GETtheMANUALS.org

DF001 PRESENT	COOLANT TEMPERATURE SENSOR CIRCUIT 1.DEF: signal incoherence 2.DEF: voltage outside tolerances 3.DEF: non-compliance with emission control standards

NOTES	**Priority when dealing with a number of faults:** Deal with fault **DF011 Sensor supply voltage no. 1** first if it is present or stored.
	Special note: – the **OBD warning light** is lit, – low-speed fan is operating continuously.

Check the **cleanliness** and **condition** of the coolant temperature sensor and its connections.
Disconnect the battery and the injection computer.
Check the **cleanliness** and **condition** of the connections.
Repair if necessary.

Use the "Universal bornier" to check the **insulation** and **continuity** of the following connections:
For F4R and F4R Turbo engines only.
Computer, connector **B, track F2** → **track B2** of the coolant temperature sensor
Computer, connector **B, track F4** → **track B1** of the coolant temperature sensor
K4M engine only:
Computer, connector **B, track F2** → **track 3** of the coolant temperature sensor
Computer, connector **B, track F4** → **track 2** of the coolant temperature sensor
Repair if necessary.

Measure the **resistance** of the coolant temperature sensor between **tracks B1** and **B2 (F4R and F4R Turbo only)** and between **tracks 2** and **3 (K4M only)**.
Replace the coolant temperature sensor if the **resistance** is not:

12.6 kΩ	**± 1.1 kΩ**	**at a coolant temperature of -10˚C**
2.2 kΩ	**± 112 Ω**	**at a coolant temperature of 25˚C**
810 Ω	**± 39 Ω**	**at a coolant temperature of 50˚C**
282.6 Ω	**± 7.8 Ω**	**at a coolant temperature of 80˚C**
114.6 Ω	**± 2.6 Ω**	**at a coolant temperature of 110˚C**
87.7 Ω	**± 1.9 Ω**	**at a coolant temperature of 120˚C**

If the fault is still present, deal with the other faults then proceed with the conformity check.

AFTER REPAIR	Ensure that all the faults have been dealt with. Clear the stored faults. Do not clear the programming. To check that the system has been properly repaired: – there must be no further electrical faults, – programming has been carried out, – engine hot (minimum 75 ˚C), – run the engine at idling speed with all electrical consumers switched on for approximately 15 minutes. If the fault is still present, continue the fault finding procedure. – perform fault finding on the catalytic converter using the CLIP tool by running command **SC006 Run catalytic converter OBD test**.

GETtheMANUALS.org

DF002 PRESENT	AIR TEMPERATURE SENSOR CIRCUIT 1.DEF: voltage outside tolerances 2.DEF: non-compliance with emission control standards

NOTES	**Priority when dealing with a number of faults:** Deal with fault **DF012 Sensor feed voltage no.2** first, if it is present or stored.
	Special note: – The **OBD warning light** is lit.

Check the **cleanliness** and **condition** of the air temperature sensor and its connections.
Disconnect the battery and the injection computer.
Check the **cleanliness** and **condition** of the connections.
Repair if necessary.

Use the "Universal bornier" to check the **insulation** and **continuity** of the following connections:
Computer, connector **B, track E3** ⟶ **track 2** of the air temperature sensor
Computer, connector **B, track E2** ⟶ **track 1** of the air temperature sensor
Repair if necessary.

Measure the **resistance** of the air temperature sensor between **tracks 1** and **2**.
Replace the air temperature sensor if the **resistance** is not:

9.6 kΩ	**± 1 kΩ**	**at an air temperature of -10˚C**
2 kΩ	**± 0.12 kΩ**	**at an air temperature of 25˚C**
810 Ω	**± 47 Ω**	**at an air temperature of 50˚C**
309 Ω	**± 17 Ω**	**at an air temperature of 80˚C**

If the fault is still present, deal with the other faults then proceed with the conformity check.

AFTER REPAIR	Ensure that all the faults have been dealt with. Clear the stored faults. Do not clear the programming. To check that the system has been properly repaired: – there must be no further electrical faults, – programming has been carried out, – engine hot (minimum 75˚C), – run the engine at idling speed with all electrical consumers switched on for approximately 15 minutes. If the fault is still present, continue the fault finding procedure. – perform fault finding on the catalytic converter using the CLIP tool by running command **SC006 Run catalytic converter OBD test**.

GETtheMANUALS.org

DF003 PRESENT OR STORED	ATMOSPHERIC PRESSURE SENSOR CIRCUIT 1.DEF: signal incoherence 2.DEF: voltage outside tolerance range 3.DEF: non-compliance with emission control standards

NOTES	**Priority when dealing with a number of faults:** Deal with fault **DF012 Sensor feed voltage no.2** first if it is present or stored.
	Conditions for applying the fault finding procedure to stored faults: The fault is considered present if: – switch off the ignition, – switch on the ignition again, – wait **10 seconds** with the engine running at idle speed.
	Special note: – **OBD warning light** and **level 1 fault warning light** comes on, – Defect mode **type 2**: Loss of air flow modulation control, – On **F4R Turbo**, after having carried out fault finding for **DF003**, check **DF004 Turbocharger pressure sensor circuit**.

Check **the cleanliness and condition** of the manifold pressure sensor and its connections.
Repair if necessary.

If the fault is still present, check for **+ 5 V** on **track H2** and for **earth** on **track H4** of connector **B** of the injection computer.
Contact the Techline if it is not correct.

AFTER REPAIR	Ensure that all the faults have been dealt with. Clear the stored faults. Do not clear the programming. To check that the system has been properly repaired: – there must be no further electrical faults, – programming has been carried out, – engine hot (minimum 75˚C), – run the engine at idling speed with all electrical consumers switched on for approximately 15 minutes. If the fault is still present, continue the fault finding procedure. – perform fault finding on the catalytic converter using the CLIP tool by running command **SC006 Run catalytic converter OBD test**.

GETtheMANUALS.org

DF003 CONTINUED	

Disconnect the battery and the injection computer.
Check the **cleanliness and condition** of the connections.
Use the “Universal bornier” to check the **insulation and continuity** of the following connections:
For K4M and F4R engines only:
Computer, connector **B, track H2** → **track C** of the atmospheric pressure sensor
Computer, connector **B, track H3** → **track B** of the atmospheric pressure sensor
Computer, connector **B, track H4** → **track A** of the atmospheric pressure sensor
For F4R Turbo engines only:
Computer, connector **B, track H2** → **track 1** of the atmospheric pressure sensor
Computer, connector **B, track H3** → **track 3** of the atmospheric pressure sensor
Computer, connector **B, track H4** → **track 2** of the atmospheric pressure sensor
Repair if necessary.

If the fault is still present, deal with the other faults then proceed with the conformity check.

AFTER REPAIR	Ensure that all the faults have been dealt with. Clear the stored faults. Do not clear the programming. To check that the system has been properly repaired: – there must be no further electrical faults, – programming has been carried out, – engine hot (minimum 75 ˚C), – run the engine at idling speed with all electrical consumers switched on for approximately 15 minutes. If the fault is still present, continue the fault finding procedure. – perform fault finding on the catalytic converter using the CLIP tool by running command **SC006 Run catalytic converter OBD test**.

GETtheMANUALS.org

DF004 PRESENT OR STORED	TURBOCHARGING PRESSURE SENSOR CIRCUIT 1.DEF: voltage outside tolerances 2.DEF: data inconsistency 3.DEF: non-compliance with emission control standards

NOTES	**Priority when dealing with a number of faults:** Deal with fault **DF012 Sensor feed voltage no.2** first, if it is present or stored.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present after the ignition is switched on or with then engine running at an engine speed above **600 rpm**.
	Special note: – For **F4R-T** engines only, – the **OBD warning light** is lit, – Defect mode **types 5 and 6** for the throttle valve.

Check the **cleanliness**, **condition** and **fitting** of the turbocharger pressure sensor.
Repair if necessary.

If the fault is still present, manipulate the harness in order to note a change in fault status (present → stored).
Look for any damage to the wiring harness, and check the **condition and connection** of the connectors of the injection computer and turbocharger pressure sensor.
Repair if necessary.

If the fault is still present, check for **+ 5 V** on **track G1** and for **earth** on **track E1** of connector **B** of the injection computer.
Contact the Techline if it is not correct.

If the fault is still present, disconnect the battery and the injection computer.
Check the **insulation, continuity and the absence of interference resistance** on the following connections:

Computer connector **B, track E1** ⟶ **track A** of the pressure sensor
Computer connector **B, track F1** ⟶ **track B** of the pressure sensor
Computer connector **B, track G1** ⟶ **track C** of the pressure sensor

Repair if necessary.

If the fault is still present, deal with the other faults then proceed to the conformity check.

AFTER REPAIR	Ensure that all the faults have been dealt with. Clear the stored faults. Do not clear the programming. To check that the system has been properly repaired: – there must be no further electrical faults, – programming has been carried out, – engine hot (minimum 75˚C), – run the engine at idling speed with all electrical consumers switched on for approximately 15 minutes. If the fault is still present, continue the fault finding procedure. – perform fault finding on the catalytic converter using the CLIP tool by running command **SC006 Run catalytic converter OBD test**.

S3000_V08_DF004

GETtheMANUALS.org

DF011 PRESENT OR STORED	SENSOR SUPPLY VOLTAGE NO. 1 1.DEF: voltage outside tolerances 2.DEF: internal electronic fault

NOTES	**Special note:** – **level 1 fault warning light** illuminated, – defect mode **type 4** for the throttle valve.

Check the **cleanliness** and **condition** of the throttle valve connections.
Check the **cleanliness** and **condition** of the pedal potentiometer connections.
Disconnect the battery and the injection computer.
Check the **cleanliness** and **condition** of the connections.
Repair if necessary.

Sensor feed No. 1 is reserved for the following components:
– motorised throttle valve,
– pedal potentiometer gang 1,
– motorised throttle potentiometer gang 1 and 2.

To locate any internal fault on one of the sensors with a 5 V supply (short circuit), disconnect each of the sensors on the list above in turn, checking after each disconnection whether the fault changes status from present to stored.
If the faulty sensor is located, check its connections and that it is in order.
Replace the faulty sensor if necessary.

Use the "Universal bornier" to check the **insulation** and **continuity** of the following connections:
Computer, connector **B, track G3** ⟶ **track 2** of the motorised throttle valve gang 1
Computer, connector **B, track D3** ⟶ **track 6** of the motorised throttle valve gang 2
Computer, connector **B, track G2** ⟶ **track 5** of the throttle valve
Computer, connector **A, track G2** ⟶ **track 4** of the pedal potentiometer gang 1
Repair if necessary.

If the fault is still present, there is a computer fault, contact the Techline.

AFTER REPAIR	Ensure that all the faults have been dealt with. Clear the stored faults. Do not clear the programming. To check that the system has been properly repaired: – there must be no further electrical faults, – programming has been carried out, – engine hot (minimum 75˚C), – run the engine at idling speed with all electrical consumers switched on for approximately 15 minutes. If the fault is still present, continue the fault finding procedure. – perform fault finding on the catalytic converter using the CLIP tool by running command **SC006 Run catalytic converter OBD test**.

S3000_V08_DF011

GETtheMANUALS.org

DF012 PRESENT OR STORED	SENSOR SUPPLY VOLTAGE No. 2 1.DEF: voltage outside tolerances 2.DEF: internal electronic fault

NOTES	**Special note:** – **Level 1 fault warning light** illuminated, – Defect mode **type 4** for the throttle valve.

Check the **cleanliness** and **condition** of the throttle valve connections.
Check the **cleanliness** and **condition** of the pedal potentiometer connections.
Disconnect the battery and the injection computer.
Check the **cleanliness** and **condition** of the connections.
Repair if necessary.

Sensor feed no. 2 is reserved for the following components:
– pedal potentiometer gang 2,
– manifold pressure sensor.

To locate any internal fault on one of the sensors with a 5 V supply (short circuit), disconnect each of the sensors on the list above in turn, checking after each disconnection whether the fault changes status from present to stored.
If the faulty sensor is located, check its connections and that it is in order.
Replace the faulty sensor if necessary.

Use the "Universal bornier" to check the **insulation** and **continuity** of the following connections:
For K4M and F4R engines only:
Computer, connector **A, track F2** ⟶ **track 5** of the pedal potentiometer gang 2
Computer, connector **B, track H2** ⟶ **track C** of the manifold pressure sensor
For F4R Turbo engines only:
Computer, connector **A, track F2** ⟶ **track 5** of the pedal potentiometer gang 2
Computer, connector **B, track H2** ⟶ **track 1** of the manifold pressure sensor
Repair if necessary.

If the fault is still present, contact the Techline.

AFTER REPAIR	Ensure that all the faults have been dealt with. Clear the stored faults. Do not clear the programming. To check that the system has been properly repaired: – there must be no further electrical faults, – programming has been carried out, – engine hot (minimum 75°C), – run the engine at idling speed with all electrical consumers switched on for approximately 15 minutes. If the fault is still present, continue the fault finding procedure. – perform fault finding on the catalytic converter using the CLIP tool by running command **SC006 Run catalytic converter OBD test**.

GETtheMANUALS.org

DF018 PRESENT OR STORED	LOW SPEED FAN ASSEMBLY CONTROL CIRCUIT CC.0: short circuit to earth CC.1: short circuit to + 12 V

NOTES	**Priorities when dealing with a number of faults:** If fault **DF001 Coolant temperature sensor circuit** and **DF084 Actuator relay circuit** are present or stored, deal with them first.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present with the engine running or when running command **AC038 Low speed fan assembly relay**.
	Special notes: Status **ET143 Low speed fan assembly control** can help deal with this fault. **Level 2 fault warning light** illuminated.

Manipulate the wiring harness between the injection computer and the low speed fan assembly relay in order to note a change in status (present ↔ stored).
Look for possible damage to the wiring harness, check the connection and condition of the low-speed fan unit relay and its connections.
Replace the connector if necessary.

Disconnect the relay.
With the ignition on, check for **+ 12 volts** on **track 1** of the low speed fan assembly relay.
If there is no **+ 12 V** feed, use the "Universal bornier" to check the **continuity** of the following connections:

Injection computer,connector **B, track M2** → **track 1** of the low speed fan assembly relay
Main relay **track 5** →

Repair if necessary.

Check the **insulation and continuity** of the connection between:
Computer, connector C, **track G2** → **track 2** of the low speed fan assembly relay
Repair if necessary.

With the ignition on, check for **earth** on **track 2** of the low speed fan assembly relay.
If, with the ignition on, the computer does not control the low speed fan assembly relay on **track 2** through an earth, contact the Techline.

AFTER REPAIR	Ensure that all the faults have been dealt with. Clear the stored faults. Do not clear the programming. To check that the system has been properly repaired: – there must be no further electrical faults, – programming has been carried out, – engine hot (minimum 75˚C), – run the engine at idling speed with all electrical consumers switched on for approximately 15 minutes. If the fault is still present, continue the fault finding procedure. – perform fault finding on the catalytic converter using the CLIP tool by running command **SC006 Run catalytic converter OBD test**.

S3000_V08_DF018

GETtheMANUALS.org

DF019 PRESENT OR STORED	HIGH SPEED FAN ASSEMBLY CONTROL CIRCUIT CC.0: short circuit to earth CC.1: short circuit to + 12 V

NOTES	**Priorities when dealing with a number of faults:** Deal with fault **DF084 Actuator relay control circuit** first if it is present or stored.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present with the engine running or when running command **AC039 High speed fan assembly relay**.
	Special notes: Status **ET144 High speed fan assembly relay control** can help deal with this fault. **Level 2 fault warning light** illuminated.

Manipulate the wiring harness between the injection computer and the high speed fan assembly relay in order to note a change in status (present ↔ stored).
Look for possible damage to the wiring harness, check the connection and condition of the high-speed fan assembly relay and its connections.
Replace the connector if necessary.

Disconnect the relay.
With the ignition on, check for **+ 12 V** on **track 1** of the high speed fan assembly relay.
If there is no **+ 12 V** feed, use the "universal bornier" to check the **continuity** of the following connections:

Injection computer,connector **B, track M2** → **track 1** of the high speed fan assembly relay
Main relay **track 5** →

Repair if necessary.

Check the **insulation and continuity** of the connection between:

Computer, connector **C, track J2** → **track 2** of the high speed fan assembly relay

Repair if necessary.

With the ignition on, check for **earth** on **track 2** of the high speed fan assembly relay.
If, with the ignition on, the computer does not control the high speed fan assembly relay on **track 2** through an earth, contact the Techline.

AFTER REPAIR	Ensure that all the faults have been dealt with. Clear the stored faults. Do not clear the programming. To check that the system has been properly repaired: – there must be no further electrical faults, – programming has been carried out, – engine hot (minimum 75˚C), – run the engine at idling speed with all electrical consumers switched on for approximately 15 minutes. If the fault is still present, continue the fault finding procedure. – perform fault finding on the catalytic converter using the CLIP tool by running command **SC006 Run catalytic converter OBD test**.

GETtheMANUALS.org

DF026 PRESENT OR STORED	CYLINDER 1 INJECTOR CONTROL CIRCUIT CO: open circuit CC.0: short circuit to earth CC.1: short circuit to + 12 V 1.DEF: non-compliance with emission control standards

NOTES	**Priority when dealing with a number of faults:** Deal with faults **DF084 Actuator relay control circuit** or **DF046 Battery voltage** first if they are present or stored.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present after the engine has been running for a timed period of **10 seconds**.
	Special note: – **OBD warning light** illuminated.

Check the **cleanliness** and **condition** of the cylinder 1 injector and its connections.
Repair if necessary.

With the ignition on, check for **+ 12 V** on **track 1** of the cylinder 1 injector connector.
If there is no **+ 12 V** feed, use the "universal bornier" to check the **continuity** of the following connections:
Injection computer, connector **B, track M2** → **track 1** of the cylinder 1 injector
Main relay **track 5** →
Repair if necessary.

Disconnect the battery and the injection computer.
Check the **cleanliness** and **condition** of the connections.
Repair if necessary.

Use the "Universal bornier" to check the **insulation and continuity** on the following connection:
Computer, connector **B, track A1** → **track 2** of cylinder 1 injector
Repair if necessary.

Measure the **resistance** of cylinder 1 injector between **tracks 1** and **2**.
Replace the cylinder 1 injector if the **resistance** is not **12 Ω ± 0.6 Ω at 20˚C (only for F4R□Turbo)** and **14.5 Ω ± 0.75 Ω at 20˚C (only for K4M and F4R)**.

If the fault is still present, replace the cylinder 1 injector.
If the fault is still present, deal with the other faults then proceed with the conformity check.

AFTER REPAIR	Ensure that all the faults have been dealt with. Clear the stored faults. Do not clear the programming. To check that the system has been properly repaired: – there must be no further electrical faults, – programming has been carried out, – engine hot (minimum 75˚C), – run the engine at idling speed with all electrical consumers switched on for approximately 15 minutes. If the fault is still present, continue the fault finding procedure. – perform fault finding on the catalytic converter using the CLIP tool by running command **SC006 Run catalytic converter OBD test**.

GETtheMANUALS.org

DF027 PRESENT OR STORED	CYLINDER 2 INJECTOR CONTROL CIRCUIT CO: open circuit CC.0: short circuit to earth CC.1: short circuit to + 12 V 1.DEF: non-compliance with emission control standards

NOTES	**Priority when dealing with a number of faults:** Deal with faults **DF084 Actuator relay control circuit** or **DF046 Battery voltage** first if they are present or stored.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present after the engine has been running for a timed period of **10 seconds**.
	Special note: – **OBD warning light** illuminated.

Check the **cleanliness** and **condition** of the cylinder 2 injector and its connections.
Repair if necessary.

With the ignition on, check for **+ 12 V** on **track 1** of the cylinder 2 injector connector.
If there is no **+ 12 V** feed, use the "universal bornier" to check the **continuity** of the following connections:

Injection computer,connector **B, track M2** → **track 1** of cylinder 2 injector
Main relay **track 5** →

Repair if necessary.

Disconnect the battery and the injection computer.
Check the **cleanliness** and **condition** of the connections.
Repair if necessary.

Use the "Universal bornier" to check the **insulation and continuity** on the following connection:

Computer, connector **B, track A2** → **track 2** of the cylinder 2 injector

Repair if necessary.

Measure the **resistance** of cylinder 2 injector between **tracks 1** and **2**.
Replace the cylinder 2 injector if the **resistance** is not **12 Ω ± 0.6 Ω at 20˚C (only for F4R□Turbo)** and **14.5 Ω ± 0.75 Ω at 20˚C (only for K4M and F4R)**.

If the fault is still present, replace the cylinder 2 injector.
If the fault is still present, deal with the other faults then proceed with the conformity check.

AFTER REPAIR	Ensure that all the faults have been dealt with. Clear the stored faults. Do not clear the programming. To check that the system has been properly repaired: – there must be no further electrical faults, – programming has been carried out, – engine hot (minimum 75˚C), – run the engine at idling speed with all electrical consumers switched on for approximately 15 minutes. If the fault is still present, continue the fault finding procedure. – perform fault finding on the catalytic converter using the CLIP tool by running command **SC006 Run catalytic converter OBD test**.

GETtheMANUALS.org

DF028 PRESENT OR STORED	CYLINDER 3 INJECTOR CONTROL CIRCUIT CO: open circuit CC.0: short circuit to earth CC.1: short circuit to + 12 V 1.DEF: non-compliance with emission control standards

NOTES	**Order of priority in the event of more than one fault:** Deal with faults **DF084 Actuator relay control circuit** or **DF046 Battery voltage** first if they are present or stored.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present after the engine has been running for a timed period of **10 seconds**.
	Special note: – **OBD warning light** illuminated.

Check the **cleanliness and condition** of the cylinder 3 injector and its connections.
Repair if necessary.

With the ignition on, check for **+ 12 V** on **track 1** of the cylinder 3 injector connector.
If there is no **+ 12 V** feed, use the "universal bornier" to check the **continuity** of the following connections:
Injection computer,connector **B, track M2** → **track 1** of the cylinder 3 injector
Main relay **track 5** →
Repair if necessary.

Disconnect the battery and the injection computer.
Check the **cleanliness** and **condition** of the connections.
Repair if necessary.

Use the "Universal bornier" to check the **insulation and continuity** on the following connection:
Computer, connector **B, track A3** → **track 2** of the cylinder 3 injector
Repair if necessary.

Measure the **resistance** of cylinder 3 injector between **tracks 1** and **2**.
Replace the cylinder 3 injector if the**resistance** is not **12 Ω ± 0.6 Ω at 20˚C (only for F4R□Turbo)** and**14.5 Ω ± 0.75 Ω at 20˚C (only for K4M and F4R)**.

If the fault is still present, replace the cylinder 3 injector.
If the fault is still present, deal with the other faults then proceed with the conformity check.

AFTER REPAIR	Ensure that all the faults have been dealt with. Clear the stored faults. Do not clear the programming. To check that the system has been properly repaired: – there must be no further electrical faults, – programming has been carried out, – engine hot (minimum 75˚C), – run the engine at idling speed with all electrical consumers switched on for approximately 15 minutes. If the fault is still present, continue the fault finding procedure. – perform fault finding on the catalytic converter using the CLIP tool by running command **SC006 Run catalytic converter OBD test**.

DF029 PRESENT OR STORED	INJECTOR CYLINDER 4 CONTROL CIRCUIT CO: open circuit CC.0: short circuit to earth CC.1: short circuit to + 12 V 1.DEF: non-compliance with emission control standards

NOTES	**Order of priority in the event of more than one fault:** Deal with faults **DF084 Actuator relay control circuit** or **DF046 Battery voltage** first if they are present or stored.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present after the engine has been running for a timed period of **10 seconds**.
	Special note: – **OBD warning light** illuminated.

Check the **cleanliness** and **condition** of the cylinder 4 injector and its connections.
Repair if necessary.

With the ignition on, check for **+ 12 V** on **track 1** of the cylinder 4 injector connector.
If there is no **+ 12 V** feed, use the "universal bornier" to check the **continuity** of the following connections:

Injection computer, connector **B , track M2** → **track 1** of the cylinder 4 injector
Main relay **track 5** →

Repair if necessary.

Disconnect the battery and the injection computer.
Check the **cleanliness** and **condition** of the connections.
Repair if necessary.

Use the "Universal bornier" to check the **insulation and continuity** on the following connection:

Computer, connector **B, track A4** → **track 2** of the cylinder 3 injector

Repair if necessary.

Measure the **resistance** of cylinder 4 injector between **tracks 1** and **2**.
Replace the cylinder 4 injector if the **resistance** is not **12 Ω ± 0.6 Ω at 20˚C (only for F4R Turbo)** and **14.5 Ω ± 0.75 Ω at 20˚C (only for K4M and F4R)**.

If the fault is still present, replace the cylinder 4 injector.
If the fault is still present, deal with the other faults then proceed with the conformity check.

AFTER REPAIR	Ensure that all the faults have been dealt with. Clear the stored faults. Do not clear the programming. To check that the system has been properly repaired: – there must be no further electrical faults, – programming has been carried out, – engine hot (minimum 75˚C), – run the engine at idling speed with all electrical consumers switched on for approximately 15 minutes. If the fault is still present, continue the fault finding procedure. – perform fault finding on the catalytic converter using the CLIP tool by running command **SC006 Run catalytic converter OBD test**.

GETtheMANUALS.org

DF038 PRESENT	COMPUTER 1.DEF: electronic fault inside computer 2.DEF: accelerator pedal sensor circuit fault 3.DEF: torque reduction 4.DEF: downstream sensor activity 5.DEF: non-compliance with emission control standards

NOTES	**Priority when dealing with a number of faults:** Deal with the other faults first. **Special note:** – the **OBD warning light** is lit, – defect mode **types 1 to 6** for the throttle valve.

Contact Techline.

AFTER REPAIR	Ensure that all the faults have been dealt with. Clear the stored faults. Do not clear the programming. To check that the system has been properly repaired: – there must be no further electrical faults, – programming has been carried out, – engine hot (minimum 75˚C), – run the engine at idling speed with all electrical consumers switched on for approximately 15 minutes. If the fault is still present, continue the fault finding procedure. – perform fault finding on the catalytic converter using the CLIP tool by running command **SC006 Run catalytic converter OBD test**.

GETtheMANUALS.org

DF046 PRESENT	BATTERY VOLTAGE 1.DEF: voltage outside tolerances

NOTES	**Priority when dealing with a number of faults:** Apply the procedure for dealing with fault **DF084 Actuator relay control circuit** first if it is present or stored.

Disconnect the battery and the injection computer.
Check the **cleanliness** and **condition** of the computer connections.
Repair if necessary.

Use the Universal bornier to check **the continuity** of the following connections:
Computer,connector **B, track M2** ⟶ **track 5** of the main relay
Computer,connector **B, track D4** ⟶ **track 2** of the main relay
Repair if necessary.

– clean the battery terminals and all connections to the **+** and the **earth**.
– check the battery voltage.
– check the charging circuit (see **MR 395, Mechanical, 16A, Starting - Charging**).
Repair or replace the faulty components, if necessary.

AFTER REPAIR	Ensure that all the faults have been dealt with. Clear the stored faults. Do not clear the programming. To check that the system has been properly repaired: – there must be no further electrical faults, – programming has been carried out, – engine hot (minimum 75˚C), – run the engine at idling speed with all electrical consumers switched on for approximately 15 minutes. If the fault is still present, continue the fault finding procedure. – perform fault finding on the catalytic converter using the CLIP tool by running command **SC006 Run catalytic converter OBD test**.

GETtheMANUALS.org

DF054 PRESENT OR STORED	TURBOCHARGING SOLENOID VALVE CONTROL CIRCUIT CO: open circuit CC.0: short circuit to earth CC.1: short circuit to + 12 V

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the ignition is switched on or with then engine running at an engine speed above **600 rpm**.
	Special note: – for **F4R-Turbo** only, – the **OBD warning light** is lit, – defect mode **type 6** for the throttle valve.

Check the **cleanliness**, **condition** and **fitting** of the turbocharging solenoid valve.
Repair if necessary.

If the fault is still present, manipulate the harness in order to note a change in fault status (present → stored).
Look for possible damage to the wiring harness, check the **condition and connection** of the connectors of the injection computer and turbocharging solenoid valve.
Repair if necessary.

If the fault is still present, check (with the ignition on) for **+ 12 V** on **track 2** of the turbocharging solenoid valve.
If there is no **+ 12 V**, check the **insulation, continuity and the absence of interference resistance** on the following connections:

Injection computer,connector **B, track M2** → **track 2** of the turbocharging solenoid valve
Main relay **track 5** →

Repair if necessary.

If the fault is still present, disconnect the battery and the injection computer.
Check the **insulation, continuity and absence of interference resistance** on the following connection:

Computer, connector **C, track G4** → **track 1** of the turbocharging solenoid valve

Repair if necessary.

If the fault is still present, measure the **resistance** of the turbocharging solenoid valve between **tracks 1** and **2**.
Replace the turbocharging solenoid valve if the **resistance** is not **30 Ω ± 2 Ω at 23˚C**.

If the fault is still present, deal with the other faults then proceed to the conformity check.

AFTER REPAIR	Ensure that all the faults have been dealt with. Clear the stored faults. Do not clear the programming. To check that the system has been properly repaired: – there must be no further electrical faults, – programming has been carried out, – engine hot (minimum 75˚C), – run the engine at idling speed with all electrical consumers switched on for approximately 15 minutes. If the fault is still present, continue the fault finding procedure. – perform fault finding on the catalytic converter using the CLIP tool by running command **SC006 Run catalytic converter OBD test**.

GETtheMANUALS.org

DF059 PRESENT OR STORED	COMBUSTION MISFIRES ON CYLINDER 1 1.DEF: destructive misfiring 2.DEF: pollutant misfiring 3.DEF: non-compliance with emission control standards

NOTES	**Priority when dealing with a number of faults:** – ignition: **DF460, DF461, DF462** and **DF463**, – fuel supply circuit: **DF026, DF027, DF028, DF029** and **DF085**, – flywheel signal: **DF154** and **DF457**. Check whether there are other cylinders with a "Combustion misfire" fault reported by the tool before starting the following fault finding procedure.
	Conditions for applying the fault finding procedure to stored faults: The fault is considered present under the following conditions: – there must be no further electrical faults, – programming must be carried out. – engine warm (min 75˚), – engine idling with all electrical consumers switched on for approximately 15 minutes.
	Special note: – **OBD warning light** illuminated.

Misfiring on cylinder 1 only	The fault is probably due to a component that can only affect this cylinder: – check the cylinder 1 injector – check the condition and conformity of the spark plugs, – check the cylinder 1 pencil coil. If everything is in order, check the same components on cylinder 4 (to cover a possible cylinder recognition error).
Combustion misfires in cylinders 1 and 4 (see DF059 Combustion misfires in cylinder 1 and DF062 Combustion misfires in cylinder 4)	The fault is probably due to a component that affects a pair of cylinders: – check the ignition coil circuit concerned (apply the interpretation of fault **DF460 Cylinder no. 1 coil control** or **DF463 Cylinder no. 4 coil control**), – check the condition and conformity of the spark plugs.

AFTER REPAIR	Ensure that all the faults have been dealt with. Clear the stored faults. Do not clear the programming. To check that the system has been properly repaired: – there must be no further electrical faults, – programming has been carried out, – engine hot (minimum 75˚C), – run the engine at idling speed with all electrical consumers switched on for approximately 15 minutes. If the fault is still present, continue the fault finding procedure. – perform fault finding on the catalytic converter using the CLIP tool by running command **SC006 Run catalytic converter OBD test**.

S3000_V08_DF059

GETtheMANUALS.org

DF059 CONTINUED	

Combustion misfires on all four cylinders (see DF060, DF061 and DF062)	The fault is probably due to a component affecting all the cylinders: – check that the correct fuel is being used, – check the condition and conformity of the spark plugs.

If the fault is still present, carry out the following checks:
– check the flywheel sensor,
– check the condition and cleanliness of the flywheel,
– check the flywheel sensor mounting,
– check the sensor/flywheel air gap,
– check the cylinder compression's,
– check the entire petrol supply circuit (see **MR 395, Mechanical, 13A, Fuel supply**),
– check the entire ignition system (see **MR 395, Mechanical, 17A, Ignition**),
– check the hydraulic tappets if there is camshaft noise (see **MR 395, Mechanical, 11A, Top and front of engine**).

If the fault is still present, deal with the other faults then proceed with the conformity check.

AFTER REPAIR	Ensure that all the faults have been dealt with. Clear the stored faults. Do not clear the programming. To check that the system has been properly repaired: – there must be no further electrical faults, – programming has been carried out, – engine hot (minimum 75˚C), – run the engine at idling speed with all electrical consumers switched on for approximately 15 minutes. If the fault is still present, continue the fault finding procedure. – perform fault finding on the catalytic converter using the CLIP tool by running command **SC006 Run catalytic converter OBD test**.

GETtheMANUALS.org

DF060 PRESENT OR STORED	MISFIRING ON CYLINDER 2 1.DEF: destructive misfiring 2.DEF: pollutant misfiring 3.DEF: non-compliance with emission control standards

NOTES	**Priority when dealing with a number of faults:** – ignition: **DF460, DF461, DF462** and **DF463**, – fuel supply circuit: **DF026, DF027, DF028, DF029** and **DF085**, – flywheel signal: **DF154** and **DF457**. Check whether there are other cylinders with a "Combustion misfire" fault reported by the tool before starting the following fault finding procedure.
	Conditions for applying the fault finding procedure to stored faults: The fault is considered present under the following conditions: – there must be no further electrical faults, – programming must be carried out, – engine warm (min 75˚), – engine idling with all electrical consumers switched on for approximately 15 minutes.
	Special note: – **OBD warning light** illuminated.

Combustion misfires in cylinder 2 only	The fault is probably due to a component that can only affect this cylinder: – check the cylinder 2 injector – check the condition and conformity of the spark plugs, – check the cylinder 2 pencil coil. If everything is in order, check the same components on cylinder 3 (to correct a possible cylinder identification error).
Misfires in cylinders 2 and 3 (see DF060 Misfires in cylinder 2 and DF061 Misfires in cylinder 3)	The fault is probably due to a component that affects a pair of cylinders: – check the ignition coil circuit concerned (apply the interpretation of fault **DF461 Cylinder no. 2 coil control** or **DF462 Cylinder no. 3 coil control**), – check the condition and conformity of the spark plugs.

AFTER REPAIR	Ensure that all the faults have been dealt with. Clear the stored faults. Do not clear the programming. DF079 PRESENT OR STORED	MOTORISED THROTTLE VALVE SERVO 1.DEF: detection of micro-cuts 2.DEF: motorised throttle stop search fault 3.DEF: safe mode 4.DEF: faulty flap return spring 5.DEF: motorised throttle valve flap vibrating 6.DEF: motorised throttle servo fault 7.DEF: inlet supply circuit

NOTES	**Priority when dealing with a number of faults:** Deal with faults **DF011 Sensor feed voltage no. 1, DF508 Motorised throttle control, DF095 Throttle potentiometer circuit gang 1** and **DF096 Throttle potentiometer circuit gang 2** first if they are present or stored.
	Conditions for applying the fault finding procedure to stored faults: The fault is considered present if: – the engine speed varies, – the engine air temperature is between **5˚C** and **105˚C**.
	Special note: Defect mode **types 1 and 2**: Limited engine speed

Check the **cleanliness**, **condition** and **fitting** of the throttle valve.
Repair if necessary.

If the fault is still present, manually check that the throttle valve **rotates correctly**.
Repair if necessary.

If the fault is still present, manipulate the harness to detect a change in status (present ↔ stored).
Look for possible damage to the wiring harness, check the **condition** and the **connection** of the connectors of the injection computer and motorised throttle valve.
Repair if necessary.

If the fault is still present, disconnect the battery and the injection computer.
Check **the insulation**, **continuity** and the **absence of interference resistance** on the following connections:

Computer, connector **B, track M3** → **track 3** of the motorised throttle valve
Computer, connector **B, track M4** → **track 5** of the motorised throttle valve
Computer, connector **B, track G4** → **track 6** of the motorised throttle valve
Computer, connector **B, track G3** → **track 1** of the motorised throttle valve
Computer, connector **B, track G2** → **track 2** of the motorised throttle valve
Computer, connector **B, track D3** → **track 4** of the motorised throttle valve

Repair if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

DF081 PRESENT OR STORED	CANISTER BLEED SOLENOID VALVE CIRCUIT CO: open circuit CC.0: short circuit to earth CC.1: short circuit to + 12 V 1.DEF: non-compliance with emission control standards

NOTES	**Priority when dealing with a number of faults:** Deal with faults **DF084 Actuator relay control circuit** or **DF046 Battery voltage** first if they are present or stored.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present after the ignition has been switched on.
	Special note: – **OBD warning light** illuminated.

Check that fuse **F8 (10A)** is in **good condition and is working correctly**. Repair if necessary.
Check **the cleanliness** and **condition** of the connections of the fuel vapour absorber bleed solenoid valve. Repair if necessary.
Measure the **resistance** of the fuel vapour absorber bleed solenoid valve. Replace the fuel vapour absorber bleed solenoid valve if the **resistance** is not **26** Ω ± 4 Ω αττ 23⌋X.
Check for **+ 12 V** on **track 1** of the connector of the fuel vapour absorber bleed solenoid valve, with the ignition on. Use the "Universal bornier" to check the **insulation** and **continuity** on the following connection: Computer, connector **B, track M2** ⟶ **track 1** of the fuel vapour absorber bleed solenoid valve Main relay **track 5** Repair if necessary.
Disconnect the battery. Disconnect the computer. Check the **cleanliness** and **condition** of the connections. Use the "Universal bornier" to check the **insulation** and **continuity** on the following connection: Computer, connector **C, track F2** ⟶ **track 2** of the fuel vapour absorber bleed solenoid valve Repair if necessary.
If the fault is still present, deal with the other faults then proceed with the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF082 PRESENT OR STORED	UPSTREAM OXYGEN SENSOR HEATING CIRCUIT CO: open circuit CC.0: short circuit to earth CC.1: short circuit to + 12 V 1.DEF: non-compliance with emission control standards

NOTES	**Priority when dealing with a number of faults:** Deal with faults **DF084 Actuator relay control circuit** or **DF046 Battery voltage** first if they are present or stored.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present after the engine has been running for a timed period of **10 seconds**.
	Special note: – **OBD warning light** illuminated.

Check the **cleanliness** and **condition** of the upstream oxygen sensor connections. Repair if necessary.
With the ignition on, check for **+ 12 V** on **track A** of the upstream oxygen sensor connector. Use the "Universal bornier" to check the **insulation** and **continuity** on the following connection: Computer, connector **B, track M2** ⟶ **track A** of the upstream oxygen sensor Repair if necessary.
Disconnect the battery and the injection computer. Check the **cleanliness** and **condition** of the connections. Use the "Universal bornier" to check the **insulation** and **continuity** on the following connection: Computer, connector **C, track L2** ⟶ **track B** of the upstream oxygen sensor Repair if necessary.
Measure the heating **resistance** between **tracks A** and **B** of the upstream oxygen sensor. Replace the upstream oxygen sensor if the **resistance** is not **9 Ω ± 0.5 Ω at 20˚C**.
If the fault is still present, deal with the other faults then proceed with the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF083 PRESENT OR STORED	DOWNSTREAM OXYGEN SENSOR HEATING CIRCUIT CO: open circuit CC.0: short circuit to earth CC.1: short circuit to + 12 V 1.DEF: non-compliance with emission control standards

NOTES	**Priority when dealing with a number of faults:** Deal with faults **DF084 Actuator relay control circuit** or **DF046 Battery voltage** first if they are present or stored.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present after the engine has been running for a timed period of **10 seconds**.
	Special note: – **OBD warning light** illuminated.

Check **the cleanliness** and **condition** of the downstream oxygen sensor connections.
Repair if necessary.

Check for **+ 12 V** on **track A** of the downstream oxygen sensor connector with the ignition on.
Use the "Universal bornier" to check the **insulation and continuity** on the following connection:
Computer, connector **B, track M2** ⟶ **track A** of the downstream oxygen sensor
Repair if necessary.

Disconnect the battery and the injection computer.
Check the **cleanliness** and **condition** of the connections.
Use the "Universal bornier" to check the **insulation and continuity** on the following connection:
Computer, connector **C, track L3** ⟶ **track B** of the downstream oxygen sensor
Repair if necessary.

Measure the heating **resistance** between **tracks A** and **B** of the downstream oxygen sensor.
Replace the downstream oxygen sensor if the **resistance** is not **9 Ω ± 0.5 Ω at 20°C**.

If the fault is still present, deal with the other faults then proceed with the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF084 PRESENT OR STORED	ACTUATOR RELAY CONTROL CIRCUIT 1.DEF: open circuit or short circuit

NOTES	None.

Disconnect the battery and the injection computer.
Check the **cleanliness** and **condition** of the computer connections.
Check the **cleanliness** and **condition** of the UCH computer connections.
Repair if necessary.

Use the "Universal bornier" to check the **insulation** and **continuity** on the following connection:
Computer,connector **B, track D4** ⟶ **track 2** of the main relay
Repair if necessary.

If the fault is still present, carry out fault finding on the UCH (see **87G, Connection unit**).
Contact Techline.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF085 PRESENT OR STORED	FUEL PUMP RELAY CONTROL CIRCUIT CO: open circuit CC.0: short circuit to earth CC.1: short circuit to + 12 V 1.DEF: non-compliance with emission control standards

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the ignition has been switched on.
	Special note: – **OBD warning light** illuminated.

Disconnect the battery and the injection computer.
Check the **cleanliness** and **condition** of the computer connections.
Check the **cleanliness** and **condition** of the connections of the fuel pump relay connector.
Repair if necessary.

Use the "Universal bornier" to check the **insulation** and **continuity** on the following connection:
Computer, connector **C, track D1** ⟶ **track 2** of the fuel pump relay
Repair if necessary.

If the fault is still present, contact the Techline.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF087 PRESENT OR STORED	AIR PUMP RELAY CONTROL CIRCUIT CO: open circuit CC.0: short circuit to earth CC.1: short circuit to + 12 V 1.DEF: non-compliance with emission control standards

IMPORTANT
If the fault is stored, do not clear it; there may be an OBD fault (On Board Diagnostic).
Refer to the Current environment on the diagnostic tool.
If status **ET049** is **ACTIVE**, carry out the fault finding procedure below.

NOTES	**Order of priority in the event of more than one fault:** If faults **DF198 Pedal sensor circuit gang 2** or **DF046 Battery voltage** are present, deal with them first.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present after the ignition has been switched on.
	Special note: Only for **F4R Turbo** engines equipped with an **automatic transmission**.

Check the **cleanliness**, **condition** and **fitting** of the air pump relay.
Repair or replace the air pump relay if necessary.

If the fault is still present with the ignition on, check for **earth** on **track 2** of the air pump relay.
If, with the ignition on, the computer does not control the air pump relay on **track 2** through an earth, contact the Techline.

If the fault is still present, check (with the ignition on) for **+ 12 V** on **track 1** of the air pump relay.
Check the **insulation, continuity and the absence of interference resistance** between the following connections:

Injection computer,connector **B, track M2** → **track 1** of the air pump relay
Main relay **track 5** →

Repair if necessary.

If the fault is still present, disconnect the battery and the injection computer.
Check the **insulation, continuity and the absence of interference resistance** between the following connections:

Computer, connector **C, track H2** → **track 2** of the air pump relay

Repair if necessary.

If the fault is still present, deal with the other faults then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF091 PRESENT OR STORED	VEHICLE SPEED SIGNAL 1.DEF: voltages outside tolerance range 2.DEF: non-compliance with emission control standards

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present with the engine running.
	Special note: – **OBD warning light** illuminated.

Run a multiplex network test (see **88B, Multiplexing**).
If the fault is still present, carry out fault finding on the **ABS - ESP system** (see **38C, Anti-lock braking system**).

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF092 PRESENT OR STORED	UPSTREAM OXYGEN SENSOR CIRCUIT CO: open circuit CC.0: short circuit to earth CC.1: short circuit to + 12 V 1.DEF: component in bad condition 2.DEF: non-compliance with emission control standards

NOTES	**Priority when dealing with a number of faults:** If faults **DF011 Sensor feed voltage no.1, DF046 Battery voltage** or **DF084 Actuator relay control circuit** are present or stored, deal with them first.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present with the engine running for **5 minutes** in richness regulation.
	Special note: – **OBD warning light** illuminated.

Check the **cleanliness** and **condition** of the upstream oxygen sensor connections.
Repair if necessary.

Disconnect the battery and the injection computer.
Check the **cleanliness** and **condition** of the connections.
Use the "Universal bornier" to check the **insulation** and **continuity** of the following connections:
Computer, **connector C, track C1** → **track D** of the upstream oxygen sensor
Computer, **connector C, track B1** → **track C** of the upstream oxygen sensor
Repair if necessary.

If the fault is still present, deal with the other faults then proceed with the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF093 PRESENT OR STORED	DOWNSTREAM OXYGEN SENSOR CIRCUIT CO: open circuit CC.0: short circuit to earth CC.1: short circuit to + 12 V 1.DEF: non-compliance with emission control standards

NOTES	**Priority when dealing with a number of faults:** Apply the procedure for dealing with faults **DF011 Sensor supply voltage no.1, DF046 Battery voltage**, **DF082 Upstream oxygen sensor heating circuit** or **DF084 Actuator relay control circuit** first if they are present or stored.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present after: – a road test driving smoothly after the fan assembly has been running and **ET056 Double richness loop** is **ACTIVE**, – a smooth driving road test after the fan unit has been in operation, immediately followed by a road test on a slope at no load (injection cut-off in the deceleration phase).
	Special note: – **OBD warning light** illuminated.

Check **the cleanliness** and **condition** of the downstream oxygen sensor connections.
Repair if necessary.

Disconnect the battery and the injection computer.
Check the **cleanliness** and **condition** of the connections.
Use the "Universal bornier" to check **the insulation** and **continuity** of the following connections:
Computer, **connector C, track B2** → **track D** of the downstream oxygen sensor
Computer, **connector C, track A2** → **track C** of the downstream oxygen sensor
Repair if necessary.

If the fault is still present, deal with the other faults then proceed with the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF095 PRESENT OR STORED	THROTTLE POTENTIOMETER CIRCUIT GANG 1 CO.0: open circuit or short circuit to earth CC.1: short circuit to + 12 V 1.DEF: signal incoherence

WARNING
Never drive the vehicle without having confirmed that no faults involving the throttle valve are present.

NOTES	**Priority when dealing with a number of faults:** If the fault **DF011 Sensor supply voltage no.1** is present or stored, deal with it first.
	Conditions for applying the fault finding procedure to stored faults: The fault is considered present after a change in the engine speed.
	Special note: – **level 1 fault warning light** illuminated. – Defect mode **types 3 and 4**: Loss of monitoring system → Limited throttle opening.

Check the **cleanliness** of the throttle valve and the **correct rotation** of the throttle (no hard point).
Check the **cleanliness** and **condition** of the throttle valve connections.
Repair if necessary.

Disconnect the battery and the injection computer.
Check the **cleanliness and condition** of the connections.
Use the "Universal bornier" to check the **insulation** and **continuity** of the following connections:
For F4R and F4R Turbo engines only.

Computer, connector **B, track G4** → **track 1** of the throttle potentiometer gang 1
Computer, connector **B, track G3** → **track 2** of the throttle potentiometer gang 1
Computer, connector **B, track G2** → **track 5** of the throttle potentiometer gang 1

K4M engine only:

Computer, connector **B, track G4** → **track 6** of the throttle potentiometer gang 1
Computer, connector **B, track G3** → **track 1** of the throttle potentiometer gang 1
Computer, connector **B, track G2** → **track 2** of the throttle potentiometer gang 1

Repair if necessary.

If the throttle body is replaced, reinitialise the programming (RZ005).

If the fault is still present, deal with the other faults then proceed with the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

S3000_V08_DF095

GETtheMANUALS.org

DF096 PRESENT OR STORED	THROTTLE POTENTIOMETER CIRCUIT GANG 2 CO.1: open circuit or short circuit to + 12 V CC.0: short circuit to earth

WARNING
Never drive the vehicle without having confirmed that no faults involving the throttle valve are present.

NOTES	**Priority when dealing with a number of faults:** If the fault **DF011 Sensor supply voltage no.1** is present or stored, deal with it first.
	Conditions for applying the fault finding procedure to stored faults: The fault is considered present after a change in the engine speed.
	Special note: – **level 1 fault warning light** illuminated. – defect mode **type 4**: Loss of monitoring system → Limited throttle opening.

Check the **cleanliness** of the throttle valve and the **correct rotation** of the throttle (no hard point).
Check the **cleanliness** and **condition** of the throttle valve connections.
Repair if necessary.

Disconnect the battery and the injection computer.
Check the **cleanliness** and **condition** of the connections.
Use the "Universal bornier" to check the **insulation** and **continuity** of the following connections:
For F4R and F4R Turbo engines only.

Computer, connector **B, track D3** ⟶ **track 6** of the throttle potentiometer gang 2
Computer, connector **B, track G2** ⟶ **track 5** of the throttle potentiometer gang 2
Computer, connector **B, track G4** ⟶ **track 1** of the throttle potentiometer gang 2

K4M engine only:

Computer, connector **B, track D3** ⟶ **track 4** of the throttle potentiometer gang 2
Computer, connector **B, track G2** ⟶ **track 2** of the throttle potentiometer gang 2
Computer, connector **B, track G4** ⟶ **track 6** of the throttle potentiometer gang 2

Repair if necessary.

If the throttle body is replaced, reinitialise the programming (RZ005).

If the fault is still present, deal with the other faults then proceed with the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF101 PRESENT OR STORED	ELECTRONIC STABILITY PROGRAM MULTIPLEX CONNECTION 1.DEF: CAN connection fault

NOTES	None.

Run a multiplex network test (see **88B, Multiplexing**).
If the fault is still present, carry out fault finding on the **ABS - ESP system** (see **38C, Anti-lock braking system**).

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF105 PRESENT OR STORED	CRUISE CONTROL/SPEED LIMITER ON/OFF CIRCUIT 1.DEF: Cruise control/speed limiter on/off button inconsistency

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present following a road test during which the cruise control and speed limiter functions are used.

Check the cleanliness and condition of the cruise control/speed limiter on/off switch and its connections. Repair if necessary.
Check for **+ 12 V** on **track A2** of the cruise control or speed limiter selector switch connector with the ignition on. Repair if necessary.
Disconnect the battery. Disconnect the computer. Check the cleanliness and condition of the connections. Use the "Universal bornier" to check the **insulation and continuity** of the following connections: Computer,connector **A, track A2** ⟶ **track A3** of the cruise control - speed limiter on/off switch Computer,connector **A, track C3** ⟶ **track B1** of the cruise control - speed limiter on/off switch If the fault is still present, check the intermediate connector **R262** on **track A6** and on **track A7**. Repair if necessary.
If the fault is still present, deal with the other faults then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF106 PRESENT OR STORED	CRUISE CONTROL/SPEED LIMITER SELECTOR SWITCH ON STEERING WHEEL 1.DEF: inconsistent data

IMPORTANT
The airbag must be removed in order to remove or check the cruise control/speed limiter control switches (see **MR 395, Mechanical, 88C, Airbag and pretensioners**).

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present following a road test during which the cruise control and speed limiter functions are used.

Check the cleanliness and condition of the incrementing switches on the steering wheel and their connections.
Repair if necessary.

Check that the earth is present on **track 2** of the incrementing switches on the steering wheel.
Repair if necessary.

Disconnect the battery.
Disconnect the computer. Check the cleanliness and condition of the connections.
Use the "Universal bornier" to check the **insulation and continuity** of the following connections:
Computer, connector **A, track D2** ⟶ **track 2** of the steering wheel control switch
Computer, connector **A, track D3** ⟶ **track 1** of the steering wheel control switch
If the fault is still present, check the intermediate connector **R262** on **track A8** and on **track A9**.
Repair if necessary.

If the fault is still present, deal with the other faults then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF109 PRESENT OR STORED	LOW FUEL LEVEL MISFIRING 1.DEF: destructive misfiring 2.DEF: polluting misfiring

NOTES	**Priority when dealing with a number of faults:** – fuel supply circuit: **DF085, DF379, DF380, DF381** and **DF382**. – combustion misfire: **DF059, DF060, DF061, DF062, DF065** with **1.DEF** or **2.DEF**.
	Conditions for applying the fault finding procedure to stored faults: The fault is present after starting the engine and under the following conditions: – there must be no further electrical faults, – programming must be carried out, – warm engine (minimum **75˚C**), – engine idling with all electrical consumers switched on for approximately **15 minutes**.
	Special note: – **OBD warning light** illuminated.

Check that there is fuel in the tank.
Check that the correct fuel is being used.

If there is no present or stored cylinder misfire fault, the misfire was caused by the low fuel level.
Clear fault **DF109** by running command **RZ007 Fault memory**.

AFTER REPAIR	Ensure that all the faults have been dealt with. Clear the stored faults. Do not clear the programming. To check that the system has been properly repaired: – there must be no further electrical faults, – programming has been carried out, – the engine must be warm (minimum **75˚C**). – run the engine at idle speed with all electrical consumers switched on for approximately **15 minutes**. If the fault is still present, continue the fault finding procedure. - run fault finding on the catalytic converter using the **CLIP diagnostic tool** by running command **SC006 Run catalytic converter OBD test**.

GETtheMANUALS.org

DF119 PRESENT OR STORED	CAMSHAFT SENSOR SIGNAL 1.DEF: camshaft tooth event 2.DEF: dephasing measurement out of range 3.DEF: tooth lost 4.DEF: non-compliance with emission control standards

NOTES	**Priority when dealing with a number of faults:** Apply the procedure for dealing with faults **DF084 Actuator relay control circuit** or **DF046 Battery voltage** first if they are present or stored. In the event of a combination of faults **DF080 Camshaft dephaser circuit**, **DF119** and **DF154 Flywheel signal sensor circuit**, ignore **DF080** and deal with the other 2 faults first.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present after a road test.

Check the **cleanliness and condition** of the camshaft sensor connections.
Check the **cleanliness and condition** of the camshaft sensor.
Repair if necessary.

If the fault is still present, check (with the ignition on) for **+ 12 V** on **track 3** of the camshaft sensor.
Check the **insulation, continuity and the absence of interference resistance** between the following connections:

Injection computer, connector **B, track M2** → **track 3** of the camshaft sensor
Main relay **track 5** →

Repair if necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the "Universal bornier" to check the **insulation and continuity** of the following connections:

Computer,connector **C, track E2** → **track 1** of the camshaft sensor
Computer,connector **C, track F1** → **track 2** of the camshaft sensor

Repair if necessary.

If the fault is still present, there is a fault on the camshaft sensor target (see **MR 395, Mechanical, 11A, Top and front of engine**).

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF126 PRESENT OR STORED	PASSENGER COMPARTMENT HEATING RESISTOR 1.DEF: CAN connection fault

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is present when the ignition is switched on.

Run a multiplex network test (see **88B, Multiplexing**).
If the fault is still present, carry out fault finding on the UCH (see **87B, Connection unit**).

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF127 PRESENT OR STORED	BRAKE SWITCH 1 CIRCUIT 1.DEF: fault on one of the two brake pedal contacts

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present: – with the engine running, – brake pedal depressed, – cruise control switch in the ON position.

Check that the pedal assembly is in good condition.
Check the **cleanliness and condition** of the dual-contact brake pedal switch and its connections.
Repair if necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness and condition** of the connections.
Use the "Universal bornier" to check the **insulation and continuity** on the following connection:
Computer, connector **A, track E4** ⟶ **track B3** of the brake pedal switch
If the fault is still present, check the condition of intermediate connector **R262** on **track C8**.
Repair if necessary.

If the fault is still present, replace the switch.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF128 PRESENT OR STORED	BRAKE SWITCH 2 CIRCUIT 1.DEF: fault on both brake pedal contacts

NOTES	**Priority when dealing with a number of faults:** Deal with fault **DF127 Brake switch 1 circuit** first if it is present or stored.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present: – with the engine running, – brake pedal depressed, – cruise control switch in the ON position and cruising speed.

Run a multiplex network test (see **88B, Multiplexing**).

If the fault is still present, carry out fault finding on the **UCH** system (see **87G, Connection unit**).

Check the **insulation, continuity and the absence of interference resistance** on the following connection:
Computer, connector **A, track A3** ⟶ **Track 1, white connector P101**, UCH
Computer, connector **A, track A4** ⟶ **Track 11, white connector P101**, UCH
Repair if necessary

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF138 PRESENT OR STORED	CLUTCH PEDAL CIRCUIT 1.DEF: component in bad condition 2.DEF: non-compliance with emission control standards

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is present with the engine running and following a check on the number of times the clutch pedal is depressed in relation to the number of gear changes calculated by the computer.
	Special note: The acquisition is made if the vehicle is not fitted with an automatic transmission. In the event of a fault, before replacing any component, check using the diagnostic tool that the clutch contact is operational and that the recommended clutch pedal clearance is still valid.

Check the **cleanliness, condition and fitting** of the clutch pedal switch. Repair if necessary.
If the fault is still present, disconnect the switch. Check that when the clutch pedal is depressed, the switch is closed, and when the clutch pedal is released, the switch is open. Replace the switch if necessary.
If the fault is still present, manipulate the harness to see if the status changes. Look for any damage to the wiring harness, and check the **condition** and **connection** of the connectors of the injection computer and clutch pedal switch. Repair if necessary.
If the fault is still present, check the **earth** on **track 2** of the switch. If there is no **earth** on **track 2**, check the **insulation, continuity and the absence of interference resistance** on the following connection: Clutch pedal switch **track 1** ⟶ **earth** Repair if necessary.
If the fault is still present, check the **insulation, continuity and ensure the absence of interference resistance** on the following connections: Clutch pedal switch **track 2** ⟶ **track C4**, connector **A** of the computer If the fault is still present, check that intermediate connector **R262** on **track A4** is in good condition. Repair if necessary.
If the fault is still present, deal with the other faults then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF154 PRESENT OR STORED	FLYWHEEL SIGNAL SENSOR CIRCUIT 1.DEF: voltage outside tolerances 2.DEF: loss of a tooth 3.DEF: non-compliance with emission control standards

NOTES	**Priority when dealing with a number of faults:** In the event of a combination of faults **DF154, DF080 Camshaft dephaser circuit** and **DF119 Camshaft sensor signal**, ignore **DF080** and deal with the other 2 faults first. **Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the starter motor has been running for **10 seconds** or at an engine speed above **600 rpm**.
	Special note: – **OBD warning light** illuminated.

1.DEF	NOTES	None.

Check the **cleanliness, condition and the fitting** of the flywheel.
Repair if necessary.

If the flywheel has been replaced or removed, the flywheel target has to be reinitialised, then reprogrammed.

Programming reinitialisation:
Run command **RZ005 Programming**.
Carrying out the flywheel target programming:
Accelerate up to **4000 rpm** in 3rd gear then decelerate, foot off the pedal, to power take-up speed*.
Then repeat immediately.
After the operation, check that status **ET089 Flywheel target programming** is **COMPLETED**.
(*This is the moment when, during deceleration with no load, the engine drops to idle speed and recovers torque).

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF154 CONTINUED	

2.DEF	NOTES	None.

Check **the mounting** and **positioning** of the engine speed sensor (see **MR 395, Mechanical, 10A, Engine and peripherals**).

Check **the cleanliness and condition** of the engine speed sensor.
Repair if necessary.

Disconnect the battery and the injection computer.
Check the **cleanliness and condition** of the connections.
Use the "Universal bornier" to check the **insulation and continuity** of the following connections:
For F4R Turbo engine only:
Computer, **connector B, track E4** → **track 2** of the engine speed sensor
Computer, **connector B, track F3** → **track 1** of the engine speed sensor
For K4M and F4R engines only.
Computer, **connector B, track E4** → **track B** of the engine speed sensor
Computer, **connector B, track F3** → **track A** of the engine speed sensor
Repair if necessary.

Measure the **resistance** of the engine speed sensor between **tracks 1**and **2 (K4M and F4R only)** and between **tracks 1** and **2 (F4R-Turbo only)**.
Replace the engine speed sensor if the **resistance** is not cut-off between **200 and 270 Ω at 23˚C**.

If the engine speed sensor has been replaced, the flywheel target programming has to be reinitialised, then reprogrammed.

Programming reinitialisation:
Run command **RZ005**.
Carrying out the flywheel target programming:
Accelerate up to **4000 rpm** in third gear then decelerate, foot off the pedal, to power take-up speed*.
Then repeat immediately.
After the operation, check that status **ET089 Flywheel target programming** is **COMPLETED**.
(*This is the moment when, during deceleration with no load, the engine drops to idle speed and recovers torque)

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF167 PRESENT OR STORED	THERMOPLUNGER RELAY CIRCUIT CO.0: open circuit or short circuit to earth CC.1: short circuit to + 12 V

NOTES	**Special note:** For **F4R** and **F4R-Turbo** engines only.

Manipulate the wiring harness between the injection computer and the thermoplunger relay in order to produce a change in status (present ↔ stored).
Look for possible damage to the wiring harness, check the **condition** and the **connection** of the connectors of the injection computer and thermoplunger relay.
Repair if necessary.

Use the "Universal bornier" to check the **insulation and continuity** on the following connection:
Computer, **connector C, track E1** → **track 1** of the water heater interface unit
Repair if necessary.

If the fault is still present, check for **earth** on **track 3** of the water heater interface unit.

Check the **condition** of additional heater relay fuses **F18** and **F19 (70A)**.
Repair if necessary.

If the fault is still present, use the "Universal bornier" to check **the insulation and continuity** of the following connections:
Actuator relay **track 5** → **track 1** of the additional heater relay no.1
→ **track 1** of additional heater relay no. 2
→ **track 9** of the water heater interface unit
Repair if necessary.

If the fault is still present, use the "Universal bornier" to check **the insulation and continuity** of the connections between:
Additional heater relay no.1 **track 2** → **track 7** of the water heater interface unit
Additional heater relay no.2 **track 2** → **track 6** of the water heater interface unit
Repair if necessary.

If the fault is still present, contact the Techline.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF196 PRESENT OR STORED	PEDAL SENSOR CIRCUIT GANG 1 CO.0: open circuit or short circuit to earth CC.1: short circuit to +12 V 1.DEF: signal incoherence

NOTES	**Priority when dealing with a number of faults:** Deal with fault **DF011 Sensor supply voltage no. 1** first if it is present or stored.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present after the accelerator pedal goes from no load to full load.
	Special note: – **level 1 fault warning light** illuminated. – defect mode **type 4**: Loss of monitoring system → Limited throttle opening.

Check that the pedal mechanism has not seized.
Check the **cleanliness** and **condition** of the throttle valve connections. Check the **cleanliness** and **condition** of the pedal potentiometer connections. Disconnect the battery and the injection computer. Check the **cleanliness** and **condition** of the connections. Repair if necessary.
Use the "Universal bornier" to check the **insulation** and **continuity** of the following connections: Computer, connector **A, track H3** ⟶ **track 2** pedal potentiometer gang 1 Computer, connector **A, track G2** ⟶ **track 4** pedal potentiometer gang 1 Computer, connector **A, track H2** ⟶ **track 3** pedal potentiometer gang 1 If the fault is still present, check the condition of intermediate connector **R262** on **track C9, C8 and C7**. Repair if necessary.
Measure the **resistance** of pedal sensor no.1 between **tracks 4** and **2**. Replace the accelerator potentiometer if the **resistance** is not **1200 Ω ± 480 Ω**. If necessary replace the sensor.
If the fault is still present, contact the Techline.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF198 PRESENT OR STORED	PEDAL SENSOR CIRCUIT GANG 2 CO.0: open circuit or short circuit to earth CC.1: short circuit to +12 V

NOTES	**Priority when dealing with a number of faults:** Deal with fault **DF012 Sensor feed no. 2 voltage** first, if it is present or stored.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present after the accelerator pedal changes from no load to full load.
	Special note: – **level 1 fault warning light** illuminated. – defect mode **type 4**: Loss of monitoring system → Limited throttle opening.

Check that the pedal mechanism has not seized.
Check the **cleanliness** and **condition** of the throttle valve connections. Check the **cleanliness** and **condition** of the pedal potentiometer connections. Disconnect the battery and the injection computer. Check the **cleanliness** and **condition** of the connections. Repair if necessary.
Use the "Universal bornier" to check the **insulation** and **continuity** of the following connections: Computer, connector **A, track F4** ⟶ **track 1** of the pedal potentiometer gang 2 Computer, connector **A, track F2** ⟶ **track 5** of the pedal potentiometer gang 2 Computer, connector **A, track F3** ⟶ **track 6** of the pedal potentiometer gang 2 If the fault is still present, check the condition of intermediate connector **R262** on **track C6, C5 and C4**. Repair if necessary.
Measure the **resistance** of pedal sensor no.2 between **tracks 6** and **1**. Replace the accelerator potentiometer if the **resistance** is not **1700 Ω ± 680 Ω**. If necessary replace the sensor.
If the fault is still present, contact the Techline.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF228 PRESENT OR STORED	BRAKE SIGNALS 1.DEF: open circuit or short circuit 2.DEF: non-compliance with emission control standards

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is present when the ignition is switched on.
	Special note: – cruise control and speed limiter deactivated.

Run a multiplex network test (see **88B, Multiplexing**).
If the fault is still present, carry out fault finding on the **ABS - ESP system** (see **38C, Anti-lock braking system**).

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF330 PRESENT OR STORED	PINKING SENSOR CIRCUIT 1.DEF: pinking signal fault

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present during a road test with a warm engine at an engine speed above **1500 rpm**.

Check the **cleanliness and condition** of the pinking sensor and its connections.
Check the **tightness** of the pinking sensor.

Disconnect the battery and the injection computer.
Check the **cleanliness and condition** of the connections.
Use the "Universal bornier" to check the **insulation and continuity** of the following connections:

- Computer, connector **B, track B3** → **track 2** of the pinking sensor
- Computer, connector **B, track B4** → **track 1** of the pinking sensor
- Computer, connector **B, track B2** → **Screening** of the pinking sensor

Repair if necessary.

Check **the conformity** of the fuel in the tank.
Check the **conformity** of the spark plugs.

If the fault is still present, deal with the other faults then proceed with the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF369 PRESENT OR STORED	INJECTION/ELECTRIC WINDSCREEN CONNECTION 1.DEF: CAN connection fault

NOTES	None.

Run a multiplex network test (see **88B, Multiplexing**).

If the fault is still present, perform fault finding on the **UCH** system.
(see **87G, Connection unit**).

Check the **insulation, continuity and the absence of interference resistance** on the following connection:

Computer, connector **A, track A3** ⟶ **Track 1, white connector**, UCH
Computer, connector **A, track A4** ⟶ **Track 11, white connector**, UCH

Repair if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF394 PRESENT OR STORED	CATALYTIC CONVERTER OPERATING FAULT 1.DEF: EOBD HC pollutant emissions threshold has been exceeded

NOTES	**Priority when dealing with a number of faults:** Deal with the other faults first. There must be no other injection system faults, either present or stored. – combustion misfire: **DF059, DF060, DF061, DF062** with **1.DEF** or **2.DEF**.
	Conditions for applying the fault finding procedure to stored faults: The fault is considered present under the following conditions: – there must be no further electrical faults, – programming done, – warm engine (minimum **75˚C**), – engine idling with all electrical consumers switched on for approximately **15 minutes**.
	Special note: – **OBD warning light** illuminated.

Replace the catalytic converter after dealing with the causes of the misfire.
If there is no present or stored misfiring fault, the misfiring was caused by the low fuel level. Clear fault **DF109** by running command **RZ007 Fault memory**.
If the fault is still present, perform fault finding on the catalytic converter using the CLIP tool by running command **SC006 Run catalytic converter OBD test**.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF398 PRESENT OR STORED	FUEL CIRCUIT OPERATING FAULT 1.DEF: operational fault finding on the fuel circuit must detect a malfunction of the petrol fuel system causing the EOBD pollutant emission thresholds to be exceeded. The on-board diagnostic can detect: – clogging of the injectors or an injector flow fault, – a fault in the supply system (pressure regulator, fuel pump, filter, etc.), – a poor connection in the petrol or injection circuits. 2.DEF: non-compliance with emission control standards

NOTES	**Priority when dealing with a number of faults:** If faults **DF085 Fuel pump relay control circuit, DF081 Canister bleed solenoid valve circuit** and injector faults (**DF026, DF027, DF028** and **DF029**) are present or stored, deal with them first.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present after the ignition has been switched on.
	Special note: – **OBD warning light** illuminated.

Check **the cleanliness, condition and fitting** of the fuel vapour absorber.
Check the **connections and correct operation** of the petrol pump.
Check the **cleanliness, condition and fitting** of the injectors and their sealing.
Repair if necessary.

Check:
– that the fuel is present and correct,
– the tank vent,
– that there are no leaks on the petrol circuit (from the tank to the injectors),
– that there are no kinked hoses (especially after dismantling),
– the fuel flow rate and pressure.
Repair the faulty component(s) if necessary (see **MR 395, Mechanical, 13A, Fuel supply**).

If the fault is still present, deal with the other faults then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF436 PRESENT OR STORED	DETECTION OF ENGINE MISFIRING 1.DEF: destructive misfiring 2.DEF: pollutant misfiring

NOTES	**Priority when dealing with a number of faults:** – ignition: **DF460, DF461, DF462** and **DF463**, – fuel supply circuit: **DF026, DF027, DF028, DF029** and **DF085**, – flywheel signal: **DF154** and **DF457**, – cylinder misfiring: **DF059, DF060, DF061** and **DF062**.
	Conditions for applying the fault finding procedure to stored faults: The fault is considered present under the following conditions: – there must be no further electrical faults, – programming must be carried out, – warm engine (minimum 75°C), – engine idling with all electrical consumers switched on for approximately 15 minutes.
	Special note: – catalytic converter misfire: **OBD warning light** flashes when the fault is present then is continuously lit, – pollutant combustion misfire: **OBD warning light** lit continuously.

Check the injectors.
Check the condition and conformity of the spark plugs.
Check the ignition pencil coils.
check that the correct fuel is being used,

If the fault is still present, carry out the following checks:
– check the flywheel sensor,
– check the condition and cleanliness of the flywheel,
– check the flywheel sensor mounting,
– check the sensor/flywheel air gap,
– check the cylinder compressions,
– check the entire petrol supply system (see **MR 395, Mechanical, 13A, Fuel supply**),
– check the entire ignition system (see **MR 395, Mechanical, 17A, Ignition**),
– check the hydraulic tappets if there is camshaft noise (see **MR 395, Mechanical, 11A, Top and front of engine**).

– **If the fault is still present, deal with the other faults then proceed with the conformity check.**

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF455 PRESENT OR STORED	LOW FUEL LEVEL SIGNAL 1.DEF: open circuit or short circuit

NOTES	None.

Run a multiplex network test (see **88B, Multiplexing**).
If the fault is still present, carry out fault finding on the **Instrument panel** system (see **83A, Instrument panel**).

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF457 PRESENT OR STORED	FLYWHEEL TARGET 1.DEF: flywheel target fault: – Missing tooth – Tooth length outside tolerances – Eccentricity on the target – Air gap outside tolerances 2.DEF: non-compliance with emission control standards

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after decelerating for a few seconds from **3500** to **3000 rpm** then from **2500** to **2500 rpm** in a gear above **2nd**.
	Special note: – **OBD warning light** illuminated.

Check the **cleanliness** and **condition** of the engine flywheel.
Repair or replace the engine flywheel if necessary.

If the flywheel has been replaced or removed, the flywheel target programming has to be reinitialised, and then programmed.

Reinitialise programming:
Run command **RZ005 Programming**
Carrying out the flywheel target programming:
Accelerate up to **4000 rpm** in 3rd gear then decelerate to power take-up speed*. Then repeat immediately.
Check the programming with **ET089 Programming flywheel target**.
(* This is the moment when, during deceleration with no load, the engine drops to idling speed and recovers torque).

If the fault is still present, contact the Techline.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF460 PRESENT OR STORED	CYLINDER 1 COIL CONTROL CO.0: open circuit or short circuit to earth CC.1: short circuit to + 12 V 1.DEF: non-compliance with emission control standards

NOTES	**Priority when dealing with a number of faults:** Deal with faults **DF046 Battery voltage, DF084 Actuator relay control circuit** or **DF085 Fuel pump relay control circuit** first if they are present or stored. If fault **DF463 Cylinder 4 coil control** is also present or stored, deal with it first.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present after the starter has been in operation for **10 seconds** or after the engine has been running for **10 seconds**.
	Special note: – **OBD warning light** illuminated.

Disconnect the cylinder 1 pencil coil connector.
Check the **cleanliness and condition** of the pencil coil and its connections.
check that the correct fuel is being used,

Measure the **primary and secondary** resistance of the cylinder 1 pencil coil.
Replace the cylinder 1 pencil coil if the **primary resistance** is not:
K4M engine only:
- **0.54 Ω ± 0.1 Ω** for the primary resistance
- **10.7 kΩ ± 1.6 kΩ** for the secondary resistance

For F4R and F4R Turbo engines only.
- **0.52 Ω ± 0.1 Ω** for the primary resistance
- **6.7 kΩ ± 0.7 kΩ** for the secondary resistance

Disconnect the battery and the injection computer.
Check the **cleanliness and condition** of the connections.
Use the "Universal bornier" to check the **insulation and continuity** of the following connections:
Computer, connector **C, track M4** → **track 2** of coil 1
Coil 1 **track 1** → **track 2** of coil 4
Repair if necessary.

Use the "Universal bornier" to check the **insulation and continuity** of the following connections:
Fuse holder unit **track 31** → **track 1** of coil 4
Petrol pump relay **track 5** →
Repair if necessary.

If the fault is still present, replace the defective pencil coil.

If the fault is still present, deal with the other faults then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF461 PRESENT OR STORED	CYLINDER 2 COIL CONTROL CO.0: open circuit or short circuit to earth CC.1: short circuit to + 12 V 1.DEF: non-compliance with emission control standards

NOTES	**Priority when dealing with a number of faults:** Deal with faults **DF046 Battery voltage, DF084 Actuator relay control circuit** or **DF085 Fuel pump relay control circuit** first if they are present or stored. If fault **DF462 Cylinder 3 coil control** is also present or stored, deal with it first.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present after the starter has been in operation for **10 seconds** or after the engine has been running for **10 seconds**.
	Special note: – **OBD warning light** illuminated.

Disconnect the cylinder 2 pencil coil connector.
Check the **cleanliness and condition** of the pencil coil and its connections. check that the correct fuel is being used.

Measure the **primary and secondary** resistance of the cylinder 1 pencil coil.
Replace the cylinder 1 pencil coil if the **primary resistance** is not:
K4M engine only:
- **0.54 Ω ± 0.1 Ω** for the primary resistance
- **10.7 kΩ ± 1.6 kΩ** for the secondary resistance

For F4R and F4R Turbo engines only.
- **0.52 Ω ± 0.1 Ω** for the primary resistance
- **6.7 kΩ ± 0.7 kΩ** for the secondary resistance

Disconnect the battery and the injection computer.
Check the **cleanliness and condition** of the connections.
Use the "Universal bornier" to check the **insulation and continuity** of the following connections:
Computer, connector **C, track M3** → **track 2** of coil 2
Coil 2 **track 1** → **track 2** of coil 3
Repair if necessary.

Use the "Universal bornier" to check the **insulation and continuity** of the following connections:
Fuse holder unit **track 31** → **track 1** of coil 3
Petrol pump relay **track 5**
Repair if necessary.

If the fault is still present, replace the defective pencil coil.

If the fault is still present, deal with the other faults then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF462 PRESENT OR STORED	CYLINDER 3 COIL CONTROL CO.0: open circuit or short circuit to earth CC.1: short circuit to + 12 V 1.DEF: non-compliance with emission control standards

NOTES	**Priority when dealing with a number of faults:** Deal with faults **DF046 Battery voltage, DF084 Actuator relay control circuit** or **DF085 Fuel pump relay control circuit** first if they are present or stored.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present after the starter has been in operation for **10 seconds** or after the engine has been running for **10 seconds**.
	Special note: – **OBD warning light** illuminated.

Check that fuse **F8 (10A)** is in **good condition and working properly**.
Repair if necessary.

Disconnect the connector from the cylinder 3 pencil coil.
Check the **cleanliness and condition** of the pencil coil and its connections. check that the correct fuel is being used,

Measure the **primary and secondary** resistance of the cylinder 1 pencil coil.
Replace the cylinder 1 pencil coil if the **primary resistance** is not:
K4M engine only:
- **0.54 Ω ± 0.1 Ω** for the primary resistance
- **10.7 kΩ ± 1.6 kΩ** for the secondary resistance

For F4R and F4R Turbo engines only.
- **0.52 Ω ± 0.1 Ω** for the primary resistance
- **6.7 kΩ ± 0.7 kΩ** for the secondary resistance

Disconnect the battery and the injection computer.
Check the **cleanliness and condition** of the connections.
Use the "Universal bornier" to check the **insulation and continuity** of the following connections:
Computer, connector **C, track M3** → **track 2** of coil 2
Coil 3 **Track 2** → **track 1** of coil 2
Repair if necessary.

Use the "Universal bornier" to check the **insulation and continuity** of the following connections:
Fuse holder unit **track 31** → **track 1** of coil 3
Petrol pump relay **track 5**
Repair if necessary.

If the fault is still present, replace the defective pencil coil.

If the fault is still present, deal with the other faults then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF463 PRESENT OR STORED	CYLINDER 4 COIL CONTROL CO.0: open circuit or short circuit to earth CC.1: short circuit to + 12 V 1.DEF: non-compliance with emission control standards

NOTES	**Priority when dealing with a number of faults:** Deal with faults **DF046 Battery voltage, DF084 Actuator relay control circuit** or **DF085 Fuel pump relay control circuit** first if they are present or stored.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present after the starter has been in operation for **10 seconds** or after the engine has been running for **10 seconds**.
	Special note: – **OBD warning light** illuminated.

Check that fuse **F8 (10A)** is in **good condition and working properly**.
Repair if necessary.

Disconnect the rod coil connector on cylinder 4.
Check the **cleanliness and condition** of the pencil coil and its connections. Check that the **correct** fuel is being used.

Measure the **primary and secondary** resistance of the cylinder 1 pencil coil.
Replace the cylinder 1 pencil coil if the **primary resistance** is not:
K4M engine only:
- **0.54 Ω ± 0.1 Ω** for the primary resistance
- **10.7 kΩ ± 1.6 kΩ** for the secondary resistance

For F4R and F4R Turbo engines only.
- **0.52 Ω ± 0.1 Ω** for the primary resistance
- **6.7 kΩ ± 0.7 kΩ** for the secondary resistance

Disconnect the battery and the injection computer.
Check the **cleanliness and condition** of the connections.
Use the "Universal bornier" to check the **insulation and continuity** of the following connections:
Computer, connector **C, track M4** → **track 2** of coil 1
Coil 4 **Track 2** → **track 1** of coil 1
Repair if necessary.

Use the "Universal bornier" to check the **insulation and continuity** of the following connections:
Fuse holder unit **track 31** → **track 1** of coil 4
Petrol pump relay **track 5**
Repair if necessary.

If the fault is still present, replace the defective pencil coil.

If the fault is still present, deal with the other faults then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF508 PRESENT OR STORED	MOTORISED THROTTLE VALVE CONTROL CC.1: short circuit to + 12 V 1.DEF: Motorised throttle general control fault

WARNING
Never drive the vehicle without having confirmed that no faults involving the throttle valve are present.

NOTES	**Priority when dealing with a number of faults:** If faults **DF095 Throttle potentiometer circuit gang 1** or **DF096 Throttle potentiometer circuit gang 2** are present, deal with these first.
	Conditions for applying the fault finding procedure to stored faults: The fault is considered present if: – the engine speed varies, – the engine air temperature should be between **5˚C** and **105˚C**.
	Special note: – **level 1 fault warning light** illuminated. – defect mode **types 1 and 2** for the throttle valve.

Check the **cleanliness and condition** of the throttle valve and its connections.

Manually check that the throttle **rotates properly**.

Disconnect the battery and the injection computer.
Check the **cleanliness and condition** of the connections.
Use the "Universal bornier" to check the **insulation and continuity** of the following connections:
Computer,connector **B, track M3** ⟶ **track 4** of the motorised throttle
Computer,connector **B, track M4** ⟶ **track 3** of the motorised throttle
Repair if necessary.

If the fault is still present, measure the **resistance** of the throttle motor between tracks **M3** and **M4**.
Replace the throttle valve if the **resistance** is not **1.57 Ω at 23˚C (only for F4R and F4R-Turbo)** and **2.2 Ω at 23˚C (only for K4M)**.

If the fault is still present, deal with the other faults then proceed with the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF573 PRESENT OR STORED	INJECTION/AIR CONDITIONING CONNECTIONS 1.DEF: CAN connection fault

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the air conditioning is connected.
	Special notes: Status **ET079 Air conditioning present** may help when dealing with this fault.

Run a multiplex network test (see **88B, Multiplexing**).
If the fault is still present, perform fault finding on the **Air conditioning** system (see **62A, Air conditioning**).

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF586 PRESENT OR STORED	INSTRUMENT PANEL MULTIPLEX CONNECTION 1.DEF: CAN connection fault

NOTES	None.

Run a multiplex network test (see **88B, Multiplexing**).
If the fault is still present, carry out fault finding on the **Instrument panel** system (see **83A, Instrument panel**).

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF612 PRESENT OR STORED	OIL VAPOUR DEFREEZE RESISTOR CIRCUIT CO.0: open circuit or short circuit to earth CC.1: short circuit to + 12 V

NOTES	**Priority when dealing with a number of faults:** If faults **DF002 Air temperature sensor circuit, DF004 Turbocharging pressure sensor circuit, DF196 Pedal sensor circuit gang 2** or **DF046 Battery voltage** are present, deal with them first.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present after the ignition has been switched on.

Check the cleanliness and condition of the oil vapour defreeze resistor connections.
Clean or replace as necessary.

Measure the electrical **resistance** of the defreeze resistor relay between **tracks 1 and 2**.
Replace the relay if the resistance is not approximately: **21 Ω at - 40˚C**
9.5 Ω at 20˚C
13.4 Ω at 120˚C

With the ignition on, check for **+ 12 V** on **track 1** of the defreeze resistor relay.
Use the "universal bornier" to check the **insulation and continuity** on the following connections:
Injection computer,connector **B, track M2** → **track 1** of the oil vapour defreeze resistor
Main relay **track 5** →
Repair if necessary.

Disconnect the battery.
Disconnect the computer. Check the cleanliness and condition of the connections.
Use the "universal bornier" to check the **insulation, continuity and the absence of interference resistance** on the following connections:
Computer,connector **B, track L2** → **track 2** of the oil vapour defreeze resistor
Repair if necessary.

If the fault is still present, deal with the other faults then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF617 PRESENT OR STORED	VACUUM PUMP RELAY CIRCUIT 1.DEF: component in bad condition

NOTES	**Special Note** Only for **F4R-Turbo** engines with an **automatic transmission**.

Manipulate the wiring harness between the injection computer and the vacuum pump relay in order to produce a change in status (present ↔ stored).
Look for possible damage to the wiring harness, and check the **connections and condition** of the vacuum pump relay and its connections.
Repair if necessary.

Check for **+ 12 V**on **track 1**of the vacuum pump relay.
If there is not **+ 12 V**, check (using the universal bornier) **the insulation, continuity and the absence of interference resistance** on the following connections:
Computer, connector **B, track M2** ⟶ **Track 1** of the vacuum pump relay
Repair if necessary.

Use the "universal bornier" to check the **insulation, continuity and the absence of interference resistance** on the following connections:
Computer, connector **B, track L3** ⟶ **Track 2** of the vacuum pump relay
Repair if necessary.

Check the condition of the vacuum pump relay fuse **F3 (30A)**.
Repair if necessary.

If the fault is still present, use the "universal bornier" to check **the insulation and continuity** of the following connection:
Fuse holder unit **track 24** ⟶ **track 3** of the vacuum pump relay
Repair if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

DF618 PRESENT OR STORED	VACUUM PUMP/PRESSURE SWITCH SYSTEM CO.0: open circuit or short circuit to earth CC.1: short circuit to + 12 V

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after negative pressure has been detected in the brake servo.
	Special Note Only for **F4R-Turbo** engines with an **automatic transmission**.

Manipulate the wiring harness between the injection computer and the mastervac pressure sensor in order to produce a change in fault status (Present ↔ Stored).
Look for possible damage to the wiring harness, and check the **condition and connection** of the mastervac pressure sensor and its connections.
Repair if necessary.

Use the "universal bornier" to check the **insulation, continuity and the absence of interference resistance** on the following connections:
Computer, connector **C, track G4** → **Track 1** of the mastervac pressure sensor
Repair if necessary.

Use the "Universal bornier" to check the **insulation and continuity** of the following connections:
Main relay **track 5** → **Track 1** of the mastervac pressure sensor
Computer, connector **B, Track M2** →
Repair if necessary.

Use the "Universal bornier" to check the **insulation and continuity** of the following connections:
Vacuum pump relay **track 5** → **Track 1** of the vacuum pump
Vacuum pump **track 2** → **Earth**
Repair if necessary.

If the fault is still present, contact the techline.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

NOTES	Only carry out this conformity check after a **complete check** using the diagnostic tool. The values shown in this conformity check are given as a guide. **Application conditions:** Engine **warm at idle speed**.

MAIN COMPUTER STATUSES AND PARAMETERS

Order	Function	Parameter or Status Check or Action		Display and notes	Fault finding
1	Battery voltage	**ET001:**	Computer + after ignition feed	**Presence of + After ignition feed**	In the event of a fault, apply the interpretation of **DF046 Battery voltage**.
2		**PR074:**	Battery voltage	**11 V < PR074 < 15 V**	
3	**Vehicle speed**	**PR155:**	vehicle speed	**Gives the vehicle speed in mph (km/h). This parameter is sent to the injection by the ABS computer via the multiplex network.**	In the event of a fault, apply the interpretation of fault **DF091 Vehicle speed signal**.
4	Faults	**ET074:**	OBD warning light illuminated by ATX	**YES** **NO**	**NONE**
5		**ET064:**	Level 1 injection fault	**ON** **OFF**	
6		**ET065:**	Level 2 Injection fault	**ON** **OFF**	
7		**PR106:**	Mileometer fault warning light lit	**Shows the distance covered with the warning light lit.**	
8		**PR105:**	Mileage counter OBD fault warning light on	**Indicates the mileage covered with the OBD warning light lit.**	

GETtheMANUALS.org

NOTES	Only carry out this conformity check after a **complete check** using the diagnostic tool. The values shown in this conformity check are given as a guide. **Application conditions:** Engine **warm at idle speed**.

AIR CIRCULATION SUB-FUNCTION (TURBOCHARGING/INLET):

Order	Function	Parameter or Status Checked or Action	Display and notes	Fault finding
1	**Air circuit pressure**	**PR035:** Atmospheric pressure	**200 mb < PR035 < 1047 mb**	If the event of an inconsistency, with the engine stopped and ignition on, check **PR035 = PR421 = Local atmospheric pressure**. **Only for F4R-T PR035 = PR421 = PR041.** In the event of a fault apply the interpretation of **PR421 Manifold pressure**
2		**PR421:** Manifold pressure	**200 mb < PR421 < 2500 mb**	
3		**PR041:** Turbocharging pressure	**200 mb < PR041 < 2500 mb default value = 103 mb**	
3	**Air temperature**	**PR058:** Air temperature	**- 40˚C < PR058 < 120˚C**	In the event of a fault, apply the interpretation of **DF002 Air temperature sensor circuit**.
4	**Coolant temperature**	**PR064:** Coolant temperature	**- 40˚C < PR064 < 120˚C**	In the event of a fault, apply the interpretation of **DF001 Coolant temperature sensor circuit**.
5	**Air flow**	**PR018:** estimated air flow	**Indicates the air flow value estimated by the motorised throttle valve.**	In the event of a fault, apply the interpretation of faults **DF095 Throttle potentiometer circuit gang 1** and **DF096 Throttle potentiometer circuit gang 2**.

GETtheMANUALS.org

NOTES	Only carry out this conformity check after a **complete check** using the diagnostic tool. The values shown in this conformity check are given as a guide. **Application conditions: Engine stopped, + after ignition**.

AIR CIRCULATION SUB-FUNCTION (TURBO / INTAKE) (CONTINUED):

Order	Function	Parameter or Status Checked or Action		Display and notes	Fault finding
6	**Camshaft dephaser**	**ET083:**	Camshaft dephaser in defect mode	**STATUS 1:** This defect mode covers all faults that affect the dephaser position measurement. The dephaser is set to the lower stop and the camshaft angle measurement is forced to 0. Tooth signal fault. **STATUS 2:** This defect mode covers all faults that affect the dephaser (pulley and solenoid valve). The dephaser is set to the low stop. **NO**	If **STATUS 1**, run fault finding on the camshaft signal/tooth consistency. If **STATUS 2**, carry out fault finding on the camshaft dephaser position.
7		**ET084:**	camshaft dephaser	**STATUS 1:** No camshaft dephaser (on F4R-T) **STATUS 2:** On/off camshaft dephaser (on F4R) **STATUS 3:** Continuous camshaft dephaser (on K4M)	**NONE**
8		**ET086:**	Camshaft dephaser control	**For K4M and F4R engines only.** Indicates whether or not the camshaft dephaser is functioning.	For continuous camshaft dephaser only: **check that PR093 = PR745**.
9		**PR093:**	Camshaft dephaser measured position	Indicates dephasing value measured. **On K4M only**	**NONE**
10		**PR745:**	Camshaft dephaser position setpoint	Indicates the required camshaft dephasing value. **On K4M only**	**NONE**
11		**PR876:**	Camshaft dephaser solenoid control OCR	Indicates the opening percentage of the solenoid valve required for the camshaft dephasing	**NONE**

GETtheMANUALS.org

NOTES	Only carry out this conformity check after a **complete check** using the diagnostic tool. The values shown in this conformity check are given as a guide. **Application conditions:** Engine **warm at idle speed**.

FUEL CIRCUIT SUB-FUNCTION:

Order	Function	Parameter or Status Checked or Action	Display and notes	Fault finding
1	**Engine speed**	**PR145 :** Engine speed	**Indicates the engine's speed of rotation in rpm.** **PR145 = 0 rpm**	In the event of a fault, apply the interpretation for **DF154 Flywheel signal sensor circuit**.
2	**Motorised throttle**	**PR014 :** Idling speed correction	**Shows engine idling speed correction value.** **PR014 = 0 rpm.** **The idling speed regulator performs all the calculations required for physical control of the idling actuator: the motorised throttle. The functional component of the regulator is adaptive (variation programming and ageing).**	**NONE**
3		**PR536 :** Idling regulation valve setpoint	**The idling regulation valve setpoint depends on oil and coolant temperature, the position of the gearbox selector, and which electrical consumers are running.** **752 rpm < PR536 < 1216 rpm.** **If a manifold pressure sensor fault is present or stored, the idle speed setpoint is 896 rpm.**	In the event of a fault, apply the interpretation of **ET054 Idle speed regulation**.
4		**ET054:** Idle speed regulation	**INACTIVE**	If **ACTIVE**, apply the interpretation of **ET054 Idle speed regulation**.

GETtheMANUALS.org

NOTES	Only carry out this conformity check after a **complete check** using the diagnostic tool. The values shown in this conformity check are given as a guide. **Application conditions:** Engine **warm at idle speed**.

FUEL CIRCUIT SUB-FUNCTION: (continued 1)

Order	Function	Parameter or Status Checked or Action		Display and notes	Fault finding
5	**Motorised throttle**	**PR090:**	Idle speed regulation programming value	**- 12% < PR090 < 12%** **PR090, an adaptive built-in action, is a stored parameter designed to program variation and engine ageing for the idle speed regulator. These are programmed only when the engine is idling and warm, and no electrical consumers (electrical windscreen, air conditioning, GMV, power steering) have been selected. Therefore it adjusts slowly.**	**NONE**
6		**PR444:**	Idling speed regulation built-in correction.	**0%** **The built-in correction is continuously calculated to take into account consumer air demand.**	
7	**Motorised throttle**	**PR091:**	Theoretical idle speed regulation OCR	**0% < PR091 < 60%** **When the conditions for regulation are met, the idle regulator continually repositions the motorised throttle to keep the engine speed at the idling speed setting. The motorised throttle opening ratio required to adhere to the engine speed setpoint is then given by parameter PR091.**	

GETtheMANUALS.org

NOTES	Only carry out this conformity check after a **complete check** using the diagnostic tool. The values shown in this conformity check are given as a guide. **Application conditions:** Engine **warm at idle speed**.

FUEL CIRCUIT SUB-FUNCTION: (continued 2)

Order	Function	Parameter or Status Checked or Action		Display and notes	Fault finding
8	Oxygen sensor	**ET055:**	Upstream sensor richness loop.	**Loop open** **Loop closed**	If **closed loop**, apply the interpretation of **ET055 Upstream sensor richness loop**.
		ET056:	Richness double loop	**ACTIVE** **INACTIVE**	In the event of a fault, apply the interpretation of **ET056 Double richness loop**.
9		**PR138:**	Richness correction	**50%** **In looping, the richness correction corrects the injection duration to obtain a fuel mixture as close as possible to a richness of 1. The correction value varies around 50, between 0 and 100.**	**NONE**
10		**PR144:**	Self-adapting richness offset	**0 < PR144 < 255** **This parameter is used to detect any tendency of the injection system to increase or decrease the richness.**	
11		**PR143:**	Self-adapting richness gain	**0 < PR143 < 255** **This parameter is used to detect any tendency of the injection system to increase or decrease the richness.**

FUEL CIRCUIT SUB-FUNCTION: (continued 1)

Order	Function	Parameter or Status Checked or Action		Display and notes	Fault finding
5	**Motorised throttle**	**PR090:**	Idle speed regulation programming value	**- 12% < PR090 < 12%** **PR090, an adaptive built-in action, is a stored parameter designed to program variation and engine ageing for the idle speed regulator. These are programmed only when the engine is idling and warm, and no electrical consumers (electrical windscreen, air conditioning, GMV, power steering) have been selected. Therefore it adjusts slowly.**	**NONE**
6		**PR444:**	Idling speed regulation built-in correction.	**4.7% < PR141 < 32%** **The built-in correction is continuously calculated to take into account consumer air demand.**	
7	**Motorised throttle**	**PR091:**	Theoretical idle speed regulation OCR	**5% < PR091 < 50%** **When the conditions for regulation are met, the idle regulator continually repositions the motorised throttle to keep the engine speed at the idling speed setting. The motorised throttle opening ratio required to adhere to the engine speed setpoint is then given by parameter PR091.**	

GETtheMANUALS.org

NOTES	Only carry out this conformity check after a **complete check** using the diagnostic tool. The values shown in this conformity check are given as a guide. **Application conditions:** Engine **warm at idle speed**.

FUEL CIRCUIT SUB-FUNCTION: (continued 2)

Order	Function	Parameter or Status Checked or Action		Display and notes	Fault finding
8	**Oxygen sensor**	**ET055:**	Upstream sensor richness loop	**Loop open**	In the event of a fault, apply the interpretation of **ET055 Upstream sensor richness loop**.
9		**ET056:**	Richness double loop	**ACTIVE**	In the event of a fault, apply the interpretation of **ET056 Double richness loop**.
10		**PR138:**	Richness correction	**0% < PR138 < 100%** **In looping, the richness correction corrects the injection time to obtain a fuel mixture which is as close as possible to a richness of 1. The correction value therefore oscillates around 50.**	**NONE**
11		**PR144:**	Self-adapting richness offset	**0 < PR144 < 255** **This parameter is used to detect any tendency of the injection system to increase or decrease the richness.**	
12		**PR143:**	Self-adapting richness gain	**0 < PR143 < 255** **This parameter is used to detect any tendency of the injection system to increase or decrease the richness.**

GETtheMANUALS.org

ET040	CLUTCH PEDAL

NOTES	There must be no present or stored faults.

Check that the pedal assembly is in good condition. Check **the cleanliness** and **condition** of the clutch pedal switch and its connections. Repair if necessary.
Check for **earth** on **track A1** of the clutch pedal switch. Repair if necessary.
Disconnect the battery and the injection computer. Check the **cleanliness** and **condition** of the connections. Using the Universal bornier, check the **insulation** and **continuity** on the following connection: Injection computer, connector **A, track C4** ⟶ **track B3** of the clutch pedal switch If the fault is still present, check the condition of intermediate connector **R262** on **track A4**. Repair if necessary.
If the fault is still present, replace the switch.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET042	CRUISE CONTROL/SPEED LIMITER

NOTES	There must be no present or stored faults.
	IMPORTANT **To remove or check the Cruise control/speed limiter control switches you need to remove the airbag** See **MR 395, Mechanics, 88C, Airbag and pretensioners)**.

With the ignition on, check for **+ 12 V** on the cruise control/speed limiter selector switch connector (see **Technical Note, Wiring diagram, LAGUNA II, 1081**).
Repair if necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness** and **condition** of the connections.
Using the universal bornier, check the **insulation** and **continuity** of the following connections:

- Injection computer, connector **A, track A2** ⟶ **track A3** of the cruise control or speed limiter on/off switch
- Injection computer, connector **A, track C3** ⟶ **track B1** of the cruise control or speed limiter on/off switch

Repair if necessary.

If the fault is still present, replace the switch.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET052	UPSTREAM O_2 SENSOR HEATING

NOTES	There must be no present or stored faults.

Check the **cleanliness** and **condition** of the upstream oxygen sensor and its connections. Repair if necessary.
Check for the **+ 12 V feed** on **track A** of the upstream oxygen sensor connector with the ignition on. Using the Universal bornier, check the **insulation** and **continuity** on the following connection: Injection computer, connector **B, track M2** ⟶ **track A** of the upstream oxygen sensor Repair if necessary.
Disconnect the battery and the injection computer. Check the **cleanliness and condition** of the connections. Using the Universal bornier, check the **insulation** and **continuity** on the following connection: Injection computer, connector **C, track L2** ⟶ **track B** of the upstream oxygen sensor Repair if necessary.
Measure the heating **resistance** between **tracks A** and **B** of the upstream oxygen sensor. Replace the upstream oxygen sensor if the **resistance** is not approximately **9 Ω at 20 °C**.
If the fault is still present, replace the upstream oxygen sensor.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET053	DOWNSTREAM O_2 SENSOR HEATING

NOTES	There must be no present or stored faults.

Check **the cleanliness** and **condition** of the downstream oxygen sensor and its connections. Repair if necessary.
Check for the **+ 12 V feed** on **track A**, downstream oxygen sensor connector with the ignition on. Using the Universal bornier, check the **insulation** and **continuity** on the following connection: Injection computer, connector **B, track M2** ⟶ **track A** of the downstream oxygen sensor Repair if necessary.
Disconnect the battery and the injection computer. Check the **cleanliness and condition** of the connections. Using the Universal bornier, check the **insulation** and **continuity** on the following connection: Injection computer, connector **C, track L3** ⟶ **track B** of the downstream oxygen sensor Repair if necessary.
Measure the heating **resistance** between **tracks A** and **B** of the downstream oxygen sensor. Replace the downstream oxygen sensor if the **resistance** is not approximately **9 Ω at 20 °C**.
If the fault is still present, replace the downstream oxygen sensor.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET054	IDLE SPEED REGULATION

NOTES	There must be no present or stored faults.
	Check parameters PR030, PR064, PR118, PR119 and PR421. Check that all these parameters are correct.

IDLE SPEED TOO LOW

Check:
– engine oil level (too high => splashing),
– that the exhaust pipe is not blocked (catalytic converter damaged),
– the cleanliness and conformity of the air filter,
– that the air inlet system is not blocked,
– that the throttle valve is not clogged,
– the condition and conformity of the spark plugs,
– the fuel circuit sealing,
– fuel pressure and flow (see **MR 395 Mechanics, 13A, Fuel supply**),
– the condition and cleanliness of the injectors,
– the engine compression,
– the timing adjustment,
– check the hydraulic tappets if there is camshaft noise (see **MR 395 Mechanics, 11A, top and front of engine**).
Repair the defective component if necessary.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET054 **CONTINUED**	

IDLE SPEED TOO HIGH

Check:
– engine oil level (too high => oil combustion),
– that the restrictions are present in the oil vapour rebreathing circuit,
– the sealing between the throttle valve and inlet manifold,
– the manifold pressure sensor sealing,
– the fuel vapour absorber bleed, which must not be jammed open,
– the fuel vapour absorber bleed system sealing,
– the brake servo system sealing,
– the sealing between the inlet manifold and cylinder head,
– the oil vapour recovery circuit sealing between the inlet manifold and cylinder head,
– fuel pressure and flow (see **MR 395 Mechanics, 13A, Fuel supply**),
– the condition and cleanliness of the injectors,
– the engine compression,
– the timing adjustment,
– check the hydraulic tappets if there is camshaft noise (see **MR 395 Mechanics, 11A, top and front of engine**).
Repair the defective component if necessary.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET055	UPSTREAM SENSOR RICHNESS LOOP

NOTES	There must be no present or stored faults.

Check the **cleanliness** and **condition** of the upstream oxygen sensor connections. Repair if necessary.
Check for the **+ 12 V feed** on **track A** of the upstream oxygen sensor connector with the ignition on. Using the Universal bornier, check the **insulation** and **continuity** on the following connection: Injection computer, connector **B, track M2** ⟶ **track A** of the upstream oxygen sensor Repair if necessary.
Disconnect the battery and the injection computer. Check the **cleanliness and condition** of the connections. Using the Universal bornier, check the **insulation** and **continuity** of the following connections: Injection computer, connector **C, track C1** ⟶ **track D** of the upstream oxygen sensor Injection computer, connector **C, track B1** ⟶ **track C** of the upstream oxygen sensor Injection computer, connector **C, track L2** ⟶ **track B** of the upstream oxygen sensor Repair if necessary.
Measure the heating **resistance** between **tracks A** and **B** of the upstream oxygen sensor. Replace the upstream oxygen sensor if the **resistance** is not approximately **9 Ω at 20 °C**.
Check **the condition** and **secure fitting** of the upstream oxygen sensor. If the vehicle is driven frequently in town, **decoke the engine**.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET055 **CONTINUED**	

Check:
– the condition of the air filter,
– that the air inlet system is not blocked,
– the condition and conformity of the spark plugs,
– the sealing between the throttle valve and inlet manifold,
– the manifold pressure sensor sealing,
– the fuel vapour absorber bleed, which must not be jammed open,
– the fuel vapour absorber bleed system sealing,
– the brake servo system sealing,
– the turbocharger safety valve circuit sealing,
– the cylinder head oil vapour recovery system sealing,
– the sealing between the inlet manifold and cylinder head,
– the exhaust pipe sealing between the cylinder head and catalytic converter.
– the fuel flow rate and pressure.

If the idle speed is not stable, check:
– the timing adjustment,
– check the hydraulic tappets if there is camshaft noise (see **MR 395 Mechanics, 11A, top and front of engine**).
– the cylinder compressions.

Drive the vehicle to check the repair.
Repair the defective components.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET056	DOUBLE RICHNESS LOOP

NOTES	There must be no present or stored faults.

Check the **cleanliness** and **condition** of the upstream oxygen sensor connections.
Repair if necessary.

Check for the **+ 12 V feed** on **track A** of the upstream oxygen sensor connector with the ignition on.
If **+ 12 V** is not present:
– disconnect the battery,
– check the **cleanliness** and **condition** of the connections,
Using the universal bornier, check the **continuity** on the following connection:
Injection computer, connector **B, track M2** ⟶ **track A** of the upstream oxygen sensor
Contact the Techline.

Disconnect the battery and the injection computer.
Check the **cleanliness and condition** of the connections.
Using the Universal bornier, check the **insulation** and **continuity** of the following connections:
Injection computer, connector **C, track C1** ⟶ **track D** of the upstream oxygen sensor
Injection computer, connector **C, track B1** ⟶ **track C** of the upstream oxygen sensor
Injection computer, connector **C, track L2** ⟶ **track B** of the upstream oxygen sensor
Repair if necessary.

Measure the heating **resistance** of the upstream oxygen sensor between **tracks A** and **B**.
Replace the sensor if the **resistance** is not around **9 Ω at 20 °C**.

Check **the condition** and **secure fitting** of the upstream oxygen sensor.
If the vehicle is driven frequently in town, **decoke the engine**.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET056 **CONTINUED 1**	

Check the **cleanliness** and **condition** of the downstream oxygen sensor connections. Repair if necessary.
Check for the **+ 12 V feed** on track A of the downstream oxygen sensor connector with the ignition on. If **+ 12 V** is not present: – disconnect the battery, – check the **cleanliness** and **condition** of the connections, Using the universal bornier, check the **continuity** on the following connection:
Injection computer, connector **B, track M2** ⟶ **track A** of the downstream oxygen sensor Contact the Techline.
Disconnect the battery and the injection computer. Check the **cleanliness and condition** of the connections. Using the Universal bornier, check the **insulation** and **continuity** of the following connections:
Injection computer, connector **C, track B2** ⟶ **track D** of the upstream oxygen sensor Injection computer, connector **C, track A2** ⟶ **track C** of the upstream oxygen sensor Injection computer, connector **C, track L3** ⟶ **track B** of the upstream oxygen sensor Repair if necessary.
Measure the heating **resistance** of the downstream oxygen sensor between **tracks A** and **B**. Replace the sensor if the **resistance** is not around **9 Ω at 20 °C**.
Check **the condition** and for **secure fitting** of the downstream oxygen sensor. If the vehicle is driven frequently in town, **decoke the engine**.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET056 **CONTINUED 2**	

Check:
– the condition of the air filter,
– that the air inlet system is not blocked,
– the condition and conformity of the spark plugs,
– the sealing between the throttle valve and inlet manifold,
– the manifold pressure sensor sealing,
– the fuel vapour absorber bleed, which must not be jammed open,
– the fuel vapour absorber bleed system sealing,
– the brake servo system sealing,
– the turbocharger safety valve circuit sealing,
– the cylinder head oil vapour recovery system sealing,
– the sealing between the inlet manifold and cylinder head,
– the exhaust pipe sealing between the cylinder head and catalytic converter.
– the fuel flow rate and pressure.

If the idle speed is not stable, check:
– the timing adjustment,
– check the hydraulic tappets if there is camshaft noise (see **MR 395 Mechanics, 11A, Top and front of engine**).
– the cylinder compressions.

Drive the vehicle to check the repair.
Repair the defective components.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET062	FLYWHEEL SIGNAL

NOTES	There must be no present or stored faults.
	Information: if the flywheel has been replaced or removed, the flywheel target programming must be reinitialised.

Check **the mounting** and **positioning** of the TDC sensor (see **MR 395, Mechanics, 11A, Top and front of engine**).
Repair if necessary.

Check the **cleanliness** and **condition** of the TDC sensor and its connections.
Check the condition of the wire.
Repair if necessary.

Disconnect the battery and the injection computer.
Check the **cleanliness** and **condition** of the connections.
Using the Universal bornier, check the **insulation** and **continuity** of the following connections:
For F4R Turbo engine only:
Injection computer, connector **B, track E4** → **track 2** of the engine speed sensor
Injection computer, connector **B, track F3** → **track 1** of the engine speed sensor
For K4M and F4R engines only:
Injection computer, connector **B, track E4** → **track A** of the engine speed sensor
Injection computer, connector **B, track F3** → **track B** of the engine speed sensor
Repair if necessary.

Measure the **resistance** of the TDC sensor between **tracks 1** and **2 (F4R-Turbo only)** and between **tracks A** and **B (for K4M and F4R only)**.
Replace the TDC sensor if the **resistance** is not **200 to 270 Ω at 23 °C**.

If the sensor has been replaced, reset the flywheel signal programming.
Flywheel signal programming reinitialisation procedure:
Accelerate to **4000 rpm** in 3rd gear then decelerate to power take-up speed*.
Then repeat immediately.
(* This is the moment when, during deceleration with no load, the engine drops to idle speed and recovers torque.)
If the fault is still present, check **the cleanliness** and **condition** of the flywheel.

AFTER REPAIR	**If the TDC sensor has been replaced, reinitialise programming (RZ005).** Repeat the conformity check from the start.

GETtheMANUALS.org

ET564	DEFECT MODE TYPE 1

NOTES	There must be no present or stored faults.

This status covers faults that disable control of the motorised throttle valve.
This defect mode cuts off the throttle control (mechanical Limp Home position).

AFTER REPAIR	**If the TDC sensor has been replaced, reinitialise programming (RZ005).** Repeat the conformity check from the start.

GETtheMANUALS.org

ET565	TYPE 2 DEFECT MODE

NOTES	There must be no present or stored faults.

This status covers faults where the system has lost control of the air flow modulation. The associated defect mode limits the engine speed through injection cut-off.

AFTER REPAIR	**If the TDC sensor has been replaced, reinitialise programming (RZ005).** Repeat the conformity check from the start.

GETtheMANUALS.org

ET566	TYPE 3 DEFECT MODE

NOTES	There must be no present or stored faults.

This status covers faults indicating that the system no longer recognises the driver's demands, but still controls the air flow modulation (throttle servo control operational). It uses the pedal mode reconstructed by calibration.

AFTER REPAIR	**If the TDC sensor has been replaced, reinitialise programming (RZ005).** Repeat the conformity check from the start.

GETtheMANUALS.org

ET567	TYPE 4 DEFECT MODE

NOTES	There must be no present or stored faults.

This status covers faults affecting the monitoring system, or for which there is an emergency operating mode viable for the system (scenario of falling back on the second gang of a pedal or throttle potentiometer if there is a fault on the main gang).
Its effect is to restrict the throttle (limited performance).

AFTER REPAIR	**If the TDC sensor has been replaced, reinitialise programming (RZ005).** Repeat the conformity check from the start.

GETtheMANUALS.org

ET568	TYPE 5 DEFECT MODE

NOTES	There must be no present or stored faults.

This status covers faults affecting the control of the throttle by the torque structure. Its effect is to use the pedal feedback mode, instead of the permanent torque structure.

AFTER REPAIR	**If the TDC sensor has been replaced, reinitialise programming (RZ005).** Repeat the conformity check from the start.

GETtheMANUALS.org

ET569	DEFECT MODE TYPE 6

NOTES	There must be no present or stored faults.

This status covers faults affecting actuation of the turbocharging valve. The valve is no longer under servo control, and opens freely. The vehicle runs without turbocharging.

AFTER REPAIR	**If the TDC sensor has been replaced, reinitialise programming (RZ005).** Repeat the conformity check from the start.

GETtheMANUALS.org

PR030	ACCELERATOR PEDAL POSITION

NOTES	There must be no present or stored faults.

Check that the pedal mechanism has not seized.
Check the **cleanliness** and **condition** of the pedal potentiometer connections.
Repair if necessary.

Disconnect the battery and the injection computer.
Check the **cleanliness** and **condition** of the connections.
Using the Universal bornier, check the **insulation** and **continuity** of the following connections:

- Injection computer, connector **A, track H3** → **track 2** of the pedal potentiometer
- Injection computer, connector **A, track G2** → **track 4** of the pedal potentiometer
- Injection computer, connector **A, track H2** → **track 3** of the pedal potentiometer
- Injection computer, connector **A, track F4** → **track 1** of the pedal potentiometer
- Injection computer, connector **A, track F2** → **track 5** of the pedal potentiometer
- Injection computer, connector **A, track F3** → **track 6** of the pedal potentiometer

Repair if necessary.

If the fault is still present, replace the pedal potentiometer.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

PR074	BATTERY VOLTAGE

NOTES	There must be no present or stored faults. **No electrical consumers**.

Ignition on	**If the voltage is at minimum:** Check the battery and the charge circuit (see **MR 395 Mechanics, 16A, Starting - charging**). **If the voltage is at maximum:** Check that the charging voltage is correct with and without electrical consumers on (see **MR 395 Repair, 16A, Starting - charging**).
At idle speed	**If the voltage is at minimum:** Check the battery and the charge circuit (see **MR 395 Mechanics, 16A, Starting - charging**). **If the voltage is at maximum:** Check that the charging voltage is correct with and without electrical consumers on (see **MR 395 Repair, 16A, Starting - charging**).

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

PR095	ANTI-PINKING CORRECTION

NOTES	There must be no present or stored faults.

The pinking sensor must not supply a zero signal, proving that it is recording the mechanical vibrations of the engine.
Check that there is the **correct** fuel in the fuel tank. Repair if necessary.
Check the **condition** and **conformity** of the spark plugs. Repair if necessary.
Check the pinking sensor **tightness**. Repair if necessary.
Check the **cleanliness** and **condition** of the pinking sensor connectors. Repair if necessary.
Disconnect the battery and the injection computer. Check the **cleanliness** and **condition** of the connections. Using the Universal bornier, check the **insulation** and **continuity** of the following connections: Injection computer, connector **B, track B3** → **track 2** of the pinking sensor Injection computer, connector **B, track B4** → **track 1** of the pinking sensor Injection computer, connector **B, track B2** → **Pinking sensor screening** Repair if necessary.
If the fault is still present, replace the pinking sensor.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

PR098	UPSTREAM OXYGEN SENSOR VOLTAGE

NOTES	There must be no present or stored faults.

Check the **cleanliness** and **condition** of the upstream oxygen sensor connections. Repair if necessary.
Disconnect the battery and the injection computer. Check the **cleanliness** and **condition** of the connections. Using the Universal bornier, check the **insulation** and **continuity** of the following connections: Injection computer, connector **C, track C1** ⟶ **track D** of the upstream oxygen sensor Injection computer, connector **C, track B1** ⟶ **track C** of the upstream oxygen sensor Repair if necessary.
Check **the tightness** of the upstream oxygen sensor. Repair if necessary.
If the vehicle is driven frequently in town, **decoke the engine**.
Check that **there are no leaks** in the exhaust system, from the manifold to the catalytic converter. Repair if necessary.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

PR098 **CONTINUED**	

If the fault is still present, replace the upstream oxygen sensor.
If the fault has still not been cured, continue with the checks.

Check:
– the condition of the air filter,
– that the air inlet system is not blocked,
– the condition and conformity of the spark plugs,
– that the catalytic converter is not clogged,
– the sealing between the throttle valve and inlet manifold,
– the manifold pressure sensor sealing,
– the fuel vapour absorber bleed, which must not be jammed open,
– the fuel vapour absorber bleed system sealing,
– the brake servo system sealing,
– the cylinder head oil vapour recovery system sealing,
– the sealing between the inlet manifold and cylinder head,
– the exhaust pipe sealing between the cylinder head and catalytic converter.
– the fuel flow rate and pressure.

If the idle speed is not stable, check:
– the timing adjustment,
– the hydraulic tappets if there is camshaft noise (see **MR 395 Mechanics, 11A, Top and front of engine**),
– the cylinder compressions.
Drive the vehicle to check the repair.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

PR099	DOWNSTREAM OXYGEN SENSOR VOLTAGE

NOTES	There must be no present or stored faults.

Check the **cleanliness** and **condition** of the downstream oxygen sensor connections. Repair if necessary.
Disconnect the battery and the injection computer. Using the Universal bornier, check the **insulation** and **continuity** of the following connections: Injection computer, connector **C, track A2** ⟶ **track C** of the downstream oxygen sensor Injection computer, connector **C, track B2** ⟶ **track D** of the downstream oxygen sensor Repair if necessary.
Check **the tightness** of the downstream oxygen sensor. Repair if necessary.
If the vehicle is driven frequently in town, **carry out the unclogging procedure** (oxygen sensors and catalytic converter clogging).
Check that the exhaust pipe is completely **leak free**. Repair if necessary.
Replace the downstream oxygen sensor.
If the fault is still present, the catalytic converter is certainly damaged.
If the catalytic converter is faulty, the cause must be determined, otherwise the new catalytic converter may be damaged in turn.
Remove the catalytic converter.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

PR099 **CONTINUED**	

Various things may destroy a catalytic converter:
- **deformation** (impact),
- **thermal shock** (cold water splashed onto a hot catalytic converter can damage it),
- **defective injector or ignition:** the catalytic converter is damaged by contact with fuel (coil fault, coil control fault, injector jammed open),
- **injector leak,**
- **abnormal oil or coolant consumption** (defective cylinder head gasket),
- **use of a fuel additive** or other equivalent product (obtain information from the customer because this type of product can contaminate the catalytic converter and render it useless sooner or later).

Look up the service history of the vehicle or, if this is not possible, ask the customer if the vehicle has had injection or ignition faults.

If the cause of the catalytic converter damage has been found and the fault has disappeared, replace the catalytic converter.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

PR421	MANIFOLD PRESSURE

NOTES	There must be no present or stored faults.

Check the **cleanliness** and **condition** of the manifold pressure sensor and its connections.
Repair if necessary.

Disconnect the battery and the injection computer.
Check the **cleanliness** and **condition** of the connections.
Using the Universal bornier, check the **insulation** and **continuity** of the following connections:

For F4R Turbo engine only:

Injection computer, connector **B, track H2** → **track 1** of the manifold pressure sensor.
Injection computer, connector **B, track H3** → **track 3** of the manifold pressure sensor
Injection computer, connector **B, track H4** → **track 2** of the manifold pressure sensor

For K4M and F4R engines only:

Injection computer, connector **B, track H2** → **track C** of the manifold pressure sensor
Injection computer, connector **B, track H3** → **track B** of the manifold pressure sensor
Injection computer, connector **B, track H4** → **track A** of the manifold pressure sensor

Repair if necessary.

If the fault is still present, replace the manifold pressure sensor.

If the fault is still present, carry out the following checks:
The inlet line must be perfectly sealed, from the throttle valve to the cylinder head.

Check:
– the condition of the air filter,
– that the air inlet system is not blocked,
– the sealing between the throttle valve and inlet manifold,
– the manifold pressure sensor sealing,
– the fuel vapour absorber bleed, which must not be jammed open,
– the fuel vapour absorber bleed system sealing,
– the brake servo system sealing,
– the turbocharger safety valve circuit sealing,
– the cylinder head oil vapour recovery system sealing,
– the sealing between the inlet manifold and cylinder head,
– the exhaust pipe sealing between the cylinder head and catalytic converter.

Repair if necessary.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

GETtheMANUALS.org

AC015	FUEL PUMP RELAY

NOTES	There must be no present or stored faults.
	Special note When running the command, the instrument panel information display shows **OIL PRESSURE FAULT**. Disregard this message and do not deal with any fault (only in the present case where you are running an injection actuator command: expected system effect).

IF THE RELAY DOES NOT CLICK	Disconnect the battery and the injection computer. Check the **cleanliness** and **condition** of the computer connections. Using the Universal bornier, check the **insulation** and **continuity** on the following connection: Injection computer, connector **C, track D1** ⟶ **track 2** of the petrol pump relay Repair if necessary.
	If the fault is still present, contact the Techline.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC015 **CONTINUED**	

IF THE PUMP DOES NOT OPERATE	Disconnect the fuel pump. Check the **cleanliness** and **condition** of the connections. With the ignition on, check for **+ 12 V** on **track 1** of the fuel pump relay. If there is no **+ 12 V feed**, check using the Universal bornier for **continuity** on the following connections: Fuel pump relay **track 5** ⟶ **track 3** of the petrol pump cut-off relay Fuel pump cut-off relay **track 4** ⟶ **track C1** of the petrol pump If the fault is still present, check **the condition** of intermediate connector **R262**. Repair if necessary.
	If, with the ignition on, there is still not **+ 12 V** on the petrol pump relay connector, check fuse **F8 (10A)** of the petrol pump relay.
	Check for **earth** on **track C2** of the fuel pump. Repair if necessary.
	If the fault is still present, replace the fuel pump.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC017	CANISTER BLEED SOLENOID VALVE

NOTES	There must be no present or stored faults.
	Special note When running the command, the instrument panel information display shows **OIL PRESSURE FAULT**. Disregard this message and do not deal with any fault (only in the present case where you are running an injection actuator command: expected system effect).

Check the **cleanliness** and **condition** of the fuel vapour absorber bleed solenoid valve connections.
Repair if necessary.

Measure the **resistance** of the petrol vapour absorber bleed solenoid valve.
Replace the petrol vapour absorber bleed solenoid valve if the **resistance** is not **26 Ω ± 4 Ω at 23 °C**.

Check for **+ 12 V feed** on **track 1** of the fuel vapour absorber bleed solenoid valve with the ignition on.
If **+ 12 V** is not present:
– using the Universal bornier, check for **continuity** on the following connections:
Fuel computer, connector **B, track M2** → **track 1** of the petrol vapour absorber bleed solenoid valve
Main relay **track 5** → **track 1** of the petrol vapour absorber bleed solenoid valve
Repair if necessary.

Disconnect the battery.
Disconnect the computer. Check the **cleanliness** and **condition** of the connections.
Using the Universal bornier, check the **insulation** and **continuity** of the following connection:
Fuel computer, connector **C, track F2** → **track 2** of the petrol vapour absorber bleed solenoid valve
Repair if necessary.

If the fault is still present, replace the solenoid valve.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC027	MOTORISED THROTTLE

WARNING
Never drive the vehicle without checking first that there are no throttle valve faults.

NOTES	There must be no present or stored faults.
	Special note When running the command, the instrument panel information display shows **OIL PRESSURE FAULT**. Disregard this message and do not deal with any fault (only in the present case where you are running an injection actuator command: expected system effect).

Switch on the ignition and run command **AC027 Motorised throttle**.
If the motorised throttle does not work, apply the interpretation for **DF079 Motorised throttle valve automatic control**.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC038	LOW SPEED GMV RELAY

NOTES	Coolant temperature with engine switched off > **100 ˚C** Air conditioning requested and authorised Coolant temperature with engine running > **99 ˚C** **Special note** When running the command, the instrument panel information display shows **OIL PRESSURE FAULT**. Disregard this message and do not deal with any fault (only in the present case where you are running an injection actuator command: expected system effect).

Check the **connection and condition** of the low-speed fan unit relay connector. Repair if necessary.
Disconnect the relay. Check for **+ 12 V** on **track 3** of the low-speed fan assembly relay connector. Repair if necessary.
Disconnect the relay. With the ignition on, check for **+ 12 volts** on **track 1** of the low-speed fan unit relay. If there is no **+ 12 V** feed, using the universal bornier, check the **continuity** of the following connections: Injection computer, connector **B, track M2** → **track 1** of the low-speed fan unit relay Main relay **track 5** → Repair if necessary.
Check the **insulation and continuity** of the connection between: Injection computer, connection **C, track G2** → **track 2** of the low-speed fan unit relay Repair if necessary.
Reconnect the relay. Check for **+ 12 V** on **track 5** of the high-speed fan unit relay connector when command **AC038 Low speed fan unit relay** is run. Replace the relay if necessary.
If the fault is still present, check (with the ignition on), for an **earth** on **track 2** of the low speed fan unit relay. If, with the ignition on, the computer does not control the high speed fan unit relay on **track 2** through an earth, contact your Techline.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC039	HIGH SPEED GMV RELAY

NOTES	Air conditioning pressure > **24 bar** Air conditioning pressure > **18 bar** + vehicle speed > **12 mph (20 km/h)** Coolant temperature with engine running > **102 ˚C**
	Special note When running the command, the instrument panel information display shows **OIL PRESSURE FAULT**. Disregard this message and do not deal with any fault (only in the present case where you are running an injection actuator command: expected system effect).

Check **the connection and condition** of the high-speed fan unit relay connector.
Repair if necessary.

Disconnect the relay.
Check for **+ 12 V** on **track 3** of the high-speed fan assembly relay connector.
Repair if necessary.

Disconnect the relay.
With the ignition on, check for **+ 12 V** on **track 1** of the high-speed fan unit relay.
If there is no **+ 12 V** feed, using the universal bornier, check the **continuity** of the following connections:
Injection computer, connector **B, track M2** → **track 1** of the high-speed fan unit relay
Main relay **track 5** →
Repair if necessary.

Check the **insulation and continuity** of the connection between:
Injection computer, connector **C, track J2** → **track 2** of the high speed fan unit relay
Repair if necessary.

Reconnect the relay.
Check for **+ 12 V** on **track 5** of the high-speed fan unit relay connector when command **AC039 High speed fan unit relay** is run.
Replace the relay if necessary.

If the fault is still present, check (with the ignition on), for an **earth** on **track 2** of the high speed fan unit relay.
If, with the ignition on, the computer does not control the high speed fan unit relay on **track 2** through an earth, contact your Techline.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

NOTES	**Only consult the customer complaints after performing a complete check with the diagnostic tool.** **WARNING** **Never drive the vehicle without checking first that there are no throttle valve faults.**

NO DIALOGUE WITH THE COMPUTER — **ALP 1**

THE ENGINE WILL NOT START — **ALP 2**

IDLING SPEED FAULTS — **ALP 3**

FAULTS WHILE DRIVING — **ALP 4**

GETtheMANUALS.org

ALP 1	No dialogue with the computer

NOTES	None

Test the diagnostic tool on another vehicle in perfect working order.
Check that the sensor's green indicator light comes on.
If you cannot establish dialogue with the second vehicle, follow the instructions in the **CLIP diagnostic tool check** section.
If you establish dialogue with the second vehicle, follow the instructions in the **Vehicle check** section.

CLIP DIAGNOSTIC TOOL CHECK	Check the **cleanliness** and **condition** of the diagnostic socket contacts which connect to the vehicle. Check the **condition** of the cable from the diagnostic socket to the sensor, and the cleanliness and condition of the connections. Check the sensor connections. Check the **condition** of the cable from the sensor to the CLIP tool, and the cleanliness and condition of the connections. Check the **cleanliness** and **condition** of the CLIP socket. If the fault is still present, contact the Techline.
CHECK ON THE VEHICLE	Check the **electrical voltage** of the battery. Check the **cleanliness** and **condition** of the battery terminals. Check the **condition** and **tightness** of the cable going from the battery + terminal to the Protection and Switching Unit. Check the **condition** of the battery earth cable and ensure that there is a **good electrical connection** with the bodywork.
	Check the injection computer earth terminal for **cleanliness** and make sure it is **properly connected** to the bodywork.
	Check the after ignition feed **30 A fuse** for the injection computer, and **the condition** and **cleanliness** of the contacts. (Continued on next page.)

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ALP 1 CONTINUED 1	

CHECKING ON THE VEHICLE (CONTINUED 1)

Using the Universal bornier, check the following tracks on the **vehicle's diagnostic socket**:

Track 1 → **+ After ignition feed**
Track 16 → **+ Battery feed**
Tracks 4 and 5 → **Earth**

Repair if necessary.

Disconnect the battery and the petrol computer.
Check the **cleanliness** and **condition** of the computer connections.
Using the Universal bornier, check the **continuity** of the **multiplex line** communication lines:

Fuel computer, connector **A, track A4** → **track 6** Vehicle diagnostic socket
Fuel computer, connector **A, track A3** → **track 14** Vehicle diagnostic socket

If the fault is still present, check **the condition** of intermediate connector **R262**.
Repair if necessary.

Check the **continuity** of the **K** communication line:

Petrol computer, connector **A, track B4** → **track 7** of the vehicle diagnostic socket

If the fault is still present, check **the condition** of the intermediate connector (**R262**).
Repair if necessary.

Disconnect the computer **earth** terminal connection from the negative battery terminal.
Check the **continuity** and **insulation** of the following tracks:

Fuel computer, connector **C, track L1** → **Earth terminal**
Fuel computer, connector **C, track M1** → **Earth terminal**
Fuel computer, connector **B, track M1** → **Earth terminal**
Fuel computer, connector **B, track L1** → **Earth terminal**

Repair if necessary.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ALP 1 **CONTINUED 2**	

CLIP VEHICLE CHECK (CONTINUED 2)	Using the Universal bornier, check for **insulation** and **continuity** on the following connection: Computer, connector **B, track D4** ⟶ t**rack 2** of the main relay Repair if necessary.
	Using the Universal bornier, check for **continuity** on the following connection: Computer, connector **B, track M2** ⟶ t**rack 5** of the main relay Repair if necessary.
	Check the condition and operation of fuse **F6 (10A)**. Using the Universal bornier, check for **continuity** on the following connection: Computer, connector **A, track D1** ⟶ t**rack 8** of the fuse box Fuse box **track 8** ⟶ **track 1** of the petrol pump relay Repair if necessary.
	If the fault is still present, contact the Techline.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ALP 2	The engine will not start

NOTES	**Follow ALP 2 after a complete check with the diagnostic tool.** *(Use the relevant section in the Workshop Repair Manual to carry out certain operations).*
	WARNING **Never drive the vehicle without ensuring that there are no throttle valve faults**

If the starter motor does not operate, there may be a fault with the engine immobiliser. Carry out fault finding on the UCH (see **87G, Connection Unit**).
Check the condition of the battery. Check the cleanliness, condition and tightness of the battery terminals. Check that the battery is correctly earthed to the vehicle bodywork. Check that the + battery leads are correctly connected.
Check that the starter motor is properly connected. Check that the starter works (see **Workshop Repair Manual 395 Mechanics, 16A, Starting-charging**).
Check the condition and conformity of the spark plugs. Check the mounting, cleanliness and condition of the flywheel signal sensor. Check the flywheel signal sensor air gap. Check the condition of the flywheel.
Check that the air filter is not clogged. Check that the air inlet system is not blocked.
Check that there is fuel in the tank (fuel sender fault). Check that the tank vent is not blocked. Check that the fuel is of the correct type. Check that there are no leaks in the fuel system, from the tank to the injectors. Check that there are no kinked hoses (especially after a removal operation). Check the fuel flow rate and pressure. Check the sealing of the injectors, and that they are working properly.
Check that the exhaust system is not blocked and the catalytic converter not clogged.
Check the timing setting.
Check the cylinder compressions.
Check the hydraulic tappets if there is camshaft noise.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ALP 3	Idle speed faults

NOTES	**Fill in ALP 3 after a complete check using the diagnostic tool.** *(Use the relevant section in the Workshop Repair Manual to carry out certain operations).*
	WARNING **Never drive the vehicle without checking first that there are no throttle valve faults.**

Check that the oil level is not too high.
Check the inlet system sealing, from the throttle to the cylinder head. Check that the fuel vapour absorber bleed is not disconnected or jammed open. Check that there are no leaks in the fuel vapour absorber bleed system. Check that there are no leaks in the braking assistance system. Check that there are no leaks in the oil vapour recovery system (manifold/cylinder head). Check that there are no leaks around the manifold pressure sensor. Check that there are no leaks around the air temperature sensor.
Check that the air filter is not clogged. Check that the air inlet system is not blocked. Check that throttle valve is not clogged.
Check the condition of the pencil coils and the cleanliness of their connections. Check the electrical resistance of the pencil coil secondary circuits. Check the condition and conformity of the spark plugs. Check the mounting, cleanliness and condition of the flywheel signal sensor. Check the flywheel signal sensor air gap. Check the condition and cleanliness of the flywheel.
Check that the tank vent is not blocked. Check that the fuel is of the correct type. Check that there are no leaks in the fuel system, from the tank to the injectors. Check that there are no kinked hoses (especially after a removal operation). Check the fuel flow rate and pressure. Check that the injectors are working properly.
Check that the exhaust system is not blocked and the catalytic converter not clogged.
Check the timing setting.
Check the cylinder compressions.
Check the hydraulic tappets if there is camshaft noise.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ALP 4	Faults occurring while driving

NOTES	**Fill in ALP 4 after a complete check using the diagnostic tool.** *(Use the relevant section in the Workshop Repair Manual to carry out certain operations).*
	WARNING **Never drive the vehicle without checking first that there are no throttle valve faults.**

Check that the oil level is not too high.
Check the condition of the pencil coils and the cleanliness of their connections. Check the electrical resistance of the pencil coil secondary circuits. Check the condition and conformity of the spark plugs. Check the mounting, cleanliness and condition of the flywheel signal sensor. Check the flywheel signal sensor air gap. Check the condition and cleanliness of the flywheel.
Check that the air filter is not clogged. Check that the air inlet system is not blocked. Check that throttle valve is not clogged. Check the inlet system sealing, from the throttle to the cylinder head.
Check that the fuel vapour absorber bleed is not disconnected or jammed open. Check that there are no leaks in the fuel vapour absorber bleed system. Check that there are no leaks in the braking assistance system. Check that there are no leaks in the oil vapour recovery system (manifold/cylinder head). Check that there are no leaks around the manifold pressure sensor. Check that there are no leaks around the air temperature sensor.
Check that the tank vent is not blocked. Check that the fuel is of the correct type. Check that there are no leaks in the fuel system, from the tank to the injectors. Check that there are no kinked hoses (especially after a removal operation). Check the fuel flow rate and pressure. Check that the injectors are working properly.
Check that the exhaust system is not blocked and the catalytic converter not clogged.
Check the timing setting.
Check the cylinder compressions.
Check the hydraulic tappets if there is camshaft noise.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

1. SCOPE OF THIS DOCUMENT

This document presents the fault finding procedure applicable to all computers with the following specifications:

Vehicles: **Espace IV phase 1 / phase 2**
Velsatis phase 1 / phase 2

Engines concerned: **V4Y 701, 711 and 715**

Function concerned: **Petrol injection**

Name of computer: **EWR 20 injection**

Program No.: **61**

Vdiag No.: **04, 08, 0C, 10**

2. PREREQUISITES FOR FAULT FINDING

Documentation type

Fault finding procedures (this manual):
– Assisted fault finding (integrated into the diagnostic tool), Dialogys.

Wiring Diagrams:
– Visu-Schema (CD-ROM).

Type of diagnostic tools
– **CLIP + sensor**

Special tooling required

Special tooling required	
	Multimeter
Elé. 1681	Universal bornier

3. RECAP

Procedure

To save energy, the UCH of the vehicle interrupts the + after ignition feed after 3 minutes.

When performing fault finding on a computer, it is possible to force the + after ignition feed for 1 hour by applying the following procedure:
– Press the card unlocking button,
– insert the card in the reader,
– press the Start button (interrupting the timed + after ignition feed mode),
– press and hold the Start button for over 5 seconds until the engine immobiliser warning light starts to flash rapidly (4 Hz).

This forced + after ignition feed mode remains active for 1 hour.
– Pressing the Start button or removing the card from the reader cuts off the forced + after ignition feed but does not cut off the timed forced + after ignition feed mode. As long as one hour has not elapsed the + after ignition feed function restarts the forced + after ignition feed for the remaining time.

GETtheMANUALS.org

Faults

Faults are declared as either present or stored (depending on whether they appeared in a certain context and have disappeared since, or whether they remain present but have not been diagnosed within the current context).

The **present** or **stored** status of faults should be taken into consideration when the diagnostic tool is switched on after the + after ignition feed (without any system components being active).

For a **present fault**, apply the procedure described in the **Interpretation of faults** section.

For a **stored fault**, note the faults displayed and apply the instructions in the **Notes** section.

If the fault is **confirmed** when the instructions in the Notes section are applied, the fault is present. Deal with the fault

If the fault is **not confirmed**, check:
- the electrical lines which correspond to the fault,
- the connectors for these lines (for oxidation, bent pins, etc.),
- the resistance of the component detected as faulty,
- the condition of the wires (melted or split insulation, wear).

Conformity check

The aim of the conformity check is to check data that does not produce a fault on the diagnostic tool because the data is inconsistent. Therefore, this stage is used to:
- carry out fault finding on faults that do not have a fault display, and which may correspond to a customer complaint.
- check that the system is operating correctly and that there is no risk of a fault recurring after repairs.

This section gives the fault finding procedures for statuses and parameters and the conditions for checking them.

If a status is not behaving normally or a parameter is outside the permitted tolerance values, consult the corresponding fault finding page.

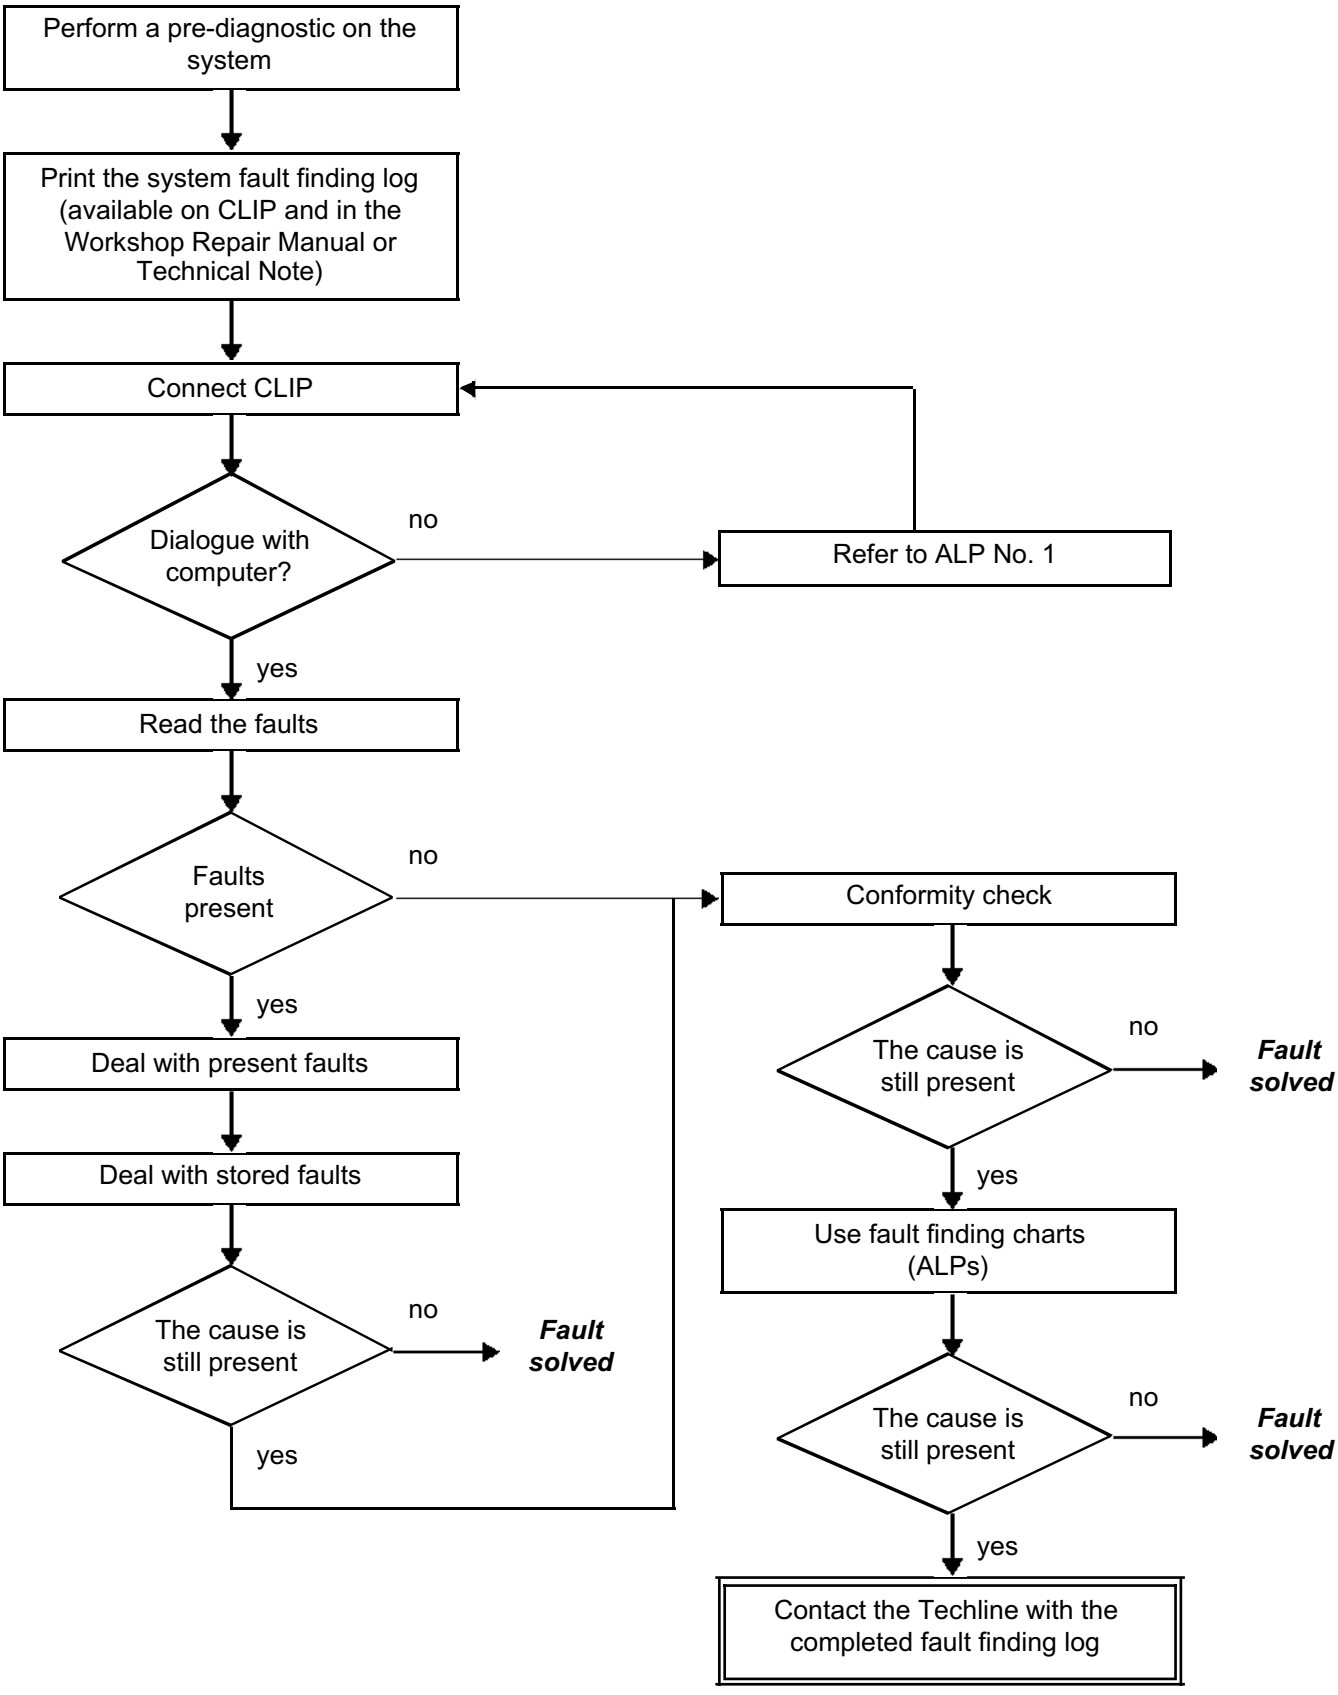
Customer complaints - Fault finding chart

If the test with the diagnostic tool is OK but the customer complaint is still present, the fault should be processed by **customer complaint**.

A synopsis of the general procedure to follow is provided on the following page in the form of a flow chart.

GETtheMANUALS.org

4. FAULT FINDING PROCEDURE



GETtheMANUALS.org

4. FAULT FINDING PROCEDURE (continued)

Wiring check

Fault finding problems
Disconnecting the connectors and/or manipulating the wiring harness may temporarily remove the cause of a fault.
Electrical measurements of voltage, resistance and insulation are generally correct, especially if the fault is not present when the analysis is made (stored fault).

Visual inspection
Look for damage under the bonnet and in the passenger compartment.
Carefully check the fuses, insulators and wiring harness routing.
Look for signs of oxidation.

Physical inspection
While manipulating the wiring harness, use the diagnostic tool to note any change in fault status from stored to present.
Make sure that the connectors are properly locked.
Apply light pressure to the connectors.
Twist the wiring harness.
If there is a change in status, try to locate the source of the fault.

Inspection of each component
Disconnect the connectors and check the appearance of the clips and tabs, as well as the crimping (no crimping on the insulating section).
Make sure that the clips and tabs are properly locked in the sockets.
Check that no clips or tabs have been dislodged during connection.
Check the clip contact pressure using an appropriate model of tab.

Resistance check
Check the continuity of entire lines, then section by section.
Look for a short circuit to earth, to **+ 12 V** or to another wire.

If a fault is detected, repair or replace the wiring harness.

GETtheMANUALS.org

5. FAULT FINDING LOG

IMPORTANT

IMPORTANT
Any fault on a complex system requires thorough fault finding with the appropriate tools. The FAULT FINDING LOG, which should be completed during the procedure, enables you to keep track of the procedure which is carried out. It is an essential document when consulting the manufacturer.

IT IS THEREFORE MANDATORY TO FILL OUT A FAULT FINDING LOG EACH TIME FAULT FINDING IS CARRIED OUT.

You will always be asked for this log:

- when requesting technical assistance from Techline,
- for approval requests when replacing parts for which approval is mandatory,
- to be attached to monitored parts for which reimbursement is requested. The log is needed for warranty reimbursement, and enables better analysis of the parts removed.

6. SAFETY ADVICE

Safety rules must be observed during any work on a component to prevent any damage or injury:

- check the battery voltage to avoid incorrect operation of computer functions,
- use the proper tools.

GETtheMANUALS.org

V4Y injection system details:

IMPORTANT
A computer is matched to the engine and the vehicle on which it is installed. It is prohibited to try a computer on another vehicle then return it to the original vehicle.

1. Motorised throttle valve

1.1 General

In the motorised throttle valve system there are no adjustments between the acquisition of the real value with the potentiometers, and the mechanical position of the throttle valve. An adjustment must therefore be made in the injection computer.
During this operation, the position of the lower mechanical stop and the **stand-by throttle position are programmed**, and the potentiometer amplifier is balanced.
The programmed values are stored in the computer memory. The sequence of **programming the end stops** and **storing programmed values** equates to **initialising** the motorised throttle valve. The springs of the motorised throttle are also tested.
The above initialisation process runs automatically and independently when the ignition is switched on, but only under certain initial conditions. It may also run several times when the ignition is on.

1.2 Throttle programming procedure

Programming should be performed at least once correctly during the vehicle life cycle, that is, when switching on for the first time (original initialisation), and then **each time either the computer or the motorised throttle valve is replaced**. After the throttle valve is replaced and before reprogramming, the **programming must be cleared**.
Switch on the ignition for approximately **30 seconds**, then switch off and wait for the end of power-latch.
Switch the ignition on again, start the engine and check that the engine responds correctly to movements of the accelerator pedal.

2. Warning light management

Management of the operation of warning lights and injection information is incorporated in the instrument panel.
In the event of a fault, refer to section **83A, Instrument panel**.
– The OBD (On Board Diagnostic) warning light (orange engine icon) signals that the pollution threshold has been exceeded.

Each time the ignition is switched on, the OBD warning light comes on to permit a visual inspection. This light goes out **3 seconds** after starting the engine.
In normal operation, if the warning light is lit continuously, the injection system is exceeding the pollution threshold due to an OBD fault (misfiring, ageing of the oxygen sensors or a fault on the fuel supply) or an electrical fault leading to an OBD fault (injector, coil, etc.). Flashing of this warning light signifies a risk of catalytic converter damage.

GETtheMANUALS.org

3. Climate control computer - injection computer connection

The injection computer is connected to the CLIMATE CONTROL computer via the multiplex link:
When the **CLIMATE CONTROL** switch is turned on, the CLIMATE CONTROL computer requests compressor operation.
The injection computer authorises or inhibits the compressor clutch and if necessary imposes a fast idle speed which increases in increments of **50 rpm**.

Compressor operation programming

During certain operating phases, the injection computer disables the compressor:
– for 3 seconds after the engine has been started, if the throttle position is more than approximately 67˚ (acceleration at a value below 54˚), for 5 seconds if use is made of the power assisted steering at the same moment as the demand for climate control, if the coolant temperature is more than **115 ˚C** and if the engine speed is above **5400 rpm** (acceleration at an engine speed below **4900 rpm**).

GETtheMANUALS.org

1. COMPUTER REPLACEMENT AND PROGRAMMING OR REPROGRAMMING OPERATIONS

The system can be reprogrammed via the diagnostic socket using the **RENAULT CLIP** diagnostic tool (see **Technical Note 3585A**)

While the computer is being reprogrammed the fan assemblies are triggered automatically.

IMPORTANT
- **Switch on the diagnostic tool (mains or cigarette lighter feed).**
- **Connect a battery charger.**
- **Switch off all electrical consumers (lights, interior lighting, air conditioning, radio, etc.).**
- **Wait for the engine to cool (engine coolant temperature below 60 ˚C and air temperature below 50 ˚C).**

After any computer reprogramming operation:
- **Switch the ignition off and then on again.**
- **Use the diagnostic tool to carry out the following steps:**
- **Run** command **VP020 Enter VIN**.
- Following programming or reprogramming, faults may appear in the injection computer; run command **RZ007 Fault memory** to clear these faults.
- Program the throttle stops. (see **Configurations and programming: 1.**)
- Program the air path. (see **Configurations and programming: 2.**)
- **IMPORTANT: NEVER** run command **RZ019 Reinitialise programming**.This would erase the engine parameter programming.
- Carry out a road test followed by a complete test with the diagnostic tool.

IMPORTANT
Never drive the vehicle without having programmed the throttle stops.
It is forbidden to perform tests with computers borrowed from the Parts Department or from another vehicle which must then be returned.
These computers are hard-coded.
If the injection computer is defective, contact Techline and refer to the "fault finding log".

2. REPLACING THE MOTORISED THROTTLE VALVE

When replacing the throttle valve, program the throttle stops and the air path. (see **Configurations and programming: 2**)

3. REPLACING THE FLOWMETER

When replacing the flowmeter, program the air path. (see **Configurations and programming: 2.**)

4. REPLACING OR DISCONNECTING THE BATTERY

When replacing or disconnecting the battery, program the air path. (see **Configurations and programming: 2**.)

GETtheMANUALS.org

CONFIGURATIONS AND PROGRAMMING

1. Programming the throttle stops.

After replacing the computer or the motorised throttle valve, switch on the ignition, wait **30 seconds** so that the computer can program the upper and lower stops, then switch off the ignition and wait **30 seconds** for the computer to store the programmed stops. Check the programming with **ET051 Programming throttle stops: Performed**.

2. Programming the air path.

Use procedure 1 or 2 to program the air path.

Preliminary conditions: (procedures 1 and 2)

1 No present or stored faults in the injection computer (otherwise deal with the present faults or clear the stored faults by running command **RZ007 Fault memory**.)
2 The battery voltage should be above **13V** (battery charger required for the manual procedure, as the engine is off)
3 The coolant temperature should be between **70 and 97 ˚C**
4 The gear lever should be in neutral or Park position
5 All electrical consumers should be off (air conditioning unit, heating devices, headlights, de-icing)
6 The cooling fan should not be running.
7 The steering wheel should be in the centre position **(close to 0˚)**
8 The vehicle speed is zero (stationary).

Procedure 1 (with routine):

1 Clear **RZ032 Program air path**
2 With the engine running, run command **VP070 Program air path**
3 Wait for the command to finish.
4 Check status **ET802 Air path programming**
If **ET802 Air path programming** is **Completed**:
– Check that the idle speed is between **600-700 rpm**.
– If **ET802 Air path programming** is **NOT Completed**:
– Check that the throttle valve is completely closed with the ignition off,
– Check the cleanliness and conformity of the air inlet circuit,
– Restart from step **1)** or carry out **procedure 2**.

Procedure 2 (Manual): (to be used if Procedure 1 does not work)

1 Clear **RZ032 Program air path**
2 Switch off the ignition and wait **10 seconds** (for powerlatch).
3 Switch on the ignition, leaving the accelerator pedal **released** for at least **2 seconds**.
4 **Depress the accelerator pedal 5 times at "full load"** in less than **6 seconds**
5 Release the accelerator pedal **completely** for at least **5 seconds**.
6 **Depress the accelerator pedal once at "full load"** for **20 seconds**.
7 Release the accelerator pedal **completely** and start the engine within **10 seconds**.
8 Allow the engine to run for **20 seconds**.
9 Check status **ET802 Air path programming**
If **ET802 Air path programming** is **Completed**:
– Check that the idle speed is between **600-700 rpm**.
If **ET802 Air path programming** is **NOT Completed**:
– Check that the throttle valve is completely closed with the ignition off,
– Check the cleanliness and conformity of the air inlet circuit,
– Restart from step **1)** or contact the **Techline**

DF001 PRESENT OR STORED	COOLANT TEMPERATURE SENSOR CIRCUIT CC.O : Short circuit to earth CO.0 : Open circuit or short circuit to earth CO.1 : Open circuit or short circuit to +12 V 1.DEF : Inconsistent signal

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present following a variation in coolant temperature (Fan unit triggered).

Check the **connection and condition of the coolant temperature sensor connector**.
Replace the connector if necessary.

Check the **resistance of the coolant temperature sensor** (value zero or infinity = total breakdown of the sensor).
Replace the coolant temperature sensor if the resistance is not:

2480 Ω ± 248 Ω at 20˚C
1750 Ω ± 175 Ω at 30˚C

Check **the insulation, continuity and absence of interference resistance** on the following connections:

Injection computer, connector A, track 36 → **Track 1 of the coolant temperature sensor**

Injection computer, connector A, track 15 → **Track 2 of the coolant temperature sensor**

Repair if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF002 PRESENT OR STORED	AIR TEMPERATURE SENSOR CIRCUIT CC.1 : Short circuit to + 12 V CO.0 : Open circuit or short circuit to earth CO.1 : Open circuit or short circuit to +12 V 1.DEF: Inconsistent signal

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present following a variation in air temperature (Fan unit triggered).

Check the **condition and connection of the connector**.
Replace the connector if necessary.

Check the **resistance of the air temperature sensor**.
Replace the air temperature sensor if the resistance is not:

2420 Ω ± 242 Ω at 20˚C.
1050 Ω ± 105 Ω at 40˚C.
600 Ω ± 60 Ω at 60˚C.
400 Ω ± 40 Ω at 80˚C.

After replacing the throttle valve, program the air line. (See Replacement of components, Configurations and programming)

Check **the insulation, continuity and absence of interference resistance** on the following connections:

Injection computer, connector A, track 17 ⟶ **Track 5 of the flowmeter**

Injection computer, connector A, track 75 ⟶ **track 3 of the flowmeter**

Repair if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF008 PRESENT OR STORED	PEDAL POTENTIOMETER CIRCUIT GANG 1 CO.0 : Open circuit or short circuit to earth 1.DEF: Inconsistency of the signal

NOTES	**Priority for dealing with a combination of faults:** Deal first with faults **DF425 First sensor reference voltage or DF009 Pedal potentiometer circuit gang 2** if they are present or stored.

Check the **condition and connection of the connector**.
Replace the connector if necessary.

Check the **resistance of accelerator pedal position potentiometer 1**.
Replace the potentiometer if the resistance is not 1.2 kΩ ± 0.5 kΩ between tracks 2 and 4 of the pedal potentiometer.

Check **the insulation, continuity and absence of interference resistance** on the following connections:

- **Injection computer, connector A, track 37** → **track 2 of the accelerator pedal position potentiometer 1**
- **Injection computer, connector A, track 38** → **track 3 of the accelerator pedal position potentiometer 1**
- **Injection computer, connector A, track 43** → **track 4 of the accelerator pedal position potentiometer 1**

Repair if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF009 PRESENT OR STORED	PEDAL POTENTIOMETER CIRCUIT GANG 2 CO.0 : Open circuit or short circuit to earth 1.DEF: Inconsistency of the signal

NOTES	**Priority for dealing with a combination of faults:** Deal with the **DF425 First sensor reference voltage fault** first if it is present or stored. If faults **DF333 Injection → Automatic transmission connection** and **DF491 Electronic Stability Program (ESP)** are also present, check the computer earth lines on **tracks 115 and 116** (see **ALP 1**). Repair them if necessary. Switch off the ignition and wait for an end of dialogue to confirm the fault.

Check the **condition and connection of the connector**.
Replace the connector if necessary.

Check the **resistance of accelerator pedal position potentiometer 2**.
Replace the potentiometer if the resistance is not **1.7 kΩ ± 0.7 kΩ** between **tracks 1 and 5** of the pedal potentiometer.

Check **the insulation, continuity and absence of interference resistance** on the following connections:

- **Injection computer, connector A, track 24** → **Track 5 of the accelerator pedal position potentiometer 2**
- **Injection computer, connector A, track 39** → **Track 6 of the accelerator pedal position potentiometer 2**
- **Injection computer, connector A, track 40** → **Track 1 of the accelerator pedal position potentiometer 2**

Repair if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF023 PRESENT OR STORED	COOLANT TEMPERATURE OVERHEATING WARNING LIGHT CIRCUIT

NOTES	None.

Run a multiplex network test (see **88B, Multiplex**).
Carry out fault finding on the Instrument panel system (see **83A, Instrument panel**).

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF038 PRESENT OR STORED	COMPUTER 1.DEF: Internal command module: RAM (Random Access Memory) error

NOTES	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Use the following procedure:
– Switch on the ignition.
– Clear the stored fault on the injection computer using the diagnostic tool.
– Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end.
– Switch on the ignition and establish dialogue with the injection computer.
If the computer fault is still present, contact the Techline.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF056 PRESENT OR STORED	AIR FLOWMETER CIRCUIT CO.0 : Open circuit or short circuit to earth CO.1 : Short circuit or open circuit to + 12 V 1.DEF: Inconsistency of the signal

NOTES	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Check **the connection and condition** of the air flow sensor connector. Replace the connector if necessary.

Check that the sensor is **pneumatically connected**. Repair if necessary.

Check that the **inlet circuit has no leaks**.
Repair if necessary.

Check the **flowmeter resistance between track 1 and track 3**.
Replace the flowmeter if the resistance is not **2420 Ω ± 242 Ω**.

After the flowmeter has been replaced, program the air line. (See Replacement of components, Configurations and programming)

Check **the insulation, continuity and absence of interference resistance** on the following connections:

Injection computer, connector A, track 43 → **Track 2 of the flowmeter**

Injection computer, connector A, track 56 → **Track 1 of the flowmeter**

Injection computer, connector A, track 75 → **Track 3 of the flowmeter**

Main relay track 3 → **Track 4 of the flowmeter**

Repair if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF059 PRESENT OR STORED	COMBUSTION MISFIRES ON CYLINDER 1

NOTES	**Special note:** Indicates that the fault is confined to this cylinder. Priority for dealing with a combination of faults: – If the following faults: **DF059 Misfiring on cylinder 1;** **DF060 Misfiring on cylinder 2;** **DF061 Misfiring on cylinder 3;** **DF062 Misfiring on cylinder 4;** **DF063 Misfiring on cylinder 5;** **DF064 Misfiring on cylinder 6;** are all present, carry out procedure **DF436 Combustion misfire fault finding**. – If the fault is confined to this cylinder, deal with fault **DF436: Detection of misfires** first.

Check:
– condition and connection of the injector,
– condition of the pipe supplying fuel to the injector,
– condition and type of spark plug,
– the operation of the coil following fault procedure **DF345 Ignition coil circuit**,
– compression.
Repair if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF060 PRESENT OR STORED	COMBUSTION MISFIRING ON CYLINDER 2

NOTES	**Special note:** Indicates that the fault is confined to this cylinder. Priority for dealing with a combination of faults: – If the following faults: **DF059 Misfiring on cylinder 1;** **DF060 Misfiring on cylinder 2;** **DF061 Misfiring on cylinder 3;** **DF062 Misfiring on cylinder 4;** **DF063 Misfiring on cylinder 5;** **DF064 Misfiring on cylinder 6;** are all present, carry out procedure **DF436 Combustion misfire fault finding**. – If the fault is confined to this cylinder, deal with fault **DF436: Detection of misfires** first.

Check:
– condition and connection of the injector,
– condition of the pipe supplying fuel to the injector,
– condition and type of spark plug,
– the operation of the coil following fault procedure **DF345 Ignition coil circuit**,
– compression.
Repair if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF061 PRESENT OR STORED	COMBUSTION MISFIRING ON CYLINDER 3 CO.0 : Open circuit or short circuit to earth CO.1 : Short circuit or open circuit to + 12 V 1.DEF: Inconsistency of the signal

NOTES	**Special note:** Indicates that the fault is confined to this cylinder. Priority for dealing with a combination of faults: – If the following faults: **DF059 Misfiring on cylinder 1;** **DF060 Misfiring on cylinder 2;** **DF061 Misfiring on cylinder 3;** **DF062 Misfiring on cylinder 4;** **DF063 Misfiring on cylinder 5;** **DF064 Misfiring on cylinder 6;** are all present, carry out procedure **DF436 Combustion misfire fault finding**. – If the fault is confined to this cylinder, deal with fault **DF436: Detection of misfires** first.

Check:
– condition and connection of the injector,
– condition of the pipe supplying fuel to the injector,
– condition and type of spark plug,
– the operation of the coil following fault procedure **DF345 Ignition coil circuit**,
– compression.
Repair if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF062 PRESENT OR STORED	COMBUSTION MISFIRING ON CYLINDER 4

NOTES	**Special note:** Indicates that the fault is confined to this cylinder. Priority for dealing with a combination of faults: – If the following faults: **DF059 Misfiring on cylinder 1;** **DF060 Misfiring on cylinder 2;** **DF061 Misfiring on cylinder 3;** **DF062 Misfiring on cylinder 4;** **DF063 Misfiring on cylinder 5;** **DF064 Misfiring on cylinder 6;** are all present, carry out procedure **DF436 Combustion misfire fault finding**. – If the fault is confined to this cylinder, deal with fault **DF436: Detection of misfires** first.

Check:
– condition and connection of the injector,
– condition of the pipe supplying fuel to the injector,
– condition and type of spark plug,
– the operation of the coil following fault procedure **DF345 Ignition coil circuit**,
– compression.
Repair if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF063 PRESENT OR STORED	COMBUSTION MISFIRING ON CYLINDER 5

NOTES	**Special note:** Indicates that the fault is confined to this cylinder. Priority for dealing with a combination of faults: – If the following faults: **DF059 Misfiring on cylinder 1;** **DF060 Misfiring on cylinder 2;** **DF061 Misfiring on cylinder 3;** **DF062 Misfiring on cylinder 4;** **DF063 Misfiring on cylinder 5;** **DF064 Misfiring on cylinder 6;** are all present, carry out procedure **DF436 Combustion misfire fault finding**. – If the fault is confined to this cylinder, deal with fault **DF436: Detection of misfires** first.

Check:
– condition and connection of the injector,
– condition of the pipe supplying fuel to the injector,
– condition and type of spark plug,
– the operation of the coil following fault procedure **DF345 Ignition coil circuit**,
– compression.
Repair if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF064 PRESENT OR STORED	COMBUSTION MISFIRING ON CYLINDER 6

NOTES	**Special note:** Indicates that the fault is confined to this cylinder. Priority for dealing with a combination of faults: – If the following faults: **DF059 Misfiring on cylinder 1;** **DF060 Misfiring on cylinder 2;** **DF061 Misfiring on cylinder 3;** **DF062 Misfiring on cylinder 4;** **DF063 Misfiring on cylinder 5;** **DF064 Misfiring on cylinder 6;** are all present, carry out procedure **DF436 Combustion misfire fault finding**. – If the fault is confined to this cylinder, deal with fault **DF436: Detection of misfires** first.

Check:
– condition and connection of the injector,
– condition of the pipe supplying fuel to the injector,
– condition and type of spark plug,
– the operation of the coil following fault procedure **DF345 Ignition coil circuit**,
– compression.
Repair if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF085 PRESENT OR STORED	FUEL PUMP RELAY CONTROL CIRCUIT

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault appears after the ignition has been switched on.
	Special note: – **OBD warning light** lit.

Disconnect the battery and the injection computer.
Check **the cleanliness** and **condition** of the computer connections.
Check **the cleanliness** and **condition** of the fuel pump relay connector connections.
Repair if necessary.

Using the universal bornier, check for **insulation** and **continuity** on the following connection:

Computer, connector **B, track 96** ⟶ **track 2** of the fuel pump relay

Repair if necessary.

If the fault is still present**, contact the Techline**.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF090 PRESENT OR STORED	VEHICLE SPEED SENSOR CIRCUIT 1.DEF: Inconsistency of the signal

NOTES	None.

Run a multiplex network test (see **88B, Multiplex**).
Carry out fault finding on ABS and ESP system (see **38C, ABS**).

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF106 PRESENT OR STORED	CRUISE CONTROL/SPEED LIMITER SELECTOR SWITCH ON STEERING WHEEL

NOTES	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Check the **condition and connection** of the function selector switch connector.
Repair if necessary.

Check **the insulation, continuity and absence of interference resistance** on the following connections:

Track 55, injection computer connector A → **Function selector switch**

Injection computer, connector A, track 54 → **Function selector switch**

Repair if necessary.

If the problem persists, replace the switch on the steering wheel.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF116 PRESENT OR STORED	MULTIPLEX NETWORK

NOTES	None.

Carry out a fault finding procedure on the multiplex network (see **88B Multiplex network**).

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF151 PRESENT OR STORED	MAIN RELAY CIRCUIT CO.0 : Open circuit or short circuit to earth

NOTES	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Check **the condition of the battery and the vehicleearths**.
Repair if necessary.

Check the **connection and condition of the main relay connector**.
Repair if necessary.

Check the **main relay coil**.
Replace the relay if necessary.

Check **for 12 V on tracks 1 and 5 of the main relay**.
Repair the wiring up to the fuse if necessary.

Check **the insulation, continuity and absence of interference resistance** on the following connections:

Injection computer, connector A, track 44 ⟶ **Track 2 of the main relay**

Injection computer, connector B, track 120 ⟶ **Track 3 of the main relay**

Repair if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF154 PRESENT OR STORED	FLYWHEEL SIGNAL SENSOR CIRCUIT 1.DEF: No signal 2.DEF: Inconsistent signal

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present when the engine is running.
	Special note: In the event of flywheel signal loss, the OBD warning light is illuminated: injection in defect mode.
	Use the Wiring Diagrams Technical Note, ESPACE 4 ph I / II / VELSATIS ph I / II.

Test the battery and run fault finding on the charging circuit (**see Technical Note 6014A, Checking the charging circuit**).
Check the **cleanliness** and **condition** of the flywheel signal sensor connectors. Repair if necessary.
Check that the injection computer connector is clean and in good condition. Repair if necessary.
With the ignition on, check for a voltage of between **4.5 and 6 volts** on connection **3FB** of the flywheel signal sensor, **component code 149**. Repair if necessary.
Use the universal bornier to check the insulation and continuity of the following connections: Between the injection computer, **component code 120** and the **flywheel signal sensor, component code 149**. **– connection code 3BL** **– connection code 3FB** **– connection code 3BG** If there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.
If the fault is still present, replace the flywheel signal sensor.
If the problem is still present, contact the Techline.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF200 PRESENT OR STORED	ATMOSPHERIC PRESSURE SENSOR CO.0 : Open circuit or short circuit to earth CO.1 : Short circuit or open circuit to + 12 V 1.DEF: Inconsistency of the signal

NOTES	**Priority for dealing with a combination of faults:** Apply the procedure for dealing with faults **DF328 Throttle potentiometer circuit or DF008 Throttle potentiometer circuit gang 1** first if they are present or stored.
	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Check the **connection and condition of the atmospheric pressure sensor connector**.
Replace the connector if necessary.

Check that the pressure sensor is **pneumatically connected**.
Repair if necessary.

Check **the insulation, continuity and absence of interference resistance** on the following connections:

- **Injection computer, connector A, track 43** → **Track C of the manifold pressure sensor**
- **Injection computer, connector A, track 22** → **Manifold pressure sensor, track B**
- **Injection computer, connector A, track 62** → **Manifold pressure sensor, track A**

Repair if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF301 PRESENT OR STORED	AIR INLET CIRCUIT CO.0 : Open circuit or short circuit to earth

NOTES	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Check the **connection and condition of the variable inlet solenoid valve connector**.
Repair if necessary.

With the ignition switched on, check for **12 V** on track A1 of the variable inlet solenoid valve. Repair the line to the main relay if necessary.

Check **the insulation, continuity and the absence of interference resistance** of the following connections:

Injection computer, connector A, track 7 ⟶ **Track 2 of the variable inlet solenoid valve**

Repair if necessary.

If necessary, replace the variable inlet solenoid valve.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF328 PRESENT OR STORED	THROTTLE POTENTIOMETER CIRCUIT CO.0 : Open circuit or short circuit to earth CO.1 : Short circuit or open circuit to + 12 V 1.DEF: Inconsistency of the signal 2.DEF: Signal outside lower limit

NOTES	**Priority for dealing with a combination of faults:** Deal first with the **DF425 First sensor reference voltage fault** if it is present or stored.
	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Check **the connection and condition** of the throttle potentiometer connector.
Replace the connector if necessary.

Check **the insulation, continuity and the absence of interference resistance** of the following connections:

- **Injection computer, connector A, track 24** → **Track A1 of the throttle potentiometer**
- **Injection computer, connector A, track 19** → **Track A2 of the throttle potentiometer**
- **Injection computer, connector A, track 20** → **Track A4 of the throttle potentiometer**
- **Injection computer, connector A, track 23** → **Track A5 of the throttle potentiometer**

Repair if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF330 PRESENT OR STORED	PINKING SENSOR CIRCUIT CO.0: Open circuit or short circuit to earth CO.1: Short circuit or open circuit to + 12 V

NOTES	None.

Check the **connection and condition of the pinking sensor connector**.
Replace the connector if necessary.

Check the **tightness of the pinking sensor** on the engine block.
Repair if necessary.

Check **the insulation, continuity and the absence of interference resistance** of the following connections:

Injection computer, connector A, track 16 → **Track 1 of the pinking sensor**

Injection computer, connector A, track 35 → **Track 2 of the pinking sensor**

Earth → **Pinking sensor screening**

Repair if necessary.

If everything is correct, replace the pinking sensor.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF333 PRESENT OR STORED	INJECTION → AUTOMATIC TRANSMISSION CONNECTION 1.DEF: No signal

NOTES	**Priority for dealing with a combination of faults:** Deal with faults **DF009 Pedal potentiometer circuit gang 2 or DF491 Electronic Stability Program (ESP)** first if they are present or stored; check the computer earth lines on **tracks 115** and **116** using the **ALP 1** procedure.
	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Run a multiplex network test (see **88B, Multiplexing**).
Carry out fault finding on the automatic transmission (see **23A, Automatic transmission**).

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF345 PRESENT OR STORED	IGNITION COIL CIRCUIT

NOTES	**Conditions for detecting the fault by injection computer:** Engine operating with starter motor activated or running for 10 seconds. **If one cylinder is misfiring, look for faults on that cylinder first.** Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Check the **connection and condition of the coil connectors**.
Replace the connector(s) if necessary.

Check the **tightness of the pinking sensor** on the engine block.
Repair if necessary.

Check **the insulation, continuity and the absence of interference resistance** of the following connections:

- **Injection computer, connector B, track 92** → **track 1 of coil 1**
- **Injection computer, connector B, track 93** → **track 1 of coil 2**
- **Injection computer, connector B, track 94** → **track 1 of coil 3**
- **Injection computer, connector B, track 95** → **track 1 of coil 4**
- **Injection computer, connector B, track 84** → **Track 1 of coil 5**
- **Injection computer, connector B, track 85** → **track 1 of coil 6**

Repair if necessary.

With the ignition on, check for **12 V on track A3 of each coil**.
Repair if necessary.

If everything is correct:
– check that the spark plugs are in good condition,
– fit the spark plugs and connect them to their coils; place the plugs in contact with a reliable earth and activate the starter motor to check that all the coils give a good spark.

Replace any non-conforming spark plug(s).

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF374 PRESENT OR STORED	COMPUTER 1.DEF: Internal electrical fault

NOTES	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Use the following procedure:
– Switch on the ignition.
– Clear the stored fault on the injection computer using the diagnostic tool.
– Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end.
– Switch on the ignition and establish dialogue with the injection computer.
If the computer fault is still present, contact the Techline.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF379 PRESENT OR STORED	CYLINDER 1 INJECTOR CONTROL 1.DEF: Open circuit or short circuit

NOTES	**Conditions for detecting the fault:** Run the engine. If the fuel pump does not operate, run the **AC015 Fuel pump relay** fault finding check first, because a fuel pump relay fault can cause this fault to occur.
	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Check the **injector 1 resistance.**
Replace the injector if the resistance is not 15 Ω ± 0.8 Ω at 20˚C.

While the starter motor is operating, check for **12 V** on injector 1.
If necessary, repair the line up to the fuel pump relay.

Check the **insulation, continuity and the absence of interference resistance** of the following connection:

Injection computer, connector B, track 106 ⟶ **Track 2 of injector 1**

Repair if necessary.

Note:
If all the injectors are faulty, check that the fuel pump relay is not defective.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF380 PRESENT OR STORED	CYLINDER 2 INJECTOR CONTROL 1.DEF: Open circuit or short circuit

NOTES	**Conditions for detecting the fault:** Run the engine. If the fuel pump does not operate, run the **AC015 Fuel pump relay** fault finding check first, because a fuel pump relay fault can cause this fault to occur.
	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Check the **injector 1 resistance.**
Replace the injector if the resistance is not 15 Ω ± 0.8 Ω at 20˚C.

While the starter motor is operating, check for **12 V** on injector 2.
If necessary, repair the line up to the fuel pump relay.

Check the **insulation, continuity and the absence of interference resistance** of the following connection:

Injection computer, connector B, track 107 ⟶ **Track 2 of injector 2**

Repair if necessary.

Note:
If all the injectors are faulty, check that the fuel pump relay is not defective.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF381 PRESENT OR STORED	CYLINDER 3 INJECTOR CONTROL 1.DEF: Open circuit or short circuit

NOTES	**Conditions for detecting the fault:** Run the engine. If the fuel pump does not operate, run the **AC015 Fuel pump relay** fault finding check first, because a fuel pump relay fault can cause this fault to occur.
	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Check the **resistance of injector 3**.
Replace the injector if the resistance is not 15 Ω ± 0.8 Ω at 20˚C.

While the starter motor is operating, check for **12 V** on injector 3.
If necessary, repair the line up to the fuel pump relay.

Check the **insulation, continuity and the absence of interference resistance** of the following connection:

Injection computer, connector B, track 108 ⟶ **Track 2 of injector 3**

Repair if necessary.

Note:
If all the injectors are faulty, check that the fuel pump relay is not defective.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF382 PRESENT OR STORED	CYLINDER 4 INJECTOR CONTROL 1.DEF: Open circuit or short circuit

NOTES	**Conditions for detecting the fault:** Run the engine. If the fuel pump does not operate, run the **AC015 Fuel pump relay** fault finding check first, because a fuel pump relay fault can cause this fault to occur.
	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Check the **resistance of injector 4**.
Replace the injector if the resistance is not 15 Ω ± 0.8 Ω at 20˚C.

While the starter motor is operating, check for **12 V** on injector 4.
If necessary, repair the line up to the fuel pump relay.

Check the **insulation, continuity and the absence of interference resistance** of the following connection:

Injection computer, connector B, track 100 ⟶ **Track 2 of injector 4**

Repair if necessary.

Note:
If all the injectors are faulty, check that the fuel pump relay is not defective.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF411 PRESENT OR STORED	BRAKE PEDAL SENSOR CIRCUIT 1.DEF: Inconsistency of the signal

NOTES	When running this fault finding check, the ABS/ESP computer must not be faulty. If fault **DF116: Multiplex network** is present, deal with it first. Switch off the ignition and wait for an end of dialogue to confirm the fault.

Check the **connection and condition of the brake pedal switch connector**. Replace the connector if necessary.
Check the **operation of the brake pedal switch**. Replace the switch if necessary.
Check the **insulation, continuity and the absence of interference resistance** of the following connection: **Injection computer, connector A, track 11** ⟶ **Track 3 of the brake pedal switch connector** Repair if necessary.
Check the connection between the brake pedal sensor and the ABS computer (see **38C, ABS system**).

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF413 PRESENT OR STORED	MOTORISED THROTTLE 1.DEF: Motorised throttle: closed

NOTES	**Priority for dealing with a combination of faults:** – Deal first with fault **DF413 Motorised throttle** if it is present and check the computer earth lines on tracks **118** and **121** using the **ALP 1** procedure. – Deal with fault **DF487 Programming throttle stops** first if it is present. Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Check the **connection and condition of the motorised throttle connector**.
Repair if necessary.

Check **the insulation, continuity and the absence of interference resistance** of the following connections:

Injection computer, connector A, track 62 → **track 6 of the motorised throttle valve**

Injection computer, connector A, track 1 → **track 3 of the motorised throttle valve**

Repair if necessary.

If everything is correct, replace the motorised throttle body.

After replacing the throttle valve, program the air path. (See Replacement of components, Configurations and programming)

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF425 PRESENT OR STORED	FIRST SENSOR REFERENCE VOLTAGE 1.DEF: Open circuit or short circuit

NOTES	This fault takes priority over the following faults: **DF328 Throttle potentiometer circuit;** **DF008 Pedal potentiometer circuit gang 1;** **DF009 Pedal potentiometer circuit gang 2;** **DF200 Atmospheric pressure sensor;** **DF579 Power-assisted steering pressure sensor circuit;** **DF106 Cruise control/speed limiter selector switches on steering wheel** **DF056 Air flowmeter circuit.** Check that parameter **PR071: Computer supply voltage** matches the battery voltage. If the voltage shown by parameter **PR071** is greater than the battery voltage, there is a short circuit to earth. If the voltage shown by parameter **PR071** is less than the battery voltage, there is a short circuit to + 12 V. Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Check the condition of the connectors for the following components:
– accelerator pedal potentiometer,
– flow sensor,
– power-assisted steering pressure sensor,
– manifold pressure sensor,
– throttle valve potentiometer.
Replace the connector(s) if necessary.

To check if the fault changes from present to stored, disconnect the following sensors, **one** by **one**:
– accelerator pedal potentiometer,
– flow sensor,
– power-assisted steering pressure sensor,
– manifold pressure sensor,
– throttle valve potentiometer.
If necessary, deal with the fault that applies to the sensor.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF425 **CONTINUED**	

Check **the insulation, continuity and the absence of interference resistance** of the following connections:

- **Injection computer, connector A, track 43** → **track 1 of the throttle potentiometer**
- **Injection computer, connector A, track 43** → **track C of the manifold pressure sensor**
- **Injection computer, connector A, track 43** → **track 2 of the flowmeter**
- **Injection computer, connector A, track 43** → **track 3 of the power-assisted steering pressure sensor**
- **Injection computer, connector A, track 43** → **track 4 of the accelerator pedal potentiometer**
- **Injection computer, connector A, track 24** → **track 5 of the accelerator pedal potentiometer**

Repair if necessary.

If the fault has still not been solved, deal with the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF429 PRESENT OR STORED	CRUISE CONTROL FUNCTION CO.0: Open circuit or short circuit to earth 1.DEF: Inconsistency of the signal 1.DEF: Internal electronic fault

NOTES	**Priority for dealing with a combination of faults:** Firstly, deal with the following faults: **DF333 Injection → automatic transmission connection,** **DF090 Vehicle speed sensor circuit,** **DF411 Brake pedal sensor circuit,** **DF116 Multiplex network,** **DF491 Electronic Stability Program (ESP),** **DF502 Cruise control or speed limiter button,** **DF411 Brake pedal sensor circuit,** **DF106 Cruise control/speed limiter selector switches on steering wheel** if they are present or stored, as these are the probable cause of this fault.

WARNING
This fault may appear if the wiring harness has been damaged.
Follow the procedure described in the Wiring Check in the Introduction.
This check enables the condition and the conformity of the engine wiring harness to be checked.

If fault **DF429 Vehicle speed regulator function** is declared present, refer to section on **Cruise control/Speed limiter** conformity check, and Interpretation of statuses **ET042 Cruise control/Speed limiter and ET415 Speed regulator deactivation**.
Check that by pressing the buttons the statuses change and that, with the ignition switched on, all the values are correct.
If the fault is still present, contact the Techline.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF431 PRESENT OR STORED	CYLINDER 5 INJECTOR CONTROL 1.DEF: Open circuit or short circuit

NOTES	**Conditions for detecting the fault:** Run the engine. If the fuel pump does not operate, run the **AC015 Fuel pump relay** fault finding check first, because a fuel pump relay fault can cause this fault to occur.
	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Check the **resistance of injector 5**.
Replace the injector if the resistance is not 15 Ω ± 0.8 Ω at 20˚C.

While the starter motor is operating, check for **12 V** on injector 5.
If necessary, repair the line up to the fuel pump relay.

Check the **insulation, continuity and the absence of interference resistance** of the following connection:

Injection computer, connector B, track 99 → **Track 2 of injector 5**

Repair if necessary.

Note:
If all the injectors are faulty, check that the fuel pump relay is not defective.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF432 PRESENT OR STORED	CYLINDER 6 INJECTOR CONTROL 1.DEF: Open circuit or short circuit

NOTES	**Conditions for detecting the fault:** Run the engine. If the fuel pump does not operate, run the **AC015 Fuel pump relay** fault finding check first, because a fuel pump relay fault can cause this fault to occur.
	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Check the **resistance of injector 6**.
Replace the injector if the resistance is not 15 Ω ± 0.8 Ω at 20˚C.

While the starter motor is operating, check for **12 V** on injector 6.
If necessary, repair the line up to the fuel pump relay.

Check the **insulation, continuity and the absence of interference resistance** of the following connection:

Injection computer, connector B, track 98 → **Track 2 of injector 6**

Repair if necessary.

Note:
If all the injectors are faulty, check that the fuel pump relay is not defective.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF436 PRESENT OR STORED	DETECTION OF ENGINE MISFIRING

NOTES	**Priority for dealing with a combination of faults:** Firstly, deal with the following faults: **DF379 Cylinder 1 injector control,** **DF380 Cylinder 2 injector control,** **DF381 Cylinder 3 injector control,** **DF382 Cylinder 4 injector control,** **DF431 Cylinder 5 injector control,** **DF432 Cylinder 6 injector control,** if they are present or stored. If one or more of the following faults: **DF059 Combustion misfire in cylinder 1,** **DF060 Misfiring on cylinder 1;** **DF061 Misfiring on cylinder 1;** **DF062 Misfiring on cylinder 1;** **DF063 Misfiring on cylinder 1;** **DF064 Misfiring on cylinder 1;** are present or stored**,** deal with them separately. If none or all six of the above-mentioned faults occur, follow this fault finding procedure.

For each cylinder, check the:
– condition and connection of the injector,
– condition and type of spark plug,
– operation of the coil following fault procedure **DF345 Ignition coil circuit**,
– compression.
Repair if necessary.

Check the engine target.
Repair if necessary.

Check the fuel system:
– the condition of the fuel filter,
– the fuel flow rate and pressure.
– the condition of the fuel pump,
– the conformity of the fuel,
– the cleanliness of the tank.
Repair if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF439 PRESENT OR STORED	IDLE SPEED REGULATION 1.DEF: Lower end stop 2.DEF: Top end stop CO.0: Open circuit or short circuit to earth

NOTES	**Priority for dealing with a combination of faults:** Deal with fault **DF413 Motorised throttle** first if it is present and check the computer earth lines on tracks **118** and **121** using procedure **ALP 1 (see ALPs)**. Deal with any present faults relating to the motorised throttle or the accelerator pedal.

Check that status **ET051: Throttle stop programming** is **DONE** and that status **ET278: Throttle position: no load** is recognised and ACTIVE.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF448 PRESENT OR STORED	UPSTREAM OXYGEN SENSOR NO. 1 CO: Open circuit CC.0: Short circuit to earth CO.1: Short circuit or open circuit to + 12 V 1.DEF: Inconsistency of the signal

NOTES	None.

Check the **connection and condition of upstream oxygen sensor connector no. 1**. Repair if necessary.
Make sure that there is **no air intake**.
If the vehicle is used frequently in town, **decoke the engine.**
Check **the insulation, continuity and the absence of interference resistance** of the following connections: **Injection computer, connector A, track 78** → **Track 4 of the oxygen sensor** **Injection computer, connector A, track 59** → **Track 1 of the oxygen sensor** Repair if necessary.
Replace the oxygen sensor if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF449 PRESENT OR STORED	UPSTREAM OXYGEN SENSOR NO. 2 CO: Open circuit CC.0: Short circuit to earth CO.1: Short circuit or open circuit to + 12 V 1.DEF: Inconsistency of the signal

NOTES	None.

Check the **connection and condition of upstream oxygen sensor connector no. 2**. Repair if necessary.
Make sure that there is **no air intake**.
If the vehicle is used frequently in town, **decoke the engine.**
Check **the insulation, continuity and the absence of interference resistance** of the following connections: **Injection computer, connector A, track 79** → **Track 4 of the oxygen sensor** **Injection computer, connector A, track 60** → **Track 1 of the oxygen sensor** Repair if necessary.
Replace the oxygen sensor if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF450 PRESENT OR STORED	DOWNSTREAM OXYGEN SENSOR NO. 1 CO.0: Open circuit or short circuit to earth CO.1: Short circuit or open circuit to + 12 V 1.DEF: Inconsistency of the signal

NOTES	None.

Check the **connection and condition of downstream oxygen sensor connector no. 1**.
Repair if necessary.

Make sure that there is **no air intake**.

If the vehicle is used frequently in town, **decoke the engine.**

Check **the insulation, continuity and the absence of interference resistance** of the following connections:

Injection computer, connector A, track 76 → **Track 4 of the oxygen sensor**

Injection computer, connector A, track 57 → **Track 1 of the oxygen sensor**

Repair if necessary.

Replace the oxygen sensor if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF451 PRESENT OR STORED	DOWNSTREAM OXYGEN SENSOR NO. 2 CO.0: Open circuit or short circuit to earth CO.1: Short circuit or open circuit to + 12 V 1.DEF: Inconsistency of the signal

NOTES	None.

Check the **connection and condition of downstream oxygen sensor connector no. 2**.
Repair if necessary.

Make sure that there is **no air intake**.

If the vehicle is used frequently in town, **decoke the engine.**

Check **the insulation, continuity and the absence of interference resistance** of the following connections:

Injection computer, connector A, track 77 → **Track 4 of the oxygen sensor**

Injection computer, connector A, track 58 → **Track 1 of the oxygen sensor**

Repair if necessary.

Replace the oxygen sensor if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF466 PRESENT OR STORED	UPSTREAM OXYGEN SENSOR NO. 1 HEATING CO.1: Short circuit or open circuit to + 12 V CO.0: Open circuit or short circuit to earth

NOTES	None.

Check the **connection and condition of upstream oxygen sensor connector no. 1**. Repair if necessary.
Check the **oxygen sensor heater resistance**. Replace the sensor if the resistance is not approximately 4 Ω ± 1 Ω.
Check for **12 V on the oxygen sensor**. Repair the line if necessary.
Check the **insulation, continuity and the absence of interference resistance** of the following connection: **Injection computer, connector B, track 109** ⟶ **Track 2 of the oxygen sensor** Repair if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF467 PRESENT OR STORED	UPSTREAM OXYGEN SENSOR NO. 2 HEATING CO.1: Short circuit or open circuit to + 12 V CO.0: Open circuit or short circuit to earth

NOTES	None.

Check the **connection and condition of upstream oxygen sensor connector no. 2**. Repair if necessary.
Check the **oxygen sensor heater resistance**. Replace the sensor if the resistance is not approximately 4 Ω ± 1 Ω.
Check for **12 V on the oxygen sensor**. Repair the line if necessary.
Check the **insulation, continuity and the absence of interference resistance** of the following connection: **Injection computer, connector B, track 110 ⟶ track 2 of the oxygen sensor** Repair if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF468 PRESENT OR STORED	DOWNSTREAM OXYGEN SENSOR NO. 1 HEATING CO.1: Short circuit or open circuit to + 12 V CO.0: Open circuit or short circuit to earth

NOTES	None.

Check the **connection and condition of downstream oxygen sensor connector no. 1**.
Repair if necessary.

Check the **oxygen sensor heater resistance**.
Replace the sensor if the resistance is not approximately 4 Ω ± 1 Ω.

Check for **12 V on the oxygen sensor**.
Repair the line if necessary.

Check the **insulation, continuity and the absence of interference resistance** on the following connection:

Injection computer, connector B, track 101 ⟶ **Track 2 of the oxygen sensor**

Repair if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF469 PRESENT OR STORED	DOWNSTREAM OXYGEN SENSOR NO. 2 HEATING CO.1: Short circuit or open circuit to + 12 V CO.0: Open circuit or short circuit to earth

NOTES	None.

Check the **connection and condition of downstream oxygen sensor connector no. 2**.
Repair if necessary.

Check the **oxygen sensor heater resistance**.
Replace the sensor if the resistance is not approximately 4 Ω ± 1 Ω.

Check for **12 V on the oxygen sensor**.
Repair the line if necessary.

Check the **insulation, continuity and the absence of interference resistance** of the following connection:

Injection computer, connector B, track 102 ⟶ **Track 2 of the oxygen sensor**

Repair if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF470 PRESENT OR STORED	BANK A FUEL SUPPLY

NOTES	None.

– Check the fitting and condition of the air filter.
– Check the condition of the air inlet circuit.

Check:
– the fuel filter,
– the condition of the fuel pump,
– the fuel flow rate and pressure,
– the condition of the fuel pressure regulator,
– the condition of the fuel circuit pipes,
– the condition of the injector rails,
– the condition of the injectors (leaks, etc.),
– the cleanliness of the tank.
Repair or replace defective component(s) if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF471 PRESENT OR STORED	BANK B FUEL SUPPLY

NOTES	None.

– Check the fitting and condition of the air filter.
– Check the condition of the air inlet circuit.

Check:
– the fuel filter,
– the condition of the fuel pump,
– the fuel flow rate and pressure,
– the condition of the fuel pressure regulator,
– the condition of the fuel circuit pipes,
– the condition of the injector rails,
– the condition of the injectors (leaks, etc.),
– the cleanliness of the tank.
Repair or replace defective component(s) if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF479 PRESENT OR STORED	THROTTLE VALVE SERVO

NOTES	**Priority for dealing with a combination of faults:** If fault **DF439: Idle speed regulation** is present, deal with it first. Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Check the **connection and condition of the connector** of the motorised throttle safety relay. Replace the connector if necessary.

Check for **+ 12 V** on track 5 of the motorised throttle safety relay. Repair the line up to the fuse if necessary.

With the ignition switched on, check for + 12 V on track 1 of the motorised throttle safety relay. Repair the line up to the main relay if necessary.

Check **the continuity on tracks 42 and 40** of the motorised throttle safety relay. Replace the relay if necessary.

Check **the insulation, continuity and the absence of interference resistance** of the following connections:

Injection computer, connector A, track 5 → **Motorised throttle safety relay track 38**

Injection computer, connector A, track 63 → **Motorised throttle safety relay, track 40**

Repair if necessary.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF487 PRESENT OR STORED	THROTTLE STOP PROGRAMMING

NOTES	**Priority for dealing with a combination of faults:** If fault **DF328: Throttle potentiometer circuit** is present, deal with it first.

Throttle stop programming has not been completed. The fault may be present following an inconsistency in the throttle position.
Carry out throttle stop programming (see **Configurations and programming**).

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF491 PRESENT OR STORED	ELECTRONIC STABILITY PROGRAM (ESP) 1.DEF: No signal

NOTES	**Priority for dealing with a combination of faults:** If faults **DF333 Injection → automatic transmission connection and DF009 Pedal potentiometer circuit gang 2** are also present, check the computer earth lines on **tracks 115 and 116** using the **ALP 1 (see Fault finding charts) procedure**. Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Run a multiplex network test (see **88B, Multiplex network**).
Carry out fault finding on ABS and ESP system (see **38C, ABS**).

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF502 PRESENT OR STORED	CRUISE CONTROL OR SPEED LIMITER BUTTON 1.DEF: Inconsistency of the signal

NOTES	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Check **the connection and condition** of the cruise control/speed limiter switch connector. Repair if necessary.

Check **the insulation, continuity and the absence of interference resistance** of the following connections:

Injection computer, connector A, track 29 → **Speed limiter track switch**

Injection computer, connector A, track 30 → **Cruise control track switch**

Repair if necessary.

If everything is correct, replace the switch.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF508 PRESENT OR STORED	MOTORISED THROTTLE VALVE CONTROL 1.DEF: Throttle position error

NOTES	Switch off the ignition and wait for an end of dialogue to confirm the fault.

Check the **connection and condition of the motorised throttle connector**.
Replace the connector if necessary.

Check the condition of the motorised throttle body and that nothing is mechanically impeding the throttle movement.
Repair if necessary.

Check **the insulation, continuity and the absence of interference resistance** of the following connections:

Injection computer, connector A, track 24 → **Track 1 of the throttle potentiometer**

Injection computer, connector A, track 19 → **Track 2 of the throttle potentiometer**

Injection computer, connector A, track 20 → **Track 4 of the throttle potentiometer**

Injection computer, connector A, track 23 → **Track 5 of the throttle potentiometer**

Injection computer, connector A, track 62 → **Track 6 of the motorised throttle valve**

Injection computer, connector A, track 1 → **Track 3 of the motorised throttle valve**

Repair if necessary.

Using the conformity check, check **parameters PR538 Measured throttle voltage gang 2 and PR539 Measured throttle voltage gang 1** for throttle potentiometer output voltages.
Replace if not correct.

After replacing the throttle valve, program the air path. (See Replacement of components, Configurations and programming)

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF536 PRESENT OR STORED	CANISTER SOLENOID VALVE CONTROL CIRCUIT CO.0: Open circuit or short circuit to earth CO.1: Short circuit or open circuit to + 12 V

NOTES	If the fuel pump does not operate, run the **AC015 Fuel pump relay** fault finding check first, because a fuel pump relay fault can cause this fault to occur. Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Check the **connection and condition of the canister bleed solenoid valve connector**.
Replace the connector if necessary.

Check the **resistance of the fuel vapour absorber bleed solenoid valve**.
Replace the valve if the resistance is not 8 Ω ± 0.4 Ω.

With the starter operating, check for **12 V on track A1 of the fuel vapour absorber bleed solenoid valve**.
If necessary, repair the line up to the fuel pump relay.

Check the **insulation, continuity and the absence of interference resistance** of the following connection:

Injection computer, connector B, track 89 ⟶ **Track 2 of the canister bleed solenoid valve**

Repair if necessary.

Using the conformity check, check **parameters PR538 Measured throttle voltage gang 2 and PR539 Measured throttle voltage gang 1** for throttle potentiometer output voltages.
Replace if not correct.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF567 PRESENT OR STORED	COMPUTER 1.DEF: Internal command module: ROM (Read Only Memory) error

NOTES	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Use the following procedure:
– Switch on the ignition.
– Clear the stored fault on the injection computer using the diagnostic tool.
– Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end.
– Switch on the ignition and establish dialogue with the injection computer.
If the computer fault is still present, contact the Techline.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF579 PRESENT OR STORED	POWER-ASSISTED STEERING PRESSURE SENSOR CIRCUIT 1.DEF: Open circuit or short circuit CO.0: Open circuit or short circuit to earth

NOTES	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Check **the condition and the connection** of the power-assisted steering pressure sensor connector.
Repair if necessary.

Check **the insulation, continuity and the absence of interference resistance** of the following connections:

- **Injection computer, connector A, track 62** → **Track A1 of the power-assisted steering pressure sensor**
- **Injection computer, connector A, track 18** → **Track A2 of the power-assisted steering pressure sensor**
- **Injection computer, connector A, track 43** → **Track A3 of the power-assisted steering pressure sensor**

Repair if necessary.

If everything is correct, replace the sensor.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF588 PRESENT OR STORED	CAMSHAFT No. 1 DEPHASER CONTROL

NOTES	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

With the ignition on, check for **12 V on track A2 of the camshaft dephaser solenoid valve**.
Repair if necessary.

Check the **insulation, continuity and the absence of interference resistance** of the following connection:

Injection computer, connector B, track 103 ⟶ **Track 2 of the camshaft dephaser solenoid valve**

Repair if necessary.

Note:
If a solenoid valve remains jammed open, the engine idle speed will probably be unstable.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF589 PRESENT OR STORED	CAMSHAFT No. 2 DEPHASER CONTROL

NOTES	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

With the ignition on, check for **12 V on track A2 of the camshaft dephaser solenoid valve**.
Repair if necessary.

Check the **insulation, continuity and the absence of interference resistance** of the following connection:

Injection computer, connector B, track 104 → **Track 2 of the camshaft dephaser solenoid valve, bank B**

Repair if necessary.

Note:
If a solenoid valve remains jammed open, the engine idle speed will probably be unstable.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF592 PRESENT OR STORED	No.1 CAMSHAFT SENSOR CIRCUIT 1.DEF: Inconsistency of the signal 2.DEF: No signal

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present when the engine is running.
	Special note: OBD warning light lit: injection in defect mode.
	Use the Wiring Diagrams Technical Note, ESPACE 4 ph I / II / VELSATIS ph I / II.

Check that the camshaft sensor is correctly pushed into its housing.
Check that the camshaft sensor and its connectors are **clean** and **in good condition**.
Repair if necessary.

Check that the injection computer connector is clean and in good condition.
Repair if necessary.

With the ignition on, check for a voltage of between **4.5 and 6 volts** on connection **3FB** of the camshaft position sensor, **component number 1305**.
Repair if necessary.

Use the universal bornier to check the **insulation and continuity** of the following connections:
Between the injection computer, **component code 120** and the camshaft position sensor, **component code 1305**.
– connection code 3UY
– connection code 3FB
– connection code 3UM
If there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

If the fault is still present, replace the camshaft sensor.

If the problem is still present, contact the Techline.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF593 PRESENT OR STORED	CAMSHAFT SENSOR CIRCUIT No.2 1.DEF: Inconsistency of the signal 2.DEF: No signal

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present when the engine is running.
	Special note: OBD warning light lit: injection in defect mode.
	Use the Wiring Diagrams Technical Note, ESPACE 4 ph I / II / VELSATIS ph I / II.

Check that the camshaft sensor is correctly pushed into its housing.
Check that the camshaft sensor and its connectors are **clean** and **in good condition**.
Repair if necessary.

Check that the injection computer connector is clean and in good condition.
Repair if necessary.

With the ignition on, check for a voltage of between **4.5 and 6 volts** on connection **3FB** of the camshaft position sensor, **component number 1306**.
Repair if necessary.

Use the universal bornier to check the **insulation and continuity** of the following connections:
Between the injection computer, **component code 120** and the camshaft position sensor, **component code 1306**.
– connection code 3VA
– connection code 3FB
– connection code 3UP
If there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

If the fault is still present, replace the camshaft sensor.

If the problem is still present, contact the Techline.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF594 PRESENT OR STORED	ROW 1 RICHNESS REGULATION 1.DEF: Inconsistency of the signal

NOTES	**Priority for dealing with a combination of faults:** Firstly, deal with the following faults: **DF056 Air flow sensor circuit,** **DF379 Cylinder 1 injector control,** **DF381 Cylinder 3 injector control,** **DF431 Cylinder 5 injector control,** **DF448 Upstream oxygen sensor no. 1;** **DF470 Fuel supply row A** and/or **DF471 Fuel supply row B** if they are present. Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Check that there are no **air leaks on the exhaust system**.
If the vehicle is driven frequently in town, **decoke the engine.**
Check the oxygen sensors using the fault procedures: **DF448 Upstream oxygen sensor no. 1;** **DF450 Downstream oxygen sensor no. 1;** **DF466 Upstream oxygen sensor no. 1 heating;** **DF468 Downstream oxygen sensor no. 1 heating.**
If the fault has still not been solved, deal with the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF595 PRESENT OR STORED	ROW 2 RICHNESS REGULATION 1.DEF: Inconsistency of the signal

NOTES	**Priority for dealing with a combination of faults:** Firstly, deal with the following faults: **DF589 Camshaft no. 2 dephaser control;** **DF380 Cylinder 2 injector control;** **DF382 Cylinder 4 injector control;** **DF432 Cylinder 6 injector control;** **DF448 Upstream oxygen sensor no. 1;** **DF470 Fuel supply row A** and/or **DF471 Fuel supply row B** if they are present.

Check that there are no **air leaks on the exhaust system**.
If the vehicle is driven frequently in town, **decoke the engine**.
Check the oxygen sensors using the fault procedures: **DF449 Upstream oxygen sensor no. 2;** **DF451 Downstream oxygen sensor no. 2;** **DF467 Upstream oxygen sensor no. 2 heating;** **DF469 Downstream oxygen sensor no. 2 heating.**
If the fault has still not been solved, deal with the other faults and then proceed to the conformity check.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF596 PRESENT OR STORED	DETECTION OF OVERHEATING

NOTES	Indicates engine overheating or a coolant temperature fault. When the fault is present, the engine will not exceed **2000 rpm**.

Check the coolant temperature sensor circuit using fault procedure **DF002 Air temperature sensor circuit**.
Check the condition of the cooling system and run the engine until the fan starts to operate to see if the fault recurs.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF610 PRESENT OR STORED	FAULT ON ONE OF THE 2 CRUISE CONTROL/SPEED LIMITER BRAKE CONTACTS 1.DEF: Fault on one of the two brake pedal contacts

NOTES	When running this fault finding check, the ABS/ESP computer must not be faulty. **Priority for dealing with a combination of faults:** Deal with fault **DF116 Multiplex network** first if it is present. Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present: – with the engine running, – With the brake pedal depressed, – With cruise control ON.

Check that the pedal assembly is in good condition.
Check **the cleanliness** and **condition** of the dual-contact brake switch and its connections.
Repair if necessary.

Check the **operation of the brake pedal switch**.
Replace the switch if necessary.

Check the **insulation, continuity and the absence of interference resistance** of the following connection:

Injection computer, connector A, track 11 ⟶ **Brake pedal switch**

Repair if necessary.

Check the connection between the brake pedal sensor and the Anti-lock braking system computer (see **38C, Anti-lock braking system**).

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF611 PRESENT OR STORED	FAULT ON THE 2 CRUISE CONTROL/SPEED LIMITER BRAKE CONTACTS 1.DEF: Fault on both brake pedal contacts

NOTES	When running this fault finding check, the ABS/ESP computer must not be faulty. **Priority for dealing with a combination of faults:** Deal with fault **DF116 Multiplex network** first if it is present. Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present: – with the engine running, – With the brake pedal depressed, – With the cruise control ON with a cruising speed set.

Check that the pedal assembly is in good condition.
Check **the cleanliness** and **condition** of the dual-contact brake switch and its connections.
Repair if necessary.

Check the **operation of the brake pedal switch**.
Replace the switch if necessary.

Check the **insulation, continuity and the absence of interference resistance** of the following connection:

Injection computer, connector A, track 11 ⟶ **Brake pedal switch**

Repair if necessary.

Check the connection between the brake pedal sensor and the Anti-lock braking system computer (see **38C, Anti-lock braking system**).

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF648 PRESENT OR STORED	COMPUTER 1.DEF: Fault in EEPROM

NOTES	Using parameter **PR071 Computer supply voltage**, check that the battery voltage is not below 11 V. Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end, then switch on the ignition again to confirm the fault.

Use the following procedure:
– Switch on the ignition.
– Clear the stored fault on the injection computer using the diagnostic tool.
– Switch off the ignition and wait for dialogue between the computer and the diagnostic tool to end.
– Switch on the ignition and establish dialogue with the injection computer.
If the computer fault is still present, contact the Techline.

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF989 PRESENT OR STORED	CATALYTIC PRE-CONVERTER No. 1

NOTES	**Apply this fault finding procedure whether the fault is present or stored.** Indicates lack of correlation between signals before and after the catalytic pre-converter, received by the two oxygen sensors on the front row.

Check that there are no **air leaks on the exhaust system**. Repair if necessary.
Visually check the condition of the catalytic pre-converter. A deformity may be causing it to malfunction. **Visually check for signs of thermal shock.**
A warm catalytic pre-converter may be damaged if it comes into contact with cold water.
Check that there has not been any **excessive consumption of oil** or **coolant**. Ask the customer if he has used an additive or other products of this kind. Such products can block the catalytic pre-converter, and damage its short or long term performance.
Check if the engine has been misfiring. This could damage the catalytic pre-converter.
Check the **driving noise**during a road test.
If the cause of the damage is identified, the catalytic pre-converter may be replaced. **If the catalytic pre-converter is replaced without finding the cause, the new catalytic pre-converter may be damaged very quickly.**

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

DF990 PRESENT OR STORED	CATALYTIC PRE-CONVERTER No. 2

NOTES	**Apply this fault finding procedure whether the fault is present or stored.** Indicates lack of correlation between signals before and after the catalytic pre-converter, received by the two oxygen sensors on the back row.

Check that there are no **air leaks on the exhaust system**. Repair if necessary.
Visually check the condition of the catalytic pre-converter. A deformity may be causing it to malfunction. **Visually check for signs of thermal shock.**
A warm catalytic pre-converter may be damaged if it comes into contact with cold water.
Check that there has not been any **excessive consumption of oil** or **coolant**. Ask the customer if he has used an additive or other products of this kind. Such products can block the catalytic pre-converter, and damage its short or long term performance.
Check if the engine has been misfiring. This could damage the catalytic pre-converter.
Check the **driving noise**during a road test.
If the cause of the damage is identified, the catalytic pre-converter may be replaced. **If the catalytic pre-converter is replaced without finding the cause, the new catalytic pre-converter may be damaged very quickly.**

AFTER REPAIR	Follow the instructions to confirm repair. Deal with any other faults. Clear the stored faults. Switch off the ignition and wait for an end of dialogue to confirm the clearance.

GETtheMANUALS.org

NOTES	Only carry out a conformity check after a **complete check** with the **diagnostic tool**. The values indicated in this conformity check are given as examples. **Application conditions:** Engine stopped, **ignition on**.

GETtheMANUALS.org

ET042	CRUISE CONTROL/SPEED LIMITER

NOTES	**Special note:** Only perform these tests if the statuses do not correspond with the system programming functions.

CRUISE CONTROL

Status **ET042** changes to "**CRUISE CONTROL**" when the **cruise control activation button** is pressed. This button is situated on the instrument panel, or on the centre console of the vehicle.
A **green** instrument panel warning light comes on when status **ET042** is at "**CRUISE CONTROL**".
If status **ET042** does not change to "**CRUISE CONTROL**", check the "**ON/OFF**" button of the cruise control, and the condition of its connector.
Repair if necessary.
Check **for continuity and make sure there is no interference resistance** on the following connection:

Track 30, injection computer connector A ⟶ **track A3** of the 6-track connector Cruise control start/stop button

Repair if necessary.

SPEED LIMITER

Status **ET042** changes to "**CRUISE CONTROL**" when the **cruise control activation button** is pressed. This button is situated on the instrument panel, or on the centre console of the vehicle.
A **yellow** instrument panel warning light comes on when status **ET042** is "**SPEED LIMITING**".
If status **ET042** does not change to "**CRUISE CONTROL**", check the "**ON/OFF**" button of the cruise control, and the condition of its connector.
Repair if necessary.
Check **for continuity and make sure there is no interference resistance** on the following connection:

Track 29, injection computer connector A ⟶ **track B1** of the 6-track connector Cruise control start/stop button

Repair if necessary.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET143	LOW-SPEED FAN UNIT RELAY CONTROL

NOTES	There should be no fault detected on the coolant temperature sensor circuit when this fault finding procedure is being carried out.

Check:
– condition of the low-speed fan unit,
– that the low-speed fan resistance is correct,
– cleanness of the low-speed fan earth,
– low-speed fan feed,
  – feed line between the low-speed fan and the low-speed fan relay.

Repair if necessary.

Check **the connection and condition of the low-speed fan unit relay connector**.
Replace the connector if necessary.

Disconnect the low-speed fan relay. With the ignition on, check for the presence of **+ 12 V on track 1 of the relay**.
Repair if necessary.

Check the **continuity of the relay coil**.
Replace the low-speed fan relay if necessary.

Connect the bornier in place of the computer and check the **insulation, continuity and the absence of interference resistance** on the connection between:

Track 64, injection computer connector A ⟶ **Low-speed fan relay**

Repair if necessary.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET144	HIGH-SPEED FAN UNIT RELAY CONTROL

NOTES	There should be no fault detected on the coolant temperature sensor circuit when this fault finding procedure is being carried out.

Check:
– condition of the high-speed fan unit,
– that the high-speed fan resistance is correct,
– cleanness of the high-speed fan earth,
– high-speed fan feed,
  – feed line between the high-speed fan and the high-speed fan relay.

Repair if necessary.

Check **the connection and condition of the high-speed fan unit relay connector**.
Replace the connector if necessary.

Disconnect the high-speed fan relay. With the ignition on, check for the presence of **+ 12 V on track 1 of the relay**.
Repair if necessary.

Check the **continuity of the relay coil**.
Replace the high-speed fan relay if necessary.

Connect the bornier in place of the computer and check the **insulation, continuity and the absence of interference resistance** on the connection between:

Track 64, injection computer connector A ⟶ **High-speed fan relay**

Repair if necessary.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET413	CRUISE CONTROL/SPEED LIMITER FUNCTION

NOTES	**Special notes:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

INCREASE

Status **ET413** changes to "**INCREASE**" when the "**+**" button for the cruise control is pressed.
This button is situated to the left of the steering wheel.
If status **ET413** does not change to "**INCREASE**", check the condition of the "±" cruise control button and its connector. Repair if necessary.
To be able to remove the driver's airbag and carry out the measures in complete safety (see 88C, Airbag and pretensioners).
Repair if necessary.

Measure **the resistance of the following connection, after pressing the "+" button**:

Track 55, injection computer connector A ⟶ **Track** A1 "±" button

If the resistance is not approximately **300 Ω**, check the continuity of the connection when the button is not pressed.
If there is continuity, replace the "±" control button.
If the connection is broken, repair it.

DECREASE

Status **ET413** changes to "**DECREASE**" when the cruise control "**-**" button is pressed.
This button is situated to the left of the steering wheel.
If status **ET413** does not change to "**DECREASE**", check the condition of the "**±**" cruise control button and its connector. Repair if necessary.
To be able to remove the driver's airbag and carry out the measures in complete safety (see 88C, Airbag and pretensioners).
Repair if necessary.

Measure **the resistance of the following connection after pressing the "-" button**:

Track 55, injection computer connector A ⟶ **Track** A2 "±" button

If the resistance is not approximately **100 Ω**, check the continuity of the connection when the button is not pressed.
If there is continuity, replace the "**±**" control button.
If the connection is broken, repair it.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET413 CONTINUED	

SUSPEND

Status **ET413** changes to "SUSPEND" when the "**0**" cruise control button is pressed. This button is situated to the right of the steering wheel.

If status **ET413** does not change to "SUSPEND", check the condition of the "**R/0**" cruise control button and its connector. Repair if necessary.

Refer to the airbag Technical Note associated with the vehicle, in order to remove the driver's airbag, and carry work out safely.
Repair if necessary.

Measure the **resistance of the following connection, after pressing the "0" button**:

Track 55, injection computer connector A ⟶ **Track A2,** "**R/0**" button

If the resistance is not approximately **0 Ω**, replace the "**R/0**" control button.
If the connection is broken, repair it.

RESUME

Status **ET413** changes to "RESUME" when the "**R**" cruise control button is pressed. This button is situated to the right of the steering wheel.

If status **ET413** does not change to "RESUME", check the condition of the "**R/0**" cruise control button and its connector. Repair if necessary.

Refer to the airbag fault finding note associated with the vehicle, in order to remove the driver's airbag, and carry work out safely.
Repair if necessary.

Measure the **resistance of the following connection, after pressing the "R" button**:

Track 55, injection computer connector A ⟶ **Track A2,** "**R/0**" button

If the resistance is not approximately **900 Ω**, check the continuity of the connection when the button is not pressed.
If there is continuity, then replace the "**R/0**" control button.
If the connection is broken, repair it.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET556	DRIVER DEACTIVATION OF THE CRUISE CONTROL/SPEED LIMITER

NOTES	**Special notes:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

Note:
Cruise control can be activated when the vehicle speed exceeds **18 mph (30 km/h)**. Status **ET556** details 6 causes for cruise control deactivation.
NOTE
To reinitialise the deactivations stored by the injection computer, use command RZ007 "Fault memory".

STATUS 1	**Brake pedal depressed**
	The cruise control function is deactivated each time the brake pedal is depressed. Status **ET556** changes to "**STATUS 1**", when driving, with cruise control active and the brake pedal depressed. If status **ET556** changes to "**STATUS 1**" without depressing the brake pedal, refer to interpretation of fault **DF411 "Brake pedal sensor circuit"**.

STATUS 2	**Traction control request**
	If the vehicle being diagnosed is fitted with traction control, the cruise control function is deactivated each time traction control is selected. Status **ET556** changes to "**STATUS 2**", when driving, with cruise control active and traction control requested. If status **ET556** changes to "**STATUS 2**" without traction control request, refer to fault finding note relating to the vehicle's traction control system.

STATUS 3	**Suspend button pressed**
	Status **ET556** changes to "**STATUS 3**" when driving, with Cruise control/Speed limiter active, if the driver presses the "**0**" button on the Cruise control/Speed limiter. If status **ET556** changes to "**STATUS 3**" without pressing the "**0**" button on the Cruise control/Speed limiter, consult the interpretation of status **ET413 "Cruise control/speed limiter function"** and run fault finding on the "**R/0**" control button of the Cruise control/ Speed limiter.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET556 CONTINUED	

STATUS 5	**Gear lever in neutral position**
	Status **ET556** changes to "**STATUS 5**", when driving, with cruise control active and – if gear lever is in neutral on an automatic transmission. This deactivates cruise control. If status **ET556** changes to "**STATUS 5**" or out of neutral on an automatic transmission, contact the Techline.

STATUS 6	**Inconsistency between the request and the vehicle speed**
	Status **ET556** changes to "**STATUS 6**" if the computer detects too great a difference between the speed requested by the driver and the vehicle speed. This may occur when driving, with cruise control active and where the difference between speeds is great. If status **ET556** changes to "**STATUS 6**" without a great difference in the speeds, contact the Techline.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET557	CRUISE CONTROL/SPEED LIMITER DEACTIVATION BY FUNCTION

NOTES	**Special notes:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

Note:
Cruise control remains deactivated as long as the vehicle speed does not exceed **18 mph (30 km/h).** Status **ET557** details 4 causes for cruise control deactivation.
NOTE
To reinitialise the deactivations stored by the injection computer, use command RZ007 "Fault memory".

STATUS 1	**Cruise control or speed limiter fault**
	If status **ET557** is "**STATUS 1**", refer to the interpretation of status **ET042** "**Cruise control/speed limiter**" and **ET413** "**Cruise control/speed limiter function**", to test the components of the cruise control system and find the faulty one. If status **ET557** changes to "**STATUS 1**", deal with the faults present or stored in the computer. If the fault is still present, contact the Techline.

STATUS 2	**Fault detected by the injection computer**
	Status **ET557** changes to "**STATUS 2**" if the injection computer detects a fault on the injection system: – **faults in the engine speed sensor or camshaft,** – **accelerator pedal faults,** – **engine speed lower than 1000 rpm,** – **engine speed greater than 4700 rpm.** Carry out a multiplex network test, then an injection system test, and carry out fault finding on any faults. If the fault is still present, contact the Techline.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET557 CONTINUED	

STATUS 3	**Invalid vehicle speed**
	Status **ET557** changes to "**STATUS 3**" if the vehicle speed received by the computer is invalid. Carry out fault finding on the **ABS** computer. If faults are present (see **38C, Anti-lock braking system).** If the fault is still present, contact the Techline.

STATUS 4	**Automatic transmission in defect mode.**
	Status **ET557** changes to "**STATUS 4**" if there is a fault in the automatic transmission system. Carry out fault finding on the **automatic transmission** computer. If there are faults (**see 23A, Automatic transmission**). If the fault is still present, contact the Techline.

AFTER REPAIR	Repeat the conformity check from the start.

AC015	FUEL PUMP RELAY

NOTES	Malfunctioning of the fuel pump relay could lead to the appearance of faults relating to the injectors and the fuel vapour absorber bleed solenoid valve.

Check the **condition and connection** of the fuel pump relay connector. Repair if necessary.
Check the continuity of the fuel pump relay **control coil**. Replace the relay if necessary.
Check for **12 V** on **track 3** of the fuel pump relay connector. Repair the wiring up to the fuse if necessary.
With the ignition switched on, check **for 12 V** on **track 2** of the fuel pump relay connector. Repair the wiring up to the fuse if necessary.
Check **the continuity and insulation** of the following connections: **Injection computer, connector B, track 96** → **Fuel pump relay track 1** **Petrol pump** → **Fuel pump relay track 5** Repair if necessary.
If the fault persists, change the petrol pump.

AFTER REPAIR	Carry out another fault finding check on the system.

GETtheMANUALS.org

NOTES	Only refer to these customer complaints after performing a complete check with the diagnostic tool.

NO DIALOGUE WITH THE COMPUTER	→ **ALP 1**
STARTING FAULTS	→ **ALP 2**
IDLING SPEED FAULTS	→ **ALP 3**
FAULTS WHILE DRIVING	→ **ALP 4**

GETtheMANUALS.org

ALP 1	No dialogue with the computer

NOTES	Check the battery voltage.

Ensure that the diagnostic tool is not the cause of the fault by using it to establish dialogue with a computer on another vehicle.
Check the connection between the diagnostic tool and the diagnostic socket (condition of the lead).
Check the injection, engine and passenger compartment fuses.
Repair if necessary.

Check for **+ 12 V** on **track 16** and for **an earth** on tracks **4** and **5** of the diagnostic socket.
Repair if necessary.

Use the bornier to check the **insulation, continuity and the absence of interference resistance** on the following **connections**:

Track 2 injection computer connector A	→	**Earth**
Track 4, injection computer connector A	→	**Earth**
Injection computer, connector B, track 115	→	**Earth**

Check the resistance and operation of the main relay control coil.
Replace the relay if necessary.

AFTER REPAIR	Carry out a complete check with the diagnostic tool.

GETtheMANUALS.org

ALP 2	Starting faults

NOTES	Only check the customer complaint after performing a **complete check with the diagnostic tool**.

Check the reliability of the starter motor.
Check that there is fuel present (the fuel gauge may be faulty). Check that the fuel is of the correct type.
Check that no hoses are pinched (especially after a removal operation). Check the condition of the fuel filter. Check the condition of the tank. Check that the tank vent is not blocked.
Check the petrol pump electrical supply. Check that the impact sensor is operating correctly.
Check the idle speed regulation valve. Tap gently to release the valve.
Disconnect the pipe connecting the canister bleed solenoid valve to the inlet manifold. Plug the pipe to prevent an air leak. If there is no longer any disturbance, the canister bleed is at fault.
Check condition of spark plugs and ignition coils. Check that these elements are correct for the vehicle.
Check that the exhaust system is not blocked and that the catalytic converters are not clogged.
Check the engine compressions.
Check the condition of the flywheel.
Check the timing gear setting.

AFTER REPAIR	Carry out a complete check with the diagnostic tool.

GETtheMANUALS.org

ALP 3	Idle speed faults

NOTES	Only check the customer complaint after performing a **complete check with the diagnostic tool**.

Check that there is fuel present (the fuel gauge may be faulty). Check that the fuel is of the correct type.
Check that no hoses are pinched (especially after a removal operation). Check the condition of the fuel filter. Check the condition of the tank. Check that the tank fresh air vent is not blocked.
Check that no hoses are pinched (especially after a removal operation). Check the condition of the fuel filter. Check the condition of the tank. Check that the tank vent is not blocked.
Check the connection and condition of the idle speed regulation stepper motor connector. Replace the connector if necessary.
Check the idle speed regulation valve. Tap gently to release the valve.
Check that the camshaft dephaser solenoid valves are not jammed in the open position.
Disconnect the pipe connecting the canister bleed solenoid valve to the inlet manifold. Plug the pipe to prevent an air leak. If there is no longer any disturbance, the canister bleed is at fault.
Check condition of spark plugs and ignition coils. Check that these elements are correct for the vehicle.

AFTER REPAIR	Carry out a complete check with the diagnostic tool.

GETtheMANUALS.org

ALP 4	Faults when driving

NOTES	Only check the customer complaint after performing a **complete check with the diagnostic tool**.

Check that there is fuel present (the fuel gauge may be faulty). Check that the fuel is of the correct type.
Check that no hoses are pinched (especially after a removal operation). Check the condition of the fuel filter. Check the condition of the tank. Check that the tank fresh air vent is not blocked.
Check that no hoses are pinched (especially after a removal operation). Check the condition of the fuel filter. Check the condition of the tank. Check that the tank vent is not blocked.
Check the connection and condition of the idle speed regulation stepper motor connector. Replace the connector if necessary.
Check the idle speed regulation valve. Tap gently to release the valve.
Check that the camshaft dephaser solenoid valves are not jammed in the open position.
Disconnect the pipe connecting the canister bleed solenoid valve to the inlet manifold. Plug the pipe to prevent an air leak. If there is no longer any disturbance, the canister bleed is at fault.
Check condition of spark plugs and ignition coils. Check that these elements are correct for the vehicle.

AFTER REPAIR	Carry out a complete check with the diagnostic tool.

GETtheMANUALS.org

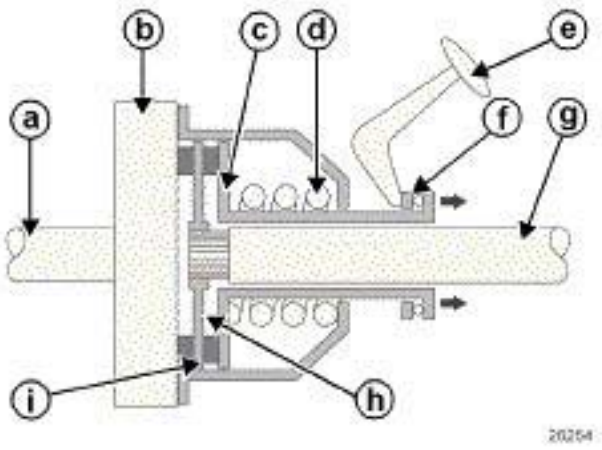
The clutch is a system which enables mechanical action to be either linked or not to an end component.
It is made up of an assembly of parts located between the engine and the transmission components.
It ensures the following functions:

- **When engaged: transmits the power provided.**
- **When disengaged: this transmission is interrupted.**
- **Between the two positions: the transmission of power is gradually restarted.**

There are different types of clutch:

- **Depending on number of discs:**
  - **dry single disc clutch,**
  - **dry double disc clutch with single control,**
  - **double disc clutch with separate control (double),**
  - **wet or dry multidisc clutch.**

- **Depending on type of control:**
  - **manual control,**
  - **hydraulic control,**
  - **electric control with electronic servo.**



a : crankshaft
b : flywheel
c : pressure plate
d : spring
e : clutch pedal
f : clutch thrust bearing
g : gearbox input shaft
h : clutch plate
i : clutch plate pad

The system is made up of the flywheel (b) (attached to the engine) (the bolts in the centre are screwed into the crankshaft (a)).
The clutch plate is attached to the gearbox.
The outermost part is called the friction or pad. The pressure plate ensures that the clutch plate is held against the flywheel when the clutch is engaged, as this is what ensures that they turn at exactly the same speed, one driving the other.
The pressure plate springs are pushed in by the clutch thrust bearing.
When the clutch control (hydraulic, or cable operated) is activated, the clutch plates move apart and less and less movement is transmitted, leaving the gearbox free of the engine. This, for example, allows the vehicle remain stationary without stalling the engine, or a gear to be changed.
The opposite action involves gradually releasing the clutch control, so that the engine and gearbox are reconnected. This manoeuvre is called "slipping the clutch".

GETtheMANUALS.org

Customer complaint: the clutch pedal remains depressed after use.

Use the fault finding chart (see next page) in the following cases:

- **The pedal remains depressed, without the vehicle moving, with the engine running or stationary:**
  - **either after making several successive manoeuvres,**
  - **or after leaving the foot down on the pedal using moderate force for a reasonably prolonged period.**

The function temporarily returns to normal after releasing the pedal manually.

- **The pedal remains depressed only after reasonably prolonged use of the vehicle, particularly in heavy traffic.**

The function temporarily returns to normal after releasing the pedal manually.

- **The pedal remains depressed immediately after each manoeuvre. There is little or no force felt from the pedal and returning the pedal manually does not stop the fault from recurring.**

- **After a prolonged stop in the disengaged position, first gear engaged (stop at traffic lights, for example), the vehicle has a tendency to creep forward after a certain amount of time. If the pedal is released, it does not return.**

GETtheMANUALS.org

NOTES	– Check that the customer has not topped up the brake fluid level. – Check the condition of the brake pads before topping up the brake fluid.

Check the area surrounding the pedals, on the passenger compartment side.

Is the floor carpet or another foreign body blocking the travel of the clutch pedal?

YES → Disengage the pedal and check that the customer complaint is no longer present.

NO → Check the return spring and the pushrod for the pedals.

Are there any anomalies?

YES → Repair the anomaly and check that the customer complaint is no longer present.

NO → Check the level of hydraulic fluid

Is the level below the take-off point supplying the master cylinder?

NO → (A)

YES → Check the sealing of the hydraulic circuit pipes

Are there any leaks around the unions or pipes?

NO → (A)

YES → Carry out the necessary repairs

NO → (A)

GETtheMANUALS.org

NOTES	– Check that the customer has not topped up the brake fluid level. – Check the condition of the brake pads before topping up the brake fluid.

ABBREVIATIONS

GETtheMANUALS.org

ABBREVIATIONS	MEANING OF ABBREVIATION
ABS	Anti-lock braking system
ALP	Fault Finding Chart
APC	After ignition
AVC	Before ignition feed
BVA	Automatic gearbox
BVM	Manual gearbox
BVR	Sequential gearbox
CAN	Controller Area Network
AC	Air conditioning
CD	Compact disc
PAS	Power assisted steering (hydraulic)
DAE	Electric power assisted steering
DVD	Digital versatile disc
DTC	Fault finding code
EGR	Exhaust gas recirculation
ESP	Electronic Stability Program
GMV	Fan assembly
CNG	Compressed natural gas
LPG	Liquefied petroleum gas
HLE	High yield strength
MAG	Metal active gas (for welding steel)
MIG	Metal inert gas (for welding aluminium)
MR	Workshop repair manual
TN	Technical Note
OBD	On board diagnostics
SER	Resistance spot welding
SSPP	Tyre pressure monitoring system
THLE	Very high-tensile strength
TM	Labour time
UCH	UCH
UPC	Protection and switching unit
UCT	Roof control unit
UHLE	Ultra high yield strength
VIN	Vehicle identification number

AUTOMATIC GEARBOX
Fault finding - Introduction

GETtheMANUALS.org

This document presents the fault finding strategy applicable to all SU1 2001 AUTOMATIC GEARBOX computers - with VDIAG 08 fitted to Vel Satis.

In order to implement fault finding on this system, it is essential to have the following items available:
- **the wiring diagram of the function for the vehicle concerned,**
- **the tools listed in the Special tooling required section.**

GENERAL APPROACH TO FAULT FINDING:

- **Use one of the diagnostic tools for identifying the system fitted on the vehicle (reading the computer type, program number, Vdiag number, etc.).**

- **Locate the Fault finding documents corresponding to the system identified.**

- **Take into consideration information contained in the introductory sections.**

- **Read the faults stored in the computer memory and use the Interpretation of faults section of the documents.**
  REMINDER: each fault is interpreted for a given type of storage (fault present, fault stored, fault present or stored). The checks defined for dealing with each fault are therefore only to be performed on the vehicle if the fault declared by the diagnostic tool is interpreted in the document for its type of storage. The way in which the fault is stored should be considered when using the diagnostic tool after the ignition has been switched off and on again.
  If a fault is interpreted when it is recorded as stored, the application conditions for the fault finding procedure appear in the Notes box. If the conditions are not met, use the fault finding procedure to check the circuit of the faulty component, since the fault is no longer present on the vehicle. Perform the same procedure when a fault is declared as stored by the diagnostic tool but is only interpreted in the documentation as a present fault.

- **Carry out the conformity check (appearance of possible faults not yet identified by the system's self fault finding procedure) and implement the relevant fault finding strategies according to the results.**

- **Confirm the repair (disappearance of the fault reported by the customer).**

- **Use the fault finding strategies for the customer complaint if the fault is still present.**

<u>Tooling required for operations on the SU1 2001 automatic gearbox:</u>

- CLIP
- Multimeter.

GETtheMANUALS.org

DF002 PRESENT	COMPUTER 1.DEF : Internal electronic fault

NOTES	**Special notes:** make sure that the fault does not appear after the computer has been reprogrammed, if it does, carry out the procedure again very carefully.

Replace the automatic gearbox computer if the fault appears during normal use or is still present after several reprogramming attempts.

AFTER REPAIR	Clear the computer memories and switch off the ignition. Now road test the vehicle to initialise the auto-adaptatives. Check again using the diagnostic tool.

GETtheMANUALS.org

DF019 STORED	GEARBOX OUTPUT SPEED SENSOR CIRCUIT 1.DEF : No signal

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: – the computer fault memory has been cleared, – the ignition has been switched off and on again, – the engine has been started and left running for **3 minutes**. **Special notes:** road test the vehicle in Drive or Reverse if the speed does not remain zero and faults **DF019** and **DF057** are present at the same time; refer to the information on ABS ECU (speed inconsistent with ABS).

1.DEF

Check the connections on the computer and the **2-track** speed sensor connector.
Check the continuity, insulation and absence of interference resistance between:

Computer connector **track 22** → **Track 2 of the speed sensor connector**
Computer connector **track 37** → **Track 1 of the speed sensor connector**

If the fault is still present after these checks, replace the vehicle speed sensor.

AFTER REPAIR	Clear the computer memories, switch off the ignition, then carry out a road test. Check again using the diagnostic tool.

GETtheMANUALS.org

DF023 STORED	GEARBOX OIL TEMPERATURE SENSOR CIRCUIT 1.DEF : Consistency CC.0 : Short circuit to earth CO.1 : Open circuit or short circuit to + 12 V

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: – the computer fault memory has been cleared, – the ignition has been switched off and on again, – the engine has been started and vehicle driven for **15 minutes**.

CC.O	***NOTES***	None.

Check the connections on the computer and the connector.
Check **the continuity and insulation** against earth and **+ 12 V** of the connections between:

Computer connector track 10 ⟶ **Track 1 of the 8-track gearbox connector**
Computer connector track 24 ⟶ **Track 5 of the 8-track gearbox connector**

Replace the wiring harness if necessary.

AFTER REPAIR	Clear the computer memories, switch off the ignition, then carry out a road test. Check again using the diagnostic tool.

GETtheMANUALS.org

DF023 **CONTINUED 1**	

CO.1	***NOTES***	The **80°C** value given by **PR004** is a safety value and not representative of the sensor signal when the fault is present.

Check the connections on the computer and the connector.
Check **the continuity and insulation** against earth and **+ 12 V** of the connections between:

Computer connector track 10 ⟶ **Track 1 of the 8-track gearbox connector**
Computer connector track 24 ⟶ **Track 5 of the 8-track gearbox connector**

Replace the wiring harness if necessary.

Switch off the ignition, disconnect the **8-track** connector on the automatic gearbox and measure the oil temperature sensor resistance between **tracks 1 and 5** on the sensor side.

If the resistance measured is not approximately:

- **111 ± 6 Ω at 145°C**
- **247 ± 16 Ω at 110°C**
- **6.445 ± 0.645 kΩ at 10°C**
- **44 ± 6 kΩ at - 30°C**

Replace the gearbox oil temperature sensor.

If the sensor resistance is correct, repair or replace the wiring concerned.

AFTER REPAIR	Clear the computer memories, switch off the ignition, then carry out a road test. Check again using the diagnostic tool.

GETtheMANUALS.org

DF023 **CONTINUED 2**	

1.DEF	***NOTES***	The **80°C** value given by **PR004** is a default value. Do not take this into account when estimating the oil temperature.

Switch off the ignition, disconnect the **8-track** connector on the automatic gearbox and measure the oil temperature sensor resistance between **tracks 1 and 5** on the sensor side.

If the resistance measured is not approximately:

- **111 ± 6 Ω at 145°C**
- **247 ± 16 Ω at 110°C**
- **6.445 ± 0.645 kΩ at 10°C**
- **44 ± 6 kΩ at - 30°C**

Replace the gearbox oil temperature sensor.

AFTER REPAIR	Clear the computer memories, switch off the ignition, then carry out a road test. Check again using the diagnostic tool.

GETtheMANUALS.org

DF057 STORED	GEARBOX INPUT SPEED SENSOR CIRCUIT 1.DEF : No signal

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: – the computer fault memory has been cleared, – the ignition has been switched off and on again, – the engine has been started and left running for **1 minute** in Neutral.
	Special notes: road test the vehicle in Drive or Reverse if the speed does not remain at zero and faults **DF019** and **DF057** are present at the same time; refer to the information on ABS ECU (speed inconsistency with ABS).

1.DEF

Check the connections on the computer and the **2-track** speed sensor connector.
Check the continuity, insulation and absence of interference resistance between:

Computer connector track 9 → **Track 2 of the speed sensor connector**

Computer connector track 23 → **Track 1 of the speed sensor connector**

If the fault is still present after these checks, replace the vehicle speed sensor.

AFTER REPAIR	Clear the computer memories, switch off the ignition, then carry out a road test. Check again using the diagnostic tool.

GETtheMANUALS.org

DF084 **STORED**	MULTIPLEX NETWORK 1.DEF : Carry out the multiplex network fault finding procedure

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the engine is started.

Carry out the fault finding procedure for the multiplex network.

If the fault is still present, replace the computer

AFTER REPAIR	Clear the computer memories, switch off the ignition, then carry out a road test. Check again using the diagnostic tool.

GETtheMANUALS.org

DF085 STORED	SEQUENCE SOLENOID VALVE CIRCUIT EVS1 CC.0 : Short circuit to earth CO.1 : Open circuit or short circuit to + 12 V

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: – the computer fault memory has been cleared, – the ignition has been switched off and on again, – the engine has been started and the vehicle driven for **3 minutes** in Drive (all the gears must be used).

CO.1	***NOTES***	None

Switch off the ignition, disconnect the **8-track** connector under the automatic gearbox and **measure the resistance** of the winding of sequence solenoid valve no. 1 between **earth** and **track 3** on the solenoid valve side.

If the resistance measured is not approximately **14 ± 2 Ω at 20°C**, remove the gearbox sump and take the same measurement on the solenoid valve itself. If the resistance is incorrect, replace the solenoid valve. If the resistance is correct, repair or replace the wiring in question.

Check the **continuity** of the connection between **track 2** of the computer connector and **track 3** of the **8-track** connector on the wiring harness side.

Check the **insulation** against **12 volts** of the connection between **tracks 29 and 30** of the computer connector and **track 3** of the **8-track** connector on the wiring harness side.

Repair or replace the automatic gearbox wiring concerned if a fault occurs.

Check the **continuity between earth** and **track 1** of the computer connector.

Check the connections on the automatic transmission computer and the **8-track** connector.
Carry out the required operations.

If the fault is still present after these tests, replace solenoid valve S1.

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Finish the operation by checking with the diagnostic tool. Use the actuator sequential command in the **SCENARIO** menu.

GETtheMANUALS.org

DF085 **CONTINUED**	

CC.0	***NOTES***	**Special notes:** None.

Switch off the ignition, disconnect the **8-track** connector under the automatic gearbox and **measure the resistance** of the winding of sequence solenoid valve no. 1 between **earth** and **track 3** on the solenoid valve side.

If the resistance measured is not approximately **14 ± 2 Ω at 20°C**, remove the gearbox sump and take the same measurement on the solenoid valve itself. If the resistance is incorrect, replace the solenoid valve. If the resistance is correct, repair or replace the wiring in question.

Check the **insulation** against earth of the connection between **track 2** of the computer connector and **track 3** of the **8-track** connector on the wiring harness side. Repair or replace the automatic gearbox wiring concerned if a fault occurs.

Check the connections on the automatic transmission computer and the **8-track** connector.
Carry out the required operations.

If the fault is still present after these tests, replace solenoid valve S1.

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Finish the operation by checking with the diagnostic tool. Use the actuator sequential command in the **SCENARIO** menu.

GETtheMANUALS.org

DF086 STORED	SEQUENCE SOLENOID VALVE CIRCUIT EVS2 CC.0 : Short circuit to earth CO.1 : Open circuit or short circuit to + 12 V

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: – the computer fault memory has been cleared, – the ignition has been switched off and on again, – the engine has been started and the vehicle driven for **3 minutes** in Drive (all the gears must be used).

CO.1	***NOTES***	None

Switch off the ignition, disconnect the **6-track** connector under the automatic gearbox and **measure the resistance** of the winding of sequence solenoid valve no. 2 between **earth** and **track 3** on the solenoid valve side.

If the resistance measured is not approximately **13 ± 2 Ω at 20°C**, remove the gearbox sump and take the same measurement on the solenoid valve itself. If the resistance is incorrect, replace the solenoid valve.

If the resistance is correct, repair or replace the wiring in question.

Check the **continuity** of the connection between **track 16** of the computer connector and **track 3** of the **6-track** connector on the wiring harness side.

Check the **insulation** against **12 volts** of the connection between **tracks 29 and 30** of the computer connector and **track 3** of the **6-track** connector on the wiring harness side.

Repair or replace the automatic gearbox wiring concerned if a fault occurs.

Check **the continuity** between **earth** and **track 1** of the computer connector.

Check the connections on the automatic transmission computer and the **6-track** connector.
Carry out the required operations.

If the fault is still present after these checks, replace solenoid valve S2.

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Finish the operation by checking with the diagnostic tool. Use the actuator sequential command in the **SCENARIO** menu.

GETtheMANUALS.org

DF086 **CONTINUED**	

CC.0	***NOTES***	**Special notes:** None.

Switch off the ignition, disconnect the **6-track** connector under the automatic gearbox and **measure the resistance** of the winding of sequence solenoid valve no. 2 between **earth** and **track 3** on the solenoid valve side.

If the resistance measured is not approximately **13 ± 2 Ω at 20°C**, remove the gearbox sump and take the same measurement on the solenoid valve itself. If the resistance is incorrect, replace the solenoid valve. If the resistance is correct, repair or replace the wiring in question.

Check the **insulation** against earth of the connection between **track 16** of the computer connector and **track 3** of the **6-track** connector on the wiring harness side. Repair or replace the automatic gearbox wiring concerned if a fault occurs.

Check the connections on the automatic transmission computer and the **6-track** connector.
Carry out the required operations.

If the fault is still present after these checks, replace solenoid valve S2.

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Finish the operation by checking with the diagnostic tool. Use the actuator sequential command in the **SCENARIO** menu.

GETtheMANUALS.org

DF087 STORED	SEQUENCE SOLENOID VALVE CIRCUIT EVS3 CC.0 : Short circuit to earth CO.1 : Open circuit or short circuit to + 12 V

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: – the computer fault memory has been cleared, – the ignition has been switched off and on again, – the engine has been started and the vehicle driven for **3 minutes** in Drive (all the gears must be used).

CO.1	***NOTES***	None

Switch off the ignition, disconnect the **6-track** connector under the automatic gearbox and **measure the resistance** of the winding of sequence solenoid valve no. 3 between **earth** and **track 6** on the solenoid valve side.

If the resistance measured is not approximately **13 ± 2 Ω at 20°C**, remove the gearbox sump and take the same measurement on the solenoid valve itself. If the resistance is incorrect, replace the solenoid valve.

If the resistance is correct, repair or replace the wiring in question.

Check the **continuity** of the connection between **track 31** of the computer connector and **track 6** of the **6-track** connector on the wiring harness side.

Check the **insulation** against **12 volts** of the connection between **tracks 29 and 30** of the computer connector and **track 6** of the **6-track** connector on the wiring harness side.

Repair or replace the automatic gearbox wiring concerned if a fault occurs.

Check **the continuity** between **earth** and **track 1** of the computer connector.

Check the connections on the automatic transmission computer and the **6-track** connector.
Carry out the required operations.

If the fault is still present after these checks, replace solenoid valve S3.

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Finish the operation by checking with the diagnostic tool. Use the actuator sequential command in the **SCENARIO** menu.

GETtheMANUALS.org

DF087 **CONTINUED**	

CC.0	***NOTES***	**Special notes:** None.

Switch off the ignition, disconnect the **6-track** connector under the automatic gearbox and **measure the resistance** of the winding of sequence solenoid valve no. 3 between **earth** and **track 6** on the solenoid valve side.

If the resistance measured is not approximately **13 ± 2 Ω at 20°C**, remove the gearbox sump and take the same measurement on the solenoid valve itself. If the resistance is incorrect, replace the solenoid valve. If the resistance is correct, repair or replace the wiring in question.

Check the **insulation** against earth of the connection between **track 31** of the computer connector and **track 6** of the **6-track** connector on the wiring harness side. Repair or replace the automatic gearbox wiring concerned if a fault occurs.

Check the connections on the automatic transmission computer and the **6-track** connector.
Carry out the required operations.

If the fault is still present after these checks, replace solenoid valve S3.

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Finish the operation by checking with the diagnostic tool. Use the actuator sequential command in the **SCENARIO** menu.

GETtheMANUALS.org

DF088 STORED	SEQUENCE SOLENOID VALVE CIRCUIT EVS5 CC.0 : Short circuit to earth CO.1 : Open circuit or short circuit to + 12 V

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: – the computer fault memory has been cleared, – the ignition has been switched off and on again, – the engine has been started and the vehicle driven for **3 minutes** in Drive (all the gears must be used).

CO.1	***NOTES***	None

Switch off the ignition, disconnect the **8-track** connector under the automatic gearbox and **measure the resistance** of the winding of sequence solenoid valve no. 5 between **earth** and **track 8** on the solenoid valve side.

If the resistance measured is not approximately **13 ± 2 Ω at 20°C**, remove the gearbox sump and take the same measurement on the solenoid valve itself. If the resistance is incorrect, replace the solenoid valve.

If the resistance is correct, repair or replace the wiring in question.

Check the **continuity** of the connection between **track 17** of the computer connector and **track 8** of the **8-track** connector on the wiring harness side.

Check the **insulation** against **12 volts** of the connection between **tracks 29 and 30** of the computer connector and **track 8** of the **8-track** connector on the wiring harness side.

Repair or replace the automatic gearbox wiring concerned if a fault occurs.

Check **the continuity** between **earth** and **track 1** of the computer connector.

Check the connections on the automatic transmission computer and the **8-track** connector.
Carry out the required operations.

If the fault is still present after these checks, replace solenoid valve S5.

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Finish the operation by checking with the diagnostic tool. Use the actuator sequential command in the **SCENARIO** menu.

GETtheMANUALS.org

DF088 **CONTINUED**	

CC.0	***NOTES***	**Special notes:** None.

Switch off the ignition, disconnect the **8-track** connector under the automatic gearbox and **measure the resistance** of the winding of sequence solenoid valve no. 5 between **earth** and **track 8** on the solenoid valve side.

If the resistance measured is not approximately **13 ± 2 Ω at 20°C**, remove the gearbox sump and take the same measurement on the solenoid valve itself. If the resistance is incorrect, replace the solenoid valve. If the resistance is correct, repair or replace the wiring in question.

Check the insulation against earth of the connection between **track 17** of the computer connector and **track 8** of the **8-track** connector on the wiring harness side. Repair or replace the automatic gearbox wiring concerned if a fault occurs.

Check the connections on the automatic transmission computer and the **8-track** connector.
Carry out the required operations.

If the fault is still present after these checks, replace solenoid valve S5.

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Finish the operation by checking with the diagnostic tool. Use the actuator sequential command in the **SCENARIO** menu.

GETtheMANUALS.org

DF089 PRESENT	SEQUENCE SOLENOID VALVE CIRCUIT EVS4 CC.0 : Short circuit to earth CO.1 : Open circuit or short circuit to + 12 V

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: – the computer fault memory has been cleared, – the ignition has been switched off and on again, – the engine has been started and the vehicle driven for **3 minutes** in Drive (all the gears must be used).

CO.1	***NOTES***	None

Switch off the ignition, disconnect the **8-track** connector under the automatic gearbox and **measure the resistance** of the winding of sequence solenoid valve no. 4 between **earth** and **track 4** on the solenoid valve side.

If the resistance measured is not approximately **13 ± 2 Ω at 20°C**, remove the gearbox sump and take the same measurement on the solenoid valve itself. If the resistance is incorrect, replace the solenoid valve.

If the resistance is correct, repair or replace the wiring in question.

Check the **continuity** of the connection between **track 3** of the computer connector and **track 4** of the **8-track** connector on the wiring harness side.

Check the **insulation** against **12 volts** of the connection between **tracks 29 and 30** of the computer connector and **track 4** of the **8-track** connector on the wiring harness side.

Repair or replace the automatic gearbox wiring concerned if a fault occurs.

Check **the continuity** between **earth** and **track 1** of the computer connector.

Check the connections on the automatic transmission computer and the **8-track** connector.
Carry out the required operations.

If the fault is still present after these checks, replace solenoid valve S4.

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Finish the operation by checking with the diagnostic tool. Use the actuator sequential command in the **SCENARIO** menu.

GETtheMANUALS.org

DF089 **CONTINUED**

Switch off the ignition, disconnect the **8-track** connector under the automatic gearbox and **measure the resistance** of the winding of sequence solenoid valve no. 4 between **earth** and **track 4** on the solenoid valve side.

If the resistance measured is not approximately **13 ± 2 Ω at 20°C**, remove the gearbox sump and take the same measurement on the solenoid valve itself. If the resistance is incorrect, replace the solenoid valve. If the resistance is correct, repair or replace the wiring in question.

Check the **insulation against earth of the connection** between **track 3** of the computer connector and **track 4** of the **8-track** connector on the wiring harness side. Repair or replace the automatic gearbox wiring concerned if a fault occurs.

Check the connections on the automatic transmission computer and the **8-track** connector.
Carry out the required operations.

If the fault is still present after these checks, replace solenoid valve S4.

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Finish the operation by checking with the diagnostic tool. Use the actuator sequential command in the **SCENARIO** menu.

GETtheMANUALS.org

DF090 STORED	CONVERTER LOCK-UP SOLENOID VALVE CIRCUIT CC.1 : Short circuit to + 12 V CO.0 : Open circuit or short circuit to earth

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: – the computer fault memory has been cleared, – the ignition has been switched off and on again, – the engine has been started and left running for **1 minute** in Neutral.

CC.1	***NOTES***	None

Switch off the ignition, disconnect the **6-track** connector under the automatic gearbox and **measure the resistance** of the winding of the lock-up solenoid valve between **track 5** and **track 2** on the solenoid valve side. If the resistance measured is not approximately **5.5 ± 0.5 Ω at 20°C**, remove the gearbox sump and take the same measurement directly from the solenoid valve. If the resistance is incorrect, replace the 3 solenoid valves (LS, LT and converter lock-up). If the resistance is correct, repair or replace the wiring in question.

Check the continuity of the connections between:

Computer connector track 6 → Track 5 of the hydraulic unit 6-track connector.
Computer connector track 18 → Track 2 of the hydraulic unit 6-track connector.

Also check the insulation between these connections.

Check the insulation against the **12 V** of the connections between:

Computer connector track 6 → Track 5 of the hydraulic unit 6-track connector.
Computer connector track 18 → Track 2 of the hydraulic unit 6-track connector.

Repair or replace the automatic gearbox wiring concerned if a fault occurs.

Check the connections on the automatic transmission computer and the **6-track** connector.
Carry out the required operations.

If the fault is still present after these checks, replace the 3 solenoid valves (lock-up, LS, LT).

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Finish the operation by checking with the diagnostic tool. Use the actuator sequential command in the **SCENARIO** menu.

GETtheMANUALS.org

DF090 **CONTINUED**	

CO.0	***NOTES***	**Special notes:** None.

Switch off the ignition, disconnect the **6-track** connector under the automatic gearbox and **measure the resistance** of the lock-up solenoid valve winding between **track 5** and **track 2** on the solenoid valve side.
If the resistance measured is not approximately **5.3 ± 0.3 Ω at 20°C**, remove the gearbox sump and take the same measurement on the solenoid valve itself. If the resistance is incorrect, replace the 3 solenoid valves (LS, LT and lock-up). If the resistance is correct, repair or replace the wiring in question.

Check the continuity of the connections between:

Computer connector track 6 → Track 5 of the hydraulic unit 6-track connector.
Computer connector track 18 → Track 2 of the hydraulic unit 6-track connector.

Also check the insulation between these connections.

Check the insulation against earth of the connections between:

Computer connector track 6 → Track 5 of the hydraulic unit 6-track connector.
Computer connector track 18 → Track 2 of the hydraulic unit 6-track connector.

Repair or replace the automatic gearbox wiring concerned if a fault occurs.

Check the connections on the automatic gearbox computer and the **6-track** connector.
Carry out the required operations.

If the fault is still present after these checks, replace the 3 solenoid valves (lock-up, LS, LT).

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Finish the operation by checking with the diagnostic tool. Use the actuator sequential command in the **SCENARIO** menu.

GETtheMANUALS.org

DF091 **STORED**	LS PRESSURE REGULATION SOLENOID VALVE CIRCUIT CC.1 : Short circuit to + 12 V CO.0 : Open circuit or short circuit to earth

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: – the computer fault memory has been cleared, – the ignition has been switched off and on again, – the engine has been started and left running for **1 minute** in Neutral.

CC.1	***NOTES***	None

Switch off the ignition, disconnect the **8-track** connector under the automatic gearbox and **measure the resistance** of the winding of the LS pressure regulation solenoid valve between **track 6** and **track 2** on the solenoid valve side. If the resistance measured is not approximately **5.5 ± 0.5 Ω at 20°C**, remove the gearbox sump and take the same measurement directly from the solenoid valve. If the resistance is incorrect, replace the 3 solenoid valves (LS, LT and converter lock-up). If the resistance is correct, repair or replace the wiring in question.

Check the continuity of the connections between:

Computer connector track 5 → **Track 2 of the hydraulic unit 8-track connector.**
Computer connector track 20 → **Track 6 of the hydraulic unit 8-track connector.**

Also check the insulation between these connections.

Check the **12 V** insulation of the connections between:

Computer connector track 5 → **Track 2 of the hydraulic unit 8-track connector.**
Computer connector track 20 → **Track 6 of the hydraulic unit 8-track connector.**

Repair or replace the automatic gearbox wiring concerned if a fault occurs.

Check the connections on the automatic transmission computer and the **8-track** connector.
Carry out the required operations.

If the fault is still present after these checks, replace the 3 solenoid valves (lock-up, LS, LT).

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Finish the operation by checking with the diagnostic tool. Use the actuator sequential command in the **SCENARIO** menu.

GETtheMANUALS.org

DF091 **CONTINUED**	

CO.0	***NOTES***	**Special notes:** None.

Switch off the ignition, disconnect the **8-track** connector under the automatic gearbox and **measure the resistance** of the LS pressure regulation solenoid valve winding between **track 6** and **track 2** on the solenoid valve side. If the resistance measured is not approximately **5.3 ± 0.3 Ω at 20°C**, remove the gearbox sump and take the same measurement on the solenoid valve itself. If the resistance is incorrect, replace the 3 solenoid valves (LS, LT and lock-up). If the resistance is correct, repair or replace the wiring in question.

Check the continuity of the connections between:

Computer connector track 5 → **Track 2 of the hydraulic unit 8-track connector.**
Computer connector track 20 → **Track 6 of the hydraulic unit 8-track connector.**

Also check the insulation between these connections.

Check the earth insulation of the connections between:

Computer connector track 5 → **Track 2 of the hydraulic unit 8-track connector.**
Computer connector track 20 → **Track 6 of the hydraulic unit 8-track connector.**

Repair or replace the automatic gearbox wiring concerned if a fault occurs.

Check the connections on the automatic transmission computer and the **8-track** connector.
Carry out the required operations.

If the fault is still present after these checks, replace the 3 solenoid valves (lock-up, LS, LT).

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Finish the operation by checking with the diagnostic tool. Use the actuator sequential command in the **SCENARIO** menu.

DF092 **STORED**	LT PRESSURE REGULATION SOLENOID VALVE CIRCUIT CC.1 : Short circuit to + 12 V CO.0 : Open circuit or short circuit to earth

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: – the computer fault memory has been cleared, – the ignition has been switched off and on again, – the engine has been started and left running for **1 minute** in Neutral.

CC.1	***NOTES***	None

Switch off the ignition, disconnect the **6-track** connector under the automatic gearbox and **measure the resistance** of the winding of the LT pressure regulation solenoid valve between **track 4** and **track 1** on the solenoid valve side. If the resistance measured is not approximately **5.5 ± 0.5 Ω at 20°C**, remove the gearbox sump and take the same measurement directly from the solenoid valve. If the resistance is incorrect, replace the 3 solenoid valves (LS, LT and converter lock-up). If the resistance is correct, repair or replace the wiring in question.

Check the continuity of the connections between:

Computer connector track 4 ⟶ **Track 1 of the hydraulic unit 6-track connector.**
Computer connector track 19 ⟶ **Track 4 of the hydraulic unit 6-track connector.**

Also check the insulation between these connections.

Check the insulation against **12 V** of the connections between:

Computer connector track 4 ⟶ **Track 1 of the hydraulic unit 6-track connector.**
Computer connector track 19 ⟶ **Track 4 of the hydraulic unit 6-track connector.**

Repair or replace the automatic gearbox wiring concerned if a fault occurs.

Check the connections on the automatic transmission computer and the **6-track** connector.
Carry out the required operations.

If the fault is still present after these checks, replace the 3 solenoid valves (lock-up, LS, LT).

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Finish the operation by checking with the diagnostic tool. Use the actuator sequential command in the **SCENARIO** menu.

GETtheMANUALS.org

DF092 **CONTINUED**	

CO.0	***NOTES***	**Special notes:** None.

Switch off the ignition, disconnect the **6-track** connector under the automatic gearbox and **measure the resistance** of the LT pressure regulation solenoid valve winding between **track 4** and **track 1** on the solenoid valve side. If the resistance measured is not approximately **5.3 ± 0.3 Ω at 20°C**, remove the gearbox sump and take the same measurement on the solenoid valve itself. If the resistance is incorrect, replace the 3 solenoid valves (LS, LT and lock-up). If the resistance is correct, repair or replace the wiring in question.

Check the continuity of the connections between:

Computer connector track 4 → **Track 1 of the hydraulic unit 6-track connector.**
Computer connector track 19 → **Track 4 of the hydraulic unit 6-track connector.**

Also check the insulation between these connections.

Check the insulation against earth of the connections between:

Computer connector track 4 → **Track 1 of the hydraulic unit 6-track connector.**
Computer connector track 19 → **Track 4 of the hydraulic unit 6-track connector.**

Repair or replace the automatic gearbox wiring concerned if a fault occurs.

Check the connections on the automatic transmission computer and the **6-track** connector.
Carry out the required operations.

If the fault is still present after these checks, replace the 3 solenoid valves (lock-up, LS, LT).

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Finish the operation by checking with the diagnostic tool. Use the actuator sequential command in the **SCENARIO** menu.

GETtheMANUALS.org

DF093 STORED	ONE-TOUCH MANUAL CONTROL CIRCUIT 1.DEF : Consistency

NOTES	**Conditions for applying the fault finding strategy to the stored fault: ET069** and **ET070** closed with the lever in P, R, N, D position. The fault is declared present after the engine has been started and left running for **45 seconds**.

Check with the lever in position P or R or N that statuses **ET069** and **ET070** are not shown as closed. What is the representative status of a fault?

ET069	Check that the one-touch switch **6-track** connector is correctly connected and in good condition. – Check the **insulation** between **tracks A3 and A2** on the one-touch switch side. If there is continuity, replace the one-touch manual control switch. – **Check the continuity and insulation** against earth between **track 41** on the computer side and **track A3** of the switch connector. Repair or replace the wiring.
ET070	Check that the one-touch switch **6-track** connector is correctly connected and in good condition. – Check the **insulation** between **tracks B3 and A2** on the one-touch switch side. If there is continuity, replace the one-touch manual control switch. – **Check the continuity and insulation** against earth **between track 26** on the computer side and **track B3** of the switch connector. Repair or replace the wiring.

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Complete the operation by testing with the diagnostic tool.

GETtheMANUALS.org

DF094 **STORED**	MULTIFUNCTION SWITCH CIRCUIT 1.DEF : Consistency

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: – the computer fault memory has been cleared, – the ignition has been switched off and on again, – the engine has been started and running for **30 seconds**.
	Special notes: ignore the value indicating the lever position displayed on the instrument panel.

Check the fitting and setting of the multifunction switch on the automatic gearbox (consult the checking procedure).

Switch off the ignition and disconnect the **10-track** connector under the automatic gearbox.
Check for the presence of **earth** on **track 10** of the multifunction switch connector.
For each locked position of the selector lever, check for the necessary continuity and insulation (see the table below).

Locked lever position	Check continuity between	Check insulation between
P	Tracks 6 and 7 / Track 10 Track 4 / Track 1	Tracks 5 and 8 / Track 10 Track 2 / Track 3
D	Tracks 5 and 8 / Track 10	Tracks 6 and 7 / Track 10 Track 4 / Track 1 Track 2 / Track 3
R	Tracks 6 and 5 / Track 10 Track 2 / Track 3	Tracks 3 and 7 / Track 10 Track 1 / Track 4
N	Tracks 5 and 7 / Track 10 Track 4 / Track 1	Tracks 8 and 6 / Track 10 Track 2 / Track 3

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Complete the operation by testing with the diagnostic tool.

GETtheMANUALS.org

DF094 **CONTINUED**	

If one of the insulation or continuity checks is not correct, replace the Multifunction switch (refer to the replacement procedure).

If the multifunction switch is not faulty, check the continuity and insulation against earth on the following connections:

Computer connector track 35 → **Track 6 of the 10-track connector on the wiring harness side.**

Computer connector track 7 → **Track 5 of the 10-track connector on the wiring harness side.**

Computer connector track 21 → **Track 8 of the 10-track connector on the wiring harness side.**

Computer connector track 36 → **Track 7 of the 10-track connector on the wiring harness side.**

Also check the insulation between all these connections.

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Complete the operation by testing with the diagnostic tool.

GETtheMANUALS.org

DF095 **STORED**	SELECTOR LEVER LOCK ELECTROMAGNET CIRCUIT CC.0 : Short circuit to earth CO.1 : Open circuit or short circuit to + 12 V

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: – the computer fault memory has been cleared, – the ignition has been switched off and on again, – the engine has been started and left running for **30 seconds** in Park.

CO.1	***NOTES***	None

Switch off the ignition and disconnect the **6-track** connector in the central console. Check the wiring and condition of the connections. Measure the **resistance** of the lever locking electromagnet winding between **tracks B1 and B2** of the electromagnet connector. If the resistance measured is not approximately **37 ± 2 Ω at 20°C**, replace the electromagnet.

Check the **continuity and insulation** against **+ 12 volts** between **track 32** of the computer connector and **track B2** of the control lever connector.

Check the presence of **+ 12 V on track B1** of the control lever connector.

If the fault is still present, replace the electromagnet assembly and any connection wires.

CC.0	***NOTES***	None

Switch off the ignition and disconnect the 6-track connector in the central console. Check the wiring and condition of the connections. Measure the **resistance** of the lever locking electromagnet winding between **tracks B1 and B2** of the electromagnet connector. If the resistance measured is not approximately **37 ± 2 Ω at 20°C**, replace the electromagnet.

Check the **continuity and insulation** against **earth** on the connection between **track 32** of the computer connector and **track B2** of the electromagnet connector.

Check that **+ after ignition feed** is present on **track B1** of the electromagnet connector.

If the fault is still present, replace the electromagnet assembly and any connection wires.

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Complete the operation by testing with the diagnostic tool.

GETtheMANUALS.org

DF096 STORED	COMPUTER SUPPLY VOLTAGE 1.DEF : Supply voltage too low

NOTES	Check the battery charge.

Check the automatic gearbox fuses.

Check the **continuity** between **track 29** of the computer connector and the **fuse board** connector and **track 30** of the computer connector and the **fuse board** connector.

Check the tightness of the earthing straps to the vehicle and the tightness of the supplies.

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Complete the operation by testing with the diagnostic tool.

GETtheMANUALS.org

DF097 STORED	CONVERTER LOCK-UP 1.DEF : Clutch slippage 2.DEF : Clutch judder

NOTES	**Processing priority in the event of a number of faults:** Deal with fault **DF090** Converter lock-up solenoid valve circuit first if it is present.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present after a road test.

Switch off the ignition, disconnect the **6-track** connector under the automatic gearbox and **measure the resistance** of the lock-up solenoid valve winding between **earth** and **track 2** on the solenoid valve side.
If the resistance measured is not approximately **5.3 ± 0.3 Ω at 20°C**, remove the gearbox sump and take the same measurement on the solenoid valve itself. If the resistance is incorrect, replace the 3 solenoid valves (LS, LT and lock-up). If the resistance is correct, repair or replace the wiring in question.

If the fault is still present after these checks, replace the hydraulic distributor.

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Complete the operation by testing with the diagnostic tool.

ET018	BRAKE PEDAL

NOTES	**Special notes:** Only carry out the checks if the depressed and released statuses are not consistent with the position of the pedal.

STATUS 2 Released: Brake pedal depressed.

If brake lights operate:

Check and ensure the continuity of the connection between **track B3** of the brake light switch connector and **track 25** of the computer connector.

If the brake lights do not operate:

Check the condition and fitting of the brake light switch and brake lights fuse.
Remove the brake light switch and check that it is operating correctly:

	Continuity between tracks	Insulation between tracks
Switch depressed (Brake pedal released)	**A1** and **B3**	**A3** and **B1**
Switch released (Brake pedal depressed)	**A3** and **B1**	**A1** and **B3**

Replace the switch if necessary.

Check the presence of **+ after ignition feed** on **tracks A1 and B1** of the brake light switch connector.

AFTER REPAIR	Carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

ET018 **CONTINUED**	

STATUS 1 Depressed: Brake pedal released.

Check the condition and fitting of the brake light switch and brake lights fuse.

Remove the brake light switch and check that it is operating correctly:

	Continuity between tracks	Insulation between tracks
Switch depressed (Brake pedal released)	**A1** and **B3**	**A3** and **B1**
Switch released (Brake pedal depressed)	**A3** and **B1**	**A1** and **B3**

Replace the switch if necessary.

Check the presence of **+ after ignition feed** on **tracks A1 and B1** of the brake light switch connector.

Check and ensure insulation against **12 V** on the connection between **track B3** of the brake light switch connector and **track 25** of the computer connector.

AFTER REPAIR	Carry out a road test followed by a check with the diagnostic tool.

GETtheMANUALS.org

ET005	KICKDOWN

NOTES	**Special notes:** None.

Check the change in the pedal signal using **PR022**.

Correct signal:

No **L**oad: Value between **0 and 16**

Full **L**oad: Value between **224 and 253**

If the value is incorrect, refer to the injection fault finding strategy for information on pedal position sensor faults.

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Complete the operation by testing with the diagnostic tool.

GETtheMANUALS.org

PR022	ACCELERATOR PEDAL POSITION

NOTES	**Special notes:** None.

Check the change in the pedal signal using **PR022**.

Correct signal:

No **L**oad: Value between **0 and 16**

Full **L**oad: Value between **224 and 253**

If the value is incorrect, refer to the injection fault finding strategy for information on pedal position sensor faults.

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Complete the operation by testing with the diagnostic tool.

GETtheMANUALS.org

REPLACING THE COMPUTER

After replacing the computer, it is important to test drive the vehicle performing all gear changes, both up and down, several times in order to store the new auto-adaptive parameter values.

SPECIAL FEATURES OF COMPONENT REPLACEMENT:

The SU1 2001 automatic gearbox computer uses auto-adaptive parameters for gear-change management and the converter lock-up function.

These auto-adaptive parameters enable the pressure and refill intervals for the brakes and clutches to be optimised as a function of the specific mechanical/hydraulic characteristics of each automatic gearbox. Therefore, replacing any components that influence these parameters requires the stored values to be updated. Using the diagnostic tool, run command RZ005 to reset the auto-adaptives. After using this command, it is essential to test drive the vehicle performing all gear changes, both up and down, several times in order to store the new values.

Reset the auto-adaptive parameters after replacing the following components:
– Hydraulic distributor.
– Torque converter.
– Solenoid valves (EVS1, EVS2, EVS3, EVS4, EVS5).
– 3 solenoid valves (converter lock-up, LS pressure regulation, LT pressure regulation).
– Complete automatic gearbox.

GETtheMANUALS.org

NOTES	Only consult the customer complaint section after a complete check with the diagnostic tool and a conformity check.

No dialogue with the tool

- **No dialogue with the computer** — **ALP 1**

Instrument panel faults

- **Perform the multiplex network test and then refer to the instrument panel fault finding section.**

Engine starting faults

- **The starter motor does not operate when the selector lever is in position P and/or N** — **ALP 2**
- **The starter turns, the engine does not start, the instrument panel lights dim, lever in N.** — **ALP 3**
- **The starter motor operates when the selector lever is at positions other than P or N** — **ALP 4**
- **Vehicle advances or reverses with the lever in position N (more than it should when creeping under 60°C)**. — **ALP 5**

Gear changing faults

- **Erratic gear changes** — **ALP 6**

- **Oil present under vehicle** — **ALP 10**

GETtheMANUALS.org

ALP 1	No dialogue with the computer

NOTES	Only consult the customer complaint section after a complete check with the diagnostic tool and a conformity check.

Try to establish dialogue with a computer on another vehicle to check that the diagnostic tool is not faulty. If the tool is not causing the fault and dialogue cannot be established with any other computer on the same car, it may be that a faulty computer is disrupting diagnostic line **K**.

Proceed by successive disconnections to locate this computer.

Check the battery voltage and carry out any operations necessary to obtain a correct voltage **(9.5. < battery voltage < 17.5 V).**

Check that the automatic gearbox supply fuse is present on the passenger compartment fuse board and in good condition.

Check that the computer connector is properly connected and check the condition of its connections.

Check the automatic gearbox **earths**.

Check that the computer is correctly supplied:
– **Earth on tracks 1 and 15** of the 42-track computer connector.
– **+ after ignition on track 29** of the 42-track computer connector.

Check that the power supply to the diagnostic socket is correct:
– + before ignition feed on track 16.
– Earth on track 5

Check / ensure continuity and the insulation of the connections between:

Computer connector track 8 ⟶ **Track 7 diagnostic socket**

If dialogue is still not established after these various checks, replace the automatic gearbox computer.

AFTER REPAIR	Check using the diagnostic tool.

GETtheMANUALS.org

ALP 2	The starter motor does not operate with the selector lever in position P and/or N

NOTES	Only consult the customer complaint section after a complete check with the diagnostic tool and a conformity check.

Switch on the diagnostic tool.
Check at **ET012** the consistency between the diagnostic tool display and the selector lever locked positions (with the ignition on and the engine stopped).

Is it consistent?

no → Does the engine start?

yes ↓

Switch off the ignition and disconnect the multifunction switch 10-track connector under the automatic gearbox.
Operate the starter and check to see if there is a **12 volt** supply on track 1 of the connector on the vehicle wiring harness side.

Is there 12 V on track 1?

no → Check the continuity of the connection between **track 1** of the connector and the starter switch.
Ensure that the ignition switch is working properly.

yes ↓

Switch off the ignition and check the continuity between tracks 1 and 4 of the multifunction switch on the gearbox side with the lever in positions P and N.
If continuity is not provided, replace the multifunction switch.
If continuity is correct, check the continuity between track 4 of the connector on the vehicle wiring side and the starter motor.

Keep the starter cranking and move the selector lever with the brakes applied.

Does the engine start?

yes → Adjust the automatic gearbox control following the procedure described in the Workshop Repair Manual.

no ↓

Check the multifunction switch mounting, the tightness of the two locking bolts on the gearbox control cable then adjust the control.
If the fault is still present, replace the multifunction switch.

AFTER REPAIR	Carry out a road test then check with the diagnostic tool.

GETtheMANUALS.org

ALP 3	**The starter motor turns the engine, but the engine does not start, the instrument panel lights dim, selector lever in position N.**

NOTES	Only consult the customer complaint section after a complete check with the diagnostic tool and a conformity check.

With the handbrake released, does the vehicle start sluggishly when the starter runs?

no → Check the battery charge and the charge circuit operation.

yes ↓

Check the condition of the oil (colour, odour, etc.). Replace the automatic gearbox if the condition of the oil suggests there is an internal fault.

ALP 4	**The starter motor runs when the selector lever is in a position other than P or N**

NOTES	Only consult the customer complaint section after a complete check with the diagnostic tool and a conformity check.

Check the consistency between the display and the selector lever locked positions at **ET012** or using the instrument panel display (with the ignition on and the engine stopped).
Adjust the automatic gearbox if there is inconsistency.
Replace the multifunction switch if there is consistency (P/N switch faulty).

Adjusting and replacement procedures are described in the Workshop Repair Manual.

AFTER REPAIR	Carry out a road test then check with the diagnostic tool.

GETtheMANUALS.org

ALP 5	**Vehicle advances or reverses with the selector lever in position N (more than it should when creeping with the oil below 60°C)**.

NOTES	Only consult the customer complaint section after a complete check with the diagnostic tool and a conformity check.

Check the consistency between the display and the selector lever locked positions at **ET012** on the diagnostic tool or using the instrument panel display (with the ignition on and the engine stopped).

Is it consistent?

no → Adjust the control following the recommendations given in the Workshop Repair Manual. Replace the multifunction switch if necessary.

yes ↓

Check the condition of the oil (colour, odour, etc.).

Does the condition of the oil suggest there is an internal fault with the automatic gearbox?

yes → Replace the automatic gearbox.

no ↓

The cause may have been misdiagnosed.

AFTER REPAIR	Carry out a road test then check with the diagnostic tool.

GETtheMANUALS.org

ALP 6	Erratic gear changes

NOTES	Only consult the customer complaint section after a complete check with the diagnostic tool and a conformity check.

Switch on the diagnostic tool.
Use function **ET013** during a road test, with the selector lever in position D.

Is the customer complaint reproduced?

- no → B
- yes ↓

Is dialogue lost when the fault appears?

- yes → Refer to the fault finding strategy relating to lack of dialogue with the tool (ALP 1).
- no ↓

Does status ET018 change when the fault appears, without the brake pedal being depressed?

- yes → Adjust the brake switch and check the operation of the brake pedal return spring.
- no ↓

Does the display for the selector lever position change when the fault appears? (position D disappears)

- no → B
- yes ↓

Check the adjustment of the external control.
If the fault is still present, replace the multifunction switch.

AFTER REPAIR	Carry out a road test then check with the diagnostic tool.

GETtheMANUALS.org

ALP 6 CONTINUED	

NOTES	Only consult the customer complaint section after a complete check with the diagnostic tool and a conformity check.

B

Check how the automatic transmission wiring is routed (high voltage interference).
Modify if necessary.

Check the load signal with the engine stopped.
Accelerate slowly and check the load change **PR022**.

Is the load change regular?

no → Refer to the injection fault finding procedure and check the load potentiometer operation.

yes

Perform an injection operation check
Apply the checks outlined in the relevant fault finding procedure if there is a fault.

Check the engine speed signal in **PR006** during a road test at a steady speed.

Is the engine speed value constant?

no → Refer to the injection fault finding procedure and check the TDC sensor operation.

yes

The cause may have been misdiagnosed.

AFTER REPAIR	Carry out a road test then check with the diagnostic tool.

GETtheMANUALS.org

ALP 7	No changing down in full load position

NOTES	Only consult the customer complaint section after a complete check with the diagnostic tool and a conformity check.

Check the conformity and settings of the accelerator control (consult the Workshop Repair Manual).

Is the accelerator control correct?

- no → Adjust the accelerator control again as shown in the Workshop Repair Manual.
- yes ↓

Check the load signal with the engine stopped: Accelerate slowly and check the load change in **PR022**.

Is the load change regular?

- no → Refer to the injection fault finding procedure and check the load potentiometer.
- yes ↓

Check the operation of **ET005**:
Depress the accelerator pedal quickly.

Is ET005 active?

- no → Refer to **PR022**
- yes ↓

The cause may have been misdiagnosed.

AFTER REPAIR	Carry out a road test then check with the diagnostic tool.

GETtheMANUALS.org

ALP 8	Automatic gearbox operating faults

NOTES	Only consult the customer complaint section after a complete check with the diagnostic tool and a conformity check.

Check the consistency between the display and the selector lever locked positions in **ET012** on the diagnostic tool or on the instrument panel display (ignition on and engine stopped).

Is it consistent?

- no → Adjust the control following the recommendations given in the Workshop Repair Manual.
- yes ↓

Check the oil level and the condition of the oil (colour, odour, etc.).

Does the condition of the oil suggest there is an internal fault in the automatic gearbox?

- yes → Replace the automatic gearbox.
- no ↓

Top up if necessary. Start the engine.
With the brakes applied, shift the selector lever to D and monitor the vehicle speed signal in **PR105** while accelerating.

Does the vehicle speed signal change?

- yes → Replace the automatic gearbox.
- no ↓

Fit a pressure gauge and check the line pressure with the engine at idle speed and the selector lever in position N.

Is the pressure zero?

- yes → Replace the automatic gearbox.
- no ↓

With the engine at idle speed and the selector lever in position N, read the line pressure (correct values between 3.5 and 4.2).

↓ (A)

AFTER REPAIR	Carry out a road test then check with the diagnostic tool.

GETtheMANUALS.org

ALP 8 CONTINUED 1	

NOTES	Only consult the customer complaint section after a complete check with the diagnostic tool and a conformity check.

(A)

Run the engine to obtain an oil temperature greater than **60°C** in **PR004**.
Put the selector lever in position D with the engine at idle speed and the brakes applied.

Is the line pressure more than 0.2 bar below the pressure reading with the lever in N?

yes → Replace the automatic gearbox.

no

Refer to the procedure and the safety instructions in the Technical Note for carrying out a stall test on the converter. Carry out this check with the lever in position D and then R, observing the line pressure and the engine speed.
Theoretical values of line pressure at the setting point:
– 12 bar in D (10.6 to 13.6),
– 18 bar in R (16.3 to 20.5).

Are the pressure values correct?

no → Replace the hydraulic distributor and the solenoid valves.
Replace the automatic gearbox if the pressure continues to be incorrect (pressure too low).

yes

Theoretical values of engine speed at the setting point:
– **G9T and P9X engines: 2403 ± 150 rpm**
– **F4Rt engines: 2661 ± 150 rpm**
– **V4Y engines: 2755 ± 150 rpm**

Is the stall speed value correct?

no → Replace the torque converter (replace the automatic gearbox if the stall speed **is more than 300 rpm** above the correct value).
Replace the automatic gearbox if the stall speed continues to be incorrect.
Note: a stall speed which is too low may be linked to a lack of engine power.

yes

(B)

AFTER REPAIR	Carry out a road test then check with the diagnostic tool.

GETtheMANUALS.org

ALP 8 CONTINUED 2	

NOTES	Only consult the customer complaint section after a complete check with the diagnostic tool and a conformity check.

B

Carry out a road test observing the engine speed on the instrument panel and the indications given by the diagnostic tool in **ET012** (refer to the help section).

Does the engine speed change each time there is a gear change?

no → Replace the hydraulic distributor and the solenoid valves.

yes

The checks carried out have not provided any evidence of a fault and the automatic gearbox appears to be working correctly. If the vehicle does show the customer complaint selected, continue with the entire fault finding procedure.

AFTER REPAIR	Carry out a road test then check with the diagnostic tool.

GETtheMANUALS.org

ALP 9	Reversing lights do not work (reverse gear works and the bulbs are sound)

NOTES	Only consult the customer complaint section after a complete check with the diagnostic tool and a conformity check.

Switch off the ignition and disconnect the 10-track connector under the automatic gearbox.
Switch the ignition on again and check to see if + after ignition feed is present on **track 3** of the connector on the vehicle wiring harness side.

Is the + after ignition feed present on track 3?

no → Check the continuity of the connection between **track 3** of the 10-track connector and the passenger compartment connection unit.

yes ↓

Switch off the ignition and check the continuity between **tracks 2** and **3** of the connector on the gearbox side with the lever in position R.
If continuity is not provided, replace the multifunction switch. If continuity is correct, check the continuity between **track 2** of the connector on the vehicle wiring harness side and the reversing lights.
Also check the rear lights earth.

AFTER REPAIR	Carry out a road test then check with the diagnostic tool.

GETtheMANUALS.org

ALP 10	Oil present under vehicle

NOTES	Only consult the customer complaint section after a complete check with the diagnostic tool and a conformity check.

Wash the automatic gearbox, top up the oil level using the procedure described in the Workshop Repair Manual, dust with talcum powder, carry out a fault finding procedure and locate the source of the leak.
Deal with the source of the leak and replace the faulty components.
Check the oil level.

AFTER REPAIR	Carry out a road test then check with the diagnostic tool.

AUTOMATIC TRANSMISSION
Fault finding - Introduction

GETtheMANUALS.org

1. SCOPE OF THIS DOCUMENT

This document presents the fault finding procedure applicable to all computers with the following specifications:

Vehicle(s): **Vel Satis Ph2, Espace IV Ph2** *Engines:* **P9X** *Function concerned:* **Automatic transmission**	*Name of computer:* **BVA** *Program No.:***0000** *Vdiag No.:* **04**

2. PREREQUISITES FOR FAULT FINDING

Documentation type

Fault finding procedures (this manual):
- Assisted fault finding (integrated into the diagnostic tool), Dialogys.

Wiring Diagrams:
- Visu-Schéma (CD-ROM).

Type of diagnostic tools
- **CLIP + multiplex line sensor**

Special tooling required

Special tooling required
Multimeter

3. RECAP

To run fault finding on the vehicle computers, switch on the ignition.

- With the vehicle card in the card reader,
- press and hold the Start button (longer than 5 seconds) with start-up conditions not present,
- connect the diagnostic tool and perform the required operations.

To cut off the + after ignition feed, proceed as follows:

- Press the Start button twice briefly (less than 3 seconds),
- ensure that the + after ignition feed has been cut off by checking that the computer indicator lights on the instrument panel have gone out.

GETtheMANUALS.org

Faults

Faults are declared as either present or stored (depending on whether they appeared in a certain context and have disappeared since, or whether they remain present but have not been diagnosed within the current context).

The **present** or **stored** status of faults should be taken into consideration when the diagnostic tool is switched on after the + after ignition feed (without any system components being active).

For a **present fault**, apply the procedure described in the **Interpretation of faults** section.

For a **stored fault**, note the faults displayed and apply the instructions in the **Notes** section.

If the fault is **confirmed** when the instructions in the Notes section are applied, the fault is present. Deal with the fault

If the fault is **not confirmed**, check:
- the electrical lines which correspond to the fault,
- the connectors for these lines (for oxidation, bent pins, etc.),
- the resistance of the component detected as faulty,
- the condition of the wires (melted or split insulation, wear).

Conformity check

The aim of the conformity check is to check data that does not produce a fault on the diagnostic tool because the data is inconsistent. Therefore, this stage is used to:
- carry out fault finding on faults that do not have a fault display, and which may correspond to a customer complaint.
- check that the system is operating correctly and that there is no risk of a fault recurring after repairs.

This section gives the fault finding procedures for statuses and parameters and the conditions for checking them.

If a status is not behaving normally or a parameter is outside the permitted tolerance values, consult the corresponding fault finding page.

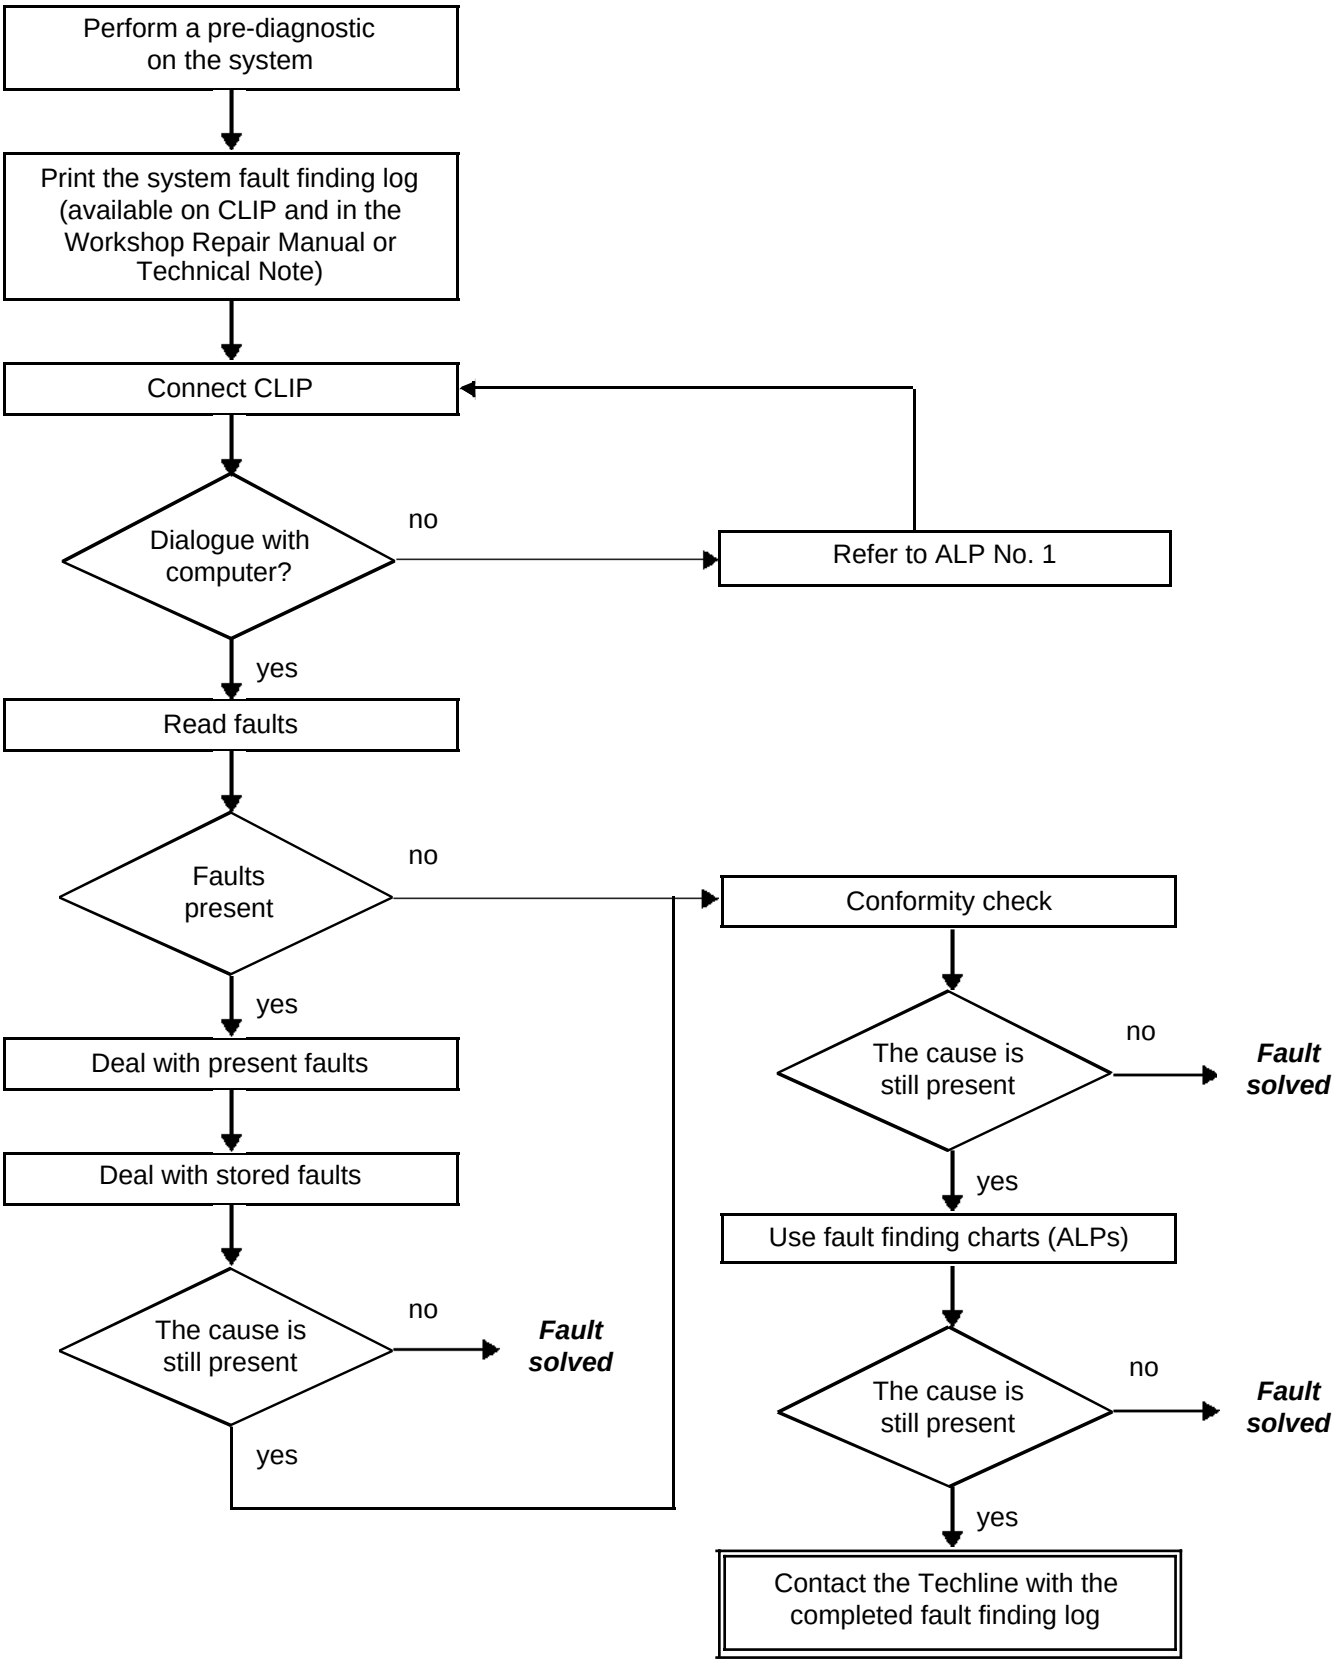
Customer complaints - Fault finding chart

If the test with the diagnostic tool is OK but the customer complaint is still present, the fault should be processed by **customer complaints**.

A synopsis of the general procedure to follow is provided on the following page in the form of a flow chart

GETtheMANUALS.org

4. FAULT FINDING PROCEDURE



GETtheMANUALS.org

4. FAULT FINDING PROCEDURE (continued)

Wiring check

Fault finding problems
Disconnecting the connectors and/or manipulating the wiring harness may temporarily remove the cause of a fault.
Electrical measurements of voltage, resistance and insulation are generally correct, especially if the fault is not present when the analysis is made (stored fault).

Visual inspection
Look for damage under the bonnet and in the passenger compartment.
Carefully check the fuses, insulators and wiring harness routing.
Look for signs of oxidation.

Tactile inspection
While manipulating the wiring harness, use the diagnostic tool to note any change in fault status from stored to present.
Make sure that the connectors are properly locked.
Apply light pressure to the connectors.
Gently move the wiring harness.
If there is a change in status, try to locate the source of the fault.

Inspection of each component
Disconnect the connectors and check the appearance of the clips and tabs, as well as the crimping (no crimping on the insulating section).
Make sure that the clips and tabs are properly locked in the sockets.
Check that no clips or tabs have been dislodged during connection.
Check the clip contact pressure using an appropriate model of tab.

Resistance check
Check the continuity of entire lines, then section by section.
Look for a short circuit to earth, to **+ 12 V** or to another wire.

If a fault is detected, repair or replace the wiring harness.

GETtheMANUALS.org

5. FAULT FINDING LOG

IMPORTANT!

IMPORTANT
Any fault on a complex system requires thorough fault finding with the appropriate tools. The FAULT FINDING LOG, which should be completed during the procedure, enables you to keep track of the procedure which is carried out. It is an essential document when consulting the manufacturer.

IT IS THEREFORE MANDATORY TO FILL OUT A FAULT FINDING LOG EACH TIME FAULT FINDING IS CARRIED OUT.

You will always be asked for this log:

- when requesting technical assistance from Techline,
- for approval requests when replacing parts for which approval is mandatory,
- to be attached to monitored parts for which reimbursement is requested. The log is needed for warranty reimbursement, and enables better analysis of the parts removed.

6. SAFETY ADVICE

Safety rules must be observed during any work on a component to prevent any damage or injury:

- make sure that the battery is properly charged to avoid damaging the computers with a low load,
- use the appropriate tools.

RENAULT

FD 12
Fault finding log

GETtheMANUALS.org

System description

The SU4 automatic transmission comprises:
– an electronic computer,
– a number of brakes and clutches used for gear changes,
– a hydraulic unit with solenoid valves, used for managing the hydraulics to actuate these components.

The solenoid valves are fitted in the factory and cannot be removed from the hydraulic distributor to ensure optimal gearbox operation, therefore they cannot be replaced separately. A computer fitted on the gearbox is used for managing the entire system, defining the operating mode by means of the controls and buttons available to the driver and ensuring smooth operation by means of sensors and signals from other vehicle systems. An inter-system connection allows the computer to establish dialogue with the other computers and the diagnostic tool.

On the instrument panel:
– a fault warning light.
– a message on the instrument panel in case of irregularity.
– an information display: gear lever position / gear engaged / brake pedal depressed indicator light / lever positioning in P or N request indicator light.

On the gear lever:
– Position: P / R / N / D / M+/-,
– Display side mounted indicator on bridge piece, specific to Renault Vel Satis,
– Shift-lock: lever lock.

Gearbox operating mode selection

According to the vehicle speed and the driver's command expressed by the accelerator pedal position, the automatic transmission determines the best moment for the gear change. It corrects any errors by the driver and does not engage a gear that might cause engine overspeed.

Gear change

Taking into account the various input factors, the computer will decide whether to actuate the various solenoid valves to ensure smooth system operation (Gearbox clutches, brakes and hydraulics).
The computer is also involved in:
– the gear change quality,
– monitoring and securing the driveshaft.

Declutching when stationary

This function temporarily disables creeping, when the vehicle is stationary with a gear engaged and the brake pedal has been depressed.

The purpose of this function is to:
- reduce fuel consumption,
- reduce vehicle vibrations,
- reduce vehicle drag to save the hydraulic slave cylinders,
- increase the oil service life.

This function is executed by the gearbox computer, which will temporarily and rapidly dump the pressure of clutch 1. To do so clutch 1 solenoid valve is actuated when all the operating conditions are satisfied (Vehicle stationary, gear engaged and brake pedal depressed).

GETtheMANUALS.org

Pressure regulation

The purpose of this function is to regulate oil pressure in the gearbox.

Release/Lockup

The converter is a hydraulic clutch providing a flexible and automatic connection between the engine and the automatic transmission mechanism: its operation can be broken down into two phases:
- When starting, it multiplies engine torque: CONVERTER FUNCTION.
- At high speed, it transmits the engine torque: COUPLER FUNCTION.

– The converter body is comprised of two half-shells welded together. It is linked to the engine crankshaft by the drive plate. When in operation, it is filled with oil.
– The impeller is integral to the converter body, and thereby the engine.
– The turbine is connected to the automatic transmission mechanism via the turbine shaft.
– The stator is placed between the impeller and the turbine.

The lockup function is to stabilise the turbine and converter body, by transforming a hydraulic connection into a mechanical connection. The role of lockup is to cancel out losses due to slipping*, which improves the performance of vehicles fitted with automatic transmissions.

Torque control

The purpose of this function is to manage the torque setpoints during certain gear shifts by informing the injection computer. This function means smoother gear shifts and better mechanical protection.

Shift-lock

The purpose of this function is to lock the lever in Park position.

Instrument panel display

The purpose of this function is to manage the transmission of multiplex line signals required for the instrument panel display.

*slipping: Slipping indicates the loss of some of the drive power and leads to overconsumption of fuel as well as a reduction in engine braking.

GETtheMANUALS.org

System operating chart in line with gear lever position

Lever positions / Gears engaged		SOLENOID VALVES						HYDRAULIC SLAVE CYLINDERS					FREE WHEEL
		EVM* clutch 1	EVM* clutch 2	EVM* clutch 3	EVM* brake 1	EVS* 1	EVS* 2	CLUTCHES			BRAKES		F1

GETtheMANUALS.org

Replacing the gearbox computer:

Remove the gearbox computer (see **MR 405 Mechanics, 23A, automatic transmission, selection cable adjustment**).

Refit the **gearbox computer** and the gear selector on the computer (see **MR 405 Mechanics, 23A, automatic transmission, selection cable adjustment**).

Line up the mark (arrow) in the axis of the **gear lever position sensor** with the fixed mark (arrow) on the **gearbox computer**.

Carry out the gearbox **neutral position programming**:

Put the lever into **N** position (Neutral). Using the diagnostic tool, restore dialogue with the **gearbox computer**. Run command **VP018 Program neutral position**.
Check that status **ET012 Gear lever position** corresponds with the lever position; if not, reprogram the neutral position.

Run command **VP001 Write VIN**.
Run command **VP009 Write last service operation date**.

GETtheMANUALS.org

SETTINGS

VP001: Write VIN.
This command permits manual entry of the vehicle's VIN into the computer.
Use this command each time the computer is replaced or (re)programmed.

VP009: Write last service operation date
Run this command after replacing or removing and refitting the gearbox computer.
This command is used to enter the date of the last service operation.

VP018: Program neutral position
Run this command after replacing or removing and refitting the gearbox computer.

Programming neutral position:

Put the lever into **N** position (Neutral). Run command **VP018 Program neutral position**.
Check that statuses **ET012 Gear lever position** and **ET013 Gear engaged** correspond with the lever position; if not, reprogram the neutral position.

Safe mode

This mode is adopted by the automatic transmission in the event of an electrical or mechanical/hydraulic fault on the system.

There are two main safe modes when driving:

– **Mode 1** (Electrical fault):
Limited gearbox torque.
When driving in 1st, 2nd, 3rd, 4th, 5th or 6th gear, the gearbox will shift to 3rd, except in the event of a malfunction on clutches 1 or 2, when the gearbox will shift to 5th.

– **Mode 2** (Operating fault):
Torque limited:
– In D: 150 Nm
– In R: 170 Nm

The converter lockup function is disabled.
When driving in 1st, 2nd, 3rd, 4th, 5th or 6th gear, the gearbox will keep the same gear engaged without converter lockup control. If neutral is selected, the gearbox will shift to 5th.

EV*: Solenoid valve

GETtheMANUALS.org

Hydraulic mode:

This mode is applied during an electrical/electronic system fault and when the computer is no longer powered. The operational gears are:
– 3rd,
– N for neutral position
– reverse.

GETtheMANUALS.org

DF002 PRESENT OR STORED	COMPUTER 1.DEF: Fault in EEPROM 2.DEF: RAM memory integrity 3.DEF: Internal electronic fault

NOTES	**Conditions for applying fault finding procedures to stored faults:** The fault is declared present after the vehicle ignition has been switched on.

If the fault appears after reprogramming, switch off the ignition, wait for 1 min, switch on the ignition again and run fault finding on the automatic transmission computer. If the fault appears as stored, clear the fault. End of fault finding.
If the fault recurs as present, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF059 PRESENT OR STORED	INJECTION → AUTOMATIC TRANSMISSION CONNECTION (MULTIPLEX LINE SIGNAL) 1.DEF: No computer multiplex signal

NOTES	**Order of priority in the event of more than one fault:** If there is a combination of the following faults: **– DF062 Multiplex line fault,** **– DF172 Invalid injection multiplex signals,** deal with fault **DF062 Multiplex line fault** first.
	Conditions for applying fault finding procedures to stored faults: The fault is declared present after the vehicle ignition has been switched on.
	Use the Visu-Schéma CD for the vehicle.

Carry out a multiplex network test (see **88B, Multiplexing**).

Look for any damage to the harness, check the condition and connection of external connector **A** (16 tracks) of the **gearbox computer** and of the **injection computer** connector.
Manipulate the wiring harness in order to observe any change in the fault status (Present → stored).

Check **the insulation and continuity** of the following connections:

gearbox computer, external connector **A** (16 tracks), **track 6** ⟶ **Track 47 injection computer** connector

gearbox computer, external connector **A** (16 tracks), **track 8** ⟶ **Track 9 injection computer** connector

If the harness or one of the connectors is not in good condition, refer to the wiring repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**).

If the fault is still present, carry out fault finding on the injection system (see **13B, diesel injection**).

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF062 PRESENT OR STORED	MULTIPLEX LINE FAULT 1.DEF: No signal

NOTES	**conditions for applying fault finding procedures to stored faults:** the fault is declared present after the vehicle ignition is switched on. **Special notes:** None.

Carry out a multiplex network test (see **88B, Multiplexing**).

Look for any damage to the harness, check the condition and connection of connector **A** (16 tracks) of the **gearbox computer** and of the **injection computer** connector.
Manipulate the wiring harness in order to observe any change in the fault status (Present → stored).

Check **the insulation and continuity** of the following connections:

gearbox computer, external connector **A** (16 tracks), **track 6** ⟶ **Track 47 injection computer** connector

gearbox computer, external connector **A** (16 tracks), **track 8** ⟶ **Track 9 injection computer** connector

If the harness or one of the connectors is not in good condition, refer to the wiring repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**).

If the fault is still present, carry out fault finding on the injection system (see **13B, diesel injection**).

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF085 PRESENT OR STORED	SEQUENCE SOLENOID VALVE CIRCUIT ESV1 CO.1 : Open circuit or short circuit to + 12 V CC.0 : Short circuit to earth

NOTES	**Conditions for applying fault finding procedures to stored faults:** The fault appears after: – the computer fault memory has been cleared, – the ignition has been switched off and on again, – starting the engine, – shifting to P, R or N. – If driving conditions permit, select 5th and 6th gears. **OR** Using the diagnostic tool, establish dialogue with the gearbox computer, run command **AC002 Sequence solenoid valve 1**.
	Use the Visu-Schéma CD for the vehicle.

Remove the gearbox computer (see **MR 402 mechanics, 23A, automatic transmission, Selection cable adjustment**).

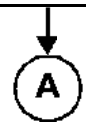
Measure the resistance of **sequence solenoid valve EVS1** between **track 5** (On round connector, 22 tracks, gearbox internal harness) **and the automatic transmission casing**.
Resistance value: **13 Ω ± 2 Ω** (at 20 °C).

If the resistance is correct

Refit the automatic transmission computer (There is no need to refit the gear selector or program the neutral position) (see **MR 402, mechanics, 23A, automatic transmission**).

Using the diagnostic tool, establish dialogue with the gearbox computer and run command **AC002 Sequence solenoid valve 1**.
Check the faults:
- If **DF085** is stored on the diagnostic tool, go to step A.
- If **DF085** is not present or stored on the diagnostic tool, end of fault finding. Apply the neutral position programming procedure described in part B.

If the resistance is incorrect



AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF085 **CONTINUED**	

A

Drain the gearbox (see **MR 402, mechanics, 23A, automatic transmission, oil change**).
Remove the hydraulic distributor case (see **MR 402, mechanics, 23A, automatic transmission, hydraulic distributor removal - refitting**).

Look for any damage to the harness, check the condition of the round connector (22 tracks), **gearbox** internal harness, and of the **sequence solenoid valve EVS1** connector.

Measure the resistance of the solenoid valve on the component terminal:

Track 1 → solenoid valve body

Resistance value: **13 Ω ± 2 Ω** (at 20 °C).
If the value is not correct: contact the Techline to confirm the solenoid valve fault (replacement of the hydraulic distributor).

If the value is correct, check the harness by applying the following procedure:
Check **the continuity** and **absence of interference resistance** of the following connection:

round connector (22 tracks), **gearbox internal harness, track 5** → **Track 1** sequence solenoid valve EVS1 connector

If the harness or one of the connectors is not in good condition, refer to the wiring repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**).

If the fault is still present, contact the Techline to confirm the solenoid valve fault (replacement of the hydraulic distributor).

B

Refit the gear selector on the computer (see **MR 402 mechanics, 23A, automatic transmission, Selection cable adjustment**).
Program the gearbox neutral position using command **VP018 Program neutral position**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF086 PRESENT OR STORED	SEQUENCE SOLENOID VALVE CIRCUIT EVS2 CO.1 : Open circuit or short circuit to + 12 V CC.0 : Short circuit to earth

NOTES	**Conditions for applying fault finding procedures to stored faults:** The fault appears after: – the computer fault memory has been cleared, – the ignition has been switched off and on again, – starting the engine, – shifting to P, R or N. – If driving conditions permit, select 1st, 2nd, 3rd, and 4th gear. **OR** Using the diagnostic tool, establish dialogue with the gearbox computer, run command **AC003 Sequence solenoid valve 2**.
	Use the Visu-Schéma CD for the vehicle.

Remove the computer (see **MR 402 mechanics, 23A, automatic transmission, Selection cable adjustment**).

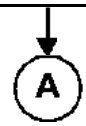
Measure the resistance of the **sequence solenoid valve EVS2** between **track 2** (On round connector, 22 tracks, gearbox internal harness) **and the automatic transmission casing**.
Resistance value: **13 Ω ± 2 Ω** (at 20 °C).

If the resistance is correct

Refit the automatic transmission computer (There is no need to refit the gear selector or program the neutral position) (see **MR 402, mechanics, 23A, automatic transmission**).

Using the diagnostic tool, establish dialogue with the gearbox computer and run command **AC003 Sequence solenoid valve 2**.
Check the faults:
- If **DF086** is stored on the diagnostic tool, go to step A.
- If **DF086** is not present or stored on the diagnostic tool, end of fault finding. Apply the neutral position programming procedure described in part B.

If the resistance is incorrect



AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF086 **CONTINUED**	

A

Drain the gearbox (see **MR 402, mechanics, 23A, automatic transmission, oil change**).
Remove the hydraulic distributor case (see **MR 402, mechanics, 23A, automatic transmission, hydraulic distributor removal - refitting**).

Look for any damage to the harness, check the condition of the round connector (22 tracks), **gearbox** internal harness, and of the **sequence solenoid valve EVS2** connector.

Measure the resistance of the solenoid valve on the component terminal:

Track 1 ⟶ solenoid valve body

Resistance value: **13 Ω ± 2 Ω** (at 20 °C).
If the value is not correct: contact the Techline to confirm the solenoid valve fault (replacement of the hydraulic distributor).

If the value is correct, check the harness by applying the following procedure:
Check **the continuity** and absence of interference resistance of the following connection:

round connector (22 tracks), **gearbox internal harness, track 2** ⟶ **Track 1** sequence solenoid valve EVS2 connector

If the harness or one of the connectors is not in good condition, refer to the wiring repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**).

If the fault is still present, contact the Techline to confirm the solenoid valve fault (replacement of the hydraulic distributor).

B

Refit the gear selector on the computer (see **MR 402 mechanics, 23A, automatic transmission, Selection cable adjustment**).
Program the gearbox neutral position using command **VP018 Program neutral position**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF090 PRESENT OR STORED	CONVERTER LOCKUP SOLENOID VALVE CIRCUIT CC.1 : Short circuit to + 12 V CO.0 : Open circuit or short circuit to earth

NOTES	**Conditions for applying fault finding procedures to stored faults:** The fault appears after: – the computer fault memory has been cleared, – the ignition has been switched off and on again, – engine started and vehicle driven. **OR** run command **AC085 Converter lockup solenoid valve**.
	Use the Visu-Schéma CD for the vehicle.

Remove the computer (see **MR 402 mechanics, 23A, automatic transmission, Selection cable adjustment**).

Measure the resistance of the **lockup solenoid valve** between **tracks 4 and 9** on the round connector (22 tracks), gearbox internal harness.
Resistance value: **5.3 Ω ± 0.3 Ω** (at 20 °C).

If the resistance is correct

Check **the insulation from earth** of the following connections:

round connector (22 tracks) gearbox internal harness, **track 4** → **Earth**

round connector (22 tracks), gearbox internal harness, **track 9** → **Earth**

If insulation is correct → A

If insulation is incorrect → B

If the resistance is incorrect → B

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF090 **CONTINUED 1**	

Refit the automatic transmission computer (There is no need to refit the gear selector or program the neutral position) (see **MR 402, mechanics, 23A, automatic transmission**).

Using the diagnostic tool, establish dialogue with the gearbox computer and run command **AC085 Converter lockup solenoid valve**.
Check the faults:
- If **DF090** is stored on the diagnostic tool, go to step B.
- If **DF090** is not present or stored on the diagnostic tool, end of fault finding. Apply the neutral position programming procedure described in part C.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF090 **CONTINUED 2**	

B

Drain the gearbox (see **MR 402, mechanics, 23A, automatic transmission, oil change**).
Remove the hydraulic distributor case (see **MR 402, mechanics, 23A, automatic transmission, hydraulic distributor removal - refitting**).

Look for any damage to the harness, check the condition of the round connector (22 tracks), **gearbox internal harness**, and of the **converter lockup solenoid valve** connector.

Measure the resistance of the solenoid valve on the component terminals:

Track 1 ⟶ track 2

Resistance value: **5.3 Ω ± 0.3 Ω** (at 20 °C).
If the value is not correct: contact the Techline to confirm the solenoid valve fault (replacement of the hydraulic distributor).

If the value is correct, check the harness by applying the following procedure:
Check **the continuity and insulation from earth** of the following connections:

round connector (22 tracks) **gearbox internal harness, track 4** ⟶ **Track 1** converter lockup solenoid valve connector

round connector (22 tracks), **gearbox internal harness, track 9** ⟶ **Track 2** converter lockup solenoid valve connector

If the harness or one of the connectors is not in good condition, refer to the wiring repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**).

If the fault is still present, contact the Techline to confirm the solenoid valve fault (replacement of the hydraulic distributor).

C

Refit the gear selector on the computer (see **MR 402 mechanics, 23A, automatic transmission, Selection cable adjustment**).
Program the gearbox neutral position using command **VP018 Program neutral position**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF092 PRESENT OR STORED	LT PRESSURE REGULATION SOLENOID VALVE CIRCUIT CC.1 : Short circuit to + 12 V CO.0 : Open circuit or short circuit to earth

NOTES	**Conditions for applying fault finding procedures to stored faults:** The fault appears after: – the computer fault memory has been cleared, – the ignition has been switched off and on again, – engine started and vehicle driven between 2nd and 6th gear. **OR** run command **AC087 LT pressure regulation solenoid valve**. Use the Visu-Schéma CD for the vehicle.

Remove the computer (see **MR 402 mechanics, 23A, automatic transmission, Selection cable adjustment**).

Measure the resistance of the **LT pressure regulation solenoid valve** between **tracks 1 and 3** on the round connector (22 tracks), gearbox internal harness.
Resistance value: **5.3 Ω ± 0.3 Ω** (at 20 °C).

If the resistance is correct

Check **the insulation from earth** of the following connections:

round connector (22 tracks), gearbox internal harness, **track 1** → **Earth**

round connector (22 tracks) gearbox internal harness, **track 3** → **Earth**

If insulation is correct → A

If insulation is incorrect → B

If the resistance is incorrect → B

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF092 **CONTINUED 1**	

Refit the automatic transmission computer (There is no need to refit the gear selector or program the neutral position) (see **MR 402, mechanics, 23A, automatic transmission, selection cable adjustment**).

Using the diagnostic tool, establish dialogue with the gearbox computer and run command **AC087 LT Pressure regulation solenoid valve**.
Check the faults:
- If **DF092** is stored on the diagnostic tool, go step B.
- If **DF092** is not present or stored on the diagnostic tool, end of fault finding. Apply the neutral position programming procedure described in part C.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF092 **CONTINUED 2**	

B

Drain the gearbox (see **MR 402, mechanics, 23A, automatic transmission, oil change**).
Remove the hydraulic distributor case (see **MR 402, mechanics, 23A, automatic transmission, hydraulic distributor removal - refitting**).

Look for any damage to the harness, check the condition of the round connector (22 tracks), **gearbox internal harness**, and of the **LT pressure regulation solenoid valve** connector.

Measure the resistance of the solenoid valve on the component terminals:

Track 1 ⟶ track 2

Resistance value: **5.3 Ω ± 0.3 Ω** (at 20 °C).
If the value is not correct: contact the Techline to confirm the solenoid valve fault (replacement of the hydraulic distributor).

If the value is correct, check the harness by applying the following procedure:
Check **the continuity and insulation from earth** of the following connections:

round connector (22 tracks), **gearbox internal harness, track 1** ⟶ **Track 1** converter lockup solenoid valve connector

round connector (22 tracks) **gearbox internal harness, track 3** ⟶ **Track 2** converter lockup solenoid valve connector

If the harness or one of the connectors is not in good condition, refer to the wiring repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**).

If the fault is still present, contact the Techline to confirm the solenoid valve fault (replacement of the hydraulic distributor).

C

Refit the gear selector on the computer (see **MR 402 mechanics, 23A, automatic transmission, Selection cable adjustment**).
Program the gearbox neutral position using command **VP018 Program neutral position**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF095 PRESENT OR STORED	SELECTOR LEVER LOCK ELECTROMAGNET CIRCUIT CC.1 : Short circuit to + 12 V CO.0 : Open circuit or short circuit to earth

NOTES	**Conditions for applying fault finding procedures to stored faults:** The fault appears after: – the computer fault memory has been cleared, – the ignition has been switched off and on again, – engine started and left running for **30 seconds** in P position.
	Special notes: Make sure that status **ET037 Brake switch signal** is consistent, if there is a fault, consult the interpretation of status **ET037**. Make sure that status **ET074 Lever lock control** is consistent, if there is a fault, consult the interpretation of status **ET037**.
	Use the Visu-Schéma CD for the vehicle.

Measure the **resistance** of the winding of the lever locking electromagnet between **tracks B1 and B2** of the gear lever connector. If the resistance measured is not **37 Ω ± 2 Ω at 20 °C**, replace the faulty component.

Look for any damage to the harness, check the condition and connection of connector **A** (16 tracks), of the **gearbox computer** connector and of the gear lever connector.
Manipulate the wiring harness in order to observe any change in the fault status (Present → stored).

Check the **insulation and continuity** of the following connection:

external connector **gearbox computer, track 13** ⟶ **Track B2** gear lever connector

If the harness or one of the connectors is not in good condition, refer to the wiring repair procedure (see **Technical Note 6015, Repairing electrical wiring, Wiring: Precautions for repairs**).

If the fault is still present, replace the faulty component.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF096 PRESENT OR STORED	COMPUTER SUPPLY VOLTAGE 1.DEF: Signal outside lower limit 2.DEF: Signal outside upper limit

NOTES	**Conditions for applying fault finding procedures to stored faults:** The fault is declared present after the vehicle ignition has been switched on.
	Use the Visu-Schéma CD for the vehicle.

Look for any damage to the harness, check the condition and connection of external connector **A** (16 tracks) of the **gearbox computer** and of the **relay/fuse box** connector.
Manipulate the wiring harness in order to observe any change in the fault status (Present → stored).

Check for fuses **FM1 (15 A)** and **FM4 (5 A)**, and their condition.

Check for **+ after ignition feed** on **tracks 1** and **2** of the **gearbox computer**.

Check for **earth** on **tracks 9** and **10** of the **gearbox computer**.

Check **the insulation and continuity** of the following connections:

external connector **gearbox computer, track 1** ⟶ **Track 25** relay/fuse box connector

external connector **gearbox computer, track 2** ⟶ **Track 25** relay/fuse box connector

external connector **gearbox computer, track 11** ⟶ **Track 30** relay/fuse box connector

If the harness or one of the connectors is not in good condition, refer to the wiring repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**).

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF097 PRESENT OR STORED	CONVERTER LOCKUP 1.DEF: Parameter at maximum limit 2.DEF: Parameter at minimum limit

NOTES	**Order of priority in the event of more than one fault:** If there is a combination of the following faults: **– DF090 Converter lockup solenoid valve circuit,** **– DF281 Converter lockup solenoid valve return current.** Deal with fault **DF090 Converter lockup solenoid valve circuit** first.
	Conditions for applying fault finding procedures to stored faults: The fault is declared present after a road test, with gear selector in position D and gearbox oil temperature above 25 °C.
	Use the Visu-Schéma CD for the vehicle.

Check the gearbox oil condition and level.

Check the line pressure:
Line pressure check:
Position D:
– The engine oil temperature, **PR004 Gearbox oil temperature** must be between 50 °C and 80 °C inclusive before performing the test.
– Put the line pressure tap plug in position D (see **Test 1: Measuring the line pressure**).
– Insert a pressure gauge in place of the plug.
– Put blocks under the vehicle wheels.
– Start the vehicle.
– Connect the diagnostic tool.
– Establish dialogue with the automatic transmission computer.
– Check parameter **PR110 LT pressure regulation solenoid valve current**.
– Depress the brake pedal to stop the vehicle rolling forward.
– Put the gear selector in position D.

With the engine idling, the pressure gauge reading should be between 3.7 bar and 4.3 bar.
The reading of **PR110 LT pressure regulation solenoid valve current** should be 1000 mA ± 10 mA.

Accelerate gently to reach an engine speed of 2000 rpm for 5 seconds.
The pressure gauge reading should be above the reading when idling, 3.7 bar.
The reading of **PR110 LT pressure regulation solenoid valve current** should be less than 1000 mA.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF097 **CONTINUED**	

Carry out a setting point check:

Setting point check:
– The engine oil temperature, **PR004 Gearbox oil temperature** must be between 50 °C and 80 °C inclusive before performing the test.
– Put blocks under the vehicle wheels.
– Start the vehicle.
– Connect the diagnostic tool.
– Establish dialogue with the automatic transmission computer.
– Keep the brake pedal depressed to stop the vehicle rolling forward.
– Put the gear selector in position R.

Check parameter **PR006 Engine speed**.
Accelerate until you reach setting point.

The engine speed value at the setting point should be between **2130 rpm and 2430 rpm** inclusive.

Recommendation: This test should not last over 5 seconds, and must not be repeated several times in succession, as this could damage the automatic transmission hydraulic system.

Analysis:
If the engine speed value is not reached, check that the engine is operating correctly.

If the fault is still present, contact the Techline to confirm the automatic transmission fault.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

NOTES	**Order of priority in the event of more than one fault:** If there is a combination of the following faults: **– DF273 Clutch 1 solenoid valve circuit,** **– DF276 Clutch 1 return circuit,** deal with fault **DF273 Clutch 1 solenoid valve circuit** first.
	Conditions for applying fault finding procedures to stored faults: The fault appears after: – clearing the computer fault memory, – the ignition has been switched off and on again, – engine started and left running for **30 seconds** in position D with the brake depressed. **OR** Using the diagnostic tool, establish dialogue with the gearbox computer, run command **AC026 Clutch 1 solenoid valve**.

1.DEF ***2.DEF***	***NOTES***	None

Check the gearbox oil condition and level.
Check parameters **PR006 Engine speed** and **PR014 Gearbox input speed**.

3.DEF	***NOTES***	None

Check the gearbox oil condition and level.
Check parameters **PR006 Engine speed** and **PR014 Gearbox input speed**.

Line pressure fault or mechanical fault.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF129 PRESENT OR STORED	ELECTRONIC STABILITY PROGRAM ESP 1DEF : Multiplex signals from generating computer invalid

NOTES	**Order of priority in the event of more than one fault:** If there is a combination of the following faults: **– DF062 Multiplex line fault,** **– DF185 No ABS/ESP multiplex signals,** **– DF290 ABS multiplex signal,** deal with fault **DF062 Multiplex line fault** first.
	Conditions for applying fault finding procedures to stored faults: The fault is declared present after a road test.

Carry out a multiplex network test (see **88B, Multiplexing**).

Run fault finding on the ABS system (see **38C, Anti-lock braking system**).

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF153 PRESENT OR STORED	REVERSING LIGHTS CONTROL CO.1 : Open circuit or short circuit to + 12 V CC.0 : Short circuit to earth

NOTES	**Conditions for applying fault finding procedures to stored faults:** Using the diagnostic tool, establish dialogue with the gearbox computer, run command **AC094 Reversing lights**.
	Use the Visu-Schéma CD for the vehicle.

Carry out a multiplex network test (see **88B, Multiplexing**).

Look for any damage to the harness, check the condition and connection of external connector **A** (16 tracks) of the **gearbox computer** and of the **reversing lights relay** connector.
Manipulate the wiring harness in order to observe any change in the fault status (Present → stored).

Check the **insulation and continuity** of the following connection:

external connector **gearbox computer, track 16** ⟶ **Track 47** reversing light relay

If the harness or one of the connectors is not in good condition, refer to the wiring repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**).

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

NOTES	**Order of priority in the event of more than one fault:** In the event of a combination of faults, deal with fault **DF062 Multiplex line fault** first.
	Conditions for applying fault finding procedures to stored faults: The fault is declared present after a road test.

Carry out a multiplex network test (see **88B, Multiplexing**).

Run fault finding on the injection system (see **13B diesel injection**).

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF183 PRESENT OR STORED	NO UCH MULTIPLEX SIGNAL 1.DEF: No computer multiplex signal

NOTES	**Order of priority in the event of more than one fault:** In the event of a combination of faults, deal with fault **DF062 Multiplex line fault** first.
	Conditions for applying fault finding procedures to stored faults: The fault is declared after 1 min with the engine running.

Carry out a multiplex network test (see **88B, Multiplexing**).

Run fault finding on the passenger compartment connection unit (see **87B passenger compartment connection unit**).

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF185 PRESENT OR STORED	NO ABS/ESP MULTIPLEX SIGNAL 1.DEF: No computer multiplex signal

NOTES	**Order of priority in the event of more than one fault:** If there is a combination of the following faults: **– DF062 Multiplex line fault,** **– DF129 Electronic Stability Program (ESP),** **– DF290 ABS multiplex signal,** deal with fault **DF062 Multiplex line fault** first.
	Conditions for applying fault finding procedures to stored faults: The fault appears after: – The computer fault memory has been cleared, – the ignition has been switched off and on again, – road test.

Carry out a multiplex network test (see **88B, Multiplexing**).

Run fault finding on the ABS system (see **38C, Anti-lock braking system**).

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF251 PRESENT OR STORED	GEARBOX INPUT SPEED 1.DEF: No signal 2.DEF: Values outside the limits

NOTES	**Conditions for applying fault finding procedures to stored faults:** The fault appears after: – the computer fault memory has been cleared, – the ignition has been switched off and on again, – engine started and left running for **1 min**.
	Use the Visu-Schéma CD for the vehicle.

Remove the computer (see **MR 402 mechanics, 23A, automatic transmission, Selection cable adjustment**).

Check **the insulation** of the following connections:

round connector (22 tracks), gearbox internal harness, **track 19** → **Earth**

round connector (22 tracks), gearbox internal harness, **track 20** → **Earth**

Check **the continuity** of the following connections:

round connector (22 tracks), gearbox internal harness, **track 19** → **Track 2** gearbox input speed sensor connector

round connector (22 tracks), gearbox internal harness, **track 20** → **Track 1** gearbox input speed sensor connector

If the harness or one of the connectors is not in good condition, refer to the wiring repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**).

If the fault is still present, contact the Techline to confirm the sensor fault (replacement of the automatic transmission).

If the insulation check and continuity check are correct, refit the automatic transmission computer and the gear selector (see **MR 402, Mechanics, 23A, Automatic transmission**).
Program the gearbox neutral position using command **VP018 Program neutral position**.
Carry out a road test.

Check the faults:
If **DF251** is stored in the diagnostic tool, contact the Techline to confirm the sensor fault (replacement of the automatic transmission).
If **DF251** is not present or stored on the diagnostic tool, end of fault finding.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF256 PRESENT OR STORED	ERRATIC GEAR JUMPING 1.DEF: Signal incoherence

NOTES	**Conditions for applying fault finding procedures to stored faults:** The fault appears after: – the computer fault memory has been cleared, – the ignition has been switched off and on again, – road test.

Carry out a multiplex network test (see **88B, Multiplexing**).
Make sure that the neutral position programming has been done (see **configurations and programming, VP018 Program neutral position**).
If the fault is still present, contact the Techline to confirm the automatic transmission fault.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF272 PRESENT OR STORED	BRAKE 1 SOLENOID VALVE CIRCUIT CC.1 : Short circuit to + 12 V CO.0 : Open circuit or short circuit to earth

NOTES	**Conditions for applying fault finding procedures to stored faults:** – the computer fault memory has been cleared, – the ignition has been switched off and on again, – starting the engine, – shifting to P or R or N. – If driving conditions permit, select 1st, 3rd, 4th, 5th gear. **OR** Run command **AC031 Brake 1 solenoid valve**. Use the Visu-Schéma CD for the vehicle.

Remove the computer (see **MR 402 mechanics, 23A, automatic transmission, Selection cable adjustment**).

Measure the resistance of **brake 1 solenoid valve** between **tracks 16 and 21** on the round connector (22 tracks), gearbox internal harness.
Resistance value: **5.3 Ω ± 0.3 Ω** (at 20 °C).

If the resistance is correct

If the resistance is incorrect

Check **the insulation from earth** of the following connections:

round connector (22 tracks), gearbox internal harness, **track 16** → **Earth**

round connector (22 tracks), gearbox internal harness, **track 21** → **Earth**

If insulation is correct

If insulation is incorrect

A

B

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF272 **CONTINUED 1**	

Refit the automatic transmission computer (There is no need to refit the gear selector or program the neutral position) (see **MR 402, mechanics, 23A, automatic transmission, selection cable adjustment**).

Using the diagnostic tool, establish dialogue with the gearbox computer and run command **AC031 Brake 1 solenoid valve**.
Check the faults:
If **DF272** is stored on the diagnostic tool, go step B.
If **DF272** is not present or stored on the diagnostic tool, end of fault finding. Apply the neutral position programming procedure described in part C.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF272 **CONTINUED 2**	

B

Drain the gearbox (see **MR 402, mechanics, 23A, automatic transmission, oil change**).
Remove the hydraulic distributor case (see **MR 402, mechanics, 23A, automatic transmission, hydraulic distributor removal - refitting**).

Look for any damage to the harness, check the condition of the round connector (22 tracks), **gearbox** internal harness and of the **brake 1 solenoid valve** connector.

Measure the resistance of the solenoid valve on the component terminals:

Track 1 ⟶ track 2

Resistance value: **5.3 Ω ± 0.3 Ω** (at 20 °C).
If the value is not correct: contact the Techline to confirm the solenoid valve fault (replacement of the hydraulic distributor).

If the value is correct, check the harness by applying the following procedure:
Check **the continuity and insulation from earth** of the following connections:

round connector (22 tracks), **gearbox internal harness, track 16** ⟶ **Track 1 brake 1** solenoid valve connector

round connector (22 tracks), **gearbox internal harness, track 21** ⟶ **Track 2 brake 1** solenoid valve connector

If the harness or one of the connectors is not in good condition, refer to the wiring repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**).

If the fault is still present, contact the Techline to confirm the solenoid valve or automatic transmission internal wiring fault (replacement of the hydraulic distributor).

C

Refit the gear selector on the computer (see **MR 402 mechanics, 23A, automatic transmission, Selection cable adjustment**).
Program the gearbox neutral position using command **VP018 Program neutral position**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

round connector (22 tracks), **gearbox internal harness, track 21** ⟶ **Track 2 brake 1** solenoid valve connector

If the harness or one of the connectors is not in good condition, refer to the wiring repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**).

If the fault is still present, contact the Techline to confirm the solenoid valve or automatic transmission internal wiring fault (replacement of the hydraulic distributor).

C

Refit the gear selector on the computer (see **MR 402 mechanics, 23A, automatic transmission, Selection cable adjustment**).
Program the gearbox neutral position using command **VP018 Program neutral position**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF280 PRESENT OR STORED	LT PRESSURE REGULATION SOLENOID VALVE RETURN CURRENT 1.DEF: Signal outside upper limit

NOTES	**Order of priority in the event of more than one fault:** If there is a combination of faults, deal with fault **DF092 LT pressure regulation solenoid valve circuit** first.
	Conditions for applying fault finding procedures to stored faults: – the computer fault memory has been cleared, – the ignition has been switched off and on again, – engine started and vehicle driven between 2nd and 6th gear. **OR** Run command **AC087 LT pressure regulation solenoid valve**.
	Use the Visu-Schéma CD for the vehicle.

Remove the computer (see **MR 402 mechanics, 23A, automatic transmission, Selection cable adjustment**).

Measure the resistance of the **LT pressure regulation solenoid valve** between **tracks 1 and 3** on the round connector (22 tracks), gearbox internal harness.
Resistance value: **5.3 Ω ± 0.3 Ω** (at 20 °C).

If the resistance is correct

If the resistance is incorrect

Check **the insulation from earth** of the following connections:

round connector (22 tracks), gearbox internal harness, **track 1** → **Earth**

round connector (22 tracks) gearbox internal harness, **track 3** → **Earth**

If insulation is correct → A

If insulation is incorrect → B

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF280 **CONTINUED 1**	

Refit the automatic transmission computer (There is no need to refit the gear selector or program the neutral position) (see **MR 402, mechanics, 23A, automatic transmission, selection cable adjustment**).

Using the diagnostic tool, establish dialogue with the gearbox computer and run command **AC087 LT Pressure regulation solenoid valve**.
Check the faults:
If **DF280** is stored on the diagnostic tool, go step B.
If **DF280** is not present or stored on the diagnostic tool, end of fault finding. Apply the neutral position programming procedure described in part C.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF280 **CONTINUED 2**	

B

Drain the gearbox (see **MR 402, mechanics, 23A, automatic transmission, oil change**).
Remove the hydraulic distributor case (see **MR 402, mechanics, 23A, automatic transmission, hydraulic distributor removal - refitting**).

Look for any damage to the harness, check the condition of the round connector (22 tracks), **gearbox internal harness**, and of the **LT pressure regulation solenoid valve** connector.

Measure the resistance of the solenoid valve on the component terminals:

Track 1 → track 2

Resistance value: **5.3 Ω ± 0.3 Ω** (at 20 °C).
If the value is not correct: contact the Techline to confirm the solenoid valve fault (replacement of the hydraulic distributor).

If the value is correct, check the harness by applying the following procedure:
Check **the continuity and insulation from earth** of the following connections:

round connector (22 tracks), **gearbox internal harness, track 1** → **Track 1** converter lockup solenoid valve connector

round connector (22 tracks) **gearbox internal harness, track 3** → **Track 2** converter lockup solenoid valve connector

If the harness or one of the connectors is not in good condition, refer to the wiring repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**).

If the fault is still present, contact the Techline to confirm the solenoid valve or automatic transmission internal wiring fault (replacement of the hydraulic distributor).

C

Refit the gear selector on the computer (see **MR 402 mechanics, 23A, automatic transmission, Selection cable adjustment**).
Program the gearbox neutral position using command **VP018 Program neutral position**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF281 PRESENT OR STORED	CONVERTER LOCKUP SOLENOID VALVE RETURN CURRENT 1.DEF: Signal outside upper limit

NOTES	**Order of priority in the event of more than one fault:** If there is a combination of faults, deal with fault **DF090 Converter lockup solenoid valve circuit** first.
	Conditions for applying fault finding procedures to stored faults: Run command **AC085 Converter lockup solenoid valve**.
	Use the Visu-Schéma CD for the vehicle.

Remove the computer (see **MR 402 mechanics, 23A, automatic transmission, Selection cable adjustment**).

Measure the resistance of the **lockup solenoid valve** between **tracks 4 and 9** on the round connector (22 tracks), gearbox internal harness.
Resistance value: **5.3 Ω ± 0.3 Ω** (at 20 °C).

If the resistance is correct

If the resistance is incorrect

Check **the insulation from earth** of the following connections:

round connector (22 tracks) gearbox internal harness, **track 4** → **Earth**

round connector (22 tracks), gearbox internal harness, **track 9** → **Earth**

If insulation is correct

If insulation is incorrect

A

B

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF284 **CONTINUED 4**	

Check the faults:
If **DF284** is stored on the diagnostic tool, go step B.
If **DF284** is not present or stored on the diagnostic tool, end of fault finding. Apply the neutral position programming procedure described in part C.

Drain the gearbox (see **MR 402, mechanics, 23A, automatic transmission, oil change**).
Remove the hydraulic distributor case (see **MR 402, mechanics, 23A, automatic transmission, hydraulic distributor removal - refitting**).

If the fault is not confirmed, look for any damage to the harness and check the condition of the **gearbox** internal wiring harness round connector (22-track).

Contact the Techline to confirm the sensor or automatic transmission internal wiring fault (replacement of the hydraulic distributor).

Refit the gear selector on the computer (see **MR 402 mechanics, 23A, automatic transmission, Selection cable adjustment**).
Program the gearbox neutral position using command **VP018 Program neutral position**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF286 PRESENT OR STORED	LEVER POSITION SENSOR SIGNAL 1.DEF: No signal 2.DEF: Signal outside upper limit 3.DEF: Internal electronic fault

NOTES	**Conditions for applying fault finding procedures to stored faults:** The fault appears after: – the computer fault memory has been cleared, – the ignition has been switched off and on again, – selector lever movement.
	Special notes: The lever position sensor is built into the computer. This sensor cannot be checked electrically.

1.DEF ***2.DEF***	***NOTES***	None

Check that the gear lever position corresponds to the position indicated on the tool, using status **ET012 Gear lever position**.
Check the condition of the cable and mountings connecting the lever to the gearbox. Replace if necessary.
If the fault is still present, contact the Techline.

3.DEF	***NOTES***	None

Contact the Techline.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF287 PRESENT OR STORED	GEARBOX OUTPUT SPEED SIGNAL 1.DEF: Values outside the limits 2.DEF: No signal

NOTES	**Conditions for applying fault finding procedures to stored faults:** The fault appears after: – the computer fault memory has been cleared, – the ignition has been switched off and on again, – engine started and left running for **3 minutes**. **Special notes:** The **gearbox output speed sensor** cannot be removed. Use the Visu-Schéma CD for the vehicle concerned.

Remove the computer (see **MR 402 mechanics, 23A, automatic transmission, Selection cable adjustment**).

Measure the resistance of the **gearbox output sensor** between **tracks 12 and 13** on the round connector (22 tracks), gearbox internal harness.
Resistance values: **- 5 MΩ**.

If the resistance is correct

If the resistance is incorrect

Check **the insulation from earth** of the following connections:

round connector (22 tracks), gearbox internal harness, **track 12** → **Earth**

round connector (22 tracks), gearbox internal harness, **track 13** → **Earth**

If insulation is correct

If insulation is incorrect

A

B

GETtheMANUALS.org

DF291 PRESENT OR STORED	GEAR 1 SHIFT 1.DEF : Shift to 1st gear rejected in mode D. Values outside the limits 2.DEF : Shift to 1st gear imposed in manual mode. Values outside the limits

NOTES	**Conditions for applying fault finding procedures to stored faults:** The fault is declared present or stored after a road test.
	Special notes: Mechanical or hydraulic fault.

1.DEF ***2.DEF***	***NOTES***	**Order of priority in the event of more than one fault:** If there is a combination of the following faults: **– DF272 Brake 1 solenoid valve circuit,** **– DF274 Clutch 2 solenoid valve circuit,** **– DF275 Clutch 3 solenoid valve circuit,** deal with them first. **Order of priority in the event of more than one fault:** If there is a combination of the following faults: **– DF085 Sequence solenoid valve EVS1 circuit,** **– DF086 Sequence solenoid valve EVS2 circuit,** deal with them first.

Line pressure check:
Position D:
– The engine oil temperature, **PR004 Gearbox oil temperature** must be between 50 °C and 80 °C inclusive before performing the test.
– Put the line pressure tap plug in position D (see **Test 1: Measuring the line pressure**).
– Insert a pressure gauge in place of the plug.
– Put blocks under the vehicle wheels.
– Start the vehicle.
– Connect the diagnostic tool.
– Establish dialogue with the automatic transmission computer.
– Check parameter **PR110 LT pressure regulation solenoid valve current**.
– Depress the brake pedal to stop the vehicle rolling forward.
– Put the gear selector in position D.

With the engine idling, the pressure gauge reading should be between 3.7 bar and 4.3 bar.
The reading of **PR110 LT pressure regulation solenoid valve current** should be 1000 mA ± 10 mA.

Accelerate gently to reach an engine speed of 2000 rpm for 5 seconds.
The pressure gauge reading should be above the reading when idling, 3.7 bar.
The reading of **PR110 LT pressure regulation solenoid valve current** should be less than 1000 mA.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF291 **CONTINUED 1**	

Position R:
– The engine oil temperature, **PR004 Gearbox oil temperature** must be between 50 °C and 80 °C inclusive before performing the test.
– Put the line pressure tap plug in position D (see **Test 1: Measuring the line pressure**).
– Insert a pressure gauge in place of the plug.
– Put blocks under the vehicle wheels.
– Start the vehicle.
– Connect the diagnostic tool.
– Establish dialogue with the automatic transmission computer.
– Check parameter **PR110 LT pressure regulation solenoid valve current**.
– Depress the brake pedal to stop the vehicle rolling forward.
– Put the gear selector in position R.

With the engine idling, the pressure gauge reading should be between 5.7 bar and 6.9 bar.
The reading of **PR110 LT pressure regulation solenoid valve current** should be 1000 mA ± 10 mA.

Accelerate gently to reach an engine speed of 2000 rpm for 5 seconds.
The pressure gauge reading should be greater than the reading when idling, 5.7 bar.
The reading of **PR110 LT pressure regulation solenoid valve current** should be less than 1000 mA.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF291 **CONTINUED 2**	

Analysis:
Engine speed idling:

1. The line pressure readings on the pressure gauge are lower than the reference values:
   - Failure on line pressure control valve solenoid.
   - Mechanical failure (spring, valve) on line pressure control solenoid valve.
   - Oil pump failure.
   - Automatic transmission internal leakage.

In these 4 cases, contact the Techline to confirm the automatic transmission fault (replacement of the hydraulic distributor).

2. The line pressure reading on the pressure gauge in position R is less than the line pressure value in position D:
   - Mechanical failure (spring, valve) on line pressure control solenoid valve.

In this case, contact the Techline to confirm the automatic transmission solenoid valve fault (replacement of the hydraulic distributor).

Engine speed at 2000 rpm:

3. The readings on the pressure gauge are identical to the readings when the engine was at idling speed:
   - Failure on line pressure control solenoid valve.
   - Hydraulic distributor failure.

In these 2 cases, contact the Techline to confirm the automatic transmission fault (replacement of the hydraulic distributor).

4. The values read for parameter **PR110 LT pressure regulation solenoid valve current** are the same at 2000 rpm and when idling:
   - Computer failure.
   - Failure of electrical wiring inside the automatic transmission.

In these 2 cases, contact the Techline to confirm the automatic transmission internal wiring (replacement of the hydraulic distributor) or computer fault.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF291 **CONTINUED 3**	

Setting point check:
- The engine oil temperature, **PR004 Gearbox oil temperature** must be between 50 °C and 80 °C inclusive before performing the test.
- Put blocks under the vehicle wheels.
- Start the vehicle.
- Connect the diagnostic tool.
- Establish dialogue with the automatic transmission computer.
- Keep the brake pedal depressed to stop the vehicle rolling forward.
- Put the gear selector in position R.

Check parameter **PR006 Engine speed**.
Accelerate until you reach the setting point.

The engine speed value at the setting point should be between **2130 rpm and 2430 rpm** inclusive.

Recommendation: This test should not last over 5 seconds, and must not be repeated several times in succession, as this could damage the automatic transmission hydraulic system.

Analysis:
If the engine speed value is not reached, check that the engine is operating correctly.

If the fault is still present, contact the Techline to confirm the automatic transmission fault.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF292 PRESENT OR STORED	GEAR 2 SHIFT 1.DEF: Shift to 2nd gear rejected. Values outside the limits

NOTES	**Order of priority in the event of more than one fault:** If there is a combination of the following faults: **– DF272 Brake 1 solenoid valve circuit,** **– DF273 Clutch 1 solenoid valve circuit,** **– DF274 Clutch 2 solenoid valve circuit,** **– DF275 Clutch 3 solenoid valve circuit,** deal with them first.
	Conditions for applying fault finding procedures to stored faults: The fault is declared present after a road test.
	Special notes: Mechanical or hydraulic fault.

Line pressure check:
Position D:
The engine oil temperature must be between 50 °C and 80 °C inclusive before performing the test.
Put the line pressure tap plug in position D (see **Test 1: Measuring the line pressure**).
Insert a pressure gauge in place of the plug.
Put blocks under the vehicle wheels.
Start the vehicle.
Depress the brake pedal to stop the vehicle rolling forward.
Put the gear selector in position D.

Connect the diagnostic tool.
Establish dialogue with the automatic transmission computer.
Check parameter **PR110 LT pressure regulation solenoid valve current**.

With the engine idling, the pressure gauge reading should be between 3.72 bar and 4.32 bar.
The reading of **PR110 LT pressure regulation solenoid valve current** should be 1000 mA ± 10 mA.

Accelerate gently to reach an engine speed of 2000 rpm for 5 seconds.
The pressure gauge reading should be greater than the reading when idling.
The reading of **PR110 LT pressure regulation solenoid valve current** should be less than 1000 mA.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF292 **CONTINUED 1**	

Position R:
The engine oil temperature must be between 50 °C and 80 °C inclusive before performing the test.
Put the line pressure tap plug in position R (see **Test 1: Measuring the line pressure**).
Insert a pressure gauge in place of the plug.
Start the vehicle.
Depress the brake pedal to stop the vehicle rolling forward.
Put the gear selector in position R.
Connect the diagnostic tool.
Establish dialogue with the automatic transmission computer.
Check parameter **PR110 LT pressure regulation solenoid valve current**.

With the engine idling, the pressure gauge reading should be between 3.72 bar and 4.32 bar.
The reading of **PR110 LT pressure regulation solenoid valve current** should be 1000 mA ± 10 mA.

Accelerate gently to reach an engine speed of 2000 rpm for 5 seconds.

DF293 PRESENT OR STORED	GEAR 3 SHIFT 1.DEF: Shift to 3rd gear rejected. Values outside the limits

NOTES	**Order of priority in the event of more than one fault:** If there is a combination of the following faults: **– DF273 Clutch 1 solenoid valve circuit,** **– DF274 Clutch 2 solenoid valve circuit,** **– DF275 Clutch 3 solenoid valve circuit,** deal with them first.
	Conditions for applying fault finding procedures to stored faults: The fault is declared present after a road test.
	Special notes: Mechanical or hydraulic fault.

Line pressure check:
Position D:
The engine oil temperature must be between 50 °C and 80 °C inclusive before performing the test.
Put the line pressure tap plug in position D (see **Test 1: Measuring the line pressure**).
Insert a pressure gauge in place of the plug.
Put blocks under the vehicle wheels.
Start the vehicle.
Depress the brake pedal to stop the vehicle rolling forward.
Put the gear selector in position D.

Connect the diagnostic tool.
Establish dialogue with the automatic transmission computer.
Check parameter **PR110 LT pressure regulation solenoid valve current**.

With the engine idling, the pressure gauge reading should be between 3.72 bar and 4.32 bar.
The reading of **PR110 LT pressure regulation solenoid valve current** should be 1000 mA ± 10 mA.

Accelerate gently to reach an engine speed of 2000 rpm for 5 seconds.
The pressure gauge reading should be greater than the reading when idling.
The reading of **PR110 LT pressure regulation solenoid valve current** should be less than 1000 mA.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF293 **CONTINUED 1**	

Position R:
The engine oil temperature must be between 50 °C and 80 °C inclusive before performing the test.
Put the line pressure tap plug in position R (see **Test 1: Measuring the line pressure**).
Insert a pressure gauge in place of the plug.
Start the vehicle.
Depress the brake pedal to stop the vehicle rolling forward.
Put the gear selector in position R.
Connect the diagnostic tool.
Establish dialogue with the automatic transmission computer.
Check parameter **PR110 LT pressure regulation solenoid valve current**.

With the engine idling, the pressure gauge reading should be between 3.72 bar and 4.32 bar.
The reading of **PR110 LT pressure regulation solenoid valve current** should be 1000 mA ± 10 mA.

Accelerate gently to reach an engine speed of 2000 rpm for 5 seconds.
The pressure gauge reading should be greater than the reading when idling.
The reading of **PR110 LT pressure regulation solenoid valve current** should be less than 1000 mA.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF293 **CONTINUED 2**	

Analysis:
Engine speed idling:

1. The line pressure readings on the pressure gauge are lower than the reference values:
   - Failure on line pressure control solenoid valve solenoid.
   - Mechanical failure (spring, valve) on line pressure control solenoid valve.
   - Oil pump failure.
   - Automatic transmission internal leakage.

In these 4 cases, contact the Techline to confirm the automatic transmission fault (replacement of the hydraulic distributor).

2. The line pressure reading on the pressure gauge in position R is less than the line pressure value in position D:
   - Mechanical failure (spring, valve) on line pressure control solenoid valve.

In this case, contact the Techline to confirm the automatic transmission solenoid valve fault (replacement of the hydraulic distributor).

Engine speed at 2000 rpm:

3. The readings on the pressure gauge are identical to the readings when the engine was at idling speed:
   - Failure on line pressure control solenoid valve.
   - Hydraulic distributor failure.

In these 2 cases, contact the Techline to confirm the automatic transmission fault (replacement of the hydraulic distributor).

4. The readings of parameter **PR110 LT pressure regulation solenoid valve current** are the same at 2000 rpm and when idling:
   - Computer failure.
   - Failure of electrical wiring inside the automatic transmission.

In these 2 cases, contact the Techline to confirm the automatic transmission internal wiring (replacement of the hydraulic distributor) or computer fault.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF294 PRESENT OR STORED	GEAR 4 SHIFT Shift to 4th gear rejected. Values outside the limits

NOTES	**Conditions for applying fault finding procedures to stored faults:** The fault is declared present after a road test. **Special notes:** Mechanical or hydraulic fault.

Line pressure check:
Position D:
The engine oil temperature must be between 50 °C and 80 °C inclusive before performing the test.
Put the line pressure tap plug in position D (see **Test 1: Measuring the line pressure**).
Insert a pressure gauge in place of the plug.
Put blocks under the vehicle wheels.
Start the vehicle.
Depress the brake pedal to stop the vehicle rolling forward.
Put the gear selector in position D.

Connect the diagnostic tool.
Establish dialogue with the automatic transmission computer.
Check parameter **PR110 LT pressure regulation solenoid valve current**.

With the engine idling, the pressure gauge reading should be between 3.72 bar and 4.32 bar.
The reading of **PR110 LT pressure regulation solenoid valve current** should be 1000 mA ± 10 mA.

Accelerate gently to reach an engine speed of 2000 rpm for 5 seconds.
The pressure gauge reading should be greater than the reading when idling.
The reading of **PR110 LT pressure regulation solenoid valve current** should be less than 1000 mA.

GETtheMANUALS.org

ET010	OIL TOO HOT SIGNAL

NOTES	**Special notes:** This status indicates that the gearbox oil temperature is too hot. Under normal operation conditions, status **ET010 Oil too hot signal** should be **NO**.

If status **ET010 Oil too hot signal** is **YES**.
Check the level (with engine running) (see **MR 402 mechanics, 23A, automatic transmission, oil change**), and check parameter **PR004 "Gearbox oil temperature"**; if resistance values are inconsistent, replace the temperature sensor.

If the fault is still present, contact Techline.

AFTER REPAIR	Carry out a road test, then check with the diagnostic tool.

GETtheMANUALS.org

ET037	BRAKE SWITCH SIGNAL

NOTES	**Special notes:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

DEPRESSED (Brake pedal depressed)

If brake lights operate:
– The **continuity and absence of interference resistance** of the following connection:

Injection computer **track A21** ⟶ **track 3**, brake light switch black connector

	Continuity between tracks	insulation between tracks
Brake pedal depressed	**1 and 2**	**3 and 4**
Brake pedal released	**3 and 4**	**1 and 2**

Repair if necessary.

If the brake lights do not operate:
– Check the condition and fitting of the **brake lights connector** and the **brake lights fuse**.
– Check for **+ after ignition feed** on **tracks 2** and **4** of the **brake light switch**.
– Then remove the **brake light switch**, and carry out the checks in the table below:
If the checks are not in order, replace the brake light switch.

AFTER REPAIR	Carry out a road test, then check with the diagnostic tool.

GETtheMANUALS.org

ET037 **CONTINUED**	

NOTES	**Special notes:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

RELEASED (Brake pedal released)

– Check the condition and fitting of the **brake lights connector** and the brake lights fuse.
– Then remove the **brake light switch**, and carry out the checks in the table below:

	Continuity between tracks	insulation between tracks
Brake pedal depressed	**1 and 2**	**3 and 4**
Brake pedal released	**3 and 4**	**1 and 2**

If the checks are not in order, replace the brake light switch.

AFTER REPAIR	Carry out a road test, then check with the diagnostic tool.

GETtheMANUALS.org

ET074	SELECTOR LEVER LOCK CONTROL

NOTES	**Special notes:** If the control is Inactive, the lever is locked. Status **ET074 Lever lock control** becomes active after the **+ after ignition feed** is activated and the brake pedal depressed; only then is lever movement authorised.

In the event of a fault, test the multiplex network.

Consult the interpretation of status **ET037 Brake switch signal**.

Consult the interpretation of fault **DF095 Selection locking electromagnet circuit**.

AFTER REPAIR	Carry out a road test, then check with the diagnostic tool.

GETtheMANUALS.org

ET084	FAULT WARNING LIGHT LIT

NOTES	**Special notes:** This status indicates the presence of an automatic transmission system malfunction. Under normal operating conditions status **ET084 Fault warning light lit** should be **NO**.

If status **ET084 Fault warning light lit** is **YES**:
Carry out a fault check on the system. If there are no faults, carry out fault finding on the instrument panel system (see **83A, Instrument panel**).

AFTER REPAIR	Carry out a road test, then check with the diagnostic tool.

GETtheMANUALS.org

Tool parameter	Diagnostic tool title
PR001	Coolant temperature
PR004	Gearbox oil temperature
PR005	Gearbox output speed
PR006	Engine speed
PR008	Computer feed voltage
PR014	Gearbox input speed
PR022	Accelerator pedal position
PR050	Brake 1 *SV control current
PR051	Clutch 1 solenoid valve control current
PR055	Clutch 2 solenoid valve control current
PR056	Clutch 3 solenoid valve control current
PR057	Clutch 1 solenoid valve return current
PR058	Clutch 2 solenoid valve return current
PR059	Clutch 3 solenoid valve return current
PR060	Brake 1 return current
PR061	Converter lockup solenoid valve return current
PR062	LT pressure regulation solenoid valve return current
PR105	Vehicle speed
PR106	Effective engine torque
PR107	No reduction engine torque
PR108	Converter lockup solenoid valve current
PR110	LT pressure regulation solenoid valve current
PR153	Slow torque setpoint
PR154	Rapid torque setpoint

***SV: solenoid valve**

GETtheMANUALS.org

PR001	COOLANT TEMPERATURE

NOTES	**Special notes:** There must be no present or stored faults. Perform this fault finding procedure: – After finding an inconsistency in the parameter, – after a customer complaint (Lack of power).

Run a multiplex network test (see **88B, Multiplex**).

ELECTRICAL CONFORMITY OF SENSOR

Check the continuity and the absence of interference resistance on the following connections:

Engine management computer, **track B95** → **track 2**, coolant temperature sensor connector

Engine management computer, **track B99** → **track 1**, coolant temperature sensor connector

Repair if necessary.

Measure the resistance of the coolant temperature sensor between tracks 1 and 2 of its connector.
Replace the sensor if the resistance is not:

at - 10 °C: **16,120 Ω ± 806 Ω**
at 25 °C: **2795 Ω ± 140 Ω**
at 50 °C: **980 Ω ± 49 Ω**
at 80 °C: **334 Ω ± 17 Ω**

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test, then check with the diagnostic tool.

GETtheMANUALS.org

PR004	GEARBOX OIL TEMPERATURE

NOTES	**Special notes:** Only apply the checks if the parameter is inconsistent.

The gearbox oil temperature value for normal operation should be less than 140 °C.

In the event of a fault, consult the interpretation of fault **DF284 Gearbox oil temperature**.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test, then check with the diagnostic tool.

GETtheMANUALS.org

PR014	GEARBOX INPUT SPEED

NOTES	**There must be no present or stored faults.** Perform this fault finding procedure: – After finding an inconsistency in the parameter, – after a customer complaint (Gear shift inconsistent).

With the engine running, parameter **PR006 Engine speed ≈ 700 rpm**:
PR110 Gearbox input speed should be ≈ **575 rpm**

In the event of a fault, consult the interpretation of fault **DF251 Gearbox input speed**.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test, then check with the diagnostic tool.

GETtheMANUALS.org

PR022	ACCELERATOR PEDAL POSITION

NOTES	**There must be no present or stored faults.** Perform this fault finding procedure: – After finding an inconsistency in the parameter, – after a customer complaint (Gear jump, gear shift inconsistency).

Run a multiplex network test (see **88B, Multiplex**).

If there is a fault, carry out fault finding on the injection system (See **13B, diesel injection**).

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test, then check with the diagnostic tool.

GETtheMANUALS.org

PR050	BRAKE 1 SOLENOID VALVE CONTROL CURRENT

NOTES	**There must be no present or stored faults.** Perform this fault finding procedure: – After finding an inconsistency in the parameter, – after a customer complaint (Gear shift or one or more gears missing).

With ignition on, engine stopped and status **ET013 "Gear engaged" P/N**:
PR050 Brake 1 solenoid valve control current should be: **1000 mA**

In the event of a fault, consult the interpretation of fault **DF272 Brake 1 SV solenoid valve circuit**.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test, then check with the diagnostic tool.

GETtheMANUALS.org

PR051	CLUTCH 1 SOLENOID VALVE CONTROL CURRENT

NOTES	**There must be no present or stored faults.** Perform this fault finding procedure: – After finding an inconsistency in the parameter, – after a customer complaint (Gear shift or one or more gears missing).

With ignition on, engine stopped and status **ET013 "Gear engaged" P/N**:
PR051 Clutch 1 solenoid valve control current should be: **1000 mA**

In the event of a fault consult the interpretation of fault **DF273 Clutch 1 solenoid valve circuit**.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test, then check with the diagnostic tool.

GETtheMANUALS.org

PR055	CLUTCH 2 SOLENOID VALVE CONTROL CURRENT

NOTES	**There must be no present or stored faults.** Perform this fault finding procedure: – After finding an inconsistency in the parameter, – after a customer complaint (Gear shift or one or more gears missing).

With ignition on, engine stopped and status **ET013 "Gear engaged" P/N**:
PR055 Clutch 2 solenoid valve control current should be: **1000 mA**

In the event of a fault consult the interpretation of fault **DF274 Clutch 2 solenoid valve circuit**.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test, then check with the diagnostic tool.

GETtheMANUALS.org

PR056	CLUTCH 3 SOLENOID VALVE CONTROL CURRENT

NOTES	**There must be no present or stored faults.** Perform this fault finding procedure: – After finding an inconsistency in the parameter, – after a customer complaint (Gear shift or one or more gears missing).

With ignition on, engine stopped and status **ET013 "Gear engaged" P/N**:
PR056 Clutch 3 solenoid valve control current should be: **1000 mA**

In the event of a fault, consult the interpretation of fault **DF275 Clutch 3 solenoid valve circuit**.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test, then check with the diagnostic tool.

GETtheMANUALS.org

PR057	CLUTCH 1 SOLENOID VALVE RETURN CURRENT

NOTES	**There must be no present or stored faults.** Perform this fault finding procedure: – After finding an inconsistency in the parameter, – after a customer complaint (Gear shift or one or more gears missing).

With ignition on, engine stopped and status **ET013 "Gear engaged" P/N**:
PR057 Clutch 1 solenoid valve return current should be: **1000 mA**

In the event of a fault consult the interpretation of fault **DF273 Clutch 1 solenoid valve circuit**.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test, then check with the diagnostic tool.

GETtheMANUALS.org

PR058	CLUTCH 2 SOLENOID VALVE RETURN CURRENT

NOTES	**There must be no present or stored faults.** Perform this fault finding procedure: – After finding an inconsistency in the parameter, – after a customer complaint (Gear shift or one or more gears missing).

With ignition on, engine stopped and status **ET013 "Gear engaged" P/N**:
PR058 Clutch 2 solenoid valve return current should be: **1000 mA**

In the event of a fault consult the interpretation of fault **DF274 Clutch 2 solenoid valve circuit**.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test, then check with the diagnostic tool.

GETtheMANUALS.org

PR059	CLUTCH 3 SOLENOID VALVE RETURN CURRENT

NOTES	**There must be no present or stored faults.** Perform this fault finding procedure: – After finding an inconsistency in the parameter, – after a customer complaint (Gear shift or one or more gears missing).

With ignition on, engine stopped and status **ET013 "Gear engaged" P/N**:
PR059 Clutch 3 solenoid valve return current should be: **1000 mA**

In the event of a fault, consult the interpretation of fault **DF275 Clutch 3 solenoid valve circuit**.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test, then check with the diagnostic tool.

GETtheMANUALS.org

PR060	BRAKE 1 SOLENOID VALVE CONTROL CURRENT

NOTES	**There must be no present or stored faults.** Perform this fault finding procedure: – After finding an inconsistency in the parameter, – after a customer complaint (Gear shift or one or more gears missing).

With ignition on, engine stopped and status **ET013 "Gear engaged" P/N**:
PR060 Brake 1 solenoid valve return current should be: **1000 mA**

In the event of a fault, consult the interpretation of fault **DF272 Brake 1 solenoid valve return circuit**.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test, then check with the diagnostic tool.

GETtheMANUALS.org

PR061	CONVERTER LOCKUP SOLENOID VALVE RETURN CURRENT

NOTES	**There must be no present or stored faults.** Perform this fault finding procedure: – After finding an inconsistency in the parameter, – after a customer complaint.

With ignition on, engine stopped and status **ET013 "Gear engaged" P/N**:
PR061 Converter lockup solenoid valve return current should be: **200 mA**

If there is a fault consult the interpretation of fault **DF090 Converter lockup solenoid valve circuit**.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test, then check with the diagnostic tool.

GETtheMANUALS.org

PR062	LT PRESSURE REGULATION SOLENOID VALVE RETURN CURRENT

NOTES	**There must be no present or stored faults.** Perform this fault finding procedure: – After finding an inconsistency in the parameter, – after a customer complaint (Jerking, gear shift or one or more gears missing).

With ignition on, engine stopped and status **ET013 "Gear engaged" P/N**:
PR062 LT pressure regulation solenoid valve return current should be: **1000 mA**

If there is a fault consult the interpretation of fault **DF092 LT pressure regulation solenoid valve circuit**.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test, then check with the diagnostic tool.

GETtheMANUALS.org

PR108	CONVERTER LOCKUP SOLENOID VALVE CURRENT

NOTES	**There must be no present or stored faults.** Perform this fault finding procedure: – After finding an inconsistency in the parameter, – after a customer complaint.

With ignition on, engine stopped and status **ET013 "Gear engaged" P/N**:
PR108 Converter lockup solenoid valve return current should be: **200 mA**

If there is a fault consult the interpretation of fault **DF090 Converter lockup solenoid valve circuit**.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test, then check with the diagnostic tool.

GETtheMANUALS.org

COMMANDS	Diagnostic tool title
AC002	Sequence solenoid 1
AC003	Sequence solenoid 2
AC024	Sequential actuator control
AC026	Clutch 1 solenoid valve
AC029	Clutch 2 solenoid valve
AC030	Clutch 3 solenoid valve
AC031	Brake 1 solenoid valve
AC085	Converter lockup solenoid valve
AC087	LT pressure regulation solenoid valve
AC088	Selector lever locking electromagnet
AC094	Reversing lights

GETtheMANUALS.org

NOTES	**Special note:** Only consult this customer complaint after a complete check using the diagnostic tool and a conformity check.

NO DIALOGUE WITH THE TOOL

- **No dialogue with the computer** **ALP1**

ENGINE STARTING PROBLEMS

- **The starter is not actuated when the selector lever is in position P and/or N** **ALP2**
- **The starter does not drive the engine, with the selector lever in position P or N** **ALP3**
- **The vehicle moves forwards or backwards with the selector lever in position N** **ALP4**

GEAR CHANGE PROBLEM

- **Erratic gear change in D** **ALP5**
- **Erratic gear change in manual mode** **ALP6**

GETtheMANUALS.org

ALP1	No dialogue with the computer

NOTES	**Special notes:** Only consult this customer complaint after running a check with the diagnostic tool on the multiplex network.

Make sure that the vehicle + after ignition feed is activated.
Check that the tool is not the cause of the fault, by attempting dialogue with a different system (UCH, Injection, etc.) on the same vehicle or another vehicle.
Carry out another multiplex network test on the vehicle using the diagnostic tool:
Is the automatic transmission computer recognised?

Yes

Establish communication with the automatic transmission computer.

Communication successful at first attempt?

Yes → End of fault finding

No

Identification screen displayed after three attempts?

No

Check that the computer connector is properly connected and check the condition of its connections.
Check for the automatic transmission supply fuse on the passenger compartment connection unit, and its condition.
Check the battery voltage:

9.5 V < battery voltage < **15.5 V**

Perform the operations required to obtain a correct voltage: Carry out a complete battery and charge circuit check (see **Technical Note 6014A, Charge circuit fault finding**).

Check the automatic transmission earths.
Check the computer supply:
Earth on tracks 9 and 10 of the computer 16 track connector.
+ after ignition feed on track 11 of the computer 16 track connector.

Carry out a multiplex network test. If the computer still does not respond, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test, then check with the diagnostic tool.

GETtheMANUALS.org

ALP2	The starter is not actuated when the selector lever is in position P and/or N

NOTES	**Special notes:** There must be no present or stored electrical faults. Only consult this customer complaint after a check using the diagnostic tool and a conformity check.

Apply this ALP after a complete check on the ignition circuit.

Check the battery voltage:

9.5 V < battery voltage < **15.5 V**

Perform the operations required to obtain a correct voltage: Carry out a complete battery and charge circuit check (see **Technical Note 6014A, Charge circuit fault finding**).

Carry out fault finding on the injection computer (see **13B, Diesel injection**) and deal with the various faults displayed on the diagnostic tool, if necessary.
Apply the customer complaints declared in the note if the cause is still present.

Connect the diagnostic tool to the vehicle and establish dialogue with the automatic transmission computer.
Check statuses **ET012 Gear lever position** and **ET013 Gear engaged**: check the consistency between the display on the tool and the selector lever locked positions (ignition on and engine stopped): P or N.

Are they consistent?

No

Check that the selection cable is correctly positioned and mounted on the lever position sensor, located on the computer and in the passenger compartment.
If necessary, program the neutral position N using command **VP018 Program neutral position**.

Run the starter motor:
Is the starter actuated?

Yes

Contact the Techline.

No

Yes

End of fault finding

GETtheMANUALS.org

ALP3	The starter drives the engine, with the selector lever in a position other than P or N

NOTES	**Special notes:** There must be no present or stored faults. Only consult this customer complaint after a check using the diagnostic tool and a conformity check.

Connect the diagnostic tool to the vehicle and establish dialogue with the automatic transmission computer. Check statuses **ET012 Gear lever position** and **ET013 Gear engaged**: check the consistency between the display on the tool and the locked positions of the selector lever on the gear selector bridge piece (with ignition on and engine stopped): P or N

Are they consistent?

No

Check the selector cable setting and that the selector lever is correctly positioned on the lever position sensor, located in the computer (see **MR 402, Mechanics, 23A, automatic transmission, selection cable adjustment**).
If necessary, program the neutral position N using command **VP018 Program neutral position**.

If the fault is still present, contact the Techline.

End of fault finding procedure.
Incorrect interpretation of customer complaint.

GETtheMANUALS.org

ALP4	The vehicle moves forwards or backwards with the selector lever in position N

NOTES	**Special notes:** There must be no present or stored electrical faults. Only consult this customer complaint after a check using the diagnostic tool and a conformity check.

Connect the diagnostic tool to the vehicle and establish dialogue with the automatic transmission computer. Check statuses **ET012 Gear lever position** and **ET013 Gear engaged**: check the consistency between the display on the tool and the locked positions of the selector lever on the gear selector bridge piece (with ignition on and engine stopped).

Are they consistent?

No

Check the selector cable setting, and that the selector lever is correctly positioned on the lever position sensor, located on the computer.
If necessary, program the neutral position N using command **VP018 Program neutral position**.

Carry out a test on the gear selector.

Is there consistency?

No

Contact the Techline, to confirm changing the automatic transmission.

Yes

End of fault finding procedure.

Yes

Check the gearbox oil condition and level (Smell of burning, colour).

Does the condition of the oil suggest there is an internal fault with the automatic transmission?

Yes

Contact the Techline, to confirm changing the automatic transmission.

No

End of fault finding. Review the cause against the customer complaint.

GETtheMANUALS.org

ALP5	Erratic gear changes in D

NOTES	**Special notes:** There must be no present or stored electrical faults. Only consult this customer complaint after a check using the diagnostic tool and a conformity check.

Connect the diagnostic tool to the vehicle and establish dialogue with the automatic transmission computer.
Check statuses **ET012 Gear lever position** and **ET013 Gear engaged**: check the consistency between the display on the tool for these 2 statuses, with the vehicle in motion, position D.

Are they consistent?

yes

Check the gearbox oil condition and level (Smell of burning, colour).

Does the condition of the oil suggest there is an internal fault with the automatic transmission?

Yes

Contact the Techline, to confirm changing the automatic transmission.

No

End of fault finding procedure. Review the cause against the customer complaint.

No

Check the selector cable setting, and that the selector lever is correctly positioned on the lever position sensor, located on the computer.
If necessary, program the neutral position N using command **VP018 Program neutral position**.

Check the consistency of parameter **PR022 Accelerator pedal position**.

If inconsistent

Contact the Techline, to confirm changing the automatic transmission.

If consistent

Contact the Techline.

GETtheMANUALS.org

ALP6	**Erratic gear change in manual mode**

NOTES	**Special notes:** Only consult this customer complaint after running a check with the diagnostic tool on the multiplex network.

Check the selector lever clearance in manual position.
Check that the M + and M - switches are working properly with status **ET012 "Gear lever position"**.
Check the condition and the level of the gearbox oil (Smell of burning, colour).

GETtheMANUALS.org

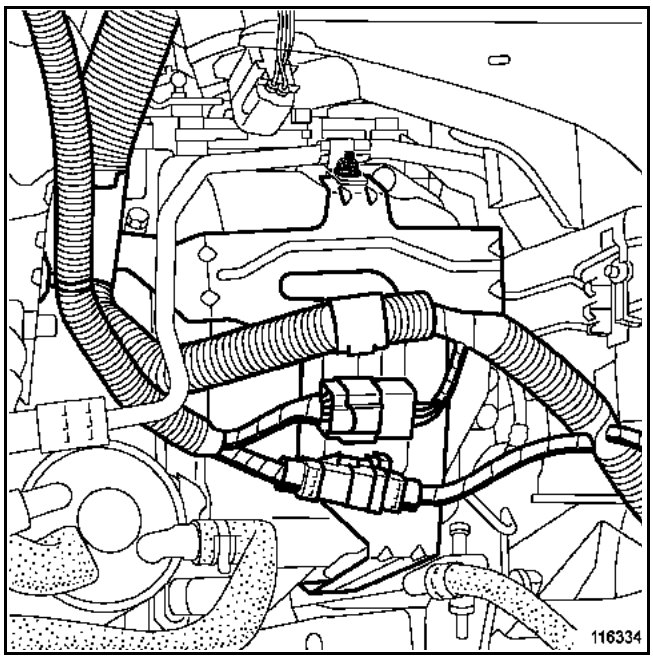
LINE PRESSURE MEASUREMENT → **TEST1**

GETtheMANUALS.org

Test 1	Line pressure measurement

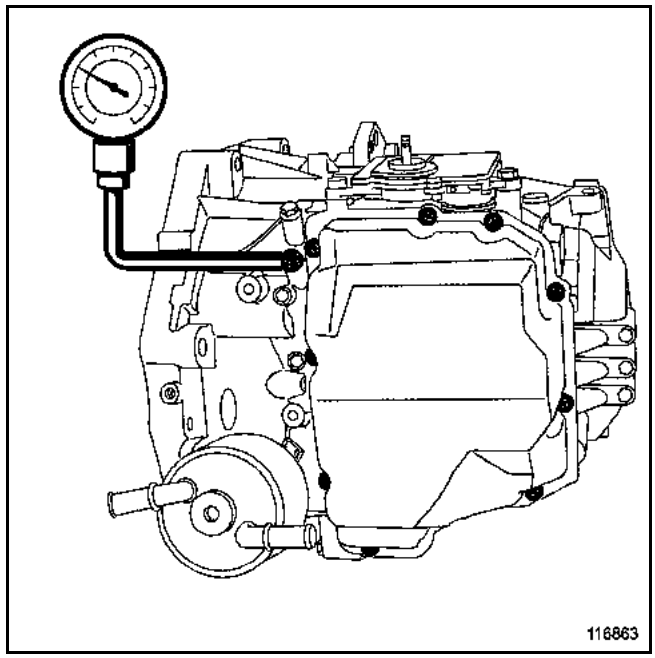
Tooling:
Gearbox kit Bvi 1215.01 and Bvi 1400.01.
Refit the O-ring to the line pressure tap plug and apply it to the end piece of the union to take the line pressure.

Prerequisite:
To access the line pressure checking bolts:
- Remove the engine undertray.
- Disconnect the wiring harness on the hydraulic distributor panel cover.

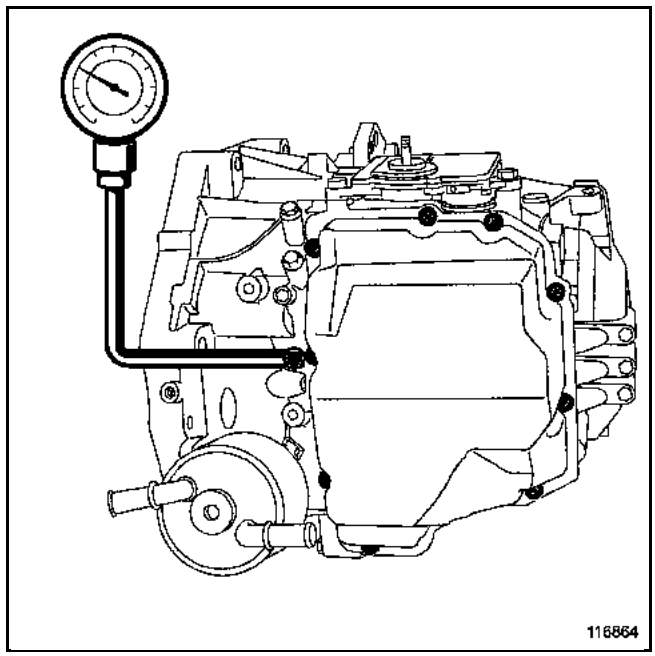


Procedure for measuring the line pressure:
- The apertures which enable the pressure to be taken are located on the converter housing, on the front of the vehicle.
- Use the plug O-ring already located on the gearbox.

Measuring the pressure in Drive position (D):



Measuring the pressure in position R (reverse):



GETtheMANUALS.org

1. SCOPE OF THIS DOCUMENT

This document presents the fault finding procedure applicable to all computers with the following specifications:

Vehicle: **ESPACE IV ph2**	*Name of computer*: **Automatic transmission**
Function concerned: **Automatic transmission**	*Vdiag No.*: **04**

2. PREREQUISITES FOR FAULT FINDING

Documentation type

Fault finding procedures (this manual):
– Assisted fault finding (integrated into the **diagnostic tool**), Dialogys.
Wiring Diagrams:
– Visu-Schéma (CD-ROM).

Type of diagnostic tools

– CLIP

Special tooling required

Special tooling required	
	Multimeter
Elé. 1681	**Universal bornier**

3. REMINDERS

Procedure

To perform fault finding on the vehicle's computers, switch on the ignition in fault finding mode.

Proceed as follows:
– With the vehicle card in the card reader,
– press and hold start button (longer than **5 seconds**) with start-up conditions not fulfilled,
– connect the diagnostic tool and perform the required operations.

To **cut off + after ignition feed**, proceed as follows:
– disconnect the diagnostic tool,
– press the Start button twice briefly (less than **3 seconds**),
– ensure that the + after ignition feed has been cut off by checking that the computer indicator lights on the instrument panel have gone out.

GETtheMANUALS.org

Faults

Faults are declared as either present or stored (depending on whether they appeared in a certain context and have disappeared since, or whether they remain present but have not been diagnosed within the current context).

The **present** or **stored** status of faults should be taken into consideration when the **diagnostic tool** is switched on after the + after ignition feed (without any system components being active).

For a **present fault**, apply the procedure described in the **Interpretation of faults** section.

For a **stored fault**, note the faults displayed and apply the instructions in the **Notes** section.

If the fault is **confirmed** when the instructions in the Notes section are applied, the fault is present. Deal with the fault

If the fault is **not confirmed**, check:
- the electrical lines which correspond to the fault,
- the connectors on these lines (corrosion, bent pins, etc.),
- the resistance of the component detected as faulty,
- the condition of the wires (melted or split insulation, wear).

Conformity check

The aim of the conformity check is to check data that does not produce a fault on the **diagnostic tool** because the data is inconsistent. Therefore, this stage is used to:
- carry out fault finding on faults that do not have a fault display, and which may correspond to a customer complaint.
- check that the system is operating correctly and that there is no risk of a fault recurring after repairs.

This section gives the fault finding procedures for statuses and parameters and the conditions for checking them.

If a status is not behaving normally or a parameter is outside the permitted tolerance values, consult the corresponding fault finding page.

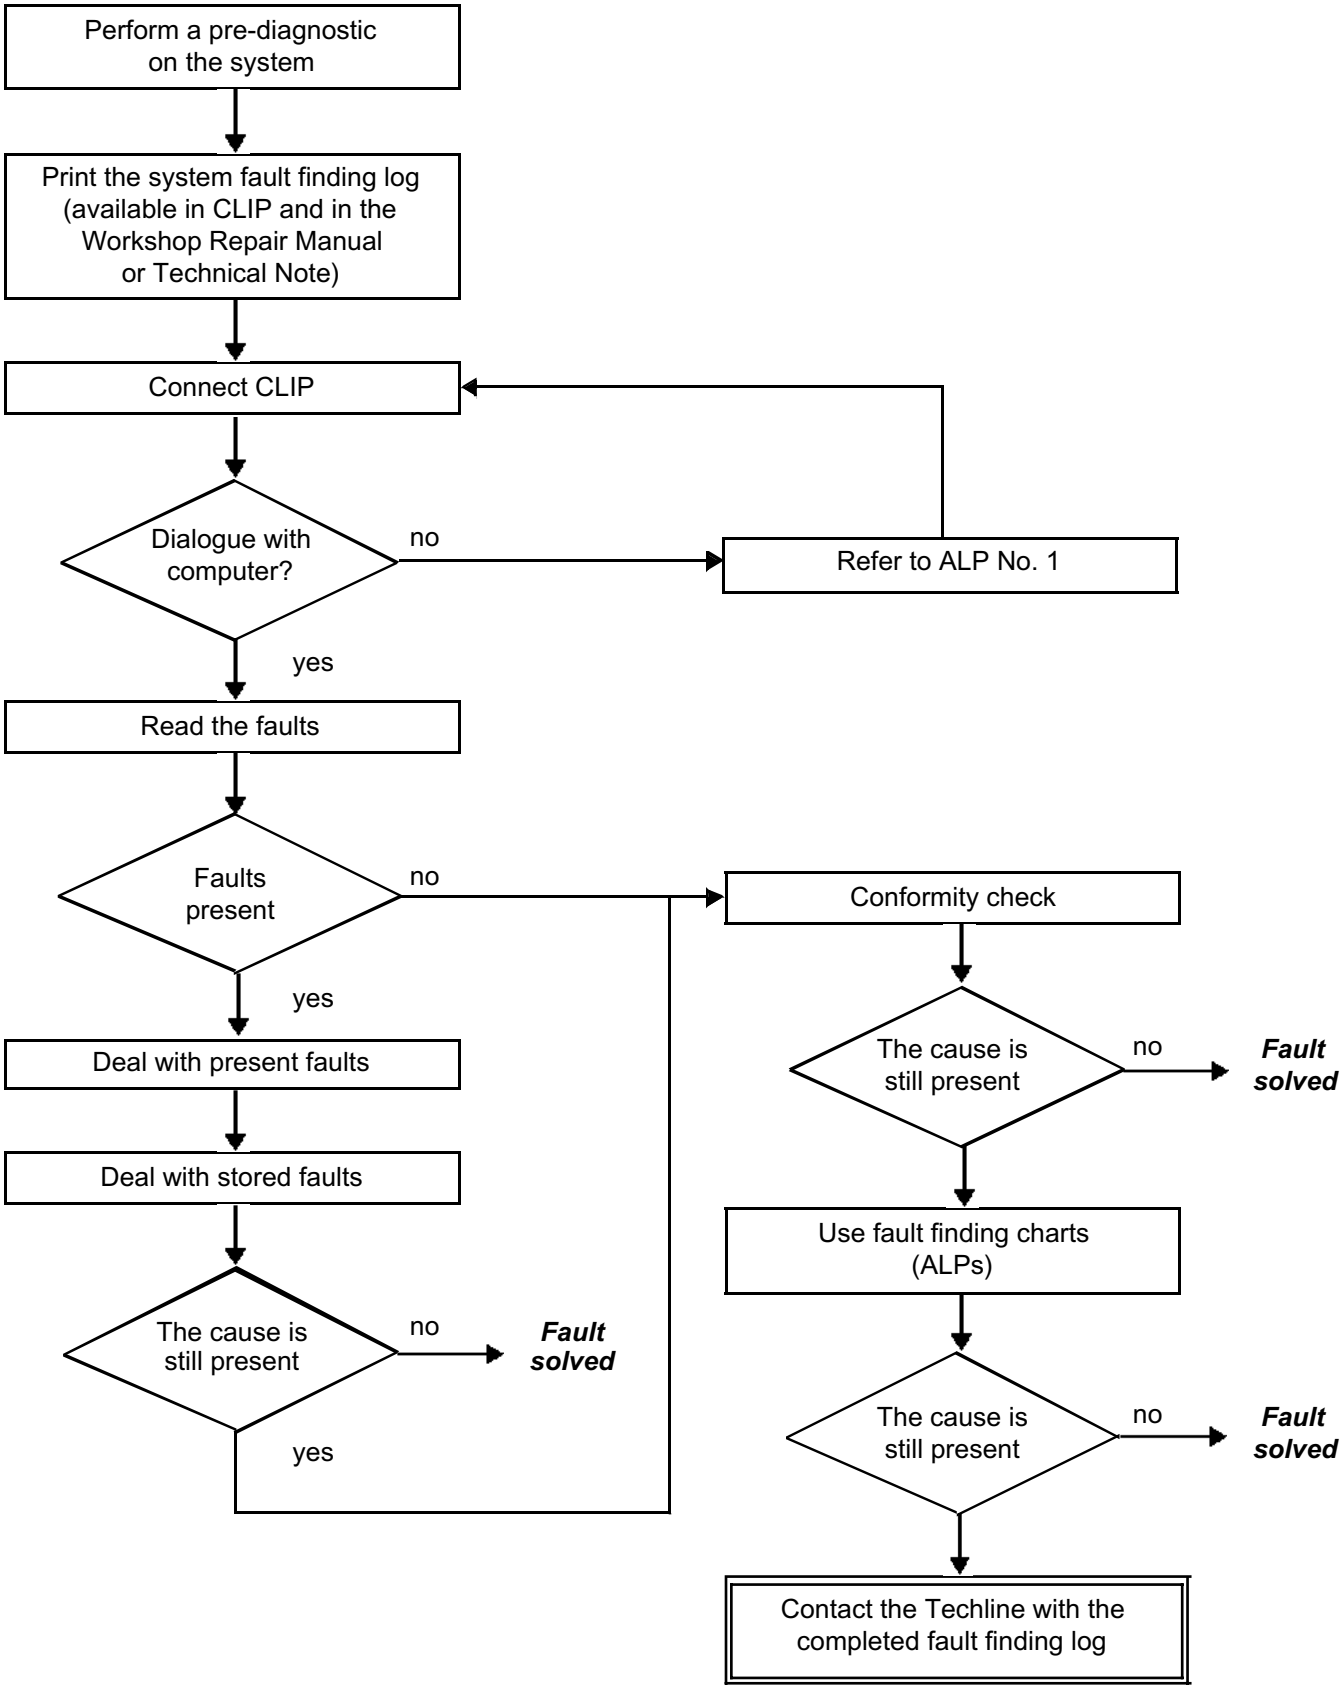
Customer complaints - Fault finding chart

If the test with the **diagnostic tool** is OK but the customer complaint is still present, the fault should be processed by **customer complaints**.

A summary of the overall procedure to follow is provided on the following page in the form of a flow chart.

GETtheMANUALS.org

4. FAULT FINDING PROCEDURE



GETtheMANUALS.org

4. FAULT FINDING PROCEDURE (CONTINUED)

Wiring check

Note:
Carry out each requested check visually. Do not remove a connector if it is not required.

Note:
Repeated connections and disconnections alter the functionality of the connectors and increase the risk of poor electrical contact. Limit the number of connections/disconnections as much as possible.

Note:
The check is carried out on the 2 parts of the connection. There may be two types of connections:
- Connector / Connector
- Connector / Device

Fault finding problems

Disconnecting the connectors and/or manipulating the wiring harness may temporarily remove the cause of a fault.
Electrical measurements of voltage, resistance and insulation are generally correct, especially if the fault is not present when the analysis is made (stored fault).

Visual inspection of the connection:

- Check that the connector is connected correctly and that the male and female parts of the connection are correctly coupled.

Visual inspection of the area around the connection:

- Check the condition of the mounting (pin, strap, adhesive tape, etc.), that the connectors are attached to the vehicle.
- Check that there is no damage to the wiring trim (sheath, foam, adhesive tape, etc.) near the wiring.
- Check that there is no damage to the electrical wires at the connector outputs, in particular on the insulating material (wear, cuts, burns, etc.).

Disconnect the connector to continue the checks.

Visual inspection of the plastic casing:

- Check that there is no mechanical damage (casing crushed, cracked, broken, etc.), in particular to the fragile components (lever, lock, openings, etc.).
- Check that there is no heat damage (casing melted, darker, deformed, etc.).
- Check that there are no stains (grease, mud, liquid, etc.).

Visual inspection of the metal contacts:

(The female contact is called CLIP. The male contact is called TAB.)

- Check that there are no bent contacts (the contact is not inserted correctly and can come out of the back of the connector). The spring contact of the connector when pulling the wire slightly.
- Check that there is no damage (folded tabs, clips open too wide, blackened or melted contact, etc.).
- Check that there is no oxidation on the metal contacts.

GETtheMANUALS.org

Visual inspection of the sealing:
(*Only for watertight connectors*)

- Check for the seal on the connection (between the 2 parts of the connection).
- Check the seal at the back of the connectors:
  - For *unit* joints (1 for each wire), check that the unit joints are present on each electrical wire and that they are correctly positioned in the opening (level with the housing). Check that plugs are present on openings which are not used.
  - For a *grommet* seal (one seal which covers the entire internal surface of the connector), check that the seal is present.
  - For *gel* seals, check for gel in all of the openings without removing the excess or any protruding sections (it does not matter if there is gel on the contacts).
  - For *hotmelt* sealing (heat-shrink sheath with glue), check that the sheath has contracted correctly on the rear of the connectors and electrical wires, and that the hardened glue comes out of the side of the wire.
- Check that there is no damage to any of the seals (cuts, burns, significant deformation, etc.).

If a fault is detected, repair or replace the wiring (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**).

GETtheMANUALS.org

5. FAULT FINDING LOG

IMPORTANT

IMPORTANT
Any fault on a complex system requires thorough fault finding with the appropriate tools. The FAULTFINDING LOG, which should be completed during the procedure, enables you to keep track of the procedure which is carried out. It is an essential document when consulting the manufacturer.

IT IS THEREFORE MANDATORY TO FILL OUT A FAULT FINDING LOG EACH TIME IT IS REQUESTED BY TECHLINE OR THE WARRANTY RETURN PLATFORM.

You will always be asked for this log:

- when requesting technical assistance from Techline,
- for approval requests when replacing parts for which approval is mandatory,
- to be attached to monitored parts for which reimbursement is requested. The log is needed for warranty reimbursement, and enables better analysis of the parts removed.

6. SAFETY INSTRUCTIONS

Safety rules must be observed during any work on a component to prevent any damage or injury:

- check the battery voltage to avoid incorrect operation of computer functions,
- use the proper tools.

GETtheMANUALS.org

Number	Description
1	Oil temperature sensor
2	Clutch 1 solenoid valve
3	Clutch 1 solenoid valve
4	Clutch 3 solenoid valve
5	LS* pressure regulation solenoid valve
6	"EVS1"* shift solenoid
7	"EVS2"* shift solenoid
8	Converter lockup and brake 1 solenoid valve
9	Brake 2 solenoid valve

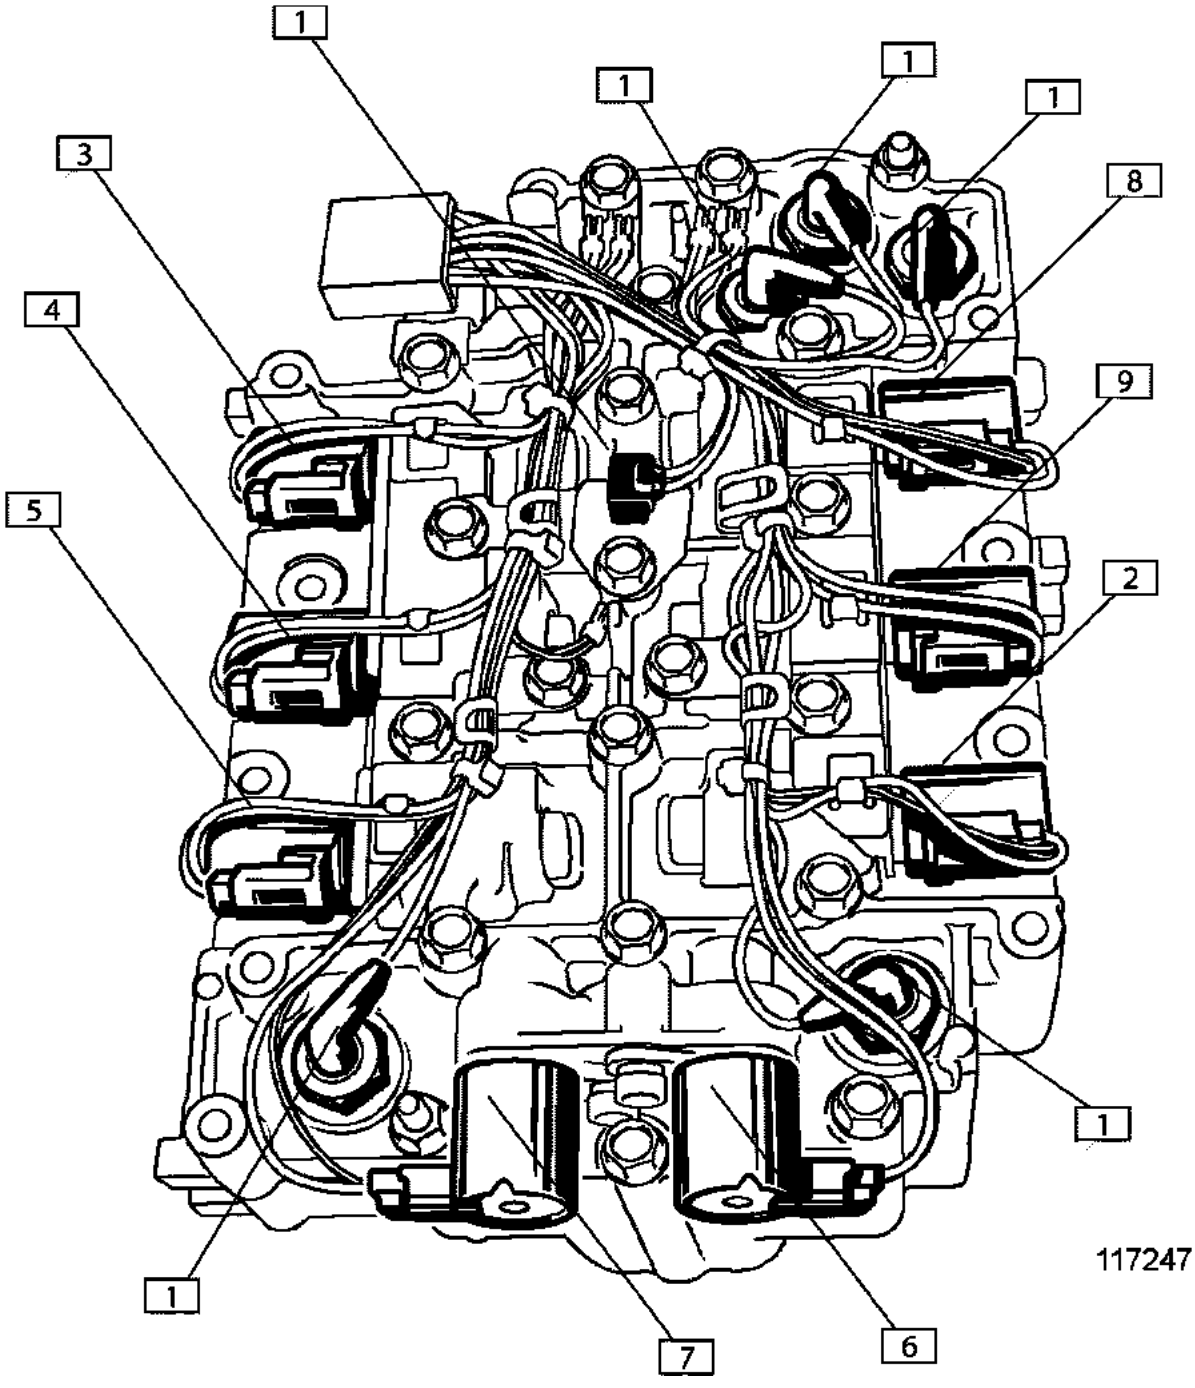
*LS: line pressure.
*EVS: sequence solenoid valve.

GETtheMANUALS.org



GETtheMANUALS.org

Role of main automatic transmission components

Automatic transmission computer:
The gearbox computer is used to manage the entire system.
Its role is to define the optimum operating mode for the automatic transmission (modify the torque transmitted to the drive wheels by the automatic transmission), inform the driver (instrument panel, information display, buzzer) and communicate with the other computers.
To carry out this function, the transmission computer takes account of:
– the operation of the gearbox,
– signals exchanged with other computers,
– driver requests.

Gearbox oil temperature sensor:
Its role is to inform the automatic transmission computer of the transmission oil temperature.

Transmission input speed sensor:
Its role is to inform the automatic transmission computer of the turbine speed.

Transmission output speed sensor:
Its role is to inform the automatic transmission computer of the vehicle speed.

Brake light switch:
Its role is to inform the automatic transmission computer that the driver has depressed the brake pedal.

Multifunction switch:
Its role is to inform the automatic transmission computer of the gear lever position.

Shift-lock:
The role of this function is to lock the lever in position “P” and to immobilise the vehicle when stationary.

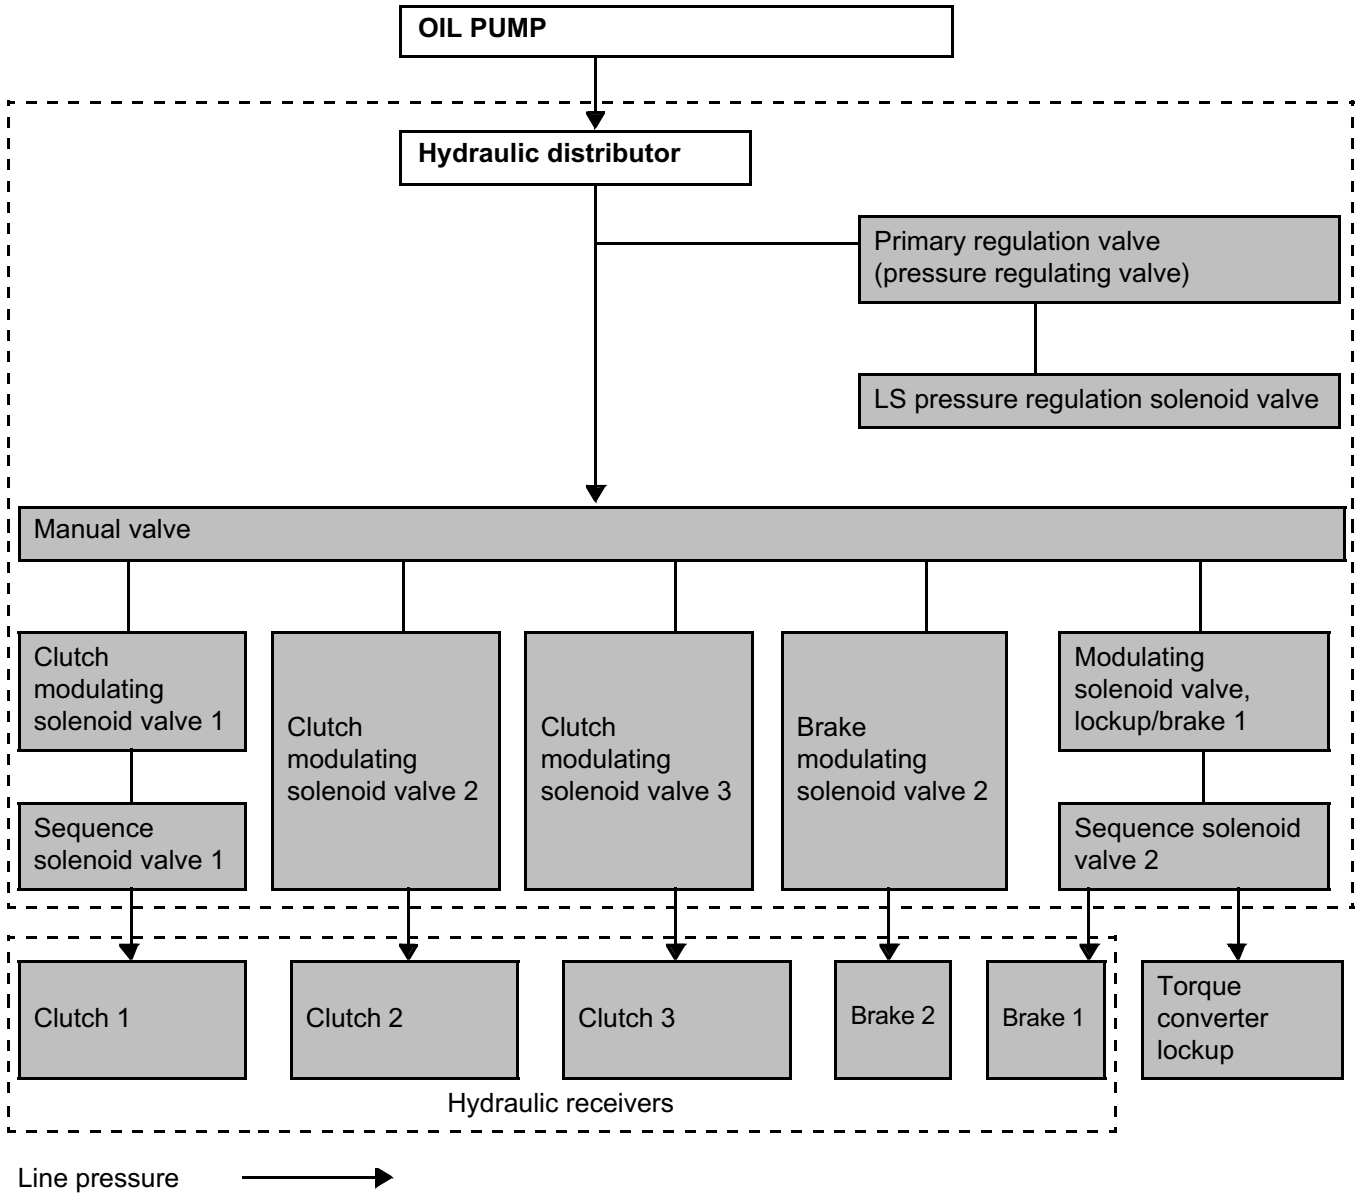
Solenoid valves:
The solenoid valves are fitted in the factory and cannot be removed from the hydraulic distributor to ensure optimum gearbox operation, therefore they cannot be replaced separately.
The automatic transmission has two types of solenoid valve:
– 2 "all or nothing" solenoid valves,
– 6 "progressive" solenoid valves.
Of these 8 solenoid valves, 7 are used to control gear changes in automatic and manual modes, and one solenoid valve controls the oil pressure in the automatic transmission hydraulic distributor.

Instrument panel display:
The purpose of this function is to manage the transmission of multiplex line signals required for the instrument panel display.

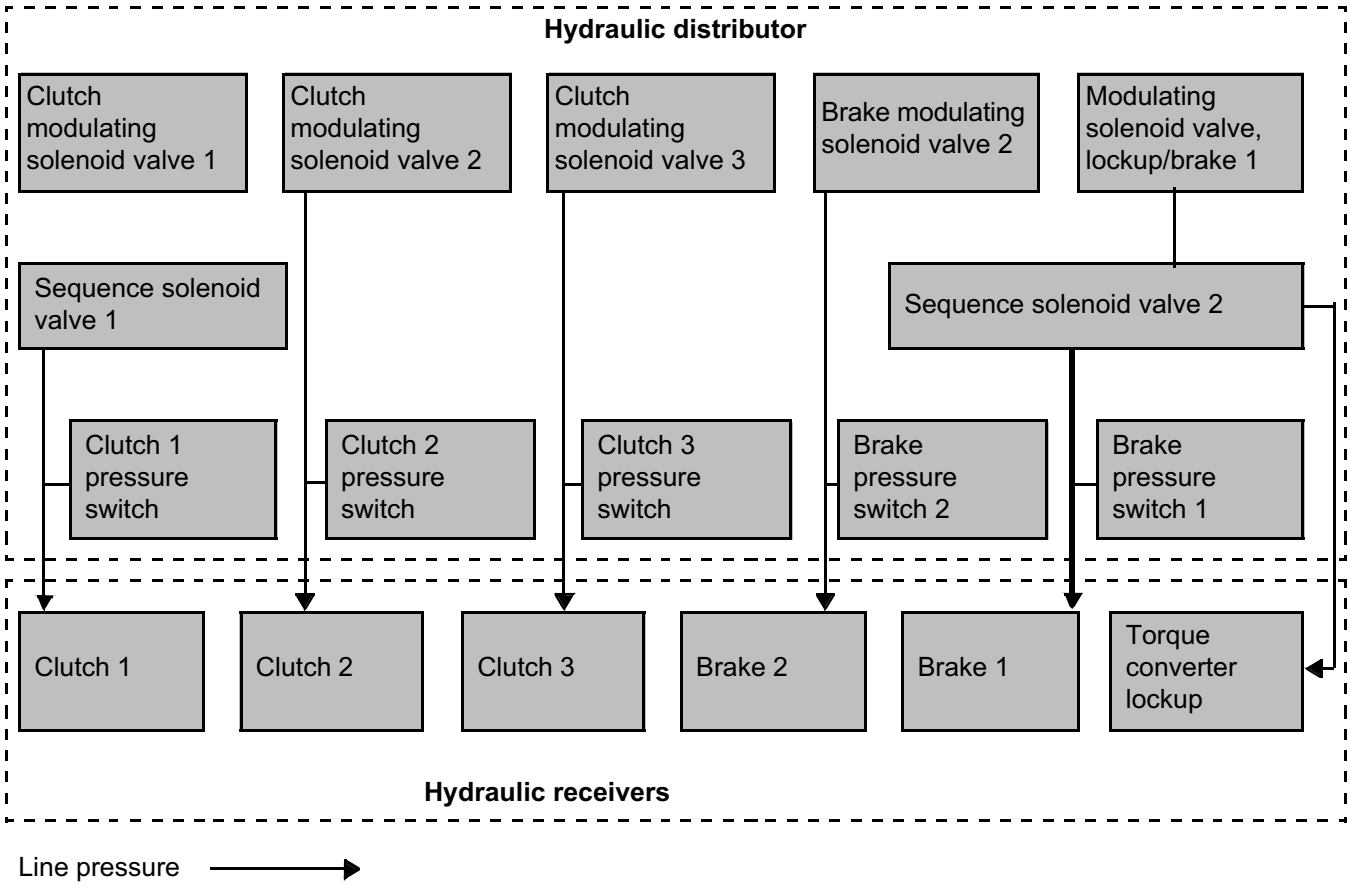
On the instrument panel:
– a fault warning light,
– a message on the instrument panel in case of irregularity,
– an information display: gear lever position / gear engaged / brake pedal depressed indicator light / lever positioning in P or N request indicator light.

On the gear lever:
– Position: P / R / N / D / M+/-,
– Shift-lock: lever lock.

GETtheMANUALS.org



GETtheMANUALS.org



GETtheMANUALS.org

The automatic transmission computer performs the following functions:

– Transmission operating mode selection:
According to the vehicle speed and the driver's request expressed by the accelerator pedal position, the automatic transmission determines the best moment for the gear change. The automatic transmission computer corrects any driver errors and inhibits engagement of a gear that would cause the engine to over- or under-rev.

– Gear changes:
Taking into account the various input factors, the computer will decide whether to actuate the various solenoid valves to ensure smooth system operation (automatic transmission clutches, brakes and hydraulics).

The computer is also involved in:
- the gear change quality,
- protecting the automatic transmission in the event of a malfunction.

– Disengaging clutch when stopped:
This function enables creep* to be inhibited temporarily when the vehicle is stationary with a gear engaged and the brake pedal depressed.

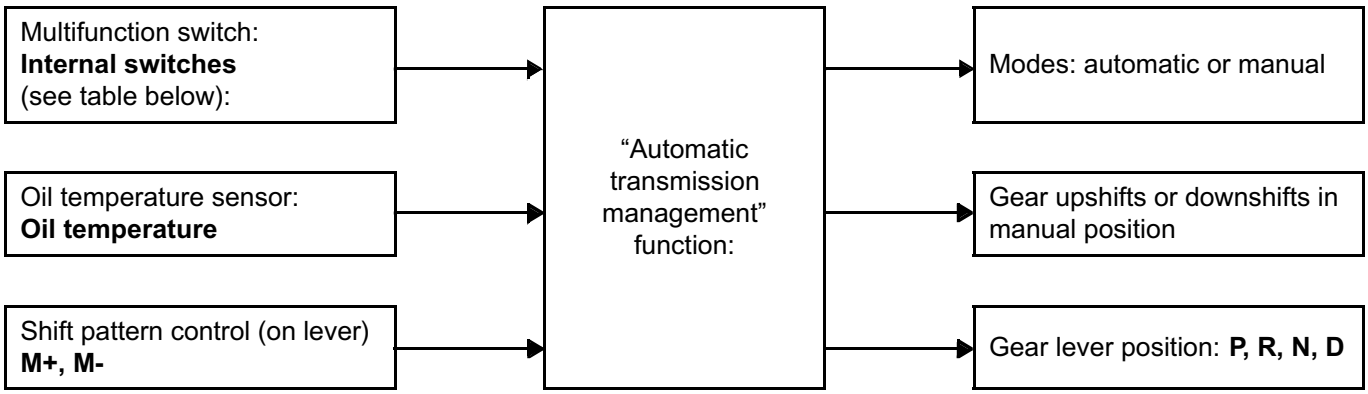
The aim of this function is to reduce drag on the vehicle in order to:
- reduce fuel consumption,
- reduce vehicle vibrations,

Creep*: describes the action of the vehicle moving forwards without acceleration and with a gear engaged.

GETtheMANUALS.org

"Automatic transmission management" FUNCTION:

Purpose of this function:
This function enables the automatic transmission computer to define the gear change programs.



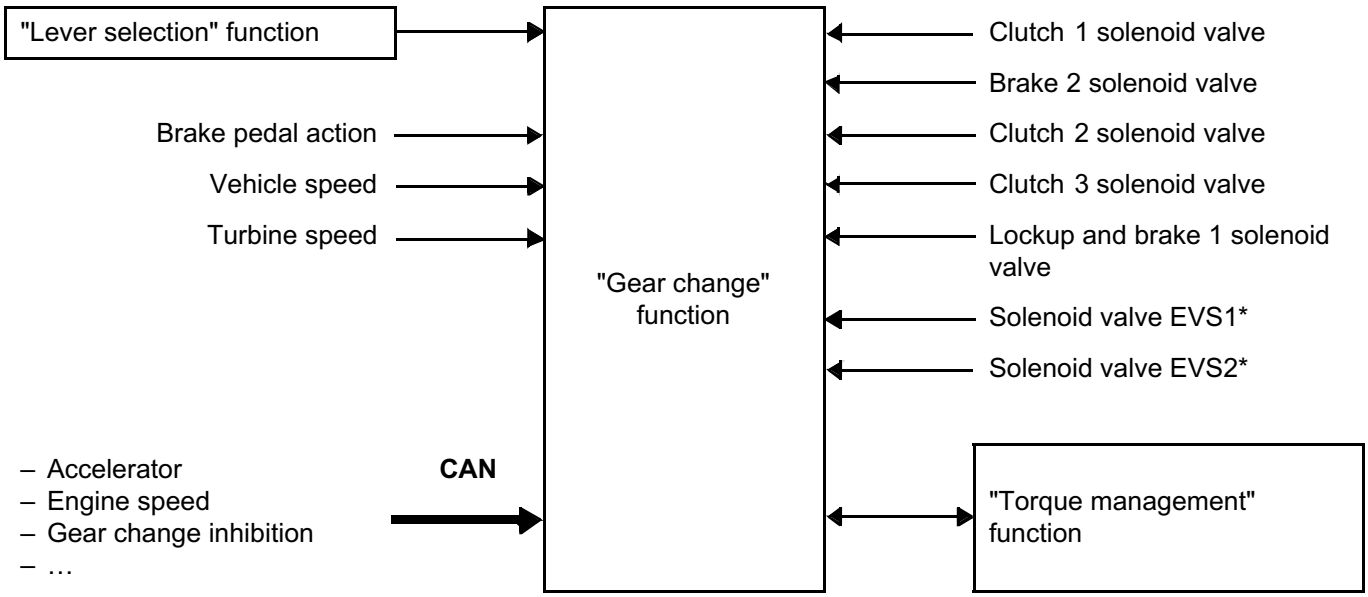
Position of multifunction switch and its associated tracks on the computer:

Track \ Position	P	R	N	D
2		o		
1	o			
3			o	
4				o
56	o	o	o	o

GETtheMANUALS.org

"GEAR CHANGE" FUNCTION:

Purpose of this function:
The purpose of this function is to control gear changes in automatic and manual modes.



***EVS: Sequence solenoid valve**

GETtheMANUALS.org

System operation table:

	PRESSURE SWITCHES					SOLENOID VALVES					SOLENOID VALVES (ALL OR NOTHING)	
	Clutch* 1	Brake 2	Clutch* 2	Clutch* 3	Brake 1	Clutch* 1	Brake 2	Clutch* 2	Clutch* 3	Lockup and brake 1	*EVS1	*EVS2
P												O
R			O		O			O		O		O
N								O	O			O
fixed 1st gear	O				O	O		O	O	O		O
D1	O*					O		O	O			O
D2	O	O				O	O	O	O			
D2 with lockup	O	O				O	O	O	O	O

D6 with lockup		O		O			O	O		O	O	

O = **Active**
***Clutch =** **Clutch**
***EVS =** **Sequence solenoid valve**
******O*: Check (engine running at idle speed and brake pedal depressed), status **ET261 "Clutch 1"** lever in position **"D":**
ET013 "gear engaged" = "1" -> status **ET261 "Clutch 1"** is **"active"**; if status **ET013 "gear engaged"** is **"disengaged"** (clutch disengaged when stationary) -> **ET261 "Clutch 1"** is **"inactive"**.

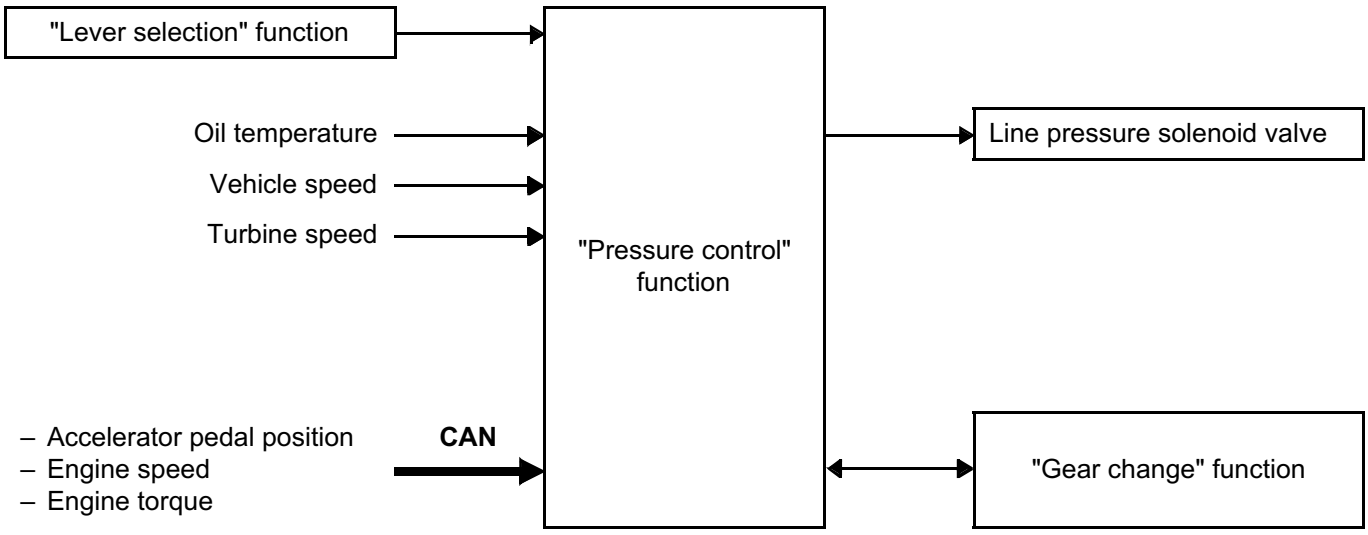
GETtheMANUALS.org

Note:
– Clutch solenoid valves 2 and 3 are high pressure solenoid valves. These solenoid valves are in opposition to the status of their corresponding pressure switch.
Example:
– In position "R", clutch solenoid valve 3 is active (therefore under low pressure) and the clutch pressure switch 3 status is inactive.
– Clutch solenoid valve 1, brake solenoid valve 2 and brake/lockup solenoid valve 1 are low pressure solenoid valves. These solenoid valves are therefore in phase with the status of their corresponding pressure switch.

Note:
If the gearbox is D2 locked up, D3 locked up, D4 locked up, D5 locked up or D6 locked up, the brake pressure switch status is not in line with brake/lockup solenoid valve 1.

"PRESSURE CONTROL" FUNCTION:

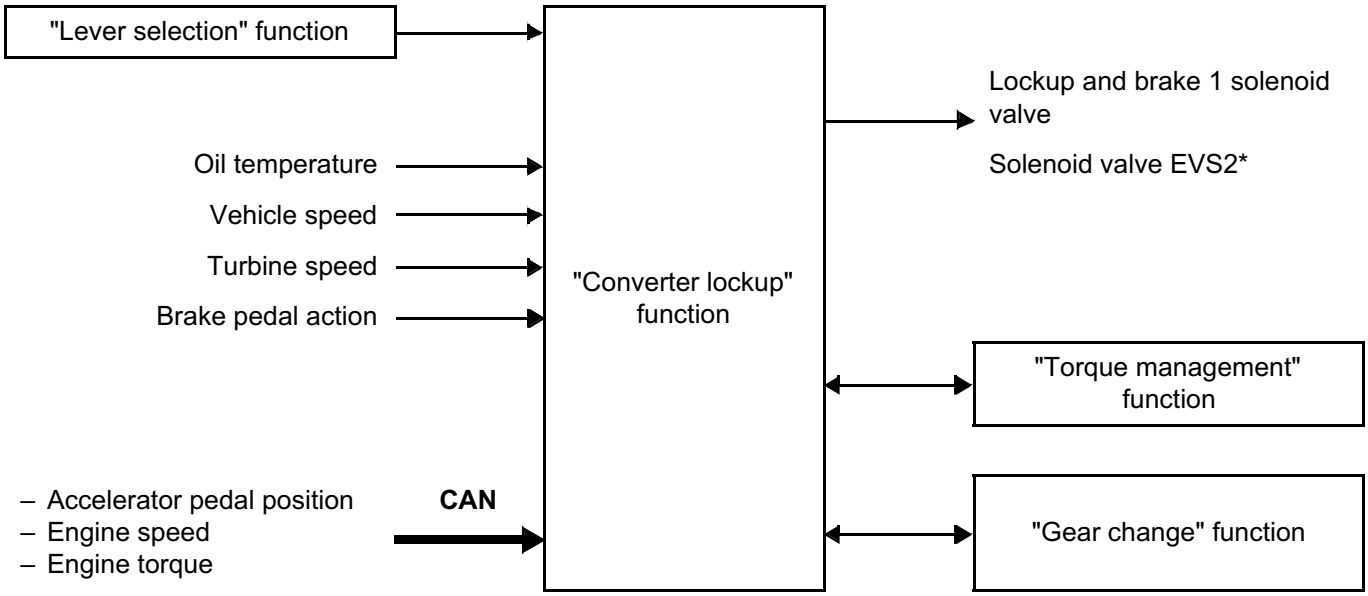
Purpose of this function:
The purpose of this function is to regulate the oil pressure inside the transmission hydraulic distributor.



GETtheMANUALS.org

"CONVERTER lockup" FUNCTION:

Aim of this function: The aim of this function is to lock up the converter.



Lockup/release definition:

The converter is a hydraulic clutch which provides a hydraulic connection between the engine and the automatic transmission pressure plate.

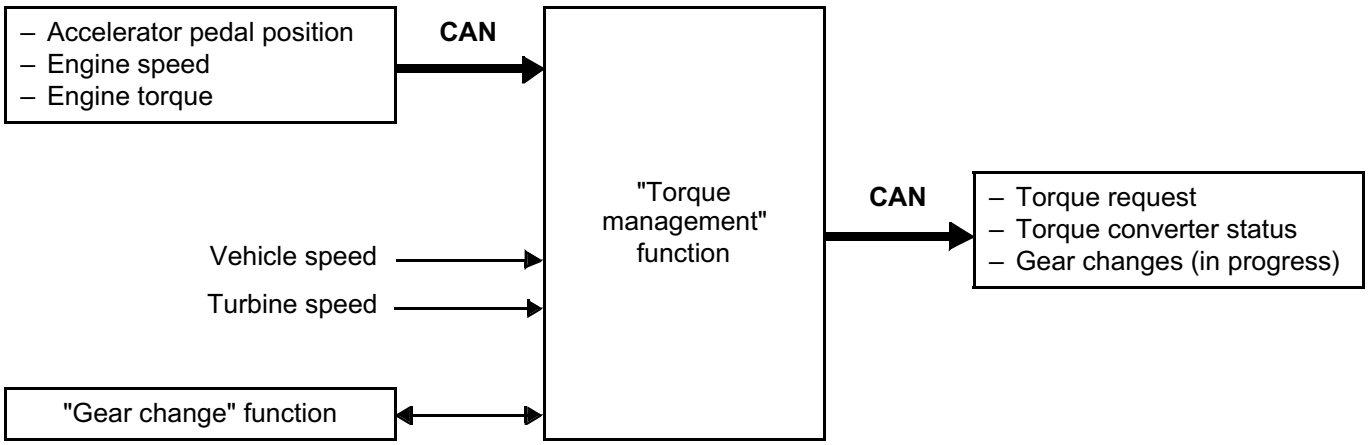
The purpose of the lockup function is to lock the turbine and the converter casing together, transforming a hydraulic connection into a mechanical connection. The role of the lockup function is to prevent slipping losses.

EVS2*: sequence solenoid valve 2.

GETtheMANUALS.org

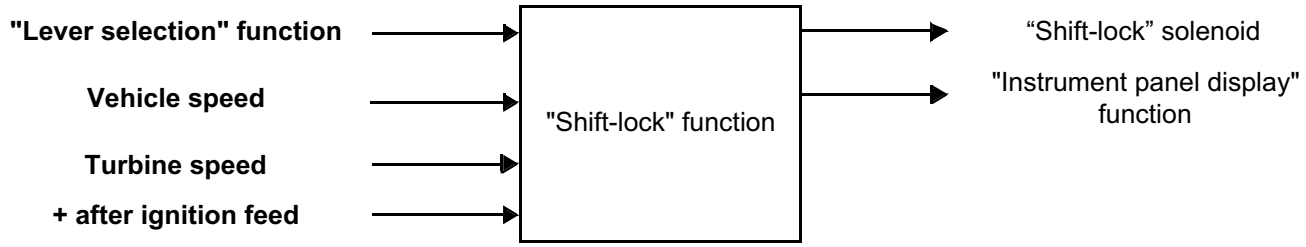
"TORQUE MANAGEMENT" FUNCTION:

Purpose of this function:
The purpose of this function is to manage the torque setpoints during certain gear shifts by informing the injection computer. This function means smoother gear shifts and better mechanical protection.



"SHIFT LOCK" FUNCTION:

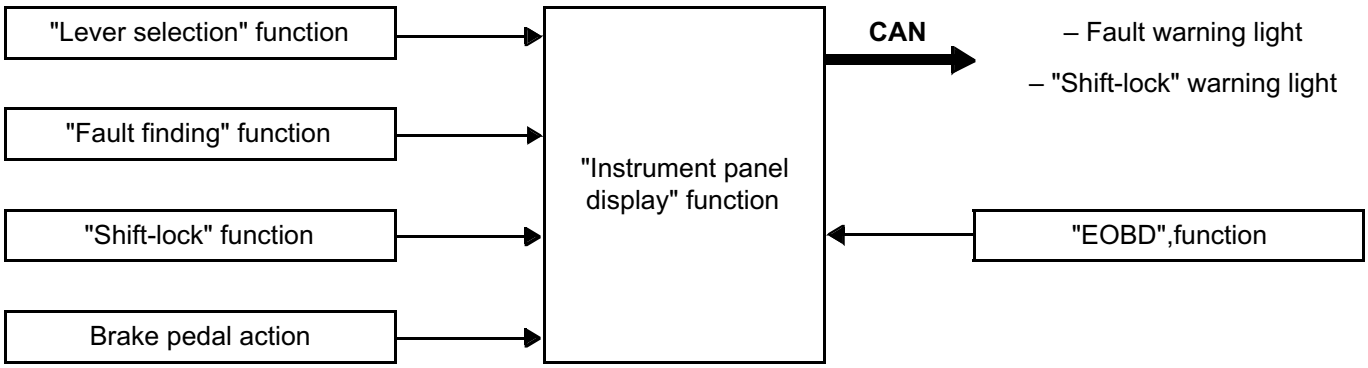
Purpose of this function:
Shift-lock: locking the gear lever in position **"P"** and blocking the transmission to immobilise the vehicle while stationary.
To release the gear lever from position "**P**", the vehicle must be stationary and the brake pedal depressed.



GETtheMANUALS.org

"INSTRUMENT PANEL DISPLAY" FUNCTION:

Purpose of this function:
The purpose of this function is to manage the transmission of multiplex line signals required for the instrument panel display.



GETtheMANUALS.org

Replacing the gearbox computer:
Remove the automatic transmission **computer** (see **MR 405 mechanical, 23A, Automatic transmission, Automatic transmission computer, Removal - Refitting**).

Refit the **automatic transmission computer** (see **MR 405 mechanical, 23A, Automatic transmission, Automatic transmission computer, Removal - Refitting**).

Establish dialogue with the **diagnostic tool**.
Use command **VP001 Enter VIN**.
Run command **VP009 "Write last After-Sales Service operation date"**.

Do not carry out any automatic programming if replacing the automatic transmission computer. Automatic programming is finalised when the vehicle is driven.
In order to optimise the automatic programming before delivering the vehicle to the customer, apply the "Programming procedure" shown below.

Replacing the hydraulic distributor:
Remove the transmission **hydraulic distributor** (see **MR 405 mechanical, 23A, automatic transmission, Hydraulic distributor, Removal - Refitting**).
Refit the transmission **hydraulic distributor** (see **MR 405 mechanical, 23A, automatic transmission, Hydraulic distributor, Removal - Refitting**).

Replacing the automatic transmission
Remove the transmission (see **MR 405, Mechanical, 23A, Automatic transmission, Removal - Refitting**).
Refit the transmission (see **MR 405, Mechanical, 23A, Automatic transmission, Removal - Refitting**).

Establish communication with the **diagnostic tool**.
Run command **VP009 "Write last After-Sales Service operation date"**.

The self-programming functions are performed when the vehicle is being driven.
In order to optimise the automatic programming before delivering the vehicle to the customer, apply the "Programming procedure" shown below.

PROGRAMMING PROCEDURE:
Programming conditions:
The automatic gearbox oil temperature should be between **60 ˚C and 100 ˚C**.
Stationary, engine running, **brake pedal depressed**:
→ **When stationary, engage neutral at least 5 times to consolidate the programming.**
While driving:
→ **Engage the same gear at least 5 times (i.e. under the same conditions) to consolidate the programming.**

Note:
Gear changes are slow and harsh the first few times the vehicle is driven, until the automatic transmission computer has carried out its automatic programming.
During upshifts and downshifts, the system analyses variations in oil pressure, components (play in the brakes and clutches, changes in spring stiffness due to ageing) and input torque, then corrects the variations in order to maintain the quality of gear changes.
The system analyses the turbine speed during the 3 phases of drag reduction (selection of Neutral when stationary, regulation during drag reduction and deselection of Neutral) and corrects this speed by adjusting the converter lockup solenoid valve pressure.

* APV: After-Sales

GETtheMANUALS.org

SETTINGS

VP001: **Enter VIN.**
This command permits manual entry of the vehicle's VIN into the computer.
Use this command each time the computer is replaced or (re)programmed.

VP009: **Enter last APV* operation date.**
Run this command after replacing or removing - refitting the transmission computer and the automatic transmission.
This command is used to enter the date of the last service operation.

Do not carry out any programming operation if replacing a component; automatic programming is carried out during driving (See **Replacement of components, Programming procedure**).

* APV: After-Sales

DF023 PRESENT OR STORED	GEARBOX OIL TEMPERATURE SENSOR CIRCUIT CO.1 : Short circuit or open circuit to + 12 V 1.DEF : Permanent low level CC.0 : Short circuit to earth 2.DEF : Signal incoherence

NOTES	**Conditions for applying fault finding procedures to stored faults:** The fault is declared present after: **– in the event of open circuit or short circuit+:** – **+ after ignition feed**, – oil temperature ≤ **- 40 °C**, – vehicle speed > **6 mph (10 km/h)**. **– in the event of permanent low level:** – **+ after ignition feed**, – oil temperature < **- 20 °C**, – vehicle speed > **6 mph (10 km/h)**, – accelerator pedal > **12.5 %** and engine speed > **305 rpm**. **– in the event of short circuit-:** – **+ after ignition feed**, – oil temperature > **180 °C**, – vehicle speed > **6 mph (10 km/h)**, – accelerator pedal > **12.5 %** and engine speed > **305 rpm**. – (**detection time in the event of short circuit- is 10 minutes**). **– in the event of signal incoherence:** – **+ after ignition feed**, – **- 20 °C** < oil temperature < **20 °C**, – vehicle speed > **6 mph (10 km/h)**, – accelerator pedal > **12.5 %** and engine speed > **305 rpm**.
	Effect on system: **– in the event of open circuit or short circuit+:** – The transmission operates as if the temperature was very low. – The lockup is inhibited (still open). Note: The default value is **-55 °C**. **– in the event of permanent low level:** – The transmission operates as if the temperature was very low. **– in the event of short circuit-:** – The transmission operates as if the temperature had increased. – No drag reduction when stationary. – The motor-driven fan assemblies are triggered at a vehicle speed < **48 mph (80 km/h)** until the fault appears. **– in the event of signal incoherence:** – No system effect.

GETtheMANUALS.org

DF023 CONTINUED 1	

NOTES	**Customer complaint:** **– in the event of open circuit or short circuit+:** If the fault occurs while driving, the transmission engages fixed 5th gear. Restarting is in 3rd gear. Gear change quality is reduced. Fault warning light comes on. **– in the event of permanent low level:** Fault warning light comes on. **– in the event of short circuit-:** Fault warning light comes on. **– in the event of signal incoherence:** Fault warning light comes on.
	Use the Wiring Diagrams Technical Note, ESPACE IV ph2.

Check that the coolant temperature **(**see **13B, Diesel injection, Conformity check)** is ≥ **- 40 ˚C** (the gearbox oil temperature sensor is within its operating range).
If the oil temperature is ≤ **- 40 ˚C**, move on to **step 1**.
If the oil temperature is ≥ **- 40 ˚C**, deal with the fault, move on to **step 2**.

Step 1:

Start the vehicle, check that the engine coolant temperature is ≥ **20 ˚C**.
If the fault is stored, deal with the other faults displayed on the **diagnostic tool**. In the absence of faults, end of fault finding.
If a fault is still present, deal with it, then move on to **step 2**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF023 CONTINUED 2	

Step 2:

Look for any damage to the harness and check the condition and connection of the **automatic transmission computer** and **automatic transmission** connectors.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Disconnect the connector of component **119**, measure the **resistance of the oil temperature sensor** (on the connector of component **119**) between the following connections:
- Connection code **5BZ**,
- Connection code **5BY**.

The **resistance** should be between:
– **4.208 ± 0.42 kΩ at 20 ˚C,**
– **1.947 ± 0.19 kΩ at 40 ˚C,**
– **0.988 ± 0.09 kΩ at 60 ˚C.**

Is the **resistance** correct?
If YES, contact the Techline.
If NO, move on to **step 3**.

Stage 3:

Disconnect the connector from component **R22** and check the **continuity and insulation** of the following connections:
- Connection code **5BZ**,
- Connection code **5BY**.

Between component 119 and connector R22.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Are the **continuity and insulation** correct?
If YES, move on to **step 4**.
If NO, replace the **external wiring harness** on the automatic transmission.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF023 CONTINUED 3	

Stage 4:

Measure the **resistance** of the **oil temperature sensor** (on connector **R22**) between the following connections:
- Connection code **5BZ**,
- Connection code **5BY**.

The **resistance** should be between:
– **4.208 ± 0.42 kΩ at 20 ˚C,**
– **1.947 ± 0.19 kΩ at 40 ˚C,**
– **0.988 ± 0.09 kΩ at 60 ˚C.**

Is the **resistance** correct?
If YES, and if the fault is still present, contact the Techline.
If NO, move on to **step 5**.

Stage 5:

Drain the **automatic transmission** (see **MR 405, Mechanical, 23A Automatic transmission, Oil change**) and remove the transmission housing (see **MR 405, Mechanical, 23A Automatic transmission, Hydraulic distributor**).

Measure the **resistance** of the **transmission temperature sensor** (on the connector of the **internal wiring harness** on the **transmission**) between the following connections:
- Connection code **5BZ**,
- Connection code **5BY**.

The **resistance** should be between:
– **4.208 ± 0.42 kΩ at 20 ˚C,**
– **1.947 ± 0.19 kΩ at 40 ˚C,**
– **0.988 ± 0.09 kΩ at 60 ˚C.**

Is the **resistance** correct?
If YES, move on to **step 6**.
If NO, replace the **internal wiring harness** on the **automatic transmission**.

Stage 6:

Measure the **continuity and insulation** of the following connections:
- Connection code **5BZ**,
- Connection code **5BY**.

Between connector **R22 and the internal connector in the transmission**.

Are the **continuity and insulation** correct?
If YES, contact the Techline.
If NO, replace the wiring harness between connector **R22** and the **internal** connector in the transmission.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF038 PRESENT OR STORED	TURBINE SPEED SENSOR CIRCUIT 1.DEF : Open circuit or short circuit

NOTES	**Conditions for applying fault finding procedures to stored faults:** The fault is declared present after: – **+ after ignition feed**, – with the engine running, – vehicle speed > **24 mph (40 km/h**), – engine speed > **1500 rpm**, – turbine speed < **600 rpm** and accelerator pedal > **0 %**.
	Effect on system: Impossible to calculate gear. lockup is inhibited. Note: The safe value is **0 rpm**.
	Customer complaint: When the fault appears, the gear remains fixed. Restarting in fixed 3rd gear (no more gear changes). Manual mode is inhibited. Fault warning light comes on.
	Use the Wiring Diagrams Technical Note, ESPACE IV ph2.

Look for any damage to the wiring harness, and check the condition and connection of the **transmission computer** and the **turbine speed sensor**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Check for **+ after ignition feed** on connection **AP4** of component **1060**.

Is the **+ after ignition feed** still present?
If YES, move on to **step 1**.
If NO, move on to **step 2**.

Step 1:

Check **the continuity and insulation** of the following connections:
- Connection code **5HN**,
- Connection code **5DA**.

Between components **119 and 1060**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Check the intermediate connector **R22**, if the fault is still present, replace component **1060**.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF038 CONTINUED	

Step 2:
Check **the continuity and insulation** of the following connection: ● Connection code **AP4** between components **119 and 1337**. If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
Check for **+ after ignition feed** on connection **AP4** of component **1337**.
Is the **+ after ignition feed** still present? If YES, move on to **step 1**. If NO (see **87G, Engine compartment connection unit**). If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF067 PRESENT OR STORED	LEVER POSITION SWITCH CIRCUIT CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 volts

NOTES	**Conditions for applying fault finding procedures to stored faults:** The fault is declared present after: **– in the event of open circuit or short circuit-:** + after ignition feed and change of lever position. **– in the event of short circuit+:** + after ignition feed, initial lever position: Position "P", "R", "N" or "D".
	Effect on system: The lever value is held at its previous valid position until the fault is confirmed. Then the lever position becomes "DRIVE" (internal software variable) irrespective of the fault. – If the fault is present and the lever in position "P", the transmission is in "N", hydraulic neutral. – If the fault is present and the lever in position "R", the transmission is in "R", hydraulic reverse. – If the fault is present and the lever in position "N", the transmission is in "N", hydraulic neutral. – If the fault is present and the lever in position "D", the transmission is in "D", hydraulic forward gear. lockup is inhibited.
	Customer complaint: No lever position display on the instrument panel following fault confirmation and starting impossible. If the engine is already running when the fault occurs, there is jolting when shifting from "P" or "N" to "R" or "D". Fault warning light comes on.
	Use the Wiring Diagrams Technical Note, ESPACE IV ph2.

If the fault is stored

Note:
It is possible to produce this fault if the driver or operator voluntarily keep the lever between two normal positions for longer than **2 seconds**.

Check sensor operation:
Establish consistency between the position of contacts under the **CLIP (ET012 "Gear lever position")** and the position displayed on the instrument panel.

Check the condition and setting of the control (see **MR 405 Mechanical, 37A, Automatic gear controls, Adjustment**) and the mountings connecting the lever to the transmission.

If the fault remains **stored**, do not replace the sensor.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF067 CONTINUED 1	

If the fault is present

Look for any damage to the wiring harness, and check the condition and connection of the **transmission computer** and **multifunction switch** connectors.
If there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Check for **+ after ignition feed** on connection **AP4** of component **779**.

Is the **+ after ignition feed** still present?
If YES, move on to **step 1**.
If NO, move on to **step 3**.

Step 1:

Disconnect the connector from component **119**, check the **insulation** and **continuity** of the following connections (on the connector of component **119**):
Position of gear lever = **P**:
- Connection code **5DF**,
- Connection code **AP4**.

Position of gear lever = **R**:
- Connection code **5DG**,
- Connection code **AP4**.

Position of gear lever = **N**:
- Connection code **5DH**,
- Connection code **AP4**.

Position of gear lever = **N**:
- Connection code **5DJ**,
- Connection code **AP4**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If the **continuity and insulation** are correct, contact the Techline.

Are the **continuity and insulation** correct?
If YES and if the fault is present, contact the Techline.
If NO, check the intermediate connector **R22** and move on to **step 2**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF067 CONTINUED 2	

Step 2:

If the **continuity and insulation** are not correct, disconnect the connector from component **779**, check **the continuity and insulation** of the following connections (on the connector of component **779**):
Position of gear lever = **P**:
- Connection code **5DF**,
- Connection code **AP4**.

Position of gear lever = **R**:
- Connection code **5DG**,
- Connection code **AP4**.

Position of gear lever = **N**:
- Connection code **5DH**,
- Connection code **AP4**.

Position of gear lever = **N**:
- Connection code **5DJ**,
- Connection code **AP4**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Are the **continuity and insulation** correct?
If YES, replace the external wiring harness on the automatic transmission.
If NO, replace the multifunction switch.

If the fault is still present, contact the Techline.

Stage 3:

Check **the continuity and insulation** of the following connection:
- Connection code **AP4** between components **119 and 1337**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Check for **+ after ignition feed** on connection **AP4** of component **1337**.

Is the **+ after ignition feed** still present?
If YES, move on to **step 1**.
If NO (see **87G, Engine compartment connection unit**).
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF084 PRESENT OR STORED	MULTIPLEX NETWORK 1.DEF : No multiplex frameworks or invalid values (signal producing computer fault or CAN connection fault).

NOTES	**Conditions for applying fault finding procedures to stored faults:** The fault is declared present after **+ APC**.
	Effect on system: Engine does not start. Appearance of fault **DF236 Invalid engine multiplex signal**. lockup is inhibited. Note: the effects of the fault disappear immediately after the ignition is switched off and back on again.
	Customer complaints: Engine does not start. If the fault occurs while driving, the transmission engages fixed 5th gear. Restarting in fixed 3rd gear (no more gear changes). Fault warning light comes on. Note: the effects of the fault disappear immediately after the ignition is switched off and back on again.
	Use the Wiring Diagrams Technical Note, ESPACE IV ph2.

Run a multiplex network test (see **88B, Multiplex**).

Check **the continuity and insulation against earth** of the following connections:
- Connection code **3MS**,
- Connection code **3MT**.

Between components **119 and 120**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF085 PRESENT OR STORED	EVS1 SEQUENCE SOLENOID VALVE CIRCUIT CC.0 : Short circuit to earth. CO.1 : Open circuit or short circuit to + 12 V.

NOTES	**Conditions for applying fault finding procedures to stored faults:** The fault is declared present after: **– in the event of short circuit+:** Lever in "Drive" position, Gear engaged = 1, 2, 3, 4, **and** inconsistency between the status of the solenoid valve command and the command voltage. **– in the event of open circuit:** Lever in "Drive" position, Gear engaged = 1, 2, 3, 4, **and** inconsistency between the status of the solenoid valve command and the command voltage. **– in the event of short circuit-:** Lever in "Drive" position, Gear engaged = 5, 6, **and** inconsistency between the status of the solenoid valve command and the command voltage. **OR** Running command **AC002 "Sequence solenoid valve 1"**
	Effect on system: **– in the event of short circuit+:** Neutral engaged. lockup inhibited. **– in the event of open circuit:** lockup inhibited. **– in the event of short circuit-:** No effect.
	Customer complaint: **– in the event of short circuit+:** If the fault occurs while driving, the transmission engages fixed 5th gear. Restarting is in 5th gear. Fault warning light comes on. **– in the event of open circuit:** If the fault occurs while driving, the transmission engages fixed 5th gear. Restarting is in 5th gear. Fault warning light comes on. **– in the event of short circuit-:** No effect.
	Use the Wiring Diagrams Technical Note, ESPACE IV ph2.

Look for any damage to the wiring harness, and check the condition and connection of the **automatic transmission computer** and the **hydraulic distributor** connectors.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF085 CONTINUED 1	

Check for **+ after ignition feed** on connection **5LW** of component **754**.

Is the **+ after ignition feed** still present?
If YES, move on to **step 1**.
If NO, move on to **step 8**.

Step 1:

Disconnect the connector from component **119**, measure the **resistance of sequence solenoid valve 1** (on the connector of component **119**) between the following connections:
- Connection code **5CX**,
- Connection code **5LW**.

The **resistance** should be **28 Ω ± 2.8 Ω at 20 °C**.

Is the **resistance** correct?
If YES, contact the Techline.
If NO, move on to **step 2**.

Step 2:

Disconnect connector **R22** and check **continuity and insulation** of the following connections:
- Connection code **5CX**,
- Connection code **5LW**.

Between component 119 and connector R22.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Are the **continuity and insulation** correct?
If YES, move on to **step 3**.
If NO, replace the **external wiring harness** on the automatic transmission.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF085 CONTINUED 2	

Stage 3:

Measure the **resistance of sequence solenoid valve 1** (on connector **R22**) between the following connections:
- Connection code **5CX**,
- Connection code **5LW**,

The **resistance** should be **28 Ω ± 2.8 Ω at 20 °C**.

Is the **resistance** correct?
If YES, and if the fault is present, contact the Techline.
If NO, move on to **step 4**.

Stage 4:

Drain the automatic transmission (see **MR 405, Mechanical, 23A Automatic transmission, Oil change**) and remove the transmission housing (see **MR 405, Mechanical, 23A Automatic transmission, Hydraulic distributor**).
Disconnect the connector of component **754**, measure the **resistance of sequence solenoid valve 1** (on the connector of the **internal wiring harness of the transmission**) between the following connections:
- Connection code **5CX**,
- Connection code **5LW**.

The **resistance** should be **28 Ω ± 2.8 Ω at 20 °C**.

Is the **resistance** correct?
If YES, move on to **step 5**.
If NO, move on to **step 6**.

Stage 5:

Measure the **continuity and insulation** of the following connections:
- Connection code **5CX**,
- Connection code **5LW**.

Between connector **R22 and the internal connector in the transmission**.

Are the **continuity and insulation** correct?
If YES, contact the Techline.
If NO, replace the intermediate wiring harness between connector **R22** and the **internal** connector in the transmission.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF085 CONTINUED 3	

Stage 6:

Disconnect the connector of **sequence solenoid valve 1**, measure the **resistance of sequence solenoid valve 1** between the following connections:
- Connection code **5CX**,
- Connection code **5LW**.

The **resistance** should be **28 Ω ± 2.8 Ω at 20 °C**.

Is the **resistance** correct?
If YES, move on to **step 7**.
If NO, replace the hydraulic distributor.

Step 7:

Measure the **continuity and insulation** of the following connections:
- Connection code **5CX**,
- Connection code **5LW**.

Between **sequence solenoid valve 1** and the **internal connector on the transmission**.

Are the **continuity and insulation** correct?
If YES, contact the Techline.
If NO, replace the internal wiring harness on the automatic transmission.

Step 8:

Check **the continuity and insulation** of the following connection:
- Connection code **5LW** between components **119 and 754**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If **+ after ignition feed** is not present after checking the **feeds and earths** on the transmission computer, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF091 PRESENT OR STORED	"LS" PRESSURE REGULATION SOLENOID VALVE CIRCUIT CC.0 : Short circuit to earth. CO.1 : Open circuit or short circuit to + 12 V.

NOTES	**Conditions for applying fault finding procedures to stored faults:** The fault is declared present after: **– in the event of short circuit+ or short circuit-:** difference between current measured and solenoid valve control. **– in the event of open circuit:** Current setpoint > **625 mA**. **OR** Running command **AC086 LS* pressure regulation solenoid valve**
	Effect on system: **– in the event of short circuit+:** The line pressure is at its minimum value. **– in the event of open circuit:** The line pressure is at its maximum value. **– in the event of short circuit-:** The line pressure is at its maximum value.
	Customer complaint: **– in the event of short circuit+:** Fault warning light comes on. **– in the event of open circuit or short circuit-:** Possible increase in fuel consumption. Possible jolting during gear changes. Fault warning light comes on.
	Use the Wiring Diagrams Technical Note, ESPACE IV ph2.

Look for any damage to the harness and check the condition and connection of the **gearbox computer** and **automatic transmission** connectors.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Check for **+ after ignition feed** on connection **5LW** of component **754**.

If **+ after ignition feed is present, move on to step 1**.
If **+ after ignition feed is not present, move on to step 8**.

*LS:

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF091 CONTINUED 1	

Step 1:

Disconnect the connector from component **119**, measure the **resistance of the LS pressure regulation solenoid valve** (on the connector of component **119**) between the following connections:
- Connection code **5BU**,
- Connection code **5LW**.

The **resistance** should be **5.3 Ω ± 0.5 Ω at 20 °C**.

Is the **resistance** correct?
If YES, contact the Techline.
If NO, move on to **step 2**.

Step 2:

Disconnect connector **R22** and check **continuity and insulation** of the following connections:
- Connection code **5BU**,
- Connection code **5LW**.

Between component 119 and connector R22.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Are the **continuity and insulation** correct?
If YES, move on to **step 3**.
If NO, replace the **external wiring harness** on the automatic transmission.

Stage 3:

Measure the **resistance of the LS pressure regulation solenoid valve** (on connector **R22**) between the following connections:
- Connection code **5BU**,
- Connection code **5LW**.

The **resistance** should be **5.3 Ω ± 0.5 Ω at 20 °C**.

Is the **resistance** correct?
If YES, and if the fault is present, contact the Techline.
If NO, move on to **step 4**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

- Connection code **5CY**,
- Connection code **5LW**.

The **resistance** should be **28 Ω ± 2.8 Ω at 20 °C**.

Is the **resistance** correct?
If YES, move on to **step 7**.
If NO, replace the hydraulic distributor.

Step 7:

Measure the **continuity and insulation** of the following connections:

- Connection code **5CY**,
- Connection code **5LW**.

Between **sequence solenoid valve 2** and the **internal connector on the transmission**.

Are the **continuity and insulation** correct?
If YES, contact the Techline.
If NO, replace the internal wiring harness on the automatic transmission.

Step 8:

Check **the continuity and insulation** of the following connection:

- Connection code **5LW** between components **119 and 754**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If **+ after ignition feed** is not present after checking the **feeds and earths** on the transmission computer, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF097 CONTINUED 4	

Fault finding on **lockup/brake solenoid valve 1**:

Look for any damage to the harness and check the condition and connection of the **gearbox computer** and on the **automatic transmission** connectors.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Check for **+ after ignition feed** on connection **5LW** of component **754**.

If **+ after ignition feed is present, move on to step 1**.
If **+ after ignition feed is not present, move on to step 8**.

Step 1:

Disconnect the connector from component **119**, measure the **resistance of the lockup/brake 1 solenoid valve** (on the connector of component **119**) between the following connections:
- Connection code **5BF**,
- Connection code **5LW**.

The **resistance** should be **5.3 Ω ± 0.5 Ω at 20 °C**.

Is the **resistance** correct?
If YES, contact the Techline.
If NO, move on to **step 2**.

Step 2:

Disconnect connector **R22** and check **continuity and insulation** of the following connections:
- Connection code **5BF**,
- Connection code **5LW**.

Between component 119 and connector R22.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Are the **continuity and insulation** correct?
If YES, move on to **step 3**.
If NO, replace the **external wiring harness** on the automatic transmission.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF097 CONTINUED 5	

Stage 3:

Measure the **resistance of lockup/brake 1 solenoid valve** (on connector **R22**) between the following connections:

- Connection code **5BF**,
- Connection code **5LW**.

The **resistance** should be **5.3 Ω ± 0.5 Ω at 20 °C**.

Is the **resistance** correct?
If YES, and if the fault is still present, contact the Techline.
If NO, move on to **step 4**.

Stage 4:

Drain the automatic transmission (see **MR 405, Mechanical, 23A Automatic transmission, Oil change**) and remove the transmission housing (see **MR 405, Mechanical, 23A Automatic transmission, Hydraulic distributor**).
Disconnect the connector from component **754**, measure the **resistance of lockup/brake 1 solenoid valve** (on the connector of the **internal wiring harness of the transmission**) between the following connections:

- Connection code **5BF**,
- Connection code **5LW**.

The **resistance** should be **5.3 Ω ± 0.5 Ω at 20 °C**.

Is the **resistance** correct?
If YES, move on to **step 5**.
If NO, move on to **step 6**.

Stage 5:

Measure the **continuity and insulation** of the following connections:

- Connection code **5BF**,
- Connection code **5LW**.

Between connector **R22 and the internal connector in the transmission**.

Are the **continuity and insulation** correct?
If YES, contact the Techline.
If NO, replace the intermediate wiring harness between connector **R22** and the **internal** connector in the transmission.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF097 CONTINUED 6	

Stage 6:

Disconnect the connector from **lockup/brake 1 solenoid valve**, measure the **resistance of lockup/brake 1 solenoid valve** between the following connections:
- Connection code **5BF**,
- Connection code **5LW**.

The **resistance** should be **5.3 Ω ± 0.5 Ω at 20 ˚C**.

Is the **resistance** correct?
If YES, move on to **step 7**.
If NO, replace the hydraulic distributor.

Step 7:

Measure the **continuity and insulation** of the following connections:
- Connection code **5BF**,
- Connection code **5LW**.

Between **lockup/brake 1 solenoid valve** and the **internal connector on the transmission**.

Are the **continuity and insulation** correct?
If YES, contact the Techline.
If NO, replace the internal wiring harness on the automatic transmission.

Step 8:

Check **the continuity and insulation** of the following connection:
- Connection code **5LW** between components **119 and 754**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If **+ after ignition feed** is not present after checking the **feeds and earths** on the transmission computer, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

DF108 PRESENT OR STORED	AVERAGE EFFECTIVE TORQUE MULTIPLEX SIGNAL 1.DEF : Multiplex frames absent or values invalid (fault with the computer generating the signal or multiplex line connection fault)

NOTES	**Effect on system:** Lockup is inhibited (still open).
	Customer complaint: Fault warning light comes on. If the fault occurs while driving, the gearbox engages fixed 5th gear. Restarting occurs in fixed 3rd gear (no more gear changes).
	Use the Wiring Diagrams Technical Note, ESPACE IV ph2.

Run a multiplex network test (see **88B, Multiplex**).

Carry out a test on the engine management computer **(**(see **13B, Diesel injection, Conformity check**) (**EDC16 CP33 M9R 721**)**)**.

Check **the continuity and insulation against earth** of the following connections:
- Connection code **3MS**,
- Connection code **3MT**.

Between components **119 and 120**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF171 PRESENT OR STORED	VEHICLE SPEED SENSOR CIRCUIT 1.DEF : Open circuit or short circuit

NOTES	**Conditions for applying fault finding procedures to stored faults:** The fault is declared present after a test. The vehicle speed transmitted by the multiplex line > **12 mph (20 km/h)** and the speed of transmission output sensor < **3 mph (5 km/h)** then the vehicle speed transmitted by multiplex line < **12 mph (20 km/h**).
	Effect on system: Impossible to calculate gear. lockup inhibited.
	Customer complaint: Gear on which fault occurred is fixed. Restarting in fixed 3rd gear (no more gear changes). Manual mode is inhibited. Fault warning light comes on.
	Use the Wiring Diagrams Technical Note, ESPACE IV ph2.

Look for any damage to the wiring and check the condition and connection of the connectors for components **119** and **1060**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Check for **+ after ignition feed** on connection **AP4** of component **1060**.

If **+ after ignition feed** is present, move on to **step 1**.
If **+ after ignition feed** is not present, **move on to step 2**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF171 CONTINUED	

Step 1:
Check **the continuity and insulation** of the following connections: ● Connection code **5TA**, ● Connection code **5T**. Between components **119 and 1060**. If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
Check the intermediate connector **R22**, if the fault is still present, replace component **1140**.
If the fault is still present, contact the Techline.

Step 2:
Check **the continuity and insulation** of the following connection: ● Connection code **AP4** between components **119 and 1337**. If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
Check for **+ after ignition feed** on connection **AP4** of component **1337**.
If **+ after ignition feed** is present, move on to **step 1**. If **+ after ignition feed** is not present (see **87G, Engine compartment connection unit**). If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF178 PRESENT OR STORED	ACCELERATOR PEDAL POSITION 1.DEF : No multiplex frameworks or invalid values (signal producing computer fault or CAN connection fault).

NOTES	**Effect on system:** lockup inhibited. Risk of up- or downshifts.
	Customer complaint: Risk of up- or downshifts.
	Use the Wiring Diagrams Technical Note, ESPACE IV ph2.

Run a multiplex network test (see **88B, Multiplex**).

Carry out a test on the engine management computer **(**(see **13B, Diesel injection, Conformity check**) (**EDC16 CP33 M9R 721**)**)**.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF183 PRESENT OR STORED	NO UCH MULTIPLEX SIGNAL 1.DEF : Multiplex frames absent or values invalid (fault with the computer generating the signal or multiplex line connection fault)

NOTES	**Effect on system:** The “alarm mode” function for an open door is not operational and the lockup is inhibited (still open).
	Use the Wiring Diagrams Technical Note, ESPACE IV ph2.

Run a multiplex network test (see **88B, Multiplex**).

Run a test on the UCH (see **87B, UCH, Fault finding**).

Check **the continuity and insulation against earth** of the following connections:
- Connection code **3MS**,
- Connection code **3MT**.

Between components **119 and 120**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF186 PRESENT OR STORED	NO INJECTION MULTIPLEX SIGNAL 1.DEF : Multiplex frames absent or values invalid (fault with the computer generating the signal or multiplex line connection fault)

NOTES	**Customer complaint:** If the fault occurs while driving, the transmission engages fixed 5th gear. Restarting occurs in fixed 3rd gear (no more gear changes). Fault warning light comes on. The effect of the fault disappears after switching on the **+ after ignition feed** again.
	Effect on system: The line pressure is not being checked properly. The lockup is inhibited (still open). Appearance of fault **DF236 Invalid engine speed multiplex signal**. The effect of the fault disappears after switching on the **+ after ignition feed** again.
	Use the Wiring Diagrams Technical Note, ESPACE IV ph2.

Run a multiplex network test (see **88B, Multiplex**).

Carry out a test on the engine management computer **(**(see **13B, Diesel injection, Conformity check**) (**EDC16 CP33 M9R 721**)**)**.

Check **the continuity and insulation against earth** of the following connections:
- Connection code **3MS**,
- Connection code **3MT**.

Between components **119 and 120**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If the fault is still present, contact the Techline.

DF236 PRESENT OR STORED	INVALID ENGINE SPEED MULTIPLEX SIGNAL 1.DEF : Multiplex frames absent or values invalid (fault with the computer generating the signal or multiplex line connection fault)

NOTES	**System effects:** The anti-stall zone has been modified. Lockup is inhibited (still open).
	Customer complaint: Engine stop or no customer complaint.
	Use the Wiring Diagrams Technical Note, ESPACE IV ph2.

Run a multiplex network test (see **88B, Multiplex**).

Carry out a test on the engine management computer **(**(see **13B, Diesel injection, Conformity check**) (**EDC16 CP33 M9R 721**)**)**.

Check **the continuity and insulation against earth** of the following connections:
- Connection code **3MS**,
- Connection code **3MT**.

Between components **119 and 120**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF238 PRESENT OR STORED	INVALID RAW ENGINE TORQUE MULTIPLEX SIGNAL 1.DEF : Multiplex frames absent or values invalid (fault with the computer generating the signal or multiplex line connection fault)

NOTES	**System effects:** The line pressure is not being checked properly. Lockup is inhibited (still open). The effects of the fault disappear immediately after the ignition is switched off and back on again.
	Customer complaint: Fault warning light comes on. If the fault occurs while driving, the transmission engages fixed 5th gear. Restarting occurs in fixed 3rd gear (no more gear changes). The effects of the fault disappear immediately after the ignition is switched off and back on again.
	Use the Wiring Diagrams Technical Note, ESPACE IV ph2.

Run a multiplex network test (see **88B, Multiplex**).

Carry out a test on the engine management computer **(**(see **13B, Diesel injection, Conformity check**) (**EDC16 CP33 M9R 721**)**)**.

Check **the continuity and insulation against earth** of the following connections:
- Connection code **3MS**,
- Connection code **3MT**.

Between components **119 and 120**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If the fault is still present, contact the Techline.

* SIG:

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF256 PRESENT OR STORED	ERRATIC GEAR JUMPING 1.DEF : Hydraulic, mechanical or electrical fault on solenoid valves, deal with the other faults first

NOTES	**Conditions for applying fault finding procedures to stored faults:** The fault appears after: **1st scenario: when driving, Drive or Manual** the gear > gear setpoint, **and** output speed ≥ **300 rpm**, **and** turbine speed ≥ **300 rpm**, **and** engine speed ≥ turbine speed **- 50 rpm**, **and** (if 1st with engine braking, accelerator pedal ≥ **6.25 % OR,** if 1st, accelerator pedal ≥ **30.75 % OR,** if 2nd to 6th accelerator pedal ≥ **6.25 %**). **2nd scenario: when driving in reverse gear** the ratio > the ratio setpoint, **and** output speed ≥ 300 rpm, **and** turbine speed ≥ **300 rpm**, **and** engine speed ≥ turbine speed **- 50 rpm**, **and** accelerator pedal ≥ **6.25 %**. **3rd case: stationary, in Drive or in Manual** The difference between the engine speed and mapping > threshold, **and** the engine speed increases constantly for **250 ms**. **4th case: stationary, reverse gear** The difference between the engine speed and mapping > 0, **and** the engine speed increases constantly for **250 ms**.
	System effects: No engine torque transmitted to wheels. Switch to defect mode occurs during vehicle speed safety conditions (vehicle speed < **32 mph (54 km/h)**). The system effects will vary depending on which solenoid valve is faulty: – If caused by brake 2 solenoid valve, system switches to fixed 2nd, 3rd or 5th gear safe mode. – If caused by clutch 2 solenoid valve, system switches to fixed 2nd, 3rd or 6th gear safe mode. – If caused by the clutch 3 solenoid valve, system switches to fixed 2nd, 3rd, 4th or 5th gear safe mode. – If caused by clutch 1 solenoid valve, system switches to fixed 3rd, 5th or 6th gear safe mode. In all cases, restarting is in 3rd gear. If vehicle stopped in Drive, system switches to fixed 5th gear if engine speed is lower than **2000 rpm**. If vehicle stopped in “R” mode, switching to “R” mode is done if engine speed is less than **2000 rpm**. In reverse, moving off when "kick-down" detected.

Note:
To accurately locate components (see **Location of components**).

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF256 **CONTINUED 1**	

NOTES	**Customer complaint:** Switch to safe mode: – If caused by brake 2 solenoid valve, system switches to fixed 2nd, 3rd or 5th gear safe mode. – If caused by clutch 2 solenoid valve, system switches to fixed 2nd, 3rd or 6th gear safe mode. – If caused by the clutch 3 solenoid valve, system switches to fixed 2nd, 3rd, 4th or 5th gear safe mode. – If caused by clutch 1 solenoid valve, system switches to fixed 3rd, 5th or 6th gear safe mode. In all cases, restarting is in 3rd gear. If vehicle stopped in Drive, system switches to fixed 5th gear if engine speed is lower than **2000 rpm**. If vehicle stopped in R, switch to R if engine speed is lower than **2000 rpm**. Fault warning light comes on.

Note:
If at least one solenoid valve is faulty, replace the hydraulic distributor.

Look for any damage to the wiring and check the condition and connection of the connectors for components **119** and **754**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

DF273 PRESENT OR STORED	CLUTCH 1 SOLENOID VALVE CIRCUIT CC.0 : Short circuit to earth. CO.1 : Open circuit or short circuit to + 12 V.

NOTES	**Conditions for applying fault finding procedures to stored faults:** The fault appears after: **– in the event of short circuit+ or short circuit-:** Lever in "Drive" position, gear engaged = 1, 2, 3, 4, 5, 6 **OR** Gear engaged = 1 and engine braking. **– in the event of open circuit:** Lever in "Drive" position, Gear engaged = 1, 2, 3, 4, **OR** Running command **AC026 "Clutch 1 solenoid valve"** and waiting **5 seconds**.
	System effects: **– in the event of short circuit+:** No effect. **– in the event of open circuit or short circuit-:** If the fault occurs on gears 1 to 4 in D mode, the transmission switches to Neutral (see **DF256 Erratic gear jumps**). Then system switches to fixed 5th gear mode after the vehicle has stopped.
	Customer complaint: **– in the event of short circuit+:** If the fault occurs while driving, the transmission engages fixed 5th gear. Restarting in fixed 5th gear (no more gear changes). Significant jolting during gear changes. Fault warning light comes on. **– in the event of open circuit or short circuit-:** If the fault occurs while driving, the transmission engages fixed 5th gear. Restarting in fixed 5th gear (gear change impossible) Fault warning light comes on.
	Use the Wiring Diagrams Technical Note, ESPACE IV ph2.

Look for any damage to the wiring harness, and check the condition and connection of the **automatic transmission computer** and **hydraulic distributor** connectors.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Check for **+ after ignition feed** on connection **5LW** of component **754**.

Is the **+ after ignition feed** still present?
If YES, move on to **step 1**.
If NO, move on to **step 8**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF273 CONTINUED 1	

Step 1:

Disconnect the connector from component **119**, measure the **resistance of clutch 1 solenoid valve** (on the connector of component **119**) between the following connections:

- Connection code **5DL**,
- Connection code **5LW**.

The **resistance** should be between **5.3 Ω ± 0.5 Ω at 20 °C**.

Is the **resistance** correct?
If YES, contact the Techline.
If NO, move on to **step 2**.

Step 2:

Disconnect connector **R22** and check the **continuity and insulation** of the following connections:

- Connection code **5DL**,
- Connection code **5LW**.

Between component 119 and connector R22.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Are the **continuity and insulation** correct?
If YES, move on to **step 3**.
If NO, replace the **external wiring harness** on the automatic transmission.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF273 CONTINUED 2	

Stage 3:

Measure the **resistance of clutch 1 solenoid valve** (on connector **R22**) between the following connections:
- Connection code **5DL**,
- Connection code **5LW**.

The **resistance** should be between **5.3 Ω ± 0.5 Ω at 20 °C**.

Is the **resistance** correct?
If YES, and if the fault is still present, contact the Techline.
If NO, move on to **step 4**.

Stage 4:

Drain the automatic transmission (see **MR 405, Mechanical, 23A Automatic transmission, Oil change**) and remove the transmission housing (see **MR 405, Mechanical, 23A Automatic transmission, Hydraulic distributor**).
Disconnect the connector from component **754**, measure the **resistance of clutch 1 solenoid valve** (on the connector of the **internal wiring harness of the transmission**) between the following connections:
- Connection code **5DL**,
- Connection code **5LW**.

The **resistance** should be between **5.3 Ω ± 0.5 Ω at 20 °C**.

Is the **resistance** correct?
If YES, move on to **step 5**.
If NO, move on to **step 6**.

Stage 5:

Measure the **continuity and insulation** of the following connections:
- Connection code **5DL**,
- Connection code **5LW**.

Between connector **R22 and the internal connector in the transmission**.

Are the **continuity and insulation** correct?
If YES, contact the Techline.
If NO, replace the intermediate wiring harness between connector **R22** and the **internal** connector in the transmission.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF273 CONTINUED 3	

Stage 6:

Disconnect the connector from **clutch 1 solenoid valve,** measure the **resistance of clutch 1 solenoid valve** between the following connections:

- Connection code **5DL**,
- Connection code **5LW**.

The **resistance** should be between **5.3 Ω ± 0.5 Ω at 20 ˚C**.

Is the **resistance** correct?
If YES, move on to **step 7**.
If NO, replace the hydraulic distributor.

Step 7:

Measure the **continuity and insulation** of the following connections:

- Connection code **5DL**,
- Connection code **5LW**.

Between **clutch solenoid valve 1** and the **internal connector on the transmission**.

Are the **continuity and insulation** correct?
If YES, contact the Techline.
If NO, replace the internal wiring harness on the automatic transmission.

Step 8:

Check **the continuity and insulation** of the following connection:

- Connection code **5LW** between components **119 and 754**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If **+ after ignition feed** is not present after checking the **feeds and earths** on the transmission computer, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF274 PRESENT OR STORED	CLUTCH 2 SOLENOID VALVE CIRCUIT CC.0 : Short circuit to earth. CO.1 : Open circuit or short circuit to + 12 V.

NOTES	**Conditions for applying fault finding procedures to stored faults:** The fault appears after: **– in the event of short circuit+ or short circuit-:** Lever in "Drive" position, gear engaged = 1, 2, 3, 4, 5, 6 **OR** Gear engaged = 1 and engine braking. **– in the event of open circuit:** Lever in "Drive" position, Gear engaged = 1, 2, 4, 6, **OR** lever in "Manual" position, gear engaged = 1 and engine braking. **OR** Running command **AC029 "Clutch solenoid valve 2"** and waiting **5 seconds**.
	System effects: **– in the event of short circuit+:** If the fault occurs in 3rd or 5th in D mode, an erratic shift to Neutral is detected (see **DF256 Erratic gear jumps**). **– in the event of open circuit:** – If the fault occurs in 1st in "Drive" position, shifting from 1st gear to 3rd gear. – If the fault occurs in 1st in “Manual” mode or in 2nd, 4th or 6th in “Drive” mode, the automatic transmission is locked. **– in the event of short circuit-:** – If the fault occurs in 1st in "Drive" position, shifting from 1st gear to 3rd gear. – If the fault occurs in 1st in “Manual” mode or in 2nd, 4th or 6th in “Drive” mode, the automatic transmission is locked. – lockup inhibited.
	Customer complaint: **– in the event of short circuit+:** Fault warning light comes on. **– in the event of open circuit:** – If the fault occurs in 1st in "Drive" position, shifting from 1st gear to 3rd gear. – If the fault occurs in 1st in "Manual" mode or in 2nd, 4th or 6th in "Drive" mode, the automatic transmission is locked. Fault warning light comes on. **– in the event of short circuit-:** If the fault occurs while driving, the transmission engages fixed 5th gear. Restarting in fixed 3rd gear (no more gear changes). Fault warning light comes on.
	Use the Wiring Diagrams Technical Note, ESPACE IV ph2.

Look for any damage to the wiring harness, and check the condition and connection of the **automatic transmission computer** and **hydraulic distributor** connectors.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF274 CONTINUED 1	

Check for **+ after ignition feed** on connection **5LW** of component **754**.

Is the **+ after ignition feed** still present?
If YES, move on to **step 1**.
If NO, move on to **step 8**.

Step 1:

Disconnect the connector from component **119**, measure the **resistance of clutch 2 solenoid valve** (on the connector of component **119**) between the following connections:
- Connection code **5DM**,
- Connection code **5LW**.

The **resistance** should be between **5.3 Ω ± 0.5 Ω at 20 °C**.

Is the **resistance** correct?
If YES, contact the Techline.
If NO, move on to **step 2**.

Step 2:

Disconnect connector **R22** and check **continuity and insulation** of the following connections:
- Connection code **5DM**,
- Connection code **5LW**.

Between component 119 and connector R22.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Are the **continuity and insulation** correct?
If YES, move on to **step 3**.
If NO, replace the **external wiring harness** on the automatic transmission.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF274 CONTINUED 2	

Stage 3:

Measure the **resistance of clutch 2 solenoid valve** (on connector **R22**) between the following connections:
- Connection code **5DM**,
- Connection code **5LW**.

The **resistance** should be between **5.3 Ω ± 0.5 Ω at 20 °C**.

Is the **resistance** correct?
If YES, and if the fault is still present, contact the Techline.
If NO, move on to **step 4**.

Stage 4:

Drain the automatic transmission (see **MR 405, Mechanical, 23A Automatic transmission, Oil change**) and remove the transmission housing (see **MR 405, Mechanical, 23A Automatic transmission, Hydraulic distributor**).
Disconnect the connector from component **754**, measure the resistance of clutch 2 solenoid valve (on the connector of the **internal wiring harness of the transmission**) between the following connections:
- Connection code **5DM**,
- Connection code **5LW**.

The **resistance** should be between **5.3 Ω ± 0.5 Ω at 20 °C**.

Is the **resistance** correct?
If YES, move on to **step 5**.
If NO, move on to **step 6**.

Stage 5:

Measure the **continuity and insulation** of the following connections:
- Connection code **5DM**,
- Connection code **5LW**.

Between connector **R22 and the internal connector in the transmission**.

Are the **continuity and insulation** correct?
If YES, contact the Techline.
If NO, replace the intermediate wiring harness between connector **R22** and the **internal** connector in the transmission.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

DF275 CONTINUED 2	

Stage 3:

Measure the **resistance of clutch 2 solenoid valve** (on connector **R22**) between the following connections:
- Connection code **5Q**,
- Connection code **5LW**.

The **resistance** should be between **5.3 Ω ± 0.5 Ω at 20 °C**.

Is the **resistance** correct?
If YES, and if the fault is still present, contact the Techline.
If NO, move on to **step 4**.

Stage 4:

Drain the automatic transmission (see **MR 405, Mechanical, 23A Automatic transmission, Oil change**) and remove the transmission housing (see **MR 405, Mechanical, 23A Automatic transmission, Hydraulic distributor**).
Disconnect the connector from component **754**, measure the **resistance of clutch 3 solenoid valve** (on the connector of the **internal wiring harness of the transmission**) between the following connections:
- Connection code **5Q**,
- Connection code **5LW**.

The **resistance** should be between **5.3 Ω ± 0.5 Ω at 20 °C**.

Is the **resistance** correct?
If YES, move on to **step 5**.
If NO, move on to **step 6**.

Stage 5:

Measure the **continuity and insulation** of the following connections:
- Connection code **5Q**,
- Connection code **5LW**.

Between connector **R22 and the internal connector in the transmission**.

Are the **continuity and insulation** correct?
If YES, contact the Techline.
If NO, replace the intermediate wiring harness between connector **R22** and the **internal** connector in the transmission.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF275 CONTINUED 3	

Stage 6:

Disconnect the connector from **clutch 3 solenoid valve**, measure the **resistance of clutch 3 solenoid valve** between the following connections:

- Connection code **5Q**,
- Connection code **5LW**.

The **resistance** should be between **5.3 Ω ± 0.5 Ω at 20 ˚C**.

Is the **resistance** correct?
If YES, move on to **step 7**.
If NO, replace the hydraulic distributor.

Step 7:

Measure the **continuity and insulation** of the following connections:

- Connection code **5Q**,
- Connection code **5LW**.

Between **clutch solenoid valve 3** and the **internal connector on the transmission**.

Are the **continuity and insulation** correct?
If YES, contact the Techline.
If NO, replace the internal wiring harness on the automatic transmission.

Step 8:

Check **the continuity and insulation** of the following connection:

- Connection code **5LW** between components **119 and 754**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If **+ after ignition feed** is not present after checking the **feeds and earths** on the transmission computer, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF289 PRESENT OR STORED	AUTOMATIC TRANSMISSION MULTIPLEX SIGNAL 1.DEF : No multiplex frameworks or invalid values (signal producing computer fault or CAN connection fault).

NOTES	**Conditions for applying fault finding procedures to stored faults:** The fault appears after: – No signals transmitted over the multiplex line network.
	Effect on system: Engine does not start. No lever position display on the instrument panel.
	Customer complaint: Engine does not start. No lever position display on the instrument panel. Jolting during gear changes.
	Use the Wiring Diagrams Technical Note, ESPACE IV ph2.

Run a multiplex network test (see **88B, Multiplex**).

Check **the continuity and insulation against earth** of the following connections:
- Connection code **3MS**,
- Connection code **3MT**.

between components **119 and 129**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF290 PRESENT OR STORED	ABS MULTIPLEX SIGNAL 1.DEF : Multiplex frames absent or values invalid (fault with the computer generating the signal or multiplex line connection fault)

NOTES	**System effects:** The lockup is inhibited (still open).
	Customer complaint: Reduction in handling. If the lever is in position “P”, the “Apply brake” icon is not displayed on the instrument panel. The function reducing drag when stationary is no longer operational.
	Use the Wiring Diagrams Technical Note, ESPACE IV ph2.

Run a multiplex network test (see **88B, Multiplex**).

Run a check on the ABS anti-lock braking system (see **38C, ABS Bosch 8.0**).

Check **the continuity and insulation against earth** of the following connections:
- Connection code **3MS**,
- Connection code **3MT**.

Between components **119 and 120**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF298 PRESENT OR STORED	GEAR SHIFTS 1.DEF : Hydraulic, mechanical or electrical fault on solenoid valves, deal with the other faults first

NOTES	**Conditions for applying fault finding procedures to stored faults:** This fault is declared present following a comparison between the solenoid control status, ratio and condition of pressure switches and detection of deceleration (**2.5 m/s^2**).
	Effect on system: Clutch deterioration and harsh deceleration. Lockup is inhibited (still open). The system effects will vary depending on which solenoid valve is faulty: – If brake 2 solenoid valve is the cause, system switches to fixed 6th gear safe mode. – If clutch 2 solenoid valve is the cause, system switches to fixed 5th gear safe mode. Restarting in 3rd gear. – If clutch 3 solenoid valve is the cause, system switches to fixed 5th gear safe mode.
	Customer complaint: Switch to safe mode: – If brake 2 solenoid valve is the cause, system switches to fixed 6th gear safe mode. – If clutch 2 solenoid valve is the cause, system switches to fixed 5th gear safe mode. Restarting in 3rd gear. – If clutch 3 solenoid valve is the cause, system switches to fixed 5th gear safe mode. Fault warning light comes on.
	Special notes: Clutch deterioration and harsh deceleration. The system effects will vary depending on which solenoid valve is faulty: – If brake 2 solenoid valve is the cause, system switches to fixed 6th gear safe mode. – If clutch 2 solenoid valve is the cause, system switches to fixed 5th gear safe mode. Restarting in 3rd gear. – If clutch 3 solenoid valve is the cause, system switches to fixed 5th gear safe mode. Fault warning light comes on.
	Use the Wiring Diagrams Technical Note, ESPACE IV ph2.

Note:
If at least one solenoid valve is faulty, replace the hydraulic distributor.

Look for any damage to the wiring and check the condition and connection of the connectors for components **119** and **754**.
Manipulate the wiring harness in order to observe any change in the fault status (Present → stored).
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

NOTES	**Conditions for applying fault finding procedures to stored faults:** The fault appears after: **– in the event of short circuit+ or short circuit-:** Lever in "Drive" position, gear engaged = 1, 2, 3, 4, 5, 6 **OR** Gear engaged = 1 and engine braking. **– in the event of open circuit:** Lever in position D, gear engaged = 1, 2, 6 **and** setpoint current **> 937 mA** **OR** Running command **AC032 "Brake solenoid valve 2"** and waiting **5 seconds**.
	System effects: **– in the event of short circuit+:** If the fault occurs in 1st in "Drive", system shifts to 2nd in "Drive". If the fault occurs in 1st in "Drive" with engine braking, 3rd, 4th, 5th in "Drive", automatic transmission locked. Automatic transmission locking detection only possible in 4th in “Drive” mode only (see **Interpretation of faults, fault DF298 Gear changes**). **– in the event of open circuit:** – If the fault appears in 2nd, downshifting to 1st without engine braking. – If the fault occurs in 6th gear in “Drive” mode, an erratic shift to neutral is detected (see **DF256 Erratic gear jumps**). **– in the event of short circuit-:** – If the fault appears in 2nd, downshifting to 1st without engine braking. – If the fault occurs in 6th gear in “Drive” mode, an erratic shift to neutral is detected (see **DF256 Erratic gear jumps**). – lockup is inhibited.
	Customer complaint: **– in the event of short circuit+:** If the fault occurs in 1st in "Drive" mode, system shifts to 2nd in "Drive" mode. If the fault occurs in 1st in "Drive" mode with engine braking, 3rd in "Drive" mode, 4th in "Drive" mode or 5th in "Drive" mode, automatic transmission locked. Jolting during gear changes. Fault warning light comes on. **– in the event of open circuit:** – If the fault appears in 2nd, downshifting to 1st without engine braking. – If the fault occurs in 6th in "Drive" mode, an erratic shift to neutral is detected. Fault warning light comes on. **– in the event of short circuit-:** If the fault occurs while driving, the transmission engages fixed 5th gear. Restarting in fixed 3rd gear (no more gear changes). Fault warning light comes on.
	Use the Wiring Diagrams Technical Note, ESPACE IV ph2.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF300 CONTINUED 1	

Look for any damage to the wiring harness, and check the condition and connection of the **automatic transmission computer** and **hydraulic distributor** connectors.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Check for **+ after ignition feed** on connection **5LW** of component **754**.

Is the **+ after ignition feed** still present?
If YES, move on to **step 1**.
If NO, move on to **step 8**.

Step 1:

Disconnect the connector from component **119**, measure the **resistance of brake 2 solenoid valve** (on the connector of component **119**) between the following connections:
- Connection code **5R**,
- Connection code **5LW**.

The **resistance** should be between **5.3 Ω ± 0.5 Ω at 20 ˚C**.

Is the **resistance** correct?
If YES, contact the Techline.
If NO, move on to **step 2**.

Step 2:

Disconnect connector **R22** and check **continuity and insulation** of the following connections:
- Connection code **5R**,
- Connection code **5LW**.

Between component 119 and connector R22.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Are the **continuity and insulation** correct?
If YES, move on to **step 3**.
If NO, replace the **external wiring harness** on the automatic transmission.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF300 CONTINUED 2	

Stage 3:

Measure the **resistance of brake 2 solenoid valve** (on connector **R22**) between the following connections:
- Connection code **5R**,
- Connection code **5LW**.

The **resistance** should be between **5.3 Ω ± 0.5 Ω at 20 ˚C**.

Is the **resistance** correct?
If YES, and if the fault is still present, contact the Techline.
If NO, move on to **step 4**.

Stage 4:

Drain the automatic transmission (see **MR 405, Mechanical, 23A Automatic transmission, Oil change**) and remove the transmission housing (see **MR 405, Mechanical, 23A Automatic transmission, Hydraulic distributor**).
Disconnect the connector from component **754**, measure the **resistance of brake 2 solenoid valve** (on the connector of the **internal wiring harness of the transmission**) between the following connections:
- Connection code **5R**,
- Connection code **5LW**.

The **resistance** should be between **5.3 Ω ± 0.5 Ω at 20 ˚C**.

Is the **resistance** correct?
If YES, move on to **step 5**.
If NO, move on to **step 6**.

Stage 5:

Measure the **continuity and insulation** of the following connections:
- Connection code **5R**,
- Connection code **5LW**.

Between connector **R22 and the internal connector in the transmission**.

Are the **continuity and insulation** correct?
If YES, contact the Techline.
If NO, replace the intermediate wiring harness between connector **R22** and the **internal** connector in the transmission.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF300 CONTINUED 3	

Stage 6:
Disconnect the connector from **brake 2 solenoid valve**, measure the **resistance of brake 2 solenoid valve** between the following connections: ● Connection code **5R**, ● Connection code **5LW**. The **resistance** should be between **5.3 Ω ± 0.5 Ω at 20 ˚C**.
Is the **resistance** correct? If YES, move on to **step 7**. If NO, replace the hydraulic distributor.

Step 7:
Measure the continuity and insulation of the following connections: ● Connection code **5R**, ● Connection code **5LW**. Between **brake solenoid valve 2** and the **internal connector on the transmission**.
Are the **continuity and insulation** correct? If YES, contact the Techline. If NO, replace the internal wiring harness on the automatic transmission.

Step 8:
Check **the continuity and insulation** of the following connection: ● Connection code **5LW** between components **119 and 754**. If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
If **+ after ignition feed** is not present after checking the **feeds and earths** on the transmission computer, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF301 PRESENT OR STORED	CLUTCH 1 PRESSURE SWITCH CIRCUIT CO.1 : Short circuit or open circuit to + 12 V

NOTES	**Conditions for applying fault finding procedures to stored faults:** The fault appears after: Lever in "Drive" position, gear engaged = 1, 2, 3, 4, **and** accelerator pedal > **0** %, vehicle speed > **6 mph (10 km/h)**, **and** for each gear, the status for clutch pressure switch 1 does not correspond to the solenoid valve control status. After engaging 4th gear, switch off the ignition and remove card from its reader. Reinsert the card in the card reader, start up the vehicle then repeat the previous operation. Check (with the engine running), status **ET261 Clutch 1** (consult status **ET261 Clutch 1 (see the interpretation of statuses)**).
	Use the Wiring Diagrams Technical Note, ESPACE IV ph2.

Look for any damage to the wiring and check the condition and connection of the connectors for components **119** and **754**.
If the circuit is faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Check the **continuity and insulation** to **+ 12 V** of the following external wiring harness connections:
Connection code **5CZ**.
Connection code **5LW**.
Between components **119 and 754**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Are the **continuity and insulation** correct?
If YES, move on to **step 1**.
If NO, replace the external wiring harness.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF301 **CONTINUED 1**	

Step 1:
Drain the automatic transmission (see **MR 405, Mechanical, 23A Automatic transmission, Oil change**) and remove the transmission housing (see **MR 405, Mechanical, 23A Automatic transmission, Hydraulic distributor**).
Check the **continuity and insulation** to **+ 12 V** of the following internal wiring harness connections: ● Connection code **5CZ**, between components **119** and the **pressure switch on clutch 1**. If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
Are the **continuity and insulation** correct? If YES, replace the **pressure switch on clutch 1**. If NO, replace the internal wiring harness.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF302 PRESENT OR STORED	CLUTCH 2 PRESSURE SWITCH CIRCUIT CO.1 : Short circuit or open circuit to + 12 V

NOTES	**Conditions for applying fault finding procedures to stored faults:** The fault appears after: Lever in "Drive" position, gear engaged = 3, 5 **OR** "Reverse" position, **and** accelerator pedal depressed > **0 %**, vehicle speed > **6 mph (10 km/h)**, **and** for each gear, the status of clutch 2 pressure switch does not correspond to the solenoid control status. After engaging 4th gear, switch off the ignition and remove card from its reader. Reinsert the card in the card reader, start up the vehicle then repeat the previous operation.
	Use the Wiring Diagrams Technical Note, ESPACE IV ph2.

Look for any damage to the wiring and check the condition and connection of the connectors for components **119** and **754**.
If the circuit is faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
Manipulate the wiring harness in order to observe any change in the fault status (Present → stored).

Check the **continuity and insulation** to **+ 12 V** of the following external wiring harness connections:

- Connection code **5LM**,
- Connection code **5LW**.

Between components **119 and 754**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Are the **continuity and insulation** correct?
If YES, move on to **step 1**.
If NO, replace the external wiring harness.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

DF306 PRESENT OR STORED	LOCKUP/BRAKE 1 SOLENOID VALVE CIRCUIT CC.0 : Short circuit to earth. CO.1 : Short circuit or open circuit to + 12 V

NOTES	**Conditions for applying fault finding procedures to stored faults:** The fault appears after: **– in the event of short circuit+ or short circuit-:** Lever in "Drive" position, gear engaged = 1, 2, 3, 4, 5, 6 **OR** Gear engaged = 1 and engine braking. **– in the event of open circuit:** Lever in "Drive" position, lockup active, Gear engaged = 1, 2, 3, 4, 5, 6 **OR** Gear engaged = 1 and engine braking. And the current setpoint > **612 mA**. Note: The fault appears after **5 seconds**.
	System effects: **– in the event of short circuit+:** lockup remains active. In D2, risk of engine stalling. **– in the event of open circuit or short circuit-:** lockup remains inactive.
	Customer complaint: **– in the event of short circuit+:** If the fault occurs while driving, the transmission engages fixed 5th gear. Restarting in fixed 3rd gear (no more gear changes). Risk of engine stalling. Fault warning light comes on. **– in the event of open circuit or short circuit-:** If the fault occurs while driving, the transmission engages fixed 5th gear. Restarting in fixed 3rd gear (no more gear changes). Fault warning light comes on.
	Use the Wiring Diagrams Technical Note, ESPACE IV ph2.

Look for any damage to the wiring harness, and check the condition and connection of the **automatic transmission computer** and **hydraulic distributor** connectors.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Check for **+ after ignition feed** on connection **5LW** of component **754**.

Is the **+ after ignition feed** still present?
If YES, move on to **step 1**.
If NO, move on to **step 8**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF306 CONTINUED 1	

Step 1:

Disconnect the connector from component **119**, measure the **resistance of the lockup/brake 1 solenoid valve** (on the connector of component **119**) between the following connections:

- Connection code **5BF**,
- Connection code **5LW**.

The **resistance** should be between **5.3 Ω ± 0.5 Ω at 20 °C**.

Is the **resistance** correct?
If YES, contact the Techline.
If NO, move on to **step 2**.

Step 2:

Disconnect connector **R22** and check **continuity and insulation** of the following connections:

- Connection code **5BF**,
- Connection code **5LW**.

Between component **119 and connector R22**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Are the **continuity and insulation** correct?
If YES, move on to **step 3**.
If NO, replace the **external wiring harness** on the automatic transmission.

Stage 3:

Measure the **resistance of lockup/brake 1 solenoid valve** (on connector **R22**) between the following connections:

- Connection code **5BF**,
- Connection code **5LW**.

The **resistance** should be between **5.3 Ω ± 0.5 Ω at 20 °C**.

Is the **resistance** correct?
If YES, and if the fault is still present, contact the Techline.
If NO, move on to **step 4**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF306 CONTINUED 2	

Stage 4:

Drain the automatic transmission (see **MR 405, Mechanical, 23A Automatic transmission, Oil change**) and remove the transmission housing (see **MR 405, Mechanical, 23A Automatic transmission, Hydraulic distributor**).
Disconnect the connector from component **754**, measure the **resistance of lockup/brake 1 solenoid valve** (on the connector of the **internal wiring harness of the transmission**) between the following connections:

- Connection code **5BF**,
- Connection code **5LW**.

The **resistance** should be between **5.3 Ω ± 0.5 Ω at 20 °C**.

Is the **resistance** correct?
If YES, move on to **step 5**.
If NO, move on to **step 6**.

Stage 5:

Measure the **continuity and insulation** of the following connections:

- Connection code **5BF**,
- Connection code **5LW**.

Between connector **R22 and the internal connector in the transmission**.

Are the **continuity and insulation** correct?
If YES, contact the Techline.
If NO, replace the intermediate wiring harness between connector **R22** and the **internal** connector in the transmission.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF306 CONTINUED 3	

Stage 6:

Disconnect the connector from **lockup/brake 1 solenoid valve**, measure the **resistance of lockup/brake 1 solenoid valve** between the following connections:
- Connection code **5BF**,
- Connection code **5LW**.

The **resistance** should be between **5.3 Ω ± 0.5 Ω at 20 °C**.

Is the **resistance** correct?
If YES, move on to **step 7**.
If NO, replace the hydraulic distributor.

Step 7:

Measure the **continuity and insulation** of the following connections:
- Connection code **5BF**,
- Connection code **5LW**.

Between **lockup/brake 1 solenoid valve** and the **internal connector on the transmission**.

Are the **continuity and insulation** correct?
If YES, contact the Techline.
If NO, replace the internal wiring harness on the automatic transmission.

Step 8:

Check **the continuity and insulation** of the following connection:
- Connection code **5LW** between components **119 and 754**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If **+ after ignition feed** is not present after checking the **feeds and earths** on the transmission computer, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF307 PRESENT OR STORED	ENGINE BRAKE 1.DEF : Hydraulic, mechanical or electrical fault on solenoid valves, deal with the other faults first

NOTES	**Order of priority in the event of more than one fault:** If there is a combination of the following faults: – **DF300 Brake solenoid valve 2 circuit, DF306 Brake/lock up solenoid valve 1 circuit and DF307,** deal first with faults **DF300 "Brake 2 solenoid valve circuit" and DF306 "Lockup/ brake 1 solenoid valve circuit"**.
	Conditions for applying fault finding procedures to stored faults: The fault appears after: Lever in "Drive" position. The solenoid valve control status corresponds to a fault **OR** the pressure switch status corresponds to a fault.
	System effects: Significant engine braking when the fault appears.
	Customer complaint: Significant engine braking when the fault appears, but then no engine braking in 1st. Fault warning light comes on.

STEP 1 (checking the **brake 2 solenoid valve**):

Look for any damage to the wiring harness, and check the condition and connection of the **automatic transmission computer** and **hydraulic distributor** connectors.
If the connection is faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Check for **+ after ignition feed** on connection **5LW** of component **754**.

Is the **+ after ignition feed** still present?
If YES, move on to **step 1**.
If NO, move on to **step 8**.

Step 1:

Disconnect the connector from component **119**, measure the **resistance of brake 2 solenoid valve** (on the connector of component **119**) between the following connections:
- Connection code **5R**,
- Connection code **5LW**.

The **resistance** should be between **5.3 Ω ± 0.5 Ω at 20 °C**.

Is the **resistance** correct?
If YES, contact the Techline.
If NO, move on to **step 2**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF307 CONTINUED 1	

Step 2:

Disconnect connector **R22** and check **continuity and insulation** of the following connections:
- Connection code **5R**,
- Connection code **5LW**.

Between component **119 and connector R22**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Are the **continuity and insulation** correct?
If YES, move on to **step 3**.
If NO, replace the **external wiring harness** on the automatic transmission.

Stage 3:

Measure the **resistance of brake 2 solenoid valve** (on connector **R22**) between the following connections:
- Connection code **5R**,
- Connection code **5LW**.

The **resistance** should be between **5.3 Ω ± 0.5 Ω at 20 °C**.

Is the **resistance** correct?
If YES, and if the fault is still present, contact the Techline.
If NO, move on to **step 4**.

Stage 4:

Drain the automatic transmission (see **MR 405, Mechanical, 23A Automatic transmission, Oil change**) and remove the transmission housing (see **MR 405, Mechanical, 23A Automatic transmission, Hydraulic distributor**).
Disconnect the connector from component **754**, measure the **resistance of brake 2 solenoid valve** (on the connector of the **internal wiring harness of the transmission**) between the following connections:
- Connection code **5R**,
- Connection code **5LW**.

The resistance should be **5.3 Ω ± 0.5 Ω at 20 °C**.

Is the **resistance** correct?
If YES, move on to **step 5**.
If NO, move on to **step 6**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF307 CONTINUED 2	

Stage 5:

Measure the **continuity and insulation** of the following connections:
- Connection code **5R**,
- Connection code **5LW**.

Between components **R22 and the internal connector in the transmission**.

Are the **continuity and insulation** correct?
If YES, contact the Techline.
If NO, replace the intermediate wiring harness between connector **R22** and the **internal** connector in the transmission.

Stage 6:

Disconnect the connector from **brake 2 solenoid valve**, measure the **resistance of brake 2 solenoid valve** between the following connections:
- Connection code **5R**,
- Connection code **5LW**.

The **resistance** should be between **5.3 Ω ± 0.5 Ω at 20 °C**.

Is the **resistance** correct?
If YES, move on to **step 7**.
If NO, replace the hydraulic distributor.

Step 7:

Measure the **continuity and insulation** of the following connections:
- Connection code **5R**,
- Connection code **5LW**.

Between **brake solenoid valve 2** and the **internal connector on the transmission**.

Are the **continuity and insulation** correct?
If YES, contact the Techline.
If NO, replace the internal wiring harness on the automatic transmission.

Step 8:

Check **the continuity and insulation** of the following connection:
- Connection code **5LW** between components **119 and 754**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If **+ after ignition feed** is not present after checking the **feeds and earths** on the transmission computer, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF307 CONTINUED 3	

STEP 2 (checking the **lockup/brake 1 solenoid valve**):

Look for any damage to the wiring harness, and check the condition and connection of the **automatic transmission computer** and **hydraulic distributor** connectors.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Check for **+ after ignition feed** on connection **5LW** of component **754**.

Is the **+ after ignition feed** still present?
If YES, move on to **step 1**.
If NO, move on to **step 8**.

Step 1:

Disconnect the connector from component **119**, measure the **resistance of the lockup/brake 1 solenoid valve** (on the connector of component **119**) between the following connections:
- Connection code **5BF**,
- Connection code **5LW**.

The **resistance** should be between **5.3 Ω ± 0.5 Ω at 20 °C**.

Is the **resistance** correct?
If YES, contact the Techline.
If NO, move on to **step 2**.

Step 2:

Disconnect connector **R22** and check **continuity and insulation** of the following connections:
- Connection code **5BF**,
- Connection code **5LW**.

Between component 119 and connector R22.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Are the **continuity and insulation** correct?
If YES, move on to **step 3**.
If NO, replace the **external wiring harness** on the automatic transmission.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF307 CONTINUED 4	

Stage 3:

Measure the **resistance of lockup/brake 1 solenoid valve** (on connector **R22**) between the following connections:

- Connection code **5BF**,
- Connection code **5LW**.

The **resistance** should be **5.3 Ω ± 0.5 Ω at 20 °C**.

Is the **resistance** correct?
If YES, and if the fault is still present, contact the Techline.
If NO, move on to **step 4**.

Stage 4:

Drain the automatic transmission (see **MR 405, Mechanical, 23A Automatic transmission, Oil change**) and remove the transmission housing (see **MR 405, Mechanical, 23A Automatic transmission, Hydraulic distributor**).
Disconnect the connector from component **754**, measure the **resistance of lockup/brake 1 solenoid valve** (on the connector of the **internal wiring harness of the transmission**) between the following connections:

- Connection code **5BF**,
- Connection code **5LW**.

The **resistance** should be **5.3 Ω ± 0.5 Ω at 20 °C**.

Is the **resistance** correct?
If YES, move on to **step 5**.
If NO, move on to **step 6**.

Stage 5:

Measure the **continuity and insulation** of the following connections:

- Connection code **5BF**,
- Connection code **5LW**.

Between components **R22 and the internal connector in the transmission**.

Are the **continuity and insulation** correct?
If YES, contact the Techline.
If NO, replace the intermediate wiring harness between connector **R22** and the **internal** connector in the transmission.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF307 CONTINUED 5	

Stage 6:

Disconnect the connector from **lockup/brake 1 solenoid valve**, measure the **resistance of lockup/brake 1 solenoid valve** between the following connections:
- Connection code **5BF**,
- Connection code **5LW**.

The **resistance** should be **5.3 Ω ± 0.5 Ω at 20 °C**.

Is the **resistance** correct?
If YES, move on to **step 7**.
If NO, replace the hydraulic distributor.

Step 7:

Measure the **continuity and insulation** of the following connections:
- Connection code **5BF**,
- Connection code **5LW**.

Between **lockup/brake 1 solenoid valve** and the **internal connector on the transmission**.

Are the **continuity and insulation** correct?
If YES, contact the Techline.
If NO, replace the internal wiring harness on the automatic transmission.

Step 8:

Check **the continuity and insulation** of the following connection:
- Connection code **5LW** between components **119 and 754**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If **+ after ignition feed** is not present after checking the **feeds and earths** on the transmission computer, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF308 PRESENT OR STORED	COMPUTER EARTH CO : Open circuit

NOTES	**Conditions for applying fault finding procedures to stored faults:** The fault appears after: switching on the **+ after ignition feed**.
	System effects: Fixed 5th gear engaged. Lockup is inhibited (still open).
	Customer complaint: Fault warning light comes on. Fixed 5th gear engaged.
	Use the Wiring Diagrams Technical Note, ESPACE IV ph2.

Look for any damage to the harness and check the condition and connection of the transmission computer connector and **earths N*** and **MC3**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Check **the continuity** of the following connections:
- Connection code **N*** between components **119 and N***.
- Connection code **5LW** between components **119 and MC3**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition, wait **1 minute** and carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

The global **conformity check** for the functions and sub-functions of this system is no longer interpreted in the conformity check. Instead, all information available in the functions and sub-functions can be found in the following sections:
For **STATUSES**, refer to the **INTERPRETATION OF STATUSES** section.
For **PARAMETERS**, refer to the **INTERPRETATION OF PARAMETERS** section.
For **COMMANDS**, refer to the **INTERPRETATION OF COMMANDS** section.

GETtheMANUALS.org

ET012	GEAR LEVER POSITION

Note:
Status **ET012** is applicable to the following sub-functions:
– **"Gear changes".**
– **"Driver parameters".**

STATUS DEFINITION	P: shows that the gear lever is in position P. R: shows that the gear lever is in position R. N: shows that the gear lever is in position N. D: shows that the gear lever is in position D. M: shows that the gear lever is in position M. FAULT: indicates a gear lever position fault.

NOTES	**Special notes:** Only perform these tests if the statuses do not correspond with the system programming functions.

Conformity check with engine stopped, ignition on or engine running.

P	Check that the lever position **"P"** corresponds with status **ET012**; in the event of a fault, consult the interpretation of fault **DF067 Lever switch circuit.**
	Check the condition of the cable, the setting (see **MR 405 Mechanical, 37A, Automatic gear controls, Adjustment**) and the mountings connecting the lever to the transmission. Replace if necessary.
R	Check that the lever position **"R"** corresponds with status **ET012**; in the event of a fault, consult the interpretation of fault **DF067 Lever position switch circuit**.
	Check the condition of the cable, the setting (see **MR 405 Mechanical, 37A, Automatic gear controls, Adjustment**) and the mountings connecting the lever to the transmission.
N	Check that the lever position **"N"** corresponds with status **ET012**; in the event of a fault, consult the interpretation of fault **DF067 Lever position switch circuit**.
	Check that the lever position **"R"** corresponds with status **ET012**; in the event of a fault, consult the interpretation of fault **DF067 Lever position switch circuit**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET012 CONTINUED	
D	Check that the lever position **"D"** corresponds with status **ET012**; in the event of a fault, consult the interpretation of fault **DF067 Lever position switch circuit**.
M	Check that lever position in Manual mode **M** matches status **ET012**; in the event of a fault: Look for any damage to the wiring and check the condition and connection of the connectors for components **119** and **129**. If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
	Check **the continuity and insulation** of the following connections: ● Connection code **5H** (sequential lever **M+** signal), ● Connection code **5FM** (sequential lever **M-** signal), between components **119** and **129**. Check for **+ 12 V after ignition feed** on connection **AP4** of component **129**. Check for **earth** on connection **N+** of component **129**. If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
	If the fault is still present, contact Techline.
FAULT	Check that each lever position in **"P","R","N","D","M",** corresponds to status **ET012**.
	In the event of a fault, for positions **"P","R","N","D",** consult the interpretation of fault **DF067 "Lever position switch circuit".** In the event of a fault on position **M"** (see **ET012, "M")**

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET013	GEAR ENGAGED

Note:
Status **ET013** is applicable to the following sub-functions:
– **"Gear changes".**
– **"Driver parameters".**

STATUS DEFINITION	**1:** indicates that the gear engaged is 1st gear. **2:** shows that the gear engaged is 2nd gear. **3:** shows that the gear engaged is 3rd gear. **4:** shows that the gear engaged is 4th gear. **5:** shows that the gear engaged is 5th gear. **6:** shows that the gear engaged is 6th gear. **R:** shows that the gear engaged is Reverse gear. **INVALID:** shows that the transmission ratio is incorrect. **DISENGAGE:** shows that the clutch disengagement function while vehicle stationary is active. **P/N:** shows that the transmission is either in "Park" or "Neutral" mode.

NOTES	**Special notes:** This status indicates clutch disengagement when stopped ("DISENGAGEMENT"), the various gears engaged (1, 2, 3, 4, 5, 6, "R"), the parking brake and neutral positions ("P" and "N") when a fault appears on the lever.

Conformity check with engine stopped and ignition on

1 **2** **3**	Check (engine stopped, ignition on and brake pedal depressed), lever in position **"M", ET013 = "1", "2" or "3"**.
	In the event of a fault, consult the interpretation of faults **DF067 Lever position switch circuit** and **DF301 Clutch pressure switch circuit 1**.
	If the fault is still present, contact Techline.
R	Check (engine stopped, ignition on and brake pedal depressed), lever in position **"R", ET013= "R"**.
	In the event of a fault, consult the interpretation of faults **DF067 Lever position switch circuit, DF304 Brake pressure switch circuit 1** and **DF306 Lockup/brake solenoid valve circuit 1**.
	If the fault is still present, contact Techline.
SIGNAL	In the event of a fault, consult the interpretation of fault **DF298 Gear shifts**
AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET013 CONTINUED	

P/N	Check (engine stopped, ignition on and brake pedal depressed), lever in position **"P" or "N", ET013 = "P" or "N"**.
	In the event of a fault, consult the interpretation of faults **DF067 Lever position switch circuit and DF086 Sequence solenoid valve EVS2 circuit**.
	If the fault is still present, contact Techline.

Conformity check with the engine running.

1 2 3	Check (engine running and brake pedal depressed), lever in position **"M", ET013 = "1", "2", "3"**.
	In the event of a fault, consult the interpretation of faults **DF067 Lever position switch circuit and DF301 Clutch pressure switch circuit 1**.
	If the fault is still present, contact Techline.
DISENGAGE (clutch disengagement)	Check (engine running at idle speed and brake pedal depressed), status **ET261 "Clutch 1"** lever in **"D"** position: **ET013 = "1"** -> status **ET261 "Clutch 1"** is "**Active**"; if status **ET013** is "**Disengaged**" (clutch disengaged when stationary) **ET261 "Clutch 1"** is "**Inactive**".
	In the event of a fault, consult the interpretation of fault **DF067 Gear position switch circuit**.
	If the fault is still present, contact Techline.

*EVS2: sequence solenoid valve 2

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET013 CONTINUED	

4 **5** **6**	These statuses only arise during the road test, with the lever in position **"D" or "M", ET013 = "4", "5", "6"**. **IMPORTANT** It is essential to have 2 people to perform these checks during a road test.
	In the event of a fault, consult the interpretation of faults **DF067 "Lever position switch circuit"** and **DF303 "Clutch 3 pressure switch circuit"**.
	If the fault is still present, contact Techline.

R	Check (engine running and brake depressed), lever in position **"R", ET013 = "R"**.
	In the event of a fault, consult the interpretation of faults **DF067 Lever position switch circuit, DF304 Brake pressure switch circuit 1** and **DF306 Lockup/brake solenoid valve circuit 1**.
	If the fault is still present, contact Techline.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET018	BRAKE PEDAL

Note:
Status **ET018** is applicable to the following sub-functions:
– "Driver parameters".

STATUS DEFINITION	**DEPRESSED**: shows that the brake pedal is depressed. **RELEASED**: shows that the brake pedal is released. **STATUS1**: shows that the brake switch signal is invalid.

NOTES	**Special notes:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

Conformity check with engine stopped, ignition on or engine running.

"DEPRESSED"
(Brake pedal depressed)

When the driver depresses the brake pedal, status **ET018** becomes **DEPRESSED**.
If the driver depresses the brake pedal and status **ET018 Brake pedal** remains **RELEASED** with the lights operating:
Check the insulation, continuity and the absence of interference resistance on the following connection:
– Connection code **5A** between the brake light switch connector, **component code 160** and the transmission computer, component code **119**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
– Remove the brake light switch and carry out the following checks:

	Continuity between connections	Insulation between connections
Brake pedal depressed	**65A and SP17**	**5A and BPT**
Brake pedal released	**5A and BPT**	**65A and SP17**

If the checks are not in order, replace the brake light switch.

If the driver depresses the brake pedal and status **ET018** becomes **DEPRESSED** and the brake lights are not operating:
– Check the condition and fitting of the **brake light switch**, the **brake light fuse** and **the brake light bulbs**.
– Check for **+ after ignition feed** on connections **SP17** and **BPT** on the **brake light switch**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET018 CONTINUED	
"RELEASED" (Brake pedal released)	When the driver releases the brake pedal, status **ET018** becomes **RELEASED**. If this does not happen, check that the brake light switch is in good condition and operating correctly by carrying out the checks associated with status **DEPRESSED**.
STATUS 1:	Check the status and operation of the brake light switch by performing the checks associated with the "**DEPRESSED**" status.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET071	TORQUE CONVERTER

Note:
Status **ET071** is applicable to the following sub-function:
– "Gear changes".

STATUS DEFINITION	**OPEN**: shows that the torque converter is not locked up. **SLIPPING**: shows that the torque converter is either in an open -> lockup phase or in a lockup -> open phase. **CLOSED**: shows that the torque converter is locked up. **INVALID**: shows that the torque converter is faulty.
NOTES	**Special notes:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

Note:
In manual mode, the torque converter is always locked up.

Conformity check with engine stopped and ignition on

OPEN	With the engine stationary, in position "N", status **ET071** should be **OPEN**. In the event of a fault, consult the interpretation of fault **DF097 "Torque converter lockup"**.

Conformity check with the engine running.

OPEN	In the event of a fault, consult the interpretation of fault **DF097 "Torque converter lockup"**.
SLIPPING	This status involves slip action when changing gear during a road test. **IMPORTANT** It is essential to have 2 people to perform these checks during a road test. In the event of a fault, consult the interpretation of fault **DF097 "Torque converter lockup"**.
CLOSED	Check (engine running at idle speed and brake pedal depressed), lever in position **"R", ET013 "Gear engaged" = "R"** or lever in position **"M", ET013 "Gear engaged" = "1", "2", "3"**. In the event of a fault, consult the interpretation of fault **DF097 "Torque converter lockup"**.
SIGNAL	Consult the interpretation of fault **DF097 "Torque converter lockup"**.
AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET086	DOWNSHIFT REQUEST

Note:
Status **ET086** is applicable to the following sub-functions:
– "Gear changes".
– "Driver parameters".

STATUS DEFINITION	**ACTIVE**: shows that the downshift mode is active. **INACTIVE**: shows that the downshift mode is inactive or is faulty during a downshift request.

NOTES	**Special notes:** This status arises with the engine running, the vehicle in motion and during a fast downshift with the accelerator pedal fully depressed.

Conformity check with engine stopped, ignition on or engine running.

INACTIVE	Status **ET086** should be "**INACTIVE**", with the engine stopped and ignition on. If status **ET086** is "**ACTIVE**", perform the following checks:
	Run a multiplex network test (see **88B, Multiplex**).
	Carry out a test on the engine management computer **(**(see **13B, Diesel injection, Conformity check**) (**EDC16 CP33 M9R 721**)**)**.
	If the fault is still present, contact Techline.

ACTIVE	Status **ET086** must be "**ACTIVE**" when the accelerator pedal is fully depressed. If status **ET086** remains "**INACTIVE**", perform the following checks:
	Run a multiplex network test (see **88B, Multiplex**).
	Carry out a test on the engine management computer **(**(see **13B, Diesel injection, Conformity check**) (**EDC16 CP33 M9R 721**)**)**.
	If the fault is still present, contact Techline.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET097	MANUAL MODE

Note:
Status **ET097** is applicable to the following sub-functions:
– **"Gear changes".**
– **"Driver parameters".**

STATUS DEFINITION	**INACTIVE**: indicates that the manual mode is inactive whenever the gear lever is not in "**M**" position, or when manual mode is faulty. **M+:** shows that the gear lever is in position **M+**. **M-:** shows that the gear lever is in position **M-**. **ACTIVE**: indicates that manual mode is active when the gear lever is in position "**M**".

NOTES	**Special notes:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

Conformity check with engine stopped, ignition on or engine running.

INACTIVE	Check that, with gear lever in a position other than "**M**", status **ET097** is "**INACTIVE**". If a fault occurs, check that status **ET012 "Gear lever position"** corresponds to the lever position. Look for any damage to the wiring and check the condition and connection of the connectors for components **119** and **129**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
	Check **the continuity and insulation** of the following connections: ● Connection code **5H** (sequential lever **M+** signal), ● Connection code **5FM** (sequential lever **M-** signal), between components **119 and 129**. Check for **+ 12 V after ignition feed** on connection **AP43** of component **129**. Check for **earth** on connection **N+** of component **129**. If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET097 CONTINUED 1	

M+	Check that, with gear lever in position "**M+**", status **ET097** is "**M+**". In the event of a fault, check that status **ET012 "Gear lever position"** corresponds to the lever position in Manual mode "**M**". Check, by moving the gear lever to "**M+**" and "**M-**", that the two positions correspond to the two statuses "**M+**" and "**M-**" of status **ET097**. Look for any damage to the wiring and check the condition and connection of the connectors for components **119** and **129**. If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
	Check **the continuity and insulation** of the following connections: ● Connection code **5H** (**M+** sequential lever signal) between components **119 and 129.** Check for **+ 12 V after ignition feed** on connection **AP43** of component **129**. Check for **earth** on connection **N+** of component **129**. If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
M-	Check that, with gear lever in position "**M-**", status **ET097** is "**M-**". In the event of a fault, check that status **ET012 "Gear lever position"** corresponds to the lever position in Manual mode "**M**". Check, by moving the gear lever to "**M+**" and "**M-**", that the two positions correspond to the two statuses "**M+**" and "**M-**" of status **ET097**. Look for any damage to the wiring and check the condition and connection of the connectors for components **119** and **129**. If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
	Check the **continuity and insulation** of the following connections: ● Connection code **5FM** (**M -** sequential lever switch control) between components **119 and 129.** Check for **+ 12 V after ignition feed** on connection **AP43** of component **129**. Check for **earth** on connection **N+** of component **129**. If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET097 CONTINUED 2	

ACTIVE	Check that, with gear lever in position "**M**", status **ET097** is "**ACTIVE**". In the event of a fault, check that status **ET012 "Gear lever position"** corresponds to the lever position in Manual mode "**M**". Check, by moving the gear lever to "**M+**" and "**M-**", that the two positions correspond to the two statuses "**M+**" and "**M-**" of status **ET097**. Look for any damage to the wiring and check the condition and connection of the connectors for components **119** and **129**. If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
	Check **the continuity and insulation** of the following connections: ● Connection code **5H** (sequential lever **M+** signal), ● Connection code **5FM** (sequential lever **M-** signal), between components **119 and 129**. Check for **+ 12 V after ignition feed** on connection **AP43** of component **129**. Check for **earth** on connection **N+** of component **129**. If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET259	BRAKE 1

Note:
Status **ET259** is applicable to the following sub-function:
– "Gear changes".

STATUS DEFINITION	**ACTIVE**: shows that brake 1 is active. **INACTIVE**: shows that brake 1 is inactive.

NOTES	**Special notes:** With the engine running, check that status **ET259 Brake 1** is **active**, gear engaged "R".

Conformity check with the engine running.

ACTIVE	Check (engine running at idle speed and brake pedal depressed), lever in position **"R", ET013 "Gear engaged" = "R"** or lever in position **"M", ET013 "Gear engaged" = "1"**.
	In the event of a fault, consult the interpretation of faults **DF304 Brake 1 pressure switch circuit** and **DF306 lockup/brake 1 solenoid valve circuit**.
	If the fault is still present, contact Techline.

INACTIVE	Status **ET259** should be "**INACTIVE**" on all other gear ratios except: - Lever in position **"R"**, status ET013 **"Gear engaged"** = "R". - Lever in position **"M",** status **ET013 "Gear engaged" = "1**".
	In the event of a fault, consult the interpretation of faults **DF304 Brake pressure switch circuit 1** and **DF306 Lockup/brake solenoid valve circuit 1**.
	If the fault is still present, contact Techline.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET260	BRAKE 2

Note:
Status **ET260** is applicable to the following sub-function:
– "Gear changes".

STATUS DEFINITION	**ACTIVE**: shows that brake 2 is active. **INACTIVE**: shows that brake 2 is inactive.

NOTES	**Special notes:** With the engine running, check that status **ET260** is **"Active"**, gear engaged 2 in mode **"M"**.

Conformity check with the engine running.

ACTIVE	Check (engine running at idle speed and brake pedal depressed): - Lever in position **"M"**, **ET013 "Gear engaged" = "2**". (Only during a road test, status **ET260** is **"Active**", when status **ET013 "Gear engaged" = "2", "6"** in mode **"D"** or when status **ET013 "Gear engaged" = "6"** in mode **"M"**). - Lever in position **"D":** **ET013 "Gear engaged" = "1"** -> status **ET260** is "**Inactive**"; if status **ET013 "Gear engaged"** is "**Disengaged**" (disengaging clutch when stationary) -> **ET260** is "**Active**".
	In the event of a fault, consult the interpretation of faults **DF300 Brake solenoid valve circuit 2** and **DF305 Brake pressure switch circuit 2**.
	If the fault is still present, contact Techline.

INACTIVE	Status **ET260** should be "**INACTIVE**" on all other gear ratios except: - Lever in position **"M",** status **ET013 "Gear engaged"** = "**2**". - Lever in position **"D":** **ET013 "Gear engaged" = "1"** -> status **ET260** is "**Inactive**"; if status **ET013 "Gear engaged"** is "**Disengaged**" (disengaging clutch when stationary) -> **ET260** is "**Active**".
	In the event of a fault, consult the interpretation of faults **DF300 Brake solenoid valve circuit 2** and **DF305 Brake pressure switch circuit 2**.
	If the fault is still present, contact Techline.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET261	CLUTCH 1

Note:
Status **ET261** is applicable to the following sub-function:
– "Gear changes".

STATUS DEFINITION	**ACTIVE**: shows that clutch 1 is active. **INACTIVE**: shows that clutch 1 is inactive.

NOTES	**Special notes:** Check (engine running) that status **ET261** is **Active**, gear engaged 1, 2, 3 in mode **"M"**.

Conformity check with the engine running.

ACTIVE	Check (engine running at idle speed and brake pedal depressed): – Lever in **"M" position, ET013 "Gear engaged" = "1", "2", "3**".(Only during a road test, status **ET261** is "**Active**", when status **ET013 "Gear engaged" = "2", "3", "4"** in mode **"D"** or when status **ET013 "Gear engaged" = "4"** in mode **"M"**). – Lever in position **"D":** **ET013 "Gear engaged" = "1"** -> status **ET261** is "**ACTIVE**"; if status **ET013 "Gear engaged"** is "**DISENGAGED**" (disengaging clutch when stationary) -> **ET261** is "**INACTIVE**".
	In the event of a fault, consult the interpretation of faults **DF273 Clutch solenoid valve circuit 1** and **DF301 Clutch pressure switch circuit 1**.
	If the fault is still present, contact Techline.

INACTIVE	Status **ET261 "Clutch 1"** must be "**INACTIVE**" on all other gear ratios except: – Lever in **"M"** position, status **ET013 "Gear engaged" = "1", "2", "3"**. – Lever in position **"D":** **ET013 "Gear engaged" = "1"** -> status **ET261 "Clutch 1"** is "INACTIVE"; if status **ET013 "Gear engaged"** is "DISENGAGED" (disengaging clutch when stationary) -> **ET261 "Clutch 1"** is "**INACTIVE**".
	In the event of a fault, consult the interpretation of faults **DF273 Clutch solenoid valve circuit 1** and **DF301 Clutch pressure switch circuit 1**.
	If the fault is still present, contact Techline.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET262	CLUTCH 2

Note:
Status **ET262** is applicable to the following sub-function:
– "Gear changes".

STATUS DEFINITION	**ACTIVE**: shows that clutch 2 is active. **INACTIVE**: shows that clutch 2 is inactive.

NOTES	**Special notes:** Check (engine running) that status **ET262** is **"Active"**, gear engaged 3, "R".

Conformity check with the engine running.

ACTIVE	Check (engine running at idle speed and brake pedal depressed), lever in position **"R", ET013 "Gear engaged" = "R"** or lever in position **"M"**, **ET013 "Gear engaged" = "3"**.
	In the event of a fault, consult the interpretation of faults **DF274 Clutch solenoid valve circuit 2** and **DF302 Clutch pressure switch circuit 2**.
	If the fault is still present, contact Techline.

INACTIVE	Status **ET262** should be "**INACTIVE**" on all other gear ratios except: – Lever in position **"R"**, status **ET013 "Gear engaged" = "R"**. (Only during a road test, status **ET262** is "Active", when status **ET013 "Gear engaged" = "3", "5"** in mode **"D"** or when status **ET013 "Gear engaged" = "5"** in mode **"M"**). – Lever in position **"M"**, **ET013 "Gear engaged" = "3"**.
	In the event of a fault, consult the interpretation of faults **DF274 Clutch solenoid valve circuit 2** and **DF302 Clutch pressure switch circuit 2**.
	If the fault is still present, contact Techline.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET263	CLUTCH 3

Note:
Status **ET263** is applicable to the following sub-function:
– "Gear changes".

STATUS DEFINITION	**ACTIVE:** shows that clutch 3 is active. **INACTIVE**: shows that clutch 3 is inactive.

NOTES	**Special notes:** Check (engine running) that status **ET263** is **active**, gear engaged 4, 5, 6.

Conformity check during a road test.

ACTIVE	Status **ET263** becomes "**ACTIVE**" for the following gears engaged: This status only arises during the road test, with the lever in position **"D"** or **"M", ET013 "Gear engaged" = "4", "5", "6**". **IMPORTANT** It is essential to have 2 people to perform these checks during a road test.
	In the event of a fault, consult the interpretation of faults **DF275 Clutch solenoid valve circuit 3 and DF303 Clutch pressure switch circuit 3**.
	If the fault is still present, contact Techline.

INACTIVE	Status **ET263** should be "**INACTIVE**" on all other gear ratios except: – Lever in **"D"** position, status **ET013 "Gear engaged" = "4", "5", "6"**. – Lever in **"M"** position, status **ET013 "Gear engaged" = "4", "5", "6**". In the event of a fault, consult the interpretation of faults **DF275 Clutch solenoid valve circuit 3** and **DF303 Clutch pressure switch circuit 3**. If the fault is still present, contact Techline.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

Tool parameter	Diagnostic tool title
PR004	Gearbox oil temperature
PR006	Engine speed
PR007	Turbine speed
PR008	Computer voltage supply
PR022	Accelerator pedal position
PR067	Calculated accelerator pedal position
PR105	Vehicle speed

PR153	Slow torque setpoint
PR154	Rapid torque setpoint

GETtheMANUALS.org

PR004	TRANSMISSION OIL TEMPERATURE

PARAMETER DEFINITION	This parameter shows the gearbox oil temperature in ˚**C**.

NOTES	**Special notes:** Only perform these tests if the parameters do not correspond with the system operation programming. **No faults should be present or stored.**

Conformity check with engine running, engine coolant temperature > 80 ˚C

With the engine running at idle speed, the gearbox oil temperature varies in accordance with the engine coolant temperature.
- 40 ˚C > PR004 > 150 ˚C
In the event of a fault, consult the interpretation of fault **DF023 Gearbox oil temperature sensor**.

Sensor electrical conformity

Disconnect the connector of component **119**, measure the **resistance of the oil temperature sensor** (on the connector of component **119**) between the following connections:
- Connection code **5BZ**,
- Connection code **5BY**.

The **resistance** should be between:
– **4.208 ± 0.42 kΩ at 20 ˚C,**
– **1.947 ± 0.19 kΩ at 40 ˚C,**
– **0.988 ± 0.09 kΩ at 60 ˚C.**

In the event of a fault, consult the interpretation of fault **DF023 Gearbox oil temperature sensor**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR006	ENGINE SPEED

Note:
Parameter **PR006** is applicable to the following sub-functions:
- **"Gear changes".**
- **"Torque activation".**
- **"Driver parameters".**

PARAMETER DEFINITION	This parameter shows the engine speed in **rpm**.

NOTES	**Special notes:** Only perform these tests if the parameters do not correspond with the system operation programming. **No faults should be present or stored.**

Conformity check with engine stopped and ignition on

PR006 = 0 rpm
In the event of a fault, carry out a multiplex network test (see **88B, Multiplex**), consult the interpretation of fault **(see interpretation of faults, DF195 Camshaft/engine speed sensor consistency" 13B EDC16 CP33 M9R 721).**

Conformity check with engine at idle speed, engine coolant temperature > 80 ˚C

PR006 ≈ 800 rpm.
In the event of a fault, check the interpretation of fault **(see 13B EDC16 CP33 M9R 721, Interpretation of faults, DF195 "Camshaft sensor/engine speed consistency").**

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR007	TURBINE SPEED

Note:
Parameter **PR007** is applicable to the following sub-functions:
- **"Gear changes".**
- **"Torque activation".**

PARAMETER DEFINITION	This parameter shows the gearbox turbine speed in **rpm**.

NOTES	**Special notes:** Only perform these tests if the parameters do not correspond with the system operation programming. **No faults should be present or stored.**

Conformity check with engine stopped and ignition on

PR007 = 0 rpm
In the event of a fault, consult the interpretation of fault **DF038 Turbine speed sensor circuit**.

Conformity check with engine running, engine coolant temperature > 80 ˚C

PR007 "Turbine speed"	PR006 "Engine speed"	PR004 "Gearbox oil temperature"	ET013 "Gear engaged"	ET012 "Gear lever position"
0 rpm	≈ 800 rpm	25 ˚C	1	D
≈ 660 rpm	≈ 800 rpm	25 ˚C	DISENGAGE (clutch disengagement)	D

In the event of a fault, consult the interpretation of fault **DF038 Turbine speed sensor circuit**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR008	COMPUTER SUPPLY VOLTAGE

PARAMETER DEFINITION	This parameter shows the computer feed voltage in **volts**.

NOTES	**Special notes:** Only perform these tests if the parameters do not correspond with the system operation programming. **No faults should be present or stored.**

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80 ˚C

Look for any damage to the wiring and check the condition and connection of the connectors for components **119** and **1337**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Check **the continuity and insulation** of the following connections:
- Connection code **BP42** between components **119 and 1337.**
- Connection code **AP4** between components **119 and 1337**.

Check for **+ 12 V after ignition feed** on connection **BP42** of component **119**.
Check for **+ 12 V after ignition feed** on connection **AP4** of component **119**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Check for earth on connection **N** of component **119**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If the fault is still present, contact Techline.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR022	ACCELERATOR PEDAL POSITION

Note:
Parameter **PR022** is applicable to the following sub-functions:
- **"Gear changes".**
- **"Torque activation".**
- **"Driver parameters".**

PARAMETER DEFINITION	This parameter indicates the accelerator pedal position as a **%**.

NOTES	**Special notes:** Only perform these tests if the parameters do not correspond with the system operation programming. **No faults should be present or stored.**

Conformity check with engine stopped and ignition on

Full load: **PR022 ≈ 114 %** and **PR067 Calculated accelerator pedal position = 100 %**.
In the event of a fault (see **13B EDC16 CP33 M9R 721, Interpretation of faults, DF196 "Pedal sensor gang 1 circuit" or DF198 "Pedal sensor gang 2 circuit"**).

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR067	CALCULATED ACCELERATOR PEDAL POSITION

Note:
Parameter **PR067** is applicable to the following sub-functions:
- **"Gear changes".**
- **"Torque activation".**

PARAMETER DEFINITION	This signal is supplied by the injection computer when the cruise control/speed limiter is operating and when there is no longer a signal from the accelerator pedal. This parameter indicates the accelerator pedal position as a **%**.

NOTES	**Special notes:** Only perform these tests if the parameters do not correspond with the system operation programming. **No faults should be present or stored.**

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80 ˚C

Full load: **PR022 Accelerator pedal position ≈ 114 %** and **PR067 = 100 %.**
In the event of a fault (see **13B EDC16 CP33 M9R 721, Interpretation of faults, DF196 "Pedal sensor gang 1 circuit" or DF198 "Pedal sensor gang 2 circuit"**).

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR105	VEHICLE SPEED

Note:
Parameter **PR105** is applicable to the following sub-functions:
- **"Gear changes".**
- **"Driver parameters".**

PARAMETER DEFINITION	This parameter indicates the vehicle speed in **mph (km/h)**.

NOTES	**Special notes:** Only perform these tests if the parameters do not correspond with the system operation programming. **No faults should be present or stored.**

Conformity check with engine stopped and ignition on.

0 mph (km/h)
In the event of a fault, consult the interpretation of fault **DF171 Vehicle speed sensor circuit**.

Conformity check with engine running, engine coolant temperature > 80 ˚C

In the event of a fault, consult the interpretation of fault **DF171 Vehicle speed sensor circuit**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR106	EFFECTIVE ENGINE TORQUE

Note:
Parameter **PR106** is applicable to the following sub-functions:
- **"Gear changes".**
- **"Torque activation".**

PARAMETER DEFINITION	This parameter indicates the effective engine torque in **Nm**. This signal is supplied to the gearbox computer by the injection computer.

NOTES	**Special notes:** Only perform these tests if the parameters do not correspond with the system operation programming. **No faults should be present or stored.**

Conformity check with engine ignition on and engine running at idle speed.

PR006 "Engine speed"	PR007 "Turbine speed"	PR106 "Effective engine torque"	PR153 "Slow torque"	PR154 "Fast torque"
0 rpm	0 rpm	140 Nm	360 Nm	- 32 Nm
≈ 802 rpm	≈ 704 rpm	≈ 34 Nm	≈ 360 Nm	≈ - 30 Nm

In the event of a fault, carry out a multiplex network test (see **88B, Multiplexing**).

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR153	SLOW TORQUE SETPOINT

Note:
Parameter **PR153** is applicable to the following sub-function:
– **"Slow torque activation".**

PARAMETER DEFINITION	This parameter indicates the slow torque setpoint in **Nm**.

NOTES	**Special notes:** Only perform these tests if the parameters do not correspond with the system operation programming. **No faults should be present or stored.**

Conformity check with engine ignition on and engine running at idle speed.

PR006 "Engine speed"	PR007 "Turbine speed"	PR106 "Effective engine torque"	PR153 "Slow torque"	PR154 "Fast torque"
0 rpm	0 rpm	140 Nm	360 Nm	- 32 Nm
≈ 802 rpm	≈ 704 rpm	≈ 34 Nm	≈ 360 Nm	≈ - 30 Nm

In the event of a fault, carry out a multiplex network test (see **88B, Multiplexing**).

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR154	FAST TORQUE SETPOINT

Note:
Parameter **PR154** is applicable to the following sub-function:
– **"Torque activation".**

PARAMETER DEFINITION	This parameter indicates the fast torque setpoint in **Nm**.

NOTES	**Special notes:** Only perform these tests if the parameters do not correspond with the system operation programming. **No faults should be present or stored.**

Conformity check with engine ignition on and engine running at idle speed.

PR006 "Engine speed"	PR007 "Turbine speed"	PR106 "Effective engine torque"	PR153 "Slow torque"	PR154 "Fast torque"
0 rpm	0 rpm	140 Nm	360 Nm	- 32 Nm
≈ 802 rpm	≈ 704 rpm	≈ 34 Nm	≈ 360 Nm	≈ - 30 Nm

In the event of a fault, carry out a multiplex network test (see **88B, Multiplexing**).

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

AC088	GEAR LEVER LOCKING ELECTROMAGNET

NOTES	**Special notes:** Engine speed zero, vehicle speed zero and gear lever in position P

Switch on the ignition and run command **AC088**.

In the event of a fault, look for any damage to the wiring and check the condition and connection of the connectors for components **119** and **129.**
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Check **the continuity and insulation** of the following connection:
- Connection code **5DU** between components **119** and **129**.

Check for **+ after ignition feed** on connection **BP42** of component **119**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If the fault is still present, contact Techline.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

NO DIALOGUE WITH THE TOOL

- No dialogue with the computer — ALP 1

ENGINE STARTING PROBLEMS

- The starter is not actuated when the gear lever is in position P and/or N — ALP 2
- The starter drives the engine, with the gear lever in a position other than P or N — ALP 3
- The vehicle moves forwards or backwards with the gear lever in position N — ALP 4

GEAR CHANGE PROBLEM

- Erratic gear change in D — ALP 5
- Erratic gear change in manual mode — ALP 6

GETtheMANUALS.org

ALP 1	No dialogue with the computer

NOTES	**Special notes:** Only consult this customer complaint after a multiplex network check using the **diagnostic tool**.

Check that the vehicle **+ after ignition feed** is activated. Check the presence and condition of the UPC automatic transmission connection fuses.
Check that the tool is not the cause of the fault, by attempting dialogue with a different system (UCH, Injection, etc.) on the same vehicle or another vehicle.
Carry out another multiplex network test on the vehicle using the **diagnostic tool**:
Is the automatic transmission computer recognised?

NO

Check that the computer connector is properly connected and check the condition of its connections.
Check for the automatic transmission supply fuse on the passenger compartment connection unit, and its condition.
Check the battery voltage:
9.5 V < battery voltage < **15.5 V**
Carry out the necessary operations to obtain a correct voltage: Carry out a full check on the battery and the charging circuit (see **Technical Note 6014A, Charging circuit check**).

YES

Establish dialogue with the automatic transmission computer.

Communication successful at first attempt?

NO

Is the identification screen displayed after 3 attempts?

YES

End of fault finding

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ALP 1 CONTINUED	

Check for **+ 12 V** on connection **BP42** of component **119**.
Check for **+ after ignition feed** on connection **AP4** of component **119**.
Check for **earth** on connection **N** of component **119**.

Check the **insulation** and the **continuity** of the following connections:
- Connection code **3MS**,
- Connection code **3MT**,

between components **119** and **120.**
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Run a multiplex network test (see **88B, Multiplex**).

If the computer still does not respond, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ALP 2	**The starter is not actuated when the gear lever is in position P and/or N**

NOTES	**Special notes:** There must be no present or stored electrical faults. Only consult this customer complaint after a complete check using the **diagnostic tool** and a conformity check.

Apply this ALP after a complete check on the ignition circuit.

Check the battery voltage:
9.5 V < battery voltage < **15.5 V**
Carry out the necessary operations to obtain a correct voltage: Carry out a full check on the battery and the charging circuit (see **Technical Note 6014A, Charging circuit check**).

Carry out fault finding on the injection computer (see **13B, Diesel injection**) and deal with the various faults displayed on the **diagnostic tool**, if necessary.

Connect the **diagnostic tool** to the vehicle and establish dialogue with the automatic transmission computer. Check statuses **ET012 "Gear lever position"** and **ET013 "Gear engaged"**; check the consistency between the tool display and the locked positions of the gear lever (ignition on and engine stopped): **"P" or "N".**

Are they consistent?

YES

Contact the Techline.

NO

Check that the selection cable is operating and is correctly positioned and fitted at the lever position sensor located on the automatic transmission.

Run the starter motor:
Does the starter motor engage?

NO

Contact the Techline.

YES

End of fault finding.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ALP 3	**The starter drives the engine, with the gear lever in a position other than P or N**

NOTES	**Special notes:** There must be no present or stored faults. Only consult this customer complaint after a complete check using the **diagnostic tool** and a conformity check.

Connect the **diagnostic tool** to the vehicle and establish dialogue with the automatic transmission computer. Check statuses **ET012 Gear lever position** and **ET013 Gear engaged**; check the consistency between the display on the tool and the locked positions of the gear lever at the bridge piece (ignition on and engine stopped): "P" or "N".

Are they consistent?

YES ↓

End of fault finding procedure.
Incorrect interpretation of customer complaint.

NO ↓

Check that the selection cable is correctly adjusted and the gear lever correctly positioned at the lever position sensor located on the automatic transmission (see **MR 405 mechanical, 37A, Automatic gear controls, Adjustment**).

↓

If the fault is still present, contact Techline.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ALP 4	The vehicle moves forwards or backwards with the gear lever in position N

NOTES	**Special notes:** There must be no present or stored electrical faults. Only consult this customer complaint after a complete check using the **diagnostic tool** and a conformity check.

Connect the **diagnostic tool** to the vehicle and establish dialogue with the automatic transmission computer. Check statuses **ET012 Gear lever position** and **ET013 Gear engaged**; check the consistency between the display on the tool and the locked positions of the gear lever at the gear lever bridge piece (ignition on and engine stopped).

Are they consistent?

YES

Check the condition and level of the transmission oil (colour).

Does the condition of the oil suggest there is an internal fault with the automatic transmission?

NO

End of fault finding. Review the cause against the customer complaint.

YES

Contact the Techline to confirm replacement of the automatic transmission.

NO

Check that the selection cable is correctly adjusted and the gear lever correctly positioned at the lever position sensor located on the automatic transmission (see **MR 405 mechanical, 37A, Automatic gear controls, Adjustment**).

Carry out a test on the gear selector.

Are they consistent?

NO

Contact the Techline to confirm replacement of the automatic transmission.

YES

End of fault finding

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ALP 5	Erratic gear changes in D

NOTES	**Special notes:** There must be no present or stored electrical faults. Only consult this customer complaint after a complete check using the **diagnostic tool** and a conformity check.

Connect the **diagnostic tool** to the vehicle and establish dialogue with the automatic transmission computer. Check statuses **ET012 "Gear lever position"** and **ET013 "Gear engaged"**; check the consistency between the display of these two statuses on the tool, vehicle in motion, position "D".

Are they consistent?

YES

Check the condition and level of the transmission oil (colour).

Does the condition of the oil suggest there is an internal fault with the automatic transmission?

NO

End of fault finding. Review the cause against the customer complaint.

YES

Carry out an injection system check.

NO

Check that the selection cable is correctly adjusted and the gear lever correctly positioned at the lever position sensor located on the automatic transmission (see **MR 405 mechanical, 37A, Automatic gear controls, Adjustment**).

Check the consistency of parameter **PR022 "Accelerator pedal position".**

If inconsistent.

Carry out an injection system check.

If consistent.

Contact the Techline.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ALP 6	Erratic gear change in manual mode

NOTES	**Special notes:** Only consult this customer complaint after a multiplex network check using the **diagnostic tool**.

Check the gear lever clearance in manual position.
Check that the M+ and M - switches are working properly with status ET012 "Gear lever position".
Check the condition and level of the transmission oil (colour).

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

1. SCOPE OF THIS DOCUMENT

This document presents the fault finding procedure applicable to all computers with the following specifications:

Vehicle(s): **Vel Satis phase 1**
Vel Satis phase 2
Laguna II Phase 2
Scénic II Phase 1 and
Scénic II Phase 2
Espace IV phase 1
Espace IV phase 2

Function concerned: **Electronic parking brake**

Name of computer: **FPA**

Vdiag No.: **0C, 04, 08, 0D**

2. PREREQUISITES FOR FAULT FINDING

Documentation type

Fault finding procedures (this document):
– Assisted fault finding (integrated into the diagnostic tool), Dialogys.
Wiring Diagrams:
– Visu-Schéma (CD-ROM), paper.

Type of diagnostic tools

– CLIP

Special tooling required

Special tooling required	
	Multimeter
Elé. 1681	**Universal bornier**

3. REMINDERS

Procedure

To save power, the UCH on the Laguna II Phase 2, Espace IV phase 1 and 2 and Vel Satis phase 1 and 2 interrupts the **+ after ignition feed** supply after **3 minutes**.

To run fault finding on a computer, it is possible to force the **+ after ignition feed** for **1 hour** by applying the following procedure:

– Press the card unlocking button,
– Insert the card into the reader,
– press the start button (interrupting the **timed + after ignition feed** mode),
– press the start button for more than **5 seconds**, until the immobiliser warning light flashes rapidly (**4 Hz**).

This **forced + after ignition feed** mode remains active for **1 hour**.
Pressing the start button or removing the card from the card reader interrupts the forced **+ after ignition feed**, but does not interrupt the time period for the forced **+ after ignition feed**. Until one hour has elapsed, activating the **+ after ignition feed** will restart forced **+ after ignition feed** for the remaining time.

GETtheMANUALS.org

Only affects the Scénic II phase 1 and the Scénic II phase 2:

To run fault finding on the vehicle's computers, switch on the ignition in fault finding mode (forced + after ignition feed).
Proceed as follows:
– Renault card in the card reader (keyless vehicle scenario 1, entry-level, without hands-free and scenario 2, top of the range, hands-free),
– press and hold start button (longer than **5 seconds**) with start-up conditions not fulfilled,
– connect the diagnostic tool and perform the required operations.

To cut off **+ after ignition feed**, proceed as follows:
– disconnect the diagnostic tool,
– press the Start button twice briefly (less than **3 seconds**),
– ensure that the + after ignition feed has been cut off by checking that the computer indicator lights on the instrument panel have gone out.

Fault context.

Only affects Vdiag 08, 0C and 0D.	
Explanation of the fault context counters. The are three different counters:	
PR022: Dating counter **PR018:** Presence counter **PR019:** Frequency counter	
Dating counter:	The counter starts when the fault appears. Each time the computer switches on and the fault is stored or present, the counter increases **by 1 up to 255**.
Presence counter:	As soon as the fault is present, the counter goes to **15**. If the fault becomes stored, each time the computer switches on, the number decreases **by 1 (from 15 to 0)** and goes back to 15 again if the fault reappears.
Frequency counter:	Number of times the present fault appears; it sets to 0 when the fault appears. It increases each time the fault moves from stored to present. The maximum value of this counter is 15.

GETtheMANUALS.org

Faults

Faults are declared present or stored (depending on whether they appeared in a certain context and have disappeared since, or whether they remain present but are not diagnosed within the current context).

The **present** or **stored** status of faults should be taken into consideration when the diagnostic tool is used following the **+ after ignition** supply being switched on (without acting on the system components).

For a **present fault**, apply the procedure described in the **Interpretation of faults** section.

For a **stored fault**, note the faults displayed and apply the instructions in the **Notes** section.

If the fault is **confirmed** when the instructions in the Notes section are applied, the fault is present. Deal with the fault.

If the fault is **not confirmed**, check:
- the electrical lines which correspond to the fault,
- the connectors for these lines (for oxidation, bent pins, etc.),
- the resistance of the component detected as defective,
- the condition of the wires (melted or split insulation, wear).

Conformity check

The aim of the conformity check is to check data that does not produce a fault on the diagnostic tool because the data is inconsistent. Therefore, this stage is used to:
- carry out fault finding on faults that do not have a fault display, and which may correspond to a customer complaint.
- check that the system is operating correctly and that there is no risk of a fault recurring after repairs.

This section gives the fault finding procedures for statuses and parameters and the conditions for checking them. If a status is not behaving normally or a parameter is outside the permitted tolerance values, consult the corresponding fault finding page.

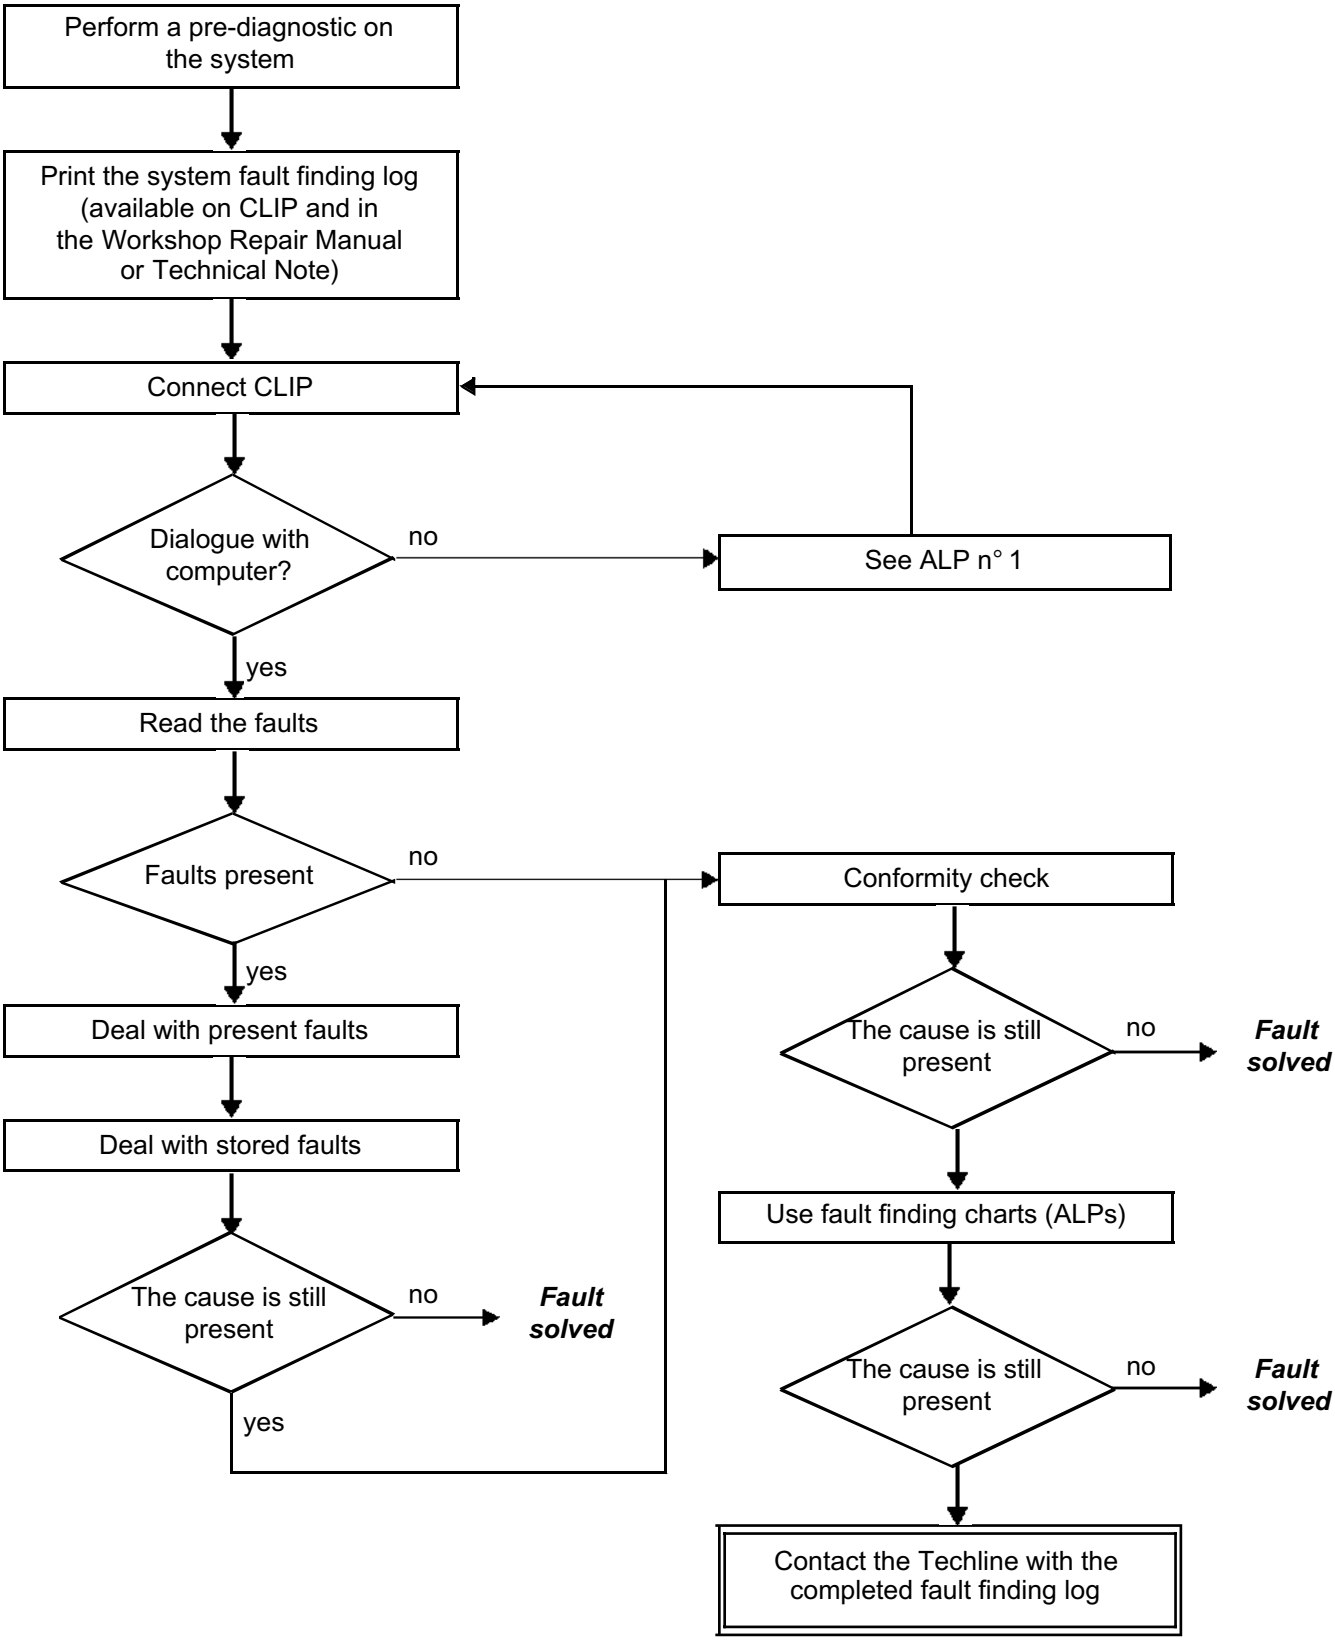
Customer complaints - Fault finding chart

If the test with the diagnostic tool is OK but the customer complaint is still present, the fault should be dealt with by **Customer complaints**.

A summary of the overall procedure to follow is provided on the following page in the form of a flow chart.

GETtheMANUALS.org

4. FAULT FINDING PROCEDURE



GETtheMANUALS.org

4. FAULT FINDING PROCEDURE (CONTINUED)

Wiring check

Fault finding problems
Disconnecting the connectors and/or handling the wiring harness may temporarily remove the cause of a fault and create other faults.
Electrical measurements of voltage, resistance and insulation are generally correct, especially if the fault is not present when the analysis is made (stored fault).

Visual inspection
Look for damage under the bonnet and in the passenger compartment.
Carefully check the fuses, insulators and wiring harness routing.
Look for signs of oxidation.

Physical inspection
While manipulating the wiring harness, use the diagnostic tool to note any change in fault status from stored to present.
Make sure that the connectors are properly locked.
Apply light pressure to the connectors.
Twist the wiring harness.
If there is a change in status, try to locate the source of the fault.

Inspection of each component
Disconnect the connectors and check the appearance of the clips and tabs, as well as the crimping (no crimping on the insulating section).
Make sure that the clips and tabs are properly locked in the sockets.
Check that no clips or tabs have been dislodged during connection.
Check the clip contact pressure using an appropriate model of tab.

Continuity and insulation check
Check the continuity of entire lines, then section by section.
Look for a short circuit to earth, to **+ 12 V** or to another wire.
If a fault is detected, repair or replace the wiring harness.

GETtheMANUALS.org

5. FAULT FINDING LOG

IMPORTANT

IMPORTANT
Any fault on a complex system requires thorough fault finding with the appropriate tools.
The FAULT FINDING LOG, which should be completed during the fault finding procedure, ensures a record is kept of the procedure carried out. It is an essential document when consulting the manufacturer.

IT IS THEREFORE ESSENTIAL THAT THE FAULT FINDING LOG IS FILLED OUT EVERY TIME IT IS REQUESTED BY TECHLINE OR THE WARRANTY RETURNS DEPARTMENT.

You will always be asked for this log:

- when requesting technical assistance from Techline,
- for approval requests when replacing parts for which approval is mandatory,
- to be attached to monitored parts for which reimbursement is requested. The log is needed for warranty reimbursement, and enables better analysis of the parts removed.

6. SAFETY INSTRUCTIONS

Safety rules must be observed during any work on a component to prevent any damage or injury:

- check the battery voltage to avoid incorrect operation of computer functions,
- use the proper tools.

GETtheMANUALS.org

PRESENTATION OF THE PARKING BRAKE:

The electronic parking brake provides the following functions:
- keeps the vehicle stationary when stopped (parking brake).
- 'dynamic' emergency brake (if the main brakes fail).
- automatic braking force adjustment according to the slope (adapted application),
- electronically-assisted parking brake application when the engine is stopped (depending on configuration),
- easy start with electronically-assisted parking brake release (depending on configuration),
- manual application and release by pulling on the lever.

SYSTEM COMPONENTS AND OPERATION:

The system consists of the following components:

- **Control lever** with brake on indicator light.
  - For applying and releasing the parking brake.

- **Control unit** (computer) housing an electric motor, the brake cable hooks, angle sensor and force sensor.
  - The **angle sensor** controls locking according to the angle of the slope.
  - The **force sensor** checks and corrects the force applied to the brakes.

- **Clutch pedal position sensor to help with pulling away**.
  - Informs the computer of the vehicle's clutch position (the position of the pedal enables the torque necessary for vehicle movement to be obtained).

- Two **mechanical cables**
  - Convey the mechanical force to the rear brakes.

- **Emergency control** cable (in the central storage compartment on the **LAGUNA, VEL SATIS** and **ESPACE** and in the boot on the **SCENIC**).
  - Enables the rear brakes to be released in the event of the battery or parking brake failing.

- **Warning lights** and symbol on the instrument panel.
  - Indicate application, releasing and any faults on the parking brake.

Note:
The parking brake cable play compensation is performed automatically by the control unit.

GETtheMANUALS.org

MANUAL OPERATION:

– The parking brake is engaged by pulling on the control lever (normal braking immobilises the vehicle).

– Over-application can be obtained by pulling and holding the lever for **5 seconds** (maximum application for steep hills or when the vehicle has reached its maximum permissible all-up weight).

– When the parking brake is applied, the computer super-applies if the force applied to the rear brake callipers is insufficient (pads cooling) or if the computer detects slight vehicle movement. This detection is limited to **24 hours**.

– The parking brake is released when the control lever is applied fully and the release switch is pressed.

Note:
When the parking brake is applied, the red light on the instrument panel (brake pads) and indicator light on the lever are lit.
Below **6 mph** (10 km/h) pulling the lever applies the rear brakes. Above **6 mph** (10 km/h) pulling the lever provides dynamic emergency braking without locking the rear wheels (statutory deceleration of **1.5 m/s^2**).
The electronic parking brake can only be released when the steering column is unlocked (**forced + after ignition feed**, see **Introduction**).

ASSISTED OPERATION:

The electronic parking brake enables assisted application and release of the brake:

- Applying the brake: When the engine is switched off, the parking brake is applied when the driver presses the start button
- Releasing: The brake releases when the drive wheels reach the torque required to move the vehicle (**Note:** with automatic transmission, the driver's door must be closed).

Restrictions on assisted brake release in automatic transmissions:
Assisted release is **not allowed** in the following cases:

– Opening the driver's door **followed** by engaging a gear (gear lever in position **D**).

Note: In this case, the instrument panel displays the message Lever in **P** or **N** and the buzzer on the instrument panel sounds.

– Engaging a gear (gear lever in position **D**) **followed** by opening the driver's door.

Note: In this case, **release is authorised for 5 s** after the driver's door has been opened (e.g. for a manoeuvre). After **5 seconds** release is prevented.

Note:
Assisted braking and release only occurs if the computer has been configured.
For details on how these configurations function, see **Configuration and programming**.

GETtheMANUALS.org

GENERAL OPERATING MODE FOR THE COMPUTER:

The electronic parking brake computer operates in two modes: **STANDBY** mode and **SWITCH ON** mode.

- **SWITCH ON** mode:

Available functions:

- Manual application and release, assisted application and release and emergency braking (steering column unlocked).
- Full system fault finding (all faults can be identified).

Switch on conditions (3 possibilities):

- The UCH sends a **switch on** request to the parking brake computer via the multiplex network when the vehicle is opened or the card is inserted in the reader.
- Braking request via the parking brake control lever.
- Battery voltage more than **13.2 V**, if the vehicle has been parked for less than **24 hours**.

- **STANDBY** mode:

Available functions:

- Monitoring of the braking force and slope angle for **24 hours** (to ensure parking brake application).
- Only application is authorised (using the lever).
- Restricted system fault finding (the computer can no longer identify all faults).
- Release not authorised.

Conditions for setting to standby:

- The UCH sends a "set to standby" request to the parking brake computer via the multiplex network after the ignition is switched off and the vehicle is locked (after a few seconds). The parking brake computer's STANDBY mode will be confirmed by the lever warning light going out (special note: the battery voltage must be less than **13.2 V**).

WARNING
Before using the emergency control, it is important to put the vehicle into gear and wedge one wheel if necessary (on a slope).

CABLE RESETTING:

The parking brake cable is locked after the control lever is released or after driving at over **1 mph** (2 km/h) (switched on mode).
When the electronic parking brake system locks, it makes a sound that lasts for a few seconds and ends with clicking (play compensation is automatic).

GETtheMANUALS.org

WARNING LIGHT MANAGEMENT

Indications of a level 1 fault:
- **Check Parking Brake** message on the instrument panel display.
- **orange warning light** (**P** in a triangle) on the instrument panel comes on.
- **SERVICE** warning light comes on.

Indications of a level 2 fault:
- **Parking brake defective** message on the instrument panel display.
- **1-second** audible warning (from the instrument panel),
- **orange warning light** (**P** in a triangle) on the instrument panel comes on.
- **SERVICE** warning light comes on,
- **Red indicator light** (brake pad light) on the instrument panel comes on.
- parking brake control lever indicator light flashes.

Note:
When the lever warning light stops flashing, the instrument panel message disappears. If the system has a level 2 fault, whenever the lever is used, the indicator light on the lever starts flashing again and the fault message reappears.

Warning occurs:
- when the door is opened and a gear is engaged on an automatic transmission,
- when the vehicle is moving, despite the parking brake being applied,
- when the door is opened, with the engine running and the parking brake released,
- when the door is opened, with the engine stopped and the parking brake released,

GETtheMANUALS.org

A/ PROCEDURE FOR REPLACING AN ELECTRONIC PARKING BRAKE COMPUTER

Note:
An electronic parking brake computer should be replaced **only when requested by the Techline** (fill out the fault finding log).

- For the description of the mechanical operations for replacing the control unit (computer) and brake cables (see **MR405 (Espace IV) or MR395 (Laguna II) or MR370 (Scénic), Mechanical, 37B, Electronic parking brake, Control unit: Removal - Refitting and 37A, Mechanical component controls, Parking brake cables: Removal - Refitting or MR353 (Vel Satis), Mechanical, 37B, Automatic parking brake, Control unit and brake cables**).
- The parking brake cables must always be replaced when the computer is replaced.
- In the same way, the computer must be replaced when the parking brake cables are changed.
- Conversely, the lever and the parking brake are independent of one another.
- Lever replacement must be carried out with **+ after ignition feed** switched off and the parking brake released, otherwise faults may occur.
- The clutch sensor must be replaced with **+ after ignition feed** switched on to avoid a fault being provoked.

BEFORE REPLACING THE PARKING BRAKE COMPUTER:

If the vehicle has a **manual gearbox**, recover the **clutch data** from the memory of the old computer so that it can be entered into the new computer (see section **C**).

Note:
With an automatic transmission, no data recovery is required (the computer can be replaced without applying sections **C and D**).

Operations to perform before replacement:

– Switch on the ignition, connect the diagnostic tool and establish dialogue with the computer (parking brake field).
– before replacing the computer, check that it is actually causing the fault by reading the faults and apply the fault finding procedure concerned.

Important:
Do not clear the faults from the computer before replacing it.

Steps to follow after replacement:

– with the ignition switched off, replace the electronic parking brake computer (with the approval of Techline).
– switch on the ignition, connect the diagnostic tool and establish dialogue with the computer (parking brake field),
– apply the procedure described in section **B: NEW COMPUTER CALIBRATION AND INITIALISATION**,
– release the parking brake lever to reset the cables.
– check parking brake operation by testing the braking, maximum braking, and release,
– read the faults to clear any stored faults and check that replacing the computer has enabled the fault on the vehicle to be rectified (no faults present).
– read the configuration (repair mode menu) to check that the parking brake computer configuration has been correctly configured.
– depending on the configuration chosen, check the assisted braking and release.

IMPORTANT: It is strictly forbidden to drive a vehicle with an electronic parking brake computer unless it is in customer mode.

GETtheMANUALS.org

B/ COMMISSIONING A NEW COMPUTER

1/ COMPUTER CONFIGURATION

– Carry out configuration in accordance with the customer's request (see **Configurations and programming**).

2/ VEHICLE IDENTIFICATION NUMBER ENTRY

– run command **VP004 Write VIN**.
– enter the vehicle identification number using the **diagnostic tool** keypad,
– confirm.

Note:
If the vehicle identification number is not entered and command **CF007 Vehicle configuration** is not run, step 3 of initialising the computer will not work.

3/ COMPUTER CALIBRATION AND COMMISSIONING

WARNING
To initialise the computer, the vehicle must be on a horizontal surface with the brake cables correctly fitted (connected to the rear brake callipers) and nobody must be working on the vehicle.

– In **+ after ignition feed**, run command **VP011 Computer calibration and initialisation** and carry out the following 4 steps.

STEP 1 VEHICLE MASS CALIBRATION
Screen 1:
With the dropdown menu, enter the following information:
– vehicle type,
– engine type,
– gearbox type,
– type of driving style,
– equipment level (for Vdiag 04),
– confirm the operation by pressing **Next**.

Screen 2:
– reread the highlighted information.
– If the highlighted information does not match the vehicle, return to the selection screen by pressing **Back**,
– if the highlighted information is correct, continue with step 2 by pressing **Next**.

STAGE 2 INITIALISING A NEW PARKING BRAKE
– Initialise the brake by pressing **YES** (you should hear a noise as the brake is applied and then released).
– Proceed to step 3 by pressing **Next**.

STEP 3 SLOPE INITIALISATION
– Calibrate the slope sensor by pressing **Confirm**. Proceed to step 4 by pressing **Next**.

STEP 4 INITIALISING ASSISTED BRAKING
– Carry out initialisation by pressing **Confirm**.
– Return to the selection list screen by pressing **Finish**.

GETtheMANUALS.org

C/ CLUTCH DATA BACKUP (for vehicles with a manual gearbox)

Purpose of the procedure:

The data saved relates to the clutch engagement point. This is important when the clutch wears, because this data enables the parking brake to release electronically when the clutch enables the vehicle to move off.

If this data cannot be retrieved from the old computer (impossible to establish dialogue with the diagnostic tool) or a new clutch has been fitted, the new computer has to be programmed with the clutch engagement point: drive the vehicle, downshifting at least 30 times (from 5^{th} to 4^{th} gear) before returning the vehicle to the customer.

If the clutch data is not recorded in the new computer, the operation of the assisted brake on steep slopes will be impaired when first used.

Perform the following operations:

IMPORTANT:
Do not apply this procedure in the event of a clutch fault.

- establish dialogue with the computer,
- select the repair mode menu on the diagnostic tool.
- open the programming menu,
- run function **SC005** Backup clutch pedal programming (the data is written to a file that is automatically selected when the new computer is programmed).
- replace the electronic parking brake computer (see **MR405 (Espace IV) or MR395 (Laguna II) or MR370 (Scénic), Mechanical, 37B, Electronic parking brake, Control unit: Removal - Refitting or MR353 (Vel Satis), Mechanical, 37B, Automatic parking brake, Control unit**),
- follow the procedures described in sections **A** and **B**.

D/ CLUTCH DATA ENTRY (for vehicles with automatic transmission)

The initialisation must be carried out (sections **A** and **B**).

Perform the following operations:

- establish dialogue with the computer,
- select the repair mode menu on the diagnostic tool.
- open the programming menu,
- run function: **SC006 Enter clutch pedal programming**.
- check that the electronic parking brake is operating correctly, including the assisted release function.

Note:
- For vehicles fitted with an **automatic gearbox**, command **SC005 Save clutch pedal programming** is **unavailable**.
- Command **SC006 Enter clutch pedal programming**, is also unavailable if command **SC005** has not already been activated.

GETtheMANUALS.org

CONFIGURATIONS:

Two functions can be turned off by configuration: assisted application and release.

Special note:
Assisted application and release are configured by default when a new computer is initialised. This configuration is accessible in the log book.

To carry out configuration, select the diagnostic tool's **Repair mode** menu.

CF007 Vehicle configuration

This configuration turns electronic parking brake application on or off when the engine is stopped.
In cold countries or regions, assisted braking should preferably be inhibited to avoid brake cables becoming frozen in the applied position.

- Select the type of configuration:
  - NORMAL (**with** assisted braking when the engine is stopped).
  - COLD CLIMATE (**without** assisted braking when the engine is stopped).
- Confirm the operation.
- Make sure the configuration has been properly entered by reading configuration **LC009 Vehicle configuration**.
- Make sure the assisted braking function works.

PROGRAMMING:

- Refer to the configuration check.

Note:
When a new computer is initialised, the angle sensor is calibrated by running command **VP011 Computer calibration and initialising**.

GETtheMANUALS.org

DF003 PRESENT OR STORED	COMPUTER 1. DEF: Internal electronic fault 2. DEF: Internal electronic fault 3. DEF: Loss of computer supply voltage

NOTES	**Priorities when dealing with a number of faults:** This fault must be dealt with first.
	Special notes: Before replacing the electronic parking brake computer, **save the data from the old computer** (for vehicles fitted with a manual gearbox). For this operation, see **Replacement of components**.

1. DEF ***2. DEF***	***NOTES***	None.

If the fault is present or stored, contact the **Techline**.

3. DEF	***NOTES***	**Special notes:** The fault does not usually come from the electronic parking brake computer. This fault indicates that the computer has detected several losses of feed (micro-breaks). **Note:** This fault may be caused by several battery disconnections or a vehicle power supply fault. **Only for Vdiag 08, 0C and 0D:** **If there is a stored fault, refer to the statuses and parameters when it appears.** Explanation of counters: see **Introduction**. If the fault is stored and **PR018 = 0** and **PR022 > 25**, then clear the fault: do not take this fault into account.
		Conditions for applying the fault finding procedure to a stored fault: Apply this fault finding procedure if the fault reappears as present or stored after a fault has been cleared and forced + after ignition feed has been switched off and on again (see **Introduction**).

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF003 **CONTINUED**	

Disconnect the electronic parking brake computer connector (under the body near the rear axle) to check the **conformity of the power supply** (this must equal the voltage measured at the battery terminals **± 0.5 V**).
Check **the insulation, continuity and the absence of interference resistance** on the following connections:

Electronic parking brake computer connector

track H4
(except Laguna II, Vel Satis and Espace IV) → **+ 12 V**
track G4

track H2
(except Laguna II, Vel Satis and Espace IV) → **earth**
track G2

Note:
If the electrical supply is correct, check that the supply has not been cut off by moving the electrical harness (near to the intermediate connector under the front left-hand seat at the computer connector).
Repair if necessary (see the vehicle wiring diagram).

If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF004 PRESENT OR STORED	COMPUTER 1. DEF: Internal electronic fault

NOTES	**Priorities when dealing with a number of faults:** This fault must be dealt with first.
	Special notes: Before replacing an electronic parking brake computer, **save the data from the old computer** (for vehicles fitted with a manual gearbox). For this operation, see **Replacement of components**.

Contact the Techline without clearing the faults.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF006 PRESENT	COMPUTER CONFIGURATION 1. DEF: Configuration absent or incorrect

NOTES	**Special notes:** Deal with this fault only after the computer has been replaced. If it appears when the electronic parking brake computer is not new, contact the Techline. This fault indicates that the parking brake control unit has not been calibrated or has been calibrated incorrectly. This fault causes the electronic parking brake to operate incorrectly, in particular for the assisted release function.

Display status **ET024 System operation** on the main screen of the diagnostic tool.
This status should be **CUSTOMER MODE**. If it is **FACTORY MODE**, initialise the computer by running command **VP011 Computer calibration and initialisation** (see **Replacement of components**).

Test that the parking brake is operating correctly by applying it, applying it completely (handle pulled right up for **5 seconds**) and releasing it.

Check the validity of parameter **PR003 "Inclination value"**.
Calibrate the sensor if necessary **(SC008 Slope initialisation**).

If necessary, reconfigure the application and release functions as requested by the customer with **CF007 Vehicle configuration** and see **Configurations and programming**.

If the above procedure does not resolve the fault (fault still present), recalibrate the computer (command **VP011 Computer calibration and initialisation** on the diagnostic tool).
During this stage, check that the vehicle criteria are correctly entered (screen 2 stage 1).

If the fault is still present, contact the **Techline** without clearing the faults.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF015 PRESENT OR STORED	CLUTCH POSITION SENSOR CIRCUIT CC.0 : Short circuit to earth CC.1 : Short circuit to + 12 volts 1. DEF: Signal inconsistency between the sensor and the gearbox 2. DEF: Signal outside lower limit 3. DEF: Sensor supply fault

NOTES	**Priorities when dealing with a number of faults:** Deal with faults **DF035 Undervoltage, DF055 Battery undervoltage and DF054 Battery voltage too high** first, if they are present or stored.
	Special notes: The fault does not usually come from the electronic parking brake computer. The fault should only be displayed on a vehicle fitted with a manual gearbox. If it is displayed on an automatic transmission, check the configurations. The sensor should be replaced in **+ after ignition feed**, if not this fault may occur. If the fault appeared following replacement of the clutch position sensor, check the procedure and repeat it in **+ after ignition feed** if necessary, after clearing the fault. If the fault cannot be cleared, disconnect the clutch sensor under **+ after ignition feed**, then reconnect it. **Only for Vdiag 08, 0C and 0D:** **If there is a stored fault, refer to the statuses and parameters when it appears.** Explanation of counters: see **Introduction**. If the fault is stored and **PR018 = 0** and **PR022 > 25** clear the fault: do not take this fault into account.

CC.0; CC.1; 3.DEF	***NOTES***	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present when the ignition is switched on (forced + after ignition feed, see **Introduction**).

Check **the connection and condition** of the clutch pedal position sensor connector. Repair if necessary.
With the clutch pedal position sensor connector disconnected, check **the insulation, continuity and absence of interference resistance** on the following connections:

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF015 CONTINUED	

Clutch pedal position sensor connector: **1057** — Electronic parking brake computer connector: **1217**

Track 1	→	**Track E4**
Track 2	→	**Track E3**
Track 3	→	**Track E2**

Repair if necessary.

Disconnect the clutch pedal position sensor connector to check, with the ignition switched on and the electronic parking brake computer connector connected, **the presence of a 5 volt supply**, by measuring between **tracks 1 and 3** of the sensor (**+ 5 V** on **track 1** and earth on **track 3**).
If the 5 V supply is not present and the connections previously checked are correct, contact the Techline.

With the clutch pedal position sensor connector disconnected, measure the sensor resistance between **tracks 1 and 3** of the sensor.
Replace the sensor if its resistance is not **5200 Ω ± 520 Ω**.

If the fault is still present, contact the **Techline**.

1. DEF; 2. DEF	*NOTES*	**Conditions for applying the fault finding procedure to a stored fault:** Engine at idle speed, and gear engaged for **5 seconds**.

Check the operation of statuses **ET016 Manual gearbox gear lever position** and **ET017 Reverse gear engaged** and the absence of any incorrect contacts.
If not correct, check the operation of the gearbox sensor.

Check that the clutch pedal position sensor is **fitted correctly**: the **"arm"** of the potentiometer should be inserted correctly into its mounting lug (neither above nor below).

Using the diagnostic tool, display parameter **PR006 Clutch pedal position** on the main data screen (see the conformity check values).

Check the conformity of the pedals.

If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF016 PRESENT OR STORED	WARNING LIGHT CIRCUIT CC.0: Short circuit to earth CC.1: Short circuit to + 12 V.

NOTES	**Priorities when dealing with a number of faults:** Deal with faults **DF035 Undervoltage, DF055 Battery undervoltage and DF054 Battery voltage too high** first, if they are present or stored.
	Conditions for applying the fault finding procedure to a stored fault: The fault is declared present after the forced + after ignition is switched on (see **Introduction**) and an application request using the control lever.
	Special notes: The fault does not usually come from the electronic parking brake computer. **Note:** After a release request, the fault becomes stored. Replacing the lever with the parking brake applied may cause this fault. If this fault appears after replacing the lever, release the parking brake and carry out the procedure again. **Only for Vdiag 08, 0C and 0D:** **If there is a stored fault, refer to the statuses and parameters when it appears.** Explanation of counters: see **Introduction** section. If the fault is stored and **PR018 = 0** and **PR022 > 25** clear the fault: do not take this fault into account. If the fault is stored and **PR019 < 3**, clear the fault: do not take this fault into account.

Check that the electronic parking brake control lever connector is in **good condition** and also check its clips (terminals).
Repair if necessary.

Check that there is a **12 V + before ignition** supply on **track 6** of the electronic parking brake control lever: see wiring diagram.
Repair if necessary.

Disconnect the electronic parking brake control lever connector in order to check **the insulation, continuity and absence of interference resistance** on the following connection:

Electronic parking brake control lever connector: **1216**		Electronic parking brake computer connector: **1217**
Track 5	→	**Track C4**

Repair if necessary.

If the fault is still present, replace the parking brake control lever (the indicator light cannot be separated).

If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF025 PRESENT OR STORED	VEHICLE MOVEMENT WITH MAXIMUM APPLICATION 1. DEF: Rear wheel movement with parking brake applied 2. DEF: Front wheel movement with parking brake applied

NOTES	**Priorities when dealing with a number of faults:** First deal with faults **DF046 Brake motor/cables connection, DF042 Force sensor, DF035 Undervoltage, DF041 Slope sensor, DF049 Brake application, DF054 Battery voltage too high and DF055 Battery undervoltage**, if they are present or stored. If none of these faults is present or stored, the parking brake computer is not normally the cause.
	Conditions for applying the fault finding procedure to a stored fault: Apply the fault finding procedure even if the fault is **stored**. **Note:** The fault does not remain present after it has been detected.

1. DEF	***NOTES***	**Special notes:** – This fault indicates that the electronic parking brake computer detected rear wheel movement although the parking brake was applied with maximum force. – It may be associated with **2.DEF**. If this fault is not associated with the faults mentioned above, check the conformity of the parking brake's mechanical force line: – Condition and conformity of rear brake pads. – Parking brake cables correctly fitted. – Good condition of the parking brake cables (no seizing or deterioration). – Conformity, condition and correct operation of the rear brake callipers. This fault is an operational warning. Check the context in which it appears. **It may appear during:** **– incorrect use of a roller test bench which drives the rear wheels (MOT test),** **– forced assisted release when starting, when the starting conditions have not been met,** **– vehicle overload on a very steep slope (maximum permissible all-up weight exceeded + angle > 18˚: e.g. towing a trailer or a caravan).**

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF025 **CONTINUED**	

2. DEF	***NOTES***	**Special notes:** – This fault indicates that the electronic parking brake computer detected front wheel movement although the parking brake was applied with maximum force. When this fault appears on its own it is an operating warning that indicates that the vehicle's conditions of use are on the limit (the braking system and parking brake are not normally the cause). This fault is an operational warning. Check the context in which it appears. **It may appear during:** **– an application request, whilst the vehicle is still being driven,** **– forced assisted release when starting, when the starting conditions have not been met,** **– parked on a steep slope with slippery surface,** **– incorrect use of a roller test bench which drives the front wheels (MOT test).** **If the fault is stored, refer to the statuses and parameters when it appears**. Explanation of counters: see **Introduction** section. If the fault is stored and **PR018 = 0 and PR022 > 25** clear the fault: do not take this fault into account.

Using the **diagnostic tool**, display the wheel speed parameters on the parameters screen. When stationary, these parameters must show **0 mph**. If this is not the case, carry out fault finding on the **anti-lock braking system** (see **38C**, **Anti-lock braking system**).
Check that the parking brake mechanical tensioning line is correct: – Parking brake cables correctly fitted. – Good condition of the parking brake cables (no seizing or deterioration). – Conformity, condition and proper functioning of the rear brake callipers. – Condition and conformity of rear brake pads. Carry out the necessary repairs.
Check that the vehicle is not overloaded.
Check that the vehicle's tyres are not bald.
If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF025 PRESENT OR STORED	VEHICLE MOVEMENT WITH MAXIMUM APPLICATION 1. DEF: The computer has detected vehicle movement when parked (parking brake applied)

NOTES	**Priorities when dealing with a number of faults:** First deal with faults **DF046 Brake motor/cables connection, DF042 Force sensor, DF035 Undervoltage, DF041 Slope sensor, DF049 Brake application, DF054 Battery voltage too high and DF055 Battery undervoltage**, if they are present or stored. If none of these faults is present or stored, the parking brake computer is not normally the cause.
	Conditions for applying the fault finding procedure to a stored fault: Apply the fault finding procedure even if the fault is **stored**. **Note:** The fault does not remain present after it has been detected.
	Special notes: – this fault indicates that the electronic parking brake computer detected movement of the vehicle although the parking brake was applied. – if this fault is present, with the ignition on, the buzzer on the instrument panel is activated (when the vehicle is moving with the parking brake applied). This fault is an operational warning. Check the context in which it appears. **It may appear during:** **– an application request, whilst the vehicle is still being driven,** **– forced assisted release when starting, when the starting conditions have not been met,** **– parked on a steep slope with slippery surface,** **– incorrect use of a roller test bench (MOT test).** **Only for Vdiag 08 and 0C:** **If there is a stored fault, refer to the statuses and parameters when it appears.** Explanation of counters: see **Introduction** section. If the fault is stored and **PR018 = 0 and PR022 > 25**, clear the fault: do not take this fault into account.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF025 **CONTINUED**	

Using the diagnostic tool, display the wheel speed parameters on the parameters screen. When stationary, these parameters must show **0 mph**. If this is not the case, carry out fault finding on the anti-lock braking system.
Check that the parking brake mechanical tensioning line is correct: – Parking brake cables correctly fitted. – Good condition of the parking brake cables (no seizing or deterioration). – Conformity, condition and proper functioning of the rear brake callipers. – Condition and conformity of rear brake pads. Carry out the necessary repairs.
Check that the vehicle is not overloaded.
Check that the vehicle's tyres are not bald.
If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF028 PRESENT OR STORED	COMPUTER 1. DEF: Internal electronic fault 2. DEF: Internal electronic fault

NOTES	**Priorities when dealing with a number of faults:** This fault must be dealt with first.
	Conditions for applying the fault finding procedure to a stored fault: Apply the fault finding procedure even if the fault is **stored**.
	Special notes: Before replacing an electronic parking brake computer, **save the data from the old computer** (for vehicles fitted with a manual gearbox). For this operation, see **Replacement of components**.

Contact the **Techline**, without clearing the fault.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF029 PRESENT OR STORED	COMPUTER 1. DEF: Internal electronic fault 2. DEF: Internal electronic fault

NOTES	**Priorities when dealing with a number of faults:** This fault must be dealt with first.
	Conditions for applying the fault finding procedure to a stored fault: Apply the fault finding procedure even if the fault is **stored**.
	Special notes: Before replacing an electronic parking brake computer, **save the data from the old computer** (for vehicles fitted with a manual gearbox). For this operation, see **Replacement of components**.

Contact the **Techline**, without clearing the fault.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF035 PRESENT OR STORED	UNDERVOLTAGE 1. DEF: Insufficient feed voltage during the command

NOTES	**Priority in the event of a number of faults:** Deal with fault **DF055 Battery undervoltage** first if it is present or stored.
	Conditions for applying the fault finding procedure to a stored fault: Apply this fault finding procedure if the fault reappears after the ignition has been switched off and on again (+ forced after ignition feed: see **Introduction**) and an application or release request using the control lever.
	Special notes: This fault is a power supply fault and does not usually stem from the electronic parking brake computer. This fault does not indicate computer feed undervoltage but a significant drop in voltage to the parking brake motor while the command is being issued. **Only for Vdiag 08, 0C and 0D:** **If there is a stored fault, refer to the statuses and parameters when it appears.** Explanation of counters: see **Introduction**. If the fault is stored and **PR018 = 0** and **PR022 > 25**, clear the fault: do not take this fault into account.

Disconnect the electronic parking brake computer connector to check the **conformity of the supplies** and to check t**he insulation, continuity and the absence of interference resistance** on the following connections:

Electronic parking brake computer connector

track H4
(except Laguna II, Vel Satis and Espace IV) → **+ 12 V**
track G4

track H2
(except Laguna II, Vel Satis and Espace IV) → **earth**
track G2

Repair if necessary (see the vehicle wiring diagram).

Apply the brake and then release it (engine running) to check that during the command the voltage measured at the fuse does not drop below **10.5 V**.
Make the repairs necessary for the parking brake computer electrical supply to be correct (equal to the battery voltage).

If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF036 PRESENT OR STORED	INJECTION MULTIPLEX SIGNAL ABSENT 1. DEF: Multiplex signals absent or values invalid (fault with the computer generating the signal or multiplex line connection fault)

NOTES	**Priority in the event of a number of faults:** Deal with faults **DF055 Battery undervoltage and DF052 Multiplex network** first if they are present or stored.
	Deal with any injection computer faults first. The fault does not usually come from the electronic parking brake computer. **Note:** If there is a multiplex line fault like this one, the parking brake loses its assisted application and release functions.
	Conditions for applying the fault finding procedure to a stored fault: Apply this fault finding procedure if the fault reappears as present or stored after a fault has been cleared, and the ignition has been switched off and on again (forced **+ after ignition feed**: see **Introduction**).
	Special notes: This fault only relates to multiplex signals received from the injection computer. This fault indicates either that there is no transmission, or that the signals received by the parking brake are inconsistent. **Only for Vdiag 08, 0C and 0D:** **If there is a stored fault, refer to the statuses and parameters when it appears.** Explanation of counters: see **Introduction** section. If the fault is stored and **PR018 = 0** and **PR022 > 25**, clear the fault: do not take this fault into account. If the fault is stored and **PR019 < 10**, clear the fault: do not take this fault into account.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF036 **CONTINUED**	

Using the diagnostic tool, run **fault finding on the multiplex network** and particularly on the injection computer - electronic parking brake computer segment. This check ensures that the various multiplex system connections are correct and finds any faulty segments. Carry out any necessary repairs.
If the multiplex network test did not find the faulty connection, carry out a **conformity check** to check that the statuses and parameters coming from the injection computer are present and correct (**ET019, PR015, PR017**). If the status and parameters shown here are not correct, carry out fault finding on the **injection**.
If the fault is still present, disconnect the injection computer connector to check that it is **good condition** as well as its clips (terminals), in particular the clips for the **multiplex tracks** (refer to the wiring diagram for the injection system fitted to the vehicle). Replace the clips if necessary.
If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF037 PRESENT OR STORED	NO ABS MULTIPLEX SIGNAL 1. DEF: Multiplex signals absent or values invalid (fault with the computer generating the signal or multiplex line connection fault)

NOTES	**Priority in the event of a number of faults:** Deal with faults **DF055 Battery undervoltage and DF052 Multiplex network** first if they are present or stored.
	Deal with any ABS computer faults first. The fault does not usually come from the electronic parking brake computer. **Note:** If this fault is present, the parking brake loses its assisted application and release functions.
	Conditions for applying the fault finding procedure to a stored fault: Apply this fault finding procedure if the fault reappears as present or stored after a fault has been cleared and the ignition has been switched off and on again (forced + after ignition feed: see **Introduction**).
	Special notes: This fault only relates to multiplex signals received from the ABS computer. This fault indicates either that there is no transmission, or that the signals received by the electronic parking brake computer are inconsistent.
	Only for Vdiag 08, 0C and 0D: **If there is a stored fault, refer to the statuses and parameters when it appears.** Explanation of counters: see **Introduction**. If the fault is stored and **PR018 = 0** and **PR022 > 25**, clear the fault: do not take this fault into account. If the fault is stored and **PR019 < 10**, clear the fault: do not take this fault into account.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF037 **CONTINUED**	

Using the diagnostic tool, run **fault finding on the multiplex system** and particularly on the ABS computer-parking brake control unit segment. This check ensures that the various multiplex system connections are correct and finds any faulty segments. Carry out any necessary repairs.
If the multiplex system test did not find the faulty connection, carry out a **conformity check** to check that the parameters coming from the ABS computer are present and correct (**PR012, PR013, PR014**). If the parameters mentioned are not correct, carry out an **ABS** computer fault finding procedure (see **38C**, **Anti-lock braking system**).
If the fault is still present, disconnect the computer connector to check that it is in **good condition** as well as its clips (terminals), in particular the clips for the **multiplex tracks** (refer to the wiring diagram for the ABS computer fitted to the vehicle). Replace the clips if necessary.
If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF038 PRESENT OR STORED	NO AUTOMATIC TRANSMISSION MULTIPLEX SIGNAL 1. DEF: Multiplex signals absent or values invalid (fault with the computer generating the signal or multiplex line connection fault)

NOTES	**Priority in the event of a number of faults:** Deal with faults **DF055 Battery undervoltage and DF052 Multiplex network** first if they are present or stored.
	Deal with any automatic transmission computer faults first. The fault does not usually come from the electronic parking brake computer. **Note:** If this fault is present, the parking brake loses its assisted application and release functions.
	Conditions for applying the fault finding procedure to a stored fault: Apply this fault finding procedure if the fault reappears as present or stored after a fault has been cleared, and the ignition has been switched off and on again (forced **+ after ignition feed**: see **Introduction**).
	Special notes: This fault only relates to multiplex signals received from the automatic transmission computer. This fault indicates either that there is no signal or that the signals transmitted are inconsistent. **Only for Vdiag 08, 0C and 0D:** **If there is a stored fault, refer to the statuses and parameters when it appears.** Explanation of counters: see **Introduction**. If the fault is stored and **PR018 = 0** and **PR022 > 25**, clear the fault: do not take this fault into account. If the fault is stored and **PR019 < 15** clear the fault: do not take this fault into account.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF038 **CONTINUED**	

Check the vehicle gearbox configuration: check that the configuration is not for a manual gearbox when the vehicle is fitted with an automatic transmission, or that it is not configured for an automatic transmission when the vehicle is manual. Using the diagnostic tool, run **fault finding on the multiplex system** and particularly on the automatic transmission computer-parking brake control unit segment. This check ensures that the various multiplex system connections are correct and finds any faulty segments. Carry out any necessary repairs.
If the multiplex system test did not find the faulty connection, carry out a **conformity check** to check that the status coming from the automatic transmission computer is present and correct (**ET018**). If status **ET018** is not correct, carry out fault finding on the **automatic transmission**.
If the fault is still present, disconnect the automatic transmission computer connector to check that it is **sound** as well as its clips (terminals), and in particular the clips for the **multiplex tracks** (refer to the wiring diagram for the automatic transmission computer fitted on the vehicle). Replace the clips if necessary.
If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF039 PRESENT OR STORED	NO UCH MULTIPLEX SIGNAL 1. DEF: Multiplex signals absent or values invalid (fault with the computer generating the signal or multiplex line connection fault)

NOTES	**Priority in the event of a number of faults:** Deal with faults **DF055 Battery undervoltage and DF052 Multiplex network** first if they are present or stored.
	Deal with any UCH computer faults first. The fault does not usually come from the electronic parking brake computer. **Note:** If this fault is present, the parking brake loses its assisted application and release functions.
	Conditions for applying the fault finding procedure to a stored fault: Apply this fault finding procedure if the fault reappears as present or stored after a fault has been cleared and the ignition has been switched off and on again (forced + after ignition feed: see **Introduction**).
	Special notes: This fault only relates to multiplex signals received from the UCH computer. This fault indicates either that there is no signal or that the signals transmitted are inconsistent. **Only for Vdiag 08, 0C and 0D:** **If there is a stored fault, refer to the statuses and parameters when it appears.** Explanation of counters: see **Introduction**. If the fault is stored and **PR018 = 0 and PR022 > 25**, clear the fault: do not take this fault into account. If the fault is stored and **PR019 < 15** clear the fault: do not take this fault into account.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF039 **CONTINUED**	

Using the diagnostic tool, run **fault finding on the multiplex system** and particularly on the UCH computer-parking brake control unit segment. This check ensures that the various multiplex system connections are correct and finds any faulty segments. Carry out any necessary repairs.
If the multiplex network test did not find the faulty connection, carry out **a conformity check** to check that the statuses coming from the UCH are present and correct (**ET001, ET014, ET016, ET017, PR001**). If the statuses and parameters specified are not correct, carry out fault finding on the **UCH**.
If the fault is still present, disconnect the connectors to ensure that the UCH connectors are in **good condition** as well as their clips (terminals), in particular the clips for the **multiplex tracks** (refer to the wiring diagram for the UCH fitted to the vehicle). Replace the clips if necessary.
If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF041 PRESENT OR STORED	SLOPE SENSOR 1. DEF: Signal inconsistency

NOTES	**Priorities when dealing with a number of faults:** This fault must be dealt with first.
	Special notes: The slope sensor is **internal** to the electronic parking brake computer, it cannot be separated. Before replacing an electronic parking brake computer, **save the data from the old computer** (for vehicles fitted with a manual gearbox). For this operation, (see **Replacement of components**).

Contact the **Techline** without clearing the faults.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF042 PRESENT OR STORED	FORCE SENSOR CC.0: Short circuit to earth CC.1: Short circuit to + 12 V 1. DEF: Sensor supply fault 2 CO.0: Open circuit or short circuit to earth

CC.1 ***1. DEF***	***NOTES***	**Priorities when dealing with a number of faults:** This fault must be dealt with first. **Special notes:** The force sensor is internal to the electronic parking brake computer; it cannot be separated. Before replacing an electronic parking brake computer, **save the data from the old computer** (for vehicles fitted with a manual gearbox). For this operation, (see **Replacement of components**).

Contact the **Techline** without clearing the faults.

CC.0	***NOTES***	**Priority when dealing with a number of faults:** Deal with faults **DF055 Battery undervoltage and DF052 Multiplex network** first if they are present or stored. **Special notes:** The force sensor is internal to the electronic parking brake computer; it cannot be separated. Before replacing a parking brake control unit, **save the data from the old computer** (for vehicles fitted with a manual gearbox). For this operation, (see **Replacement of components**).

Contact the **Techline** without clearing the faults.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF042 CONTINUED	

2 CO.0	***NOTES***	**Priorities when dealing with a number of faults:** This fault must be dealt with first.
		Special notes: The force sensor is internal to the electronic parking brake computer; it cannot be separated. **Only for Espace IV Ph2 and Vel satis Ph2 in Vdiag 0D.** Before replacing an electronic parking brake computer, **save the data from the old computer** (for vehicles fitted with a manual gearbox). For this operation, (see **Replacement of components**).

Contact the **Techline** without clearing the faults.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF043 PRESENT OR STORED	PARKING BRAKE MOTOR 1. DEF: Internal electrical fault

NOTES	**Priorities when dealing with a number of faults:** This fault must be dealt with first.
	Special notes: Before replacing an electronic parking brake computer, **save the data from the old computer** (for vehicles fitted with a manual gearbox). For this operation, (see **Replacement of components**).

Check that the parking brake mechanical tensioning line is correct:
– Check the conformity, condition and correct operation of the brake callipers.
– Check the automatic adjustment of the rear brake callipers.

Contact the **Techline** without clearing the faults.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF044 PRESENT OR STORED	BRAKING SWITCH CC.0: Short circuit to earth CC.1: Short circuit to + 12 V

NOTES	**Priority when dealing with a number of faults:** Deal first with faults **DF047 Manual control, DF035 Undervoltage, DF055 Battery undervoltage and DF054 Battery voltage too high**, if they are present or stored.
	Conditions for applying the fault finding procedure to a stored fault: The fault is declared present after the ignition is switched on (forced **+ after ignition feed**, see **Introduction**) and an application request using the control lever.
	The fault does not usually come from the electronic parking brake computer. **Special notes:** The braking switch is in fact the first contact of the lever (the lever travels about **3 mm**). This fault appears naturally when the lever is disconnected. **Note:** The fault warning light comes on **10 seconds** after the fault appears. **Only for Vdiag 08, 0C and 0D:** **If there is a stored fault, refer to the statuses and parameters when it appears.** Explanation of counters: see **Introduction**. If the fault is stored and **PR018 = 0** and **PR022 > 25**, clear the fault: do not take this fault into account. If the fault is stored and **PR019 < 3**, clear the fault: do not take this fault into account.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF044 **CONTINUED 1**	

Using the diagnostic tool (**PARKING** sub-function), check the operation of the parking brake control lever. With the ignition on, statuses **ET008, ET009**, **ET010** should operate as follows:

	ET008 "Application switch position"	**ET009 "Redundant braking switch position"**	**ET010 "Release switch position"**
Lever **at rest**	**INACTIVE**	**INACTIVE**	**RELEASED**
Lever **pulled slightly (3 mm travel)**	**ACTIVE**	**INACTIVE**	**RELEASED**
Lever **pulled to end of travel**	**ACTIVE**	**ACTIVE**	**RELEASED**
Lever **pulled and release switch pressed**	**ACTIVE**	**ACTIVE**	**PRESSED**

If the statuses do not operate as explained above, check the **connection and condition** of the parking brake control lever connector.
Repair if necessary.

Check **the condition and connection** of the parking brake computer connectors and their clips (terminals).
Repair if necessary.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF044 **CONTINUED 2**	

With the parking brake control lever connector disconnected, check the **insulation, continuity and absence of interference resistance** on the following connections:

Parking brake lever connector: **1216**		Electronic parking brake computer: **1217**
track 9	→	**track D2**
track 7	→	**track C2**

Repair if necessary.

With the parking brake control lever connector disconnected, switch on the ignition and **check for a 5 V supply (4 V < X < 5 V)** on **track 7** of the lever connector. If the power supply is not present and the parking brake computer is correctly supplied (no other faults detected by the diagnostic tool), then contact the **Techline**.

If the fault is still present, measure the resistance of the braking switch between **tracks 7 and 9** of the parking brake control lever.
Replace the lever (see **MR405 (Espace IV), MR395 (Laguna II) or MR370 (Scénic), Mechanical, 37B, Electronic parking brake, Lever: Removal - Refitting or MR353 (Vel Satis), Mechanical, 37B, Automatic parking brake, Lever**) if the resistance of the brake application switch is not approximately:
– Lever in rest position: **2700 Ω ± 100 Ω.**
– Lever pulled: **172 Ω ± 15 Ω**.

If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF045 PRESENT OR STORED	REDUNDANT BRAKE SWITCH 1. DEF: Signal inconsistency

NOTES	**Priority when dealing with a number of faults:** Deal first with faults **DF047 Manual control, DF035 Undervoltage and DF055 Battery voltage too low**, if they are present or stored.
	Conditions for applying the fault finding procedure to a stored fault: This fault must be dealt with first.
	Special notes: The fault does not usually come from the electronic parking brake computer. The redundant brake switch is the second contact of the lever (maximum lever travel). **Only for Vdiag 08, 0C and 0D:** **If there is a stored fault, refer to the statuses and parameters when it appears.** Explanation of counters: see **Introduction**. If the fault is stored and **PR018 = 0** and **PR022 > 25** clear the fault: do not take this fault into account. If the fault is stored and **PR019 < 3**, clear the fault: do not take this fault into account.

Using the diagnostic tool (**PARKING** sub-function), check the operation of the parking brake control lever. With the ignition switched on, statuses **ET008, ET009** and **ET010** should operate as follows:

	ET008 "Engagement switch position"	**ET009 "Redundant braking switch position"**	**ET010 "Release switch position"**
Lever **at rest**	**INACTIVE**	**INACTIVE**	**RELEASED**
Lever **pulled slightly (3 mm travel)**	**ACTIVE**	**INACTIVE**	**RELEASED**
Lever **pulled to end of travel**	**ACTIVE**	**ACTIVE**	**RELEASED**
Lever **pulled and release switch pressed**	**ACTIVE**	**ACTIVE**	**PRESSED**

If the statuses do not operate as explained above, check the **connection and condition** of the parking brake control lever connector.
Repair if necessary.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF045 **CONTINUED**	

With the parking brake control lever connector disconnected, check the **insulation, continuity and absence of interference resistance** on the following connection:

Parking brake lever connector: **1216**		Electronic parking brake computer: **1217**
track 10	⟶	**track C3**

Repair if necessary.

With the parking brake control lever connector disconnected, check **for earth** on **track 2** of the lever connector.
Repair if necessary.

If the fault persists, **check the redundant braking switch**:
Lever in rest position: **insulation** between **tracks 2 and 10** of the lever.
Lever fully applied: **continuity** between **tracks 2 and 10** of the lever.
Replace the parking brake control lever if it does not function as indicated (see **MR405 (Espace IV), MR395 (Laguna II) or MR370 (Scénic), Mechanical, 37B, Electronic parking brake, Lever: Removal - Refitting or MR353 (Vel Satis), Mechanical, 37B, Automatic parking brake, Lever**).

If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF046 PRESENT OR STORED	BRAKE MOTOR/CABLES CONNECTION (EMERGENCY UNLOCKING) 1. DEF: Parking brake unlocked by the emergency handle

NOTES	**Priority when dealing with a number of faults:** Deal first with faults **DF003, DF004, DF028, DF029, DF035, DF041, DF042, DF043, DF050, DF054, DF055, DF057, DF058 and DF073** if they are present or stored.
	Conditions for applying the fault finding procedure to a stored fault: Apply this fault finding procedure if the fault recurs after the fault is cleared, with the ignition switched off and on again (forced **+ after ignition feed**, see **Introduction**), and the parking brake released then applied using the control lever.
	Special notes: The fault does not usually come from the electronic parking brake computer. This fault indicates that the electronic parking brake system has been unlocked by the manual control (if this is the case, check that the handle protector has not been damaged). Check that the emergency unlocking handle has not been manually pulled by the user, which would provoke this fault. The cables are reset by the parking brake release manual command or automatically (if the fault is present) when the vehicle is driven at more than **1.2 mph (2 km/h)** (the fault is then stored).
	Only for Vdiag 08, 0C and 0D: **If there is a stored fault, refer to the statuses and parameters when it appears.** Explanation of counters: see **Introduction**. If the fault is stored and **PR018 = 0** and **PR022 > 25** clear the fault: do not take this fault into account. If there has been no manual use of the emergency unlocking handle and if **PR019 > 5**, contact the **Techline**.

Check that the fault was not provoked by manual usage of the emergency unlocking handle. In this case, it is normal for the fault to arise; clear the fault.
Carry out a releasing command, then a braking command with the control lever to **reset the cables** of the parking brake.
Check the conformity of the parking brake mechanical tensioning line: correctly attached, no breakage. Check the conformity of the emergency unlocking cable. Carry out the necessary repairs.
Check that the braking force and maximum braking are operating correctly.
If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF047 PRESENT OR STORED	MANUAL CONTROL 1. DEF: No signal 2. DEF: Signal inconsistency 3. DEF: Short circuit 4. DEF: Lever fault

NOTES	**Priorities when dealing with a number of faults:** Deal with faults: **DF035 Undervoltage, DF055 Battery undervoltage and DF054 Battery voltage too high** first, if they are present or stored.
	Note: The fault does not usually come from the electronic parking brake computer. The fault is only stored after the brakes have been applied 3 times with the control level.
	Conditions for applying the fault finding procedure to a stored fault: Deal with the fault as if it were present.
	Only for Vdiag 08, 0C and 0D: **If there is a stored fault, refer to the statuses and parameters when it appears.** Explanation of counters: see **Introduction**. If the fault is stored and **PR018 = 0** and **PR022 > 25** clear the fault: do not take this fault into account. If the fault is stored and **PR019 < 3**, clear the fault: do not take this fault into account.

Using the diagnostic tool (**PARKING** sub-function), check the operation of the parking brake control lever. With the ignition switched on, statuses **ET008, ET009** and **ET010** should operate as follows:

	ET008 "Engagement switch position"	**ET009 "Redundant braking switch position"**	**ET010 "Release switch position"**
Lever **at rest**	**INACTIVE**	**INACTIVE**	**RELEASED**
Lever **pulled slightly (3 mm travel)**	**ACTIVE**	**INACTIVE**	**RELEASED**
Lever **pulled to end of travel**	**ACTIVE**	**ACTIVE**	**RELEASED**
Lever **pulled and release switch pressed**	**ACTIVE**	**ACTIVE**	**PRESSED**

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF047 CONTINUED	

If the statuses do not operate as explained above, check the **connection and condition** of the parking brake control lever connector.
Repair if necessary.

With the parking brake control lever connector disconnected, check **for earth** on **track 2** of the lever connector (repair if necessary).
Also **check for a 5 V supply (4 V < X < 5 V)** on **track 7** of the lever connector.
If the supply is not present and the parking brake computer is correctly supplied (no other faults detected by the diagnostic tool), then contact the **Techline**.

Check **the condition and connection** of the electronic parking brake computer connectors and their clips (terminals).
Repair if necessary.

With the parking brake control lever connector disconnected, check the **insulation** (from earth and to**+ 12 V** and the insulation of the 4 wires from each other), **the continuity and absence of interference resistance** on the following connections:

Parking brake lever connector: **1216**		Electronic parking brake computer: **1217**
track 9	→	**track D2**
track 7	→	**track C2**
track 10	→	**track C3**
track 4	→	**track D3**

Repair if necessary.

With the parking brake control unit connector disconnected, check the **insulation** between **tracks C2** and **D2** of the computer. If the tracks are in short circuit, replace the lever (see **Replacement of components**, **Part A/ Procedure for replacing an electronic parking brake computer**) (see **MR405 (Espace IV) or MR395 (Laguna II) or MR370 (Scénic), Mechanical, 37B, Electronic parking brake, Lever: Removal - Refitting or MR353 (Vel Satis), Mechanical, 37B, Automatic parking brake, Lever**).

If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF048 PRESENT OR STORED	RELEASE SWITCH 1. DEF: Signal inconsistency

NOTES	**Priority when dealing with a number of faults:** Deal first with faults **DF003, DF004, DF028, DF029, DF035, DF041, DF042, DF043, DF047, DF050, DF054, DF055, DF057, DF058 and DF073** if they are present or stored.
	Conditions for applying the fault finding procedure to a stored fault: The fault is declared present after the ignition is switched on (forced **+ after ignition feed**, see **Introduction**) and a brake release request using the control lever.
	Special notes: The fault does not usually come from the electronic parking brake computer. 8 applications (in **2 seconds**) using the control lever without pressing the release switch causes the fault to appear as present. **Only for Vdiag 08, 0C and 0D:** **If there is a stored fault, refer to the statuses and parameters when it appears.** Explanation of counters: see **Introduction**. If the fault is stored and **PR018 = 0** and **PR022 > 25** clear the fault: do not take this fault into account. If the fault is stored and **PR019 < 3**, clear the fault: do not take this fault into account.

Using the diagnostic tool (**PARKING** sub-function), check the operation of the parking brake control lever.
With the ignition switched on, statuses **ET008, ET009** and **ET010** should operate as follows:

	ET008 "Engagement switch position"	**ET009 "Redundant braking switch position"**	**ET010 "Release switch position"**
Lever **at rest**	**INACTIVE**	**INACTIVE**	**RELEASED**
Lever **pulled slightly (3 mm travel)**	**ACTIVE**	**INACTIVE**	**RELEASED**
Lever **pulled to end of travel**	**ACTIVE**	**ACTIVE**	**RELEASED**
Lever **pulled and release switch pressed**	**ACTIVE**	**ACTIVE**	**PRESSED**

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF048 **CONTINUED**	

If the statuses do not operate as explained above, check the **connection and condition** of the parking brake control lever connector.
Repair if necessary.

With the parking brake control lever connector disconnected, check **for earth** on **track 2** of the lever connector.
Repair if necessary.

Check **the connections and condition** of the electronic parking brake computer connectors and their clips (terminals) and its intermediate connector (under front left-hand seat).

With the parking brake control lever connector disconnected, check the **insulation, continuity and absence of interference resistance** on the following connection:

Parking brake lever connector: **1216**		Electronic parking brake computer: **1217**
track 4	→	**track D3**

Repair if necessary.

If the fault is still present, **check the release switch.**
Lever in rest position: **insulation** between **tracks 2 and 4** of the lever,
Lever fully applied and release switch pressed: **continuity** between **tracks 2 and 4** of the lever.
Replace the parking brake control lever if it does not function as indicated (see **Replacement of components, Part A/ Procedure for replacing the electronic parking brake computer**) (see **MR405 (Espace IV) or MR395 (Laguna II) or MR370 (Scénic), Mechanical, 37B, Electronic parking brake, Lever: Removal - Refitting or MR353 (Vel Satis), Mechanical, 37B, Automatic parking brake, Lever**).

If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF049 PRESENT OR STORED	BRAKING 1. DEF: Inconsistent braking value 2. DEF: Normal brake application value not reached 3. DEF: Normal brake release value not reached 4. DEF: Insufficient braking force

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present after: – a braking command is issued **on a slope**.
	Priorities when dealing with a number of faults: Deal with faults: **DF046 Brake motor / cables connection, DF050 Mechanical seizure, DF035 Undervoltage, DF058 Parking brake motor current and DF055 Battery undervoltage** first if they are present or stored.

Check that the parking brake mechanical tensioning line is correct:
- that the parking brake cables are fitted correctly (refer to the repair procedure),
- that the parking brake cables are in good condition (not seized or deteriorated),
- that the rear brake callipers are correct, in good condition and operating correctly,
- that the rear brake pads are correct and in good condition.

Carry out the necessary repairs.

Using the **diagnostic tool** statuses screen, display parameter **PR003 Slope value**.
If the value displayed is not 0 degrees (± 1) on level ground, carry out slope initialisation again (actuator control mode menu).

Using the **diagnostic tool** parameters screen, display the following parameters: **PR005 Force setpoint** and **PR004 Measured force value**. These must show the various values recorded in the conformity check.

Clear the fault, switch off the ignition for **5 minutes** (vehicle doors and windows closed), switch the ignition back on and repeat a braking command **on a slope**.

If the fault reappears, switch off the ignition and disconnect the computer supply fuse (fuse **F23** of the engine fuse box, refer to the wiring diagram) for approximately **1 minute**.
Reconnect the fuse, switch the ignition on and establish dialogue with the computer. Apply the brake to check whether the fault recurs.

If the fault reappears despite the above tests, or if the parameter values are not within conformity check tolerances while the brake is applied, then contact your **Techline**.

AFTER REPAIR	Clear the fault memory. Follow the instructions to confirm repair. If the computer has been replaced (**at the request of the Techline**), initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other possible faults.

GETtheMANUALS.org

DF049 PRESENT OR STORED	BRAKING 1. DEF: Inconsistent braking value 2. DEF: Normal brake application value not reached 3. DEF: Normal brake release value not reached 4. DEF: Insufficient braking force

NOTES	**Priorities when dealing with a number of faults:** Deal first with faults **DF003 (1.DEF; 2.DEF), DF004, DF028, DF029, DF041, DF042, DF043, DF050, DF055, DF057, DF058 and DF073**.
	Conditions for applying the fault finding procedure to a stored fault: The fault is declared present after the ignition is switched on (forced **+ after ignition feed**, see **Introduction**) and an application request **on a slope**.

1. DEF	***NOTES***	**Special notes:** The **1.DEF** code indicates an inconsistency between the measured force value (**PR004**) and the parking brake status (**ET030: Electronic parking brake operation** when there is a fault in the fault context). This fault can appear after disconnecting the battery (parking brake applied).

Check the context of the fault when the fault appears:
If **ET030** is **STATUS 5, STATUS 6, STATUS 7, STATUS 8, STATUS 9 or STATUS 10** and if **PR004** is greater than **450 N** and if **PR012 Vehicle speed** is **0 mph (0 km/h)** when the fault appears: – check to see if the battery has been disconnected, if it has, the appearance of this fault is normal, clear the fault, – if not, check the computer supply voltage and the battery. Repair if necessary. If the fault persists, contact the **Techline**.
If **ET030** is **STATUS 5, STATUS 6, STATUS 7** and if **PR004** is less than **450 N** and if **PR012 Vehicle speed** is less than **3 mph (5 km/h)** when the fault appears: – Check for traces of heating on the brakes: – Check that the pads have returned correctly to the rest position. – Check that the small lever has sufficient return force. – Check that there is no friction or points of resistance on the cables. – If there is no indication of any defective operation of these components and if **PR019 < 3 and PR022 > 25 and PR018 < 15**, then clear the fault. – If not, contact the **Techline**.
If the fault is still present, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF049 **CONTINUED 1**	

2. DEF	***NOTES***	**Special notes:** The specification **2.DEF** mainly comes from a fault with the electrical power supply, braking application travel or the internal force sensor.

If this fault appears after the parking brake has been replaced:
- Check the conformity of the parking brake fitting.
- Check that the battery voltage **PR001** is greater than **12.5 V**.
- Clear the fault and restart the procedure for fitting the parking brake: see **Replacement of components**.

Check the fault context when the fault appears: if the battery voltage **PR001** is less than **9 V** when the fault appears, then:
- Check the supply line and that the resistance is less than **150 mΩ**.
- If there is no sign of a fault on the supply line and if **PR019 < 3** and **PR022 > 25** and **PR018 < 15** then clear the fault.

Check the fault context when the fault appears: If **ET028 Brake switch signal** is **PRESSED,** then:
- If **PR019 < 3** and **PR022 > 25** and **PR018 < 15**, then clear the fault.
- The fault can be caused when the user depresses the brake pedal **hard**, when the parking brake is being applied. If this is the case, clear the fault.

If there is a **loud** noise when applying, when maximum braking is requested, then the cause may be mechanical.

Check that the parking brake mechanical tensioning line is correct:
- Parking brake cables correctly fitted.
- Good condition of the parking brake cables (no seizing or deterioration).
- Conformity, condition and proper functioning of the rear brake callipers.
- Condition and conformity of rear brake pads.
- Conformity of rear brakes bleeding.

Carry out the necessary repairs.

Using the **diagnostic tool (PARKING** sub-function), display the parameters **PR005 Force setpoint** and **PR004 Measured force value**. These must have the various values recorded in the conformity check.

If the fault is still present, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF049 **CONTINUED 2**	

3. DEF ***4. DEF***	***NOTES***	**Special notes:** The specification **3.DEF** mainly comes from a fault with the electrical power supply or the internal force sensor. The **4.DEF** code is mainly generated by an electrical supply fault or an internal fault (motor, sensor, etc.). It indicates that the parking brake is neither applied or released.

If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF050 PRESENT OR STORED	MECHANICAL SEIZURE

NOTES	**Priorities when dealing with a number of faults:** Deal first with faults **DF055 Battery voltage too low, DF046 Brake motor/cables connection, DF042 Force sensor and DF035 Undervoltage** if they are present or stored.
	Conditions for applying fault finding procedures to stored faults: Deal with the fault as if it were present.

Check that the parking brake mechanical tensioning line is correct:
- Parking brake cables correctly fitted.
- Good condition of the parking brake cables (no seizing or deterioration).
- Conformity, condition and correct operation of the brake callipers.

Carry out the necessary repairs.

Check the brake callipers.
Carry out the necessary repairs.

If the fault is still present, contact the **Techline** without clearing the faults.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF051 PRESENT OR STORED	SYSTEM FAULT AFTER COMPUTER REPLACEMENT

NOTES	**Special notes:** This fault indicates a malfunction due to not following procedures correctly: replacement or reconfiguration of the electronic parking brake computer was carried out with a present fault.
	Conditions for applying the fault finding procedure to a stored fault: Deal with the fault as if it were present.

Using the **diagnostic tool**, **run fault finding on the electronic parking brake computer**.
Deal with other present or stored faults first.
Carry out any necessary repairs. Clear the fault.

If no fault is displayed on the **diagnostic tool**, **carry out a conformity check** to check the conformity of the parking brake system.

If the conformity check and fault finding with the **diagnostic tool** have not enabled the fault to be solved (see **Introduction**) for **fault warning light management**, to find out which components may be causing the malfunction.

If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF052 PRESENT OR STORED	MULTIPLEX NETWORK 1. DEF: Problem receiving multiplex frames by the parking brake computer. The computer is not receiving any multiplex signals or else two computers are not communicating with the parking brake computer

NOTES	**Priorities when dealing with a number of faults:** Deal first with faults **DF003 (1.DEF; 2.DEF), DF004, DF028, DF029, DF041, DF042, DF043, DF050, DF055, DF057, DF058 and DF073**.
	Deal with any faults on the multiplex network first (see 88B, Multiplexing).
	Conditions for applying the fault finding procedure to a stored fault: Apply this fault finding procedure if the fault reappears as present after the ignition has been switched on (forced **+ after ignition feed**, see **Introduction**).
	Special notes: This fault indicates either a complete absence of multiplex signal transmission (no inconsistency) to the parking brake control unit, or no multiplex signal transmission from two computers (the continuity of the multiplex network lines may be correct, but if two computers fail to respond, this fault appears). The fault does not usually come from the electronic parking brake computer. **Note:** Using another battery for a boost when starting may trigger this fault. **Only for Vdiag 08, 0C and 0D:** **If there is a stored fault, refer to the statuses and parameters when it appears.** Explanation of counters: see **Introduction**. If the fault is stored and **PR018 = 0** and **PR022 > 25** clear the fault: do not take this fault into account.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF052 **CONTINUED**	

Check that an additional booster battery has not been used when starting, if this is the case, this fault may appear.
Use the **diagnostic tool** to carry out a **multiplex system test**. This check ensures that the various multiplex system connections are correct and finds any faulty segments. Carry out any necessary repairs.
If the multiplex system test has not made it possible to find the defective connection, disconnect the electronic parking brake computer connector to check it is in **good condition** and check the condition of the clips (terminals) and in particular the clips for **tracks A2 and A3.** Replace the clips if necessary.
With the electronic parking brake computer connector disconnected, check **the insulation, continuity and the absence of interference resistance** on the connections between tracks **A2** and **A3** of the electronic parking brake computer and the following computers: – anti-lock braking system (see diagram of the various computers), – injection (see diagram of the different computers), – automatic transmission (see diagram of the different computers), – UCH (see diagram of the different computers), – Protection and Switching Unit (see diagram of the different computers). Repair if necessary.
If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF054 PRESENT OR STORED	BATTERY VOLTAGE TOO HIGH 1. DEF: Battery voltage too high

NOTES	**Priorities when dealing with a number of faults:** Deal first with faults **DF003 (1.DEF; 2.DEF), DF004, DF028, DF029, DF041, DF042, DF043, DF050, DF057, DF058 and DF073**.
	Conditions for applying the fault finding procedure to a stored fault: Apply this fault finding procedure if the fault appears as present again after the ignition has been switched on (forced **+ after ignition feed**, see **Introduction**).
	Special notes: The fault does not usually come from the electronic parking brake computer. This fault appears as present if the computer supply voltage is greater than **16.5 V**, and becomes stored when the voltage goes back down below **15.7 V**. **Note:** Using another battery for a boost when starting may trigger this fault. **Only for Vdiag 08, 0C and 0D.** **If there is a stored fault, refer to the statuses and parameters when it appears.** Explanation of counters: see **Introduction**. If the fault is stored and **PR018 = 0** and **PR022 > 25**, clear the fault: do not take this fault into account.

Check the charging circuit: the alternator should not supply a voltage of less than **+ 12 V** or greater than **+ 14.4 V** (engine at idle speed).
Check the alternator and the regulator.
Carry out the necessary repairs.

If the fault is still present, check that no electrical system using the same supply fuse as the electronic parking brake computer is faulty.

If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF055 PRESENT OR STORED	BATTERY UNDERVOLTAGE 1. DEF: Battery voltage too low 2. DEF: Electronic parking brake reset when vehicle being driven

1. DEF	***NOTES***	**Special notes:** The fault does not usually come from the electronic parking brake computer. This fault appears as present if the computer supply voltage is less than **10.3 V**, and becomes stored once the voltage rises back above **10.5 V**. **Only for Vdiag 08, 0C and 0D:** **If there is a stored fault, refer to the statuses and parameters when it appears.** Explanation of counters: see **Introduction**. If the fault is stored and **PR018 = 0** and **PR022 > 25**, clear the fault: do not take this fault into account.
		Note: This fault may appear if starting is very difficult.
		Conditions for applying the fault finding procedure to a stored fault: Apply this fault finding procedure if the fault reappears as present after the ignition has been switched on (forced **+ after ignition feed**, see **Introduction**).

2. DEF	***NOTES***	**Note:** This fault only affects Vdiag 0D.
		Priorities when dealing with a number of faults: Deal first with faults **DF046 Brake motor/cables connection, DF042 Force sensor, DF035 Undervoltage, DF041 Slope sensor, DF049 Brake application, DF054 Battery voltage too high and DF055 Battery undervoltage** if they are present or stored. If none of these faults is present or stored, the parking brake computer is not normally the cause.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF055 **CONTINUED**	

2. DEF	***NOTES***	**Special notes:** This fault is generated after the automatic parking brake is switched on whilst driving or following an internal reset. With the anti-lock braking system, this detection is active at **> 0.6 mph (> 1 km/h)**, otherwise the multiplex signal emitted by the injection computer must be 1.
		Note: The driver is only informed of this fault after 16 successive detections. This fault may be due to battery disconnections or vehicle supply faults, in which case it is associated with fault 1.DEF (battery voltage too low) dealt with previously.

If the frequency counter (**PR016**) > 3 and if the onboard network (battery, wiring) analysis does not bring up any present or stored fault under battery voltage, contact the **Techline**.

Check that the battery, battery - starter - alternator connection lead, battery earth - chassis lead and the chassis earth - engine and transmission assembly lead are in **good condition**.
Repair if necessary.

Check the charging circuit: the alternator should not supply a voltage of less than **+ 12 V** or greater than **+ 14.4 V** (engine at idle speed).
Carry out the necessary repairs.

track H4
(except Laguna II, Vel Satis and Espace IV) → **+ 12 V**
track G4

track H2
(except Laguna II, Vel Satis and Espace IV) → **earth**
track G2

Repair if necessary (see the vehicle wiring diagram).

If the fault is still present, check that no electrical system using the same supply fuse as the electronic parking brake computer is faulty.

If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF056 PRESENT OR STORED	BRAKE CABLES INCORRECTLY FITTED 1. DEF: Incorrect brake cable fitting detected

NOTES	**Priorities when dealing with a number of faults:** Deal first with faults **DF003 (1.DEF; 2.DEF), DF004, DF028, DF029, DF041, DF042, DF043, DF050, DF057, DF058 and DF073**.
	Special notes: This fault only appears during configuration of the parking brake. The fault does not usually come from the electronic parking brake computer.
	Conditions for applying the fault finding procedure to a stored fault: Deal with the fault as if it were present.

Check that the battery voltage **PR001** is above **12.5 V**.

Check that the mechanical tensioning line is correctly fitted: cables, connections, callipers.
If the parking brake cables are damaged (particularly at the calliper collars), replace both cables (see **MR405 (Espace IV) or MR395 (Laguna II) or MR370 (Scénic), Mechanical, 37A, Mechanical component controls, Parking brake cables: Removal - Refitting or MR353 (Vel Satis), Mechanical, 37B, Automatic parking brake, Brake cables**).
Start the electronic parking brake computer configuration process again: run command **VP011 Computer calibration and initialisation** (see **Replacement of components**).

If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF057 PRESENT OR STORED	COMPUTER INTERNAL TEMPERATURE SENSOR 1. DEF: Temperature sensor outside correct range (internal fault) 2. DEF: Internal electronic fault

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** Apply the fault finding procedure even if the fault is **stored**.
	Special notes: Before replacing an electronic parking brake computer, **save the data from the old computer** (for vehicles fitted with a manual gearbox). For this operation, (see **Replacement of components**).

Contact the **Techline** without clearing the faults.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF058 PRESENT OR STORED	PARKING BRAKE MOTOR CURRENT 1. DEF: Inconsistent current value

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** Apply the fault finding procedure even if the fault is **stored**.
	Special notes: Before replacing an electronic parking brake computer, **save the data from the old computer** (for vehicles fitted with a manual gearbox). For this operation, (see **Replacement of components**).

Check to see if battery polarity has been inverted, if this is the case, clear the fault and check that the electronic parking brake computer is operating correctly (see **System operation**).
If the fault is still present, contact the **Techline** without clearing the fault.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF059 PRESENT OR STORED	NO PROTECTION AND SWITCHING UNIT MULTIPLEX SIGNAL 1. DEF: Multiplex signals absent or values invalid (fault with the computer generating the signal or multiplex line connection fault)

NOTES	**Priority when dealing with a number of faults:** Deal with faults **DF055 Battery undervoltage and DF052 Multiplex network** first if they are present or stored.
	Deal with any Protection and Switching Unit computer faults first. The fault does not usually come from the electronic parking brake computer.
	Conditions for applying the fault finding procedure to a stored fault: Apply this fault finding procedure if the fault reappears as present or stored after it has been cleared, the ignition has been switched back on (forced **+ after ignition feed**: see **Introduction**), and the parking brake is released then applied using the control lever.
	Special notes: This fault only relates to multiplex signals received from the **Protection and Switching Unit** computer. This fault indicates either that there is no signal or that the signals transmitted are inconsistent. **Note:** If a multiplex line fault such as this is present, the electronic parking brake computer may lose all or some of its assisted parking functions (application and release).
	If there is a stored fault, refer to the statuses and parameters when it appears. Explanation of counters: see **Introduction** section. If the fault is stored and **PR018 = 0** and **PR022 > 25**, clear the fault: do not take this fault into account.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF059 **CONTINUED**	

Use the diagnostic tool to carry out a **multiplex system test**. This check ensures that the various multiplex system connections are correct and finds any faulty segments. Carry out any necessary repairs.
If the multiplex network test did not find the faulty connection, carry out **a conformity check** to check that the status from the Protection and Switching Unit computer is present and correct (**ET016, PR015, PR017**). Check the gearbox contacts. If the status and parameters shown here are not correct, carry out fault finding on the **Protection and Switching Unit** (see **87G, Engine compartment connection unit**).
If the fault is still present, disconnect the Protection and Switching Unit computer connector to check that the connector and its clips (terminals) are in **good condition**, especially the **multiplex track** clips (see the wiring diagram of the **Protection and Switching Unit** fitted to the vehicle). Replace the clips if necessary.
If the fault persists, contact the **Techline**.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

DF073 PRESENT OR STORED	COMPUTER 1. DEF: Internal electrical fault

NOTES	**Priority when dealing with a number of faults:** This fault must be dealt with first.
	Conditions for applying the fault finding procedure to a stored fault: Deal with this fault as if it were present.
	Special notes: The electronic parking brake computer has detected a fault during standby mode (ignition off, vehicle doors and windows closed and lever warning light off) Before replacing an electronic parking brake computer, **save the data from the old computer** (for vehicles fitted with a manual gearbox). For this operation, (see **Replacement of components**).

Contact the **Techline**, without clearing the fault.

AFTER REPAIR	If the computer has been replaced **(at the request of the Techline)**, initialise the electronic parking brake computer (see **Replacement of components**). Issue several braking and release commands to confirm the repair. Deal with any other faults.

GETtheMANUALS.org

NOTES	Only carry out this conformity check after carrying out a **complete check** using the diagnostic tool. **Application conditions: ignition on (forced + after ignition, see Introduction)** **Note:** **The interpretation of these statuses and parameters is only valid with the ignition switched on,** the statuses and parameters displayed in blue on the diagnostic tool is information supplied by other computers, which are transmitted via the multiplex network. If these variables display inconsistent values, make sure that the multiplex system test has not shown up any faulty connections. **Repair the faulty multiplex connections before looking for a possible problem with the signals.** Each sub-function in this test is associated with a **Fault finding chart**. **Special notes:** The diagnostic tool may display the message **Computer busy** when displaying statuses and parameters. This message is displayed when the parking brake is applying or releasing the brake, because the computer gives priority to controlling the motor before transmitting variables. If this message is displayed, exit the current screen and then return to it.

MAIN SCREEN

Order	Function	Parameter or Status Checked or Action	Display and notes	Fault finding
1	Parking brake operation status	**ET024:** System operation	**CUSTOMER MODE**	If the status displays **FACTORY MODE**, the computer is **not operational**. To enter **CUSTOMER MODE**, initialise the computer again, by running command **VP011 Computer calibration and initialisation** (see **Replacement of components**).
2	Computer electrical supply	**ET001:** + After ignition feed	**Ignition off: ABSENT** **Ignition on: PRESENT**	In the event of a fault on this status, refer to the interpretation of status **ET001: + after ignition supply.**
		PR001: Battery voltage	**9.6 V < PR001 < 15 V**	If the value of the parameter is not within this range, check **the insulation, continuity and the absence of interference resistance** on the computer supplies and earths (see wiring diagram). If the fault is still present, carry out **fault finding on the charging circuit** (see **Technical Note 6014A, Checking the charging circuit**).

GETtheMANUALS.org

NOTES	Only carry out this conformity check after carrying out a **complete check** using the diagnostic tool. **Application conditions: ignition on (forced + after ignition, see Introduction)** **Note:** **The interpretation of these statuses and parameters is only valid with the ignition switched on,** the statuses and parameters displayed in blue on the diagnostic tool is information supplied by other computers, which are transmitted via the multiplex network. If these variables display inconsistent values, make sure that the multiplex system test has not shown up any faulty connections. **Repair the faulty multiplex connections before looking for a possible problem with the signals.** Each sub-function in this test is associated with a **Fault finding chart**. **Special notes** The diagnostic tool may display the message **Computer busy** when displaying statuses and parameters. SUB-FUNCTION: AUTOMATIC RELEASE (CONTINUED 2)

Order	Function	Parameter or Status Check or Action	Display and Notes	Fault finding
5	Door opening switches	**ET014:** Door opening switches	**OPEN:** driver's door open. **CLOSED:** driver's door closed. **Note:** This status only works with the driver's door.	If the status is not operating as shown, check that the UCH is correctly sending the signal (absence of faults **DF039 No UCH multiplex signal** and **DF052 Multiplex network**). If the status operates with the passenger door but not the driver's door, reinitialise the computer by running command **VP011 Computer calibration and initialisation** (see **Replacement of components**) to configure the correct type of steering (right or left-hand drive). If the fault is still present, run **fault finding** on the UCH (see **87B, Passenger compartment connection unit**).

GETtheMANUALS.org

NOTES	Only carry out this conformity check after carrying out a **complete check** using the diagnostic tool. **Application conditions: ignition on (forced + after ignition, see Introduction)** **Note:** **The interpretation of these statuses and parameters is only valid with the ignition switched on**, the statuses and parameters displayed in blue on the diagnostic tool is information supplied by other computers, which are transmitted via the multiplex network. If these variables display inconsistent values, check that the multiplex system test has not shown up any faulty connections. **Repair the faulty multiplex connections before looking for a possible problem with the signals.** Each sub-function in this test is associated with a **Fault finding chart**. **Special notes:** The diagnostic tool may display the message **Computer busy** when displaying statuses and parameters. This message is displayed when the parking brake is applying or releasing the brake, because the computer gives priority to controlling the motor before transmitting variables. If this message is displayed, exit the current screen and then return to it.

SUB-FUNCTION: AUTOMATIC RELEASE (CONTINUED 3)

Order	Function	Parameter or Status Checked or Action	Display and notes	Fault finding
6	Clutch pedal	**PR006:** Clutch pedal position	No load position: **0% < X < 20%** --- Pedal fully depressed: Right-hand drive: **50 < X < 70%** Left-hand drive: **70 < X < 90%**	In the event of a fault, check that the potentiometer is fitted correctly. If the fault is still present, **consult the interpretation** of fault **DF015 Clutch position sensor circuit.** **Note:** The clutch pedal operating values differ according to the type of steering.
7	Accelerator pedal	**PR017:** Accelerator pedal position	No load position: **0 < X < 10%** --- Pedal depressed fully (depressed past resistance point): **110 < X < 120%** **Invalid value: 118%** (this value means that the signal is not being received, e.g.: ignition switched off).	In the event of a fault with this parameter, check that the injection computer is correctly sending the signal (absence of fault **DF036 No injection multiplex signal**) If the fault is still present, run **fault finding** on the injection computer (see **13B, Diesel injection or 17B, Petrol injection**). **Note: the value of this parameter depends on the injection fitted to the vehicle. The values noted in this check are therefore only average values (refer to the injection conformity check).**

GETtheMANUALS.org

NOTES	Only carry out this conformity check after carrying out a **complete check** using the diagnostic tool. **Application conditions: ignition on (forced + after ignition, see Introduction)** **Note:** **The interpretation of these statuses and parameters is only valid with the ignition switched on**, the statuses and parameters displayed in blue on the diagnostic tool is information supplied by other computers, which are transmitted via the multiplex network. If these variables display inconsistent values, check that the multiplex system test has not shown up any faulty connections. **Repair the faulty multiplex connections before looking for a possible problem with the signals.** Each sub-function in this test is associated with a **Fault finding chart**. **Special notes** The diagnostic tool may display the message **Computer busy** when displaying statuses and parameters. This message is displayed when the parking brake is applying or releasing the brake, because the computer gives priority to controlling the motor before transmitting variables. If this message is displayed, exit the current screen and then return to it.

SUB-FUNCTION: AUTOMATIC RELEASE (CONTINUED 4)

Order	Function	Parameter or Status Check or Action	Display and Notes	Fault finding
8	Engine	**PR015:** Engine speed	**0 rpm**	In the event of a fault with this parameter and these statuses, make sure that the injection computer is in fact sending signals (absence of faults **DF036 No injection multiplex transmission** and **DF052 Multiplex network**). If the fault is still present, run **fault finding** on the injection computer (see **13B, Diesel injection or 17B, Petrol injection**).
		ET019: Engine	**STOPPED** Other possibilities depending on the operating status of the engine: **- RUNNING** **- UNDER STARTER** **- STALLED** (in the event where the engine is not stopped in the normal way)	

GETtheMANUALS.org

NOTES	Only carry out this conformity check after carrying out a **complete check** using the diagnostic tool. **Application conditions: ignition on (forced + after ignition, see Introduction)** **Note:** **The interpretation of these statuses and parameters is only valid with the ignition switched on**, the statuses and parameters displayed in blue on the diagnostic tool is information supplied by other computers, which are transmitted via the multiplex network. If these variables display inconsistent values, check that the multiplex system test has not shown up any faulty connections. **Repair the faulty multiplex connections before looking for a possible problem with the signals.** Each sub-function in this test is associated with a **Fault finding chart**. **Special notes** The diagnostic tool may display the message **Computer busy** when displaying statuses and parameters. This message is displayed when the parking brake is applying or releasing the brake, because the computer gives priority to controlling the motor before transmitting variables. If this message is displayed, exit the current screen and then return to it.

SUB-FUNCTION: AUTOMATIC RELEASE (CONTINUED 5)

Order	Function	Parameter or Status Checked or Action	Display and notes	Fault finding
9	Wheel speeds	**PR012:** Vehicle speed	**X = 0 mph (km/h)**	In the event of a fault with this parameter, check that the anti-lock braking system computer is sending the signal correctly (absence of faults **DF037 No ABS system multiplex signal** and **DF052 Multiplex network**). If the fault is still present, run **fault finding** on the anti-lock braking system computer (see **38C, Anti-lock braking system**).

GETtheMANUALS.org

NOTES	Only carry out this conformity check after carrying out a **complete check** using the diagnostic tool. **Application conditions: ignition on (forced + after ignition, see Introduction)** **Note:** **The interpretation of these statuses and parameters is only valid with the ignition switched on**, the statuses and parameters displayed in blue on the diagnostic tool is information supplied by other computers, which are transmitted via the multiplex network. If these variables display inconsistent values, check that the multiplex system test has not shown up any faulty connections. **Repair the faulty multiplex connections before looking for a possible problem with the signals.** Each sub-function in this test is associated with a **Fault finding chart**. **Special notes** The diagnostic tool may display the message **Computer busy** when displaying statuses and parameters. This message is displayed when the parking brake is applying or releasing the brake, because the computer gives priority to controlling the motor before transmitting variables. If this message is displayed, exit the current screen and then return to it.

SUB-FUNCTION: AUTOMATIC RELEASE (CONTINUED 6)

Order	Function	Parameter or Status Checked or Action	Display and notes	Fault finding
10	Electronic parking brake	**PR005:** Force setting **PR004:** Measured force value	In rest position: **X = 0 N** When applying the brake on a level surface: **400 < X < 550 N** When fully applied (lever fully pulled for 2 seconds) on a level surface: **1100 < X < 1150 N** **Note**: **depressing the brake pedal once** when the parking brake is applied changes the measured force value (change in the tension of the brake cables) and the parking brake may be over-applied. **Interpretation of these parameters is only valid without any pressure on the brake pedal.**	The difference between the reference and measured values must not be more than - **50 N or + 100 N**. If the measured value does not reach or exceeds the reference value (mechanical or electrical fault with the control), the electronic parking brake computer will detect a fault (**DF025 Vehicle movement with maximum application, DF049 Brake application** or **DF050 Mechanical jamming**). If one of these three faults is displayed by the diagnostic tool, use the relevant interpretation.

GETtheMANUALS.org

NOTES	Only carry out this conformity check after carrying out a **complete check** using the diagnostic tool. **Application conditions: ignition on (forced + after ignition, see Introduction)** **Note:** **The interpretation of these statuses and parameters is only valid with the ignition switched on**, the statuses and parameters displayed in blue on the diagnostic tool is information supplied by other computers, which are transmitted via the multiplex network. If these variables display inconsistent values, check that the multiplex system test has not shown up any faulty connections. **Repair the faulty multiplex connections before looking for a possible problem with the signals.** Each sub-function in this test is associated with a **Fault finding chart**. **Special notes** The diagnostic tool may display the message **Computer busy** when displaying statuses and parameters. This message is displayed when the parking brake is applying or releasing the brake, because the computer gives priority to controlling the motor before transmitting variables. If this message is displayed, exit the current screen and then return to it.

SUB-FUNCTION: AUTOMATIC RELEASE (CONTINUED 7)

Order	Function	Parameter or Status Check or Action	Display and Notes	Fault finding
11	Electronic parking brake	**ET011:** Parking brake	No movement of the lever: **INACTIVE** When released: **Released** (while releasing, then **INACTIVE**) When applying the brake: **STATUS 1: Static braking** During emergency braking: **STATUS 2: Dynamic braking** (over 6 mph (10 km/h)). When the system is faulty: **DEFECTIVE**	If the status does not function as indicated, **consult the interpretation** of fault **DF043 Parking brake motor**.
12	Vehicle incline	**PR003:** Slope value	On horizontal ground the value is: **- 2 d° < X < + 2 d°** Possible values according to the slope: **- 25 d° < X < + 25 d°**	On a level surface, if the reading is not **0 d° ± 2**: Refer to the interpretation of parameter **PR003 Slope value**.

GETtheMANUALS.org

NOTES	Only carry out this conformity check after carrying out a **complete check** using the diagnostic tool. **Application conditions: ignition on (forced + after ignition, see Introduction)** **Note:** **The interpretation of these statuses and parameters is only valid with the ignition switched on**, the statuses and parameters displayed in blue on the diagnostic tool is information supplied by other computers, which are transmitted via the multiplex network. If these variables display inconsistent values, check that the multiplex system test has not shown up any faulty connections. **Repair the faulty multiplex connections before looking for a possible problem with the signals.** Each sub-function in this test is associated with a **Fault finding chart**. **Special notes** The diagnostic tool may display the message **Computer busy** when displaying statuses and parameters. This message is displayed when the parking brake is applying or releasing the brake, because the computer gives priority to controlling the motor before transmitting variables. If this message is displayed, exit the current screen and then return to it.

SUB-FUNCTION: EMERGENCY BRAKING

Order	Function	Parameter or Status Checked or Action	Display and notes	Fault finding
1	Engine	**ET019:** Engine	**STOPPED** Other possibilities depending on the operating status of the engine: **- RUNNING** **- UNDER STARTER** **- STALLED**	In the event of a fault with this status, check that the injection computer is sending the signal correctly (absence of faults **DF036 No injection multiplex signal** and **DF052 Multiplex network**). If the fault is still present, run **fault finding** on the injection computer (see **13B, Diesel injection or 17B, Petrol injection**).
2	Wheel speeds	**PR012:** Vehicle speed	**X = 0 mph (km/h)**	In the event of a fault with these parameters, check that the anti-lock braking system computer is sending the signals correctly (absence of faults **DF037 No ABS multiplex signal** and **DF052 Multiplex network**). If the fault is still present, run **fault finding** on the anti-lock braking system computer (see **38C, Anti-lock braking system**).
		PR013: Rear left-hand wheel speed	**X = 0 mph (km/h)**	
		PR014: Rear right-hand wheel speed	**X = 0 mph (km/h)**	

GETtheMANUALS.org

NOTES	Only carry out this conformity check after carrying out a **complete check** using the diagnostic tool. **Application conditions: ignition on (forced + after ignition, see Introduction)** **Note:** **The interpretation of these statuses and parameters is only valid with the ignition switched on**, the statuses and parameters displayed in blue on the diagnostic tool is information supplied by other computers, which are transmitted via the multiplex network. If these variables display inconsistent values, check that the multiplex system test has not shown up any faulty connections. **Repair the faulty multiplex connections before looking for a possible problem with the signals.** Each sub-function in this test is associated with a **Fault finding chart**. **Special notes:** The diagnostic tool may display the message **Computer busy** when displaying statuses and parameters. This message is displayed when the parking brake is applying or releasing the brake, because the computer gives priority to controlling the motor before transmitting variables. If this message is displayed, exit the current screen and then return to it.

SUB-FUNCTION: EMERGENCY BRAKING (CONTINUED 1)

Order	Function	Parameter or Status Checked or Action		Display and notes	Fault finding
3	Parking brake control lever	**ET008:**	Braking switch position	Lever released: **INACTIVE** Lever pulled to the first contact (approximately 3 mm travel): **ACTIVE**	If the status does not operate as specified, **apply the interpretation** of status **ET008 Brake application switch position**.
		ET009:	Redundant braking switch position	Lever released: **INACTIVE** Lever pulled to the second contact (end of travel): **ACTIVE**	If the status does not operate as specified, **use the interpretation** of status **ET009 Redundant braking switch position**.
		ET010:	Release switch position	Lever in rest position **RELEASED** Lever fully pulled and releasing switch pressed: **PRESSED**	If the status does not operate as specified, **apply the interpretation** of status **ET010 Releasing switch position**.

GETtheMANUALS.org

NOTES	Only carry out this conformity check after carrying out a **complete check** using the diagnostic tool. **Application conditions: ignition on (forced + after ignition, see Introduction)** **Note:** **The interpretation of these statuses and parameters is only valid with the ignition switched on**, the statuses and parameters displayed in blue on the diagnostic tool is information supplied by other computers, which are transmitted via the multiplex network. If these variables display inconsistent values, check that the multiplex system test has not shown up any faulty connections. **Repair the faulty multiplex connections before looking for a possible problem with the signals.** Each sub-function in this test is associated with a **Fault finding chart**. **Special notes:** The diagnostic tool may display the message **Computer busy** when displaying statuses and parameters. This message is displayed when the parking brake is applying or releasing the brake, because the computer gives priority to controlling the motor before transmitting variables. If this message is displayed, exit the current screen and then return to it.

SUB FUNCTION: EMERGENCY BRAKING (CONTINUED 2)

Order	Function	Parameter or Status Checked or Action	Display and notes	Fault finding
4	Electronic parking brake	**ET011:** Parking brake	No movement of the lever: **INACTIVE** When released: **Released** (while releasing, then **INACTIVE**) When applying the brake: **STATUS 1: Static braking** During emergency braking: **STATUS 2: Dynamic braking** (over 6 mph (10 km/h)). When the system is faulty: **DEFECTIVE**	If the status does not function as indicated, **consult the interpretation** of fault **DF043 Parking brake motor**.

GETtheMANUALS.org

NOTES	Only carry out this conformity check after carrying out a **complete check** using the diagnostic tool. **Application conditions: ignition on (forced + after ignition, see Introduction)** **Note:** **The interpretation of these statuses and parameters is only valid with the ignition switched on**, the statuses and parameters displayed in blue on the diagnostic tool is information supplied by other computers, which are transmitted via the multiplex network. If these variables display inconsistent values, make sure that the multiplex system test has not shown up any faulty connections. **Repair the faulty multiplex connections before looking for a possible problem with the signals.** Each sub-function in this test is associated with a **Fault finding chart**. **Special notes** The diagnostic tool may display the message **Computer busy** when displaying statuses and parameters. This message is displayed when the parking brake is applying or releasing the brake, because the computer gives priority to controlling the motor before transmitting variables. If this message is displayed, exit the current screen and then return to it.

SUB FUNCTION: EMERGENCY BRAKING (CONTINUED 3)

Order	Function	Parameter or Status Checked or Action	Display and notes	Fault finding
1	Parking brake assist	**PR005:** Force setting **PR004:** Measured force value	In rest position: **X = 0 N** When applying the brake on a level surface: **400 < X < 550 N** When fully applied (lever fully pulled for 2 seconds) on a level surface: **1100 < X < 1150 N** **Note:** **depressing the brake pedal once** when the parking brake is applied changes the measured value of the force (change in the tension of the brake cables) and the parking brake may be over-applied. **Interpretation of these parameters is only valid without any pressure on the brake pedal.**	The difference between the reference and measured values must not be more than **- 50 N or + 100 N**. If the measured value does not reach or exceeds the reference value (mechanical or electrical fault with the control), the electronic parking brake computer will detect a fault (**DF025 Vehicle movement with maximum application, DF049 Brake application** or **DF050 Mechanical jamming**). If one of these three faults is displayed by the diagnostic tool, use the relevant interpretation.

GETtheMANUALS.org

Tool status	Diagnostic tool title
ET001	+ After ignition supply
ET008	Manual control: brake application switch
ET009	Redundant braking switch position
ET010	Manual control: brake releasing switch
ET011	Parking brake
ET014	Door opening switches
ET016	Manual gearbox lever position
ET017	Reverse gear engaged
ET018	Automatic gearbox lever position
ET019	Engine
ET022	Automatic braking configuration
ET024	System operation

GETtheMANUALS.org

ET001	+ AFTER IGNITION FEED

NOTES	None

This status means there is a + 12 V computer after ignition.
When the ignition is switched off, the status displays: ABSENT.
When the ignition is switched on, the status displays: PRESENT.

If the status does not operate as specified: disconnect the electronic parking brake computer connector to check the insulation, continuity and the absence of interference resistance on the following connections:
Automatic parking brake computer connector

track H4
(except Laguna II, Vel Satis and Espace IV) track G4 → **+ 12 V**

track H2
(except Laguna II, Vel Satis and Espace IV) track G2 → **earth**

Repair if necessary (see the vehicle wiring diagram).

If the connections are correct, the power is correctly supplied to the electronic parking brake computer, but the fault is still present, contact the Techline.

AFTER REPAIR	Repeat the conformity check from the start.

FPA_V0C_ET001 / FPA_V04_ET001 / FPA_V08_ET001 / FPA_V0D_ET001

GETtheMANUALS.org

ET008 **ET009** **ET010**	MANUAL CONTROL: BRAKE APPLICATION SWITCH REDUNDANT BRAKE APPLICATION SWITCH POSITION MANUAL CONTROL: BRAKE RELEASING SWITCH

NOTES	None

Using the diagnostic tool (**PARKING** sub-function), check the operation of the parking brake control lever. With the ignition on, statuses **ET008, ET009, ET010** should operate as follows:

	ET008 Manual control: brake application switch	**ET009 "Redundant braking switch position"**	**ET010 Manual control: brake releasing switch**
Lever **in rest position**	**INACTIVE**	**INACTIVE**	**RELEASED**
Lever **applied slightly (3 mm travel)**	**ACTIVE**	**INACTIVE**	**RELEASED**
Lever **applied fully**	**ACTIVE**	**ACTIVE**	**RELEASED**
Lever **applied and release button pressed**	**ACTIVE**	**ACTIVE**	**PRESSED**

If the statuses do not operate as specified, refer to the fault finding procedure for fault **DF047 Manual control**.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET022	AUTOMATIC BRAKING CONFIGURATION

NOTES	**Special notes:** To understand the operation of assisted brake application, refer to **System operation**.

This status indicates the assisted braking configuration status.
This configuration can be checked on two screens.

- Configuration reading screen (repair mode): **LC009 Vehicle configuration** (**NORMAL** with braking, **COLD CLIMATE** without assisted braking).
- Variables screen (fault finding mode, assisted brake application sub-function).

ET022 Automatic braking configuration.
When the assisted braking is **ACTIVE**, the status should be **WITH**.
When the assisted braking is not **ACTIVE** (for cold countries, for example), the status should be **WITHOUT**.
If the configuration does not match the customer's request, reconfigure the electronic parking brake computer by activating configuration **CF007 Vehicle configuration** (repair mode, see **Configuration and programming**).

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

Tool parameter	Diagnostic tool title
PR001	Battery voltage
PR003	Slope value
PR004	Measured force value
PR005	Force setting
PR006	Clutch pedal position
PR012	Vehicle speed
PR013	Rear left-hand wheel speed
PR014	Rear right-hand wheel speed
PR015	Engine speed
PR017	Accelerator pedal position

GETtheMANUALS.org

PR003	SLOPE VALUE

NOTES	None

This parameter shows the vehicle's angle on a slope (X-axis).
The value displayed represents degrees (and not percentage grade).
Normally, this parameter should display:
- On level ground: **- 2 d° < X < + 2 d°**
- Possible values, depending on slope: **- 25 d° < X < + 25 d°**

If the values displayed are not correct, **contact the Techline**.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC002	BRAKING

NOTES	**Special notes:** The commands are found in the tool's fault finding mode, **Actuator command** button.

Running this command tightens the electronic parking brake cables.
It can therefore be used to test operation of the electronic parking brake motor, either to display a present fault or to test motor operation in the event of a control lever failure.
Note:
Before running this command, check that the brake cables are correctly fitted and that no one is working on the vehicle.
Only run this command with the parking brake released.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC003	RELEASE

NOTES	**Special notes:** The commands are found in the tool's fault finding mode, **Actuator command** button.

Running this command releases the electronic parking brake cables.
It can therefore be used to test operation of the electronic parking brake motor, either to display a present fault or to test motor operation in the event of a control lever failure.
Note:
Before running this command, check that the brake cables are correctly fitted and that no one is working on the vehicle.
Only run this command with the parking brake engaged.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

SC005	SAVE CLUTCH PEDAL PROGRAMMING

NOTES	**Special notes:** The commands are found in the tool's repair mode, **Programming** button.

Run command **SC005 Backup clutch pedal programming** with the electronic parking brake computer which is faulty or to be replaced.
The pedals and the gearbox must not be operated during the backup procedure.
Carrying out this backup procedure before each replacement of the computer enables the old clutch pedal travel specifications to be re-entered into the new electronic parking brake computer.

Park the vehicle on a **level surface**.
– Select the diagnostic tool's **Repair mode** menu.
– From the tool's navigation menu, select **Programming**.
Run command **SC005 Backup clutch pedal programming**.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

SC006	ENTER CLUTCH PEDAL PROGRAMMING

NOTES	**Special notes:** The commands are found in the tool's repair mode, **Programming** button.

Once the electronic parking brake computer has been changed.
Run command **SC006 Enter clutch pedal programming** after running command **SC005 Backup clutch pedal programming**.
Test braking and release, and starting the electronic parking brake computer when applied, to check conformity.

Park the vehicle on a **level surface**.
– Select the diagnostic tool's **Repair mode** menu.
– From the tool's navigation menu, select **Programming**.
– Run command **SC006 Enter clutch pedal programming**.

Note:
When a new electronic parking brake computer is initialised, the angle sensor is calibrated after running command **VP011 Computer calibration and initialisation**.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

SC008	SLOPE INITIALISATION

NOTES	**Special notes:** The commands are found in the tool's repair mode, **Programming** button.

Using the diagnostic tool's automatic release sub-function screen, display parameter **PR003 Slope value**.
If the value displayed is not **0 d° ± 2** on level ground: run the command by following the procedure described below.

Park the vehicle on a **level surface**.
– Select the diagnostic tool's **Repair mode** menu.
– From the tool's navigation menu, select **Programming**.
– Run command **SC008 "Slope initialisation"**.
– Check the conformity of parameter **PR003 Slope value**.

Note:
When a new electronic parking brake computer is initialised, the angle sensor is calibrated after running command **VP011 Computer calibration and initialisation**.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

NOTES	Only check the customer complaint after performing a complete check with the diagnostic tool.

NO DIALOGUE WITH THE COMPUTER	**ALP1**
WILL NOT RELEASE	**ALP2**
ASSISTED RELEASE TOO EARLY OR TOO LATE	**ALP3**
ASSISTED BRAKE APPLICATION PROBLEMS (when the engine stops)	**ALP4**
ELECTRONIC PARKING BRAKE MANUAL RELEASE IMPOSSIBLE	**ALP5**
RELEASE WITH THE EMERGENCY BRAKE IMPOSSIBLE	**ALP6**
ELECTRONIC PARKING BRAKE SEEMS TO BE APPLIED WHEN DRIVING	**ALP7**
ELECTRONIC PARKING BRAKE IS NOT APPLIED CORRECTLY ON A SLOPE	**ALP8**

GETtheMANUALS.org

ALP1	No dialogue with the computer

NOTES	None.

Try the diagnostic tool on another vehicle.

Check:
– the connection between the **diagnostic tool** and the diagnostic sensor (wiring in good condition),
– the connection between the diagnostic sensor and the diagnostic socket (lead in good condition),
– the engine and passenger compartment fuses.

Check for **+ 12 V battery** on **track 16**, and **+ 12 V after ignition feed** on **track 1** and an **earth** on **track 5** and on **track 4** of the diagnostic socket.
Repair if necessary.

Disconnect the automatic or electronic parking brake computer connector to check the **insulation, continuity and absence of interference resistance** on the following connections:
Automatic parking brake computer connector

track H4
(except Laguna II, Vel Satis and Espace IV) track G4 → **+ 12 V**

track H2
(except Laguna II, Vel Satis and Espace IV) track G2 → **earth**

track A4 → **track 7** of the diagnostic socket (K line)

Repair if necessary (see the vehicle wiring diagram).

AFTER REPAIR	Carry out a check using the **diagnostic tool**. Deal with any other faults.

GETtheMANUALS.org

ALP2	Will not release

NOTES	Only consult this customer complaint after a **full check using the diagnostic tool** (no present or stored faults). The main causes of the brake not releasing are: – Driver's door incorrectly closed (on vehicles with an automatic transmission). – Insufficient acceleration value. – Fault with gearbox switch. – Fault with door switch. – Pads stuck. – Incorrect multiplex line signals. If the manual release will not work, see ALP 4 **(see the wiring diagrams technical note for the vehicle concerned).**

Check that the force applied to the accelerator pedal is sufficient whether or not the vehicle is on a downward slope or not.

For a vehicle fitted with an automatic transmission, check that the door on the driver's side is not open or incorrectly closed.
Close the door again and go back through neutral if necessary.

Check that the interior lights have gone out.
Check that the door switch is working correctly:
Check the **insulation, continuity and the absence of interference resistance** on the following connections:
– connection code 87H
– connection code MA
Between the door switch, **component code 140** and the UCH, **component code 645.**
If there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
Repair if necessary.

Check that the force applied to the accelerator pedal is sufficient and that the accelerator value is sufficient (refer to the conformity check) whether the vehicle is on a downward slope or not.

AFTER REPAIR	Carry out a check using the **diagnostic tool**. Deal with any other faults.

GETtheMANUALS.org

ALP2 CONTINUED 1	

For a vehicle fitted with an automatic gearbox:

Check the connection and condition of the automatic gearbox multifunction switch, component code **779**.
Check the connection and condition of the automatic gearbox computer, component code **119**.
If the connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**) repair the connector(s); otherwise, replace the wiring.

Check **the insulation, continuity and the absence of interference resistance** of the following connections:
- **5DF** between components **779** and **119**,
- **5DG** between components **779** and **119**,
- **5DH** between components **779** and **119**,
- **5CF** between components **779** and **119**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

For a vehicle fitted with a manual gearbox:

Check the connection and condition of the reversing lights sensor, component code **1109**.
Check the connection and condition of the Protection and Switching Unit, component code **1337** (Only for **Scénic II**), or the UCH, component code 645 (Only for **Vel Satis phase 1 and phase 2, Laguna II phase 2, Espace IV phase 1 and phase 2**).
If the connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**) repair the connector(s); otherwise, replace the wiring.

Check the **insulation, continuity and the absence of interference resistance** of the following connection:
- **H66P** between components **1109** and **1337** (Only for **Scénic II**),
- **H66P** between components **1109** and **645** (Only for **Vel Satis phase 1 and phase 2, Laguna II phase 2, Espace IV phase 1 and phase 2**).

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

AFTER REPAIR	Carry out a check using the **diagnostic tool**. Deal with any other faults.

GETtheMANUALS.org

ALP2 CONTINUED 2	

Carry out a multiplex network test (see **88B, Multiplexing**) and check for any potential incorrect multiplex line signals from the injection computer (see **13B, Diesel injection or 17B, Petrol injection**), the automatic gearbox computer (see **23A, Automatic gearbox**) the UCH computer (see **87B, Passenger compartment connection unit**) and the Protection and Switching Unit computer (see **87G, Engine compartment connection unit**).

Test the braking system:
Look for any areas where the brake pads may be sticking (due to ice, salt, etc.).
Check that the brake piston is operating correctly.
Repair if necessary.

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a check using the **diagnostic tool**. Deal with any other faults.

GETtheMANUALS.org

ALP3	Assisted release too early or too late

NOTES	Only consult this customer complaint after a **full check using the diagnostic tool** (no present or stored faults). **(see the wiring diagrams technical note for the vehicle concerned).**

Assisted release may be activated too late if a trailer is attached to the vehicle.
Test assisted release without the trailer.

Test the braking system:
Look for any areas where the brake pads may be sticking (due to ice, salt, etc.).
Check that the brake piston is operating correctly.
Repair if necessary.

Check the clutch sensor positioning:

● **Espace IV and Vel Satis**

Check the **insulation, continuity and the absence of interference resistance** on the following connections:
– connection code 150K,
– connection code 150L,
– connection code 26X.
Between the electronic parking brake computer, **component code 1217** and the clutch position sensor, **component code 1057**.
If there is a repair procedure (**see Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.
Reposition it, if necessary.
Replace the clutch sensor if necessary (see **MR405 (Espace IV) or MR395 (Laguna II) or MR370 (Scénic), Mechanical, 37A, Mechanical component controls, Clutch pedal position sensor: Removal - Refitting or MR353 (Vel Satis ph 1), Mechanical, 37A, Mechanical component controls, Clutch pedal or MR402 (Vel Satis ph 2), Mechanical, 37A, Mechanical component controls, Clutch pedal switch: Removal - Refitting**).

● **Laguna II and Scénic II**

Check the **insulation, continuity and the absence of interference resistance** on the following connections:
– connection code 150Q,
– connection code 150L.
Between the electronic parking brake computer, **component code 1217** and the clutch pedal sensor, **component code 675** (see **section 87B, UCH, Door switch**).

1. Laguna II:

Check **the continuity and absence of interference resistance on the following connection**:
– connection code 86D
Between the injection computer, **component code 120** and the clutch pedal switch, **component code 675**.

AFTER REPAIR	Carry out a check using the **diagnostic tool**. Deal with any other faults.

GETtheMANUALS.org

ALP3 CONTINUED	

2. Scénic II:
Check **the continuity and absence of interference resistance on the following connection**:
– connection code H51.
Between the injection computer, **component code 120** and the clutch pedal switch, **component code 675**.
If there is a repair procedure (**see Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.
Reposition it, if necessary.
Replace the clutch sensor if necessary (see **MR405 (Espace IV) or MR395 (Laguna II) or MR370 (Scénic), Mechanical, 37A, Mechanical component controls, Clutch pedal position sensor: Removal - Refitting or MR353 (Vel Satis ph 1), Mechanical, 37A, Mechanical component controls, Clutch pedal or MR402 (Vel Satis ph 2), Mechanical, 37A, Mechanical component controls, Clutch pedal switch: Removal - Refitting**).

Reconfigure the vehicle clutch curve by applying the special command **SC006 Enter clutch pedal programming**.
Test the assisted brake release.

Check the condition of the clutch system (wear of the different components, possible build-up of grease on surfaces in friction).
Repair if necessary.
Carry out a multiplex network test (see **88B, Multiplexing**) and check for any potential faults on the injection computer (see **13B, Diesel injection or 17B, Petrol injection**), the automatic gearbox computer (see **23A, Automatic gearbox**) and the UCH computer (see **87B, Passenger compartment connection unit**).

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a check using the **diagnostic tool**. Deal with any other faults.

GETtheMANUALS.org

ALP4	Assisted braking fault (when the engine is stopped)

NOTES	Only consult this customer complaint after a **full check using the diagnostic tool** (no present or stored faults). **(see the wiring diagrams technical note for the vehicle concerned).**

Check for any potential faults in the ABS computer (see **38C, Anti-lock braking system**), the UCH computer (see **87B, Passenger compartment connection unit**) and the injection computer (see **13B, Diesel injection or 17B, Petrol injection**) to ensure that they have actually received a request to stop the engine. Test the application of the electronic parking brake with the engine switched off.
Incorrect signal faults on the multiplex line. Run a multiplex network test (see **88B, Multiplex**).
When the engine stalls, the automatic brake application function is not active.
Check the **+ 12 V** supply, the **insulation, continuity and the absence of interference resistance** on the following connection: **– connection code BP2** Between the electronic parking brake computer, **component code 1217** and the battery, **component code 107**. If the continuity is correct, test the charging circuit (see **Technical Note 6014A, Checking the charging circuit**). Repair if necessary.
If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a check using the **diagnostic tool**. Deal with any other faults.

GETtheMANUALS.org

ALP5	**Impossible to manually release electronic parking brake**

NOTES	Only consult this customer complaint after a **full check using the diagnostic tool** (no present or stored faults). **(see the wiring diagrams technical note for the vehicle concerned).**

Check any incorrect signals on the multiplex line. Run a multiplex network test (see **88B, Multiplex**).
Check that the card is correctly inserted for a card reader, scenario 1 (not hands-free). If not, refer to the fault finding procedure for the UCH (see **87B, Passenger compartment connection unit**). Reposition it, if necessary.
Check that the steering column is unlocked.
Check the **+ 12 V** supply, the **insulation, continuity and the absence of interference resistance** on the following connection: **– connection code BP2** Between the electronic parking brake computer, **component code 1217** and the battery, **component code 107**. If the continuity is correct, test the charging circuit (see **Technical Note 6014A, Checking the charging circuit**). Repair if necessary.
Check the operation of the release switch. Check the continuity of the following connection codes: **– connection code 150P,** **– connection code 150N,** **– connection code 150B,** **– connection code 150G,** Between the control unit of the electronic parking brake lever, **component code 1216** and the electronic parking brake computer, **component code 1217**. Repair if necessary.
If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a check using the **diagnostic tool**. Deal with any other faults.

GETtheMANUALS.org

ALP6	**Impossible to release with the emergency brake**

NOTES	Only consult this customer complaint after a **full check using the diagnostic tool** (no present or stored faults).

Check that the electronic parking brake is not already released.
Check that the force is sufficient to release the emergency brake. Reduce the emergency brake cable voltage, if necessary.
If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a check using the **diagnostic tool**. Deal with any other faults.

GETtheMANUALS.org

ALP7	**The electronic parking brake seems to apply whilst driving**

NOTES	Only consult this customer complaint after a **full check using the diagnostic tool** (no present or stored faults).

Check that the engine has not stalled whilst driving.
Check that the electronic parking brake is actually released.
Check that the injection control system is not in defect mode (engine Limp Home). Run a multiplex network test (see **88B, Multiplex**). Check for any potential faults in the injection computer (see **13B, Diesel injection or 17B, Petrol injection**). If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a check using the **diagnostic tool**. Deal with any other faults.

GETtheMANUALS.org

ALP8	**The electronic parking brake does not apply correctly on a slope**

NOTES	Only consult this customer complaint after a **full check using the diagnostic tool** (no present or stored faults). **(see the wiring diagrams technical note for the vehicle concerned).**

Check that the vehicle is correctly gripping the ground.
Check that the vehicle is not outside the limits.
Check the **+ 12 V** supply, the **insulation, continuity and the absence of interference resistance** on the following connection: **– connection code BP2** Between the electronic parking brake computer, **component code 1217** and the battery, **component code 107**. If the continuity is correct, test the charging circuit (see **Technical Note 6014A, Checking the charging circuit**). Repair if necessary.
Check the condition of the brake pads (wear, fitting, insufficient running in, etc.). Replace if necessary.
Check the condition of the brake callipers. Repair if necessary.
Check the fitting of the pressure plate between the electronic parking brake and the brake calliper. Refit if necessary.
If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a check using the **diagnostic tool**. Deal with any other faults.

ANTI-LOCK BRAKING SYSTEM
Fault finding - Introduction

GETtheMANUALS.org

1. SCOPE OF THIS DOCUMENT

This Technical Note **ABS/ESP MK60** should only be applied when performing fault finding on the affected vehicle.

Vehicle(s): ***Vel Satis Phase II*** *Function concerned:* ***MK60 ABS/ESP***	*Computer name:* ***MK60 ABS/ESP***

2. PREREQUISITES FOR FAULT FINDING

Documentation type

Fault finding procedure (this document):
– Assisted fault finding (integrated to diagnostic tool), Dialogys.

Wiring diagrams:
– Visu-Schéma (CD-ROM), paper.

Type of diagnostic tools

– **CLIP**

Special tooling required

Special tooling required
Multimeter

GETtheMANUALS.org

Faults

Faults are declared either present or stored (depending on whether they appeared in a certain situation and have disappeared since, or whether they remain but have not been diagnosed within the current context).

Consider the fault status, **present** or **stored** when the diagnostic tool is used after the + after ignition feed (without operating the system components).

For a **present fault**, apply the procedure described in the **Interpretation of faults** section.

For a **stored fault**, note the faults displayed and apply the **Notes** section.

If the fault is **confirmed** when the Notes are applied, the fault is present. Deal with the fault

If the fault is **not confirmed**, check:
- the electrical lines corresponding with the faulty part,
- the connectors on these lines (corrosion, bent pins, etc.),
- the resistance of the faulty component,
- the condition of the wires (melted or cut insulation, wear),
- or use the fault finding procedure to check the circuit of the faulty component.

Conformity check

The conformity check is designed to check the statuses and parameters which do not display any faults on the diagnostic tool when not operating consistently. Therefore, this phase allows us to:
- perform fault finding for faults that do not have a fault display, and which may correspond to a customer complaint.
- check that the system is operating correctly and that there is no risk of a fault reappearing after repairs.

This section gives the fault finding procedures for statuses and parameters and the conditions for checking them.

If a status is not behaving normally or a parameter is outside permitted tolerance values, you should consult the corresponding fault finding page.

Customer complaints - Fault finding chart

If the diagnostic tool check is correct, but the customer complaint is still present, the fault should be dealt with according to the **customer complaint**.

A summary of the overall procedure to follow is provided on the following page in the form of a flow chart.

GETtheMANUALS.org

4. FAULT FINDING PROCEDURE (continued)

Wiring check:

Fault finding problems:
Disconnecting the connectors and/or manipulating the wiring may temporarily clear the cause of a fault.
Electrical measurements of the voltage, resistance and insulation are generally correct, especially if the fault is not present when the measurements are being taken (stored fault).

Visual inspection:
Look for any damage under the bonnet and in the passenger compartment.
Carefully check the protective parts, insulators and wiring harness routing.
Look for signs of oxidation.

Touch inspection:
While manipulating the wiring, use the diagnostic tool to detect any changes in fault status from stored to present.
Make sure that the connectors are firmly secured.
Apply light pressure to the connectors,
Twist the wiring harness.
If there is a change in status, try to locate the source of the fault.

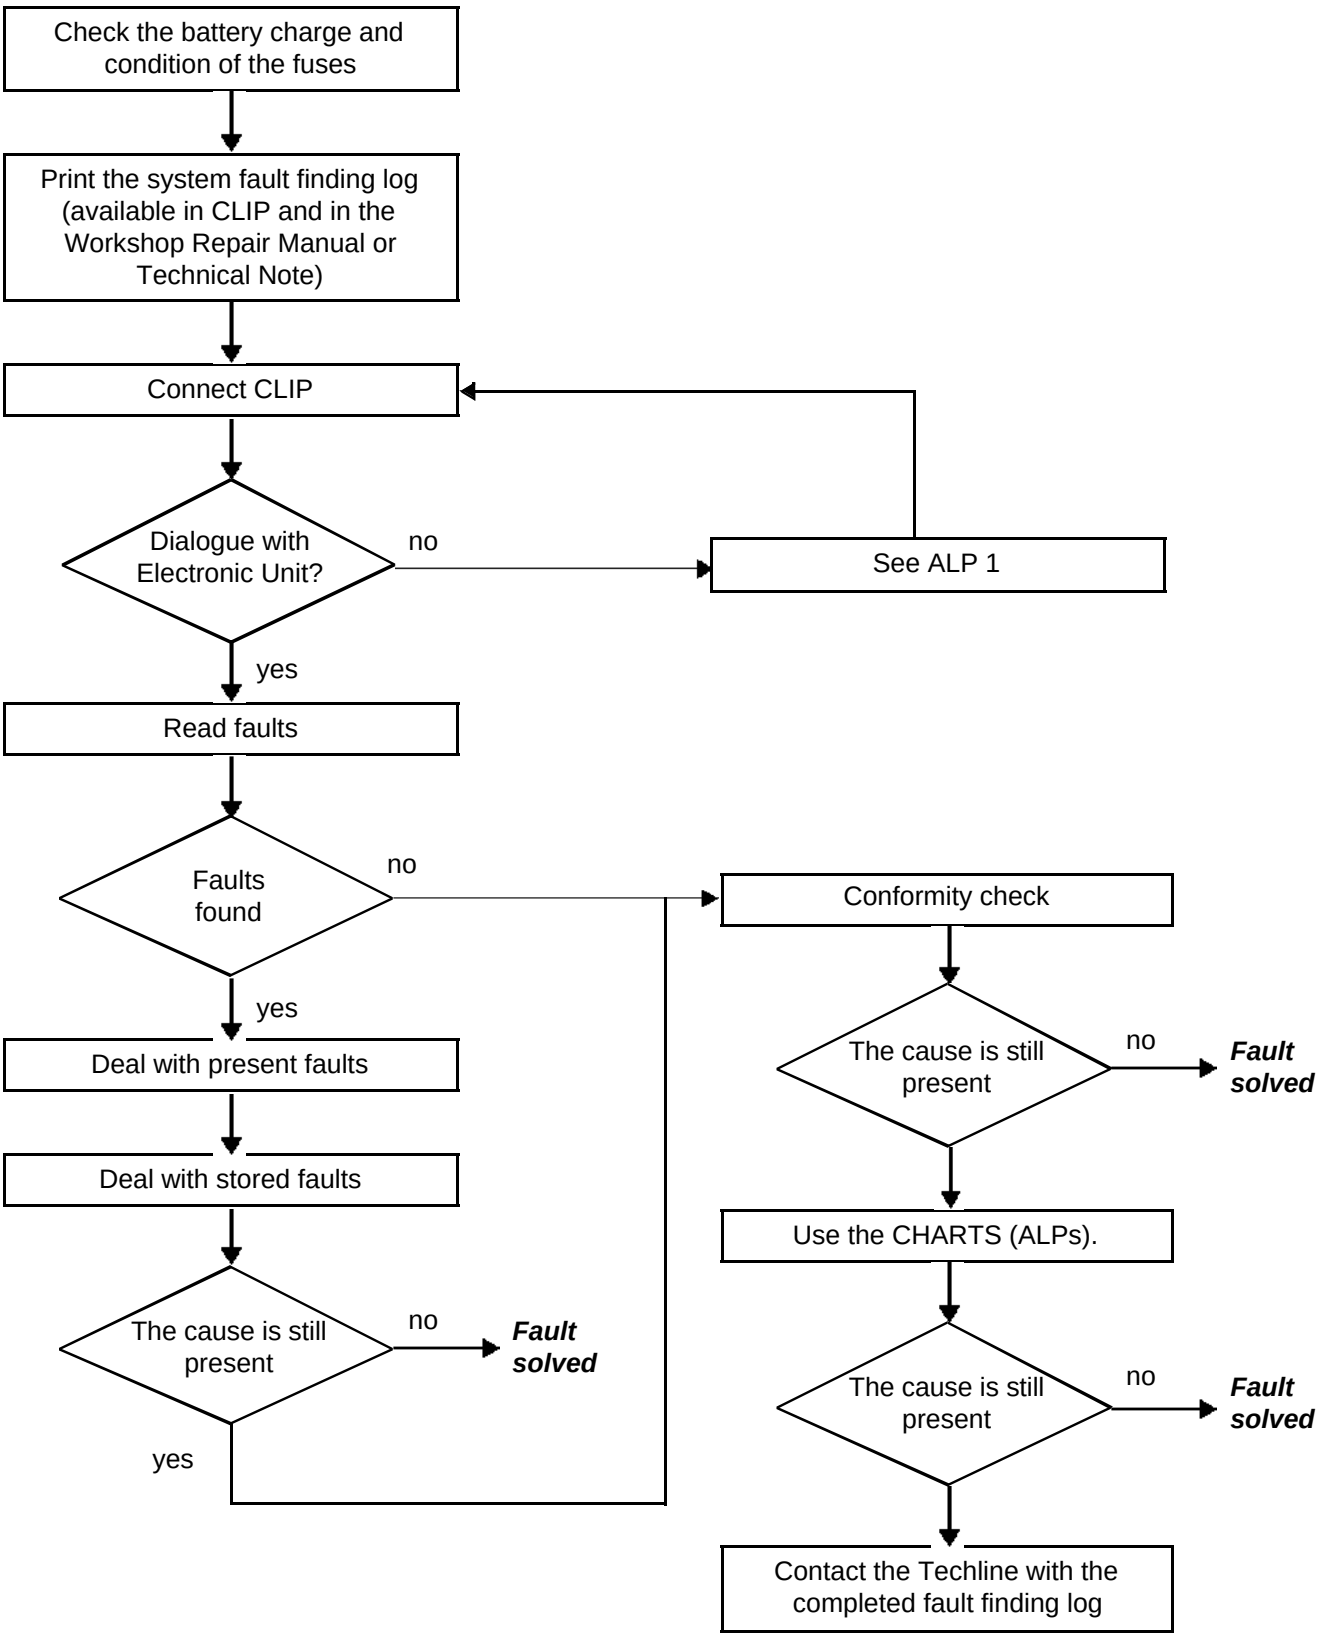
Inspection of each component:
Disconnect the connectors and check the appearance of the clips and tabs and their crimping (no crimping on the insulating section).
Make sure that the clips and tabs are properly locked in the sockets.
Check that no clips or tabs have been dislodged during connection.
Check the clip contact pressure using the appropriate type of tab.

Resistance check:
Check the continuity of the entire lines, then section by section. Look for a short circuit to earth, to the + 12 V feed or with another wire.

If a fault is detected, repair or replace the wiring harness.

GETtheMANUALS.org

4. FAULT FINDING PROCEDURE



GETtheMANUALS.org

5. FAULT FINDING LOG

WARNING!

WARNING:
Any fault on a complex system call for thorough fault finding with the appropriate tools. The FAULT FINDING LOG, which should be completed during the fault finding procedure, ensures a record is kept of the procedure carried out. It is an essential component when consulting the manufacturer.

IT IS THEREFORE MANDATORY TO FILL OUT A FAULT FINDING LOG EACH TIME FAULT FINDING IS CARRIED OUT.

You will always be asked for this report:

- When requesting technical assistance from the Techline.
- For certification requests when replacing parts that must be certified.
- To be enclosed when returning monitored parts on request. The sheet is needed for warranty compensation, and enables better analysis of the removed parts.

6. SAFETY ADVICE

All work on components requires obeying safety rules to prevent damage or injury:

– Make sure that the battery is properly charged to avoid damaging the computers with a low load.

– Use the appropriate tools.

– **It is forbidden to carry out a road test while dialogue is still established between the diagnostic tool and the computer, as the ABS and Electric Braking Distribution (EBD) functions are deactivated. Braking pressure is identical on both vehicle axles (risk of a spin under heavy braking).**

DF006 PRESENT OR STORED	FRONT LEFT-HAND WHEEL SPEED SENSOR CIRCUIT

NOTES	**Special notes:** None.
	Conditions for applying fault finding procedure to a stored fault: Apply the fault finding procedure described below in **DF006 stored**.

DF006 present	***NOTES***	**Special notes:** None.

Check the connection and condition of the sensor and the computer.
Disconnect the sensor and check that a voltage of approximately **12 V** is present **under + after ignition feed** at the sensor connector terminals on the computer side.
Is the voltage measured correct?

YES	Swap the two front wheel speed sensors over. Clear the computer memory. Switch off the ignition. Switch on the ignition again. If the fault initially declared **DF006 Front left-hand wheel speed sensor circuit** has become **DF026 Front right-hand wheel speed sensor circuit**, replace the wheel speed sensor. If the fault remains on the same side, the wiring between the computer and the sensor is faulty. Check and ensure the continuity of the following connections: Sensor connector **track 1** → **track 46** Computer connector Sensor connector **track 2** → **track 45** Computer connector Also check the insulation between these two connections.
NO	Check and ensure the continuity of the following connections: Sensor connector **track 1** → **track 46** Computer connector Sensor connector **track 2** → **track 45** Computer connector Also check the insulation between these two connections. Carry out a visual inspection of the sensor wiring. If all the checks are correct, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF006 CONTINUED	

DF006 stored	*NOTES*	**Special notes:** None.

Check the connection and condition of the sensor and the computer.
Swap the two front wheel speed sensors over.
Clear the computer memory.
Carry out a road test and then recheck with the diagnostic tool.

If the fault initially declared **DF006 Front left-hand wheel speed sensor circuit** has become **DF026 Front right-hand wheel speed sensor circuit**, replace the wheel speed sensor.

If the fault remains on the same side, the wiring between the computer and the sensor is faulty.

Check and ensure the continuity of the following connections:

Sensor connector **track 1** ⟶ **track 46** Computer connector
Sensor connector **track 2** ⟶ **track 45** Computer connector

Also check the insulation between these two connections.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF007 PRESENT OR STORED	REAR LEFT-HAND WHEEL SPEED SENSOR CIRCUIT

NOTES	**Special notes:** None.
	Conditions for applying fault finding procedure to a stored fault: Apply the fault finding procedure described below in **DF007 stored**.

DF007 present	***NOTES***	**Special notes:** None.

Check the connection and condition of the sensor and the computer.
Disconnect the sensor and check that a voltage of approximately **12 V** is present **under + after ignition feed** at the sensor connector terminals on the computer side.

Is the voltage measured correct?

YES

Swap the two rear wheel speed sensors. Clear the computer memory.

Switch off the ignition. Switch on the ignition again.

If the fault initially declared **DF007 Rear left-hand wheel speed sensor circuit** has become **DF027 Rear right-hand wheel speed sensor circuit**, replace the wheel speed sensor.

If the fault remains on the same side, the wiring between the computer and the sensor is faulty.

Check and ensure the continuity of the following connections:

Sensor connector **track 1** → **track 37** Computer connector
Sensor connector **track 2** → **track 36** Computer connector

Also check the insulation between these two connections.

NO

Check and ensure the continuity of the following connections:

Sensor connector **track 1** → **track 37**Computer connector
Sensor connector **track 2** → **track 36** Computer connector

Also check the insulation between these two connections.

Carry out a visual inspection of the sensor wiring.

If all the checks are correct, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF007 CONTINUED	

DF007 stored	***NOTES***	Special notes: None.

Check the connection and condition of the sensor and the computer.
Swap the two rear wheel speed sensors.
Clear the computer memory.
Carry out a road test and then recheck with the diagnostic tool.

– If the fault initially declared **DF007 Rear left-hand wheel speed sensor circuit** has become **DF027 Rear right-hand wheel speed sensor circuit**, replace the wheel speed sensor.
– If the fault remains on the same side, the wiring between the computer and the sensor is faulty.

Check and ensure the continuity of the following connections:

Sensor connector **track 1** ⟶ **track 37** Computer connector
Sensor connector **track 2** ⟶ **track 36** Computer connector

Also check the insulation between these two connections.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF008 STORED	FRONT LEFT-HAND WHEEL SPEED SENSOR SIGNAL

NOTES	**Priorities when dealing with a number of faults:** Deal with fault **DF006 Front left-hand wheel speed sensor circuit** first if it is present.
	Conditions for applying the fault finding procedure to stored faults: The fault is present during: road test (in excess of **12 mph (20 km/h)** for **2 minutes**).

Check that the wheel speed sensor mounting is in good condition (correct clipping).
Check the sensor / target air gap over one wheel revolution: **0.1 mm < front wheel air gap < 1.1 mm**.
Check the conformity of the target: condition, **number of teeth = 48** (using special command **SC001 Check target teeth**).

Check the connection and the condition of the sensor connectors.
Carry out a visual inspection of the sensor wiring and check the condition of the connections on the **47-track computer connector**.

If the results of the checks are correct, reconnect the computer and the wheel speed sensor and clear the computer memory.
Exit the fault finding procedure and carry out a road test. Replace the sensor if the fault recurs.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF009 **STORED**	REAR LEFT-HAND WHEEL SPEED SENSOR SIGNAL

NOTES	**Priorities when dealing with a number of faults:** Deal with fault **DF001 Rear left-hand wheel speed sensor circuit** first if it is present.
	Conditions for applying the fault finding procedure to stored faults: The fault is present during: road test (in excess of **12 mph (20 km/h)** for **2 minutes**).

Check that the wheel speed sensor mounting is in good condition (correct clipping).
Check the sensor / target air gap over one wheel revolution: **0.3 mm < rear wheel air gap < 1.3 mm**.
Check the conformity of the target: condition, **number of teeth = 48** (using special command **SC001 Check target teeth**).

Check the connection and the condition of the sensor connectors.
Carry out a visual inspection of the sensor wiring and check the condition of the connections on the **47-track computer connector**.

If the results of the checks are correct, reconnect the computer and the wheel speed sensor and clear the computer memory.
Exit the fault finding procedure and carry out a road test. Replace the sensor if the fault recurs.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF010 PRESENT OR STORED	PUMP MOTOR CIRCUIT

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the pedal has been held down **+ AC016 Test pump motor actuator command**.

Check the **ABS earths** (tightening of the terminal on the earth bolt above the hydraulic assembly).
Check the continuity between the **ABS earth** and **tracks 47 and 16** of the computer connector.
Check the **+ before ignition feed** on **track 1** on the **47-track** connector. Check the condition and position of the **40A** fuse in the engine fuse box.

If the fault appears after the computer has been removed or replaced, remove the computer and check the condition and presence of the internal connections (2 tracks) across the hydraulic assembly.

If the fault recurs, replace the hydraulic assembly (mechanical locking of the pump, etc.).

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF017 PRESENT OR STORED	COMPUTER

NOTES	**Conditions for applying the fault finding procedure to stored faults:** Apply the fault finding procedure whether the fault is present or stored.

Check the connections on the **47-track connector** of the ABS computer.
Check that there are no traces of oxidisation.
If traces of oxidisation are found, you must replace the ABS wiring and the computer. If not, replace only the computer.

Clear the computer memory, exit the diagnostic and switch off the ignition.
Perform a new check using the diagnostic tool. If the fault is still present, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF020 PRESENT	TACHOMETRIC INDEX PROGRAMMING

NOTES	**Special notes:** None.

The TEVES MK60 ABS/ESP computer with the tachometry function transmits the vehicle speed signal to all subscribers using this signal (instrument panel, engine management, etc.).
This vehicle speed signal replaces the one supplied by the speed sensor located on the gearbox.
The ABS/ESP computer calculates the vehicle speed from the wheel speed and the tyre circumference.

The tyre circumference must be programmed into the memory of a new computer. This involves entering an "X" index using command VP007 Tachometric index on the diagnostic tool.

Once the index has been entered using the **VP007** command, clear the computer memory and then switch off the ignition. Use the parameter **PR030** to check that the index entered has been stored correctly.

If the fault is still present, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF026 PRESENT OR STORED	FRONT RIGHT-HAND WHEEL SPEED SENSOR CIRCUIT

NOTES	**Special notes:** None.
	Conditions for applying fault finding procedure to a stored fault: Apply the fault finding procedure described below in **DF026 stored**.

DF026 present	***NOTES***	**Special notes:** None.

Check the connection and condition of the sensor and computer connections.
Check the connector on the intermediary connections under the body on the front left-hand upper wing section (**R183**). Disconnect the sensor and check that a voltage of approximately **12 V** is present **under + after ignition feed** at the sensor connector terminals on the computer side.
Is the voltage measured correct?

YES

Swap the 2 front wheel speed sensors over. Clear the computer memory.

Switch off the ignition. Switch on the ignition again.

If the fault initially declared **DF026 Front right-hand wheel speed sensor circuit** has become **DF006 Front left-hand wheel speed sensor circuit**, replace the wheel speed sensor.

If the fault remains on the same side, the wiring between the computer and the sensor is faulty.

Check and ensure the continuity of the following connections:

Sensor connector **track 1** → **track 33** Computer connector
Sensor connector **track 2** → **track 34** Computer connector

If the connection is faulty:
Disconnect the intermediate **2-track R183** connector on the front left-hand upper wing section and check the condition of the connections.

Check and ensure the continuity of the connections between:

Sensor connector **track 1** → **track B** Intermediate connector
Sensor connector **track 2** → **track A** Intermediate connector

Also check the insulation between these connections.

Check and ensure the continuity of the connections between:

Sensor connector **track 33** → **track B** Intermediate connector
Sensor connector **track 34** → **track A** Intermediate connector

Also check the insulation between these connections.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF026 CONTINUED 1	

NO

Check and ensure the continuity of the following connections:

Sensor connector **track 1** → **track 33** Computer connector
Sensor connector **track 2** → **track 34** Computer connector

If the connection is faulty:

Disconnect the intermediate **2-track R183** connector on the front left-hand upper wing section and check the condition of the connections.

Check and ensure the continuity of the connections between:

Sensor connector **track 1** → **track B** Intermediate connector
Sensor connector **track 2** → **track A** Intermediate connector

Also check the insulation between these connections.

Check and ensure the continuity of the connections between:

Sensor connector **track 33** → **track B** Intermediate connector
Sensor connector **track 34** → **track A** Intermediate connector

Also check the insulation between these connections.

Carry out a visual inspection of the sensor wiring.

If all the checks are correct, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF026 CONTINUED 2	

DF026 stored	*NOTES*	**Special notes:** None.

Check the connection and condition of the sensor and computer connections.
Check the connector on the intermediary connections under the body on the front left-hand upper wing section (**R183**).
Swap the two front wheel speed sensors over.
Clear the computer memory.
Carry out a road test and then recheck with the diagnostic tool.

If the fault initially declared **DF026 Front right-hand wheel speed sensor circuit** has become **DF006 Front left-hand wheel speed sensor circuit**, replace the wheel speed sensor.

If the fault remains on the same side, the wiring between the computer and the sensor is faulty.

Check and ensure the continuity of the following connections:

Sensor connector **track 1** ⟶ **track 33** Computer connector
Sensor connector **track 2** ⟶ **track 34** Computer connector

If the connection is faulty:

Disconnect the intermediate **2-track R183** connector on the front left-hand upper wing section and check the condition of the connections.

Check and ensure the continuity of the connections between:

Sensor connector **track 1** ⟶ **track B** Intermediate connector
Sensor connector **track 2** ⟶ **track A** Intermediate connector

Also check the insulation between these connections.

Check and ensure the continuity of the connections between:

Sensor connector **track 33** ⟶ **track B** Intermediate connector
Sensor connector **track 34** ⟶ **track A** Intermediate connector

Also check the insulation between these connections.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

DF027 PRESENT OR STORED	REAR RIGHT-HAND WHEEL SPEED SENSOR CIRCUIT

NOTES	**Special notes:** None.
	Conditions for applying fault finding procedure to a stored fault: Apply the fault finding procedure described below in **DF027 stored**.

DF027 present	***NOTES***	**Special notes:** None.

Check the connection and condition of the sensor and the computer.
Disconnect the sensor and check that a voltage of approximately **12 V** is present **under + after ignition feed** at the sensor connector terminals on the computer side.
Is the voltage measured correct?

YES

Swap the two rear wheel speed sensors. Clear the computer memory.

Switch off the ignition. Switch on the ignition again.

If the fault initially declared **DF027 Rear right-hand wheel speed sensor circuit** has become **DF027 Rear left-hand wheel speed sensor circuit**, replace the wheel speed sensor.

If the fault remains on the same side, the wiring between the computer and the sensor is faulty.

Check and ensure the continuity of the following connections:

Sensor connector **track 1** → **track 42** Computer connector
Sensor connector **track 2** → **track 43** Computer connector

Also check the insulation between these two connections.

NO

Check and ensure the continuity of the following connections:

Sensor connector **track 1** → **track 42** Computer connector
Sensor connector **track 2** → **track 43** Computer connector

Also check the insulation between these two connections.

Carry out a visual inspection of the sensor wiring.

If all the checks are correct, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF027 CONTINUED	

DF027 stored	*NOTES*	**Special notes:** None.

Check the connection and condition of the sensor and computer connections.
Swap the two rear wheel speed sensors.
Clear the computer memory.
Carry out a road test and then recheck with the diagnostic tool.

If the fault initially declared **DF027 Rear right-hand wheel speed sensor circuit** has become **DF007 Rear left-hand wheel speed sensor circuit present**, replace the wheel speed sensor.

If the fault remains on the same side, the wiring between the computer and the sensor is faulty.

Check and ensure the continuity of the following connections:

Sensor connector **track 1** → **track 42** Computer connector
Sensor connector **track 2** → **track 43** Computer connector

Also check the insulation between these two connections.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF028 **STORED**	FRONT RIGHT-HAND WHEEL SPEED SENSOR SIGNAL

NOTES	**Priorities when dealing with a number of faults:** Deal with fault **DF026 Front right-hand wheel speed sensor circuit** first if it is present.
	Conditions for applying the fault finding procedure to stored faults: The fault is present during: road test (in excess of **12 mph (20 km/h)** for **2 minutes**).

Check that the wheel speed sensor mounting is in good condition (correct clipping).
Check the sensor/target air gap over one wheel revolution: **0.1 mm < front wheel air gap < 1.1 mm**.
Check the conformity of the target: condition, **number of teeth = 48** (using special command **SC001 Check target teeth**).

Check the connection and the condition of the sensor connectors.
Check the connector on the intermediary connections under the body on the front left-hand upper wing section (**R183**).

Carry out a visual inspection of the sensor wiring and check the condition of the connection on the **47-track computer connector**.

If the results of the checks are correct, reconnect the computer and the wheel speed sensor and clear the computer memory.
Exit the fault finding procedure and carry out a road test. Replace the sensor if the fault recurs.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF029 **STORED**	REAR RIGHT-HAND WHEEL SPEED SENSOR SIGNAL

NOTES	**Priorities when dealing with a number of faults:** Deal with fault **DF027 Rear right-hand wheel speed sensor circuit** first if it is present.
	Conditions for applying the fault finding procedure to stored faults: The fault is present during: road test (in excess of **12 mph (20 km/h)** for **2 minutes**).

Check that the wheel speed sensor mounting is in good condition (correct clipping).
Check the sensor/target air gap over one wheel revolution: **0.3 mm < rear wheel air gap < 1.3**
Check the conformity of the target: condition, **number of teeth = 48** (using special command **SC001 Check target teeth**).

Check the connection and the condition of the sensor connectors.
Carry out a visual inspection of the sensor wiring and check the condition of the connection on the **47-track computer connector**.

If the results of the checks are correct, reconnect the computer and the wheel speed sensor and clear the computer memory.
Exit the fault finding procedure and carry out a road test. Replace the sensor if the fault recurs.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF047 PRESENT	MULTIPLEX NETWORK (bus off)

NOTES	**Special notes:** None.

Carry out the multiplex network test.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF056 PRESENT OR STORED	BRAKE PEDAL CONTACT CONSISTENCY

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is recorded as present when: the brake pedal is depressed.

Depress the brake pedal observing the **ET017 BRAKE PEDAL** status.

Check that the pedal released and pedal depressed positions are registered.

YES	Apply the fault finding procedure described in the interpretation of the **ET017 BRAKE PEDAL** status.
NO	Check the two brake light bulbs and the earth of the rear light units (no earthing of **track 41** across the bulbs when the pedal is not depressed).

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF066 PRESENT	NO MULTIPLEX TRANSMISSION FROM INJECTION

NOTES	**Special notes:** None.

Carry out the multiplex network test.
If the fault is still present, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF075 **STORED**	STEERING WHEEL ANGLE SENSOR SIGNAL

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is recorded as present following: steering from lock to lock and road test.

After replacing a sensor, program the steering wheel angle sensor using the diagnostic tool by selecting the configuration **VP003 Steering wheel angle sensor**.

Ensure that the steering wheel angle sensor is correctly installed and positioned on the steering column.

(With the wheels straight, check that the yellow marker on the steering wheel angle sensor is visible in the centre of the window and check that the connector is correctly connected to the sensor and not to the inert mounting next to the sensor.)

Position the wheels straight and use a diagnostic tool in the parameter category to check that **PR033** is between **- 15° and + 15°**: if not, check that the yellow marker on the steering wheel angle sensor is visible in the centre of the window.

Program the steering wheel angle using the diagnostic tool by selecting the configuration **VP003 Steering wheel angle sensor**.

Exit the fault finding procedure and carry out a road test.
Replace the sensor if the fault recurs.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF088 PRESENT	BRAKE PRESSURE SENSOR CIRCUIT

NOTES	**Special notes:** None.

Check the condition and correct connection of the brake pressure sensor.

Check the connection and the condition of the computer connectors.

Check and ensure the continuity of the following connections:

Sensor connector **track 1** → **track 19** Computer connector
Sensor connector **track 2** → **track 20** Computer connector
Sensor connector **track 3** → **track 18** Computer connector

Also check the insulation between these connections.

Carry out a visual inspection of the sensor wiring.

Disconnect the pressure sensor and check the presence of a voltage of approximately **5 V** under **+ after ignition feed** between **tracks 1 and 3** of the sensor connector (ignore any new faults caused by this inspection).

If the voltage is approximately **0 V**, contact your Techline.

If the results of the checks are correct, reconnect the computer and the brake pressure sensor and clear the computer memory.

Exit fault finding mode and switch off the ignition.

Switch the ignition on and replace the sensor if the fault recurs.

IMPORTANT

Whenever a brake pressure sensor is replaced, it is essential to calibrate the sensor using the diagnostic tool. Carry out the following operations.
– **Do not depress the brake pedal for the entire duration of the operation.**
– **Configure VP026 Pressure sensor using the diagnostic tool.**

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF090 **STORED**	FRONT RIGHT-HAND WHEEL TARGET

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is recorded as present during: road test.

Check that the sensor casing is absent when rotating.
Check that the wheel speed sensor mounting is in good condition (clipping).
Check the conformity of the targets: condition, **number of teeth = 48** (using special command **SC001 Check target teeth**).

If the checks reveal no faults, clear the fault memory.

Exit the fault finding procedure and carry out a road test.

Replace the instrumented bearing if the fault recurs.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF091 **STORED**	FRONT LEFT-HAND WHEEL TARGET

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is recorded as present during: road test.

Check that the sensor casing is absent when rotating.
Check that the wheel speed sensors mounting is correct (clipping).
Check the conformity of the targets: condition, **number of teeth = 48** (using special command **SC001 Check target teeth**).

If the checks reveal no faults, clear the fault memory.

Exit the fault finding procedure and carry out a road test.

Replace the instrumented bearing if the fault recurs.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF092 **STORED**	RIGHT-HAND REAR WHEEL TARGET

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is recorded as present after: road test.

Check that the sensor casing is absent when rotating.
Check that the wheel speed sensors mounting is correct (clipping).
Check the conformity of the targets: condition, **number of teeth = 48** (using special command **SC001 Check target teeth**).

If the checks reveal no faults, clear the fault memory.

Exit the fault finding procedure and carry out a road test.

Replace the instrumented bearing if the fault recurs.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF093 **STORED**	LEFT-HAND REAR WHEEL TARGET

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is recorded as present during: road test.

Check that the sensor casing is absent when rotating.
Check that the wheel speed sensors mounting is correct (clipping).
Check the conformity of the targets: condition, **number of teeth = 48** (using special command **SC001 Check target teeth**).

If the checks reveal no faults, clear the fault memory.

Exit the fault finding procedure and carry out a road test.

Replace the instrumented bearing if the fault recurs.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF094 / DF095 PRESENT OR STORED	COMPUTER SUPPLY VOLTAGE

NOTES	**Special notes:** Apply the fault finding procedure below, whether the fault is indicated as present or stored. This fault appears when the engine is started with a battery charger or a **24-volt** battery. The undervoltage fault is not stored unless the vehicle speed is above **12 mph (20 km/h)**.
	Conditions for applying the fault finding procedure to stored faults: Apply the fault finding procedure whether the fault is present or stored.

Check for the presence of **+ 12 before ignition feed** on **track 32** of the **47-track** computer connector.
Perform the operations necessary to obtain the correct **+ after ignition feed** voltage supply to the computer:

10 V < correct voltage < 17 V

– Battery charge check.
– Charging circuit check.
– Check the tightness and condition of the battery terminals.

Check the presence of **+ after ignition feed** on **track 4** of the **47-track** computer connector (**5A** fuse).
Check for the presence of **+ before ignition feed** on **track 1** and **32** of the **47-track** connector (fuses **30A** and **40A** located in the engine fuse box).
Check the earths are in good condition (properly tightened, not oxidised etc.), check the tightness of the terminal on the earth bolt located above the hydraulic power unit.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF096 PRESENT	COMPUTER INTERNAL ELECTRICAL FAULT

NOTES	**Special notes:** None.

Using the diagnostic tool, check the **FUNCTION CODE NUMBER** (CLIP: identification screen and NXR: parameter screen **PR041**).

– If the **function code number is C1** (the system is fitted with electric emergency braking assistance), start the engine and use command **AC161 Brake servo solenoid valve**.

If **DF185 Brake servo / internal feed circuit** appears, apply the fault finding procedure associated with this fault.

If **DF185** does not appear, check with your Techline.

– If the **function code number is E0 or E1** (the system is fitted with manual emergency brake assist), contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF097 PRESENT	NO AUTOMATIC GEARBOX MULTIPLEX SIGNAL

NOTES	**Special notes:** None.

Carry out the multiplex network test.
If the fault is still present, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF098 PRESENT	NO UCH MULTIPLEX SIGNAL

NOTES	**Special notes:** None.

Carry out the multiplex network test.
If the fault is still present, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF099 PRESENT	ABS PRIVATE MULTIPLEX NETWORK (bus off)

NOTES	**Special notes:** None.

Ensure that the connections and the position of any special equipment, such as CB, car phone, amplifier, etc. are not preventing the ABS from working correctly.

Using the diagnostic tool, check the **FUNCTION CODE NUMBER** (CLIP: identification screen and NXR: parameter screen PR041).

– **E0, C1, E1** indicates that the system is fitted with a combined sensor.

Check the connection and condition of the combined sensor connectors and the steering wheel angle sensor.

– Check the continuity and insulation of the connections between:

Computer connector **Track 29** → **Track 3** Steering wheel angle sensor + feed
→ **Track 2** combined sensor

Computer connector **Track 25** → **Track 2** Steering wheel angle sensor
→ **Track 1** Combined sensor

– If the fault is still present, switch off the ignition, disconnect the combined sensor, and then switch the ignition back on.
Replace the combined sensor if **DF099** is stored. Ignore any new faults that appear during the operation.

– If **DF099** remains present, switch off the ignition, reconnect the combined sensor and disconnect the steering wheel angle sensor. Switch ignition back on.
Replace the steering wheel angle sensor if **DF099** is stored. Ignore any new faults that appear during the operation.

If the checks are correct, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF100 PRESENT	NO STEERING WHEEL ANGLE MULTIPLEX SIGNAL

NOTES	**Special notes:** None.

Check the connection and condition of the steering wheel angle sensor and computer connectors.

Check the continuity of the following connections:

Computer connector **Track 25** → **Track 2** of the steering wheel angle sensor
Computer connector **Track 29** → **Track 3** of the steering wheel angle sensor

Check for the presence of **+ 12 before ignition feed** between **tracks 1 and 5** of the steering wheel angle sensor.

If the fault is still present, replace the steering wheel angle sensor.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF101 PRESENT	NO COMBINED SENSOR MULTIPLEX SIGNAL

NOTES	**Special notes:** None.

Check the connection and condition of the combined sensor and computer connectors.
Carry out a visual inspection of the sensor wiring.

Check the continuity and the insulation of the connections between:

Sensor connector **track 1** → **track 25** computer connector
Sensor connector **track 2** → **track 29** computer connector
Sensor connector **track 3** → **track 6** computer connector
Sensor connector **track 5** → **track 24** computer connector

Also check the insulation between these connections.

Measure the voltage across **tracks 5 and 3** of the combined sensor connector under **+ after ignition feed**.
Replace the computer if the voltage is not approximately the same as the **+ after ignition feed**.

If the results of the checks are correct, reconnect the computer and the combined sensor and clear the computer memory.

Exit fault finding mode and switch off the ignition.

Switch the ignition on and replace the sensor if the fault recurs.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF102 PRESENT	SAVE CALIBRATION (Computer configuration and sensor calibration)

NOTES	**Special notes:** None.

Using the diagnostic tool, run the following configuration commands:

– **CF077** ABS/ESP calibration.
Calibration is performed by selecting the engine type fitted to the vehicle.

– Adaptive cruise control:
Select command **CF078** on the diagnostic tool.

– Gearbox type:
Select command **CF079** on the diagnostic tool.

– Vehicle parameters (drive torque index configuration + brake type):
Select command **CF080** on the diagnostic tool.

– To program the steering wheel angle:
Select command **VP003** on the diagnostic tool.

– To program the tachometric index:
Select command **VP007** on the diagnostic tool.

If the calibration attempt fails, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF103 PRESENT	NO MULTIPLEX ACC SIGNAL

NOTES	**Special notes:** None.

Carry out the multiplex network test.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF104 PRESENT	COMBINED SENSOR INTERNAL ELECTRICAL FAULT

NOTES	**Special notes:** None.

Replace the combined sensor.

IMPORTANT

Each time a combined pressure sensor is replaced, it is essential to calibrate the sensor using the diagnostic tool. Carry out the following operations.
– Position the vehicle on a flat, horizontal surface.
– Configure parameter VP025 Transverse acceleration sensor using the diagnostic tool.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF107 PRESENT	STEERING WHEEL ANGLE SENSOR IDENTIFIER

NOTES	**Special notes:** None.

Program the steering wheel angle sensor using the diagnostic tool by selecting the configuration **VP003 Steering wheel angle sensor**.

If attempts to program fail, replace the steering wheel angle sensor.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF108 PRESENT OR STORED	STEERING WHEEL ANGLE SENSOR

NOTES	**Special notes:** Ignore this fault if the vehicle is on the dynamometer or if a jack has been placed underneath the vehicle and has not had an effect on the steering wheel angle though it has generated a vehicle speed.
	Conditions for applying the fault finding procedure to stored faults: Apply the fault finding procedure whether the fault is present or stored.

Check the connection and condition of the steering wheel angle sensor and computer connectors.

Using the diagnostic tool, check the **FUNCTION CODE NUMBER** (CLIP: identification screen and NXR: parameter screen **PR041**).

If the function code number is E0, C1, E1:
– Check the continuity of the connections between:
Computer connector **Track 25** → **Track 2** steering wheel angle sensor
Computer connector **Track 29** → **Track 3** steering wheel angle sensor

Check the presence of **+ 12 after ignition feed** between **tracks 1 and 5** of the steering wheel angle sensor connector.

If the results of the checks are correct, reconnect the computer and the steering wheel angle sensor and clear the computer memory.
Exit the fault finding procedure and carry out a road test. Replace the sensor if the fault recurs.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF109 PRESENT OR STORED	BRAKE PRESSURE SENSOR SIGNAL (consistency)

NOTES	**Special notes:** Deal with these faults first **DF088 Brake pressure sensor circuit** and **DF056 Brake pedal switch consistency**, if they are present.
	Conditions for applying the fault finding procedure to stored faults: Apply the fault finding procedure whether the fault is present or stored.

Ensure that there are no leaks in the hydraulic circuit.

When the engine is switched off, depress the brake pedal several times. After this has been performed, the pedal should remain hard.

If the pressure sensor has been removed or refitted, an air bubble may have become trapped in the pressure sensor thus altering the reading issued by the sensor. Remove the sensor and refill with brake fluid before refitting.

If the fault is still present, replace the brake pressure sensor.

If the checks reveal no faults, clear the computer memory.
Exit the fault finding procedure and carry out a road test.
Replace the sensor if the fault recurs.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF110 PRESENT OR STORED	SENSOR SUPPLY (brake pressure sensor)

NOTES	**Special notes:** Check the **FUNCTION CODE NUMBER** (CLIP: identification screen and NXR: parameter screen **PR041**).
	Conditions for applying the fault finding procedure to stored faults: Apply the fault finding procedure whether the fault is present or stored.

If the function code number is: E0, C1, E1

Check the presence of **+ 5 Volts** under **after ignition feed** between **tracks 1 and 3** of the brake pressure sensor.

If the voltage is incorrect, check the wiring harness.

Ensure that the computer and the brake pressure sensor connectors are in good condition and correctly connected.
Check and ensure the continuity of the following connections:

Sensor connector track 1 → track 19 Computer connector
Sensor connector track 2 → track 20 computer connector
Sensor connector track 3 → track 18 computer connector

Also check the insulation between these connections.

If the checks show no faults, replace the brake pressure sensor.

Clear the computer memory and road test the vehicle then recheck with the diagnostic tool.

If the fault is still present, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF111 PRESENT	BRAKE PEDAL TRAVEL SENSOR CIRCUIT

NOTES	**Special notes:** Deal with fault **DF110 Sensor supply** first if it is present.

Check the condition and connection of the brake pedal travel sensor connector.

Check the connection and the condition of the computer connectors.
Check and ensure the continuity of the following connections:

Sensor connector **track 1** → **track 7** Computer connector
Sensor connector **track 2** → **track 5** Computer connector
Sensor connector **track 3** → **track 3** computer connector

Also check the insulation between these connections.

Carry out a visual inspection of the sensor wiring.

If the results of the checks are correct, reconnect the computer and the brake pedal travel sensor and clear the computer memory.
Carry out a road test and then recheck with the diagnostic tool.
Replace the sensor if the fault recurs.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF112 **PRESENT**	BRAKE PEDAL TRAVEL CONSISTENCY

NOTES	**Special notes:** None.

Using the diagnostic tool, check on the statuses screen that **ET017** recognises the depressed and released positions of the brake pedal. If they are not detected, use the fault finding procedure for **ET017**.
Check the brake pedal position using **PR039** on the diagnostic tool. – Pedal released: **PR039** < 5.5 mm. If the value is different, replace the sensor.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF114 PRESENT	BRAKE SERVO MICROSWITCH CIRCUIT

NOTES	**Special notes:** None.

Check the condition and connection of the brake servo connector.

Check the presence of **+ 12 Volts after ignition feed** on the disconnected brake servo connector between **track 5** and the vehicle **earth**.

If the voltage is incorrect, check the wiring loom.

Check the continuity and insulation of the connection between:

Servo connector **track 5** ⟶ **track 28** Computer connector

If the continuity and insulation have been checked and the voltage remains incorrect, replace the ABS/ESP computer.

Check that the computer connections and the **6 tracks** of the brake servo are correctly connected and in good condition.
Check and ensure the continuity of the following connections:

Servo connector **track 2** ⟶ **track 30** Computer connector
Servo connector **track 1** ⟶ **track 27** Computer connector

Also check the insulation between these connections.

If the results of the checks are correct, reconnect the computer and the brake servo and then clear the computer memory.
Replace the sensor if the fault recurs.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF115 PRESENT	BRAKE SERVO MICROSWITCH STATUS CONSISTENCY

NOTES	**Special notes:** None.

Ensure that the brake switch is in correct working order by carrying out the **ET017** (interpretation of statuses) procedure.
Check the condition and connection of the brake servo connector. Check the continuity between **tracks 30 and 28** of the computer connector with the brake pedal released. Check the continuity between **tracks 27 and 28** of the computer connector with the brake pedal depressed.
Check the brake pedal position using **PR039** on the diagnostic tool. – Pedal released: **PR039** < 5.5 mm. If the value is different, replace the sensor.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF116 PRESENT	VEHICLE CONFIGURATION PROGRAMMING

NOTES	**Special notes:** None.

Run the configuration command **CF080 Vehicle parameters** in order to define the engine type fitted to the vehicle.

If configuration attempts fail, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF117 PRESENT	ABS/ESP CALIBRATION PROGRAMMING

NOTES	**Special notes:** None.

Run the configuration command **CF077 ABS/ESP CALIBRATION**.

Calibration is performed by selecting the engine type fitted to the vehicle.

If the computer configuration fails, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF118 PRESENT	VEHICLE OPTIONS PROGRAMMING

NOTES	**Special notes:** None.

Run the configuration commands **CF078 Cruise control distance control** and **CF079 Gearbox type** to define the vehicle equipment.

If the computer configuration fails, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF119 PRESENT	GEARBOX TYPE CONFIGURATION (consistency between computer configuration and multiplex network frames)

NOTES	**Priorities when dealing with a number of faults:** Deal with fault **DF097 No automatic gearbox multiplex signal** if it is present.

Run the configuration command **CF079 Gearbox type** to reconfigure the gearbox type.

If the computer configuration fails, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF120 PRESENT OR STORED	INJECTION MULTIPLEX SIGNALS CONSISTENCY

NOTES	**Special note:** Although stored in the computer, this fault is caused by the injection system rather than ABS/ESP components. It is therefore necessary to perform fault finding on the injection. **Note:** The injection computer does not always store these transient faults as quickly as the ABS/ESP computer. If no fault is stored in the injection computer, start the engine; if there is no fault present, contact your Techline. Once the fault in the injection system has been remedied, clear the ABS/ESP computer memories. The injection multiplex signal is transmitted to the ABS/ESP computer via the Protection and Switching Unit.

Consult the fault finding procedure for the injection.
If the fault is still present, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF121 PRESENT OR STORED	TORQUE REQUESTED CANNOT BE SUPPLIED

NOTES	**Special note:** Although stored in the computer, this fault is caused by the injection system rather than ABS/ESP components. It is therefore necessary to perform fault finding on the injection. **Note:** The injection computer does not always store these transient faults as quickly as the ABS/ESP computer. If no fault is stored in the injection computer, start the engine; if there is no fault present, contact your Techline. Once the fault in the injection system has been remedied, clear the ABS/ESP computer memories. The injection multiplex signal is transmitted to the ABS/ESP computer via the Protection and Switching Unit.

Consult the fault finding procedure for the injection.
If the fault is still present, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF122 PRESENT OR STORED	NO INJECTION MULTIPLEX SIGNALS

NOTES	**Special note:** Although stored in the computer, this fault is caused by the injection system rather than ABS/ESP components. It is therefore necessary to perform fault finding on the injection. **Note:** The injection computer does not always store these transient faults as quickly as the ABS/ESP computer. If no fault is stored in the injection computer, start the engine; if there is no fault present, contact your Techline. Once the fault in the injection system has been remedied, clear the ABS/ESP computer memories. The injection multiplex signal is transmitted to the ABS/ESP computer via the Protection and Switching Unit.

Consult the fault finding procedure for the injection.
If the fault is still present, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF125 PRESENT	COMBINED SENSOR SUPPLY VOLTAGE

NOTES	**Priorities when dealing with a number of faults:** Deal with fault **DF094/095 Computer supply voltage** first if it is present.

Check the connection and condition of the combined sensor and computer connectors.

Switch the ignition on and check the presence of the + after ignition feed between **tracks 3 and 5** of the sensor connector.

If the voltage is correct, replace the combined sensor.

Check the continuity and insulation of the following connections:

Sensor connector **Track 3** → **Track 6** computer connector

Sensor connector **Track 5** → **Track 24** computer connector

Also check the insulation between these connections.

If these checks are correct, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF126 PRESENT OR STORED	COMBINED SENSOR SIGNAL PLAUSIBILITY

NOTES	**Conditions for applying the fault finding procedure to stored faults:** Apply the fault finding procedure whether the fault is present or stored.

Check that the combined sensor is fitted in the right direction, is in good condition and correctly tightened to **8 Nm** (the combined sensor is located under the central console between the gear lever and rear heater).

Check the connection and condition of the combined sensor connector.
Ensure that the connections, approval and position of any special equipment such as CB, car phone, amplifier, bass speaker (subwoofer type), etc. are not preventing the ABS from working correctly.

If the results of the checks are correct, reconnect the combined sensor and clear the computer memory.

Replace the combined sensor if the fault recurs.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF127 PRESENT	TEMPERATURE SENSOR CIRCUIT

NOTES	**Special notes:** None.

Contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF155 PRESENT	ELECTRONIC STABILITY PROGRAM FUNCTION

NOTES	**Special notes:** It is normal for this fault to occur after the vehicle has been driven on a race track (involving high transverse acceleration and without a steering angle value). Ensure that the fault does not occur after the vehicle has been driven at low speed.

Ensure that the transverse acceleration sensors/yaw angle or combined sensor are correctly fixed to the board and that the whole is fixed to the floor.

Check **PR033 Steering wheel angle** with the wheels straight.

Program the steering wheel angle sensor using the diagnostic tool by selecting the configuration **VP003 Wheel angle sensor**.
Replace the steering wheel angle sensor if the calibration has failed or if the angular value is not between **±15°**.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF171 PRESENT OR STORED	ADAPTIVE CRUISE CONTROL

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present when: a road test is carried out with the adaptive cruise control operational.

This fault appears when a multiplex connection fault arises between the ESP computer and the adaptive cruise control computer.

Apply the fault finding procedure for the multiplex network.

If the fault is still present, consult the fault finding procedure for the adaptive cruise control

AFTER REPAIR	Clear the computer memory. Carry out a road test with the adaptive cruise control operational then test it again with the diagnostic tool.

GETtheMANUALS.org

DF172 **PRESENT**	DISTANCE LIMITER DECELERATION CONTROL

NOTES	**Special notes:** None.

Apply the fault finding procedure for the multiplex network.

If the fault is still present, test the adative cruise control system using the diagnostic tool.

If the fault is still present, consult the fault finding procedure for the adaptive cruise control

AFTER REPAIR	Clear the computer memory. Carry out a road test with the adaptive cruise control operational then test it again with the diagnostic tool.

GETtheMANUALS.org

DF173 **STORED**	BRAKE SERVO SOLENOID VALVE

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present when: the driver requests adaptive cruise control.

Check the condition and connection of the brake servo connector.

Check that the **47-track** computer connections and the **6 tracks** of the brake servo are correctly connected and in good condition.
Check and ensure the continuity of the following connections:

Servo connector **track 4** → **track 17** Computer connector
Servo connector **track 3** → **track 31** Computer connector

Also check the insulation between these connections.

Visually inspect the brake servo wiring.

Check the resistance of the brake servo **R = 2 Ω**. If the resistance is incorrect, replace the brake servo.

Check for the presence of approximately **+ 12 Volts after ignition feed** on the brake servo connector (connected) between **track 4** and **earth**.

If the voltage is incorrect, contact your Techline.

If the results of the checks are correct, reconnect the computer and the brake servo and then clear the computer memory.
If the fault is still present, consult the fault finding procedure for adaptive cruise control.
If the fault reappears, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test with the cruise control with distance limiter working then test it again with the diagnostic tool.

GETtheMANUALS.org

DF174 **STORED**	DISTANCE LIMITER BRAKE SERVO SOLENOID VALVE

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present when: the driver requests adaptive cruise control.

Check the condition and connection of the brake servo connector.

Check that the **47-track** computer connections and the **6 tracks** of the brake servo are correctly connected and in good condition.
Check and ensure the continuity of the following connections:

Servo connector **track 4** → **track 17** Computer connector
Servo connector **track 3** → **track 31** Computer connector

Also check the insulation between these connections.

Visually inspect the brake servo wiring.

Check the resistance of the brake servo **R = 2 Ω**. If the resistance is incorrect, replace the brake servo.

Check for the presence of approximately **+ 12 Volts after ignition feed** on the brake servo connector (connected) between **track 4** and **earth**.

If the voltage is incorrect, contact your Techline.

If the results of the checks are correct, reconnect the computer and the brake servo and then clear the computer memory.
If the fault is still present, consult the fault finding procedure for adaptive cruise control.
If the fault reappears, contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test with the adaptive cruise control operational and then test it again with the diagnostic tool.

GETtheMANUALS.org

DF176 **DF177** **DF178** **DF179** **STORED**	WHEEL SENSOR FREQUENCY

NOTES	**Priority in the event of a number of faults:** Deal with the wheel speed sensor circuit fault first, if there are two faults on a single sensor.
	Conditions for applying the fault finding procedure to stored faults: The fault is present during: road test (in excess of **12 mph (20 km/h) for 2 minutes**).

Check that the wheel speed sensor mounting is in good condition (correct clipping).
Check the sensor/target air gap over one wheel revolution: **0.1 mm < front wheel air gap < 1.1 mm**.
0.3 mm < rear wheel air gap < 1.3 mm.

Check the conformity of the target: condition, **number of teeth = 48** (using special command **SC001 Check target teeth**).

Check the connection and the condition of the sensor connectors.

Check the connector on the intermediary connections under the body on the front left-hand wing upper section (**R183**).

Carry out a visual inspection of the sensor wiring and check the condition of the connections on the **47-track computer connector**.

If the results of the checks are correct, reconnect the computer and the wheel speed sensor and clear the computer memory.
Exit the fault finding procedure and carry out a road test. Replace the sensor if the fault recurs.

AFTER REPAIR	Clear the computer memory. Carry out a road test over **12 mph (20 km/h)** for **2 minutes** then carry out a new test with the diagnostic tool.

GETtheMANUALS.org

DF185 PRESENT OR STORED	BRAKE SERVO SOLENOID VALVE CIRCUIT / INTERNAL SUPPLY

NOTES	**Special notes:** Check the **FUNCTION CODE NUMBER** (CLIP: identification screen and NXR: parameter screen PR041).
	Conditions for applying the fault finding procedure to stored faults: Apply the fault finding procedure whether the fault is present or stored.

If the function code number is: C1

Check the condition and connection of the brake servo connector.

Check that the computer connections and the 6 tracks of the brake servo are correctly connected and in good condition.
Check and ensure the continuity of the following connections:

- Servo connector **track 4** → **track 17** Computer connector
- Servo connector **track 3** → **track 31** Computer connector

Also check the insulation between these connections.

Visually inspect the brake servo wiring.

Check the resistance of the brake servo **R = 2 Ω**. If the resistance is incorrect, replace the brake servo.

Check the presence of **+ 12 Volts after ignition feed** on the brake servo connector between **track 4** and the **earth**.
If the voltage is incorrect, contact your Techline.

If the results of the checks are correct, reconnect the computer and the brake servo and then clear the computer memory.
Replace the brake servo if the fault recurs.

If the function code number is: E0 or E1

Contact your Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

NOTES	Only carry out conformity check after a full check using the diagnostic tool.

Order	Function	Parameter or status Check or action	Display and notes	Fault finding
1	Diagnostic tool dialogue	-	**ABS/ESP MK60**	**ALP 1**
2	Computer configuration	**PR030:** TACHOMETRIC INDEX	Check that the index entered corresponds to the tyres fitted to the vehicle (refer to the Help section)	None
3	Detection that brake pedal is not depressed	**ET017:** BRAKE PEDAL	Released status confirmed, brake pedal not depressed	**ET017**
4	Detection that brake pedal is depressed	**ET017:** BRAKE PEDAL	Depressed status confirmed; brake pedal fully depressed	**ET017**
5	Detection of Electronic Stability Program activation	**ET023:** ESP start/stop button	Depressed status confirmed when button is pressed	**ET023**
6	Detection of Electronic Stability Program activation	**ET023:** ESP start/stop button	Released status confirmed when button is released	**ET023**

GETtheMANUALS.org

Use of command modes:

Before using the command modes, check that the battery charge is sufficient

Control of the wheel solenoid valves in order to check the hydraulic system:

Raise the vehicle in order to be able to rotate the wheels, and check that they rotate freely.
Keep the brake pedal depressed to prevent the wheel being tested from being turned by hand (do not brake so firmly that full brake power is reached).

Select and confirm the command of the wheel being examined (Front left-hand wheel solenoid valves, etc.)

⟶ Turn the wheel in question by hand; five locking/unlocking cycles should be detected.

Pump motor control:

Select the Test pump motor command.

⟶ Confirm motor operation for 5 seconds

Bleeding the hydraulic circuits:

Apply the procedure described in the Bleeding the circuits section of the repair procedure Technical Note.

Summary of the FUNCTION CODES:

- **C1:** Electronic ABS + EBA + ESP for ACC + CLUSTER + UNDER-STEERING CONTROL
- **E0:** Mechanical ABS + EBA + ESP + CLUSTER
- **E1:** Mechanical ABS + EBA + ESP + CLUSTER + UNDER-STEERING CONTROL

Electrical EBA: System equipped with electrical emergency brake assist.

Mechanical EBA: System equipped with mechanical emergency brake assist.

ESP: Electronic Stability Program.

CLUSTER (combined sensor): a single sensor combining the yaw sensor and transverse acceleration sensor functions.

ACC: Adaptive cruise control.

CSV: Under-steer control.

What is the difference between an ABS/ESP system with mechanical EBA or electrical EBA?

Electrical EBA has extra components which do not feature in mechanical EBA, such as:
- A brake light cut-off relay.
- A brake servo solenoid valve.
- A brake potentiometer (brake pedal travel).

Depending on the function code, certain statuses or parameters on the diagnostic tool will not function.

GETtheMANUALS.org

REPLACING THE COMPUTER:

After replacing a computer, configure as follows:

– **tachometric index configuration.**

The TEVES MK60 ABS computer with the tachometry function supplies the vehicle speed signal to all subscribers in the vehicle using this information (instrument panel, engine management, etc.).
This vehicle speed signal replaces the one supplied by the speed sensor located on the gearbox.
The ABS computer calculates the vehicle speed from the speed of the wheels and the circumference of the tyres fitted on the vehicle.

The tyre circumference must be programmed into the memory of a new computer. This involves entering an "X" index using command VP007 Tachometric index on the diagnostic tool.

Once the index has been entered using the **VP007** command, clear the computer memory and then switch off the ignition. Use the **PR030** parameter to check that the index has been stored correctly.

– ABS/ESP calibration:

Select command **CF077** on the diagnostic tool.

– Adaptive cruise control:

Select command **CF078** on the diagnostic tool.

– Gearbox type:

Select command **CF079** on the diagnostic tool.

– Vehicle parameters (drive torque index configuration + brake type):

Select command **CF080** on the diagnostic tool.

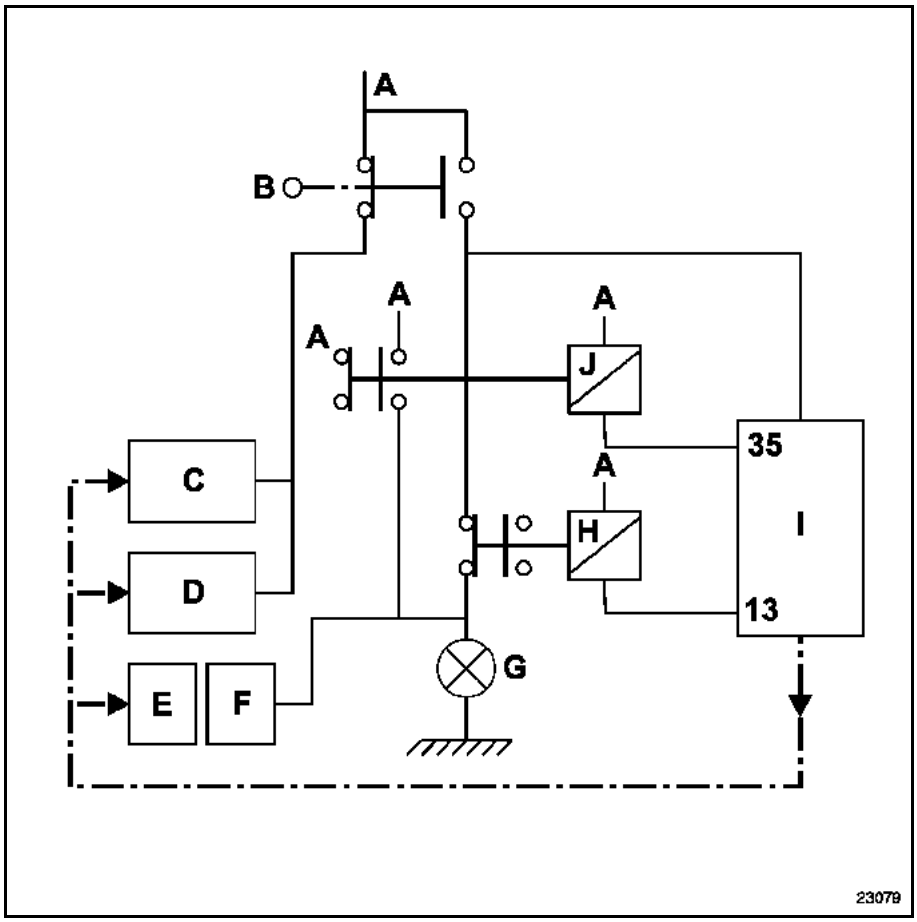
– To program the steering wheel angle:

Select command **VP003** on the diagnostic tool.

GETtheMANUALS.org

BRAKE LIGHT COATED WIRING CONNECTED TO UNDERSTEER CONTROL (E1, C1 FUNCTION CODE) + LIGHTING SWITCH OFF in adaptive cruise control function (C1 FUNCTION CODE).

The **function code** is available on the **PARAMETERS (PR041)** screen or the **IDENTIFICATION** screen on the diagnostic tool.



- **A + after ignition feed.**
- **B Brake lights switch.**
- **C Injection computer.**
- **D Automatic transmission computer.**
- **E UCH.**
- **F Passenger compartment relay and fuse box.**
- **G Brake lights.**
- **H Lights off relay.**
- **I ABS / ESP computer.**
- **J Ignition relay.**
- **Track 35 of the 35-track ABS/ESP computer connector.**
- **Track 13 of the 13-track ABS/ESP computer (not connected if mechanical EBA).**

GETtheMANUALS.org

ET017	BRAKE PEDAL

NOTES	**Special notes:** Only perform the checks if the depressed and released statuses are not consistent with the position of the pedal. Refer to the diagrams in the **Help** section.

STATUS Released brake pedal depressed.

If brake lights operate:

– Check the continuity of the connection between **track A3** of the brake light switch connector and **track 41** of the computer connector.

If the brake lights do not operate:

– Check the condition and fitting of the brake light switch and brake lights fuse.
– Check that there is **+ after ignition feed** on **tracks A1 and B1** of the brake switch connector.
– Remove the brake light switch and check that it is operating correctly:

	Continuity between tracks	Insulation between tracks
Switch depressed (Brake pedal released)	**A1 and B3**	**A3 and B1**
Switch released (Brake pedal depressed)	**A3 and B1**	**A1 and B3**

– Replace the switch if necessary. Check the continuity of the connection between **track A3** of the brake light switch connector and **track 41** of the computer connector.
– Check the condition and ensure the continuity of the connection between **track A3** of the brake switch connector and the brake lights.

Depressed STATUS brake pedal released.

– Check the condition and fitting of the brake light switch and brake lights fuse.
– Remove the brake light switch and check that it is operating correctly:

	Continuity between tracks	Insulation between tracks
Switch depressed (Brake pedal released)	**A1 and B3**	**A3 and B1**
Switch released (Brake pedal depressed)	**A3 and B1**	**A1 and B3**

– Replace the switch if necessary.
– Check the insulation against **12 V** of the connection between **track A3** of the brake switch connector and **track 41** of the computer connector.
– If the switch works correctly and **PR041** is **E1** or **C1**, check that the ignition relay is working (contact sticking, permanent command. Check if the status works normally when the relay is removed).

AFTER REPAIR	Carry out a road test and then a test with the diagnostic tool.

GETtheMANUALS.org

ET023	ESP start/stop button

NOTES	**Special notes:** Only perform the checks if the pressed and released statuses are not consistent with the position of the button.

STATUS Button released

Ensure that the ESP on/off switch connector is in good condition and correctly connected.

Repair if necessary.

Check there is no continuity between **tracks A2 and B1** in the released position of the switch. If there is continuity, replace the switch.

Check the insulation against earth of the connection between:

Switch connector **Track B1** ⟶ **Track 38** computer connector

STATUS Button pressed

Ensure that the ESP on/off switch connector is in good condition and correctly connected.
Repair if necessary.

Check that there is continuity between **tracks A2 and B1** in the pressed position of the switch. If there is no continuity, replace the switch.

Check that there is earth on **track A2** of the switch connector.

AFTER REPAIR	Carry out a road test and then a test with the diagnostic tool.

ANTI-LOCK BRAKING SYSTEM
Fault finding - Customer complaints

GETtheMANUALS.org

NOTES	Only consult the customer complaints section after a complete check using the diagnostic tool.

FAULTS DETECTED ON BRAKING WITH ABS/BRAKING REGULATION

- **Locking of one or more wheels.** — **ALP 2**
- **Pulling.** — **ALP 3**
- **Drift.** — **ALP 4**
- **Unexpected ABS operation at low speed with light pedal pressure.** — **ALP 5**
- **Unexpected ABS operation on poor road surfaces.** — **ALP 6**
- **Unexpected ABS operation with use of accessories (car phone, CB etc.)** — **ALP 7**
- **Extension of brake pedal travel following ABS regulation (with an irregular pedal when entering ABS regulation).** — **ALP 8**
- **Spongy pedal.** — **ALP 9**
- **Brake pedal vibration.** — **ALP 10**
- **Noises from the pump, the pipes or the hydraulic unit.** — **ALP 11**

OTHER CASES

- **No dialogue with the ABS computer.** — **ALP 1**
- **Brake lights do not light up go out (E1/C1 function code)** — **ALP 12**

GETtheMANUALS.org

ALP 1	No dialogue with the ABS computer

NOTES	None

Try to establish dialogue with a computer on another vehicle to make sure that the diagnostic tool is not faulty.
If the tool is not causing the fault and dialogue cannot be established with any other computer on the same vehicle, it may be that a faulty computer is disrupting the **K** diagnostic line.
Proceed by successive disconnections to locate this computer.
Check the voltage of the battery and perform the operations necessary to obtain a voltage which conforms to specification (**9.5 Volts** < battery voltage < **17.5 Volts**).

Check that the ABS fuses on the passenger compartment fuse board (**5A**) and two in the engine compartment (**30A and 40A**) are present and sound.
Check that the computer connector is properly connected and check the condition of its connections.
Check the ABS earths (good quality, not oxidised, sheath sealing ring (on the earth terminal), tightness of the earth bolt located above the ABS assembly).
Check that the computer is correctly supplied:

- **Earth on tracks 16 and 47** of the **47-track connector**
- **+ before ignition feed on tracks 1 and 32** of the **47-track** connector.
- **+ after ignition feed on track 4** of the **47-track** connector.

Check that the power supply to the diagnostic socket is correct:

- **+ before ignition on track 16**.
- **+ after ignition on track 1**
- **Earth on track 5**.

Check the continuity and insulation of the connection between:

Computer connector **track 2** ⟶ **track 7** diagnostic socket.

Contact your Techline if dialogue has still not been established after these various checks.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

ALP 2	Locking of one or more wheels

NOTES	Only consult this customer complaint after a complete check using the diagnostic tool.

Reminder: The wheels locking on a vehicle fitted with ABS, or the tyres grating, which feels like locking to the customer, may be linked to normal operation of the system and should not always be considered as a fault:
- Locking is allowed below **4 mph (6 km/h)** (the system will not provide regulation).
- Braking with ABS intervention on very poor roads (significant squealing).

However, if the wheels are actually locking, lift the vehicle in order to be able to turn the wheels and check:

- Possible inversion of the speed sensor connection.
  Using parameters **PR001, PR002, PR003 and PR004**, rotate the wheels slowly and check the consistency of the results obtained.
  If the value measured is zero, rotate the other wheels to confirm an electrical inversion of the sensors and repair the wiring harness.

- Possible inversion of pipes on the hydraulic unit.
  Use the Front left-hand wheel solenoid valves, Front right-hand wheel solenoid valves, Rear left-hand wheel solenoid valves and Rear right-hand wheel solenoid valves commands while depressing the brake pedal and check for the occurrence of ten locking/unlocking cycles on the relevant wheel (see the Help section). If the ten cycles do not occur on the wheel tested, (wheel remains locked), see if they occur on another wheel (if a bad connection is confirmed: repair).
  If the ten cycles do not occur on a wheel and the pipes are correctly connected, replace the hydraulic unit.

Check that the sensor casing is secured when rotating.
Check that the wheel speed sensors mounting is correct (clipping).
Check the conformity of the targets: condition, **number of teeth = 48 (using the SC001 Check target teeth command)**.

If the fault is still present following these checks, replace the hydraulic unit.

AFTER REPAIR	Carry out a road test followed by a diagnostic tool check.

GETtheMANUALS.org

ALP 3	**Pull**

NOTES	Only consult this customer complaint after a complete check using the diagnostic tool.

Disconnect one wheel speed sensor.
Start the engine and ensure that only the ABS fault warning light comes on. Do not drive the vehicle if the brake fault warning light also lights up, as the brake limiter function is no longer guaranteed.
Carry out a road test with the ABS deactivated.

Is the fault still present under these conditions?

yes →

If the brake pedal travel is relatively long, bleed the brake circuit.
If the travel is normal, check the tyre pressures, the front axle, or for any leaks in the circuit.

no ↓

Raise the vehicle so that you can rotate the wheels and check:

– Possible inversion of the speed sensor connection.
– Possible inversion of pipes on the hydraulic unit.
To perform these tests, refer to and apply the procedures defined in **ALP 2**.
Check the condition of the ABS targets and that they conform to specifications.
Also check the sensor/target air gap by rotating each front and rear wheel one revolution.
If the fault is still present, replace the hydraulic unit.

AFTER REPAIR	Carry out a road test followed by a diagnostic tool check.

GETtheMANUALS.org

ALP 4	Wandering

NOTES	Only consult this customer complaint after a complete check using the diagnostic tool.

Disconnect one wheel speed sensor.
Start the engine and ensure that only the ABS fault warning light comes on. Do not drive the vehicle if the brake fault warning light also lights up, as the brake limiter function is no longer guaranteed.
Carry out a road test with the ABS deactivated.

Is the fault still present under these conditions?

yes →

Road handling fault not connected with the ABS.
Check the condition of the brake linings and that they are to specification and check the tyre pressures, the front axle, etc.

no ↓

Normal behaviour linked to the system operation during the intervention phase, mainly on surfaces with uneven grip or which are poorly laid.

AFTER REPAIR	Carry out a road test followed by a diagnostic tool check.

GETtheMANUALS.org

ALP 5	**Unexpected ABS operation at low speed and with light pedal pressure**

NOTES	Only consult this customer complaint after a complete check using the diagnostic tool. Warning: ABS regulation may be unresponsive when vehicle is driven on surfaces such as icy roads, cobbled streets, etc.

Brake pedal vibrations may be felt which are connected to the reactions of the system in particular situations:
- Crossing speed bumps.
- Tight cornering with lifting of the inside rear wheel.

These vibrations may be linked to simple brake limiter activation, when the pressure on the rear axle is limited.

If the fault is different, check the speed sensor connectors (micro-breaks) as well as the targets.

AFTER REPAIR	Carry out a road test followed by a diagnostic tool check.

GETtheMANUALS.org

ALP 6	**Unexpected ABS system intervention on a poor road surface**

NOTES	Only consult this customer complaint after a complete check using the diagnostic tool.

On poor road surfaces it is normal to feel bucking and vibration of the pedal as well as more significant tyre squealing than on good surfaces.
This gives the impression of a variation in efficiency, but this should be considered normal.

AFTER REPAIR	Carry out a road test followed by a diagnostic tool check.

GETtheMANUALS.org

ALP 7	**Unexpected ABS operation with use of accessories** (car phone, CB, etc.)

NOTES	Only consult this customer complaint after a complete check using the diagnostic tool.

Check that the equipment which is causing the fault is approved.
Check that the equipment has been correctly installed with no alteration to the original wiring, in particular that of the ABS (unauthorised connections to earth and **+ after ignition feed/before ignition feed** of the ABS).

AFTER REPAIR	Carry out a road test followed by a diagnostic tool check.

GETtheMANUALS.org

ALP 8	**Extension of brake pedal travel following regulation** (with an irregular pedal when entering regulation).

NOTES	Only consult this customer complaint after a complete check using the diagnostic tool.

Air transit from the hydraulic unit regulation channels to the brake circuits.
Bleed the circuits in accordance with the procedure recommended in the Workshop Repair Manual (use the command modes on the diagnostic tool).
Following the operation, carry out a road test with ABS regulation.

If the fault is still present, perform the above operation once or twice more.
If the customer complaint is particularly serious, and bleeding the circuit does not improve matters, replace the hydraulic unit.

AFTER REPAIR	Carry out a road test followed by a diagnostic tool check.

GETtheMANUALS.org

ALP 9	**Spongy pedal.**

NOTES	Only consult this customer complaint after a complete check using the diagnostic tool.

Air in the brake circuits.
Bleed the circuits in the conventional way starting with the rear right-hand brake, followed by rear left, front left and finally front right. **Repeat the operation if necessary.**

AFTER REPAIR	Carry out a road test followed by a diagnostic tool check.

GETtheMANUALS.org

ALP 10	**Brake pedal vibration.**

NOTES	Only consult this customer complaint after a complete check using the diagnostic tool.

Normal reaction of the brake pedal during an **ABS** operation or of limitation of pressure on the rear axle (brake compensator function).

AFTER REPAIR	Carry out a road test followed by a diagnostic tool check.

GETtheMANUALS.org

ALP 11	**Noise from pump, pipes or hydraulic assembly.**

NOTES	Only consult this customer complaint after a complete check using the diagnostic tool.

– Vibration of the assembly: check the presence and the condition of the assembly bracket insulating rubber mounting fittings.
– - Vibration of the pipes: check that all of the pipes are correctly engaged in their securing clips and that there is no contact between the pipes or between the pipes and the body.

The front left-hand wheel solenoid valves, front right-hand wheel solenoid valves, rear left-hand wheel solenoid valves and rear right-hand wheel solenoid valves control commands may be used while depressing the brake pedal to determine where the noise is coming from.

AFTER REPAIR	Carry out a road test followed by a diagnostic tool check.

GETtheMANUALS.org

ALP 12	**Brake lights will not light up or go out.**

NOTES	Only consult this customer complaint after a complete check using the diagnostic tool.

Using the diagnostic tool, check that **ET017** is functioning correctly.
If not, apply the fault finding procedure described above for **ET017**.

Using the diagnostic tool, check that the **FUNCTION CODE NUMBER** (CLIP: identification screen and NXR: parameter screen **PR041**) is **E1 or C1**.

– Check that the earths are present on the rear lights.
– Check that there is continuity on the relay mounting (relay fitted) between tracks **C3 and C4**.

If the continuity is incorrect, replace the lights out relay.

If the brake lights still do not light up under **+ after ignition feed**.

Check the insulation in relation to the earth of the connection between **track 13** of the computer connector and **track C2** of the brake light cut-off relay.

if the fault is still present, check the continuity between **tracks A3** of the brake light connector and the **rear lights connector**.

AFTER REPAIR	Carry out a road test followed by a diagnostic tool check.

ANTI-LOCK BRAKING SYSTEM
Fault finding - Introduction

GETtheMANUALS.org

1. SCOPE OF THIS DOCUMENT

This document presents the fault finding procedure applicable to all computers with the following specifications:

Vehicle(s): **VELSATIS**	*Computer name:* **TEVES ESP**
Function concerned: **TEVES MK60P ESP**	*Vdiag No.:* **10, 11**

2. PREREQUISITES FOR FAULT FINDING

Documentation type

Fault finding procedures (this manual):
– Assisted fault finding (integrated into the diagnostic tool), Dialogys.
Wiring Diagrams:
– Visu-Schéma (CD-ROM), paper version.

Type of diagnostic tools

– CLIP

Special tooling required

Special tooling required	
	Multimeter
Elé. 1681	Universal bornier

3. RECAP

Procedure

In order to save energy, the Velsatis UCH cuts off the **+ after ignition feed** after **3 minutes**.
To run fault finding on a computer, it is possible to force the **+ after ignition feed** on for **1 hour** by applying the following procedure:

Press the unlocking button on the card,
insert the card in the card reader,
press the Start button (cutting off **+ After Ignition Feed** timed mode),
hold the Start button for over 5 seconds until the immobiliser warning light starts flashing rapidly (**4 Hz**).

This "**forced + after ignition feed**" mode remains active for **1 hour**.
Pressing the Start button or removing the card from the card reader cuts off the **+ after ignition feed** but does not cut off the **forced after ignition feed** timed mode. Until one hour has elapsed, activating the **+ after ignition feed** will restart **forced + after ignition feed** for the remaining time.

GETtheMANUALS.org

Faults

Faults are declared as either present or stored (depending on whether they appeared in a certain context and have disappeared since, or whether they remain present but have not been diagnosed within the current context).

The **present** or **stored** status of faults should be taken into consideration when the diagnostic tool is switched on after the + after ignition feed (without any system components being active).

For a **present fault**, apply the procedure described in the **Interpretation of faults** section.

For a **stored fault**, note the faults displayed and apply the instructions in the **Notes** section.

If the fault is **confirmed** when the instructions in the Notes section are applied, the fault is present. Deal with the fault

If the fault is **not confirmed**, check:
- the electrical lines which correspond to the fault,
- the connectors for these lines (for oxidation, bent pins, etc.),
- the resistance of the component detected as faulty,
- the condition of the wires (melted or split insulation, wear).

Conformity check

The aim of the conformity check is to check data that does not produce a fault on the diagnostic tool because the data is inconsistent. Therefore, this stage is used to:
- carry out fault finding on faults that do not have a fault display, and which may correspond to a customer complaint.
- check that the system is operating correctly and that there is no risk of a fault recurring after repairs.

This section gives the fault finding procedures for statuses and parameters and the conditions for checking them.

If a status is not behaving normally or a parameter is outside the permitted tolerance values, consult the corresponding fault finding page.

Customer complaints - Fault finding chart

If the test with the diagnostic tool is OK but the customer complaint is still present, the fault should be processed by **customer complaints**.

A synopsis of the general procedure to follow is provided on the following page in the form of a flow chart

GETtheMANUALS.org

4. FAULT FINDING PROCEDURE (continued)

Wiring check

Fault finding problems
Disconnecting the connectors and/or manipulating the wiring harness may temporarily remove the cause of a fault.
Electrical measurements of voltage, resistance and insulation are generally correct, especially if the fault is not present when the analysis is made (stored fault).

Visual inspection
Look for damage under the bonnet and in the passenger compartment.
Carefully check the fuses, insulators and wiring harness routing.
Look for signs of oxidation.

Tactile inspection
While manipulating the wiring harness, use the diagnostic tool to note any change in fault status from stored to present.
Make sure that the connectors are properly locked.
Apply light pressure to the connectors.
Twist the wiring harness.
If there is a change in status, try to locate the source of the fault.

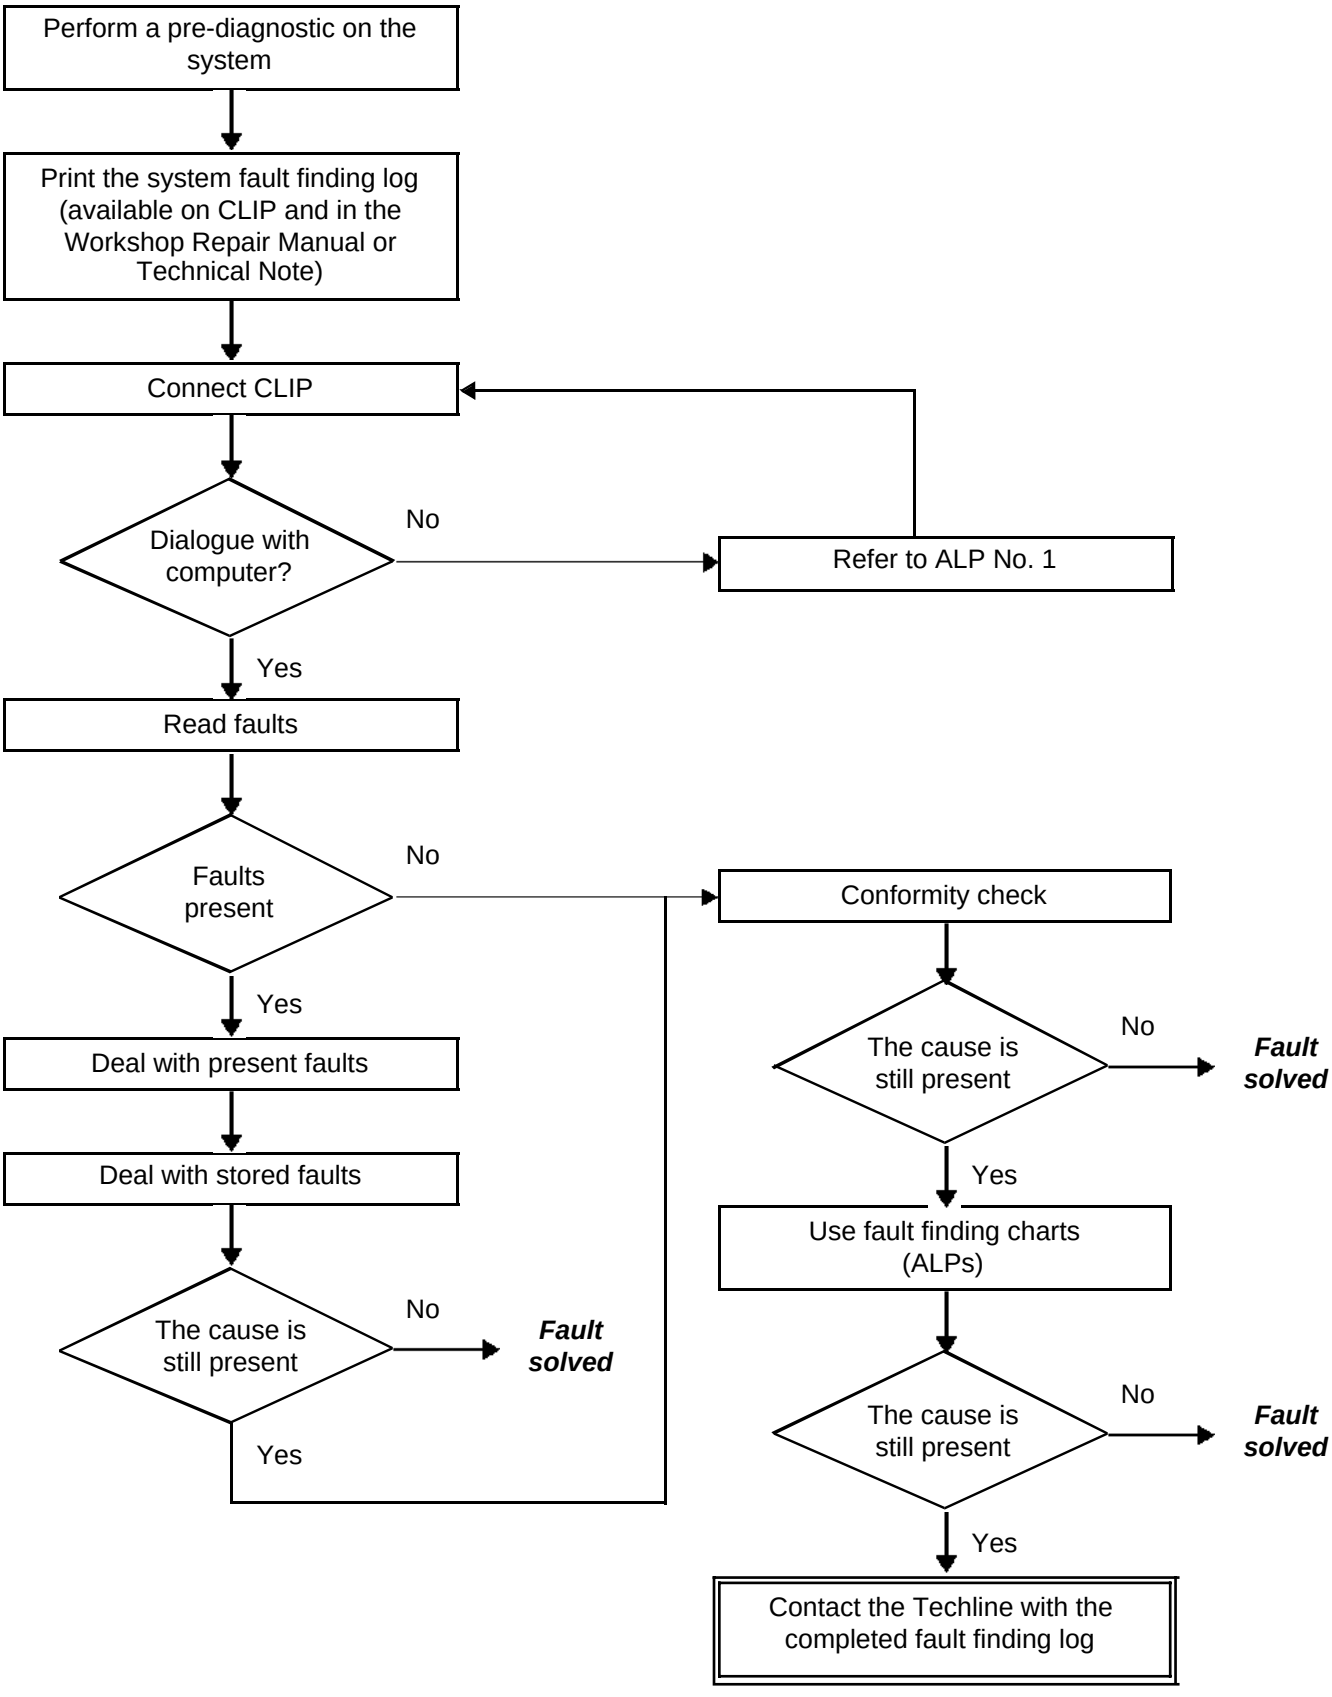
Inspection of each component
Disconnect the connectors and check the appearance of the clips and tabs, as well as the crimping (no crimping on the insulating section).
Make sure that the clips and tabs are properly locked in the sockets.
Check that no clips or tabs have been dislodged during connection.
Check the clip contact pressure using an appropriate model of tab.

Resistance check
Check the continuity of entire lines, then section by section.
Look for a short circuit to earth, to **+ 12 V** or to another wire.

If a fault is detected, repair or replace the wiring harness.

GETtheMANUALS.org

4. FAULT FINDING PROCEDURE



GETtheMANUALS.org

5. FAULT FINDING LOG

IMPORTANT!

IMPORTANT
Any fault on a complex system requires thorough fault finding with the appropriate tools. The FAULT FINDING LOG, which should be completed during the procedure, enables you to keep track of the procedure which is carried out. It is an essential document when consulting the manufacturer.

IT IS THEREFORE COMPULSORY TO COMPLETE A FAULT FINDING LOG EVERY TIME A FAULT FINDING PROCEDURE IS PERFORMED

You will always be asked for this log:

- when requesting technical assistance from Techline,
- for approval requests when replacing parts for which approval is mandatory,
- to be attached to monitored parts for which reimbursement is requested. The log is needed for warranty reimbursement, and enables better analysis of the parts removed.

6. SAFETY ADVICE

Safety rules must be observed during any work on a component to prevent any damage or injury:

- make sure that the battery is properly charged to avoid damaging the computers with a low load,
- use the appropriate tools.

GETtheMANUALS.org

The **ESP** system on this vehicle incorporates the following functions:

- **ABS** (anti-lock braking system). The main functions of the **ABS** system are the electronic braking distribution (**EBD**) between the front and the rear through the regulation of rear wheel skidding, and anti-lock braking through the regulation of skidding on all four wheels.
- **MSR** (modulate system regulation). Traction control on the driven wheels under no load by limiting the engine braking.
- **ASR** (traction control). Limits skidding of the drive wheels during starting or acceleration phases by limiting the engine torque and braking the spinning wheel(s).
- **ESP** (electronic stability program). Electronic stability program limiting oversteer or understeer by braking certain wheels and controlling the engine torque.
- **CSV** (understeer control). Specific control of situations involving pronounced understeer by significant vehicle braking in conjunction with a specific dynamic stability program.
- **AFU** (emergency brake assist). This function is not connected to the ABS/ESP electronic system. It is provided mechanically in braking assistance.
- **HBA** (hydraulic brake assist). This function is used to compensate for lack of vacuum pressure on the brake servo. This vacuum pressure is generally generated by the engine. The ESP system detects a lack of braking efficiency by means of the pressure sensor and wheel speed sensor (deceleration). In this case the HBA system supports the driver's actions by actuating the hydraulic assembly pump and compensating for the lack of braking efficiency (emergency brake assist).
- **ASTM** (autoadaptive single track model). This function enables the computer to allow for dynamic chassis modifications during the lifetime of the vehicle (compensating for chassis ageing). The ESP can be restored to its initial configuration by disabling this function.
- **AUTOMATIC LIGHTING UP OF BRAKE LIGHTS.** In the event of understeer control (**CSV** only), the **ESP** computer controls the lighting of the brake lights, via a relay, to give warning of a severe deceleration as generated by the system (depending on national legislation).

The system also supplies the other computers with the vehicle speed via a wire connection for the radio and electric sunroof, and via the multiplex network for the rest of the computers. The **ESP** computer provides the odometry for the instrument panel and navigation aid over the multiplex network.

GETtheMANUALS.org

Fault finding warning lights programming

Instrument panel warning light				Instrument panel message	Meaning
Brake faults	ESP	SERVICE	STOP		
Brake faults	ESP		STOP		No computer
	ESP flashing at **8 Hz**				Tachometric index not programmed.
	ESP flashing at **8 Hz**	SERVICE			Tachometric and variant index not programmed.
Brake faults flashing at **2 Hz**	ESP flashing at **2 Hz**				ESP computer in fault finding mode.
	ESP	SERVICE		**Check the ESP**	ESP faulty.
Brake faults	ESP	SERVICE	STOP	**Braking system fault**	Electronic braking compensation faulty.
		SERVICE		**Check the ESP**	ESP faulty.
				ESP off	ESP off
				ESP (ESP regulation)	ESP active
		SERVICE		**ESP (ESP regulation)**	ESP being regulated. with fault

Note:
The STOP warning light is always accompanied by a single audible warning (1 beep).

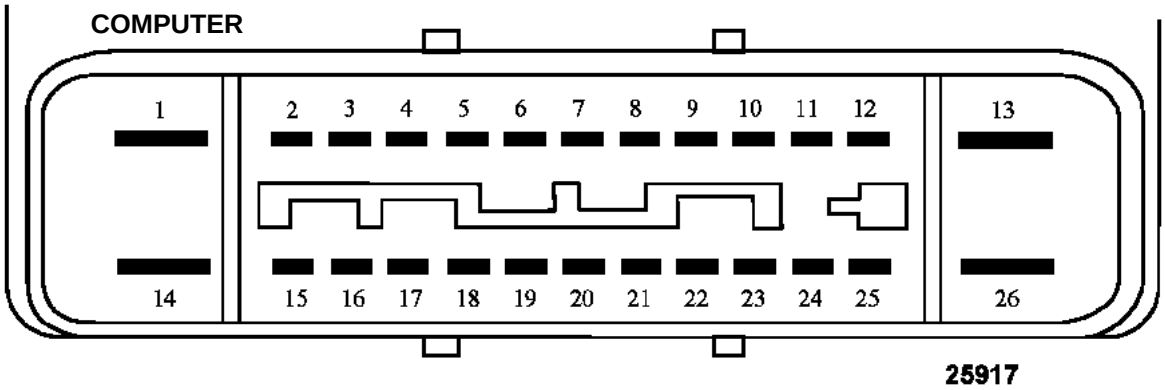
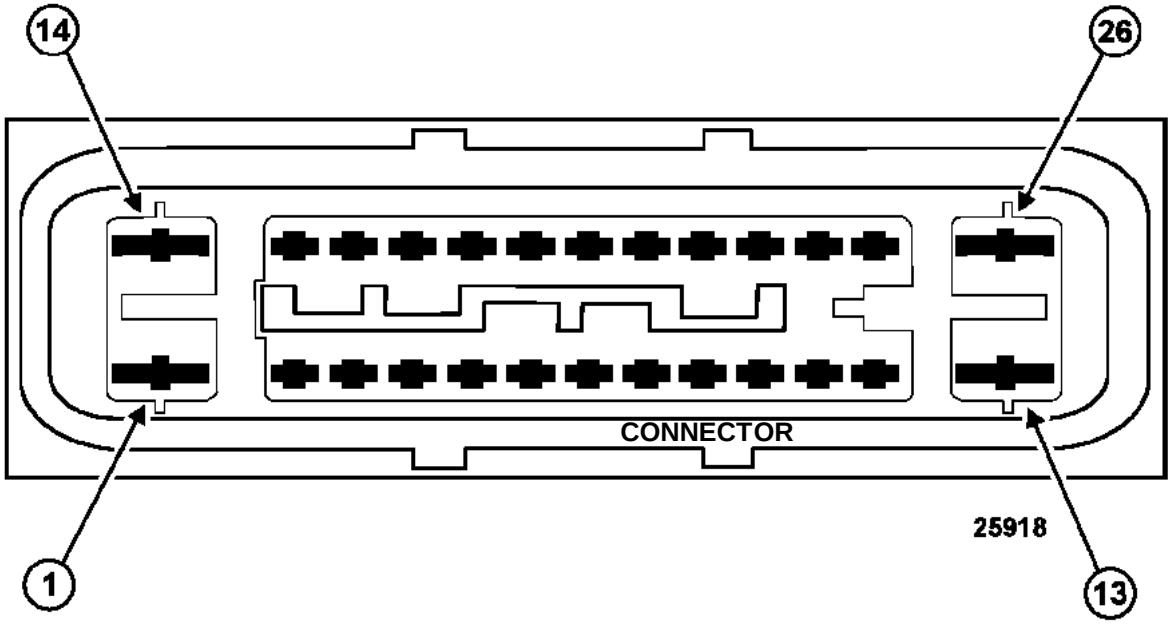
26-TRACK CONNECTOR

Track	Allocation	Sensor / Actuator track
1	**+ Before Ignition Feed** solenoid valves and computer	Engine fuse and relay box 20A fuse
2	Rear left-hand speed sensor signal and earth	Track 1 rear left-hand wheel sensor
3	Rear left-hand speed sensor supply	Track 2 rear left-hand wheel sensor
4	Combined sensor supply	Track 3 combined sensor
5	Front right-hand speed sensor supply	Track 2 front right-hand wheel sensor
6	Front right-hand speed sensor signal and earth	Track 1 front right-hand wheel sensor
7	ESP On/Off switch (switch pressed signal)	Track B1 ESP On/Off Button
8	Front left-hand speed sensor signal and earth	Track 1 front left-hand wheel sensor
9	Front left-hand speed sensor supply	Track 2 front left-hand wheel sensor
10	Combined sensor earth	Track 5 combined sensor
11	Rear right-hand speed sensor supply	Track 2 rear right-hand wheel sensor
12	Rear right-hand speed sensor signal and earth	Track 1 rear right-hand wheel sensor
13	Earth (solenoid valves and computer)	Bodywork earth
14	Pump motor **+ before ignition feed**	Engine fuse and relay box 40A fuse
15	ESP private multiplex line L	Track 2 steering wheel angle sensor and track 1 combined sensor
16	Brake light switch signal	Brake light switch track A1
17	ESP private multiplex line H	Track 3 steering wheel angle sensor and track 2 combined sensor
18	K fault finding line	Diagnostic socket track A7
19	Not used	
20	**+ after ignition feed**	Passenger compartment fuse and relay box 5A fuse
21	Multiplex line L	Diagnostic socket track A14
22	Brake light activation control relay (earth)	Passenger compartment fuse and relay box white connector track C2
23	Multiplex line H	Diagnostic socket track A6
24	Vehicle speed signal output (by wire)	Navigation aid, xenon bulb, radio, proximity sensor and sunroof if fitted
25	Not used	
26	Pump earth	Bodywork earth

GETtheMANUALS.org





GETtheMANUALS.org

REPLACING THE ESP COMPUTER

Apply the following procedure when replacing the computer:
- **switch off the ignition;**
- **replace the computer (see MR 355 Mechanical, 38C, Anti-lock braking system),**
- **enter the VIN using command VP001,**
- **configure the tachometric index using command VP007,**
- **configure the vehicle parameters with command VP004,**
- **configure the gearbox type fitted on the vehicle using command CF079,**
- **inhibit or authorise the automatic lighting of the brake lights** (in accordance with national legislation) **using commands VP021 or VP022,**
- **for vehicles with F4R turbo or V4Y engines, use command VP031 Hydraulic braking compensation to activate the function;**
- **enter the most recent After Sales operation date using command VP006;**
- **perform a road test followed by a fault reading to confirm that the system is operating correctly.**

IMPORTANT
You must ensure that the variants selected correspond correctly with the vehicle type.

REPLACING THE COMBINED SENSOR

After replacing the combined sensor, **be sure to clear the offset using command RZ008 Lateral acceleration sensor offset**.

REPLACING THE STEERING WHEEL ANGLE SENSOR

Two types of steering wheel angle sensor are fitted to the Vel Satis:
- **1 multi-turn steering wheel sensor on Vel Satis Phase 1,**
- **1 single-turn steering wheel sensor on Vel Satis Phase 2.**

The multiturn sensor can be identified if, when the vehicle wheels are straight, there is a yellow patch opposite the window on the sensor (blue background when turning).

On the single-turn sensor nothing appears in the window (no coloured parts moving).

Note:
After replacing the steering wheel angle sensor, it is imperative to clear the offset using command RZ007 Steering wheel angle sensor offset.

GETtheMANUALS.org

SETTINGS

VP001: Write VIN.
This command allows the **vehicle identification number** to be entered into the computer. Use this command each time the computer is replaced. The VIN (**VF** ...) is etched on the manufacturer's plate on the front right-hand door pillar and stamped on the body under the windscreen to the left-hand side.

VP004: Vehicle parameters.

This command allows the configuration of the engine type + braking definition + body type.
Select command VP004 on the diagnostic tool.
You must ensure that the variants selected correspond correctly with the vehicle type.

VP006: Enter last After-Sales operation date.
Whenever the **ESP** is worked on in the shop, the date must be entered.

Select command VP006 on the diagnostic tool.
Enter the operation date with the tool keyboard.

VP007: Tachometric index.
This command is used to program the computer memory with the index required to calculate vehicle speed from the speed at which the wheels turn.

The **ESP MK60P** computer supplies the vehicle speed signal to all vehicle components that use this data (instrument panel, engine management, etc.). This vehicle speed signal replaces the one supplied by the speed sensor located on the gearbox.

The ESP computer calculates the vehicle speed from the wheel speed and the tyre circumference.

Note:
The vehicle speed is sent by wire (**track 24**) to the navigation assistance computer, radio and electric sunroof, and via the multiplex network to the other computers.

The tyre circumference must be programmed into the memory of a new computer. This consists of entering a number X using the VP007 "Tachometric index" command on the diagnostic tool.

Once the number has been entered using the **VP007** command, delete the fault in the computer memory and then switch off the ignition. Use the **PR030** parameter to check that the index has been stored correctly.

GETtheMANUALS.org

SETTINGS (continued)

VP021: Automatic brake lights deactivation.
Use this command only in those countries where legislation prohibits the brake lights lighting automatically without the brake pedal being depressed. The control of the brake lights is not authorised by **ESP** regulation (according to the legislation of the country).

VP022: Automatic brake lights authorisation.
This command is used to reactivate automatic lighting of the brake lights by **ESP** intervention after it has been inhibited by command **VP021** (in accordance with national legislation).

VP030: Chassis wear programming.
This programming should be **ACTIVE**. This command should only be used when applying a Technical Note.

VP031: Hydraulic braking compensation.
This function should be **ACTIVE** only on **F4R turbo and V4Y** engines.

CONFIGURATIONS

CF079: Gearbox type.
Use this command to configure the gearbox type fitted on the vehicle.

OTHER COMMANDS

LC008: Gearbox type.
This command tells you the gearbox type configured on the vehicle.

LC016: Chassis wear programming.
This command tells you whether the chassis wear function has been activated on the vehicle.

LC017: Hydraulic braking compensation.
This command tells you whether the hydraulic brake limiting function has been activated on the vehicle.

DF001 PRESENT OR STORED	COMPUTER SUPPLY VOLTAGE 1.DEF: Battery undervoltage 2.DEF: Battery voltage too high

NOTES	**Conditions for applying the fault finding procedure to stored faults:** Apply the fault finding procedure whether the fault is present or stored.

1.DEF	***NOTES***	**Special notes:** this fault will appear during a road test (in excess of **12 mph (20 km/h)**) if the computer feed voltage is below the minimum operating voltage (**9.4 V** < min. battery voltage < **10 V**).

Check the tightness and the condition of the battery terminals.
Check the battery voltage and carry out the operations necessary to obtain a correct voltage (**10 V < battery voltage < 17 V**).

Check the connections on the **ESP** computer **26-track connector**.
Check the condition of the **ESP earths on tracks 13 and 26** (tightness, corrosion, etc.) and check the tightness of the terminal on the earth bolt on top of the hydraulic unit.
Visually check all the **ESP** wiring.

Check the condition and positioning of the **ESP fuses** in the **engine fuse and relay box**.
Check the **40A** and **20A** fuses in the **engine fuse and relay box**.
Check the **5A fuse (passenger compartment fuse and relay box)**.
Check for the **+ after ignition feed** on **track 20** of the computer's **26 track** connector.
Check for the **+ before ignition feed** on **tracks 1 and 14** of the computer's **26 track** connector.

If all the checks are in order, reconnect the computer and clear the computer fault memory.
Exit the fault finding procedure and carry out a road test.
If the fault is still present, contact the Techline.

AFTER REPAIR	Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF001 **CONTINUED**	

2.DEF	***NOTES***	**Special notes:** This fault will appear in a road test (in excess of **12 mph (20 km/h)**) if the computer supply voltage is above the maximum operating voltage (**17.5 V** < max battery voltage < **19 V**). This fault may appear when starting using a charger or a **24 V** battery.

Check the tightness and the condition of the battery terminals. Check the battery voltage and carry out the operations necessary to obtain a correct voltage (**10 V < battery voltage < 17 V**).
If all the checks are in order, reconnect the computer and clear the computer fault memory. Exit the fault finding procedure and carry out a road test. If the fault is still present, contact the Techline.

AFTER REPAIR	Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF006 PRESENT OR STORED	FRONT LEFT-HAND WHEEL SPEED SENSOR CIRCUIT

NOTES	**Conditions for applying the fault finding procedure to stored faults:** Apply the fault finding procedure described below in **DF006 stored**.

DF006 PRESENT	***NOTES***	None

Check the connection and condition of the sensor and computer connectors.
Disconnect the sensor and check **under + after ignition feed** that there is a voltage of approximately **12 V** on the sensor connector terminals on the computer side.
Is the voltage measured correct?

YES

Swap the 2 front wheel speed sensors over. Clear the computer fault memory.
Switch off the ignition. Switch on the ignition again.
If the fault initially declared **DF006 Front left-hand wheel speed sensor circuit** has become **DF026 Front right-hand wheel speed sensor circuit**, replace the wheel speed sensor.
If the fault is still on the same side, the wiring between the computer and the sensor is faulty.
Check and ensure the continuity of the following connections:

Sensor connector **track 1** → **track 8** Computer connector

Sensor connector **track 2** → **track 9** Computer connector

Also check the insulation between these 2 connections.

NO

Check and ensure the continuity of the following connections:

Sensor connector **track 1** → **track 8** Computer connector

Sensor connector **track 2** → **track 9** Computer connector

Also check the insulation between these 2 connections.
Carry out a visual inspection of the sensor wiring.
If the fault is still present, contact the Techline.

AFTER REPAIR	Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF006 **CONTINUED**	

DF006 STORED	*NOTES*	None

Check the connection and condition of the sensor and computer connectors.
Swap the 2 front wheel speed sensors over.
Clear the computer fault memory.
Carry out a road test followed by another check with the diagnostic tool.

– If the fault initially declared **DF006 Front left-hand wheel speed sensor circuit** has become **DF026 Front right-hand wheel speed sensor circuit**, replace the wheel speed sensor.
– If the fault remains on the same side, the wiring between the computer and the sensor is faulty.
Check and ensure the continuity of the following connections:

Sensor connector **track 1** ⟶ **track 8** Computer connector

Sensor connector **track 2** ⟶ **track 9** Computer connector

Also check the insulation between these 2 connections.

AFTER REPAIR	Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF007 PRESENT OR STORED	REAR LEFT-HAND WHEEL SPEED SENSOR CIRCUIT

NOTES	**Conditions for applying the fault finding procedure to stored faults:** Follow the fault finding procedure described below for **DF007 stored**.

DF007 PRESENT	***NOTES***	None

Check the connection and condition of the sensor and computer connectors.
Disconnect the sensor and check **under + after ignition feed** that there is a voltage of approximately **12 V** on the sensor connector terminals on the computer side.
Is the voltage measured correct?

YES

Swap the 2 rear wheel speed sensors. Clear the computer fault memory.
Switch off the ignition. Switch on the ignition again.
If the fault initially declared **DF007 "Rear left-hand wheel speed sensor circuit"** has become a **DF027 "Rear right-hand wheel speed sensor circuit" present fault**, replace the wheel speed sensor.
If the fault is still on the same side, the wiring between the computer and the sensor is faulty.
Check and ensure the continuity of the following connections:

Sensor connector **track 1** → **Track 2** Computer connector

Sensor connector **track 2** → **Track 3** Computer connector

Also check the insulation between these 2 connections.

NO

Check and ensure the continuity of the following connections:

Sensor connector **track 1** → **Track 2** Computer connector

Sensor connector **track 2** → **Track 3** Computer connector

Also check the insulation between these 2 connections.
Carry out a visual inspection of the sensor wiring.
If all the checks are in order, contact Techline.

AFTER REPAIR	Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF007 **CONTINUED**	

DF007 STORED	*NOTES*	None

Check the connection and condition of the sensor and computer connectors.
Swap the 2 rear wheel speed sensors.
Clear the computer fault memory.
Carry out a road test followed by another check with the diagnostic tool.

– If the fault initially declared **DF007 "Rear left-hand wheel speed sensor circuit"** has become a **DF027 "Rear right-hand wheel speed sensor circuit" present fault**, replace the wheel speed sensor.
– If the fault remains on the same side, the wiring between the computer and the sensor is faulty.
Check and ensure the continuity of the following connections:

Sensor connector **track 1** → **Track 2** Computer connector

Sensor connector **track 2** → **Track 3** Computer connector

Also check the insulation between these 2 connections.

AFTER REPAIR	Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF008 STORED	FRONT LEFT WHEEL SPEED SENSOR SIGNAL

NOTES	**Priorities when dealing with a number of faults:** Deal with fault **DF006 Front left wheel speed sensor circuit** first if it is present.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present during a road test (in excess of **12 mph (20 km/h)** for **2 minutes**).

Check the condition of the axles (impacts, damage, etc.) and the conformity and good condition of the tyres.
Check that the braking system (condition of brake pads, sealing, sticking, bleed, bearing clearance, etc.) is in good condition.

Visually inspect the condition of the target (for clogging, metallic contamination, bearing grease, etc.) and clean using compressed air if necessary.
If there is a lot of grease on the target, contact the Techline.
Check the quality of the mounting of the wheel speed sensor (correct clipping without excessive play).
Check the conformity of the target (condition, number of teeth = **48**) using the special command **SC001 Check target teeth**.

Check the connection and the condition of the sensor connectors.
Visually inspect the sensor wiring and check the quality of the connections on the **26 track** computer connector.

If all the checks are in order, swap the 2 front wheel speed sensors. Clear the computer fault memory.
Switch off the ignition. Switch the ignition back on and carry out a road test.
If the fault initially declared **DF008 "Front left-hand wheel speed sensor signal"** has become a **DF028 "Front right-hand wheel speed sensor signal" present fault**, replace the wheel speed sensor.
If the fault stays on the same side, the target is faulty, replace the active sensor bearing.

AFTER REPAIR	Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF009 STORED	REAR LEFT-HAND WHEEL SPEED SENSOR SIGNAL

NOTES	**Priorities when dealing with a number of faults:** Deal with fault **DF007 "Rear left-hand wheel speed sensor circuit"** first if it is present.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present during a road test (in excess of **12 mph (20 km/h)** for **2 minutes**).

Check the condition of the axles (impacts, damage, etc.) and the conformity and good condition of the tyres.
Check that the braking system (condition of brake pads, sealing, sticking, bleed, bearing clearance, etc.) is in good condition.

Visually inspect the condition of the target (for clogging, metallic contamination, bearing grease, etc.) and clean using compressed air if necessary.
If there is a lot of grease on the target, contact the Techline.
Check that the wheel speed sensor mounting is in good condition.
Check the sensor/target air gap through one revolution of the wheel: **0.3 mm < rear wheel air gap < 1.3 mm**.
Check the conformity of the target (condition, number of teeth = **48**) using the special command **SC001 Check target teeth**.

Check the connection and the condition of the sensor connectors.
Carry out a visual check of the sensor wiring and check that the connections on the **26-track computer connector** are in good condition.

If all the checks are in order, swap the 2 rear wheel speed sensors. Clear the computer fault memory.
Switch off the ignition. Switch the ignition back on and carry out a road test.
If fault **DF009 Rear left-hand wheel speed sensor signal** initially displayed has changed to **DF029 Rear right-hand wheel speed sensor signal** present, replace the wheel speed sensor.
If the fault remains on the same side, the target is defective, replace the rear left-hand "disk-hub-bearing" assembly (see **MR353 Mechanical, 33A, Rear axle components**).

AFTER REPAIR	Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF010 PRESENT OR STORED	PUMP MOTOR CIRCUIT

NOTES	**Special note: if this fault appears after replacing the computer, the pump motor connection is twisted. Separate the hydraulic unit from the computer and restore the connection to working order.**
	Conditions for applying the fault finding procedure to stored faults: The fault appears after: Brake pedal held down + actuator command **AC016 Pump motor test**.

Check the tightness and the condition of the battery terminals.
Check the condition and positioning of the **ESP fuses** in the **engine fuse and relay box**.
Check the **40A and 20A** fuses in the **engine fuse and relay box**.
Check the **5A fuse (passenger compartment fuse and relay box)**.

Check the connections on the **ESP** computer **26-track connector**.
Check for the **+ after ignition feed** on **track 20** of the computer's **26 track** connector.
Check for the **+ before ignition feed** on **tracks 1 and 14** of the computer's **26 track** connector.

Check the condition of the **ESP earths on tracks 13 and 26** (tightness, corrosion, etc.) and check the tightness of the terminal on the earth bolt on top of the hydraulic unit.
Visually check all the **ESP** wiring.

Run actuator command **AC016 Pump motor test**. If the fault is still present (no sound of the pump turning or loss of communication with the computer), replace the hydraulic unit (pump mechanically seized, pump short circuited, etc.).

AFTER REPAIR	Clear the computer fault memory. Carry out a road test (in excess of **24 mph (40 km/h)**, then carry out another check with the diagnostic tool.

GETtheMANUALS.org

DF017 PRESENT OR STORED	COMPUTER 1.DEF: Internal electronic fault

NOTES	**Conditions for applying the fault finding procedure to stored faults:** Apply the fault finding procedure whether the fault is present or stored.

Check the connections on the **ESP computer** 26-track connector.
Check that there are no traces of oxidisation.
If signs of oxidation are found, the ESP wiring and the computer must be replaced. If not, replace only the computer.

Clear the computer fault memory, exit the diagnostic and switch off the ignition.
Carry out another check using the diagnostic tool. If the fault is still present, contact the Techline.

AFTER REPAIR	Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF020 PRESENT	TACHOMETRIC INDEX PROGRAMMING

NOTES	None

The **ESP MK60P** computer with tachometric function transmits the vehicle speed signal to all vehicle components that use this data (instrument panel, engine management, etc.).
This vehicle speed signal replaces the one supplied by the speed sensor located on the gearbox.
The **ESP** computer calculates the vehicle speed from the wheel speed and the tyre circumference.

The tyre circumference must be programmed into the memory of a new computer. This consists of entering an index X using the VP007 TACHOMETRIC INDEX command on the diagnostic tool.
Once the index has been entered using the **VP007** command, clear the computer fault memory and switch off the ignition.
Use the **PR030** parameter to check that the index has been stored correctly.

If the fault is still present, contact the Techline.

AFTER REPAIR	Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF026 PRESENT OR STORED	FRONT RIGHT-HAND WHEEL SPEED SENSOR CIRCUIT

NOTES	**Conditions for applying the fault finding procedure to stored faults:** Follow the fault finding procedure described below for **DF026 stored**.

DF026 PRESENT	***NOTES***	None

Check the connection and condition of the sensor and computer connectors.
Check the connector on the intermediate connections under the body on the front left-hand wing upper section (**R183**).
Disconnect the sensor and check **under + after ignition feed** that there is a voltage of approximately **12 V** on the sensor connector terminals on the computer side.
Is the voltage measured correct?

YES

Swap the 2 front wheel speed sensors over. Clear the computer fault memory.
Switch off the ignition. Switch on the ignition again.
If the fault initially declared **DF026 "Front right-hand wheel speed sensor circuit"** has become a **DF006 "Front left-hand wheel speed sensor circuit" present fault**, replace the wheel speed sensor.
If the fault remains on the same side, the wiring between the computer and the sensor is faulty.
Check and ensure the continuity of the following connections:

Sensor connector **track 1** ⟶ **track 6** Computer connector

Sensor connector **track 2** ⟶ **track 5** Computer connector

If the connection is faulty:
Disconnect **2-track intermediate R183 connector** mounted in the upper section of the front left-hand wing and check the condition of the connections.
Check and ensure the continuity of the connections between:

Sensor connector **track 1** ⟶ **track B** Intermediate connector

Sensor connector **track 2** ⟶ **track A** Intermediate connector

Also check the insulation between these connections.

Check and ensure the continuity of the connections between:

Sensor connector **track 5** ⟶ **track A** Intermediate connector

Sensor connector **track 6** ⟶ **track B** Intermediate connector

Also check the insulation between these connections.

AFTER REPAIR	Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF026 **CONTINUED 1**	

NO

Check and ensure the continuity of the following connections:

Sensor connector **track 1** → **track 6** Computer connector

Sensor connector **track 2** → **track 5** Computer connector

If the connection is faulty:
Disconnect **2-track intermediate R183 connector** mounted in the upper section of the front left-hand wing and check the condition of the connections.
Check and ensure the continuity of the connections between:

Sensor connector **track 1** → **track B** Intermediate connector

Sensor connector **track 2** → **track A** Intermediate connector

Also check the insulation between these connections.

Check and ensure the continuity of the connections between:

Sensor connector **track 5** → **track A** Intermediate connector

Sensor connector **track 6** → **track B** Intermediate connector

Also check the insulation between these connections.
Visually inspect the sensor wiring.
If all the checks are in order, contact Techline.

AFTER REPAIR	Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF026 **CONTINUED 2**	

DF026 STORED	*NOTES*	None

Check the connection and condition of the sensor and computer connectors.
Check the connector on the intermediate connections under the body on the front left-hand wing upper section (**R183**).
Swap the 2 front wheel speed sensors over.
Clear the computer fault memory.
Carry out a road test followed by another check with the diagnostic tool.

– If the fault initially declared **DF026 "Front right-hand wheel speed sensor circuit"** has become a **DF006 "Front left-hand wheel speed sensor circuit" present fault**, replace the wheel speed sensor.
– If the fault remains on the same side, the wiring between the computer and the sensor is faulty.
Check and ensure the continuity of the following connections:

Sensor connector **track 1** → **track 6** Computer connector

Sensor connector **track 2** → **track 5** Computer connector

If the connection is faulty:
Disconnect **2-track intermediate R183 connector** mounted in the upper section of the front left-hand wing and check the condition of the connections.
Check and ensure the continuity of the connections between:

Sensor connector **track 1** → **track B** Intermediate connector

Sensor connector **track 2** → **track A** Intermediate connector

Also check the insulation between these connections.

Check and ensure the continuity of the connections between:

Computer connector **track 5** → **track A** Intermediate connector

Computer connector **track 6** → **track B** Intermediate connector

Also check the insulation between these connections.

AFTER REPAIR	Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF027 PRESENT OR STORED	REAR RIGHT-HAND WHEEL SPEED SENSOR CIRCUIT

NOTES	**Conditions for applying the fault finding procedure to stored faults:** Follow the fault finding procedure described below for **DF027 stored**.

DF027 PRESENT	***NOTES***	None

Check the connection and condition of the sensor and computer connectors.
Disconnect the sensor and check **under + after ignition feed** that there is a voltage of approximately **12 V** on the sensor connector terminals on the computer side.
Is the voltage measured correct?

YES

Swap the 2 rear wheel speed sensors. Clear the computer fault memory.
Switch off the ignition. Switch on the ignition again.
If the fault initially declared **DF027 "Rear right-hand wheel speed sensor circuit"** has become a **DF007 "Rear left-hand wheel speed sensor circuit" present fault**, replace the wheel speed sensor.
If the fault remains on the same side, the wiring between the computer and the sensor is faulty.
Check and ensure the continuity of the following connections:

Sensor connector **track 1** → **track 12** Computer connector

Sensor connector **track 2** → **track 11** Computer connector

Also check the insulation between these 2 connections.

NO

Check and ensure the continuity of the following connections:

Sensor connector **track 1** → **track 12** Computer connector

Sensor connector **track 2** → **track 11** Computer connector

Also check the insulation between these 2 connections.
Visually inspect the sensor wiring.
If all the checks are in order, contact Techline.

AFTER REPAIR	Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF027 **CONTINUED**	

DF027 STORED	*NOTES*	None

Check the connection and condition of the sensor and computer connectors.
Swap the 2 rear wheel speed sensors.
Clear the computer fault memory.
Carry out a road test followed by another check with the diagnostic tool.

– If the fault initially declared **DF027 "Rear right-hand wheel speed sensor circuit"** has become a **DF007 "Rear left-hand wheel speed sensor circuit" present fault**, replace the wheel speed sensor.
– If the fault remains on the same side, the wiring between the computer and the sensor is faulty.
Check and ensure the continuity of the following connections:

Sensor connector **track 1** → **track 12** Computer connector

Sensor connector **track 2** → **track 11** Computer connector

Also check the insulation between these 2 connections.

AFTER REPAIR	Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF028 STORED	FRONT RIGHT-HAND WHEEL SPEED SENSOR SIGNAL

NOTES	**Priorities when dealing with a number of faults:** Deal with fault **DF026 Front right wheel speed sensor circuit** first if it is present.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present during a road test (in excess of **12 mph (20 km/h)** for **2 minutes**).

Check the condition of the axles (impacts, damage, etc.) and the conformity and good condition of the tyres.
Check that the braking system (condition of brake pads, sealing, sticking, bleed, bearing clearance, etc.) is in good condition.

Visually inspect the condition of the target (for clogging, metallic contamination, bearing grease, etc.) and clean using compressed air if necessary.
If there is a lot of grease on the target, contact the Techline.
Check the quality of the mounting of the wheel speed sensor (correct clipping without excessive play).
Check the conformity of the target (condition, number of teeth = **48**) using the special command **SC001 Check target teeth**.

Check the connection and the condition of the sensor connectors.
Carry out a visual check of the sensor wiring and check that the connections on the **26-track computer connector** are in good condition.

If all the checks are in order, swap the 2 front wheel speed sensors. Clear the computer fault memory.
Switch off the ignition. Switch the ignition back on and carry out a road test.
If the fault initially declared **DF028 "Front right-hand wheel speed sensor signal"** has become a **DF008 "Front left-hand wheel speed sensor signal" present fault**, replace the wheel speed sensor.
If the fault stays on the same side, the target is faulty, replace the active sensor bearing.

AFTER REPAIR	Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF029 STORED	REAR RIGHT-HAND WHEEL SPEED SENSOR SIGNAL

NOTES	**Priorities when dealing with a number of faults:** Deal with fault **DF027 right rear wheel speed sensor circuit** first if it is present.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present during a road test (in excess of **12 mph (20 km/h)** for **2 minutes**).

Check the condition of the axles (impacts, damage, etc.) and the conformity and good condition of the tyres.
Check that the braking system (condition of brake pads, sealing, sticking, bleed, bearing clearance, etc.) is in good condition.

Visually inspect the condition of the target (for clogging, metallic contamination, bearing grease, etc.) and clean using compressed air if necessary.
If there is a lot of grease on the target, contact the Techline.
Check that the wheel speed sensor mounting is in good condition.
Check the sensor/target air gap through one revolution of the wheel: **0.3 mm < rear wheel air gap < 1.3 mm**.
Check the conformity of the target (condition, number of teeth = **48**) using the special command **SC001 Check target teeth**.

Check the connection and the condition of the sensor connectors.
Carry out a visual check of the sensor wiring and check that the connections on the **26-track computer connector** are in good condition.

If all the checks are in order, swap the 2 rear wheel speed sensors. Clear the computer fault memory.
Switch off the ignition. Switch the ignition back on and carry out a road test.
If the fault initially declared as **DF029 Rear right wheel speed sensor circuit signal** has become a present **DF009 Rear left wheel speed sensor circuit signal**, replace the wheel speed sensor.
If the fault remains on the same side, the target is defective; replace the rear right-hand disk-hub-bearing assembly (see **MR353 Mechanical, 33A, Rear axle components**).

AFTER REPAIR	Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF066 PRESENT OR STORED	NO INJECTION MULTIPLEX SIGNAL

NOTES	**Special note:** although stored in the computer, the **ESP** system is not defective. The **ESP** is deactivated due to unusable injection signals. Perform fault finding on the injection system using the diagnostic tool. Note: The injection does not always store these transient faults as quickly as the **ESP system**. If no fault is stored in the injection computer, start the engine; if there is no fault present, contact the Techline. **Once the fault in the injection system has been repaired, clear the ESP computer fault memory.**
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present when the engine is started up.

Carry out a multiplex network test and check the injection system with the diagnostic tool.
If the fault is still present, contact the Techline.

AFTER REPAIR	Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF075 STORED	STEERING WHEEL ANGLE SENSOR SIGNAL

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present following after turning from lock to lock and a road test.

Check that the connector is correctly connected to the sensor and not to the inert headlight switch support next to the sensor.
Check that the steering wheel angle sensor is correctly fitted and positioned on the steering column.
Set the wheels straight ahead and check in the diagnostic tool parameter section that **PR033** is between **- 15**° **and + 15**° inclusive.
If **PR033** is incorrect, carry out a complete axle geometry check.
Use the diagnostic tool to clear the sensor offset with the clear command **RZ007 Steering wheel angle sensor offset**.

Clear the computer fault memory, exit the diagnostic and switch off the ignition.
Carry out a road test on a perfectly straight road.

If the fault recurs replace the steering wheel angle sensor (**see Replacement of components**) and clear the offset using command **RZ007**.

AFTER REPAIR	**after replacing the steering wheel angle sensor, it is imperative to clear the offset using command RZ007 Steering wheel angle sensor offset.** Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF080 PRESENT	YAW RATE SENSOR CIRCUIT 1.DEF: Signal inconsistent 2.DEF: Sensor internal electronic fault 3.DEF: Offset too high

NOTES	**Priorities when dealing with a number of faults:** Deal first with fault **DF104 Combined sensor internal electronic fault** if it is present.

1.DEF	***NOTES***	**Special notes:** The signal supplied by the yaw sensor is not consistent with the yaw rate recalculated using the wheel speeds, the steering wheel angle and lateral acceleration. This fault only appears at speeds above **6 mph (10 km/h)**.

Check that the combined sensor is fitted the right way round on its plate, is in good condition and correctly tightened to 8 Nm and check the mounting of the plate on the floor (under the centre console behind the gear lever).
Switch on the ignition and check for the **+ after ignition feed** between **tracks 3 and 5** of the combined sensor connector:
– If the voltage is incorrect:
Check and ensure continuity and insulation of the following connections:

Sensor connector Track 3 → **Track 4 computer connector**

Sensor connector Track 5 → **Track 10 computer connector**

Also check the insulation between these connections.
If the wiring is in order, contact Techline.

– If the voltage is correct but the fault is still present after clearing the computer's fault memory:
Check for and ensure continuity and insulation from the vehicle earth on the following connections:

Sensor connector Track 3 → **Track 4 computer connector**

Sensor connector Track 5 → **Track 10 computer connector**

Also check the insulation between these connections.
If all the checks are in order, replace the combined sensor (**see Replacement of components**) and clear the offset using command **RZ008 Lateral acceleration sensor offset**.

AFTER REPAIR	**After replacing the combined sensor, it is imperative to clear the offset using command RZ008 Lateral acceleration sensor offset.** Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF080 **CONTINUED**	

2.DEF	***NOTES***	**Special notes:** The signal supplied by the sensing element inside the yaw sensor is outside the ranges specified, or defective temperature compensation mechanism. This fault may be the result of an impact on the sensor (or on the vehicle), or an excessive temperature in the area where the sensor is fitted.

Check that the combined sensor is fitted the right way round on its plate, is in good condition and correctly tightened to **8 Nm** and check the mounting of the plate on the floor (under the centre console behind the gear lever).
Clear the computer fault memory.
Check that the temperature in the area where the sensor is mounted is < **80 °C**.
If the fault recurs, replace the combined sensor (**see Replacement of components**) and clear the offset using command **RZ008 Lateral acceleration sensor offset**.

3.DEF	***NOTES***	**Special notes:** The signal offset is too high.

Check that the combined sensor is fitted the right way round on its plate, is in good condition and correctly tightened to **8 Nm** and check the mounting of the plate on the floor (under the centre console behind the gear lever).
Check that the connections, type and location of any special equipment (CB, Car phone, Amplifier, Bass loudspeaker (subwoofer type), etc.) do not disturb ESP operation.
Clear the computer fault memory.
Carry out a road test followed by another check with the diagnostic tool.
If the fault recurs, replace the combined sensor (**see Replacement of components**) and clear the offset using command **RZ008 Lateral acceleration sensor offset**.

AFTER REPAIR	**After replacing the combined sensor, it is imperative to clear the offset using command RZ008 Lateral acceleration sensor offset.** Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF084 PRESENT	LATERAL ACCELERATION SENSOR CIRCUIT 1.DEF: Signal inconsistent 2.DEF: Sensor internal electronic fault

NOTES	**Priorities when dealing with a number of faults:** Deal first with fault **DF104 Combined sensor internal electronic fault** if it is present.

1.DEF	***NOTES***	**Special notes:** The lateral acceleration signal supplied by the combined sensor is not consistent with lateral acceleration recalculated using the wheel speeds, the steering wheel angle and yaw rate. This fault only appears at speeds above **6 mph (10 km/h)**.

Check that the combined sensor is fitted the right way round on its plate, is in good condition and correctly tightened to **8 Nm** and check the mounting of the plate on the floor (under the centre console behind the gear lever).
Switch on the ignition and check for the **+ after ignition feed** between **tracks 3 and 5** of the combined sensor connector:
– If the voltage is incorrect:
Check and ensure continuity and insulation of the following connections:

Sensor connector Track 3 ⟶ **Track 4 computer connector**

Sensor connector Track 5 ⟶ **Track 10 computer connector**

Also check the insulation between these connections.
If the wiring is in order, contact Techline.

– If the voltage is correct but the fault is still present after clearing the computer's fault memory:
Check for and ensure continuity and insulation from the vehicle earth on the following connections:

Sensor connector Track 3 ⟶ **Track 4 computer connector**

Sensor connector Track 5 ⟶ **Track 10 computer connector**

Also check the insulation between these connections.
If all the checks are in order, replace the combined sensor (**see Replacement of components**) and clear the offset using command **RZ008 Lateral acceleration sensor offset**.

AFTER REPAIR	**After replacing the combined sensor, it is imperative to clear the offset using command RZ008 Lateral acceleration sensor offset.** Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF084 **CONTINUED**	

2.DEF	***NOTES***	**Special notes:** The lateral acceleration sensor has an internal self-test function that can fully check the signal pathway; from the physical sensor to the combined sensor processor. The fault is stored in the event of an error during the self-test.

Check that the combined sensor is fitted the right way round on its plate, is in good condition and correctly tightened to **8 Nm** and check the mounting of the plate on the floor (under the centre console behind the gear lever).
Clear the computer fault memory.

If the fault recurs, replace the combined sensor (see **Replacement of components**) and clear the offset using command **RZ008 Lateral acceleration sensor offset**.

AFTER REPAIR	**After replacing the combined sensor, it is imperative to clear the offset using command RZ008 Lateral acceleration sensor offset.** Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF088 **PRESENT**	PRESSURE SENSOR CIRCUIT 1.DEF: Signal inconsistent 2.DEF: Sensor internal electronic fault

NOTES	**Special notes:** The signal supplied by one of the 2 pressure sensors (inside the hydraulic unit) is outside the specified ranges.

Clear the computer fault memory.
With the engine running, read the brake pressure value **PR035 using the diagnostic tool** and depress the brake pedal hard; the pressure should reach approximately **100 to 150 bar**.
Separate the computer from the hydraulic unit to check the cleanliness of the contacts: the 4 springs on the computer side and the 4 studs opposite them on the pressure sensor.
Repair if necessary.

If the fault recurs, replace the entire hydraulic unit.

AFTER REPAIR	**The pressure sensor is incorporated in the computer. If the pressure sensor is defective: change the complete hydraulic unit.** Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF090 STORED	FRONT RIGHT-HAND WHEEL TARGET

NOTES	**Priorities when dealing with a number of faults:** Deal with fault **DF026 Front right wheel speed sensor circuit** first if it is present.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present during a road test (in excess of **12 mph (20 km/h)** for **2 minutes**).

Check the condition of the axles (impacts, damage, etc.) and the conformity and good condition of the tyres.
Check that the braking system (condition of brake pads, sealing, sticking, bleed, bearing clearance, etc.) is in good condition.

Visually inspect the condition of the target (for clogging, metallic contamination, bearing grease, etc.) and clean using compressed air if necessary.
If there is a lot of grease on the target, contact the Techline.
Check the quality of the mounting of the wheel speed sensor (correct clipping without excessive play).
Check the conformity of the target (condition, number of teeth = **48**) using the special command **SC001 Check target teeth**.

Check the connection and the condition of the sensor connectors.
Carry out a visual check of the sensor wiring and check that the connections on the **26-track computer connector** are in good condition.

If all the checks are in order, swap the 2 front wheel speed sensors. Clear the computer fault memory.
Switch off the ignition. Switch the ignition back on and carry out a road test.
If the fault initially declared **DF090 "Front right wheel target"** has become a present **DF091 "Left front wheel target"**, replace the wheel speed sensor.
If the fault stays on the same side, the target is faulty, replace the active sensor bearing.

AFTER REPAIR	Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF091 STORED	FRONT LEFT-HAND WHEEL TARGET

NOTES	**Priorities when dealing with a number of faults:** Deal with fault **DF006 Front left wheel speed sensor circuit** first if it is present.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present during a road test (in excess of **12 mph (20 km/h)** for **2 minutes**).

Check the condition of the axles (impacts, damage, etc.) and the conformity and good condition of the tyres.
Check that the braking system (condition of brake pads, sealing, sticking, bleed, bearing clearance, etc.) is in good condition.

Visually inspect the condition of the target (for clogging, metallic contamination, bearing grease, etc.) and clean using compressed air if necessary.
If there is a lot of grease on the target, contact the Techline.
Check the quality of the mounting of the wheel speed sensor (correct clipping without excessive play).
Check the conformity of the target (condition, number of teeth = **48**) using the special command **SC001 Check target teeth**.

Check the connection and the condition of the sensor connectors.
Carry out a visual check of the sensor wiring and check that the connections on the **26-track computer connector** are in good condition.

If all the checks are in order, swap the 2 front wheel speed sensors. Clear the computer fault memory.
Switch off the ignition. Switch the ignition back on and carry out a road test.
If the fault initially declared **DF091 "Left front wheel target"** has become a present **DF090 "Front right wheel target"**, replace the wheel speed sensor.
If the fault stays on the same side, the target is faulty, replace the active sensor bearing.

AFTER REPAIR	Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF092 **STORED**	REAR RIGHT-HAND WHEEL TARGET

NOTES	**Priorities when dealing with a number of faults:** Deal with fault **DF027 right rear wheel speed sensor circuit** first if it is present.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present during a road test (in excess of **12 mph (20 km/h)** for **2 minutes**).

Check the condition of the axles (impacts, damage, etc.) and the conformity and good condition of the tyres.
Check that the braking system (condition of brake pads, sealing, sticking, bleed, bearing clearance, etc.) is in good condition.

Visually inspect the condition of the target (for clogging, metallic contamination, bearing grease, etc.) and clean using compressed air if necessary.
If there is a lot of grease on the target, contact the Techline.
Check that the wheel speed sensor mounting is in good condition.
Check the sensor/target air gap through one revolution of the wheel: **0.3 mm < rear wheel air gap < 1.3 mm**.
Check the conformity of the target (condition, number of teeth = **48**) using the special command **SC001 Check target teeth**.

Check the connection and the condition of the sensor connectors.
Carry out a visual check of the sensor wiring and check that the connections on the **26-track computer connector** are in good condition.

If all the checks are in order, swap the 2 rear wheel speed sensors. Clear the computer fault memory.
Switch off the ignition. Switch the ignition back on and carry out a road test.
If the fault initially declared **DF092 "Offside rear wheel target"** has become a present **DF093 "Nearside rear wheel target"**, replace the wheel speed sensor.
If the fault remains on the same side, the target is defective; replace the rear right-hand disk-hub-bearing assembly (see **MR353 Mechanical, 33A, Rear axle components**).

AFTER REPAIR	Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF093 STORED	REAR LEFT-HAND WHEEL TARGET

NOTES	**Priorities when dealing with a number of faults:** Deal with fault **DF007 "Rear left-hand wheel speed sensor circuit"** first if it is present.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present during a road test (in excess of **12 mph (20 km/h)** for **2 minutes**).

Check the condition of the axles (impacts, damage, etc.) and the conformity and good condition of the tyres.
Check that the braking system (condition of brake pads, sealing, sticking, bleed, bearing clearance, etc.) is in good condition.

Visually inspect the condition of the target (for clogging, metallic contamination, bearing grease, etc.) and clean using compressed air if necessary.
If there is a lot of grease on the target, contact the Techline.
Check that the wheel speed sensor mounting is in good condition.
Check the sensor/target air gap through one revolution of the wheel: **0.3 mm < rear wheel air gap < 1.3 mm**.
Check the conformity of the target (condition, number of teeth = **48**) using the special command **SC001 Check target teeth**.

Check the connection and the condition of the sensor connectors.
Carry out a visual check of the sensor wiring and check that the connections on the **26-track computer connector** are in good condition.

If all the checks are in order, swap the 2 rear wheel speed sensors. Clear the computer fault memory.
Switch off the ignition. Switch the ignition back on and carry out a road test.
If the fault initially declared **DF093 "Nearside rear wheel target"** has become a present **DF092 "Offside rear wheel target"**, replace the wheel speed sensor.
If the fault remains on the same side, the target is defective; replace the rear left-hand disk-hub-bearing assembly (see **MR353 Mechanical, 33A, Rear axle components**).

AFTER REPAIR	Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF096 PRESENT	COMPUTER INTERNAL ELECTRONIC IRREGULARITY

NOTES	None

Clear the fault memory using the diagnostic tool and switch off the ignition.
If the fault is still present, contact the Techline.

AFTER REPAIR	Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF097 PRESENT OR STORED	NO AUTOMATIC TRANSMISSION MULTIPLEX SIGNAL

NOTES	**Special note:** although it is stored in the computer's memory, this fault does not cause warning lights to illuminate or generate a fault message because the **ESP** system is not defective. Perform fault finding on the **automatic transmission** using the diagnostic tool. Note: **When the fault in the automatic transmission system is repaired, clear the ESP system fault memory.**
	Order of priority when dealing with a combination of faults: deal first with fault **DF152 Multiplex network (BUS OFF)** if it is present or stored.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present when the engine is started up.

Check the gearbox type configuration with the diagnostic tool, using command **LC008 Gearbox type**.
If the configuration is not correct, configure the gearbox type present on the vehicle using configuration command **CF079 Gearbox type**.

Carry out a multiplex network test and check the **automatic transmission** with the diagnostic tool.
If the fault is still present, contact the Techline.

AFTER REPAIR	Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF098 PRESENT OR STORED	NO UCH MULTIPLEX SIGNAL

NOTES	**Special note:** although it is stored in the computer's memory, this fault does not cause warning lights to illuminate or generate a fault message because the **ESP** system is not defective. Perform fault finding on the **UCH** with the diagnostic tool. Note: **When the fault in the UCH is repaired, clear the ESP system fault memory.**
	Order of priority when dealing with a combination of faults: deal first with fault **DF152 Multiplex network (BUS OFF)** if it is present or stored.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present when the engine is started up.

Carry out a multiplex network test and check the **UCH** with the diagnostic tool.
If the fault is still present, contact the Techline.

AFTER REPAIR	Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF099 PRESENT	PRIVATE MULTIPLEX NETWORK

NOTES	**Special note:** the computer has detected more than 15 error frames on the private multiplex network.

Measure the resistance of the private multiplex network between **tracks 2 and 3** on the steering wheel angle sensor connector.
Is the resistance 60 Ω ± 10 Ω?

NO

120 Ω

Check the condition and connections of the ESP computer and combined sensor connectors.
Check the continuity of the connections between:

ESP computer connector **track 15**	→	**track 2** steering wheel angle sensor connector
ESP computer connector **track 17**	→	**track 3** steering wheel angle sensor connector
Steering wheel angle sensor connector **track 2**	→	**track 1** combined sensor connector
Steering wheel angle sensor connector **track 3**	→	**track 2** combined sensor connector

Also check the insulation between these connections. Repair if necessary.

The multiplex network terminating resistance of the ESP computer or combined sensor is faulty.
– Measure the terminating resistance of the ESP computer between **tracks 15 and 17** on the computer.
Replace the ESP computer if the resistance is not **120 Ω ± 10 Ω**.
If the resistance is correct, reconnect the ESP computer and disconnect the combined sensor.
– Measure the resistance between **tracks 1 and 2** on the combined sensor.
Replace the combined sensor (see **Replacement of components**) if the resistance is not **120 Ω ± 10 Ω**.

AFTER REPAIR	**After replacing the combined sensor or steering wheel angle sensor, it is imperative to clear the offsets using command RZ008 or RZ007.** Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF099 **CONTINUED 1**	

0 Ω or INFINITE

Check the condition and connections of the ESP computer and combined sensor connectors.
Check the continuity and insulation of the connections between:

ESP computer connector **track 15**	→	**track 2** steering wheel angle sensor connector
ESP computer connector **track 17**	→	**track 3** steering wheel angle sensor connector
Steering wheel angle sensor connector **track 2**	→	**track 1** combined sensor connector
Steering wheel angle sensor connector **track 3**	→	**track 2** combined sensor connector

Also check the insulation between these connections. Repair if necessary.

AFTER REPAIR	**After replacing the combined sensor or steering wheel angle sensor, it is imperative to clear the offsets using command RZ008 or RZ007.** Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF099 **CONTINUED 2**	

YES

This may be a fault inside the ESP computer, combined sensor or steering wheel angle sensor.
To determine which component is at fault, carry out the following tests:

1. Switch off the ignition, disconnect the ESP computer and combined sensor, and switch on the ignition. Using the oscilloscope on Clip technic (procedure as below), measure the signal between **track 15** (**CAN L**, taken as earth reference) and **track 17 (CAN H)** on the **ESP wiring harness** connector.

Note:
If the computer is disconnected, the supply to the combined sensor is off, so it cannot generate multiplex signals.

- **If there is no signal**, replace the steering wheel angle sensor (**see Replacement of components**).
- **If there is a signal**, (**see Fig. 1**, series of signals with an amplitude of **3 V ± 0.5 V**), the steering wheel angle sensor is not defective. Carry out **test 2** on the next page.

AFTER REPAIR	**After replacing the combined sensor or steering wheel angle sensor, it is imperative to clear the offsets using command RZ008 or RZ007.** Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF099 **CONTINUED 3**	

Procedure:
Select the Oscilloscope function.
AUTO regulation.
Time base: 10 ms/div.
Calibre (signal amplitude): 1 V/div.

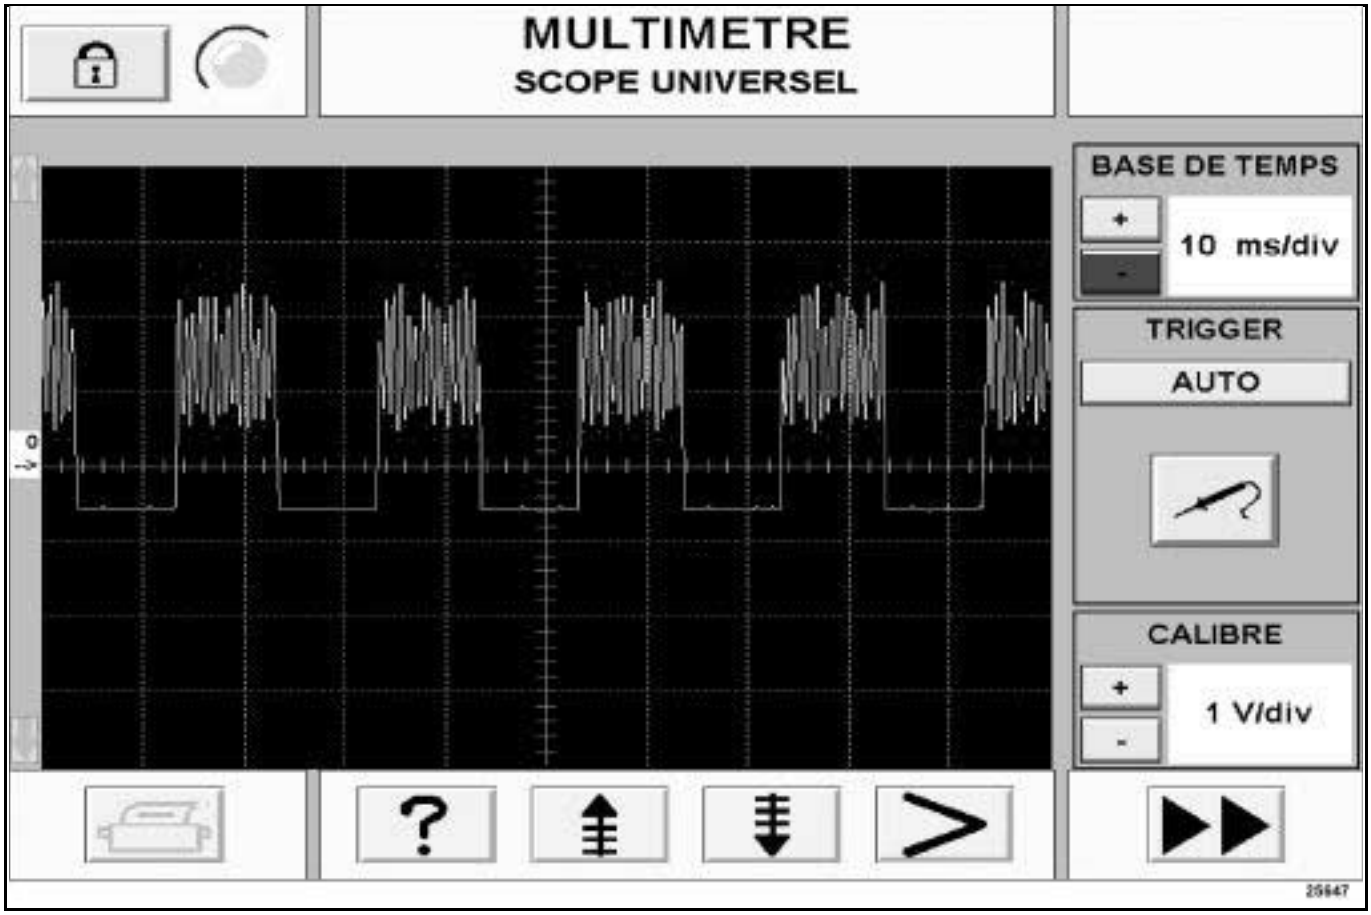

FIG. 1

AFTER REPAIR	**After replacing the combined sensor or steering wheel angle sensor, be sure to clear the offsets using command RZ008 or RZ007.** Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF099 **CONTINUED 4**	

2. Switch off the ignition, reconnect the ESP computer and disconnect the combined sensor and steering wheel angle sensor, then switch on the ignition. Using the oscilloscope on the Clip technic (procedure below), measure the signal between **track 2** (**CAN L**, taken as earth reference) and **track 3 (CAN H)** on the steering wheel angle sensor connector.

- **If there is no signal**, replace the ESP computer.
- **If there is a signal**, (**See Fig 2**, sequence of signals with amplitude **2 V ± 0.3 V**), the ESP computer is not defective; replace the combined sensor (**see Replacement of components**) and carry out **TEST 3**.

Procedure:
Select the Oscilloscope function.
AUTO regulation.
Time base: 500 µs/div.
Calibre (signal amplitude): 1 V/div.

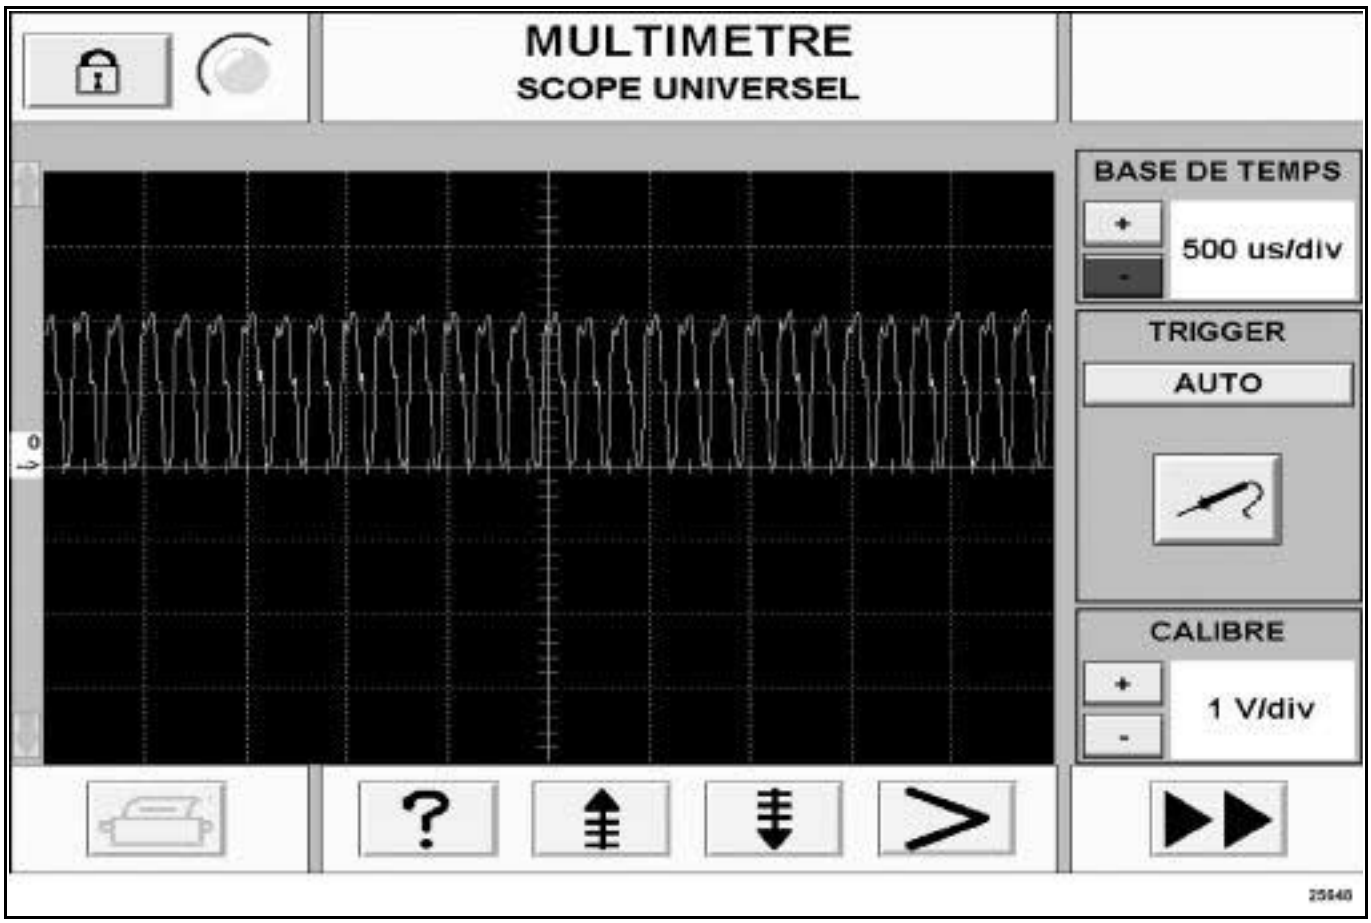

FIG. 2

AFTER REPAIR	**After replacing the combined sensor or steering wheel angle sensor, be sure to clear the offsets using command RZ008 or RZ007.** Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF099 **CONTINUED 5**	

3. To confirm system repair, switch off the ignition, reconnect the combined sensor and disconnect the steering wheel angle sensor then switch on the ignition.
Using the oscilloscope on the Clip technic (procedure below), measure the signal between **track 2** (**CAN L**, taken as earth reference) and **track 3 (CAN H)** on the steering wheel angle sensor connector.

– **See the correct signal in FIGURE 3**

Procedure:
Select the Oscilloscope function.
AUTO regulation.
Time base: 5 ms/div.
Calibre (signal amplitude): 1 V/div.

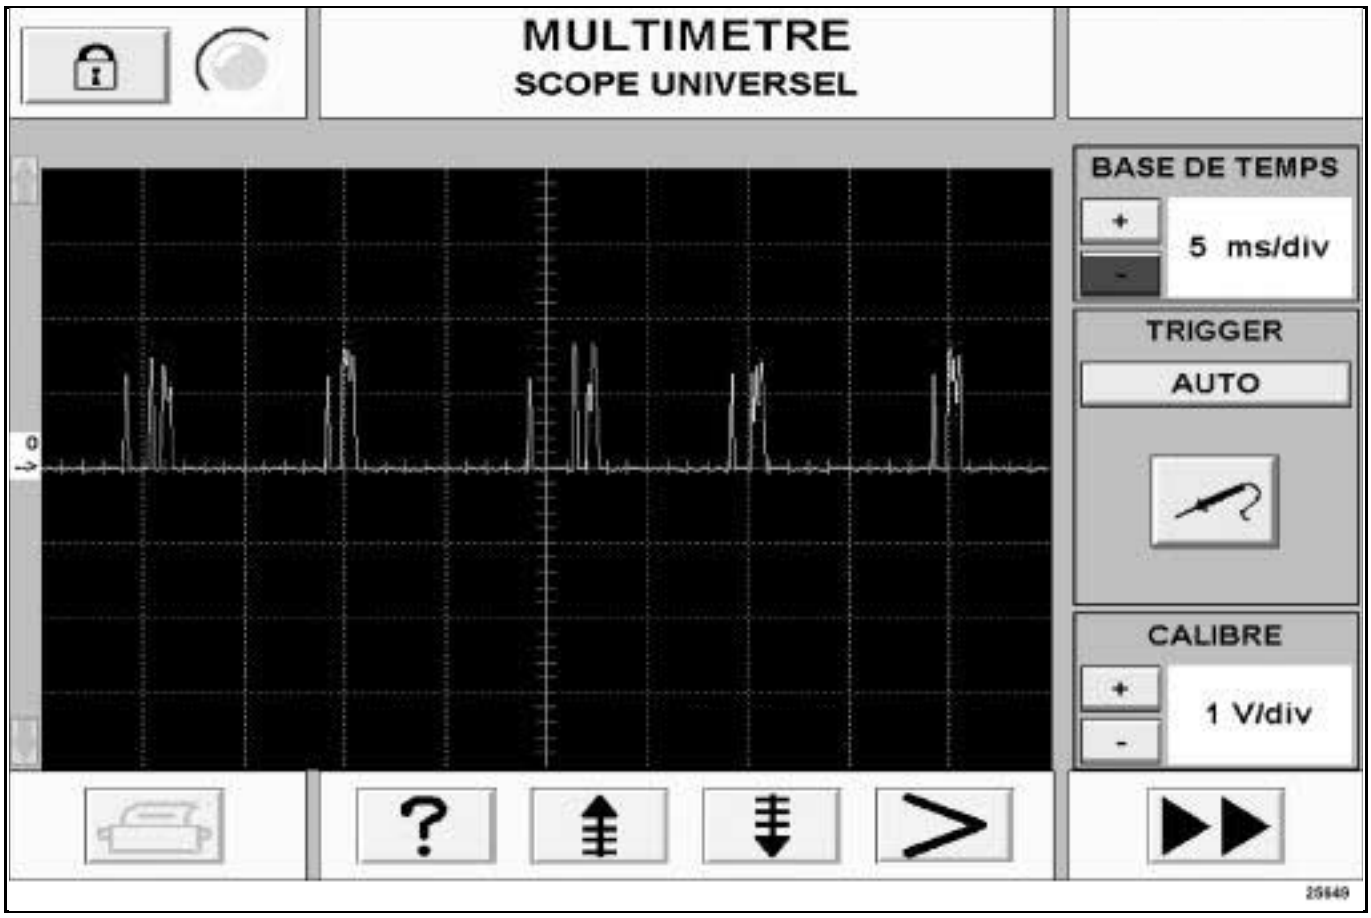

FIG. 3

AFTER REPAIR	**After replacing the combined sensor or steering wheel angle sensor, be sure to clear the offsets using command RZ008 or RZ007.** Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF104 PRESENT	COMBINED SENSOR INTERNAL ELECTRONIC IRREGULARITY

NOTES	None

Clear the computer fault memory.
If the fault recurs, replace the combined sensor (**see Replacement of components**) and clear the offset using command **RZ008 Lateral acceleration sensor offset**.

AFTER REPAIR	**After replacing the combined sensor, be sure to clear the offset using command RZ008 "Lateral acceleration sensor offset".** Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF108 PRESENT OR STORED	STEERING WHEEL ANGLE SENSOR 1.DEF: Internal electronic fault

NOTES	**Special note:** Ignore this fault if the vehicle has been on the dynamometer or if a jack has been placed underneath the vehicle without affecting the steering wheel angle although it has generated a vehicle speed. The steering wheel angle sensor tells the computer, via the private CAN, that there is an internal fault.
	Conditions for applying the fault finding procedure to stored faults: Apply the fault finding procedure whether the fault is present or stored.

Make sure that the connector is correctly plugged into the sensor rather than the inert headlight switch support next to the sensor).
Check the condition and correct connection of the steering wheel angle sensor and computer connectors.
Check for **+ After Ignition Feed** on **track 5** and for **earth** on **track 1** of the steering wheel angle sensor connector.
Repair if necessary.

If all the checks are in order, reconnect the computer and the steering wheel angle sensor, then clear the computer fault memory.
Exit the fault finding procedure and carry out a road test.
Replace the sensor (**see Replacement of components**) if the fault recurs and clear the offset using command **RZ007 Steering wheel angle sensor offset**.

AFTER REPAIR	**After replacing the steering wheel angle sensor, be sure to clear the offset using command RZ007 Steering wheel angle sensor offset.** Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF116 PRESENT	VEHICLE CONFIGURATION PROGRAMMING

NOTES	None

Use command **VP004 "Vehicle parameters"** to define the appropriate vehicle type variant.
Clear the computer fault memory, exit the diagnostic and switch off the ignition.
Switch on the ignition again and carry out a new check using the diagnostic tool.
If the fault is still present, contact the Techline.

AFTER REPAIR	Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF119 PRESENT	GEARBOX TYPE CONFIGURATION (consistency between computer configuration and multiplex network signals)

NOTES	**Priorities when dealing with a number of faults:** Deal with fault **DF097 "No automatic transmission multiplex signal"** first if it is present.

Read **LC008 Gearbox type**, and use command **CF079 Gearbox type** to define the gearbox type present on the vehicle.
Clear the computer fault memory, exit the diagnostic and switch off the ignition.
Switch on the ignition again and carry out a new check using the diagnostic tool.
If the fault is still present, contact the Techline.

AFTER REPAIR	Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF121 PRESENT OR STORED	TORQUE REQUESTED NOT AVAILABLE

NOTES	**Special note:** although stored in the ESP computer, this fault is caused by injection components, not ESP components. Run fault finding on the injection system. **Note:** the injection computer does not always store these transient faults as quickly as the ESP computer. If there are no stored faults in the injection computer memory, start the engine; if no present faults appear, contact your Techline. Once the fault in the injection system has been repaired, clear the ESP computer fault memory. The injection computer cannot achieve the torque setting requested by the ESP.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present during a road test.

Run fault finding on the injection system.
If the fault is still present, contact the Techline.

AFTER REPAIR	Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF125 PRESENT	COMBINED SENSOR SUPPLY 1.DEF: Feed voltage too low 2.DEF: Feed voltage too high 3.DEF: Voltage outside tolerance

NOTES	**Priorities when dealing with a number of faults:** Deal first with fault **DF104 Combined sensor internal electronic fault** if it is present.

Check the connection and condition of the combined sensor and computer connectors.
Switch on the ignition and check for the **+ after ignition feed** between **tracks 3 and 5** of the sensor connector.
– If the voltage is correct, replace the combined sensor (**see Replacement of components**) and clear the offset using command **RZ008 Lateral acceleration sensor offset**.

Check and ensure continuity and the insulation of the connections between:

Sensor connector Track 3 ⟶ **Track 4 computer connector**

Sensor connector Track 5 ⟶ **Track 10 computer connector**

Also check the insulation between these connections.

If the fault is still present, contact the Techline.

AFTER REPAIR	**After replacing the combined sensor, it is imperative to clear the offset using command RZ008 Lateral acceleration sensor offset.** Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF152 **STORED**	MULTIPLEX NETWORK. (BUS OFF)

NOTES	**Special instructions:** If several computers are affected by a similar multiplex network fault, contact the Techline first to check previously reported cases.
	Conditions for applying the fault finding procedure to stored faults: Apply the fault finding procedure as below.

If no other computer has detected a fault on the multiplex network, but only the absence of **ESP** frames, carry out the following checks:
– check the connection and condition (oxidisation, bent terminal, crimping, etc.) of the computer connectors (**tracks 21 and 23**).
Repair if necessary.

Check the continuity, insulation and absence of interference resistance between:

Computer connector **track 21** → **Track 14** of the **diagnostic socket** connector

Computer connector **track 23** → **Track 6** of the **diagnostic socket** connector

Also check the insulation between these 2 connections. Repair or replace the wiring if necessary.
If the fault is still present, run fault finding on the multiplex network.

AFTER REPAIR	Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF155 PRESENT OR STORED	ELECTRONIC STABILITY PROGRAM FUNCTION

NOTES	**Special notes:** The fault is stored if an ESP regulation with the brakes applied lasts over **15 seconds** without trajectory correction. This fault may appear if the vehicle is driven on a speed circuit with banking turns. Major modification of the vehicle chassis may result in unwanted long ESP regulations leading to this fault.
	Conditions for applying the fault finding procedure to stored faults: Apply the fault finding procedure as below.

Check that the combined sensor is fitted the right way round on its plate, is in good condition and correctly tightened to 8 Nm and check the mounting of the plate on the floor (under the centre console behind the gear lever).
Check the connection and condition of the combined sensor connector.
Check that the connections, type and location of any special equipment (CB, Car phone, Amplifier, Bass loudspeaker (subwoofer type), etc.) do not disturb ESP operation.

Check the condition of the axles (impacts, deformations, clearances etc.), and the conformity and condition of the tyre fitting.
Check the vehicle chassis (wheel alignment, shock absorbers, etc.).

– Check the connection and condition of the steering wheel angle sensor, combined sensor and computer connectors.
– Check for continuity and insulation on the wiring between the computer, the steering wheel angle sensor and the combined sensor.
– Check **PR033 "Steering wheel angle"** with the wheels straight.

Clear the steering wheel angle sensor and lateral acceleration sensor offsets using commands **RZ007 Steering wheel angle sensor offset and RZ008 Lateral acceleration sensor offset**.

AFTER REPAIR	Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF188 PRESENT OR STORED	BRAKE LIGHT SWITCH CIRCUIT 1.DEF: Signal inconsistent

NOTES	**Conditions for applying the fault finding procedure to stored faults:** Clear the stored fault, carry out a road test at a speed of > **36 mph (60 km/h)** and test the brakes using **ABS**. Use the interpretation of the fault if it recurs.
	Special note: the fault is detected if the computer does not detect a brake lights switch status change in 4 acceleration/braking cycles, and/or if the contact is closed for more than 6 minutes with the vehicle speed above 24 mph (40 km/h).

Using the diagnostic tool, check on the statuses screen that **ET017 Brake pedal** recognises the depressed and released positions of the brake pedal.
If the pedal position is not detected, use the interpretation of **ET017**.

If the fault is still present, contact the Techline.

AFTER REPAIR	Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF191 PRESENT	ESP ON/OFF BUTTON CIRCUIT

NOTES	None

Apply the interpretation of status **ET023 ESP on/off button**.

AFTER REPAIR	Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF203 PRESENT OR STORED	COMBINED SENSOR MULTIPLEX SIGNALS 1.DEF: Signal not available

NOTES	**Priorities when dealing with a number of faults:** If faults **DF203 and DF099** are combined, deal first with fault **DF099 Private multiplex network**. If faults **DF203 and DF125** are combined, deal first with fault **DF125 Combined sensor supply**. If faults **DF203 and DF104** are combined, deal first with fault **DF104 Combined sensor internal electronic fault**.
	Special note: The computer has detected over 15 error frames on the private multiplex network.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present when the engine is started up.

Check that the combined sensor is fitted the right way round on its plate, is in good condition and correctly tightened to 8 Nm and check the mounting of the plate on the floor (under the centre console behind the gear lever).
Check the connection and condition of the combined sensor connector.
Check that the connections, type and location of any special equipment (CB, Car phone, Amplifier, Bass loudspeaker (subwoofer type), etc.) do not disturb ESP operation.

Apply the fault finding procedure described in **DF099 Private multiplex network**.
If the fault recurs, contact the Techline.

AFTER REPAIR	**After replacing the combined sensor, it is imperative to clear the offset using command RZ008 Lateral acceleration sensor offset.** Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF215 PRESENT OR STORED	LATERAL ACCELERATION PROGRAMMING OFFSET

NOTES	**Priorities when dealing with a number of faults:** If faults **DF215 and DF104** are combined, deal first with fault **DF104 Combined sensor internal electronic fault**.
	Conditions for applying the fault finding procedure to stored faults: The fault is stored if the calculated offset exceeds **1.7 m/s^2**.

Check that the combined sensor is fitted the right way round on its plate, is in good condition and correctly tightened to 8 Nm and check the mounting of the plate on the floor (under the centre console behind the gear lever).
Check the connection and condition of the combined sensor connector.
Check that the connections, type and location of any special equipment (CB, Car phone, Amplifier, Bass loudspeaker (subwoofer type), etc.) do not disturb ESP operation.

– Read the lateral acceleration sensor offset value **PR016 Lateral acceleration programming offset"**.
If the value is over 1.7 m/s^2, replace the combined sensor (**see Replacement of components**) and clear the offset using command **RZ008 "Lateral acceleration sensor offset"**.
If the value is below 1.7 m/s^2, clear the lateral acceleration offset using command **RZ008 Lateral acceleration sensor offset**.
Switch off the ignition, then switch it on again and carry out a road test followed by another check with the diagnostic tool.
If the fault recurs, contact the Techline.

AFTER REPAIR	**After replacing the combined sensor, it is imperative to clear the offset using command RZ008 Lateral acceleration sensor offset.** Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF216 PRESENT OR STORED	STEERING WHEEL ANGLE PROGRAMMING OFFSET

NOTES	**Special notes:** The signal supplied by the steering wheel angle sensor is not consistent with the steering wheel angle recalculated using the wheel speeds, the lateral acceleration and yaw rate. **This fault can be recognised with the ignition on by manipulating the sensor without it being mounted on the steering column (value in excess of ± 720°)**.
	Conditions for applying the fault finding procedure to stored faults: Apply the fault finding procedure whether the fault is present or stored.

Set the wheels straight ahead and in the **Electronic stability program** function on the diagnostic tool, read **PR033 Steering wheel angle**.

– **If, - 10° < PR033 < 10°**, use the diagnostic tool to clear the sensor offset with clear command **RZ007 Steering wheel angle sensor offset**.

Switch off the ignition and carry out a road test followed by another check with the diagnostic tool.

– If **PR033** is outside **- 10° < PR033 < 10°**, check that the steering wheel angle sensor is correctly fitted and positioned on the steering column and carry out a complete axle geometry check.

Use the diagnostic tool to clear the sensor offset with the clear command **RZ007 Steering wheel angle sensor offset**.
Switch off the ignition and carry out a road test followed by another check with the diagnostic tool.

If the fault is still present replace the steering wheel angle sensor (**see Replacement of components**) and clear the offset using clear command **RZ007 Steering wheel angle sensor offset**.

AFTER REPAIR	**After replacing the steering wheel angle sensor, be sure to clear the offset using command RZ007 Steering wheel angle sensor offset.** Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF218 PRESENT OR STORED	PRESSURE SENSOR PROGRAMMING OFFSET

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present when the engine is started up.

Clear the computer fault memory.
– Read the brake pressure sensor offset value **PR017 Pressure sensor programming offset**.
If the value is above **15 bar**, clear the offset using command **RZ009 Brake pressure sensor offset**.
If the value is between **11 bar and 15 bar**, separate the computer from the hydraulic unit to check the cleanliness of the contacts: the 4 springs on the computer side and the 4 contacts facing them on the pressure sensor.
Repair if necessary.

Reread the value of **PR017**.
If the value is still between **11 bar and 15 bar** inclusive, replace the entire hydraulic unit.

AFTER REPAIR	**The pressure sensor is incorporated in the computer. If the pressure sensor is defective: change the complete hydraulic unit.** Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF219 PRESENT OR STORED	ABS MULTIPLEX SIGNALS CONSISTENCY

NOTES	**Special note:** although stored in the computer, the **ESP** system is not defective. The **ESP** is deactivated due to unusable injection signals. Perform fault finding on the injection system using the diagnostic tool. Note: The injection does not always store these transient faults as quickly as the **ESP system**. If no fault is stored in the injection computer, start the engine; if there is no fault present, contact the Techline. **Once the fault in the injection system has been repaired, clear the ESP computer fault memory.**
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present when the engine is started up.

Run fault finding on the injection system.
If the fault is still present, contact the Techline.

AFTER REPAIR	Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF220 PRESENT	HYDRAULIC UNIT TEMPERATURE SENSOR CIRCUIT 1.DEF: Signal inconsistent

NOTES	**Special note:** The computer has detected a discrepancy between 2 temperature measurements of over **6 °C in 1 second**.

Clear the computer fault memory.
– Separate the computer from the hydraulic unit to check the cleanliness of the contacts: the 4 springs on the computer side and the 4 contacts facing them on the pressure sensor.

If the fault recurs, replace the entire hydraulic unit.

AFTER REPAIR	Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF221 PRESENT	STEERING WHEEL ANGLE SENSOR MULTIPLEX SIGNALS 1.DEF: Signal not available

NOTES	**Priorities when dealing with a number of faults:** If there is a combination of faults **DF221 and DF099**, deal with fault **DF099** first.
	Special note: the computer has received invalid multiplex frames from the steering wheel angle sensor.

Check that the connector is correctly connected to the sensor and not to the inert headlight switch support next to the sensor. Check the condition and correct connection of the steering wheel angle sensor and computer connectors. Check for **+ After Ignition Feed** on **track 5** and for **earth** on **track 1** of the steering wheel angle sensor connector. Repair if necessary.
Use the interpretation of **DF099 Private multiplex network**. If the fault recurs, contact the Techline.

AFTER REPAIR	Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF224 PRESENT	ESP FUNCTION DEACTIVATED

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present when the ignition is switched on.
	Special note: This fault is stored only if the "**Electronic stability program**" functions are deliberately disconnected using the diagnostic.

If this fault appears contact Techline.

AFTER REPAIR	Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF225 PRESENT	ESP AND TRACTION CONTROL FUNCTIONS DEACTIVATED

NOTES	**Special note:** This fault is stored only if the "**Electronic stability program**" functions are deliberately disconnected using the diagnostic.

If this fault appears contact Techline.

AFTER REPAIR	Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF226 STORED	STEERING WHEEL ANGLE SENSOR INITIALISATION

NOTES	**Priorities when dealing with a number of faults:** Deal with faults **DF080, DF084, DF104, DF125, DF203, DF215, DF227** first if they are present (combined sensor faults). **Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present following a road test at a vehicle speed greater than **60 mph (100 km/h)**. **Special notes:** The steering wheel angle sensor needs to be initialised (woken) each time the **+ After Ignition Feed** is activated. Initialisation involves turning the steering wheel through at least **4**°. This fault may appear if this initialisation has not been carried out, and the vehicle has been driven at over **60 mph (100 km/h)** or after a micro-break on the supply when driving. Due to a local micro-break, the sensor alters its function. This causes "non-initialisation" of the steering wheel angle sensor.

Check that the steering wheel angle sensor is correctly fitted on the steering column control unit.
Check that the connector is correctly connected to the sensor and not to the inert headlight switch support next to the sensor.
Check the condition and correct connection of the steering wheel angle sensor and computer connectors.
Switch on the ignition and check for the **+ After ignition feed** between **tracks 5 and 1** of the steering wheel angle sensor connector:
– If the voltage is incorrect:
Check the condition and positioning of the steering wheel angle sensor **5A** supply fuse in the Passenger Compartment Fuse and Relay Box.
Check and ensure continuity and insulation of the following connections:

Sensor connector Track 1	→	**Vehicle earth**
Sensor connector Track 5	→	**Track 4 (5A sensor feed fuse) passenger compartment fuse and relay box black connector**

Also check the insulation between these connections.

– If the voltage is correct but the fault is still present after clearing the computer's fault memory:
Replace the steering wheel angle sensor (**see Replacement of components**) and clear the sensor offset using clear command **RZ007 Steering wheel angle sensor offset**.

AFTER REPAIR	**After replacing the steering wheel angle sensor, be sure to clear the offset using command RZ007 Steering wheel angle sensor offset.** Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF227 PRESENT	COMBINED SENSOR INITIALISATION

NOTES	**Priorities when dealing with a number of faults:** If faults **DF227 and DF104** are combined, deal first with fault **DF104 Combined sensor internal electronic fault**.

Check the connection and condition of the combined sensor and computer connectors.
Switch on the ignition and check for the **+ after ignition feed** between **tracks 3 and 5** of the sensor connector.

– If the voltage is correct, replace the combined sensor (**see Replacement of components**) and clear the offset using command **RZ008 Lateral acceleration sensor offset**.

Check and ensure continuity and the insulation of the connections between:

Sensor connector Track 3 ⟶ **Track 4 computer connector**

Sensor connector Track 5 ⟶ **Track 10 computer connector**

Also check the insulation between these connections.

If the fault is still present, contact the Techline.

AFTER REPAIR	**After replacing the combined sensor, be sure to clear the offset using command RZ008 "Lateral acceleration sensor offset".** Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF229 to DF232 PRESENT OR STORED	WHEEL SPEEDS

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present during a road test (in excess of **12 mph (20 km/h)** for **2 minutes**).

Check the condition of the axles (impacts, damage, etc.) and the conformity and good condition of the tyres.
Check that the braking system (condition of brake pads, sealing, sticking, bleed, bearing clearance, etc.) is in good condition.

Visually inspect the condition of the target (for clogging, metallic contamination, bearing grease, etc.) and clean using compressed air if necessary.
If there is a lot of grease on the target, contact the Techline.
Check the quality of the wheel speed sensor mounting (for the front wheels: correct clipping without excessive play).
Check the sensor/target air gap through one revolution of the rear wheels: **0.3 mm < rear wheel air gap < 1.3 mm**.
Check the conformity of the target (condition, number of teeth = **48**) using the special command **SC001 Check target teeth**.

Check the connection and the condition of the sensor connectors.
Visually inspect the sensor wiring and check the quality of the connections on the **26 track** computer connector.

AFTER REPAIR	Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF248 PRESENT	CHASSIS WEAR COMPENSATION FUNCTION INHIBITED

NOTES	**Stored fault fault finding conditions:** this fault appears after deliberate inhibition of the function by **VP030 Chassis wear programming**.

The Chassis wear compensation function must be active.
The function must only be inhibited according to an instruction in a Technical Note.
Check the configuration using **LC016 Chassis wear programming**.
If **LC016 Chassis wear programming** is **INACTIVE**, use the **VP030 Chassis wear programming** setting to activate the function.

If the fault is still present, contact the Techline.

AFTER REPAIR	Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF250 **DF251** **DF252** **DF253** **DF254** **PRESENT** **OR** **STORED**	ENGINE SPEED MULTIPLEX SIGNAL EFFECTIVE ENGINE TORQUE MULTIPLEX SIGNAL TORQUE REQUEST MULTIPLEX FEEDBACK SIGNAL CALCULATED TORQUE MULTIPLEX SIGNAL RESISTING TORQUE MULTIPLEX SIGNAL

NOTES	**Special note:** although stored in the computer, the **ESP** system is not defective. The **ESP** is deactivated due to unusable injection signals. Perform fault finding on the injection system using the diagnostic tool. Note: The injection does not always store these transient faults as quickly as the **ESP system**. If no fault is stored in the injection computer, start the engine; if there is no fault present, contact the Techline. **Once the fault in the injection system has been repaired, clear the ESP computer fault memory.** **Conditions for applying the fault finding procedure to stored faults:** The fault is declared present when the engine is started up.

Run fault finding on the injection system.
If the fault is still present, contact the Techline.

AFTER REPAIR	Clear the computer fault memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

NOTES	Only check conformity after a complete check using the diagnostic tool.

Order	Function	Parameter or Status checked or Action	Display and Notes	Fault finding
1	Diagnostic tool dialogue		**ABS/ESP**	**Apply ALP1**
2	Computer configuration	**PR030:** TACHOMETRIC INDEX	Check that the index entered corresponds to the tyres fitted to the vehicle (see **Clip Help**).	**See Configurations and Programming (VP007).**
3	Brake pedal not depressed detection	**ET017:** BRAKE PEDAL	**Released** status confirmed, brake pedal not depressed	**In the event of a fault, apply interpretation of ET017.**
4	Depressed brake pedal detection	**ET017:** BRAKE PEDAL	**Depressed** status confirmed, depressed brake pedal	**In the event of a fault, apply interpretation of ET017.**

GETtheMANUALS.org

SUMMARY TABLE OF STATUSES

Tool status	Diagnostic tool title
ET017	Brake pedal
ET023	ESP on/off button
ET030	Automatic brake light lighting

PARAMETER SUMMARY TABLE

Tool parameter	Diagnostic tool title
PR001	Front right-hand wheel speed
PR002	Front left-hand wheel speed
PR003	Rear right-hand wheel speed
PR004	Rear left-hand wheel speed
PR005	Computer feed voltage
PR016	Lateral acceleration programming offset
PR017	Pressure sensor programming offset
PR018	Hydraulic unit temperature
PR030	Tachometric index
PR033	Steering wheel angle
PR034	Yaw angle
PR035	Brake fluid pressure
PR036	Transverse acceleration
PR038	Vehicle speed
PR063	Vehicle parameters
PR066	Steering wheel angle programming offset

GETtheMANUALS.org

ET017	BRAKE PEDAL

NOTES	**Special notes:** Only carry out the checks if the **depressed** and **released** statuses are not consistent with the position of the pedal.

Released STATUS Brake pedal depressed.

If the brake lights are working:
– Check for and ensure continuity on the connection between **track 1** of the brake light switch connector and **track 16** of the computer connector.
If the brake lights are not working:
– Check the condition, mounting and adjustment of the brake light switch. Check the conformity of the fuse and bulbs.
– Check for **+ after ignition feed** on **tracks 2 and 4** on the brake light switch connector.
– Remove the brake light switch and check that it is operating correctly:

	Continuity between tracks	Insulation between tracks
Switch pressed (Brake pedal released)	3 and 4	1 and 2
Switch released (Brake pedal depressed)	1 and 2	3 and 4

– Replace the switch if necessary.

Depressed STATUS brake pedal released.

– Check the condition, mounting and adjustment of the brake light switch. Check the conformity of the fuse and bulbs.
– Remove the brake light switch and check that it is operating correctly:

	Continuity between tracks	Insulation between tracks
Switch pressed (Brake pedal released)	3 and 4	1 and 2
Switch released (Brake pedal depressed)	1 and 2	3 and 4

– Replace the switch if necessary.
– Check for **insulation from 12 V** on the connection between **track 1** of the brake light switch connector and **track 16** of the computer connector.

AFTER REPAIR	Carry out a road test, followed by a check with the diagnostic tool.

GETtheMANUALS.org

ET023	ESP ON/OFF BUTTON

NOTES	**Special notes:** Only carry out the checks if the **pressed** and **released** statuses are not consistent with the position of the button.

button Released STATUS

Check the connection and condition of the ESP on/off button connectors. Repair if necessary.
Check there is no continuity between switch **tracks A2 and B1** in the released position. If there is continuity, replace the switch.
Ensure insulation against earth of the connection between:

Button connector **Track B1** ⟶ **Track 7** computer connector

button Pressed STATUS

Check the connection and condition of the ESP on/off button connectors. Repair if necessary.
Check the continuity between button **tracks A2 and B1** in the pressed position. If there is no continuity, replace the switch.
Check that **Track A2** of the button connector is connected to earth.

AFTER REPAIR	Carry out a road test, followed by a check with the diagnostic tool.

GETtheMANUALS.org

PARAMETERS

PR001: Front right-hand wheel speed.

PR002: Front left-hand wheel speed.

PR003: Rear right-hand wheel speed.

PR004: Rear left-hand wheel speed
These parameters indicate the speed **in mph (km/h)** of each wheel on the vehicle.

PR005: Computer supply.
This parameter indicates in **Volts** only the computer's **+ after ignition feed** supply voltage, rather **than the hydraulic unit power supply.**

PR016: Lateral acceleration programming offset.
This parameter gives the correction made by the ESP on the gross value of the lateral acceleration sensor.

PR017: Pressure sensor programming offset.
This parameter indicates the correction applied by the ESP to the pressure sensor gross value.

PR018: Hydraulic unit temperature.
This parameter indicates the temperature in **°C** of the hydraulic unit.

PR030: Tachometric index.
This parameter specifies the tachometric index entered in the computer for the tyres fitted to the vehicle.

PR033: Steering wheel angle.
This parameter gives the steering wheel angle in **degrees**.

PR034: Yaw angle.
This parameter indicates the yaw angle in **°/s** supplied by the combined sensor. It should be 0 when the vehicle is stationary.

PR035: Brake fluid pressure.
This parameter indicates the brake fluid pressure in the hydraulic unit.

PR036: Transverse acceleration.
This parameter indicates the lateral acceleration in **g** supplied by the combined sensor.
It should be 0 when the vehicle is stationary.

PR038: Vehicle speed.
This parameter indicates the vehicle speed in **mph (km/h)**.

PR063: Vehicle parameters.
This parameter shows whether the configuration (**VP004**) matches the vehicle undergoing fault finding.

PR066: Steering wheel angle programming offset.
This parameter indicates the correction made by the **ESP** to the steering wheel angle sensor gross value.

GETtheMANUALS.org

STATUSES

ET017: Brake pedal.
This status gives the position (depressed or released) of the brake pedal

ET023: ESP On/Off button
This status enables you to check whether the **ESP** On/Off button works. This (**depressed or released**) status is checked by keeping the button pressed.

ET030: Automatic brake light illumination.
This status shows whether automatic brake light illumination is authorised or inhibited with **CSV** (understeer control). The parameters of this status can be modified using commands **VP021** and **VP022** according to the legislation in force in the country concerned.

GETtheMANUALS.org

CLEARING

RZ001: Fault memory.
This command is used for clearing the computer's stored faults.

RZ007: Steering wheel angle sensor offset.
This command reinitialises the steering wheel angle sensor offset. Use this command when replacing the steering wheel angle sensor or after any operation on the axles.

RZ008: Lateral acceleration sensor offset.
This command reinitialises the lateral acceleration sensor offset. Use this command when replacing the combined sensor.

RZ009: Brake pressure sensor offset.
This command reinitialises the brake pressure sensor offset. Use this command only if specified in the fault interpretation or on request by Techline.

ACTIVATION

Using the commands
Before using the commands, check that the battery is well charged.

AC003: Front left-hand wheel solenoid valves.
AC004: Front right-hand wheel solenoid valves.
AC005: Rear left-hand wheel solenoid valves.
AC006: Rear right-hand wheel solenoid valves.
These commands permit a check on the hydraulics of each wheel.

Position the vehicle on a 2-post lift so that the free rotation of the wheels can be checked.
Keep the brake pedal depressed enough to prevent the wheel being tested from being turned by hand (do not brake so hard that the anti-lock function operates).
Select and confirm the command for the wheel in question (e.g. Front left-hand wheel solenoid valve, etc.).
Turn the wheel concerned by hand: 5 braking/releasing cycles should be detected.

AC016: Pump motor test.
This command is used to test the pump motor control circuit.

Select command **AC016 Pump Motor Test**.
The motor must run for **5 seconds**.

GETtheMANUALS.org

ACTUATION (continued)

AC153: Bleed front left-hand wheel.
AC154: Bleed front right-hand wheel.
AC155: Bleed rear left-hand wheel.
AC156: Bleed rear right-hand wheel.
This command must be used only if an extension of brake pedal travel is noted during a road test with **ABS** regulation (the system must have been bled beforehand by the usual procedure).

Follow the procedure described in **MR 355 Mechanical, 38C, Anti-lock braking system**.

AC187: Brake light on relay.
This command is for testing brake light activation by the **ESP** when controlling understeering with sharp deceleration.

AC195: Vehicle speed signal.
This command generates a speed other than **0 mph** on the computer's vehicle speed wire output (**Track 24**) for users of that signal (navigation aid, car radio, sunroof).

Note:
This command has no visible effect on the dashboard speedometer needle.

– **Radio:** Turn on the radio and make sure that the Adjust volume as a function of speed function is active. Run command **AC195**. Check that the volume of the sound increases and then decreases while the command is running.

– **Sunroof:** This command has no visible effect on the sunroof. This command changes the activation threshold of the anti-pinch system (the force required to close the sunroof varies with vehicle speed due to aerodynamic constraints).

AC196: Request to switch on hazard warning lights.
This command sends the **UCH** a request to switch on the hazard warning lights to test their functioning during emergency braking (depending on **UCH** configuration).

SPECIAL COMMANDS

SC001: Check target teeth.
This command tests the integrity of the teeth on each wheel.

Select command **SC001 Check target teeth** and follow the instructions.
The test result should indicate **48 sprockets**.

GETtheMANUALS.org

NOTES	Only refer to these customer complaints after performing a complete check with the diagnostic tool.

FAULTS DETECTED ON BRAKING WITH ABS/BRAKING REGULATION

LOCKING OF ONE OR MORE WHEELS	**ALP2**
PULLING	**ALP3**
WANDERING	**ALP4**
UNEXPECTED ABS OPERATION AT LOW SPEEDS AND SLIGHT PEDAL PRESSURE	**ALP5**
UNEXPECTED ABS OPERATION ON A POOR ROAD SURFACE	**ALP6**
UNEXPECTED ABS OPERATION WHEN SPECIAL FEATURES USED (CAR PHONE, CB, etc.)	**ALP7**
LENGTHENING OF BRAKE PEDAL TRAVEL FOLLOWING ABS (WITH PEDAL RECEDING WHEN ENTERING ABS)	**ALP8**
SPONGY PEDAL	**ALP9**
BRAKE PEDAL VIBRATION	**ALP10**
NOISES FROM THE PUMP, PIPES OR HYDRAULIC UNIT	**ALP11**

OTHER CASES

NO COMMUNICATION WITH THE ABS COMPUTER	**ALP1**

GETtheMANUALS.org

ALP1	No dialogue with the ABS computer

NOTES	**Special note: To run fault finding on the vehicle computers, switch on the ignition in fault finding mode (forced + after ignition feed, see introduction).**

Check that the diagnostic tool is not causing the fault by trying to establish dialogue with a computer on another vehicle. If the tool is not at fault, and dialogue cannot be established with any other computer on the same vehicle, the cause could be a faulty computer interfering on the multiplex network.
Check the battery voltage and carry out the operations necessary to obtain the correct voltage (**9.5 V < battery voltage < 17.5 V**).

Perform fault finding on the multiplex network using the diagnostic tool.

Check that the ABS/ESP fuses are in place (**5 A** fuse on the passenger compartment fuse board) and in the engine compartment (**20 A and 40 A**) and in good condition.
Check that the computer connector is properly connected and check the condition of its connections.
Check the ABS/ESP earths (quality, oxidation, sealing of sheath on the earth bolt terminal above the ABS/ESP assembly).
Check that the supply to the computer is correct:

- **Earth on tracks 13 and 26** of the 26 track connector.
- **+ before ignition feed on tracks 1 and 14** of the 26 track connector.
- **+ after ignition feed on track 20** of the 26 track connector.

Ensure that the supply to the diagnostic socket is correct:

- **+ before ignition feed on track 16.**
- **+ after ignition feed on track 1.**
- **Earth connection on tracks 4 and 5.**

If dialogue has still not been established after these checks, contact Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

ALP2	Locking of one or more wheels

NOTES	Only consult this customer complaint after a complete check with the diagnostic tool.

Reminder: Locking of wheels on a vehicle fitted with ABS, or squealing of the tyres, which feels like locking to the customer, may be linked to normal operation of the system and should not always be considered a fault:
- Locking is allowed below **4 mph (6 km/h)** (system regulation will not be activated).
- Braking with ABS on very poor roads (significant squealing).
- ----------

However, if there is actually wheel locking, lift the vehicle in order to be able to rotate the wheels and check:
- Possible inversion when connecting the speed sensors.
  Using parameters **PR001, PR002, PR003 and PR004**, rotate the wheels slowly and check the consistency of the results obtained.
  If the value measured is zero, rotate the other wheels to confirm an electrical inversion of the sensors and repair the wiring harness.
- Possible inversion of pipes on the hydraulic unit.
  Use commands Front left-hand wheel solenoid valves, Front right-hand wheel solenoid valves, Rear left-hand wheel solenoid valves and Rear right-hand wheel solenoid valves while depressing the brake pedal and check for 10 unlocking/locking cycles on the wheel concerned (see **dealing with command modes**). If the 10 cycles are not completed on the wheel being tested (wheel still locked), check whether they are completed on another wheel (if inversion is confirmed: repair).
  If the 10 cycles are not completed on a wheel and the pipes have not been reversed, replace the hydraulic unit.

Check that the sensor holder does not rotate (depending on fitting).
Check the quality of the mounting of the wheel speed sensors (correct clipping for the front wheels).
Check the conformity of the targets: condition, **number of teeth = 48 (using command SC001 Check target teeth)**.
If the fault is still present after these checks, replace the hydraulic unit.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

ALP3	Pull

NOTES	Only consult this customer complaint after a complete check with the diagnostic tool.

Disconnect one wheel speed sensor.
Start the engine and check that only the ABS fault warning light comes on. Do not drive the vehicle if the brake fault warning light is also lit, as the brake limiter function is no longer guaranteed to operate correctly.
Carry out a road test with the ABS deactivated.
Is the fault still present under these conditions?

YES →

If the brake pedal travel is relatively long, bleed the brake circuit.
If the travel is normal, check the tyre pressures, the front axle, or for any leaks in the circuit.

NO ↓

Raise the vehicle so that you can rotate the wheels and check:
– Possible inversion when connecting the speed sensors.
– Possible inversion of pipes on the hydraulic unit.
To perform these tests, refer to and apply the procedures defined in **ALP 2**.
Check the condition of the ABS targets and that they conform to specifications.
Also check the sensor/target air gap by rotating each rear wheel through one revolution.
If the fault is still present replace the hydraulic unit.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

ALP4	Drift

NOTES	Only consult this customer complaint after a complete check with the diagnostic tool.

Disconnect one wheel speed sensor.
Start the engine and check that only the ABS fault warning light is lit. Do not drive the vehicle if the brake fault warning light is also lit, as the brake limiter function is no longer guaranteed to operate correctly.
Carry out a road test with the ABS deactivated.
Is the fault still present under these conditions?

YES →

Road handling fault not connected with the ABS.
Check the condition of the brake linings and that they are to specification and check the tyre pressures, the front axle, etc.

NO ↓

Normal behaviour linked to the system operation during the regulation phase, mainly on surfaces with uneven grip or which are poorly laid.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

ALP5	**Unexpected ABS operation at low speed and with slight pedal pressure**

NOTES	Only consult this customer complaint after a complete check using the diagnostic tool. Warning: ABS regulation may be "unresponsive" when the vehicle is driven on very low grip surfaces (icy roads, wet cobbles, etc.).

Brake pedal vibrations may be felt which are connected to the system behaviour in particular situations:
- Crossing speed bumps.
- Tight cornering with lifting of the inside rear wheel.

These vibrations may be linked to simple brake limiter activation, when the pressure on the rear axle is limited.
If the fault relates to something else, check the speed sensor connectors (micro-breaks) as well as the targets.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

ALP6	Unexpected ABS system intervention on a poor road surface

NOTES	Only consult this customer complaint after a complete check with the diagnostic tool.

On poor road surfaces it is normal to feel bucking and vibration of the pedal as well as more significant tyre squealing than on good surfaces.
This gives the impression of a variation in efficiency, but this should be considered normal.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

ALP7	**Unexpected ABS operation when use special features used** (car phone, CB, etc.)

NOTES	Only consult this customer complaint after a complete check with the diagnostic tool.

Check that the equipment which is causing the fault is approved.
Check that this equipment has been correctly installed without modification to the original wiring, in particular, that of the ABS (unauthorised ABS connections to earth and **+ after ignition/+ before ignition**).

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

ALP8	**Lengthening of the brake pedal travel following a regulation phase** (with an irregular pedal when entering the regulation phase)

NOTES	Only consult this customer complaint after a complete check with the diagnostic tool.

Air transit from the hydraulic unit regulation channels to the brake circuits.
Bleed the circuits according to the recommended procedure in **MR 355 Mechanical, 38C, Anti-lock braking system** (using the diagnostic tool command modes).
Following the operation, carry out a road test with ABS regulation.

If the customer complaint is still present, carry out the above operation again once or twice.
If the customer complaint is particularly serious, and bleeding the circuit does not improve matters, replace the hydraulic unit.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

ALP9	Spongy pedal

NOTES	Only consult this customer complaint after a complete check with the diagnostic tool.

Air in the brake circuits.
Bleed the circuits in the conventional way starting with the rear right-hand brake, followed by rear left, front left and finally front right. Repeat the operation if necessary.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

ALP10	Brake pedal vibration

NOTES	Only consult this customer complaint after a complete check with the diagnostic tool.

Normal reaction of the brake pedal during ABS regulation or of limitation of pressure on the rear axle (brake limiter function).

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

ALP11	Noise from the pump, pipes or hydraulic unit

NOTES	Only consult this customer complaint after a complete check with the diagnostic tool.

– Vibration of the unit: Check that the unit support insulating rubber mounting bushes are in place and in good condition.
– Vibration of pipes: check that all the pipes are secure in their mounting clips and there is no contact between pipes or between pipes and bodywork.

The "Front left-hand wheel solenoid valves", "Front right-hand wheel solenoid valves", "Rear left-hand wheel solenoid valves" and "Rear right-hand wheel solenoid valves" actuating commands may be used while depressing the brake pedal to determine where the noise is coming from.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

SELF-CONTAINED HEATER
Fault finding - Introduction

GETtheMANUALS.org

This document explains the generic fault finding procedure for the additional heater function on VEL SATIS phase 1 and 2 vehicles, with diesel engines.
A "Fault Finding Special Features" Technical Note is available for each vehicle fitted with this computer/ function. It covers all the fault finding special features in this document for the vehicle concerned. This Special notes Note complements or replaces the information provided in the Generic fault finding document.

To carry out fault finding on this system, it is essential to have the following items:

- the Workshop Repair Manual for the vehicle concerned,
- the wiring diagram of the function for the vehicle concerned,
- the tools listed in Special tooling required.

GENERAL APPROACH TO FAULT FINDING

- Use one of the diagnostic tools to identify the system fitted to the vehicle (to read the computer group, the program number, the Vdiag, etc.).

- Search for fault finding documents corresponding to the system identified.

- Take note of information contained in the introductory sections.

- Read the faults stored in the computer memory and use the Interpretation of Faults section of the documents.

  REMINDER: each fault is interpreted for a given type of storage (fault present, fault stored, fault present or stored). The checks defined for dealing with each fault are therefore only to be performed on the vehicle if the fault declared by the diagnostic tool is interpreted in the document for its type of storage. The storage type should be considered when using the diagnostic tool after the ignition has been switched off and switched back on.
  If a fault is interpreted when it is declared as stored, the conditions for applying fault finding appear in the Notes box. If the conditions are not met, use the fault finding procedure to check the circuit of the component concerned, since the fault is no longer present on the vehicle. Carry out the same procedure when a fault is declared as stored by the diagnostic tool but is only interpreted in the documentation as a present fault.

- Carry out the conformity check (appearance of possible faults not yet identified by the system's self-test procedure) and implement the associated fault finding procedures according to the results.

- Confirm the repair (customer complaint disappears).

- Use the fault finding procedure for each Customer complaint if the fault persists.

SPECIAL TOOLING REQUIRED:

- diagnostic tool (except XR25),
- multimeter.

GETtheMANUALS.org

DF001 present or stored	PRE-HEATER PLUG CC.0 : Short circuit to earth CO : Open circuit

NOTES	It is a condition of application of the diagnostic to the stored fault that only one fault can be declared present at a time. **The fault is declared present after ignition of the spark plug and with no other fault declared present.**

Remove the blower cover and disconnect connector B2 from the control unit.
Check the condition of the connector and replace it if necessary.

Check the **insulation, continuity and absence of interference resistance of the connectors:**

connector B2 **track 9** → **+** Spark plug
connector B2 **track 12** → **earth** spark plug

Repair if necessary.

If the fault persists, change the spark plug.

AFTER REPAIR	Apply the reference value to confirm that the repair is successful. Deal with any other possible faults. Clear the stored faults and check that no other fault appears.

GETtheMANUALS.org

DF002 present or stored	FUEL METERING PUMP CC.0 : Short circuit to earth CO : Open circuit

NOTES	It is a condition of application of the diagnostic to the stored fault that only one fault can be declared present at a time. **The fault is declared present after the metering pump has been switched on and with no other fault declared present.**

Check the condition of the 8-track connector and replace it if necessary.
Check the **insulation, continuity and absence of interference resistance of the connectors:** 8-track connector **track 4** → **track 2** connector **ST2** metering pump 8-track connector **track 2** → **track 1** connector **ST2** metering pump Repair if necessary.
Measure the resistance at the meter pump terminals.If it is not approximately **10 ohms** replace the meter pump.
Replace the metering pump if the fault persists.

AFTER REPAIR	Apply the reference value to confirm that the repair is successful. Deal with any other possible faults. Clear the stored faults and check that no other fault appears.

GETtheMANUALS.org

DF003 present or stored	COOLANT TEMPERATURE SENSOR CIRCUIT CC.0 : Short circuit to earth CO : Open circuit

NOTES	It is a condition of application of the diagnostic to the stored fault that only one fault can be declared present at a time. **The fault is declared present after the boiler has been ignited and with no other fault declared present.**

Remove the blower cover and disconnect connector B2 from the control unit. Check the condition of the connector and replace it if necessary.
Check the **insulation, continuity and absence of interference resistance of the connectors:** connector B2 **track 3** ⟶ temperature sensor connector B2 **track 4** ⟶ temperature sensor Repair if necessary.
Measure the resistance at the sensor terminals.If it is not **12 KΩ ± 5% at 20˚C** replace the internal wiring of the boiler
Replace the boiler if the fault persists.

AFTER REPAIR	Apply the reference value to confirm that the repair is successful. Deal with any other possible faults. Clear the stored faults and check that no other fault appears.

GETtheMANUALS.org

DF004 present or stored	COMBUSTION AIR FAN CC.0 : Short circuit to earth CO : Open circuit DEF : Blocked

NOTES	It is a condition of application of the diagnostic to the stored fault that only one fault can be declared as present at a time. **The fault is declared present after the boiler has been ignited and with no other fault declared present.**

Remove the blower cover and disconnect connector B2 from the control unit.
Check the condition of the connector and replace it if necessary.

Check the **insulation, continuity and absence of interference resistance of the connectors:**

connector B2 **track 14** → **earth** combustion air fan
connector B2 **track 13** → **+** combustion air fan

Repair if necessary.

Using a multimeter, check that the coil of the fan has not been cut.

Replace the boiler if necessary.

AFTER REPAIR	Apply the reference value to confirm that the repair is successful. Deal with any other possible faults. Delete the stored faults and check that no other fault appears.

GETtheMANUALS.org

DF005 present or stored	OVERHEATING SWITCH CC.0 : Short circuit to earth CO : Open circuit

NOTES	It is a condition of application of the diagnostic to the stored fault that only one fault can be declared as present at a time. **The fault is declared present after the boiler has been ignited and with no other fault declared present.**

Remove the blower cover and disconnect connector B2 from the control unit. Check the condition of the connector and replace it if necessary.
Check the **insulation, continuity and absence of interference resistance of the connectors:** connector B2 **track 6** ⟶ overheating switch connector B2 **track 5** ⟶ overheating switch Repair if necessary.
Measure the resistance at switch terminals.If it is not **12 KΩ ± 5 % at 20˚C** replace the internal wiring of the boiler (the overheating switch is connected to the internal wiring).
Replace the boiler if the fault persists.

AFTER REPAIR	Apply the reference value to confirm that the repair is successful. Deal with any other possible faults. Clear the stored faults and check that no other fault appears.

GETtheMANUALS.org

DF006 present or stored	FLAME DETECTOR CC.0 : Short circuit to earth CO : Open circuit

NOTES	It is a condition of application of the diagnostic to the stored fault that only one fault can be declared present at a time. **The fault is declared present after the boiler has been ignited and with no other fault declared present.**

Remove the blower cover and disconnect connector B2 from the control unit.
Check the condition of the connector and replace it if necessary.

Check the **insulation, continuity and absence of interference resistance of the connectors:**

connector B2 **track 1** → flame detector
connector B2 **track 2** → flame detector

Repair if necessary.

Measure the resistance at the flame detector terminals. If it is not **1200 KΩ ± 5% at 50˚C** replace the internal wiring (the flame detector is connected to the internal wiring).

Replace the **boiler** if the fault persists.

AFTER REPAIR	Apply the reference value to confirm that the repair is successful. Deal with any other possible faults. Delete the stored faults and check that no other fault appears.

GETtheMANUALS.org

DF008 present or stored	BOILER MALFUNCTION 1.DEF : Excess voltage 2.DEF : Not enough voltage

NOTES	It is a condition of application of the diagnostic to the stored fault that only one fault can be declared present at a time. **The fault is declared present after the boiler has been ignited and with no other fault declared present.**

Check the voltage between **tracks 1and 2** of the 8-track connector. This should be between: **10.2 V < X < 16 V.**

Check the **insulation, continuity and absence of interference resistance of the connectors:**

8-track connector **track 1** → **+ battery**
8-track connector **track 2** → **battery earth**

Repair if necessary.

Check the battery and charge circuit if the problem persists.

AFTER REPAIR	Apply the reference value to confirm that the repair is successful. Deal with any other possible faults. Clear the stored faults and check that no other fault appears.

GETtheMANUALS.org

DF010 present or stored	EXCEEDING START UP TIME 1.DEF

NOTES	It is a condition of application of the diagnostic to the stored fault that only one fault can be declared as present at a time. **The fault is declared present if two unsucessful attempts have been made to ignite the boiler in 180 seconds and no other fault is declared present.**

Check the **air inlet and exhaust ducts.** Repair if necessary.
Check the **diesel supply pipes for bubbles.** Check the condition of the metering pump filter Repair if necessary.
Measure the resistance at the filter pump terminals.If it is not **10 Ω ± 5%** replace the metering pump.
Check the condition of the **spark plug.** Replace if necessary.
Replace the **boiler** if the fault persists.

AFTER REPAIR	Apply the reference value to confirm that the repair is successful. Deal with any other possible faults. Delete the stored faults and check that no other fault appears.

GETtheMANUALS.org

DF011 present or stored	EXCEEDING THE COOLING FAN TIME 1.DEF : if flame detector **> 70˚C** the engine cooling fan is activated for **four minutes**

NOTES	It is a condition of application of the diagnostic to the stored fault that only one fault can be declared present at a time. **The fault is declared present after the boiler has been ignited and with no other fault declared present.**

Check the exhaust gas and the combustion air ducts.
Repair if necessary.

Remove the blower cover and disconnect connector B2 from the control unit.
Check the condition of the connector and replace it if necessary.

Check the **insulation, continuity and absence of interference resistance of the connectors:**

connector B2 **track 1** → flame detector
connector B2 **track 2** → flame detector

Repair if necessary.

Measure the resistance at the flame detector terminals.If it is not **1200 KΩ ± 5% at 50˚C** replace the internal wiring of the boiler (the overheating switch is connected to the wiring).

Replace the **boiler** if the fault persists.

AFTER REPAIR	Apply the reference value to confirm that the repair is successful. Deal with any other possible faults. Delete the stored faults and check that no other fault appears.

GETtheMANUALS.org

DF012 present or stored	CONTROL UNIT 1.DEF: Unidentified electrical fault

NOTES	It is a condition of application of the diagnostic to the stored fault that only one fault can be declared as present at a time. **The fault is declared present after the boiler has been ignited and with no other fault declared present.**

Replace the **control unit**.

AFTER REPAIR	Apply the reference value to confirm that the repair is successful. Deal with any other possible faults. Delete the stored faults and check that no other fault appears.

AC002 AC003	BOILER CONTROL AC002 : Ignite the boiler AC003 : Extinguish the boiler

NOTES	**Important : During boiler control, it is essential that the engine is running to avoid any overheating due to non-circulation of water.**

The command menu on the diagnostic tool can be used to stop or start the boiler.If it fails to start check the following:

– there is fuel in the tank,
– the fuses are intact
– the combustion air inlet and outlet ducts are not blocked.

Repair if necessary.

Check **the connection and the condition of the intermediary 5-track connector** between the vehicle wiring and the boiler and replace if necessary.

Check the **insulation, continuity and absence of interference resistance** of the connections between:

+ battery	→	**Track A** 5 track connector
Earth	→	**Track D** 5 track connector
+12V After contact	→	**Track E** 5-track connector
HK7 diagnostic socket	→	**Track B** 5 track connector

Repair if necessary.

Replace the **boiler if the fault persists.**

GETtheMANUALS.org

ET001	+APC PRESENT

NOTES	None.

If the state **INACTIVE is displayed** check that the battery charge is above **10.2 volts,** otherwise repair the vehicle charge circuit.
Check **the connection of the intermediary 5 track connector** between the vehicle wiring and the boiler and replace if necessary. Check **the connection and condition of the intermediary 8-track connector located on the boiler mounting.**
Check the **insulation, continuity and absence of interference resistance** of the connections between: **+ battery** → **Track 1** 8 track connector **Earth** → **Track 2** 8 track connector **+12 V After connector** → **Track 7** 8 track connector Repair if necessary.
Replace the boiler **control unit** if the problem persists.

GETtheMANUALS.org

ET005	BOILER OUTPUT

NOTES	None

OFF	State normal **if engine** off. The state of the boiler is **OFF** if the external air temperature is **above 5˚C.** The boiler is also **OFF** when the engine temperature is above **82˚C.**

MIN	The state of the boiler is **MINIMUM OUTPUT** when the engine temperature is between **77˚C and 82˚C and is increasing, and** the external air temperature is below **5˚C.** The state of the boiler is **MINIMUM OUTPUT** when the engine temperature is between **82˚C and 73˚C and is decreasing, and** the external air temperature is below **5˚C.**

AVERAGE	The state of the boiler is **AVERAGE OUTPUT** when the outside air temperature is below **5˚C** and the coolant temperature is below **73˚C**. It will function at this level of output until the coolant temperature reaches **77˚C.**

GETtheMANUALS.org

ET007	ENGINE RUNNING

NOTES	None.

Check **the connection and condition of the connector** on the alternator and the vehicle charge circuit. Repair if necessary.
Check the **insulation, the continuity and absence of interference resistance** on the connection between: **Alternator track L** ⟶ **Track C** 5 track connector Repair if necessary.
Check the **insulation, continuity and absence of interference resistance** of the connections between: **Track C** ST1 5 track connector ⟶ **Track 1** ST3 bimetallic strip connector **Track 2** ST3 bimetallic strip connector ⟶ **Track 6** 8 track connector Repair if necessary. If the continuity is poor between **tracks 1 and 2 of the ST3 connector,** replace **the bimetallic strip with a schunt** and test the continuity between **tracks 1 and 2.** Replace the bimetallic strip if necessary.
Replace the **boiler control unit** if the problem persists.

GETtheMANUALS.org

PR108	COMPUTER SUPPLY VOLTAGE

NOTES	None.

Check **the connection of the intermediary 5-track connector** between the vehicle wiring and the boiler and replace if necessary.

Check the **insulation, continuity and absence of interference resistance** of the connections between:

+ Battery	→	**Track A** 5-track connector
Earth	→	**Track D** 5-track connector
+12V After ignition	→	**Track E** 5-track connector

Repair if necessary.

Check the **insulation, continuity and absence of interference resistance** of the connections between:

Track A 5 track connector	→	**Track 1** 8 track connector
Track D 5-track connector	→	**Track 2** 8-track connector
Track E 5 track connector	→	**Track 7** 8 track connector

Repair if necessary.

Replace the **boiler control unit** if the problem persists.

GETtheMANUALS.org

1. SCOPE OF THIS DOCUMENT

This document presents the fault finding procedure applicable to all computers with the following specifications:

Vehicle: **Vel Satis Phase 1 and Phase 2**	*Computer name:* **Climate control**
Function concerned: **Climate control**	*Program No.:* **20**
	Vdiag No.: **09**

2. PREREQUISITES FOR FAULT FINDING

Documentation type:

Fault finding procedures (this manual):
– Assisted fault finding (integrated into the **diagnostic tool**), Dialogys.
Wiring Diagrams:
– Visu-Schéma (CD-ROM), paper.

Type of diagnostic tools:

– **CLIP**

Special tooling required:

Special tooling required	
	Multimeter
Elé. 1681	Computer connection bornier

3. RECAP

Procedure

To save energy, the Vel Satis Phase 1 and Phase 2 UCH interrupts the + after ignition feed after **3 minutes** have elapsed.

To run fault finding on a computer, it is possible to force the + after ignition feed on for **1 hour** by applying the following procedure:
– Press the card unlocking button,
– insert the card in the reader,
– press the Start button (interrupting the timed + after ignition feed mode),
– press and hold the start button for over **5 seconds** until the engine immobiliser warning light starts to flash rapidly (4 Hz).

This forced + after ignition feed mode remains on for **1 hour**.

Pressing the start button or removing the card from the card reader cuts off the forced + after ignition feed, but does not interrupt the forced + after ignition feed mode timing. As long as the full time has not elapsed, switching on the + after ignition feed reactivates the forced + after ignition feed for the remaining time.

GETtheMANUALS.org

Faults

Faults are declared as either present or stored (depending on whether they appeared in a certain context and have disappeared since, or whether they remain present but have not been diagnosed within the current context).

The **present** or **stored** status of faults should be taken into consideration when the diagnostic tool is switched on after the + after ignition feed (without any system components being active).

For a **present fault**, apply the procedure described in the **Interpretation of faults** section.

For a **stored fault**, note the faults displayed and apply the instructions in the **Notes** section.

If the fault is **confirmed** when the instructions in the Notes section are applied, the fault is present. Deal with the fault

If the fault is **not confirmed**, check:
- the electrical lines which correspond to the fault,
- the connectors on these lines (corrosion, bent pins, etc.),
- the resistance of the component detected as faulty,
- the condition of the wires (melted or split insulation, wear).

Conformity check

The aim of the conformity check is to check data that does not produce a fault on the diagnostic tool because the data is inconsistent. Therefore, this stage is used to:
- carry out fault finding on faults that do not have a fault display, and which may correspond to a customer complaint.
- check that the system is operating correctly and that there is no risk of a fault recurring after repairs.

This section gives the fault finding procedures for statuses and parameters and the conditions for checking them.

If a status is not behaving normally or a parameter is outside the permitted tolerance values, consult the corresponding fault finding page.

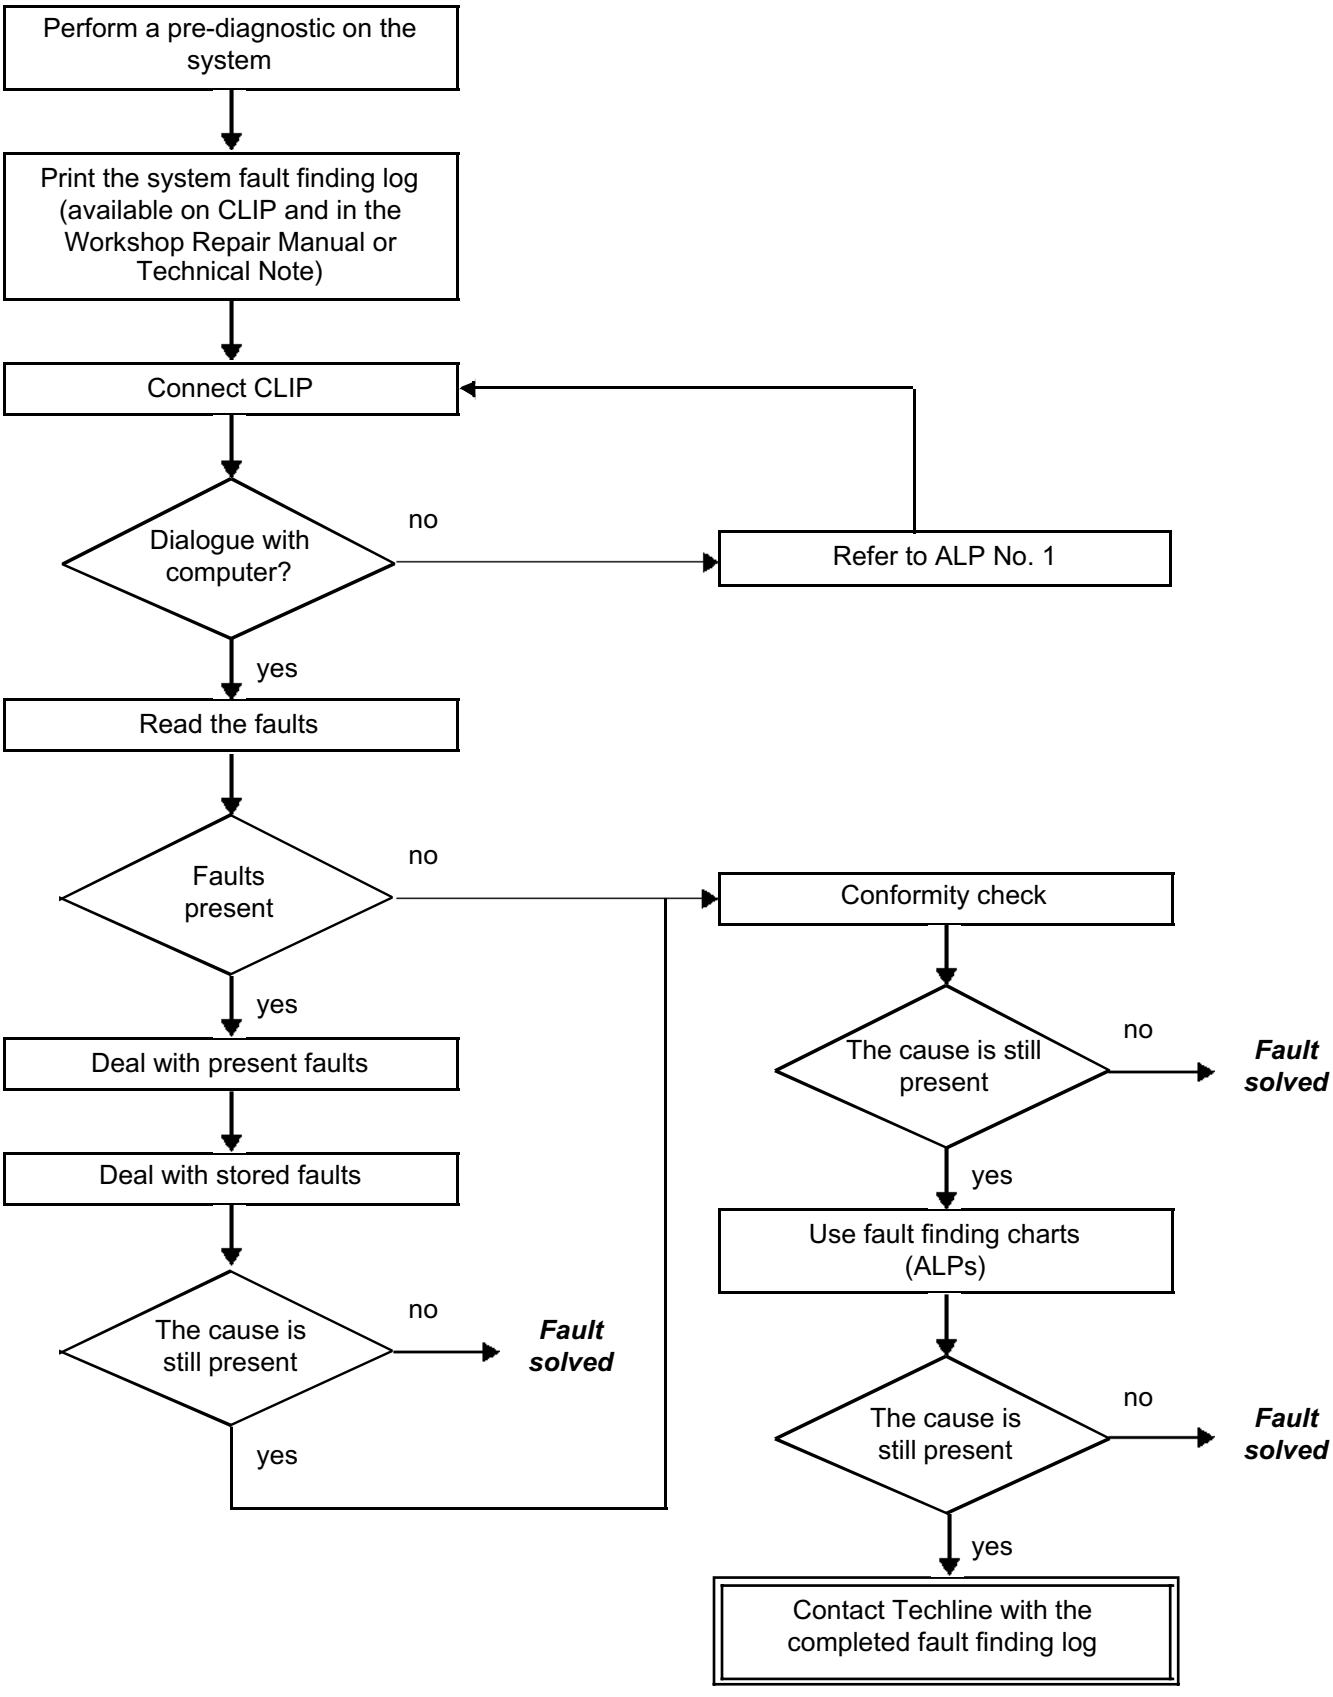
Customer complaints - Fault finding chart

If the test with the diagnostic tool is OK but the customer complaint is still present, the fault should be processed by **customer complaint**.

A synopsis of the general procedure to follow is provided on the following page in the form of a flow chart.

GETtheMANUALS.org

4. FAULT FINDING PROCEDURE



GETtheMANUALS.org

4. FAULT FINDING PROCEDURE (continued)

Wiring check

Fault finding problems
Disconnecting the connectors and/or manipulating the wiring harness may temporarily remove the cause of a fault.
Electrical voltage, resistance and insulation measurements are generally correct, especially if the fault is not present when the analysis is made (stored fault).

Visual inspection
Look for damage under the bonnet and in the passenger compartment.
Carefully check the fuses, insulators and wiring harness routing.
Look for signs of oxidation.

Tactile inspection
While manipulating the wiring harness, use the diagnostic tool to note any change in fault status from stored to present.
Make sure that the connectors are properly locked.
Apply light pressure to the connectors.
Twist the wiring harness.
If there is a change in status, try to locate the source of the fault.

Inspection of each component
Disconnect the connectors and check the appearance of the clips and tabs, as well as the crimping (no crimping on the insulating section).
Make sure that the clips and tabs are properly locked in the sockets.
Check that no clips or tabs have been dislodged during connection.
Check the clip contact pressure using an appropriate model of tab.

Continuity and insulation check
Check the continuity of entire lines, then section by section.
Look for a short circuit to earth, to **+ 12 V** or to another wire.

If a fault is detected, repair or replace the wiring harness.

GETtheMANUALS.org

5. FAULT FINDING LOG

IMPORTANT

IMPORTANT
Any fault on a complex system requires a full fault finding procedure with the appropriate tools. The FAULT FINDING LOG, which should be completed during the procedure, enables you to keep track of the procedure which is carried out. It is an essential document when consulting the manufacturer.

IT IS THEREFORE MANDATORY TO FILL OUT A FAULT FINDING LOG EACH TIME FAULT FINDING IS CARRIED OUT.

You will always be asked for this log:

- when requesting technical assistance from Techline,
- for approval requests when replacing parts for which approval is mandatory,
- to be attached to monitored parts for which reimbursement is requested. The log is needed for warranty reimbursement, and enables better analysis of the parts removed.

6. SAFETY ADVICE

Safety rules must be observed during any work on a component to prevent any damage or injury:

– check the battery voltage to avoid incorrect operation of computer functions,
– Use the proper tools.

REPLACING THE CLIMATE CONTROL COMPUTER:

WARNING
Before replacing the climate control computer, check that it is faulty (read faults, conformity of variables, read customer complaints). Techline will authorise replacement of the computer after completion of a fault finding log (available in this manual and the diagnostic tool).

– Note the computer configuration according to the optional equipment fitted on the vehicle.
– Ensure that the ignition is switched off.
– After approval from the **Techline,** replace the computer.
– Switch on the ignition and carry out a check using the diagnostic tool.
– Configure the computer according to the vehicle specifications.
– Switch off the ignition and then back on for the configurations to register.
– Go to the Read configuration menu and confirm that the configurations have been stored.
– Check for faults and carry out the fault finding procedure corresponding to the possible faults shown on the diagnostic tool.
– Clear any stored faults.
– Start the engine, switch on the air conditioning and ensure that it is working correctly.

GETtheMANUALS.org

CLIMATE CONTROL COMPUTER CONFIGURATION: The climate control computer has several configurations. These configurations need to be set after replacing the computer.
These configurations are important as they ensure optimal air conditioning inside the vehicle (improved control of the climate control). If they are not entered correctly, cold air and warm air production will be severely affected.
Take configuration readings to ensure that the configurations have taken effect.

NOTES	None.

Check **the connection and condition** of the climate control control panel connectors.
Repair if necessary.

Connect the universal bornier in place of the computer and check the **insulation, continuity and the absence of interference resistance** on the following connections:

- computer connector A **track 1** → **earth**
- computer connector A **track 16** → **earth**
- computer connector A **track 30** → **earth**
- computer connector A **track 6** → **+ after ignition**
- computer connector A **track 18** → **+ after ignition**

Repair if necessary.

If the fault is still present, **replace the control panel** for the climate control system (before carrying out the replacement, record the configuration to program the new computer).

AFTER REPAIR	Reconfigure the computer (see the help section). Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF002 PRESENT	REFRIGERANT PRESSURE SENSOR CIRCUIT CO : open circuit CC : short circuit

NOTES	**Special notes:** The air conditioning compressor disengages if the condenser outlet pressure is below 2 bar or above 27 bar (relative).

Check the **connection and condition** of the refrigerant pressure sensor connector.
Replace the connector if necessary.

use the universal bornier to check the **insulation, continuity and the absence of interference resistance** on the following connections:

computer connector A **track 8** → **track A** of the pressure sensor
computer connector A **track 11** → **track B** of the pressure sensor
computer connector A **track 3** → **track C** of the pressure sensor

Repair if necessary.

With the ignition switched on, check that the sensor is correctly supplied by the computer by measuring between: **track A** and **track B** of the sensor.
If there is no **5 V**, replace the climate control computer.

If the fault is still present, **replace** the pressure sensor.

AFTER REPAIR	Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF007 PRESENT	INTERIOR TEMPERATURE SENSOR CIRCUIT CO : open circuit CC : short circuit

NOTES	**Special notes:** The interior temperature sensor is attached to a printed circuit with the humidity sensor. This component is located in the fixed casing below the interior rear-view mirror.

Check **the connection and condition** of the interior temperature sensor connector. Replace the connector if necessary.
With the ignition on, check that the temperature sensor fan **is operating correctly**. If it is not working, check for **+12 V** on **track 1** of the temperature sensor connector and **earth** on **track 3**. If the fan feed is correct and the fault is still present, replace the **sensors/fan** (the fan is not available separately).
Connect the universal bornier in place of the computer and check the **insulation, continuity and the absence of interference resistance** of the following connections: computer connector A **track 29** ⟶ **track 4** of the temperature sensor computer connector A **track 26** ⟶ **track 5** of the temperature sensor Repair if necessary.
Check **the resistance value** of the sensor across: **Track 4** and **track 5** of the internal temperature sensor connector and replace the sensor if the resistance is not approximately: **10 kΩ at 25°C**.
If the fault is still present, **replace** the internal temperature sensor.

AFTER REPAIR	Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF018 PRESENT OR STORED	RIGHT-HAND MIXING MOTOR CIRCUIT

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the air conditioning has been switched on and the right-hand temperature control has been operated.
	Special notes: The dashboard must be removed to allow access to check the mixer motor.

Connect the universal bornier in place of the computer and check the **resistance value** of the motor as well as the **insulation against earth and against + 12 V** of the connections between:
Track 26 and **track 27** of computer connector B or **tracks 11** and **12** of the new 2005 computer connector B.
The motor should have a resistance of approximately: **36** Ω at 20˚C.

If the value is incorrect, or if the fault is still present due to a poor or loose connection: **remove the dashboard** to gain access to the right-hand mixing motor.

Check **the connection and condition of the** right-hand mixing motor.
Replace the connector if necessary.

Check that the mixing motor flap is not **jammed**.
Repair if necessary.

Connect the universal bornier in place of the computer and check the **insulation, continuity and the absence of interference resistance** of the following connections:

computer connector B **track 26** ⟶ **track 5** of the right-hand mixing motor
computer connector B **track 27** ⟶ **track 6** of the right-hand mixing motor

or:

computer connector B **track 11** ⟶ **track 5** of the right-hand mixing motor
computer connector B **track 12** ⟶ **track 6** of the right-hand mixing motor

For the new redesign 2005 computer.
Repair if necessary.

Check the resistance value of the right-hand mixing motor by measuring between:
track 5 and **track 6** of the mixing motor connector; replace the motor if the resistance is not approximately: **36 Ω** at 20˚C.

If the fault is still present, **replace** the right-hand mixing motor.

AFTER REPAIR	Follow the instructions to confirm repair. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF019 PRESENT OR STORED	LEFT-HAND MIXING MOTOR CIRCUIT

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the climate control system has been switched on and the left-hand side temperature control has been operated.
	Special notes: The dashboard must be removed to allow access to check the mixer motor.

Connect the universal bornier in place of the computer and check the **resistance value** of the motor as well as the **insulation against earth and against + 12 V** of the connections by measuring between:
Track 22 and **track 23** of computer connector B or **tracks 7** and **8** of the new 2005 redesign computer connector B.
The motor should have a resistance of approximately: **36** Ω at 20˚C.

If the value is incorrect, or if the fault is still present due to a poor or loose connection: **remove the dashboard** to gain access to the left-hand mixing motor.

Check **the connection and condition of the** left-hand mixing motor.
Replace the connector if necessary.

Check that the mixing motor flap is not **jammed**.
Repair if necessary.

Connect the universal bornier in place of the computer and check the **insulation, continuity and the absence of interference resistance** of the following connections:

computer connector B **track 22** ⟶ **track 5** of the left-hand mixing motor
computer connector B **track 23** ⟶ **track 6** of the left-hand mixing motor

or:

computer connector B **track 7** ⟶ **track 5** of the left-hand mixing motor
computer connector B **track 8** ⟶ **track 6** of the left-hand mixing motor

For the new redesign 2005 computer.
Repair if necessary.

Check the resistance value of the left-hand mixing motor by measuring between:
track 5 and **track 6** of the mixing motor connector; replace the motor if the resistance is not approximately: **36 Ω** at 20˚C.

If the fault is still present, **replace** the left-hand mixing motor.

AFTER REPAIR	Follow the instructions to confirm repair. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF020 PRESENT	EVAPORATOR TEMPERATURE SENSOR CIRCUIT CO : open circuit CC : short circuit

NOTES	None.

Check **the connection and condition** of the evaporator temperature sensor connector.
Replace the connector if necessary.

Connect the universal bornier in place of the computer and check the **insulation, continuity and the absence of interference resistance** of the following connections:

computer connector B **track 28** → **track 1** of the temperature sensor
computer connector B **track 15** → **track 2** of the temperature sensor

or:

computer connector B **track 13** → **track 1** of the temperature sensor
computer connector B **track 5** → **track 2** of the temperature sensor

For the new redesign 2005 computer.
Repair if necessary.

Check the resistance value of the evaporator temperature sensor by measuring between:
track 1 and the **track 2** of the evaporator temperature sensor connector and replace the sensor if the resistance is not approximately: **30 kΩ** at 25˚C.

If the fault is still present, **replace** the evaporator temperature sensor.

AFTER REPAIR	Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF021 PRESENT OR STORED	RECIRCULATION MOTOR CIRCUIT

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the climate control system has been switched on and the recirculation control has been operated.
	Special notes: The air recirculation motor is located beneath the particle filter and the base of the glove compartment must be removed to gain access to it.

Check **the connection and condition** of the air recirculation motor.
Replace the connector if necessary.

Check that the recirculation motor flap is not **jammed**.
Repair if necessary.

Connect the universal bornier in place of the computer and check the **insulation, continuity and the absence of interference resistance** of the following connections:

computer connector B **track 29** → **track A** of the air recirculation motor
computer connector B **track 30** → **track B** of the air recirculation motor

or:

computer connector B **track 14** → **track A** of the air recirculation motor
computer connector B **track 15** → **track B** of the air recirculation motor

For the new redesign 2005 computer.
Repair if necessary.

Check the resistance value of the recirculation motor by measuring between:
track A and **track B** of the recirculation motor connector and replace the motor if the resistance is not approximately: **36** Ω at 20˚C.

If the fault is still present, **replace** the recirculation motor.

AFTER REPAIR	Follow the instructions to confirm repair. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF026 PRESENT	SOLAR RADIATION SENSOR CIRCUIT CO : open circuit CC : short circuit

NOTES	**Special notes:** The sunlight sensor (a little black button) is located on top of the instrument panel, on the windscreen side.

Check that the solar radiation sensor is not hidden under something (nothing should be placed on top of the sensor).

Check **the connection and condition of the** solar radiation sensor connector.
Replace the connector if necessary.

Connect the universal bornier in place of the computer and check the **insulation, continuity and the absence of interference resistance** of the following connections:
computer connector A **track 26** ⟶ **track 1** of the solar radiation sensor
computer connector A **track 19** ⟶ **track 2** of the solar radiation sensor
Repair if necessary.

If the fault is still present, **replace** the solar radiation sensor.

AFTER REPAIR	Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF027 PRESENT	HUMIDITY SENSOR CIRCUIT

NOTES	**Special notes:** The humidity sensor is attached to a printed circuit with the interior temperature sensor. This component is located in the fixed casing below the interior rear-view mirror.

Check **the connection and condition** of the humidity sensor connector.
Replace the connector if necessary.

With the ignition on, check that the humidity sensor fan **is operating correctly**.
If not, check for **+12 V** on **track 1** of the humidity sensor connector and an **earth** on **track 3**.
If the fan feed is correct and the fault is still present, replace the **sensors/fan** (the fan is not available separately).

Connect the universal bornier in place of the computer and check the **insulation, continuity and the absence of interference resistance** of the following connections:
computer connector A **track 26** ⟶ **track 5** of the humidity sensor
computer connector A **track 22** ⟶ **track 6** of the humidity sensor
Repair if necessary.

If the fault is still present, **replace** the humidity sensor.

AFTER REPAIR	Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF028 PRESENT OR STORED	FOOTWELL/VENTILATION DISTRIBUTION MOTOR CIRCUIT

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the climate control has been activated and the air distribution control has been operated.

Connect the universal bornier in place of the computer and check the **resistance value** of the motor as well as the **insulation against earth and against + 12 V** of the connections by measuring between:
Track 24 and **track 25** of computer connector B or **tracks 9** and **10** of the new 2005 computer connector B.
The motor should have a resistance of approximately: **36** Ω at 20˚C.

If the value is incorrect, or if the fault is still present due to a poor or loose connection: **remove the dashboard** to gain access to the footwell/ventilation distribution motor.

Check **the connection and condition** of the footwell distribution motor connector.
Replace the connector if necessary.

Check that the distribution motor flap is not **jammed**.
Repair if necessary.

Connect the universal bornier in place of the computer and check the **insulation, continuity and the absence of interference resistance** of the following connections:

computer connector B **track 24** ⟶ **track A** of the footwell distribution motor
computer connector B **track 25** ⟶ **track B** of the footwell distribution motor

or:

computer connector B **track 9** ⟶ **track A** of the footwell distribution motor
computer connector B **track 10** ⟶ **track B** of the footwell distribution motor

For the new redesign 2005 computer.
Repair if necessary.

Check the resistance value of the distribution motor by measuring between:
track A and **track B** of the distribution motor connector and replace the motor if the resistance is not approximately: **36** Ω at 20˚C.

If the fault is still present, **replace** the footwell distribution motor.

AFTER REPAIR	Follow the instructions to confirm repair. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF030 PRESENT	COMPRESSOR OUTPUT CONTROL CIRCUIT CO : open circuit CC : short circuit

NOTES	**Special notes:** The capacity of the compressor is electrically controlled by a control valve on the F4R, G9T, and M9R engines. V4Y and P9X engines are not fitted with this valve, the capacity is pneumatically controlled (CALSONIC V6 and Denso 7SBU16 compressors). This fault finding procedure **can therefore not be carried out on vehicles fitted with** V4Y and P9X engines.

Check **the connection and condition** of the compressor capacity control connector. Repair if necessary.
With the ignition on, check for **+ 12 V** on **track B** of the compressor output control connector. Repair if necessary.
Connect the universal bornier in place of the computer and check the **insulation, continuity and the absence of interference resistance** on the following connection: Computer connector A **track 7** ⟶ Output control solenoid valve **track A** Repair if necessary.
Measure the resistance between: **track A** and **track B** of the compressor output control solenoid valve; replace the compressor if the resistance is not approximately: **18.5 Ω** ± 0.5% at 25˚C.
If the fault is still present, the climate control computer may be damaged, contact Techline.

AFTER REPAIR	Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF033 PRESENT OR STORED	REFRIGERANT FLUID CHARGE

NOTES	**Conditions for applying the fault finding procedure to stored faults:** Once the fault is stored, it is difficult to reproduce (**6** consecutive journeys required); the fault finding procedure should be applied even if the fault is only stored.
	Special notes: The refrigerant fill is measured following road tests at 54 mph (90 km/h) (maximum capacity). The fault will be confirmed after the 6th test, if the above conditions are observed. This fault only concerns compressors with electrical capacity control. In vehicles with pneumatically controlled compressors, the compressor compensates for the loss of refrigerant by reducing its capacity. Consequently, the air conditioning becomes less efficient.
	Priorities when dealing with a number of faults: – Deal with fault **DF002 REFRIGERANT PRESSURE SENSOR CIRCUIT** first, if it is present or stored.

Then check for refrigerant leaks. Repair if necessary.
Check the **level of refrigerant** (for reference, the amount of refrigerant to use is 650 g ± 25 g).
Clear the refrigerant charge fault before starting the engine and carrying out any tests.

AFTER REPAIR	Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF043 PRESENT	MULTIPLEX NETWORK DEF : apply the multiplex network fault finding procedure 1.DEF: apply the multiplex network fault finding procedure

NOTES	None.

Check **the connection and condition** of the climate control control panel connectors.
Repair if necessary.

Connect the universal bornier in place of the computer and check the **insulation, continuity and the absence of interference resistance** of the following connections:

computer connector A **track 9** ⟶ **track CAN L** of the UCH
computer connector A **track 10** ⟶ **track CAN H** of the UCH
(refer to diagrams for the vehicle and model year concerned).

Repair if necessary.

If the fault is still present, **carry out fault finding** on the multiplex network.

AFTER REPAIR	Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF082 PRESENT OR STORED	PASSENGER COMPARTMENT BLOWER MOTOR CIRCUIT

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: the ventilation is switched on.
	Special notes: An open circuit on track 27 (passenger compartment fan unit power module control) will not be detected by the diagnostic tool but will result in customer complaints (**ALP 6** and **ALP 9**) as the passenger compartment climate control will no longer work.

Check **the connection and condition** of the black 2 ∞ 5-track connector bolted underneath the glove compartment as well as **the connection and condition** of the following three connectors:
– the blue 2-track connector and the black 4-track connector of the fan unit power module.
– the black 2-track connector of the fan.
Repair if necessary.

With the ignition on, check for **+12 V** on **track B5** and an earth on **track B4** of the black 2 x 5-track connector of the passenger compartment fan unit.

Connect the universal bornier in place of the computer and check the **insulation, continuity and the absence of interference resistance** of the following connections:
computer connector A **track 13** ⟶ **track A2** of the power module
computer connector A **track 27** ⟶ **track A3** of the power module
Repair if necessary (refer to the diagram in the HELP section).

Disconnect the black 2-track blower connector and **measure the resistance** of the blower between track A and track B.
Replace the fan if its resistance is zero or infinite.

If the fault is still present, **replace** the fan unit power module.

AFTER REPAIR	Clear the stored faults. Follow the instructions to confirm repair. Deal with any other faults.

GETtheMANUALS.org

DF090 PRESENT	COMPRESSOR CONTROL CO : open circuit CC : short circuit

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the ventilation is switched on.

Check **the connection and condition** of the compressor clutch connector. Repair if necessary.
With the ignition on, check for **+ 12 V** on **track B** of the compressor clutch connector.
Connect the universal bornier in place of the computer and check the **insulation, continuity and the absence of interference resistance** on the following connection: computer connector A **track 15** ⟶ **track A** of the compressor clutch Repair if necessary.
Measure the resistance between: **track A** and **track B** of the compressor clutch and replace the compressor if the resistance is not between 3 and 4 Ω.

AFTER REPAIR	Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF092 PRESENT	INJECTION MULTIPLEX SIGNAL ABSENT DEF : apply the multiplex network fault finding procedure 1.DEF: apply the multiplex network fault finding procedure

NOTES	None.

Check **the connection and condition** of the climate control control panel connectors.
Repair if necessary.

Connect the universal bornier in place of the computer and check the **insulation, continuity and the absence of interference resistance** on the following connections:

computer connector A **track 9** ⟶ **track CAN L** of the injection computer
computer connector A **track 10** ⟶ **track CAN H** of the injection computer
(refer to diagrams for the vehicle and model year in question).

Repair if necessary.

If the fault is still present, **perform fault finding** on the multiplex network and the injection system.

AFTER REPAIR	Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF093 PRESENT	NO UCH MULTIPLEX SIGNAL DEF : apply the multiplex network fault finding procedure 1.DEF: apply the multiplex network fault finding procedure

NOTES	None.

Check **the connection and condition** of the air conditioning control panel connectors.
Repair if necessary.

Connect the universal bornier in place of the computer and check the **insulation, continuity and the absence of interference resistance** on the following connections:

computer connector A **track 9** → **track CAN L** of the UCH
computer connector A **track 10** → **track CAN H** of the UCH
(refer to diagrams for the vehicle and model year in question).

Repair if necessary.

If the fault is still present, **carry out fault finding** on the multiplex network.

AFTER REPAIR	Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF094 PRESENT	NO ABS MULTIPLEX SIGNAL DEF : apply the multiplex network fault finding procedure 1.DEF: apply the multiplex network fault finding procedure

NOTES	None.

Check **the connection and condition** of the air conditioning control panel connectors.
Repair if necessary.

Connect the universal bornier in place of the computer and check the **insulation, continuity and the absence of interference resistance** of the following connections:

computer connector A **track 9** ⟶ **track CAN L** of the ABS computer
computer connector A **track 10** ⟶ **track CAN H** of the ABS computer
(refer to diagrams for the vehicle and model year in question).

Repair if necessary.

If the fault is still present, **carry out fault finding** on the multiplex network.

AFTER REPAIR	Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

ET005	REFRIGERANT: UNDERPRESSURE

NOTES	The under-pressure status rises if the pressure reading taken by the sensor is **below 2 bar**.
	There must be no present or stored faults. (in particular, faults: **DF033** Refrigerant load and **DF002** Refrigerant pressure sensor circuit).
	Special note: The underpressure status **inhibits** air conditioning operation.

Check the **connection and condition** of the refrigerant fluid pressure sensor connector. Replace the connector if necessary.
Connect the bornier in place of the computer and check the **insulation, continuity and the absence of interference resistance** on the following connections: computer connector A **track 8** ⟶ **track A** of the pressure sensor computer connector A **track 11** ⟶ **track B** of the pressure sensor computer connector A **track 3** ⟶ **track C** of the pressure sensor Repair if necessary.
With the ignition switched on, check that the sensor is correctly supplied by the computer across: **track A** and **track B** of the sensor. If the voltage is not **5 V**, replace the climate control computer.
Ensure that there are no refrigerant fluid **leaks** in the climate control system.
If the fault is still present, **check the refrigerant fluid (650 g ± 25 g)**. Refill if necessary.
If the refrigerant level is correct, there are no leaks in the climate control system and the pressure sensor connections checks are correct: **replace** the pressure sensor.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET006	REFRIGERANT: OVERPRESSURE

NOTES	The overpressure status is set if the pressure reading taken by the sensor is **above 27 bar (relative)**.
	There must be no present or stored faults. (in particular faults: **DF033** Refrigerant charge, **DF030** Compressor capacity control circuit and **DF002** Refrigerant pressure circuit).
	Special note: The overpressure status **inhibits** air conditioning operation.

For electrically controlled capacity:
Check the **connection and condition** of the refrigerant fluid pressure sensor connector.
Replace the connector if necessary.

Connect the bornier in place of the computer and check the **insulation, continuity and the absence of interference resistance** of the following connections:

computer connector A **track 8** ⟶ **track A** of the pressure sensor
computer connector A **track 11** ⟶ **track B** of the pressure sensor
computer connector A **track 3** ⟶ **track C** of the pressure sensor

Repair if necessary.

Display parameter: **PR016** Refrigerant pressure, and check that the pressure readings drop sharply (the parameter should not remain static) after the climate control has been turned off.
If the pressure does not fall, **replace** the refrigerant pressure sensor.

Check that **the capacity control is being correctly carried out** by displaying parameter **PR104** Compressor capacity control:
– With the engine off, this parameter should display 0 % (maximum capacity).
– With the engine running and the air conditioning switched on, this parameter should display a value between 0 and 100 % (there is no standard control case because there are multiple conditions for this case).

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET006 **CONTINUED 1**	

If the capacity does not vary and the control solenoid valve is not faulty:
With the ignition on, check for **12 V feed** on **track B** of the capacity control solenoid valve.
Repair if necessary.

If the capacity still does not vary: **check the refrigerant level** (650 g ± 25 g) as a shortage of refrigerant may be corrected by the climate control system, which will raise the compressor capacity (in order to maintain climate control efficiency).
Refill if necessary.

If the refrigerant fluid level is correct and the capacity control is operating correctly (feed on track B of the solenoid valve and an earth control on track A) there may be a mechanical fault on the compressor capacity control card.
If this is the case **replace the air conditioning compressor**.

For pneumatically controlled capacity:
Check the **connection and condition** of the refrigerant pressure sensor connector.
Replace the connector if necessary.

Connect the bornier in place of the computer and check **the insulation, continuity and absence of interference resistance** on the following connections:

computer connector A **track 8** → **track A** of the pressure sensor
computer connector A **track 11** → **track B** of the pressure sensor
computer connector A **track 3** → **track C** of the pressure sensor

Repair if necessary.

Display parameter: **PR016** Refrigerant pressure, and check that the pressure readings drop sharply (the parameter should not remain static) after the climate control has been turned off.
If the pressure does not fall, **replace** the refrigerant pressure sensor.

If the refrigerant pressure is correct, there may be a mechanical fault on the compressor capacity control card.
If this is the case **replace the air conditioning compressor**.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET022	HEATED REAR SCREEN CONTROL

NOTES	If the active/inactive status is inconsistent, apply the interpretation of this status.

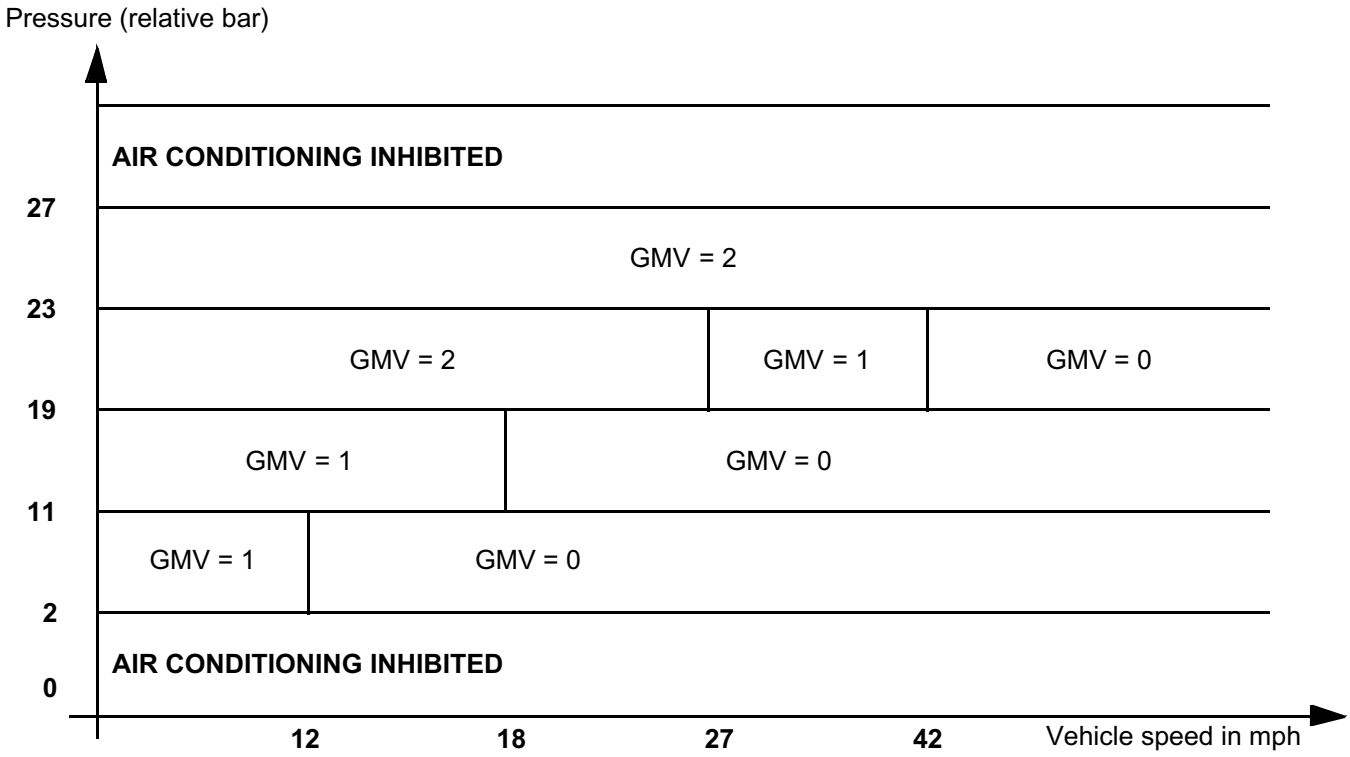
Check for the **presence** of the heated rear screen relay.
Check **the condition of the clips** on the heated rear screen relay, located on the relay plate. Replace the clips if necessary.
With the ignition on, check for **+ 12 V** on **track 1** of the relay.
Connect the universal bornier in place of the computer and check the **insulation, continuity and the absence of interference resistance** on the following connection: computer connector A **track 12** ⟶ **track 2** of the heated rear screen relay Repair if necessary.
Measure **the resistance** of the relay between: **track 1** and **track 2** of the heated rear screen relay and replace the relay if the resistance is not approximately: **60 Ω** at 20 ˚C.

AFTER REPAIR	Follow the instructions to confirm repair. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

ET023	LOW-SPEED FAN ASSEMBLY

NOTES	If the fan unit is not operating as normal, carry out a complete check on the fan unit circuit (details under fault finding - injection).



GMV = 1 Low-speed engine cooling fan
GMV = 2 High-speed engine cooling fan
GMV = 0 Cooling fan off

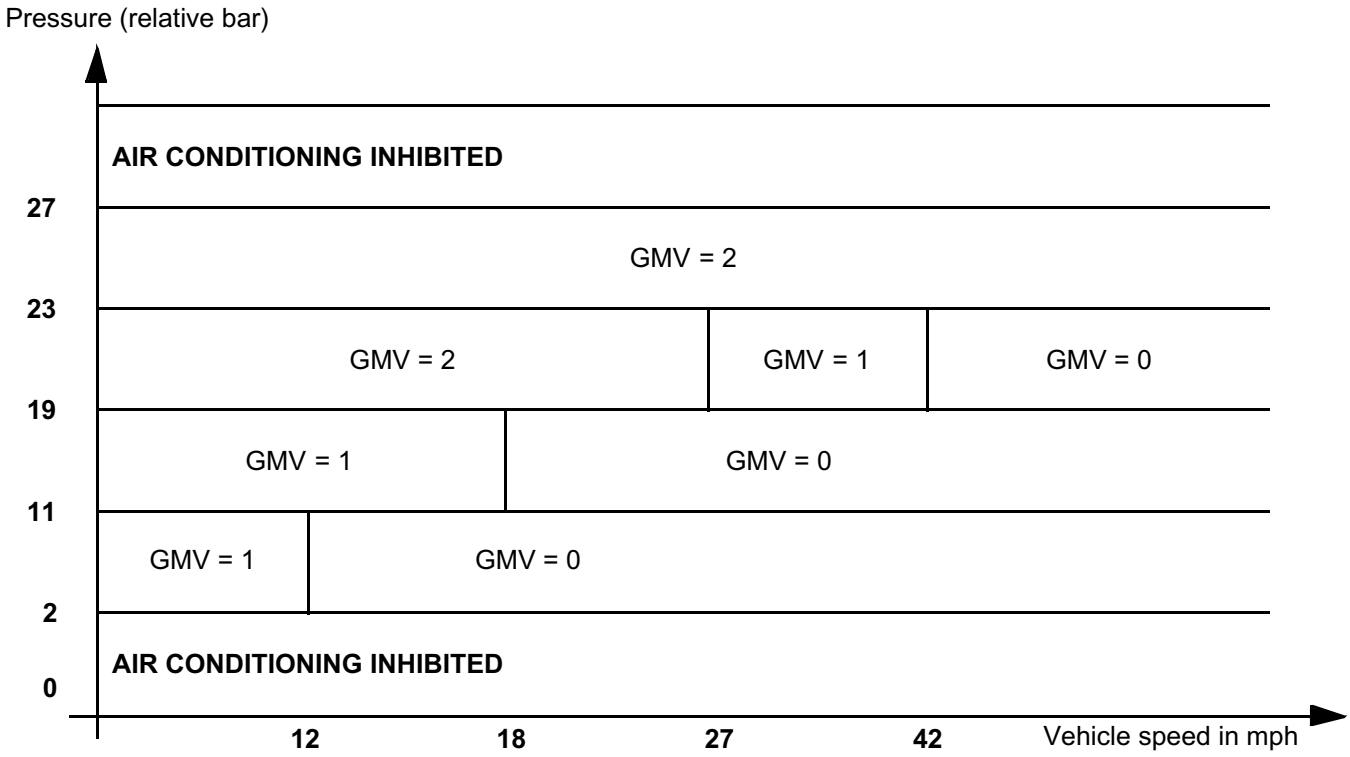
The fan unit is not used for vehicle speeds above 42 mph (70 km/h).
Except in rare cases, or despite the above speed being reached, the pressure is greater than 23 bar e.g.: (when driving behind a lorry).
When the vehicle is stationary, the fan unit is always used, and runs at low speed when the high pressure is lower than 19 bar (relative), and at high speed if not.
When the vehicle is being driven, the fan unit may either not operate or operate at high or low speed depending on the condenser outlet pressure and the vehicle speed.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET024	HIGH-SPEED FAN ASSEMBLY

NOTES	If the fan unit is not operating as normal, carry out a complete check on the fan unit circuit (details under fault finding - injection).



GMV = 1 Low-speed engine cooling fan
GMV = 2 High-speed engine cooling fan
GMV = 0 Cooling fan off

The fan unit is not used for vehicle speeds above 42 mph (70 km/h).
Except in rare cases, or despite the above speed being reached, the pressure is greater than 23 bar e.g.: (when driving behind a lorry).
When the vehicle is stationary, the fan unit always operates, and runs at low speed if the high pressure is lower than 19 bar (relative), and at high speed if not.
When the vehicle is being driven, the fan unit may either not operate or operate at high or low speed depending on the condenser outlet pressure and the vehicle speed.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET028	HEATED WINDSCREEN COMMAND

NOTES	If the active/inactive status is inconsistent, apply the interpretation of this status.

Check for the **presence** of the heated windscreen relay.
Check **the condition of the clips** on the heated windscreen relay, located on the relay plate. Replace the clips if necessary.
With the ignition on, check for **+ 12 V** on **track 1** of the relay.
Connect the bornier in place of the computer and check **the insulation, continuity and absence of interference resistance** on the following connection: computer connector A **track 4** ⟶ **track 2** of the heated windscreen relay Repair if necessary.
Measure **the resistance** of the relay across **track 1** and **track 2** of the heated windscreen relay. Replace the relay if its resistance is zero or infinity (on average, the resistance should be between 60 to 90 Ω depending on the type of relay).

AFTER REPAIR	Follow the instructions to confirm repair. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

ET033	AUTOMATIC MODE

NOTES	None

ET033 AUTOMATIC MODE:

The automatic mode is activated by pressing the **AUTO** button on the control panel. This mode comprises automatic operation of the air distribution, passenger compartment ventilation and compressor engagement functions according to the temperature requested. Only the temperature setpoint (left-hand and right-hand) is made manually.
After the **AUTO** button on the control panel is pressed, status **ET033** should display **YES**. If the status does not display this, check that the warning light on the **AUTO** button lights up at the same time as the **AC** button. If the warning lights do not light up, take a fault reading and carry out a conformity check to verify system conformity. If the fault is still present, contact your **Techline**.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET050	AIR CONDITIONING MODE

NOTES	None

ET050 AIR CONDITIONING MODE:

The air conditioning mode corresponds to the climate control manual mode. This mode is activated by pressing the **AUTO** button on the control panel. This mode comprises engagement of the compressor (according to the temperature requested). Adjustments to the left-hand and right-hand temperature setpoints, air distribution, passenger compartment ventilation and compressor engagement functions are made manually.
After the **AC** button on the control panel is pressed, status **ET050** should display **YES**. If the status does not display this, check that the warning light on the **AC** button lights up. If the warning light does not light up, take a fault reading and carry out a conformity check to verify system conformity.
If the fault is still present, contact your **Techline**.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

PR005	POWER ABSORBED SIGNAL

NOTES	The values listed below are examples only.

Whether the variable capacity compressor is "pneumatic" or electrically controlled, the power absorbed by the compressor can be anything from several hundred watts to approximately 6 kW depending on weather conditions, vehicle speed and compressor rotation speed.

The power absorbed signal is a function of two parameters:
– The continuous high pressure readings.
– The compressor rotation speed.

The power consumed value calculated by the climate control computer is transmitted to the engine computer. This allows the engine computer to anticipate the effect that the load variations induced by the compressor will have on the vehicle at idle speed and when in motion.

GETtheMANUALS.org

PR008	FAN SPEED

NOTES	The values listed below are examples only.

Controlled values with engine stopped and engine running (tolerance ± 15 %).

GETtheMANUALS.org

PR017	CO INPUT TOXICITY

NOTES	**If the CO input toxicity sensor is faulty, the parameter value displayed is 0 %. Fault finding cannot be carried out on this sensor and therefore no fault is associated with it.**

Check the **connection and condition** of the CO input toxicity sensor
Replace the connector if necessary.

Use the universal bornier to check the **insulation, continuity and the absence of interference resistance** of the following connections:

computer connector B **track 16** → **track 5** of the sensor
computer connector B **track 18** → **track 7** of the sensor
computer connector B **track 19** → **track 10** of the sensor

or:

computer connector B **track 1** → **track 5** of the sensor
computer connector B **track 3** → **track 7** of the sensor
computer connector B **track 4** → **track 10** of the sensor

For the new redesign 2005 computer.
Repair if necessary.

If the fault is still present, **replace** the CO input toxicity sensor.

GETtheMANUALS.org

PR018	NO INPUT TOXICITY

NOTES	**If the NO input toxicity sensor is faulty, the parameter value displayed is 0 %. Fault finding cannot be performed on this sensor and therefore there is no associated fault.**

Check the **connection and condition** of the NO input toxicity sensor connector.
Replace the connector if necessary.

Use the universal bornier to check the **insulation, continuity and the absence of interference resistance** of the following connections:

computer connector B **track 16** → **track 5** of the sensor
computer connector B **track 17** → **track 6** of the sensor
computer connector B **track 19** → **track 10** of the sensor

or:

computer connector B **track 1** → **track 5** of the sensor
computer connector B **track 2** → **track 6** of the sensor
computer connector B **track 4** → **track 10** of the sensor

For the new redesign 2005 computer.
Repair if necessary.

If the fault is still present, **replace** the NO input toxicity sensor

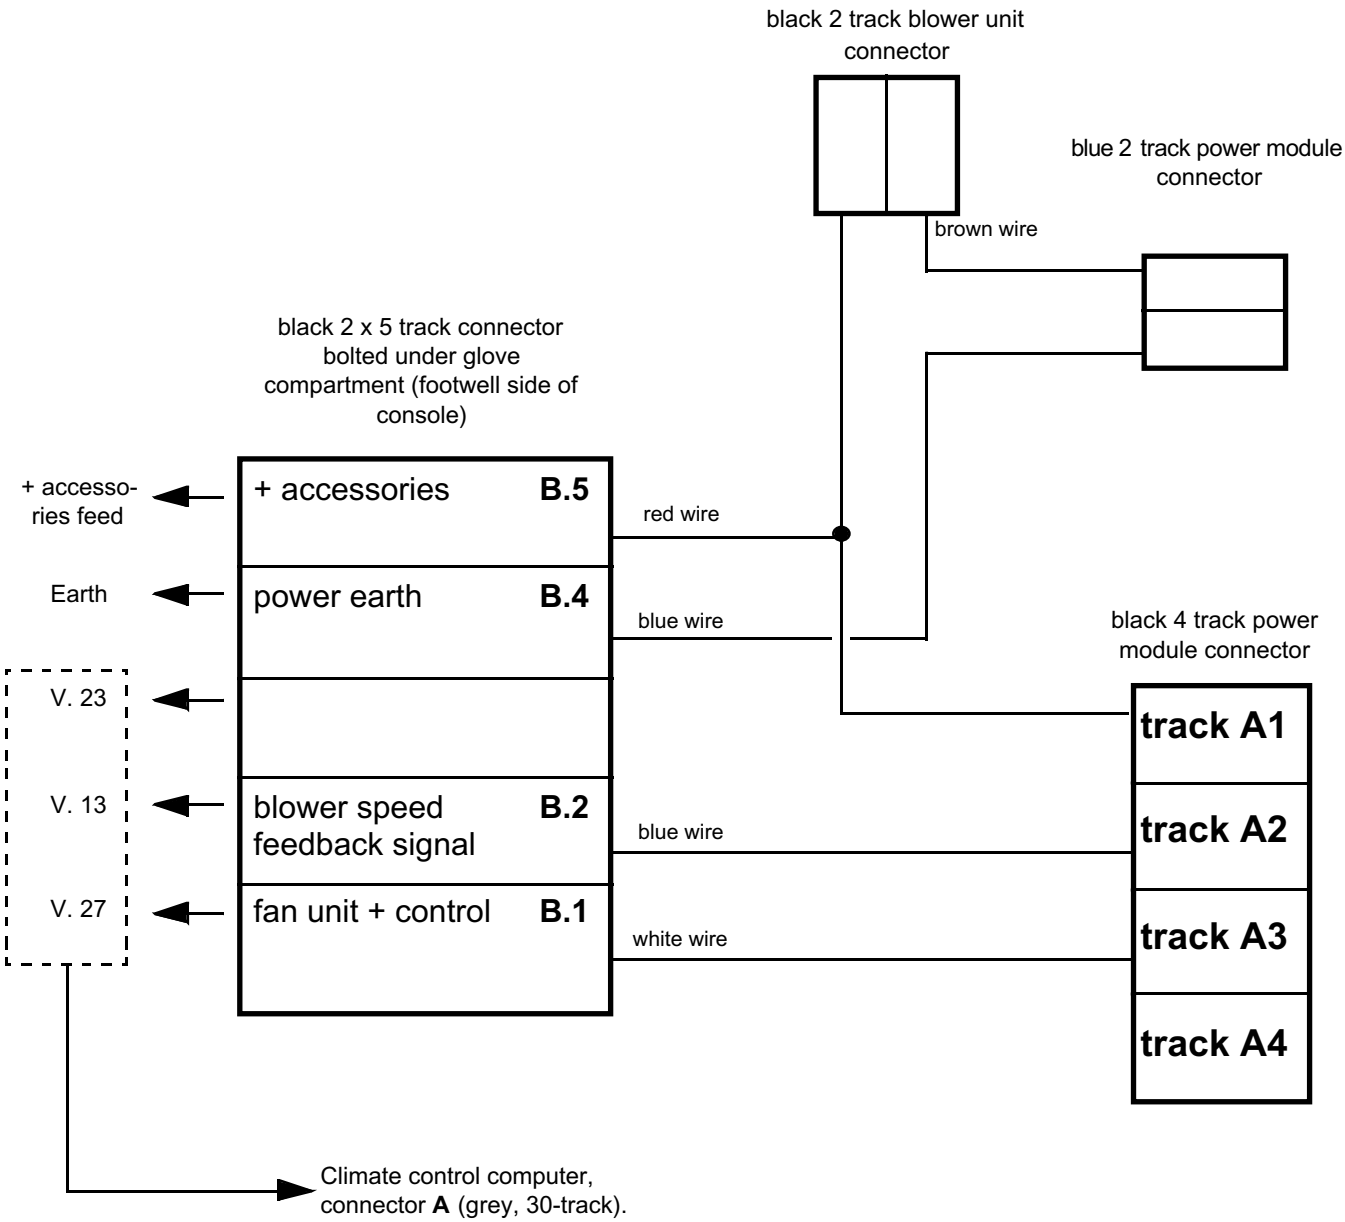
Passenger compartment fan unit sub-harness (beneath glove compartment)



GETtheMANUALS.org

REPLACING THE CLIMATE CONTROL COMPUTER:

– Note the computer configuration according to the optional equipment fitted on the vehicle.

– Ensure that the ignition is switched off.

– Replace the computer (control panel).

– Switch on the ignition and carry out a check using the diagnostic tool.

– Configure the computer according to the optional equipment fitted on the vehicle (see Introduction).

– Go to the read configuration menu and confirm that the configurations have been stored.

– Check for faults and carry out fault finding procedures on any faults that have recurred.

– Clear any stored faults.

– Start the engine, switch on the air conditioning and ensure that it is working correctly.

COLOUR CODING OF COMPUTER CONNECTORS:
– The **grey 30 track** climate control computer connector is referred to in this note as: **connector A**.
– The **green 30 track** climate control computer connector is referred to in this note as: **connector B**.

– The green 15-track connector of the new 2005 redesign climate control computer is also connector B of the new redesign 2005 computer.

Method of recognising the 2005 redesign computer:
– From software 523C31 soft/calibration part no. **8 200 487 008**.
– Visually, you can recognise this computer by looking at the rear side of the control panel: there should be a green 15-track connector, not a 30-track connector.

GETtheMANUALS.org

MEASURING THE CONTROL VOLTAGE OF THE PASSENGER COMPARTMENT FAN UNIT POWER MODULE

There are two ways to measure the control voltage of the passenger compartment fan power module:

1 / Measuring with a multimeter (in voltmeter position):
With the power module connector connected, measure across **track 3** of the module and the earth.
At speed 0, the voltage measured should be approximately 6 V.
At maximum speed (8), the voltage should be zero (± 0.5 V).
The voltage varies between 0 and 6 V for the seven intermediate speeds.

Theoretical values:

speed **0**	6 V
speed **1**	5.1 V
speed **2**	4.75 V
speed **3**	4.3 V
speed **4**	3.9 V

speed **5**	3.5 V
speed **6**	3 V
speed **7**	2.6 V
speed **8**	0 V

2 / Measuring using an oscilloscope (Optima 5800, technical Clip or NXR):
The fan power module is controlled by pulse width modulated control voltage (PWM).
This control voltage is always **6 V**, whereas the control signal (square pulse signal) varies: the amplitude and frequency do not move but the **high status (6 V)** varies in relation to the **low status (0 V)**.
To measure, connect the oscilloscope earth lead to the battery earth and the oscilloscope measuring lead to **track 3** of the power module (module connector connected).
Adjust the time base on the oscilloscope to **2 ms** divisions with a gauge of **5 V** divisions.
The signals obtained should be: a high status of 6 V at 7.6 ms and a low status of 0 V at 0.4 ms for speed 0 and a straight line at 0 V for speed 8.
Example of measurements for the seven speeds in between (for information only):

Blower unit speed	Duration of high state	Duration of low state
speed **1**	7.2 ms	0.8 ms
speed **2**	6.4 ms	1.6 ms
speed **3**	6 ms	2 ms
speed **4**	5.4 ms	2.4 ms
speed **5**	4.8 ms	3.2 ms
speed **6**	4 ms	4 ms
speed **7**	3.6 ms	4.4 ms

GETtheMANUALS.org

ALP 0	No dialogue with the computer

NOTES	**None.**

Try the diagnostic tool on another vehicle.

Check:
– The connection between the diagnostic tool and the diagnostic socket (lead in good condition).
– That the fuses are in good condition.

Check for a **+ 12 V battery feed** on **track 16**, and a **+ 12 V after ignition supply** on **track 1** and an **earth** on **track 5** and on **track 4** of the diagnostic socket.
Repair if necessary.

Disconnect **connector A** from the climate control computer to check the **conformity of the computer feeds** and the **insulation, continuity and absence of interference resistance** on the following connections:
Air conditioning connector A (grey, 30-track)

track 6 → **+ after ignition feed**
track 18 → **+ before ignition feed**
track 1 → **earth**
track 16 → **earth**
track 30 → **earth**
track 5 → **track 7** of the diagnostic socket (line K)

Repair if necessary (see the vehicle wiring diagram).

AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP 1	Air distribution fault

NOTES	Only consult this customer complaint after a **complete check with the diagnostic tool**.
	Special notes: Adjusting the air distribution or ventilation controls switches off automatic air conditioning mode.

Make sure that **the air circuit** (**cabin filter**, scuttle panel grille, air ducts etc.) is not blocked.
Ensure that the blower blades are in good condition.
If necessary, repair, clean or replace the cabin filter.

Check that the blower unit **has no leaks**.
Repair if necessary.

↓

Switch the passenger compartment fan to full, the temperature control to maximum heat or maximum cold, and vary the air distribution.
Check that the air outlet is the one selected.

Is the **air distribution** correct?

YES → The air distribution is operating correctly. If necessary, explain how the system works to the customer again.

NO

↓

Using the diagnostic tool, check the air distribution control by checking the distribution motor parameters.
PR023 position of footwell/ventilation distribution flaps

Do the flaps open 100 %?

NO → Refer to the interpretation of parameter **PR023 Position of footwell/ventilation distribution flap**, and check how far the flap opens.
In the event of a fault, refer to the Technical Note for fault finding procedures for distribution motors.

YES

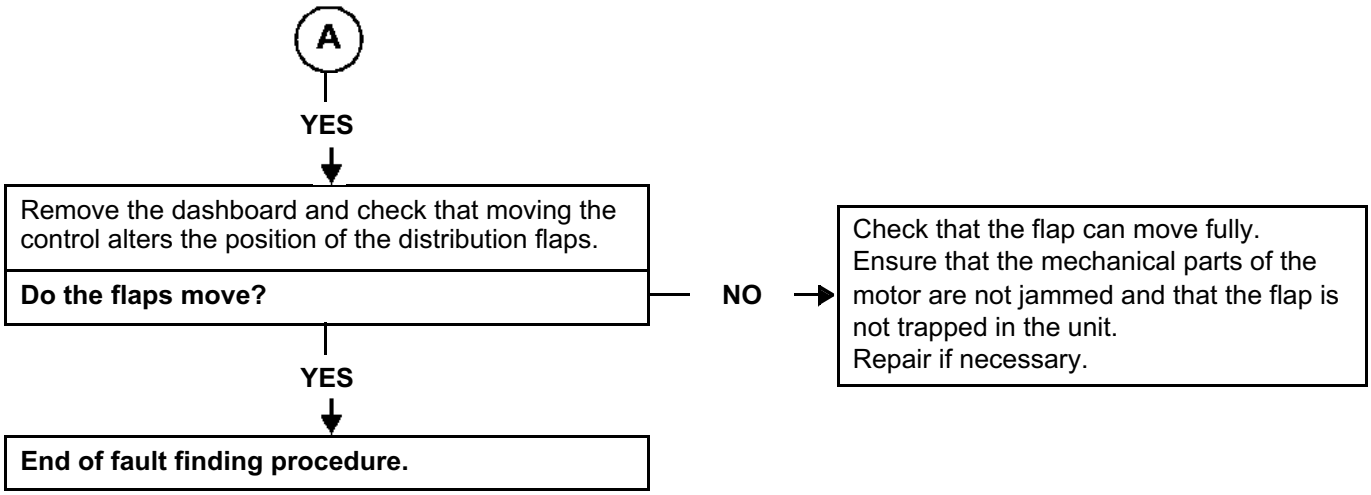
↓

(A)

AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP 1 CONTINUED	



AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP 2	Front air flow fault

NOTES	Only check the customer complaint after **a complete check with the diagnostic tool**. Check that the customer knows how to operate the air conditioning system properly.

Does the front passenger compartment fan **work**? — **NO** → Repair, see **ALP 7**.

YES

↓

Make sure that **the air circuit** (**cabin filter**, scuttle panel grille, air vents and extractors, etc.) is not blocked. Ensure that the blower blades are in good condition.
If necessary, repair, clean or replace the cabin filter.

↓

Ensure that the front fan unit is properly **airtight**.
Repair if necessary.

↓

Using the diagnostic tool, check that the recirculation flap is not closed in the recirculation position by checking status **ET021 Recirculation motor control**.
Repair if necessary.

↓

Does the fault disappear when the **air distribution** is changed? — **YES** → Ensure that all the air vents are open.
If the fault is still present, refer to **ALP 1**.

NO

↓

Run a **conformity check** as the problem may arise from a faulty signal from one of the sensors (temperature/ humidity, etc.).
Check that the interior air temperature sensor micro-turbine is in correct working order (if it is faulty it may falsify the measurement).
Replace any faulty components.

↓

(A)

AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP 2

CONTINUED

(A)

Using the diagnostic tool, check that the fan speed corresponds to computer specifications (tolerance of ± 15 %) by checking parameters:
PR019 passenger compartment fan assembly PWM setpoint (modulated control voltage).
PR008 Fan unit speed
(fan unit speed return signal).
Refer to the Interpretation of parameters **PR019** and **PR008** table to ensure that the values obtained are consistent.

Does the speed comply with specifications?

YES → **End of fault finding procedure.**

NO

Check that the **PWM modulated control** (modulated control voltage) of the passenger compartment fan unit power module varies between 0 and 6 V (from 0 to 100 %) by measuring between track A3 of the module and earth (connector connected).
Note:
for a greater degree of precision, refer to the HELP section when taking the measurement.

Does the voltage vary correctly?

YES

Replace the power module.

NO

Check the **continuity and absence of interference resistance** of the following connection:
computer connector B **track 27** → **track A3** of the module
or
redesign 2005 computer connector B **track 12** → **track A3** of the module
Repair if necessary.

Is the fault still present?

NO

YES

Replace the control panel.

End of fault finding procedure.

AFTER REPAIR Check that the system is operating correctly.

GETtheMANUALS.org

ALP 3	Rear air flow problem

NOTES	Only check the customer complaint after **a complete check with the diagnostic tool**. Check that the customer knows how to operate the air conditioning system properly.

Does the rear passenger compartment fan **work**? — **NO** → Repair; refer to **ALP 8**.

YES ↓

Make sure that **the air circuit** (**cabin filter**, scuttle panel grille, air vents and extractors etc.) is not blocked.
Ensure that the blower blades are in good condition.
If necessary, repair, clean or replace the cabin filter.

↓

Ensure that the rear fan unit is properly **airtight**.
Repair if necessary.

↓

Check the resistance of the rear blower: **0.95 Ω**.
Replace the rear blower if necessary.

↓

Does the fault disappear when the **air distribution** is changed? — **YES** → Ensure that all the air vents are open.
If the fault is still present, refer to **ALP 1**.

NO ↓

Using the diagnostic tool, check that the fan speed corresponds to the computer signal (tolerance of ± 5 %) by checking parameters:
PR024 Rear fan speed (fan speed feedback signal).
Consult the interpretation of parameter **PR024**, to make sure that the values obtained are consistent.

Does the speed comply with specifications? — **YES** → **End of fault finding procedure.**

NO ↓

(A)

AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP 3

CONTINUED

(A)

Check the resistances of the rear fan resistor unit.
Replace the resistor unit if the resistances are not as follows (**± 0.5 Ω**):
- V1: **5.0 Ω** (tracks C and B)
- V2: **2.4 Ω** (tracks A and B)
- V3: **0.8 Ω** (tracks D and B)

Are the resistances correct?

NO → **Replace** the resistor unit.

YES

Check the continuity and absence of interference resistance on the following connections:
- Rear control unit **Track B3** → **Track D** of the resistor unit
- Rear control unit **Track B2** → **Track A** of the control unit
- Rear control unit **Track A1** → **Track C** of the resistor unit

Is the fault still present?

NO

YES

Using an ohmmeter, check that the rear fan control unit is operating correctly.
Replace the unit if necessary.

End of fault finding procedure.

AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP 4	Inefficient windscreen demisting

NOTES	Only check the customer complaint after **a complete check with the diagnostic tool**.
	Special notes: Check that the inside of the windows are not dirty, as this reduces the efficiency of the demister.

If the vehicle is fitted with a heated windscreen, use the diagnostic tool to check that the **computer is configured correctly** by reading configuration: **LC005 Heated windscreen**. Reconfigure the computer if necessary and check that the heated windscreen is working correctly (see Introduction).

↓

Check that the air extraction vents are not blocked.
Repair if necessary.

Is the fault still present?

NO → **End of fault finding procedure.**

YES

↓

Ensure that there are no **water leaks** in the passenger compartment which would significantly increase the moisture and reduce the effectiveness of the demisting function.
Repair if necessary (see **ALP 14**).

Is the fault still present?

NO → **End of fault finding procedure.**

YES

↓

Check that the compressor is in **correct working order** by using command: **AC021 Compressor clutch** or by switching on the climate control.
Repair if necessary.

↓

(A)

AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP 4

CONTINUED

(A)

Check that the condensation outlet (water from the evaporator) is not blocked.
Repair if necessary

Is it an **air distribution** fault? — **YES** → See **ALP 1**.

NO

Is it an **air flow** fault? — **YES** → See **ALP 2**

NO

Is it a **heater performance** fault? — **YES** → See **ALP 9**

NO

Using the diagnostic tool, check that the recirculation flap is in the **external air** position by checking status **ET021 Recirculation motor command**.
Repair if necessary.

Is the fault still present?

YES

Run a **conformity check** as the fault may arise from a faulty signal from one of the sensors (temperature/humidity, etc.).
Check that the interior air temperature sensor micro-turbine is in correct working order (if it is faulty it may falsify the measurement).
Replace any faulty components.

NO

End of fault finding procedure.

AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP 5	Inefficient rear screen de-icing/demisting

NOTES	Only consult this customer complaint after a **complete check with the diagnostic tool**.
	Special notes: – Check that the inside of the windows are not **dirty** as this reduces the efficiency of the de-icing function. – **The de-icing control is only authorised when the engine is running to save power.** **Rear screen de-icing can be activated in two ways:** – Pressing the lower part of the de-icing switch on the control panel activates the heated rear screen and the door mirrors. – Pressing the upper part of the heating switch on the control panel operates the See clear function (heated rear screen and door mirrors, ventilated windscreen and electrically heated windscreen, if fitted to the vehicle). Note: **In both instances de-icing activation is only authorised with the engine running.**

Ensure that there are no water leaks in the passenger compartment which would significantly increase the moisture and reduce the effectiveness of the demisting function.
Repair if necessary (see **ALP 14**).

Is the fault still present?

NO → **End of fault finding procedure.**

YES

↓

Use the diagnostic tool to check the heated rear screen relay control, by checking status **ET022 Heated rear screen control**.
Repair if necessary (see **ET022**).

↓

(A)

AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP 5 CONTINUED	

(A)

Remove the plastic pillars from the rear screen and check that **the heating wires have not been cut** by measuring their resistance (**0.5 to 1Ω**).
Repair if necessary.

Check for an **earth** on the terminal located on the right-hand side of the heated rear screen and **+ 12 V** (when the de-icing is switched on) on the left-hand side terminal.
If there is no supply to the screen, check **the continuity and absence of interference resistance** of the connection between:

Rear screen relay **track 5** → heated rear screen left-hand terminal connector

Repair if necessary.
If the fault is still present, **apply the fault finding procedure** for fault **ET022 Heated rear screen control**.

Is the fault still present?

YES

Carry out a **conformity check** as the fault may result from an incorrect signal from the external temperature sensor.
Check that the interior air temperature sensor micro-turbine is in correct working order (if it is faulty it may falsify the measurement).
Replace any faulty components.

NO

End of fault finding procedure.

AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP 6	Inefficient ventilation

NOTES	Only check the customer complaint after **a complete check with the diagnostic tool**.

Is the **air flow** correct?
— **NO** → See **ALP 2** and **ALP 3**.

YES ↓

Is the **air distribution** correct?
— **NO** → See **ALP 1**.

YES ↓

End of fault finding procedure.

AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP 7	No front passenger compartment fan

NOTES	Only consult this customer complaint after **a complete check with the diagnostic tool**.

Check that the **fuses** are in good condition.

↓

Using the diagnostic tool, check that the fan unit control setpoint given by the computer varies from 0 to 100 % by checking parameter **PR019 Passenger compartment fan PWM setpoint**.

Does the value vary? — **NO** → Replace the control panel.

YES

↓

Check that the **PWM modulated control** (modulated control voltage) of the passenger compartment fan unit power module varies between 0 and 6 V (from 0 to 100 %) by measuring between track A3 of the module and earth (connector connected).
Note:
For a greater degree of accuracy, refer to the HELP section when taking the measurement.

Does the voltage vary correctly? — **YES** → (A)

NO

↓

Connect the bornier in place of the computer and check the **insulation, continuity and absence of interference resistance** of the following connections:

computer connector A **track 27** → **track A3** of the front fan unit power module
computer connector A **track 13** → **track A2** of the front fan unit power module

Repair if necessary.

↓

With the ignition on, check for **+ 12 V** on track **B5** and **earth** on track **B4** of the black 2 x 5 track connector of the blower unit (screwed under the glove compartment on the console base side).
Repair if necessary.

↓

(A)

AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP 7 CONTINUED	

(A)

Check the **insulation, continuity and interference resistance** on the following connections:

black 2 x 5-track connector	**black 4-track connector of the power module**
track B1	**track A3**
track B2	**track A2**
track B3	**track A4**
track B5	**track A1**
track B4	**black 2-track fan connector**
	track A
	track B
	blue 2-track connector of the power module
	track A
	track B

Repair if necessary.

Check that the passenger compartment fan blades have not **broken or come away** from their shaft. Ensure that there are no foreign bodies blocking the fan.
Repair or replace the passenger compartment fan if necessary.

Disconnect the fan unit black 2-track connector and **check the resistance of the motor** across tracks A and B. Replace the fan unit if there is zero or infinite resistance.

Is the fault still present?

NO → End of fault finding procedure.

YES

Replace the power module.

AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP 8	No rear passenger compartment fan

NOTES	Only check the customer complaint after **a complete check with the diagnostic tool**.

Check that the **fuses** are in good condition.

With the ignition on, check for 12 V feed on **track B1** of the rear fan control unit.

Is there a feed? — **YES**

NO

Check the **insulation, continuity and absence of interference resistance** on the following connection:

Rear control unit — **Track B1** → **Rear fan unit relay** — **Track A5**

Repair if necessary.

With the ignition on, check for + 12 volts feed on **track A1** and **A3** of the rear fan unit relay and an earth on **track A2**.
Repair if necessary (see wiring diagram).

Check that the rear fan unit relay is in correct working order.
Replace the relay if necessary.

Using an ohmmeter, check that the rear fan control unit is operating correctly:
Speed 1: Continuity between **track B1** and **track A1**.
Speed 2: Continuity between **track B1** and **track B2**.
Speed 3: Continuity between **track B1** and **track B3**.
Replace the rear fan unit control unit if necessary.

(A)

AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP 8 CONTINUED 1	

(A)

Check the **insulation, continuity and absence of interference resistance** of the following connections:

Rear control unit **Track D** → **Track B3** of the resistor unit
Rear control unit **Track A** → **Track B2** of the resistor unit
Rear control unit **Track C** → **Track A1** of the resistor unit

Repair if necessary.

Check the resistances of the rear fan resistor unit (**± 0.5 Ω**):

– V1: **5.0 Ω** (tracks C and B) – V2: **2.4 Ω** (tracks A and B) – V3: **0.8 Ω** (tracks D and B)

Replace the resistor unit if the values measured do not correspond to those given above.

Check the consistency of the rear fan unit control voltages according to the 3 control speeds: Measure between **track 2** of the black 6-track intermediary connector and **earth** (refer to the HELP section for information on taking the measurement).

Are the voltages correct?

YES → (B)

NO

Check the **insulation, continuity and absence of interference resistance** on the following connection:

Resistor unit	Black 6-track intermediary connector	Climate control computer connector A (grey, 30-track)
	Track 2 →	Track 20
Track B →		

Repair if necessary.
If the connection is correct (or after adjusting it), disconnect the connector from **track A** of the fan unit and repeat the previous test.

Are the voltages correct?

NO → **Replace** the resistor unit.

YES → (B)

AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP 8 CONTINUED 2	

B

Check for an **earth** on **track 3** of the black 6-track intermediary connector.
Repair if necessary.

Check the **insulation, continuity and absence of interference resistance** of the following connection:
Black 6-track intermediary connector

Track 3 → **Track 2** of the rear fan unit relay
→ **Track A2** of the rear control panel
→ **Track B** of the rear fan unit

Repair if necessary.

Check that the rear fan unit blades have not **broken or come away** from their shaft.
Ensure that there are no foreign bodies blocking the fan.
Repair or replace the passenger compartment fan if necessary.

Disconnect the black 2-track connector from the rear fan and **check the resistance of the motor** across **tracks A** and **B**.
Replace the fan if the resistance is zero or infinite.

End of fault finding procedure.

AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP 9	No heating or inadequate heating

NOTES	Only check the customer complaint after **a complete check with the diagnostic tool**.

Is the **air flow** correct?
- **NO** → See **ALP 2**, air flow fault.
- **YES** ↓

Is the **air distribution** correct?
- **NO** → See **ALP 1**, air distribution fault.
- **YES** ↓

With a warm engine, set the heating to max.
Is the air supplied hot?
- **YES** → If necessary, explain how the system works to the customer again.
- **NO** ↓

Using the diagnostic tool, check the air mixing control by checking the mixing motor parameters.
PR020 Left-hand mixing flap position
PR021 Right-hand mixing flap position

Do the flaps open fully? (maximum heat position: 100 % displayed on tool)
- **NO** → Run **a conformity check** on the mixing motors.
  In the event of a fault, refer to the mixing motor diagnostic procedures in the Technical Note (**DF018** and **DF019**).

  Is the fault still present?
  - **YES** → Run a **conformity check** on the sensors as the problem may arise from a faulty signal from one of the sensors (temperature/humidity, etc.). Check that the interior air temperature sensor micro-turbine is in correct working order (if it is faulty it may falsify the measurement). Replace any faulty components.
  - **NO** → **End of fault finding procedure.**

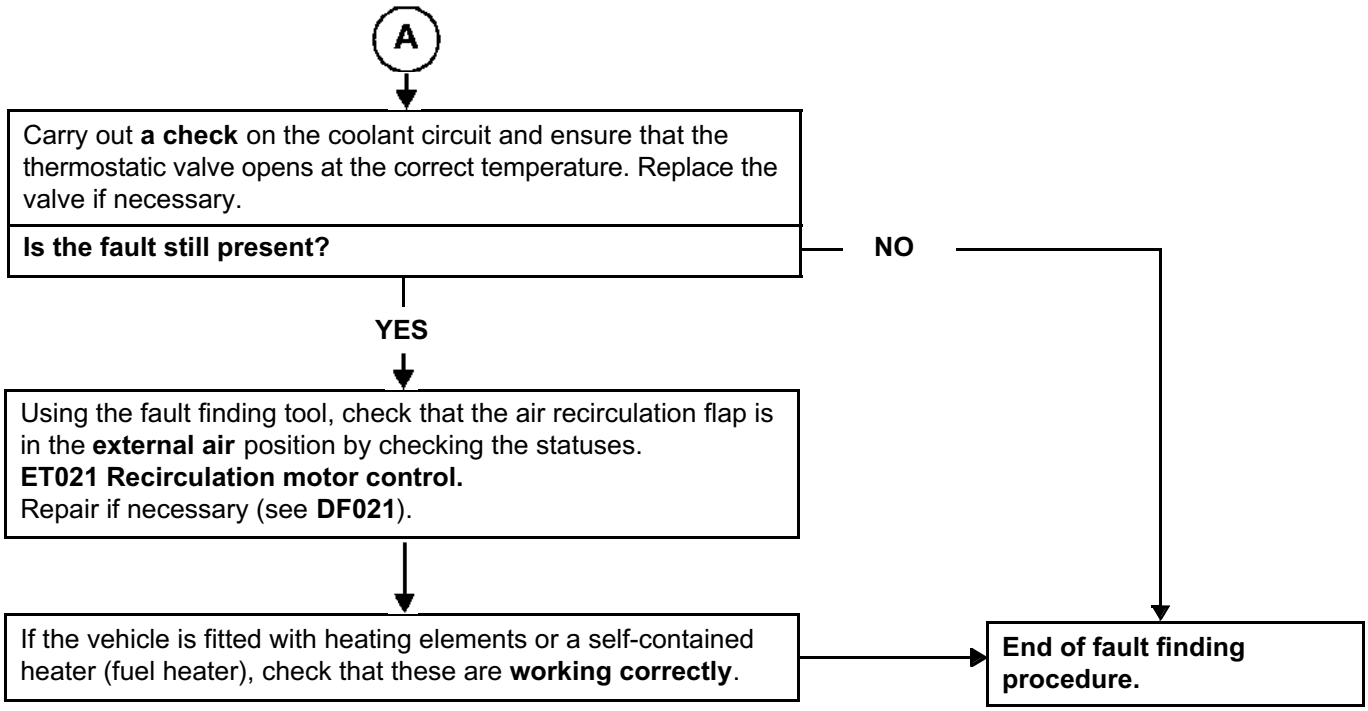
ALP 10 CONTINUED	



AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP 11	No cold air

NOTES	Only refer to this customer complaint after a **complete check using the diagnostic tool**

Start the engine, switch on the climate control (compressor engaged by pressing and holding AC button) with a very cold temperature request (minimum position on the left and right). Using the fault finding tool, display status **ET140 Air conditioning request**; this status should display **YES**.

Is the status YES?

NO → Carry out **a conformity check**, referring mainly to the sensor temperature values (evaporator temperature, interior air temperature, the refrigerant fluid pressure, etc.)

YES ↓

Using the diagnostic tool and with the engine at idle speed, check that the injection computer authorises air conditioning.
The status **ET003 AC inhibited by the injection computer** should display **NO**.

Is the correct status displayed?

NO → Carry out **fault finding on the injection** (faulty injection leading to a substandard performance may prevent the climate control from functioning). Ensure that the fan unit motor is in correct working order. Repair if necessary.

YES ↓

Check the condition of the **climate control compressor belt**.
Replace it if necessary and check the **tension**.

Is the tension correct?

NO → **Replace** the belt (refer to the repair procedures).

YES ↓

(A)

AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP 11 CONTINUED 1	

(A)

Using the diagnostic tool, select command **AC021 Compressor clutch**.

Does the compressor clutch stick? — **YES** →

NO ↓

Check for **+ 12 V** on **track B** (**track 2** on the V4Y engine) of the compressor clutch and on **track B** of the variable capacity control solenoid valve (not the electric control solenoid valve on the V4Y and P9X engines).
Repair if necessary.

↓

Connect the bornier in place of the computer and check the **insulation, continuity and the absence of interference resistance** on the following connections:

computer connector A **track 15** → **track A** of the compressor clutch
computer connector A **track 7** → **track A** of the variable capacity control solenoid valve.

Repair if necessary

↓

Vary the position of the left-hand and right-hand mixing flaps from very cold to very hot (from minimum temperature position to maximum temperature position) and check subjectively whether there is a difference in temperature.

Can you feel the difference in temperature? — **NO** → Run **a conformity check** on the mixing motors. In the event of a fault, refer to the mixing motor diagnostic procedures in the Technical Note (**DF018** and **DF019**).

YES ↓

(B)

AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP 11

CONTINUED 2

B

Check the cold loop by examining the condition of the pipes and ensuring that the climate control system is not **leaking refrigerant** (carry out the check with the engine cold and then hot, using the electronic buzzer or a leak detecting product to avoid charging the climate control system twice in succession).
Repair if necessary.

Check that the condenser is clean (no leaves, mud, etc.).
Clean the condenser if necessary.

With the climate control switched on (on a very cold setting), touch the refrigerant pipe between the calibrated choke and the evaporator to make sure that it is **very cold**.

Is the refrigerant pipe cold?

NO → Check that there is a **calibrated jet**.

Is the calibrated jet present?

YES → **Replace the calibrated choke**

NO → **Replace the pipe** (between the condenser outlet and the evaporator inlet).

YES →

Top up the refrigerant, referring to the Workshop Repair Manual (650 g ± 25 g).

Is the fault still present?

YES → Replace the compressor

NO → **End of fault finding procedure.**

AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP 12	Too much cold air

NOTES	Only consult this customer complaint after a **complete check with the diagnostic tool**.

Start the engine and switch on the climate control system (engage the compressor by pressing the AC button):
Does the compressor operate?

YES

NO

Use the diagnostic tool to display the evaporator temperature (**PR003**), with the climate control operational. Does the temperature drop below 0 ˚C (the point at which the compressor clutch is disengaged)?

YES

Does the compressor clutch disengage when the temperature is below 0 ˚C? (1 minute delay).

YES

NO

If the compressor is not faulty and there are no mechanical faults on the compressor clutch, replace the climate control computer.

NO

Ensure that **the evaporator temperature sensor** is in the correct position (it is inserted approximately 20 mm into the evaporator air outlet).

Check **the resistance** of the evaporator sensor between **track 1** and **track 2** of the sensor.
Replace the sensor if the resistance is not approximately:
30 KΩ at 25 ˚C.

Is the fault still present?

NO

End of fault finding procedure.

A

AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP 12 CONTINUED	

(A)

Run a **conformity check** on the sensors as the problem may arise from a faulty signal from one of the sensors (interior temperature, external temperature, engine coolant temperature, evaporator temperature, etc.). Check that the interior air temperature sensor micro-turbine is in correct working order (if it is faulty it may falsify the measurement).
Replace any faulty components.

↓

Using the fault finding tool, examine the air mixer control by checking the mixing motor parameters.
PR020 Left-hand mixing flap position
PR021 Right-hand mixing flap position

Is the mixing correct?
(0 % maximum cold, 100 % maximum heat)

NO → Run **a conformity check** on the mixing motors.
In the event of a fault, refer to the mixing motor diagnostic procedures in the Technical Note (**DF018** and **DF019**).

YES

↓

Check the refrigerant level.

AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP 13	Unpleasant odours in the passenger compartment

NOTES	Only check the customer complaint after a complete check with the diagnostic tool.

Check that the cabin filter is not blocked or damaged.
Replace it if necessary.

Is the fault still present?

NO → **End of fault finding procedure.**

YES ↓

Check that the condensate **drain pipe** (water from the evaporator) is not blocked.
Repair if necessary.

Is the fault still present?

NO → **End of fault finding procedure.**

YES ↓

Check that **the heating unit is completely sealed and there are no leaks** into the engine compartment.
Repair if necessary.

Is the fault still present?

NO → **End of fault finding procedure.**

YES ↓

Place the vehicle on a lift.
Apply the climate control cleaning product using the extension piece through the condensation (evaporator water evacuation pipe) outlet pipe.
Spray the entire contents of the aerosol.
Leave the product to work for **15 minutes**.

AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP 14	Water is present in the passenger compartment

NOTES	Only refer to this customer complaint section after a complete check using the diagnostic tool.

Pressurize the cooling circuit.

Is there any coolant leaking into the vehicle? — **YES** → **Repair.**

NO ↓

Check that the condensation **evacuation pipe** (water from the evaporator) is not blocked.
Repair if necessary.

Is the fault still present? — **NO** → **End of fault finding procedure.**

YES ↓

The fault may be caused by **ice** in the evaporator.
Does the customer complain of water droplets coming out of the air vents? — **NO** → The leak is not coming from the air conditioning system.

YES ↓

Use the diagnostic tool to display the evaporator temperature (**PR003**). Does it seem consistent? (in normal operation, temperature should be > **0 °C**, and the compressor should disengage for one minute when it falls below this value). — **YES** → Run a **conformity check** as the fault may arise from a faulty signal from one of the sensors (temperature/ humidity, etc.).
Replace any faulty components.

NO ↓

Ensure that **the evaporator temperature sensor** is in the correct position (it is inserted approximately 20 mm into the evaporator air output).

→ **End of fault finding procedure.**

AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP 15	No front control panel lighting

NOTES	Only follow up this customer complaint after a full check of the multiplex network and the air conditioning with the diagnostic tool.
	Special notes: The control panel is permanently lit but the buttons only light up when the side lights are switched on.
	Note: A delay in the climate control panel lighting could be due to an external temperature sensor malfunction.

Check the **connection and condition** of the computer output connectors.
Connect the bornier in place of the computer and check **the insulation, continuity and absence of interference resistance** of the following connections:

computer connector A **track 14** → **track 2** of the lighting dimmer

earth → **track 3** of the dimmer

Repair if necessary.

Is the fault still present?

NO → **End of fault finding procedure.**

YES

Check the **resistance** value of the dimmer by measuring across: **track 2** and **track 3** of the dimmer connector.
When the dimmer is operated, its resistance should vary between **0 and 1000 Ω** ± 5 %.
Replace the lighting dimmer if this is not the case.

Is the fault still present?

NO → **End of fault finding procedure.**

YES

(A)

AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP 15 CONTINUED	

(A)

Connect the bornier in place of the computer and check the **insulation, continuity and absence of interference resistance** of the connection:

computer connector A **track 2** → **+ side lights feed (see diagram for the vehicle and model year concerned)**

Repair if necessary.

Is the fault still present?

YES

Check the passenger compartment connection unit with the diagnostic tool.
Check that the side light command status changes to active when the lights switch on.
If this does not occur, refer to the **UCH fault finding** procedure, or run **fault finding on the multiplex network**.

Is the fault still present?

NO → **End of fault finding procedure.**

YES

Replace the computer (control panel).

NO

AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP 16	No rear control panel lighting

NOTES	**Special notes:** The control panel only lights up when the side lights are switched on.

Check the condition of the fuses.
Repair if necessary.

↓

Check the condition of the bulb.
Repair if necessary.

↓

Check the **connection and condition** of the rear fan control unit connector. Check the **insulation, continuity and absence of interference resistance** of the following connections:

track A3 of the control unit → **UCH** (see diagram)
track A2 of the control unit → **earth**

Repair if necessary.

↓

Check for 12 V feed on **track A3** of the rear fan control unit.

Is there a 12 V supply? — **YES** → **End of fault finding procedure.**

NO

↓

Carry out fault finding on the UCH.

AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP 17	Noisy compressor

NOTES	Only consult this customer complaint after a complete check with the diagnostic tool.

Using the screen for reading configurations on the diagnostic tool, check that **the drive ratio and compressor type match the vehicle equipment** by displaying the following information:
The **LC036 Read drive ratio** information should indicate the type of engine fitted to the vehicle (the engine is associated with a drive ratio).
The information **LC012 Compressor type** information should indicate the type of compressor fitted to the vehicle.
Reconfigure the climate control computer if necessary.

↓

Check that the compressor **belt is in good condition** and **check its tension** (for engines without automatic tensioner).
Replace the belt if necessary.

↓

Check that the compressor is **correctly mounted**.
Repair if necessary.

↓

Check **the refrigerant level** and look for leaks as the compressor may become noisy if a significant volume of fluid is lost.
Refill if necessary.

↓

For compressors fitted with an electric compressor capacity control valve (except V4Y and P9X engines), connect the bornier in place of the computer and check the **insulation, continuity and absence of interference resistance** of the following connection:
computer connector A **track 7** ⟶ **track A** of the variable capacity control solenoid valve.
Repair if necessary.

↓

If the fault is still present, **replace** the air conditioning compressor.

AFTER REPAIR	Check that the system is operating correctly.

80A BATTERY

Battery – Initialisation	80A - 2
Battery – Specifications	80A - 3
Battery – Advice	80A - 4
Battery – Check	80A - 5
Battery – Test	80A - 7

V3 **Edition Anglaise**

"The repair procedures given by the manufacturer in this document are based on the technical specifications current when it was prepared.

The procedures may be modified as a result of changes introduced by the manufacturer in the production of the various component units and accessories from which his vehicles are constructed."

All rights reserved by Renault s.a.s.

Copying or translating, in part or in full, of this document or use of the service part reference numbering system is forbidden without the prior written authority of Renault s.a.s.

© Renault s.a.s. 2008

GETtheMANUALS.org

When removing or disconnecting the battery, check that the battery is working correctly by performing a number of initialisations on different vehicle functions.
These initialisations do not require a tool of any kind.

Anti-theft code:
– Entering a 4-digit radio or radio navigation code (see **86A, Radio, Radio: Anti-theft code**).
– Setting the time on the radio or the radio navigation system:
To set the radio navigation system time, enter the four digit code. Insert the navigation CD-ROM then drive the vehicle to pick up the satellite signals. It is now possible to set the time (see **86A, Radio, Radio: Setting the time**).

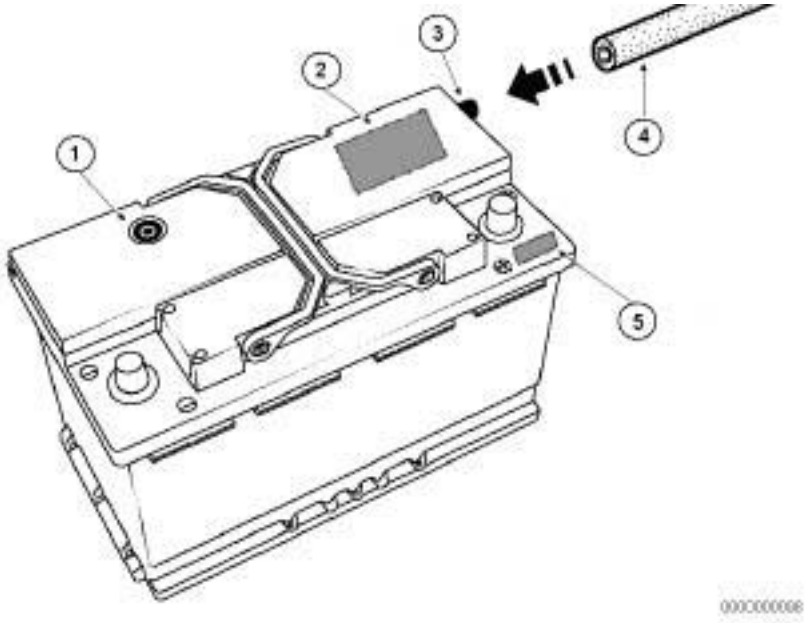
Initialisation of the window winders:
– Check that the electric windows are still initialised. The windows should open and close when the switch is pressed. If this does not happen, re-initialise (see **87D, Electric windows - sunroof, Electric windows: Initialisation**).

Initialising the sunroof:
– Check that the sunroof is still initialised. The sunroof should open or close to the requested position without stopping. If this does not happen, re-initialise (see **87D, Electric windows - Sunroof, Electric sunroof: Initialisation**).

Initialising the computers:
-The other computers are automatically initialised when the vehicle is being driven. Drive the vehicle for at least **1 minute** at a speed greater than **18 mph (30 km/h)** so that the tyre pressures are displayed again.

GETtheMANUALS.org

Battery specifications:
Always replace a battery with one that has the same electrical and dimensional specifications.



1	Hydrometer (magic eye)
2	Battery label example: L5 12V 95AH Test 850A EN 82 00 000 000
	L5: dimensions Letter L = height 190 mm Letters LB = height 175 mm Figure 5 = length 352 mm (if 4 = 314 mm, etc.) The width is always 175 mm 12V: nominal voltage 95Ah: nominal capacity 850A: starting current EN: complies with European standards 82 00 000 000: part number (maybe 24 41 000 01R new number system)
3	Degassing vent
4	Degassing pipe
5	Date of manufacture format: DD/MM/YYYY

Visual inspection of the battery
Make sure there are no cracks or breakages, traces of acid, or creepage (sulphation) on the terminals. If any of the above are present, replace the battery and clean the surrounding area.
Check that the degassing pipe is properly connected to the battery vent

Check that the degassing pipe (4) is correctly positioned.

GETtheMANUALS.org

IMPORTANT
- All vehicles are equipped with low water consumption batteries. Opening the battery and topping up the electrolyte level are PROHIBITED.
- Batteries contain sulphuric acid, which is a hazardous chemical.
- Battery charging produces hydrogen and oxygen, which are very flammable gases and thus there is a risk of explosion.
- Any batteries with filling plugs must not be opened under any circumstances but replaced immediately with Renault approved batteries.

Battery recharging:

When parked, vehicles consume power through their permanent consumers and through any accessories fitted as After-Sales options. To keep battery discharging to a minimum, limit the number of times the vehicle is started, periods with the ignition on, doors open, etc., as much as possible.
A discharged battery must be recharged using a Renault-approved battery charger (see **Technical Note 6512A, Battery charging**)

IMPORTANT
- Simultaneous recharging of several batteries in series or in parallel is forbidden.
- A battery charger used on a battery connected to a vehicle can irreparably damage the vehicle computers due to the high voltages created when charging.
- The location of the charger must take this into account (ventilation).
- A battery charger or a booster not approved by Renault can damage the electrical components.

Battery storage:

Even when stored off the vehicle, a battery gradually discharges, and more rapidly if the ambient temperature is high.
In order that a battery remains operational for a long time, it must be stored at a temperature of around **15 ˚C** and protected from humidity. To retain a good level of charge, it is recommended that a battery is completely recharged after it has been stored for 3 months.
A new battery that has been stored for more than one year must not be fitted to a vehicle.

GETtheMANUALS.org

Test procedure using the MIDTRONICS tool

Special tooling required	
Elé. 1593	Battery tester MIDTRONICS R330

Test conditions

The measurement must be taken when the vehicle is stationary and the ignition is off.

If the engine has been run in the last hour, switch the battery status to test and carry out the following operations:
– engine switched off,
– switch on the main beam headlights for **2 minutes**,
– switch off the main beam headlights,
– wait for **2 minutes**,
– switch off the ignition.

Equipment to be used:
– Tester approved by the Service Department: MIDTRONICS MICRO R330.
– Tool available as part no.: Elé. 1593.
– Equipment available in France from the Parts Department.
– Tool available in 6 languages.
– For other countries, consult your contact in your country.

WARNING
Failure to observe the procedure or poorly maintained equipment may result in incorrect measurements, which could be:
– detrimental to the customer (the battery is not sound),
– detrimental to RENAULT (unnecessary replacement of a sound or rechargeable battery),
– detrimental to the dealership (if the battery is tested as sound or rechargeable for a part return under warranty, the warranty reimbursement request will be cancelled).

GETtheMANUALS.org

Mode (test on vehicle)

– Connect the tool directly to the battery terminals, without disconnecting the vehicle battery, as close as possible to the battery terminal but ensuring it is not after the fuse (on-vehicle test) or carry out the battery test after disconnecting the two terminals if necessary**,**
– check that the vehicle ignition is switched off,
– select the "battery connected to the vehicle" or "battery disconnected" test type using buttons [△] and [▽] Confirm using the green button [↵]
– The test is carried out to the EN standard by default. Confirm using the green button [↵].
– Select the starting power on the battery label (see page 3) using buttons [△] and [▽].

– Confirm using the green button [↵].
– The tool displays: **TEST IN PROGRESS**.
– The MIDTRONICS tool carries out the test and gives the results of the fault finding procedure.

To set the tool language, carry out the following operations:
– before connecting the tool, simultaneously press buttons [△] and [▽]
– connect the device to the battery,
– release the buttons,
– scroll through the languages using buttons [△] and [▽],
– confirm using the green button [↵].

Note:
The battery must always be disconnected in the following order:
– Wait for at least **1 minute** between switching the ignition off and disconnecting the battery, to enable the computer systems to go on standby.
– Wait for the engine cooling fan to stop completely.
– Disconnect the negative terminal first.

GETtheMANUALS.org

1. SCOPE OF THIS DOCUMENT

This document presents the fault finding procedure applicable to all computers with the following specifications:

Vehicle(s): **VelSatis Phase 2** *Function concerned:* **xenon bulb**	*Name of computer:* **LAD** *VDIAG No.:* **44**

2. PREREQUISITES FOR FAULT FINDING

Documentation type

Fault finding procedures (this manual):
– Assisted fault finding (integrated into the diagnostic tool), Dialogys.

Wiring diagrams:
– Visu-Schéma (CD-ROM), paper version.

Type of diagnostic tools

CLIP + CAN probe

Special tooling required

Special tooling required	
	Multimeter
Elé. 1674	Clip + CAN probe

GETtheMANUALS.org

3. RECAP

Faults:

Faults are declared as either present or stored (depending on whether they appeared in a certain context and have disappeared since, or whether they remain present but have not been diagnosed within the current context).

The **present** or **stored** status of faults should be taken into consideration when the diagnostic tool is used after the + after ignition supply is switched on (without acting on the system components).

For a **present fault**, apply the procedure described in the **Interpretation of faults** section.

For a **stored fault**, note the faults displayed and apply the instructions in the **Notes** section.

If the fault is **confirmed** when the instructions in the Notes section are applied, the fault is present. Deal with the fault

If the fault is **not confirmed**, check:
- the electrical lines which correspond to the fault,
- the connectors on these lines (corrosion, bent pins, etc.),
- the resistance of the component detected as faulty,
- the condition of the wires (melted or split insulation, wear).

Conformity check:

The aim of the conformity check is to check data that does not produce a fault display on the diagnostic tool when it is inconsistent. Therefore, this phase is used to:
- carry out fault finding on faults that do not have a fault display, and which may correspond to a customer complaint.
- check that the system is operating correctly and that there is no risk of a fault recurring after repair.

This section provides the fault finding procedures for statuses and parameters and the conditions for testing them.

If a status is not behaving normally or a parameter is outside the permitted tolerance values, consult the corresponding fault finding page.

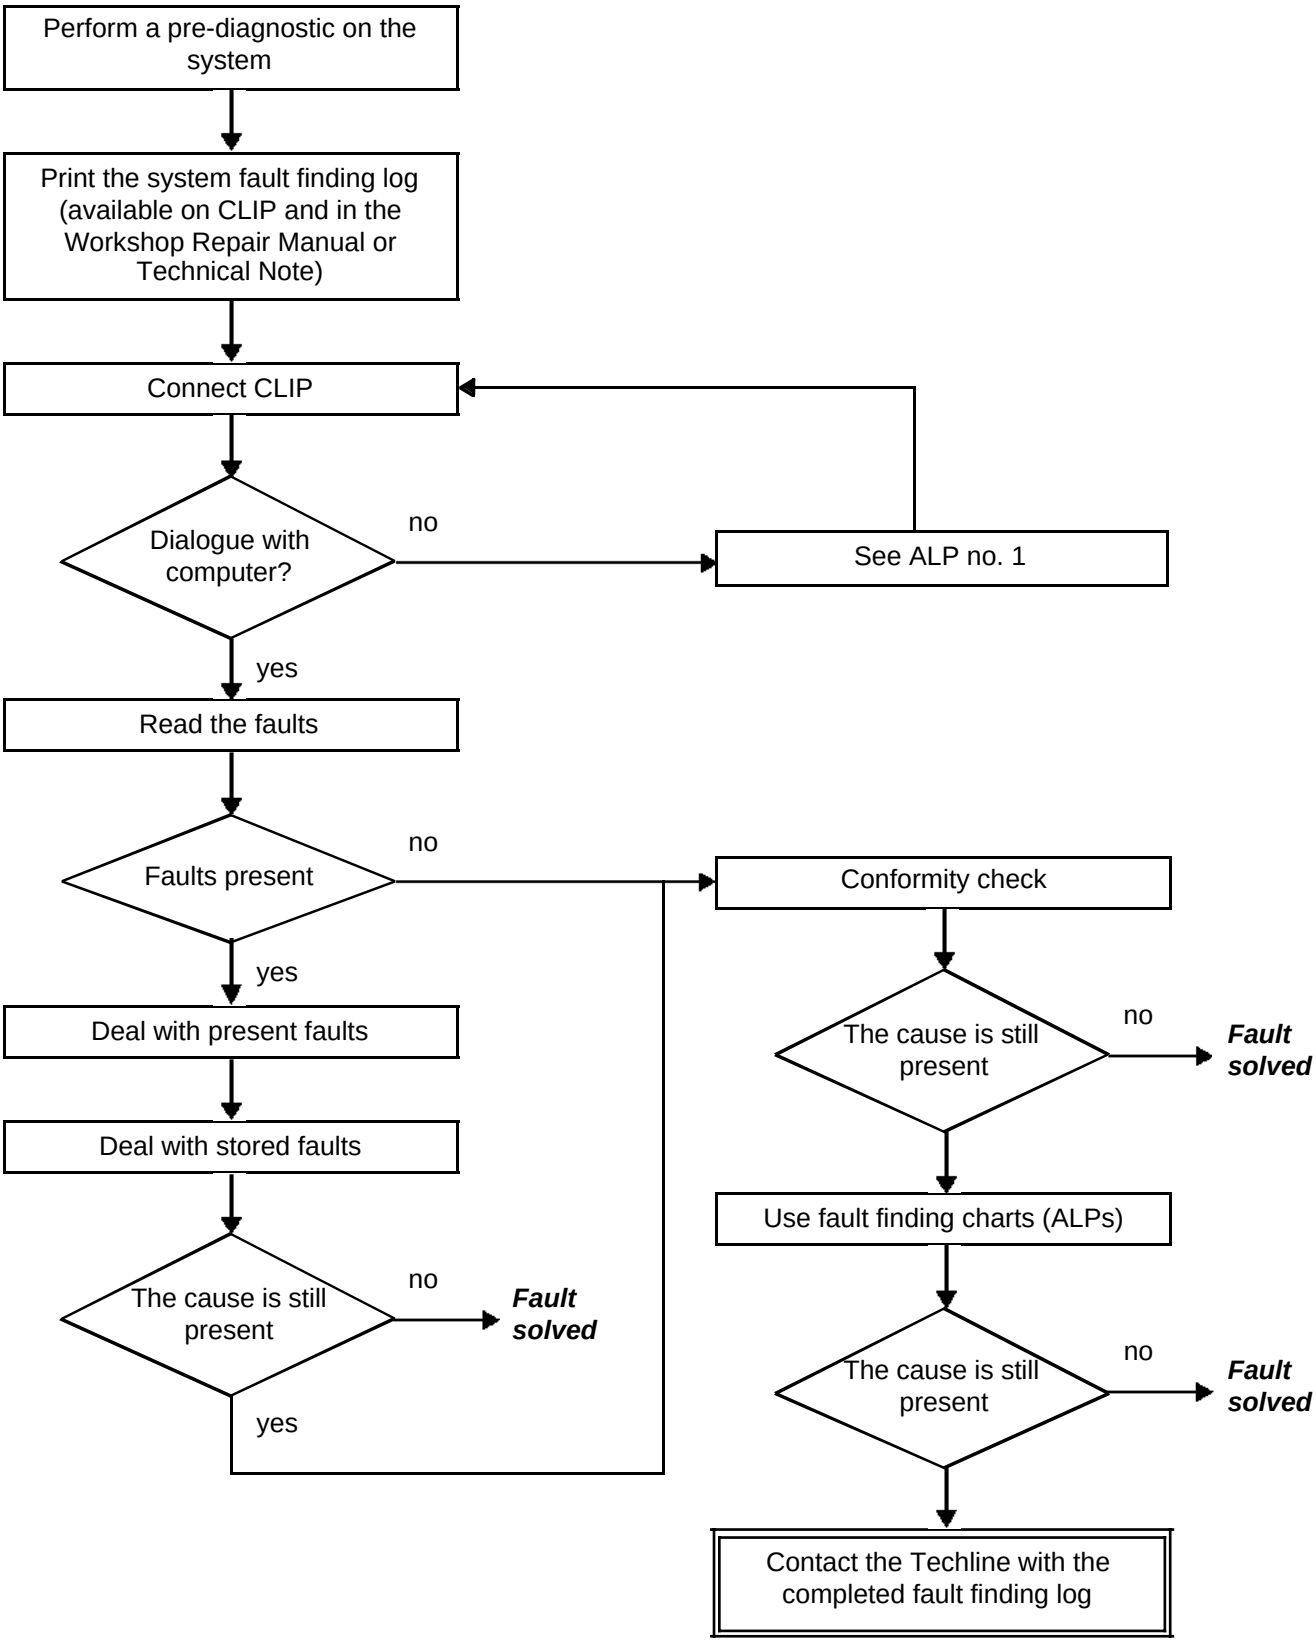
Customer complaints - Fault finding chart

If the test with the diagnostic tool is OK but the customer complaint is still present, the fault should be treated by **Customer Complaints**.

A synopsis of the general procedure to follow is provided on the following page in the form of a flow chart.

GETtheMANUALS.org

4. FAULT FINDING PROCEDURE



GETtheMANUALS.org

4. FAULT FINDING PROCEDURE (continued)

Wiring check:

Fault finding problems:
Disconnecting the connectors and/or manipulating the wiring harness may temporarily remove the cause of a fault.
Electrical measurements of voltage, resistance and insulation are generally correct, especially if the fault is not present when the analysis is made (stored fault).

Visual inspection:
Look for damage under the bonnet and in the passenger compartment.
Carefully check the fuses, insulators and wiring harness routing.
Look for signs of oxidation.

Tactile inspection:
While manipulating the wiring harness, use the diagnostic tool to note any change in fault status from stored to present.
Make sure that the connectors are properly locked.
Apply light pressure to the connectors.
Twist the wiring harness.
If there is a change in status, try to locate the source of the fault.

Inspection of each component:
Disconnect the connectors and check the appearance of the clips and tabs, as well as their crimping (no crimping on the insulating section).
Make sure that the clips and tabs are properly locked in the sockets.
Make sure that no clips or tabs have been dislodged during connection.
Check the clip contact pressure using an appropriate model of tab.

Resistance check:
Check the continuity of entire lines, then section by section.
Look for a short circuit to earth, to **+12 V** feed or to another wire.

If a fault is detected, repair or replace the wiring harness.

GETtheMANUALS.org

5. FAULT FINDING LOG

WARNING:

IMPORTANT
Any fault on a complex system requires thorough fault finding with the appropriate tools. The FAULT FINDING LOG, which should be completed during the procedure, enables you to keep track of the procedure which is carried out. It is an essential document when consulting the manufacturer.

IT IS THEREFORE MANDATORY TO FILL OUT A FAULT FINDING LOG EACH TIME FAULT FINDING IS CARRIED OUT.

You are always asked for this log:

- when requesting technical assistance from the Techline,
- for approval requests when replacing parts for which approval is obligatory,
- and it should be enclosed when returning monitored parts on request. The log is needed for warranty compensation, and enables better analysis of the parts removed.

6. SAFETY ADVICE

Safety rules must be observed during any work on a component to prevent any damage or injury:

– make sure that the battery is properly charged to avoid damaging the computers with a low load,
– do not smoke,
– use the appropriate tools,
– Do not touch the xenon bulbs, and do not work on the COSLAD system when it is in operation, as the voltage can be more than 20,000 V.

GETtheMANUALS.org

1. System description:

The vehicle on which a fault finding is being performed is fitted with a xenon bulb system.
This system allows:

- Dynamic correction of headlights (**LAD function**)

2. System layout:

Xenon bulb function:

The system comprises:

- a computer to manage information and control the actuators,
- a front height sensor mounted on the front axle to measure vehicle body height variations,
- a rear height sensor mounted on the rear axle to measure vehicle body height variations,
- two adjustment motors mounted inside the headlights,
- two voltage transformers (ballast) which cannot be diagnosed,
- two xenon bulbs located inside the headlights and which cannot be diagnosed.

3. Operation programming

Xenon bulb function:

The user requests that the dipped headlights are switched on by pressing on the control stalk.
The driver request is received by the UCH which sends it to the computer via the vehicle multiplex network.

The xenon bulb computer operates the headlight adjustment motors.

Signature:

When the xenon bulbs come on, the headlights run through the signature.
This function consists of operating the actuators to three different beam heights.
The driver is notified that the system is operating correctly.

Is the computer is faulty, the signature is not performed when the bulbs are switched on.

The signature is performed if the following conditions are fulfilled:

- stalk in dipped headlights position.
- system initialised,
- vehicle stationary or speed of **< 6 mph (10 km/h)**.

GETtheMANUALS.org

Dynamic correction:

This function allows correction of the xenon bulb beam height as a function of variations in vehicle body height and vehicle speed.

This information is provided by:
- the front and rear body sensors,
- the ABS computer (speed signal via the CAN network),
- the longitudinal acceleration sensor.

The xenon bulb computer operates the adjustment motors according to the information received, thereby obtaining optimal beam characteristics under all driving conditions.

Raise/lower according to speed:

This function allows operation of the adjustment motors to elevate the beam at a speed of more than **18 mph (30 km/h)**, to optimise driving comfort. The beam is adjusted as a function of the vehicle speed.

If the vehicle speed is **< 18 mph (30 km/h)**, the adjustment motors lower the beam.

Raised dipped beam function:

This function raises the beam of the dipped beam headlights when the main beam function is activated.
If an actuator is faulty, the raised dipped beam function is disabled. The fault information is sent to the CAN network which results in the faulty bulb being switched off. A warning message is sent by the UCH to the instrument panel, and the front fog lights are lit.

GETtheMANUALS.org

a) 12-track black connector

GETtheMANUALS.org

a) Instructions to be followed after replacing the xenon bulb computer:

The following actions must be taken after replacing the xenon bulb computer:

- Allocate the computer to the vehicle by using configuration **CF001 Vehicle type**.
- Initialise the system using the **VP002 System initialisation** configuration.

b) Instructions to be followed after replacing one or both adjustment motors:

Replacement of an adjustment motor requires the manual adjustment of the headlights (see **MR 405 Mechanical, 80C, Xenon Headlights: Adjustment**).

c) Instructions to be followed after replacement of a height sensor:

Replacement of a height sensor requires initialisation of the system operating parameters.

Use the **VP002 System initialisation configuration** after each replacement of a height sensor.

GETtheMANUALS.org

Summary of configurations and system configuration readings:

CF001 and LC001 Vehicle type:

VelSatis ph2
Modus
Laguna II ph2
X 85

Use this configuration when the xenon bulb computer is replaced.
Select the vehicle on which fault finding is being run and confirm.
Switch off the ignition and wait for the immobiliser warning light to flash.
Switch on the ignition again and check configuration reading **LC001 Vehicle type**.
If you do not have the correct vehicle type, restart the configuration.

IMPORTANT
The system must be initialised after each configuration of the vehicle type.
Use the VP002 System initialisation configuration.

CF002 Dynamic correction: **WITH**

This configuration is used to activate beam adjustment according to the movements of the vehicle body recorded by the front and rear height sensors.
Select **WITH** to activate this feature.
Once the configuration is complete, switch off the ignition, and wait for the immobiliser warning light to flash.
Switch the ignition on again and check the **LC002 Dynamic correction** configuration reading.

LC002 Dynamic correction:

WITH
WITHOUT

This configuration reading should be **WITH** by default.
If **LC002 = WITHOUT** following replacement of the xenon bulb computer, use configuration **CF002 Dynamic correction**.

CF003 Automatic dipping of the headlights: **WITH**

This configuration is used to change the direction of the beam as a function of vehicle speed in order to improve driving comfort.
Select **WITH** to activate this feature.
Once the configuration is complete, switch off the ignition, and wait for the immobiliser warning light to flash.
Switch the ignition on again and verify the **LC003 Automatic dipping of the headlights** configuration reading.

LC003 Automatic dipping of the headlights:

WITH
WITHOUT

This configuration reading should be **WITH** by default.
If **LC003 = WITHOUT** following replacement of the xenon bulb computer, use configuration CF003 **Automatic dipping of the headlights**.

GETtheMANUALS.org

CF004 Raised dipped function: **WITH**

This configuration is used to raise the dipped headlights when the driver requests the main beam function.
Select **WITH** to activate this feature.
Once the configuration is complete, switch off the ignition, and wait for the immobiliser warning light to flash.
Switch the ignition on again and check the **LC004 Raised dip** configuration reading.

LC004 Raised dipped beam: **WITH**
WITHOUT

This configuration reading should be **WITH** by default.
If **LC004 = WITHOUT** following replacement of the xenon bulb computer, use configuration **CF004 Dynamic correction**.

CF005 Initialisation: **WITH**

This configuration is used to operate the adjustment motors when the xenon bulbs are switched on.
It tells the driver the system is operating correctly and there are no faults.
Select **WITH** to activate this feature.
Once the configuration is complete, switch off the ignition, and wait for the immobiliser warning light to flash.
Switch the ignition on again and check the **LC005 Initialisation** configuration reading.

LC005 Initialisation: **WITH**
WITHOUT

This configuration reading should be **WITH** by default.
If **LC005 = WITHOUT** following replacement of the xenon bulb computer, use configuration **CF005 Dynamic correction**.

VP002: System initialisation

This configuration must be used when replacing the xenon bulb computer or a body height sensor.
It is used to assign the operating values of the body height sensors in their initial position.

Run this command under the following conditions:
– vehicle stopped,
– + after ignition supply,
– no fault present in the computer,
– vehicle unladen,
– handbrake off,
– vehicle on horizontal flat ground,
– gearbox in neutral.

When the command is completed, switch off the ignition and wait for the immobiliser warning light to flash.

Switch the ignition on again and consult interpretation of status **ET002 Computer initialisation**.

If the status **ET002** does not become **COMPLETED**, carry out the configuration again.

DF001 PRESENT OR STORED	COMPUTER 1.DEF : internal electronic fault

NOTES	**None.**

Disconnect the xenon bulb computer **12-track** black connector. Check the condition of the connections for corrosion, damage, etc. Repair if necessary.
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF002 PRESENT OR STORED	FRONT HEIGHT SENSOR CIRCUIT CC.1 : short circuit to +12 V C0.0 : open circuit or short circuit to earth 1.DEF : values out of range

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present following a road test or a system initialisation.

CC.1	***NOTES***	**None.**

Manipulate the wiring harness between the xenon bulb computer and the front height sensor in order to produce a change in status (Present ↔ Stored).
Look for possible damage to the harness, and check the **connection and condition** of the front height sensor and its connection.
Repair if necessary.

Disconnect the front height sensor and check the condition of the connections (damage, corrosion, etc.).
Repair if necessary.

Check the continuity and insulation against +12 V of the following connections:

- black 12-track connector on the xenon bulb computer **track 11** → **track 4** of the front height sensor black connector
- black 12-track connector on the xenon bulb computer **track 6** → **track 5** of the front height sensor black connector
- black 12-track connector on the xenon bulb computer **track 12** → **track 1** of the front height sensor black connector

If the fault is still present, check the **intermediate connector R265** at **tracks A2, A3, A4**.
Repair if necessary.

If all the checks are OK, replace the front height sensor.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF002 **CONTINUED 1**	

C0.0	***NOTES***	**None.**

Manipulate the wiring harness between the instrument panel and the oil level sensor in order to produce a change in fault status (Present ↔ Stored).
Look for possible damage to the harness, and check the **connection and condition** of the height sensor and its connectors.
Repair if necessary.

Disconnect the front height sensor and check the condition of the connections (damage, corrosion, etc.).
Repair if necessary.

Check **the continuity and the absence of interference resistance** on the following connections:

- black 12-track connector on the xenon bulb computer **track 11** → **track 4** of the front height sensor black connector
- black 12-track connector on the xenon bulb computer **track 6** → **track 5** of the front height sensor black connector
- black 12-track connector on the xenon bulb computer **track 12** → **track 1** of the front height sensor black connector

Check the insulation against earth of the following connections:

- black 12-track connector on the xenon bulb computer **Track 11** → **track 4** of the front height sensor black connector
- black 12-track connector on the xenon bulb computer **Track 6** → **track 5** of the front height sensor black connector

If the fault is still present, check the **intermediate connector R265** at **tracks A2, A3, A4**.
Repair if necessary.

If all the checks are OK, replace the front height sensor.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF002 **CONTINUED 2**	

1.DEF	***NOTES***	**None.**

Check the condition of the sensor linkage rod. Replace if necessary.
Disconnect the front height sensor and check the condition of the connections (oxidation, damage, etc.). Repair if necessary.
Manipulate the harness between the height sensor and the computer in order to produce a fault status change (Present ↔ Stored). Look for possible damage to the harness, and check the **connection and condition** of the height sensor and its connectors. Repair if necessary.
Check **the continuity and the absence of interference resistance** on the following connections: black 12-track connector on the xenon bulb computer **track 11** → **track 4** of the front height sensor black connector black 12-track connector on the xenon bulb computer **track 6** → **track 5** of the front height sensor black connector black 12-track connector on the xenon bulb computer **track 12** → **track 1** of the front height sensor black connector If the fault is still present, check the **intermediate connector R2625** at **tracks A2, A3, A4**. Repair if necessary.
If all the checks are OK, replace the front height sensor.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF003 PRESENT OR STORED	REAR HEIGHT SENSOR CIRCUIT CC.1 : short circuit to +12 V CC.0 : short circuit to earth 1.DEF: values out of range

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present following a road test or a system initialisation.

CC.1	***NOTES***	**None.**

Manipulate the harness between the xenon bulb computer and the rear height sensor in order to produce a change in status (Present ↔ Stored).
Look for possible damage to the harness, and check the **connection and condition** of the rear height sensor and its connectors.
Repair if necessary.

Disconnect the front height sensor and check the condition of the connections (damage, corrosion, etc.).
Repair if necessary.

Check **the continuity and insulation against +12 V** of the following connections:

- black 12-track connector on the xenon bulb computer **track 5** → **track 4** of the front height sensor black connector
- black 12-track connector on the xenon bulb computer **track 6** → **track 5** of the front height sensor black connector
- black 12-track connector on the xenon bulb computer **track 12** → **track 1** of the front height sensor black connector

If the fault is still present, check the **intermediate connector R2625** at **tracks A2, A3, A5**.
Repair if necessary.

If all the checks are OK, replace the front height sensor.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF004 PRESENT OR STORED	VEHICLE SPEED SIGNAL 1.DEF: vehicle speed signal error

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after a road test.

Test the multiplex network (see **88B, Multiplexing**) and interpret any faults present. Test the ABS computer (see **38C, Anti-lock braking system**).
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF005 PRESENT	COMPUTER INITIALISATION 1.DEF: computer initialisation not performed

NOTES	**None.**

Fault **DF005** is directly associated with the status **ET002 Computer initialisation**.
If the computer initialisation has not been performed, run command **VP002 System initialisation**.
Follow the procedure described in the **Configurations and programming** section.
When the command has been completed, clear the faults and check that the **DF005** fault is absent.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF009 PRESENT OR STORED	LEFT-HAND ADJUSTMENT MOTOR CIRCUIT 1.DEF: unidentified electrical fault

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: – the dipped headlights are switched on, – command **AC001 Adjustment motors** is run.

Special notes:
If the fault has appeared in the dipped headlights position:
- the left-hand adjustment motor will remain immobile,
- the left and right-hand adjustment motors will no longer be operated.

If the fault has appeared in the main beam headlights position:
- the left-hand adjustment motor will remain immobile,
- the right-hand adjustment motor will be pointing downwards,
- the left-hand dipped beam bulb will be off,
- the front fog lights will be lit,
- an instrument panel warning message will be sent.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF009 **CONTINUED**	

The **DF009** fault appears following:
- **an open circuit** on the left-hand adjustment motor control lines,
- **a short circuit to +12 V** on one of the left-hand adjustment motor control lines,
- **a short circuit between 2 control lines** of the left-hand adjustment motor,
- **a short circuit to earth** on one of the left-hand adjustment motor control lines.

Disconnect the black **4-track** left-hand adjustment motor connector.
Check the condition of the connections (oxidation, damage, etc).
Repair if necessary.

Check the **continuity, absence of interference resistance and insulation against +12 V, and the insulation against earth** on the following connections:

Xenon bulb computer, black 10-track connector, **track 2** → **track 4** of the left-hand adjustment motor black 4-track connector

Xenon bulb computer, black 10-track connector, **track 4** → **track 3** of the left-hand adjustment motor 4-track black connector

Xenon bulb computer, 10-track black connector, **track 1** → **track 2** of the left-hand adjustment motor 4-track black connector

Xenon bulb computer, 10-track black connector, **track 3** → **track 1** of the left-hand adjustment motor 4-track black connector

Repair if necessary.

With the connectors disconnected, check the insulation between each control wire.
If two wires are in short-circuit, repair the relevant connections.

If the fault is still present, replace the left-hand adjustment motor.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF010 **PRESENT**	RIGHT-HAND ADJUSTMENT MOTOR CIRCUIT 1.DEF: unidentified electrical fault

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: – the dipped headlights are switched on, – command **AC001 Adjustment motors** is run.

Special notes:
If the fault has appeared in the dipped headlights position:
- the right-hand adjustment motor will remain immobile,
- the left and right-hand adjustment motors will no longer be operated.

If the fault has appeared in the main beam headlights position:
- the right-hand adjustment motor will remain immobile,
- the left-hand adjustment motor will be pointed pointed downwards,
- the right-hand dipped beam bulb will be off,
- the front fog lights will be lit,
- an instrument panel warning message will be sent.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF010 **CONTINUED**	

Fault **DF010** appears following:
- **an open circuit** on the right-hand adjustment motor control lines,
- **a short circuit to +12 V** on one of the right-hand adjustment motor control lines,
- **a short circuit between 2 control lines** of the right-hand adjustment motor,
- **a short circuit to earth** on one of the right-hand adjustment motor control lines,

Disconnect the black **4-track** right-hand adjustment motor connector
Check the condition of the connections (oxidation, damage, etc).
Repair if necessary.

Check the **continuity, absence of interference resistance and insulation against +12 V, and the insulation against earth** on the following connections:

Xenon bulb computer, 10-track black connector, **track 8** → **track 4** of the right-hand adjustment motor 4-track black connector
Xenon bulb computer, 10-track black connector, **track 6** → **track 3** of the right-hand adjustment motor 4-track black connector
Xenon bulb computer, 10-track black connector, **track 9** → **track 2** of the right-hand adjustment motor 4-track black connector
Xenon bulb computer, 10-track black connector, **track 7** → **track 1** of the right-hand adjustment motor 4-track black connector

Repair if necessary.

With the connectors disconnected, check the insulation between each control wire.
If two wires are in short circuit, repair the relevant connections.

If the fault is still present, replace the right-hand adjustment motor.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF011 PRESENT OR STORED	STEERING WHEEL POSITION SIGNAL 1.DEF: producer computer multiplex signals invalid

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: – the steering wheel is turned to full lock, – a road test.

1.DEF	***NOTES***	This fault is outside the xenon bulb system. Fault present on the vehicle CAN network.

Test the electric power assisted steering (see MR 405 Mechanical, 36B, Interpretation of faults).

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF013 PRESENT OR STORED	COMPUTER SUPPLY VOLTAGE 1.DEF : feed voltage too low 2.DEF : feed voltage too high

NOTES	**Conditions for applying the fault finding procedure to stored faults:** If the fault is declared present following: – engine start, – battery replacement.

1.DEF	***NOTES***	**None.**

Check the condition of the battery and the vehicle charge circuit.

2.DEF	***NOTES***	**None.**

Check for **+12 V** on **track 7** of the xenon bulb computer 12-track connector.
Repair if necessary.

If the fault is still present, check the condition of fuse: **F27 (10A)**.
Repair if necessary.

Check the following connection for continuity and make sure that there is no interference resistance:

Passenger compartment relay and fuse box, green connector, **track 1** → **Track 1** of the xenon bulb computer 5-track black connector

Vehicle earth → **Track 8** of the xenon bulb computer black 12-track connector.

Repair if necessary.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF014 **PRESENT**	COMPUTER CONFIGURATION 1.DEF: vehicle configuration not performed

NOTES	**None.**

If the **DF014** fault is present, the vehicle has not been configured.
Use the **CF001 Vehicle type** configuration (see **Configurations and programming**).

Once the procedure is completed, check for system faults.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

ET001	COMPUTER CONFIGURATION

NOTES	Status **ET001 COMPUTER CONFIGURATION** shows the system operation and authorises computer initialisation.

INHIBITED

If status **ET001** is **INHIBITED**, the computer cannot be initialised.

Possible causes:
- configuration not performed when configuration attempted,
- speed is not zero when configuration attempted,
- sensor fault or value out of range when configuration attempted.

Check height sensors.
Check vehicle configuration.

After repair, initialise the system using the **VP002** command.

When this procedure has finished, the **ET001** status should be **AUTHORISED**.

AUTHORISED

If status **ET001** is **AUTHORISED**, system initialisation is possible.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET002	COMPUTER INITIALISATION

NOTES	If status **ET002 COMPUTER INITIALISATION COMPUTER** is **INHIBITED**, system initialisation is impossible.

NOT COMPLETED

If status **ET002** is **NOT COMPLETED**, the computer is not initialised.
Fault **DF014 Computer configuration** is present, and the system functions are inhibited.
Use configuration **CF001 Vehicle type** by following the procedure given in the **Configuration and programming** section.
When this procedure has finished, the **ET002** status should be **COMPLETED**.

COMPLETED

If status **ET002** is **COMPLETED**, computer initialisation has been performed and the system is operating normally.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET004	LEFT-HAND ADJUSTMENT

NOTES	These checks are carried out only if the status is inconsistent with the system operating conditions.

ACTIVE

Status **ET004** is **ACTIVE** when the left-hand adjustment motor is operated by the computer:
- on switching on the dipped beam headlights
- during adjustment of the beam.

STATUS1: INITIALISATION

Status **ET004** is **STATUS1** when the system is in the initialisation phase.
The computer is informed of the initial positions of the adjustment motors and the height sensors.

STATUS2: DIPPED HEADLIGHT STANDBY

Status **ET004** is **STATUS2** when the dipped headlights are off.
The adjustment system is in standby mode.
The computer is informed of the initial positions of the adjustment motors and the height sensors.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET004 **CONTINUED 1**	

STATUS3: REFERENCING PHASE

Status **ET004** is **STATUS3** when the computer authorises the system signature.
The status is only visible for a brief moment.

STATUS4: SIGNATURE PHASE

Status **ET004** is **STATUS4** during the signature operation. The signature operation consists of operating the adjustment actuators at three different beam heights when the dipped headlights are switched on.
This action verifies correct operation of the system and checks for possible faults (see System Operation).

STATUS5: DELAY POWER FEED FREEZE WAITING

If a fault is present on the adjustment motors, the power supply to the motors is cut, and their position is locked.
Status **ET004** becomes **STATUS5**. No command is performed on the left-hand adjustment motor.

STATUS6: POWER SUPPLY FREEZE EXPIRED

The command lock is terminated, the system changes to defect mode.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET004 **CONTINUED 2**	

STATUS7: DEFECT MODE

Status **ET004** is **STATUS7** when:
- the left-hand adjustment motor is faulty,
- the rear height sensor is faulty,
- the computer feed voltage is **< 10 V for 10 seconds**.

Consult the relevant fault finding pages, and refer to their interpretation if necessary.
If there are no faults affecting the system, consult interpretation of the **AC001 Adjustment motors** command.

STATUS8: RAISED DIPPED FREEZE

Status **ET004** is **STATUS8**, when:
- the system is in raised dipped phase,
- a fault in the left-hand adjustment motor has been detected in the main beam position.

The raised dipped function is disabled until a repair is carried out.
The opposite adjustment motor is moved to the low position.
The system changes to defect mode.

STATUS9: RAISED DIPPED DEFECT MODE

The raised dipped function is no longer available on the left-hand adjustment motor.
The adjustment motor will no longer be operated whatever the operating conditions.
The motor will remain locked in one position.
The power supply to the left-hand bulb of the dipped headlights is cut.
The front fog lights have a power supply.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET005	RIGHT-HAND ADJUSTMENT

NOTES	These checks are carried out only if the status is inconsistent with the system operating conditions.

ACTIVE

Status **ET005** is **ACTIVE** when the left-hand adjustment motor is operated by the computer:
- on switching on the dipped beam headlights
- during adjustment of the beam.

STATUS1: INITIALISATION

Status **ET005** is **STATUS1** when the system is in the initialisation phase.
The computer is informed of the initial positions of the adjustment motors and the height sensors.

STATUS2: DIPPED HEADLIGHT STANDBY

Status **ET005** is **STATUS2** when the dipped headlights are off.
The adjustment system is in standby mode.
The computer is informed of the initial positions of the adjustment motors and the height sensors.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET005 **CONTINUED 1**	

STATUS3: REFERENCING PHASE

Status **ET005** is **STATUS3** when the computer authorises the system signature.
The status is only visible for a brief moment.

STATUS4: SIGNATURE PHASE

Status **ET005** is **STATUS4** during the signature operation. The signature operation consists of operating the adjustment actuators at three different beam heights when the dipped headlights are switched on.
This action verifies correct operation of the system and checks for possible faults (see System Operation).

STATUS5: DELAY POWER FEED FREEZE WAITING

If a fault is present on the adjustment motors, the power supply to the motors is cut, and their position is locked.
Status **ET005** becomes **STATUS5**. No command is performed on the left-hand adjustment motor.

STATUS6: POWER SUPPLY FREEZE EXPIRED

The command lock is terminated, the system changes to defect mode.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET005 **CONTINUED 2**	

STATUS7: DEFECT MODE

Status **ET005** is **STATUS7** when:
- the left-hand adjustment motor is faulty,
- the rear height sensor is faulty,
- the computer feed voltage is **< 10 V for 10 seconds**.

Consult the relevant fault finding pages, and refer to their interpretation if necessary.
If there are no faults affecting the system, consult interpretation of the **AC001 Adjustment motors** command.

STATUS8: RAISED DIPPED FREEZE

Status **ET005** is **STATUS8**, when:
- the system is in raised dipped phase,
- a fault in the left-hand adjustment motor has been detected in the main beam position.

The raised dipped function is disabled until a repair is carried out.
The opposite adjustment motor is moved to the low position.
The system changes to defect mode.

STATUS9: RAISED DIPPED DEFECT MODE

The raised dipped function is no longer available on the left-hand adjustment motor.
The adjustment motor will no longer be operated whatever the operating conditions.
The motor will remain locked in one position.
The power supply to the left-hand bulb of the dipped headlights is cut.
The front fog lights have a power supply.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET008	REQUEST TO TURN OFF DIPPED HEADLIGHTS

NOTES	These checks are carried out only if the status is inconsistent with the system operating conditions.

NO

Status **ET008** is **NO** during normal operation of the system.
There is no fault present in the system.

STATUS1: LEFT-HAND SIDE

Status **ET008** is **STATUS1** when a fault is detected in the main beam position on the left-hand adjustment motor circuit.
The computer cuts the power supply to the left-hand bulb of the dipped headlights.
The system is then in defect mode, the computer requests activation of the front fog lights.

STATUS2: RIGHT-HAND SIDE

Status **ET008** is **STATUS2** when a fault is detected in the main beam position on the right-hand adjustment motor circuit.
The computer cuts the power supply to the right-hand bulb of the dipped headlights.
The system is then in defect mode, the computer requests activation of the front fog lights.

STATUS3: BOTH SIDES

Status **ET008** is **STATUS3** when a fault is detected in the main beam position on both adjustment motor circuits.
The computer cuts the power supply to the right-hand bulb of the dipped headlights.
The system is then in defect mode, the computer requests activation of the front fog lights.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET009	LEFT-HAND RAISED DIPPED BEAM

NOTES	These checks are carried out only if the status is inconsistent with the system operating conditions.

DEACTIVATED

Status **ET009** is **DEACTIVATED** when the driver switches off the main beam headlight function.

ACTIVE

Status **ET009** is **ACTIVE** when the system is in the initialisation phase.
The computer is informed of the operating positions of the adjustment motors and the system sensors.

STATUS1: DRIVING MODE

Status **ET009** is **STATUS1 when the raised dipped beam function is activated and when the vehicle speed is > 6 mph (10 km/h)**.
The dipped beam is raised when the driver changes to main beam and dynamic correction is activated.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET009 **CONTINUED**	

STATUS2: STOP MODE

Status **ET009** is **STATUS2** when the raised beam function is not activated:
- Vehicle speed < 6 mph (10 km/h),
- Main beam headlights off.

Dynamic correction is activated and the beam is slightly raised.

STATUS3: EEPROM WRITE MODE

Status **ET009** is **STATUS3** when the xenon bulb computer is being configured.
This status is not visible in fault finding mode.

STATUS4: DEFECT MODE

Status **ET009** is **STATUS4** when a fault is detected on the left-hand adjustment motor in the main beam position.
The power feed to the right-hand dipped beam bulb is then cut and then the front fog lights power feed is activated.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET010	RIGHT-HAND RAISED DIPPED BEAM

NOTES	These checks are carried out only if the status is inconsistent with the system operating conditions.

DEACTIVATED

Status **ET010** is **DEACTIVATED** when the driver switches off the main beam headlight function.

ACTIVE

Status **ET010** is **ACTIVE** when the system is in the initialisation phase.
The computer is informed of the operating positions of the adjustment motors and the system sensors.

STATUS1: DRIVING MODE

Status **ET010** is **STATUS1 when the raised dipped beam function is activated and when the vehicle speed is > 6 mph (10 km/h)**.
The dipped beam is raised when the driver changes to main beam and dynamic correction is activated.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET010 **CONTINUED**	

STATUS2: STOP MODE

Status **ET010** is **STATUS2** when the raised beam function is not activated:
- Vehicle speed < 6 mph (10 km/h),
- If the main beam headlights are switched off, dynamic correction is activated and the dipped beam headlights are slowly raised.

STATUS3: EEPROM WRITE MODE

Status **ET010** is **STATUS3** when the xenon bulb computer is being configured.
This status is not visible in fault finding mode.

STATUS4: DEFECT MODE

Status **ET010** is **STATUS4** when a fault is detected on the left-hand adjustment motor in the main beam position. The power feed to the right-hand dipped beam bulb is then cut and then the front fog lights power feed is activated.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

Tool parameter	Tool name
PR004	Rear reference height
PR005	Front reference height
PR006	Vehicle speed
PR008	Right-hand adjustment motor position
PR009	Left-hand adjustment motor position
PR011	Front height sensor signal
PR012	Rear height sensor signal
PR013	Height sensor feed voltage
PR014	Raise/lower offset as a function of speed
PR016	Computer supply voltage
PR021	Left-hand adjustment motor position set point
PR022	Right-hand adjustment motor position set point

GETtheMANUALS.org

Tool command	Diagnostic tool title
RZ001	Fault memory.
AC001	Adjustment motors
VP001	Write VIN
VP002	System initialisation

GETtheMANUALS.org

AC001	ADJUSTMENT MOTORS

This command is for testing the control circuit of the adjustment motors. Select the actuators tab of the diagnostic tool. Select the command **AC001**. The adjustment motors should move while the command is executing.
Switch the lights on if necessary to verify the beam height variation.
If one or both of the motors do not move, consult the following fault codes: **DF009 Left-hand adjustment motor circuit,** **DF010 Right-hand adjustment motor control circuit.**

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

HEADLIGHTS
Fault finding - Customer complaints

GETtheMANUALS.org

NOTES	**Only consult the customer complaints after performing a complete check with the diagnostic tool.**

NO DIALOGUE WITH THE XENON BULB COMPUTER	**ALP 1**
NO HEIGHT ADJUSTMENT ON EITHER OR BOTH HEADLIGHTS, REGARDLESS OF VEHICLE LOAD	**ALP 2**
DAZZLING OR LACK OF POWER OF ONE OR BOTH HEADLIGHTS	**ALP 3**

GETtheMANUALS.org

ALP 1	No dialogue with the xenon bulb computer

NOTES	Only consult this customer complaint after a complete check with the diagnostic tool.

Disconnect the xenon bulb computer black 12-track connector.
Check the condition of the connections: no corrosion, damaged contacts, etc.
Repair if necessary.

Check the battery voltage and carry out the operations required to obtain the correct voltage (**9.5 V < battery voltage < 16 V**).

Check for the presence and condition of fuse **F27 10A**.
Replace it if necessary.

Check **the continuity and the absence of interference resistance** on the following connections:
- black 12-track connector of the xenon bulb computer **track 7** → **track 1** of the fuse box black 6-track connector
- Xenon bulb computer black connector **track 8** → **Vehicle earth**

If the fault is still present, check the **R265 intermediate connector on track A6**.
Repair if necessary.

Check the **continuity of the CAN H and CAN L connections**:
- black 12-track connector of the xenon bulb computer **track 2** → **track 11** of the brown 20-track UCH connector
- black 12-track connector of the xenon bulb computer **track 4** → **track 1** of the brown 20-track UCH connector

Repair if necessary.

Check the power supply and earths of the diagnostic socket:
- presence of **+12 V before ignition** on **track 16**
- presence of **+12 V after ignition** on **track 1**
- presence of an earth on **tracks 4 and 5**.

If all the checks are OK, replace the front height sensor.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

ALP 2	No height adjustment on either or both headlights, regardless of vehicle load

NOTES	Only consult this customer complaint after a complete check with the diagnostic tool.

Verify the signature when the dipped headlights are switched on **with the vehicle stationary**. If the signature is not performed, the adjustment motors or one of the system components could be faulty.
Check the conformity and condition of fuse **F106 15A**. Replace it if necessary.
Use the **AC001 Adjustment motors** command to check the operation of the adjustment motors. If nothing happens when the command is run, refer to interpretation of the **AC001 Adjustment motors** command.
Check the conformity of the parameters **PR011** and **PR012 Front and rear height sensor signals**.
Check the conditions of the height sensor linkage rods: sticking, ball joint disconnected, damage to the sensor and electrical connections. Repair if necessary.
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

ALP 3	Dazzling or lack of power in one or both headlights

NOTES	Only consult this customer complaint after a complete check with the diagnostic tool.

Check that headlights are properly mounted.
Check that the front right-hand and front left-hand lens units project their beams at the same level. If the heights of the units are different, adjust the headlights manually.
Check the mechanical components of the system (sensor mountings, linkage rods). Repair if necessary.
Perform an initialisation of the system using the **VP002** command (see procedure described in the Configurations and programming section).
Switch on the dipped beam headlights and use the **AC001 Adjustment motors** command. If the adjustment motors are actuated but the direction of the beam does change, check the condition of the adjustment motor/headlight linkage rods. Replace the faulty adjustment motor(s).
If the adjustment motors fail to move, replace the faulty adjustment motor(s). If the adjustment motors move and the direction of the beam changes, adjust the headlights manually.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

1. SCOPE OF THIS DOCUMENT

This document presents the fault finding procedure applicable to all computers with the following specifications:

Vehicle(s): **VEL SATIS** *Function concerned:* **Instrument panel**	*Name of computer:* **Instrument panel** *Vdiag No.:* **11**

2. PREREQUISITES FOR FAULT FINDING

Documentation type

Fault finding procedures (this manual):
– Assisted fault finding (integrated into the diagnostic tool), Dialogys.
Wiring Diagrams:
– Visu-Schéma (CD-ROM), paper.

Type of diagnostic tools

CLIP + CAN probe

Special tooling required

Special tooling required	
	Multimeter
Elé. 1681	Universal bornier

3. RECAP

Procedure

In order to save energy, the Laguna II Phase 2 UCH cuts off the + after ignition feed after 3 minutes.

To perform fault finding on a computer, it is possible to force the + after ignition feed for 1 hour by applying the following procedure:
– press the card unlocking button,
– insert the card in the reader,
– if the ignition is switched on, press the Start button (interruption of timed + after ignition feed),
– press and hold the Start button for over 5 seconds until the engine immobiliser warning light starts to flash rapidly (4 Hz).

This forced + after ignition feed mode remains active for 1 hour.

Pressing the Start button or removing the card from the reader cuts off the forced + after ignition feed but does not cut off the timed forced + after ignition feed mode. As long as one hour has not elapsed the + after ignition feed function restarts the forced + after ignition feed for the remaining time.

GETtheMANUALS.org

Faults

Faults are declared as either present or stored (depending on whether they appeared in a certain context and have disappeared since, or whether they remain present but have not been diagnosed within the current context).

The **present** or **stored** status of faults should be taken into consideration when the diagnostic tool is used following the + after ignition supply being switched on (without acting on the system components).

For a **present fault**, apply the procedure described in the **Interpretation of faults** section.

For a **stored fault**, note the faults displayed and apply the instructions in the **Notes** section.

If the fault is **confirmed** when the instructions in the Notes section are applied, the fault is present. Deal with the fault.

If the fault is **not confirmed**, check:
- the electrical lines which correspond to the fault,
- the connectors on these lines (corrosion, bent pins, etc.),
- the resistance of the component detected as faulty,
- the condition of the wires (melted or split insulation, wear).

Conformity check

The aim of the conformity check is to check data that does not produce a fault display on the diagnostic tool when it is inconsistent. Therefore, this stage is used to:
- carry out fault finding on faults that do not have a fault display, and which may correspond to a customer complaint.
- check that the system is operating correctly and that there is no risk of a fault recurring after repair.

This section provides the fault finding procedures for statuses and parameters and the conditions for testing them.

If a status is not behaving normally or a parameter is outside the permitted tolerance values, consult the corresponding fault finding page.

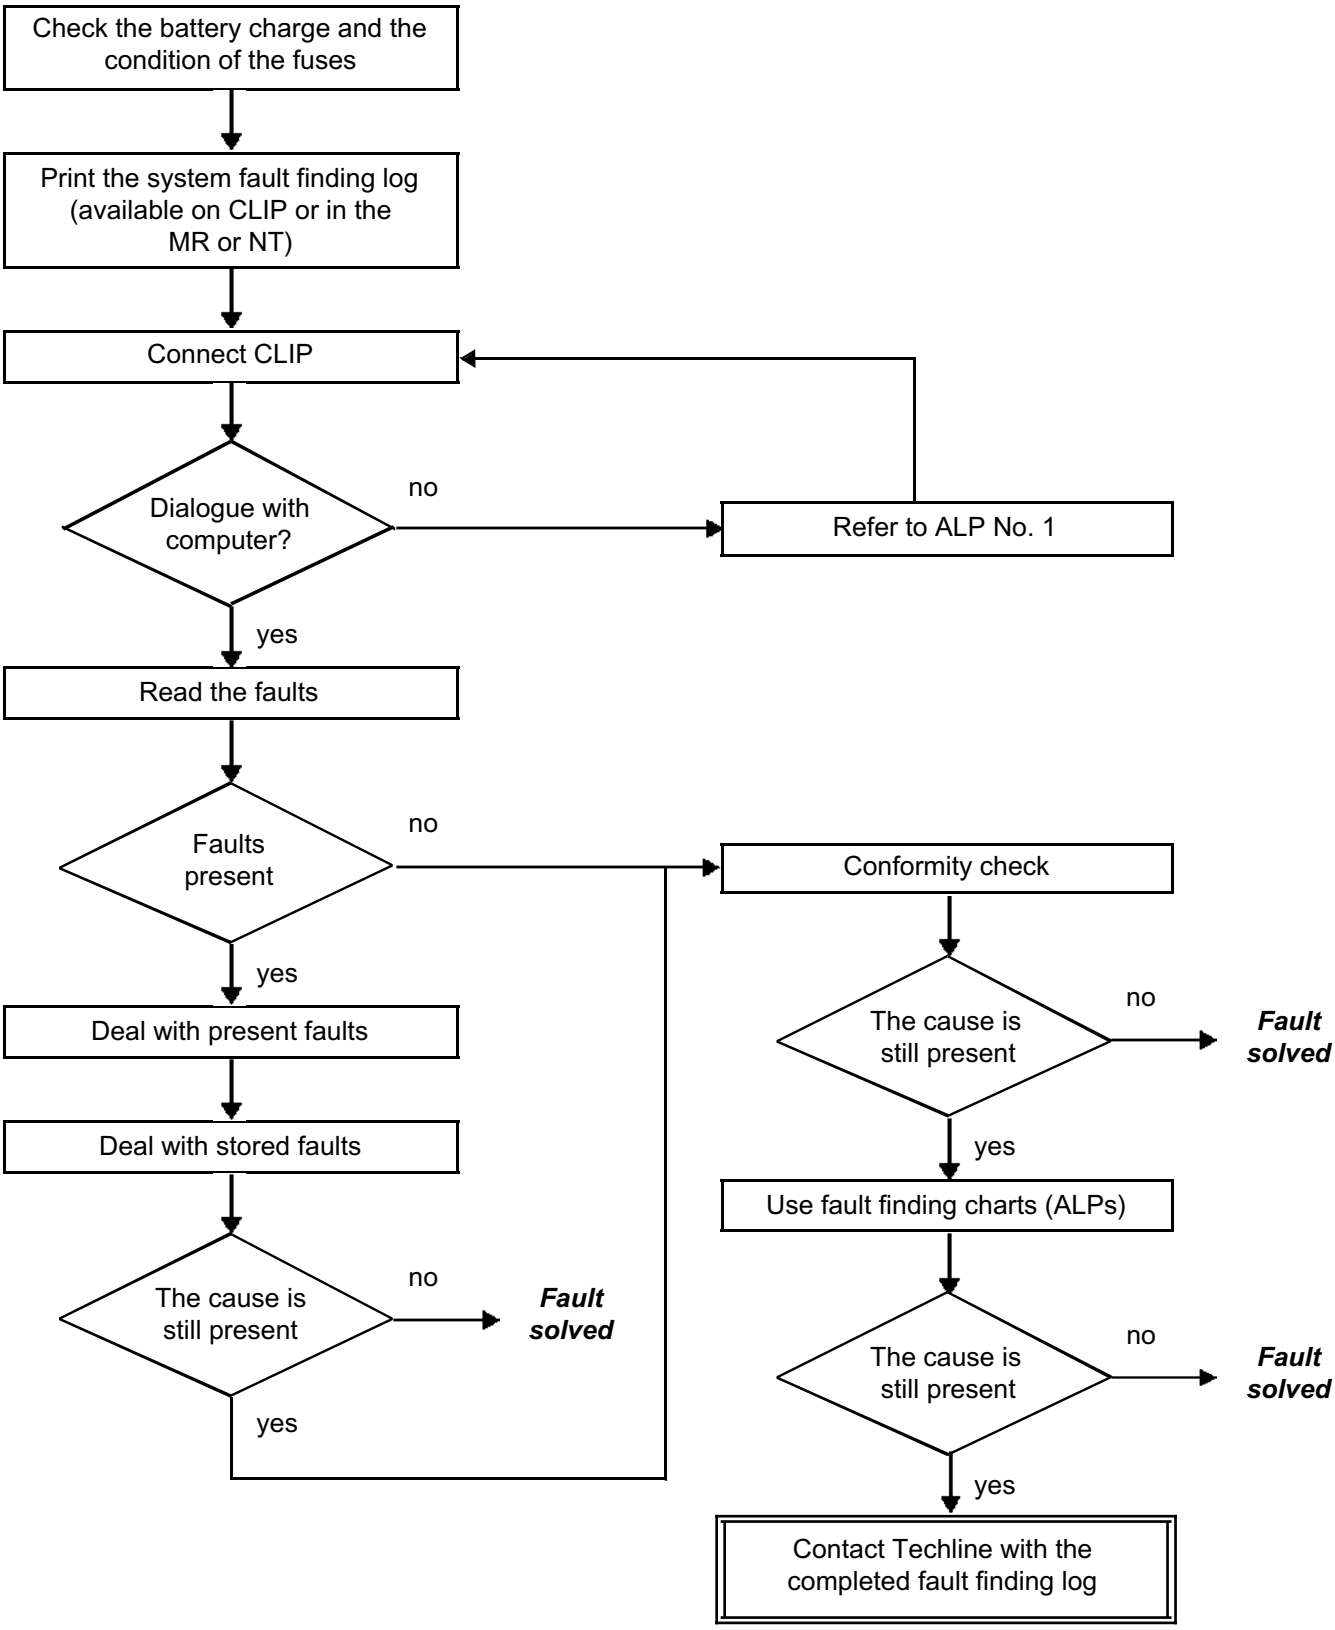
Customer complaints - Fault finding chart

If the test with the diagnostic tool is OK but the customer complaint is still present, the fault should be treated by **Customer complaints**.

A summary of the overall procedure to follow is provided on the following page in the form of a flow chart

GETtheMANUALS.org

4. FAULT FINDING PROCEDURE



GETtheMANUALS.org

4. FAULT FINDING PROCEDURE (continued)

Wiring check

Fault finding problems

Disconnecting the connectors and/or manipulating the wiring harness may temporarily remove the cause of a fault.
Electrical measurements of voltage, resistance and insulation are generally correct, especially if the fault is not present when the analysis is made (stored fault).

Visual inspection

Look for damage under the bonnet and in the passenger compartment.
Carefully check the fuses, insulators and wiring harness routing.
Look for signs of oxidation.

Tactile inspection

While manipulating the wiring harness, use the diagnostic tool to note any change in fault status from stored to present.
Make sure that the connectors are properly locked.
Apply light pressure to the connectors.
Twist the wiring harness.
If there is a change in status, try to locate the source of the fault.

Inspection of each component

Disconnect the connectors and check the appearance of the clips and tabs, as well as their crimping (no crimping on the insulating section).
Make sure that the clips and tabs are properly locked in the sockets.
Make sure that no clips or tabs have been dislodged during connection.
Check the clip contact pressure using an appropriate model of tab.

Resistance check

Check the continuity of entire lines, then section by section.
Look for a short circuit to earth, to **+ 12 V** or to another wire.

If a fault is detected, repair or replace the wiring harness.

GETtheMANUALS.org

5. FAULT FINDING LOG

IMPORTANT

IMPORTANT
Any fault on a complex system requires thorough fault finding with the appropriate tools. The FAULT FINDING LOG, which should be completed during the fault finding procedure, ensures a record is kept of the procedure carried out. It is an essential document when consulting the manufacturer.

IT IS THEREFORE ESSENTIAL THAT THE FAULT FINDING LOG IS FILLED OUT EVERY TIME IT IS REQUESTED BY TECHLINE OR THE WARRANT RETURNS DEPARTMENT.

You will always be asked for this log:
- when requesting technical assistance from the Techline.
- for approval requests when replacing parts for which approval is obligatory.
- to be attached to monitored parts for which reimbursement is requested. The log is needed for warranty reimbursement, and enables better analysis of the parts removed.

6. SAFETY GUIDELINES

Safety rules must be observed during any work on a component to prevent any damage or injury:
- Check that the battery is properly charged to avoid damaging the computers in the event of a low load,
- Do not smoke,
- Use the appropriate tools.

GETtheMANUALS.org

1. Instrument panel functions:

– Features on petrol versions:
  - gas (LPG) indicator light,
  - rev counter up to **7125 rpm**.

– Features on diesel versions:
  - Exhaust particle filter indicator light,
  - rev counter up to **5000 rpm**.

– Needle gauge displays:
  - vehicle speed,
  - rev counter,
  - fuel level (petrol, diesel or gas),
  - engine coolant temperature.

– LCD displays:
  - mileometer and trip mileometer: ABS/ESP signal via the CAN,
  - oil level,
  - Trip Computer:
    - fuel consumed (petrol or diesel),
    - average consumption (petrol or diesel),
    - instantaneous consumption (petrol or diesel),
    - fuel range (petrol or diesel),
    - gas consumed,
    - average gas consumption,
    - fuel range,
    - distance travelled,
    - average speed,
    - mileage before oil change.

– Display on a single-colour dot matrix display informing the driver of the operating status of the vehicle using a system of colours:
  – white: status message (cruise control, keyless vehicle, etc.),
  – amber: hazard warning (tyre pressure monitor sensor not operational, etc.),
  – red: danger warning (coolant temperature, etc.).

– The information display is used for the following functions:
  - keyless vehicle,
  - tyre pressure monitor,
  - opening element statuses,
  - Automatic transmission indicator (option),
  - etc. (approximately 70 messages per language - 4 lines of 13 characters).

Notes
It is possible to enter instrument panel **self-test mode.** To do this, it is necessary to **switch on the ignition** while pressing the **trip computer scroll button** on the end of the wiper stalk.

GETtheMANUALS.org

– Management of a multifunction buzzer:
  The audible alert is used for the following functions:
  - indicating the operation of the direction indicator,
  - indicating that the lights have been left on accidentally,
  - indicating to the driver the activation/deactivation of automatic locking when driving,
  - indicating the failure of the childproof lock system,
  - indicating that the driver's position is stored,
  - indicating that the parking brake is not applied,
  - indicating that the driver's or passenger's seat belts are not fastened when driving,
  - signalling the start of the display of all the level 1 warnings (associated with the STOP warning light):
    – severe injection failure,
    – brake circuit or Electronic Braking Distribution fault,
    – battery charge circuit fault,
    – oil pressure fault,
    – engine coolant temperature warning,
    – immobiliser system fault,
    – lock fault,
    – parking brake fault,
  - indicating a first level tyre pressure monitor fault: major air leak or puncture,
  - low fuel warning,
  - indicating that a door or the tailgate is not correctly closed,
  - indicating that the handbrake is applied while the vehicle is being driven,
  - indicating a request to manage the cruise control,
  - indicating activation or deactivation of the cruise control,
  - indicating that a speed has been exceeded, for Arabian versions, where an overspeed warning is legally required.

  The audible alert is operational as soon as the instrument panel is started.
  The following buzzers can sound:
  - lights on,
  - direction indicators,
  - card left in reader,
  - automatic parking brake.

– Instrument panel dimmer: the instrument panel brightness can be adjusted using a button when the side lights are switched on.
– Certain functions or configurations are set by programming with the diagnostic tool.

– The oil level is measured after a set period; the voltage difference being measured across the terminals of the oil level sensor. This difference in voltage is processed by a circuit board, which sends this signal to the level indicator.

– For the "Change oil" and "Change oil as soon as possible" messages:
  The oil service interval distance and time values and the mileage before oil change are reinitialised after an oil change in accordance with two parameters: "Initial mileage before oil change and "Initial time before oil change".

  Reaching the 1st warning level: Oil change required soon
  When the mileage before oil change falls to 9,000 miles (1,500 km) OR the time interval falls to 2 months, the first warning level is reached: "Oil change required soon".

  Reaching the 2nd warning level: Change oil as soon as possible
  When the mileage before oil change OR the time before oil change to 0, the second warning level is reached and "Change oil as soon as possible" is displayed (with the SERVICE warning light coming on)

GETtheMANUALS.org

1. REPLACING, PROGRAMMING OR REPROGRAMMING THE INSTRUMENT PANEL:

For any operation involving the replacement of the instrument panel, follow the procedure described in the following paragraph (see **Configuration and programming**).

NOTE
After programming, reprogramming or replacing the instrument panel, it is essential to run the command **VP011 Fuel sender calibration**.

GETtheMANUALS.org

1. CONFIGURATIONS:

If the instrument panel has never been configured, the **NO PROG** message appears on the display when the ignition is switched on.

WARNING
It is necessary to take into account the configurations, in order that the new configuration values are used by the system.

CF or LC No.	Configuration	Note:
CF018 or LC001	**Reserve tank capacity**	
	→ LAGUNA II phase 2 (and phase 1)	= 6 l
	→ VELSATIS phase 2 (and phase 1)	= 9 l
CF019 or LC003	**Trip Computer display type**	
	→ Europe (l/100 km) → GB (miles/gallon) → Brazil (km/l)	Check the presence or absence of the instantaneous consumption trip computer screen
CF035 or LC006	**Tank capacity**	
	→ LAGUNA II phase 2 (phase 1)	= 70 l
	→ VELSATIS phase 2 (phase 1)	= 80 l
CF039 or LC065	**UCH**	
	→ VELSATIS → VELSATIS phase 2	
CF040 or LC066	**Particle filters**	
	→ None → With	If the vehicle is a VELSATIS phase 1, always configure CF040 to WITHOUT even if the vehicle is fitted with a particle filter.
CF049 or LC070	**Oil pressure warning threshold**	
	→ P9X/V4Y → Others	

GETtheMANUALS.org

CF050 or LC071	**Oil measurement temperature threshold**		
	→	V4Y	
	→	Others	
CF053 or LC072	**Oil measurement delay**		
	→	V4Y	
	→	Others	
CF054 or LC073	**Parking distance control function**		
	→	None	Front parking distance control configuration.
	→	With	
CF125 or LC002	**Language version**		
	→	French	
	→	English	
	→	Italian	
	→	German	
	→	Spanish	
	→	Dutch	
	→	Portuguese	
	→	Turkish	
	→	Japanese	
	→	Russian	
CF136 or LC047	**Tyre pressure units**		
	→	Bar	To select the unit of measurement that the tyre pressures will be displayed in.
	→	Psi	
CF137 or LC030	**Vehicle type**		
	→	VELSATIS	To select the vehicle in which the instrument panel is to be installed.

GETtheMANUALS.org

CF138 or LC049	**Type of fuel**	
	→ Petrol → Diesel	Petrol: Check that the rev counter indicates the scale to a maximum of 7000 rpm. Diesel: Check that the rev counter indicates the scale to a maximum of 6000 rpm, and that the preheating warning light comes on when the ignition is switched on. **IMPORTANT** **This check is important, because it also determines the correct operation of the gauges.**
CF139 or LC050	**Voice synthesiser**	
	→ None → With	**(VELSATIS only)**
CF140 or LC051	**Unit of distance**	
	→ Km → Miles	
CF141 or LC052	**Overspeed function - Arabia**	
	→ None → With	Driving **at more than 78 mph (130 km/h)**, you should hear a warning
CF142 or LC053	**Electronic stability program (ESP)**	
	→ With	If the vehicle is equipped with ESP: check, by pushing on the ESP OFF button, that "ESP deactivated" message definitely appears.
CF145 or LC056	**Tyre pressure monitor**	
	→ None → With	If the vehicle is equipped with a tyre pressure monitoring system: check that the vehicle profile does not remain displayed without the wheels and that there is no "Pressure not monitored" message (message indicating the absence of the tyre pressure monitoring system packets).

GETtheMANUALS.org

CF146 or LC057	**Automatic parking brake**		
	→	With	**IMPORTANT** If the instrument panel is configured **without automatic parking brake** and the vehicle is equipped with this function, the instrument panel displays **NO PROG** on the matrix display.
CF148 or LC059	**Automatic headlighting**		
	→	With → None	Disconnect the automatic headlights, and check that the "Auto Headlights Off" message is displayed.
CF149 or LC029	**Gearbox type**		
	→	Automatic gearbox connection → Sequential gearbox → Manual gearbox	If the vehicle has an automatic transmission or sequential gearbox, check that the instrument panel shows the gear selected. If the vehicle is not equipped with an automatic transmission or sequential gearbox, check that there is no "Check gearbox" message (this message indicates the absence of the automatic transmission frames if the instrument panel has been configured for an automatic transmission or sequential gearbox).
CF150 or LC061	**Cruise control/speed limiter**		
	→	With → None → Distance control/speed limiter (automatic)	If the vehicle is equipped with a Cruise Control - Speed Limiter function: check that the cruise control or speed limiter warning light comes on when the cruise control/ speed limiter button is pressed.
CF158 or LC064	**Seat belt reminder buzzer**		
	→	With → None	
CF196 or LC101	**Forward strategy on cruise control/speed limiter**		
	→	With → None	For vehicles fitted with cruise control: If this has been incorrectly configured, a difference in speed will appear between the regulator speed setpoint and the vehicle speed displayed by the instrument panel.

GETtheMANUALS.org

Oil service interval:

– The time and mileage before oil change displayed need to be reinitialised after the oil is changed in accordance with the two parameters which can be configured with the CLIP tool, **VP008 Distance before oil change: current in km** and **VP009 Time before oil change: current value in months**.

Reaching the 1st warning level: Oil change required soon

– When the mileage before oil change falls to 900 miles (1,500 km) OR the time before next oil change falls to **2 months** the first warning level is reached **Oil change A**

Reaching the 2nd warning level: Change oil as soon as possible

– When the mileage before oil change OR oil change interval reaches zero, the second warning level is reached and "Change oil as soon as possible" is displayed (with the **SERVICE** warning light coming on)

Oil change frequency:

This configuration must only be used if the instrument panel is **new**.
This configuration updates the new instrument panel, in accordance with two parameters which can be configured by the CLIP tool, **VP006 Oil change frequency in KM** and **VP007 Oil change frequency in months** from the old instrument panel.
Refer the driver's handbook for the vehicle for the mileage and time interval for the vehicle according to the country.
Ignition on, engine off. Run command **VP006 Oil change frequency in KM**.
Enter the Oil service interval in km.

Example of entry:
Using the Clip numeric keypad, type 20 to display 20,000 kilometres
or
enter 30 to display 30,000 kilometres

Special features of UK versions:
The new instrument panel is supplied configured, by default, in kilometres.
In addition to the language configuration **CF125 "Language version" (KM → Miles**), carry out the calculation below to allow the instrument panel to display consistent values between the **distance** before next oil change and the desired **oil service interval frequency**.
To display the oil service intervals in **Miles, multiply** the value in miles indicated in the maintenance service booklet by **10** then **divide** by **6**, to find the exact figure in **kilometres**.
After the value has been entered, the computer automatically performs the conversion into **miles** for the **oil change frequency**.
It is imperative to use the following procedure for correct functioning of the range and oil change frequency.

Example:
18,000 miles x 10 = 180,000 miles, then divide by 6 = 30,000 Km (**Enter 30**)

GETtheMANUALS.org

Odometer

This configuration must only be used if the instrument panel is **new**.
This configuration updates the mileometer on the new instrument panel, in accordance with a parameter configured by the CLIP tool, **VP010 Update mileometer**.
The update counter increments every time the instrument panel mileage is updated (maximum 15). This update counter is in the EEPROM and can only be reinitialised by the production or After-Sales services. The value of the update counter corresponds to a reset EEPROM value.

Calibration of the fuel sender

This configuration must only be used if the instrument panel is **new**.
This configuration reinitialises the measurement of the fuel level on the new instrument panel, in accordance with a parameter configured by the CLIP tool **VP011 Fuel sender calibration**.
Ignition on, engine off. Run command **VP011 Fuel sender calibration**.
The range of the nominal measurement is from **15 Ω** to **320 Ω** and the instrument panel converts the resistance value into litres.

2. PROGRAMMING:

None concerned.

GETtheMANUALS.org

Tool fault	Associated DTC	Diagnostic tool title
DF007	**9402**	Fuel sender circuit
DF009	**9407**	Oil pressure sensor circuit
DF016	**9401**	Oil level sensor circuit
DF018	**9405**	Instrument panel
DF019	**9404**	Battery voltage
DF020	**9406**	Steering column lock circuit

GETtheMANUALS.org

DF007 PRESENT OR STORED	FUEL SENDER CIRCUIT CO : Open circuit CC : Short circuit 1.DEF: Internal electronic fault 2.DEF: Voltage outside tolerance range

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present when the ignition is switched on. Wait **2 minutes** to confirm the fault.

Manipulate the wiring harness between the fuel sender and the instrument panel until a change in fault status is produced. (Present ↔ Stored).
Look for possible damage to the harness, and check the **connection and condition** of the fuel sender unit and its connections.
Repair if necessary.

Check the **continuity and insulation** of the following connections:
Fuel sender unit **track A1** ⟶ **track 22 of the 30-track** instrument panel connector
Fuel sender unit **track B1** ⟶ **track 25 of the 30-track** instrument panel connector
Repair if necessary.

Measure the **resistance** between **tracks A1 and B1** of the fuel sender unit.
Replace the fuel sender unit if the **resistance** value is not: **350 Ω fuel tank in reserve**
10 Ω full tank

If the fault is still present, **contact Techline**.

AFTER REPAIR	Clear the computer memory. Carry out a road test and then recheck with the diagnostic tool.

GETtheMANUALS.org

DF009 PRESENT OR STORED	OIL PRESSURE SENSOR CIRCUIT 1.DEF: Signal incoherence

NOTES	**Conditions for applying the fault finding procedure to stored faults:** Switch on the ignition, start the engine (the speed should be above **500 rpm**); the status should be inactive if the indicator light is not lit.

Manipulate the wiring harness between the instrument panel and the oil level sensor in order to produce a change in fault status (Present ↔ Stored).
Look for possible damage to the harness, and check **the connection and condition** of the oil level sensor and its connections.
Repair if necessary.

Check **the condition and connection** of the instrument panel 30-track connector, bent tabs, oxidised, broken, etc.
Repair if necessary.

Check the **insulation** and **continuity** of the following connections:

Pressure switch, transparent connector, **track 1** ⟶ **track 18 on the 30-track** instrument panel connector

Pressure switch, grey connector, **track 2** ⟶ **track 18 on the 30-track** instrument panel connector

If the fault is still present, check the **R262 intermediate connector** on **track C5**.
Repair if necessary.

Check that the pressure switch is correctly fitted and check if there are any leaks (see **MR 353 or 402 Mechanical, 10A, Engine and peripherals**).

If the fault is still present, **contact Techline**.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF016 PRESENT OR STORED	OIL LEVEL SENSOR CIRCUIT CO : Open circuit CC : Short circuit 1.DEF: Inconsistent current value 2.DEF: Internal electronic fault 3.DEF: Battery voltage out of range

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present when the ignition is switched on. Wait **2 minutes** to confirm the fault.

Manipulate the wiring harness between the instrument panel and the oil level sensor in order to produce a change in fault status (Present ↔ Stored).
Look for possible damage to the harness, and check **the connection and condition** of the oil level sensor and its connections.
Repair if necessary.

Check **the condition and connection** of the instrument panel 30-track connector, bent tabs, oxidised, broken, etc.
Repair if necessary.

Check the **insulation and continuity** of the connections:
Oil level sensor **track 2** ⟶ **track 26** of the 30-track instrument panel connector
Oil level sensor **track 1** ⟶ **track 21** of the 30-track instrument panel connector
If the fault is still present, check the **R262 intermediate connector** on **tracks C6** and **C7**.
Repair if necessary.

Measure the resistance between the **tracks 3** and **4** of the oil level sensor.
Replace the oil level sensor if the **resistance** is not between **7** and **20 Ω**.

If the fault is still present, **contact Techline**.

AFTER REPAIR	Clear the computer memory. Carry out a road test and then recheck with the diagnostic tool.

GETtheMANUALS.org

DF018 PRESENT OR STORED	INSTRUMENT PANEL 1.DEF : EEPROM fault 2.DEF : Battery voltage too low

NOTES	**Special notes:** An EEPROM fault is declared when the instrument panel has detected an anomaly in the odometer control in EEPROM*. The mileage is no longer guaranteed to be correct. **Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the ignition is switched on if the battery voltage is below **5 V** or above **12 V**.

1.DEF	***NOTES***	None

If the fault is still present, contact Techline.

2.DEF	***NOTES***	None

Manipulate the wiring harness between the instrument panel and the battery until a change in fault status is produced (Present ↔ Stored).
Look for any damage to the wiring and check the **connection and condition** of the battery and its connections.
Repair if necessary.

Check **the condition and connection** of the instrument panel 30-track connector, bent tabs, oxidised, broken, etc.
Repair if necessary.

Check **the condition of the battery** and **the charge circuit**.
Check the **condition** of the vehicle **earths**.

Check for **+ 12 V** on **track 4 of the 30-track** instrument panel connector.
Repair if necessary.
With the ignition on, check for **+ 12 V** on **track 16 of the 30-track** instrument panel connector.
Repair if necessary.
Check for an **earth** on **track 24** of the **30-track** instrument panel connector.
Repair if necessary.

* EEPROM = Computer memory.

AFTER REPAIR	Clear the computer memory. Carry out a road test and then recheck with the diagnostic tool.

GETtheMANUALS.org

DF019 PRESENT OR STORED	BATTERY VOLTAGE 1.DEF: Voltage too weak 7 V 2.DEF: Feed voltage too high (between 16 and 18 volts) 3.DEF: Feed voltage too high (above 18 V) 4.DEF: Internal electronic fault

NOTES	**Special note:** If the battery voltage is greater than **18 V** due to a polarity inversion, check that the instrument panel is not damaged.

Manipulate the wiring harness between the instrument panel and the battery until a change in fault status is produced (Present ↔ Stored). Look for any damage to the wiring and check the **connection and condition** of the battery and its connections. Repair if necessary.
Check **the condition and connection** of the instrument panel 30-track connector, bent tabs, oxidised, broken, etc. Repair if necessary.
Check **the condition of the battery** and **the charge circuit**. Check the **condition** of the vehicle **earths**.
Check for **+ 12 V** on **track 4 of the 30-track** instrument panel connector. Repair if necessary. With the ignition on, check for **+ 12 V** on **track 16 of the 30-track** instrument panel connector. Repair if necessary. Check for an **earth** on **track 24** of the **30-track** instrument panel connector. Repair if necessary.
If the fault is still present, contact Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF020 PRESENT OR STORED	STEERING LOCK CIRCUIT CC.0 : Short circuit to earth

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the ignition has been switched on.

Manipulate the wiring harness between the instrument panel and the electric steering lock in order to produce a change in fault status (Present ⇔ Stored).
Look for possible damage to the harness, and check the **condition and connection** of the electric steering column lock and its connections.
Repair if necessary.

Check the **insulation** and **continuity** of the connection:
Instrument panel, **30-track connector, track 7** ⟶ **track 5** of the electric steering column lock
Repair if necessary.

If the fault is still present, contact Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test and then recheck with the diagnostic tool.

GETtheMANUALS.org

NOTES	Only check the conformity after a **complete check** with the diagnostic tool. The values indicated in this conformity check are given as examples. **Application condition:** Engine **stopped, ignition on**.

MAIN COMPUTER STATUSES AND PARAMETERS

Order	Function	Parameter, Status checked or Action		Display and Notes	Fault finding

GETtheMANUALS.org

ET002	+ 12 V AFTER IGNITION FEED

NOTES	There must be no present or stored faults. Switch on the ignition, status **ET002** should be **PRESENT**.

Check instrument panel fuse **F11 (20A)** on the Passenger Compartment Fuse and Relay Board.
Check the passenger compartment fuse and relay box connectors.

Check **the insulation and continuity** of the wiring between:

Fuse and relay box, **green connector, track 1** → **Track B9, black connector,** passenger compartment fuse and relay box

Passenger compartment fuse and relay box, **black connector, track J5** → **Track 4** of the instrument panel **30-track connector**

Observe the Verlog diode.
Repair if necessary.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET008	VEHICLE SPEED SIGNAL < 9 MPH (15 KM/H)

NOTES	There must be no present or stored faults. Switch on the ignition and carry out a road test.

In the event of a fault, **carry out a fault finding procedure on the multiplex network** and the **ABS** (see **88B, Multiplex network** and **38C, ABS**).

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET014	SCREEN WASH LEVEL MINIMUM

NOTES	There must be no present or stored faults. Switch on the ignition, fill the washer fluid reservoir: status **ET014** should be **YES**.

Check the instrument panel connector and the washer fluid reservoir connector.
Check that the **earth** is properly connected to the reservoir on **track 2**. Repair if necessary.
Check **the insulation and continuity** of the connection: Instrument panel, **30-track connector, track 13** ⟶ **track 1** of the washer fluid reservoir If the fault is still present, check **intermediate connector R265** on **track C7**. Repair if necessary.
Check that the reservoir's two tracks are not short-circuiting. If necessary, replace the reservoir.

IMPORTANT
The warning message is only displayed for 30 seconds on activation of the after ignition feed if the fault is already present, otherwise 8 seconds in fault finding.
The fault is confirmed after 30 seconds.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET016	DRIVER'S DOOR OPEN

NOTES	There must be no present or stored faults. Switch on the ignition, open the door, status **ET016** should be **YES**.

Check the driver's door wiring harness connector.
Check the **earth** on **track D** of the lock.
IMPORTANT
There are several locks (see **Wiring Diagram Technical Note, Velsatis**).

Check **the continuity and insulation** between:
Instrument panel, **30-track connector, track 1** ⟶ **Track C** of the driver's door locking function
If the fault is still present, check **intermediate connector R153** on **track B10**.
Repair if necessary.

Check that the lock is working and in particular that it engages properly in the striker.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET018	BONNET OPEN

NOTES	There must be no present or stored faults. Switch on the ignition, open the bonnet, status **ET018** should be **YES**.

Check the instrument panel connector and the bonnet connector. Check that the bonnet switch is firmly attached to the bodywork and that it operates properly.
Check **the insulation and continuity** of the wiring between: Instrument panel **30-track connector, track 19** ⟶ **Track 2** of the bonnet switch Repair if necessary.
Check **the insulation and continuity** of the wiring between: Bonnet switch **track 1** ⟶ Vehicle earth If the fault is still present, check **intermediate connector R265** on **track B1**. Repair if necessary.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET019	MINIMUM BRAKE FLUID LEVEL

NOTES	There must be no present or stored faults. Switch on the ignition, check the brake fluid level in the reservoir.

Check the instrument panel connector and the reservoir connector.
Check **the insulation and continuity** of the wiring between: Instrument panel **30-track connector, track 30** ⟶ **track 2** of the brake fluid reservoir Repair if necessary.
Check that the earth is properly connected to **track 1** of the brake fluid reservoir level sensor. If necessary, replace the reservoir.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET030	TRIP COMPUTER SCROLL BUTTON

NOTES	There must be no present or stored faults. Switch on the ignition, press the button: status **ET030** should be **PRESSED**.

Check the instrument panel connector and the wiper stalk connector.
Check **the insulation and continuity** of the wiring between: Instrument panel, **15-track connector, track 6** ⟶ **track B7** of the windscreen wiper stalk Repair if necessary.
Check that the **earth** on **track B5** is properly connected to the stalk. If necessary, replace the stalk.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET031	MUTE BUTTON

NOTES	There must be no present or stored faults. The vehicle must be equipped with a voice synthesiser. Switch on the ignition, press the button: status **ET031** should be **PRESSED**.

Manipulate the wiring harness between the instrument panel connector and the voice synthesis control connector, to produce a change in fault status.
Look for any damage to the wiring harness, check the **connection and condition** of the voice synthesis computer and its connections.
Repair if necessary.

Carry out a fault finding procedure on the multiplex network (see **88B Multiplex network**).

Check **the insulation and continuity** of the wiring between:
Instrument panel, **15-track connector, track 2** ⟶ **track A3** of the voice synthesis control
Repair if necessary.

Check that the **earth** is properly connected to control **track A2**.
If necessary, change the set of buttons.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET033	REPEAT BUTTON

NOTES	There must be no present or stored faults. The vehicle must be equipped with a voice synthesiser. Switch on the ignition, press the button: status **ET033** should be **PRESSED**.

Manipulate the wiring harness between the instrument panel connector and the voice synthesis control connector, to produce a change in fault status.
Look for any damage to the wiring harness, check the **connection and condition** of the voice synthesis computer and its connections.
Repair if necessary.

Carry out a fault finding procedure on the multiplex network (see **88B Multiplex network**).

Check **the insulation and continuity** of the wiring between:
Instrument panel, **30-track connector, track 28** ⟶ **track A1** of the voice synthesis control
Repair if necessary.

Check that the earth is properly connected to control on **track A2**.
If necessary, change the set of buttons.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET055	HEATED SEAT

NOTES	There must be no present or stored faults. Switch on the ignition, press the heated seat button: status **ET031** should be **ACTIVE**.

Check the instrument panel connection and the connectors.
Check **the continuity and insulation** between: Instrument panel, **30-track connector, track 15** ⟶ **Track A1** of the heated seat switches (driver's and passenger) If the fault is still present, check the **R334** and **R335 intermediate connectors** on **track 16**. Repair if necessary.
Check that the seats are properly installed and that the automatic connectors (**R334** and **R335**) between the seat wiring harness and the passenger compartment wiring harness are correctly locked.
Also check that the **earth** on **track B1** is connected to these switches.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET056	COOLANT TEMPERATURE SIGNAL ABSENT

NOTES	There must be no present or stored faults. Switch on the ignition, start the engine.

Perform fault finding on the **multiplex network** and the **injection** (see **88B, Multiplex network** and **17B, Petrol injection** or **13B, Diesel injection**).

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET058	BATTERY CHARGE

NOTES	There must be no present or stored faults. Switch on the ignition, start the engine (the speed should be above **1000 rpm**); status **ET058** should be **OK** if the warning light is not lit. Check that the speed is above **400 rpm** for more than **10 seconds** before registering a possible fault.

Manipulate the wiring harness between the instrument panel connector and the alternator connector, in order to produce a change in status.
Look for any harness damage, and check **the condition and connection** of the alternator and its connections.
Repair if necessary.

Check the alternator installation and mountings.
Check that the alternator is recharging the battery.

Check **the insulation and continuity** of the wiring between:
Instrument panel, **30-track connector, track 14** ⟶ **track 1** of the alternator black connector
If the fault is still present, check **intermediate connector R262** on **track C4**.
Repair if necessary.

If status **ET058** does not change to "**INACTIVE**", check the operation signals of the alternator (see **MR 355 or 402 Mechanical, 16A, Starting - Charging**).

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET097	PARKING BRAKE

NOTES	There must be no present or stored faults. Switch on the ignition, apply the brake: status **ET097** should be **APPLIED**.
	Special Note Check whether the vehicle is fitted with an automatic parking brake by referring to configuration **LC057 Automatic parking brake**. If it does have this function, status **ET097** is **RELEASED**.

Manipulate the wiring harness between the instrument panel connector and the handbrake connector in order to produce a change in status.
Look for possible damage to the harness, and check the **connection and condition** of the handbrake and its connections.
Repair if necessary.

Check that the handbrake is firmly attached to the bodywork and that it operates correctly.

Check **the insulation and continuity** of the wiring between:
Instrument panel, **30-track connector, track 29** ⟶ **Track 1** of the handbrake
Repair if necessary.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET098	DRIVER'S SEAT BELT CONTACT

NOTES	There must be no present or stored faults. Switch on the ignition, fasten the seat belt: status **ET098** should be **OPEN**.

Check the instrument panel connector and the seat belt anchorage stirrup connector.
Manipulate the wiring harness between the instrument panel connector and the stirrup/seat belt anchorage, to produce a change in fault status.
Look for possible damage to the harness, and check **the connection and the condition** of the stirrup/seat belt anchorage and its connections.
Repair if necessary.

Check **the insulation and continuity** of the wiring between:
Instrument panel, **30-track connector, track 6** ⟶ **track A2** of the driver's seat belt clamp
If the fault is still present, check the **R335 intermediate connector** on **track 2**.
Repair if necessary.

Check that there is an earth connection on the seat belt anchorage/stirrup (**track A1**).
If necessary, change the seat belt anchorage stirrup.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET110	DRIVER'S SEAT BELT CONTACT

NOTES	If in short circuit for over 100 seconds, the needle fluctuates between full and half-full. If in open circuit for over 100 seconds, the needle fluctuates between half-full and 0.

Check the **insulation and continuity** of the connections:
Instrument panel, **30-track connector, track 22** ⟶ track A1 of the fuel sender
Instrument panel, **30-track connector, track 25** ⟶ track B1 of the fuel sender
Repair if necessary.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

Tool parameter	Diagnostic tool title
PR002	Fuel sender unit resistance
PR003	Fuel consumption
PR004	LPG fuel consumption
PR005	Oil change frequency in km
PR006	Oil change frequency in months
PR007	Distance to next oil service: current value in km
PR008	Time to next oil service: current value in months
PR009	Odometer
PR010	Fuel tank capacity
PR011	Oil level sensor voltage
PR110	Battery voltage
PR112	Fuel flow

GETtheMANUALS.org

PR110	BATTERY VOLTAGE

NOTES	None

Check that there are no faults.
If the voltage is at minimum:
Check the battery and the charge circuit.
If the voltage is at maximum:
Check that the charging voltage is correct with and without electrical consumers switched on.

Check the **insulation, continuity and the absence of interference resistance** on the following connection:
Instrument panel, **30-track connector, track 04** ⟶ **+ battery feed**
Repair if necessary.

GETtheMANUALS.org

PR112	FUEL FLOW

NOTES	With the engine idling, the flow should be around **0**. Vary the engine speed to confirm the increase in flow.
	Note: A fuel flow signal fault causes an inconsistency in trip computer operation.

Perform a **multiplex network** and **injection test** (see **88B, Multiplex network** and **17B, Petrol injection** or **13B, Diesel injection**).

GETtheMANUALS.org

CLEARING

RZ001: Fault memory
This command is used for clearing the computer's stored faults.

ACTIVATION

AC003: Opening element indicator light
This command enables the opening element indicator lights to be tested.

Switch on the ignition and run command **AC003**.
The buzzer should be heard.

AC004: Seatbelt warning light
This command enables the seat belt warning light to be tested.

Switch on the ignition and run command **AC004**.
The buzzer should be heard.

AC005: Display test
This command enables the entire display assembly to be tested.

Switch on the ignition and run command **AC005**.
All the display elements on the instrument panel should light up.

AC006: Audible warning (Buzzer)
This command is for testing the buzzer function.

Switch on the ignition and run command **AC006**.
The buzzer should be heard.

AC008: Instrument panel needles
This command enables the needles to be tested (rev counter, speedometer, oil and coolant temperature).

Switch on the ignition and run command **AC008**.
The buzzer should be heard.

AC009: Instrument panel indicator/ warning lights
This command enables the all the instrument panel warning lights to be tested.

The warning lights come on and then go out:
– make sure that lighting of one warning light does not cause the lighting, even partially, of another warning light.
The indicator lights are all lit:
– make that sure the lighting is correct.

GETtheMANUALS.org

ACTUATION (continued)

AC010: Lighting
This command enables the instrument panel lighting to be tested.

Switch on the ignition and run command **AC010**.
The instrument panel lights up; change the lighting brightness.

AC011: Symbol display
This command enables the matrix display to be tested.

Switch on the ignition and run command **AC011**.
All the matrix display pixels should be red.

AC015: Voice synthesiser
This command enables the voice synthesiser to be tested.

Switch on the ignition and run command **AC015**.
A voice synthesis message should be heard.

GETtheMANUALS.org

NOTES	**Only consult the customer complaints after a complete check using the diagnostic tool.** **Run fault finding on the multiplex network.** **Run fault finding on the instrument panel.** **In the case of a top of the range instrument panel (with central display), run fault finding on the function.**

ONE OR MORE OF THE NEEDLES DOES/DO NOT MOVE	**ALP 1**
ONE OR MORE OF THE NEEDLES DOES/DO NOT MOVE IN ACCORDANCE WITH THE SCALE DIVISIONS	**ALP 1**

GETtheMANUALS.org

MESSAGES ARE ISSUED WHEN THEY SHOULD NOT BE	ALP 7
THE INSTRUMENT PANEL BACKLIGHTING DOES NOT WORK	ALP 8
THE INSTRUMENT PANEL DOES NOT LIGHT UP WHEN THE SIDE LIGHTS ARE ON	ALP 8
INSTRUMENT PANEL SELF-TEST PROCEDURE	PRO 1

GETtheMANUALS.org

ALP 1	**One or more of the needles does/do not move** **One or more of the needles does/do not move in accordance with the scale divisions** **The display on the on trip computer or central display is incomplete or blurred** **Some of the trip computer data is incorrect** **Some of the trip computer data has been replaced with dashes** **The fuel gauge (apart from LPG) displays an implausible value** **The oil gauge displays an incorrect measurement**

NOTES	None.

Run the instrument panel self-test procedure (**PRO 1**).

AFTER REPAIR	If an instrument panel has been replaced: Remember to run a self-test and clear the faults. Remember to configure the instrument panel.

GETtheMANUALS.org

ALP 2	The trip computer does not work when the button is pressed

NOTES	Carry out a fault finding procedure on the multiplex network (see **88B Multiplex network**). Switch on the ignition.

Run the instrument panel self-test procedure (**PRO 1**).
Check the **insulation and continuity** of the connection between: Instrument panel, **15-track connector, track 6** ⟶ **track B7** of the windscreen wiper stalk Repair if necessary.
Check the **earth** on **track B5** of the wiper stalk connector.
Check that the voltage on **track 6** is zero when the button is pressed. If necessary, repair the wiring or replace the windscreen wiper control.
Replace the instrument panel.

AFTER REPAIR	If an instrument panel has been replaced: Remember to run a self-test and clear the faults. Remember to configure the instrument panel.

GETtheMANUALS.org

ALP 3	The warning lights do not come on or messages are not displayed when there is a fault The warning lights come on although there is no fault

NOTES	Carry out a fault finding procedure on the multiplex network (see **88B Multiplex network**). Carry out a fault finding procedure on the system that controls the warning light / message. Switch on the ignition.

List of warning/indicator lights lit up by a wire connection and not via the multiplex network:
- brake fluid fault,
- dipped headlights on,
- main beam headlights on,
- front fog lights on,
- rear fog lights on,
- direction indicators,
- heated seat indicator light,
- immobiliser warning light,
- parking brake,
- driver's seat belt.

If these warning/indicator lights do not come on or come on when they should not:
- check the continuity of the wiring between the warning/indicator light control (sensor, lighting stalk, alternator, etc.) and the instrument panel,
- check that the control system is working properly, that there is a feed to it and that there are no short-circuits on the connection.

The UCH detects if there is a bulb failure and transmits the bulb status on the multiplex network.

Replace the instrument panel.

AFTER REPAIR	If an instrument panel has been replaced: Remember to run a self-test and clear the faults. Remember to configure the instrument panel.

GETtheMANUALS.org

ALP 4	Voice synthesiser does not work

NOTES	Switch on the ignition. Press the repeat button, check if a message is issued. Carry out a fault finding procedure on the multiplex network, in particular check that the network linking the instrument panel to the voice synthesiser is correct). Carry out fault finding on the instrument panel. Check the (language) configurations. Check that the presses on the repeat and mute buttons have been detected.

Check the feed (+ battery feed, earth and + ignition feed) to the instrument panel and the voice synthesiser.

If the radio does not mute, check the multiplex network.
Switch off the ignition, disconnect and reconnect the battery. Switch the ignition back on so that the instrument panel is reconfigured correctly.

Check the **continuity and insulation** of the following connections:
Voice synthesiser **track 14** ⟶ **track A1** of the speaker
Voice synthesiser **track 15** ⟶ **track A2** of the speaker
Check the speaker.
Repair if necessary.

Replace the voice synthesiser computer.
If the fault persists, replace the instrument panel.

AFTER REPAIR	If an instrument panel has been replaced: Remember to run a self-test and clear the faults. Remember to configure the instrument panel.

GETtheMANUALS.org

ALP 5	**The radio does not cut out when the voice synthesiser is issuing a message**

NOTES	Check that the radio is working correctly. Switch on the ignition.

Check **the continuity and insulation** of the following connection:
Voice synthesiser **track 10** ⟶ **Track 3, black connector** for the radio
Repair if necessary.

Disconnect the voice synthesiser.
Connect **track 10** of the connector to earth.
If the radio mutes, replace the voice synthesiser; if not, replace the radio.

AFTER REPAIR	If an instrument panel has been replaced: Remember to run a self-test and clear the faults. Remember to configure the instrument panel.

GETtheMANUALS.org

ALP 6	The voice synthesiser messages are inconsistent (different language...)

NOTES	Carry out a fault finding procedure on the multiplex network (see **88B Multiplex network**). Carry out fault finding on the instrument panel. Carry out a fault finding procedure on the systems that the messages refer to. Switch on the ignition.

Replace the voice synthesiser computer.
If the fault is still present, replace the instrument panel.

AFTER REPAIR	If an instrument panel has been replaced: Remember to run a self-test and clear the faults. Remember to configure the instrument panel.

GETtheMANUALS.org

ALP 7	Messages are issued when they should not be

NOTES	Carry out a fault finding procedure on the multiplex network (see **88B Multiplex network**). Carry out a fault finding procedure on the system that the message refers to.

Replace the instrument panel.
If the fault is still present, replace the voice synthesiser.

AFTER REPAIR	If an instrument panel has been replaced: Remember to run a self-test and clear the faults. Remember to configure the instrument panel.

GETtheMANUALS.org

ALP 8	**The lighting dimmer on the instrument panel does not work** **The panel does not light up when the side lights are on**

NOTES	Switch on the ignition. Switch on the side lights. Carry out a fault finding procedure on the instrument panel (check that the side lights are active).

Check that the voltage on **track 27 of the 30-track** instrument panel connector is **12 V** when the side lights are switched.

Check **the continuity and insulation** of the connections between:

Instrument panel, **15-track connector, track 5** ⟶ **track 2** of the dimmer

Dimmer **track 3** ⟶ Earth

Repair if necessary.

Check that the resistance of the dimmer varies between **0** and **1000 Ω** when the wheel is moved.
If not, check that the climate control varies and refer to the fault finding procedure for the climate control (see **62B, Regulated air conditioning**).

AFTER REPAIR	If an instrument panel has been replaced: Remember to run a self-test and clear the faults. Remember to configure the instrument panel.

GETtheMANUALS.org

PRO 1	Instrument panel self-test procedure

NOTES	There must be no present or stored faults. The warning lights run by the instrument panel should be lit. Press the button of the trip computer (trip computer scroll button on the windscreen wiper stalk). Holding the button down, switch on the ignition (card inserted into the reader up to the stop). As soon as the needles begin to move, the test mode runs for **5 minutes**. Release the button. To skip from one screen to another on the trip computer, briefly press the trip computer scroll button again. Press the km reset button to exit from the mode and **clear the faults**.

Check that the rev counter, speedometer, coolant temperature gauge and fuel level gauge needles are moving properly and following all the scale divisions. If not, replace the instrument panel.
Check that all the digits on the trip computer are lit up. If not, replace the instrument panel.
Each time the Trip computer scroll button is pressed, the image on the central display changes. Replace the instrument panel if some images are unclear.

AFTER REPAIR	If an instrument panel has been replaced: Remember to run a self-test and clear the faults. Remember to configure the instrument panel.

INSTRUMENT PANEL
Fault finding - Introduction

GETtheMANUALS.org

1. SCOPE OF THIS DOCUMENT

This document presents the fault finding procedure applicable to all computers with the following specifications:

Vehicle(s): **VEL SATIS** *Function concerned:* **Instrument panel**	*Name of computer:* **Instrument panel** *Vdiag No.:* **11**

2. PREREQUISITES FOR FAULT FINDING

Documentation type

Fault finding procedures (this manual):
– Assisted fault finding (integrated into the diagnostic tool), Dialogys.
Wiring Diagrams:
– Visu-Schéma (CD-ROM), paper version.

Type of diagnostic tools

CLIP + CAN probe

Special tooling required

Special tooling required	
	Multimeter
Elé. 1681	Universal bornier

3. RECAP

Procedure

In order to save energy, the Laguna II Phase 2 UCH cuts off the + after ignition feed after 3 minutes.

To perform fault finding on a computer, it is possible to force the + after ignition feed for 1 hour by applying the following procedure:
– Press the card unlocking button,
– insert the card in the reader,
– if the ignition is switched on, press the Start button (interruption of timed + after ignition feed),
– press and hold the Start button for over 5 seconds until the engine immobiliser warning light starts to flash rapidly (4 Hz).

This forced + after ignition feed mode remains active for 1 hour.

Pressing the Start button or removing the card from the reader cuts off the forced + after ignition feed but does not cut off the timed forced + after ignition feed mode. As long as one hour has not elapsed the + after ignition feed function restarts the forced + after ignition feed for the remaining time.

GETtheMANUALS.org

Faults

Faults are declared as either present or stored (depending on whether they appeared in a certain context and have disappeared since, or whether they remain present but have not been diagnosed within the current context).

The **present** or **stored** status of faults should be taken into consideration when the diagnostic tool is used following the + after ignition supply being switched on (without acting on the system components).

For a **present fault**, apply the procedure described in the **Interpretation of faults** section.

For a **stored fault**, note the faults displayed and apply the instructions in the **Notes** section.

If the fault is **confirmed** when the instructions in the Notes section are applied, the fault is present. Deal with the fault

If the fault is **not confirmed**, check:
- the electrical lines which correspond to the fault,
- the connectors on these lines (corrosion, bent pins, etc.),
- the resistance of the component detected as faulty,
- the condition of the wires (melted or split insulation, wear).

Conformity check

The aim of the conformity check is to check data that does not produce a fault display on the diagnostic tool when it is inconsistent. Therefore, this stage is used to:
- carry out fault finding on faults that do not have a fault display, and which may correspond to a customer complaint,
- check that the system is operating correctly and that there is no risk of a fault recurring after repair.

This section provides the fault finding procedures for statuses and parameters and the conditions for testing them.

If a status is not behaving normally or a parameter is outside the permitted tolerance values, consult the corresponding fault finding page.

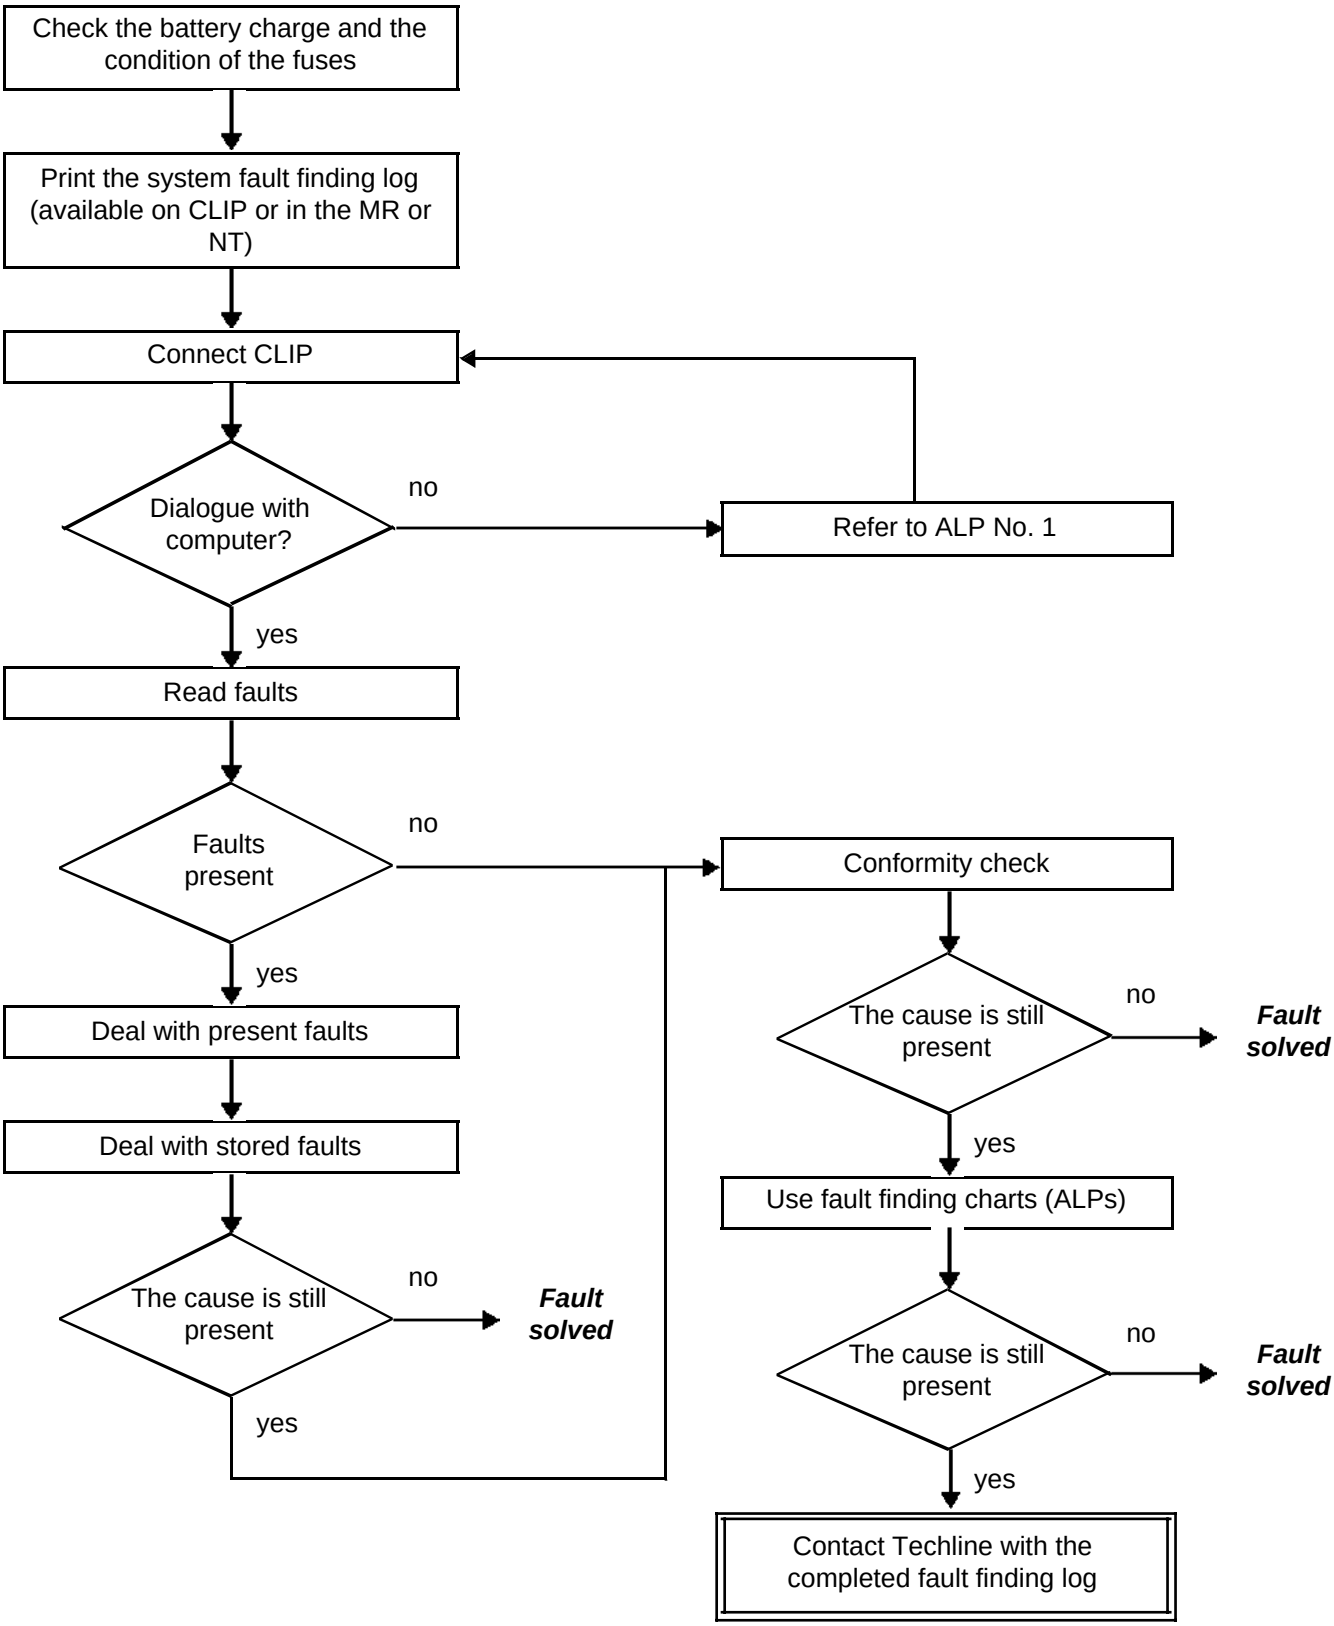
Customer complaints - Fault finding chart

If the test with the diagnostic tool is OK but the customer complaint is still present, the fault should be treated by **Customer complaints**.

A summary of the general procedure is provided in the form of a flow chart on the following page

GETtheMANUALS.org

4. FAULT FINDING PROCEDURE



GETtheMANUALS.org

4. FAULT FINDING PROCEDURE (continued)

Wiring check

Fault finding problems

Disconnecting the connectors and/or manipulating the wiring harness may temporarily remove the cause of a fault.
Electrical measurements of voltage, resistance and insulation are generally correct, especially if the fault is not present when the analysis is made (stored fault).

Visual inspection

Look for damage under the bonnet and in the passenger compartment.
Carefully check the fuses, insulators and wiring harness routing.
Look for signs of oxidation.

Tactile inspection

While manipulating the wiring harness, use the diagnostic tool to note any change in fault status from stored to present.
Check that the connectors are properly locked.
Apply light pressure to the connectors.
Twist the wiring harness.
If there is a change in status, try to locate the source of the fault.

Inspection of each component

Disconnect the connectors and check the appearance of the clips and tabs, as well as their crimping (no crimping on the insulating section).
Make sure that the clips and tabs are properly locked in the sockets.
Make sure that no clips or tabs have been dislodged during connection.
Check the clip contact pressure using an appropriate model of tab.

Resistance check

Check the continuity of entire lines, then section by section.
Look for a short circuit to earth, to **+ 12 V** or to another wire.

If a fault is detected, repair or replace the wiring harness.

GETtheMANUALS.org

5. FAULT FINDING LOG

IMPORTANT!

IMPORTANT
Any fault on a complex system requires thorough fault finding with the appropriate tools. The FAULT FINDING LOG, which should be completed during the fault finding procedure, ensures a record is kept of the procedure carried out. It is an essential document when consulting the manufacturer.

IT IS THEREFORE MANDATORY TO FILL OUT A FAULT FINDING LOG FOR EACH FAULT FINDING PROCEDURE.

You will always be asked for this sheet:
- when requesting technical assistance from the Techline.
- for approval requests when replacing parts for which approval is obligatory.
- to be attached to monitored parts for which reimbursement is requested. The log is needed for warranty reimbursement, and enables better analysis of the parts removed.

6. SAFETY GUIDELINES

All work on components requires the observation of safety rules to prevent damage or injury:
- Check that the battery is properly charged to avoid damaging the computers in the event of a low load,
- Do not smoke,
- Use the appropriate tools.

GETtheMANUALS.org

Fault finding log

GETtheMANUALS.org

1. Instrument panel functions:

– Features on petrol versions:
  - gas (LPG) indicator light,
  - rev counter up to **7125 rpm**.

– Features on diesel versions:
  - Exhaust particle filter indicator light,
  - rev counter up to **5000 rpm**.

– Needle gauge displays:
  - vehicle speed,
  - rev counter,
  - fuel level (petrol, diesel or gas),
  - engine coolant temperature.

– LCD displays:
  - mileometer and trip mileometer: ABS/ESP signal via the CAN,
  - oil level,
  - Trip Computer:
    - fuel consumed (petrol or diesel),
    - average consumption (petrol or diesel),
    - instantaneous consumption (petrol or diesel),
    - fuel range (petrol or diesel),
    - gas consumed,
    - average gas consumption,
    - fuel range,
    - distance travelled,
    - average speed,
    - mileage before oil change.

– Display on a single-colour dot matrix display informing the driver of the operating status of the vehicle using a system of colours:
  – white: status message (cruise control, keyless vehicle, etc.),
  – amber: hazard warning (tyre pressure monitor sensor not operational, etc.),
  – red: danger warning (coolant temperature, etc.).

– The information display is used for the following functions:
  - keyless vehicle,
  - tyre pressure monitor,
  - opening element statuses,
  - Automatic transmission indicator (option),
  - etc. (approximately 70 messages per language - 4 lines of 13 characters).

Notes
It is possible to enter instrument panel **self-test mode.** To do this, it is necessary to **switch on the ignition** while pressing the **trip computer scroll button** on the end of the wiper stalk.

GETtheMANUALS.org

– Management of a multifunction buzzer:
  The audible alert is used for the following functions:
  - indicating the operation of the direction indicator,
  - indicating that the lights have been left on accidentally,
  - indicating to the driver the activation/deactivation of automatic locking when driving,
  - indicating the failure of the childproof lock system,
  - indicating that the driver's position is stored,
  - indicating that the parking brake is not applied,
  - indicating that the driver's or passenger's seat belts are not fastened when driving,
  - signalling the start of the display of all the level 1 warnings (associated with the STOP warning light):
    – severe injection failure,
    – brake circuit or Electronic Braking Distribution fault,
    – battery charge circuit fault,
    – oil pressure fault,
    – engine coolant temperature warning,
    – immobiliser system fault,
    – lock fault,
    – parking brake fault,
  - indicating a first level tyre pressure monitor fault: major air leak or puncture,
  - low fuel warning,
  - indicating that a door or the tailgate is not correctly closed,
  - indicating that the handbrake is applied while the vehicle is being driven,
  - indicating a request to manage the cruise control,
  - indicating activation or deactivation of the cruise control,
  - indicating that a speed has been exceeded, for Arabian versions, where an overspeed warning is legally required.

  The audible alert is operational as soon as the instrument panel is started.
  The following buzzers can sound:
  - lights on,
  - direction indicators,
  - card left in reader,
  - automatic parking brake.

– Instrument panel dimmer: the instrument panel brightness can be adjusted using a button when the side lights are switched on.
– Certain functions or configurations are set by programming with the diagnostic tool.

– The oil level is measured after a set period; the voltage difference being measured across the terminals of the oil level sensor. This difference in voltage is processed by a circuit board, which sends this signal to the level indicator.

– For the "Change oil" and "Change oil as soon as possible" messages:
  The oil service interval distance and time values and the mileage before oil change are reinitialised after an oil change in accordance with two parameters: "Initial mileage before oil change and "Initial time before oil change".

  Reaching the 1st warning level: Oil change required soon
  When the mileage before oil change falls to 9,000 miles (1,500 km) OR the time interval falls to 2 months, the first warning level is reached: "Oil change required soon".

  Reaching the 2nd warning level: Change oil as soon as possible
  When the mileage before oil change OR the time before oil change to 0, the second warning level is reached and "Change oil as soon as possible" is displayed (with the SERVICE warning light coming on)

GETtheMANUALS.org

2. Display following defect mode

Trip Computer parameters	Fuel consumed fault present	ABS stored fault present	ECU stored fault present	LPG/CNG stored absence fault	petrol/ diesel sender stored fault present	Gas sender fault	fault(s) Currently being detected
Petrol/diesel consumed	dashes flashing at 2 Hz	no effect	dashes flashing at 2 Hz	no effect	no effect	no effect	Value remains unchanged

Instrument panel computer, 30-track connector:

Tracks	Description
1	Driver's door
2	Right-hand direction indicator
3	Left-hand direction indicator
4	+ battery feed
5	Verlog Led control
6	Driver's seat belt
7	Safety Line output
8	Dipped headlights
9	Main beam headlights
10	Seat belt warning light supply
11	Rear fog lights
12	Front fog lights
13	Minimum washer fluid
14	Battery charge
15	Heated seats
16	+ After ignition feed
17	**RESERVE PHASE 1**
18	Oil pressure
19	Bonnet input
20	Not used
21	+ Oil level sensor
22	+ Fuel sender feed
23	Not used
24	Earth
25	- Fuel sender
26	- Oil level sensor
27	+ Side light feed
28	Repeat button
29	Parking brake input
30	Nivocode input

GETtheMANUALS.org

Instrument panel computer, 15-track connector:

Tracks	Description
1	Opening element indicator light output
2	Mute button
3	Negative seat belt warning light output
4	Not used
5	Dimmer
6	Odometer/trip computer scroll
7	Not used
8	Vehicle CAN_H copy output
9	Not used
10	Vehicle CAN_H
11	Vehicle CAN_L
12	**RESERVE PHASE 1**
13	Vehicle CAN_L copy output
14	Negative AIRBAG OFF warning light output
15	Positive AIRBAG OFF warning light feed

GETtheMANUALS.org

1. REPLACING, PROGRAMMING OR REPROGRAMMING THE INSTRUMENT PANEL:

For any operation involving the replacement of the instrument panel, follow the procedure described in the following paragraph (see **Configuration and programming**).

NOTE
After programming, reprogramming or replacing the instrument panel, it is essential to run the command **VP011 Fuel sender calibration**.

GETtheMANUALS.org

1. CONFIGURATIONS:

If the instrument panel has never been configured, the **NO PROG** message appears on the display when the ignition is switched on.

WARNING
It is necessary to take into account the configurations, in order that the new configuration values are used by the system.

CF or LC No.	Configuration	Note:
CF018 or LC001	**Reserve tank capacity**	
	→ LAGUNA II phase 2 (and phase 1)	= 6 l
	→ VELSATIS phase 2 (and phase 1)	= 9 l
CF019 or LC003	**Trip Computer display type**	
	→ Europe (l/100 km) → GB (miles/gallon) → Brazil (km/l)	Check the presence or absence of the instantaneous consumption trip computer screen.
CF035 or LC006	**Fuel tank capacity**	
	→ LAGUNA II phase 2 (phase 1)	= 70 l
	→ VELSATIS phase 2 (phase 1)	= 80 l
CF039 or LC065	**UCH**	
	→ VELSATIS → VELSATIS phase 2	
CF040 or LC066	**Particle filters**	
	→ None → With	If the vehicle is a VELSATIS phase 1, always configure CF040 to WITHOUT even if the vehicle is fitted with a particle filter.
CF049 or LC070	**Oil pressure warning threshold**	
	→ P9X/V4Y → Others	

GETtheMANUALS.org

CF050 or LC071	**Oil measurement temperature threshold**		
	→	V4Y	
	→	Others	
CF053 or LC072	**Oil measurement delay**		
	→	V4Y	
	→	Others	
CF054 or LC071	**Parking proximity sensor function**		
	→	None	
	→	With	
CF125 or LC002	**Language version**		
	→	French	
	→	English	
	→	Italian	
	→	German	
	→	Spanish	
	→	Dutch	
	→	Portuguese	
	→	Turkish	
	→	Japanese	
	→	Russian	
CF136 or LC047	**Tyre pressure units**		
	→	Bar	To select the unit of measurement that the tyre pressures will be displayed in.
	→	Psi	
CF137 or LC030	**Vehicle type**		
	→	VELSATIS	To select the vehicle in which the instrument panel is to be installed.

GETtheMANUALS.org

CF138 or LC049	**Type of fuel**	
	→ Petrol → Diesel	Petrol: Check that the rev counter indicates the scale to a maximum of 7000 rpm. Diesel: Check that the rev counter indicates the scale to a maximum of 6000 rpm, and that the preheating warning light comes on when the ignition is switched on. **IMPORTANT** **This check is essential, because it also sets the correct operation of the gauge.**
CF139 or LC050	**Voice synthesiser**	
	→ None → With	**(VELSATIS only)**
CF140 or LC051	**Unit of distance**	
	→ Km → Miles	
CF141 or LC052	**Overspeed function - Arabia**	
	→ None → With	Driving **at more than 78 mph (130 km/h)**, you should hear a warning.
CF142 or LC053	**Electronic stability program (ESP)**	
	→ With	If the vehicle is equipped with ESP: check, by pushing on the ESP OFF button, that "ESP deactivated" message definitely appears.
CF145 or LC056	**Tyre pressure monitor**	
	→ None → With	If the vehicle is equipped with a tyre pressure monitoring system: check that the vehicle profile does not remain displayed without the wheels and that there is no "Pressure not monitored" message (message indicating the absence of the tyre pressure monitoring system packets).

GETtheMANUALS.org

CF146 or LC057	**Automatic parking brake**	
	→ With	**IMPORTANT** If the instrument panel is configured **without automatic parking brake** and the vehicle is equipped with this function, the instrument panel displays **NO PROG** on the matrix display.
CF148 or LC059	**Automatic lights activation**	
	→ With → None	Disconnect the automatic headlights, and check that the "Auto Headlights Off" message is displayed.
CF149 or LC029	**Gearbox type**	
	→ Automatic gearbox → Sequential gearbox → Manual gearbox	If the vehicle has an automatic transmission or sequential gearbox, check that the instrument panel shows the gear selected. If the vehicle is not equipped with an automatic transmission or sequential gearbox, check that there is no "Check gearbox" message (this message indicates the absence of the automatic transmission frames if the instrument panel has been configured for an automatic transmission or sequential gearbox).
CF150 or LC061	**Cruise control/Speed limiter**	
	→ With → None → Distance control/speed limiter (automatic)	If the vehicle is equipped with a Cruise Control - Speed Limiter function: check that the cruise control or speed limiter warning light comes on when the cruise control/ speed limiter button is pressed.
CF158 or LC064	**Seat belt reminder buzzer**	
	→ With → None	
CF196 or LC101	**Forward strategy on cruise control/speed limiter**	
	→ With → None	For vehicles fitted with cruise control: If this has been incorrectly configured, a difference in speed will appear between the regulator speed setpoint and the vehicle speed displayed by the instrument panel.

GETtheMANUALS.org

Oil service interval:

– The time and mileage before oil change displayed need to be reinitialised after the oil is changed in accordance with the two parameters which can be configured with the CLIP tool, **VP008 Distance before oil change: current in km** and **VP009 Time before oil change: current value in months**.

Reaching the 1st warning level: Oil change required soon

– When the mileage before oil change falls to 9000 miles (1, 500 km) OR the time before next oil change falls to **2 months** the first warning level is reached **Oil change A**.

Reaching the 2nd warning level: Change oil as soon as possible

– When the mileage before oil change OR oil change interval reaches zero, the second warning level is reached and "Change oil as soon as possible" is displayed (with the **SERVICE** warning light coming on).

Oil change frequency:

This configuration must only be used if the instrument panel is **new**.
This configuration updates the new instrument panel, in accordance with two parameters which can be configured by the CLIP tool, **VP006 Oil change frequency in KM** and **VP007 Oil change frequency in months** from the old instrument panel.
Refer to the vehicle handbook for the mileage and frequency for the vehicle according to the country.
Ignition on, engine off. Run command **VP006 Oil change frequency in KM**.
Enter the Oil service interval in km.

Example of entry:
Using the Clip numeric keypad, type 20 to display 20,000 kilometres
or
enter 30 to display 30,000 kilometres

Special features of UK versions:
The new instrument panel is supplied configured, by default, in kilometres.
Carry out, in addition to the language configuration **CF125 Language version (KM → Miles)**, the calculation below to allow the instrument panel to display consistent values between the **distance** before next oil change and the desired oil service interval **frequency**.
To display the oil service intervals in **Miles, multiply** the value in miles indicated in the maintenance service booklet by **10** then **divide** by **6**, to find the exact figure in **kilometres**.
After the value has been entered, the computer automatically performs the conversion into **miles** for the **oil change frequency**.
It is imperative to use the following procedure for correct functioning of the range and frequency of oil change.

Example:
18,000 miles x 10 = 180,000 miles, then divide by 6 = 30,000 Km (**Enter 30**)

GETtheMANUALS.org

Odometer

This configuration must only be used if the instrument panel is **new**.
This configuration updates the mileometer on the new instrument panel, in accordance with a parameter configured by the CLIP tool, **VP010 Update mileometer**.
The update counter increments every time the instrument panel mileage is updated (maximum 15). This update counter is in the EEPROM and can only be reinitialised by the production or After-Sales services. The value of the update counter corresponds to a reset EEPROM value.

Calibration of the fuel sender

This configuration must only be used if the instrument panel is **new**.
This configuration reinitialises the measurement of the fuel level on the new instrument panel, in accordance with a parameter configured by the CLIP tool **VP011 Fuel sender calibration**.
Ignition on, engine off. Run command **VP011 Fuel sender calibration**.
The range of the nominal measurement is from **15 Ω** to **320 Ω** and the instrument panel converts the resistance value into litres.

2. PROGRAMMING:

None concerned.

GETtheMANUALS.org

Tool fault	Associated DTC	Diagnostic tool title
DF007	**9402**	Fuel sender circuit
DF009	**9407**	Oil pressure sensor circuit
DF016	**9401**	Oil level sensor circuit
DF018	**9405**	Instrument panel
DF019	**9404**	Battery voltage
DF020	**9406**	Steering column lock circuit

GETtheMANUALS.org

DF007 PRESENT OR STORED	FUEL SENDER CIRCUIT CO : Open circuit CC : Short circuit 1.DEF: Internal electronic fault 2.DEF: Voltage outside tolerance range

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present when the ignition is switched on. Wait **2 minutes** to confirm the fault.

Manipulate the wiring harness between the fuel sender and the instrument panel until a change in fault status is produced (Present ↔ Stored).
Look for possible damage to the harness, and check the **connection and condition** of the fuel sender unit and its connections.
Repair if necessary.

Check the **continuity and insulation** of the following connections:
Fuel sender **track A1** → **track 22, 30-track connector**, instrument panel
Fuel sender **track B1** → **track 25, 30-track connector**, instrument panel
Repair if necessary.

Measure the **resistance** between **tracks A1 and B1** of the fuel sender unit.
Replace the fuel sender unit if the **resistance** value is not: **350 Ω fuel tank in reserve**
10 Ω full tank

If the fault is still present, **contact Techline**.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF009 PRESENT OR STORED	OIL PRESSURE SENSOR CIRCUIT 1.DEF: Signal incoherence

NOTES	**Conditions for applying the fault finding procedure to stored faults:** Switch on the ignition, start the engine (the speed should be above **500 rpm**); the status should be inactive if the indicator light is not lit.

Manipulate the wiring harness between the instrument panel and the oil level sensor in order to produce a change in fault status (Present ↔ Stored).
Look for possible damage to the harness, and check **the connection and condition** of the oil level sensor and its connections.
Repair if necessary.

Check **the condition and connection** of the instrument panel 30-track connector, bent tabs, oxidised, broken, etc.
Repair if necessary.

Check the **insulation** and **continuity** of the connection:
Pressure switch, transparent connector, **track 1** ⟶ **track 18, 30-track connector**, instrument panel
Pressure switch, grey connector, **track 2** ⟶ **track 18, 30-track connector**, instrument panel
If the fault is still present, check the **R262 intermediate connector** on **track C5**.
Repair if necessary.

Check that the pressure switch is correctly fitted and check if there are any oil leaks (see **MR 395 Mechanical, 10A, Engine and peripherals**).

If the fault is still present, **contact Techline**.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF016 PRESENT OR STORED	OIL LEVEL SENSOR CIRCUIT CO : Open circuit CC : Short circuit 1.DEF: Inconsistent current value 2.DEF: Internal electronic fault 3.DEF: Battery voltage out of range

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present when the ignition is switched on. Wait **2 minutes** to confirm the fault.

Manipulate the wiring harness between the instrument panel and the oil level sensor in order to produce a change in fault status (Present ↔ Stored).
Look for possible damage to the harness, and check **the connection and condition** of the oil level sensor and its connections.
Repair if necessary.

Check **the condition and connection** of the instrument panel 30-track connector, bent tabs, oxidised, broken, etc.
Repair if necessary.

Check the **insulation and continuity** of the connections:
Oil level sensor **track 2** ⟶ t**rack 26** of the 30-track instrument panel connector
Oil level sensor **track 1** ⟶ t**rack 21** of the 30-track instrument panel connector
If the fault is still present, check the **R262 intermediate connector** on **tracks C6** and **C7**.
Repair if necessary.

Measure the resistance between the **tracks 3** and **4** of the oil level sensor.
Replace the oil level sensor if the **resistance** is not between **7** and **20** Ω.

If the fault is still present, **contact Techline**.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF018 PRESENT OR STORED	INSTRUMENT PANEL 1.DEF: Fault in EEPROM 2.DEF: Battery voltage too low

NOTES	**Special notes:** An EEPROM fault is declared when the instrument panel has detected a fault in the management of the mileometer in the EEPROM*. The mileage is no longer guaranteed.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present after the ignition is switched on if the battery voltage is below **5 V** or above **12 V**.

1.DEF	***NOTES***	None.

If the fault is still present, contact the Techline.

2.DEF	***NOTES***	None.

Manipulate the wiring harness between the instrument panel and the battery until a change in fault status is produced (Present ↔ Stored).
Look for any harness damage, and check **the connection and condition** of the battery and its connections.
Repair if necessary.

Check **the condition and connection** of the instrument panel 30-track connector, bent tabs, oxidised, broken, etc.
Repair if necessary.

Check **the condition of the battery** and **the charge circuit**.
Check the **condition** of the vehicle **earths**.

Check for **+ 12 V** on **track 4 of the 30-track** instrument panel connector.
Repair if necessary.
With the ignition on, check for **+ 12 V** on **track 16 of the 30-track** instrument panel connector.
Repair if necessary.
Check for an **earth** on **track 24** of the **30-track** instrument panel connector.
Repair if necessary.

* EEPROM = Computer memory.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF019 PRESENT OR STORED	BATTERY VOLTAGE 1.DEF: Voltage too weak 7V 2.DEF: Feed voltage too high (between 16 and 18 V) 3.DEF: Feed voltage too high (above 18 V) 4.DEF : Internal electronic fault.

NOTES	**Special note:** If the battery voltage is greater than **18 V** due to a polarity inversion, check that the instrument panel is not damaged.

Manipulate the wiring harness between the instrument panel and the battery until a change in fault status is produced (Present ↔ Stored). Look for any harness damage, and check **the connection and condition** of the battery and its connections. Repair if necessary.
Check **the condition and connection** of the instrument panel 30-track connector, bent tabs, oxidised, broken, etc. Repair if necessary.
Check **the condition of the battery** and **the charge circuit**. Check the **condition** of the vehicle **earths**.
Check for **+ 12 V** on **track 4 of the 30-track** instrument panel connector. Repair if necessary. With the ignition on, check for **+ 12 V** on **track 16 of the 30-track** instrument panel connector. Repair if necessary. Check for an **earth** on **track 24** of the **30-track** instrument panel connector. Repair if necessary.
If the fault is still present, contact the Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

DF020 PRESENT OR STORED	STEERING LOCK CIRCUIT CC.0 : Short circuit to earth

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the ignition has been switched on.

Manipulate the wiring harness between the instrument panel and the electric steering lock in order to produce a change in fault status (Present ⇔ Stored).
Look for possible damage to the harness, and check the **condition and connection** of the electric steering column lock and its connections
Repair if necessary.

Check the **insulation** and **continuity** of the connection:
Instrument panel, **30-track connector, track 7** ⟶ **track 5** of the electric steering column lock
Repair if necessary.

If the fault is still present, contact the Techline.

AFTER REPAIR	Clear the computer memory. Carry out a road test followed by another check with the diagnostic tool.

GETtheMANUALS.org

NOTES	Only check the conformity after a **complete check** with the diagnostic tool. The values indicated in this conformity check are given as examples. **Application condition:** Engine **stopped, ignition on**.

MAIN COMPUTER STATUSES AND PARAMETERS

Order	Function	Parameter, Status checked or Action		Display and Notes	Fault finding
1	Power supply	**ET002:**	+ 12 V after ignition feed	**With the ignition on, the status should be PRESENT**	In the event of a fault, refer to the interpretation of status **ET002 + 12 V after ignition feed**.
2	Battery voltage	**PR110:**	Battery voltage	**8 V < PR110 < 16 V**	If there is a fault, consult the interpretation of fault **DF019 Battery voltage**.
3		**ET058:**	Battery charge	**OK**	In the event of a fault, refer to the interpretation of status **ET058 Battery charge**.
4	Vehicle speed	**ET008:**	Vehicle speed signal < 9 mph (15 km/h)	**YES**	In the event of a fault, refer to the interpretation of status **ET008 Vehicle speed signal < 9 mph (15 km/h)**.
5	Temperature	**ET056:**	Coolant temperature: no signal	**NO**	In the event of a fault consult the interpretation for status **ET056 Coolant temperature: no signal**.

GETtheMANUALS.org

NOTES	Only check the conformity after a **complete check** with the diagnostic tool. The values indicated in this conformity check are given as examples. **Application condition:** Engine **stopped, ignition on**.

TRIP COMPUTER

Order	Function	Parameter, Status checked or Action		Display and Notes	Fault finding
1	Radio	**ET030:**	Trip computer scroll button	**DEPRESSED RELEASED**	In the event of a fault, consult the interpretation of status **ET030 Trip computer scroll button**.
2		**ET034:**	Trip Computer reset button	**DEPRESSED RELEASED**	If the fault is still present, contact Techline.
3		**ET031:**	Mute button	**DEPRESSED RELEASED**	In the event of a fault, refer to the interpretation of status **ET031 Mute button**.
4		**ET033:**	Repeat button	**DEPRESSED RELEASED**	In the event of a fault, refer to the interpretation of status **ET033 Repeat button**.
5	Fuel	**PR003:**	Fuel consumption.	**Indicates the fuel consumption.**	If there is a fault, consult the interpretation for fault **DF007 Fuel sender unit circuit**.
6		**PR004:**	LPG fuel consumption	**Indicates the LPG fuel consumption.,**	
7		**PR112:**	Fuel flow	**Indicates fuel flow.**	
8	Instrument panel	**AC011:**	Symbol display	**This command allows the matrix information display to be viewed in three colours.**	If the fault is still present, contact Techline.
9		**AC015:**	Voice synthesiser	**With the ignition on and engine stopped, the voice synthesiser emits a message.**	

GETtheMANUALS.org

NOTES	Only check the conformity after a **complete check** with the diagnostic tool. The values indicated in this conformity check are given as examples. **Application condition:** Engine **stopped, ignition on**.

DISPLAY

Order	Function	Parameter, Status checked or Action		Display and Notes	Fault finding
1	Vehicle speed	**ET008:**	Vehicle speed signal < 9 mph (15 km/h)	**YES**	In the event of a fault, refer to the interpretation of status **ET008 Vehicle speed signal < 9 mph (15 km/h)**.
2	Washer fluid	**ET014:**	minimum washer fluid level	**Indicates the screen washer fluid level.** **YES:** Level too low **NO:** Level sufficient	In the event of a fault consult the interpretation of status **ET014 Minimum washer fluid level**.
3	Central door locking	**ET016:**	Driver's door open	**YES:** Door open **NO:** Door closed	In the event of a fault, refer to the interpretation of status **ET016 Driver's door open**.
4		**ET018:**	Bonnet open	**YES:** Bonnet open **NO:** Bonnet closed	In the event of a fault, refer to the interpretation of status **ET018 Bonnet open**.
5	Brake fluid level light	**ET019:**	minimum brake fluid level	**Indicates the brake fluid level.** **YES:** Level too low **NO:** Level sufficient	In the event of a fault, consult the interpretation of status **ET019 Minimum brake fluid level**.
6	Heated seat	**ET055:**	Heated seat	**Turn on the heated seat function, the status should be ACTIVE.**	In the event of a fault, refer to the interpretation of status **ET055 Heated seat**.
7	Oil pressure	**ET096:**	Oil pressure contact	**CLOSED** **OPEN**	If the event of a fault, consult the interpretation for fault **DF009 Oil pressure sensor circuit**.

GETtheMANUALS.org

NOTES	Only check the conformity after a **complete check** with the diagnostic tool. The values indicated in this conformity check are given as examples. **Application condition:** Engine **stopped, ignition on**.

DISPLAY (continued 1)

Order	Function	Parameter, Status checked or Action	Display and Notes	Fault finding
8	Parking brake	**ET097:** Parking brake	**Indicates parking brake position (APPLIED/RELEASE) except for automatic parking brakes; in which case the status is INACTIVE**	In the event of a fault, refer to the interpretation of status **ET097 Parking brake**.
9	Seat belt	**ET098:** Driver's seat belt contact	**With the ignition on, trigger the driver's seat belt, the status should be OPEN.**	In the event of a fault, refer to the interpretation of status **ET098 Driver's seat belt contact**.
10		**ET156:** Passenger seat belt contact	**With the ignition on, trigger the passenger seat belt, the status should be OPEN.**	In the event of a fault, perform fault finding on the airbag and pretensioner computer (see **38C, ABS**).
11	Exterior lighting	**ET157:** Dipped headlights signal	**PRESENT**	In the event of a fault, perform fault finding on the UCH (see **87B, Passenger compartment connection unit**).
12		**ET158:** Side lights signal		
13		**ET159:** Front fog light signal		
14		**ET160:** Rear fog light signal		
15	Instrument panel lighting	**ET107:** Lighting dimmer wheel	**With the ignition on, dipped headlights lit, the brightness will vary, the status should be CONNECTED.**	In the event of a fault contact Techline.

GETtheMANUALS.org

NOTES	Only check the conformity after a **complete check** with the diagnostic tool. The values indicated in this conformity check are given as examples. **Application condition:** Engine **stopped, ignition on**.

DISPLAY (continued 2)

Order	Function	Parameter, Status checked or Action		Display and Notes	Fault finding
16		**AC009:**	Instrument panel warning lights	**The instrument panel warning lights are activated in several stages. The warning lights are lit one after another, then the command lights all the warning lights.**	If the fault is still present, contact Techline.
17		**AC008:**	Instrument panel needle gauges	**With the ignition switched on and the engine stopped, the needles should move.**	
18		**AC005:**	Display test	**With the ignition switched on and the engine stopped, all the displays on the instrument panel light up.**	
19		**AC010:**	Lighting	**Following activation of all the instrument panel warning lights, the brightness will vary between 25 %, 50 %, 75 % then 100 % of the maximum brightness for 4 seconds each time.**	
20		**AC004:**	Seat belt warning light	**Seat belt warning light lighting.**	
21		**AC003:**	Opening element indicator light	**Opening element indicator light lighting.**	
22	Buzzer	**AC006:**	Buzzer	**With the ignition on and engine off, the buzzer should sound.**	

GETtheMANUALS.org

NOTES	Only check the conformity after a **complete check** with the diagnostic tool. The values indicated in this conformity check are given as examples. **Application condition:** Engine **stopped, ignition on**.

GAUGES

Order	Function	Parameter, Status checked or Action	Display and Notes	Fault finding
1	Fuel	**ET110:** Fuel sender defect mode	**NO** **Warns of a fuel level fault**	In the event of a fault, apply the fault finding procedure **DF007 Fuel sender circuit**.
2		**PR002:** Fuel sender resistance	**PR002 empty = 5 Ω** **PR002 full = 350 Ω**	
3		**PR010:** Tank capacity	**Indicates the volume of fuel contained in the tank.** **0 < PR010 < 80 l**	In the event of a fault, check that configuration **LC006 Fuel tank capacity** has been performed. If the fault is still present, contact the Techline.
4	Oil level	**PR011:** Oil level sensor voltage	**Maximum oil level:** **≤ 190 mV** **Minimum oil level:** **≥ 440 mV**	If there is a fault, consult the interpretation for fault **DF016 Oil level sensor circuit**.

GETtheMANUALS.org

NOTES	Only check the conformity after a **complete check** with the diagnostic tool. The values indicated in this conformity check are given as examples. **Application condition:** Engine **stopped, ignition on**.

MILEOMETER

Order	Function	Parameter, Status checked or Action		Display and Notes	Fault finding
1	Oil change frequency	**PR005:**	Oil change frequency in km	**Indicates the oil change frequency in km.**	If the fault is still present, contact Techline.
2		**PR006:**	Oil change frequency in months	**Indicates the oil change frequency in months.**	
3	Oil service interval	**PR007:**	Oil service interval: current value in km	**Indicates the distance remaining to the oil service in km. (this value should be equal to or below the frequency). PR005 - PR009 = PR007**	
4		**PR008:**	Oil service interval: actual value in months	**Indicates the oil service interval in months. (this value should be equal to or below the frequency).**	
5	Odometer	**PR009:**	Odometer	**Indicates the counter value in km.**	

GETtheMANUALS.org

Tool status	Diagnostic tool title
ET002	+ 12 V after ignition feed
ET008	Vehicle speed signal < 9 mph (15 km/h)
ET014	Minimum washer fluid level

GETtheMANUALS.org

ET002	+ 12 V AFTER IGNITION FEED

NOTES	There must be no present or stored faults. Switch on the ignition, status **ET002** should be **PRESENT**.

Check instrument panel fuse **F11 (20A)** on the Passenger Compartment Fuse and Relay Board.
Check the passenger compartment fuse and relay box connectors.

Check **the insulation and continuity** of the wiring between:

Fuse and relay box, **green connector, track 1** → **Track B9, black connector**, passenger compartment fuse and relay box

Passenger compartment fuse and relay box, **black connector, track J5** → **Track 4, 30-track connector**, instrument panel

Observe the Verlog diode.
Repair if necessary.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET008	VEHICLE SPEED SIGNAL < 9 MPH (15 KM/H)

NOTES	There must be no present or stored faults. Switch on the ignition and carry out a road test.

In the event of a fault, **carry out a fault finding procedure on the multiplex network** and the **ABS** (see **88B, Multiplex network** and **38C, ABS**).

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET014	SCREEN WASH LEVEL MINIMUM

NOTES	There must be no present or stored faults. Switch on the ignition, fill the washer fluid reservoir: status **ET014** should be **YES**.

Check the instrument panel connector and the washer fluid reservoir connector.
Check that the **earth** is properly connected to the reservoir on **track 2**. Repair if necessary.
Check **the insulation and continuity** of the connection: Instrument panel, **30-track connector, track 13** ⟶ **track 1** of the washer fluid reservoir If the fault is still present, check **intermediate connector R265** on **track C7**. Repair if necessary.
Check that the reservoir's two tracks are not short-circuiting. If necessary, replace the reservoir.

IMPORTANT
The warning message is only displayed for 30 seconds on activation of the after ignition feed if the fault is already present, otherwise 8 seconds in fault finding.
The fault is confirmed after 30 seconds.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET016	DRIVER'S DOOR OPEN

NOTES	There must be no present or stored faults. Switch on the ignition, open the door, status **ET016** should be **YES**.

Check the driver's door wiring harness connector.
Check the **earth** on **track D** of the lock.
IMPORTANT
There are several locks (see **Technical Note XXX, Wiring diagrams, 140**).

Check **the continuity and insulation** between:
Instrument panel, **30-track connector, track 1** ⟶ **Track C** of the driver's door locking function
If the fault is still present, check **intermediate connector R153** on **track B10**.
Repair if necessary.

Check that the lock is working and in particular that it engages properly into the striker.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET018	BONNET OPEN

NOTES	There must be no present or stored faults. Switch on the ignition, open the bonnet, status **ET018** should be **YES**.

Check the instrument panel connector and the bonnet connector.
Check that the bonnet switch is firmly attached to the bodywork and that it operates properly.

Check **the insulation and continuity** of the wiring between:
Instrument panel **30-track connector, track 19** ⟶ **Track 2** of the bonnet switch
Repair if necessary.

Check **the insulation and continuity** of the wiring between:
Bonnet switch **track 1** ⟶ Vehicle earth
If the fault is still present, check **intermediate connector R265** on **track B1**.
Repair if necessary.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET019	MINIMUM BRAKE FLUID LEVEL

NOTES	There must be no present or stored faults. Switch on the ignition, check the brake fluid level in the reservoir.

Check the instrument panel connector and the reservoir connector.
Check **the insulation and continuity** of the wiring between: Instrument panel **30-track connector, track 30** ⟶ **track 2** of the brake fluid reservoir Repair if necessary.
Check that the earth is properly connected to **track 1** of the brake fluid reservoir level sensor. If necessary, replace the reservoir.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET030	TRIP COMPUTER SCROLL BUTTON

NOTES	There must be no present or stored faults. Switch on the ignition, press the button: status **ET030** should be **PRESSED**.

Check the instrument panel connector and the wiper stalk connector.
Check **the insulation and continuity** of the wiring between: Instrument panel, **15-track connector, track 6** ⟶ **track B7** of the windscreen wiper stalk Repair if necessary.
Check that the **earth** on **track B5** is properly connected to the stalk. If necessary, replace the stalk.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET031	MUTE BUTTON

NOTES	There must be no present or stored faults. The vehicle must be equipped with a voice synthesiser. Switch on the ignition, press the button: status **ET031** should be **PRESSED**.

Manipulate the wiring harness between the instrument panel connector and the voice synthesis control connector, to produce a change in fault status.
Look for any damage to the wiring harness, check the **connection and condition** of the voice synthesis computer and its connections.
Repair if necessary.

Carry out a fault finding procedure on the multiplex network (see **88B Multiplex network**).

Check **the insulation and continuity** of the wiring between:
Instrument panel, **15-track connector, track 2** ⟶ **track A3** of the voice synthesiser control
Repair if necessary.

Check that the **earth** is properly connected to control **track A2**.
If necessary, change the set of buttons.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET033	REPEAT BUTTON

NOTES	There must be no present or stored faults. The vehicle must be equipped with a voice synthesiser. Switch on the ignition, press the button: status **ET033** should be **PRESSED**.

Manipulate the wiring harness between the instrument panel connector and the voice synthesis control connector, to produce a change in fault status.
Look for any damage to the wiring harness, check the **connection and condition** of the voice synthesis computer and its connections.
Repair if necessary.

Carry out a fault finding procedure on the multiplex network (see **88B Multiplex network**).

Check **the insulation and continuity** of the wiring between:
Instrument panel, **30-track connector, track 28** ⟶ **track A1** of the voice synthesiser control
Repair if necessary.

Check that the earth is properly connected to control on **track A2**.
If necessary, change the set of buttons.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET055	HEATED SEAT

NOTES	There must be no present or stored faults. Switch on the ignition, press the heated seat button: status **ET031** should be **ACTIVE**.

Check the instrument panel connection and the connectors.
Check **the continuity and insulation** between: Instrument panel, **30-track connector, track 15** ⟶ **Track A1** of the heated seat switches (driver and passenger) If the fault is still present, check the **R334** and **R335 intermediate connectors** on **track 16**. Repair if necessary.
Check that the seats are properly installed and that the automatic connectors (**R334** and **R335**) between the seat wiring harness and the passenger compartment wiring harness are correctly locked.
Also check that the **earth** on **track B1** is connected to these switches.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET056	COOLANT TEMPERATURE SIGNAL ABSENT

NOTES	There must be no present or stored faults. Switch on the ignition, start the engine.

Perform fault finding on the **multiplex network** and the **injection** (see **88B, Multiplex network** and **17B, Petrol injection** or **13B, Diesel injection**).

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET058	BATTERY CHARGE

NOTES	There must be no present or stored faults. Switch on the ignition, start the engine (the speed should be above **1000 rpm**); status **ET058** should be **OK** if the warning light is not lit. Ensure that the speed is above 400 rpm for more than 10 seconds before registering a possible fault.

Manipulate the wiring harness between the instrument panel connector and the alternator connector, in order to produce a change in status.
Look for any harness damage, and check **the condition and connection** of the alternator and its connections.
Repair if necessary.

Check the alternator installation and mountings.
Check that the alternator is recharging the battery.

Check **the insulation and continuity** of the wiring between:
Instrument panel, **30-track connector, track 14** ⟶ **track 1** of the alternator black connector
If the fault is still present, check **intermediate connector R262** on **track C4**.
Repair if necessary.

If status **ET058** does not change to **INACTIVE**, check the alternator operating signals (see **MR 405 Mechanical, 16A, Starting - Charging**).

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET097	PARKING BRAKE

NOTES	There must be no present or stored faults. Switch on the ignition, apply the brake: status **ET097** should be **APPLIED**.
	Special Note Check whether the vehicle is fitted with an automatic parking brake by referring to configuration **LC057 Automatic parking brake**. If it does have this function, status **ET097** is **RELEASED**.

Manipulate the wiring harness between the instrument panel connector and the handbrake connector in order to produce a change in status.
Look for possible damage to the harness, and check the **connection and condition** of the handbrake and its connections.
Repair if necessary.

Check that the handbrake is firmly attached to the bodywork and that it operates correctly.

Check **the insulation and continuity** of the wiring between:
Instrument panel, **30-track connector, track 29** ⟶ **Track 1** of the handbrake
Repair if necessary.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET098	DRIVER'S SEAT BELT CONTACT

NOTES	There must be no present or stored faults. Switch on the ignition, fasten the seat belt: status **ET098** should be **OPEN**.

Check the instrument panel connector and the seat belt anchorage stirrup connector.
Manipulate the wiring harness between the instrument panel connector and the stirrup/seat belt anchorage, to produce a change in fault status.
Look for possible damage to the harness, and check **the connection and the condition** of the stirrup/seat belt anchorage and its connections.
Repair if necessary.

Check **the insulation and continuity** of the wiring between:
Instrument panel, **30-track connector, track 6** ⟶ **track A2** of the driver's seat belt clamp
If the fault is still present, check the **R335 intermediate connector** on **track 2**.
Repair if necessary.

Check that there is an earth connection on the seat belt anchorage/stirrup (**track A1**).
If necessary, change the seat belt anchorage stirrup.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET110	DRIVER'S SEAT BELT CONTACT

NOTES	If in short circuit for over 100 seconds, the needle fluctuates between full and half-full. If in open circuit for over 100 seconds, the needle fluctuates between half-full and 0.

Check the **insulation and continuity** of the connections:

Instrument panel, **30-track connector, track 22** → track A1 of the fuel sender

Instrument panel, **30-track connector, track 25** → track B1 of the fuel sender

Repair if necessary.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

Tool parameter	Diagnostic tool title
PR002	Fuel sender unit resistance
PR003	Fuel consumption
PR004	LPG fuel consumption
PR005	Oil change frequency in km
PR006	Oil change frequency in months
PR007	Distance to next oil service: current value in km
PR008	Time to next oil service: current value in months
PR009	Odometer
PR010	Fuel tank capacity
PR011	Oil level sensor voltage
PR110	Battery voltage
PR112	Fuel flow

GETtheMANUALS.org

PR110	BATTERY VOLTAGE

NOTES	None.

Check that there are no faults.
If the voltage is at minimum:
Check the battery and the charge circuit.
If the voltage is at maximum:
Check that the charging voltage is correct with and without electrical consumers switched on.

Check the **insulation, continuity and the absence of interference resistance** on the following connection:
Instrument panel, **30-track connector, track 04** ⟶ **+ battery feed**
Repair if necessary.

GETtheMANUALS.org

PR112	FUEL FLOW

NOTES	With the engine idling, the flow should be around **0**. Vary the engine speed to confirm the increase in flow.
	Note: A fuel flow signal fault causes an inconsistency in trip computer operation.

Perform a **multiplex network** and **injection test** (see **88B, Multiplex network** and **13B, Petrol injection** or **17B, Diesel injection**).

GETtheMANUALS.org

GETtheMANUALS.org

CLEARING

RZ001: Fault memory
This command is used for clearing the computer's stored faults.

ACTIVATION

AC003: Opening element indicator light
This command enables the opening element indicator lights to be tested.

Switch on the ignition and run command **AC003**.
The buzzer should be heard.

AC004: Seatbelt warning light
This command enables the seat belt warning light to be tested.

Switch on the ignition and run command **AC004**.
The buzzer should be heard.

AC005: Display test
This command enables the entire display assembly to be tested.

Switch on the ignition and run command **AC005**.
All the display elements on the instrument panel should light up.

AC006: Audible warning (Buzzer)
This command is for testing the buzzer function.

Switch on the ignition and run command **AC006**.
The buzzer should be heard.

AC008: Instrument panel needles
This command enables the needles to be tested (rev counter, speedometer, oil and coolant temperature).

Switch on the ignition and run command **AC008**.
The buzzer should be heard.

AC009: Instrument panel indicator/ warning lights
This command enables the all the instrument panel warning lights to be tested.

The warning lights come on and then go out:
– make sure that lighting of one warning light does not cause the lighting, even partially, of another warning light.
The indicator lights are all lit:
– make that sure the lighting is correct.

GETtheMANUALS.org

ACTUATION (continued)

AC010: Lighting
This command enables the instrument panel lighting to be tested.

Switch on the ignition and run command **AC010**.
The instrument panel lights up; change the lighting brightness.

AC011: Symbol display
This command enables the matrix display to be tested.

Switch on the ignition and run command **AC011**.
All the matrix display pixels should be red.

AC015: Voice synthesiser
This command enables the voice synthesiser to be tested.

Switch on the ignition and run command **AC015**.
A voice synthesis message should be heard.

GETtheMANUALS.org

NOTES	**Only consult the customer complaints after a complete check using the diagnostic tool.** **Run fault finding on the multiplex network.** **Run fault finding on the instrument panel.** **In the case of a top of the range instrument panel (with central display), run fault finding on the function.**

ONE OR MORE OF THE NEEDLES DOES/DO NOT MOVE	**ALP 1**
ONE OR MORE OF THE NEEDLES DOES/DO NOT MOVE IN ACCORDANCE WITH THE SCALE DIVISIONS	**ALP 1**
THE DISPLAY ON THE TRIP COMPUTER OR CENTRAL DISPLAY IS INCOMPLETE OR BLURRED	**ALP 1**
SOME OF THE TRIP COMPUTER DATA IS INCORRECT	**ALP 1**
SOME OF THE TRIP COMPUTER DATA HAS BEEN REPLACED WITH DASHES	**ALP 1**
THE FUEL SENDER (APART FROM LPG) DISPLAYS AN IMPLAUSIBLE VALUE	**ALP 1**
THE OIL GAUGE DISPLAYS AN INCORRECT READING	**ALP 1**
THE TRIP COMPUTER DOES NOT WORK WHEN THE BUTTON IS PRESSED	**ALP 2**
THE WARNING LIGHTS DO NOT COME ON OR MESSAGES ARE NOT DISPLAYED WHEN THERE IS A FAULT	**ALP 3**
THE WARNING LIGHTS COME ON WHEN THERE IS NO FAULT	**ALP 3**
THE VOICE SYNTHESISER DOES NOT WORK	**ALP 4**
THE RADIO DOES NOT CUT OUT WHEN THE VOICE SYNTHESISER IS DELIVERING A MESSAGE	**ALP 5**
THE VOICE MESSAGES CANNOT BE UNDERSTOOD (DIFFERENT LANGUAGE, ETC.)	**ALP 6**

GETtheMANUALS.org

MESSAGES ARE ISSUED WHEN THEY SHOULD NOT BE	ALP 7
THE INSTRUMENT PANEL BACKLIGHTING DOES NOT WORK	ALP 8
THE INSTRUMENT PANEL DOES NOT LIGHT UP WHEN THE SIDE LIGHTS ARE ON	ALP 8
INSTRUMENT PANEL SELF-TEST PROCEDURE	PRO 1

GETtheMANUALS.org

ALP 1	**One or more of the needles does/do not move** **One or more of the needles does/do not move in accordance with the scale divisions** **The display on the on trip computer or central display is incomplete or blurred** **Some of the trip computer data is incorrect** **Some of the trip computer data has been replaced with dashes** **The fuel gauge (apart from LPG) displays an implausible value** **The oil gauge displays an incorrect measurement**

NOTES	None.

Run the instrument panel self-test procedure (**PRO 1**).

AFTER REPAIR	If an instrument panel has been replaced: Remember to run a self-test and clear the faults. Remember to configure the instrument panel.

GETtheMANUALS.org

ALP 2	The trip computer does not work when the button is pressed

NOTES	Carry out a fault finding procedure on the multiplex network (see **88B Multiplex network**). Switch on the ignition.

Run the instrument panel self-test procedure (**PRO 1**).
Check the **insulation and continuity** of the connection between: Instrument panel, **15-track connector, track 6** ⟶ **track B7** of the windscreen wiper stalk Repair if necessary.
Check the **earth** on **track B5** of the wiper stalk connector.
Check that the voltage on **track 6** is zero when the button is pressed. If necessary, repair the wiring or replace the windscreen wiper control.
Replace the instrument panel.

AFTER REPAIR	If an instrument panel has been replaced: Remember to run a self-test and clear the faults. Remember to configure the instrument panel.

GETtheMANUALS.org

ALP 3	The warning lights do not come on or messages are not displayed when there is a fault The warning lights come on although there is no fault

NOTES	Carry out a fault finding procedure on the multiplex network (see **88B Multiplex network**). Carry out a fault finding procedure on the system that controls the warning light / message. Switch on the ignition.

List of warning/indicator lights lit up by a wire connection and not via the multiplex network:
– brake fluid fault,
– dipped headlights on,
– main beam headlights on,
– front fog lights on,
– rear fog lights on,
– direction indicators,
– heated seat indicator light,
– immobiliser warning light,
– parking brake,
– driver's seat belt.

If these warning/indicator lights do not come on or come on when they should not:
– check the continuity of the wiring between the warning/indicator light control (sensor, lighting stalk, alternator, etc.) and the instrument panel,
– check that the control system is working properly, that there is a feed to it and that there are no short-circuits on the connection.

The UCH detects if there is a bulb failure and transmits the bulb status on the multiplex network.

Replace the instrument panel.

AFTER REPAIR	If an instrument panel has been replaced: Remember to run a self-test and clear the faults. Remember to configure the instrument panel.

GETtheMANUALS.org

ALP 4	Voice synthesiser does not work

NOTES	Switch on the ignition. Press the repeat button, check if a message is issued. Carry out a fault finding procedure on the multiplex network, in particular check that the network linking the instrument panel to the voice synthesiser is correct). Carry out fault finding on the instrument panel. Check the (language) configurations. Check that the presses on the repeat and mute buttons have been detected.

Check the feed (+ battery feed, earth and + ignition feed) to the instrument panel and the voice synthesiser.
If the radio does not mute, check the multiplex network. Switch off the ignition, disconnect and reconnect the battery. Switch the ignition back on so that the instrument panel is reconfigured correctly.
Check the **continuity and insulation** of the following connections: Voice synthesiser **track 14** ⟶ **track A1** of the speaker Voice synthesiser **track 15** ⟶ **track A2** of the speaker Check the speaker. Repair if necessary.
Replace the voice synthesiser computer. If the fault persists, replace the instrument panel.

AFTER REPAIR	If an instrument panel has been replaced: Remember to run a self-test and clear the faults. Remember to configure the instrument panel.

GETtheMANUALS.org

ALP 5	**The radio does not cut out when the voice synthesiser is issuing a message**

NOTES	Check that the radio is working correctly. Switch on the ignition.

Check **the continuity and insulation** of the following connection:
Voice synthesiser **track 10** ⟶ **Track 3, black connector** for the radio
Repair if necessary.

Disconnect the voice synthesiser.
Connect **track 10** of the connector to earth.
If the radio mutes, replace the voice synthesiser; if not, replace the radio.

AFTER REPAIR	If an instrument panel has been replaced: Remember to run a self-test and clear the faults. Remember to configure the instrument panel.

GETtheMANUALS.org

ALP 6	The voice synthesiser messages are inconsistent (different language...)

NOTES	Carry out a fault finding procedure on the multiplex network (see **88B Multiplex network**). Carry out fault finding on the instrument panel. Carry out a fault finding procedure on the systems that the messages refer to. Switch on the ignition.

Replace the voice synthesiser computer.
If the fault is still present, replace the instrument panel.

AFTER REPAIR	If an instrument panel has been replaced: Remember to run a self-test and clear the faults. Remember to configure the instrument panel.

GETtheMANUALS.org

ALP 7	Messages are issued when they should not be

NOTES	Carry out a fault finding procedure on the multiplex network (see **88B Multiplex network**). Carry out a fault finding procedure on the system that the message refers to.

Replace the instrument panel.
If the fault is still present, replace the voice synthesiser.

AFTER REPAIR	If an instrument panel has been replaced: Remember to run a self-test and clear the faults. Remember to configure the instrument panel.

GETtheMANUALS.org

ALP 8	**The lighting dimmer on the instrument panel does not work** **The panel does not light up when the side lights are on**

NOTES	Switch on the ignition. Switch on the side lights. Carry out a fault finding procedure on the instrument panel (check that the side lights are active).

Check that the voltage on **track 27 of the 30-track** instrument panel connector is **12 V** when the side lights are switched.

Check **the continuity and insulation** of the connections between:

Instrument panel, **15-track connector, track 5** ⟶ **track 2** of the dimmer

Dimmer **track 3** ⟶ Earth

Repair if necessary.

Check that the resistance of the dimmer varies between **0** and **1000** Ω when the wheel is moved.
If not, check that the climate control varies and refer to the fault finding procedure for the climate control (see **62B, Regulated air conditioning**).

AFTER REPAIR	If an instrument panel has been replaced: Remember to run a self-test and clear the faults. Remember to configure the instrument panel.

GETtheMANUALS.org

PRO 1	Instrument panel self-test procedure

NOTES	There must be no present or stored faults. The warning lights run by the instrument panel should be lit. Press the button of the trip computer (trip computer scroll button on the windscreen wiper stalk). Holding the button down, switch on the ignition (card inserted into the reader up to the stop). As soon as the needles begin to move, the test mode runs for **5 minutes**. Release the button. To skip from one screen to another on the trip computer, briefly press the trip computer scroll button again. Press the km reset button to exit from the mode and **clear the faults**.

Check that the rev counter, speedometer, coolant temperature gauge and fuel level gauge needles are moving properly and following all the scale divisions. If not, replace the instrument panel.
Check that all the digits on the trip computer are lit up. If not, replace the instrument panel.
Each time the Trip computer scroll button is pressed, the image on the central display changes. Replace the instrument panel if some images are unclear.

AFTER REPAIR	If an instrument panel has been replaced: Remember to run a self-test and clear the faults. Remember to configure the instrument panel.

GETtheMANUALS.org

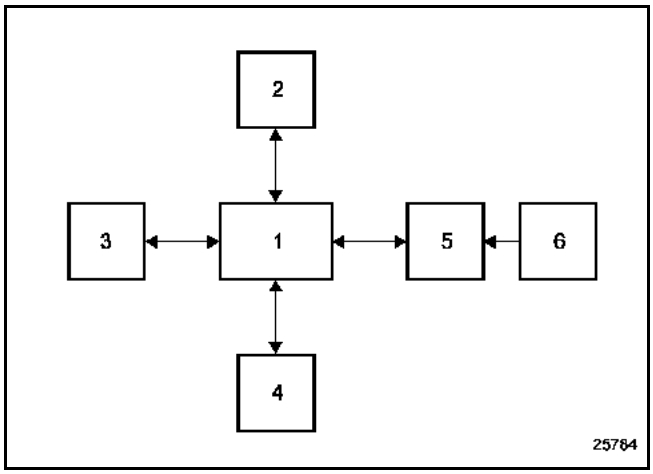
The tuner-amplifier has a test menu (see radio self-test procedure) to carry out repair operations or fault finding.

The radio will operate for approximately 20 minutes without the ignition being switched to the accessories position. The radio beeps then switches off.

Diagram:



1 Radio
2 Aerial
3 CD changer
4 Speakers/tweeter speakers
5 Display
6 Steering wheel controls

GETtheMANUALS.org

Special features of radios in the PN range:
PN0: radio with built-in display.
PN1: radio with remote display.
PN2: radio and cassette player with built-in display.
PN3: radio and cassette player with remote display.
PN4: radio and CD player with built-in display.
PN5: radio and CD player with remote display.

Notes:
- All radios are designed to control a CD changer.
- There is a special procedure for replacing the CD changer located in the dashboard front panel.
- According to the vehicle version, the remote displays may have a 24 or 30-track connector or two 15-track connectors. This display may be built into the instrument panel.

GETtheMANUALS.org

The radio features allow you to:
– listen to the radio (four geographical zones can be programmed for FM radio)
– display the name of the station using RDS which automatically switches to the best transmitter (AF function),
– receive traffic news (**I Traffic** function),
– receive news flashes and emergency bulletins (**I News** function).
– receive public safety emergency bulletins (**PTY 31**).

RADIO FUNCTION

The tuner has three selection modes displayed on the screen and accessible from the radio front panel:
– manual mode (MANU),
– preset mode (PRESET),
– alphabetical mode (LIST).

CASSETTE FUNCTION

The cassette plays automatically once cassette mode has been selected using the steering wheel control or the front panel.

Only the Dolby fast-forward and rewind with search controls can be selected by specific buttons.

Note:
The Mute function, accessed via the voice synthesiser or the steering wheel control, stops the cassette playing.

CD FUNCTION

The CD player can play conventional discs and any audio tracks on a CD-ROM.

CDs can be played in order or tracks can be chosen at random.

If a CD changer is being used, random play is possible on only one of the possible 6 compact discs.

THERMAL PROTECTION

If the radio temperature is too high for it to function properly, the volume is automatically reduced (without changing the volume shown in the display).

Should one of the speaker tracks short circuit, the supply to the amplifier will be cut off.

GETtheMANUALS.org

VOLUME CONTROL

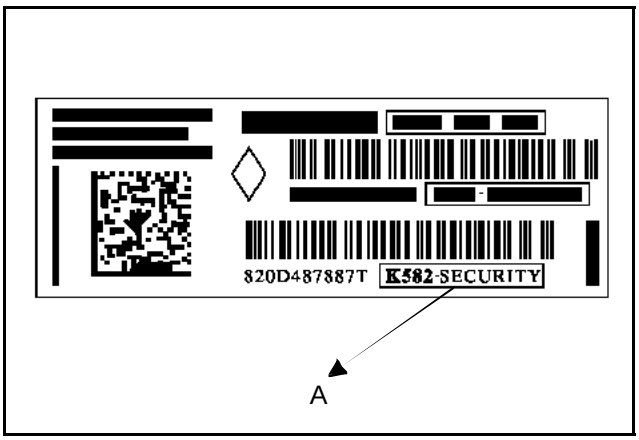
The volume can be increased according to the vehicle speed. To operate this function:
select the desired volume adjustment curve by using the **Expert** mode (press and hold the **Source** button until a bleep is heard): **SPEED 5** for maximum increase, **0** to cancel the increase.

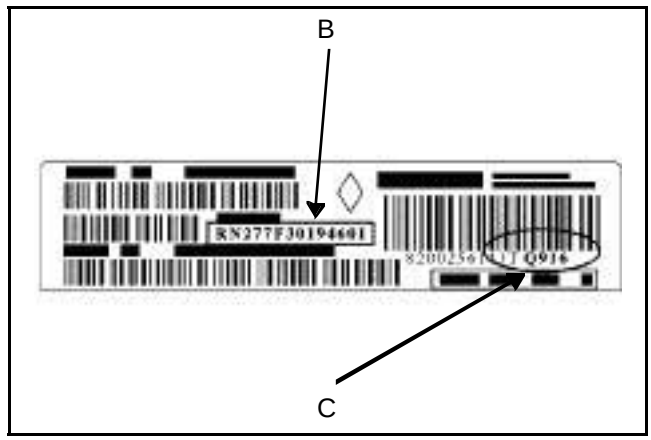
GETtheMANUALS.org

2 methods for recovering the pre-code (1 letter and 3 digits):

1 For **PN** type radios:
The pre-code is recovered by removing the **RECEIVER** and noting the four characters on the barcode that follow the letter T (see photo no. 114936).
On older versions, note the series number at (**B**) and the pre-code after the letter T at (**C**).
2 For **NR** type radios
The pre-code is recovered **without removal**, by applying the following procedure:
- Switch on the radio.
- Press buttons 1 and 6 simultaneously for approximately 2 seconds.
- The pre-code appears on the display.

Note: on NR type radios, the pre-code remains visible at (A) on the radio (see photo no. 114937).





THE VIN MUST BE ENTERED IN ALL 4 SOLUTIONS

4 methods for recovering the radio code (4 digits):

1 **Only the VIN is available**: connect to code management on Renault.Net and enter the VIN. The code server gives the original radio code entered in the World Vehicle Database (BVM).

If the code has not been entered in the World Vehicle Database or is incorrect when the code is entered in the radio, follow the procedure below:
2 **The pre-code is available**: go back to code management on Renault.Net, enter the pre-code and obtain the radio code.
3 For older vehicles which do not have a radio pre-code, enter the series number of the radio again. For example, for Philips radio, this code starts with RN. In the photo of the radio, this code is RN277F30194601.

If this code is correct, the radio will operate again; if not, follow the procedure below:
4 On Renault.Net, write a help message to be sent to the assistance unit.

WHEN REPLACING PARTS, OR FOR AN UNKNOWN VIN, WRITE A HELP MESSAGE IN CODE MANAGEMENT ON RENAULT.NET TO UPDATE THE DATABASE.

GETtheMANUALS.org

The radio is protected by a four digit code. This code must be entered via the control satellite or the radio keypad each time the battery is disconnected.

Entering the code with the control on the steering wheel:
Press the lower button on the control to confirm an entry.

Entry via the radio:
Enter the digits using buttons 1, 2, 3 and 4, and then confirm with button 6.

If the code is entered incorrectly, the radio will be locked (1 minute for the first error, 2 minutes for the second error, 4 minutes for the third error, etc. 32 minutes maximum).

Some configurations must be set after the code has been entered for the first time (see the **Configuration** Section). These settings are stored when the battery is disconnected.

Reminder:
The radio will operate for approximately 2 minutes in scrambled mode without the code having been entered (with regular warning beeps).

If the vehicle is equipped with a CD changer in the front panel, a code is exchanged between the CD changer and the radio.
– If a new CD changer is fitted, the radio code is programmed when the battery or CD changer is connected.
– If the radio is replaced, enter the security code of the old radio connected to the CD changer. The CD changer is programmed with the code for the new radio.
– If the old radio code is lost, the changer code can be cleared using the clearing code. The clearing code is issued by the Techline, server, etc.

Note:
If there is a configuration error, you can return to scrambled mode by pressing the 2 and 5 buttons at the same time as switching the power on. Then wait 2 minutes.

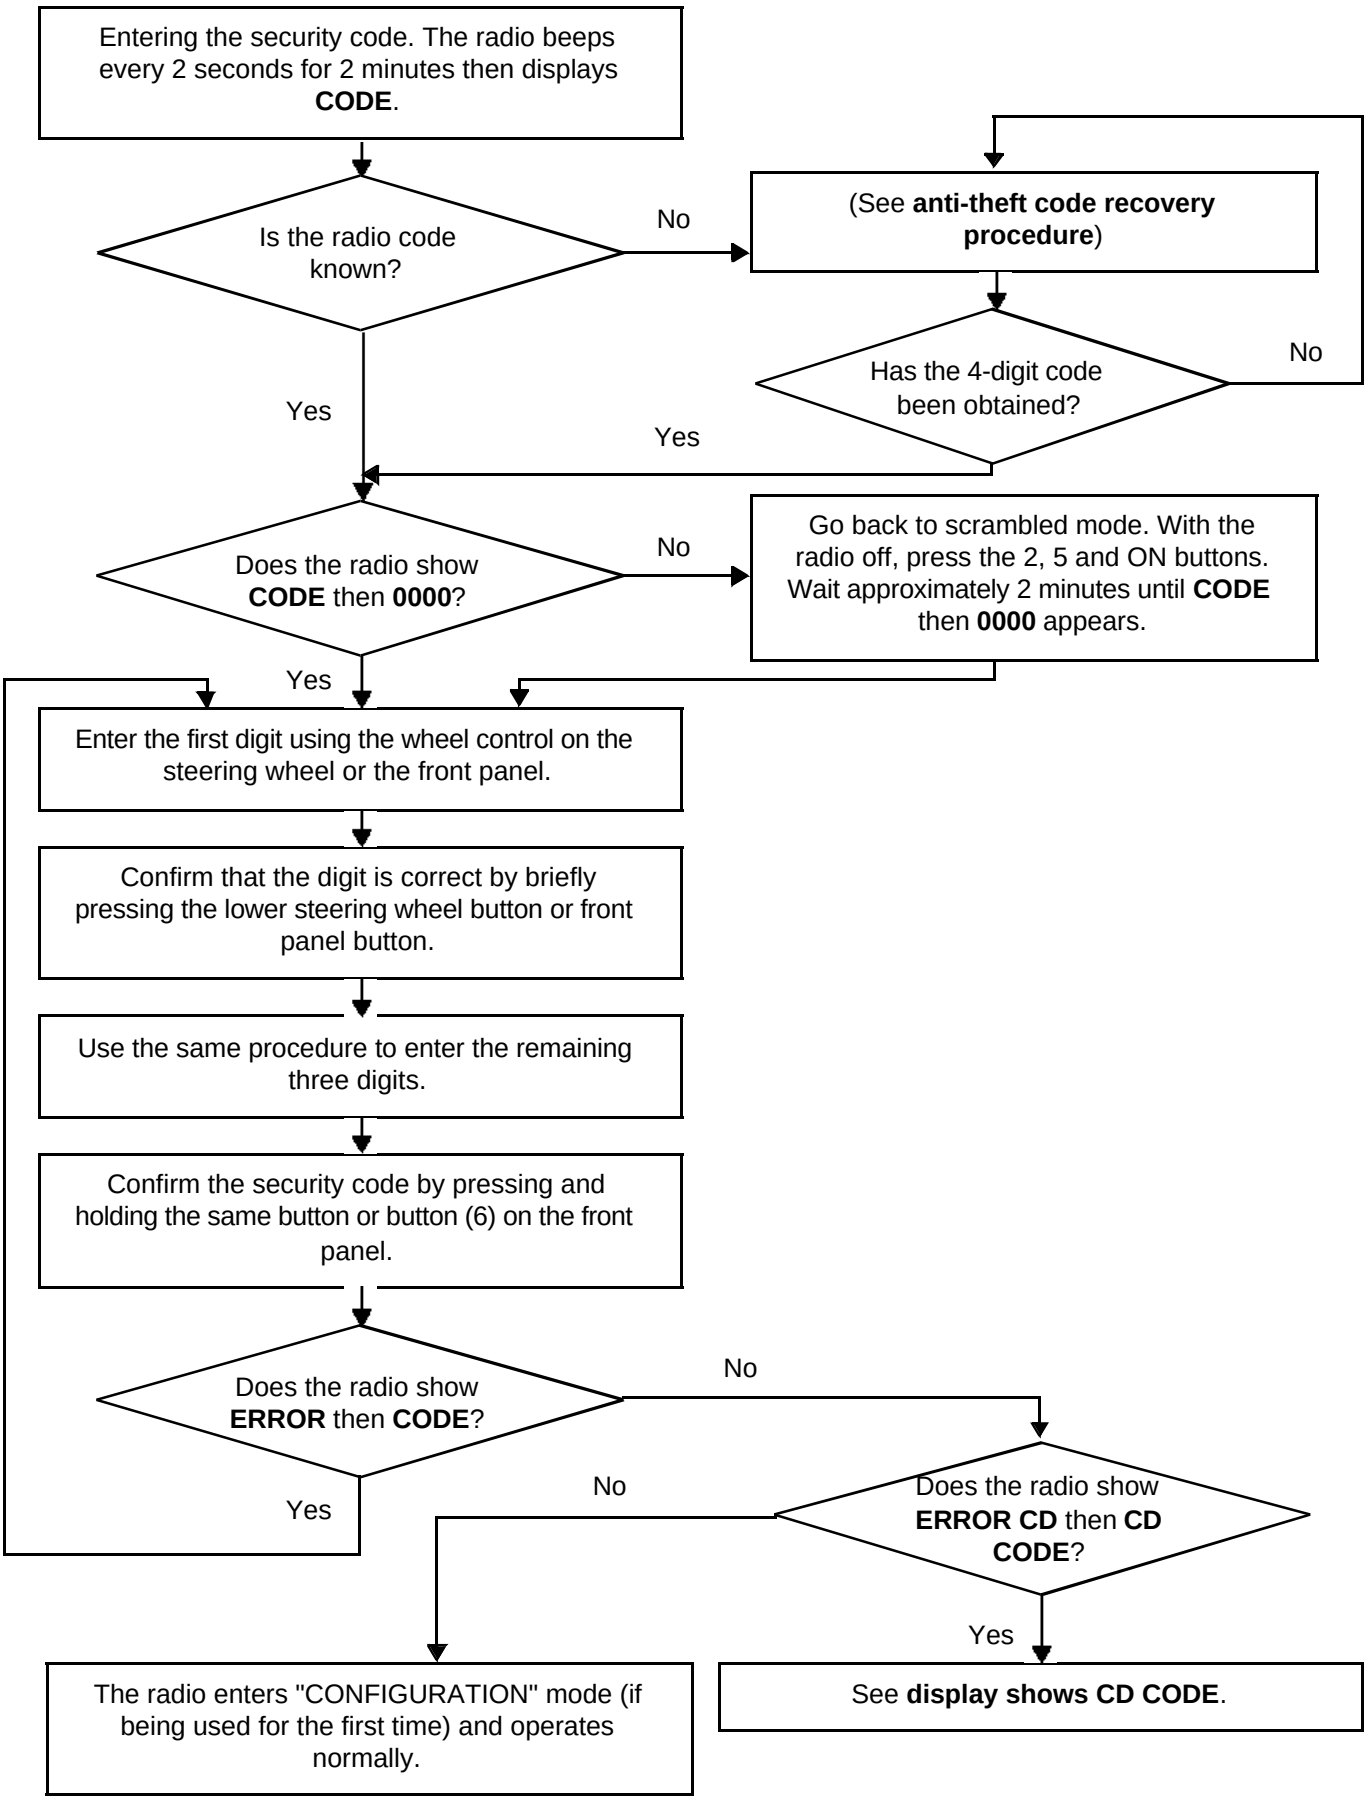
Note:
The CD changer is supplied uncoded. When it is installed in the vehicle, the CD changer is programmed with the radio supply code.

Reminder:
The radio will operate for approximately 2 minutes in scrambled mode without the code having been entered (with regular warning beeps).

IMPORTANT
If the vehicle is fitted with a top of the range navigation system (ITS), enter the radio code in the following way:
1. switch on the system by activating the vehicle's + after ignition feed,
2. wait 2 minutes: scrambled mode with beeps from the speakers, then code request screen appears,
3. enter the radio code using the ITS keypad: move the cursor with the central control and press to confirm.
4. switch off the ignition.

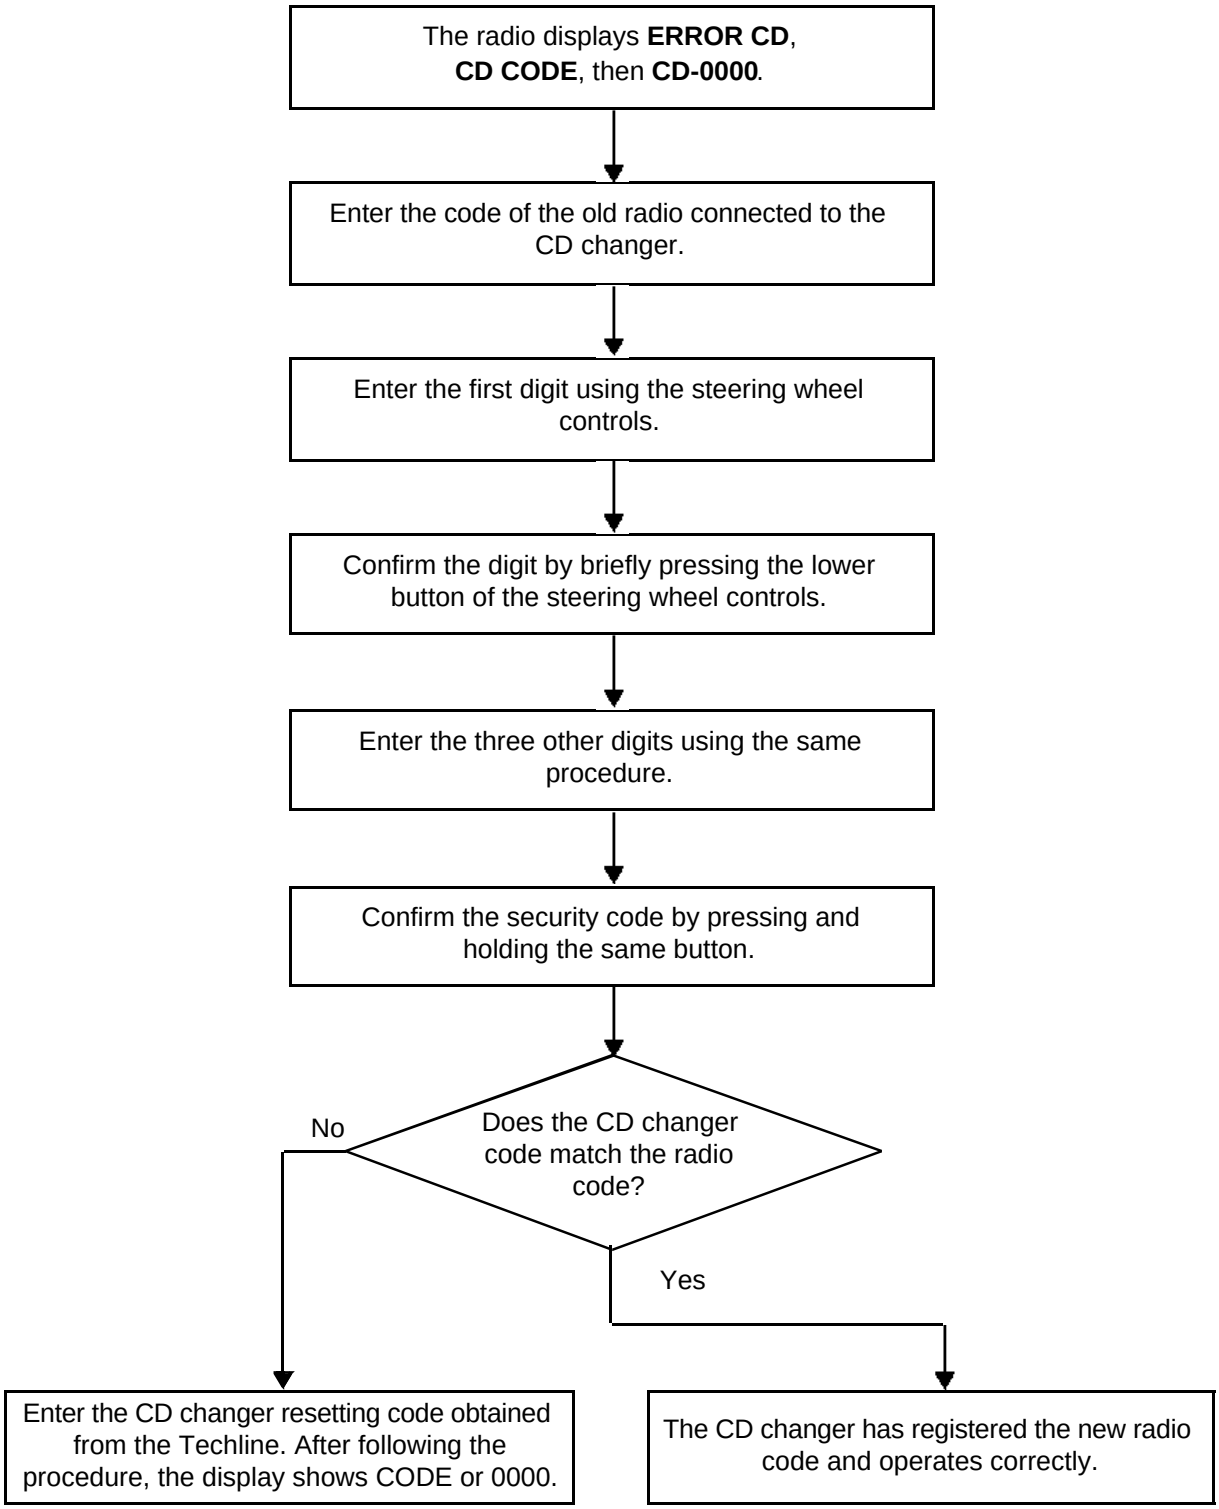
GETtheMANUALS.org

THE DISPLAY SHOWS 'CODE' OR '0000'



GETtheMANUALS.org

THE DISPLAY SHOWS "CD CODE"



GETtheMANUALS.org

CONFIGURATIONS

NOTE:
To select the zone in which the radio is to be used, press the buttons **2** and **5** while switching the power on. Then wait approximately 2 min. Enter the four digit code and then:

- select the tone curve appropriate for the vehicle
  - 0: no regulation
  - 1: Twingo
  - 2: Clio
  - 3: Mégane / Scénic
  - 4: Laguna
  - 5: Vel Satis - Espace

- select the relevant zone:
  - **America**
  - **Japan**
  - **Asia**
  - **Arabia**
  - **Others** (Europe, Africa, other)

Note:
These configurations are not required when the secret code is entered after the power supply has been cut.

SETTINGS

To enter configuration mode (**Expert** mode), press and hold the **Source** button (4 seconds) until you hear a bleep. This allows you to adjust the following functions:

NR range:
- AF mode activation (automatic retuning),
- vehicle speed-dependent volume control (5 for maximum regulation, 0 to cancel regulation),
- **Loudness** mode activation.

PN range:
- AF mode activation (automatic retuning),
- vehicle speed-dependent volume control (5 for maximum regulation, 0 to cancel regulation),
- **Loudness** mode activation,
- **Assisted tuner** mode activation,
- configuration of the number of **speakers** (2 or 4),
- manual or dynamic list selection.

PN6 radio:
- AF mode activation (automatic retuning),
- vehicle speed-dependent volume control (5 for maximum regulation, 0 to cancel regulation),
- **Loudness** mode activation,
- **Assisted tuner** mode activation,
- configuration of the number of **speakers** (2 or 4),
- manual or dynamic list selection.
- activation of data storage in accordance with the RENAULT Card: **CARD ON/OFF**. To operate, the radio must be accompanied by the navigation system.

GETtheMANUALS.org

To allocate the tracks for the different functions that are connected to the radio (CD changer, steering wheel control, display, aerial), refer to the Wiring Diagrams Technical Note corresponding to the vehicle.

Radio: see Wiring diagrams Technical Note, vehicle, code **261**

CD changer: see Wiring diagrams Technical Note, vehicle, code **1272**

Display: see Wiring diagrams Technical Note, vehicle, code **1127**
For displays which are connected to the instrument panel, the code is **247**

Steering wheel control: see Wiring diagrams Technical Note, vehicle, code **325**

Aerial: see Wiring diagrams Technical Note, vehicle, code **886**

GETtheMANUALS.org

The self-test procedure mode of the previous generation radios (PN0-6) allows certain main functions to be tested:

- by pressing buttons 2 and 4 at the same time, the speakers can be tested. They are supplied one by one; the display enables the connections and signals from each speaker to be checked,
- by pressing buttons 1 and 6 at the same time, the reception level can be tested (after frequency is displayed),
  - 9 or letter: good reception,
  - less than 3: poor reception,
  - if 2: total loss of stereo.

The self-test procedure mode of the new generation radios (NR4/5) enables certain main functions to be tested using the combination of buttons 1, 6 and i. The messages will be displayed in the following way:

- **Radio pre-code displays one letter and 3 digits to avoid removal of the radio**,
- speaker test with two bleeps (bass - treble) from the speakers, with the tested speakers shown on the display (front left-hand H01, front right-hand H02, rear right-hand H03, rear left-hand H04),
- displays the frequencies and levels of the tuner sensors,
- software version displayed, displays fault finding for the connected aerial if the aerial is supplied by a coaxial cable; in this case, the display shows H15 with X = 0, 1 or 2 depending on the aerial status (0: open circuit, 1: short circuit to earth, 2: power consumption),
- audio test loudness OFF (H08), cuts any loudness for an audio test.

Note:
Also displays source use time and total time in 10 minute slots (Tuner (H09)/CD (H10)/cassette (H11)/CD changer (H12)/auxiliary (13)/MP (H14)/Total (H15)).

GETtheMANUALS.org

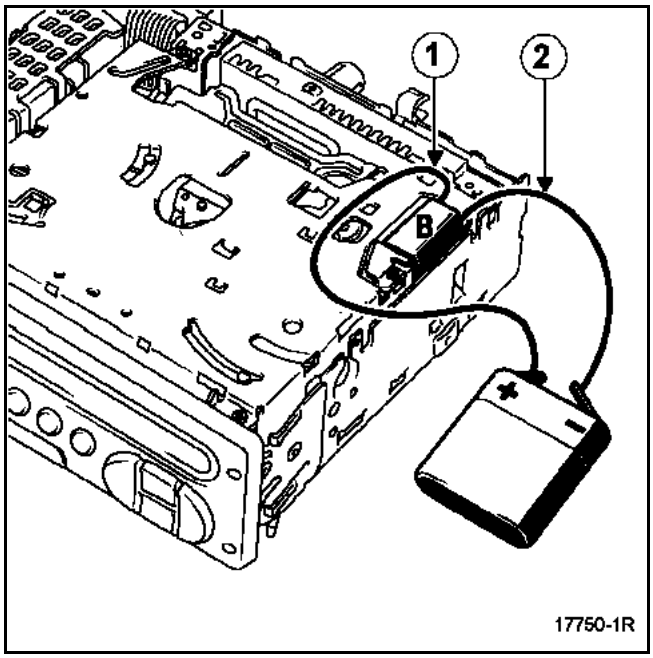
RADIO

First solution

If the electric ejector motor is operational, eject the CD using a **4.5 V** battery to supply the electric motor (**B**) (attach the + wire to contact (**1**) and the - wire to contact (**2**) when ejecting the CD).

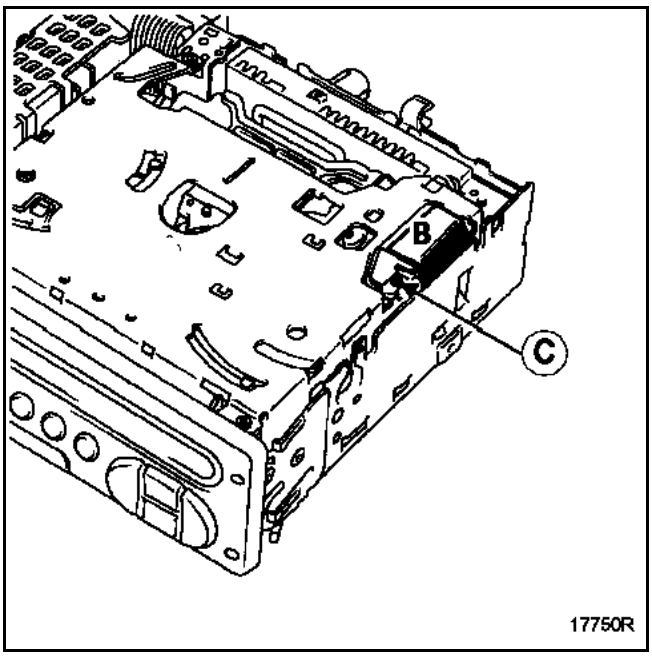


GETtheMANUALS.org

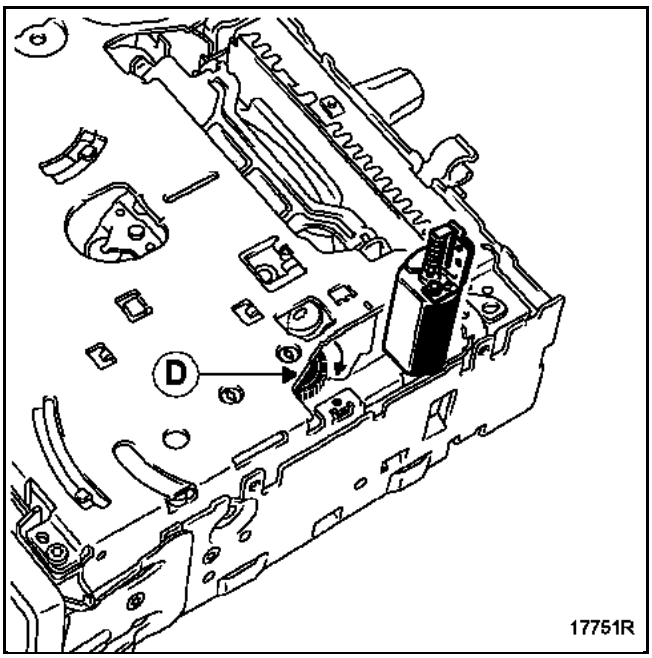
RADIO

Second solution

If the electric ejector motor is not operational, remove the bolt (**C**) and release the electric motor (**B**).



Turn toothed wheel (**D**) by hand in a clockwise direction until the CD is ejected.



Before replacing the radio:

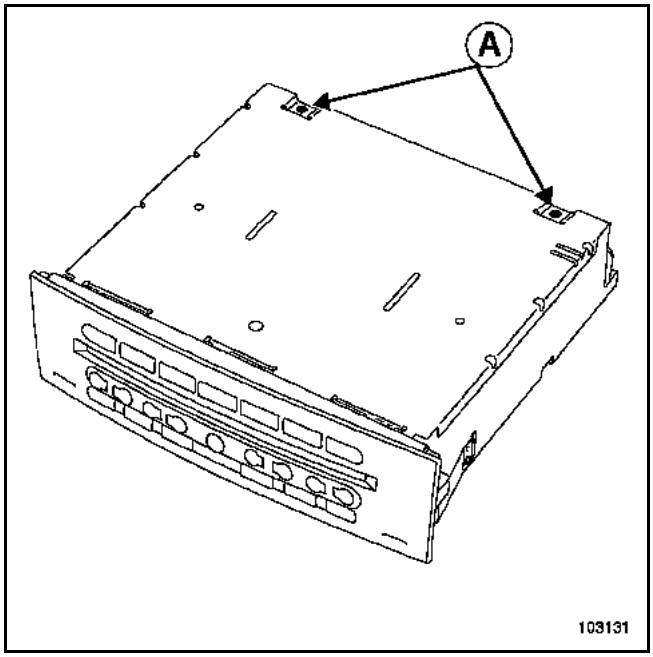
- refit the electric motor and attach it using the bolt (second solution only),
- refit the casing.

GETtheMANUALS.org

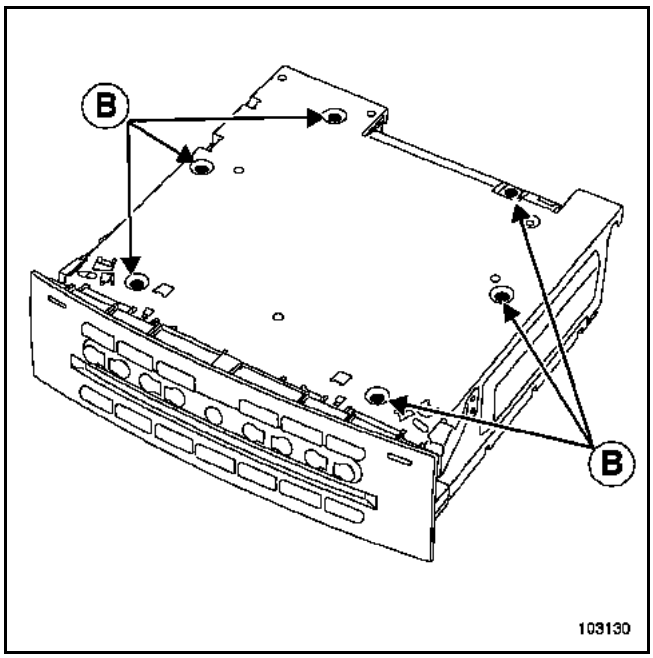
CHANGER IN THE DASHBOARD

REMOVAL

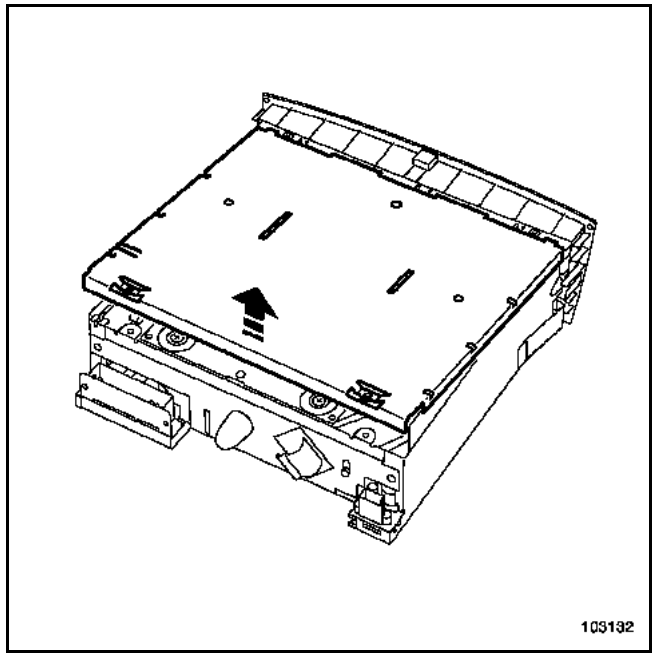
Remove the two bolts (**A**).



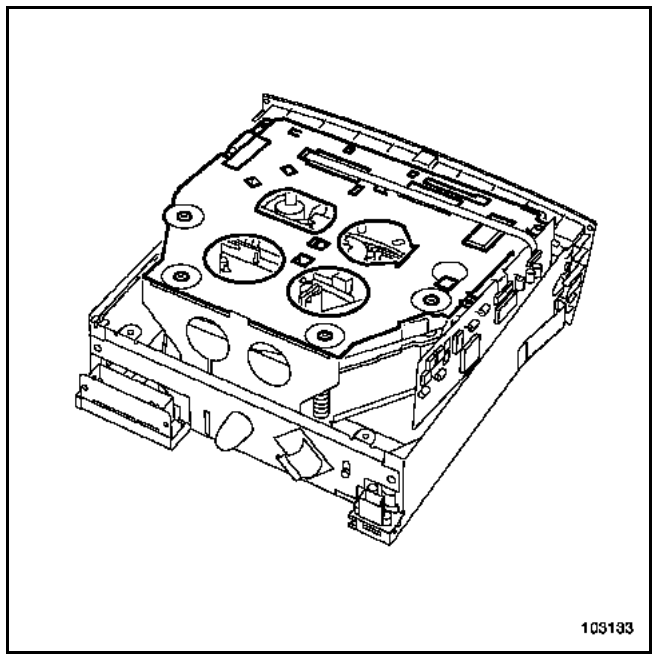
Turn the CD changer upside down.
Remove the 6 bolts (**B**).



Turn the CD changer upside down.
Remove the cover.



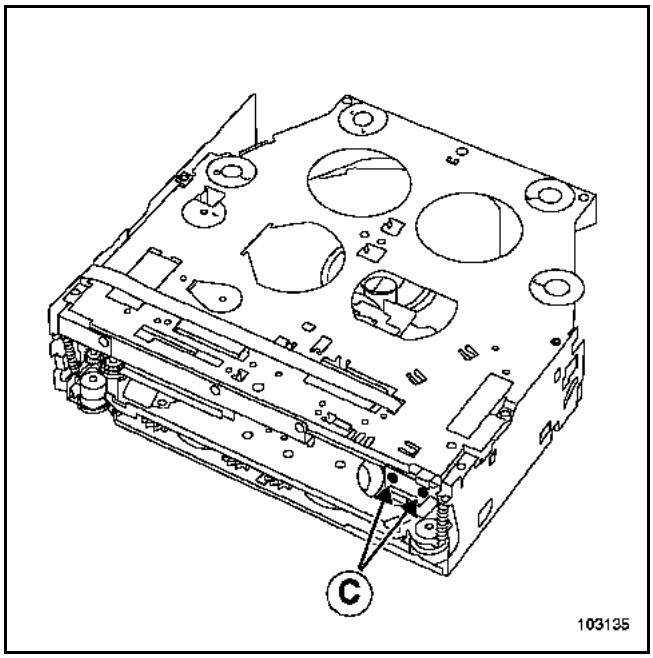
Remove the mechanism from its housing.



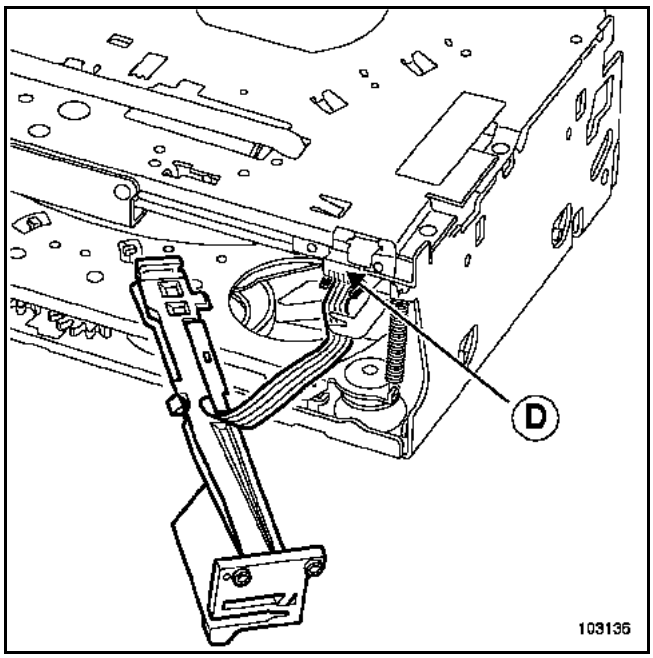
GETtheMANUALS.org

CHANGER IN THE DASHBOARD

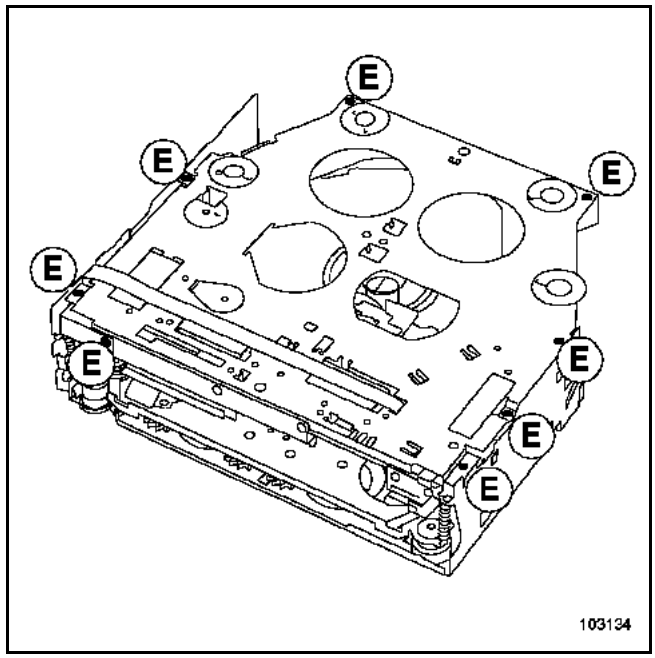
Remove the two bolts (**C**).



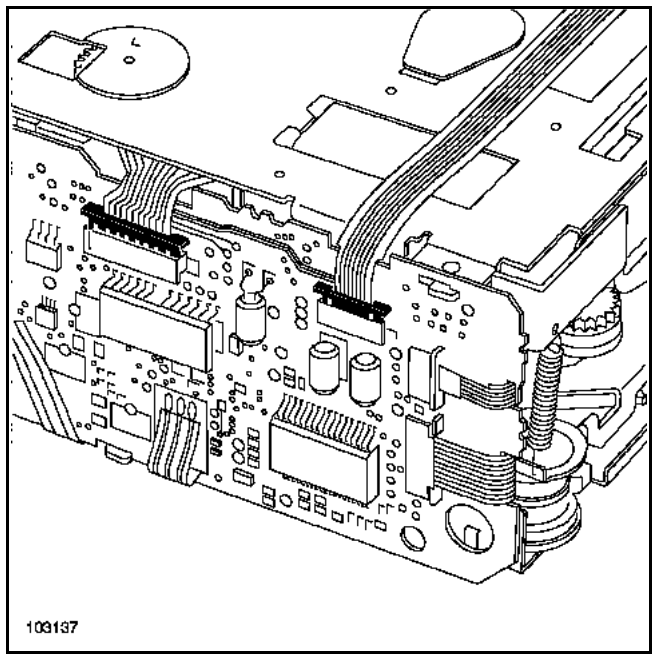
Remove the CD guide arm.
Disconnect connector (**D**).



Remove the eight bolts (**E**),



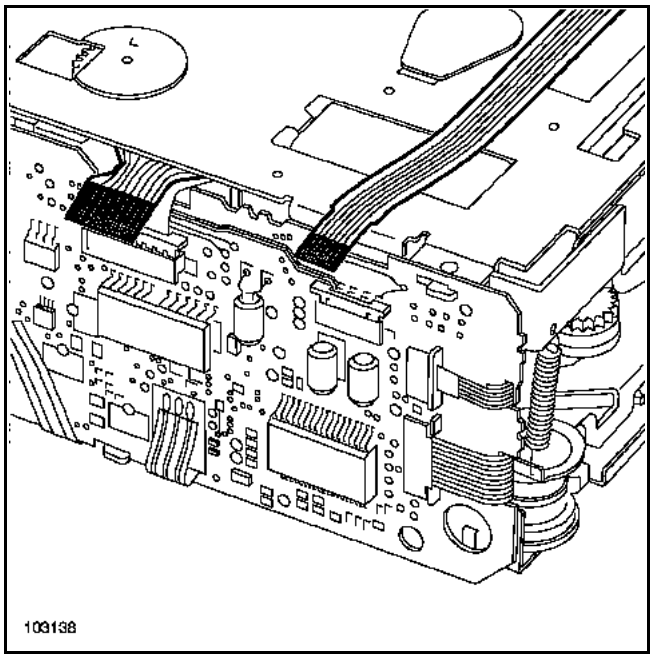
Remove both clips from the two connectors.



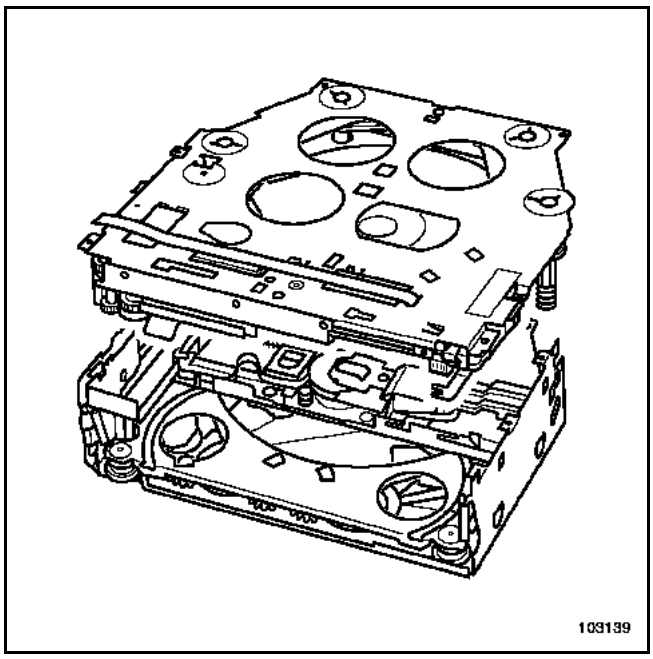
GETtheMANUALS.org

CHANGER IN THE DASHBOARD

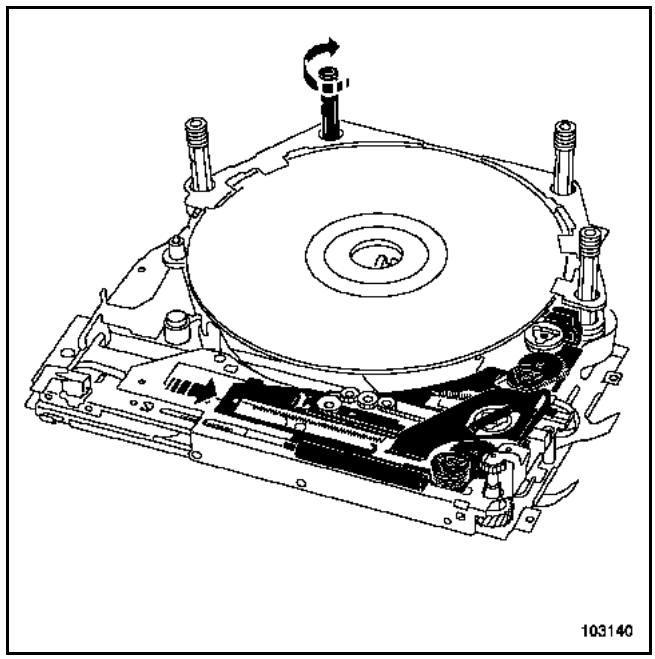
Remove both ribbon cables.



Remove the upper section of mechanism.



Turn the guides and push the mechanism as shown in the diagram in order to raise or lower the CDs.



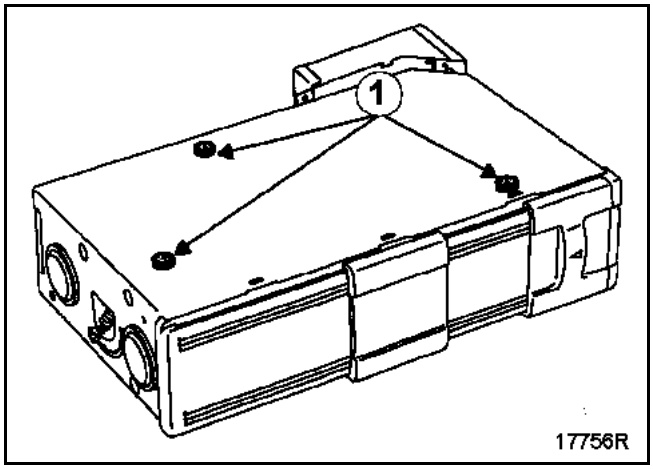
The CDs can now be accessed.

IMPORTANT
Never refit the changer mechanism once it has been removed.

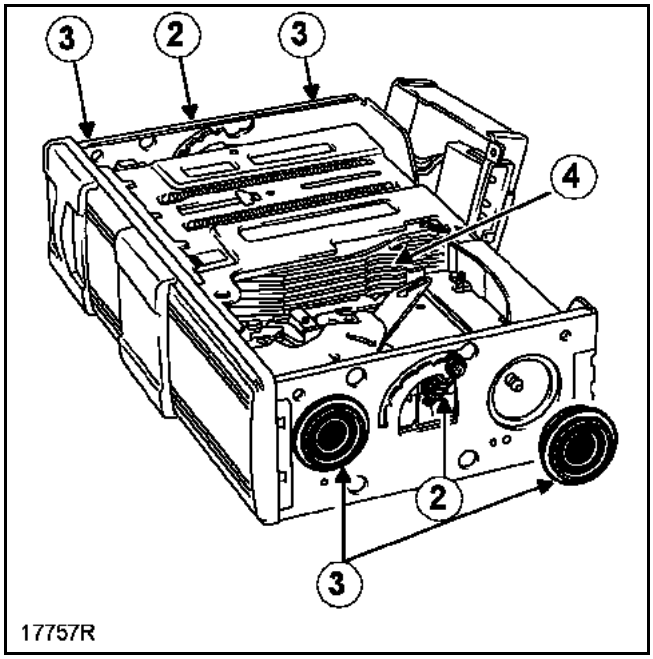
GETtheMANUALS.org

CHANGER IN THE BOOT

Remove:
– the three bolts (**1**) located underneath the unit,

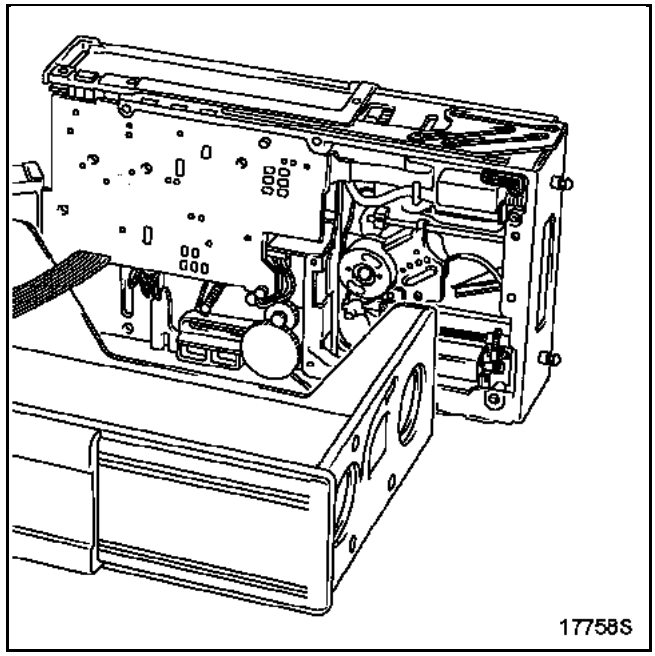


– the two springs (**2**) after bringing them to the upper position,



– the four dampers (**3**) (clipped on).

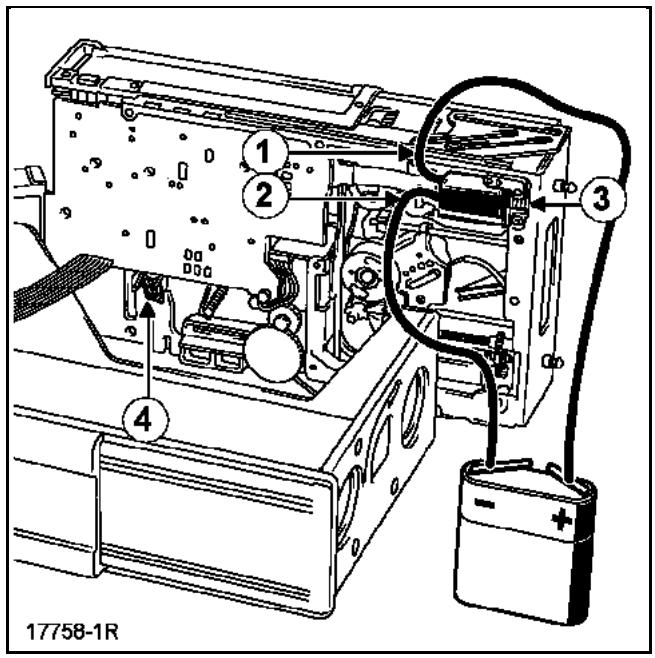
Remove the electronic module from the mounting and place it to the side.



First solution

If the electric motors are operating:

1 Reinsert the CD and its drawer into the changer (**4**) using a 4.5 V battery to supply the electric motor (**3**), (attach the + wire to contact (**1**) and the - wire to contact (**2**)).
2 Eject the changer by moving lever (**4**).



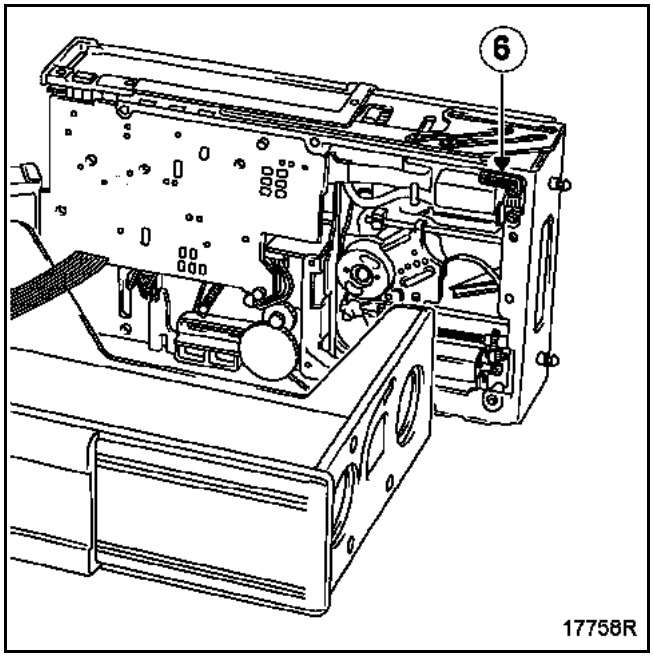
GETtheMANUALS.org

CHANGER IN THE BOOT

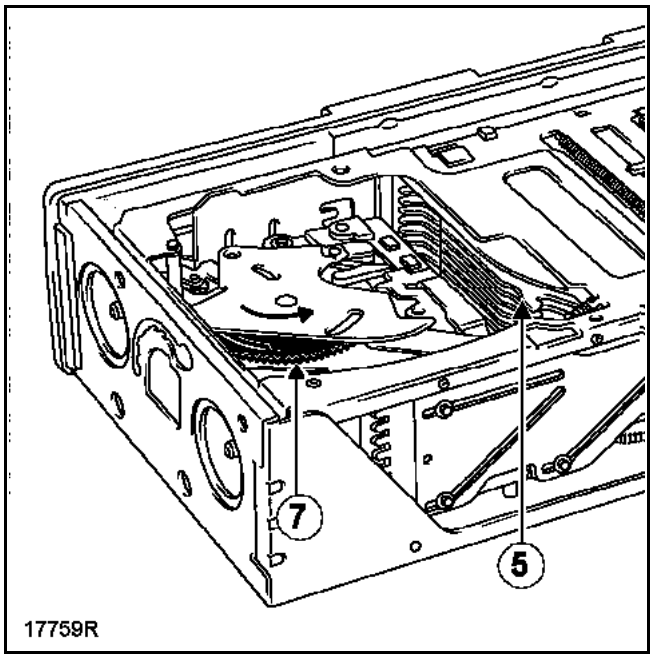
Second solution

If the electric motors are not operational:

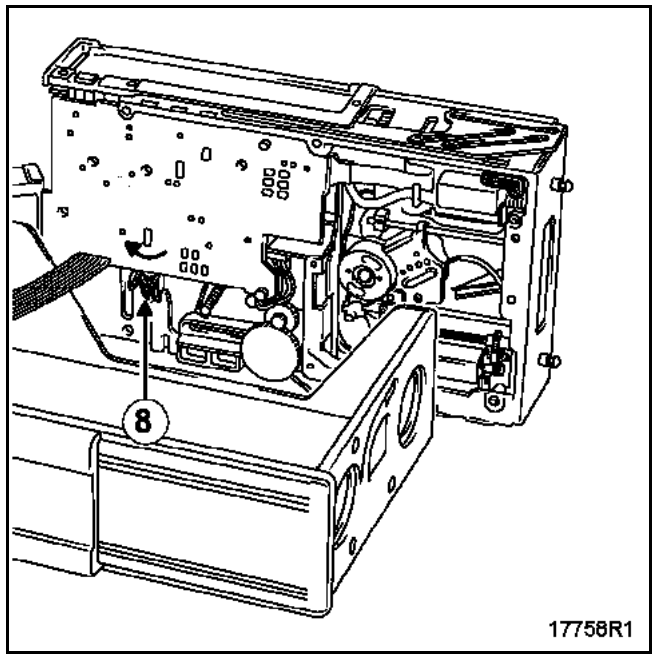
1 To reinsert the CD and its drawer into changer (**5**), remove the pinion mounting (**6**) by its bolt,



turn the toothed wheel (**7**) by hand in an anticlockwise direction until the drawer is turned completely upside down in the changer (**5**).



2 Eject the CD changer by moving the lever (**8**).



Before replacing the radio:

- refit the module in its unit, replace the four dampers and the two springs,
- attach the module to the unit using the three bolts,
- re-close the changer, attach its cover and refit the rear section.

GETtheMANUALS.org

1. SCOPE OF THIS DOCUMENT

This document presents the fault finding procedure applicable to all computers with the following specifications:

Vehicle(s): **Velsatis Phase 1 and 2** *Function concerned:* **Car phone**	*Name of computer:* **Integrated Hands-Free Phone** *Vdiag No.:* **04**

2. PREREQUISITES FOR FAULT FINDING

Documentation type

Fault finding procedures (this manual):
– Assisted fault finding (integrated into the diagnostic tool), Dialogys.
Wiring Diagrams:
– Visu-Schéma (CD-ROM), paper.

Type of diagnostic tools

– CLIP

Special tooling required

Special tooling required	
	Multimeter
Elé. 1681	Computer connection bornier
Elé. 1737	Test adapter

3. RECAP

Procedure

To save energy, the Velsatis Phase 1 and 2 UCH interrupts the + after ignition feed after 3 minutes have elapsed.

When performing fault finding on a computer, it is possible to force the + after ignition feed for 1 hour by applying the following procedure:
– Press the card unlocking button,
– insert the card in the reader,
– press the Start button (interrupting the timed + after ignition feed mode),
– press and hold the Start button for over 5 seconds until the engine immobiliser warning light starts to flash rapidly (4 Hz).

This forced + after ignition feed mode remains active for 1 hour.
Pressing the Start button or removing the card from the reader cuts off the forced + after ignition feed but does not cut off the timed forced + after ignition feed mode. As long as one hour has not elapsed the + after ignition feed function restarts the forced + after ignition feed for the remaining time.

GETtheMANUALS.org

Faults

Faults are declared as either present or stored (depending on whether they appeared in a certain context and have disappeared since, or whether they remain present but have not been diagnosed within the current context).

The **present** or **stored** status of faults should be taken into consideration when the diagnostic tool is switched on after the + after ignition feed (without any system components being active).

For a **present fault**, apply the procedure described in the **Interpretation of faults** section.

For a **stored fault**, note the faults displayed and apply the instructions in the **Notes** section.

If the fault is **confirmed** when the instructions in the Notes section are applied, the fault is present. Deal with the fault

If the fault is **not confirmed**, check:
- the electrical lines which correspond to the fault,
- the connectors for these lines (for oxidation, bent pins, etc.),
- the resistance of the component detected as faulty,
- the condition of the wires (melted or split insulation, wear).

Conformity check

The aim of the conformity check is to check data that does not produce a fault on the diagnostic tool because the data is inconsistent. Therefore, this stage is used to:
- carry out fault finding on faults that do not have a fault display, and which may correspond to a customer complaint.
- check that the system is operating correctly and that there is no risk of a fault recurring after repairs.

This section gives the fault finding procedures for statuses and parameters and the conditions for checking them.

If a status is not behaving normally or a parameter is outside the permitted tolerance values, consult the corresponding fault finding page.

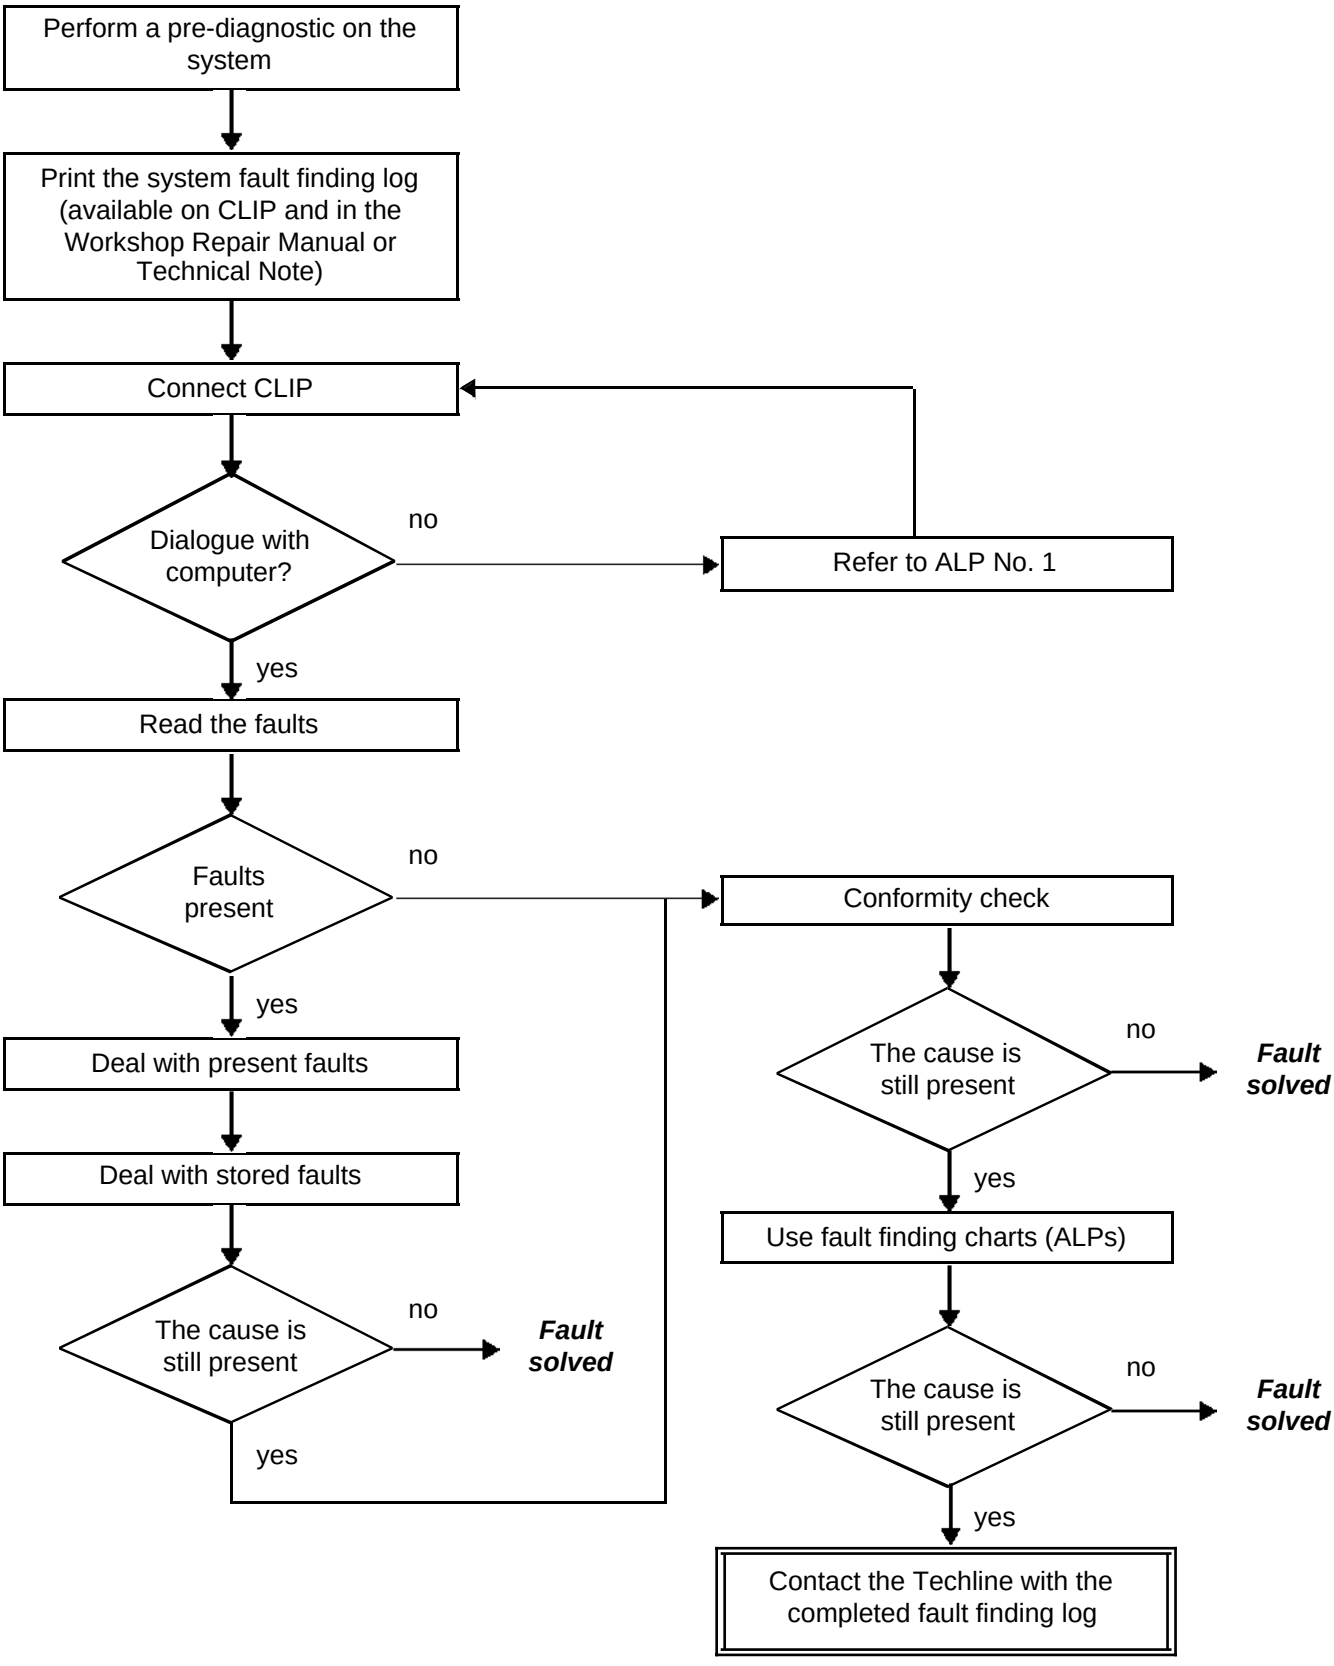
Customer complaints - Fault finding chart

If the test with the diagnostic tool is OK but the customer complaint is still present, the fault should be processed by **customer complaint**.

A synopsis of the general procedure to follow is provided on the following page in the form of a flow chart.

GETtheMANUALS.org

4. FAULT FINDING PROCEDURE



GETtheMANUALS.org

4. FAULT FINDING PROCEDURE (continued)

Wiring check

Fault finding problems
Disconnecting the connectors and/or manipulating the wiring harness may temporarily remove the cause of a fault.
Electrical measurements of voltage, resistance and insulation are generally correct, especially if the fault is not present when the analysis is made (stored fault).

Visual inspection
Look for damage under the bonnet and in the passenger compartment.
Carefully check the fuses, insulators and wiring harness routing.
Look for signs of oxidation.

Tactile inspection
While manipulating the wiring harness, use the diagnostic tool to note any change in fault status from stored to present.
Make sure that the connectors are properly locked.
Apply light pressure to the connectors.
Twist the wiring harness.
If there is a change in status, try to locate the source of the fault.

Inspection of each component
Disconnect the connectors and check the appearance of the clips and tabs, as well as the crimping (no crimping on the insulating section).
Make sure that the clips and tabs are properly locked in the sockets.
Check that no clips or tabs have been dislodged during connection.
Check the clip contact pressure using an appropriate model of tab.

Continuity and insulation check
Check the continuity of entire lines, then section by section.
Look for a short circuit to earth, to **+ 12 V** or to another wire.

If a fault is detected, repair or replace the wiring harness.

GETtheMANUALS.org

5. FAULT FINDING LOG

IMPORTANT

IMPORTANT
Any fault on a complex system requires thorough fault finding with the appropriate tools. The FAULT FINDING LOG, which should be completed during the procedure, enables you to keep track of the procedure which is carried out. It is an essential document when consulting the manufacturer.

IT IS THEREFORE MANDATORY TO FILL OUT A FAULT FINDING LOG EACH TIME FAULT FINDING IS CARRIED OUT.

You will always be asked for this log:

- when requesting technical assistance from Techline,
- for approval requests when replacing parts for which approval is mandatory,
- to be attached to monitored parts for which reimbursement is requested. The log is needed for warranty reimbursement, and enables better analysis of the parts removed.

6. SAFETY ADVICE

Safety rules must be observed during any work on a component to prevent any damage or injury:

– check the battery voltage to avoid incorrect operation of computer functions,
– Use the proper tools.

GETtheMANUALS.org

WARNING
Only use this fault finding manual if the vehicle is not fitted with a Carminat navigation and communication system.
Fault finding is performed on the Hands-Free Telephone integrated Control system using the telephone icon on the diagnostic tool desktop
This application must never be opened at the same time as the CLIP application (RENAULT icon) and inversely, never open the CLIP application (RENAULT icon) at the same time as the Hands-Free Kit (HFK) fault finding.

Note:
The **Integrated Hands-Free Telephone** system is also called the **M**odified **H**ands **F**ree **K**it (HFK).

FUNCTIONS CARRIED OUT BY THE HANDS-FREE KIT:

The **H**ands **F**ree **K**it system allows the customer to use their telephone in hands-free mode (without holding the telephone).
The customer can use their telephone in two ways: with the radio satellite control buttons or with the voice recognition mode (if configured: see **Configurations and programming**).
For more information, consult the user manual for the **H**ands **F**ree **K**it.

The **H**ands **F**ree **K**it system is used for the following functions:
– to receive or make calls,
– to alter the volume of calls (by deleting echo and reducing unwanted noise),
– to scroll through the telephone functions (directory, calls received, etc.) using the satellite control or voice recognition,
– to display the telephone screen information on the vehicle display,
– to recharge the telephone battery (using the telephone cradle),
– to use the vehicle's aerial for improved call reception,
– to use the vehicle's speakers instead of the telephone's speaker,
– to switch the radio off when making or receiving calls.

GETtheMANUALS.org

CONTENTS OF THE HANDS-FREE KIT SYSTEM

The system is made up of the following components:
– a computer (**Hands-Free Kit**),
– a telephone cradle (telephone adapter) fitted onto the vehicle base plate,
– a vehicle base plate designed to hold the telephone cradle (i.e. the part fitted onto the base of the centre console),
– a microphone (between the sun visors),
– a call button (a button at the end of the indicator stalk),
– the customer's telephone (specific models: see Owner's Manual).

The system uses radio components on the vehicle:
– radio;
– satellite control under the steering wheel,
– display,
– vehicle speakers,
– radio aerial.

Note:
A test adapter (Elé. 1737) is used to check the conformity of serial and audio connections between the telephone cradle and the computer. This adapter is used with the **VP005 Series connections tests** and **VP006 Audio connections tests** commands (see interpretation of these commands).

GETtheMANUALS.org

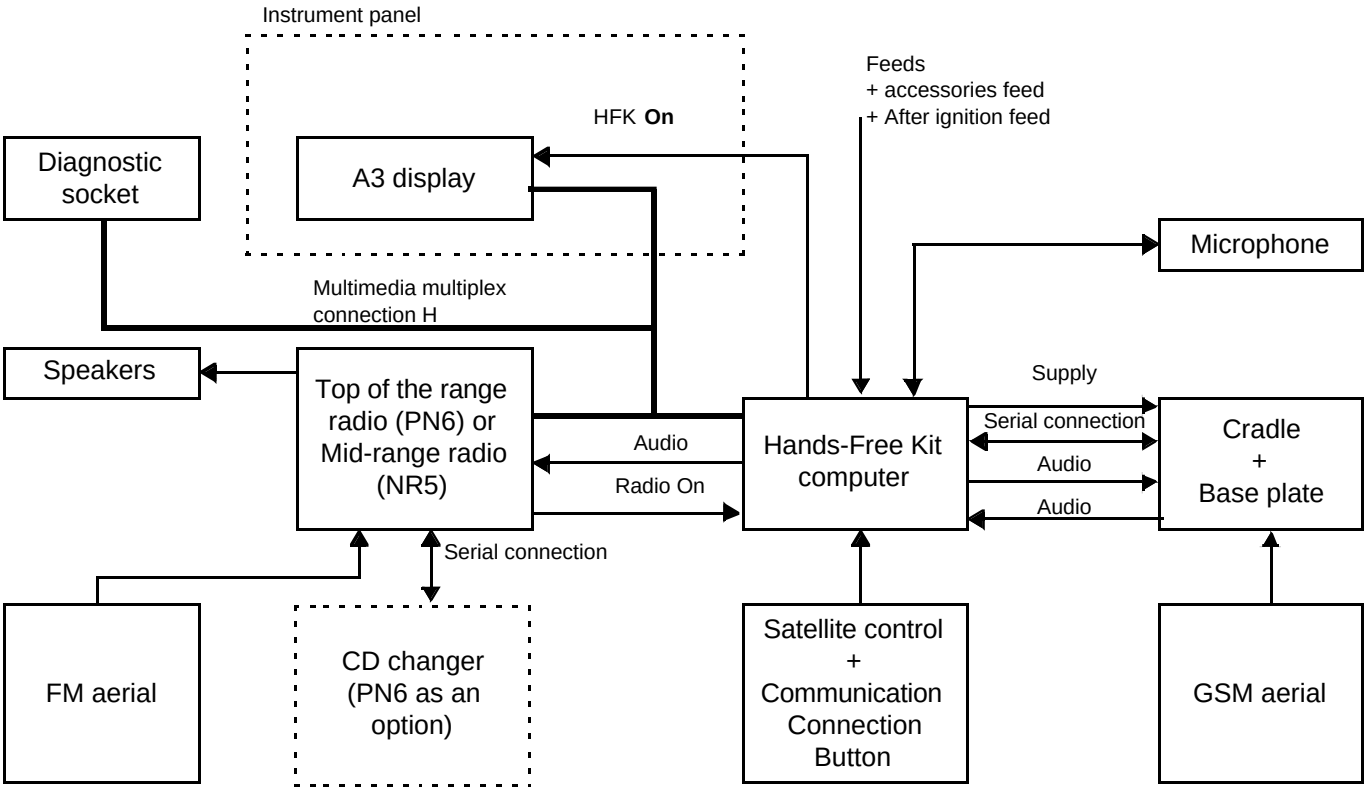
SYSTEM DESCRIPTION

The Hands-Free Kit system allows the customer's mobile telephone resources to be used via the vehicle's multimedia equipment (Radio, Display, Satellite control, Microphone). The Velsatis Phase II Hands-Free Kit system is never fitted with a navigation system and can be fitted with two different types of radio:

Without navigation:
– Top of the range Auditorium radio without navigation (PN6) and with or without a C.D. multi-changer.
– Middle of the range radio without navigation (NR5) and without a C.D. multi-changer.

Note:
The vehicle can be fitted with a navigation system as well as the Carminat Navigation and Communication system which has a different computer to the one dealt with in this document. Fault finding can also be run on this computer. In the event of a fault with the Hands-Free Kit on a vehicle fitted with the navigation system, refer to the section on Carminat Navigation and Communication system fault finding.

FLOWCHART FOR SYSTEM WITHOUT NAVIGATION



HFK On: Signal that activates the display.

Radio On: Signal that activates the Hands-Free Kit (except with + Accessories feed) and therefore starts up the audio system.

GETtheMANUALS.org

WARNING
Before replacing the Hands-Free Phone Kit computer, check that it is faulty (read faults, conformity of variables, read customer complaints). Computer replacement is subject to authorisation by the Techline after a fault finding log has been completed and submitted.

Replacing the Hands-Free Phone computer:
- Note the computer configuration according to the optional equipment fitted on the vehicle.
- Ensure that the ignition is switched off.
- After approval from the **Techline,** replace the computer.
- Switch on the ignition and carry out a check using the diagnostic tool.
- **It is essential* to calibrate and activate computer VP011** according to the optional equipment fitted on the vehicle (see **Configurations and programming**).
- Switch off the ignition and then back on for the configurations to register.
- Go to the Read configuration menu and confirm that the configurations have been stored.
- Check for faults and carry out the fault finding procedure which corresponds to possible faults shown on the diagnostic tool.
- Clear any stored faults.
- Write the VIN by running command **VP002 Write VIN**.
- Enter the After-Sales operation date by running command **VP001 Write last After-Sales operation date**.
- Check that the **H**ands **F**ree **K**it is operating correctly.

*** WARNING**
Do not run commands **CF009 Language** and **VP011 Computer calibration and commissioning** if the part number for the computer from the Parts Department is 82 00 214 822 or 82 00 433 328: **RISK OF DAMAGING THE SYSTEM** (see identification screen).
For all other part numbers from the Parts Department, the two commands above must be run for the system to operate correctly.

GETtheMANUALS.org

SUMMARY TABLE

CONFIGURATION		OPTIONS	CONFIGURATION READING	
VP011	COMPUTER CALIBRATION AND COMMISSIONING	VEHICLE TYPE TYPE OF RADIO SCREEN TYPE EQUIPMENT LEVEL LANGUAGE (directly accessible)	**LC001**	RADIO GENERATION
			LC002	TYPE OF RADIO
			LC003	DISPLAY GENERATION
			LC004	TYPE OF DISPLAY
			LC005	HANDS-FREE KIT GENERATION
			LC006	TYPE OF HANDS-FREE KIT
			LC007	VEHICLE TYPE
CF009	LANGUAGE * (also accessible with command VP011)	FRENCH ENGLISH GERMAN ITALIAN PORTUGUESE DUTCH SPANISH	**LC009**	LANGUAGE

Note:
– Following configuration, switch the ignition off and then back on for the configurations to register.
– As this fault finding is the same as the Laguna II Phase II and Espace IV, ignore the configurations not indicated above.
– Acoustic configuration is automatic on computer calibration and commissioning.

*** WARNING**
Do not run commands **CF009 Language** and **VP011 Computer calibration and commissioning** if the part number for the computer from the Parts Department is 82 00 214 822 or 82 00 433 328: **RISK OF DAMAGING THE SYSTEM** (see identification screen).
For all other part numbers from the Parts Department, the two commands above must be run for the system to operate correctly.

– Command **VP011 Computer calibration and commissioning** enables the type of radio, vehicle type, screen type, language options, equipment level and acoustic specifications to be defined for the vehicle.

– The **CF009 Language** configuration **is used to activate voice recognition** in the language selected.

– The acoustic specifications enable adjustment of the echo/noise reduction and voice recognition functions depending on the vehicle's interior volume.

GETtheMANUALS.org

DF001 PRESENT OR STORED	COMPUTER 1.DEF: internal electronic fault

NOTES	**Priority in the event of a number of faults:** Firstly, deal with fault **DF003 Computer supply voltage**, if it is present or stored.

If the fault is stored:
Clear the fault, switch off the ignition and disconnect the computer supply fuse (see wiring diagram).
Reconnect the fuse and switch on the ignition again (forced + after ignition feed).

If the fault reappears as **stored** when the ignition is switched on:
Check the **connection, condition and conformity** of the Hands-Free Kit computer connectors and their clips.
Repair if necessary.

Disconnect the Hands-Free Kit computer 40-track connector and check the conformity of the electrical supplies (they must be the same as the battery voltage).
In the event of a fault, check the **insulation, continuity and the absence of interference resistance** on the following connections:

Hands-Free Kit computer 40-track connector

Track 9	→	**Earth**
Track 4	→	**+ 12 V before ignition feed**
Track 6	→	**+ 12 V accessories feed**
Track 7	→	**+ 12 V after ignition feed**

Repair if necessary.

If the fault is present or if it cannot be dealt with, fill in the **fault finding log** and contact the **Techline**.

AFTER REPAIR	If the computer was replaced (**at the request of the Techline**): reconfigure the computer (see **Configurations and programming**). Deal with any other faults.

GETtheMANUALS.org

DF002 PRESENT OR STORED	COMPUTER/DISPLAY CONNECTION CO.1 : open circuit or short circuit to + 12 V CC.0 : short circuit to earth

NOTES	**Priorities when dealing with a number of faults:** First deal with fault **DF014 Incorrect display configuration**.

Check the **connection, condition and conformity** of the Hands-Free Kit computer 40-track connector and its clips.
Repair if necessary.

Check the **connection, condition and conformity** of the instrument panel 24-track connector and its clips.
Repair if necessary.

Disconnect the Hands-Free Kit computer 40-track connector and the A3 display 24-track connector to check the **insulation, continuity and the absence of interference resistance** of the connection:

Hands-Free Kit computer Black 40-track connector		**A3 display Black 24-track connector**
Track 2	→	**Track 16**

Repair if necessary.

AFTER REPAIR	Clear the stored faults. Deal with any other faults. Check that the system is operating correctly.

GETtheMANUALS.org

DF003 PRESENT OR STORED	COMPUTER SUPPLY VOLTAGE 1.DEF: undervoltage 2.DEF: excess voltage

NOTES	**Special notes:** The undervoltage fault appears if the computer supply voltage is equal to or less than **8.5 V**. The excess voltage fault appears if the computer supply voltage is equal to or greater than **16 V**.

Check the conformity of the battery voltage (**10 V < X < 14.4 V**).
If the voltage is not correct, run fault finding on the battery and the charge circuit.

Check that the fuses are in good condition: F23 of 10A (+ 12 V accessories feed), F28 of 20A (+ 12 V after ignition feed) and F50 of 20A (+ 12 V before ignition feed): see wiring diagram.

Check the **connection, condition and conformity** of the Hands-Free Kit computer connectors and their clips. Repair if necessary.

Disconnect the Hands-Free Kit computer 40-track connector and check the conformity of the electrical supplies (they must be the same as the battery voltage).
In the event of a fault, check the **insulation, continuity and the absence of interference resistance** on the following connections:

Hands-Free Kit computer 40-track connector

Track 9	→	**Earth**
Track 4	→	**+ 12 V before ignition feed** (see vehicle diagram)
Track 6	→	**+ 12 V accessories feed** (see vehicle diagram)
Track 7	→	**+ 12 V after ignition feed** (see vehicle diagram)

Repair if necessary.

AFTER REPAIR	Clear the stored faults. Deal with any other faults. Check that the system is operating correctly.

GETtheMANUALS.org

DF004 PRESENT OR STORED	COMPUTER/MICROPHONE CONNECTION CO : open circuit CC.0 : short circuit to earth CC.1 : short circuit to + 12 V

NOTES	**Special notes:** The microphone is located in the middle of the sun visor.

Run the **VP004 Test microphone** command (repair mode of the diagnostic tool, parameter setting tab): see the interpretation of this command.

If the result from the test is 0 %, check **the connection, condition and conformity** of the Hands-Free Kit computer 40-track connector and its clips and **the connection, condition and conformity** of the microphone's grey 6-track connector and its clips.
Repair if necessary.

Switch off the ignition and disconnect the aforementioned connectors to check the insulation, continuity and absence of interference resistance on the following connections:

Hands-Free Kit computer 40-track connector		**Microphone 6-track connector**
Track 28 (+ Microphone)	→	**Track 2**
Track 29 (- Microphone)	→	**Track 1**

Repair if necessary (refer to vehicle wiring diagrams).

AFTER REPAIR	Clear the stored faults. Deal with any other faults. Check that the system is operating correctly.

GETtheMANUALS.org

DF005 PRESENT OR STORED	TELEPHONE CRADLE POWER SUPPLY CO.1 : open circuit or short circuit to + 12 V CC.0 : short circuit to earth

NOTES	**Priorities when dealing with a number of faults:** Firstly, deal with fault **DF003 Computer supply voltage**, if it is present or stored. **Special notes:** The telephone cradle is located in the centre console.

Check the conformity of the battery voltage (**10 V < X < 14.4 V**).
If the voltage is not correct, run fault finding on the battery and the charge circuit.

Check that the fuses are in good condition: F23 of 10A (+ 12 V accessories feed), F28 of 20A (+ 12 V after ignition feed) and F50 of 20A (+ 12 V before ignition feed): see wiring diagram.

Check the **connection, condition and conformity** of the telephone base plate connector (behind the gear lever) as well as the condition of the electrical contacts between the base plate in the vehicle and the telephone cradle. Repair if necessary.

Check the insulation, continuity and the absence of interference resistance on the following connections:

Hands-Free Kit computer Black 24-track connector		**Telephone cradle 14-track connector**
Track 13	→	**Track 4 (+ 12 V)**
Track 14	→	**Track 6 (earth)**

Repair if necessary.

If the connections checked before and the power supplies are fine but the fault is still present: replace the telephone base plate.

AFTER REPAIR	Clear the stored faults. Deal with any other faults. Check that the system is operating correctly.

GETtheMANUALS.org

DF006 PRESENT OR STORED	COMPUTER/TELEPHONE CRADLE CONNECTION 1.DEF: absence of or poor response from telephone cradle to the computer

NOTES	**Priorities when dealing with a number of faults:** Firstly, deal with fault **DF005 Telephone cradle supply voltage**, if present or stored.
	Special notes: The connections between the computer and the telephone base plate comprise wire connections. The telephone base plate is located in the centre console.

Activate the **VP005 Series connections test** command (repair mode of the diagnostic tool, setting tab).

If the command result displays Incorrect:
Check the **connection, condition and conformity** of the telephone base plate connector (behind the gear lever) as well as the condition of the electrical contacts between the base plate in the vehicle and the telephone cradle.
Repair if necessary.

Check the **connection, condition and conformity** of the Hands-Free Kit computer 24-track connector and its clips.
Repair if necessary.

Disconnect the computer 24-track connector and that of the telephone base plate and check **the insulation, continuity and absence of interference resistance** on the following serial connections:

Hands-Free Kit computer 24-track connector		**Telephone base plate 14-track connector**
Track 17	→	**Track 8**
Track 18	→	**Track 9**
Track 21	→	**Track 13**
Track 22	→	**Track 14**

Repair if necessary.

AFTER REPAIR	Clear the stored faults. Deal with any other faults. Check that the system is operating correctly.

GETtheMANUALS.org

DF007 PRESENT OR STORED	TELEPHONE SIGNAL 1.DEF: signal incoherence

NOTES	**Processing priority in the event of a number of faults:** Firstly, deal with fault **DF006 Computer/telephone connection**, if it is present or stored.
	Special notes: The telephone base plate is located in the centre console. This fault indicates either an absence of communication or poor communication between the telephone (or the telephone cradle and not the base plate) and the computer.

Check **the connection and the status** of the telephone cradle base plate connector. Repair if necessary.
Check the condition of the telephone base plate and the telephone cradle contacts (gold-plated contacts). Replace the vehicle base plate or the telephone cradle if necessary.
Put the telephone in its cradle and check on the navigation screen that the telephone is detected ("Tel" non barred symbol). If the fault is still present, check that the customer telephone still works.

AFTER REPAIR	Clear the stored faults. Deal with any other faults. Check that the system is operating correctly.

GETtheMANUALS.org

DF008 PRESENT OR STORED	INCONSISTENT ACOUSTIC CONFIGURATION 1.DEF: incorrect acoustic parameters

NOTES	**Special note:** This fault indicates that the acoustic parameters in the computer's memory are not correct for the vehicle to which the system is fitted.

Set the acoustic parameters in the computer by running command **VP011 Computer calibration and commissioning** (see **Configurations and programming**).

AFTER REPAIR	Clear the stored faults. Deal with any other faults. Check that the system is operating correctly.

GETtheMANUALS.org

DF010 PRESENT OR STORED	HANDS FREE KIT MULTIPLEX NETWORK 1.DEF: No computer multiplex signal

NOTES	**Processing priority in the event of a number of faults:** Deal with fault **DF013 Incorrect audio equipment configuration** first, if present or stored.

PN6 top of the range radio

Disconnect the 40-track connector from the Hands-Free Phone unit, and the 15-track radio connector (PN6) to check the insulation, **continuity and the absence of interference resistance** on the following connections:

Hands-Free Phone computer 40-track connector		**PN6 Radio Black 15-track connector**
Track 14	→	**Track 3**
Track 11	→	**Track 4**
PN6 Radio Black 15-track connector		**Diagnostic socket**
Track 1	→	**Track 13**
Track 2	→	**Track 12**

Repair if necessary.

NR5 mid-range radio

Disconnect the 40-track connector from the Hands-Free Phone unit, and the yellow 6-track radio connector (NR5) to check the insulation, **continuity and the absence of interference resistance** on the following connections:

Hands-Free Phone computer 40-track connector		**NR5 radio Yellow 6-track connector**
Track 14	→	**Track 2**
Track 11	→	**Track 1**
NR5 radio Black 15-track connector		**Diagnostic socket**
Track 1	→	**Track 12**
Track 2	→	**Track 13**

Repair if necessary.

AFTER REPAIR	Clear the stored faults. Deal with any other faults. Check that the system is operating correctly.

GETtheMANUALS.org

DF011 PRESENT OR STORED	NO RADIO MULTIPLEX SIGNAL

NOTES	**Processing priority in the event of a number of faults:** Deal with fault **DF013 Incorrect audio equipment configuration** first, if present or stored.

PN6 top of the range radio

Disconnect the 40-track connector from the Hands-Free Phone unit, and the 15-track radio connector (PN6) to check the insulation, **continuity and the absence of interference resistance** on the following connections:

Hands-Free Phone computer 40-track connector		**PN6 Radio Black 15-track connector**
Track 14	→	**Track 3**
Track 11	→	**Track 4**

PN6 Radio Black 15-track connector		**Diagnostic socket**
Track 1	→	**Track 13**
Track 2	→	**Track 12**

Repair if necessary.

NR5 mid-range radio

Disconnect the 40-track connector from the Hands-Free Phone unit, and the yellow 6-track radio connector (NR5) to check the insulation, **continuity and the absence of interference resistance** on the following connections:

Hands-Free Phone computer 40-track connector		**NR5 radio Yellow 6-track connector**
Track 14	→	**Track 2**
Track 11	→	**Track 1**

NR5 radio Black 15-track connector		**Diagnostic socket**
Track 1	→	**Track 12**
Track 2	→	**Track 13**

Repair if necessary.

AFTER REPAIR	Clear the stored faults. Deal with any other faults. Check that the system is operating correctly.

GETtheMANUALS.org

DF012 PRESENT OR STORED	NO DISPLAY MULTIPLEX SIGNAL

NOTES	**Processing priority in the event of a number of faults:** Deal with fault **DF014 Incorrect display configuration** first, if present or stored.

Check that the computer is configured correctly; reconfigure if necessary (see **Configurations and programming**).
In the event of a fault, run **fault finding on the multiplex network**.

Check the connection and the condition of the Hands-Free Kit computer 40-track connectors and the display's 24-track connector.

PN6 top of the range radio

Disconnect the radio (PN6) black 15-track connector, the Hands-Free Kit computer black 40-track connector and the A3 display black 24-track connector, to check the insulation, continuity and absence of interference resistance on the following connections:

A3 display 24-track connector		PN6 Radio 15-track connector		Hands-Free Kit computer 40-track connector
Track 11	→	Track 2	Track 4	→ Track 11
Track 12	→	Track 1	Track 3	→ Track 14

PN6 Radio Black 15-track connector		Diagnostic socket
Track 1	→	Track 13
Track 2	→	Track 12

Repair if necessary.

AFTER REPAIR	Clear the stored faults. Deal with any other faults. Check that the system is operating correctly.

GETtheMANUALS.org

DF012 **CONTINUED**	

NR5 mid-range radio	Disconnect the radio (NR5) yellow 6-track connector and the Hands-Free Kit computer black 40-track connector to check the insulation, continuity and the absence of interference resistance on the following connections: **A3 display 24-track connector** → **NR5 radio 6-track connector** **Track 11** → **Track 1** **Track 12** → **Track 2** **NR5 radio Black 15-track connector** → **Diagnostic socket** **Track 1** → **Track 12** **Track 2** → **Track 13** Repair if necessary.

AFTER REPAIR	Clear the stored faults. Deal with any other faults. Check that the system is operating correctly.

GETtheMANUALS.org

DF013 PRESENT	INCORRECT CONFIGURATION OF AUDIO EQUIPMENT

NOTES	**None.**

Configure the Hands-Free Kit computer by running command **VP011 Computer calibration and commissioning** (see **Configurations and programming**).
Following configuration, switch the ignition off and then back on for the configurations to register.

AFTER REPAIR	Clear the stored faults. Deal with any other faults. Check that the system is operating correctly.

GETtheMANUALS.org

DF014 PRESENT	INCORRECT DISPLAY CONFIGURATION

NOTES	**None.**

Configure the Hands-Free Kit computer by running command **VP011 Computer calibration and commissioning** (see **Configurations and programming**).
Following configuration, switch the ignition off and then back on for the configurations to register.

AFTER REPAIR	Clear the stored faults. Deal with any other faults. Check that the system is operating correctly.

GETtheMANUALS.org

DF015 PRESENT	COMPUTER CONFIGURATION 1.DEF: blank or incomplete configuration

NOTES	**None.**

Configure the Hands-Free Kit computer by running command **VP011 Computer calibration and commissioning** (see **Configurations and programming**).
Following configuration, switch the ignition off and then back on for the configurations to register.

AFTER REPAIR	Clear the stored faults. Deal with any other faults. Check that the system is operating correctly.

GETtheMANUALS.org

DF016 PRESENT OR STORED	COMPUTER 1.DEF: inconsistencies in computer software

NOTES	**Priority in the event of a number of faults:** Firstly, deal with fault **DF003 Computer supply voltage**, if it is present or stored.

If the fault is stored, clear the fault, switch off the ignition and disconnect the computer's supply fuse (see wiring diagram).
Reconnect the fuse and switch on the ignition again (forced + after ignition feed).

If the fault reappears as **stored** when ignition is switched on, check the **connection, condition and conformity** of the Hands-Free Kit computer connectors and their clips.
Repair if necessary.

Disconnect the Hands-Free Kit computer 40-track connector and check the conformity of the electrical supplies (they must be the same as the battery voltage).
In the event of a fault, check the **insulation, continuity and the absence of interference resistance** on the following connections:

Hands-Free Kit computer 40-track connector

Track 9	→	**Earth**
Track 4	→	**+ 12 V before ignition feed**
Track 6	→	**+ 12 V accessories feed**
Track 7	→	**+ 12 V after ignition feed**

Repair if necessary.

If the fault is present or if it cannot be dealt with, fill in the **fault finding log** and contact the **Techline**.

AFTER REPAIR	If the computer was replaced (**at the request of the Techline**): reconfigure the computer (see **Configurations and programming**). Deal with any other faults.

GETtheMANUALS.org

NOTES	Carry out this conformity check after a full check using the diagnostic tool (fault reading and configuration checks). **Conditions of use:** ignition on.

MAIN COMPUTER STATUSES AND PARAMETERS

Order	Function	Parameter or Status checked or Action		Display and notes	Fault finding

GETtheMANUALS.org

ET002	RADIO ON SIGNAL

NOTES	**Special notes:** **ET002 RADIO ON SIGNAL** has two specifications: – present, – absent.

PN6 auditorium radio

This signal activates the Hands-Free Kit (except with + Accessories feed) and therefore starts up the audio system. It passes between the Hands-Free Kit computer and the radio.

If the signal is **Absent** when the radio is switched on, disconnect the Hands-Free Kit computer 40-track connector and the top of the range radio black 15-track PN6 connector to check the **insulation, continuity and absence of interference resistance** of the connection:

Hands-Free Kit computer 40-track connector		**Top of the range radio Black 15-track connector**
Track 18	→	**Track 8**

Repair if necessary.

NR5 mid-range radio

This signal activates the Hands-Free Kit (outside + accessories feed) thereby turning on the audio system; the signal passes between the Hands-Free Kit computer and the radio.

If the signal is **Absent** when the radio is switched on, disconnect the 40-track Hands-Free Kit computer connector and the middle of the range black/yellow 6-track NR5 radio connector to check the **insulation, continuity and absence of interference resistance** on the following connections:

Hands-Free Kit computer 40-track connector		**Mid-range radio Yellow 6-track connector**
Track 18	→	**Track 5**

Repair if necessary.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET003	+ 12 V AFTER IGNITION

NOTES	**Special notes:** The **ET003 + 12 V after ignition feed** has two specifications: – present, – absent. If the status is absent when ignition is switched on, apply the interpretation for this status.

The **+ 12 V** after ignition feed to the Hands-Free Kit computer is supplied via track 7 of the 40-track connector.
With the ignition switched on, check the presence and conformity of the **+ 12 V** after ignition feed on track 7 of the Hands-Free Kit computer.
If the feed is not correct:
– check the 20A F28 fuse located in the passenger compartment fuse and relay box (replace it if necessary),
– use the universal bornier to check the **insulation, continuity and the absence of interference resistance** on the following connection:

Passenger compartment fuse and relay box
White 18-track green clip connector, Track 3
→
40-track Hands-Free Kit computer connector, track 7

Repair if necessary.

Reconnect the passenger compartment fuse and relay box and connectors and the Hands-Free Kit computer connectors.

If the fault is still present, carry out fault finding on the charge circuit.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET004	+ 12 V ACCESSORIES

NOTES	**Special notes:** **ET004 + 12 V accessories feed** has two specifications: – present, – absent. If the status is absent when ignition is switched on, apply the interpretation for this status.

The **+ 12 V** accessories feed to the Hands-Free Kit computer is supplied via track 6 of the 40-track connector.
With the ignition switched on, check the presence and conformity of the **+ 12 V** accessories feed on track 6 of the Hands-Free Kit computer.
If the feed is not correct:
– check the 10 A F23 fuse located in the passenger compartment fuse and relay box (replace it if necessary).
– use the universal bornier to check the **insulation, continuity and the absence of interference resistance** on the following connection:

Passenger compartment fuse and relay box **Black 27-track connector, track 7**	→	**Hands-Free Kit computer** Track 6, 40-track connector

Repair if necessary.

Reconnect the passenger compartment fuse and relay box and connectors and the Hands-Free Kit computer connectors.

If the fault is still present, carry out fault finding on the charge circuit.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET006	+ BUTTON

NOTES	**Special notes:** **ET006 + button** has two specifications: – pressed, – released. If the specification of the status is not the same as the action on the button, apply this fault finding procedure. For the allocation of the satellite tracks (see the Allocation of computer tracks section).

Disconnect the connector from the satellite control and run the following check using an ohmmeter:
- **+** button pressed: continuity (**R < 150 Ω**) between track **A1** and track **B1**,
- **+** button released: no continuity between track **A1** and track **B1**,

If the button does not operate as indicated, replace the radio satellite control.

If the satellite control is operating correctly, disconnect the Hands-Free Kit computer 40-track connector to check **the insulation, continuity and absence of interference resistance** on the following connections:

Hands-Free Kit computer 40-track connector		**Radio satellite control**
Track 20	→	**Track B1**
Track 25	→	**Track A1**

Repair if necessary.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET007	- BUTTON

NOTES	**Special notes:** **ET007 - button** has two specifications: – pressed, – released. If the specification of the status is not the same as the action on the button, apply this fault finding procedure. For the allocation of the satellite tracks (see the Allocation of computer tracks section).

Disconnect the connector from the satellite control and run the following check using an ohmmeter:
– **-** button pressed: continuity (**R < 150 Ω**) between track **B3** and track **B1**,
– **-** button released: no continuity between track **B3** and track **B1**,
If the button does not operate as indicated, replace the radio satellite control.

If the satellite control is operating correctly, disconnect the Hands-Free Kit computer 40-track connector to check **the insulation, continuity and absence of interference resistance** on the following connections:

Hands-Free Kit computer 40-track connector		**Radio satellite control**
Track 20	→	**Track B1**
Track 23	→	**Track B3**

Repair if necessary.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET008	TOP BUTTON

NOTES	**Special notes:** **ET008 Upper button** has two specifications: – pressed, – released. If the specification of the status is not the same as the action on the button, apply this fault finding procedure.
	Note: The upper button has the words Audio Source on it (button near to the steering wheel). For the allocation of the satellite tracks (see the Allocation of computer tracks section).

Disconnect the connector from the satellite control and run the following check using an ohmmeter:
- Upper button pressed: continuity (**R < 150 Ω**) between track **B3** and track **B2**,
- Upper button released: no continuity between track **B3** and track **B2**.

If the button does not operate as indicated, replace the radio satellite control.

If the satellite control is operating correctly, disconnect the Hands-Free Kit computer 40-track connector to check **the insulation, continuity and absence of interference resistance** on the following connections:

Hands-Free Kit computer 40-track connector		**Radio satellite control**
Track 23	→	**Track B3**
Track 22	→	**Track B2**

Repair if necessary.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET009	TOP BUTTON

NOTES	**Special notes:** The **ET009 Top button** has two specifications: – pressed, – released. If the specification of the status is not the same as the action on the button, apply this fault finding procedure. For the allocation of the satellite tracks (see the Allocation of computer tracks section). Note: The top button is the button with a telephone symbol.

Disconnect the connector from the satellite control and run the following check using an ohmmeter:
- Top button pressed: continuity (**R < 150 Ω**) between track **A3** and track **B2**,
- Top button released: no continuity between track **A3** and track **B2**.

If the button does not operate as indicated, replace the radio satellite control.

If the satellite control is operating correctly, disconnect the Hands-Free Kit computer 40-track connector to check **the insulation, continuity and absence of interference resistance** on the following connections:

Hands-Free Kit computer 40-track connector		**Radio satellite control**
Track 21	→	**Track A3**
Track 22	→	**Track B2**

Repair if necessary.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET010	LOWER BUTTON

NOTES	**Special notes:** **ET010 Lower button** has two specifications: – pressed, – released. If the specification of the status is not the same as the action on the button, apply this fault finding procedure. For the allocation of the satellite tracks (see the Allocation of computer tracks section).
	Note: The lower button is the lower button on the satellite control.

Disconnect the connector from the satellite control and run the following check using an ohmmeter:
- Lower button pressed: continuity (**R < 150 Ω**) between track **A3** and track **B1**,
- Lower button released: no continuity between track **A3** and track **B1**.

If the button does not operate as indicated, replace the radio satellite control.

If the continuity on the satellite control is correct when a button is pressed, disconnect the Hands-Free Kit computer 40-track connector to check the insulation, continuity and absence of interference resistance on the following connections:

Hands-Free Kit computer 40-track connector		**Radio satellite control**
Track 21	→	**Track A3**
Track 20	→	**Track B1**

Repair if necessary.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET011	TUMBLEWHEEL ACTION

NOTES	**Special notes:** **ET011 Tumblewheel action** has three specifications: – inactive, – upwards, – downwards, If the status specification is inactive when the tumblewheel is activated, apply the interpretation of this status. For the allocation of the satellite tracks (see the Allocation of computer tracks section).

Check the operation of the satellite control by referring to Steering wheel control in Section 86A of the Electrical equipment MR.

- Tumblewheel 1st position: continuity (**R = 1.5 Ω ± 0.5**) between track **A3** and track **A2**,
- Tumblewheel 2nd position: continuity between track **B3** and track **A2**,
- Tumblewheel 3rd position: continuity between track **A1** and track **A2**,

If the button does not operate as indicated, replace the radio satellite control.

If the satellite control is operating correctly, disconnect the Hands-Free Kit computer 40-track connector to check **the insulation, continuity and absence of interference resistance** on the following connections:

Hands-Free Kit computer 40-track connector		**Radio satellite control**
Track 24	→	**Track A2**
Track 21	→	**Track A3**
Track 23	→	**Track B3**
Track 25	→	**Track A1**

Repair if necessary.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET013	COMMUNICATION CONNECTION BUTTON

NOTES	**Special notes:** **ET013 Communication connection button** has two specifications: – pressed, – released. If the specification of the status is not the same as the action on the button, apply this fault finding procedure.
	Note: The communication connection button is located on the end of the lighting stalk.

Disconnect the Hands-Free Kit computer 40-track connector to check the insulation, continuity and absence of interference resistance on the following connection:

Hands-Free Kit computer 40-track connector		**Lighting stalk black 3-track connector**
Track 17	→	**Track 2**

Repair if necessary.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET014	TELEPHONE

NOTES	**Special notes:** **ET014 Telephone** has two specifications: – present, – absent. If the specification of the status is not the same as the status of the system, apply this fault finding procedure.
	Note: This status is only active if the telephone is in its cradle.

Check the status and connection of the 14-track base plate connector. Repair if necessary.
Check the condition of the contacts between the vehicle base plate and the telephone cradle. Replace the base plate or the cradle if necessary.
If the fault is still present, check that the telephone is operating.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET015	PIN CODE

NOTES	**Special notes:** **ET015 PIN code** has two specifications: – valid, – incorrect. If the specification of the status is not the same as the status of the system, apply this fault finding procedure.
	Note: This status is only active if the telephone is in its cradle.

Make sure that the PIN code entered in the telephone is correct.
If not, re-enter the correct PIN code.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET016	TELEPHONE NETWORK

NOTES	**Special notes:** **ET016 Telephone network** has two specifications: – present, – absent. If the specification of the status is not the same as the status of the system, apply this fault finding procedure.
	Note: – This status is only active if the telephone is in its cradle. – Check on the telephone that the telephone network is present (bargraph on the telephone). If the telephone cannot detect the network, change position before interpreting this status.

Fit the **Elé. 1737** test adapter in the place of the telephone cradle to check the aerial connection: Adapter warning light is green: the connection is fine. Adapter warning light is red: the connection is incorrect.
If the adapter warning light is red, check the insulation, **continuity and absence of interference resistance** on the connection between the aerial and the vehicle base plate. Note: This connection is ensured by a coaxial cable that joins the aerial directly to the base plate.
If the status does not operate as indicated, check the condition of the contacts between the base plate on the vehicle and the telephone cradle
If the fault is still present, check that the telephone is operating.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET021	TELEPHONE OPERATION

NOTES	**Special notes:** **ET021 Telephone operation** has two specifications: – on, – off. If the specification of the status is not the same as the status of the system, apply this fault finding procedure.
	Note: – This status is only active if the telephone is in its cradle. – Check the operation of the telephone before interpreting this status.

If the status does not operate as indicated, check the condition of the contacts between the base plate on the vehicle and the telephone cradle
If the fault is still present, check that the telephone is operating.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

Tool parameter	Diagnostic tool title
PR001	Telephone signal
PR003	Battery voltage
PR004	Vehicle speed

GETtheMANUALS.org

PR001	TELEPHONE SIGNAL

NOTES	**Special notes:** – This parameter only operates if the telephone is in its cradle. – Check on the telephone that the telephone network is indeed present (bargraphs on the telephone). If the system is not detected by the telephone, change position before interpreting this parameter.

Fit the **Elé. 1737** test adapter in the place of the telephone cradle to check the aerial connection:
Adapter warning light is green: the connection is fine.
Adapter warning light is red: the connection is incorrect.

If the adapter warning light is red, check the insulation, **continuity and absence of interference resistance** on the connection between the aerial and the vehicle base plate.
Note:
This connection is ensured by a coaxial cable that joins the aerial directly to the base plate.

If the parameter does not operate as indicated in the conformity check, check the condition of the contacts between the vehicle base plate and the telephone cradle.

If the fault is still present, check that the telephone is operating.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

PR003	BATTERY VOLTAGE

NOTES	None

Check the conformity of the battery voltage (**10 V < X < 14.4 V**).
If the voltage is not correct, run fault finding on the battery and the charge circuit.

Check that the fuses are in good condition: F23 of 10A (+ 12 V accessories feed), F28 of 20A (+ 12 V after ignition feed) and F50 of 20A (+ 12 V before ignition feed): see wiring diagram.

Check the **connection, condition and conformity** of the Hands-Free Kit computer connectors and their clips.
Repair if necessary.

Disconnect the Hands-Free Kit computer 40-track connector and check the conformity of the electrical supplies (they must be the same as the battery voltage).
In the event of a fault, check the **insulation, continuity and the absence of interference resistance** on the following connections:

- Computer connector **Track 9** → **Earth**
- Computer connector **Track 4** → **+ 12 V before ignition feed** (see vehicle diagram)
- Computer connector **Track 6** → **+ 12 V accessories feed** (see vehicle diagram)
- Computer connector **Track 7** → **+ 12 V after ignition feed** (see vehicle diagram)

Repair if necessary.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

PR004	VEHICLE SPEED

NOTES	None

If this parameter is inconsistent, carry out fault finding on the ABS system.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

Tool command	Diagnostic tool title
RZ001	Fault memory
AC001	Telephone ring tone
AC002	High-pitched tone
AC003	Low-pitched tone
VP001	Enter last After-Sales service date
VP002	Write VIN
VP004	Microphone test
VP005	Serial connections test
VP006	Audio connections test
VP011	Computer calibration and commissioning

GETtheMANUALS.org

AC001	TELEPHONE RING TONE

NOTES	**Special notes:** With the ignition on, this command is accessible in the tool's fault finding mode (actuator command tab).

The telephone ring tone should be heard during this command.
Running this command confirms the connections between the Hands-Free Kit computer, the radio and the speakers.

PN6 auditorium radio

If, during this command, the telephone's ring tone cannot be heard, disconnect the **40-track** Hands-Free Kit computer connector and the **transparent, 15-track** top of the range radio connector to check **the insulation, continuity and absence of interference resistance** on the following connections:

Hands-Free Kit computer 40-track connector		**Top of the range radio 15-track connector**
Track 35	→	**Track 28**
Track 36	→	**Track 30**
Track 37	→	**Track 29**

Repair if necessary.

NR5 mid-range radio

If, during this command, the telephone's ring tone cannot be heard, disconnect the **40-track** Hands-Free Kit computer connector and the **green 6-track** NR5 radio connector to check **the insulation, continuity and absence of interference resistance** on the following connections:

Hands-Free Kit computer 40-track connector		**NR5 radio Green 6-track connector**
Track 35	→	**Track 7**
Track 36	→	**Track 5**
Track 38	→	**Track 9**

Repair if necessary.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC001 **CONTINUED**	

If the command remains mute after this step, check the continuity of the connections between the top of the range radio and the speakers by operating the radio. If it remains mute, disconnect the radio ISO B 8-track connector to check the insulation, continuity and absence of interference resistance on the following connections:

Top of the range radio 8-track connector		**Speakers**
Track 1	→	**+ rear right-hand**
Track 2	→	**- rear right-hand**
Track 3	→	**+ front right-hand**
Track 4	→	**- front right-hand**
Track 5	→	**+ front left-hand**
Track 6	→	**- front left-hand**
Track 7	→	**+ rear left-hand**
Track 8	→	**- rear left-hand**

Repair if necessary.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC002	HIGH-PITCHED TONE

NOTES	**Special notes:** With the ignition on, this command is accessible in the tool's fault finding mode (actuator command tab).

A high-pitched tone should be heard during this command.
Running this command confirms the connections between the Hands-Free Kit computer, the radio and the speakers.

PN6 auditorium radio

If, during this command, the telephone's ring tone cannot be heard, disconnect the **40-track** Hands-Free Kit computer connector and the **transparent, 15-track** top of the range radio connector to check **the insulation, continuity and absence of interference resistance** on the following connections:

Hands-Free Kit computer 40-track connector		**Top of the range radio 15-track connector**
Track 35	→	**Track 28**
Track 36	→	**Track 30**
Track 37	→	**Track 29**

Repair if necessary.

NR5 mid-range radio

If, during this command, the telephone's ring tone cannot be heard, disconnect the **40-track** Hands-Free Kit computer connector and the **green 6-track** NR5 radio connector to check **the insulation, continuity and absence of interference resistance** on the following connections:

Hands-Free Kit computer 40-track connector		**NR5 radio Green 6-track connector**
Track 35	→	**Track 7**
Track 36	→	**Track 5**
Track 38	→	**Track 9**

Repair if necessary.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC002 **CONTINUED**	

If the command remains mute after this step, check the continuity of the connections between the top of the range radio and the speakers by operating the radio. If it remains mute, disconnect the radio ISO B 8-track connector to check the insulation, continuity and absence of interference resistance on the following connections:

Top of the range radio 8-track connector		**Speakers**
Track 1	→	**+ rear right-hand**
Track 2	→	**- rear right-hand**
Track 3	→	**+ front right-hand**
Track 4	→	**- front right-hand**
Track 5	→	**+ front left-hand**
Track 6	→	**- front left-hand**
Track 7	→	**+ rear left-hand**
Track 8	→	**- rear left-hand**

Repair if necessary.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC003	LOW-PITCHED TONE

NOTES	**Special notes:** With the ignition on, this command is accessible in the tool's fault finding mode (actuator command tab).

A low-pitched tone should be heard during this command.
Running this command confirms the connections between the Hands-Free Kit computer, the radio and the speakers.

PN6 auditorium radio

If, during this command, the telephone's ring tone cannot be heard, disconnect the **40-track** Hands-Free Kit computer connector and the **transparent, 15-track** top of the range radio connector to check **the insulation, continuity and absence of interference resistance** on the following connections:

Hands-Free Kit computer 40-track connector		**Top of the range radio 15-track connector**
Track 35	→	**Track 28**
Track 36	→	**Track 30**
Track 37	→	**Track 29**

Repair if necessary.

NR5 mid-range radio

If, during this command, the telephone's ring tone cannot be heard, disconnect the **40-track** Hands-Free Kit computer connector and the **green 6-track** NR5 radio connector to check the **insulation, continuity and absence of interference resistance** on the following connections:

Hands-Free Kit computer 40-track connector		**NR5 radio Green 6-track connector**
Track 35	→	**Track 7**
Track 36	→	**Track 5**
Track 38	→	**Track 9**

Repair if necessary.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC003 **CONTINUED**	

If the command remains mute after this step, check the continuity of the connections between the top of the range radio and the speakers by operating the radio. If it remains mute, disconnect the radio ISO B 8-track connector to check the insulation, continuity and absence of interference resistance on the following connections:

Top of the range radio 8-track connector		**Speakers**
Track 1	→	**+ rear right-hand**
Track 2	→	**- rear right-hand**
Track 3	→	**+ front right-hand**
Track 4	→	**- front right-hand**
Track 5	→	**+ front left-hand**
Track 6	→	**- front left-hand**
Track 7	→	**+ rear left-hand**
Track 8	→	**- rear left-hand**

Repair if necessary.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

VP004	MICROPHONE TEST

NOTES	**Special notes:** With the ignition on, this command is accessible in the tool's repair mode (parameter setting tab). To perform this test, the technician must be seated in the driver's seat and speak **normally**.

Running this command confirms the following connections:

HFK computer ⟶ Microphone ⟶ HFK computer

The electrical connections comply if the test result displays a percentage which is equal to or above 4. If the test result displays a percentage of less than 4:
Disconnect the **40-track** Hands-Free Kit computer connector as well as the **6-track** microphone connector in order to check the **insulation, continuity and absence of interference resistance** on the following connections:

Hands-Free Kit computer 40-track connector		**Microphone 6-track connector**
Track 28	⟶	**Track 2**
Track 29	⟶	**Track 1**

Repair if necessary.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

VP005	SERIAL CONNECTIONS TEST

NOTES	**Special notes:** With the ignition on, this command is accessible in the tool's repair mode (parameter setting tab).

Running this command confirms the following serial connections:

HFK computer → Telephone base plate → Test adapter → Telephone base plate → HFK computer

Before running this command, fit the test adapter (Elé. 1737) in the place of the telephone cradle.
When running this command, the Hands-Free Kit sends data via the serial connections. This data is looped back to the base plate by the test adapter, and sent on to the Hands-Free Kit which analyses it.
This data cannot be displayed. The electrical connections comply if the test result displays: **CORRECT**.
If the test result displays: **INCORRECT**, disconnect the **24-track** Hands-Free Kit computer connector as well as the **14-track** telephone cradle base plate connector in order to check the **insulation, continuity and absence of interference resistance** on the following connections:

Hands-Free Kit computer 24-track connector		**Telephone base plate 14-track connector**
Track 17	→	**Track 8**
Track 18	→	**Track 9**
Track 21	→	**Track 13**
Track 22	→	**Track 14**

Repair if necessary.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

VP006	AUDIO CONNECTIONS TEST

NOTES	**Special notes:** With the ignition on, this command is accessible in the tool's repair mode (parameter setting tab).

Running this command confirms the following audio connections:

HFK → telephone base plate → Test adapter → telephone base plate → HFK → Radio → Speakers

Before running this command, fit the test adapter (Elé. 1737) in the place of the telephone cradle.
This command is confirmed by a sound from the speakers: if it is absent, carry out a continuity check on the system component connections:
Disconnect the **24-track** Hands-Free Kit computer connector as well as the **14-track** telephone cradle base plate connector in order to check for **the insulation, continuity and absence of interference resistance** on the following connections:

Hands-Free Kit computer 24-track connector		**Telephone base plate 14-track connector**
Track 3	→	**Track 2**
Track 4	→	**Track 11**
Track 6	→	**Track 3**
Track 7	→	**Track 12**

Repair if necessary.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

COMMUNICATION FAULT

NO DIALOGUE WITH THE COMPUTER — **ALP 1**

GETtheMANUALS.org

ALP1	No dialogue with the computer

NOTES	Before applying this procedure, check that the radio is working.

Check the conformity of the battery voltage (**10 V < X < 14.4 V**).
If the voltage is not correct, run fault finding on the battery and the charge circuit.

Check that the fuses are in good condition: F23 of 10A (+ 12 V accessories feed), F28 of 20A (+ 12 V after ignition feed) and F50 of 20A (+ 12 V before ignition feed): see wiring diagram.

Check:
– the connection between the diagnostic tool and the diagnostic sensor (lead in good condition),
– the connection between the diagnostic head and the diagnostic socket (wiring in good condition).
Repair if necessary.

Check that there is **+ 12 V before ignition feed** on **track 16**, **+ 12 V after ignition feed** on **track 1** and an earth on **tracks 4 and 5** of the vehicle's diagnostic socket.
Repair if necessary.

Test the diagnostic tool on another vehicle (to make sure the tool is not the problem).
Repair if necessary.

Check **the continuity, insulation and absence of interference resistance** on the connections to check the conformity of the Hands-Free Kit computer feeds and earths.

40-track HFK computer connector

Track 6	→	**+ 12 V accessories feed**
Track 4	→	**+ 12 V battery feed**
Track 7	→	**+ 12 V after ignition feed**
Track 9	→	**Earth**
Track 11	→	**Radio (see diagram for the radio fitted on the vehicle)**
Track 14	→	**Radio (see diagram for the radio fitted on the vehicle)**
Radio (see diagram for the radio fitted on the vehicle)	→	**Track 12 (diagnostic socket)**
	→	**Track 13 (diagnostic socket)**

Repair if necessary.

If the fault is still present, contact the Techline.

1. SCOPE OF THIS DOCUMENT

This document presents the fault finding procedure applicable to all computers with the following specifications:

Vehicle: **Espace IV phase 2** *Function concerned:* **Navigation, hands-free telephone integrated control, tuner-amplifier, CD changer**	*Name of computer:* **ITS** ***Program No.:*** *0020* ***Vdiag No.:*** *04*

2. PREREQUISITES FOR FAULT FINDING

Documentation type

Fault finding procedures (this document):
- Assisted fault finding (integrated into the diagnostic tool), Dialogys.

Wiring Diagrams:
- Visu-Schéma (CD-ROM), paper.

Type of diagnostic tools
- **CLIP**

Special tooling required

3. REMINDERS

Procedure

In order to save energy, the Espace IV Phase 2 UCH cuts off the + after ignition feed after 3 minutes.

To run fault finding on a computer, it is possible to force the + after ignition feed on for 1 hour by applying the following procedure:
- Press the card unlocking button,
- insert the card in the reader,
- press the Start button (interrupting the timed + after ignition feed mode),
- press and hold the start button for over 5 seconds until the engine immobiliser warning light starts to flash rapidly (4 Hz).

This forced + after ignition feed mode remains on for 1 hour.
- Pressing the Start button or removing the card from the card reader cuts off the + after ignition feed but does not cut off the forced after ignition feed timed mode. Until one hour has elapsed, activating the + after ignition feed will restart forced + after ignition feed for the remaining time.

GETtheMANUALS.org

Faults

Faults are declared present or stored (depending on whether they appeared in a certain context and have disappeared since, or whether they remain present but are not diagnosed within the current context).

The **present** or **stored** status of faults should be taken into consideration when the diagnostic tool is switched on following + after ignition feed being activated (without any system components being active).

For a **present fault**, apply the procedure described in the **Interpretation of faults** section.

For a **stored fault**, note the faults displayed and apply the **Notes** section.

If the fault is **confirmed** when the instructions in the Notes section are applied, the fault is present. Deal with the fault.

If the fault is **not confirmed**, check:
- the electrical lines which correspond to the fault,
- the connectors for these lines (for oxidation, bent pins, etc.),
- the resistance of the component detected as faulty,
- the condition of the wires (melted or split insulation, wear).

Conformity check

The aim of the conformity check is to check data that does not produce a fault on the diagnostic tool because it is inconsistent. Therefore, this stage is used to:

- carry out fault finding on faults that do not have a fault display, and which may correspond to a customer complaint.
- check that the system is operating correctly and that there is no risk of a fault recurring after repairs.

This section gives the fault finding procedures for statuses and parameters and the conditions for checking them.

If a status is not behaving normally or a parameter is outside the permitted tolerance values, consult the corresponding fault finding page.

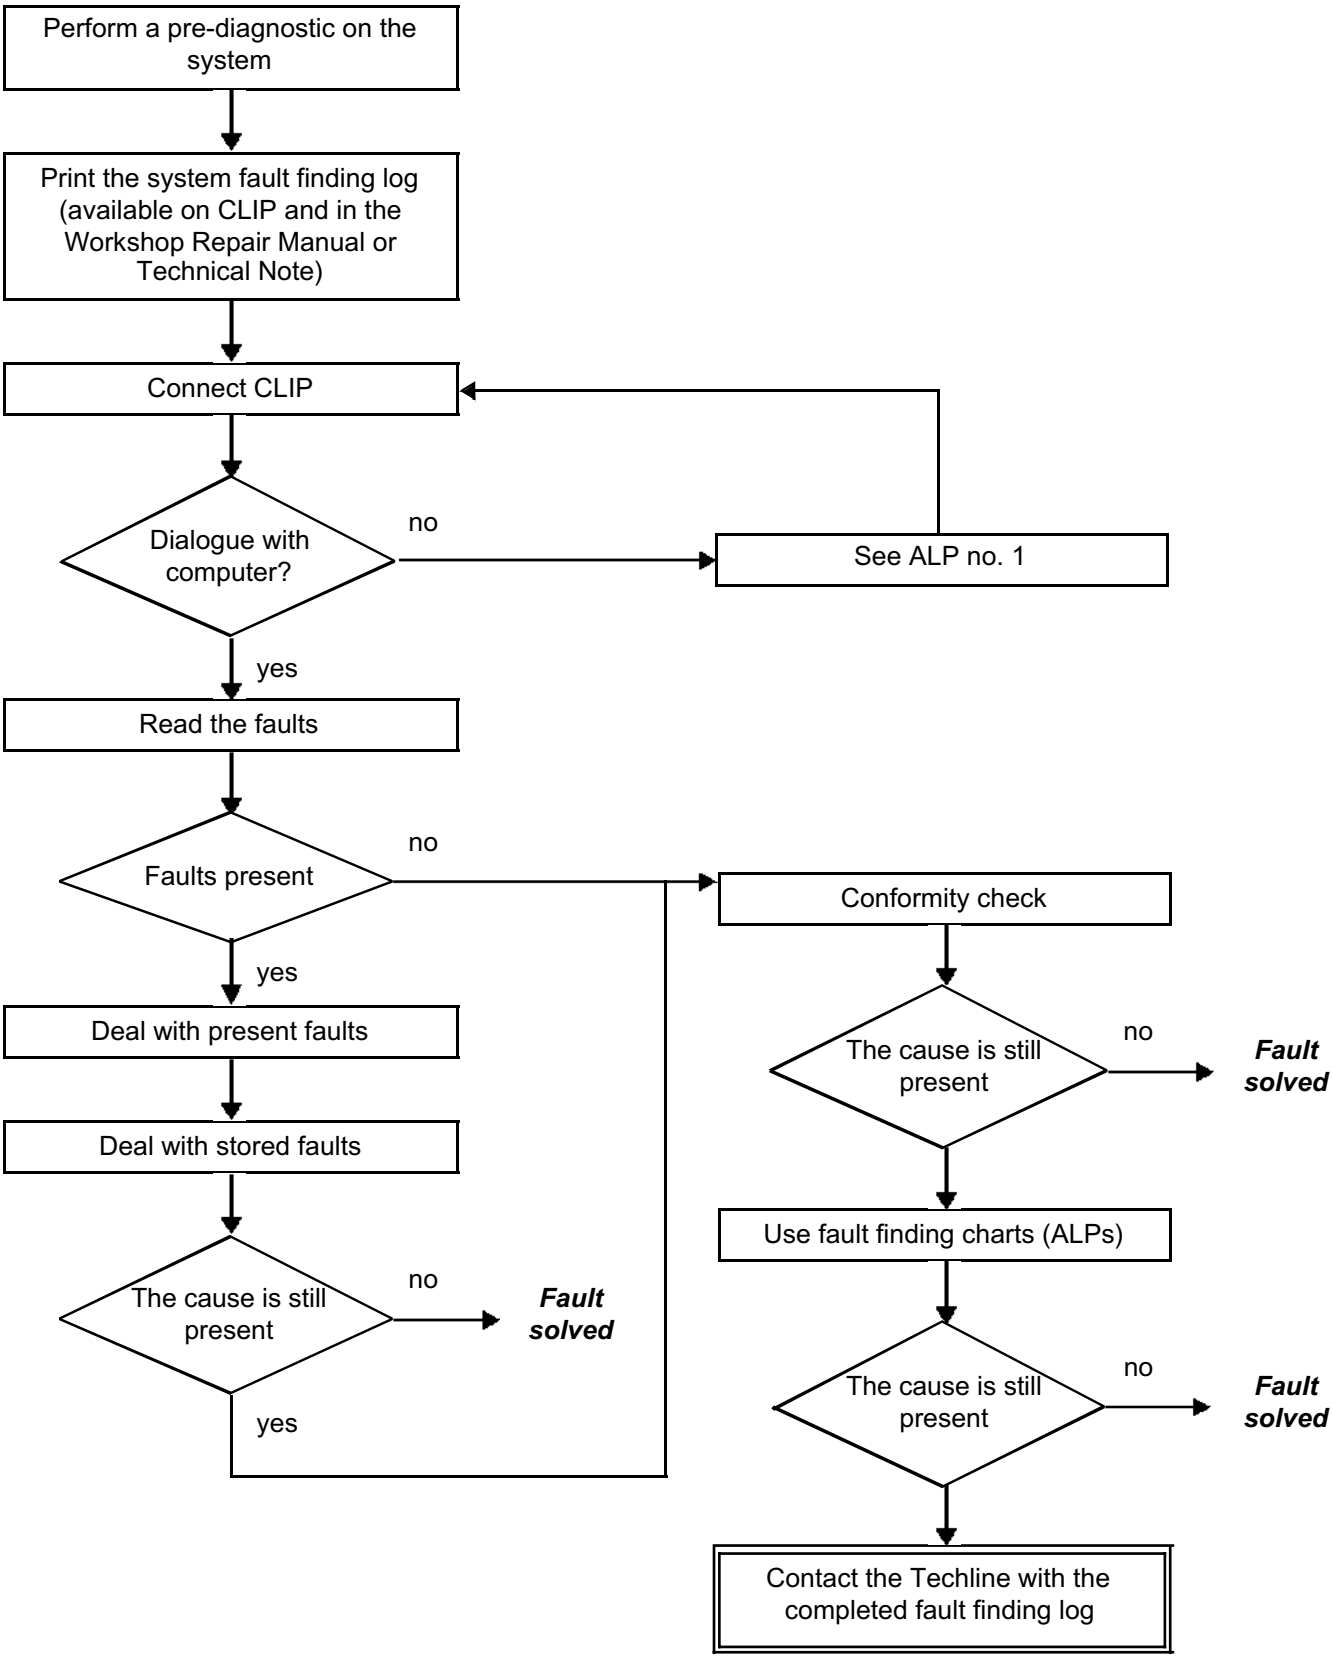
Customer complaints - Fault finding chart

If the test with the diagnostic tool is OK but the customer complaint is still present, the fault should be processed by **Customer complaints**.

A synopsis of the general procedure to follow is provided on the following page in the form of a flow chart.

GETtheMANUALS.org

4. FAULT FINDING PROCEDURE



GETtheMANUALS.org

4. FAULT FINDING PROCEDURE (continued)

Wiring check

Fault finding problems
Disconnecting the connectors and/or manipulating the wiring may temporarily remove the cause of a fault.
Electrical measurements of voltage, resistance and insulation are generally correct, especially if the fault is not present when the analysis is made (stored fault).

Visual inspection
Look for damage under the bonnet and in the passenger compartment.
Carefully check the fuses, insulators and wiring harness routing.
Look for signs of oxidation.

Physical inspection
While manipulating the wiring, use the diagnostic tool to note any change in fault status from stored to present.
Make sure that the connectors are properly locked.
Apply light pressure to the connectors.
Twist the wiring harness.
If there is a change in status, try to locate the source of the fault.

Inspection of each component
Disconnect the connectors and check the appearance of the clips and tabs, as well as the crimping (no crimping on the insulating section).
Make sure that the clips and tabs are properly locked in the sockets.
Check that no clips or tabs have been dislodged during connection.
Check the clip contact pressure using an appropriate model of tab.

Continuity, insulation and resistance check
Check the continuity of entire lines, then section by section.
Look for a short circuit to earth, to **+ 12 V** or with another wire.

If a fault is detected, repair or replace the wiring harness.

GETtheMANUALS.org

5. FAULT FINDING LOG

IMPORTANT!

IMPORTANT
Any fault on a complex system requires thorough fault finding with the appropriate tools. The FAULT FINDING LOG, which should be completed during the fault finding procedure, ensures a record is kept of the procedure carried out. It is an essential document when consulting the manufacturer.

IT IS THEREFORE MANDATORY TO FILL OUT A FAULT FINDING LOG EACH TIME FAULT FINDING IS CARRIED OUT.

You will always be asked for this log:

- when requesting technical assistance from Techline,
- for approval requests when replacing parts for which approval is mandatory,
- to be attached to monitored parts for which reimbursement is requested. The log is needed for warranty reimbursement, and enables better analysis of the parts removed.

6. SAFETY INSTRUCTIONS

Safety rules must be observed during any work on a component to prevent any damage or injury:

- check the battery voltage to avoid incorrect operation of computer functions,
- use the proper tools.

GETtheMANUALS.org

The "**CARMINAT NAVIGATION** and **COMMUNICATION**" system corresponds to the "top of the range" navigation system on Espace IV ph2. This system is also called ITS (ITS: **I**ntelligent **T**ransport **S**ystem).
The navigation computer for this system combines the functions of the Central Communications Unit and the Hands-Free Telephone Integrated Control computer (Modified Hands-free Kit).

General operation

The **CARMINAT NAVIGATION** and **COMMUNICATION** system is involved in the following functions:
– Tuner-amplifier.
– CD multi-changer.
– Satellite guidance navigation.
– Hands-free telephone integrated control.
– Display.
– External thermometer.
– Clock.

1 - Tuner-amplifier

This function is used for listening to AM and FM radio. The tuner-amplifier automatically selects the best frequency for a station using the AF function. It receives road traffic information via the TMC function to optimise the CARMINAT NAVIGATION and COMMUNICATION system guidance.

2 - CD multi-changer

The CD multi-changer located on the dashboard can hold up to 6 CDs. It can play audio CDs, CD-Rs recorded by the customer and MP3 CDs. The number of CDs in the changer is visible using parameter **PR005 Number of CDs in the changer**.

3 - Navigation

This function guides the driver by displaying maps and issuing voice messages. Addresses for guidance can be entered via the central control or as voice commands.

4 - Hands-free telephone integrated control

This function enables the driver to use a mobile phone hands-free using the microphone located next to the driver's sun visor and the vehicle speakers. The CARMINAT NAVIGATION and COMMUNICATION system can be used to access the telephone directory, to receive and send calls and to receive SMS text messages. The telephone can be connected to the vehicle using Bluetooth.

5 - Display

The display is used to display information such as navigation maps, radio, CD title, time, temperature and information from the mobile phone

GETtheMANUALS.org

For removal/refitting of this computer (see **MR 405 Mechanical, 83C, Navigation system on-board telematics system: Removal - Refitting**).

Procedures to be carried out before replacing the navigation computer:

1. Before replacing the computer (with the agreement of the Techline), read the faults and carry out a conformity check to ensure that it is definitely faulty.

2. Before removing the computer, clear the customer's data (telephone numbers, customer address book, etc.) using command **RZ003 Parameters and customer data** in the diagnostic tool.

3. After receiving the Techline's approval, remove the computer with the ignition off.

The navigation computers available from the Parts Department are supplied unconfigured and in factory mode (tuner-amplifier set to 162 kHz AM, and it beeps for 2 minutes).

Procedures to be carried out after replacing the navigation computer:

1. Enter the unlocking code for the CARMINAT NAVIGATION and COMMUNICATION system.

– How to obtain the unlocking code for the Carminat Navigation and Communication system

  – switch on the + after ignition feed,
  – switch on the CARMINAT NAVIGATION and COMMUNICATION system,
  – connect the Clip diagnostic tool,
  – note the navigation programming key number given in the **Identification** menu,
  – contact Techline with this navigation programming number to obtain the CARMINAT NAVIGATION and COMMUNICATIONS system unlocking code,
  – the unlocking code is requested 2 mins after the CARMINAT NAVIGATION and COMMUNICATION system comes on,
  – enter this code using the navigation central control.

Note:
If the code is incorrect, you will have to wait between 2 and 32 minutes before you can enter a code again.
Delete the incorrect code before entering the new one.

GETtheMANUALS.org

2. Configure the computer (see **Configurations and Programming**).

– The two configurations to enter are **CF001 Vehicle type** and **VP004 Netherlands legislation**

Note:
(only for vehicles registered in the Netherlands)
If the computer is replaced. Depending on the manufacturing date of the vehicle:
– BEFORE 01 JANUARY 2006, it is essential to run command VP004 “Netherlands Legislation” (LC002 Netherlands)
– AFTER 01 JANUARY 2006, command VP004 Netherlands Legislation (LC002 Except Netherlands) must not be run under any circumstances.

3. Enter the VIN code (see **Dealing with commands**).

– The command for entering the VIN code is **VP002 Write VIN**.

GETtheMANUALS.org

Configurations available and operating mode

– **Vehicle type (CF001):**

This configuration enables the system to identify the vehicle in which it is installed.

– **NETHERLANDS LEGISLATION (VP004):**

IMPORTANT
Running command NETHERLANDS LEGISLATION initialises the computer according to this country's legislation. This configuration is IRREVERSIBLE: it is not possible to clear this selection.

Note:
(only for vehicles registered in the Netherlands)
If the computer is replaced. Depending on the manufacturing date of the vehicle:
– BEFORE 01 JANUARY 2006, it is essential to run command VP004 “Netherlands Legislation” (LC002 Netherlands)
– AFTER 01 JANUARY 2006, command VP004 Netherlands Legislation (LC002 Except Netherlands) must not be run under any circumstances.

List of individual configurations available on the diagnostic tool with the associated configuration reading

Configuration	Configuration reading	Name of configuration	Choice of configuration
CF001	**LC001**	**Vehicle type**	**Vel Satis ph 2/Espace IV Laguna II ph2/Scénic II**
VP004	**LC002**	**Country type**	**Except Netherlands Netherlands**

Procedure to be followed to modify the vehicle type (Netherlands legislation is irreversible)
- Establish dialogue with the computer.
- Select the menu **repair mode**.
- Select the **Write configuration** menu.
- Select the line corresponding to the configuration to be modified.
- Select the line in the drop-down menu that corresponds to the vehicle.
- Click on **Confirm**.
- Exit diagnostic mode (ends dialogue with the computer without switching off the tool), switch off the ignition for 5 seconds and then switch the ignition back on.
- Establish dialogue with the computer.
- In the **Read configuration** menu, check that the configuration has been completed.

Programming

There is no programming on the navigation and communication system tool.

GETtheMANUALS.org

Summary of faults that can be diagnosed by the navigation computer, with corresponding technical center codes.

Tool fault	Associated DTC	Diagnostic tool title

DF001 **DF002** **DF003** **DF004** **DF005** **DF006** **DF007** **DF008** **DF009** **DF010** **PRESENT** **OR** **STORED**	COMPUTER 1.DEF : internal electronic fault

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** Apply this fault finding procedure if the fault reappears as present or stored after it has been cleared and the ignition has been switched off and on again.

If the fault is stored, clear the fault, switch off the ignition and disconnect computer supply fuse F50 (**20A**).
– Refit the fuse and switch the ignition back on.
– Turn on the navigation system.
If the fault reappears as stored, contact Techline.
If the fault does not reappear: operate the navigation system, including the CD multi-changer, the amplifier-tuner and the hands-free telephone integrated control (if present on the vehicle) to check that the system is operating correctly.

Check the conformity of **+ 12 V** on **track 20** of the navigation computer 40-track connector.
Check that the **earth** on **track 40** of the navigation computer 40-track connector is in perfect condition.
Repair if necessary.

If the fault is present, contact your Techline.

AFTER REPAIR	If the computer was replaced (at the request of the Techline), reconfigure the computer (see **Configurations and programming**). Deal with any other faults.

GETtheMANUALS.org

DF021 PRESENT OR STORED	COMPUTER CONFIGURATION 1.DEF: blank or incomplete configuration

NOTES	None.

If the fault is present, carry out the system configurations (see **86C, Configurations and programming**).

After the configuration, switch off the ignition for 5 seconds then switch the ignition back on again.

Check that the configurations have been correctly registered by reading configurations **LC001 Vehicle Type** and **LC002 Country type**.

If the fault is still present, contact the Techline.

If the fault is stored, clear the faults using command **RZ001 Fault memory**.

AFTER REPAIR	Carry out another fault finding check on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF022 PRESENT OR STORED	NO RADIO MULTIPLEX SIGNAL

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** Apply this fault finding procedure if the fault reappears as present or stored after the fault has been cleared, the ignition switched off and back on again and the tuner-amplifier started after several operations.
	If faults **DF022 No radio multiplex fault** and **DF027 No CD multi-changer signal** are both present, check the multimedia multiplex network (see **88B, Multiplex**).

Check the condition and connection of the tuner-amplifier 32-track connector in the glovebox (broken, bent, oxidised tabs).
Repair if necessary.

Check the condition and connection of the navigation central control connector (broken, bent, oxidised tabs).
Repair if necessary.

Check the condition and connection of the navigation computer 32-track connector (broken, bent, oxidised tabs).
Repair if necessary.

Check the **insulation, continuity and the absence of interference resistance** on the following connections:

central control connector **track 5** → **track 17** 32-track tuner-amplifier connector
central control connector **track 11** → **track 18** 32-track tuner-amplifier connector
central control connector **track 6** → **track 18** 32-track navigation computer connector
central control connector **track 12** → **track 2** 32-track navigation computer connector

Repair if necessary.

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out another fault finding check on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF023 PRESENT OR STORED	NO DISPLAY MULTIPLEX SIGNAL 1.DEF: no communication with the display 2.DEF: display malfunction

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** Apply this fault finding procedure if the fault reappears as present or stored after it has been cleared, the ignition turned off and on again and the navigation system started.

1.DEF	***NOTES***	None

Check the condition and connection of the display connector (bent, oxidised, broken tabs).
Repair if necessary.

Check the condition and connection of the navigation computer 32-track connector (broken, bent, oxidised tabs).
Repair if necessary.

Check the **insulation, continuity and the absence of interference resistance** on the following connections:

- display connector **track 4** → **track 25** 32-track navigation computer connector
- display connector **track 5** → **track 28** 32-track navigation computer connector
- display connector **track 8** → **track 23** 32-track navigation computer connector
- display connector **track 9** → **track 29** 32-track navigation computer connector
- display connector **track 10** → **track 11** 32-track navigation computer connector
- display connector **track 11** → **track 27** 32-track navigation computer connector
- display connector **track 12** → **track 12** 32-track navigation computer connector
- display connector **track 15** → **track 26** 32-track navigation computer connector
- display connector **track 16** → **track 10** 32-track navigation computer connector
- display connector **track 22** → **track 14** 32-track navigation computer connector
- display connector **track 23** → **track 30** 32-track navigation computer connector
- display connector **track 24** → **track 15** 32-track navigation computer connector

Repair if necessary.

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out another fault finding check on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF023 CONTINUED	

2.DEF	***NOTES***	None

Check the condition and connection of the display connector (bent, oxidised, broken tabs). Repair if necessary.
With the ignition on, check for **12 V** on **track 14** of the display. Check that the **earth** on **track 13** of the display is in perfect condition. Repair if necessary.
If the fault is still present, replace the display.

AFTER REPAIR	Carry out another fault finding check on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF024 PRESENT OR STORED	INSTRUMENT PANEL MULTIPLEX SIGNAL ABSENT

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** Apply this fault finding procedure if the fault reappears as present or stored after a fault has been cleared and the ignition has been switched off and on again

Carry out a fault finding procedure on the instrument panel (see **83A, Instrument panel**).
Repair if necessary.

Check the condition and connection of the navigation computer 32-track connector (broken, bent, oxidised tabs).
Repair if necessary.

Check the condition and connection of the instrument panel red connector (bent, oxidised, broken tabs).
Repair if necessary.

Check the **insulation, continuity and the absence of interference resistance** on the following connections:

32-track connector of the navigation computer **track 17** → **track 9** red instrument panel connector

32-track connector of the navigation computer **track 1** → **track 8** red instrument panel connector

Repair if necessary.

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out another fault finding check on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF025 PRESENT OR STORED	NO CENTRAL CONTROL MULTIPLEX SIGNAL 1.DEF: no communication with the central control

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** Apply this fault finding procedure if the fault reappears as present or stored after the fault has been cleared, the ignition switched off and back on again and the navigation system started after using the central control several times.
	If faults **DF022 No radio multiplex fault, DF025 No central control multiplex signal** and **DF027 No CD multi-changer audio signal** are all present, check the multimedia network (see **88B, Multiplex**).

Check the condition and connection of the central control connector (broken, bent, oxidised tabs).
Repair if necessary.

Check the condition and connection of the navigation computer 32-track connector (broken, bent, oxidised tabs).
Repair if necessary.

Check the **insulation, continuity and the absence of interference resistance** on the following connections:
central control connector **track 6** → **track 18** 32-track navigation computer connector
central control connector **track 12** → **track 2** 32-track navigation computer connector
Repair if necessary.

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out another fault finding check on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF027 PRESENT OR STORED	NO AUDIO CD CHANGER SIGNALS 1.DEF: no communication with the CD multi-changer keypad

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** Apply this fault finding procedure if the fault reappears as present or stored after the fault has been cleared, the ignition switched off and back on again and the audio system started after using the CD multi-changer several times.
	Order of priority in the event of more than one fault: Deal with fault **DF022 No radio multiplex fault** first.

Check the condition and connection of the CD multi-changer connector (broken, bent, oxidised tabs).
Repair if necessary.

Check the condition and connection of the tuner-amplifier C2 (green) connector (in the glovebox) (broken, bent, oxidised tabs).
Repair if necessary.

Check the **insulation, continuity and the absence of interference resistance** on the following connections:

- CD changer connector **track 1** → **track 20** connector C3 (blue) of the tuner-amplifier
- CD changer connector **track 2** → **track 18** connector C3 (blue) of the tuner-amplifier
- CD changer connector **track 13** → **track 17** connector C3 (blue) of the tuner-amplifier
- CD changer connector **track 14** → **track 19** connector C3 (blue) of the tuner-amplifier

Repair if necessary.

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out another fault finding check on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF029 PRESENT OR STORED	NAVIGATION DVD READER 1.DEF: unreadable disc

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** Apply this fault finding procedure if the fault reappears as present or stored after the fault has been cleared, the ignition switched off and back on again and the navigation system started with a navigation DVD in good condition.

Check that the DVD is inserted the right way up.
Check that the DVD in the navigation computer is not an audio CD or other type but a navigation DVD designed for this navigation system.
Wipe the DVD from the centre out with a soft, clean cloth.
Replace the navigation DVD if it is scratched.

AFTER REPAIR	Carry out another fault finding check on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF030 PRESENT OR STORED	GPS AERIAL CIRCUIT CO : open circuit

NOTES	**Conditions for applying the fault finding procedure to the stored fault:** Apply this fault finding procedure if the fault reappears as present or stored after a fault has been cleared and the ignition has been switched off and on again.

Check the condition and connection of the GPS aerial 2-track connector (bent, oxidised, broken tabs). Repair if necessary.
Check the condition and connection of the navigation computer 2-track connector (broken, bent, oxidised tabs). Repair if necessary.
Check the **insulation, continuity and the absence of interference resistance** on the following connections: 2-track computer connector **track 1** ⟶ **track 1** GPS aerial connector 2-track computer connector **track 2** ⟶ **track 2** GPS aerial connector Repair if necessary.
If the connections are correct, replace the GPS aerial.
If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out another fault finding check on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

NOTES	Only carry out this conformity check after a **complete check** with the diagnostic tool (fault reading and configuration checks). **Application conditions:** Engine stopped, + after ignition feed switched on.

MAIN SCREEN

Order	Function	Parameter or Status Check or Action		Display and Notes	Fault finding
1	**Night-time lighting**	**ET003:**	+ 12 V side lights	**ON** **OFF**	In the event of a fault, refer to the interpretation of status **ET003**.
		PR007:	Night lighting level	**0% < X < 102%** **(max) (min)**	In the event of a fault, consult **the interpretation of parameter PR007**.
2	**Vehicle speed**	**PR002:**	Vehicle speed	**0 mph (0 km/h)**	In the event of a fault, **carry out fault finding on the ABS**.
3	**Reverse gear**	**ET024:**	Reverse gear engaged	**YES** **NO**	In the event of a fault, **refer to the interpretation of status ET024**.
4	**CD multi-changer**	**PR005:**	Number of CDs in the multi-changer	**0, 1, 2, 3, 4, 5 or 6**	None.

GETtheMANUALS.org

NOTES	Only carry out this conformity check after a **complete check** with the diagnostic tool (fault reading and configuration checks). **Application conditions:** Engine stopped, + after ignition feed switched on.

Sub-function: DRIVER SELECTION

Order	Function	Parameter or Status Check or Action		Display and Notes	Fault finding
1	**Radio satellite control**	**ET006:**	+ button	**DEPRESSED** **RELEASED**	In the event of a fault, consult **the interpretation of statuses ET006, ET007, ET008, ET009 and ET010**.
		ET007:	- button	**DEPRESSED** **RELEASED**	
		ET009:	Up button ( )	**DEPRESSED** **RELEASED**

GETtheMANUALS.org

ET003	+ 12 V SIDE LIGHTS FEED

NOTES	**Check that the side lights are working. If not, carry out fault finding on the steering wheel and side light controls** (see **80D, Lighting**).

If no left-hand side light is working on the vehicle, check the condition and connection of connector CGB2-A in the passenger compartment fuse and relay box (tabs bent, broken, etc.).
Repair if necessary.
Check the condition of fuse **F4** (7.5A) on the passenger compartment fuse and relay box.
Replace the fuse if necessary.

Check the condition and connection of the navigation computer 32-track connector (broken, bent tabs etc.).
Repair if necessary.

Check the condition and connection of the navigation central control connector (broken, bent tabs, etc.).
Repair if necessary.

Check the condition and connection of the CD multi-changer connector (broken, bent tabs, etc.).
Repair if necessary.

Check **the insulation, continuity and the absence of interference resistance** on the following connection:
connector CGB2-A of the passenger compartment fuse and relay box **track 4** →
- **track 22** of the 32-track navigation computer connector
- **track 10** of the navigation central control connector
- **track 24** of the CD multi-changer connector

Repair if necessary.

If the fault is still present, contact the Techline.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET006 **ET007** **ET008** **ET009** **ET010**	+ BUTTON – BUTTON TOP BUTTON UP BUTTON DOWN BUTTON

NOTES	**There must be no present or stored faults.**

Check the condition and connection of the radio satellite control 6-track connector (broken, bent, oxidised tabs).
Repair if necessary.

Check the condition and connection of the tuner-amplifier 32-track connector (broken, bent, oxidised tabs).
Repair if necessary.

Check **the insulation, continuity and the absence of interference resistance** of the connections between the radio satellite control connector and the tuner-amplifier 32-track connector:
32-track connector of the tuner-amplifier **track 8** → **track B2** of the radio satellite control connector
32-track connector of the tuner-amplifier **track 9** → **track A3** of the radio satellite control connector
32-track connector of the tuner-amplifier **track 10** → **track B3** of the radio satellite control connector
32-track connector of the tuner-amplifier **track 24** → **track A2** of the radio satellite control connector
32-track connector of the tuner-amplifier **track 25** → **track B1** of the radio satellite control connector
32-track connector of the tuner-amplifier **track 26** → **track A1** of the radio satellite control connector
Repair if necessary.

Carry out the following checks on the radio satellite control using an ohmmeter:
- When the + button is pressed the resistance should be **28 Ω** between **tracks A1** and **B1**
- When the + button is released there should be **insulation** between **tracks A1** and **B1**
- When the - button is pressed the resistance should be **0.5 Ω** between **tracks B1** and **B3**
- When the - button is released there should be **insulation** between **tracks B1** and **B3**
- When the top button is pressed the resistance should be **28 Ω** between **tracks B2** and **B3**
- When the top button is released there should be **insulation** between **tracks B2** and **B3**
- When the up button is pressed the resistance should be **28** Ω between **tracks A3** and **B2**
- When the up button is released there should be **insulation** between **tracks A3** and **B2**
- When the down button is pressed the resistance should be **28** Ω between **tracks A3** and **B1**
- When the down button is released there should be **insulation** between **tracks A3** and **B1**

If the measured values do not correspond with the values above, replace the radio satellite control.

If the fault is still present, contact the Techline.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET017	COMMUNICATION CONNECTION BUTTON

NOTES	**There must be no present or stored faults.**

Check the condition and connection of the direction indicator control 3-track connector (broken, bent, oxidised tabs).
Repair if necessary.

Check the condition and connection of the tuner-amplifier 32-track connector (broken, bent, oxidised tabs).
Repair if necessary.

Check **the insulation, continuity and the absence of interference resistance** of the connection between the direction indicator control connector and the tuner-amplifier 32-track connector:
32-track connector of the tuner-amplifier **track 11** ⟶ **track 2** of the direction indicator control connector
Repair if necessary.

Check **the continuity** of the communication connection button:
– between **tracks 1** and **2** of the direction indicator control 3-track connector, with the communication connection button pressed.
If there is no continuity, replace the direction indicator control.

Make sure that the **earth** on **track 1** of the direction indicator control connector is in perfect condition.

If the fault is still present, contact the Techline.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET018	WHEEL ACTION

NOTES	**There must be no present or stored faults.**

Check the condition and connection of the radio satellite control 6-track connector (broken, bent, oxidised tabs).
Repair if necessary.

Check the condition and connection of the tuner-amplifier 32-track connector (broken, bent, oxidised tabs).
Repair if necessary.

Check **the insulation, continuity and the absence of interference resistance** of the connections between the radio satellite control connector and the tuner-amplifier 32-track connector:

- 32-track connector of the tuner-amplifier **track 9** → **track A3** of the radio satellite control connector
- 32-track connector of the tuner-amplifier **track 10** → **track B3** of the radio satellite control connector
- 32-track connector of the tuner-amplifier **track 26** → **track A1** of the radio satellite control connector
- 32-track connector of the tuner-amplifier **track 24** → **track A2** of the radio satellite control connector

Repair if necessary.

Check **the continuity** of the radio satellite control:
– between **tracks A2** and **A1**.
– between **tracks A2 and A3**.
– between **tracks A2 and B3**.
(see **MR 405 Mechanical, 86A, Radio control satellite: Removal - Refitting**).
If there is no continuity, replace the radio satellite control.

If the fault is still present, contact the Techline.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET024	REVERSE GEAR ENGAGED

NOTES	**There must be no present or stored faults.**

Run a vehicle multiplex network test (see **88B, Multiplex**).
Carry out fault finding on the UCH (see **87B, Passenger Compartment Connection Unit**).
Check the condition and connection of the navigation computer 32-track connector (broken, bent, oxidised tabs). Repair if necessary.
Check the condition and connection of the UCH P100 connector (bent, oxidised, broken tabs). Repair if necessary.
Check **the insulation, continuity and the absence of interference resistance** of the connection between the UCH P100 connector and the navigation computer 32-track connector: UCH P100 connector **track 8** ⟶ **track 20** of the 32-track navigation computer connector Repair if necessary.
If the fault is still present, contact the Techline.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC009	Microphone test

GETtheMANUALS.org

RZ001 Fault memory:

This command is used to clear faults stored in the navigation computer.

RZ002 Computer memory:

This command enables the configuration **CF001 Vehicle Type** for the navigation computer to be removed.

IMPORTANT
The configuration **NETHERLANDS** is **IRREVERSIBLE**. This selection cannot be cleared.

RZ003 Customer parameters and data

This command is used to erase command configurations **RZ002 "Computer memory"** + the address book, centre of interest, and navigation adjustments recorded by the customer in the navigation computer.
This command is also used to clear telephone numbers stored in the navigation computer and the list of received and dialled calls when the telephone is connected to the vehicle.

IMPORTANT
This command must be activated before removing the computer.

Clearing procedure
- Establish dialogue with the navigation computer.
- Select the menu **repair mode**.
- Select the **Clear** menu.
- Select the line of your choice.
- Confirm.

VP002 Write VIN:
This command permits manual entry of the vehicle's VIN into the computer. Use this command each time the computer is replaced. The VIN number is inscribed on the manufacturer's plate.

Procedure for writing the VIN
- Establish dialogue with the navigation computer.
- Select the menu **repair mode**.
- Select the **other parameters** menu.
- Select line **VP002 Write VIN**.
- Enter the VIN.
- Exit fault finding mode.
- Switch off the ignition.
- Wait for the end of power latch.
- Read the VIN again from the **Identification** menu for confirmation.

GETtheMANUALS.org

AC006	SCREEN TEST: COLOUR BARS

NOTES	**There must be no present or stored faults.**

Apply this procedure if one or more colour options are missing from the display when the command is activated.

Check the condition and connection of the display connector (bent, oxidised, broken tabs, etc.).
Repair if necessary.

Ensure that the **earth** on **track 9** of the display connector is in perfect condition.
Repair if necessary.

Check for **+ 12 V** on track **14** of the display connector**.**
Check the presence and condition of fuse **F50** (20A).
Replace the fuse and repair if necessary.

Check the condition and connection of the navigation computer 32-track connector (broken, bent, oxidised tabs etc.).
Repair if necessary.

Check the **insulation, continuity and the absence of interference resistance** on the following connections:

- display connector **track 8** → **track 23** 32-track navigation computer connector
- display connector **track 9** → **track 29** 32-track navigation computer connector (earth)
- display connector **track 22** → **track 14** 32-track navigation computer connector (blue)
- display connector **track 23** → **track 30** 32-track navigation computer connector (green)
- display connector **track 24** → **track 15** 32-track navigation computer connector (red)

Repair if necessary.

If these checks are consistent but the colours shown on the display are incorrect, replace the display.

AFTER REPAIR	Carry out another fault finding check on the system.

GETtheMANUALS.org

AC007	SCREEN TEST: GRADATION OF GREY

NOTES	**There must be no present or stored faults.**

Apply this procedure if the shade of grey shown on the display when the command is activated is incorrect.

Check the condition and connection of the display connector (bent, oxidised, broken tabs, etc.).
Repair if necessary.

Ensure that the **earth** on **track 9** of the display connector is in perfect condition.
Repair if necessary.

Check for **+ 12 V** on track **14** of the display connector.
Check the presence and condition of fuse **F50** (20A).
Replace the fuse and repair if necessary.

Check the condition and connection of the navigation computer 32-track connector (broken, bent, oxidised tabs etc.).
Repair if necessary.

Check the **insulation, continuity and the absence of interference resistance** on the following connections:

- display connector **track 4** → **track 25** 32-track navigation computer connector
- display connector **track 5** → **track 28** 32-track navigation computer connector
- display connector **track 10** → **track 11** 32-track navigation computer connector
- display connector **track 11** → **track 27** 32-track navigation computer connector
- display connector **track 12** → **track 12** 32-track navigation computer connector
- display connector **track 15** → **track 26** 32-track navigation computer connector
- display connector **track 16** → **track 10** 32-track navigation computer connector

Repair if necessary.

If these checks are correct but the shade of grey shown on the display is incorrect, replace the display.

AFTER REPAIR	Carry out another fault finding check on the system.

GETtheMANUALS.org

AC009	MICROPHONE TEST

NOTES	**There must be no present or stored faults.**

Apply this procedure if the **Faulty connection** message appears when these commands are activated.

Check the condition and connection of the microphone connector (bent, oxidised, broken tabs).
Repair if necessary.

Check the condition and connection of the navigation computer 40-track connector (broken, bent, oxidised tabs).
Repair if necessary.

Check the **insulation, continuity and the absence of interference resistance** on the following connections:

- microphone connector **track 1** → **track 37** 40-track navigation computer connector
- microphone connector **track 2** → **track 17** 40-track navigation computer connector
- microphone connector **track 3** → **track 18** 40-track navigation computer connector

Repair if necessary.

If these checks are correct but the microphone is not working, replace the microphone.

AFTER REPAIR	Carry out another fault finding check on the system.

GETtheMANUALS.org

AC004	SPEAKER TEST

NOTES	**There must be no present or stored faults.** **This command activates the front left-hand and front right-hand treble speakers and the front right-hand, rear right-hand, front left-hand and rear left-hand bass speakers.**

Check the condition and connection of the tuner-amplifier connector B (broken, bent, oxidised tabs, etc.).
Repair if necessary.

Check the condition and connection of the defective speaker connector (bent, broken tabs, etc.).
Repair if necessary.

Check the **insulation, continuity and the absence of interference resistance** on the following connections:

- radio connector B **track 1** → **track A1** connector for rear right-hand speaker and rear right-hand tweeter
- radio connector B **track 2** → **track A2** connector for rear right-hand speaker and rear right-hand tweeter
- radio connector B **track 3** → **track A1** connectors for door speakers and front right-hand tweeter
- radio connector B **track 4** → **track A2** connectors for door speakers and front right-hand tweeter
- radio connector B **track 5** → **track A1** connectors for door speakers and front left-hand tweeter
- radio connector B **track 6** → **track A2** connectors for door speakers and front left-hand tweeter
- radio connector B **track 7** → **track A1** connector for rear left-hand speaker and rear left-hand tweeter
- radio connector B **track 8** → **track A2** connector for rear left-hand speaker and rear left-hand tweeter

Repair if necessary.

If these tests are correct but one or more speakers do not work, replace the faulty speaker or speakers.

If the fault is still present, contact Techline.

AFTER REPAIR	Carry out another fault finding check on the system.

THE CALL IS NOT TRANSFERRED TO THE NAVIGATION AND COMMUNICATION SYSTEM IF A NUMBER IS DIALLED ON THE TELEPHONE — ALP 17

COMMUNICATIONS ARE SUBJECT TO INTERFERENCE IN BLUETOOTH — ALP 18

THE PERSON CALLING USING THE COMMUNICATION SYSTEM CANNOT HEAR ME VERY WELL OR CANNOT HEAR ME AT ALL (WITH BLUETOOTH) — ALP 19

VOICE RECOGNITION IS NOT WORKING — ALP 20

GETtheMANUALS.org

ALP 1	No dialogue with the computer

NOTES	Switch on the + after ignition feed to enter fault finding mode with the computer.

Check the condition and connection of the battery connections.
Check the condition of the fuses.
Check the voltage of the battery.
Repair if necessary.

Try the diagnostic tool on another vehicle.

Check:
– the connection between the diagnostic tool and the diagnostic sensor (wiring in good condition),
– the connection between the diagnostic sensor and the diagnostic socket (wiring in good condition).

Check for **+ 12 V battery feed** on **track 16,+ 12 V after ignition feed** on **track 1** and an **earth** on **track 5** and on **track 4** of the diagnostic socket.
Repair if necessary.

Check for **+ 12 V battery feed** on **track 7**, and an **earth** on **track 8** of the navigation central control.
Repair if necessary.

Disconnect the navigation computer 32-track connector and the navigation central control connector to check for **the insulation, continuity and absence of interference resistance** on the following connections:

32-track navigation computer connector **track 2** → **track 12** of the navigation central control
32-track navigation computer connector **track 18** → **track 6** of the navigation central control
navigation central control **track 5** → **track 13** of the diagnostic socket (CAN H)
navigation central control **track 11** → **track 12** of the diagnostic socket (CAN L)
navigation computer 40-track connector **track 20** → **track 2** of unit fuse F50 (+ battery feed)
navigation computer 40-track connector **track 40** → **earth**

Repair if necessary.

AFTER REPAIR	Carry out a complete check using the diagnostic tool.

GETtheMANUALS.org

ALP 2	The screen stays black

NOTES	Only check the customer complaint after performing a **full check with the diagnostic tool**. Check that the customer is using the navigation system correctly.

Check that the display has not been deactivated Press the **LIGHT** button on the central control for **2 seconds** to reactivate the display.

↓

Check the display power supply. Switch on the ignition, turn on the navigation system and eject the navigation DVD.

Has the DVD been removed?

No →

Check for **+ 12 V** on **track 20** and **earth** on **track 40** of the navigation computer.

Are these tests correct?

Yes →

Contact the Techline.

No →

Check that supply fuse **F50** (20A) is present and in good condition. Replace the fuse if necessary.

Check the **insulation, continuity and the absence of interference resistance** of the connections between the navigation computer and the display (see wiring diagram).

Are these tests correct?

No →

Carry out the necessary repairs.

Yes →

Contact the Techline.

Yes ↓

Check for **+ 12 V** on **track 14** and **earth** on **track 13** of the display.

Are these tests correct?

No →

Check that supply fuse **F50** (20A) is present and in good condition. Replace the fuse if necessary.

Yes ↓

Check **insulation, the continuity and the absence of interference resistance** on the connection between **track 3** of the display connector and **track 21** of the CD multi-changer connector.

↓

– If the connection is correct, replace the display.
– If the connection is faulty, carry out the necessary repairs.

AFTER REPAIR	Carry out a complete check using the diagnostic tool.

GETtheMANUALS.org

ALP 3	Screen display frozen

NOTES	Only check the customer complaint after performing a **full check with the diagnostic tool**. Check that the customer is using the navigation system correctly.

The display on the screen stays frozen. Switch off the ignition and wait until the system shuts down completely (**at least 1 minute).**
Switch on the ignition again.

Has the fault been solved?

No → Carry out a multiplex network test.

Are the tests correct?

Yes → Contact the Techline.

No → Repair the defective connections.

Yes → End of fault finding.
If the fault recurs, contact Techline.

AFTER REPAIR	Carry out a complete check using the diagnostic tool.

GETtheMANUALS.org

ALP 4	The screen displays Connect a diagnostic tool

NOTES	Only consult this customer complaint after a **full check with the diagnostic** tool.

The navigation computer configuration has not been carried out. Carry out the computer configuration (see **86C, Configuration and programming**).

Has the fault disappeared?

No → Carry out a multiplex network test.

Are the tests correct?

Yes → Contact the Techline.

No → Repair the defective connections.

Yes → End of fault finding.

AFTER REPAIR	Carry out a complete check using the diagnostic tool.

GETtheMANUALS.org

ALP 5	No voice messages

NOTES	Only check the customer complaint after performing a **full check with the diagnostic tool**. Check that the customer is using the navigation system correctly.

Check that the sound from the radio is coming through the front and rear speakers.
Otherwise, adjust the sound for all vehicle speakers.

↓

Check that voice guidance is activated. Press the **SET** button and select the **Navigation; Guidance preference; Voice guidance** menus.

Has voice guidance been activated?

No → Activate voice guidance.

Yes

↓

Ensure that the voice guidance volume has been properly adjusted.
Press the **SET** button and select the **Volume and beeps, and Guidance volume** menus.

Has the voice guidance volume been properly adjusted?

No → Adjust the voice guidance volume.

Yes

↓

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a complete check using the diagnostic tool.

GETtheMANUALS.org

ALP 6	No traffic information messages on the screen

NOTES	Only consult this customer complaint after a **full check with the diagnostic** tool. Check that the customer is using the navigation system correctly.

TMC road information is disseminated via the FM band on the radio. The **TMC** pictogram should be green in order for the traffic information to be received.

What colour is the TMC pictogram?

Grey → No traffic information is being received.

Green

↓

The system is working but there is no traffic information available.

↓

Check that the traffic information display has been activated.
Press the **INFO** button and select the **TMC traffic information; Traffic information adjustment; Card display** menus.

has the display been activated?

No → Activate the TMC traffic information display.

Yes

↓

Check that the traffic information settings are correct.
Press the **INFO** button and select the **TMC traffic information; Traffic information adjustment; Type of information to be displayed; Traffic information service menus**.

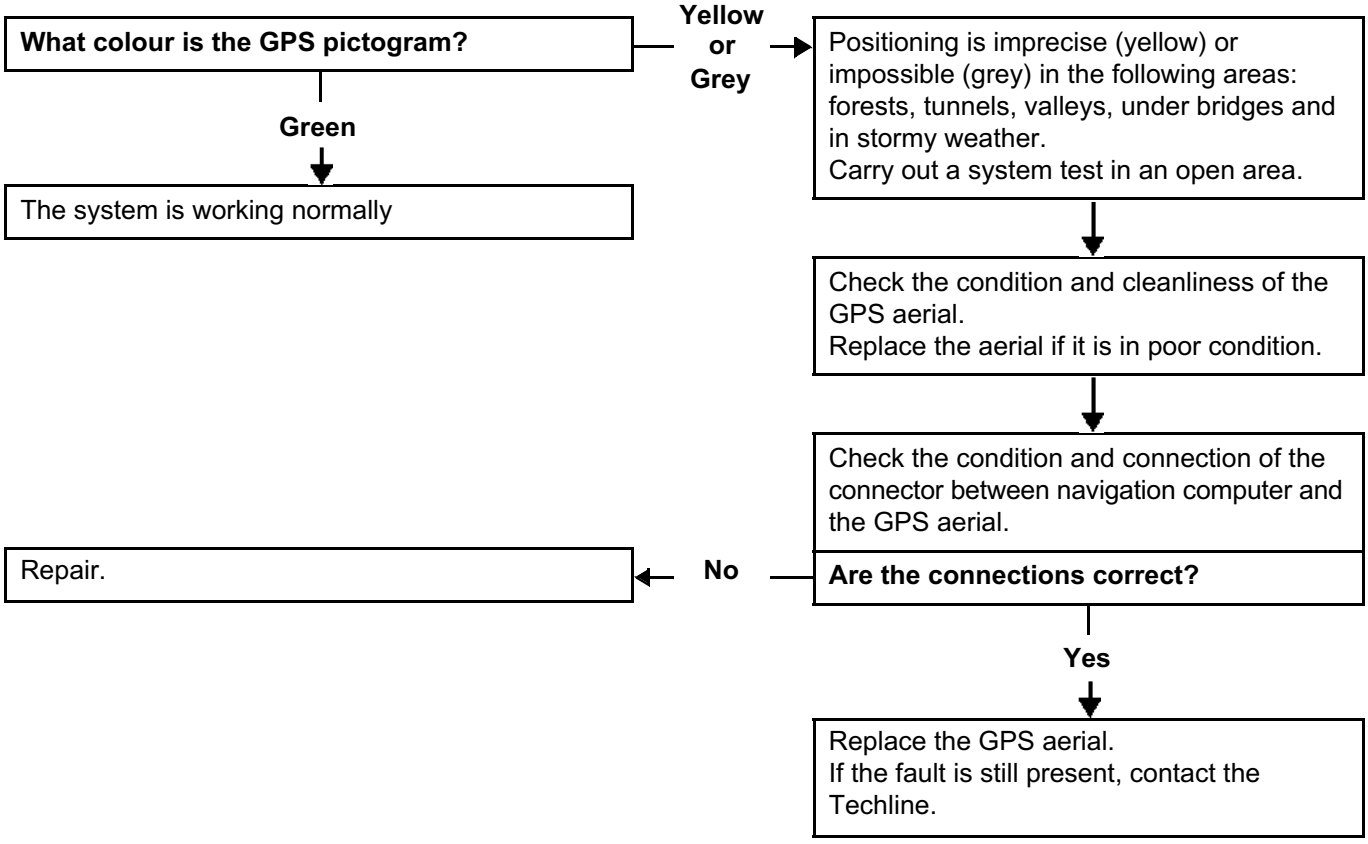
Make any necessary adjustments.

AFTER REPAIR	Carry out a complete check using the diagnostic tool.

GETtheMANUALS.org

ALP 7	Poor satellite reception

NOTES	Only consult this customer complaint after a **full check with the diagnostic** tool. Check that the customer is using the navigation system correctly. Ensure there are no present or stored faults.



AFTER REPAIR	Carry out a complete check using the diagnostic tool.

GETtheMANUALS.org

ALP 8	The radio does not switch on automatically or switches off after 20 minutes

NOTES	Only consult this customer complaint after a **full check with the diagnostic** tool. Check that the customer is using the navigation system correctly.

The navigation system does not receive the multimedia wake-up signal when the + after ignition feed is switched on.

↓

Check the **insulation, continuity and the absence of interference resistance** on the following connections:

CD changer connector **track 21**
- → **track 14** of the radio C3 connector
- → **track 1** of the central navigation control
- → **track 3** of the display
- → **track 38** of the navigation computer 40-track connector

Repair if necessary.

AFTER REPAIR	Carry out a complete check using the diagnostic tool.

GETtheMANUALS.org

ALP 9	Clock not displayed or incorrect

NOTES	Only consult this customer complaint after a **full check with the diagnostic** tool. Check that the customer is using the navigation system correctly.

Check that the time display is activated and the time zones and settings are correct. Press the **SET** button and select **clock; display clock; time zone differential adjustment; summer time; time zone**.

Are these adjustments correct?

No → Set the display and time.
Explain to the customer how to make these adjustments.

Yes ↓

Drive the vehicle outside into an open area and check that the satellite reception is correct.

Is the GPS pictogram green?

No → See the fault finding chart ALP 7 Poor satellite reception.

Yes ↓

Wait a few minutes in a location with good satellite reception.
If the time is still incorrect, contact Techline.

AFTER REPAIR	Carry out a complete check using the diagnostic tool.

GETtheMANUALS.org

ALP 10	The volume does not increase with an increase in vehicle speed

NOTES	Only consult this customer complaint after a **full check with the diagnostic** tool. Check that the customer is using the navigation system correctly.

Check that volume according to speed function has been activated.
Press the **SET** button and select the **volume correction** menu.

Has the volume according to speed function been activated?

No → Activate this function.

Yes

↓

Check the condition and connection of the navigation computer 32-track connector and the ABS/ESP computer connector.
Repair if necessary.

↓

Check the **insulation, continuity and the absence of interference resistance** on the following connection:
navigation computer 32-track connector **track 4** ⟶ **track 24** ABS / ESP computer connector
Repair if necessary.

AFTER REPAIR	Carry out a complete check using the diagnostic tool.

GETtheMANUALS.org

ALP 11	Poor radio reception

NOTES	Only consult this customer complaint after a **full check with the diagnostic** tool.

Check the condition and connection of connector A and the aerial connector on the radio.
Repair if necessary.

↓

Check the condition and connection of the aerial amplifier connector.
Repair if necessary.

↓

Check the **insulation, continuity and the absence of interference resistance** on the following connection:

radio connector A **track 5** → **single track** of the aerial amplifier
radio aerial connector **track 1** → **track 1** of the aerial amplifier
radio aerial connector **track 2** → **track 2** of the aerial amplifier

Repair if necessary.

↓

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a complete check using the diagnostic tool.

GETtheMANUALS.org

ALP 12	The CD changer does not work

NOTES	Only consult this customer complaint after a **full check with the diagnostic** tool. Check that the customer is using the system properly.

Check the connection and condition of the CD multi-changer connector.
Repair if necessary.

↓

Make sure that the **earth** on **track 10** of the multi-changer connector is in perfect condition.

↓

Check for a **+ battery feed** on **track 22**, of the **+ accessories supply** on **track 3** and an **+ after ignition feed** on **track 15** of the CD multi-changer connector.

↓

Check the condition of fuses **F23** (10 A) (+ accessories feed) and **F28** (20A) (+ after ignition feed) on the passenger compartment fuse and relay box.

Are the fuses in good condition? — **No** → Replace the fuses.

Yes

↓

Check the condition of unit fuse **F50** (20 A) (+ battery).
Replace the fuse if necessary.

Is the fuse in good condition? — **No** → Replace the fuse.

Yes

↓

Contact the Techline.

AFTER REPAIR	Carry out a complete check using the diagnostic tool.

GETtheMANUALS.org

ALP 13	Impossible to alter GPS guidance when driving

NOTES	Only consult this customer complaint after a **full check with the diagnostic** tool.

If the configuration **LC002 Country type** is **NETHERLANDS**, it is normal not to be able to adjust the guidance when driving.
This configuration is **IRREVERSIBLE** and it is not possible to clear this choice.

AFTER REPAIR	Carry out a complete check using the diagnostic tool.

GETtheMANUALS.org

ALP 14	After updating the navigation DVD, the system no longer works

NOTES	Only consult this customer complaint after a **full check with the diagnostic** tool.

Check that the navigation computer software version is compatible with the navigation DVD update.

↓

If the navigation DVD is not compatible with the navigation computer software, suggest that the customer buys a navigation DVD in a version compatible with the vehicle's navigation system.

AFTER REPAIR	Carry out a complete check using the diagnostic tool.

GETtheMANUALS.org

ALP 15	Impossible to use the telephone with Bluetooth

NOTES	Only consult this customer complaint after a **full check with the diagnostic** tool. Check that the customer is using the system properly. Check that fault **DF009 Computer** is not present or stored.

Note:
List of telephones researched and approved by Renault in March 2005: Nokia 6820, Nokia 6230, Siemens S65, Motorola V500, Motorola V600.
To see the latest list of telephones approved by Renault as well as the various operations to be carried out on these phones, see **Technical Note 6024A: Special features of mobile phones used with the navigation and communication system**.

Check that Bluetooth mode is activated in the navigation and communication system. Press the **SET** button and select the **telephone; Bluetooth option; Bluetooth connection** menus.

Has the telephone been researched by Renault?

No → Suggest that the customer buy a telephone approved by Renault.

Yes

Check that the telephone software on the telephone is compatible with the vehicle's navigation and communication system.
The telephone software compatible with the navigation and communication system is more advanced than or the same as:
Nokia 6230 and 6820: v 03.15
Motorola V500 and V600: Triplets_G_0B.09.44R
Siemens S65: v 12

- Nokia: *#0000#
- Motorola: select configuration, telephone status then version information
- Siemens: *#06#

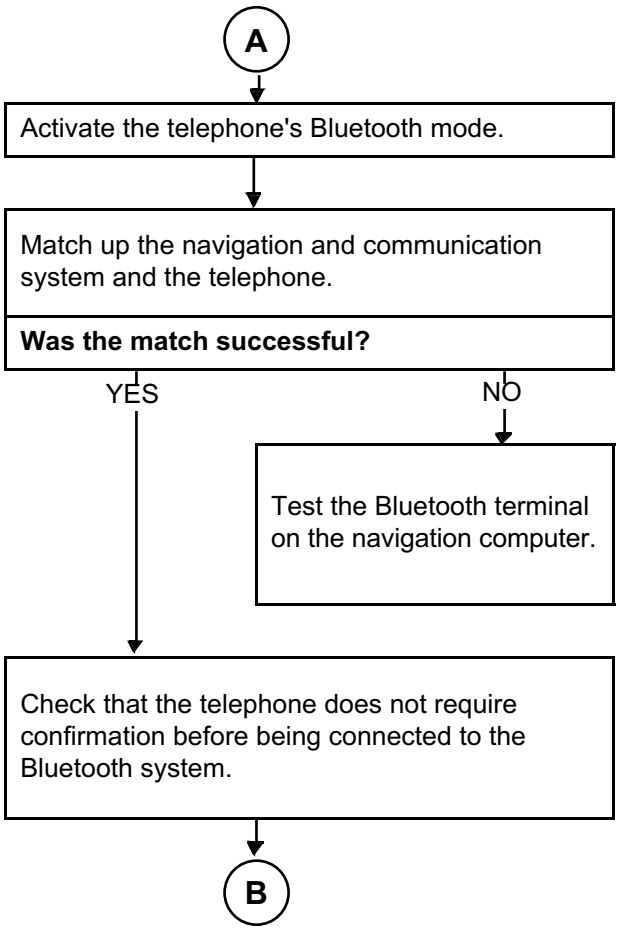
Is the telephone software compatible with the vehicle's navigation and communication system?

No → Ask the customer to contact the telephone vendor in order to install a software version into the telephone that would be compatible with the navigation and communication system.

A

GETtheMANUALS.org

ALP 15 (CONTINUED 1)



Procedure for activating Bluetooth mode on the telephone:

- Nokia: Select **Parameters, Connectivity, Bluetooth, Activate** in the main menu.
- Motorola: Select **Configuration, Connection, Bluetooth link, Configuration, Supply, Activated** in the main menu.
- Siemens: Select **Adjustments, Mode/Data, Bluetooth**, then activate Bluetooth mode.

Procedure for matching the communication system and the telephone:

On the navigation and communication system:

- Press the **SET** button
- Enter the **telephone** menu.
- Select the **Bluetooth option** line.
- Select the **save a Bluetooth telephone** line.

On the telephone:

- Enter the menu to find a Bluetooth accessory.
- In the list of found accessories, select **My CAR**.
- Enter the PIN code given on the vehicle's navigation display.

AFTER REPAIR	Carry out a complete check using the diagnostic tool.

GETtheMANUALS.org

ALP 15 (CONTINUED 2)

B

If so, reply that you want to connect then inhibit this function on the telephone (not possible on Siemens phones).

Check that the telephone is at the top of the matched phones list (icon opposite its name).

Is it first?

NO → Put the telephone at the top of the list of telephones matched to the navigation and communication system.

Try to match another telephone to the vehicle's navigation and communication system.

Was the match successful?

NO → If the fault has not been solved, contact Techline.

YES

The customer's telephone is definitely the reason why it does not work with the navigation and communication system.

AFTER REPAIR	Carry out a complete check using the diagnostic tool.

GETtheMANUALS.org

ALP 16	Not possible to make a call from the numbers stored in the list of received calls.

NOTES	Only consult this customer complaint after a **full check with the diagnostic** tool. Check that the customer is using the system properly.

This fault occurs with Nokia phones and cannot be repaired.

AFTER REPAIR	Carry out a complete check using the diagnostic tool.

GETtheMANUALS.org

ALP 17	The call is not transferred to the navigation and communication system if a number is dialled on the telephone

NOTES	Only consult this customer complaint after a **full check with the diagnostic** tool. Check that the customer is using the system properly.

This fault occurs with Siemens phones and cannot be repaired.
In this case, dial the numbers using the navigation central control.

AFTER REPAIR	Carry out a complete check using the diagnostic tool.

GETtheMANUALS.org

ALP 18	Communication is subject to interference with Bluetooth

NOTES	Only consult this customer complaint after a **full check with the diagnostic** tool. Check that the customer is using the system properly. Check that the telephone network availability is sufficient to make a call. To see the latest list of telephones approved by Renault as well as the various operations to be carried out on these phones, see **Technical Note 6024A: Special features of mobile phones used with the navigation and communication system**.

Make a call to a fixed line.

Is the interference still present?

No → The fault is linked to the number the customer is calling or to a localised lack of network availability.

Yes

- Deactivate Bluetooth mode on the telephone.
- Deactivate Bluetooth mode in the navigation and communication system.

Press the **SET** button and select the **telephone; Bluetooth option; Bluetooth connection** menus.
Make a call to a fixed line.

Procedure for activating Bluetooth mode on the telephone:

- Nokia: Select **Parameters, Connectivity, Bluetooth, Deactivate** in the main menu.
- Motorola: Select **Configuration, Connection, Bluetooth link, Configuration, Supply, Deactivated** in the main menu.
- Siemens: Select **Adjustments, Mode/Data, Bluetooth**, then deactivate Bluetooth mode.

Is the interference still present?

No → The fault is linked to the customer's telephone.
Ask the customer to carry out a fault finding procedure on the telephone with the vendor.

Yes

Switch off the radio if it is on.

Is the interference still present?

No → Run fault finding on the radio.
Replace the radio if necessary.

Yes

(A)

GETtheMANUALS.org

ALP 18 (CONTINUED)

(A)

Place the telephone close to the navigation computer.

If the fault is still present, check the condition and connection of the connectors on the navigation computer and the radio.

Is the interference still present?

No → End of fault finding.

Yes

Match up another telephone and make a call.

Is the interference still present?

Yes

If the fault is still present, contact the Techline.

No

Fault solved, end of fault finding.

Procedure for matching the communication system and the telephone:

On the navigation and communication system:
- Press the **SET** button.
- Enter the **telephone** menu.
- Select the **Bluetooth option** line.
- Select the **save a Bluetooth telephone** line.

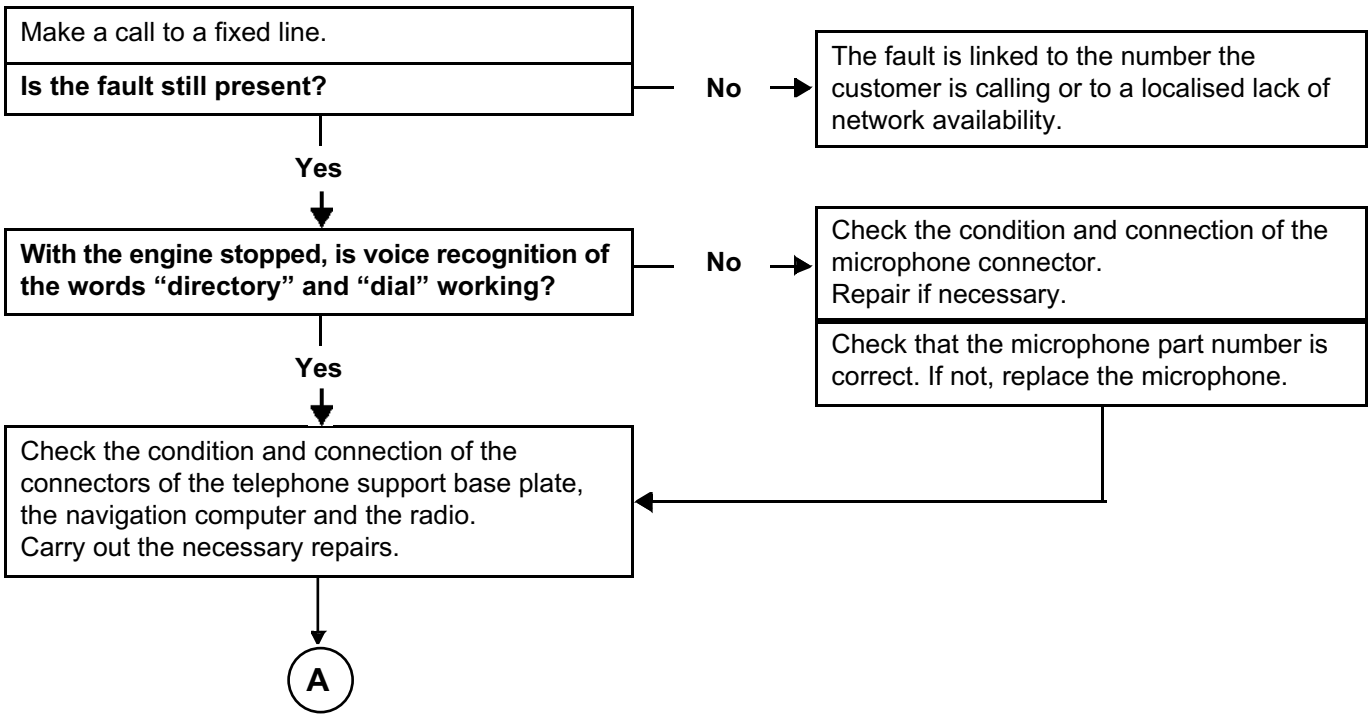
On the telephone:
- Enter the menu to find a Bluetooth accessory.
- In the list of found accessories, select **My CAR**.
- Enter the PIN code given on the vehicle's navigation display.

AFTER REPAIR	Carry out a complete check using the diagnostic tool.

GETtheMANUALS.org

ALP 19	The person calling using the communication system cannot hear me very well or cannot hear me at all (with Bluetooth)

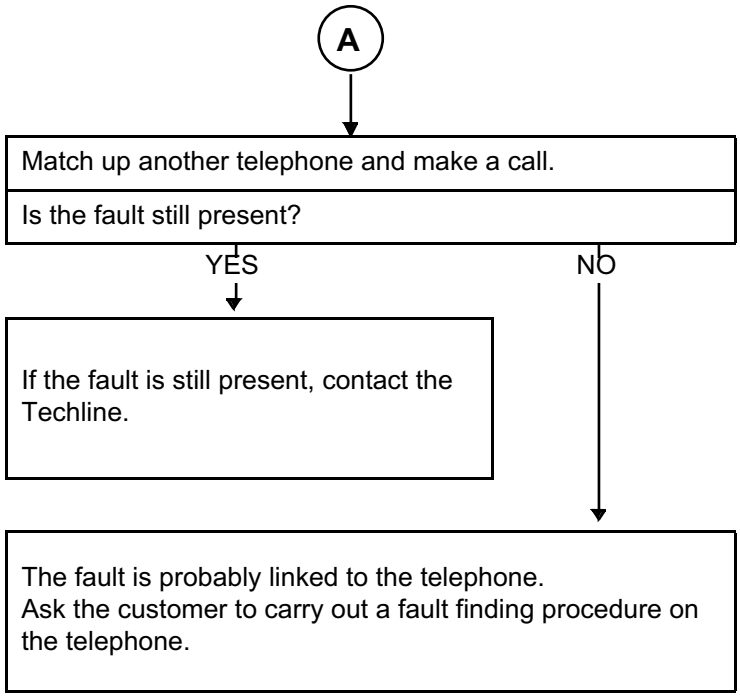
NOTES	Only consult this customer complaint after a **full check with the diagnostic** tool. Check that the customer is using the system properly. Check that the telephone network availability is sufficient to make a call. Idem ALP18 To see the latest list of telephones approved by Renault as well as the various operations to be carried out on these phones, see **Technical Note 6024A: Special features of mobile phones used with the navigation and communication system**.



AFTER REPAIR	Carry out a complete check using the diagnostic tool.

GETtheMANUALS.org

ALP 19 (CONTINUED)	



Procedure for matching the communication system and the telephone:

On the navigation and communication system:
- Press the **SET** button
- Enter the **Telephone** menu.
- Select the **Bluetooth option** line.
- Select the **Save a Bluetooth telephone** line.

On the telephone:
- Go into the menu to find a Bluetooth accessory.
- In the list of found accessories, select **My CAR**
- Enter the PIN code given on the vehicle's navigation display.

AFTER REPAIR	Carry out a complete check using the diagnostic tool.

GETtheMANUALS.org

ALP 20	Voice recognition is not working

NOTES	Only consult this customer complaint after a **full check with the diagnostic** tool. Check that the customer is using the system properly.

With the engine stopped, then at 30 mph (50 km/h) does voice recognition of the words Directory and Dial work?

No →

Check the condition and connection of the microphone connector.
Repair if necessary.

Check that the microphone part number is correct. If not, replace the microphone.

Yes ↓

The customer needs to use voice recognition intensively for 2 weeks so that the voice recognition system can learn to recognise his voice.

↓

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a complete check using the diagnostic tool.

GETtheMANUALS.org

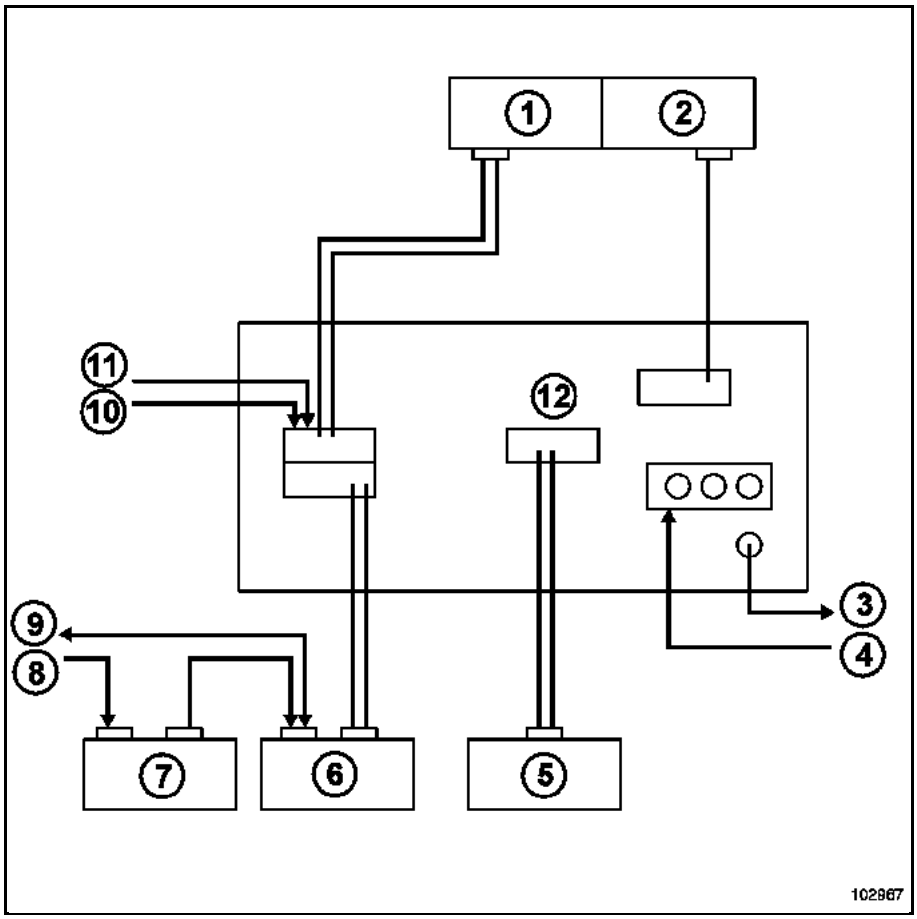
.**GENERAL INFORMATION**

The video system for the rear seats consists of:
– a DVD player located under the rear seat cushion,
– a video control (A) behind the rear face of the console with an on/off button as well as headset and accessory sockets,
– a screen attached to a fold-out motor,
– a **top of the range** radio,
– an infrared remote control for the controls.

The video system can play DVDs, audio CDs, or take input from accessories (game consoles, video cameras etc.).

Diagram



1 Retractable case
2 Screen
3 Headset socket
4 Accessories input
5 DVD player
6 Tuner-amplifier
7 CD changer
8 + battery feed,
9 Vehicle signal (+ accessories, + after ignition feed)
10 + battery feed
11 Vehicle signal (+ accessories, + after ignition feed)
12 Video controls

GETtheMANUALS.org

For repairs, the system has an integrated self-test procedure menu, see **self-test procedure**. Never try to repair a system component. Malfunctioning components must be replaced.

GETtheMANUALS.org

OPERATION

The battery voltage must be between **11** and **15 V** for the system to operate correctly. Outside of this voltage range, it will only function for a limited time or not at all.

In high temperatures, its operation is impaired or impossible.

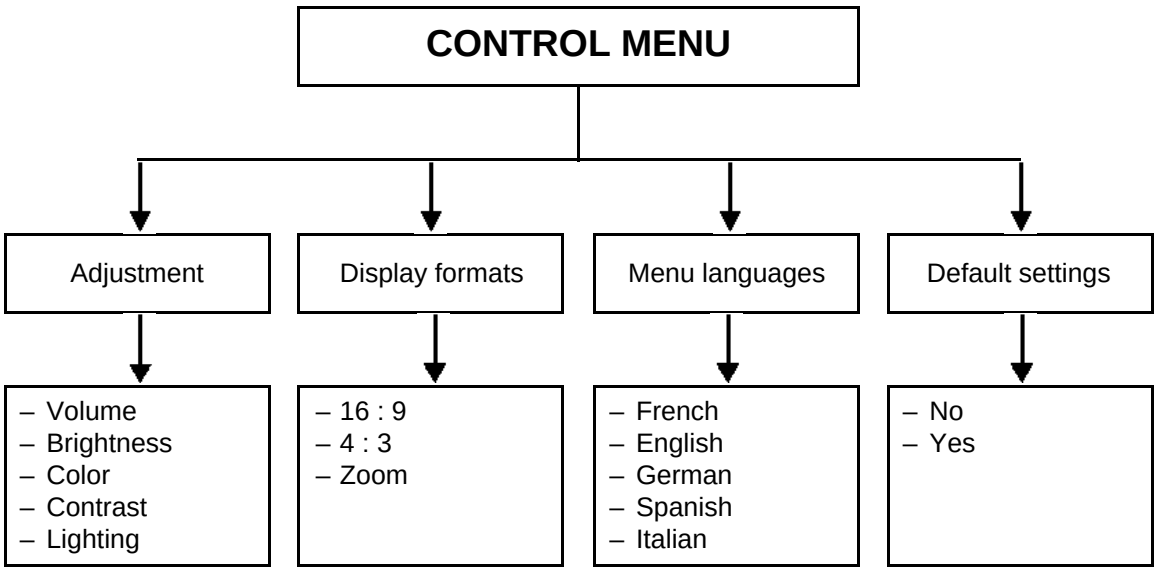
For the system to work, the card must be in the **+ accessories** position. Press the on/off button on the video or remote control to fold out the screen.

Once the power to the **+ accessories** system is cut off, the screen automatically retracts after a few seconds.

The system is protected by a four digit code. This code can be changed; see **Anti-theft code**. After the power is cut off, the code must be entered each time.

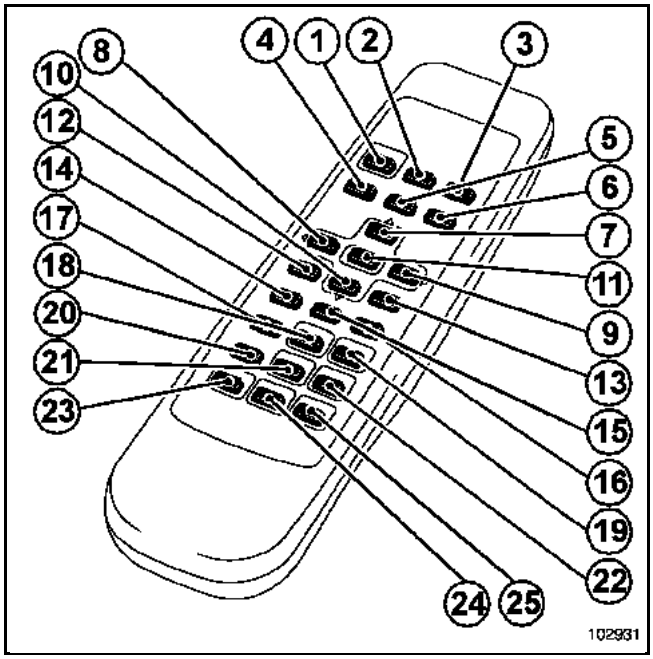
The system has a self-test procedure.

MENU



GETtheMANUALS.org

DESCRIPTION OF THE REMOTE CONTROL:



1 System on/off
2 Screen tilt control
3 Screen on and off
4 Access to control configuration menus
5 Video input selection
6 Access to video system menus
7 Menu navigation control
8 Menu navigation control
9 Menu navigation control
10 Menu navigation control
11 Confirm key
12 Image format and zoom selector
13 Numeric keypad access
14 DVD soundtrack language selection
15 Control to adjust volume, brightness, contrast, etc.
16 Control to adjust volume, brightness, contrast, etc.
17 DVD subtitles language selection
18 Fast rewind
19 Fast forward
20 DVD camera angle selection
21 Skip to previous segment
22 Skip to next segment
23 Stop player
24 Freeze frame
25 Normal DVD or audio CD play

The remote control is not coded, so is interchangeable with another vehicle (Espace).

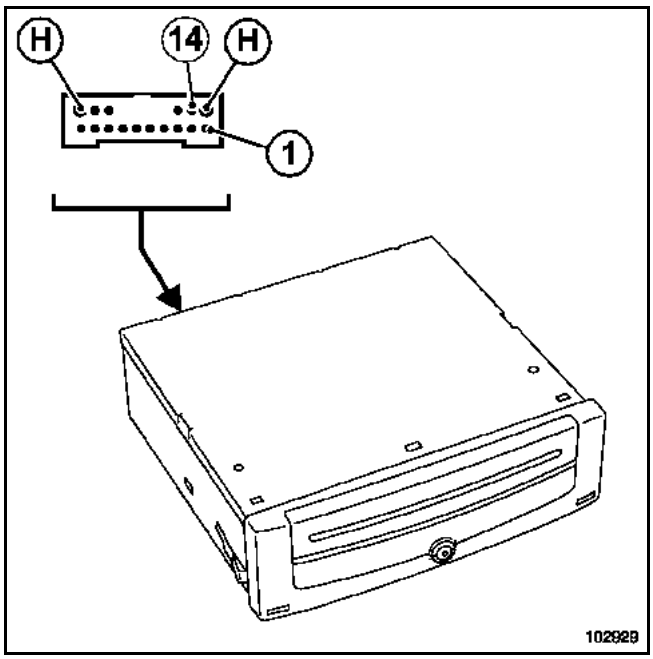
To operate the system with the remote control, point it at one of the infrared sensors on the controls or on the CD changer on the front of the dashboard.

Some functions such as subtitling, camera angle, zoom or language are not accessible. They depend on the DVD menu.

GETtheMANUALS.org

CONNECTION

14-track connector (to video control)

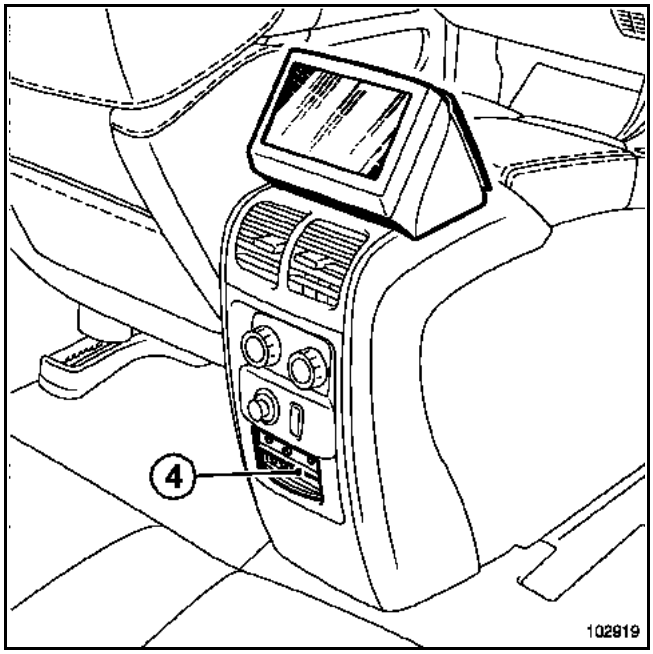


The system's resistance can be controlled:
– resistance of Y signal: **75 Ω** between connections 34CP and 34CQ,
– resistance of C signal: **75 Ω** between connections 34CS and 34CT,
– resistance of audio outputs: **100 kΩ** between connections 34CK and 34CL then between connections 34CM and 34CN.

See Technical Note Wiring Diagrams, Velsatis, code 1280.

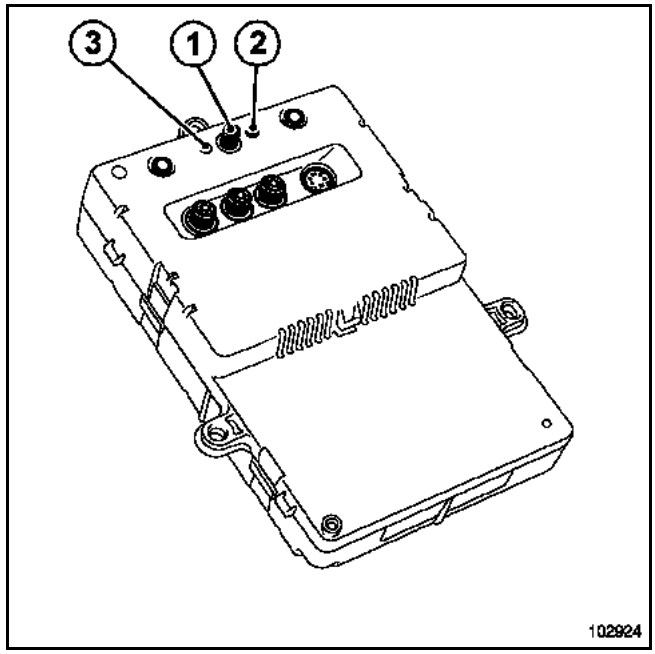
Note:
The 2 big clips on the connectors are guides (H).

GETtheMANUALS.org



The video control (**4**) is the only part of the system which is protected by a code (see **Anti-theft code**).

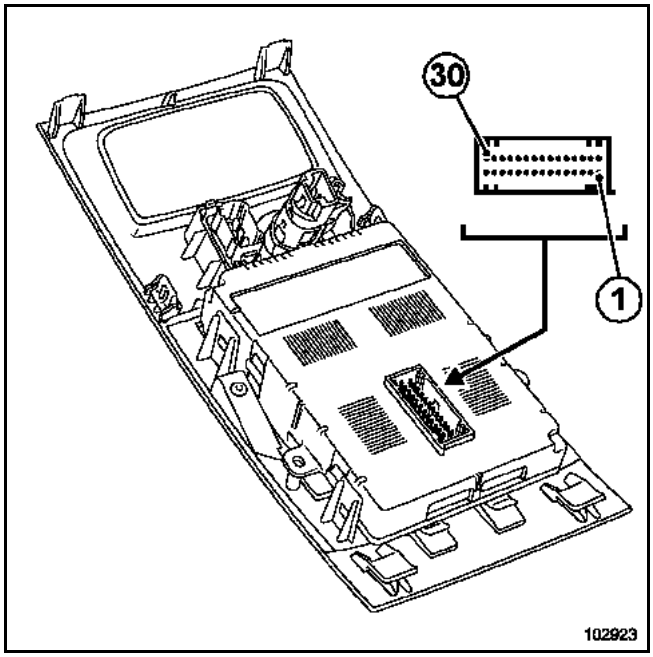
The controls have a self-test mode (see **Self-test procedure**).



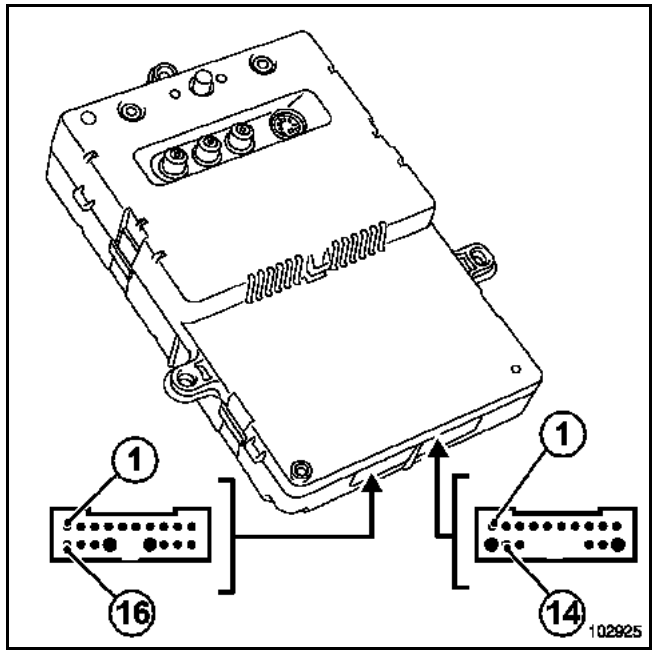
The controls consist of:
– an on/off switch (**1**),
– the operation indicator light (**2**),
– an infrared receiver (**3**),
– two headset sockets (right and left),
– audio and video accessory inputs.

GETtheMANUALS.org

CONNECTION



See Technical Note Wiring Diagrams, Velsatis, code 1273.

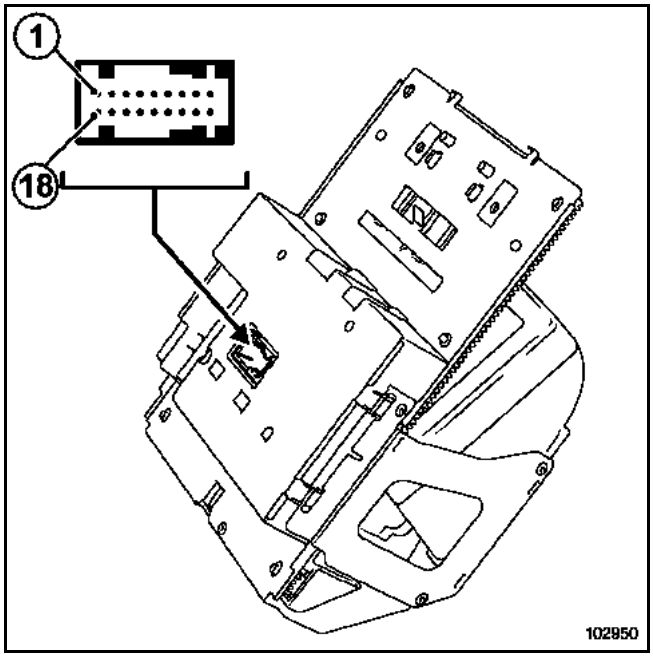


Screen on/off control
– off: **0 V**
– on: **12 V**

The brightness output should be between **0** and **5 V**.

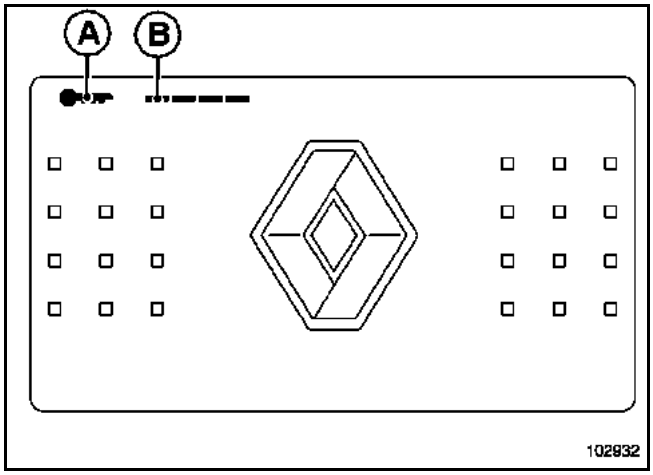
GETtheMANUALS.org

CONNECTION



See Technical Note Wiring Diagrams, Velsatis, code 1303.

GETtheMANUALS.org



A Lock indicator key:
– White key: system locked after power cut off. Enter anti-theft code.
– Red key: system locked after five failed attempts to enter code. Perform unlocking procedure.
B Numeric keypad to enter code (for dashes, press **Shift** on the remote control).

Procedure for entering the anti-theft code

– Turn on the control unit (screen folds out and displays RENAULT logo and white key) (**A**)).

– Press **Shift** on the remote control to display the dashes (**B**).

– Enter the four digit code then confirm.

Note:
The system locks after 5 failed attempts to enter the code.

Unlocking procedure:

– Turn on the control unit. The logo and red key (**A**) appear,

– press **Shift** on the remote control. The dashes (**B**) appear on the screen,

– enter 6401 (which is the code for all the video controls),

– the control generates a four-digit code (numerical), if the code only has 2 digits, add two 0 digits (e.g.: 24 → 0024),

– go to the server of the VIN code and the code generated by the video control. In the Return video control code menu, enter the VIN and the code. The server will give the unlocking code,

– press Shift on the remote control. The dashes (**B**) appear on the screen,

– enter the unlocking code,

– the control displays New Code, enter a new code (for example, the radio code to prevent several codes being used), enter the code twice,

– the video control is unlocked and operational (key no longer displayed).

GETtheMANUALS.org

SELF-TEST PROCEDURE

Press **Shift** 6 times to access the numeric keypad.

The code for launching the test is **1046**.

Fault finding messages now start displaying on the screen, or the indicator light flashes:

– **1 flash** of the indicator light and message **1** Running self-test procedure is displayed.

– **2 flashes** of the indicator light and message **2** Controls out of order is displayed.

– **3 flashes** of the indicator light and message **3** DVD player out of order is displayed.

– **4 flashes** of the indicator light and message **4** Retractable unit out of order is displayed.

– **5 flashes** of the indicator light and message **5** Self-test procedure completed is displayed.

– **6 flashes** of the indicator light and message **6** No fault is displayed.

Note:
Each time a button on the remote control is pressed, the indicator light on the control unit should flash.

GETtheMANUALS.org

NO SOUND FROM RADIO SPEAKERS	ALP 1
VOLUME INCREASES SUDDENLY	ALP 2
NO IMAGE (BLACK SCREEN) - OR SCREEN FROZEN ON WELCOME PAGE	ALP 3
NO IMAGE CHANGE WHEN LIGHTS SWITCHED ON	ALP 4
SCREEN DOES NOT FOLD OUT	ALP 5
REMOTE CONTROL DOES NOT WORK	ALP 6

IMPORTANT
The faults may often be bugs in the video system software. For example, frozen image, faulty display or sound etc. This type of fault can often be fixed simply by disconnecting the video system and reconnecting a few seconds later (with the controls connector or battery).
Carry out this operation before checking the wiring harness and before replacing a system component.
Similarly, rule out any disk faults: damaged disk, unrecognized format (the player cannot read MP3 or DIV X files, non-Region 2 DVDs, or some burned discs). To make sure it is a system fault, try another disk before any removal or fault finding procedure.

V5 **Edition Anglaise**

"The repair procedures given by the manufacturer in this document are based on the technical specifications current when it was prepared.

The procedures may be modified as a result of changes introduced by the manufacturer in the production of the various component units and accessories from which his vehicles are constructed."

All rights reserved by Renault s.a.s.

Copying or translating, in part or in full, of this document or use of the service part reference numbering system is forbidden without the prior written authority of Renault s.a.s.

GETtheMANUALS.org

1. SCOPE OF THIS DOCUMENT

This document presents the fault finding procedure applicable to all computers with the following specifications:

Vehicle(s): **Vel-Satis Phase 2** *Function concerned:* **UCH**	*Name of computer:* **UCH** *Program no.:* **0031** *Vdiag No.:* **14, 15**

2. PREREQUISITES FOR FAULT FINDING

Documentation type

Fault finding procedures (this manual):
– Assisted fault finding (integrated into the diagnostic tool), Dialogys.
Wiring Diagrams:
– Visu-Schéma (CD-ROM), paper.

Type of diagnostic tools

– **CLIP**

Special tooling required

Special tooling required	
	Multimeter
Elé. 1681	Universal bornier
Valve exciter part no.: MS-1607 (if this tool is available in your workshop)	

3. RECAP

Procedure

In order to save energy, the Vel-Satis Phase 2 UCH cuts off the + after ignition feed after 3 minutes.

To perform fault finding on a computer, it is possible to force the + after ignition feed for 1 hour by applying the following procedure:
– Press the card unlocking button,
– insert the card in the reader,
– press the Start button (interrupting the timed + after ignition feed mode),
– press and hold the Start button for over 5 seconds until the engine immobiliser warning light starts to flash rapidly (4 Hz).

This forced + after ignition feed mode remains active for 1 hour.
Pressing the Start button or removing the card from the reader cuts off the forced + after ignition feed but does not cut off the timed forced + after ignition feed mode. As long as one hour has not elapsed the + after ignition feed function restarts the forced + after ignition feed for the remaining time.

GETtheMANUALS.org

Faults

Faults are declared as either present or stored (depending on whether they appeared in a certain context and have disappeared since, or whether they remain present but have not been diagnosed within the current context).

The **present** or **stored** status of faults should be taken into consideration when the diagnostic tool is switched on after the + after ignition feed (without any system components being active).

For a **present fault**, apply the procedure described in the **Interpretation of faults** section.

For a **stored fault**, note the faults displayed and apply the instructions in the **Notes** section.

If the fault is **confirmed** when the instructions in the Notes section are applied, the fault is present. Deal with the fault

If the fault is **not confirmed**, check:
- the electrical lines which correspond to the fault,
- the connectors for these lines (for oxidation, bent pins, etc.),
- the resistance of the component detected as faulty,
- the condition of the wires (melted or split insulation, wear).

Conformity check

The aim of the conformity check is to check data that does not produce a fault on the diagnostic tool because the data is inconsistent. Therefore, this stage is used to:
- carry out fault finding on faults that do not have a fault display, and which may correspond to a customer complaint.
- check that the system is operating correctly and that there is no risk of a fault recurring after repairs.

This section gives the fault finding procedures for statuses and parameters and the conditions for checking them.

If a status is not behaving normally or a parameter is outside the permitted tolerance values, consult the corresponding fault finding page.

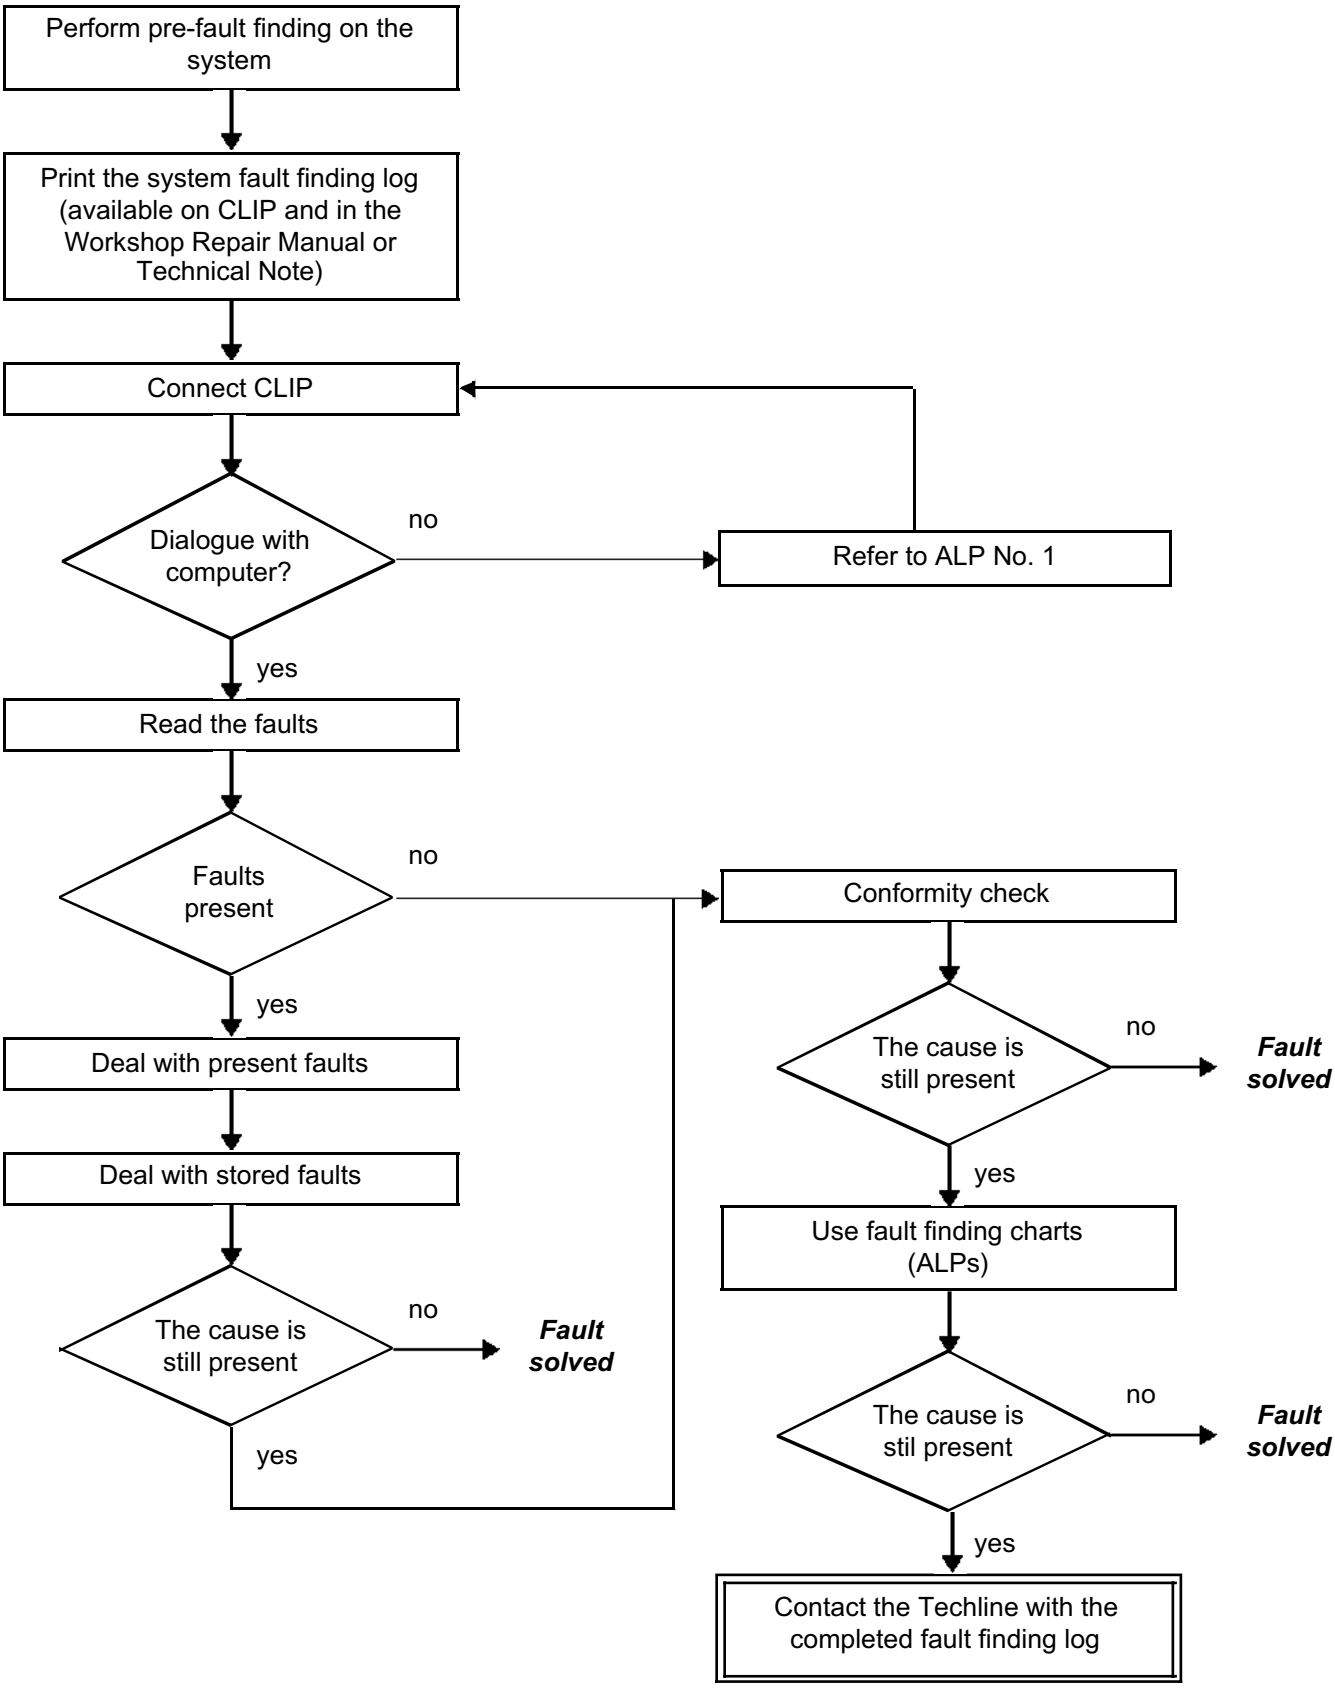
Customer complaints - Fault finding chart

If the test with the diagnostic tool is OK but the customer complaint is still present, the fault should be processed by **customer complaint**.

A synopsis of the general procedure to follow is provided on the following page in the form of a flow chart.

GETtheMANUALS.org

4. FAULT FINDING PROCEDURE



GETtheMANUALS.org

4. FAULT FINDING PROCEDURE (continued)

Wiring check

Fault finding problems
Disconnecting the connectors and/or manipulating the wiring harness may temporarily remove the cause of a fault.
Electrical measurements of voltage, resistance and insulation are generally correct, especially if the fault is not present when the analysis is made (stored fault).

Visual inspection
Look for damage under the bonnet and in the passenger compartment.
Carefully check the fuses, insulators and wiring harness routing.
Look for signs of oxidation.

Tactile inspection
While manipulating the wiring harness, use the diagnostic tool to note any change in fault status from stored to present.
Make sure that the connectors are properly locked.
Apply light pressure to the connectors.
Twist the wiring harness.
If there is a change in status, try to locate the source of the fault.

Inspection of each component
Disconnect the connectors and check the appearance of the clips and tabs, as well as the crimping (no crimping on the insulating section).
Make sure that the clips and tabs are properly locked in the sockets.
Check that no clips or tabs have been dislodged during connection.
Check the clip contact pressure using an appropriate model of tab.

Resistance check
Check the continuity of entire lines, then section by section.
Look for a short circuit to earth, to **+ 12 V** or to another wire.

If a fault is detected, repair or replace the wiring harness.

GETtheMANUALS.org

5. FAULT FINDING LOG

IMPORTANT

IMPORTANT
Any fault on a complex system requires thorough fault finding with the appropriate tools. The FAULT FINDING LOG, which should be completed during the procedure, enables you to keep track of the procedure which is carried out. It is an essential document when consulting the manufacturer.

IT IS THEREFORE MANDATORY TO FILL IN A FAULT FINDING LOG EVERY TIME IT IS REQUESTED BY TECHLINE OR THE WARRANTY RETURN SERVICE.

You will always be asked for this log:

- when requesting technical assistance from Techline,
- for approval requests when replacing parts for which approval is mandatory,
- to be attached to monitored parts for which reimbursement is requested. The log is needed for warranty reimbursement, and enables better analysis of the parts removed.

6. SAFETY ADVICE

Safety rules must be observed during any work on a component to prevent any damage or injury:

- check the battery voltage to avoid incorrect operation of computer functions,
- use the proper tools.

GETtheMANUALS.org

IMMOBILISER FUNCTION:

This concerns an engine immobiliser system that recognises a RENAULT card with a random rolling code (V3 encryption).
There is no longer a security code but a repair code allocated to the vehicle for life during manufacture:

– there are no numbers on the RENAULT Card,
– at the time of delivery, the vehicle does not have a label showing the code.
When working on the system, the repair code number can be requested from the local assistance network.

When requesting the code number, it is essential to provide the vehicle identification number as well as its production number. This enables the operator to identify the vehicle in order to provide the correct code.
RENAULT Cards are fitted with a backup key (1) enabling the door to be opened in the event of an operating fault.
Replacement RENAULT Cards are supplied non-coded and without an emergency metal insert.
A green cover is fitted in the place of the backup key.
When replacing a RENAULT Card, it is necessary to replace the green cover with the customer's backup key and to fit the green cover on the faulty RENAULT Card when returning it for analysis.

Note:
A backup key can be ordered from the Parts Department by quoting the vehicle security number.
This system can have up to four RENAULT Cards.
The remote control function and the battery have no effect on the immobiliser.
The **Basic** and **Hands-Free** RENAULT Cards are different and not interchangeable.
They cannot be used on a vehicle not set up for them.
In the event of a card being stolen or lost or upon the customer's request, a RENAULT Card can be de-allocated from a vehicle. It can be reallocated to the same vehicle if necessary.

Indicator light table:

Warning light illumination	Instrument panel message	Ignition on	Possible cause
Flashing	**Apply brakes + Start or declutch**	**No**	**Immobiliser on (no card recognised by reader)**
Flashing	**Reader out of order or card not detected**	**No**	**Unknown card in reader. The card does not correspond to the vehicle or has been de-allocated.**
Flashing	**Steering not locked or card not recognised**	**No**	**Faulty electric steering column lock or multiplex connection.**
Permanently on	**Faulty injection -** Faulty engine immobiliser	**Yes**	**The electric steering column lock is unlocked.** There is a fault with the vehicle injection system.
On permanently (3 seconds) then off		**Yes**	**Starting the engine**

GETtheMANUALS.org

KEYLESS VEHICLE

This function is divided into three sub-functions: Access, Protection and Starting
The **Vel-Satis Ph2** keyless system is taken from the **Espace IV**.
It has the following changes:

– hands-free opening and starting (with card detection including the tailgate),
– improved control of the access and locking zone around the vehicle,
– remote activation of lights (remote lighting).

Two options are available on the new Vel-Satis:

	Access function (locking/unlocking)	**Starting function**
Scenario 1	Pressing the card buttons	Insertion of the card in the reader, pressing the Start/Stop button. Automatic transmission conditions: – in P or N. Manual gearbox conditions: – neutral or clutch fully depressed.
Scenario 2 (hands-free)	Unlocking by gripping the handle with card close to the vehicle. Unlocking while walking away: Feedback of information by two flashes of the lights and sounding of audible warning. Manual locking/unlocking remains possible as in scenario 1. However, this action inhibits hands-free mode until the ignition is switched on again.	As the card is in the starting zone (passenger compartment, including luggage compartment), press on the Start-Stop button. Automatic transmission conditions: – in P or N + brake pedal depressed. Manual gearbox conditions: – neutral + brake pedal depressed or clutch fully depressed.

GETtheMANUALS.org

Table showing the way in which presses on the card are managed and their associated actions:

Press on the Renault card		Effect on locks	Operation of direction indicators	Operation of side mounted indicators	Operation of horn
Closing	1 short press	Central door locking	2 flashes	2 flashes	-
	2 short presses	Deadlocking of opening elements	Rapid flashing	Rapid flashing	-
	1 long press****	Closing of the windows and sunroof*	2 flashes	Rapid flashing	-
	Hands-free mode	Central door locking	2 flashes	Continuously lit for approximately 10 seconds	1 signal (configurable)
Opening	1 short press	Unlocking of the doors and luggage compartment or the driver's door**	1 flash	1 flash	-
	2 short presses	Unlocking of the doors and luggage compartment***	-	-	-
	Hands-free mode	Unlocking of the doors and luggage compartment or the driver's door**	1 flash	1 flash	-

*: for this function, the vehicle must be fitted with one-touch electric windows and anti-pinch sunroof.
**: some right-hand drive vehicles may be fitted with "Driver's door only" unlocking. This function allows the driver's door and luggage compartment only to be unlocked by pressing the Renault card briefly.
***: unlocking of doors and tailgate for vehicles fitted with "Driver's door only" unlocking.
****: on some right-hand drive versions, this function is preceded by deadlocking.

GETtheMANUALS.org

The **VSC1 keyless vehicle** system:

The system consists of:

A Renault card.
A radio frequency receiver integrated into the card reader.
An electronic controller integrated into the UCH.
An engine start push-button.
The door locks.
A red "Door locked" indicator light.
The vehicle direction indicators.
The injection computer.
The clutch pedal sensors and gearbox neutral position sensors.
The electric steering column lock.

Basic system operation

When the immobiliser system is operational, the engine immobiliser red indicator light flashes (slow flashing: once per second).
The electric steering column lock is locked.
The immobiliser is activated a few seconds after the ignition is switched off.
Once the RENAULT **Card** is inserted into the **reader, its code** is sent to the **UCH.**
If the **code is recognised** by the **UCH**, it sends a coded signal to the **electric steering column** lock via the multiplex network.
If the **coded signal** received by the electric lock is identical to the one it has in its memory, the lock releases the steering column and sends a confirmation message to the UCH.
When the **UCH** receives this message, it applies the **+ APC** and switches off the engine immobiliser red warning light.
When the ignition is on, the UCH and the injection computer send coded signals to each other via the multiplex network.
If the signals transmitted by the **UCH** and the **injection computer match, the UCH authorises the engine to start** and the injection is unlocked.

Special cases
If the injection computer or electric steering column lock has no reference code in its memory:
the code sent to it is stored in the memory.
If the codes do not match, the system remains locked.
The red immobiliser warning light flashes (rapidly) or is continuously lit.
Refer to the indicator light table.

IMPORTANT
When the vehicle battery has a low charge, the drop in voltage caused by operating the starter could reactivate the immobiliser.
If the voltage is too low, the engine cannot be started, even by pushing the vehicle.

GETtheMANUALS.org

The **VSC2 keyless vehicle** system:

The system consists of:

Access aerials:
Two or three aerials are necessary for the hands-free access function:
– An access aerial bonded into the headlining.
– A reception aerial incorporated into the card reader.
The starting aerials:
These four aerials determine the area which the card must be in to authorise starting:
– A central internal aerial (located behind the central console) (resistance: **3.8 Ω ± 0.6 Ω**).
– A front internal aerial located under the dashboard console (resistance: **2.3 Ω ± 0.4 Ω**).
– An instrument panel aerial (located behind the instrument panel, attached to the beam) (resistance of instrument panel + rear internal aerial resistance: **8 Ω ± 1 Ω**).
– A rear internal aerial (located behind the bench seat).

Two hands-free Renault cards (the system can include up to four cards).
A card reader.
An immobiliser warning light.
An electronic controller integrated into the UCH.
An engine start push-button.
An injection computer.
An airbag computer.
An anti-lock braking system computer.
A clutch pedal sensor and gearbox neutral position sensor.
A brake pedal sensor.
An electric steering column lock.
Presence sensors for each door handle.
A red "Door locked" indicator light.
The vehicle direction indicators.
The specific door locks for the deadlocking function.
An audible warning.

Starting procedure:

1st situation: starting conditions not fulfilled:
An initial press of the Start button establishes the level of accessories power supply (the presence of the card in the starting zone is not essential).
A second press activates the starting aerials and the card reading operation. If the card is recognised, the steering column is unlocked and the ignition is switched on (delay 3 minutes).

2nd situation: starting conditions fulfilled:
A single press on the Start button activates all the above-mentioned steps up to starting the engine.

GETtheMANUALS.org

Hands-free system operation

When the immobiliser system is operational, the engine immobiliser red indicator light flashes (slow flashing: once per second).
The electric steering column lock is locked.
When the Start button is pressed, the vehicle interrogates the RENAULT Card via the **125 kHz** aerial.
The RENAULT Card responds under a frequency of **433 MHz or 315 MHz** (depending on country).
The RENAULT Card code is received by the card reader and sent to the UCH.

WARNING
"Hands-free" starting of the vehicle can be deactivated by configuring the UCH.
In this case, starting the vehicle is the same as for the basic system.
If the code is recognised by the UCH, it sends a coded signal to the electric steering column lock via the multiplex network.
If the coded signal received by the electric lock is identical to the one it has in its memory, the lock releases the steering column and sends a confirmation message to the UCH.
When the UCH receives this message, it applies the + after ignition feed and switches off the engine immobiliser warning light.
When the ignition is on, the UCH and the injection computer send coded signals to each other via the multiplex network.
If the signals transmitted by the UCH and the injection computer match, the UCH authorises the engine to start and the injection is unlocked.

Note:
The Hands-Free RENAULT Card operates with a battery.
If the battery does not work, the RENAULT Card can be inserted in the reader.
The vehicle operates like a vehicle without Hands-Free.

GETtheMANUALS.org

VARIABLE POWER ASSISTED STEERING FUNCTION (variable PAS)
The computer that performs the variable power assisted steering function is the UCH.
Power supply: + APC with engine running.

Operation:
The variable power-assisted steering system (DAV) is designed to provide greater power assistance during parking manoeuvres than that provided by constant power-assisted steering (DAC), and to gradually reduce this power assistance as the vehicle speed increases. It also gives much firmer steering than DAC at high speed.

The DAV function controls the stepper motor according to the speed of the vehicle.

Hardware:

The DAV system consists of:
Hydraulics:
– A constant flow hydraulic pump.
– A hydraulic jack.
– A valve controlled by an electromechanical actuator.
– An oil reservoir.
– A pipe assembly (hydraulic connections, cooler).

Electrics:
– A source of electrical power.
– An integrated function in the UCH.
– Three vehicle status signals.
– An actuator.
– The diagnostic connection.
– The connection between the different electrical components (wiring).
– The vehicle signals: speed.

GETtheMANUALS.org

WIPING FUNCTION

The front and rear screen wiper functions must be disabled when the UCH is blank (unprogrammed). On the other hand, the diagnostic actuator commands are always possible.
The wiper motor (a serial motor) has a built-in electronic controller. This motor is driven by the UCH using a serial connection. The rain sensor, if it is fitted, communicates with the UCH and the motor via this serial connection.

Operation of opposite direction wipers with serial connection rain sensor:
When the + APC is activated, the UCH drives a two-way serial line via which it sends the various commands. The UCH reads the signals sent by the motor and the rain sensor.
The motor's electronics are supplied directly by the 12 V battery. The wiper commands (stop, automatic, low speed, high speed) are given by the UCH.
Position of the stalk in automatic mode:
When the combined wash/wipe stalk is in the auto position as the + APC is activated, the rain sensor is disabled. The rain sensor is activated on detection of a transmission of the automatic intermittent speed input or following a screen wash request (short or long press) with the wash/wipe stalk in automatic position. In this case, the sensor controls the motor directly using different speed requests depending on the type of rain.

Defect mode in the event of a faulty sensor:
In the event of line failure (no dialogue), on activation (start-up or auto using the control), the UCH will operate the windscreen wiper in permanent intermittent mode with a 5 second interval for the auto position of the wash/wipe stalk. In the event of line failure (no dialogue) during operation, the windscreen wiper control will retain the status of the last sensor command. This part of the defect mode is controlled by the internal electronics of the opposite direction wiper motor.

Note: The rain sensor is optional, it may or may not be present.

GETtheMANUALS.org

LIGHTING FUNCTION

The lighting system can be broken down into three functions:
– Direction indicators and hazard warning lights.
– Sidelights, dipped beam headlights, main beam headlights and fog lights.
– Interior lighting.

Direction indicators and hazard warning lights
Direction indicators:
The unit should instruct the left-hand or right-hand direction indicator to flash depending on the order sent by the stalk.
The buzzer integrated into the instrument panel is used to replace the indicator relay.
When the vehicle is locked using the card, the UCH must power the left- and right-hand direction indicators twice for 400 ms. However, this functionality is not activated in the following cases:
– If a door is found to be open.
– If a fault in the power supply to the electric door locking motors or in the connection is detected.

Defect mode: this is requested if one of the front or rear bulbs is faulty. Defect mode is not requested if one of the bulbs of the side-mounted repeaters is defective, as it is not possible to detect this fault.

Hazard warning lights:
The control unit must make all the right- and left-hand direction indicators flash according to the command sent by the hazard warning light control (whatever the position of the direction indicator stalk), the deceleration signal sent by the ABS computer (during emergency braking) or the signal sent by the airbag computer (in the event of impact).

Sidelights, dipped beam headlights, main beam headlights and fog lights
These functions are supplied according to the position of the lighting stalk.

Automatic headlighting (sidelights and dipped beam)
The automatic headlighting function is exclusive with the running light function (activation of lights in daytime).
This function consists of automatically activating the sidelights and dipped beam headlights. The UCH receives the request from the rain/light sensor.
Switch-off request by the sensor: if the fog lights and dipped beam headlights are not being used, they are switched off at the request of the rain/light sensor.

> Note:
> The automatic headlighting function is operational as soon as the engine is detected as running.

Operation in defect mode: if the side lights and the dipped beam headlights have been activated at the request of the sensor, failure of the latter causes the light activation command to be maintained until the engine is switched off. If the failure occurs when the main beam headlights are on, the side lights and dipped beam headlights will also be maintained until the engine is switched off.

Running lights function (activation of lights in daytime)
When the lighting stalk is in the park position, with + APC on, detection that the engine is running causes activation of the side lights and dipped beam headlights. The lights are turned off when the engine stops.

Fog light ring
Operation of the fog light ring is independent of the positions of the lighting stalk and lighting ring. The UCH receives the front and rear fog pulse inputs when there is a + 12 V supply.

GETtheMANUALS.org

TYRE FUNCTION (TYRE PRESSURE MONITOR):

This system continuously monitors the pressure status of all four tyres, indicates the tyre pressure when the ignition is switched on to within **0.1 bar** (depending on version), and warns the driver when:
– the pressure is **0.3 bar** below the recommended pressure (orange warning) or **0.6 bar** below (red warning),
– the pressure is too high,
– a tyre is leaking excessively,
– a tyre is faulty,
– there is a pressure difference between the left-hand and right-hand wheels.

Composition of the system:
The **tyre pressure monitor** consists of the following components:
– Four pressure sensors built into the valves (one per wheel, but not on the spare wheel). They send a radio signal to the receiver.
– A receiver located under the vehicle, which collects and decodes the information from the sensors and sends it to the **UCH**.
– The **UCH**, which receives the signals from the receiver and decides on the message to be displayed.
– A display (specific or integrated into the instrument panel).

Note:
A second set of four wheel sensors may be identified by the **UCH**. Respect the colour coding of the sensors according to their location.

GETtheMANUALS.org

The following table lists the functions used in the different UCH versions:

	Entry level (N1)	Top of the range (N3)
Relay/fuse box use	*	*
Direction indicators/hazard warning lights	*	*
Hazard warning lights with emergency braking	*	*
Running lights (automatic activation of the side lights and dipped beam headlights)	*	*
Automatic activation of the sidelights and dipped beam headlights	*	*
Follow me home (lighting extension)	*	*
Remote lighting	*	*
Interior lighting (38 W)	*	*
Timed feed	*	*
Side lights	*	*
Bulb failure		*
Failure of brake lights		*
Control of buzzer integrated into instrument panel	*	*
Instrument panel message display	*	*
Intermittent wiper operation	*	*
Automatic windscreen wiper operation	*	*
Opposite direction windscreen wipers	*	*
Rear screen wiper	*	*
Headlight washers	*	*
Management of door locking system	*	*
Door locking system/unlocking of driver's door only	*	*
Door locking system/locking while driving	*	*

GETtheMANUALS.org

New parts are not coded. When fitted to the vehicle, they must be programmed with a code to make them operational.

To perform this procedure, certain vehicle components must already be correctly coded (refer to the following allocation table).

IMPORTANT
Once a part is programmed with a code, it is allocated to the vehicle; the code cannot be deleted and the part cannot be reprogrammed with another code. The programmed code cannot be erased.

AFTER-SALES OPERATION	STATUS OF COMPONENTS				REPAIR CODE NEEDED
	UCH	**RENAULT Card**	**Injection computer**	**Electric steering column lock**	
Programming the **UCH**	Blank	Programmed	Programmed	-	YES
Programming the **RENAULT Card**	Programmed	Blank*	Programmed	Coded	YES
Programming the **injection computer**	Programmed	Programmed	Blank	Coded	NO
Programming the **electric steering column lock**	Programmed	Programmed	-	Blank	NO

*: The RENAULT Card allocated to a vehicle must be blank or already programmed on this vehicle.
NOTE: These may be programmed on a vehicle but not yet operational (not assigned).

GETtheMANUALS.org

REPLACEMENT OF THE UCH:

A new **UCH** is not coded. When fitted to the vehicle, it must be programmed with a code to make it operational.
To perform this procedure, you must have at least one of the old RENAULT Cards for the vehicle, plus the repair code, and the injection computer must be correctly coded.

IMPORTANT
Once a code has been programmed into the **UCH**, it is allocated to the vehicle and it is not possible to program the UCH with another one.

Manually enter the VIN code on the first page of the Clip tool.
Run the Multiplex network test.
The tool displays Vehicle configuration unknown:
Check the undetected or unrecognised computers.
Click on OK.
In the screen with the list of computers, click on continue.
Select the passenger compartment then click on Run fault finding.
Click on the repair mode and on the program menu.

REMINDER: only the RENAULT cards submitted during the allocation process will be operational. To allocate the cards to the vehicle, run **SC010 Program cards**.

Note:
After each replacement of the **UCH**, carry out the configurations associated with the functions available on the vehicle. Functions not configured will not be operational.
To perform the configurations, see **Configuration and programming**).

WARNING
After each replacement of the UCH, do not forget to program the electrical windows (see **Configuration and programming**), and to re-enter the radio and navigation codes.

GETtheMANUALS.org

REPLACEMENT OF THE ELECTRIC STEERING COLUMN LOCK:

A new **steering column lock** is not coded. It will therefore be important to program it with a code to make it operational.
To perform this procedure, you must have at least one of the old RENAULT Cards for the vehicle, and a **UCH** already coded on the vehicle.

Note:
When replacing the steering column lock (see MR 402 Mechanical systems, 82A, Immobiliser, Removing-refitting the steering column lock).

Note:
WHENEVER REPLACING THE COMPUTER, PERFORM A VIN ENTRY OPERATION (perform the VP004 configuration operation).

REPLACING THE RAIN/LIGHT SENSOR (Vdiag 15 only):

When replacing the rain/light sensor, see **MR 402 Mechanical systems, 85A, wipers - washing**.
Before replacing any rain/light sensor, check that the new rain/light sensor has the same part number as the old one.
After replacing the rain/light sensor, apply configuration **CF199 Rain sensor type** (see **configuration and programming**).

GETtheMANUALS.org

CONFIGURATIONS

NOTES	**These configuration operations must be carried out every time a UCH is replaced and must be checked during every fault finding procedure.**

Index	Title	Specifications and notes
CF009 LC003	Deadlocking	**With or Without**
CF 010 LC001	Hands-free function	**With or Without**
CF011 LC005	Gearbox type	**Manual or Automatic transmission** With manual or automatic transmission
CF014 LC008	Daytime running lights	**With or Without** Warning, do not configure without checking the vehicle specification and the wiring used, otherwise this may not work
CF020 LC014	Type of driving style	**Right-hand or left-hand** With right-hand drive or left-hand drive
CF023 LC017	Tyre Pressure Monitor Function	**With or Without** Tyre Pressure Monitor function.
CF024 LC018	Hazard warning lights switched on by ABS	**With or Without** (In certain countries such as the UK, automatic hazard warning lights during emergency braking are forbidden)
CF030 LC033	Xenon bulb	**With or Without** xenon bulb function
CF032 LC025	See-me-home lighting:	**With or Without**
CF 033 LC026	Electric child safety lock	**With or Without**
CF035 LC044	Rain/light sensor	**With or Without**
CF036 LC029	Selective door opening	**With** This configuration allows the driver's door and luggage compartment lid only to be unlocked on right-hand drive versions when the vehicle is unlocked (normal or hands-free).
CF088 LC049	Automatic door locking warning beep	**Without, 1, 2, 3, 4, 5, 6 or 7** This configuration is used to adjust the buzzer volume. The buzzer is activated when the vehicle is locked using the hands-free function.

GETtheMANUALS.org

NOTES	**These configuration operations must be carried out every time a UCH is replaced and must be checked during every fault finding procedure.**

Index	Title	Features and comments
CF089 LC050	Driver's seat position memory	**With or Without**
CF091 LC052	Sunroof	**With or Without**
CF097 LC011	Vehicle type	**Vel-Satis Ph 2 or Espace IV** Run this command every time the computer is modified or replaced.

CF120 LC057	Auto.* window closing (with card)	**With or Without** automatic window closing function (using the card)
CF132 LC051	Vehicle family (Vdiag 14 only)	**Estate or hatch**
CF134 LC063	Type of power-assisted steering	**Basic or variable**
CF169 LC068	Automatic headlighting	**With or without** If the vehicle is equipped with a rain sensor, the function can be configured. Once it has been configured, it can be activated or deactivated by flashing the **dipped headlights** twice
CF174 LC071	Selective opening element opening inhibition	**With** This configuration allows all doors and luggage compartment lid/tailgate to be unlocked on right-hand drive versions when the vehicle is unlocked (normal or hands-free).
LC027	Valve set	**Summer or winter**
LC040	Automatic locking when driving	**With or Without**
CF186 LC092	Automatic fold-in of door mirrors (Vdiag 15 only)	**With or Without** To be configured **WITH** on vehicles with production numbers more recent than S321163 and if the vehicle is fitted with "FR* SEATS WITH MEMORY FUNCTION" (Refer to information available on ICM**).
CF131 LC060	Voice synthesiser	**With or Without**

* auto: automatic
** ICM: Shared World Information
* FR = front

GETtheMANUALS.org

NOTES	**These configuration operations must be carried out every time a UCH is replaced and must be checked during every fault finding procedure.**

Index	Title	Specifications and notes
CF199 **LC101**	**Type of rain/light sensor** (Vdiag 15 only)	In order to identify the rain/light sensor, remove the plastic cover located on the top section of the rear view mirror to display the RENAULT part number on the sensor. **OLD:** This configuration can be applied to all old rain/light sensors (Part no.: 8200063060). Each time the engine is stopped, the user will have to initialise the sensor by activating the windscreen wipers once to make the rain/light sensor operational. **NEW:** This configuration can be applied to sensor part numbers (different to part number: 8200063060). In this case, the user does not need to initialise the rain/light sensor each time the engine is stopped. **SPARE:** This configuration applies to new sensors **only by request of the Techline**. An old sensor will not work if it is configured in this way. This configuration enables a new rain/light sensor to work with initialisation: in this case, each time the engine is stopped, the user will have to initialise the sensor by activating the windscreen wipers to make the rain/light sensor operational.

GETtheMANUALS.org

PROGRAMMING

MANUAL PROGRAMMING OF THE ELECTRICAL WINDOWS:

NOTES	Perform this programming after replacing the **UCH**.

Switch on the ignition.
Lower the electric window to its lower limit.
Raise the electric window to its upper limit.
Electric window programming must be carried out.

Carry out this operation on the other electric windows.

GETtheMANUALS.org

VALVE/WHEEL MATCHING:

Each sensor is matched to a wheel during vehicle manufacture when the UCH is programmed with the identification codes. This is necessary so that a faulty wheel can be identified, as the receiver cannot determine the position of the wheel transmitting.

Changing wheels over without programming the valve codes is **PROHIBITED**. If the wheels are changed over on the vehicle, replace the valve rings at the location described below:
Front left-hand: green
Rear left-hand: red
Front right-hand: yellow
Rear right-hand: black

If the driver wants to swap over his wheels, there are two possible solutions:
– Either remove each sensor and then replace it in its original position on the vehicle;
– Or, using the diagnostic tool, reprogram the new sensor positions into the UCH (you would then need to swap the coloured rings so that they correspond to the order described above).

How do you find out the sensor codes?

There are three possible solutions:
– **The sensor is new:** it has a two-part label, one of which is detachable. The code is written on both parts. The detachable part is used to remind the operator of the code after fitting the sensor on the wheel (it is advisable to temporarily affix this label to the wheel where the sensor is fitted).
– **The sensor is used:** If removed with the label still attached on top, its code can be read.
– **The sensor is already fitted to the wheel and no label is visible:**

In this case:
– either remove the tyre and read the number on the sensor,
– or acquire the sensor codes with the diagnostic tool. The difficulty is that each sensor only transmits once every hour when stationary. Furthermore, if more than one sensor is fitted, it is not possible to determine which sensor transmitted. In this case:
– **either run the wheel at over 12 mph (20 km/h) so that the sensor transmits more often and can therefore be noted (wheel balancer, driving with just one wheel fitted),**
– or force the sensor to transmit using the valve exciter (code feedback and valve status changes to Status 1).

GETtheMANUALS.org

SC002	PROGRAMMING THE 4 VALVE CODES

NOTES	Run this command after replacing the four valves. See above-mentioned section Valve/Wheel matching. **Special note:** Any operations involving valve replacement should not be attempted without full knowledge of the recommendations defined in the **Workshop Repair Manual section 35**.

WARNING
– Check that each sensor is used on the correct wheel:
Green = front left-hand
Yellow = front right-hand
Red = rear left-hand
Black = rear right-hand
– Exercise care when matching valve and wheel codes.
– Ensure that fault **DF052 Valve signal receiver** is not present.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

SC002 **CONTINUED**	

There are two possible solutions for programming valve codes:
– With the valve exciter.
– Without the valve exciter.

Automatic programming with valve exciter:
To carry out this programming it is essential to use tool **MS. 1607**.
Procedure:
Establish dialogue with the UCH.
Select the **repair mode** menu.
Select the **Programming** menu.
Select **Tyre programming**.
Confirm scenario **SC002: "Programming the 4 valve codes"**.
Confirm the steps described in the scenario.
End of procedure. The UCH has been programmed with the valve codes.

Manual programming without valve exciter:
For this programming, it is important to use the valve code indicated on the label on the wheel sensor concerned.
Procedure:
Establish dialogue with the UCH.
Select the **repair mode** menu.
Select the **Programming** menu.
Select **Tyre programming**.
Confirm scenario **SC002: "Programming the 4 valve codes"**.
Confirm the steps described in the scenario.
End of procedure. The UCH has been programmed with the valve codes.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

GENERAL INFORMATION

The engine immobiliser protection system is controlled by a RENAULT card recognition system with random rolling code.

A coded transponder chip key (operating without a battery) independent of the remote control function is built into each of the vehicle's RENAULT Cards.

The engine immobiliser is active a few seconds after the RENAULT Card is removed from the card reader. When the RENAULT card is removed from the reader, the red warning light flashes on the instrument panel and the steering column lock locks.

To obtain the immobiliser code, see **Technical Note 5037A, Code supply procedure 82A, Immobiliser**.

There are two programming methods: "Not connected" to the code server mode and "connected" to the code server mode.
- In the "not connected" mode, CLIP supplies a programming key and the user enters the immobiliser code.
- In the "connected" mode, CLIP automatically exchanges the programming key and the immobiliser code.

IMPORTANT
If not all of the Renault cards are available, reallocate all Renault cards later. Cards not inserted will no longer be allocated to this vehicle.

IMPORTANT
In "not connected" mode, once the tool has issued the programming key, the user has a limited amount of time in which to enter the immobiliser code.
If this time expires, the CLIP **diagnostic tool** displays the message **"Time expired. Restart the procedure"**.

Note:
If just the UCH is being replaced. There are no operations to be carried out on the injection computer or on the steering column lock. The injection computer and the steering column lock keep the same immobiliser code.

IMPORTANT
Once a part is programmed with a code, it is allocated to the vehicle; the code cannot be deleted and the part cannot be reprogrammed with another code. The programmed code cannot be erased.

IMPORTANT
In "connected" mode, the exchange of the programming key and the entry of the immobiliser code is done automatically.
If the connection parameters are not met, "connected" mode switches automatically to "not connected" mode.

GETtheMANUALS.org

SC004	PROGRAMMING THE UCH

Equipment required
CLIP

The role of this command is to code the UCH.

Use this command only with a new and blank UCH.

A new UCH is not coded and is therefore not assigned to the vehicle; once it is fitted on the vehicle, it must be programmed to assign it to the vehicle.

To carry out this programming operation, you will need to have:
– **a card belonging to the vehicle** (allocated to the old UCH).

Before starting this operation, make sure that there are no components capable of interfering with the electromagnetic field (e.g.: CB (Citizen Band), mobile phone, etc.).

Note:
After an injection computer has been replaced, there are no operations to be performed on the UCH. It retains the same immobiliser code.

Note:
After only the UCH has been replaced, there are no operations to be performed on the injection computers. The computers keep the same immobiliser code.

IMPORTANT
When the UCH programming procedure is successfully completed, the UCH is no longer blank and is permanently assigned to the vehicle. It will not work on another vehicle.

IMPORTANT
When the programming operation is complete, only remove the key once the message **Programming complete** is displayed on the screen. Otherwise, programming has failed and the UCH cannot be used.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

SC004 (CONTINUED)	

IMPORTANT
– Do not interrupt the procedure when it is in progress.
– If it is interrupted, restart the procedure; a new programming key will be displayed.

UCH programming procedure

– Establish dialogue with the UCH.
– Select the **repair mode** menu.
– Select the **Secure programming** menu.
– Select line **S0004 UCH programming**.

Follow the instructions on the **CLIP diagnostic tool**.
In "not connected" mode, when the **CLIP diagnostic tool** displays the programming key, make a note of this key and the VIN.
To obtain the immobiliser code, see **Technical Note 5037A, Code supply procedure 82A, Immobiliser**.

IMPORTANT
In "not connected" mode, the programming key can only be used for a limited amount of time, as indicated by the CLIP **diagnostic tool**. After this time has expired, the programming key and its associated immobiliser code are no longer valid. The operation must be restarted from the beginning.

Operations to be carried out after programming the UCH

- Enter the vehicle's VIN to the computer using command **VP004 Enter VIN**.
- After programming the UCH, allocate all the cards using command **SC010 Allocate cards**.
- Configure the equipment that may or may not be present on the vehicle using the commands (see **Configuration and programming**).

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

SC009	PROGRAMMING A VALVE CODE

NOTES	Activate this command after the valve replacement. See above-mentioned section Valve/Wheel matching. **Special note:** Any operations involving valve replacement should not be attempted without full knowledge of the recommendations defined in the Workshop Repair Manual section 35.

WARNING
– Check that each sensor is in used on the corresponding wheel:
Green = front left-hand
Yellow = front right-hand
Red = rear left-hand
Black = rear right-hand
– Exercise care when matching valve and wheel codes.
– Ensure that fault **DF052 Valve signal receiver** is not present.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

SC009 **CONTINUED**	

There are two possible solutions for programming valve codes:
– With the valve exciter.
– Without the valve exciter.

Automatic programming with valve exciter:
To carry out this programming it is essential to use tool **MS. 1607**.
Procedure:
Establish dialogue with the UCH.
Select the **repair mode** menu.
Select the **Programming** menu.
Select **Tyre programming**.
Confirm scenario **SC009: "Programming a valve code"**.
Confirm the steps described in the scenario.
End of procedure. The UCH has been programmed with the valve codes.

Manual programming without valve exciter:
Procedure:
Establish dialogue with the UCH.
Select the **repair mode** menu.
Select the **Programming** menu.
Select **Tyre programming**.
Confirm scenario **SC009: "Programming a valve code"**.
Confirm the steps described in the scenario.
End of procedure. The UCH has been programmed with the valve codes.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

SC010	CARD ALLOCATION

Equipment required
CLIP

IMPORTANT
It is not possible to allocate more than two blank cards per operation. If there are more than 2 blank cards to be allocated: allocate 2 blank cards, then restart the procedure with all the cards.

IMPORTANT
Only cards which have been ordered for the vehicle concerned or the vehicle's old cards can be inserted.

IMPORTANT
– Do not interrupt the procedure when it is in progress.
– If it is interrupted, restart the procedure; a new programming key will be displayed.

– Run the Multiplex network test.
– Establish dialogue with the UCH.
– Select the **Repair mode** menu.
– Select the **Secure programming** menu.
– Confirm the line **SC010 Allocate cards**.
The card allocation procedure takes place in two parts:
1 Card insertion stage.
2 Card allocation stage.

Card insertion stage:
The CLIP diagnostic tool requests that the cards to be allocated are inserted. Insert ALL the cards to be allocated (old and new blank cards), any cards not inserted at this stage will be rejected in the **Card allocation** stage and the operation will have to be restarted from the beginning. Once all the cards are inserted, the **Clip diagnostic tool** displays the programming key. To obtain the immobiliser code see **Technical Note 5037A, Code supply procedure, 82A, Immobiliser**.

IMPORTANT
In "not connected" mode, the programming key can only be used for a limited amount of time, as indicated by the **CLIP diagnostic tool**. After this time has expired, the programming key and its associated immobiliser code are no longer valid. The operation must be restarted from the beginning.

Card allocation stage:
Continue the procedure following the instructions on **the CLIP diagnostic tool**.
– Once the cards have been allocated, make sure that all the cards can lock and start the vehicle.

With this system it is not possible to replace some components, such as the UCH and the Renault card as these parts are sold blank and uncoded. These components cannot be coded when replaced unless they have the vehicle's original code stored.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

DF001 PRESENT OR STORED	UCH 1.DEF: Internal electronic fault

NOTES	Switch on the ignition.

If the fault is present:
Switch off the ignition.
Disconnect the battery to initialise the **UCH**.
If the fault is still present, contact the Techline.

AFTER REPAIR	Reconfigure the UCH.

GETtheMANUALS.org

DF002 PRESENT OR STORED	STEERING LOCK 1.DEF: Steering lock internal electronic fault

NOTES	Switch the ignition on and off and check the steering lock is released and locked. **Special note:** If the fault is present the immobiliser warning light remains continuously lit.

If the fault is stored:
Disconnect the battery to initialise the **UCH**.
If the fault is still stored, contact the Techline.

If the fault is present:
Replace the steering column lock. For replacement of the **steering column lock**, (see **MR 402 Mechanical, 82A Immobiliser, Removal - Refitting of the steering column lock**).
WARNING
The steering column lock is secured with a reverse thread bolt (left-hand thread). Furthermore, it can only be removed if it has been released beforehand.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF003 PRESENT OR STORED	CLUTCH SWITCH CIRCUIT CC: Short circuit CO: Open circuit

NOTES	**This fault only applies to manual gearboxes.** There must be no present or stored faults. Switch on the ignition. Depress the clutch pedal.
	The fault appears following: Vehicle being driven at a speed above **3 mph** (**5 km/h**) with the clutch **depressed** for more than **2 minutes** or the vehicle going from **0 to 36 mph** (**0 to 60 km/h**) **128 times** without the clutch signal appearing.
	Special notes: Switch on the ignition. The status **ET048** must be **DEPRESSED** when the clutch pedal is depressed.

Check the connection and condition of the connector for the **clutch pedal switch**.
Make sure that the clutch pedal switch is correctly positioned.
Repair if necessary.

Check for an earth on **track 2** of the **clutch pedal switch**.
Repair if necessary.

Check the **continuity** between **tracks 1** and **2** of the **clutch pedal switch** in the depressed position.
If it is not correct, replace the **clutch pedal switch**.

Check the condition and connection of the black connector**P100** for the **UCH**.
Repair if necessary.

Check the **insulation and continuity** of the following connection:

UCH black connector **P100** (40 track), green connection strip **track 26** ⟶ **Track 1 clutch pedal switch**

If the fault is still present, replace the **clutch pedal switch**.
If the fault is still present contact Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF005 PRESENT	CARD 1.DEF: Card no. 1 battery low 2.DEF: Card no. 2 battery low 3.DEF: Card no. 3 battery low 4.DEF: Card no. 4 battery low

NOTES	**Condition for appearance of the fault:** The fault appears when the card battery voltage is less than **2.6V**.

Replace the battery in the faulty card.
If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF006 **DF007** **DF008** **DF009** **PRESENT** **OR** **STORED**	FRONT LEFT-HAND WHEEL VALVE SENSOR FRONT RIGHT-HAND WHEEL VALVE SENSOR REAR RIGHT-HAND WHEEL VALVE SENSOR REAR LEFT-HAND WHEEL VALVE SENSOR 1.DEF: No sensor signal

NOTES	These faults only apply if the vehicle is fitted with a tyre pressure monitor: check that **CFD23 Tyre pressure monitor** is **WITH**. **Priority for dealing with a combination of faults:** **DF052**
	Conditions for carrying out a fault finding test on the fault stored. The fault becomes present after a road test.
	Special note: Before any operation, ensure that all the wheels fitted have tyre pressure monitor valves (or that the emergency spare wheel has not been fitted on one of the axles).

The absence of a valve signal may be due to incorrect programming of the valve code or to a faulty valve.
Carry out programming on the valve concerned (see **SC009**), clear the fault and carry out a road test.
If the fault has been rectified, fault finding can end here.
If the fault is still present:
If using a valve exciter:
Take a reading of the valve status from the status menu:
ET032 (FRONT LEFT-HAND WHEEL VALVE SIGNAL)
ET033 (FRONT RIGHT-HAND WHEEL VALVE SIGNAL)
ET034 (REAR RIGHT-HAND WHEEL VALVE SIGNAL)
ET035 (REAR LEFT-HAND WHEEL VALVE SIGNAL)
Perform a forced signal transmission from the faulty valve, if the **STATUS1 FORCED SIGNAL** is not obtained, then replace the valve and perform the programming **SC009 Programming a valve code**.
If not using a valve exciter:
Take a reading of the valve condition in the status menu.
Create an air leak > 0.86 bar and carry out a road test (or wait a quarter of an hour). Note that its status changes to **STATUS3 Transmission due to a pressure variation**.
If **STATUS3** remains the same as the status noted previously, replace the valve and carry out the programming **SC009 Programming a valve code**.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF011 PRESENT OR STORED	RAIN/LIGHT SENSOR CIRCUIT 1.DEF: Open circuit or short circuit 2.DEF: Sensor internal electronic fault

NOTES	Switch on the ignition, put the windscreen wiper stalk in the automatic position or put the lighting stalk in the automatic position to confirm the fault. The status **ET114 Windscreen wiper request by rain detector** should be Yes or the status **ET278 Automatic activation of the headlights** should be Active or the status **ET115 Headlight activation request by rain sensor** should be Active. Check that the vehicle is configured with a rain/light sensor. Check that **CF035 Rain/light sensor** is **WITH**.

1.DEF	***NOTES***	None.

Check the condition and position of the **F24 (20 A)** fuse in the **Passenger compartment fuse and relay box**.
Check the condition and connection of the black 40-track connector **P100** for the UCH and the connector for the rain sensor.
Check for the **supply** between **track 1** of the **rain/light sensor** and the **front left-hand earth**.
Check the **insulation and the continuity** of the following connections: **UCH** black connector **P100** (40 track), green connection strip **track 23** → **Track 3 rain/light sensor** **Rain/light sensor track 2** → **Front left-hand earth (MB)** **Passenger Compartment Relay/Fuse Box** black connector (CGB2), white connection strip **track 6** → **Track 1 Rain/light sensor**
If the fault is still present, check the **R260 intermediate connector (grey)** on **tracks 8 and 3**. Repair if necessary.
If the fault is still present, replace the rain/light sensor.
If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

GETtheMANUALS.org

DF028 PRESENT OR STORED	DRIVER'S SEAT POSITION MEMORY CONNECTION 1.DEF: Open circuit or short circuit

NOTES	Switch on the ignition.

Check that the **UCH** is not configured with seat position memory when the feature is not available on the vehicle.

Check the condition and connection of the white 40-track connector **P101** for the **UCH** and check the connector for the seat position memory computer.

Check the **insulation and the continuity** of the following connections:

UCH white connector **P101** green connection strip**track 32** → **Track 27 passenger door multiplex computer**

UCH white connector **P101** green connection strip **track 36** → **Track 15 passenger door multiplex computer**

UCH black connector **P100** green connection strip **track 21** → **Track 27 driver's door multiplex computer**

If the fault is still present, check the **R154** intermediate connector on **tracks D3 and D4**.
Check the intermediate connector **R153 track C8**.
Repair if necessary.

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF029 PRESENT	STEERING LOCK CIRCUIT CC.1: Short circuit to +12 volts CO.0: Open circuit or short circuit to earth 1.DEF: Lock earth not present or multiplex network fault (e.g.: steering column lock → **UCH** connection)

NOTES	Switch on the ignition.

CC.1 ***CO.1***	***NOTES***	None.

Carry out a multiplex network test.

Check that the steering column lock is correct for the vehicle.

Check the condition and connection of the white 40-track connector **P101** for the **UCH** and the connector for the steering column lock.

Check the **insulation and the continuity** of the following connections:

UCH white 40-track connector **P101** brown connection strip **track 9**	→	**Track 2** connector **for the steering column lock**
UCH white 40-track connector **P101** brown connection strip **track 10**	→	**Track 4** connector for the **steering column lock**
connector for the **steering column lock track 1**	→	Vehicle **earth**
Diagnostic socket **track 6**	→	**Track 3** connector for the **steering column lock**
Diagnostic socket **track 14**	→	**Track 6** connector for the **steering column lock**

Repair if necessary.

If the fault is still present, replace the steering column lock.

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF029 **CONTINUED**	

1.DEF	***NOTES***	**Special notes**: None.

Carry out a multiplex network test.
Check the **insulation and the continuity** of the following connections: connector for the **steering column lock track 1** ⟶ Vehicle **earth** Repair if necessary.
If the fault is still present, replace the steering column lock.
If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF037 PRESENT OR STORED	STRIKER PLATE CONTROL RELAY CIRCUIT CC.1: Short circuit to + 12 volts

NOTES	**Special notes:** Open the luggage compartment and confirm the fault.

Check for **+12 V** on the tailgate striker panel, component code **1151** on the following connection:
- **BP3A** of component **1151**.

Check the **continuity, insulation**, and the **absence of interference resistance** on the following connection:
- **BP3A** between components **1151** and **260**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Check **for earth** on the tailgate striker panel, component code **1151** between the following connection:
- **MF** of component **1151**.

Check the **continuity, insulation**, and the **absence of interference resistance** on the following connection:
- **MF** between component **1151** and **earth**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Check the **continuity, insulation**, and the **absence of interference resistance** on the following connection:
- **H81** between components **1151** and **645**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Open the tailgate and measure the voltage on connection **H81** at the connector end of component **1151**.
If the voltage is approaching **12 V**, replace the tailgate striker panel, component code **1151**.

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF040 PRESENT OR STORED	REAR SCREEN WIPER PARK POSITION 1.DEF: Unidentified electrical fault

NOTES	Switch on the ignition and operate the **rear screen wiper**.

Check that there is nothing interfering with the operation of the **rear screen wiper** motor and wiper arm and that they are not jammed.

Check the condition and position of the **F14 (30 A)** fuse in the **passenger compartment fuse and relay box**.
Check for the presence of **+ after ignition feed** on **track 1** of the **rear screen wiper motor**.
Check for the **earth** on **track 3** of the **rear screen wiper**.

Check the condition and connection of the black 40-track connector **P100** for the **UCH** and the connector for the **rear screen wiper motor**.

Check the insulation, continuity and the absence of interference resistance on the following connections:

Rear left-hand earth	→	**Track 3** connector for the **rear screen wiper motor**
Passenger compartment fuse and relay box, grey connector, white connection strip **track 6**	→	**Track 1** connector for the **rear screen wiper motor**
UCH black connector **P100**, green connection strip **track 38**	→	**Track 2** connector for the **rear screen wiper motor**

If the fault is still present, check the **R355 intermediate connector on tracks 1 and 5**.
Repair if necessary.

If the fault is still present, replace the **rear screen wiper motor**.

If the fault is still present contact Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF050 **DF051** **PRESENT**	FRONT TYRE PRESSURE IMBALANCE REAR TYRE PRESSURE IMBALANCE

NOTES	Ensure that all the wheels fitted have tyre pressure monitor valves, and that the spare wheel has not been fitted.

Check to ensure that the fault is not caused by the wheels having been switched around: see paragraph on **Pairing the valve to the wheel**in the section on **Configuration and programming**.
Check that the recommended pressures entered correspond with the manufacturer's recommendations.
PR009 Front wheels low speed recommended pressure.
PR010 Rear wheels low speed recommended pressure.
PR011 Rear wheels high speed recommended pressure.
PR012 Front wheels high speed recommended pressure.
If they do not, refer to the Procedure for entering the recommended pressures, and run command **VP005 Enter recommended pressures**.
If the entry is correct, check the pressures using a pressure gauge, check the tyre pressure according to the manufacturer's information.
Check that the vehicle is configured with the tyre pressure monitor: **CF023 Tyre pressure monitor** should be **WITH**.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF052 PRESENT OR STORED	VALVE SIGNAL RECEIVER 2.DEF: Open circuit or short circuit 1.DEF: Unidentified electrical fault

NOTES	**Special note:** When the vehicle is stored, removing the short circuit fuse will lead to a stored fault; in this case, do not replace the receiver and clear the fault. If the customer complaint refers to the intermittent disappearance of the four wheels from the display, then apply the interpretation for this fault.

1.DEF	***NOTES***	None.

Check that the **UCH** is not configured with the Tyre Pressure Monitor (SSPP) when the system is not available on the vehicle.
Check the condition and connection of the white 40-track connector **P100**for the **UCH** and the connector for the tyre pressure monitor receiver (SSPP).
Check the condition and position of the **F50 (20 A)** fuse in the **passenger compartment fuse and relay box**.
Check that there is a supply between: **Earth** → **Track 3** of the connector for the underbody receiver **F50 unit fuse** → **Track 4** of the connector for the underbody receiver
Ensure the continuity and the insulation of the following connection: Receiver connector **track 1** → **Track 18** UCH **P100**, black connector, brown connection strip
If the fault is still present, switch off the ignition and change the underbody receiver.
If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF052 **CONTINUED**	

1.DEF	***NOTES***	None.

Check that the **UCH** is not configured with the **tyre pressure monitor** if the vehicle is not fitted with it.
Check the connection and status of the **P100** 40 track UCH black connector and the **tyre pressure monitor** receiver connector.
Manipulate the wiring harness between the **UCH** and the **Tyre Pressure Signal Unit**, to check for a change in fault status (Present ↔ Stored). Look for possible damage to the wiring harness and check the condition of the black connector **P100 for the Tyre Pressure Signal Unit** and check the condition of the connector for the **Tyre Pressure Signal Unit**. Repair if necessary.
Check for the presence of **+ 12 V** on **track 4** of the **Tyre Pressure Signal Unit** connector.
Check the **insulation, continuity and absence of interference resistance** on the following connections: UCH black connector **P100, brown** connection strip **Track 18** → **Track 1** Connector for the **underbody receiver** **Underbody receiver connector track 3** → **Tunnel electronic earth**
Check the **intermediate connector R351 track 2**. Repair if necessary

Manipulate the wiring harness between **unit fuse F50 (20 A)** and the **Tyre Pressure Signal Unit** to check for a change in fault status (Present ↔ Stored). Look for possible damage to the wiring harness and check the condition of the black connector **P100 for the Tyre Pressure Signal Unit** and check the condition of the connector for the **Tyre Pressure Signal Unit**. Repair if necessary.
Check for the presence of **+ 12 V** on **track 4** of the **Tyre Pressure Signal Unit** connector.
Check the **insulation, continuity and absence of interference resistance** on the following connection: **underbody receiver track 4** → **F50 unit fuse (20A)** Check the **intermediate connector R351 track 2**. Repair if necessary.
If the fault is still present, replace the **Tyre Pressure Signal Unit**.
If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF053 PRESENT OR STORED	VEHICLE SPEED SIGNAL 1.DEF: No vehicle speed signal 2.DEF: Inconsistent vehicle speed

NOTES	None.

Carry out fault finding on the **multiplex network** (see **88B, Multiplexing**).
Run a complete fault finding procedure on the **ABS system** (see **38C, Anti-lock braking system**).

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF055 PRESENT OR STORED	CARD PRESENT SWITCH CIRCUIT CO.0: Open circuit or short circuit to earth

NOTES	Insert the card halfway into the reader. The vehicle must be equipped with the VSC1 cardless vehicle system only.

Check the condition and position of the **F11 (10 A)** fuse in the passenger compartment fuse box.

Check the condition and connection of the connectors **P101** and **P100** for the **UCH** and the connector for the card reader.

Check for the presence of an earth on **track 8** and check for **+ 12V** on **track 2** of the card reader.

Check the continuity and insulation of the following connections:

UCH white connector **P101, brown connection strip, track 12**	→	**Track 5** card reader
UCH black connector **P100, brown connection strip, track 1**	→	**Track 7** card reader
UCH black connector **P100, brown connection strip, track 6**	→	**Track 1** card reader
UCH black connector **P100, brown connection strip, track 19**	→	**Track 4** card reader

Repair if necessary.

If the fault is still present, replace the card reader.

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF056 PRESENT OR STORED	CARD FULLY INSERTED SWITCH CIRCUIT CO.0: Open circuit or short circuit to earth

NOTES	Insert the card into the card reader up to the stop. Not used if vehicle has "hands-free" option.

Check the condition and positioning of the **F11 10A** fuse in the passenger compartment fuse box.

Check the condition and connection of the connectors **P101** and **P100** for the **UCH** and the connector for the card reader.

Check for the presence of an earth on **track 8** and check for **+ 12V** on **track 2** of the card reader.

Check the continuity and insulation of the following connections:

UCH white connector **P101, brown connection strip, track 12**	→	**Track 5** card reader
UCH black connector **P100, brown connection strip, track 1**	→	**Track 7** card reader
UCH black connector **P100, brown connection strip, track 6**	→	**Track 1** card reader
UCH black connector **P100, brown connection strip, track 19**	→	**Track 4** card reader

Repair if necessary.

If the fault is still present, replace the card reader.

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF058 PRESENT OR STORED	NEUTRAL SWITCH CIRCUIT CC.1: Short-circuit to + 12 V CO: Open circuit

NOTES	**On manual gearboxes only.** Switch on the ignition. Select neutral: the switch status must be active.

Check the condition and position of the **F24** (**20 A**) fuse in the passenger compartment fuse box.
Check the condition and connection of the black 40-track connector **P100** for the **UCH** and the connector for the neutral switch.
Check the insulation, continuity and the absence of interference resistance on the following connection: UCH black connector **P100** 40 track **Track 7** ⟶ **Track 3** Switch
Check for the presence of **+ after ignition feed** on **track 2** of the neutral switch.
Check that the switch is correctly fitted to the gearbox, dismantle the switch and press the On/Off switch. The neutral switch status changes to active and then the reversing lights come on. Replace the switch if it is faulty.
If the fault is still present, replace the switch.
If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF060 PRESENT OR STORED	+ 12 V AFTER IGNITION FEED RELAY CONTROL CIRCUIT CC: Short circuit 1.DEF: After ignition inconsistency

NOTES	Switch on the ignition.

CC	***NOTES***	None.

Check the correct operation and position of the **+ after ignition feed relay** (**RL 22**) on the fuse and relay box. Replace it if necessary.
If the fault is still present, replace the relay **RL 22**.
If the fault is still present, contact the Techline.

1.DEF	***NOTES***	None.

In the wiring, check that there is no short circuit between **+ before ignition feed** and **+ after ignition feed** or between **+ accessories feed** and **+ after ignition feed** (e.g. window switch, brake light switch)
Check the correct operation and position of the **+ after ignition feed** relay on the fuse and relay box. Replace it if necessary.
If the fault is still present, replace the relay **RL 22**. If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF061 PRESENT OR STORED	+ 12 V ACCESSORIES FEED RELAY CONTROL CIRCUIT CC: Short circuit

NOTES	Switch on the ignition.

Check the condition of the connectors **U1** and **U2** for the **UCH** as well as the connectors for the fuse and relay box. Check that the fuse and relay box is correctly positioned and connected to the **UCH**.
Check the operation of the **+ accessories feed relays** (**RL 18** and **19**) on the fuse and relay box. Replace the relays if necessary.
If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF062 PRESENT OR STORED	STARTER RELAY CONTROL CIRCUIT CC: Short circuit

NOTES	Switch on the ignition.

Check the condition of the **UCH** U1 and U2 connectors and the fuse and relay box connectors. Check that the fuse and relay box is correctly positioned and connected to the **UCH**.
Check that the **internal starter relay RL 20** is operating correctly.
If the fault is still present, replace the **Passenger Compartment Fuse and Relay Box**.
If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF064 PRESENT	IMMOBILISER WARNING LIGHT CIRCUIT 1.DEF: Open circuit or short circuit

NOTES	Switch on the ignition.

Check the condition and connection of the white 40-track connector **P101** for the **UCH** and the connector for the instrument panel.
Check the insulation, continuity and absence of interference resistance on the following connection: **UCH** white connector **P101 track 14** ⟶ **Track 5** of the Instrument Panel Repair if necessary.
If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF067 **DF068** **PRESENT**	VALVE CODES FOR THE SUMMER SET OF WHEELS VALVE CODES FOR THE WINTER SET OF WHEELS 1.DEF: At least one valve code is missing 2.DEF : There are at least two identical valve codes

NOTES	Any operations involving changing a valve or replacing a tyre should not be attempted without full knowledge of the recommendations laid out in the Workshop Repair Manual. Check that configuration **CF023 Tyre pressure monitor** is **WITH**.

1.DEF	***NOTES***	**Special note:** Before any operation, check that all the wheels fitted have a tyre pressure monitoring valve and that the spare wheel has not been fitted.

If the UCH has not been programmed with valve codes for one of the two types of wheel set (summer or winter), the fault is classed as 'normal' and will always be present. In this case, the only solution to prevent the fault from reappearing is to program the same valve codes for the two types of wheel set, using command **SC002 Program 4 valve codes** or **SC009 Program one valve code**.
If the UCH recognises codes for both types of wheel (on the parameter menu), it is because the code has been programmed incorrectly or the wrong set of wheels has been stored in the memory.
In the identification menu, note the type of wheel set stored (winter or summer).
Go to the parameter menu and take a reading of the valve codes assigned to the stored wheel type set.
Program the four valve codes (see **configuration and programming, SC002 Program 4 valve codes or SC009 Program one valve code**.
If they do not correspond, program the missing codes or amend the incorrect codes.
Carry out a road test to confirm that the fault has been rectified.

2.DEF	***NOTES***	None.

Repeat the valve code programming procedure from the beginning.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF072 PRESENT OR STORED	CHILD SAFETY LOCK CIRCUIT CC.0: Short circuit to earth CC: Short circuit

NOTES	**Special notes:** Switch on the ignition and press the child safety lock button.

Check the condition and position of the central door locking fuse.

Check the condition and connection of the white 40-track connector **P101** for the **UCH** and the connector for the rear door electric central locking motors.

Check the insulation to **+ 12V** and to **earth** of the following connections:

UCH white connector **P101, brown connection strip, track 4**	→	**Track A** of the rear right-hand door electric central locking motor.
UCH white connector **P101, green connection strip track 21**	→	**Track F** of the rear left-hand door central locking motor.

Repair if necessary.

Check that the rear door central locking motors are working properly.
Replace them, if necessary.

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF075 PRESENT OR STORED	TIMED SUPPLY CIRCUIT CC: Short circuit

NOTES	Switch on the ignition.

Check the condition of the **UCH** U1 and U2 connectors and the fuse and relay box connectors. Check that the fuse and relay box is correctly positioned and connected to the **UCH**.
If the fault is still present contact Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF081 PRESENT	DOOR UNLOCKING BUTTON CIRCUIT CC.0: Short circuit to earth

NOTES	**Special notes:** Switch on the ignition and press the door unlocking button.

Check the condition and connection of the black 40-track connector **P100** for the **UCH** and the connector for the door unlocking button.

Check the insulation, continuity and absence of interference resistance on the following connection:

UCH black connector **P100**, brown connection strip **track 17** → **Track B1** of the door unlocking button

Repair if necessary.

Check the condition of the door unlocking button and that it is working properly. Replace it, if necessary.

If the fault is still present, contact Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF082 PRESENT OR STORED	DOOR LOCKING BUTTON INDICATOR LIGHT CIRCUIT 1.DEF: Open circuit or short circuit

NOTES	**Special notes**: Switch on the ignition and press the door locking button.

Check the condition of **fuse F24** (20 A).
Check the condition and connection of the black 40-track connector **P100** for the **UCH** and the connector for the door unlocking button.
Check the insulation, continuity and absence of interference resistance on the following connection: **Passenger compartment fuse and relay box** black connector **CGB2** white connection strip **track 6** ⟶ **Track A1** of the central door locking button Repair if necessary.
Check for the presence of **+ 12 V after ignition feed** between **track A1** and the **front right-hand electrical earth**.
Check for the presence of the earth between **track A2** of the central door locking button and the **front right-hand electrical earth**.
Check the condition of the door locking button and that it is working properly. Replace it, if necessary.
If the fault is still present, contact Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF084 PRESENT OR STORED	CHILD SAFETY BUTTON INDICATOR LIGHT CIRCUIT 1.DEF: Open circuit or short circuit

NOTES	**Special notes:** Switch on the ignition and press the child safety lock button.

Check the condition and connection of the white connector **P101** for the UCH and the connector for the child safety lock button.
Check the insulation, continuity and absence of interference resistance on the following connection: UCH white connector **P101 track 24** ⟶ **Track B3** of the child safety lock button Repair if necessary.
Check the condition of the child safety lock button and that it is working properly. Replace it, if necessary.
If the fault is still present, contact Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF086 PRESENT OR STORED	REAR WIPER RELAY CC.1: Short circuit to + 12 V

NOTES	Switch on the ignition and the rear screen wiper.

Check the condition and correct position of the **F14 (30 A) fuse**. Replace the fuse if necessary.
Check the condition of the **UCH** U1 and U2 connectors and the Relay/Fuse Box connectors. Check that the relay/fuse box is correctly positioned and connected to the **UCH**.
Check that **RL 15 the internal starter relay** is positioned and operating correctly.
If the **RL 15 internal relay** does not work, replace the Relay/Fuse Box; if the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF087 PRESENT OR STORED	SIDE LIGHTS RELAY CONTROL CIRCUIT CC : Short circuit

NOTES	Switch on the ignition.

Check the condition of the **UCH** U1 and U2 connectors and the Relay/Fuse Box connectors.
Check that the relay/fuse box is correctly positioned and connected to the **UCH**.

Check the condition **and position** of **fuses F04 (7.5 A)** and **F05 (7.5 A)**.

Manipulate the wiring harness between the **stalk** and the **UCH** in order to detect a fault status change (present ↔ stored).
Look for any harness damage and check the condition of the **P101 UCH** white connector and the **stalk** connector. Repair if necessary.

Check the **insulation, continuity and the absence of interference resistance** on the following connection:

the UCH white connector (40-track), green connection strip **track 29** ⟶ **Track B1 stalk** connector.

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF088 PRESENT	DIPPED BEAM HEADLIGHTS RELAY CONTROL CIRCUIT 1.DEF: Open circuit or short circuit

NOTES	Switch on the ignition.

Check the condition of the **UCH** U1 and U2 connectors and the Relay/Fuse Box connectors.
Check that the relay/fuse box is correctly positioned and connected to the **UCH**.

Check the condition of fuses **F2 (15 A), F17 (15 A), F19 (5 A)** of the **Relay/Fuse Box**; replace them if necessary.
Check the condition of the bulb, replace if necessary.

Manipulate the wiring harness between the **UCH** and the **stalk** in order to detect a fault status change (present ↔ stored).
Look for any harness damage and check the condition of the **UCH P101** white connector and the **stalk** connector.
Repair if necessary.

Check **the continuity and insulation** of the following connection:

UCH P101 white 40-track **connector**, green connection strip **track 6** ⟶ **Track B3** stalk black connector

Repair if necessary.

Replace the relay/fuse box and, if the fault is still present, contact Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF088 **CONTINUED**	

Manipulate the wiring harness between the **Relay/Fuse box** and the **stalk** in order to detect a fault status change (present ↔ stored).
Look for possible damage to the harness, check the condition of the **Relay/Fuse Box** black connector and the **stalk** connector.
Repair if necessary.

Check the **insulation, continuity and the absence of interference resistance** on the following connection:

Relay/Fuse Box black connector, black connection strip **track 4** → **Track B2 stalk** black connector

Repair if necessary.

Manipulate the wiring harness between the **Relay/Fuse Box** and the **headlight** in order to detect a fault status change (present ↔ stored).
Look for possible damage to the harness, check the condition of the **Relay/Fuse Box** black connector and the **headlight** connector.
Repair if necessary.

Check for **+ 12 V** on **track 4** of the **headlight** connector.

Check for earth on **track 1** of the **headlight** connector and the **front panel earth**.

Check the **insulation, continuity and the absence of interference resistance** on the following connections:

Relay/Fuse Box black connector, black connection strip **track 6** → **Track 4** of the **right-hand headlight** black connector

Relay/Fuse Box black connector, black connection strip **track 9** → **Track 4** of the **left-hand headlight** black connector

If the fault is still present, check **intermediate connector R265**.
Repair if necessary.

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF089 PRESENT OR STORED	HEADLIGHT WASHER RELAY CONTROL CIRCUIT CC.1 : Short circuit to + 12 V

NOTES	**Special notes:** Switch on the ignition, switch on the dipped headlights and activate the windscreen washer.

Check the condition and correct position of the **FM16 (40 A) fuse**.
Check for **+ After relay feed on track D3** of the **passenger compartment fuse and relay box**.
Check that **headlight washer relay R30** is correctly positioned and operational. Replace **headlight washer relay R30** if necessary.
Check the **insulation, continuity and the absence of interference resistance** on the following connections: **UCH P101** white connector (40-track), green connection strip **track 40** → **Track D2** of the **passenger compartment fuse and relay box** **Passenger compartment fuse and relay box, track D4** → **Front right-hand earth**
If the fault is still present, replace the **headlight washer motor**.
If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF098 PRESENT OR STORED	MAIN BEAM HEADLIGHT RELAY CONTROL CIRCUIT CC : Short circuit

NOTES	**Special notes:** Switch on the ignition then the main beam headlights.

Check the condition of the **UCH** U1 and U2 connectors and the Relay/Fuse Box connectors.
Check that the relay/fuse box is correctly positioned and connected to the **UCH**.

Check the condition of fuses **F1 (20 A), F7 (15 A), F19 (5 A)** of the **passenger compartment fuse and relay box and fuses FM18 (70 A) and FM 20 (60 A) of the engine fuse and relay box**; replace them if necessary.
Check the condition of the bulb, replace if necessary.

Manipulate the wiring harness between the **UCH** and the **stalk** in order to detect a fault status change (present ↔ stored).
Look for any harness damage and check the condition of the **P100 UCH** black connector and the **stalk** connector.
Repair if necessary.

Check the **continuity and insulation** of the following connections:

UCH P100 black connector, green connection strip **track 32** → **Track B7** of the **stalk** connector

UCH P100 black connector (40 tracks), green connection strip **track 39** → **Track B5** of the **stalk** connector

Repair if necessary.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF098 **CONTINUED**	

Manipulate the wiring harness between the **Relay/Fuse box** and the **stalk** in order to detect a fault status change (present ↔ stored).
Look for possible damage to the harness, check the condition of the **Relay/Fuse Box** black connector and the **stalk** connector.
Repair if necessary.

Check the **insulation, continuity and the absence of interference resistance** on the following connections:

Relay/Fuse Box black connector, black connection strip **track 3** → **Track B6** of the **stalk** connector.

Relay/Fuse Box black connector, black connection strip **track 4** → **Track B4** of the **stalk** connector

Repair if necessary.

If the fault is still present contact Techline.

Manipulate the wiring harness between the **Relay/Fuse Box** and the **headlight** in order to detect a fault status change (present ↔ stored).
Look for possible damage to the harness, check the condition of the **Relay/Fuse Box** black connector and the **headlight** connector.
Repair if necessary.

Check for **+ 12 V** on **track 2** of the **headlight** connector.

Check for earth on **track 1** of the **headlight** connector and the **front panel earth**.

Check the **insulation, continuity and the absence of interference resistance** on the following connections:

Relay/Fuse Box white connector, black connection strip **track 1** → **Track 2** connector of the **left- or right-hand headlight**

If the fault is still present, check **intermediate connector R265**.
Repair if necessary.

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF100 PRESENT OR STORED	OPPOSING WIPERS 1.DEF: Wiper system jammed 2.DEF: Wiper system overloaded 3.DEF: Wiper system fault 4.DEF: Open circuit or short circuit

NOTES	**Special notes:** Switch on the ignition, activate the windscreen wiper.

Check the condition of the **UCH** U1 and U2 connectors and the Relay/Fuse Box connectors.
Check that the relay/fuse box is correctly positioned and connected to the **UCH**.

Replace the Relay/Fuse Box and, if the fault is still present, contact the Techline.

Check that there is nothing affecting the operation of the **windscreen wiper motor** and arm and that they are not jammed.

Check the condition and the position of fuses **F14 (30 A)** of the **Passenger compartment fuse/relay box** and **FM23 (60 A)** of the **Motor fuse/relay box**.

Ensure the **+ after ignition feed** between **track 4** of the **windscreen wiper motor** and the **front panel earth connection**.

Check the connection and condition of the **P100 UCH** 40-track black connector and the **windscreen wiper motor** connector.

Check the **insulation, continuity and the absence of interference resistance** on the following connections:

UCH P100 black connector, green connection strip **track 23**	→	**Track 5 windscreen wiper motor** connector
Passenger Compartment Relay/Fuse Box black connector, white connection strip **track 6**	→	**Track 4, windscreen wiper motor** connector
Engine relay/fuse box **track S23**	→	**Track 1** windscreen wiper motor
Front panel earth	→	**Track 2 windscreen wiper motor** connector

Repair if necessary.

If the fault is still present, replace the **windscreen wiper motor**.

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF101 PRESENT OR STORED	FUSE AND RELAY BOX 1.DEF : Detection of a short circuit in the operation of one or more internal relays in the Relay/Fuse Box after locking or unlocking the doors

NOTES	**Special notes:** Lock or unlock the doors.

Replace the Relay/Fuse Box.

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF102 PRESENT OR STORED	STEERING MOTOR CONTROL CIRCUIT 1.DEF: Open circuit or short circuit

NOTES	**Special notes:** With the engine running, move the steering wheel to engage the variable power steering motor.

Check that the **UCH** is not configured with variable power-assisted steering when the feature is not available on the vehicle.

Check the connection and condition of the **P101** white **UCH** 40-track connector and the variable power steering motor connector.

Check for the earth on **trackE** of the variable power steering motor.

Check the insulation, continuity and the absence of interference resistance on the following connections:

UCH P101 white connector, **brown connection strip track 2**	→	**Track D** variable power assisted steering motor connector
UCH P101 white connector, **brown connection strip, track 3**	→	**Track B** variable power assisted steering motor connector
UCH P101 white connector, **brown connection strip, track 13**	→	**Track C** variable power assisted steering motor connector
UCH P101 white connector, **brown connection strip track 18**	→	**Track A** variable power assisted steering motor connector

Repair if necessary.

If the fault is still present, replace the power assisted steering motor.

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF103 PRESENT	VARIABLE POWER ASSISTED STEERING MOTOR VOLTAGE 1.DEF: Voltage outside permitted range of values

NOTES	Switch on the ignition. **Special notes:** The fault may appear when the voltage is greater than **17 V** or less than **9 V** (it can appear after a starter charger has been used).

Check that the battery voltage is correct and carry out fault finding on the charge circuit (the alternator regulator may be faulty).

Test the multiplex network.

If the fault is still present, contact the Techline.

Manipulate the wiring harness between the **UCH** and the **variable power assisted steering motor** to detect a fault status change (present ↔ stored).
Look for any harness damage and check the condition of the **P101 UCH** white connector and the condition of the **variable power steering motor** connector.
Repair if necessary.

Check the **insulation, continuity and the absence of interference resistance** on the following connections:

UCH P101 white connector, brown connection strip **track 2**	→	**Track D variable power assisted steering motor** connector
UCH P101 white connector, brown connection strip **track 3**	→	**Track B variable power steering motor** connector
UCH P101 white connector, brown connection strip **track 13**	→	**Track C variable power assisted steering motor** connector
UCH P101 white connector, brown connection strip **track 18**	→	**Track A variable power steering motor** connector
Variable power steering motor track E	→	**Tunnel electronic earth**

Repair if necessary.

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF105 PRESENT OR STORED	CENTRAL DOOR LOCKING SUPPLY CIRCUIT CC : Short circuit

NOTES	Switch on the ignition and lock the doors. **Special notes:** The fault may occur anywhere except the tailgate lock. One of the **internal CPE*** relays (**no. 1** to **no. 6**) may be stuck.

Check the condition of the **UCH U1** and **U2** connectors and the Relay/Fuse Box connectors.
Check that the relay/fuse box is correctly positioned and connected to the **UCH**.

Check the conformity of the battery voltage and carry out a fault finding procedure on the charge circuit.

Check the door locking motor wiring (with the exception of the tailgate lock), the absence of short circuit (see wiring diagram, depending on the type of vehicle).

Replace the Relay/Fuse Box.

If the fault is still present, contact the Techline.

CPE*: electric central door locking.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF106 PRESENT	DOOR LOCKING BUTTON CIRCUIT CC.0 : Short circuit to earth

NOTES	Switch on the ignition and lock the doors.

Check the connection and condition of the **P100** black **UCH** connector and the door locking button connector.
Check insulation against earth of the following connection: **UCH P100** black connector, brown **connection strip track 9** → **Track A3** of the central door locking button Repair if necessary.
Check the condition of the door locking button and that it is working properly. Replace it, if necessary.
If the fault is still present, contact Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF108 PRESENT OR STORED	FRONT FOG LIGHTS CONTROL CIRCUIT CC.1 : Short circuit to + 12 V

NOTES	Switch on the ignition with the stalk in the position for front fog lights on.

Check the condition of the **UCH U1** and **U2** connectors and the Relay/Fuse Box connectors.
Check that the relay/fuse box is correctly positioned and connected to the **UCH**.

Check the condition of fuse **F19 (5 A)**, of the **Passenger compartment fuse/relay box**, replace it if necessary.
Check the condition of the bulb, replace if necessary.

Manipulate the wiring harness between the **UCH** and the **stalk** in order to detect a fault status change (present ↔ stored).
Look for any harness damage and check the condition of the **UCH P101** white connector and the **stalk** connector.
Repair if necessary.

Check the **continuity and insulation** of the following connections:

UCH P101 white **connector**, green connection strip **track 28** → **Track A1** of the **stalk** connector

UCH P101 white **connector**, green connection strip **track 31** → **Track A3** of the **stalk** connector

Repair if necessary.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF108 **CONTINUED**	

Manipulate the wiring harness between the **Passenger Compartment Relay/Fuse Box** and the **stalk** in order to detect a change in fault status (present ↔ stored).
Look for possible damage to the harness, check the condition of the **Passenger Compartment Relay/Fuse Box** black connector and the **stalk** connector.
Repair if necessary.

Check **the continuity and insulation** of the following connection:

Stalk track B4 ⟶ **Track 4 Relay/Fuse Box** black connector, black connection strip

Repair if necessary.

Manipulate the wiring harness between the **Passenger Compartment Relay/Fuse Box** and the **front fog light** in order to detect a change in fault status (present ↔ stored).
Look for possible damage to the harness, check the condition of the **Passenger Compartment Relay/Fuse Box** black connector and the **front fog light** connector.
Repair if necessary.

Check **the continuity and insulation** of the following connection:

Relay/fuse box grey connector, white connection strip **Track 5** ⟶ **Track 1 front fog light**

If the fault is still present, check the **R265 intermediate connector, track B10**.
Repair if necessary.
If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF109 PRESENT OR STORED	REAR FOG LIGHTS CONTROL CIRCUIT CC.1 : Short circuit to + 12 V

NOTES	Switch on the ignition with the stalk in the position for rear fog lights on.

Check the condition of fuse **F19 (5 A)**, of the **Passenger compartment fuse/relay box**, replace it if necessary.
Check the condition of the bulb, replace if necessary.

Manipulate the wiring harness between the **UCH** and the **stalk** in order to detect a fault status change (present ↔ stored).
Look for any harness damage and check the condition of the **UCH P101** white connector and the **stalk** connector.
Repair if necessary.

Check the **continuity and insulation** of the following connections:

UCH P101 white **connector**, green connection strip **track 28** → **Track A1** of the **stalk** connector.

UCH P101 white **connector**, green connection strip **track 31** → **Track A3** of the **stalk** connector

Repair if necessary.

Manipulate the wiring harness between the **Passenger Compartment Relay/Fuse Box** and the **stalk** in order to detect a change in fault status (present ↔ stored).
Look for possible damage to the harness, check the condition of the **Passenger Compartment Relay/Fuse Box** black connector and the **stalk** connector.
Repair if necessary.

Check **the continuity and insulation** of the following connection:

Stalk track B4 → **Track 4 Relay/Fuse Box** black connector, black connection strip

Repair if necessary.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF109 **CONTINUED**	

Manipulate the wiring harness between the **Passenger Compartment Relay/Fuse Box** and the **rear fog light** in order to detect a change in fault status (present ↔ stored).
Look for possible damage to the harness, check the condition of the **Passenger Compartment Relay/Fuse Box** black connector and the **rear fog light** connector.
Repair if necessary.

Check the **continuity and insulation** of the following connections:

Relay/Fuse Box black connector, black connection strip **Track 7** → **Track 5 Rear right-hand fog light**

Relay/Fuse Box black connector, black connection strip **Track 7** → **Track 1 Rear left-hand fog light**

If the fault is still present, check the **R355 intermediate connector, track 1**.
Repair if necessary.
If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF110 PRESENT OR STORED	DIRECTION INDICATOR CONTROL CIRCUIT CO : Open circuit CC.0 : Short circuit to earth 1.DEF: Fuel supply system

NOTES	Switch on the ignition.

1.DEF ***CO*** ***CC***	***NOTES***	**Special note:** With the ignition on and the stalk in right- or left-hand indicator position (not hazard).

Check there is no over-consumption due to too many bulbs being fitted (caravan does not conform).

Manipulate the wiring harness between the UCH and the stalk, in order to detect a change in fault status (present ↔ stored).
Look for possible damage to the harness, check the condition of the stalk connector and the UCH connector.
Repair if necessary.

Check the **continuity and insulation** of the following connections:

Black **UCH connector P100**, green connection strip **track 36** → **Track A5** of the **stalk** connector

Black **UCH connector P100**, green connection strip **track 37** → **Track A7** of the **stalk** connector

Stalk track 1 → **Front left-hand earth**

Repair if necessary.

If the fault is still present, replace the stalk.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF110 **CONTINUED 1**	

Manipulate the wiring harness between the **Relay/Fuse Box** and the **headlight** in order to detect a fault status change (present ↔ stored).
Look for possible damage to the harness, check the condition of the **Relay/Fuse Box** black connector and the **headlight** connector.
Repair if necessary.

Check for **+ 12 V** on **track 2** of the **headlight** connector.

Check for earth on **track 3** of the **headlight** connector and the **front panel earth**.

Check the **insulation, continuity and the absence of interference resistance** on the following connections:

Relay/Fuse Box white connector, white connection strip **track 6** → **Track 3** of the **right-hand headlight** connector

Relay/Fuse Box grey connector, white connection strip **track 1** → **Track 3** of the **left-hand headlight** connector

If the fault is still present, check the **R265 intermediate connector track B7** and **A7**.
Repair if necessary.

Manipulate the wiring harness between the **Relay/Fuse Box** and the **rear light** in order to detect a fault status change (present ↔ stored).
Look for possible damage to the harness, check the condition of the **Relay/Fuse Box** black connector and the **rear light** connector.
Repair if necessary.

Check for **+ 12 V** on **track 5** of the **rear light** connector.

Check for earth on **track 1** of the **headlight** connector and the **rear right-hand earth**.

Check the **insulation, continuity and the absence of interference resistance** on the following connections:

Relay/Fuse Box white connector, white connection strip **track 6** → **Track 5** of the **rear right-hand light** connector

Relay/Fuse Box grey connector, white connection strip **track 1** → **Track 5** of the **rear left-hand light** connector

If the fault is still present, check the **R297 intermediate connector track 6** and **track 16**.
Repair if necessary.

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF110 **CONTINUED 2**	

Manipulate the wiring harness between the **Relay/Fuse Box** and the **side mounted indicator** in order to detect a change in fault status (present ↔ stored).
Look for possible damage to the harness, check the condition of the **Relay/Fuse Box** black connector and the **side mounted indicator** connector.
Repair if necessary.

Check for **+ 12 V** on **track 1** of the **side mounted indicator** connector.

Check for the presence of earth on **track 2** of the **side mounted indicator** connector and the **front panel earth (for the right-hand side mounted indicator)** and the front left-hand earth (**for the left-hand side mounted indicator**).

Check the **insulation, continuity and the absence of interference resistance** on the following connections:

Relay/Fuse Box white connector, white connection strip **track 6**	→	**Track 1 right-hand side mounted indicator** connector
Relay/Fuse Box grey connector, white connection strip **track 1**	→	**Track 1 left-hand side mounted indicator** connector

If the fault is still present, check the **R265 intermediate connector tracks B7** and **A7 (this check only concerns the right-hand repeater)**.
Repair if necessary.

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF111 PRESENT OR STORED	FRONT LEFT-HAND DOOR OPTICAL SENSOR CIRCUIT CC.0 : Short circuit to earth CO : Open circuit

NOTES	**Special note:** The fault appears when the sensor for this door is seen to be active for more than **16 seconds** when the vehicle is being driven or after 32 detections of the door being opened without being detected by the sensor.

Check the condition and connection of the **P100** 40-track black connector on the **UCH** and the front left-hand door optical sensor connector.

Check the **insulation against earth** and the continuity of the following connection:

Black UCH **P100** connector, green connection strip **track 28** → **Track 1** of the optical sensor **connector**

Repair if necessary.

Ensure there is a power feed to the optical sensor between tracks 3 and 2.

If the fault is still present, replace the optical sensor of the front left-hand door.

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF112 PRESENT OR STORED	FRONT RIGHT-HAND DOOR OPTICAL SENSOR CIRCUIT CC.0 : Short circuit to earth CO : Open circuit

NOTES	**Special note:** The fault appears when the sensor for this door is seen to be active for more than **16 seconds** when the vehicle is being driven or after 32 detections of the door being opened without being detected by the sensor.

Check the condition and connection of the UCH **P100** 40 track black connector and the front right-hand door optical sensor connector.

Check the insulation against **earth** and the continuity of the following connection:

Black UCH **P100** connector, green connection strip **track 33** → **Track 1** of the optical sensor connector

Repair if necessary.

Ensure there is a power feed to the optical sensor between tracks 3 and 2.

If the fault is still present, replace the optical sensor of the front right-hand door.

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF113 PRESENT OR STORED	REAR LEFT-HAND DOOR OPTICAL SENSOR CIRCUIT CC.0 : Short circuit to earth CO : Open circuit

NOTES	**Special note:** The fault appears when the sensor for this door is seen to be active for more than **16 seconds** when the vehicle is being driven or after 32 detections of the door being opened without being detected by the sensor.

Check the condition and connection of the **P100** 40-track black connector on the **UCH** and the rear left-hand door optical sensor connector.

Check the insulation against **earth** and the continuity of the following connection:

White **UCH P101** connector, green connection strip **track 23** → **Track 1** of the optical sensor **connector**

Repair if necessary.

Ensure there is a power feed to the optical sensor between tracks 3 and 2.

If the fault is still present, replace the optical sensor of the rear left-hand door.

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF114 PRESENT OR STORED	REAR RIGHT-HAND DOOR OPTICAL SENSOR CIRCUIT CC.0 : Short circuit to earth CO : Open circuit

NOTES	**Special note:** The fault appears when the sensor for this door is seen to be active for more than **16 seconds** when the vehicle is being driven or after 32 detections of the door being opened without being detected by the sensor.

Check the condition and connection of the **P100** 40-track black connector on the **UCH** and the rear right-hand door optical sensor connector.

Check the insulation against **earth** and the continuity of the following connection:

UCH P100 black connector, green connection strip **track 29** → **Track 1** of the optical sensor connector

Repair if necessary.

Ensure there is a power feed to the optical sensor between tracks 3 and 2.

If the fault is still present, replace the optical sensor of the rear right-hand door.

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF115 PRESENT	ANTI-PINCH ONE TOUCH WINDOW CIRCUIT 1.DEF: Open circuit or short circuit

NOTES	Switch on the ignition.

Check that the **UCH** is not configured with anti-pinch one-touch windows when the feature is not available on the vehicle.

Check the connection and condition of the black **P100** 40-track connector on the **UCH** and the anti-pinch one-touch window connector.

For each anti-pinch electric window, check the insulation and continuity on the following connection:

UCH P100 black connector, green connection strip **track 22** → **track 6** driver's electric window

OR for anti-pinch electric windows with door mirror position memory:

UCH P100 black connector, **green connection strip track 22** → **track 27** driver's electric window

OR for the anti-pinch sunroof:

UCH P100 black connector, green connection strip **track 22** → **track 9** sunroof

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF116 PRESENT OR STORED	REQUEST TO TURN OFF DIPPED HEADLIGHTS 1.DEF : Request to inhibit the right-hand dipped beam headlight. Carry out a fault finding procedure on the xenon bulb computer 2.DEF : Request to inhibit the left-hand dipped beam headlight. Carry out a fault finding procedure on the xenon bulb computer

NOTES	Switch on the ignition.

Run fault finding on the xenon bulb computer (see **80B, Headlights**).

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF118 PRESENT	START BUTTON 1.DEF : Faulty engine running warning light on the start button 2.DEF : Faulty 'OK to start' indicator light on the Start button

NOTES	Switch on the ignition.

1.DEF	***NOTES***	**Special note:** The fault appears when the engine is running.

Check the condition of the **F11 (10 A)** fuse in the **Passenger Compartment Fuse and Relay Box**, replace it if necessary.

Check the condition and connection of the black **P100** 40-track connector on the **UCH** and the **start button** connector.

Check the insulation and continuity of the following connections:

UCH P100 black connector, **brown connection strip track 3** → **Track 4** of the **Start button**

Passenger Compartment Relay/Fuse Box green connector, black connection strip **track 2** → **Track 2** of the **Start button**

Repair if necessary.

If the fault is still present, replace the Start button.

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

DF118 **CONTINUED**	

2.DEF	***NOTES***	**Special note:** The fault appears when the ignition is switched on, a condition for starting.

Check the condition of the **F11 (10 A)** fuse in the **Passenger Compartment Fuse and Relay Box**, replace it if necessary.

Check the condition and connection of the UCH **P100** black 40-track connector and the **Start button** connector.

Check the insulation and continuity of the following connections:

UCH P100 black connector, **brown connection strip track 11** → **Track 3** of the **Start button**

Passenger Compartment Relay/Fuse Box green connector, black connection strip **track 2** → **Track 2** of the **Start button**

Repair if necessary.

If the fault is still present, replace the Start button.

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

NOTES	Only check conformity after a **full check** with the diagnostic tool. The values indicated in this conformity check are given as examples.

MAIN COMPUTER STATUSES AND PARAMETERS

Order	Function	Parameter or Status checked or Action		Display and notes	Fault finding
1	UCH	**ET008:**	Blank UCH	**NO** **YES**	Refer to setting **SC004 UCH Programming**
2	Steering lock	**ET071:**	Unprogrammed steering lock	**NO** **YES**	In the event of a fault, refer to the interpretation of status **ET071 Blank steering column lock**
3	Battery voltage	**PR001:**	Battery voltage	**8 V < PR001 < 16 V**	
4	Power supply	**ET238:**	APC relay + 12 V break contact	**ABSENT** **PRESENT**	In the event of a fault, consult status **ET238 APC relay + 12 V break contact**
5		**ET004:**	+ 12 V after ignition feed	**ABSENT** **PRESENT**	In the event of a fault, consult fault **DF060 + 12 V APC relay control circuit**
6		**ET174:**	+ 12 V after ignition feed relay control	**INACTIVE** **ACTIVE**	
7	Set of valves recognised	**ET001:**	Set of valves recognised	**SUMMER** **WINTER**	Ensure that configuration **CF023 Tyre pressure monitor function** is **Active**. Read configuration **LC017 Tyre pressure monitor function**. Perform the programming operations **SC009 Programming a valve code** and **SC002 Programming the 4 valve codes**. If the fault is still present, run fault finding on the **tyre pressure monitor**.

ET001	VALVE SET RECOGNISED

NOTES	There must be no present or stored faults.

The **ET001 SET OF VALVES RECOGNISED** status gives the type of valves selected according to the season.
The status must be **Summer** or **Winter**.

To modify the valve type, run scenario command **SC002 PROGRAMMING THE 4 VALVE CODES**.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

ET032 **ET033** **ET034** **ET035**	REAR RIGHT-HAND WHEEL VALVE SIGNAL REAR LEFT-HAND WHEEL VALVE SIGNAL FRONT RIGHT-HAND WHEEL VALVE SIGNAL FRONT LEFT-HAND WHEEL VALVE SIGNAL

NOTES	**These checks are carried out only if one of the statuses is inconsistent with the system operating conditions.**

WARNING
If the system detects a continual pressure readjustment of 260 mbar or more in one tyre, pressure warnings for all four tyres are cleared.
It is advisable to correct all 4 pressures after a pressure warning on the instrument panel.

NORMAL

The valve signals are **NORMAL** if:
– the valves are recognised by the computer and are operating correctly,
the tyre pressures correspond to the recommended pressures.

STATUS1: NO SIGNAL

If one or more valve signal statuses is/are **STATUS1**, check that:
– the faulty wheel is fitted with a Tyre Pressure Monitor valve,
Carry out programming using command **SC009 Programming a valve code or SC002 Programming the 4 valve codes**.

Check that the valves are not damaged and that they are fitted the right way round.
If the fault is still present, replace the faulty valve(s) (see **MR 353, Mechanical components 35A Wheels and tyres**).

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

ET032 **ET033** **ET034** **ET035** **CONTINUED 1**	

WARNING
If the system detects a continual pressure readjustment of 260 mbar or more in one tyre, pressure warnings for all four tyres are cleared.
It is advisable to correct all 4 pressures after a pressure warning on the instrument panel.

STATUS2: OVER-INFLATED TYRE

If one or more valve signal statuses are **STATUS2**, adjust the 4 tyre pressures in accordance with the recommended pressures for the vehicle in question.

If one of the statuses is still **STATUS2** after the operation,
consult the following parameters:

PR009 Front wheels low speed recommended pressure
PR010 Rear wheels low speed recommended pressure
PR012 Front wheels high speed recommended pressure
PR011 Rear wheels high speed recommended pressure.

If the values of these parameters do not match the manufacturer's values, use configuration **VP005 Enter recommended pressures**.

STATUS3: TYRE OVER-INFLATED COMPARED WITH THE OTHER 3

If one or more valve signal statuses are **STATUS3**, adjust the pressures of the 4 tyres in accordance with the recommended pressures for the vehicle in question.

If one of the statuses is still **STATUS3** after the operation,
consult the following parameters:

PR009 Front wheels low speed recommended pressure
PR010 Rear wheels low speed recommended pressure
PR012 Front wheels high speed recommended pressure
PR011 Rear wheels high speed recommended pressure.

If the values of these parameters do not match the manufacturer's values, use configuration **VP005 Enter recommended pressures**.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

ET032 **ET033** **ET034** **ET035** **CONTINUED 2**	

STATUS4: TYRE UNDER-INFLATED COMPARED WITH THE OTHER 3

If one or more valve signal statuses are **STATUS4**, adjust the pressures of the 4 tyres in accordance with the recommended pressures for the vehicle in question.

If one of the statuses is still **STATUS4** after the operation,
consult the following parameters:

PR009 Front wheels low speed recommended pressure
PR010 Rear wheels low speed recommended pressure
PR012 Front wheels high speed recommended pressure
PR011 Rear wheels high speed recommended pressure.

If the values of these parameters do not match the manufacturer's values, use configuration **VP005 Enter recommended pressures**.

STATUS5: LEAK DETECTION

If one or more valve signal statuses is/are **STATUS5**, check the wheel(s) concerned for leaks
(leak in the tyre, rim wear or corrosion, damaged valve, damaged valve seal, loose valve, etc.).
Carry out the necessary repairs.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

ET032 **ET033** **ET034** **ET035** **CONTINUED 3**	

STATUS6: SLIGHTLY UNDER-INFLATED TYRE

If one or more valve signal statuses is/are **STATUS6**, adjust the 4 tyre pressures according to the recommended pressures for the vehicle in question.

If one of the statuses is still **STATUS6** after the operation:
consult the following parameters:

PR009 Front wheels low speed recommended pressure
PR010 Rear wheels low speed recommended pressure
PR012 Front wheels high speed recommended pressure
PR011 Rear wheels high speed recommended pressure.

If the values of these parameters do not match the manufacturer's values, use configuration **VP005 Enter recommended pressures**.

STATUS7: HIGHLY UNDER-INFLATED TYRE

If one or more valve signal statuses are **STATUS7**, adjust the pressures of the 4 tyres in accordance with the recommended pressures for the vehicle in question.

If one of the statuses is still **STATUS7** after the operation,
consult the following parameters:

PR009 Front wheels low speed recommended pressure
PR010 Rear wheels low speed recommended pressure
PR012 Front wheels high speed recommended pressure
PR011 Rear wheels high speed recommended pressure.

If the values of these parameters do not match the manufacturer's values, use configuration **VP005 Enter recommended pressures**.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

ET042	PASSENGER DOOR

NOTES	Open the passenger door. Status **ET042 Passenger door** should be OPEN.

If status **ET042** is CLOSED:
Check the connection and condition of the passenger door central locking connector and repair if necessary.
Check the **continuity** between **tracks C** and **D** of the passenger door central locking connector in the door open position. If the checks are not correct, replace the passenger door central door locking.
Check the condition and connection of the **P101 UCH** white connector. Repair if necessary.
Check the **continuity and insulation** of the following connections: **The UCH P101** white connector (40-track), brown connection strip **track 20** → **Track C** of the passenger door central door locking connector. rear left-hand door central locking connector **Track D** → **Passenger earth**
If the fault is still present, check the **intermediate connector R154** on **track B10**. Repair if necessary.
If the fault is still present, contact Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

ET043	RAID FUNCTION AUTHORISATION BY CENTRAL DOOR LOCKING SYSTEM

NOTES	There must be no present or stored faults. Check that the **UCH** is configured with Locking while driving. The status should be **ACTIVE** or **DEACTIVATED**

Press the vehicle locking button for more than 5 seconds (with the + after ignition feed on) to activate automatic locking (the electric central door locking status is active).
Press the vehicle locking button for more than 5 seconds (with the + after ignition feed on) to deactivate automatic locking (the electric central door locking status is active).
Press the vehicle lock button for more than 5 seconds (without the + after ignition feed on) to lock the vehicle (specification for Spain).

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

ET044	CENTRAL DOOR LOCKING BUTTON

NOTES	There must be no present or stored faults. Switch on the ignition and press the central door locking button. The status should be **LOCKING, UNLOCKING**.

If status **ET044** remains **RELEASED**:
Check the condition and connection of the UCH **P100** 40-track black connector (tabs bent, broken, oxidised, etc.). Repair if necessary.
Check the condition and connection of the black central door locking connector (tabs bent, broken, oxidised, etc.). Repair if necessary.
Check the condition of the **F18 (30 A)** and **F24 (20 A)** fuses.
Check for **+ 12 V** on **track B2** of the central door locking control connector.
Check for **+ APC** on **track A1** of the central door locking control connector.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

ET044 **CONTINUED**	

Check the **insulation, continuity and the absence of interference resistance** on the following connections:

UCH P100 black connector (green connection strip) **Track 21** → **Track B3** electric central door locking connector

UCH P100 black connector (brown connection strip) **Track 9** → **Track A3** central door locking control connector

UCH P100 black connector (brown connection strip) **Track 17** → **Track B1** central door locking control connector

Repair if necessary.

Check for **continuity** between the central door locking connector **track A2** and the vehicle **earth**.

Check:
The **continuity** of the central door locking switch, tracks **A3** and **B1** (switch pressed).
The **insulation** of the central door locking switch, tracks **A3** and **B1** (switch not pressed).

Replace the central door locking button if necessary.

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

ET045	RF SIGNAL RECEIVED

NOTES	There must be no present or stored faults.
	Special note: This status is used for the Unlocking/Locking functions. Hands-free starting. This status is used to check the correct operation of the **UCH** receiving aerial.

If **status ET045** becomes **NO** after pressing one of the buttons on the **card** or on the occurrence of a fault in the tyre pressure monitor system:
Check the condition of the card battery. Replace the battery if necessary.
Test the card, run command **SC011 CHECK CARDS**.
Test the **UCH** receiving aerial, run command **SC026 AERIAL TEST**.
If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

ET046	ENGINE IMMOBILISER

NOTES	There must be no present or stored faults. **Special note:** Status **ET046 IMMOBILISER** shows the vehicle protection status. so that the engine management computer and the UCH can authorise start-up. Note: If more than 5 failed attempts at authentication are made in succession, the engine management computer will activate protection mode (antiscanning) and will not attempt to authenticate the UCH. Status **ET046 IMMOBILISER** should be **INACTIVE**. Status **ET127 Immobiliser warning light** should be **Off**.

If status **ET046** is **Active** and **ET127** is **On**:

Fault finding for **VSC1**:

Check the battery voltage, refer to parameter **PR001 Battery voltage**.
Test the card, run command **SC011 Check cards**.
Carry out a card programming operation, run **SC010 Card programming**.
Carry out a UCH-CARD READER connection test, run command **SC023 UCH-CARD READER**.
Refer to the interpretation of faults **DF002 Steering column lock** and **DF029 Steering column lock circuit**.

Fault finding for **VSC2**:

Ensure that configuration **CF100 Hands-free starting** is WITH, read configuration **LC032 Hands-free starting**.
Check the battery voltage, refer to parameter **PR001 Battery voltage**.
Test the card, run command **SC011 Check cards**.
Carry out a card programming operation, run **SC010 Card programming**.
Test the aerials, run command **SC026 Aerial test**.
(Carry out a UCH-CARD READER connection test, run command **SC023 UCH-CARD READER**).
Refer to the interpretation of faults **DF002 Steering column lock** and **DF029 Steering column lock circuit**.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

ET047	BRAKE PEDAL POSITION

NOTES	There must be no present or stored faults. Switch on the ignition. Status **ET047** should be **PRESSED**, when the brake pedal is depressed.

If status **ET047** is **RELEASED**.
Check the condition of the **F21 (brake switch (10 A)) fuse** in the **Passenger Compartment Relay/Fuse Box**, replace if necessary.
Check the connection and condition of the **brake light switch** connector. Repair if necessary.
Check the **continuity** between **tracks 1** and **2** of the brake switch in the pedal depressed position. If not OK, replace the brake switch.
Check the **continuity and insulation** of the following connections: **UCH P101** white connector (40 tracks), green connection strip **track 26** → **Track 3** of the brake switch connector **Passenger Compartment Relay/Fuse Box** grey connector, black connection strip **track 5** → **Track 26** of the brake switch connector
If the fault is still present, replace the brake switch. If the fault is still present after that, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

ET051	REAR LEFT-HAND DOOR

NOTES	Open the rear left-hand door. Status **ET051 Rear left-hand door** should be OPEN.

If status **ET051** is CLOSED:
Check the connection and condition of the rear left-hand door central door locking connector and repair if necessary.
Check the **continuity** between **tracks C** and **D** of the rear left-hand door central locking connector in the door open position. If not OK, replace the rear left-hand door central door locking.
Check the condition and connection of the **P101 UCH** white connector. Repair if necessary.
Check **the continuity and insulation** of the following connection: **UCH P101** white 40-track connector, brown connection strip **track 15** → **Track C** of the rear left-hand door central locking connector
If the fault is still present, check **intermediate connector R155** on **tracks A9** and **B9**. Repair if necessary.
If the fault is still present, contact Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

ET052	REAR RIGHT-HAND DOOR

NOTES	Open the rear right-hand door. Status **ET052 Rear right-hand door** should be OPEN.

If status **ET052** is CLOSED:
Check the connection and condition of the rear right-hand door central door locking connector and repair if necessary.
Check the **continuity** between **tracks C** and **D** of the rear right-hand door central locking connector in the door open position. If not OK, replace the rear right-hand door central door locking.
Check the condition and connection of the **P101 UCH** white connector. Repair if necessary.
Check **the continuity and insulation** of the following connection: **UCH P101** white 40-track connector, brown connection strip **track 7** → **Track C** of the rear right-hand door central locking connector.
If the fault is still present, check **intermediate connector R156** on **tracks C5** and **C6**. Repair if necessary.
If the fault is still present, contact Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

ET053	DRIVER'S DOOR

NOTES	Open the driver's door. Status **ET053 Driver's door** should be OPEN.

If status **ET053** is CLOSED:
Check the connection and condition of the driver's door central locking connector and repair if necessary.
Check the **continuity** between **tracks C** and **D** of the driver's door central locking connector in the door open position. If the checks are not OK, replace the driver's door central locking.
Check the condition and connection of the **UCH P101** black connector. Repair if necessary.
Check **the continuity and insulation** of the following connection: **UCH P101** white 40-track connector, brown connection strip **track 16** ⟶ **Track C** of the driver's door central door locking connector
If the fault is still present, check the **R153 intermediate connector track B10**. Repair if necessary.
If the fault is still present, contact Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

ET070	START BUTTON

NOTES	Press the start button. Status **ET070** should be **Pressed**.

If status **ET070** is **Released**:
Manipulate the wiring harness between the **UCH** and the **Start button** in order to detect a change in fault status (present ↔ stored). Look for any harness damage and check the condition of the **UCH** black connector and the **Start button** connector. Repair if necessary.
Check the condition of the **F11 (10 A)** fuse in the **Passenger Compartment Relay/Fuse Box**, replace it if necessary.
Check the condition and connection of the UCH **P100** black 40-track connector and the **Start button** connector.
Check the continuity and insulation of the following connections: **UCH P100** black 40-track connector **track 20** → **Track 1** of the **Start button** **Passenger Compartment Relay/Fuse Box** green connector, black connection strip **track 2** → **Track 2** of the **Start button** Repair if necessary.
Replace the Start button.
If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

ET071	BLANK STEERING COLUMN LOCK

NOTES	There must be no present or stored faults. Status **ET071** should be **NO** after replacement of the lock.

If status **ET071** is **YES**:
Check that the card is **PROGRAMMED**, run command **SC011**. If the card has not been programmed, perform the **SC010 CARD PROGRAMMING** operation.
Check the connections between the **UCH** and the card reader: Carry out test **SC023 UCH - CARD READER CONNECTIONS TEST**.
Check that when depressing the clutch pedal or on the brake pedal or the ON/OFF button that the UCH issues an unlock signal (if the steering is locked).
Check that the **UCH** is coded, check **ET220 UCH programming**. The status is only accessible in the **SC004 UCH programming** scenario command.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

ET077	WIPER STALK POSITION

NOTES	Status **ET077** should be **AUTOMATIC, LOW SPEED, HIGH SPEED** or **INACTIVE**.

Switch on the ignition, put the **stalk** in the automatic position.
If status **ET077** becomes **INACTIVE**:

Manipulate the wiring harness between the **wiper stalk** and the **UCH** in order to detect a change in fault status (present ↔ stored).
Look for any harness damage and check the condition of the **UCH** black connector and the **windscreen wiper stalk** connector.
Repair if necessary.

Check the **insulation, continuity and the absence of interference resistance** on the following connections:

UCH P100 black connector, green connection strip **track 24**	→	**Track B2** of the **windscreen wiper stalk** connector
UCH P100 black connector, brown connection strip **track 10**	→	**Track A1** of the **windscreen wiper stalk** connector
Windscreen wiper stalk track B5	→	**Front left-hand earth**

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

ET077 **CONTINUED 1**	

Switch on the ignition, put the **stalk** in the low speed position.
If status **ET077** becomes **INACTIVE**:

Manipulate the wiring harness between the **wiper stalk** and the **UCH** in order to detect a change in fault status (present ↔ stored).
Look for any harness damage and check the condition of the **UCH** black connector and the **windscreen wiper stalk** connector.
Repair if necessary.

Check the **insulation, continuity and the absence of interference resistance** on the following connections:

UCH black connector, brown connection strip **track 15** → **Track A3** of the **windscreen wiper stalk** connector

Windscreen wiper stalk track B5 → **Front left-hand earth**

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

ET077 **CONTINUED 2**	

Switch on the ignition, put the **stalk** in the high speed position.
If status **ET077** becomes **INACTIVE**:

Manipulate the wiring harness between the **wiper stalk** and the **UCH** in order to detect a change in fault status (present ↔ stored).
Look for any harness damage and check the condition of the **UCH** black connector and the **windscreen wiper stalk** connector.
Repair if necessary.

Check the **insulation, continuity and the absence of interference resistance** on the following connection:

UCH black connector, brown connection strip **track 25** → **Track A2** of the **windscreen wiper stalk** connector

If the fault is still present, replace the **wiper stalk.**

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

ET078 **ET079**	WINDSCREEN WASHER REQUEST REAR SCREEN WASHER REQUEST

NOTES	Switch on the ignition, put the stalk in the windscreen washer position or in the rear screen washer position. Status **ET078** should be **ACTIVE**.

If status **ET078** becomes **INACTIVE**:

Manipulate the wiring harness between the **washer motor** and the **UCH** in order to detect a change in fault status (present ↔ stored).
Look for any harness damage and check the condition of the **UCH** black connector and the **washer motor** connector.
Repair if necessary.

Check the **insulation, continuity and the absence of interference resistance** on the following connections:

UCH black connector, green connection strip **track 25** → **Track B1** of the **washer stalk connector**

UCH black connector, green connection strip **track 35** → **Track A4** of the **washer stalk connector**

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

ET089	ELECTRIC CHILD SAFETY BUTTON

NOTES	Switch on the ignition and press the child safety lock button. There should be a signal if the vehicle is configured WITH Child Safety. Status **ET089** should be **ACTIVE**.

If status **ET089** is **DEACTIVATED**:

Refer to the interpretation of fault **DF072 CHILD SAFETY CIRCUIT**.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

ET109	REVERSE GEAR ENGAGED

NOTES	Switch on the ignition, engage reverse gear. Status **ET109** should be **YES**.

If status **ET109** becomes **NO**:

Manual gearbox:

Check the condition of the **UCH P100** connector and the condition of the **reversing light sensor**.
Repair if necessary.

Check the **insulation, continuity and the absence of interference resistance** on the following connection:

UCH P100 black connector, brown connection strip **track 7** → **Track 3** of the **reversing light sensor**

If the fault is still present, check the **R262 intermediate connector**.
Repair if necessary.

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

ET124 **ET125**	FRONT FOG LIGHTS REAR FOG LIGHTS

NOTES	Switch on the ignition and the front and rear fog lights. Statuses **ET124 and ET125** should be **ON**.

If statuses **ET124 and ET125** become **OFF**:

Refer to the interpretation of faults **DF109 REAR FOG LIGHT(S) CONTROL CIRCUIT** and **DF108 FRONT FOG LIGHTS CONTROL CIRCUIT**.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

ET141 **ET196** **ET199** **ET204**	SLIGHT OVER-INFLATION SLIGHT UNDER-INFLATION PUNCTURE WARNING LIGHT ACTIVATED BY THE SYSTEM TYRE PRESSURE MONITOR WARNING LIGHT

NOTES	Switch on the ignition. Signal can be interpreted if the vehicle is configured WITH **Tyre pressure monitor system**. Slightly under-inflate or over-inflate a tyre. Status **ET141** should be **YES**. Status **ET196** should be **YES**.

If statuses **ET141** and **ET196** are **NO**:

Refer to the interpretation of fault **DF052 VALVE SIGNAL RECEIVER**.

Refer to the interpretation of fault **DF006 FRONT LEFT-HAND WHEEL VALVE SENSOR**.
Refer to the interpretation of fault **DF007 FRONT RIGHT-HAND WHEEL VALVE SENSOR**.
Refer to the interpretation of fault **DF008 REAR RIGHT-HAND WHEEL VALVE SENSOR**.
Refer to the interpretation of fault **DF009 REAR LEFT-HAND WHEEL VALVE SENSOR**.

If statuses **ET141** and **ET196** become **NO**:

Test the **tyre pressure monitor** network.
Test the **multiplex network (see 88B multiplexing)**.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

ET150 **ET151**	RIGHT-HAND DIRECTION INDICATOR LEFT-HAND DIRECTION INDICATOR

NOTES	Switch on the ignition, operate the left- or right-hand direction indicator. Statuses **ET150 and ET151** should be **ON**.

If statuses **ET150 and ET151** become **OFF**:

Refer to the interpretation of fault **DF110 DIRECTION INDICATORS CONTROL CIRCUIT**.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

ET159 **ET160**	REAR LEFT-HAND DOOR CHILD SAFETY LOCK REAR RIGHT-HAND DOOR CHILD SAFETY LOCK

NOTES	Switch on the ignition and press the child safety lock button. There should be a signal if the vehicle is configured WITH Child Safety. Statuses **ET159 and ET160** should be **ACTIVE**.

If statuses **ET159 and ET160** become **INACTIVE**:

Refer to the interpretation of fault **DF072 CHILD SAFETY CIRCUIT**.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

ET275	HAZARD WARNING LIGHTS CONTROL

NOTES	With the hazard warning lights on.

Manipulate the wiring harness between the **UCH** and the **hazard warning lights switch** in order to detect a change in fault status (present ↔ stored).
Look for any harness damage and check the condition of the **UCH P100** and **P101** connectors and the condition of the **hazard warning lights switch** connector.
Repair if necessary.

Check for **+ 12 V** between **track 3** of the **hazard warning lights switch** and the **front left-hand earth**.

Check the **continuity and insulation** of the following connections:

UCH P100 black connector (40 tracks), brown connection strip **track 2**	→	**Track 3** of the **hazard warning lights switch** connector.
UCH P101 white connector (40 tracks), green connection strip **track 38**	→	**Track 4** of the **hazard warning lights switch** connector.
Hazard warning lights switch track 2	→	**Front left-hand earth**

Repair if necessary.
If a fault is still present, replace the **hazard warning lights switch**.
If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

ET283	CAUSE OF STEERING COLUMN LOCK INHIBITION

NOTES	None

If **STATUS4, STATUS5, STATUS6, STATUS7, STATUS8** are present:

Check that the steering column lock is correct for the vehicle.

Check the condition and connection of the **P101** white **UCH** 40-track connector and the steering column lock connector.

Check the **continuity and insulation** of the following connections:

UCH P101 40-track white connector, brown connection strip **track 9**	→	**Track 2 steering column lock** connector
UCH P101 40-track white connector, brown connection strip **track 10**	→	**Track 4 steering column lock** connector
steering column lock connector **track 1**	→	**Vehicle earth**
Diagnostic socket **track 6**	→	**Track 3 steering column lock** connector
Diagnostic socket **track 14**	→	**Track 6 steering column lock** connector

Repair if necessary.

If the fault is still present, replace the steering column lock.

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

ET332	TAILGATE LOCK CONTROL

NOTES	Ensure the absence of fault **DF037 Striker panel relay control circuit**; if the fault is present, deal with it. Press the tailgate opening switch.

Check the connection and condition of the UCH **P101** white 40-track connector and the **tailgate lock**.
Check for **+ 12 V (tailgate opening authorisation power feed)** between **track 2** of the **tailgate lock** connector and the **rear left-hand earth**.
Check for **earth** between **track 1** of the **tailgate lock** connector and the **rear left-hand earth**.
Measure the resistance of the **tailgate lock motor** between **tracks 1 and 2**.
Check the insulation, continuity and the absence of interference resistance on the following connection: **UCH P101** white 40-track connector, brown connection strip **track 8** ⟶ **Track 2** of the **tailgate lock** connector Repair if necessary.
If the fault is still present, check the **R355 intermediate connector** on **track 7**. Repair if necessary.
If the fault is still present, replace the **tailgate lock**; if the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

ET332 **CONTINUED**	

Check the connection and condition of the UCH **P101** white 40-track connector and the **tailgate opening switch**.
Check the **continuity** between **tracks 1** and **2** of the **tailgate opening switch**.
Check the connections for insulation, continuity and the absence of interference resistance: **UCH P101** white connector (40 tracks), green connection strip **track 30** → **Track 1** of the **tailgate opening switch** connector Repair if necessary.
If the fault is still present, check the **R355 intermediate connector** on **track 8**. Repair if necessary.
Check for **earth** between **track 2** of the **rear opening switch** connector and the **rear left-hand earth**.
If the fault is still present, replace the **rear opening switch**; if the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

VP004	VIN ENTRY

NOTES	Perform this configuration after replacing the computer.

Establish dialogue with the **UCH**. Select the **Command mode** menu. Select the **Parameters** menu. Select line **VP** Write VIN. Confirm the steps described in the scenario. End of procedure.
The VIN is reread in the identification screen: ID019.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

VP005	ENTERING RECOMMENDED PRESSURES

NOTES	**Special notes:** To write the recommended pressures correctly, it is essential to have the manufacturer's recommended pressures (Workshop Repair Manual or driver's handbook **for the vehicle concerned**).

Under the general menu, select command mode and then click on the parameter button and enter: **VP005**.
Save the Workshop Repair Manual values and confirm.
Check that the recommended pressures have been correctly stored in the Parameters menu: In the fault finding mode menu, select the **Read statuses and parameters icon then select Tyre management** from the sub functions.
If there is a fault, repeat the operation from the beginning.

The pressure entry reread operation is performed in the sub-function screen, tyre management: **PR009, PR010, PR011, PR012**.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

VP007	WHEEL SET SELECTION

NOTES	**Special notes:** In the general menu, click on the **status list** sub-menu, check the type of wheel set stored by displaying status **ET001 Set of valves recognised**. If the selected wheel set is incorrect, follow the procedure below:

Under the general menu, select **command mode**, then click the parameter button and enter selection **VP004**.
Save the Workshop Repair Manual values and confirm.
Check that the **recognised valve set** has been properly stored:
In the fault finding mode menu, select the **Read statuses and parameters icon then select Tyre management** from the sub functions.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

AC013	WARNING BUZZER

NOTES	Switch on the ignition. IMPORTANT: only use this command on vehicles fitted with the hands-free function. It allows you to test the connection between the UCH and the electronic audible warning.

Check the insulation and continuity of the following connection:

Audible warning **track 3** ⟶ **Track 22** UCH **P101** 40-track white connector

Check the audible warning's power supply (**track 1**) and earth connection (**track 2**).
Repair if necessary.

Replace the audible warning.

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

AC030	HEADLIGHT WASHER RELAY

NOTES	Switch on the ignition. This command tests the connection between the **UCH** and the headlight washer.

Check the **resistance of the headlight washer relay** between tracks **D1** and **D2** of the **Passenger Compartment Relay/Fuse Box (with connector disconnected)**.

Check the insulation from the + 12 V feed of the following connection:

UCH P101 white connector (40-track), green connection strip **track 40** → **Track D2** of the **passenger compartment fuse and relay box**

Repair if necessary.

If the fault is still present, replace the relay.

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

AC043	+ 12 V AFTER IGNITION FEED RELAY

NOTES	Ignition off.

The **+ 12 V after ignition feed** relay is switched for **1 second**.

Check the condition and position of the **RL22** relay and replace it if necessary.

Test the relay. Replace the relay if necessary.

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

AC044	+ 12 V ACCESSORIES FEED RELAY

NOTES	Remove the card from the reader.

The **+ 12 V accessories feed** relays are switched for **1 second**.

Check the condition and the position of the **RL18** and **RL19 accessories relays** (in the Passenger Compartment Relay/Fuse Box), replace them if necessary.

Test the relay.
Replace the relay if necessary.

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

AC047	OK TO START INDICATOR LIGHT

NOTES	Check that the side lights are off. Switch on the ignition. The 'OK to start' indicator light only comes on when the brake or clutch pedal is depressed.

'OK to start' indicated on engine Start/Stop button when the ignition is switched on.
Run the command if the light is not on.
If the indicator light does not light up, check the insulation and continuity of the following connection:

Start/Stop button **track 3** ⟶ **track 11** UCH black 40-track connector **P100**

Check the **+ 12 V AVC** button supply on **track 2**.

Replace the engine Start/Stop button.

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

AC048	ENGINE RUNNING INDICATOR LIGHT

NOTES	Check that the side lights are off. Switch on the ignition.

'OK to start' indicated on engine Start/Stop button when the ignition is switched on.
Run the command if the indicator light is not lit.
If the indicator light does not light up, check the insulation and continuity of the following connection:

Start/Stop button **track 4** ⟶ **track 3** UCH black 40-track **P100** connector

Check the **+ 12 V AVC** button supply on **track 2**.

Replace the engine Start/Stop button.

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

SC011	CARD CHECK

NOTES	**Special note:** Apply this procedure if difficulties occur when reading the card and opening the doors.

Procedure:
Insert the card in the reader.
Establish dialogue with the **UCH**.
Select the **Command mode** menu.
Select the **Specific command** menu.
Select line **SC011 Check cards**.
Confirm the steps described in the scenario.
End of procedure.
Status **ET135 CARD CODE VALID** should be **YES**.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

SC012	HANDS-FREE SYSTEM TEST

NOTES	Run this command to: – Test the RF signal between the card and the card reader. – Test the card battery.

Establish dialogue with the **UCH**.
Select the **Command mode** menu.
Select the **Specific command** menu.
Select line **SC012 Hands-free system test**.
Confirm the steps described in the scenario.
End of procedure.
In the event of a fault, perform the following checks (see the section dealing with command modes):
– **SC011 Check cards.**
– **SC023 UCH-card reader connection test.**
– **SC026 Aerial test.**

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

SC023	UCH - CARD READER CONNECTIONS TEST

NOTES	There must be no present or stored faults. Apply this procedure if difficulties occur when reading the card.

Procedure:
Establish dialogue with the **UCH**.
Select the **Command mode** menu.
Select the **Specific command** menu.
Select line **SC023 UCH - card reader connection test**.
Confirm the steps described in the scenario.
End of procedure.
The result of the command should be: **Connections correct** or **Connections faulty**.

Connections faulty:

Check the condition and connection of the black **P100** 40-track connector of the **UCH** and the card reader connector.

Check the insulation, continuity and the absence of interference resistance on the following connections:

UCH black connector brown connection strip **P100** (40 tracks) **track 6** → **track 1** card reader

UCH black connector (40 tracks), **P100** brown connection strip **track 19** → **track 4** card reader

Check for earth on **track 8** of the card reader switch.
Check for **+ battery feed** on **track 2** of the card reader switch.
Repair if necessary.

If the fault is still present, replace the card reader.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

SC026	AERIAL TEST

NOTES	Apply this procedure if difficulties occur when opening the doors.

Procedure:
With ignition off.
Using the diagnostic tool.
From the general menu, select the **Command mode** sub-menu then **specific command**.
Perform command **SC023 Aerial test**.
The result of the command is:
Good or **Poor**

If the result of commands is **ET225 Roof aerial, ET405 Tailgate aerial, ET406 Instrument panel aerial, ET226 Centre console aerial**:
Good for each aerial:
Press the three buttons on the card for **10 seconds**.
The card indicator light starts flashing quickly when the card switches to test mode.
The indicator light on the card lights up every time a signal is received from the vehicle.
Walk around the vehicle, moving away from it and coming back to find the area covered.
Press the three buttons to exit test mode.
Note:
If test mode is not deactivated, the card battery will run down quickly.

If one of these statuses **ET225 Roof aerial, ET405 Tailgate aerial, ET406 Instrument panel aerial, ET226 Centre console aerial** shows **Not OK**:
There is an open circuit on the aerial associated with the status.
Disconnect the faulty aerial and carry out a continuity check on the aerial.
Note:
The tailgate aerial and instrument panel aerial are fitted in parallel.

AFTER REPAIR	Carry out a fault finding procedure on the system. Clear the stored faults. Deal with any other faults.

GETtheMANUALS.org

NOTES	Carry out a fault finding procedure on the passenger compartment connection unit.

NO DIALOGUE WITH THE UCH	**ALP 1**
NO DIRECTION INDICATORS WORKING	**ALP 2**
CHECK TYRE PRESSURE WARNING LIGHT OR SIGNAL	**ALP 3**
PRESSURE NOT MONITORED WARNING LIGHT OR SIGNAL (INTERMITTENT WARNING)	**ALP 4**
PRESSURE NOT MONITORED WARNING LIGHT OR SIGNAL (CONTINUOUS WARNING)	**ALP 5**

GETtheMANUALS.org

ALP 1	No communication with the UCH

NOTES	Switch on the ignition. Ensure that the diagnostic tool is able to communicate with the vehicle.

Check the condition of the fuses, earths and **+ 12 V feed** to the Passenger Compartment Relay/Fuse Box.

Check for **insulation and the absence of interference resistance** on the following connections:

UCH black **P100** connector (40-track), brown connection strip **track 13** → **Track 7 diagnostic socket**

UCH white **P101** connector (40-track), brown connection strip **track 1** → **Track 14 diagnostic socket**

UCH white **P101** connector (40-track), brown connection strip **track 11** → **Track 6 diagnostic socket**

Repair if necessary.

If the fault is still present, contact Techline.

AFTER REPAIR	Remember to reposition the shunts if the Passenger Compartment Relay/Fuse Box is replaced.

GETtheMANUALS.org

ALP 2	No direction indicators are working

NOTES	First carry out a function fault finding check. Switch on the ignition.

Press the hazard warning lights switch.
Check that the hazard warning lights switch status is active.
If not refer to the section on dealing with this status.

Replace the passenger compartment fuse and relay box.

AFTER REPAIR	Remember to reposition the shunts if the Passenger Compartment Relay/Fuse Box is replaced.

GETtheMANUALS.org

ALP 3	Check tyre pressure warning light or signal

Force the four sensors to transmit using the valve exciter (without reprogramming) and check whether the message on the instrument panel and the pressure check warning lights are cleared.
Make sure that the recommended pressures read in parameters **PR009 to PR012** match the recommended pressures indicated on the door or in the driver's handbook for the vehicle. Otherwise, run command **VP005 Enter recommended pressures** (see **Processing command modes**). Force the valves to transmit (without reprogramming).
If there is a puncture warning on the instrument panel after readjusting the pressure, the sensor may not have detected the readjustment. In this case, deflate the tyre concerned by at least **300 mbar** and force the valve to transmit using the exciter. Then readjust the pressure and force the valve to transmit again using the exciter. Switch the ignition off and then on again.
If the instrument panel warning occurred while the vehicle was being started or after it had been parked in severe weather conditions (under the midsummer sun or outside in intense cold), switch off the ignition for **1 hour 45 minutes** then switch it back on or program the four valve codes in accordance with procedure **SC002 Programming the 4 valve codes**.
If the Check pressure message is still there after these steps, replace the malfunctioning sensor(s). Then reprogram the valve codes from the beginning. Send in the sensor(s) with a completed tyre pressure monitor operation fault finding log.
If the message is still present, contact the Techline.

GETtheMANUALS.org

ALP 4	Pressure not monitored warning light or signal (Intermittent warning)

Check:
- the underbody receiver connector.
- the UCH connector.
- the wiring harness connecting the UCH and underbody receiver.
- the rear left-hand wheel arch connection.

Carry out the necessary repairs.

If there are no faults on the connections or wiring harness, replace the underbody receiver.

After changing the underbody receiver, excite the sensors using the valve exciter and check that statuses **ET200 to ET203 WHEEL SIGNAL** change to **STATUS1**: forced transmission.

Send the receiver to the Parts Return Department with a completed fault finding log.

If these checks do not help, the warning is present. See **ALP 5 Pressure not monitored, continuous warning.**

GETtheMANUALS.org

ALP 5	Pressure not monitored warning light or signal (Continuous warning)

One or more wheel warning lights on the instrument panel display disappear

Remove the tyre from the wheel missing on the instrument panel. Make sure the sensor is fitted the right way round.
If it is fitted the right way round, replace it and program the code for the new sensor. Send the sensor to the Parts Return Department with a completed tyre pressure monitor fault finding log.
If it is fitted the wrong way round, put it right and carry out a road test for at least **5 minutes** at a speed greater than **18 mph (30 km/h)**.
If the wheel warning light does not reappear, contact the Techline and send the sensor to the Parts Return Department with a completed Tyre Pressure Monitor fault finding log.

1. SCOPE OF THIS DOCUMENT

This document presents the fault finding procedure applicable to all computers with the following specifications:

Vehicle(s):	**CLIO III, Laguna II ph 1 and 2** **Vel-Satis ph1 and 2,** **Espace IV ph1 and 2,** **Mégane II, Scénic II, Modus ph2**

Computer name: **Parking distance control**
Vdiag No: 04-08

2. PREREQUISITES FOR FAULT FINDING

Documentation type

Fault finding procedures (this manual):
– Assisted fault finding (integrated into the **diagnostic tool**), Dialogys.
Wiring Diagrams:
– Visu-Schéma (CD-ROM), paper.

Type of diagnostic tools

– CLIP + multiplex line sensor

Special tooling required

Special tooling required	
	Multimeter
Elé. 1681	Universal bornier

3. RECAP

To run fault finding on the vehicle computers, switch on the ignition.

Depending on the type of vehicle equipment, proceed as follows:

For vehicles with radio frequency remote control/key, switch on the ignition with the key.
For vehicles with a Renault card, with the vehicle card in the card reader, press and hold start button (longer than **5 seconds**) with start-up conditions not fulfilled, connect the diagnostic tool and perform the required operations.

To cut off the + after ignition feed, proceed as follows:

For vehicles with key/radiofrequency remote control, use the key to switch off the ignition.
For vehicles with a Renault card, press the Start button twice briefly (less than **3 seconds**), ensure that the + after ignition feed has been cut off by checking that the computer indicator lights on the instrument panel have gone out.

GETtheMANUALS.org

Faults

Faults are declared as either present or stored (depending on whether they appeared in a certain context and have disappeared since, or whether they remain present but have not been diagnosed within the current context).

The **present** or **stored** status of faults should be taken into consideration when the **diagnostic tool** is used following the + after ignition supply being switched on (without operating the system components).

For a **present fault**, apply the procedure described in the **Interpretation of faults** section.

For a **stored fault**, note the faults displayed and apply the instructions in the **Notes** section.

If the fault is **confirmed** when the instructions in the Notes section are applied, the fault is present. Deal with the fault

If the fault is **not confirmed**, check:
- the electrical lines which correspond to the fault,
- the connectors for these lines (for oxidation, bent pins, etc.),
- the resistance of the component detected as faulty,
- the condition of the wires (melted or split insulation, wear).

Conformity check

The aim of the conformity check is to check data that does not produce a fault on the **diagnostic tool** because the data is inconsistent. Therefore, this stage is used to:
- carry out fault finding on faults that do not have a fault display, and which may correspond to a customer complaint.
- check that the system is operating correctly and that there is no risk of a fault recurring after repairs.

This section gives the fault finding procedures for statuses and parameters and the conditions for checking them.

If a status is not behaving normally or a parameter is outside the permitted tolerance values, consult the corresponding fault finding page.

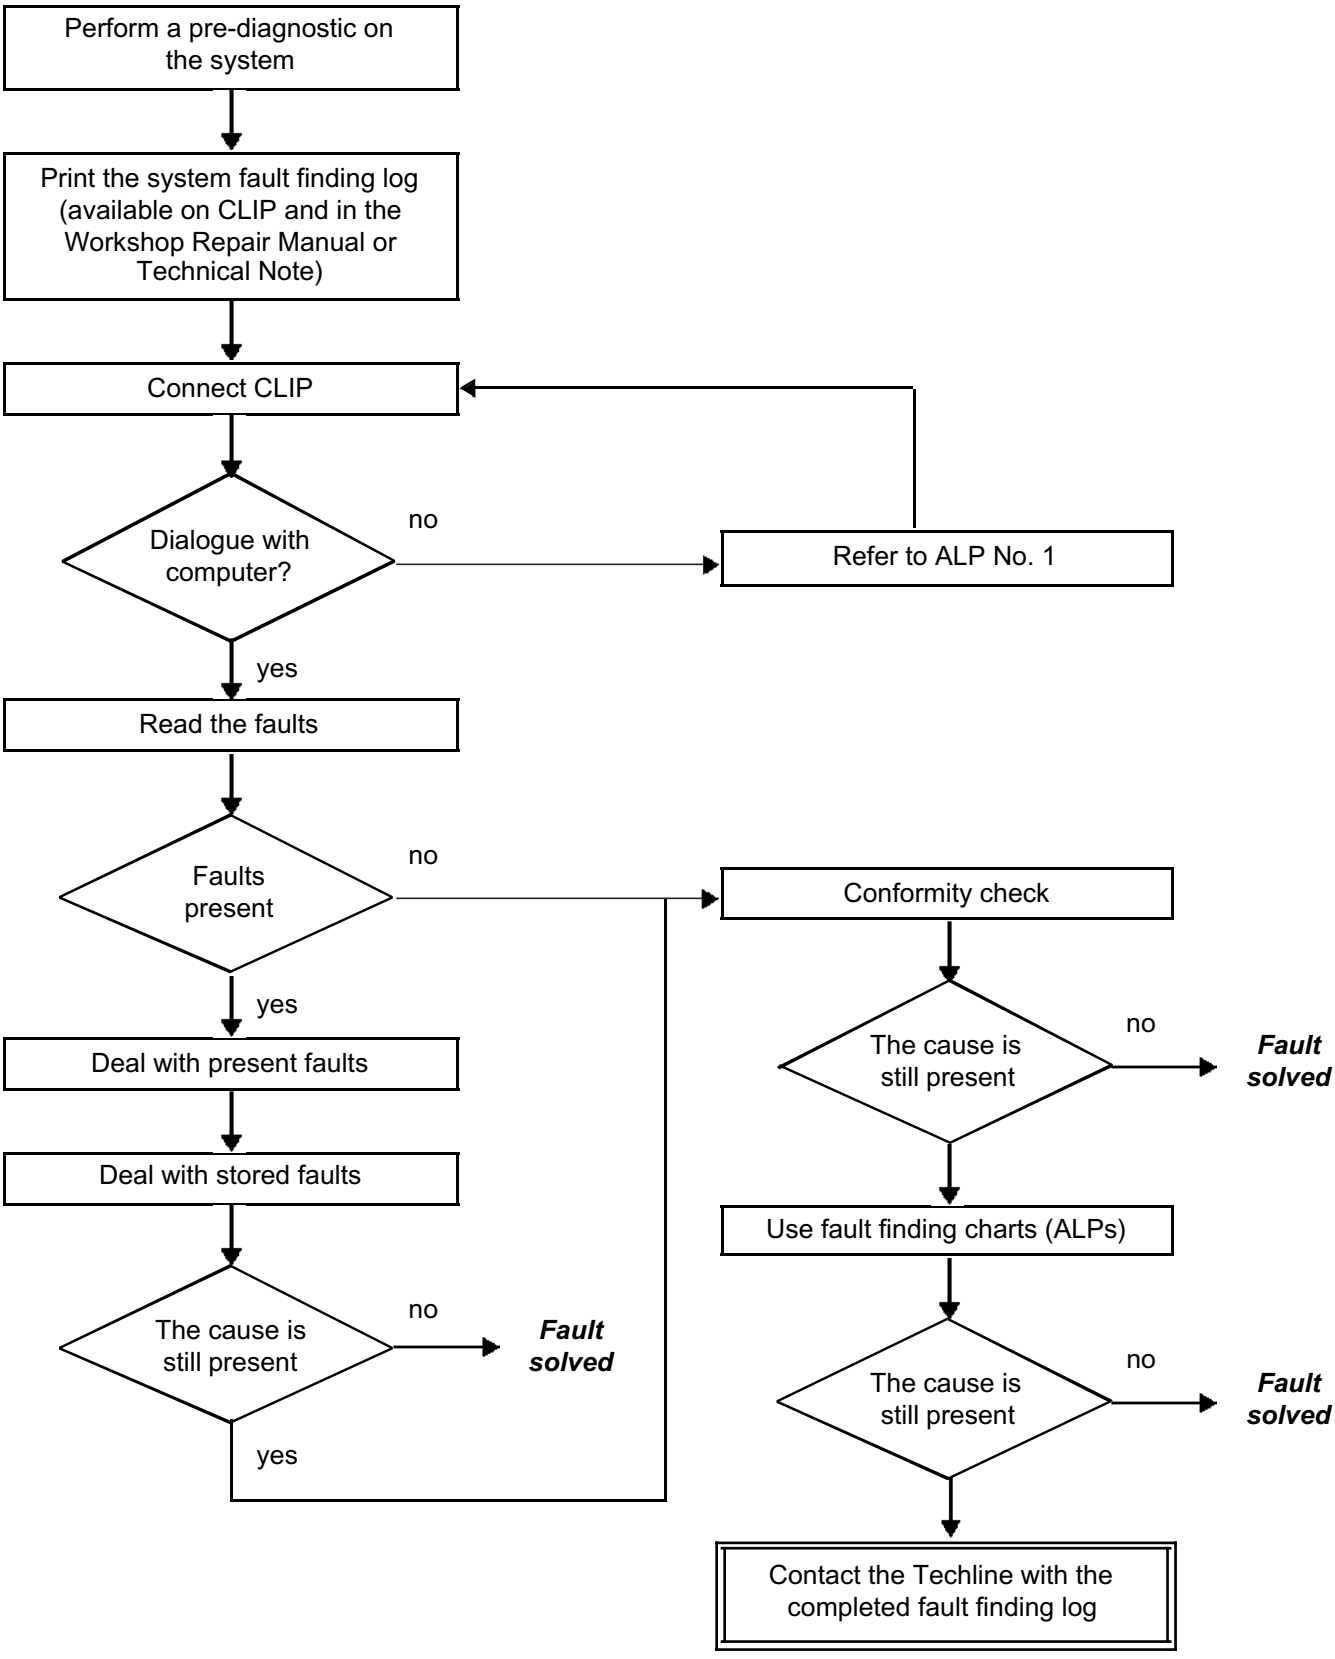
Customer complaints - Fault finding chart

If the test with the diagnostic tool is OK but the customer complaint is still present, the fault should be processed by **customer complaint**.

A synopsis of the general procedure to follow is provided on the following page in the form of a flow chart.

GETtheMANUALS.org

4. FAULT FINDING PROCEDURE



GETtheMANUALS.org

4. FAULT FINDING PROCEDURE (continued)

Wiring check

Fault finding problems
Disconnecting the connectors and/or manipulating the wiring harness may temporarily remove the cause of a fault.
Electrical measurements of voltage, resistance and insulation are generally correct, especially if the fault is not present when the analysis is made (stored fault).

Visual inspection
Look for damage under the bonnet and in the passenger compartment.
Carefully check the fuses, insulators and wiring harness routing.
Look for signs of oxidation.

Tactile inspection
While manipulating the wiring harness, use the **diagnostic tool** to note any change in fault status from stored to present.
Make sure that the connectors are properly locked.
Apply light pressure to the connectors.
Twist the wiring harness.
If there is a change in status, try to locate the source of the fault.

Inspection of each component
Disconnect the connectors and check the appearance of the clips and tabs, as well as the crimping (no crimping on the insulating section).
Make sure that the clips and tabs are properly locked in the sockets.
Check that no clips or tabs have been dislodged during connection.
Check the clip contact pressure using an appropriate model of tab.

Resistance check
Check the continuity of entire lines, then section by section.
Look for a short circuit to earth, to **+ 12 V** or to another wire.

If a fault is detected, repair or replace the wiring harness.

GETtheMANUALS.org

5. FAULT FINDING LOG

IMPORTANT

IMPORTANT
Any fault on a complex system requires thorough fault finding with the appropriate tools. The FAULT FINDING LOG, which should be completed during the procedure, enables you to keep track of the procedure which is carried out. It is an essential document when consulting the manufacturer.

IT IS THEREFORE ESSENTIAL THAT THE FAULT FINDING LOG IS FILLED OUT EVERY TIME IT IS REQUESTED BY TECHLINE OR THE WARRANT RETURNS DEPARTMENT.

You will always be asked for this log:

- when requesting technical assistance from Techline,
- for approval requests when replacing parts for which approval is mandatory,
- to be attached to monitored parts for which reimbursement is requested. The log is needed for warranty reimbursement, and enables better analysis of the parts removed.

6. SAFETY ADVICE

Safety rules must be observed during any work on a component to prevent any damage or injury:

– check the battery voltage to avoid incorrect operation of computer functions,
– use the appropriate tools,
– do not touch the xenon bulbs, and do not work on the COSLAD system when it is in operation, as the voltage can be above 20,000 V.

GETtheMANUALS.org

Description of operation

The system consists of four sensors built into the rear bumper, a computer and a buzzer.
The system assists the driver during parking manoeuvres by warning of any obstacles to the rear of the vehicle.
– The sensors and the computer calculate the distance between the vehicle and any obstacles. The sensors operate over a distance range from **20 - 30 cm minimum to 150 cm maximum**.
– The driver is informed of the distances by a **buzzer**.
– The system only works when the vehicle **is in reverse gear**. Activation is indicated by a **brief 0.5 second activation sound**.

The buzzer is activated when the vehicle is **150 cm** from the obstacle. As the distance diminishes, the frequency of the buzzer increases. When the distance reaches **20 - 30 cm**, the buzzer becomes continuous.
– The system can only be **activated** in **+ after ignition feed**.

DEACTIVATING THE SYSTEM:

– The parking distance control can be deactivated in two ways:
– **Temporary deactivation:** briefly **pressing** (**1 second**) the parking distance control switch on the dashboard deactivates the system (the red warning light on the switch comes on). The function can be switched on again by pressing **briefly** for a second time (the red indicator light on the switch goes out) or by switching the ignition off and back on.
– **Permanent deactivation:** the parking distance control system can be deactivated **for a longer period** by **pressing and holding** (for approximately **3 seconds**) the parking distance control switch on the dashboard (the red warning light on the switch comes on). The function can be switched on again only by **pressing and holding** the switch again (the red warning light on the switch goes out).

Note:
Using the **diagnostic tool** statuses, it is possible to find out the function status (ready, detecting, suspended or disabled) by using status **ET003 Parking distance control function** (see **conformity check** or **the relevant status interpretation**).

Fault finding:
A low pitched, 5-second continuous warning sound upon switching on the ignition informs the driver that a system fault has occurred.

GETtheMANUALS.org

Computer with 1 connector (Clio III, Laguna II ph1 and 2, Vel Satis ph1 and 2 Espace IV ph 1 and 2 Mégane II, Scénic II, Modus ph2):

REPLACING THE PARKING DISTANCE CONTROL COMPUTER

BEFORE REPLACING ANY COMPUTER IT IS ESSENTIAL THAT YOU CONTACT TECHLINE.

When replacing the computer, apply the following procedure:
– switch off the ignition,
– replace the parking distance control computer (see **MR 392, 385, 405, 395, 364, 370 or 470 mechanical systems 87F parking distance control, parking distance control computer: Removal - Refitting**),
– configure the vehicle identification using command **CF005 Vehicle identification** (refer to **Configurations and Programming**),
– configure the volume of the buzzer and adjust the pitch using commands **CF001 Buzzer volume** and **CF006 Adjusting the pitch** (refer to **Configurations and Programming**),
– enter the VIN using command **VP001 Enter VIN**,
– check that the system is operating correctly and make sure that there are no faults.

GETtheMANUALS.org

CONFIGURATION AFTER REPLACING THE COMPUTER

After replacing the computer, configure the parking distance control computer with the vehicle type using configuration **CF005 Vehicle identification** (repair mode menu, diagnostic tool configuration function). The configuration adapts the sensors' detection field to the type of body.
Depending on a vehicle's gearbox type (automatic or manual), the parking distance control can be delayed from working. Activation of the parking distance control is indicated by a **brief 0.5 second activation sound** (vehicle in reverse gear). On vehicles with an automatic transmission, the **3-second** delay prevents the activation noise from sounding every time the driver shifts from Park to Drive.

After having configured the computer, check that the configuration has taken effect by reading the configuration **LC005 Vehicle identification**.

Special note (Vdiag 08 only):
If a vehicle is fitted with a caravan towbar and if there is a continuous beeping noise, take the towbar out of the detection field for the rear sensors, run the command for parameter **VP003 Caravan towbar distance**, then increase the detection area centimetre by centimetre. To avoid impairing the detection, the parameter **PR026 Caravan towbar distance** must not exceed **40 cm**.

SETTING OPTIONS

The volume and the tone of the buzzer can be changed if the customer desires.
Configuration **CF001 Buzzer volume** is used to adjust the **volume** of the buzzer.

Configuration function **CF006 Pitch adjustment** is used to adjust the **pitch** of the buzzer.

After configuring the computer, check that the configurations have been registered correctly using configuration readings **LC001 Buzzer volume** and **LC006 Tone adjustment**.

GETtheMANUALS.org

DF002 PRESENT OR STORED	LEFT-HAND OUTER SENSOR CC.1 : Short circuit to + 12 V CO.0 : Open circuit or short circuit to earth 1.DEF: Internal electronic fault

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present following selection of reverse gear if the parking distance control function is **ACTIVE (READY)**: the parking distance control warning light is not lit, see the interpretation of status **ET003 Parking distance control function**.
	Special notes: This fault is indicated by the buzzer (a **5 second** warning sound) and the system shuts down.

If a combination of faults are present on the sensors:
Check the connection and condition of the intermediate connectors (the sensors up to the computer). Repair if necessary.
Check for **+ 12 V**, after ignition, between **tracks 1 and 3** of all the sensors.
Computer with 1 connector:
Check the **insulation, continuity and the absence of interference resistance** of the supply for each sensor (between **Tracks 1 and 3**) and for the computer (between **tracks 9 and 10**).
Computer with 2 connectors:
Check the **insulation, continuity and absence of interference resistance** of the supply between **tracks 1 and 3** for each sensor and between **tracks 8 and 11** of the computer **12-track** connector.

In the case where only one sensor is faulty:
Swap the defective sensor with a non-defective sensor.
Check for faults:

If the sensor is no longer faulty, replace the defective sensor.

If the fault is still present, **with the ignition off,** disconnect the parking distance control computer connector to check **the insulation, continuity and the absence of interference resistance** on the following connections:
1 connector:

Parking distance control computer	→	Left-hand outer sensor
Track 9	→	**Track 1**
Track 15	→	**Track 2**
Track 10	→	**Track 3**

Repair if necessary (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

AFTER REPAIR	Clear the stored faults. Follow the instructions to confirm repair. Deal with any faults.

GETtheMANUALS.org

2 connectors:

12-track parking distance control computer connector		Left-hand outer sensor
Track 11	→	**Track 1**
Track 5	→	**Track 2**
Track 8	→	**Track 3**

Repair if necessary (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

If the fault is still present, contact the Techline.

AFTER REPAIR	Clear the stored faults. Follow the instructions to confirm repair. Deal with any faults.

GETtheMANUALS.org

DF003 PRESENT OR STORED	LEFT-HAND INNER SENSOR CC.1 : Short circuit to + 12 V CO.0 : Open circuit or short circuit to earth 1.DEF: Internal electronic fault

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present following selection of reverse gear if the parking distance control function is **ACTIVE (READY)**: the parking distance control warning light is not lit, see the interpretation of status **ET003 Parking distance control function**.
	Special notes: This fault is indicated by the buzzer (a **5 second** warning sound) and the system shuts down.

When dealing with a combination of faults on the sensors:
Check the connection and the status of the intermediate connectors (the sensors up to the computer). Repair if necessary.
Check for **+ 12 V**, after ignition, between **Tracks 1 and 3** of all the sensors.
Computer with 1 connector:
Check the **insulation, continuity and the absence of interference resistance** of the supply for each sensor (between **Tracks 1 and 3**) and for the computer (between **tracks 9 and 10**).
Computer with 2 connectors:
Check the **insulation, continuity and absence of interference resistance** of the supply between **tracks 1 and 3** for each sensor and between **tracks 8 and 11** of the computer **12-track** connector.

In the case where only one sensor is faulty:
Swap the defective sensor with a non-defective sensor.
Check for faults:

If the sensor is no longer faulty, replace the defective sensor.

If the fault is still present, **with the ignition off**, disconnect the parking distance control computer connector to check **the insulation, continuity and the absence of interference resistance** on the following connections:
1 connector:

Parking distance control computer		Left-hand inner sensor
Track 9	→	**Track 1**
Track 14	→	**Track 2**
Track 10	→	**Track 3**

Repair if necessary (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

AFTER REPAIR	Clear the stored faults. Follow the instructions to confirm repair. Deal with any faults.

NOTES	Only perform this conformity check after a thorough check with the **diagnostic tool**. **Conditions for applying the fault finding procedure:** ignition on.

Order	Function	Parameter or Status checked or Action		Display and Notes	Fault finding
1	Parking distance control system status	**ET003:**	Parking distance control function	**READY** (system operating and ready to detect)	For further information or, if there is a fault, consult the interpretation of status **ET003**.
				DETECTING (if the system is detecting)	
				SUSPENDED (if the system is temporarily switched off)	
				OFF (if the system is completely switched off)	
2	Parking distance control deactivation switch.	**ET004:**	Parking distance control switch	**PRESS DETECTED** when the switch is pressed, **RELEASED** when released.	In the event of a fault, consult the interpretation of status **ET004**.
3	Feeds	**PR006:**	Sensor feed voltage	**10.5 V < X < 14.4 V**	In the event of a fault, apply the fault finding procedure for **DF007 Sensor supply voltage**.
		PR020:	Computer feed voltage	**10.5 V < X < 14.4 V**	If there is a fault with this parameter, check the **insulation, continuity and the absence of interference resistance** on the computer power feed and earth (see wiring diagram). If the fault is still present, carry out **fault finding on the charging circuit**.
4	Reverse gear selection	**ET001:**	Reverse gear engaged	**YES** or **NO**	If there is a fault, refer to the interpretation of status **ET001**.

GETtheMANUALS.org

NOTES	Only perform this conformity check after a thorough check with the **diagnostic tool**. **Conditions for applying the fault finding procedure:** ignition on.

Order	Function	Parameter or Status checked or Action	Display and Notes	Fault finding
5	Buzzer control	**ET002:** Buzzer control	**ACTIVE** when the buzzer sounds. **INACTIVE** if not.	In the event of a fault, consult the interpretation of status **ET002**.
6	Proximity sensors	**PR001:** Left-hand outer sensor distance	**20 cm < X < 150 cm** depending on the distance from the obstacle (“out of range” value: **255 cm**).	In the event of a fault, refer to the interpretation of the parameter **PR001**.
		PR002: Left-hand inner sensor distance	**20 cm < X < 150 cm** depending on the distance from the obstacle (“out of range” value: **255 cm**).	If there is a fault, refer to the interpretation of parameter **PR002**.
		PR003: Right-hand outer sensor distance	**20 cm < X < 150 cm** depending on the distance from the obstacle (“out of range” value: **255 cm**).	In the event of a fault, consult the interpretation of parameter **PR003**.
		PR004: Right-hand inner sensor distance	**20 cm < X < 150 cm** depending on the distance from the obstacle (“out of range” value: **255 cm**).	If there is a fault, refer to the interpretation of parameter **PR004**.
		PR005: Shortest distance calculated	**20 cm < X < 150 cm** depending on the distance from the obstacle (“out of range” value: **255 cm**).	If there is a fault, refer to the interpretation of parameter **PR005**.
7	**Vdiag 08 only:** Caravan attachment detection zone	**PR026**: Distance from the caravan attachment	**By default: 35 cm** Beyond **40 cm**, the function is less effective, (setting the detection area of the rear centre sensors so that the presence of a caravan towbar is not detected)	If the caravan attachment is detected, increase the non-detection value using parameter **VP003**.
		VP003: Distance from the caravan attachment	Enables the non-detection area for the caravan attachment to be modified.	

GETtheMANUALS.org

Tool status	Diagnostic tool title
ET001	Reverse gear engaged

ET004	Parking distance control switch

GETtheMANUALS.org

ET001	REVERSE GEAR ENGAGED

NOTES	**Special note:** Only carry out the checks if the YES and NO statuses are not consistent with the position of the gear lever.

1 connector:

Check that the reversing lights are working correctly: they should come on when reverse gear is selected and go out when it is not.

If the reversing lights fail to function as specified:
With the ignition switched off, disconnect the parking distance control computer connector to check the **insulation** (against **+ 12 V**), **and the continuity and absence of interference resistance** on the following connection:
Laguna II ph1 ph2, Espace IV ph1 ph2, Vel-Satis ph2, Clio III, Modus ph2:

Parking distance control computer connector		Rear lights connector
Track 4	→	**Track 3**

Repair if necessary (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

Vel-Satis ph1, Scénic II:

Parking distance control computer connector		Rear left hand lights connector
Track 4	→	**Track 2**

Repair if necessary (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET001 (CONTINUED 1)	

Mégane II:
Only for 3 and 5-door hatches:

Parking distance control computer connector (white) — Left-hand rear light connector

Track 4 → **Track 5**

Parking distance control computer connector (white) — Right-hand rear light connector

Track 4 → **Track 1**

Repair if necessary (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

Only for 4-door hatches:

Parking distance control computer connector (white) — Left-hand rear light connector

Track 4 → **Track 5**

Parking distance control computer connector (white) — Right-hand rear light connector

Track 4 → **Track 2**

Repair if necessary (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

Only for cabriolets:

Parking distance control computer connector (white) — Left-hand rear light connector

Track 4 → **Track 6**

Parking distance control computer connector (white) — Right-hand rear light connector

Track 4 → **Track 1**

Repair if necessary (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET001 (CONTINUED 2)	

Only for estates:

Parking distance control computer connector (white)		Left-hand rear light connector
Track 4	→	**Track 5**
Parking distance control computer connector (white)		Right-hand rear light connector
Track 4	→	**Track 5**

Repair if necessary (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

2 connectors:

Laguna II ph1, Espace IV ph1, Vel-Satis ph2, Clio III:

Parking distance control computer connector		Rear light connector
Track 6	→	**Track 3**

Repair if necessary (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

Vel Satis ph1:

Parking distance control computer connector		Rear light connector
Track 6	→	**Track 2**

Repair if necessary (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET002	BUZZER CONTROL

NOTES	There must be no present or stored faults.

ET002 remains OFF	Check that the parking distance control system is switched on using status **ET003 "Parking distance control function"** (parking distance control switch warning light goes out). If the status displays “suspended” or “deactivated”, restart the system by pressing for **1 or 3 seconds**, consult the interpretation of status **ET003 “Parking distance control function”**.
	Check that the parking distance control configuration is correct for the vehicle on which it is fitted (**LC005 Vehicle identification**). If necessary, reconfigure the computer using command **CF005 Vehicle identification**.
	Check, when the vehicle is close to an obstacle (between **20 and 150 cm**), that the distance evaluated corresponds to the distance displayed by the **diagnostic tool** (**PR001** to **PR004**). If the distance reading does not match or the distance parameters stay at **255 cm**, contact your Techline.

ET002 ON but buzzer does not sound	Check that the buzzer volume is not at a zero setting **LC001 Buzzer volume**. If the configured volume is **ZERO or DEACTIVATED**, reconfigure the computer using command **CF001 Buzzer volume**. Select the volume required by the customer.
	Switch off the ignition, and disconnect the parking distance control computer 16-track connector to check the **insulation and continuity and ensure the absence of interference resistance** on the following connections: **Laguna II ph2, Espace IV ph2, Espace IV ph1 (1 connector), Vel-Satis ph2, Vel-Satis ph1 (1 connector), Laguna II ph1 (1 connector),** Parking distance control computer → Buzzer **Track 2** → **Track 1** **Track 6** → **Track 2** Repair if necessary (refer to vehicle wiring diagrams).

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET002 (CONTINUED)	

Mégane II, Scénic II, Clio III, Modus ph2:

Parking distance control computer		Buzzer
Track 2	→	**Track 2**
Track 6	→	**Track 1**

Repair if necessary (refer to vehicle wiring diagrams).

Laguna II ph1 (2 connector), Espace IV ph1 (1 connector), Vel-Satis ph1 (1 connector):

Parking distance control computer		Buzzer
Track 10	→	**Track 2**
Track 2	→	**Track 1**

Repair if necessary (refer to vehicle wiring diagrams).

Measure the resistance between the buzzer's 2 **tracks**.
Replace the buzzer if its resistance is not approximately **48 Ω**.

If the fault is still present, replace the buzzer.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET003	PARKING DISTANCE CONTROL FUNCTION

NOTES	**Special note**: If the parking distance control system is suspended or deactivated, the parking distance control switch indicator light comes on.

This status indicates whether the parking distance control system is on or off:

ET003: READY → This means that, when reversing, the parking distance control detects obstacles and the buzzer sounds (the parking distance control switch indicator light goes out).

ET003: DETECTING → This information is displayed when in reverse gear and indicates that the parking distance control has detected an obstacle.

ET003: SUSPENDED → This means the parking distance control system is switched off (no detection possible). The suspension is **temporary** because the parking distance control system will come back on after the ignition is switched off and on. To suspend or reactivate the system manually, **briefly press** (**1 second**) the parking distance control switch.

ET003: DEACTIVATED → This means the parking distance control system is switched off (no detection possible). This suspension is **permanent** (switching the + after ignition off and on again will not reactivate the system). To deactivate or reactivate the system manually, **press and hold** (**3 seconds**) the parking distance control switch.

If the status is not as specified, check for an **earth** on **track A2** of the parking distance control switch. Repair if necessary.

With the ignition off, disconnect the parking distance control switch to check the **insulation** (against the earth and **+ 12 V**), **continuity and absence of interference resistance** in the following connection:
Laguna II ph2, Espace IV ph2, Vel-Satis ph2, Mégane II, Scénic II, Espace IV ph1 (1 connector), Vel-Satis ph1 (1 connector), Clio III, Modus ph2:

Parking distance control switch connector **Track B1** → Parking distance control computer connector **Track 12**

Repair if necessary

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET003 **CONTINUED**	

Espace IV ph1 (2 connectors), Vel-Satis ph1 (2 connectors):

Parking distance control switch connector **Track B1** → Parking distance control computer connector **Track 12**

Repair if necessary

If the connection just checked is OK (no open or short circuit), and there is an **earth** on **track A2** of the switch but the fault is still present, check the switch operation with an ohmmeter.
Switch not pressed: **insulation** between **track A2** and **B1**.
Switch pressed: **continuity** between **track A2** and **B1**.
Replace the parking distance control switch if it fails to function as specified.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET004	PARKING DISTANCE CONTROL SWITCH

NOTES	**Special notes:** Only apply the status interpretation procedure if the parking distance control switch position is not consistent with the information supplied by status (**"Press detected" or "Release"**). There must be no present or stored faults.

With the ignition off, disconnect the parking distance control switch to check the **insulation** (against the earth and **+ 12 V**), **continuity and absence of interference resistance** in the following connection:

Parking distance control switch connector		Parking distance control computer connector
Track B1	→	**track 12**

Repair if necessary.

If the connection just checked is OK (no open or short circuit), and there is an **earth** on **track A2** of the switch but the fault is still present, check the switch operation with an ohmmeter.
Switch not pressed: **insulation** between **track A2** and **B1**.
Switch pressed: **continuity** between **track A2** and **B1**.
Replace the parking distance control switch if it fails to function as specified.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

Tool parameter	Diagnostic tool title
PR001	Left-hand outer sensor distance
PR002	Left-hand inner sensor distance
PR003	Right-hand outer sensor distance
PR004	Right-hand inner sensor distance
PR005	Shortest distance calculated
PR006	Sensor feed voltage
PR020	Computer feed voltage
PR026	Distance from caravan attachment **(Vdiag 08 only)**

GETtheMANUALS.org

PR001 **PR002** **PR003** **PR004**	LEFT-HAND OUTER SENSOR DISTANCE LEFT-HAND INNER SENSOR DISTANCE RIGHT-HAND OUTER SENSOR DISTANCE RIGHT-HAND INNER SENSOR DISTANCE

NOTES	**Special notes:** Before searching for a fault with these parameters, make sure no fault is present or stored. If there is a fault, apply the interpretation for the fault detected by the **diagnostic tool**.
	Note: The ultrasonic sensors are very fragile. Therefore, when removing the rear bumper, be careful not to scratch them. An obstacle which is further than **150 cm** away cannot be detected, the parameter value is **255** in this case. For an obstacle which is between **20** and **150 cm** away, the parameter value is the distance to the obstacle. For an obstacle which is closer than **20 cm** away, the value of the parameters is **0**.

Using the **diagnostic tool** configuration reading screen (repair mode menu), check that the parking distance control system is configured correctly for the vehicle type to which it is fitted (**LC005 Vehicle identification**).
If necessary, reconfigure the computer using command **CF005 Vehicle identification**.

Check, when the vehicle is close to an obstacle (between **20 and 150 cm**), that the distance evaluated corresponds to the distance displayed by the **diagnostic tool** (**PR001** to **PR004**).
If the distance is incorrect or if the distance parameters remain at **255**, make sure nothing is interfering with the reading (sticker, mud, snow etc. on the rear bumper).

If the distances displayed by the sensors seem incorrect or if **255** is displayed continuously, check the condition of the sensor(s). There must be no scratches on the detection component (outer metal section) of the sensors.
Replace the defective sensor.

If the fault is still present, apply the fault finding procedure to the sensor whose distance parameter is incorrect (even if the **diagnostic tool** does not report a fault).

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

PR005	SHORTEST DISTANCE CALCULATED

NOTES	**Special notes:** Before searching for a fault with this parameter, make sure that no fault is present or stored. If there is a fault, apply the interpretation for the fault detected by the **diagnostic tool**.
	Note: The ultrasonic sensors are very fragile. Therefore, when removing the rear bumper, be careful not to scratch them. **This parameter is an average calculated by the computer when an obstacle is placed between two sensors.** When below **30 cm**, the estimated distance is displayed as **0 cm** (critical detection zone with constant warning sound).

Using the diagnostic tool configuration reading screen, check that the parking distance control system is configured correctly for the body on which it is fitted **LC005 Vehicle identification**). If necessary, reconfigure the computer using command **CF005 Vehicle identification**.
With the vehicle close to an obstacle (between **0 and 150** cm), check whether the calculated distance is consistent. If the distance is inconsistent or if the parameter remains at 255, ensure that nothing is interfering with the measurement (sticker, mud or snow, etc. on the rear bumper).
If the distance calculated is still inconsistent or if it is continuously displayed as **255**, check the condition of the sensors; the detection part (metallic outer part) must not have any scratches. Replace the defective sensor.
If the fault is still present, apply the fault finding procedure to the sensor whose distance parameter is incorrect (even if the **diagnostic tool** does not report a fault).

AFTER REPAIR	Repeat the conformity check from the start.

PARKING DISTANCE CONTROL
Fault finding - Customer complaints

GETtheMANUALS.org

NOTES	**Only consult this customer complaint after a complete check with the diagnostic tool.**

NO DIALOGUE WITH THE COMPUTER	→ **ALP1**
NO BUZZER	→ **ALP2**
WARNING SOUND EMITTED CONTINUOUSLY (NO OBSTACLE DETECTED)	→ **ALP3**

GETtheMANUALS.org

ALP1	No dialogue with the computer

NOTES	None

Try the **diagnostic tool** on another vehicle.

Check:
– The connection between the **diagnostic tool** and the diagnostic socket (lead in good condition).
– The injection, engine and passenger compartment fuses.

Check for the **+ 12 V battery feed** on **track 16**, for a **+ 12 V after ignition feed** on **track 1** and for **earth** on **track 5** and on **track 4** of the diagnostic socket.
Repair if necessary.

1 connector:
Switch off the ignition, and disconnect the parking distance control computer connector to check the **insulation, continuity and absence of interference resistance** on the following connections:

Parking distance control computer connector

Track 1 → **+ Before ignition** (see vehicle diagram)

Track 3 → **Earth**

Track 8 → **track 7** of the diagnostic socket (K line)

Repair if necessary (refer to vehicle wiring diagrams).

2 connectors:
Switch off the ignition, and disconnect the parking distance control computer **16-track** connector to check the **insulation and continuity and ensure the absence of interference resistance** on the following connections:

Parking distance control computer connector

Track 1 → **+ Before ignition** (see vehicle diagram)

Track 8 → **Earth**

Track 12 → **track 7** of the diagnostic socket (K line)

Repair if necessary (refer to vehicle wiring diagrams).

AFTER REPAIR	Carry out a complete check using the diagnostic tool.

GETtheMANUALS.org

ALP2	No buzzer

NOTES	Only investigate this customer complaint **after a full check using the diagnostic tool** (no faults must be present or stored).

Using the diagnostic tool Main Data screen, check that the parking distance control system is on.
The status **ET003 Parking distance control function** must be READY (and the red warning light on the parking distance control switch must be off).

Is status ET003 READY?

NO → Turn on the parking distance control by pressing the switch for **1 or 3** seconds (the red light should go out).
Note:
For more information concerning the activation of the system, consult the interpretation of status **ET003 Parking distance control**.

YES ↓

Is status ET001 "YES", with reverse gear engaged?

NO → Apply the interpretation procedure for status **ET001**

YES ↓

Using the diagnostic tool configuration readings screen, check that the buzzer volume has not been switched off (**LC001 Buzzer volume** should not be ZERO)

Is the LC001 function ZERO

YES → Reconfigure the buzzer volume using the diagnostic tool (command **CF001 Buzzer volume**).

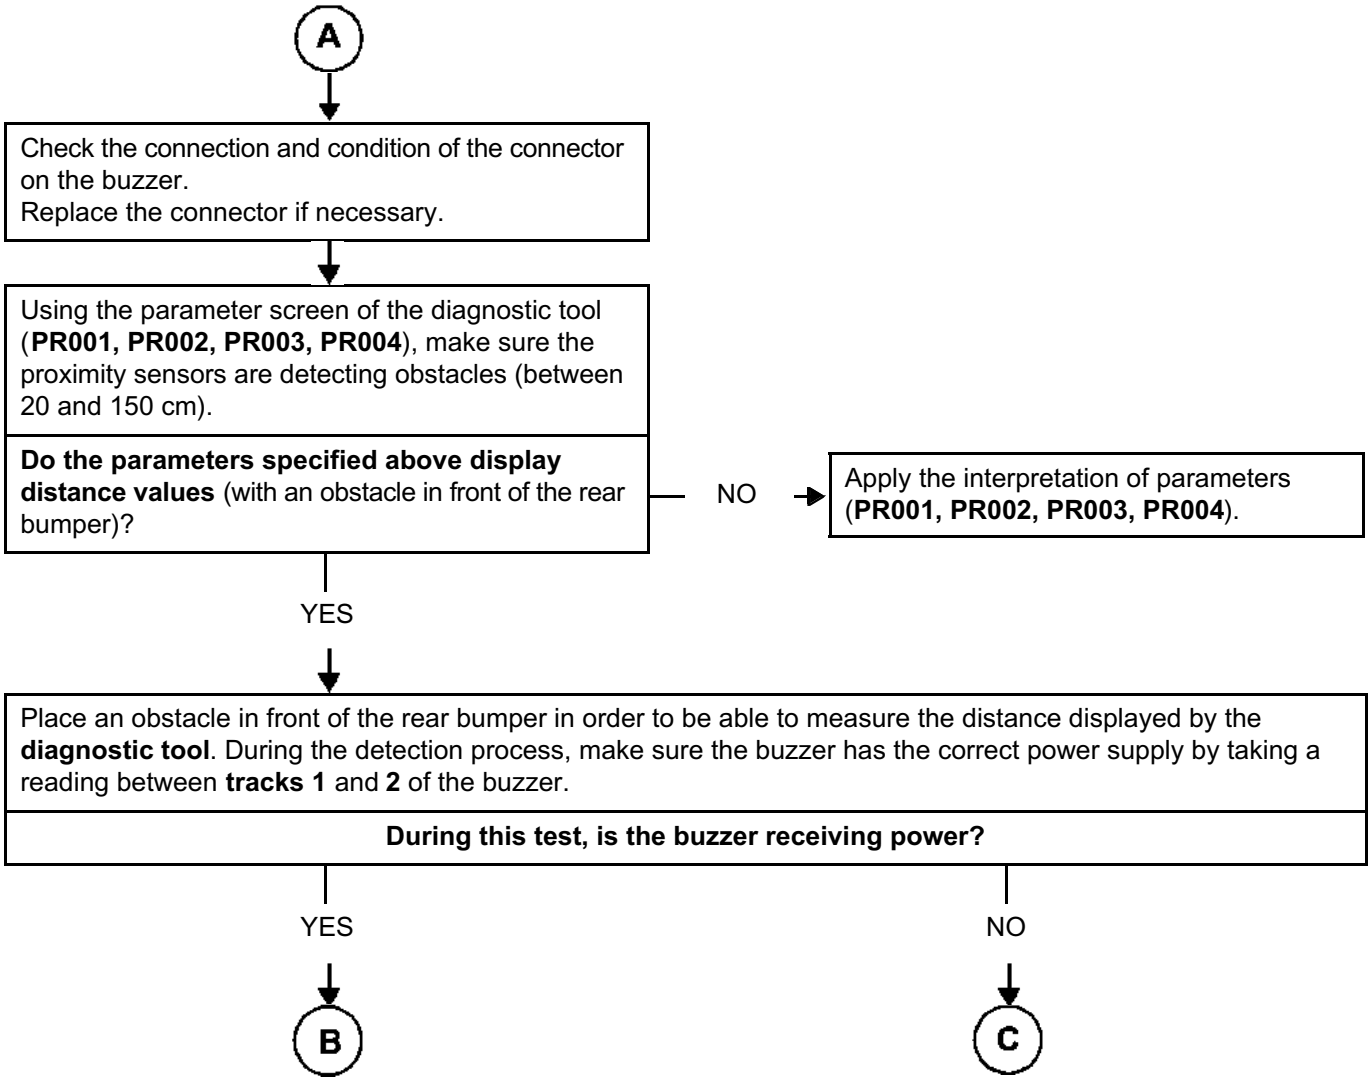
NO ↓

(A)

AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP2 CONTINUED 1	



AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP2 CONTINUED 2	

(B)

Measure the resistance between the buzzer's two tracks. Replace the buzzer if its resistance is not approximately **48 Ω**.

Is the fault still present?

YES

Replace the buzzer.

NO

(C)

Switch off the ignition, and disconnect the parking distance control computer **16-track** connector to check the **insulation and continuity and ensure the absence of interference resistance on the following connections**:

Parking distance control computer with 1 connector		Buzzer
Track 2	→	**Track 2**
Track 6	→	**Track 1**

Parking distance control computer with 2 connectors:		Buzzer
Track 10	→	**Track 2**
Track 2	→	**Track 1**

Repair if necessary (see vehicle wiring diagrams).

Is the fault still present?

NO

End of fault finding procedure.

YES

Contact the Techline.

AFTER REPAIR	Check that the system is operating correctly.

PARKING DISTANCE CONTROL
Fault finding - Fault Finding Chart

GETtheMANUALS.org

ALP3	Buzzer sounds constantly (no obstacle detected)

NOTES	Only investigate this customer complaint **after a full check using the diagnostic tool** (no faults must be present or stored).

Switch off the ignition, and disconnect the parking distance control computer connector to check the **insulation and continuity and ensure the absence of interference resistance** on the following connections:

1 connector: Parking distance control computer — Buzzer

Track 2 → **Track 2**
Track 6 → **Track 1**

Note:
The line coming from **track 2** of the computer must be insulated against + 12 V and the line coming from **track 6** of the computer must be insulated against earth.

2 connectors:

Parking distance control computer **16-track** connector — Buzzer

Track 10 → **Track 2**
Track 2 → **Track 1**

Repair if necessary (see vehicle wiring diagram).

Is the fault still present?

NO → End of fault finding procedure.

YES ↓

With no obstacle less than 150 cm in front of the rear bumper, check that the distance parameters on the diagnostic tool are 255 cm out of range (**PR001, PR002, PR003, PR004**).
If the parameters display a setting even though there is no obstacle in front of the rear bumper, make sure nothing is interfering with the reading (sticker, mud, snow etc. on the rear bumper).
Repair if necessary.

↓

End of fault finding procedure.

AFTER REPAIR	Check that the system is operating correctly.

V4 **Edition Anglaise**

"The repair procedures given by the manufacturer in this document are based on the technical specifications current when it was prepared.

The procedures may be modified as a result of changes introduced by the manufacturer in the production of the various component units and accessories from which his vehicles are constructed."

All rights reserved by Renault s.a.s.

Copying or translating, in part or in full, of this document or use of the service part reference numbering system is forbidden without the prior written authority of Renault s.a.s.

© Renault s.a.s. 2011

GETtheMANUALS.org

1. SCOPE OF THIS DOCUMENT

This document presents the fault finding method applicable to all computers with the following specifications:

Vehicle: **Vel Satis Phase 2, Espace IV, Laguna 2** *Function concerned:* **Parking distance control**	*Computer name:* **Parking distance control** *Vdiag No.:* **0C**

2. PREREQUISITES FOR FAULT FINDING

Documentation type

Fault finding procedures (this document):
– Assisted fault finding (integrated into the diagnostic tool), Dialogys.
Wiring Diagrams:
– Visu-Schéma (CD-ROM), paper.

Type of diagnostic tools

– **CLIP + multiplex line sensor**

Special tooling required

Special tooling required	
	Multimeter
Elé. 1681	**Universal bornier**

3. REMINDERS

Procedure

In order to save energy, the Vel Satis Phase 2 UCH cuts off the + after ignition feed after 3 minutes.

To run fault finding on a computer, force the + after ignition feed for 1 hour by applying the following procedure:
– Press the card unlocking button,
– insert the card in the reader,
– press the start button (interrupting the timed + after ignition feed mode),
– press the start button for more than 5 seconds, until the immobiliser warning light flashes rapidly (4 Hz).
This forced + after ignition feed mode remains active for 1 hour.
Pressing the start button or removing the card from the card reader interrupts the forced + after ignition feed, but does not interrupt the time period for the forced + after ignition feed. Until one hour has elapsed, activating the + after ignition feed will restart forced + after ignition feed for the remaining time.

GETtheMANUALS.org

Faults

Faults are declared present or stored (depending on whether they appeared in a certain context and have disappeared since, or whether they remain present but are not diagnosed within the current context).

The **present** or **stored** status of the faults should be considered when the diagnostic tool is switched on after the + after ignition feed is switched on (with no system components being active).

For a **present fault**, apply the procedure described in the **Interpretation of faults** section.

For a **stored fault**, note the faults displayed and apply the **Notes** section.

If the fault is **confirmed** when the instructions are applied, the fault is present. Deal with the fault.

If the fault is **not confirmed**, check:
- the electrical lines which correspond to the fault,
- the connectors for these lines (for oxidation, bent pins, etc.),
- the resistance of the faulty component,
- the condition of the wires (melted or split insulation, wear).

Conformity check

The aim of the conformity check is to check data that does not produce a fault on the diagnostic tool when the data is inconsistent. Therefore, this stage is used to:
- carry out fault finding on faults that do not have a fault display, and which may correspond to a customer complaint,
- check that the system is operating correctly and that there is no risk of a fault recurring after repairs.

This section gives the fault finding procedures for statuses and parameters and the conditions for checking them.

If a status is not behaving normally or a parameter is outside the permitted tolerance values, consult the corresponding fault finding page.

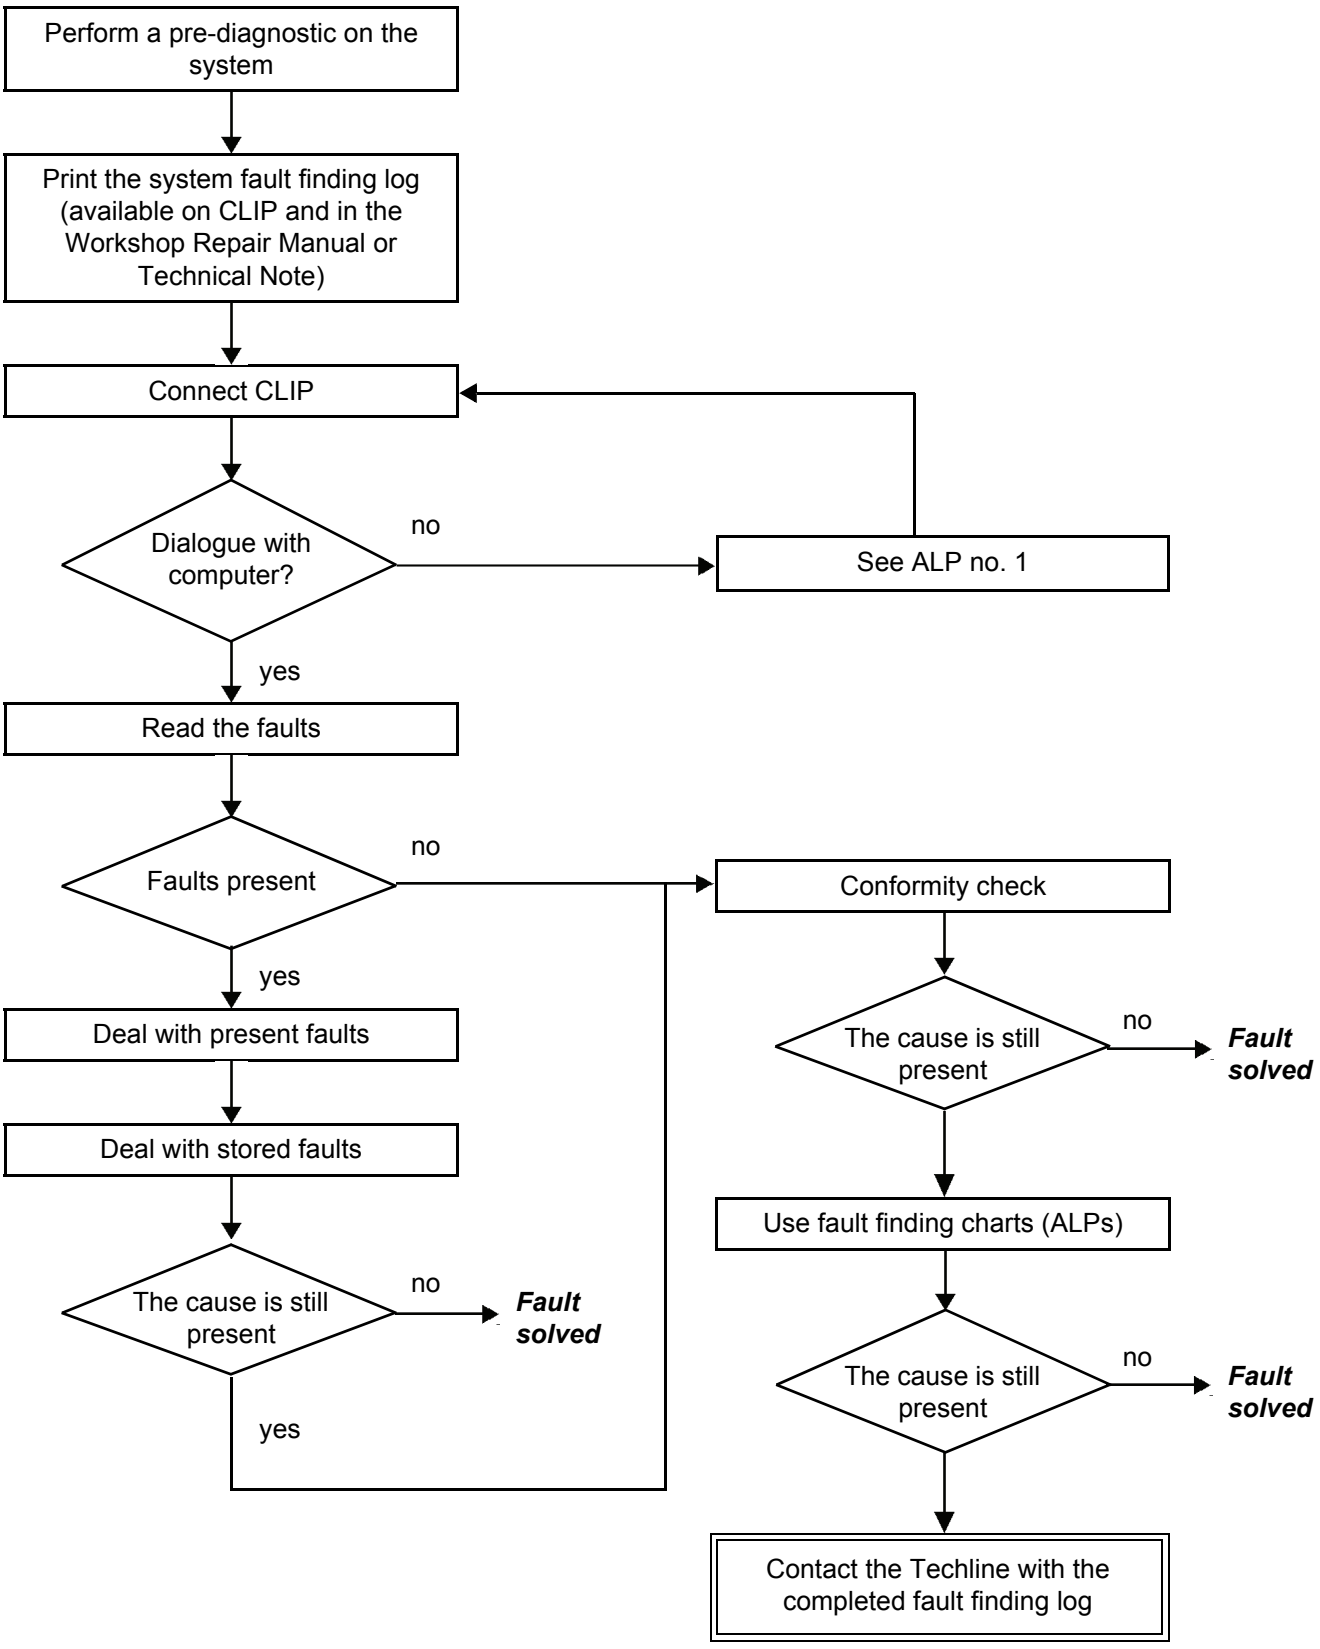
Customer complaints - Fault finding chart

If the test with the diagnostic tool is OK but the customer complaint is still present, the fault should be processed by **Customer complaints**.

A synopsis of the general procedure to follow is provided on the following page in the form of a flow chart.

GETtheMANUALS.org

4. FAULT FINDING PROCEDURE



GETtheMANUALS.org

4. FAULT FINDING PROCEDURE (continued)

Wiring check

Fault finding problems
Disconnecting the connectors and/or manipulating the wiring may temporarily remove the cause of a fault.
Electrical measurements of voltage, resistance and insulation are generally correct, especially if the fault is not present when the analysis is made (stored fault).

Visual inspection
Look for damage under the bonnet and in the passenger compartment.
Carefully check the fuses, insulators and wiring harness routing.
Look for signs of oxidation.

Physical inspection
While manipulating the wiring, use the diagnostic tool to note any change in fault status from stored to present.
Make sure that the connectors are properly locked.
Apply light pressure to the connectors.
Twist the wiring harness.
If there is a change in status, try to locate the source of the fault.

Inspection of each component
Disconnect the connectors and check the appearance of the clips and tabs, as well as the crimping (no crimping on the insulating section).
Make sure that the clips and tabs are properly locked in the sockets.
Check that no clips or tabs have been dislodged during connection.
Check the clip contact pressure using an appropriate model of tab.

Resistance check
Check the continuity of entire lines, then section by section.
Look for a short circuit to earth, to **+ 12 V** or with another wire.

If a fault is detected, repair or replace the wiring harness.

GETtheMANUALS.org

5. FAULT FINDING LOG

IMPORTANT!

IMPORTANT
Any fault on a complex system requires thorough fault finding with the appropriate tools. The FAULT FINDING LOG, which should be completed during the fault finding procedure, ensures a record is kept of the procedure carried out. It is an essential document when consulting the manufacturer.

IT IS THEREFORE ESSENTIAL THAT THE FAULT FINDING LOG IS FILLED OUT EVERY TIME IT IS REQUESTED BY TECHLINE OR THE WARRANTY RETURNS DEPARTMENT.

You will always be asked for this log:

- when requesting technical assistance from Techline,
- for approval requests when replacing parts for which approval is mandatory,
- to be attached to monitored parts for which reimbursement is requested. The log is needed for warranty reimbursement, and enables better analysis of the parts removed.

6. SAFETY INSTRUCTIONS

Safety rules must be observed during any work on a component to prevent any damage or injury:

– check the battery voltage to avoid incorrect operation of computer functions,
– use the appropriate tools,
– do not touch the discharge bulbs, and do not work on the COSLAD system when it is in operation, as the voltage can be above 20,000 V.

GETtheMANUALS.org

Description of operation

The system consists of four sensors integrated into the rear bumper, plus four sensors in the front bumper, a computer, a rear buzzer and a front buzzer.
The system assists the driver during parking manoeuvres by warning of any obstacles behind or in front of the vehicle.

- The sensors and the computer calculate the distance between the vehicle and any obstacles. The sensors operate over a distance range from **20 - 30 cm minimum to 150 cm maximum**.
- The driver is informed of the distances by **buzzers**.
- The system only works when the vehicle **is in reverse gear**. Activation is indicated by a **brief 0.5 second activation sound**.
- The buzzer is activated when the vehicle is **150 cm** from the obstacle. As the distance diminishes, the frequency of the buzzer increases. When the distance reaches **20 - 30 cm**, the buzzer becomes continuous.
- The front system is only activated when the vehicle is travelling at below **12 mph (20 km/h)**.
- The front buzzer is activated when the vehicle is **60 cm** from the obstacle (90 cm if reverse gear was engaged beforehand). As the distance diminishes, the frequency of the buzzer increases. When the distance reaches **20 - 30 cm**, the buzzer becomes continuous.
- The system can only be **activated** in **+ after ignition feed**.

DEACTIVATING THE SYSTEM:

- The parking proximity sensor system can be deactivated in two ways:
- **Temporary deactivation: briefly pressing** (1 second) the parking distance control switch on the instrument panel deactivates the system (the red warning light on the switch comes on). The function can be switched on again by pressing **briefly** for a second time (the red indicator light on the switch goes out) or by switching the ignition off and back on.
- **Permanent deactivation:** The parking distance control system can be deactivated **for a longer period** by **pressing and holding** (for approximately 3 seconds) the parking distance control switch on the instrument panel (the red warning light on the switch comes on). The function can be switched on again only by **pressing and holding** the switch again (the red warning light on the switch goes out).

Note:
The statuses in the diagnostic tool can be used to determine the status of the system (ready, detecting, suspended or deactivated) through status **ET003 Parking proximity function** (see conformity check or status interpretation).

Fault finding:
A low pitch 5-second continuous warning sound informs the driver that a system fault has occurred when the ignition is switched on.

Track	Description
Yellow 16-track connector	
1	+ 12 V after ignition feed
2	+ 12 V front and rear buzzers
3	Computer earth
4	Reverse gear signal (+ 12 V)
5	Warning light control
6	Rear buzzer earth
7	Vehicle speed signal
8	Diagnostic line K
9	+ 12 V rear sensors
10	Rear sensors earth
11	Not used
12	Function activation or cut-off signal
13	Rear right-hand inner sensor signal
14	Rear left-hand inner sensor signal
15	Rear left-hand outer sensor signal
16	Rear right-hand outer sensor signal
Beige 12-track connector	
1	Multiplex line L
2	Front right-hand outer sensor signal
3	Front left-hand inner sensor signal
4	Front right-hand outer sensor signal
5	Front left-hand outer sensor signal
6	Not used
7	Front sensors earth
8	Multiplex line H
9	Not used
10	Not used
11	Front buzzer earth
12	+ 12 V front sensors feed

Replacing the parking distance control computer

BEFORE REPLACING ANY COMPUTER IT IS ESSENTIAL THAT YOU CONTACT TECHLINE.

When replacing the computer, apply the following procedure:

- switch off the ignition,
- replace the computer,
- configure the vehicle identification using command **CF005 Vehicle identification** (refer to **Configuration and Programming**),
- configure the buzzer volume and the tone setting using **commands CF001 Buzzer volume, CF006 Tone setting, CF007 Front buzzer volume and CF009 Front buzzer tone setting** (refer to **Configuration and Programming**),
- enter the last After-Sales operation date using command **VP006 Enter last After-Sales operation date**,
- enter the VIN with the diagnostic tool command **VP001 Enter VIN**,
- check that the system is operating correctly and make sure that there are no faults.

GETtheMANUALS.org

CONFIGURATIONS AFTER REPLACING A COMPUTER

After replacing the computer, configure the parking distance control computer with the vehicle type using configuration **CF005 Vehicle identification** (repair mode menu, diagnostic tool configuration function).
The configuration adapts the sensors' detection field to the type of body.
Depending on a vehicle's gearbox type (automatic or manual), the parking distance control can be delayed from working. Activation of the parking distance control is indicated by a **brief 0.5 second activation sound** (vehicle in reverse gear). On vehicles with an automatic transmission, the **3-second** delay prevents the activation noise from sounding every time the driver shifts from Park to Drive.

After having configured the computer, check that the configuration has taken effect by reading the configuration **LC005 Vehicle identification**.

SETTING OPTIONS

The volume and the tone of the buzzer can be changed if the customer desires.
- Configuration **CF001 Buzzer volume** is used to adjust the **volume** of the buzzer.
- Configuration **CF007 Front buzzer volume** is used to adjust the **volume** of the front buzzer.
- Configuration function **CF006 Tone setting** is used to adjust the **tone** of the rear buzzer.
- Configuration function **CF009 Front tone setting** is used to adjust the **tone** of the front buzzer.

- After configuring the computer, check that the configurations have registered correctly using the configuration readings **LC001 Buzzer volume, LC006 Tone setting, LC007 Front buzzer volume** and **LC009 Adjusting the front tone**.

Configuration	Configuration reading	Name of configuration
CF001	LC001	Buzzer volume
CF005	LC005	Vehicle identification
CF006	LC006	Tone setting
CF007	LC007	Front buzzer volume
CF009	LC009	Front tone setting

GETtheMANUALS.org

Procedure to follow for modifying these configurations:

- Establish dialogue with the computer.
- Select the **Repair mode** menu.
- Select the **Write configuration** menu.
- Select the line corresponding to the configuration to be modified.
- In the drop-down menu, select the line corresponding to the vehicle and customer selection.
- Click on **Confirm**.
- Exit diagnostic mode (ends dialogue with the computer without switching off the tool), switch off the ignition for 5 seconds and then switch the ignition back on.
- Establish dialogue with the computer.
- In the **Read configuration** menu, check that the configuration has been completed.

Special note:

If a vehicle is equipped with a caravan towbar and if there is a continuous beeping noise, take the towbar out of the detection field for the rear sensors, run the command for parameter **VP003 Caravan towbar distance**: increase the detection area centimetre by centimetre. To avoid impairing the detection, the parameter **PR026 Caravan towbar distance** must not exceed 40 cm.

GETtheMANUALS.org

Summary of sensors and actuators on which fault finding can be performed by the parking distance control computer (with corresponding Design Office codes)

Tool fault	Associated DTC	Diagnostic tool title
DF002	**9001**	Left-hand outer sensor
DF003	**9002**	Left-hand inner sensor
DF004	**9004**	Right-hand outer sensor
DF005	**9003**	Right-hand inner sensor
DF006	**9006**	Buzzer
DF008	**9005**	Computer fault
DF012	**9009**	Parking proximity sensor switch indicator light
DF013	**900A**	Front left-hand outer sensor
DF014	**900B**	Front left-hand inner sensor
DF015	**900C**	Front right-hand inner sensor
DF016	**900D**	Front right-hand outer sensor
DF017	**900E**	Front buzzer volume

GETtheMANUALS.org

DF002 PRESENT OR STORED	LEFT-HAND OUTER SENSOR CC.1 : Short circuit to + 12 V CO.0 : Open circuit or short circuit to earth 1.DEF : Internal electronic fault

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present following selection of reverse gear if the parking distance control function is **ACTIVE**: the parking distance control indicator light is not lit; refer to status interpretation **ET003 parking distance control function**.
	Special notes: This fault is indicated by the buzzer (a **5 second** warning sound) and the system shuts down.

Switch off the ignition and disconnect the computer's **16-track connector**.
Measure the computer's internal resistances:

- Between **track 15** and **track 9** a resistance of **215 kΩ ± 10 kΩ**.
- Between **track 15** and **track 10** a resistance of **100 kΩ ± 5 kΩ**.

If the readings do not match the above values, or if there is a short circuit between the specified tracks, contact your Techline.

Remove the rear bumper and disconnect the **3-track** connector on the left-hand outer sensor.
Check the condition of the sensor connector. Replace the connector if necessary.
Measure the resistance between **track 2** (signal) and **track 1** (supply) of the sensor. Replace the sensor if the resistance is not infinite.
Measure the resistance between **track 2** (signal) and **track 3** (earth) of the sensor. Replace the sensor if the resistance is not **40 kΩ ± 5 kΩ** (wait a few seconds for the reading to stabilise).

Switch off the ignition, and disconnect the parking proximity sensor computer to check the **insulation, continuity and the absence of interference resistance** on the following connections:

16-track parking distance control computer connector		Left-hand outer sensor
Track 9	→	**Track 1**
Track 15	→	**Track 2**
Track 10	→	**Track 3**

Repair if necessary (refer to vehicle wiring diagrams).

If the fault is still present, replace the left-hand outer sensor.

AFTER REPAIR	Clear the stored faults. Follow the instructions to confirm repair. Deal with any other faults.

GETtheMANUALS.org

DF003 PRESENT OR STORED	LEFT-HAND INNER SENSOR CC.1 : Short circuit to + 12 V CO.0 : Open circuit or short circuit to earth 1.DEF : Internal electronic fault

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present following selection of reverse gear if the parking distance control function is **ACTIVE**: the parking distance control indicator light is not lit; refer to status interpretation **ET003 parking distance control function**.
	Special notes: This fault is indicated by the buzzer (a **5 second** warning sound) and the system shuts down.

Switch off the ignition and disconnect the computer's **16-track connector**.
Measure the computer's internal resistances:

- Between **track 14** and **track 9** a resistance of **215 kΩ ± 10 kΩ**.
- Between **track 14** and **track 10** a resistance of **100 kΩ ± 5 kΩ**.

If the readings do not match the above values, or if there is a short circuit between the specified tracks, contact your Techline.

Remove the rear bumper and disconnect the **3-track** connector on the left-hand inner detection sensor.
Check the condition of the sensor connector. Replace the connector if necessary.
Measure the resistance between **track 2** (signal) and **track 1** (supply) of the sensor. Replace the sensor if the resistance is not infinite.
Measure the resistance between **track 2** (signal) and **track 3** (earth) of the sensor. Replace the sensor if the resistance is not **40 kΩ ± 5 kΩ** (wait a few seconds for the reading to stabilise).

Switch off the ignition, and disconnect the parking proximity sensor computer to check the **insulation, continuity and the absence of interference resistance** on the following connections:

16-track parking distance control computer connector		Left-hand inner sensor
Track 9	→	**Track 1**
Track 14	→	**Track 2**
Track 10	→	**Track 3**

Repair if necessary (refer to vehicle wiring diagrams).

If the fault is still present, replace the left-hand inner detection sensor.

AFTER REPAIR	Clear the stored faults. Follow the instructions to confirm repair. Deal with any other faults.

GETtheMANUALS.org

DF004 PRESENT OR STORED	RIGHT-HAND OUTER SENSOR CC.1 : Short circuit to + 12 V CO.0 : Open circuit or short circuit to earth 1.DEF : Internal electronic fault

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present following selection of reverse gear if the parking distance control function is **ACTIVE**: the parking distance control indicator light is not lit; refer to status interpretation **ET003 parking distance control function**.
	Special notes: This fault is indicated by the buzzer (a **5 second** warning sound) and the system shuts down.

Switch off the ignition and disconnect the computer's **16-track connector**.
Measure the computer's internal resistances:

- Between **track 16** and **track 9** a resistance of **215 kΩ ± 10 kΩ**.
- Between **track 16** and **track 10** a resistance of **100 kΩ ± 5 kΩ**.

If the readings do not match the above values, or if there is a short circuit between the specified tracks, contact your Techline.

Remove the rear bumper and disconnect the **3-track** connector on the right-hand outer detection sensor.
Check the condition of the sensor connector. Replace the connector if necessary.
Measure the resistance between **track 2** (signal) and **track 1** (supply) of the sensor. Replace the sensor if the resistance is not infinite.
Measure the resistance between **track 2** (signal) and **track 3** (earth) of the sensor. Replace the sensor if the resistance is not **40 kΩ ± 5 kΩ** (wait a few seconds for the reading to stabilise).

With the ignition switched off, disconnect the parking proximity sensor computer connector to check the **insulation, continuity and the absence of interference resistance** on the following connections:

16-track parking distance control computer connector		Right-hand outer sensor
Track 9	→	**Track 1**
Track 16	→	**Track 2**
Track 10	→	**Track 3**

Repair if necessary (refer to vehicle wiring diagrams).

If the fault is still present, replace the right-hand outer detection sensor.

AFTER REPAIR	Clear the stored faults. Follow the instructions to confirm repair. Deal with any other faults.

GETtheMANUALS.org

DF005 PRESENT OR STORED	RIGHT-HAND INNER SENSOR CC.1 : Short circuit to + 12 V CO.0 : Open circuit or short circuit to earth 1.DEF : Internal electronic fault

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present following selection of reverse gear if the parking distance control function is **ACTIVE**: the parking distance control indicator light is not lit; refer to status interpretation **ET003 parking distance control function**.
	Special notes: This fault is indicated by the buzzer (a **5 second** warning sound) and the system shuts down.

Switch off the ignition and disconnect the computer's **16-track connector**.
Measure the computer's internal resistances:
- Between **track 13** and **track 9** a resistance of **215 kΩ ± 10 kΩ**.
- Between **track 13** and **track 10** a resistance of **100 kΩ ± 5 kΩ**.

If the readings do not match the above values, or if there is a short circuit between the specified tracks, contact your Techline.

Remove the rear bumper and disconnect the **3-track** connector on the right-hand inner detection sensor.
Check the condition of the sensor connector. Replace the connector if necessary.
Measure the resistance between **track 2** (signal) and **track 1** (supply) of the sensor. Replace the sensor if the resistance is not infinite.
Measure the resistance between **track 2** (signal) and **track 3** (earth) of the sensor. Replace the sensor if the resistance is not **40 kΩ ± 5 kΩ** (wait a few seconds for the reading to stabilize).

With the ignition switched off, disconnect the parking proximity sensor computer connector to check the **insulation, continuity and the absence of interference resistance** on the following connections:

16-track parking distance control computer connector		Right-hand inner sensor
Track 9	→	**Track 1**
Track 13	→	**Track 2**
Track 10	→	**Track 3**

Repair if necessary (refer to vehicle wiring diagrams).

If the fault is still present, replace the right-hand inner detection sensor.

AFTER REPAIR	Clear the stored faults. Follow the instructions to confirm repair. Deal with any other faults.

GETtheMANUALS.org

DF006 PRESENT OR STORED	BUZZER CC.1 : Short circuit to + 12 V CO.0 : Open circuit or short circuit to earth

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present following selection of reverse gear if the parking distance control function is **ACTIVE**: the parking distance control indicator light is not lit; refer to status interpretation **ET003 parking distance control function**.
	Special notes: The fault is indicated by the absence of the **1-second** beep normally emitted by the buzzer when reverse gear is selected.

Switch off the ignition and disconnect the computer's **16-track connector**.
Measure the internal resistance of the computer between **tracks 2 and 6**.
If the value read is not **314 Ω ± 10%** or if there is a short circuit between the specified tracks, contact Techline.

Check **the connection and condition of the connector** on the buzzer.
Replace the connector if necessary.

Switch off the ignition, and disconnect the parking proximity sensor computer to check the **insulation, continuity and the absence of interference resistance** on the following connections:

16-track parking distance control computer connector		Buzzer
Track 2	→	**Track 2**
Track 6	→	**Track 1**

Repair if necessary (refer to vehicle wiring diagrams).

Measure the buzzer resistance between **tracks 1 and 2**.
Replace the buzzer if its resistance is not approximately **48 Ω**.

If the fault is still present, replace the buzzer.

AFTER REPAIR	Clear the stored faults. Follow the instructions to confirm repair. Deal with any other faults.

GETtheMANUALS.org

DF008 PRESENT OR STORED	COMPUTER FAULT 1.DEF : Internal electronic fault 2.DEF : Speed signal incoherence 3.DEF : Internal electronic fault

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault reappears present or stored after its has been cleared, the ignition is switched on and off again and reverse gear is selected.
	Special notes: If the fault is present and is represented by **1.DEF** or **2.DEF**, the system operates in defect mode (substitute values are used). If the fault is present and characterised **3.DEF** and the buzzer fails to sound when shifting into reverse, contact your Techline.

1.DEF	***NOTES***	**Special notes:** None

After following the instructions, if the fault recurs, switch off the ignition and disconnect the parking proximity sensor computer supply fuse (see vehicle diagram).
Reconnect the fuse, switch the ignition back on, and perform a fault reading.

If the fault recurs, check **the connections and condition** of the parking proximity sensor computer connector (no damage to the connections).
Repair if necessary.

With the ignition switched off, disconnect the parking proximity sensor computer connector to check the **conformity of the feeds** and to check the **insulation, continuity and the absence of interference resistance** on the following connections:

16-track parking distance control computer connector

Track 1	→	+ after ignition feed
Track 3	→	earth

Repair if necessary (refer to vehicle wiring diagrams).

If the fault is still present, contact the Techline.

2.DEF	***NOTES***	**Special notes:** None

Perform fault finding on the whole ABS system using the diagnostic tool.

AFTER REPAIR	Clear the stored faults. Follow the instructions to confirm repair. Deal with any other faults.

GETtheMANUALS.org

DF012 PRESENT OR STORED	PARKING PROXIMITY SENSOR SWITCH INDICATOR LIGHT CC.0 : short circuit to earth CC.1 : short circuit to + 12 V

NOTES	**Conditions for applying the fault finding procedure to stored faults:** A fault is declared present after reverse gear is engaged and the parking distance control deactivation switch is pressed.

Remove the parking proximity sensor switch and check the connections and condition of its connector.
Repair if necessary.

Check for an earth on **track B3** of the parking proximity sensor switch connector.
Repair if necessary.

With the ignition off, disconnect the parking proximity sensor computer to check the **insulation, continuity and the absence of interference resistance** on the following connection:

Parking proximity sensor switch connector		16-track parking distance control computer connector
Track B2	⟶	**Track 5**

Repair if necessary.

If the fault is still present, replace the parking proximity sensor switch.

AFTER REPAIR	Clear the stored faults. Follow the instructions to confirm repair. Deal with any other faults.

GETtheMANUALS.org

DF013 PRESENT OR STORED	FRONT LEFT-HAND OUTER SENSOR CC.1 : Short circuit to + 12 V CO.0 : Open circuit or short circuit to earth 1.DEF : Internal electronic fault

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present following selection of reverse gear if the parking distance control function is **ACTIVE**: the parking distance control indicator light is not lit, refer to status interpretation **ET003 Parking distance control function**.
	Special notes: This fault is indicated by the buzzer (a **5 second** warning sound) and the system shuts down.

Switch off the ignition and disconnect the computer's **12-track** connector
Measure the computer's internal resistances:
- Between **track 12** and **track 5** a resistance of **215 kΩ ± 10 kΩ**.
- Between **track 5** and **track 7** a resistance of **100 kΩ ± 5 kΩ**.

If the readings do not match the above values, or if there is a short circuit between the specified tracks, contact your Techline.

Remove the rear bumper and disconnect the **3-track** front left-hand outer detection sensor connector.
Check the condition of the sensor connector. Replace the connector if necessary.
Measure the resistance between **track 2** (signal) and **track 1** (supply) of the sensor. Replace the sensor if the resistance is not infinite.
Measure the resistance between **track 2** (signal) and **track 3** (earth) of the sensor. Replace the sensor if the resistance is not **40 kΩ ± 5 kΩ** (wait a few seconds for the reading to stabilise).

Switch off the ignition, and disconnect the parking proximity sensor computer to check the **insulation, continuity and the absence of interference resistance** on the following connections:

Parking distance control computer 12-track connector		Front left-hand outer sensor
Track 12	→	**Track 1**
Track 5	→	**Track 2**
Track 7	→	**Track 3**

Repair if necessary (refer to vehicle wiring diagrams).

If the fault is still present, replace the left-hand outer sensor.

AFTER REPAIR	Clear the stored faults. Follow the instructions to confirm repair. Deal with any other faults.

GETtheMANUALS.org

DF014 PRESENT OR STORED	FRONT LEFT-HAND INNER SENSOR CC.1 : Short circuit to + 12 V CO.0 : Open circuit or short circuit to earth 1.DEF : Internal electronic fault

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present following selection of reverse gear if the parking distance control function is **ACTIVE**: the parking distance control indicator light is not lit, refer to status interpretation **ET003 Parking distance control function**.
	Special notes: This fault is indicated by the buzzer (a **5 second** warning sound) and the system shuts down.

Switch off the ignition and disconnect the computer's **12-track** connector
Measure the computer's internal resistances:
- Between **track 12** and **track 3** a resistance of **215 kΩ ± 10 kΩ**.
- Between **track 3** and **track 7** a resistance of **100 kΩ ± 5 kΩ**.

If the readings do not match the above values, or if there is a short circuit between the specified tracks, contact your Techline.

Remove the rear bumper and disconnect the **3-track** front left-hand inner detection sensor connector.
Check the condition of the sensor connector. Replace the connector if necessary.
Measure the resistance between **track 2** (signal) and **track 1** (supply) of the sensor. Replace the sensor if the resistance is not infinite.
Measure the resistance between **track 2** (signal) and **track 3** (earth) of the sensor. Replace the sensor if the resistance is not **40 kΩ ± 5 kΩ** (wait a few seconds for the reading to stabilise).

Switch off the ignition, and disconnect the parking proximity sensor computer to check the **insulation, continuity and the absence of interference resistance** on the following connections:

Parking distance control computer 12-track connector		Front left-hand inner sensor
Track 12	→	**Track 1**
Track 3	→	**Track 2**
Track 7	→	**Track 3**

Repair if necessary (refer to vehicle wiring diagrams).

If the fault is still present, replace the left-hand outer sensor.

AFTER REPAIR	Clear the stored faults. Follow the instructions to confirm repair. Deal with any other faults.

GETtheMANUALS.org

DF015 PRESENT OR STORED	FRONT RIGHT-HAND INNER SENSOR CC.1 : Short circuit to + 12 V CO.0 : Open circuit or short circuit to earth 1.DEF : Internal electronic fault

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present following selection of reverse gear if the parking distance control function is **ACTIVE**: the parking distance control indicator light is not lit, refer to status interpretation **ET003 Parking distance control function**.
	Special notes: This fault is indicated by the buzzer (a **5 second** warning sound) and the system shuts down.

Switch off the ignition and disconnect the computer's **12-track** connector
Measure the computer's internal resistances:
- Between **track 12** and **track 2** a resistance of **215 kΩ ± 10 kΩ**.
- Between **track 2** and **track 7** a resistance of **100 kΩ ± 5 kΩ**.

If the readings do not match the above values, or if there is a short circuit between the specified tracks, contact your Techline.

Remove the rear bumper and disconnect the **3-track** front left-hand inner detection sensor connector.
Check the condition of the sensor connector. Replace the connector if necessary.
Measure the resistance between **track 2** (signal) and **track 1** (supply) of the sensor. Replace the sensor if the resistance is not infinite.
Measure the resistance between **track 2** (signal) and **track 3** (earth) of the sensor. Replace the sensor if the resistance is not **40 kΩ ± 5 kΩ** (wait a few seconds for the reading to stabilise).

Switch off the ignition, and disconnect the parking proximity sensor computer to check the **insulation, continuity and the absence of interference resistance** on the following connections:

Parking distance control computer 12-track connector		Front right-hand inner sensor
Track 12	→	**Track 1**
Track 2	→	**Track 2**
Track 7	→	**Track 3**

Repair if necessary (refer to vehicle wiring diagrams).

If the fault is still present, replace the left-hand outer sensor.

AFTER REPAIR	Clear the stored faults. Follow the instructions to confirm repair. Deal with any other faults.

GETtheMANUALS.org

DF016 PRESENT OR STORED	FRONT RIGHT-HAND OUTER SENSOR CC.1 : Short circuit to + 12 V CO.0 : Open circuit or short circuit to earth 1.DEF : Internal electronic fault

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present following selection of reverse gear if the parking distance control function is **ACTIVE**: the parking distance control indicator light is not lit, refer to status interpretation **ET003 Parking distance control function**.
	Special notes: This fault is indicated by the buzzer (a **5 second** warning sound) and the system shuts down.

Switch off the ignition and disconnect the computer's **16-track connector**.
Measure the computer's internal resistances:
- Between **track 12** and **track 4** a resistance of **215 kΩ ± 10 kΩ**.
- Between **track 4** and **track 7** a resistance of **100 kΩ ± 5 kΩ**.

If the readings do not match the above values, or if there is a short circuit between the specified tracks, contact your Techline.

Remove the rear bumper and disconnect the **3-track** front left-hand inner detection sensor connector.
Check the condition of the sensor connector. Replace the connector if necessary.
Measure the resistance between **track 2** (signal) and **track 1** (supply) of the sensor. Replace the sensor if the resistance is not infinite.
Measure the resistance between **track 2** (signal) and **track 3** (earth) of the sensor. Replace the sensor if the resistance is not **40 kΩ ± 5 kΩ** (wait a few seconds for the reading to stabilise).

Switch off the ignition, and disconnect the parking proximity sensor computer to check the **insulation, continuity and the absence of interference resistance** on the following connections:

Parking proximity sensor computer		Front right-hand outer sensor
Track 12	→	**Track 1**
Track 4	→	**Track 2**
Track 7	→	**Track 3**

Repair if necessary (refer to vehicle wiring diagrams).

If the fault is still present, replace the left-hand outer sensor.

AFTER REPAIR	Clear the stored faults. Follow the instructions to confirm repair. Deal with any other faults.

GETtheMANUALS.org

DF017 PRESENT OR STORED	FRONT BUZZER CC.1 : Short circuit to + 12 V CO.0 : Open circuit or short circuit to earth

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present following selection of reverse gear if the parking distance control function is **ACTIVE**: the parking distance control indicator light is not lit, refer to status interpretation **ET003 Parking distance control function**.

Switch off the ignition and disconnect the **12-track** and **16-track** computer connectors.
Measure the internal resistance of the computer between **track 2 of the 16-track connector and track 11 of the 12-track connector**.
If the value read is not **314 Ω ± 10%** or if there is a short circuit between the specified tracks, contact Techline.

Check **the connection and condition of the connector** of the front buzzer.
Replace the connector if necessary.

Switch off the ignition, and disconnect the parking proximity sensor computer to check the **insulation, continuity and the absence of interference resistance** on the following connections:

Parking proximity sensor computer		Front buzzer volume
Track 2 of the 16-track connector	→	**Track 2**
Track 11 of the 12-track connector	→	**Track 1**

Repair if necessary (refer to vehicle wiring diagrams).

Measure the front buzzer resistance value between **tracks 1 and 2**.
Replace the buzzer if its resistance is not approximately **48 Ω**.

If the fault is still present, replace the buzzer.

AFTER REPAIR	Clear the stored faults. Follow the instructions to confirm repair. Deal with any other faults.

GETtheMANUALS.org

NOTES	Only carry out this conformity check after a complete check with the diagnostic tool. **Conditions for applying the fault finding procedure:** ignition on.

Order	Function	Parameter or Status checked or Action		Display and notes	Fault finding
1	Parking proximity sensor system status	**ET003:**	Parking proximity sensor function	**READY** (system operation and ready to detect). **SUSPENDED** (if the system is temporarily deactivated). **OFF** (if the system is completely switched off)	For further information or, if there is a fault, consult the interpretation of status **ET003**.
2	Feeds	**PR006:**	Sensor supply voltage	**10.5 V < X <14.4 V**	If there is a fault with this parameter, check the **insulation, continuity and the absence of interference resistance** on the computer power supply and earth (refer to wiring diagram).
		PR020:	Computer feed voltage	**10.5 V < X <14.4 V**	If there is a fault with this parameter, check the **insulation, continuity and the absence of interference resistance** on the computer power supply and earth (see wiring diagram). If the fault is still present, carry out **fault finding on the charge circuit**.
3	Reverse gear selection	**ET001:**	Reverse gear engaged	**YES** **NO**	If there is a fault, refer to the interpretation of status **ET001**.
4	Buzzer control	**ET002:**	Buzzer control	**ACTIVE** when the buzzer sounds. **INACTIVE** if not.	In the event of a fault, consult the interpretation of status **ET002**.

GETtheMANUALS.org

NOTES	Only carry out this conformity check after a complete check with the diagnostic tool. **Conditions for applying the fault finding procedure:** ignition on.

Order	Function	Parameter or Status checked or Action	Display and notes	Fault finding
5	Caravan towbar detection area	**PR026:** Caravan towing distance	**By default:** 35 cm Above 40 cm, the function becomes weaker, (Adjust the detection area of the rear centre sensors so that the caravan towbar is not detected).	In the event of a fault, check the positioning of the caravan towbar protection.
6	Deactivation time if **S = 0 mph**	**PR027:** Time before deactivation	Deactivation is detected after **5 s** if the system detects the same obstacle at the same distance	
7	Maximum detection distance	**PR028:** Maximum limit	**0 mph < Speed < 30 mph (50 km/h)**	

GETtheMANUALS.org

NOTES	Only carry out this conformity check after a complete check with the diagnostic tool. **Conditions for applying the fault finding procedure:** ignition on.

Order	Function	Parameter or Status checked or Action		Display and notes	Fault finding
8	Proximity sensors	**PR001:**	Left-hand outer sensor distance	**20 cm < X < 150 cm** depending on the proximity of the obstacle (out of detection range: **255 cm**).	If there is a fault, refer to the interpretation of parameter **PR001**.
		PR002:	Left-hand inner sensor distance	**20 cm < X < 150 cm** depending on the proximity of the obstacle (out of detection range: **255 cm**).	If there is a fault, refer to the interpretation of parameter **PR002**.
		PR003:	Right-hand outer sensor distance	**20 cm < X < 150 cm** depending on the proximity of the obstacle (out of detection range: **255 cm**).	If there is a fault, consult the interpretation of parameter **PR003**.
		PR004:	Right-hand inner sensor distance	**20 cm < X < 150 cm** depending on the proximity of the obstacle (out of detection range: **255 cm**).	If there is a fault, refer to the interpretation of parameter **PR004**.
		PR005:	Shortest distance calculated	**20 cm < X < 150 cm** depending on the proximity of the obstacle (out of detection range: **255 cm**).	If there is a fault, refer to the interpretation of parameter **PR005**.
		PR021:	Front left-hand outer sensor distance	**20 cm < X < 90 cm** depending on the proximity of the obstacle (out of detection range: **255 cm**).	If there is a fault, refer to the interpretation of parameter **PR021**.
		PR022:	Front left-hand inner sensor distance	**20 cm < X < 90 cm** depending on the proximity of the obstacle (out of detection range: **255 cm**).	If there is a fault, refer to the interpretation of parameter **PR022**.
		PR023	Front right-hand inner sensor distance	**20 cm < X < 90 cm** depending on the proximity of the obstacle (out of detection range: **255 cm**).	If there is a fault, refer to the interpretation of parameter **PR023**.
		PR024:	Front right-hand outer sensor distance	**20 cm < X < 90 cm** depending on the proximity of the obstacle (out of detection range: **255 cm**).	If there is a fault, refer to the interpretation of parameter **PR024**.
		PR025:	Shortest front distance calculated	**20 cm < X < 150 cm** depending on the proximity of the obstacle (out of detection range: **255 cm**).	If there is a fault, refer to the interpretation of parameter **PR025**.

GETtheMANUALS.org

Tool status	Diagnostic tool title
ET001	Reverse gear engaged
ET003	Parking proximity sensor function

GETtheMANUALS.org

ET001	REVERSE GEAR ENGAGED

NOTES	**Special note:** Only carry out the checks if the **YES** and **NO** statuses are not consistent with the position of the gear lever.

Check that the reversing lights are working correctly: they should come on when reverse gear is selected and go out when it is not.

If the reversing lights fail to function as specified:
With the ignition switched off, disconnect the parking proximity sensor computer connector to check the **insulation** (to + 12 V), **and the continuity and the absence of interference resistance** on the following connection:

Parking proximity sensor computer connector		Rear light connector in luggage compartment
Track 4	→	**Track 2 (right-hand lights)**
Track 4	→	**Track 4 (left-hand lights)**

Repair if necessary.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET003	PARKING PROXIMITY SENSOR FUNCTION

NOTES	**Special notes:** If the parking proximity sensor system is suspended or deactivated, the parking proximity sensor switch indicator light comes on.

This status indicates whether the parking proximity sensor system is on or off:

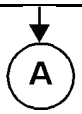
ET003 READY	This means that, when reversing, the parking proximity sensor detects obstacles and the buzzer sounds (the parking proximity sensor switch indicator light goes out).
ET003 SUSPENDED	This means the parking proximity sensor system is switched off (no detection possible). The suspension is **temporary** because the parking proximity sensor system will come back on after the ignition is switched off and on. To suspend or reactivate the system manually, **briefly** press (1 second) the parking distance control switch.
ET003 DEACTIVATED	This means the parking proximity sensor system is switched off (no detection possible). This suspension is **permanent** (switching the + after ignition feed off and on again will not reactivate the system). To deactivate or reactivate the system manually, **press and hold** the parking distance control switch (3 seconds).

If the status is not as specified, check for an **earth** on **track A2** of the parking proximity sensor switch. Repair if necessary.

With the ignition off, disconnect the parking distance control switch to check the **insulation** (to earth and + 12 V), **continuity and absence of interference resistance** on the following connection:

Parking proximity sensor switch connector		16-track parking distance control computer connector
Track B1	→	**Track 12**

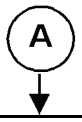
Repair if necessary



AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

ET003 **CONTINUED**	



If the connection just checked is OK (no open or short circuit), and there is an **earth** on **track A2** of the switch but the fault is still present, check the switch operation with an ohmmeter.
Switch not pressed: **insulation** between **track A2** and **B1**.
Switch pressed: **continuity** between **track A2** and **B1**.
Replace the parking proximity sensor switch if it fails to function as specified.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

Tool parameter	Diagnostic tool title

PR027	Time before deactivation
PR028	Maximum limit

GETtheMANUALS.org

PR001 **PR002** **PR003** **PR004**	LEFT-HAND OUTER SENSOR DISTANCE LEFT-HAND INNER SENSOR DISTANCE RIGHT-HAND OUTER SENSOR DISTANCE RIGHT-HAND INNER SENSOR DISTANCE

NOTES	**Special notes:** Before searching for a fault with these parameters, make sure no fault is present or stored. If there is a fault, apply the interpretation procedure for the fault detected by the diagnostic tool.
	Note: The ultrasonic sensors are very fragile. Therefore, when removing the rear bumper, be careful not to scratch them. An obstacle more than 150 cm away cannot be detected, the value of the parameters is therefore 255 cm. For an obstacle which is between 20 and 150 cm away, the value of the parameters is the distance to the obstacle. For an obstacle which is closer than 20 cm away, the value of the parameters is 0.

Using the configuration reading screen on the diagnostic tool (repair mode menu), check that the parking proximity sensor system is correctly configured for the type of body to which it is fitted (**LC005 Vehicle identification** Vel Satis, Espace, Automatic or manual gearbox).
If necessary, reconfigure the computer using command **CF005 Vehicle identification**.

With the vehicle near an obstacle (20 to 150 cm), make sure the real distance matches the value displayed by the diagnostic tool (**PR001** to **PR004**).
If the distance is inconsistent or if the distance parameters remain at 255 cm, make sure nothing is interfering with the reading (sticker, mud, snow etc. on the rear bumper).

If the distances displayed by the sensors seem wrong or 255 cm is displayed continuously, check the condition of the sensor(s). There must be no scratches on the detection component (outer metal section) of the sensors. Replace the defective sensor.

If the fault is still present, apply the fault finding procedure to the sensor whose distance parameter is incorrect (even if the diagnostic tool does not report a fault).

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

PR005	SHORTEST DISTANCE CALCULATED

NOTES	**Special notes:** Before searching for a fault with this parameter, make sure that no fault is present or stored. If this is not the case, apply the interpretation of the fault displayed by the diagnostic tool
	Note: The ultrasonic sensors are very fragile. Therefore, when removing the rear bumper, be careful not to scratch them. **This parameter is an average calculated by the computer when an obstacle is placed between two sensors.** An obstacle more than 150 cm away cannot be detected, the value of the parameter is therefore 255 cm. When the distance is under 30 cm, the estimated distance is displayed as 0 cm (critical detection zone with constant buzzer).

Using the diagnostic tool's configuration reading screen check that the parking proximity system is properly configured for the type of body to which it is fitted (**LC005 Vehicle identification**: Vel Satis, Espace Automatic or Manual gearbox) If necessary, reconfigure the computer using command **CF005 Vehicle identification**.
With the vehicle near an obstacle (0 to 150 cm), see if the calculated distance is accurate. If the distance is inconsistent or if the parameter remains at 255 cm, ensure that nothing is interfering with the measurement (sticker, mud or snow, etc. on the rear bumper).
If the calculated distance is still inconsistent or if it displays 255 cm continuously, check the condition of the sensors. There must be no scratches on the detection component (outer metal section) of the sensors. Replace the defective sensor.
If the fault is still present, apply the fault finding procedure to the sensor whose distance parameter is incorrect (even if the diagnostic tool does not report a fault).

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

PR025	SHORTEST FRONT DISTANCE CALCULATED

NOTES	**Special notes:** Before searching for a fault with this parameter, make sure that no fault is present or stored. If there is a fault, apply the interpretation procedure for the fault detected by the diagnostic tool.
	Note: The ultrasonic sensors are very fragile. When removing the front bumper, be careful not to scratch the ultrasonic sensors. **This parameter is an average calculated by the computer when an obstacle is placed between two sensors.** When the distance is under 30 cm, the estimated distance is displayed as 0 cm (critical detection zone with constant buzzer).

Using the diagnostic tool's configuration reading screen check that the parking proximity system is properly configured for the type of body to which it is fitted (**LC005 Vehicle identification**: Vel Satis, Espace Automatic or Manual gearbox) If necessary, reconfigure the computer using command **CF005 Vehicle identification**.
With the vehicle near an obstacle (0 to 150 cm), see if the calculated distance is accurate. If the distance is inconsistent or if the parameter remains at 255 cm, ensure that nothing is interfering with the measurement (sticker, mud or snow, etc. on the rear bumper).
If the calculated distance is still inconsistent or if it displays 255 cm continuously, check the condition of the sensors. There must be no scratches on the detection component (outer metal section) of the sensors. Replace the defective sensor.
If the fault is still present, apply the fault finding procedure to the sensor whose distance parameter is incorrect (even if the diagnostic tool does not report a fault).

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

PR021 **PR022** **PR023** **PR024**	FRONT LEFT-HAND OUTER SENSOR DISTANCE FRONT LEFT-HAND INNER SENSOR DISTANCE FRONT RIGHT-HAND INNER SENSOR DISTANCE FRONT RIGHT-HAND OUTER SENSOR DISTANCE

NOTES	**Special notes:** Before searching for a fault with these parameters, make sure no fault is present or stored. If there is a fault, apply the interpretation procedure for the fault detected by the diagnostic tool.
	Note: The ultrasonic sensors are very fragile. When removing the front bumper, be careful not to scratch the ultrasonic sensors.

Using the configuration reading screen on the diagnostic tool (repair mode menu), check that the parking proximity sensor system is correctly configured for the type of body to which it is fitted (**LC005 Vehicle identification** Vel Satis, Espace, Automatic or manual gearbox). If necessary, reconfigure the computer using command **CF005 Vehicle identification**.
With the vehicle close to an obstacle (20 to 90 cm), make sure the distance matches the value displayed by the diagnostic tool (**PR021** to **PR024**). If the distance is not correct or if the distance parameter remains at 255 cm, make sure nothing is interfering with the reading (adhesive, mud, snow etc. on the front bumper)
If the distances displayed by the sensors seem wrong or 255 cm is displayed continuously, check the condition of the sensor(s). There must be no scratches on the detection component (outer metal section) of the sensors. Replace the defective sensor.
If the fault is still present, apply the fault finding procedure to the sensor whose distance parameter is incorrect (even if the diagnostic tool does not report a fault).

AFTER REPAIR	Repeat the conformity check from the start.

NOTES	**Only consult this customer complaint after a complete check with the diagnostic tool.**

NO DIALOGUE WITH THE COMPUTER → **ALP 1**

NO REAR BUZZER SIGNAL → **ALP 2**

NO FRONT BUZZER SIGNAL → **ALP 3**

CONTINUOUS REAR BUZZER SIGNAL (WITHOUT OBSTACLE DETECTION) → **ALP 4**

CONTINUOUS FRONT BUZZER SIGNAL (WITHOUT OBSTACLE DETECTION) → **ALP 5**

GETtheMANUALS.org

ALP 1	No dialogue with the computer

NOTES	None

Try the diagnostic tool on another vehicle.

Check:
– The connection between the diagnostic tool and the diagnostic socket (lead in good condition).
– The injection, engine and passenger compartment fuses.

Check for the presence of **+ 12 V battery** on **track 16,** and **+ 12 V after ignition feed** on **track 1** and an **earth** on **track 5** and on **track 4** of the diagnostic socket.
Repair if necessary.

Switch off the ignition, and disconnect the parking distance control computer to check the **insulation, continuity and the absence of interference resistance** on the following connections:

Parking distance control computer yellow connector

Track 1 ⟶ **+ Before ignition** (see vehicle diagram)
Track 3 ⟶ **Earth**

Parking distance control computer beige connector

Track 8 ⟶ **track 6** of the diagnostic socket (multiplex line H)
Track 1 ⟶ **track 14** of the diagnostic socket (CAN L)

Repair if necessary (refer to vehicle wiring diagrams).

AFTER REPAIR	Carry out a full check with the diagnostic tool.

GETtheMANUALS.org

ALP 2	No rear buzzer signal

NOTES	Only investigate this customer complaint **after a full check using the diagnostic tool** (no faults must be present or stored).

Using the diagnostic tool Main Data screen, check that the parking distance control system is on.
The status **ET003 Parking distance control function** must be **READY** and the red indicator light on the parking distance control switch must be off).

Is status ET003 READY?

NO → Switch on the parking distance control by pressing the switch for 1 or 3 seconds (the red indicator light should go out).
Note: for more details about system activation, see the interpretation of status **ET003**.

YES

Using the diagnostic tool's **main data** screen, check that reverse gear is selected.
The status **ET001 Reverse gear selected** should be **YES**
Also ensure that the reversing lights come on when reverse gear is selected.

Is status ET001 YES?

YES

Using the diagnostic tool configuration readings screen, check that the buzzer volume has not been switched off (**LC001 Buzzer volume** should not be **ZERO**).

Is the LC001 function ZERO

NO → Apply the interpretation of status ET001

NO

Check the connection and condition of the connector on the buzzer.
Replace the connector if necessary.

YES → Reconfigure the buzzer volume using the diagnostic tool (command **CF001 Buzzer volume**).

A

AFTER REPAIR	Check that the system is operating correctly.

ALP 2

CONTINUED

A

Using the parameter screen of the diagnostic tool (**PR001, PR002, PR003, PR004**), make sure the proximity sensors are detecting obstacles (between 20 and 150 cm).

Do the parameters specified above display distance values (with an obstacle in front of the rear bumper)?

NO → Apply the interpretation of parameters (**PR001, PR002, PR003, PR004**).

YES

Place an obstacle in front of the rear bumper to make the tool display a distance reading. During the detection process, make sure the buzzer has the correct power supply by taking a reading between **tracks 1** and **2** of the buzzer.

During this test, is the buzzer receiving power?

YES

Measure the resistance between the buzzer's two tracks. Replace the buzzer if its resistance is not approximately **48** Ω.

Is the fault still present?

YES

Replace the buzzer.

NO

End of fault finding

NO

Switch off the ignition, and disconnect the parking distance control computer to check the **insulation, continuity and the absence of interference resistance** on the following connections:

Parking proximity sensor computer beige connector → Buzzer

Track 2 → **Track 2**

Track 11 → **Track 1**

Is the fault still present?

NO

End of fault finding

YES

Contact the Techline.

AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP 3	No front buzzer signal

NOTES	Only investigate this customer complaint **after a full check using the diagnostic tool** (no faults must be present or stored).

Using the diagnostic tool Main Data screen, check that the parking distance control system is on.
The status **ET003 Parking distance control function** must be **READY** and the red indicator light on the parking distance control switch must be off).

Is status ET003 READY?

NO → Switch on the parking distance control by pressing the switch for 1 or 3 seconds (the red indicator light should go out).
Note: for more details about system activation, see the interpretation of status **ET003**.

YES

Check the connection and condition of the connector on the buzzer.
Replace the connector if necessary.

A

AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP 3
CONTINUED

A

Using the parameter screen of the diagnostic tool (**PR021, PR022, PR023, PR024**), check that the proximity sensors are detecting obstacles (between 20 and 60 cm).

Do the parameters specified above display distance values (with an obstacle in front of the rear bumper)?

NO → Apply the interpretation of parameters (**PR021, PR022, PR023, PR024**).

YES

Place an obstacle in front of the bumper to make the tool display a distance reading. During the detection process, make sure the buzzer has the correct power supply by taking a reading between **tracks 1** and **2** of the buzzer.

During this test, is the buzzer receiving power?

YES

Measure the resistance between the buzzer's two tracks. Replace the buzzer if its resistance is not approximately **48** Ω.

Is the fault still present?

YES

Replace the buzzer.

NO

End of fault finding procedure.

NO

Switch off the ignition, and disconnect the parking distance control computer to check the **insulation, continuity and the absence of interference resistance** on the following connections:

Parking distance control computer		Buzzer
Track 2 of the 16 track connector	→	Track 2
Track 11 of the 12-track connector	→	Track 1

Repair if necessary (see vehicle wiring diagrams).

Is the fault still present?

NO

End of fault finding procedure.

YES

Contact the Techline.

AFTER REPAIR	Check that the system is operating correctly.

AAPX73 ph2V1.1

GETtheMANUALS.org

ALP 4	Continuous rear buzzer signal (without obstacle detection)

NOTES	Only investigate this customer complaint **after a full check using the diagnostic tool** (no faults must be present or stored).

Is the vehicle fitted with a caravan towbar?

YES →

Check that the caravan towbar protection is correctly positioned.

Apply the parameter command **VP003 Caravan towbar distance**: increase the detection zone a centimetre at a time. To avoid impairing the detection, the parameter **PR026 Caravan towbar distance** must not exceed 40 cm.

NO ↓

With no obstacle less than 150 cm in front of the rear bumper, check that the distance parameters on the diagnostic tool are 255 cm out of range (**PR001, PR002, PR003, PR004**).
If those parameters display a distance value even though there is no obstacle in front of the rear bumper, make sure nothing is interfering with the reading (a sticker, mud, snow etc. on the rear bumper).
Repair if necessary.

Is the fault still present?

YES ↓

Switch off the ignition, and disconnect the parking distance control computer to check the **insulation, continuity and the absence of interference resistance** on the following connections:

Parking distance control computer		Buzzer
Track 2	→	**Track 1**
Track 6	→	**Track 2**

Note:
The line coming from **track 2** of the computer must be insulated against + 12 V and the line coming from **track 6** of the computer must be insulated against earth. Repair if necessary (see vehicle wiring diagram).

Is the fault still present?

NO → End of fault finding procedure.

↓

Contact the Techline.

End of fault finding procedure.

AFTER REPAIR	Check that the system is operating correctly.

GETtheMANUALS.org

ALP 5	Continuous front buzzer signal (without obstacle detection)

NOTES	Only investigate this customer complaint **after a full check using the diagnostic tool** (no faults must be present or stored).

With no obstacle less than 150 cm in front of the rear bumper, make sure the distance parameters on the diagnostic tool are 255 cm out of range (**PR021, PR022, PR023, PR024**).
If those parameters display a distance value even though there is no obstacle in front of the rear bumper, make sure nothing is interfering with the reading (a sticker, mud, snow etc. on the rear bumper).
Repair if necessary.

Is the fault still present?

YES

With the ignition switched off, disconnect the parking distance control computer connector to check the **insulation, continuity and absence of interference resistance** on the following connections:

Parking distance control computer — Buzzer

- **Track 2** of the 16-track connector → **Track 1**
- **Track 11** of the 12-track connector → **Track 2**

Note:
Note:
the line coming from track 2 of the 16-track connector of the computer must be insulated against **+ 12 V** and the line coming from **track 11 of the 12-track connector** of the computer must be insulated against earth.
Repair if necessary (see vehicle wiring diagram).

Is the fault still present?

NO → End of fault finding procedure.

GETtheMANUALS.org

INTRODUCTION

Description of the multiplex network:

The multiplex network consists of a pair of twisted wires connected to several computers on the vehicle.
These two wires are called CAN H and CAN L.

There may be two multiplex networks, depending on the vehicle's equipment.
- **CAN V** ehicle (injection, ABS, instrument panel, etc.) is always present,
- **CAN M** ultimedia (navigation, radio, hands-free telephone) depending on the vehicle's equipment.

Note:
The RENAULT tool can only perform fault finding on the CAN Vehicle multiplex network.

Data exchanged by computers on the networks circulates at a communication speed of:
- 250 kbit/s for the **CAN V** network
- 500 kbit/s for the **CAN M** network

The **CAN Vehicle** network has two computers, each with an internal resistance of **120 Ω** (network termination resistances):
- **the injection computer,**
- **the UCH.**

The **CAN Multimedia** network's termination resistance is in the navigation computer and radio for vehicles fitted with navigation.

PURPOSE

- The purpose of the multiplex network test is to determine the computers present on the vehicle's multiplex network as well as the cause of possible inter-computer communication faults.

- It also serves to determine the functions installed in the vehicle, which are sometimes housed in various computers (distributed functions).

- The test also checks the condition of multiplex network segments.

- The multiplex network test can also run fault finding on computers disconnected from the multiplex network; this provides an overview of the vehicle's electronic layout.

GETtheMANUALS.org

CHECKING MULTIPLEX NETWORK OPERATION

Vehicle computer power supply for fault finding:

Forced + after ignition feed procedure

To save energy, the Phase Vel Satis 2 UCH interrupts the + after ignition feed after 3 minutes have elapsed.
To perform fault finding on a computer, it is possible to force the + after ignition for 1 hour by applying the following procedure:
– press the unlocking button on the card,
– insert the card into the reader,
– press the start button (interrupting the timed + after ignition feed mode),
– press the button for over 5 seconds and until the engine immobiliser warning light starts to flash rapidly (4 Hz).
This forced + after ignition feed mode remains active for 1 hour.

Pressing the start button or removing the card from the reader cuts off the forced + after ignition feed but does not cut off the timed forced + after ignition feed mode. As long as one hour has not elapsed the + after ignition feed function restarts the forced + after ignition feed for the remaining time.
Connect the diagnostic tool and perform the required operations.

This step is the essential starting point for any computer fault finding procedure.

It ensures that the network is correctly connected at the terminals of each computer and that the signal is correctly sent to it and received by it. This function also reads the number of faults present in the computers.

The Test multiplex network function is started after the user selects the vehicle then selects the Test computers icon.

After the network check, the other functions become accessible.

MULTIPLEX NETWORK TEST PROCEDURE:

– Establish dialogue with the computers storing the vehicle configuration (identification reading).
– Read vehicle configuration in the computer containing the multiplex network configuration (Airbag).
– Read list of computers on which fault finding may be performed in the computer containing the information.
– Interrogation of computer.
– Physical measurements (electrical) on the CAN network.

IMPORTANT
There are three diagnostic lines, depending on the computer:

Fault finding performed on computer by the CAN V network: **– Instrument panel** **– Xenon bulb dynamic adjustment** **– S3000 Injection** **– Parking proximity sensor (rear and front sensors)**	**Fault finding procedure performed on computer by the CAN M network:** **Intelligent Transport System (Central Communications Unit)** **Modified hands-free kit (KMLE)**

Fault finding procedure performed on computer by line K:

– UCH	**Climate control system**
– Airbag	**ME7.4.6 Injection**
– ABS/ESP	**EDC15, EDC16 C3 Injection**
– Automatic parking brake	**Parking proximity sensor (rear sensors)**
– Automatic gearbox	**Heater (not present on the CAN)**

GETtheMANUALS.org

ACQUISITION AND DISPLAY OF THE RESULTS

The acquisition screen is made up of a bar graph which changes when the various initialisation, acquisition and data analysis stages are updated.
At the end of the test, the tool displays a screen with the test result.

How to read the topological diagram:

The results display screen consists of three screens:
- the upper zone: fault finding procedure result message,
- the left-hand centre zone: topological diagram (not always available),
- the right-hand centre zone: interpretation of the results from the various vehicle computers and list.

COMPUTERS

- **Valid:** green outline, green lettering.
- **Undetected:** red outline, red lettering.
- **Fault finding not possible:** black outline, black lettering.
- **Unknown:** red outline, red lettering + exclamation mark.

SEGMENTS

- **Valid:** green dash.
- **Faulty:** red dash.
- **Fault finding not possible:** black dash.

Interpreting test result charts

On the **Faults** tab, the computers are organised into the following groups:
- **Undetected** if the computer failed to respond to the tool's identification request.
  Within the **undetected** category, the computers are subdivided into **Stores multiplex network configuration** and **Does not store multiplex network configuration**.
- **Not recognised** if the computer is detected but cannot be identified from its response.

On the **Information** tab, the computers are organised and listed as follows:
- **Fault finding not possible**, if the computer cannot support fault finding with the tool and therefore was not interrogated.
- **Valid** if the computer responded correctly to the tool's request.

Clicking on the **Continue** icon in the lower right-hand corner displays a new screen with the following tabs:

Under the **Results** tab, the computers are organised into the following groups:
- **Faulty** if the computer is recognised and has a non-zero number of faults.
- **OK** if the computer was detected, recognised and has no faults.
- **Not recognised** if the computer was detected but could not be identified from its response.
- **Undetected** if the computer can support fault finding but failed to respond.

GETtheMANUALS.org

MULTIPLEX NETWORK CONFIGURATION

The computer storing the multiplex network configuration on this vehicle is the **Airbag** computer.

The **Configuration** screen consists of two tabs for displaying and modifying:
– The first tab: **Multiplex network configuration** on the multiplex network version and the list of computers defined as present on the multiplex network.
– The second tab: **Configuration of computers supporting fault finding** indicates the relevant diagram number, and the list of defined computers which can support fault finding with the RENAULT tool.

IMPORTANT
First repair the computers containing the multiplex network configuration (Airbag) to be able to display the screen with the multiplex network configuration diagram for the vehicle undergoing fault finding.

Computer	Multiplex network configuration	Computers that can support fault finding configuration
Injection	PRESENT	YES
ABS/ESP or ABS/ESP/ACC	PRESENT	YES
UCH	PRESENT	YES
Automatic transmission	PRESENT (option)	YES (option)
Xenon bulb dynamic correction	PRESENT (option)	YES (option)
Automatic parking brake	PRESENT	YES
Instrument panel	PRESENT	YES
Airbag/pretensioners	PRESENT	YES
Steering lock	PRESENT	NO
Communication unit (Intelligent Transport System)	PRESENT (option)	YES
Climate control	PRESENT	YES
Parking proximity sensor (Front and Rear)	PRESENT (option)	YES (option)
Parking proximity sensor (rear)	ABSENT	YES (option)
Modified Hands-Free Kit	ABSENT	YES (option)
Heater	ABSENT	YES (option)

Option: depending on equipment level

If during the multiplex network test the following message appears: "No dialogue with some computers: check power supply and diagnostic lines before relaunching the test"
– the multiplex network can still be seen
– make sure there are not too many computers entered in the configuration: update the multiplex network in accordance with the table above.

GETtheMANUALS.org

NETWORK CONFIGURATION

NOTES	**The configuration is entered with the ignition on; apply the forced + after ignition feed procedure (see Introduction).** **It can be run from the multiplex network test results screens.**

The tool presents the Airbag configuration.

Configuration involves the following steps:
– Select the computer to be modified.

– Choice of multiplex network diagram version.

This is the multiplex network diagram version. The version number increases with each change to the multiplex network wiring in this vehicle.

IMPORTANT
On Velsatis ph2 there are two versions of the diagram:
– Diagram version 4: If P9X engine fitted
– Diagram version 3: All other vehicle configurations

Choice of computers in the vehicle present on the network
Always present in the vehicle:
- Injection,
- the ABS/ESP,
- the instrument panel,
- the UCH,
- the airbag/pretensioners.
- steering lock,
- regulated climate control;

+ the vehicle options:
- the automatic gearbox,
- xenon bulbs (COSLAD),
- Parking proximity sensor, CAN (Front and rear)
- automatic parking brake,
- Intelligent transport system (ITS) = communications unit.
- Parking proximity sensor (Rear)

IMPORTANT
A computer connected to the multiplex network but not registered in the computer containing the multiplex network configuration will not be checked in the multiplex network test.
Correct the configuration by registering as present the computer missing from the Airbag configuration.
Start the multiplex network test again after modifying the configuration.

GETtheMANUALS.org

MULTIPLEX NETWORK NOT OPERATIONAL

NOTES	**First check that the computer at the end of the faulty segment is correctly supplied (earth, + battery, + accessories or + after ignition feed).** **Always check the computer conformity.** **IMPORTANT** Switch off the ignition, remove the RENAULT Card from the card reader, check that the side lights are not on and wait for **1 minute**.

Finding the fault type	***NOTES***	Obtain a copy of the multiplex network diagram for the vehicle. (Diagnostic socket diagram).

Measure the resistance between **tracks 6** and **14** of the diagnostic socket.
What is the resistance?

0 Ω	The two lines are short circuited (consult the **Repair help** section).
60Ω	Check that there is an **earth, + battery feed, + accessories feed or + after ignition feed at the injection computer and UCH terminals**.
Between 70 Ω and 110 Ω	Check that there is no interference resistance on **tracks 6 and 14**, and then check that there is no short circuit to earth or + battery feed.
120 Ω	Open circuit on one or two lines. Disconnect the injection computer and check the multiplex connection between the diagnostic socket and the injection computer. Is the multiplex connection correct?

YES	Check that the resistance is approximately **120 Ω** between the two network tracks on the injection computer: – If the resistance is not approximately **120 Ω, contact Techline**. – If the resistance is **120 Ω**, check the continuity and absence of interference resistance on the multiplex connection between the diagnostic socket and the UCH. Repair if necessary.
	Check that the resistance is approximately **120 Ω** between the two network tracks on the UCH computer: – If the resistance is not approximately **120 Ω, contact Techline**.
NO	Repair the multiplex connection between the diagnostic socket and the injection computer. If the fault is still present, **contact your Techline**.

AFTER REPAIR	Carry out the multiplex network test again using the diagnostic tool. Clear the stored faults on all the computers connected to the network. Deal with any other faults.

GETtheMANUALS.org

FAULTY SEGMENT

NOTES	**First check that the computer at the end of the faulty segment is correctly supplied (earth, + battery, + accessories or + after ignition feed).** **Always check the computer conformity.** **IMPORTANT** It may be that the tool cannot exactly determine the faulty segment(s). It will then suggests several segments that could be faulty. In this case, repair the segment closest to the diagnostic socket.

Isolate the faulty segment by disconnecting both ends of the segment. Check the condition of the connectors.
Check the continuity of the CAN H and CAN L lines between the two connectors on the isolated segment.
For computer and connection track allocations (see **CAN H and CAN L connections summary table**).
Perform the necessary operations to check the continuity of the two lines (for example, replacing the wiring).
Make sure that the computer present in the vehicle is compatible and that the data it is producing is correct.

Reconnect the segment.
Carry out a new multiplex network test with the diagnostic tool.
Is the segment still declared faulty?

NO	End of fault finding.
YES	Are there other faulty segments?

NO	Repeat the multiplex network tests to check the continuity and insulation of the CAN H and CAN L lines between the end of the faulty segment and the diagnostic socket.
YES	Apply the same procedure to each segment.

AFTER REPAIR	Carry out the multiplex network test again using the diagnostic tool. Clear the stored faults on all the computers connected to the network. Deal with any other faults.

GETtheMANUALS.org

FAULTY COMPUTER

NOTES	Make sure that the computers installed in the vehicle are the correct type and are compatible with the vehicle. Check the power supply to the computers (earth, + battery, + accessories or + after ignition feed).

Make sure that the computer **wake-up mode** is in full working order on the vehicle and properly assimilated by the computers.

The wake-up mode is:
- **Timed feed:** UCH, Instrument panel, Parking brake.
- **+ accessories feed:** Climate control, Central communications unit, ABS/ASR.
- **+ After ignition feed:** Injection, Airbag/Pretensioners, Automatic Transmission, Xenon bulbs, Parking proximity sensor.
  In **+ accessories feed** these computers will not appear.

– Switch to **computer fault finding** mode.

Test dialogue with computers.

- No dialogue between computers and the diagnostic tool: see ALP 1 **No dialogue with the computer** of the computer(s) on which there is no dialogue with the diagnostic tool.
  Check the connections to the computers and that there are no open circuits.
  Repair if necessary.
- Computers are not displaying all the information on their identifications:
  Check in the Workshop Repair Manual or the World Vehicle Database that the computer is compatible with the vehicle.
  Check that the CLIP diagnostic tool update is recent enough to be able to deal with faults on the vehicle.

If no faults or open or short circuits have been detected after these checks, contact Techline.

AFTER REPAIR	Carry out the multiplex network test again using the diagnostic tool. Clear the stored faults on all the computers connected to the network. Deal with any other faults.

GETtheMANUALS.org

UNRECOGNISED COMPUTERS ON THE NETWORK

NOTES	– Check computer compatibility with the vehicle.

Check that the CLIP diagnostic tool update is recent enough to be able to deal with faults on the vehicle.

– Switch to **computer fault finding** mode.

Test dialogue with computers.

- No dialogue between computers and diagnostic tool: see ALP 1.
  No dialogue with the computers or computers not communicating with the diagnostic tool.
  Check the connections to the computers and that there are no open circuits.
  Repair if necessary.
- If there is communication with computers:
  Make sure that the computer identification information is correct and matches the vehicle which has undergone fault finding.

– Enter the data on the computers:
  – Parts Department part no.:
  – Vdiag:
  – Program no.:
  – Version no.:
  – Calibration no.:

If no faults or open or short circuits have been detected after these tests, contact Techline.

AFTER REPAIR	Carry out the multiplex network test again using the diagnostic tool. Clear the stored faults on all the computers connected to the network. Deal with any other faults.

GETtheMANUALS.org

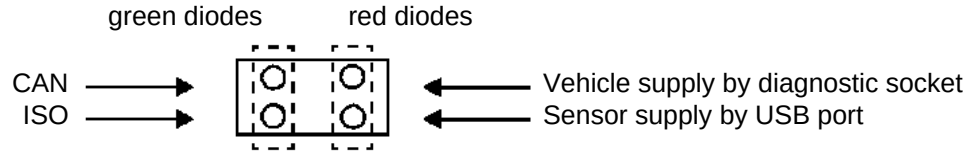
ALP 1	No dialogue with computers

NOTES	**Vehicle computer power supply for fault finding:** Engine stopped, ignition on. Connect the diagnostic tool and perform the required operations.

Try the diagnostic tool on another vehicle.
Make sure that the tool update version is **CD no. 53** onwards.

Check:
– the connection between the diagnostic tool and socket (connection and cable in good condition),
– the computers' power supply.
– the engine and passenger compartment fuses.

Check that the **CLIP** sensor is supplied by tracks **16 (+12 V)**, and **4** and **5 (earth)** of the diagnostic socket, this can be visually confirmed if the two red diodes on the sensor light up.
Check that the **CLIP** sensor is supplied by the computer's USB port (red diode).
Make sure that the **CLIP** sensor is communicating properly with the vehicle's computers; this can be seen by the two green diodes on the sensor lighting up.



Use the diagnostic socket to check the following tracks:
Track 1 → **+ After ignition feed**
Track 16 → **+ battery feed**
Tracks 4 and 5 → **Earth**
Repair if necessary.

Computer connected to CAN Vehicle
If the fault is still present, check the **continuity** and **insulation** of the lines:
CAN H (diagnostic socket track 6)
CAN L (diagnostic socket track 14)

With a multimeter, make sure that the voltages at the diagnostic socket terminals are:
– **2.5 V** across **CAN H (track 6)** and earth (**tracks 4 and 5**) (Average values)
– **2.5 V** across **CAN L (track 14)** and earth (**tracks 4 and 5**) (Average values)

Computer connected to Multimedia CAN
If the fault is still present, check the **continuity** and **insulation** of the lines:
CAN H (diagnostic socket track 13)
CAN L (diagnostic socket track 12)

With a multimeter, make sure that the voltages at the diagnostic socket terminals are:
– **2.5 V** across **CAN H (track 13)** and earth (**tracks 4 and 5**) (Average values)
– **2.5 V** across **CAN L (track 12)** and earth (**tracks 4 and 5**) (Average values)

To locate a short circuit on the vehicle's multiplex network, refer to the **Repair help** section.

GETtheMANUALS.org

ALP 2	No topology diagram or configuration table display at the end of the multiplex network test

The topology cannot be displayed under the following conditions:

1 The computer containing the multiplex network configuration has not responded.
2 The multiplex network is not operational; therefore dialogue is impossible.
3 In the **multiplex network** tab on the configuration screen, an incorrect **diagram version** number has been entered in the computer containing the network configuration.
4 No **diagram version** has been entered in the computer containing the configuration.

1 - The computer containing the multiplex network configuration has not responded.
First check that the computer containing the configuration (Airbag) is supplied (earth + battery feed, + accessories feed or + after ignition feed).
Check the condition of the multiplex network and the continuity and insulation of the CAN H and CAN L lines between the computers storing the configuration.

2 - The multiplex network is not operational; therefore dialogue is impossible.
See **Multiplex network not operational** fault

3 - In the multiplex network tab on the configuration screen, an incorrect diagram version number has been entered in the computer containing the network configuration.
See the **network configuration** configuration.

4 - No diagram version has been entered in the computer containing the configuration.
See the **network configuration** configuration.

GETtheMANUALS.org

ALP 3	Configuration table display at the end of the multiplex network test

NOTES	Fault finding chart to use if the tool loads the configuration screen at the end of the multiplex network test. The configuration chart is always accessible through the **Configuration** icon. Update the vehicle configuration again then relaunch the multiplex network test. Check that the two tabs are consistent before relaunching the test.

The RENAULT diagnostic tool loads the configuration screen directly under the following conditions:

- **MULTIPLEX NETWORK** tab
  - The **diagram version** on the computer containing the multiplex network configuration is incorrect (see Network configuration).
  - In this case, the following message appears during the multiplex test: "Some computers responding to the diagnostic tool are not stored in the computer configuration".
  - The computer containing the network version is blank (if Airbag computer has been replaced).
- **COMPUTERS SUPPORTING FAULT FINDING** tab
  - Inconsistency between the list of computers entered and the computers actually detected on the vehicle. Some computers present on the vehicle are absent in the computer containing the network configuration (see Multiplex network configuration). In this case, the following message appears during the multiplex test: "Some computers responding to the diagnostic tool are not stored in the computer configuration".

GETtheMANUALS.org

1. SCOPE OF THIS DOCUMENT

This document presents the fault finding procedure applicable to all computers with the following specifications:

Vehicle(s): **VELSATIS, LAGUNA II, ESPACE IV**	*Computer name:* **ACU3 AIRBAG**
Function concerned: **AIRBAG**	*Vdiag No.:* **24, 28, 2C, 2D**

2. PREREQUISITES FOR FAULT FINDING

Documentation type:

Fault finding procedures (this manual):
– Assisted fault finding (integrated into the diagnostic tool), Dialogys.
Wiring Diagrams:
– Visu-Schéma (CD-ROM), paper version.

Diagnostic tools type:

– CLIP

Type of special tooling required:

Special tooling required	
– Multimeter. – Set of adapters and borniers for using the Airbag and pretensioner wiring harness checks function of CLIP and XRBAG tools for updates comprising the borniers listed below. **– The development of the airbag ignition module connectors requires modification of a dummy ignition module.** **LOCAL MODIFICATION OF THE DUMMY IGNITION MODULE** **– Remove the ignition module from its red mounting and remove one of the two brown locking notches.**	
Elé. 1615	**75-track B53** computer bornier.
Elé. 1617 4/4	**10-track black** rotary switch adapter.
Elé. 1617 2/4	**6-track yellow** wiring harness test adapter.
Elé. 1616	**28-track** seat wiring harness test adapter.
Elé. 1684	**29-track** door wiring harness test adapter.
Elé. 1645	**12-track** A computer wiring harness test adapter.

GETtheMANUALS.org

3. RECAP

Phase 2 vehicle procedure

To save energy, the UCH of the VELSATIS, LAGUNAII and ESPACE IV cuts off the **+ after ignition feed** after **3 minutes**.

To run fault finding on a computer, it is possible to force the **+ after ignition feed** for **1 hour** by applying the following procedure:

- Press the card unlocking button,
- insert the card into the reader,
- press the Start button (interrupting the **timed + after ignition feed** mode),
- press the button for more than 5 seconds, until the immobiliser warning light starts to flash rapidly (**4 Hz**).

This **forced + after ignition feed** mode remains active for **1 hour**.
Pressing the Start button or removing the card from the card reader cuts off the **+ after ignition feed** but does not cut off the **forced after ignition feed** timed mode. Until one hour has elapsed, activating the **+ after ignition feed** will restart **forced + after ignition feed** for the remaining time.

Phase 1 vehicle procedure:

To run fault finding on the vehicle's computers, switch on the ignition in fault finding mode:

- **Vehicle card in card reader**.

Faults

Faults are declared as either present or stored (depending on whether they appeared in a certain context and have disappeared since, or whether they remain present but have not been diagnosed within the current context).

The **present** or **stored** status of faults should be taken into consideration when the diagnostic tool is switched on after the + after ignition feed (without any system components being active).

For a **present fault**, apply the procedure described in the **Interpretation of faults** section.

For a **stored fault**, note the faults displayed and apply the instructions in the **Notes** section.

If the fault is **confirmed** when the instructions in the Notes section are applied, the fault is present. Deal with the fault

If the fault is **not confirmed**, check:
- the electrical lines which correspond to the fault,
- the connectors for these lines (for oxidation, bent pins, etc.),
- the resistance of the component detected as faulty,
- the condition of the wires (melted or split insulation, wear).

GETtheMANUALS.org

Conformity check

The aim of the conformity check is to check data that does not produce a fault on the diagnostic tool because the data is inconsistent. Therefore, this stage is used to:
– carry out fault finding on faults that do not have a fault display, and which may correspond to a customer complaint,
– check that the system is operating correctly and that there is no risk of a fault recurring after repairs.

This section gives the fault finding procedures for statuses and parameters and the conditions for checking them.

If a status is not behaving normally or a parameter is outside the permitted tolerance values, consult the corresponding fault finding page.

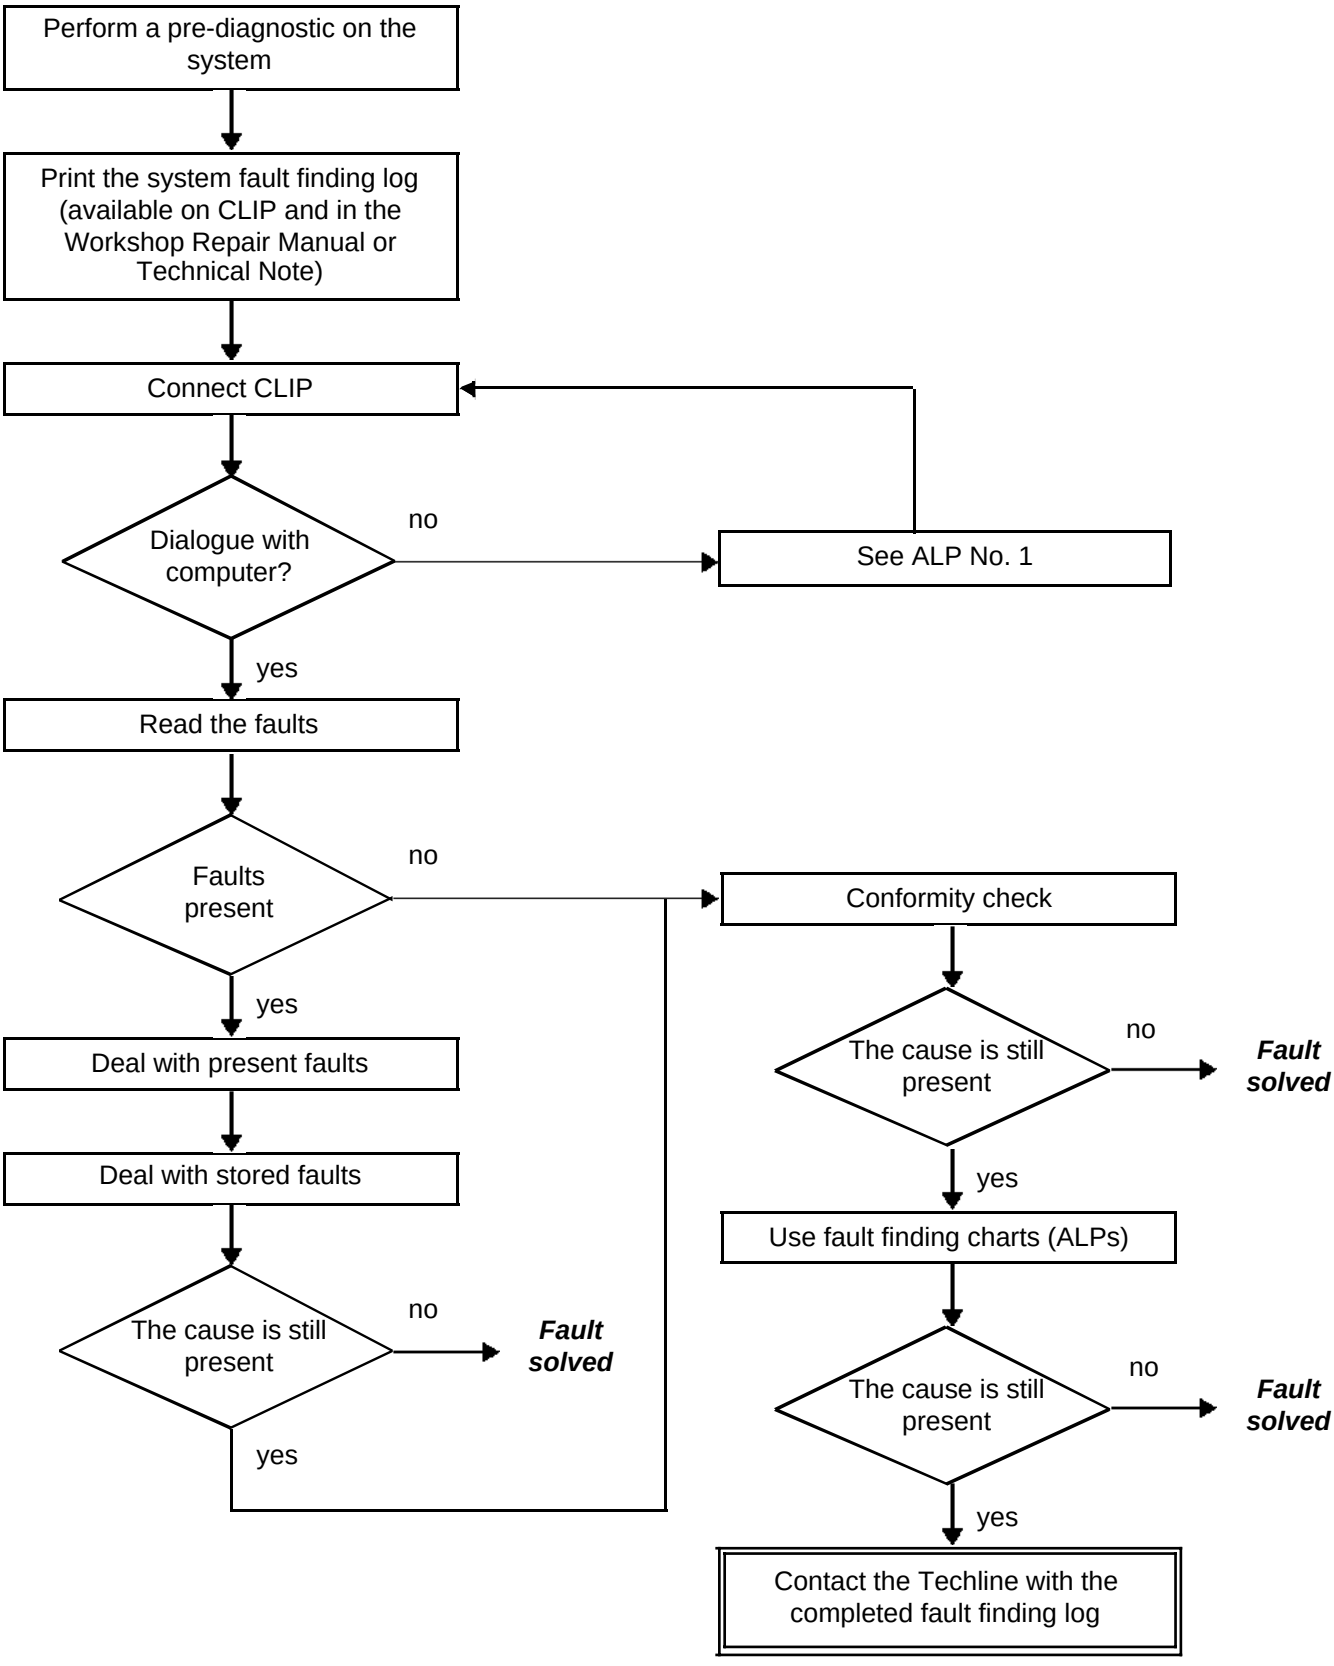
Customer complaints - Fault finding chart

If the test with the diagnostic tool is OK but the customer complaint is still present, the fault should be processed by **customer complaints**.

A synopsis of the general procedure to follow is provided on the following page in the form of a flow chart

GETtheMANUALS.org

4. FAULT FINDING PROCEDURE



GETtheMANUALS.org

4. FAULT FINDING PROCEDURE (continued)

Wiring check

Fault finding problems
Disconnecting the connectors and/or manipulating the wiring harness may temporarily remove the cause of a fault.
Electrical measurements of voltage, resistance and insulation are generally correct, especially if the fault is not present when the analysis is made (stored fault).

Visual inspection
Look for damage under the bonnet and in the passenger compartment.
Carefully check the fuses, insulators and wiring harness routing.
Look for signs of oxidation.

Tactile inspection
While manipulating the wiring harness, use the diagnostic tool to note any change in fault status from stored to present.
Make sure that the connectors are properly locked.
Apply light pressure to the connectors.
Twist the wiring harness.
If there is a change in status, try to locate the source of the fault.

Inspection of each component
Disconnect the connectors and check the appearance of the clips and tabs, as well as the crimping (no crimping on the insulating section).
Make sure that the clips and tabs are properly locked in the sockets.
Check that no clips or tabs have been dislodged during connection.
Check the clip contact pressure using an appropriate model of tab.

Resistance check
Check the continuity of entire lines, then section by section.
Look for a short circuit to earth, to **+ 12 V** or to another wire.

If a fault is detected, repair or replace the wiring harness.

GETtheMANUALS.org

5. FAULT FINDING LOG

IMPORTANT!

NOTE
Any fault on a complex system requires thorough fault finding with the appropriate tools. The FAULT FINDING LOG, which should be completed during the procedure, enables you to keep track of the procedure which is carried out. It is an essential document when consulting the manufacturer.

IT IS THEREFORE MANDATORY TO FILL OUT A FAULT FINDING LOG EACH TIME FAULT FINDING IS CARRIED OUT

You will always be asked for this log:

- when requesting technical assistance from the Techline,
- for approval requests when replacing parts for which approval is obligatory,
- to be enclosed when returning monitored parts on request. The log is needed for warranty reimbursement, and enables better analysis of the parts removed.

6. SAFETY ADVICE

Safety rules must be observed during any work on a component to prevent any damage or injury:

- make sure that the battery is properly charged to avoid damaging the computers with a low load,
- use the appropriate tools.

During operations on the airbag/seat belt pretensioner systems it is essential that you lock the computer using the diagnostic tool to prevent any risk of accidental triggering (all the ignition lines will be inhibited). The locked mode is indicated when the instrument panel warning light comes on.

If it is impossible to connect the diagnostic tool, switch off the ignition, remove the system power supply fuse and wait at least 2 seconds for the discharge of the reserve power capacity.

Never measure the airbag or pretensioner trigger lines with any device other than XRBAG or CLIP's Airbag and pretensioner wiring harness check function.

Before using a dummy ignition module, ensure that its resistance is between 1.8 and 2.5 Ω.

Check during the operation that the computer feed voltage does not drop below 10 volts.

Disconnect the battery before any removal - refitting of a pyrotechnical component (airbag module, pretensioner or seat belt inertia reel).

NOTE
Airbag and pretensioner destruction and scrapping is subject to national legislation.

DEFINITION OF TRIGGER LINES FOR THE VELSATIS AND LAGUNA II

L1: Driver's lap belt pretensioner circuit (**cable K on B53**).

L2: Passenger lap belt pretensioner circuit (**cable L on B53**).

L3: Driver's side buckle pretensioner circuit (**cable B or C on B53**).

L4: Passenger side buckle pretensioner circuit (**cable E or F on B53**).

L5: Passenger frontal airbag circuit, circuit 1 (**cable O on B53**).

L6: Passenger frontal airbag circuit, circuit 2 (**cable P on B53**).

L7: Driver's frontal airbag circuit, circuit 1 (**cable M on B53**).

L8: Driver's frontal airbag circuit, circuit 2 (**cable N on B53**).

L9: Curtain airbag circuit, driver side (**cable S on B53**).

L10: Curtain airbag circuit, passenger's side (**cable T on B53**).

L11: Driver's chest level front side airbag circuit (**cable Q on B53**).

L12: Passenger front chest level side airbag circuit (**cable R on B53**).

L13: Rear chest level side airbag circuit, driver side (**cable W on B53**).

L14: Rear chest level side airbag, passenger side (**cable X on B53**).

Note:
The ignition module circuits not present on a vehicle are declared in open circuit following the replacement of the computer (default configuration with all trigger lines present).
Configure the trigger lines present on the vehicle using the diagnostic tool (note: configuration of the ignition modules on CLIP covers 2 screens).

GETtheMANUALS.org

DEFINITION OF TRIGGER LINES FOR THE ESPACE IV

L1: Driver's lap belt pretensioner circuit (**cable K of B53**).

L2: Passenger lap belt pretensioner circuit (**cable L of B53**).

L3: Front buckle pretensioners circuit (**cable B and C on B53**).

L5: Passenger frontal airbag circuit, circuit 1 (**cable O on B53**).

L6: Passenger frontal airbag circuit, circuit 2 (**cable P on B53**).

L7: Driver's frontal airbag circuit, circuit 1 (**cable M on B53**).

L8: Driver's frontal airbag circuit, circuit 2 (**cable N on B53**).

L9: Front curtain airbag circuit, driver's side (**cable S on B53**).

L10: Front curtain airbag circuit, passenger's side (**cable T on B53**).

L11: Driver's chest level front side airbag circuit (**cable Q on B53**).

L12: Passenger chest level front side airbag circuit (**cable R on B53**).

L13: Rear chest level side airbag circuit, driver side (**cable W on B53**).

L14: Rear chest level side airbag, passenger side (**cable X on B53**).

L15: Rear curtain airbag circuit, driver's side (**cable U on B53**).

L16: Rear curtain airbag circuit, passenger's side (**cable V on B53**).

Note:
The ignition module circuits not present on a vehicle are declared in open circuit following the replacement of the computer (default configuration with all trigger lines present).
Configure the trigger lines present on the vehicle using the diagnostic tool (note: configuration of the ignition modules on CLIP covers 2 screens).

GETtheMANUALS.org

The main function of the ACU 3 computer is to activate, in the event of severe impact, the restraint systems such as seat belt pretensioners, the pyrotechnic inertia reels and the frontal and side airbags according to the system configuration.

The passenger and driver's frontal airbags are adaptive (2 ignition modules).

Presence of a passenger airbag locking switch

Two distinct impact levels are transmitted on the **CAN** network:
- level 1 unlocks the doors and lights the hazard warning lights,
- level 2 cuts off the fuel pump in addition to the level 1 actions.

Special features of the operation of the airbag locking switch in Vdiag 24, 28:

The vehicle user has **10 seconds** after **+ after ignition** to inhibit the passenger airbag by the key.

After this time, the computer will store the **DF193** fault, and light up the instrument panel warning light.

Switching the ignition off and on again will block this fault.

Special features of the operation of the airbag locking switch in Vdiag 2C, 2D:

Inhibition of the passenger airbag is authorised even with the engine running, at a vehicle speed of less than **4 mph (7 km/h)**.

If the switch status is changed above **4 mph (7 km/h)**, the system status remains unchanged in relation to is status before the speed threshold was exceeded, nevertheless the fault warning light will light up and **DF193** will be stored. If the speed signal is unavailable, it will not be possible to change the switch status.

In this case the two warning lights are dissociated and the passenger airbag status signal is maintained while the airbag fault warning light is lit.

Note for the VELSATIS and LAGUNA II:
The front buckle pretensioner of the driver's seat and the rear inertia reel on the driver's side, are wired in series.
The passenger's front buckle pretensioner and rear inertia reel on the passenger side are wired in series.

Note for the ESPACE IV:
The front buckle pretensioners are wired in series.

GETtheMANUALS.org

NOTE
During work on the airbag/seat belt pretensioner systems it is vital that you lock the computer using the diagnostic tool to prevent any risk of accidental triggering (all the trigger lines will be disabled). This 'locked' mode is obtained using command VP006 Locking the computer and is indicated by the instrument panel warning light being lit.

Replacing a system component:

The battery must be disconnected when removing and refitting any pyrotechnic system component (airbag module, pretensioner or seat belt retractor).

Replacing the airbag computer

BEFORE REPLACING THE COMPUTER IT IS ESSENTIAL THAT YOU CONTACT THE TECHLINE.

It is prohibited to use command RZ001 Clear fault memory when DF001 Computer is present or stored, to allow the failure of the returned computer to be analysed.

The airbag computers are sold in locked mode to avoid any risk of accidental triggering (all trigger lines are inhibited).

Locked mode is signalled by illumination of the airbag fault warning light on the instrument panel (**DF034 present**).

Follow this procedure when replacing an airbag computer:
– check that the ignition is switched off,
– replace the computer,
– modify the computer configuration, if necessary (see Note),
– set the driving side parameter using the command **CF291**,
– enter the VIN into the computer with diagnostic tool command **VP010 Write VIN**,
– switch off the ignition,
– carry out a check using the diagnostic tool,
– enter the After-Sales operation date with diagnostic tool command **VP008 Enter last After-Sales operation date**,
– unlock the computer using command VP0078 Unlocking the computer, only when no fault is present on the diagnostic tool (apart from **DF034**),
– verify that the warning light goes out.

Note:
The ignition module circuits not present on a vehicle are declared in open circuit following the replacement of the computer (default configuration with all trigger lines present).
It is therefore necessary to configure the trigger lines present on the vehicle using the diagnostic tool (note: the configuration of the ignition modules on CLIP are performed on 2 screens).

GETtheMANUALS.org

COMMAND MODE

CONFIGURATION READING

– **LC034:** **Vehicle type.**
This command is for checking that the computer fitted to the vehicle corresponds to the vehicle type.

– **LC088:** **Driving side.**
This command permits verification that the driving side is correctly configured, in relation to the vehicle.
In case of the absence of a configuration, use command **CF291 Driving side** to configure it.

CONFIGURATION

– **CF291:** **Driving side.**
This command allows configuration of the driving side type (right-hand drive or left-hand drive) of the vehicle.
It is essential to carry out this configuration.

SETTINGS

– **VP006:** **Lock computer.**
This command should be used for any operation on the system. It permits inhibition of all trigger lines.

– **VP007:** **Unlock computer.**
This command is for unlocking the computer (either a new computer or following locking).

– **VP008:** **Write date of the last After-Sales service.**
This command is used to enter the date the system was serviced.

– **VP010:** **Write VIN.**
This command is for entering the vehicle identification number (VIN) into the computer.

GETtheMANUALS.org

COMMAND MODE (CONTINUED)

SPECIAL COMMAND

– **SC004:** **Read impact context.**
Use this command during repair of the vehicle following an impact. It gives a list of the lines triggered and the system's status at the moment of impact from the computer that is to be replaced.

– **SC005:** **Configuration of system components.**
This command allows the computer to be configured to the equipment actually installed in the vehicle.

– **SC008:** **Ignition module configuration.**
The ignition module configuration command allows the computer to be configured to the equipment actually installed in the vehicle.

NOTE
IGNITION MODULE CONFIGURATION COVERS TWO SCREENS (Use the 'next page' button to access the second screen).

OTHER COMMAND

– **RZ001:** **Fault memory.**
This command is used for clearing the stored faults from the computer.

GETtheMANUALS.org

DF060 PRESENT	MULTIPLEX NETWORK 1.DEF: Carry out the multiplex network fault finding procedure

Vdiag 24, 28

NOTES	None

Carry out the fault finding procedure for the multiplex network.

AFTER REPAIR	Clear the computer memory then switch off the ignition. Carry out another check using the diagnostic tool.

GETtheMANUALS.org

DF061 PRESENT	PASSENGER LAP BELT PRETENSIONER CIRCUIT CC : Short circuit CO : Open circuit CC.1 : Short circuit to + 12 V CC.0 : Short circuit to earth

NOTES	**Priorities when dealing with a number of faults:** If fault **DF061** is present with at least one of **DF068, DF073, DF092**, begin the fault finding by checking the **28-track** under-seat connector.
	Special notes: Never carry out measuring operations on trigger lines using any tool other than CLIP or XRBAG. Use the **75-track B53 Elé. 1615** adapter when working on the computer connector (**cable L**) and the **28-track Elé. 1616** adapter when working on the seat (**cable C**).

CO ***CC***	***NOTES***	None

Lock the computer using the diagnostic tool (VP006). Switch off the ignition and check that the ignition module of the passenger lap belt pretensioner is correctly connected.
Disconnect the ignition module of the passenger lap belt pretensioner and connect a dummy ignition module to the ignition module connector. Switch on the ignition and carry out a check using the diagnostic tool. Replace the passenger lap belt pretensioner if the fault is stored (the fault is no longer declared present).
Disconnect the computer connector and fit **the 75-track B53 Elé. 1615** test **adapter**. The CLIP or XRBAG tools must be used for measuring resistance on the **cable marked L** on the adapter. If the value obtained is correct, check the connections of the **75-track (tracks 29 and 54)** connector.
Remove the passenger seat and check the wiring on the **28-track** connector under the seat (**tracks 14 and 28**). Repair if necessary. Fit the **28-track Elé. 1616** test adapter on the seat. The CLIP or XRBAG tool must be used to measure the resistance in adapter **cable C**. If the value obtained is incorrect, the wiring is faulty between the **28-track** connector and the passenger lap belt pretensioner (**C1 and C3**). Replace the wiring if necessary.
If the fault persists, the wiring is faulty between the **75-track** computer connector and the passenger seat (**C0 and C1**).

AFTER REPAIR	Reconnect the computer and the pretensioner igniter, then switch on the ignition again. Clear the computer fault memory then switch off the ignition. Carry out the check again using the diagnostic tool and, if there is no fault, unlock the computer. Destroy the pretensioner if it has been replaced (tool **Elé. 1287**).

GETtheMANUALS.org

DF061 **CONTINUED**	

CC.1 ***CC.0***	***NOTES***	None

Lock the computer using the diagnostic tool (VP006). Disconnect the ignition module of the passenger lap belt pretensioner and connect a dummy ignition module to the ignition module connector. Switch on the ignition and carry out a check using the diagnostic tool. If the fault is now stored (fault no longer declared as present), check the condition of the seat wiring. Replace the passenger lap belt pretensioner if the wiring is not faulty.
Disconnect the computer connector and fit **the 75-track B53 Elé. 1615** test **adapter**. The CLIP or XRBAG tools must be used for measuring the insulation appropriately for the type of fault on the **cable marked L** on the adapter. If the value obtained is correct, check the connections of the **75-track (tracks 29 and 54)** connector.
Remove the passenger seat and check the wiring on the **28-track** connector under the seat (**tracks 14 and 28**). Repair if necessary. Fit the **28-track Elé. 1616** test adapter on the seat. The CLIP or XRBAG tool must be used to correctly measure the insulation for the type of fault in adapter **cable C**. If the value obtained is incorrect, the wiring is faulty between the **28-track** connector and the passenger lap belt pretensioner (**C1 and C3**). Replace the wiring if necessary.
If the fault is still present, the wiring is faulty between the **75-track** computer connector and the **28-track** front passenger seat connector (**C0 and C1**).

AFTER REPAIR	Reconnect the computer and the pretensioner igniter, then switch on the ignition again. Clear the computer fault memory then switch off the ignition. Carry out the check again using the diagnostic tool and, if there is no fault, unlock the computer. Destroy the pretensioner if it has been replaced (tool **Elé. 1287**).

GETtheMANUALS.org

DF065 **PRESENT**	DRIVER'S SEAT POSITION SENSOR CIRCUIT CO : Open circuit CC.0 : Short circuit to earth CC.1 : Short circuit to + 12 V 1.DEF: Below minimum threshold 2.DEF: Configuration 3.DEF: Faulty sensor

NOTES	**Priorities when dealing with a number of faults:** If fault **DF065** is present with at least one of **DF076, DF077, DF080**, begin the fault finding by checking the **28-track** under-seat connector.
	Special notes: Use the **75-track B53 Elé. 1615** adapter when working on the computer connector and the **28-track Elé. 1616** adapter when working on the seat.

LAGUNA II

CO ***CC.0*** ***CC.1*** ***1.DEF***	***NOTES***	None

Lock the computer using the diagnostic tool (VP006).
Fit the **75-track B53** test adapter and measure the resistance between **tracks 31 and 56**, with the seat in the fully forward and fully back positions.

In the fully forward position, the resistance is approximately: **400 Ω**
In the fully back position, the resistance is approximately: **100 Ω**.

If the resistances are correct, check the connections of the **75-track** computer connector.

Remove the driver's seat and check the wiring on the **28-track** connector under the seat.
Repair if necessary.
Fit the **28 track** test adapter to the seat and measure the resistance between **tracks 9 and 13**.
Is the measured value approximately 100 or 400 Ω?

AFTER REPAIR	Reconnect the computer, the seat position sensor, refit the seat then switch on the ignition. Clear the computer fault memory then switch off the ignition. Carry out the check again using the diagnostic tool and, if there is no fault, unlock the computer.

GETtheMANUALS.org

DF065 **CONTINUED**	

LAGUNA II

NO	Check the connection and the condition of the sensor connectors. Check the continuity and insulation of the connections between: Bornier **Track 9** → **Sensor connector** Bornier **Track 13** → **Sensor connector** If the checks are correct, replace the seat position sensor.
YES	Check the wiring again on the seat connector (**track 13 and 9**) as well as on the **75-track connector (tracks 31 and 56**). If the fault is still present, the wiring is faulty between the computer and the driver's seat (**C0/C1**). Replace the wiring if necessary.

2.DEF	***NOTES***	None

This fault corresponds to an inconsistency between the computer configuration and the vehicle equipment detected by the computer.
The computer detects the presence of the driver's seat position sensor, but the computer is configured **WITHOUT**.
Modify the computer configuration using the **SC005 Configuration of system components** command.

3.DEF	***NOTES***	None

Replace the driver's seat position sensor.

AFTER REPAIR	Reconnect the computer, the seat position sensor, refit the seat then switch on the ignition. Clear the computer fault memory then switch off the ignition. Carry out the check again using the diagnostic tool and, if there is no fault, unlock the computer.

GETtheMANUALS.org

YES	Check the seat connector connections (**tracks 9 and 23**) again, as well as those of the **75-track (tracks 31 and 56)** connector. If the fault is still present, the wiring is faulty between the computer and the driver's seat (**C0/C1**). Replace the wiring if necessary.

2.DEF	***NOTES***	None

This fault corresponds to an inconsistency between the computer configuration and the vehicle equipment detected by the computer.
The computer detects the presence of the driver's seat position sensor, but the computer is configured **WITHOUT**.
Modify the computer configuration using the **SC005 Configuration of system components** command.

3.DEF	***NOTES***	None

Replace the driver's seat position sensor.

AFTER REPAIR	Reconnect the computer, the seat position sensor, refit the seat then switch on the ignition. Clear the computer fault memory then switch off the ignition. Carry out the check again using the diagnostic tool and, if there is no fault, unlock the computer.

GETtheMANUALS.org

DF065 PRESENT	DRIVER'S FRONT SEAT POSITION SENSOR CIRCUIT CO : Open circuit CC.0 : Short circuit to earth CC.1 : Short circuit to + 12 V 1.DEF: Below minimum threshold 2.DEF: Configuration 3.DEF: Faulty sensor

NOTES	**Priorities when dealing with a number of faults:** If fault **DF065** is present with at least one of **DF077, DF080, DF210**, begin the fault finding by checking the **28-track** under-seat connector.
	Special notes: Use the **75-track B53 Elé.1615** adapter when working on the computer connector and the **28-track Elé.1616** adapter when working on the seat.

ESPACE IV

CO ***CC.0*** ***CC.1*** ***1.DEF***	***NOTES***	None

Lock the computer using the diagnostic tool (VP006).
Fit the **75-track B53** test adapter and measure the resistance between **tracks 31 and 56** with the seat in the fully forward and fully back positions.

In the fully forward position, the resistance is approximately: **400 Ω**
In the fully back position, the resistance is approximately: **100 Ω**

If the resistances are correct, check the connections of the **75-track** computer connector.

Remove the driver's seat and check the wiring on the **28-track** connector under the seat.
Repair if necessary.
Fit the **28-track** test adapter to the seat and measure the resistance between **tracks 9 and 23**.
Is the measured value approximately 100 Ω or 400 Ω?

AFTER REPAIR	Reconnect the computer, the seat position sensor, refit the seat then switch on the ignition. Clear the computer fault memory then switch off the ignition. Carry out the check again using the diagnostic tool and, if there is no fault, unlock the computer.

GETtheMANUALS.org

DF065 **CONTINUED**	

ESPACE IV

NO	Check the connection and the condition of the sensor connectors. Check the continuity and insulation of the connections between: Bornier **Track 9** → **Sensor connector** Bornier **Track 23** → **Sensor connector** If the checks are correct, replace the seat position sensor.
YES	Check the seat connector connections (**tracks 9 and 23**) again, as well as those of the **75-track (tracks 31 and 56)** connector. If the fault is still present, the wiring is faulty between the computer and the driver's seat (**C0/C1**). Replace the wiring if necessary.

2.DEF	***NOTES***	None

This fault corresponds to an inconsistency between the computer configuration and the vehicle equipment detected by the computer.
The computer detects the presence of the driver's seat position sensor, but the computer is configured **WITHOUT**.
Modify the computer configuration using the **SC005 Configuration of system components** command.

3.DEF	***NOTES***	None

Replace the driver's seat position sensor.

AFTER REPAIR	Reconnect the computer, the seat position sensor, refit the seat then switch on the ignition. Clear the computer fault memory then switch off the ignition. Carry out the check again using the diagnostic tool and, if there is no fault, unlock the computer.

ESPACE IV

NO	Check the seat connector connections (**tracks 7 and 21**). Remove the trim from the front passenger seat and check that the side airbag ignition module is connected correctly.
	Disconnect the passenger airbag ignition module, connect a dummy ignition module to the ignition module connector then measure the resistance on **cable B** of the adapter again. – If the value obtained is correct, replace the passenger's front chest side airbag module. – If the value obtained is still not correct, replace the wiring between **points C1 and C3** (seat wiring).
YES	Check the seat connector connections (**tracks 7 and 21**) again, as well as those of the **75-track connector (tracks 42 and 67)**.
	If the fault is still present, the wiring is faulty between the computer and the front passenger seat (**C0/C1**). Replace the wiring if necessary.

AFTER REPAIR	Reconnect the computer and the ignition module of the passenger's front chest side airbag module then switch on the ignition again. Clear the computer fault memory then switch off the ignition. Carry out the check again using the diagnostic tool and, if there is no fault, unlock the computer. When replacing the airbag module, do not forget to reconnect the earth on the new module. Destroy the passenger's chest side airbag module if it has been replaced (tool **Elé. 1287**).

ESPACE IV

CC.1 ***CC.0***	***NOTES***	None

Lock the computer using the diagnostic tool (VP006), disconnect the computer connector and fit the **75-track B53** adapter. The CLIP or XRBAG tools must be used for measuring the insulation appropriately for the type of fault on the **cable marked R** on the adapter.
If the value obtained is correct, check the connections of the **75-track (tracks 42 and 67)** connector.

Remove the passenger seat and check the wiring on the **28-track** connector under the seat. Repair if necessary. Fit the **28-track** test adapter to the seat (**point C1**).
The CLIP or XRBAG tool must be used to correctly measure the insulation for the type of fault in the adapter **cable marked B**.
Is the value obtained correct?

NO

Check the seat connector connections (**tracks 7 and 21**).
Remove the trim from the front passenger seat and check that the side airbag ignition module is connected correctly.

Disconnect the side airbag ignition module, connect a dummy ignition module to the ignition module connector and measure the proper insulation for the type of fault, in **cable B** of the adapter again.
– If the value obtained is correct, replace the passenger's front chest side airbag module.
– If the value obtained is still not correct, replace the wiring between **points C1 and C3** (seat wiring).

YES

Check the seat connector connections (**tracks 7 and 21**) again, as well as those of the **75-track connector (tracks 42 and 67)**.

If the fault is still present, the wiring is faulty between the computer and the front passenger seat (**C0/C1**). Replace the wiring if necessary.

AFTER REPAIR	Reconnect the computer and the ignition module of the passenger's front chest side airbag module then switch on the ignition again. Clear the computer fault memory then switch off the ignition. Carry out the check again using the diagnostic tool and, if there is no fault, unlock the computer. When replacing the airbag module, do not forget to reconnect the earth on the new module. Destroy the passenger's chest side airbag module if it has been replaced (tool **Elé. 1287**).

GETtheMANUALS.org

DF069 PRESENT	PASSENGER CURTAIN AIRBAG CIRCUIT CC : Short circuit CO : Open circuit CC.1 : Short circuit to + 12 V CC.0 : Short circuit to earth

NOTES	**Special notes:** Never carry out measuring operations on trigger lines using any tool other than CLIP or XRBAG. Use the **75-track B53 Elé. 1615** adapter for working on the computer connector (**cable T**) and the **6 track Elé. 1617 (cable B)** adapter.

DF073 PRESENT	PASSENGER SIDE BUCKLE PRETENSIONER CIRCUIT CC : Short circuit CO : Open circuit CC.1 : Short circuit to + 12 V CC.0 : Short circuit to earth

NOTES	**Priorities when dealing with a number of faults:** If faults **DF073 and DF068** are present, begin the fault finding by checking the **28-track** under-seat connector.
	Special notes: The buckle pretensioner of the front passenger's seat is wired in series with the rear pyrotechnic seat belt retractor on the passenger's side. Never carry out measuring on the trigger lines with any tool other than CLIP or XRBAG. Use the **75-track B53 Elé. 1615** adapter for working on the computer connector (**cable E or F**) and the **28-track Elé. 1616** adapter for working on the seat (**cable A**).

CO ***CC***	***NOTES***	None

Lock the computer using the diagnostic tool (VP006).
Switch off the ignition and check that the ignition module of the passenger's seat buckle pretensioner is correctly connected.
Disconnect the ignition module of the pretensioner and connect a dummy ignition module to the ignition module connector.
Switch on the ignition and carry out a check using the diagnostic tool.
Replace the passenger front seat buckle pretensioner if the fault becomes stored (fault no longer declared present).

Switch off the ignition and check that the ignition module of the rear seat belt inertia reel, passenger's side is correctly connected.
Disconnect the ignition module of the inertia reel and connect a dummy ignition module to the ignition module connector.
Switch on the ignition and carry out a check using the diagnostic tool.
Replace the rear seat belt retractor on the passenger side, if the fault becomes stored (fault no longer declared present).

Disconnect the computer and check the connections of the connector (**tracks 4, 5, 27 and 52**).
Fit the **75-track B53 adapter**.
CLIP or XRBAG tools must be used for checking the resistance on **cable F** of the adapter.
If the value obtained is incorrect, the wiring is faulty between the computer and the rear seat belt retractor on the passenger side (**C0/C3**). Replace the wiring if necessary.
See next page.

AFTER REPAIR	Reconnect the computer, the pretensioner and the inertia reel then switch on the ignition again. Clear the computer fault memory then switch off the ignition. Carry out the check again using the diagnostic tool and, if there is no fault, unlock the computer. Destroy the pretensioner or the inertia reel if it has been replaced (tool **Elé. 1287**).

GETtheMANUALS.org

DF073 **CONTINUED 1**	

The CLIP or XRBAG must be used to measure the resistance in adapter **cable E**.
If the value obtained is incorrect, the wiring is faulty between the computer and the passenger seat buckle pretensioner (**C0/C3**).

Remove the passenger seat and check the wiring on the **28-track** connector under the seat (**tracks 8 and 22**).
Repair if necessary. Fit the **28-track** test adapter to the seat (**point C1**).
The CLIP or XRBAG tool must be used for checking resistance in adapter **cable A**.
Is the value obtained correct?

NO	Check the seat-side seat connector connections again (**tracks 8 and 22**). If the fault is still present, the wiring is faulty between the **28-track** seat connector and the passenger seat buckle pretensioner (**C1/C3**). Replace the wiring if necessary.
YES	Check the wiring again on the seat connector (**tracks 8 and 22**) on the passenger compartment wiring side and the wiring of the **75 track connector (tracks 4 and 27**). If the fault is still present, the wiring is faulty between the computer and the front passenger seat (**C0/C1**). Replace the wiring if necessary.

DF076 PRESENT	DRIVER'S SIDE BUCKLE PRETENSIONER CIRCUIT CC : Short circuit CO : Open circuit CC.1 : Short circuit to + 12 V CC.0 : Short circuit to earth

NOTES	**Priorities when dealing with a number of faults:** If fault **DF076** is present with at least one of **DF065, DF077, DF080**, begin the fault finding by checking the **28-track** under-seat connector.
	Special notes: The buckle pretensioner of the driver's seat is wired in series with the rear pyrotechnic seat belt retractor on the driver's side. Never carry out measuring on the trigger lines with any tool other than CLIP or XRBAG. Use the **75-track B53 Elé. 1615** adapter for working on the computer connector (**cable B or C**) and the **28-track Elé. 1616** adapter for working on the seat (**cable A**).

CO ***CC***	***NOTES***	None

Lock the computer using the diagnostic tool (VP006).
Switch off the ignition and check that the ignition module of the driver's seat buckle pretensioner is correctly connected.
Disconnect the ignition module of the pretensioner and connect a dummy ignition module to the ignition module connector.
Switch on the ignition and carry out a check using the diagnostic tool.
Replace the driver's seat buckle pretensioner if the fault becomes stored (fault no longer declared present).

Switch off the ignition and check that the ignition module of the rear pyrotechnic seat belt retractor, driver's side is correctly connected.
Disconnect the ignition module of the inertia reel and connect a dummy ignition module to the ignition module connector.
Switch on the ignition and carry out a check using the diagnostic tool.
Replace the rear pyrotechnic seat belt retractor, driver's side, if the fault becomes stored (fault no longer declared present).

Reconnect the pretensioner and the inertia reel.
Disconnect the computer and check the connections of the connector (**tracks 2, 3, 26 and 51**).
Fit the **75-track adapter B53**.
The CLIP or XRBAG tool must be used to measure the resistance in adapter **cable C**.
If the value obtained is incorrect, the wiring is faulty between the computer and the rear pyrotechnic seat belt retractor, driver's side (**C0/C3**). Replace the wiring if necessary.
See next page.

AFTER REPAIR	Reconnect the computer, the pretensioner and the inertia reel then switch on the ignition again. Clear the computer fault memory then switch off the ignition. Carry out the check again using the diagnostic tool and, if there is no fault, unlock the computer. Destroy the pretensioner or the inertia reel if it has been replaced (tool **Elé. 1287**).

GETtheMANUALS.org

DF076 **CONTINUED 1**	

The CLIP or XRBAG must be used to measure the resistance in adapter **cable B**.
If the value obtained is incorrect, the wiring is faulty between the computer and the driver's seat buckle pretensioner (**C0/C3**).

Remove the driver's seat and check the wiring on the **28-track** connector under the seat (**tracks 8 and 22**). Repair if necessary. Fit the **28-track** test adapter to the seat (**point C1**).
The CLIP or XRBAG tool must be used for checking resistance in adapter **cable A**.
Is the value obtained correct?

NO	Check the driver's side seat connector connections again (**tracks 8 and 22**). If the fault is still present, the wiring is faulty between the **28-track** seat connector and the driver's seat buckle pretensioner (**C1/C3**). Replace the wiring if necessary.
YES	Check the wiring again on the seat connector (**tracks 8 and 22**) on the passenger compartment wiring harness side and the wiring of the **75 track connector (tracks 2 and 26)**.
	If the fault is still present, the wiring is faulty between the computer and the driver's seat (**C0/C1**). Replace the wiring if necessary.

AFTER REPAIR	Reconnect the computer, the pretensioner and the inertia reel then switch on the ignition again. Clear the computer fault memory then switch off the ignition. Carry out the check again using the diagnostic tool and, if there is no fault, unlock the computer. Destroy the pretensioner or the inertia reel if it has been replaced (tool **Elé. 1287**).

GETtheMANUALS.org

DF076 **CONTINUED 2**	

CC.1 ***CC.0***	***NOTES***	None

Lock the computer using the diagnostic tool (VP006).
Disconnect the computer and check the connections of the connector (**tracks 2, 3, 26 and 51**).
Fit the **75-track adapter B53**.
CLIP or XRBAG tools must be used for the insulation measurement appropriate to the type of fault, on **cable C** of the adapter.
If the value obtained is incorrect, the wiring is faulty between the computer and the rear pyrotechnic seat belt retractor, driver's side (**C0/C3**). Replace the wiring if necessary.

The CLIP or XRBAG tool must be used to correctly measure the insulation for the type of fault in the adapter **cable marked B**.
If the value obtained is incorrect, remove the driver's seat and check the wiring on the **28-track** connector under the seat (**tracks 8 and 22**). Repair if necessary. Fit the **28-track** test adapter to the seat (**point C1**).
The CLIP or XRBAG tool must be used to correctly measure the insulation for the type of fault in adapter **cable A**.
Is the value obtained correct?

NO	Check the driver's side seat connector connections again (**tracks 8 and 22**). If the fault is still present, the wiring is faulty between the **28-track** seat connector and the driver's seat buckle pretensioner (**C1/C3**). Replace the wiring if necessary.
YES	Check the wiring again on the seat connector (**tracks 8 and 22**) on the passenger compartment wiring harness side and the wiring of the **75 track connector (tracks 2 and 26)**.
	If the fault is still present, the wiring is faulty between the computer and the driver's seat (**C0/C1**). Replace the wiring if necessary.

AFTER REPAIR	Reconnect the computer, the pretensioner and the inertia reel then switch on the ignition again. Clear the computer fault memory then switch off the ignition. Carry out the check again using the diagnostic tool and, if there is no fault, unlock the computer. Destroy the pretensioner or the inertia reel if it has been replaced (tool **Elé. 1287**).

GETtheMANUALS.org

DF077 **PRESENT**	DRIVER'S FRONT CHEST SIDE AIRBAG CIRCUIT CC : Short circuit CO : Open circuit CC.1 : Short circuit to + 12 V CC.0 : Short circuit to earth

NOTES	**Priorities when dealing with a number of faults:** If fault **DF077** is present with at least one of **DF065, DF076, DF080**, begin the fault finding by checking the **28-track** under-seat connector.
	Special notes: Never carry out measuring operations on trigger lines using any tool other than CLIP or XRBAG. Use the **75 track B53 Elé. 1615** adapter for working on the computer connector (**cable Q**) and the **28 track Elé. 1616** adapter for working on the seat (**cable C**).

LAGUNA II

CO ***CC***	***NOTES***	None

Lock the computer using the diagnostic tool (VP006), disconnect the computer connector and fit the **75-track B53 adapter**. The CLIP or XRBAG tools must be used for measuring resistance on the **cable marked Q** on the adapter. If the value obtained is correct, check the connections of the **75-track (tracks 41 and 66)** connector.

Remove the driver's seat and check the wiring on the **28-track** connector under the seat.
Repair if necessary.
Fit the **28-track** test adapter to the seat (**point C1**).
The CLIP or XRBAG tool must be used to measure the resistance in adapter **cable C**.
Is the value obtained correct?

AFTER REPAIR	Reconnect the computer and the ignition module of the driver's front side chest airbag module then switch on the ignition. Clear the computer fault memory then switch off the ignition. Carry out the check again using the diagnostic tool and, if there is no fault, unlock the computer. When replacing the airbag module, do not forget to reconnect the earth on the new module. Destroy the chest side airbag module if it has been replaced (tool **Elé. 1287**).

GETtheMANUALS.org

DF077 **CONTINUED 1**	

LAGUNA II

NO	Check the seat connector connections (**tracks 14 and 28**). Remove the trim from the driver's seat and check that the side airbag ignition module is correctly connected.
	Disconnect the side airbag ignition module, connect a dummy ignition module to the ignition module connector and re-measure the resistance on **cable C** of the adapter. – If the value obtained is correct, replace the driver's front chest side airbag module. – If the value obtained is still not correct, replace the wiring between **points C1 and C3** (seat wiring).
YES	Check the seat connector connections (**tracks 14 and 28**) again, as well as those of the **75-track (tracks 41 and 66)** connector.
	If the fault is still present, the wiring is faulty between the computer and the driver's seat (**C0/C1**). Replace the wiring if necessary.

AFTER REPAIR	Reconnect the computer and the ignition module of the driver's front side chest airbag module then switch on the ignition. Clear the computer fault memory then switch off the ignition. Carry out the check again using the diagnostic tool and, if there is no fault, unlock the computer. When replacing the airbag module, do not forget to reconnect the earth on the new module. Destroy the chest side airbag module if it has been replaced (tool **Elé. 1287**).

GETtheMANUALS.org

DF077 **CONTINUED 2**	

LAGUNA II

CC.1 ***CC.0***	***NOTES***	None

Lock the computer using the diagnostic tool (VP006), disconnect the computer connector and fit the **75-track B53** adapter. The CLIP or XRBAG tools must be used for measuring the insulation appropriately for the type of fault on the **cable marked Q** on the adapter.
If the value obtained is correct, check the connections of the **75-track (tracks 41 and 66)** connector.

Remove the driver's seat and check the wiring on the **28-track** connector under the seat.
Repair if necessary.
Fit the **28-track** test adapter to the seat (**point C1**).
The CLIP or XRBAG tool must be used to correctly measure the insulation for the type of fault in adapter **cable C**.
Is the value obtained correct?

NO

Check the seat connector connections (**tracks 14 and 28**).
Remove the trim from the driver's seat and check that the side airbag ignition module is correctly connected.

Disconnect the side airbag ignition module, connect a dummy ignition module to the ignition module connector and again measure the proper insulation for the type of fault, in **cable C** of the adapter.
– If the value obtained is correct, replace the driver's front chest side airbag module.
– If the value obtained is still not correct, replace the wiring between **points C1 and C3** (seat wiring).

YES

Check the seat connector connections (**tracks 14 and 28**) again, as well as those of the **75-track (tracks 41 and 66)** connector.

If the fault is still present, the wiring is faulty between the computer and the driver's seat (**C0/C1**). Replace the wiring if necessary.

AFTER REPAIR

Reconnect the computer and the ignition module of the driver's front side chest airbag module then switch on the ignition. Clear the computer fault memory then switch off the ignition.
Carry out the check again using the diagnostic tool and, if there is no fault, unlock the computer. When replacing the airbag module, do not forget to reconnect the earth on the new module. Destroy the driver's chest side airbag module if it has been replaced (tool **Elé. 1287**).

Lock the computer using the diagnostic tool (VP006).
Switch off the ignition and check that the ignition module of the driver's lap belt pretensioner is correctly connected.

Disconnect the ignition module of the driver's lap belt pretensioner and connect a dummy ignition module to the ignition module connector.
Switch on the ignition and carry out a check using the diagnostic tool.
Replace the driver's lap belt pretensioner if the fault is stored (the fault is no longer declared present).

Disconnect the computer connector and fit the **75-track B53 adapter**.
The Clip or XRBAG tools MUST be used for checking resistance on the **wire marked K** on the adapter.
If the value obtained is correct, check the connections of the **75-track (tracks 28 and 53)** connector.

Remove the driver's seat and check the wiring on the **28-track** connector under the seat (**tracks 14 and 28**). Repair if necessary.
Fit the **28-track** test adapter to the seat (**point C1**).
The CLIP or XRBAG tool must be used to measure the resistance in adapter **cable C**.
If the value obtained is incorrect, the wiring is faulty between the **28-track** connector and the driver's lap belt pretensioner (**C1 and C3**). Replace the wiring if necessary.
See next page.

AFTER REPAIR	Reconnect the computer and the pretensioner igniter, then switch on the ignition again. Clear the computer fault memory then switch off the ignition. Carry out the check again using the diagnostic tool and, if there is no fault, unlock the computer. Destroy the pretensioner if it has been replaced (tool **Elé. 1287**).

GETtheMANUALS.org

DF080 **CONTINUED**	

ESPACE IV

If the fault is still present, the wiring is faulty between the **75-track** computer connector and the driver's seat (**C0/C1**).
Replace the wiring if necessary.

CC.1 ***CC.0***	***NOTES***	None

Lock the computer using the diagnostic tool (VP006).
Disconnect the computer connector and fit the **75-track adapter B53**.
The CLIP or XRBAG tools must be used for measuring the insulation appropriate to the type of fault on **cable K** on the adapter.
If the value obtained is correct, check the connections of the **75-track (tracks 28 and 53)** connector.

If the value is not correct, remove the driver's seat and check the wiring on the **28-track** connector under the seat (**tracks 14 and 28**).
Repair if necessary.
Fit the **28-track** test adapter to the seat (**point C1**).
The CLIP or XRBAG tool must be used to correctly measure the insulation for the type of fault in adapter **cable C**.
If the value obtained is incorrect, the wiring is faulty between the **28-track** connector and the driver's lap belt pretensioner (**C1 and C3**). Replace the wiring if necessary.
If the value obtained is correct, the wiring is faulty between the **75-track** computer connector and the driver's seat (**C0/C1**).
Replace the wiring if necessary.

AFTER REPAIR	Reconnect the computer and the pretensioner igniter, then switch on the ignition again. Clear the computer fault memory then switch off the ignition. Carry out the check again using the diagnostic tool and, if there is no fault, unlock the computer. Destroy the pretensioner if it has been replaced (tool **Elé. 1287**).

DF092 PRESENT	FRONT SEAT INERTIA REEL LOCKING FUNCTION CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 V 1.DEF: Configuration

NOTES	**Special notes:** Never carry out measuring operations on trigger lines using any tool other than CLIP or XRBAG. Use the **75-track B53 Elé. 1615** adapter for working on the computer connector and the **12-track Elé. 1645** adapter for working on the A computer.

CO.0	***NOTES***	This function is only present on the VELSATIS. In the event of CO.0 on the LAGUNA, change the computer configuration (SC005).

Lock the computer, disconnect the connector from the A computer, check its connections and fit **12-track bornier Elé. 1645.**
Ensure that there is **+ After ignition feed** on **track 3** and an **earth** on **track 1**.
Ensure insulation across these two connections.

Check the condition of **track 8** on the A computer connections.
Reconnect the A computer connector.
Disconnect the airbag computer connector and check the condition of its connections. Fit the **75-track B53** adapter.
Check the continuity and insulation of the connection between:

Airbag computer **track 55** ⟶ **Track 8** of the A computer

If the connection is faulty, replace the wiring between the airbag computer and the A computer.

Using **12-track Elé. 1645 bornier**, ensure that **the resistance** of the inertia reels between **tracks 5 and 6** passenger side and **11 and 12** driver's side are approximately **47.5 Ω ± 5**.
Is the resistance correct?

YES	Check the condition of the A computer connection again. Replace the A computer if the fault is still present.

AFTER REPAIR	Reconnect the airbag computer and the A computer, then switch on the ignition. Clear the computer fault memory then switch off the ignition. Carry out the check again using the diagnostic tool and, if there is no fault, unlock the computer.

GETtheMANUALS.org

DF092 **CONTINUED**	

NO	Remove the seat with the incorrect resistance and check the connections of the **28-track** connector under the seat (**tracks 6 and 27**). Fit the **28 track** test adapter on the seat to **point C1**. Measure the resistance of the seat inertia reel between **tracks 6 and 27** of the bornier. * **The resistance** is approximately **47.5 Ω ± 5**: replace the wiring between the A computer and the **28-track** connector under the seat. * **The resistance** is not approximately **47.5 Ω ± 5**: strip the seat and check that the inertia reel wiring harness is correctly connected. If the module is correctly connected, measure the resistance directly on the inertia reel motor. – **The resistance** is not approximately **47.5 Ω ± 5**: replace the seat inertia reel. – **The resistance** is approximately **47.5 Ω ± 5**: replace the module between the **28-track** connector and the seat inertia reel

CC.1	***NOTES***	None

Lock the computer (VP006), disconnect the connector from the **A** computer, check its connections and fit **the 12-track adapter**.
Ensure that there is **+ After ignition feed** on **track 3** and an **earth** on **track 1**.
Ensure insulation across these two connections.

Check the condition of **track 8** on the **A** computer connections.
Disconnect the airbag computer connector and check the condition of its connections. Fit the **75-track B53** adapter.
Check the continuity and insulation of the connection between:

Airbag computer **track 55** ⟶ **Track 8** of A computer

If the connection is faulty, replace the wiring between the airbag computer and the **A** computer.

1.DEF	***NOTES***	None

This fault corresponds to an inconsistency between the computer configuration and the vehicle equipment detected by the computer. The computer detects the presence of a connection with the A computer but the computer is configured without.
Modify the computer configuration using the **SC005 Configuration of system components** command.

AFTER REPAIR	Reconnect the airbag computer and the A computer, then switch on the ignition. Clear the computer fault memory then switch off the ignition. Carry out the check again using the diagnostic tool and, if there is no fault, unlock the computer.

Carry out the check again using the diagnostic tool and, if there is no fault, unlock the computer. Destroy any pretensioners that have been replaced (tool **Elé. 1287**).

GETtheMANUALS.org

DF210 **CONTINUED 3**	

Remove the seat displaying the fault and check the **28-track** connector wiring under the seat (**tracks 8 and 22**).
Repair if necessary.
Fit the **28-track Elé. 1616** test adapter on the seat (**point C1**).
Only use the CLIP or XRBAG tools to measure the insulation appropriately for the type of fault on **cable A**.
Is the value obtained correct?

NO	Check the seat connector connections again (**tracks 8 and 22**). If the fault persists, the wiring is faulty between the **28-track** seat connector and the buckle pretensioner of the faulty seat (**C1/C3**).
YES	Check the seat connector wiring again (**tracks 8 and 22**) on the passenger compartment wiring side as well as that of the **75-track connector (tracks 2 and 26, driver's seat or 51 and 3, passenger seat)**.
	If the fault persists, the wiring is faulty between the computer and the seat displaying the fault (**C0/C1**). Replace the wiring if necessary.

AFTER REPAIR	Reconnect the computer and the buckle pretensioners then switch on the ignition again. Clear the computer fault memory then switch off the ignition. Carry out the check again using the diagnostic tool and, if there is no fault, unlock the computer. Destroy any pretensioners that have been replaced (tool **Elé. 1287**).

DF242 PRESENT	LEFT-HAND DRIVE/RIGHT-HAND DRIVE CONFIGURATION

NOTES	None

This fault occurs because left-hand/right-hand drive has not been configured.
Configure the computer using command **CF291 "Driving side"**.
Read the configuration of the driving side using command **LC088 "Driving side"** under the **"Read configuration"** heading.

AFTER REPAIR	None.

GETtheMANUALS.org

NOTES	Only check conformity after a complete check using the diagnostic tool.

Order	Function	Parameter or status checked or action	Display and notes	Fault finding
1	Diagnostic tool dialogue	-	Airbag ACU 3	**ALP 1**
2	Computer conformity	Configuration reading **LC034: Vehicle type**	**LAGUNA II** **LAGUNA II ph II** **VELSATIS** **VELSATIS ph II** **ESPACE IV**	**NONE**
3	Computer configuration	Use the following commands: **SC008: Configuration of ignition modules** **SC005: System component configuration**	Ensure that the computer configuration defined in the **Current** column corresponds to the vehicle equipment.	**NONE**
		CF291: Driving side	Ensure that the computer configuration defined in configuration reading **LC088** corresponds to the vehicle type.	
4	Operation of the warning light Computer initialisation check	Ignition on	Warning light comes on for **3 seconds** when the ignition is switched on	**In the even of any problems, apply the interpretation of DF010 Fault warning light circuit.**

GETtheMANUALS.org

Tool status	Diagnostic tool title
ET072	Passenger airbag status indicator light commanded
ET073	Computer locked by tool
ET074	Fault warning light activated
ET075	Fault warning light activated as a result of impact
ET079	Faulty front inertia reel locking
ET083	Driver's seat position
ET084	All ignition modules ignited
ET085	Locking switch.
ET102	Passenger airbag locked
ET166	Passenger seatbelt contact (Vdiag 2C)
ET167	Passenger presence detected (Vdiag 2C)

Trigger line or sensor impedance is equal to **99.9 Ω** when the component is disconnected or not controlled by the computer.

ALP1	ABSENCE OF DIALOGUE WITH THE AIRBAG COMPUTER

NOTES	**Special note: See "Introduction, Procedure for Vdiag 2C, 2D" to enable forced + after ignition feed to run fault finding on a computer.**

Try to establish dialogue with a computer on another vehicle to make sure that the diagnostic tool is not faulty.
If the tool is not causing the fault and dialogue cannot be established with any other computer on the same vehicle, it may be that a faulty computer is disrupting fault finding line **K**.
Proceed by successive disconnections to locate this computer.
Check the battery voltage and perform the operations necessary to obtain the correct voltage (**10.5 V < battery voltage < 16 V**).

Check the presence and condition of the airbag computer supply fuse.
Check that the computer connector is properly connected and check the condition of its connections.
Check that the supply to the computer is correct:
- Disconnect the airbag computer and fit the **50 track adapter B53 (cable 1)**.
- Check and ensure the presence of **+ after ignition feed** between the terminals marked **earth** and **+ after ignition feed**.

Check that the supply to the diagnostic socket is correct:
- **+ before ignition feed** on **track 16**.
- **+ after ignition feed** on **track 1**.
- **Earth** on **tracks 4 and 5**.

Check the continuity and insulation of the lines of the diagnostic socket/airbag computer connection:
- Between the terminal marked **K** and **track 7** of the diagnostic socket.

If dialogue has still not been established after these various checks, contact the Techline.

AFTER REPAIR	When communication is established, deal with any faults indicated.
