressure monitor receiver** first if it is present. **Conditions for carrying out a fault finding test on the fault stored:** If the fault is present after a road test. **Special notes:** Any operations involving valve replacement should not be attempted without full knowledge of the recommendations defined in the Workshop Repair Manual, **section 35**.

1.DEF	***NOTES***	Before any operation, ensure that all the wheels fitted have tyre pressure monitor valves (or that the emergency spare wheel has not been fitted).

The absence of a valve signal may be due to incorrect programming of the valve code or to a faulty valve.

Program the valve concerned (see **Help**). Clear the fault and carry out a road test. If the fault has been rectified, fault finding can end here.

If the fault is still present:

With the valve exciter (MS.1607):
Take a reading of the valve status from the status menu.
– Force the valve to transmit a signal,
– ensure that its status changes to **status 1 Forced transmission**, if it remains at the previous status, change the valve and program in **SC001** (see **Help**).

If not using a valve exciter:
Take a reading of the valve condition in the status menu.
Deflate by > 1 bar and carry out a road test at low speed, i.e. ***V > 18mph (30 km/h)*** *(or wait for 15 minutes)*
– ensure that its status changes to **status 2 Leak**, if it remains at the previous status, change the valve and program in **SC001 Programming a valve code** (see **Help**).

AFTER REPAIR	Deal with any other faults. Clear the stored faults. Switch off the ignition and carry out a road test followed by a check with **the diagnostic tool**.

GETtheMANUALS.org

DF008 **DF009** **STORED**	SUMMER SET VALVE CODES FAULT WINTER SET VALVE CODES FAULT 1.DEF: At least one valve code is missing

NOTES	**Special notes:** Any operations involving changing a valve or removing a tyre should not be attempted without full knowledge of the precautions defined in **section 35** of the Workshop Repair Manual. Before any operation, ensure that all the wheels have tyre pressure monitor valves, and that the emergency spare wheel has not been fitted.

If the SSPP computer has not been programmed with valve codes for one of the two types of wheel sets (winter or summer), this fault is normal and will always be present. If this occurs, the only way to avoid the fault recurring is to program the same valve codes for both sets of wheels.

If the computer recognizes codes for both types of wheel (on the parameter menu), it is because the code has been programmed incorrectly or the wrong set of wheels has been stored in the memory.

Take a reading of the stored wheel types (Summer or Winter) in the statuses menu.

In the parameters menu, take a reading of the valve codes assigned to the stored wheel type.

Program in the four valve codes (see **section: Fault finding - Help**).

If they do not correspond, program the missing or incorrect codes (see **section: Fault finding - Help**).

Carry out a road test to confirm that the fault has been rectified.

AFTER REPAIR	Deal with any other faults. Clear the stored faults. Switch off the ignition and carry out a road test followed by a check with **the diagnostic tool**.

GETtheMANUALS.org

DF010 PRESENT	VEHICLE SPEED SIGNAL 1.DEF: The ABS computer is not sending a speed signal.

NOTES	Carry out a road test to ensure that the speedometer on the instrument panel is working correctly.

If the speed information is displayed on the instrument panel, then:
Check the wiring connection between:

SSPP computer track 14 ⟶ **Instrument panel**

Repair if necessary.

If the speed information is displayed on the instrument panel, then:
Check the wiring connection between:

Instrument panel ⟶ **ABS computer**

Repair if necessary.

If no faults are present on the connection, run a fault finding test on the **ABS**.

Is dialogue re-established with the ABS computer?

YES	Check the vehicle speed signal sent by the ABS computer. Replace the ABS computer if it does not send a signal.
NO	Apply the ABS computer fault finding procedure.

Switch on the ignition and confirm that the fault has been rectified. If it remains, repeat the fault finding procedure from the beginning.

AFTER REPAIR	Deal with any other faults. Clear the stored faults. Switch off the ignition and carry out a road test followed by a check with **the diagnostic tool**.

GETtheMANUALS.org

DF014 PRESENT	TYRE PRESSURE MONITOR WARNING BEEPER 1.DEF: Unidentified electrical fault

NOTES	**None**

Check the wiring connection between:

Audible warning track 5 → **SSPP computer track 8**

Audible warning track 2 → **Passenger compartment fuse box track 7**

Ensure that fuse **F19** and its holder are in good working order (check terminals, crimping of wires on the terminal, etc.).
Repair if necessary.

After repair, road test the vehicle above 50 mph (80 km/h) to confirm the repair.
Replace the tyre pressure monitor beeper if the fault persists.

AFTER REPAIR	Deal with any other faults. Clear the stored faults. Switch off the ignition and carry out a road test followed by a check with **the diagnostic tool**.

GETtheMANUALS.org

DF015 STORED	VALVE CODE PROGRAMMING 1.DEF: Summer set valve code programming fault 2.DEF: Winter set valve code programming fault

NOTES	**None**

If the SSPP computer has not been programmed with valve codes for one of the two types of wheel sets (winter or summer), this fault is normal and will always be stored. If this occurs, the only way to avoid the fault recurring is to program the same valve codes for both sets of wheels.

Go to the status menu and take a reading of the set of wheels type (summer or winter) stored in the memory.

In the parameters menu, take a reading of the valve codes assigned to the stored wheel type.

Program the four valve codes (see section: **Fault finding - Help**).

Carry out a road test to confirm that the fault has been rectified.

AFTER REPAIR	Deal with any other faults. Clear the stored faults. Switch off the ignition and carry out a road test followed by a check with **the diagnostic tool**.

GETtheMANUALS.org

DF016 PRESENT	TYRE PRESSURE MONITOR RECEIVER UNIT 1.DEF: Unidentified electrical fault

NOTES	**None**

Check the receiver connection under the body. Repair if necessary.
Check the tyre pressure monitor computer connector. Repair if necessary.
Check the wiring harness linking the computer and the under body receiver (for cuts, contamination, pinching, overheating etc.). Repair if necessary.
Check the rear right-hand side connection under the bodywork. Repair if necessary.

Ensure that the receiver is being supplied:

Earth → **track 3** of the underbody receiver connector
+ 12 volt battery → **track 4** of the underbody receiver connector

Ensure that fuse **F6** and its holder are in good working order (check terminals, crimping of wires on the terminal, etc.).

Ensure **the continuity and insulation** against earth of the connection between:
Receiver connector **track 1** → **track 13** SSPP computer

Measure the line resistance of the same connection.
Carry out the necessary operations if the resistance is abnormally high.

If the problem persists, replace the underbody receiver.

AFTER REPAIR	Deal with any other faults. Clear the stored faults. Switch off the ignition and carry out a road test followed by a check with **the diagnostic tool**.

GETtheMANUALS.org

NOTES	**Test conditions: engine stopped, ignition on, tyres inflated to correct pressure.**

Function	Parameter or status Check or action	Display and notes	Fault finding
Valve status	**ET036:** Rear left-hand wheel signal **ET035:** Rear right-hand wheel signal **ET034:** Front right-hand wheel signal **ET033:** Front left-hand wheel signal	Check that each wheel is at normal state if the car has been stationary for more than an hour. Several statuses can be observed: – **Standard** – **Status 1:** Forced signal – **Status 2**: Signal due to a variation in pressure (leak) – **Status 3:** Transmitted when speed is > **12 mph (20 km/h)** – **Status 4:** The valve battery is low – **Status 5:** No signal from the valve	If all the valves are ***correct***, using the valve exciter should change them to **status 1**. If this is not the case, refer to the fault finding procedure for these statuses. Changing the status can also be achieved by deflating the tyres (changing to **status 2**after**15 minutes**) **In all cases, consult the fault finding procedures for states ET033 to ET036**
Wheel type selected	**ET007:** Wheel set selected	Winter or summer	None
Battery voltage	**ET010:** + After ignition feed computer	**ACTIVE**	None

GETtheMANUALS.org

NOTES	**Test conditions: engine stopped, ignition on, tyres inflated to correct pressure.**

Function	Parameter or status Check or action	Display and notes	Fault finding
System warning lights	**ET005:** Service warning light switched on by the system	**UNCONFIRMED**	If one (or more) of these statuses are confirmed, consult the section in the Driver's Handbook on the **Tyre pressure monitor**.

GETtheMANUALS.org

ET033 **ET034** **ET035** **ET036**	FRONT LEFT-HAND WHEEL TRANSMISSION FRONT RIGHT-HAND WHEEL TRANSMISSION REAR RIGHT-HAND WHEEL TRANSMISSION REAR LEFT-HAND WHEEL TRANSMISSION

NOTES	**Special notes: Because a tyre pressure sensor is fitted in the wheel, precautions must be taken when removing/refitting tyres. Failure to respect the precautions specified in section 35 of the Workshop Repair Manual could result in the sensor being damaged, and potential operational faults in the tyre pressure monitor.**

Valve status definitions:

Normal: the valve detects a correct pressure (vehicle stationary).

Status 1: the valve changes to forced transmission after the valve exciter tool has been used.

Status 2: the valve detects a leak (when the vehicle is moving and stationary).

Status 3: transmitted by the sensor when the speed is greater than **12 mph (20 km/h)**.

Status 4: the sensor detects a loss of battery power (vehicle stationary and when driving).

Status 5: the valve is no longer transmitting or is no longer present (no reception when stationary or when driving).

STEP 1

It is advisable to ensure that all the valves are transmitting correctly before proceeding with each conformity check. To do this, either run a valve exciter test on all the valves or allow some air to escape from the tyre. Then check to see if their statuses have changed:

Initial status = **normal** or **status 3** or **status 4** or **status 5**	**valve exciter test or air leak**	= Final status = **status 1** (or **2**)
Initial status = **status 2**	**valve exciter test**	= Final status = **status 1**

If the initial status does not change and there is no other receiver fault, replace the valve concerned, following the instructions and the valve code programming procedure, **SC001 Programming a valve code** described in the **Help** section.

STEP 2

If the initial status is: **Status 2**:

Carry out step 1. Check the pressure using a pressure gauge and carry out any operations required to repair the air leak.

If the initial status is **Status 3**:

None. If the status is "increased" **when the vehicle has been stationary** for more than **15 minutes**, replace the faulty valve.

If the initial status is: **Status 4** or **Status 5**:

Carry out step 1. Change the valve on the wheel concerned, following the instructions and the valve code programming procedure **SC001 Programming a valve code**, in the **Fault finding - Help section**.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET032 **ET031** **ET030** **ET029**	FRONT LEFT-HAND WHEEL VALVE SIGNAL FRONT RIGHT-HAND WHEEL VALVE SIGNAL REAR RIGHT-HAND WHEEL VALVE SIGNAL REAR LEFT-HAND WHEEL VALVE SIGNAL

NOTES	**Special notes: If there is a tyre pressure sensor on the wheels, precautions must be taken when removing/refitting tyres. Failure to respect the precautions outlined in the Workshop Repair Manual could result in the sensor being damaged, and potential operational faults in the tyre pressure monitor.**

Valve status definitions:

Status 1: the sensor has detected a correct pressure (when the vehicle is stationary).

Status 2: the sensor is either no longer transmitting or missing (no reception from the valve when the vehicle is moving or stationary).

Status 3: the tyre is over inflated.

Status 4: the tyre is over inflated.

Status 5: the tyre is under inflated.

Status 6: there is an abnormal loss of air from the tyre.

Status 7: the tyre is slightly under inflated.

Status 8: the tyre is dangerously under inflated.

To check that the valves are working correctly, it is advisable to ensure that they are all transmitting correctly before each conformity check. To do this, either run a valve exciter test on all the valves or allow some air to escape from the tyre. Then check to see if their states have changed:

Initial status = **status 3** or **status 4** or **status 5** or **status 7** or **status 8** exciter (or leak) = **status 1**
If the status does not change, take pressure readings using a pressure gauge.

Initial status = **status 2** exciter (or leak) = **status 1**
If the status does not change and there is no other receiver fault, replace the valve concerned following the instructions and the valve code programming procedure **SC001** described in the **Help** part.

If the initial status = **status 6**:
Check the pressure using a pressure gauge and carry out any operations required to repair the air leak.

Note:
- Threshold for slight under inflation: **302 mbar**.
- Threshold for serious under inflation.**605 mbar**.
- Over inflation threshold when hot: **796 mbar**.
- Over inflation threshold when cold: **494 mbar**.
  (tyres are considered to be cold when there has been no **+ after ignition feed** for 1 hour 45 minutes).
- Left - right pressure imbalance: **494 mbar**.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

PR001 **PR004**	REAR AXLE HIGH SPEED RECOMMENDED PRESSURE FRONT AXLE HIGH SPEED RECOMMENDED PRESSURE

NOTES	**No fault should be present or stored:** Carry out this fault finding procedure after detecting a discrepancy between the recommended pressure levels and the readings stored in the computer memory. **Warning:** The Workshop Repair Manual must be consulted to obtain the recommended pressures for the tyres **actually fitted on the vehicle** or on the label on the door rabbet (depending on version) or the driver's handbook.

If after comparing with the manufacturer's recommendations (see **section 35 of the Workshop Repair Manual**), the recommended pressures and those stored in the computer are found to be incorrect, reprogram the recommended pressures as follows:

In the general menu, select **Command mode**, then click on the settings button and enter selection: **VP009: Enter recommended pressures**.

Enter and confirm the recommended pressure values.

Then check that the recommended tyre inflation pressures have been stored correctly by going to the parameter menu.

In the event of any problem occurring, start the operation again from the beginning.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

PR002 **PR003**	FRONT AXLE LOW SPEED RECOMMENDED PRESSURE REAR AXLE LOW SPEED RECOMMENDED PRESSURE

NOTES	**There must be no present or stored faults.** Carry out this fault finding procedure after detecting a discrepancy between the recommended pressure levels and the readings stored in the computer memory. **Warning:** The Workshop Repair Manual must be consulted to obtain the recommended pressures for the tyres **actually fitted on the vehicle** or on the label on the door rabbet (depending on version) or the driver's handbook.

If after comparing with the manufacturer's recommendations (see **section 35 of the Workshop Repair Manual**), the recommended pressures and those stored in the computer are found to be incorrect, reprogram the recommended pressures as follows:

In the general menu, select **Command mode**, then click on the settings button and enter selection: **VP009: Enter recommended pressures**.

Enter and confirm the recommended pressure values.

Then check that the recommended tyre inflation pressures have been stored correctly by going to the parameter menu.

In the event of any problem occurring, start the operation again from the beginning.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

PR027 **PR028** **PR029** **PR030**	FRONT LEFT-HAND WHEEL TYRE PRESSURE FRONT RIGHT-HAND WHEEL TYRE PRESSURE REAR RIGHT-HAND WHEEL TYRE PRESSURE REAR LEFT-HAND WHEEL TYRE PRESSURE

NOTES	**There must be no present or stored faults** Carry out this fault finding procedure after detecting a discrepancy in the parameter displays.

IMPORTANT
When communication is established, the default value of the settings is displayed (3.5 bar). Using the valve exciter or a road test, force each valve to transmit to discover the actual pressure levels measured by the sensors during the fault finding procedure.

In all cases, check that the pressure readings displayed on the fault finding tool correspond with those on the pressure gauge. (to the nearest) **0.5 bar**.

If the sets of readings correspond, the parameters and sensors are sound, and the fault finding test can be ended here.

If the readings do not correspond, you may encounter two possible scenarios:

1st case: The parameters still display **3.5 bar**:

This means that the wheel valve codes do not correspond to the wheel set programmed into the computer. (When the computer receives the valve codes, it will not recognize them because they do not correspond to the wheel set codes already programmed, which are the only ones it will recognize). To rectify this:

Go to the **Command Mode** menus, and then settings: **VP002** and change the wheel set (if necessary, follow the procedure described in the **section: Fault finding - Help**). Go back to the **Settings** menu, excite each valve and check that the correct readings are being displayed.

2nd case: The parameters display readings different from those measured (and different from **3.5 bar**).

Where the difference is significant, it indicates a faulty sensor. Replace any faulty sensors. Follow the programming procedure: **SC001**, see **section Fault finding - Help**.

After programming, repeat the fault finding procedure from the beginning.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

MATCHING THE VALVE TO THE TYRE

Each sensor is matched to the correct wheel during production, when the tyre pressure monitor computer is programmed with the identification codes. This is so that a faulty wheel can be identified (given that the receiver cannot determine the position of the wheel transmitting the signal).

Consequently, **it is forbidden to swap wheels over without having carried out reprogramming**. A sensor marking system ensures that tyres can easily be refitted in their original place.

Coloured rings are attached to the valve nuts, and they correspond to the four colours shown on the pressures label and the vehicle handbook.

The colours are:

Front left: green	Front right: yellow
Rear left-hand: red	Rear right: black

If the driver wants to swap over his wheels, there are two possible solutions:
– either remove each sensor and replace them in their original position on the vehicle,
– or, using the diagnostic tool, reprogram the tyre pressure monitor computer with the new sensor positions (the coloured rings must be swapped so that they are in the correct order, as shown above).

How do you find out the sensor codes?

There are three possible solutions:

- ***If the sensor is new:*** It has a two-part label, one of which is detachable. The code is written on both sections. The detachable section enables the operator to remember the code after the sensor has been fitted in the wheel (it is advisable to temporarily attach this label to the wheel in which the sensor is fitted).

- ***If the sensor is used:*** If removed with the label still attached on top, its code can still be read.

- ***If the sensor is already fitted to the wheel and no label is visible:*** in this case, you can:

– either remove the tyre and read the number on the sensor,
– or obtain the sensor codes using the diagnostic tool.

The difficulty is that each sensor only transmits once every hour when stationary. Furthermore, if more than one sensor is fitted, it is not possible to determine which sensor transmitted. In which case:
– either turn the wheel at a speed of more than **12 mph (20 km/h)** so that the sensor transmits a signal more frequently and can therefore be identified (wheel balance, driving with only one sensor fitted),
– or send the sensor into forced transmission using the valve exciter (recalling the code and entering **status 1**).

GETtheMANUALS.org

CF005	CONFIGURATION PROCEDURE

Mégane with PAX tyres or Mégane without PAX tyres or VEL SATIS

Go to the **Command mode - Configuration** menu and, according to the vehicle equipment level, select either:

CF005: Mégane with PAX tyres, if the vehicle is fitted with a tyre pressure monitor for PAX (these tyres allow the vehicle to be driven with flat tyres for a maximum distance of 120 miles (200 km)),

or

CF005: Mégane without PAX tyres, if the vehicle is fitted with a tyre pressure monitor without PAX.

or

CF005: VEL SATIS, if the vehicle is fitted with a tyre pressure monitor without PAX.

Exit the **Configuration** menu and enter the **LC006** and **LC003 Configuration reading** menu to check that the command has been stored.

If the configuration has not been recorded, repeat the procedure from the beginning.

GETtheMANUALS.org

SC001	VALVE CODE PROGRAMMING PROCEDURE

IMPORTANT
Any operations involving valve replacement should not be attempted without full knowledge of the recommendations defined in the Workshop Repair Manual section 35.

There are two methods for valve programming.

– Manually, using the diagnostic tool, in which case the valve code must be known,

– Automatically, by changing the valve status, in which case a valve exciter tool must be available (**MS. 1607**).

Manual programming: Exercise special care when matching valve and wheel codes.

⇒ (**CLIP**) In the General menu, select the **Command mode** sub-menu, followed by **Specific command**. Select command **SC001 VALVE CODE PROGRAMMING** and follow the instructions given for manual entry (1 to 8 digits maximum).

⇒ (**NXR**) Go to the **Command** menu, select **Scenario** and then select command **SC001 VALVE CODE PROGRAMMING** and follow the instructions given for manual entry (1 to 8 digits maximum).

Automatic programming with valve exciter: Ensure that fault **DF016: SSPP receiver** is not present.

⇒ Same access procedure as manual programming, but follow the instructions for automatic programming.

⇒ Excite the valve concerned. The exciter must be resting **against the tyre** just under the valve concerned. Pressing the exciter button switches on the green indicator light. When this light goes out, and the red light comes on, the valve exciter test is complete. Then check that the code has been retrieved on the tool.

If running the exciter test does not make the code reappear, change the valve.

Automatic programming without valve exciter.

REMINDER: The valve sends the receiver a message consisting of: its status, pressure and code. The receiver decodes this information and sends it to the UCH.

When the vehicle is moving, the valves transmit their status every minute if no leak is present and every 10 seconds if a leak is present (***status 2***).

When the vehicle is stationary, the valves transmit their status every hour if no leak is present and every fifteen minutes if a leak is present (***status 2***).

If a valve exciter is not available, the valve status can be changed by allowing some air to escape (drop the tyre pressure by at least 1 bar, which will raise the wheel to status 2 on the parameter menu).

⇒ Either with the vehicle stationary, in which case wait a quarter of an hour,

⇒ or with the vehicle moving at **> 12 mph (20 km/h)**, (valid only for one wheel at a time).

(tyre leak + road test + save on tool + reinflate tyre) ⟶ **must be repeated for each wheel.**

GETtheMANUALS.org

SC002	PROGRAMMING PROCEDURE FOR THE FOUR VALVE CODES

IMPORTANT
Any operations involving valve replacement should not be attempted without full knowledge of the recommendations defined in the Workshop Repair Manual section 35.

There are two methods for valve programming.

– Manually, using the diagnostic tool, in which case all valve codes must be known,

– Automatically, by changing the valve statuses, in which case the use of valve exciter tool (**MS.1607**) is advised.

Manual programming: Exercise care when matching valve and wheel codes.

⇒ (**CLIP**) In the General menu, select the **Command mode** sub-menu, followed by **Specific command**. Select command **SC002 PROGRAMMING THE FOUR VALVE CODES** and follow the instructions given for manual entry (1 to 8 digits maximum).

⇒ (**NXR**) Go to the **Command** menu, select **Scenario** and then select command **SC002 PROGRAMMING THE FOUR VALVE CODES** and follow the instructions given for manual entry (1 to 8 digits maximum).

Automatic programming with valve exciter: Ensure that fault **DF016: SSPP** receiver is not present.

⇒ Same access procedure as manual programming, but follow the instructions for automatic programming.

⇒ Excite each valve in the order shown on the tool. The exciter must be resting **against the tyre** just under the valve concerned. Pressing the exciter button switches on the green indicator light. When this light goes out, and the red light comes on, the valve exciter test is complete. Then check that the code has been retrieved on the tool. Repeat the process for the other valves.

⇒ If exciting a valve test does not make the code appear, replace the valve.

Automatic programming without valve exciter.

REMINDER: the valve sends a message to the receiver which includes: its code, pressure and status. The receiver decodes this signal and sends it to the tyre pressure monitor computer.

When the vehicle is moving, the valves transmit their status every minute if no leak is present and every 10 seconds if a leak is present (***status 2***).

When the vehicle is stationary, the valves transmit their status every hour if no leak is present, and every fifteen minutes if a leak is present: ***(status 2)***.

If a valve exciter is not available, the valve status can be changed by allowing some air to escape (drop the tyre pressure by at least 1 bar, which will raise the wheel to status 2 on the parameter menu).

⇒ Either with the vehicle stationary, in which case wait fifteen minutes for each wheel,

⇒ Or, with the vehicle moving at a speed > **12 mph (20 km/h)**, (but only valid for one wheel at a time)

(tyre leak + road test + save on tool + reinflate wheel ⟶ **repeat for each wheel**)

GETtheMANUALS.org

VP009	ENTERING THE RECOMMENDED PRESSURE READINGS:

To enter the recommended pressure readings correctly, it is essential to refer to the manufacturer's recommendations (in the Workshop Repair Manual or driver's handbook **for the vehicle concerned**).

In the general menu, select **Command mode**, then click on the settings button and enter selection: **VP009: Enter recommended pressures**.

Program the Workshop Repair Manual values into the memory and confirm.

Then check that the recommended readings have been stored correctly by going to the parameter menu (via the general menu).

In the event of any problem occurring, start the operation again from the beginning.

VP002	WHEEL SET SELECTION PROCEDURE:

Go to the general menu, click on the **list of statuses** sub menu, check the wheel set type stored in the memory, by displaying status: **ET007**.

If the selected wheel set is incorrect, follow the procedure described below:

– In the general menu, select **Command mode**, then click on the settings button and enter selection: **VP002: Tyre set selection**.

– Move the cursor key to winter (climate type) and press enter, then select a climate type using the up and down arrow keys. Confirm.

– Use the blue button to confirm again and the storage window opens. Select yes or no. Press the return key to exit the window.

Checking the modification:

– Go back to the general menu, click on the **list of statuses** sub-menu and check that the wheel set has been correctly stored in the memory by displaying status: **ET007**.

– Each valve must then undergo an exciter test to discover the tyre pressure. (If not, the tool will display a default value of: **3.5 bar**).

In the event of any problem occurring, start the operation again from the beginning.

GETtheMANUALS.org

VP017	CHANGING THE ACTIVATION THRESHOLD

NOTES	**IMPORTANT** Use this command for the valves fitted on Vel Satis.

This command is used to increase the activation threshold of the pressure warning light on the display, so that the valves are less sensitive to pressure differences.

This command can be used in the event of the persistent, erratic appearance of the pressure fault warning light on the display.

In the general menu (CLIP and NXR), select Command mode, then click on the other **Settings** button and enter selection **VP017 MODIFICATION OF ACTIVATION THRESHOLD**.

CLIP: Use the blue button to confirm, the memory window opens. Switch off the ignition and select yes or no. Wait for the "Command executed" message before leaving this window with the return button.

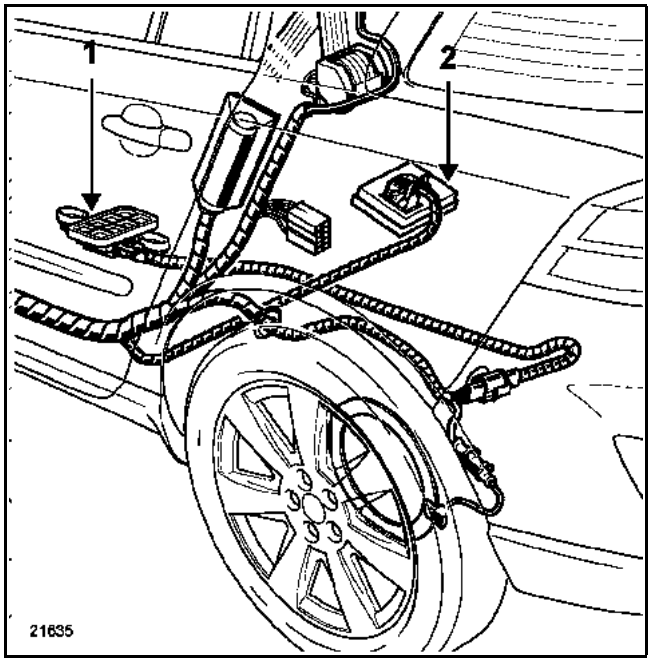
NXR: Switch off the ignition and confirm with the Next button.

In the event of any problem occurring, start the operation again from the beginning.

Repeating the operation several times changes nothing and involves no risk. However, the original values cannot be restored once this operation has been carried out.

Running this command is the only way to confirm its proper execution (the new thresholds cannot be checked in the computer).

GETtheMANUALS.org



No.	Description
1	Tyre pressure monitor receiver
2	Tyre pressure monitor computer (under rear seat)

GETtheMANUALS.org

AC001	WARNING LIGHTS AND DISPLAY

NOTES	**No fault should be present or stored:** Carry out this fault finding test after detecting a malfunction on the display.

Command **AC001** controls the tyre pressure monitor symbol located in the centre of the dashboard.

Running this command triggers:
- On the symbol: – The flashing of the four wheels and doors.
  – The "mph (km/h)" and "puncture" symbols are lit continuously.
- On the instrument panel: – The flashing of the tyre pressure monitor fault warning light (**10 sequences**).

The **SERVICE** and **STOP** warning lights on the instrument panel are not activated by the command, although it is possible to monitor them in the period between the ignition being switched on and the engine starting. The **Tyre Pressure Monitor fault** warning light can be checked in the same way: it is lit for **3 seconds** after the ignition is switched on.

If the vehicle is equipped with the voice synthesiser, when this command is activated it will inform you of the valve statuses. In this case, it reports a failure because valves with an operational fault are being simulated on the display.

In the event of a problem, carry out a fault finding procedure for the instrument panel to interpret command AC001.

With tyre pressure monitor symbol + instrument panel (see previous page):
Switch on the ignition: does the symbol light up?
If not, check the display supply:
Check that fuses **F19** are in good condition (must be **15A**, check for continuity, oxidation, crimping of wires on terminals). Repair if necessary.

+ 12 V after ignition

⟶

Track 6, **15-track** black connector for tyre pressure monitoring system display.

earth

⟶

Track 5, **15-track** black connector for tyre pressure monitoring system display.

Repair if necessary.

If the display lights up, are the door icons visible?
If not: Run a check on the connection between the display and the door switches.
Repair if necessary.

If the doors are depicted, and the symbol displays do not light up when the command is run: Replace the SSPP display.

Tyre pressure monitor computer track 2 → **Earth**
Tyre pressure monitor computer track 10 → **Earth**
Tyre pressure monitor track 12 → **Track 7 Diagnostic socket**

Repair if necessary.

Check for a **+ 12 volts supply** to the tyre pressure monitor computer:
Tyre pressure monitor computer track 1 → **Earth**
Tyre pressure monitor computer track 3 → **Earth**

Check the various fuses of the system.
Repair if necessary.

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a check using the diagnostic tool.

GETtheMANUALS.org

ALP 2	System check screen fault

NOTES	**Only refer to this customer complaint after a complete check with the diagnostic tool.** The four wheel icons do not light up on the display after the ignition has been switched on.

Run the instrument panel self-test procedure to check the operation of the tyre pressure monitor and display warning lights.

Check that the vehicle is fully equipped with tyre pressure monitor valves.

Run a valve exciter test on one of the vehicle's four valves. Check that the status corresponding to the wheel has switched to **STATUS1**, if not:

Check the underbody receiver connection.

Repair if necessary, or change the receiver.

If the connection is correct, the underbody aerial is faulty.

Change the receiver.

Check:
– the connection between computer **track 13** and the underbody receiver,
– that the underbody wiring is in good condition.

Repair if necessary.

AFTER REPAIR	Carry out a check using the diagnostic tool.

GETtheMANUALS.org

ALP 3	Check tyre pressure warning light or signal

Force the four sensors to transmit using the valve exciter (without reprogramming) and check whether the message on the instrument panel and the pressure check warning lights are cleared.
Make sure that the recommended pressures read in parameters **PR001 to PR004** match the recommended pressures indicated on the door or in the driver's handbook for the vehicle. Otherwise, run command **VP009 Enter recommended pressures** (see **Dealing with command modes**). Do a forced transmission of the valves (without reprogramming).
If there is a puncture warning on the instrument panel after readjusting the pressure, the sensor may not have detected the readjustment. In this case, deflate the tyre concerned by at least **300 mbar** and force the valve to transmit using the exciter. Then readjust the pressure and force the valve to transmit again using the exciter. Switch the ignition off and then on again.
If the instrument panel warning occurred while the vehicle was being started after it had been parked in severe weather conditions (under the midsummer sun or outside in intense cold), switch off the ignition for **1 hour 45 minutes** then switch it back on or program the four valve codes in accordance with procedure **SC002 Programming the 4 valve codes**.
If the check pressure message is still there after all this, replace the malfunctioning sensor(s). Then repeat the valve code programming procedure from the beginning. Send in the sensor(s) with a completed tyre pressure monitor operation fault finding log.
If the message is still present, contact the Techline.

AFTER REPAIR	Carry out a check using the diagnostic tool.

GETtheMANUALS.org

ALP 4	Pressure not monitored warning light or signal (Intermittent warning)

Check: – the underbody receiver connector. – the UCH connector. – the wiring harness connecting the UCH and underbody receiver. – the rear left-hand wheel arch union. Carry out the necessary repairs.
If there are no faults on the connections or wiring harness, replace the underbody receiver.
After changing the underbody receiver, excite the sensors using the valve exciter and check that statuses **ET033 to ET036 WHEEL SIGNAL change to STATUS 1**: forced transmission.
Send the receiver to the Part Returns Department with a duly completed diagnostic sheet.
If these tests do not lead to improvement and the warning is present (see **ALP 5 Pressure not monitored, continuous warning**).

AFTER REPAIR	Carry out a check using the diagnostic tool.

GETtheMANUALS.org

ALP 5	Pressure not monitored warning light or signal (Permanent warning)

One or more wheel warning lights on the instrument panel display disappear

Remove the tyre of the wheel missing on the dashboard. Make sure the sensor is fitted the right way round.
If it is fitted the right way round, replace it and program the code for the new sensor. Send the sensor to the Part Returns Department with a duly completed TPMS diagnostic sheet.
If it is fitted the wrong way round, correct it and carry out a road test for at least **5 minutes** at a speed greater than **18 mph (30 km/h)**.
If the wheel warning light does not reappear, contact the Techline and send the sensor to the Parts Return Department with a completed Tyre Pressure Monitor fault finding log.

AFTER REPAIR	Carry out a check using the diagnostic tool.

V9 **Edition Anglaise**

"The repair procedures given by the manufacturer in this document are based on the technical specifications current when it was prepared.

The procedures may be modified as a result of changes introduced by the manufacturer in the production of the various component units and accessories from which his vehicles are constructed."

All rights reserved by Renault s.a.s.

Copying or translating, in part or in full, of this document or use of the service part reference numbering system is forbidden without the prior written authority of Renault s.a.s.

GETtheMANUALS.org

1. SCOPE OF THIS DOCUMENT

This document presents the fault finding procedure applicable to all computers with the following specifications:

Vehicle(s): **Vel Satis phase 1**
Vel Satis phase 2
Laguna II Phase 2
Scénic II Phase 1 and
Scénic II Phase 2
Espace IV phase 1
Espace IV phase 2
Espace IV phase 4

Function concerned: **Electronic parking brake**

Name of computer: **FPA**

Vdiag No.: **0C, 04, 08, 0D, 11**

2. PREREQUISITES FOR FAULT FINDING

Documentation type

Fault finding procedures (this document):
– Assisted fault finding (integrated into the diagnostic tool), Dialogys.
Wiring Diagrams:
– Visu-Schéma (CD-ROM), paper.

Type of diagnostic tools

– CLIP

Special tooling required

Special tooling required	
Multimeter	
Elé. 1681	**Universal bornier**

3. REMINDERS

Procedure

To save power, the UCH on the Laguna II Phase 2, Espace IV phase 1, 2 and 4, and Vel Satis phase 1 and 2 interrupts the **+ after ignition feed** supply after **3 minutes**.

To run fault finding on a computer, it is possible to force the **+ after ignition feed** for **1 hour** by applying the following procedure:

– Press the card unlocking button,
– Insert the card into the reader,
– press the start button (interrupting the **timed + after ignition feed** mode),
– press the start button for more than **5 seconds**, until the immobiliser warning light flashes rapidly (**4 Hz**).

This **forced + after ignition feed** mode remains active for **1 hour**.
Pressing the start button or removing the card from the card reader interrupts the forced **+ after ignition feed**, but does not interrupt the time period for the forced **+ after ignition feed**. Until one hour has elapsed, activating the **+ after ignition feed** will restart forced **+ after ignition feed** for the remaining time.

GETtheMANUALS.org

Only affects the Scénic II phase 1 and the Scénic II phase 2:

To run fault finding on the vehicle's computers, switch on the ignition in fault finding mode (forced + after ignition feed).
Proceed as follows:
– Renault card in the card reader (keyless vehicle scenario 1, entry-level, without hands-free and scenario 2, top of the range, hands-free),
– press and hold the Start button (longer than **5 seconds**) with start-up conditions not fulfilled,
– connect the diagnostic tool and perform the required operations.

To cut off **+ after ignition feed**, proceed as follows:
– disconnect the diagnostic tool,
– press the Start button twice briefly (less than **3 seconds**).
– ensure that the + after ignition feed has been cut off by checking that the computer indicator lights on the instrument panel have gone out.

Fault context.

Affects VDiag 08, 0C, 0D and 11.	
Explanation of the fault context counters. The are three different counters:	
PR022: Dating counter **PR018:** Presence counter **PR019:** Frequency counter	
Dating counter:	The counter starts when the fault appears. Each time the computer switches on and the fault is stored or present, the counter increases **by 1 up to 255**.
Presence counter:	As soon as the fault is present, the counter goes to **15**. If the fault becomes stored, each time the computer switches on, the number decreases **by 1 (from 15 to 0)** and goes back to 15 again if the fault reappears.
Frequency counter:	Number of times the present fault appears; it sets to 0 when the fault appears. It increases each time the fault moves from stored to present. The maximum value of this counter is 15.

GETtheMANUALS.org

Faults

Faults are declared present or stored (depending on whether they appeared in a certain context and have disappeared since, or whether they remain present but are not diagnosed within the current context).

The **present** or **stored** status of faults should be taken into consideration when the diagnostic tool is used following the **+ after ignition** supply being switched on (without acting on the system components).

For a **present fault**, apply the procedure described in the **Interpretation of faults** section.

For a **stored fault**, note the faults displayed and apply the instructions in the **Notes** section.

If the fault is **confirmed** when the instructions are applied, the fault is present. Deal with the fault.

If the fault is **not confirmed**, check:
- the electrical lines which correspond to the fault,
- the connectors for these lines (for oxidation, bent pins, etc.),
- the resistance of the faulty component,
- the condition of the wires (melted or split insulation, wear).

Conformity check

The aim of the conformity check is to check data that does not produce a fault on the diagnostic tool when the data is inconsistent. Therefore, this stage is used to:
- carry out fault finding on faults that do not have a fault display, and which may correspond to a customer complaint,
- check that the system is operating correctly and that there is no risk of a fault recurring after repairs.

This section gives the fault finding procedures for statuses and parameters and the conditions for checking them. If a status is not behaving normally or a parameter is outside the permitted tolerance values, consult the corresponding fault finding page.

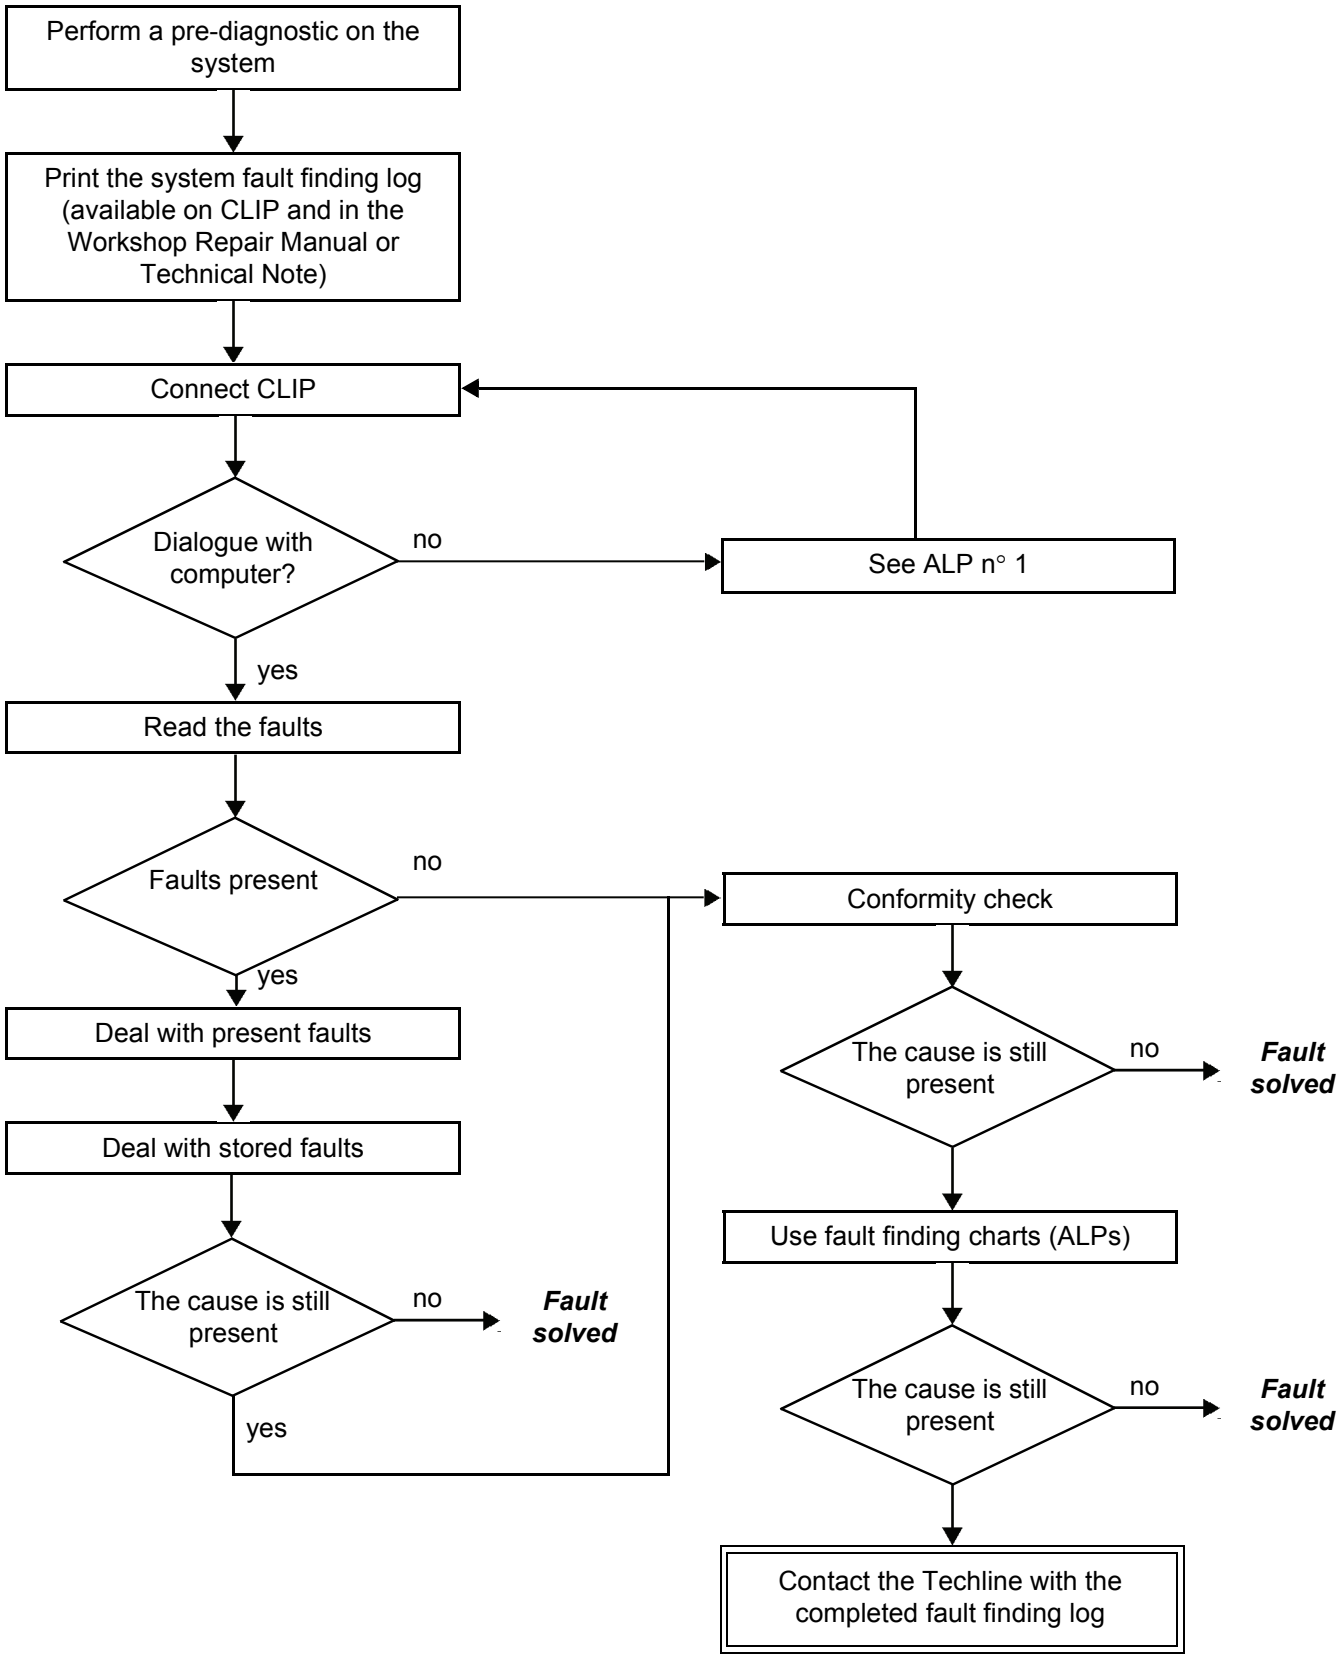
Customer complaints - Fault finding chart

If the test with the diagnostic tool is OK but the customer complaint is still present, the fault should be dealt with by **Customer complaints**.

A summary of the overall procedure to follow is provided on the following page in the form of a flow chart.

GETtheMANUALS.org

4. FAULT FINDING PROCEDURE



GETtheMANUALS.org

4. FAULT FINDING PROCEDURE (CONTINUED)

Wiring check

Fault finding problems
Disconnecting the connectors and/or handling the wiring harness may temporarily remove the cause of a fault and create other faults.
Electrical measurements of voltage, resistance and insulation are generally correct, especially if the fault is not present when the analysis is made (stored fault).

Visual inspection
Look for damage under the bonnet and in the passenger compartment.
Carefully check the fuses, insulators and wiring harness routing.
Look for signs of oxidation.

Physical inspection
While manipulating the wiring, use the diagnostic tool to note any change in fault status from stored to present.
Make sure that the connectors are properly locked.
Apply light pressure to the connectors.
Twist the wiring harness.
If there is a change in status, try to locate the source of the fault.

Inspection of each component
Disconnect the connectors and check the appearance of the clips and tabs, as well as the crimping (no crimping on the insulating section).
Make sure that the clips and tabs are properly locked in the sockets.
Check that no clips or tabs have been dislodged during connection.
Check the clip contact pressure using an appropriate model of tab.

Continuity and insulation check
Check the continuity of entire lines, then section by section.
Look for a short circuit to earth, to **+ 12 V** or to another wire.
If a fault is detected, repair or replace the wiring harness.

GETtheMANUALS.org

5. FAULT FINDING LOG

IMPORTANT!

IMPORTANT
Any fault on a complex system requires thorough fault finding with the appropriate tools. The FAULT FINDING LOG, which should be completed during the fault finding procedure, ensures a record is kept of the procedure carried out. It is an essential document when consulting the manufacturer.

IT IS THEREFORE ESSENTIAL THAT THE FAULT FINDING LOG IS FILLED OUT EVERY TIME IT IS REQUESTED BY TECHLINE OR THE WARRANTY RETURNS DEPARTMENT.

You will always be asked for this log:

- when requesting technical assistance from Techline,
- for approval requests when replacing parts for which approval is mandatory,
- to be attached to monitored parts for which reimbursement is requested. The log is needed for warranty reimbursement, and enables better analysis of the parts removed.

6. SAFETY INSTRUCTIONS

Safety rules must be observed during any work on a component to prevent any damage or injury:

– check the battery voltage to avoid incorrect operation of computer functions,
– use the proper tools.

GETtheMANUALS.org

PRESENTATION OF THE PARKING BRAKE:

The electronic parking brake provides the following functions:
- keeps the vehicle stationary when stopped (parking brake).
- 'dynamic' emergency brake (if the main brakes fail).
- automatic braking force adjustment according to the slope (adapted application),
- electronically-assisted parking brake application when the engine is stopped (depending on configuration),
- easy start with electronically-assisted parking brake release (depending on configuration),
- manual application and release by pulling on the lever.

SYSTEM COMPONENTS AND OPERATION:

The system consists of the following components:

- **Control lever** with brake on indicator light.
  - For applying and releasing the parking brake.

- **Control unit** (computer) housing an electric motor, the brake cable hooks, angle sensor and force sensor.
  - The **angle sensor** controls locking according to the angle of the slope.
  - The **force sensor** checks and corrects the force applied to the brakes.

- **Clutch pedal position sensor to help with pulling away**.
  - Informs the computer of the vehicle's clutch position (the position of the pedal enables the torque necessary for vehicle movement to be obtained).

- Two **mechanical cables**
  - Convey the mechanical force to the rear brakes.

- **Emergency control** cable (in the central storage compartment on the **LAGUNA, VEL SATIS** and **ESPACE** and in the boot on the **SCENIC**).
  - Enables the rear brakes to be released in the event of the battery or parking brake failing.

- **Warning lights** and symbol on the instrument panel.
  - Indicate application, releasing and any faults on the parking brake.

Note:
The parking brake cable play compensation is performed automatically by the control unit.

GETtheMANUALS.org

MANUAL OPERATION:

– The parking brake is engaged by pulling on the control lever (normal braking immobilises the vehicle).

– Over-application can be obtained by pulling and holding the lever for **5 seconds** (maximum application for steep hills or when the vehicle has reached its maximum permissible all-up weight).

– When the parking brake is applied, the computer super-applies if the force applied to the rear brake callipers is insufficient (pads cooling) or if the computer detects slight vehicle movement. This detection is limited to **24 hours**.

– The parking brake is released when the control lever is applied fully and the release switch is pressed.

Note:
When the parking brake is applied, the red light on the instrument panel (brake pads) and indicator light on the lever are lit.
Below **6 mph** (10 km/h) pulling the lever applies the rear brakes. Above **6 mph** (10 km/h) pulling the lever provides dynamic emergency braking without locking the rear wheels (statutory deceleration of **1.5 m/s^2**).
The electronic parking brake can only be released when the steering column is unlocked (**forced + after ignition feed**, see **Introduction**).

ASSISTED OPERATION:

The electronic parking brake enables assisted application and release of the brake:

- Applying the brake: When the engine is switched off, the parking brake is applied when the driver presses the start button
- Releasing: The brake releases when the drive wheels reach the torque required to move the vehicle (**Note:** with automatic transmission, the driver's door must be closed).

Restrictions on assisted brake release in automatic transmissions:
Assisted release is **not allowed** in the following cases:

– Opening the driver's door **followed** by engaging a gear (gear lever in position **D**).

Note: In this case, the instrument panel displays the message Lever in **P** or **N** and the buzzer on the instrument panel sounds.

– Engaging a gear (gear lever in position **D**) **followed** by opening the driver's door.

Note: In this case, **release is authorised for 5 s** after the driver's door has been opened (e.g. for a manoeuvre). After **5 seconds** release is prevented.

Note:
Assisted braking and release only occurs if the computer has been configured.
For details on how these configurations function, see **Configuration and programming**.

GETtheMANUALS.org

GENERAL OPERATING MODE FOR THE COMPUTER:

The electronic parking brake computer operates in two modes: **STANDBY** mode and **SWITCH ON** mode.

- **SWITCH ON** mode:

Available functions:

- Manual application and release, assisted application and release and emergency braking (steering column unlocked).
- Full system fault finding (all faults can be identified).

Switch on conditions (3 possibilities):

- The UCH sends a **switch on** request to the parking brake computer via the multiplex network when the vehicle is opened or the card is inserted in the reader.
- Braking request via the parking brake control lever.
- Battery voltage more than **13.2 V**, if the vehicle has been parked for less than **24 hours**.

- **STANDBY** mode:

Available functions:

- Monitoring of the braking force and slope angle for **24 hours** (to ensure parking brake application).
- Only application is authorised (using the lever).
- Restricted system fault finding (the computer can no longer identify all faults).
- Release not authorised.

Conditions for setting to standby:

- The UCH sends a "set to standby" request to the parking brake computer via the multiplex network after the ignition is switched off and the vehicle is locked (after a few seconds). The parking brake computer's STANDBY mode will be confirmed by the lever warning light going out (special note: the battery voltage must be less than **13.2 V**).

WARNING
Before using the emergency control, it is important to put the vehicle into gear and wedge one wheel if necessary (on a slope).

CABLE RESETTING:

The parking brake cable is locked after the control lever is released or after driving at over **1 mph** (2 km/h) (switched on mode).
When the electronic parking brake system locks, it makes a sound that lasts for a few seconds and ends with clicking (play compensation is automatic).

GETtheMANUALS.org

WARNING LIGHT MANAGEMENT

Indications of a level 1 fault:
- **Check Parking Brake** message on the instrument panel display.
- **orange warning light** (**P** in a triangle) on the instrument panel comes on.
- **SERVICE** warning light comes on.

Indications of a level 2 fault:
- **Parking brake defective** message on the instrument panel display.
- **1-second** audible warning (from the instrument panel),
- **orange warning light** (**P** in a triangle) on the instrument panel comes on.
- **SERVICE** warning light comes on,
- **Red indicator light** (brake pad light) on the instrument panel comes on.
- parking brake control lever indicator light flashes.

Note:
When the lever warning light stops flashing, the instrument panel message disappears. If the system has a level 2 fault, whenever the lever is used, the indicator light on the lever starts flashing again and the fault message reappears.

Warning occurs:
- when the door is opened and a gear is engaged on an automatic transmission,
- when the vehicle is moving, despite the parking brake being applied,
- when the door is opened, with the engine running and the parking brake released,
- when the door is opened, with the engine stopped and the parking brake released,

Note:
The clutch pedal sensor is only fitted to vehicles with a manual gearbox.

GETtheMANUALS.org

A/ PROCEDURE FOR REPLACING AN ELECTRONIC PARKING BRAKE COMPUTER

Note:
An electronic parking brake computer should be replaced **only when requested by the Techline** (fill out the fault finding log).

- For the description of the mechanical operations for replacing the control unit (computer) and brake cables (see **MR405 (Espace IV) or MR395 (Laguna II) or MR370 (Scénic), Mechanical, 37B, Electronic parking brake, Control unit: Removal - Refitting and 37A, Mechanical component controls, Parking brake cables: Removal - Refitting or MR353 (Vel Satis), Mechanical, 37B, Automatic parking brake, Control unit and brake cables**).
- The parking brake cables must always be replaced when the computer is replaced.
- In the same way, the computer must be replaced when the parking brake cables are changed.
- Conversely, the lever and the parking brake are independent of one another.
- Lever replacement must be carried out with **+ after ignition feed** switched off and the parking brake released, otherwise faults may occur.
- The clutch sensor must be replaced with **+ after ignition feed** switched on to avoid a fault being provoked.

BEFORE REPLACING THE PARKING BRAKE COMPUTER:

If the vehicle has a **manual gearbox**, recover the **clutch data** from the memory of the old computer so that it can be entered into the new computer (see section **C**).

Note:
With an automatic transmission, no data recovery is required (the computer can be replaced without applying sections **C and D**).

Operations to perform before replacement:

– Switch on the ignition, connect the diagnostic tool and establish dialogue with the computer (parking brake field).
– before replacing the computer, check that it is actually causing the fault by reading the faults and apply the fault finding procedure concerned.

Important:
Do not clear the faults from the computer before replacing it.

Steps to follow after replacement:

– with the ignition switched off, replace the electronic parking brake computer (with the approval of Techline).
– switch on the ignition, connect the diagnostic tool and establish dialogue with the computer (parking brake field),
– apply the procedure described in section **B: NEW COMPUTER CALIBRATION AND INITIALISATION**,
– release the parking brake lever to reset the cables.
– check parking brake operation by testing the braking, maximum braking, and release,
– read the faults to clear any stored faults and check that replacing the computer has enabled the fault on the vehicle to be rectified (no faults present).
– read the configuration (repair mode menu) to check that the parking brake computer configuration has been correctly configured.
– depending on the configuration chosen, check the assisted braking and release.

IMPORTANT: It is strictly forbidden to drive a vehicle with an electronic parking brake computer unless it is in customer mode.

GETtheMANUALS.org

B/ COMMISSIONING A NEW COMPUTER

1/ COMPUTER CONFIGURATION

– Carry out configuration in accordance with the customer's request (see **Configurations and programming**).

2/ VEHICLE IDENTIFICATION NUMBER ENTRY

– run command **VP004 Write VIN**.
– enter the vehicle identification number using the **diagnostic tool** keypad,
– confirm.

Note:
If the vehicle identification number is not entered and command **CF007 Vehicle configuration** is not run, step 3 of initialising the computer will not work.

3/ COMPUTER CALIBRATION AND COMMISSIONING

WARNING
To initialise the computer, the vehicle must be on a horizontal surface with the brake cables correctly fitted (connected to the rear brake callipers) and nobody must be working on the vehicle.

– In **+ after ignition feed**, run command **VP011 Computer calibration and initialisation** and carry out the following 4 steps.

STEP 1 VEHICLE MASS CALIBRATION
Screen 1:
With the dropdown menu, enter the following information:
– vehicle type,
– engine type,
– gearbox type,
– type of driving style,
– equipment level (for Vdiag 04),
– confirm the operation by pressing **Next**.

Screen 2:
– reread the highlighted information.
– If the highlighted information does not match the vehicle, return to the selection screen by pressing **Back**,
– if the highlighted information is correct, continue with step 2 by pressing **Next**.

STAGE 2 INITIALISING A NEW PARKING BRAKE
– Initialise the brake by pressing **YES** (you should hear a noise as the brake is applied and then released).
– Proceed to step 3 by pressing **Next**.

STEP 3 SLOPE INITIALISATION
– Calibrate the slope sensor by pressing **Confirm**. Proceed to step 4 by pressing **Next**.

STEP 4 INITIALISING ASSISTED BRAKING
– Carry out initialisation by pressing **Confirm**.
– Return to the selection list screen by pressing **Finish**.

GETtheMANUALS.org

C/ CLUTCH DATA BACKUP (for vehicles with a manual gearbox)

Purpose of the procedure:

The data saved relates to the clutch engagement point. This is important when the clutch wears, because this data enables the parking brake to release electronically when the clutch enables the vehicle to move off.

If this data cannot be retrieved from the old computer (impossible to establish dialogue with the diagnostic tool) or a new clutch has been fitted, the new computer has to be programmed with the clutch engagement point: drive the vehicle, downshifting at least 30 times (from 5^{th} to 4^{th} gear) before returning the vehicle to the customer.

If the clutch data is not recorded in the new computer, the operation of the assisted brake on steep slopes will be impaired when first used.

Perform the following operations:

IMPORTANT:
Do not apply this procedure in the event of a clutch fault.

- establish dialogue with the computer,
- select the repair mode menu on the diagnostic tool.
- open the programming menu,
- run function **SC005** Backup clutch pedal programming (the data is written to a file that is automatically selected when the new computer is programmed).
- replace the electronic parking brake computer (see **MR405 (Espace IV) or MR395 (Laguna II) or MR370 (Scénic), Mechanical, 37B, Electronic parking brake, Control unit: Removal - Refitting or MR353 (Vel Satis), Mechanical, 37B, Automatic parking brake, Control unit**),
- follow the procedures described in sections **A** and **B**.

D/ CLUTCH DATA ENTRY (for vehicles with automatic transmission)

The initialisation must be carried out (sections **A** and **B**).

Perform the following operations:

- establish dialogue with the computer,
- select the repair mode menu on the diagnostic tool.
- open the programming menu,
- run function: **SC006 Enter clutch pedal programming**.
- check that the electronic parking brake is operating correctly, including the assisted release function.

Note:
- For vehicles fitted with an **automatic gearbox**, command **SC005 Save clutch pedal programming** is **unavailable**.
- Command **SC006 Enter clutch pedal programming**, is also unavailable if command **SC005** has not already been activated.

GETtheMANUALS.org

CONFIGURATIONS:

Two functions can be turned off by configuration: assisted application and release.

Special note:
Assisted application and release are configured by default when a new computer is initialised. This configuration is accessible in the log book.

To carry out configuration, select the diagnostic tool's **Repair mode** menu.

CF007 Vehicle configuration

This configuration turns electronic parking brake application on or off when the engine is stopped.
In cold countries or regions, assisted braking should preferably be inhibited to avoid brake cables becoming frozen in the applied position.

- Select the type of configuration:
  - NORMAL (**with** assisted braking when the engine is stopped).
  - COLD CLIMATE (**without** assisted braking when the engine is stopped).
- Confirm the operation.
- Make sure the configuration has been properly entered by reading configuration **LC009 Vehicle configuration**.
- Make sure the assisted braking function works.

PROGRAMMING:

- Refer to the configuration check.

Note:
When a new computer is initialised, the angle sensor is calibrated by running command **VP011 Computer calibration and initialising**.

GETtheMANUALS.org

DF003 PRESENT OR STORED	COMPUTER 1. DEF: Internal electronic fault 2. DEF: Internal electronic fault 3. DEF: Loss of computer supply voltage

NOTES	**Priorities when dealing with a number of faults:** This fault must be dealt with first.
	Special notes: Before replacing the electronic parking brake computer, **save the data from the old computer** (for vehicles fitted with a manual gearbox). For this operation, see **Replacement of components**.

1. DEF ***2. DEF***	***NOTES***	None.

If the fault is present or stored, contact the **Techline**.

3. DEF	***NOTES***	**Special notes:** The fault does not usually come from the electronic parking brake computer. This fault indicates that the computer has detected several losses of feed (micro-breaks). **Note:** This fault may be caused by several battery disconnections or a vehicle power supply fault. **Only for Vdiag 08, 0C and 0D:** **If there is a stored fault, refer to the statuses and parameters when it appears.** Explanation of counters: see **Introduction**. If the fault is stored and **PR018 = 0** and **PR022 > 25**, then clear the fault: do not take this fault into account.
		Conditions for applying the fault finding procedure to a stored fault: Apply this fault finding procedure if the fault reappears as present or stored after a fault has been cleared and forced + after ignition feed has been switched off and on again (see **Introduction**).

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF003 **CONTINUED**	

Disconnect the electronic parking brake computer connector (under the body near the rear axle) to check the **conformity of the power supply** (this must equal the voltage measured at the battery terminals **± 0.5 V**).
Check **the insulation, continuity and the absence of interference resistance** on the following connections:

Electronic parking brake computer connector

track H4
(except Laguna II, Vel Satis and Espace IV) → **+ 12 V**
track G4

track H2
(except Laguna II, Vel Satis and Espace IV) → **earth**
track G2

Note:
If the electrical supply is correct, check that the supply has not been cut off by moving the electrical harness (near to the intermediate connector under the front left-hand seat at the computer connector).
Repair if necessary (see the vehicle wiring diagram).

If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF004 PRESENT OR STORED	COMPUTER 1. DEF: Internal electronic fault

NOTES	**Priorities when dealing with a number of faults:** This fault must be dealt with first.
	Special notes: Before replacing an electronic parking brake computer, **save the data from the old computer** (for vehicles fitted with a manual gearbox). For this operation, see **Replacement of components**.

Contact the Techline without clearing the faults.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF006 PRESENT	COMPUTER CONFIGURATION 1. DEF: Configuration absent or incorrect

NOTES	**Special notes:** Deal with this fault only after the computer has been replaced. If it appears when the electronic parking brake computer is not new, contact the Techline. This fault indicates that the parking brake control unit has not been calibrated or has been calibrated incorrectly. This fault causes the electronic parking brake to operate incorrectly, in particular for the assisted release function.

Display status **ET024 System operation** on the main screen of the diagnostic tool.
This status should be **CUSTOMER MODE**. If it is **FACTORY MODE**, initialise the computer by running command **VP011 Computer calibration and initialisation** (see **Replacement of components**).

Test that the parking brake is operating correctly by applying it, applying it completely (handle pulled right up for **5 seconds**) and releasing it.

Check the validity of parameter **PR003 "Inclination value"**.
Calibrate the sensor if necessary **(SC008 Slope initialisation**).

If necessary, reconfigure the application and release functions as requested by the customer with **CF007 Vehicle configuration** and see **Configurations and programming**.

If the above procedure does not resolve the fault (fault still present), recalibrate the computer (command **VP011 Computer calibration and initialisation** on the diagnostic tool).
During this stage, check that the vehicle criteria are correctly entered (screen 2 stage 1).

If the fault is still present, contact the **Techline** without clearing the faults.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF015 PRESENT OR STORED	CLUTCH POSITION SENSOR CIRCUIT CC.0 : Short circuit to earth CC.1 : Short circuit to + 12 volts 1. DEF: Signal inconsistency between the sensor and the gearbox 2. DEF: Signal outside lower limit 3. DEF: Sensor supply fault

NOTES	**Priorities when dealing with a number of faults:** Deal with faults **DF035 Undervoltage, DF055 Battery undervoltage and DF054 Battery voltage too high** first, if they are present or stored.
	Special notes: The fault does not usually come from the electronic parking brake computer. The fault should only be displayed on a vehicle fitted with a manual gearbox. If it is displayed on an automatic transmission, check the configurations. The sensor should be replaced in **+ after ignition feed**, if not this fault may occur. If the fault appeared following replacement of the clutch position sensor, check the procedure and repeat it in **+ after ignition feed** if necessary, after clearing the fault. If the fault cannot be cleared, disconnect the clutch sensor under **+ after ignition feed**, then reconnect it. **Only for Vdiag 08, 0C and 0D:** **If there is a stored fault, refer to the statuses and parameters when it appears.** Explanation of counters: see **Introduction**. If the fault is stored and **PR018 = 0** and **PR022 > 25** clear the fault: do not take this fault into account.

CC.0; CC.1; 3.DEF	***NOTES***	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present when the ignition is switched on (forced + after ignition feed, see **Introduction**).

Check **the connection and condition** of the clutch pedal position sensor connector.
Repair if necessary.

With the clutch pedal position sensor connector disconnected, check **the insulation, continuity and absence of interference resistance** on the following connections:

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF015 **CONTINUED**	

Clutch pedal position sensor connector: **1057**

Electronic parking brake computer connector: **1217**

Track 1 → **Track E4**

Track 2 → **Track E3**

Track 3 → **Track E2**

Repair if necessary.

Disconnect the clutch pedal position sensor connector to check, with the ignition switched on and the electronic parking brake computer connector connected, **the presence of a 5 volt supply**, by measuring between **tracks 1 and 3** of the sensor (**+ 5 V** on **track 1** and earth on **track 3**).
If the 5 V supply is not present and the connections previously checked are correct, contact the Techline.

With the clutch pedal position sensor connector disconnected, measure the sensor resistance between **tracks 1 and 3** of the sensor.
Replace the sensor if its resistance is not **5200** Ω **± 520** Ω.

If the fault is still present, contact the **Techline**.

1. DEF; 2. DEF	***NOTES***	**Conditions for applying the fault finding procedure to a stored fault:** Engine at idle speed, and gear engaged for **5 seconds**.

Check the operation of statuses **ET016 Manual gearbox gear lever position** and **ET017 Reverse gear engaged** and the absence of any incorrect contacts.
If not correct, check the operation of the gearbox sensor.

Check that the clutch pedal position sensor is **fitted correctly**: the **"arm"** of the potentiometer should be inserted correctly into its mounting lug (neither above nor below).

Using the diagnostic tool, display parameter **PR006 Clutch pedal position** on the main data screen (see the conformity check values).

Check the conformity of the pedals.

If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF016 PRESENT OR STORED	WARNING LIGHT CIRCUIT CC.0: Short circuit to earth CC.1: Short circuit to + 12 V.

NOTES	**Priorities when dealing with a number of faults:** Deal with faults **DF035 Undervoltage, DF055 Battery undervoltage and DF054 Battery voltage too high** first, if they are present or stored.
	Conditions for applying the fault finding procedure to a stored fault: The fault is declared present after the forced + after ignition is switched on (see **Introduction**) and an application request using the control lever.
	Special notes: The fault does not usually come from the electronic parking brake computer. **Note:** After a release request, the fault becomes stored. Replacing the lever with the parking brake applied may cause this fault. If this fault appears after replacing the lever, release the parking brake and carry out the procedure again. **Only for Vdiag 08, 0C and 0D:** **If there is a stored fault, refer to the statuses and parameters when it appears.** Explanation of counters: see **Introduction** section. If the fault is stored and **PR018 = 0** and **PR022 > 25** clear the fault: do not take this fault into account. If the fault is stored and **PR019 < 3**, clear the fault: do not take this fault into account.

Check that the electronic parking brake control lever connector is in **good condition** and also check its clips (terminals).
Repair if necessary.

Check that there is a **12 V + before ignition** supply on **track 6** of the electronic parking brake control lever: see wiring diagram.
Repair if necessary.

Disconnect the electronic parking brake control lever connector in order to check **the insulation, continuity and absence of interference resistance** on the following connection:

Electronic parking brake control lever connector: **1216**		Electronic parking brake computer connector: **1217**
Track 5	⟶	**Track C4**

Repair if necessary.

If the fault is still present, replace the parking brake control lever (the indicator light cannot be separated).

If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF025 PRESENT OR STORED	VEHICLE MOVEMENT WITH MAXIMUM APPLICATION 1. DEF: Rear wheel movement with parking brake applied 2. DEF: Front wheel movement with parking brake applied

NOTES	**Priorities when dealing with a number of faults:** First deal with faults **DF046 Brake motor/cables connection, DF042 Force sensor, DF035 Undervoltage, DF041 Slope sensor, DF049 Brake application, DF054 Battery voltage too high and DF055 Battery undervoltage**, if they are present or stored. If none of these faults is present or stored, the parking brake computer is not normally the cause.
	Conditions for applying the fault finding procedure to a stored fault: Apply the fault finding procedure even if the fault is **stored**. **Note:** The fault does not remain present after it has been detected.

1. DEF	***NOTES***	**Special notes:** – This fault indicates that the electronic parking brake computer detected rear wheel movement although the parking brake was applied with maximum force. – It may be associated with **2.DEF**. If this fault is not associated with the faults mentioned above, check the conformity of the parking brake's mechanical force line: – Condition and conformity of rear brake pads. – Parking brake cables correctly fitted. – Good condition of the parking brake cables (no seizing or deterioration). – Conformity, condition and correct operation of the rear brake callipers. This fault is an operational warning. Check the context in which it appears. **It may appear during:** **– incorrect use of a roller test bench which drives the rear wheels (MOT test),** **– forced assisted release when starting, when the starting conditions have not been met,** **– vehicle overload on a very steep slope (maximum permissible all-up weight exceeded + angle > 18°: e.g. towing a trailer or a caravan).**

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF025 **CONTINUED**	

2. DEF	***NOTES***	**Special notes:** – This fault indicates that the electronic parking brake computer detected front wheel movement although the parking brake was applied with maximum force. When this fault appears on its own it is an operating warning that indicates that the vehicle's conditions of use are on the limit (the braking system and parking brake are not normally the cause). This fault is an operational warning. Check the context in which it appears. **It may appear during:** **– an application request, whilst the vehicle is still being driven,** **– forced assisted release when starting, when the starting conditions have not been met,** **– parked on a steep slope with slippery surface,** **– incorrect use of a roller test bench which drives the front wheels (MOT test).** **If the fault is stored, refer to the statuses and parameters when it appears**. Explanation of counters: see **Introduction** section. If the fault is stored and **PR018 = 0 and PR022 > 25** clear the fault: do not take this fault into account.

Using the **diagnostic tool**, display the wheel speed parameters on the parameters screen. When stationary, these parameters must show **0 mph**. If this is not the case, carry out fault finding on the **anti-lock braking system** (see **38C**, **Anti-lock braking system**).
Check that the parking brake mechanical tensioning line is correct: – Parking brake cables correctly fitted. – Good condition of the parking brake cables (no seizing or deterioration). – Conformity, condition and proper functioning of the rear brake callipers. – Condition and conformity of rear brake pads. Carry out the necessary repairs.
Check that the vehicle is not overloaded.
Check that the vehicle's tyres are not bald.
If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF025 PRESENT OR STORED	VEHICLE MOVEMENT WITH MAXIMUM APPLICATION 1. DEF: The computer has detected vehicle movement when parked (parking brake applied)

NOTES	**Priorities when dealing with a number of faults:** First deal with faults **DF046 Brake motor/cables connection, DF042 Force sensor, DF035 Undervoltage, DF041 Slope sensor, DF049 Brake application, DF054 Battery voltage too high and DF055 Battery undervoltage**, if they are present or stored. If none of these faults is present or stored, the parking brake computer is not normally the cause.
	Conditions for applying the fault finding procedure to a stored fault: Apply the fault finding procedure even if the fault is **stored**. **Note:** The fault does not remain present after it has been detected.
	Special notes: – this fault indicates that the electronic parking brake computer detected movement of the vehicle although the parking brake was applied. – if this fault is present, with the ignition on, the buzzer on the instrument panel is activated (when the vehicle is moving with the parking brake applied). This fault is an operational warning. Check the context in which it appears. **It may appear during:** **– an application request, whilst the vehicle is still being driven,** **– forced assisted release when starting, when the starting conditions have not been met,** **– parked on a steep slope with slippery surface,** **– incorrect use of a roller test bench (MOT test).** **Only for Vdiag 08 and 0C:** **If there is a stored fault, refer to the statuses and parameters when it appears.** Explanation of counters: see **Introduction** section. If the fault is stored and **PR018 = 0 and PR022 > 25**, clear the fault: do not take this fault into account.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF025 **CONTINUED**	

Using the diagnostic tool, display the wheel speed parameters on the parameters screen. When stationary, these parameters must show **0 mph**. If this is not the case, carry out fault finding on the anti-lock braking system.
Check that the parking brake mechanical tensioning line is correct: – Parking brake cables correctly fitted. – Good condition of the parking brake cables (no seizing or deterioration). – Conformity, condition and proper functioning of the rear brake callipers. – Condition and conformity of rear brake pads. Carry out the necessary repairs.
Check that the vehicle is not overloaded.
Check that the vehicle's tyres are not bald.
If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF028 PRESENT OR STORED	COMPUTER 1. DEF: Internal electronic fault 2. DEF: Internal electronic fault

NOTES	**Priorities when dealing with a number of faults:** This fault must be dealt with first.
	Conditions for applying the fault finding procedure to a stored fault: Apply the fault finding procedure even if the fault is **stored**.
	Special notes: Before replacing an electronic parking brake computer, **save the data from the old computer** (for vehicles fitted with a manual gearbox). For this operation, see **Replacement of components**.

Contact the **Techline**, without clearing the fault.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF029 PRESENT OR STORED	COMPUTER 1. DEF: Internal electronic fault 2. DEF: Internal electronic fault

NOTES	**Priorities when dealing with a number of faults:** This fault must be dealt with first.
	Conditions for applying the fault finding procedure to a stored fault: Apply the fault finding procedure even if the fault is **stored**.
	Special notes: Before replacing an electronic parking brake computer, **save the data from the old computer** (for vehicles fitted with a manual gearbox). For this operation, see **Replacement of components**.

Contact the **Techline**, without clearing the fault.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF035 PRESENT OR STORED	UNDERVOLTAGE 1. DEF: Insufficient feed voltage during the command

NOTES	**Priority in the event of a number of faults:** Deal with fault **DF055 Battery undervoltage** first if it is present or stored.
	Conditions for applying the fault finding procedure to a stored fault: Apply this fault finding procedure if the fault reappears after the ignition has been switched off and on again (+ forced after ignition feed: see **Introduction**) and an application or release request using the control lever.
	Special notes: This fault is a power supply fault and does not usually stem from the electronic parking brake computer. This fault does not indicate computer feed undervoltage but a significant drop in voltage to the parking brake motor while the command is being issued. **Only for Vdiag 08, 0C and 0D:** **If there is a stored fault, refer to the statuses and parameters when it appears.** Explanation of counters: see **Introduction**. If the fault is stored and **PR018 = 0** and **PR022 > 25**, clear the fault: do not take this fault into account.

Disconnect the electronic parking brake computer connector to check the **conformity of the supplies** and to check t**he insulation, continuity and the absence of interference resistance** on the following connections:

Electronic parking brake computer connector

track H4
(except Laguna II, Vel Satis and Espace IV) → **+ 12 V**
track G4

track H2
(except Laguna II, Vel Satis and Espace IV) → **earth**
track G2

Repair if necessary (see the vehicle wiring diagram).

Apply the brake and then release it (engine running) to check that during the command the voltage measured at the fuse does not drop below **10.5 V**.
Make the repairs necessary for the parking brake computer electrical supply to be correct (equal to the battery voltage).

If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF036 PRESENT OR STORED	INJECTION MULTIPLEX SIGNAL ABSENT 1. DEF: Multiplex signals absent or values invalid (fault with the computer generating the signal or multiplex line connection fault)

NOTES	**Priority in the event of a number of faults:** Deal with faults **DF055 Battery undervoltage and DF052 Multiplex network** first if they are present or stored.
	Deal with any injection computer faults first. The fault does not usually come from the electronic parking brake computer. **Note:** If there is a multiplex line fault like this one, the parking brake loses its assisted application and release functions.
	Conditions for applying the fault finding procedure to a stored fault: Apply this fault finding procedure if the fault reappears as present or stored after a fault has been cleared, and the ignition has been switched off and on again (forced **+ after ignition feed**: see **Introduction**).
	Special notes: This fault only relates to multiplex signals received from the injection computer. This fault indicates either that there is no transmission, or that the signals received by the parking brake are inconsistent. **Only for Vdiag 08, 0C and 0D:** **If there is a stored fault, refer to the statuses and parameters when it appears.** Explanation of counters: see **Introduction** section. If the fault is stored and **PR018 = 0** and **PR022 > 25**, clear the fault: do not take this fault into account. If the fault is stored and **PR019 < 10**, clear the fault: do not take this fault into account.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF036 **CONTINUED**	

Using the diagnostic tool, run **fault finding on the multiplex network** and particularly on the injection computer - electronic parking brake computer segment. This check ensures that the various multiplex system connections are correct and finds any faulty segments. Carry out any necessary repairs.
If the multiplex network test did not find the faulty connection, carry out a **conformity check** to check that the statuses and parameters coming from the injection computer are present and correct (**ET019, PR015, PR017**). If the status and parameters shown here are not correct, carry out fault finding on the **injection**.
If the fault is still present, disconnect the injection computer connector to check that it is **good condition** as well as its clips (terminals), in particular the clips for the **multiplex tracks** (refer to the wiring diagram for the injection system fitted to the vehicle). Replace the clips if necessary.
If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF037 PRESENT OR STORED	NO ABS MULTIPLEX SIGNAL 1. DEF: Multiplex signals absent or values invalid (fault with the computer generating the signal or multiplex line connection fault)

NOTES	**Priority in the event of a number of faults:** Deal with faults **DF055 Battery undervoltage and DF052 Multiplex network** first if they are present or stored.
	Deal with any ABS computer faults first. The fault does not usually come from the electronic parking brake computer. **Note:** If this fault is present, the parking brake loses its assisted application and release functions.
	Conditions for applying the fault finding procedure to a stored fault: Apply this fault finding procedure if the fault reappears as present or stored after a fault has been cleared and the ignition has been switched off and on again (forced + after ignition feed: see **Introduction**).
	Special notes: This fault only relates to multiplex signals received from the ABS computer. This fault indicates either that there is no transmission, or that the signals received by the electronic parking brake computer are inconsistent.
	Only for Vdiag 08, 0C and 0D: **If there is a stored fault, refer to the statuses and parameters when it appears.** Explanation of counters: see **Introduction**. If the fault is stored and **PR018 = 0** and **PR022 > 25**, clear the fault: do not take this fault into account. If the fault is stored and **PR019 < 10**, clear the fault: do not take this fault into account.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF037 **CONTINUED**	

Using the diagnostic tool, run **fault finding on the multiplex system** and particularly on the ABS computer-parking brake control unit segment. This check ensures that the various multiplex system connections are correct and finds any faulty segments. Carry out any necessary repairs.
If the multiplex system test did not find the faulty connection, carry out a **conformity check** to check that the parameters coming from the ABS computer are present and correct (**PR012, PR013, PR014**). If the parameters mentioned are not correct, carry out an **ABS** computer fault finding procedure (see **38C**, **Anti-lock braking system**).
If the fault is still present, disconnect the computer connector to check that it is in **good condition** as well as its clips (terminals), in particular the clips for the **multiplex tracks** (refer to the wiring diagram for the ABS computer fitted to the vehicle). Replace the clips if necessary.
If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF038 PRESENT OR STORED	NO AUTOMATIC TRANSMISSION MULTIPLEX SIGNAL 1. DEF: Multiplex signals absent or values invalid (fault with the computer generating the signal or multiplex line connection fault)

NOTES	**Priority in the event of a number of faults:** Deal with faults **DF055 Battery undervoltage and DF052 Multiplex network** first if they are present or stored.
	Deal with any automatic transmission computer faults first. The fault does not usually come from the electronic parking brake computer. **Note:** If this fault is present, the parking brake loses its assisted application and release functions.
	Conditions for applying the fault finding procedure to a stored fault: Apply this fault finding procedure if the fault reappears as present or stored after a fault has been cleared, and the ignition has been switched off and on again (forced **+ after ignition feed**: see **Introduction**).
	Special notes: This fault only relates to multiplex signals received from the automatic transmission computer. This fault indicates either that there is no signal or that the signals transmitted are inconsistent. **Only for Vdiag 08, 0C and 0D:** **If there is a stored fault, refer to the statuses and parameters when it appears.** Explanation of counters: see **Introduction**. If the fault is stored and **PR018 = 0** and **PR022 > 25**, clear the fault: do not take this fault into account. If the fault is stored and **PR019 < 15** clear the fault: do not take this fault into account.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF038 **CONTINUED**	

Check the vehicle gearbox configuration: check that the configuration is not for a manual gearbox when the vehicle is fitted with an automatic transmission, or that it is not configured for an automatic transmission when the vehicle is manual. Using the diagnostic tool, run **fault finding on the multiplex system** and particularly on the automatic transmission computer-parking brake control unit segment. This check ensures that the various multiplex system connections are correct and finds any faulty segments. Carry out any necessary repairs.
If the multiplex system test did not find the faulty connection, carry out a **conformity check** to check that the status coming from the automatic transmission computer is present and correct (**ET018**). If status **ET018** is not correct, carry out fault finding on the **automatic transmission**.
If the fault is still present, disconnect the automatic transmission computer connector to check that it is **sound** as well as its clips (terminals), and in particular the clips for the **multiplex tracks** (refer to the wiring diagram for the automatic transmission computer fitted on the vehicle). Replace the clips if necessary.
If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF039 PRESENT OR STORED	NO UCH MULTIPLEX SIGNAL 1. DEF: Multiplex signals absent or values invalid (fault with the computer generating the signal or multiplex line connection fault)

NOTES	**Priority in the event of a number of faults:** Deal with faults **DF055 Battery undervoltage and DF052 Multiplex network** first if they are present or stored.
	Deal with any UCH computer faults first. The fault does not usually come from the electronic parking brake computer. **Note:** If this fault is present, the parking brake loses its assisted application and release functions.
	Conditions for applying the fault finding procedure to a stored fault: Apply this fault finding procedure if the fault reappears as present or stored after a fault has been cleared and the ignition has been switched off and on again (forced + after ignition feed: see **Introduction**).
	Special notes: This fault only relates to multiplex signals received from the UCH computer. This fault indicates either that there is no signal or that the signals transmitted are inconsistent. **Only for Vdiag 08, 0C and 0D:** **If there is a stored fault, refer to the statuses and parameters when it appears.** Explanation of counters: see **Introduction**. If the fault is stored and **PR018 = 0 and PR022 > 25**, clear the fault: do not take this fault into account. If the fault is stored and **PR019 < 15** clear the fault: do not take this fault into account.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF039 **CONTINUED**	

Using the diagnostic tool, run **fault finding on the multiplex system** and particularly on the UCH computer-parking brake control unit segment. This check ensures that the various multiplex system connections are correct and finds any faulty segments. Carry out any necessary repairs.
If the multiplex network test did not find the faulty connection, carry out **a conformity check** to check that the statuses coming from the UCH are present and correct (**ET001, ET014, ET016, ET017, PR001**). If the statuses and parameters specified are not correct, carry out fault finding on the **UCH**.
If the fault is still present, disconnect the connectors to ensure that the UCH connectors are in **good condition** as well as their clips (terminals), in particular the clips for the **multiplex tracks** (refer to the wiring diagram for the UCH fitted to the vehicle). Replace the clips if necessary.
If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF041 PRESENT OR STORED	SLOPE SENSOR 1. DEF: Signal inconsistency

NOTES	**Priorities when dealing with a number of faults:** This fault must be dealt with first.
	Special notes: The slope sensor is **internal** to the electronic parking brake computer, it cannot be separated. Before replacing an electronic parking brake computer, **save the data from the old computer** (for vehicles fitted with a manual gearbox). For this operation, (see **Replacement of components**).

Contact the **Techline** without clearing the faults.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF042 PRESENT OR STORED	FORCE SENSOR CC.0: Short circuit to earth CC.1: Short circuit to + 12 V 1. DEF: Sensor supply fault 2 CO.0: Open circuit or short circuit to earth

CC.1 1. DEF	***NOTES***	**Priorities when dealing with a number of faults:** This fault must be dealt with first.
		Special notes: The force sensor is internal to the electronic parking brake computer; it cannot be separated. Before replacing an electronic parking brake computer, **save the data from the old computer** (for vehicles fitted with a manual gearbox). For this operation, (see **Replacement of components**).

Contact the **Techline** without clearing the faults.

CC.0	***NOTES***	**Priority when dealing with a number of faults:** Deal with faults **DF055 Battery undervoltage and DF052 Multiplex network** first if they are present or stored.
		Special notes: The force sensor is internal to the electronic parking brake computer; it cannot be separated. Before replacing a parking brake control unit, **save the data from the old computer** (for vehicles fitted with a manual gearbox). For this operation, (see **Replacement of components**).

Contact the **Techline** without clearing the faults.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF042 CONTINUED	

2 CO.0	***NOTES***	**Priorities when dealing with a number of faults:** This fault must be dealt with first.
		Special notes: The force sensor is internal to the electronic parking brake computer; it cannot be separated. **Only for Espace IV Ph2 and Vel satis Ph2 in Vdiag 0D.** Before replacing an electronic parking brake computer, **save the data from the old computer** (for vehicles fitted with a manual gearbox). For this operation, (see **Replacement of components**).

Contact the **Techline** without clearing the faults.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF043 PRESENT OR STORED	PARKING BRAKE MOTOR 1. DEF: Internal electrical fault

NOTES	**Priorities when dealing with a number of faults:** This fault must be dealt with first.
	Special notes: Before replacing an electronic parking brake computer, **save the data from the old computer** (for vehicles fitted with a manual gearbox). For this operation, (see **Replacement of components**).

Check that the parking brake mechanical tensioning line is correct:
– Check the conformity, condition and correct operation of the brake callipers.
– Check the automatic adjustment of the rear brake callipers.

Contact the **Techline** without clearing the faults.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF044 PRESENT OR STORED	BRAKING SWITCH CC.0: Short circuit to earth CC.1: Short circuit to + 12 V

NOTES	**Priority when dealing with a number of faults:** Deal first with faults **DF047 Manual control, DF035 Undervoltage, DF055 Battery undervoltage and DF054 Battery voltage too high**, if they are present or stored.
	Conditions for applying the fault finding procedure to a stored fault: The fault is declared present after the ignition is switched on (forced **+ after ignition feed**, see **Introduction**) and an application request using the control lever.
	The fault does not usually come from the electronic parking brake computer. **Special notes:** The braking switch is in fact the first contact of the lever (the lever travels about **3 mm**). This fault appears naturally when the lever is disconnected. **Note:** The fault warning light comes on **10 seconds** after the fault appears. **Only for Vdiag 08, 0C and 0D:** **If there is a stored fault, refer to the statuses and parameters when it appears.** Explanation of counters: see **Introduction**. If the fault is stored and **PR018 = 0** and **PR022 > 25**, clear the fault: do not take this fault into account. If the fault is stored and **PR019 < 3**, clear the fault: do not take this fault into account.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF044 **CONTINUED 1**	

Using the diagnostic tool (**PARKING** sub-function), check the operation of the parking brake control lever. With the ignition on, statuses **ET008, ET009**, **ET010** should operate as follows:

	ET008 "Application switch position"	**ET009 "Redundant braking switch position"**	**ET010 "Release switch position"**
Lever **at rest**	**INACTIVE**	**INACTIVE**	**RELEASED**
Lever **pulled slightly (3 mm travel)**	**ACTIVE**	**INACTIVE**	**RELEASED**
Lever **pulled to end of travel**	**ACTIVE**	**ACTIVE**	**RELEASED**
Lever **pulled and release switch pressed**	**ACTIVE**	**ACTIVE**	**PRESSED**

If the statuses do not operate as explained above, check the **connection and condition** of the parking brake control lever connector.
Repair if necessary.

Check **the condition and connection** of the parking brake computer connectors and their clips (terminals).
Repair if necessary.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF044 **CONTINUED 2**	

With the parking brake control lever connector disconnected, check the **insulation, continuity and absence of interference resistance** on the following connections:

Parking brake lever connector: **1216**		Electronic parking brake computer: **1217**
track 9	→	**track D2**
track 7	→	**track C2**

Repair if necessary.

With the parking brake control lever connector disconnected, switch on the ignition and **check for a 5 V supply (4 V < X < 5 V)** on **track 7** of the lever connector. If the power supply is not present and the parking brake computer is correctly supplied (no other faults detected by the diagnostic tool), then contact the **Techline**.

If the fault is still present, measure the resistance of the braking switch between **tracks 7 and 9** of the parking brake control lever.
Replace the lever (see **MR405 (Espace IV), MR395 (Laguna II) or MR370 (Scénic), Mechanical, 37B, Electronic parking brake, Lever: Removal - Refitting or MR353 (Vel Satis), Mechanical, 37B, Automatic parking brake, Lever**) if the resistance of the brake application switch is not approximately:
– Lever in rest position: **2700 Ω ± 100 Ω**.
– Lever pulled: **172 Ω ± 15 Ω**.

If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF045 PRESENT OR STORED	REDUNDANT BRAKE SWITCH 1. DEF: Signal inconsistency

NOTES	**Priority when dealing with a number of faults:** Deal first with faults **DF047 Manual control, DF035 Undervoltage and DF055 Battery voltage too low**, if they are present or stored.
	Conditions for applying the fault finding procedure to a stored fault: This fault must be dealt with first.
	Special notes: The fault does not usually come from the electronic parking brake computer. The redundant brake switch is the second contact of the lever (maximum lever travel). **Only for Vdiag 08, 0C and 0D:** **If there is a stored fault, refer to the statuses and parameters when it appears.** Explanation of counters: see **Introduction**. If the fault is stored and **PR018 = 0** and **PR022 > 25** clear the fault: do not take this fault into account. If the fault is stored and **PR019 < 3**, clear the fault: do not take this fault into account.

Using the diagnostic tool (**PARKING** sub-function), check the operation of the parking brake control lever. With the ignition switched on, statuses **ET008, ET009** and **ET010** should operate as follows:

	ET008 "Engagement switch position"	**ET009 "Redundant braking switch position"**	**ET010 "Release switch position"**
Lever **at rest**	**INACTIVE**	**INACTIVE**	**RELEASED**
Lever **pulled slightly (3 mm travel)**	**ACTIVE**	**INACTIVE**	**RELEASED**
Lever **pulled to end of travel**	**ACTIVE**	**ACTIVE**	**RELEASED**
Lever **pulled and release switch pressed**	**ACTIVE**	**ACTIVE**	**PRESSED**

If the statuses do not operate as explained above, check the **connection and condition** of the parking brake control lever connector.
Repair if necessary.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF045 **CONTINUED**	

With the parking brake control lever connector disconnected, check the **insulation, continuity and absence of interference resistance** on the following connection:

Parking brake lever connector: **1216**		Electronic parking brake computer: **1217**
track 10	⟶	**track C3**

Repair if necessary.

With the parking brake control lever connector disconnected, check **for earth** on **track 2** of the lever connector.
Repair if necessary.

If the fault persists, **check the redundant braking switch**:
Lever in rest position: **insulation** between **tracks 2 and 10** of the lever.
Lever fully applied: **continuity** between **tracks 2 and 10** of the lever.
Replace the parking brake control lever if it does not function as indicated (see **MR405 (Espace IV), MR395 (Laguna II) or MR370 (Scénic), Mechanical, 37B, Electronic parking brake, Lever: Removal - Refitting or MR353 (Vel Satis), Mechanical, 37B, Automatic parking brake, Lever**).

If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF046 PRESENT OR STORED	BRAKE MOTOR/CABLES CONNECTION (EMERGENCY UNLOCKING) 1. DEF: Parking brake unlocked by the emergency handle

NOTES	**Priority when dealing with a number of faults:** Deal first with faults **DF003, DF004, DF028, DF029, DF035, DF041, DF042, DF043, DF050, DF054, DF055, DF057, DF058 and DF073** if they are present or stored.
	Conditions for applying the fault finding procedure to a stored fault: Apply this fault finding procedure if the fault recurs after the fault is cleared, with the ignition switched off and on again (forced **+ after ignition feed**, see **Introduction**), and the parking brake released then applied using the control lever.
	Special notes: The fault does not usually come from the electronic parking brake computer. This fault indicates that the electronic parking brake system has been unlocked by the manual control (if this is the case, check that the handle protector has not been damaged). Check that the emergency unlocking handle has not been manually pulled by the user, which would provoke this fault. The cables are reset by the parking brake release manual command or automatically (if the fault is present) when the vehicle is driven at more than **1.2 mph (2 km/h)** (the fault is then stored).
	Only for Vdiag 08, 0C and 0D: **If there is a stored fault, refer to the statuses and parameters when it appears.** Explanation of counters: see **Introduction**. If the fault is stored and **PR018 = 0** and **PR022 > 25** clear the fault: do not take this fault into account. If there has been no manual use of the emergency unlocking handle and if **PR019 > 5**, contact the **Techline**.

Check that the fault was not provoked by manual usage of the emergency unlocking handle. In this case, it is normal for the fault to arise; clear the fault.
Carry out a releasing command, then a braking command with the control lever to **reset the cables** of the parking brake.
Check the conformity of the parking brake mechanical tensioning line: correctly attached, no breakage. Check the conformity of the emergency unlocking cable. Carry out the necessary repairs.
Check that the braking force and maximum braking are operating correctly.
If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF047 PRESENT OR STORED	MANUAL CONTROL 1. DEF: No signal 2. DEF: Signal inconsistency 3. DEF: Short circuit 4. DEF: Lever fault

NOTES	**Priorities when dealing with a number of faults:** Deal with faults: **DF035 Undervoltage, DF055 Battery undervoltage and DF054 Battery voltage too high** first, if they are present or stored.
	Note: The fault does not usually come from the electronic parking brake computer. The fault is only stored after the brakes have been applied 3 times with the control level.
	Conditions for applying the fault finding procedure to a stored fault: Deal with the fault as if it were present.
	Only for Vdiag 08, 0C and 0D: **If there is a stored fault, refer to the statuses and parameters when it appears.** Explanation of counters: see **Introduction**. If the fault is stored and **PR018 = 0** and **PR022 > 25** clear the fault: do not take this fault into account. If the fault is stored and **PR019 < 3**, clear the fault: do not take this fault into account.

Using the diagnostic tool (**PARKING** sub-function), check the operation of the parking brake control lever. With the ignition switched on, statuses **ET008, ET009** and **ET010** should operate as follows:

	ET008 "Engagement switch position"	**ET009 "Redundant braking switch position"**	**ET010 "Release switch position"**
Lever **at rest**	**INACTIVE**	**INACTIVE**	**RELEASED**
Lever **pulled slightly (3 mm travel)**	**ACTIVE**	**INACTIVE**	**RELEASED**
Lever **pulled to end of travel**	**ACTIVE**	**ACTIVE**	**RELEASED**
Lever **pulled and release switch pressed**	**ACTIVE**	**ACTIVE**	**PRESSED**

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF047 **CONTINUED**	

If the statuses do not operate as explained above, check the **connection and condition** of the parking brake control lever connector.
Repair if necessary.

With the parking brake control lever connector disconnected, check **for earth** on **track 2** of the lever connector (repair if necessary).
Also **check for a 5 V supply (4 V < X < 5 V)** on **track 7** of the lever connector.
If the supply is not present and the parking brake computer is correctly supplied (no other faults detected by the diagnostic tool), then contact the **Techline**.

Check **the condition and connection** of the electronic parking brake computer connectors and their clips (terminals).
Repair if necessary.

With the parking brake control lever connector disconnected, check the **insulation** (from earth and to**+ 12 V** and the insulation of the 4 wires from each other), **the continuity and absence of interference resistance** on the following connections:

Parking brake lever connector: **1216**		Electronic parking brake computer: **1217**
track 9	→	**track D2**
track 7	→	**track C2**
track 10	→	**track C3**
track 4	→	**track D3**

Repair if necessary.

With the parking brake control unit connector disconnected, check the **insulation** between **tracks C2** and **D2** of the computer. If the tracks are in short circuit, replace the lever (see **Replacement of components**, **Part A/ Procedure for replacing an electronic parking brake computer**) (see **MR405 (Espace IV) or MR395 (Laguna II) or MR370 (Scénic), Mechanical, 37B, Electronic parking brake, Lever: Removal - Refitting or MR353 (Vel Satis), Mechanical, 37B, Automatic parking brake, Lever**).

If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF048 PRESENT OR STORED	RELEASE SWITCH 1. DEF: Signal inconsistency

NOTES	**Priority when dealing with a number of faults:** Deal first with faults **DF003, DF004, DF028, DF029, DF035, DF041, DF042, DF043, DF047, DF050, DF054, DF055, DF057, DF058 and DF073** if they are present or stored.
	Conditions for applying the fault finding procedure to a stored fault: The fault is declared present after the ignition is switched on (forced **+ after ignition feed**, see **Introduction**) and a brake release request using the control lever.
	Special notes: The fault does not usually come from the electronic parking brake computer. 8 applications (in **2 seconds**) using the control lever without pressing the release switch causes the fault to appear as present. **Only for Vdiag 08, 0C and 0D:** **If there is a stored fault, refer to the statuses and parameters when it appears.** Explanation of counters: see **Introduction**. If the fault is stored and **PR018 = 0** and **PR022 > 25** clear the fault: do not take this fault into account. If the fault is stored and **PR019 < 3**, clear the fault: do not take this fault into account.

Using the diagnostic tool (**PARKING** sub-function), check the operation of the parking brake control lever.
With the ignition switched on, statuses **ET008, ET009** and **ET010** should operate as follows:

	ET008 "Engagement switch position"	**ET009 "Redundant braking switch position"**	**ET010 "Release switch position"**
Lever **at rest**	**INACTIVE**	**INACTIVE**	**RELEASED**
Lever **pulled slightly (3 mm travel)**	**ACTIVE**	**INACTIVE**	**RELEASED**
Lever **pulled to end of travel**	**ACTIVE**	**ACTIVE**	**RELEASED**
Lever **pulled and release switch pressed**	**ACTIVE**	**ACTIVE**	**PRESSED**

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF048 **CONTINUED**	

If the statuses do not operate as explained above, check the **connection and condition** of the parking brake control lever connector.
Repair if necessary.

With the parking brake control lever connector disconnected, check **for earth** on **track 2** of the lever connector.
Repair if necessary.

Check **the connections and condition** of the electronic parking brake computer connectors and their clips (terminals) and its intermediate connector (under front left-hand seat).

With the parking brake control lever connector disconnected, check the **insulation, continuity and absence of interference resistance** on the following connection:

Parking brake lever connector: **1216**		Electronic parking brake computer: **1217**
track 4	⟶	**track D3**

Repair if necessary.

If the fault is still present, **check the release switch.**
Lever in rest position: **insulation** between **tracks 2 and 4** of the lever,
Lever fully applied and release switch pressed: **continuity** between **tracks 2 and 4** of the lever.
Replace the parking brake control lever if it does not function as indicated (see **Replacement of components, Part A/ Procedure for replacing the electronic parking brake computer**) (see **MR405 (Espace IV) or MR395 (Laguna II) or MR370 (Scénic), Mechanical, 37B, Electronic parking brake, Lever: Removal - Refitting or MR353 (Vel Satis), Mechanical, 37B, Automatic parking brake, Lever**).

If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF049 PRESENT OR STORED	BRAKING 1. DEF: Inconsistent braking value 2. DEF: Normal brake application value not reached 3. DEF: Normal brake release value not reached 4. DEF: Insufficient braking force

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present after: – a braking command is issued **on a slope**.
	Priorities when dealing with a number of faults: Deal with faults: **DF046 Brake motor / cables connection, DF050 Mechanical seizure, DF035 Undervoltage, DF058 Parking brake motor current and DF055 Battery undervoltage** first if they are present or stored.

Check that the parking brake mechanical tensioning line is correct:
- that the parking brake cables are fitted correctly (refer to the repair procedure),
- that the parking brake cables are in good condition (not seized or deteriorated),
- that the rear brake callipers are correct, in good condition and operating correctly,
- that the rear brake pads are correct and in good condition.

Carry out the necessary repairs.

Using the **diagnostic tool** statuses screen, display parameter **PR003 Slope value**.
If the value displayed is not 0 degrees (± 1) on level ground, carry out slope initialisation again (actuator control mode menu).

Using the **diagnostic tool** parameters screen, display the following parameters: **PR005 Force setpoint** and **PR004 Measured force value**. These must show the various values recorded in the conformity check.

Clear the fault, switch off the ignition for **5 minutes** (vehicle doors and windows closed), switch the ignition back on and repeat a braking command **on a slope**.

If the fault reappears, switch off the ignition and disconnect the computer supply fuse (fuse **F23** of the engine fuse box, refer to the wiring diagram) for approximately **1 minute**.
Reconnect the fuse, switch the ignition on and establish dialogue with the computer. Apply the brake to check whether the fault recurs.

If the fault reappears despite the above tests, or if the parameter values are not within conformity check tolerances while the brake is applied, then contact your **Techline**.

AFTER REPAIR	Clear the fault memory. Follow the instructions to confirm repair. If the computer has been replaced (**at the request of the Techline**), initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other possible faults.

GETtheMANUALS.org

DF049 PRESENT OR STORED	BRAKING 1. DEF: Inconsistent braking value 2. DEF: Normal brake application value not reached 3. DEF: Normal brake release value not reached 4. DEF: Insufficient braking force

NOTES	**Priorities when dealing with a number of faults:** Deal first with faults **DF003 (1.DEF; 2.DEF), DF004, DF028, DF029, DF041, DF042, DF043, DF050, DF055, DF057, DF058 and DF073**.
	Conditions for applying the fault finding procedure to a stored fault: The fault is declared present after the ignition is switched on (forced **+ after ignition feed**, see **Introduction**) and an application request **on a slope**.

1. DEF	***NOTES***	**Special notes:** The **1.DEF** code indicates an inconsistency between the measured force value (**PR004**) and the parking brake status (**ET030: Electronic parking brake operation** when there is a fault in the fault context). This fault can appear after disconnecting the battery (parking brake applied).

Check the context of the fault when the fault appears:
If **ET030** is **STATUS 5, STATUS 6, STATUS 7, STATUS 8, STATUS 9 or STATUS 10** and if **PR004** is greater than **450 N** and if **PR012 Vehicle speed** is **0 mph (0 km/h)** when the fault appears: – check to see if the battery has been disconnected, if it has, the appearance of this fault is normal, clear the fault, – if not, check the computer supply voltage and the battery. Repair if necessary. If the fault persists, contact the **Techline**.
If **ET030** is **STATUS 5, STATUS 6, STATUS 7** and if **PR004** is less than **450 N** and if **PR012 Vehicle speed** is less than **3 mph (5 km/h)** when the fault appears: – Check for traces of heating on the brakes: – Check that the pads have returned correctly to the rest position. – Check that the small lever has sufficient return force. – Check that there is no friction or points of resistance on the cables. – If there is no indication of any defective operation of these components and if **PR019 < 3 and PR022 > 25 and PR018 < 15**, then clear the fault. – If not, contact the **Techline**.
If the fault is still present, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF049 **CONTINUED 1**	

2. DEF	***NOTES***	**Special notes:** The specification **2.DEF** mainly comes from a fault with the electrical power supply, braking application travel or the internal force sensor.

If this fault appears after the parking brake has been replaced:
- Check the conformity of the parking brake fitting.
- Check that the battery voltage **PR001** is greater than **12.5 V**.
- Clear the fault and restart the procedure for fitting the parking brake: see **Replacement of components**.

Check the fault context when the fault appears: if the battery voltage **PR001** is less than **9 V** when the fault appears, then:
- Check the supply line and that the resistance is less than **150 mΩ**.
- If there is no sign of a fault on the supply line and if **PR019 < 3** and **PR022 > 25** and **PR018 < 15** then clear the fault.

Check the fault context when the fault appears: If **ET028 Brake switch signal** is **PRESSED,** then:
- If **PR019 < 3** and **PR022 > 25** and **PR018 < 15**, then clear the fault.
- The fault can be caused when the user depresses the brake pedal **hard**, when the parking brake is being applied. If this is the case, clear the fault.

If there is a **loud** noise when applying, when maximum braking is requested, then the cause may be mechanical.

Check that the parking brake mechanical tensioning line is correct:
- Parking brake cables correctly fitted.
- Good condition of the parking brake cables (no seizing or deterioration).
- Conformity, condition and proper functioning of the rear brake callipers.
- Condition and conformity of rear brake pads.
- Conformity of rear brakes bleeding.

Carry out the necessary repairs.

Using the **diagnostic tool (PARKING** sub-function), display the parameters **PR005 Force setpoint** and **PR004 Measured force value**. These must have the various values recorded in the conformity check.

If the fault is still present, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF049 **CONTINUED 2**	

3. DEF ***4. DEF***	***NOTES***	**Special notes:** The specification **3.DEF** mainly comes from a fault with the electrical power supply or the internal force sensor. The **4.DEF** code is mainly generated by an electrical supply fault or an internal fault (motor, sensor, etc.). It indicates that the parking brake is neither applied or released.

If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF050 PRESENT OR STORED	MECHANICAL SEIZURE

NOTES	**Priorities when dealing with a number of faults:** Deal first with faults **DF055 Battery voltage too low, DF046 Brake motor/cables connection, DF042 Force sensor and DF035 Undervoltage** if they are present or stored.
	Conditions for applying fault finding procedures to stored faults: Deal with the fault as if it were present.

Check that the parking brake mechanical tensioning line is correct:
- Parking brake cables correctly fitted.
- Good condition of the parking brake cables (no seizing or deterioration).
- Conformity, condition and correct operation of the brake callipers.

Carry out the necessary repairs.

Check the brake callipers.
Carry out the necessary repairs.

If the fault is still present, contact the **Techline** without clearing the faults.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF051 PRESENT OR STORED	SYSTEM FAULT AFTER COMPUTER REPLACEMENT

NOTES	**Special notes:** This fault indicates a malfunction due to not following procedures correctly: replacement or reconfiguration of the electronic parking brake computer was carried out with a present fault.
	Conditions for applying the fault finding procedure to a stored fault: Deal with the fault as if it were present.

Using the **diagnostic tool**, **run fault finding on the electronic parking brake computer**. Deal with other present or stored faults first. Carry out any necessary repairs. Clear the fault.
If no fault is displayed on the **diagnostic tool**, **carry out a conformity check** to check the conformity of the parking brake system.
If the conformity check and fault finding with the **diagnostic tool** have not enabled the fault to be solved (see **Introduction**) for **fault warning light management**, to find out which components may be causing the malfunction.
If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF052 PRESENT OR STORED	MULTIPLEX NETWORK 1. DEF: Problem receiving multiplex frames by the parking brake computer. The computer is not receiving any multiplex signals or else two computers are not communicating with the parking brake computer

NOTES	**Priorities when dealing with a number of faults:** Deal first with faults **DF003 (1.DEF; 2.DEF), DF004, DF028, DF029, DF041, DF042, DF043, DF050, DF055, DF057, DF058 and DF073**.
	Deal with any faults on the multiplex network first (see 88B, Multiplexing).
	Conditions for applying the fault finding procedure to a stored fault: Apply this fault finding procedure if the fault reappears as present after the ignition has been switched on (forced **+ after ignition feed**, see **Introduction**).
	Special notes: This fault indicates either a complete absence of multiplex signal transmission (no inconsistency) to the parking brake control unit, or no multiplex signal transmission from two computers (the continuity of the multiplex network lines may be correct, but if two computers fail to respond, this fault appears). The fault does not usually come from the electronic parking brake computer. **Note:** Using another battery for a boost when starting may trigger this fault. **Only for Vdiag 08, 0C and 0D:** **If there is a stored fault, refer to the statuses and parameters when it appears.** Explanation of counters: see **Introduction**. If the fault is stored and **PR018 = 0** and **PR022 > 25** clear the fault: do not take this fault into account.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF052 **CONTINUED**	

Check that an additional booster battery has not been used when starting, if this is the case, this fault may appear.
Use the **diagnostic tool** to carry out a **multiplex system test**. This check ensures that the various multiplex system connections are correct and finds any faulty segments. Carry out any necessary repairs.
If the multiplex system test has not made it possible to find the defective connection, disconnect the electronic parking brake computer connector to check it is in **good condition** and check the condition of the clips (terminals) and in particular the clips for **tracks A2 and A3.** Replace the clips if necessary.
With the electronic parking brake computer connector disconnected, check **the insulation, continuity and the absence of interference resistance** on the connections between tracks **A2** and **A3** of the electronic parking brake computer and the following computers: – anti-lock braking system (see diagram of the various computers), – injection (see diagram of the different computers), – automatic transmission (see diagram of the different computers), – UCH (see diagram of the different computers), – Protection and Switching Unit (see diagram of the different computers). Repair if necessary.
If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF054 PRESENT OR STORED	BATTERY VOLTAGE TOO HIGH 1. DEF: Battery voltage too high

NOTES	**Priorities when dealing with a number of faults:** Deal first with faults **DF003 (1.DEF; 2.DEF), DF004, DF028, DF029, DF041, DF042, DF043, DF050, DF057, DF058 and DF073**.
	Conditions for applying the fault finding procedure to a stored fault: Apply this fault finding procedure if the fault appears as present again after the ignition has been switched on (forced **+ after ignition feed**, see **Introduction**).
	Special notes: The fault does not usually come from the electronic parking brake computer. This fault appears as present if the computer supply voltage is greater than **16.5 V**, and becomes stored when the voltage goes back down below **15.7 V**. **Note:** Using another battery for a boost when starting may trigger this fault. **Only for Vdiag 08, 0C and 0D.** **If there is a stored fault, refer to the statuses and parameters when it appears.** Explanation of counters: see **Introduction**. If the fault is stored and **PR018 = 0** and **PR022 > 25**, clear the fault: do not take this fault into account.

Check the charging circuit: the alternator should not supply a voltage of less than **+ 12 V** or greater than **+ 14.4 V** (engine at idle speed). Check the alternator and the regulator. Carry out the necessary repairs.
If the fault is still present, check that no electrical system using the same supply fuse as the electronic parking brake computer is faulty.
If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF055 PRESENT OR STORED	BATTERY UNDERVOLTAGE 1. DEF: Battery voltage too low 2. DEF: Electronic parking brake reset when vehicle being driven

1. DEF	***NOTES***	**Special notes:** The fault does not usually come from the electronic parking brake computer. This fault appears as present if the computer supply voltage is less than **10.3 V**, and becomes stored once the voltage rises back above **10.5 V**. **Only for Vdiag 08, 0C and 0D:** **If there is a stored fault, refer to the statuses and parameters when it appears.** Explanation of counters: see **Introduction**. If the fault is stored and **PR018 = 0** and **PR022 > 25**, clear the fault: do not take this fault into account.
		Note: This fault may appear if starting is very difficult.
		Conditions for applying the fault finding procedure to a stored fault: Apply this fault finding procedure if the fault reappears as present after the ignition has been switched on (forced **+ after ignition feed**, see **Introduction**).

2. DEF	***NOTES***	**Note:** This fault only affects Vdiag 0D.
		Priorities when dealing with a number of faults: Deal first with faults **DF046 Brake motor/cables connection, DF042 Force sensor, DF035 Undervoltage, DF041 Slope sensor, DF049 Brake application, DF054 Battery voltage too high and DF055 Battery undervoltage** if they are present or stored. If none of these faults is present or stored, the parking brake computer is not normally the cause.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF055 **CONTINUED**	

2. DEF	***NOTES***	**Special notes:** This fault is generated after the automatic parking brake is switched on whilst driving or following an internal reset. With the anti-lock braking system, this detection is active at **> 0.6 mph (> 1 km/h)**, otherwise the multiplex signal emitted by the injection computer must be 1.
		Note: The driver is only informed of this fault after 16 successive detections. This fault may be due to battery disconnections or vehicle supply faults, in which case it is associated with fault 1.DEF (battery voltage too low) dealt with previously.

If the frequency counter (**PR016**) > 3 and if the onboard network (battery, wiring) analysis does not bring up any present or stored fault under battery voltage, contact the **Techline**.

Check that the battery, battery - starter - alternator connection lead, battery earth - chassis lead and the chassis earth - engine and transmission assembly lead are in **good condition**.
Repair if necessary.

Check the charging circuit: the alternator should not supply a voltage of less than **+ 12 V** or greater than **+ 14.4 V** (engine at idle speed).
Carry out the necessary repairs.

track H4
(except Laguna II, Vel Satis and Espace IV) → **+ 12 V**
track G4

track H2
(except Laguna II, Vel Satis and Espace IV) → **earth**
track G2

Repair if necessary (see the vehicle wiring diagram).

If the fault is still present, check that no electrical system using the same supply fuse as the electronic parking brake computer is faulty.

If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF056 PRESENT OR STORED	BRAKE CABLES INCORRECTLY FITTED 1. DEF: Incorrect brake cable fitting detected

NOTES	**Priorities when dealing with a number of faults:** Deal first with faults **DF003 (1.DEF; 2.DEF), DF004, DF028, DF029, DF041, DF042, DF043, DF050, DF057, DF058 and DF073**.
	Special notes: This fault only appears during configuration of the parking brake. The fault does not usually come from the electronic parking brake computer.
	Conditions for applying the fault finding procedure to a stored fault: Deal with the fault as if it were present.

Check that the battery voltage **PR001** is above **12.5 V**.

Check that the mechanical tensioning line is correctly fitted: cables, connections, callipers.
If the parking brake cables are damaged (particularly at the calliper collars), replace both cables (see **MR405 (Espace IV) or MR395 (Laguna II) or MR370 (Scénic), Mechanical, 37A, Mechanical component controls, Parking brake cables: Removal - Refitting or MR353 (Vel Satis), Mechanical, 37B, Automatic parking brake, Brake cables**).
Start the electronic parking brake computer configuration process again: run command **VP011 Computer calibration and initialisation** (see **Replacement of components**).

If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF057 PRESENT OR STORED	COMPUTER INTERNAL TEMPERATURE SENSOR 1. DEF: Temperature sensor outside correct range (internal fault) 2. DEF: Internal electronic fault

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** Apply the fault finding procedure even if the fault is **stored**.
	Special notes: Before replacing an electronic parking brake computer, **save the data from the old computer** (for vehicles fitted with a manual gearbox). For this operation, (see **Replacement of components**).

Contact the **Techline** without clearing the faults.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF058 PRESENT OR STORED	PARKING BRAKE MOTOR CURRENT 1. DEF: Inconsistent current value

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** Apply the fault finding procedure even if the fault is **stored**.
	Special notes: Before replacing an electronic parking brake computer, **save the data from the old computer** (for vehicles fitted with a manual gearbox). For this operation, (see **Replacement of components**).

Check to see if battery polarity has been inverted, if this is the case, clear the fault and check that the electronic parking brake computer is operating correctly (see **System operation**).
If the fault is still present, contact the **Techline** without clearing the fault.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF059 PRESENT OR STORED	NO PROTECTION AND SWITCHING UNIT MULTIPLEX SIGNAL 1. DEF: Multiplex signals absent or values invalid (fault with the computer generating the signal or multiplex line connection fault)

NOTES	**Priority when dealing with a number of faults:** Deal with faults **DF055 Battery undervoltage and DF052 Multiplex network** first if they are present or stored.
	Deal with any Protection and Switching Unit computer faults first. The fault does not usually come from the electronic parking brake computer.
	Conditions for applying the fault finding procedure to a stored fault: Apply this fault finding procedure if the fault reappears as present or stored after it has been cleared, the ignition has been switched back on (forced **+ after ignition feed**: see **Introduction**), and the parking brake is released then applied using the control lever.
	Special notes: This fault only relates to multiplex signals received from the **Protection and Switching Unit** computer. This fault indicates either that there is no signal or that the signals transmitted are inconsistent. **Note:** If a multiplex line fault such as this is present, the electronic parking brake computer may lose all or some of its assisted parking functions (application and release).
	If there is a stored fault, refer to the statuses and parameters when it appears. Explanation of counters: see **Introduction** section. If the fault is stored and **PR018 = 0** and **PR022 > 25**, clear the fault: do not take this fault into account.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF059 **CONTINUED**	

Use the diagnostic tool to carry out a **multiplex system test**. This check ensures that the various multiplex system connections are correct and finds any faulty segments. Carry out any necessary repairs.
If the multiplex network test did not find the faulty connection, carry out **a conformity check** to check that the status from the Protection and Switching Unit computer is present and correct (**ET016, PR015, PR017**). Check the gearbox contacts. If the status and parameters shown here are not correct, carry out fault finding on the **Protection and Switching Unit** (see **87G, Engine compartment connection unit**).
If the fault is still present, disconnect the Protection and Switching Unit computer connector to check that the connector and its clips (terminals) are in **good condition**, especially the **multiplex track** clips (see the wiring diagram of the **Protection and Switching Unit** fitted to the vehicle). Replace the clips if necessary.
If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF073 PRESENT OR STORED	COMPUTER 1. DEF: Internal electrical fault

NOTES	**Priority when dealing with a number of faults:** This fault must be dealt with first.
	Conditions for applying the fault finding procedure to a stored fault: Deal with this fault as if it were present.
	Special notes: The electronic parking brake computer has detected a fault during standby mode (ignition off, vehicle doors and windows closed and lever warning light off) Before replacing an electronic parking brake computer, **save the data from the old computer** (for vehicles fitted with a manual gearbox). For this operation, (see **Replacement of components**).

Contact the **Techline**, without clearing the fault.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

NOTES	Only carry out this conformity check after carrying out a **complete check** using the diagnostic tool. **Application conditions: ignition on (forced + after ignition, see Introduction)** **Note:** **The interpretation of these statuses and parameters is only valid with the ignition switched on,** the statuses and parameters displayed in blue on the diagnostic tool is information supplied by other computers, which are transmitted via the multiplex network. If these variables display inconsistent values, make sure that the multiplex system test has not shown up any faulty connections. **Repair the faulty multiplex connections before looking for a possible problem with the signals.** Each sub-function in this test is associated with a **Fault finding chart**. **Special notes:** The diagnostic tool may display the message **Computer busy** when displaying statuses and parameters. This message is displayed when the parking brake is applying or releasing the brake, because the computer gives priority to controlling the motor before transmitting variables. If this message is displayed, exit the current screen and then return to it.

MAIN SCREEN

Order	Function	Parameter or Status Checked or Action	Display and notes	Fault finding
1	Parking brake operation status	**ET024:** System operation	**CUSTOMER MODE**	If the status displays **FACTORY MODE**, the computer is **not operational**. To enter **CUSTOMER MODE**, initialise the computer again, by running command **VP011 Computer calibration and initialisation** (see **Replacement of components**).
2	Computer electrical supply	**ET001:** + After ignition feed	**Ignition off: ABSENT** **Ignition on: PRESENT**	In the event of a fault on this status, refer to the interpretation of status **ET001: + after ignition supply.**
		PR001: Battery voltage	**9.6 V < PR001 < 15 V**	If the value of the parameter is not within this range, check **the insulation, continuity and the absence of interference resistance** on the computer supplies and earths (see wiring diagram). If the fault is still present, carry out **fault finding on the charging circuit** (see **Technical Note 6014A, Checking the charging circuit**).

GETtheMANUALS.org

NOTES	Only carry out this conformity check after carrying out a **complete check** using the diagnostic tool. **Application conditions: ignition on (forced + after ignition, see Introduction)** **Note:** **The interpretation of these statuses and parameters is only valid with the ignition switched on,** the statuses and parameters displayed in blue on the diagnostic tool is information supplied by other computers, which are transmitted via the multiplex network. If these variables display inconsistent values, make sure that the multiplex system test has not shown up any faulty connections. **Repair the faulty multiplex connections before looking for a possible problem with the signals.** Each sub-function in this test is associated with a **Fault finding chart**. **Special notes** The diagnostic tool may display the message **Computer busy** when displaying statuses and parameters. This message is displayed when the parking brake is applying or releasing the brake, because the computer gives priority to controlling the motor before transmitting variables. If this message is displayed, exit the current screen and then return to it.

MAIN SCREEN (CONTINUED 1)

Order	Function	Parameter or Status Checked or Action	Display and notes	Fault finding
3	Electronic parking brake	**PR005:** Force setting **PR004:** Measured force value	In rest position: **X = 0 N** When applying the brake on a level surface: **400 < X < 550 N** When fully applied (lever fully pulled for 2 seconds) on a level surface: **1100 < X < 1150 N** **Note**: **depressing the brake pedal once** when the parking brake is applied changes the measured force value (change in the tension of the brake cables) and the parking brake may be over-applied. **Interpretation of these parameters is only valid without any pressure on the brake pedal.**	The difference between the reference and measured values must not be more than - **50 N or + 100 N**. If the measured value does not reach or exceeds the reference value (mechanical or electrical fault with the control), the electronic parking brake computer will detect a fault (**DF025 Vehicle movement with maximum application, DF049 Brake application** or **DF050 Mechanical jamming**). If one of these three faults is displayed by the diagnostic tool, use the relevant interpretation.

GETtheMANUALS.org

SUB-FUNCTION: AUTOMATIC RELEASE (CONTINUED 1)

Order	Function	Parameter or Status Checked or Action		Display and notes	Fault finding
3	Vehicles fitted with a manual gearbox	**ET016:**	Manual gearbox gear lever position.	**Neutral: NEUTRAL** or **Gear engaged: NOT IN NEUTRAL**	In the event of a fault with these statuses, check that the UCH is sending signals correctly (absence of fault **DF039 No UCH multiplex signal**) If the fault is still present, run **fault finding** on the UCH (see **87B, Passenger compartment connection unit**).
		ET017:	Reverse gear engaged	**YES** (lever in reverse gear). **NO** (for other gear lever positions).	
4	Vehicles fitted with an automatic gearbox	**ET018:**	Automatic gearbox lever position	**Depending on the lever position:** **P, R, N, D** or **Manual mode** (manual mode = sequential gear selection position).	In the event of a fault with these statuses, check that the computers concerned are sending signals correctly (absence of fault **DF038 No automatic transmission multiplex signal and DF052 Multiplex network**) If the fault is still present run **fault finding on** the computer concerned.
		ET017:	Reverse gear engaged	**YES** (selector lever in **R**). **NO** (for other gear lever positions).	

GETtheMANUALS.org

NOTES	Only carry out this conformity check after carrying out a **complete check** using the diagnostic tool. **Application conditions: ignition on (forced + after ignition, see Introduction)** **Note:** **The interpretation of these statuses and parameters is only valid with the ignition switched on**, the statuses and parameters displayed in blue on the diagnostic tool is information supplied by other computers, which are transmitted via the multiplex network. If these variables display inconsistent values, check that the multiplex system test has not shown up any faulty connections. **Repair the faulty multiplex connections before looking for a possible problem with the signals.** Each sub-function in this test is associated with a **Fault finding chart**. **Special notes** The diagnostic tool may display the message **Computer busy** when displaying statuses and parameters. This message is displayed when the parking brake is applying or releasing the brake, because the computer gives priority to controlling the motor before transmitting variables. If this message is displayed, exit the current screen and then return to it.

SUB-FUNCTION: AUTOMATIC RELEASE (CONTINUED 2)

Order	Function	Parameter or Status Check or Action	Display and Notes	Fault finding
5	Door opening switches	**ET014:** Door opening switches	**OPEN:** driver's door open. **CLOSED:** driver's door closed. **Note:** This status only works with the driver's door.	If the status is not operating as shown, check that the UCH is correctly sending the signal (absence of faults **DF039 No UCH multiplex signal** and **DF052 Multiplex network**). If the status operates with the passenger door but not the driver's door, reinitialise the computer by running command **VP011 Computer calibration and initialisation** (see **Replacement of components**) to configure the correct type of steering (right or left-hand drive). If the fault is still present, run **fault finding** on the UCH (see **87B, Passenger compartment connection unit**).

GETtheMANUALS.org

NOTES	Only carry out this conformity check after carrying out a **complete check** using the diagnostic tool. **Application conditions: ignition on (forced + after ignition, see Introduction)** **Note:** **The interpretation of these statuses and parameters is only valid with the ignition switched on**, the statuses and parameters displayed in blue on the diagnostic tool is information supplied by other computers, which are transmitted via the multiplex network. If these variables display inconsistent values, check that the multiplex system test has not shown up any faulty connections. **Repair the faulty multiplex connections before looking for a possible problem with the signals.** Each sub-function in this test is associated with a **Fault finding chart**. **Special notes:** The diagnostic tool may display the message **Computer busy** when displaying statuses and parameters. This message is displayed when the parking brake is applying or releasing the brake, because the computer gives priority to controlling the motor before transmitting variables. If this message is displayed, exit the current screen and then return to it.

SUB-FUNCTION: AUTOMATIC RELEASE (CONTINUED 3)

Order	Function	Parameter or Status Checked or Action	Display and notes	Fault finding
6	Clutch pedal	**PR006:** Clutch pedal position	No load position: **0% < X < 20%** --- Pedal fully depressed: Right-hand drive: **50 < X < 70%** Left-hand drive: **70 < X < 90%**	In the event of a fault, check that the potentiometer is fitted correctly. If the fault is still present, **consult the interpretation** of fault **DF015 Clutch position sensor circuit.** **Note:** The clutch pedal operating values differ according to the type of steering.
7	Accelerator pedal	**PR017:** Accelerator pedal position	No load position: **0 < X < 10%** --- Pedal depressed fully (depressed past resistance point): **110 < X < 120%** **Invalid value: 118%** (this value means that the signal is not being received, e.g.: ignition switched off).	In the event of a fault with this parameter, check that the injection computer is correctly sending the signal (absence of fault **DF036 No injection multiplex signal**) If the fault is still present, run **fault finding** on the injection computer (see **13B, Diesel injection or 17B, Petrol injection**). **Note: the value of this parameter depends on the injection fitted to the vehicle. The values noted in this check are therefore only average values (refer to the injection conformity check).**

GETtheMANUALS.org

NOTES	Only carry out this conformity check after carrying out a **complete check** using the diagnostic tool. **Application conditions: ignition on (forced + after ignition, see Introduction)** **Note:** **The interpretation of these statuses and parameters is only valid with the ignition switched on**, the statuses and parameters displayed in blue on the diagnostic tool is information supplied by other computers, which are transmitted via the multiplex network. If these variables display inconsistent values, check that the multiplex system test has not shown up any faulty connections. **Repair the faulty multiplex connections before looking for a possible problem with the signals.** Each sub-function in this test is associated with a **Fault finding chart**. **Special notes** The diagnostic tool may display the message **Computer busy** when displaying statuses and parameters. This message is displayed when the parking brake is applying or releasing the brake, because the computer gives priority to controlling the motor before transmitting variables. If this message is displayed, exit the current screen and then return to it.

SUB-FUNCTION: AUTOMATIC RELEASE (CONTINUED 4)

Order	Function	Parameter or Status Check or Action	Display and Notes	Fault finding
8	Engine	**PR015:** Engine speed	**0 rpm**	In the event of a fault with this parameter and these statuses, make sure that the injection computer is in fact sending signals (absence of faults **DF036 No injection multiplex transmission** and **DF052 Multiplex network**). If the fault is still present, run **fault finding** on the injection computer (see **13B, Diesel injection or 17B, Petrol injection**).
		ET019: Engine	**STOPPED** Other possibilities depending on the operating status of the engine: **- RUNNING** **- UNDER STARTER** **- STALLED** (in the event where the engine is not stopped in the normal way)	

GETtheMANUALS.org

NOTES	Only carry out this conformity check after carrying out a **complete check** using the diagnostic tool. **Application conditions: ignition on (forced + after ignition, see Introduction)** **Note:** **The interpretation of these statuses and parameters is only valid with the ignition switched on**, the statuses and parameters displayed in blue on the diagnostic tool is information supplied by other computers, which are transmitted via the multiplex network. If these variables display inconsistent values, check that the multiplex system test has not shown up any faulty connections. **Repair the faulty multiplex connections before looking for a possible problem with the signals.** Each sub-function in this test is associated with a **Fault finding chart**. **Special notes** The diagnostic tool may display the message **Computer busy** when displaying statuses and parameters. This message is displayed when the parking brake is applying or releasing the brake, because the computer gives priority to controlling the motor before transmitting variables. If this message is displayed, exit the current screen and then return to it.

SUB-FUNCTION: AUTOMATIC RELEASE (CONTINUED 5)

Order	Function	Parameter or Status Checked or Action	Display and notes	Fault finding
9	Wheel speeds	**PR012:** Vehicle speed	**X = 0 mph (km/h)**	In the event of a fault with this parameter, check that the anti-lock braking system computer is sending the signal correctly (absence of faults **DF037 No ABS system multiplex signal** and **DF052 Multiplex network**). If the fault is still present, run **fault finding** on the anti-lock braking system computer (see **38C, Anti-lock braking system**).

GETtheMANUALS.org

NOTES	Only carry out this conformity check after carrying out a **complete check** using the diagnostic tool. **Application conditions: ignition on (forced + after ignition, see Introduction)** **Note:** **The interpretation of these statuses and parameters is only valid with the ignition switched on**, the statuses and parameters displayed in blue on the diagnostic tool is information supplied by other computers, which are transmitted via the multiplex network. If these variables display inconsistent values, check that the multiplex system test has not shown up any faulty connections. **Repair the faulty multiplex connections before looking for a possible problem with the signals.** Each sub-function in this test is associated with a **Fault finding chart**. **Special notes** The diagnostic tool may display the message **Computer busy** when displaying statuses and parameters. This message is displayed when the parking brake is applying or releasing the brake, because the computer gives priority to controlling the motor before transmitting variables. If this message is displayed, exit the current screen and then return to it.

SUB-FUNCTION: AUTOMATIC RELEASE (CONTINUED 6)

Order	Function	Parameter or Status Checked or Action	Display and notes	Fault finding
10	Electronic parking brake	**PR005:** Force setting **PR004:** Measured force value	In rest position: **X = 0 N** When applying the brake on a level surface: **400 < X < 550 N** When fully applied (lever fully pulled for 2 seconds) on a level surface: **1100 < X < 1150 N** **Note**: **depressing the brake pedal once** when the parking brake is applied changes the measured force value (change in the tension of the brake cables) and the parking brake may be over-applied. **Interpretation of these parameters is only valid without any pressure on the brake pedal.**	The difference between the reference and measured values must not be more than - **50 N or + 100 N**. If the measured value does not reach or exceeds the reference value (mechanical or electrical fault with the control), the electronic parking brake computer will detect a fault (**DF025 Vehicle movement with maximum application, DF049 Brake application** or **DF050 Mechanical jamming**). If one of these three faults is displayed by the diagnostic tool, use the relevant interpretation.

GETtheMANUALS.org

NOTES	Only carry out this conformity check after carrying out a **complete check** using the diagnostic tool. **Application conditions: ignition on (forced + after ignition, see Introduction)** **Note:** **The interpretation of these statuses and parameters is only valid with the ignition switched on**, the statuses and parameters displayed in blue on the diagnostic tool is information supplied by other computers, which are transmitted via the multiplex network. If these variables display inconsistent values, check that the multiplex system test has not shown up any faulty connections. **Repair the faulty multiplex connections before looking for a possible problem with the signals.** Each sub-function in this test is associated with a **Fault finding chart**. **Special notes** The diagnostic tool may display the message **Computer busy** when displaying statuses and parameters. This message is displayed when the parking brake is applying or releasing the brake, because the computer gives priority to controlling the motor before transmitting variables. If this message is displayed, exit the current screen and then return to it.

SUB-FUNCTION: AUTOMATIC RELEASE (CONTINUED 7)

Order	Function	Parameter or Status Check or Action	Display and Notes	Fault finding
11	Electronic parking brake	**ET011:** Parking brake	No movement of the lever: **INACTIVE** When released: **Released** (while releasing, then **INACTIVE**) When applying the brake: **STATUS 1: Static braking** During emergency braking: **STATUS 2: Dynamic braking** (over 6 mph (10 km/h)). When the system is faulty: **DEFECTIVE**	If the status does not function as indicated, **consult the interpretation** of fault **DF043 Parking brake motor**.
12	Vehicle incline	**PR003:** Slope value	On horizontal ground the value is: **- 2 d° < X < + 2 d°** Possible values according to the slope: **- 25 d° < X < + 25 d°**	On a level surface, if the reading is not **0 d° ± 2**: Refer to the interpretation of parameter **PR003 Slope value**.

GETtheMANUALS.org

NOTES	Only carry out this conformity check after carrying out a **complete check** using the diagnostic tool. **Application conditions: ignition on (forced + after ignition, see Introduction)** **Note:** **The interpretation of these statuses and parameters is only valid with the ignition switched on**, the statuses and parameters displayed in blue on the diagnostic tool is information supplied by other computers, which are transmitted via the multiplex network. If these variables display inconsistent values, check that the multiplex system test has not shown up any faulty connections. **Repair the faulty multiplex connections before looking for a possible problem with the signals.** Each sub-function in this test is associated with a **Fault finding chart**. **Special notes** The diagnostic tool may display the message **Computer busy** when displaying statuses and parameters. This message is displayed when the parking brake is applying or releasing the brake, because the computer gives priority to controlling the motor before transmitting variables. If this message is displayed, exit the current screen and then return to it.

SUB-FUNCTION: EMERGENCY BRAKING

Order	Function	Parameter or Status Checked or Action	Display and notes	Fault finding
1	Engine	**ET019:** Engine	**STOPPED** Other possibilities depending on the operating status of the engine: **- RUNNING** **- UNDER STARTER** **- STALLED**	In the event of a fault with this status, check that the injection computer is sending the signal correctly (absence of faults **DF036 No injection multiplex signal** and **DF052 Multiplex network**). If the fault is still present, run **fault finding** on the injection computer (see **13B, Diesel injection or 17B, Petrol injection**).
2	Wheel speeds	**PR012:** Vehicle speed	**X = 0 mph (km/h)**	In the event of a fault with these parameters, check that the anti-lock braking system computer is sending the signals correctly (absence of faults **DF037 No ABS multiplex signal** and **DF052 Multiplex network**). If the fault is still present, run **fault finding** on the anti-lock braking system computer (see **38C, Anti-lock braking system**).
		PR013: Rear left-hand wheel speed	**X = 0 mph (km/h)**	
		PR014: Rear right-hand wheel speed	**X = 0 mph (km/h)**	

GETtheMANUALS.org

NOTES	Only carry out this conformity check after carrying out a **complete check** using the diagnostic tool. **Application conditions: ignition on (forced + after ignition, see Introduction)** **Note:** **The interpretation of these statuses and parameters is only valid with the ignition switched on**, the statuses and parameters displayed in blue on the diagnostic tool is information supplied by other computers, which are transmitted via the multiplex network. If these variables display inconsistent values, check that the multiplex system test has not shown up any faulty connections. **Repair the faulty multiplex connections before looking for a possible problem with the signals.** Each sub-function in this test is associated with a **Fault finding chart**. **Special notes:** The diagnostic tool may display the message **Computer busy** when displaying statuses and parameters. This message is displayed when the parking brake is applying or releasing the brake, because the computer gives priority to controlling the motor before transmitting variables. If this message is displayed, exit the current screen and then return to it.

SUB-FUNCTION: EMERGENCY BRAKING (CONTINUED 1)

Order	Function	Parameter or Status Checked or Action		Display and notes	Fault finding
3	Parking brake control lever	**ET008:**	Braking switch position	Lever released: **INACTIVE** Lever pulled to the first contact (approximately 3 mm travel): **ACTIVE**	If the status does not operate as specified, **apply the interpretation** of status **ET008 Brake application switch position**.
		ET009:	Redundant braking switch position	Lever released: **INACTIVE** Lever pulled to the second contact (end of travel): **ACTIVE**	If the status does not operate as specified, **use the interpretation** of status **ET009 Redundant braking switch position**.
		ET010:	Release switch position	Lever in rest position **RELEASED** Lever fully pulled and releasing switch pressed: **PRESSED**	If the status does not operate as specified, **apply the interpretation** of status **ET010 Releasing switch position**.

GETtheMANUALS.org

NOTES	Only carry out this conformity check after carrying out a **complete check** using the diagnostic tool. **Application conditions: ignition on (forced + after ignition, see Introduction)** **Note:** **The interpretation of these statuses and parameters is only valid with the ignition switched on**, the statuses and parameters displayed in blue on the diagnostic tool is information supplied by other computers, which are transmitted via the multiplex network. If these variables display inconsistent values, check that the multiplex system test has not shown up any faulty connections. **Repair the faulty multiplex connections before looking for a possible problem with the signals.** Each sub-function in this test is associated with a **Fault finding chart**. **Special notes:** The diagnostic tool may display the message **Computer busy** when displaying statuses and parameters. This message is displayed when the parking brake is applying or releasing the brake, because the computer gives priority to controlling the motor before transmitting variables. If this message is displayed, exit the current screen and then return to it.

SUB FUNCTION: EMERGENCY BRAKING (CONTINUED 2)

Order	Function	Parameter or Status Checked or Action	Display and notes	Fault finding
4	Electronic parking brake	**ET011:** Parking brake	No movement of the lever: **INACTIVE** When released: **Released** (while releasing, then **INACTIVE**) When applying the brake: **STATUS 1: Static braking** During emergency braking: **STATUS 2: Dynamic braking** (over 6 mph (10 km/h)). When the system is faulty: **DEFECTIVE**	If the status does not function as indicated, **consult the interpretation** of fault **DF043 Parking brake motor**.

GETtheMANUALS.org

NOTES	Only carry out this conformity check after carrying out a **complete check** using the diagnostic tool. **Application conditions: ignition on (forced + after ignition, see Introduction)** **Note:** **The interpretation of these statuses and parameters is only valid with the ignition switched on**, the statuses and parameters displayed in blue on the diagnostic tool is information supplied by other computers, which are transmitted via the multiplex network. If these variables display inconsistent values, make sure that the multiplex system test has not shown up any faulty connections. **Repair the faulty multiplex connections before looking for a possible problem with the signals.** Each sub-function in this test is associated with a **Fault finding chart**. **Special notes** The diagnostic tool may display the message **Computer busy** when displaying statuses and parameters. This message is displayed when the parking brake is applying or releasing the brake, because the computer gives priority to controlling the motor before transmitting variables. If this message is displayed, exit the current screen and then return to it.

SUB FUNCTION: EMERGENCY BRAKING (CONTINUED 3)

Order	Function	Parameter or Status Checked or Action	Display and notes	Fault finding
1	Parking brake assist	**PR005:** Force setting **PR004:** Measured force value	In rest position: **X = 0 N** When applying the brake on a level surface: **400 < X < 550 N** When fully applied (lever fully pulled for 2 seconds) on a level surface: **1100 < X < 1150 N** **Note:** **depressing the brake pedal once** when the parking brake is applied changes the measured value of the force (change in the tension of the brake cables) and the parking brake may be over-applied. **Interpretation of these parameters is only valid without any pressure on the brake pedal.**	The difference between the reference and measured values must not be more than **- 50 N or + 100 N**. If the measured value does not reach or exceeds the reference value (mechanical or electrical fault with the control), the electronic parking brake computer will detect a fault (**DF025 Vehicle movement with maximum application, DF049 Brake application** or **DF050 Mechanical jamming**). If one of these three faults is displayed by the diagnostic tool, use the relevant interpretation.

GETtheMANUALS.org

Tool status	Diagnostic tool title
ET001	+ After ignition supply
ET008	Manual control: brake application switch
ET009	Redundant braking switch position
ET010	Manual control: brake releasing switch
ET011	Parking brake
ET014	Door opening switches
ET016	Manual gearbox lever position
ET017	Reverse gear engaged

ET019	Engine
ET022	Automatic braking configuration
ET024	System operation

GETtheMANUALS.org

ET001	+ AFTER IGNITION FEED

NOTES	None

This status means there is a + 12 V computer after ignition.
When the ignition is switched off, the status displays: ABSENT.
When the ignition is switched on, the status displays: PRESENT.

If the status does not operate as specified: disconnect the electronic parking brake computer connector to check the insulation, continuity and the absence of interference resistance on the following connections:
Automatic parking brake computer connector

track H4
(except Laguna II, Vel Satis and Espace IV) track G4 → **+ 12 V**

track H2
(except Laguna II, Vel Satis and Espace IV) track G2 → **earth**

Repair if necessary (see the vehicle wiring diagram).

If the connections are correct, the power is correctly supplied to the electronic parking brake computer, but the fault is still present, contact the Techline.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET008 **ET009** **ET010**	MANUAL CONTROL: BRAKE APPLICATION SWITCH REDUNDANT BRAKE APPLICATION SWITCH POSITION MANUAL CONTROL: BRAKE RELEASING SWITCH

NOTES	None

Using the diagnostic tool (**PARKING** sub-function), check the operation of the parking brake control lever. With the ignition on, statuses **ET008, ET009, ET010** should operate as follows:

	ET008 Manual control: brake application switch	**ET009 "Redundant braking switch position"**	**ET010 Manual control: brake releasing switch**
Lever **in rest position**	**INACTIVE**	**INACTIVE**	**RELEASED**
Lever **applied slightly (3 mm travel)**	**ACTIVE**	**INACTIVE**	**RELEASED**
Lever **applied fully**	**ACTIVE**	**ACTIVE**	**RELEASED**
Lever **applied and release button pressed**	**ACTIVE**	**ACTIVE**	**PRESSED**

If the statuses do not operate as specified, refer to the fault finding procedure for fault **DF047 Manual control**.

AFTER REPAIR	Repeat the conformity check from the start.

FPA_V0C_ET008 / FPA_V0C_ET009 / FPA_V0C_ET010 / FPA_V04_ET008 / FPA_V04_ET009 / FPA_V04_ET010 / FPA_V08_ET008 / FPA_V08_ET009 / FPA_V08_ET010 / FPA_V0D_ET008 / FPA_V0D_ET009 / FPA_V0D_ET010 / FPA_V11_ET008 / FPA_V11_ET009 / FPA_V11_ET010

GETtheMANUALS.org

ET022	AUTOMATIC BRAKING CONFIGURATION

NOTES	**Special notes:** To understand the operation of assisted brake application, refer to **System operation**.

This status indicates the assisted braking configuration status.
This configuration can be checked on two screens.
- Configuration reading screen (repair mode): **LC009 Vehicle configuration** (**NORMAL** with braking, **COLD CLIMATE** without assisted braking).
- Variables screen (fault finding mode, assisted brake application sub-function).

ET022 Automatic braking configuration.
When the assisted braking is **ACTIVE**, the status should be **WITH**.
When the assisted braking is not **ACTIVE** (for cold countries, for example), the status should be **WITHOUT**.
If the configuration does not match the customer's request, reconfigure the electronic parking brake computer by activating configuration **CF007 Vehicle configuration** (repair mode, see **Configuration and programming**).

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

Tool parameter	Diagnostic tool title
PR001	Battery voltage
PR003	Slope value
PR004	Measured force value
PR005	Force setting
PR006	Clutch pedal position
PR012	Vehicle speed
PR013	Rear left-hand wheel speed
PR014	Rear right-hand wheel speed
PR015	Engine speed
PR017	Accelerator pedal position

GETtheMANUALS.org

PR003	SLOPE VALUE

NOTES	None

This parameter shows the vehicle's angle on a slope (X-axis).
The value displayed represents degrees (and not percentage grade).
Normally, this parameter should display:
- On level ground: **- 2 d° < X < + 2 d°**
- Possible values, depending on slope: **- 25 d° < X < + 25 d°**

If the values displayed are not correct, **contact the Techline**.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC002	BRAKING

NOTES	**Special notes:** The commands are found in the tool's fault finding mode, **Actuator command** button.

Running this command tightens the electronic parking brake cables.
It can therefore be used to test operation of the electronic parking brake motor, either to display a present fault or to test motor operation in the event of a control lever failure.
Note:
Before running this command, check that the brake cables are correctly fitted and that no one is working on the vehicle.
Only run this command with the parking brake released.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC003	RELEASE

NOTES	**Special notes:** The commands are found in the tool's fault finding mode, **Actuator command** button.

Running this command releases the electronic parking brake cables.
It can therefore be used to test operation of the electronic parking brake motor, either to display a present fault or to test motor operation in the event of a control lever failure.
Note:
Before running this command, check that the brake cables are correctly fitted and that no one is working on the vehicle.
Only run this command with the parking brake engaged.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

SC005	SAVE CLUTCH PEDAL PROGRAMMING

NOTES	**Special notes:** The commands are found in the tool's repair mode, **Programming** button.

Run command **SC005 Backup clutch pedal programming** with the electronic parking brake computer which is faulty or to be replaced.
The pedals and the gearbox must not be operated during the backup procedure.
Carrying out this backup procedure before each replacement of the computer enables the old clutch pedal travel specifications to be re-entered into the new electronic parking brake computer.

Park the vehicle on a **level surface**.
– Select the diagnostic tool's **Repair mode** menu.
– From the tool's navigation menu, select **Programming**.
Run command **SC005 Backup clutch pedal programming**.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

SC006	ENTER CLUTCH PEDAL PROGRAMMING

NOTES	**Special notes:** The commands are found in the tool's repair mode, **Programming** button.

Once the electronic parking brake computer has been changed.
Run command **SC006 Enter clutch pedal programming** after running command **SC005 Backup clutch pedal programming**.
Test braking and release, and starting the electronic parking brake computer when applied, to check conformity.

Park the vehicle on a **level surface**.
– Select the diagnostic tool's **Repair mode** menu.
– From the tool's navigation menu, select **Programming**.
– Run command **SC006 Enter clutch pedal programming**.
Note:
When a new electronic parking brake computer is initialised, the angle sensor is calibrated after running command **VP011 Computer calibration and initialisation**.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

SC008	SLOPE INITIALISATION

NOTES	**Special notes:** The commands are found in the tool's repair mode, **Programming** button.

Using the diagnostic tool's automatic release sub-function screen, display parameter **PR003 Slope value**.
If the value displayed is not **0 d° ± 2** on level ground: run the command by following the procedure described below.

Park the vehicle on a **level surface**.
– Select the diagnostic tool's **Repair mode** menu.
– From the tool's navigation menu, select **Programming**.
– Run command **SC008 "Slope initialisation"**.
– Check the conformity of parameter **PR003 Slope value**.

Note:
When a new electronic parking brake computer is initialised, the angle sensor is calibrated after running command **VP011 Computer calibration and initialisation**.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

NOTES	Only check the customer complaint after performing a complete check with the diagnostic tool.

NO DIALOGUE WITH THE COMPUTER	**ALP1**
WILL NOT RELEASE	**ALP2**
ASSISTED RELEASE TOO EARLY OR TOO LATE	**ALP3**
ASSISTED BRAKE APPLICATION PROBLEMS (when the engine stops)	**ALP4**
ELECTRONIC PARKING BRAKE MANUAL RELEASE IMPOSSIBLE	**ALP5**
RELEASE WITH THE EMERGENCY BRAKE IMPOSSIBLE	**ALP6**
ELECTRONIC PARKING BRAKE SEEMS TO BE APPLIED WHEN DRIVING	**ALP7**
ELECTRONIC PARKING BRAKE IS NOT APPLIED CORRECTLY ON A SLOPE	**ALP8**

GETtheMANUALS.org

ALP1	No dialogue with the computer

NOTES	**None.**

Try the diagnostic tool on another vehicle.

Check:
– the connection between the **diagnostic tool** and the diagnostic sensor (wiring in good condition),
– the connection between the diagnostic sensor and the diagnostic socket (lead in good condition),
– the engine and passenger compartment fuses.

Check for **+ 12 V battery** on **track 16**, and **+ 12 V after ignition feed** on **track 1** and an **earth** on **track 5** and on **track 4** of the diagnostic socket.
Repair if necessary.

Disconnect the automatic or electronic parking brake computer connector to check the **insulation, continuity and absence of interference resistance** on the following connections:
Automatic parking brake computer connector

track H4 → **(except Laguna II, Vel Satis and Espace IV) track G4** → **+ 12 V**

track H2 → **(except Laguna II, Vel Satis and Espace IV) track G2** → **earth**

track A4 → **track 7** of the diagnostic socket (K line)

Repair if necessary (see the vehicle wiring diagram).

AFTER REPAIR	Carry out a check using the **diagnostic tool**. Deal with any other faults.

GETtheMANUALS.org

ALP2	Will not release

NOTES	Only consult this customer complaint after a **full check using the diagnostic tool** (no present or stored faults). The main causes of the brake not releasing are: – Driver's door incorrectly closed (on vehicles with an automatic transmission). – Insufficient acceleration value. – Fault with gearbox switch. – Fault with door switch. – Pads stuck. – Incorrect multiplex line signals. If the manual release will not work, see ALP 4 **(see the wiring diagrams technical note for the vehicle concerned).**

Check that the force applied to the accelerator pedal is sufficient whether or not the vehicle is on a downward slope or not.

For a vehicle fitted with an automatic transmission, check that the door on the driver's side is not open or incorrectly closed.
Close the door again and go back through neutral if necessary.

Check that the interior lights have gone out.
Check that the door switch is working correctly:
Check the **insulation, continuity and the absence of interference resistance** on the following connections:
– connection code 87H
– connection code MA
Between the door switch, **component code 140** and the UCH, **component code 645.**
If there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
Repair if necessary.

Check that the force applied to the accelerator pedal is sufficient and that the accelerator value is sufficient (refer to the conformity check) whether the vehicle is on a downward slope or not.

AFTER REPAIR	Carry out a check using the **diagnostic tool**. Deal with any other faults.

GETtheMANUALS.org

ALP2 CONTINUED 1	

For a vehicle fitted with an automatic gearbox:

Check the connection and condition of the automatic gearbox multifunction switch, component code **779**.
Check the connection and condition of the automatic gearbox computer, component code **119**.
If the connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**) repair the connector(s); otherwise, replace the wiring.

Check **the insulation, continuity and the absence of interference resistance** of the following connections:
- **5DF** between components **779** and **119**,
- **5DG** between components **779** and **119**,
- **5DH** between components **779** and **119**,
- **5CF** between components **779** and **119**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

For a vehicle fitted with a manual gearbox:

Check the connection and condition of the reversing lights sensor, component code **1109**.
Check the connection and condition of the Protection and Switching Unit, component code **1337** (Only for **Scénic II**), or the UCH, component code 645 (Only for **Vel Satis phase 1 and phase 2, Laguna II phase 2, Espace IV phase 1 and phase 2**).
If the connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**) repair the connector(s); otherwise, replace the wiring.

Check the **insulation, continuity and the absence of interference resistance** of the following connection:
- **H66P** between components **1109** and **1337** (Only for **Scénic II**),
- **H66P** between components **1109** and **645** (Only for **Vel Satis phase 1 and phase 2, Laguna II phase 2, Espace IV phase 1 and phase 2**).

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

AFTER REPAIR	Carry out a check using the **diagnostic tool**. Deal with any other faults.

GETtheMANUALS.org

ALP2 CONTINUED 2	

Carry out a multiplex network test (see **88B, Multiplexing**) and check for any potential incorrect multiplex line signals from the injection computer (see **13B, Diesel injection or 17B, Petrol injection**), the automatic gearbox computer (see **23A, Automatic gearbox**) the UCH computer (see **87B, Passenger compartment connection unit**) and the Protection and Switching Unit computer (see **87G, Engine compartment connection unit**).

Test the braking system:
Look for any areas where the brake pads may be sticking (due to ice, salt, etc.).
Check that the brake piston is operating correctly.
Repair if necessary.

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a check using the **diagnostic tool**. Deal with any other faults.

GETtheMANUALS.org

ALP3	Assisted release too early or too late

NOTES	Only consult this customer complaint after a **full check using the diagnostic tool** (no present or stored faults). **(see the wiring diagrams technical note for the vehicle concerned).**

Assisted release may be activated too late if a trailer is attached to the vehicle.
Test assisted release without the trailer.

Test the braking system:
Look for any areas where the brake pads may be sticking (due to ice, salt, etc.).
Check that the brake piston is operating correctly.
Repair if necessary.

Check the clutch sensor positioning:
● **Espace IV and Vel Satis**
Check the **insulation, continuity and the absence of interference resistance** on the following connections:
– connection code 150K,
– connection code 150L,
– connection code 26X.
Between the electronic parking brake computer, **component code 1217** and the clutch position sensor, **component code 1057**.
If there is a repair procedure (**see Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.
Reposition it, if necessary.
Replace the clutch sensor if necessary (see **MR405 (Espace IV) or MR395 (Laguna II) or MR370 (Scénic), Mechanical, 37A, Mechanical component controls, Clutch pedal position sensor: Removal - Refitting or MR353 (Vel Satis ph 1), Mechanical, 37A, Mechanical component controls, Clutch pedal or MR402 (Vel Satis ph 2), Mechanical, 37A, Mechanical component controls, Clutch pedal switch: Removal - Refitting**).
● **Laguna II and Scénic II**
Check the **insulation, continuity and the absence of interference resistance** on the following connections:
– connection code 150Q,
– connection code 150L.
Between the electronic parking brake computer, **component code 1217** and the clutch pedal sensor, **component code 675** (see **section 87B, UCH, Door switch**).
1. Laguna II:
Check **the continuity and absence of interference resistance on the following connection**:
– connection code 86D
Between the injection computer, **component code 120** and the clutch pedal switch, **component code 675**.

AFTER REPAIR	Carry out a check using the **diagnostic tool**. Deal with any other faults.

GETtheMANUALS.org

ALP3 **CONTINUED**	

2. Scénic II:
Check **the continuity and absence of interference resistance on the following connection**:
– connection code H51.
Between the injection computer, **component code 120** and the clutch pedal switch, **component code 675**.
If there is a repair procedure (**see Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.
Reposition it, if necessary.
Replace the clutch sensor if necessary (see **MR405 (Espace IV) or MR395 (Laguna II) or MR370 (Scénic), Mechanical, 37A, Mechanical component controls, Clutch pedal position sensor: Removal - Refitting or MR353 (Vel Satis ph 1), Mechanical, 37A, Mechanical component controls, Clutch pedal or MR402 (Vel Satis ph 2), Mechanical, 37A, Mechanical component controls, Clutch pedal switch: Removal - Refitting**).

Reconfigure the vehicle clutch curve by applying the special command **SC006 Enter clutch pedal programming**.
Test the assisted brake release.

Check the condition of the clutch system (wear of the different components, possible build-up of grease on surfaces in friction).
Repair if necessary.
Carry out a multiplex network test (see **88B, Multiplexing**) and check for any potential faults on the injection computer (see **13B, Diesel injection or 17B, Petrol injection**), the automatic gearbox computer (see **23A, Automatic gearbox**) and the UCH computer (see **87B, Passenger compartment connection unit**).

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a check using the **diagnostic tool**. Deal with any other faults.

GETtheMANUALS.org

ALP4	Assisted braking fault (when the engine is stopped)

NOTES	Only consult this customer complaint after a **full check using the diagnostic tool** (no present or stored faults). **(see the wiring diagrams technical note for the vehicle concerned).**

Check for any potential faults in the ABS computer (see **38C, Anti-lock braking system**), the UCH computer (see **87B, Passenger compartment connection unit**) and the injection computer (see **13B, Diesel injection or 17B, Petrol injection**) to ensure that they have actually received a request to stop the engine. Test the application of the electronic parking brake with the engine switched off.
Incorrect signal faults on the multiplex line. Run a multiplex network test (see **88B, Multiplex**).
When the engine stalls, the automatic brake application function is not active.
Check the **+ 12 V** supply, the **insulation, continuity and the absence of interference resistance** on the following connection: **– connection code BP2** Between the electronic parking brake computer, **component code 1217** and the battery, **component code 107**. If the continuity is correct, test the charging circuit (see **Technical Note 6014A, Checking the charging circuit**). Repair if necessary.
If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a check using the **diagnostic tool**. Deal with any other faults.

GETtheMANUALS.org

ALP5	Impossible to manually release electronic parking brake

NOTES	Only consult this customer complaint after a **full check using the diagnostic tool** (no present or stored faults). **(see the wiring diagrams technical note for the vehicle concerned).**

Check any incorrect signals on the multiplex line. Run a multiplex network test (see **88B, Multiplex**).
Check that the card is correctly inserted for a card reader, scenario 1 (not hands-free). If not, refer to the fault finding procedure for the UCH (see **87B, Passenger compartment connection unit**). Reposition it, if necessary.
Check that the steering column is unlocked.
Check the **+ 12 V** supply, the **insulation, continuity and the absence of interference resistance** on the following connection: **– connection code BP2** Between the electronic parking brake computer, **component code 1217** and the battery, **component code 107**. If the continuity is correct, test the charging circuit (see **Technical Note 6014A, Checking the charging circuit**). Repair if necessary.
Check the operation of the release switch. Check the continuity of the following connection codes: **– connection code 150P,** **– connection code 150N,** **– connection code 150B,** **– connection code 150G,** Between the control unit of the electronic parking brake lever, **component code 1216** and the electronic parking brake computer, **component code 1217**. Repair if necessary.
If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a check using the **diagnostic tool**. Deal with any other faults.

GETtheMANUALS.org

ALP6	**Impossible to release with the emergency brake**

NOTES	Only consult this customer complaint after a **full check using the diagnostic tool** (no present or stored faults).

Check that the electronic parking brake is not already released.
Check that the force is sufficient to release the emergency brake. Reduce the emergency brake cable voltage, if necessary.
If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a check using the **diagnostic tool**. Deal with any other faults.

GETtheMANUALS.org

ALP7	**The electronic parking brake seems to apply whilst driving**

NOTES	Only consult this customer complaint after a **full check using the diagnostic tool** (no present or stored faults).

Check that the engine has not stalled whilst driving.
Check that the electronic parking brake is actually released.
Check that the injection control system is not in defect mode (engine Limp Home). Run a multiplex network test (see **88B, Multiplex**). Check for any potential faults in the injection computer (see **13B, Diesel injection or 17B, Petrol injection**). If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a check using the **diagnostic tool**. Deal with any other faults.

GETtheMANUALS.org

ALP8	**The electronic parking brake does not apply correctly on a slope**

NOTES	Only consult this customer complaint after a **full check using the diagnostic tool** (no present or stored faults). **(see the wiring diagrams technical note for the vehicle concerned).**

Check that the vehicle is correctly gripping the ground.
Check that the vehicle is not outside the limits.
Check the **+ 12 V** supply, the **insulation, continuity and the absence of interference resistance** on the following connection: **– connection code BP2** Between the electronic parking brake computer, **component code 1217** and the battery, **component code 107**. If the continuity is correct, test the charging circuit (see **Technical Note 6014A, Checking the charging circuit**). Repair if necessary.
Check the condition of the brake pads (wear, fitting, insufficient running in, etc.). Replace if necessary.
Check the condition of the brake callipers. Repair if necessary.
Check the fitting of the pressure plate between the electronic parking brake and the brake calliper. Refit if necessary.
If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a check using the **diagnostic tool**. Deal with any other faults.

ANTI-LOCK BRAKING SYSTEM
Fault finding - Introduction

GETtheMANUALS.org

1. SCOPE OF THIS DOCUMENT

This document presents the fault finding procedure applicable to all computers with the following specifications:

Vehicle(s): ***Vel Satis*** *Function concerned:* ***MK60 ABS/ESP***	*Computer name:* ***MK60 ABS/ESP*** *Program no.:* *VDIAG no.:*

2. PREREQUISITES FOR FAULT FINDING

Documentation type

Fault finding procedure (this document)**:**
– Assisted fault finding (integrated to diagnostic tool), Dialogys.

Wiring diagrams:
– Visu-Schéma (CD-ROM), paper.

Type of diagnostic tools

– **CLIP or NXR**

Special tooling required

Special tooling required
Multimeter

GETtheMANUALS.org

Faults

Faults are displayed as present or stored (they appeared in a certain context and have since disappeared, or they are still present but cannot be diagnosed in the current context).

The **present** or **stored** status of faults should be taken into consideration when the diagnostic tool is used after the + after ignition feed has been supplied (without acting on the system components).

For a **present fault**, apply the procedure described in the **Interpretation of faults** section.

For a **stored fault**, note the faults displayed and apply the instructions in the **Notes** section.

If the fault is **confirmed** when the notes are applied, the fault is present. Deal with the fault

If the fault is **not confirmed**, check:
- the electrical lines which correspond to the fault,
- the connectors on these lines (corrosion, bent pins, etc.),
- the resistance of the faulty component,
- the condition of the wires (melted or cut insulation, wear).
- or use the fault finding procedure to check the circuit of the faulty component.

Conformity check

The conformity check is designed to check the statuses and parameters which do not display any faults on the diagnostic tool when not operating consistently. Therefore, this stage is used to:
- perform fault finding on faults that do not have a fault display, and which may correspond to a customer complaint.
- check that the system is operating correctly and that there is no risk of a fault reappearing after repairs.

This section gives the fault finding procedures for statuses and parameters and the conditions for checking them.

If a status is not behaving normally or a parameter is outside permitted tolerance values, you should consult the corresponding fault finding page.

Customer complaints - Fault finding chart

If the diagnostic tool check is correct, but the customer complaint is still present, the fault should be dealt with according to the **customer complaint**.

A summary of the overall procedure to follow is provided on the following page in the form of a flow chart

GETtheMANUALS.org

4. FAULT FINDING PROCEDURE (continued)

Wiring check:

Fault finding problems:
Disconnecting the connectors and/or manipulating the wiring may temporarily clear the cause of a fault.
Electrical measurements of the voltage, resistance and insulation are generally correct, especially if the fault is not present when the measurements are being taken (stored fault).

Visual inspection:
Look for any damage under the bonnet and in the passenger compartment.
Carefully check the fuses, insulators and wiring harness routing.
Look for signs of oxidation.

Touch inspection:
While manipulating the wiring, use the diagnostic tool to detect any changes in fault status from stored to present.
Make sure that the connectors are firmly secured.
Apply light pressure to the connectors,
Twist the wiring harness.
If there is a change in status, try to locate the source of the fault.

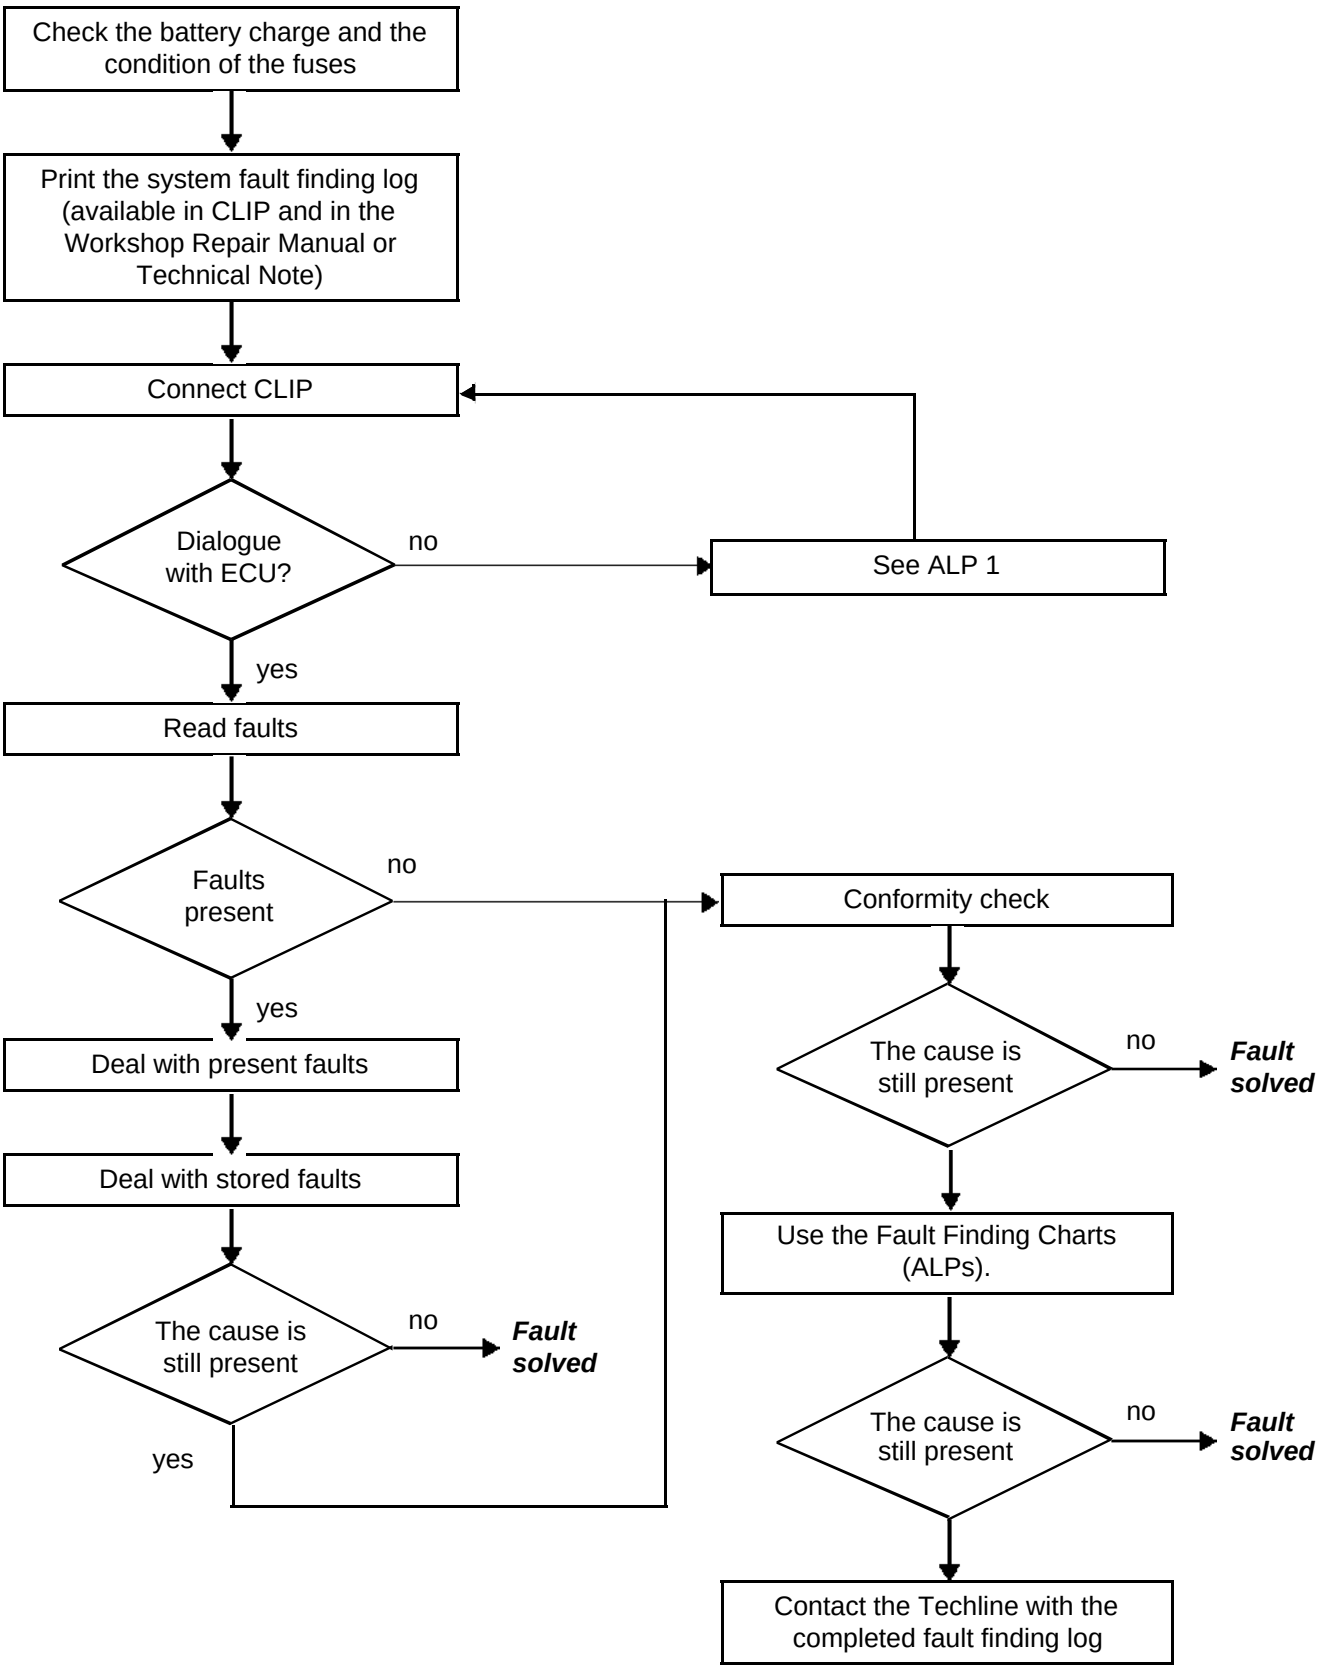
Inspection of each component:
Disconnect the connectors and check the appearance of the clips and tabs and their crimping (no crimping on the insulating section).
Make sure that the clips and tabs are properly locked in the sockets.
Check that no clips or tabs have been dislodged during connection.
Check the clip contact pressure using the appropriate type of tab.

Resistance check:
Check the continuity of the entire lines, then section by section. Look for a short circuit to earth, to the + 12 V feed or with another wire.

If a fault is detected, repair or replace the wiring harness.

GETtheMANUALS.org

4. FAULT FINDING PROCEDURE



GETtheMANUALS.org

IMPORTANT!

5. FAULT FINDING LOG

IMPORTANT:
Any fault on a complex system call for thorough fault finding with the appropriate tools. The FAULT FINDING LOG, which should be completed during the fault finding procedure, ensures a record is kept of the procedure carried out. It is an essential document when consulting the manufacturer.

IT IS THEREFORE MANDATORY TO FILL OUT A FAULT FINDING LOG EACH TIME FAULT FINDING IS CARRIED OUT.

You will always be asked for this log:

- When requesting technical assistance from the Techline.
- For certification requests when replacing parts that must be certified.
- To be attached to monitored parts for which reimbursement is requested. The log is needed for warranty reimbursement, and enables better analysis of the parts removed.

6. SAFETY ADVICE

Safety rules must be observed whenever work is carried out on a component to prevent physical damage or human injury:

– Make sure the battery is properly charged to avoid damaging the computers with a low load.

– Use the appropriate tools.

– **It is forbidden to carry out a road test while dialogue is still established between the diagnostic tool and the computer, as the ABS and Electric Braking Distribution (EBD) functions are deactivated. Braking pressure is identical on both vehicle axles (risk of a spin under heavy braking).**

GETtheMANUALS.org

DF006 PRESENT OR STORED	FRONT LEFT-HAND WHEEL SPEED SENSOR CIRCUIT.

NOTES	**Special notes:** None.
	Conditions for applying fault finding procedure to a stored fault: Apply the fault finding procedure described below in **DF006 stored**.

DF006 present	***NOTES***	**Special notes:** None.

Check the connection and condition of the sensor and the computer.
Disconnect the sensor and check that a voltage of approximately **12 V** is present **under + after ignition feed** at the sensor connector terminals on the computer side.
Is the voltage measured correct?

YES

Swap the 2 front wheel speed sensors over. Clear the computer memory.

Switch off the ignition. Switch on the ignition again.

If the fault initially declared **DF006 Front left-hand wheel speed sensor circuit** has become **DF026 Front right-hand wheel speed sensor circuit**, replace the wheel speed sensor.

If the fault remains on the same side, the wiring between the computer and the sensor is faulty.

Check and ensure the continuity of the following connections:

Sensor connector **track 1** → **track 46** Computer connector
Sensor connector **track 2** → **track 45** Computer connector

Also check the insulation between these two connections.

NO

Check and ensure the continuity of the following connections:

Sensor connector **track 1** → **track 46** Computer connector
Sensor connector **track 2** → **track 45** Computer connector

Also check the insulation between these two connections.

Carry out a visual inspection of the sensor wiring.

If all the checks are correct, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF006 CONTINUED	

DF006 stored	*NOTES*	**Special notes:** None.

Check the connection and condition of the sensor and the computer.
Swap the 2 front wheel speed sensors over.
Clear the computer memory.
Carry out a road test and then recheck with the diagnostic tool.

If the fault initially declared **DF006 Front left-hand wheel speed sensor circuit** has become **DF026 Front right-hand wheel speed sensor circuit**, replace the wheel speed sensor.

If the fault remains on the same side, the wiring between the computer and the sensor is faulty.

Check and ensure the continuity of the following connections:

Sensor connector **track 1** ⟶ **track 46** Computer connector
Sensor connector **track 2** ⟶ **track 45** Computer connector

Also check the insulation between these two connections.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF007 PRESENT OR STORED	REAR LEFT-HAND WHEEL SPEED SENSOR CIRCUIT

NOTES	**Special notes:** None.
	Conditions for applying fault finding procedure to a stored fault: Apply the fault finding procedure described below in **DF007 stored**.

DF007 present	***NOTES***	**Special notes:** None.

Check the connection and condition of the sensor and the computer.
Disconnect the sensor and check that a voltage of approximately **12 V** is present **under + after ignition feed** at the sensor connector terminals on the computer side.

Is the voltage measured correct?

YES

Swap the 2 rear wheel speed sensors. Clear the computer memory.

Switch off the ignition. Switch on the ignition again.

If the fault initially declared **DF007 "Rear left-hand wheel speed sensor circuit"** has become a **DF027 "Rear right-hand wheel speed sensor circuit" present fault**, replace the wheel speed sensor.

If the fault remains on the same side, the wiring between the computer and the sensor is faulty.

Check and ensure the continuity of the following connections:

Sensor connector **track 1** → **track 37** Computer connector
Sensor connector **track 2** → **track 36** Computer connector

Also check the insulation between these two connections.

NO

Check and ensure the continuity of the following connections:

Sensor connector **track 1** → **track 37** Computer connector
Sensor connector **track 2** → **track 36** Computer connector

Also check the insulation between these two connections.

Carry out a visual inspection of the sensor wiring.

If all the checks are correct, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF007 CONTINUED	

DF007 stored	***NOTES***	Special notes: None.

Check the connection and condition of the sensor and the computer.
Swap the 2 rear wheel speed sensors.
Clear the computer memory.
Carry out a road test and then recheck with the diagnostic tool.

– If the fault initially declared **DF007 "Rear left-hand wheel speed sensor circuit"** has become a **DF027 "Rear right-hand wheel speed sensor circuit" present fault**, replace the wheel speed sensor.
– If the fault remains on the same side, the wiring between the computer and the sensor is faulty.

Check and ensure the continuity of the following connections:

Sensor connector **track 1** ⟶ **track 37** Computer connector
Sensor connector **track 2** ⟶ **track 36** Computer connector

Also check the insulation between these two connections.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF008 STORED	FRONT LEFT-HAND WHEEL SPEED SENSOR SIGNAL.

NOTES	**Priorities when dealing with a number of faults:** Deal with fault **DF006 Front left-hand wheel speed sensor circuit** first if it is present.
	Conditions for applying the fault finding procedure to stored faults: The fault is present during: road test (in excess of **12 mph (20 km/h)** for **2 minutes)**.

Check that the wheel speed sensor mounting is in good condition (correct clipping).
Check the sensor/target air gap over one wheel revolution: **0.1 mm < front wheel air gap < 1.1 mm**
Check the conformity of the target: condition, **number of teeth = 48** (using specific command **SC001 Check target teeth**).

Check the connection and the condition of the sensor connectors.
Carry out a visual inspection of the sensor wiring and check the condition of the connections on the **47-track computer connector.**

If the results of the checks are correct, reconnect the computer and the wheel speed sensor and clear the computer memory.
Exit the fault finding procedure and carry out a road test. Replace the sensor if the fault recurs.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF009 STORED	REAR LEFT-HAND WHEEL SPEED SENSOR SIGNAL.

NOTES	**Priorities when dealing with a number of faults:** Deal with fault **DF001 Rear left-hand speed sensor circuit** first if it is present.
	Conditions for applying the fault finding procedure to stored faults: The fault is present during: road test (in excess of **12 mph (20 km/h)** for **2 minutes)**.

Check that the wheel speed sensor mounting is in good condition (correct clipping).
Check the sensor/target air gap through one revolution of the wheel: **0.3 mm < rear wheel air gap < 1.3 mm**
Check the conformity of the target: condition, **number of teeth = 48** (using specific command **SC001 Check target teeth**).

Check the connection and the condition of the sensor connectors.
Carry out a visual inspection of the sensor wiring and check the condition of the connections on the **47-track computer connector.**

If the results of the checks are correct, reconnect the computer and the wheel speed sensor and clear the computer memory.
Exit the fault finding procedure and carry out a road test. Replace the sensor if the fault recurs.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF010 PRESENT OR STORED	PUMP MOTOR CIRCUIT.

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the brake pedal has been held down + **AC016** Test pump motor actuator command.

Check the **ABS earths** (tightening of the terminal on the earth bolt above the hydraulic assembly).
Check the continuity between the **ABS earth** and **tracks 47 and 16** of the computer connector.
Check the **+ before ignition feed** on **track 1** on the **47-track** connector. Check the condition and position of the **40A** fuse in the engine fuse box.

If the fault appears after the computer has been removed or replaced, remove the computer and check the condition and presence of the internal connections (2 tracks) across the hydraulic assembly.

If the fault recurs, replace the hydraulic assembly (mechanical locking of the pump, etc.).

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF017 PRESENT OR STORED	COMPUTER

NOTES	**Conditions for applying the fault finding procedure to stored faults:** Apply the fault finding procedure whether the fault is present or stored.

Check the connections on the **47-track connector** of the ABS computer.
Check that there are no traces of oxidisation.
If traces of oxidisation are found, you must replace the ABS wiring and the computer. If not, replace only the computer.

Clear the computer memory, exit the diagnostic and switch off the ignition.
Perform a new check using the diagnostic tool. If the fault is still present, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF020 PRESENT	TACHOMETRIC INDEX PROGRAMMING

NOTES	**Special notes:** None.

The TEVES MK60 ABS/ESP computer with the tachometry function transmits the vehicle speed signal to all subscribers using this signal (instrument panel, engine management, etc.).
This vehicle speed signal replaces the one supplied by the speed sensor located on the gearbox.
The ABS/ESP computer calculates the vehicle speed from the wheel speed and the tyre circumference.

The tyre circumference must be programmed into the memory of a new computer. This consists of entering an index X using the VP007 Tachometric Index command on the diagnostic tool.

Once the index has been entered using the **VP007** command, clear the computer memory and then switch off the ignition. Use the parameter **PR030** to check that the index entered has been stored correctly.

If the fault is still present, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF026 PRESENT OR STORED	FRONT RIGHT-HAND WHEEL SPEED SENSOR CIRCUIT

NOTES	**Special notes:** None.
	Conditions for applying fault finding procedure to a stored fault: Apply the fault finding procedure described below in **DF026 stored**.

DF026 present	***NOTES***	**Special notes:** None.

Check the connection and condition of the sensor and computer connections.
Check the connector on the intermediate connections under the body on the front left-hand wing upper section (**R183**). Disconnect the sensor and check that a voltage of approximately **12 V** is present **under + after ignition feed** at the sensor connector terminals on the computer side.
Is the voltage measured correct?

YES

Swap the 2 front wheel speed sensors over. Clear the computer memory.

Switch off the ignition. Switch on the ignition again.

If the fault initially declared **DF026 Front right-hand wheel speed sensor circuit** has become **DF006 Front left-hand wheel speed sensor circuit**, replace the wheel speed sensor.

If the fault remains on the same side, the wiring between the computer and the sensor is faulty.

Check and ensure the continuity of the following connections:

Sensor connector **track 1** → **track 33** Computer connector
Sensor connector **track 2** → **track 34** Computer connector

If the connection is faulty:

Disconnect the intermediate **2-track R183** connector on the front left-hand upper wing section and check the condition of the connections.

Check and ensure the continuity of the connections between:

Sensor connector **track 1** → **track B** Intermediate connector
Sensor connector **track 2** → **track A** Intermediate connector

Also check the insulation between these connections.

Check and ensure the continuity of the connections between:

Sensor connector **track 33** → **track B** Intermediate connector
Sensor connector **track 34** → **track A** Intermediate connector

Also check the insulation between these connections.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF026 CONTINUED 1	

NO

Check and ensure the continuity of the following connections:

Sensor connector **track 1** → **track 33** Computer connector
Sensor connector **track 2** → **track 34** Computer connector

If the connection is faulty:

Disconnect the intermediate **2-track R183** connector on the front left-hand upper wing section and check the condition of the connections.

Check and ensure the continuity of the connections between:

Sensor connector **track 1** → **track B** Intermediate connector
Sensor connector **track 2** → **track A** Intermediate connector

Also check the insulation between these connections.

Check and ensure the continuity of the connections between:

Sensor connector **track 33** → **track B** Intermediate connector
Sensor connector **track 34** → **track A** Intermediate connector

Also check the insulation between these connections.

Carry out a visual inspection of the sensor wiring.

If all the checks are correct, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF026 CONTINUED 2	FRONT RIGHT-HAND WHEEL SPEED SENSOR CIRCUIT

DF026 stored	*NOTES*	**Special notes:** None.

Check the connection and condition of the sensor and computer connections.
Check the connector on the intermediate connections under the body on the front left-hand wing upper section (**R183**).
Swap the 2 front wheel speed sensors over.
Clear the computer memory.
Carry out a road test and then recheck with the diagnostic tool.

If the fault initially declared **DF026 Front right-hand wheel speed sensor circuit** has become **DF006 Front left-hand wheel speed sensor circuit**, replace the wheel speed sensor.

If the fault remains on the same side, the wiring between the computer and the sensor is faulty.

Check and ensure the continuity of the following connections:

Sensor connector **track 1** → **track 33** Computer connector
Sensor connector **track 2** → **track 34** Computer connector

If the connection is faulty:

Disconnect the intermediate **2-track R183** connector on the front left-hand upper wing section and check the condition of the connections.

Check and ensure the continuity of the connections between:

Sensor connector **track 1** → **track B** Intermediate connector
Sensor connector **track 2** → **track A** Intermediate connector

Also check the insulation between these connections.

Check and ensure the continuity of the connections between:

Sensor connector **track 33** → **track B** Intermediate connector
Sensor connector **track 34** → **track A** Intermediate connector

Also check the insulation between these connections.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF027 PRESENT OR STORED	REAR RIGHT-HAND WHEEL SPEED SENSOR CIRCUIT

NOTES	**Special notes:** None.
	Conditions for applying fault finding procedure to a stored fault: Apply the fault finding procedure described below in **DF027 stored**.

DF027 present	***NOTES***	**Special notes:** None.

Check the connection and condition of the sensor and the computer.
Disconnect the sensor and check that a voltage of approximately **12 V** is present **under + after ignition feed** at the sensor connector terminals on the computer side.
Is the voltage measured correct?

YES

Swap the 2 rear wheel speed sensors. Clear the computer memory.

Switch off the ignition. Switch on the ignition again.

If the fault initially declared **DF027 Rear right-hand wheel speed sensor circuit** has become **DF027 Rear left-hand wheel speed sensor circuit**, replace the wheel speed sensor.

If the fault remains on the same side, the wiring between the computer and the sensor is faulty.

Check and ensure the continuity of the following connections:

Sensor connector **track 1** → **track 42** Computer connector
Sensor connector **track 2** → **track 43** Computer connector

Also check the insulation between these two connections.

NO

Check and ensure the continuity of the following connections:

Sensor connector **track 1** → **track 42** Computer connector
Sensor connector **track 2** → **track 43** Computer connector

Also check the insulation between these two connections.

Carry out a visual inspection of the sensor wiring.

If all the checks are correct, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF027 CONTINUED	

DF027 stored	***NOTES***	**Special notes:** None.

Check the connection and condition of the sensor and computer connections.
Swap the 2 rear wheel speed sensors.
Clear the computer memory.
Carry out a road test and then recheck with the diagnostic tool.

If the fault initially declared **DF027 Rear right-hand wheel speed sensor circuit** has become **DF007 Rear left-hand wheel speed sensor circuit present**, replace the wheel speed sensor.

If the fault remains on the same side, the wiring between the computer and the sensor is faulty.

Check and ensure the continuity of the following connections:

Sensor connector **track 1** → **track 42** Computer connector
Sensor connector **track 2** → **track 43** Computer connector

Also check the insulation between these two connections.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF028 STORED	FRONT RIGHT-HAND WHEEL SPEED SENSOR SIGNAL

NOTES	**Priorities when dealing with a number of faults:** Deal with fault **DF026 Front right-hand wheel speed sensor circuit** first if it is present.
	Conditions for applying the fault finding procedure to stored faults: The fault is present during: road test (in excess of **12 mph (20 km/h)** for **2 minutes)**.

Check that the wheel speed sensor mounting is in good condition (correct clipping).
Check the sensor/target air gap over one wheel revolution: **0.1 mm < front wheel air gap < 1.1 mm**
Check the conformity of the target: condition, **number of teeth = 48** (using specific command **SC001 Check target teeth**).

Check the connection and the condition of the sensor connectors.
Check the connector on the intermediate connections under the body on the front left-hand wing upper section (**R183**).

Carry out a visual inspection of the sensor wiring and check the condition of the connections on the **47-track computer connector.**

If the results of the checks are correct, reconnect the computer and the wheel speed sensor and clear the computer memory.
Exit the fault finding procedure and carry out a road test. Replace the sensor if the fault recurs.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF029 STORED	REAR RIGHT-HAND WHEEL SPEED SENSOR SIGNAL

NOTES	**Priorities when dealing with a number of faults:** Deal with fault **DF027 rear right-hand wheel speed sensor circuit** first if it is present.
	Conditions for applying the fault finding procedure to stored faults: The fault is present during: road test (in excess of **12 mph (20 km/h)** for **2 minutes)**.

Check that the wheel speed sensor mounting is in good condition (correct clipping).
Check the sensor/target air gap over one wheel revolution: **0.3 mm < rear wheel air gap < 1.3**
Check the conformity of the target: condition, **number of teeth = 48** (using specific command **SC001 Check target teeth**).

Check the connection and the condition of the sensor connectors.
Carry out a visual inspection of the sensor wiring and check the condition of the connections on the **47-track computer connector.**

If the results of the checks are correct, reconnect the computer and the wheel speed sensor and clear the computer memory.
Exit the fault finding procedure and carry out a road test. Replace the sensor if the fault recurs.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF047 PRESENT	MULTIPLEX NETWORK (bus off)

NOTES	**Special notes:** None.

Carry out the multiplex network test.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF056 PRESENT OR STORED	BRAKE PEDAL CONTACT INCONSISTENCY

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is recorded as present when: the brake pedal is depressed.

Depress the brake pedal observing the **ET017 BRAKE PEDAL** status.
Check that the pedal released and pedal depressed positions are registered.

YES	Apply the fault finding procedure described in the interpretation of the **ET017 BRAKE PEDAL** status.

NO	Check the two brake light bulbs and the earth of the rear light units (no earthing of **track 41** across the bulbs when the pedal is not depressed).

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF066 PRESENT	NO INJECTION MULTIPLEX SIGNAL

NOTES	**Special notes:** None.

Carry out the multiplex network test.
If the fault is still present, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF075 **STORED**	STEERING WHEEL ANGLE SENSOR SIGNAL.

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is recorded as present following: steering from lock to lock and road test.

After replacing a sensor, program the steering wheel angle sensor using the diagnostic tool by selecting the configuration **VP003 Steering wheel angle sensor**.

Check that the steering wheel angle sensor is correctly fitted and positioned on the steering column.

(With the wheels straight, check that the yellow marker on the steering wheel angle sensor is visible in the centre of the window and check that the connector is correctly connected to the sensor and not to the inert mounting next to the sensor.)

Position the wheels straight and use a diagnostic tool in the parameter category to check that **PR033** is between **-15° and +15°** if not, check that the yellow marker on the steering wheel angle sensor is visible in the centre of the window.

Program the steering wheel angle using the diagnostic tool by selecting the configuration **VP003 Steering wheel angle sensor**.

Exit the fault finding procedure and carry out a road test.
Replace the sensor if the fault recurs.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF088 PRESENT	BRAKE PRESSURE SENSOR CIRCUIT

NOTES	**Special notes:** None.

Check the condition and correct connection of the brake pressure sensor.

Check the connection and the condition of the computer connectors.

Check and ensure the continuity of the following connections:

Sensor connector **track 1** → **track 19** Computer connector
Sensor connector **track 2** → **track 20** Computer connector
Sensor connector **track 3** → **track 18** Computer connector

Also check the insulation between these connections.

Carry out a visual inspection of the sensor wiring.

Disconnect the pressure sensor and check the presence of a voltage of approximately **5 V** under **+ after ignition feed** between **tracks 1 and 3** of the sensor connector (ignore any new faults caused by this inspection).

If the voltage is approximately **0 V**, contact your Techline.

If the results of the checks are correct, reconnect the computer and the brake pressure sensor and clear the computer memory.

Exit fault finding mode and switch off the ignition.

Switch the ignition on and replace the sensor if the fault recurs.

WARNING
Whenever a brake pressure sensor is replaced, it is essential to calibrate the sensor using the diagnostic tool. Carry out the following operations.
– Do not depress the brake pedal for the entire duration of the operation.
– Configure VP026 Pressure sensor using the diagnostic tool.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF090 **STORED**	FRONT RIGHT-HAND WHEEL TARGET

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is recorded as present during: road test.

Check that the sensor casing is absent when rotating.
Check that the wheel speed sensor mounting is in good condition (clipping).
Check the conformity of the targets: condition, **number of teeth = 48** (using the **SC001 Check target teeth** command).

If the checks reveal no faults, clear the fault memory.

Exit the fault finding procedure and carry out a road test.

Replace the instrumented bearing if the fault recurs.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF091 STORED	FRONT LEFT-HAND WHEEL TARGET.

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is recorded as present during: road test.

Check that the sensor casing is absent when rotating.
Check that the wheel speed sensors are correctly mounted (clipped).
Check the conformity of the targets: condition, **number of teeth = 48** (using the **SC001 Check target teeth** command).

If the checks reveal no faults, clear the fault memory.

Exit the fault finding procedure and carry out a road test.

Replace the instrumented bearing if the fault recurs.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF092 **STORED**	REAR RIGHT-HAND WHEEL TARGET

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is recorded as present after: road test.

Check that the sensor casing is absent when rotating.
Check that the wheel speed sensors are correctly mounted (clipped).
Check the conformity of the targets: condition, **number of teeth = 48** (using the **SC001 Check target teeth** command).

If the checks reveal no faults, clear the fault memory.

Exit the fault finding procedure and carry out a road test.

Replace the instrumented bearing if the fault recurs.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF093 **STORED**	REAR LEFT-HAND WHEEL TARGET.

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is recorded as present during: road test.

Check that the sensor casing is absent when rotating.
Check that the wheel speed sensors are correctly mounted (clipped).
Check the conformity of the targets: condition, **number of teeth = 48** (using the **SC001 Check target teeth** command).

If the checks reveal no faults, clear the fault memory.

Exit the fault finding procedure and carry out a road test.

Replace the instrumented bearing if the fault recurs.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF094 / DF095 PRESENT OR STORED	COMPUTER SUPPLY VOLTAGE

NOTES	**Special notes:** Apply the fault finding procedure below, whether the fault is indicated as present or stored. This fault appears when the engine is started with a battery charger or a **24-volt** battery. The undervoltage fault is not stored unless the vehicle speed is above **12 mph (20 km/h)**.
	Conditions for applying the fault finding procedure to stored faults: Apply the fault finding procedure whether the fault is present or stored.

Check for the presence of **+ 12 before ignition feed** on **track 32** of the **47-track** computer connector.
Perform the operations necessary to obtain the correct **+ after ignition feed** voltage supply to the computer:

10 V < correct voltage < 17 V.

– Battery charge check.
– Charging circuit check.
– Check the tightness and condition of the battery terminals.

Check for **+ after ignition feed** on **track 4** of the **47-track** computer connector (**5 A** fuse).
Check for **+ before ignition feed** on **track 1** and **32** of the **47-track** computer connector (**30A** and **40A fuses** located in the engine fuse box).
Check the earths are in good condition (properly tightened, not oxidised etc.), check the tightness of the terminal on the earth bolt located above the hydraulic power unit.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF096 PRESENT	COMPUTER INTERNAL ELECTRONIC IRREGULARITY

NOTES	**Special notes:** None.

Using the diagnostic tool, check the **FUNCTION CODE NUMBER** (CLIP: identification screen and NXR: parameter screen **PR041**).

– If the **function code number is C1** (the system is fitted with electric emergency braking assistance), start the engine and run command **AC161 Brake servo solenoid valve**.

If **DF185 Brake servo/internal feed circuit** appears, apply the fault finding procedure associated with this fault.

If **DF185** does not appear, check with your Techline.

– If the **function code number is E0 or E1** (the system is fitted with manual emergency brake assist), contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF097 PRESENT	NO AUTOMATIC TRANSMISSION MULTIPLEX SIGNAL.

NOTES	**Special notes:** None.

Carry out the multiplex network test.
If the fault is still present, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF098 PRESENT	NO UCH MULTIPLEX SIGNAL

NOTES	**Special notes:** None.

Carry out the multiplex network test.
If the fault is still present, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF099 PRESENT	ABS PRIVATE MULTIPLEX NETWORK (bus off)

NOTES	**Special notes:** None.

Ensure that the connections and the position of any special equipment, such as CB, car phone, amplifier, etc. are not preventing the ABS from working correctly.

Use the diagnostic tool to check the **FUNCTION CODE NUMBER** (CLIP: identification screen and NXR: parameter screen PR041).

– **E0, C1, E1** indicates that the system is fitted with a combined sensor.

Check the connection and condition of the combined sensor connectors and the steering wheel angle sensor.

– Check the continuity and insulation of the connections between:

Computer connector	**Track 29**	→	**Track 3**	Steering wheel angle sensor + feed
		→	**Track 2**	Combined sensor
Computer connector	**Track 25**	→	**Track 2**	Steering wheel angle sensor
		→	**Track 1**	Combined sensor

– If the fault is still present, switch off the ignition, disconnect the combined sensor, and then switch the ignition back on.
Replace the combined sensor if **DF099** is stored. Ignore any new faults that appear during the operation.

– If **DF099** remains present, switch off the ignition, reconnect the combined sensor and disconnect the steering wheel angle sensor. Switch ignition back on.
Replace the steering wheel angle sensor if **DF099** is stored. Ignore any new faults that appear during the operation.

If the checks are correct, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF100 PRESENT	NO STEERING WHEEL ANGLE MULTIPLEX SIGNAL

NOTES	**Special notes:** None.

Check the connection and condition of the steering wheel angle sensor and computer connectors.

Check the continuity of the following connections:

Computer connector **Track 25** → **Track 2** of the steering wheel angle sensor
Computer connector **Track 29** → **Track 3** of the steering wheel angle sensor

Check for the presence of **+ 12 before ignition feed** between **tracks 1 and 5** of the steering wheel angle sensor.

If the fault is still present, replace the steering wheel angle sensor.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF101 PRESENT	NO COMBINED SENSOR MULTIPLEX SIGNAL

NOTES	**Special notes:** None.

Check the connection and condition of the combined sensor and computer connectors.
Carry out a visual inspection of the sensor wiring.

Check and ensure continuity and the insulation of the connections between:

Sensor connector **Track 1** → **track 25** computer connector
Sensor connector **Track 2** → **track 29** computer connector
Sensor connector **Track 3** → **track 6** computer connector
Sensor connector **Track 5** → **track 24** computer connector

Also check the insulation between these connections.

Measure the voltage across **tracks 5 and 3** of the combined sensor connector under **+ after ignition feed**.
Replace the computer if the voltage is not approximately the same as the **+ after ignition feed**.

If the results of the checks are correct, reconnect the computer and the combined sensor and clear the computer memory.

Exit fault finding mode and switch off the ignition.

Switch the ignition on and replace the sensor if the fault recurs.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF102 PRESENT	SAVE CALIBRATION. (Computer configuration and sensor calibration)

NOTES	**Special notes:** None.

Using the diagnostic tool, run the following configuration commands:

– **CF077** ABS/ESP calibration.
Calibration is performed by selecting the engine type fitted to the vehicle.

– Adaptive cruise control:
Select command **CF078** on the diagnostic tool.

– Gearbox type:
Select command **CF079** on the diagnostic tool.

– Vehicle parameters (drive torque index configuration + brake type):
Select command **CF080** on the diagnostic tool.

– To program the steering wheel angle:
Select command **VP003** on the diagnostic tool.

– To program the tachometric index:
Select command **VP007** on the diagnostic tool.

If the calibration attempt fails, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF103 PRESENT	NO MULTIPLEX ACC SIGNALS

NOTES	**Special notes:** None.

Carry out the multiplex network test.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF104 PRESENT	COMBINED SENSOR INTERNAL ELECTRONIC IRREGULARITY

NOTES	**Special notes:** None.

Replace the combined sensor.

WARNING
Each time a combined pressure sensor is replaced, it is essential to calibrate the sensor using the diagnostic tool. Carry out the following operations.
– Position the vehicle on a flat, horizontal surface.
– Configure parameter VP025 Transverse acceleration sensor using the diagnostic tool.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF107 PRESENT	STEERING WHEEL ANGLE SENSOR IDENTIFIER

NOTES	**Special notes:** None.

Program the steering wheel angle using the diagnostic tool by selecting the configuration **VP003 Steering wheel angle sensor**.

If attempts to program fail, replace the steering wheel angle sensor.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF108 PRESENT OR STORED	STEERING WHEEL ANGLE SENSOR

NOTES	**Special notes:** Ignore this fault if the vehicle is on the dynamometer or if a jack has been placed underneath the vehicle and has not had an effect on the steering wheel angle though it has generated a vehicle speed.
	Conditions for applying the fault finding procedure to stored faults: Apply the fault finding procedure whether the fault is present or stored.

Check the connection and condition of the steering wheel angle sensor and computer connectors.

Using the diagnostic tool, check the **FUNCTION CODE NUMBER** (CLIP: identification screen and NXR: parameter screen **PR041**).

If the function code number is E0, C1, E1:
– Check the continuity of the connections between:
Computer connector **Track 25** → **Track 2** steering wheel angle sensor
Computer connector **Track 29** → **Track 3** steering wheel angle sensor

Check the presence of **+ 12 after ignition feed** between **tracks 1 and 5** of the steering wheel angle sensor connector.

If the results of the checks are correct, reconnect the computer and the steering wheel angle sensor and clear the computer memory.
Exit the fault finding procedure and carry out a road test. Replace the sensor if the fault recurs.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF109 PRESENT OR STORED	BRAKE PRESSURE SENSOR SIGNAL (consistency)

NOTES	**Special notes:** Deal with faults **DF088** Brake pressure sensor circuit and **DF056** Brake pedal contact consistency first if they are present.
	Conditions for applying the fault finding procedure to stored faults: Apply the fault finding procedure whether the fault is present or stored.

Ensure that there are no leaks in the hydraulic circuit.

When the engine is switched off, depress the brake pedal several times. After this has been performed, the pedal should remain hard.

If the pressure sensor has been removed or refitted, an air bubble may have become trapped in the pressure sensor thus altering the reading issued by the sensor. Remove the sensor and refill with brake fluid before refitting.

If the fault is still present, replace the brake pressure sensor.

If the checks reveal no faults, clear the computer memory.
Exit the fault finding procedure and carry out a road test.
Replace the sensor if the fault recurs.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF110 PRESENT OR STORED	SENSOR SUPPLY (brake pressure sensor)

NOTES	**Special notes:** Check the **FUNCTION CODE NUMBER** (CLIP: identification screen and NXR: parameter screen **PR041**).
	Conditions for applying the fault finding procedure to stored faults: Apply the fault finding procedure whether the fault is present or stored.

If the function code number is: **E0, C1, E1**

Check the presence of **+ 5 Volts** under **after ignition feed** between **tracks 1 and 3** of the brake pressure sensor.

If the voltage is incorrect, check the wiring harness.

Ensure that the computer and the brake pressure sensor connectors are in good condition and correctly connected.
Check and ensure the continuity of the following connections:

Sensor connector track 1 → track 19 Computer connector
Sensor connector track 2 → track 20 Computer connector
Sensor connector track 3 → track 18 Computer connector

Also check the insulation between these connections.

If the checks show no faults, replace the brake pressure sensor.

Clear the computer memory and road test the vehicle then recheck with the diagnostic tool.

If the fault is still present, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF111 PRESENT	BRAKE PEDAL TRAVEL SENSOR CIRCUIT

NOTES	**Special notes:** Deal with fault **DF110** Sensor supply first if it is present.

Check the condition and connection of the brake pedal travel sensor connector.

Check the connection and the condition of the computer connectors.
Check and ensure the continuity of the following connections:

Sensor connector **Track 1** → **track 7** Computer connector
Sensor connector **Track 2** → **track 5** Computer connector
Sensor connector **Track 3** → **track 3** Computer connector

Also check the insulation between these connections.

Carry out a visual inspection of the sensor wiring.

If the results of the checks are correct, reconnect the computer and the brake pedal travel sensor and clear the computer memory.
Carry out a road test and then recheck with the diagnostic tool.
Replace the sensor if the fault recurs.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF112 **PRESENT**	BRAKE PEDAL TRAVEL INCONSISTENCY

NOTES	**Special notes:** None.

Using the diagnostic tool, check on the statuses screen that **ET017** detects the depressed and released positions of the brake pedal. If they are not detected, use the fault finding procedure for **ET017**.
Check the brake pedal position using **PR039** on the diagnostic tool. – Pedal released: **PR039** < 5.5 mm. If the value is different, replace the sensor.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF114 PRESENT	BRAKE SERVO MICROSWITCH CIRCUIT

NOTES	**Special notes:** None.

Check the condition and connection of the brake servo connector.

Check the presence of **+ 12 Volts after ignition feed** on the disconnected brake servo connector between **track 5** and the vehicle **earth**.

If the voltage is incorrect, check the wiring loom.

Check the continuity and insulation of the connection between:

Servo connector **track 5** ⟶ **track 28** Computer connector

If the continuity and insulation have been checked and the voltage remains incorrect, replace the ABS/ESP computer.

Check that the computer connections and the **6 tracks** of the brake servo are correctly connected and in good condition.
Check and ensure the continuity of the following connections:

Servo connector **track 2** ⟶ **track 30** Computer connector
Servo connector **track 1** ⟶ **track 27** Computer connector

Also check the insulation between these connections.

If the results of the checks are correct, reconnect the computer and the brake servo and then clear the computer memory.
Replace the sensor if the fault recurs.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF115 PRESENT	BRAKE SERVO MICROSWITCH STATUS CONSISTENCY.

NOTES	**Special notes:** None.

Ensure that the brake switch is in correct working order by carrying out the **ET017** (interpretation of statuses) procedure.
Check the condition and connection of the brake servo connector. Check the continuity between **tracks 30 and 28** of the computer connector with the brake pedal released. Check the continuity between **tracks 27 and 28** of the computer connector with the brake pedal depressed.
Check the brake pedal position using **PR039** on the diagnostic tool. – Pedal released: **PR039** < 5.5 mm. If the value is different, replace the sensor.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF116 PRESENT	VEHICLE CONFIGURATION PROGRAMMING

NOTES	**Special notes:** None.

Run the configuration command **CF080 Vehicle parameters** in order to define the engine type fitted to the vehicle.
If configuration attempts fail, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF117 PRESENT	ABS/ESP CALIBRATION PROGRAMMING

NOTES	**Special notes:** None.

Run the configuration command **CF077** ABS/ESP CALIBRATION.

Calibration is performed by selecting the engine type fitted to the vehicle.

If the computer configuration fails, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF118 PRESENT	VEHICLE OPTIONS PROGRAMMING

NOTES	**Special notes:** None.

Run the configuration commands **CF078 Cruise control distance control** and **CF079 Gearbox type** to define the vehicle equipment type.

If the computer configuration fails, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF119 PRESENT	GEARBOX TYPE CONFIGURATION (consistency between computer configuration and multiplex network signals)

NOTES	**Priorities when dealing with a number of faults:** Deal with fault **DF097 "No automatic transmission multiplex signal"** first if it is present.

Run the configuration command **CF079 Gearbox type** to reconfigure the gearbox type.

If the computer configuration fails, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF120 PRESENT OR STORED	INJECTION MULTIPLEX SIGNALS CONSISTENCY.

NOTES	**Special note:** Although stored in the computer, this fault is caused by the injection system rather than ABS/ESP components. It is therefore necessary to perform fault finding on the injection. **Note:** The injection computer does not always store these transient faults as quickly as the ABS/ESP computer. If no fault is stored in the injection computer, start the engine; if there is no fault present, contact your Techline. Once the fault in the injection system has been remedied, clear the ABS/ESP computer memories. The injection multiplex signal is transmitted to the ABS/ESP computer via the Protection and Switching Unit.

Consult the fault finding procedure for the injection.
If the fault is still present, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF121 PRESENT OR STORED	TORQUE REQUESTED NOT AVAILABLE

NOTES	**Special note:** Although stored in the computer, this fault is caused by the injection system rather than ABS/ESP components. It is therefore necessary to perform fault finding on the injection. **Note:** The injection computer does not always store these transient faults as quickly as the ABS/ESP computer. If no fault is stored in the injection computer, start the engine; if there is no fault present, contact your Techline. Once the fault in the injection system has been remedied, clear the ABS/ESP computer memories. The injection multiplex signal is transmitted to the ABS/ESP computer via the Protection and Switching Unit.

Consult the fault finding procedure for the injection.
If the fault is still present, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF122 PRESENT OR STORED	NO INJECTION MULTIPLEX SIGNALS

NOTES	**Special note:** Although stored in the computer, this fault is caused by the injection system rather than ABS/ESP components. It is therefore necessary to perform fault finding on the injection. **Note:** The injection computer does not always store these transient faults as quickly as the ABS/ESP computer. If no fault is stored in the injection computer, start the engine; if there is no fault present, contact your Techline. Once the fault in the injection system has been remedied, clear the ABS/ESP computer memories. The injection multiplex signal is transmitted to the ABS/ESP computer via the Protection and Switching Unit.

Consult the fault finding procedure for the injection.
If the fault is still present, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF125 PRESENT	COMBINED SENSOR SUPPLY

NOTES	**Priorities when dealing with a number of faults:** Deal with fault **DF094/095** "**Computer supply voltage** first if it is present.

Check the connection and condition of the combined sensor and computer connectors.

Switch the ignition on and check the presence of the + after ignition feed between **tracks 3 and 5** of the sensor connector.

If the voltage is correct, replace the combined sensor.

Check and ensure continuity and insulation of the following connections:

Sensor connector **Track 3** ⟶ **Track 6** computer connector

Sensor connector **Track 5** ⟶ **Track 24** computer connector

Also check the insulation between these connections.

If these checks are correct, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF126 PRESENT OR STORED	COMBINED SENSOR SIGNAL PLAUSIBILITY

NOTES	**Conditions for applying the fault finding procedure to stored faults:** Apply the fault finding procedure whether the fault is present or stored.

Check that the combined sensor is fitted in the right direction, is in good condition and correctly tightened to **8 Nm** (the combined sensor is located under the central console between the gear lever and rear heater).

Check the connection and condition of the combined sensor connector.
Ensure that the connections, approval and position of any special equipment such as CB, car phone, amplifier, bass speaker (subwoofer type), etc. are not preventing the ABS from working correctly.

If the results of the checks are correct, reconnect the combined sensor and clear the computer memory.

Replace the combined sensor if the fault recurs.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF127 PRESENT	TEMPERATURE SENSOR CIRCUIT

NOTES	**Special notes:** None.

Contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF155 PRESENT	ELECTRONIC STABILITY PROGRAM FUNCTION

NOTES	**Special notes:** It is normal for this fault to occur after the vehicle has been driven on a race track (involving high transverse acceleration and without a steering angle value). Ensure that the fault does not occur after the vehicle has been driven at low speed.

Ensure that the transverse acceleration sensors/yaw angle or combined sensor are correctly fixed to the board and that the whole is fixed to the floor.

Check **PR033 "Steering wheel angle"** with the wheels straight.

Program the steering wheel angle using the diagnostic tool by selecting the configuration **VP003 Steering wheel angle sensor**.
Replace the steering wheel angle sensor if the calibration has failed or if the angular value is not between **± 15**.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF171 PRESENT OR STORED	ADAPTIVE CRUISE CONTROL

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present when: a road test is carried out with the adaptive cruise control operational.

This fault appears when a multiplex connection fault arises between the ESP computer and the adaptive cruise control computer.

Apply the fault finding procedure for the multiplex network.

If the fault is still present, consult the fault finding procedure for the adaptive cruise control

AFTER REPAIR	Clear the computer memory. Carry out a road test with the adaptive cruise control operational then test it again with the diagnostic tool.

GETtheMANUALS.org

DF172 **PRESENT**	DISTANCE LIMITER DECELERATION CONTROL

NOTES	**Special notes:** None.

Apply the fault finding procedure for the multiplex network.

If the fault is still present, test the adaptive cruise control system using the diagnostic tool.

If the fault is still present, consult the fault finding procedure for the adaptive cruise control

AFTER REPAIR	Clear the computer memory. Carry out a road test with the adaptive cruise control operational then test it again with the diagnostic tool.

GETtheMANUALS.org

DF173 STORED	BRAKE SERVO SOLENOID VALVE

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present when: the driver requests adaptive cruise control.

Check the condition and connection of the brake servo connector.

Check that the **47-track** computer connections and the **6 tracks** of the brake servo are correctly connected and in good condition.
Check and ensure the continuity of the following connections:

Servo connector **track 4** → **track 17** Computer connector
Servo connector **track 3** → **track 31** Computer connector

Also check the insulation between these connections.

Visually inspect the brake servo wiring.

Check the resistance of the brake servo **R = 2 Ω**. If the resistance is incorrect, replace the brake servo.

Check for the presence of approximately **+ 12 Volts after ignition feed** on the brake servo connector (connected) between **track 4** and **earth**.

If the voltage is incorrect, contact your Techline.

If the results of the checks are correct, reconnect the computer and the brake servo and then clear the computer memory.
If the fault is still present, consult the fault finding procedure for adaptive cruise control.
If the fault reappears, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test with the adaptive cruise control operational then test it again with the diagnostic tool.

GETtheMANUALS.org

DF174 **STORED**	DISTANCE LIMITER BRAKE SERVO SOLENOID VALVE

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present when: the driver requests adaptive cruise control.

Check the condition and connection of the brake servo connector.

Check that the **47-track** computer connections and the **6 tracks** of the brake servo are correctly connected and in good condition.
Check and ensure the continuity of the following connections:

Servo connector **track 4** → **track 17** Computer connector
Servo connector **track 3** → **track 31** Computer connector

Also check the insulation between these connections.

Visually inspect the brake servo wiring.

Check the resistance of the brake servo **R = 2 Ω**. If the resistance is incorrect, replace the brake servo.

Check for the presence of approximately **+ 12 Volts after ignition feed** on the brake servo connector (connected) between **track 4** and **earth**.

If the voltage is incorrect, contact your Techline.

If the results of the checks are correct, reconnect the computer and the brake servo and then clear the computer memory.
If the fault is still present, consult the fault finding procedure for adaptive cruise control.
If the fault reappears, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test with the adaptive cruise control operational then test it again with the diagnostic tool.

GETtheMANUALS.org

DF176 **DF177** **DF178** **DF179** **STORED**	WHEEL SENSOR FREQUENCY

NOTES	**Priorities when dealing with a number of faults:** Deal with the wheel speed sensor circuit fault first, if there are two faults on a single sensor.
	Conditions for applying the fault finding procedure to stored faults: The fault is present during: road test (in excess of **12 mph (20 km/h)** for **2 minutes)**.

Check that the wheel speed sensor mounting is in good condition (correct clipping).
Check the sensor/target air gap over one wheel revolution: **0.1 mm < front wheel air gap < 1.1 mm**.
0.3 mm < rear wheel air gap < 1.3 mm.

Check the conformity of the target: condition, **number of teeth = 48** (using specific command **SC001 Check target teeth**).

Check the connection and the condition of the sensor connectors.

Check the connector on the intermediary connections under the body on the front left-hand wing upper section (**R183**).

Carry out a visual inspection of the sensor wiring and check the condition of the connections on the **47-track computer connector.**

If the results of the checks are correct, reconnect the computer and the wheel speed sensor and clear the computer memory.
Exit the fault finding procedure and carry out a road test. Replace the sensor if the fault recurs.

AFTER REPAIR	Clear the computer memory. Carry out a road test over **12 mph (20 km/h)** for **2 minutes** then carry out a new test with the diagnostic tool.

GETtheMANUALS.org

DF185 PRESENT OR STORED	BRAKE SERVO SOLENOID VALVE CIRCUIT / INTERNAL SUPPLY

NOTES	**Special notes:** Check the **FUNCTION CODE NUMBER** (CLIP: identification screen and NXR: parameter screen PR041).
	Conditions for applying the fault finding procedure to stored faults: Apply the fault finding procedure whether the fault is present or stored.

If the function code number is: C1

Check the condition and connection of the brake servo connector.

Check that the computer connections and the 6 tracks of the brake servo are correctly connected and in good condition.
Check and ensure the continuity of the following connections:

- Servo connector **track 4** → **track 17** Computer connector
- Servo connector **track 3** → **track 31** Computer connector

Also check the insulation between these connections.

Visually inspect the brake servo wiring.

Check the resistance of the brake servo **R = 2 Ω**. If the resistance is incorrect, replace the brake servo.

Check the presence of **+ 12 Volts after ignition feed** on the brake servo connector between **track 4** and the **earth**. If the voltage is incorrect, contact your Techline.

If the results of the checks are correct, reconnect the computer and the brake servo and then clear the computer memory.
Replace the brake servo if the fault recurs.

If the function code number is: E0 or E1

Contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

NOTES	Only carry out conformity check after a full check using the diagnostic tool.

Order	Function	Parameter or status Checked or action	Display and notes	Fault finding
1	Diagnostic tool dialogue	-	**ABS/ESP MK60**	**ALP1**
2	Computer configuration	**PR030:** TACHOMETRIC INDEX	Check that the index entered corresponds to the tyres fitted to the vehicle (refer to the Help section)	None
3	Brake pedal not depressed detection	**ET017:** BRAKE PEDAL	"Released" status confirmed, brake pedal not depressed	**ET017**
4	Depressed brake pedal detection	**ET017:** BRAKE PEDAL	"Depressed" status confirmed, brake pedal fully depressed	**ET017**
5	Detection of Electronic Stability Program activation	**ET023:** ESP start/stop BUTTON	Depressed status confirmed when button is pressed	**ET023**
6	Detection of Electronic Stability Program activation	**ET023:** ESP start/stop BUTTON	Released status confirmed when button is released	**ET023**

GETtheMANUALS.org

Use of command modes:

Before using the command modes, check that the battery charge is sufficient

Control of the wheel solenoid valves in order to check the hydraulic system:

Raise the vehicle in order to be able to rotate the wheels, and check that they rotate freely.
Keep the brake pedal depressed to prevent the wheel being tested from being turned by hand (do not brake so firmly that full braking power is reached).

Select and confirm the command of the wheel being examined (Front left-hand wheel solenoid valves, etc.)

⟶ Turn the wheel in question by hand; five locking/unlocking cycles should be detected.

Pump motor control:

Select the Test pump motor command.

⟶ Confirm motor operation for 5 seconds

Bleeding the hydraulic circuits:

Apply the procedure described in the Bleeding the circuits section of the repair procedure Technical Note.

Summary of the FUNCTION CODES:

– **C1:** Electronic ABS + EBA + ESP for ACC + CLUSTER + UNDER-STEERING CONTROL
– **E0:** Mechanical ABS + EBA + ESP + CLUSTER
– **E1:** Mechanical ABS + EBA + ESP + CLUSTER + UNDER-STEERING CONTROL

Electrical EBA: System equipped with electrical emergency brake assist.

Mechanical EBA: System equipped with mechanical emergency brake assist.

ESP: Electronic Stability Program.

CLUSTER (combined sensor): a single sensor combining the yaw sensor and transverse acceleration sensor functions.

ACC: Adaptive cruise control.

CSV: Under-steer control.

What is the difference between an ABS/ESP system with mechanical EBA or electrical EBA?

Electrical EBA has extra components which do not feature in mechanical EBA, such as:
– A brake light cut-off relay.
– A brake servo solenoid valve.
– A brake potentiometer (brake pedal travel).

Depending on the function code, certain statuses or parameters on the diagnostic tool will not function.

GETtheMANUALS.org

REPLACING THE COMPUTER:

After replacing a computer, configure as follows:

– **tachometric index configuration.**

The TEVES MK60 ABS computer with the tachometry function supplies the vehicle speed signal to all subscribers in the vehicle using this information (instrument panel, engine management, etc.).
This vehicle speed signal replaces the one supplied by the speed sensor located on the gearbox.
The ABS computer calculates the vehicle speed from the speed of the wheels and the circumference of the tyres fitted on the vehicle.

The tyre circumference must be programmed into the memory of a new computer. This consists of entering an index X using the VP007 Tachometric Index command on the diagnostic tool.

Once the index has been entered using the **VP007** command, clear the computer memory and then switch off the ignition. Use the **PR030** parameter to check that the index has been stored correctly.

– ABS/ESP calibration:

Select command **CF077** on the diagnostic tool.

– Adaptive cruise control:

Select command **CF078** on the diagnostic tool.

– Gearbox type:

Select command **CF079** on the diagnostic tool.

– Vehicle parameters (drive torque index configuration + brake type):

Select command **CF080** on the diagnostic tool.

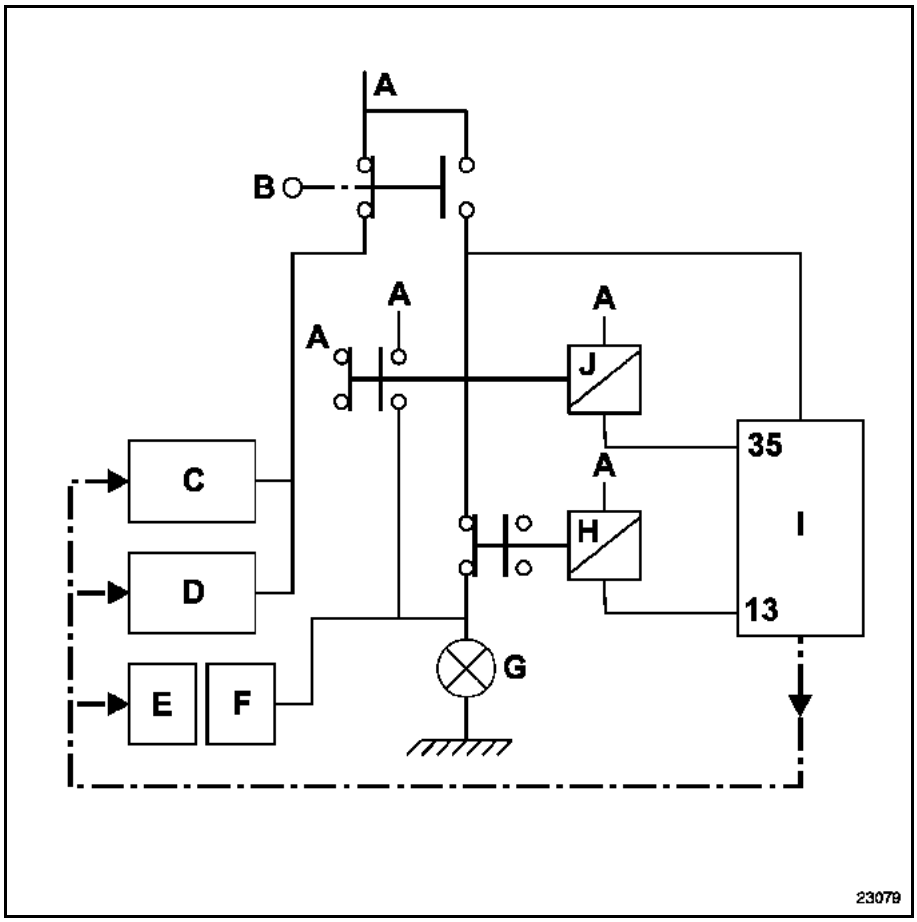
– To program the steering wheel angle:

Select command **VP003** on the diagnostic tool.

GETtheMANUALS.org

BRAKE LIGHT COATED WIRING CONNECTED TO UNDERSTEER CONTROL (E1, C1 FUNCTION CODE) + LIGHTING SWITCH OFF in adaptive cruise control function (C1 FUNCTION CODE).

The **function code** is available on the **PARAMETERS (PR041)** screen or the **IDENTIFICATION** screen on the diagnostic tool.



- **A + after ignition feed.**
- **B Brake lights switch.**
- **C Injection computer.**
- **D Automatic transmission computer.**
- **E UCH.**
- **F Passenger compartment relay and fuse box.**
- **G Brake lights.**
- **H Lights off relay.**
- **I ABS / ESP computer.**
- **J Ignition relay.**
- **Track 35 of the 35-track ABS/ESP computer connector.**
- **Track 13 of the 13-track ABS/ESP computer (not connected if mechanical EBA).**

GETtheMANUALS.org

ET017	BRAKE PEDAL

NOTES	**Special notes:** Only perform the checks if the depressed and released statuses are not consistent with the position of the pedal. Refer to the diagrams in the **Help** section.

STATUS Released brake pedal depressed.

If brake lights operate:

– Check the continuity of the connection between **track A3** of the brake light switch connector and **track 41** of the computer connector.

If the brake lights do not operate:

– Check the condition and fitting of the brake light switch and brake lights fuse.
– Check that there is **+ after ignition feed** on **tracks A1 and B1** of the brake switch connector.
– Remove the brake light switch and check that it is operating correctly:

	Continuity between tracks	Insulation between tracks
Switch depressed (Brake pedal released)	**A1 and B3**	**A3 and B1**
Switch released (Brake pedal depressed)	**A3 and B1**	**A1 and B3**

– Replace the switch if necessary. Check the continuity of the connection between **track A3** of the brake light switch connector and **track 41** of the computer connector.
– Check the condition and ensure the continuity of the connection between **track A3** of the brake switch connector and the brake lights.

Depressed STATUS brake pedal released.

– Check the condition and fitting of the brake light switch and brake lights fuse.
– Remove the brake light switch and check that it is operating correctly:

	Continuity between tracks	Insulation between tracks
Switch depressed (Brake pedal released)	**A1 and B3**	**A3 and B1**
Switch released (Brake pedal depressed)	**A3 and B1**	**A1 and B3**

– Replace the switch if necessary.
– Check the insulation against **12 V** of the connection between **track A3** of the brake switch connector and **track 41** of the computer connector.
– If the switch works correctly and **PR041** is **E1 / C1**, check that the ignition relay is working (contact sticking, permanent command. Check if the status works normally when the relay is removed).

AFTER REPAIR	Carry out a road test and then a test with the diagnostic tool.

GETtheMANUALS.org

ET023	ESP start/stop BUTTON

NOTES	**Special notes:** Only perform the checks if the pressed and released statuses are not consistent with the position of the button.

STATUS Button released

Ensure that the ESP on/off switch connector is in good condition and correctly connected.

Repair if necessary.

Check there is no continuity between **tracks A2 and B1** in the released position of the switch. If there is continuity, replace the switch.

Ensure insulation against earth of the connection between:

Switch connector **Track B1** ⟶ **Track 38** computer connector

STATUS Button pressed

Ensure that the ESP on/off switch connector is in good condition and correctly connected.
Repair if necessary.

Check that there is continuity between **tracks A2 and B1** in the pressed position of the switch. If there is no continuity, replace the switch.

Check that there is earth on **track A2** of the switch connector.

AFTER REPAIR	Carry out a road test and then a test with the diagnostic tool.

ANTI-LOCK BRAKING SYSTEM
Fault finding - Customer complaints

GETtheMANUALS.org

NOTES	Only consult the customer complaints section after a complete check using the diagnostic tool.

FAULTS DETECTED ON BRAKING WITH ABS/BRAKING REGULATION

- **Locking of one or more wheels.** — **ALP 2**
- **Pulling.** — **ALP 3**
- **Drift.** — **ALP 4**
- **Unexpected ABS operation at low speed with light pedal pressure.** — **ALP 5**
- **Unexpected ABS operation on poor road surfaces.** — **ALP 6**
- **Unexpected ABS operation with use of accessories (car phone, CB etc.).** — **ALP 7**
- **Extension of brake pedal travel following ABS regulation (with an irregular pedal when entering ABS regulation).** — **ALP 8**
- **Spongy pedal.** — **ALP 9**
- **Brake pedal vibration.** — **ALP 10**
- **Noises from the pump, the pipes or the hydraulic unit.** — **ALP 11**

OTHER CASES

- **No dialogue with the ABS computer.** — **ALP 1**
- **Brake lights do not light up go out (E1/C1 function code)** — **ALP 12**

GETtheMANUALS.org

ALP 1	No dialogue with the ABS computer

NOTES	None

Try to establish dialogue with a computer on another vehicle to make sure that the diagnostic tool is not faulty. If the tool is not causing the fault and dialogue cannot be established with any other computer on the same vehicle, it may be that a faulty computer is disrupting diagnostic line **K**.
Proceed by successive disconnections to locate this computer.
Check the voltage of the battery and perform the operations necessary to obtain a voltage which conforms to specification (**9.5 Volts** < battery voltage < **17.5 Volts**).

Check that the ABS fuses on the passenger compartment fuse board (**5A**) and two in the engine compartment (**30A and 40A**) are present and sound.
Check that the computer connector is properly connected and check the condition of its connections.
Check the ABS earths (good quality, not oxidised, sheath sealing ring (on the earth terminal), tightness of the earth bolt located above the ABS assembly).
Check that the supply to the computer is correct:

- **Earth on tracks 16 and 47** of the **47-track connector**
- **+ before ignition feed on tracks 1 and 32** of the **47-track** connector.
- **+ after ignition feed on track 4** of the **47-track** connector.

Check that the power supply to the diagnostic socket is correct:

- **+ Before ignition on track 16**.
- **+ after ignition on track 1**
- **Earth on track 5**.

Check the continuity and insulation of the connection between:

Computer connector **track 2** ⟶ **track 7** diagnostic socket.

Contact your Techline if dialogue has still not been established after these various checks.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

ALP 2	Locking of one or more wheels

NOTES	Only consult this customer complaint after a complete check using the diagnostic tool.

Reminder: The wheels locking on a vehicle fitted with ABS, or the tyres grating, which feels like locking to the customer, may be linked to normal operation of the system and should not always be considered as a fault:
- Locking is allowed below **4 mph (6 km/h)** (system regulation will not be activated).
- Braking with ABS on very poor roads (significant squealing).

However, if the wheels are actually locking, lift the vehicle in order to be able to turn the wheels and check:

- Possible inversion when connecting the speed sensors.
  Using parameters **PR001, PR002, PR003 and PR004**, rotate the wheels slowly and check the consistency of the results obtained.
  If the value measured is zero, rotate the other wheels to confirm an electrical inversion of the sensors and repair the wiring harness.

- Possible inversion of pipes on the hydraulic unit.
  Use the Front left-hand wheel solenoid valves, Front right-hand wheel solenoid valves, Rear left-hand wheel solenoid valves and Rear right-hand wheel solenoid valves commands while depressing the brake pedal and check for the occurrence of ten locking/unlocking cycles on the relevant wheel (see the Help section). If the ten cycles do not occur on the wheel tested, (wheel remains locked), see if they occur on another wheel (if a bad connection is confirmed: repair).
  If the ten cycles do not occur on a wheel and the pipes are correctly connected, replace the hydraulic unit.

Check that the sensor casing is secured when rotating.
Check that the wheel speed sensors are correctly mounted (clipped).
Check the conformity of the targets: condition, **number of teeth = 48 (using the SC001 Check target teeth command)**.

If the fault is still present after these checks, replace the hydraulic unit.

AFTER REPAIR	Carry out a road test followed by a diagnostic tool check.

GETtheMANUALS.org

ALP 3	**Pull**

NOTES	Only consult this customer complaint after a complete check using the diagnostic tool.

Disconnect one wheel speed sensor.
Start the engine and ensure that only the ABS fault warning light comes on. Do not drive the vehicle if the brake fault warning light is also lit, as the brake limiter function is no longer ensured.
Carry out a road test with the ABS deactivated.

Is the fault still present under these conditions?

yes →

If the brake pedal travel is relatively long, bleed the brake circuit.
If the travel is normal, check the tyre pressures, the front axle, or for any leaks in the circuit.

no ↓

Raise the vehicle so that you can rotate the wheels and check:

– Possible inversion when connecting the speed sensors.
– Possible inversion of pipes on the hydraulic unit.
  To perform these tests, refer to and apply the procedures defined in **ALP 2**.
  Check the condition of the ABS targets and that they conform to specifications.
  Also check the sensor/target air gap by rotating each front and rear wheel one revolution.
  If the fault is still present replace the hydraulic unit.

AFTER REPAIR	Carry out a road test followed by a diagnostic tool check.

GETtheMANUALS.org

ALP 4	Drift

NOTES	Only consult this customer complaint after a complete check using the diagnostic tool.

Disconnect one wheel speed sensor.
Start the engine and ensure that only the ABS fault warning light comes on. Do not drive the vehicle if the brake fault warning light is also lit, as the brake limiter function is no longer ensured.
Carry out a road test with the ABS deactivated.

Is the fault still present under these conditions?

yes →

Road handling fault not connected with the ABS.
Check the condition of the brake linings and that they are to specification and check the tyre pressures, the front axle, etc.

no ↓

Normal behaviour linked to the system operation during the regulation phase, mainly on surfaces with uneven grip or which are poorly laid.

AFTER REPAIR	Carry out a road test followed by a diagnostic tool check.

GETtheMANUALS.org

ALP 5	**Unexpected ABS operation at low speed and with slight pedal pressure**

NOTES	Only consult this customer complaint after a complete check using the diagnostic tool. Warning: ABS regulation may be unresponsive when vehicle is driven on surfaces such as icy roads, cobbled streets, etc.

Brake pedal vibrations may be felt which are connected to the system behaviour in particular situations:
- Crossing speed bumps.
- Tight cornering with lifting of the inside rear wheel.

These vibrations may be linked to simple brake limiter activation, when the pressure on the rear axle is limited.

If the fault relates to something else, check the speed sensor connectors (micro-breaks) as well as the targets.

AFTER REPAIR	Carry out a road test followed by a diagnostic tool check.

GETtheMANUALS.org

ALP 6	**Unexpected ABS system intervention on a poor road surface**

NOTES	Only consult this customer complaint after a complete check using the diagnostic tool.

On poor road surfaces it is normal to feel bucking and vibration of the pedal as well as more significant tyre squealing than on good surfaces.
This gives the impression of a variation in efficiency, but this should be considered normal.

AFTER REPAIR	Carry out a road test followed by a diagnostic tool check.

GETtheMANUALS.org

ALP 7	**Unexpected ABS operation when use special features used (car phone, CB, etc.)**

NOTES	Only consult this customer complaint after a complete check using the diagnostic tool.

Check that the equipment which is causing the fault is approved.
Check that the equipment has been correctly installed with no alteration to the original wiring, in particular that of the ABS (unauthorised connections to earth and **+ after ignition feed/before ignition feed** of the ABS).

AFTER REPAIR	Carry out a road test followed by a diagnostic tool check.

GETtheMANUALS.org

ALP 8	**Lengthening of the brake pedal travel following a regulation phase** (with an irregular pedal when entering the regulation phase)

NOTES	Only consult this customer complaint after a complete check using the diagnostic tool.

Air transit from the hydraulic unit regulation channels to the brake circuits.
Bleed the circuits in accordance with the procedure recommended in the Workshop Repair Manual (use the command modes on the diagnostic tool).
Following the operation, carry out a road test with ABS regulation.

If the fault is still present, perform the above operation once or twice more.
If the customer complaint is particularly serious, and bleeding the circuit does not improve matters, replace the hydraulic unit.

AFTER REPAIR	Carry out a road test followed by a diagnostic tool check.

GETtheMANUALS.org

ALP 9	**Spongy pedal**

NOTES	Only consult this customer complaint after a complete check using the diagnostic tool.

Air in the brake circuits.
Bleed the circuits in the conventional way starting with the rear right-hand brake, followed by rear left, front left and finally front right. **Repeat the operation if necessary.**

AFTER REPAIR	Carry out a road test followed by a diagnostic tool check.

GETtheMANUALS.org

ALP 10	**Brake pedal vibration**

NOTES	Only consult this customer complaint after a complete check using the diagnostic tool.

Normal reaction of the brake pedal during an **ABS** operation or of limitation of pressure on the rear axle (brake compensator function).

AFTER REPAIR	Carry out a road test followed by a diagnostic tool check.

GETtheMANUALS.org

ALP 11	**Noise from the pump, pipes or hydraulic unit**

NOTES	Only consult this customer complaint after a complete check using the diagnostic tool.

– Vibration of the unit: Check that the unit support insulating rubber mounting bushes are in place and in good condition.
– Vibration of the pipes: check that all of the pipes are correctly engaged in their securing clips and that there is no contact between the pipes or between the pipes and the body.

The "Front left-hand wheel solenoid valves", "Front right-hand wheel solenoid valves", "Rear left-hand wheel solenoid valves" and "Rear right-hand wheel solenoid valves" actuating commands may be used while depressing the brake pedal to determine where the noise is coming from.

AFTER REPAIR	Carry out a road test followed by a diagnostic tool check.

GETtheMANUALS.org

ALP 12	**Brake lights will not light up or go out.**

NOTES	Only consult this customer complaint after a complete check using the diagnostic tool.

Using the diagnostic tool, check that **ET017** is functioning correctly.
If not, apply the fault finding procedure described above for **ET017**.

Using the diagnostic tool, check that the **FUNCTION CODE NUMBER** (CLIP: identification screen and NXR: parameter screen **PR041**) is **E1 or C1**.

– Check that the earths are present on the rear lights.
– Check that there is continuity on the relay mounting (relay fitted) between tracks **C3 and C4**.

If the continuity is incorrect, replace the lights out relay.

If the brake lights still do not light up under **+ after ignition feed**.

Check the insulation in relation to the earth of the connection between **track 13** of the computer connector and **track C2** of the brake light cut-off relay.

if the fault is still present, check the continuity between **tracks A3** of the brake light connector and the **rear lights connector**.

AFTER REPAIR	Carry out a road test followed by a diagnostic tool check.

GETtheMANUALS.org

This document explains the generic fault finding procedure for the additional heater function on VEL SATIS phase 1 and 2 vehicles, with diesel engines.
A "Fault Finding Special Features" Technical Note is available for each vehicle fitted with this computer/ function. It covers all the fault finding special features in this document for the vehicle concerned. This Special notes Note complements or replaces the information provided in the Generic fault finding document.

To carry out fault finding on this system, it is essential to have the following items:

- the Workshop Repair Manual for the vehicle concerned,
- the wiring diagram of the function for the vehicle concerned,
- the tools listed in Special tooling required.

GENERAL APPROACH TO FAULT FINDING

- Use one of the diagnostic tools to identify the system fitted to the vehicle (to read the computer group, the program number, the Vdiag, etc.).

- Search for fault finding documents corresponding to the system identified.

- Take note of information contained in the introductory sections.

- Read the faults stored in the computer memory and use the Interpretation of Faults section of the documents.

  REMINDER: each fault is interpreted for a given type of storage (fault present, fault stored, fault present or stored). The checks defined for dealing with each fault are therefore only to be performed on the vehicle if the fault declared by the diagnostic tool is interpreted in the document for its type of storage. The storage type should be considered when using the diagnostic tool after the ignition has been switched off and switched back on.
  If a fault is interpreted when it is declared as stored, the conditions for applying fault finding appear in the Notes box. If the conditions are not met, use the fault finding procedure to check the circuit of the component concerned, since the fault is no longer present on the vehicle. Carry out the same procedure when a fault is declared as stored by the diagnostic tool but is only interpreted in the documentation as a present fault.

- Carry out the conformity check (appearance of possible faults not yet identified by the system's self-test procedure) and implement the associated fault finding procedures according to the results.

- Confirm the repair (customer complaint disappears).

- Use the fault finding procedure for each Customer complaint if the fault persists.

SPECIAL TOOLING REQUIRED:

- diagnostic tool (except XR25),
- multimeter.

GETtheMANUALS.org

DF001 present or stored	PRE-HEATER PLUG CC.0 : Short circuit to earth CO : Open circuit

NOTES	It is a condition of application of the diagnostic to the stored fault that only one fault can be declared present at a time. **The fault is declared present after ignition of the spark plug and with no other fault declared present.**

Remove the blower cover and disconnect connector B2 from the control unit.
Check the condition of the connector and replace it if necessary.

Check the **insulation, continuity and absence of interference resistance of the connectors:**

connector B2 **track 9** → **+** Spark plug
connector B2 **track 12** → **earth** spark plug

Repair if necessary.

If the fault persists, change the spark plug.

AFTER REPAIR	Apply the reference value to confirm that the repair is successful. Deal with any other possible faults. Clear the stored faults and check that no other fault appears.

GETtheMANUALS.org

DF002 present or stored	FUEL METERING PUMP CC.0 : Short circuit to earth CO : Open circuit

NOTES	It is a condition of application of the diagnostic to the stored fault that only one fault can be declared present at a time. **The fault is declared present after the metering pump has been switched on and with no other fault declared present.**

Check the condition of the 8-track connector and replace it if necessary.
Check the **insulation, continuity and absence of interference resistance of the connectors:** 8-track connector **track 4** → **track 2** connector **ST2** metering pump 8-track connector **track 2** → **track 1** connector **ST2** metering pump Repair if necessary.
Measure the resistance at the meter pump terminals.If it is not approximately **10 ohms** replace the meter pump.
Replace the metering pump if the fault persists.

AFTER REPAIR	Apply the reference value to confirm that the repair is successful. Deal with any other possible faults. Clear the stored faults and check that no other fault appears.

GETtheMANUALS.org

DF003 present or stored	COOLANT TEMPERATURE SENSOR CIRCUIT CC.0 : Short circuit to earth CO : Open circuit

NOTES	It is a condition of application of the diagnostic to the stored fault that only one fault can be declared present at a time. **The fault is declared present after the boiler has been ignited and with no other fault declared present.**

Remove the blower cover and disconnect connector B2 from the control unit. Check the condition of the connector and replace it if necessary.
Check the **insulation, continuity and absence of interference resistance of the connectors:** connector B2 **track 3** ⟶ temperature sensor connector B2 **track 4** ⟶ temperature sensor Repair if necessary.
Measure the resistance at the sensor terminals.If it is not **12 KΩ ± 5% at 20°C** replace the internal wiring of the boiler
Replace the boiler if the fault persists.

AFTER REPAIR	Apply the reference value to confirm that the repair is successful. Deal with any other possible faults. Clear the stored faults and check that no other fault appears.

GETtheMANUALS.org

DF004 present or stored	COMBUSTION AIR FAN CC.0 : Short circuit to earth CO : Open circuit DEF : Blocked

NOTES	It is a condition of application of the diagnostic to the stored fault that only one fault can be declared as present at a time. **The fault is declared present after the boiler has been ignited and with no other fault declared present.**

Remove the blower cover and disconnect connector B2 from the control unit.
Check the condition of the connector and replace it if necessary.

Check the **insulation, continuity and absence of interference resistance of the connectors:**

connector B2 **track 14** → **earth** combustion air fan
connector B2 **track 13** → **+** combustion air fan

Repair if necessary.

Using a multimeter, check that the coil of the fan has not been cut.

Replace the boiler if necessary.

AFTER REPAIR	Apply the reference value to confirm that the repair is successful. Deal with any other possible faults. Delete the stored faults and check that no other fault appears.

GETtheMANUALS.org

DF005 present or stored	OVERHEATING SWITCH CC.0 : Short circuit to earth CO : Open circuit

NOTES	It is a condition of application of the diagnostic to the stored fault that only one fault can be declared as present at a time. **The fault is declared present after the boiler has been ignited and with no other fault declared present.**

Remove the blower cover and disconnect connector B2 from the control unit.
Check the condition of the connector and replace it if necessary.

Check the **insulation, continuity and absence of interference resistance of the connectors:**

connector B2 **track 6** ⟶ overheating switch
connector B2 **track 5** ⟶ overheating switch

Repair if necessary.

Measure the resistance at switch terminals.If it is not **12 KΩ ± 5 % at 20°C** replace the internal wiring of the boiler (the overheating switch is connected to the internal wiring).

Replace the boiler if the fault persists.

AFTER REPAIR	Apply the reference value to confirm that the repair is successful. Deal with any other possible faults. Clear the stored faults and check that no other fault appears.

GETtheMANUALS.org

DF006 present or stored	FLAME DETECTOR CC.0 : Short circuit to earth CO : Open circuit

NOTES	It is a condition of application of the diagnostic to the stored fault that only one fault can be declared present at a time. **The fault is declared present after the boiler has been ignited and with no other fault declared present.**

Remove the blower cover and disconnect connector B2 from the control unit.
Check the condition of the connector and replace it if necessary.

Check the **insulation, continuity and absence of interference resistance of the connectors:**

connector B2 **track 1** → flame detector
connector B2 **track 2** → flame detector

Repair if necessary.

Measure the resistance at the flame detector terminals. If it is not **1200 KΩ ± 5% at 50°C** replace the internal wiring (the flame detector is connected to the internal wiring).

Replace the **boiler** if the fault persists.

AFTER REPAIR	Apply the reference value to confirm that the repair is successful. Deal with any other possible faults. Delete the stored faults and check that no other fault appears.

GETtheMANUALS.org

DF008 present or stored	BOILER MALFUNCTION 1.DEF : Excess voltage 2.DEF : Not enough voltage

NOTES	It is a condition of application of the diagnostic to the stored fault that only one fault can be declared present at a time. **The fault is declared present after the boiler has been ignited and with no other fault declared present.**

Check the voltage between **tracks 1and 2** of the 8-track connector. This should be between: **10.2 V < X < 16 V.**

Check the **insulation, continuity and absence of interference resistance of the connectors:**

8-track connector **track 1** ⟶ **+ battery**
8-track connector **track 2** ⟶ **battery earth**

Repair if necessary.

Check the battery and charge circuit if the problem persists.

AFTER REPAIR	Apply the reference value to confirm that the repair is successful. Deal with any other possible faults. Clear the stored faults and check that no other fault appears.

GETtheMANUALS.org

DF010 present or stored	EXCEEDING START UP TIME 1.DEF

NOTES	It is a condition of application of the diagnostic to the stored fault that only one fault can be declared as present at a time. **The fault is declared present if two unsucessful attempts have been made to ignite the boiler in 180 seconds and no other fault is declared present.**

Check the **air inlet and exhaust ducts.** Repair if necessary.
Check the **diesel supply pipes for bubbles.** Check the condition of the metering pump filter Repair if necessary.
Measure the resistance at the filter pump terminals.If it is not **10 Ω ± 5%** replace the metering pump.
Check the condition of the **spark plug.** Replace if necessary.
Replace the **boiler** if the fault persists.

AFTER REPAIR	Apply the reference value to confirm that the repair is successful. Deal with any other possible faults. Delete the stored faults and check that no other fault appears.

GETtheMANUALS.org

DF011 present or stored	EXCEEDING THE COOLING FAN TIME 1.DEF : if flame detector **> 70°C** the engine cooling fan is activated for **four minutes**

NOTES	It is a condition of application of the diagnostic to the stored fault that only one fault can be declared present at a time. **The fault is declared present after the boiler has been ignited and with no other fault declared present.**

Check the exhaust gas and the combustion air ducts. Repair if necessary.
Remove the blower cover and disconnect connector B2 from the control unit. Check the condition of the connector and replace it if necessary.
Check the **insulation, continuity and absence of interference resistance of the connectors:** connector B2 **track 1** → flame detector connector B2 **track 2** → flame detector Repair if necessary.
Measure the resistance at the flame detector terminals.If it is not **1200 K Ω ± 5% at 50°C** replace the internal wiring of the boiler (the overheating switch is connected to the wiring).
Replace the **boiler** if the fault persists.

AFTER REPAIR	Apply the reference value to confirm that the repair is successful. Deal with any other possible faults. Delete the stored faults and check that no other fault appears.

GETtheMANUALS.org

DF012 present or stored	CONTROL UNIT 1.DEF: Unidentified electrical fault

NOTES	It is a condition of application of the diagnostic to the stored fault that only one fault can be declared as present at a time. **The fault is declared present after the boiler has been ignited and with no other fault declared present.**

Replace the **control unit**.

AFTER REPAIR	Apply the reference value to confirm that the repair is successful. Deal with any other possible faults. Delete the stored faults and check that no other fault appears.

GETtheMANUALS.org

DF013 DF014 DF015 present or stored	MINIMUM FLAME EXTINGUISHER OUTPUT AVERAGE FLAME EXTINCTION OUTPUT MAXIMUM FLAME EXTINGUISHER OUTPUT DEF : Unidentified electrical fault

NOTES	It is a condition of application of the diagnostic to the stored fault that only one fault can be declared present at a time. **The fault is declared present after the boiler has been ignited and with no other fault declared present.**

Check the exhaust gas duct and the combustion air duct. Repair if necessary.
Check the diesel supply pipes to the boiler for air bubbles. Repair if necessary.
Check the condition of connector B2 in the control unit and replace it if necessary.
Check the **insulation, continuity and absence of interference resistance of the connectors:** connector B2 **track 9** → **+** Spark plug connector B2 **track 12** → **earth** spark plug Repair if necessary.
If the fault persists, change the **spark plug.**

AFTER REPAIR	Apply the reference value to confirm that the repair is successful. Deal with any other possible faults. Delete the stored faults and check that no other fault appears.

GETtheMANUALS.org

DF016 DF017 DF018 present or stored	DETECTION OF OVERHEATING: LOW PROBABILITY DETECTION OF OVERHEATING: PROBABLE DETECTION OF OVERHEATING: CONFIRMED DEF : Unidentified electrical fault

NOTES	It is a condition of application of the diagnostic to the stored fault that only one fault can be declared as present at a time. **The fault is declared present after the boiler has been ignited and with no other fault declared present.**
	Special notes **probability:** temperature difference of **15˚C between the sensor and the overheating switch** **confirmed:** temperature at the sensor or switch **> 125˚C** **low probability:** material temperature threshold exceeded, sensor or switch **> 130˚C.**

Check the circulation of water through the system.
Check that it has been degassed.

Remove the blower cover and disconnect connector B2 from the control unit.
Check the condition of the connector and replace it if necessary.

Check the **insulation, continuity and absence of interference resistance of the connectors:**

- connector B2 **track 3** → temperature sensor
- connector B2 **track 4** → temperature sensor
- connector B2 **track 5** → overheating switch
- connector B2 **track 6** → overheating switch

Repair if necessary.

Measure the resistance at the sensor terminals. If it is not **12 KΩ ± 5% at 20˚C** replace the internal wiring of the boiler
Measure the resistance at switch terminal. If it is not **12 KΩ ± 5% at 20˚C** replace the internal wiring of the boiler

Replace the **boiler if the fault persists.**

AFTER REPAIR	Apply the reference value to confirm that the repair is successful. Deal with any other possible faults. Clear the stored faults and check that no other fault appears.

GETtheMANUALS.org

DF019 present or stored	BLOCK: TOO MANY CONSECUTIVE START UP ATTEMPTS DEF : Unidentified electrical fault

NOTES	Priority in dealing with a number of faults: If more than one of the faults **DF019** and **DF001, DF002** are stored, treat as a priority faults **DF001 pre-heater plug and DF002 metering pump.** It is a condition of application of the diagnostic to the stored fault that only one fault can be declared as present at a time. **The fault is declared present following ten failed attempts to start the boiler and with no other faults declared present**

Clear **bad start up counter** using the delete commandl **RZ002.**

AFTER REPAIR	Apply the reference value to confirm that the repair is successful. Deal with any other possible faults. Delete the stored faults and check that no other fault appears.

GETtheMANUALS.org

DF020 present or stored	BLOCK: SUCCESSIVE OVERHEATING DEF : Unidentified electrical fault

NOTES	It is a condition of application of the diagnostic to the stored fault that only one fault can be declared present at a time. **The fault is declared present after the boiler overheats ten times in succession and with no other fault declared present.**

Delete **overheating meter** using the clear control **RZ001.**

AFTER REPAIR	Apply the reference value to confirm that the repair is successful. Deal with any other possible faults. Clear the stored faults and check that no other fault appears.

SELF-CONTAINED HEATER
Fault finding - Conformity check

GETtheMANUALS.org

NOTES	Only check the conformity after performing a **complete check** with the diagnostic tool. The values indicated in this conformity check are given as examples. Condition for performing check: **engine temperature below 81°C and external temperature below 5°C**

Order	Function	Parameter or state Check or action	Display and notes	Fault finding
1	+ After ignition present	**ET001:** + After ignition present	**YES**	If there is a problem refer to fault finding state **ET001.**
2	Engine running	**ET007:** Engine running	**YES** **NO** if check **AC002** is activated, light boiler	If there is a problem refer to fault finding state **ET007.**
3	Boiler ventilation	**ET002:** Combustion air ventilation fan	**IGNITE**	**In the event of a problem,** perform the **fault finding procedure** for the combustion air fan **DF004**
		PR014: Engine cooling fan voltage	**0 to 7 volts**	
4	Flame detected	**ET003:** Flame detected	**YES**	**In the event of a problem,** perform the **fault finding procedure** for the flame detector **DF006**
5	System blocked	**ET004:** System blocked	**NO**	**In the event of a problem,** perform the **fault finding procedure** for block due to too many consecutive starts **DF019 and** block due to successive overheating **DF020**
6	Boiler output	**ET005:** Boiler output	**MIN OR AVERAGE**	In the event of a problem, refer to the fault finding procedure for state **ET005**.

SELF-CONTAINED HEATER
Fault finding - Conformity check

GETtheMANUALS.org

NOTES	Only check the conformity after performing a **complete check** with the diagnostic tool. The values indicated in this conformity check are given as examples. Condition for performing check: **engine temperature below 81˚C and external temperature below 5˚C**

Order	Function	Parameter or state Check or action	Display and notes	Fault finding
7	Overheating switch	**PR008:** Overheating switch value measured	**Overheating if temperature is above 125˚C**	**If there is a problem,** perform the **fault finding procedure** on the overheating switch **DF005.**
8	Coolant temperature sensor	**PR010:** Coolant temperature sensor value measured	**X = engine temperature ± 5ºC**	**If there is a problem,** perform the fault finding procedure on the coolant temperature sensor circuit. **DF003.**
9	Flame detector	**PR013:** Flame detector value measured	**X = boiler temperature ± 20˚C**	**If there is a problem,** perform the **fault finding procedure** on the flame detector DF006.
10	Computer supply voltage	**PR108:** Computer supply voltage	**10.2 V < X < 16 V**	If there is a problem check the fault finding of parameter **PR108**

AC002 AC003	BOILER CONTROL AC002 : Ignite the boiler AC003 : Extinguish the boiler

NOTES	**Important : During boiler control, it is essential that the engine is running to avoid any overheating due to non-circulation of water.**

The command menu on the diagnostic tool can be used to stop or start the boiler.If it fails to start check the following:

– there is fuel in the tank,
– the fuses are intact
– the combustion air inlet and outlet ducts are not blocked.

Repair if necessary.

Check **the connection and the condition of the intermediary 5-track connector** between the vehicle wiring and the boiler and replace if necessary.

Check the **insulation, continuity and absence of interference resistance** of the connections between:

+ battery	→	**Track A** 5 track connector
Earth	→	**Track D** 5 track connector
+12V After contact	→	**Track E** 5-track connector
HK7 diagnostic socket	→	**Track B** 5 track connector

Repair if necessary.

Replace the **boiler if the fault persists.**

GETtheMANUALS.org

ET001	+APC PRESENT

NOTES	None.

If the state **INACTIVE is displayed** check that the battery charge is above **10.2 volts,** otherwise repair the vehicle charge circuit.

Check **the connection of the intermediary 5 track connector** between the vehicle wiring and the boiler and replace if necessary.

Check **the connection and condition of the intermediary 8-track connector located on the boiler mounting.**

Check the **insulation, continuity and absence of interference resistance** of the connections between:

+ battery → **Track 1** 8 track connector
Earth → **Track 2** 8 track connector
+12 V After connector → **Track 7** 8 track connector

Repair if necessary.

Replace the boiler **control unit** if the problem persists.

GETtheMANUALS.org

ET005	BOILER OUTPUT

NOTES	None

OFF	State normal **if engine** off. The state of the boiler is **OFF** if the external air temperature is **above 5˚C.** The boiler is also **OFF** when the engine temperature is above **82˚C.**

MIN	The state of the boiler is **MINIMUM OUTPUT** when the engine temperature is between **77˚C and 82˚C and is increasing, and** the external air temperature is below **5˚C.** The state of the boiler is **MINIMUM OUTPUT** when the engine temperature is between **82˚C and 73˚C and is decreasing, and** the external air temperature is below **5˚C.**

AVERAGE	The state of the boiler is **AVERAGE OUTPUT** when the outside air temperature is below **5˚C** and the coolant temperature is below **73˚C**. It will function at this level of output until the coolant temperature reaches **77˚C.**

GETtheMANUALS.org

ET007	ENGINE RUNNING

NOTES	None.

Check **the connection and condition of the connector** on the alternator and the vehicle charge circuit. Repair if necessary.
Check the **insulation, the continuity and absence of interference resistance** on the connection between: **Alternator track L** ⟶ **Track C** 5 track connector Repair if necessary.
Check the **insulation, continuity and absence of interference resistance** of the connections between: **Track C** ST1 5 track connector ⟶ **Track 1** ST3 bimetallic strip connector **Track 2** ST3 bimetallic strip connector ⟶ **Track 6** 8 track connector Repair if necessary. If the continuity is poor between **tracks 1 and 2 of the ST3 connector,** replace **the bimetallic strip with a schunt** and test the continuity between **tracks 1 and 2.** Replace the bimetallic strip if necessary.
Replace the **boiler control unit** if the problem persists.

GETtheMANUALS.org

PR108	COMPUTER SUPPLY VOLTAGE

NOTES	None.

Check **the connection of the intermediary 5-track connector** between the vehicle wiring and the boiler and replace if necessary.

Check the **insulation, continuity and absence of interference resistance** of the connections between:

+ Battery	→	**Track A** 5-track connector
Earth	→	**Track D** 5-track connector
+12V After ignition	→	**Track E** 5-track connector

Repair if necessary.

Check the **insulation, continuity and absence of interference resistance** of the connections between:

Track A 5 track connector	→	**Track 1** 8 track connector
Track D 5-track connector	→	**Track 2** 8-track connector
Track E 5 track connector	→	**Track 7** 8 track connector

Repair if necessary.

Replace the **boiler control unit** if the problem persists.

GETtheMANUALS.org

NO DIALOGUE WITH THE COMPUTER	**CHART 1**
NO HEATING OR INADEQUATE HEATING	**CHART 2**

GETtheMANUALS.org

ALP 1	No dialogue with the computer

NOTES	None.

Try the diagnostic tool on another vehicle.

Check:
– the connection between the diagnostic tool and the diagnostic socket (lead in good condition),
– the engine fuses.

Check for the presence of **+ 12 volts before ignition feed** on **track 16**, **+ 12 volts after ignition feed** on **track 1** and an **earth** on **tracks 4 and 5** of the diagnostic socket.

Repair if necessary.

Check **the insulation, continuity and the absence of interference resistance** on the connections between:

connector **ST1 track A**	→	**V battery** (fuse box)
connector **ST1 track E**	→	**+ after ignition feed** (fuse box)
connector **ST1 track D**	→	**earth**
connector **ST1 track B**	→	**track 7** of the diagnostic socket (line K)

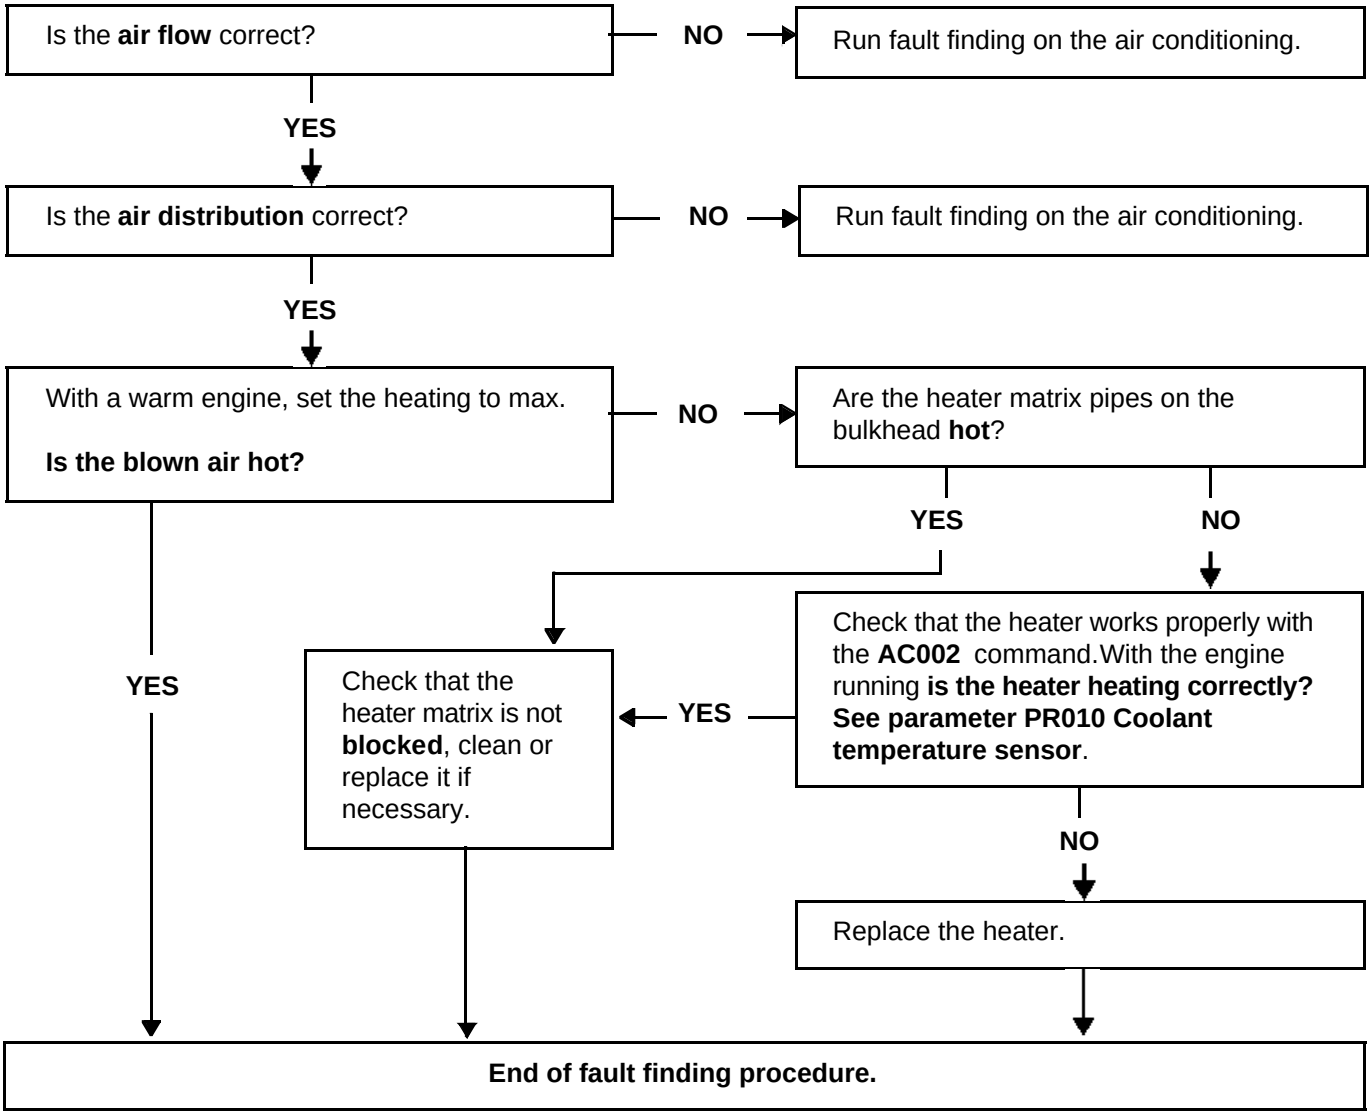
Repair if necessary.

AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP 2	No heating or inadequate heating

NOTES	Only check the customer complaint after performing a **complete check** with the **diagnostic tool**.



AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

This document contains the special fault finding procedures applicable to all climate control computers fitted on Vel Satis vehicles.

In order to carry out fault finding on this system, it is essential to have the following items available:

- **This section of the MR,**
- **The wiring diagram of the function for the vehicle concerned,**
- **The test bornier Elé. 1619, a multimeter and the CLIP diagnostic tool.**

GENERAL APPROACH TO FAULT FINDING

- Use of one of the diagnostic tools to identify the system fitted on the vehicle (to read the computer family, the program number, the Vdiag, etc.).
- Search for fault finding documents corresponding to the system identified.
- Use of information contained in the introductory sections.

DESCRIPTION OF THE FAULT FINDING PHASES

1 - FAULT CHECKING

It is essential to start with this stage before any work is carried out on the vehicle.

- Read the faults stored in the computer memory and use the Interpretation of faults section of the documents.

Reminder: Each fault is interpreted for a particular type of storage (present fault, stored fault, present or stored fault). The checks defined for dealing with each fault are therefore only to be performed on the vehicle if the fault declared by the diagnostic tool is interpreted in the document for its type of storage. The way in which the fault is stored should be considered when using the diagnostic tool after the ignition has been switched off and on again. If a fault is interpreted when it is declared as stored, the conditions for applying fault finding appear in the Notes box. If the conditions are not met, use the fault finding procedure to check the circuit of the faulty component, since the fault is no longer present on the vehicle. Carry out the same procedure when a fault is declared as stored by the diagnostic tool but is only interpreted in the documentation as a present fault.

2 - CONFORMITY CHECK

The aim of the conformity check is to check data that does not produce a fault on the diagnostic tool because the data is inconsistent. Therefore, this stage is used to:
- perform fault finding on faults that do not have a fault display, and which may correspond to a customer complaint.
- check the reliability of the air conditioning system and ensures that a fault will not reappear after repair.

This section gives the fault finding procedures for statuses and parameters and the conditions for checking them. If a status is not behaving normally or a parameter is outside the permitted tolerance values, consult the corresponding fault finding page.

3 - PROCESSING THE CUSTOMER COMPLAINT

If the test with the diagnostic tool is OK but the customer complaint is still present, the fault should be dealt with by Customer complaints.
This section has fault finding charts (ALPs), which suggest a series of possible causes for the fault. Only use these charts in the following cases:
- no faults appear on the diagnostic tool,
- no faults are detected during the conformity check,
- the vehicle is not operating correctly.

GETtheMANUALS.org

DF001 PRESENT	COMPUTER

NOTES	**Special notes:** the climate control computer is supplied by the UCH.

Check the condition of the fuses.
Repair if necessary.

Check **the connection and condition** of the climate control control panel connectors.
Repair if necessary.

Check the supply of the climate control computer on **track 6** after ignition and **track 18** before ignition of connector A.
If there is no power supply, check the UCH.

Connect the bornier in place of the computer and check **the insulation, continuity and the absence of interference resistance** of the following connections:

- computer connector A **track 1** → **earth**
- computer connector A **track 16** → **earth**
- computer connector A **track 30** → **earth**
- computer connector A **track 6** → **UCH (see vehicle diagrams)**
- computer connector A **track 18** → **UCH (see vehicle diagrams)**

Repair if necessary.

If the fault is still present, **replace the climate control control panel** (computer).
(before replacing the computer, make a note of the configurations needed to re-program the new computer)

AFTER REPAIR	Reconfigure the computer (see the **help** section). Clear the fault memory. Deal with any other faults.

GETtheMANUALS.org

DF002 PRESENT	REFRIGERANT PRESSURE SENSOR CIRCUIT CO : open circuit CC : short circuit

NOTES	**Special notes:** The air conditioning compressor disengages if the condenser outlet pressure is below **2 bar** or above **27 bar** (relative). **Priority when dealing with a number of faults:** Deal with fault: **DF033 Refrigerant Charge** first, if it is present or stored.

Check **the connection and condition** of the refrigerant pressure sensor connector.
Replace the connector if necessary.

Connect the bornier to check the insulation, **continuity and the absence of interference resistance** on the following connections:

- computer connector A **track 8** → **track A** of the pressure sensor
- computer connector A **track 11** → **track B** of the pressure sensor
- computer connector A **track 3** → **track C** of the pressure sensor

Repair if necessary.

With the ignition switched on, check that the sensor is correctly supplied by the computer by measuring between: **track A** and **track B** of the sensor.
If there is no **5 V**, replace the climate control computer.

If the fault is still present, **replace** the pressure sensor.

AFTER REPAIR	Clear the fault memory. Deal with any other faults.

GETtheMANUALS.org

DF005 PRESENT OR STORED	HEATED REAR SCREEN RELAY CONTROL CIRCUIT CO : open circuit CC : short circuit

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: – an attempt to activate the rear screen heating due to a short circuit to 12 volts. – the heated rear screen is inactive due to a short circuit at the earth or an open circuit.

Check for the **presence** of the heated rear screen relay.
Check **the condition of the clips** on the heated rear screen relay, located on the relay plate. Replace the clips if necessary.
With the ignition on, check **for + 12 volts** on **track 1**of the relay.
Connect the bornier in place of the computer and check **the insulation, continuity and the absence of interference resistance** of the connection: computer connector A **track 12** ⟶ **track 2** of the heated rear screen relay Repair if necessary.
Measure **the resistance** of the relay between: **track 1** and **track 2** of the heated rear screen relay and replace the relay if the resistance is not approximately: **60 Ω** at **20°C**.

AFTER REPAIR	Follow the instructions to confirm repair. Clear the fault memory. Deal with any other faults.

GETtheMANUALS.org

DF006 PRESENT OR STORED	HEATED WINDSCREEN RELAY CONTROL CIRCUIT CO : open circuit CC : short circuit

NOTES	Only to be taken into account if the vehicle is fitted with a heated windscreen (**LC005: Heated windscreen** should be **with**, if necessary carry out reconfigurations **CF050 Heated windscreen**). **Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: – an attempt to activate the electric windscreen due to a short circuit at 12 volts. – electric windscreen inactive due to a short circuit at the earth or an open circuit.

Check for the **presence** of the heated windscreen relay.
Check **the condition of the clips** on the heated windscreen relay, located on the relay plate. Replace the clips if necessary.
With the ignition on, check **for + 12 volts** on **track 1**of the relay.
Connect the bornier in place of the computer and check **the insulation, continuity and the absence of interference resistance** of the connection: computer connector A **track 4** ⟶ **track 2** of the heated windscreen relay Repair if necessary.
Measure **the resistance** of the relay between: **track 1** and **track 2** of the heated windscreen relay and replace the relay if the resistance is not approximately: **90 Ω** at **20°C**.

AFTER REPAIR	Follow the instructions to confirm repair. Clear the fault memory. Deal with any other faults.

GETtheMANUALS.org

DF007 PRESENT	INTERIOR TEMPERATURE SENSOR CIRCUIT CO : open circuit CC : short circuit

NOTES	**Special notes:** The interior temperature sensor is attached to a printed circuit with the humidity sensor. This component is located in the fixed casing below the interior rear-view mirror.

Check **the connection and condition** of the internal temperature sensor connector.
Replace the connector if necessary.

With the ignition on, check that the temperature sensor fan **is operating correctly**.
If not, check for **+ 12 volts** on **track 1** of the temperature sensor connector and an **earth** on **track 3**.
If the fan supply is correct and the fault is still present, replace the **sensors/fan** (the fan is not available separately).

Connect the bornier in place of the computer and check **the insulation, continuity and absence of interference resistance** of the connections:

computer connector A **track 29** → **track 4** of the temperature sensor
computer connector A **track 26** → **track 5** of the temperature sensor

Repair if necessary.

Check **the resistance value** of the sensor between:
track 4 and **track 5** of the internal temperature sensor connector and replace the sensor if the resistance is not approximately: **10 kΩ** at **25°C**.

If the fault is still present, **replace** the internal temperature sensor.

AFTER REPAIR	Clear the fault memory. Deal with any other faults.

GETtheMANUALS.org

DF018 PRESENT OR STORED	RIGHT-HAND MIXING MOTOR CIRCUIT

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the air conditioning has been switched on and the right-hand temperature control has been operated.
	Special notes: The dashboard must be removed to allow access to check the mixer motor.

Use the bornier and check the **resistance value** of the motor as well as the **insulation to earth and to + 12 V** of the connections between:
Track 26 and **track 27** of computer connector B or tracks 11 and 12 of the new 2005 redesigned computer connector B.
The motor should have a resistance of approximately: **36** Ω at **20°C**.

If the value is incorrect, or if the fault is still present due to a poor or loose connection: **remove the dashboard** to gain access to the right-hand mixing motor.

Check **the connection and condition** of the right-hand mixing motor connector.
Replace the connector if necessary.

Check that the mixing motor flap is not **jammed**.
Repair if necessary.

Use the bornier to check the insulation, **continuity and the absence of interference resistance** on the following connections:

computer connector B **track 26** → **track A** of the right-hand mixing motor
computer connector B **track 27** → **track B** of the right-hand mixing motor
or
computer connector B **track 11** → **track A** of the right-hand mixing motor
computer connector B **track 12** → **track B** of the right-hand mixing motor
for the new 2005 redesigned computer.

Repair if necessary.

Check the resistance value of the right-hand mixing motor by measuring between:
track A and **track B** of the mixing motor; replace the motor if the resistance is not approximately: **36 Ω** at **20°C**.

If the fault is still present, **replace** the right-hand mixing motor.

AFTER REPAIR	Follow the instructions to confirm repair. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF019 PRESENT OR STORED	LEFT-HAND MIXING MOTOR CIRCUIT

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the air conditioning has been switched on and the left-hand side temperature control has been operated.
	Special notes: The dashboard must be removed to allow access to check the mixer motor.

Connect the bornier in place of the computer and check the **resistance value** of the motor as well as the **insulation from the earth and from + 12 V** of the connections by measuring between:
track 22 and **track 23** of computer connector B or tracks 7 and 8 of the new 2005 redesigned computer connector B.
The motor should have a resistance of approximately: **36** Ω at **20˚C**.

If the value is incorrect, or if the fault is still present due to a poor or loose connection: **remove the dashboard** to gain access to the left-hand mixing motor.

Check **the connection and condition** of the left-hand mixing motor.
Replace the connector if necessary.

Check that the mixing motor flap is not **jammed**.
Repair if necessary.

Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the connections:

computer connector B **track 22** → **track A** of the left-hand mixing motor
computer connector B **track 23** → **track B** of the left-hand mixing motor
or
computer connector B **track 7** → **track A** of the left-hand mixing motor
computer connector B **track 8** → **track B** of the left-hand mixing motor
for the new 2005 redesigned computer.

Repair if necessary.

Check the resistance value of the left-hand mixing motor by measuring between:
track A and **track B** of the mixing motor; replace the motor if the resistance is not approximately: **36** Ω at **20˚C**.

If the fault is still present, **replace** the left-hand mixing motor.

AFTER REPAIR	Follow the instructions to confirm repair. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF020 PRESENT	EVAPORATOR TEMPERATURE SENSOR CIRCUIT CO : open circuit CC : short circuit

NOTES	None.

Check **the connection and condition** of the evaporator temperature sensor connector.
Replace the connector if necessary.

Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the connections:

computer connector B **track 28** → **track 1** of the temperature sensor
computer connector B **track 15** → **track 2** of the temperature sensor
or
computer connector B **track 13** → **track 1** of the temperature sensor
computer connector B **track 5** → **track 2** of the temperature sensor
for the new 2005 redesigned computer.

Repair if necessary.

Check the resistance value of the evaporator temperature sensor by measuring between:
track 1 and the **track 2** of the evaporator temperature sensor connector and replace the sensor if the resistance is not approximately: **30 kΩ** at **25°C**.

If the fault is still present, **replace** the evaporator temperature sensor.

AFTER REPAIR	Clear the fault memory. Deal with any other faults.

GETtheMANUALS.org

DF021 PRESENT OR STORED	RECIRCULATION MOTOR CIRCUIT

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the climate control has been switched on and the air recirculation control has been activated.
	Special notes: The air recirculation motor is located beneath the particle filter and the base of the glove compartment has to be removed to gain access to it.

Check **the connection and condition** of the recirculation motor.
Replace the connector if necessary.

Check that the recirculation motor flap is not **jammed**.
Repair if necessary.

Connect the bornier in place of the computer and check **the insulation, continuity and absence of interference resistance** of the connections:

(left-hand drive)
computer connector B **track 29** → **track A** of the air recirculation motor
computer connector B **track 30** → **track B** of the air recirculation motor
or
computer connector B **track 14** → **track A** of the air recirculation motor
computer connector B **track 15** → **track B** of the air recirculation motor
for the new 2005 redesigned computer.

(right-hand drive)
computer connector B **track 29** → **track B** of the air recirculation motor
computer connector B **track 30** → **track A** of the air recirculation motor
or
computer connector B **track 14** → **track B** of the air recirculation motor
computer connector B **track 15** → **track A** of the air recirculation motor
for the new 2005 redesigned computer.

Repair if necessary.

Check the resistance value of the recirculation motor by measuring between:
track A and **track B** of the recirculation motor connector and replace the motor if the resistance is not approximately: **36** Ω at **20°C**.

If the fault is still present, **replace** the recirculation motor.

AFTER REPAIR	Follow the instructions to confirm repair. Clear the fault memory. Deal with any other faults.

GETtheMANUALS.org

DF026 PRESENT	SOLAR RADIATION SENSOR CIRCUIT CO : open circuit CC : short circuit

NOTES	**Special notes:** The sunlight sensor (a little black button) is located on top of the instrument panel, on the windscreen side.

Check that the solar radiation sensor is not hidden under something (nothing should be placed on top of the sensor).

Check **the connection and condition** of the solar radiation sensor connector.
Replace the connector if necessary.

Connect the bornier in place of the computer and check **the insulation, continuity and absence of interference resistance** of the connections:

computer connector A **track 26** → **track 1** of the solar radiation sensor
computer connector A **track 19** → **track 2** of the solar radiation sensor

Repair if necessary.

If the fault is still present, **replace** the solar radiation sensor.

AFTER REPAIR	Clear the fault memory. Deal with any other faults.

ACREGX731.0

GETtheMANUALS.org

DF027 PRESENT	HUMIDITY SENSOR CIRCUIT

NOTES	**Special notes:** The humidity sensor is attached to a printed circuit with the interior temperature sensor. This component is located in the fixed casing below the interior rear-view mirror.

Check **the connection and condition** of the humidity sensor connector.
Replace the connector if necessary.

With the ignition on, check that the humidity sensor fan **is operating correctly**.
If it is not operating, check for **+ 12 volts** on **track 1** of the humidity sensor connector and an **earth** on **track 3**.
If the fan supply is correct and the fault is still present, replace the **sensors/fan** (the fan is not available separately).

Connect the bornier in place of the computer and check **the insulation, continuity and absence of interference resistance** of the connections:

computer connector A **track 26** → **track 5** of the humidity sensor
computer connector A **track 22** → **track 6** of the humidity sensor

Repair if necessary.

If the fault is still present, **replace** the humidity sensor.

AFTER REPAIR	Clear the fault memory. Deal with any other faults.

GETtheMANUALS.org

DF028 PRESENT OR STORED	FOOTWELL/VENTILATION DISTRIBUTION MOTOR CIRCUIT

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: the air conditioning has been switched on and the air distribution control has been operated.

Use the bornier and check the **resistance value** of the motor as well as the **insulation to earth and to + 12 V** of the connections between:
Track 24 and **track 25** of computer connector B or tracks 9 and 10 of the new 2005 computer connector B.
The motor should have a resistance of approximately: **36** Ω at **20°C**.

If the value is incorrect, or if the fault is still present due to a poor or loose connection: **remove the dashboard** to gain access to the footwell/ventilation distribution motor.

Check **the connection and condition** of the footwell distribution motor connector.
Replace the connector if necessary.

Check that the distribution motor flap is not **jammed**.
Repair if necessary.

Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the connections:

computer connector B **track 24** → **track A** of the footwell air distribution motor
computer connector B **track 25** → **track B** of the footwell air distribution motor
or
computer connector B **track 9** → **track A** of the footwell air distribution motor
computer connector B **track 10** → **track B** of the footwell air distribution motor
for the new 2005 redesigned computer.

Repair if necessary.

Check the resistance value of the distribution motor by measuring between:
track A and **track B** of the distribution motor connector; replace the motor if the resistance is not approximately: **36 Ω** at **20°C**.

If the fault is still present, **replace** the footwell distribution motor.

AFTER REPAIR	Follow the instructions to confirm repair. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF029 PRESENT OR STORED	DE-ICING DISTRIBUTION MOTOR CIRCUIT

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: the air conditioning has been switched on and the air distribution control has been operated.

Connect the bornier in place of the computer and check the **resistance value** of the motor as well as the **insulation from earth and + 12 volts** of the connections by measuring between:
Track 20 and **track 21** of computer connector B.
The motor should have a resistance of approximately: **36** Ω at **20°C**.

If the value is incorrect, or if the fault is still present due to a poor or loose connection, **remove the dashboard** to gain access to the de-icing distribution motor.

Check the **connection and condition** of the de-icing distribution motor connector.
Replace the connector if necessary.

Check that the de-icing distribution motor flap is not **jammed**.
Repair if necessary.

Connect the bornier in place of the computer and check **the insulation, continuity and absence of interference resistance** of the connections:

computer connector B **track 20** ⟶ **track B** of the de-icing distribution motor
computer connector B **track 21** ⟶ **track A** of the de-icing distribution motor

Repair if necessary.

Check the resistance value of the distribution motor by measuring between:
track A and **track B** of the distribution motor connector; replace the motor if the resistance is not approximately: **36 Ω** at **20°C**.

If the fault is still present, **replace** the de-icing distribution motor.

AFTER REPAIR	Follow the instructions to confirm repair. Clear the fault memory. Deal with any other faults.

GETtheMANUALS.org

DF030 PRESENT	COMPRESSOR OUTPUT CONTROL CIRCUIT CO : open circuit CC : short circuit

NOTES	**Special notes:** The compressor output is controlled electrically by a control valve on F4R and G9T engines (Delphi Harrison v5E compressor). As V4Y and P9X engines (Calsonic Kansel and Denso) are not fitted with this control valve, the output is controlled pneumatically. This fault finding procedure **can therefore not be carried out** on vehicles fitted with V4Y and P9X engines.

Check the **connection and condition** of the compressor output control connector. Repair if necessary.
With the ignition on, check **for + 12 volts** on **track B** of the compressor output control connector. Repair if necessary.
Connect the bornier in place of the computer and check **the insulation, continuity and the absence of interference resistance** of the connection: computer connector A **track 7** ⟶ **track A** of the compressor output control connector. Repair if necessary.
Measure the resistance between: **track A** and **track B** of the compressor output control solenoid valve and replace the compressor if the resistance is not approximately: **18.5 Ω ± 0.5%** at **25˚C**.
If the fault is still present, the climate control computer may be damaged, contact Techline.

AFTER REPAIR	Clear the fault memory. Deal with any other faults.

ACREGX731.0

GETtheMANUALS.org

DF033 PRESENT OR STORED	REFRIGERANT FLUID CHARGE

NOTES	**Conditions for applying the fault finding procedure to stored faults:** Once the fault is stored, it is unlikely to reappear (six consecutive journeys, etc.), therefore, the fault finding procedure should be carried out even if the fault is only stored.
	Special notes: The refrigerant fill is measured following road tests at 54 mph (90 km/h) (maximum capacity). The fault will be confirmed after the 6th test, if the above conditions are observed. In vehicles with pneumatically controlled compressors, the compressor compensates for the loss of refrigerant by minimizing its capacity. Consequently, the air conditioning becomes less efficient. **Priority when dealing with a number of faults:** – First deal with the DF002 - refrigerant fill fault if it is present or stored.

Check that there are **no refrigerant fluid leaks** in the air conditioning system. Repair if necessary.
Check that the compressor is operating (belt broken). Repair if necessary.
Check the refrigerant level (for reference, the amount of liquid to use is **650 grams ± 25 g**).

AFTER REPAIR	Clear the fault memory. Deal with any other faults.

GETtheMANUALS.org

DF035 PRESENT	TOXICITY SENSOR CIRCUIT (CO) CO : open circuit CC : short circuit

NOTES	**Special notes:** The toxicity sensor is located behind the air recirculation motor (to the right of the particle filter) and the bottom of the glove compartment has to be removed to gain access to it. If a sensor needs to be replaced and the new sensor has been stored in a polluted environment, the ignition must be switched on and off five times after the sensor has been fitted in order to lower the pollution threshold.

Check **the connection and condition** of the toxicity sensor connector.
Replace the connector if necessary.

Connect the bornier in place of the computer and check **the insulation, continuity and absence of interference resistance** of the connections:

computer connector B **track 16** → **track 5** of the toxicity sensor
computer connector B **track 18** → **track 7** of the toxicity sensor
computer connector B **track 19** → **track 10** of the toxicity sensor
or
computer connector B **track 1** → **track 5** of the toxicity sensor
computer connector B **track 3** → **track 7** of the toxicity sensor
computer connector B **track 4** → **track 10** of the toxicity sensor
for the new 2005 redesigned computer.

Repair if necessary.

If the fault is still present, **replace** the toxicity sensor.

AFTER REPAIR	Clear the fault memory. Deal with any other faults.

GETtheMANUALS.org

DF036 PRESENT	TOXICITY SENSOR CIRCUIT (NO) CO : open circuit CC : short circuit

NOTES	**Special notes:** The toxicity sensor is located behind the air recirculation motor (to the right of the particle filter). The base of the glove compartment has to be removed to gain access to it. If a sensor needs to be replaced and the new sensor has been stored in a polluted environment, the ignition must be switched on and off five times after the sensor has been fitted in order to lower the pollution threshold.

Check **the connection and condition** of the toxicity sensor connector.
Replace the connector if necessary.

Connect the bornier in place of the computer and check **the insulation, continuity and absence of interference resistance** of the connections:

computer connector B **track 16** → **track 5** of the toxicity sensor
computer connector B **track 17** → **track 6** of the toxicity sensor
computer connector B **track 19** → **track 10** of the toxicity sensor
or
computer connector B **track 1** → **track 5** of the toxicity sensor
computer connector B **track 2** → **track 6** of the toxicity sensor
computer connector B **track 4** → **track 10** of the toxicity sensor
for the new 2005 redesigned computer.

Repair if necessary.

If the fault is still present, **replace** the toxicity sensor.

AFTER REPAIR	Clear the fault memory. Deal with any other faults.

ACREGX731.0

GETtheMANUALS.org

DF043 PRESENT	MULTIPLEX NETWORK DEF : apply the multiplex network fault finding procedure 1.DEF: Apply the multiplex network fault finding procedure

NOTES	None.

Check **the connection and condition** of the climate control control panel connectors.
Repair if necessary.

Connect the bornier in place of the computer and check **the insulation, continuity and absence of interference resistance** of the connections:

computer connector A **track 9** → **track CAN L** of the UCH
computer connector A **track 10** → **track CAN H** of the UCH
(refer to diagrams for the vehicle and model year concerned).

Repair if necessary.

If the fault is still present, **carry out fault finding** on the multiplex network.

AFTER REPAIR	Clear the fault memory. Deal with any other faults.

GETtheMANUALS.org

DF082 PRESENT OR STORED	FRONT PASSENGER COMPARTMENT VENTILATION CIRCUIT

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: the ventilation is switched on.
	Special notes: An open circuit on track 27 (passenger compartment fan assembly power module control) will not be detected by the tool but a customer complaint is likely (**ALP7** and **ALP11**) as the passenger compartment ventilation and climate control will no longer operate.

Check **the condition and connection** of the black 2 × 5-track connector screwed under the glove compartment as well as **the connection and condition** of the following three connectors:
– the **blue 2-track** connector and the **black 4-track connector** of the fan assembly power module.
– the **black 2-track** connector of the fan.
Repair if necessary.

With the ignition on, check for **+12 volts** on **track B5** and an earth on **track B4** of the black 2 × 5-track connector of the passenger compartment fan assembly.

Connect the bornier in place of the computer and check **the insulation, continuity and absence of interference resistance** of the connections:
computer connector A **track 13** ⟶ **track A2** of the power module connector
computer connector A **track 27** ⟶ **track A3** of the power module connector
Repair if necessary.

Disconnect the black 2-track connector from the fan and **measure the resistance** of the fan between track A and track B.
Replace the fan if the resistance is not approximately: **0.2 Ω < R < 0.5 Ω**

If the fault is still present, **replace** the fan assembly power module.

AFTER REPAIR	Clear the fault memory. Follow the instructions to confirm repair. Deal with any other faults.

GETtheMANUALS.org

DF090 PRESENT	COMPRESSOR CONTROL CO : open circuit CC : short circuit

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: – an attempt to activate the air conditioning due to a short circuit at 12 volts. – air conditioning inactive due to a short circuit at the earth or an open circuit.

Check the **connection and condition** of the compressor clutch connector.
Repair if necessary.

With the ignition on, check **for +12 volts** on **track B** of the compressor clutch connector for F4RT, G9T and P9X engines and on track 1 for V4Y engines.

Connect the bornier in place of the computer and check **the insulation, continuity and the absence of interference resistance** of the following connections:

computer connector A **track 15** ⟶ **track A** of the compressor clutch (for F4RT, G9T and P9X engines).

computer connector A **track 15** ⟶ **track 2** of the compressor clutch (for V4Y engines).

Repair if necessary.

Measure the resistance between **track A** and **track B** or track 1 and track 2 of the compressor clutch and replace the compressor if the resistance is not between 3 and 4 Ω.

AFTER REPAIR	Clear the fault memory. Deal with any other faults.

GETtheMANUALS.org

DF092 PRESENT	INJECTION MULTIPLEX SIGNAL ABSENT DEF : apply the multiplex network fault finding procedure 1.DEF: Apply the multiplex network fault finding procedure

NOTES	None.

Check **the connection and condition** of the climate control control panel connectors.
Repair if necessary.

Connect the bornier in place of the computer and check **the insulation, continuity and absence of interference resistance** of the connections:

computer connector A **track 9** → **track CAN L** of the UCH (refer to diagrams for the vehicle and model year concerned).

computer connector A **track 10** → **track CAN H** of the UCH (refer to diagrams for the vehicle and model year concerned).

Repair if necessary.

If the fault is still present, **carry out fault finding** on the multiplex network.

AFTER REPAIR	Clear the fault memory. Deal with any other faults.

GETtheMANUALS.org

DF093 PRESENT	NO UCH MULTIPLEX SIGNAL DEF : apply the multiplex network fault finding procedure 1.DEF: Apply the multiplex network fault finding procedure

NOTES	None.

Check **the connection and condition** of the climate control control panel connectors.
Repair if necessary.

Connect the bornier in place of the computer and check **the insulation, continuity and absence of interference resistance** of the connections:

computer connector A **track 9** → **track CAN L** of the UCH (refer to diagrams for the vehicle and model year concerned).

computer connector A **track 10** → **track CAN H** of the UCH (refer to diagrams for the vehicle and model year concerned).

Repair if necessary.

If the fault is still present, **carry out fault finding** on the multiplex network.

AFTER REPAIR	Clear the fault memory. Deal with any other faults.

GETtheMANUALS.org

DF094 PRESENT	NO ABS MULTIPLEX SIGNAL DEF : apply the multiplex network fault finding procedure 1.DEF: Apply the multiplex network fault finding procedure

NOTES	None.

Check **the connection and condition** of the climate control control panel connectors.
Repair if necessary.

Connect the bornier in place of the computer and check **the insulation, continuity and absence of interference resistance** of the connections:

computer connector A **track 9** → **track CAN L** of the UCH (refer to diagrams for the vehicle and model year concerned).

computer connector A **track 10** → **track CAN H** of the UCH (refer to diagrams for the vehicle and model year concerned).

Repair if necessary.

If the fault is still present, **carry out fault finding** on the multiplex network.

AFTER REPAIR	Clear the fault memory. Deal with any other faults.

MARKINGS ON FRONT FAN, TOXICITY SENSOR, LEFT-HAND MIXING MOTOR AND RIGHT-HAND MIXING MOTOR CONNECTOR WIRES

Black 4-track front fan power module connector, viewed from behind with the location notch on the top, from left to right:
– spare track
– track 3 fan unit control (computer connector A track 27)
– track 2 fan unit speed feedback signal (computer connector A track 13)
– track 1 12 volt supply

Toxicity sensor connector, viewed from behind with location notch on the top, from left to right:
– track 5 5-volt supply (computer connector B track 16, or computer connector B track 1 for the 2005 redesign)
– track 8 NOx signal (computer connector B track 17, or computer connector B track 2 for the 2005 redesign)
– track 7 CO signal (computer connector B track 18, or computer connector B track 3 for the 2005 redesign)
– spare track
– spare track
– track 10 earth (computer connector B track 19, or computer connector B track 4 for the 2005 redesign)

Left-hand mixing motor connector, viewed from behind with location notch on the top, from left to right:
– track 5 control 1 of the right-hand mixing motor (computer connector B track 22, or computer connector B track 7 for the 2005 redesign)
– track 6 control 2 of the right-hand mixing motor (computer connector B track 23, or computer connector B track 8 for the 2005 redesign)
– spare track
– spare track
– spare track
– spare track

Right-hand mixing motor connector, viewed from behind with location notch on the top, from left to right:
– track 5 control 1 of the right-hand mixing motor (computer connector B track 26, or computer connector B track 11 for the 2005 redesign)
– track 6 control 2 of the right-hand mixing motor (computer connector B track 27, or computer connector B track 12 for the 2005 redesign)
– spare track
– spare track
– spare track
– spare track

GETtheMANUALS.org

MEASURING THE CONTROL VOLTAGE OF THE FRONT PASSENGER COMPARTMENT FAN UNIT POWER MODULE

There are two ways to measure the control voltage of the passenger compartment blower power module:

1 / Measuring on a multimeter (in voltmeter position):

With the power module connector connected, measure across **track 3** of the module and the earth.
At speed 0, the voltage measured should be approximately **6 volts**.
At maximum speed (8) the voltage should be negligible (± **0.5 volts).**
At the seven intermediary speeds, the voltage varies between **0 and 6 volts**.

Examples of measurements taken with the voltmeter with the engine at idling speed (values given as a guide):

speed **0**	6 Volts
speed **1**	5.1 Volts
speed **2**	4.75 Volts
speed **3**	4.36 Volts
speed **4**	3.91 Volts
speed **5**	3.48 Volts
speed **6**	3.02 Volts
speed **7**	2.61 Volts
speed **8**	0.20 Volts

2 / Measuring using an oscilloscope (Optima 5800, Clip technique or NXR):

The fan power module is controlled by pulse width modulated control voltage (PWM).

This control voltage is always **6 Volts** whereas the control signal (square pulse signal) varies: the range and frequency do not move, the **high status (6 Volts)** varies in relation to the **low status (0 Volts)**.

To measure, connect the oscilloscope earth lead to the battery earth and the oscilloscope measuring lead to **track 3** of the power module (module connector connected). Adjust the time base on the oscilloscope to **2 ms** divisions with a gauge of **5-volt** divisions.

The signals obtained should be: a high status of **6 Volts** for **7.6 ms** and a low status of **0 Volts** for **0.4 mins** for speed 0 and a straight line at **0 Volts** for speed 8.

GETtheMANUALS.org

Example of measurements for the seven speeds in between (values given as a guide):

Fan unit speed	duration of high status	duration of low status
speed **1**	7.2 ms	0.8 ms
speed **2**	6.4 ms	1.6 ms
speed **3**	6 ms	2 ms
speed **4**	5.4 ms	2.4 ms
speed **5**	4.8 ms	3.2 ms
speed **6**	4 ms	4 ms
speed **7**	3.6 ms	4.4 ms

Using a multimeter in voltmeter position, measure the control voltage of the rear fan unit

With the fan unit connected, measure across **track B** of the fan unit and the earth.
At speed 0, the voltage measured should be **negligible**.
At maximum speed (3), the voltage should be **9.4 volts ± 0.5 volts**.
For the two intermediate speeds, the voltage varies between **0 and 9.4 volts**.

Examples of measurements taken with the voltmeter with the engine at idling speed (values given as a guide):

speed **0**	0 volts
speed **1**	4.6 volts
speed **2**	6.5 volts
speed **3**	9.4 volts

REPLACING THE CLIMATE CONTROL COMPUTER

– Note the computer configuration according to the optional equipment fitted on the vehicle.

– Ensure that the ignition is switched off.

– Replace the computer (control panel).

– Switch on the ignition and carry out a check using the diagnostic tool.

– Configure the computer according to the options available on the vehicle.

– Go to the read configuration menu and confirm that the configurations have been stored.

– Check for faults and carry out fault finding procedures on any faults that have recurred.

– Clear any stored faults.

– Start the engine, switch on the air conditioning and ensure that it is operating correctly.

COLOUR CODING OF COMPUTER CONNECTORS:

– the **grey 30-track** climate control computer connector is referred to in this section as: **connector A**.

– the **green 30-track** climate control computer connector is referred to in this section as: **connector B**.

– The green 15-track connector of the new 2005 redesigned climate control computer is also connector B of the new 2005 redesigned computer.

Method of recognising the 2005 redesigned computer:

– From the S23C31 software, software/calibration part number: 8 200 487 008.

– Visually, you can recognise this computer by looking at the rear side of the control panel: there should be a green 15-track connector, not a 30-track connector.

	PR021:	Position of right-hand mixing flap	**0%** maximum cold to **100%** maximum hot	In the event of a fault, **apply the fault finding procedure** for fault: **DF018 Right-hand mixing motor circuit**.
Air recirculation motor control	**ET021:**	Air recirculation motor control	**STATUS 1 air recirculation motor:** recirculation or **STATUS 2 air recirculation motor:** external air.	In the event of a fault, apply the fault finding procedure for fault **DF021 Recirculation motor circuit**.

GETtheMANUALS.org

ET005	REFRIGERANT: UNDER-PRESSURE

NOTES	The under-pressure status rises if the pressure reading taken by the sensor is **less than 2 bar**.
	There must be no present or stored faults. (in particular, faults: **DF033** Refrigerant level and **DF002** Refrigerant pressure sensor circuit).
	Special note: The under-pressure status **inhibits** climate control operation.

Check the **connection and condition** of the refrigerant pressure sensor connector.
Replace the connector if necessary.

Connect the bornier in place of the computer and check the **insulation, continuity and the absence of interference resistance** of the following connections:

computer connector A **track 8** → **track A** of the pressure sensor
computer connector A **track 11** → **track B** of the pressure sensor
computer connector A **track 3** → **track C** of the pressure sensor

Repair if necessary.

With the ignition switched on, check that the sensor is correctly supplied by the computer by measuring between: **track A** and **track B** of the sensor.
If the voltage is not **5 volts**, change the air conditioning computer.

Check that there are **no refrigerant fluid leak**s in the air conditioning system.

If the fault is still present, **check the refrigerant level (650 ± 25 grams)**.
Refill if necessary.

If the refrigerant level is correct, there are no leaks in the air conditioning system and the pressure sensor connections checks are all sound: **replace** the pressure sensor.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET006	REFRIGERANT: OVERPRESSURE

NOTES	The overpressure status rises if the pressure measured by the sensor is **greater than 27 bar (relative)**.
	There must be no present or stored faults. (in particular, faults: **DF033** Refrigerant level, **DF030** Compressor output control circuit and **DF002** Refrigerant pressure sensor circuit).
	Special note: The overpressure status **prevents** air conditioning operation.

For electrically controlled output:
Check the **connection and condition** of the refrigerant pressure sensor connector.
Replace the connector if necessary.

Connect the bornier in place of the computer and check the **insulation, continuity and absence of interference resistance** of the following connections:

computer connector A **track 8** → **track A** of the pressure sensor
computer connector A **track 11** → **track B** of the pressure sensor
computer connector A **track 3** → **track C** of the pressure sensor

Repair if necessary.

Display parameter: **PR016** Refrigerant pressure and check that the pressure readings drop sharply (the parameter should not remain static) after the air conditioning has been turned off.
If the pressure does not fall, **replace** the refrigerant pressure sensor.

Check that **the output control is operating correctly** by displaying parameter:
PR104 Compressor output control

– When stopped, this parameter should display **0%** (maximum output).
– With the engine running and the air conditioning switched on, this parameter should display a value between **0** and **100%** (there is no standard control case because there are multiple conditions for this case).

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET006 **CONTINUED 1**	

If the capacity does not vary and the control solenoid valve is not faulty:
With the ignition on, check for a **supply** to **track B** of the output control solenoid valve.
Repair if necessary.

If the output still does not vary: **check the refrigerant level** (650 grams) as a shortage of refrigerant may be corrected by the air conditioning system by increasing the compressor output (in order to maintain air conditioning performance).
Refill if necessary.

If the refrigerant fluid is correct and the output control is operating correctly (presence of a supply on track B of the solenoid valve and an earth control on track A) there may be a compressor output control panel mechanical fault.
If this is the case **replace the air conditioning compressor**.

For pneumatically controlled capacity:
Check the **connection and condition** of the refrigerant pressure sensor connector.
Replace the connector if necessary.

Connect the bornier in place of the computer and check the **insulation, continuity and absence of interference resistance** of the following connections:

computer connector A **track 8** → **track A** of the pressure sensor
computer connector A **track 11** → **track B** of the pressure sensor
computer connector A **track 3** → **track C** of the pressure sensor

Repair if necessary.

Display parameter: **PR016** Refrigerant pressure, and check that the pressure readings drop sharply (the parameter should not remain static) after the air conditioning has been turned off.
If the pressure does not fall, **replace** the refrigerant pressure sensor.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET006 **CONTINUED 2**	

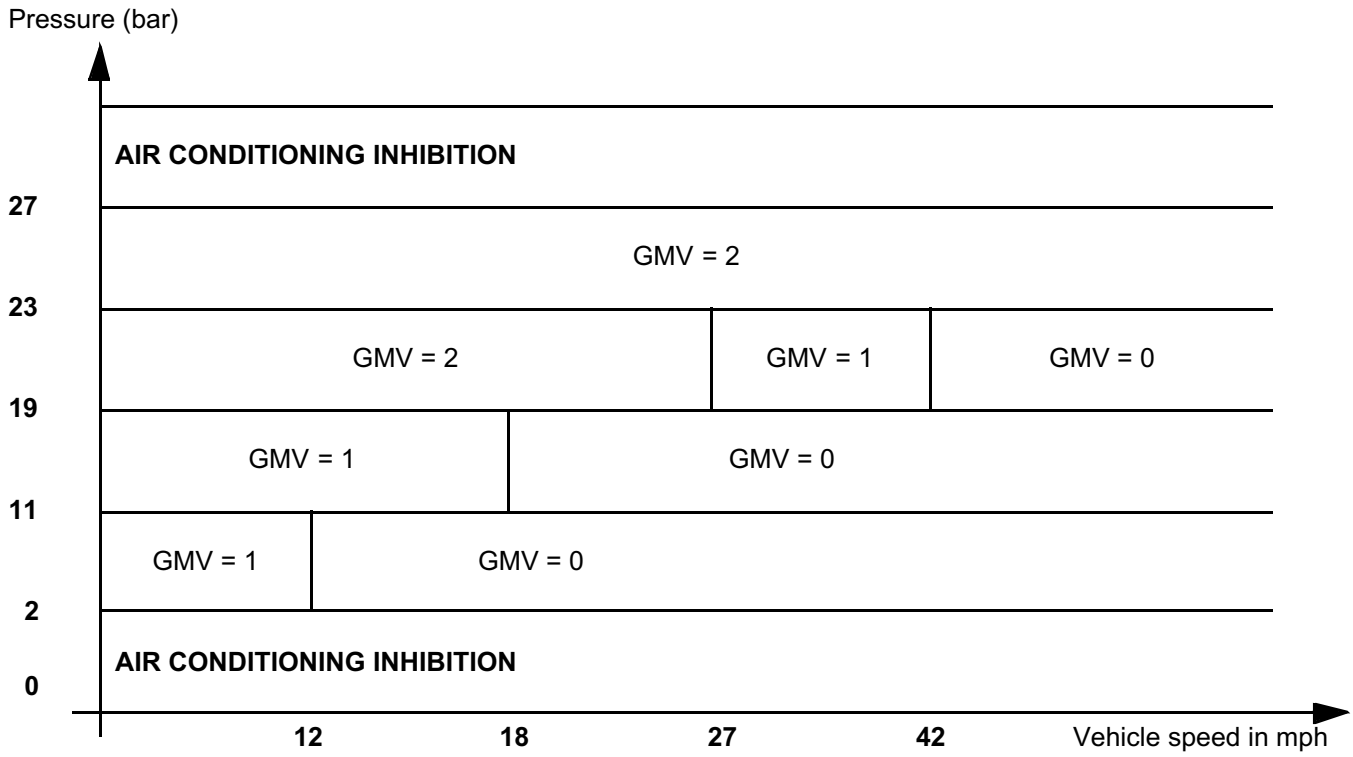
Check the refrigerant level (650 grams) as a shortage of refrigerant can be corrected by the air conditioning system by decreasing the compressor output. **Refill if necessary.**
If the refrigerant level is correct, there may be a mechanical fault on the compressor control board. If this is the case **replace the air conditioning compressor**.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET023 **ET024**	LOW-SPEED FAN ASSEMBLY HIGH-SPEED FAN ASSEMBLY

NOTES	If the fan assembly is not operating as normal, carry out a complete check on the fan assembly circuit (details under fault finding - injection).



GMV = 1 Low speed cooling fan
GMV = 2 High speed cooling fan
GMV = 0 Cooling fan off

The fan assembly is not used for speeds greater than **42 mph (70 km/h)**.
Except in of rare cases where the pressure is greater than **23 bar** despite the high speed
example: (driving behind a lorry).
When the vehicle is stationary, the fan assembly is always used at low speed if the high pressure is less than **19 bar** (relative) and at high speed if not.
When the vehicle is being driven, the fan assembly may either not operate or operate at high or low speed depending on the condenser outlet pressure and the vehicle speed.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET033 **ET050**	AUTOMATIC MODE AIR CONDITIONING MODE

NOTES	None.

ET033	The automatic mode is activated by pressing the **AUTO** button on the control panel. This mode comprises automatic operation of the air distribution, passenger compartment ventilation and compressor engagement functions according to the temperature requested. Only the temperature setpoint adjustment (left and right-hand) is made manually. After the **AUTO** button on the control panel is pressed, status **ET033** should display **YES**. If the status does not display this, check that the indicator light on the **AUTO** button lights up at the same time as indicator light on the **AC** button. If the indicator lights do not light up, take a fault reading and carry out a conformity check to check the conformity of the system. If the fault is still present, **contact the Techline**.

ET050	The air conditioning mode corresponds to the air conditioning manual mode. This mode is activated by pressing the **AUTO** button on the control panel. This mode relates to the engagement of the compressor (according to the temperature requested). Adjustments to the left-hand and right-hand temperature setpoints, air distribution, passenger compartment ventilation and air recirculation functions are made manually. When the **AC** button on the control panel is pressed, status **ET050** should display: **YES**. If the status does not display this, check that the indicator light on the **AC** button lights up. If the indicator light does not light up, take a fault reading and carry out a conformity check to check the conformity of the system. If the fault is still present, **contact the Techline**.

AFTER REPAIR	Repeat the conformity check.

GETtheMANUALS.org

GETtheMANUALS.org

PR024	REAR FAN UNIT SPEED

NOTES	The values listed below are examples only.

Controlled values for engine off and engine running (tolerance ± 5%).

Blower speed	SPEED 0	SPEED 1	SPEED 2	SPEED 3
Fan unit speed	**0 %**	**28 %**	**55 %**	**85 %**

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

PR005	POWER ABSORBED SIGNAL

NOTES	The values listed below are examples only.

Whether the variable output compressor is<< pneumatic >> or electrically controlled, the power absorbed by the compressor can be anything from several hundred watts to approximately **6 kW** depending on weather conditions and vehicle speed, and also compressor rotation speed.

The power absorbed signal is a function of two parameters:
– continuous high pressure readings,
– compressor rotation speed.

The power absorbed value calculated by the climate control computer is transmitted to the engine management computer. This allows the engine management computer to anticipate the effect that the load variations induced by the compressor will have on the engine at idle speed and when in motion.

AFTER REPAIR	Repeat the conformity check from the start.

ALP 0	No dialogue with the computer

NOTES	None.

Try the diagnostic tool on another vehicle.

Check:
– The connection between the **diagnostic tool** and the diagnostic socket (cable in good condition).
– That the fuses are sound.

Check for **+ 12 V battery feed** on **track 16,** and **+ 12 V after ignition feed** on **track 1** and an **earth** on **track 5** and on **track 4** of the diagnostic socket.
Repair if necessary.

Disconnect **connector A** from the air conditioning computer to check the **conformity of the computer feeds** and the **insulation, continuity and the absence of interference resistance** of the following connections:
Air conditioning computer connector A (grey, **30-track**)

Track 6 → **+ after ignition**
Track 18 → **+ before ignition**
Track 1 → **earth**
Track 16 → **earth**
Track 30 → **earth**
Track 5 → **track 7** of the diagnostic socket (K line)

Repair if necessary (see the vehicle wiring diagram).

AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP 1	Air distribution fault

NOTES	Only consult this customer complaint after a **complete check with the diagnostic tool**.
	Special notes: Adjusting the air distribution or ventilation controls switches off automatic climate control mode.

Check that **the air circuit** (**particle filter**, scuttle panel grille, air vents, etc.) is not blocked.
Ensure that the fan blades are in good condition.
Repair, clean or replace the particle filter if necessary.

Ensure that the front fan unit is properly **sealed**.
Repair if necessary.

↓

Switch the front passenger compartment fan to full, the temperature control to very hot or very cold, and move the air distribution control.
Check that the air outlet is the one selected.

Is the air distribution correct?

YES → The air distribution is operating correctly.
If necessary, explain how the system works to the customer again.

NO

↓

Using the **diagnostic tool**, check the air distribution control by checking the distribution motor parameters.
PR022 → de-icing distribution flap position
PR023 → footwell distribution flap position

Do the flaps open 100%?

NO → Refer to the interpretation of parameters PR022 and PR023 Position of distribution flaps, and check how far the flaps open.
In the event of a problem occurring, refer to the Technical Note for fault finding strategies for distribution motors.

YES

↓

(A)

AFTER REPAIR	Check that the system is operating correctly.

AFTER REPAIR	Check that the system is operating correctly.

ACREGX731.0

GETtheMANUALS.org

ALP 2	Faulty front air flow

NOTES	Only consult this customer complaint after a **complete check with the diagnostic tool**. Check that the customer knows how to work the air conditioning system properly.

Does the front passenger compartment fan **work**?

NO → Repair, see **ALP 7 No passenger compartment ventilation.**

YES

↓

Check that **the air circuit** (**particle filter**, scuttle panel grille, air vents and extractors, etc.) is not blocked.
Ensure that the fan blades are in good condition.
Repair, clean or replace the particle filter if necessary.

↓

Ensure that the front fan unit is properly **sealed**.
Repair if necessary.

↓

Using the **diagnostic tool**, check that the air recirculation flap is not stuck in air recirculation position using status check: **ET021** Air recirculation motor control.

↓

Does the fault disappear when the **air distribution** is changed?

YES → Ensure that all the air vents are open.
If the fault is still present, refer to **ALP 1**.

NO

↓

Run a **conformity check** as the fault may arise from a faulty signal from one of the sensors (temperature/ humidity, etc.).
Check that the internal air temperature sensor micro turbine is operating (if this is malfunctioning, the measurement could be incorrect).
Replace any faulty components.

↓

(A)

AFTER REPAIR	Check that the system is operating correctly.

ACREGX731.0

GETtheMANUALS.org

ALP 2

CONTINUED

(A)

Using the diagnostic tool, check that the fan speed corresponds to the setpoints provided by the computers (tolerance of ± 15%) by checking parameters:

PR019 → passenger compartment fan assembly modulated control voltage.

PR008 → fan assembly speed (fan speed feedback signal).

Refer to the Interpretation of parameters table **PR019** and **PR008** to ensure that the values obtained are consistent.

Does the speed correspond to the setpoint?

YES → **End of fault finding procedure.**

NO

Check that the modulated control voltage of the passenger compartment fan unit power module varies between **0** and **6 V** (from 0 to 100%) by measuring between **track A3** of the power module and the earth (connector connected).

Does the voltage vary correctly?

YES → **Replace** the power module.

NO

Check the **continuity and absence of interference resistance** of the connections:

computer connector B **track 27** → **track A3** of the power module

or the new 2005 computer connector B **track 12** → **track A3** of the module

Repair if necessary.

Is the fault still present?

NO → **End of fault finding procedure.**

YES

Replace the control panel. → **End of fault finding procedure.**

AFTER REPAIR	Check that the system is operating correctly.

ACREGX731.0

GETtheMANUALS.org

ALP 3	Faulty rear air flow

NOTES	Only consult this customer complaint after a **complete check with the diagnostic tool**. Check that the customer knows how to work the heating and ventilation properly.

does the rear passenger compartment fan **work**? — **NO** → repair, see **ALP 8**.

YES

↓

Check that **the air circuit** (**particle filter**, scuttle panel grille, air vents and extractors, etc.) is not blocked.
Ensure that the rear blower blades are in good condition.
Repair, clean or replace the particle filter if necessary.

↓

Ensure that the rear blower unit is properly **sealed**.
Repair if necessary.

↓

Check the resistance of the rear blower: **0.95 Ω**.
Replace the rear blower if necessary.

↓

Does the fault disappear when the **air distribution** is changed? — **YES** → Ensure that all the air vents are open.
If the fault is still present, refer to **ALP 1**.

↓

Using the **diagnostic tool**, check that the fan speed corresponds to the computer information (tolerance of **± 5%**) by checking parameters:
PR024 → rear fan assembly speed (fan unit speed return signal).
To ensure that the values obtained are consistent, refer to the Interpretation of parameters table **PR024**.

Does the speed comply with specifications? — **YES** → **End of fault finding procedure.**

NO

↓

(A)

AFTER REPAIR	Check that the system is operating correctly.

ACREGX731.0

ALP 3
CONTINUED

(A)

Check the resistors of the rear fan assembly resistor unit.

Replace the resistor unit if the resistances are not as follows (± **0.5 Ω**):

- V1: **5.0 Ω** (tracks C and B)
- V2: **2.4 Ω** (tracks A and B)
- V3: **0.8 Ω** (tracks D and B)

Are the resistances correct? — **NO** → **Replace** the resistor unit.

YES

Check the **continuity and absence of interference resistance** of the connections:
control unit **track B3** → **track D** of the resistance unit
control unit **track B2** → **track A** of the resistance unit
control unit **track A1** → **track C** of the resistance unit
Repair if necessary.

Is the fault still present? — **NO** → **End of fault finding procedure.**

YES

Using an ohmmeter, check that the rear fan assembly control unit works properly.

End of fault finding procedure.

AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP 4	Inefficient windscreen demisting

NOTES	Only consult this customer complaint after a **complete check with the diagnostic tool**.
	Special notes: Check that the inside of the windows are not greasy, as this lowers the efficiency of the demister.

If the vehicle is fitted with a heated windscreen, use the **diagnostic tool** to check that the **computer is correctly configured** by using configuration readings: **LC015** ← Electrical windscreen.
Reconfigure the computer if necessary and ensure the heated windscreen is working correctly.

↓

Check that the air extraction vents are not blocked.
Repair if necessary.

Is the fault still present?? — **NO** → **End of fault finding procedure.**

YES

↓

Check that there are no **water leaks** into the passenger compartment which would significantly increase the humidity levels and reduce the effectiveness of demisting.
Repair if necessary (see **ALP14 Water in the passenger compartment**).

Is the fault still present?? — **NO** → **End of fault finding procedure.**

YES

↓

Check that the compressor is **working correctly** by using command: **AC021 Compressor clutch** or by switching on the air conditioning.
Repair if necessary

↓

(A)

AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP 4 CONTINUED

(A)

Ensure that the water condenser outlet is not blocked up.
Repair if necessary.

Is it an **air distribution** fault? — **YES** → See **ALP 1**

NO

Is it an **air flow** fault? — **YES** → See **ALP 2.**

NO

Is it a **heater performance** fault? — **YES** → See **ALP 9 No heating or insufficient heating**

NO

Using the **diagnostic tool**, check that the air recirculation flap is in the **external air** position by checking status **ET021** Air recirculation motor control.
Repair if necessary.

Is the fault still present?

YES

Run a **conformity check** as the fault may arise from a faulty signal from one of the sensors (temperature/ humidity, etc.).
Check that the internal air temperature sensor micro turbine is operating (if this is malfunctioning, the measurement could be incorrect).
Replace any faulty components.

NO

End of fault finding procedure.

AFTER REPAIR — Check that the system is operating correctly.

ACREGX731.0

GETtheMANUALS.org

ALP 5	Inefficient rear screen de-icing/demisting

NOTES	Only consult this customer complaint after a **complete check with the diagnostic tool**.
	Special notes: – Check that the inside of the glass is not **greasy** as this lowers the de-icing efficiency. – The de-icing control is only authorised when the engine is running to save power. **Rear screen de-icing can be activated in two ways:** – Pressing the lower part of the heating switch on the control panel heats up the rear screen and the door mirrors. – Pressing the lower part of the heating switch on the control panel operates the demister (on the heated rear screen and door mirrors, ventilated windscreen and electrically heated windscreen, provided that the vehicle is fitted with these parts). Note: in both cases the activation of de-icing is only authorised when the engine is running.

Check that there are no water leaks into the passenger compartment which would significantly increase the humidity levels and reduce the effectiveness of demisting. Repair if necessary (see **ALP14 Water in the passenger compartment**).

Is the fault still present?

NO → **End of fault finding procedure.**

YES

↓

Use the **diagnostic tool** to check the heated rear screen control relay by checking statuses:
ET022 ⟶ Heated rear screen switch.
Repair if necessary (see **DF005**).

↓

(A)

AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP 5 CONTINUED	

(A)

Remove the plastic pillars from the rear screen and check that **the heating wires have not been cut** by measuring their resistance (**0.5 to 1 Ω**).
Repair if necessary.

Check for an **earth** on the terminal located on the right-hand side of the heated rear screen and **+ 12 volts** (when de-icing switched on) on the left-hand side terminal.
If there is no supply to the screen, check **the continuity and interference resistance** of the connection:
Rear screen relay **track 5** → heated rear screen left-hand terminal connector
Repair if necessary.
If the fault is still present, **apply the fault finding procedure** for fault: **DF005** Heated rear screen relay control circuit.

Is the fault still present??

YES

Run a **conformity check** as the fault may arise from a faulty signal from one of the sensors (temperature/ humidity, etc).
Check that the internal air temperature sensor micro turbine is operating (if this is malfunctioning, the measurement could be incorrect).
Replace any faulty components.

NO

End of fault finding procedure.

AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP 8	No rear passenger compartment ventilation

NOTES	Only consult this customer complaint after a **complete check with the diagnostic tool**.

Check that the **fuses**are in good condition.

↓

With the ignition on, check for **12 V feed on track B1** of the rear fan assembly control unit.

Is there a supply?

NO ↓

Check the **continuity, insulation and the absence of interference resistance** on the following connection:
Rear control unit **Track B1** → Rear fan assembly relay **Track A5**
Repair if necessary

↓

With the ignition on, check for **+ 12 volts feed on track A1 and A3** of the rear fan assembly relay and an earth on **track A2**.
Repair if necessary (see wiring diagram).

YES ↓

↓

Check that the rear fan assembly relay is in correct working order.
Replace the relay if necessary.

↓

Using an ohmmeter, check that the rear fan assembly control unit is operating correctly:
Continuity between **track B1** and **track A1**.
Continuity between **track B1** and **track B2**.
Continuity between **track B1** and **track B3**.
Replace the rear fan assembly control unit if necessary.

↓

(A)

AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP 8 CONTINUED 1	

(A)

Check the **insulation, continuity and the absence of interference resistance** of the following connection:
Rear control unit **track D** → **track B3** of the resistor unit
Rear control unit **track A** → **track B2** of the resistor unit
Rear control unit **track C** → **track A1** of the resistor unit
Repair if necessary.

Check the resistances of the rear fan assembly resistor unit (**± 0.5 Ω**).
– V1: **5.0 Ω** (tracks C and B)
– V2: **2.4 Ω** (tracks A and B)
– V3: **0.8 Ω** (tracks D and B)
Replace the resistor unit if the values measured do not correspond to those given above.

Check the consistency of the rear fan assembly control voltages according to the 3 control speeds:
Measure between **track 2** of the black 6-track intermediate connector and **earth** (refer to the **Help** section for information on taking the measurement).

Are the voltages correct?

NO

Check the **continuity, insulation and the absence of interference resistance** on the following connection:

Resistor unit	Black 6-track intermediate connector	Air conditioning computer connector A (30-track grey)
Track B	**Track2**	**Track 20**

Repair if necessary.
If the voltage is correct (or after adjusting it), disconnect the connector from **track A** of the fan assembly and repeat the previous test.

Are the voltages correct?

YES

Replace the resistor unit

(B)

AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP 11	No cold air

NOTES	Only consult this customer complaint after a **complete check with the diagnostic tool**.

Start the engine and switch the air condition onto its coolest position while driving (minimum position left and right). Using **the diagnostic tool**, display status **ET140 Air conditioning request**. This status must be **ACTIVE**

Is the status ACTIVE?

NO → Run a **conformity check** and focus on the sensor temperature values (evaporator temperature, internal air temperature, etc.).

YES

Using **the diagnostic tool** and with the engine at idling speed, check that the injection computer authorises the air conditioning.
Status **ET003 AC inhibited by injection computer** should be **NO**.

Is the status NO?

NO → Carry out a **fault finding test on the injection** (faulty injection leading to a poor performance may prevent the air conditioning from working). Ensure that the engine cooling fan assembly is in correct working order.
Repair if necessary.

YES

Check **the condition** of the air conditioning compressor belt.
Replace it if necessary and check its **tension**.

Is the tension correct?

NO → **Tighten** the belt (see the repair procedures for engines without auto-tensioner).

YES

AFTER REPAIR	Check that the system is operating correctly.

ACREGX731.0

GETtheMANUALS.org

ALP 11
CONTINUED 1

(A)

Using the diagnostic tool, run command **AC021** Compressor clutch.

Does the compressor clutch jam?

YES →

NO

Check **for + 12 volts** on **track B** (**track 1** on V4Y) of the compressor clutch and on **track B** of the variable output solenoid valve (no electric solenoid valve on P9X and V4Y).
Repair if necessary.

Connect the bornier in place of the computer and check the **insulation, continuity and absence of interference resistance** of the following connections:
computer connector A **track 15** → **track A**of the compressor clutch(**track 2** on L7X).
computer connector A **track 7** → **track A** of the output control solenoid valve.
Repair if necessary.

Vary the position of the left and right mixer flaps from very cold to very hot (from minimum temperature position to maximum temperature position) and check subjectively whether there is a difference in temperature.

Can you feel the difference in temperature?

NO → Run **a conformity check** on the mixing motors.
In the event of a fault, refer to the Technical Note for fault finding procedures for mixing motors (**DF018** and **DF019**).

YES

(B)

AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP 11
CONTINUED 2

B

Check the cold loop by checking the condition of the pipes and checking that the air conditioning system is not **leaking refrigerant** (carry out the check with the engine cold and then hot, using the electronic buzzer or a leak detecting product to avoid filling the air conditioning system twice in succession).
Repair if necessary.

Check the cleanliness of the condenser (presence of leaves, mud, etc.).
Clean the condenser if necessary.

With the air conditioning switched on (with the coldest setting selected), touch the refrigerant pipe between the pressure relief valve and the evaporator to make sure that it is **very cold**.

Is the refrigerant pipe cold?

NO → Check for the **pressure relief valve**.

Is the pressure relief valve present?

YES → **Replace the pressure relief valve.**

NO → **Replace the pipe** (between the condenser outlet and the evaporator inlet).

YES

Top up the refrigerant, referring to the Workshop Repair Manual (**650 gr ± 25 gr**).

Is the fault still present?

YES → Replace the compressor.

NO → **End of fault finding procedure.**

AFTER REPAIR — Check that the system is operating correctly.

ACREGX731.0

GETtheMANUALS.org

ALP 12	Too much cold air

NOTES	Only consult this customer complaint after a **complete check with the diagnostic tool**.

Start the engine and switch on the climate control: **Does the compressor operate?**

YES → **End of fault finding procedure.**

NO

Use the diagnostic tool to display the evaporator temperature (**PR 003**), with air conditioning switched on. Does the temperature drop below 0°C, which will disengage the compressor clutch?

YES → Does the compressor clutch disengage below **0°C**? (after a delay of one minute).

YES → **End of fault finding procedure.**

NO

If the compressor is not faulty and there are no mechanical faults on the compressor clutch, replace the air conditioning computer.

NO

Check that **the evaporator temperature sensor** is in the correct position (it is inserted approximately 20 mm into the evaporator air outlet).

Check **the resistance** of the evaporator sensor by measuring between **track 1** and **track 2** of the sensor. Replace the sensor if the resistance is not approximately: **30 KΩ** at **25°C**.

Is the fault still present?

NO → **End of fault finding procedure.**

A

AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP 12 CONTINUED	

(A)

Run a **conformity check** as the fault may arise from a faulty signal from one of the sensors (temperature/ humidity, etc).
Check that the internal air temperature sensor micro turbine is operating (if this is malfunctioning, the measurement could be incorrect).
Replace any faulty components.

Using the diagnostic tool, check the air mixer control by checking the mixer motor parameters.
PR020 → Left-hand mixing flap position
PR021 → Right-hand mixing flap position

Is the mixing correct?
(0 % maximum cold, 100% maximum heat)

NO → Run **a conformity check** on the mixing motors.
In the event of a fault, refer to the Technical Note for fault finding procedures for mixing motors (**DF018** and **DF019**).

YES

Check the refrigerant level.

AFTER REPAIR	Check that the system is operating correctly.

ACREGX731.0

GETtheMANUALS.org

ALP 13	Unpleasant odours in the passenger compartment

NOTES	Only consult this customer complaint after a **complete check with the diagnostic tool**.

Ensure that the pollen filter is not blocked or worn.
Replace it if necessary.

Is the fault still present?

NO → **End of fault finding procedure.**

YES ↓

Ensure that **the evaporator outlet pipe** is not blocked.
Repair if necessary.

Is the fault still present?

NO → **End of fault finding procedure.**

YES ↓

Check that there are **no leaks on the heating unit** in relation to the engine compartment.
Repair if necessary.

Is the fault still present?

NO → **End of fault finding procedure.**

YES ↓

Place the vehicle on a lift.
Run an extension through the evaporator outlet pipe to apply the air conditioning freshener.
Spray the entire contents of the aerosol.
Leave the product to work for **15 minutes**.

AFTER REPAIR	Check that the system is operating correctly.

ACREGX731.0

GETtheMANUALS.org

ALP 14	Water is present in the passenger compartment

NOTES	Only consult this customer complaint after a **complete check with the diagnostic tool**.

Pressurise the cooling circuit.

Is there any coolant leaking into the vehicle?

YES → **Repair.**

NO

Ensure that **the evaporator outlet pipe** is not blocked.
Repair if necessary.

Is the fault still present?

NO → **End of fault finding procedure.**

YES

The fault may be caused by **ice** in the evaporator.
Does the customer complain of water droplets coming out of the air vents?

NO → The leak does not come from the heating and ventilation system.

YES

Use the diagnostic tool to display the evaporator temperature (**PR003**). Does it seem consistent? (in normal operation > **0˚C**, and the compressor is disengaged below this value after a delay of one minute).

YES → Run a **conformity check** as the fault may arise from a faulty signal from one of the sensors (temperature/humidity, etc.). Replace any faulty components.

NO

Check that **the evaporator temperature sensor** is in the correct position (it is inserted approximately 20 mm into the evaporator air outlet).

→ **End of fault finding procedure.**

AFTER REPAIR	Check that the system is operating correctly.

ACREGX731.0

GETtheMANUALS.org

ALP 15	No front control panel lighting

NOTES	Only consult this customer complaint after a complete check of the multiplex network and the air conditioning **with the diagnostic tool**.
	Special notes: The control panel is always lit but the buttons do not light up unless the side lights are operating, with or without contact. **Note:** If the display does not light up after 20 seconds there is a fault on the external temperature sensor.

Check the **connection and condition** of the computer output connectors.
Connect the bornier in place of the computer and check **the insulation, continuity and absence of interference resistance** of the connections:
computer connector A **track 14** → **track 2** of the lighting dimmer
earth → **track 3** of the lighting dimmer
Repair if necessary.

Is the fault still present?

NO → **End of fault finding procedure.**

YES

Check the **resistance** value of the dimmer by measuring between:
track 2 and **track 3** of the dimmer connector.
When the dimmer is operated, its resistance should vary between **0 to 1000 Ω ± 5%**.
Replace the dimmer if this is not the case.

Is the fault still present?

NO → **End of fault finding procedure.**

YES

* comp: computer

AFTER REPAIR	Check that the system is operating correctly.

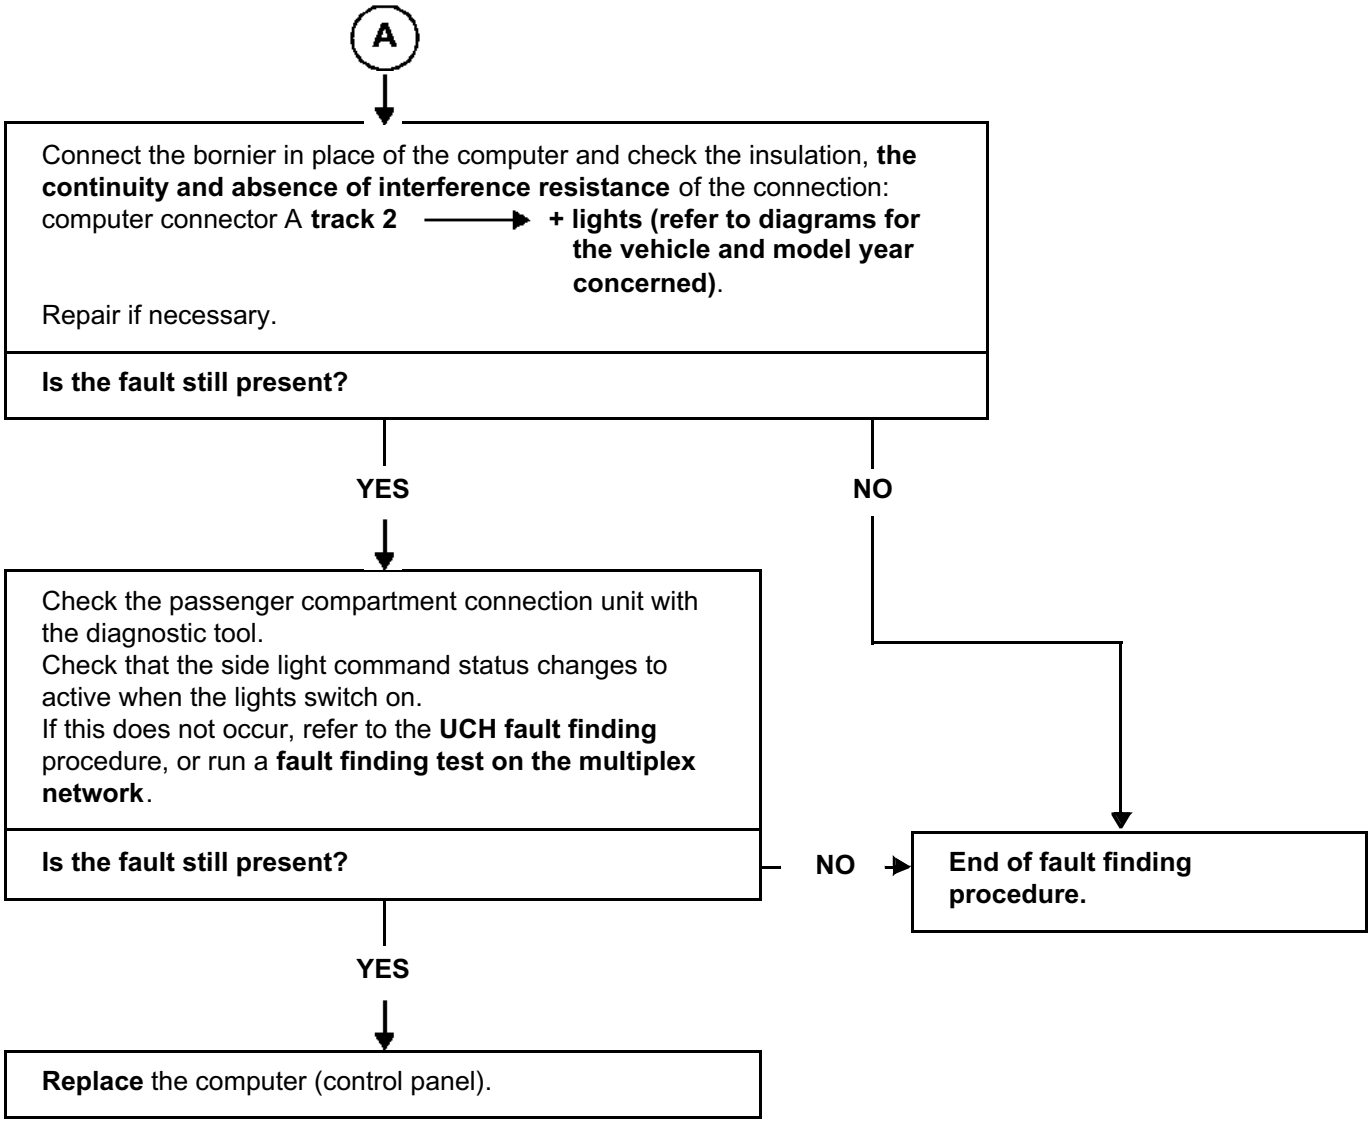
GETtheMANUALS.org

ALP 15 CONTINUED	



AFTER REPAIR	Check that the system is operating correctly.

ACREGX731.0

GETtheMANUALS.org

ALP 16	No rear control panel lighting

NOTES	**Special notes:** The control panel only lights up when the side lights are on.

Check the condition of the fuses.
Repair if necessary.

↓

Check the condition of the bulb.
Repair if necessary.

↓

Check the **connection and condition** of the rear fan assembly control unit connector.

Check **the insulation, continuity and absence of interference resistance** on the following connections:
track A3 of the control unit ⟶ UCH see diagrams of the vehicle concerned
track A2 of the control unit ⟶ **earth**
Repair if necessary.

↓

Check the 12 volt supply on track A3 of the rear fan assembly control unit.

Is there a supply? — **NO** → **End of fault finding procedure.**

↓ **NO**

Check the UCH.

↓

End of fault finding procedure.

AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP 17	Noisy compressor

NOTES	Only consult this customer complaint after a complete check **with the diagnostic tool**.

Using the **diagnostic tool** configuration reading screen, check that **the drive ratio and the type of compressor are consistent with the vehicle equipment** by displaying the following information:
Information: **LC018** Drive ratio reading should indicate the type of engine fitted to the vehicle (the engine is associated with a drive ratio).
Information: **LC012** Compressor type should indicate the make of compressor fitted to the vehicle.
Reconfigure the climate control computer if necessary.

↓

Check that the **compressor belt is in good condition** and **check its tension** (for engines without automatic tensioner).
Replace the belt if necessary.

↓

Check that the compressor is **correctly positioned**.
Repair if necessary.

↓

Check the refrigerant fluid and look for leaks as the compressor may become noisy if it loses a significant volume of fluid.
Refill if necessary.

↓

For compressors fitted with an electric compressor output control valve (except V4Y and P9X engines), connect the bornier in place of the computer and check the **insulation, continuity and absence of interference resistance** on the connection:
computer connector A **track 7** ⟶ **track A** of the clutch solenoid valve
Repair if necessary.

↓

If the fault is still present, **replace** the air conditioning compressor.

AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

1. SCOPE OF THIS DOCUMENT

This document presents the fault finding procedure applicable to all computers with the following specifications:

Vehicle: Vel Satis Phase 1 and Phase 2 *Function concerned: Climate control*	*Computer name:* **Climate control** *Program No.: 20* *Vdiag No.:* **09**

2. PREREQUISITES FOR FAULT FINDING

Documentation type:

Fault finding procedures (this manual):
– Assisted fault finding (integrated into the **diagnostic tool**), Dialogys.
Wiring Diagrams:
– Visu-Schéma (CD-ROM), paper.

Type of diagnostic tools:

– **CLIP**

Special tooling required:

Special tooling required	
	Multimeter
Elé. 1681	Computer connection bornier

3. RECAP

Procedure

To save energy, the Vel Satis Phase 1 and Phase 2 UCH interrupts the + after ignition feed after **3 minutes** have elapsed.

To run fault finding on a computer, it is possible to force the + after ignition feed on for **1 hour** by applying the following procedure:
– Press the card unlocking button,
– insert the card in the reader,
– press the Start button (interrupting the timed + after ignition feed mode),
– press and hold the start button for over **5 seconds** until the engine immobiliser warning light starts to flash rapidly (4 Hz).

This forced + after ignition feed mode remains on for **1 hour**.

Pressing the start button or removing the card from the card reader cuts off the forced + after ignition feed, but does not interrupt the forced + after ignition feed mode timing. As long as the full time has not elapsed, switching on the + after ignition feed reactivates the forced + after ignition feed for the remaining time.

GETtheMANUALS.org

Faults

Faults are declared as either present or stored (depending on whether they appeared in a certain context and have disappeared since, or whether they remain present but have not been diagnosed within the current context).

The **present** or **stored** status of faults should be taken into consideration when the diagnostic tool is switched on after the + after ignition feed (without any system components being active).

For a **present fault**, apply the procedure described in the **Interpretation of faults** section.

For a **stored fault**, note the faults displayed and apply the instructions in the **Notes** section.

If the fault is **confirmed** when the instructions in the Notes section are applied, the fault is present. Deal with the fault

If the fault is **not confirmed**, check:
- the electrical lines which correspond to the fault,
- the connectors on these lines (corrosion, bent pins, etc.),
- the resistance of the component detected as faulty,
- the condition of the wires (melted or split insulation, wear).

Conformity check

The aim of the conformity check is to check data that does not produce a fault on the diagnostic tool because the data is inconsistent. Therefore, this stage is used to:
- carry out fault finding on faults that do not have a fault display, and which may correspond to a customer complaint.
- check that the system is operating correctly and that there is no risk of a fault recurring after repairs.

This section gives the fault finding procedures for statuses and parameters and the conditions for checking them.

If a status is not behaving normally or a parameter is outside the permitted tolerance values, consult the corresponding fault finding page.

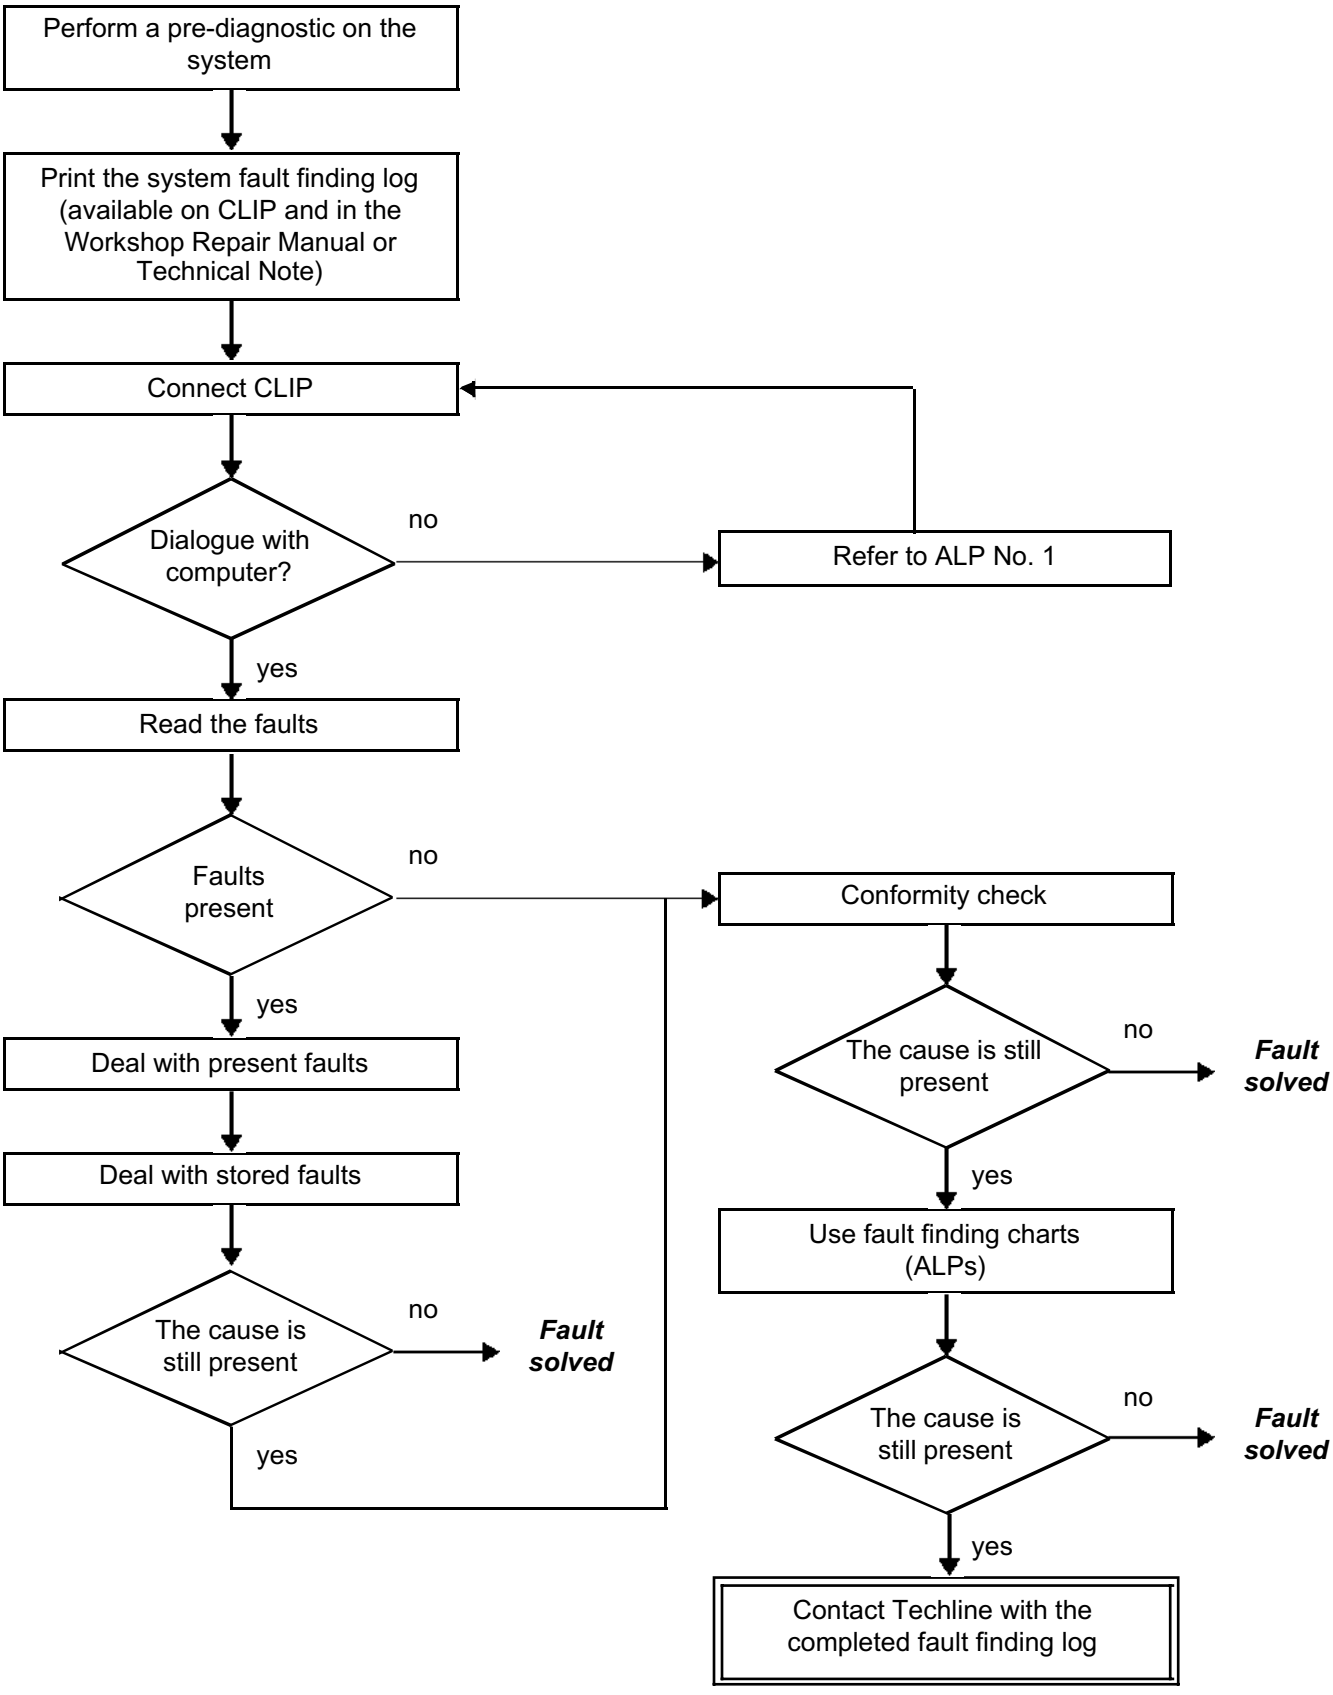
Customer complaints - Fault finding chart

If the test with the diagnostic tool is OK but the customer complaint is still present, the fault should be processed by **customer complaint**.

A synopsis of the general procedure to follow is provided on the following page in the form of a flow chart.

GETtheMANUALS.org

4. FAULT FINDING PROCEDURE



GETtheMANUALS.org

4. FAULT FINDING PROCEDURE (continued)

Wiring check

Fault finding problems
Disconnecting the connectors and/or manipulating the wiring harness may temporarily remove the cause of a fault.
Electrical voltage, resistance and insulation measurements are generally correct, especially if the fault is not present when the analysis is made (stored fault).

Visual inspection
Look for damage under the bonnet and in the passenger compartment.
Carefully check the fuses, insulators and wiring harness routing.
Look for signs of oxidation.

Tactile inspection
While manipulating the wiring harness, use the diagnostic tool to note any change in fault status from stored to present.
Make sure that the connectors are properly locked.
Apply light pressure to the connectors.
Twist the wiring harness.
If there is a change in status, try to locate the source of the fault.

Inspection of each component
Disconnect the connectors and check the appearance of the clips and tabs, as well as the crimping (no crimping on the insulating section).
Make sure that the clips and tabs are properly locked in the sockets.
Check that no clips or tabs have been dislodged during connection.
Check the clip contact pressure using an appropriate model of tab.

Continuity and insulation check
Check the continuity of entire lines, then section by section.
Look for a short circuit to earth, to **+ 12 V** or to another wire.

If a fault is detected, repair or replace the wiring harness.

GETtheMANUALS.org

5. FAULT FINDING LOG

IMPORTANT

IMPORTANT
Any fault on a complex system requires a full fault finding procedure with the appropriate tools. The FAULT FINDING LOG, which should be completed during the procedure, enables you to keep track of the procedure which is carried out. It is an essential document when consulting the manufacturer.

IT IS THEREFORE MANDATORY TO FILL OUT A FAULT FINDING LOG EACH TIME FAULT FINDING IS CARRIED OUT.

You will always be asked for this log:

- when requesting technical assistance from Techline,
- for approval requests when replacing parts for which approval is mandatory,
- to be attached to monitored parts for which reimbursement is requested. The log is needed for warranty reimbursement, and enables better analysis of the parts removed.

6. SAFETY ADVICE

Safety rules must be observed during any work on a component to prevent any damage or injury:

– check the battery voltage to avoid incorrect operation of computer functions,
– Use the proper tools.

REPLACING THE CLIMATE CONTROL COMPUTER:

WARNING
Before replacing the climate control computer, check that it is faulty (read faults, conformity of variables, read customer complaints). Techline will authorise replacement of the computer after completion of a fault finding log (available in this manual and the diagnostic tool).

– Note the computer configuration according to the optional equipment fitted on the vehicle.
– Ensure that the ignition is switched off.
– After approval from the **Techline,** replace the computer.
– Switch on the ignition and carry out a check using the diagnostic tool.
– Configure the computer according to the vehicle specifications.
– Switch off the ignition and then back on for the configurations to register.
– Go to the Read configuration menu and confirm that the configurations have been stored.
– Check for faults and carry out the fault finding procedure corresponding to the possible faults shown on the diagnostic tool.
– Clear any stored faults.
– Start the engine, switch on the air conditioning and ensure that it is working correctly.

GETtheMANUALS.org

CLIMATE CONTROL COMPUTER CONFIGURATION: The climate control computer has several configurations. These configurations need to be set after replacing the computer.
These configurations are important as they ensure optimal air conditioning inside the vehicle (improved control of the climate control). If they are not entered correctly, cold air and warm air production will be severely affected.
Take configuration readings to ensure that the configurations have taken effect.

CONFIGURATION		CONFIGURATION READING

GETtheMANUALS.org

DF001 PRESENT	COMPUTER

NOTES	None.

Check **the connection and condition** of the climate control control panel connectors.
Repair if necessary.

Connect the universal bornier in place of the computer and check the **insulation, continuity and the absence of interference resistance** on the following connections:

- computer connector A **track 1** → **earth**
- computer connector A **track 16** → **earth**
- computer connector A **track 30** → **earth**
- computer connector A **track 6** → **+ after ignition feed**
- computer connector A **track 18** → **+ after ignition feed**

Repair if necessary.

If the fault is still present, **replace the control panel** for the climate control system (before carrying out the replacement, record the configuration to program the new computer).

AFTER REPAIR	Reconfigure the computer (see the help section). Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF002 PRESENT	REFRIGERANT PRESSURE SENSOR CIRCUIT CO : open circuit CC : short circuit

NOTES	**Special notes:** The air conditioning compressor disengages if the condenser outlet pressure is below 2 bar or above 27 bar (relative).

Check the **connection and condition** of the refrigerant pressure sensor connector.
Replace the connector if necessary.

use the universal bornier to check the **insulation, continuity and the absence of interference resistance** on the following connections:

computer connector A **track 8** ⟶ **track A** of the pressure sensor
computer connector A **track 11** ⟶ **track B** of the pressure sensor
computer connector A **track 3** ⟶ **track C** of the pressure sensor

Repair if necessary.

With the ignition switched on, check that the sensor is correctly supplied by the computer by measuring between: **track A** and **track B** of the sensor.
If there is no **5 V**, replace the climate control computer.

If the fault is still present, **replace** the pressure sensor.

AFTER REPAIR	Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF007 PRESENT	INTERIOR TEMPERATURE SENSOR CIRCUIT CO : open circuit CC : short circuit

NOTES	**Special notes:** The interior temperature sensor is attached to a printed circuit with the humidity sensor. This component is located in the fixed casing below the interior rear-view mirror.

Check **the connection and condition** of the interior temperature sensor connector. Replace the connector if necessary.
With the ignition on, check that the temperature sensor fan **is operating correctly**. If it is not working, check for **+12 V** on **track 1** of the temperature sensor connector and **earth** on **track 3**. If the fan feed is correct and the fault is still present, replace the **sensors/fan** (the fan is not available separately).
Connect the universal bornier in place of the computer and check the **insulation, continuity and the absence of interference resistance** of the following connections: computer connector A **track 29** ⟶ **track 4** of the temperature sensor computer connector A **track 26** ⟶ **track 5** of the temperature sensor Repair if necessary.
Check **the resistance value** of the sensor across: **Track 4** and **track 5** of the internal temperature sensor connector and replace the sensor if the resistance is not approximately: **10 kΩ at 25°C**.
If the fault is still present, **replace** the internal temperature sensor.

AFTER REPAIR	Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF018 PRESENT OR STORED	RIGHT-HAND MIXING MOTOR CIRCUIT

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the air conditioning has been switched on and the right-hand temperature control has been operated.
	Special notes: The dashboard must be removed to allow access to check the mixer motor.

Connect the universal bornier in place of the computer and check the **resistance value** of the motor as well as the **insulation against earth and against + 12 V** of the connections between:
Track 26 and **track 27** of computer connector B or **tracks 11** and **12** of the new 2005 computer connector B.
The motor should have a resistance of approximately: **36** Ω at 20˚C.

If the value is incorrect, or if the fault is still present due to a poor or loose connection: **remove the dashboard** to gain access to the right-hand mixing motor.

Check **the connection and condition of the** right-hand mixing motor.
Replace the connector if necessary.

Check that the mixing motor flap is not **jammed**.
Repair if necessary.

Connect the universal bornier in place of the computer and check the **insulation, continuity and the absence of interference resistance** of the following connections:

computer connector B **track 26** ⟶ **track 5** of the right-hand mixing motor
computer connector B **track 27** ⟶ **track 6** of the right-hand mixing motor

or:

computer connector B **track 11** ⟶ **track 5** of the right-hand mixing motor
computer connector B **track 12** ⟶ **track 6** of the right-hand mixing motor

For the new redesign 2005 computer.
Repair if necessary.

Check the resistance value of the right-hand mixing motor by measuring between:
track 5 and **track 6** of the mixing motor connector; replace the motor if the resistance is not approximately: **36** Ω at 20˚C.

If the fault is still present, **replace** the right-hand mixing motor.

AFTER REPAIR	Follow the instructions to confirm repair. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF019 PRESENT OR STORED	LEFT-HAND MIXING MOTOR CIRCUIT

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the climate control system has been switched on and the left-hand side temperature control has been operated.
	Special notes: The dashboard must be removed to allow access to check the mixer motor.

Connect the universal bornier in place of the computer and check the **resistance value** of the motor as well as the **insulation against earth and against + 12 V** of the connections between:
Track 22 and **track 23** of computer connector B or **tracks 7** and **8** of the new 2005 redesign computer connector B.
The motor should have a resistance of approximately: **36** Ω at 20˚C.

If the value is incorrect, or if the fault is still present due to a poor or loose connection: **remove the dashboard** to gain access to the left-hand mixing motor.

Check **the connection and condition of the** left-hand mixing motor.
Replace the connector if necessary.

Check that the mixing motor flap is not **jammed**.
Repair if necessary.

Connect the universal bornier in place of the computer and check the **insulation, continuity and the absence of interference resistance** of the following connections:

computer connector B **track 22** ⟶ **track 5** of the left-hand mixing motor
computer connector B **track 23** ⟶ **track 6** of the left-hand mixing motor

or:

computer connector B **track 7** ⟶ **track 5** of the left-hand mixing motor
computer connector B **track 8** ⟶ **track 6** of the left-hand mixing motor

For the new redesign 2005 computer.
Repair if necessary.

Check the resistance value of the left-hand mixing motor by measuring between:
track 5 and **track 6** of the mixing motor connector; replace the motor if the resistance is not approximately: **36 Ω** at 20˚C.

If the fault is still present, **replace** the left-hand mixing motor.

AFTER REPAIR	Follow the instructions to confirm repair. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF020 PRESENT	EVAPORATOR TEMPERATURE SENSOR CIRCUIT CO : open circuit CC : short circuit

NOTES	None.

Check **the connection and condition** of the evaporator temperature sensor connector.
Replace the connector if necessary.

Connect the universal bornier in place of the computer and check the **insulation, continuity and the absence of interference resistance** of the following connections:

computer connector B **track 28** → **track 1** of the temperature sensor
computer connector B **track 15** → **track 2** of the temperature sensor

or:

computer connector B **track 13** → **track 1** of the temperature sensor
computer connector B **track 5** → **track 2** of the temperature sensor

For the new redesign 2005 computer.
Repair if necessary.

Check the resistance value of the evaporator temperature sensor by measuring between:
track 1 and **track 2** of the evaporator temperature sensor connector and replace the sensor if the resistance is not approximately: **30 kΩ** at 25˚C.

If the fault is still present, **replace** the evaporator temperature sensor.

AFTER REPAIR	Clear the stored faults. Deal with any other faults.

DF021 PRESENT OR STORED	RECIRCULATION MOTOR CIRCUIT

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the climate control system has been switched on and the recirculation control has been operated. **Special notes:** The air recirculation motor is located beneath the particle filter and the base of the glove compartment must be removed to gain access to it.

Check **the connection and condition** of the air recirculation motor.
Replace the connector if necessary.

Check that the recirculation motor flap is not **jammed**.
Repair if necessary.

Connect the universal bornier in place of the computer and check the **insulation, continuity and the absence of interference resistance** of the following connections:

computer connector B **track 29** → **track A** of the air recirculation motor
computer connector B **track 30** → **track B** of the air recirculation motor

or:

computer connector B **track 14** → **track A** of the air recirculation motor
computer connector B **track 15** → **track B** of the air recirculation motor

For the new redesign 2005 computer.
Repair if necessary.

Check the resistance value of the recirculation motor by measuring between:
track A and **track B** of the recirculation motor connector and replace the motor if the resistance is not approximately: **36** Ω at 20˚C.

If the fault is still present, **replace** the recirculation motor.

AFTER REPAIR	Follow the instructions to confirm repair. Clear the stored faults. Deal with any other faults.

DF026 PRESENT	SOLAR RADIATION SENSOR CIRCUIT CO : open circuit CC : short circuit

NOTES	**Special notes:** The sunlight sensor (a little black button) is located on top of the instrument panel, on the windscreen side.

Check that the solar radiation sensor is not hidden under something (nothing should be placed on top of the sensor).
Check **the connection and condition of the** solar radiation sensor connector. Replace the connector if necessary.
Connect the universal bornier in place of the computer and check the **insulation, continuity and the absence of interference resistance** of the following connections: computer connector A **track 26** ⟶ **track 1** of the solar radiation sensor computer connector A **track 19** ⟶ **track 2** of the solar radiation sensor Repair if necessary.
If the fault is still present, **replace** the solar radiation sensor.

AFTER REPAIR	Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF027 PRESENT	HUMIDITY SENSOR CIRCUIT

NOTES	**Special notes:** The humidity sensor is attached to a printed circuit with the interior temperature sensor. This component is located in the fixed casing below the interior rear-view mirror.

Check **the connection and condition** of the humidity sensor connector.
Replace the connector if necessary.

With the ignition on, check that the humidity sensor fan **is operating correctly**.
If not, check for **+12 V** on **track 1** of the humidity sensor connector and an **earth** on **track 3**.
If the fan supply is correct and the fault is still present, replace the **sensors/fan** (the fan is not available separately).

Connect the universal bornier in place of the computer and check the **insulation, continuity and the absence of interference resistance** of the following connections:
computer connector A **track 26** ⟶ **track 5** of the humidity sensor
computer connector A **track 22** ⟶ **track 6** of the humidity sensor
Repair if necessary.

If the fault is still present, **replace** the humidity sensor.

AFTER REPAIR	Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF028 PRESENT OR STORED	FOOTWELL/VENTILATION DISTRIBUTION MOTOR CIRCUIT

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the climate control has been activated and the air distribution control has been operated.

Connect the universal bornier in place of the computer and check the **resistance value** of the motor as well as the **insulation against earth and against + 12 V** of the connections between:
Track 24 and **track 25** of computer connector B or **tracks 9** and **10** of the new 2005 computer connector B.
The motor should have a resistance of approximately: **36** Ω at 20˚C.

If the value is incorrect, or if the fault is still present due to a poor or loose connection: **remove the dashboard** to gain access to the footwell/ventilation distribution motor.

Check **the connection and condition** of the footwell distribution motor connector.
Replace the connector if necessary.

Check that the distribution motor flap is not **jammed**.
Repair if necessary.

Connect the universal bornier in place of the computer and check the **insulation, continuity and the absence of interference resistance** of the following connections:

computer connector B **track 24** → **track A** of the footwell distribution motor
computer connector B **track 25** → **track B** of the footwell distribution motor
