Check the tightness and the condition of the battery terminals.

Using the appropriate wiring diagram:
– Check **the continuity** and **absence of interference resistance** on the following connection:

• **3FB** between components **120** and **983** or **1337**.

Check the conformity of the **earths** on connections **NT** of component **120**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF051 STORED	CRUISE CONTROL/SPEED LIMITER 1.DEF: Cruise control/speed limiter steering wheel control

NOTES	**Priority when dealing with a number of faults:** **– DF196 Pedal sensor circuit gang 1** **– DF198 Pedal sensor circuit gang 2.**
	Conditions for applying the fault finding procedure to a stored fault: If the fault is declared **present** after: – a road test with activation of the cruise control/speed limiter function, – the engine is started.
	Special notes: If the fault is **present**: – the cruise control/speed limiter function is switched off. Use bornier **Elé. 1681** for any operations on the injection computer connectors.
	Use the **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2**.

If the wiring of the particle filter downstream temperature sensor, component code **1288**, is present (with or without the sensor being present), check the electrical insulation in relation to **+ 12 V** between the following connections:

– **3XU** between components **120** and **1288**,
– **3TG** between components **120** and **1288**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

EDC16CP33_V18_DF051M / EDC16CP33_V1C_DF051M / EDC16CP33_V54_DF051M / EDC16CP33_V20_DF051M / EDC16CP33_V58_DF051M / EDC16CP33_V5C_DF051M / EDC16CP33_V24_DF051M / EDC16CP33_V04_DF051M / EDC16CP33_V08_DF051M / EDC16CP33_V44_DF051M / EDC16CP33_V4C_DF051M / EDC16CP33_V34_DF051M / EDC16CP33_V38_DF051M / EDC16CP33_V74_DF051M / EDC16CP33_V28_DF051M / EDC16CP33_V62_DF051M / EDC16CP33_V26_DF051M / EDC16CP33_V60_DF051M

GETtheMANUALS.org

DF051 CONTINUED	

Check the conformity of the steering wheel controls as follows: disconnect connector **689** under the centre cover of the steering wheel (ohmmeter connected on the steering wheel control side). The measurement should read:

- **890 Ω < X < 910 Ω** when the **Resume** button is pressed.
(or the one-touch switch **R** on the right-hand side of the steering wheel)
- **0 Ω < X < 0.8 Ω** when the **Suspend** button is pressed.
(or the one-touch switch **O** on the right-hand side of the steering wheel)
- **290 Ω < X < 310 Ω** when the **Set +** button is pressed.
(or the one-touch switch on the left of the steering wheel)
- **90 Ω < X < 110 Ω** when the **Set -** button is pressed.
(or the one-touch switch on the left of the steering wheel)
- **Infinite resistance** in rest position.

– If the values are not correct, replace the controls on the steering wheel.
– If the values are correct, take the same measurements on connections **86G** and **86M** from component **120** (**steering wheel control connector connected**).

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.
If the values are correct, clear the fault, switch off the ignition, wait for the **diagnostic tool** message (maximum wait **8 min**): **Loss of dialogue with the computer: EDC16 CP33, check the tool connection and the computer supply voltage** and switch on the ignition again.
If the fault is still present (after pressing the steering wheel controls), contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF052 PRESENT OR STORED	INJECTORS CONTROL CIRCUIT CC.0: Short circuit to earth CC.1: Short circuit to + 12 volts CC: Short circuit

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** the fault becomes **present** after: – the ignition is switched on. – the engine is started.
	Special notes: If the fault is **present**: – the level 2 warning light is lit, – the engine stops. Use bornier **Elé. 1681** for all operations on the engine management computer connectors.
	Use the **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2**.
	IMPORTANT: – cylinder no.1 is located at the timing end. – do not disconnect the injectors when the engine is running. – please observe the cleanliness guidelines and safety advice.

Check the condition and connection of the injector connectors (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component codes 193, 194, 195, 196**).
Check the condition and connection of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Séenic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF052 CONTINUED	

Check the **continuity**, **insulation** and the **absence of interference resistance** on the following connections:
- **3KW** between components **120** and **193**,
- **3CR** between components **120** and **193,**
- **3KX** between components **120** and **194**,
- **3CS** between components **120** and **194**,
- **3KY** between components **120** and **195**,
- **3CT** between components **120** and **195**,
- **3KZ** between components **120** and **196**,
- **3CU** between components **120** and **196**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

Check for the **absence of a short circuit** between **the earth** (injector body) and the following connections using a multimeter in the ohmmeter setting:
- **3KW** of component **193**
- **3CR** of component **193**
- **3KX** of component **194**
- **3CS** of component **194**
- **3KY** of component **195**
- **3CT** of component **195**
- **3KZ** of component **196**
- **3CU** of component **196**.

If the check is not correct, replace the faulty injector(s) (see **MR 402 (Vel Satis ph2), MR 395 (Laguna II ph2), MR 364 (Mégane II ph2), MR 370 (Scénic II ph2), MR 405 (Espace IV ph2) Mechanical, 13B Diesel injection, Diesel injector, Removal - Refitting** and consult the section **Replacement of components**).

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF054 PRESENT OR STORED	TURBOCHARGING SOLENOID VALVE CONTROL CIRCUIT CO: open circuit CC.1: short-circuit to + 12 V CC.0: Short circuit to earth 1.DEF: Internal electronic fault

NOTES	**Priorities when dealing with a number of faults:** **– DF046 Battery voltage.**
	Conditions for applying the fault finding procedure to a stored fault: If the fault is declared **present** after: – the ignition is switched on. – starting the engine, – a road test, – actuator command **AC004 Turbocharging solenoid valve**.
	Special notes: If the fault is **present**: – turbocharging is no longer authorised, – the EGR function is inhibited, – the **level 1** and **EOBD (European On Board Diagnostic)** warning lights are lit. Use bornier **Elé.1681** for any work on the injection computer connectors.
	Use the **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2**.

CO	***NOTES***	None.

Check the condition of the turbocharging solenoid valve connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 1475**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF054 CONTINUED 1	

Measure the **resistance** between connections **3FB** and **3MG** of component **1475**.
Replace the turbocharging solenoid valve if the resistance measured is greater than **1 k**Ω or less than **6** Ω.

Check **the continuity** of the following connection:
- **3MG** between components **120** and **1475**.

Check **the + 12 V after relay supply** of the turbocharging solenoid valve on the following connection:
- **3FB** of component **1475**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

If the fault is still present, replace the turbocharging solenoid valve.

CC.1	*NOTES*	None.

Check the condition of the turbocharging solenoid valve connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 1475**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

Measure the **resistance** between connections **3FB** and **3MG** of component **1475**.
Replace the turbocharging solenoid valve if the resistance measured is greater than **1 k**Ω or less than **6** Ω

Check **the insulation** in relation to **+12 V** of the following connection:
- **3MG** between components **120** and **1475**.

If the connection is faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If the fault is still present, replace the turbocharging solenoid valve.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF054 CONTINUED 2	

CC.0	***NOTES***	None.

Check the condition of the turbocharging solenoid valve connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 1475**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

Measure the **resistance** between connections **3FB** and **3MG** of component **1475**.
Replace the turbocharging solenoid valve if the resistance measured is greater than **1 k**Ω or less than **6** Ω

Check the **insulation** to **earth** of the following connection:
- **3MG** between components **120** and **1475**.

Check **the + 12 V after relay supply** of the turbocharging solenoid valve on the following connection:
- **3FB** of component **1475**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

If the fault is still present, replace the turbocharging solenoid valve.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF054 CONTINUED 3	

1.DEF	*NOTES*	**Special notes:** This fault appears when the computer control section overheats or when command **AC004 "Turbocharging solenoid valve"** is run.

Check the condition of the turbocharging solenoid valve connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 1475**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

Measure the **resistance** between connections **3FB** and **3MG** of component **1475**.
Replace the turbocharging solenoid valve if the resistance measured is greater than **1 k**Ω or less than **6** Ω

Check the **continuity** and **absence of interference resistance** on the following connection:
- **3MG** between components **120** and **1475**.

Check **the + 12 V after relay supply** of the turbocharging solenoid valve on the following connection:
- **3FB** of component **1475**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

If the fault is **stored,** clear the fault and run command **AC004**.
If, when command **AC004**, **DF054 Turbocharging solenoid valve control circuit 1.DEF** is **present** or **stored**, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF056 PRESENT OR STORED	AIR FLOW SENSOR CIRCUIT CO.0: Open circuit or short circuit to earth CC.1: Short circuit + 12 volts 1.DEF: Consistent after switching off the ignition

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** If the fault is declared **present** after: – the ignition is switched on. – starting the engine, – a road test, – the ignition is switched off: **1.DEF**.
	Priorities when dealing with a number of faults: **– DF013 Sensor supply voltage no. 3, 1.DEF**
	Special notes: If the fault is **present**: – the **EOBD (European On Board Diagnostic)** warning light is lit, – the **level 1** warning light is lit and turbocharging is no longer authorised for **CO.0** and **CC.1**, – the **level 1** warning light is lit for **1.DEF** (for **Vdiag 20, 24, 58** and **5C**), – the EGR function is inhibited by the engine management computer, – engine torque limited, – safe value **PR132 Air flow = 90 kg/h** at idle speed, – particle filter regeneration is inhibited. Use bornier **Elé. 1681** for all operations on the engine management computer connectors.
	Use the **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF056 CONTINUED 1	

CO.0	*NOTES*	In the event of the simultaneous presence of fault **DF002 Air temperature sensor circuit**, check that the air flow sensor connector is connected correctly.

Check the condition of the air flowmeter connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 799**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

Check the **continuity** and **insulation** to **earth** of the following connections:
- **3DV** between components **120** and **799**,
- **3KJ** between components **120** and **799**,
- **3DW** between components **120** and **799**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Check the **+ 5 V feed** to the air flowmeter.
- **3KJ** of component **799**.

Check the **+12 V after relay feed** to the air flowmeter.
- **3FB** of component **799**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.
Run **Test 5 Air flowmeter**.
With the flowmeter **connected**, the vehicle **ignition on** and **engine stopped**:
Measure the **voltage** between connections **3DW** and **3DV** of component **799**.
Replace the air flowmeter if the voltage is not between **0.3 V < X < 0.7 V**.

If the fault is still present, replace the air flowmeter.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF056 CONTINUED 2	

CC.1	*NOTES*	None.

Check the condition of the air flowmeter connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 799**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

Check the **insulation** in relation to **+ 12 V** of the following connections:
- **3DV** between components **120** and **799**,
- **3KJ** between components **120** and **799**,
- **3DW** between components **120** and **799**.

Check the **+ 5 V supply** of the air flowmeter on the following connection:
- **3KJ** of component **799**.

Check the **+ 12 V after relay supply** of the air flowmeter on the following connection:
- **3FB** of component **799**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

With the flowmeter **connected**, the vehicle **ignition on** and **engine stopped**:
Measure the **voltage** between connections **3DW** and **3DV** of component **799**.
Replace the air flowmeter if the voltage is not between **0.3 V < X < 0.7 V**.

If the fault is still present, replace the air flowmeter.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF056 CONTINUED 3	

1.DEF	*NOTES*	None.

Check the condition of the air flowmeter connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 799**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

Check **for continuity** and **absence of interference resistance** of the following connections:
- **3DV** between components **120** and **799**,
- **3KJ** between components **120** and **799**,
- **3DW** between components **120** and **799**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

Check the condition of the flowmeter: no visible damage to the sensing element of the flowmeter.

Use the **Monitool application: MT001 Turbocharging function** to check the entire air line (for **Vdiag 04** and **44**).

If the fault is still present, replace the air flowmeter.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

DF065 PRESENT OR STORED	COMBUSTION MISFIRES 1.DEF: Combustion misfires detected on several cylinders.

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault reappears after: – engine speed **PR055 Engine speed** between idle speed and **1050 rpm**, – a coolant temperature **PR064 Coolant temperature** ≥ **20°C**.
	Priorities when dealing with a number of faults: **– DF052 Injector control circuit** **– DF026 Cylinder 1 injector control circuit** **– DF027 Cylinder 2 injector control circuit** **– DF028 Cylinder 3 injector control circuit** **– DF029 Cylinder 4 injector control circuit**
	IMPORTANT: When removing and refitting an injector, respect the cleanliness guidelines and safety advice (see **MR364 (Mégane II ph2), MR370 (Scénic II ph2), MR 395 (Laguna II ph2), 402 (Vel Satis ph2), 405 (Espace IV ph2), Mechanical, 13B Diesel injection, Diesel injectors: Removal - Refitting**).

Perform **TEST 2 Resolving misfires**.
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF066 PRESENT OR STORED	INJECTOR(S) CODE(S) 1.DEF: No code stored 2.DEF: Configuration/Initialisation

NOTES	**Special notes:** If the fault is **present**: – the injection flow will be limited, – engine torque limited, resulting in a maximum engine speed of **1500 rpm**, – the **level 1** warning light is illuminated.

1.DEF	***NOTES***	**Special notes:** This fault appears when an incorrect injector code is entered from command **SC002 Enter injector codes**. The **IMA*** codes must be read from left to right.

Check the injector codes and reprogram the correct codes using command **SC002 Enter injector codes**, see **Interpretation of commands**.
(Consult the procedures defined in the **Interpretation of commands** section).

– After the codes have been written:
– Switch off the ignition.
– Wait for the **diagnostic tool** message (maximum wait **8 minutes**): **Loss of dialogue with the computer: EDC16 CP33, check the tool connection and the computer supply** before switching the ignition back on.
– Establish dialogue and clear the fault memory.
– End of the procedure.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF066 CONTINUED 1	

WARNING:
If fault **DF066** is still **present** after the injector codes have been entered, check that power latch occurs each time the ignition is switched off:
– Switch off the ignition.
– Wait for the **diagnostic tool** message (maximum wait **8 min**): **Loss of dialogue with the computer: EDC16 CP33, check the tool connection and the computer supply voltage** and switch on the ignition again.
– Establish dialogue.

If the fault has become ***stored***, clear the fault memory and end the operation.

If the fault is still present, contact the Techline.

IMA*: Individual injector correction

2.DEF	*NOTES*	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present after: – the injection computer has been replaced, – reprogramming.

This fault is **present** on all blank computers (new or after reprogramming).

– Program the injector codes using:
– either command **SC001 Write saved data**,
– or command **SC002 Enter injector codes** or **Interpretation of commands**.
The **IMA*** codes must be read from left to right.

(Consult the procedures defined in the **Interpretation of commands** section).

IMA*: Individual injector correction

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF066 CONTINUED 2	

– After the codes have been written:
– Switch off the ignition.
– Wait for the **diagnostic tool** message (maximum wait **8 min**): **Loss of dialogue with the computer: EDC16 CP33, check the tool connection and the computer supply voltage** and switch on the ignition again.
– Establish dialogue and clear the fault memory.

End of the procedure.

WARNING:
If fault **DF066** is still **present** after the injector codes have been entered, check that power latch occurs each time the ignition is switched off:
– Switch off the ignition.
– Wait for the **diagnostic tool** message (maximum wait **8 min**): **Loss of dialogue with the computer: EDC16 CP33, check the tool connection and the computer supply voltage** and switch on the ignition again.
– Establish dialogue.

If the fault is still present, contact the Techline.

IMA*: Individual injector correction

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF069 PRESENT OR STORED	IMPACT DETECTED SIGNAL

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present under **+ after ignition feed**.
	Special notes: As soon as the injection computer receives this signal: – engine operation is prohibited, the **level 2** warning light is lit.

The fault appears when the injection computer receives a frontal impact signal from the Airbag computer via the multiplex network.

Do not deal with this fault.

If the vehicle has been involved in an accident:
Carry out any necessary repairs,
– clear the fault,
– switch off the ignition,
– wait for **1 minute**,
– switch on the ignition.
If the fault does not reappear, end of fault finding procedure.
If the fault recurs, run fault finding on the **AIRBAG** computer.

If the vehicle has not been involved in an accident:
Run fault finding on the **AIRBAG computer (see 88C, Airbag and pretensioner)**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF086 PRESENT OR STORED	COOLANT PUMP RELAY CONTROL CIRCUIT CO: Open circuit CC.0: Short circuit to earth CC.1: Short-circuit on +12 volts. 1.DEF: Internal electronic fault

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** If the fault becomes **present** after: – the ignition is switched on. – starting the engine, – a road test.
	Special notes: The control relay is located in the engine compartment connection unit. Use bornier **Elé. 1681** for all operations on the engine management computer connectors.
	Use the **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2**.

CO	***NOTES***	None.

Check the condition of the coolant pump relay mounting connector on the engine fuse box (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 597**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

Check the conformity of the coolant pump relay (relay removed):
- **Insulation** between connections **3FB** and **3VH** of component **573.**
- Measure the **resistance** between connections **3AAZ** and **3FB** of component **573.**

Replace the relay if the resistance of the coolant pump relay is greater than **1 k**Ω or less than **6** Ω.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

EDC16CP33_V18_DF086 / EDC16CP33_V1C_DF086 / EDC16CP33_V20_DF086 / EDC16CP33_V24_DF086 / EDC16CP33_V26_DF086 / EDC16CP33_V28_DF086 / EDC16CP33_V54_DF086 / EDC16CP33_V58_DF086 / EDC16CP33_V5C_DF086 / EDC16CP33_V60_DF086 / EDC16CP33_V62_DF086

GETtheMANUALS.org

DF086 CONTINUED 1	

Check the **continuity** of the following connections:
- **3AAZ** between components **120** and **573,**
- **3VH** between components **573** and **369**,
- **M** between components **369** and the vehicle **earth**.

Check the **+ 12 V after relay supply** to the coolant pump relay:
- **3FB** of component **573**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

CC.1	*NOTES*	None.

Check the condition of the coolant pump relay mounting connector on the engine fuse box (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 597**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

Check the conformity of the coolant pump relay (relay removed):
- **Insulation** between connections **3FB** and **3VH** of component **573.**
- Measure the **resistance** between connections **3AAZ** and **3FB** of component **573.**

Replace the relay if the resistance of the coolant pump relay is greater than **1 k**Ω or less than **6** Ω.

Check the **insulation** from **+ 12 V** of the following connections:
- **3AAZ** between components **120** and **573,**
- **3VH** between components **573** and **369.**

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF086 CONTINUED 2	

CC.0	*NOTES*	None.

Check the condition of the coolant pump relay mounting connector on the engine fuse box (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 597**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

Check the conformity of the coolant pump relay (relay removed):
- **Insulation** between connections **3FB** and **3VH** of component **573.**
- Measure the **resistance** between connections **3AAZ** and **3FB** of component **573.**

Replace the relay if the resistance of the coolant pump relay is greater than **1 k**Ω or less than **6** Ω.

Check the **insulation** to **earth** of the following connections:
- **3AAZ** between components **120** and **573,**
- **3VH** between components **573** and **369.**

Check the **+ 12 V after relay supply** to the coolant pump relay on the following connection:
- **3FB** of component **573**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF086 CONTINUED 3	

1.DEF	***NOTES***	**Special note:** This fault appears when the computer control section has overheated.

Check the condition of the coolant pump relay mounting connector on the engine fuse box (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 597**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

Check the conformity of the coolant pump relay (relay removed):
- **Insulation** between connections **3FB** and **3VH** of component **573.**
- Measure the **resistance** between connections **3AAZ** and **3FB** of component **573.**

Replace the relay if the resistance of the coolant pump relay is greater than **200** Ω or less than **20** Ω.

Check **the absence of interference resistance** of the following connection:
- **3AAZ** between components **120** and **573.**

Check the **+ 12 V after relay supply** to the coolant pump relay on the following connection:
- **3FB** of component **573**.

Check the **+ 12 V battery supply** to the coolant pump relay on the following connection:
- **3FB** of component **573**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF091 STORED	VEHICLE SPEED SIGNAL 1.DEF: Vehicle speed too high.

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** If the fault is declared **present** after a road test.
	Special notes: – the vehicle speed signal sent by the ABS computer to the injection computer is greater than the threshold defined in the calibration, – use bornier **Elé.1681** for any operations on the injection computer connectors.
	Use the **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2**.

Check the condition of the ABS computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 1094**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

Run complete fault finding on the ABS computer (see **38C, Anti-lock braking system**).

Run complete fault finding on the multiplex network (see **88B, Multiplexing**).

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF098 PRESENT OR STORED	FUEL TEMPERATURE SENSOR CIRCUIT CC.0: Short circuit to earth CO.1: Open circuit or short circuit to +12 V

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** If the fault is declared **present** when the ignition is switched on.
	Special notes: If the fault is **present,** – fuel temperature safe value **PR063 Fuel temperature = 100°C**, – use bornier **Elé. 1681** for all operations on the engine management computer connectors.
	Use the **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2**.

CC.0	***NOTES***	None.

Check the condition of the fuel temperature sensor connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 1066**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

Measure the **resistance** between connections **3FAB** and **3LD** of component **1066**.
Replace the fuel temperature sensor if its resistance is less than **85** Ω or greater than **50 k**Ω**.**

Check the **insulation** to **earth** of the following connection:
- **3FAB** between components **120** and **1066**.

If the connection is faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF098 CONTINUED	

CO.1	*NOTES*	None.

If the wiring of the particle filter downstream temperature sensor, component code **1288**, is present (with or without the sensor being present), check the electrical insulation in relation to **+ 12 V** between the following connections:

– **3XU** between components **120** and **1288**,
– **3TG** between components **120** and **1288**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Check the condition of the fuel temperature sensor connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 1066**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

Measure the **resistance** between connections **3FAB** and **3LD** of component **1066**.
Replace the fuel temperature sensor if its resistance is less than **85** Ω or greater than **50 k**Ω.

Check **the continuity** of the following connections:
- **3FAB** between components **120** and **1066**,
- **3LD** between components **120** and **1066.**

Check **the insulation** in relation to **+12 V** of the following connection:
- **3FAB** between components **120** and **1066**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF107 PRESENT OR STORED	COMPUTER MEMORY 1.DEF: Internal electronic fault

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** If the fault is declared **present** after: – a road test followed by a power latch phase.
	Special notes: The **level 1** and **EOBD (European On Board Diagnostic)** warning lights are lit.

If the fault is **stored**, clear the fault from the computer memory.

In the main screen of the **CLIP diagnostic tool**, note the injector codes.
Clear the computer memory using command **RZ034 Computer memory.**

Switch off the ignition, wait for the **diagnostic tool** message (maximum wait **8 min**): **Loss of dialogue with the computer: EDC16 CP33, check the tool connection and the computer supply voltage** then switch on the ignition again.
Switch on the ignition and re-establish dialogue.

If the fault is still present, contact the Techline.

If the fault is no longer present, carry out the programming (see Programming).
Switch off the ignition, wait for the **diagnostic tool** message (maximum wait **8 min**): **Loss of dialogue with the computer: EDC16 CP33, check the tool connection and the computer supply voltage** then switch on the ignition again.

For vehicles equipped with a particle filter:
– Check the exhaust pipe for leaks or blockage. Repair if necessary.
– Carry out a particle filter regeneration using command **SC017 Particle filter regeneration** (see **Interpretation of commands**) and perform an oil change if the vehicle is not new.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF119 PRESENT OR STORED	CAMSHAFT SENSOR SIGNAL 1.DEF: No camshaft signal or timing fault (tension or setting) 2.DEF: Supply fault, signal interference, camshaft sensor internal fault

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** If the fault is declared **present** after: – starting the engine, – a road test.
	Special notes: – the **level 1** warning light is lit. Use bornier **Elé.1681** for any operations on the injection computer connectors.
	Use the **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2**.

1.DEF	***NOTES***	None.

Check the condition of the camshaft sensor connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 746**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

If the fault is **stored**:
Visually check the condition of the surrounding area.
If, on detection of the fault, the engine speed is considerably lower than the idling speed (less than **150 rpm**) and no customer complaint is declared (warning light indicated by the customer does not come on and vehicle can be started), the fault was detected because the engine had stalled.
Clear the fault and carry out a road test.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF119 CONTINUED 1	

Note:
Measure the **resistance** between the connections indicated without producing a short circuit between the connections.

1. Disconnect the sensor before measuring the resistance with an Ohmmeter or multimeter.
2. Resistance between connections **3CQ** and **3FB** of component **746** (signal and supply) must be between **7.2 kΩ** and **13.4 kΩ** (**10.2 kΩ** nominal).
3. The resistance between connections **3PL** and **3FB** of component **746** (earth and supply) must be greater than **100 kΩ**.
4. The resistance between connections **3PL** and **3CQ** of component **746** (earth and signal) must be greater than **100 kΩ**.

If the values are incorrect, replace the camshaft sensor.

Check the **continuity** of the following connections:
- **3PL** between components **120** and **746**,
- **3CQ** between components **120** and **746.**

Check the **+ 12 V after relay feed** to the camshaft sensor on the following connection:
- **3FB** of component **746**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

If the fault is still present, replace the camshaft sensor.

2.DEF	*NOTES*	**Priorities when dealing with a number of faults:** **– DF120 Engine speed sensor signal**

Check the condition of the camshaft sensor connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 746**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF119 CONTINUED 2	

Check the **continuity** of the following connections:
- **3PL** between components **120** and **746**,
- **3CQ** between components **120** and **746.**

Check the **+ 12 V after relay feed** to the camshaft sensor on the following connection:
- **3FB** of component **746**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

– Check the conformity of the camshaft sprocket/camshaft assembly.
– Check the timing adjustment.
Carry out the necessary repairs.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF120 PRESENT OR STORED	ENGINE SPEED SENSOR SIGNAL 1.DEF: Engine speed signal interference, broken tooth on flywheel or engine speed sensor internal fault 2.DEF: No engine speed signal, or interference affecting engine speed signal

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** If the fault is declared **present** after: – starting the engine, – a road test, – attempting to start the engine.
	Special notes: The engine speed sensor is consistent with the camshaft sensor. If the fault is **present**: – particle filter regeneration is inhibited, – the **level 2** warning light is lit. Use bornier **Elé.1681** for any operations on the injection computer connectors.
	Use the **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2**.

Check the condition of the engine speed sensor connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 149**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

Check that the sensor is securely attached.
Measure **the resistance** between connections **3BG** and **3BL** of component **149**.

If the **winding resistance** is not between **600** Ω and **1000** Ω, replace the engine speed sensor.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF120 CONTINUED	

Check the **continuity, insulation** from **+ 12 V** and **absence of interference resistance** of the following connections:

- **3BG** between components **120** and **149**,
- **3BL** between components **120** and **149**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

If the fault is still present, replace the engine speed sensor.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF151 STORED	MAIN RELAY CIRCUIT 1.DEF: Relay cut off too soon 2.DEF: Relay cut off too late

NOTES	**Special notes:** The **level 1** warning light is on.
	Use the **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2**.
	IMPORTANT: For **Mégane II ph2 and Scénic II ph2**, the injection supply relay is located on the UPC. For **Laguna II ph2 and Espace IV ph2**, the injection supply relay is located on the engine fuse and relay box.

1.DEF	***NOTES***	None.

Check the condition of the injection supply relay mounting connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 983**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

Check the tightness and the condition of the "**+** " and "**-**" battery terminals.

Check the conformity of the main relay (relay removed) **(Laguna II ph2 and Espace IV ph2)**:
- **Insulation** between connections **3FB** and **BP37** or **3MV** of component **983**.
- Measure the **resistance** between connections **3AA** and **BP37** of component **983**.

(see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, Component code 983**).
Replace the relay if its resistance is less than **6** Ω or greater than **1 k**Ω.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

EDC16CP33_V18_DF151M / EDC16CP33_V1C_DF151M / EDC16CP33_V54_DF151M / EDC16CP33_V20_DF151M / EDC16CP33_V58_DF151M / EDC16CP33_V5C_DF151M / EDC16CP33_V24_DF151M / EDC16CP33_V04_DF151M / EDC16CP33_V08_DF151M / EDC16CP33_V44_DF151M / EDC16CP33_V4C_DF151M / EDC16CP33_V34_DF151M / EDC16CP33_V38_DF151M / EDC16CP33_V74_DF151M / EDC16CP33_V28_DF151M / EDC16CP33_V62_DF151M/ EDC16CP33_V26_DF151M / EDC16CP33_V60_DF151M

GETtheMANUALS.org

DF151 CONTINUED 1	

Check the **+ 12 V battery supply** to the injection supply relay on the following connection:
- **BP37** or **3MV** of component **983 (Laguna II ph2** and **Espace IV ph2)**,
- **BP31** of component **1337 (Mégane II ph2** and **Scénic II ph2**).

Check the **+ 12 V after relay feed** to the injection supply relay on the following connection:
- **3FB** of component **983** or **1337**.

Check the **continuity** and **insulation** from **+ 12 V** of the following connection:
- **3AA** between components **120** and **983** or **1337**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

Check the **+ 12 V after relay supply** to the engine management computer on the following connection:
- **3FB** of component **120**.

Check the conformity of the **earths** on connections **NT** of component **120**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

If the fault is still present, replace the injection supply relay.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF151 CONTINUED 2	

2.DEF	***NOTES***	None.

Check the condition of the injection supply relay mounting connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 983** or **1337**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

Check the conformity of the main relay (relay removed) **(Laguna II ph2** and **Espace IV ph2)**:
- **Insulation** between connections **3FB** and **BP37** of component **983**.
- Measure the **resistance** between connections **3AA** and **BP37** (or **3MV**)of component **983**.

(see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 983**).
Replace the relay if its resistance is less than **6** Ω or greater than **1 k**Ω**.**

Check the **insulation** to **earth** of the following connection:
- **3AA** between components **120** and **983** or **1337**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

If the fault is still present, replace the injection supply relay.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF165 PRESENT OR STORED	ACCELERATOR PEDAL POSITION SENSOR CIRCUIT 1.DEF: Detection of the accelerator pedal depressed at the same time as the brake pedal. 2.DEF: No signal 3.DEF: Jammed accelerator pedal detected

NOTES	**Priorities when dealing with a number of faults:** **– DF012 Sensor supply voltage no. 2.**
	Conditions for applying the fault finding procedure to a stored fault: The fault is declared **present** when the brake pedal and accelerator pedal are depressed simultaneously.
	Special notes: – Turbocharging and cruise control are not authorised. – The engine speed is fixed at **1700 rpm**. – The **level 1** warning light is lit for **2.DEF** and **3.DEF.** Use bornier **Elé.1681** for any operations on the computer connectors.
	Use the **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2**.

Check that the accelerator pedal is not jammed
Check the condition of the pedal sensor connector (**component code 921**). Check the condition of the engine management computer connector (**component code 120**). If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.
Measure the **resistance** between connections **3LT** and **3LR** of component **921**. If the accelerator pedal sensor resistance is not between: **0.7 kΩ < X < 1.7 kΩ** or **0.91 kΩ < X < 2.49 kΩ (M9R721),** replace the sensor.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF165 CONTINUED	

Measure the **resistance** between connections **3LU** and **3LV** of component **921**.
If the accelerator pedal sensor resistance is not between: **1 kΩ < X < 2.4 kΩ** or **385.97 kΩ < X < 388.03 kΩ (M9R721)**, replace the sensor.

Check the **continuity** and **absence of interference resistance** of the following connections:
- **3LR** between components **120** and **921**.
- **3LS** between components **120** and **921**.
- **3LT** between components **120** and **921**.
- **3LU** between components **120** and **921**.
- **3LW** between components **120** and **921**.
- **3LV** between components **120** and **921**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF195 PRESENT OR STORED	ENGINE SPEED/CAMSHAFT SENSOR CONSISTENCY 1.DEF: No engine speed signal, or engine speed signal interference

NOTES	**Priorities when dealing with a number of faults:** **– DF119 Camshaft sensor signal** **– DF120 Engine speed sensor signal.**
	Conditions for applying the fault finding procedure to a stored fault: The fault is declared **present** after the starter has been running for **10 seconds** or a **1 minute** delay with the engine running.
	Special notes: Use bornier **Elé. 1681** for any operations on the computer connector.
	Use the **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2**.

Check the sensor mounting and the conformity of the camshaft target.
Check the condition of the engine speed sensor connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 149**). Check the condition of the camshaft sensor connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 746**). Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**). If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.
– Check the conformity of the camshaft sprocket/camshaft assembly. – Check the timing adjustment. Carry out the necessary repairs.
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

EDC16CP33_V18_DF195 / EDC16CP33_V1C_DF195 / EDC16CP33_V54_DF195 / EDC16CP33_V20_DF195 / EDC16CP33_V58_DF195 / EDC16CP33_V5C_DF195 / EDC16CP33_V24_DF195 / EDC16CP33_V04_DF195 / EDC16CP33_V08_DF195 / EDC16CP33_V44_DF195 / EDC16CP33_V4C_DF195 / EDC16CP33_V34_DF195 / EDC16CP33_V38_DF195 / EDC16CP33_V74_DF195 / EDC16CP33_V28_DF195 / EDC16CP33_V62_DF195/ EDC16CP33_V26_DF195 / EDC16CP33_V60_DF195

- **3LT** between components **120** and **921**,
- **3LU** between components **120** and **921**,
- **3LW** between components **120** and **921**,
- **3LV** between components **120** and **921**.

Check the **insulation** between the following connections:
- **3LW** between components **120** and **921**,
- **3LS** between components **120** and **921**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

If the fault is still present, vary the pedal position and refer to the interpretation of **PR030 Accelerator pedal position** to check the operating values of the accelerator pedal sensor.
If the values displayed are inconsistent, replace the accelerator pedal sensor.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF200 PRESENT OR STORED	ATMOSPHERIC PRESSURE SENSOR 1.DEF: Above maximum threshold 2.DEF: Below minimum threshold

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared **present** after: – the ignition is switched on. – the engine is started, – a road test.
	Special notes: The **EOBD (European On Board Diagnostic)** warning light is lit. The atmospheric pressure sensor is integrated in the injection computer, and cannot be separated.
	If the fault is **present**: – there is light smoke, – the atmospheric pressure value changes to safe mode, **PR035 Atmospheric pressure = 0.75 bar**. Use bornier **Elé. 1681** for any work on the computer connectors.
	Use the **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2**.

Disconnect the injection computer and check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

Check the value of **PR035 Atmospheric pressure** by comparing it with the reading on a conforming vehicle in the workshop.

If the value of **PR035** is not correct (difference greater than **0.1 bar** between the 2 vehicles), contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

From the "List of statuses" menu, check **ET704 Brake contact no. 1** and **ET705 Brake contact no. 2** and check:
– brake pedal in rest position **ET704** = **INACTIVE** and **ET705** = **INACTIVE**
– brake pedal depressed **ET704** = **ACTIVE** and **ET705 = ACTIVE**

Is **ET705** correctly recognised?
NO → B
YES

Is **ET704** correctly recognised?
YES → Clear the fault
End of fault finding procedure
NO → A

C

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF228 CONTINUED 2	

A

NO

Check the condition of the brake pedal switch connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 160**).
Check the condition of the ABS computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 1094 or 118**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

Check the **+ 12 V after relay supply** to the brake pedal switch on the following connections:
- **SP13** of component **160**,
- **AP10** of component **160**.

Disconnect the ABS/ESP (electronic stability program) computer and check the **continuity** and **insulation** from **+ 12 V** and from **earth** of the following connections:
- **65A** between components **1094** (or **118**) and **160**,
- **65G** between components **1094** and **160**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

Remove the brake pedal switch and check that it is working correctly:
– in the rest position: infinite resistance between connections **SP13** and **5A** of component **160.**
– depressed: continuity between connections **SP13** and **5A** of component **160**.

Replace the switch if necessary.

If the fault is still present, run **fault finding on the ABS/ESP** (see **38C, Anti-lock braking system),** then if no faults are detected, run **fault finding on the multiplex network** (see **88B, Multiplexing**).

C

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF228 CONTINUED 3	

B

NO

Check the condition of the brake pedal switch connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 160**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

Remove and check the condition and adjustment of the brake pedal switch.
Repair if necessary.

Check the **+ 12 V after relay supply** to the brake pedal switch on the following connections:
- **SP13** of component **160**,
- **AP10** of component **160**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

Disconnect the ABS/ESP (electronic stability program) computer and check the **continuity and insulation** from **+ 12 V** and from **earth** of the following connection:
- **5A** between components **120** and **160**.

If the connection is faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Check that the brake pedal switch is working correctly:
– in the rest position: infinite resistance between connections **SP13** and **5A** of component **160**,
– depressed: continuity between connections **SP13** and **5A** of component **160**.

Replace the switch if necessary.

If the fault is still present, repeat the procedure from the start.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF228 CONTINUED 4	

2.DEF	*NOTES*	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present after the brake pedal is depressed.
		Special notes: If the fault is **present**: – the cruise control/speed limiter function is switched off. Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

Check the condition of the ABS computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 1094**). Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**). If the connector or connectors are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.
Run complete fault finding on the ABS (see **38C Anti-lock braking system**).
Run complete fault finding on the multiplex network (see **88B, Multiplexing**).
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

DF272 CONTINUED 1	

Check **the continuity** of the following connections:
- **3VP** between components **120** and **1460** or **169**,
- **3VQ** between components **120** and **1460** or **169**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

If the fault is still present, contact the Techline.

CC.0 ***CC.1***	***NOTES***	None.

Check the condition of the EGR valve (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 1460 or 169**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

Measure the **resistance** between connections **3VP** and **3VQ** of component **1460** or **169**.
If the resistance of the EGR valve is less than **1** Ω or greater than **400** Ω, replace the EGR valve.

After replacement, run command **SC036 Reinitialise programming** and select **EGR valve** to reinitialise the EGR valve offsets.

Check the **insulation** from **+ 12 V** of the following connections:
- **3VP** between components **120** and **1460** or **169**,
- **3VQ** between components **120** and **1460** or **169**.

Check the **insulation** to **earth** of the following connections:
- **3VP** between components **120** and **1460** or **169**,
- **3VQ** between components **120** and **1460** or **169**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF272 CONTINUED 2	

CC	*NOTES*	None.

Check the condition of the EGR valve (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 1460 or 169**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

Measure the **resistance** between connections **3VP** and **3VQ** of component **1460** or **169**.
If the resistance of the EGR valve is less than **1** Ω or greater than **400** Ω, replace the EGR valve.

After replacement, run command **SC036 Reinitialise programming** and select **EGR valve** to reinitialise the EGR valve offsets.

Check the **insulation** between the following connections:
- **3VP** between components **120** and **1460** or **169**,
- **3VQ** between components **120** and **1460** or **169**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

If the fault is still present, contact the Techline.

1.DEF	*NOTES*	**Special notes:** This fault appears when the computer control section has overheated.
		Priorities when dealing with a number of faults: Deal with **CO**, **CC.O**, **CC.1** and **CC** first if they are **present** or **stored**.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF293 PRESENT OR STORED	WATER IN DIESEL FUEL SENSOR 1.DEF: Open circuit on the line or water present in the diesel fuel

NOTES	**IMPORTANT:** Please observe the cleanliness guidelines and safety advice.
	Use the **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2**.

Check that there is no water in the fuel filter.
Bleed the fuel filter and the low pressure diesel circuit if necessary.
Start the engine and wait at least **1 minute** to confirm the repair.
If the fault was **stored** but not **present**, carry out a road test (see **Note**).

If the fault is still present:
Check the **continuity** and **absence of interference resistance** on the following connection:
- **3WT** between the components **120** and **414**.

Check the **+ 12 V after relay supply** to the water detection sensor on the following connection:
- **3FB** of component **414**.

Check that the **earth** is in order on connection **NT** or **M** of component **414**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

Start the engine and wait **at least 1 minute** to confirm the repair.

If the fault is still present, check the conformity of the fuel used:
– Check that the fuel tank has been filled correctly.
– Run **Test 12 Fuel conformity check**.
– If the diesel fuel is not correct:
  – Replace the diesel fuel.
  – Change the diesel filter.
  – Bleed the low pressure diesel circuit.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

EDC16CP33_V18_DF293 / EDC16CP33_V1C_DF293 / EDC16CP33_V54_DF293 / EDC16CP33_V20_DF293 / EDC16CP33_V58_DF293 / EDC16CP33_V5C_DF293 / EDC16CP33_V24_DF293 / EDC16CP33_V04_DF293 / EDC16CP33_V08_DF293 / EDC16CP33_V44_DF293 / EDC16CP33_V4C_DF293 / EDC16CP33_V34_DF293 / EDC16CP33_V38_DF293 / EDC16CP33_V74_DF293 / EDC16CP33_V28_DF293 / EDC16CP33_V62_DF293 / EDC16CP33_V26_DF293 / EDC16CP33_V60_DF293

GETtheMANUALS.org

DF293 CONTINUED	

If none of these checks reveal any faults:
– Replace the water detection sensor.
– Clear the fault.
Start the engine and wait **at least 1 minute** to confirm the repair.

Note:
When the water level in the fuel filter unit is below the sensor's electrodes, some driving conditions (cornering, gradients) may result in water being detected (in fact, the sensor's off-centre position in the fuel filter unit, combined with the driving conditions, causes water to be detected).

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF297 PRESENT OR STORED	PRESSURE SENSOR 1. DEF: Absent

NOTES	**Conditions for applying fault finding procedures to stored faults:** The fault is declared **present** after the engine is started or following a road test.
	Special notes: If the fault is **present:** – particle filter regeneration is inhibited, – blue/white smoke and black particles coming from the exhaust, – the **EOBD (European On Board Diagnostic)** warning light will come on after three consecutive driving cycles (starting **+ 5 seconds** + switch off the ignition and wait **40 seconds**). – The **level 1** warning light is lit (for **Vdiag 20, 24, 58**, **5C, 26, 28, 60 and 62**).
	Priorities when dealing with a number of faults: **– DF315 Particle filter diff. pressure sensor if present or stored.** **– DF717 Particle filter upstream pressure if it is present or stored.**
	NOTE: In the long term, this fault may lead to premature wear and a greater risk of turbocharger failure.

Check the condition of the differential pressure sensor connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 1290**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF297 CONTINUED	

Check the particle filter is present.
If it is present:
Visually check that the particle filter is in good condition by positioning the vehicle on a lift:
– not damaged (no abnormal welds, if necessary compare it with another vehicle fitted with particle filter),
– if there are After-Sales sleeves, as a result of a previous operation, check that the particle filter's contents were not emptied out when it was removed.

If the particle filter is not working correctly or is absent:
– replace it,
– run command **SC036 Reinitialise programming** and select **After particle filter replacement** (see **Interpretation of commands**),
– switch off the ignition and wait for the **diagnostic tool** message (maximum time **8 minutes**): **Loss of dialogue with the computer: EDC16 CP33, check the tool connection and the computer supply voltage**,
– then switch on the ignition again,
– clear the faults from the computer memory (this operation must be carried out within **3 minutes** of the ignition being switched on).
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF304 PRESENT OR STORED	EGR BY-PASS CIRCUIT CO: Open circuit CC.0: Short circuit to earth CC.1: Short circuit to + 12 V 1.DEF: Internal electronic fault

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault reappears when the ignition is switched on.
	Special notes: Use bornier **Elé. 1681** for all operations on the engine management computer connectors.
	Use the **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2**.

CO	***NOTES***	None.

Check the condition of the EGR bypass solenoid valve connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 1301**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

Measure the **resistance** between connections **3FB** and **3TP** of component **1301.**
If the resistance is greater than **1 k**Ω or less than **6** Ω, replace the EGR bypass solenoid valve.

Check **the continuity** of the following connection:
- **3TP** between components **120** and **1301**.

Check the **+ 12 V after relay supply** to the EGR bypass solenoid valve on the following connection:
- **3FB** of component **1301**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

If the fault is still present, replace the EGR by-pass solenoid valve.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

1.DEF	*NOTES*	**Special notes:** This fault appears when the computer control section has overheated. A road test may be necessary to reveal this fault.

Check the condition of the EGR bypass solenoid valve connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 1301**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

Measure the **resistance** between connections **3FB** and **3TP** of component **1301.**
If the resistance is greater than **1 kΩ** or less than **6 Ω**, replace the EGR bypass solenoid valve.

Check the **continuity** and **the absence of interference resistance** on the following connection:
- **3TP** between components **120** and **1301**.

Check the **+ 12 V after relay supply** to the EGR bypass solenoid valve on the following connection:
- **3FB** of component **1301**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF308 PRESENT OR STORED	CLOGGED PARTICLE FILTER 1.DEF: Maximum limit

NOTES	**Conditions for applying fault finding procedures to stored faults:** The fault is declared **present** after the engine is started or following a road test.
	Special notes: If the fault is **present**: – particle filter regeneration is inhibited, – the EGR function is inhibited, – the vehicle performance is reduced, – the **level 1** warning light is lit and a warning message (or warning light) is displayed on the instrument panel, – the **EOBD (European On Board Diagnostic)** warning light is lit (except **Vdiag 18**, **1C, 24** and **54**).
	Priorities when dealing with a number of faults: Deal with the following faults first: **– DF315 Particle filter differential pressure sensor if it is present.** **– DF308 if DF315 is stored.** **– DF717 Particle filter upstream pressure if it is present or stored.** **– DF645 Damper valve position regulation if it is present or stored.** **– DF272 EGR valve control circuit if it is present or stored.** **– DF647 EGR valve position regulation if it is present or stored.** **– DF309 Particle filter downstream temperature sensor if it is present or stored.** **– DF899 Regeneration temperature threshold exceeded if it is present or stored.** **– DF310 Particle filter upstream temperature sensor if it is present or stored.** **– DF652 Turbine upstream temperature sensor circuit if it is present or stored.**

diff.*: Differential
temp.*: Temperature

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF308 CONTINUED	

1.DEF	*NOTES*	None.

The fault appears if the **weight** of soot contained in the particle filter is:
– Vdiag 18 and 54: above 56 g.
– Vdiag 1C, 20, 24, 5C, 58: above 58 g
– Vdiag 26 and 28: greater than 68 g.

If **Vdiag 18**, reprogram the computer (see **Replacement of components**). Then apply the procedure corresponding to the new Vdiag.

For the other **Vdiag**:
Check that there are no leaks or blockages in the exhaust pipe,
Repair if necessary.

Clear fault **DF308 Present** or **Stored**.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF309 PRESENT OR STORED	PARTICLE FILT. DOWNSTREAM TEMP. SENSOR CC.0: Short circuit to earth CO.1: Open circuit or short circuit to +12 V

NOTES	**Conditions for applying fault finding procedures to stored faults:** The fault becomes **present** if: – ignition is on **(CC.0)**, – following a road test, engine warm **(CO.1)**.
	IMPORTANT: **The particle filter downstream temperature sensor only measures temperatures greater than 50°C.**
	Special notes: – If the fault is **present**: – After-Sales particle filter regeneration is inhibited, – particle filter fault finding is inhibited (for **Vdiags 18, 1C** and **54**).

CC.0	***NOTES***	None.

Check the condition of the particle filter downstream temperature sensor connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 1288**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

Check the **insulation** from **earth** of the following connections:
- **3TG** between components **120** and **1288**,
- **3XU** between components **120** and **1288**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

If the fault is still present, replace the particle filter downstream temperature sensor.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF312 CONTINUED 1	

The fault appears:

– **Vdiag 18** and **1C:**
4 failed regeneration attempts (for **Laguna II ph2**) and 5 failed regeneration attempts (for **Vel Satis ph2** and **Espace IV ph2**) when driving and the weight of soot in the particle filter is above **20 g**.

– Vdiag 54:
5 failed regeneration attempts (for **Mégane ph2**) when driving and the weight of soot in the particle filter is above **20 g**.

– Vdiag 20, 24 and 26:
4 failed regeneration attempts (for **Laguna II ph2**) and 5 failed regeneration attempts (for **Vel Satis ph2** and **Espace IV ph2**) and 7 failed regeneration attempts (for **Espace IV ph2, M9R 761** only) when driving and the weight of soot in the particle filter is above **20 g** for **M9R760 and M9R762** or **36 g** for **M9R761 and M9R763**.

– **Vdiag 5C** and **58:**
5 failed regeneration attempts (for **Mégane II ph2**, **M9R 722/724** only) and 7 failed regeneration attempts (for **Mégane II ph2**, **M9R 721** only) when driving and the weight of soot in the particle filter is above **20 g** for **M9R 722/724** or **36 g** for **M9R 721**.

PART A
The flow chart on the following page allows analysis of the driving profile and the causes for the warning to come on:

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF312 CONTINUED 2

Repair request with **DF312 Speed request present** or **stored** ONLY

Read the information from the**Particle filter history sub-function: PR784** to **PR793 Stored DF312 No. 1 to No. 10**

Are **PR784 to PR793** all equal to **0 miles (0 km)**? — YES → B

NO

Among these parameters (**PR784 to PR793**):
– Find the parameter with the highest mileage: it is the **Mileage of the last DF312**.
– Note the parameter index on the order of repair with the relevant mileage value.
E.g.: **PR787 = 2794 miles (4657 Km)**.

Read the information in the **Particle filter history** sub-function:
PR794 to **PR803 Stored regeneration failures No. 1 to No. 10**.

Vdiag 18, 1C, 54

Is at least one of parameters **PR794** to **PR803 = 19660 miles (32766 km)**? — YES → B

NO

Vdiag 20, 58, 5C and 24

Identify the distance(s) from the values of parameters **PR794** to **PR803 Stored regeneration failures No. 1 to No. 10** included between the **Distance of the last DF312** and the **Distance of the last DF312** - **120 miles (- 200 km)**. This is the **Distance of the most recent failures**.
Example: **2674 miles (4457 km) < PR801 = 2760 miles (4600 km) < 2794 miles (4657 km)**

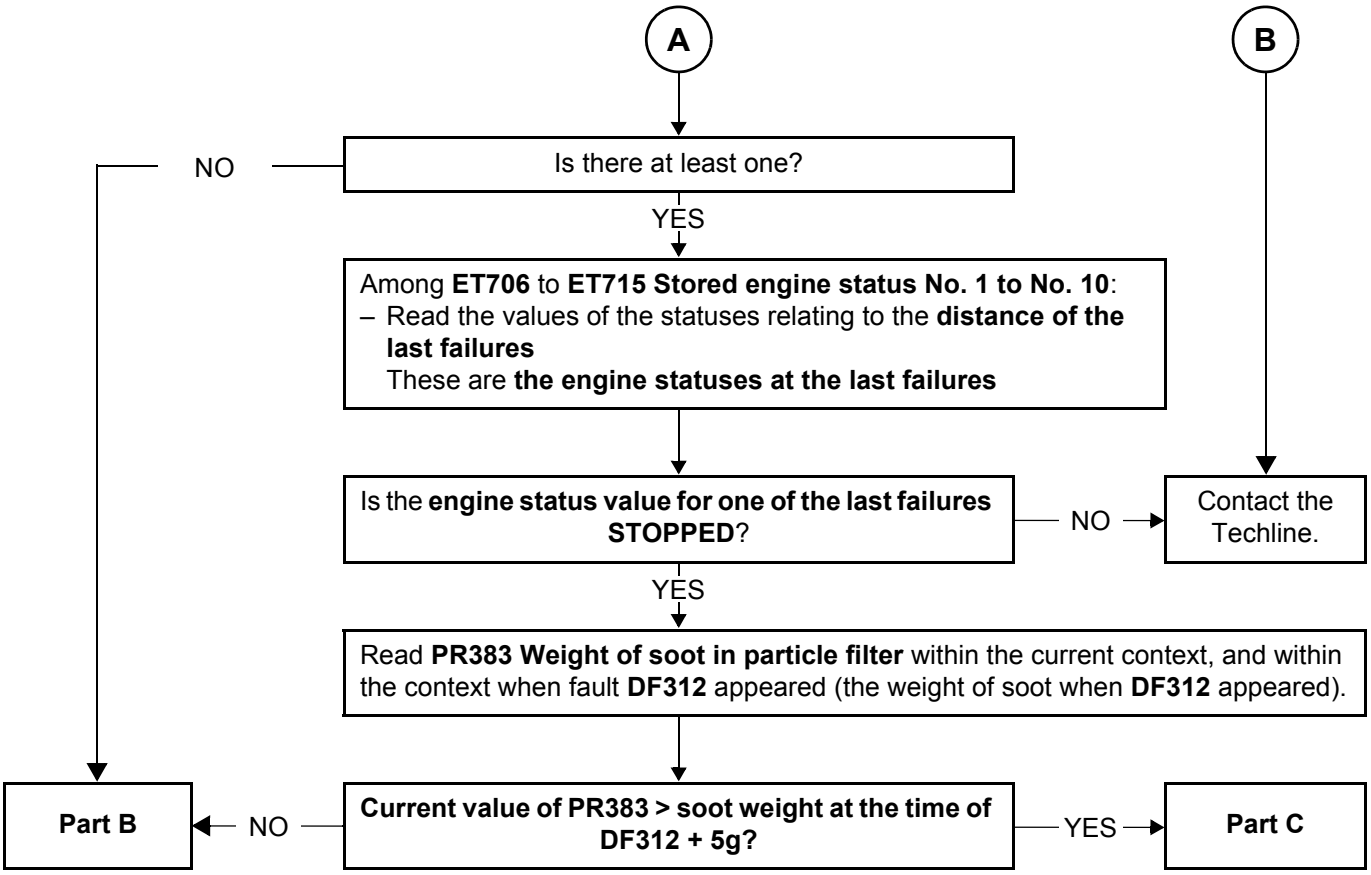
A

B

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF312 CONTINUED 3



AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF312 CONTINUED 4	

PART B

1. No particle filter regeneration.

2. Write on the repair order the parameter and status relating to the last failure:

– Mileage of the last DF312 Speed request.
– Mileage of the last failures.
– Engine statuses of the last failures.
E.g.: **PR787 = 2794 miles (4657 km)**; **PR801 = 2760 miles (4600 km)**; engine status = STOPPED

3. Interpretation of the values written on the repair order by the service advisor for the customer:

Before the last time the **particle filter warning light or message** came on (appeared at the **Mileage of the last DF312**), the customer had not respected the driving recommendations: the failure that occurred at the **Mileage of the last failure** is due to the engine being switched off.

4. Explain to the customer the procedure to turn off the warning light, making use of the parameters noted in the repair order: see **PART D**.

PART C

If **Vdiag 18**:
Reprogram the computer in **Vdiag 1C**.
Then apply the procedure corresponding to **Vdiag 1C**.

If **Vdiag 1C, 54, 58, 20** and **24**:
– Check that there are no leaks or blockages in the exhaust pipe,
Repair if necessary.
– Carry out an After-Sales regeneration with **approval from the Techline**.
– Follow the procedure for command **SC017 Particle filter regeneration** (see **Interpretation of commands**).
– Explain to the customer the procedure for regeneration when driving to avoid unnecessary repairs: see **PART D**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF312 CONTINUED 5	

PART D
Procedure to switch off the Particle filter message or warning light on the instrument panel

Certain types of driving can trigger illumination of the particle filter warning light or message, and activate fault **DF312**. The customer must carry out a specific driving operation (cf. vehicle user manual) that consists of:

1. When the engine is warm, drive at a speed greater than **48 mph (80 km/h)** for **2 minutes** to trigger the regeneration procedure.

2. Keep driving at an average speed of **48 mph (80 km/h)**, until the "particle filter" warning light or message on the instrument panel goes out. In order for the procedure to succeed, it is necessary to drive without stopping the engine or leaving the engine running at idle speed for an extended period of time. The regeneration time depends on the vehicle and driving conditions but should last for **20 minutes maximum.**

If regeneration fails when driving (the warning light does not go out or the service warning light comes on), check the exhaust pipe for leaks or blockage. Repair if necessary. Proceed with an After Sales regeneration. Run command **SC017** (see **Interpretation of commands**).

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF315 PRESENT OR STORED	PARTICLE FILTER DIFFERENTIAL PRESSURE SENSOR CO: Open circuit CO.0: Open circuit or short circuit to earth CC.1: Short circuit to + 12 V

NOTES	**Conditions for applying fault finding procedures to stored faults:** The fault is declared **present** after the engine is started or following a road test.
	Special notes: If the fault is **present:** – the **level 1** warning light is lit, – the **EOBD (European On Board Diagnostic)** warning light will come on after three consecutive driving cycles (starting **+ 5 seconds** + switching off the ignition and waiting for **1 minute**), – the particle filter fault finding procedure is inhibited, – particle filter regeneration is inhibited.
	Priorities when dealing with a number of faults: – **DF315** if it is **present**. – **DF308 Particle filter clogged** if **DF315** is **stored** and **DF308 is present**. – **DF011 Sensor supply voltage no. 1** if it is **present** or **stored**.

CC.1	***NOTES***	None.

Check the condition of the differential pressure sensor connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 1290**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF315 CONTINUED	

Check the continuity and insulation from + 12 V of the following connections:

- **3TL** between components **120** and **1290**,
- **3TM** between components **120** and **1290.**

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

If the fault is still present, replace the differential pressure sensor.

CO.0 CO	***NOTES***	None.

Check the condition of the differential pressure sensor connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 1290**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

Check the **continuity** and **insulation** to **earth** of the following connections:

- **3TL** between components **120** and **1290**,
- **3TM** between components **120** and **1290.**

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

If the wiring of the particle filter downstream temperature sensor, component code **1288**, is present (with or without the sensor being present), check the electrical insulation in relation to **+ 12 V** between the following connections:

– **3XU** between components **120** and **1288**,
– **3TG** between components **120** and **1288**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If the fault is still present, replace the differential pressure sensor.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF323 PRESENT OR STORED	DAMPER VALVE CC.0: Short circuit to earth CC.1: Short circuit to + 12 V CC: Short circuit C0: Open circuit 1.DEF: Internal electronic fault

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared **present** after the ignition has been switched on.
	Special notes: If the fault is **present**: – the **level 1** warning light is lit (for **Vdiag 20, 58**, **24, 5C, 26, 28, 60 and 62**), – particle filter regeneration is inhibited. Use bornier **Elé. 1681** for all operations on the engine management computer connector.
	Use the **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2**.

CC.0 **CC.1**	***NOTES***	None.

Check the condition of the damper valve connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 1461**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

Measure the **resistance** between connections **3AAX** and **3AAY** of component **1461**.
If the resistance of the damper valve is less than **0.5** Ω or greater than **400** Ω, replace the damper valve.

Then run command **SC036: Reinitialise programming** and select **Damper valve** to reinitialise the valve's opening and closing stops.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

EDC16CP33_V18_DF323 / EDC16CP33_V1C_DF323 / EDC16CP33_V54_DF323 / EDC16CP33_V20_DF323 / EDC16CP33_V58_DF323 / EDC16CP33_V5C_DF323 / EDC16CP33_V24_DF323 / EDC16CP33_V04_DF323 / EDC16CP33_V08_DF323 / EDC16CP33_V44_DF323 / EDC16CP33_V4C_DF323 / EDC16CP33_V34_DF323 / EDC16CP33_V38_DF323 / EDC16CP33_V74_DF323 / EDC16CP33_V28_DF323 / EDC16CP33_V62_DF323 / EDC16CP33_V26_DF323 / EDC16CP33_V60_DF323

GETtheMANUALS.org

DF323 CONTINUED 1	

Check the **insulation** to **earth** of the following connections:
- **3AAX** between components **120** and **1461**,
- **3AAY** between the components **120** and **1461**.

Check the **insulation** from **+ 12 V** of the following connections:
- **3AAX** between components **120** and **1461**,
- **3AAY** between the components **120** and **1461**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

If the fault is still present, contact the Techline.

CC	*NOTES*	None.

Check the condition of the damper valve connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 1461**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

Measure the **resistance** between connections **3AAX** and **3AAY** of component **1461**.
If the resistance of the damper valve is less than **0.5** Ω or greater than **400** Ω, replace the damper valve.

Then run command **SC036 Reinitialise programming** and select **Damper valve** to reinitialise the valve's opening and closing stops.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF323 CONTINUED 2	

Check the **insulation** between the following connections:
- **3AAX** between components **120** and **1461**,
- **3AAY** between the components **120** and **1461**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

If the fault is still present, contact the Techline.

CO	*NOTES*	None.

Check the condition of the damper valve connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 1461**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

Measure the **resistance** between connections **3AAX** and **3AAY** of component **1461**.

If the resistance of the damper valve is less than **0.5** Ω or greater than **400** Ω, replace the damper valve.

Then run command **SC036: Reinitialise programming** and select **Damper valve** to reinitialise the valve's opening and closing stops.

Check the **continuity** of the following connections:
- **3AAX** between components **120** and **1461**,
- **3AAY** between the components **120** and **1461**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF323 CONTINUED 3	

1.DEF	***NOTES***	**Special notes:** This fault appears when the computer control section has overheated. A road test may be necessary.
		Priorities when dealing with a number of faults: Deal with **CO**, **CO.0**, **CC.1** and **CO** first if they are **present** or **stored**.

Check the condition of the damper valve connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 1461**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

Check **the continuity** of the following connections:
- **3AAX** between components **120** and **1461**,
- **3AAY** between the components **120** and **1461**.

Check the **insulation** from **+ 5 V** (computer supplies) of the following connections:
- **3AAX** between components **120** and **1461**,
- **3AAY** between the components **120** and **1461**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF333 PRESENT OR STORED	INJECTION -> AUTOMATIC TRANSMISSION CONNECTION 1.DEF: Multiplex network

NOTES	**Special notes:** – Use bornier **Elé. 1681** for all operations on the engine management computer connectors. – **Do not clear the fault before reading the contexts of the fault.** (see **Wiring diagram Technical Note for Mégane II ph2, Scénic II ph2, Espace IV ph2**)
	Conditions for applying the fault finding procedure to a stored fault: – The fault is declared **present** if the **EOBD (European On Board Diagnostic)** warning light is lit.

Check the multiplex network.

Check the condition of the automatic transmission computer connector (see **Wiring Diagram Technical Note, Mégane II ph2, Scénic II ph2, Espace IV ph2, component code 119**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Mégane II ph2, Scénic II ph2, Espace IV ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

Check the **insulation** to **earth, the continuity** and **absence of interference resistance** on the following connections:
- **3MT** between components **119** and **120**,
- **3MS** between components **119** and **120.**

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If the fault is still present, check that the automatic transmission computer is recognised by the **CLIP diagnostic tool**.
If dialogue is not established (see **MR 366, 372, 407, 23A, Automatic transmission**).

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF364 PRESENT OR STORED	HEATING AND AIR CONDITIONING SYSTEM CC.0: Short circuit to earth CO.1: Open circuit or short circuit to +12 V

CC.0 CO.1	***NOTES***	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors.
		Use the **Wiring Diagram Technical Note for Mégane II ph2 or Scénic II ph2**.

Check the heating and air conditioning circuit (see **MR 364 (Mégane II ph2), 370 (Scénic II ph2) Mechanical, 62A, Air conditioning**).

Check the condition of the refrigerant pressure sensor connector (see **Wiring Diagram Technical Note, Mégane II ph2 or Scénic II ph2, component code 1202**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note**, **Mégane II ph2 or Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

Disconnect the battery and the injection computer.
Check the **insulation** and **continuity** of the following connections:
- **38Y** between components **120** and **1202**,
- **38X** between components **120** and **1202**,
- **38U** between components **120** and **1202**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF364 PRESENT OR STORED CONTINUED	

If the wiring of the particle filter downstream temperature sensor, component code **1288**, is present (with or without the sensor being present), check the electrical insulation in relation to **+ 12 V** between the following connections:

– **3XU** between components **120** and **1288**,
– **3TG** between components **120** and **1288**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If the fault is still present, replace the refrigerant pressure sensor.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF502 PRESENT OR STORED	CRUISE CONTROL OR SPEED LIMITER BUTTON 1.DEF: Cruise control/speed limiter on/off button inconsistency

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** If the fault is declared **present** after: – a road test with activation of the cruise control/speed limiter function, – the engine is started.
	Special notes: If the fault is **present**: – the cruise control/speed limiter function is switched off. Use bornier **Elé.1681** for any operations on the injection computer connectors.
	Use the **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2**.

Check the condition of the cruise control/speed limiter on/off button connector (see **Technical Note Wiring Diagram, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, component code 1081** or **component code 1546** for **Scénic II ph2**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

With the button in the rest position, check the **insulation** between the following connections:
- **AP10** and **3FX** of component **1081** (for **Vel Satis ph2, Laguna II ph2** and **Espace IV ph2**),
- **AP10** and **3PD** of component **1081** (for **Vel Satis ph2, Laguna II ph2** and **Espace IV ph2**),
- **AP43** and **3FX** of component **1081** (for **Mégane II ph2**),
- **AP43** and **3PD** of component **1081** (for **Mégane II ph2**),
- **AP43** and **3FX** of component **1546** (for **Mégane II ph2**),
- **AP43** and **3PD** of component **1546** (for **Scénic II ph2**).

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF502 CONTINUED	

With speed limiter selected, check the **continuity** between the following connections:
- **AP10** and **3PD** of component **1081** (for **Vel Satis ph2, Laguna II ph2** and **Espace IV ph2**),
- **AP43** and **3PD** of component **1081** (for **Mégane II ph2**),
- **AP43** and **3PD** of component **1546** (for **Scénic II ph2**).

With cruise control selected, check the **continuity** between connections:
- **AP10** and **3FX** of component **1081** (for **Vel Satis ph2, Laguna II ph2** and **Espace IV ph2**),
- **AP43** and **3FX** of component **1081** (for **Mégane II ph2**),
- **AP43** and **3FX** of component **1546** (for **Scénic II ph2**).

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

If necessary, replace the cruise control/speed limiter on/off button.

Check the **continuity** and **absence of interference resistance** of the following connections:
- **3FX** between components **120** and **1081** (for **Vel Satis ph2, Laguna II ph2, Espace IV ph2** and **Mégane II ph2**),
- **3PD** between components **120** and **1081** (for **Vel Satis ph2, Laguna II ph2, Espace IV ph2** and **Mégane II ph2**),
- **3FX** between components **120** and **1546** (for **Scénic II ph2**),
- **3PD** between components **120** and **1546** (for **Scénic II ph2**).

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF532 PRESENT OR STORED	ALTERNATOR CHARGE SIGNAL 1.DEF: Internal electronic fault 2.DEF: Inconsistent signal

NOTES	**Priorities when dealing with a number of faults:** **– DF046 Battery voltage.**
	Conditions for applying the fault finding procedure to a stored fault: If the fault is declared **present** after: – starting the engine, – a road test.
	Special notes: Computer operating voltage: **6 V < operating voltage < 16.5 V**. Use bornier **Elé.1681** for any operations on the injection computer connectors.
	Use the **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2**.

Check the condition of the alternator connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 103**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF532 CONTINUED	

Check the **continuity** and **the absence of interference resistance** on the following connection: • **2K** between components **120** and **103**. If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.
Check the charging circuit; apply **Technical Note 6014A Checking the charging circuit**. Carry out the necessary repairs.
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF569 PRESENT OR STORED	TURBOCHARGING CIRCUIT 1.DEF: Turbocharging pressure too high 2.DEF: Turbocharging pressure too low 3DEF: Inconsistency

NOTES	**Priorities when dealing with a number of faults:** **– DF054 Turbocharging solenoid valve control circuit** **– DF004 Turbocharging pressure sensor circuit.**
	Conditions for applying the fault finding procedure to a stored fault: If the fault is declared **present** after: – the ignition is switched on, – starting for **2.DEF**, – a road test, – in turbo regulation phase for **1.DEF**, – engine speed > **3000 rpm** for **1.DEF**, – system flow > **20 mg/st** for **1.DEF**.
	Special notes: Use bornier **Elé.1681** for any operations on the injection computer connectors. If the fault is **present**: – particle filter regenerations are inhibited (for **Vdiag 18, 1C, 54, 20, 58, 5C, 24** only), – engine torque limited, – turbocharging regulation is inhibited, – the EGR function is inhibited, – the **level 1** and **EOBD (European On Board Diagnostic)** warning lights are lit.
	Use the **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF569 CONTINUED 1	

1.DEF **2.DEF** **3.DEF**	***NOTES***	None.

If the specification of this fault is: **2.DEF: Turbocharging pressure too low**, apply **test 6: Fuel circuit return valve check**.

Continue fault finding, regardless of whether or not the fuel return rail has been replaced.

For the other specifications, move on to the next step.

If the loss of power was not noted during slight acceleration **and** if there was a loss of engine power during **each acceleration at full load**, replace the diesel fuel injector return rail and its overpressure valve (see **MR364 (Mégane II ph2), MR370 (Scénic II ph2), MR 395 (Laguna II ph2), 402 (Vel Satis ph2), 405 (Espace IV ph2) Mechanical, 13B, Diesel fuel injector return rail: Removal - Refitting**).

Check the condition of the turbocharging pressure sensor connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 1071**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF569 CONTINUED 2	

Check **for continuity** and **absence of interference resistance** of the following connections:
- **3LQ** between components **120** and **1071**,
- **3LP** between components **120** and **1071**,
- **3LN** between components **120** and **1071**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Test the high pressure fuel circuit:
Apply scenario **SC035 High pressure fuel circuit fault finding**.
To interpret the result, apply the interpretation of command **SC035** (see **Interpretation of commands**).

With the engine stopped and ignition on, view parameters **PR035 Atmospheric pressure** and **PR041 Turbocharging pressure**.
If there is a difference of **> 100 mbar**, check that the atmospheric pressure reading is consistent (by comparison with another vehicle for example).
If atmospheric pressure is consistent, replace the turbocharging sensor.
If not, contact the Techline.

Use the **Monitool application: MT001 Turbocharging function** to check the entire air line (only for **Vdiag 04 and 44**).

Apply **Test 4 Turbocharged air inlet circuit check**.

Run **Test 7 Variable geometry turbocharger control**.

Run **Test 8 Turbocharger rotating part**.

If the fault is still present, refer to the interpretation of parameter **PR041 Turbocharging pressure**.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF645 PRESENT OR STORED	DAMPER VALVE POSITION REGULATION 1.DEF: Data inconsistency 2.DEF: Value outside permitted tolerance values 3.DEF: Damper valve jammed open

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared **present** after: – with the engine running, – the battery voltage **X > 8V**.
	Priorities when dealing with a number of faults: **– DF038 Computer,** **– DF323 Damper valve,** **– DF012 Sensor supply voltage no. 2,** **– DF646 Damper valve position sensor.**
	Special notes: If the fault is **present**: – the **level 1** warning light is lit (for **Vdiag 20, 58**, **24, 5C, 26, 28, 60 and 62**), – particle filter regeneration is inhibited. Use bornier **Elé. 1681** for all operations on the engine management computer connector.
	Use the **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2**.

Check the condition and connection of the damper valve connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 1461**).
Check the condition and connection of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair),** repair the connector, otherwise replace the wiring.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF645 CONTINUED	

Check the **continuity**, **insulation** from earth and **+ 12 V** and **absence of interference resistance** on the following connections:
- **3AAX** between the components **120** and **1461**,
- **3AAY** between components **120** and **1461**,
- **38KQ** between components **120** and **1461**,
- **38KS** between components **120** and **1461**,
- **38KP** between components **120** and **1461**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Check that the valve is not **mechanically jammed** (check that the valve is clean and that no component is preventing it from closing; clean if necessary):
With the engine switched off, disconnect the air inlet hose from the damper valve.
Check that the valve is in the open position.
Start, then switch off the engine.
Check that the valve closes when the engine is switched off and then opens again when the engine has stopped.
If this does not happen, replace the damper valve.

Then run command **SC036 Reinitialise programming** and select **Damper valve** to reinitialise the valve's opening and closing stops.

Check if the damper valve performs 3 opening/closing cycles.
Otherwise program the damper valve using command **SC036 Reinitialise programming**.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF646 PRESENT OR STORED	DAMPER VALVE POSITION SENSOR CC.0: Short circuit to earth CO.0: Open circuit or short circuit to earth CO.1: Open circuit or short circuit to +12 V 1.DEF: Open circuit or short circuit

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared **present** after: – the engine is started, – a road test.
	Priorities when dealing with a number of faults: **– DF012 Sensor supply voltage no. 2.**
	Special notes: If the fault is **present**: – the **level 1** warning light is lit (for **Vdiag 20, 58**, **24, 5C, 26, 28, 60 and 62**), – particle filter regeneration is inhibited. Use bornier **Elé. 1681** for all operations on the engine management computer connector.
	Use the **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2**.

CO.1 **1.DEF**	***NOTES***	None.

Check the condition of the damper valve connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 1461**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF646 CONTINUED 1	

Measure the **resistances** between connections **38KQ** and **38KP (potentiometer supply** and **potentiometer earth)** and between **38KS** and **38KP (potentiometer signal** and **potentiometer earth)** of component **1461**.
If the resistances of the damper valve are not between **290 Ω < X < 6 kΩ**, replace the damper valve.

Then run command **SC036: Reinitialise programming** and select **Damper valve** to reinitialise the valve's opening and closing stops.

Check the **insulation** from **+ 12 V** and **+ 5 V** between the following connections:
- **38KP** between components **120** and **1461**,
- **38KQ** between components **120** and **1461**,
- **38KS** between components **120** and **1461**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

If the fault is still present, contact the Techline.

CC.0 **CO.0**	***NOTES***	None.

Check the condition of the damper valve connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 1461**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

DF647 PRESENT OR STORED	EGR VALVE POSITION REGULATION 1.DEF: EGR 1 offset inconsistency 2.DEF: EGR 2 offset inconsistency 3.DEF: Valve jammed closed 4.DEF: Valve jammed open

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared **present** after: – the ignition is switched on. – the engine is started, – a road test, – if the air flowmeter temperature **> 5°C**.
	Priorities when dealing with a number of faults: **– DF209 EGR valve position sensor circuit,** **– DF046 Battery voltage,** **– DF012 Sensor supply voltage no. 2,** **– DF272 EGR valve control circuit.**
	Special notes: – the **level 1** and **EOBD (European On Board Diagnostic)** warning lights are lit for **1.DEF**, **2.DEF,** and **4.DEF** – only the **EOBD (European On Board Diagnostic)** warning light is lit for **3.DEF**, – the EGR function is inhibited by the engine management computer, – reduced performance for **2.DEF** and **3.DEF** or **1.DEF** and **2.DEF** (for **Vdiags 5C, 58 and 24**, and **20, 26, 28, 60, 62**). Use bornier **Elé. 1681** for all operations on the engine management computer connector.
	Use the **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF647 CONTINUED 1	

1.DEF 2.DEF	*NOTES*	None.

Check the condition of the EGR valve (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 1460 or 169**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

Measure the **resistance** between connections **3EL** and **3JM** of component **1460** or **169**.
If the resistance of the EGR valve is not between **1 kΩ < X < 7,5 kΩ**, replace the EGR valve.
Measure the **resistance** between connections **3EL** and **3GC** of component **1460** or **169**.
If the resistance of the EGR valve is not between **3.9 kΩ < X < 12.6 kΩ**, replace the EGR valve.
After replacement, run command **SC036 Reinitialise programming** and select **EGR valve** to reinitialise the EGR valve offsets.

Check the **continuity** and **absence of interference resistance** of the following connections:
- **3GC** between components **120** and **1460** or **169**,
- **3EL** between components **120** and **1460** or **169**,
- **3JM** between components **120** and **1460** or **169**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

Remove and clean the EGR valve, then refit the EGR valve and start the engine (see **MR364 (Mégane II ph2), MR370 (Scénic II ph2), MR 395 (Laguna II ph2), 402 (Vel Satis ph2), 405 (Espace IV ph2), Mechanical, 14A, Emission control, Exhaust gas recirculation solenoid valve: Removal - Refitting**).
If the fault is still present, replace the EGR valve then run command **SC036 Reinitialise programming** and select **EGR valve** to reinitialise the EGR valve offsets.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF647 CONTINUED 2	

3.DEF **4.DEF**	***NOTES***	None.

Remove and clean the EGR valve, then refit it and start the engine. (see **MR364 (Mégane II ph2), MR370 (Scénic II ph2), MR 395 (Laguna II ph2), 402 (Vel Satis ph2), 405 (Espace IV ph2) Mechanical, 14A, Emission control, Exhaust gas recirculation valve: Removal - Refitting**).

If the fault is still present, replace the EGR valve then run command **SC036** and select **EGR valve** to reinitialise the EGR valve offsets.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF651 PRESENT OR STORED	TURBINE UPSTREAM PRESSURE SENSOR CIRCUIT CO.0: Open circuit or short circuit to earth CC.1: Short circuit to + 12 V 1.DEF: Inconsistency

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** If the fault is declared **present** after: – With the ignition on, – when the engine is running.
	Special notes: If the fault is **present**: – engine torque limited, – the EGR function is inhibited by the engine management computer, – the vehicle performance is reduced, – particle filter regeneration is inhibited, – the **level 1** warning light is illuminated, – the **EOBD (European On Board Diagnostic)** warning light is lit (for **Vdiag 5C, 58, 24** and **20** (only for **M9R761, M9R722**, **M9R760** and **M9R724**)).
	Priorities when dealing with a number of faults: **DF011 Sensor supply voltage no. 1.**

CO.0	***NOTES***	None.

Check the condition of the turbine upstream pressure sensor connector (**component code 1299**).
Check the condition of the engine management computer connector (**component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF651 CONTINUED 1	

Check the continuity and insulation from earth of the following connections:

- **3MX** between components **120** and **1299**,
- **3MY** between components **120** and **1299**,
- **3MZ** between components **120** and **1299.**

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

If the wiring of the particle filter downstream temperature sensor, component code **1288**, is present (with or without the sensor being present), check the electrical insulation in relation to **+ 12 V** between the following connections:

– **3XU** between components **120** and **1288**,
– **3TG** between components **120** and **1288**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If the faults **DF569 Turbocharging circuit** and/or **DF1188 Air taken into the turbocharging circuit** are present, perform **Test 8 Turbocharger rotating part**.

If the fault is still present, replace the turbine upstream pressure sensor.

CC.1	*NOTES*	None.

Check the condition of the turbine upstream pressure sensor connector (**component code 1299**).
Check the condition of the engine management computer connector (**component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF651 CONTINUED 2	

Check the **continuity** and **insulation** from **+ 12 V** of the following connections:

- **3MX** between components **120** and **1299**,
- **3MY** between components **120** and **1299**,
- **3MZ** between components **120** and **1299.**

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

If the faults **DF569 Turbocharging circuit** and/or **DF1188 Air taken into the turbocharging circuit** are present, perform **Test 8 Turbocharger rotating part**.

If the fault is still present, replace the turbine upstream pressure sensor.

1.DEF	*NOTES*	None.

Check the condition of the turbine upstream pressure sensor connector (**component code 1299**).
Check the condition of the engine management computer connector (**component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

Check the continuity and absence of interference resistance on the following connection:

- **3MY** between components **120** and **1299.**

If the connection is faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If the faults **DF569 Turbocharging circuit** and/or **DF1188 Air taken into the turbocharging circuit** are present, perform **Test 8 Turbocharger rotating part**.

Replace the turbine upstream pressure sensor if necessary.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF652 PRESENT OR STORED	TURBINE UPSTREAM TEMPERATURE SENSOR CIRCUIT CC.0: Short circuit to earth CO.1: Open circuit or short circuit to +12 V

NOTES	**Conditions for applying fault finding procedures to stored faults:** The fault becomes **present** if: – the ignition is on **(CC.0)** or after a road test with the engine warm **(CO.1)**.
	Special notes: If the fault is **present**: – particle filter regeneration is inhibited, – the vehicle performance is reduced, – temperature regulation upstream of the particle filter is inhibited, – the **level 1** warning light is illuminated, – the **EOBD (European On Board Diagnostic) warning light** is lit (for **Vdiag 5C, 58, 24** and **20**).

CC.0	***NOTES***	None.

Check the condition of the turbine upstream temperature sensor connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 1589**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

Check the **insulation** from **earth** of the following connections:
- **3ABS** between components **120** and **1589**,
- **3ABT** between components **120** and **1589.**

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

If fault is still present, replace the turbine upstream temperature sensor

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF652 CONTINUED	

CO.1	***NOTES***	None.

Apply **test 6: Fuel circuit return valve check**. **Continue fault finding, regardless of whether or not the fuel return rail has been replaced.**
Check **the continuity** and **insulation** from **+ 12 V** of the following connections: • **3ABS** between components **120** and **1589**, • **3ABT** between components **120** and **1589.** If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.
If fault is still present, replace the turbine upstream temperature sensor.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF717 PRESENT OR STORED	PARTICLE FILTER UPSTREAM PRESSURE 1.DEF: Inconsistency

NOTES	**Conditions for applying fault finding procedures to stored faults:** The fault is declared **present** after the engine is started or following a road test.
	Special notes: If the fault is **present:** – the **level 1** warning light is lit, – the **EOBD (European On Board Diagnostic)** warning light will come on after three consecutive driving cycles (starting **+ 5 seconds** + switching off the ignition and waiting for **1 minute**), – the particle filter fault finding procedure is inhibited, – particle filter regeneration is inhibited.

Check the condition of the pressure pipe between the particle filter upstream take-off point and the differential pressure sensor.

Check that the pipe is not crushed, blocked or pierced.

Check that the differential pressure sensor is correctly positioned and connected (see **MR 395, 402, 405, 364, 370, Mechanical, 19B Exhaust, Particle filter pressure sensor: Removal - Refitting**).

Replace the pressure pipe if necessary.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF890 PRESENT OR STORED	MOVEMENT DURING REGENERATION PRESSURE SENSOR 1.DEF: Above max threshold

NOTES	**Conditions for applying fault finding procedures to stored faults:** The fault becomes **present** during an After-Sales regeneration carried out using the **diagnostic tool** at a speed above zero.
	Special notes: If the fault is **present**, the particle filter regeneration in progress is interrupted.

IMPORTANT:
The fault is present because the vehicle was driven while the After-Sales regeneration was in progress.
The vehicle must remain stationary throughout regeneration.

DO NOT DRIVE THE VEHICLE.
CHECK THAT THE VEHICLE IS CORRECTLY IMMOBILISED.

- Switch off the ignition and wait for the **diagnostic tool** message (maximum wait **8 minutes**): **Loss of dialogue with the computer: EDC16 CP33, check the tool connection and the computer supply**,
- switch on the ignition again,
- establish dialogue with the injection computer, clear the faults from the computer memory,
- carry out another After-Sales regeneration,
- run command **SC017 Particle filter regeneration** and follow the procedure described in **Interpretation of commands**.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF891 PRESENT OR STORED	GROUP 1 INJECTORS FEED CC.0: Short circuit to earth 1.DEF: Faulty connections

NOTES	**Group 1 corresponds to injectors 1 and 2.**
	Conditions for applying the fault finding procedure to a stored fault: If the fault becomes **present** after: – the ignition is switched on, – the engine is started.
	Priorities when dealing with a number of faults: **– DF026 Cylinder 1 injector control circuit** **– DF027 Cylinder 2 injector control circuit.**
	Special notes: If the fault is **present**: – particle filter regeneration is inhibited, – the **level 2** warning light will be lit, – the engine stops. Use bornier **Elé.1681** for all operations on the engine management computer.
	Use the **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2**.

Check the condition of the injector connectors (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component codes 193, 194**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF891 CONTINUED	

Check the **continuity** and **insulation** of the following connections:
- **3KW** between components **120** and **193**,
- **3CR** between components **120** and **193**,
- **3KX** between components **120** and **194**,
- **3CS** between components **120** and **194**,

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF892 PRESENT OR STORED	GROUP 2 INJECTORS FEED CC.0: Short circuit to earth 1.DEF: Faulty connections

NOTES	**Group 2 corresponds to injectors 3 and 4.**
	Conditions for applying the fault finding procedure to a stored fault: If the fault becomes **present** after: – the ignition is switched on, – the engine is started.
	Priorities when dealing with a number of faults: **– DF028 Cylinder 3 injector control circuit** **– DF029 Cylinder 4 injector control circuit.**
	Special notes: If the fault is **present**: – particle filter regeneration is inhibited, – the **level 2** warning light will be lit, – the engine stops. Use bornier **Elé.1681** for all operations on the engine management computer.
	Use the **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2**.

Check the condition of the injector connectors (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component codes 195, 196**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

GETtheMANUALS.org

DF895 CONTINUED 1	

1.DEF **2.DEF** **3.DEF** **4.DEF**	***NOTES***	None.

Check that there are no leaks on the high pressure diesel fuel circuit. Repair if necessary.
Check the level of fuel in the tank. In the event of a fuel gauge sensor fault, deal with this fault first. Check the low pressure circuit using **Test 3 Low pressure circuit test** and check that there are no exterior air leaks in the low pressure fuel circuit.
Test the high pressure fuel circuit: Run scenario **SC035 High pressure fuel circuit fault finding** (see **Interpretation of commands**).
If the fault is still present, check the rail pressure regulator connections **(DRV)**. check the engine management computer connections.
Check the seal on the rail pressure regulator **(DRV)**: Disconnect the low-pressure return pipe from the rail pressure regulator **(DRV)**. In its place, connect a transparent pipe, with the other end leading to a container of some sort in order to collect the drained diesel fuel. Start the engine and let the engine idle. When the engine is started, no diesel should flow into the transparent pipe as the rail pressure regulator **(DRV)** is closed so that the pressure in the hydraulic system can rise. Diesel fuel should flow into the transparent pipe a few seconds after the engine is started, provided that the diesel is cold (less than **15°C**), as the regulation is provided by the rail pressure regulator (**DRV**). If the diesel is warm (above **15°C**), regulation is controlled by the pump pressure regulator (**MPROP**). No diesel should flow into the pipe.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF895 CONTINUED 2	

If the diesel does not behave in accordance with this description, replace the rail (removing the rail pressure regulator (**DRV**) is not permitted).

Note: the above description no longer applies if faults **DF898 Rail pressure regulator circuit**, **DF897 Pump pressure regulator circuit** and **DF896 Pump pressure regulation** are present.

Check the condition of the pressure regulator connector on the pump **(MPROP)** (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 1105**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

Measure the **resistance** between connections **3FB** and **3HI** of component **1105.**

If the resistance of the pressure regulator connector on the pump is not between **2 Ω < X < 6 Ω** at **20°C**, contact the Techline.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

DF896 CONTINUED	

Test the high pressure fuel circuit: Run scenario **SC035 High pressure fuel circuit fault finding**.
Check the condition of the pressure regulator connector on the pump **(MPROP)** (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 1105**). Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**). If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.
Check the condition of the rail pressure regulator connector **(DRV)** (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 1198**). Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**). If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

DF897 PRESENT OR STORED	PUMP PRESSURE REGULATOR CIRCUIT CO: Open circuit CC.0: Short circuit to earth CC.1: Short circuit to + 12 V 1.DEF: Internal electronic fault

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault reappears after: – the ignition is switched on, – the regulator is controlled using command **AC226 Pump pressure regulator**.
	Special notes: The **fuel flow regulator** is built into the high pressure pump. If the fault is **present**: – particle filter regeneration is inhibited, – the quantity of fuel injected is limited and the engine speed is limited to **3000 rpm**: **CO, CC.1, 1.DEF**, – regulation with open loop for fuel flow, – the **level 2** warning light comes on: **CC.0**: **engine stop**, – the **level 1** warning light comes on: **CO, CC.1, 1.DEF**, – pressure is regulated by the pump pressure regulator **(MPROP)**. Use bornier **Elé. 1681** for all operations on the engine management computer connectors.
	Use the **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2**.

CO	***NOTES***	None.

Check the condition of the pressure regulator connector on the pump **(MPROP)** (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 1105**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF897 CONTINUED 1	

Measure the **resistance** between connections **3FB** and **3HI** of component **1105.**
If the resistance of the pressure regulator connector on the pump is less than **1.5** Ω or greater than **1 k**Ω, contact the Techline.

Check **the continuity** of the following connection:
- **3HI** between the components **120** and **1105**.

Check the **+12 V after relay supply** to the pump pressure regulator **(MPROP)** on the following connection**:**
- **3FB** of component **1105**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

If the fault is still present, contact the Techline.

CC.0	*NOTES*	None.

Check the condition of the pressure regulator connector on the pump **(MPROP)** (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 1105**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

Measure the **resistance** between connections **3FB** and **3HI** of component **1105.**
If the resistance of the pressure regulator connector on the pump is less than **1.5** Ω or greater than **1 k**Ω, contact the Techline.

Check the **continuity** and **insulation** from **earth** of the following connection:
- **3HI** between the components **120** and **1105**.

Check the **+12 V after relay supply** to the pump pressure regulator **(MPROP)** on the following connection**:**
- **3FB** of component **1105**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF897 CONTINUED 2	

CC.1	***NOTES***	None.

Check the condition of the pressure regulator connector on the pump **(MPROP)** (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 1105**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

Measure the **resistance** between connections **3FB** and **3HI** of component **1105.**
If the resistance of the pressure regulator connector on the pump is less than **1.5** Ω or greater than **1 k**Ω, contact the Techline.

Check the **continuity** and **insulation** from + **12 V** of the following connection:
- **3HI** between the components **120** and **1105**.

Check the **+12 V after relay supply** to the pump pressure regulator **(MPROP)** on the following connection:
- **3FB** of component **1105**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

If the fault is still present, contact the Techline.

1.DEF	***NOTES***	This fault appears when the computer control section has overheated.

Check the condition of the pressure regulator connector on the pump **(MPROP)** (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 1105**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

DF899 PRESENT OR STORED	REGENERATION TEMPERATURE LIMIT EXCEEDED

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared **present** during an After-Sales regeneration, if the temperature threshold is exceeded.
	Special notes: If the fault is **present**: – regeneration in progress is stopped. **IMPORTANT: The fault appears if the temperature threshold is exceeded during the After-Sales regeneration phase.**

- Carry out particle filter replacement
- run command **SC036 Reinitialise programming** (see **Interpretation of commands**) and select **After particle filter replacement**.
- **switch off the ignition and wait** for the **diagnostic tool** message (maximum wait **8 minutes**): **Loss of dialogue with the computer: EDC16 CP33, check the tool connection and the computer supply voltage**,
- **then switch on the ignition again**,
- **clear** the **present** or **stored** faults from the computer memory (**operation to be carried out within 3 minutes of switching on the ignition**).

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF997 PRESENT OR STORED	CONTROL UNIT -> THERMOPLUNGERS CONNECTION 1.DEF: Signal incoherent

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** the fault is declared **present** after the engine starts.
	Special notes: If the fault is **present**: The engine performance is impaired during the particle filter regeneration phase.

Check the condition of the thermoplunger **1, 2, 3** relay mounting connector on the engine fuse box or additional heater interface unit (see **Wiring Diagram Technical Note**, **Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 1067, 1068, 1069 or 1550**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note**, **Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
Check the condition of the thermoplunger connectors (see **Wiring Diagram Technical Note**, **Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component codes 898, 1072, 1073, 1074**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

Check the conformity of the thermoplunger **1, 2, 3** relay (relay removed) or the additional heater interface unit:
– Check the **insulation** between the following connections:
- **BP9** and **3JB** of component **1067** or **1550**.
- **BP91** and **3JAD** or **3JD** and **3JAC** of component **1068** or **1550**.
- **BP9** and **3JAC** or **3JC** of component **1069** or **1550**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

Check the **continuity** of the following connections:
- **3JAC** or **3JC** between component **1069** or **1550**,
- **3JAD** or **3JD** and **3JAC** between component **1068** or **1550**,
- **3JA** between component **1067** or **1550**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF997 CONTINUED	

Check **the absence of interference resistance** on the following connections:
- **3JA** between components **120** and **1067** or **1550**,
- **3JAA** between components **120** and **1068** or **1550**,
- **3JAB** between components **120** and **1069** or **1550**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.
Check the **+ 12 V after relay supply** to the thermoplunger **1**, thermoplunger **2**, thermoplunger **3** relay mounting of the following connections:
- **3FB** of component **1067** or **1550**,
- **BP91** of component **1068** or **1550**,
- **BP9** of component **1069** or **1550**.

If the connection or connections are faulty and if there is a repair method (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

Actuate the various thermoplunger relays one by one using commands:
– AC063 Thermoplunger no. 1 relay
– AC064 Thermoplunger no. 2 relay
– AC031 Thermoplunger no. 3 relay
Check the voltage using a multimeter. If the voltage is zero, the thermoplunger is faulty.
Only replace the faulty thermoplunger.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF1020 PRESENT OR STORED	ENGINE OIL DILUTION 1.DEF: Above maximum threshold

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** the fault is declared **present** after the engine starts.
	Special notes: If the fault is **present**: Particle filter regeneration inhibited, **Level 1** warning light lit, Risk of engine damage.

Drain the engine oil. Reset the oil wear counter. Clear the faults.
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF1069 PRESENT OR STORED	HEATER PLUGS NOT CONFIGURED 1.DEF: Configuration / Initialisation

NOTES	**Special notes:** If the fault is **present**: – engine torque limited, – an engine speed below **1500 rpm**. The **level 1** warning light is illuminated.
	Conditions under which the fault appears: This fault only appears when the computer is reprogrammed after a change of Vdiag.

If the fault is **present**, display status **ET781 Heater plugs** in the sub-function **Ignition/Preheating**.
If status **ET781** is **STATUS 3**, this means that the heater plugs are not configured in the injection computer.
To find out which type of heater plugs are fitted to the engine, look at the colour of the rings on the plugs.
– Slow plugs have a black ring.
– Fast plugs have a white ring.
To configure the type of plugs, run command **SC036 Reinitialise programming** and select **HEATER PLUGS** (see **Interpretation of commands**).
If the fault is **stored**, clear the fault.
End of fault finding.

If the fault is still present or if status **ET781** is not **STATUS 3** or is inconsistent with the type of plug fitted, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF1188 PRESENT OR STORED	AIR TAKEN INTO THE TURBOCHARGING CIRCUIT 1.DEF: Air leak in the turbocharging circuit

NOTES	**Priorities when dealing with a number of faults:** **– DF004 Turbocharging pressure sensor circuit.**
	Conditions for applying the fault finding procedure to stored faults: The fault is declared **present** with the engine running above **3000 rpm** and during the turbocharger regulation phase (for at least **10 seconds**).
	Special notes: If the fault is **present**: – the **level 1** and **OBD** warning lights are lit, – the vehicle performance is reduced, – engine torque is limited, – the turbo function is inhibited, – particle filter regeneration is inhibited, – the EGR function is inhibited by the engine management computer,

Check the condition of the turbocharging pressure sensor connector (**component code 1071**).
Check the condition of the turbocharging solenoid valve connector (**component code 1475**).
Check the condition of the engine management computer connector (**component code 120**).
If the connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair),** repair the connector, otherwise replace the wiring.

Check **the continuity** and **insulation** of the following connections:
- **3LQ** between components **120** and **1071**,
- **3LP** between components **120** and **1071**,
- **3LN** between components **120** and **1071**,
- **3MG** between the components **120** and **1475**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF1188 CONTINUED	

Apply **Test 4 Turbocharged air inlet circuit check**.
Apply **Test 7 Variable geometry turbocharger control**.
Apply **Test 8 Turbocharger rotating part.**
Run **Test 11 Temperature upstream of turbine too low**.
Check the take-off point of the turbine upstream pressure sensor
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

The global **conformity check** for the functions and sub-functions of this system is no longer explained in the conformity check sub-section. Instead, all of the information available in the **CLIP diagnostic tool** functions and sub-functions is detailed in the following sections:
For **STATUSES**, refer to the **INTERPRETATION OF STATUSES** section.
For **PARAMETERS**, refer to the **INTERPRETATION OF PARAMETERS** section.
For **COMMANDS**, refer to the **INTERPRETATION OF COMMANDS** section.

ET001	COMPUTER + AFTER IGNITION FEED

STATUS DEFINITION	**PRESENT:** This status indicates that the **+ after ignition feed** is active. **ABSENT:** This status indicates that the **+ after ignition feed** is not active.

NOTES	**Special notes:** Only perform these tests if the parameters do not correspond with the system operation programming. Use the **Wiring Diagram Technical Note**, **Laguna II ph2, Vel Satis ph2, Mégane II ph2, Scénic II ph2, Espace IV ph2.**

Conformity check: Engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

"PRESENT"	Ignition on and engine running warm at idle speed with the **+ after ignition feed** activated. Normal operating condition. The computer is correctly supplied after the ignition has been switched on. In the event of a fault, refer to the interpretation of **DF046 Battery voltage** or **DF151 Main relay circuit**.

Sensor electrical conformity.

"ABSENT"	***NOTES***	Ignition on

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V18_ET001 / EDC16CP33_V1C_ET001 / EDC16CP33_V54_ET001 / EDC16CP33_V20_ET001 / EDC16CP33_V58_ET001 / EDC16CP33_V5C_ET001 / EDC16CP33_V24_ET001 / EDC16CP33_V04_ET001 / EDC16CP33_V08_ET001 / EDC16CP33_V44_ET001 / EDC16CP33_V4C_ET001 / EDC16CP33_V34_ET001 / EDC16CP33_V38_ET001 / EDC16CP33_V74_ET001 / EDC16CP33_V28_ET001 / EDC16CP33_V62_ET001 / EDC16CP33_V26_ET001 / EDC16CP33_V60_ET001

GETtheMANUALS.org

ET001 CONTINUED	

If the ignition is not switched on, status **ET001** should be **ABSENT**.
As soon as the ignition is switched on, the computer should be supplied with power. Status **ET001** becomes **PRESENT**.
If this status remains locked on **ABSENT**, follow the procedure below:
– Check the condition of fuse **FM3 (30A)** in the engine fuse and relay box (see **MR 395 (Laguna II ph2), 405 (Espace IV ph2) Mechanical, 81C, Fuses, Fuses: List and location of components**).
– Check the condition of fuse **F18 (15A)** in the Protection and Switching Unit (UPC) (see **MR364 (Mégane II ph2), MR370 (Scénic II ph2) Mechanical, 81C, Fuses, Fuses: List and location of components**).
Check **the continuity** and **absence of interference resistance** on the following connection:

• **3AA** between components **120** and **983 or 1337**.

If the connection is faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**).
If the connector is faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET003	ENGINE IMMOBILISER

STATUS DEFINITION	**ACTIVE:** This status indicates that the immobiliser is active. **INACTIVE:** This status indicates that the immobiliser is inactive.

NOTES	**Special notes:** Only perform these tests if the parameters do not correspond with the system operation programming.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

ACTIVE	Refer to the fault finding note for the UCH (see **87B, Passenger compartment connection unit**).

INACTIVE	Refer to the fault finding note for the UCH (see **87B, Passenger compartment connection unit**).

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V18_ET003 / EDC16CP33_V1C_ET003 / EDC16CP33_V54_ET003 / EDC16CP33_V20_ET003 / EDC16CP33_V58_ET003 / EDC16CP33_V5C_ET003 / EDC16CP33_V24_ET003 / EDC16CP33_V04_ET003 / EDC16CP33_V08_ET003 / EDC16CP33_V44_ET003 / EDC16CP33_V4C_ET003 / EDC16CP33_V34_ET003 / EDC16CP33_V38_ET003 / EDC16CP33_V74_ET003 / EDC16CP33_V28_ET003 / EDC16CP33_V62_ET003 / EDC16CP33_V26_ET003 / EDC16CP33_V60_ET003

GETtheMANUALS.org

ET007	PRE-POSTHEATING UNIT CONTROL

STATUS DEFINITION	**ACTIVE:** when the heater plugs are activated according to the engine coolant temperature. **INACTIVE:** after the engine has been running for a certain period In the event of a fault, consult the interpretation of fault **DF017 Preheating unit control circuit**.

NOTES	**Special notes:** **This status is specific to slow heater plugs (black ring).**

Conformity check with engine stopped and ignition on.

"ACTIVE"

When the ignition is switched on, status **ET007** should be **ACTIVE** for a time that varies according to the engine coolant temperature. Both the relay and the heater plugs are supplied.
After starting, the status should remain **ACTIVE** for a time that varies according to the engine temperature. This is the postheating phase.

If **ET007** is **INACTIVE** when the ignition is switched on, check:
– Supply fuse **FM12 (70A)** of component **597** (engine fuse and relay box) or **F2 (70A)** of component **777** for **Mégane II and Scénic II**
– The **supply** to the heater plugs after relay actuation, and the connections of the heater plugs.

Important: on this engine, the plug supply voltage is variable.
– Check the **continuity** and **absence of interference resistance** of the following connections:
• **37AB** between components **257** and **683**,
• **37AA** between components **257** and **680**,
• **37Z** between components **257** and **681**,
• **37AC** between components **257** and **682**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V18_ET007 / EDC16CP33_V1C_ET007 / EDC16CP33_V54_ET007 / EDC16CP33_V20_ET007 / EDC16CP33_V58_ET007 / EDC16CP33_V5C_ET007 / EDC16CP33_V24_ET007 / EDC16CP33_V04_ET007 / EDC16CP33_V08_ET007 / EDC16CP33_V44_ET007 / EDC16CP33_V4C_ET007 / EDC16CP33_V34_ET007 / EDC16CP33_V38_ET007 / EDC16CP33_V74_ET007 / EDC16CP33_V28_ET007 / EDC16CP33_V26_ET007

GETtheMANUALS.org

ET007 CONTINUED	

"ACTIVE"	– Check the connection and condition of the preheating unit (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 257**). If the connector or connectors are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring. If the vehicle starts, postheating has ended and status **ET007** remains **ACTIVE** during the engine operating phase, refer to the interpretation of faults **DF017 Preheating unit control circuit** and **DF025 Preheating unit diagnostic connection**.
"INACTIVE"	If the vehicle does not start, the status remains **INACTIVE** and preheating does not start when the ignition is switched on or during the starting phase. Check the **continuity** and **absence of interference resistance** on the following connections: • **3FY** and **3FF** between components **120** and **257**. Check the **+ 12 V battery supply** to the preheating unit on the following connection: • **BP35** of component **257**. If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Conformity check with the engine running and engine coolant temperature > 80°C

"ACTIVE" then "INACTIVE"	After the engine has been running for a certain period, the status changes from **ACTIVE to INACTIVE**. In the event of a fault, consult the interpretation of fault **DF017 Preheating unit control circuit**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET024 **ET025** **ET026**	THERMOPLUNGER NO. 1 REQUEST THERMOPLUNGER NO. 2 REQUEST THERMOPLUNGER NO. 3 REQUEST

STATUS DEFINITION	**ACTIVE:** These statuses indicate that the thermoplungers are active. **INACTIVE:** These statuses indicate that the thermoplungers are inactive.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

"INACTIVE"	Statuses **ET024, ET025, and ET026** are **INACTIVE** when the ignition is switched on with the engine stopped, or when the engine is warm.

"ACTIVE"	Statuses **ET024, ET025, and ET026** are **ACTIVE** when: – the engine has been started, – and the engine coolant temperature is low (**< 15°C**), – and the air temperature is low (**< 5°C**). This strategy allows the engine coolant to be heated and to allow the heating of the passenger compartment. To control the operation of the thermoplunger relays, run the following commands: **– AC063 Thermoplunger no. 1 relay,** **– AC064 Thermoplunger no. 2 relay,** **– AC031 Thermoplunger no. 3 relay.** In the event of a fault, refer to the interpretation of faults: **– DF032 Thermoplunger no. 1 relay control circuit,** **– DF033 Thermoplunger no. 2 relay control circuit,** **– DF034 Thermoplunger no. 3 relay control circuit.**

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET034	CLUTCH SIGNAL DETECTED

STATUS DEFINITION	**NO:** This status indicates that the clutch pedal has not been depressed since the ignition was switched on. **YES:** This status indicates that the clutch pedal has been depressed since the ignition was switched on.

NOTES	**Special notes:** Only perform these tests if the parameters do not correspond with the system operation programming.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

NO	When the vehicle ignition is switched on without depressing the clutch pedal, status **ET034** is **NO**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V18_ET034 / EDC16CP33_V1C_ET034 / EDC16CP33_V54_ET034 / EDC16CP33_V20_ET034 / EDC16CP33_V58_ET034 / EDC16CP33_V5C_ET034 / EDC16CP33_V24_ET034 / EDC16CP33_V04_ET034 / EDC16CP33_V08_ET034 / EDC16CP33_V44_ET034 / EDC16CP33_V4C_ET034 / EDC16CP33_V34_ET034 / EDC16CP33_V38_ET034 / EDC16CP33_V74_ET034 / EDC16CP33_V28_ET034 / EDC16CP33_V62_ET034 / EDC16CP33_V26_ET001 / EDC16CP33_V60_ET001

GETtheMANUALS.org

ET034 CONTINUED	

YES	When the driver depresses the clutch pedal, status **ET034** becomes **YES** until the ignition is next switched off. If **NO** appears despite the clutch pedal being depressed, carry out the following operations: – Remove the clutch pedal switch, check the **insulation** between connections **M** and **86D** of component **675**, with the switch in the rest position. – Repeat this operation with the switch engaged and check the **continuity** between the two connections. If these 2 checks are faulty, replace the switch. Check the condition of the clutch switch connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 675**). Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 120**). If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring. Then check the **continuity** and **absence of interference resistance** of the connection: • **86D** between components **120** and **675**. – Check for complete **earthing** on connection **M** of component **675**. If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET038	ENGINE

STATUS DEFINITION	**+ AFTER IGNITION:** This status indicates that the engine is in **+ after ignition feed**. **RUNNING:** This status indicates that the engine is running. **STOPPED:** This status indicates that the engine is stopped.

Conformity check with engine stopped and ignition on.

+ APC	This status indicates that the engine is in **+ after ignition feed**. In the event of a fault, switch off the ignition, wait for the message to appear on the **diagnostic tool** (maximum time **8 minutes**): **Loss of dialogue with the computer: EDC16 CP33, check the connection of the tool and the computer supply**. If the fault is still present, contact the Techline.

Conformity check with the engine running and engine coolant temperature > 80°C

"RUNNING"	This status indicates that the engine is running. In the event of a fault, switch off the ignition, wait for the message to appear on the **diagnostic tool** (maximum time **8 minutes**): **Loss of dialogue with the computer: EDC16 CP33, check the connection of the tool and the computer supply**, If the fault is still present, contact the Techline.
"STOPPED"	This status indicates that the engine has just cut out, without the ignition being switched off.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET042	CRUISE CONTROL/SPEED LIMITER

STATUS DEFINITION	**NOT DETECTED:** This status indicates that the cruise control or speed limiter function is not present on the vehicle. **INACTIVE:** This status indicates that the main on/off switch of the cruise control/speed limiter is in the rest (or neutral) position. **LIMITER:** This status indicates that the driver has used the main switch to select the speed limiter. **CRUISE CONTROL:** This status indicates that the driver has used the main switch to select the cruise control.

NOTES	**Special notes:** Only perform these tests if the parameters do not correspond with the system operation programming.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

NOT DETECTED	The cruise control or speed limiter function is not present on the vehicle.
INACTIVE	No button has been pressed.
LIMITER	The speed limiter **ON/OFF** button has been pressed. Lights the orange warning light on the instrument panel.
CRUISE CONTROL	The cruise control **ON/OFF** button has been pressed. Lights the green warning light on the instrument panel.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V18_ET042 / EDC16CP33_V1C_ET042 / EDC16CP33_V54_ET042 / EDC16CP33_V20_ET042 / EDC16CP33_V58_ET042 / EDC16CP33_V5C_ET042 / EDC16CP33_V24_ET042 / EDC16CP33_V04_ET042 / EDC16CP33_V08_ET042 / EDC16CP33_V44_ET042 / EDC16CP33_V4C_ET042 / EDC16CP33_V34_ET042 / EDC16CP33_V38_ET042 / EDC16CP33_V74_ET042 / EDC16CP33_V28_ET042 / EDC16CP33_V62_ET042 / EDC16CP33_V26_ET042 / EDC16CP33_V60_ET042

GETtheMANUALS.org

ET042 CONTINUED 1	

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

NOT DETECTED	If the vehicle is not fitted with cruise control/speed limiter function buttons, status **ET042 Cruise control/speed limiter** is permanently **NOT DETECTED**. Confirmation of the absence of the cruise control or speed limiter function on the vehicle. If the vehicle is fitted with cruise control or speed limiter function buttons and the main switch is in the rest (or neutral) position and after the injection computer has been programmed or reprogrammed, then status **ET042** is **NOT DETECTED**. To activate the cruise control or speed limiter function, press the main switch in the cruise control position and then in the speed limiter position. Return to rest position The tool displays status **ET042: INACTIVE**. If not, several steps must be checked: 1. Return to the multiplex network test page on the Clip application. Repeat the multiplex network test. Re-establish dialogue with the injection computer. Check **ET042**. If **ET042** is **INACTIVE**, the injection computer has detected the various positions of the main switch. The cruise control/speed limiter is active. 2. If **ET042** is still **NOT DETECTED**, check that the owner of the vehicle has not had the cruise control/speed limiter function deactivated in the past. Contact the Techline.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET042 CONTINUED 2	

"INACTIVE"	When the main button is in rest position (or Neutral), status **ET042 Cruise control/ speed limiter** is **INACTIVE**. If **CRUISE CONTROL** or **SPEED LIMITER** appears despite the main switch being in the rest (or neutral) position, carry out the following operations: Check the connections of the cruise control/speed limiter main switch. Check for **+12 V after ignition** on the switch connector on the following connections: • **AP10** of component **1081** (for **Vel Satis ph 2, Laguna II ph2** and **Espace IV ph2**), • **AP43** of component **1081** (for **Mégane II ph2**), • **AP43** of component **1546** (for **Scénic II ph2**). Disconnect the main switch, and when it is in the rest position, check the **insulation** between the following connections: • **AP10** and **3FX** of component **1081** (for **Vel Satis ph2, Laguna II ph2** and **Espace IV ph2**), • **AP10** and **3PD** of component **1081** (for **Vel Satis ph2, Laguna II ph2** and **Espace IV ph2**), • **AP43** and **3FX** of component **1081** (for **Mégane II ph2**), • **AP43** and **3PD** of component **1081** (for **Mégane II ph2**), • **AP43** and **3FX** of component **1546** (for **Scénic II ph2**), • **AP43** and **3PD** of component **1546** (for **Scénic II ph2**). With speed limiter selected, check the **continuity** between the following connections: • **AP10** and **3PD** of component **1081** (for **Vel Satis ph2, Laguna II ph2** and **Espace IV ph2**), • **AP43** and **3PD** of component **1081** (for **Mégane II ph2**), • **AP43** and **3PD** of component **1546** (for **Scénic II ph2**). With cruise control selected, check the **continuity** between the following connections: • **AP10** and **3FX** of component **1081** (for **Vel Satis ph2, Laguna II ph2** and **Espace IV ph2**), • **AP43** and **3FX** of component **1081** (for **Mégane II ph2**), • **AP43** and **3FX** of component **1546** (for **Scénic II ph2**).

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET042 CONTINUED 3	

"INACTIVE"	If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it. Check the **continuity**, **insulation** and the **absence of interference resistance** of the following connections: • **3FX** and **3PD** between components **1081** and **120** (for **Vel Satis ph2, Laguna II ph2, Espace IV ph2** and **Mégane II ph2**), • **3FX** and **3PD** between components **1546** and **120** (for **Scénic II ph2**). If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it. Also check: The engine management computer connections. If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET042 CONTINUED 4	

LIMITER	When the driver presses the main switch to the speed limiter position, status **ET042 Cruise control / speed limiter** becomes **SPEED LIMITER**. If **CRUISE CONTROL or INACTIVE** appears although the switch was pressed in the speed limiter position, carry out the following operations: Check the connections of the cruise control/speed limiter main switch. Check for **+12 V after ignition** on the switch connector on the following connections: • **AP10** of component **1081** (for **Vel Satis ph2, Laguna II ph2** and **Espace IV ph2**), • **AP43** of component **1081** (for **Mégane II ph2**), • **AP43** of component **1546** (for **Scénic II ph2**). Disconnect the main switch, and when it is in the rest position, check the **insulation** between the following connections: • **AP10** and **3FX** of component **1081** (for **Vel Satis ph2, Laguna II ph2** and **Espace IV ph2**), • **AP10** and **3PD** of component **1081** (for **Vel Satis ph2, Laguna II ph2** and **Espace IV ph2**), • **AP43** and **3FX** of component **1081** (for **Mégane II ph2**), • **AP43** and **3PD** of component **1081** (for **Mégane II ph2**), • **AP43** and **3FX** of component **1546** (for **Scénic II ph2**), • **AP43** and **3PD** of component **1546** (for **Scénic II ph2**). With speed limiter selected, check the **continuity** between the following connections: • **AP10** and **3PD** of component **1081** (for **Vel Satis ph2, Laguna II ph2** and **Espace IV ph2**), • **AP43** and **3PD** of component **1081** (for **Mégane II ph2**), • **AP43** and **3PD** of component **1546** (for **Scénic II ph2**). With cruise control selected, check the **continuity** between the following connections: • **AP10** and **3FX** of component **1081** (for **Vel Satis ph2, Laguna II ph2** and **Espace IV ph2**), • **AP43** and **3FX** of component **1081** (for **Mégane II ph2**), • **.AP43** and **3FX** of component **1546** (for **Scénic II ph2**). If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

ET042 CONTINUED 6	

CRUISE CONTROL	When the driver presses the cruise control switch, status **ET042 Cruise control/ speed limiter** becomes **CRUISE CONTROL**. If **SPEED LIMITER** or **INACTIVE** appears although the driver pressed the switch in the cruise control position, carry out the following operations: Check the connections of the cruise control/speed limiter main switch. Check for **+12 V after ignition** on the switch connector on the following connections: • **AP10** of component **1081** (for **Vel Satis ph2, Laguna II ph2** and **Espace IV ph2**). • **AP43** of component **1081** (for **Mégane II ph2**). • **AP43** of component **1546** (for **Scénic II ph2**). Disconnect the main switch, and when it is in the rest position, check the **insulation** between the following connections: • **AP10** and **3FX** of component **1081** (for **Vel Satis ph2, Laguna II ph2** and **Espace IV ph2**), • **AP10** and **3PD** of component **1081** (for **Vel Satis ph2, Laguna II ph2** and **Espace IV ph2**), • **AP43** and **3FX** of component **1081** (for **Mégane II ph2**), • **AP43** and **3PD** of component **1081** (for **Mégane II ph2**), • **AP43** and **3FX** of component **1546** (for **Scénic II ph2**), • **AP43** and **3PD** of component **1546** (for **Scénic II ph2**). With speed limiter selected, check the **continuity** between the following connections: • **AP10** and **3PD** of component **1081** (for **Vel Satis ph2, Laguna II ph2** and **Espace IV ph2**), • **AP43** and **3PD** of component **1081** (for **Mégane II ph2**), • **AP43** and **3PD** of component **1546** (for **Scénic II ph2**). With cruise control selected, check the **continuity** between the following connections: • **AP10** and **3FX** of component **1081** (for **Vel Satis ph2, Laguna II ph2** and **Espace IV ph2**), • **AP43** and **3FX** of component **1081** (for **Mégane II ph2**), • **.AP43** and **3FX** of component **1546** (for **Scénic II ph2**).

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET042 CONTINUED 7	

CRUISE CONTROL	If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it. Check the **continuity**, **insulation** and the **absence of interference resistance** of the following connections: • **3FX** and **3PD** between components **1081** and **120** (for **Vel Satis ph2, Laguna II ph2, Espace IV ph2** and **Mégane II ph2**), • **3FX** and **3PD** between components **1546** and **120** (for **Scénic II ph2**). GETtheMANUALS.org

ET120	PRE-POSTHEATING SIGNAL

STATUS DEFINITION	**PRESENT:** This status indicates that the pre-postheating signal is still active. **ABSENT:** This status indicates that the pre-postheating signal is not active.

NOTES	Test the battery and run fault finding on the charging circuit (see **Technical Note 6014A, Checking the charging circuit**).

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

"PRESENT"	Status **ET120** is **PRESENT** when preheating is activated. Refer to the interpretation of fault **DF025 Preheating unit diagnostic line**, if status **ET120** remains **ABSENT**.
"ABSENT"	Status **ET120** is **ABSENT** when the pre-postheating is not activated. Consult the interpretation of faults **DF025 Preheating unit diagnostic line** and **DF017 Preheating unit control circuit** if status **ET120** is **PRESENT** instead of **ABSENT**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V18_ET120 / EDC16CP33_V1C_ET120 / EDC16CP33_V54_ET120 / EDC16CP33_V20_ET120 / EDC16CP33_V58_ET120 / EDC16CP33_V5C_ET120 / EDC16CP33_V24_ET120 / EDC16CP33_V04_ET120 / EDC16CP33_V08_ET120 / EDC16CP33_V44_ET120 / EDC16CP33_V4C_ET120 / EDC16CP33_V34_ET120 / EDC16CP33_V38_ET120 / EDC16CP33_V74_ET120 / EDC16CP33_V28_ET120 / EDC16CP33_V62_ET120 / EDC16CP33_V26_ET120 / EDC16CP33_V60_ET120

GETtheMANUALS.org

ET143	LOW-SPEED FAN ASSEMBLY RELAY CONTROL

STATUS DEFINITION	This status indicates whether the low speed fan assembly is active.

NOTES	**Special notes:** Only perform these tests if the parameters do not correspond with the system operation programming.
	If the vehicle is fitted with air conditioning, the fan assembly electrical circuit includes **2 relays**. The 1st speed fan assembly relay will be actuated when the engine coolant temperature exceeds **99°C** and its function is to cool the engine so that the engine temperature does not exceed **102°C**. If the engine coolant temperature exceeds **102°C**, the 2nd speed fan assembly relay will be actuated and the fan will rotate faster.
	Use the **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2**.

IMPORTANT:
If the vehicle is equipped with air conditioning, the engine cooling fan will operate at 1st speed as soon as the air conditioning compressor is activated.

Conformity check with engine stopped and ignition on.

"INACTIVE"	Engine cold and air conditioning switched off In the event of a fault, consult the interpretation of fault **DF018 Low speed fan assembly control circuit**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V18_ET143 / EDC16CP33_V1C_ET143 / EDC16CP33_V54_ET143 / EDC16CP33_V20_ET143 / EDC16CP33_V58_ET143 / EDC16CP33_V5C_ET143 / EDC16CP33_V24_ET143 / EDC16CP33_V04_ET143 / EDC16CP33_V08_ET143 / EDC16CP33_V44_ET143 / EDC16CP33_V4C_ET143 / EDC16CP33_V34_ET143 / EDC16CP33_V38_ET143 / EDC16CP33_V74_ET143 / EDC16CP33_V28_ET143 / EDC16CP33_V26_ET143

GETtheMANUALS.org

ET143 CONTINUED 1	

Conformity check with the engine running and engine coolant temperature > 80°C

INACTIVE or **ACTIVE**, depending on the engine temperature (air conditioning switched off).
In the event of a fault, refer to the interpretation of fault **DF018**.

Sensor electrical conformity

"ACTIVE"	When the coolant reaches **99°C**, the injection computer actuates the low-speed fan assembly relay, and status **ET143** becomes **ACTIVE**. The relay then supplies the fan assembly and the cooling fan begins to turn. If status **ET143** is **ACTIVE**, but the cooling fan is not running, perform the following operations: Check the condition of fuse **FM15 (60 A)** in the engine fuse and relay box (see **MR364 (Mégane II ph2), MR370 (Scénic II ph2), MR 395 (Laguna II ph2), 402 (Vel Satis ph2), 405 (Espace IV ph2) Mechanical, 81C, Fuses, Fuses: List and location of components**). Disconnect the low speed and high speed relays, check that they are operating correctly and check the condition of the relay mounting connectors (see **Wiring Diagram Technical Note**, **Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 597**). If one of the connectors is faulty and there is a repair procedure (**see Technical Note 6015A, Electrical wiring repair, wiring: precautions for repair**), repair the connector, otherwise replace the wiring. Check the **+ 12 V after relay supply** to the low speed fan assembly relay on the following connection: • **3FB** of component **700**. Check the **continuity** and **absence of interference resistance** of the following connections: • **49L** between components **700** and **321**, • **49B** between components **262** and **321**, • **3JN** between components **700** and **120**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET143 CONTINUED 2	
"ACTIVE"	Check that the **earth** is in order on connection **MAS** of component **262**. If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
"INACTIVE"	If the engine temperature is lower than **99°C**, the engine cooling fan cannot switch on and the low speed fan relay of the cannot be run. Status **ET143** should therefore be **INACTIVE** when the control relay and the engine cooling fan are not supplied.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET144	HIGH-SPEED FAN ASSEMBLY RELAY CONTROL

STATUS DEFINITION	This status indicates whether the high speed fan assembly is active.

NOTES	**Special notes:** Only perform these tests if the parameters do not correspond with the system operation programming.
	If the vehicle is not fitted with air conditioning, low-speed fan assembly relay does not exist. The circuit therefor only contains a single command relay to supply the engine cooling fan. The engine cooling fan will thus have only one operating speed.
	Use the **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2**.

Conformity check with engine stopped and ignition on.

"INACTIVE"	Engine cold and air conditioning switched off In the event of a fault, consult the interpretation of fault **DF019 High speed fan assembly control circuit**.

Conformity check with the engine running and engine coolant temperature > 80°C

INACTIVE or **ACTIVE**, depending on the engine temperature (air conditioning switched off).
In the event of a fault, refer to the interpretation of fault **DF019**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V18_ET144 / EDC16CP33_V1C_ET144 / EDC16CP33_V54_ET144 / EDC16CP33_V20_ET144 / EDC16CP33_V58_ET144 / EDC16CP33_V5C_ET144 / EDC16CP33_V24_ET144 / EDC16CP33_V04_ET144 / EDC16CP33_V08_ET144 / EDC16CP33_V44_ET144 / EDC16CP33_V4C_ET144 / EDC16CP33_V34_ET144 / EDC16CP33_V38_ET144 / EDC16CP33_V74_ET144 / EDC16CP33_V28_ET144 / EDC16CP33_V26_ET144

GETtheMANUALS.org

ET144 CONTINUED 1	

Sensor electrical conformity

"ACTIVE"

When the coolant reaches **102°C**, the injection computer actuates the fan assembly relay and status **ET144** becomes **ACTIVE**. The relay then supplies the cooling fan.

If status **ET144** is **ACTIVE**, but the cooling fan is not running, perform the following operations:

Check the condition of fuse **FM15 (60 A)** in the engine fuse and relay box (see **MR364 (Mégane II ph2), MR370 (Scénic II ph2), MR 395 (Laguna II ph2), 402 (Vel Satis ph2), 405 (Espace IV ph2) Mechanical, 81C, Fuses, Fuses: List and location of components**).

Disconnect the low speed and high speed relays, check that they are operating correctly and check the condition of the relay mounting connectors (see **Wiring Diagram Technical Note**, **Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2, component code 597**).
If one of the connectors is faulty and there is a repair procedure (**see Technical Note 6015A, Electrical wiring repair, wiring: precautions for repair**), repair the connector, otherwise replace the wiring.

Check the **+ 12 V after relay supply** to the high-speed fan assembly relay on the following connection:
- **3FB** of component **234**.

Check the **continuity** and **absence of interference resistance** of the following connections:
- **3JP** between components **234** and **120**,
- **49B** between components **234** and **262**.

Check that the **earth** is in order on connection **MAS** of component **262**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET144 CONTINUED 2	
"INACTIVE"	When the injection computer no longer requests cooling, status **ET144** changes to **INACTIVE**. The fan assembly should then switch off.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

Only for Laguna II ph2 without a particle filter

ET205 **ET206** **ET207**	THERMOPLUNGER 1 RELAY CONTROL THERMOPLUNGER 2 RELAY CONTROL THERMOPLUNGER 3 RELAY CONTROL

STATUS DEFINITION	**ACTIVE:** This status indicates that the thermoplunger is supplied. **INACTIVE:** This status indicates that the thermoplunger is not supplied.

NOTES	None.

"INACTIVE"	Statuses **ET205, ET206, ET207** are **INACTIVE** when the ignition is switched on and the engine stopped, or when the engine is warm.

"ACTIVE"	Statuses **ET205**, **ET206** and **ET207** are **ACTIVE** when the engine is started, the engine coolant temperature is low (< **15°C**) and the air temperature is low (< **5°**). This program allows the engine coolant to be heated to enable the passenger compartment to be heated. The thermoplungers also act both to load the engine to improve regeneration of the particle filter. To control the operation of the thermoplunger relays, run the following commands: **– AC063 Thermoplunger no.1 relay,** **– AC064 Thermoplunger no. 2 relay,** **– AC031 Thermoplunger no.3 relay.** In the event of a fault, refer to the interpretation of faults: **– DF034 "Thermoplunger 3 relay control circuit",** **– DF033 "Heating element 2 relay control circuit",** **– DF032 Thermoplunger 1 relay control circuit.**

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET238	SYNCHRONISATION

STATUS DEFINITION	Synchronisation is carried out during the engine starting phase. The camshaft position sensor and the TDC sensor are synchronised. Once this synchronisation has been carried out, it enables the computer to identify cylinder n°1 and to ascertain the precise position of the cylinder's top dead centre. Synchronisation also allows the computer to determine the injection strategy.

NOTES	**Special notes:** Only perform these tests if the parameters do not correspond with the system operation programming.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

COMPLETED	Status **ET238** is **DONE** when the engine is started. The computer has identified cylinder no. 1 and has identified the exact top dead centre position. Injection phasing and engine management are now possible, and the engine should be working properly.
NOT COMPLETED	Status **ET238** is **NOT COMPLETED** when the engine has been stopped with the + after ignition feed on. If status **ET238** remains **NOT COMPLETED** after an attempted start, consult the interpretation of fault **DF195 Camshaft sensor/engine speed consistency**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V18_ET238 / EDC16CP33_V1C_ET238 / EDC16CP33_V54_ET238 / EDC16CP33_V20_ET238 / EDC16CP33_V58_ET238 / EDC16CP33_V5C_ET238 / EDC16CP33_V24_ET238 / EDC16CP33_V04_ET238 / EDC16CP33_V08_ET238 / EDC16CP33_V44_ET238 / EDC16CP33_V4C_ET238 / EDC16CP33_V34_ET238 / EDC16CP33_V38_ET238 / EDC16CP33_V74_ET238 / EDC16CP33_V28_ET238 / EDC16CP33_V62_ET238 / EDC16CP33_V26_ET238 / EDC16CP33_V60_ET238

ET341	IMMOBILISER CODE PROGRAMMED

STATUS DEFINITION	**YES:** This status indicates that the immobiliser code has been programmed. **NO:** This status indicates that the immobiliser code has not been programmed.

NOTES	**Special notes:** Only perform these tests if the parameters do not correspond with the system operation programming.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

"YES"	Status **ET341** is **YES** if dialogue is possible between the UCH computer and the injection computer and the key code is recognised. The engine is only authorised to start if the code is correctly recognised by the UCH computer and status**ET003 Engine immobiliser** is **INACTIVE**. In the event of a fault, (see **87B, Passenger compartment connection unit, Conformity check**).
"NO"	Status **ET341** is **NO** if dialogue is not possible between the UCH computer and the injection computer (status **ET003** remains **ACTIVE**). This fault may be caused by incorrect key programming or a lack of key programming. In this case, refer to the UCH fault-finding note (see **87B**, **Passenger compartment connection unit**) and follow the key programming procedure. If the key programming is not the cause, run a multiplex network test (see **88B, Multiplexing**) and check that dialogue between the UCH and the injection computer is possible. If dialogue is not established, contact Techline.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V18_ET341 / EDC16CP33_V1C_ET341 / EDC16CP33_V54_ET341 / EDC16CP33_V20_ET341 / EDC16CP33_V58_ET341 / EDC16CP33_V5C_ET341 / EDC16CP33_V24_ET341 / EDC16CP33_V04_ET341 / EDC16CP33_V08_ET341 / EDC16CP33_V44_ET341 / EDC16CP33_V4C_ET341 / EDC16CP33_V34_ET341 / EDC16CP33_V38_ET341 / EDC16CP33_V74_ET341 / EDC16CP33_V28_ET341 / EDC16CP33_V62_ET341 / EDC16CP33_V26_ET341 / EDC16CP33_V60_ET341

GETtheMANUALS.org

ET405	CLUTCH PEDAL SWITCH

STATUS DEFINITION	**ACTIVE:** this status indicates that the clutch pedal is depressed. **INACTIVE:** this status indicates that the clutch pedal is released.

NOTES	Can only be displayed for manual gearboxes.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

"ACTIVE"	**Clutch pedal depressed.** Non-conformity of the brake signals and/or the clutch switch signals can cause the engine to race during gear changes. In the event of a fault, check the electrical conformity of the sensor.
"INACTIVE"	**Clutch pedal released.** Non-conformity of the brake signals and/or the clutch switch signals can cause the engine to race during gear changes. In the event of a fault, check the electrical conformity of the sensor.

Sensor electrical conformity

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V18_ET405 / EDC16CP33_V1C_ET405 / EDC16CP33_V54_ET405 / EDC16CP33_V20_ET405 / EDC16CP33_V58_ET405 / EDC16CP33_V5C_ET405 / EDC16CP33_V24_ET405 / EDC16CP33_V04_ET405 / EDC16CP33_V08_ET405 / EDC16CP33_V44_ET405 / EDC16CP33_V4C_ET405 / EDC16CP33_V34_ET405 / EDC16CP33_V38_ET405 / EDC16CP33_V74_ET405 / EDC16CP33_V28_ET405 / EDC16CP33_V62_ET405 / EDC16CP33_V26_ET405 / EDC16CP33_V60_ET405

ET405 CONTINUED	

"INACTIVE"	Check the condition and fitting of the clutch pedal switch. Remove the clutch pedal switch, check the **insulation** between connections **M** and **86D** of **component 675**, with the switch in the rest position. If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it. Repeat this operation with the switch pressed, and check the **continuity** between the two connections. If these 2 checks are faulty, replace the switch. Then check the **continuity** and **absence of interference resistance** of the following connection: • **86D** between components **120** and **675**. Check that the **earth** is in order on connection **M** of component **675**. If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
"ACTIVE"	Check the condition and fitting of the clutch pedal switch. Remove the clutch pedal switch, check the **insulation** between connections **M** and **86D** of **component 675**, with the switch in the rest position. – Repeat this operation with the switch pressed, and check the **continuity** between the two connections. If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it. If these 2 checks are faulty, replace the switch.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET415	CRUISE CONTROL/SPEED LIMITER DEACTIVATION

STATUS DEFINITION	This status varies according to engine specifications.

NOTES	None.

Note:
Cruise control can be activated when the vehicle speed exceeds **18 mph (30 km/h)**.
Status **ET415** shows various reasons for deactivation of the cruise control / speed limiter function, due to a driver request or the external environment (e.g. **STATUS 1**).

IMPORTANT:
Clear the fault memory by running command **RZ001 "Fault memory" to reset this status to "NONE"**.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

STATUS 1:	Traction control request.
STATUS 2:	Brake pedal depressed.
STATUS 3:	Clutch pedal depressed.
STATUS 4:	Suspend button pressed.
STATUS 5:	Cruise control or speed limiter monitoring.
STATUS 6:	Gear lever in neutral (manual gearbox) or neutral position (automatic gearbox).

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V18_ET415 / EDC16CP33_V1C_ET415 / EDC16CP33_V54_ET415 / EDC16CP33_V20_ET415 / EDC16CP33_V58_ET415 / EDC16CP33_V5C_ET415 / EDC16CP33_V24_ET415 / EDC16CP33_V04_ET415 / EDC16CP33_V08_ET415 / EDC16CP33_V44_ET415 / EDC16CP33_V4C_ET415 / EDC16CP33_V34_ET415 / EDC16CP33_V38_ET415 / EDC16CP33_V74_ET415 / EDC16CP33_V28_ET415 / EDC16CP33_V62_ET415 / EDC16CP33_V26_ET415 / EDC16CP33_V60_ET415

GETtheMANUALS.org

ET415 CONTINUED 1	

STATUS 7:	Inconsistency between the request and the vehicle speed.
STATUS 8:	Automatic transmission in defect mode.
STATUS 9:	Vehicle speed monitoring.
STATUS 10:	Monitoring by injection computer.

Sensor electrical conformity

WITHOUT	This status is present on the **diagnostic tool** if: the computer has been reinitialised, The computer has been reprogrammed.

STATUS 1	**Traction control request**

If the vehicle is fitted with a traction control system, the cruise control function is deactivated every time the ABS computer calls for traction control.

Status **ET415** becomes **STATUS 1** when driving with the cruise control active (**ET042 Cruise control / speed limiter: CRUISE CONTROL**) and traction control is requested.
This deactivates cruise control.

Reinitialise status ET415 on the injection computer by running command RZ001 Fault memory.

If status **ET415** becomes **STATUS 1** with no traction control request (see **38C, Anti-lock braking system**).

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET415 CONTINUED 2	

STATUS 2	**Brake pedal depressed**
	The cruise control function is deactivated when the brake pedal is depressed. Status **ET415** becomes **STATUS 2**, when driving with the cruise control active (**ET042: CRUISE CONTROL**) and brake pedal depressed. This deactivates cruise control. **Reinitialise status ET415 on the injection computer by running command RZ001 Fault memory.** If status **ET415** becomes **STATUS 2** without depressing the brake pedal, consult the interpretation of statuses **ET704 Brake contact no. 1** and **ET705 Brake contact no. 2**.

STATUS 3	**Clutch pedal depressed**
	Manual gearbox ONLY The cruise control function is deactivated when the gearbox is not coupled to the engine (clutch pedal depressed). Status **ET415** becomes **STATUS 3** when driving with the cruise control active (**ET042 Cruise control / speed limiter: CRUISE CONTROL**) and the clutch pedal is depressed. This deactivates cruise control. **Reinitialise status ET415 on the injection computer by running command RZ001 Fault memory.** If status **ET415** becomes **STATUS 3** without the clutch pedal being depressed, consult the interpretation of status **ET405 Clutch pedal switch**. If the vehicle is fitted with an automatic transmission: Test the multiplex network: check the configuration of the multiplex network in relation to the vehicle's technical specification, especially the configuration of the automatic transmission computer (see **88B, Multiplexing**).

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET415 CONTINUED 3	

STATUS 4	**Cancel button pressed**
	The cruise control/speed limiter function is deactivated each time the suspend button is pressed. Status **ET415** becomes **STATUS 4**, when driving when: – Either the cruise control is active, or – the speed limiter is active – and when the **"0"** button is pressed by the driver. This action deactivates the Cruise control/Speed limiter. **Reinitialise status ET415 on the injection computer by running command RZ001 Fault memory.** If status **ET415** becomes **STATUS 4** without pressing the **0** button, consult the interpretation of status **ET703 Cruise control / speed limiter buttons** and run fault finding on the **R/0** control button located on the right-hand side of the steering wheel.

STATUS 5	**Cruise control or speed limiter monitoring**
	This status appears when the vehicle brakes or decelerates sharply without the injection computer receiving a signal that the brake pedal switch has been pressed. If status **ET415** is **STATUS 5**, consult the interpretation: - of status **ET042 Cruise control / speed limiter**, - of status **ET703 Cruise control / speed limiter buttons**, - of status **ET704 Brake switch no. 1**, - of status **ET705 Brake switch no. 2**, to test the cruise control/speed limiter system components and find the defective component. In addition, check the operation of the accelerator pedal, and use the **diagnostic tool** to check for any faults associated with the accelerator pedal. Deal with them if necessary.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET415 CONTINUED 4	

STATUS 5	**Reinitialise status ET415 on the injection computer by running command RZ001 Fault memory.** If status **ET415** changes to **STATUS 5**, deal with **present** faults or those **stored** in the injection computer. If the fault is still present, contact the Techline.

STATUS 6	**Gear lever in neutral (manual gearbox) or neutral (automatic gearbox)**
	Status **ET415** changes to **STATUS 6**, when driving, with cruise control active (**ET042: CRUISE CONTROL**) and: – if the driver puts the gear lever in neutral position on a manual gearbox without declutching or, – if the gear lever is put in neutral on an automatic transmission. This deactivates cruise control. **Reinitialise status ET415 on the injection computer by running command RZ001 Fault memory.** If status **ET415** becomes **STATUS 6** without shifting the gear lever into neutral on a manual gearbox without declutching, or into the neutral position on an automatic transmission, run fault finding on the ABS computer and check the configuration of the tyre size stored in the computer. If the configuration is correct, contact the Techline.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET415 CONTINUED 5	

STATUS 7	**Lack of correlation between the request and the vehicle speed**
	Status **ET415** becomes **STATUS 7** if the computer detects too great a difference between the speed requested by the driver and the vehicle speed. This could occur when driving with the cruise control active (**ET042 Cruise control / speed limiter: CRUISE CONTROL**) on very steep terrain. This inconsistency deactivates cruise control. **Reinitialise status ET415 on the injection computer by running command RZ001 Fault memory.** If status **ET415** becomes **STATUS 7** where the surface is not uneven, contact the Techline.

STATUS 8	**Automatic gearbox in defect mode.**
	Status **ET415** becomes **STATUS 8**, when driving with cruise control active (**ET042: CRUISE CONTROL**) and if the automatic transmission is in defect mode. This signal is conveyed on the **multiplex line** and deactivates the cruise control. Carry out a multiplex network test, then run fault finding on the automatic transmission computer. Deal with any **present** or **stored** faults (see **23A, Automatic transmission**). Clear the automatic transmission computer memory by running command **RZ001**. **Reinitialise status ET415 on the injection computer by running command RZ001 Fault memory.** If **STATUS 8** is still present, contact the Techline.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET415 CONTINUED 6	

STATUS 9	**Vehicle speed monitoring.**
	Status **ET415** becomes **STATUS 9** if the vehicle speed received by the computer is invalid or absent. This signal is conveyed on the **multiplex line** and deactivates the cruise control. Carry out a multiplex network test, then run fault finding on the **ABS** computer. Deal with any **present** or **stored** faults (see **38C, Anti-lock braking system, Interpretation of faults**). **Reinitialise status ET415 on the injection computer by running command RZ001 Fault memory.** If **STATUS 9** is still present, contact the Techline.

STATUS 10	**Monitoring by injection computer.**
	Status **ET415** becomes **STATUS 10** when driving with cruise control active (**ET042 Cruise control / speed limiter: CRUISE CONTROL**) and if the injection computer detects a fault anywhere in the engine management system, or an engine overspeed or underspeed. This signal is conveyed on the **multiplex line** and deactivates the cruise control. Carry out a multiplex network test, then Perform fault finding on the injection computer. Deal with any **present** or **stored** faults (see **Interpretation of faults**). **Reinitialise status ET415 on the injection computer by running command RZ001.** If **STATUS 10** is still present, contact the Techline.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET587	RECIRCULATED EXHAUST GAS COOLING

STATUS DEFINITION	**ACTIVE:** This status indicates that exhaust gas cooling is recirculated. **INACTIVE:** This status indicates that exhaust gas cooling is not recirculated.

NOTES	**Special notes:** Only perform these tests if the parameters do not correspond with the system operation programming.

Conformity check: Engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

INACTIVE:
According to computer programming.
In the event of a fault, consult the interpretation of faults **DF209 EGR valve position sensor circuit** and **DF647 EGR valve position regulation**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET703 CONTINUED 1	

Sensor electrical conformity

"INACTIVE"	Status **ET703** becomes **INACTIVE** when none of the cruise control / speed limiter buttons is pressed. These buttons are located on the steering wheel. If status **ET703** does not display **INACTIVE**, – check the condition of the cruise control / speed limiter **+/-** button and the condition of its connector, – check the condition of the cruise control / speed limiter **R/0** button and the condition of its connector.
"PLUS"	Status **ET703** becomes **PLUS** when the cruise control / speed limiter **+** button is pressed. This button is on the steering wheel, on the left-hand side. If status **ET703** does not display **INCREASE**, check the condition of the cruise control/speed limiter **+/-** button and the condition of its connector. Repair if necessary. To perform these checks and measurements in complete safety, observe the recommendations for removing the driver's front airbag (see **MR Mechanical, 88C, Airbag and pretensioners, Driver's front airbag: Removal - Refitting**). Measure **the resistance** of the following connections while pressing the **+** button (on the button connections): • **86G** of component **331**, • **86M** of component **331.** If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it. If the resistance is not approximately **300** Ω, check the **continuity** of the connection when the button is not pressed. If there is continuity, replace the **+/-** control button. If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET703 CONTINUED 2	

"MINUS"	Status **ET703** becomes **DECREASE** when the **-** button of the cruise control/speed limiter is pressed. This button is on the steering wheel, on the left-hand side. If status **ET703** does not change to **MINUS**, check the condition of the cruise control/ speed limiter **+/-** button, and the condition of its connector. Repair if necessary. To perform these checks and measurements in complete safety, observe the recommendations for removing the driver's front airbag (see **MR Mechanical, 88C, Airbag and pretensioners, Driver's front airbag: Removal - Refitting**). Measure **the resistance** of the following connections while pressing the **-** button (on the button connections): • **86G** of component **331**, • **86M** of component **331.** If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it. If the resistance is not approximately **100** Ω check the **continuity** of the connection when the button is not pressed. If there is **continuity**, replace the **+/-** control button. If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET703 CONTINUED 3	

"SUSPEND"	Status **ET703** becomes **SUSPEND** when the cruise control / speed limiter **0** button is pressed. This button is located on the steering wheel, to the right. If status **ET703** does not change to **SUSPEND**, check the condition of the cruise control / speed limiter **R/0** button, and the condition of its connector. To perform these checks and measurements in complete safety, observe the recommendations for removing the driver's front airbag (see **MR Mechanical, 88C, Airbag and pretensioners, Driver's front airbag: Removal - Refitting**). Measure **the resistance** of the following connections while pressing the **0** button (on the button connections): • **86G** of component **331**, • **86M** of component **331.** If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it. If the resistance is not approximately **0** Ω, replace the **R/0** control button. If there is **continuity**, replace the **R/0** control button. If there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET703 CONTINUED 4	

"REACTIVATE"	Status **ET703** becomes **RESUME** when the **R** button of the cruise control/speed limiter is pressed. This button is located on the steering wheel, to the right. If status **ET703** does not change to **RESUME**, check the status of the cruise control/ speed limiter **R/0** button, and the status of its connector. Repair if necessary. To perform these checks and measurements in complete safety, observe the recommendations for removing the driver's front airbag (see **MR Mechanical, 88C, Airbag and pretensioners, Driver's front airbag: Removal - Refitting**). Measure **the resistance** of the following connections while pressing the **R** button (on the button connections): • **86G** of component **331**, • **86M** of component **331.** If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it. If the resistance is not approximately **900** Ω, check the **continuity** of the connection when the button is not pressed. If there is continuity, replace the **R/0** control button. If there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

ET704 **ET705**	BRAKE SWITCH NO. 1 BRAKE SWITCH NO. 2

STATUS DEFINITION	**ACTIVE**: This status indicates that the brake pedal is depressed. **INACTIVE**: This status indicates that the brake pedal is released.

NOTES	**Note:** Statuses **ET704** and **ET705** must change specification at the same time. If they are inconsistent, refer to the interpretation of fault **DF228 Brake signal**.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

"ACTIVE"	**Brake pedal depressed.** A brake signal non-conformity may cause the engine to race during gear changes. In the event of a fault, consult the interpretation of **ET704** and **ET705**.
"INACTIVE"	**Brake pedal released.** A brake signal non-conformity may cause the engine to race during gear changes. In the event of a fault, consult the interpretation of **ET704** and **ET705**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET704 ET705 CONTINUED 1	

Sensor electrical conformity

"ACTIVE" or "INACTIVE"

If the brake lights are working:
– check **the continuity** and **the absence of interference resistance** on the following connection:

- **5A** between components **160 and 120 / 645 / 119**.

If there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

If the brake lights are not operational, check:
– the condition and fitting of the brake switch,
– the condition and conformity of the brake light fuse,
– the conformity of the values in the following table:

For **MEGANE II ph2** and **SCENIC II ph2** with ESP:

	Continuity between connections:	**Insulation** between connections:
Switch engaged (Brake pedal released)	**5A** and **BPT**	**65G** and **SP17**
Switch released (Brake pedal depressed)	**65G** and **SP17**	**5A** and **BPT**

For **MEGANE II ph2** and **SCENIC II ph2** without ESP:

	Continuity between connections:	**Insulation** between connections:
Switch engaged (Brake pedal released)	**5A BPT**	**65A SP17**
Switch released (Brake pedal depressed)	**65A SP17**	**5A BPT**

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET704 ET705 CONTINUED 2	

"ACTIVE" or "INACTIVE"

For **Laguna II ph2** and **Espace IV ph2**

	Continuity between connections:	**Insulation** between connections:
Switch engaged (Brake pedal released)	**5A** and **SP13**	**65A** and **AP10**
Switch released (Brake pedal depressed)	**65A** and **AP10**	**5A** and **SP13**

For **Vel Satis ph2**

	Continuity between connections:	**Insulation** between connections:
Switch engaged (Brake pedal released)	**5A** and **SP13**	**65G** and **AP10**
Switch released (Brake pedal depressed)	**65G** and **AP10**	**5A** and **SP13**

Replace the switch if the values obtained are not correct.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET706 **ET707** **ET708** **ET709** **ET710** **ET711** **ET712** **ET713** **ET714** **ET715** **CONTINUED**	

Conformity check: Engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

This status indicates the recorded engine status in the event of a regeneration failure when driving: **NONE**, **+ AFTER IGNITION**, **RUNNING**, **STOPPED**.

Each **STATUS** between **ET706** and **ET715** corresponds to failed regenerations for which the mileage is recorded by **PR794 Stored regeneration failure No. 1** to **PR803 Stored regeneration failure No. 10** (for example, **PR797 Stored regeneration failure No. 4** is linked to **ET709**).

"RUNNING"	If the **STATUS** is **RUNNING**, the regeneration failed because: – the customer's driving did not generate enough heat, – an engine management system component is defective.
"STOPPED"	If the **STATUS** is **STOPPED**, the regeneration failed because the engine was switched off.
+ APC	POWER LATCH
"NONE"	No failed regeneration is present.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

ET742 **ET743** **ET744** **ET745** **ET746** **ET747** **ET748** **ET749** **ET750** **ET751** **CONTINUED**	

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

STATUS1	**Request by weight of soot** Regeneration was requested based on the measurement of maximum soot weight in the particle filter, without the particle filter warning light coming on.
STATUS2	**Request by estimated weight of soot** Regeneration was requested based on an estimation of maximum soot weight in the particle filter, without the particle filter warning light coming on.
STATUS3	**Request by distance travelled** Regeneration has been requested after a maximum distance has been travelled since the last successful regeneration without the particle filter warning light coming on.
STATUS4	**Request by number of regeneration failures or weight of soot** This status corresponds to the appearance of **DF312 Speed request**. This corresponds to the maximum number of failed regeneration or to the maximum weight of soot in the particle filter, with the particle filter warning light coming on.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET776	RECIRCULATED EXHAUST GAS COOL* SETPOINTS

STATUS DEFINITION	**ACTIVE**: This status indicates that the recirculated exhaust gas cooling setpoint is active. **INACTIVE**: This status indicates that the recirculated exhaust gas cooling setpoint is not active.

NOTES	None.

Conformity check: Engine stopped and ignition on and Engine running and engine coolant temperature > 80°C

This status gives a setpoint for status **ET587 Recirculated exhaust gas cooling**. This programming changes depending on the computer.
In the event of a fault, see the interpretation of faults **DF209 EGR valve position sensor circuit** and **DF647 EGR valve position regulation.**

COOL*: Cooling

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET781	HEATER PLUGS

STATUS DEFINITION	This status indicates what type of heater plugs are fitted to the engine.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

STATUS1	Slow plugs
STATUS2	Fast plugs
STATUS3	NOT DEFINED

Electrical conformity

STATUS1	Slow plugs
	Status **ET781** is **STATUS 1** if the heater plugs fitted to the engine have black rings, otherwise run command **SC036 Reinitialise programming** and select **HEATER PLUGS** (see **Interpretation of commands**).

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET781 CONTINUED	

STATUS2	Fast plugs
	Status **ET781** is **STATUS 2** if the heater plugs fitted to the engine have white rings, otherwise run command **SC036** and select **HEATER PLUGS** (see **Interpretation of commands**).

STATUS3	NOT DEFINED
	Status **ET781** is **STATUS 3** when the heater plugs are not configured in the injection computer. To determine the heater plugs fitted to the engine, visually check the colour of the plug rings, then run command **SC036** and select **HEATER PLUGS** (see **Interpretation of commands**).

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR002	ALTERNATOR CHARGE

PARAMETER DEFINITION	This parameter indicates the alternator charge value in %.

NOTES	None.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

The alternator load value changes depending on the battery voltage and the electrical consumers.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR005	EGR VALVE OPENING VALUE REQUIRED

PARAMETER DEFINITION	This parameter indicates a theoretical opening value for the EGR valve giving optimum engine performance in %.

NOTES	**Special notes:** Only perform these tests if the parameters do not correspond with the system operation programming.

Conformity check: Engine stopped and ignition on

The theoretical opening value for the EGR valve should be between:
- 10 < PR005 < 0%.

Conformity check with the engine running and engine coolant temperature > 80°C

The theoretical opening value for the EGR valve is between:
10 < PR005 < 40%.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V18_PR005 / EDC16CP33_V1C_PR005 / EDC16CP33_V54_PR005 / EDC16CP33_V20_PR005 / EDC16CP33_V58_PR005 / EDC16CP33_V5C_PR005 / EDC16CP33_V24_PR005 / EDC16CP33_V04_PR005 / EDC16CP33_V08_PR005 / EDC16CP33_V44_PR005 / EDC16CP33_V4C_PR005 / EDC16CP33_V34_PR005 / EDC16CP33_V38_PR005 / EDC16CP33_V74_PR005 / EDC16CP33_V28_PR005 / EDC16CP33_V62_PR005 / EDC16CP33_V26_PR005 / EDC16CP33_V60_PR005

GETtheMANUALS.org

PR006	RAIL PRESSURE REGULATOR CURRENT

PARAMETER DEFINITION	This parameter indicates the current absorbed by the rail pressure regulator in **mA**.

NOTES	**Special notes:** Only perform these tests if the parameters do not correspond with the system operation programming.

Conformity check: Engine stopped and ignition on, or Engine running, and engine coolant temperature > 80°C

This parameter indicates the current absorbed by the rail pressure regulator **PR006** ≈ **PR007 Rail pressure regulator current setpoint**.
In the event of a fault, consult the interpretation of fault **DF898 Rail pressure regulator circuit**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V18_PR006 / EDC16CP33_V1C_PR006 / EDC16CP33_V54_PR006 / EDC16CP33_V20_PR006 / EDC16CP33_V58_PR006 / EDC16CP33_V5C_PR006 / EDC16CP33_V24_PR006 / EDC16CP33_V04_PR006 / EDC16CP33_V08_PR006 / EDC16CP33_V44_PR006 / EDC16CP33_V4C_PR006 / EDC16CP33_V34_PR006 / EDC16CP33_V38_PR006 / EDC16CP33_V74_PR006 / EDC16CP33_V28_PR006 / EDC16CP33_V62_PR006 / EDC16CP33_V26_PR006 / EDC16CP33_V60_PR006

PR009	TURBOCHARGING PRESSURE SETPOINTS

PARAMETER DEFINITION	This parameter indicates the theoretical turbocharging pressure setpoint value in **bar**.

NOTES	**Special notes:** Only perform these tests if the parameters do not correspond with the system operation programming.

Conformity check: Engine stopped and ignition on, or Engine running, and engine coolant temperature > 80°C

The theoretical turbocharging pressure value is a setpoint of:
PR009 ≈ 1 bar.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V18_PR009 / EDC16CP33_V1C_PR009 / EDC16CP33_V54_PR009 / EDC16CP33_V20_PR009 / EDC16CP33_V58_PR009 / EDC16CP33_V5C_PR009 / EDC16CP33_V24_PR009 / EDC16CP33_V04_PR009 / EDC16CP33_V08_PR009 / EDC16CP33_V44_PR009 / EDC16CP33_V4C_PR009 / EDC16CP33_V34_PR009 / EDC16CP33_V38_PR009 / EDC16CP33_V74_PR009 / EDC16CP33_V28_PR009 / EDC16CP33_V62_PR009 / EDC16CP33_V26_PR009 / EDC16CP33_V60_PR009

GETtheMANUALS.org

PR015	ENGINE TORQUE

PARAMETER DEFINITION	This parameter indicates the engine torque in **Nm**.

NOTES	None.

Conformity check: Engine running, engine coolant temperature > 80°C, without electrical consumers

The engine torque value must be between:
20 N.m < PR015 < 40 N.m.
This parameter is only valid when the engine is running.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR017	FUEL FLOW

PARAMETER DEFINITION	This parameter indicates the fuel flow in **mg/st**.

NOTES	**Special notes:** Only perform these tests if the parameters do not correspond with the system operation programming.

Conformity check: Engine stopped and ignition on

The fuel flow value must be:
PR017 = 0 mg/st (ignition on).
In the event of a fault, consult the interpretation of **DF897 Pump pressure regulator circuit**.

Conformity check with the engine running and engine coolant temperature > 80°C

Engine running: PR017 = PR157: Fuel flow setpoint.
In the event of a fault, refer to the interpretation of fault **DF897**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V18_PR017 / EDC16CP33_V1C_PR017 / EDC16CP33_V54_PR017 / EDC16CP33_V20_PR017 / EDC16CP33_V58_PR017 / EDC16CP33_V5C_PR017 / EDC16CP33_V24_PR017 / EDC16CP33_V04_PR017 / EDC16CP33_V08_PR017 / EDC16CP33_V44_PR017 / EDC16CP33_V4C_PR017 / EDC16CP33_V34_PR017 / EDC16CP33_V38_PR017 / EDC16CP33_V74_PR017 / EDC16CP33_V28_PR017 / EDC16CP33_V62_PR017 / EDC16CP33_V26_PR017 / EDC16CP33_V60_PR017

GETtheMANUALS.org

PR022	EGR VALVE POSITION FEEDBACK LOOP DIFFERENCE

PARAMETER DEFINITION	This parameter indicates the percentage difference between the setpoint and the EGR valve position.

NOTES	**Special notes:** Only perform these tests if the parameters do not correspond with the system operation programming.

Conformity check: Engine stopped and ignition on

This parameter indicates the percentage difference between the setpoint and the EGR valve position.
In the event of a fault, consult the interpretation of faults **DF209 EGR valve position sensor circuit** and **DF647 EGR valve position regulation.**

Conformity check with the engine running and engine coolant temperature > 80°C

The **PR022** value must be between:
- 5% < PR022 < + 5%.
In the event of a fault, refer to the interpretation of faults **DF209** and **DF647**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V18_PR022 / EDC16CP33_V1C_PR022 / EDC16CP33_V54_PR022 / EDC16CP33_V20_PR022 / EDC16CP33_V58_PR022 / EDC16CP33_V5C_PR022 / EDC16CP33_V24_PR022 / EDC16CP33_V04_PR022 / EDC16CP33_V08_PR022 / EDC16CP33_V44_PR022 / EDC16CP33_V4C_PR022 / EDC16CP33_V34_PR022 / EDC16CP33_V38_PR022 / EDC16CP33_V74_PR022 / EDC16CP33_V28_PR022 / EDC16CP33_V62_PR022 / EDC16CP33_V26_PR022 / EDC16CP33_V60_PR022

GETtheMANUALS.org

PR023	DIFFERENCE IN AIR FLOW

PARAMETER DEFINITION	This parameter indicates the difference between the inlet air flow and the air entering the engine in **mg/st**.

NOTES	None.

Conformity check: Engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

In the event of a fault, consult the interpretation of fault **DF056 Air flow sensor circuit**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR030	ACCELERATOR PEDAL POSITION

PARAMETER DEFINITION	This parameter indicates the accelerator pedal position as a percentage.

NOTES	**There must be no present or stored faults.** Perform this fault finding procedure: – after finding an inconsistency in the parameter, – after a customer complaint (e.g. lack of power, etc.).

Conformity check: Engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

If no pressure is being applied to the pedal PR030 = 0%.
In the event of a fault, consult the interpretation of **DF196 Pedal sensor circuit gang 1** or **DF198 Pedal sensor circuit gang 2**.

Sensor electrical conformity

Check the **continuity** and **absence of interference resistance** of the following connections:
– **3LR** between components **120** and **921**,
– **3LS** between components **120** and **921**,
– **3LT** between components **120** and **921**,
– **3LU** between components **120** and **921**,
– **3LW** between components **120** and **921**,
– **3LV** between components **120** and **921**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V18_PR030 / EDC16CP33_V1C_PR030 / EDC16CP33_V54_PR030 / EDC16CP33_V20_PR030 / EDC16CP33_V58_PR030 / EDC16CP33_V5C_PR030 / EDC16CP33_V24_PR030 / EDC16CP33_V04_PR030 / EDC16CP33_V08_PR030 / EDC16CP33_V44_PR030 / EDC16CP33_V4C_PR030 / EDC16CP33_V34_PR030 / EDC16CP33_V38_PR030 / EDC16CP33_V74_PR030 / EDC16CP33_V28_PR030 / EDC16CP33_V62_PR030 / EDC16CP33_V26_PR030 / EDC16CP33_V60_PR030

GETtheMANUALS.org

PR030 CONTINUED	

The accelerator pedal sensor should be **connected,** the vehicle should have the **ignition on** and the **engine switched off**:

– Check that the accelerator pedal value is:
PR030 = 0%: no load,
100% < PR030 < 120%: full load,
135% < PR030 < 145%: full load after pedal kickdown point.
If the value is not correct, replace the pedal sensor.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR035	ATMOSPHERIC PRESSURE

PARAMETER DEFINITION	This parameter indicates the atmospheric pressure in **bar**. The sensor is integrated in the computer.

NOTES	**Special notes:** Only perform these tests if the parameters do not correspond with the system operation programming.

Conformity check: Engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

The atmospheric pressure value must be between:
0.80 bar < PR035 < 1.20 bar.
In the event of a fault, consult the interpretation of fault **DF004 Turbocharging pressure sensor circuit** and **DF200 Atmospheric pressure sensor**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR037	REFRIGERANT PRESSURE

PARAMETER DEFINITION	This parameter indicates the refrigerant pressure in **bar**.

NOTES	**Special notes:** Only perform these tests if the parameters do not correspond with the system operation programming.

Conformity check with the engine running and engine coolant temperature > 80°C

The value should be higher than **2 bar**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V18_PR037 / EDC16CP33_V1C_PR037 / EDC16CP33_V54_PR037 / EDC16CP33_V20_PR037 / EDC16CP33_V58_PR037 / EDC16CP33_V5C_PR037 / EDC16CP33_V24_PR037 / EDC16CP33_V04_PR037 / EDC16CP33_V08_PR037 / EDC16CP33_V44_PR037 / EDC16CP33_V4C_PR037 / EDC16CP33_V34_PR037 / EDC16CP33_V38_PR037 / EDC16CP33_V74_PR037 / EDC16CP33_V60_PR037 / EDC16CP33_V62_PR037

GETtheMANUALS.org

PR038	RAIL PRESSURE

PARAMETER DEFINITION	This parameter indicates the rail pressure in **bar**.

NOTES	**There must be no present or stored faults.** Perform this fault finding procedure: – after finding an inconsistency in the parameter, – after a customer complaint (starting faults, poor performance, stalling etc.), – after interpretation of command **AC225 Rail pressure regulator**.
	Special notes: Only perform these tests if the parameters do not correspond with the system operation programming.

Conformity check: Engine stopped and ignition on

The rail pressure value is between:
0 bar < PR038 < 90 bar if the coolant temperature **< 30°C.**
In the event of a fault, consult the interpretation of fault **DF007 Rail pressure sensor circuit**.

Conformity check with the engine running and engine coolant temperature > 80°C

The rail pressure value must be between:
250 bar < PR038 < 290 bar (at idle speed),
1680 bar < PR038 < 1720 bar (full load).
In the event of a fault, refer to the interpretation of fault **DF007**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V18_PR038 / EDC16CP33_V1C_PR038 / EDC16CP33_V54_PR038 / EDC16CP33_V20_PR038 / EDC16CP33_V58_PR038 / EDC16CP33_V5C_PR038 / EDC16CP33_V24_PR038 / EDC16CP33_V04_PR038 / EDC16CP33_V08_PR038 / EDC16CP33_V44_PR038 / EDC16CP33_V4C_PR038 / EDC16CP33_V34_PR038 / EDC16CP33_V38_PR038 / EDC16CP33_V74_PR038 / EDC16CP33_V38_PR028 / EDC16CP33_V62_PR038 / EDC16CP33_V26_PR038 / EDC16CP33_V60_PR038

GETtheMANUALS.org

PR038 CONTINUED	

Sensor electrical conformity

Check the condition of the rail pressure sensor connector (see **Wiring Diagram Technical Note, Vehicle, Component code 1032**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note, Vehicle, Component code 120**).
If one of the connectors is faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.
Check the **continuity** and **absence of interference resistance** of the following connections:

- **3LX** between components **120** and **1032**,
- **3LY** between components **120** and **1032**,
- **3LZ** between components **120** and **1032**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Check that there are no external diesel leaks from the high pressure fuel circuit.
With the ignition on and the engine stopped for over **1 minute:**
View parameter **PR038 Rail pressure**.
– If the pressure is below **90 bar**, the sensor is in order.
– If the pressure is above **90 bar**, contact the Techline.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR041	TURBOCHARGING PRESSURE

PARAMETER DEFINITION	This parameter indicates the turbocharging pressure in **bar**.

NOTES	None.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

The turbocharging pressure value must be:
PR041 = PR035 Atmospheric pressure + /- 0.20 bar.
In the event of a fault, consult the interpretation of **DF004 Turbocharging pressure sensor circuit**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V18_PR041 / EDC16CP33_V1C_PR041 / EDC16CP33_V54_PR041 / EDC16CP33_V20_PR041 / EDC16CP33_V58_PR041 / EDC16CP33_V5C_PR041 / EDC16CP33_V24_PR041 / EDC16CP33_V04_PR041 / EDC16CP33_V08_PR041 / EDC16CP33_V44_PR041 / EDC16CP33_V4C_PR041 / EDC16CP33_V34_PR041 / EDC16CP33_V38_PR041 / EDC16CP33_V74_PR041 / EDC16CP33_V28_PR041 / EDC16CP33_V62_PR041 / EDC16CP33_V26_PR041 / EDC16CP33_V60_PR041

GETtheMANUALS.org

PR041 CONTINUED	

Sensor electrical conformity

Check the **continuity** and **absence of interference resistance** of the following connections:
- **3LQ** between components **120** and **1071**,
- **3LP** between components **120** and **1071**,
- **3LN** between components **120** and **1071**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Vehicle with the ignition on, and the engine stopped for at least 1 minute:
Compare the values of **PR041 Turbocharging pressure** and **PR035 Atmospheric pressure**.

If the difference between **PR041** and **PR035** is greater than **0.1 bar**,
check the value of **PR035** by comparing it with the reading on a vehicle in the workshop which is correct.

If the value of **PR035** is not correct (difference greater than **0.1 bar** between the 2 vehicles), contact the Techline.

Otherwise (when the value of **PR035** is correct), replace the turbocharger pressure sensor.

If the difference between **PR041** and **PR035** is less than **0.1 bar**.

Start the engine, with the engine idling:
Compare the values of **PR041** and **PR035**.

If the difference between **PR041** and **PR035** is greater than **0.2 bar**.

Check the air inlet circuit:
Apply **Test 4 Turbocharged air inlet circuit check**.
Low and **high pressure** air circuit **sealed** and **not obstructed**: ducts, mounting clamps present and tightened, turbocharging pressure sensor fitted, exchanger, etc.
Check that the damper valve is not jammed closed.
Repair if necessary.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR042	FILTERED TURBOCHARGING PRESSURE

PARAMETER DEFINITION	This parameter indicates the filtered turbocharging pressure in **bar**.

NOTES	None.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

PR042 corresponds to the average value of **PR041 Turbocharging pressure.**

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR048	RAIL PRESSURE REGULATION VALVE OCR*

PARAMETER DEFINITION	This parameter indicates the turbocharger pressure opening cyclic ratio in %.

NOTES	None.

Conformity check: Engine stopped and ignition on

The turbo pressure opening cyclic ratio value must be:
PR048 = 15%
In the event of a fault, consult the interpretation of faults **DF007 Rail pressure sensor circuit** and **DF053 Rail pressure regulation function**.

Conformity check: Engine running, engine coolant temperature > 80°C, without electrical consumers

The turbo pressure opening cyclic ratio value must be between:
35% < PR048 < 45%
In the event of a fault, refer to the interpretation of fault **DF007**.

OCR*: Opening Cyclic Ratio

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V18_PR048 / EDC16CP33_V1C_PR048 / EDC16CP33_V54_PR048 / EDC16CP33_V20_PR048 / EDC16CP33_V58_PR048 / EDC16CP33_V5C_PR048 / EDC16CP33_V24_PR048 / EDC16CP33_V04_PR048 / EDC16CP33_V08_PR048 / EDC16CP33_V44_PR048 / EDC16CP33_V4C_PR048 / EDC16CP33_V34_PR048 / EDC16CP33_V38_PR048 / EDC16CP33_V74_PR048 / EDC16CP33_V28_PR048 / EDC16CP33_V62_PR048 / EDC16CP33_V26_PR048 / EDC16CP33_V60_PR048

PR051	EGR VALVE POSITION FEEDBACK

PARAMETER DEFINITION	This parameter indicates the opening ratio of the EGR valve in %.

NOTES	**There must be no present or stored faults.** Perform this fault finding procedure: – after finding an inconsistency in the parameter, – after a customer complaint (loss of power, smoke etc.). – after interpretation of command **AC103 EGR by-pass**.
	Use the **Technical Note Wiring Diagram, Laguna II ph2, Vel Satis ph2, Mégane II ph2, Scénic II ph2, Espace IV ph2**.

Conformity check: Engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

In the event of a fault, see the interpretation of faults **DF209 EGR valve position sensor circuit** and **DF647 EGR valve position regulation.**

Sensor electrical conformity

Check the **continuity** and **absence of interference resistance** of the following connections:
- **3JM** between components **120** and **1460** or **169**,
- **3EL** between components **120** and **1460** or **169**,
- **3GC** between components **120** and **1460** or **169**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

PR053	SPEED REQUESTED BY HEATING/AIR CONDITIONING

PARAMETER DEFINITION	This parameter indicates the engine's speed of rotation with air conditioning in **rpm**.

NOTES	**Special notes:** Only perform these tests if the parameters do not correspond with the system operation programming. **Note:** Take parameter **PR053** into account only if **PR037 Refrigerant pressure > 12 bar**.

Conformity check: Engine stopped and ignition on

The value of the engine speed with air conditioning must be:
PR053 = 0 rpm (ignition on).

Conformity check with the engine running and engine coolant temperature > 80°C

The speed requested by the air-conditioning is increased and varies around **850 rpm**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V18_PR053 / EDC16CP33_V1C_PR053 / EDC16CP33_V54_PR053 / EDC16CP33_V20_PR053 / EDC16CP33_V58_PR053 / EDC16CP33_V5C_PR053 / EDC16CP33_V24_PR053 / EDC16CP33_V04_PR053 / EDC16CP33_V08_PR053 / EDC16CP33_V44_PR053 / EDC16CP33_V4C_PR053 / EDC16CP33_V34_PR053 / EDC16CP33_V38_PR053 / EDC16CP33_V74_PR053 / EDC16CP33_V28_PR053 / EDC16CP33_V62_PR053 / EDC16CP33_V26_PR053 / EDC16CP33_V60_PR053

GETtheMANUALS.org

PR055	ENGINE SPEED

PARAMETER DEFINITION	This parameter indicates the engine's rotational speed in **rpm**.

NOTES	None.

Conformity check with engine stopped and ignition on.

The value of the engine speed must be:
PR055 = 0 rpm (ignition on).
In the event of a fault, refer to the interpretation of faults **DF195 Camshaft sensor/engine speed consistency**, **DF119 Camshaft sensor signal** and **DF120 Engine speed sensor signal**.

Conformity check with the engine running and engine coolant temperature > 80°C

The value of the engine speed must be between:
750 rpm < PR055 < 850 rpm (with the engine running at idle speed).
In the event of a fault, refer to the interpretation of faults **DF195, DF119** and **DF120**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

PR059	INLET AIR TEMPERATURE

PARAMETER DEFINITION	This parameter indicates the air inlet temperature in **°C**.

NOTES	**There must be no present or stored faults.** Perform this fault finding procedure: – after finding an inconsistency in the parameter, – after a customer complaint (e.g. lack of power).
	Use the **Technical Note Wiring Diagram, Laguna II ph2, Vel Satis ph2, Mégane II ph2, Scénic II ph2, Espace IV ph2**.

Conformity check: Engine stopped and ignition on

With the ignition on the inlet air temperature varies according to the exterior temperature.
In the event of a fault, consult the interpretation of fault **DF002 Air temperature sensor circuit**.
Parameter **PR059** ≈ **PR064 Coolant temperature** engine cold.

Conformity check with the engine running and engine coolant temperature > 80°C

With the engine running at idle speed the inlet air temperature varies according to the engine coolant temperature.
In the event of a fault, refer to the interpretation of fault **DF002**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V18_PR059 / EDC16CP33_V1C_PR059 / EDC16CP33_V54_PR059 / EDC16CP33_V20_PR059 / EDC16CP33_V58_PR059 / EDC16CP33_V5C_PR059 / EDC16CP33_V24_PR059 / EDC16CP33_V04_PR059 / EDC16CP33_V08_PR059 / EDC16CP33_V44_PR059 / EDC16CP33_V4C_PR059 / EDC16CP33_V34_PR059 / EDC16CP33_V38_PR059 / EDC16CP33_V74_PR059 / EDC16CP33_V28_PR059 / EDC16CP33_V62_PR059 / EDC16CP33_V26_PR059 / EDC16CP33_V60_PR059

PR059 CONTINUED	

Sensor electrical conformity

With the flow sensor disconnected, check the **insulation** from **earth** of the following connection:
- **3ABQ** between components **120** and **799**.

Check the **+ 12 V after relay supply** of the air flowmeter on the following connection:
- **3FB** of component **799**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Measure **the resistance** between the following connections:
- **3ABQ** and **3DW** of component **799**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
If the resistances of the air flowmeter are not between:

8716 Ω < X < 9689 Ω (at - 10°C),
2353 Ω < X < 2544 Ω (at + 20°C),
794 Ω < X < 839 Ω (at + 50°C),
310 Ω < X < 321 Ω (at + 80°C),
5497 Ω < X < Ω 6050 (at + 0°C),
1613 Ω < X < Ω 1730 (at + 30°C),
569 Ω < X < Ω 598 (at + 60°C),
234 Ω < X < Ω 242 (at + 90°C),
3553 Ω < X < Ω 3875 (at +10°C),
1114 Ω < X < Ω 1186 (at +40°C),
418 Ω < X < Ω 436 (at +70°C),

replace the air flowmeter

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR061	EXTERIOR AIR TEMPERATURE

PARAMETER DEFINITION	This parameter indicates the exterior air temperature in **°C**.

NOTES	None.

Conformity check: Engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

The exterior air temperature value must be:
PR061 = 20°C (default value).
This parameter is controlled by the UCH and transmitted to the injection on the multiplex network.
In the event of a fault, run fault finding on the UCH (see **87B, Passenger compartment connection unit**).

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V18_PR061 / EDC16CP33_V1C_PR061 / EDC16CP33_V54_PR061 / EDC16CP33_V20_PR061 / EDC16CP33_V58_PR061 / EDC16CP33_V5C_PR061 / EDC16CP33_V24_PR061 / EDC16CP33_V04_PR061 / EDC16CP33_V08_PR061 / EDC16CP33_V44_PR061 / EDC16CP33_V4C_PR061 / EDC16CP33_V34_PR061 / EDC16CP33_V38_PR061 / EDC16CP33_V74_PR061 / EDC16CP33_V28_PR061 / EDC16CP33_V62_PR061 / EDC16CP33_V26_PR061 / EDC16CP33_V60_PR061

PR063	FUEL TEMPERATURE

PARAMETER DEFINITION	This parameter indicates the fuel temperature in **°C**.

NOTES	**There must be no present or stored faults.** Perform this fault finding procedure: – after finding an inconsistency in the parameter, – after a customer complaint (e.g. lack of power).
	Use the **Technical Note Wiring Diagram, Laguna II ph2, Vel Satis ph2, Mégane II ph2, Scénic II ph2, Espace IV ph2**.

Conformity check: Engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

The fuel temperature value must be between:
– 30°C < PR063 <90°C
PR063 = 100°C (default value).
In the event of a fault, consult the interpretation of fault **DF098 Fuel temperature sensor circuit**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V18_PR063 / EDC16CP33_V1C_PR063 / EDC16CP33_V54_PR063 / EDC16CP33_V20_PR063 / EDC16CP33_V58_PR063 / EDC16CP33_V5C_PR063 / EDC16CP33_V24_PR063 / EDC16CP33_V04_PR063 / EDC16CP33_V08_PR063 / EDC16CP33_V44_PR063 / EDC16CP33_V4C_PR063 / EDC16CP33_V34_PR063 / EDC16CP33_V38_PR063 / EDC16CP33_V74_PR063 / EDC16CP33_V28_PR063 / EDC16CP33_V62_PR063 / EDC16CP33_V26_PR063 / EDC16CP33_V60_PR063

GETtheMANUALS.org

PR063 CONTINUED	

Sensor electrical conformity

Check the **continuity** and **absence of interference resistance** of the following connections:
- **3FAB** between components **120** and **1066**,
- **3LD** between components **120** and **1066.**

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Measure **the resistance** between the following connections:
- **3FAB** and **3LD** of component **1066**.

If the fuel temperature sensor resistances are not between:
3538 Ω < X < 4502 Ω (at + 10°C),
1950 Ω < X < 2150 Ω (at + 25°C),
763 Ω < X < 857 Ω (at +50°C),
replace the sensor.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR064	COOLANT TEMPERATURE

PARAMETER DEFINITION	This parameter indicates the engine coolant temperature in **°C**.

NOTES	**There must be no present or stored faults.** Perform this fault finding procedure: – after finding an inconsistency in the parameter, – after a customer complaint (e.g. lack of power).
	Use the **Technical Note Wiring Diagram, Laguna II ph2, Vel Satis ph2, Mégane II ph2, Scénic II ph2, Espace IV ph2**.

Conformity check with engine stopped and ignition on.

With the ignition on the coolant temperature varies according to the exterior temperature.
In the event of a fault, consult the interpretation of fault **DF001 Coolant temperature sensor circuit**.
Parameter **PR059: Inlet air temperature** ≈ **PR064** engine cold.

Conformity check with the engine running and engine coolant temperature > 80°C

With the engine running at idle speed the coolant temperature varies according to the engine temperature.
If there is a fault, refer to the interpretation of fault **DF001**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR064 CONTINUED	

Sensor electrical conformity

Check **the continuity** and **absence of interference resistance** of the following connections:
- **3C** between components **120** and **244**,
- **3JK** between components **120** and **244**,

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Measure **the resistance** between the following connections:
- **3C** and **3JK** of component **244**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
If the temperature sensor resistances are not between:
11332 Ω < X < 13588 Ω (at - 10°C),
2140 Ω < X < 2364 Ω (at + 25°C),
772 Ω < X < 850 Ω (at + 50°C),
275 Ω < X < 291 Ω (at + 80°C),
112 Ω < X < 118 Ω (at + 110°C),
replace the sensor.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR074	BATTERY VOLTAGE

PARAMETER DEFINITION	This parameter indicates the battery voltage in **volts**.

NOTES	**Special notes:** Only perform these tests if the parameters do not correspond with the system operation programming.

Conformity check: Engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

The battery voltage value must be between:
8.5 V < PR074 < 15 V.
Test the battery and run fault finding on the charging circuit (see **Technical Note 6014A, Charging circuit check**).

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

PR088	PEDAL POTENTIOMETER GANG 2 VOLTAGE

PARAMETER DEFINITION	This parameter indicates the pedal potentiometer gang 2 voltage in **volts**.

NOTES	**Special notes:** Only perform these tests if the parameters do not correspond with the system operation programming.

Conformity check: Engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

The value of the pedal potentiometer gang 2 voltage must be between:
0.30 V < PR088 < 0.40 V (accelerator pedal released).

IMPORTANT:
This corresponds to normal operation.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V18_PR088 / EDC16CP33_V1C_PR088 / EDC16CP33_V54_PR088 / EDC16CP33_V20_PR088 / EDC16CP33_V58_PR088 / EDC16CP33_V5C_PR088 / EDC16CP33_V24_PR088 / EDC16CP33_V04_PR088 / EDC16CP33_V08_PR088 / EDC16CP33_V44_PR088 / EDC16CP33_V4C_PR088 / EDC16CP33_V34_PR088 / EDC16CP33_V38_PR088 / EDC16CP33_V74_PR088 / EDC16CP33_V28_PR088 / EDC16CP33_V62_PR088 / EDC16CP33_V26_PR088/ EDC16CP33_V60_PR088

GETtheMANUALS.org

PR089	VEHICLE SPEED

PARAMETER DEFINITION	Gives the vehicle speed in **km/h**.

NOTES	**Special notes:** Only perform these tests if the parameters do not correspond with the system operation programming.
	This parameter is transmitted by the ABS computer. This signal is transmitted to the injection on the multiplex network.

Conformity check: Engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

In the event of a fault, test the multiplex network (see **88B, Multiplex**).
And then complete fault finding on the ABS computer (see **38C, Anti-lock braking system**).

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V18_PR089 / EDC16CP33_V1C_PR089 / EDC16CP33_V54_PR089 / EDC16CP33_V20_PR089 / EDC16CP33_V58_PR089 / EDC16CP33_V5C_PR089 / EDC16CP33_V24_PR089 / EDC16CP33_V04_PR089 / EDC16CP33_V08_PR089 / EDC16CP33_V44_PR089 / EDC16CP33_V4C_PR089 / EDC16CP33_V34_PR089 / EDC16CP33_V38_PR089 / EDC16CP33_V74_PR089 / EDC16CP33_V28_PR089 / EDC16CP33_V62_PR089 / EDC16CP33_V26_PR089 / EDC16CP33_V60_PR089

GETtheMANUALS.org

PR104	TURBOCHARGING SV* OCR* SETPOINT

PARAMETER DEFINITION	This parameter indicates the turbocharging solenoid valve opening ratio percentage.

NOTES	None.

Conformity check: Engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

PR104 ≈ **PR846 TURBOCHARGING SOLENOID VALVE OCR**, these 2 values must be similar.
In the event of a fault, consult the interpretation of fault **DF054 EGR valve position sensor circuit**.

OCR*: Opening Cyclic Ratio
SV*: Solenoid valve

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V18_PR104 / EDC16CP33_V1C_PR104 / EDC16CP33_V54_PR104 / EDC16CP33_V20_PR104 / EDC16CP33_V58_PR104 / EDC16CP33_V5C_PR104 / EDC16CP33_V24_PR104 / EDC16CP33_V04_PR104 / EDC16CP33_V08_PR104 / EDC16CP33_V44_PR104 / EDC16CP33_V4C_PR104 / EDC16CP33_V34_PR104 / EDC16CP33_V38_PR104 / EDC16CP33_V74_PR104 / EDC16CP33_V28_PR104 / EDC16CP33_V62_PR104 / EDC16CP33_V26_PR104 / EDC16CP33_V60_PR104

GETtheMANUALS.org

PR128	FIRST EGR VALVE OFFSET

PARAMETER DEFINITION	This parameter indicates the closing ratio of the EGR valve for the first offset of the EGR valve.

NOTES	None.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

The EGR valve closure value during the first EGR valve offset must be between:
15% < PR128 < 25%.
PR128 ≈ PR129 Last EGR valve offset, these 2 values should be similar.
In the event of a fault, see the interpretation of faults **DF209 EGR valve position sensor circuit** and **DF647 EGR valve position regulation.**

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V18_PR128 / EDC16CP33_V1C_PR128 / EDC16CP33_V54_PR128 / EDC16CP33_V20_PR128 / EDC16CP33_V58_PR128 / EDC16CP33_V5C_PR128 / EDC16CP33_V24_PR128 / EDC16CP33_V04_PR128 / EDC16CP33_V08_PR128 / EDC16CP33_V44_PR128 / EDC16CP33_V4C_PR128 / EDC16CP33_V34_PR128 / EDC16CP33_V38_PR128 / EDC16CP33_V74_PR128 / EDC16CP33_V28_PR128 / EDC16CP33_V62_PR128 / EDC16CP33_V26_PR128 / EDC16CP33_V60_PR128

GETtheMANUALS.org

PR129	LAST EGR VALVE OFFSET

PARAMETER DEFINITION	This parameter indicates the closing ratio of the EGR valve for the first EGR valve offset.

NOTES	None.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

The EGR valve closure value during the last EGR valve offset must be between:
15% < PR129 < 25%.
PR128 First EGR valve offset ≈ **PR129**, these 2 values should be similar.
In the event of a fault, consult the interpretation of faults **DF209 EGR valve position sensor circuit** and **DF647 EGR valve position regulation.**

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V18_PR129 / EDC16CP33_V1C_PR129 / EDC16CP33_V54_PR129 / EDC16CP33_V20_PR129 / EDC16CP33_V58_PR129 / EDC16CP33_V5C_PR129 / EDC16CP33_V24_PR129 / EDC16CP33_V04_PR129 / EDC16CP33_V08_PR129 / EDC16CP33_V44_PR129 / EDC16CP33_V4C_PR129 / EDC16CP33_V34_PR129 / EDC16CP33_V38_PR129 / EDC16CP33_V74_PR129 / EDC16CP33_V28_PR129 / EDC16CP33_V62_PR129 / EDC16CP33_V26_PR129 / EDC16CP33_V60_PR129

GETtheMANUALS.org

PR130	CRUISE CONTROL SETPOINT

PARAMETER DEFINITION	This parameter indicates the cruise control speed setpoint in **mph (km/h)**.

NOTES	**Special notes:** Only perform these tests if the parameters do not correspond with the system operation programming.
	There must be no faults present. Perform this fault finding procedure: – after finding an inconsistency in the parameter, – or after a customer complaint (lack of power, smoke etc.).

Conformity check: Engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

The cruise control speed setpoint closure value must be:
PR130 > 18 mph (30 km/h).

Cruise control can only be activated for a speed.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V18_PR130 / EDC16CP33_V1C_PR130 / EDC16CP33_V54_PR130 / EDC16CP33_V20_PR130 / EDC16CP33_V58_PR130 / EDC16CP33_V5C_PR130 / EDC16CP33_V24_PR130 / EDC16CP33_V04_PR130 / EDC16CP33_V08_PR130 / EDC16CP33_V44_PR130 / EDC16CP33_V4C_PR130 / EDC16CP33_V34_PR130 / EDC16CP33_V38_PR130 / EDC16CP33_V74_PR130 / EDC16CP33_V28_PR130 / EDC16CP33_V62_PR130 / EDC16CP33_V26_PR130 / EDC16CP33_V60_PR130

GETtheMANUALS.org

PR132	AIR FLOW

PARAMETER DEFINITION	This parameter indicates the inlet air flow in **kg/h**.

NOTES	**There must be no faults present.** Perform this fault finding procedure: – after finding an inconsistency in the parameter, – or after a customer complaint (lack of power, smoke etc.).
	Use the **Technical Note Wiring Diagram, Laguna II ph2, Vel Satis ph2, Mégane II ph2, Scénic II ph2, Espace IV ph2**.

Conformity check with engine stopped and ignition on.

The inlet air flow value must be:
PR132 = 0 kg/h.

Conformity check with the engine running and engine coolant temperature > 80°C

The inlet air flow value must be between:
20 kg/h < PR132 < 30 kg/h.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR132 CONTINUED	

Sensor electrical conformity

Check the air inlet circuit (from the air filter inlet to the inlet manifold,
apply **Test 4 Turbocharged air inlet circuit check**):
– air filter unit inlet not blocked and filter not clogged,
– **visual** inspection only, **apply Test 4** of **ALP 2 Starting fault or starting impossible**,
– oil vapour recirculation circuit connection conformity.
– **absence of leaks** or **blockages** in the **low** and **high pressure** air circuits: pipes, presence and tightness of the mounting clips, mounting of the turbocharger pressure sensor, intercooler, etc.
– check that the damper valve is not jammed closed.
Carry out the necessary repairs.

Check the **electrical conformity of the air flowmeter**:
Check the **+ 5 V supply** of the air flowmeter on the following connection:
• **3KJ** of component **799**.
Check the **+ 12 V after relay supply** of the air flowmeter on the following connection:
• **3FB** of component **799**.
Check **the continuity** and **absence of interference resistance** of the following connections:
• **3DV** between components **120** and **799**,
• **3DW** between components **120** and **799**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

With the flowmeter connected, the vehicle **ignition on**, and the engine stopped:
Check the voltage between connections **3DW** and **3DV** of component **799**.
If the air flow sensor voltage is not between **0.3 V < X < 0.7 V**, replace the sensor.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR157	FUEL FLOW SETPOINT

PARAMETER DEFINITION	This parameter indicates the fuel flow setpoint in **mg/st**.

NOTES	**Special notes:** Only perform these tests if the parameters do not correspond with the system operation programming.

Conformity check: Engine stopped and ignition on

The fuel flow setpoint value must be:
PR157 = 0 mg/st (ignition on).
In the event of a fault, consult the interpretation of **DF897 Pump pressure regulator circuit**.

Conformity check with the engine running and engine coolant temperature > 80°C

Engine running: PR017: Fuel flow = PR157.
In the event of a fault, refer to the interpretation of fault **DF897**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR171	AIR FLOW SETPOINT FOR EGR

PARAMETER DEFINITION	This parameter indicates the fuel flow setpoint in **mg/st**.

NOTES	**Special notes:** Only perform these tests if the parameters do not correspond with the system operation programming.

Conformity check: Engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

Indicates the air flow required by the EGR valve

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR190	IDLE SPEED SETPOINT

PARAMETER DEFINITION	This parameter indicates the engine's rotational speed in **rpm**.

NOTES	None.

Conformity check with engine stopped and ignition on.

With the ignition on, the engine speed value must be:
PR190 = 800 rpm or **PR190 = 850 rpm (depending on the vehicle)**.
In the event of a fault, refer to the interpretation of faults **DF195 Camshaft sensor / engine speed consistency**, **DF119 Camshaft sensor signal** and **DF120 Engine speed sensor signal**.

Conformity check with the engine running and engine coolant temperature > 80°C

With the engine running at idle speed, the engine speed value must be:
PR190 = 800 rpm or **PR190 = 850 rpm (depending on the vehicle)**.
In the event of a fault, refer to the interpretation of faults **DF195, DF119** and **DF120**.
The difference between the engine idle speed and its setpoint must be less than **50 rpm**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR209	TURBOCHARGING PRESSURE LOOP DIFFERENCE

PARAMETER DEFINITION	This parameter indicates the turbocharging pressure loop difference in **bar**.

NOTES	None.

Conformity check: Engine running, engine coolant temperature > 80°C, without electrical consumers.

The turbocharging pressure loop difference value must be:
PR209 = PR009 Turbocharging pressure setpoint - PR041 Turbocharging pressure = ~ 0.
If **PR209** is significant, refer to the interpretation of the command **AC004 Turbocharging solenoid valve**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR213	RAIL PRESSURE LOOP DIFFERENCE

PARAMETER DEFINITION	This parameter indicates the rail pressure loop difference in **bar**.

NOTES	**Special notes:** Only perform these tests if the parameters do not correspond with the system operation programming.

Conformity check: Engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

The rail pressure loop difference value must be:
PR213 = PR008 Rail pressure setpoints - PR038 Rail pressure.
In the event of a fault, consult the interpretation of fault **DF007 Rail pressure sensor circuit**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR224	TURBOCHARGING PRESSURE SENSOR VOLTAGE

PARAMETER DEFINITION	This parameter indicates the turbocharging pressure sensor voltage in **volts**.

NOTES	**Special notes:** Only perform these tests if the parameters do not correspond with the system operation programming.

Conformity check: Engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

The turbocharger sensor voltage value must be between:
0 V < PR224 < 5 V.
In the event of a fault, consult the interpretation of faults **DF011 Sensor supply voltage no. 1**, **DF012 Sensor supply voltage no. 2** and **DF013 Sensor supply voltage no. 3**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR225	AIR FLOW SENSOR VOLTAGE

PARAMETER DEFINITION	This parameter indicates the air flow sensor voltage in **volts**.

NOTES	**Special notes:** Only perform these tests if the parameters do not correspond with the system operation programming.
	There must be no faults present. Perform this fault finding procedure: – after finding an inconsistency in the parameter, – or after a customer complaint (lack of power, smoke etc.).

Conformity check: Engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

The air flow sensor voltage value must be between:
0 V < PR225 < 5 V.
In the event of a fault, consult the interpretation of parameter **DF056 Air flow sensor circuit**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR290	AC REFRIGERANT PRESSURE SENSOR VOLTAGE

PARAMETER DEFINITION	This parameter indicates the refrigerant pressure sensor voltage in **volts**.

NOTES	None.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

The refrigerant pressure sensor voltage value must be between:
0 V ≤ **PR290** ≤ **5 V**.
Carry out fault finding on the climate control computer (see **62B, Climate control**).

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR364	CYLINDER NO. 1 FUEL FLOW CORRECTION

PARAMETER DEFINITION	This parameter indicates the cylinder's fuel flow correction in **mg/st**.

NOTES	**Special notes:** Only perform these tests if the parameters do not correspond with the system operation programming.

Conformity check: Engine stopped and ignition on

The cylinder no. 1 fuel flow correction value must be:
PR364 = 0.0 mg/st.
In the event of a fault, consult **Test 10 Poor injector operation**.

Conformity check with the engine running and engine coolant temperature > 80°C

The cylinder no. 1 fuel flow correction value must be between:
- 6 mg/st < PR364 < 6 mg/st.
In the event of a fault, consult **Test 10 Poor injector operation**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR365	CYLINDER NO. 4 FUEL FLOW CORRECTION

PARAMETER DEFINITION	This parameter indicates the cylinder's fuel flow correction in **mg/st**.

NOTES	**Special notes:** Only perform these tests if the parameters do not correspond with the system operation programming.

Conformity check: Engine stopped and ignition on

The cylinder fuel flow correction value must be:
PR365 = 0.0 mg/st.
In the event of a fault, consult **Test 10 Poor injector operation**.

Conformity check with the engine running and engine coolant temperature > 80°C

The cylinder fuel flow correction value must be between:
- 6 mg/st < PR365 < 6 mg/st.
In the event of a fault, consult **Test 10**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR381	PARTICLE FILTER DOWNSTREAM TEMPERATURE

PARAMETER DEFINITION	This parameter indicates the particle filter downstream temperature in **°C**.

NOTES	None.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

Indicates the **particle filter** downstream air temperature in **°C**.
PR381 ≈ PR382 Particle filter upstream temperature ≈ ± 200°C

In the event of a fault, consult the interpretation of faults **DF309 Particle filter downstream temperature sensor** and **DF310 Particle filter upstream temperature sensor**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR382	PARTICLE FILTER UPSTREAM TEMPERATURE

PARAMETER DEFINITION	This parameter indicates the air temperature of the exhaust gas upstream of the particle filter in **°C**.

NOTES	None.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

The value of the air temperature of the exhaust gas upstream of the particle filter must be:
PR382 ≈ 200°C

In the event of a fault, consult the interpretation of faults **DF309 Particle filter downstream temperature sensor** and **DF310 Particle filter upstream temperature sensor**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR383	WEIGHT OF SOOT IN PARTICLE FILTER

PARAMETER DEFINITION	This parameter indicates the weight of soot in the particle filter in **g**.

NOTES	None.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

The value of the weight of soot in the particle filter must be:
PR383 < 56 g.

If the weight is greater than 56 g:
For all Vdiags (except 18): carry out an After-Sales regeneration. Run command **SC017 Particle filter regeneration** and follow the procedure (see **Interpretation of commands**).

For Vdiag 18:
Reprogram the computer in **Vdiag 1C**.
Then apply the procedure corresponding to **Vdiag 1C**.
In the event of a fault, refer to the interpretation of fault **DF315 Particle filter diff* pressure sensor**.

diff.*: differential

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR385	EXHAUST SYSTEM FLOW

PARAMETER DEFINITION	This parameter indicates the exhaust pipe flow in **m^3/h**.

NOTES	None.

Conformity check with engine stopped and ignition on.

When stationary, the exhaust pipe flow value must be:
PR385 = 0 m^3/h.

Conformity check with the engine running and engine coolant temperature > 80°C

The exhaust pipe flow value must be between:
20 m^3/h < PR385 < 80 m^3/h.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V18_PR385 / EDC16CP33_V1C_PR385 / EDC16CP33_V54_PR385 / EDC16CP33_V20_PR385 / EDC16CP33_V58_PR385 / EDC16CP33_V5C_PR385 / EDC16CP33_V24_PR385 / EDC16CP33_V28_PR385 / EDC16CP33_V62_PR385 / EDC16CP33_V26_PR385 / EDC16CP33_V60_PR385

GETtheMANUALS.org

PR391	DISTANCE SINCE PARTICLE FILTER REPL*

PARAMETER DEFINITION	This parameter indicates the distance since the particle filter was last replaced in **miles (km)**.

NOTES	None.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

Indicates the mileage travelled since replacement of the particle filter.

REPL*: REPLACEMENT

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR405	CYLINDER NO. 2 FUEL FLOW CORRECTION

PARAMETER DEFINITION	This parameter indicates the cylinder's fuel flow correction in **mg/st**.

NOTES	None.

Conformity check with engine stopped and ignition on.

The cylinder fuel flow correction value must be:
PR405 = 0.0 mg/st.
In the event of a fault, consult **Test 10 Poor injector operation**.

Conformity check with the engine running and engine coolant temperature > 80°C

The cylinder fuel flow correction value must be between:
- 6 mg/st < PR405 < 6 mg/st.
In the event of a fault, consult **Test 10**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR406	CYLINDER NO. 3 FUEL FLOW CORRECTION

PARAMETER DEFINITION	This parameter indicates the cylinder's fuel flow correction in **mg/st**.

NOTES	None.

Conformity check with engine stopped and ignition on.

The cylinder fuel flow correction value must be:
PR406 = 0.0 mg/st.
In the event of a fault, consult **Test 10 Poor injector operation**.

Conformity check with the engine running and engine coolant temperature > 80°C

The cylinder fuel flow correction value must be between:
– 6 mg/st < PR406 < 6 mg/st.
In the event of a fault, consult **Test 10**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR412	DISTANCE AT LAST SUCCESSFUL REGENERATION

PARAMETER DEFINITION	This parameter indicates the distance at the last successful regeneration in **miles (km)**.

NOTES	None.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

This parameter indicates the vehicle's mileage at the last successful regeneration.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR414	PARTICLE FILTER DIFF* PRESSURE

PARAMETER DEFINITION	This parameter indicates the particle filter differential pressure in **mbar**.

NOTES	None.

Conformity check: Engine stopped and ignition on

The value of the particle filter differential pressure must be between:
- 1 mbar < PR414 < 1 mbar

In the event of a fault, refer to the interpretation of fault **DF315 Particle filter diff* pressure sensor**.

Conformity check with the engine running and engine coolant temperature > 80°C

The value of the particle filter differential pressure must be between:
10 mbar < PR414 < 100 mbar

In the event of a fault, refer to the interpretation of fault **DF315**.

diff.*: differential

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR415	TIME SINCE LAST REGENERATION

PARAMETER DEFINITION	This parameter indicates the time since the last regeneration in **hours**.

NOTES	None.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

Time counter since last regeneration in hours.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR484	FUEL REGULATION SOLENOID VALVE OCR*

PARAMETER DEFINITION	This parameter indicates the solenoid valve opening ratio as a %.

Conformity check with engine stopped and ignition on.

The value of the solenoid valve opening ratio must be:
PR484 = 0%.
In the event of a fault, consult the interpretation of **DF897 Pump pressure regulator circuit**.

Conformity check: Engine running, engine coolant temperature > 80°C

The solenoid valve opening value must be between:
30% < PR484 < 40%.
In the event of a fault, refer to the interpretation of fault **DF897**.

OCR*: Opening Cyclic Ratio

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR490	ENGINE AIR FLOW

PARAMETER DEFINITION	This parameter indicates the air flow entering the engine in **mg/st**.

NOTES	None.

Conformity check: Engine stopped and ignition on

The inlet air flow value must be:
PR490 = 0 mg/st.

Conformity check with the engine running and engine coolant temperature > 80°C

The inlet air flow value must be:
PR490 ± 500 mg/st.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR667	TURBINE UPSTREAM TEMPERATURE

PARAMETER DEFINITION	This parameter indicates the turbine upstream temperature in **°C**.

NOTES	None.

Conformity check: Engine stopped and ignition on, or Engine running and engine coolant temperature > 80°C

The value of the turbine upstream air temperature must be:
PR667 ≈ 200°C.

In the event of a fault, refer to the interpretation of fault **DF652 Turbine upstream temperature sensor circuit**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR668	TURBINE UPSTREAM TEMPERATURE SENSOR VOLTAGE

PARAMETER DEFINITION	This parameter indicates the turbine upstream temperature sensor voltage in **volts**.

NOTES	None.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

The turbine upstream temperature sensor voltage value must be between:
PR668 ≈ 5 V.

In the event of a fault, consult the interpretation of fault **DF652 Turbine upstream temperature sensor circuit**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR672	DAMPER VALVE POSITION SETPOINT

PARAMETER DEFINITION	This parameter indicates the damper valve position setpoint as a %.

NOTES	None.

Conformity check: Engine stopped and ignition on, or Engine running and engine coolant temperature > 80°C without electrical consumers

The value of the damper valve position must be:
PR672 < 5%.
In the event of a fault, consult the interpretation for fault **DF323 Damper valve.**

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR739	FUEL FLOW SOLENOID VALVE CURRENT

PARAMETER DEFINITION	This parameter indicates the current absorbed by the fuel flow solenoid valve in **mA**.

Conformity check with engine stopped and ignition on.

The value of the current absorbed by the fuel flow solenoid valve must be:
PR739 ≈ 200 mA.
In the event of a fault, consult the interpretation of **DF897 Pump pressure regulator circuit**.

Conformity check with the engine running and engine coolant temperature > 80°C

The value of the current absorbed by the fuel flow solenoid valve must be:
PR739 ≈ 300 mA.
In the event of a fault, refer to the interpretation of fault **DF897**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR747	DAMPER VALVE POSITION

PARAMETER DEFINITION	This parameter indicates the damper valve position as a %.

NOTES	None.

Conformity check with engine stopped and ignition on.

The value of the damper valve position must be:
PR747 = 0% (with the engine stopped),
PR747 ≈ 5% (with the ignition on).
In the event of a fault, consult the interpretation of faults **DF645 Damper valve position regulation, DF646 Damper valve position sensor** and **DF323 Damper valve**.

Conformity check with the engine running and engine coolant temperature > 80°C

The value of the damper valve position must be:
PR747 ≈ 5% (at idle speed).
In the event of a fault, refer to the interpretation of **faults DF645, DF646** and **DF323**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR782	TURBINE UPSTREAM PRESSURE SENSOR VOLTAGE

PARAMETER DEFINITION	This parameter indicates the turbine upstream pressure sensor voltage in **volts**.

NOTES	**Special notes:** Only perform these tests if the parameters do not correspond with the system operation programming.

Conformity check: Engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

The turbine upstream pressure sensor voltage value must be between:
PR782 ≈ 5 V.
In the event of a fault consult the interpretation of fault **DF651 Turbine upstream pressure sensor circuit**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR784 **PR785** **PR786** **PR787** **PR788** **PR789** **PR790** **PR791** **PR792** **PR793** **CONTINUED**	

These parameters are used so that the history of the last ten activations of the particle filter warning light are known.

In **Vdiag 18, 1C, 54**:
Each parameter from **PR784** to **PR793** records the distance when the particle filter warning light comes on which is associated with the appearance of **DF312**.
Each time the particle filter warning light comes on, the vehicle mileage is stored in the following parameter (PR+1).

When all ten parameters have a value other than zero, and the particle filter warning light comes on again, the distance information for **PR784** is cleared and replaced by the new value.

For other Vdiags:

Each parameter from **PR784 DF312 record no. 1** to **PR793 DF312 record no. 10** contains a record of the vehicle mileage when the particle filter warning light comes on. The appearance of fault **DF312 Speed request** is associated with each of these parameters.

PR784 to **PR793** operate through successive copying (when the particle filter warning light comes on, the value of **PR784** is copied to **PR785 DF312 record no. 2,** the value of **PR785** is copied to **PR786 DF312 record no. 3** and so on).
When there are more than ten records, the value of **PR793** is deleted. The new mileage is allocated to **PR784**.

If none of the parameters between **PR784** and **PR793** is available in the sub-function, this means that no data has been saved. The parameters appear in the sub-function when they have a value above zero.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

PR794 **PR795** **PR796** **PR797** **PR798** **PR799** **PR800** **PR801** **PR802** **PR803** **CONTINUED**	

In **Vdiag 18, 1C, 54**:
Each of these parameters contains the vehicle mileage during a failed particle filter regeneration when driving. Each parameter relates to an engine status. The **statuses** and **parameters** are recorded at the same time (for example **PR797** is associated with **ET709 Stored engine status no. 4**).

Each new recorded value is saved under the next **PR (PR+1)**.

When all ten parameters have a value other than zero and there is a regeneration failure when driving, the distance information for **PR794** is cleared and replaced by the new value.

For other Vdiags:

Every parameter between **PR794 Stored regeneration failure no. 1** and **PR803 Stored regeneration failure no. 10** contains the vehicle mileage at the time of a particle filter regeneration failure when driving. Each parameter relates to an engine status. They are recorded simultaneously (for example **PR797 is associated with ET709 Stored engine status no. 4**).

PR794 to **PR803** operate through successive copying (when there is a regeneration failure when driving, the value of **PR794** is copied to **PR795 Stored regeneration failure no. 2**, the value of **PR795** is copied to **PR796 Stored regeneration failure no. 3** and so on).
When there are more than ten records, the value of **PR803** is deleted. The new mileage is allocated to **PR794**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

PR816 **PR817** **PR818** **PR819** **PR820** **PR821** **PR822** **PR823** **PR824** **PR825** **CONTINUED**	

In **Vdiag 18, 1C, 54**:
Each parameter between **PR816** and **PR825** contains the vehicle distance stored when particle filter regeneration starts when driving. Each parameter is connected with a status "Regeneration request status record". They are recorded simultaneously (for example **PR819** is associated with **ET745 Stored regeneration request status No. 4**).

Each new recorded value is saved under the next **PR (PR+1)**.
When all ten parameters have a value other than zero, and a new regeneration starts when driving, the distance information for **PR816** is cleared and replaced by the new value.

For other Vdiags:

Each parameter from **PR816 Stored regeneration start No. 1** to **PR825 Stored regeneration start No. 10** records the mileage when particle filter regeneration starts for which the status request is recorded in **ET742 Stored rege*. request status No.1 to ET751 Stored rege*. request status No.10**. (for example **PR819 Stored regeneration start No. 4 is associated with ET745 Stored rege*. request status No.4**).

Each time a new regeneration when driving is started, the vehicle mileage is recorded in **PR816**, as well as its status in **ET742**.

PR816 to **PR825** operate through successive copying (when regeneration starts, the value of **PR816** is copied to **PR817 Stored regeneration start no. 2**, the value of **PR817** is copied to **PR818 Stored regeneration start no. 3** and so on).

rege*: Regeneration

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR846	TURBOCHARGING SV* OCR*

PARAMETER DEFINITION	This parameter indicates the turbocharging solenoid valve opening ratio percentage.

NOTES	None.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

PR846 ≈ **PR104 Turbocharging solenoid valve OCR**, these 2 values must be similar.
In the event of a fault, consult the interpretation of fault **DF054 EGR valve position sensor circuit**.

OCR*: Opening Cyclic Ratio
SV*: Solenoid valve

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR848	NUMBER OF REGENERATION FAILURES

PARAMETER DEFINITION	This parameter indicates the number of regeneration failures.

NOTES	None.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

This parameter indicates the number of failed regenerations when driving.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR850	FUEL FLOW SOLEN.* CURRENT SETPOINT

PARAMETER DEFINITION	This parameter indicates the setpoint for the current absorbed by the fuel flow solenoid valve in **mA**.

NOTES	None.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

This parameter indicates the setpoint for the current absorbed by the fuel flow solenoid valve.

SOLEN.*: Solenoid valve

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR858	DAMPER VALVE OPEN FIRST OFFSET

PARAMETER DEFINITION	This parameter indicates the damper valve opening ratio during the first damper valve offset.

NOTES	None.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

This parameter indicates the damper valve opening offset percentage.

PR858 ≈ **PR861 Damper valve open last offset**, these two values must be similar.

In the event of a fault, consult the interpretation of faults **DF645 Damper valve position regulation, DF646 Damper valve position sensor** and **DF323 Damper valve**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR859	DAMPER VALVE CLOSED FIRST OFFSET

PARAMETER DEFINITION	This parameter indicates the damper valve closing ratio during the first damper valve offset.

NOTES	None.

Conformity check: Engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

This parameter indicates the damper valve closing offset percentage.

PR859 ≈ **PR860 Damper valve closed last offset**, these two values must be similar.

In the event of a fault, consult the interpretation of faults **DF645 Damper valve position regulation, DF646 Damper valve position sensor** and **DF323 Damper valve**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR860	DAMPER VALVE CLOSED LAST OFFSET

PARAMETER DEFINITION	This parameter indicates the damper valve closing ratio during the first damper valve offset.

NOTES	None.

Conformity check: Engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

This parameter indicates the damper valve closing offset percentage.

PR860 ≈ **PR859 Damper valve closed first offset**, these two values must be similar.

In the event of a fault, consult the interpretation of faults **DF645 Damper valve position regulation, DF646 Damper valve position sensor** and **DF323 Damper valve**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR861	DAMPER VALVE OPEN LAST OFFSET

PARAMETER DEFINITION	This parameter indicates the damper valve closing ratio during the first damper valve offset.

NOTES	None.

Conformity check: Engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

This parameter indicates the damper valve opening offset percentage.

PR861 ≈ **PR858 Damper valve open first offset**, these two values must be similar.

In the event of a fault, consult the interpretation of faults **DF645 Damper valve position regulation, DF646 Damper valve position sensor** and **DF323 Damper valve**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR863	DAMPER VALVE POSITION FEEDBACK

PARAMETER DEFINITION	This parameter indicates the damper valve opening ratio.

NOTES	None.

Conformity check with engine stopped and ignition on.

PR863 ≈ PR747 Damper valve position
The damper valve opening percentage value must be:
PR863 = 0% (with the engine stopped),
PR863 ≈ 5% (with the ignition on).
In the event of a fault, consult the interpretation of faults **DF646 Damper valve position sensor** and **DF323 Damper valve**.

Conformity check with the engine running and engine coolant temperature > 80°C

The damper valve opening percentage value must be:
PR863 ≈ 5% (at idle speed).
In the event of a fault, refer to the interpretation of faults **DF646** and **DF323**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR873	OIL OXIDATION SIGNAL

STATUS DEFINITION	This parameter indicates the vehicle distance in **miles (km)** when the oil oxidation threshold is reached.

NOTES	This parameter should only be interpreted if the **OCS (Oil Control System)** program is activated on the instrument panel. On the instrument panel computer, check the configuration reading **LC106 O.C.S**: **WITH.**

Conformity check: Engine stopped and the ignition on, or Engine running and the engine coolant temperature > 80°C without electrical consumers

The oil condition is calculated by the oxidation program in the injection computer, according to the number of engine revolutions.

When this count reaches a certain threshold before the end of the oil service period, the injection computer sends a signal to the instrument panel, which will display **service due**. Parameter **PR873** corresponds to the vehicle mileage at the time this signal is sent.

Then the instrument panel computer deducts **900 miles (1500 km)** before displaying the message **Service required**.

IMPORTANT:
When the message **Service due** appears on the instrument panel, the customer must have the oil changed within the remaining **900 miles (1500 km)**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V5C_PR873 / EDC16CP33_V20_PR873 / EDC16CP33_V34_PR873 / EDC16CP33_V38_PR873 / EDC16CP33_V74_PR873 / EDC16CP33_V26_PR873 / EDC16CP33_V28_PR873 / EDC16CP33_V60_PR873 / EDC16CP33_V62_PR873

GETtheMANUALS.org

PR874	LAST SERVICE

STATUS DEFINITION	This parameter indicates the vehicle's mileage at the last service in **miles (km)**. It is updated when the oil service parameters are reinitialised on the instrument panel.

NOTES	None.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR875	OIL DILUTION SIGNAL

STATUS DEFINITION	This parameter indicates the vehicle mileage in **miles (km)** when the oil dilution threshold is reached.

NOTES	This parameter should only be interpreted if the **OCS (Oil Control System)** program is activated on the instrument panel. On the instrument panel computer, check the configuration reading **LC106 O.C.S**: **WITH.**

Conformity check: Engine stopped and ignition on, or engine running and engine coolant temperature > 80°C without electrical consumers

The injection computer estimates the degree of engine oil dilution according to the customer's driving style.

When the dilution level reaches a certain threshold before the end of the oil change interval, the injection computer sends a signal to the instrument panel which then displays **Service required**. Parameter **PR875** corresponds to the vehicle mileage at the time this signal is sent.

IMPORTANT:
When the message **Service required** appears on the instrument panel, the customer must arrange an immediate oil change to prevent damage to the engine.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR1012	WEIGHT OF SOOT AFTER REGENERATION

STATUS DEFINITION	This parameter indicates the weight in **g** of soot present in the particle filter following regeneration.

NOTES	This parameter should be consulted after running **SC017 Particle filter regeneration**.

Conformity check: Engine stopped and ignition on, or engine running and engine coolant temperature > 80°C without electrical consumers

If this parameter is less than **15 g**, particle filter regeneration was successful.
If **PR1012** is greater than **15 g**, it is necessary to perform a second particle filter regeneration using command **SC017 Particle filter regeneration**.

IMPORTANT:
Before performing a second After-Sales regeneration of the particle filter, the engine must be allowed to cool down for **2 hours** with the bonnet open.
Do not carry out an engine oil change before a second After-Sales regeneration.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V1C_PR1012 / EDC16CP33_V54_PR1012 / EDC16CP33_V20_PR1012 / EDC16CP33_V58_PR1012 / EDC16CP33_V5C_PR1012 / EDC16CP33_V24_PR1012 / EDC16CP33_V28_PR1012 / EDC16CP33_V62_PR1012/ EDC16CP33_V26_PR1012 / EDC16CP33_V60_PR1012

GETtheMANUALS.org

NOTES	The commands are run to check the correct operation of certain components or to replace parts.

Tool command	Diagnostic tool title
SC001	Write saved data
SC002	Enter injector codes
SC003	Save computer data
SC017	Particle filter regeneration (except Vdiag 18, 04, 08, 44, 4C, 34, 38, 74)
SC031	Operational fault finding of cylinders (except Vdiag 18)
SC035	High pressure fuel circuit fault finding
SC036	Reinitialise programming
RZ001	Fault memory
RZ005	Programming
RZ034	Computer memory
AC004	Turbocharging solenoid valve
AC012	Damper valve
AC031	Thermoplunger No. 3 relay
AC037	Preheating relay
AC063	Thermoplunger No. 1 relay
AC064	Thermoplunger No. 2 relay
AC103	EGR by-pass
AC153	High speed fan assembly (except Mégane II ph2 and Scénic II ph2)
AC154	Low speed fan assembly (except Mégane II ph2 and Scénic II ph2).
AC195	Electric coolant pump (except Vdiag 04, 08, 44, 4C, 34, 38, 74)
AC225	Rail pressure regulator
AC226	Pump pressure regulator.
MT001	Turbocharging function (Vdiag 04 and 44 only)
VP010	Write VIN
VP036	Fuel supply inhibited

GETtheMANUALS.org

SC001	WRITE SAVED DATA

NOTES	To use this command, first save the data with the **SC003 Save computer data** command. The writing is carried out after the computer has been reprogrammed or replaced. Engine stopped.

In the **diagnostic tool**, select scenario **SC001**.

Note:
If no files have been saved before, a write error appears when command **SC001** is activated.

Validating this command writes the data saved using command **SC003 Save computer data**.

The data is as follows:
– vehicle-specific idling,
– injector codes,
– various offsets for components, EGR, damper valve,
– options available on the vehicle and generated by the computer.

This data will configure the computer and will prevent:
– engine malfunction after reprogramming or replacing the computer,
– incorrect interpretation of the information provided by the **diagnostic tool**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

SC002	ENTER INJECTOR CODES

NOTES	This command is carried out after the replacement of one or more injectors. Engine stopped.

To enter this information, select command **SC002** in the **diagnostic tool**.
Procedure to be followed:
– Read the 7-character alphanumeric codes engraved on the upper section of the injector bodies. **The IMA* codes should be read from left to right** (see illustration in **MR 402 (Vel Satis ph2), MR 395 (Laguna II ph2), MR 364 (Mégane II ph2), MR 370 (Scénic II ph2), MR 405 (Espace IV ph2) Mechanical, 13B, Diesel injection, Diesel injector, Removal – Refitting**)
Note: When entering characters, confusion can arise between:
– Figure **1** with the letters **I** and **L,**
– Figure **2** with the letter **Z,**
– Figure **5** with the letter **S,**
– Figure **6** with the letter **G,**
– Figure **8** with the letter **B.**
After programming or reprogramming the computer, it is essential to enter the 4 injector codes before confirming the entry.
– Enter each injector code for the associated cylinder.
– **Important:** cylinder no. 1 is located at the timing end.
– Confirm the change of injector code configuration.
– When the command is completed, the modified codes appear in the current column.
– Check that the codes correspond to those read earlier.
If the codes entered appear in neither the "current" column nor the "desired" column, check the codes read and make sure the data has been entered correctly.
– Exit fault finding mode.
– Switch off the ignition and wait for the **diagnostic tool** message (maximum wait **8 min**): **Loss of dialogue with the computer: EDC16 CP33, check the tool connection and the computer supply**.
– Switch the ignition back on and check for faults.
– **DF066 Injector code(s)** should be **stored**.

IMA*: Individual injector correction

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

SC002 CONTINUED	

If **DF066** is still **present**, the command has not been run correctly.
Start the procedure again and follow the instructions.
If this is still not effective, follow the procedure below:
A fault could cause **DF066** to be reported, and also incorrect confirmation of command **SC002**.
If the power latch does not occur after switching off the ignition, the injection computer will not store the new injector codes:
Switch off the ignition and wait for the **diagnostic tool** message (maximum wait **8 min**): **Loss of dialogue with the computer: EDC16 CP33, check the tool connection and the computer supply**.
Switch off the ignition and check that the immobiliser warning light flashes **2 seconds** after the ignition is switched off.
If the warning light flashes as soon as the ignition is switched off, the power latch has not been performed and the command will not be taken into account.
If all these checks do not enable the command to be confirmed, contact the Techline.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

SC003	SAVE COMPUTER DATA

NOTES	This save is performed before reprogramming or replacing the computer. Engine stopped.

In the **diagnostic tool**, select scenario **SC003**.

Confirming this command saves the following vehicle-specific data:
– Vehicle-specific idling.
– Injector code(s).
– Options available on the vehicle and managed by the computer.
– Various offsets for components, EGR, damper valve.

This information will be saved in the **diagnostic tool**.

After saving has finished, use the command **SC001 Enter saved data** to be able to set the new computer parameters, after programming and reprogramming.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V18_SC003 / EDC16CP33_V1C_SC003 / EDC16CP33_V54_SC003 / EDC16CP33_V20_SC003 / EDC16CP33_V58_SC003 / EDC16CP33_V5C_SC003 / EDC16CP33_V24_SC003 / EDC16CP33_V04_SC003 / EDC16CP33_V08_SC003 / EDC16CP33_V44_SC003 / EDC16CP33_V4C_SC003 / EDC16CP33_V34_SC003 / EDC16CP33_V38_SC003 / EDC16CP33_V74_SC003 / EDC16CP33_V28_SC003 / EDC16CP33_V62_SC003 / EDC16CP33_V26_SC003 / EDC16CP33_V60_SC003

GETtheMANUALS.org

SC017	PARTICLE FILTER REGENERATION

NOTES	Only run this command after interpretation of the following faults: – **DF308 Clogged particle filter,** – **DF311 Failed regenerations limit exceeded,** – **df312: speed request.**

WARNING:
– It is essential to observe the health and safety guidelines (see **MR364 (Mégane II ph2), MR370 (Scénic II ph2), MR 395 (Laguna II ph2), 402 (Vel Satis ph2), 405 (Espace IV ph2) Mechanical, 19B, Exhaust**, **Particle filter: Cleaning**) and follow the procedure below.

SAFETY INSTRUCTIONS TO BE FOLLOWED:

The regeneration causes exhaust fumes and high temperatures.
It is strongly recommended that you put the vehicle outside during regeneration.
If it is not possible to carry out regeneration outside, use an extractor fan that can withstand the very high regeneration temperatures **(400°C at the exhaust outlet)**.

Perform regeneration on a surface free from fire risks (oil, dry leaves, etc.).
Nothing should be left in the vicinity of the exhaust pipe.

Check that there are no leaks or blockages in the exhaust pipe,
Repair if necessary.

WARNING:
Check the engine oil level before running the command to avoid any engine racing. The oil level must be between the minimum level and the middle level on the oil dipstick.
Before performing a particle filter regeneration, it is essential to deactivate the air conditioning compressor (risk of engine damage) and all the electrical consumers.

IF NECESSARY:

Regeneration can be stopped by pressing the engine start button twice briefly (less than **3 seconds**).
Switch off the ignition and wait for the **diagnostic tool** message (maximum time **8 minutes**) **Communication lost with computer: EDC16 C33, check the tool connection and the computer power supply** before switching the ignition back on.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V1C_SC017 / EDC16CP33_V54_SC017 / EDC16CP33_V20_SC017 / EDC16CP33_V58_SC017 / EDC16CP33_V5C_SC017 / EDC16CP33_V24_SC017 / EDC16CP33_V28_SC017 / EDC16CP33_V62_SC017/ EDC16CP33_V26_SC017 / EDC16CP33_V60_SC017

GETtheMANUALS.org

SC017 CONTINUED 1	

PROCEDURE TO BE FOLLOWED:

To run this command, select the command mode on the **diagnostic tool** and run command **SC017**.

When regeneration is complete, a message will indicate whether regeneration was successful, and what operations need to be carried out **(filter replacement, whether an oil service is required, etc.).**

DESCRIPTION OF THE PROCESS

particle filter regeneration takes place in 3 stages (values given as a guide only):
Heating phase: the speed is fixed or fluctuating around **3000 rpm**.
- This phase lasts at least **6 minutes**, until the coolant temperature is above **80°C**.
- **Regeneration phase**: the speed is fixed or varies around **2000 rpm**. Engine injection is retarded. The exhaust fumes rise in temperature and burn the soot retained in the particle filter. The **particle filter downstream temperature** starts to rise after the **particle filter upstream temperature** due to the volume of the particle filter. Then the combustion of the soot stored in the particle filter causes the **particle filter downstream temperature** to increase, possibly reaching more than **700°C** depending on the amount of soot in the filter (with a **particle filter upstream temperature** of around **600°C**). This phase lasts about **30 minutes**.
- **Cooling phase:** the engine speed is fixed or varies around **2000 rpm**.
- Engine injection returns to normal and the exhaust gases cool the particle filter.
- This phase lasts **3 minutes**. At the end of this period, the engine speed returns to idle speed or remains fixed at **2000 rpm**.

The process lasts at least 40 minutes (the regeneration time will be increased depending on how long it takes for the coolant to heat up to **80°C**).

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

SC017 CONTINUED 2	

VALIDATING THE REGENERATION PROCESS:

At the end of regeneration, a message appears to announce whether the regeneration was successful:
- **Particle filter regeneration finished**:

Consult **PR1012 Weight of soot after regeneration.** If this parameter is less than **15 g,** the particle filter regeneration was successful. If **PR1012** is greater than **15 g**, it is necessary to carry out a second particle filter regeneration using **the diagnostic tool** and run command **SC017**.

IMPORTANT:
Before performing a second After-Sales regeneration of the particle filter, the engine must be allowed to cool down for **2 hours** with the bonnet open.
Do not carry out an engine oil change before a second After-Sales regeneration.

For **Vdiag 28 and 62**:
Change the engine oil if requested by a message on the instrument panel.

For the other **VDiag**:
Consult **PR848 Number of regeneration failures**. If **PR848** is greater than **3**, change the engine oil.

Particle filter too full - replace the particle filter: regeneration has failed. The weight of soot in the particle filter is so great that it is creating a counter pressure. Deal with any faults that appear or replace the particle filter. Run command **SC036: Reinitialise programming** and select **After particle filter replacement**.

For **Vdiag 28 and 62**:
Change the engine oil if requested by a message on the instrument panel.

For the other **Vdiags:**
Consult **PR848 Number of regeneration failures**. If this parameter is greater than **3**, it is essential to change the engine oil.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

SC017 CONTINUED 3	

– **Particle filter regeneration failed:** regeneration failed because the temperature upstream of the turbine is too low. Apply **Test 11 Temperature upstream of turbine too low**.

In all cases, carry out the following operations:
– switch off the ignition and wait for the **diagnostic tool** message (maximum time **8 minutes**) **Communication lost with computer: EDC16 CP33, check the tool connection and the computer supply**,
– switch on the ignition and establish dialogue with the injection computer,
– run command **SC036**,
– depending on the operation carried out, select **After particle filter regeneration with the diagnostic tool or After particle filter replacement**,
– **switch off the ignition and wait** for the **diagnostic tool** message (maximum wait **8 min**): **Loss of dialogue with the computer: EDC16 CP33, check the tool connection and the computer supply voltage**,
– then switch on the ignition again,
clear the **present** or **stored** faults from the computer memory (**operation to be carried out within 3 minutes of switching on the ignition**).

Note:
Always change the **engine oil** and the **oil filter** in the following cases:
• following an After-Sales regeneration **only** if requested by a message on the **CLIP diagnostic tool**,
• after particle filter replacement following **DF311 Number of failed regenerations exceeded**,
– after a second regeneration (when two successive regenerations).

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

SC031	OPERATIONAL FAULT FINDING OF CYLINDERS

NOTES	This command allows fault finding to be carried out on the output of each cylinder and each injector and applies to all the Vdiags **except Vdiag 18, 04** and **44**. **Note**: For **Vdiags 18, 04** and **44**, check that the fuel flow correction value of parameters **PR364 Cylinder no. 1 fuel flow correction, PR365 Cylinder no. 4 fuel flow correction, PR405 Cylinder no. 2 fuel flow correction** and **PR406 Cylinder no. 3 fuel flow correction** is between: **-5 mg/st < X < 5 mg/st**.

Reminder: cylinder no. 1 is located at the timing end.

Procedure to be followed:
– select scenario **SC031**,
– once the conditions have been met, press the **confirm** button; the test will take approximately **5 minutes**,
– the tool displays **cylinder no. 1 cut-off** and there will be a perceptible engine speed variation when the cylinder is cut off; then the same procedure for the other three cylinders,
– **the diagnostic tool** displays the results,
– end of test.

Interpretation of correct results:

– If the displayed results are **"VALID"**, it means that the entire cylinder and injector assembly is in order. There is no need for any operation.

	Results	**Interpretation of results**
Cylinder 1	VALID	No operation
Cylinder 2	VALID	No operation
Cylinder 3	VALID	No operation
Cylinder 4	VALID	No operation

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

SC031 CONTINUED	

– If a displayed result is **INVALID**, the cylinder or injector is not correct.

	Difference compared to average	Results	Interpretation of results
Cylinder X	Negative number or Positive number	INVALID	Carry out the checks described below.

Run **part B** of **Test 10 Poor injector operation** to continue fault finding.

If the result of scenario **SC031** is not confirmed, check the engine compressions:
Use a compression gauge and apply command **VP036 Fuel supply inhibition** (see **Interpretation of commands**).

Run compressions on all cylinders.
Are the compressions correct?

NO

Check the cylinder block.

YES

Check the fitting of the injector and repair if necessary.
Otherwise change the injector concerned.
After replacing the injector, follow the injector code programming procedure (see **Replacement of components**), run **SC036 Reinitialise programming**, and select the number of the injector replaced.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

SC035	HIGH PRESSURE FUEL CIRCUIT FAULT FINDING

NOTES	This command is used to interpret the state of the high pressure fuel circuit (high pressure pump, rail, injectors and high pressure supply pipes).

To run this command, select scenario **SC035** on the **diagnostic tool**.

Procedure to be followed:

– select scenario **SC035**,
– follow the instructions then **"confirm"**,
– with the command in progress: do not operate on the vehicle,
– switch off the engine at the end of the test,
– **the diagnostic tool** displays the results,
– end of test.

Interpretation of correct results:

– If the results displayed are **OK**, the entire high pressure fuel circuit is in order. There is no need for any operation.

STEP X (X is the variable from 1 to 4)	Rail pressure Raise time	Rail pressure Dump time	Interpretation of results
STEP X	OK	OK	No operation
STEP 5		OK	No operation

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V18_SC035 / EDC16CP33_V1C_SC035 / EDC16CP33_V54_SC035 / EDC16CP33_V20_SC035 / EDC16CP33_V58_SC035 / EDC16CP33_V5C_SC035 / EDC16CP33_V24_SC035 / EDC16CP33_V04_SC035 / EDC16CP33_V08_SC035 / EDC16CP33_V44_SC035 / EDC16CP33_V4C_SC035 / EDC16CP33_V34_SC035 / EDC16CP33_V38_SC035 / EDC16CP33_V74_SC035 / EDC16CP33_V28_SC035 / EDC16CP33_V62_SC035 / EDC16CP33_V26_SC035 / EDC16CP33_V60_SC035

GETtheMANUALS.org

SC035 CONTINUED 1	

Interpretation of incorrect results:

– Is one of the value definitions for the various displayed stages is **"TOO SLOW"** or **"TOO FAST"**, see the following table:

STEP X (X is the variable from 1 to 4)	Rail pressure Raise time	Rail pressure Dump time	Interpretation of results
STEP X	TOO SLOW	TOO SLOW	Check 1
STEP X	TOO SLOW	TOO FAST	Check 2
STEP X	TOO SLOW	OK	Check 3
STEP X	OK	TOO SLOW	Check 4
STEP X	OK	TOO FAST	Check 5
STEP 5		TOO FAST	Check 5

Explanation of results interpretation:

Check 1:
– Apply **Test 10 Poor injector operation**.
– Apply **ALP6 Fuel circuit leaks**.
– Apply **Test 3 Low pressure circuit check**.
– Replace the high pressure pump.

Check 2:
– Apply **Test 10**.
– Apply **ALP6**.
– Apply the part of **Test 3** concerning the fuel filter.
– Replace the high pressure pump.
– Check the injector return flow and the injectors.
– Check the rail pressure regulator by running command **AC225 Rail pressure regulator**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

SC035 CONTINUED 2	

Check 3:
– Apply **Test 10**.
– Apply **Test 3**.
– Replace the high pressure pump.

Check 4:
– Replace the high pressure pump.

Check 5:
– Check the injector return flow and the injectors.
– Check the pressure regulator on the rail by running command **AC225**.

– Consult the Repair Manual depending on the results of the various checks (from 1 to 5), (see **MR 395 (Laguna II ph2), MR 364 (Mégane II ph2), MR 370 (Scénic II ph2), MR 405 (Espace IV ph2), MR 402 (Vel Satis ph2), Mechanical, 13B, Diesel injection, Injector rail, Removal - Refitting**).

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

SC036	REINITIALISE PROGRAMMING

NOTES	This command is used to reset the computer parameters according to the type of operation or component repaired or replaced from the following list: – the injectors – the EGR valve, – the damper valve, – after particle filter replacement, – after particle filter regeneration using the **CLIP diagnostic tool**, – after injection computer replacement with no backup option, – the heater plugs. **Ignition on and engine stopped.**

To run this command, select scenario **SC036** in the **diagnostic tool**.

Procedure to be followed:
– on the main screen, select the component to reinitialise after an operation (removal - refitting, regeneration or replacement of the component),
– select **YES** then **OK** to begin reinitialisation,
– **Important**: when reinitialising injectors, do not forget that cylinder no. 1 is located at the timing end,
– select **end** on the **configuration completed** screen to return to the main screen,
– end of operation.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V18_SC036 / EDC16CP33_V1C_SC036 / EDC16CP33_V54_SC036 / EDC16CP33_V20_SC036 / EDC16CP33_V58_SC036 / EDC16CP33_V5C_SC036 / EDC16CP33_V24_SC036 / EDC16CP33_V04_SC036 / EDC16CP33_V08_SC036 / EDC16CP33_V44_SC036 / EDC16CP33_V4C_SC036 / EDC16CP33_V34_SC036 / EDC16CP33_V38_SC036 / EDC16CP33_V74_SC036 / EDC16CP33_V28_SC036 / EDC16CP33_V62_SC036 / EDC16CP33_V26_SC036 / EDC16CP33_V60_SC036

GETtheMANUALS.org

RZ005	PROGRAMMING

NOTES	**Special notes:** this command enables you to reinitialise the entire computer configuration according to the vehicle.

Command **RZ005** reconfigures the computer.
If the computer does not have any configuration data, use command **RZ005** to enter the vehicle options:
– air conditioning,
– Passenger compartment heating resistor,
– cruise control/speed limiter.

These options are detected by the computer even if command **RZ005** is not used.

The computer is configured as soon as the one of the vehicle's optional system components is operated.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

RZ034	COMPUTER MEMORY

NOTES	**IMPORTANT** Only use this command if **DF107 Computer memory** is **Present**. **Ignition on and engine stopped.**

Command **RZ034** reinitialises the computer memory.

With the ignition on:
- Use command **RZ034**.
- Switch off the ignition and wait for the message Communication lost with computer.
- Switch on the ignition again.
- Run the programming commands (see **Configuration and programming**).
- Switch off the ignition and wait for the message Communication lost with computer.

Perform a road test to reinitialise the vehicle parameters.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V18_RZ034 / EDC16CP33_V1C_RZ034 / EDC16CP33_V54_RZ034 / EDC16CP33_V20_RZ034 / EDC16CP33_V58_RZ034 / EDC16CP33_V5C_RZ034 / EDC16CP33_V24_RZ034 / EDC16CP33_V04_RZ034 / EDC16CP33_V08_RZ034 / EDC16CP33_V44_RZ034 / EDC16CP33_V4C_RZ034 / EDC16CP33_V34_RZ034 / EDC16CP33_V38_RZ034 / EDC16CP33_V74_RZ034 / EDC16CP33_V26_RZ034 / EDC16CP33_V28_RZ034/ EDC16CP33_V60_RZ034 / EDC16CP33_V62_RZ034

GETtheMANUALS.org

AC004	TURBOCHARGING SOLENOID VALVE

NOTES	Perform this fault finding procedure: – following interpretation of an unresolved fault or, – following application of the interpretation of **PR041 Turbocharging pressure** or – after a customer complaint (loss of power, smoke etc.).
	Use the **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2**.

1. The following procedure is for checking that the turbocharger and its control circuit are working properly.

Preliminary operation

Check the high pressure air circuit is sealed:
Apply **Test 4 Turbocharged air inlet circuit check** or **Test 3 Low pressure circuit check**.
Pipe not joined or pierced, pressure sensor disconnected or poorly fitted (seal present), exchanger pierced.
To test the exchanger: stabilise the engine speed between **3500** and **4000 rpm** with the vehicle stopped and check that there are no leaks.

Measure the **resistance** between connections **3FB** and **3MG** of component **1475**.
If the resistance is not between **18 Ω and 22 Ω** at **+ 23°C,** replace the turbocharging solenoid valve.

Check **the continuity** of the following connection:
- **3MG** between the components **120** and **1475**.

Check the **+ 12 V after relay supply** of the turbocharging solenoid valve on the following connection:
- **3FB** of component **1475**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

AC004 CONTINUED	

Run command **AC004**; if a faint whistling noise is heard along with a clicking from the solenoid valve, go to **STEP 2**, otherwise check the operation of the computer output stage:

Vehicle under + after ignition feed, clear the faults displayed by the diagnostic tool.
With the voltmeter in the direct current position:
With the turbocharging solenoid valve connected, connect the voltmeter earth lead to connection **3MG** of component **1475** and the positive lead to connection **3FB** of component **1475**. Run command **AC004**; the voltmeter must display four successive voltages between **2.2 V and 2.6 V**.
If the measurement is not correct, contact the Techline.

2. turbocharger control circuit check
– Apply **Test 7 Variable geometry turbocharger control**.
– With the engine stopped, make sure that the control rod is in the resting position.
– Start the engine and make sure that the control rod actuates to the upper stop.
(when the engine stops, the control rod should return to the rest position).

If the control rod does not move correctly, carry out the following checks:

1. Check the control vacuum:
– Disconnect the solenoid valve inlet **hose** and connect it to a pressure gauge.
– Start the engine and run it at a stable idle speed.
If the vacuum does not reach a value **between 0.250 bar and 0.550 bar**, check the vacuum circuit from the vacuum pump.
– Stop the engine, reconnect the inlet **hose** and move onto step no. 2.

2. Check the solenoid valve actuation:
– Disconnect the solenoid valve outlet **hose**.
– Start the engine and run it at a stable idle speed.
– Place your hand on the solenoid valve and block the outlet **union** with your thumb.
– If there is no perceptible vibration of the solenoid valve, contact the Techline.

3. Check the solenoid valve actuation:
– Connect the pressure gauge to the solenoid valve outlet **union**.
– Start the engine and run it at a stable idle speed.
If the vacuum does not reach a value between **0.250 bar and 0.550 bar**, replace the solenoid valve.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

AC012	DAMPER VALVE

NOTES	Carry out this interpretation: – after **DF645 Damper valve position regulation**, **DF646 Damper valve position sensor**, – or after a customer complaint (starting faults, poor performance).
	Use the **Wiring Diagram Technical Note, Laguna II ph2, Mégane II, Scénic II, Espace IV ph2, Vel Satis ph2**.

Measure **the resistance** between connections **38KQ** and **38KP** of component **1461**.
If the resistance is not between **875** Ω **and 1625** Ω replace the damper valve.

Check the **continuity** and **absence of interference resistance** of the following connections:
- **38KQ** between components **120** and **1461**,
- **38KP** between components **120** and **1461**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

With the vehicle ignition on, and the engine stopped:
Make sure the **damper flap** is **open**,
If not, clean or replace the damper valve.
Actuate the valve using command **AC012** and check the damper valve travel and rest position of the valve.

Check the operation of the computer output stage with a voltmeter in the alternating current position:
Actuate the valve with command **AC012**.
Connect the voltmeter earth lead to connection **38KS** of component **1461** and the positive lead to connection **38KQ** of component **1461**.
The voltmeter should display **three cycles** of ON-OFF (**12.5 V** then return to **0 V**).
If the measurement is correct, replace the damper valve
If the measurement does not show any operation, contact the Techline.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V18_AC012 / EDC16CP33_V1C_AC012 / EDC16CP33_V54_AC012 / EDC16CP33_V20_AC012 / EDC16CP33_V58_AC012 / EDC16CP33_V5C_AC012 / EDC16CP33_V24_AC012 / EDC16CP33_V04_AC012 / EDC16CP33_V08_AC012 / EDC16CP33_V44_AC012 / EDC16CP33_V4C_AC012 / EDC16CP33_V34_AC012 / EDC16CP33_V38_AC012 / EDC16CP33_V74_AC012 / EDC16CP33_V28_AC012 / EDC16CP33_V62_AC012 / EDC16CP33_V26_AC012 / EDC16CP33_V60_AC012

GETtheMANUALS.org

AC031	THERMOPLUNGER No. 3 RELAY

NOTES	Check that the computer is correctly configured using command **LC056 Thermoplungers** There must be no **present** or **stored** faults: Perform this fault finding procedure if there is a fault with the passenger compartment heating - demisting.
	Use the **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2**.

If the Thermoplunger no. 3 relay or **the additional heater interface unit does not function** when command **AC031** is run.
Check the condition of the **thermoplunger 3** relay mounting on the engine fuse box or the additional heater interface unit (see **Wiring Diagram Technical Note**, **Vehicle, component code 1069 or 1550**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note**, **Vehicle, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

if the fault is still present, check as follows that this relay is controlled by the engine management computer:
Disconnect the thermoplunger no. 3 relay and fit a **50** Ω to **100** Ω resistor on its mounting instead of the coil and connect a voltmeter as follows:
– positive terminal to **+ 12 V battery**,
– negative terminal to connection **3JAB** of component **1069** or **1550**.

Run command **AC031**.

If the voltmeter indicates the battery voltage (4 ON-OFF cycles of **10 seconds**), replace the thermoplunger no. 3 relay.
If the voltmeter does not show the battery voltage (4 ON-OFF cycles of **10 seconds**), contact the Techline.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

AC031 CONTINUED	

If the thermoplunger no. 3 relay or **the additional heater interface unit functions using command AC031**, but there is still a passenger compartment heating/demisting problem, use the wiring diagram to check:
– The conformity of the thermoplungers maxi-fuse.
– Check for **+ 12 V battery** feed on connection **BP9** of component **1069** or **1550**.
– Check the conformity of heating element no. 3 relay.
– Check **the continuity** of connection **3JAC or 3JC** between components **1069** or **1550** and **1074**.
– Measure the **resistance** of the thermoplunger*.
– The presence of **earth** on the water chamber (thermoplunger mounting).
– Also check the level of the cooling circuit and that there are no leaks.
Carry out the necessary repairs.

* supplier: ***Champion***: the load resistance is between: **547 mΩ < X < 669 mΩ**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

AC037	PREHEATING RELAY

NOTES	This command is only run if fault **DF025 Preheating unit diagnostic connection** or **DF017 Preheating unit control circuit** is **present** or **stored** and if no other fault is **present**.
	Use the **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2**.
	IMPORTANT: – Please observe the cleanliness guidelines and safety advice. – Make sure the correct type of plug is fitted on the vehicle, **slow** or **fast**: Slow plugs have a black ring Quick plugs have a white ring. For **Vdiag 20, 24, 34, 38** and **74,** if replacing heater plugs by plugs of a different type (see **Replacement of components** and **Replacing heater plugs**).

Before applying the following fault finding procedure, check that the battery voltage is not below 12 V. Otherwise, recharge the battery.

STEP 1:

Using a multimeter fitted with a current clamp, bring together the 4 heater plug supply wires.

Run command **AC037** and measure the current consumed by the 4 heater plugs.

If the value of the current consumed is not between **60 A and 80 A**, move on to step 2, otherwise end of fault finding.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

AC037 CONTINUED	

STEP 2:
Check the connections of the preheating unit, component code **257**, the heater plugs, component codes **680, 681, 682** and **683** and the injection computer, component code **120**.
Measure **the resistance** of the heater plugs. If the resistance value is **> 2** Ω, replace the faulty plug or plugs, making sure that the correct plug type, **slow** or **fast**, is fitted on the vehicle.
Check the **continuity** and **absence of interference resistance** of the following connections:
- **37AB** between components **257** and **683**,
- **37AA** between components **257** and **680**,
- **37Z** between components **257** and **681**,
- **37AC** between components **257** and **682.**

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Check the condition of the preheating unit supply fuse **(70 A)** (see **MR 364 (Mégane II ph2), MR 370 (Scénic II ph2), MR 395 (Laguna II ph2), 402 (Vel Satis ph2), 405 (Espace IV ph2) Mechanical, 81C, Fuses, Fuses: List and location of components**).
Check the **+ 12 V battery supply** to the preheating unit on the following connection:
- **BP35** of component **257**.

Check the **continuity** and **absence of interference resistance** of the following connections:
- **3FY** between components **120** and **257**,
- **3FF** between components **120** and **257**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If the fault is still present, replace the preheating unit.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

AC063	THERMOPLUNGER No. 1 RELAY

NOTES	There must be no **present** or **stored** faults: Perform this fault finding procedure if there is a fault with the passenger compartment heating - demisting.
	Use the **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2**.

If the Thermoplunger no. 1 relay or t**he additional heater interface unit does not function** when command **AC063** is run.
Check the condition of the thermoplunger no. 1 relay mounting connector on the engine fuse box (see **Wiring Diagram Technical Note**, **Vehicle, component code 1067 or 1550**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note**, **Vehicle, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

if the fault is still present, check as follows that this relay is controlled by the engine management computer:
Disconnect thermoplunger no. 1 relay, and fit a **50** Ω to **100** Ω resistor on the mounting instead of the coil and connect a voltmeter as follows:
– positive terminal to **+ 12 V** battery,
– negative terminal to connection **3JA** of component **1067** or **1550**.

Run command **AC063**.
If the voltmeter shows the battery voltage (4 ON-OFF cycles of **10 seconds**), replace the thermoplunger no. 1 relay.
If the voltmeter does not show the battery voltage (4 ON-OFF cycles of **10 seconds**), contact the Techline.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

AC063 CONTINUED	

If the Thermoplunger no. 1 relay or the additional heater interface unit functions using command AC063, but there is still a passenger compartment heating/demisting problem, check using the wiring diagram:
The conformity of the thermoplunger maxi-fuse.
Check for **+ 12 V battery** on connection **BP9** of component **1067** or **1550**.
Check the conformity of the thermoplunger no. 1 relay or the **additional heater interface unit**.
Check **the continuity** of connection **3JB** between components **1067** or **1550** and **998**.
Measure the **resistance** of the thermoplunger*.
The presence of **earth** on the water chamber (thermoplunger mounting).
Also check the level of the cooling circuit and that there are no leaks.
Carry out the necessary repairs.

* supplier: ***Champion***: the load resistance is between: **547 mΩ < X < 669 mΩ**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

AC064	THERMOPLUNGER No. 2 RELAY

NOTES	There must be no **present** or **stored** faults. Perform this fault finding procedure if there is a fault with the passenger compartment heating - demisting. Consult the **"Wiring diagrams"** Technical Note to locate the relevant fuses and relays.
	Special notes: The thermoplunger no. 2 relay **or the additional heater interface unit supplies** thermoplungers 2 and 3 in parallel.
	Use the **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2**.

If the thermoplunger no. 2 relay does not operate during command **AC064**.
Check the condition of the thermoplunger 2 relay mounting on the engine fuse box **or the additional heater interface unit** (see **Wiring Diagram Technical Note**, **Vehicle, component code 1068 or 1550**).
Check the condition of the engine management computer connector (see **Wiring Diagram Technical Note**, **Vehicle, component code 120**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

if the fault is still present, check as follows that this relay is controlled by the engine management computer:
Disconnect the thermoplunger no. 2 relay, fit a **50** Ω to **100** Ω resistor on its mounting instead of the coil, and connect a voltmeter as follows:
– positive terminal to **+ 12 V battery**,
– negative terminal on connection **3JAA** of component **1068** or **1550**.

Run command **AC064**.
If the voltmeter shows the battery voltage (4 ON-OFF cycles of **10 seconds**), replace the thermoplunger no. 2 relay.
If the voltmeter does not show the battery voltage (4 ON-OFF cycles of **10 seconds**), contact the Techline.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

AC064 CONTINUED	THERMOPLUNGER No. 2 RELAY

If thermoplunger no. 2 relay operates with command AC064, but there is still a passenger compartment heating/demisting fault, use the wiring diagram to check:
The conformity of the thermoplunger maxi-fuse.

Check for **+ 12 V battery** on connection **BP91** of component **1068** or **1550**
Check the conformity of thermoplunger no. 2 relay.

Check **the continuity** of connection **3JAD** or **3JD** and **3JAC** between components **1068** or **1550** and **(1072** and **1073)**.
Measure **the resistances** of the thermoplungers*
The presence of **earth** on the water chamber (thermoplunger mounting).
Also check the level of the cooling circuit and that there are no leaks.
Carry out the necessary repairs.

* supplier: ***Champion***: the load resistance is between: **547 mΩ < X < 669 mΩ**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

AC103	EGR BY-PASS

NOTES	Carry out this fault finding procedure when the interpretation of fault **DF304 EGR bypass circuit** has not been resolved.
	Use the **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2**.

Measure the **resistance** between connections **3FB** and **3TP** of component **1301.**

If the resistance of the solenoid valve is not between:
- **43 Ω and 49 Ω** at **+ 25 °C**,
- **32 Ω and 37 Ω** at **- 40 °C**, replace the EGR bypass solenoid valve.

Check the **continuity** and **the absence of interference resistance** on the following connection:
- **3TP** between components **120** and **1301**.

Check the **+ 12 V after relay supply** to the EGR bypass solenoid valve of the following connection:
- **3FB** of component **1301**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
If you notice no valve movement when running command **AC103**, ensure that the computer output stage is functioning:

Vehicle under + after ignition feed, clear the faults displayed by the diagnostic tool.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

AC103 CONTINUED	

With the voltmeter in the direct current position:
With the EGR BYPASS solenoid valve connected, connect the voltmeter earth lead to connection **3TP** of component **1301** and the positive lead to connection **3FB** of component **1301**. Run command **AC103**, the voltmeter should display four successive readings which are approximately equal to the **12 V** battery voltage.

If the voltmeter indicates no control or a continuous voltage, contact the Techline.

If activation has run correctly, check the control vacuum:
– Disconnect the solenoid valve inlet **hose** and connect it to a pressure gauge.
– Start the engine and run it at a stable idle speed.
– If the vacuum does not reach a value between **0.250 bar and 0.550 bar**, check the vacuum circuit from the vacuum pump.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

Laguna II ph2, Vel Satis ph2, Espace IV ph2 only.

AC153	HIGH SPEED FAN ASSEMBLY

NOTES	There must be no **present** or **stored** faults: Perform this fault finding after an engine cooling fault. Engine stopped.
	Use the **Wiring Diagram Technical Note for Laguna II ph2, Vel Satis ph2, Espace IV ph2**.

If command **AC153** does not actuate the **high speed fan assembly relay**.
Check the condition of the **high speed fan assembly** relay mounting connectors (see **Wiring Diagram Technical Note**, **Vehicle, component code 597**).
If the connector or connectors are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

If the fault is still present, check that the relay is actuated by the engine management computer as follows:
Disconnect the high speed fan assembly relay, fit a **50** Ω to **100** Ω resistor on its mounting in place of the coil, and connect a voltmeter as follows:
– positive terminal to **+ 12 V** battery,
– negative terminal to connection **3JP** of component **234**.

Run command **AC153**.
If the voltmeter shows the battery voltage (4 ON-OFF cycles of **10 seconds**), replace the relay.
If the voltmeter does not show the battery voltage (4 ON-OFF cycles of **10 seconds**), contact the Techline.

If the **high speed fan assembly** relay is supplied using command **AC153**, but there is still a fan assembly actuation fault, use the wiring diagram to check:
The conformity of the fan assembly maxi-fuse.

– Check the **+ 12 V battery supply** to connection **BP71** of component **234**.
– Check the conformity of the **high speed fan assembly** relay.
– Check the **continuity** of connection **49B** between components **234** and **362**.
– Check the conformity of the fan assembly.
– Check for complete **earthing** on connection **MAS** of component **162**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V18_AC153 / EDC16CP33_V1C_AC153 / EDC16CP33_V54_AC153 / EDC16CP33_V20_AC153 / EDC16CP33_V58_AC153 / EDC16CP33_V5C_AC153 / EDC16CP33_V24_AC153 / EDC16CP33_V04_AC153 / EDC16CP33_V08_AC153 / EDC16CP33_V44_AC153 / EDC16CP33_V4C_AC153 / EDC16CP33_V34_AC153 / EDC16CP33_V38_AC153 / EDC16CP33_V74_AC153 / EDC16CP33_V28_AC153 / EDC16CP33_V26_AC153

GETtheMANUALS.org

Laguna II ph2, Vel Satis ph2, Espace IV ph2 only.

AC154	LOW-SPEED FAN ASSEMBLY

NOTES	There must be no **present** or **stored** faults. Perform this fault finding after an engine cooling fault or air conditioning fault. Engine stopped.
	Use the **Wiring Diagram Technical Note for Laguna II ph2, Vel Satis ph2, Espace IV ph2**.

If, when running command **AC154**, the **low speed fan assembly** relay does not operate:
Check the condition of the **low speed fan assembly** relay mounting connectors (see **Wiring Diagram Technical Note**, **Vehicle, component code 597**).
If the connector or connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

If the fault is still present, check that the relay is actuated by the engine management computer as follows:
Disconnect the **low speed fan assembly** relay, fit a **50** Ω to **100** Ω resistor on the relay mounting in place of the coil, and connect a voltmeter as follows:
– positive terminal to **+ 12 V** battery,
– negative terminal to connection **3JN** of component **700**.

Run command **AC154**.
If the voltmeter shows the battery voltage (4 ON-OFF cycles of **10 seconds**), replace the relay.
If the voltmeter does not show the battery voltage (4 ON-OFF cycles of **10 seconds**), contact the Techline.

If the **low speed fan assembly** relay is supplied using command **AC154**, but there is still a fan assembly actuation fault, use the wiring diagram to check:
The conformity of the fan assembly maxi-fuse.

– Check **the continuity** of connection **49L** between components **700** and **321**.
– Check the low speed **resistor** (resistance and connections).
– Check **the continuity** of connection **49B** between components **262** and **321**.
– Check for complete **earthing** on connection **MAS** of component **162**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ac195	electric coolant pump

NOTES	this command allows you to check the operation of the electric coolant pump.

Check the connection and condition of the coolant pump relay connector, component code **573** and the injection computer connector, component code **120**.

If the connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the connector, otherwise replace the connector.

Check the **insulation, continuity** and the **absence of interference resistance** on the following connections:

- **3AAZ** between components **573** and **120**,
- **3VH** between components **573** and **369,**
- **3FB** between components **573** and **983**,
- **3FB1** between components **573** and **983**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If the fault is still present, contact the techline.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

AC225	RAIL PRESSURE REGULATOR

NOTES	Perform this fault finding procedure: – following interpretation of an unresolved fault – following an inconsistency recorded in the parameters, – following a customer complaint (starting problems, engine speed instability, injection noise).

STEP 1

Check the **continuity** and **absence of interference resistance** on the following connection:
- **3RG** between the components **120** and **1198**.

Check the **+ 12 V after relay supply** to the rail pressure regulator **(DRV)** of the following connection:
- **3FB** of component **1198**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Run command **AC225**, if you can hear a slight whistling noise and rattling from the pressure regulator, go to **step 2**, otherwise, check the operation of the computer output stage:

Vehicle under + after ignition feed, clear the faults displayed by the diagnostic tool.

With the voltmeter in the direct current position:
With the rail pressure regulator connected, connect the voltmeter earth lead to connection **3RG** of component **1198** and the positive lead to connection **3FB** of component **1198**. Run command **AC225**, the voltmeter should display four successive voltages between **2 V and 2.4 V**.

If the measurement is not correct, contact the Techline.

STEP 2

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

AC225 CONTINUED	

STEP 2

In the event of rail overpressure:
Check that there are no air bubbles in the diesel fuel low pressure circuit.
Check that the rail pressure sensor is working, and then interpret parameter **PR038 Rail pressure**.
If these checks do not reveal any faults, replace the rail regulator.

in the event of rail underpressure:
Check the correct operation of the rail pressure sensor, as well as the interpretation of parameter **PR038**.
Check the low pressure diesel circuit priming.
Check the conformity of the diesel filter connections.
Check the condition of the filter (clogging and water saturation).
Check that there are no air bubbles between the filter and the high pressure pump.
Check the sealing of the low and high pressure diesel fuel systems: use **ALP6 Fuel circuit leaks** (visual inspections, touch tests, odours, etc.) on:
pump body, pressure release valve, pipes, rail and injectors unions, injector wells, etc.
Check the conformity of the seal fitting on the pressure regulator.
Check the operation of the injectors: run **Test 10 Incorrect injector operation**.

Carry out the necessary repairs.

If the engine starts:

Clear any faults.

Check the rail pressure regulator using **ALP7 Rough idling**.

With the engine warm, leave it to idle for a few minutes (**3** to **5 minutes**):
– If it stalls and the fault reappears, replace the rail pressure regulator.
– If it does not stall, stabilise the engine speed at **2000 rpm (1 minute)** then depress the accelerator fully until the maximum engine speed imposed by the computer is obtained **(~5500 rpm)**. The maximum rotation speed of the engine must be stabilised in the time taken to fully depress and then fully release the pedal. This test is carried out with no load (engine in neutral).
– If the engine stalls, contact the Techline

If the engine does not start or there is no timing, first replace the rail pressure regulator.
If the fault is still present, contact the Techline

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

AC226	PUMP PRESSURE REGULATOR

NOTES	Perform this fault finding procedure: – following interpretation of an unresolved fault – following an inconsistency recorded in the parameters, – following a customer complaint (starting problems, engine speed instability, injection noise).

STEP 1

Check the **continuity** and **absence of interference resistance** on the following connection:
• **3HI** between the components **120** and **1105**.

Check the **+ 12 V after relay supply** to the pump pressure regulator **(MPROP)** of the following connection:
• **3FB** of component **1105**.

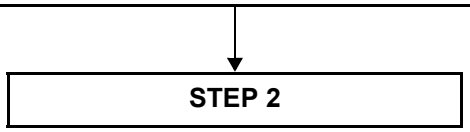
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Run command **AC226**, if you can hear a slight whistling noise and rattling from the pressure regulator, go to **step 2**, otherwise, ensure that the computer output stage is functioning correctly:

Vehicle under + after ignition feed, clear the faults displayed by the diagnostic tool.

With the voltmeter in the direct current position:
With the pump pressure regulator connected, connect the voltmeter earth lead to connection **3HI** of component **1105** and the positive lead to connection **3FB** of component **1105**. Run command **AC226**, the voltmeter must display four successive voltages between **2 V and 2.4 V**.

If the measurement is not correct, contact the Techline.



AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

AC226 CONTINUED	

STEP 2

In the event of rail overpressure:
Check that there are no air bubbles in the diesel fuel low pressure circuit.
Check that the rail pressure sensor is working, and then interpret parameter **PR038 Rail pressure**.
If these checks do not reveal any faults, replace the pump regulator.

in the event of rail underpressure:
Check the correct operation of the rail pressure sensor, as well as the interpretation of parameter **PR038**.
Check the low pressure diesel circuit priming.
Check the conformity of the diesel filter connections.
Check the condition of the filter (clogging and water saturation).
Check that there are no air bubbles between the filter and the high pressure pump.
Check the sealing of the low and high pressure diesel fuel systems: use **ALP6 Fuel circuit leaks** (visual inspections, touch tests, odours, etc.) on:
pump body, pressure release valve, pipes, rail and injectors unions, injector wells, etc.
Check the conformity of the seal fitting on the pressure regulator.
Check the operation of the injectors: run **Test 10 Poor injector operation** in this document.

Carry out the necessary repairs.

If the engine starts:

Clear any faults.

Check the pump pressure regulator by applying (see **ALP 7 Rough idle**).

With the engine warm, leave it to idle for a few minutes (**3** to **5 minutes**):
– If it stalls and the fault reappears, replace the pump regulator.
– If the engine does not stall, stabilise the engine speed at **2000 rpm (1 minute)** then depress the accelerator pedal fully until the maximum engine speed imposed by the computer is obtained **(~5500 rpm)**. The maximum rotation speed of the engine must be stabilised in the time taken to fully depress and then fully release the pedal. This test is carried out with no load (engine in neutral).
– If the engine stalls, contact the Techline

If the engine does not start or does not stall, first replace the pump regulator.
If the fault is still present, contact the techline.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

MT001	TURBOCHARGING FUNCTION

NOTES	Perform this fault finding procedure: – following the interpretation of a fault concerning the air line which cannot be rectified, – following an inconsistency found in the parameters concerning the air line (turbocharging pressure or inlet air flow), – following a customer complaint (starting faults, engine speed instability, lack of power).

NOTES	This fault finding mode allows you to check dynamically certain mechanical components on the engine. To do this, the engine will run a 4-phase cycle which will enable the entire air line to be checked: air filter, air flowmeter, duct (hoses), air refrigerant, turbocharging pressure sensor, turbocharger, inlet manifold, exhaust manifold and exhaust pipe. This test lasts for approximately **50 seconds**.

Interpretation of test results:
The data recorded during this test is displayed in the DATA section.
- Identify any data which is outside the tolerance range and apply the different Monitool fault finding procedures if necessary.

Introduction:
Engine parameters used during this test:
- **PR055 Engine speed**
- **PR035 Atmospheric pressure**
- **PR059 Inlet air temperature**
- **PR064 Coolant temperature**
- **PR132 Air flow**
- **PR041 Turbocharging pressure**
- **PR051 EGR valve position feedback**

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

MT001 CONTINUED 1	

Test procedure: the test on the **M9R** engine comprises 4 phases:

	Duration (in **milliseconds**)		Parameter observed
Phase 0	**5000**	Engine conditioning, checking the different systems needed for the test. Engine speed actuation,	
Phase 1	**15000**	Selection of the turbocharger control's minimum stop.	
Phase 2	**15000**	Selection of the turbocharger control's maximum stop.	
Phase 3	**15000**	Selection of the turbocharger control's minimum stop.	

Phase 0 deals with conformity; fault finding data is not recorded during this phase.
The measurements are only taken during phases 1, 2 and 3.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

MT001 CONTINUED 2	

PHASE 1:
Preliminary test:
Engine speed between: **2480 rpm < X < 2520 rpm**
Coolant temperature **> 70°C**
EGR valve feedback position **< 1%**

If data from the preliminary checks indicates a non-conformity, check the fuel circuit then contact the Techline.

Interpretation:
If, during phase 1, no data is outside the maximum and minimum limits for each variable, interpret the Monitool analysis for phase 2.

Faults, Values outside the limits	Threshold	Fault finding procedure
Air flow < Minimum threshold	Minimum threshold < Turbocharging pressure < maximum threshold	**Fault finding procedure Monitool no. 1**
	Turbocharging pressure < minimum threshold	**Fault finding procedure Monitool no. 2**
	Turbocharging pressure > maximum threshold	Contact Techline
Air flow > maximum threshold	Minimum threshold < Turbocharging pressure < maximum threshold	**Fault finding procedure Monitool no. 3**
	Turbocharging pressure < minimum threshold	Contact Techline
	Turbocharging pressure > maximum threshold	Contact Techline
Turbocharging pressure < minimum threshold	Minimum threshold < Air flow < maximum threshold	**Fault finding procedure Monitool no. 4**
	Air flow < Minimum threshold	**Fault finding procedure Monitool no. 2**
	Air flow > maximum threshold	Contact Techline
Turbocharging pressure > maximum threshold	Minimum threshold < Air flow < maximum threshold	**Fault finding procedure Monitool no. 5**
	Air flow < Minimum threshold	Contact Techline
	Air flow > maximum threshold	Contact Techline

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

MT001 CONTINUED 3	

Fault finding procedure Monitool no. 1:
– Check the fitting of the air flowmeter (direction of fitting to be observed).
– Check the tightness of the different air flowmeter clips.
– Check the **+ 5 V supply** of connection **3KJ** of component **799**.
If the connection is faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
– Check that there are no air leaks between the air flowmeter and the turbocharger.
– Run **Test 5 Air flowmeter**: check that there is no dust on the sensors.
If the checks do not reveal any non-conformity and the fault is still present, change the air flowmeter. Attach a screen copy of the Monitool results.

Monitool no. 2 fault finding procedure:
– Measure the internal **resistance** of the turbocharger control solenoid valve by applying the interpretation of **DF054 Turbocharging solenoid valve control circuit**.
– Check the connection of all the air hoses and the tightness of the clips.
– Check the condition of the air filter and replace it if necessary.
– Check that the exhaust pipe is not clogged, run **Test 1 Exhaust pipe check**.
– Apply **Test 7 Variable geometry turbocharger control**.
– Check that there are no leaks around the exhaust manifold.
– Check that there is no clogging obstructing the air refrigerant.
– Check that there are no air leaks on the engine (compression test).
If the checks do not reveal any non-conformity and the fault is still present, replace the turbocharger. Attach a screen copy of the Monitool results.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

MT001 CONTINUED 4	

Monitool no. 3 fault finding procedure:
– Check the **+ 5 V supply** of connection **3KJ** of component **799**.
If the connection is faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
– Run **Test 5 Air flowmeter**: check that there is no dust on the sensors.
If the checks do not reveal any non-conformity and the fault is still present, change the air flowmeter. Attach a screen copy of the Monitool results.

Monitool no. 4 fault finding procedure:
– Check that there are no air leaks between the turbocharger and the inlet manifold.
– Check the tightness of the different clips.
– Check that there are no air refrigerant leaks.
If the checks do not reveal any non-conformity and the fault is still present, change the turbocharging pressure sensor. Attach a screen copy of the Monitool results.

Monitool no. 5 fault finding procedure:
– Check the turbocharging pressure sensor by interpreting the conformity check for **PR041 Turbocharging pressure**.
If the checks do not reveal any non-conformity and the fault is still present, change the turbocharging pressure sensor. Attach a screen copy of the Monitool results.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

MT001 CONTINUED 5	

PHASE 2:
Preliminary test:
Engine speed between: **2480 rpm < X < 2520 rpm**
Coolant temperature **> 70°C**
EGR valve feedback position **< 1%**

Interpretation:
If, during phase 2, no data is outside the maximum and minimum limits for each variable, interpret the Monitool analysis for phase 3.

Note: the interpretation of faults during phase 2 should only be carried out in the following situation:
– The variables measured during phase 1 are correct, i.e. they are within the maximum and minimum authorised limits. If this is not the case, apply the different Monitool fault finding procedures which relate to the different faults revealed during the phase 1. To confirm the repairs or modifications carried out, run the **MT001** monitool test again.

Faults, Values outside the limits	Threshold	Fault finding procedure
Air flow < Minimum threshold	Minimum threshold < Turbocharging pressure < maximum threshold	Contact Techline
	Turbocharging pressure < minimum threshold	Contact Techline
	Turbocharging pressure > maximum threshold	Contact Techline
Air flow > maximum threshold	Minimum threshold < Turbocharging pressure < maximum threshold	Contact Techline
	Turbocharging pressure < minimum threshold	Contact Techline
	Turbocharging pressure > maximum threshold	**Fault finding procedure Monitool no. 6**
Turbocharging pressure < minimum threshold	Minimum threshold < Air flow < maximum threshold	Contact Techline
	Air flow < Minimum threshold	Contact Techline
	Air flow > maximum threshold	Contact Techline
Turbocharging pressure > maximum threshold	Minimum threshold < Air flow < maximum threshold	Contact Techline
	Air flow < Minimum threshold	Contact Techline
	Air flow > maximum threshold	**Fault finding procedure Monitool no. 6**

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

MT001 CONTINUED 6	

Monitool no. 6 fault finding procedure:
– Apply **Test 7 Variable geometry turbocharger control**.
If the checks do not reveal any non-conformity and the fault is still present, replace the turbocharger. Attach a screen copy of the Monitool results.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

MT001 CONTINUED 7	

PHASE 3:
Preliminary test:
Engine speed between: **2480 rpm < X < 2520 rpm**
Coolant temperature **> 70°C**
EGR valve feedback position **< 1%**
Interpretation:
If, during phase 3, there is no data outside of the maximum and minimum limits for each variable, then the air line is correct and no component replacement is to be carried out. Check the fuel circuit or deal with **present** or **stored** faults which are displayed on **the diagnostic tool**.
Note: the interpretation of faults during phase 3 should only be carried out in the following situation:
– The variables measured during phase 1 and 2 are correct, i.e. they are within the minimum and maximum authorised limits. If this is not the case, apply the different Monitool fault finding procedures which relate to the different faults revealed during the phase 1 and phase 2. To confirm the repairs or modifications carried out, run the **MT001** monitool test again.

Faults, Values outside the limits	Threshold	Fault finding procedure
Air flow < Minimum threshold	Minimum threshold < Turbocharging pressure < maximum threshold	**Fault finding procedure Monitool no. 7**
	Turbocharging pressure < minimum threshold	**Fault finding procedure Monitool no. 8**
	Turbocharging pressure > maximum threshold	Contact Techline
Air flow > maximum threshold	Minimum threshold < Turbocharging pressure < maximum threshold	Contact Techline
	Turbocharging pressure < minimum threshold	Contact Techline
	Turbocharging pressure > maximum threshold	Contact Techline
Turbocharging pressure < minimum threshold	Minimum threshold < Air flow < maximum threshold	Contact Techline
	Air flow < Minimum threshold	**Fault finding procedure Monitool no. 8**
	Air flow > maximum threshold	Contact Techline
Turbocharging pressure > maximum threshold	Minimum threshold < Air flow < maximum threshold	Contact Techline
	Air flow < Minimum threshold	Contact Techline
	Air flow > maximum threshold	Contact Techline

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

MT001 CONTINUED 8	

Monitool no. 7 fault finding procedure:
– Check the fitting of the air flowmeter (direction of fitting to be observed).
– Check the tightness of the different air flowmeter clips.
– Check the **+ 5 V supply** of connection **3KJ** of component **799**.
If the connection is faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
– Check that there are no air leaks between the air flowmeter and the turbocharger.
– Run **Test 5 Air flowmeter**: check that there is no dust on the sensors.
If the checks do not reveal any non-conformity and the fault is still present, change the air flowmeter. Attach a screen copy of the Monitool results.

Monitool no. 8 fault finding procedure:
– Measure the internal **resistance** of the turbocharger control solenoid valve by applying the interpretation of **DF054 Turbocharging solenoid valve control circuit**.
– Apply **Test 7 Variable geometry turbocharger control**.
If the checks do not reveal any non-conformity and the fault is still present, replace the turbocharger. Attach a screen copy of the Monitool results.

If all the checks do not allow the vehicle to be repaired, contact the Techline.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

VP036	INHIBIT FUEL SUPPLY

NOTES	This command enables you to disable the supply to the injectors. This command is carried out with the engine switched off, and ignition on.

This command allows the injectors to be locked, so that starting is not possible.
Command **VP036** allows the engine compressions to be checked in complete safety without disconnecting the connectors of the injectors or the TDC sensor.

Procedure to follow (cylinder no. 1 is located on the timing end):

– Remove **all** of the **heater plugs**, connect the **compression gauge** with the **M9R** flexible end piece, part no. **MOT 1772,** to a cylinder.
– Position the gear lever in neutral (manual gearbox) or to position P (automatic/sequential gearbox).
– Depress the brake pedal and keep it in this position throughout the test.

– Activate command **VP036.**
– Attempt to start the vehicle (within **10 seconds** of activating command **VP036**).

If the vehicle does not start, check the cylinder compressions.

Start the procedure again on another cylinder.

WARNING:
Keep the brake pedal depressed for the length of the test.

This command is inhibited automatically after **10 seconds**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

NOTES	Only refer to the customer complaints after a full check with the **diagnostic tool**.

NO DIALOGUE WITH ENGINE MANAGEMENT COMPUTER	**ALP 1**
STARTING FAULT OR STARTING IMPOSSIBLE	**ALP 2**
POOR PERFORMANCE	**ALP 4**
IRREGULAR ENGINE OPERATION	**ALP 5**
EXTERNAL LEAKS FROM THE FUEL CIRCUIT	**ALP 6**
ROUGH IDLE	**ALP 7**
ENGINE STALLING	**ALP 8**
PARTICLE FILTER WARNING LIGHT COMES ON TOO FREQUENTLY	**ALP 9**

AFTER REPAIR	Carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

ALP1	No dialogue with engine management computer

Use the **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2**.

STEP 1
Check the conformity of the vehicle type, and the domain selected on the tool.

Check that the tool is not faulty by trying to establish dialogue with a computer on another vehicle.
Check **the supply** to the diagnostic socket, component code **225**, of the following connections:
- **BCP4** of component **225 (+ before ignition)**,
- **AP10** of component **225 (+ after ignition)**,
- **NAP** and **MA** of component **225 (earth)**.

Check the conformity of the **after ignition** fuse.
– The conformity of the injection relay mounting.
Check the conformity of the main relay (relay removed):
– **Insulation** between connections **3FB** and **BP37** of component **983** or **1337**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
– Measure the **resistance** between connections **3AA** and **BP37** of component **983** or **1337**.
If the resistance of the injection relay is not between: **60** Ω **< X < 70** Ω, replace the relay.

Disconnect the engine management computer and check that there are no conducting parts on the computer studs. If this reveals any kind of impurity, rectify it and try to establish dialogue.
If the fault is still present, place the bornier **Elé. 1681** on the engine harness:

Check the **continuity** and **absence of interference resistance** on the following multiplex connections:
- **133B** between components **120** and **225**,
- **133C** between components **120** and **225**.

Check the **+12 V after relay supply** to the engine management computer on the following connections:
- **3FB** of component **120**,
- **3FB1** of component **120**,
- **3FB2** of component **120**.

Check for complete **earthing** on connections **NT** of component **120**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ALP1 CONTINUED	

While shunting the "normally open" contact of the supply relay i.e. connections **BP37** and **3FB** of component **983** or **1337**:
- **3FB** of component **120**, (with test shunt)
- **3FB1** of component **120**, (with test shunt)
- **3FB2** of component **120**, (with test shunt)

Check the **continuity** and **absence of interference resistance** of the following connection:
- **3AA** between components **120** and **983** or **1337**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Try to establish dialogue with another computer on the same vehicle.

If dialogue is established with **another computer on the same vehicle,** go to **step 2**.
If dialogue is not established **with any other computer on the same vehicle**, (see **88B, Multiplexing, ALP 1**).

STEP 2
Contact the Techline.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ALP2	starting difficult or impossible

NOTES	Before analysing this customer complaint, check that there are no faults, and the conformity (or otherwise) of the parameters and statuses, using the **diagnostic tool**. If the customer complaint is not eliminated, perform the following checks.
	Use the **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2**.

Is it difficult or impossible to start the engine?

Impossible → **PART B**

Difficult ↓

PART A:

If fault **DF308 Clogged particle filter** is **present**, consult the interpretation of **DF308**.
Check the engine **earths**.
If the engine speed is less than **200 rpm**, refer to **Technical Note 6014A, Charging circuit check**, **Starter fault finding, Starter (formerly Technical Note 3632A)**.
If an engine speed of **200 rpm** is achieved with starter motor in operation, **PR055 Engine speed**.
If the engine speed is zero with the **diagnostic tool**:
Measure **the resistance** between connections **3BG** and **3BL** of component **149**.
If the sensor resistance is not between: **600 Ω < X < 1000 Ω**, replace the sensor.

Check the **continuity** and **absence of interference resistance** on the following connections:
- **3BG** between the components **120** and **149**,
- **3BL** between components **120** and **149**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ALP2 CONTINUED 1	

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Check the conformity of the engine **earths** (oxidation, tightness, etc.).
Check the mounting and condition (overheating) of the sensor.

Check the synchronisation of the camshaft sensors and the engine speed sensors with the display of **ET238 Synchronisation**. If synchronisation is not active, refer to the checks described in **DF195 Camshaft/engine speed sensor consistency**.

Test the high pressure fuel circuit:
Run scenario **SC035 High pressure fuel circuit fault finding**.
To interpret the result, apply the interpretation of command **SC035** (see **Interpretation of commands**).

Check the fuel circuit sealing: run **Test 3 Low pressure circuit check**.
If **Test 3** is correct.
If **Test 3** is not correct, proceed as follows:

Check the conformity of the type of heater plugs configured:

For Vdiag 20, 24, 38 and **74**: consult **ET781 Heater plugs** in the **Ignition/Preheating** subfunction and check the conformity with the type of plugs installed:
– Slow plugs have a black ring.
– Fast plugs have a white ring.
If the heater plugs are being replaced with plugs of a different type (see **Replacement of components, Replacing heater plugs**).

For all Vdiags, check that all **4 plugs have the same colour ring**.

Check that the heater plugs are actuated using the **AC037 Preheating relay** command.
Check the sealing and condition of the inlet circuit: run **Test 4 Turbocharged air inlet circuit check**, and follow the related fault finding procedure (see **Test 4**).

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ALP2 CONTINUED 2	

Check that the exhaust is not blocked: run **Test 1 Exhaust pipe check**, and follow the related fault finding procedure (see **Test 4**).

Check the consistency of the signal from the engine coolant temperature sensor.

Check the operation of the rail pressure regulator **(DRV)** using command **AC225 Rail pressure regulator** and then the operation of the pump pressure regulator **(MPROP)** using command **AC226 Pump pressure regulator**.

Check the timing setting.

Apply **part B** of **Test 10 Poor injector operation**.

End of part A.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ALP2 CONTINUED 3	

PART B

If fault **DF308 Clogged particle filter** is **present**, apply the interpretation of **DF308**.

Is there diesel in the tank?

NO → Fill the tank with diesel fuel.
Bleed the low and high pressure diesel circuit.

YES

Does the starter motor work properly?
(Ensure that the engine speed reaches **> ≈ 200 rpm** with the starter in operation, **PR055 Engine speed**)

NO → Refer to **Technical Note 6014A, Charging circuit check, 16A (formerly Technical Note 3455A), Starter fault finding, Starter (formerly Technical Note 3632A)**.

YES

Using the **diagnostic tool**, check the conformity of the immobiliser: **ET003 Immobiliser** must be **INACTIVE**.

ET003 not correct, or warning light permanently on

Consult the fault finding procedure for the immobiliser.

ET003 correct (immobiliser code warning light off)

Continue the fault finding procedure with **Part A** of this fault finding chart.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ALP4	Poor performance

NOTES	Before analysing this customer complaint, check that there are no faults, and the conformity (or otherwise) of the parameters and statuses, using the **diagnostic tool**. If the customer complaint is not eliminated, perform the following checks.

IMPORTANT:
In the event of the engine overheating above **118°C**, the computer deliberately limits the fuel flow (overheating warning light comes on from **115°C**).
– Please observe the cleanliness guidelines and safety advice.

Note:
For the **M9R 724 (Vdiag 5C** and **58)**:
The engine is limited to **3000 rpm** if the vehicle is stationary or if the vehicle speed is less than **4 mph (7 km/h)** and if the engine is warm.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V18_ALP04 / EDC16CP33_V1C_ALP04 / EDC16CP33_V54_ALP04 / EDC16CP33_V20_ALP04 / EDC16CP33_V58_ALP04 / EDC16CP33_V5C_ALP04 / EDC16CP33_V24_ALP04 / EDC16CP33_V04_ALP04 / EDC16CP33_V08_ALP04 / EDC16CP33_V44_ALP04 / EDC16CP33_V4C_ALP04 / EDC16CP33_V34_ALP04 / EDC16CP33_V38_ALP04 / EDC16CP33_V74_ALP04 / EDC16CP33_V28_ALP04 / EDC16CP33_V62_ALP04 / EDC16CP33_V26_ALP04 / EDC16CP33_V60_ALP04

GETtheMANUALS.org

ALP4 CONTINUED 1	

Is the engine running on all cylinders? — YES → A

NO ↓

Test the high pressure fuel circuit:
Run scenario **SC035 High pressure fuel circuit fault finding** (see **Interpretation of commands**).
Check that the fuel tank is correctly filled and that the fuel is correct: run **Test 12 Diesel fuel conformity check**.
If the fuel (diesel fuel) used is not correct:
– Replace the fuel (diesel fuel).
– Replace the fuel filter (diesel fuel).
– Bleed the low and high pressure fuel circuit (diesel fuel).

Check that the injectors are correctly fitted (presence and **conformity of the sealing washer**).
– Checking procedure:
– Take a straightedge approximately **40 cm** long and place it on the 4 injectors. The straightedge should rest on the 4 injectors.
– If one or more injector(s) are not in order, remove and check the conformity of the washer.
– If one injector does not touch the straightedge (clearance of more than **1 mm**), remove the injector and check that the washer is present.
Clean the injector well and the injector, refit the injector with the correct sealing washer.

Check the sealing and the condition of the inlet circuit: run **Test 4 Turbocharged air inlet circuit check**.
Check the condition of the air flowmeter: run **Test 5 Air flowmeter**.
Check the turbocharger: run **Test 7 Variable geometry turbocharger control** then **Test 8 Turbocharger rotating part**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ALP4 CONTINUED 2	

A

YES

Perform the following road test (looking for a loss of power when accelerating under full load):
– in the highest gear ratio, accelerate fully,
– lift your foot off the accelerator pedal completely for at least 2 seconds,
– accelerate fully again,
– release the accelerator pedal completely,
– accelerate slightly.

If the loss of power was not noted during slight acceleration **and** if there was a loss of engine power during **each acceleration at full load**, replace the diesel fuel injector return rail and its overpressure valve (see **MR364 (Mégane II ph2), MR370 (Scénic II ph2), MR 395 (Laguna II ph2), 402 (Vel Satis ph2), 405 (Espace IV ph2) Mechanical, 13B, Diesel injection, Diesel injector fuel return rail: Removal - Refitting**).

Check the connection and positioning of the differential pressure sensor (see **MR 395 (Laguna II ph2), 402 (Vel Satis Ph2), 405 (Espace IV ph2), 364 (Mégane II ph2), 370 (Scénic II ph2) Mechanical, 19B, Exhaust, Particle filter pressure sensor: Removal - Refitting**).

Check the conformity of the accelerator pedal position sensor, the brake pedal sensor, the atmospheric pressure sensor, the exhaust gas recirculation valve, and the damper valve (see **Interpretation of statuses and parameters**).

Check the consistency of the signal from the air flowmeter, the engine coolant temperature sensor, the fuel temperature sensor and the engine speed sensor.

Check the connections, the **continuity** and **the absence of interference resistance** of the following components:
– the air flowmeter (apply **DF056 Air flow sensor circuit**)
– the engine coolant temperature sensor (apply **DF001 Coolant temperature sensor circuit**)
– the fuel temperature sensor (apply **DF098 Fuel temperature sensor circuit**)
– the engine speed sensor (apply **DF195 Engine speed/camshaft sensor consistency**).

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ALP4 CONTINUED 3	

Check:
– That the diesel filter is not clogged.
– That there are no leaks on the high and low pressure diesel circuits: run **Test 3 Low pressure circuit check**.
– **Test the high pressure fuel circuit**:
Run scenario **SC035 High pressure fuel circuit fault finding** (see **Interpretation of commands**).

Continue by checking the following:
– The connection of the oil vapour rebreathing circuit.
– The pump pressure regulator (**MPROP**), (jamming - sticking); apply the interpretation of command **AC226 Pump pressure regulator**.
– The rail pressure regulator (**DRV**), (jamming - sticking); apply the interpretation of command **AC225 Rail pressure regulator**.
– Check the engine timing (and the position of the high pressure pump sprocket).
– Check the engine compressions: use a compression gauge, **M9R** hose end piece, part no. **Mot. 1772** and apply command **VP036 Fuel supply inhibition** (see **Interpretation of commands**).

If the fault is still present, contact the techline.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ALP5	Irregular engine operation

NOTES	Before analysing this customer complaint, check that there are no faults, and the conformity (or otherwise) of the parameters and statuses, using the **diagnostic tool**. If the customer complaint is not eliminated, perform the following checks.
	Use the **Wiring Diagram Technical Note, Laguna II ph2, Vel Satis ph2, Espace IV ph2, Mégane II ph2, Scénic II ph2**.

If the engine races during gear changes, if there is a floor mat, check that this is not blocking the accelerator pedal, the brake pedal and the clutch pedal, then check the conformity of the clutch switch and the conformity of the accelerator pedal sensor when the pedal is released (see **PR086 Pedal potentiometer voltage gang 1** and **PR088 Pedal potentiometer voltage gang 2**, Sensor supply).
Measure **the resistance** between connections **3BG** and **3BL** of component **149**.
If the sensor resistance is not between:
741 Ω < X < 905 Ω at **+20°C**, replace the sensor**.**

Check the **continuity** and **absence of interference resistance** on the following connections:
- **3BG** between the components **120** and **149**,
- **3BL** between components **120** and **149**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Check the conformity of the engine **earths** (oxidation, tightness, etc.).
Check the mounting and condition (overheating) of the sensor.

Check the low pressure circuit: run **Test 3 Low pressure circuit check**.

Apply the air flow checking procedure, (see **conformity in the interpretation of statuses and parameters**).

Check the turbocharger: apply **Test 7 Variable geometry turbocharger control**.

If the fault is still present, **test the high pressure fuel circuit**:
Run scenario **SC035 High pressure fuel circuit fault finding**.
To interpret the result, apply the interpretation of command **SC035** (see **Interpretation of commands**).

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

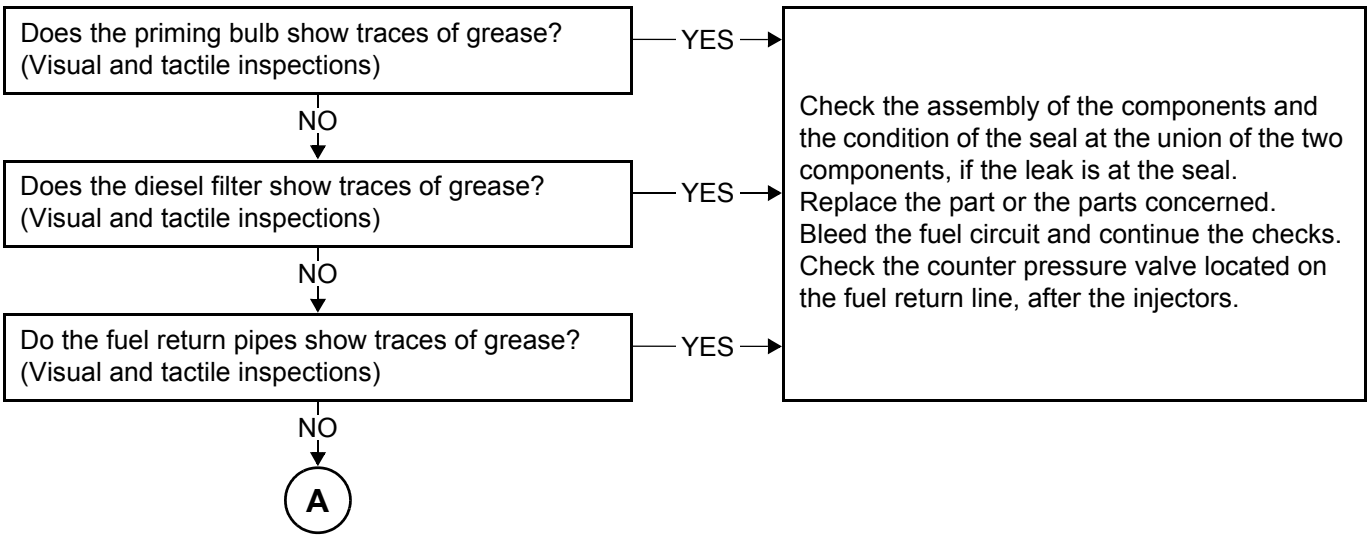
ALP6	Fuel system leaks

NOTES	Before analysing this customer complaint, check that there are no faults, and the conformity (or otherwise) of the parameters and statuses, using the **diagnostic tool**. If the customer complaint is not eliminated, perform the following checks. **IMPORTANT:** Please observe the cleanliness guidelines and safety advice.

Procedure for checking for an external leak on the fuel circuit:

Clean away traces of grease with clean thinner and wipe the part or parts concerned with cleaning cloths.
Start the engine and increase the engine temperature until the diesel fuel reaches **40/50°C**.
Stop the engine and check for traces of grease on the part or parts concerned.
If this is the case, replace the part or parts concerned.



AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16CP33_V18_ALP06 / EDC16CP33_V1C_ALP06 / EDC16CP33_V54_ALP06 / EDC16CP33_V20_ALP06 / EDC16CP33_V58_ALP06 / EDC16CP33_V5C_ALP06 / EDC16CP33_V24_ALP06 / EDC16CP33_V04_ALP06 / EDC16CP33_V08_ALP06 / EDC16CP33_V44_ALP06 / EDC16CP33_V4C_ALP06 / EDC16CP33_V34_ALP06 / EDC16CP33_V38_ALP06 / EDC16CP33_V74_ALP06 / EDC16CP33_V28_ALP06 / EDC16CP33_V62_ALP06 / EDC16CP33_V26_ALP06 / EDC16CP33_V60_ALP06

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ALP6 CONTINUED 2	

B

NO

– Run command **SC035 High pressure fuel circuit fault finding**.

– While running the test, check that there are no leaks from the high pressure circuit.

Is there a leak from the high pressure circuit? — YES → C

NO

End of fault finding.

Reminder:

Only replace the rail, pump or injector if there is damage to the union and this damage is visible during checks. Bleed the fuel circuit and continue the checks.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ALP7	Rough idle

NOTES	Before analysing this customer complaint, check that there are no faults, and the conformity (or otherwise) of the parameters and statuses, using the **diagnostic tool**. If the customer complaint is not eliminated, perform the following checks.

Check the sealing and the condition of the inlet circuit: run **Test 4 Turbocharged air inlet circuit check**. Check the low pressure circuit: run **Test 3 Low pressure circuit check**.

Check the engine parameters:

- Check the update of the engine management computer calibration (last calibration).
- Check the conformity of the **IMA*** codes (see **Interpretation of commands, SC002 Enter injector codes**).

Check the charging circuit using **Technical Note 6014A, Charging circuit check, Alternator fault finding, 16A, Alternator (formerly Technical Note 3455A)**.

- Check that the engine speed signal is correct using an oscilloscope: no interference, broken tooth, etc.
- If not correct, check:
- The wiring.
- The flywheel position and the condition of the flywheel teeth.
- Check the position and tightness of the engine speed sensor.

- Check the connections and wiring of the injectors.
- Check the connections and wiring of the engine management computer to the injectors.

Check the high pressure circuit (external leaks).
(see the end of the **Fuel circuit external leaks** fault finding chart)

GETtheMANUALS.org

TEST1	Exhaust system check

Engine stopped: Check that the silencer outlet is not blocked. Repair or replace the silencer, if necessary.

↓

Check the seal of the exhaust manifold on the contact surface between the turbocharger and the exhaust manifold.
Is the seal in order?

NO → Repair or replace the faulty part.

YES ↓

Loosen the catalytic converter on the turbocharger side.
Place a wooden block between the two parts.
Start the vehicle and check if the engine runs better.
Is the engine running normally?

NO → The exhaust system is not the cause of the fault; repeat the engine fault finding (see **Customer complaints - Fault finding chart**).

YES ↓

Retighten the catalytic converter.
Loosen or separate the particle filter on the catalytic converter side. Place a wooden block between the two parts if necessary.
Start the vehicle and check if the engine runs better.
Is the engine running normally?

NO → Replace the catalytic converter.

YES ↓

TEST2	Resolving misfires

Check for faults **DF059 Misfire on cylinder 1, DF060 Misfire on cylinder 2, DF061 Misfire on cylinder 3, DF062 Misfire on cylinder 4, DF065 Misfire** using the diagnostic tool.

↓

Run a compression test using the **M9R** flexible end piece, part number Mot. 1772 and apply command **VP036 Fuel supply inhibition** (see Interpretation of commands).
Are the values obtained correct?

NO → Check the mechanical conformity of the valves, heater plugs and segments.

YES ↓

Clear the faults, start the engine and leave the engine running at idle speed for 1 minute.
Check for faults **DF059, DF060, DF061, DF062, DF065** using the diagnostic tool.
Are there any faults remaining?

NO → End of test.

YES ↓

Change the faulty injector to another position.
Did the fault follow the injector to its new location?

NO → Put the injectors back in their initial positions.

YES ↓

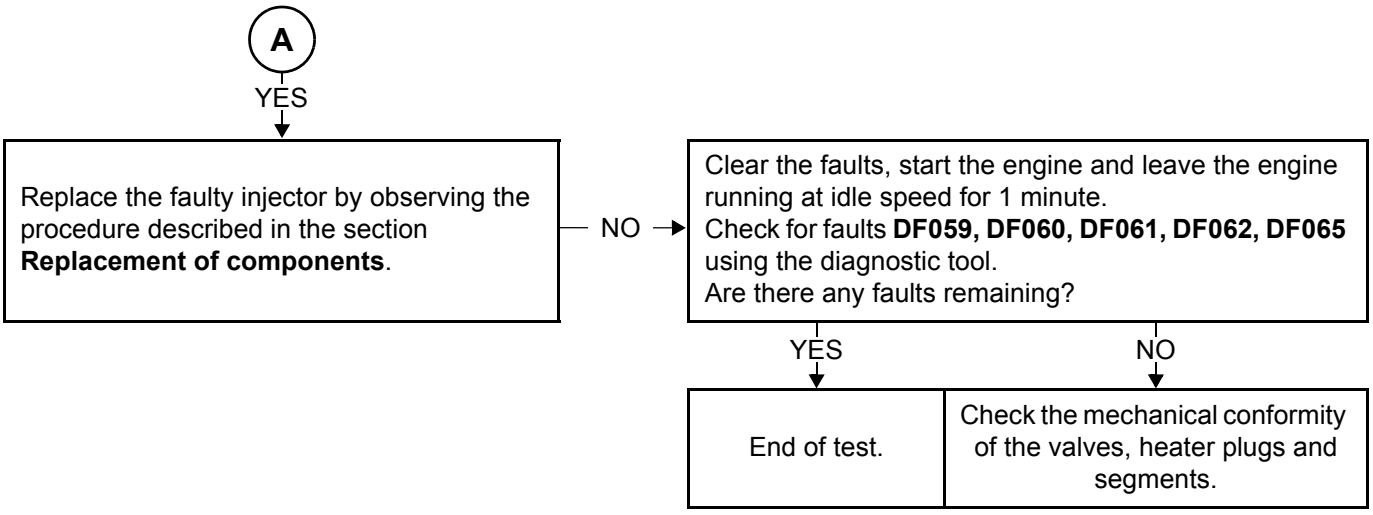
GETtheMANUALS.org

TEST2 CONTINUED	



GETtheMANUALS.org

TEST3	Low pressure circuit check

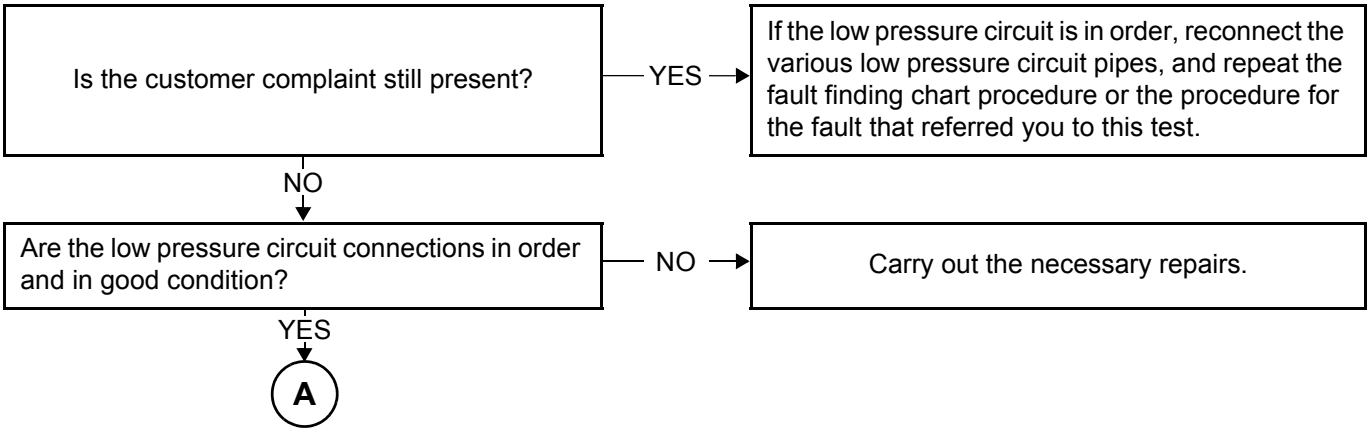
Check the fuel filter:
– Conformity of the fuel filter (correct part number and **RENAULT** filter).
– Positioning and degree of clogging of the filter cartridge.
– Positioning and condition of the seals.
– If there is metal swarf in the filter:
Replace the fuel filter, bleed the circuit and **continue the fault finding procedure**.

Supplying the injection system with fuel from an additional tank.

This operation aims to detect possible faults in the low pressure supply system of a vehicle by replacing it entirely with an additional tank.

Mode:

– Disconnect the diesel fuel supply pipe at the fuel filter inlet and block it with a plug.
– Connect a pipe to the fuel filter inlet and insert the other end in a **clean** container with a capacity of approximately **5 litres**.
– Disconnect the diesel fuel return pipe at the diesel temperature sensor (pump return and injector return join), and block it using a plug.
– Connect a transparent pipe to the union of the diesel fuel temperature sensor, and insert the other end in the container.
– Fill the container with **clean** diesel fuel.
– Start the engine and let the system drain itself of its air (there must not be any air bubbles in the return pipe).



GETtheMANUALS.org

TEST3 CONTINUED	

A

YES

Check the condition and operation of the priming bulb. Perform repairs if necessary and continue the test.

Check the condition of all the low pressure diesel pipes from the tank to the injection pump (in particular no pinching of pipes).

If the fault is still present with a low fuel level, check the consistency of the actual fuel level and that indicated on the instrument panel.
The transfer pump is supplied via a Venturi pipe located underneath it.
Check that the opening of the venturi (**6 mm** to **8 mm** in diameter) is not blocked by dirt contained in the fuel tank.

Check the priming of the low pressure diesel circuit.

Check that the fuel tank is correctly filled and that the fuel is correct (see **Test 12 Diesel fuel conformity check**).
If the diesel fuel is not correct:
– Replace the fuel (diesel fuel).
– Replace the fuel filter (diesel fuel).
– Bleed the low and high pressure fuel circuit (diesel fuel).

Low pressure circuit correct.

GETtheMANUALS.org

TEST4	Turbocharged air inlet circuit check

Engine stopped: Check the **sealing** (leak or air intake) of the low and high pressure air circuit (before/after turbocharger).

↓

Check the parts that are abnormally greasy of the circuit and reveal a lack of tightness.
Check:
– the condition and fitting of the ducts (foreign, clogged, not joined, kinked, broken, pierced, cut bodies, tightness of the mounting bolts, etc.).
– the presence, condition and fitting of the seals.
– the present and tightening of the clamps.
– The fitting of the turbocharging pressure sensor.
– The pipes and the take-off point between the air duct and the turbocharging sensor.

Carry out the necessary repairs.

↓

Check the air filter.

↓

Check:
– That the inlet and outlet of the air filter unit is not blocked.
– the condition and the assembly of the air filter unit (disconnected, broken, pierced …).
– The cleanliness, the conformity and the non-distortion of the filter element.
– The air flowmeter: run **Test 5 Air flowmeter.**

Carry out the necessary repairs

↓

Check:
– the condition of the damper valve,
– the tightening of the mounting bolts,
– cracks in the damper valve.

Carry out the necessary repairs.

↓

A

GETtheMANUALS.org

TEST4 CONTINUED	Turbocharged air inlet circuit check

A

Check that there is no leak at the exhaust manifold, in particular at the exhaust manifold/turbocharger connection.
Check the exhaust, run **Test 1 Exhaust pipe check**.
Carry out the necessary repairs.

Visually check the EGR circuit sealing.

Note:
The operational clearance of the EGR exchanger flap shaft leaves slight traces of a black substance due to inconsequential leakage. Do not replace this part.

– Check the condition of the intercooler:
– clogging,
– leaks (vehicle stationary, stabilise the engine speed between **3500 rpm** and **4000 rpm** and check that there are no leaks).

Replace if necessary.

Check that the turbocharging pressure sensor take-off point is not blocked.
Carry out the necessary repairs

END OF TEST.

GETtheMANUALS.org

TEST5	Air flowmeter

Damage to electrical components

Visual inspection: remove the flow sensor - the components should not be broken.

Replace the air flowmeter if necessary.

Oxidation of the electrical components

Visual inspection: remove the air flowmeter, there should not be any greenish deposits on the electrical components.

Replace the air flowmeter if necessary.

Clogging of the air flowmeter

Test:
– Check the values for conformity:
– During the first 5 seconds after starting,
– **PR064 Coolant temperature**: **80°C.**
– **PR055: Engine speed**: idling.
– **PR059: Air temperature** between **30** and **70°C**.
– **PR146 Inlet air flow**: between **20** and **28 kg/h**.
– **PR220 EGR valve OCR***: between **22** and **30%**.
– **PR132 Air flow**: between **20** and **28 kg/h**.
– **PR051 EGR valve position feedback:** between **22** and **30%**.
– **PR023 Air flow difference** between **- 50** and **+ 50 mg/stroke**.
– Apply the procedure for **DF056 Air flow sensor circuit** for the checks on the air flowmeter.

Replace the air flowmeter if necessary.

END OF TEST.

OCR*: Opening Cyclic Ratio

GETtheMANUALS.org

TEST6	Fuel return rail valve check

This test consists of creating a vacuum downstream of the anti-return valve of the injector return rail and checking whether fuel is drawn in by the valve.

Fitting:
Remove the rail protector.
Disconnect the union of the return rail on injector 4 (on the gearbox side).
Disconnect the union downstream of the anti-return valve.
Connect the **8 mm** quick-release coupling.
Connect a transparent hose (resistant to diesel, length **60 cm** and internal diameter **8 mm**).
Connect a manual vacuum pump.

Gradually apply a vacuum up to **0.5 bar**.
If **more than a cm** of diesel is quickly drawn into the hose, the valve is leaking. Stop the vacuum immediately.
Replace the diesel injector fuel return rail and its overpressure valve (see **MR364 (Mégane II ph2), MR370 (Scénic II ph2), MR 395 (Laguna II ph2), MR 402 (Vel-Satis ph2), MR405 (Espace IV ph2) Mechanical, 13B, Diesel injection, Diesel injector fuel return rail: Removal - Refitting**).

Otherwise, maintain the vacuum for **1 minute**.
If **less than a cm** of diesel is drawn into the hose, the valve of the rail is not leaking.
End of test.

GETtheMANUALS.org

TEST10	Incorrect injector operation

Part A (for VDiag 18, 04 and 44):

Fuel regulation balance check for each injector (individual correction):
– In the **CLIP diagnostic tool**, choose the **Fuel circuit** subfunction.
– With the engine idling and the fuel temperature **> 50°C**, view the flow correction values of each injector (individual correction), i.e.:
– PR364 Cylinder no. 1 fuel flow correction;
– PR405 Cylinder no. 2 fuel flow correction;
– PR406 Cylinder no. 3 fuel flow correction;
– PR365 Cylinder no. 4 fuel flow correction.

The **normal value** for flow correction for an injector is approximately **X = ±1.5 mg/stroke**. This tolerance value may increase with time, but indicates an injector / cylinder fault if it exceeds **X = ±5 mg/stroke**.

Check the **IMA*** injector codes, by comparing the **IMA** codes engraved on the injectors (the **IMA** codes are read from left to right) and the **IMA** codes read with the **diagnostic tool**. If the **IMA** codes are correct, continue the fault finding procedure, if not, enter the incorrect **IMA** codes using command **SC002 Enter injector codes** (see **Interpretation of commands**).

1- If at least one of these values is X > + 5 mg/stroke

– Check the valve clearance.
– Check the condition of the engine and test the compressions. Use a compression gauge, the **M9R** hose end piece, part number **Mot.1772** and apply command **VP036 Fuel supply inhibition** (see **Interpretation of commands**).
– If the compression test reveals a cylinder fault, carry out the necessary repairs.
– If the compression is correct, check the injector fitting conforms according to the procedure (see **MR 402 (Vel Satis ph2), MR 395 (Laguna II ph2), MR 364 (Mégane II ph2), MR 370 (Scénic II ph2) or MR 405 (Espace IV ph2) Mechanical, 13B, Diesel injection, Diesel injectors: Removal - Refitting**).
– Check the fuel regulation again for each injector (individual correction).
– If the customer complaint is still present, replace the injector* concerned.
– See paragraph **Part C: Confirmation of flow correction fault finding for each injector**, for confirmation of the fault finding.

IMA*: Individual injector correction

GETtheMANUALS.org

TEST10 CONTINUED 1	

2. If at least one of these values is X < - 5 mg/stroke

– Check the valve clearance.
– Check the level and condition of the engine oil.
– Remove the injector with the largest adjustment.
– If there is contamination via the diesel, check the condition of the cylinder concerned (cylinder, piston, valves).
– Replace the injector* concerned.
– See paragraph **Part C**, for confirmation of the fault finding.

3. If at least one of these values does not stabilise (20 seconds after starting):

– Check the low pressure circuit using **Test 3 Low pressure circuit test**.
– Check the fuel is correct by carrying out **Test 12 Diesel fuel conformity check**.
See paragraph **Part C of Test 10**, for confirmation of the fault finding.

After replacing an injector, follow the injector code programming procedure (see **Replacement of components**), run **SC036 Reinitialise programming** and select the number of the injector replaced.

IMPORTANT:
When removing / refitting injectors, follow the cleanliness and safety instructions (see **MR 395 (Laguna II ph2), 402 (Vel Satis), 405 (Espace IV Ph2), 364 (Megane II ph2), 370 (Scenic II ph2) Mechanical, 13B, Diesel injection, Diesel injectors: Removal - Refitting**).

GETtheMANUALS.org

TEST10 CONTINUED 2	

Part B (except VDiag 18, 04 and 44):

Run **SC031 Cylinder operational fault finding**.
Is **SC031** correct?

NO → Check the engine compressions: use a compression gauge, **M9R** hose end piece, part no. **Mot. 1772** and apply command **VP036 Fuel supply inhibition** (see **Interpretation of commands**).

Run compressions on all cylinders.
Are the compressions correct?

YES → Check the fitting of the injector concerned and repair if necessary.
Otherwise change the injector concerned.
After replacing the injector, follow the injector code programming procedure (see **Replacement of components**), run **SC036 Reinitialise programming**, and select the number of the injector replaced.

Repeat **Part B of Test 10** to confirm the repairs.

NO → Check the cylinder block.

YES → The injectors are operating correctly.

IMPORTANT:
When removing / refitting injectors, follow the cleanliness and safety instructions (see **MR 395 (Laguna II ph2), 402 (Vel Satis), 405 (Espace IV Ph2), 364 (Megane II ph2), 370 (Scenic II ph2) Mechanical, 13B, Diesel injection, Diesel injectors: Removal - Refitting**).

GETtheMANUALS.org

TEST10 CONTINUED 3	

Part C:

Confirmation of flow correction fault finding for each injector (individual correction):

Clear the faults and run a test with the **engine at idle speed** and the fuel temperature **> 50°C**, check that no faults appear on the **diagnostic tool** and that the correction values do not reach **X = ±** 5 mg/stroke to confirm the repair.
– If one or more cylinders have flow correction values for an injector which exceed **X = ± 5 mg/stroke**, follow the fault finding procedure described in **Part A: Fuel regulation balance check for each injector (individual) of Test 10**.
– Otherwise, follow the fault finding procedure described in **Part D of Test 10**.

Part D:

Injector nozzle sealing check:

Check the level and condition of the engine oil:
– If there is contamination from the diesel fuel, the leaking injector nozzle will be "greasy".
– Disconnect the preheating relay.
– Ensure that this is not caused by rising engine oil by checking the engine compression values.
– Check the condition of the heater plug: this must not be wet. If it is, change the defective injector.
– If the engine compression values are correct: locate the faulty injector by looking at the condition of the cylinders and the pistons through the heater plug wells (greasy cylinder, overheating, signs of damage, etc.).
– If the cylinder - piston examination is not conclusive, remove the injectors and change the one with the greasy nozzle.
– If the fault finding checks do not enable the engine to be repaired, contact the Techline.

After replacing the injector, follow the injector code programming procedure (see **Replacement of components**), run **SC036 Reinitialise programming**, and select the number of the injector replaced.

Note:
Before replacing an injector, check for the sealing washer and its conformity (see **Fault finding chart ALP4 Poor performance**).

IMPORTANT:
When removing / refitting injectors, follow the cleanliness and safety instructions (see **MR 395 (Laguna II ph2), 402 (Vel Satis), 405 (Espace IV Ph2), 364 (Megane II ph2), 370 (Scenic II ph2) Mechanical, 13B, Diesel injection, Diesel injectors: Removal - Refitting**).

GETtheMANUALS.org

TEST11	Temperature upstream of turbine too low

Perform a complete fault finding of the injection computer using the diagnostic tool.
Are there any present or stored faults?
YES → Apply the procedure for dealing with the associated faults.

NO

Run **Test 1 Exhaust system check**
Is the exhaust pipe correct?
NO →

YES

Apply **Test 4 Turbocharged air inlet circuit check**.
Is the inlet circuit in order?
NO →

YES

Run **Test 4 Air flowmeter**
Is the air flow sensor correct?
NO →

YES

Run **Test 10 Poor injector operation**
Are the injectors correct?
NO →

YES

Contact the Techline.

Repair then carry out another particle filter regeneration.
Run command **SC017 "Particle filter regeneration"** (see **Interpretation of commands**).

If the second regeneration is successful, it is **essential** to change the engine oil and replace the oil filter.

If the second regeneration fails, contact the Techline.

GETtheMANUALS.org

TEST12	Diesel fuel conformity check

WARNING
During this operation, it is essential to:
– refrain from smoking or bringing incandescent objects close to the work area,
– guard against petrol splashes caused by the residual pressure in the pipes,
– wear safety goggles with side guards,
– wear leaktight gloves (Nitrile type).

IMPORTANT
– To avoid any corrosion or damage, protect the areas on which fuel is likely to run.
– To prevent impurities from entering the circuit, place protective plugs on all fuel circuit components exposed to the open air.

Preparations:
Weigh an empty **1300 ml plastic cup (part no. 77 11 171 413)** with its cover **(part no. 77 11 171 416)** using electronic scales such as those used in body paint workshops (example: **PANDA part no. 77 11 224 995**). Record the weight of the empty plastic cup.
This type of plastic cup is used to prepare paint.

Remove **1 litre** of fuel from the **diesel fuel filter outlet** (see **MR395 (Laguna II ph2) or MR402 (Vel Satis ph2) or MR405 (Espace IV ph2) or MR364 (Mégane II ph2) or MR370 (Scénic II ph2), Mechanical, 19C, Tank, Fuel tank: Draining**), using a pneumatic transfer pump (**part no. 634-200**) and place it in the **1300 ml** plastic cup. Cover the plastic cup with its cover and let it settle for approximately**2 minutes**.

Is the fuel cloudy or does it separate into two parts?

YES → Presence of water in diesel fuel, the fuel is not compliant. Drain the fuel circuit, including the tank (see **MR395 (Laguna II ph2) or MR402 (Vel Satis ph2) or MR405 (Espace IV ph2) or MR364 (Mégane II ph2) or MR370 (Scénic II ph2), Mechanical, 19C, Tank, Fuel tank: Draining**).

NO → A

EDC16CP33_V18_TEST12 / EDC16CP33_V1C_TEST12 / EDC16CP33_V54_TEST12 / EDC16CP33_V20_TEST12 / EDC16CP33_V58_TEST12 / EDC16CP33_V5C_TEST12 / EDC16CP33_V24_TEST12 / EDC16CP33_V04_TEST12 / EDC16CP33_V08_TEST12 / EDC16CP33_V44_TEST12 / EDC16CP33_V4C_TEST12 / EDC16CP33_V34_TEST12 / EDC16CP33_V38_TEST12 / EDC16CP33_V74_TEST12 / EDC16CP33_V28_TEST12 / EDC16CP33_V62_TEST12/ EDC16CP33_V26_TEST12 / EDC16CP33_V60_TEST12

GETtheMANUALS.org

TEST12 CONTINUED 1	

A

NO

Weigh the diesel fuel and note the fuel weight after subtracting the weight of the empty plastic cup and its cover.
Does the fuel weight fall between the minimum and maximum weights given in the table below?

Calculated weight (g.)		Fuel temperature (°C)
Min. weight	Max. weight	
821	846	13
821	846	14
820	845	15
819	844	16
819	844	17
818	843	18
817	842	19
816	841	20
816	841	21
815	840	22
814	839	23
814	839	24
813	838	25

Check the fuel temperature by immersing a thermometer in the plastic cup.

YES

End of test.

NO

The fuel is not correct.
If the fuel weight is less than the minimum value then there is petrol in the diesel fuel.
If the fuel weight is greater than the minimum value then there is oil in the diesel fuel.
Drain the fuel circuit, including the tank (see **MR395 (Laguna II ph2) or MR402 (Vel Satis ph2) or MR405 (Espace IV ph2) or MR364 (Mégane II ph2) or MR370 (Scénic II ph2), Mechanical, 19C, Tank, Fuel tank: Draining**).

GETtheMANUALS.org

TEST12 CONTINUED 2	

Note:
If the weight measured reaches the limit values, the measurement can be performed with a **2230 ml plastic cup (part no. 77 11 171 414)** and its cover **(part no. 77 11 171 417):**
– Carry out a quick test drive in order to mix the fuel, then remove **2 l** of fuel.
– Perform the test again and check the results by multiplying the limit values by 2.

Contact the Techline if you have doubts or problems with the customer.

GETtheMANUALS.org

1. SCOPE OF THIS DOCUMENT

This document presents the fault finding procedure applicable to all computers with the following specifications:

Vehicle(s): **Laguna II phase 2, Espace IV phase 2, Velsatis phase 2**	*Name of computer:* **Bosch H EDC16C36**
Engines: **G9T 605, 607, 645**	*Program No.:* **91**
Function concerned: **Diesel injection**	Vdiag No.: ***04, 08***

2. PREREQUISITES FOR FAULT FINDING

Documentation type

Fault finding procedures (this manual):
– Assisted fault finding (integrated into the **diagnostic tool**), Dialogys.

Wiring Diagrams:
– Visu Schéma (CD-ROM), paper.

Type of diagnostic tools

– CLIP

Special tooling required

Special tooling required	
Multimeter	
Elé. 1681	**Universal bornier**

3. REMINDERS

Procedure

To save energy, **the vehicle's UCH interrupts the + after ignition feed after 3 minutes**.

To run fault finding on a computer, it is possible to force the + after ignition feed for **1 hour** by applying the following procedure:
– press the unlocking button on the card,
– insert the card in the reader,
– press the Start button (interrupting the timed + after ignition feed mode),
– press the start button for more than **5 seconds**, **without conditions for starting being met**, until the immobiliser warning light flashes rapidly (**4 Hz**).

This "forced + after ignition feed" mode remains on for **1 hour**.
Pressing the Start button or removing the card from the reader cuts off the forced + after ignition feed but does not cut off the timed forced + after ignition feed mode. As long as one hour has not elapsed the + after ignition feed function restarts the forced + after ignition feed for the remaining time.

GETtheMANUALS.org

Faults

Faults are declared present or stored (depending on whether they appeared in a certain context and have disappeared since, or whether they remain present but are not diagnosed within the current context).

The **present** or **stored** status of faults should be taken into consideration when the **diagnostic tool** is used after the + after ignition feed (without activating the system components).

For a **present fault**, apply the procedure described in the **Interpretation of faults** section.
For a **stored fault**, note the faults displayed and apply the instructions in the **Notes** section.
If the fault is **confirmed** when the instructions in the Notes section are applied, the fault is present. Deal with the fault.
If the fault is **not confirmed**, check:
– the electrical lines which correspond to the fault,
– the connectors on these lines (corrosion, bent pins, etc.),
– the resistance of the faulty component,
– the condition of the wires (melted or cut insulation, wear).

Conformity check

The aim of the conformity check is to check data which does not produce a fault on the **diagnostic tool** when the data is inconsistent. Therefore, this stage is used to:
– carry out fault finding on faults that do not have a fault display, and which may correspond to a customer complaint,
– check that the system is operating correctly and that there is no risk of a fault recurring after repair.

This section gives the fault finding procedures for statuses and parameters and the conditions for checking them.

If a status is not behaving normally or a parameter is outside permitted tolerance values, you should consult the corresponding fault finding page.

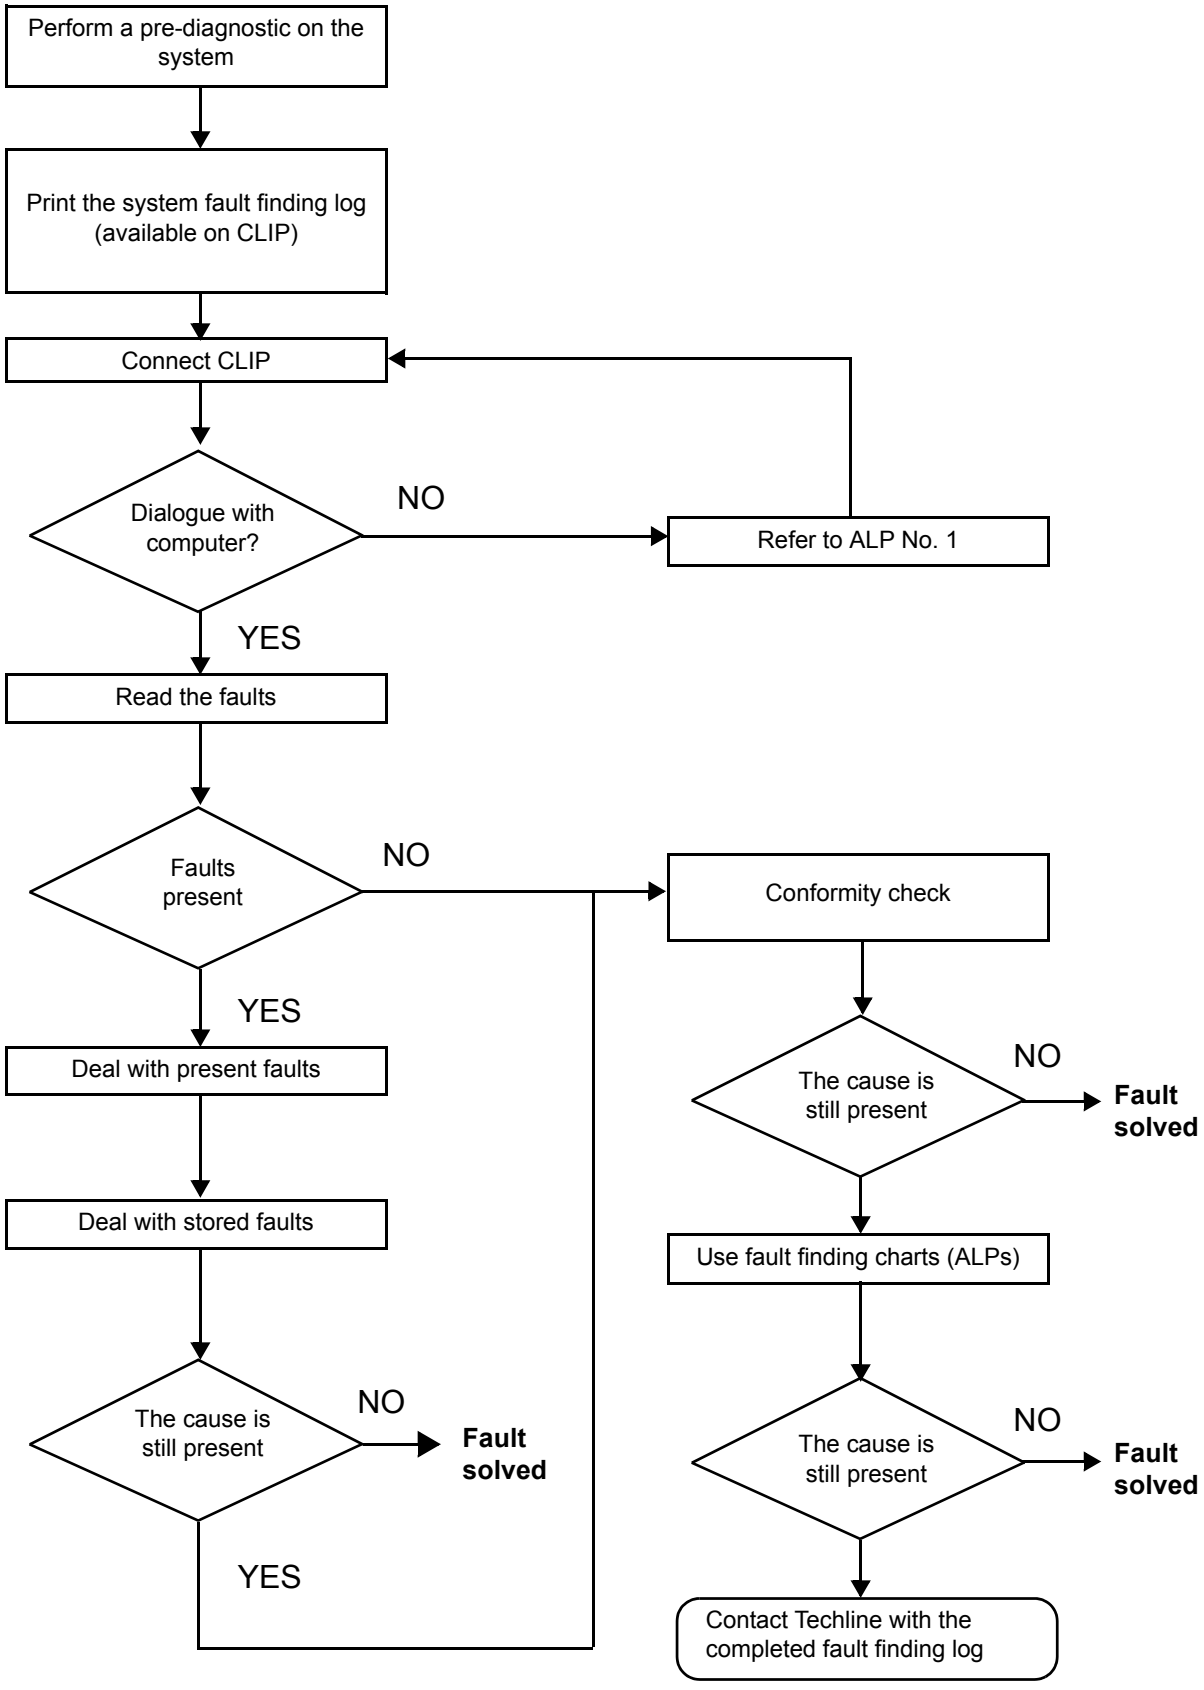
Customer complaints - Fault finding chart

If the test with the **diagnostic tool** is OK but the customer complaint is still present, the fault should be dealt with by **customer complaints**.

A summary of the overall procedure to follow is provided on the following page in the form of a flow chart.

GETtheMANUALS.org

4. FAULT FINDING PROCEDURE



GETtheMANUALS.org

4. FAULT FINDING PROCEDURE (continued)

Wiring check

Fault finding problems
Disconnecting the connectors and/or manipulating the wiring may temporarily clear the cause of a fault.
Electrical measurements of voltage, resistance and insulation are generally correct, especially if the fault is not present when the analysis is made (stored fault).

Visual inspection
Look for damage under the bonnet and in the passenger compartment.
Carefully check the fuses, insulators and wiring harness routing.
Look for signs of oxidation.

Physical inspection
While manipulating the wiring harness, use the diagnostic tool to note any change in fault status from stored to present.
Make sure that the connectors are firmly secured.
Apply light pressure to the connectors.
Twist the wiring harness.
If there is a change in status, try to locate the source of the fault.

Inspection of each component
Disconnect the connectors and check the appearance of the clips and tabs, as well as the crimping (no crimping on the insulating section).
Make sure that the clips and tabs are properly locked in the sockets.
Check that the clips or tabs have not been bent back during connection.
Check the clip contact pressure using an appropriate model of tab.

Resistance check
Check the continuity of entire lines, then section by section.
Look for a short circuit to earth, to **+ 12 V** or with another wire.

If a fault is detected, repair or replace the wiring harness.

GETtheMANUALS.org

5. FAULT FINDING LOG

IMPORTANT

IMPORTANT
All faults involving a complex system call for thorough diagnostics with the appropriate tools. The FAULT FINDING LOG, which should be completed during the fault finding procedure, ensures a record is kept of the procedure carried out. It is an essential document when consulting the manufacturer.

IT IS THEREFORE ESSENTIAL THAT THE FAULT FINDING LOG IS FILLED OUT EVERY TIME IT IS REQUESTED BY TECHLINE OR THE WARRANT RETURNS DEPARTMENT.

You will always be asked for this log:
– when requesting technical assistance from the Techline,
– when requesting approval before replacing parts for which approval is compulsory,
– to be attached to "monitored" parts to be returned. The log is needed for warranty reimbursement, and enables better analysis of the parts removed.

6. SAFETY INSTRUCTIONS

Safety rules must be observed during any work on a component to prevent any damage or injury:
– check the battery voltage to avoid incorrect operation of computer functions,
– use the proper tools.

GETtheMANUALS.org

1. HAZARDS ASSOCIATED WITH CONTAMINATION

The high pressure direct injection system is highly sensitive to contamination. The risks caused by the introduction of contamination are:
– damage to or destruction of the high pressure injection system,
– a component seizing up,
– a component losing its sealing.

All After-Sales operations must be performed under very clean conditions. This means that no impurities (particles a few microns in size) should have penetrated the system during dismantling.

The cleanliness guidelines must be applied from the filter through to the injectors.

What are the sources of contamination?

– metal or plastic swarf,
– paint,
– fibres:
    – from cardboard,
    – from brushes,
    – from paper,
    – from clothing,
    – from cloths,
– foreign bodies such as hair,
– the ambient atmosphere,
– etc.

Important
Cleaning the engine using a high pressure washer is prohibited because of the risk of damaging connections. In addition, moisture may collect in the connectors and create faults in the electrical connections.

2. INSTRUCTIONS TO BE FOLLOWED PRIOR TO ALL OPERATIONS

Important
Before carrying out any work on the high pressure injection system, protect:
– the accessories and timing belts,
– the electrical accessories, (starter, alternator, electric power-assisted steering pump),
– the flywheel surface, to prevent any diesel from running onto the clutch friction plate.

Check that you have plugs for the unions to be opened (set of plugs available from the Parts Department). The plugs are single-use only. After use, they must be discarded (once used they are soiled and cleaning is not sufficient to make them reusable). Unused plugs must be discarded.

GETtheMANUALS.org

Check that you have hermetically resealable plastic bags for storing removed parts. Parts stored in this way will be less susceptible to the risk of contamination. The bags are to be used once only, and discarded after use.

Use lint-free cleaning cloths (cloth part reference **77 11 211 707**). Using normal cloth or paper is prohibited. They are not lint-free and could contaminate the fuel circuit. A lint-free cloth should only be used once.

Use fresh cleaning agent for each operation (used cleaning agent is contaminated). Pour it into a clean receptacle.

For each operation, use a clean brush in good condition (the brush must not shed its bristles).

Use a brush and cleaning agent to clean the unions to be opened.

Blow compressed air over the cleaned parts (tools, workbench, the parts, unions and injection system zones). Check that no bristles are left.

Wash your hands before and during the operation if necessary.

When wearing leather protective gloves cover them with latex gloves to prevent contamination.

3. INSTRUCTIONS TO BE FOLLOWED DURING THE OPERATION

As soon as the circuit is open, all openings must be plugged to prevent impurities from entering the system. The plugs to be used are available from the Parts Department. The plugs must not be reused under any circumstances.

Seal the pouch shut, even if it has to be opened shortly afterwards. The ambient atmosphere carries contamination.

All components removed from the injection system must be stored in a hermetically-sealed plastic bag once the plugs have been inserted.

Using a brush, cleaning agent, air gun, brush or normal cloth is strictly prohibited once the circuit has been opened. These items could allow contamination to enter the system.

A new component replacing an old one must not be removed from its packaging until it is to be fitted to the vehicle.

GETtheMANUALS.org

System outline

The high pressure injection system is designed to deliver a precise quantity of diesel fuel to the engine at a set moment.

It is fitted with a **BOSCH 128-track** computer, **type** EDC16C36.

The system comprises:
– a priming bulb on the low pressure circuit,
– a diesel filter fitted with a water in diesel fuel sensor,
– a high pressure pump with a built-in low pressure pump (transfer pump),
– a high pressure regulator mounted on the pump,
– an injector rail,
– a diesel fuel pressure sensor built into the rail,
– four solenoid injectors,
– a diesel temperature sensor,
– a coolant temperature sensor,
– a cylinder reference sensor,
– an engine speed sensor,
– a turbocharger pressure sensor,
– an accelerator pedal potentiometer,
– an exhaust gas recirculation valve,
– a recirculated gas cooling solenoid valve (**G9T 605, 607, 645**),
– an atmospheric pressure sensor integrated into the injection computer,
– an air flowmeter fitted with an air temperature sensor,
– a turbocharging pressure limitation solenoid valve,
– a motorised damper valve,
– a particle filter,
– a particle filter differential pressure sensor,
– a particle filter upstream temperature sensor,
– a particle filter downstream of the temperature sensor,
– a temperature sensor upstream of the turbine,
– a richness ratio sensor (**G9T 605, 607, 645**).

The **common rail** direct high pressure injection system works sequentially (based on the petrol engine multipoint injection).

This injection system reduces operating noise, reduces the volume of pollutant gases and particles and produces high engine torque at low engine speeds thanks to a pre-injection procedure.

The high pressure pump generates the high pressure and transmits it to the injector rail. The actuator located on the pump controls the quantity of diesel supplied, according to the demand determined by the computer. The rail supplies each injector through a steel pipe.

GETtheMANUALS.org

a. The computer:

Determines the value of injection pressure necessary for the engine to operate correctly and then controls the pressure regulator.
Checks that the pressure value is correct by analysing the value transmitted by the pressure sensor located on the rail.
It determines the injection timing required to deliver the right quantity of diesel fuel and the moment when injection should start. Controls each injector electrically and individually after determining these two values.

The flow injected into the engine is determined by:
– the duration of injector control,
– the rail pressure (regulated by the computer),
– the injector opening and closing speed,
– the needle stroke (determined by a constant for the type of injector),
– the nominal hydraulic flow of the injector (specific to each injector).

The computer manages:
– idling regulation,
– exhaust gas flow reinjection to the inlet (EGR),
– fuel supply check (advance, flow and rail pressure),
– the fan assembly control unit for engines **G9T605/607/645**
– the air conditioning (cold loop function),
– cruise control/speed limiter function,
– pre-post heating control,
– indicator lights control via the multiplex network,
– the operation of the catalysed particle filter.

The high pressure pump is supplied at low pressure by an integrated low pressure pump (transfer pump).

It supplies the rail, the pressure of which is controlled by the fuel flow actuator (MPROP) for charging, and for discharging by the injector valves. This compensates for pressure drops.

The flow actuator allows the high-pressure pump to supply the exact quantity of diesel fuel required to maintain the pressure in the rail. This component minimises the heat generated and improves engine output.
In order to discharge the rail using the injector valves, the valves are controlled by brief electrical pulses which are:
– short enough not to open the injector (passing through the feedback circuit from the injectors),
– long enough to open the valves and discharge the rail.

Some vehicles have a presence sensor mounted in the filter for detecting water in the diesel. If there is water in the diesel fuel, the orange "Injection and pre-post heating" warning light will come on.

WARNING
The engine must not operate with:
– Diesel fuel containing more than **10%** diester,
– petrol even in minute quantities

The system can inject diesel fuel into the engine at a pressure of up to **1600 bar**. Before each operation, check that the injector rail is depressurised and that the fuel temperature is not too high.

When working on the high pressure injection system, you must follow the cleanliness guidelines and safety advice specified in this document.

GETtheMANUALS.org

Removal of the internal parts of the pump and injectors is prohibited. Only the fuel flow regulator/actuator, diesel fuel temperature sensor and the venturi can be replaced.

For safety reasons, it is strictly prohibited to undo a high pressure pipe union when the engine is running.

It is not possible to remove the pressure sensor from the fuel rail because this may cause circuit contamination faults. In the event of pressure sensor failure, replace the pressure sensor, rail and high pressure pipes associated with the rail.

Supplying **+ 12 V** directly to any component in the system is prohibited.

Ultrasonic decoking and cleaning are prohibited.

Never start the engine unless the battery is connected correctly.

Disconnect the injection computer when carrying out any welding work on the vehicle.

b. The connections between the vehicle's various computers are multiplexed.

The electronic system fitted in this vehicle is multiplexed.
It enables dialogue between the various vehicle computers. As a result:
– the fault warning lights on the instrument panel are lit by the multiplex network,
– vehicle faults are displayed by the multiplex network,
– the vehicle speed sensor on the gearbox is not needed.

The vehicle speed signal on the instrument panel is sent by the ABS computer via the multiplex network. The vehicle speed signal is mainly used by the injection computer, the airbag computer and the automatic transmission computer (if the vehicle is fitted with this).

GETtheMANUALS.org

c. Functions hosted:

Air conditioning management assistance:
For vehicles with air conditioning, the **EDC16C36** system can deactivate the air conditioning via the UCH in certain conditions of use:
– when requested by the driver,
– when starting the engine,
– if the engine overheats (in order to reduce the power the engine has to supply),
– when the engine speed is kept at a very high level (to protect the compressor),
– during transition phases (e.g. under heavy acceleration when overtaking, anti-stalling and moving off strategies). These conditions are only taken into account when they do not occur repeatedly, in order to prevent system instabilities (erratic deactivations), when certain faults appear.

Management of the damper valve:
The damper valve currently has three functions:
– the valve closes in order to block the passage of air towards the cylinders to shut off the engine. The aim of this is to stop the engine as quickly as possible and to reduce instabilities as the engine is switched off.
– "valving" function depending on the engine operation: the damper valve closes by a few % to create a "venturi" effect at the EGR valve passage section.
– The purpose of this valving is to accelerate the air flow of EGR gas and decrease pollutant emissions, a control function during regeneration of the particle filter.

Thermoplunger management:
This vehicle is fitted with thermoplungers. They are managed and activated by the injection system.
There are two types of program:
– controlled by the injection system during particle filter regeneration,
– passenger compartment function; the air conditioning requests the injection to activate one or more thermoplungers to raise the air temperature in the passenger compartment. The injection computer authorises the actuation or non-actuation of the thermoplungers according to the operating phases and the power requirements of the engine. The maximum number of heating elements that can be managed is four; their activation depends mainly on the coolant temperature (< **15°C**) and air temperature (< **5°C**).

GETtheMANUALS.org

Cruise control/speed limiter management:

The vehicle cruise control function, when activated, allows you to keep the vehicle speed at a selected value regardless of the driving conditions encountered.
Using the control buttons, the driver can increase or reduce the speed of the vehicle.

If the driver wishes to exceed the cruising speed, he may:
– press the accelerator pedal and exceed the cruising speed (the vehicle will return to the initial cruising speed once the driver takes his foot off the pedal),
– press the system control buttons.

The cruise control function can be deselected either by:
– the system control buttons,
– deactivating the cruise control switch,
– when system events are detected, such as the brake pedal or clutch being pressed,
– when system errors are detected such as an inconsistent vehicle speed.

The cruise control function can also be temporarily disabled when the driver wants to increase speed by pressing the accelerator pedal. The cruising speed is resumed when the driver releases the accelerator pedal.
The vehicle will then attempt to reach the cruising speed at a controlled acceleration rate.

It is possible to reactivate the vehicle speed control and resume the last cruising speed after deactivation (computer supply not cut off).

When activated (using the selection switch) the vehicle speed limiter function limits the vehicle speed to a preselected value. The driver controls the vehicle in the normal way using the accelerator pedal until the limit speed is reached.

If an attempt is made to exceed this speed, the system ignores the pedal request and controls the vehicle speed in the same way as the cruise control function, provided that the driver keeps the accelerator pedal depressed.
As with the cruise control function, the cruising speed can be altered using the control buttons by pressing briefly or keeping the switch pressed.

For safety reasons, it is possible to exceed the limit speed by depressing the accelerator pedal and exceeding the pedal position limit value. The vehicle speed is then totally controlled as a function of pedal position until the speed falls back below the cruising speed when the speed limiter function will once again be reactivated.

If the driver wishes to exceed the cruising speed, he may:
– exceed the accelerator pedal's kickdown point,
– increase the limit speed by pressing or pressing and holding the limit speed switch.

The speed limiter function can be deselected either:
– the system control buttons,
– by switching off the speed limiter switch,
– when system events are detected, such as the brake pedal or clutch being pressed,
– when system errors are detected such as an inconsistent vehicle speed.

GETtheMANUALS.org

Exhaust gas recirculation management:

The EGR (Exhaust Gas Recirculation) system involves removing exhaust gases and reintroducing them into the inlet.
The exhaust gases are collected in the exhaust manifold (before the turbocharger), then directed to the EGR cooler and the EGR valve.

EGR cooler
The EGR cooler bypass function cools, using a gas-water exchanger, the gases collected from the exhaust and then reintroduces them into the inlet. This cooler is equipped with an all-or-nothing solenoid valve, which enables gases to be cooled or not cooled, depending on the emission control requirements.

EGR valve
The system comprises a direct current EGR valve and a potentiometer which reports the position of the valve.
A positive command controls its opening (**0**→**100%**).
The potentiometer serves to control and run fault finding on the valve.
The very first time the engine is started, then each subsequent engine start, the "valve closed" position is programmed (offset). This value is compared to the very first offset or last programmed offset, for the purposes of fault finding. It is also used to readjust the valve control function. This is why it is important to associate the EGR valve to the computer which controls it.

Mixture ratio sensor management:

The richness ratio sensor is mounted in the turbo outlet.
Its function is to reset the injection system drift.

The injection computer does not control the sensor immediately when the engine has just been started:
– **ET300 Richness regulation** is **INACTIVE**,
– **PR779 Richness ratio sensor** is **1**.

After a length of time that depends on the coolant temperature, with the engine running and in the absence of no load conditions, the injection computer authorises the heating of the sensor:
– **ET300 Richness regulation** becomes **ACTIVE**,
– in approximately ten seconds, **PR778 Richness ratio sensor temperature** increases up to approximately **780°C**,
– then **PR779 Richness ratio sensor** displays a value of **0.3 ± 0.1** at idle speed.

GETtheMANUALS.org

Catalysed particle filter management:

The particle filter prevents the escape of carbon particles emitted by the engine but not yet removed from the exhaust gases.

The particle filter is a microporous structure containing channels arranged so as to force-filter the exhaust gases.

The exhaust pipe consists of several components:
– an oxidation catalytic converter mounted after the turbocharger. This catalytic converter ensures that HC/CO levels meet current standards by generating the heat (rise in exhaust temperature caused by catalysis) required for particle filter regeneration.
– a catalysed particle filter located under the bodywork;
– differential pressure sensor to inform the computer about the difference in pressure upstream and downstream of the particle filter and a temperature sensor upstream and downstream of the particle filter,
– a temperature sensor upstream of the turbine (TAVT).

During driving, the particle filter becomes loaded with particles of soot. When a given weight of soot determined by computer mapping is reached, regeneration mode can be triggered if the maximum weight of soot in the particle filter has not been reached and the engine operating conditions are met (coolant temperature,etc.)

Particle filter regeneration consists of burning the particles of soot that have accumulated in the filter.

The differential pressure sensor measures the particle filter inlet/outlet pressure differential; this measurement is used to estimate the weight of soot present in the particle filter by mapping in the computer:
(soot weight = pressure differential as a function of exhaust volume flow rate).

If all the criteria are met, the computer enters regeneration mode. The injection programming is adjusted in order to raise the target exhaust gas temperature between **550 and 650°C**.
This temperature allows the particles accumulated in the filter to be partially or completely burnt (regenerated).
Regeneration efficiency depends on the particle filter inlet temperature and the time spent in regeneration mode.

Regeneration can be carried out automatically when driving if the weight of soot is less than **70 g** and if the number of regeneration attempts when driving is less than **11**.

If the weight of soot is greater than **70 g**, the user will need to request after-sales regeneration.

This regeneration is carried out in the workshop. Be sure to follow the instructions described in the interpretation of commands (**SC017 Particle filter regeneration**) to ensure a completely safe regeneration procedure.

IMPORTANT
The particle filter must be replaced after a period of time which largely depends on the grade of engine oil used - this information is in the driver's handbook.
After replacing it, be sure to reconfigure certain parameters on the computer using command **SC036 Reinitialise programming**.

GETtheMANUALS.org

Warning light management:

Instrument panel display
The computer displays certain information on the instrument panel relating to engine operation. This involves six functions:
– the pre-postheating warning light,
– the coolant temperature warning message,
– the **level 1** fault warning light (non-critical fault),
– the **level 2** fault warning light (emergency stop),
– the **OBD** warning light (European On Board Diagnostic),
– the special particle filter warning light.

These six functions are represented by 5 warning lights and/or messages displayed by the on-board computer.
In addition, certain warning lights are, when lit, accompanied by a spoken message on vehicles fitted with a voice synthesiser (refer to the driver's handbook).

A **3 second** visual inspection (automatic test procedure managed by the instrument panel) is carried out by the injection computer when the ignition is switched on.

Orange pre-postheating warning light
This warning light is used as an in-operation indicator lamp:

– Continuously lit under + after ignition feed: indicates preheating of the heater plugs.
It goes out when preheating is complete and the engine is able to start.

Orange SERVICE non-critical fault warning light (level 1)
This warning light is used to indicate a fault in the system:
– Continuously lit with the message **"CHECK INJECTION"**:

Indicates a **level 1** fault (involving operation of the injection system in defect mode).
The driver should have the repairs carried out as soon as possible.

Temperature/red emergency STOP (level 2) warning light
This indicator light is used both as an in-operation indicator light and as a system fault warning light.
– Intermittently lit, accompanied by the message**"ENGINE OVERHEATING"**:
Indicates that the coolant temperature is too high (the driver is free to stop the vehicle or not).
– Continuously lit, accompanied by the message **INJECTION FAULT: STOP THE ENGINE** and by a bleep, indicates a **level 2** fault.
In that case, the vehicle must be stopped immediately (when traffic conditions allow).
The driver should carry out repairs as soon as possible.

European On Board Diagnostic excess pollution ORANGE warning light

An engine symbol accompanied by the message **"CHECK ANTIPOLLUTION"**.
This warning light comes on if the system has one or more OBD faults.
This warning light is used to alert the driver to injection faults that could lead to excessive pollution, or if the **EOBD system (European On Board Diagnostic)** has been deactivated.
The injection computer requests illumination of the OBD warning light for a present fault only after three consecutive driving cycles.
The driver should have the repairs carried out as soon as possible.

GETtheMANUALS.org

Special ORANGE particle filter warning light
This warning light is used to warn the driver that the particle filter is loaded with particles (weight of soot greater than **45 g** or more than **8** regeneration failures whilst driving due to driving conditions not being favourable for regeneration). The driver must drive as soon as possible at an average speed of **48 mph (80 km/h)** subject to the road conditions and authorised speed limits.

European On Board Diagnostic management:
The **OBD (On Board Diagnostic)** system permits detection of any faults relating to the vehicle emission control system (OBD EURO IV emission control standards being exceeded).

This system should be active for the entire life of the vehicle.

1. Conditions of an OBD fault appearing

An OBD fault will be detected after **3 driving cycles**.
It allows the driver to know whether the vehicle has a fault directly linked to the emission control system.

2. System faults displayed by the OBD

Only a few faults are displayed by the OBD system:
- **DF002 Air temperature sensor circuit.**
- **DF004 Turbocharging pressure sensor circuit.**
- **DF011 Sensor feed voltage no. 1.**
- **DF012 Sensor feed voltage no. 2.**
- **DF013 Sensor feed voltage no. 3.**
- **DF026 Cylinder 1 injector control circuit.**
- **DF027 Cylinder 2 injector control circuit.**
- **DF028 Cylinder 3 injector control circuit.**
- **DF029 Cylinder 4 injector control circuit**
- **DF054 Turbocharging solenoid valve control circuit.**
- **DF055 Turbocharging pressure regulation circuit.**
- **DF056 Air flow sensor circuit.**
- **DF107 Computer memory.**
- **DF200 Atmospheric pressure sensor.**
- **DF209 EGR position sensor circuit.**
- **DF272 EGR valve control circuit.**
- **DF315 Particle filter diff.* pressure sensor.**
- **DF504 Automatic transmission.**
- **DF647 EGR valve position regulation**

Some repair operations require programming to ensure that certain engine components function correctly. Follow the programming procedures (see Replacement of components), if replacing the exhaust gas recirculation valve or an injector.

* diff: differential

GETtheMANUALS.org

3. Conditions for deleting an OBD fault

An OBD fault is deleted in several phases.
The **present** fault on **the diagnostic tool** will only be **stored** (after a repair operation) after the vehicle has been driven 3 times.
The OBD warning light will only go out after these 3 trips.
The instrument panel warning light coming on does not automatically mean that the system has a fault.

In order for the OBD fault and display parameters to be cleared from the computer, the system requires 40 engine heating cycles.

An engine heating cycle is a driving cycle during which:
– the engine coolant temperature reaches at least 71.1°C,
– the engine coolant temperature varies by 22.2°C in relation to the engine starting temperature.

If one of these conditions is not fulfilled, the OBD fault will still be present or stored on the injection computer.

GETtheMANUALS.org

COMPUTER REPLACEMENT OR REPROGRAMMING

IMPORTANT
– Switch on the diagnostic tool (mains or cigarette lighter supply).
– Connect a battery charger.
– Cut off all the electrical consumers (lights, interior lighting, air conditioning, radio CD, etc.).
– Wait for the engine to cool (engine coolant temperature < 60° and air temperature < 50°).
– During (re)programming, the instrument panel screen displays **OIL PRESSURE FAULT**.
Ignore this message and do not take any action in connection with it.

Two operations must be performed when replacing or reprogramming the computer:
SC003 Save computer data and SC001 Write saved data.
– Run **SC003** before replacing or reprogramming the computer. This enables certain data to be saved in the diagnostic tool so that the new computer* can be reconfigured like the old one. The saved data includes: injector codes, EGR programming, specific data for particle filter operation and vehicle options.
– Run **SC001** after replacing or reprogramming the computer. It enables you to rewrite the data (saved by command **SC003**), to the new computer*.

If it is not possible to set up communications with the computer to be replaced: no information can be saved.
After replacing the computer:
– Manually enter the IMA code for each injector by reading the code on each injector (see **replacement of injectors**).
– Enter the data specific to particle filter operation by running **SC036 Reinitialise programming** and select "after replacing injection computer with no save option".

Exhaust gas recirculation valve data is programmed automatically the 1st time the new computer is turned on*.

* *new computer or reprogrammed computer.*

GETtheMANUALS.org

➡ **PROCEDURE:**
Before replacing or reprogramming the computer:
– Select **SC003 Backup computer data**,
– if the following message appears: **there is a saved file, do you want to overwrite this data?**: *(this file corresponds to the last save carried out on the tool)*
– select "YES".
– Once the data has been saved, follow the cruise control/speed limiter procedure:
Before reprogramming the injection computer, move the main **Cruise control/Speed limiter switch to the rest position**. The information about the cruise control or the speed limiter displayed on the instrument panel disappears.
Otherwise, if the main switch remains in the cruise control or speed limiter position during and after reprogramming, the Cruise control/Speed limiter function will not be operational.

The procedure for resetting the function is as follows:
Vehicle ignition on.
– Position the main switch in rest position (the computer then detects the rest position).
– Move the switch to the cruise control position to activate the Cruise control function.
– Move the switch to the Limiter position to activate the Speed limiter function.

– Replace the computer or carry out reprogramming then go onto the next step.
After replacing or reprogramming the computer:
– Select **SC001 Write saved data**, then follow the instructions given by the **diagnostic tool**,
– if the VIN is not entered (see **Computer identification** on the main screen),
– Select **VP010 Write VIN**,
– When both these commands have finished,
– switch off the ignition, wait for the **diagnostic tool** message (maximum time **8 minutes**): **"Communication lost with computer: EDC16C36, check the tool connection and computer power supply"**. Before switching the ignition back on,
– then check the system faults, and clear any stored faults,
– if there are no stored faults, deal with present faults,
– clear the faults from the computer memory.

Carry out a road test followed by a complete check with the diagnostic tool.

IMPORTANT
– The injection computer retains the same immobiliser code for life.
– The system has no security code.
– It is forbidden to perform tests with computers borrowed from the Parts Department or from another vehicle which must then be returned.
– These computers are hard-coded.
– If the injection computer appears to be faulty, contact the Techline and refer to the fault finding log.

End of the procedure.

GETtheMANUALS.org

REPLACING THE INJECTORS

Note:
The IMA coding (individual injector correction) is a calibration carried out in production on **each injector** to **adjust the flow** accurately.
These correction values are etched onto the Bakelite body of each injector (7 alphanumeric characters) and then entered into the computer which then controls each injector taking into account its individual **manufacturing variation**.

After one or more injectors have been changed, enter the IMA codes again and then run command SC036 Reset programming.
The system must be configured via the diagnostic socket using the RENAULT CLIP diagnostic tool.

➡ **PROCEDURE to be followed after one or more injectors have been replaced:**

IMPORTANT
Cylinder no. 1 is located at the **engine flywheel end**.

– Make a note of the **IMA** code(s) engraved on the injector body,
– enter these codes in the computer using command **SC002 Enter injector codes**, then follow the instructions given by the **diagnostic tool**,
– once the command has finished,
– switch off the ignition,
– wait for the **diagnostic tool** message (maximum time **8 minutes**): **"Communication lost with computer: EDC16C36, check the tool connection and computer power supply"**. Before switching the ignition back on.
– Return to fault finding mode.
– Select the **Identify computer function** from the main screen.
– Check that the injector codes entered into the computer match those found on the bodies of the injectors:
– If the codes do not match, restart the command **SC002 Enter injector codes procedure**.
– If the codes match, run command **SC036 Reinitialise programming**,
– select **Injectors** as the type of operation, then follow the instructions given by the diagnostic tool.
– Then check the system faults, and clear any stored faults,
– if there are no stored faults, deal with present faults,
– clear the faults from the computer memory.

Carry out a road test followed by a complete check with the diagnostic tool.

IMPORTANT
Engines can only operate correctly if the correct IMA codes have been entered.
If no code has been entered, or if an implausible code has been entered, fault DF276 Injector Code Programming will be present, and the engine will be in defect mode (engine speed is reduced significantly).
If another injector's code has been entered, the system will accept it but will make the wrong correction. This could lead to engine damage, loss of performance and excessive pollution.
Always use the correct injector codes for the engine cylinder/computer.

End of the procedure.

GETtheMANUALS.org

REPLACING THE EXHAUST GAS RECIRCULATION (EGR) VALVE

After the exhaust gas recirculation valve has been replaced, the computer must store the new valve's offset and the offset measured the last time the ignition was switched off, which is when the valve closed.
Using this data, the computer can detect whether the valve is clogged or seized.

When the valve is replaced, clear the stored offsets so that the program uses the new valve's offset value.

The data linked to this strategy is compiled in the **Emission control/OBD** sub-function.
– **PR128: FIRST EGR VALVE OFFSET**.
– **PR129: LAST EGR VALVE OFFSET > or = PR128 if the valve is new**.

Programming **PR128 and PR129** must be cleared every time the exhaust gas recirculation valve is replaced.

➡ **PROCEDURE to be followed after replacing the exhaust gas recirculation valve:**

– Run command **SC036 Reinitialise programming**,
– select **EGR valve** as the type of operation, then follow the instructions given by the **diagnostic tool**.

Note:
When the reinitialisation is complete, the **Emission control/OBD** sub-function displays:
PR128 = PR129 > 100 %

– When the command is finished,
– **switch off the ignition**,
– wait for the **diagnostic tool** message (maximum time **8 minutes**): **"Communication lost with computer: EDC16C36, check the tool connection and the computer power supply"**, before switching the ignition back on.

When the ignition is switched on again the new EGR valve offset is automatically reset.

Note:
When the new EGR valve offset is reprogrammed, the **Antipollution/OBD** sub-function will display:
10 % < PR128 < 40 %
PR129 > 100 %

– Start the vehicle to enable the latest EGR valve offset to be programmed.
– Switch off the ignition,
– wait for the **diagnostic tool** message (maximum time **8 minutes**): **"Communication lost with computer: EDC16C36, check the tool connection and computer power supply"**, before switching the ignition back on.

GETtheMANUALS.org

The last EGR valve offset reprogrammed is stored on the computer.

Note:
When the reprogramming of the last EGR valve offset has been completed, the Emission control/OBD sub-function displays:
10 % < PR128 < 40 %
10 % < PR129 < 40 %
and - 1 % ≤ PR129 – PR128 ≤ 5 %

– Then check the system faults, and clear any stored faults,
– if there are no stored faults, deal with present faults,
– clear the faults from the computer memory.

Carry out a road test followed by a **complete check** with the **diagnostic tool**.

End of the procedure.

GETtheMANUALS.org

REPLACING THE DAMPER VALVE

After replacing the damper valve, reconfigure the computer.
The system must be configured via the diagnostic socket using the RENAULT CLIP tool.

➡ **PROCEDURE to be followed after the damper valve is replaced:**
– Switch on the ignition,
– establish dialogue with the injection computer,
– run command **SC036 Reinitialise programming**,
– select **Damper valve** as the type of operation, then follow the instructions given by the **diagnostic tool**,
– switch off the ignition,
– wait for **the diagnostic tool** message (maximum time **8 minutes**): **"Communication lost with the computer: EDC16C36, check the connection of the tool and computer power supply"**, before switching the ignition back on.

Check that **PR420 Damper valve error counter** = 0,
– then check the system faults, and clear any stored faults,
– if there are no stored faults, deal with present faults,
– clear the faults from the computer memory.

Carry out a road test followed by a **complete check** with **the diagnostic tool**.

REPLACING THE PARTICLE FILTER

After replacing the particle filter, reconfigure the computer.
The system must be configured via the diagnostic socket using the RENAULT CLIP tool.

➡ **PROCEDURE to be followed after the particle filter is replaced:**
– Switch on the ignition,
– establish dialogue with the injection computer,
– run command **SC036 Reinitialise programming**,
– select **After particle filter replacement** as the operation type, then follow the instructions given by the **diagnostic tool**,
– switch off the ignition,
– wait for the **diagnostic tool** message (maximum time **8 minutes**): **"Communication lost with computer: EDC16C36, check the tool connection and computer power supply"**, before switching the ignition back on.
– clear the faults from the computer memory (this operation must be carried out within **3 minutes** of the ignition being switched on).

Carry out a road test followed by a **complete check** with the **diagnostic tool**.

DF001 PRESENT OR STORED	COOLANT TEMPERATURE SENSOR CIRCUIT CC.0: Short circuit to earth CO.1: Open circuit or short circuit to +12 V

NOTES	**Priorities when dealing with a number of faults:** Deal with fault **DF046 Battery voltage** first if it is present or stored.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present after: – the ignition is switched on, – starting the engine, – a road test.
	Special notes: If the fault is present: – the engine management overrides the EGR function, – the heating elements are no longer controlled, – the coolant temperature: **PR064 Coolant temperature** is fixed at **118°C**, – the preheating phase is greater than **10 seconds**, – the fan assembly is permanently supplied, – **ET587 Recycled exhaust gas cooling** is **ACTIVE**. The **level 1** warning light is illuminated. Use bornier **Elé. 1681** for any operations on the computer connectors.
	Use the **Espace IV ph2, Laguna II ph2, Vel Satis ph2** wiring diagram Technical Note.

CC.0	***NOTES***	None.

Check the coolant temperature sensor connections.
Check the engine management computer connections.
If there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

DF046 CONTINUED	

2.DEF	*NOTES*	Use the **Vel Satis ph2**, **Espace IV ph2**, **Laguna II ph2** wiring diagram Technical Note.

Reminder on computer operating voltage: **6 V < operating voltage < 16.5 V**.
– Using a voltmeter, take a reading of the battery voltage at its terminals.
– Compare the voltage obtained with the value displayed on the **diagnostic tool PR071 Computer supply voltage**.
If there is no difference (**less than 1 V):**
Recharge and test the battery and replace it if it is defective.
Next check the charge circuit.
If there is a difference (**greater than 1 V**):
Check the tightness and the condition of the battery terminals.

Check **the continuity and absence of interference resistance** on the following connections:
– Connection code **3FB**,
– Connection code **AP29**,
between components **597 and 120**.
– Connection code **Technical Note** between the NT earths **and component 120.**
(Check the four **NT** connections)

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

3.DEF	*NOTES*	Only deal with this fault when it is present.

Switch off the ignition then switch it on again after **1 minute**; check to see if the fault is still present.
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

DF054 PRESENT OR STORED	TURBOCHARGING SOLENOID VALVE CONTROL CIRCUIT CO: Open circuit CC.1: Short circuit to + 12 V CC.0: Short circuit to earth. 1.DEF: Internal electronic fault

NOTES	**Priorities when dealing with a number of faults:** Deal with fault **DF046 Battery voltage** first, if it is present or stored.
	Conditions for applying the fault finding procedure to a stored fault: The fault is declared present after: – the ignition is switched on. – starting the engine, – a road test, – actuator command **AC004 Turbocharging solenoid valve**.
	Special notes: If the fault is present: – turbocharging is no longer authorised, – the EGR function is inhibited, – the **level 1** and **European On Board Diagnostic** warning lights are lit. Use bornier Elé.1681 for any operations on the injection computer connectors.
	IMPORTANT This fault can result in a rapid and significant fouling of the particle filter.
	Use the **Espace IV ph2, Vel Satis ph2, Laguna II ph2** wiring Diagram Technical Note.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF054 CONTINUED 1	

CO	***NOTES***	None.

Check the turbocharging solenoid valve connections. Check the injection computer connections. If there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
Measure the **resistance** of the turbocharging solenoid valve between the following connections: – Connection code **3FB**, – Connection code **3MG**, of component **1475.** If the resistance reading is not **15.4** Ω ± **- 0.7** Ω, replace the turbocharging solenoid valve.
Check the continuity of the following connections: – Connection code **3MG** between components **1475 and 120**. Check for the presence of **+ 12 V** after relay feed on the turbocharging solenoid valve connector: – Connection code **3FB** of component **1475**. If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
If the fault is still present, replace the turbocharging solenoid valve.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF054 CONTINUED 2	

CC.1	***NOTES***	None.

Check the turbocharging solenoid valve connections. Check the injection computer connections. If there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
Measure the **resistance** of the turbocharging solenoid valve between **the following connections**: – Connection code **3FB**, – Connection code **3MG**, of component **1475.** If the resistance reading is not **15.4** Ω ± **0.7** Ω, replace the turbocharging solenoid valve.
Check **the continuity** and **insulation** in relation to **+ 12 V** of the following connection: – Connection code **3MG** between components **1475 and 120**. If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
If the fault is still present, replace the turbocharging solenoid valve.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF054 CONTINUED 3	

CC.0	***NOTES***	None.

Check the turbocharging solenoid valve connections. Check the injection computer connections. If there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**) repair the wiring, otherwise replace it.
Measure the **resistance** of the turbocharging solenoid valve between **the following connections**: – Connection code **3FB**, – Connection code **3MG**, of component **1475.** If the resistance reading is not **15.4** Ω ± **0.7** Ω, replace the turbocharging solenoid valve.
Check **the continuity** and **insulation** to **earth** of the following connections: – Connection code **3MG** between components **1475 and 120**. Check for **the presence** of **+ 12 V after relay** on the turbocharging solenoid valve connector. – Connection code **3FB** of component **1475**. If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
If the fault is still present, replace the turbocharging solenoid valve.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF054 CONTINUED 4	

1.DEF	*NOTES*	**Special note:** The fault appears when the computer control section is overheating.

Check the turbocharging solenoid valve connections. Check the injection computer connections. If there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
Measure the **resistance** of the turbocharging solenoid valve between the following connections**:** – Connection code **3FB**, – Connection code **3MG**, of component **1475.** If the resistance reading is not **15.4** Ω ± **0.7** Ω, replace the turbocharging solenoid valve.
Check the **continuity** and **insulation** of the following connection: – Connection code **3MG** between components **1475 and 120**. Check for **the presence** of **+ 12 V after relay** on the turbocharging solenoid valve connector. – Connection code **3FB** of component **1475**. If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
If the fault is stored, clear the fault using command **AC004 Turbocharging solenoid valve**. If, when command **AC004 Turbocharging solenoid valve** is activated, **DF054 Turbocharging solenoid valve control circuit 1.DEF** is present or stored, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF055 PRESENT OR STORED	TURBOCHARGING PRESSURE REGULATION CIRCUIT 1.DEF: Turbocharging pressure too high 2.DEF: Turbocharging pressure too low

NOTES	**Priorities when dealing with a number of faults:** Deal with faults **DF054 Turbocharging solenoid valve control circuit** and **DF004 Turbocharging pressure sensor circuit** first, if they are present or stored.
	Conditions for applying the fault finding procedure to a stored fault: The fault is declared present after: – the ignition is switched on. – starting the engine, – a road test.
	Special notes: If the fault is present: – engine torque limited, – turbocharging regulation is inhibited, – the EGR function is inhibited, – the **level 1** and **European On Board Diagnostic** warning lights are lit. Use bornier **Elé.1681** for any operations on the injection computer connectors.
	IMPORTANT This fault can result in a rapid and significant fouling of the particle filter.
	Use the **Espace IV ph2, Vel Satis ph2, Laguna II ph2** Wiring Diagram Technical Note.

1.DEF **2.DEF**	***NOTES***	None.

Check the turbocharger pressure sensor connections.
check the engine management computer connections.
If there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF055 CONTINUED	

Check for **continuity and the absence of interference resistance** of the following connections:
– Connection code **3LP**,
– Connection code **3LQ**,
– Connection code **3LN**,
between components **1071** and **120**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
With the engine stopped and ignition on, view parameters **PR035 Atmospheric pressure** and **PR041 Turbocharging pressure**.
If the difference **is greater than 100 mbar**, make sure that the atmospheric pressure reading is consistent (by comparing with another vehicle for instance).
If atmospheric pressure is consistent, replace the turbocharging sensor.
If not, contact the Techline.

Run **Test 3 Turbocharged air inlet circuit check**:

If the fault is still present, refer to the interpretation of parameter **PR041 Turbocharging pressure**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF056 PRESENT OR STORED	AIR FLOW SENSOR CIRCUIT CO.0: Open circuit or short circuit to earth CC.1: Short circuit + 12 volts 1.DEF: Value outside permitted tolerance values

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present after: – the ignition is switched on. – starting the engine, – a road test, – the ignition is switched off: **1.DEF**
	Special notes: If the fault is present: – the **European On Board Diagnostic** warning light is lit, – the **level 1** warning light is lit, – the EGR function and particle filter regeneration are inhibited, – safe value **PR132 Air flow 500 kg/h** at idle speed. Use bornier **Elé. 1681** for all operations on the engine management computer connectors.
	Use the **Espace IV ph2, Vel Satis ph2, Laguna II ph2** Wiring Diagram Technical Note.

CO.0	***NOTES***	**Priorities when dealing with a number of faults:** In the event of the simultaneous presence of fault **DF002 Air temperature sensor circuit**, check that the air flow sensor connector is connected correctly. Deal with fault **DF013 Sensor supply voltage no.3 (1.DEF)** first, if it is present or stored.

Check the air flowmeter connectors.
check the engine management computer connections.
If there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF056 CONTINUED 1	

Check **the continuity and insulation to** earth of the following connections:
– Connection code **3DW**,
– Connection code **3DV**,
– Connection code **3KJ**,
between components **799 and 120**.

Check for the presence of the **+ 5 V** feed on the air flowmeter connector.
– Connection code **3KJ** of component **799**.

Check for the **+ 12 V** feed on the air flowmeter connector.
– Connection code **3DV** of component **799**.

Run **Test 4 Air flowmeter**
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

With the flowmeter **connected**, the vehicle **ignition on** and **engine stopped**:
Check the **voltage** between the following connections:
– Connection code **3DW**,
– Connection code **3DV**,
of component **799**.
Replace the air flowmeter if the voltage is not between **0.3 V** and **0.7 V**.

If the fault is still present, replace the air flowmeter.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF056 CONTINUED 2	

CC.1	*NOTES*	**Priorities when dealing with a number of faults:** Deal with fault **DF013 Sensor supply voltage no.3 (1.DEF)** first, if it is present or stored.

Check the air flowmeter connectors.
check the engine management computer connections.
If there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**) repair the wiring, otherwise replace it.

Check the **insulation** in relation to **+ 12 V** of the following connections:
– Connection code **3DW**,
– Connection code **3DV**,
– Connection code **3KJ**,
between components **799 and 120**.

Check for the presence of the **+ 5 V** feed on the air flowmeter connector.
– Connection code **3KJ** of component **799**.

Check for the **+ 12 V** feed on the air flowmeter connector.
– Connection code **3DV** of component **799**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

With the flowmeter **connected**, the vehicle **ignition on** and **engine stopped**:
Check the **voltage** between the following connections:
– Connection code **3DW**,
– Connection code **3DV**,
of component **799.**
Replace the air flowmeter if the voltage is not between **0.3 V** and **0.7 V**.

If the fault is still present, replace the air flowmeter.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF056 CONTINUED 3	

1.DEF	*NOTES*	**Priorities when dealing with a number of faults:** Deal with fault **DF013 Sensor supply voltage no.3 (1.DEF)** first, if it is present or stored.

Check the air flowmeter connectors. check the engine management computer connections. If there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
Check **for continuity** and **absence of interference resistance** of the following connections: – Connection code **3DW**, – Connection code **3DV**, – Connection code **3KJ**, between components **799 and 120**. If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
Check the condition of the flowmeter: no visible damage to the nearby flowmeter element.
If the fault is still present, replace the air flowmeter.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF059 PRESENT OR STORED	COMBUSTION MISFIRES ON CYLINDER 1

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present after: – **PR055 Engine speed** between idling and **1050 rpm** – **PR064 Coolant temperature** ≥ **50°C**
	Priorities when dealing with a number of faults: Apply the interpretation of faults: **DF026 Cylinder 1 Injector command circuit** and **DF249 Injector commands** first, **if they are present or stored**.
	Special notes: – Check that the stored injector codes are consistent with those engraved on each injector. If not, run command **SC002 Enter injector codes** and follow the procedure. – After an injector has been replaced, run commands **SC002 Enter injector codes** and **SC036 Reinitialise programming** and follow the procedure.
	IMPORTANT **Cylinder no. 1** is located at the timing end. Do not disconnect the injectors when the engine is running. For the removal-refitting of an injector, observe the cleanliness and safety guidelines (see **MR 402 (Vel Satis ph2), MR 361 Espace IV ph2) or MR 395 (Laguna II ph2) Mechanics, 13B, Diesel injection, Diesel fuel injectors: Removal - Refitting).**

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF059 CONTINUED	

DF059 appears on the **diagnostic tool** when the engine management computer has detected a fault during the combustion phase several times in succession.
Several components may be responsible:
– the piston rings,
– the piston,
– the valves,
– the injector,
– the heater plug sealing.

If the fault is present:
remove the injector concerned,
if there is no obvious fault in the way the injector has been fitted (notably the injector washer), swap the injector with another from the engine.
Run commands **SC002 Enter injector codes** and **SC036 Reinitialise programming** and follow the procedure.
Restart the engine.
If the injector concerned produces another combustion misfire in its new position, replace it.
If the fault is stored:
– check that no customer complaint occurs, clear the fault and carry out a road test.

If the fault is still present, run **Test 7 Poor injector operation**.
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF060 PRESENT OR STORED	MISFIRING ON CYLINDER 2

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present after: – **PR055 Engine speed** between idling and **1050 rpm** – **PR064 Coolant temperature** ≥ **50°C**
	Priorities when dealing with a number of faults: Apply the interpretation of faults **DF027 Cylinder 2 injector control circuit**, and **DF249 Injector controls**, **first if they are present or stored**.
	Special notes: – Check that the stored injector codes are consistent with those engraved on each injector; if not, run command **SC002 Enter injector codes** and follow the procedure – After an injector has been replaced, run commands **SC002 Enter injector codes** and **SC036 Reinitialise programming** and follow the procedure.
	IMPORTANT **Cylinder no. 1** is located at the timing end. Do not disconnect the injectors when the engine is running. When removing-refitting an injector, observe the cleanliness and safety instructions (see **MR 402 (Vel Satis ph2), MR 361 (Espace IV ph2) or MR 395 (Laguna II ph2) Mechanical 13B Diesel injection, Diesel fuel injectors: Removal - Refitting**).

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF065 CONTINUED	

1.DEF	***NOTES***	When removing-refitting an injector, observe the cleanliness and safety instructions (see **MR 402 (Vel Satis ph2), MR 361 (Espace IV ph2) or MR 395 (Laguna II ph2) Mechanical 13B Diesel injection, Diesel fuel injectors: Removal - Refitting**).

DF065 appears on the **diagnostic tool** when the engine management computer has detected a fault during the combustion phase several times in succession.
Several components may be responsible:
– the piston rings,
– the piston,
– the valves,
– the injector,
– the heater plug sealing.

When dealing with a number of misfiring faults, check the conformity of the fuel by running **TEST 9 Diesel fuel conformity check**.
Check the engine compressions.
Carry out the necessary repairs.

If the fault is still present, run **Test 7 Poor injector operation**.
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF069 PRESENT OR STORED	IMPACT DETECTED SIGNAL 1.DEF: Impact stored by the injection computer

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present under **+ after ignition feed**.
	Special notes: As soon as the injection computer receives this signal: – engine operation is prohibited, the **level 2** warning light is lit.

The fault appears when the injection computer receives a frontal impact signal from the Airbag computer via the multiplex network.

Do not deal with this fault.

If the vehicle has been involved in an accident:
Carry out any necessary repairs,
– clear the fault,
– switch off the ignition,
– wait for **1 minute**,
– switch on the ignition.
If the fault does not reappear, end of fault finding procedure.
If the fault recurs, run fault finding on the **AIRBAG** computer.

If the vehicle has not been involved in an accident:
Run fault finding on the **AIRBAG** computer (see **88C, Airbag and pretensioners**).

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

DF098 PRESENT OR STORED	FUEL TEMPERATURE SENSOR CIRCUIT CC.0: Short circuit to earth. CO.1: Open circuit or short circuit to +12 V

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present after the ignition has been switched on.
	Special notes: If the fault is present, – safe value **PR063 Fuel temperature = 100°C**, – use bornier **Elé. 1681** for all operations on the engine management computer connectors.
	Use the **Vel Satis ph2, Espace IV ph2, Laguna II ph2** wiring diagram Technical Note.

CC.0	***NOTES***	None.

Check the fuel temperature sensor connections.
check the engine management computer connections.
If there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Measure **the resistance** of the fuel temperature sensor between the following connections**:**
– Connection code **3FAB**,
– Connection code **3LD**,
of component **1066**.
Replace the sensor if its resistance is not:
3820 Ω ± 282 Ω at 10°C
2050 Ω ± 123 Ω at 25°C
810 Ω ± 47 Ω at 50°C

Check the **insulation** to **earth** of the following connection:
– Connection code **3FAB** between components **1066 and 120**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

CO.1	***NOTES***	None.

Check the fuel temperature sensor connections.
Check the computer connections.
If there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**) repair the wiring, otherwise replace it.

Measure **the resistance** of the fuel temperature sensor between the following connections**:**
– Connection code **3FAB**,
– Connection code **3LD**,
of component **1066**.
Replace the sensor if its resistance is not:
3820 Ω ± 282 Ω at 10°C
2050 Ω ± 123 Ω at 25°C
810 Ω ± 47 Ω at 50°C

Check the **continuity and insulation** to **+ 12 V** on the following connections:
– Connection code **3FAB**,
– Connection code **3LD**,
between components **1066 and 120**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF107 PRESENT OR STORED	COMPUTER MEMORY 1.DEF: Internal electronic fault

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present after the ignition has been switched on.
	Special notes: The **level 1 and European On Board Diagnostic** warning lights are lit. Use bornier **Elé.1681** for any operations on the injection computer connectors.
	Use the **Vel Satis ph2, Espace IV ph2, Laguna II ph2** wiring diagram Technical Note.

If the fault is **stored**, clear the fault from the computer memory.
Switch off the ignition, wait for the **diagnostic tool** message (maximum time **8 minutes**): **Communication lost with computer: EDC16C36, check the tool connection and computer supply** before switching the ignition back on. Start the engine and re-establish dialogue.
This fault may be linked to a write error following disconnection of the battery when the computer was in the process of writing to the EEPROM phase (computer memory).
If this is the case, loading a new calibration will remove the fault.
If a more recent calibration is available, load this calibration on to the computer.

If the fault is still present:
– use the command **RZ034 Computer memory,**
– Switch off the ignition and wait for the computer dialogue lost message,
– switch on the ignition again,
– configure the injector codes using command **SC002 Enter injector codes**.
– Run the programming commands (see **Configuration and programming**),
– switch off the ignition and wait for the message loss of communication with the computer.
– Perform a road test to reinitialise the vehicle parameters.

If the vehicle is not new (mileage greater than approximately **6 miles (10 km)**):
– Check that there are no leaks or blockages in the exhaust pipe,
Repair if necessary.

– Perform an After-Sales regeneration using command **SC017 Particle filter regeneration.**
– Drain the engine oil (see **MR 395 (Laguna II ph2), MR 402 (Vel Satis ph2) or MR 361 (Espace IV ph2), Mechanical, 10A Engine and peripherals, Engine oil: Draining - Filling**).

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF119 PRESENT OR STORED	CAMSHAFT SENSOR SIGNAL 1.DEF: No camshaft signal or timing fault (belt tension or timing adjustment). 2.DEF: Feed fault, signal interference, camshaft sensor internal fault.

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present after: – starting the engine, – a road test.
	Special notes: If the fault is present, the **level 1** warning light will illuminate. Use bornier **Elé.1681** for any operations on the injection computer connectors.
	Use the **Vel Satis ph2, Espace IV ph2, Laguna II ph2** Wiring Diagram Technical Note.

1.DEF	***NOTES***	None.

Check the camshaft sensor connections.
check the engine management computer connections.
If there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

WARNING
If the fault is **stored**:
Visually check the condition of the surrounding area.
If, on detection of the fault, the engine speed is considerably lower than the idling speed (**less than 400 rpm**) and no customer complaint is declared (warning light indicated by the customer does not come on and vehicle can be started), the fault was detected because the engine had stalled. Clear the fault and carry out a road test.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

DF119 CONTINUED 1	

Check the sensor mounting and the conformity of the camshaft target.
Check that the camshaft sensor/camshaft sprocket air gap is **3 mm maximum**.

Check the electrical specifications of the sensor:
Note: be sure to measure the resistance between the connections indicated.

1. Disconnect the sensor before measuring the resistance with an Ohmmeter or multimeter.

2. Measure the resistance between the following connections:

– Connection codes **3FB and 3PL** (earth and supply) of component **746**
The resistance must be between **7.2 kΩ and 13.4 kΩ** (**10.2 kΩ** nominal).

3. Measure the resistance between the following connections:

– Connection codes **3FB and 3CQ** (output and supply) of component **746**
The resistance should be greater than **100 kΩ**.

4. The resistance between connections **3PL and 3CQ** of **component 746** (output and earth) should be greater than **100 kΩ**.

If the values are incorrect, replace the camshaft sensor.

Check the **continuity** of the following connections:
– Connection code **3PL**,
– Connection code **3CQ**,
between components **746 and 120**.

Check **for + 12 V after relay** feed on the following connection:
– **3FB** of component **746.**

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If the fault is still present, replace the camshaft sensor.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

2.DEF	***NOTES***	**Priorities when dealing with a number of faults:** Deal with fault **DF120 Engine speed sensor signal, 1.DEF** first if it is present or stored.

Check the camshaft sensor connections. check the engine management computer connections. If there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
Check the sensor mounting and the conformity of the camshaft target. Check that the camshaft sensor/camshaft sprocket air gap is **3 mm maximum**.
Check the **continuity** of the following connections: – Connection code **3PL**, – Connection code **3CQ**, between components **746 and 120**. Check **for + 12 V after relay** feed on the following connection: – **3FB** of component **746** If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
– Check the tension of the **timing belt.** – Check the conformity of the camshaft sprocket/camshaft assembly. – Check the timing adjustment. Carry out the necessary repairs.
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF120 PRESENT OR STORED	ENGINE SPEED SENSOR SIGNAL 1.DEF: Engine speed signal interference, broken tooth on flywheel or engine speed sensor internal fault 2.DEF: No engine speed signal, or interference affecting the engine speed signal.

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** If the fault is declared present after: – when an attempt is made to start the engine, – starting the engine, – a road test.
	Special notes: The engine speed sensor is consistent with the camshaft sensor. If the fault is present, the **level 2** warning light are lit. Use bornier **Elé.1681** for any operations on the injection computer connectors.
	Use the **Vel Satis ph2, Espace IV ph2, Laguna II ph2** wiring diagram Technical Note.

Check the engine speed sensor connections.
If there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
Check that the sensor is securely attached.

Measure the **resistance** of the engine speed sensor between the following connections:
– Connection code **3BG**,
– Connection code **3BL**,
of component **149**.
If the **winding resistance** is not between the interval indicated below, **175** and **295** Ω at **23°C**, replace the engine speed sensor.

Check the injection computer connections.
If there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Check the **continuity, insulation** and the **absence of interference resistance** on the following connections:
– Connection code **3BG**,
– Connection code **3BL**,
between components **149 and 120**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If the fault is still present, replace the engine speed sensor.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

DF151 PRESENT OR STORED	MAIN RELAY CIRCUIT 1.DEF: Relay cut off too soon 2.DEF: Relay cut off too late

NOTES	**Special notes:** The level 1 warning light is illuminated. Use the **Vel Satis ph2, Espace IV ph2, Laguna II ph2** wiring diagram Technical Note.

1.DEF	***NOTES***	None.

Check the connections of the injection supply relay mounting.
check the engine management computer connections.
If there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Check the tightness and the condition of the "**+** " and "**-**" battery terminals.

Check the conformity of the main relay (relay removed):
Insulation of the contacts between the following connections**:**
– Connection code **3FB**,
– Connection code **BP37**,
of component **983**.

Resistance of the coil between the following connections**:**
– Connection code **3AA**,
– Connection code **BP37**,
of component **983**.
Replace the relay if the resistance is **less than 6** Ω or **greater than 1 k**Ω.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

– Connection code **3LW**,
of component **921**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If the fault is still present, vary the position of the pedal and refer to the **conformity check** to check the operating values of the accelerator pedal sensor.
If the values displayed are inconsistent, replace the accelerator pedal sensor.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF200 PRESENT OR STORED	ATMOSPHERIC PRESSURE SENSOR 1.DEF: Above maximum threshold 2.DEF: Below minimum threshold

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present after: – the ignition is switched on. – the engine is started, – a road test.
	Special notes: The **level 1** and **European On Board Diagnostic** warning lights are lit. The atmospheric pressure sensor is integrated in the injection computer, and cannot be separated.
	If the fault is present: – there is light smoke, – the atmospheric pressure value changes to safe mode, **PR035 Atmospheric pressure = 750 mbar**. Use bornier **Elé.1681** for any operations on the computer connectors.

1.DEF **2.DEF**	***NOTES***	None.

Disconnect the injection computer and check the condition of the contacts of its connector.
If there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
Verify the value of **PR035 "Atmospheric pressure"** by comparing it with the reading on a vehicle in the workshop which is correct.
If the value of **PR035 Atmospheric pressure** is not correct (more than **100 mbar** difference between the 2 vehicles), contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF209 PRESENT OR STORED	EGR VALVE POSITION SENSOR CIRCUIT CC.1: Short circuit to + 12 V CO.0: Open circuit or short circuit to earth

NOTES	**Priorities when dealing with a number of faults:** **– DF046 Battery voltage,** **– DF012 Sensor supply voltage no. 2,** if present or stored.
	Conditions for applying the fault finding procedure to a stored fault: The fault is declared present after: – the ignition is switched on. – the engine is started, – a road test.
	Special notes: If the fault is present: – the **European On Board Diagnostic** warning light is lit. – increase in polluting emissions, – EGR programming cut-off: valve in the closed position. Use bornier **Ele. 1681** for all operations on the engine management computer connector.
	For EGR valves with a flat connector, it is not possible to check the sensor resistance.
	Use the **Vel Satis ph2, Espace IV ph2, Laguna II ph2** wiring diagram Technical Note.

CC.1	***NOTES***	None.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

EDC16C36_V04_DF209/EDC16C36_V08_DF209

GETtheMANUALS.org

DF209 CONTINUED 1	

Check the condition of the **EGR valve** connector, component code **1460**.
Check the condition of the engine management computer connector, component code **120**.
If the connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair),** repair the connector, otherwise replace the wiring.

Check the **continuity and insulation** against **+12 V** and **+5 V** on the following connections:
– Connection code **3GC** between components **1460** and **120**,
– Connection code **3EL** between components **1460** and **120**,
– Connection code **3JM** between components **1460** and **120**.

Check the **insulation between** the following connections:
– Connection code **3GC** between components **1460** and **120**,
– Connection code **3VP** between components **1460** and **120**,
– Connection code **3EL** between components **1460** and **120**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

EGR valve with a square connector:
Measure the resistances of the EGR valve between the following connections:
(sensor supply and sensor earth)
– Connection code **3GC** of component **1460**,
– Connection code **3JM** of component **1460**.
Replace the valve if the resistances are not between: **3.9 kΩ < X < 9.1 kΩ**.
EGR valve with a flat connector (with adapter attachment):
Replace the EGR valve.

When replacing the EGR valve, run command **SC036 Reinitialise programming and select EGR valve** to reinitialise the EGR valve offsets (see **Replacement of components**).

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF209 CONTINUED 2	

CO.0	*NOTES*	None.

Check the condition of the **EGR valve** connector, component code **1460**.
Check the condition of the engine management computer connector, component code **120**.
If the connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair),** repair the connector, otherwise replace the wiring.

Check **the continuity and insulation** from earth of the following connections:
– Connection code **3GC** between components **1460** and **120**,
– Connection code **3EL** between components **1460** and **120**,
– Connection code **3JM** between components **1460** and **120**.
Check the **insulation between** the following connections:
– Connection code **3GC** between components **1460** and **120**,
– Connection code **3EL** between components **1460** and **120**,
– Connection code **3JM** between components **1460** and **120**,
– Connection code **3VQ** between components **1460** and **120**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Measure the resistances of the EGR valve between the following connections:
(sensor supply and sensor earth)
– Connection code **3GC** of component **1460**.
– Connection code **3JM** of component **1460**.
Replace the valve if the resistances are not between: **3.9 kΩ < X < 9.1 kΩ**.

When replacing the **EGR** valve, run command **SC036 Reinitialise programming** and select **EGR valve** to reinitialise the EGR valve offsets (see **Replacement of components**).

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF226 CONTINUED 3	

1.DEF **2.DEF** **3.DEF**	***NOTES***	**Special notes:** This fault appears when the computer control section has overheated. A road test may be necessary
		Priority when dealing with a number of faults: Deal with the statuses **CO, CC.0, and CC.1** first if they are present or stored. After any operation on the damper valve, use **SC036 Reinitialise programming**, and then switch off the ignition and wait for the **diagnostic tool** message (Maximum time **8 minutes**): **"Communication lost with computer: EDC16C36, check the tool connection and computer power supply"**.

Check the damper valve connections.
Check the injection computer connections.
If there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
Check that the valve is not **mechanically jammed**:
With the engine stopped, disconnect the air inlet hose from the damper valve.
Check that the valve is in the open position.
Start, then switch off the engine.
Check that the valve closes when the engine is switched off and then opens again when the engine has stopped.
If this does not happen, replace the damper valve.

Check that the valve is clean and that there is no **component preventing it from closing** (particularly for **2.DEF**).
Clean if necessary.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF226 CONTINUED 4	

Check **the continuity** of the following connections:
– Connection code **3VM**,
– Connection code **3VN**,
between components **1461 and 120**.

Check the **insulation** against **+ 5 V and + 12 V** (computer feeds) of the following connections:
– Connection code **3VM**,
– Connection code **3VN**,
between components **1461 and 120**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF228 PRESENT OR STORED	BRAKE SIGNALS 1.DEF: Consistency with redundant brakes 2.DEF: Engine deceleration too high

1.DEF **2.DEF**	***NOTES***	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared **present** after the brake pedal is depressed.
		Special notes: If the fault is present, the cruise control/speed limiter is switched off. Use bornier **Elé. 1681** for all operations on the engine management computer connectors.
		Use the **Vel Satis ph2, Espace IV ph2, Laguna II ph2** wiring diagram Technical Note.

STEP 1:
From the **List of statuses** menu, check **ET012 Primary brake contact** and **ET013 Secondary brake contact** and check:
– brake pedal in rest position: **ET012** = **RELEASED** and **ET013** = **RELEASED**
– brake pedal depressed: **ET012** = **DEPRESSED** and **ET013** = **DEPRESSED**

Has **ET013 Secondary brake contact** been correctly recognised?
YES, move on to **STEP 2.**
NO, move on to **STEP 4.**

STEP 2:
Has **ET012 Primary brake contact** been correctly recognised?
YES, clear the fault. End of fault finding procedure.
NO, move on to **STEP 3.**

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

EDC16C36_V04_DF228/EDC16C36_V08_DF228

GETtheMANUALS.org

DF228 CONTINUED 1	

STEP 3:
Check the connections of the brake pedal switch, the ABS computer, the electronic stability program computer and the engine management computer.
If there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
Check **for + 12 V** after ignition feed on the **connections** of the brake pedal switch connector and the condition of the fuse.
– Connection codes **AP10 and SP13** of component **160**.
Disconnect the ABS - ESP (if fitted) and check the **continuity and insulation** from **+ 12 V** and **earth** of the following connection:
– Connection code **65A or 65G** between components **160 and 1094.**

Check that the brake pedal switch is working correctly:
in rest position: infinite resistance insulation between the following connections**:**
– Connection code **65A or 65G**,
– Connection code **AP10**
of component **160**.

depressed: continuity between the following connections:
– Connection code **65A or 65G**,
– Connection code **AP10**
of component **160**.

Replace the switch if necessary.
If the fault is still present, **run fault finding on the Anti-lock Braking System - electronic stability program**; if no irregularity is detected, then **run fault finding on the multiplex network**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF228 CONTINUED 2	

STEP 4
Check the brake pedal switch connections and the engine management computer connections.
If there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Check the condition and adjustment of the brake-pedal switch. Repair if necessary.
Check **for + 12 V** after ignition feed on the **connections** of the brake pedal switch connector and the condition of the fuse.
– Connection codes **AP10 and SP13** of component **160**.

Check the **continuity and insulation** against **+ 12 V** and against **earth** of the following connection:
– Connection code **5A** between components **160 and 120/645/119**.

Check that the brake pedal switch is working correctly:
in rest position: infinite resistance insulation between the following connections**:**
– Connection codes **SP13 and 5A** of component **160**.

depressed: continuity between the following connections**:**
– Connection codes **SP13 and 5A** of component **160**.

Replace the switch if necessary.
Check the brake pedal statuses, go to **STEP 1**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF293 PRESENT OR STORED	WATER IN DIESEL FUEL SENSOR 1.DEF: Open circuit on the line or water in diesel fuel.

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present after: – the ignition is switched on, – a road test.
	Special notes: If this fault is present, risk of engine damage if fault **DF293** not dealt with. Use bornier **Ele. 1681** for all operations on the engine management computer connector. **IMPORTANT** **Please observe the cleanliness guidelines and safety advice.**
	Use the **Vel Satis ph2, Espace IV ph2, Laguna II ph2** wiring diagram Technical Note.

Make sure there is **no water** in the fuel filter.
Bleed the fuel filter and the low and high pressure diesel circuit, if necessary, see **MR 402 (Vel Satis ph2), MR 361 (Espace IV ph2) or MR 395 (Laguna II ph2) Mechanical 13A and 13B Diesel injection).**

Start the engine and wait **at least 1 minute** to confirm the repair.
If the fault was stored but not present, carry out a road test (see **Note**).
If the fault does not reappear, end of fault finding procedure.

Check the **continuity, insulation and the absence of interference resistance** on the following connection:
– Connection code **3WT** between components **414** and **120**.
Check the +12 V after relay feed of the water detection sensor:
– Connection code **3FB** of component **414**
Check the earth of the water detection sensor:
– Connection code **NT** of component **414**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
– Start the engine and wait **at least 1 minute** to confirm the repair.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

EDC16C36_V04_DF293/EDC16C36_V08_DF293

GETtheMANUALS.org

DF293 CONTINUED	

Check the conformity of the fuel used by running **TEST 9 Diesel fuel conformity check**.

If none of these checks reveal any faults:
– Replace the water detection sensor,
– clear the fault,
- start the engine and wait **at least 1 minute** to confirm the repair.

Note:
When the water level in the fuel filter unit is below the sensor's electrodes, some driving conditions (cornering, gradients) may result in water being detected (in fact, the sensor's off-centre position in the fuel filter unit, combined with the driving conditions, causes water to be detected).

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF304 PRESENT OR STORED	EGR BY-PASS CIRCUIT CO: Open circuit CC.0: Short circuit to earth CC.1: Short circuit to + 12 V 1.DEF: Internal electronic fault

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present after: – the ignition is switched on, – and the relay is being actuated by command **AC103 EGR By-pass**.
	Special notes: Use bornier **Elé. 1681** for all operations on the engine management computer connectors.
	Use the **Vel Satis ph2, Espace IV ph2, Laguna II ph2** wiring diagram Technical Note.

CO	***NOTES***	None.

Check the EGR by-pass solenoid valve connections. check the engine management computer connections. If there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
Measure the resistance of the EGR by-pass solenoid valve between the following connections: – Connection code **3TP**, – Connection code **3FB**, of component **1301**. If the resistance measured is not between **43 and 49 Ω at 25°C**, replace the EGR by-pass solenoid valve.
Check **the continuity** of the following connection: – Connection code **3TP** between components **1301 and 120**. Also check for **+ 12 V after relay** feed on the EGR by-pass solenoid valve connector. – Connection code **3FB** of component **1301**. If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
If the fault is still present, replace the EGR by-pass solenoid valve.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

DF312 CONTINUED 1

Repair request with **DF312** present or stored ONLY

↓

Read the information from the sub-function **Particle filter histo*: PR784 to PR793 DF312 No. 1 to No. 10 records**

↓

Are **PR784 to PR793** all equal to **0 miles (0 km)**? — YES → Contact the Techline

NO ↓

Among these parameters (**PR784 to PR793**):
– Find the parameter with the highest mileage: it is the **Mileage of the last DF312**.
– Note the parameter index on the order of repair with the relevant mileage value.
E.g.: **PR787 = 2794 miles (4657 Km)**

↓

Read the information in the **Particle filter histo*** sub-function:
PR794 to PR803 Stored regeneration failures No. 1 to No. 10.

↓

Does at least one of parameters **PR794 to PR803 = 19659 miles (32766 Km)**? — YES → Contact the Techline

NO ↓

Identify the distance(s) from the values of **parameters PR794 to PR803 Stored regeneration failures No. 1 to No. 10**, included between the **Mileage of the last DF312** and the **Mileage of the last DF312 - 120 miles (200 km)**. These are the **mileages of the last failures**.
Example: **2674 miles (4457 km) < PR801 = 2760 miles (4600 km) < 2794 miles (4657 km)**

↓

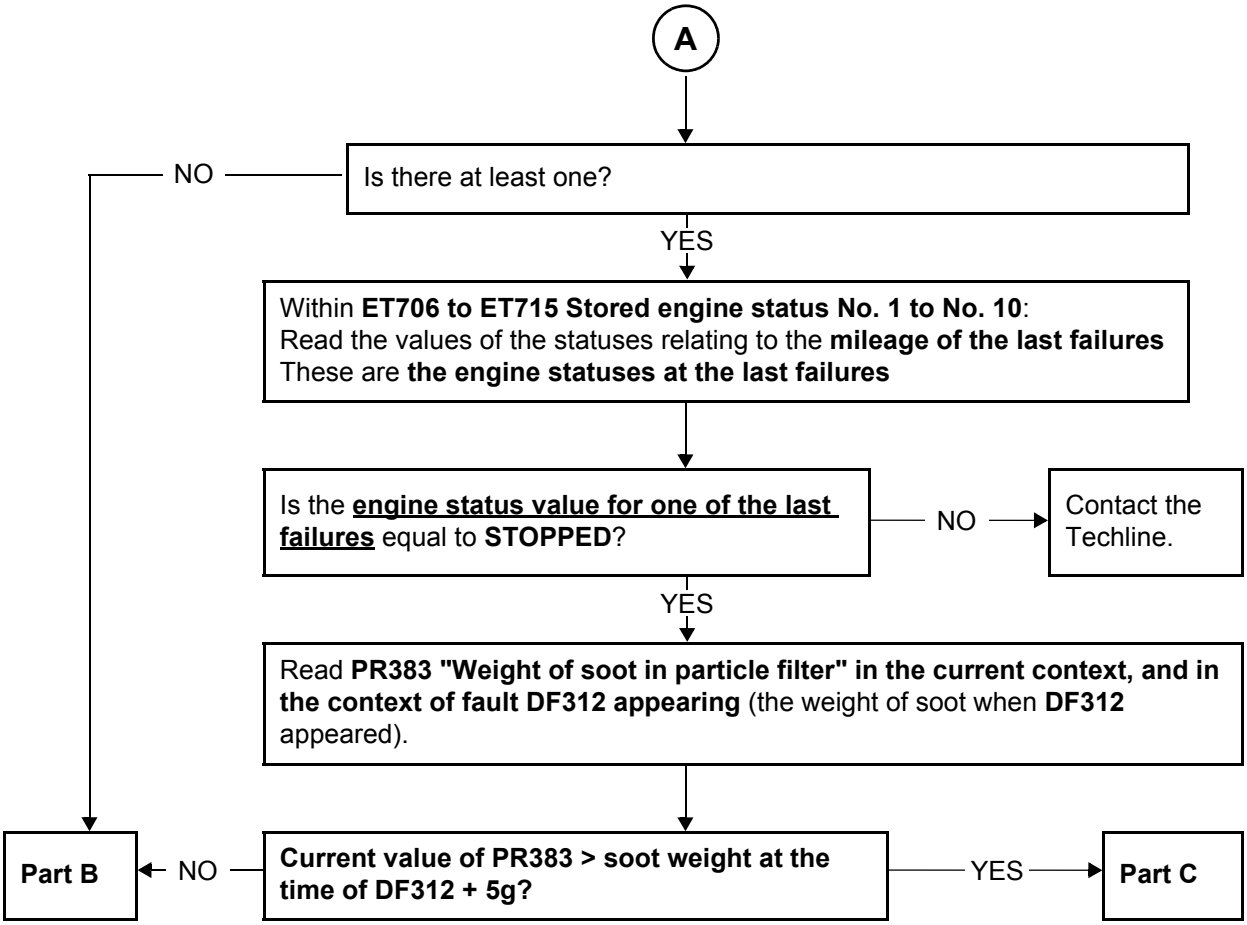
(A)

* histo: history

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF312 CONTINUED 2	



AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF312 CONTINUED 3	

PART B

1. No particle filter regeneration.

2. Write on the repair order the parameter and status relating to the last failure:

Mileage of last DF312
Mileage of last failures
Engine statuses of last failures
E.g.: **PR787 = 2794 miles (4657 km); PR801 = 2760 miles (4600 km); engine status = STOPPED**

3. Interpretation of the values written on the repair order by the service advisor for the customer:

Before the last time the **Particle filter warning light or message** came on (appeared at the **Mileage of the last DF312**), the customer had not respected the driving recommendations: the failure that occurred at the **Mileage of the last failure** is due to the engine being switched off.

4. Explain to the customer the procedure to turn off the warning light, making use of the parameters noted in the repair order: see PART D.

PART C

Check the sealing of the air inlet circuit (see **test 3 Turbocharged air inlet circuit check**).
Check that there are no leaks or blockages in the exhaust pipe,
Repair if necessary.
Carry out an After-Sales regeneration with the **approval from the Techline**.
Follow the procedure for command **SC017 Particle filter regeneration** (see **Interpretation of commands**).
Important: At the end of After-Sales regeneration, always replace the engine oil and the oil filter if the particle filter is being replaced.

Explain to the customer the procedure for regeneration when driving to avoid unnecessary repairs: see **PART D**.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF312 CONTINUED 4	

PART D
Procedure to switch off the **Particle filter** message or warning light on the instrument panel

Certain driving styles may trigger the warning light or the "**particle filter**" message, activating fault **DF312 Speed request**.
The fault appears after 8 failed regeneration attempts when driving, or if the weight of soot in the particle filter is greater than 45 g,

The customer must carry out a specific driving operation (cf. vehicle user manual) that consists of:
When the engine is warm, drive at a speed greater than **48 mph (80 km/h)** for **2 minutes** to trigger the regeneration procedure.

Keep driving at an average speed of **48 mph (80 Km/h)**, until the "**particle filter**" message or warning light on the instrument panel turns off. In order for the procedure to succeed, it is necessary to drive without stopping the engine or leaving the engine running at idle speed for an extended period of time. The regeneration time depends on the vehicle and driving conditions but should last for **20 minutes maximum**.

If regeneration when driving fails (the warning light has not switched off or the service warning light has come on), carry out a particle filter regeneration in the Renault dealership. Run command **SC017 Particle filter regeneration** (see **Interpretation of commands**).

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

Check the injection computer connections.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If the fault is still present, replace the cruise control/speed limiter on/off button.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF504 PRESENT OR STORED	AUTOMATIC TRANSMISSION 1.DEF: Multiplex line connection fault

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** If the fault is declared present after: – the ignition is switched on, – a road test
	Special notes: If the fault is present, the **European On Board Diagnostic** warning light is on.
	Use the **Vel Satis ph2, Espace IV ph2, Laguna II ph2** wiring diagram Technical Note.

Carry out a full check on the multiplex network (see **88B, Multiplexing, Interpretation of faults**) Repair if necessary.
If the fault is still present, run fault finding on the automatic transmission system (see **23A, Automatic transmission**). Check the **insulation** against earth and **+ 12 V** of the following connections: – Connection code **3MS**, – Connection code **3MT**, between components **119** and **120**. If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF643 PRESENT OR STORED	RAIL PRESSURE REGULATOR CIRCUIT CO: Open circuit CC.0: Short circuit to earth CC.1: Short circuit to + 12 V 1.DEF: Internal electronic fault

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault reappears after: – the ignition is switched on, – the regulator is actuated by command **AC011 Rail pressure regulator**.
	Special notes: If the fault is present: – the engine stops, – performance is reduced, – regulation with open loop for fuel flow, – the **level 2** warning light is lit. Use bornier **Elé. 1681** for all operations on the engine management computer connectors.
	Use the **Vel Satis ph2, Espace IV ph2, Laguna II ph2** wiring diagram Technical Note.

Check the pressure regulator connectors.
check the engine management computer connections.
If there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
Check the low pressure circuit.
Repair if necessary.

Check **the continuity and insulation against earth and against +12 V** on the following connection:
– Connection code **3HI** between components **1105 and 120**.

Also check for **+ 12 V after relay** feed on the pressure regulator connector.
– Connection code **3FB** of component **1105**.
If the connection or connections are faulty and if there is a repair method (see Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair), repair the wiring, otherwise replace the wiring.

Measure the **resistance** of the pressure regulator between the following connections**:**
– Connection code **3FB**,
– Connection code **3HI**,
of component **1105**.
If the regulator resistance value is not around **3 Ω ± 0.**1 Ω **at 20°C**, replace the pressure regulator.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF647 PRESENT OR STORED	EGR VALVE POSITION REGULATION 1.DEF: Inconsistent EGR 1 offset 2.DEF: Offset too high: valve clogged, stuck open or abnormal 3.DEF: Inconsistent EGR 3 offset 4.DEF: Above maximum threshold 5.DEF: Valve jammed closed

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present after: – the engine is started, – a road test.
	Special notes: If the fault is present: – the **level 1** warning light is lit for **1.DEF**, **3.DEF** and **5.DEF**, – the **European On Board Diagnostic** warning light is lit for **2.DEF** and **4.DEF**, – the EGR function and turbocharging are inhibited by the engine management computer, – engine torque is limited. Use bornier **Ele. 1681** for all operations on the engine management computer connector.
	If faults **DF647** and **DF038 Computer** are displayed at the same time, deal with **DF038 Computer** first. Then check that the **EGR valve** is open during idling to make sure that the programming has not been lost. If the valve does not open, carry out the programming phase.
	Priorities when dealing with a number of faults: **– DF209 EGR valve position sensor circuit,** **– DF046 Battery voltage,** **– DF012 Sensor supply voltage no. 2,** **– DF272 EGR valve control circuit,** if they are present or stored.
	For EGR valves with a flat connector, it is not possible to check the sensor resistance.
	Use the **Vel Satis ph2, Espace IV ph2, Laguna II ph2** wiring diagram Technical Note.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

EDC16C36_V04_DF647/EDC16C36_V08_DF647

GETtheMANUALS.org

DF647 CONTINUED	

Check the condition of the **EGR valve** connector, component code **1460**.
Check the condition of the engine management computer connector, component code **120**.
If the connectors are faulty and if there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair),** repair the connector, otherwise replace the wiring.

Check the continuity and absence of interference resistance of the following connections:
– Connection code **3GC** between components **1460** and **120**,
– Connection code **3JM** between components **1460** and **120**,
– Connection code **3EL** between components **1460** and **120**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

EGR valve with a square connector:
Measure the **resistance** of the EGR valve between the following connections:
– Connection code **3JM** of component **1460**,
– Connection code **3GC** of component **1460**.
Replace the valve if the resistance is not between: **3.9 kΩ < X < 9.1 kΩ**.

EGR valve with a flat connector (with adapter attachment):
Replace the EGR valve.

When replacing the EGR valve, run command **SC036 Reinitialise programming** and select **EGR valve** to reinitialise the EGR valve offsets (see **Replacement of components**).

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF652 PRESENT OR STORED	TURBINE UPSTREAM TEMPERATURE SENSOR CIRCUIT CC.O: Short circuit to earth CO.1: Open circuit or short circuit to +12 V

NOTES	**Conditions for applying fault finding procedures to stored faults:** The fault becomes present with the ignition on **(CC.0)** or after a road test, with the engine warm **(CO.1)**.
	Special notes: **If the fault is present:** – particle filter regeneration is inhibited, – the vehicle performance is reduced, – temperature regulation before the particle filter is inhibited.
	Use the **Vel Satis ph2, Espace IV ph2, Laguna II ph2** wiring diagram Technical Note.

CC.0	***NOTES***	None.

Check the condition of the turbine upstream temperature sensor connector. Check the condition of the engine management computer connector. If one of the connectors is faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.
Check the **insulation** from earth of the following connections: – connection code **3ABS**, – connection code **3ABT**, between components **120** and **1589**. If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
If the fault is still present, replace the turbine upstream temperature sensor.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

EDC16C36_V04_DF652/EDC16C36_V08_DF652

GETtheMANUALS.org

DF652 CONTINUED	

CO.1	*NOTES*	None.

Check the condition of the turbine upstream temperature sensor connector. Check the condition of the engine management computer connector. If one of the connectors is faulty and if there is a repair procedure (**see Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.
Check the **continuity and insulation** from **+ 12 V** of the following connections: – connection code **3ABS**, – connection code **3ABT**, between components **120** and **1589**. If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
If the fault is still present, replace the turbine upstream temperature sensor.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF890 PRESENT OR STORED	MOVEMENT DURING PARTICLE FILTER REGENER.*

NOTES	**Conditions for applying fault finding procedures to stored faults:** The fault becomes present during an After-Sales regeneration carried out using the **diagnostic tool** at a speed above zero.
	Special notes: If the fault is present: – regeneration in progress is stopped.

IMPORTANT
The fault is present because the vehicle was driven while the After-Sales regeneration was in progress. The vehicle must remain stationary throughout regeneration.

DO NOT DRIVE THE VEHICLE DURING AFTER-SALES REGENERATION.
CHECK THAT THE VEHICLE IS CORRECTLY IMMOBILISED.

– switch off the ignition and wait for the **diagnostic tool** message (maximum time **8 minutes**): **Communication lost with computer: EDC16C36, check the tool connection and computer supply**.
– switch on the ignition,
– establish dialogue with the injection computer,
– clear the faults from the computer memory.
– carry out another After-Sales regeneration,
– run command **SC017 Particle filter regeneration** and follow the procedure (see **Interpretation of commands**).

If the fault is still present, contact the Techline.

* regener: regeneration

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

DF892 CONTINUED	

Check the injector connections. check the engine management computer connections. If there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
Check the **continuity** and **insulation** of the following connections: – Connection code **3KW**, – Connection code **3CR**, between components **193 and 120**. – Connection code **3KX**, – Connection code **3CS**, between components **194 and 120**. – Connection code **3KY**, – Connection code **3CT**, between components **195 and 120**. – Connection code **3KZ**, – Connection code **3CU**, between components **196 and 120**. If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF899 PRESENT OR STORED	REGENERATION TEMPERATURE LIMIT EXCEEDED

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present during an After-Sales regeneration, if the temperature threshold is exceeded.
	Special notes: If the fault is present: – regeneration in progress is stopped.

Carry out particle filter replacement:
– Switch on the ignition.
– establish dialogue with the injection computer,
– run command **SC036 Reinitialise programming**,
– select **After particle filter replacement** as the operation type, then follow the instructions given by the **diagnostic tool**,
– switch off the ignition.
– wait for the diagnostic tool message (maximum time **8 minutes**): **Communication lost with computer: EDC16C36, check the tool connection and computer supply**, and switch the ignition back on.
– clear the faults from the computer memory (this operation must be carried out within **3 minutes** of the ignition being switched on).

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

EDC16C36_V04_DF899/EDC16C36_V08_DF899

GETtheMANUALS.org

DF953 PRESENT OR STORED	PARTICLE FILTER ABSENT

NOTES	**Conditions for applying fault finding procedures to stored faults:** The fault is declared present after the engine is started or following a road test.
	Special notes: **If the fault is present:** – particle filter regeneration is inhibited, – blue/white smoke and black particles coming from the exhaust, – the **OBD** warning light will come on after three consecutive driving cycles (starting **+ 5 seconds**, switch off the ignition and wait **40 seconds**).
	Priorities when dealing with a number of faults: **DF315 Particle filter diff.* pressure sensor if present or stored**
	IMPORTANT In the long term, this fault may lead to premature wear and a greater risk of turbocharger failure.
	Use the Wiring diagram Technical Note for **Laguna II ph2, Vel satis ph2, Espace IV ph2**.

Check the condition of the differential pressure sensor connector.
Check the condition of the engine management computer connector.
If one of the connectors is faulty and if there is a repair procedure (**see Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the connector, otherwise replace the wiring.

* diff: differential

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

EDC16C36_V04_DF953/EDC16C36_V08_DF953

GETtheMANUALS.org

DF953 CONTINUED	

Check the particle filter is present.
If it is present,
Visually check that the particle filter is in good condition by positioning the vehicle on a lift:
– not damaged (no abnormal welds, if necessary compare it with another vehicle fitted with particle filter),
– if there are After-Sales sleeves, as a result of a previous operation, check that the particle filter does not lose its contents when being removed.
If the particle filter is not working correctly or is absent:
– Replace the particle filter.
– Switch on the ignition.
– establish dialogue with the injection computer,
– run command **SC036 Reinitialise programming**,
– select **After particle filter replacement** as the operation type, then follow the instructions given by the **diagnostic tool**,
– switch off the ignition.
– wait for the **diagnostic tool** message (maximum time **8 minutes**): **Communication lost with computer: EDC16C36, check the tool connection and computer supply** before switching the ignition back on,
– clear the faults from the computer memory (this operation must be carried out within **3 minutes** of the ignition being switched on).
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any other faults. Clear the fault memory. Switch off the ignition until the end of the power-latch phase, and carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

DF967 PRESENT OR STORED	RICHNESS RATIO SENSOR CIRCUIT CC.0: Short circuit to earth CC.1: Short circuit to + 12 V CO: Open circuit 1.DEF: Abnormal voltage 2.DEF: Below minimum threshold 3.DEF: Above maximum threshold

NOTES	**Conditions for applying the fault finding procedure to a stored fault:** The fault is declared present after: – the ignition is switched on, – a road test.
	Special notes: Use bornier Elé.1681 for any operations on the injection computer connectors.
	Use the **Vel Satis ph2, Espace IV ph2, Laguna II ph2** wiring diagram Technical Note.

Check the injection computer connections.
Check the richness ratio sensor connections.
If there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Check the **continuity, insulation and absence of interference resistance** on the following connections:
– Connection code **3AAS**,
– Connection code **3AAT**,
– Connection code **3AAU**,
– Connection code **3AAV**,
– Connection code **3AAW**,
between components **1587 and 120**.

Check for **+ 12 V** on the richness ratio sensor connector.
– Connection code **3FB** of component **1587**.

If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If the fault is still present, contact the Techline.

ET001	COMPUTER + AFTER IGNITION FEED

STATUS DEFINITION	**PRESENT**: This status indicates that the + after ignition feed is active. **ABSENT**: This status indicates that the + after ignition feed is not active.

NOTES	Use the Wiring diagram Technical Note for **Laguna II ph2**, **Vel satis ph2**, **Espace IV ph2**.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C, without electrical consumers

PRESENT	This status indicates that the + after ignition feed is active. In the event of a fault, refer to the interpretation of **DF046 Battery voltage** or **DF151 Main relay circuit**.
ABSENT	This status indicates that the + after ignition feed is not active.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16C36_V08_ET001/EDC16C36_V04_ET001

GETtheMANUALS.org

ET001 CONTINUED	

Sensor electrical conformity

If the ignition is not switched on, status **ET001** should be **ABSENT**.
As soon as the ignition is switched on, the computer should be supplied with power. Status **ET001** becomes **PRESENT.**
If this status remains **ABSENT**, follow the procedure below:
Check the condition of fuse **FM3** (**30A**) in the engine fuse and relay box**.**
Check for **earth** on the injection computer.
– Connection code **NT** of component **120** (4 connections).

Check the continuity and absence of interference resistance on the following connection:
– Connection code **3AA** between components **120 and 983**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A**, **Electrical wiring repair**, **Wiring: Precautions for repair**), repair the wiring, otherwise replace it

Check the connections and the condition of the contacts of the brown **connector B** on the injection computer.
If the connector is faulty and there is a repair method (see **Technical Note 6015A**, **Repairing electrical wiring**, **Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.
If the fault is still present, contact the techline.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET003	ENGINE IMMOBILISER

STATUS DEFINITION	**ACTIVE**: This status indicates that the immobiliser is active. **INACTIVE**: This status indicates that the immobiliser is inactive.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C, without electrical consumers

ACTIVE	***NOTES***	If status **ET003** is permanently **ACTIVE**, refer to the UCH diagnostic note (see **87B**, **Passenger compartment connection unit**).

INACTIVE	***NOTES***	When the ignition is switched on and when driving, status **ET003** should be **INACTIVE**. If it isn't, refer to the UCH diagnostic note (see **87B**, **Passenger compartment connection unit**).

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16C36_V08_ET003/EDC16C36_V04_ET003

GETtheMANUALS.org

ET004	AIR CONDITIONING AUTHORISATION

STATUS DEFINITION	**YES**: This status indicates that the air conditioning is active. **NO**: This status indicates that the air conditioning is inactive.

NOTES	None.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

"YES" or "NO"	If the air conditioning is authorised or the compressor actuated (see **62A, Air conditioning**).

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16C36_V04_ET004/EDC16C36_V08_ET004

GETtheMANUALS.org

ET004 CONTINUED	

Sensor electrical conformity	
YES	Air conditioning authorisation becomes **YES** if: – the air conditioning request has been made by the driver (air conditioning switch in **AC** or **AUTO** position with minimum ventilation), – the engine is not under full load, – the air conditioning system is not faulty.
NO	Status **ET004** remains **NO** under the following conditions: – Vehicle stopped with the ignition on, – faults present in the air conditioning circuit, – no air conditioning request made by the driver, – engine under full load. If status **ET004** remains **NO** then the air conditioning should be authorised; check: – that the air conditioning compressor starts correctly, – the air conditioning system supply fuses, – the presence of refrigerant in the air conditioning circuit. If the fault is still present, check the air conditioning computer faults (see **62C, Air conditioning**).

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET007	PRE-POSTHEATING UNIT CONTROL

STATUS DEFINITION	**ACTIVE**: when the heater plugs are activated according to the engine coolant temperature. **INACTIVE**: after the engine has been running for a certain period In the event of a fault, consult the interpretation of fault **DF017 Preheating unit control circuit**.

NOTES	Use the Wiring diagram Technical Note for **Laguna II ph2**, **Vel satis ph2**, **Espace IV ph2**.

Conformity check with engine stopped and ignition on

ACTIVE

When the ignition is switched on, status **ET007** should be **ACTIVE** for a time that varies according to the engine coolant temperature. Both the relay and the heater plugs are then supplied.
After starting the status should remain **ACTIVE** for a variable period depending on the engine coolant temperature. This is postheating.

If **ET007** is **INACTIVE** when the ignition is switched on, check:
- Supply fuse **FM12** (**70A**) in the engine fuse and relay box.
- The feed to the heater plugs after relay actuation, and the connections of the heater plugs.
- The **continuity and absence of interference resistance** between:
  - Connection code **37Z** between components **257** and **680**.
  - Connection code **37AA** between components **257** and **681**.
  - Connection code **37AB** between components **257** and **682**.
  - Connection code **37AC** between components **257** and **683**.

The condition and correct connection of the contacts of the preheating unit connector.

If the vehicle starts, postheating is ended and status ET007 remains **ACTIVE** during the engine operating phase, consult the interpretation of faults **DF017 Preheating unit control circuit** and **DF025 Preheating unit diagnostic connection**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16C36_V08_ET007/EDC16C36_V04_ET007

GETtheMANUALS.org

ET007 CONTINUED	

INACTIVE	If the vehicle does not start or the status remains **INACTIVE** and preheating has not been carried out during the starting phase, check the following connections: – Connection code **3FY**, – Connection code **3FF**, between components **120 and 257**.
	Check for **+ 12 V** on the pre-postheating unit (**fuse FM12 (70 A)**). – Connection code **BP35** of component **257.** If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A**, **Electrical wiring repair**, **Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Conformity check with engine running, engine coolant temperature > 80°C, without electrical consumers

"ACTIVE" then "INACTIVE"	After the engine has been running for a certain period, the status changes from **ACTIVE to INACTIVE**. In the event of a fault, consult the interpretation of fault **DF017 Preheating unit control circuit**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET014	FAN ASSEMBLY 1 CHECK

STATUS DEFINITION	**RUNNING**: This status indicates that fan assembly 1 is being supplied. **OFF**: This status indicates that fan assembly 1 is not being supplied.

NOTES	None.

Note:
Status **ET014** and status **ET143 Low speed fan assembly relay control** change simultaneously.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C, without electrical consumers

RUNNING	The low-speed engine fan is supplied in three scenarios: – the engine coolant temperature is greater than **89°C**, – **the air conditioning is operating,** – the injection computer has system faults that could lead to the engine overheating. When the low-speed fan assembly is supplied: – status **ET014** becomes **RUNNING** – status **ET143 Low speed fan assembly relay control** becomes **ACTIVE**.
	If the low-speed engine fan does not operate, refer to the test for status **ET143 Low speed fan assembly relay control**.
STOPPED	The low-speed fan assembly stops when: – the engine coolant temperature is less than**89°C**, – the air conditioning is not switched on by the driver.

Note:
In the event that the low-speed engine fan assembly is defective, the high-speed engine fan assembly will then be activated.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16C36_V04_ET014/ EDC16C36_V08_ET014

GETtheMANUALS.org

ET015	FAN ASSEMBLY 2 CHECK

STATUS DEFINITION	**RUNNING**: This status indicates that fan assembly 2 is being supplied. **OFF**: This status indicates that fan assembly 2 is not being supplied.

NOTES	None.

Note:
Status **ET015** and status **ET144 High speed fan assembly relay control** change status simultaneously.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C, without electrical consumers

RUNNING	The engine fan assembly can be supplied when: – the engine coolant temperature is greater than **99°C**, – the injection computer has system faults that could lead to the engine overheating. When the high speed fan is supplied: – status **ET015** becomes **RUNNING,** – status **ET144 High speed fan assembly relay control** becomes **ACTIVE**.
	If the high speed engine fan does not operate, refer to the test for status **ET144 High speed fan assembly control relay**.

STOPPED	The high speed fan assembly is stopped when the engine coolant temperature is less than**89°C.**

Note:
If the low-speed fan assembly is defective, the high-speed fan assembly will be activated.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET038	ENGINE

STATUS DEFINITION	**STOPPED**: This status indicates that the engine ignition is on without the starter engaged. **STALLED**: This status indicates that the engine has stalled. The vehicle is still under **+ after ignition feed**. **UNDER STARTER**: This status indicates that the engine is in starting phase. **RUNNING**: This status indicates that the engine has started.

NOTES	None.

Conformity check with engine stopped and ignition on

STOPPED	Status **ET038** is **STOPPED** if the engine ignition is on without the starter engaged. In the event of a fault, switch off the ignition, and wait for the **diagnostic tool** message (maximum time **8 minutes**): **"Communication lost with computer: EDC16C36, check the tool connection and computer power supply"**. If the fault is still present, contact the Techline.
STALLED	Status **ET038** is **STALLED** when the engine has stalled. The vehicle is still under **+ after ignition feed**. In case of inconsistency, contact the Techline.

With the engine running, engine coolant temperature > 80°C, without electrical consumers

UNDER STARTER	Status **ET038** is **STARTER MOTOR** when the engine is in starting phase. In case of inconsistency, contact the Techline.
RUNNING	Status **ET038** is **Running** if the engine has started. In case of inconsistency, contact the Techline.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET042	CRUISE CONTROL/SPEED LIMITER

NOTES	Use the **Vel Satis ph2**, **Espace IV ph2**, **Laguna II ph2** wiring diagram Technical Note.

NO DETECTED	If the vehicle is not fitted with cruise control/speed limiter function buttons, status **ET042** is permanently **NOT DETECTED**. This confirms that the cruise control/speed limiter function is not present on the vehicle. If the vehicle is fitted with cruise control or speed limiter function buttons and the main switch is in the rest (or neutral) position and the injection computer has just been programmed or reprogrammed, then status **ET042** is **NOT DETECTED**. To activate the cruise control or speed limiter function, press the main switch in the cruise control position and then in the speed limiter position. Return to rest position. The tool displays status **ET042**: **INACTIVE**. If not, several steps must be checked: return to the multiplex network test page on the CLIP application. Repeat the multiplex network test. Re-establish dialogue with the injection computer. Check **ET042**. If **ET042** is **INACTIVE**, the injection computer has detected the various positions of the main switch. The cruise control/speed limiter is active. If status **ET042** is still **NOT DETECTED**, check that the vehicle's owner has not had the cruise control/speed limiter function disabled in the past. Contact the Techline.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16C36_V08_ET042/EDC16C36_V04_ET042

GETtheMANUALS.org

ET042 CONTINUED 1	

INACTIVE

When the main switch is in rest position (or neutral), status **ET042** is **INACTIVE**.
If **CRUISE CONTROL** or **SPEED LIMITER** appears despite the main switch being in the rest (or neutral) position, carry out the following operations:

Check the connections of the cruise control/speed limiter main switch.
Check for **+ 12 V** APC on the main switch connector.
- Connection code **AP10** of component **1081**.

Disconnect the main switch and with it in the rest position, check the insulation between:
- Connection codes **AP10** and **3FX** of component **1081**.
- Connection codes **AP10** and **3PD** of component **1081**.

– In the **speed limiter position**, check the continuity between:
- Connection codes AP10 and 3PD of component 1081.

– In the **cruise control position**, check the continuity between:
- Connection codes **AP10** and **3FX** of component **1081**.

If these checks are not in order, replace the switch.

Check the **continuity**, **insulation and the absence of interference resistance** on the following connections:
- Connection code **3FX**,
- Connection code **3PD**,

between components **1081** and **120**

Also check the engine management computer connectors.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A**, **Electrical wiring repair**, **Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET042 CONTINUED 2	

SPEED LIMITER

When the driver presses the main speed limiter switch, status **ET042** becomes **SPEED LIMITER**.
If **CRUISE CONTROL** or **INACTIVE** appears although the switch was pressed in the speed limiter position, carry out the following operations:

Check the connections of the cruise control/speed limiter main switch.
Check for **+ 12 V** APC on the main switch connector.
- Connection code **AP10** of component **1081**.

Disconnect the main switch and with it in the rest position, check the insulation between:
- Connection codes **AP10** and **3FX** of component **1081**.
- Connection codes **AP10** and **3PD** of component **1081**.

– In the **speed limiter position**, check the **continuity** between:
- Connection codes **AP10** and **3PD** of component **1081**.

– In the **cruise control position**, check the **continuity** between:
- Connection codes **AP10** and **3FX** of component **1081**.

If these checks show incorrect values, replace the main switch.

Check the **continuity**, **insulation and the absence of interference resistance** on the following connections:
- Connection code **3FX**,
- Connection code **3PD**,

between components **1081** and **120.**

Also check the engine management computer connectors.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A**, **Electrical wiring repair**, **Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET042 CONTINUED 3	

CRUISE CONTROL

When the driver presses the main cruise control button, status **ET042** becomes **CRUISE CONTROL**.

If **SPEED LIMITER** or **INACTIVE** appears although the driver pressed the switch in the cruise control position, carry out the following operations:
Check the connections of the cruise control/speed limiter main switch.

Check for **+ 12 V** APC on the main switch connector.
- Connection code **AP10** of component **1081**.

Disconnect the main switch, and when it is in the rest position, check the insulation between:
- Connection codes **AP10** and **3FX** of component **1081**.
- Connection codes **AP10** and **3PD** of component **1081**.

– In the **speed limiter position**, check the continuity between:
- Connection codes **AP10** and **3PD** of component **1081**.

– In the **cruise control position**, check the continuity between:
- Connection codes **AP10** and **3FX** of component **1081**.

If these checks show incorrect values, replace the main switch.

Check the **continuity**, **insulation and the absence of interference resistance** on the following connections:
- Connection code **3FX**,
- Connection code **3PD**,

between components **1081** and **120.**

Also check the engine management computer connectors.
If there is a repair procedure (see **Technical Note 6015A**, **Repairing electrical wiring**, **Wiring: Precautions for repair)** repair the wiring, otherwise replace it.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET076	STARTING

STATUS DEFINITION	**AUTHORISED**: this status indicates that starting the engine is authorised. **PROHIBITED**: this status indicates that starting the engine is prohibited.

NOTES	None.

Conformity check with engine stopped and ignition on

AUTHORISED	Starting the vehicle is authorised when the UCH authorises starting. Status **ET076** changes to **AUTHORISED** if the vehicle cards are recognised and the engine immobiliser is inactive.
PROHIBITED	If the card is not recognised by the UCH, starting the vehicle is prohibited. Status **ET076** is **INHIBITED** and the vehicle is not authorised to start. Run fault finding on the UCH and refer to the fault finding note for the vehicle to deal with any faults (see **87B**, **Passenger compartment connection unit**).

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET077	IMPACT DETECTED

STATUS DEFINITION	**YES**: This status indicates that the injection computer has detected an impact. **NO**: This status indicates that the injection computer has not detected an impact.

NOTES	None.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C, without electrical consumers

YES	If the vehicle has been involved in an accident, the injection computer receives the impact signal via the airbag computer over the multiplex network, and may switch off the injection. Is status **ET077 YES**? Switch off the ignition for **10 seconds**, then switch it back on, so the engine can be restarted. After the repair, clear the faults (even if no fault is displayed). Carry out a multiplex network test and deal with any faults. Run fault finding on the airbag computer (see **88C**, **Airbag and pretensioners**).
NO	Under normal operating conditions, status **ET077** is **NO** when the computer has received no impact signal.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET088	REQUEST TO START COMPRESSOR

STATUS DEFINITION	**ACTIVE**: This status indicates that the compressor is engaged. **INACTIVE**: This status indicates that the compressor is not engaged.

NOTES	None.

Engine running, engine coolant temperature > 80°C

ACTIVE	The air conditioning request has been made by the driver when pressing one of the air conditioning controls (Auto or AC). Status **ET088 becomes ACTIVE** and the computer authorises or does not authorise air conditioning depending on the operating conditions. If status **ET088** does not become **ACTIVE** when the control button is pressed, refer to the heating and air conditioning fault finding note (see **62A**, **Air conditioning**). Note: **Compressor operation is only authorised when the engine is running.**

Conformity check with engine stopped and ignition on

"INACTIVE"	When the driver deactivates the air conditioning, status **ET088** must become **INACTIVE**. If it does not, refer to the heating and air conditioning fault finding note (see **62A**, **Air conditioning**). Note: **Compressor operation is only authorised when the engine is running.**

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET143	LOW-SPEED FAN ASSEMBLY RELAY CONTROL

STATUS DEFINITION	**ACTIVE**: This status indicates that the low speed fan assembly relay is being actuated. **INACTIVE**: This status indicates that the low speed fan assembly relay is not being actuated.

NOTES	If the vehicle is equipped with air conditioning, the fan assembly electrical circuit contains **3 relays according to the vehicle type**. The 1st speed fan assembly relay will be actuated when the engine coolant temperature exceeds **89°C** and its function is to cool the engine so that the engine temperature does not exceed **99°C**. If the engine coolant temperature exceeds **99°C**, both of the 2nd speed fan assembly relays will operate and the fan will rotate faster.
	Use the Wiring diagram Technical Note for **Laguna II ph2**, **Vel satis ph2**, **Espace IV ph2**.

WARNING
If the vehicle is equipped with air conditioning, the engine cooling fan will operate at 1st speed as soon as the air conditioning compressor is activated.

Conformity check with engine stopped and ignition on	
INACTIVE	Engine cold and air conditioning switched off

Conformity check with engine running, engine coolant temperature > 80°C
(heating and air conditioning off) **INACTIVE** or **ACTIVE**, depending on the engine temperature.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

ET144 CONTINUED 1	

ACTIVE	When the coolant reaches **99°C**, the injection computer actuates the fan assembly relay and status **ET144** becomes **ACTIVE**. The relay then supplies the cooling fan. If status **ET144** is **ACTIVE**, but the cooling fan is not running, perform the following operations: – Check the condition of fuse **FM15** (**60 A)** in the engine fuse and relay box. – Disconnect the fan assembly relays, check their operation and the condition of the connections. Carry out the following electrical checks according to the type of vehicle: **LAGUNA II PH2:** – Check for **+ 12 V** on connection **BP71** of component **188** and on connection **49B** of component **262**. – Check for earth on connection **49A** of component **188** and on connection **MAS** of component **262**. If the tests are ok, replace the defective fan. If not, carry out the following operations: – Check the **continuity**, **insulation and the absence of interference resistance** on the following connections: – Connection code **49B** between components **262**, **335** and **336.** – Connection code **MAS** between components **262** and **MAS**. – Connection code **49A** between components **188** and **337**. – Connection code **BP71** between components **188** and **335** and **597**. – Connection code **3FB** between components **335**, **336**, **337** and **120.** – Connection code **MAS** between components **337** and **MAS**. – Connection code **3JP** between components **335, 337** and **120**. If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A**, **Electrical wiring repair**, **Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET144 CONTINUED 2	

ACTIVE	**VEL SATIS PH2:** – Check for **+ 12 V** on connection **BP72** of component **188** and on connection **49B** of component **262**. – Check for earth on connection **49A** of component **188** and on connection **MAS** of component **262**. If the tests are ok, replace the defective fan. If not, carry out the following operations: – Check the **continuity**, **insulation and the absence of interference resistance** on the following connections: – Connection code **49B** between components **262**, **1827** and **1829.** – Connection code **MAS** between components **262** and **MAS**. – Connection code **49A** between components **188**, **1828** and **1829.** – Connection code **BP72** between components **188** and **597**. – Connection code **3FB** between components **1831** and **120**. – Connection code **MAS** between components **1828**, **262** and **MAS**. – Connection code **3JP** between components **1831** and **120**. If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A**, **Electrical wiring repair**, **Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET144 CONTINUED 3	

ACTIVE	**ESPACE IV PH2:** – Check for **+ 12 V** on connection **BP71** of component **188** and on connection **49B** of component **262**. – Check for earth on connection **49A** of component **188** and on connection **MAS** of component **262**. If the tests are ok, replace the defective fan. If not, carry out the following operations: – Check the **continuity**, **insulation and the absence of interference resistance** on the following connections: – Connection code **49B** between components **262**, **1827** and **1829.** – Connection code **MAS** between components **262** and **MAS**. – Connection code **49A** between components **188**, **1828** and **1829.** – Connection code **BP71** between components **188** and **1827** and **597**. – Connection code **3FB** between components **1831** and **120**. – Connection code **MAS** between components **1828**, **262** and **MAS**. – Connection code **3JP** between components **1831** and **120**. If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A**, **Electrical wiring repair**, **Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
INACTIVE	When the injection computer no longer requests cooling, status **ET144** changes to **INACTIVE**. The fan unit should switch off.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET205 **ET206** **ET207**	THERMOPLUNGER 1 RELAY CONTROL THERMOPLUNGER 2 RELAY CONTROL THERMOPLUNGER 3 RELAY CONTROL

STATUS DEFINITION	**ACTIVE**: This status indicates that the thermoplunger is supplied. **INACTIVE**: This status indicates that the thermoplunger is not supplied.

NOTES	**Only for Laguna II ph2 and Vel Satis ph2.**

INACTIVE

Statuses **ET205**, **ET206**, **ET207** are **INACTIVE** with the ignition on and the engine stopped, or when the engine is warm.

ACTIVE

Statuses **ET205**, **ET206** and **ET207** are **ACTIVE** when the engine is started, the engine coolant temperature is low (**< 15°C**) and the air temperature is low (**< 5°**).
This program allows the engine coolant to be heated to enable the passenger compartment to be heated.
The thermoplungers also act both to load the engine to improve regeneration of the particle filter

To control the operation of the thermoplunger relays, run the following commands:
AC063 Thermoplunger no. 1 relay.
AC064 Thermoplunger no. 2 relay.
AC031 Thermoplunger no. 3 relay.

In the event of a fault, refer to the interpretation of faults:
DF034 "Heating element 3 relay control circuit".
DF033 Thermoplunger 2 relay control circuit.
DF032 Thermoplunger 1 relay control circuit.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET238	SYNCHRONISATION

STATUS DEFINITION	Synchronisation is carried out during the engine starting phase. The camshaft position sensor and the TDC sensor are synchronised. Once this synchronisation has been carried out, it enables the computer to identify cylinder no.1 and to ascertain the precise position of the cylinder's top dead centre. Synchronisation also allows the computer to determine the injection strategy.

NOTES	None.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C, without electrical consumers

COMPLETED	Status **ET238** is **DONE** when the engine is started. The computer has identified cylinder no. 1 and has identified the exact top dead centre position. Injection phasing and engine management are possible, and the engine should be working properly.
NOT PERFORMED	Status **ET238** is **NOT COMPLETED** if the engine has been stopped with the **+ after ignition feed** on. If status **ET238** remains **NOT COMPLETED** after an attempted start, consult the interpretation of fault **DF195 Camshaft sensor/engine speed consistency**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16C36_V04_ET238/EDC16C36_V08_ET238

GETtheMANUALS.org

ET300	RICHNESS REGULATION

STATUS DEFINITION	**ACTIVE**: This status indicates that the richness is regulated. **INACTIVE**: This status indicates that the richness is not regulated.

NOTES	None.

Conformity check with engine stopped and ignition on

"INACTIVE"	The status is **INACTIVE** when the engine is not running. In the event of a fault, consult the interpretation of fault **DF967 Richness ratio sensor circuit**.

With engine running at idle speed, engine coolant temperature > 80°C, without electrical consumers

ACTIVE	The status is **ACTIVE** when the engine is running. In the event of a fault, consult the interpretation of fault **DF967 Richness ratio sensor circuit**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16C36_V04_ET300/EDC16C36_V08_ET300

GETtheMANUALS.org

ET341	IMMOBILISER CODE PROGRAMMED

STATUS DEFINITION	**YES**: This status indicates that the immobiliser code has been programmed. **NO**: This status indicates that the immobiliser code has not been programmed.

NOTES	None.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C, without electrical consumers

YES	Status **ET341** is **YES** if dialogue is possible between the UCH computer and the injection computer and the key code is recognised. The engine is only authorised to start if the code is recognised by the UCH computer and if status **ET003 Immobiliser is INACTIVE**.
NO	Status **ET341** is **NO** if dialogue is not possible between the UCH computer and the injection computer (status **ET003 Immobiliser remains ACTIVE**). The cause of this fault may be incorrect card programming; in this case refer to the UCH fault finding note and follow the card programming procedure. If the card programming is not the cause of the fault, run a multiplex network test and check that dialogue is possible between the UCH and the injection computer. If dialogue is not established, contact Techline.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16C36_V04_ET341/EDC16C36_V08_ET341

GETtheMANUALS.org

ET415	CRUISE CONTROL/SPEED LIMITER DEACTIVATION

STATUS DEFINITION	This status varies according to engine specifications.

NOTES	None.

Note:
Cruise control can be activated when the vehicle speed exceeds **18 mph (30 km/h).**
Status **ET415** shows various factors that cause deactivation of the cruise control/speed limiter function, due to a driver request or the external environment (e.g. STATUS 1).

IMPORTANT
Clear the fault memory by running command **RZ001 Fault memory** to reset this status to **NONE**.

WITHOUT	This status is present on the **diagnostic tool** if: The computer has been reinitialised. the computer has been reprogrammed.

STATUS 1	**Traction control request**
	If the vehicle is fitted with a traction control system, the cruise control function is deactivated every time the ABS computer calls for traction control. Status **ET415** becomes **STATUS 1** when driving, with cruise control active (**ET042: Cruise control/Speed limiter: CRUISE CONTROL**) and after a traction control request. This deactivates cruise control. **Reinitialise status ET415 on the injection computer by running command RZ001 Fault memory.** If status **ET415** becomes **STATUS 1** with no traction control request (see **38C**, **ABS**).

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16C36_V04_ET415/EDC16C36_V08_ET415

GETtheMANUALS.org

ET415 CONTINUED 1	

STATUS 2	**Brake pedal depressed**
	The cruise control function is deactivated when the brake pedal is depressed. Status **ET415** becomes **STATUS 2**, when driving with the cruise control active (**ET042 Cruise control/Speed limiter: CRUISE CONTROL**) and brake pedal depressed. This deactivates cruise control. **Reinitialise status ET415 on the injection computer by running command RZ001 Fault memory.** If status **ET415** becomes **STATUS 2** without depressing the brake pedal, consult the interpretation of statuses **ET704** and **ET705 Brake contact No. 1 and No. 2**.

STATUS 3	**Clutch pedal depressed**
	Manual gearbox ONLY The cruise control function is deactivated when the gearbox is not coupled to the engine (clutch pedal depressed). Status **ET415** becomes **STATUS 3** when driving with the cruise control active (**ET042 Cruise control/speed limiter: CRUISE CONTROL**) and the clutch pedal is depressed. This deactivates cruise control. **Reinitialise status ET415 on the injection computer by running command RZ001 Fault memory.** If status **ET415** becomes **STATUS 3** without the clutch pedal being depressed, consult the interpretation of status **ET405 Clutch pedal switch**. If the vehicle is fitted with automatic transmission: Test the multiplex network: check the configuration of the multiplex network in relation to the vehicle's technical specification, especially the configuration of the automatic transmission computer (see **88B**, **Multiplexing**).

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET415 CONTINUED 2	

STATUS 4	**Cancel button pressed**
	The cruise control/speed limiter function is deactivated whenever the suspend button is pressed. Status **ET415** becomes **STATUS 4** when driving with: – Either the cruise control is active, or – the speed limiter is active – and when the **"0"** button is pressed by the driver. This action deactivates the Cruise control/Speed limiter. **Reinitialise status ET415 on the injection computer by running command RZ001 Fault memory.** If status **ET415** becomes **STATUS 4** without pressing the “0” button, consult the interpretation of status **ET703 Cruise control/speed limiter buttons** and perform fault finding on the **R/0** control button located on the steering wheel, to the right.

STATUS 5	**Cruise control or speed limiter monitoring**
	This status appears when the vehicle brakes or decelerates sharply without the injection computer receiving a signal that the brake pedal switch has been pressed. If status **ET415** is **STATUS 5**, refer to the interpretation of statuses: **– ET042 Cruise control/Speed limiter,** **– ET703 Cruise control/speed limiter buttons,** **– ET704 Brake switch No. 1,** **– ET705 Brake switch No. 2,** to test the cruise control/speed limiter system components and identify the faulty component. Also, check the operation of the accelerator pedal, and use the **diagnostic tool** to check the presence of a fault connected with this component. Deal with them if necessary. **Reinitialise status ET415 on the injection computer by running command RZ001 Fault memory.** If status **ET415** changes to **STATUS 5**, deal with faults which are present or stored in the injection computer. If the fault is still present, contact the techline.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET415 CONTINUED 3	

STATUS 6	**Gear lever in neutral (manual gearbox) or the neutral position (automatic gearbox)**
	Status **ET415** becomes **STATUS 6**, when driving with the cruise control active (**ET042 Cruise control/speed limiter: CRUISE CONTROL**) and – if the driver puts the gear lever in neutral position on a manual gearbox without declutching or, – if the gear lever is in neutral on an automatic gearbox. This deactivates cruise control. **Reinitialise status ET415 on the injection computer by running command RZ001 Fault memory.** If status **ET415** becomes **STATUS 6** without shifting the gear lever into neutral on a manual gearbox without declutching, or into neutral on an automatic transmission, run fault finding on the ABS computer and check the configuration of the tyre size stored in the computer. If the configuration is correct, contact the Techline.

STATUS 7	**Lack of correlation between the request and the vehicle speed**
	Status **ET415** changes to **STATUS 7** if the computer detects too great a difference between the speed requested by the driver and the vehicle speed. This could occur when driving with cruise control active **(ET042 Cruise control/ speed limiter: CRUISE CONTROL)** and when there is a significant difference. This inconsistency deactivates cruise control. **Reinitialise status ET415 on the injection computer by running command RZ001 Fault memory.** If status **ET415** becomes **STATUS 7** without a great difference in speeds, contact Techline.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET415 CONTINUED 4	

STATUS 8	**Automatic gearbox in defect mode.**
	Status **ET415** becomes **STATUS 8**, when driving with cruise control active **(ET042: Cruise control/speed limiter: CRUISE CONTROL)** and if the automatic transmission is in defect mode. This signal is conveyed on the multiplex line and deactivates the cruise control. Carry out a multiplex network test, then run fault finding on the automatic transmission computer. Deal with any present or stored faults (see **23A**, **Automatic transmission**, **Interpretation of faults**). Clear the automatic transmission computer memory by running command **RZ001 Fault memory**. **Reinitialise status ET415 on the injection computer by running command RZ001 Fault memory.** If **STATUS 8** is still present, contact the Techline.

STATUS 9	**Vehicle speed monitoring**
	Status **ET415** becomes **STATUS 9** if the vehicle speed received by the computer is invalid or absent. This signal is conveyed on the multiplex line and deactivates the cruise control. Carry out a multiplex network test, then run fault finding on the ABS computer. Deal with any present or stored faults (see **38C**, **ABS**, **Interpretation of faults**). **Reinitialise status ET415 on the injection computer by running command RZ001 Fault memory.** If **STATUS 9** is still present, contact the Techline.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET415 CONTINUED 5	

STATUS 10	Monitoring by injection computer
	Status **ET415** becomes **STATUS 10** when driving, with cruise control active (**ET042 Cruise control/Speed limiter: CRUISE CONTROL**) and if the injection computer detects a fault on the engine management system, or excessive or insufficient speed. This signal is conveyed on the multiplex line and deactivates the cruise control. Carry out a multiplex network test, then Perform fault finding on the injection computer. Deal with any present or stored faults (see **Interpretation of faults**). **Reinitialise status ET415 on the injection computer by running command RZ001 Fault memory.** If **STATUS 10** is still present, contact the Techline.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET587	RECIRCULATED EXHAUST GAS COOLING

STATUS DEFINITION	**ACTIVE**: This status indicates that exhaust gas cooling is recirculated. **INACTIVE**: This status indicates that exhaust gas cooling is not recirculated.

NOTES	None.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C, without electrical consumers

INACTIVE
According to computer programming.
In the event of a problem, consult the interpretation of faults **DF209 EGR valve position sensor circuit**, **DF304 EGR by-pass circuit** and **DF647 EGR valve position regulation**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ET703 CONTINUED 1	

Sensor electrical conformity

INACTIVE

Status **ET703** becomes **INACTIVE** when none of the cruise control/speed limiter buttons is pressed. These buttons are located on the steering wheel.

If status **ET703** does not display **INACTIVE**,
check the condition of the cruise control/speed limiter **±** button and the condition of its connector.
check the condition of the cruise control/speed limiter **R/0** button and its connector.

INCREASE

Status **ET703** becomes **INCREASE** when the cruise control/speed limiter **+** button is pressed. This button is on the steering wheel, on the left-hand side.

If status **ET703** does not display **INCREASE**, check the condition of the cruise control/speed limiter **±** button and its connector. Repair if necessary.

To carry out the checks and measurements in complete safety, observe the recommendations for removing the driver's front airbag (see **MR 402 (Vel Satis ph2), MR 361 (Espace IV ph2) or MR 395 (Laguna II ph2) Mechanical, 88C, Airbag and pretensioners, Driver's front airbag, Removal – Refitting**).

Measure **the resistance of the following connections while pressing the + button (on the button connections)**:
– Connection code **86G** of component **331**.
– Connection code **86M** of component **331**.

If the resistance is not approximately **300** Ω, check the continuity of the connection when the button is not pressed.
If there is continuity, replace the **"±"** control button.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A**, **Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

AFTER REPAIR	Carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

ET703 CONTINUED 2	

DECREASE

Status **ET703** becomes **DECREASE** when the cruise control/speed limiter **-** button is pressed. This button is on the steering wheel, on the left-hand side.

If status **ET703** does not change to **DECREASE**, check the condition of the cruise control/speed limiter **±** button, and the condition of its connector. Repair if necessary.

To carry out the checks and measurements in complete safety, observe the recommendations for removing the driver's front airbag (see **MR 402 (Vel Satis ph2), MR 361 (Espace IV ph2) or MR 395 (Laguna II ph2) Mechanical, 88C, Airbag and pretensioners, Driver's front airbag, Removal – Refitting**).

Measure **the resistance of the following connections while pressing the "-" button (on the button connections)**:
– Connection code **86G** of component **331**.
– Connection code **86M** of component **331**.

If the resistance is not approximately **100** Ω check the continuity of the connection when the button is not pressed.
If there is continuity, replace the **"±"** control button.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A**, **Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

AFTER REPAIR	Carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

ET703 CONTINUED 3	

SUSPEND	Status **ET703** becomes **SUSPEND** when the cruise control/speed limiter **0** button is pressed. This button is located on the steering wheel, to the right. If status **ET703** does not change to **SUSPEND**, check the condition of the cruise control/speed limiter **R/0** button, and the condition of its connector. To carry out the checks and measurements in complete safety, observe the recommendations for removing the driver's front airbag (see **MR 402 (Vel Satis ph2), MR 361 (Espace IV ph2) or MR 395 (Laguna II ph2) Mechanical, 88C, Airbag and pretensioners, Driver's front airbag, Removal – Refitting**). Measure **the resistance of the following connections while pressing the "0" button (on the button connections)**: – Connection code **86G** of component **331**. – Connection code **86M** of component **331**. If the resistance is not approximately **0** Ω, replace the **R/0** control button. If there is continuity, replace the **R/0** control button. If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A**, **Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

AFTER REPAIR	Carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

ET703 CONTINUED 4	

RESUME	Status **ET703** becomes **RESUME** when the cruise control/speed limiter **R** button is pressed. This button is located on the steering wheel, to the right. If status **ET703** does not change to **RESUME**, check the condition of the cruise control/speed limiter **R/0** button and its connector. Repair if necessary. To carry out the checks and measurements in complete safety, observe the recommendations for removing the driver's front airbag (see **MR 402 (Vel Satis ph2), MR 361 (Espace IV ph2) or MR 395 (Laguna II ph2) Mechanical, 88C, Airbag and pretensioners, Driver's front airbag, Removal – Refitting**). Measure **the resistance of the following connections while pressing the "R" button (on the button connections)**: – Connection code **86G** of component **331**. – Connection code **86M** of component **331**. If the resistance is not approximately **900** Ω, check the continuity of the connection when the button is not pressed. If there is continuity, replace the **R/0** control button. If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A**, **Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

AFTER REPAIR	Carry out a road test followed by a check with the **diagnostic tool**.

ET715	STORED ENGINE STATUS NO. 10

STATUS DEFINITION	These statuses indicate the engine status in the event of a regeneration failure when driving.

NOTES	**Special notes:** These statuses should only be interpreted on **DF312 Speed request** if they are present or stored.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80 °C

This status indicates the engine status in the event of a regeneration failure when driving:
NONE, + AFTER IGNITION FEED, RUNNING, **STOPPED**.

Each **STATUS** between **ET706** and **ET715** corresponds to the engine status during a regeneration failure for which the mileage is saved by **PR794 Stored regeneration failure No. 1** to **PR803 Stored regeneration failure No. 10** (for example, **PR797 Stored regeneration failure No. 4 is related to ET709 Stored engine status No. 4**).

AFTER REPAIR	Carry out a road test followed by a check with the **diagnostic tool**.

EDC16C36_V04_ET706/EDC16C36_V04_ET707/EDC16C36_V04_ET708/EDC16C36_V04_ET709/EDC16C36_V04_ET710

EDC16C36_V08_ET711/EDC16C36_V08_ET712/EDC16C36_V08_ET713/EDC16C36_V08_ET714/EDC16C36_V08_ET715

GETtheMANUALS.org

ET706 **ET707** **ET708** **ET709** **ET710** **ET711** **ET712** **ET713** **ET714** **ET715** **CONTINUED**	

RUNNING	If the **STATUS** is **RUNNING**, the regeneration failed because: – the customer's driving did not generate enough heat, – an engine management system component is defective.
STOPPED	If the **STATUS** is **STOPPED**, regeneration has failed due to the engine being switched off.
+ APC	POWER LATCH
NONE	No failed regeneration is present.

AFTER REPAIR	Carry out a road test followed by a check with the **diagnostic tool**.

GETtheMANUALS.org

ET742	STORED REGEN. REQUEST STATUS No. 1
ET743	STORED REGEN. REQUEST STATUS No. 2
ET744	STORED REGEN. REQUEST STATUS No. 3
ET745	STORED REGEN. REQUEST STATUS No. 4
ET746	STORED REGEN. REQUEST STATUS No. 5
ET747	STORED REGEN. REQUEST STATUS No. 6
ET748	STORED REGEN. REQUEST STATUS No. 7
ET749	STORED REGEN. REQUEST STATUS No. 8
ET750	STORED REGEN. REQUEST STATUS No. 9
ET751	STORED REGEN. REQUEST STATUS No. 10

STATUS DEFINITION	Statuses **ET742** to **ET751** correspond to the causes for the regeneration request. They are related to parameters **PR816 Stored regeneration start No. 1 to PR825 Stored regeneration start No. 10** which contains the stored mileage of the vehicle at the start of the regeneration. (For example, **PR745 Stored regeneration start No. 4** is related to **ET709 Stored regeneration request status No. 4**).

NOTES	**Special note:** These statuses should only be interpreted for **ALP7 Particle filter warning light comes on too frequently**.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80 °C

STATUS 1	**Request by weight of soot**
	Regeneration has been requested after the maximum weight of soot has been reached and measured in the particle filter, without the particle filter warning light coming on.

STATUS 2	**Request by estimated weight of soot**
	Regeneration has been requested following an estimate of the maximum weight of soot in the particle filter, without the particle filter warning light coming on.

AFTER REPAIR	Carry out a road test followed by a check with the **diagnostic tool**.

EDC16C36_V04_ET742/EDC16C36_V04_ET743/EDC16C36_V04_ET744/EDC16C36_V04_ET745/EDC16C36_V04_ET746

GETtheMANUALS.org

ET742 **ET743** **ET744** **ET745** **ET746** **ET747** **ET748** **ET749** **ET750** **ET751** **CONTINUED**	

STATUS 3	**Request by distance travelled**
	Regeneration has been requested because the distance travelled since the last successful regeneration has reached the maximum authorised value (the particle filter warning light has not come on)

STATUS 4	**Request by number of regeneration failures or weight of soot**
	This status corresponds to the increase of **DF312 Speed request**. This corresponds to the maximum number of failed regeneration or to the maximum weight of soot in the particle filter, with the particle filter warning light coming on.

AFTER REPAIR	Carry out a road test followed by a check with the **diagnostic tool**.

PR005	EGR VALVE OPENING VALUE REQUIRED

PARAMETER DEFINITION	This parameter indicates a theoretical opening value for the EGR valve for optimum engine performance.

NOTES	None.

Conformity check with engine stopped and ignition on

The EGR valve theoretical opening value for operation with the engine stopped and ignition on is:
- 10 < PR005 < 0%

Conformity check with engine running, engine coolant temperature > 80°C, without electrical consumers

The theoretical EGR valve opening value for operation with the engine running and, engine coolant temperature **> 80°C** is **10 < PR005 < 40%**

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16C36_V04_PR005/EDC16C36_V08_PR005

GETtheMANUALS.org

PR006	RAIL PRESSURE REGULATOR CURRENT

PARAMETER DEFINITION	This parameter indicates the current absorbed by the rail pressure regulator.

NOTES	None.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C, without electrical consumers

This parameter indicates the current absorbed by the rail pressure regulator **PR006** ≈ **PR007 Rail pressure regulator current setpoint**.
In the event of a fault, consult the interpretation of fault **DF898 Rail pressure regulator circuit**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16C36_V04_PR006/EDC16C36_V08_PR006

GETtheMANUALS.org

PR007	RAIL PRESSURE REGULATOR CURRENT SETPOINT

PARAMETER DEFINITION	This parameter indicates the theoretical current absorbed by the rail pressure regulator.

NOTES	None.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C, without electrical consumers

This parameter indicates the theoretical current absorbed by the rail pressure regulator.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16C36_V04_PR007/EDC16C36_V08_PR007

GETtheMANUALS.org

PR008	RAIL REFERENCE PRESSURES

PARAMETER DEFINITION	This parameter indicates the theoretical rail pressure value for optimum engine operation in bar.

NOTES	None.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C, without electrical consumers

The theoretical rail pressure value is a setpoint of **PR008 = 250 ± 50 bar**

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16C36_V04_PR008/EDC16C36_V08_PR008

GETtheMANUALS.org

PR009	TURBOCHARGING PRESSURE SETPOINT

PARAMETER DEFINITION	This parameter indicates the theoretical turbocharging pressure setpoint value in **bar**.

NOTES	None.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C, without electrical consumers

The theoretical turbocharging pressure setpoint value is **PR009** ≈ **1 bar**

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16C36_V04_PR009/EDC16C36_V08_PR009

GETtheMANUALS.org

PR015	ENGINE TORQUE

PARAMETER DEFINITION	This parameter indicates the engine torque in **Nm**.

NOTES	None.

Engine running, engine coolant temperature > 80°C, with no electrical consumers

The value must be between **20 < PR015 < 40 Nm**
This parameter is only valid when the engine is running.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16C36_V04_PR015/EDC16C36_V08_PR015

GETtheMANUALS.org

PR017	CURRENT SETPOINT

PARAMETER DEFINITION	This parameter indicates the fuel flow in **mg/st**.

NOTES	None.

Conformity check with engine stopped and ignition on

Ignition on: 0.0 mg/st.
If there is a fault, refer to the interpretation of fault **DF643 Rail pressure regulator circuit**.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C, without electrical consumers

Engine running: PR017 = PR157: Fuel flow setpoint.
If there is a fault, refer to the interpretation of fault **DF643 Rail pressure regulator circuit**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16C36_V04_PR017/EDC16C36_V08_PR017

GETtheMANUALS.org

PR022	EGR VALVE POSITION FEEDBACK LOOP DIFFERENCE

PARAMETER DEFINITION	This parameter indicates the percentage difference between the setpoint and the EGR valve position.

NOTES	None.

Conformity check with engine stopped and ignition on

This parameter indicates the percentage difference between the setpoint and the EGR valve position.
In the event of a fault, consult the interpretation of faults **DF209 EGR valve position sensor circuit** and **DF647 EGR valve position regulation**.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C, without electrical consumers

PR022 = ± 5%
In the event of a fault, consult the interpretation of faults **DF209 EGR valve position sensor circuit** and **DF647 EGR valve position regulation**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16C36_V04_PR022/EDC16C36_V08_PR022

GETtheMANUALS.org

PR030	ACCELERATOR PEDAL POSITION

PARAMETER DEFINITION	This parameter indicates the accelerator pedal position as a percentage.

NOTES	**There must be no present or stored faults.** Perform this fault finding procedure: – after finding an inconsistency in the parameter, – after a customer complaint (e.g. lack of power).
	Use the **Vel Satis ph2, Espace IV ph2, Laguna II ph2** wiring diagram Technical Note.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C, without electrical consumers

If no pressure is being applied to the pedal PR030 = 0%
In the event of a fault, consult the interpretation of **DF196 Pedal sensor circuit gang 1** or **DF198 Pedal sensor circuit gang 2**.

Sensor electrical conformity

Check the **continuity and absence of interference resistance** of the following connections:
– connection code **3LR**,
– connection code **3LS**,
– connection code **3LT**,
– connection code **3LU**,
– connection code **3LW**,
– connection code **3LV**,
– between components **120** and **921**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Pedal sensor **connected**, vehicle with **ignition on and engine stopped**:
– check the value of **PR030**:
0% no load,
100% full load,
138% full load after kickdown point on pedal.
– if the value is not correct, replace the pedal sensor.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16C36_V04_PR030/EDC16C36_V08_PR030

GETtheMANUALS.org

PR035	ATMOSPHERIC PRESSURE

PARAMETER DEFINITION	This parameter indicates the atmospheric pressure in bar; the sensor is integrated in the computer.

NOTES	None.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C, without electrical consumers

The atmospheric pressure value is **PR035** ≈ **1 bar ± 0.20 bar**
In the event of a fault, consult the interpretation of fault **DF200 Atmospheric pressure sensor**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16C36_V04_PR035/EDC16C36_V08_PR035

GETtheMANUALS.org

PR037	REFRIGERANT PRESSURE

PARAMETER DEFINITION	This parameter indicates the pressure in the air conditioning circuit. It changes according to the air conditioning system operating mode.

NOTES	None.

Engine running, engine coolant temperature > 80°C, with no electrical consumers

The value must be between **1 < PR037 < 40 bar**
In the event of a fault, carry out a multiplex network test (**see 88B, Multiplexing**).

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16C36_V04_PR037/EDC16C36_V08_PR037

GETtheMANUALS.org

PR038	RAIL PRESSURE

PARAMETER DEFINITION	This parameter indicates the rail pressure in **bar**.

NOTES	**There must be no present or stored faults.** Perform this fault finding procedure: – after finding an inconsistency in the parameter, – after a customer complaint (starting faults, poor performance, stalling etc.), – after an interpretation of command **AC011 Rail pressure regulator**.
	Use the **Vel Satis ph2, Espace IV ph2, Laguna II ph2** wiring diagram Technical Note.

Conformity check with engine stopped and ignition on

The rail pressure value is **0 < PR038 < 90 bar if the Coolant temperature < 30°C**
In the event of a fault, consult the interpretation of fault **DF007 Rail pressure sensor circuit**.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C, without electrical consumers

The rail pressure value at idle speed is: **PR038 = 270 bar ± 20 bar**
Full load: **PR038 = 1700 bar ± 20 bar**
In the event of a fault, consult the interpretation of fault **DF007 Rail pressure sensor circuit**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16C36_V04_PR038/EDC16C36_V08_PR038

GETtheMANUALS.org

PR038 CONTINUED	

Sensor electrical conformity

Check the condition of the rail pressure sensor connector.
Check the condition of the engine management computer connector.
If one of the connectors is faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, wiring: precautions for repair**), repair the connector, otherwise replace the wiring.
Check the **continuity** and absence of **interference resistance** of the following connections:
– connection code **3LX**,
– connection code **3LY**,
– connection code **3LZ**,
between components **120** and **1032**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Check that there are no external diesel leaks from the high pressure fuel circuit.
With the ignition on and the engine stopped for over **1 minute**:
View parameter **PR038 Rail pressure**.
– If the pressure is below **90 bar**, the sensor is in order.
– If the pressure is above **90 bar**, contact the Techline.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR041	TURBOCHARGING PRESSURE

PARAMETER DEFINITION	This parameter indicates the turbocharging pressure in **mbar**.

NOTES	Use the **Vel Satis ph2, Espace IV ph2, Laguna II ph2** wiring diagram Technical Note.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C, without electrical consumers

The turbocharging pressure value is **PR041 = PR035 ± 200 mbar**
In the event of a problem, refer to the sensor electrical conformity.

Sensor electrical conformity

Check the **continuity** and absence of **interference resistance** of the following connections:
– connection code **3LQ**,
– connection code **3LP**,
– connection code **3LN**.
between components **120** and **1071**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16C36_V04_PR041/EDC16C36_V08_PR041

GETtheMANUALS.org

PR041 CONTINUED	

Vehicle with ignition on, and the engine stopped for over 1 minute:
Compare the values of **PR041 Turbocharging pressure** and **PR035 Atmospheric pressure**.
If the difference between **PR041** and **PR035** is greater than **200 mbar**, check the value of **PR035** by comparing it with the reading on a conforming vehicle in the workshop.

If the value of **PR035** is not correct (a difference of over **200 mbar** between the 2 vehicles), contact the Techline.

Otherwise (when the value of **PR035** is correct), replace the turbocharger pressure sensor.
If the difference between **PR041** and **PR035** is less than **200 mbar**, carry out the following actions

Start the engine, with the engine idling:
Compare the values of **PR041** and **PR035**.

If the difference between **PR041** and **PR035** is greater than **200 mbar, check the air inlet circuit**:
Check that the **low** and **high pressure** air circuit is **sealed** and **free from blockages**: ducts, mounting clips present and tightened, mounting of turbocharger pressure sensor, exchanger, etc.
Check that the damper valve is not jammed closed.

Repair if necessary.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR045	POWER REQUESTED BY HEATING ELEMENTS

PARAMETER DEFINITION	This parameter indicates the power consumed by the heating elements in **watts**.

NOTES	**Special note:** **Only on Vel Satis ph2 and Laguna II ph2.**

Engine running, engine coolant temperature > 80°C, with no electrical consumers

0 < PR045 < 1200 W
If the parameter value is not within this range, consult the interpretation of faults:
– DF032 "Heating element 1 relay control circuit",
– DF033 "Heating element 2 relay control circuit",
– DF034 "Heating element 3 relay control circuit".

Engine stopped, ignition on

PR045 = 0 W
In the event of a fault, refer to the interpretation of faults:
– DF032 "Heating element 1 relay control circuit",
– DF033 "Heating element 2 relay control circuit",
– DF034 "Heating element 3 relay control circuit".

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR051	EGR VALVE POSITION FEEDBACK

PARAMETER DEFINITION	This parameter indicates the EGR valve opening ratio.

NOTES	**There must be no present or stored faults.** Perform this fault finding procedure: – after finding an inconsistency in the parameter, – after a customer complaint (loss of power, smoke etc.), – after the interpretation of command **AC103 EGR by-pass**
	Use the **Vel Satis ph2, Espace IV ph2, Laguna II ph2** wiring diagram Technical Note.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C, without electrical consumers

This parameter indicates the EGR valve opening ratio.
In the event of a fault, consult the interpretation of faults **DF209 EGR valve position sensor circuit** and **DF647 EGR valve position regulation**.

Sensor electrical conformity

Check the **continuity** and absence of **interference resistance** of the following connections:
– connection code **3JM**,
– connection code **3EL**,
– connection code **3GC**,
between components **120** and **1460**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If the fault is still present, contact the Techline

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR053	SPEED REQUESTED BY HEATING/AIR CONDITIONING

PARAMETER DEFINITION	This parameter indicates the engine's speed of rotation with air conditioning in **rpm**.

NOTES	None.

Conformity check with engine stopped and ignition on

Indicates the rotation speed of the engine with air conditioning: **0 rpm**.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C

The engine speed requested by the air conditioning is increased and fluctuates around **850 rpm**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16C36_V04_PR053/EDC16C36_V08_PR053

GETtheMANUALS.org

PR055	ENGINE SPEED

PARAMETER DEFINITION	This parameter indicates the engine's rotational speed in **rpm**.

NOTES	None.

Conformity check with engine stopped and ignition on

With the ignition on the value is **0 rpm**.
In the event of a fault, consult the interpretation of faults **DF195 Engine speed/camshaft sensor consistency, DF119 Camshaft sensor signal** and **DF120 Engine speed sensor signal**.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C, without electrical consumers

With the engine running at idle speed, the value is approximately **800 rpm**.
In the event of a fault, consult the interpretation of faults **DF195 Engine speed/camshaft sensor consistency, DF119 Camshaft sensor signal** and **DF120 Engine speed sensor signal**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR058	AIR TEMPERATURE

PARAMETER DEFINITION	This parameter indicates the air inlet temperature in **°C**.

NOTES	**There must be no present or stored faults.** Perform this fault finding procedure: – after finding an inconsistency in the parameter, – after a customer complaint (e.g. lack of power).
	Use the **Vel Satis ph2, Espace IV ph2, Laguna II ph2** wiring diagram Technical Note.

Conformity check with engine stopped and ignition on

With the ignition on the inlet air temperature varies according to the exterior temperature.
Default value: 20°C
In the event of a fault, consult the interpretation of fault **DF002 Air temperature sensor circuit**.
The parameter **PR058** ≈ **PR064 Coolant temperature** cold engine.

Conformity check with engine running, engine coolant temperature > 80°C, without electrical consumers

With the engine running at idle speed the inlet air temperature varies according to the engine coolant temperature.
Default value: 20°C
In the event of a fault, consult the interpretation of fault **DF002 Air temperature sensor circuit**.

Sensor electrical conformity

With the flow sensor disconnected, check the **insulation** from **earth** of the following connection:
– connection code **3ABQ** between components **120** and **799**.
Check the **+ 12 V after relay feed** to the air flowmeter.
– connection **3FB** of component **799**
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Measure the **resistance** between connections **3ABQ** and **3DW** of component **799**.
Replace the air flowmeter if the resistance is not between **100** Ω and **40 k**Ω.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

PR063	FUEL TEMPERATURE

PARAMETER DEFINITION	This parameter indicates the fuel temperature in **°C**.

NOTES	**There must be no present or stored faults.** Perform this fault finding procedure: – after finding an inconsistency in the parameter, – after a customer complaint (e.g. lack of power).
	Use the **Vel Satis ph2, Espace IV ph2, Laguna II ph2** wiring diagram Technical Note.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C, without electrical consumers

This parameter indicates the fuel temperature: **- 30°C < PR063 < 90°C**
Default value: **100°C**
In the event of a fault, consult the interpretation of fault **DF098 Fuel temperature sensor circuit**.

Sensor electrical conformity

Check the **continuity** and absence of **interference resistance** of the following connections:
– connection code **3FAB**,
– connection code **3LD**,
between components **120** and **1066**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Measure the **resistance** between connections **3FAB** and **3LD** of component **1066**.
Replace the sensor if the resistance is not approximately:
3820 Ω ± 282 Ω at + 10°C
2050 Ω ± 123 Ω at + 25°C
810 Ω ± 47 Ω at + 50°C

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR064	COOLANT TEMPERATURE

PARAMETER DEFINITION	This parameter indicates the engine coolant temperature in **°C**.

NOTES	**There must be no present or stored faults.** Perform this fault finding procedure: – after finding an inconsistency in the parameter, – after a customer complaint (e.g. lack of power).
	Use the **Vel Satis ph2, Espace IV ph2, Laguna II ph2** wiring diagram Technical Note.

Conformity check with engine stopped and ignition on

With the ignition on the coolant temperature varies according to the exterior temperature.
In the event of a fault, consult the interpretation of fault **DF001 Coolant temperature sensor circuit.**
Parameter **PR058 Air temperature** ≈ **PR064** with the engine cold.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C, without electrical consumers

With the engine running at idle speed the coolant temperature varies according to the engine temperature.
In the event of a fault, refer to the interpretation of **DF001 Coolant temperature sensor circuit**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

PR064 CONTINUED	

Sensor electrical conformity

Check the **continuity** and absence of **interference resistance** of the following connections:
– connection code **3C**,
– connection code **3JK**,
between components **120** and **244**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Measure the **resistance** between connections **3C** and **3JK** of component **244**.
Replace the sensor if the resistance is not:
12460 Ω ± 1128 Ω at - 10°C
2252 Ω ± 112 Ω at + 25°C
811 Ω ± 39 Ω at + 50°C
283 Ω ± 8 Ω at + 80°C
115 Ω ± 3 Ω at + 110°C

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

PR132 CONTINUED	

Sensor electrical conformity

Check the air inlet circuit from the air filter inlet to the inlet manifold, running **test 3 Turbocharged air inlet circuit check**:
– air filter unit inlet not blocked and filter not clogged,
– **visual inspection only, apply test 3** of **ALP2 Starting fault or starting impossible**,
– oil vapour recirculation circuit connection conformity.
– **absence of leaks or blockages** in the **low** and **high pressure** air circuits: pipes, presence and tightness of the mounting clips, mounting of the turbocharger pressure sensor, intercooler, etc.
– check that the damper valve is not jammed closed.

Carry out the necessary repairs.

Check **the electrical conformity of the air flowmeter**:
Check the **+ 5 V feed** to the air flowmeter.
– connection **3KJ** of component **799**.

Check the **+ 12 V after relay feed** to the air flowmeter.
– connection **3FB** of component **799**

Check the **continuity and absence of interference resistance** of the following connections:
– connection code **3DV**,
– connection code **3DW**,
between components **120** and **799**.

With the flowmeter **connected, the vehicle ignition on**, and **engine stopped**:
Check the voltage between connections **3DW** and **3DV** of component **799**.
– Replace the air flowmeter if the voltage is not between **0.3 V** and **0.7 V**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

PR146	INLET AIR FLOW

PARAMETER DEFINITION	This parameter indicates the flow of air entering the engine in **mg/st**.

NOTES	None.

Conformity check with engine stopped and ignition on

This parameter indicates the air flow entering the engine **PR146 = 0 mg/st**
In the event of a fault, consult the interpretation for fault **DF056 Air flow sensor circuit**.

Engine running, engine coolant temperature > 80°C, with no electrical consumers

This parameter indicates the air flow entering the engine.
In the event of a fault, consult the interpretation for fault **DF056 Air flow sensor circuit**.

PR791	DF312 RECORD NO. 8
PR792	DF312 RECORD NO. 9
PR793	DF312 RECORD NO. 10

PARAMETER DEFINITION	These parameters are shown in **Km**.

NOTES	**Special notes:** These parameters must only be interpreted for **DF312 Speed request** if it is present or stored.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C, without electrical consumers

In the event of a fault, consult the interpretation of fault **DF312 Speed request**.

These parameters are used for looking up the history of the last ten particle filter warning light activations

Each parameter from **PR784 to PR793** records the vehicle's mileage upon activation of the particle filter warning light, with which the appearance of **DF312 Speed request** is associated.
Each time the particle filter warning light comes on, the vehicle mileage is stored in the following parameter (PR+1).

When all ten parameters have a value other than zero, and the particle filter warning light illuminates again, the mileage information for **PR784 DF312 record no. 1** is cleared and replaced by the new value.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

PR848	NUMBER OF REGENERATION FAILURES

PARAMETER DEFINITION	This parameter indicates the number of regeneration failures.

NOTES	None.

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C, without electrical consumers

This parameter indicates the number of failed regenerations when driving.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16C36_V04_PR848/EDC16C36_V08_PR848

GETtheMANUALS.org

PR873	OIL OXIDATION SIGNAL

PARAMETER DEFINITION	This parameter indicates the distance of the vehicle when the oil dilution threshold is reached.

NOTES	This parameter should only be interpreted if the **OCS (Oil Control System)** program is activated on the instrument panel. On the instrument panel computer, check the configuration reading **LC106 O.C.S**: **WITH**

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C, without electrical consumers

The oil condition is calculated by the oxidation program in the injection computer, according to the number of engine revolutions.
When this count reaches a certain threshold before the end of the oil service period, the injection computer sends a signal to the instrument panel, which will display **service due**. Parameter **PR873** corresponds to the vehicle mileage at the time this signal is sent.
Then the instrument panel computer deducts **900 miles (1500 km)** before displaying the message **Service required**.

IMPORTANT
When the message **Service due** appears on the instrument panel, the customer must have the oil changed within the remaining **900 miles (1500 km)**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16C36_V04_PR873/EDC16C36_V08_PR873

GETtheMANUALS.org

PR874	LAST SERVICE

PARAMETER DEFINITION	This parameter indicates the vehicle mileage the last time a service was carried out. It is updated when the oil service parameters are reinitialised in the instrument panel.

NOTES	None.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16C36_V04_PR874/EDC16C36_V08_PR874

GETtheMANUALS.org

PR875	OIL DILUTION SIGNAL

PARAMETER DEFINITION	This parameter indicates the vehicle mileage when the oil dilution threshold is reached.

NOTES	This parameter should only be interpreted if the **OCS (Oil Control System)** program is activated on the instrument panel. On the instrument panel computer, check the configuration reading **LC106 O.C.S**: **WITH.**

Conformity check with engine stopped and ignition on, or engine running, and engine coolant temperature > 80°C, without electrical consumers

The injection computer estimates the degree of engine oil dilution according to the customer's driving style.
When the dilution level reaches a certain threshold before the end of the oil change interval, the injection computer sends a signal to the instrument panel which then displays **Service required**. Parameter **PR875** corresponds to the vehicle mileage at the time this signal is sent.

IMPORTANT
When the message **service required** appears on the instrument panel, the customer must carry out an oil service immediately to prevent damage to their engine.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

SC001	WRITE SAVED DATA

NOTES	To use this command, first save the data with the **SC003 Save computer data** command. The writing is carried out after the computer has been reprogrammed or replaced. **Ignition on and engine stopped.**

Validating this command writes the data saved using command **SC003 Save computer data**.

The data is as follows:
– injector codes,
– the egr valve data programming;
– options available on the vehicle and managed by the computer (e.g. air conditioning);
– specific data related to the operation of the particle filter.

This data will configure the computer and will prevent:
– engine malfunction after (re)programming or replacing the computer;
– faulty interpretation of information provided by the **CLIP tool**.

AFTER REPAIR	Repeat the conformity check from the start.

EDC16C36_V04_SC001/EDC16C36_V08_SC001

GETtheMANUALS.org

SC002	ENTER INJECTOR CODES

NOTES	This command is run after replacing the injectors and only if the vehicle is IMA configured (**ET104 Injector code use** is **YES**). If this command is not run, fault **DF276 Injector code programming** will be present. Ignition on and engine stopped.

WARNING
The letters **J and Q**, and figures **0 and 9** are **not used in IMA coding**.
If these characters are used the entry will be **invalid**.
Cylinder no. 1 is the cylinder located at the engine flywheel end.

Procedure to be followed:
– Read the **7-character** alphanumeric codes engraved on the upper section of the injector body.
– Use command **SC002**.
– Select the cylinder number for the cylinder concerned in the **Desired**, column, then confirm.
– Enter the injector code noted for the cylinder.
– Enter the new codes for each cylinder, then confirm.
– When the command is completed, the modified codes appear in the **Current** column.
– Check that the codes correspond to those read earlier.
– If the codes entered appear in neither the **Current** column nor the **Desired** column, check the codes read and make sure that the data has been entered correctly.

The possible confusions are:
– **the figure "1" with the letter "I" and "L"**,
– **the figure "2" with the letter "Z"**,
– **the figure "5" with the letter "S"**,
– **the figure "6" with the letter "G"**,
– **the figure "8" with the letter "B"**.
– Exit fault finding mode.
– Switch off the ignition and wait for the **diagnostic tool** message (maximum time **8 minutes**): **Communication lost with computer: EDC16C36, check the tool connection and computer supply**.
– Switch the ignition back on and check for faults.

AFTER REPAIR	Repeat the conformity check from the start.

EDC16C36_V04_SC002/EDC16C36_V08_SC002

GETtheMANUALS.org

SC002 CONTINUED	ENTER INJECTOR CODES

DF276 Injector code programming should be stored.
If fault **DF276** is still present, the command has not been performed correctly.
Start the procedure again and follow the instructions.
If the codes are still not recognised, check that the computer has correctly entered standby mode, switch off the ignition and wait for **the diagnostic tool** message (maximum time **8 minutes**): **Communication lost with computer: EDC16C36, check the tool connection and computer supply**.
If the warning light is flashing or constantly lit when the ignition is switched off, the computer has not entered standby mode, and the command will be ignored.

If all these checks still do not enable the command to be confirmed, contact the Techline.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

SC003	SAVE COMPUTER DATA

NOTES	This save is performed before reprogramming or replacing the computer. **Ignition on and engine stopped.**

Select in the CLIP tool, scenario **SC003.**
If the following message appears:
"**a saved file exists, do you want to overwrite this data?**":
*(this file corresponds to the last save made on the **diagnostic tool**)*
select **"YES"**.

Confirming this command saves the following vehicle-specific data:
– injector codes,
– the egr valve data programming;
– options available on the vehicle and managed by the computer (e.g. air conditioning);
– specific data related to the operation of the particle filter.

This information will be saved in **the CLIP tool**.

After saving has finished, use the command **SC001 Enter saved data** to be able to set the new computer parameters, after programming and reprogramming.

AFTER REPAIR	Repeat the conformity check from the start.

EDC16C36_V04_SC003/EDC16C36_V08_SC003

GETtheMANUALS.org

SC017	PARTICLE FILTER REGENERATION

NOTES	Only run this command after interpretation of the following faults: – **DF308 Clogged particle filter,** – **DF311 Failed regenerations limit exceeded** – **DF312 Speed request**

WARNING
Always observe the health and safety regulations (see MR 402 (Vel Satis ph2), MR 361 (Espace IV ph2) or MR 395 (Laguna II ph2) Mechanical, 19B Exhaust, Particle filter: Cleaning).

Safety instructions to be followed:
The regeneration causes exhaust fumes and high temperatures.
The vehicle must be outside during regeneration.
If it is not possible to carry out regeneration outside, use an extractor fan that can withstand the very high regeneration temperatures **(400°C at the exhaust outlet)**.

Perform regeneration on a surface free from fire risks (oil, dry leaves, etc.). **Nothing should be left in the vicinity of the exhaust pipe.**

Check that there are no leaks or blockages in the exhaust pipe,
Repair if necessary.

Check the engine oil level before running the command to avoid any engine racing. The oil level should be between the minimum and below the maximum levels.
Before performing particle filter regeneration, always switch off all of the electrical consumers (heating and air conditioning system, de-icing, etc.)

If necessary:
Regeneration can be stopped by briefly pressing the vehicle start button twice (less than **3 seconds**).
Switch off the ignition and wait for the **diagnostic tool** message (maximum time **8 minutes**): **Communication lost with computer: EDC16C36, check the tool connection and computer supply**. before switching on the ignition again.

AFTER REPAIR	Repeat the conformity check from the start.

EDC16C36_V04_SC017/EDC16C36_V08_SC017

GETtheMANUALS.org

SC017 CONTINUED 1	

Procedure to be followed:
To run this command, select the command mode on the **diagnostic tool** and run command **SC017**.

When regeneration is complete, a message will indicate whether regeneration was successful, and what operations need to be carried out **(filter replacement, whether an oil service is required, etc.).**

DESCRIPTION OF THE PROCESS
Particle filter regeneration takes place in 3 stages (values given as a guide only):
– **Heating phase**: the engine speed is fixed or fluctuating around **2000 rpm**.
– This phase lasts at least between **3 and 5 minutes**, until the coolant temperature exceeds **60°C**.
– **Regeneration phase**: the engine speed is fixed or varies around **1750 rpm**. Engine injection is retarded. The exhaust fumes rise in temperature and burn the soot retained in the particle filter. The **particle filter downstream temperature** measurement starts after the **particle filter upstream temperature** measurement due to the volume of the particle filter. Then the combustion of the soot stored in the particle filter causes the **particle filter downstream temperature** to increase, possibly reaching more than **700°C** depending on the amount of soot in the filter (with a **particle filter upstream temperature** of around **600°C**). This phase lasts between **20** and **25 minutes**.
– **Cooling phase**: the engine speed is fixed or fluctuating around **1750 rpm**.
Engine injection returns to normal and the exhaust gases cool the particle filter.
This phase lasts **5 minutes**.

The procedure lasts at least **30 minutes**, and varies depending on the time taken to reach a coolant temperature of **60°C**.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

SC017 CONTINUED 2	

VALIDATING THE REGENERATION PROCESS:

At the end of regeneration, a message appears to announce whether the regeneration was successful or not:

- **Particle filter regeneration successful**: regeneration completed correctly. Change the engine oil if a message on the **CLIP diagnostic tool** requests it.
- **Particle filter too full - replace the particle filter**: regeneration has failed. The weight of soot in the particle filter is so great that it is creating a counter pressure. Deal with any faults that appear or replace the particle filter. After replacing the particle filter, run command **SC036 Reinitialise programming** and select **After particle filter replacement**.
- **Particle filter regeneration failed - run test Temperature upstream of turbine too low**: regeneration has failed because the temperature upstream of the turbine is too low. Run **Test 8 Temperature upstream of turbine too low**.
- In all cases, carry out the following operations:
- switch off the ignition and wait for the **diagnostic tool** message (maximum time **8 minutes**): **Communication lost with computer: EDC16C36, check the tool connection and computer supply**.
- switch on the ignition and establish dialogue with the injection computer,
- run command **SC036 Reinitialise programming**,
- depending on the operation carried out, select **After particle filter regeneration with the diagnostic tool**, or **After particle filter replacement.**
- switch off the ignition and wait for the **diagnostic tool** message (maximum time **8 minutes**): **Communication lost with computer: EDC16C36, check the tool connection and computer supply**.
- clear the **Present or Stored** faults from the computer memory (operation to be carried out within **3 minutes** of the ignition being switched on).

If **DF308 Particle filter clogged** or **DF312 Speed request** is still present, contact Techline.

Note:
Always change the **engine oil** and the **oil filter** in the following cases:

- following an After-Sales regeneration **only** if requested by a message on the **CLIP diagnostic tool**,
- after **replacement** of the particle filter following **DF311 Number of failed regenerations exceeded**,
- after a second regeneration (when two successive regenerations).

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

SC036	REINITIALISE PROGRAMMING

NOTES	This command is used to reset the computer parameters according to the type of operation or component repaired or replaced from the following list: – the injectors – the EGR valve, – the damper valve, – after particle filter replacement, – after particle filter regeneration with the **diagnostic tool**, – after injection computer replacement with no backup option, **Ignition on and engine stopped.**

To perform this command, select scenario **SC036** in the **CLIP too**l.
Procedure to be followed:
– on the main screen, select the component to reinitialise after an operation (component removal/refitting, regeneration or replacement),
– select **YES** then **OK** to begin reinitialisation,
– select **end** on the **configuration completed** screen to return to the main screen,
end of operation.

AFTER REPAIR	Repeat the conformity check from the start.

EDC16C36_V04_SC36/EDC16C36_V08_SC036

GETtheMANUALS.org

RZ005	PROGRAMMING

NOTES	this command enables you to reinitialise the entire computer configuration according to the vehicle. **Ignition on and engine stopped.**

Command **RZ005** reconfigures the computer.
If the computer does not have any configuration data, use command **RZ005** to enter the vehicle options:
– air conditioning,
– thermoplungers,
– cruise control/speed limiter.

These options are detected by the computer even if command **RZ005** is not used.

the computer is configured as soon as the one of the vehicle's optional system components is operated.

AFTER REPAIR	Repeat the conformity check from the start.

EDC16C36_V04_RZ005/EDC16C36_V08_RZ005

GETtheMANUALS.org

RZ034	COMPUTER MEMORY

NOTES	**IMPORTANT** Only use this command if **DF107 Computer Memory** is **Present.** **Ignition on and engine stopped.**

Command **RZ034** is used to reconfigure the computer.
With the ignition on:
– Use command **RZ034**.
– Switch off the ignition and wait for the message Communication lost with computer.
– Switch on the ignition again.
– Configure the injector codes using command **SC002 Enter injector codes**.
– Run the programming commands (see **Configuration and programming**).
– Switch off the ignition and wait for the message **Communication lost with computer**.

Perform a road test to reinitialise the vehicle parameters.

AFTER REPAIR	Repeat the conformity check from the start.

EDC16C36_V04_RZ034/EDC16C36_V08_RZ034

GETtheMANUALS.org

AC004	TURBOCHARGING SOLENOID VALVE

NOTES	Perform this fault finding procedure: – following interpretation of an unresolved fault or – after dealing with the interpretation of **PR041 Turbocharging pressure** or – after a customer complaint (loss of power, smoke etc.). **Ignition on and engine stopped.** Use the **Vel Satis ph2, Espace IV ph2, Laguna II ph2** Wiring Diagram Technical Note.

1. The following procedure is for checking that the turbocharger and its control circuit are working properly.
Check the sealing of the high pressure air circuit: run **Test 2 Low pressure circuit check.**
Pipe not joined or pierced, pressure sensor disconnected or poorly fitted (seal present), exchanger pierced.
To test the exchanger, stabilise the engine speed between **3500 and 4000 rpm** with the vehicle stopped and check there are no leaks.

Measure **the resistance** of the turbocharging pressure solenoid valve between the following connections**:**
– Connection code **3MG**,
– Connection code **3FB**,
of component **1475**.
Replace the solenoid valve if its resistance is not **15.4 Ω ± 0.7 Ω at + 20°C.**

Check the **continuity, insulation, and the absence of interference resistance** on the following connections:
– Connection code **3MG** between components **1475 and 120**.
– Connection code **3FB** between components **1475 and 983**
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Run command **AC004 Turbocharging solenoid valve**. If a faint whistling noise is heard along with a clicking from the solenoid valve, go to **stage 2**, otherwise check the operation of the computer output stage:
Vehicle under + after ignition feed, clear the faults displayed by the diagnostic tool.

With the voltmeter in the direct current position:
With the turbocharging solenoid valve connected, connect the voltmeter earth lead to **connection 3MG of component 1475** and the positive lead to connection **3FB**.
Run command **AC004 Turbocharging solenoid valve**, the voltmeter should display four successive readings of **2.4 V ± 0.2 V**.
If the measurement is not correct, contact the Techline.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC004 CONTINUED	

2. Turbocharger control circuit check:

– With the engine stopped, make sure that the control rod is in the resting position.
– Start the engine and make sure that the control rod actuates to the upper stop.
(when the engine is switched off, the control rod should return to the rest position)
If the control rod does not move correctly, carry out the following checks:

1) Control vacuum check:
– Disconnect the solenoid valve inlet **hose** and connect it to a pressure gauge.
– Start the engine and run it at a stable idle speed.
– If the vacuum pressure does not reach **400 mbar ± 150**: check the vacuum circuit from the vacuum pump.
– Stop the engine, reconnect the intake hose and go to **step no. 2**.

2) Solenoid valve control check:
– Disconnect the solenoid valve outlet **hose**.
– Start the engine and run it at a stable idle speed.
– Place your hand on the solenoid valve and block the outlet **union** with your thumb.
– If there is no perceptible vibration of the solenoid valve, contact the Techline.

3) Solenoid valve operation check:
– Connect the pressure gauge to the solenoid valve outlet **union**.
– Start the engine and run it at a stable idle speed.
– If the vacuum does not reach **400 mbar ± 150**, replace the solenoid valve.

↓

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC011	RAIL PRESSURE REGULATOR

NOTES	Perform this fault finding procedure: – following interpretation of an unresolved fault – following an inconsistency recorded in the parameters, – following a customer complaint (starting problems, engine speed instability, injection noise). **Ignition on and engine stopped.** Use the **Vel Satis ph2, Espace IV ph2, Laguna II ph2** wiring diagram Technical Note.

Step 1
Check **the continuity and absence of interference resistance** on the following connections:
– Connection code **3HI** between components **1105 and 120**.
– Connection code **3FB** between components **1105 and 983**

Run command **AC011 Rail pressure regulator**. If a slight whistling and clicking can be heard from the pressure regulator, go to **stage 2**, otherwise check the operation of the computer output stage:

Vehicle under + after ignition feed, clear the faults displayed by the diagnostic tool.

With the voltmeter in the direct current position:
With the pressure regulator connected, connect the voltmeter earth lead to **connection 3HI of component 1105** and the positive lead to **connection 3FB**.
Run command **AC011 Rail pressure regulator**, the voltmeter should display four successive voltage readings of **2.2 V ± 0.2 V**.

If the measurement is not correct, contact the Techline.

STEP 2

AFTER REPAIR	Repeat the conformity check from the start.

EDC16C36_V04_AC011/EDC16C36_V08_AC011

GETtheMANUALS.org

AC011 CONTINUED	

Step 2

In the event of rail overpressure:
Check that there are no air bubbles in the diesel fuel low pressure circuit.
Check that the rail pressure sensor is operating correctly.
Consult the interpretation of parameter **PR038 Rail pressure**.
If these checks reveal no irregularities, replace the regulator.

in the event of rail underpressure:
Check that the rail pressure sensor is operating correctly.
Consult the interpretation of parameter **PR038 Rail pressure**.
Check the low pressure diesel circuit priming.
Check the conformity of the diesel filter connections.
Check the condition of the filter (clogging and water saturation).
Check that there are no air bubbles between the filter and the high pressure pump.
Check the sealing of the low pressure and high pressure diesel fuel circuits: apply **ALP5 External leaks on the fuel circuit** (visual inspections, touch tests, etc.) on:
pump casing, overpressure valve (run **Test 10 Incorrect operation of the overpressure valve**), pipes, rail and injector unions, injector wells, etc.
Check the conformity of the seal fitting on the pressure regulator.
Check the operation of the injectors, run **Test 7 Poor injector operation**.

Carry out the necessary repairs.

If the engine starts:
Clear any faults.
Check the pressure regulator (**see ALP6 Rough idle**).
With the engine warm, leave it to idle for a few minutes (**3 to 5 minutes**):
– If it stalls and the fault reappears, replace the regulator.
– If it does not stall, stabilise the engine speed at **2000 rpm** (**1 minute**) then accelerate under full load until it cuts out.
If the engine stalls, contact the Techline.

If the engine does not startor there is no timing:
first, replace the regulator and if the fault is still present, contact the Techline.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC012	DAMPER VALVE

NOTES	Carry out this interpretation: – after **DF226 Damper valve circuit** – or after a customer complaint (starting faults, poor performance). **Ignition on and engine stopped.** Use the **Vel Satis ph2, Espace IV ph2, Laguna II ph2** Wiring Diagram Technical Note.

Check **the continuity, insulation and absence of interference resistance** on the following connections:
– Connection code **3VN**,
– Connection code **3VM**,
between components **1461 and 120**.

Check for **+ 12 V** on connection **3FB** of component **1461**.
Check for **earth** on connection **NT** of component **1461**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

With the vehicle ignition on, and the engine stopped:
Check that the **damper valve** is **open**.
If not, clean or replace the damper valve.
Actuate the valve using command **AC012** and check the damper valve travel and the rest position of the valve.

Check the operation of the computer output stage with a voltmeter:
Actuate the valve with command **AC012**:
Positive lead to connection **3FB** and negative lead to connection **3VN** of component **1461**.
The voltmeter should display **three cycles** of ON-OFF (**12.5 V** then return to **0 V**).

If the measurement is correct, replace the damper valve.
If the measurement does not show any operation, contact the Techline.

AFTER REPAIR	Repeat the conformity check from the start.

EDC16C36_V04_AC012/EDC16C36_V03_AC012

GETtheMANUALS.org

AC031	THERMOPLUNGER NO. 3 RELAY

NOTES	Check that the computer is correctly configured using command **LC056 heating elements**. **There must be no present or stored faults:** Perform this fault finding procedure if there is a fault with the passenger compartment heating - demisting. **Ignition on and engine stopped.** Use the **Vel Satis ph2**, **Laguna II ph2** Wiring Diagram Technical Note.

If the thermoplunger no. 3 relay does not operate during command **AC031**
Check the connections of the **Thermoplunger no. 3 relay** mounting.
check the engine management computer connections.
If there is a repair procedure (see **Technical Note 6015A**, **Repairing electrical wiring**, **Wiring**: **Precautions for repair**) repair the wiring, otherwise replace it.

Check for **+ 12 V after relay feed** on the thermoplunger no. 3 relay mounting.
– Connection code **3FB** of component **1069**.
Check the continuity and insulation of the following connection:
– Connection code **3JAB** between components **1069** and **120**.
If any connections are faulty and if there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair**, **Wiring**: **Precautions for repair**), repair the wiring, otherwise replace it.

if the fault is still present, check as follows that this relay is controlled by the engine management computer:
Disconnect the thermoplunger no. 3 relay, and fit a 50 **to 100** Ω resistor on its mounting instead of the coil and connect a voltmeter as follows:
– positive terminal to **+ 12 V** battery,
– negative terminal to connection **3JAB** of component **1069**.
Run command **AC031**.
If the voltmeter shows the battery voltage (4 ON/OFF cycles of **10 seconds**), replace the thermoplunger no. 3 relay.
If the voltmeter does not show the battery voltage (4 ON-OFF cycles of **10 seconds**), contact the Techline.
If the thermoplunger no. 3 relay operates with command **AC031**, but there is still a passenger compartment heating/demisting fault, check the following using the wiring diagram:
The conformity of the thermoplungers maxi-fuse.
The presence of **+ 12 V battery** feed on connection **BP9** of component **1069**.
The conformity of the thermoplunger no. 3 relay.
Check the continuity and insulation of the following connection:
– Connection code **3JAC** between components **1069 or 1550 and 120**.
The conformity of the thermoplunger resistor (**608 m Ω ± 61 m Ω**)
the presence of earth at the water chamber (heating element mounting).
Also check the level of the cooling circuit and that there are no leaks.
Carry out the necessary repairs.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC037	PREHEATING RELAY

NOTES	This command is only run if fault **DF025 Preheating unit diagnostic connection** or **DF017 Preheating unit control circuit** is present or stored and if there is no present fault. Consult the Wiring Diagram Technical Note **Espace IV ph2**, **Laguna II ph2**, **Vel Satis ph2** to locate the fuses and relays concerned. **Ignition on and engine stopped.**

Before applying the following fault finding procedure, check that the battery voltage is not below 12 V. Otherwise, recharge the battery.
Check the connections on the preheating unit, heater plugs and injection computer.
If there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
Measure **the resistance** of the heater plugs. If this resistance is **> 2** Ω, replace the defective plug(s).

Check **the continuity and the absence of interference resistance** of the following connections:
– Connection code **37AA** between components **257 and 681**.
– Connection code **37AB** between components **257 and 682**.
– Connection code **37AC** between components **257 and 683**.
– Connection code **37Z** between components **257 and 680**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Check the **condition** of supply fuse **FM12 (70 A)** of the preheating unit on component **597**. Replace it if necessary.

Then check for **+12 V** on connection **BP35** of component **257**.
Check **the continuity, insulation, and the absence of interference resistance** of the following connections:
– Connection code **3FF**,
– Connection code **3FY**,
between components **257 and 120**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If the fault is still present, replace the pre-postheating unit.

AFTER REPAIR	Repeat the conformity check from the start.

EDC16C36_V04_AC037/EDC16C36_V08_AC037

GETtheMANUALS.org

AC038	LOW-SPEED FAN ASSEMBLY RELAY

NOTES	**There must be no present or stored faults.** Perform this fault finding after an engine cooling fault or air conditioning fault. Consult the Wiring Diagrams Technical Note **Vel Satis ph2**, **Espace IV ph2**, **Laguna II ph2** to locate the fuses and relays concerned. **Ignition on and engine stopped.**

If the **low speed fan assembly relay** does not operate when command **AC038** is run:
Check the **low-speed fan assembly** relay mounting and the connections of the engine management computer.
Check the fan assembly connections.
If there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If the fault is still present, check that the relay is actuated by the engine management computer as follows:
Disconnect the **low-speed fan assembly** relay, and fit a **50** to **100** Ω resistor on the relay mounting in place of the coil, and connect a voltmeter as follows:
– positive terminal to **+ 12 V** battery,
– negative terminal to connection **3JN** of component **336** or **1829**.
Run command **AC038**.
If the voltmeter shows the battery voltage (4 ON-OFF cycles of **10 seconds**), replace the relay.

If the **low speed fan assembly** relay is supplied using command **AC038**, but there is still a fan assembly activation fault, check using the wiring diagram.
The conformity of the fan assembly maxi-fuse **FM15**.

AFTER REPAIR	Repeat the conformity check from the start.

EDC16C36_V04_AC038/EDC16C36_V04_AC038

GETtheMANUALS.org

AC038 CONTINUED	

– Check for **+12 V** on connection **49B** of component **262** and on connection **BP71** of component **188**.
– Check for earth on connection **MAS** of component **262**.

If the tests are ok, replace the defective fan.
If not, carry out the following operations:
Check the **continuity**, **insulation and the absence of interference resistance** on the following connections:
– Connection code **49B** between components **262 and 335**, **336** or between components **262**, **1827 and 1829**.
– Connection code **MAS** between components **262 and MAS**.
– Connection code **49A** between components **188 and 337** or between components **188**, **1828 and 1829**.
– Connection code **BP71** or **BP72** between components **188**, **597 and 1827** or between components **188**, **597 and 335**.
– Connection code **49T**between components **336 and 337** or between components **1829 and 1831**.
– Connection code **3FB (Laguna II ph2)**.
– Connection code **3JN**
between components **336 or 1829 and 120**.
If any connections are faulty and if there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair**, **Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Check the conformity of the fan assembly.
Carry out the necessary repairs.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC039	HIGH-SPEED FAN ASSEMBLY RELAY

NOTES	**There must be no present or stored faults:** Perform this fault finding after an engine cooling fault. Consult the Wiring Diagrams Technical Note **Vel Satis ph2**, **Espace IV ph2**, **Laguna II ph2** to locate the fuses and relays concerned. **Ignition on and engine stopped.**

If, when running command **AC039**, the **high-speed fan assembly relay** is not activated:
Check the **high-speed fan assembly** relay mounting and the connections of the engine management computer.
Check the fan assembly connections.
Repair if necessary.

If the fault is still present, check that the relay is actuated by the engine management computer as follows:
Disconnect **high-speed fan assembly** relay **335** and fit a **50 to 100** Ω resistor on its mounting in place of the coil and connect a voltmeter as follows:
– positive terminal to **+ 12 V** battery,
– negative terminal to **connection 3JP** of component **335**.

Run command **AC039**.
If the voltmeter shows the battery voltage (4 ON-OFF cycles of **10 seconds**), replace the relay.

Disconnect **high-speed fan assembly** relay **337** and fit a **50 to 100** Ω resistor on its mounting in place of the coil and connect a voltmeter as follows:
– positive terminal to **+ 12 V** battery,
– negative terminal to **connection 3JP of component 337**.

Run command **AC039**.
If the voltmeter shows the battery voltage (4 ON-OFF cycles of **10 seconds**), replace the relay.

If the **high-speed fan assembly** relays are being powered via command **AC039 High-speed fan assembly relay**, but there is still a fan assembly activation problem, check the following using the wiring diagram:
The conformity of the fan assembly **FM15** maxi-fuse.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC039 CONTINUED	

– Check for **+12 V** on connection **BP71** of component **188** and on connection **49B** of component **262**.
– Check for **earth** on connection **49A** of component **188** and on connection **MAS** of component **262**.

If the tests are ok, replace the defective fan.

If not, carry out the following operations:
Check the **continuity**, **insulation and the absence of interference resistance** on the following connections:
– Connection code **49B** between components **262 and 335**, **336 or between components 262**, **1827 and 1829**.
– Connection code **MAS** between components **262 and MAS**.
– Connection code **49A** between components **188 and 337** or between components **188, 1828 and 1829**.
– Connection code **BP71** or **BP72** between components **188, 597 and 1827** or between components **188, 597 and 335**.
– Connection code **3FB**,
– Connection code **3JP**,
between components **335 or 1831 and 120**.
– Connection code **MAS** between components **337 and MAS**.
– Connection code **3FB**,
– Connection code **3JP**,
between components **337 and 120**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC063	THERMOPLUNGER NO. 1 RELAY

NOTES	Check that the computer is correctly configured using command **LC056 Thermoplungers** **There must be no present or stored faults:** Perform this fault finding procedure if there is a fault with the passenger compartment heating - demisting. **Ignition on and engine stopped.** Use the **Laguna II ph2**, **Vel Satis ph2** wiring diagram Technical Note.

If the thermoplunger no. 1 relay does not operate during command **AC063.**
Check the thermoplunger no.1 relay mounting.
check the engine management computer connections.
If there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Check for **+ 12 V** after relay on connection **3FB** of component **1067**.
If there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

if the fault is still present, check as follows that this relay is controlled by the engine management computer:
Disconnect the thermoplunger no. 1 relay, and fit a **50** to **100** Ω resistor on the mounting instead of the coil and connect a voltmeter as follows:
– positive terminal to **+ 12 V** battery,
– negative terminal to connection **3JA** of component **1067**.
Run command **AC063**.
If the voltmeter shows the battery voltage (4 ON-OFF cycles of **10 seconds**), replace the thermoplunger no. 1 relay.

If the voltmeter does not show the battery voltage (4 ON-OFF cycles of **10 seconds**):
Check the continuity and insulation of the following connection:
– Connection code **3JA** between components **1067 and 120**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
If the fault is still present, contact the Techline.

AFTER REPAIR	Repeat the conformity check from the start.

EDC16C36_V04_AC063/EDC16C36_V08_AC063

GETtheMANUALS.org

AC063 CONTINUED	

If "thermoplunger no. 1 relay" operates when command AC063 is run, but there is still a fault with the passenger compartment heating – demisting, check the following using the wiring diagram:
The conformity of the thermoplungers maxi-fuse.
The presence of **+ 12 V battery** feed on connection **BP9** of component **1067**.
The conformity of the thermoplunger no. 1 relay.
The **continuity and insulation of** the following connection:
– Connection code **3JB** between components **1067 and 898**.

The conformity of the thermoplunger* resistor
the presence of earth at the water chamber (heating element mounting).
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
Also check the level of the cooling circuit and that there are no leaks.
Carry out the necessary repairs.

*supplier: ***Champion***: load resistance: **608 mΩ ± 61**

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC064	THERMOPLUNGER NO. 2 RELAY

NOTES	Check that the computer is correctly configured using command **LC056 Thermoplungers** **There must be no present or stored faults:** Perform this fault finding procedure if there is a fault with the passenger compartment heating - demisting. **Ignition on and engine stopped.**
	Special notes: The thermoplunger no. 2 relay **supplies** thermoplungers 2 and 3 in parallel. Use the **Laguna II ph2**, **Vel Satis ph2** wiring diagram Technical Note.

If the thermoplunger no. 2 relay does not operate during command **AC064**.
Check the connections of the **thermoplunger no. 2 relay** mounting.
check the engine management computer connections.
If there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

Check for + **12 V** after relay feed on connection **3FB** of component **1068**.
If there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
if the fault is still present, check as follows that this relay is controlled by the engine management computer:
Disconnect the thermoplunger no. 2 relay, and fit a **50** to **100** Ω resistor on the mounting instead of the coil and connect a voltmeter as follows:
– positive terminal to **+ 12 V** battery,
– negative terminal to connection **3JAA** of component **1068**.

Run command **AC064**.
If the voltmeter shows the battery voltage (4 ON-OFF cycles of **10 seconds**), replace the thermoplunger no. 2 relay.
If the voltmeter does not show the battery voltage (4 ON-OFF cycles of **10 seconds**):
Check the **continuity and insulation** of the following connection:
– Connection code **3JAA** between components **1068 and 120**.
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
If the fault is still present, contact the Techline.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC064 CONTINUED	

If the thermoplunger no. 2 relay operates with command AC064, but there is still a passenger compartment heating/demisting fault. Check using the wiring diagram:
The conformity of the thermoplungers maxi-fuse.
The presence of **+ 12 V** battery feed on connection BP91 of component **1068**.
The conformity of the thermoplunger no. 2 relay.
The **continuity and insulation of** the following connection:
– Connection code **3JAD** between components **1068 and 1072/1073**.

The conformity of the thermoplunger* resistors
the presence of earth at the water chamber (heating element mounting).
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.
Also check the level of the cooling circuit and that there are no leaks.
Carry out the necessary repairs.

*supplier: ***Champion***: load resistance: **608 mΩ ± 61**

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC103	EGR BY-PASS

NOTES	Carry out this fault finding procedure when the interpretation of fault **DF304 EGR bypass circuit** has not been resolved. **Ignition on and engine stopped.** Use the **Vel Satis ph2**, **Espace IV ph2**, **Laguna II ph2** Wiring Diagram Technical Note.

Measure **the resistance** of the EGR bypass solenoid valve between the following connections**:**
– Connection code **3TP,**
– Connection code **3FB,**
of component **1301.**
43 Ω to 49 Ω at + 25°C.
32 Ω to 37 Ω at - 40°C

If the resistance is not correct, replace the EGR by-pass solenoid valve.

Check **the continuity, insulation and absence of interference resistance** on the following connections:
– Connection code **3TP** between components **1301 and 120**.
– Connection code **3FB** between components **1301 and 983.**
If the connection or connections are faulty and there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace it.

If you notice no valve movement when running command **AC103**, ensure that the computer output stage is functioning:

Vehicle under + after ignition feed, clear the faults displayed by the diagnostic tool.

With the voltmeter in the direct current position:
With the EGR BY-PASS solenoid valve connected, connect the voltmeter earth lead to connection **3TP** of component **1301** and the positive lead to connection **3FB**.
Run command **AC103**, the voltmeter should display four successive readings which are approximately equal to the **12 V** battery voltage.

If the voltmeter indicates no control or a continuous voltage, contact the Techline.
If activation has run correctly, check the control vacuum:
– Disconnect the solenoid valve inlet **hose** and connect it to a pressure gauge.
– Start the engine and run it at a stable idle speed.
– If the vacuum pressure does not reach **800 mbar ± 100**: check the vacuum circuit from the vacuum pump.
Repair if necessary.

AFTER REPAIR	Repeat the conformity check from the start.

EDC16C36_V04_AC103/EDC16C36_V08_AC103

GETtheMANUALS.org

NOTES	Only check the customer complaint after performing a **complete check** with the **diagnostic tool.**

No dialogue with engine management computer	**ALP1**
Starting difficult or impossible	**ALP2**
Poor performance	**ALP3**
Irregular engine operation	**ALP4**
External leaks from the fuel circuit	**ALP5**
Rough idle	**ALP6**
Particle filter warning light comes on too often	**ALP7**

GETtheMANUALS.org

ALP1	No dialogue with engine management computer

STEP 1
Check the conformity of the vehicle type and the domain selected on the tool.
Check that the **diagnostic tool** is not faulty by attempting to establish dialogue with a computer on another vehicle.
Check the supply to the diagnostic socket:
– + Before ignition.
– + After ignition.
– Earth.

Check (according to wiring diagram and equipment):
– The conformity of the after ignition fuse.
– The conformity of the injection relay mounting.

the conformity of the injection relay: **65** Ω ± **5** Ω between the following connections**:**
– Connection code **BP37**,
– Connection code **3AA**,
of component **983**.

Infinite resistance between the following connections (open contact):
– Connection code **BP37**,
– Connection code **3FB**,
of component **983**.

resistance < **0.2** Ω between the following connections (contact closed):
– Connection code **BP37**,
– Connection code **3FB**,
of component **983**.

Disconnect the engine management computer and check that there are no conducting parts on the computer studs. If this reveals any kind of impurity, rectify it and try to establish dialogue.
If the fault is still present, place the bornier **Elé. 1681** on the engine harness:
Check **for continuity and absence of interference resistance** on the following multiplex connections:
– Connection code **133B**,
– Connection code **133C**,
between components **120 and 225**.

Check for **+ 12 V** on the following connections:
– **3FB** and **AP29** of component **120**

Check for **earth** on the following connections:
– **NT** of component **120.**

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16C36_V04_ALP01/EDC16C36_V08_ALP01

GETtheMANUALS.org

ALP1 CONTINUED	

If there is no + **12 V**, carry out the following operations:
Shunt the **normally open** contact of the central injection unit supply relay, i.e. connections **BP37 and 3FB** of component **983**.
Check for + **12 V** on connections **3FB and AP29** of component **120**.

Check the continuity of the following connection:
Connection code **3AA** between components **120** and **983**

Try to establish dialogue with another computer on the same vehicle.
If dialogue is established with **another computer on the same vehicle,** go to **step 2**.
If dialogue cannot be established with **any other computer on the same vehicle** (**see 88B**, **Multiplexing**, **ALP**).

STEP 2
Contact the Techline.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ALP2	Starting difficult (or impossible)

NOTES	**Before analysing this customer complaint, check that there are no faults, and the conformity (or otherwise) of the parameters and statuses, using the diagnostic tool.** **If the customer complaint is not eliminated, perform the following checks.** Use the **Vel Satis ph2**, **Espace IV ph2**, **Laguna II ph2** Wiring Diagram Technical Note.

Is it difficult or impossible to start the engine?

impossible → **PART B**

difficult ↓

PART A:

Check the engine earths.
If the engine speed is less than **200 rpm**, consult **Technical Note 6014A**, **Checking the charging circuit**, and **Technical Note 3632A**, **Starter fault finding**, **Starter**
If an engine speed of **200 rpm** is achieved with starter motor in operation, **PR055 Engine speed**.

If the engine speed shown on CLIP is zero and the engine is running, check the **resistance** of the engine speed sensor between the following connections:
– Connection code **3BG**,
– Connection code **3BL**,
of component **149**.
Replace the sensor if its resistance is not between **175 Ω and 295 Ω at 23°C**.

Check **the continuity and insulation** of the following connections:
– Connection code **3BG**,
– Connection code **3BL**,
between components **120 and 149**.

Check the conformity of the engine earths (oxidation, tightness, etc.).
Check the mounting and condition (overheating) of the sensor.
Replace if necessary.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16C36_V04_ALP02/EDC16C36_V08_ALP02

GETtheMANUALS.org

ALP2 CONTINUED 1	

Check the synchronisation of the camshaft sensors and the engine speed sensors by displaying **ET238 Synchronisation**. If synchronisation is not active, refer to the checks described in **DF195 Engine speed/ camshaft sensor consistency**.

Check the fuel circuit sealing: run **Test 2 Low pressure circuit check**.
If **Test 2 Low pressure circuit check** is correct,
apply **part A** of **test 12 High pressure fuel circuit test**.

Check that the heater plugs are actuated using the **AC037 Preheating relay** command.
Check the sealing and condition of the inlet circuit, run **Test 3 Turbocharged air inlet circuit check** and follow the procedure.

Check that the exhaust is not blocked, run **Test 1 Exhaust system check** and follow the procedure.

Check the consistency of the signal from the engine coolant temperature sensor.

Check the operation of the rail pressure regulator (DRV) using command **AC011 Rail pressure regulator**.

Check the timing setting.

Check engine compression.

Apply **part B** of **Test 12 High pressure fuel circuit test**.
End of part A

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ALP2 CONTINUED 2	

PART B

Is there diesel fuel in the fuel tank?

NO → Fill the tank with diesel fuel. Bleed the low and high pressure diesel circuit.

YES

Does the starter motor work properly? (Check that an engine speed **> ~ 200 rpm** is obtained under starter, **PR055 Engine speed**)

NO → Refer to **Technical Note 6014A, Checking the charging circuit, 16A, Starter fault finding, Starter**

YES

Using **the diagnostic tool**, check the conformity of the immobiliser: **ET003 Immobiliser** must be **INACTIVE**.

ET003 not correct or immobiliser warning light permanently illuminated → Consult the fault finding procedure for the immobiliser.

ET003 correct (immobiliser code warning light off) → Continue the fault finding procedure with **Part A** of this fault finding chart.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ALP3	Poor performance

NOTES	**Before analysing this customer complaint, check that there are no faults, and the conformity (or otherwise) of the parameters and statuses, using the diagnostic tool.** **If the customer complaint is not eliminated, perform the following checks.**

IMPORTANT
In the case of engine overheating to above **118°C**, the computer deliberately limits the fuel flow (overheating warning light lights up from **115°C**).
– Please observe the cleanliness guidelines and safety advice.

Is the engine running on all cylinders? — YES → (A)

NO ↓

Check the operation of the injectors, run **Test 7 Poor injector operation**.
Check the conformity of the fuel used, apply **Test 9 Diesel fuel conformity check**.

– Check that the injectors are correctly fitted (presence and **conformity of the sealing washer**).
– Checking procedure:
– Take a straight edge approximately **40 cm** long, and place it on the **4** injectors. The straightedge should rest on the **4** injectors.
– If **1** injector protrudes, remove the injector and check that the washer is correct.
– If one injector does not touch the straightedge (clearance of more than **1 mm**), remove the injector and check for the presence of the washer.
– Clean the injector well and the injector, refit the injector with its correct sealing washer.

– Check the sealing and condition of the inlet circuit, run **Test 3 Turbocharged air inlet circuit check**.
– Check the condition of the air flowmeter, run **Test 4 Air flowmeter**.
– Check the turbocharger: run **Test 5 Variable geometry turbocharger control** then **Test 6 Turbocharger rotating part**.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

EDC16C36_V04_ALP03/EDC16C36_V08_ALP03

GETtheMANUALS.org

ALP3 CONTINUED	

A

Check the correct location and connection of the differential pressure sensor (see **MR 402 (Vel Satis ph2), MR 361 (Espace IV ph2) or MR 395 (Laguna II ph2) Mechanical, 19B Exhaust, Particle filter pressure sensor: Removal - Refitting.**

Carry out the check conformity for the accelerator pedal sensor, for the brake pedal sensor, for the atmospheric pressure sensor, for the exhaust gas recirculation valve and for the damper valve.
– Check the consistency of the signal for the air flowmeter, the engine coolant temperature sensor, the fuel temperature sensor and the engine speed.
Check the connections, the continuity and the absence of interference resistance of the air flowmeter (apply **DF056 Air flow sensor circuit**), the engine coolant temperature sensor (apply **DF001 Coolant temperature circuit**), the fuel temperature sensor (apply **DF098 Fuel temperature sensor circuit**) and the engine speed (apply **DF195 Engine speed/camshaft sensor consistency**).

Check:
– That the diesel filter is not clogged.
– That there are no leaks on the high and low pressure diesel circuits, run **test 2 Low pressure circuit check**.
– The connection of the oil vapour rebreathing circuit.
– The rail pressure regulator (MPROP) (jammed - stuck); apply the interpretation of command **AC011 Rail pressure regulator**.

– Check the engine timing (and the position of the high pressure pump sprocket).
(See the procedure in the **Workshop Repair Manual** if necessary)
– Check the engine compressions**.**

If the fault is still present, contact the techline.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ALP4	Irregular engine operation

NOTES	**Before analysing this customer complaint, check that there are no faults, and the conformity (or otherwise) of the parameters and statuses, using the diagnostic tool.** **If the customer complaint is not eliminated, perform the following checks.** Use the **Vel Satis ph2**, **Espace IV ph2**, **Laguna II ph2** Wiring Diagram Technical Note.

If the engine races during gear changes, if there is a floor carpet, check that this is not blocking the accelerator pedal, the brake pedal and the clutch pedal, then check the conformity of the clutch switch and the conformity of the accelerator pedal sensor when the pedal is released.

Measure **the resistance** of the engine speed sensor between the following connections:
– Connection code **3BG**,
– Connection code **3BL**,
of component **149**.
Replace the sensor if the resistance is not: **175 Ω to 295 Ω at +23°C**

Check the **continuity** of the following connections:
– Connection code **3BG**,
– Connection code **3BL**,
between components **120 and 149**.

Check the conformity of the engine earths (oxidation, tightness, etc.).
Check the mounting and condition (overheating) of the sensor.
Replace if necessary.

Check the low pressure circuit: run **Test 2 Low pressure circuit check**.
– Apply the air flow checking procedure, (see "conformity check").

– Check the turbocharger: run **Test 5 Variable geometry turbocharger control** then **Test 6 Turbocharger rotating part**

If the customer complaint is still present, contact Techline.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

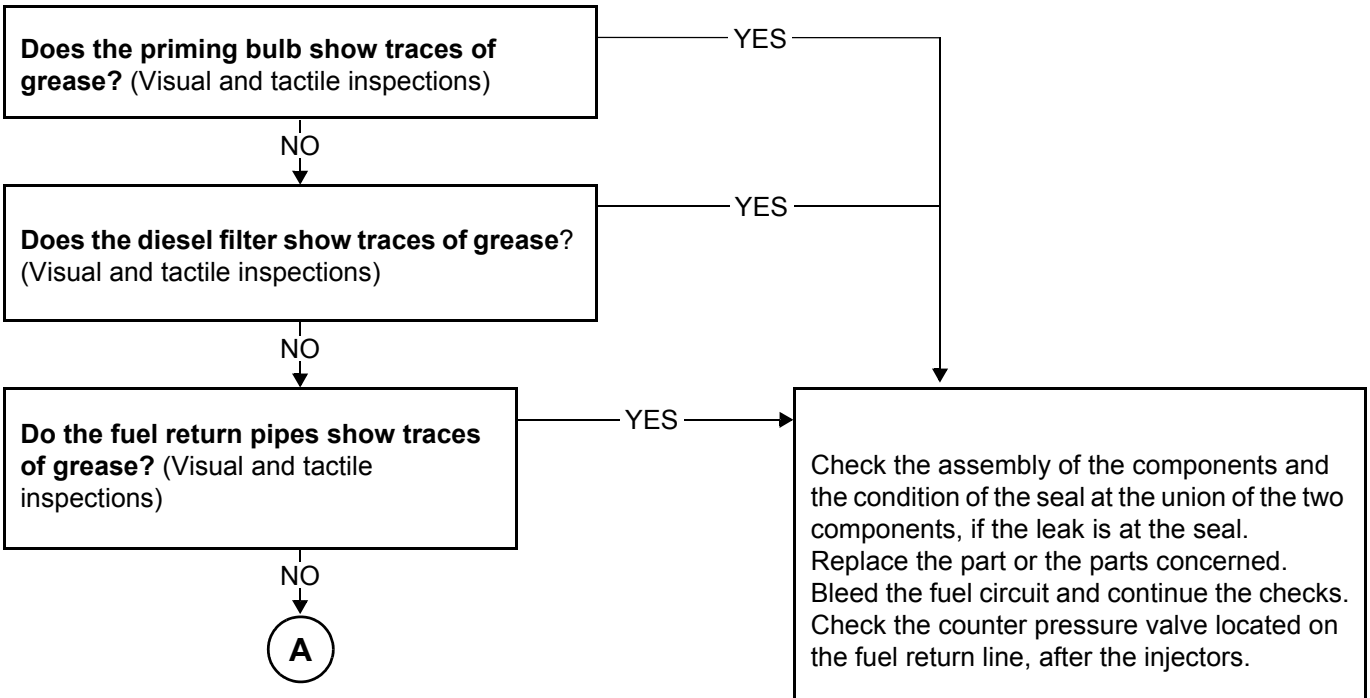
EDC16C36_V04_ALP04/EDC16C36_V08_ALP04

GETtheMANUALS.org

ALP5	External leaks from the fuel circuit

NOTES	**Before analysing this customer complaint, check that there are no faults, and the conformity (or otherwise) of the parameters and statuses, using the diagnostic tool.** **If the customer complaint is not eliminated, perform the following checks.** **IMPORTANT** **Please observe the cleanliness guidelines and safety advice.**

Procedure for checking for an external leak on the fuel circuit:
Clean away traces of grease with clean thinner and wipe the part or parts concerned with cleaning cloths.
Start the engine and increase the engine temperature until the diesel fuel reaches **40/50°C**.
Stop the engine and check for traces of grease on the part or parts concerned.
If this is the case, replace the part or parts concerned.
Bleed the fuel circuit and continue the checks.



AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

Does the high pressure pump show traces of grease? (Visual and tactile inspections)

YES

NO

Do the high pressure pipes and the injector rail show traces of grease?
(Visual and tactile inspections)

YES

NO

Do the injectors show traces of grease?
(Visual and tactile inspections)

YES

NO

End of fault finding.

Location of the leak: Where does the leak appear?

On the component

– If the leak is on the component, replace this and the high pressure pipe(s) at the same time as the component.

on theunion/ join

– If the leak is on the join of a high pressure pipe and the component, remove the high pressure pipe and perform a visual inspection of the unions: if you find damaged unions, change the faulty component and the high pressure pipe(s) removed at the same time as the component.

– For safety reasons, high pressure pipes must not be refitted.

Reminder:
Only replace the rail, pump or injector if there is damage to the union and this damage is visible during checks. Bleed the fuel circuit and continue the checks.

AFTER REPAIR	Carry out a road test, then check with the **diagnostic tool**.

GETtheMANUALS.org

ALP6	Rough idle

NOTES	**Before analysing this customer complaint, check that there are no faults, and the conformity (or otherwise) of the parameters and statuses, using the diagnostic tool.** **If the customer complaint is not eliminated, perform the following checks.**

– Check the sealing and condition of the inlet circuit by running **Test 3 Turbocharged air inlet circuit check**.
– Check the low pressure circuit by running **Test 2 Low pressure circuit check**.

↓

check the engine parameters:
– Check the update of the engine management computer calibration (last calibration).
– Check the conformity of the**IMA** codes (using the **Identification** screen on the **Clip diagnostic tool**).
– Check the charging circuit (see **Technical Note 6014A, Checking the charging circuit**)

To check the conformity of the engine speed signal, check:
* the wiring,
* The position of the flywheel and the condition of the flywheel teeth.
* the position and tightness of the engine speed sensor.
– Check the fuel flow correction from station to station, run **Test 7 Poor injector operation**.

↓

Check the connections and wiring of the injectors.
Check the connections and wiring of the engine management computer to the injectors.
Repair if necessary.

↓

GETtheMANUALS.org

TEST1	Exhaust system check

Engine stopped:
Check that the silencer outlet is not blocked. Repair or replace the silencer, if necessary.

↓

Check the seal of the exhaust manifold on the contact surface between the turbocharger and the exhaust manifold.
Is the seal in order?

NO → Repair or replace the faulty part.

YES ↓

Loosen the catalytic converter on the turbocharger side.
Place a wooden block between the two parts.
Start the vehicle and check if the engine runs better.
Is the engine running normally?

NO → The exhaust pipe is not the cause of the fault; repeat the engine fault finding in the Customer complaints - Fault finding chart section.

YES ↓

Retighten the catalytic converter.
Loosen or uncouple the particle filter on the catalytic converter side. Place a wooden block between the two parts if necessary.
Start the vehicle and check if the engine runs better.
Is the engine running normally?

NO → Replace the catalytic converter.

YES ↓

Retighten the particle filter.
Loosen or separate the silencer on the particle filter side (**see MR 395, 402, 405 Mechanical,19B Exhaust, Parts and consumables for repair**).
Start the vehicle and check if the engine runs better.
Is the engine running normally?

NO → Replace the particle filter (**see MR 395, 402, 405 Mechanical,19B Exhaust, Particle filter removal - refitting**).
After any operation on the particle filter, reinitialise the parameters.
Run command **SC036: Reinitialise programming** and select **After particle filter replacement**.

YES ↓

Replace the silencer.

EDC16C36_V04_TEST01/EDC16C36_V08_TEST01

GETtheMANUALS.org

TEST2	Low pressure circuit check

CP3 HIGH PRESSURE PUMP, M9R Engine

Check the fuel filter:
– Conformity of the fuel filter (correct part number and RENAULT filter),
– positioning and clogging condition of the filter cartridge,
– Positioning and condition of the seals.
– if there is metal swarf in the filter:
Replace the fuel filter, bleed the circuit and **continue the fault finding procedure**.

Supplying the injection system with fuel from an additional tank.

This operation aims to detect possible faults in the low pressure supply system of a vehicle by replacing it entirely with an additional tank.
Mode:
– Disconnect the diesel fuel supply pipe at the fuel filter inlet and seal it with a plug.
– Connect a pipe to the fuel filter inlet and insert the other end in a **clean** container with a capacity of approximately **5 litres**.
– Disconnect the diesel return pipe at the diesel temperature sensor (pump return and injector return join), and block it using a plug.
– Connect a transparent pipe to the union of the diesel temperature sensor, and insert the other end in the container.
– Fill the container with **clean** diesel fuel.
– Start the engine and let the system drain itself of its air (there must not be any air bubbles in the return pipe).

Is the customer complaint still present? — YES → If the low pressure circuit is in order, reconnect the various pipes of the low pressure circuit and repeat the fault finding chart fault finding or of the fault that referred you to this test.

NO

Are the low pressure circuit connections in order and in good condition? — YES → Carry out the necessary repairs.

NO

A

EDC16C36_V04_TEST02/EDC16C36_V08_TEST02

GETtheMANUALS.org

TEST2 CONTINUED	

A

Check the condition and operation of the priming bulb. Perform repairs if necessary and continue the test.

Check the condition of all the low pressure diesel pipes from the tank to the injection pump (in particular no pinching of pipes).

If the fault is still present with a low fuel level, check the consistency of the actual fuel level and that indicated on the instrument panel.
– The transfer pump is supplied via a Venturi pipe mounted underneath it.
Check that the opening of the venturi (**6 to 8 mm** in diameter) is not blocked by dirt contained in the fuel tank.

Check the priming of the low pressure diesel circuit.

– Check the conformity of the fuel used, apply Test 9 Diesel fuel conformity check.

Low pressure circuit correct.

GETtheMANUALS.org

TEST3	Checking the turbocharged air inlet circuit

Engine stopped: Check the **sealing** (air leaks in or out) of the low and high pressure air circuit (before/after the turbocharger).

Check the parts that are abnormally greasy of the circuit and reveal a lack of tightness.
Check:
– The condition and fitting of the ducts (foreign bodies, clogged, displaced, kinked, broken, pierced, cut, tightness of the mounting bolts, etc.).
– the presence, condition and fitting of the seals,
– the presence and tightening of the clamps,
– the fitting of the turbocharger pressure sensor.
– the pipe and take-off point between the air duct and the turbocharging sensor
Carry out the necessary repairs.

Checking the air filter.

Check that the air filter box inlet and outlet are free from blockages, the condition and fitting of the air filter box (loose, broken, pierced etc.), the cleanliness, conformity and non-deformation of the filter element, and the air flowmeter: run **test 4 Air flowmeter**. Carry out the necessary repairs.

Check:
– - the condition of the damper valve,
– - the tightness of the mounting bolts,
– - cracks in the damper valve.
Carry out the necessary repairs.
Replace if necessary.

Check that there is no leak at the exhaust manifold, in particular at the exhaust manifold/turbocharger connection.
Check the exhaust system, run **test 1 Exhaust system check** in **ALP 2**.
Carry out the necessary repairs.

Carry out a visual inspection of the EGR circuit sealing.
Note: the operating play in the EGR heat exchanger valve shaft produces small black marks due to a slight leak of no importance. Do not replace this part.
Replace if necessary.

Check the condition of the intercooler:
– clogging,
– leaks (vehicle stationary, stabilise the engine speed between **3500 rpm and 4000 rpm** and check that there are no leaks).
Replace if necessary.

Check that the take-off point for the turbocharging pressure sensor is not blocked.
Replace if necessary.
END OF TEST.

GETtheMANUALS.org

TEST4	Air flowmeter

Damage to electrical components
Visual inspection: remove the flow sensor - the components should not be broken.
Replace the air flowmeter if necessary.

↓

Oxidation of the electrical components
Visual inspection: remove the air flowmeter, there should not be any greenish deposits on the electrical components.
Replace the air flowmeter if necessary.

↓

Clogging of the air flowmeter
Test:
– Check the values for conformity:
– During the first 5 seconds after starting,
– PR064 Coolant temperature: 80°C,
– **PR055: Engine speed**: idle speed**,**
– **PR058 Air temperature** between **30 and 70°C**
– PR132 Air flow: 24 ± 4 kg/h
– PR051 EGR valve position feedback 26 ± 4 %,
– **PR023 Air flow difference** between **- 50 and + 50 mg/stroke**.
– Apply the procedure for **DF056 Air flow sensor circuit** for the checks on the air flowmeter.

Replace the air flowmeter if necessary.

END OF TEST.

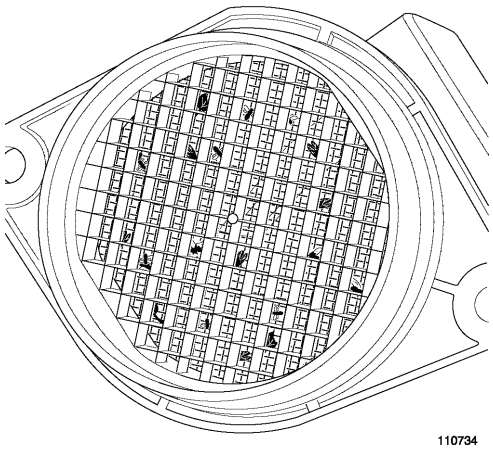
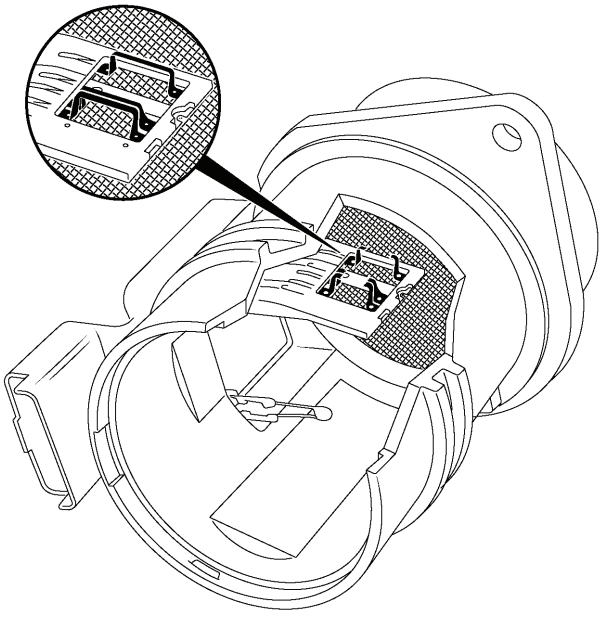
GETtheMANUALS.org

TEST4 CONTINUED	

Contamination of the grille



Damage to the electrical sensors



END OF TEST4.

GETtheMANUALS.org

TEST 7	Incorrect injector operation

Part A: Fuel regulation balance check for each injector (individual correction):

– In the **CLIP diagnostic tool**, choose the **Fuel circuit** subfunction.
– With the engine idling and the fuel temperature **> 50°C**, view the flow correction values of each injector (individual correction), i.e.:
– PR364 Cylinder no. 1 fuel flow correction.
– PR405 Cylinder no. 2 fuel flow correction.
– PR406 Cylinder no. 3 fuel flow correction.
– PR365 Cylinder no. 4 fuel flow correction.
The normal flow correction **value** per injector is between **- 5 mg/stroke and + 5 mg/stroke without reaching these values**.

– If this has not already been carried out, check the injector connections and wiring.
– Check the connections and wiring of the engine management computer to the injectors.
– Repair if necessary.

– Check the **IMA** injector codes, by comparing the **IMA** engraved codes on the injectors (the **IMA** codes are read from left to right) and the **IMA** codes read with the **diagnostic tool**.
– If the **IMA** codes are correct, continue the fault finding procedure,
– If not, enter the incorrect **IMA** codes using command **SC002 Enter injector codes** (see **Interpretation of commands**).
To confirm the repair, consult **part B** of this test.

CASE No. 1: If at least one of the values is greater than or equal to + 5 mg/st
– Check the valve clearance.
– Check the status of the engine and the compressions (using **the CLIP diagnostic tool** or using a compression gauge).
– If the compression test reveals a cylinder fault, carry out the necessary repairs.
– If the compression is correct, check the fitting conformity of the injector (see **MR 402 (Vel Satis ph2**), **MR 361 (Espace IV ph2) or MR 395 (Laguna II ph2) Mechanical 13B Diesel injection**, **Diesel fuel injectors: Removal - Refitting).**

Ensure that each injector has only one heat protection washer.
Check the fuel regulation again for each injector (individual correction).
– Otherwise, replace the injector and check the presence of the sealing washer. Modify the **IMA** code using command **SC002 Enter injector codes** (see **Interpretation of commands**).
– Apply **Part B** of this test to confirm the fault finding.

GETtheMANUALS.org

TEST 7 CONTINUED 1	

CASE No. 2: If at least one of the values is less than or equal to - 5 mg/st
– Check the valve clearance.
– Check the level and condition of the engine oil.
– Remove the injector with the largest adjustment.
– If there is contamination via the diesel, check the condition of the cylinder concerned (cylinder, piston, valves). Use an endoscope if possible.
– Only replace the removed injector, and modify the **IMA** code using command **SC002 Enter injector codes** (see **Interpretation of commands**).
– Apply **Part B** of this test to confirm the fault finding procedure.

CASE No. 3: If at least one of these values does not stabilise (20 seconds after starting)
– Check the low pressure circuit with **Test 3 Low pressure circuit check**.
– Check the conformity of the fuel, apply **Test 9 Diesel fuel conformity check**.
– Apply **Part B** of this test to confirm the fault finding procedure.

CASE No. 4: If the fuel flow correction values are all correct (between - 5 mg/st and + 5 mg/st)
Apply **Part C** of this test (**Fuel return flow measurement).**

IMPORTANT
When removing and refitting the injectors, observe the cleanliness and safety instructions (see **MR 402 (Vel Satis ph2)**, **MR 361 (Espace IV ph2) or MR 395 (Laguna II ph2) Mechanical, 13B, Diesel injection**, **Diesel injectors: Removal - Refitting**).

Section B: Confirmation of flow correction fault finding for each injector (individual correction):

Clear the faults and perform a test with the **engine idling** for at least **5 minutes**, fuel temperature **> 50°C**.
Check that no fault appears on **the CLIP diagnostic tool** and that the correction values do not reach **± 5 mg/st** to confirm the repair.
If the customer complaint is still present and the fuel flow correction values are between **-5 mg/st and + 5mg/st,** apply **part A Fuel regulation balance check for each injector (individual)** of this test **(Case No.4)**.

If one or more cylinders has injector flow correction values which reach **± 5 mg/stroke,** apply **Part A Fuel regulation balance check for each injector (individual)**, as one or more additional injectors may be defective.

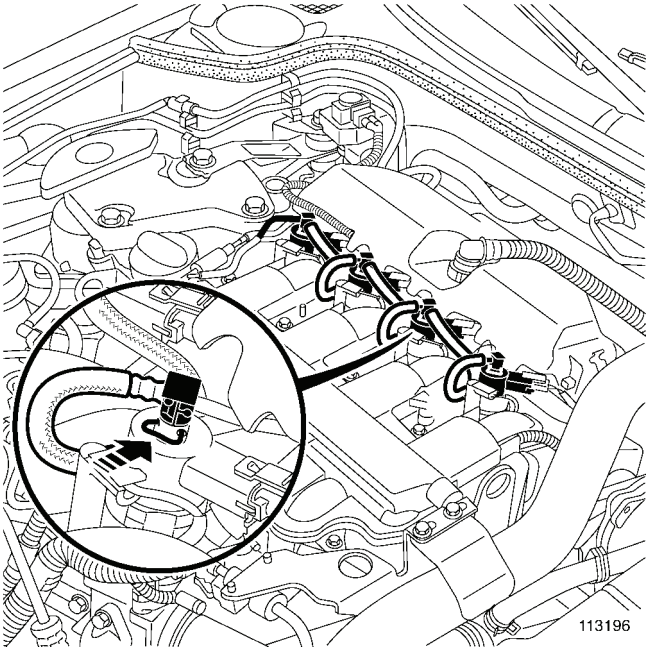
GETtheMANUALS.org

TEST 7 CONTINUED 2	

Part C: Measuring fuel return flow

1. Fitting the tool:

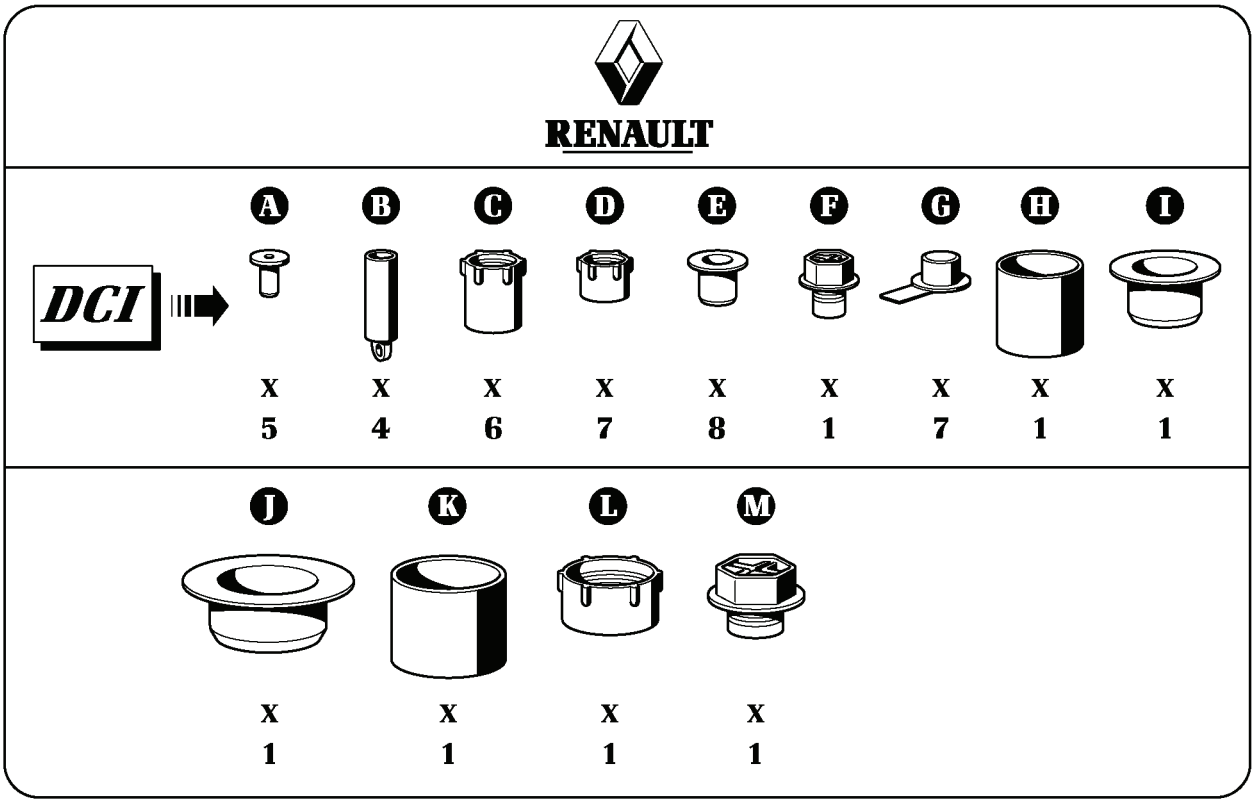
Only carry out this part if PR063 Fuel temperature is greater than 50°C (see step 2 of Part C of this test).
Remove the engine undertray.
Disconnect the entire fuel return pipe in accordance with the following procedure (do not remove the clips):
– press the clip,
– pull the fuel return pipe end piece vertically (see the arrow on illustration 113196).



IMPORTANT
The end piece is fragile. Be careful not to break it by pulling it too hard. Replace all removed clips

GETtheMANUALS.org

TEST 7 CONTINUED 3	

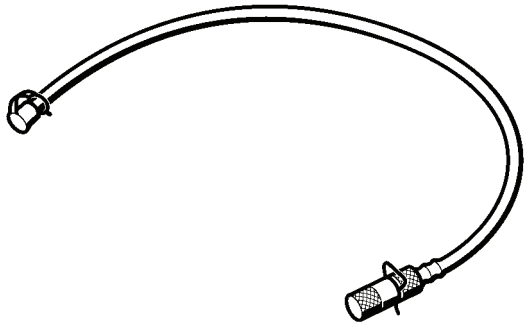


107209

Fit the blanking plugs **(B)**, from the kit (part number **77 01 208 229**), on the end pieces of the fuel return pipe.
If **Mot. 1760** is not fitted on the injectors immediately, place blanking plugs **(A)** on the injector fuel return openings.

GETtheMANUALS.org

TEST 7 CONTINUED 4	

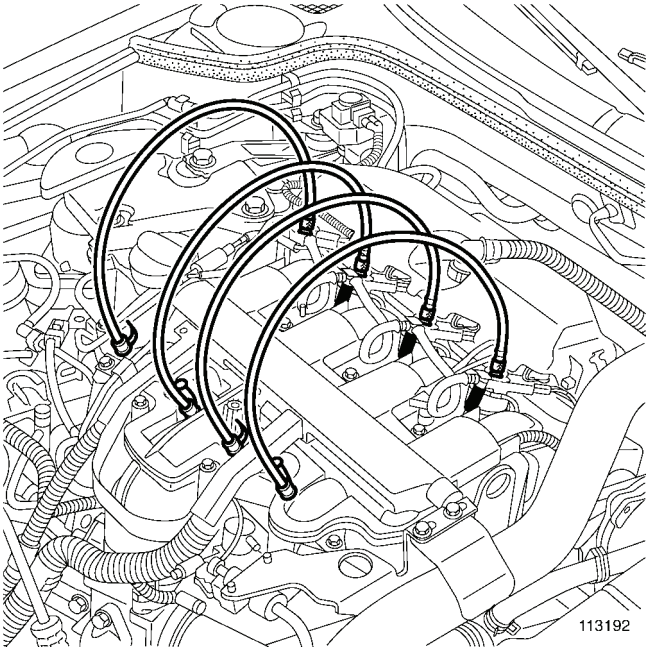


113195

On the **Mot.1760** tool pipes (see illustration **113195**), remove the clips and the plugs from the end pieces (on the right in the diagram) and leave the plugs (on the left in the diagram) in place.

GETtheMANUALS.org

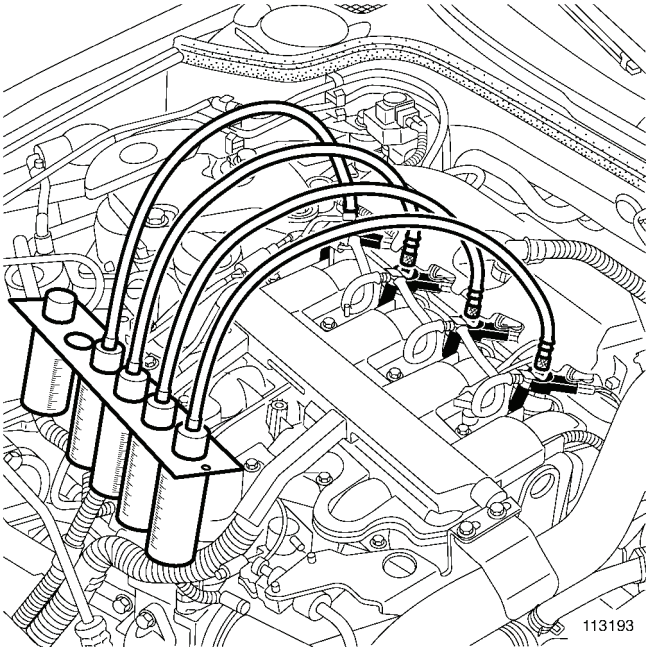
TEST 7 CONTINUED 5	



Connect the pipes from the **Mot.1760** tool to the injectors (without removing the clips on the injectors):
– press on the injector clip,
– insert the end piece in the injector fuel return opening.
– remember to fit the end piece plugs to the injector fuel return openings with the clips provided.
– Remove the plugs left on the **Mot.1760**

GETtheMANUALS.org

TEST 7 CONTINUED 6	



Insert the ends of the pipes into the measuring cylinders of tool **Mot.1760**; the measuring cylinders are taken from tool **Mot. 1711.**

GETtheMANUALS.org

TEST 7 CONTINUED 7	

2. Check the injector return flow balance:

Does the engine start? — NO →
- Fit **Mot. 1760** as shown in the tool fitting procedure.
- Start the vehicle or perform a **15 second** starting sequence (with ignition key).
- Measure the length travelled by the diesel fuel in the pipes of the **Mot. 1760**.
- Replace the injector if the length travelled by the fuel is more than **10 cm** compared with the average of the other three injectors.

YES ↓

- The injector return pipes must be fitted to the injectors.
- Start the engine.
- Display the **Fuel circuit** sub-function in the **CLIP diagnostic tool**.
- Raise the temperature of the engine.
- Read the diesel fuel temperature with **PR063 Fuel temperature** until the diesel fuel temperature is greater than **50°C**
- Switch off the engine.
- Fit **Mot. 1760** as shown in the installation procedure (see **step 1**).
- Check the value of the **PR038 Rail pressure**.
- Ask another Cotech to monitor the rise in fuel in the cans during engine turnover, as one of the cans will fill up quickly if one of the injectors is leaking.
- Start the engine.
- Accelerate the engine until the pressure in the rail is **550 bar**:
  * if the engine speed is **less than 3,000 rpm**, maintain this pressure.
  * if the engine speed is **greater than 3,000 rpm**, reduce the engine speed until the rail pressure is **500 bar** and maintain this pressure.
- Maintain these conditions for one minute.
- Release the accelerator pedal and maintain the idle speed for **10 seconds**.
- Switch off the engine.
- Measure the quantity of fuel contained in each measuring cylinder.
- Replace the injector if the quantity of fuel is more than **50 ml**.
- Remove **Mot. 1760** as shown in the tool removal procedure (see **step 3**).

GETtheMANUALS.org

TEST 7 CONTINUED 8	

3. Removing the tool:

IMPORTANT
Use a cleaning cloth (**part number 77 11 211 707**) to absorb fuel run-off.

Disconnect the pipe from an injector:
– press on the injector clip,
– pull vertically on the end piece of the pipe of tool **Mot. 1760** while placing a cloth on the end piece to prevent run-off.

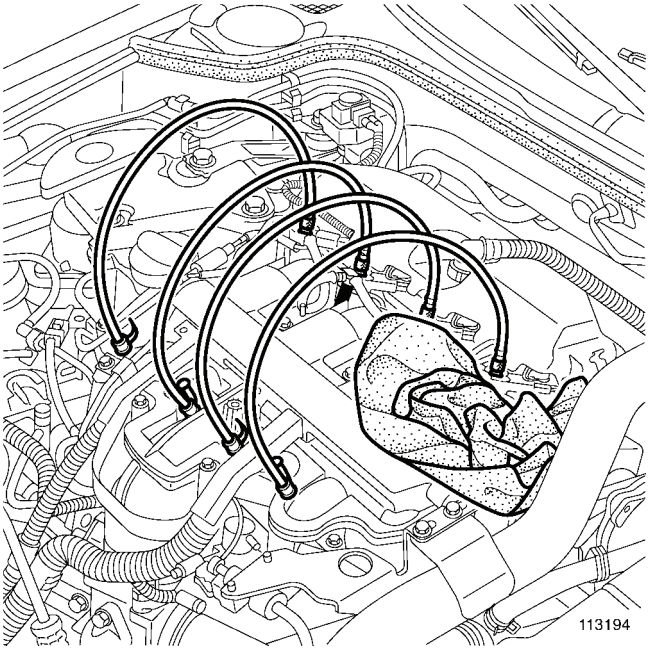
Lift the end piece vertically so that the fuel contained in the pipes flows into the measuring cylinders of the **Mot.1760** tool.

Remove the other 3 pipes using the same procedure.

GETtheMANUALS.org

TEST 7 CONTINUED 9	

Remove the plug welds from the fuel return pipe end pieces.
Connect the complete fuel return pipe to the injectors.
Wipe up any fuel run-off using a cleaning cloth (part number **77 11 211 707**).



End of test 7.

GETtheMANUALS.org

TEST 8	Insufficient turbine upstream temperature

Perform a complete fault finding of the injection computer using the diagnostic tool.
Do any stored or present faults appear?

YES → Apply the procedure for dealing with the associated faults.

NO

Apply **test 1 Exhaust pipe check**
Is the exhaust pipe correct?

NO

YES

Apply **test 3 Turbocharged air inlet circuit check**
Is the inlet circuit in order?

NO

YES

Apply **test 4 Air flowmeter**
Is the air flow sensor correct?

NO

YES

Apply **test 7 Poor injector operation**
Are the injectors correct?

NO

YES

Contact the Techline.

Repair then carry out another particle filter regeneration.
Run command **SC017 Particle filter regeneration** (see **Interpretation of commands**).

– If the second regeneration is successful, it is essential to change the engine oil and replace the oil filter.

– If the second regeneration fails, contact the Techline.

EDC16C36_V04_TEST8/EDC16C36_V08_TEST8

GETtheMANUALS.org

TEST 9	Diesel fuel conformity check

WARNING
During this operation, it is essential to:
– refrain from smoking or bringing incandescent objects close to the work area,
– protect yourself against fuel splashes due to residual pressure in the pipes,
– wear safety goggles with side guards,
– wear leaktight gloves (Nitrile type).

IMPORTANT
– To avoid any corrosion or damage, protect the areas on which fuel is likely to run.
– To prevent impurities from entering the circuit, place protective plugs on all fuel circuit components exposed to the open air.

Preparations:
Weigh an empty **1300 ml** plastic cup **(part no. 77 11 171 413)** with its cover **(part no. 77 11 171 416)** using electronic scales similar to those used in body paint workshops (example: **PANDA part no. 77 11 224 995**). Record the weight of the empty plastic cup.
This type of plastic cup is used to prepare paint.

Remove **1 l** of fuel at the diesel filter outlet (see **MR 402 (Vel Satis ph2), MR 361 (Espace IV ph2) or MR 395 (Laguna II ph2), Mechanical, 19C, Tank, Fuel tank: Draining**), using a pneumatic transfer pump (**part no. 634-200**) and place it in the **1300 ml** plastic cup.
Cover the plastic cup with its cover and let the fuel settle for approximately **2 minutes**.

Is the fuel cloudy or does it separate into two parts?

YES → Presence of water in diesel fuel, the fuel is not compliant.
Drain the fuel circuit, including the tank (see **MR 402 (Vel Satis ph2), MR 361 (Espace IV ph2) or MR 395 (Laguna II ph2), Mechanical, 19C, Tank, Fuel tank: Draining**).

NO ↓

(A)

EDC16C36_V04_TEST9/EDC16C36_V08_TEST9

GETtheMANUALS.org

TEST 9 CONTINUED 1	

A

Weigh the diesel fuel and note the fuel weight after subtracting the weight of the empty plastic cup and its cover.
Does the fuel weight fall between the minimum and maximum weights given in the table below?

Calculated weight (g.)		Fuel temperature (°C)
Min. weight	Max. weight	
821	846	13
821	846	14
820	845	15
819	844	16
819	844	17
818	843	18
817	842	19
816	841	20
816	841	21
815	840	22
814	839	23
814	839	24
813	838	25

Check the fuel temperature by immersing a thermometer in the plastic cup.

YES → B

NO → C

GETtheMANUALS.org

TEST 9 CONTINUED 2	

B
YES

End of test.

C
NO

The fuel is not correct.
If the fuel weight is less than the minimum value then there is petrol in the diesel fuel.
If the fuel weight is greater than the maximum value then there is oil in the diesel fuel.
Drain the fuel circuit, including the tank (see **MR 402 (Vel Satis ph2), MR 361 (Espace IV ph2) or MR 395 (Laguna II ph2), Mechanical, 19C, Tank, Fuel tank: Draining**).

Note:
If the measured weight reaches the limit values, the measurement can be performed with a **2230 ml** plastic cup (**part no. 77 11 171 414**) and its cover (**part no. 77 11 171 417**):
– Carry out a quick test drive in order to mix the fuel, then remove **2 l** of fuel.
– Perform the test again and check the results by multiplying the limit values by 2.

Contact the Techline if you have doubts or problems with the customer.

GETtheMANUALS.org

TEST 10	Incorrect operation of the overpressure valve

Part 1. Overpressure valve return flow test:

Is the engine working?

NO

- Fit **Mot. 1760** as shown in the tool fitting procedure (see part 2).
- Press the Start button (with card).
- Measure the length travelled by the diesel fuel in the pipes of the **Mot. 1760.**
- Replace the overpressure valve if the diesel length travelled is greater than **10 cm**.

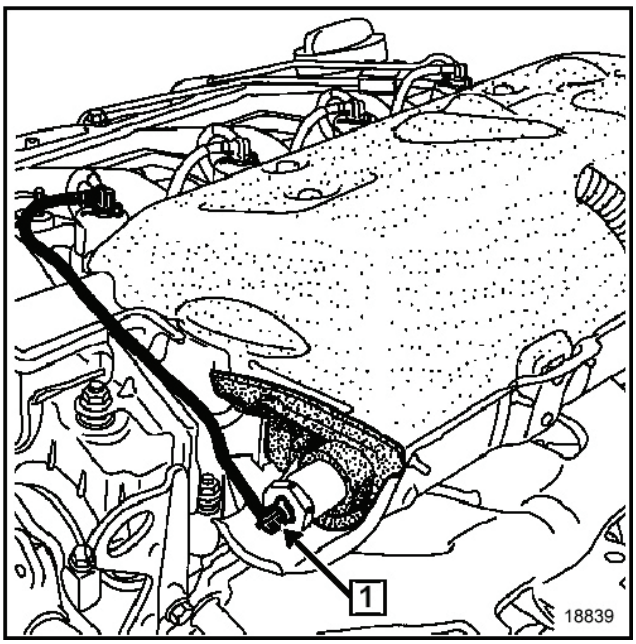
YES

- The overpressure valve return pipe must be fitted to the injector rail.
- Start the engine.
- Set the CLIP diagnostic tool to parameter reading mode.
- Raise the temperature of the engine.
- Display parameter **PR063 Fuel temperature**. Increase the diesel temperature to **above 50°C**.
- Switch off the engine.
- Fit **Mot. 1760** as shown in the tool fitting procedure (see part 2).
- Display parameter **PR038 Rail pressure**.
- Ask another Cotech to monitor the rise in fuel in the container during engine turnover, as the container will fill up quickly if the overpressure valve is leaking.
- Start the engine.
- Accelerate the engine until the pressure in the rail is **550 bar**:
  - if the engine speed is **less than 3000 rpm**, maintain this pressure,
  - if the engine speed is greater than **3000 rpm**, reduce the engine speed until the rail pressure is **500 bar** and maintain this pressure.
- Maintain these conditions for 1 min.
- Release the accelerator pedal and maintain the idle speed for **10 seconds**.
- Switch off the engine.
- Measure the length of diesel contained in the measuring cylinder**.**
- Replace the injector rail if the quantity of diesel fuel is greater than **5 ml**.
- Remove **Mot. 1760** as shown in the tool removal procedure (see part 3).

GETtheMANUALS.org

TEST10 (CONTINUED 1)	

Part 2: Fitting the tool:



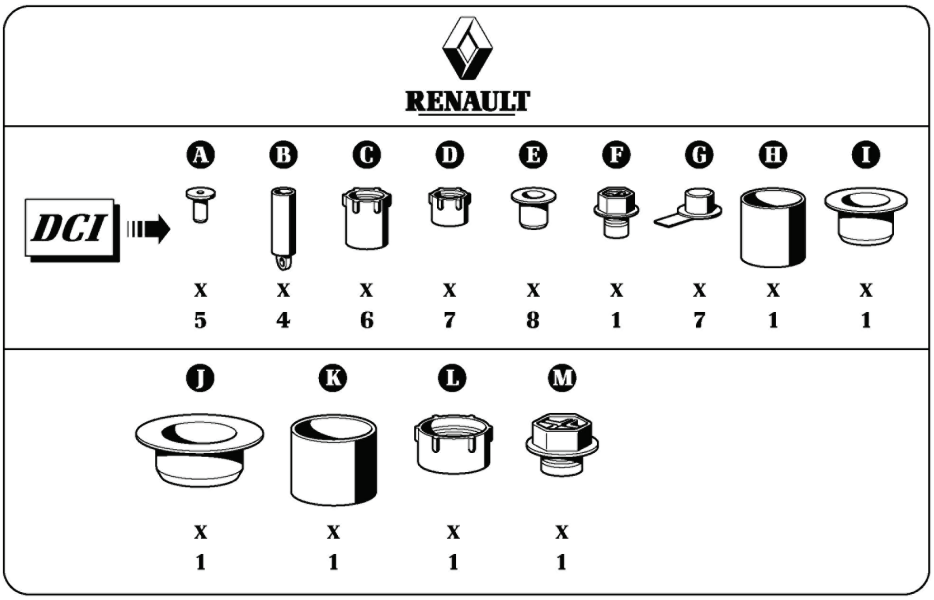
Remove the engine undertray.

Disconnect the overpressure valve return pipe according to the following procedure **(do not remove the clips):**
– press the clip,
– pull vertically on the end piece (**1**) of the fuel return pipe.

GETtheMANUALS.org

TEST10 (CONTINUED 2)	

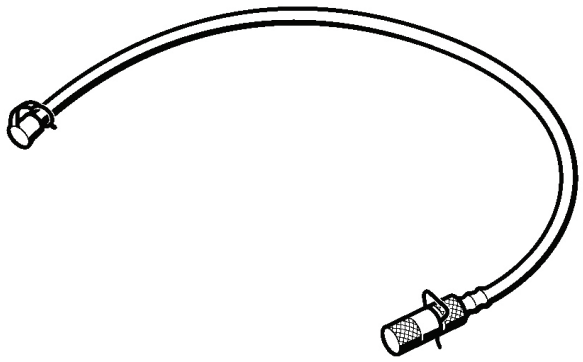
IMPORTANT
The end piece is fragile. Be careful not to break it by pulling it too hard. Replace all removed clips.



Fit the blanking plugs (**B**), from the kit (part number **77 01 208 209**), on the end pieces of the fuel return pipe. If **Mot.1760** is not fitted immediately on the overpressure valve, place a blanking plug (**A**) on the overpressure valve fuel return opening.

GETtheMANUALS.org

TEST10 (CONTINUED 3)	



113195

Shown above is the pipe (**Mot. 1760**) with the end piece (**2**) on the right and the plug (**4**) on the left.

Remove the clip and the plug from the end piece (**2**) of the pipe of tool **Mot. 1760**, leave the plug (**4**) in place.

Connect the pipe of **Mot. 1760** to the rail overpressure valve (without removing the clip on the overpressure valve):
– press on the clip (**1**) of the overpressure valve,
– insert the end piece (**2**) in the overpressure valve fuel return opening.
– do not forget to fit the end piece plug (**2**) to the overpressure valve fuel return opening using the clip supplied.

Remove the plug (**4**).
Insert the end of the pipe in the measuring cylinder of the tool **Mot. 1760**, the measuring cylinder is retrieved from the tool **Mot.1711**.

Measure the return flow (see the procedure in **part 1** of this test).

GETtheMANUALS.org

TEST10 (CONTINUED 4)	

Part 3: Removing the tool:

IMPORTANT
Use a cleaning cloth (part number **77 11 211 707**) to absorb fuel run-off.

Disconnect the pipe of **Mot. 1760** on the overpressure valve:
– press on the clip (**1**) of the overpressure valve,
– pull horizontally on the end piece (**2**) of the pipe of **Mot. 1760** while putting a cloth on the end piece (**2**) to avoid the drips.

Lift the end piece (**2**) vertically so that the diesel fuel contained in the pipe flows into the measuring cylinder of **Mot. 1760**.

Remove the plug from the fuel return pipe end piece (**2**).

Connect the complete fuel return pipe to the overpressure valve.

Wipe up any diesel fuel run-off using a cleaning cloth (part number **77 11 211 707**).

GETtheMANUALS.org

1. SCOPE OF THIS DOCUMENT

This document presents the fault finding procedure applicable to all computers with the following specifications:

Vehicle(s): **Vel Satis phase 1 & 2**
Espace IV phase 1
Engine type: **P9X701**
Function concerned: **Diesel injection**

Computer name: **DENSO Isuzu**
Program no.: **BF**
Vdiag no.: **04, 08, 0C**

2. PREREQUISITES FOR FAULT FINDING

Documentation type

Fault finding procedures (this manual):
– Assisted fault finding (integrated into the diagnostic tool), Dialogys.

Wiring Diagrams:
– "Wiring Diagrams" Technical Note for the vehicle (Visu-Schéma CD-ROM).

Type of diagnostic tools
– CLIP + CAN probe

Special tooling required

Special tooling required	
	Multimeter
Elé. 1681	Universal bornier

3. RECAP

Procedure

To run fault finding on the vehicle's computers, switch on the ignition in fault finding mode (forced + after ignition feed).

Proceed as follows:
– vehicle card in reader,
– press and hold start button (longer than **5 seconds**) with start-up conditions not fulfilled,
– connect the diagnostic tool and perform the required operations.

To **cut off + after ignition**, proceed as follows:
– disconnect the diagnostic tool,
– press the Start button twice briefly (less than **3 seconds**),
– ensure that the + after ignition feed has been cut off by checking that the computer indicator lights on the instrument panel have gone out.

GETtheMANUALS.org

Faults

Faults are declared as either present or stored (depending on whether they appeared in a certain context and have disappeared since, or whether they remain present but have not been diagnosed within the current context).

The **present** or **stored** status of faults should be taken into consideration when the **diagnostic tool** is switched on after the + after ignition feed (without any system components being active).

For a **present fault**, apply the procedure described in the **Interpretation of faults** section.

For a **stored fault**, note the faults displayed and apply the instructions in the **Notes** section.

If the fault is **confirmed** when the instructions in the Notes section are applied, the fault is present. Deal with the fault

If the fault is **not confirmed**, check:
- the electrical lines which correspond to the fault,
- the connectors for these lines (for oxidation, bent pins, etc.),
- the resistance of the component detected as faulty,
- the condition of the wires (melted or split insulation, wear).

Conformity check

The aim of the conformity check is to check data that does not produce a fault on the **diagnostic tool** because the data is inconsistent. Therefore, this stage is used to:

- carry out fault finding on faults that do not have a fault display, and which may correspond to a customer complaint.
- check that the system is operating correctly and that there is no risk of a fault recurring after repairs.

This section gives the fault finding procedures for statuses and parameters and the conditions for checking them.

If a status is not behaving normally or a parameter is outside the permitted tolerance values, consult the corresponding fault finding page.

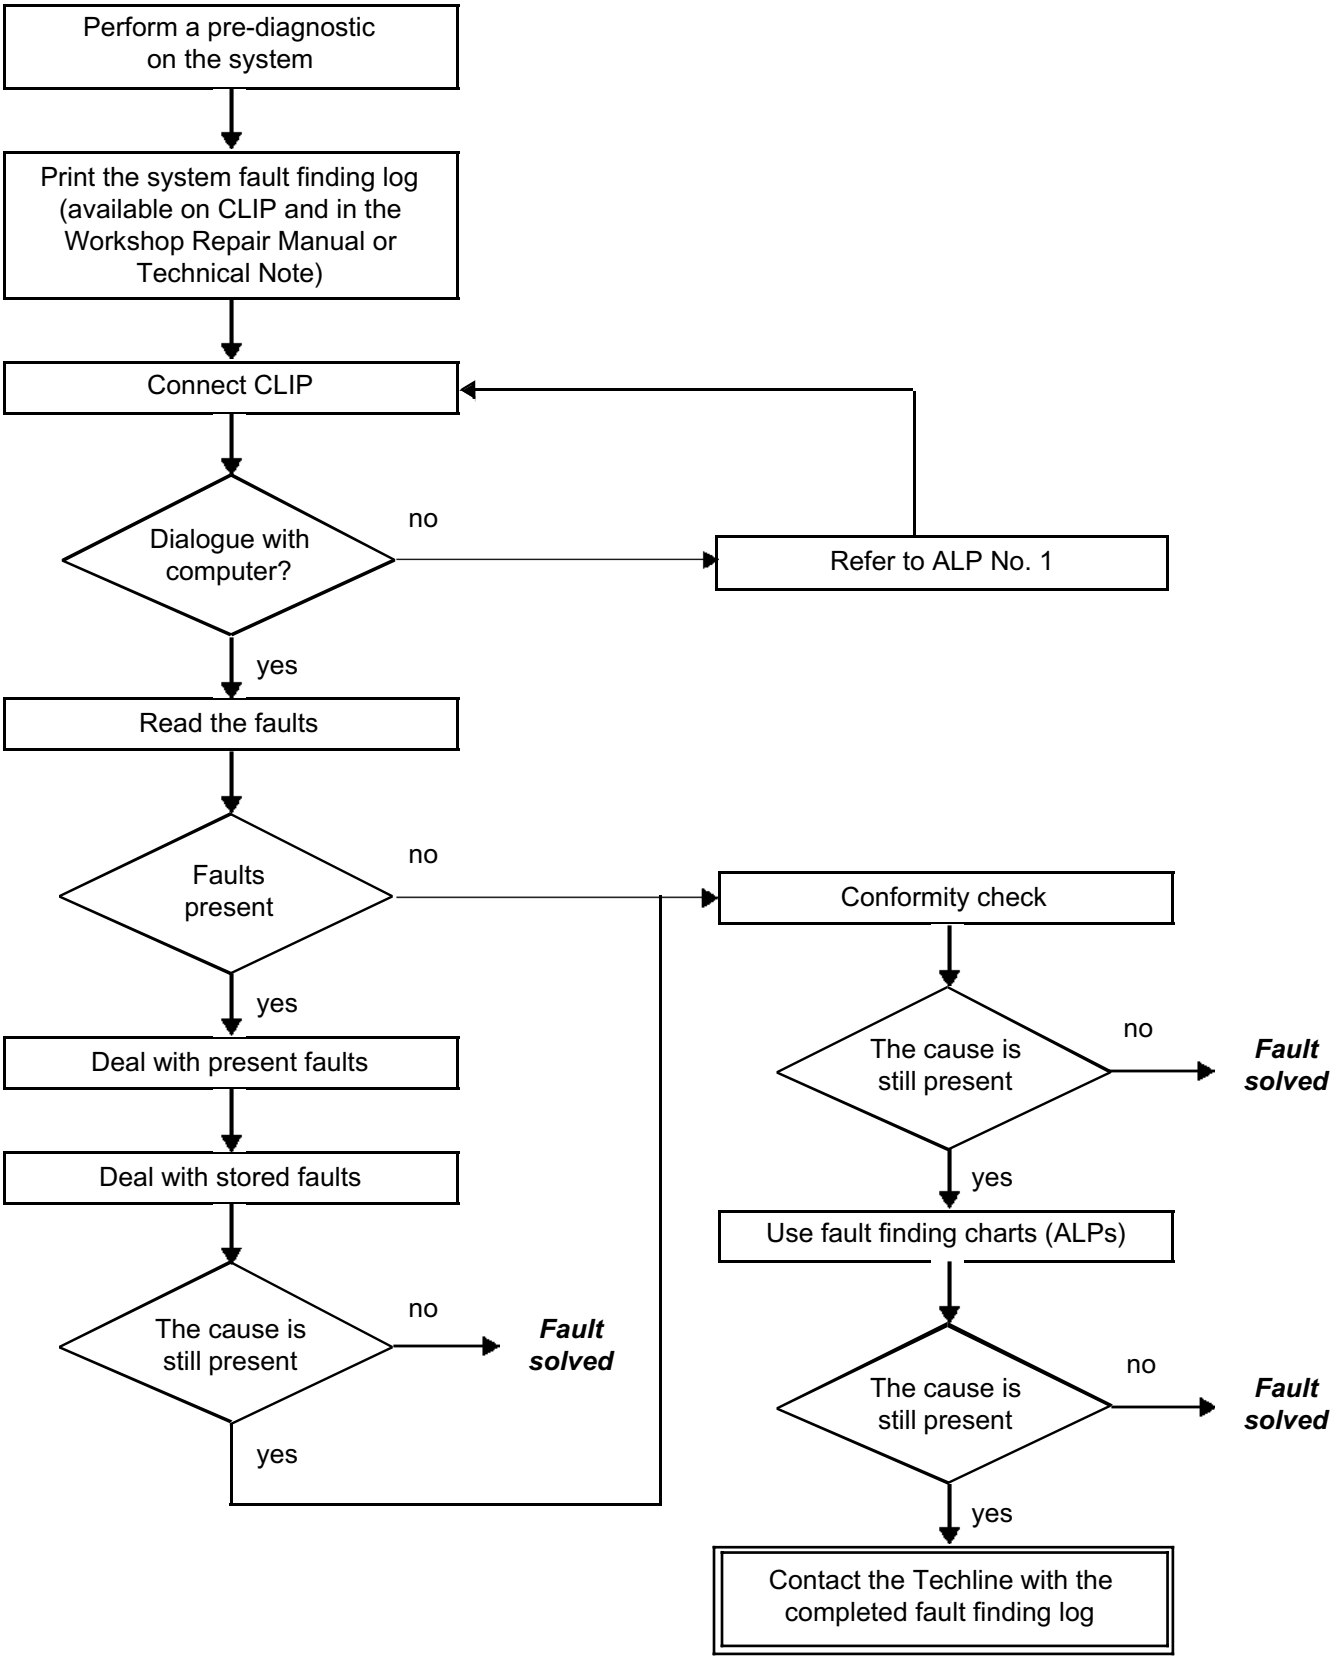
Customer complaints - Fault finding chart

If the test with the **diagnostic tool** is OK but the customer complaint is still present, the fault should be processed by **customer complaints**.

A synopsis of the general procedure to follow is provided on the following page in the form of a flow chart.

GETtheMANUALS.org

4. FAULT FINDING PROCEDURE



GETtheMANUALS.org

4. FAULT FINDING PROCEDURE (continued)

Wiring check

Fault finding problems
Disconnecting the connectors and/or manipulating the wiring harness may temporarily remove the cause of a fault.
Electrical measurements of voltage, resistance and insulation are generally correct, especially if the fault is not present when the analysis is made (stored fault).

Visual inspection
Look for damage under the bonnet and in the passenger compartment.
Carefully check the fuses, insulators and wiring harness routing.
Look for signs of oxidation.

Tactile inspection
While manipulating the wiring harness, use the diagnostic tool to note any change in fault status from stored to present.
Make sure that the connectors are properly locked.
Apply light pressure to the connectors.
Twist the wiring harness.
If there is a change in status, try to locate the source of the fault.

Inspection of each component
Disconnect the connectors and check the appearance of the clips and tabs, as well as the crimping (no crimping on the insulating section).
Make sure that the clips and tabs are properly locked in the sockets.
Check that no clips or tabs have been dislodged during connection.
Check the clip contact pressure using an appropriate model of tab.

Resistance check
Check the continuity of entire lines, then section by section.
Look for a short circuit to earth, to **+ 12 V** or to another wire.

If a fault is detected, repair or replace the wiring harness.

GETtheMANUALS.org

5. FAULT FINDING LOG

IMPORTANT

IMPORTANT
Any fault on a complex system requires thorough fault finding with the appropriate tools. The FAULT FINDING LOG, which should be completed during the procedure, enables you to keep track of the procedure which is carried out. It is an essential document when consulting the manufacturer.

IT IS THEREFORE MANDATORY TO FILL OUT A FAULT FINDING LOG EACH TIME FAULT FINDING IS CARRIED OUT.

You will always be asked for this log:

- when requesting technical assistance from Techline,
- for approval requests when replacing parts for which approval is mandatory,
- to be attached to monitored parts for which reimbursement is requested. The log is needed for warranty reimbursement, and enables better analysis of the parts removed.

6. SAFETY ADVICE

Safety rules must be observed during any work on a component to prevent any damage or injury:

- check the battery voltage to avoid incorrect operation of computer functions,
- Use the proper tools.

GETtheMANUALS.org

I - RISKS ASSOCIATED WITH CONTAMINATION

The high pressure direct injection system is highly sensitive to contamination. The risks associated with contamination are:
– damage to or destruction of the high pressure injection system,
– components jamming,
– components losing seal integrity.

All After-Sales operations must be performed under very clean conditions. This means that no impurities (particles a few microns in size) should have entered the system during dismantling.

The cleanliness principle must be applied from the filter to the injectors.

What are the sources of contamination?
– metal or plastic swarf,
– paint,
– fibres:
  – from cardboard,
  – from brushes,
  – from paper,
  – from clothing,
  – from cloths,
– foreign bodies such as hair,
– ambient air
– etc.

IMPORTANT
Cleaning the engine using a high pressure washer is prohibited because of the risk of damaging connections. In addition, moisture may collect in the connectors and create electrical connection faults.

II - NOTES TO BE FOLLOWED BEFORE ANY OPERATION

IMPORTANT
Before any work is carried out on the high pressure injection system, protect:
– the accessories and timing belts,
– the electrical accessories, (starter, alternator, electric power-assisted steering pump),
– the flywheel surface, to prevent any diesel from running onto the clutch friction plate.

Check that you have plugs for the unions to be opened (set of plugs available from the Parts Department). The plugs are single-use only. After use, they must be discarded (once used they are soiled and cleaning is not sufficient to make them reusable). Unused plugs must be discarded.

GETtheMANUALS.org

Check that you have hermetically resealable plastic bags for storing removed parts. Parts stored in this way will be less susceptible to the risk of contamination. The bags are to be used once only, and discarded after use.

Use lint-free cleaning cloths (cloth part number **77 11 211 707**). Using normal cloth or paper is prohibited. They are not lint-free and could contaminate the fuel circuit. Each cloth should only be used once.

Use fresh cleaning agent for each operation (used cleaning agent is contaminated). Pour it into an uncontaminated container.

For each operation, use a clean brush in good condition (the brush must not shed its bristles).

Use a brush and cleaning agent to clean the unions to be opened.

Blast compressed air over the cleaned parts (tools, workbench, the parts, unions and injection system zones). Check that no bristles remain.

Wash your hands before and during the operation if necessary.

When wearing leather protective gloves cover them with latex gloves to prevent contamination.

III - INSTRUCTIONS TO BE FOLLOWED DURING THE OPERATION

As soon as the circuit is open, all openings must be plugged to prevent impurities from entering the system. The plugs to be used are available from the Parts Department. The plugs must not be reused under any circumstances.

Seal the pouch shut, even if it has to be opened shortly afterwards. Ambient air carries contamination.

All components removed from the injection system must be stored in a hermetically sealed plastic bag once they have been plugged.

Using a brush, cleaning agent, air gun, sponge or normal cloth is strictly prohibited once the circuit has been opened. These items could allow contamination to enter the system.

A new component replacing an old one must not be removed from its packaging until it is to be fitted to the vehicle.

GETtheMANUALS.org

The high pressure injection system is designed to deliver a precise quantity of diesel fuel to the engine at a set moment.
It is fitted with a **121-track** computer made by **DENSO ISUZU**

The system comprises:
- a priming pump,
- a diesel filter fitted with a heater,
- a high pressure pump with two pumping pistons,
- two high pressure regulators attached to the pump,
- an injector rail,
- a diesel fuel pressure sensor built into the rail,
- a pressure limiter,
- six solenoid injectors,
- a diesel fuel temperature sensor,
- a coolant temperature sensor,
- an air inlet temperature sensor (Vdiag 04, 08 only),
- an oil temperature sensor (Vdiag 0C only),
- a cylinder reference sensor,
- a turbocharging pressure sensor,
- an exhaust gas recirculation solenoid valve,
- an accelerator pedal potentiometer,
- an atmospheric pressure sensor integrated into the injection computer,
- an injection computer,
- a flow sensor (fitted with an OBD air temperature sensor),
- a turbocharging limiter solenoid valve,
- a damper flap solenoid valve.

The "**common rail**" high pressure direct injection system works sequentially (based on the multipoint injection system for petrol engines).

This new injection system reduces operating noise, reduces the volume of pollutant gases and particles and produces high engine torque at low engine speeds thanks to a pre-injection procedure.

The high pressure pump generates the high pressure and transmits it to the injector rail. The actuators located on the pump control the quantity of diesel fuel supplied based on the demand determined by the computer. The rail supplies each injector through a steel pipe.

GETtheMANUALS.org

a) The computer:

This determines the injection pressure value necessary for the engine to operate correctly and then controls the pressure regulators. It checks that the pressure value is correct by analysing the value transmitted by the pressure sensor located on the rail.
It determines the injection timing required to deliver the right quantity of diesel fuel and the moment when injection should start.
Controls each injector electrically and individually after determining these two values.

The flow injected into the engine is determined by:
- the duration of injector control,
- the rail pressure (regulated by the computer),
- the injector opening and closing speed,
- the needle stroke (determined by a constant for the type of injector),
- the nominal hydraulic flow of the injector (specific to each injector),
- the pedal load,
- the engine speed.

The computer manages:
- idling regulation,
- exhaust gas flow reinjection to the inlet,
- the fuel supply (advance, flow and rail pressure),
- the fan unit control via the Switching and Protection Unit (centralised coolant temperature management function),
- the air conditioning (cold loop function),
- the cruise control/speed limiter function,
- pre-post heating control,
- fault warning lights via the multiplex network.

The high pressure pump supplies the rail whose pressure is controlled by the fuel flow actuator for filling and by the injector valves for discharging. This compensates for pressure drops. The flow actuator allows the high pressure pump to supply the exact quantity of diesel fuel required to maintain the pressure in the rail. This component minimises the heat generated and improves engine output.
In order to discharge the rail using the injector valves, the valves are controlled by brief electrical pulses which are:
- short enough not to open the injector (passing through the feedback circuit from the injectors),
- long enough to open the valves and discharge the rail.
- multiplexed connection between the vehicle's various computers.

The fault warning lights on the instrument panel are activated via the multiplex network.

The vehicle speed signal on the instrument panel is transmitted by the ABS system computer or the WHEEL SPEED computer via a wire connection and is then transmitted via the multiplex network by the instrument panel. The main users of the vehicle speed signal are the injection computer and the airbag computer.

Some vehicles have adopted a sensor for detecting water in the diesel fuel, located in the filter. If there is water in the fuel, the orange injection and pre/postheating warning light will come on.

GETtheMANUALS.org

WARNING
The engine must not operate with:
- diesel fuel containing more than 10 % diester,
- petrol, even in tiny quantities.

The system injects diesel fuel into the engine at a pressure of up to **1600 bar**. Before each operation, check that the injector rail is depressurised and that the fuel temperature is not too high.

When working on the high pressure injection system, you must follow the cleanliness guidelines and safety advice specified in this document.

Removal of the internal parts of the pump and injectors is prohibited. Only the fuel flow actuator and the diesel fuel temperature sensor can be replaced.

For safety reasons, it is strictly prohibited to undo a high pressure pipe union when the engine is running.

It is not possible to remove the pressure sensor from the fuel rail because this may cause circuit contamination faults. If the pressure sensor fails, replace the pressure sensor, the rail and the high pressure pipes.

Supplying + 12 V directly to any component in the system is prohibited.

Ultrasonic decoking and cleaning are prohibited.

Never start the engine unless the battery is connected correctly.

Disconnect the injection computer when carrying out any welding work on the vehicle.

GETtheMANUALS.org

b) Management of cruise control/speed limiter:

When activated, the cruise control function maintains the vehicle at a preselected speed, regardless of the driving conditions encountered. Using the control buttons, the driver can increase or reduce the vehicle speed.

The cruise control function can be deactivated either using the control buttons, or by switching off the cruise control function selection switch or when system events are detected (such as the brake pedal being depressed), or when system errors are detected such as an inconsistent vehicle speed or excessive vehicle deceleration.

The cruise control function can also be temporarily suspended when the driver wants to resume control of the vehicle and exceed the selected cruising speed by depressing the accelerator pedal which then exceeds the selected fuel flow. The cruising speed is resumed when the driver releases the accelerator pedal.

The cruise control function can be reactivated and the last cruising speed can be resumed after deactivating the function for whatever reason until the vehicle ignition is switched off (i.e. for as long as computer supply not cut off). The vehicle will then attempt to return to the cruising speed using a controlled vehicle acceleration rate.

When switched on (with the selection switch), the vehicle speed limiter function limits the vehicle speed to a preset value. The driver controls the vehicle in the normal way using the accelerator pedal until the limit speed is reached. If an attempt is made to exceed this speed, the system will ignore the pedal request and will control the vehicle speed in the same way as the cruise control function, provided that the driver keeps the accelerator pedal depressed.
As with the cruise control function, the limit speed can be altered using the control buttons by pressing briefly or pressing and holding.
For safety reasons, it is possible to exceed the limit speed by rapidly depressing the accelerator pedal. The vehicle speed is then controlled by the pedal according to the driver's request. The vehicle's speed limiter is reactivated when the vehicle speed drops below the limit speed again.

The driver has the following controls for the cruise control/speed limiter function:
- accelerator pedal,
- brake pedal,
- function selection switch for selecting speed limiter or cruise control operating mode,
- controls at the steering wheel.

GETtheMANUALS.org

Instrument panel display:

The computer manages the data display on the instrument panel relating to engine operation. This involves 5 functions:
– the EOBD (European On Board Diagnostic) MIL (Malfunction Indicator Lamp),
– pre-postheating,
– the coolant temperature,
– engine faults:
  - Level 1 (non critical fault)
  - Level 2 (emergency stop).

These five functions are represented by 4 warning lights and/or messages displayed by the trip computer.

Pre-postheating warning light:

Permanently on, supplied by + after ignition feed:
indicates preheating of the plugs (automatic timed operation lasting 3 to 6 seconds).

Temperature warning/emergency stop light (level 2):

This light is used as an operation indicator light and as a system fault warning light.
It switches on for 3 seconds when a voltage is applied (automatic test procedure controlled by the instrument panel).

Permanently on: this indicates engine overheating or a level 2 fault.

If the fault reaches a critical level, the injection cuts off automatically after a few seconds. In the event of overheating, it is up to the driver whether to stop the vehicle or continue driving.

OPERATION OF INSTRUMENT PANEL WARNING LIGHTS:

Orange SERVICE non-critical fault warning light (level 1):

This warning light comes on, **along with the "check injection" message**.

The driver should carry out repairs as soon as possible.

Red STOP emergency stop warning light (level 2):

This warning light comes on, **accompanied by the "faulty injection" message.**

The driver should carry out repairs as soon as possible.

Orange OBD excess pollution warning light:

This warning light is represented by an engine, and comes on for approximately 2 seconds when the ignition is switched on, and then goes out.

Continuous lighting: indicates a fault in an engine component preventing emission control standards being met.

The driver should carry out repairs as soon as possible.

COMPUTER REPLACEMENT OR REPROGRAMMING

The system can be programmed and reprogrammed via the diagnostic socket using the RENAULT CLIP diagnostic tool (**Consult Technical Note 3585A or follow the instructions provided by the diagnostic tool**).

IMPORTANT
- **switch on the diagnostic tool (mains or cigarette lighter supply),**
- **connect a battery charger,**
- **shut down all the electrical consumers (lights, interior lights, air conditioning, radio CD, etc.),**
- **wait for the engine to cool (engine coolant temperature below 60 ˚C and air temperature below 50 ˚C).**

Every time the computer has been reprogrammed or replaced
- **switch the ignition off and then on again.**
- **start and then stop the engine (for automatic programming) and wait 40 seconds.**
- **use the diagnostic tool to carry out the following procedures:**
  1.Use the **VP010 Write VIN** command.
  2. Carry out a road test followed by another check with the diagnostic tool.

IMPORTANT
It is not possible to try an injection computer coming from the Parts Department because it will no longer be possible to use it on another vehicle.

GETtheMANUALS.org

Summary of available settings

NOTES	The settings are made to inform the vehicle computer of the vehicle VIN and the engine idling speed.

VP010: Enter VIN
This setting allows the VIN to be entered in the injection computer.
Use this command each time the computer is replaced or (re)programmed.

VP007: Decrease idling speed
This setting is used to decrease the engine's idling speed by a maximum of 50 rpm, in 10 rpm steps.

VP011: Increase idling speed
This setting is used to increase the engine's idling speed by a maximum of 50 rpm, in 10 rpm steps.

VP036: Inhibit fuel supply
This command allows you to block the diesel circuit upstream of the injectors in order to carry out an engine cylinder compression test.

VP037: End fuel supply inhibition
This command restores fuel supply to the injectors.

DF001 PRESENT OR STORED	COOLANT TEMPERATURE SENSOR CIRCUIT CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 V DEF : Inconsistent data

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

CO.0	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – + after ignition feed present, – the coolant temperature sensor voltage is less than **0.12 V**.

Manipulate the wiring harness between the diesel computer and the coolant temperature sensor in order to detect a status change (present ↔ stored).
Look for possible damage to the harness, and check **the connection and the condition** of the coolant temperature sensor and its connections.
Repair if necessary.

If the fault is still present, check that the thermostat is working correctly.
Check the fill level and sealing of the cooling circuit (see **MR 353, MR 402 or MR 361 Mechanical, 19A, Cooling, Checks**).

Check for **insulation against earth, continuity and the absence of interference resistance** on the following connection:

Coolant temperature sensor **track 1** ⟶ **track B 99** of the diesel computer

Repair if necessary.

Check the **insulation from + 5 V and + 12 V, continuity and absence of interference resistance** on the following connection:

Coolant temperature sensor **track 2** ⟶ **track B 95** of the diesel computer

Repair if necessary.

Measure the **resistance** of the coolant temperature sensor between **tracks 1** and **2** of its connector.
Replace the sensor if the **resistance** is not:
3515 ± 200 Ω at 20 °C
992 ± 100 Ω at 50 °C
475 ± 50 Ω at 70 °C
244 ± 25 Ω at 90 °C

Clear the faults from memory and then start the engine.

If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF001 **CONTINUED 1**	

CC.1	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – + after ignition feed present, – the coolant temperature sensor voltage is greater than **4.9 V**.

Manipulate the wiring harness between the diesel computer and the coolant temperature sensor in order to detect a status change (present ↔ stored).
Look for possible damage to the harness, and check **the connection and the condition** of the coolant temperature sensor and its connections.
Repair if necessary.

If the fault is still present, check that the thermostat is working correctly.
Check the fill level and sealing of the cooling circuit (see **MR 353, MR 402 or MR 361 Mechanical, 19A, Cooling, Checks**).

Check for **insulation against earth, continuity and the absence of interference resistance** on the following connection:

Coolant temperature sensor **track 1** ⟶ **track B 99** of the diesel computer

Repair if necessary.

Check the **insulation from + 5 V and + 12 V, continuity and absence of interference resistance** on the following connection:

Coolant temperature sensor **track 2** ⟶ **track B 95** of the diesel computer

Repair if necessary.

Measure the **resistance** of the coolant temperature sensor between **tracks 1** and **2** of its connector.
Replace the sensor if the **resistance** is not:
3515 ± 200 Ω at 20 °C
992 ± 100 Ω at 50 °C
475 ± 50 Ω at 70 °C
244 ± 25 Ω at 90 °C

Clear the faults from memory and then start the engine.

If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF001 **CONTINUED 2**	

DEF	***NOTES***	**Priority when dealing with a number of faults:** Deal with **DF001 CC.0** and **CO.1** first if they are present or stored.
		Conditions for applying the fault finding procedure to stored faults: The fault is declared as present if: – following an engine start. – the battery voltage is low, – fault detection time between **14** and **19 min**.

Check the condition of the battery and the charging circuit (see **Technical Note 6014A Charging circuit check**). Check **the condition of the vehicle earths**.
Manipulate the wiring harness between the diesel computer and the coolant temperature sensor in order to detect a status change (present ↔ stored). Look for possible damage to the harness, and check **the connection and the condition** of the coolant temperature sensor and its connections. Repair if necessary.
If the fault is still present, check that the thermostat is working correctly. Check the fill level and sealing of the cooling circuit (see **MR 353, MR 402 or MR 361 Mechanical, 19A, Cooling, Checks**).
Check for **insulation against earth, continuity and the absence of interference resistance** on the following connection: Coolant temperature sensor **track 1** ⟶ **track B 99** of the diesel computer Repair if necessary.
Check the **insulation from + 5 V and + 12 V, continuity and absence of interference resistance** on the following connection: Coolant temperature sensor **track 2** ⟶ **track B 95** of the diesel computer Repair if necessary.
Measure the **resistance** of the coolant temperature sensor between **tracks 1** and **2** of its connector. Replace the sensor if the **resistance** is not: **3515 ± 200 Ω at 20 °C** **992 ± 100 Ω at 50 °C** **475 ± 50 Ω at 70 °C** **244 ± 25 Ω at 90 °C**
Clear the faults from memory and then start the engine.
If the conformity check does not detect the fault, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF003 PRESENT OR STORED	ATMOSPHERIC PRESSURE SENSOR CIRCUIT CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 V

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

CO.0	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the atmospheric pressure sensor voltage is less than **1.16 V**. – the engine is started, – Fault detection time **3 seconds**.

Clear the fault with the diagnostic tool.
If the fault is still present, deal with any other faults. If the fault is still present, **contact Techline**.

CC.1	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the atmospheric pressure sensor voltage is greater than **4.6 V**. – the engine is started, – Fault detection time **3 seconds**.

Clear the fault with the diagnostic tool.
If the fault is still present, deal with any other faults. If the fault is still present, **contact Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF015 STORED	MAIN RELAY control CIRCUIT CO : Open circuit CC.0 : Short circuit to earth

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the computer detects an open circuit on **track A 76** or absence of supply on **tracks A 1** and **A 2**, – the engine is switched off.
	Special notes: Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

Manipulate the wiring harness between the diesel computer and the main relay (injection locking relay) to detect a status change (present ↔ stored)
Look for possible damage to the harness, and check **the connection and the condition** of the main relay and its connections.
Repair if necessary.

Check the computer supply voltage **F1 (15A)** fuse, repair if necessary.

Check **the continuity** of the following line:

Main relay **track 15** ⟶ Diesel computer **track A 76**

Repair if necessary.

Check for **insulation from earth, continuity and the absence of interference resistance** on the following connections:

Main relay **track 13** ⟶ Diesel computer **track A 1**

Main relay **track 13** ⟶ Diesel computer **track A 2**

Repair if necessary.

Change over the main relay with another similar relay.
If the fault disappears, replace the relay.

Check for **+ 12 V** on **tracks 16** and **14** of the relay.
Repair if necessary.

Clear the fault memory and start the engine.
If the fault is still present, **contact Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF038 PRESENT OR STORED	COMPUTER 1.DEF: Internal electronic fault

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present if the computer detects an internal electrical malfunction.
	Special notes: Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

If the fault is **stored** or **present**, clear the fault from the computer memory.
Switch off the ignition, wait **40 s**, then switch the ignition on again and re-establish dialogue.

If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF039 PRESENT OR STORED	INLET AIR TEMPERATURE SENSOR CIRCUIT CO.0 : Short circuit to earth CC.1 : Short circuit or open circuit to + 12 V

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors. **Only affects the OBD air temperature sensor at the flow sensor.** **ONLY FOR VDIAG 04 AND 08**

CO.0	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the air temperature sensor voltage is less than **0.12 V**. – + after ignition feed present.

Move the wiring harness between the diesel computer and the air temperature sensor in order to detect a status change (present ↔ stored).
Look for possible damage to the harness, and check **the connection and the condition** of the air temperature sensor and its connections.
Repair if necessary.

Check for **insulation from earth, continuity and the absence of interference resistance** on the following connections:

Diesel computer **track A 11** ⟶ **Earth**

Repair if necessary.

Measure the **resistance** of the air temperature sensor between **tracks 1** and **2** of its connector.
Replace the sensor if the **resistance** is not:
5728 ± 300 Ω at 10 °C
3515 ± 200 Ω at 20 °C
2268 ± 100 Ω at 30 °C

If the fault is still present, deal with any other faults.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF039 **CONTINUED**	

		Priority when dealing with a number of faults: Deal with fault **DF001 Coolant temperature sensor circuit** first, if it is present or stored.
CC.1	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the air temperature sensor voltage is less than **4.9 V**. – + after ignition present, – engine coolant temperature above **- 25 ˚C**.

Move the wiring harness between the diesel computer and the air temperature sensor in order to detect a status change (present ↔ stored).
Look for possible damage to the harness, and check **the connection and the condition** of the air temperature sensor and its connections.
Repair if necessary.

Check the **insulation, continuity and absence of interference resistance** on the following connections:

Air temperature sensor **track 2** ⟶ Diesel computer **track A 11**

Air temperature sensor **track 1** ⟶ Diesel computer **track A 29**

Repair if necessary.

Measure the **resistance** of the air temperature sensor between **tracks 1** and **3** of its connector.
Replace the sensor if the **resistance** is not:
5728 ± 300 Ω at 10 ˚C
3515 ± 200 Ω at 20 ˚C
2268 ± 100 Ω at 30 ˚C

If the fault is still present, deal with any other faults.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

DF040 PRESENT OR STORED	CYLINDER 1 INJECTOR CIRCUIT CC : Short circuit CO : Open circuit CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 V

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

CC	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the line voltage is greater than **0.2 V**, – ignition on, – the engine is stopped.

Manipulate the wiring harness between the diesel computer and injector 1 to detect a change in status (present ↔ stored).
Look for any harness damage, and check **the condition and connection** of injector 1 and its connections.
Repair if necessary.

Check the **continuity, insulation from + 12 V and the absence of interference resistance** for the following connection:

Diesel computer **track B 95** ⟶ **track 2** of injector 1

Repair if necessary.

Measure the **resistance** of the injector 1 coil between **tracks 1** and **2** of the injector connector.
Replace the injector if there is a **short circuit (R = 0 Ω)** or an **open circuit (resistance = infinity)**.

If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF040 **CONTINUED 1**	

CO	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the line voltage is greater than **4.8 V**. – ignition on, – the engine is stopped.

Manipulate the wiring harness between the diesel computer and injector 1 to detect a change in status (present ↔ stored).
Look for any harness damage, and check **the condition and connection** of injector 1 and its connections.
Repair if necessary.

Check for **insulation against earth, continuity and the absence of interference resistance** on the following connection:

Diesel computer **track B 90** ⟶ **track 1** of injector 1

Repair if necessary.

Measure the **resistance** of the injector 1 coil between **tracks 1** and **2** of the injector connector.
Replace the injector if there is a **short circuit (R = 0 Ω)** or an **open circuit (resistance = infinity)**.

If the fault is still present**, contact the Techline**.

CC.1	***NOTES***	**Priority when dealing with a number of faults:** Deal with **DF217 (DEF) Sensor supply voltage no. 2** first if it is present or stored.
		Conditions for applying the fault finding procedure to stored faults: The fault is declared as present if: – the air flow sensor voltage is greater than **4.9 V**. – + after ignition feed present.

Manipulate the wiring harness between the diesel computer and the air flow sensor to detect a change in status (present '↔ stored).
Look for possible damage to the harness, and check **the condition and connection** of the air flow sensor and its connections.
Repair if necessary.

Check the **continuity, insulation from + 12 V and the absence of interference resistance** for the following connection:

Air flow sensor **track 5** ⟶ Diesel computer **track A 30**

Repair if necessary.

Check for **insulation against earth, continuity and the absence of interference resistance** on the following connection:

Air flow sensor **track 4** ⟶ Diesel computer **track A 26**

Repair if necessary.

Check **insulation from + 5 V, continuity and absence of interference resistance** on the following connection:

Air flow sensor **track 3** ⟶ Diesel computer **track A 11**

Repair if necessary.

Clear the faults from memory and then start the engine.
Check that the fault has disappeared.
If the fault reappears, replace the air flow sensor.

Clear the stored faults.
Restart the vehicle and wait **30 seconds**.

If the fault is still present, deal with any other faults.
Perform a new computer fault finding procedure; if the fault reappears contact the Techline.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF056 **CONTINUED 2**	

DEF	***NOTES***	**Priority when dealing with a number of faults:** Prioritise the other present or stored faults.
		Conditions for applying the fault finding procedure to stored faults: The fault is declared as present if: – engine speed between **650** and **1050 rpm** stabilised. – detection time greater than **5 seconds**.

Manipulate the wiring harness between the diesel computer and the air flow sensor to detect a change in status (present '↔ stored).
Look for possible damage to the harness, and check **the condition and connection** of the air flow sensor and its connections.
Repair if necessary.

Check the entire air inlet circuit:
– air inlet circuit sealing,
– air filter unit inlet not blocked and filter not clogged,
– no foreign bodies on the air flow sensor grille (visual inspection only).

IMPORTANT
Cleaning the grille with compressed air is prohibited.

Check that the air flow sensor is fitted correctly on the engine inlet air line.
If not, replace the air flow sensor.

Check the **insulation, continuity and absence of interference resistance** on the following connections:

Air flow sensor **track 5** → Diesel computer **track A 30**

Air flow sensor **track 4** → Diesel computer **track A 26**

Air flow sensor **track 3** → Diesel computer **track A 11**

Repair if necessary.

Clear the faults from memory and then start the engine.
Wait **30 seconds** then restart computer fault finding; if the fault reappears, check conformity of the engine with the different parameters.

If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

DF112 **CONTINUED 3**	

3.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the computer detects a major phase shift between the camshaft and the crankshaft. **During the starting phase:** – the engine speed is greater than **350 rpm.** – the engine coolant temperature is greater than **20 °C**; **Engine running:** – Engine speed greater than **670 rpm**.

Check that the camshaft position sensor connectors and the crankshaft position sensor connectors are in **good condition**.
Repair if necessary.

Check that the **shielding earth connection** of the camshaft position sensor's electric wiring harness is in **good condition**.

Check that the **timing belt** is correctly **tensioned** and **adjusted**.
Check that the **timing belt pulleys** are correctly **adjusted** on the camshafts and the crankshaft.

Check the **condition** and the **position** of the **target on the camshaft**.
Replace the target if it does not have **6 slots** in sound condition.
Check that the camshaft position sensor is in **good condition** and replace it if necessary.

Check the **condition** and the **position** of the **target on the crankshaft**.
Replace the target if it does not have **24 slots** in sound condition.
Check that the crankshaft position sensor is in **good condition** and replace it if necessary.

Check for **insulation against earth, continuity and the absence of interference resistance** on the following connection:

Diesel computer **track B 110** ⟶ **track 1** of the engine speed sensor

Repair if necessary.

Check for **insulation against earth, continuity and the absence of interference resistance** on the following connection:

Diesel computer **track B 111** ⟶ **track 2** of the engine speed sensor

Repair if necessary.

If the fault is still present, replace both sensors (see **MR 353, MR 402 or MR 361 Mechanical, 10A, Engine and peripherals**).
If the fault is still present, **contact Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

DF154 PRESENT OR STORED	FLYWHEEL SIGNAL SENSOR CIRCUIT 1.DEF: Engine speed sensor in open circuit 2.DEF: Engine speed inconsistency

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

1.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the computer only receives the camshaft position sensor signal, – the computer does not receive a flywheel sensor signal, – when the engine is running.

Check that the **battery** voltage is greater than **11.6 V**.
Check the **condition of the vehicle earths** and the charging circuit (see **Technical Note 6014A, Charging circuit check**).
Replace the battery if necessary.

Manipulate the wiring harness between the diesel computer and the flywheel signal sensor to detect a change in status (present ↔ stored).
Look for possible damage to the harness, and check **the connection and the condition** of the flywheel signal sensor and its connections.
Repair if necessary.

Check the **continuity and the absence of interference resistance** on the following connection:

Flywheel signal sensor **track 1** ⟶ Diesel computer **track B 110**

Repair if necessary.

Check the **continuity and the absence of interference resistance** on the following connection:

Flywheel signal sensor **track 2** ⟶ Diesel computer **track B 111**

Repair if necessary.

Check for **insulation against earth, continuity and the absence of interference resistance** on the following connection:

Diesel computer **track B 114** ⟶ **Earth**

Repair if necessary.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF154 **CONTINUED**	

If the fault is still present, check the **condition** of the flywheel signal sensor electric wiring harness **shielding earth**. Repair if necessary.
Check that the **shielding earth connection** of the camshaft position sensor's electric wiring harness is in **good condition**.
Measure the **resistance** of the flywheel signal sensor between **tracks 1** and **2** of its connector. Replace the sensor if the **resistance** is not between **1850 Ω and 2450 Ω at 20 ˚C**.
If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF175 PRESENT OR STORED	SUPPLY 1.DEF: Feed voltage too high. 2.DEF: Feed voltage too low

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

1.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present when: – the computer is supplied with a voltage greater than **15.8 V**. – the heating elements are disconnected, – when the engine is running.

Check the charging circuit (see **Technical Note 6014A, Charging circuit check**).
Check **the condition** of the **vehicle earths**.

Check that the feed voltage is around **14.4 V** and that it never exceeds **15.8 V**.
Repair if necessary.

Check the **continuity and the absence of interference resistance** on the following connection:

Diesel computer **track A 24** → **track 28** of the fuse box (F6)
→ **track 2** of the alternator

Repair if necessary.

If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF175 **CONTINUED 1**	

2.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the computer is supplied with a voltage less than **11.6 V**. – the heating elements are disconnected, – when the engine is running. **Special note:** – **level 2 fault warning light** illuminated.

Check the **condition of the battery** and the charging circuit (see **Technical Note 6014A, Charging circuit check**).
Check **the condition** of the **vehicle earths**.

Check that the feed voltage is around **14.4 V** and that it is never less than **11.6 V**.
Repair if necessary.

During the **starting phase**, check that the alternator is **working correctly**.
Replace the alternator if necessary.
If the alternator is not working correctly, check **the condition** of the **F3 fuse (30 A)**.
Repair if necessary.

A) Vehicle without alternator load shedding (refer to the **Wiring Diagrams** Technical Note for the vehicle):
Check for **continuity and the absence of interference resistance** on the following connection:

Alternator relay track 1 → **Track A24** of the injection computer
Alternator relay track 2 →

Repair if necessary.

B) Vehicle with alternator load shedding (refer to the **Wiring Diagrams** Technical Note for the vehicle):
Check for **+ 12 V** on **tracks 52** and **48** of the alternator load shedding relay (opto relay).
If the tracks are not powered, check the **condition** of the **F6 fuse (10 A)**.

Check the **continuity and the absence of interference resistance** on the following connection:

Fuse box (F3) **track 24** → **track 3** of the alternator

Repair if necessary.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF175 **CONTINUED 2**	

Check the **continuity and the absence of interference resistance** on the following connection:

Diesel computer **track A 53** → **track 50** of the alternator opto relay

Diesel computer **track A 24** → **track 28** of the fuse box (F6)

Fuse box (F6) **track 28** → **tracks 52** and **48** of the alternator opto relay

Alternator opto relay **track 51** → **track 2** of the alternator

Repair if necessary.

If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF176 PRESENT OR STORED	LOW-SPEED FAN UNIT CIRCUIT CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 V

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

CO.0	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the computer does not detect voltage on **track A 18** when operating the relay, – under + APC,
		Special note: Run the **AC038 Low speed fan relay** command to check whether the relay is working.

Manipulate the wiring harness between the diesel computer and the fan circuit to detect a status change (present ↔ stored)
Look for possible damage to the wiring harness, check **the connection and condition** of the fan circuit and its connections.
Repair if necessary.

Check the **continuity and the absence of interference resistance** on the following connection:

Low speed fan relay **track 11** ⟶ Diesel computer **track A 18**

Repair if necessary.

Check that the low speed fan unit relay **coil** is not cut and that the contacts are operational.
Replace the relay if necessary.

If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF176 **CONTINUED**	

CC.1	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present: – the computer does not detect voltage on **track A 18** when operating the relay.

DF197 PRESENT OR STORED	FUEL PRESSURE SIGNAL CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 V 1.DEF: Measured pressure too low 2.DEF: Measured pressure too high

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

CO.0	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present if the voltage on the fuel pressure signal line is greater than **4.7 V**.

Manipulate the wiring harness between the diesel computer and the fuel rail pressure sensor in order to detect a status change (present ↔ stored)
Look for possible damage to the harness, and check **the connection and the condition** of the fuel rail pressure sensor and its connections.
Repair if necessary.

Check for **insulation from earth**, **continuity and absence of interference resistance** on the fuel pressure signal connections:

Fuel pressure sensor **track 1** → Diesel computer **track B 106**

Fuel pressure sensor **track 1** → Diesel computer **track B 107**

Fuel pressure sensor **track 3** → Diesel computer **track B 98**

Repair if necessary.

Check for **earth** on the following connection:

Fuel pressure sensor **track 2** → Diesel computer **track B 87**

Repair if necessary.

If the fault is still present, replace the injection rail (see **MR 353, MR 402 or MR 361 Mechanical, 13B, Diesel injection, Injection rail**).
If the fault is still present, **contact Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF197 **CONTINUED 1**	

CC.1	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present if the voltage on the fuel pressure signal line is less than **0.7 V**.

Manipulate the wiring harness between the diesel computer and the fuel rail pressure sensor in order to detect a status change (present ↔ stored)
Look for possible damage to the harness, and check **the connection and the condition** of the fuel rail pressure sensor and its connections.
Repair if necessary.

Check the **insulation against + 5 and + 12 V, the continuity, and absence of interference resistance** on the fuel pressure signal connections:

Fuel pressure sensor **track 1** → Diesel computer **track B 106**

Fuel pressure sensor **track 1** → Diesel computer **track B 107**

Fuel pressure sensor **track 2** → Diesel computer **track B 87**

Repair if necessary.

Check for **+ 5 V** on the following connection:

Fuel pressure sensor **track 3** → Diesel computer **track B 98**

Repair if necessary.

If the fault is still present, replace the injection rail (see **MR 353, MR 402 or MR 361 Mechanical, 13B, Diesel injection, Injection rail**).
If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF197 **CONTINUED 2**	

1.DEF	***NOTES***	**Priorities when dealing with a number of faults:** Treat as a priority any other fault that is present or stored.
		Conditions for applying the fault finding procedure to stored faults: The fault is declared as present if: – there is no fuel pressure sensor short circuit or open circuit fault. – there is no power unit fault, – there is no rail pressure solenoid valve fault, – there is no fuel temperature fault. **During the starting phase:** – the rail pressure is greater than **150 bar**. – the engine speed is between **50** and **300 rpm**, – injection flow greater than **5 mm^3/stroke**. **Engine running:**- – the engine speed is between **500** and **5200 rpm**, – the fuel temperature less than **160 ˚C**, – pressure loop difference greater than **150 bar**.

Check the fuel pressure sensor connections.
Check the fuel pressure solenoid valve connections.
Check the engine management computer connections.
Repair if necessary.

Check the condition of the high pressure injection rail and make sure there is no leakage.
Check operation of the fuel pressure regulator (e.g., locked open).
a) For all Vdiags except VELSATIS Vdiag 04:
Check the **ET038 ENGINE** status and parameters **PR364 Fuel flow correction cylinder 1, PR405 Fuel flow correction cylinder 2, PR406 Fuel flow correction cylinder 3, PR365 Fuel flow correction cylinder 4, PR407 Fuel flow correction cylinder 5** and **PR408 Fuel flow correction cylinder 6**, see the conformity check in the **Fuel circuit** sub-function.
Replace the injection rail if necessary.
If the injectors are not faulty, first replace the regulator.
If the fault is still present, replace the high pressure pump (see **MR 353, MR 402, or MR 361 Mechanical, 13B, Diesel Injection, High pressure pump**).
b) For VELSATIS Vdiag 04:
Perform the conformity check in the **Fuel circuit** sub-function.

If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF197 **CONTINUED 3**	

2.DEF	***NOTES***	**Priorities when dealing with a number of faults:** Treat as a priority any other fault that is present or stored.
		Conditions for applying the fault finding procedure to stored faults: The fault is declared present: **Engine running:** – engine speed greater than **500 rpm**, – there is no fuel pressure sensor short circuit or open circuit fault. – there is no power unit fault, – **there is no rail pressure solenoid valve fault,** – there is no fuel temperature fault after acceleration.

Check the fuel pressure sensor connections.
Check the fuel pressure solenoid valve connections.
Check the engine management computer connections.
Repair if necessary.

Check the condition of the high pressure injection rail and make sure there is no leakage.
Check operation of the fuel pressure regulator (e.g., locked open).

– check the priming of the low pressure diesel circuit,
– also check the conformity of the diesel filter connections and that the diesel fuel is not saturated with water.
– check that there are no air bubbles between the filter and the low pressure pump,
– Check the seal of the low and high pressure diesel fuel circuits (visual inspection, odour, etc.): pump housing, overpressure valve, pipes, rail and injector unions, injector wells, etc.).

Step 1
– Check the connections of the following components:
- rail pressure sensor,
- fuel pressure regulator,
- computer,
- fuel temperature sensor,
- Also check the condition of the wiring harness (wear, pinching, etc.).

If all of the checks reveal no faults, proceed to stage 2.
Checking the fuel Low Pressure system:
Step 2
– Check the fuel level in the tank:
- Fill up if necessary and reproduce the fault. Otherwise, proceed to step 3.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF197 **CONTINUED 4**	

Step 3
– check that there are no fuel leaks (odour, etc.):
- repair if necessary, otherwise proceed to step 4.

Step 4
– check the sealing of the Low Pressure circuit:
- if there are air bubbles present or external leaks, check the filter bleed screw, and repair the leaks if necessary.
- if the pipes or hoses are worn or damaged, repair if necessary, otherwise proceed to step 5.

Step 5
– Check the fuel priming bulb:
- If the unit is compressed, check for the loss of load before the unit.
- if the engine is fitted with a priming pump, check the variation of flow in the fuel filter, otherwise go to step 6.

Step 6
– check the condition of the fuel filter:
- replace the filter if it is dirty. The fuel filter tank must be cleaned before the new filter is fitted, to prevent dust particles from being transferred to the high pressure pump and the high pressure circuit.

– ignition on, and engine stopped for over **1 minute**:
– display **PR038 Rail pressure**.
  – if the value is less than **50 bar**, the sensor is OK.
  – if not replace the rail pressure sensor.

For all Vdiags except VELSATIS Vdiag 04:
Check the **ET038 "ENGINE**" status and parameters **PR364 "Fuel flow correction cylinder 1", PR405 "Fuel flow correction cylinder 2", PR406 "Fuel flow correction cylinder 3", PR365 "Fuel flow correction cylinder 4", PR407 "Fuel flow correction cylinder 5"** and **PR408 "Fuel flow correction cylinder 6"**, see the conformity check in the **Fuel circuit** sub-function.

If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

DF198 PRESENT OR STORED	PEDAL SENSOR CIRCUIT GANG NO. 2 CO.0 : Open circuit or short circuit to earth CC : Short circuit

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

CO.0	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present if the voltage on the potentiometer no. 1 signal line is less than **0.17 V**.

Manipulate the wiring harness between the diesel computer and the accelerator potentiometer to detect a status change (present ↔ stored).
Look for any harness damage, and check **the condition and connection** of the accelerator potentiometer and its connections.
Repair if necessary.

Check the **continuity and the absence of interference resistance** on the following connection:

Accelerator potentiometer **track 5** ⟶ Diesel computer **track A 26**

Repair if necessary.

Check for insulation against earth, continuity and absence of interference resistance on the following connection:

Accelerator potentiometer **track 1** ⟶ Diesel computer **track A 11**

Repair if necessary.

Measure the **resistance** of pedal sensor no. 2 between **tracks 5** and **1**.
Replace the accelerator potentiometer if the **resistance** is not **1700 ± 500 Ω**.
If necessary replace the sensor.

If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF198 **CONTINUED**	

CC	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present if the voltage on the potentiometer no. 1 signal line is greater than **3.6 V**.

Manipulate the wiring harness between the diesel computer and the accelerator potentiometer to detect a status change (present ↔ stored).
Look for any harness damage, and check **the condition and connection** of the accelerator potentiometer and its connections.
Repair if necessary.

Check for insulation against earth, continuity and absence of interference resistance on the following connection:

Accelerator potentiometer **track 1** ⟶ Diesel computer **track A 11**

Repair if necessary.

Check the **continuity, insulation from + 12 V and the absence of interference resistance** for the following connection:

Accelerator potentiometer **track 6** ⟶ Diesel computer **track A 8**

Repair if necessary.

Measure the **resistance** of pedal sensor no. 2 between **tracks 5** and **1**.
Replace the accelerator potentiometer if the **resistance** is not **1700 ± 500 Ω**.
If necessary replace the sensor.

If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF208 PRESENT OR STORED	FUEL PRESSURE SOLENOID VALVE CIRCUIT 1.DEF: Open circuit or short circuit to earth 2.DEF: Short circuit to + 12 V 3.DEF: Open circuit or short circuit to earth 4.DEF: Short circuit

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

1.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the computer detects too low a voltage on **tracks B 120** and **B 121**.

Manipulate the wiring harness between the diesel computer and the regulation solenoid valves to detect a change in status (present ↔ stored).
Look for possible damage to the harness, and check **the condition and connection** of the regulating solenoid valves and connections.
Repair if necessary.

Check the **insulation, continuity and absence of interference resistance** on the following connections:

Both regulating solenoid valves **track 2** ⟶ Diesel computer **track B 116**

Repair if necessary.

If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF208 **CONTINUED 1**	

2.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – The computer detects **+ 12 V** on one of its control lines.

Manipulate the wiring harness between the diesel computer and the regulation solenoid valves to detect a change in status (present ↔ stored).
Look for possible damage to the harness, and check **the condition and connection** of the regulating solenoid valves and connections.
Repair if necessary.

Check for **continuity, absence of interference resistance and insulation from + 12 V** on the following connections:

Regulating solenoid valve no. 1 **track 1** → Diesel computer **track B 121**

Regulating solenoid valve no. 2 **track 1** → Diesel computer **track B 120**

Repair if necessary.

If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF208 **CONTINUED 2**	

3.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the computer detects a voltage of less than **12 V** on **track B 116**.

Manipulate the wiring harness between the diesel computer and the regulation solenoid valves to detect a change in status (present ↔ stored).
Look for possible damage to the harness, and check **the condition and connection** of the regulating solenoid valves and connections.
Repair if necessary.

Check for **insulation against earth, continuity and the absence of interference resistance** on the following connection:

Both regulating solenoid valves **track 2** → Diesel computer **track B 116**

Regulating solenoid valve no. 1 **track 1** → Diesel computer **track B 121**

Regulating solenoid valve no. 2 **track 1** → Diesel computer **track B 120**

Repair if necessary.

Measure the **resistance** of both solenoid valves between **tracks 1** and **2**.
Replace them if the **resistance** is not between **1.3 Ω** and **1.9 Ω**.

Ensure **insulation from earth** of the two solenoid valves, and replace them if necessary.

If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF208 **CONTINUED 3**	

4.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the computer detects a voltage of more than **12 V** on **tracks B 120** and **B 121**.

Manipulate the wiring harness between the diesel computer and the regulation solenoid valves to detect a change in status (present ↔ stored).
Look for possible damage to the harness, and check **the condition and connection** of the regulating solenoid valves and connections.
Repair if necessary.

Check for **insulation from earth, continuity and absence of interference resistance** on the following connections:

Both regulating solenoid valves **track 2** ⟶ Diesel computer **track B 116**

Repair if necessary.

Measure the **resistance** of both solenoid valves between **tracks 1** and **2**.
Replace them if the **resistance** is not between **1.3 Ω** and **1.9 Ω**.

If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF209 PRESENT OR STORED	EGR VALVE POSITION SENSOR CIRCUIT CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 V

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

CO.0	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present if the EGR position signal voltage is less than **1.1 V**.

Manipulate the wiring harness between the diesel computer and the EGR valve in order to detect a status change (present ↔ stored)
Look for possible damage to the wiring harness, check **the connection and the condition** of the EGR valve and its connections.
Repair if necessary.

Check for **insulation from earth, continuity and the absence of interference resistance** on the following connections:

EGR valve **track 1** → Diesel computer **track B 94**

EGR valve **track 3** → Diesel computer **track B 98**

Repair if necessary.

If the fault is still present, replace the EGR valve (see **MR 353, MR 402 or MR 361 Mechanical, 12A, Fuel mixture, Exhaust gas recirculation valve**).
If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF209 **CONTINUED**	

CC.1	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present if the EGR position signal voltage is greater than **4.7 V**.

Manipulate the wiring harness between the diesel computer and the EGR valve in order to detect a status change (present ↔ stored)
Look for possible damage to the wiring harness, check **the connection and the condition** of the EGR valve and its connections.
Repair if necessary.

Check the following connections for **insulation against + 12 V, continuity and absence of interference resistance**:

EGR valve **track 1** → Diesel computer **track B 94**

EGR valve **track 2** → Diesel computer **track B 87**

Repair if necessary.

Measure the **resistance** of the EGR valve between **tracks 4** and **5**.
Replace the EGR valve, if the resistance is not **6.8 ± 0.5 Ω at 20 °C**.
Measure the **resistance** of the EGR valve between **tracks 2** and **3**.
Replace the EGR valve if the resistance is not **5 ± 0.5 Ω at 20 °C**.
(see **MR 353, MR 402 Mechanical, 12A, Fuel mixture, Exhaust gas recirculation valve**).

If the fault is still present, replace the EGR valve (see **MR 353, MR 402 or MR 361 Mechanical, 12A, Fuel mixture, Exhaust gas recirculation valve**).
If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF216 PRESENT OR STORED	SENSOR FEED NO. 1 VOLTAGE DEF : Open circuit or short circuit to sensor power supply earth

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present when the computer detects an inconsistency in the power supply to its sensors. **Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

Sensor feed no. 1 is dedicated to the following components:
– fuel rail pressure sensor,
– gas recycling potentiometer,
– turbocharger pressure sensor,
– turbocharger position sensor.

Display parameter **PR215 Sensor power supply voltage no. 1**:
– If the voltage is less than **3.9 V** or greater than **4.1 V**, disconnect the sensors mentioned above one by one.

If, following disconnection, the voltage becomes normal again, replace the sensor concerned or repair the connection (wait a few seconds **between each disconnection** for the computer to make its measurement).
Clear the faults created by the multiple disconnections.
If, with sensors disconnected the voltage is still less than **3.9 V** or greater than **4.1 V**:
– check for **insulation against earth, continuity and the absence of interference resistance** on the following connection:

Injection computer **track B 98**
– Check the **insulation from + 5 V and + 12 V, continuity and absence of interference resistance** on the following connection:

Injection computer **track B 87**
– check for **+ 5 V** on **track B 98** of the injection computer and on each of its sensors.

If the fault is still present, check the computer connections.
If the fault is still present**, contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF217 PRESENT OR STORED	SENSOR SUPPLY VOLTAGE No. 2 DEF: Open circuit or short circuit to sensor power supply earth

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present when the computer detects an inconsistency in the power supply to its sensors.
	Special notes: Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

Sensor supply no. 2 is dedicated to the following components:
– fuel temperature sensor,
– coolant temperature sensor,
– correction resistance of injectors 1 to 6.

If, with sensors disconnected, the voltage is still less than **3.9 V** or greater than **4.1 V** :
– Check the **insulation from + 5V and +12V, continuity and absence of interference resistance** on the following connection:

Injection computer **track B 95.**

If the fault is still present, check the computer connections.
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF218 PRESENT OR STORED	MICROCONTROLLER DEF: Internal electronic fault

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: – the computer detects an internal electronic fault, – + after ignition feed on.

Clear the faults from memory and then start the engine.
Switch off the ignition and wait 40 seconds. Switch on + after ignition again. Check for present faults and deal with them. Clear the faults.
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF262 PRESENT OR STORED	HEATER PLUG GROUP NO. 1 CIRCUIT DEF: Row 1 heater plugs in CO.0

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is considered present if: – the voltage on the diagnostic line is greater than **4.7 V**.
	Special note: – run the **A C037 Preheating relay** command to check whether the relay is working. – use bornier **Elé. 1681** for all operations on the engine management computer connectors.

Check the condition of the **70 A** fuse for the rear preheating circuit. Replace it if necessary.
Check the **condition** of the supply lines **tracks 6, 4 and 2** between the preheating unit and the back row plugs and check their **insulation to earth** and their **continuity**. Repair if necessary.
Check the **condition** of preheating unit supply line **track 1** from the battery, and check its continuity. If everything is correct, replace the preheating unit.
Check the **condition** and **resistance** of the back row heater plugs. Replace the heater plugs if the **resistance** is greater than **30 Ω**.
Clear the fault memory and start the engine. **If the fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF263 PRESENT OR STORED	HEATER PLUG GROUP NO. 2 CIRCUIT DEF : Heater plugs row 2 in CO.0

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is considered present if: – the voltage on the diagnostic line is greater than **4.7 V**.
	Special note: – run the **A C037 Preheating relay** command to check whether the relay is working. – use bornier **Elé. 1681** for all operations on the engine management computer connectors.

Check the condition of the **70 A** fuse for the front preheating circuit. Replace it if necessary.
Check the **condition** of the supply lines **tracks 7, 5 and 3** between the preheating unit and the front row plugs and check their **insulation to earth** and their **continuity**. Repair if necessary.
Check the **condition** of the preheating unit supply line **track 1** from the battery, and check its continuity. If everything is correct, replace the preheating unit.
Check the **condition** and **resistance** of the front row heater plugs. Replace the heater plugs if the **resistance** is greater than **30 Ω**.
Clear the fault memory and start the engine. **If the fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF264 PRESENT OR STORED	POWER UNIT 1.DEF: Insulation fault on the injector power lines

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is considered present if: – the engine speed is greater than **500 rpm**, – the battery voltage is greater than **11 V**, – an insulation fault appears on the injector power lines.
	Special notes: Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

Disconnect the connector from the Power Unit.

Check for **+ 12 V** on **track 1** of the **black connector** of the Power Unit.
Check for earth on **track 8** of the **black connector** of the Power Unit.
Repair or replace the Power Unit if necessary (see **MR 353, MR 402 or MR 361 Mechanical, 13B, Diesel Injection, Power computer**).

Check for **insulation against earth, continuity and the absence of interference resistance** on the following connection:

Diesel computer **track A 66** ⟶ Power Unit **grey connector, track 2**

Repair if necessary.

If the fault is still present, replace the Power Unit (see **MR 353, MR 402 or MR 361 Mechanical, 13B, Diesel injection, Power computer**).

Clear the fault memory and start the engine.
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF265 PRESENT OR STORED	INJECTOR NO. 1 DEF: Injector mechanical fault

NOTES	**Priority when dealing with a number of faults:** Deal with all other faults first if they are present or stored.
	Conditions for applying the fault finding procedure to stored faults: The fault is considered present if: – vehicle speed is zero, – engine speed is less than **850 rpm**, – the engine coolant temperature is greater than **70˚C**, – fault detection time is **10 seconds**.
	Special notes: Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

With the engine stopped, disconnect the connector from injector 1.

Measure the **resistance** of the injector 1 coil between **tracks 1** and **2** of the injector connector.
Replace the injector if it is in **short circuit (R = 0 Ω)** or in **open circuit (resistance measurement = infinity).**
Otherwise, **reconnect injector no. 1**.
If **the fault is still present**, apply **test 10 Poor injector operation**.

Clear the fault memory and start the engine.
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF266 PRESENT OR STORED	INJECTOR No.2 DEF: Injector mechanical fault

NOTES	**Priority when dealing with a number of faults:** Deal with all other faults first if they are present or stored.
	Conditions for applying the fault finding procedure to stored faults: The fault is considered present if: – vehicle speed is zero, – engine speed is less than **850 rpm**, – the engine coolant temperature is greater than **70˚C**, – fault detection time is **10 seconds**.
	Special notes: Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

With the engine stopped, disconnect the connector from injector 2.
Measure the **resistance** of injector 2 coil between **tracks 1** and **2** of the injector connector. Replace the injector if it is in **short circuit (R = 0 Ω)** or in **open circuit (resistance measurement = infinity).** Otherwise, **reconnect injector no. 2**. If **the fault is still present**, apply **test 10 Poor injector operation**.
Clear the fault memory and start the engine. **If the fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF267 PRESENT OR STORED	INJECTOR no. 3 DEF: Injector mechanical fault

NOTES	**Priority when dealing with a number of faults:** Deal with all other faults first if they are present or stored.
	Conditions for applying the fault finding procedure to stored faults: The fault is considered present if: – vehicle speed is zero, – engine speed is less than **850 rpm**, – the engine coolant temperature is greater than **70˚C**, – fault detection time is **10 seconds**.
	Special notes: Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

With the engine stopped, disconnect the connector from injector 3.
Measure the **resistance** of the coil for injector 3 between **tracks 1** and **2** of the injector connector. Replace the injector if it is in **short circuit (R = 0 Ω)** or in **open circuit (resistance measurement = infinity).** Otherwise, **reconnect injector no. 3**. If **the fault is still present**, apply **test 10 Poor injector operation**.
Clear the fault memory and start the engine. **If the fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF268 PRESENT OR STORED	INJECTOR no. 4 DEF : Injector mechanical fault

NOTES	**Priority when dealing with a number of faults:** Deal with all other faults first if they are present or stored.
	Conditions for applying the fault finding procedure to stored faults: The fault is considered present if: – vehicle speed is zero, – engine speed is less than **850 rpm**, – the engine coolant temperature is greater than **70˚C**, – fault detection time is **10 seconds**.
	Special notes: Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

With the engine stopped, disconnect the connector from injector 4.
Measure the **resistance** of the coil for injector 4 between **tracks 1** and **2** of the injector connector. Replace the injector if it is in **short circuit (R = 0 Ω)** or in **open circuit (resistance measurement = infinity).** Otherwise, **reconnect injector no. 4**. If **the fault is still present**, apply **test 10 Poor injector operation**.
Clear the fault memory and start the engine. **If the fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF269 PRESENT OR STORED	INJECTOR NO. 5 DEF: Injector mechanical fault

NOTES	**Priority when dealing with a number of faults:** Deal with all other faults first if they are present or stored.
	Conditions for applying the fault finding procedure to stored faults: The fault is considered present if: – vehicle speed is zero, – engine speed is less than **850 rpm**, – the engine coolant temperature is greater than **70˚C**, – fault detection time is **10 seconds**.
	Special notes: Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

Engine stopped, disconnect the connector from injector 5.
Measure the **resistance** of the coil for injector 5 between **tracks 1** and **2** of the injector connector. Replace the injector if it is in **short circuit (R = 0 Ω)** or in **open circuit (resistance measurement = infinity).** Otherwise, **reconnect injector no. 5**. If **the fault is still present**, apply **test 10 Poor injector operation**.
Clear the fault memory and start the engine. **If the fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF270 PRESENT OR STORED	INJECTOR NO. 6 DEF: Injector mechanical fault

NOTES	**Priority when dealing with a number of faults:** Deal with all other faults first if they are present or stored.
	Conditions for applying the fault finding procedure to stored faults: The fault is considered present if: – vehicle speed is zero, – engine speed is less than **850 rpm**, – the engine coolant temperature is greater than **70˚C**, – fault detection time is **10 seconds**.
	Special notes: Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

With the engine stopped, disconnect the connector from injector ?6?.
Measure the **resistance** of the coil for injector 6 between **tracks 1** and **2** of the injector connector. Replace the injector if it is in **short circuit (R = 0 Ω)** or in **open circuit (resistance measurement = infinity).** Otherwise, **reconnect injector no. 6**. If **the fault is still present**, apply **test 10 Poor injector operation**.
Clear the fault memory and start the engine. **If the fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF324 PRESENT OR STORED	OBD AIR TEMPERATURE SENSOR CIRCUIT CC.1: Short circuit to + 12 V CO.0: Open circuit or short circuit to earth

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors. **Does not involve the air inlet temperature sensor.** **ONLY FOR VDIAG 08 AND 0C**

CC.1	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present if the sensor voltage is greater than **4.9 V**.

Manipulate the wiring harness between the diesel computer and the OBD air temperature sensor to detect a change of status (present ´ stored).
Look for possible damage to the harness, and check the **connection** and **the condition** of the OBD air temperature sensor and its connections.
Repair if necessary.

Check for **the continuity, the absence of interference resistance and insulation against + 5 V and + 12 V** on the following connections:

Diesel computer **track B 109** ⟶ **track 1** of the OBD air temperature sensor

If the fault is still present, check **the connection** and **condition** of **intermediate connector R115**.
Repair if necessary.

Measure the **resistance** between **tracks 1** and **3** of the OBD air temperature sensor.
Replace the sensor if the **resistance** is not:
5516 ± 400 Ω at 0˚C
3728 ± 300 Ω at 10˚C
2515 ± 200 Ω at 20˚C

If the fault is still present, apply **test 5 Air flowmeter**.
Repair if necessary.
If the fault is still present, apply **test 4 Checking the turbocharging and air inlet circuit**.
Repair if necessary.
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF324 **CONTINUED**	

CO.0	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present if the sensor voltage is less than **0.12 V**.

Manipulate the wiring harness between the diesel computer and the OBD air temperature sensor to detect a change of status (present ↔ stored).
Look for possible damage to the harness, and check **the connection and the condition** of the OBD air temperature sensor and its connections.
Repair if necessary.

Check the **insulation against earth, continuity and the absence of interference resistance** on the following connection:

Diesel computer **track B 109** ⟶ **track 1** of the OBD air temperature sensor

If the fault is still present, check **the connection** and **condition** of **intermediate connector R115**.
Repair if necessary.

Check the **continuity and lack of interference resistance** of the connection:

Diesel computer **track A 11** ⟶ **track 3** of the OBD air temperature sensor

Repair if necessary.

Measure the **resistance** between **tracks 1** and **3** of the OBD air temperature sensor.
Replace the sensor if the **resistance** is not:
5516 ± 400 Ω at 0˚C
3728 ± 300 Ω at 10˚C
2515 ± 200 Ω at 20˚C

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF325 PRESENT OR STORED	EXHAUST GAS RECIRCULATION FUNCTION CC.1: Short circuit to + 12 V CO.0: Open circuit or short circuit to earth 1.DEF: Excessive EGR valve flow 2.DEF: Insufficient EGR valve flow 3.DEF: EGR valve position feedback loop error

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

CC.1	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is considered present if: – inconsistency with the EGR valve control voltage when it is operated, – the battery voltage is too low.

Manipulate the wiring harness between the diesel computer and the EGR valve to detect a change in status (present ⇔ stored).
Look for possible damage to the harness, and check **the connections and condition** of the EGR valve and its connections.
Repair if necessary.

Check the **insulation from + 5V and +12 V, continuity and absence of interference resistance** on the following connection:

Diesel computer **track B 115** ⟶ **track 4** of the EGR valve

Diesel computer **track B 87** ⟶ **track 2** of the EGR valve

Repair if necessary.

Measure the **resistance** of the EGR valve between **tracks 4** and **5**.
Replace the EGR valve if the resistance is not **6.8 ± 0.5 Ω at 20˚C**.
Measure the **resistance** of the EGR valve between **tracks 2** and **3**.
Replace the EGR valve if the resistance is not **5 ± 0.5 kΩ at 20˚C**.
(see **MR 353, MR 402 Mechanical, 12A, Fuel mixture, Exhaust gas recirculation valve**).

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF325 **CONTINUED 1**	

CO.0	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is considered present if: – with the engine running, – the battery voltage is too low.

Manipulate the wiring harness between the diesel computer and the EGR valve to detect a change in status (present ↔ stored).
Look for possible damage to the harness, and check **the connections and condition** of the EGR valve and its connections.
Repair if necessary.

Check the **insulation against earth, continuity and the absence of interference resistance** on the following connection:

Diesel computer **track B 115** ⟶ **track 4** of the EGR valve

Repair if necessary.

Measure the **resistance** of the EGR valve between **tracks 4** and **5**.
Replace the EGR valve if the resistance is not **6.8 ± 0.5 Ω at 20˚C**.
Measure the **resistance** of the EGR valve between **tracks 2** and **3**.
Replace the EGR valve if the resistance is not **5 ± 0.5 kΩ at 20˚C**.
(see **MR 353, MR 402 Mechanical, 12A, Fuel mixture, Exhaust gas recirculation valve**).

Check the **continuity and absence of interference resistance** of the connections::

Main relay **track 13** ⟶ **track 5** of the EGR valve

Diesel computer **tracks A 1** and **A 2** ⟶ **track 5** of the EGR valve

Ensure the presence of **+ 12 V** on **track A 1**
If the fault is still present, check **intermediate connector R 115** on **track 2**.
Repair if necessary.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF325 **CONTINUED 2**	

1.DEF ***2.DEF***	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present: – speed loop error less than **150 rpm**. – vehicle speed between **27 mph (45 km/h)** and **33 mph (55 km/h)**. – detection time **11 seconds**. – air intake temperature between **20** and **75˚C**, – if **1.DEF**: The difference between the EGR valve opening cyclic ratio and the EGR opening cyclic ratio setpoint is **greater than 20%**. – if **2.DEF**: The difference between the EGR valve opening cyclic ratio and the EGR valve opening cyclic ratio setpoint is **less than 29%**.
3.DEF		**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present: – with the engine running, – engine speed greater than **1700 rpm**, – detection time **11 seconds**. – engine coolant temperature between **70** and **100˚C**, – the recorded value of the EGR valve position and the estimated value of the EGR valve position is greater than **1 mm**, – the estimated value of the EGR valve position and the recorded value of the EGR valve position is greater than **4 mm**.

Manipulate the wiring harness between the diesel computer and the EGR valve to detect a change in status (present ↔ stored).
Look for possible damage to the harness, and check **the connections and condition** of the EGR valve and its connections.
Repair if necessary.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF325 **CONTINUED 3**	

Check that the EGR valve inlet duct and the inlet tracts on the manifold are not damaged (cracked manifold, pierced hoses), blocked or pinched. Check the extent of clogging of the EGR valve. Repair if necessary.
Clear the fault memory and start the engine. Repeat fault finding with the diagnostic tool. If the fault reappears, replace the EGR valve (see **MR 353, MR 402 or MR 361 Mechanical, 12A, Fuel mixture, Inlet manifold**).
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF374 PRESENT OR STORED	COMPUTER 1.DEF: Memory self-test

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present if the computer detects an internal electrical malfunction.
	Special notes: Use bornier **Elé. 1621** for all operations on the engine management computer connectors.

If the fault is **stored** or **present**, clear the fault from the computer memory.
Switch off the ignition, wait **40 s**, then switch the ignition on again and re-establish dialogue.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF767 PRESENT OR STORED	POWER UNIT 1.DEF: Loss of EDU power supply, injector control line CC.0 or CC.1

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is considered present if: – the engine speed is greater than **500 rpm**, – the battery voltage is greater than **11 V**, – the Power Unit loses its power supply, – or its injector control lines are short circuited to **earth** or to **+12 V**.
	Special notes: Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

Manipulate the wiring harness between the diesel computer and the Power Unit* to detect a change in status (present ↔ stored).
Look for possible damage to the harness, and check **the condition and connection** of the Power Unit and its connections.
Repair if necessary.

Check the **insulation from earth, continuity and the absence of interference resistance** on the following connections:

Diesel computer **track A 46** → **track 3** of the Power Unit
Diesel computer **track A 65** → **track 4** of the Power Unit
Diesel computer **track A 45** → **track 5** of the Power Unit
Diesel computer **track A 64** → **track 6** of the Power Unit
Diesel computer **track A 44** → **track 7** of the Power Unit
Diesel computer **track A 63** → **track 8** of the Power Unit

Repair if necessary.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF767 **CONTINUED**	

Check the **supply** of power to the Power Unit terminals. With the ignition on, check for **+ 12 V** on **track A 1** in contact and **track 1** of the Power Unit. Repair if necessary.
Check the **continuity, insulation from + 12 V and the absence of interference resistance** for the following connection: Diesel computer **track A 66** ⟶ **track 2** of the Power Unit Repair if necessary.
If the fault is still present, replace the Power Unit (see **MR 353, MR 402 or MR 361 Mechanical, 13B, Diesel injection, Power computer**).
Clear the fault memory and start the engine. **If the fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF768 PRESENT OR STORED	POWER UNIT 1.DEF: The diesel computer detects low power consumption by the Power Unit

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present: – if the diesel computer detects a low power consumption by the Power Unit, – at engine speeds above **500 rpm**, – If the battery voltage is greater than **11 V**; **Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

Manipulate the wiring harness between the diesel computer and the Power Unit to detect a change in status (present ↔ stored).
Look for possible damage to the harness, and check **the condition and connection** of the Power Unit connector and its connections.
Repair if necessary.

Check the **insulation and continuity** of the following connections:

Power Unit **track 1**	→	**track 4** of injectors no. 1 to 6
Power unit **track 7**	→	**track 3** of injectors no. 1
Power unit **track 6**	→	**track 3** of injectors no. 2
Power unit **track 5**	→	**track 3** of injectors no. 3
Power unit **track 4**	→	**track 3** of injectors no. 4
Power unit **track 3**	→	**track 3** of injectors no. 5
Power unit **track 2**	→	**track 3** of injectors no. 6

Power Unit = Injector control unit.
Repair if necessary.
If the connections are correct and the fault is still present, replace the Power Unit (see **MR 353, MR 402 or MR 361 Mechanical, 13B, Diesel injection, Power computer**).

Clear the fault memory and start the engine.
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the diagnostic tool. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF769 PRESENT OR STORED	OIL TEMPERATURE 1.DEF: Above maximum threshold

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present if the temperature is greater than **123˚C**.
	Special notes: Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

Manipulate the wiring harness between the diesel computer and the oil temperature sensor to detect a change of status (present ⇔ stored).
Look for possible damage to the harness, and check **the connection and the condition** of the oil temperature sensor and its connections.
Repair if necessary.

Measure the **resistance** between tracks **1** and **2** of the oil temperature sensor.
Replace the sensor if the **resistance** is not:
16100 ± 400 Ω at - 10˚C
9200 ± 300 Ω at 0˚C
3515 ± 200 Ω at 20˚C
1500 ± 100 Ω at 40˚C

If the fault is still present, check the engine cooling circuit (see **MR 353, MR 402 or MR 361 Mechanical, 19A, Cooling, Checks**).
Repair or replace the faulty components, if necessary.

If the fault is still present, contact the Techline.

ENGINE COOLING (CONTINUED 2)

Order	Function	Parameter or Status Check or Action	Display and notes	Fault finding
8	**Sensor voltage**	**PR083:** Air temperature sensor voltage	**3.3 ± 0.1 V at 80 ˚C**	In the event of a fault, apply the interpretation of faults **DF039 Air inlet temperature sensor circuit** (Vdiag 04, 08 only) **and DF324 OBD air temperature sensor circuit** (Vdiag 0C only).
9		**PR084:** Coolant temperature sensor voltage	**1.3 ± 0.1 V at 80 ˚C**	If there is a fault use the interpretation for **DF001 Coolant temperature sensor circuit**.
10		**PR085:** Oil temperature sensor voltage	**1.4 V ± 0.1 V at 80 ˚C**	In the event of a fault, apply the interpretation of **DF058 Oil temperature sensor circuit** (Vdiag 0C only).
11		**PR082:** Fuel temperature sensor voltage	**1.6 ± 0.1 V at 80 ˚C**	In the event of a fault, apply the interpretation of **DF098 Fuel temperature sensor circuit**.
12	**Coolant temperature warning light**	**ET027:** Coolant temperature warning light request	**INACTIVE**	**In the event of a fault with interpretation of ET027 "Coolant temperature warning light request",** run fault finding on the instrument panel.

GETtheMANUALS.org

NOTES	The values indicated in this conformity check are only given as examples. It is therefore essential to refer to the Technical Note which deals with your vehicle. **Test conditions:** engine warm, idling at **80 ˚C**.

HEATING

Order	Function	Parameter or Status Check or Action		Display and notes	Fault finding
1	**Coolant temperature**	**PR064:**	Coolant temperature	**80 ˚C ± 5 ˚C**	If there is a fault use the interpretation for **DF001 Coolant temperature sensor circuit**.
2	**Heating element**	**ET276:**	Heating elements	**WITH (depending on vehicle configuration)**	In the event of a fault, apply the interpretation of **ET276 Heating elements**.
3	**Sensor voltage**	**PR084:**	Coolant temperature sensor voltage	**1.3 ± 0.1 V at 80 ˚C**	If there is a fault use the interpretation for **DF001 Coolant temperature sensor circuit**.
4	**Heating element**	**ET205:**	Heating element no. 1 relay control	**INACTIVE at 80 ˚C**	In the event of a fault, apply the interpretation of **ET205 Heating element no. 1 relay control**.
5		**ET206:**	Heating element no. 2 relay control	**INACTIVE at 80 ˚C**	In the event of a fault, apply the interpretation of **ET206 Heating element no. 2 relay control**.
6		**ET207:**	Heating element no. 3 relay control	**INACTIVE at 80 ˚C**	In the event of a fault, apply the interpretation of **ET207 Heating element no. 3 relay control**.

GETtheMANUALS.org

NOTES	The values indicated in this conformity check are only given as examples. It is therefore essential to refer to the Technical Note which deals with your vehicle. **Test conditions:** engine warm, idling at **80 ˚C**.

CRUISE CONTROL/SPEED LIMITER

Order	Function	Parameter or Status Check or Action		Display and notes	Fault finding
1	**Vehicle speed**	**PR155:**	Vehicle speed	**Gives the vehicle speed in mph (km/h). 0 mph**	**Perform a fault finding procedure on the ABS computer.**
2	**Cruise control/ speed limiter**	**PR130:**	Cruise control setpoint	**0 mph**	In the event of a fault, apply the interpretation of **ET557 Deactivation by cruise control/speed limiter function**.
3		**ET042:**	Cruise control/ speed limiter	**INACTIVE LIMIT CRUISE**	If there is a fault, use the interpretation for **ET042 Cruise control/Speed limiter**.
4		**ET413:**	Cruise control/ speed limiter function	**INACTIVE SUSPEND RESUME MINUS PLUS INACTIVE**	In the event of a fault, apply the interpretation for **ET413 Cruise control/Speed limiter function**.
5		**PR178:**	Cruise control switch voltage (except VELSATIS Vdiag 04)	If **ET045** is **"INACTIVE", PR178 = 5 ± 0.1 V**. If **ET045** is **"PLUS", PR178 = 2.4 ± 0.1 V**. If **ET045** is **"MINUS", PR178 = 1.3 ± 0.1 V**. If **ET045** is **"SUSPEND", PR178 = 0.1 ± 0.1 V**. If **ET045** is **"RESUME", PR178 = 3.76 ± 0.1 V**.

GETtheMANUALS.org

ET003	ENGINE IMMOBILISER

NOTES	**Special note:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

ACTIVE	If status **ET003** is permanently **ACTIVE**, refer to the interpretation of the UCH fault finding note (see **87G, Connection unit**).
INACTIVE	When the ignition is switched on, and when driving, status **ET003** becomes **INACTIVE**. If this does not occur, refer to the interpretation of the UCH fault finding note (see **87G, Connection unit**).

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET012	PRIMARY BRAKE CONTACT

NOTES	**Special note:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

PRESSED

When the driver presses the brake pedal, status **ET012** becomes "**PRESSED**", and status **ET013 "Secondary brake contact"** becomes "**PRESSED**".

If the driver depresses the brake pedal and status **ET012** remains **RELEASED** and **the brake lights are operating**:
Check:
– the condition of the brake light switch contacts and connections.
– the **continuity and absence of interference resistance** on the following connection:

Diesel computer **track A 21** ⟶ brake switch **black connector, tracks B3 or 3**

Repair if necessary.

If the driver depresses the brake pedal and status **ET012** remains **PRESSED** and **the brake lights are not operating**:
Check:
– the condition of the bulbs, replace if necessary,
– the condition of the **F6 (20A)** fuse in the passenger compartment fuse box and relay,
– the presence of **+ 12 V** after ignition on **tracks A1** and **B1** or **track 2** of the switch,
– then remove the brake light switch and carry out the checks in the following table:

	Continuity between tracks	**Insulation between tracks**
Switch pressed (brake pedal released)	A1 and B3 Or 2 and 3	B1 and A3 Or 2 and 1
Switch released (brake pedal pressed)	B1 and A3 Or 2 and 1	A1 and B3 Or 2 and 3

If these checks are not in order, replace the brake light switch.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET012 CONTINUED	

RELEASED	When the driver releases the brake pedal, status **ET012** becomes **RELEASED**, and status **ET013 Secondary brake contact** becomes **RELEASED**. If this does not happen, check the condition and operation of the brake light switch by carrying out the checks associated with the **PRESSED** status.

Note:
The statuses **ET012 Primary brake contact** and **ET013 Secondary brake contact** are directly linked.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET013	SECONDARY BRAKE CONTACT

NOTES	**Special note:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

PRESSED

When the driver depresses the brake pedal, status **ET013** becomes "**PRESSED**", and status **ET012 "Primary brake contact"** becomes "**PRESSED**".

If the driver depresses the brake pedal and status **ET013** remains "**RELEASED**" and **the brake lights are operating**:
Check:
– the condition of the brake light switch contacts and connections.
– the **continuity and absence of interference resistance** on the following connection:

Diesel computer **track A 21** ⟶ brake switch **black connector, tracks B3 or 3**

Repair if necessary.

If the driver depresses the brake pedal and status **ET013** remains **PRESSED** and **the brake lights are not operating**:
Check:
– the condition of the bulbs, replace if necessary,
– the condition of the **F6 (20A)** fuse in the passenger compartment fuse box and relay,
– the presence of **+ 12 V** after ignition on **tracks A1** and **B1** or **track 2** of the switch,
– then remove the brake light switch and carry out the checks in the following table:

	Continuity between tracks	**Insulation between tracks**
Switch pressed (brake pedal released)	A1 and B3 Or 2 and 3	B1 and A3 Or 2 and 1
Switch released (brake pedal pressed)	B1 and A3 Or 2 and 1	A1 and B3 Or 2 and 3

If these checks are not in order, replace the brake light switch.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET013 CONTINUED	

RELEASED	When the driver releases the brake pedal, status **ET013** becomes **RELEASED**, and status **ET012 Primary brake contact** becomes **RELEASED**. If this does not happen, check the condition and operation of the brake light switch by carrying out the checks associated with the **PRESSED** status.

Note:
The statuses **ET012 Primary brake contact** and **ET013 Secondary brake contact** are directly linked.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET038	Engine

NOTES	**Special note:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

Except VELSATIS Vdiag 04

NORMAL	After starting the engine, status **ET038** becomes **NORMAL**. Run a multiplex network test (see **88B, Multiplex**).
STATUS 1:	Status **ET038** is permanently **STATUS 1** when the engine misfires (combustion fault). Perform a conformity check using the **Fuel circuit** sub-function. **Check:** – that the injectors are in good condition, – the compression rate, – the high pressure circuit sealing (leaks, etc.), – the other faults displayed by the diagnostic tool. If the fault is still present, contact Techline.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET042	CRUISE CONTROL/SPEED LIMITER

NOTES	**Special note:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

CRUISE CONTROL	When the driver presses the cruise control switch, status **ET042** must change to **CRUISE** and the **green** speed limiter warning light on the instrument panel must be displayed. Check the **insulation, continuity and absence of interference resistance** of the following connection: Diesel computer **track A 81** → **track A3** of the cruise control switch Repair if necessary.
	If the fault has still not been solved, look for possible damage to the wiring harness, check the **connections and condition** of the cruise control switch and its connections. Replace or repair if necessary. If the fault is still present, contact the Techline.

LIMITER	When the driver presses the cruise control switch, status **ET042** must change to **LIMIT** and the **orange** speed limiter warning light on the instrument panel must be displayed. Check the **insulation, continuity and absence of interference resistance** of the following connection: Diesel computer **track A 23** → **track B1** of the cruise control switch Repair if necessary.
	If the fault has still not been solved, look for possible damage to the wiring harness, check the **connections and condition** of the cruise control switch and its connections. Replace or repair if necessary. If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET077	IMPACT DETECTED

NOTES	**Special note:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

YES	If the vehicle has been involved in an accident, the injection computer receives the impact signal via the multiplex network and may switch off the ignition. Status **ET077** is **YES**. Switch off the ignition for **10 seconds**, then switch it back on, so the engine can be restarted. Test the multiplex network (see **88B, Multiplexing**) and deal with any faults present.
NO	Under normal operating conditions, status **ET077** is **NO** when the computer has received no impact signal.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET133	MAIN RELAY CONTROL

NOTES	**Special note:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

ACTIVE	Status **ET133** becomes **ACTIVE** when the main relay is supplied with power. If status **ET133** is permanently "**INACTIVE**", refer to the interpretation of fault **DF015 "Main relay control circuit"**.
INACTIVE	If status **ET133** is permanently "**INACTIVE**", refer to the interpretation of fault **DF015 "Main relay control circuit"**.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET134	PRE-POSTHEATING RELAY CONTROL

NOTES	**Special note:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

ACTIVE	When the ignition is switched on, status **ET134** becomes **ACTIVE** for a time that varies according to the engine coolant temperature. Both the relay and the heater plugs are then supplied. When the vehicle is started from cold, the injection computer always actuates the preheating unit to allow the vehicle to start more easily; the status becomes **ACTIVE** during the starting phase. After starting, the status should remain **ACTIVE** for a variable period depending on the engine coolant temperature. If the vehicle does not start and status **ET134** becomes "**ACTIVE**" when switching on the ignition or during the starting phase, a preheating connection or circuit component may be damaged.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET134 CONTINUED	

"ACTIVE" (CONTINUED)

Check:
– the **F12 (70A)** power fuse on the supply and power board,
– the **+ 12 V** feed to heater plugs after relay control, and the relay connections,
– the **continuity and absence of interference resistance** of the following connections:

Pre-postheating unit, white connector, **track 1**	→	Heater plug no. 1 **track 1**
Pre-postheating unit, purple connector, **track 1**	→	Heater plug no. 2 **track 1**
Pre-postheating unit, white connector, **track 2**	→	Heater plug no. 3 **track 1**
Pre-postheating unit, purple connector, **track 2**	→	Heater plug no. 4 **track 1**
Pre-postheating unit, white connector, **track 6**	→	Heater plug no. 5 **track 1**
Pre-postheating unit, purple connector, **track 6**	→	Heater plug no. 6 **track 1**

– the condition and correct connection of the contacts of the pre-postheating unit **R300** connector.

If the vehicle starts, the preheating has finished and status **ET134** remains "**ACTIVE**" during the engine operating phase, consult the interpretation of faults **DF186 "Heater plugs circuit", DF262 "Heater plugs no. 1 group circuit"** and **DF263 "Heater plugs no. 2 group circuit"**.

INACTIVE

If the vehicle does not start, the status remains **INACTIVE** and the preheating was not performed when the ignition was switched on or during the starting phase, check the following connections:

Diesel computer **track A 19**	→	Pre-postheating unit **green connector, track 8**
Diesel computer **track A 49**	→	Pre-postheating unit **green connector, track 9**
Diesel computer **track A 68**	→	Pre-postheating unit, purple connector, **track 9**

Repair if necessary.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET143	LOW-SPEED FAN ASSEMBLY RELAY CONTROL

NOTES	Apply the conformity check to see if the statuses are consistent with the operating programs of the system. If the vehicle is fitted with air conditioning, the fan assembly electrical circuit contains 2 relays. Fan assembly speed 1 relay will be run when the temperature of the engine coolant exceeds **96**˚ and will be dedicated to cooling of the engine as long as the engine coolant temperature does not exceed **99**˚. If the engine coolant temperature exceeds **99**˚, fan assembly speed 2 relay will be run and the engine cooling fan will run more quickly.

ACTIVE	When the coolant reaches **96 ˚C**, the diesel computer actuates the low speed fan relay and status **ET143** becomes **ACTIVE**. The relay then supplies the fan assembly and the cooling fan begins to turn. Run command **AC038 Low-speed fan assembly relay** and check visually that the cooling fan is turning. If this is not the case, carry out the following operations: – check the condition of the **F15 (60A)** fuse and the engine relay, – disconnect the low-speed and high-speed relays, check their operation and the condition of the connections. – repair if necessary, – Check for **+ 12 V** on **terminal 10** of the low-speed relay during its actuation, – then check the **continuity and the absence of interference resistance** of the following connection: Diesel computer **track A 18** ⟶ **track 11** of the low-speed relay

INACTIVE	If the engine temperature is lower than **96 ˚C**, the engine cooling fan cannot switch on and the low speed engine cooling fan relay cannot be run. Status **ET143** becomes **INACTIVE** when the control relay and the engine cooling fan are not supplied.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET144	HIGH-SPEED FAN ASSEMBLY RELAY CONTROL

NOTES	Apply the conformity check to see if the statuses are consistent with the operating programs of the system. If the vehicle is fitted with air conditioning, the fan assembly electrical circuit contains 2 relays. Fan assembly speed 2 relay will be actuated when the engine coolant temperature exceeds **99 ˚C** and will be dedicated to engine cooling as long as the engine coolant temperature does not exceed **102 ˚C**.

ACTIVE	When the coolant reaches **99 ˚C**, the diesel computer activates the high speed fan relay and status **ET144** becomes **ACTIVE**. The relay then supplies the fan assembly and the cooling fan begins to turn. Run command **AC039 High-speed fan assembly relay** and visually check that the cooling fan is turning. If this is not the case, carry out the following operations: – check the condition of the **F15 (60A)** fuse and the engine relay, – disconnect the fan unit relays, check their operation and the condition of the connections, – repair if necessary, – Check for the presence of **+ 12 V** on **terminal 6** of the fan unit and on **terminal 62** of the high speed relay when it is actuated, – then check the **continuity and absence of interference resistance** of the following connections: Diesel computer **track A 38** → **track 7** of the fan assembly relay Fan unit relay **track 7** → High speed relay **track 60**

INACTIVE	If the engine temperature is lower than **99 ˚C**, the engine cooling fan cannot switch on and the high speed engine cooling fan relay cannot be run. Status **ET144** becomes **INACTIVE** when the control relay and the engine cooling fan are not supplied.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET204	PREHEATING WARNING LIGHT CONTROL

NOTES	Apply the conformity check to see if the statuses are consistent with the operating programs of the system. Statuses **ET028 Level 1 fault warning light request** and **ET204 Preheating warning light control** are directly linked. If one is active, the other must assume the same status.

ACTIVE	Check that status **ET204** becomes **ACTIVE** and that the preheating warning light is activated when the ignition is switched on.
	Perform a fault finding procedure beforehand on the multiplex network.
	If the network is not correct (see **88B Multiplexing**).
	If the network diagnosis is OK, check:
	– the complete engine injection system,
	– deal with any faults,
	– If the fault is still present, check the preheating unit and the heater plugs using the following faults:
	  – **DF186 Heater plug circuit,**
	  – **DF262** Heater plug group no. 1 circuit
	  – **DF263 Heater plug group no. 2 circuit.**
	– check the preheating relay using command **AC037 Preheating relay**.
	– if the fault is still present, perform a fault finding procedure on the instrument panel (see **MR 353, MR 402 or MR 361 Mechanical, 83A, Instrument panel**),
	– If the fault is still present, contact the Techline.

INACTIVE	Status **ET204 "Preheating warning light control"** is "**INACTIVE**" when the preheating warning light is off.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET205	HEATING ELEMENT 1 RELAY CONTROL

NOTES	**Special note:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

ACTIVE

Status **ET205** becomes **ACTIVE** when the heating element no. 1 relay control is activated.
Where the heating element no. 1 relay is requested and status **ET205** is not **ACTIVE** when the ignition is switched on, a connection or circuit component of the heating element no. 1 relay may be damaged.

Check:
– the heating element no. 1 relay fuse **F14 (70 A)**,
– the heating element no. 1 relay mounting connections,
– the engine management computer connections,
– repair if necessary,
– check for **insulation from earth, continuity and absence of interference resistance** on the following connections:

Diesel computer **track A 1** → Heating element no. 1 relay **track 2**

Diesel computer **track A 2** → Heating element no. 1 relay **track 2**

– check the **continuity, insulation from + 12 V and the absence of interference resistance** for the following connection:

Diesel computer **track A 36** → Heating element no.1 relay **track 65**

INACTIVE

Status **ET205** becomes **INACTIVE** when the heating control is not activated.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET206	HEATING ELEMENT 2 RELAY CONTROL

NOTES	**Special note:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

ACTIVE

Status **ET206** becomes **ACTIVE** when the heating element no. 2 relay control is activated.
Where the heating element no. 2 relay is requested and status **ET206** is not **ACTIVE** when the ignition is switched on, a connection or circuit component of the heating element no. 2 relay may be damaged.

Check:
– the heating element no. 2 relay fuse **F13 (70 A)**,
– the heating element no. 2 relay mounting connections,
– the engine management computer connections,
– repair if necessary,
– check for **insulation from earth, continuity and absence of interference resistance** on the following connections:

Diesel computer **track A 1** → Heating element no. 2 relay **track 2**

Diesel computer **track A 2** → Heating element no. 2 relay **track 2**

– check the **continuity, insulation from + 12 V and the absence of interference resistance** for the following connection:

Diesel computer **track A 17** → Heating element no. 2 relay **track 3**

INACTIVE

Status **ET206** becomes **INACTIVE** when the heating control is not activated.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET207	HEATING ELEMENT No. 3 RELAY CONTROL

NOTES	**Special note:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

ACTIVE

Status **ET207** must be **ACTIVE** when the heating element no. 3 relay control is activated. Where the no. 3 relay is requested and status **ET207** is not **ACTIVE** when the ignition is switched on, a connection or circuit component of the heating element no. 3 relay may be damaged.

Check:
- the heating element no. 3 relay fuse **F14 (70 A)**,
- the heating element no. 3 relay mounting connections,
- the engine management computer connections,
- repair if necessary,
- check for **insulation from earth, continuity and absence of interference resistance** on the following connections:

  Diesel computer **track A 1** → Heating element no. 3 relay **track 2**

  Diesel computer **track A 2** → Heating element no. 3 relay **track 2**

- check the **continuity, insulation from + 12 V and the absence of interference resistance** for the following connection:

  Diesel computer **track A 56** → Heating element no. 3 relay **track 35**

INACTIVE

Status **ET207** becomes **INACTIVE** when the heating control is not engaged.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET273	ANTI-PERCOLATION

NOTES	**Special note:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

ACTIVE	Status **ET273** is "**ACTIVE**" when the engine management computer detects a high engine coolant temperature after the engine is stopped. The engine management program operates the fan to cool the engine and continuously checks the coolant temperature.
STANDBY	Status **ET273** is "**STANDBY**" when the engine has just been stopped. The status corresponds to an engine coolant temperature control phase after the engine has stopped. If the coolant temperature exceeds the maximum predefined threshold, status **ET273** becomes "**ACTIVE**". If the coolant temperature does not exceed the maximum predefined threshold in the set time, status **ET273 becomes INACTIVE**.
INACTIVE	Status **ET273** is "**INACTIVE**" when the engine coolant temperature is below the maximum threshold authorised by the engine management computer after the engine has stopped.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET276	HEATING ELEMENTS

NOTES	**Special note:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

Except VELSATIS Vdiag 04, but presence of heating elements on the vehicle

WITH	Status **ET276 Heating elements** is **WITH** when the vehicle is fitted with additional heating.
NONE	Status **ET276 Heating elements** is **WITHOUT** when the vehicle is not fitted with additional heating. If the vehicle is fitted with additional heating and heating element relays with status **ET276** set to **WITHOUT**, refer to the interpretation of the following statuses: **ET205 "Heating element no. 1 relay control",** **ET206 "Heating element no. 2 relay control",** **ET207 "Heating element no. 3 relay control".**

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET341	IMMOBILISER CODE PROGRAMMED

NOTES	**Special note:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

YES	Status **ET341** becomes **YES** if dialogue is possible between the UCH and the injection computer and the card code is recognised. Engine starting authorisation is only given if the code is recognised by the UCH computer, and status **ET003 Engine immobiliser** is **INACTIVE**.
NO	The code remains **NO** if dialogue between the UCH and the injection computer is not possible. Status **ET003 Engine immobiliser** is **ACTIVE**. The cause of the fault may be incorrect card programming (see **87G, Interconnection unit** and follow the **card programming** procedure. Where it does not stem from the card codes, perform a multiplex network test (see **88B, Multiplexing**). Where the fault finding procedure was performed by function, ensure that dialogue is present between the UCH, the Protection and Switching unit and the injection computer. If dialogue is not established, contact the Techline.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET413	CRUISE CONTROL/SPEED LIMITER FUNCTION

NOTES	**Special note:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

INACTIVE	Status **ET413** is **INACTIVE** when no cruise control function button has been pressed and parameter **PR178 Cruise control switch voltage** becomes **5 V**.

SUSPEND	Status **ET413** is "**SUSPEND**" when cruise control button "**0**" is pressed and parameter **PR178 "Cruise control switch voltage"** should be **0.1 V**. This button is situated to the right of the steering wheel. If status **ET413** does not change to **SUSPEND**, check the **R/0** cruise control button, and the condition of its connector. Repair if necessary. **To be able to remove the driver's airbag and carry out the measures in complete safety (**see **88C, Airbag and pretensioners).** Repair if necessary. Measure the **resistance** of the following connection, **after pressing the "0" button**: If the resistance is not approximately **0 Ω**, check the continuity of the connection when the button is not pressed. If there is continuity, replace the "R/0" control button. Measure the **resistance of the following connection, after pressing the "0"** button: Diesel computer **track A 10** ⟶ "R/0" button **track A2** Diesel computer **track A 11** ⟶ "R/0" button **track A1** If the connection is broken, repair it.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET413 CONTINUED 1	

RESUME

Status **ET413** is "**RESUME**" when cruise control button "**R**" is pressed and parameter **PR178 "Cruise control switch voltage"** should be **3.76 V**. This button is situated to the right of the steering wheel.
If status **ET413** does not change to **RESUME**, check the **R/0** cruise control button, and the condition of its connector. Repair if necessary.
To be able to remove the driver's airbag and carry out the measures in complete safety (see **88C, Airbag and pretensioners).**
Repair if necessary.
Measure the **resistance** of the following connection, **after pressing the "R" button**:
If the resistance is not approximately **900 Ω**, check the continuity of the connection when the button is not pressed.
If there is continuity, replace the "R/0" control button.

Measure the **resistance** of the following connection, **after pressing the R button**:

Diesel computer **track A 10** ⟶ "R/0" button **track A2**

Diesel computer **track A 11** ⟶ "R/0" button **track A1**

If the connection is broken, repair it.

PLUS

Status **ET413** is "**PLUS**" when cruise control button "**+**" is pressed and parameter **PR178 "Cruise control switch voltage"** should be **2.4 V**. This button is situated to the left of the steering wheel.
If status **ET413** does not change to **PLUS**, check the condition of the **+/-** cruise control button, and the condition of its connector. Repair if necessary.
To be able to remove the driver's airbag and carry out the measures in complete safety (see **88C, Airbag and pretensioners).**
Repair if necessary.
Measure the **resistance** of the following connection, **after pressing the "+" button**:
If the resistance is not approximately **300 Ω**, check the continuity of the connection when the button is not pressed.
If there is continuity, replace the "R/0" control button.

Measure the **resistance** of the following connection, after pressing the "**+**" button:

Diesel computer **track A 10** ⟶ "+/-" button **track A2**

Diesel computer **track A 11** ⟶ "+/-" button **track A1**

If the connection is broken, repair it.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET413 CONTINUED 2	

MINUS	Status **ET413** is "**MINUS**" when cruise control button "**-**" is pressed and parameter **PR178 "Cruise control switch voltage"** should be **1.3 V**. This button is situated to the left of the steering wheel. If status **ET413** does not change to **MINUS**, check the condition of the **+/-** cruise control button, and the condition of its connector. Repair if necessary. **Refer to the airbag technical note that applies to the vehicle to be able to remove the driver's airbag and carry out the measures in complete safety (see 88C, Airbag and pretensioners)**. Repair if necessary. Measure the **resistance** of the following connection, **after pressing the "-" button**: If the resistance is not approximately **100 Ω**, check the continuity of the connection when the button is not pressed. If there is continuity, replace the "R/0" control button. Measure the **resistance** of the following connection, **after pressing the "-" button**: Diesel computer **track A 10** ⟶ "+/-" button **track A2** Diesel computer **track A 11** ⟶ "+/-" button **track A1** If the connection is broken, repair it.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET556	DRIVER'S DEACTIVATION OF THE CRUISE CONTROL/SPEED LIMITER

NOTES	**Special notes:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

Note:
Cruise control can be activated when the vehicle speed exceeds **18 mph (30 km/h)**. Status **ET556** details 6 causes for cruise control deactivation.
IMPORTANT
To reinitialise the deactivations stored by the injection computer, use command RZ007 "Fault memory".

STATUS 1	**Brake pedal depressed**
	The cruise control function is deactivated each time the brake pedal is depressed. Status **ET556** becomes **STATUS 1**, when the vehicle is being driven, with cruise control active and the brake pedal depressed. If status **ET556** becomes "**STATUS 1**" without the brake pedal being depressed, consult the interpretation of statuses **ET012 "Primary brake contact"** and **ET013 "Secondary brake contact"**.

STATUS 2	**Traction control request**
	If the vehicle being diagnosed is fitted with traction control, the cruise control function is deactivated each time traction control is selected. Status **ET556** changes to **STATUS 2**, when driving, with cruise control active and traction control requested. If status **ET556** changes to **STATUS 2** without traction control request, refer to fault finding note relating to the vehicle's traction control system.

STATUS 3	**Suspend button pressed**
	Status **ET556** changes to **STATUS 3** when driving with Cruise control/Speed limiter active, if the driver presses the Cruise control/Speed limiter **0** button. If status **ET556** becomes **STATUS 3** without button **0** on the Cruise control/Speed limiter being pressed, consult the interpretation of status **ET413 Cruise control/Speed limiter function** and perform a fault finding procedure on control button **R/0** of the Cruise control/Speed limiter.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET556 CONTINUED	

STATUS 4	**Clutch pedal depressed**
	MANUAL GEARBOX ONLY The cruise control function is deactivated if the gearbox is no longer coupled to the engine (clutch pedal depressed). Status **ET556** becomes **STATUS 4** when driving, with cruise control active and the clutch pedal depressed. If status **ET556** becomes **STATUS 4** without the clutch pedal being depressed, consult the interpretation of status **ET233 Clutch pedal**.

STATUS 5	**Gear lever in neutral position**
	Status **ET556** changes to **STATUS 5**, when driving, with cruise control active and – if the driver puts the gear lever in neutral on a MANUAL GEARBOX without declutching or, – if gear lever is in neutral on an automatic transmission. This deactivates cruise control. If status **ET556** becomes **STATUS 5** without putting the gear lever in neutral on a manual gearbox without declutching, or without neutral on an automatic transmission, contact the Techline.

STATUS 6	**Inconsistency between the request and the vehicle speed**
	Status **ET556** changes to **STATUS 6** if the computer detects too great a difference between the speed requested by the driver and the vehicle speed. This may occur when driving, with cruise control active and where the difference between speeds is great. If status **ET556** changes to **STATUS 6** without a great difference in the speeds, contact the Techline.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET557	CRUISE CONTROL/SPEED LIMITER DEACTIVATION BY FUNCTION

NOTES	**Special notes:** Only perform these tests if the statuses do not correspond with the system programming functions.

Note:
Cruise control remains deactivated as long as the vehicle speed does not exceed **18 mph (30 km/h).** Status **ET557** details 4 causes for cruise control deactivation.
IMPORTANT
To reinitialise the deactivations stored by the injection computer, use command RZ007 "Fault memory".

STATUS 1	**Cruise control or speed limiter fault**
	If status **ET557** is "**STATUS 1**", refer to the interpretation of statuses **ET042 "Cruise control/speed limiter"** and **ET413 "Cruise control/speed limiter function"**, to test the components of the cruise control system and find the faulty one. If status **ET557** changes to **STATUS 1**, deal with the faults present or stored in the computer. If the fault is still present, contact Techline.

STATUS 2	**Fault detected by the injection computer**
	Status **ET557** changes to **STATUS 2** if the injection computer detects a fault on the injection system: – **faults in the engine speed sensor or camshaft,** – **accelerator pedal faults,** – **engine speed lower than 1000 rpm,** – **engine speed greater than 4700 rpm.** Carry out a multiplex network test, then an injection system test, and carry out fault finding on any faults. If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET557 CONTINUED	

STATUS 3	**Vehicle speed not refreshed**
	Status **ET557** becomes **STATUS 3** if the vehicle speed received by the computer does not vary. Carry out fault finding on the **ABS** computer. If faults are present (see **38C, Anti-lock braking system).** If the fault is still present, contact the Techline.

STATUS 4	**Invalid vehicle speed**
	Status **ET557** becomes **STATUS 4** if the vehicle speed received by the computer is invalid. Carry out fault finding on the **ABS** computer. If faults are present (see **38C, Anti-lock braking system).** If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

AC029	HIGH PRESSURE CIRCUIT SEAL TEST

NOTES	**This command is not available on VELSATIS Vdiag 04.** Ignition on, engine off.

Test condition:
– engine running at idling speed,
– engine temperature greater than **80 ˚C**
– automatic transmission in neutral
– accelerator pedal signal **0 %**,
– vehicle speed **0 mph**.
The test lasts for **60 seconds**, the engine speed will reach **2000 rpm** and the rail pressure will reach a minimum of **1450 bar**.
Carry out a visual inspection of the high pressure injection circuit to detect any fuel leaks.

GETtheMANUALS.org

AC031	HEATING ELEMENT NO. 3 RELAY

NOTES	**No fault should be present or stored:** Carry out this fault finding procedure in the event of a malfunction detected in the actuator control menu or a fault in the passenger compartment heating/demisting system. Consult the **Wiring Diagrams** Technical Note for your vehicle to locate the fuses and relays (see **Technical Note 8247 or 8248, Wiring diagrams, 777**).

If heating element no. 3 relay does not operate during command **AC031**.
Check the connections of heating element no. 3 relay mounting.
Check the engine management computer connections.
Repair if necessary.

If the fault is still present, check as follows that this relay is controlled by the engine management computer:
– disconnect the heating element no. 3 relay, place the **50 Ω** and **100 Ω** resistor on its mounting in place of the coil and connect a voltmeter:
  positive terminal to **+ 12 V** battery,
  negative terminal on **track 37** of the heating element no. 3 relay mounting.
– clear the fault and run command **AC031**.
– if the voltmeter shows the correct battery voltage, replace heating element no. 3 relay.
– If the voltmeter does not indicate the battery voltage, contact your Techline.

If heating element no. 3 relay operates with command AC031, but there is still a passenger compartment heating/demisting fault. Check using the wiring diagram:
– the conformity of the heating element fuse,
– the presence of the **+ 12 V** battery feed on **track 35** of the heating element no. 3 relay mounting,
– the conformity of the heating element no. 3 relay,
– the conformity of the heating element resistance,
– the presence of earth at the water chamber (heating element mounting).
– Also check the level of the cooling circuit and that there are no leaks.
Carry out the necessary repairs.

GETtheMANUALS.org

AC037	PREHEATING RELAY

NOTES	This command is only carried out if the fault **DF186 Heater plugs circuit**, or **DF262 and DF263 Heater plugs 1 and 2 group circuit** is present or stored and if no other fault is present. Consult the **Wiring Diagrams** Technical Note for your vehicle to locate the fuses and relays (**Technical Note 8247 or 8248, Wiring diagrams, 777**).

Before applying the following fault finding procedure, check that the battery voltage is not below 12 V.

Step 1:
Using a multimeter fitted with a current clamp, group the 4 heater plug supply wires together.
Control the preheating relay using command **AC037** and measure the current used by the heater plugs.
If the current consumed is not between **60 A** and **80 A**, go to step 2.

Step 2:
Check the connections on the preheating unit, heater plugs and diesel computer.
Repair if necessary.
Measure **the resistance** of the heater plugs.
If the resistance is greater than **30 Ω**, replace the faulty plugs.

Check the **continuity** and **absence of interference resistance** of the following connections:

Pre-postheating unit, white connector, **track 1**	→	Heater plug no. 1 **track 1**
Pre-postheating unit, purple connector, **track 1**	→	Heater plug no. 2 **track 1**
Pre-postheating unit, white connector, **track 2**	→	Heater plug no. 3 **track 1**
Pre-postheating unit, purple connector, **track 2**	→	Heater plug no. 4 **track 1**
Pre-postheating unit, white connector, **track 6**	→	Heater plug no. 5 **track 1**
Pre-postheating unit, purple connector, **track 6**	→	Heater plug no. 6 **track 1**

Check the condition of the **F12 (70A)** fuse which supplies the preheating unit. Replace it if necessary.
Then check for **+ 12 V** on **track 3** of the preheating relay.

Check the **continuity** and **absence of interference resistance** of the following connections:

Diesel computer **track A 19**	→	Pre-postheating unit **green connector, track 8**
Diesel computer **track A 49**	→	Pre-postheating unit **green connector, track 9**
Diesel computer **track A 68**	→	Pre-postheating unit, purple connector, **track 9**

If the fault is still present, replace the pre-postheating unit.

GETtheMANUALS.org

AC038	LOW-SPEED FAN UNIT RELAY

NOTES	**No fault should be present or stored:** Perform this fault finding procedure if a malfunction is detected in the actuator command menu or after an engine cooling system or air conditioning fault.' Consult the **Wiring Diagrams** Technical Note for your vehicle to locate the fuses and relays (**Technical Note 8247 or 8248, Wiring diagrams, 777**).

If the low speed fan unit relay does not operate when command **AC038** is run:
Check the low speed fan relay mounting and the connections of the engine management computer.
Repair if necessary.

If the fault is still present, check that the relay is actuated by the engine management computer as follows:
– Disconnect the "low speed fan unit" relay and place a resistor of **50 Ω** to **100 Ω** on the relay mounting in place of the coil and link up a voltmeter as follows:
  positive terminal to **+ 12 V** battery,
  negative terminal on **track 11** of the "low-speed fan unit relay" mounting.
– clear the fault and run command **AC038**,
– if the voltmeter indicates the battery voltage, replace the relay,
– If the voltmeter does not indicate the battery voltage, contact your Techline.

Check that the low speed fan unit relay **coil** is not cut and that the contacts are operational.
Replace the relay if necessary.

If the "low speed fan unit" relay operates but there remains a fan unit triggering fault, check the following using the wiring diagram:
– the conformity of the fan unit fuse,
– the conformity of the "low speed fan unit" relay,
– the conformity of the low speed resistance,
– Check the **continuity, insulation from + 12 V and the absence of interference resistance** of the following connection:

Diesel computer **track A 18** → Low speed fan relay **track 11**

– check for **insulation from earth, continuity and absence of interference resistance** on the following connections:

Diesel computer **track A 1** → Low speed fan relay **track 10**

Diesel computer **track A 2** → Low speed fan relay **track 10**

Carry out the necessary repairs.

GETtheMANUALS.org

AC039	HIGH-SPEED FAN ASSEMBLY RELAY

NOTES	**No fault should be present or stored:** Perform this fault finding procedure if a malfunction is detected in the actuator command menu or after an engine cooling system or air conditioning fault.' Consult the **Wiring Diagrams** Technical Note for your vehicle to locate the fuses and relays (**Technical Note 8247 or 8248, Wiring diagrams, 777**).

If the high speed fan unit relay does not operate when command **AC039** is run:
Check the high speed fan unit relay mounting and the connections of the engine management computer.
Repair if necessary.

If the fault is still present, check that the relay is actuated by the engine management computer as follows:
– disconnect the "high speed fan assembly" relay, mount a resistor of **50 Ω** to **100 Ω** on the relay mounting in place of the coil, and connect a voltmeter as follows:
  positive terminal to **+ 12 V** battery,
  negative terminal on **track 11** of the "high speed fan assembly" relay mounting,
– clear the fault and run command **AC039**
– if the voltmeter indicates the battery voltage, replace the relay,
– If the voltmeter does not indicate the battery voltage, contact your Techline.

Check that the high speed fan unit relay **coil** is not cut and that the contacts are operational.
Replace the relay if necessary.

If the "high-speed fan unit" relay is actuated, but the fan still does not trigger, check the following using the wiring diagram:
– the conformity of the fan unit fuse,
– the conformity of the "high speed fan unit" relay,
– the conformity of the low speed resistance,
– Check the **insulation from + 12 V, continuity, and the absence of interference resistance** of the following connection:

Diesel computer **track A 38** → **track 7** of the fan assembly relay

Fan unit relay **track 7** → High speed relay **track 60**

– check for **insulation from earth, continuity and absence of interference resistance** on the following connections:

Diesel computer **track A 1** → Fan unit relay **track 6**

Fan unit relay **track 6** → High speed fan relay **track 62**

Diesel computer **track A 2** → Fan unit relay **track 6**

Fan unit relay **track 6** → High speed fan relay **track 62**

Carry out the necessary repairs.

GETtheMANUALS.org

AC063	HEATING ELEMENT RELAY NO. 1

NOTES	**No fault should be present or stored:** Carry out this fault finding procedure in the event of a malfunction detected in the actuator control menu or a fault in the passenger compartment heating/demisting system. Consult the **Wiring Diagrams** Technical Note for your vehicle to locate the fuses and relays (see **Technical Note 8247 or 8248, Wiring diagrams, 777**).

If the heating element no. 1 relay does not operate during command **AC063**:
Check the connections of the heating element no. 1 relay mounting.
Check the engine management computer connections.
Repair if necessary.

If the fault is still present, check as follows that this relay is controlled by the engine management computer:
– Disconnect the heating element no. 1 relay, place the **50 Ω** and **100 Ω** resistor on its mounting in place of the coil and connect a voltmeter:
  positive terminal to **+ 12 V** battery,
  negative terminal on **track 65** of the heating element no. 1 relay mounting,
– clear the fault and run command **AC063**,
– if the voltmeter shows the correct battery voltage, replace the heating element no. 1 relay.
– If the voltmeter does not indicate the battery voltage, contact your Techline.

If heating element no. 1 relay operates with command **AC063**, but there is still a passenger compartment heating/demisting fault. Check using the wiring diagram:
– the conformity of the heating element fuse,
– the presence of the **+ 12 V** battery on **track 63** of the heating element no.1 relay mounting,
– the conformity of the heating element no. 1 relay,
– the conformity of the heating element resistance,
– the presence of earth at the water chamber (heating element mounting).
– Also check the level of the cooling circuit and that there are no leaks.
Carry out the necessary repairs.

GETtheMANUALS.org

AC064	heating element RELAY NO. 2

NOTES	**No fault should be present or stored:** Carry out this fault finding procedure in the event of a malfunction detected in the actuator control menu or a fault in the passenger compartment heating/demisting system. Consult the **Wiring Diagrams** Technical Note for your vehicle to locate the fuses and relays (see **Technical Note 8247 or 8248, Wiring diagrams, 777**).

If heating element no. 2 relay does not operate during command **AC064**.
Check the connections of heating element no. 2 relay mounting.
Check the engine management computer connections.
Repair if necessary.

If the fault is still present, check as follows that this relay is controlled by the engine management computer:
– disconnect the heating element no. 2 relay, place the **50 Ω** and **100 Ω** resistor on its mounting in place of the coil and connect a voltmeter:
  positive terminal to **+ 12 V** battery,
  negative terminal on **track 3** of the additional heater no. 2 relay mounting,
– clear the fault and run command **AC064**.
– if the voltmeter shows the correct battery voltage, replace heating element no. 2 relay.
– If the voltmeter does not indicate the battery voltage, contact your Techline.

If heating element no. 2 relay operates with command **AC064**, but there is still a passenger compartment heating/demisting fault. Check using the wiring diagram:
– the conformity of the heating element fuse,
– the presence of the **+ 12 V** battery feed on **track 2**of the heating element no. 2 relay mounting,
– the conformity of the heating element relay no. 2,
– the conformity of the heating element resistance,
– the presence of earth at the water chamber (heating element mounting).
– Also check the level of the cooling circuit and that there are no leaks.
Carry out the necessary repairs.

GETtheMANUALS.org

AC068	INJECTION FAULT WARNING LIGHT

NOTES	Perform this fault finding in the event of a malfunction detected in the actuator command menu.

With the ignition on and the engine stopped, the **SERVICE** injection fault warning light should flash and the message **Check injection** be displayed on the instrument panel.

Check the instrument panel connections.
Check the engine management computer connections.
Repair if necessary.
Using the wiring diagram.
– check the **continuity and absence of interference resistance** on the following connection:

Diesel computer **track A 67** ⟶ Transparent connector on the instrument panel **track 16**

– Check for **+ 12 V** battery on **track 4** of the instrument panel black connector.

If the fault is still present, check that the warning light is actuated by the engine management computer as follows:
Disconnect the connector from the instrument panel and connect a voltmeter as follows:
– positive terminal on **+ 12 V**,
– negative terminal on **track 24**, transparent connector on the instrument panel.
Activate the warning light using command **AC068**.

- If the voltmeter shows the battery voltage, then check the instrument panel. Carry out the necessary repairs.
- If the voltmeter does not indicate the battery voltage, contact your Techline.

GETtheMANUALS.org

AC069	SEVERE INJECTION FAULT WARNING LIGHT

NOTES	Perform this fault finding in the event of a malfunction detected in the actuator command menu.

With the ignition on and the engine stopped, the **STOP** serious injection fault warning light should flash and the message **Injection fault: stop the engine** be displayed on the instrument panel.

Check the instrument panel connections.
Check the engine management computer connections.
Repair if necessary.
Using the wiring diagram.
– check the **continuity and absence of interference resistance** on the following connection:

Diesel computer **track A 67** ⟶ Transparent connector on the instrument panel **track 16**

– Check for **+ 12 V** battery on **track 4** of the instrument panel black connector.

If the fault is still present, check that the warning light is actuated by the engine management computer as follows:
Disconnect the connector from the instrument panel and connect a voltmeter as follows:
– positive terminal on **+ 12 V**,
– negative terminal on **track 24**, transparent connector on the instrument panel.
Activate the warning light using command **AC069**.

- If the voltmeter shows the battery voltage, then check the instrument panel. Carry out the necessary repairs.
- If the voltmeter does not indicate the battery voltage, contact your Techline.

GETtheMANUALS.org

AC079	ACTUATOR STATIC TEST

NOTES	Ignition on, engine off.

This command allows you to display faults on these actuators (if fault present) without starting the engine.
The diesel computer will carry out the following electrical checks:

- **turbocharger solenoid valve,**
- **EGR valve,**
- **the two rail pressure regulation solenoid valves,**
- **The 6 injectors.**

GETtheMANUALS.org

VP036	INHIBIT FUEL SUPPLY

NOTES	Ignition on, engine off.

This command allows the injectors to be locked, so that starting is not possible.
The command **VP036** enables the cylinder compression to be checked in complete safety.
Run command **VP036** and perform a vehicle starting sequence.
Check the cylinder compressions then, once this is done, reestablish control of the injectors using command **VP037 "Stop fuel supply inhibition"** or by switching of the ignition for more than **40 seconds**.

GETtheMANUALS.org

VP037	CANCEL FUEL SUPPLY INHIBITION

NOTES	Ignition on, engine off.

The command allows the supply to the injectors to be re-established, following an engine compression test.
Run command **VP037**, and try to start the vehicle.
If the vehicle does not start, start the procedure again.

GETtheMANUALS.org

NOTES	Only check the customer complaint after performing a complete check with the **diagnostic tool**.

THE ENGINE DOES NOT TURN OVER WHEN THE STARTER IS OPERATED	→ **ALP1**
THE ENGINE TURNS OVER TOO SLOWLY WHEN THE STARTER IS OPERATED	→ **ALP1**
THE ENGINE TURNS OVER BUT DOES NOT START	→ **ALP2**
THE ENGINE STARTS BUT DOES NOT ACCELERATE OR STALLS	→ **ALP2**
ENGINE BUCKING	→ **ALP3**
ROUGH IDLE	→ **ALP4**
OVERHEATING	→ **ALP5**
THE ENGINE DOES NOT REACH ITS OPERATING TEMPERATURE	→ **ALP6**
THE ENGINE TAKES TIME TO REACH ITS OPERATING TEMPERATURE	→ **ALP6**
EXCESSIVE FUEL CONSUMPTION	→ **ALP7**
LOSS OF POWER	→ **ALP7**
EXCESSIVE OIL CONSUMPTION	→ **ALP8**

GETtheMANUALS.org

NOTES	Only check the customer complaint after performing a complete check with the **diagnostic tool**.

MAJOR VIBRATIONS	→ **ALP9**
HEAVY BLACK SMOKE FROM EXHAUST	→ **ALP10**
HEAVY WHITE SMOKE FROM EXHAUST	→ **ALP11**
HEAVY BLUE SMOKE FROM EXHAUST	→ **ALP12**
NO DIALOGUE WITH ENGINE MANAGEMENT COMPUTER	→ **ALP13**

GETtheMANUALS.org

ALP1	**The engine does not turn over when the starter is operated** **The engine does not turn over when the starter is operated**

NOTES	In the event of a fault, perform a **multiplex network test** using the diagnostic tool, then if the test is OK, apply the conformity check before any operation on the diesel injection system.

Check **the battery charge**.
Check **the condition of the battery connections**.
Check that there is no corrosion on the engine earth straps.
Check for the presence of faults with the diagnostic tool, deal with these first.
Repair if necessary.

Check the starter motor connections.
Check that a **+ 12 V** voltage is present on the starter motor terminal during starter action.
Check starter motor operation.
Repair if necessary.

Check that oil is present in the crankcase to avoid any engine seizing.
Check that the crankshaft is not locked by performing a crankshaft rotation.

Permanent seizing may be due to:

1) Seizure of equipment driven by the accessories belt: remove the accessories belt and check that all the equipment driven by the accessories belt is rotating correctly.
2) Seizure of the crankshaft itself, due to filling of the cylinders with a fluid (diesel fuel, coolant, etc.): remove the heater plugs to check that there is no fluid inside the combustion chambers.
   The presence of diesel fuel in the combustion chambers may be due to a permanent opening of the injectors: check that the injector power unit (EDU*) is operating correctly.
   The presence of a fluid such as coolant fluid or engine oil shows failure of the cylinder head gasket or a crack in one of the components forming the cylinder head or the engine cylinders.
2) Destruction of the timing belt, causing damage to the timing system components.
3) Seizure of the automatic transmission: remove the transmission to check whether the flywheel is released again.
5) Damage to moving parts requiring replacement of the engine.

*EDU: Electronic Drive Unit

AFTER REPAIR	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

ALP2	The engine turns over but does not start The engine starts but does not accelerate or stalls

NOTES	In the event of a fault, perform a **multiplex network test** using the diagnostic tool; if this is OK, carry out a **UCH test** and **immobiliser** test.

– Check the operation of the pre-heating plugs.
– Check for fuel in the tank.
– Ensure that the correct fuel is being used. Run **test 12 Fuel conformity check**.

Remove the diesel filter and check its condition.
Check that there is no paraffin crystallised in the low pressure fuel pipes following freezing.
Rinse the fuel circuit and replace the fuel and the diesel filter if necessary.
If metal deposits are present at the bottom of the container, a serious fault in the injection system has occurred.
These particles may have entered the high pressure injection system and may foul the injectors, causing them to seize.
In this case, the entire injection system must be replaced (High Pressure Pump, Injection rail, Injectors, High pressure injector pipe, etc.).

Run fault finding on the diesel injection system using the diagnostic tool, deal with the other faults.

Check the condition of the air inlet circuit and make sure there is no obstruction in the inlet circuit.
Check for possible seizing of the turbocharger shaft.

Inhibit injection using command **VP036 Inhibit fuel supply**.
Measure the rail pressure using the parameter **PR038 Rail pressure** while the starter motor is operated (less than **10 seconds** per test).The pressure should be greater than **170 bar** and the engine speed signal should be greater than **250 rpm** at an air temperature of **20˚C**.
IMPORTANT
If the air temperature is less than **20˚C**, the engine speed signal should not be less than **250 rpm**.

AFTER REPAIR	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

ALP2 CONTINUED	

– Check the valve clearance,
– check the condition of the engine, measure the cylinder compression with a compression gauge.
The compression values recorded for each injector must be the same.
– The minimum compression limit must not be less than **20.4 kg/cm^2**.
(1 bar = 1.0197 kg/cm^2),
– if the compression test reveals a cylinder fault, carry out the necessary repairs,
– if the compression values are OK, check the conformity of the injector assembly using the procedure described in the **Workshop Repair Manual**.

If a mechanical operation has occurred beforehand on the injection pump, check the conformity of the pump pulley fitting (recommendation of target positioning).

For all Vdiags except VELSATIS Vdiag 04:
Check the fuel regulation injector by injector by performing **test: 10 Incorrect injector operation**.
If the customer complaint is still present, replace the injector.

AFTER REPAIR	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

ALP3	Engine hesitation

NOTES	In the event of a fault, perform a **multiplex network test** using the diagnostic tool, then if the test is OK, apply the conformity check before any operation on the diesel injection system.

– Check for fuel in the tank. – Ensure that the correct fuel is being used. Run **test 12 Fuel conformity check**.
Remove the diesel filter and check its condition. Check that there is no paraffin crystallised in the low pressure fuel pipes following freezing. Rinse the fuel circuit and replace the fuel and the diesel filter if necessary. If metal deposits are present at the bottom of the container, a serious fault in the injection system has occurred. These particles may have entered the high pressure injection system and may foul the injectors, causing them to seize. In this case, the entire injection system must be replaced (High Pressure Pump, Injection rail, Injectors, High pressure injector pipe, etc.).
Check the condition of the air inlet circuit and make sure there is no obstruction in the inlet circuit. Check for possible seizing of the turbocharger shaft.
Measure the rail pressure using parameter **PR038 Rail pressure** during the phases of engine hesitation. The rail pressure should have stable values for a stabilised engine speed, and the rail pressure loop difference should not exceed **± 40 bar**. If the fault is still present, run **test 3 Low pressure circuit check**. Rail pressure instability may be due to seizure of the regulation solenoid valves or a failure of the high pressure pump. If the fault is still present, run **test 11 High pressure pump**.
If the fault is still present, run **test 10 Poor injector operation**.

AFTER REPAIR	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

ALP4	Rough idle

NOTES	In the event of a fault, perform a **multiplex network test** using the diagnostic tool, then if the test is OK, apply the conformity check before any operation on the diesel injection system.

– Check for fuel in the tank. – Ensure that the correct fuel is being used. Run **test 12 Fuel conformity check**.
Check the condition of the air inlet circuit and make sure there is no obstruction in the inlet circuit. Check for possible seizing of the turbocharger shaft.
Check the resistance of the exhaust gas recirculation valve and check if the slide of the valve is seized.
Measure the rail pressure using parameter **PR038 Rail pressure** while the engine is running in an unstable manner; the rail pressure should have stable values for a stabilised engine speed, and the rail pressure variation should not exceed **± 40 bar**. Rail pressure instability may be due to seizing of the regulation solenoid valves or a failure of the high pressure pump. Remove the diesel filter and check its condition. Rinse the fuel circuit and replace the fuel and the diesel filter if necessary.
For all Vdiags except VELSATIS Vdiag 04: If the fault is still present, change the regulation solenoid valves or the diesel fuel pump or the injectors. Check status **ET038 Engine**, if **ET038** is **NORMAL**, check the statuses of the following combustion misfires: **ET057 Misfire on cylinder 1,** **ET058 Misfire on cylinder 2,** **E T059 Misfire on cylinder 3,** **ET060 Misfire on cylinder 4,** **ET274 Misfire on cylinder 5,** **ET275 Misfire on cylinder 6** using the diagnostic tool. If one of the misfire statuses is **DETECT** or **PRESENT**, run **TEST 10 Poor injector operation**. If the unstable idle speed fault is still present, check **the condition** and **correct operation** of the diesel fuel pump. Replace or repair if necessary.

***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

ALP5	Overheating

NOTES	In the event of a fault, perform a **multiplex network test** using the diagnostic tool, then if the test is OK, apply the conformity check before any operation on the diesel injection system.

Run fault finding on the injection computer using the diagnostic tool. Deal with all present faults. Using commands **A C038 Low speed fan relay** and **A C039 High speed fan relay** check that the cooling fan speeds are correct. Repair if necessary. Check that the cooling circuit is correctly filled.
Check correct opening of the thermostat (start of opening at **82˚C** - fully open at **88˚C**). For an engine temperature greater than **85˚C** the bottom hose of the cooling radiator should not be cold; replace the thermostat if necessary.
Check that the water pump is operating correctly by checking the presence of a coolant fluid return flow from the expansion bottle. In the event of a fault, check for possible clogging of the return path from the expansion bottle before performing a fault finding test for a water pump failure.
Compare the temperature values given by the injection coolant temperature sensor and the value given by an external temperature sensor. If the values are inconsistent, replace the coolant temperature sensor.
If the fault is still present, rinse the cooling circuit and check that the radiator is not clogged. Clean the front of the radiator with a high pressure cleaner to remove any dirt from the radiator fins. Replace the expansion bottle cap.

***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

ALP6	The engine does not reach its operating temperature The engine takes time to reach its operating temperature

NOTES	In the event of a fault, perform a **multiplex network test** using the diagnostic tool, then if the test is OK, apply the conformity check before any operation on the diesel injection system.

Run fault finding on the injection computer using the diagnostic tool. Process all the present or stored faults.
Check that the engine does reach its operating temperature during motorway driving.
Check that the themoplungers are operating correctly. Check their resistances and check that the 3 thermoplunger relays are supplied using the following commands: **AC063 Thermoplunger no.1 relay,** **AC064 Thermoplunger no.2 relay,** **AC031 Thermoplunger no.3 relay.** In the event of faults, check the operation of the thermoplunger plug relays, check the connection between the relay coils and the diesel computer, check the power supply to the relay terminals, and check the **continuity** of the power lines between the thermoplungers and their relays.
Engine cold or stopped for at least **6 hours**. Compare the temperature values given by the injection coolant temperature sensor and the value given by an external temperature sensor. If the values are inconsistent, replace the coolant temperature sensor.
If the value supplied by the injection coolant temperature sensor is correct, replace the thermostat.
Refer to **Technical Note 3175A, Cooling system, ALP7 There is no heating inside the vehicle**.

***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

ALP7	Excessively high fuel consumption Loss of power

NOTES	In the event of a fault, perform a **multiplex network test** using the diagnostic tool, then if the test is OK, apply the conformity check before any operation on the diesel injection system.

IMPORTANT In the event of the engine overheating (Oil temperature > 123˚C), the computer deliberately limits the engine power and vehicle speed without illuminating a warning light, see the interpretation of fault **DF769 Oil temperature**.
Check conformity of the tyres and their pressure.
Check that the vehicle is not equipped with external devices affecting its aerodynamics.
Look for possible fuel leaks: – Run **test 3 Low pressure circuit check**. Repair if necessary. – Run command **AC029 High pressure circuit sealing test (Except VELSATIS Vdiag 04)**. Carry out a visual inspection of the high pressure injection circuit to detect any fuel leaks. Repair if necessary.
Check the condition of the air filter and replace it if necessary.
Check that the entire inlet circuit is in good condition, free of leaks and is not clogged (hose and intercooler, air flowmeter clogging), apply **test 5 Air flowmeter**.
Check the air flow value using parameters **P R146 Inlet air flow** and **P R136 EGR valve position**. At a speed of **700 rpm** and with a coolant temperature of **80˚C**, check that the air flow is **42 kg/h ± 4.2 kg/h** at an EGR valve position of **3.2 mm** and **72.3 kg/h ± 7.2 kg/h** at an EGR valve position of **0 mm**.
Check that the engine does reach its operating temperature during motorway driving.
Reset the trip computer and perform a new test on the motorway and then in town, and estimate the vehicle's consumption from its average speed.

***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

ALP7 CONTINUED	

Check that the exhaust pipe is not blocked, apply **test 1 Exhaust system check**.
Check that the turbocharger operates correctly. – Run **test 7 Variable geometry turbocharger command** and – Run **test 8 Turbocharger rotating part**. Repair if necessary.
If the vehicle lacks power, run **test 11 High pressure pump**.
Run **TEST 10 Poor injector operation (Except VELSATIS Vdiag 04)**.
– Check the valve clearance, – check the condition of the engine, measure the cylinder compression with a compression gauge. The compression values recorded for each injector must be the same. – The minimum compression limit must not be less than **20.4 kg/cm^2**. **(1 bar = 1.0197 kg/cm^2)** – If the compression test reveals a cylinder fault, carry out the necessary repairs. – if the compression values are OK, check the conformity of the injector assembly using the procedure described in the **Workshop Repair Manual**.

***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

ALP8	Excessive oil consumption

NOTES	In the event of a fault, perform a **multiplex network test** using the diagnostic tool, then if the test is OK, apply the conformity check before any operation on the diesel injection system.

Check that the oil level is correct, and remove the excess if necessary. Check for possible external leaks. Repair if necessary.
Check the air circuit: – the condition of the air filter, – run **test 4 Air inlet circuit and turbocharging check**.
Check that the turbocharger operates correctly. Run **test 8 Turbocharger rotating part**.
Check the sealing of the engine block and turbocharger lubrication pipes, and the pipes and oil cooler. Repair if necessary.
Check that the oil breather pipes are not crushed or clogged.
Remove the inlet tract from the turbocharger inlet and outlet, and check that there is not a large quantity of oil in the turbocharger or in the inlet hoses. – A large quantity of oil in the turbocharger inlet hose is due to extensive oil evacuation via the oil breather (engine wear or breather clogged, etc.), – A large quantity of oil in the turbocharger outlet hose indicates failure of the turbine shaft sealing ring. Replace the turbocharger if necessary.
Check the correct condition of the heater plugs. Repair or replace the faulty components, if necessary.

***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

ALP9	Major vibration

NOTES	In the event of a fault, perform a **multiplex network test** using the diagnostic tool, then if the test is OK, apply the conformity check before any operation on the diesel injection system.

Run fault finding on the injection computer using the diagnostic tool. Process all the present or stored faults.
Check the condition and tightness of the engine mountings.
Check the accessories drive pulley. The rubber mounting bushes should be in perfect condition and the pulley should not warp during rotation; replace if necessary.
Remove the accessories belt and start the engine. If the vibration has disappeared, look for the faulty component among the accessories driven by the belt.
Remove the starter motor and check that the automatic transmission torque converter is correctly tightened.
Check timing belt adjustment.
If the fault is still present, change the regulation solenoid valves or the diesel fuel pump or the injectors. **For all Vdiags except VELSATIS Vdiag 04:** Check status **ET038 Engine**, if **ET038** is **NORMAL**, check the statuses of the following combustion misfires: **ET057 Misfire on cylinder 1,** **ET058 Misfire on cylinder 2,** **E T059 Misfire on cylinder 3,** **ET060 Misfire on cylinder 4,** **ET274 Misfire on cylinder 5,** **ET275 Misfire on cylinder 6** using the diagnostic tool. If one of the misfire statuses is **DETECT** or **PRESENT**, run **TEST 10 Poor injector operation**. If the unstable idle speed fault is still present, check **the condition** and **correct operation** of the diesel fuel pump. Replace or repair if necessary.

***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

ALP10	Heavy black smoke from exhaust

NOTES	If the vehicle has not been used for a long time, let the engine reach its operating temperature and, after first checking the coolant fluid level, carry out a road test.

Run fault finding on the diesel injection using a diagnostic tool. Deal with any fault detected.
Check that the whole inlet system is neither clogged nor leaky. Check the condition of the air filter and replace if necessary.
Check that the exhaust gas recirculation valve is not stuck open. Replace it, if necessary.
Remove the inlet hose from the turbocharger inlet and check that the turbine shaft rotates very freely. Check that the turbocharger axial and lateral play values are within tolerances.
Check for possible seizing of the turbocharger wastegate in the open position, and replace the turbocharger if necessary (turbocharger seizing may be due to poor lubrication of the bearings: check for possible clogging of the lubrication circuit and check the engine oil pressure). If the fault is still present, run **test 10 Incorrect operation of the injectors**.

***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

ALP11	Heavy white smoke from exhaust

NOTES	If the vehicle has not been used for a long time, let the engine reach its operating temperature and, after first checking the coolant fluid level, carry out a road test.

Check with the customer that the vehicle has not overheated recently.
Check the coolant fluid level. A sharp drop in this level is due to a cooling circuit leak or to fluid consumption by the engine at the cylinder head gasket. Apply **Technical Note 3175A, Cooling circuit, ALP3 Emission of smoke from the exhaust, white smoke, engine warm**.
Run the engine at idle speed until its operating temperature is reached, with the expansion bottle cap in place. If the vehicle emits white smoke from the exhaust, slowly loosen the expansion bottle cap to reduce the pressure in the cooling circuit. If the vehicle stops emitting smoke, one of the cylinder head gaskets is damaged. Replace both the cylinder head gaskets.
If not, check that there is no water in the diesel filter. Ensure that the correct fuel is being used. Run **test 12 Fuel conformity check**.

***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

ALP12	Heavy blue smoke from exhaust

NOTES	If the vehicle has not been used for a long time, let the engine reach its operating temperature and, after first checking the coolant fluid level, carry out a road test.

Run fault finding on the diesel injection using a diagnostic tool.
Deal with any fault detected.

Top up the oil level, and if the level is too high remove the excess.
If the level is too low, refer to **ALP8 Excessive oil consumption**.

Check that the oil breather pipes are not crushed or clogged.

Remove the inlet hose from the turbocharger inlet and outlet.
Check that there is not a large quantity of oil in the turbocharger or the inlet hoses.

- A large quantity of oil in the turbocharger inlet hose is due to extensive oil evacuation via the oil breather (engine "sealing ring" wear or breather clogged, etc.).
- A large quantity of oil in the turbocharger outlet hose indicates failure of the turbine shaft sealing ring. Replace the turbocharger if necessary.
- if the inlet system is clean, a small quantity of oil deposited on the walls of the inlet hoses is acceptable. The oil consumption is undoubtedly due to an engine internal failure, e.g. valve stem seal, oil scraper ring, etc.

***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

ALP 13	No dialogue with engine management computer

NOTES	In the event of a fault, perform a **multiplex network test** using the diagnostic tool.

Check that the tool is not the cause of the fault by trying to establish dialogue with a computer on another vehicle.
If the tool is not at fault, and dialogue cannot be established with any other computer on the same vehicle, it may be that a faulty computer is disrupting **line K**.
Trace which one through a process of elimination, successively disconnecting each computer.
Also check the battery voltage following interpretation of parameter **PR071 Computer supply voltage**.

Check the condition of the engine fuses in the engine fuse and relay box; refer to the **Wiring Diagrams** Technical Note for the vehicle.
Check the computer power supply on the connector side.
Check the earth connections.
Check the computer connector (crimping of wires to terminals, and condition of terminals).
If the connection or connections are faulty and if there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

Check the supply to the diagnostic socket:
+ Before ignition feed on **track 24**.
+ After ignition feed on **tracks 1 and 2**.
Earth on **tracks 4** and **5**.
Ensure **the continuity** and **the insulation** of the following connection:

Diesel computer **track A 50** ⟶ **track 7** of the diagnostic socket

If the connection or connections are faulty and if there is a repair procedure (see **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.
If dialogue is still impossible after these checks, replace the engine management computer.
If necessary, modify the configuration of the new computer to match the equipment options available on the vehicle.

***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

EXHAUST SYSTEM CHECK	→ TEST1
LOW PRESSURE CIRCUIT TEST	→ TEST3
TURBOCHARGING AND AIR INLET CIRCUIT TEST	→ TEST4
AIR FLOW SENSOR	→ TEST5
VARIABLE GEOMETRY TURBOCHARGER CONTROL	→ TEST7
ROTATING PART OF TURBOCHARGER	→ TEST8
POOR INJECTOR OPERATION	→ TEST10
HIGH PRESSURE PUMP	→ TEST11
FUEL CONFORMITY CHECK	→ TEST12

GETtheMANUALS.org

TEST1	Exhaust system check

Engine stopped: Check that the silencer outlet is not blocked.
Repair or replace the silencer, if necessary.

YES

Check the seal of the exhaust manifold on the contact surface between the turbocharger and the exhaust manifold.
Is the seal in order?

NO → Repair or replace the faulty part.

YES

Loosen the catalytic pre-converter at the turbocharger outlet.
Place a wooden block between the two parts.
Start the vehicle and check if the engine runs better.
Is the engine running normally?

NO → The exhaust pipe is correct.
Restart fault finding.

YES

Retighten the catalytic pre-converter.
Loosen and decouple or cut the catalytic converter at the catalytic pre-converter outlet.
Place a wooden block between the two parts if necessary.
Start the vehicle and check if the engine runs better.
Is the engine running normally?

NO → Replace the catalytic pre-converter.

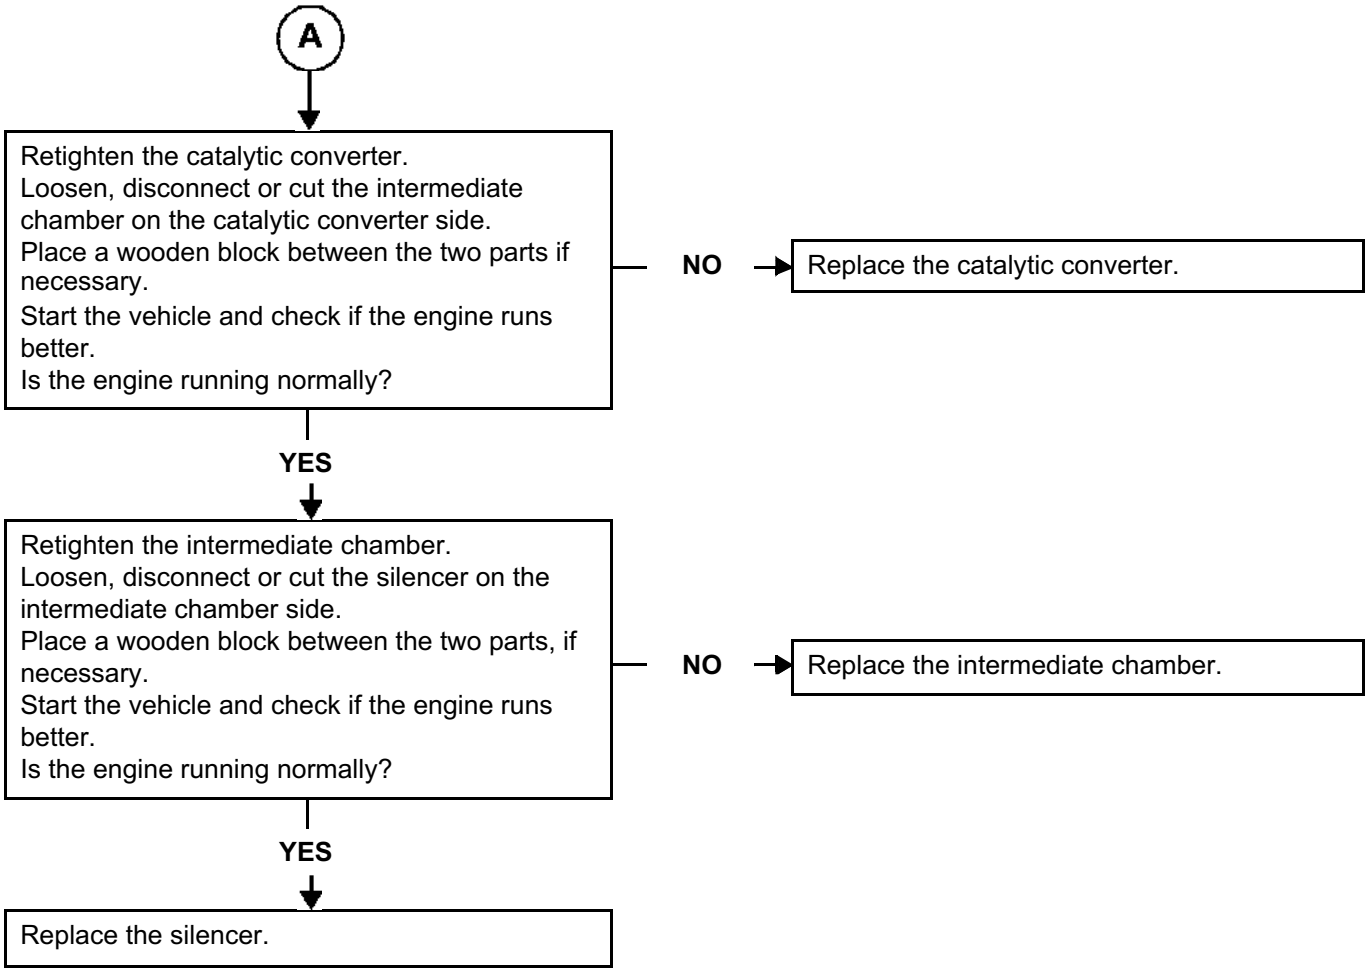
YES

(A)

***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

TEST1 CONTINUED	



AFTER REPAIR	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

TEST3	Low pressure circuit check

Ensure that the correct fuel is being used.
Run **test 12 Fuel conformity check**.

↓

Check the condition of all the low pressure diesel fuel pipes from the tank to the injection pump (the pipes should not be pinched).

↓

Check the condition of the priming bulb, and that it is working properly. Perform repairs if necessary and continue the test.

↓

If the fault is still present with a low fuel level, check the consistency of the actual fuel level and that indicated on the instrument panel.
– The transfer pump is supplied via a venturi valve located beneath it.
Check that the opening of the venturi is not blocked by dirt contained in the fuel tank.
Check the priming of the low pressure diesel circuit.

↓

Check the fuel filter:
- Conformity of the fuel filter (correct part number and RENAULT filter).
- Positioning and amount of clogging in the filter element.
- Positioning and condition of the seals.

↓

(A)

***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

TEST3 CONTINUED	

Fuel supply of the injection system with additional tank.

This operation aims to detect possible faults in the low pressure supply system of a vehicle by replacing it entirely with an additional tank.

Mode:

– Disconnect the diesel fuel supply pipe at the fuel filter inlet and seal it with a plug.
– Connect a pipe to the fuel filter inlet and insert the other end into a **clean** container which is approximately **5 litres** in volume.
– Disconnect the diesel return pipe to the injector and high pressure pump outlet union, and use a plug to block it.
– Connect a transparent pipe to the injector and high pressure pump outlet union, and insert the other end into the container.
– Fill the container with **clean** diesel fuel.
– Start the engine and let the system drain itself of its air (there must not be any air bubbles in the return pipe).

Is the customer complaint still present?

→ Low pressure circuit correct.
Reconnect the different low pressure circuit pipes and restart fault finding.

Are the low pressure circuit connections in order and in good condition?

→ Carry out the necessary repairs.
Low pressure circuit correct.
Reconnect the different low pressure circuit pipes and restart fault finding.

Low pressure circuit correct.
Restart fault finding.
END OF TEST.

***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

TEST4	Turbocharging and air inlet circuit check

Engine stopped: Check the low and high pressure air circuits for **leaks** (air leaks in or out, upstream or downstream of the turbocharger).

→ Check the parts that are abnormally greasy of the circuit and reveal a lack of tightness.
Check:
- the condition and fitting of the ducts (foreign bodies, clogged, disconnected, pinched, broken, holed, cut, tightness of the mounting bolts, etc.).
- the present and tightening of the clamps.
- the turbocharger pressure sensor is mounted correctly on the manifold.
- The pipes and the take-off point between the air duct and the turbocharging sensor.

Carry out the necessary repairs.

↓

Checking the air filter.

→ Check:
- That the air filter unit inlet and outlet are not blocked.
- That air filter unit is in good condition and is fitted correctly (not dislodged, broken, pierced; condition and positioning of the foam, etc.).
- The cleanliness, conformity and the absence of deformation of the filter element.
- The air flowmeter, run **test 5 Air flowmeter**.

←

Check:
- the condition of the damper valve (damper),
- the condition of the swirl flaps,
- the tightness of the mounting bolts,

Carry out the necessary repairs.
Replace if necessary.

→ Carry out a visual inspection of the EGR circuit sealing.
Replace if necessary.

←

Check the exhaust, run **test 1 Exhaust system check**.
Carry out the necessary repairs.

↓

→ Check the condition of the intercooler:
- clogging,
- leaks (vehicle stationary, stabilise the engine speed between **3500 rpm** and **4000 rpm** and check that there are no leaks).

Replace if necessary.

↓

Check that the turbocharging pressure sensor take-off point is not blocked.
Replace if necessary.
END OF TEST.

AFTER REPAIR	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

TEST5	Air flowmeter

Contamination of the grille
Visual inspection: remove the flowmeter; there should be no foreign bodies in the grilles (see **illustration no. 110734 test 5 continued**).
Do not clean the grilles using compressed air or any other procedure: this damages the sensors and creates variations from the values displayed on the CLIP tool.
Check the air circuit sealing upstream of the air flowmeter: ducts and air filter unit disconnected or pierced, presence of seals.
Replace the air flowmeter if necessary and clean upstream of this, if necessary.

↓

Damage to electrical components
Visual inspection: remove the flow sensor - the components should not be broken.
Replace the air flowmeter if necessary.

↓

Oxidation of the electrical components
Visual inspection: remove the air flow sensor connector, there should not be any green deposits on the electrical components.
Replace the air flowmeter if necessary.

↓

Clogging of the air flowmeter
Test:

- Check the conformity values, with a warm engine (coolant temperature: **80˚C**).
- During the **first 30 seconds** after starting.
- Engine speed: idling
- Air temperature between **30 and 70˚C**.
- **PR145 ENGINE SPEED = 700 rpm and PR136 EGR POSITION = 3.2 mm:**
  PR146 EGR POSITION = 42 kg/h ± 4.2 kg/h
- **PR145 "ENGINE SPEED" = 700 rpm and PR136 "EGR POSITION" = 0 mm:**
  PR146 EGR POSITION = 72.3 kg/h ± 7.2 kg/h

(To obtain **PR136 EGR POSITION = 0 mm**, depress the accelerator pedal **briefly** and release the pedal while displaying parameter **PR136 EGR position** in the **diagnostic tool** then freeze the image when the parameter **PR136 EGR POSITION = 0 mm**).

- Apply the procedure for **DF056 Air flow sensor circuit** for the checks on the air flowmeter.

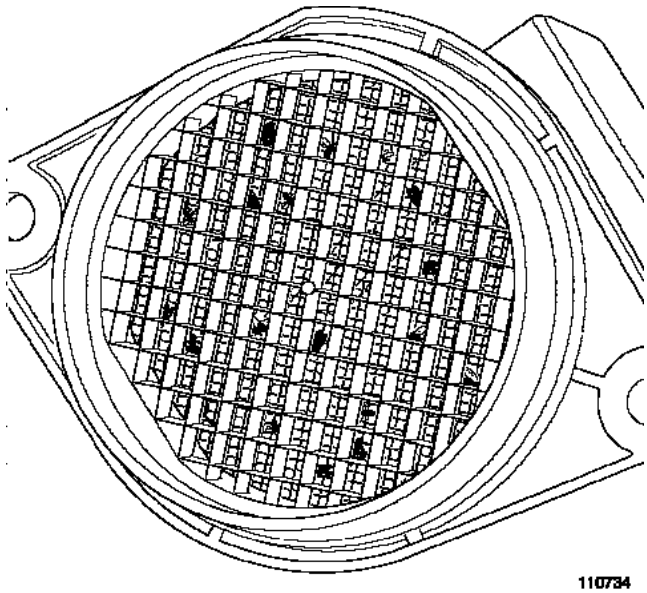
Replace the air flowmeter if necessary.
END OF TEST.

***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

TEST5 CONTINUED	

Contamination of the grille



***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

TEST7	Variable geometry turbocharger control

Start the engine and check that:
- **PR346 Turbocharger wastegate valve position ≈ 1.64 ± 0.1 mm**, warm engine,
- **PR345 Turbocharger wastegate potentiometer voltage ≈ 3.9 ± 0.1 V at 20˚C**,
- the variable geometry control moves easily.

↓

Does the variable geometry control move easily? — **NO** → Replace the turbocharger.

YES

↓

Stop the engine and check that:
- **PR346 Turbocharger wastegate valve position ≈ 10 mm at idle speed, < 10 mm during deceleration**,
- **PR345 Turbocharger wastegate potentiometer voltage ≈ 0.45 V with PR346 = 10 mm**,
- the variable geometry control moves easily.

↓

Does the variable geometry control move easily? — **NO** → Replace the turbocharger.

YES

↓

Stop the engine and check that:
- **PR346 Turbocharger wastegate valve position ≈ 10 mm at idle speed, < 10 mm during deceleration**,
- **PR345 Turbocharger wastegate potentiometer voltage ≈ 0.45 V with PR346 = 10 mm**,
- the variable geometry control moves easily.

↓

Continue the turbocharger test with **test 8 Rotating part of turbocharger**.

***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

TEST8	Rotating part of a turbocharger

With the engine cold and stopped, remove the air inlet duct from the turbocharger; check manually if the shaft of the turbine and of the compressor turns.
Does the shaft turn?

NO → Replace the turbocharger.

Seizing of the turbocharger may be caused by poor lubrication of the bearings. Check the lubrication circuit for any blockage and check the engine oil pressure. Apply the procedure described in **Technical Note 3938A, F9Q engine-Turbocharger failure** which can be applied to this engine.

YES

Visually check the condition of the compressor wheel then the turbine wheel (see illustrations **No. 110737 test 8 continued 1 and 110738 test 8 continued 2**).
Are the wheels in good condition?

NO

YES

Manually check the end float of the wheels (see illustration **no. 110880 test 8 continued 3**).
The significant end float is approximately **2 mm**.
Does the turbocharger have too much play in the shaft?

YES → Replace the turbocharger. Apply the procedure described in **Technical Note 3938A, F9Q engine-Turbocharger failure** which can be applied to this engine.

If the moving part is broken: apply the procedure described in **Technical Note 3938A, F9Q engine-Turbocharger failure** which can be applied to this engine.
IMPORTANT
Risk of destroying the new turbocharger and the engine if the air circuit is not cleaned and the oil and its filter are not replaced.

NO

The rotating section is in order.
Is there oil in the exhaust?

NO → **END OF TEST.**

YES

Replace the catalytic pre-converter.

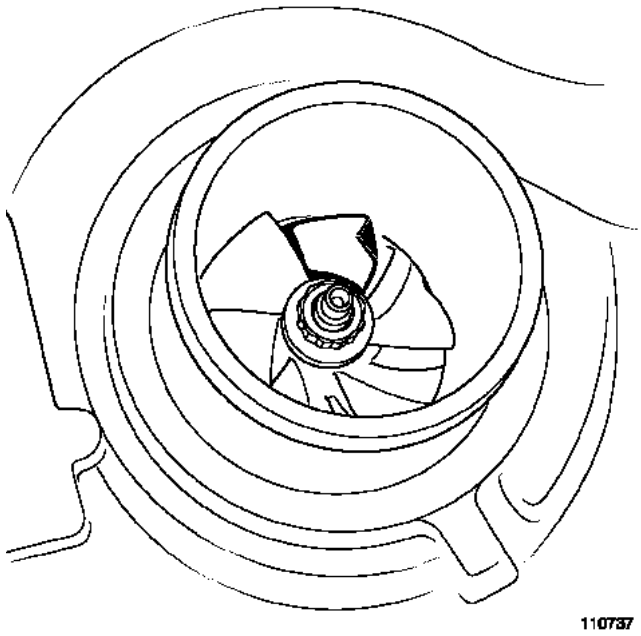
***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

TEST8 CONTINUED 1	

Information:
The operating play of the turbocharger bearings is approximately **25 µm** (micrometers or microns) between the shaft of the turbocharger and the internal mating face of the bearings and **75 µm** between the exterior part of the bearings and the bearing housing.
Risks:
In the event of destruction of the turbocharger bearings, the steel and bronze swarf from this destruction are evacuated through the turbocharger oil to the engine's oil sump. The swarf can, consequently, be returned to the oil circuit via the oil pump, then cause widespread contamination of the engine oil circuit. This causes abnormal wear on the crankshaft bearing bushings, the con rod bearing shells and the camshafts, etc.
In the event of the compressor wheel breaking, parts of the blades may be found in the intercooler or in the air circuit ducts. The turbine wheel could easily be found in the catalytic converter.

Deformed, twisted blade (“soft” foreign body)

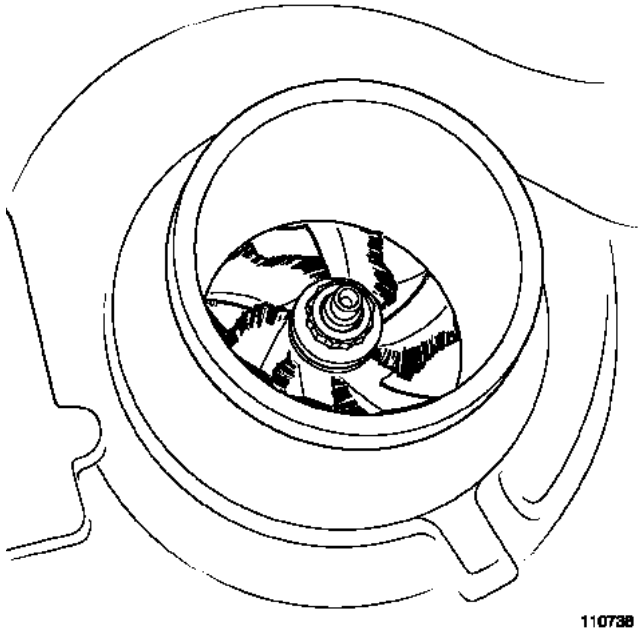


***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

TEST8 CONTINUED 2	

Broken blades (“hard” foreign body)



***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

TEST10	Incorrect injector operation

For all Vdiags except VELSATIS Vdiag 04:

PART A

CHECK THE INJECTOR FLOW CORRECTION: (INDIVIDUAL CORRECTION)
– In CLIP, choose the **Fuel circuit** sub-function.
– With the engine idling and the fuel temperature **> 50˚C**, display the flow correction values for each injector (individual correction), i.e.:
PR364 Cylinder no. 1 fuel flow correction;
PR405 Cylinder no. 2 fuel flow correction;
PR406 Cylinder no. 3 fuel flow correction;
PR365 Cylinder no. 4 fuel flow correction,
PR407 Cylinder no. 5 fuel flow correction,
PR408 Cylinder no. 6 fuel flow correction.
The **normal value** for flow correction for an injector is approximately **± 1 mm^3/stroke**. This tolerance may increase with time, but indicates an injector/cylinder fault if it exceeds **± 5 mm^3/stroke**.
1) If at least one of these values is > + 5 mm^3/stroke
– If the compression value recorded with the compression gauge reveals a faulty cylinder, carry out the necessary repairs and apply **Part C**.
– If the customer complaint is still present, replace the injector.
– Check the valve clearance.
– See paragraph **Part B**, for confirming the fault finding.
2) If at least one of these values is < - 5 mm^3/stroke
– Check the level and condition of the engine oil.
– Remove the injector which has the biggest negative value.
– Check the valve clearance.
– Replace the injector.
– See paragraph **Part B**, for confirming the fault finding.
3) If at least one of these values does not stabilise (at least 30 seconds after starting and when warm)
– Check the low pressure circuit with **test 3 Low pressure circuit check**.
– Ensure that the correct fuel is being used. Run **test 12 Fuel conformity check**.
– See paragraph **Part B**, for confirming the fault finding.

Note:
Before replacing an injector, check that its sealing washer is in place and in order.

IMPORTANT
When removing or refitting an injector, respect the cleanliness guidelines and safety advice (see **MR 353, MR 402 or MR 361 Mechanical, 13B, Diesel injection, Removal/refitting of injectors**).

***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

TEST10 CONTINUED	

PART B
Confirmation of flow correction check fault finding for each injector: (individual correction)
Clear the fault(s) and carry out a test with the **engine at idle speed** and the fuel temperature **> 50˚C**, check that no faults appear on the diagnostic tool and that the correction values do not reach **± 5 mm^3/stroke** to confirm the repair.
– If any other cylinders have injector flow correction values which exceed **± 5 mm^3/stroke**, follow the fault finding procedure described in **Part A**". Fuel regulation balance check for each injector (individual).

PART C
Injector nozzle sealing check:
– Check the level and condition of the engine oil:
– If there is diesel fuel contamination, the leaking injector nozzle will be "greasy".
– Disconnect the preheating relay.
– Check that these traces are not caused by rising engine oil, by checking the engine compression values.
– Check the condition of the heater plug: this must not be wet. If it is, change the defective injector.
– If the engine compression values are correct, locate the faulty injector by looking at the condition of the cylinders and the pistons across the heater plug wells (greasy cylinder, overheating, starting to incur damage, etc.).
– If the cylinder - piston examination is not conclusive, remove the injectors and change the one with the "greasy" nozzle.
– If the fault finding checks do not enable the engine to be repaired, contact the Techline.

Note:
Before replacing an injector, check that its sealing washer is in place and in order.

IMPORTANT
When removing or refitting an injector, respect the cleanliness guidelines and safety advice (see **MR 353, MR 402 or MR 361 Mechanical, 13B, Diesel injection, Removal/refitting of injectors**).

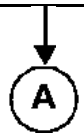
***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

TEST11	High pressure pump

Confirm the customer complaint:
Loss of power, sometimes with difficult starting from cold, before applying the test described below.
Are the following conditions confirmed?
– No fault code.
– No external leak from the fuel circuit.
– No air intake on the fuel circuit.
Check that there is no OTS to be carried out on the vehicle.
As AC029 "High pressure circuit sealing test" is not available on all VELSATIS Vdiag 04, this test may not succeed.

Stage 1: measure of the rail pressure:
– Carry out a road test and record the following parameters as soon as power is lost:
  – **PR145 Engine speed.**
  – **PR030 Accelerator pedal position.**
  – **PR038 Rail pressure.**
  – **PR008 Rail pressure setpoint.**
  – **PR213 Rail pressure loop difference.**
– Print the data found.

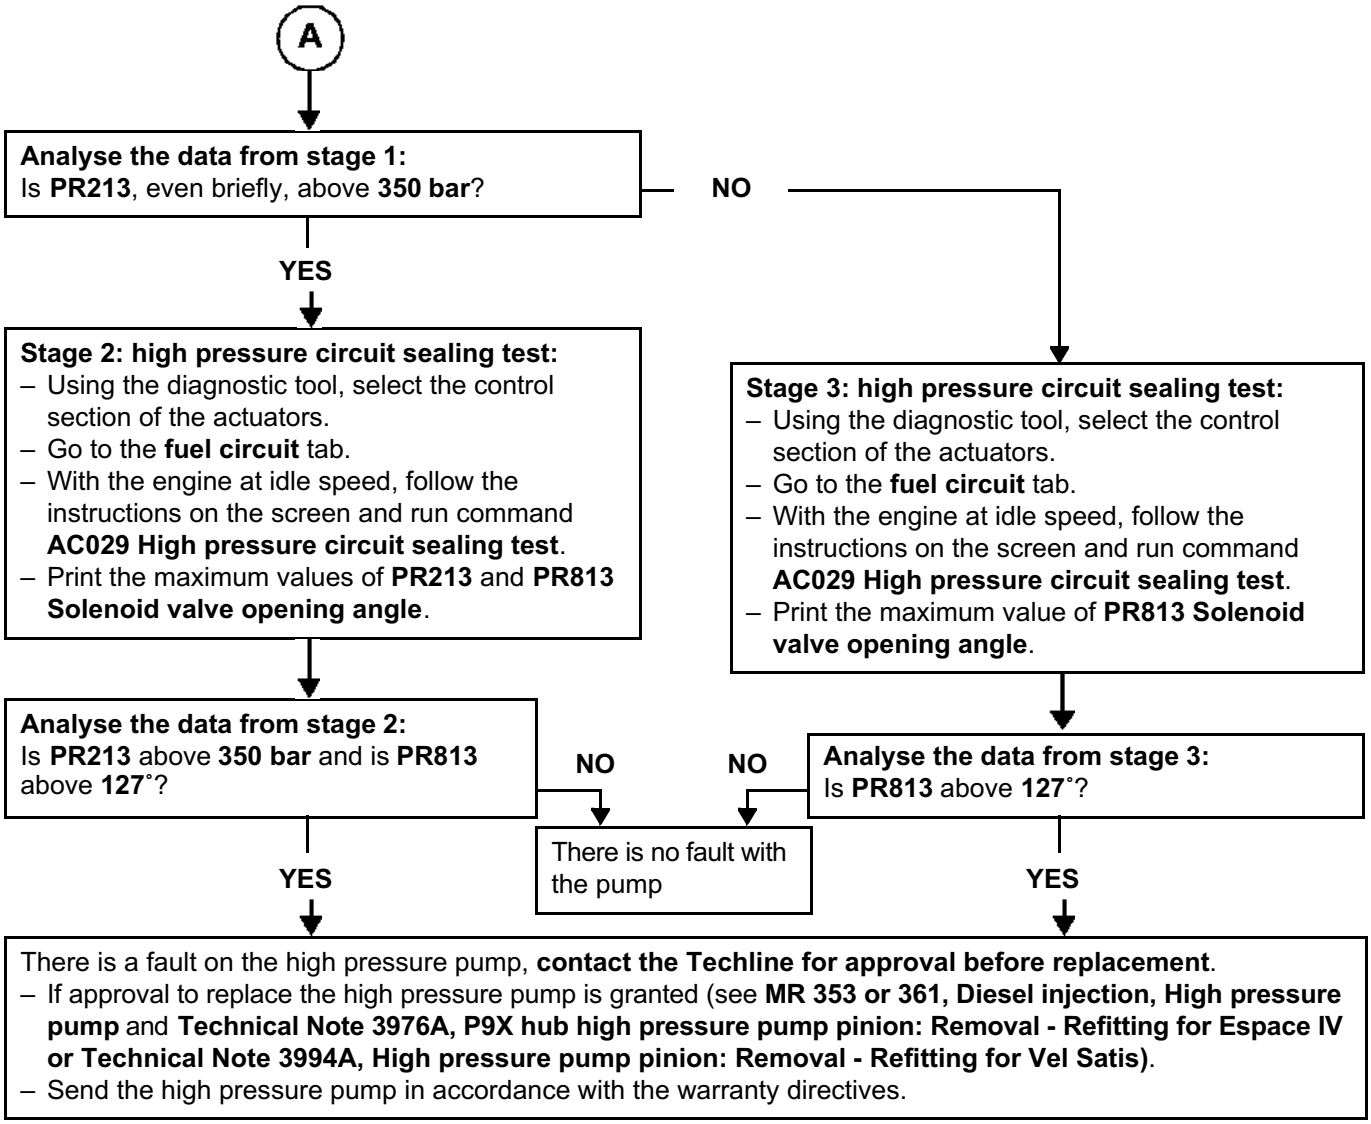


***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

TEST11

CONTINUED



***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

TEST12	Fuel conformity check

WARNING
During this operation, it is essential to:
– refrain from smoking or bringing incandescent objects close to the work area,
– guard against petrol splashes caused by the residual pressure in the pipes,
– wear safety goggles with side guards,
– wear leaktight gloves (Nitrile type).

IMPORTANT
– To avoid any corrosion or damage, protect the areas on which fuel is likely to run.
– To prevent impurities from entering the circuit, place protective plugs on all fuel circuit components exposed to the open air.

Preparations:
Weigh an empty **1300 ml plastic cup (part no. 77 11 171 413)** with its cover **(part no. 77 11 171 416)** using electronic scales such as those used in body paint workshops (example: **PANDA part no. 77 11 224 995**). Record the weight of the empty plastic cup.
This type of plastic cup is used to prepare paint.

Remove **1 L** of fuel **at the diesel filter outlet** (see **MR 353, 361 or 402, Mechanical, 19C, Tank, Fuel tank: Draining**), using a pneumatic transfer pump (**part no. 634-200**) and place it in the **1300 ml** plastic cup.
Cover the plastic cup with its cover and let it settle for approximately **2 minutes**.

,

Is the fuel cloudy or does it separate into two parts?

YES → Presence of water in diesel fuel, the fuel is not compliant. Drain the fuel circuit, including the tank (**MR353, 361 or 402, Mechanical, 19C, Tank, Fuel tank: Draining).**

NO ↓

***AFTER** REPAIR*	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

TEST12 CONTINUED 1	

A

Weigh the diesel fuel and note the fuel weight after subtracting the weight of the empty plastic cup and its cover.
Does the fuel weight fall between the minimum and maximum weights given in the table below?

Calculated weight (g.)		Fuel temperature (˚C)
Minimum weight	Maximum weight	
821	846	13
821	846	14
820	845	15
819	844	16
819	844	17
818	843	18
817	842	19
816	841	20
816	841	21
815	840	22
814	839	23
814	839	24
813	838	25

Check the fuel temperature by immersing a thermometer in the plastic cup.

YES → B

NO → C

AFTER REPAIR	Carry out a road test, followed by a check with the fault finding tool.

GETtheMANUALS.org

TEST12 CONTINUED 1	

B

End of test.

C

The fuel is not correct.
If the fuel weight is less than the minimum value then there is petrol in the diesel fuel.
If the fuel weight is greater than the minimum value then there is oil in the diesel fuel.
Drain the fuel circuit, including the tank (**MR353, 361 or 402, Mechanical, 19C, Tank, Fuel tank: Draining).**

Note:
If the weight measured reaches the limit values, the measurement can be performed with a **2230 ml plastic cup (part no.77 11 171 414)** and its cover **(part no.77 11 171 417):**
– Carry out a quick test drive in order to mix the fuel, then remove **2 l** of fuel.
– Perform the test again and check the results by multiplying the limit values by 2.

Contact the Techline if you have doubts or problems with the customer.

AFTER REPAIR	Carry out a road test, followed by a check with the fault finding tool.

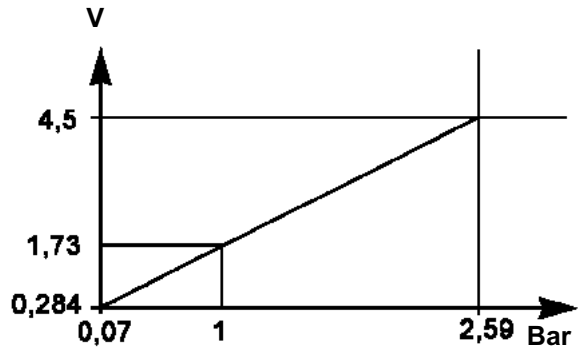
GETtheMANUALS.org

MANIFOLD/TURBOCHARGER PRESSURE SENSOR

Characteristics:	Pressure - Voltage transducer
Supply voltage:	**5 V ± 0.25 V**
Type of circuit:	Active circuit
System equipped:	Denso injection
Type of connector:	**3-track** (1 signal - 2 minus - 3 plus)

Description:
This sensor is used by the injection system to give a signal relating to the manifold pressure vacuum or the turbocharging pressure.
It uses a piezoelectric component which produces an electric voltage proportional to the stress applied to it (in this case, pressure).
This signal is very weak and is amplified by an internal electronic system which requires an external **5 V** feed supplied by the injection computer.

Checking the sensor:
The sensor delivers a voltage proportional to the inlet manifold vacuum:
2.59 bar absolute (**1.59 bar** relative) = **4.5 V**.
1 bar absolute (**0 bar** relative) = **1.73 V**.
0.07 bar absolute (**- 0.93 bar** relative) = **0.284 V**.



Check first that the sensor is correctly supplied with a voltage of **+ 5 V** with the sensor connected.
Use a multivac pump connected to the sensor's vacuum union to check that the signal does correspond to the graph. Disconnect **track 3** linking the computer to the sensor and connect the + lead of a multimeter (rated at between **5 and 10 V**) on **track 3** of the sensor and the - lead to **track 2** of the sensor (sensor earth still connected to the computer).
At atmospheric pressure, the voltage should be approximately equal to **1.73 V**.
At close to **2.59 bar** absolute, the voltage should be more or less equal to **4.5 V**.
At close to **0.07 bar** absolute, the voltage should be more or less equal to **0.284 V**.
If the voltages do not correspond to the pressures, replace the sensor.

GETtheMANUALS.org

AIR FLOW SENSOR

Characteristics:	Air flow - Voltage transducer
Supply voltage:	**12 V**
Type of circuit:	Active circuit
System equipped:	Denso injection
Type of connector:	**5-track** (**5**: signal; **3**: earth; **4**: + 5 V; **2**: + 12 V)

Description:
This sensor is used by the injection system to give a signal relating to the air flow circulating in the inlet circuit.
It uses a so-called "hot film" system, a ceramic insert onto which a heating resistor and a temperature sensor are screen-printed, which are placed in the middle of the air stream.
An electronic circuit heats the insert and monitors its temperature by means of its temperature sensor located away from the heating resistor.
The passage of air cools the ceramic wafer, and the electronic circuit will compensate for this cooling by increasing the current passing through the heating resistor so as to maintain its reference temperature.
This current, after being formatted by the flow sensor electronics, represents the air flow passing through the flow sensor.
A signal varying from **0** to **12 V** represents an air mass flow rate.
An external **12 V** power supply provided by the injection computer's safety relay is necessary for it to operate.

Checking the sensor:
Check that the grilles protecting the flow sensor are not clogged or damaged and check the cleanliness of the ceramic sensor located in the centre of the housing, which should be clean and must not be broken. Do not use detergent to clean the sensor (risk of damage).
The sensor cannot be dismantled; in case of doubt regarding its consistency, carry out a flow measurement.
Conditions:
Engine at operating temperature, exhaust gas recirculation valve and turbocharger wastegate disconnected and air conditioning off.
Perform a measurement at idling speed and then at a stabilised 3,000 rpm. Repeat this measurement with another flow sensor. The values should be more or less equivalent; if not, replace the flow sensor.
Average flow value at inlet according to the conditions set out above:
At idle speed (700 rpm): 70 kg/h
At 3000 rpm (stabilised): 320 kg/h

Note:
These values are typical for a new engine in operation and may only be used as an estimate.
To confirm the test, carry out a test with another flowmeter.

GETtheMANUALS.org

COOLANT TEMPERATURE SENSOR - INLET AIR - FUEL

IMPORTANT
Only affects the OBD air temperature sensor at the flow sensor.

Characteristics:	Temperature - resistance transducer
Resistance:	Depends on the temperature
Type of circuit:	Passive circuit
System equipped:	Denso injection
Type of connector:	**2 tracks**

Description:
This sensor is used by the injection system to give a signal representing a temperature of a component to which the sensor is attached.
This is a negative temperature coefficient resistor (the resistance drops when the temperature increases).
A circuit in the computer powers the sensor with a constant current and variation of the resistance causes variation of the voltage across the terminals of the sensor, this voltage being representative of the temperature.

Checking the sensor:
The presence of a yellow or transparent wax in the connector indicates that the sensor seal is broken; replace it and recheck the sealing.
Use a multimeter to first check the insulation of the sensor's two tracks from its metal base (if so equipped) or from engine earth.
The resistance should in this case be infinite; if this is not the case replace the sensor.
Using a multimeter, check the sensor's resistance in relation to the temperature.
This should be **3515 Ω ± 200 Ω at 20 °C**.
If the values do not correspond, replace the sensor.

GETtheMANUALS.org

ACCELERATOR POTENTIOMETER

Characteristics:	Position - resistance transducer
Supply voltage:	2 gangs, each at **+ 5 V ± 0.25 V**
Resistance:	Depends on the angle
Type of circuit:	Passive circuit
System equipped:	Denso injection
Type of connector:	**6 tracks**

Pin configuration:

Track 2 > potentiometer earth 1	**track 1 >** potentiometer earth 2
Track 4 > potentiometer supply 1	**track 5 >** potentiometer supply 2
Track 2 > potentiometer signal 1	**track 1 >** potentiometer signal 2

Description:
This sensor is equipped with two potentiometers (variable resistance) insulated from one another.
The position of the shaft causes a variation in the sensor's internal resistance.
The two gangs are not synchronous, gang 2 has a resistance value double that of gang 1.
These two gangs are used by the injection computer to check that the accelerator potentiometer is giving consistent signals.

Checking the sensor:
Use a multimeter to measure the resistance of the potentiometers,
– between **tracks 1** and **5**, the resistance should be **1700 ± 500 Ω**,
– between **tracks 2** and **6**, the resistance should be **1200 ± 500 Ω**,
If one of the gangs is not within these tolerances, replace the accelerator potentiometer.

MINIMUM value:
Gang 1 (from **13.6 % to 16.4 %** of Valim P1 (5 V) or **0.68 to 0.82 V**)
Gang 1 (from **5.2 % to 9.8 %** of Valim P2 (5 V) or **0.26 to 0.49 V**)

MAXIMUM value:
Gang 1 (from **83.6 % to 92.4 %** of Valim P1 (5 V) or **4.18 to 4.62 V**)
Gang 1 (from **40.7 % to 47.3 %** of Valim P2 (5 V) or **2.03 to 2.36 V**)

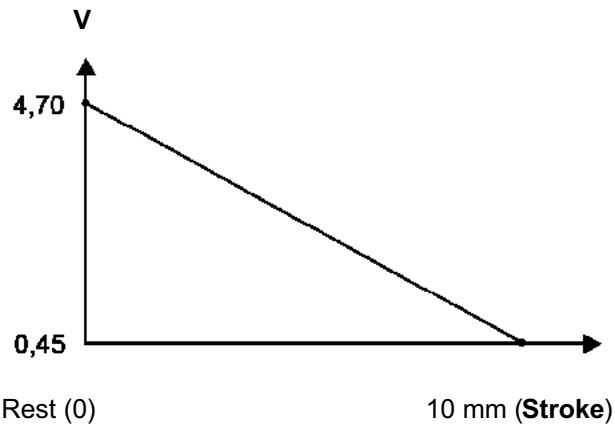
GETtheMANUALS.org

WASTEGATE POSITION SENSOR

Characteristics: Position - resistance transducer
Supply voltage: **5 V ± 0.25 V**
Type of circuit: Passive circuit
System equipped: Denso injection
Type of connector: **3-track** (1 signal - 2 minus - 3 plus)

Description:
This sensor is used by the injection system to give a signal relating to the turbocharger wastegate control position.
It uses a potentiometer powered externally by the injection computer at a voltage of **5 V**.
The sensor will thus generate a voltage proportional to its position.

Checking the sensor:
The sensor delivers a voltage proportional to the position of the wastegate rod:
End stop in rest position = **4.70 V**
10 mm of stroke = **0.45 V**



Check first that the sensor is correctly supplied with a voltage of **+ 5 V** with the sensor connected.
Use a multivac pump connected to the capsule's vacuum union and a rule to measure the rod travel.
Check that the signal corresponds to the graph.
Disconnect **track 1** linking the computer to the sensor and connect the + lead of a multimeter (rated at between **5 and 10 V**) to **track 1** of the sensor and the - lead to **track 2** of the sensor (sensor earth still connected to the computer).
If the voltages do not correspond to the position of the wastegate rod, replace the sensor.

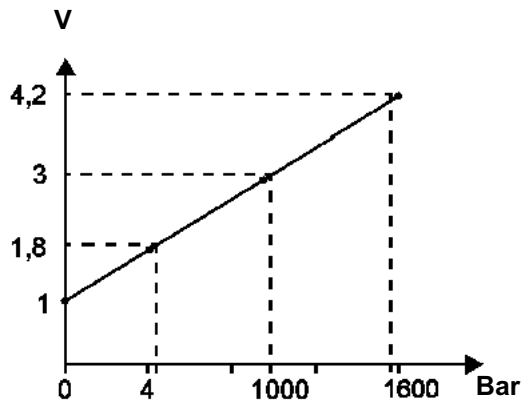
GETtheMANUALS.org

RAIL PRESSURE SENSOR

Characteristics:	Pressure - Voltage transducer
Supply voltage:	**5 V ± 0.25**
Type of circuit:	Active circuit
System equipped:	Denso injection
Type of connector:	**3-track** (1 signal - 2 minus - 3 plus)

Description:
This sensor is used by the injection system to give a signal relating to the rail pressure (fuel pressure in the common rail).
It uses a piezoelectric component which produces an electric voltage proportional to the stress applied to it (in this case, pressure).
This signal is very weak and is amplified by an internal electronic system which requires an external **5 V** feed supplied by the injection computer.

Checking the sensor:
The sensor delivers a voltage proportional to the rail pressure:
1600 bar = 4.20 V
0 bar = 1 V



The formula is as follows:
P being the pressure in bar: **(P/500) + 1 = U**
U being the signal pressure in volts: **(U - 1) x 500 = P**
Check first that the sensor is correctly supplied with a voltage of **+ 5 V** with the sensor connected.
Dump the pressure in the common rail and check that the sensor signal voltage is **1 V**.
If the voltage is not correct, replace the sensor.

GETtheMANUALS.org

1. SCOPE OF THIS DOCUMENT

This document presents the fault finding procedure applicable to all computers with the following specifications:

Vehicle(s): **VEL SATIS Phase II**
ESPACE IV phase II

Engine: **P9X715**

Function concerned: **Diesel Injection**

Computer name: **DENSO Isuzu**

Program No.: **BF57**

Vdiag No.: **11**

2. PREREQUISITES FOR FAULT FINDING

Documentation type

Fault finding procedures (this document):
– Assisted fault finding (integrated into the diagnostic tool), Dialogys.
Wiring Diagrams:
– Visu-Schéma (CD-ROM).

Type of diagnostic tools

– **CLIP**

Special tooling required

Special tooling required	
	Multimeter
Elé. 1681	Universal bornier

3. REMINDERS

Procedure

To run fault finding on the vehicle's computers, switch on the ignition in fault finding mode (forced + after ignition feed).

Proceed as follows:
– vehicle card in reader,
– press and hold the Start button (longer than **5 seconds**) with start-up conditions not fulfilled,
– connect the diagnostic tool and perform the required operations.

To **cut off the + after ignition feed**, proceed as follows:
– disconnect the diagnostic tool,
– press the Start button twice briefly (less than **3 seconds**),
– ensure that the + after ignition feed has been cut off by checking that the computer indicator lights on the instrument panel have gone out.

GETtheMANUALS.org

Faults

Faults are declared present or stored (depending on whether they appeared in a certain context and have disappeared since, or whether they remain present but are not diagnosed within the current context).

The **present** or **stored** status of faults should be considered when using the **diagnostic tool** after the + after ignition feed is switched on (without any action on the system components).

For a **present fault**, apply the procedure described in the **Interpretation of faults** section.

For a **stored fault**, note the faults displayed and apply the **Notes** section.

If the fault is **confirmed** when the instructions are applied, the fault is present. Deal with the fault.

If the fault is **not confirmed**, check:
- the electrical lines which correspond to the fault,
- the connectors for these lines (for oxidation, bent pins, etc.),
- the resistance of the component detected as faulty,
- the condition of the wires (melted or split insulation, wear).

Conformity check

The aim of the conformity check is to check data that does not produce a fault on the **diagnostic tool** when the data is inconsistent. Therefore, this stage is used to:
- carry out fault finding on faults that do not have a fault display, and which may correspond to a customer complaint.
- check that the system is operating correctly and that there is no risk of a fault recurring after repairs.

This section gives the fault finding procedures for statuses and parameters and the conditions for checking them.

If a status is not behaving normally or a parameter is outside the permitted tolerance values, consult the corresponding fault finding page.

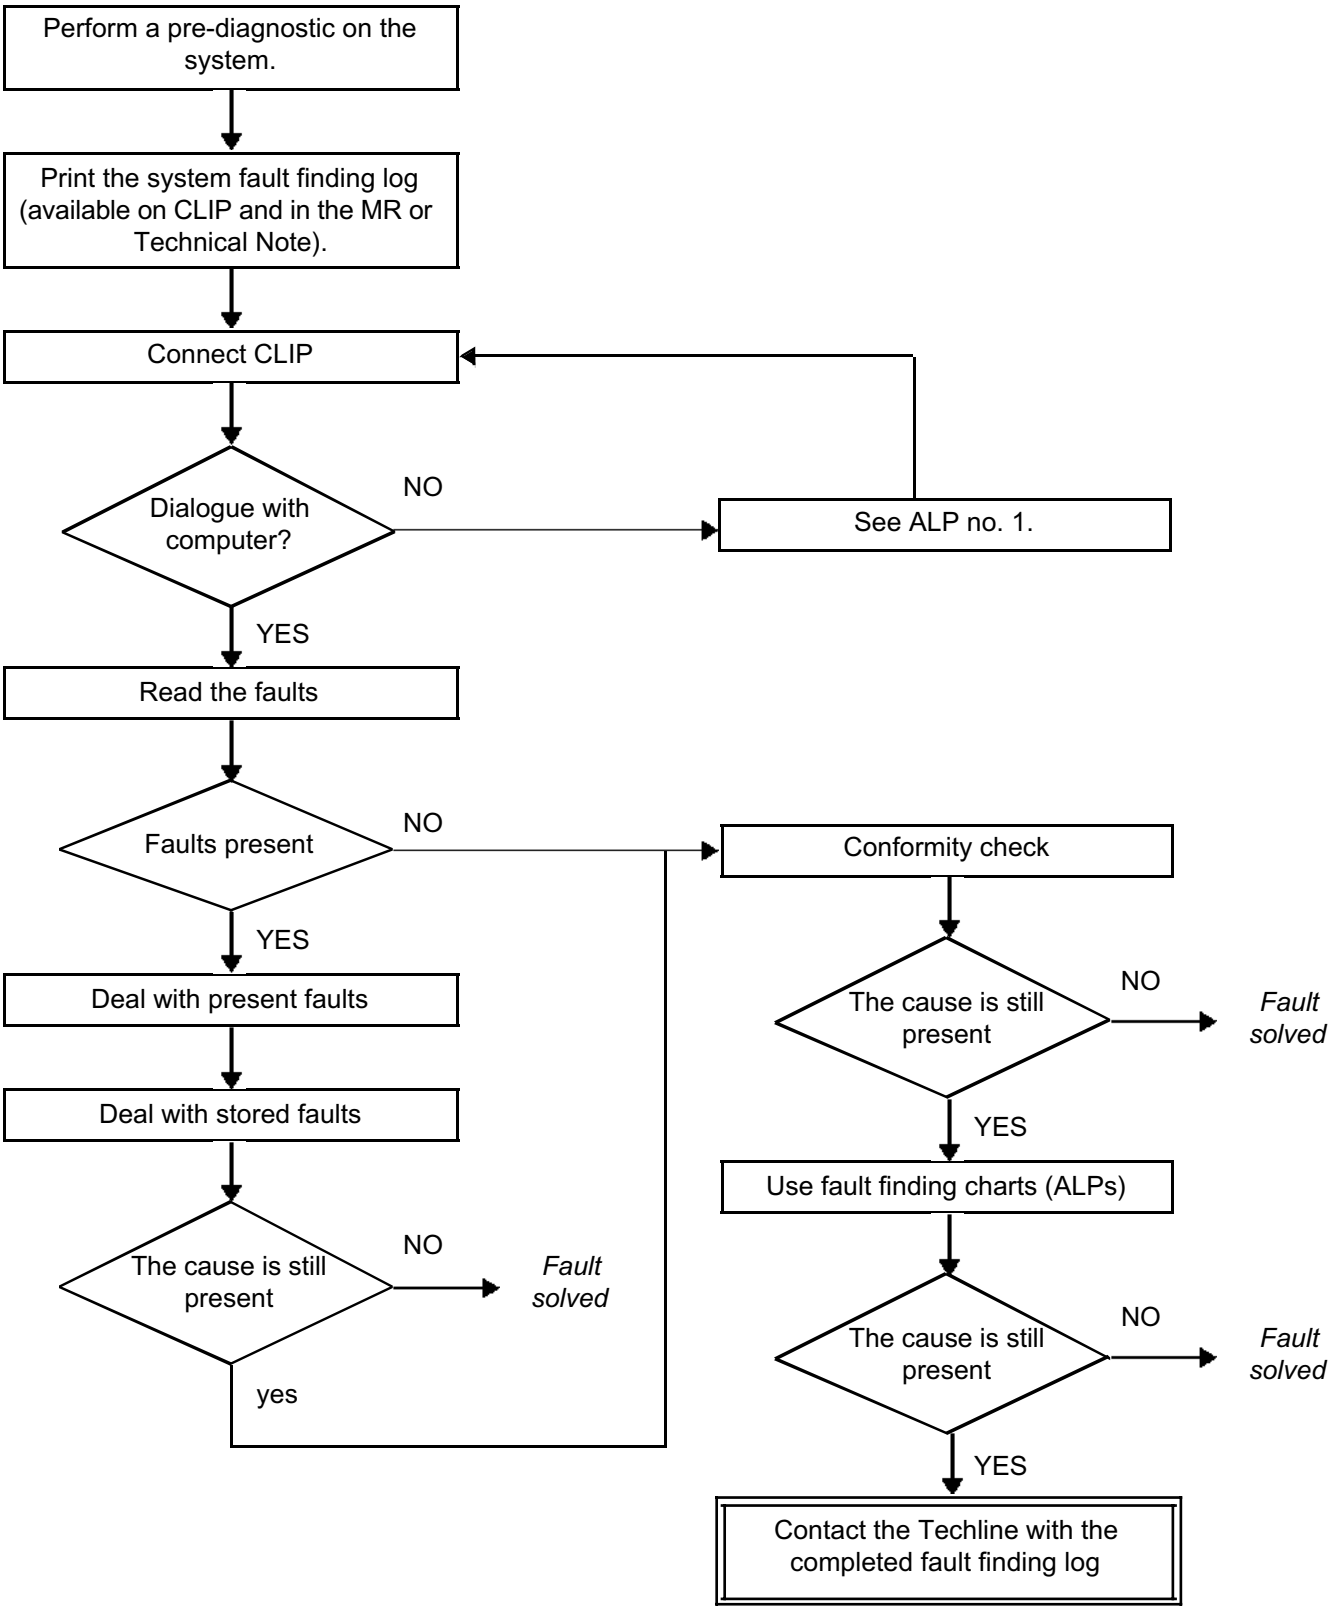
Customer complaints - Fault finding chart

If the test with the diagnostic tool is OK but the customer complaint is still present, the fault should be processed by **Customer complaints**.

A synopsis of the general procedure to follow is provided on the following page in the form of a flow chart.

GETtheMANUALS.org

4. FAULT FINDING PROCEDURE



GETtheMANUALS.org

4. FAULT FINDING PROCEDURE (continued)

Wiring check

Fault finding problems:
Disconnecting the connectors and/or handling the wiring harness may temporarily remove, the cause of a fault.
Electrical measurements of voltage, resistance and insulation are generally correct, especially if the fault is not present when the analysis is made (stored fault).

Visual inspection:
Look for damage under the bonnet and in the passenger compartment.
Carefully check the fuses, insulators and wiring harness routing.
Look for signs of oxidation.

Tactile inspection:
While manipulating the wiring, use the diagnostic tool to note any change in fault status from stored to present.
Make sure that the connectors are properly locked.
Apply light pressure to the connectors.
Twist the wiring harness.
If there is a change in status, try to locate the source of the fault.

Inspection of each component:
Disconnect the connectors and check the appearance of the clips and tabs, as well as the crimping (no crimping on the insulating section).
Make sure that the clips and tabs are properly locked in the sockets.
Check that no clips or tabs have been dislodged during connection.
Check the clip contact pressure using an appropriate model of tab.

Resistance check:
Check the continuity of entire lines, then section by section.
Look for a short circuit to earth, to **+ 12 V** or with another wire.

If a fault is detected, repair or replace the wiring harness.

GETtheMANUALS.org

5. FAULT FINDING LOG

IMPORTANT!

IMPORTANT
Any fault on a complex system requires thorough fault finding with the appropriate tools.
The **FAULT FINDING LOG**, which should be completed during the fault finding procedure, ensures a record is kept of the procedure carried out. It is an essential document when consulting the manufacturer.

IT IS THEREFORE MANDATORY TO FILL OUT A FAULT FINDING LOG EACH TIME FAULT FINDING IS CARRIED OUT.

You will always be asked for this log:

- when requesting technical assistance from Techline,
- for approval requests when replacing parts for which approval is mandatory,
- to be attached to monitored parts for which reimbursement is requested. The log is needed for warranty reimbursement, and enables better analysis of the parts removed.

6. SAFETY INSTRUCTIONS

Safety rules must be observed during any work on a component to prevent any damage or injury:

- check the battery voltage to avoid incorrect operation of computer functions,
- use the proper tools.

GETtheMANUALS.org

I - RISKS ASSOCIATED WITH CONTAMINATION

The high pressure direct injection system is highly sensitive to contamination. The risks associated with contamination are:
– damage to or destruction of the high pressure injection system,
– components jamming,
– components losing seal integrity.

All After-Sales operations must be performed under very clean conditions. This means that no impurities (particles a few microns in size) should have entered the system during dismantling.

The cleanliness principle must be applied from the filter to the injectors.

What are the sources of contamination?
– metal or plastic chips,
– paint,
– fibres:
  – from cardboard,
  – from brushes,
  – from paper,
  – from clothing,
  – from cloths,
– foreign bodies such as hair,
– ambient air,
– etc.

IMPORTANT
Cleaning the engine using a high pressure washer is prohibited because of the risk of damaging connections. Also, moisture may collect in the connectors and create electrical connection faults.

II - NOTES TO BE FOLLOWED BEFORE ANY OPERATION

IMPORTANT
Before any work is carried out on the high pressure injection system, protect:
– the accessories and timing belts,
– the electrical accessories, (starter, alternator, electric power assisted steering pump),
– the flywheel surface, to prevent any diesel from running onto the clutch friction plate.

Check that you have plugs for the unions to be opened (set of plugs available from the Parts Department). The plugs are single-use only. After use, they must be discarded (once used they are soiled and cleaning is not sufficient to make them reusable). Unused plugs must be discarded.

GETtheMANUALS.org

Check that you have hermetically resealable plastic bags for storing removed parts. Parts stored in this way will be less susceptible to the risk of contamination. The bags are to be used once only, and discarded after use.

Use lint-free cleaning cloths (cloth part number **77 11 211 707**). Using normal cloth or paper is prohibited. They are not lint-free and could contaminate the fuel circuit. Each cloth should only be used once.

Use fresh cleaning agent for each operation (used cleaning agent is contaminated). Pour it into an uncontaminated container.

For each operation, use a clean brush in good condition (the brush must not shed its bristles).

Use a brush and cleaning agent to clean the unions to be opened.

Blast compressed air over the cleaned parts (tools, workbench, the parts, unions and injection system zones). Check that no bristles remain.

Wash your hands before and during the operation if necessary.

When wearing leather protective gloves cover them with latex gloves to prevent contamination.

III - INSTRUCTIONS TO BE FOLLOWED DURING THE OPERATION

As soon as the circuit is open, all openings must be plugged to prevent impurities from entering the system. The plugs to be used are available from the Parts Department. The plugs must not be reused under any circumstances.

Seal the pouch shut, even if it has to be opened shortly afterwards. Ambient air carries contamination.

All components removed from the injection system must be stored in a hermetically sealed plastic bag once they have been plugged.

Using a brush, cleaning agent, air gun, sponge or normal cloth is strictly prohibited once the circuit has been opened. These items could allow contamination to enter the system.

A new component replacing an old one must not be removed from its packaging until it is to be fitted to the vehicle.

GETtheMANUALS.org

The high pressure injection system is designed to deliver a precise quantity of diesel fuel to the engine at a set moment.

It is fitted with a **121-track** computer made by **DENSO ISUZU**

The system is comprised of:
- a priming pump,
- a diesel filter fitted with a heater,
- a high pressure pump with two pumping pistons,
- two high pressure regulators attached to the pump,
- an injector rail,
- a diesel fuel pressure sensor built into the rail,
- a pressure limiter,
- six solenoid injectors,
- a diesel fuel temperature sensor,
- a coolant temperature sensor,
- an air inlet temperature sensor,
- an oil temperature sensor,
- a cylinder reference sensor,
- a turbocharger pressure sensor,
- an exhaust gas recirculation solenoid valve,
- an accelerator pedal potentiometer,
- an atmospheric pressure sensor integrated into the injection computer,
- an injection computer,
- an air flow sensor (fitted with an OBD air temperature sensor),
- a turbocharging limiter solenoid valve,
- a damper flap solenoid valve.

The "**common rail**" high pressure direct injection system works sequentially (based on the multipoint injection system for petrol engines).

This new injection system reduces operating noise, reduces the volume of pollutant gases and particles and produces high engine torque at low engine speeds thanks to a pre-injection procedure.

The high pressure pump generates the high pressure and transmits it to the injector rail. The actuators located on the pump control the quantity of diesel fuel supplied based on the demand determined by the computer. The rail supplies each injector through a steel pipe.

GETtheMANUALS.org

a) The computer:

This determines the injection pressure value necessary for the engine to operate correctly and then controls the pressure regulators. It checks that the pressure value is correct by analysing the value transmitted by the pressure sensor located on the rail.

It determines the injection timing required to deliver the right quantity of diesel fuel and the moment when injection should start.

Controls each injector electrically and individually after determining these two values.

The flow injected into the engine is determined by:
- the duration of injector control,
- the rail pressure (regulated by the computer),
- the injector opening and closing speed,
- the needle stroke (determined by a constant for the type of injector),
- the nominal hydraulic flow of the injector (specific to each injector),
- the pedal load,
- the engine speed.

The computer manages:
- idling regulation,
- exhaust gas flow reinjection to the inlet,
- the fuel supply (advance, flow and rail pressure),
- the motor-driven fan assembly control via the Protection and Switching Unit (centralised coolant temperature management function),
- the air conditioning (cold loop function),
- the cruise control/speed limiter function,
- pre-post heating control,
- fault warning lights via the multiplex network.

The high pressure pump supplies the rail whose pressure is controlled by the fuel flow actuator for filling and by the injector valves for discharging. This compensates for pressure drops. The fuel flow actuator enables the high pressure pump to supply the exact quantity of diesel fuel required to maintain the rail pressure. This component minimises the heat generated and improves engine output.
In order to discharge the rail using the injector valves, the valves are controlled by brief electrical pulses which are:
- short enough not to open the injector (passing through the feedback circuit from the injectors),
- long enough to open the valves and discharge the rail,
- multiplexed connection between the vehicle's various computers.

The fault warning lights on the instrument panel are activated via the multiplex network.

The vehicle speed signal on the instrument panel is transmitted by the ABS computer or the **WHEEL SPEED** computer via a wire connection and is then transmitted via the multiplex network by the instrument panel. The main users of the vehicle speed signal are the injection computer and the airbag computer.

Some vehicles have adopted a sensor for detecting water in the diesel fuel, located in the filter. If there is water in the fuel, the orange injection and pre/postheating warning light will come on.

GETtheMANUALS.org

IMPORTANT
The engine must not operate with:
- diesel fuel containing more than 10% diester,
- petrol, even in tiny quantities.

The system can inject diesel fuel into the engine at a pressure of up to **1450 bar**. Before each operation, check that the injector rail is depressurised and that the fuel temperature is not too high.

When working on the high pressure injection system, you must follow the cleanliness guidelines and safety advice specified in this document.

Removal of the internal parts of the pump and injectors is prohibited. Only the fuel flow actuator and the diesel fuel temperature sensor can be replaced.

For safety reasons, it is strictly prohibited to undo a high pressure pipe union when the engine is running.

It is not possible to remove the pressure sensor from the fuel rail because this may cause circuit contamination faults. If the pressure sensor fails, replace the pressure sensor, the rail and the high pressure pipes.

Supplying **+ 12 V** directly to any component in the system is prohibited.

Ultrasonic decoking and cleaning are prohibited.

Never start the engine unless the battery is connected correctly.

Disconnect the injection computer when carrying out any welding work on the vehicle.

b) Management of cruise control/speed limiter:

When activated, the cruise control function maintains the vehicle at a preselected speed, regardless of the driving conditions encountered. Using the control buttons, the driver can increase or reduce the vehicle speed.

The cruise control function can be deactivated either using the control buttons, or by switching off the cruise control function selection switch or when system events are detected (such as the brake pedal being depressed), or when system errors are detected such as an inconsistent vehicle speed or excessive vehicle deceleration.

The cruise control function can also be temporarily suspended when the driver wants to resume control of the vehicle and exceed the selected cruising speed by depressing the accelerator pedal which then exceeds the selected fuel flow. The cruising speed is resumed when the driver releases the accelerator pedal.

The cruise control function can be reactivated and the last cruising speed can be resumed after deactivating the function for whatever reason until the vehicle ignition is switched off (i.e. for as long as computer supply not cut off). The vehicle will then attempt to return to the cruising speed using a controlled vehicle acceleration rate.

GETtheMANUALS.org

When switched on (with the selection switch), the vehicle speed limiter function limits the vehicle speed to a preset value. The driver controls the vehicle in the normal way using the accelerator pedal until the limit speed is reached. If the driver attempts to exceed this speed, the system will ignore the pedal request and will control the vehicle speed in the same way as the cruise control function, provided that the driver keeps the accelerator pedal depressed.
As with the cruise control function, the limit speed can be altered using the control buttons by pressing briefly or pressing and holding.
For safety reasons, it is possible to exceed the limit speed by rapidly depressing the accelerator pedal. The vehicle speed is controlled by the accelerator pedal according to the driver's request. The vehicle's speed limiter is reactivated when the vehicle speed drops below the cruising speed again.

The driver has the following controls to operate the cruise control function:

- accelerator pedal,
- brake pedal,
- function selection switch for selecting speed limiter or cruise control operating mode,
- controls at the steering wheel.

GETtheMANUALS.org

Instrument panel display:

The computer manages the data display on the instrument panel relating to engine operation. This involves 5 functions:
– the EOBD (European On Board Diagnostic) MIL (Malfunction Indicator Lamp),
– pre-postheating,
– the coolant temperature,
– engine faults:
  - Level 1 (non critical fault),
  - Level 2 (emergency stop).

These five functions are represented by 4 warning lights and/or messages displayed by the trip computer.

Pre-postheating warning light:

Permanently on, supplied by + after ignition feed:
Indicates preheating of the plugs (automatic timed operation lasting **0 to 4 seconds**).

Coolant temperature/emergency stop (level 2) warning light:

This light is used as an operation indicator light and as a system fault warning light.
It switches on for **3 seconds** when a voltage is applied (automatic test procedure controlled by the instrument panel).

Continuously lit: indicates engine overheating or a **Level 2** fault.

If the fault reaches a critical level, the injection cuts off automatically after a few seconds. In the event of overheating, it is up to the driver whether to stop the vehicle or continue driving.

OPERATION OF INSTRUMENT PANEL WARNING LIGHTS:

Orange SERVICE non-critical fault warning light (level 1):

This warning light comes on, **accompanied by the faulty injection message**.

The driver should carry out repairs as soon as possible.

Red STOP emergency stop warning light (level 2):

This warning light comes on, **along with the check injection message**.

The driver should carry out repairs as soon as possible.

Orange OBD excess pollution warning light:

This warning light is represented by an engine, and it lights up when switching on the ignition for approximately **2 seconds** then goes out.

Continuous lighting: indicates a fault in an engine component preventing emission control standards being met.

The driver should carry out repairs as soon as possible.

COMPUTER REPLACEMENT OR REPROGRAMMING

There are two steps that must be carried out when the computer is replaced or reprogrammed: **SC003 Save computer data** and **SC001 Write saved data**.

- **SC003** Run the command **before replacing or reprogramming** the computer. This enables certain data to be saved **in the diagnostic tool** so that the new computer* can be reconfigured like the old one. The data saved is the injector codes.
- **SC001** Run the command **after replacing or reprogramming** the computer. It is used to re-enter the information (saved using command **SC003**) into the new computer*.

* *new computer or reprogrammed computer.*

The system can be programmed and reprogrammed via the diagnostic socket using the RENAULT CLIP **diagnostic tool** (**Refer to Technical Note 3585A, Computer programming and reprogramming procedure or follow the instructions provided by the diagnostic tool**).

IMPORTANT
- **switch on the diagnostic tool (mains or cigarette lighter supply),**
- **connect a battery charger,**
- **shut down all the electrical consumers (lights, interior lights, air conditioning, radio CD, etc.),**
- **wait for the engine to cool down (coolant temperature below 60 ˚C and air temperature below 50 ˚C),**
- **during reprogramming the oil pressure warning light comes on, and then goes off when reprogramming has finished.**

Every time the computer has been reprogrammed or replaced:
- **Switch the ignition off and then on again,**
- **start and then stop the engine (to initialise the computer) and wait for 2 minutes,**
- **use the diagnostic tool to carry out the following procedures:**
  1. run command **VP010 Enter VIN**,
  2. carry out a road test followed by another check with the **diagnostic tool**.

IMPORTANT
It is not possible to try an injection computer coming from the Parts Department because it will no longer be possible to use it on another vehicle.

GETtheMANUALS.org

Summary of the configurations and programming available

NOTES	The configurations and programming are carried out to inform the vehicle computer of the VIN for the vehicle and the engine inhibitions.

VP010: Enter VIN

This command allows the VIN to be entered in the injection computer.
Use this command each time the computer is replaced or (re)programmed.

VP012: Deactivation of electrical consumers

This command is used to inhibit the electrical supply to the preheating unit, GMV control relay unit and heating element relays.

VP035: End deactivation of electrical consumers

This command is used to re-establish the electrical supply to the preheating unit, GMV control relay unit and heating element relays.

VP036: Inhibit fuel supply

This command is used to inhibit fuel supply to the injectors.

VP037: Restore fuel supply

This command is used to re-establish fuel supply to the injectors.

DF001 PRESENT OR STORED	COOLANT TEMPERATURE SENSOR CIRCUIT CO.1 : Open circuit or short circuit to + 12 V CC.0 : Short circuit to earth 1.DEF: Inconsistency

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors. (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

CO.1	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – **level 1** and **OBD** warning lights are lit, – presence of **+ after ignition feed**, – the voltage of the coolant temperature sensor is greater than **4.974 V**, – the air temperature is greater than **25 °C**.

Manipulate the wiring harness between the engine management computer and the coolant temperature sensor to detect a status change (present ↔ stored).
Look for chafing damage on the harness.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the connection and condition of the **engine management computer connector**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the connection and condition of the **coolant temperature sensor connector**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Measure the coolant temperature sensor resistance between its connections **3C** and **3CK** of the connector for component **244**.
Replace the sensor if the **resistance** is not: **3511 Ω ± 176 at + 20 °C**
980 Ω ± 50 at + 50 °C
469 Ω ± 24 at + 70 °C
242 Ω ± 12 at + 90 °C

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF001 **CONTINUED 1**	

Check the **insulation from + 12 V and earth, and the continuity and absence of interference resistance** on the following connection:
– connection code **3CK**,
between the coolant temperature sensor, **component code 244** and the engine management computer, **component code 120**.
Check the **insulation** from **+ 5 V and + 12 V** on the following connection:
– connection code **3C**,
between the coolant temperature sensor, **component code 244** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

If the fault is still present, check that the thermostat is working correctly.
Check the fill level and sealing of the cooling circuit (**see MR402 or MR 405 Mechanical, 19A, Cooling, Engine cooling system: Check**).

Clear the faults from memory and then start the engine.

If the **fault is still present**, contact the Techline.

CC.0	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – **level 1** and **OBD** warning lights are lit, – presence of **+ after ignition feed**, – the coolant temperature sensor voltage is less than **0.12 V**.

Manipulate the wiring harness between the engine management computer and the coolant temperature sensor to detect a status change (present ↔ stored).
Look for chafing damage on the harness.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the connection and condition of the **engine management computer connector**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the connection and condition of the **coolant temperature sensor connector**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF001 **CONTINUED 2**	

Measure the coolant temperature sensor resistance between its connections **3C** and **3CK** of the connector for component **244**.
Replace the sensor if the **resistance** is not: **3511 Ω ± 176 at + 20 ˚C**
980 Ω ± 50 at + 50 ˚C
469 Ω ± 24 at + 70 ˚C
242 Ω ± 12 at + 90 ˚C

Check the **insulation, continuity and the absence of interference resistance** on the following connection:
– connection code **3CK**,
between the coolant temperature sensor, **component code 244** and the engine management computer, **component code 120**.
The resistance is equal to or greater than 10 MΩ.
Check the **insulation** from **+ 5 V** and **+ 12 V** on the following connection:
– connection code **3C**,
between the coolant temperature sensor, **component code 244** and the engine management computer, **component code 120**.
The resistance is equal to or greater than 10 MΩ.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

If the fault is still present, check that the thermostat is working properly.
Check the fill level and sealing of the cooling circuit (see **MR402 or MR 405 Mechanical, 19A**).

Clear the faults from memory and then start the engine.
If the **fault is still present**, contact the Techline.

1.DEF	***NOTES***	**Priority when dealing with a number of faults:** Deal with statuses **DF001, CC.0** and **CO.1** first if they are present or stored.
		Conditions for applying the fault finding procedure to stored faults: The fault is declared as present if: – **level 1** and **OBD** warning lights are lit, – following an engine start, – coolant temperature **> - 40 ˚C and < 33 ˚C**.

Check the condition of the battery and the charging circuit (see **Technical Note 6014A, Checking the charging circuit**).
Check **the condition of the vehicle earths**.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF001 **CONTINUED 3**	

Manipulate the wiring harness between the engine management computer and the coolant temperature sensor to detect a status change (present ↔ stored).
Look for chafing damage on the harness.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the connection and condition of the **engine management computer connector**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the connection and condition of the **coolant temperature sensor connector**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Measure the coolant temperature sensor resistance between its connections **3C** and **3CK** of the connector for component **244**.
Replace the sensor if the **resistance** is not: **3511 Ω ± 176 at + 20 °C**
980 Ω ± 50 at + 50 °C
469 Ω ± 24 at + 70 °C
242 Ω ± 12 at + 90 °C

Check **the insulation from earth, the continuity and absence of interference resistance** on the following connection:
– connection code **3CK**,
between the coolant temperature sensor, **component code 244** and the engine management computer, **component code 120**.
The resistance is equal to or greater than 10 MΩ.
Check the **insulation** from **+ 5 V** and **+ 12 V** on the following connection:
– connection code **3C**,
between the coolant temperature sensor, **component code 244** and the engine management computer, **component code 120**.
The resistance is equal to or greater than 10 MΩ.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

If the fault is still present, check that the thermostat is working correctly.
Check the fill level and sealing of the cooling circuit (see **MR402 or MR 405 Mechanical, 19A**).

Clear the faults from memory and then start the engine.

If the conformity check does not detect the fault, **contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF002 PRESENT OR STORED	AIR TEMPERATURE SENSOR CIRCUIT CC.0 : Short circuit to earth CO.1 : Open circuit or short circuit to + 12 V

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors. Does not affect the inlet air temperature sensor (**inlet manifold**). (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

CC.0	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** – The fault is declared present if the sensor voltage is less than **0.10 V**, – **OBD** indicator light is on.

Manipulate the wiring between the engine management computer and the air flow sensor air temperature sensor to detect a change of status (present ↔ stored).
Look for possible damage to the harness, and check the connection and the condition of the flowmeter air temperature sensor and its connections.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Disconnect the injection computer connector and the flow meter air temperature sensor connector.

Measure the flow sensor air temperature sensor resistance between connections **3B** and **3DU** of the connector for component **799**.
Replace the sensor if the **resistance** is not: **5499 Ω ± 275 at + 0 °C**
3604 Ω ± 180 at + 10 °C
2420 Ω ± 121 at + 20 °C

Check for **insulation against earth, continuity and absence of interference resistance** on the following connections:
– connection code **3B**,
between the flow sensor air temperature sensor, **component code 799** and the engine management computer, **component code 120**.
The resistance is equal to or greater than 10 MΩ.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

If the **fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF002 **CONTINUED 1**	

CO.1	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** – The fault is declared present if the sensor voltage is greater than **4.88 V**, – **OBD** indicator light is on.

Manipulate the wiring between the engine management computer and the air flow sensor air temperature sensor to detect a change of status (present ↔ stored).
Look for any damage to the wiring and check the **connection** and **condition** of the flow meter air temperature sensor and its connections.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Disconnect the injection computer connector and the flow meter air temperature sensor connector.

Measure the flow sensor air temperature sensor resistance between connections **3B** and **3DU** of the connector for component **799**.
Replace the sensor if the **resistance** is not: **5499 Ω ± 275 at + 0 °C**
3604 Ω ± 180 at + 10 °C
2420 Ω ± 121 at + 20 °C

Check for **insulation against earth, continuity and absence of interference resistance** on the following connections:
– connection code **3B**,
between the flow sensor air temperature sensor, **component code 799** and the engine management computer, **component code 120**.
The resistance is equal to or greater than 10 MΩ.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

If the **fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF003 PRESENT OR STORED	ATMOSPHERIC PRESSURE SENSOR CIRCUIT CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 V

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

CO.0	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the atmospheric pressure sensor voltage is less than **0.12 V**, – the engine is started, – **level 1** and **OBD** warning lights are lit.

If the fault is stored, clear the fault using the **diagnostic tool**.
If the **fault is present or persists, deal with any other faults**. If the **fault is still present**, contact the Techline.

CC.1	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the atmospheric pressure sensor voltage is greater than **4.39 V**, – the engine is started, – **level 1** and **OBD** warning lights are lit.

If the fault is stored, clear the fault using the **diagnostic tool**.
If the **fault is present or persists, deal with any other faults**. If the **fault is still present,** contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF005 PRESENT OR STORED	ENGINE SPEED SENSOR CIRCUIT 1.DEF: Inconsistency 2.DEF: No signal

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors. (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

1.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the computer receives an incorrect signal from the flywheel sensor (value other than 56 pulses per revolution or signal interference), – with the engine running, – defective sensor, – the harness or connections are faulty, – there is an incorrectly positioned sensor, – damaged target (timing side), – **level 1** and **OBD** warning lights are lit.

Check that the battery **voltage** is greater than **10 V**. Replace the battery if necessary.
Manipulate the wiring harness between the engine management computer and the engine speed sensor to detect a status change (present ↔ stored). Look for chafing damage on the harness. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check the connection and condition of the **computer connector**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check the connection and condition **of the engine speed sensor connector**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Verify the **condition** of the earth connection of the **engine speed sensor harness shielding**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF005 **CONTINUED 1**	

Check the **air gap** between the engine speed sensor and the target (see **MR 402 or MR 405 Mechanical, 13B Diesel injection**). Repair if necessary.
Check the conformity of the target (broken, worn or damaged teeth). Repair if necessary.
Clear the faults from memory and then start the engine.
Perform another fault finding procedure on the computer. If the fault is still present, deal with any other faults. If the **fault is still present**, contact the Techline.

2.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the computer only receives the camshaft position sensor signal, – the computer does not receive the engine speed sensor signal, **with the engine running**, – with the engine running, – defective sensor, – the harness or connections are faulty, – there is an incorrectly positioned sensor, – **level 1** and **OBD** warning lights are lit.

Check that the battery **voltage** is greater than **10 V**. Check **the condition of the vehicle earths** and the charging circuit (see **Technical Note 6014A, Checking the charging circuit**). Replace the battery if necessary.
Manipulate the wiring harness between the engine management computer and the engine speed sensor to detect a status change (present ↔ stored). Look for chafing damage on the harness. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check the connection and condition of the **computer connector**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check the connection and condition **of the engine speed sensor connector**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF005 **CONTINUED 2**	

Check **the insulation from earth, the continuity and absence of interference resistance** on the following connection: – connection code **3BG**, between the engine speed sensor, **component code 149** and the engine management computer, **component code 120**. The resistance is equal to or greater than 10 MΩ. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check **the insulation from earth, the continuity and absence of interference resistance** on the following connection: – connection code **3BL**, between the engine speed sensor, **component code 149** and the engine management computer, **component code 120**. The resistance is equal to or greater than 10 MΩ. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check **the insulation from earth, the continuity and absence of interference resistance** on the following connection: – connection code **5CS**, between the engine speed sensor, **component code 149** and the engine management computer, **component code 120**. The resistance is equal to or greater than 10 MΩ. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
If the fault is still present, check the **condition** of the flywheel signal sensor electric wiring harness **shielding earth**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check that the **earth connection** of the camshaft position sensor electric wiring harness **shielding** is in **good condition**.
If the **fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF007 PRESENT OR STORED	RAIL PRESSURE SENSOR CIRCUIT CO.1 : Open circuit or short circuit to + 12 V CC.0 : Short circuit to earth 1.DEF: Inconsistency CC : Short circuit

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors. (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

CO.1	***NOTES***	**Special notes:** – fast idling at **1000 rpm**, – limitation of performance.
		Conditions for applying the fault finding procedure to stored faults: The fault is declared as present if: – presence of **+ after ignition feed**, – the rail pressure sensor voltage is greater than **4.56 V**, – **level 1** and **OBD** warning lights are lit.

Manipulate the wiring harness between the engine management computer and the rail pressure sensor to detect a status change (present ↔ stored).
Look for chafing damage on the harness.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the connection and condition of the **computer connector**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the **connection and condition of the rail pressure sensor connector**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF007 **CONTINUED 1**	

Check for **insulation from + 12 V, the continuity and absence of interference resistance** on the following connections:
– connection code **3CJ**,
– connection code **3LY**,
between the rail pressure sensor, **component code 1032** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
If all the connections are correct.
Check for **earth** on the following connection:
– connection code **3CJ**,
between the rail pressure sensor, **component code 1032** and the engine management computer, **component code 120**.
Check for **+ 5 V** on the following connection:
– connection code **3AX**,
between the rail pressure sensor, **component code 1032** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

If the fault is still present, replace the injector rail.
Clear the faults.
Start the engine.

If the fault is still present, **contact the Techline**.

CC.0	***NOTES***	**Special notes:** – fast idling at **1000 rpm**, – limitation of performance.
		Conditions for applying the fault finding procedure to stored faults: The fault is declared as present if: – presence of **+ after ignition feed**, – the rail pressure sensor voltage is less than **0.67 V**, – **level 1** and **OBD** warning lights are lit.

Manipulate the wiring harness between the engine management computer and the rail pressure sensor to detect a status change (present ↔ stored).
Look for chafing damage on the harness.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF008 **CONTINUED 1**	

CC.1	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present if the voltage on the potentiometer no. 1 signal line is less than **0.34 V**. – the **level 1** warning light comes on.

Manipulate the wiring harness between the engine management computer and the pedal potentiometer to detect a status change (present ↔ stored). Look for chafing damage on the harness. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check the connection and condition of the **computer connector**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check the **connection and condition of the pedal potentiometer sensor connector**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check for **continuity and the absence of interference resistance** on the following connection: – connection code **3LT**, between the pedal potentiometer gang 1, **component code 921** and the engine management computer, **component code 120**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check the **insulation** from **+ 12 V, the continuity and absence of interference resistance** on the following connection: – connection code **3LS**, between the pedal potentiometer gang 1, **component code 921** and the engine management computer, **component code 120**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
If the fault is still present, replace the pedal potentiometer. Clear the faults, then start the engine.
If the **fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF008 **CONTINUED 2**	

1.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present when there is a large signal difference between potentiometers 1 and 2, – the **level 1** warning light comes on.

Manipulate the wiring harness between the engine management computer and the pedal potentiometer to detect a status change (present ↔ stored). Look for chafing damage on the harness. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check the connection and condition of the **computer connector**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check the connection and condition of the **pedal potentiometer connector**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check **the insulation, continuity and the absence of interference resistance** on the following connections: – connection code **3LR**, – connection code **3LS**, – connection code **3LT**, – connection code **3LU**, – connection code **3LW**, – connection code **3LV**, between the pedal potentiometer gangs 1 and 2, **component code 921** and the engine management computer, **component code 120**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
If the fault is still present, replace the accelerator potentiometer (see **MR 402 or MR 405, Mechanical, 13B, Diesel Injection**). Clear the faults and start the engine.
If the **fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF009 PRESENT OR STORED	PEDAL POTENTIOMETER CIRCUIT GANGED CIRCUIT 2 CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 V

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors. (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

CO.0	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present if the voltage on the potentiometer no. 2 signal line is greater than **3.64 V**, – the **level 1** warning light comes on.

Manipulate the wiring harness between the engine management computer and the pedal potentiometer to detect a status change (present ↔ stored).
Look for chafing damage on the harness.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the connection and condition of the **computer connector**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the connection and condition of the **pedal potentiometer connector**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check **the insulation from earth, the continuity and absence of interference resistance** on the following connection:
– connection code **3LW**,
between the pedal potentiometer gang 2, **component code 921** and the engine management computer, **component code 120**.
The resistance is equal to or greater than 10 MΩ.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check **the continuity and absence of interference resistance** of the following connections:
– connection code **3LU**,
– connection code **3LW**,
between the pedal potentiometer gang 2, **component code 921** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

DF009 **CONTINUED**	

If the fault is still present, replace the pedal potentiometer.
Clear the faults, then start the engine.

If the **fault is still present**, contact the Techline.

CC.1	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present if the voltage on the potentiometer no. 2 signal line is less than **0.17 V**, – the **level 1** warning light comes on.

Manipulate the wiring harness between the engine management computer and the pedal potentiometer to detect a status change (present ↔ stored).
Look for chafing damage on the harness.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the connection and condition of the **computer connector**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the connection and condition of the **pedal potentiometer connector**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check for **insulation from + 12 V, the continuity and absence of interference resistance** on the following connections:
– connection code **3LV**,
– connection code **3LW**,
between the pedal potentiometer gang 2, **component code 921** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

If the fault is still present, replace the pedal potentiometer.
Clear the faults, then start the engine.

If the **fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF011 PRESENT OR STORED	SENSOR SUPPLY VOLTAGE NO. 1 1.DEF: Below minimum threshold 2.DEF: Above maximum threshold

NOTES	**Priorities when dealing with a number of faults:** If one of the following faults is present at the same time: – **DF008 Pedal potentiometer circuit ganged circuit 1**, check that the pedal sensor connector is connected correctly. – **DF005 Engine speed sensor circuit**, check that the engine speed sensor connector is connected correctly.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present after the ignition has been switched on.
	Special notes: If the fault is present: – The cruise control/speed limiter function is deactivated. – Power is restricted. – **Level 1** and **OBD** warning lights are lit. (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

The sensors connected to **feed no. 1** are:
– **pedal potentiometer gang 1,**
– **engine speed sensor.**
To locate a faulty sensor and/or connection, disconnect one of these sensors then check whether the fault becomes stored.
If the fault is still present, start the operation again with each sensor (one by one).
(Wait several seconds between each disconnection to allow the computer time to detect the fault).
If the fault is stored after disconnection, change the faulty sensor or repair the connection.
Clear the faults created by the multiple disconnections.

Check the connection and condition of the connector for the sensors and the injection computer.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

If the sensors, **pedal potentiometer gang 1 and engine speed sensor** are disconnected, and the fault is still present:
Check **the insulation, continuity and the absence of interference resistance** on the following connections:
– connection code **3BL**,
– connection code **5CS**,
between the engine speed sensor, **component code 149** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF011 **CONTINUED**	

Check **the insulation, continuity and the absence of interference resistance** on the following connections:
– connection code **3LR**,
– connection code **3LT**,
between the pedal potentiometer gang 1, **component code 921** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF012 PRESENT OR STORED	SENSOR SUPPLY VOLTAGE NO. 2 1.DEF: Below minimum threshold 2.DEF: Above maximum threshold

NOTES	**Priorities when dealing with a number of faults:** If one or more of the following faults are present at the same time: – **DF089 Manifold pressure sensor circuit**, check that the connector for the **inlet manifold pressure sensor** is correctly connected. – **DF007 Rail pressure sensor circuit**, check that the rail pressure sensor connector is connected correctly. – **DF097 Camshaft sensor circuit**, check that the **camshaft sensor** connector is correctly connected. – **DF951 Swirl flap position sensor circuit**, check that the swirl flap sensor connector is correctly connected. – **DF209 EGR valve position sensor circuit**, check that the EGR valve position sensor connector is connected correctly.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present under **+ after ignition feed**.
	Special notes: If the fault is present: – **level 1** and **OBD** warning lights are lit. (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

The sensors connected to **feed no. 2** are:
– **turbocharger pressure sensor,**
– **rail pressure sensor,**
– **camshaft sensor,**
– **EGR valve position sensor,**
– **swirl flap position sensors.**

To locate a sensor and/or connection concerned, disconnect one of these sensors then check if the fault becomes stored.
If the fault is still present, start the operation again with each sensor (one by one).
(Wait several seconds between each disconnection to allow the computer time to detect the fault).
If the fault is stored after disconnection, change the faulty sensor or repair the connection.
Clear the faults created by the multiple disconnections.

Check the connection and condition of the **connector for the sensors** and **the injection computer**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF012 **CONTINUED 1**	

If the sensors, **turbocharger pressure sensor, rail pressure sensor, camshaft sensor, EGR valve position sensor and swirl flap position sensors** are disconnected, and the fault is still present:
Check **the insulation, continuity and the absence of interference resistance** on the following connections:
– connection code **3AX**,
– connection code **3CJ**,
between the back row swirl flap sensor, **component code 1293** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check **the insulation, continuity and the absence of interference resistance** on the following connections:
– connection code **3AX**,
– connection code **3CJ**,
between the front row swirl flap sensor, **component code 1709** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check **the insulation, continuity and the absence of interference resistance** on the following connections:
– connection code **3AX**,
– connection code **3CJ**,
between the turbocharger pressure sensor, **component code 1474** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check **the insulation, continuity and the absence of interference resistance** on the following connections:
– connection code **3AX**,
– connection code **3CJ**,
between the rail pressure sensor, **component code 1032** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF012 **CONTINUED 2**	

Check **the insulation, continuity and the absence of interference resistance** on the following connections:
– connection code **3AX**,
– connection code **3CJ**,
between the EGR valve position sensor, **component code 169** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check **the insulation, continuity and the absence of interference resistance** on the following connections:
– connection code **3QL**,
– connection code **3QK**,
between the camshaft sensor, **component code 746** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

If the fault is still present, **contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF013 PRESENT OR STORED	SENSOR SUPPLY VOLTAGE NO. 3 1.DEF: Below minimum threshold 2.DEF: Above maximum threshold

NOTES	**Priorities when dealing with a number of faults:** If one or more of the following faults are present at the same time: – **DF009 Pedal potentiometer circuit ganged circuit 2**, check that the pedal sensor connector is connected correctly. – **DF056 Air flow sensor circuit**, check that the air flow sensor connector is connected correctly.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present under **+ after ignition feed**.
	Special notes: If the fault is present: – cruise control is deactivated, – power is restricted, – **level 1** and **OBD** warning lights are lit. (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

The sensors connected to **supply no. 3** are:
– **Accelerator pedal potentiometer gang 2.**
– **Air flow sensor.**
To locate a faulty sensor and/or connection, disconnect one of these sensors then check whether the fault becomes stored.
If the fault is still present, start the operation again with each sensor (one by one).
(Wait several seconds between each disconnection to allow the computer time to detect the fault).
If the fault is stored after disconnection, change the faulty sensor or repair the connection.
Clear the faults created by the multiple disconnections.

Check the connection and condition of the **connector for the sensors** and **the injection computer**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

If the sensors, **accelerator pedal potentiometer gang 2 and air flow sensor** are disconnected, and the fault is still present:
Check **the insulation, continuity and the absence of interference resistance** on the following connections:
– connection code **3DU**,
– connection code **3LU**,
between the air flow sensor, **component code 799** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF013 **CONTINUED**

GETtheMANUALS.org

DF026 PRESENT OR STORED	CYLINDER 1 INJECTOR CONTROL CIRCUIT CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 V

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors. (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

CO.0	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the computer detects a fault on the injector 1 control line, – engine speed greater than **500 rpm**, – battery voltage greater than **11 V**, – the **level 1** warning light comes on.

Manipulate the harness between the engine management computer and the injector control computer, then the injector control computer and injector 1 to detect a change of status (present ↔ stored).
Look for chafing damage on the harness.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the connection and condition of the **engine management computer connector and the injector control computer**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the connection and condition **of the injector 1 connector**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Measure the resistance of injector 1 between connections **3KW** and **3CR** of the connector for component **193**.
Replace the injector if the resistance **is greater than 50** Ω.

Check for **insulation against earth, continuity and absence of interference resistance** for the following connections:
– connection code **3CR**,
– connection code **3KW**,
– connection code **3H**,
between injector 1, **component code 193** and the injector control computer, **component code 1167**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF026 **CONTINUED**	

Check the **insulation from earth, the continuity and absence of interference resistance** on the following connection:
– connection code **3QP**,
between the injector control computer, **component code 1167** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Clear the fault memory and start the engine.
If the fault is still present, apply **test 10 Incorrect injector operation**.
Otherwise, replace the injector control computer (see **MR 402 or MR 405, Mechanical, 13B, Diesel injection**).
If the fault is still present, **contact the Techline**.

CC.1	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the computer detects a fault on the injector 1 control line, – engine speed is greater than **500 rpm**, – battery voltage is greater than **11 V**, – the **level 2** warning light is lit.

Manipulate the harness between the engine management computer and the injector control computer, then the injector control computer and injector 1 to detect a change of status (present ↔ stored).
Look for chafing damage on the harness.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the connection and condition of the **engine management computer connector and the injector control computer**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the connection and condition **of the injector 1 connector**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

CO.0	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the computer detects a fault on the injector 3 control line, – engine speed is greater than **500 rpm**, – battery voltage is greater than **11 V**, – the **level 1** warning light comes on.

Manipulate the harness between the engine management computer and the injector control computer, then the injector control computer and injector 3 to detect a change of status (present ↔ stored).
Look for chafing damage on the harness.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the connection and condition of the **engine management computer connector and the injector control computer**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the **connection and condition of the connector of injector 3**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Measure the resistance of injector 3 between connections **3KY** and **3CT** of the connector for component **195**.
Replace the injector if the resistance **is greater than 50** Ω.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF028 **CONTINUED 1**	

Check the **insulation from earth, the continuity and absence of interference resistance** on the following connections:
– connection code **3CT**,
– connection code **3KY**,
– connection code **3H**,
between injector 3, **component code 195** and the injector control computer, **component code 1167**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the **insulation from earth, the continuity and absence of interference resistance** on the following connection:
– connection code **3QR**,
between the injector control computer, **component code 1167** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Clear the fault memory and start the engine.
If the fault is still present, apply **test 10: Incorrect injector operation**.
Otherwise, replace the injector control computer (see **MR 402 or MR 405, Mechanical, 13B, Diesel injection**).
If the **fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF028 **CONTINUED 2**	

CC.1	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the computer detects a fault on the injector 3 control line, – engine speed is greater than **500 rpm**, – battery voltage is greater than **11 V**, – the **level 2** warning light is lit.

Manipulate the harness between the engine management computer and the injector control computer, then the injector control computer and injector 3 to detect a change of status (present ↔ stored).
Look for chafing damage on the harness.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the connection and condition of the **engine management computer connector and the injector control computer**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the **connection and condition of the connector of injector 3**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Disconnect connector **B** from the injector control computer, **component code 1167**.
Switch on the ignition.
Check that the voltage is zero on connection **3CT** of the injector control computer.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Clear the fault memory and start the engine.
If the **fault is still present**, replace the injector control computer (see **MR 402 or MR 405 Mechanical, 13B, Diesel injection**).
If the **fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF039 PRESENT OR STORED	INLET AIR TEMPERATURE SENSOR CIRCUIT CC.0 : Short circuit to earth CO.1 : Open circuit or short circuit to + 12 V

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors. **Does not affect the flow meter air temperature sensor.** **The inlet air temperature sensor is coupled with the turbocharger pressure sensor.** (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

CC.0	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the air temperature sensor voltage is less than **0.22 V**, – presence of **+ after ignition feed**, – defective harness or connections.

Manipulate the wiring harness between the engine management computer and the manifold air temperature sensor to detect a status change (present ↔ stored).
Look for chafing damage on the harness.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the connection and condition of the **computer connector**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the connection and status of the **manifold air temperature sensor connector**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Measure the manifold air temperature sensor resistance between connections **3KQ** and **3CJ** of the connector for component **1474**.
Replace the sensor if the **resistance** is not: **3820 Ω ± 191 at + 10 °C**
2509 Ω ± 126 at + 20 °C
1686 Ω ± 83 at + 30 °C

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF039 **CONTINUED 1**	

Check the **insulation from earth, the continuity and absence of interference resistance** on the following connection:
– connection code **3KQ**,
between the manifold air temperature sensor, **component code 1474** and the engine management computer, **component code 120**.
The resistance is equal to or above **10 MΩ**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

If the fault is still present, deal with any other faults.

If the fault is still present, **contact the Techline**.

CO.1	***NOTES***	**Priority when dealing with a number of faults:** Deal with fault **DF001 Coolant temperature sensor circuit** first, if it is present or stored.
		Conditions for applying the fault finding procedure to stored faults: The fault is declared as present if: – the air temperature sensor voltage is greater than **4.9 V**, – presence of **+ after ignition feed**, – engine coolant temperature above **- 25 ˚C**.

Manipulate the wiring harness between the engine management computer and the manifold air temperature sensor to detect a status change (present ↔ stored).
Look for chafing damage on the harness.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the connection and condition of the **computer connector**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the connection and status of the **manifold air temperature sensor connector**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF039 **CONTINUED 2**	

Measure the manifold air temperature sensor resistance between connections **3KQ** and **3CJ** of the connector for component **1474**.
Replace the sensor if the **resistance** is not: **3820 Ω ± 191 at + 10 °C**
2509 Ω ± 126 at + 20 °C
1686 Ω ± 83 at + 30 °C

Check for **insulation from + 12 V, the continuity and absence of interference resistance** on the following connections:
– connection code **3KQ**,
– connection code **3CJ**,
between the manifold air temperature sensor, **component code 1474** and the engine management computer, **component code 120**.
The resistance is equal to or above **10 MΩ**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

If the fault is still present, deal with any other faults.

If the fault is still present, **contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF046 PRESENT OR STORED	BATTERY VOLTAGE 1.DEF: Below minimum threshold 2.DEF: Above maximum threshold

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors. (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

1.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the computer is supplied with a voltage less than **11.6 V**, – the heating elements are disconnected, – with the engine running, – the **level 2** warning light is lit.

Check the charging circuit (see **Technical Note 6014A Checking the charging circuit**). Check **the condition** of the **vehicle earths**.
Check that the feed voltage is around **14.4 V** and that it is never less than **11.6 V**. Check the alternator supply. If correct, replace the alternator. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check **the continuity and absence of interference resistance** of the following connections: – the two connection codes **3FB**, – connection code **3AA**, between the main relay, **component code 238** and the engine management computer, **component code 120**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check **the continuity and absence of interference resistance** of the following connections: – the three connection codes **N***, between the vehicle earth and the engine management computer, **component code 120**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
If the **fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF046 **CONTINUED**	

2.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present when: – the computer is supplied with a voltage greater than **15.8 V**, – the heating elements are disconnected, – with the engine running, – the **level 2** warning light is lit.

Check the **condition of the battery** and the **charging circuit (see Technical Note 6014A, Checking the charging circuit**).
Check the **condition** of the vehicle **earths**.

Check that the supply voltage is around **14.4 V** and that it never exceeds **15.8 V**.
Replace the alternator if necessary.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

If the fault is still present, **contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF051 PRESENT OR STORED	CRUISE CONTROL/SPEED LIMITER FUNCTION 1.DEF: Fault on one of the two brake pedal contacts 2.DEF: Fault on both brake pedal contacts 3.DEF: Steering wheel control 4.DEF: Cruise control/speed limiter on-off circuit

NOTES	**Special notes:** If the fault is present, the cruise control/speed limiter function will be inhibited. (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

1.DEF ***2.DEF***	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** If the fault is declared present after the brake pedal has been depressed. **Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

When the driver depresses the brake pedal, statuses **ET704 and ET705** should change at the same time. In the event of inconsistency, check:
– the condition of fuses **F28 (20A)** and **F21 (10 A)** in the passenger compartment relay and fuse box,
– for **+ 12 V** APC on connections **AP10** and **SP13** of the switch,
– remove the brake switch and carry out the checks in the following table:

	Continuity between connections	**Insulation between connections**
Switch closed (Brake pedal released)	**SP13 and 5A**	**65A and AP10**
Switch open (Brake pedal depressed)	**65A and AP10**	**SP13 and 5A**

If these checks are not OK, replace the brake light switch.
If these checks are OK, check **the continuity and the absence of interference resistance** on the following connection:
– connection code **5A**,
between the brake light switch connector, **component code 160** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF051 **CONTINUED 1**	

Disconnect the ABS/ESP computer and check the **continuity and insulation** from **+ 12 V** and from **earth** on the following connection:
– connection code **65A**,
between the brake pedal switch connector, **component code 160** and the ABS/ESP computer connector, **component code 1094**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

If the fault is still present, carry out **fault finding on the ABS/ESP**; if no irregularity is detected, carry out fault finding on the **multiplex network**.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF051 **CONTINUED 2**	

3.DEF	***NOTES***	Note: All operations on the connections beneath the steering wheel centre cover require the **airbag computer to be locked**.
		Special notes: Refer to the **Technical Note Wiring diagrams** for the vehicle to locate the wires and connections concerned.
		Conditions for applying the fault finding procedure to stored faults: If the fault is declared present after depressing the steering wheel switches.

Display **PR178 Cruise control switch voltage**. With no pressure on the steering wheel switches, the voltage shown should be: **4.9 V ± 0.2**.

If the voltage is not in this region, disconnect the steering wheel switch (black union **2 tracks** beneath the steering wheel centre cover) and display **PR178** again.
If the voltage becomes **4.9 V ± 0.2**, go to step 1.
If the voltage does not change, check the connections of the engine management computer.
Repair if necessary. If the fault is still present, go to step **a**, otherwise go to step **b**.

1 - Check the conformity of the steering wheel switches as follows: disconnect the **2-track** black connector under the central cover of the steering wheel (connect the ohmmeter on the steering wheel switch side). The measurement should be:
- **900** Ω (± 10 Ω) when the **Repeat** switch is pressed.

(or the one-touch switch **R** on the right of the steering wheel)
- **0** Ω (not more than 0.8 Ω) when the **Cancel** switch is pressed.

(or the one touch switch **O** on the right of the steering wheel)
- **300** Ω (± 10 Ω) when the **Set +** switch is pressed.

(or the one-touch switch on the left of the steering wheel)
- **100** Ω (± 10 Ω) when the **Set -** switch is pressed.

(or the one-touch switch on the left of the steering wheel)
- **Infinite resistance** in rest position.

If ***the values are not correct***, replace the steering wheel controls.
If ***the values are correct***, carry out the same measures from **connector A** of the engine management computer by connecting the ohmmeter between connections **86G and 86M** (**steering wheel control** connector **connected**).

a - If the fault is still present, check the connection between the engine management computer and the connector under the steering wheel, see **Wiring Diagrams Technical Note** (line resistance, open circuit, short circuit). Carry out the necessary repairs.

b - If the values are correct, clear the fault, switch off the ignition, wait until the end of the power latch* phase and switch on the ignition again.

If the fault reappears (after pressing the steering wheel controls), contact the Techline.

* The immobiliser warning light will flash a few seconds after switching off the ignition.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF051 **CONTINUED 3**	

4.DEF	***NOTES***	**Special notes:** – The cruise control function is inhibited. – Refer to the **Wiring diagrams** Technical Note for the vehicle to locate the wires and connections concerned. **Conditions for applying the fault finding procedure to stored faults:** If the fault reappears as present after: – pressing the cruise control/speed limiter ON/OFF switch.

Check the connection and condition of the **engine management computer connector A**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the connection and condition of the connections for the cruise control/speed limiter on/off switch.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Cruise control/speed limiter on/off switch in speed limiter position:
Check the **continuity** between the following connections:
– connection code **AP10**,
– connection code **3PD**,
between the cruise control/speed limiter switch connector, **component code 1081** and the engine management computer, **component code 120**.
Check **the insulation** between the following connections:
– connection code **AP10**,
– connection code **3FX**,
between the cruise control/speed limiter switch connector, **component code 1081** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF051 **CONTINUED 4**	

Cruise control/speed limiter on/off switch in cruise control position:
Check **the insulation** between the following connections:
– connection code **AP10**,
– connection code **3PD**,
between the cruise control/speed limiter switch connector, **component code 1081** and the engine management computer, **component code 120**.
Check the **continuity** between the following connections:
– connection code **AP10**,
– connection code **3FX**,
between the cruise control/speed limiter switch connector, **component code 1081** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check **the insulation, continuity and the absence of interference resistance** on the following connections:
– connection code **3FX**,
– connection code **3PD**,
between the cruise control/speed limiter switch connector, **component code 1081** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF056 PRESENT OR STORED	AIR FLOW SENSOR CIRCUIT CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 V 1.DEF: Inconsistency 2.DEF: Permanent low signal

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors. (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

CO.0	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the air flow sensor voltage is less than **0.2 V**, – presence of **+ after ignition feed**, – defective harness or connections.

Manipulate the wiring harness between the engine management computer and the air flow sensor to detect a change in status (present ↔ stored). Look for chafing damage on the harness. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check the connection and condition of the **computer connector**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check the condition and connection of the **air flow sensor**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check the condition of fuse **FM6 (10A)**. Replace the fuse, if necessary. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check the **insulation from earth, the continuity and absence of interference resistance** on the following connection: – connection code **3DV**, between the air flow sensor, **component code 799** and the engine management computer, **component code 120**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Clear the faults from memory and then start the engine. Check that the fault has disappeared. If the fault recurs, replace the air flow sensor.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF056 **CONTINUED 1**	

Clear the stored faults.
Restart the vehicle and wait **30 seconds**.

If the fault is still present, apply **test 5 Air flow sensor**.
Perform another fault finding procedure on the computer.
If the **fault recurs**, contact the Techline.

CC.1	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present if: – the air flow sensor voltage is greater than **4.9 V**, – presence of **+ after ignition feed**, – defective harness or connections.

Manipulate the wiring harness between the engine management computer and the air flow sensor to detect a change in status (present ↔ stored).
Look for chafing damage on the harness.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the connection and condition of the **computer connector**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the condition and connection of the **air flow sensor**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the **insulation from + 12 V, the continuity and absence of interference resistance** for the following connection:
– connection code **3LU**,
between the air flow sensor, **component code 799** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the **insulation from earth, the continuity and absence of interference resistance** on the following connection:
– connection code **3DV**,
between the air flow sensor, **component code 799** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF056 **CONTINUED 2**	

Check the **insulation from + 5 V, the continuity and absence of interference resistance** on the following connection:
– connection code **3DU**,
between the air flow sensor, **component code 799** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Clear the faults from memory and then start the engine.
Check that the fault has disappeared.
If the fault recurs, replace the air flow sensor.

Clear the stored faults.
Restart the vehicle and wait **30 seconds**.

If the fault is still present, deal with any other faults.
Apply **test 5 Air flowmeter**.
Perform another fault finding procedure on the computer.
If the **fault recurs**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF056 **CONTINUED 3**	

1.DEF	***NOTES***	**Priority when dealing with a number of faults:** Prioritise the other present or stored faults. **Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – fast idling at **1000 rpm** and limitation of performance, – **level 1** and **OBD** warning lights are lit, – turbocharger inactive, – presence of **+ after ignition feed**, – defective harness or connections.

Manipulate the wiring harness between the engine management computer and the air flow sensor to detect a change in status (present ↔ stored).
Look for chafing damage on the harness.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the connection and condition of the **computer connector**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the condition and connection of the **air flow sensor**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the entire air inlet circuit:
Apply **test 4: Turbocharging and air inlet circuit check**.

Check for **continuity and the absence of interference resistance** of the following connections:
– connection code **3LU**,
– connection code **3DV**,
– connection code **3DU**,
between the air flow sensor, **component code 799** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Clear the faults from memory and then start the engine.
Wait **30 seconds** then restart computer fault finding; if the fault reappears, check conformity of the engine with the different parameters.

Apply **test 5 Air flowmeter**.
If the **fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

DF058 PRESENT OR STORED	OIL TEMPERATURE SENSOR CIRCUIT CO.1 : Open circuit or short circuit to + 12 V CC.0 : Short circuit to earth

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors. (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

CO.1	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present: – if the voltage on the diagnostic line is greater than **4.97 V**, – the **level 1** warning light comes on.

Manipulate the wiring harness between the engine management computer and the oil temperature sensor to detect a status change (present ↔ stored).
Look for chafing damage on the harness.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the connection and condition of the **computer connector**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the connection and condition of the **oil temperature sensor connector**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Measure the oil temperature sensor resistance between connections **47Q** and **3CK** of the connector for component **343**.
Replace the sensor if the **resistance** is not: **3511 Ω ± 176 at + 20 °C**
980 Ω ± 50 at + 50 °C
469 Ω ± 24 at + 70 °C
242 Ω ± 12 at + 90 °C

Check for **insulation against earth, continuity and absence of interference resistance** for the following connections:
– connection code **47Q**,
– connection code **3CK**,
between oil temperature sensor, **component code 343** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

If the **fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF058 **CONTINUED 1**	

CC.0	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the voltage on the diagnostic line is less than **0.12 V**, – **the level 1 warning light comes on.**

Manipulate the wiring harness between the engine management computer and the oil temperature sensor to detect a status change (present ↔ stored).
Look for chafing damage on the harness.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the connection and condition of the **computer connector**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the connection and condition of the **oil temperature sensor connector**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Measure the oil temperature sensor resistance between connections **47Q** and **3CK** of the connector for component **343**.
Replace the sensor if the **resistance** is not: **3511 Ω ± 176 at + 20 °C**
980 Ω ± 50 at + 50 °C
469 Ω ± 24 at + 70 °C
242 Ω ± 12 at + 90 °C

Check **insulation from + 5V and +12V, continuity and absence of interference resistance** on the following connections:
– connection code **47Q**,
– connection code **3CK**,
between oil temperature sensor, **component code 343** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

If the **fault is still present**, contact the Techline.

Remove the high pressure pipe of injector 2. Look for any blockages of the high pressure pipe. Replace the high pressure pipe, if necessary.
Look for possible blockages of the union joining injector 2 to the injector rail. Clean if necessary.
Replace injector 2, if the high pressure pipe and the injector rail are clean when removed. Clear the stored faults. Start the vehicle again.
If **the fault is still present**, apply **test 10: Incorrect injector operation**. If **the fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF061 PRESENT OR STORED	MISFIRING ON CYLINDER 3 1.DEF: Value outside permitted tolerance values

1.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** – battery voltage greater than **10 V**, – engine coolant temperature greater than **70 °C**.

Remove the high pressure pipe of injector 3. Look for any blockages of the high pressure pipe. Replace the high pressure pipe, if necessary.
Look for possible blockages of the union joining injector 3 to the injector rail. Clean if necessary.
Replace injector 3, if the high pressure pipe and the injector rail are clean when removed. Clear the stored faults. Start the vehicle again.
If **the fault is still present**, apply **test 10: Incorrect injector operation**. If **the fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF062 PRESENT OR STORED	MISFIRING ON CYLINDER 4 1.DEF: Value outside permitted tolerance values

1.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** – battery voltage greater than **10 V**, – engine coolant temperature greater than **70 °C**.

Remove the high pressure pipe of injector 4. Look for any blockages of the high pressure pipe. Replace the high pressure pipe, if necessary.
Look for possible blockages of the union joining injector 4 to the injector rail. Clean if necessary.
Replace injector 4, if the high pressure pipe and the injector rail are clean when removed. Clear the stored faults. Start the vehicle again.
If **the fault is still present**, apply **test 10: Incorrect injector operation**. If **the fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF063 PRESENT OR STORED	MISFIRING ON CYLINDER 5 1.DEF: Value outside permitted tolerance values

1.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** – battery voltage greater than **10 V**, – engine coolant temperature greater than **70 °C**.

Remove the high pressure pipe of injector 5. Look for any blockages of the high pressure pipe. Replace the high pressure pipe, if necessary.
Look for possible blockages of the union joining injector 5 to the injector rail. Clean if necessary.
Replace injector 5, if the high pressure pipe and the injector rail are clean when removed. Clear the stored faults. Start the vehicle again.
If **the fault is still present**, apply **test 10: Incorrect injector operation**. If **the fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF064 PRESENT OR STORED	MISFIRING ON CYLINDER 6 1.DEF: Value outside permitted tolerance values

1.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** – battery voltage greater than **10 V**, – engine coolant temperature greater than **70 °C**.

Remove the high pressure pipe of injector 6. Look for any blockages of the high pressure pipe. Replace the high pressure pipe, if necessary.
Look for possible blockages of the union joining injector 6 to the injector rail. Clean if necessary.
Replace injector 6, if the high pressure pipe and the injector rail are clean when removed. Clear the stored faults. Start the vehicle again.
If **the fault is still present**, apply **test 10: Incorrect injector operation**. If **the fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

DF089 PRESENT OR STORED	INLET MANIFOLD PRESSURE SENSOR CIRCUIT CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 V 1.DEF: Inconsistency 2.DEF: Variable geometry: turbocharger vanes jammed shut 3.DEF: Variable geometry: turbocharger vanes jammed open

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors. (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

CO.0	***NOTES***	**Priority when dealing with a number of faults:** Deal with faults **DF569 Turbocharging circuit and DF956 Lack of air in the inlet circuit** first, if they are present or stored.
		Conditions for applying the fault finding procedure to stored faults: The fault is declared as present if: – the manifold pressure sensor voltage is less than **1.16 V**, – the battery voltage is greater than **11.6 V**, – under **+ after ignition feed**, – fast idling at **1000 rpm** and limitation of performance, – turbocharger inactive, – **level 1** and **OBD** warning lights are lit.

Manipulate the wiring harness between the engine management computer and the inlet pressure sensor to detect a status change (present ↔ stored).
Look for chafing damage on the harness.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the connection and condition of the **computer connector**.
Check the connection and condition **of the manifold pressure sensor connector**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF089 **CONTINUED 1**	

Check for **insulation against earth, continuity and absence of interference resistance** on the following connections:
– connection code **3LP**,
– connection code **3AX**,
between the manifold pressure sensor, **component code 1474** and the engine management computer, **component code 120**.
The resistance is equal to or greater than 10 MΩ.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Clear the fault memory and start the engine.
If the fault is still present, replace the inlet manifold pressure sensor (see **MR 402 or MR 405 Mechanical, 12A**).

Clear the fault memory and restart the engine.
If the **fault is still present**, contact the Techline.

		Priority when dealing with a number of faults: Deal with faults **DF569 Turbocharging circuit and DF957 Too much air in the inlet circuit** first, if they are present or stored.
CC.1	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the manifold pressure sensor voltage is greater than **4.78 V**, – the battery voltage is greater than **11.6 V**, – under **+ after ignition feed**, – fast idling at **1000 rpm** and limitation of performance, – turbocharger inactive, – **level 1** and **OBD** warning lights are lit.

Manipulate the wiring harness between the engine management computer and the inlet pressure sensor to detect a status change (present ↔ stored).
Look for chafing damage on the harness.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF089 **CONTINUED 2**	

Check the connection and condition of the **computer connector**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check the connection and condition **of the manifold pressure sensor connector**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check **the continuity and absence of interference resistance** of the following connections: – connection code **3CJ**, – connection code **3AX**, – connection code **3LP**, between the manifold pressure sensor, **component code 1474** and the engine management computer, **component code 120**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Stop the engine and check for a voltage of less than **+ 5 V** on connection **3LP** of the inlet manifold pressure sensor with **+ after ignition feed**. Repair if necessary.
Clear the fault memory and restart the engine. If the fault is still present, replace the sensor. If the **fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF089 **CONTINUED 3**	

1.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present if: – the inlet manifold vacuum is less than **150 mbar** at atmospheric pressure, refer to parameter **PR035 Atmospheric pressure**, – engine speed is less than **1050 rpm**, – atmospheric pressure signal without faults, – the fuel flow is less than **15 mm^3/stroke**, – the vehicle is stopped, – **level 1** and **OBD** warning lights are lit.

Manipulate the wiring harness between the engine management computer and the inlet manifold pressure sensor to detect a status change (present ↔ stored).
Look for chafing damage on the harness.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the connection and condition of the **computer connector**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the connection and condition **of the manifold pressure sensor connector**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check **the continuity and absence of interference resistance** of the following connections:
– connection code **3CJ**,
– connection code **3AX**,
– connection code **3LP**,
between the manifold pressure sensor, **component code 1474** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Clear the fault memory and start the engine.
If the fault is still present, check the air supply circuit between the turbocharger and the inlet manifold.
Verify the conformity check, **with engine running,** of **PR041 Turbocharging pressure** and **PR132 Inlet air flow**.
If the fault is still present, replace the inlet manifold pressure sensor.

Clear the fault memory and restart the engine.
Apply **test 4: Turbocharging and air inlet circuit check**.
If the **fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF089 **CONTINUED 4**	

2.DEF ***3.DEF***	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** – the **level 1** warning light comes on.

Manipulate the wiring harness between the engine management computer and the turbocharger controller to detect a status change (present ↔ stored). Look for chafing damage on the harness. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check the connection and condition of the **computer connector**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check the condition and status **of the turbocharger controller connector**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Look for any possible jamming of the turbocharger variable geometry command. Apply **test 7: Variable geometry turbocharger command**. Replace the turbocharger, if necessary.
Clear the fault memory and start the engine.
If the **fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF097 PRESENT OR STORED	CAMSHAFT SENSOR CIRCUIT 1.DEF: Inconsistency 2.DEF: No signal

1.DEF	***NOTES***	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors. (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)
		Conditions for applying the fault finding procedure to stored faults: The fault is declared as present if: – the computer receives an incorrect signal from the engine speed sensor or an incorrect signal from the camshaft sensor, – engine speed is greater than **600 rpm**, – the **level 1** warning light comes on.

Check the condition of the battery and the charging circuit (see **Technical Note 6014A, Checking the charging circuit**).
Check the condition of the vehicle earths.
Replace the battery if its voltage is less than **10 V**.

Manipulate the wiring harness between the engine management computer and the camshaft sensor to detect a status change (present ↔ stored).
Look for chafing damage on the harness.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the connection and condition of the **computer connector**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the connection and status of the **camshaft sensor connector**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check that the **earth connection** of the camshaft position sensor electric wiring harness **shielding** is in **good condition**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

If the fault is still present, replace the camshaft sensor.

Clear the fault memory and start the engine.
If the **fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF097 **CONTINUED 1**	

2.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – camshaft sensor signal not detected, – engine speed signal detected, – defective harness or connections, – defective sensor, – the **level 1** warning light comes on.

Check the condition of the battery and the charging circuit (see **Technical Note 6014A, Checking the charging circuit**). Check the condition of the vehicle earths. Replace the battery if its voltage is less than **10 V**.
Manipulate the wiring harness between the engine management computer and the camshaft sensor to detect a status change (present ↔ stored). Look for possible damage to the harness, and check **the connection and the condition** of the camshaft sensor and its connections. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check the connection and condition of the **computer connector**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check the connection and status of the **camshaft sensor connector**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check that the **earth connection** of the camshaft position sensor electric wiring harness **shielding** is in **good condition**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check for **insulation against earth, continuity and absence of interference resistance** on the following connections: – connection code **3SV**, – connection code **3QL**, – connection code **3QK**, between the camshaft sensor, **component code 746** and the engine management computer, **component code 120**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Clear the fault memory and start the engine. If the **fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF098 PRESENT OR STORED	FUEL TEMPERATURE SENSOR CIRCUIT CC.0 : Short circuit to earth CO.1 : Open circuit or short circuit to + 12 V

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors. (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

CO.1	***NOTES***	**Priority when dealing with a number of faults:** Deal with **DF012 Sensor supply voltage No. 2** first if it is present or stored.
		Conditions for applying the fault finding procedure to stored faults: The fault is declared as present if: – the fuel temperature sensor voltage is greater than **4.97 V**, – presence of **+ after ignition feed**, – **level 1** and **OBD** warning lights are lit.

Manipulate the wiring harness between the engine management computer and the fuel temperature sensor to detect a status change (present ↔ stored).
Look for chafing damage on the harness.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the connection and condition of the **computer connector**.
Check the connection and condition **of the fuel temperature sensor connector**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Measure the fuel temperature sensor resistance between the connections **3LD** and **3CK** of the connector for component **1066**.
Replace the sensor if the **resistance** is not: **5658 Ω ± 280 at + 10 °C**
3511 Ω ± 176 at + 20 °C
980 Ω ± 50 at + 50 °C

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF098 **CONTINUED 1**	

Check for **insulation against earth, continuity and absence of interference resistance** for the following connections:
– connection code **3LD**,
– connection code **3CK**,
between the fuel temperature sensor, **component code 1066** and the engine management computer, **component code 120**.
The resistance is equal to or greater than 10 MΩ.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

If the fault is still present, deal with any other faults.

If the **fault is still present**, contact the Techline.

CC.0	***NOTES***	**Priority when dealing with a number of faults:** Deal with **DF012 Sensor supply voltage No. 2** first if it is present or stored.
		Conditions for applying the fault finding procedure to stored faults: The fault is declared as present if: – the fuel temperature sensor voltage is less than **0.12 V**, – presence of **+ after ignition feed**, – **level 1** and **OBD** warning lights are lit.

Manipulate the wiring harness between the engine management computer and the fuel temperature sensor to detect a status change (present ↔ stored).
Look for chafing damage on the harness.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the connection and condition **of the computer connector**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the connection and condition **of the fuel temperature sensor connector**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF098 **CONTINUED 2**	

Measure the fuel temperature sensor resistance between the connections **3LD** and **3CK** of the connector for component **1066**. Replace the sensor if the **resistance** is not: **5658 Ω ± 280 at + 10 °C** **3511 Ω ± 176 at + 20 °C** **980 Ω ± 50 at + 50 °C**
Check **the continuity, absence of interference resistance and insulation from + 5 V and + 12 V** of the following connection: – connection code **3CK**, between the fuel temperature sensor, **component code 1066** and the engine management computer, **component code 120**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check the **insulation from earth, the continuity and absence of interference resistance** on the following connection: – connection code **3LD**, between the fuel temperature sensor, **component code 1066** and the engine management computer, **component code 120**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
If the fault is still present, deal with any other faults.
If the **fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF114 PRESENT OR STORED	PREHEATING RELAY CONTROL CIRCUIT GROUP 1 CO.1 : Open circuit or short circuit to + 12 V CC.0 : Short circuit to earth

CO.1	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – at least one of the plugs is faulty, – the preheating unit is faulty, – defective harness or connections.
		Special notes: – run the **AC037 Preheating relay** command to check whether the relay is working, – use bornier **Elé. 1681** for all operations on the engine management computer connectors. (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

Check the **condition** and the **resistance** of the back row heater plugs (cylinders 1, 3 and 5).
Replace the heater plugs if the **resistance** is greater than **30** Ω.

Check the condition of the **FM18 and FM19 (70 A)** fuses for the back row heater plug control unit.
Replace the fuse(s), if necessary.

Check for **insulation against earth, continuity and absence of interference resistance** on the following connections:
– connection code **3SP**,
between the heater plug of **cylinder no. 1, component code 680** and the heater plug control unit, **component code 257**.
– connection code **3SR**,
between the heater plug of **cylinder no. 3, component code 682** and the heater plug control unit, **component code 257**.
– connection code **3ST**,
between the heater plug of **cylinder no. 5, component code 1260** and the heater plug control unit, **component code 257**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the **+ 12 V** feed on connection **BP35** of the back row pre-postheating unit.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF144 **CONTINUED 1**	

Check for **continuity and the absence of interference resistance** on the following connection: – connection code **BP35**, between the battery, **component code 107** and the back row heater plug control unit, **component code 257**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Otherwise, replace the connector.
Check **the continuity and absence of interference resistance** of the following connections: – connection code **3FF**, – connection code **3HM**, between the engine management computer, **component code 120** and the back row heater plug control unit, **component code 257**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Replace the pre-postheating unit, if necessary. Clear the fault memory and start the engine. If the **fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF144 **CONTINUED 2**	

CC.0	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – one of the plugs is faulty, – the preheating unit is faulty, – defective harness or connections.
		Special notes: – run the **AC037 Preheating relay** command to check whether the relay is working, – use bornier **Elé. 1681** for all operations on the engine management computer connectors.

Check for **insulation against earth, continuity and absence of interference resistance** on the following connections:
– connection code **3FF**,
– connection code **3HM**,
between the engine management computer, **component code 120** and the back row heater plug control unit, **component code 257**.
The resistance is equal to or greater than 10 MΩ.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Replace the pre-postheating unit, if necessary.
Clear the fault memory and start the engine.
If the **fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF151 **STORED**	MAIN RELAY CIRCUIT 1.DEF: Permanent low level 2.DEF: Permanent high signal

1.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – defective harness or connections, – the main relay is faulty. **Special note:** – use bornier **Elé. 1681** for all operations on the engine management computer connectors. (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

Check the connection and condition of the **computer** connector.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the connection and condition of the **main relay** connector.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Remove the main relay.

Check for **insulation against earth, continuity and absence of interference resistance** on the following connections:
– the two connection codes **3FB**,
– connection code **3AA**,
between the main relay, **component code 238** and the engine management computer, **component code 120**.
The resistance is equal to or greater than 10 MΩ.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check the **+ 12 V** feed on connection code **BP*** of the main relay, **component code 238**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Replace the **main relay**, if the continuities and supply are correct.
Clear the fault memory and start the engine.
If the **fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF151 **CONTINUED 1**	

2.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – defective harness or connections, – the main relay is faulty, – the engine is switched off. **Special note:** – use bornier **Elé. 1681** for all operations on the engine management computer connectors.

Check the condition of the engine management computer supply voltage fuse **FM3 (30A)**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Manipulate the wiring harness between the engine management computer and the main relay (injection locking relay) to detect a status change (present ↔ stored). Look for chafing damage on the harness. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check the connection and condition of the **computer connector**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check the condition and status **of the main relay**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check for **insulation against earth, continuity and absence of interference resistance** on the following connections: – the two connection codes **3FB**, – connection code **3AA**, between the main relay, **component code 238** and the engine management computer, **component code 120**. The resistance is equal to or greater than 10 MΩ. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF151 **CONTINUED**	

Check the electrical circuit between the positive battery terminal and the main relay. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Change over the main relay with another similar relay. If the fault disappears, replace the relay.
If the **fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF158 PRESENT OR STORED	PREHEATING RELAY CONTROL CIRCUIT GROUP 2 CO.1 : Open circuit or short circuit to + 12 V CC.0 : Short circuit to earth

CO.1	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – at least one of the plugs is faulty, – the preheating unit is faulty, – defective harness or connections.
		Special notes: – run the **AC037 Preheating relay** command to check whether the relay is working, – use bornier **Elé. 1681** for all operations on the engine management computer connectors. (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

Check the **condition** and **resistance** of the front row heater plugs (cylinders 2, 4 and 6).
Replace the heater plugs if the **resistance** is greater than 30 Ω.

Check the condition of the fuses **FM18** and **FM19 (70 A)** for the front row heater plug control unit circuit.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check for **insulation against earth, continuity and absence of interference resistance** on the following connections:
– connection code **3SQ**,
between the heater plug of **cylinder no. 2, component code 681** and the heater plug control unit, **component code 257**.
– connection code **3SS**,
between the heater plug of **cylinder no. 4, component code 683** and the heater plug control unit, **component code 257**.
– connection code **3SU**,
between the heater plug of **cylinder no. 6, component code 1261** and the heater plug control unit, **component code 257**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the **+ 12 V** feed on connection **BP35** of the front row pre-postheating unit.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF158 CONTINUED 1	

Check the **continuity and the absence of interference resistance** on the following connection:
– connection code **BP35**,
between the battery, **component code 107** and the control unit of the heater plugs on the front row, **component code 257**.
If the connections are faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**) repair the wiring, otherwise replace the wiring.

If the fault is still present, replace the connector.

Check the **continuity and absence of interference resistance** of the following connections:
– connection code **3FF**,
– connection code **3HL**,
between the engine management computer, **component code 120** and the heater plug control unit, **component code 257**.
If the connections are faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**) repair the wiring, otherwise replace the wiring.

Replace the pre-postheating unit, if necessary.
Clear the fault memory and start the engine.
If the **fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF158 CONTINUED 2	

CC.0	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is considered present if: – one of the plugs is faulty, – the preheating unit is faulty, – defective harness or connections.
		Special note: – run command **AC037 Preheating relay** to check whether the relay is working, – use bornier **Elé. 1681** for all operations on the engine management computer connectors.

Check the **insulation against earth, continuity and the absence of interference resistance** on the following connections:
– connection code **3FF**,
– connection code **3HL**,
between the engine management computer, **component code 120** and the heater plug control unit, **component code 257**.
The resistance is equal to or greater than 10 MΩ.
If the connections are faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**) repair the wiring, otherwise replace the wiring.

Replace the pre-postheating unit, if necessary.
Clear the fault memory and start the engine.
If the **fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF195 PRESENT OR STORED	ENGINE SPEED/CAMSHAFT SENSOR CONSISTENCY 1.DEF: Inconsistency

1.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is considered present if: – with the engine running, – the harness or connections are faulty, – there is an incorrectly positioned sensor, – the **level 2** warning light is lit.

Check that the battery **voltage** is greater than **10 V**. Replace the battery if necessary.
Manipulate the wiring harness between the engine management computer, the engine speed sensor and the camshaft sensor to detect a change of status (present ↔ stored). Look for possible damage to the wiring harness. If the connections are faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**) repair the wiring, otherwise replace the wiring.
Check the connection and condition **of the computer connector**. If the connections are faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**) repair the wiring, otherwise replace the wiring.
Check the connection and condition of the **camshaft sensor and engine speed sensor connector**. If the connections are faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**) repair the wiring, otherwise replace the wiring.
Check the camshaft sensor output signal value.
Check the engine speed sensor output signal value.
Check the engine speed sensor target conformity (damaged or worn teeth and target fitted). Check the conformity of the target on the camshaft.
Replace the sensors if necessary.
Clear the faults from memory and then start the engine.
Perform another fault finding procedure on the computer. If the **fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF209 PRESENT OR STORED	EGR VALVE POSITION SENSOR CIRCUIT CO.0: Open circuit or short circuit to earth CC.1: Short circuit to + 12 V 1.DEF: Inconsistent position

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors. (see **Wiring Diagram Technical Note, Vel Satis phase 2**) (see **Wiring Diagram Technical Note, Espace IV phase 2**)

CO.0	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is considered present if: – the signal voltage of the exhaust gas recirculation position is above **0.32 V**, – fast idle speed at **1000 rpm**, – the **level 1** and **OBD** warning lights are lit, – EGR command inactive.

Manipulate the wiring harness between the engine management computer and the EGR valve position sensor to detect a change in status (present ↔ stored).
Look for chafing damage on the harness.
If the connections are faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**) repair the wiring, otherwise replace the wiring.

Check the connection and condition **of the computer connector**.
If the connections are faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**) repair the wiring, otherwise replace the wiring.

Check the connection and condition **of the EGR valve position sensor connector**.
If the connections are faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**) repair the wiring, otherwise replace the wiring.

Check the **insulation against earth, continuity and the absence of interference resistance** on the following connections:
– connection code **3AX**,
– connection code **3EL**,
between the engine management computer, **component code 120** and the EGR valve position sensor, **component code 169**.
If the connections are faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**) repair the wiring, otherwise replace the wiring.

If the fault is still present, replace the exhaust gas recirculation valve (see **MR 402 or MR 405, Mechanical, 12A**).
If the **fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF209 CONTINUED 1	

CC.1	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is considered present if: – the signal voltage of the exhaust gas recirculation position is above **4.66 V**, – fast idle speed at **1000 rpm**, – the **level 1** and **OBD** warning lights are lit, – EGR command inactive.

Manipulate the wiring harness between the engine management computer and the **EGR valve position sensor** to detect a change in status (present ↔ stored). Look for possible damage to the wiring harness. If the connections are faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**) repair the wiring, otherwise replace the wiring.
Check the connection and condition **of the computer connector**. If the connections are faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**) repair the wiring, otherwise replace the wiring.
Check the connection and condition **of the EGR valve position sensor**. If the connections are faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**) repair the wiring, otherwise replace the wiring.
Check the **insulation from + 12 V, the continuity and the absence of interference resistance** of the following connection: – connection code **3CJ**, between the engine management computer, **component code 120** and the EGR valve position sensor, **component code 169**. If the connections are faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**) repair the wiring, otherwise replace the wiring.
Check the voltage between the **connections**: – connection code **3CJ**, – connection code **3EL**, of the injection computer, **component code 120**. If the **voltage** is not **less than 1 V**, repair or replace the wiring harness.
If the fault is still present, replace the exhaust gas recirculation valve (see **MR 402 or MR 405, Mechanical, 12A**). If the **fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF209 CONTINUED 2	

1.DEF	***NOTES***	**Priority when dealing with a number of faults:** Deal with the other faults first if they are present or stored.
		Conditions for applying the fault finding procedure to stored faults: The fault is considered present if: – fast idle speed at **1000 rpm**, – limitation of performance 30% accelerator pedal, – limitation of the quantity of fuel injected, – turbocharger command inactive, – EGR command inactive, – **level 1** and **OBD** warning lights are lit,

Replace the exhaust gas recirculation valve.
Clear the fault memory and start the engine. If the **fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF226 PRESENT OR STORED	DAMPER VALVE CIRCUIT CC.1: Short circuit to + 12 V CO.0: Open circuit or short circuit to earth

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors. (see **Wiring Diagram Technical Note, Vel Satis phase 2**) (see **Wiring Diagram Technical Note, Espace IV phase 2**)

CC.1	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is considered present if: – the damper valve solenoid valve is active.

Manipulate the wiring harness between the engine management computer and the damper valve solenoid valve connector to detect a change in status (present ↔ stored).
Look for any possible damage to the wiring harness, check **the connection and condition** of the damper valve solenoid valve and its connections, and the injection computer and its connections.
If the connections are faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**) repair the wiring, otherwise replace the wiring.

Disconnect connector **B** from the engine management computer and the damper valve solenoid valve connector.

Check **the insulation from earth, the continuity and the absence of interference resistance** on the following connection:
– connection code **3VN**,
between the damper valve solenoid valve, **component code 819** and the engine management computer, **component code 120**.
The resistance is equal to or greater than 10 MΩ.
If the connections are faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**) repair the wiring, otherwise replace the wiring.

If the **fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF226 CONTINUED 1	

CO.0	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is considered present if: – the damper valve solenoid valve is active.

Check fuse **FM3 (30 A)**. If the connections are faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**) repair the wiring, otherwise replace the wiring.
Disconnect connector **B** from the engine management computer and the damper valve solenoid valve connector.
Measure the resistance of the damper valve solenoid valve between connections **3VN** and **3FB** of the connector for component **819**. Replace the damper valve solenoid valve if the **resistance** is not **40 Ω ± 4 at + 20˚C**.
Measure the resistance between **connection 3FB** of the damper valve solenoid valve and the damper valve solenoid valve casing. The resistance must be above **1 MΩ**. Replace the damper valve solenoid valve, if necessary.
Check **the insulation from earth, the continuity and the absence of interference resistance** on the following connection: – connection code **3VN**, between the damper valve solenoid valve, **component code 819** and the engine management computer, **component code 120**. If the connections are faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**) repair the wiring, otherwise replace the wiring.
Check the **continuity** between **connection 3FB** of the damper valve solenoid valve and fuse **FM3**. If the connections are faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**) repair the wiring, otherwise replace the wiring.
If the **fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF272 PRESENT OR STORED	EGR VALVE CONTROL CIRCUIT CO: Open circuit 1.DEF: Valve jammed CC: Short circuit

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

CO	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is considered present if: – under **+ APC**, – battery voltage is greater than **11 V**, – the **level 1** warning light is lit.

Disconnect connector **B** from the engine management computer and the EGR valve connector.
Measure the resistance of the exhaust gas recirculation valve between connections **3VP** and **3VQ** of the connector for component **169**. Replace the exhaust gas recirculation valve, if the resistance is not **2.45 Ω ± 0.75**.
Check the **continuity and absence of interference resistance** of the following connections: – connection code **3VP**, – connection code **3VQ**, between the exhaust gas recirculation valve, **component code 169** and the engine management computer, **component code 120**. If the connections are faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**) repair the wiring, otherwise replace the wiring.
If the **fault is still present**, contact the Techline.

DF276 PRESENT OR STORED	INJECTOR CODE PROGRAMMING 1.DEF: Code not programmed 2.DEF: Inconsistency 3.DEF: Internal electronic fault

NOTES	**Special notes:** If the fault is present: – the injection flow will be limited, – engine torque limited, resulting in a maximum engine speed of **1500 rpm**.

1.DEF	***NOTES***	This fault appears when an injector code has not been entered via command **SC002 Enter injector codes**.

Check the injector codes and reprogram the correct codes using command **SC002 Enter injector codes**.
(consult the procedures defined in the section **Interpretation of commands**).
– After the codes have been written:
  – Switch off the ignition.
  – Wait for the end of the power latch* phase and switch on the ignition again.
  – Establish dialogue and clear the fault memory.
  – End of operation.

WARNING
If fault **DF276 Program injector codes** is still present after the injector codes have been entered, check that the power-latch* is executed each time the ignition is switched off.
– Switch off the ignition.
– Wait for the end of the power latch* phase then switch on the ignition again.
– Establish dialogue.
If the fault becomes stored, clear the fault memory and end the operation.

If the fault is present, contact Techline.

* The immobiliser warning light will flash a few seconds after the ignition is switched off.

AFTER REPAIR	Deal with any faults displayed by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF276 CONTINUED 1	

2.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: – the injection computer is replaced, – reprogramming.

This fault is present on all blank computers (new or after reprogramming).
– Program the injector codes using:
  – either command **SC001 Write saved data**,
  – or command **SC002 Enter injector codes**.

(Consult the procedures defined in the section **Interpretation of commands**).
– After the codes have been written:
  – Switch off the ignition.
  – Wait for the end of the power latch* phase and switch on the ignition again.
  – Establish dialogue and clear the fault memory.
  – End of operation.

WARNING
If fault **DF276 Program injector codes** is still present after the injector codes have been entered, check that the power-latch* is executed each time the ignition is switched off.
If the **fault is still present**, contact the Techline.

* The immobiliser warning light will flash a few seconds after the ignition is switched off.

GETtheMANUALS.org

DF279 PRESENT OR STORED	EXCESSIVE ENGINE SPEED 1.DEF: Above maximum threshold

NOTES	**Priority when dealing with a number of faults:** Deal with the other faults first if they are present or stored.
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present if the engine speed has exceeded **5300 rpm**.
	Special notes: Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

Check the engine oil level. Top up the oil level if necessary.
Check the condition of the turbocharger, apply **test 7 Variable geometry turbocharger command** and **test 8 Turbocharger rotating part**. Repair if necessary.
Check the condition of the vacuum pump and its pipes. Repair if necessary.
Check the oil vapour rebreathing circuit. Repair if necessary.
Check the diesel injection system. Repair if necessary.
Check the condition of the engine (compression values and condition of heater plugs). Repair if necessary.
If the **fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF333 PRESENT OR STORED	INJECTION → AUTOMATIC TRANSMISSION CONNECTION 1.DEF: Multiplex network

NOTES	**Special notes:** – Use bornier **Elé. 1681** for all operations on the engine management computer connectors. – **Do not clear the fault before reading the contexts of the fault.** (see **Wiring Diagram Technical Note, Vel Satis phase 2**) (see **Wiring Diagram Technical Note, Espace IV phase 2**)
	Conditions for applying the fault finding procedure to stored faults: The fault is declared present if the **OBD** warning light is lit.

Check the multiplex network.

Check status **ET285 Injection → Automatic transmission connection** in the Fault context window in the Current context section. Status **ET285** is **ABSENT** if the fault is present.

Check the **insulation against earth, continuity and the absence of interference resistance** on the following connections:
– connection code **3MT**,
– connection code **3MS**,
between the automatic transmission computer, **component code 119** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**) repair the wiring, otherwise replace the wiring.
If the fault is still present, check that the automatic transmission computer is recognised by the CLIP **diagnostic tool**.
If communication is not established (see **MR 404, 23A, Automatic transmission**).

AFTER REPAIR	Deal with any faults displayed by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF358 PRESENT OR STORED	INJECTOR CONTROL COMPUTER 1.DEF: Abnormal voltage 2.DEF: Inconsistency 3.DEF: Internal electronic fault

NOTES	**Special notes:** – Use bornier **Elé. 1681** for all operations on the engine management computer connectors. – **Do not clear the fault before reading the contexts of the fault.** (see **Wiring Diagram Technical Note, Vel Satis phase 2**) (see **Wiring Diagram Technical Note, Espace IV phase 2**)

1.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is considered present if: – engine speed is **500 rpm** minimum, – under + APC, – battery voltage is greater than **11 V**, – there are no injector faults, – the **level 2** warning light is lit.

Check the voltage of connection **3FB** of the injector control computer, component code 1167. The voltage is equal to **PR074 Battery voltage**. If not, repair. If the connections are faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**) repair the wiring, otherwise replace the wiring.
Check **for continuity and the absence of interference resistance** on the connection between: – connection code **N***, between the injector control computer, **component code 1167** and the vehicle earth. If the connections are faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**) repair the wiring, otherwise replace the wiring.
Clear the fault memory and start the engine. If the fault is still present, replace the injector control computer.
Clear the fault memory and start the engine.
If the **fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF358 CONTINUED 1	

2.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is considered present if: – the **level 1** and **OBD** warning lights are lit, – engine speed is **500 rpm** minimum.

Check **ET692 Injector signal fault finding** and **ET693 Injector fault finding** in the **Fault context** window in the **Fault appearance context** section.
One of the two statuses must display an injector number, check the section regarding this injector.

INJECTOR NO. 1

Check the insulation of the coil for injector no. 1 and the casing of injector no. 1.
The resistance is equal to or greater than 10 MΩ.
Replace injector no.1 if necessary.

Check **the insulation from earth, the continuity and the absence of interference resistance** on the following connection:
– connection code **3QP**,
between the injector control computer, **component code 1167** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**) repair the wiring, otherwise replace the wiring.

Check the **insulation against earth, continuity and the absence of interference resistance** on the following connections:
– connection code **3CR**,
– connection code **3H**,
between the injector control computer, **component code 1167** and the injector no. 1 connector, **component code 193**.
If the connections are faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**) repair the wiring, otherwise replace the wiring.

Continue dealing with fault, after injector no. 6.

AFTER REPAIR	Deal with any faults displayed by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF358 CONTINUED 2	

INJECTOR No.2

Check the insulation of the coil for injector no. 2 and the casing of injector no. 2.
The resistance is equal to or greater than 10 MΩ.
Replace injector no.2 if necessary.

Check **the insulation from earth, the continuity and the absence of interference resistance** on the following connection:
– connection code **3QQ**,
between the injector control computer, **component code 1167** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**) repair the wiring, otherwise replace the wiring.

Check the **insulation against earth, continuity and the absence of interference resistance** on the following connections:
– connection code **3CS**,
– connection code **3HA**,
between the injector control computer, **component code 1167** and the injector no. 2 connector, **component code 194**.
If the connections are faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**) repair the wiring, otherwise replace the wiring.
Continue dealing with fault, after injector no. 6.

INJECTOR no. 3

Check the insulation of the coil for injector no. 3 and the casing of injector no. 3.
The resistance is equal to or greater than 10 MΩ.
Replace injector no.3 if necessary.

Check **the insulation from earth, the continuity and the absence of interference resistance** on the following connection:
– connection code **3QR**,
between the injector control computer, **component code 1167** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**) repair the wiring, otherwise replace the wiring.

AFTER REPAIR	Deal with any faults displayed by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF358 CONTINUED 3	

Check the **insulation against earth, continuity and the absence of interference resistance** on the following connections:
– connection code **3CT**,
– connection code **3H**,
between the injector control computer, **component code 1167** and the injector no. 3 connector, **component code 195**.
If the connections are faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**) repair the wiring, otherwise replace the wiring.
Continue dealing with fault, after injector no. 6.

INJECTOR no. 4

Check the insulation of the coil for injector no. 4 and the casing of injector no. 4.
The resistance is equal to or greater than 10 MΩ.
Replace injector no.4 if necessary.

Check **the insulation from earth, the continuity and the absence of interference resistance** on the following connection:
– connection code **3QS**,
between the injector control computer, **component code 1167** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**) repair the wiring, otherwise replace the wiring.

Check the **insulation against earth, continuity and the absence of interference resistance** on the following connections:
– connection code **3CU**,
– connection code **3HA**,
between the injector control computer, **component code 1167** and the injector no.4 connector, **component code 196**.
If the connections are faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**) repair the wiring, otherwise replace the wiring.
Continue dealing with fault, after injector no. 6.

AFTER REPAIR	Deal with any faults displayed by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF358 CONTINUED 4	

INJECTOR NO. 5

Check the insulation of the coil for injector no. 5 and the casing of injector no. 5.
The resistance is equal to or greater than 10 MΩ.
Replace injector no.5 if necessary.

Check **the insulation from earth, the continuity and the absence of interference resistance** on the following connection:
– connection code **3QT**,
between the injector control computer, **component code 1167** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**) repair the wiring, otherwise replace the wiring.

Check the **insulation against earth, continuity and the absence of interference resistance** on the following connections:
– connection code **3DM**,
– connection code **3H**,
between the injector control computer, **component code 1167** and the injector no. 5 connector, **component code 197**.
If the connections are faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**) repair the wiring, otherwise replace the wiring.
Continue dealing with fault, after injector no. 6.

INJECTOR NO. 6

Check the insulation of the coil for injector no.6 and the casing of injector no.6.
The resistance is equal to or greater than 10 MΩ.
Replace injector no. 6 if necessary.

Check **the insulation from earth, the continuity and the absence of interference resistance** on the following connection:
– connection code **3QU**,
between the injector control computer, **component code 1167** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**) repair the wiring, otherwise replace the wiring.

AFTER REPAIR	Deal with any faults displayed by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF358 CONTINUED 5	

Check the **insulation against earth, continuity and the absence of interference resistance** on the following connections:
– connection code **3EK**,
– connection code **3HA**,
between the injector control computer, **component code 1167** and the injector no.6 connector, **component code 198**.
If the connections are faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**) repair the wiring, otherwise replace the wiring.

After dealing with the fault:
Clear the fault memory and start the engine.
Carry out another fault finding procedure using the **diagnostic tool**.

If **the fault is still present**, replace the injector control computer.

Clear the fault memory and start the engine.
Carry out another fault finding procedure using the **diagnostic tool**.

If the **fault is still present**, contact the Techline.

3.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is considered present if: – the **level 2** warning light is lit, – engine speed is **500 rpm** minimum.

Clear the fault memory and start the engine.
Carry out another fault finding procedure using the **diagnostic tool**.

Check **ET692 Injector signal fault finding** and **ET693 Injector fault finding** in the **Fault context** window in the **Fault appearance context** section.
One of the two statuses must display an injector number, check the section regarding this injector.

INJECTOR NO. 1

Check the insulation of the coil for injector no. 1 and the casing of injector no. 1.
The resistance is equal to or greater than 10 MΩ.
Replace injector no.1 if necessary.

AFTER REPAIR	Deal with any faults displayed by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF358 CONTINUED 6	

Check the **insulation against earth, continuity and the absence of interference resistance** on the following connections:
– connection code **3CR**,
– connection code **3H**,
between the injector control computer, **component code 1167** and the injector no. 1 connector, **component code 193**.
If the connections are faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise replace the wiring.
Continue dealing with fault, after injector no. 6.

INJECTOR NO. 2

Check the insulation of the coil for injector no. 2 and the casing of injector no. 2.
The resistance is equal to or greater than 10 MΩ.
Replace injector no.2 if necessary.

Check the **insulation against earth, continuity and the absence of interference resistance** on the following connections:
– connection code **3CS**,
– connection code **3HA**,
between the injector control computer, **component code 1167** and the injector no. 2 connector, **component code 194**.
If the connections are faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**) repair the wiring, otherwise replace the wiring.
Repair if necessary.
Continue dealing with fault, after injector no. 6.

AFTER REPAIR	Deal with any faults displayed by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

DF644 PRESENT OR STORED	FUEL FLOW REGULATOR CIRCUIT CC.1: Short circuit to + 12 V CC: Short circuit CO.0: Open circuit or short circuit to earth 1.DEF: Inconsistency

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors. (see **Wiring Diagram Technical Note, Vel Satis phase 2**) (see **Wiring Diagram Technical Note, Espace IV phase 2**)

CC.1	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** – the **level 2** warning light is lit, – engine switched off, – under **+ APC**.

Switch off the ignition. Disconnect connector **H5** (black 9-track intermediate connector) (near the engine oil filler cap).
Switch on the ignition. Measure the voltage on the following connections: – connection code **3QM**, – connection code **3QN**, of connector H5 (carry out the test on the engine management computer wiring side). **If there is no voltage**, repair the wiring harness on the fuel flow regulators side. If the connections are faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**) repair the wiring, otherwise replace the wiring. If **there is a voltage**, move to the next step.
Switch off the ignition. Disconnect connector **B** from the engine management computer.
Switch on the ignition. Measure the voltage on the following connections: – connection code **3QM**, – connection code **3QN**, of the engine management computer, **component code 120**. **If there is no voltage**, repair the wiring harness. If the connections are faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repairs**) repair the wiring, otherwise replace the wiring.
If **there is a voltage**, contact the Techline.

AFTER REPAIR	Deal with any faults displayed by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF644 **CONTINUED 1**	

CC	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** – **level 1** warning light on, – limitation of performance: 30% accelerator pedal, – limitation of the quantity of fuel injected, – engine speed at **1000 rpm**.

Disconnect connector **H5** (black 9-track intermediate connector) (near the engine oil filler cap).
Measure the resistance of the two fuel flow regulators between connections **3LQ** and **3QM** and connections **3LQ** and **3QN** of connector **H5** (carry out the test on the side of the fuel flow regulator wiring). Replace the injection pump, if the resistance is not **1.6 Ω ± 0.3 at + 20 °C**.
Check for **insulation against earth, continuity and absence of interference resistance** on the following connections: – connection code **3LQ**, – connection code **3QM**, – connection code **3QN**, of connector **H5** (Carry out the test on the side of the fuel flow regulator wiring). The resistance is equal to or greater than 10 MΩ. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
If **the fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF644 **CONTINUED 2**	

CO.0	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** – **level 1** warning light on, – limitation of performance: 30% accelerator pedal, – limitation of the quantity of fuel injected.

Manipulate the wiring harness between the engine management computer and the fuel flow regulators to detect a status change (present ↔ stored). (Without removal). Look for possible damage to the wiring harness, check the **connection and condition** of the injection computer and connector **H5** (black 9-track intermediate connector) (near the engine oil filler cap). If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Look for any possible damage to connector **H5** and to the wiring, as well as any poor connections. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Disconnect connector **B** from the engine management computer.
Measure the resistance between **connections 3LQ and 3QN, and connections 3LQ and 3QM** of the wiring of connector **B** of the engine management computer. If the resistance is not **1.6 Ω ± 0.3 at + 20 °C**.
Disconnect connector **H5** (black 9-track intermediate connector). Measure the resistance of the two fuel flow regulators between connections **3LQ** and **3QM** of connector **H5** and connections **3LQ** and **3QN** of connector **H5**. The resistance is **1.6 Ω ± 0.3 at + 20 °C**. If the resistance is correct, repair the wiring between the engine management computer and connector **H5** (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**).
If the resistance is not correct: Disconnect connectors **E31** and **E32** from the fuel flow regulators. Measure the resistance between **connections 3LQ and 3QN, and connections 3LQ and 3QM** of the two fuel flow regulators, **component code 1105**. Replace the injection pump, if the resistance is not **1.6 Ω ± 0.3 at + 20 °C**. If the resistance is correct, If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
If **the fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF644 **CONTINUED 3**	

1.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** – the **level 2** warning light is lit, – the engine is switched off.

Look for possible damage or poor connections on the fuel flow regulator connectors and wiring connectors (without removal). If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Disconnect connector **B** from the engine management computer and connector **H5** (black 9-track intermediate connector) (near the engine oil filler cap).
Check **the insulation from earth, the continuity and absence of interference resistance** on the following connection: – connection code **3LQ**, between the engine management computer, **component code 120** and connector **H5**. The resistance is equal to or greater than 10 MΩ. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Disconnect connectors **E31** and **E32** from the fuel flow regulators.
Check for **insulation against earth, continuity and absence of interference resistance** on the following connections: – the two connection codes **3LQ**, between connector **H5** and the connector of the fuel flow regulators, **component code 1105**. The resistance is equal to or greater than 10 MΩ. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
If **the fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF721 PRESENT OR STORED	ENGINE OVERHEATING 1.DEF: Above maximum threshold

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is present if: – Engine overheating. (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

Check the cooling system and the coolant fluid level.
Check the level and grade of the engine oil.
Top up the levels of fluid if necessary.
Check **the consistency of temperature values from the oil and coolant temperature sensors**.
Repair or replace the faulty components, if necessary.

Check:
– the cooling radiator,
– possible leaks on the cooling hoses and pipes,
– the condition of the oil and coolant temperature sensor connectors,
– irregularities.
Repair if necessary.

Measure the coolant temperature sensor resistance between its connections **3C** and **3CK** of the connector for component **244**.
Replace the sensor if the **resistance** is not **3511 Ω ± 176 at + 20 ˚C**
980 Ω ± 50 at + 50 ˚C
469 Ω ± 23 at + 70 ˚C
242 Ω ± 12 at + 90 ˚C
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check for **insulation against earth, continuity and absence of interference resistance** on the following connections:
– connection code **3C**,
– connection code **3CK**,
between the coolant temperature sensor connector, **component code 244** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF721 **CONTINUED**	

Measure the oil temperature sensor resistance between connections **47Q** and **3CK** of the connector for component **343**.
Replace the sensor if the **resistance** is not: **3511 Ω ± 176 at + 20 ˚C**
980 Ω ± 50 at + 50 ˚C
469 Ω ± 23 at + 70 ˚C
242 Ω ± 12 at + 90 ˚C
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check for **insulation against earth, continuity and absence of interference resistance** on the following connections:
– connection code **47Q**,
– connection code **3CK**,
between the oil temperature sensor connector, **component code 343** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check that the thermostat is operating correctly.
Repair if necessary.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check for possible mechanical damage to the engine.
Repair if necessary.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF891 PRESENT OR STORED	GROUP 1 INJECTORS SUPPLY 1.DEF : Inconsistency CC : Short circuit

NOTES	**Special notes:** – Use bornier **Elé. 1681** for all operations on the engine management computer connectors. – **This fault affects the rear row (injectors no. 1, 3 and 5).** (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

1.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the harness or connections are faulty, – under + APC, – the **level 2** warning light is lit.

Clear the fault memory and start the engine. If the fault is still present, disconnect connector **A** form the injector control computer. Switch on the ignition.
Check the voltage between the earth and the following connection: – connection code **3PZ**, of the injector control computer wiring, **component code 1167**. If there is a voltage, move on to the next test. If there is no voltage, replace the injector control computer.
Switch off the ignition. Disconnect connector **A** from the engine management computer.
Check for **continuity and the absence of interference resistance** on the following connection: – connection code **3PZ**, between the injector control computer, **component code 1167** and the engine management computer, **component code 120**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Clear the fault memory and start the engine. If **the fault is still present**, contact the Techline.

GETtheMANUALS.org

DF891 **CONTINUED 1**	

CC	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present: – the **level 2** warning light is lit.

Disconnect connector **A** from the injector control computer. **Switch on the ignition.**
Check the voltage between the earth and the following connections: – connection code **3QP**, – connection code **3QR**, – connection code **3QT**, of the injector control computer wiring, **component code 1167**. If there is a voltage, repair the wiring harness. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Switch off the ignition. Remove connector **A** from the engine management computer.
Check for **insulation against earth, continuity and absence of interference resistance** on the following connections: – connection code **3PZ**, – connection code **3QP**, – connection code **3QR**, – connection code **3QT**, between the injector control computer, **component code 1167** and the engine management computer, **component code 120**. The resistance is equal to or greater than 10 MΩ. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Clear the fault memory and start the engine. If the fault is still present, disconnect injector connectors no. 1, 3 and 5. Switch on the ignition.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF891 **CONTINUED 2**	

Check the voltage between the earth and the following connection: – connection code **3CR**, of the connector wiring of injector no. 1, **component code 193**. If there is a voltage, repair the wiring. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check the voltage between the earth and the following connection: – connection code **3CT**, of the connector wiring of injector no. 3, **component code 195**. If there is a voltage, repair the wiring. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check the voltage between the earth and the following connection: – connection code **3DM**, of the connector wiring of injector no. 5, **component code 197**. If there is a voltage, repair the wiring. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
If there is no voltage: Measure the continuity between connections **3CR** and **3H** of the connector wiring of injector no. 1, **component code 193**. Measure the continuity between connections **3CT** and **3H** of the connector wiring of injector no. 3, **component code 195**. Measure the continuity between connections **3DM** and **3H** of the connector wiring of injector no. 5, **component code 197**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Clear the fault memory and start the engine. If the fault is still present, replace the injector control computer.
Clear the fault memory and start the engine. If the fault is still present, **contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF892 PRESENT OR STORED	GROUP 2 INJECTORS SUPPLY 1.DEF : Inconsistency CC : Short circuit

NOTES	**Special notes:** – Use bornier **Elé. 1681** for all operations on the engine management computer connectors. – **This fault affects the front row (injectors no. 2, 4 and 6).** (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

1.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the harness or connections are faulty, – under + APC, – the **level 2** warning light is lit.

Clear the fault memory and start the engine. If the fault is still present, disconnect connector **A** form the injector control computer. Switch on the ignition.
Check the voltage between the earth and the following connection: – connection code **3ABU**, of the injector control computer wiring, **component code 1167**. If there is a voltage, move on to the next test. If there is no voltage, replace the injector control computer.
Switch off the ignition. Disconnect connector **A** from the engine management computer.
Check for **continuity and the absence of interference resistance** on the following connection: – connection code **3ABU**, between the injector control computer, **component code 1167** and the engine management computer, **component code 120**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Clear the fault memory and start the engine. If **the fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF892 **CONTINUED 1**	

CC	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present: – the **level 2** warning light is lit.

Disconnect connector **A** from the injector control computer. **Switch on the ignition.**
Check the voltage between the earth and the following connections: – connection code **3QQ**, – connection code **3QS**, – connection code **3QV**, of the injector control computer wiring, **component code 1167**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
If there is a voltage, repair the wiring harness.
Switch off the ignition. Remove connector **A** from the engine management computer.
Check for **insulation against earth, continuity and absence of interference resistance** on the following connections: – connection code **3ABU**, – connection code **3QQ**, – connection code **3QS**, – connection code **3QV**, between the injector control computer, **component code 1167** and the engine management computer, **component code 120**. The resistance is equal to or greater than 10 MΩ. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Clear the fault memory and start the engine. If the fault is still present, disconnect injector connectors **no. 2, 4 and 6**. Switch on the ignition.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF892 **CONTINUED 2**	

Check the voltage between the earth and the following connection: – connection code **3CS**, of the connector wiring of injector no. 2, **component code 194**. If there is a voltage, repair the wiring. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check the voltage between the earth and the following connection: – connection code **3CU**, of the connector wiring of injector no. 4, **component code 196**. If there is a voltage, repair the wiring. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check the voltage between the earth and the following connection: – connection code **3EK**, of the connector wiring of injector no. 6, **component code 198**. If there is a voltage, repair the wiring. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
If there is no voltage: Measure the continuity between connections **3CS** and **3HA** of the connector wiring of injector no. 2, **component code 194**. Measure the continuity between connections **3CU** and **3HA** of the connector wiring of injector no. 4, **component code 196**. Measure the continuity between connections **3EK** and **3HA** of the connector wiring of injector no. 6, **component code 198**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Clear the fault memory and start the engine. If the fault is still present, replace the injector control computer.
Clear the fault memory and start the engine. If the fault is still present, **contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF947 PRESENT OR STORED	RAIL PRESSURE LIMITER 1.DEF: Parameter at maximum limit

NOTES	**Priority when dealing with a number of faults:** Prioritise the other present or stored faults.
	Conditions for applying the fault finding procedure to stored faults: – the engine stops, – the **level 2** warning light is lit.

Look for possible diesel fuel leaks.
Repair if necessary.

Clear the fault memory and start the engine.
If the fault is still present, run command **AC029 High pressure circuit sealing test** (look for possible diesel fuel leaks).
If there is significant inconsistency between parameters **PR038 Rail pressure** and **PR008 Rail pressure setpoint** during command **AC029**, replace the injection pump.
If the inconsistency or consistency between **PR038 and PR008** is not obvious, record **30 seconds** of **PR008, PR038 and PR055 Engine speed** from idle speed up to **2000 rpm**, then stabilise it at **2000 rpm** for at least **20 seconds**, then return to idle speed.
Note the difference between **PR038 and PR008**; if there is significant inconsistency, replace the injection pump.

If the fault is still present, run command **AC029** again.
If there is significant inconsistency between parameters **PR038 Rail pressure** and **PR008 Rail pressure setpoint** during command **AC029**, replace the injection pump.
If the inconsistency or consistency between **PR038 and PR008** is not obvious, record **30 seconds** of **PR008, PR038 and PR055 Engine speed** from idle speed up to **2000 rpm**, then stabilise it at **2000 rpm** for at least **20 seconds**, then return to idle speed.
Note the difference between **PR038 and PR008**; if there is significant inconsistency, replace the injector rail.

If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

DF948 PRESENT OR STORED	GMV CONTROL CIRCUIT 1 CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 V

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors. (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

CO.0	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the computer does not detect voltage on connections **3JN** when operating the relays, – under **+ after ignition feed**.
		Special note: Run command **AC228 GMV control 1** to check if the relays operate.

Manipulate the wiring harness between the engine management computer and the fan assembly relay to mark a status change (present ↔ stored).
Look for chafing damage on the harness.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the connection and condition of the **engine management computer connector**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the connection and condition of the **GMV relay connector**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the **insulation to earth, continuity and the absence of interference resistance** on the following connection:
– connection code **3JN**,
between the GMV relay unit, **component code 1839** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF948 **CONTINUED 1**	

Check for **insulation against earth, continuity and absence of interference resistance** on the following connections:
– connection code **3AJG**,
– connection code **3AJH**,
of the fan assemblies, **component code 188**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Switch on the ignition.
Run command **AC228 GMV control 1**.
Check the earth on connection **3JN** of the GMV relay unit connector, component code 1839 during this command.
If there is no earth, contact Techline.
If there is an earth, switch off the ignition.
Connect the fan assembly relay unit connector and disconnect the left and right-hand fan assembly connectors.
Switch on the ignition.
Run command **AC228 GMV control 1**.
Check the voltage on connections **3AJG** and **3AJH** of the fan assemblies, **component code 188** during this command.
If there is no voltage, check the wiring between the GMV relay unit and the GMV connectors, if there is no damage, replace the GMV relay unit.
If there is a voltage, check that the fan assemblies operate.
Replace the GMV(s) if the GMV does not operate.
If the GMVs operate, move on to the next stage.

If okay, check the **continuity and the absence of interference resistance** on the three fan assembly relay unit earth connections.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
If correct, replace the GMV relay unit.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF948 **CONTINUED 2**	

CC.1	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared as present if: – the computer detects a voltage on connection **3JN** when operating the relays. **Special note:** Run command **AC228 GMV control 1** to check if the relays operate.

Manipulate the wiring harness between the engine management computer and the fan assembly relay to mark a status change (present ↔ stored). Look for chafing damage on the harness. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check the connection and condition of the **engine management computer connector**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check the connection and condition of the **GMV relay connector**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check the **insulation from + 12 V, the continuity and absence of interference resistance** on the following connection: – connection code **3JN**, between the fan assembly relay unit, **component code 1839** and the engine management computer, **component code 120**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check for **insulation from + 12 V, the continuity and absence of interference resistance** on the following connections: – connection code **3AJG**, – connection code **3AJH**, of the fan assemblies, **component code 188**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
If the **fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF949 PRESENT OR STORED	GMV CONTROL CIRCUIT 2 CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 V

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors. (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

CO.0	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present: – if the computer does not detect voltage on connection **3JP** when operating the relays, – under **+ after ignition feed**.
		Special note: Run the command **AC229 GMV control 2** to check whether the relay is working.

Manipulate the wiring harness between the engine management computer and the fan assembly relays to mark a status change.
Look for chafing damage on the harness.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the connection and condition of the **computer connector**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the connection and condition of the **fan assembly relay connector**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the **insulation to earth, continuity and the absence of interference resistance** on the following connection:
– connection code **3JP**,
between the fan assembly relay unit, **component code 1839** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

DF951 PRESENT OR STORED	SWIRL FLAP POSITION SENSOR CIRCUIT 1.DEF: Front row swirl flap jammed closed 2.DEF: Front row swirl flap jammed open

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors. (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

1.DEF	***NOTES***	**Priority when dealing with a number of faults:** Deal with fault **DF952 Swirl flap circuit** first, if it is present or stored.
		Conditions for applying the fault finding procedure to stored faults: – **level 1** warning light on, – limitation of performance 30% accelerator pedal, – limitation of the quantity of fuel injected, – swirl flap control inactive, – EGR command inactive.

Check the position of the inlet manifold front row swirl flap.
Check the status **ET695 Front row swirl flap position**.
The front row swirl flap must be open.
If it is not, check the swirl flap moves using a vacuum pump. Check status **ET695** changes.
If it does not, replace the front row inlet manifold.

Check for **continuity and the absence of interference resistance** on the following connection:
– connection code **3MD**,
between the swirl flap solenoid valve connector, **component code 1075** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check **the insulation from earth, the continuity and absence of interference resistance** on the following connection:
– connection code **3ACZ**,
between the front row swirl flap position sensor connector, **component code 1709** and the engine management computer**, component code 120**.
The resistance is equal to or greater than 10 MΩ.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

If **the fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF951 **CONTINUED**	

2.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** – **level 1** warning light on, – swirl flap control inactive.

Check the swirl flap moves using a vacuum pump. Check the status **ET695 Front row swirl flap position**. Replace the inlet manifold if necessary. Check the vacuum circuit, if the swirl flap is operating. Repair or replace the vacuum circuit if necessary.
Check for **continuity and the absence of interference resistance** on the following connection: – connection code **3MD**, between the swirl flap solenoid valve connector, **component code 1075** and the engine management computer, **component code 120**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check the following connections for **continuity and make sure there is no interference resistance**: – connection code **3ACZ**, – connection code **3CJ**, – connection code **3AX**, between the front row swirl flap position sensor connector, **component code 1709** and the engine management computer, **component code 120**. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check the performance of the vacuum pump. The vacuum is greater than **- 900 mbar**. Replace the vacuum pump, if the pump does not perform correctly.
If **the fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

DF952 PRESENT OR STORED	SWIRL FLAP CIRCUIT CO.0 : Open circuit or short circuit to earth CC.1 : Short circuit to + 12 V 1.DEF: Back row swirl flap jammed closed 2.DEF: Back row swirl flap jammed open

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors. (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

CO.0	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present: – **level 1** warning light on, – swirl flap solenoid valve control inactive.

Disconnect the solenoid valve connector from the swirl flaps.
Check the continuity of the swirl flap solenoid valve coil.
Replace the solenoid valve, if the resistance is not **40 Ω ± 4**.

Disconnect connector **B** from the engine management computer.

Check the **insulation from earth, the continuity and absence of interference resistance** on the following connection:
– connection code **3MD**,
between the swirl flap solenoid valve connector, **component code 1075** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

If **the fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF952 **CONTINUED 1**	

CC.1	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present: – **level 1** warning light on, – swirl flap solenoid valve active.

Disconnect the solenoid valve connector from the swirl flaps. Check the continuity of the swirl flap solenoid valve coil. Replace the solenoid valve, if the resistance is not **40 Ω ± 4**.
Disconnect connector **B** from the engine management computer. Check the **insulation from + 12 V, the continuity and absence of interference resistance** on the following connection: – connection code **3MD**, between the swirl flap solenoid valve connector, **component code 1075** and the engine management computer, **component code 120**. The resistance is equal to or greater than 10 MΩ. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
If **the fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF952 **CONTINUED 2**	

1.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** – **level 1** warning light on, – limitation of performance: 30% accelerator pedal, – limitation of the quantity of fuel injected, – swirl flap control inactive, – EGR command inactive.

Check the position of the inlet manifold back row swirl flap.
Check the status **ET696 Back row swirl flap position**.
The back row swirl flap must be open.
If it is not, check the swirl flap moves using a vacuum pump. Check status **ET696** changes.
If it does not, replace the back row inlet manifold.

Check the **insulation from + 12 V, the continuity and absence of interference resistance** on the following connection:
– connection code **3MD**,
between the swirl flap solenoid valve connector, **component code 1075** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check **the insulation from earth, the continuity and absence of interference resistance** on the following connection:
– connection code **3ACY**,
between the back row swirl flap position sensor connector, **component code 1293** and the engine management computer, **component code 120**.
The resistance is equal to or greater than 10 MΩ.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

If **the fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF952 **CONTINUED 3**	

2.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** – **level 1** warning light on, – swirl flap control inactive.

Check the swirl flap moves using a vacuum pump.
Check the status **ET696 Back row swirl flap position**.
Replace the inlet manifold if necessary.
Check the vacuum circuit, if the swirl flap is operating.
Repair or replace the vacuum circuit if necessary.

Check for **continuity and the absence of interference resistance** on the following connection:
– connection code **3MD**,
between the swirl flap solenoid valve connector, **component code 1075** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the following connections for **continuity and make sure there is no interference resistance**:
– connection code **3ACY**,
– connection code **3CJ**,
– connection code **3AX**,
between the back row swirl flap position sensor connector, **component code 1293** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the performance of the vacuum pump. The vacuum is greater than **- 900 mbar**.
Replace the vacuum pump, if the pump does not perform correctly.

If **the fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF954 PRESENT OR STORED	TURBOCHARGER CONTROLLER CIRCUIT 1.DEF: No signal 2.DEF: Internal electronic fault 3.DEF: Configuration/Initialisation

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors. (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

1.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** – **level 1** warning light on, – limitation of performance: 30% accelerator pedal, – limitation of the quantity of fuel injected, – engine speed at **1000 rpm**, – turbocharger inactive,

Disconnect the turbocharger controller connector.
Switch on the ignition.
Check the voltage on connection **3FB** of the turbocharger controller connector, the voltage is equal to **PR074 Battery voltage**.
Check the continuity between connection **M*** of the turbocharger controller connector and **earth**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Disconnect connector **B** from the engine management computer.

Check for **insulation against earth, continuity and absence of interference resistance** on the following connections:
– connection code **3YQ**,
– connection code **3YP**,
between the turbocharger controller connector, **component code 1862** and the engine management computer, **component code 120**.
The resistance is equal to or greater than 10 MΩ.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF954 **CONTINUED**	

Switch on the ignition.
Check the voltage between the following connections:
– connection code **3YQ**,
– connection code **3YP**,
of the engine management computer, **component code 120**.
If there is a voltage, repair the wiring harness.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
If there is no voltage, replace the turbocharger controller.

Clear the fault memory and start the engine.
If the fault is still present, **contact the Techline**.

2.DEF ***3.DEF***	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** – **level 1** warning light on, – limitation of performance: 30% accelerator pedal, – limitation of the quantity of fuel injected, – engine speed at **1000 rpm**.

Replace the turbocharger controller.

Clear the fault memory and start the engine.
If the **fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF956 PRESENT OR STORED	LACK OF AIR IN INLET CIRCUIT 1.DEF: Negative loop deviation 2.DEF: EGR valve stuck shut

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

1.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** – **level 1** and **OBD** warning lights on, – fast idle speed, – limitation of performance: 30% accelerator pedal, – limitation of the quantity of fuel injected, – turbocharger regulation cut-off.

Look for any blockages on the air inlet: Apply **test 4: Turbocharging and air inlet circuit check**. Repair if necessary.
Look for any blockages in the EGR valve cooler. Repair if possible or replace it.
Look for any blockages in the EGR valve. Replace the EGR valve if necessary.
Check the condition of the EGR valve duct. Repair if necessary or replace it.
Clear the fault memory and start the engine. If the fault is still present, replace the EGR valve, if it has not been replaced before.
Clear the fault memory and start the engine. If the fault is still present, **contact the Techline**.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF956 **CONTINUED**	

2.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** – **level 1** and **OBD** warning lights on, – fast idle speed, – limitation of performance: 30% accelerator pedal, – limitation of the quantity of fuel injected, – the turbocharger command inactive.

Replace the EGR valve.
Clear the fault memory and start the engine. If **the fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF957 PRESENT OR STORED	TOO MUCH AIR IN THE INLET CIRCUIT 1.DEF: Positive loop deviation 2.DEF: EGR valve jammed open

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors.

1.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** – **level 1** and **OBD** warning lights on, – fast idle speed, – limitation of performance: 30% accelerator pedal, – limitation of the quantity of fuel injected, – the turbocharger command inactive.

Look for any leaks in the air inlet: Apply **test 4: Turbocharging and air inlet circuit check**. Repair if necessary.
Clear the fault memory and start the engine. If the fault is still present, replace the EGR valve.
Clear the fault memory and start the engine. If the fault is still present, **contact the Techline**.

2.DEF	***NOTES***	**Conditions for applying the fault finding procedure to stored faults:** – **level 1** and **OBD** warning lights on, – limitation of performance: 30% accelerator pedal, – limitation of the quantity of fuel injected, – the EGR valve command inactive, – the turbocharger command inactive.

Replace the EGR valve.
Clear the fault memory and start the engine. If **the fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF958 PRESENT OR STORED	STARTER BUTTON CIRCUIT CC.1 : Short circuit to + 12 V CO.0 : Open circuit or short circuit to earth

NOTES	**Special notes:** Use bornier **Elé. 1681** for all operations on the engine management computer connectors. (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

CC.1	***NOTES***	None

Disconnect connector **A** from the injection computer.
Switch on the ignition.
Check the voltage on connection code **D** of the injection computer connector.
If the voltage is close to the battery voltage.
Look for a short circuit.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the voltage between the UCH and the starter button (see **section 87B, UCH, Starter button**).

If **the fault is still present**, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

DF958 **CONTINUED**	

CO.0	***NOTES***	None

Disconnect connector **A** from the injection computer. Disconnect the UCH connector. Disconnect the starter connector.
Check for **insulation against earth, continuity and absence of interference resistance** on the following connections: – connection code **133C**, – connection code **133B**, between the UCH connector, **component code 645** and the engine management computer, **component code 120**. The resistance is equal to or greater than 10 MΩ. If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
If the fault is still present, run fault finding on **the passenger compartment connection unit** (see **section 87B, passenger compartment connection unit**).
Replace the UCH if necessary.
If the fault is still present, contact the Techline.

AFTER REPAIR	Deal with any faults detected by the **diagnostic tool**. Clear the computer memory. Carry out a road test followed by another check with the **diagnostic tool**.

GETtheMANUALS.org

NOTES	Only carry out this conformity check after a **complete check** with the diagnostic tool. The values indicated in this conformity check are only given as examples. **Test conditions: engine stopped, ignition on.**

MAIN SCREEN

Order	Function	Parameter or Status Checked or Action		Display and Notes	Fault finding
1	**Computer after ignition feed**	**ET001:**	+ After ignition computer feed	**PRESENT**	In the event of a fault, refer to the interpretation of **DF046 Battery voltage or DF151 Main relay circuit**.
2	**Engine speed**	**PR055:**	Engine speed	**0 rpm**	In the event of a fault, apply the interpretation of **DF005 Engine speed sensor circuit or DF195 Engine speed/camshaft sensor consistency**.
3	**Vehicle speed**	**PR089:**	Vehicle speed	**Gives the vehicle speed in mph (km/h). 0 mph (0 km/h)**	**Perform a fault finding procedure on the ABS computer.**
4	**Pressure**	**PR038:**	Rail pressure	**0 bar** If the engine has just been stopped, wait a few seconds to obtain this value.	In the event of a fault, apply the interpretation of fault **DF007 Rail pressure sensor circuit or DF947 Rail pressure limiter**.
		PR041:	Turbocharging pressure	**950 < X < 1030 mbar** (depending on altitude)	In the event of a fault, apply the interpretation of **DF954 Turbocharger controller circuit** or **DF569 Turbocharging circuit or DF957 Too much air in inlet circuit or DF956 Lack of air in inlet circuit**.

GETtheMANUALS.org

ET001	COMPUTER + AFTER IGNITION FEED

NOTES	**Special note:** Only apply the checks if the **ABSENT** and **PRESENT** statuses are not consistent with the system operating program. (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

ABSENT	***NOTES***	Ignition on.

Check for an earth on the following connections:
– the three connection codes **N***,
between the earth and the engine management computer, **component code 120**.

If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check for **+ 12 APC** on connection code **AP*** of engine management computer connector A, **component code 120**.
If there is no voltage, check the **insulation to earth and the continuity** between the following connection:
– connection code **AP***,
between **+ after ignition feed and** the engine management computer, **component code 120**.

If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

PRESENT	***NOTES***	Ignition on.

Check for no **+ 12 APC** with the ignition off
– connection code **AP***,
between **+ after ignition feed** and the engine management computer, **component code 120**.

If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET003	ENGINE IMMOBILISER

NOTES	**Special note:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

ACTIVE

If status **ET003 Immobiliser** is permanently **ACTIVE**, consult the interpretation of the UCH (see **87B, Passenger compartment connection unit**).

INACTIVE

When the ignition is switched on, and when driving, status **ET003 Immobiliser becomes INACTIVE**.
If it does not, consult the note (see **87B, Passenger compartment connection unit**).

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET007	PREHEATING UNIT CONTROL

NOTES	**Special note:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system. (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

ACTIVE

When the ignition is switched on, status **ET007** becomes **ACTIVE** for a time that varies according to the engine coolant temperature. Both the relay and the heater plugs are supplied.
When the vehicle is started from cold, the injection computer always runs the preheating unit to allow the vehicle to start more easily, the status should become **ACTIVE** during the starting phase.
After starting, the status should remain **ACTIVE** for a variable period depending on the engine coolant temperature.
If the vehicle does not start and status **ET007** becomes **ACTIVE** when switching on the ignition or during the starting phase, a preheating connection or circuit component may be damaged.
Check:
– the supply fuses **FM18 and FM19 (70A)** on the power supply fuse board,
– the **+ 12 V** supply to the heater plugs after relay control, and that these are connected correctly.

Check for **insulation against earth, continuity and absence of interference resistance** on the following connections:
– connection code **3SP**,
between the heater plug of **cylinder no. 1, component code 680** and the heater plug control unit, **component code 257**.
– connection code **3SR**,
between the heater plug of **cylinder no. 3, component code 682** and the heater plug control unit, **component code 257**.
– connection code **3ST**,
between the heater plug of **cylinder no. 5, component code 1260** and the heater plug control unit, **component code 257**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET007 **CONTINUED**	

Check for **insulation against earth, continuity and absence of interference resistance** on the following connections:
– connection code **3SQ**,
between the heater plug of **cylinder no. 2, component code 681** and the heater plug control unit, **component code 257**.
– connection code **3SS**,
between the heater plug of **cylinder no. 4, component code 683** and the heater plug control unit, **component code 257**.
– connection code **3SU**,
between the heater plug of **cylinder no. 6, component code 1261** and the heater plug control unit, **component code 257**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

If the vehicle starts, preheating has ended, and status **ET007** remains **ACTIVE** during the engine operating phases, consult the interpretation of faults **DF144 Preheating relay control circuit group 1** and **DF158 Preheating relay control circuit group 2**.

INACTIVE

If the vehicle does not start, the status remains **INACTIVE** and preheating was not executed when the ignition was switched on or during the starting phase.
Check the following connections:
– the two connection codes **BP35**,
between the battery, **component code 107** and the heater plug control unit, **component code 257**.

Check the following connections:
– connection code **3FF**,
– connection code **3HL**,
– connection code **3HM**,
between the preheating unit connectors, **component code 257** and the engine management computer, **component code 120**.

If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET042	CRUISE CONTROL/SPEED LIMITER

NOTES	**Special notes:** Only perform these tests if the statuses do not correspond with the system programming functions.

NOT DETECTED

If the vehicle is not fitted with cruise control/speed limiter function buttons, status **ET042** is permanently **NOT DETECTED**, therefore confirm that the cruise control or speed limiter function is not present on the vehicle.
If the vehicle is fitted with cruise control or speed limiter function buttons, the main button is in rest position (or Neutral) and the computer has just been programmed or reprogrammed, then status **ET042** is **NOT DETECTED**.
To enable the computer to detect the cruise control or speed limiter function, press the main switch when in cruise control position and then in speed limiter position.
Return to rest position
Status **ET042 is INACTIVE** on the diagnostic tool.

INACTIVE

When the main button is in rest position (or Neutral), status **ET042 Cruise control/speed limiter** is **INACTIVE**.
If **CRUISE CONTROL** or **SPEED LIMITER** appears despite the main button being in the rest position (or neutral), carry out the following operations:
Check the connections of the main cruise control/speed limiter switch.
Check for **+ 12 V** APC on the switch connector.
- Connection code **AP10, of component 1081**.

Disconnect the switch, and, in the rest position, check the insulation between:
- Connection codes **AP10 and 3FX, of component 1081**.
- Connection codes **AP10 and 3PD, of component 1081**.

– Check the **continuity between connections AP10 and 3PD of component 1081** in the speed limiter position.
– Check the **continuity between connections AP10 and 3PD of component 1081** in the cruise control position.
If the checks produce incorrect results, replace the switch.
Check the **insulation, continuity and the absence of interference resistance** on the following connections:
- Connection code **3FX**.
- Connection code **3PD**.

between components 1081 and 120.
Also check:
The engine management computer connections.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET042 **CONTINUED 1**	

SPEED LIMITER

When the driver presses the main speed limiter button, status **ET042** becomes **SPEED LIMITER**.
If **CRUISE CONTROL** appears when the driver presses the speed limiter switch, carry out the following operations:
Check the connections of the main cruise control/speed limiter switch.
Check for **+ 12 V** APC on the switch connector.
- Connection code **AP10, of component 1081**.

Disconnect the switch, and when it is in the rest position check the insulation between:
- Connection codes **AP10 and 3FX, of component 1081**.
- Connection codes **AP10 and 3PD, of component 1081**.

– Check the continuity between **connections AP10 and 3PD of component 1081** in the speed limiter position.
– Check the continuity between **connections AP10 and 3PD of component 1081** in the cruise control position.
If the checks produce incorrect results, replace the switch.
Check the **insulation, continuity and the absence of interference resistance** on the following connections:
- Connection code **3FX**.
- Connection code **3PD**.

between components 1081 and 120.
Also check:
The engine management computer connections.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET042 **CONTINUED 2**	

CRUISE CONTROL

When the driver presses the main cruise control button, status **ET042** becomes **CRUISE CONTROL**.
If **LIMITER** appears when the driver presses the cruise control button, carry out the following operations:
Check the connections of the main cruise control/speed limiter switch.
Check for **+ 12 V** APC on the switch connector.
- Connection code **AP10, of component 1081**.

Disconnect the switch, and, in the rest position, check the insulation between:
- Connection codes **AP10 and 3FX, of component 1081**.
- Connection codes **AP10 and 3PD, of component 1081**.

– Check the continuity between **connections AP10 and 3PD of component 1081** in the speed limiter position.
– Check the continuity between **connections AP10 and 3FX of component 1081** in the cruise control position.
If the results of the checks are not correct, replace the switch.
Check the **continuity, insulation and the absence of interference resistance** on the following connections:
- Connection code **3FX**.
- connection code **3PD**.

between components **1081 and 120**.
Also check:
The engine management computer connections.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET077	IMPACT DETECTED

NOTES	**Special note:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

YES

If the vehicle has been involved in an accident, the injection computer receives the impact signal from the airbag computer via the multiplex network and may switch off the ignition. Status **ET077** is **YES**.
Switch off the ignition for **2 minutes** then switch on the ignition again so the engine can be restarted.
Test the multiplex network (see **88B, Multiplexing**) and deal with any faults present.

NO

Under normal operating conditions, status **ET077** is **NO** when the computer has received no impact signal.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET115	PREHEATING INDICATOR LIGHT

NOTES	**Special notes:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system. Statuses **ET220 Fault/preheating indicator light** and **ET115 Preheating indicator light** are directly linked. If one is **ON**, the other must also assume the status **ON**.

ON

Check that the status **ET115** becomes **ON** and that the preheating warning light comes on when the ignition is switched on. Perform a fault finding procedure beforehand on the multiplex network.
If the network is not correct (see **88B Multiplexing**).
If the fault is still present, check the preheating unit and the heater plugs using the following faults:

- **DF144 Preheating relay control circuit group 1,**
- **DF158 Preheating relay control circuit group 2.**

– check the preheating unit using command **AC037 Preheating relay**.
If the fault is still present, run fault finding on the Instrument panel (see **83A, Instrument panel**).
If the fault is still present, contact your Techline.

OFF

Status **ET115 Preheating indicator light** is **OFF** when the preheating indicator light is off.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET117	OVERHEATING WARNING LIGHT

NOTES	**Special notes:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system. Statuses **ET117** and **ET460 Coolant temperature warning light** are directly linked. If one is **ON**, the other must also assume the status **ON**.

ON

Check that status **ET117** becomes **ON** and that the overheating indicator light (coolant temperature) comes on when switching on the ignition.
Perform a fault finding procedure beforehand on the multiplex network.
If the network is not correct (see **88B Multiplexing**).
If the network is correct, check:
– the coolant temperature sensor,
– deal with any faults.
If the fault is still present, check the coolant temperature circuit to using the interpretation of fault:
– **DF721 Engine overheating.**
If the fault is still present, run fault finding on the Instrument panel (see **83A, Instrument panel**).
If the fault is still present, contact your Techline.

OFF

Status **ET117** is **INACTIVE** when the overheating warning light is off.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET205	HEATING ELEMENT 1 RELAY CONTROL

NOTES	**Special note:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system. (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

ACTIVE

Status **ET205 Heating element relay no. 1 control** can be:
– **ACTIVE:** when heating element relay control no. 1 is activated.
– **INACTIVE:** with the ignition on.
When heating element no. 1 relay is requested and status **ET205** is **INACTIVE**, a connection or circuit component of the heating element no. 1 relay may be damaged.
Check:
– the heating element no. 1 relay fuse: **FM12 (70A)**,
– the heating element no. 1 relay mounting connections,
– the engine management computer connections.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check **the insulation from earth, the continuity and absence of interference resistance** on the following connection:
– connection code **3JA**,
between heating element relay 1, **component code 1067** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the **insulation from + 12 V, the continuity and absence of interference resistance** for the following connection:
– connection code **3JA**,
between heating element relay 1, **component code 1067** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

INACTIVE

Status **ET205** becomes **INACTIVE** when the heating control is not activated.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET206	HEATING ELEMENT 2 RELAY CONTROL

NOTES	**Special note:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system. (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

ACTIVE

Status **ET206 Heating element no. 2 relay control** can be:
– **ACTIVE:** when heating element no. 2 relay control is activated.
– **INACTIVE:** with the ignition on.
When heating element no. 2 relay is requested and status **ET206** is **INACTIVE**, a connection or circuit component of the heating element no. 2 relay may be damaged.
Check:
– the heating element no. 2 relay fuse **FM13 (70A)**,
– the heating element no. 2 relay mounting connections,
– the engine management computer connections.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check **the insulation from earth, the continuity and absence of interference resistance** on the following connection:
– connection code **3JAA**,
between heating element 2 relay, **component code 1068** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the **insulation from + 12 V, the continuity and absence of interference resistance** on the following connection:
– connection code **3JAA**,
between heating element 2 relay, **component code 1068** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

INACTIVE

Status **ET206** becomes **INACTIVE** when the heating control is not activated.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET207	HEATING ELEMENT NO. 3 RELAY CONTROL

NOTES	**Special note:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system. (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

ACTIVE

Status **ET207** can be:
– **ACTIVE:** when heating element no. 3 relay control is activated.
– **INACTIVE:** with the ignition on.
When heating element no. 3 relay is requested and status **ET207** is **INACTIVE**, a connection or circuit component of the heating element no. 3 relay may be damaged.
Check:
– the heating element no. 3 relay fuse **FM14 (70 A)**,
– the heating element no. 3 relay mounting connections,
– the engine management computer connections.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check **the insulation from earth, the continuity and absence of interference resistance** on the following connection:
– connection code **3JAB**,
between heating element 3 relay, **component code 1069** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the **insulation from + 12 V, the continuity and absence of interference resistance** on the following connection:
– connection code **3JAB**,
between heating element 3 relay, **component code 1069** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

INACTIVE

Status **ET207 Heating element no. 3 relay control** becomes **INACTIVE** when the heater control is not activated.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET220	FAULT/PREHEATING INDICATOR LIGHT

NOTES	Apply the conformity check to see if the statuses are consistent with the operating programs of the system. Statuses **ET220 Fault/preheating indicator light** and **ET115 Preheating indicator light** are directly linked. If one is **ON**, the other must assume the same status.

ON

Check that status **ET220 Fault/preheating indicator light** becomes **ON** and that the preheating indicator light is activated when the ignition is switched on.
Perform a fault finding procedure beforehand on the multiplex network.
If the network is not correct (see **88B Multiplexing**).
If the network diagnosis is OK, check:
– the complete engine injection system.
If the fault is still present, run fault finding on the Instrument panel (see **83A, Instrument panel**).
If the fault is still present, contact your Techline.

OFF

Status **ET220** is **OFF** when the preheating indicator light is off.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET341	IMMOBILISER CODE PROGRAMMED

NOTES	**Special note:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

YES

Status **ET341** becomes **YES** if dialogue is possible between the UCH and the injection computer and the RENAULT card code is recognised.
Engine starting authorisation is only given if the code is recognised by the UCH computer, and status **ET003 Engine immobiliser** is **INACTIVE**.

NO

The code remains **NO** if dialogue between the UCH and the injection computer is not possible. Status **ET003 Engine immobiliser** is **ACTIVE**.
The fault may be caused by incorrect card programming (see **87B, Passenger compartment connection unit** and follow the **RENAULT card programming** procedure).
If the card codes are not faulty, carry out a multiplex network test (see **88B, Multiplex**).
Where the fault finding procedure was performed by function, ensure that dialogue is present between the UCH, the Protection and Switching unit and the injection computer.
If dialogue is not established, contact the Techline.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET520	OBD WARNING LIGHT

NOTES	**Special note:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

ACTIVE

Check that status **ET520** becomes **ACTIVE** and that the OBD warning light comes on when the ignition is switched on.
Perform a fault finding procedure beforehand on the multiplex network.
If the network is not correct (see **88B Multiplexing**).
If the network is correct, check:
– the complete engine injection system,
– deal with any faults.
If the fault is still present, run fault finding on the Instrument panel (see **83A, Instrument panel**).
If the fault is still present, contact your Techline.

INACTIVE

Status **ET520** is **INACTIVE** when the OBD warning light is off.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET556	DRIVER'S DEACTIVATION OF THE CRUISE CONTROL/SPEED LIMITER

NOTES	**Special notes:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system.

Note:
Cruise control can be activated when the vehicle speed exceeds **18 mph (30 km/h)**.
Status **ET556** specifies 6 causes of cruise control deactivation which are due to driver's demands or to the external environment (e.g. STATUS 4).
To reactivate the cruise control/speed limiter, press button "R".
IMPORTANT
To reinitialise the deactivations stored by the injection computer, use command RZ007 Clearing.

STATUS 1	**Brake pedal depressed**
	The cruise control function is deactivated each time the brake pedal is depressed. Status **ET556** becomes **STATUS 1**, when driving, with cruise control active (**ET042 Cruise control/Speed limiter: CRUISE CONTROL**) and brake pedal depressed. This deactivates cruise control. If status **ET556** becomes **STATUS 1** without pressing the brake pedal, consult the interpretation of statuses **ET704** and **ET705 Brake contact no.1 and no. 2**.

STATUS 2	**Clutch pedal depressed**
	Manual gearboxes ONLY The cruise control function is deactivated if the gearbox is no longer coupled to the engine (clutch pedal depressed). Status **ET556** becomes **STATUS 2** when driving, with cruise control active (**ET042 Cruise control/speed limiter: CRUISE CONTROL**) and brake pedal depressed. This deactivates cruise control. If status **ET556** becomes **STATUS 2** without the clutch pedal being pressed, consult the interpretation of status **ET405 Clutch pedal switch**.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET556 CONTINUED	

STATUS 3	**Suspend button pressed**
	The cruise control/speed limiter function is deactivated each time the suspend button is pressed. Status **ET556** becomes **STATUS 3** when driving with either the cruise control or speed limiter active and if the driver presses the **0** button. This deactivates cruise control. If status **ET556** becomes **STATUS 3** without pressing the **0** button, consult the interpretation of status **ET703 Cruise control/speed limiter buttons** and run fault finding on the **R/0** control button, located on the right-hand side on the steering wheel.

STATUS 4	**Traction control request**
	If the vehicle being diagnosed is fitted with a traction control system, the cruise control function is deactivated every time the traction control is requested by the ABS computer. Status **ET556** becomes **STATUS 4** when driving, with cruise control active (**ET042 Cruise control/speed limiter: CRUISE CONTROL**) and traction control requested. If status **ET556** becomes **STATUS 4** with no traction control request (see **38C, Anti-lock Braking System**).

STATUS 5	**Gear lever in neutral (manual gearbox) or neutral (automatic transmission)**
	Status **ET556** becomes **STATUS 5**, when driving with cruise control active (**ET042 Cruise control/speed limiter: CRUISE CONTROL**) and: – If the driver puts the gear lever in neutral position on a manual gearbox without declutching or, – if the gear lever is in neutral on an automatic transmission. This deactivates cruise control. If status **ET556** becomes **STATUS 5** without putting the gear lever in neutral position on a manual gearbox without declutching, or in neutral position on an automatic transmission, then contact Techline.

STATUS 6	**Inconsistency between the request and the vehicle speed**
	Status **ET556** changes to **STATUS 6** if the computer detects too great a difference between the speed requested by the driver and the vehicle speed. This could occur when driving with cruise control active (**ET042 Cruise control/ speed limiter: CRUISE CONTROL**) and when there is a significant difference. This inconsistency deactivates cruise control. If status **ET556** changes to **STATUS 6** without a great difference in the speeds, contact the Techline.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET557	CRUISE CONTROL/SPEED LIMITER DEACTIVATION BY FUNCTION

NOTES	**Special notes:** Only perform these tests if the statuses do not correspond with the system programming functions.

Note:
Cruise control remains deactivated as long as the vehicle speed does not exceed **18 mph (30 km/h).**
Status **ET557** details 4 causes for cruise control deactivation.
IMPORTANT
To reinitialise the deactivations stored by the injection computer, use command RZ007 Fault memory.

STATUS 2	**Monitoring by injection computer**
	Status **ET557** becomes **STATUS 2** when driving with cruise control active (**ET042 Cruise control/speed limiter: CRUISE CONTROL**) and if the injection computer detects a fault in the injection system or in the engine management assembly. This signal is conveyed on the multiplex line and deactivates the cruise control. Carry out a multiplex network test, then run fault finding on the injection computer. Deal with the present or stored faults (see **13A Diesel injection or 17A Diesel injection**). Clear the fault memory by applying command **RZ007 Fault memory**. If status **ET557** remains **STATUS 2** is still present, contact Techline.

STATUS 3	**Vehicle speed monitoring**
	If status **ET557** changes to **STATUS 3** if the vehicle speed received by the computer is invalid or absent. This signal is conveyed on the multiplex line and deactivates the cruise control. Carry out a multiplex network test, then run fault finding on the **ABS** computer. Deal with the present or stored faults (see **38C, ABS**). **Reinitialise ET557 of the automatic transmission computer by running command RZ007 Fault memory.** If status **ET557** remains **STATUS 3** is still present, contact Techline.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET557 CONTINUED	

STATUS 4	Cruise control or speed limiter monitoring
	If status **ET557** is **STATUS 4**, consult the interpretation: – of status **ET042 Cruise control/Speed limiter**, – of status **ET703 Cruise control/Speed limiter buttons**, – of status **ET704 Brake contact no. 1**, – of status **ET705 Brake contact no. 2**, to test the cruise control system components and locate the faulty component. If status **ET557** becomes **STATUS 4**, deal with the faults present or stored in the computer. If the fault is still present, contact the Techline.

STATUS 5	Vehicle speed not refreshed
	Status **ET557** becomes **STATUS 5** if the vehicle speed received by the computer does not vary. Carry out fault finding on the **ABS** computer. If there are faults present (see **MR 404, 38C, ABS**). If the fault is still present, contact the Techline.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET688	GMV CONTROL CIRCUIT 1

NOTES	Apply the conformity check to see if the statuses are consistent with the operating programs of the system. If the vehicle is fitted with air conditioning, the GMV electrical circuit contains 5 relays. The GMV relay unit will be run by control 1 when the engine coolant temperature **is between 94 and 96 °C** and will be dedicated to cooling the engine as long as the engine coolant temperature does not exceed **96 °C**. If the engine coolant temperature exceeds **99 °C**, the GMV relay unit will be run by controls 2 and 3 and the engine cooling fans will rotate more quickly.

ACTIVE

When the coolant has reached **96 °C**, the injection computer controls **connection 3JN** which supplies the GMV relay unit, status **ET688 GMV control circuit 1** becomes **ACTIVE**. The GMV relay unit supplies the engine cooling fan and they start to turn.
Run command **AC228 GMV control circuit 1** and check visually that the cooling fan is turning. If this is not the case, carry out the following operations:
– check the condition of fuses **FM15 (60 A) and FM23 (60 A)**,
– check for **+ 12 V** on **connection codes BP71** and **BP72** of the GMV relay unit,
– then check the **continuity and absence of interference resistance** on the following connection:
  – connection code **3JN**,

between the GMV relay unit, **component code 1839** and the engine management computer, **component code 120**.
– check for **+ 12 V** on **connection codes 3AJG and 3AJH** of the GMV, **component codes 188**, when running command **AC228 GMV control circuit 1**.

If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

INACTIVE

If the engine temperature is less than **94 °C**, the engine cooling fans must stop turning. If status **ET688** becomes **INACTIVE**, the GMV relay unit should no longer be controlled.
Status **ET688** becomes **INACTIVE** when the GMV relay unit is supplied by controls 2 and 3 (**connection codes 3JP and 3AJD** of the injection computer), if the temperature is above **96 °C**.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET689	GMV 2 CONTROL CIRCUIT

NOTES	Apply the conformity check to see if the statuses are consistent with the operating programs of the system. If the vehicle is fitted with air conditioning, the GMV electrical circuit contains 5 relays. If the engine coolant temperature exceeds **96 ˚C** and is between **96 ˚C** and **99 ˚C**, the GMV relay unit will be actuated by controls 2 and 3 and the engine cooling fans will then turn more quickly. If the engine coolant temperature is **between 102 and 107 ˚C after switching the ignition off or stopping the engine,** the GMV relay unit is actuated by control 2. (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

ACTIVE

When the coolant temperature is between **102 and 107 ˚C** after stopping the engine, the injection computer controls **connection code 3JP** which supplies the GMV relay unit, status **ET689 GMV control circuit 2** becomes **ACTIVE**. The GMV relay unit supplies the engine cooling fan and they start to turn.
Run command **AC229 GMV control circuit 2** and check visually that the cooling fan is turning. If this is not the case, carry out the following operations:
– check the condition of fuses **FM15 (60 A) and FM23 (60 A)**,
– check for **+ 12 V** on **connection codes BP71** and **BP72** of the GMV relay unit.
then check the **continuity and absence of interference resistance** on the following connection:
– connection code **3JP**,
between the GMV relay unit, **component code 1839** and the engine management computer, **component code 120**.
– check for **+ 12 V** on **connection codes 3AJH** and **3AJG** of the GMV when running command **AC229 GMV control circuit 2**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

INACTIVE

If the engine coolant temperature is less than **102 ˚C** when stopped, the engine cooling fans cannot turn and the GMV relay unit cannot be run.
Status **ET689** becomes **INACTIVE** when the GMV relay unit is no longer supplied by any injection computer command.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET690	GMV CONTROL CIRCUIT 3

NOTES	Apply the conformity check to see if the statuses are consistent with the operating programs of the system. If the vehicle is fitted with air conditioning, the GMV electrical circuit contains 5 relays. The GMV relay unit will be run by controls 2 and 3 when the engine coolant temperature is between **96 °C** and **99 °C** and will be dedicated to cooling the engine as long as the engine coolant temperature does not exceed **99 °C**. If the engine coolant temperature exceeds **99 °C**, the GMV relay unit will be run by controls 1, 2 and 3 and the engine cooling fans will rotate more quickly.

ACTIVE

When the coolant reaches **96 °C**, the injection computer controls **connections 3JP and 3AJD** which supply the GMV relay unit, status **ET690 GMV control circuit 3** becomes **ACTIVE**. The GMV relay unit supplies the engine cooling fan and they start to turn.
Run command **AC230 GMV control circuit 3** and check visually that the cooling fans are turning. If this is not the case, carry out the following operations:
– check the condition of fuses **FM15 (60 A) and FM23 (60 A)**.
– check for **+ 12 V** on **connection codes BP71** and **BP72** of the GMV relay unit.
then check the **continuity and absence of interference resistance** on the following connection:
– connection code **3AJD**,
between the GMV relay unit, **component code 1839** and the engine management computer, **component code 120**.
– check for **+ 12 V** on **connection codes 3AJG** and **3AJH** of the GMV when running command **AC230 GMV control circuit 3**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET690 **CONTINUED**	

INACTIVE

If the engine coolant temperature is less than **96** ˚**C**, the GMV relay unit can only be requested by control 1 (**connection 3JN** of the injection computer) therefore the engine cooling fan must turn at a slower speed than if **ET690** is **ACTIVE**, (GMV relay unit requested by control 3).
Status **ET690 GMV control circuit 3** becomes **INACTIVE** when the GMV relay unit is supplied by control 1 (**connection 3JN** of the injection computer) (engine running).

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET691	START BUTTON

NOTES	**Special note:** Apply the conformity check to see if the statuses are consistent with the operating programs of the system. (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

ACTIVE

Status **ET691** becomes **ACTIVE** when the vehicle's starter button is pressed.
If this is not the case, carry out the following operations:
Check the **continuity and the absence of interference resistance** on the following connections:
– connection code **133C**,
– connection code **133B**,
between the UCH connector, **component code 645** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

If the fault is still present, run fault finding on **the passenger compartment connection unit** (see **87B, UCH, Passenger compartment connection unit**).

INACTIVE

Status **ET691** is **INACTIVE** except when the vehicle's starter button is pressed.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET703	CRUISE CONTROL/SPEED LIMITER BUTTONS

NOTES	**Special notes:** Only perform these tests if the statuses do not correspond with the system programming functions.

INCREASE	Status **ET703** becomes **INCREASE** when the **+** button for the cruise control is pressed. This button is located on the left-hand side on the steering wheel. If status **ET703** does not become **INCREASE**, check the condition of the **+/-** cruise control button and its connector. Repair if necessary. **To remove the driver's airbag and carry out the measurements in complete safety** (see **MR 404 or MR 407, 38C, ABS**). **Measure the resistance of the following connections whilst pressing the "+" button (on the button tracks):** ● Connection code **86G**, of component **331**. ● Connection code **86M**, of component **331**. If the resistance is not approximately **300** Ω, check the continuity of the button connection when not pressed. If there is continuity, replace the **+/-** control button.

DECREASE	Status **ET703** becomes **DECREASE** when the cruise control **-** button is pressed. This button is located on the left-hand side on the steering wheel. If status **ET703** does not change to **DECREASE**, check the condition of the **+/-** cruise control button and its connector. Repair if necessary. **To remove the driver's airbag and carry out the measurements in complete safety** (see **MR 404 or MR 407, 38C, ABS**). If there is a repair procedure (See **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring. Measure the **resistance of the following connection whilst pressing the "-" button (on the button tracks)**: ● Connection code **86G**, of component **331**. ● Connection code **86M**, of component **331**. If the resistance is not approximately **100** Ω, check the continuity of the connection when the button is not pressed. If there is continuity, replace the **+/-** control button.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET703 **CONTINUED**	

SUSPEND	Status **ET703** changes to **SUSPEND** when the **0** cruise control button is pressed. This button is located on the right-hand side on the steering wheel. If status **ET703** does not change to **SUSPEND**, check the condition of the **R/0** cruise control button and the condition of its connector. **To remove the driver's airbag and carry out the measurements in complete safety** (see **MR 404 or MR 407, 38C, ABS**). If there is a repair procedure (See **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring. Measure the **resistance of the following connection whilst pressing the "0" button (on the button tracks)**: ● Connection code **86G**, of component **331**. ● Connection code **86M**, of component **331**. If the resistance is not approximately **0** Ω, replace the **R/0** control button. If there is continuity, replace the **R/0** control button.
RESUME	Status **ET703** changes to **RESUME** when the **R** cruise control button is pressed. This button is located on the right-hand side on the steering wheel. If status **ET703** does not change to **RESUME** check the condition of the **R/0** cruise control button and the condition of its connector. Repair if necessary. **To remove the driver's airbag and carry out the measurements in complete safety** (see **MR 404 or MR 407, 38C, ABS**). If there is a repair procedure (See **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring. Measure the **resistance of the following connection whilst pressing the "R" button (on the button tracks)**: ● Connection code **86G**, of component **331**. ● Connection code **86M**, of component **331**. If the resistance is not approximately **900** Ω, check the continuity of the connection when the button is not pressed. If there is continuity, replace the **R/0** control button.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

GETtheMANUALS.org

ET704 **ET705**	BRAKE CONTACT NO. 1 BRAKE CONTACT NO. 2

NOTES	**Special note:** Only perform the tests if the statuses do not correspond with the system programming functions.

Note:
Statuses **ET704 and ET705** should change at the same time. In the event of inconsistency, consult the interpretation of fault **DF051 Cruise control/speed limiter function**.

ACTIVE

If the brake lights are working:
– check the continuity and make sure there is no interference resistance on the following connection:
● connection code **5A**,
between components 160 and 120/645/119.
If there is a repair procedure (See **Technical Note 6015A, Electrical wiring repair, Wiring: Precautions for repair**), repair the wiring, otherwise replace the wiring.

or

INACTIVE

If the brake lights are not operational, check:
– the condition and fitting of the brake switch,
– the condition and conformity of the brake light fuse,
– the conformity of the values in the following table:

	Continuity between connections	**Insulation between connections**
Switch engaged (Brake pedal released)	**5A and SP13**	**65G and AP10**
Switch released (Brake pedal depressed)	**65G and AP10**	**5A and SP13**

Replace the switch if the values obtained are not correct.

AFTER REPAIR	Carry out another fault finding check on the system. Deal with any other faults. Clear the stored faults.

PR767	Turbocharger position

*Opening cyclic ratio.

GETtheMANUALS.org

PR030	ACCELERATOR PEDAL POSITION

NOTES	**There must be no present or stored faults.** Perform this fault finding procedure: – after finding an inconsistency in the parameter, – after a customer complaint (e.g. lack of power). (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

ELECTRICAL CONFORMITY OF THE SENSOR:

Check the **continuity and for the absence of interference resistance** on the following connections:

- connection code **3LR**,
- connection code **3LT**,
- connection code **3LS**,

between the pedal potentiometer connector, **component code 921** and the engine management computer, **component code 120**.

If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Pedal sensor **connected**, vehicle with **ignition on** and **engine stopped**:

– check that the value of **PR030 Accelerator pedal position**:
  - **0%** no load,
  - **100% ± 5** full load before pedal kickdown point,
  - **100% ± 139%** full load after pedal kickdown point.

– if the value is not correct, replace the pedal potentiometer.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

PR038	RAIL PRESSURE

NOTES	**There must be no present or stored faults.** Perform this fault finding procedure: – after finding an inconsistency in the parameter, – after a customer complaint (starting faults, poor performance, stalling etc.). (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

ELECTRICAL CONFORMITY OF THE SENSOR:

Check the rail pressure sensor connectors.
Check the injection computer connections.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check the **continuity and the absence of the interference resistance** of the following connections:

- the two connection codes **3LY**,
- connection code **3AX**,
- connection code **3CJ**,

between the rail pressure sensor connector, **component code 1032** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check that there are no external diesel leaks from the high pressure fuel circuit.
With the ignition on and the engine stopped for over 1 minute:
Display parameter **PR038 Rail pressure**:
– If the pressure is below **90 bar**, the sensor is in order.
– If the pressure is above **90 bar**, contact the Techline.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

PR041	TURBOCHARGING PRESSURE

NOTES	**There must be no present or stored faults.** Perform this fault finding procedure: – after finding an inconsistency in the parameter, – after a customer complaint (e.g. lack of power). (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

ELECTRICAL CONFORMITY OF THE SENSOR:

Check for continuity and the absence of interference resistance on the following connections:
– connection code **3LP**,
– connection code **3AX**,
– connection code **3CJ**,
between the turbocharging pressure sensor connector, **component code 1474** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Vehicle with ignition on, and the engine stopped for over 1 minute:
Compare the values of **PR041 Turbocharging pressure** and **PR035 Atmospheric pressure**.
If the difference between **PR041** and **PR035** is greater than **0.1 bar**, check the value of **PR035 Atmospheric pressure** by comparing it with the value displayed on a correct vehicle in the workshop.
If the value of **PR035 Atmospheric pressure** is not correct (difference greater than **0.1 bar** between the 2 vehicles), contact the Techline.
Otherwise (when the value **PR035 Atmospheric pressure** is correct), change the turbocharging pressure sensor.
If the difference between **PR041** and **PR035** is less than **0.1 bar**,
Start the engine; engine at idling speed:
Compare the values of **PR041 Turbocharging pressure** and **PR035 Atmospheric pressure**.
If the difference between **PR041** and **PR035** is greater than **0.2 bar**,
Check the air inlet circuit: apply **test 4: Turbocharging and air inlet circuit check**.
Low and **high pressure** air circuit **sealed** and **not obstructed**: Pipes, mounting clamps present and tightened, turbocharger pressure sensor fitted, heat exchanger etc.
Check that the damper valve is not jammed closed.
Repair if necessary.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

PR063	FUEL TEMPERATURE

NOTES	**There must be no present or stored faults.** Perform this fault finding procedure: – after finding an inconsistency in the parameter, – after a customer complaint (e.g. loss of power). (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

ELECTRICAL CONFORMITY OF THE SENSOR:

Check **for continuity and absence of interference resistance** on the following connections:
– connection code **3LD**,
– connection code **3CK**,
between the fuel temperature sensor, **component code 1066** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Measure the fuel temperature sensor resistance between the connections **3LD** and **3CK** of the connector for component **1066**.
Replace the sensor if the resistance is not: **5,658 Ω ± 280 at + 10 °C**
3,511 Ω ± 176 at + 20 °C
980 Ω ± 50 at + 50 °C

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

PR064	COOLANT TEMPERATURE

NOTES	**There must be no present or stored faults.** Perform this fault finding procedure: – after finding an inconsistency in the parameter, – after a customer complaint (e.g. lack of power). (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

ELECTRICAL CONFORMITY OF THE SENSOR:

Check the **continuity** and absence of **interference resistance** on the following connections:
– connection code **3C**,
– connection code **3CK**,
between coolant temperature sensor, **component code 244** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Measure the coolant temperature sensor resistance between its connections **3C** and **3CK** of the connector for component **244**.
Replace the sensor if the resistance is not: **3,511 Ω ± 176 at + 20 °C**
980 Ω ± 50 at + 50 °C
469 Ω ± 24 at + 70 °C
242 Ω ± 12 at + 90 °C

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

PR132	AIR FLOW

NOTES	**There must be no faults present.** Perform this fault finding procedure: – after finding an inconsistency in the parameter, – or after a customer complaint (lack of power, smoke etc.). (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

Check the air inlet circuit (from the air filter inlet to the inlet manifold):
apply **test 4: Air inlet circuit and turbocharging check**:
– air filter unit inlet not blocked and filter not clogged,
– oil vapour recirculation circuit connected correctly,
– **tightness** and **not blocked low** and **high-pressure** air circuit: ducts, presence and tightness of the mounting clips, turbocharger pressure sensor mounting, intercooler, etc...,
– check that the damper valve is not jammed closed.
Carry out the necessary repairs.
Switch on the ignition.
Check **the conformity** of the following connection:
– connection code **3LU**,
of the air flow sensor, **component code 799 (+ 5 V supply)**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check for a **+ 12 V feed** on the following connection:
– connection code **3FB**,
of the air flow sensor, **component code 799** and the **+ 12 V after relay supply**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check **for earth** on the following connection:
– connection code **3DU**,
of the air flow sensor, **component code 799** and the **computer earth**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

PR132 **CONTINUED**	

Check for **continuity, insulation and absence of interference resistance** on the connection between:
– connection code **3DV**,
between the air flow sensor, **component code 799** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
With the flow sensor **connected, the vehicle ignition on** and **the engine stopped**:
Check the voltage between connections **3DV** and **3DU** of the connector for component **799**:
– If the voltage is not **1 V ± 0.5**, replace the air flow sensor.

Air flow conversion formula from mg/cyl to kg/h:

$$\text{Air flow (kg/h)} = \frac{9 \times \text{air flow (mg/cyl)} \times \text{N engine (rpm)}}{50\,000}$$

Air flow conversion table from mg/cyl to kg/h:		
PR132 (Air flow, in mg/cyl)	**PR055 (Engine speed, in rpm)**	**PR132 (Air flow in kg/h)**
500	**728**	**65.54**
540	**851**	**82.72**
560	**907**	**91.43**

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

PR311	AIR FLOW SENSOR TEMPERATURE

NOTES	**There must be no present or stored faults.** Perform this fault finding procedure: – after finding an inconsistency in the parameter, – after a customer complaint (e.g. lack of power). (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

ELECTRICAL CONFORMITY OF THE SENSOR:

With the air flow sensor disconnected, check **the insulation** in relation to **earth** of the connection between:
– connection code **3B**,
between the air flow sensor, **component code 799** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check **for** a **+ 12 V feed** on the **following connection**:
– connection code **3FB**,
between the air flow sensor, **component code 799** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Measure the air temperature sensor resistance between connections **3DU** and **3B** of the connector for component **799**.
Replace the air temperature sensor if resistance is not between:

5,499 Ω ± 275	**at + 0 °C**
3,604 Ω ± 180	**at + 10 °C**
2,420 Ω ± 121	**at + 20 °C**

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

GETtheMANUALS.org

SC001	WRITE SAVED DATA

NOTES	To use this command, first save the data with the **SC003 Save computer data** command. Writing is carried out after the computer has been reprogrammed or replaced. Engine stopped.

On the CLIP tool, select the **SC001 Write saved data** scenario.
Note:
If no files have been saved before, an entry error appears when command **SC001 Write saved data** is activated.
Validating this command writes the data saved using command **SC003 Save computer data**.
The data is as follows:
– The injector codes.
The data is used to configure the computer and prevent:
– engine malfunction after reprogramming or replacing the computer,
– incorrect interpretation of information provided by the Clip tool.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

SC002	ENTER INJECTOR CODES

NOTES	This command is carried out after the replacement of one or more injectors. Engine stopped.

To enter this data, select command **SC002 Enter injector codes** on the CLIP tool.
Procedure to be followed:
– Read the 24 character alphanumeric codes engraved on the upper section of the injector bodies.
– Enter each injector code for the associated cylinder.
– **IMPORTANT**
Cylinder no. 1 is located at the timing end.
– Confirm the change of injector code configuration.
– When the command is completed, the modified codes appear in the current column.
– Check that the codes correspond to those read earlier.
If the codes entered appear in neither the **current** column nor the **desired** column, check the codes read and make sure the data has been entered correctly.
– Exit fault finding mode.
– Switch off the ignition and **wait for the end of the power-latch* (2 minutes)**.
– Switch the ignition back on and check for faults.
– **DF276 Injector code programming** should be stored.
If the **DF276** fault is still present, the command has not been executed correctly.
Start the procedure again and follow the instructions.
If the procedure is still not executed correctly, apply the following procedure:
A fault could cause **DF276** to be raised again and also incorrect confirmation of command **SC002**.
If the power latch* is not performed after the ignition is switched off, the injection computer will not store the new injector codes.
Switch off the ignition and check that the immobiliser warning light flashes **2 seconds** after switching the ignition off.
If the warning light flashes as soon as the ignition is switched off, the power latch* has not been executed and the command will not have been recognised.
If all these checks do not enable the command to be confirmed, contact the Techline.

* The immobiliser warning light will flash a few seconds after switching off the ignition.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

SC003	SAVE COMPUTER DATA

NOTES	This save is performed before reprogramming or replacing the computer. Engine stopped.

On the CLIP tool, select the **SC003 Save computer data**.
Confirming this command saves the following vehicle-specific data:
– The injector codes.
This information will be saved on the CLIP tool.
After saving has finished, use the command **SC001 Enter saved data** to be able to set the new computer parameters, after programming and reprogramming.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC029	HIGH PRESSURE CIRCUIT SEAL TEST

NOTES	None

Test condition:
– engine running at idling speed,
– engine coolant temperature greater than **60 °C**,
– automatic gearbox in neutral or park position,
– accelerator pedal signal **0%**,
– vehicle speed **0 mph**.
The test lasts **60 seconds**, the engine speed will reach **2000 rpm** and the rail pressure will reach **500 bar** minimum and **1450 bar** maximum.
Carry out a visual inspection of the high pressure injection circuit to detect any fuel leaks.
To interrupt the command, depress the accelerator pedal.
If it is not possible to reach the engine coolant temperature requested, run the command at the current engine temperature.
During this command, the message **Command finished** appears on the **diagnostic tool** after the command has lasted for **60 seconds**.
The test is carried out over **60 seconds** and it is normal to be able to see **PR008 Rail pressure setpoint** and **PR038 Rail pressure** change during this command.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC031	HEATING ELEMENT NO. 3 RELAY

NOTES	**No fault should be present or stored:** Carry out this fault finding procedure in the event of a malfunction detected in the actuator control menu or a fault in the passenger compartment heating/demisting system. Refer to the **Wiring diagrams** Technical Note for the vehicle to locate the fuses and relays.

If heating element no. 3 relay does not operate during command **AC031 Heating element no. 3 relay**.
Check the connections of heating element no. 3 relay mounting.
Check the engine management computer connections.
Repair if necessary.

If the fault is still present, check as follows that this relay is controlled by the engine management computer:
– disconnect the heating element no. 3 relay, place the **50** Ω to **100** Ω resistor on its mounting in place of the coil and connect a voltmeter:
  positive terminal to **+ 12 V** battery,
  negative terminal on connection **3JAB** of the heating element no. 3 relay mounting.
– clear the fault and run command **AC031 Heating element no. 3 relay**,
– if the voltmeter shows the correct battery voltage, replace heating element no. 3 relay,
– if the voltmeter does not indicate the battery voltage, contact your Techline.

If the heating element no. 3 relay operates with command **AC031 Heating element no. 3 relay**, but there is still a fault with the passenger compartment heating/demisting. Check using the wiring diagram:
– the conformity of heating element no. 3 relay supply fuse,
– for **+ 12 V** battery feed on connection **3FB** of heating element no. 3 relay mounting,
– the conformity of the heating element no.3 relay coil: **91** Ω ± **9 at + 20 °C**,
– the conformity of the heating element resistor: less than **10** Ω,
– the presence of earth at the plenum chamber (heating element mounting),
– also check the level of the cooling circuit and that there are no leaks.
Carry out the necessary repairs.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC037	PREHEATING RELAY

NOTES	**Special notes:** This command is only carried out if the fault or **DF144 Preheating relay control circuit group 1**, or **DF158 Preheating relay control circuit group 2** is present or stored and if no other fault is present. Refer to the **Wiring diagrams** Technical Note for the vehicle to locate the fuses and relays. (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

Before applying the following fault finding procedure, check that the battery voltage is not below 12 V.
Step 1:
Using a multimeter fitted with a current clamp, group the 3 heater plug feed wires together, either side of the engine block.
Actuate the preheating relay via command **AC037 Preheating relay** and measure the current used by the heater plugs.
If the current consumed by each row is not between **18A** and **54A**, go to step 2.
Step 2:
Check the connections on the preheating unit, heater plugs and injection computer.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Next measure the **resistance** of the heater plugs.
Replace the faulty plugs, if the resistance is greater than **30 Ω per plug**.
Check for **continuity** and **absence of interference resistance** of the following connections:
– connection code **3SP**,
between the heater plug of **cylinder no. 1, component code 680** and the heater plug control unit, **component code 257**.
– connection code **3SR**,
between the heater plug of **cylinder no. 3, component code 682** and the heater plug control unit, **component code 257**.
– connection code **3ST**,
between the heater plug of **cylinder no. 5, component code 1260** and the heater plug control unit, **component code 257**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check for **continuity** and **absence of interference resistance** of the following connections:
– connection code **3SQ**,
between the heater plug of **cylinder no. 2, component code 681** and the heater plug control unit, **component code 257**.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC037 **CONTINUED**	

– connection code **3SS**,
between the heater plug of **cylinder no. 4, component code 683** and the heater plug control unit, **component code 257**.
– connection code **3SU**,
between the heater plug of **cylinder no. 6, component code 1261** and the heater plug control unit, **component code 257**.
The resistance is equal to or greater than 10 MΩ.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check the condition of the preheating unit supply fuses **FM18** and **FM19 (70A)**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Then check for **+ 12 V** on the two connection codes **BP35** of the preheating relay for connectors A and B.
Check for **continuity** and **absence of interference resistance** of the following connections:
– connection code **3FF**,
– connection code **3HM**,
– connection code **3HL**,
between the engine management computer, **component code 120** and the back row heater plug control unit, **component code 257**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check for **continuity and the absence of interference resistance** on the following connection:
– the two connection codes **BP35**,
between the battery, **component code 107** and the front row heater plug control unit, **component code 257**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
If the fault is still present, replace the preheating unit.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC063	HEATING ELEMENT NO. 1 RELAY

NOTES	**No fault should be present or stored:** Carry out this fault finding procedure in the event of a malfunction detected in the actuator control menu or a fault in the passenger compartment heating/demisting system. Refer to the **Wiring diagrams** Technical Note for the vehicle to locate the fuses and relays.

If the heating element no. 1 relay does not work during command **AC063 Heating element no. 1 relay**.
Check the connections of the heating element no. 1 relay mounting.
Check the engine management computer connections.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

If the fault is still present, check as follows that this relay is controlled by the engine management computer:
– disconnect the heating element no. 1 relay, place the **50** Ω to **100** Ω resistor on its mounting in place of the coil and connect a voltmeter:
  positive terminal to **+ 12 V** battery,
  negative terminal on connection **3JA** of the heating element no. 1 relay mounting.
– clear the fault and run command **AC063 Heating element no. 1 relay**,
– if the voltmeter shows the correct battery voltage, replace the heating element no. 1 relay,
– if the voltmeter does not indicate the battery voltage, contact your Techline.

If the heating element no. 1 relay operates with command **AC063 Heating element no. 1 relay**, but there is still a fault with the passenger compartment heating/demisting.
Check using the wiring diagram:
– the conformity of the heating element fuse,
– for **+ 12 V** battery feed on connection **3FB** of the heating element no. 1 relay mounting,
– the conformity of the heating element no.1 relay coil: **90** Ω ± **9 at + 20** °**C**,
– the conformity of the heating element resistor: less than **10** Ω,
– the presence of earth at the plenum chamber (heating element mounting),
– also check the level of the cooling circuit and that there are no leaks.

Carry out the necessary repairs.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC064	HEATING ELEMENT NO. 2 RELAY

NOTES	**No fault should be present or stored:** Carry out this fault finding procedure in the event of a malfunction detected in the actuator control menu or a fault in the passenger compartment heating/demisting system. Refer to the **Wiring diagrams** Technical Note for the vehicle to locate the fuses and relays.

If the heating element no. 2 relay does not operate correctly when command **AC064 Heating element no. 2 relay** is run:
Check the connections of heating element no. 2 relay mounting.
Check the engine management computer connections.
Repair if necessary.

If the fault is still present, check as follows that this relay is controlled by the engine management computer:
– disconnect the heating element no. 2 relay, place the **50** Ω to **100** Ω resistor on its mounting in place of the coil and connect a voltmeter:
  positive terminal to **+ 12 V** battery,
  negative terminal on **connection 3JAA** of the heating element no. 2 relay mounting.
– clear the fault and run command **AC064 Heating element relay no. 2**,
– if the voltmeter shows the correct battery voltage, replace heating element no. 2 relay,
– if the voltmeter does not indicate the battery voltage, contact your Techline.

If the heating element no. 2 relay operates with command **AC064 Heating element no. 2 relay**, but there is still a fault with the passenger compartment heating/demisting. Check using the wiring diagram:
– the conformity of the heating element fuse,
– for **+ 12 V** battery feed on connection **3FB** of the heating element no. 2 relay mounting,
– the conformity of the heating element no.3 relay coil: **91** Ω ± **9 at + 20** °**C**,
– the conformity of the heating element resistor: less than **10** Ω,
– the presence of earth at the plenum chamber (heating element mounting),
– also check the level of the cooling circuit and that there are no leaks.
Carry out the necessary repairs.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC068	INJECTION FAULT WARNING LIGHT

NOTES	Perform this fault finding in the event of a malfunction detected in the actuator command menu. (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

With the ignition on and engine stopped, the **SERVICE** injection fault warning light should flash and the message **Check injection** is displayed on the instrument panel.

Check the instrument panel connections.
Check the engine management computer connections.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Using the wiring diagram:
Check **the continuity and absence of interference resistance** of the following connections:
– connection code **133C**,
– connection code **133B**,
between the instrument panel **black connector** (RG), **component code 247** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
– Check for **+ 12 V** battery on connection **BP3A** of the instrument panel black connector (GR).
If the fault is still present, check that warning light is controlled by the injection computer as follows:
Disconnect the connector from the instrument panel and connect a voltmeter as follows:
– positive terminal on **+ 12 V**,
– negative terminal on connection **133B** of the instrument panel black connector (RG).
Activate the warning light with command **AC068 Injection fault warning light**.
● If the voltmeter shows the battery voltage, then check the instrument panel.
Carry out the necessary repairs.
● If the voltmeter does not indicate the battery voltage, contact your Techline.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC069	SEVERE INJECTION FAULT WARNING LIGHT

NOTES	Perform this fault finding in the event of a malfunction detected in the actuator command menu. (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

With the ignition on and the engine stopped, the **STOP** serious injection fault warning light should flash and the message **Injection fault: stop the engine** is displayed on the instrument panel.

Check the instrument panel connections.
Check the engine management computer connections.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Using the wiring diagram:
– check **the continuity and absence of interference resistance** on the following connections:
– connection code **133C**,
– connection code **133B**,
between the instrument panel **black connector** (RG), **component code 247** and the engine management computer, **component code 120**.
– Check for **+ 12 V** battery on connection **BP3A** of the instrument panel black connector (GR).
If the fault is still present, check that warning light is controlled by the injection computer as follows:
Disconnect the connector from the instrument panel and connect a voltmeter as follows:
– positive terminal on **+ 12 V**,
– negative terminal on connection **133B** of the instrument panel black connector (RG).
Activate the warning light using command **AC069**.
● If the voltmeter shows the battery voltage, then check the instrument panel.
Carry out the necessary repairs.
● If the voltmeter does not indicate the battery voltage, contact your Techline.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC079	ACTUATOR STATIC TEST

NOTES	Ignition on, engine off.

This command prompts the appearance of faults on these actuators (if fault present) without starting the engine and it also configures the computer automatically.
The injection computer is going to carry out the following electrical checks:

- **inlet flap control solenoid valve,**
- **EGR valve,**
- **the two fuel flow regulators,**
- **the 6 injectors.**

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC092	INJECTOR NO. 1 TEST

NOTES	– Idling speed. – Before running the command, check the number of faults.

Test condition:
– engine running at idling speed,
– engine temperature greater than **80 °C**,
– automatic gearbox in neutral or park position,
– accelerator pedal signal **0%**,
– vehicle speed **0 mph**.
Command **AC092** inhibits the cylinder no. 1 injection command.
Command **AC092** may produce fault **DF059 Combustion misfire on cylinder 1**.
If **DF059** occurs during command **AC092**, stop the engine for **10 seconds**, start the engine again and continue the injector tests, if necessary.
This command can be run, if necessary, with the engine cold.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC093	INJECTOR NO. 2 TEST

NOTES	– Idling speed. – Before running the command, check the number of faults.

Test condition:
– engine running at idling speed,
– engine temperature greater than **80 °C**,
– automatic gearbox in neutral or park position,
– accelerator pedal signal **0%**,
– vehicle speed **0 mph**.
Command **AC093** inhibits the cylinder no. 2 injection command.
Command **AC093** may produce fault **DF060 Combustion misfire on cylinder 2**.
If **DF060** occurs during command **AC093**, stop the engine for **10 seconds**, start the engine again and continue the injector tests, if necessary.
This command can be run, if necessary, with the engine cold.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC094	INJECTOR NO. 3 TEST

NOTES	– Idling speed. – Before running the command, check the number of faults.

Test condition:
– engine running at idling speed,
– engine temperature greater than **80 °C**,
– automatic gearbox in neutral or park position,
– accelerator pedal signal **0%**,
– vehicle speed **0 mph**.
Command **AC094** inhibits the cylinder no. 3 injection command.
Command **AC094** may produce fault **DF061 Combustion misfire on cylinder 3**.
If **DF061** occurs during command **AC094**, stop the engine for **10 seconds**, start the engine again and continue the injector tests, if necessary.
This command can be run, if necessary, with the engine cold.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC095	INJECTOR NO. 4 TEST

NOTES	– Idling speed. – Before running the command, check the number of faults.

Test condition:
– engine running at idling speed,
– engine temperature greater than **80 °C**,
– automatic gearbox in neutral or park position,
– accelerator pedal signal **0%**,
– vehicle speed **0 mph**.
Command **AC095** inhibits the cylinder no. 4 injection command.
Command **AC095** may produce fault **DF062 Combustion misfire on cylinder 4**.
If **DF062** occurs during command **AC095**, stop the engine for **10 seconds**, start the engine again and continue the injector tests, if necessary.
This command can be run, if necessary, with the engine cold.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC096	INJECTOR NO. 5 TEST

NOTES	– Idling speed. – Before running the command, check the number of faults.

Test condition:
– engine running at idling speed,
– engine temperature greater than **80 °C**,
– automatic gearbox in neutral or park position,
– accelerator pedal signal **0%**,
– vehicle speed **0 mph**.
Command **AC096** inhibits the cylinder no. 5 injection command.
Command **AC096** may produce fault **DF063 Combustion misfire on cylinder 5**.
If **DF063** occurs during command **AC096**, stop the engine for **10 seconds**, start the engine again and continue the injector tests, if necessary.
This command can be run, if necessary, with the engine cold.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC097	INJECTOR NO. 6 TEST

NOTES	– Idling speed. – Before running the command, check the number of faults.

Test condition:
– engine running at idling speed,
– engine temperature greater than **80 °C**,
– automatic gearbox in neutral or park position,
– accelerator pedal signal **0%**,
– vehicle speed **0 mph**.
Command **AC097** inhibits the cylinder no. 6 injection command.
Command **AC097** may produce fault **DF064 Combustion misfire on cylinder 6**.
If **DF064** occurs during command **AC097**, stop the engine for **10 seconds**, start the engine again and continue the injector tests, if necessary.
This command can be run, if necessary, with the engine cold.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC228	GMV CONTROL CIRCUIT 1

NOTES	**No fault should be present or stored:** Perform this fault finding procedure if a malfunction is detected in the actuator command menu or after an engine cooling system or air conditioning fault.' Refer to the **Wiring diagrams** Technical Note for the vehicle to locate the fuses and relays concerned. (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

Run command **AC228 GMV control circuit 1** and check visually that the cooling fan is turning. If this is not the case, carry out the following operations:
– check the condition of fuses **FM15 (60 A) and FM23 (60 A)**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check for **+ 12 V** on **connections BP71 and BP72** of the GMV relay unit.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check for **continuity and the absence of interference resistance** on the following connection:
– connection code **3JN**,
between the **GMV relay unit, component code 1839** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check for **+ 12 V** on **connection codes 3AJG and 3AJH** of the GMV, **component code 188** when running command **AC228**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC229	GMV CONTROL CIRCUIT 2

NOTES	**No fault should be present or stored:** Perform this fault finding procedure if a malfunction is detected in the actuator command menu or after an engine cooling system or air conditioning fault.' Refer to the **Wiring diagrams** Technical Note for the vehicle to locate the fuses and relays concerned. (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

Run command **AC229 GMV control circuit 2** and check visually that the cooling fan is turning. If this is not the case, carry out the following operations:
– check the condition of fuses **FM15 (60 A) and FM23 (60 A)**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check for **+ 12 V** on **connections BP71 and BP72** of the GMV relay unit.
Repair if necessary.
Check for **continuity and the absence of interference resistance** on the following connection:
– connection code **3JP**,
between the **GMV relay unit, component code 1839** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check for **+ 12 V** on **connection codes 3AJG and 3AJH** of the GMV, **component code 188** when running command **AC229**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC230	GMV CONTROL CIRCUIT 3

NOTES	**No fault should be present or stored:** Perform this fault finding procedure if a malfunction is detected in the actuator command menu or after an engine cooling system or air conditioning fault.' Refer to the **Wiring diagrams** Technical Note for the vehicle to locate the fuses and relays concerned. (see **Technical Note wiring diagram, Vel Satis phase 2**) (see **Technical Note wiring diagram, Espace IV phase 2**)

Run command **AC230 GMV control circuit 3** and check visually that the cooling fans are turning. If this is not the case, carry out the following operations:
check the condition of fuses **FM15 (60 A) and FM23 (60 A)**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.
Check for **+ 12 V** on **connections BP71 and BP72** of the GMV relay unit.
Repair if necessary.
Check for **continuity and the absence of interference resistance** on the following connection:
– connection code **3AJD**,
between the **GMV relay unit, component code 1839** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

Check for **+ 12 V** on **connection codes 3AJG and 3AJH** of the GMV, **component code 188**, when running command **AC230 GMV control circuit 3**.
If the connections are faulty and there is a repair procedure (see **Technical Note 6015A, Repairing electrical wiring, wiring: precautions for repairs**) repair the wiring, otherwise change the wiring.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC241	FUEL FLOW REGULATOR TEST 1 WITH LOW INTENSITY

NOTES	With the ignition on.

Test condition:
– With the ignition on.
Command **AC241** is used to control the fuel flow regulator no.1 operation.
Command **AC241** lasts **30 seconds** and makes the fuel flow regulator no. 1 oscillate with a low control intensity.
If there is no noise from the fuel flow regulator no. 1, run command **AC242 Fuel flow regulator test 1 with high intensity**.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC242	FUEL FLOW REGULATOR TEST 1 WITH HIGH INTENSITY

NOTES	With the ignition on.

Test condition:
– With the ignition on.
Command **AC242** is used to control the fuel flow regulator no.1 operation.
Command **AC242** lasts **30 seconds** and makes the fuel flow regulator no. 1 oscillate with a high control intensity.
If there is no noise from fuel flow regulator no. 1, check the wiring of fuel flow regulator no. 1: apply the tests for fault **DF644 Fuel flow regulator circuit**.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC243	FUEL FLOW REGULATOR TEST 2 WITH LOW INTENSITY

NOTES	With the ignition on.

Test condition:
– With the ignition on.
Command **AC243** is used to control the fuel flow regulator no.2 operation.
Command **AC243** lasts **30 seconds** and makes the fuel flow regulator no. 2 oscillate with a low control intensity.
If there is no noise from fuel flow regulator no. 2, run command **AC244 Fuel flow regulator test 2 with high intensity**.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

AC244	FUEL FLOW REGULATOR TEST 2 WITH HIGH INTENSITY

NOTES	With the ignition on.

Test condition:
– With the ignition on.
Command **AC244** is used to control the fuel flow regulator no.2 operation.
Command **AC244** lasts **30 seconds** and makes fuel flow regulator no. 2 oscillate with a high control intensity.
If there is no noise from fuel flow regulator no. 2, check the wiring of fuel flow regulator no. 2: apply the tests for fault **DF644 Fuel flow regulator circuit**.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

VP010	ENTER VIN

NOTES	Perform this configuration after replacing the computer.

Establish dialogue with the engine management computer. Select the **Parameters** screen. Select the line **VP010 Enter VIN**. Confirm the stages described in the scenario **SC001 Enter saved data**. End of procedure.
The VIN is reread in the **Identification** screen.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

VP012	DISABLE ELECTRICAL CONSUMERS

NOTES	Under + APC.

This command inhibits electrical consumers.
Command **VP012**, deactivates preheating, the engine cooling fans and the heating elements.
Starting the engine or command **VP035 Cancel inhibit electrical consumers** stops command **VP012**.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

VP035	CANCEL INHIBITION OF ELECTRICAL CONSUMERS

NOTES	Under + APC.

Command **VP035**, reactivates preheating, the engine cooling fans and the heating elements.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

VP036	FUEL SUPPLY INHIBITION

NOTES	Ignition on, engine off.

This command locks the injectors by closing the fuel flow regulators so that it is impossible to start the engine.
Command **VP036** stops the fuel supply to the engine to check the cylinder compressions without worrying about fuel splashback.
Run command **VP036 Inhibit fuel supply** and start the vehicle.
Check the cylinder compressions values, then once these have finished, run the injectors again using command **VP037 Cancel inhibit fuel supply** or cut the supply with a power-latch*.

* The immobiliser warning light will flash a few seconds after switching off the ignition.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

VP037	CANCEL FUEL SUPPLY INHIBITION

NOTES	Ignition on, engine off.

Command **VP037** reactivates injector fuel supply.

AFTER REPAIR	Repeat the conformity check from the start.

GETtheMANUALS.org

NOTES	Only check the customer complaint after performing a complete check with the **diagnostic tool**.

NO DIALOGUE WITH ENGINE MANAGEMENT COMPUTER	**ALP 1**
STARTING FAULT OR STARTING IMPOSSIBLE	**ALP 2**
ENGINE BUCKING	**ALP 3**
LACK OF POWER/PERFORMANCE	**ALP 4**
EXCESSIVE FUEL CONSUMPTION	**ALP 5**

GETtheMANUALS.org

ALP1	No dialogue with engine management computer

NOTES	In the event of a fault, perform a **multiplex network** test using the **diagnostic tool**. (see **Wiring Diagram Technical Note, Vel Satis phase 2**) (see **Wiring Diagram Technical Note, Espace IV phase 2**)

Check that the tool is not the cause of the fault by trying to establish dialogue with a computer on another vehicle.
If the tool is not at fault, and dialogue cannot be established with any other computer on the same vehicle, it may be that a faulty computer is disrupting **line K**.
Trace which one through a process of elimination, successively disconnecting each computer.

Check for the presence and condition of the engine fuses in the engine fuse and relay box, refer to the **Wiring Diagrams Technical Note** for the vehicle.
Check the computer power supply on the connector side.
Check the earth connections.
Check the computer connector (crimping of wires to terminals, and condition of terminals).
If the connections are faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**) repair the wiring, otherwise replace the wiring.

Check the supply to the diagnostic socket **from + after ignition feed** on the following connections:
– connection code **BCP4**,
– connection code **AP10**,
on the diagnostic socket, **component code 225**.
Check **the continuity and absence of interference resistance of the earths** on the following connections:
– connection codes **MA** and **NAP**,
on the diagnostic socket, **component code 225**.
Check the **insulation, continuity and the absence of interference resistance** on the following connection:
– connection code **HK**,
between the diagnostic socket connector, **component code 225** and the engine management computer, **component code 120**.
If the connections are faulty and there is a repair method (see **Technical Note 6015A, Repairing electrical wiring, Wiring: Precautions for repair**) repair the wiring, otherwise replace the wiring.

If dialogue is still impossible after these checks, replace the engine management computer.

AFTER REPAIR	Carry out a road test, followed by a check with the **fault finding tool**.

GETtheMANUALS.org

ALP2	starting difficult or impossible

NOTES	In the event of a fault, perform a **multiplex network test** using the diagnostic tool, then if the test is OK, apply the conformity check before any operation on the diesel injection system.

Start button pressed.

Does the engine operate?

NO →

Check that the starter operating conditions are satisfied:
– Gear lever in position **P** or **N**.
– **ET003 Immobiliser: Inactive** (if Active: run fault finding on the UCH).
If okay, check the starter circuit:
– + 12 V feed and earth.
1. If the power-fuse is switched off:
   – Manually check the engine rotation (if the engine does not rotate, check the lower engine).
   – Check that the starter has not short circuited (if it has, replace the starter).
2. If the starter clicks:
   – Manually check the engine rotation (if the engine does not rotate, check the lower engine).
   – Check that the starter has not short circuited (if it has, replace the starter).

YES ↓

During the starter phase, note or check the following parameters:
– **PR038 Rail pressure,**
– **PR132 Air flow,**
– **PR055 Engine speed,**
– **PR074 Battery voltage.**

↓

During the starter phase, is the engine speed less than **240 rpm**?

YES → **A**

NO ↓

During the starter phase, is the rail pressure greater than **170 bar**?

NO → **B**

YES ↓

During the starter phase, does the air flow differ from zero kg/h?

NO → **C**

YES ↓

Measure the compressions.
If the compressions are less than 20.4 bar.
Check:
– Valve clearance.
– Valve/cylinder sealing.

AFTER REPAIR	Carry out a road test, followed by a check with the **fault finding tool**.

GETtheMANUALS.org

ALP2 CONTINUED	

A

Voltage < 9.5 V:
– Check the condition of the battery.
– Check the condition of the starter motor.
– Check the starter wiring harness.
– Check the starter and engine earths (visually and by removing).

Voltage > 9.5 V:
– Manually check the engine rotation (if the engine does not rotate, check the lower engine).
– Check the timing adjustment.
– Check that no fluid is present in the cylinder.

B

– Is there fuel in the tank?
– Check the conformity of the fuel. Run **test 12 Diesel fuel conformity check**.
– Look for possible external leaks.
– Is an injector jammed open?
– Replace the high pressure pump if there is no pressure.

C

– Run **test 4 Air inlet circuit and turbocharging check**.
– Visually check whether the damper valve is closed.
– Check the air flow sensor wiring.
– If the wiring is correct, replace the air flow sensor.

AFTER REPAIR	Carry out a road test, followed by a check with the **fault finding tool**.

GETtheMANUALS.org

ALP3	Engine hesitation

NOTES	In the event of a fault, perform a **multiplex network test** using the **diagnostic tool**, then if the test is OK, apply the conformity check before any operation on the diesel injection system.

Identify the conditions under which the fault occurs (talk to the customer):
– Warm or cold engine.
– Changing gear.
– Vehicle speed.
– Engine speed.
– Accelerator pedal depressed.

Look for possible vibrations:
– Check the condition and tightness of the engine mountings.
– Check the condition and tightness of the engine tie-bars.
– Check the condition of the crankshaft pulley.
– Check the axles.
Repair if necessary.

Using the **diagnostic tool**:
Carry out a road test and note the parameters for the conditions under which the engine cut-outs appear.
Interpret the results of the following parameters:
– **PR055 Engine speed,**
– **PR132 Air flow,**
– **PR038 Rail pressure,**
– **PR041 Turbocharging pressure,**
– **PR030 Accelerator pedal position,**
– **PR220 EGR valve OCR*,**
– **PR767 Turbocharger position,**
– **PR766 Turbocharger position setpoint,**
– **PR017 Fuel flow.**

OCR*: Opening Cyclic Ratio.

AFTER REPAIR	Carry out a road test, followed by a check with the **fault finding tool**.

GETtheMANUALS.org

ALP3 CONTINUED	

If there is a significant variation in one or more parameters, carry out the following operations:
A. If there is significant variation in the injector rail pressure:
- Check the low pressure circuit:
  - Run **test 3 Low pressure circuit check**.
- Check the high pressure pump:
  - Run **test 11 High pressure pump**.
- Check the injectors:
  - Run **test 10 Poor injector operation**.
  - Run command **AC029 High pressure circuit sealing test**.
- Replace the injector rail pressure sensor, **component code 1032** if the injector rail pressure when cold is different from the injector rail pressure when hot, under + after ignition feed.
- Run commands **AC241 Test flow regulator 1 with low intensity and AC243 Test flow regulator 2 with low intensity**.
- If the fault is still present, replace the injection pump (see **MR 402-1 or MR 405-1, 13B, Engine and peripherals**).

B. If there is significant variation in the air flow/EGR/turbocharger:
- Check the turbocharging circuit:
  - Run **test 4 Air inlet circuit and turbocharging check**.
  - Run **test 7 Variable geometry turbocharger command**.

AFTER REPAIR	Carry out a road test, followed by a check with the **fault finding tool**.

GETtheMANUALS.org

ALP4	Lack of power/performance

NOTES	In the event of a fault, perform a **multiplex network test** using the **diagnostic tool**, then if the test is OK, apply the conformity check before any operation on the diesel injection system.

IMPORTANT
In the event of the engine overheating, the computer deliberately limits engine power without the warning light coming on, see the interpretation of fault **DF721 Engine overheating**.
● Please observe the cleanliness guidelines and safety advice.

Lack of power with smoke — **NO** → (A)

YES ↓

Check the entire air circuit:
– Run **test 4 Air inlet circuit and turbocharging check**.
Ensure that the correct fuel is being used.
– Run **test 12 Diesel fuel conformity check**.
– Run **test 3 Low pressure circuit check**.
Check the high pressure pump:
– Run **test 11 High pressure pump**.
Check the condition of the injectors:
– Run **test 10 Poor injector operation**.
– Run command **AC029 High pressure circuit sealing test**.
– Replace the injector rail pressure sensor, **component code 1032** if the injector rail pressure when cold is different from the injector rail pressure when hot, under + after ignition feed.
Repair if necessary.

Measure the compressions.

AFTER REPAIR	Carry out a road test, followed by a check with the **fault finding tool**.

GETtheMANUALS.org

ALP4 CONTINUED	

Check the high pressure pump: – Run **test 11 High pressure pump**. Repair if necessary.
Check the condition of the injectors: – Run **test 10 Poor injector operation**. Repair if necessary.
Check the condition of the air flow sensor: – Run **Test 5 Air flowmeter**. Repair if necessary.
Check the condition of the turbocharger: – Run **test 7 Variable geometry turbocharger control** and **test 8 Turbocharger rotating part**. Repair if necessary.
Check the condition of the exhaust system: – Run **test 1 Exhaust system check**. Repair if necessary.
Apply the interpretation of **AC029 High pressure circuit sealing test**. Repair if necessary.
Measure the compressions.

AFTER REPAIR	Carry out a road test, followed by a check with the **fault finding tool**.

GETtheMANUALS.org

ALP5	Excessively high fuel consumption

NOTES	In the event of a fault, perform a **multiplex network test** using the **diagnostic tool**, then if the test is OK, apply the conformity check before any operation on the diesel injection system.

Check conformity of the tyres and their pressure.
Check that the vehicle is not equipped with external devices affecting its aerodynamics.
Look for possible fuel leaks: – Run **test 3 Low pressure circuit check**. Repair if necessary. – Run command **AC029 High pressure circuit sealing test**. During this command, check for possible leaks in the high pressure circuit. Repair if necessary.
Refer to **ALP4 Lack of power/performance**.

AFTER REPAIR	Carry out a road test, followed by a check with the **fault finding tool**.

GETtheMANUALS.org

ALP6	Excessive oil consumption

NOTES	In the event of a fault, perform a **multiplex network test** using the diagnostic tool, then if the test is OK, apply the conformity check before any operation on the diesel injection system.

Confirm the excessive oil consumption (see **MR 402-1 or MR 405-1, 10A, Engine and peripherals**)
Check for possible external leaks.
Check the air circuit: – the condition of the air filter, – run **test 4 Air inlet circuit and turbocharging check**.
Check that the turbocharger operates correctly. Run **test 8 Turbocharger rotating part**.
Check for any possible blocking in the oil vapour rebreathing system. Check the condition of the rebreathing valve (see **MR 402-1 or MR 405-1, 14A, Engine and peripherals**).
Check the condition of the heater plugs. Measure the engine compressions: If the compressions are less than **20.4 bar**. Check: – Cylinder sealing. – Valve stem sealing.

AFTER REPAIR	Carry out a road test, followed by a check with the **fault finding tool**.

GETtheMANUALS.org

ALP7	Rough idle

NOTES	In the event of a fault, perform a **multiplex network test** using the **diagnostic tool**, then if the test is OK, apply the conformity check before any operation on the diesel injection system.

Check that the accessories belt-driven components operate (alternator, air conditioning compressor, etc.).
Check the consistency of parameter **PR064 Coolant temperature**. Repair if necessary.
Using the **diagnostic tool**, check the following parameters: **PR364 Cylinder no. 1 fuel flow correction,** **PR405 Cylinder no. 2 fuel flow correction,** **PR406 Cylinder no. 3 fuel flow correction,** **PR365 Cylinder no. 4 fuel flow correction,** **PR407 Cylinder no. 5 fuel flow correction,** **PR408 Cylinder no. 6 fuel flow correction.** If one of the parameters is not correct, run **test 10: Poor injector operation**. Replace or repair, if necessary.
Measure or note the injector rail pressure with parameter **PR038 Rail pressure** during the rough idle phases, the rail pressure should have stable values for a stabilised engine speed, and the rail pressure variation should not exceed **± 40 bar**.
Check the condition of the engine by measuring the cylinder compression with the special tool. The compression values recorded for each cylinder must be the same. – the minimum compression limit must not be less than **20.4 bar**, – the maximum pressure difference between two cylinders must not be greater than **2 bar**, – If the compression test reveals a cylinder fault, carry out the necessary repairs.
Check the timing adjustment (see **MR 353, 11A, Timing belt**).

AFTER REPAIR	Carry out a road test, followed by a check with the **fault finding tool**.

GETtheMANUALS.org

ALP8	Overheating

NOTES	In the event of a fault, perform a **multiplex network test** using the **diagnostic tool**, then if the test is OK, apply the conformity check before any operation on the diesel injection system.

Check using commands **AC228 Fan assembly command 1, AC229 Fan assembly command 2** and **AC230 Fan assembly command 3** that the three cooling fan assembly commands operate correctly. Repair if necessary.
Refer to **Technical Note 3175A, Cooling system**.
Engine running: Check the thermostat opens correctly (start of opening **82˚C ± 4.1**). For an engine coolant temperature greater than **85˚C**, the bottom hose of the cooling radiator should not be cold; replace the thermostat if necessary.
Check that the water pump is operating correctly by checking the presence of a coolant fluid return flow from the expansion bottle. In the event of a fault, check for any possible clogging in the expansion bottle return or that the hoses have been reversed before considering a fault in the water pump.
Compare the temperature values given by the injection coolant temperature sensor, **component code 244** and the value given by an external temperature sensor. If the values are inconsistent: Check the wiring and repair or replace the coolant temperature sensor.
If the fault is still present, rinse the cooling circuit and check that the radiator is not clogged. Clean the front of the radiator with a high pressure cleaner to remove any dirt from the radiator fins. Replace the expansion bottle cap.

AFTER REPAIR	Carry out a road test, followed by a check with the **fault finding tool**.

GETtheMANUALS.org

ALP9	No heating

NOTES	In the event of a fault, perform a **multiplex network test** using the diagnostic tool, then if the test is OK, apply the conformity check before any operation on the diesel injection system.

Check that the engine does reach its operating temperature during motorway driving.
Check that the thermoplungers operate correctly (only for Vel Satis). Check their resistances and check that the 3 thermoplunger relays are supplied using the following commands: **AC063 Thermoplunger no.1 relay,** **AC064 Thermoplunger no.2 relay,** **AC031 Thermoplunger no.3 relay.** In the event of faults, check the operation of the thermoplunger relays, check the connection between the relay coils and the injection computer, check the supply at the relay terminals, and check the **continuity** of the power lines between the thermoplungers and their relays.
Engine cold or stopped for at least **6 hours**. Compare the temperature values given by the injection coolant temperature sensor and the value given by an external temperature sensor. If the values are inconsistent: Check the wiring and repair or replace the coolant temperature sensor.
If the value supplied by the injection coolant temperature sensor is correct, replace the thermostat.
Refer to **Technical Note 3175A, Cooling system, ALP7 There is no heating inside the vehicle**.

AFTER REPAIR	Carry out a road test, followed by a check with the **fault finding tool**.

GETtheMANUALS.org

ALP10	Heavy black smoke from exhaust

NOTES	If the vehicle has not been used for a long time, let the engine reach its operating temperature and, after first checking the coolant fluid level, carry out a road test.

If there is a lack of power in addition to the smoke, Refer to **ALP4 Lack of power/performance**.
Otherwise, carry out **test 10 Poor injector operation**.

AFTER REPAIR	Carry out a road test, followed by a check with the **fault finding tool**.

GETtheMANUALS.org

ALP11	Heavy white smoke from exhaust

NOTES	If the vehicle has not been used for a long time, let the engine reach its operating temperature and, after first checking the coolant fluid level, carry out a road test.

Check with the customer that the vehicle has not overheated recently.
Check the coolant fluid level; a significant drop may be due to a leak in the cooling system or excessive fluid consumption by the engine at the cylinder head gaskets (apply **Technical Note 3175A, Cooling system, ALP3 Release of exhaust smoke, white smoke, warm engine**).
Check the EGR valve cooler (for fluid inside the EGR pipe).
White smoke released from exhaust without water consumption: Make sure that there is no water in the diesel filter. Check the conformity of the fuel. Run **test 12 Diesel fuel conformity check**. Clean if necessary. Carry out a road test.
Otherwise, the smoke is related to specific driving conditions (mountain driving, traffic jams or prolonged idling).

AFTER REPAIR	Carry out a road test, followed by a check with the **fault finding tool**.

GETtheMANUALS.org

ALP12	Heavy blue smoke from exhaust

NOTES	If the vehicle has not been used for a long time, let the engine reach its operating temperature and, after first checking the coolant fluid level, carry out a road test.

Check the oil level:
If the level is too high, remove the excess diesel fuel or oil.
Check that there is no diesel fuel in the oil; remove the excess.
If the level is too low,
Refer to **ALP6 Excessive oil consumption**.

Check that the oil breather pipes are not crushed or clogged.

Remove the inlet hose from the turbocharger inlet and outlet.
Check that there is not a large quantity of oil in the turbocharger or the inlet hoses.
– A large quantity of oil in the turbocharger inlet hose is due to extensive oil evacuation via the oil breather (engine "sealing ring" wear or breather clogged, etc.),
– A large quantity of oil in the turbocharger outlet hose indicates failure of the turbine shaft sealing ring. Replace the turbocharger if necessary.
– If the inlet system is clean, a small quantity of oil deposited on the walls of the inlet hoses is acceptable. The oil consumption is undoubtedly due to an engine internal failure, e.g. valve stem seal, oil scraper ring, etc.

AFTER REPAIR	Carry out a road test, followed by a check with the **fault finding tool**.

GETtheMANUALS.org

EXHAUST SYSTEM CHECK → TEST1

LOW PRESSURE CIRCUIT TEST → TEST3

TURBOCHARGING AND AIR INLET CIRCUIT TEST → TEST4

AIR FLOW SENSOR → TEST5

VARIABLE GEOMETRY TURBOCHARGER CONTROL → TEST7

ROTATING PART OF TURBOCHARGER → TEST8

POOR INJECTOR OPERATION → TEST10

HIGH PRESSURE PUMP → TEST11

DIESEL FUEL CONFORMITY CHECK → TEST12

GETtheMANUALS.org

TEST1	Exhaust system check

Engine stopped: Check that the silencer outlet is not blocked. Repair or replace the silencer, if necessary.

↓

Check the seal of the exhaust manifold on the contact surface between the turbocharger and the exhaust manifold.
Is the seal in order?

NO → Repair or replace the faulty part.

YES

↓

Loosen the catalytic pre-converter at the turbocharger outlet.
Place a wooden block between the two parts.
Start the vehicle and check if the engine runs better.
Is the engine running normally?

NO → The exhaust pipe is correct.
Restart fault finding.

YES

↓

Retighten the catalytic pre-converter.
Loosen and decouple or cut the catalytic converter at the catalytic pre-converter outlet. Place a wooden block between the two parts, if necessary.
Start the vehicle and check if the engine runs better.
Is the engine running normally?

NO → Replace the catalytic pre-converter.

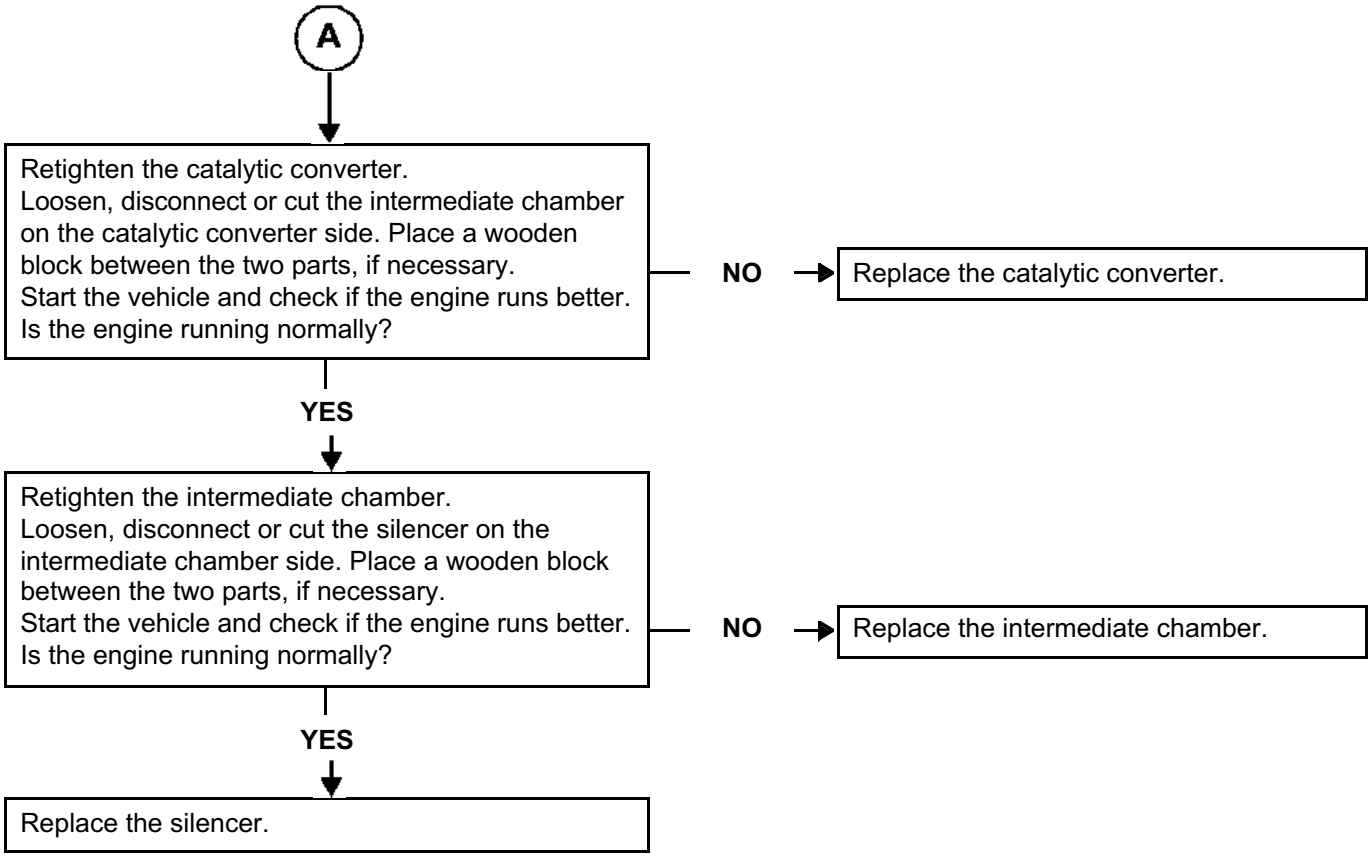
YES

↓

(A)

GETtheMANUALS.org

TEST1 CONTINUED	



GETtheMANUALS.org

TEST3	Low pressure circuit check

Check the conformity of the fuel:
– Apply **test 12 Diesel fuel conformity check**.
If the diesel fuel is not correct:
– Replace the diesel fuel.
– Change the diesel filter.
– Bleed the low and high pressure diesel circuit.

↓

Check the condition of all the low pressure diesel pipes from the tank to the injection pump (in particular, that the pipes are not being crushed).

↓

Check the condition of the priming bulb, and that it is working properly. Perform repairs if necessary and continue the test.

↓

If the fault is still present with a low fuel level, check the consistency of the actual fuel level and that indicated on the instrument panel.
– The transfer pump is supplied via a venturi pipe mounted underneath it.
Check that the opening of the venturi is not blocked by dirt contained in the fuel tank.
Check the priming of the low pressure diesel circuit.

↓

Check the fuel filter:
– Conformity of the fuel filter (correct part number and RENAULT filter).
– Positioning and amount of clogging in the filter element.
– Positioning and condition of the seals.

↓

GETtheMANUALS.org

TEST3 CONTINUED	

Supplying the injection system with fuel from an additional tank.
This operation aims to detect possible faults in the low pressure supply system of a vehicle by replacing it entirely with an additional tank.
Mode:
– Disconnect the diesel fuel supply pipe at the fuel filter inlet and seal it with a plug.
– Connect a tube to the fuel filter inlet and insert the other end into a **clean** container which is approximately 5 litres in volume.
– Disconnect the diesel return pipe to the injector and high pressure pump outlet union, and use a plug to block it.
– Connect a transparent pipe to the injector and high pressure pump outlet union, and insert the other end into the container.
– Fill the container with **clean** diesel fuel.
– Start the engine and let the system drain itself of its air (there must not be any air bubbles in the return pipe).

Is the customer complaint still present?

YES → Low pressure circuit correct.
Reconnect the different low pressure circuit pipes and restart fault finding.

NO

Are the low pressure circuit connections in order and in good condition?

NO → Carry out the necessary repairs.
Low pressure circuit correct.
Reconnect the different low pressure circuit pipes and restart fault finding.

YES

Low pressure circuit correct.
Restart fault finding.
END OF TEST.

GETtheMANUALS.org

TEST4	Turbocharging and air inlet circuit check

Engine stopped: Check the low and high pressure air circuits for **leaks** (air leaks in or out, upstream or downstream of the turbocharger).

→ Check the parts that are abnormally greasy of the circuit and reveal a lack of tightness.
Check:
– the condition and fitting of the ducts (foreign bodies, clogged, disconnected, pinched, broken, holed, cut, tightness of the mounting bolts, etc.).
– the present and tightening of the clamps.
– the turbocharger pressure sensor is mounted correctly on the manifold.
– The pipes and the take-off point between the air duct and the turbocharging sensor.
Carry out the necessary repairs.

Checking the air filter.

→ Check:
– That the air filter unit inlet and outlet are not blocked.
– That air filter unit is in good condition and is fitted correctly (not dislodged, broken, pierced; condition and positioning of the foam, etc.).
– The cleanliness, conformity and the absence of deformation of the filter element.
– The air flowmeter: run **test 5 Air flowmeter**.

Check:
– the condition of the damper valve (damper),
– the condition of the swirl flaps,
– the tightness of the mounting bolts,
Carry out the necessary repairs.
Replace if necessary.

→ Carry out a visual inspection of the EGR circuit sealing.
Replace if necessary.

Check the exhaust: run **test 1 Exhaust pipe check**.
Carry out the necessary repairs.

→ Check the condition of the intercooler:
– clogging,
– leaks (vehicle stationary, stabilise the engine speed between 3500 rpm and 4000 rpm and check that there are no leaks).
Replace if necessary.

→ Check that the take-off point for the turbocharging pressure sensor is not blocked.
Replace if necessary.
END OF TEST.

GETtheMANUALS.org

TEST5	Air flow sensor

Contamination of the grille
Visual inspection: remove the flowmeter. There should be no foreign bodies in the grilles (see illustration **no. 110734**).
Do not clean the grilles using compressed air or by any other method: this may damage the sensors and create variations from the values displayed on the CLIP tool.
Check the air circuit sealing upstream of the air flowmeter: ducts and air filter unit disconnected or pierced, presence of seals.
Replace the air flowmeter if necessary and clean upstream of this, if necessary.

↓

Damage to electrical components
Visual inspection: remove the flow sensor - the components should not be broken.
Replace the air flowmeter if necessary.

↓

Oxidation of the electrical components
Visual inspection: remove the air flow sensor connector, there should not be any green deposits on the electrical components.
Replace the air flowmeter if necessary.

↓

Clogging of the air flowmeter
Test:
- Check the conformity values, with a warm engine (coolant temperature: **80˚C**).
- During the first 30 seconds after starting.
- Engine speed: idling.
- Air temperature between **30 and 70˚C**.
- **PR132 Air flow: 23 kg/h ± 3.**
- **PR220 EGR valve OCR*: 45 ± 10%.**

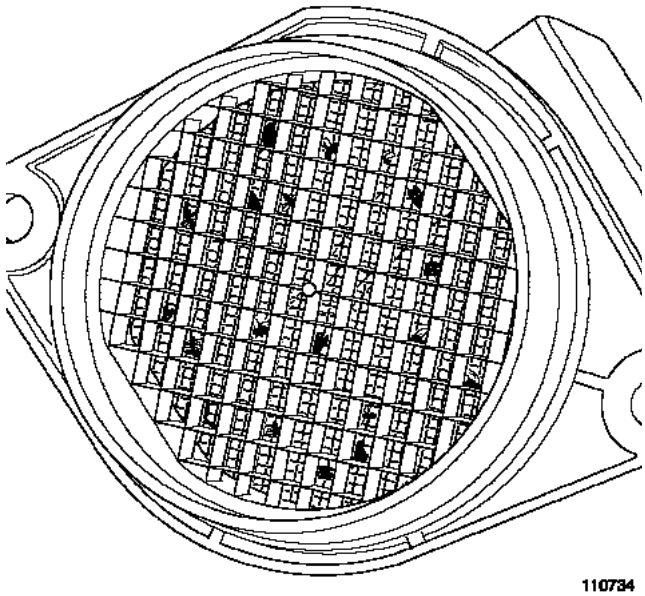
– Apply the procedure for **DF056 Air flow sensor circuit** for the checks on the air flowmeter.
Replace the air flowmeter if necessary.
END OF TEST.

* OCR = Opening Cycle Ratio.

GETtheMANUALS.org

TEST5 CONTINUED	

Contamination of the grille



GETtheMANUALS.org

TEST7	Variable geometry turbocharger control

Start the engine and check that:
– the **PR767 Turbocharger position** changes and that it follows **PR766 Turbocharger position setpoint**,
– the variable geometry control moves easily.

↓

Does the variable geometry control move easily? — **NO** → Replace the turbocharger.

YES

↓

Stop the engine and check that:
– the **PR767 Turbocharger position** changes and that it follows **PR766 Turbocharger position setpoint**,
– the variable geometry control moves easily.

↓

Does the variable geometry control move easily? — **NO** → Replace the turbocharger.

YES

↓

Continue the turbocharger test with **test 8 Rotating part of turbocharger**.

GETtheMANUALS.org

TEST8	Rotating part of a turbocharger

With the engine cold and stopped, remove the air inlet duct from the turbocharger; check manually if the shaft of the turbine and of the compressor turns.

Does the shaft turn?

NO → Replace the turbocharger.

Seizing of the turbocharger may be caused by poor lubrication of the bearings. Check the lubrication circuit for any blockage and check the engine oil pressure. Apply the procedure described in **Technical Note 3938A** which is applicable to this engine.

YES

Visually inspect the condition of the compressor wheel and the turbine wheel (see illustrations no. 110737 and no. 110738).
Are the wheels in good condition?

NO → Replace the turbocharger.
Apply the procedure described in **Technical Note 3938A** which is applicable to this engine.

YES

Check the axial clearance of the wheels by hand (see illustration no. 110880).
The significant end float is approximately 2 mm.
Does the turbocharger have too much play in the shaft?

YES → If the rotating section is broken:
Apply the procedure described in **Technical Note 3938A** which is applicable to this engine.
IMPORTANT
Risk of destroying the new turbocharger and the engine if the air circuit is not cleaned and the oil and its filter are not replaced.

NO

The rotating section is in order.
Is there oil in the exhaust?

NO → **END OF TEST.**

YES

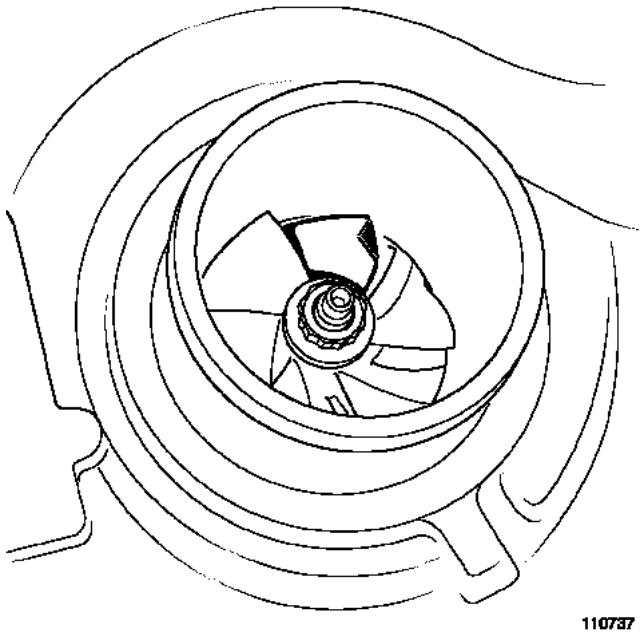
Replace the catalytic pre-converter.

Information:
The operating play of the turbocharger bearings is approximately 25 µm (micrometers or microns) between the shaft of the turbocharger and the internal mating face of the bearings and 75 µm between the exterior part of the bearings and the bearing housing.
Risks:
In the event of destruction of the turbocharger bearings, the steel and bronze swarf from this destruction are evacuated through the turbocharger oil to the engine's oil sump. The swarf can, consequently, be returned to the oil circuit via the oil pump, then cause widespread contamination of the engine oil circuit. This causes abnormal wear on the crankshaft bearing bushings, the con rod bearing shells and the camshafts, etc.
In the event of the compressor wheel breaking, parts of the blades may be found in the intercooler or in the air circuit ducts. The turbine wheel could easily be found in the catalytic converter.

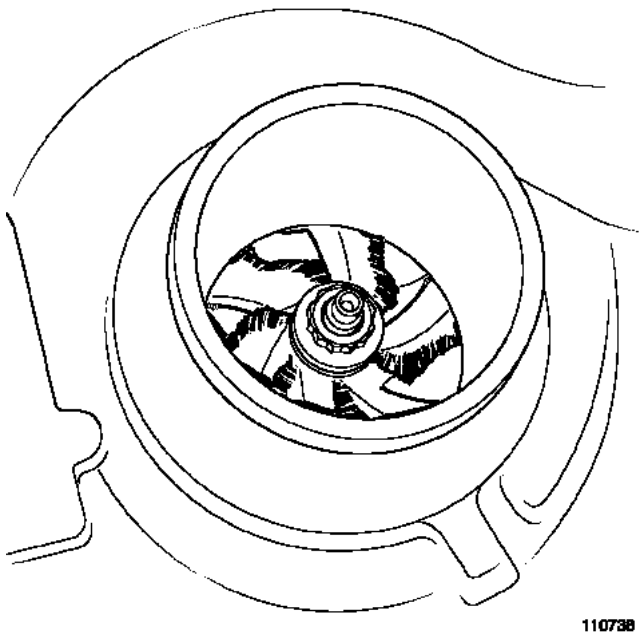
GETtheMANUALS.org

TEST8 CONTINUED 1	

Deformed, twisted blade ("soft" foreign body)



Broken blades ("hard" foreign body)



GETtheMANUALS.org

TEST10	Incorrect injector operation

Part A
Check the injector flow correction: (individual correction)
– In CLIP, choose **Fuel circuit**.
– With the engine idling and the fuel temperature **> 50˚C**, view the flow correction values for each injector (individual correction), i.e.:
PR364 Cylinder no. 1 fuel flow correction,
PR405 Cylinder no. 2 fuel flow correction,
PR406 Cylinder no. 3 fuel flow correction,
PR365 Cylinder no. 4 fuel flow correction,
PR407 Cylinder no. 5 fuel flow correction,
PR408 Cylinder no. 6 fuel flow correction.
The **normal flow correction value** for an injector is approximately **± 200 µs**. This tolerance value may increase with time, but indicates an injector/cylinder fault if it exceeds **± 300 µs**.
1) If at least one of these values > + 300 µs
– If the compression value recorded with the compression gauge reveals a faulty cylinder, carry out the necessary repairs and apply **Part C**.
– If the customer complaint is still present, replace the injector.
– Check the valve clearance.
– See paragraph **Part B**, for confirming the fault finding.
2) If at least one of these values < - 300 µs
– Check the level and condition of the engine oil.
– Remove the injector which has the biggest negative value.
– Check the valve clearance.
– Replace the injector.
– See paragraph **Part B**, for confirming the fault finding.
3) If at least one of these values does not stabilise (at least 30 seconds after starting and when warm)
– Check the low pressure circuit with **test 3 Low pressure circuit check**.
– Check the conformity of the fuel. Apply **test 12 Diesel fuel conformity check.**
– See paragraph **Part B**, for confirming the fault finding.
After replacing an injector, follow the injector code programming procedure (refer to **Interpretation of commands**), run **SC002 Enter injector codes** and select the number for the replaced injector.
IMPORTANT
When removing and refitting the injectors, follow the cleanliness guidelines and safety advice (see **MR 402 or MR 405 Mechanical, 13B, Diesel injection: Removal - Refitting**).

GETtheMANUALS.org

TEST10 CONTINUED	

Part B
Confirmation of flow correction check fault finding for each injector: (individual correction)
Clear the fault(s) and carry out a test with the **engine idling** and fuel temperature **> 50˚C**, check that no faults appear on the **diagnostic tool** and that the correction values do not reach **± 300 µs** to confirm the repair.
– If any other cylinders have injector flow correction values which exceed **± 300 µs**, follow the fault finding procedure described in **Part A**. Fuel regulation balance check for each injector (individual).

Part C
Injector nozzle sealing check:
– Check the level and condition of the engine oil:
– If there is diesel fuel contamination, the leaking injector nozzle will be "greasy".
– Disconnect the preheating relay.
– Check that these traces are not caused by rising engine oil, by checking the engine compression values.
– Check the condition of the heater plug: this must not be wet. If it is, change the defective injector.
– If the engine compression values are correct, locate the faulty injector by looking at the condition of the cylinders and the pistons across the heater plug wells (greasy cylinder, overheating, starting to incur damage, etc.).
– If the cylinder - piston examination is not conclusive, remove the injectors and change the one with the "greasy" nozzle.
– If the fault finding checks do not enable the engine to be repaired, contact the Techline.

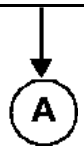
IMPORTANT
When removing and refitting the injectors, respect the cleanliness guidelines and safety advice (do not forget to stick the label at the position indicated), (see **MR 402 or MR 405 Mechanical, 13B, Diesel injector: Removal - Refitting**).

GETtheMANUALS.org

TEST11	High pressure pump

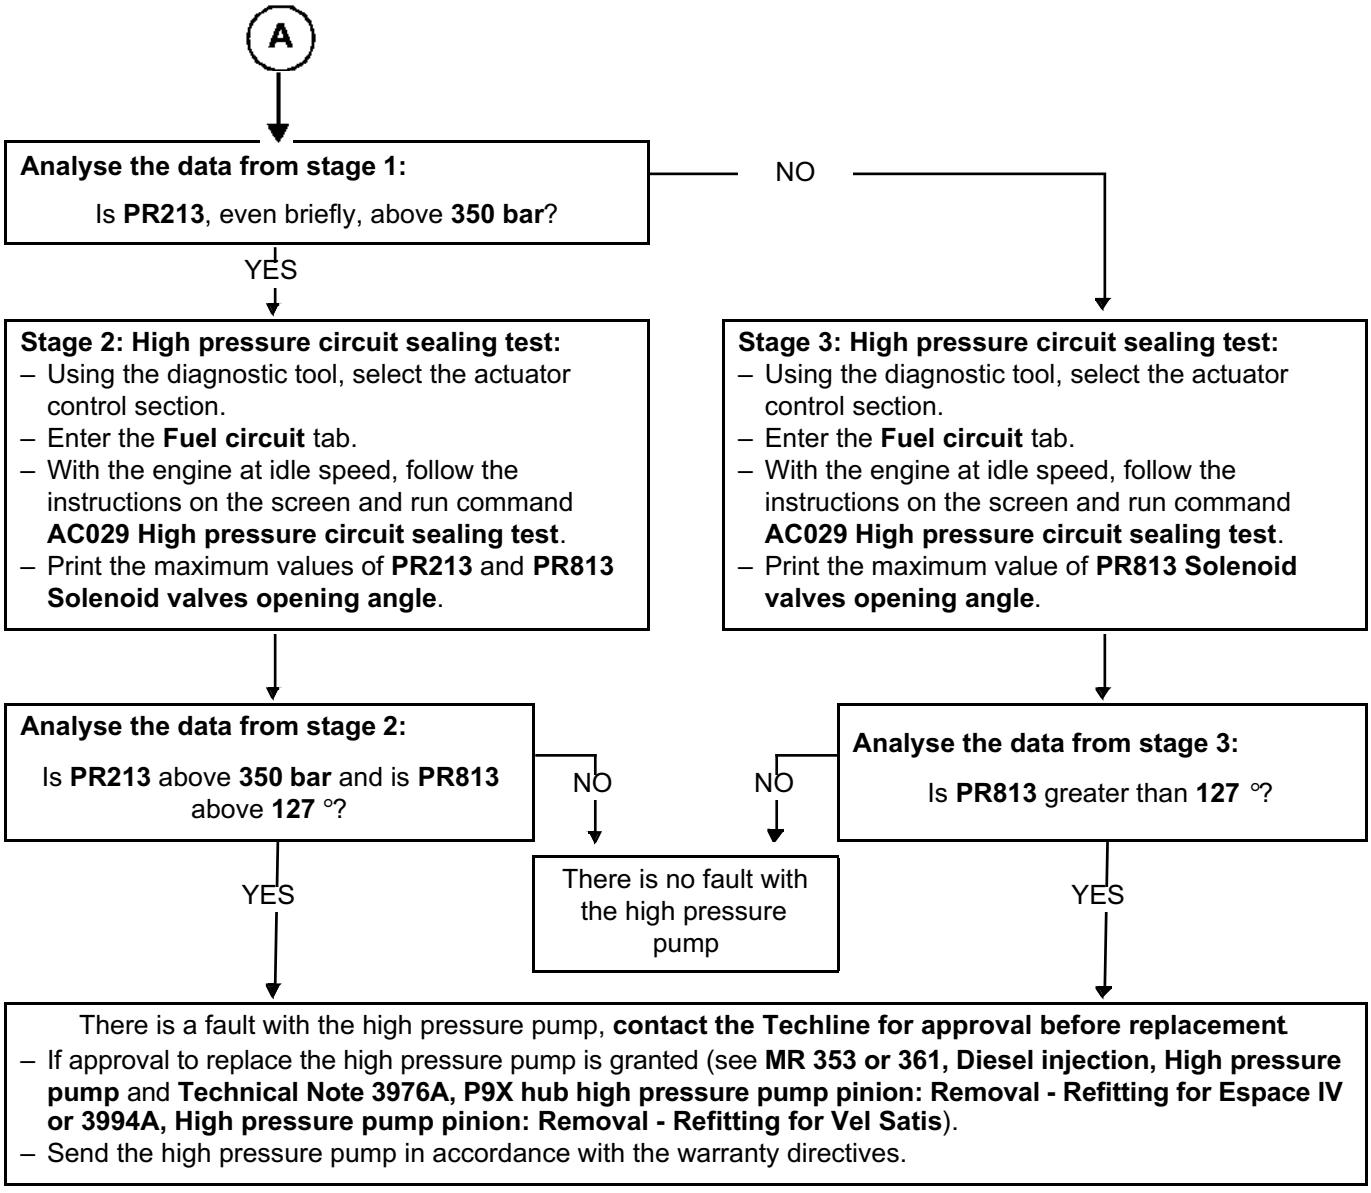
Are the following conditions confirmed?
– No fault code.
– No external leak from the fuel circuit.
– No air intake on the fuel circuit.
Check that there is no OTS to be carried out on the vehicle.

Stage 1: Measuring the rail pressure:
– Carry out a road test and record the following parameters as soon as power is lost.
  – **PR145 Engine speed.**
  – **PR030 Accelerator pedal position**.
  – **PR038 Rail pressure.**
  – **PR008 Rail pressure setpoint.**
  – **PR213 Rail pressure loop difference.**
– Print the data found.



GETtheMANUALS.org

TEST11
CONTINUED



GETtheMANUALS.org

TEST12	Diesel fuel conformity check

WARNING
During this operation, it is essential to:
- **refrain from smoking or bringing incandescent objects close to the work area,**
- **protect yourself against fuel splashes due to residual pressure in the pipes,**
- **wear safety goggles with side guards,**
- **wear leaktight gloves (Nitrile type).**

IMPORTANT
- **To avoid any corrosion or damage, protect the areas on which fuel is likely to run.**
- **To prevent impurities from entering the circuit, place protective plugs on all fuel circuit components exposed to the open air.**

Preparations:

Weigh an empty **1300 ml plastic cup (part no. 77 11 171 413)** with its cover **(part no. 77 11 171 416)** using electronic scales such as those used in body paint workshops (example: **PANDA part no. 77 11 224 995**). Record the weight of the empty plastic cup.
This type of plastic cup is used to prepare paint.

Remove **1 L** of fuel **at the diesel filter outlet** (see **MR 402 or 405, Mechanical, 19C, Tank, Fuel tank: Draining**), using a pneumatic transfer pump (part no. 634-200) and place it in the **1300 ml** plastic cup.

Cover the plastic cup with its cover and allow it to settle for approximately **2 minutes**.

Is the fuel cloudy or does it separate into two parts?

YES → The diesel fuel contains water and is not compliant.
Drain the fuel circuit, including the tank (see **MR 402 or 405, Mechanical, 19C, Tank, Fuel tank: Draining**).

NO → A

GETtheMANUALS.org

TEST12 CONTINUED 1	

A

Weigh the diesel fuel and note the fuel weight after subtracting the weight of the empty plastic cup and its cover.
Does the fuel weight fall between the minimum and maximum weights given in the table below?

Calculated weight (g.)		Fuel temperature (˚C)
Min. weight	Max. weight	
821	846	13
821	846	14
820	845	15
819	844	16
819	844	17
818	843	18
817	842	19
816	841	20
816	841	21
815	840	22
814	839	23
814	839	24
813	838	25

Check the fuel temperature by immersing a thermometer in the plastic cup.

YES → A

NO → B

GETtheMANUALS.org

TEST12 CONTINUED 2	

A
YES

End of test.

B
NO

The fuel is not correct.

If the fuel weight is less than the minimum value then there is petrol in the diesel fuel.

If the fuel weight is greater than the maximum value then there is oil in the diesel fuel.

Drain the fuel circuit, including the tank (see **MR 402 or 405, Mechanical, 19C, Tank, Fuel tank: Draining**).

Note:

If the weight measured reaches the limit values, the measurement can be performed with a **2230 ml (part no. 77 11 171 414)** plastic cup with a cover **(part no.77 11 171 417):**

– Carry out a quick test drive in order to mix the fuel and then take a sample of **2 litres** of fuel.
– Perform the test again and check the results by multiplying the limit values by 2.

Contact your Techline if you have doubts or problems with the customer.

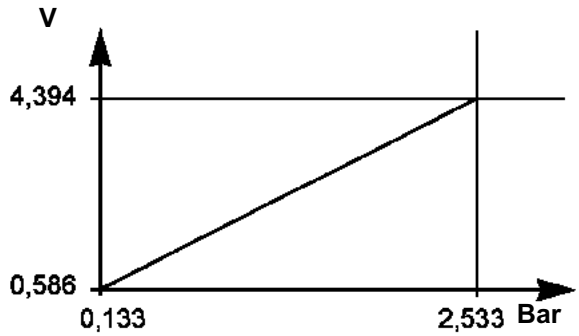
GETtheMANUALS.org

MANIFOLD PRESSURE SENSOR/TURBOCHARGING/MANIFOLD AIR TEMPERATURE

Specifications:	Voltage/Pressure transducer
Supply voltage:	**5 V ± 0.25**
Type of circuit:	Active circuit
System fitted:	Denso Injection
Type of connector:	**4 tracks** (1 earth - 2 inlet manifold vacuum signal - 3 + 5 V - 4 manifold temperature signal)

Description:
This sensor is used by the injection system to give a signal relating to the manifold pressure vacuum or the turbocharging pressure.
It uses a piezoelectric component which produces an electric voltage proportional to the stress applied to it (in this case, pressure).
This signal is very weak and is amplified by an internal electronic system which requires an external **5 V** feed supplied by the injection computer.

Pressure sensor test:
The sensor delivers a voltage proportional to the inlet manifold vacuum:
2.533 bar absolute (**1.533 bar** relative) = **4.394 V**.
0.133 bar absolute (**- 0.867 bar** relative) = **0.586 V**.



Check first that the sensor is correctly supplied with a voltage of **+ 5 V** with the sensor connected.
Use a multivac pump connected to the sensor's vacuum union to check that the signal does correspond to the graph. Disconnect **track 3** linking the computer to the sensor and connect the + lead of a multimeter (rated at between **5 and 10 V**) on **track 3** of the sensor and the - lead to **track 2** of the sensor (sensor earth still connected to the computer).
At atmospheric pressure, the voltage should be approximately equal to **1.95 V**.
At close to **2.533 bar** absolute, the voltage should be more or less equal to **4.394 V**.
At close to **0.133 bar** absolute, the voltage should be more or less equal to **0.586 V**.
If the voltages do not correspond to the pressures, replace the sensor.

GETtheMANUALS.org

Temperature-dependent resistance values for the inlet manifold air temperature sensor:

Temperature (in ˚C)	Resistance (in Ω)	Resistance tolerance (in Ω)

GETtheMANUALS.org

AIR FLOW SENSOR

Specifications:	Air Flow/Voltage transducer
Supply voltage:	**12 V**
Type of circuit:	Active circuit
System fitted:	Denso Injection
Type of connector:	**5 tracks** (**1**: flow sensor temperature signal; **2**: + 12 V; **3**: Earth; **4**: + 5 V; **5**: air flow signal)

Description:

This sensor is used by the injection system to give a signal relating to the air flow circulating in the inlet circuit. It uses a so-called "hot film" system, a ceramic insert onto which a heating resistor and a temperature sensor are screen-printed, which are placed in the middle of the air stream.

An electronic circuit heats the insert and monitors its temperature by means of its temperature sensor located away from the heating resistor.

The passage of air cools the ceramic wafer, and the electronic circuit will compensate for this cooling by increasing the current passing through the heating resistor so as to maintain its reference temperature.

This current, after being formatted by the air flow sensor electronics, represents the air flow passing through the air flow sensor.

A signal varying from **0** to **5 V** represents an air mass flow rate.

An external **12 V** power supply provided by the injection computer's safety relay is necessary for it to operate.

Checking the sensor:

Check that the grilles protecting the flow sensor are not clogged or damaged and check the cleanliness of the ceramic sensor located in the centre of the housing, which should be clean and must not be broken. Do not use detergent to clean the sensor (risk of damage).

The sensor cannot be dismantled; in case of doubt regarding its consistency, carry out a flow measurement.

Conditions:

Engine at operating temperature, exhaust gas recirculation valve and turbocharger compressor vane control, compressor disconnected and air conditioning off.

Measure at idling speed then at stabilised 2000 rpm. Repeat this measurement with another air flow sensor. The values should be more or less equivalent; if not, replace the air flow sensor.

Average flow value at inlet according to the conditions set out above:

At idle speed (700 rpm): 23 kg/h ± 3

At stabilised 2000 rpm: 140 kg/h ± 3

Note:

These values are typical for a new engine in operation and may only be used as an estimate. To confirm the test, carry out a test with another flowmeter.

GETtheMANUALS.org

GETtheMANUALS.org

FUEL-OIL-COOLANT TEMPERATURE SENSOR

Specifications:	Temperature/Resistance transducer
Resistance:	According to the temperature
Type of circuit:	Passive circuit
System fitted:	Denso Injection
Type of connector:	**2 tracks**

Description:
This sensor is used by the injection system to give a signal representing a temperature of a component to which the sensor is attached.
This is a negative temperature coefficient resistor (the resistance drops when the temperature increases).
A circuit in the computer powers the sensor with a constant current and variation of the resistance causes variation of the voltage across the terminals of the sensor, this voltage being representative of the temperature.

Checking the sensor:
The presence of a yellow or transparent wax in the connector indicates that the sensor seal is broken; replace it and recheck the sealing.
Use a multimeter to first check the insulation of the sensor's two tracks from its metal base (if so equipped) or from engine earth.
The resistance should in this case be infinite and if this is not the case replace the sensor.
Using a multimeter, check the sensor's resistance in relation to the temperature.
This should be: **3511 Ω ± 176 at + 20 °C**.
If the values do not correspond, replace the sensor.

Temperature-dependent resistance values for the engine coolant temperature sensor, engine oil temperature sensor and fuel temperature sensor:

Temperature (in °C)	Resistance (in Ω)	Resistance tolerance (in Ω)
- 40	100 865	5043
-30	52 594	2630
- 20	28 583	1429
- 10	16 120	806

GETtheMANUALS.org

ACCELERATOR POTENTIOMETER

Specifications:	Position/Resistance transducer
Supply voltage:	2 tracks, each at **+ 5 V ± 0.25 V**
Resistance:	Depends on the angle
Type of circuit:	Passive circuit
System fitted:	Denso Injection
Type of connector:	**6 tracks**

Pin configuration:

Track 2 > potentiometer 1 earth
Track 4 > potentiometer 1 supply
Track 3 > potentiometer 1 signal
track 1 > potentiometer 2 earth
track 5 > potentiometer 2 supply
track 6 > potentiometer 2 signal

Description:
This sensor is equipped with two potentiometers (variable resistance) insulated from one another.
The position of the shaft causes a variation in the sensor's internal resistance.
The two gangs are not synchronous, gang 2 has a resistance value double that of gang 1.
These two gangs are used by the injection computer to check that the accelerator potentiometer is giving consistent signals.

Checking the sensor:
Use a multimeter to measure the resistance of the potentiometers,
– between **tracks 1** and **5**, the resistance should be **1700** Ω ± **680**,
– between **tracks 2** and **4**, the resistance should be **1200** Ω **± 480**,
If one of the gangs is not within these tolerances, replace the accelerator potentiometer.

MINIMUM value:
Gang 1 (from **13.6% to 16.4%** of Valim P1 (5 V) or **0.68 to 0.82 V**)
Gang 1 (from **5.2% to 9.8%** of Valim P2 (5 V) or **0.26 to 0.49 V**)
MAXIMUM value:
Gang 1 (from **83.6% to 92.4%** of Valim P1 (5 V) or **4.18 to 4.62 V**)
Gang 1 (from **40.7% to 47.3%** of Valim P2 (5 V) or **2.03 to 2.36 V**)

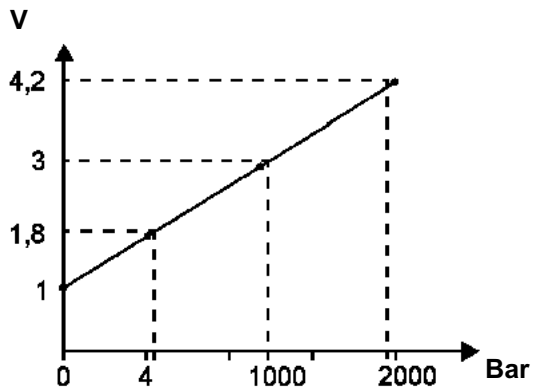
GETtheMANUALS.org

RAIL PRESSURE SENSOR

Specifications:	Voltage/Pressure transducer
Supply voltage:	**5 V ± 0.25**
Type of circuit:	Active circuit
System fitted:	Denso Injection
Type of connector:	**3 tracks** (**1**: earth - **2**: signal - **3**: + 5 V)

Description:
This sensor is used by the injection system to give a signal relating to the rail pressure (fuel pressure in the common rail).
It uses a piezoelectric component which produces an electric voltage proportional to the stress applied to it (in this case, pressure).
This signal is very weak and is amplified by an internal electronic system which requires an external **5 V** feed supplied by the injection computer.

Checking the sensor:
The sensor delivers a voltage proportional to the rail pressure:
2000 bar = 4.20 V
0 bar = 1 V



The formula is as follows:
where P is the pressure in bar: **(P/500) + 1 = U**
U is the signal voltage in volts: **(U - 1) x 500 = P**
Check first that the sensor is correctly supplied with a voltage of **+ 5 V** with the sensor connected.
Dump the pressure in the common rail and check that the sensor signal voltage is **1 V**.
If the voltage is not correct, replace the sensor.

1. SCOPE OF THIS DOCUMENT

This document presents the fault finding procedure applicable to all computers with the following specifications:

Vehicle(s): **LAGUNA 2 ph2 - VELSATIS ph2 - ESPACE IV ph1 and 2** *Engines:* **K4M 716 / F4R 714, 715, 792 F4R-t 766, 767, 784, 786, 787, 796, 797** F4R-t 866, 867, 886, 887, 896, 897 *Function concerned:* **Petrol injection**	*Name of computer:* **Sagem S3000** *Program No.:* **AC** *VDIAG No.:* **08**

2. PREREQUISITES FOR FAULT FINDING

Documentation type

Fault finding procedures (this document):
– Assisted fault finding (integrated into the diagnostic tool), Dialogys.
Wiring Diagrams:
– Visu-Schéma (CD-ROM), paper.

Type of diagnostic tools

– **CLIP + multiplex line sensor**

Special tooling required

Special tooling required	
	Multimeter
Elé. 1481	Bornier
Elé. 1681	Universal bornier

3. REMINDERS

Procedure

To save energy, the UCH of the vehicle interrupts the + after ignition feed after 3 minutes.

To run fault finding on a computer, it is possible to force the + after ignition feed on for 1 hour by applying the following procedure:
– press the unlocking button on the card,
– insert the card in the reader,
– if the ignition is switched on, press the Start button (interruption of timed + after ignition feed),
– press and hold the start button for over 5 seconds until the engine immobiliser warning light starts to flash rapidly (4 Hz).

This forced + after ignition feed mode remains on for 1 hour.
Pressing the Start button or removing the card from the card reader cuts off the + after ignition feed but does not cut off the forced after ignition feed timed mode. Until one hour has elapsed, activating the + after ignition feed will restart forced + after ignition feed for the remaining time.

GETtheMANUALS.org

Faults

Faults are displayed as present or stored (they appeared in a certain context and have since disappeared, or they are still present but cannot be diagnosed in the current context).

The **present** or **stored** status of faults should be taken into consideration when the diagnostic tool is used after the + after ignition feed is switched on (without acting on the system components).

For a **present fault**, apply the procedure described in the **Interpretation of faults** section.

For a **stored fault**, note the faults displayed and apply the **Notes** section.

If the fault is **confirmed** when the instructions are applied, the fault is present. Deal with the fault.

If the fault is **not confirmed**, check:
– the electrical lines which correspond to the fault,
– the connectors for these lines (for oxidation, bent pins, etc.),
– the resistance of the component detected as faulty,
– the condition of the wires (melted or split insulation, wear).

Conformity check

The aim of the conformity check is to check data that does not produce a fault on the diagnostic tool because the data is inconsistent. Therefore, this stage is used to:
– perform fault finding on faults that do not have a fault display, and which may correspond to a customer complaint.
– check that the system is operating correctly and that there is no risk of a fault recurring after repair.

This section gives the fault finding procedures for statuses and parameters and the conditions for checking them.

If a status is not behaving normally or a parameter is outside the permitted tolerance values, consult the corresponding fault finding page.

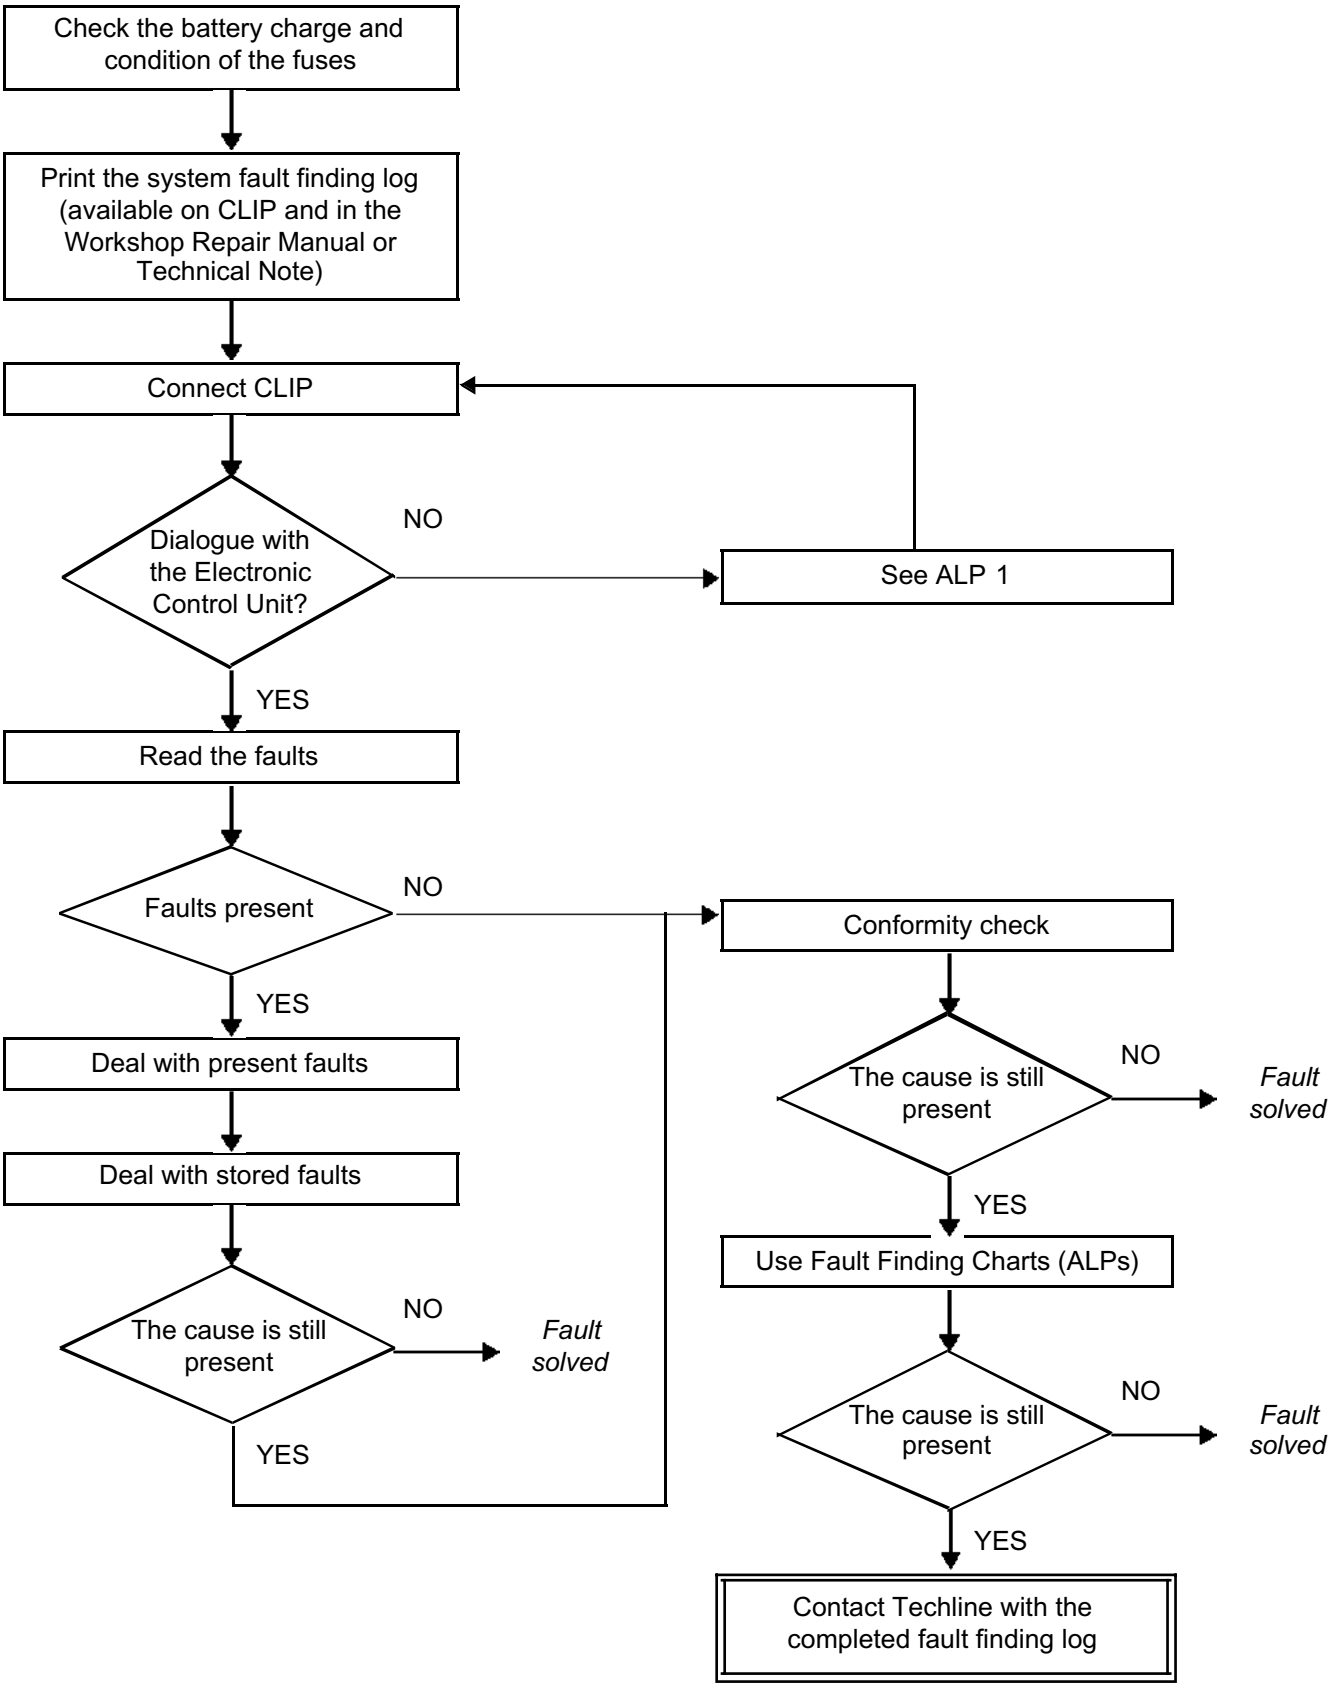
Customer complaints - Fault finding chart

If the test with the diagnostic tool is OK but the customer complaint is still present, the fault should be processed by **Customer complaints**.

A summary of the overall procedure to follow is provided on the following page in the form of a flow chart

GETtheMANUALS.org

4. FAULT FINDING PROCEDURE



GETtheMANUALS.org

4. FAULT FINDING PROCEDURE (continued)

Wiring check:

Fault finding problems:

Disconnecting the connectors and/or manipulating the wiring may temporarily remove the cause of a fault.
Electrical measurements of the voltage, resistance and insulation are generally correct, especially if the fault is not present when the analysis is made (stored fault).

Visual inspection:

Look for damage under the bonnet and in the passenger compartment.
Carefully check the fuses, insulation and wiring routing.
Look for signs of oxidation.

Tactile inspection:

While manipulating the wiring, use the diagnostic tool to note any change in fault status from stored to present.
Check that the connectors are correctly tightened, apply light pressure to the connectors, twist the wiring harness.
If there is a change in status, try to locate the source of the fault.

Inspection of each component:

Disconnect the connectors and check the appearance of the clips and tabs as well as their crimping (no crimping on insulation section).
Make sure that the clips and tabs are properly locked in the sockets.
Make sure no clips or tabs have been dislodged during connection.
Check the clip contact pressure using an appropriate model of tab.

Resistance check:

Check the continuity of entire lines, then section by section.
Look for a short circuit to earth, to **+ 12 V** or with another wire.

If a fault is detected, repair or replace the wiring harness.

GETtheMANUALS.org

5. FAULT FINDING LOG

IMPORTANT!

IMPORTANT:
Any fault on a complex system requires thorough fault finding with the appropriate tools.
The FAULT FINDING LOG, which should be completed during the fault finding procedure, ensures a record is kept of the procedure carried out. It is an essential document when consulting the manufacturer.

IT IS THEREFORE MANDATORY TO FILL OUT A FAULT FINDING LOG EACH TIME FAULT FINDING IS CARRIED OUT.

You will always be asked for this log:
– when requesting technical assistance from Techline,
– for approval requests when replacing parts with mandatory approval, and to be enclosed when returning monitored parts on request. The log is needed for warranty reimbursement, and enables better analysis of the parts removed.

6. SAFETY INSTRUCTIONS

Obey safety rules when working on any component, to prevent damage or injury.
– check the battery voltage to avoid incorrect operation of computer functions,
– use the proper tools.

7. FAULT FINDING

Stored faults are managed the same way for all sensors and actuators.
A stored fault is cleared after 128 recurrence-free starts.

GETtheMANUALS.org

1. SYSTEM OPERATION

Composition

The injection system consists of the:
– accelerator potentiometer,
– clutch pedal switch,
– TDC sensor,
– atmospheric pressure sensor,
– air temperature sensor,
– coolant temperature sensor,
– upstream oxygen sensor,
– downstream oxygen sensor,
– cruise control switch,
– steering column switch,
– cruise control on/off switch,
– fuel vapour absorber,
– injection computer,
– motorised throttle valve,
– 4 injectors,
– 4 pencil coils,
– Pinking sensor,
– camshaft dephaser,
– camshaft sensor (only on K4M),
– turbocharging pressure sensor (F4R turbo only)
– water pump (only on F4R Turbo),
– wastegate solenoid valve (only on F4R Turbo),
– turbocharging solenoid valve (only on F4R-Turbo)
– air pump (only on F4R Turbo engines with an automatic gearbox),
– air pump (only on F4R Turbo engines with an automatic gearbox),
– pressure switch (only on F4R Turbo engines with an automatic gearbox),

Computer

SAGEM S3000 FLASH EEPROM 128-track computer controlling the injection and ignition.

Multipoint injection in sequential mode.

Connections to the other computers:
– air conditioning,
– UCH,
– Automatic Gearbox Electronic Control Unit (ECU Automatic Gearbox).
– airbag,
– ABS/ESP,
– instrument panel.

GETtheMANUALS.org

2. Role of components, operating strategy

Engine immobiliser

The Verlog 3 type immobiliser function is managed by the UCH computer and the engine management computer.

Before any starting request, the engine management computer is protected.

When a starting request is made, the injection computer and the UCH exchange authentication data via the multiplex network; this determines whether the engine start is authorised.

After more than 5 consecutive failed authentication attempts, the engine management computer goes into protection (anti-scanning) mode and no longer tries to authenticate the UCH computer. It only exits this mode when the following sequence of operations occurs:

- the ignition is left on for at least **60 seconds**,
- the message is switched off,
- the injection computer self-supply cuts out when it should (the time varies according to engine temperature).

After this, only one authentication attempt is allowed. If this fails again, repeat the sequence of operations described above.

If the engine management computer still fails to unlock, contact the Techline.

Impact detected

If an impact has been stored by the injection computer, switch off the ignition for **10 seconds**, then switch it back on so that the engine can be started. Clear the faults.

WARNING
Disconnect the injection computer when carrying out any welding work on the vehicle.

Torque management

The torque structure is the system for managing engine torque. It is necessary for some functions like the electronic stability program (ESP), the automatic transmission (BVA) or the sequential gearbox (BVR).

Each inter-system (ESP, automatic gearbox, sequential gearbox) sends the injection computer a torque request via the multiplex network. This arbitrates between the inter-system torque requests and the driver's request (made via the pedal or the cruise control/speed limiter function). The result of the arbitration gives the torque setpoint. Using the torque setpoint, the torque structure calculates the throttle position setpoint, the timing and if the turbocharging function is present, the turbocharging valve (wastegate) setpoint.

GETtheMANUALS.org

Camshaft dephaser

Its role is to modify the valve timing.

The camshaft dephaser is continuously variable in operation.

In applications without a camshaft sensor, the engine phasing is controlled by software. This is the case on engines that do not have a camshaft dephaser.

This information can be viewed through status **ET084 Camshaft dephaser**.

A first strategy called "Memo phasing" is applied to phase the engine management on starting according to the data recorded when the engine last stalled. Wait for the end of auto-feed (power latch and therefore this data to be saved) before disconnecting the computer.

Then, a second program confirms the first decision. It is based on torque analysis.

The injection computer actuates a camshaft dephaser that varies according to the engine:

- **K4M engine**
  Continuous variable inlet camshaft dephaser between **0 and 43**˚ of the crankshaft, controlled by a solenoid valve supplied by an opening cyclic ratio circuit through the injection computer.

- **F4R and F4R-T engines**
  Inlet camshaft dephaser controlled by a solenoid valve with an all or nothing supply from the injection computer.

Camshaft sensor (only on K4M)

The role of the camshaft sensor is:
– to locate the computer cylinders so that the computer correctly synchronises the sequential injection,
– checks the position of the inlet camshaft.

Motorised throttle valve

The throttle valve carries out idling speed regulation and engine air intake modulation functions. It comprises an electric motor and two throttle position potentiometers.
When the engine is idling, the throttle position is regulated according to the idling speed setpoint. This setpoint takes into account the major power consumers (air conditioning) and operating conditions (air temperature and coolant temperature).

GETtheMANUALS.org

Fuel supply management

Fuel is supplied by the fuel pump. It is actuated each time the ignition is switched on for one second, to provide a certain pressure level in the circuit, and thereby achieve a proper start, particularly if the vehicle has been unused for a long time.
When the engine is running, the fuel pump relay is always controlled.

Control of the petrol pump relay can be viewed through status **ET047 Petrol pump control circuit**.

The petrol tank is vented by way of a canister filled with activated charcoal that traps the vapour from the petrol tank. This canister is bled via the engine vacuum pipe. It enters the inlet plenum via a hose, whose section is controlled by a bleed valve. It is controlled by the injection computer via the opening cyclic ratio. For reasons of engine instability or canister bleed solenoid valve operating noise emitted by the vehicle, there are two possible frequencies for controlling the canister bleed solenoid valve:

- a low frequency **8 Hz**,
- a high frequency **20 Hz**.

The frequency of the control opening cyclic ratio depends on the engine speed.
Bleed the canister to drain it as it fills, to limit vapour release into the air if a canister is saturated for example.

Air supply management

The idle speed regulator performs all the calculations required for physical control of the idling speed actuator: the motorised throttle. The functional component of the regulator is adaptive (variation programming and ageing).

If the idling speed regulation conditions are observed, **ET054 Idle speed regulation** is **ACTIVE**, the idling speed regulator continuously positions the motorised throttle to maintain the engine speed at its idling setpoint. The motorised throttle opening ratio necessary to comply with the speed setpoint is then given by parameter **PR091 Idle speed regulation theoretical OCR**.

Note on parameter **PR091**:

This parameter uses only 2 parameters accessible in fault finding frame: **PR444 Idle speed integral correction** and **PR090 Idle speed regulation programming value** which is the integral adaptive action.

- **PR090 Idling speed regulation programming value** is a stored parameter designed to program dispersion and engine ageing for the idling speed regulator. The programming is carried out only when the engine is idling and warm, and no electrical consumer (air conditioning, fan unit, power assisted steering) is operating. So it adjusts slowly.
- **PR444 Idle speed regulation integral correction** is continuously calculated to take into account the air required by consumers.

GETtheMANUALS.org

Adaptive idling speed correction:

Under normal warm operating conditions, the idling speed opening cyclic ratio value **PR091 Idling speed regulation theoretical OCR** varies between a high value and a low value to obtain the nominal idling speed.
After operating dispersion (running in, engine fouling, etc.), the opening cyclic ratio value may be close to the high or low values.

The adaptive correction **PR090 Idle speed regulation programming value** on the idling speed opening cyclic ratio compensates for the gradual variations in the engine's air requirement, by bringing the idling speed opening cyclic ratio back to an average nominal value.
This adjustment only takes effect if the coolant temperature is above **75 °C**, **1 minute** after starting the engine and during the idle speed regulation phase.

Idling speed setpoint calculation:

The idling speed setpoint is given by parameter **PR536 Idle speed regulation valve setpoint**.
The idling speed regulation setpoint depends on the coolant temperature, the emissions control programming, the climate control requirements, the position of the gearbox selector, any power assisted steering action, the passenger compartment heating resistors, the oil temperature (engine protection) and the electricity balance calculated by the injection software (the engine speed is increased by **160 rpm** maximum if the battery voltage remains below **12.7 V**).

Richness management

For optimum operation of the catalytic converter, it is necessary to adjust around richness 1.

Richness regulation is controlled by the upstream sensor. The sensor gives voltage according to the difference between the partial oxygen pressures contained in the exhaust and a cavity filled with a reference mixture (atmosphere).

As the partial oxygen pressure in the exhaust is representative of the richness, the voltage supplied to the computer represents a Rich - Lean signal.

Adaptive richness correction:

In loop mode, the richness regulation corrects the injection time to obtain a a mixture as close as possible to richness 1. The richness correction value **PR138 Richness correction** is around **50 %**, with thresholds of **0** and **100 %**.
The richness adaptive corrections **PR143 Self-adapting richness gain** and **PR144 Self-adapting richness offset** are used to offset the injection mapping to centre richness regulation on **50 %**.
Adaptive corrections take **50 %** as an average value after computer initialisation (clearing the programming) and have the following limit values:

GETtheMANUALS.org

A vehicle is fitted with an upstream sensor if the configuration reading **LC003 Upstream oxygen sensor** is **WITH**.

For the upstream sensor to be operational very rapidly, it is heated. Sensor heating **ET052 Upstream O_2 sensor heating** is only **ACTIVE** when the engine is running. It is disabled above **84 mph (140 km/h)** or with the engine under load.

The downstream sensor is also used for richness regulation via the double loop program. The way it works is to characterise the condition of the upstream sensor and to compensate for any upstream sensor dynamic richness drift.

The vehicle is fitted with a downstream sensor if the configuration reading **LC004 Downstream oxygen sensor** is **WITH**.
For the double loop **ET056 Double richness loop** to be **ACTIVE**, the vehicle must be driven with the engine warm for approximately **1 minute 30 seconds** in the absence of no load conditions.

The downstream sensor is also heated. The command is not immediate when the engine is started. **ET053 Downstream O_2 sensor heating** is **ACTIVE** after a time that depends on the latest coolant temperature with the engine running and in the absence of no load conditions. The heating of the downstream sensor is deactivated under **84 mph (140 km/h)** or when the engine is under load.

There are several types of control depending on the sensor type:

- **BOSCH LSH25/NTK 6L (6 Ω)/DELPHI AFS128 (3 wires):** Continuous control,
- **BOSCH LSF 4.7 (known as PLANAR):** Each time the engine is started, control is first executed by means of an OCR type signal of **20 Hz** in frequency for approximately **20 seconds** then it becomes continuous,
- **BOSCH NTK 6L (3.3 Ω):** each time the engine is started, control is at first continuous for **15 seconds** and is then controlled by means of an OCR type signal with a frequency of **20 Hz**.

Management of turbocharging pressure (F4R Turbo only)

The turbocharging pressure is adjusted via the position of the pressure regulation valve (wastegate).

Principle

This pressure adjustment valve is linked via a rod to the wastegate diaphragm and is controlled by the injection computer via a solenoid valve. This solenoid valve is normally open and is fitted to the inlet pipe between the air filter and turbocharger inlet.

In the rest position, (open), this solenoid valve links the turbocharger outlet (turbocharging pressure) and the pressure regulation valve control diaphragm.

The turbocharging pressure affects the diaphragm directly, the pressure regulation valve (wastegate) opens and the maximum possible pressure is approximately **1,350 mbar - 1,400 mbar**, irrespective of the engine speed (minimum turbocharging for the engine).

When the solenoid valve is controlled, the turbocharging pressure signal (taken at the turbocharger outlet) is diverted to the compressor inlet. As a result, the diaphragm is not subject to turbocharging pressure, the pressure regulation valve (wastegate) closes back to a position imposed by the regulation system.

GETtheMANUALS.org

In addition to turbocharging pressure management, the computer controls the engine for full load constant torque operation.

This means that, irrespective of the engine conditions (air temperature, atmospheric pressure etc.), the maximum torque will always be **275 Nm** and the power **125 kW**. Therefore, for an air temperature of **20 °C**, the turbocharging pressure at full load will be less than at **50 °C**. Except for controlled torque management, the turbocharging pressure can never exceed **1800 mbar**.

Ignition management

The advance is calculated for each cylinder. This may have a negative value, and is limited to between **- 23.625 °** and **+ 72 °** and includes any corrections due to pinking.

The slow loop anti-pinking correction is the maximum advance value that is deducted from the advance of one of the cylinders. If none of the cylinders is pinking, this correction is zero.

Injectors

The injectors are controlled according to several modes. In particular, the engine is started in semi-full group mode (injectors 1 and 4, then injectors 2 and 3 simultaneously), then it enters sequential mode, to ensure a correct start whether or not it is correctly phased.

In fact in rare cases it is possible for the engine to run incorrectly phased if the Memo phasing program failed during the last engine stop. So, since the system did not enter sequential injection mode and the cylinder 1 detection program did not run, the injections are offset by 2 cylinders: therefore injecting in the order 4-2-1-3 rather than the expected 1-3-4-2.

The injection time is constantly calculated and may be zero, in the event of cut-off during deceleration or overspeed for example.

Vacuum pump/pressure switch system

The electric vacuum pump (on a petrol engine) helps create a vacuum when there is not a sufficient vacuum in the inlet manifold at low speeds (fewer rpm, less power).

GETtheMANUALS.org

3. OBD management

Managed OBD programming is as follows:
- catalytic converter operational fault finding,
- upstream oxygen sensor operational fault finding,
- misfiring fault finding with two levels of detection: pollutant misfiring and catalytic converter breakage misfiring,
- fuel supply system fault finding.

The misfiring and fuel supply system fault finding is performed continuously.

The operational fault finding for the upstream sensor and the catalytic converter can be only be carried out once per journey, and can never occur at the same time.

OBD fault manager:

The OBD faults manager does not replace or modify conventional electrical fault management. Perform to comply with OBD standard.

The requirements are:
- storing OBD faults,
- illuminate the OBD warning light for all faults where the OBD emission thresholds are exceeded,
- flash the OBD warning light for misfire faults damaging the catalytic converter.

Operating principle

If a fault is detected and confirmed during **3** consecutive journeys then:
- an OBD stored fault is displayed,
- the OBD fault warning light receives a request to be lit continuously. This request is only recognised if the fault in question is authorised to activate the OBD warning light.

To deactivate the warning light, no OBD faults should be detected for **3 consecutive** journeys.

The electrical fault finding checks taken into consideration by the OBD faults manager are as follows:

- pressure,
- turbocharging pressure,
- coolant temperature,
- air temperature
- vehicle speed
- upstream sensor,
- downstream sensor,
- missing tooth on crankshaft target,
- no tooth signal,
- flywheel target fault,
- upstream sensor heating,
- downstream sensor heating,
- injector 1,
- injector 2,
- injector 3,
- injector 4,
- ignition coil 1,
- ignition coil 2,
- ignition coil 3,
- ignition coil 4,
- petrol pump,
- wastegate,
- canister bleed,
- air line system,
- turbocharging system
- pressure consistency,
- pinking sensor,
- camshaft dephaser.

GETtheMANUALS.org

Catalytic converter:

Purpose

Catalytic converter operational fault finding should detect a malfunction which would cause hydrocarbon pollutant emissions to exceed the EOBD limit.

Principle

The ability of the catalytic converter to store oxygen indicates the condition of the catalytic converter.
As the catalytic converter ages, its ability to store oxygen reduces along with its ability to treat pollutants. The principle lies in using the correlation between the oxygen storage capacity and the HC emissions.
When the conditions for starting fault finding are confirmed, richness excitation peaks are applied, which has the effect of sending bursts of oxygen into the catalytic converter.
If the catalytic converter is in good condition it will absorb the oxygen sent to it and the downstream sensor voltage will remain at its average value.
If it is damaged, it rejects the oxygen that it cannot store and the downstream sensor starts knocking. The more the catalytic converter is damaged, the more the downstream oxygen sensor will oscillate.

Catalytic converter air pump heating system

With the new OBD standards, accelerates the heating up of the catalytic converter when the engine is cold. During this operating phase, the air-fuel mixture is rich and contains large amounts of carbon dioxide (CO) and hydrocarbons (HC). To improve operation, add oxygen to oxidise the carbon dioxide and hydrocarbons and heat up the catalytic converter.
The role of the air pump is to inject air (oxygen) into the exhaust manifold to heat up the catalytic converter.

Sensors:

Purpose

Sensor converter operational fault finding must be able to detect a malfunction causing pollutant HC emissions to exceed the EOBD threshold.

There are 2 kinds of oxygen sensor damage:
- mechanical damage to the component (breakage, cut in wire) which leads to an electrical fault,
- chemical or thermal damage to the component leading to a slower response time of the sensor and to the increase in the average reaction time.

Description of programming

When the conditions for starting fault finding are confirmed, read the upstream sensor signal periods by removing the glitches (interference phenomena), then take the average, and compare with an EOBD limit average period.
The fault finding check may be staggered, i.e. divided over several consecutive engine stability phases, and its duration will vary according to the condition of the sensor.

GETtheMANUALS.org

4. Engine coolant temperature management

Engine cooling is provided by 1 or 2 fan assemblies (depending on the vehicle layout). The injection computer requests their activation by the air conditioning computer via the multiplex network.

To provide cooling:

With the engine running, fan unit 1 is requested if the coolant temperature exceeds **99 ˚C** and is shut down if the coolant temperature falls below **96 ˚C**. Fan unit 2 is requested if the coolant temperature exceeds **102 ˚C** and is shut down if the coolant temperature falls below **99 ˚C**.

With the engine off, only fan assembly 1 may be activated to provide the anti-percolation function (if engine is stopped when very hot). The anti-percolation function is active with the ignition off for a determined period. During this period, fan unit 1 is requested if the coolant temperature exceeds approximately **100 ˚C** and is shut down if the coolant temperature drops below around **95 ˚C**.

If a fault is detected on the coolant temperature sensor circuit, then fan assembly 1 is requested to operate continuously.

If the engine coolant temperature goes beyond the warning threshold of **118 ˚C**, the injection computer requests the instrument panel computer via the multiplex network to illuminate on the coolant temperature warning light until the coolant temperature falls back below **115 ˚C**.

In addition to the engine requirements, the injection computer centralises the cooling requirements for the Air conditioning and Automatic gearbox/Sequential gearbox functions.

5. Air conditioning function

The S3000 computer manages a cold loop air conditioning system.
- request for air conditioning by logical link,
- acquisition of air conditioning circuit pressure,
- vehicle speed
- air conditioning compressor control,
- fan assembly control for the requirements of this function.

The injection computer recovers the power absorbed by the air conditioning compressor and the fast idling speed request using the pressure acquired in the air conditioning circuit.
These signals are necessary for adapting the engine management (idle speed regulation, air flow correction, etc.), for several reasons:
- air conditioning compressor efficiency,
- sturdier engine to torque bucking caused by compressor activation,
- helping the alternator.

Requests for fan unit 1 and/or fan unit 2 are recovered based on the air conditioning circuit pressure and the vehicle speed. In short, the lower the speed and the higher the pressure, the greater the fan unit requests.

GETtheMANUALS.org

6. Defect modes

Motorised throttle valve
In defect mode, the motorised throttle valve can have 6 different statuses.

Type 1	The throttle opening is less than the Safe mode position. The throttle is no longer activated and is automatically in Safe mode. The ESP, distance control and cruise control/speed limiter systems are disabled. The automatic transmission is in "Safe mode".
Type 2	The throttle opening is no longer actuated. The engine speed is limited by injection cut-off.
Type 3	Defect mode is associated with restructuring of the pedal setpoints (constant pedal setpoint for each gear).
Type 4	The associated defect mode restricts the throttle opening. The maximum throttle valve opening threshold results in a speed of below 54 mph (90 km/h).
Type 5	The computer no longer processes torque changes requested by the ESP, distance control, cruise control/speed limiter and automatic gearbox systems. This defect mode results from a computer malfunction, or a fault with the manifold or turbocharging pressure sensor. The system then only uses the accelerator pedal signal. The ESP, distance control and cruise control/speed limiter systems are disabled. The automatic transmission system is in Safe mode.
Type 6	The turbocharging valve no longer works.

Any entry into type 1 to 5 defect mode always leads to the application of type 6.

DF198 Pedal potentiometer circuit gang 2				**CO.0/** **CC.1**		
DF508: Motorised throttle control	**CC.1** **1.DEF**	**CC.1** **1.DEF**				

Camshaft dephaser:

The camshaft dephaser **ET083 Camshaft dephaser in defect mode** may assume two different statuses.

- **Status 1**
  This defect mode covers all faults that affect the dephaser position measurement. The dephaser is set to the minimum stop and the camshaft angle measurement is forced to 0.
  Tooth signal fault.
  Tooth/camshaft signal consistency diagnostic.

- **Status 2**
  This defect mode covers all faults affecting the dephaser (pulley and solenoid valve). The dephaser is set to the minimum stop.
  Electrical fault finding on the solenoid valve.
  Dephaser position fault finding procedure.

GETtheMANUALS.org

7. OPERATIONAL SAFETY

Warning lights illumination

The S3000 injection system manages the illumination of three warning lights and the display of warning messages according to the severity of the faults detected, with the aim of informing the customer and guiding fault finding.
The injection computer manages the illumination of warning lights and warning messages displayed on the instrument panel. These warning lights illuminate during the starting phase and in the event of an injection fault or engine overheating.
The warning light illumination signals reach the instrument panel via the multiplex network.

Warning light illumination principle

During the starting phase (START button pressed), the **OBD** (On-Board Diagnostic) warning light comes on for approximately **3 seconds** then goes out.

If there is an injection fault **(level 1)**, the message **CHECK INJECTION** is lit, followed by the **SERVICE** warning light. It indicates a reduced level of operation and a limited safety level.
The driver should carry out repairs as soon as possible.
Components involved:
– motorised throttle valve,
– accelerator pedal potentiometer,
– inlet manifold pressure sensor,
– computer,
– actuator feed,
– computer feed.

If there is a serious injection fault (**level 2**), the red engine symbol and the word **STOP** (display with information display only), appears with the message **ENGINE OVERHEATING** followed by the **STOP** warning light and a buzzer. If this happens, the vehicle must be stopped immediately.
When a fault causing excessive pollution in the exhaust gases is detected, **the orange OBD warning light** engine symbol is lit:
– **flashing** in the event of a fault which might cause destruction of the catalytic converter (destructive misfires). If this happens, the vehicle must be stopped immediately.
– **constantly** in the case of non-compliance with the anti-pollution standards (polluting misfires, catalytic converter fault, oxygen sensor faults, inconsistency between the oxygen sensors and canister fault).

Mileage travelled with fault

This parameter counts the mileage travelled with one of the injection fault warning lights lit: level 1 fault warning light (amber), coolant temperature overheating warning light, or OBD warning light. The meter can be reset using the diagnostic tool.

Special note
When running an actuator injector command, the instrument panel information display displays **OIL PRESSURE FAULT**. Disregard this message and do not deal with any fault (only in the present case where you are running an injection actuator command: expected system effect).

GETtheMANUALS.org

8. Mileage travelled with fault

These two parameters **PR105 Distance travelled with OBD fault warning light on** and **PR106 Distance travelled with fault warning light on** are used to count the distance travelled with one of the injection fault warning lights lit: **level 1 fault warning light** (amber) as well as the **OBD warning light**.
These counters can be reset to 0 using the diagnostic tool (clear faults command).

9. Inter-system engine functions

The inter-system connections concerning the particular requirements of engine management are as follows:

- **OBD warning light** illumination request by the instrument panel computer to prevent a pollution fault,
- **level 1 warning light** illumination request to warn of an operating safety fault relating to the injection system,
- **level 2 warning light** illumination request to warn of an operating safety fault or provide an engine overheating alert,
- fan unit activation request for engine cooling requirements, but also for the air conditioning and Automatic transmission/Sequential gearbox,
- air conditioning compressor shut-down request for engine programming requirements such as pulling away, performance, anti-stalling, overspeed, etc.
- passenger compartment heating resistor shut-down or fixing request for engine programming requirements such as pulling away, performance, anti-stall, overspeed, etc.

1. COMPUTER REPLACEMENT AND PROGRAMMING OPERATIONS

The system can be programmed and reprogrammed via the diagnostic socket using the RENAULT CLIP diagnostic tool (**Consult Technical Note 3585A or follow the instructions provided by the diagnostic tool**).

IMPORTANT:
- **switch on the diagnostic tool (mains or cigarette lighter supply),**
- **Connect a battery charger (during the entire computer (re)programming procedure, the engine fan assemblies are triggered automatically).**
- **Observe the engine temperature setpoints given on the diagnostic tool before (re)programming.**

Whenever the computer has been programmed, reprogrammed or replaced:

- **Switch off the ignition.**
- **Start and then stop the engine (to initialise the computer) and wait 30 seconds.**
- **Turn on the ignition and use the diagnostic tool to carry out the following steps:**
- Use command **VP010 Enter VIN**.
- deal with any faults declared by the diagnostic tool. Clear the computer memory.
- program the flywheel sensor target and throttle stops,
- carry out a road test followed by another check with the diagnostic tool.

IMPORTANT
It is not possible to test an injection computer from the Parts Department because it cannot be fitted on any other vehicle.

2. REPLACING OR REMOVING THE TDC SENSOR

When replacing or removing the TDC sensor, program the flywheel target.

IMPORTANT
- The injection computer retains the immobiliser code for life,
- the system has no security code,
- it is forbidden to perform tests with computers borrowed from the Parts Department or from another vehicle which must then be returned. These computers are hard-coded.

GETtheMANUALS.org

3. REPLACING THE MOTORISED THROTTLE VALVE

When replacing a throttle valve, program the throttle stops using command **RZ005 Programming**.

IMPORTANT
Never drive the vehicle without having programmed the throttle stops.

4. CATALYTIC CONVERTER REPLACEMENT

IMPORTANT
Never perform **a Catalytic converter fault finding check** before following the steps below.

When replacing the Catalytic converter, be sure to observe the following recommendations:
- with the engine running,
- run the GMV for 2 cycles so that the catalytic converter can remember these conditions for normal use.

After carrying out the recommendations, activate command **SC006 Start OBD test: catalytic converter** using the diagnostic tool.

2. PROGRAMMING

Programming the flywheel target

Accelerate up to **4000 rpm** in 3rd gear then decelerate to power take-up* speed. Then repeat immediately.

Check the programming using **ET089 Flywheel target programming**.

Programming the throttle end stops

Following replacement of the computer or motorised throttle valve, after turning on the ignition, wait **30 seconds** for the computer to memorise the MAXIMUM and MINIMUM stops.

Check the programming using **ET051 Throttle stop programming**.

* This is the moment when, during deceleration with no load, the engine drops to idling speed and recovers torque.
