Safety symbol (special precautions to be taken when carrying out operations).

SPECIAL TOOLING REQUIRED	
Cha. 280-02	**Adaptor cup for trolley jack**

If a trolley jack is used, appropriate axle stands must always be used.

IMPORTANT:
The vehicle subframe is protected by products which guarantee against corrosion for 12 years.

Materials fitted with rubber pads should always be used to prevent any direct metal to metal contact which could damage the original corrosion protection.

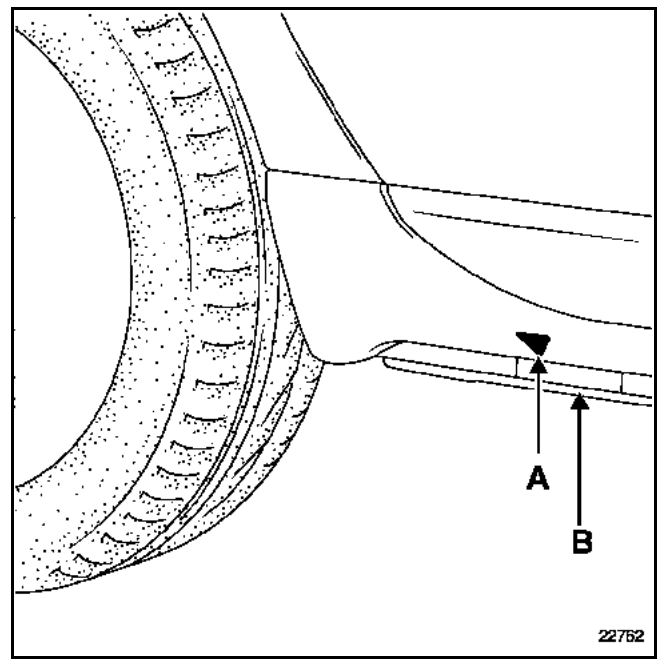
The vehicle **must not** be raised by placing the jack beneath the front suspension arm or under the rear axle.

To lift a front or rear wheel, place the jack at (B) on the subframe underbody flange in alignment with marks (A).

To lift both the front and rear wheels laterally, use the cup **Cha. 280-02**.

Place the jack under the sill body flange at the centre point of the front door.

CAUTION:
Position the body flange correctly into the shim groove.



To move the vehicle onto axle stands, lift the entire vehicle laterally and position the axle stands under the body flange stiffeners provided for the tool kit trolley jack (B).

GETtheMANUALS.org

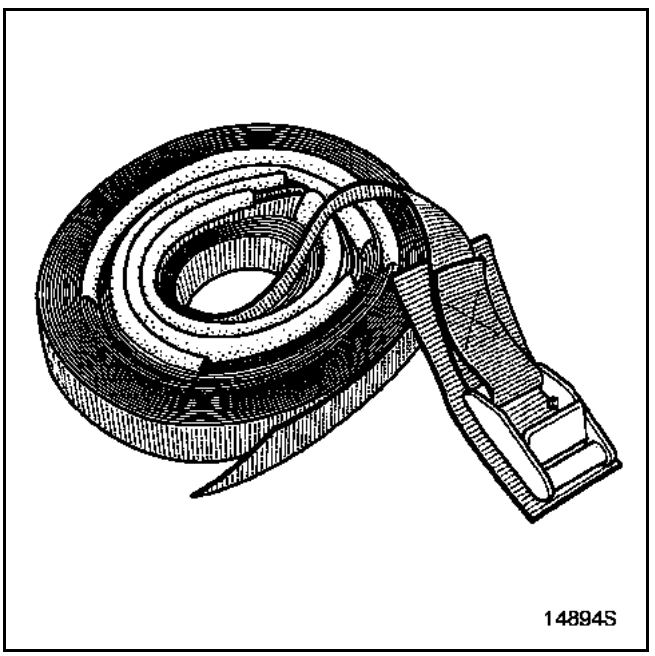
SAFETY NOTES

If heavy components need to be removed from the vehicle, it is preferable to use a four-post lift if possible.

In fact, after removing a large component (for example: engine and transmission assembly, rear axle, fuel tank, etc.), the vehicle has lost a large proportion of its load and there is a risk that it can become unstable on two-post lift supports (see the position of the arms further on).

This is even more dangerous when the vehicle is lifted to greater height

When the vehicle is lifted from underneath the body by a two-post lift it is necessary to fit safety straps which are available at **Parts Stores** part no.: **77 11 172 554**.



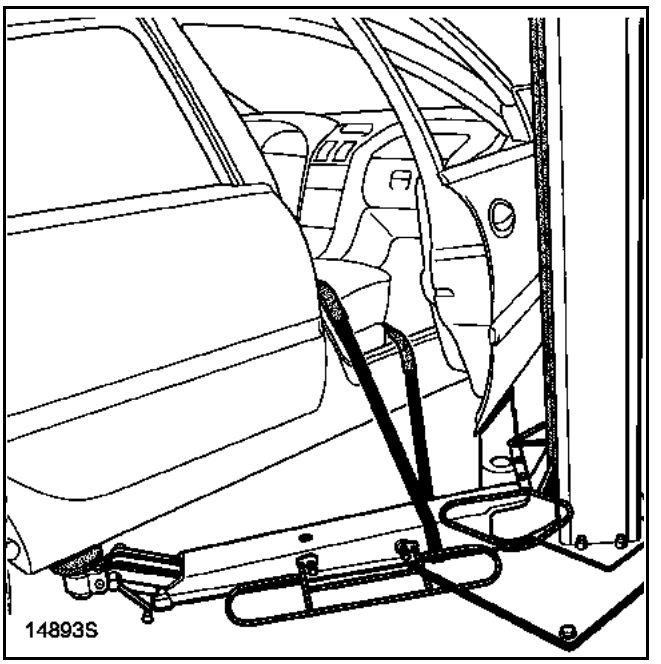
FITTING THE STRAPS

For obvious safety reasons, these straps should be kept in perfect condition (if they become frayed, replace them immediately).

When fitting the straps, check that the protectors are located on the seats and the fragile parts of the vehicle, do not overtighten the straps.

Place the straps under the post-lift arms and pass them around the vehicle.

The following example demonstrates the vehicle lashing for an operation on the front of the vehicle.

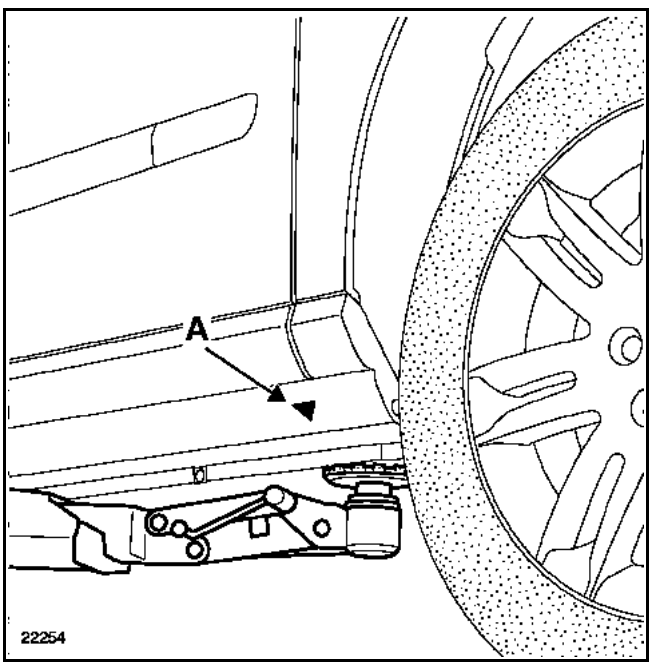


GETtheMANUALS.org

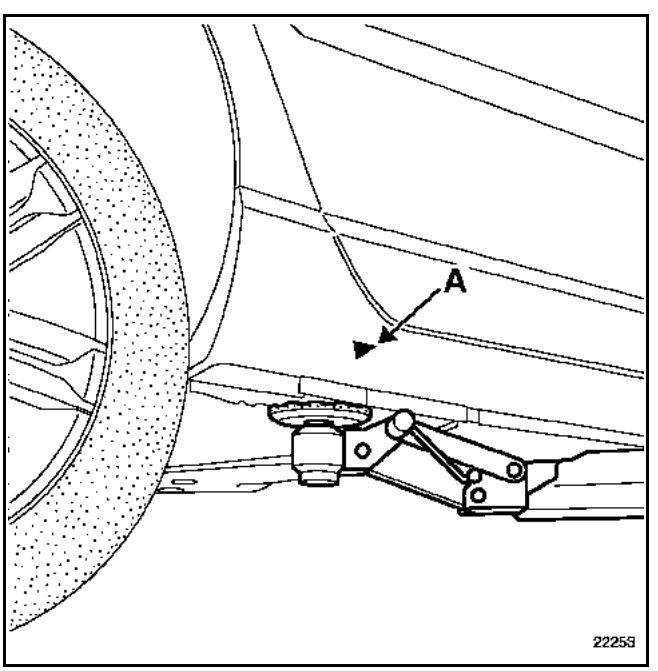
POSITIONING OF THE LIFTING ARMS

Position the lifting arm on the subframe underbody flange in alignment with the markings (A).

FRONT



REAR



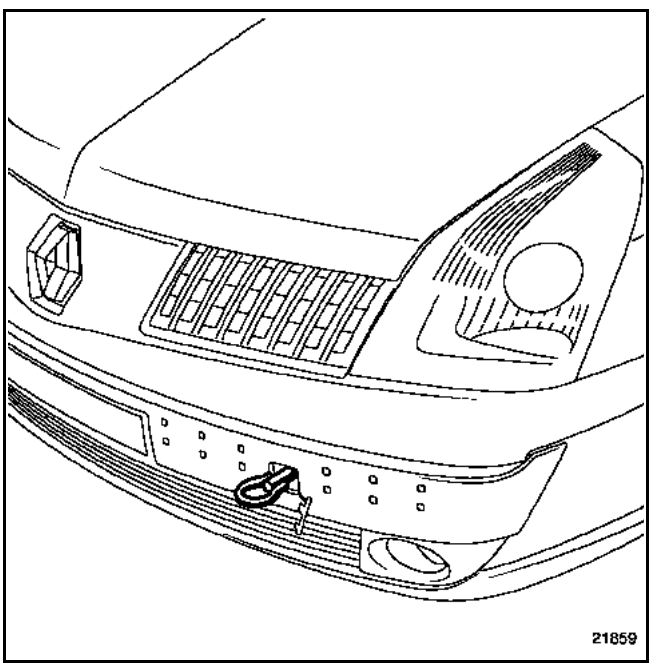
GETtheMANUALS.org

OBSERVE THE TOWING REQUIREMENTS OF THE COUNTRY YOU ARE IN.

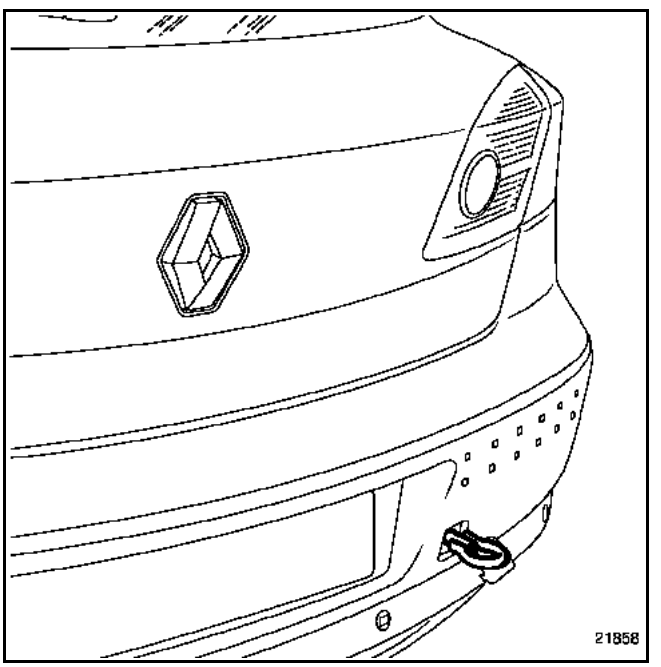
NEVER USE THE DRIVESHAFTS AS AN ATTACHMENT POINT.

The towing points may only be used for towing the vehicle on the road. They should never be used for removing the vehicle from a ditch or to lift the vehicle, either directly or indirectly.

FRONT



REAR



GETtheMANUALS.org

DESCRIPTION	PACKAGING	PART NUMBER
GREASES		
● **MOLYKOTE "BR2"** for main bearing journal faces, thrust pad guide tubes, clutch fork pads, lower suspension arm bearings, torsion bar splines, steering box and driveshaft splines.	1 kg tin	77 01 421 145
● **MOLYKOTE "33 Medium"** bushes, tubular rear axle, anti-roll bar bushes.	100 g tube	77 01 028 179
● **ANTI-SEIZE** (high temperature grease) Turbo, etc.	80 ml tube	77 01 422 307
● **"MOBIL CVJ" 825 Black Star or MOBIL EXF57C** for driveshaft seals.	180 g sachet	77 01 366 100
● **MULTIPURPOSE GREASE** wheel sensor.	Aerosol	77 01 422 308
MECHANICAL SEALANTS		
● **Mastic** for sealing exhaust pipe unions.	1.5 kg tin	77 01 421 161
● **RHODORSEAL 5661**	– Cartridge – 100 g tube	77 01 421 042 77 01 404 452
● **HARDENER KIT (RHODORSEAL 5661)** for side sealing of bearing caps.	Kit	77 01 421 080
● **AUTO blue seal** sealing paste.	100 g tube	77 01 396 227
VARNISHES		
● **"CIRCUIT PLUS"** varnish for repairing heated rear screens.	Bottle	77 01 421 135
BRAKES		
● Brake fluid	0.5 litre bottle DOT 4	77 11 172 381
● "Low viscosity" brake fluid.	0.5 litre bottle DOT 4	77 11 218 589

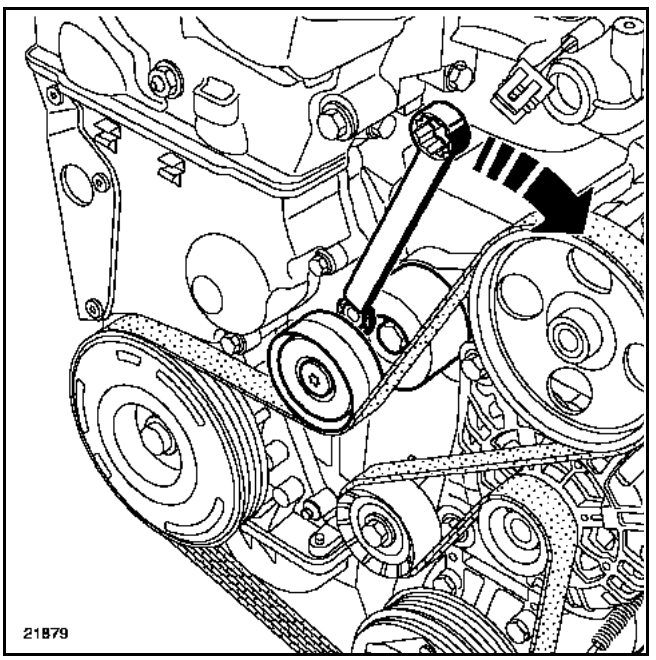
REMOVAL

Put the vehicle on a two-post lift.

Disconnect the battery.

Remove:
– the engine covers,
– the front right wheel,
– the side protection.

To remove the belt, pivot the automatic belt tensioner in the direction shown below using a **16 mm angled ring spanner**.



Remove the accessories belt.

REFITTING

NOTE: never refit a belt once it has been removed, but replace it.

Refitting is the reverse of removal.

Connect the battery and carry out the necessary programming.

GETtheMANUALS.org

REMOVAL

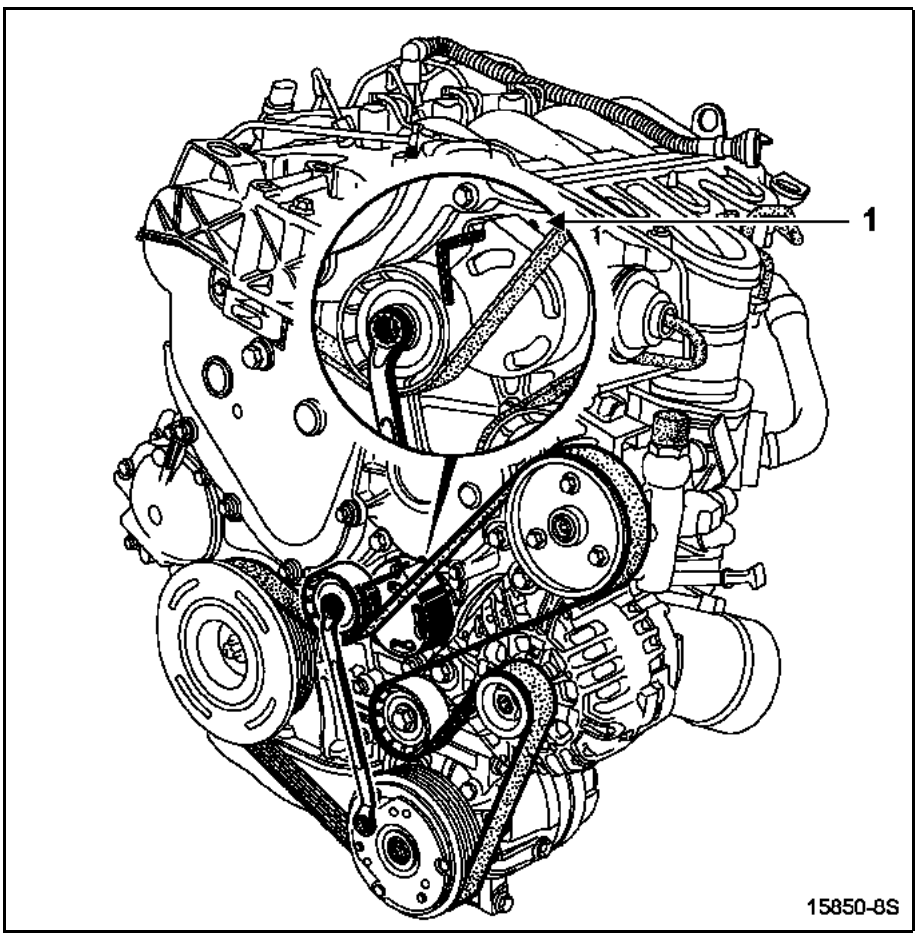
Put the vehicle on a two-post lift.

Disconnect the battery.

Remove:
– the engine covers,
– the front right wheel,
– the side protection.

Special notes for removing the accessories belt

Pivot the auto tensioner **to the left** using a spanner to loosen the belt. Lock the tension wheel by putting a **4 mm** Allen key in the hole (1).



REFITTING

NOTE: never refit a belt once it has been removed, but replace it.

Refitting is the reverse of removal.

Connect the battery and carry out the necessary programming.

GETtheMANUALS.org

REMOVAL

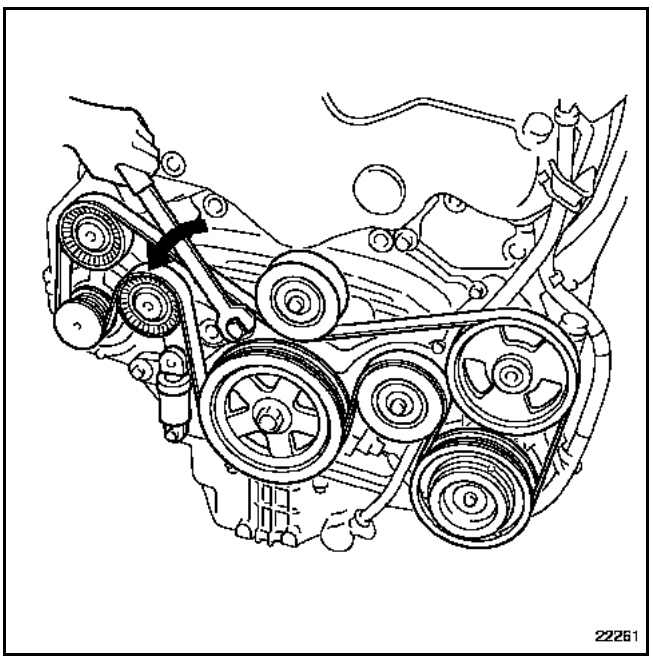
Put the vehicle on a two-post lift.

Disconnect the battery.

Remove:
– the engine covers,
– the front right wheel,
– the side protection.

Special notes for removing the accessories belt

Swivel the auto tensioner as indicated below using a **19 mm** offset wrench to loosen the belt.



Remove the belt.

REFITTING

NOTE: never refit a belt once it has been removed, but replace it.

Refitting is the reverse of removal.

Tighten the tension wheel bolts to a torque of **2.5 daNm.**

Tighten the tension wheel bolts to a torque of **5.8 daNm.**

Connect the battery and carry out the necessary programming.

Accessories belt tensioning

GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Mot. 1505	**Belt tension measuring tool**

REMOVAL

Put the vehicle on a two-post lift.

Remove the engine covers.

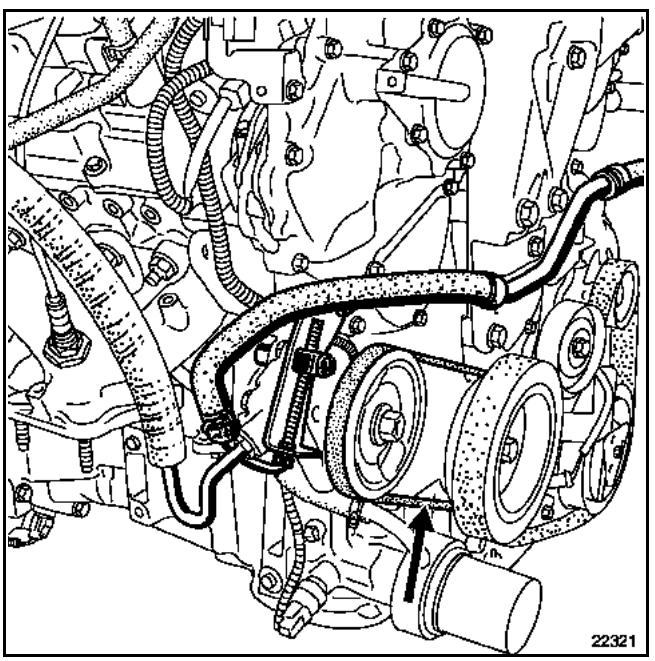
Disconnect the battery.

Remove:
– the front right wheel,
– the side protection.

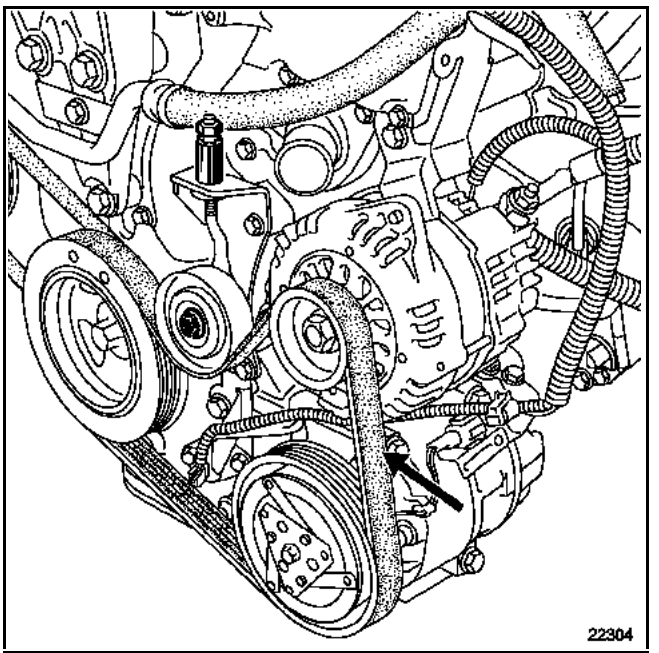
→ **tension checking point**

Components	Power assisted steering pump belt,	Air conditioning compressor and alternator belt,
Fitting tension (Hz)	**234 ± 8**	**260 ± 8**

Power assisted steering pump belt,



Air conditioning compressor and alternator belt,



REFITTING

NOTE: always replace a belt after it has been removed.

Proceed in the reverse order to removal.

Connect the battery and carry out the necessary programming.

GETtheMANUALS.org

CYLINDER HEAD

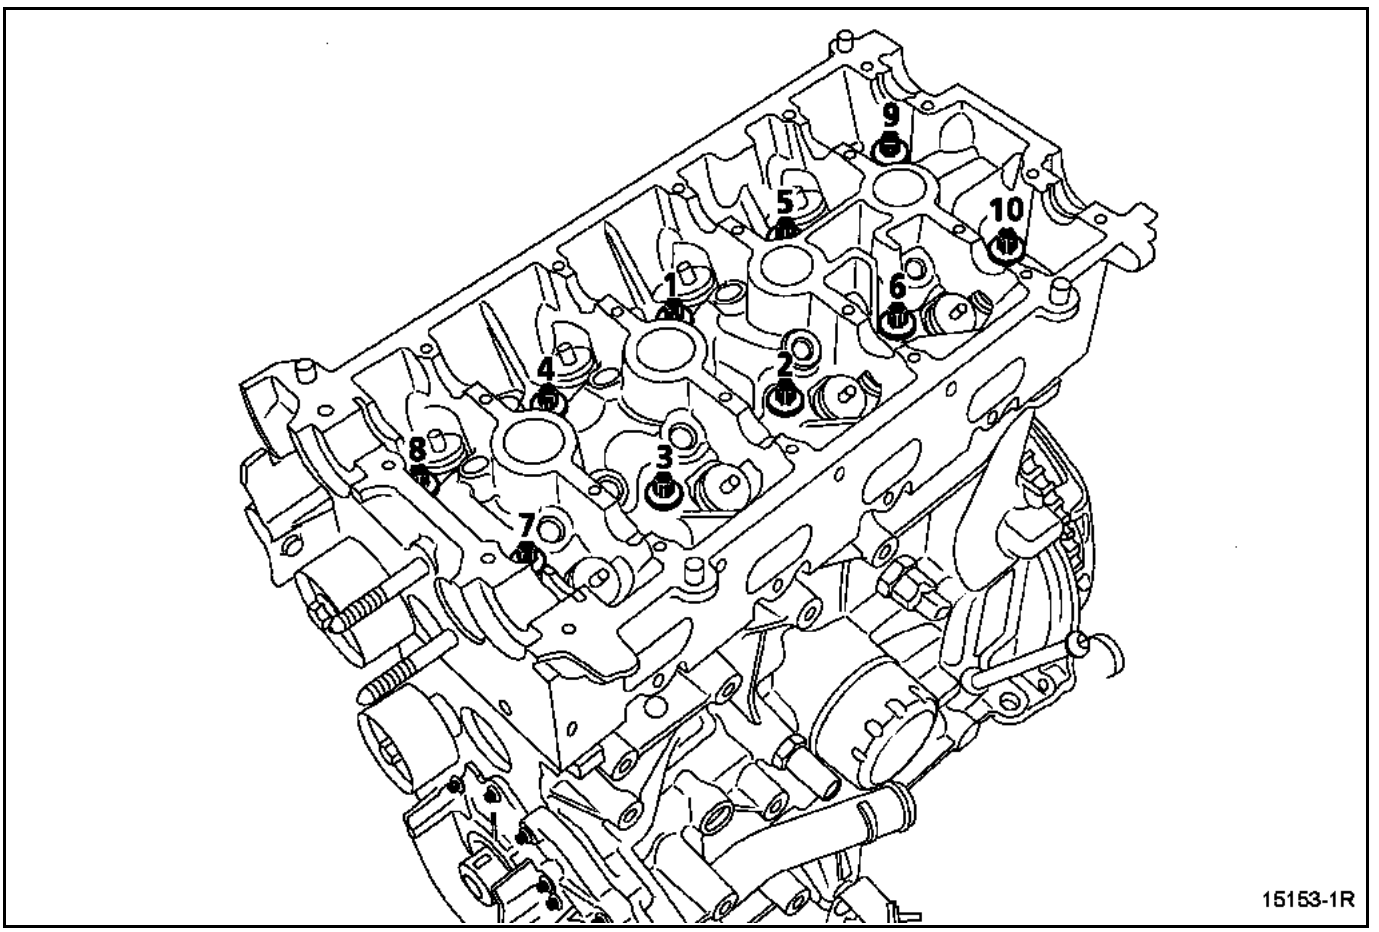
The bolts can be reused if the length under the head does not exceed **117.5 mm** (otherwise replace all the bolts).

Cylinder head tightening procedure

REMINDER: Use a syringe to remove any oil which may have entered the cylinder head mounting bolt holes to achieve correct tightening of the bolts.

Do not oil the new bolts. However, the bolts must be oiled if they are being reused.

Tighten all the bolts to **2 daNm** in the order recommended below.



Check that all the bolts are correctly tightened to **2 daNm** then, bolt by bolt, tighten to an angle of **165° ± 6°**.

Do not retighten the cylinder head bolts after applying this procedure.

GETtheMANUALS.org

CYLINDER HEAD

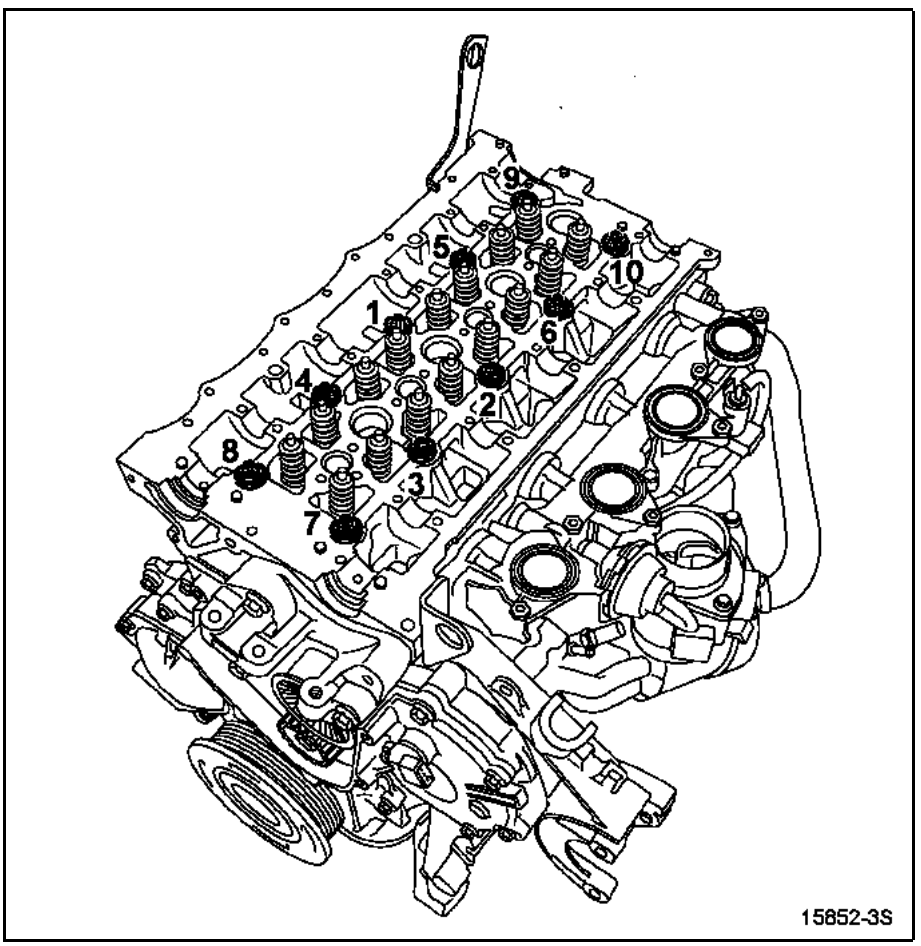
The bolts must be replaced systematically.

Cylinder head tightening procedure

REMINDER: Use a syringe to remove any oil which may have entered the cylinder head mounting bolt holes to achieve correct tightening of the bolts.

Do not oil the new bolts.

Tighten all the bolts to **3 daNm** in the order recommended below.



Check that all the bolts are tightened to **3 daNm** then, bolt by bolt, tighten to an angle of **300° ± 6°.**

Do not retighten the cylinder head bolts after applying this procedure.

GETtheMANUALS.org

CYLINDER HEAD

The bolts must always be replaced.

Cylinder head tightening procedure

REMINDER: Use a syringe to remove any oil which may have entered the cylinder head mounting bolt holes to achieve correct tightening of the bolts.

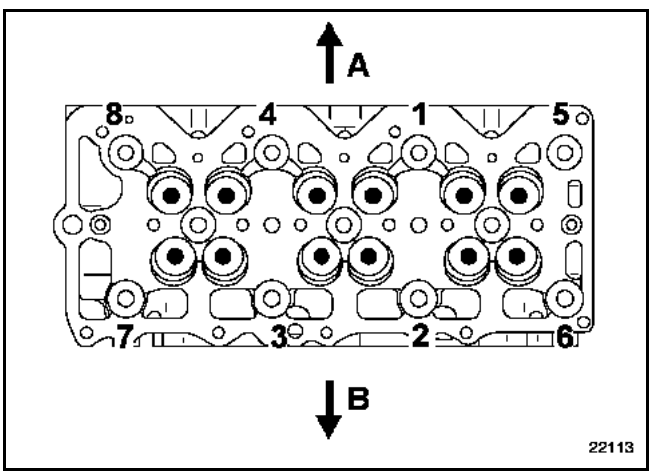
First stage:
– Tighten all the bolts to **3.9 daNm** in the order recommended below.

Second stage:
– bolts numbered **1** to **4**: angle-tighten to **130°**
– bolts numbered **5** to **8**: angle-tighten to **110°**

Third stage:
– bolts numbered **1** to **4**: angle-tighten to **130°**
– bolts numbered **5** to **8**: angle-tighten to **110°**

A: inlet side

B: exhaust side



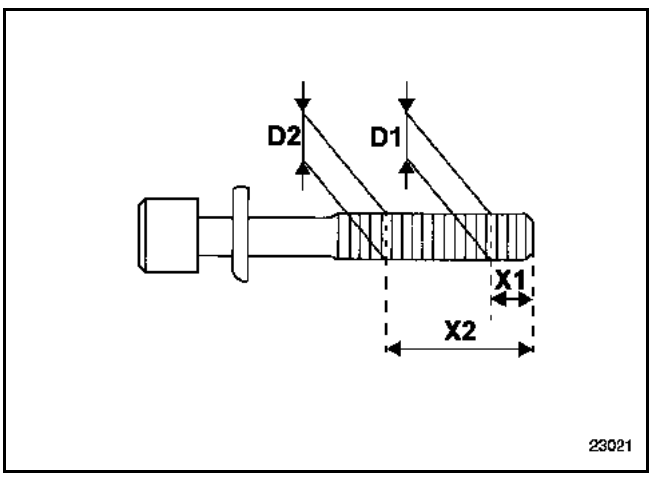
Do not retighten the cylinder head after carrying out this procedure.

Tightening the cylinder head

GETtheMANUALS.org

Cylinder head tightening procedure

The bolts can be reused if the difference between D1 and D2 (shown by the dimensions X1 and X2) is less than or equal to **0.11 mm**.



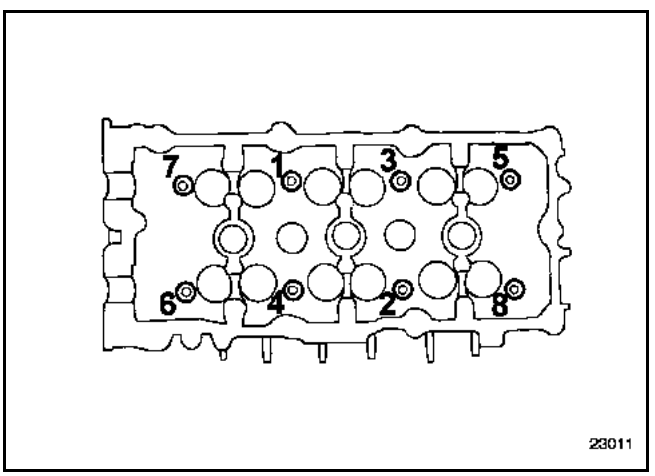
X1: 11 mm
X2: 48 mm

REMINDER: to achieve correct tightening of the bolts, use a syringe to remove any oil which may have entered the cylinder head mounting holes.

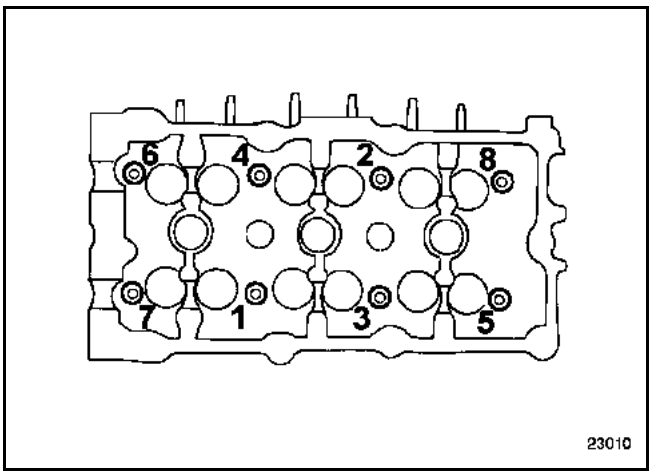
Do not oil the new bolts. However, the bolts must be oiled if they are being reused.

Tighten all the bolts to **10 daNm** in the order recommended below.

Front cylinder head



Rear cylinder head



Loosen the bolts.

Tighten to **4 daNm**.

First angle-tighten to **95°**.

Then angle-tighten to **95°**.

Do not retighten the cylinder head bolts after performing this procedure.

GETtheMANUALS.org

Engine	Rim	Tyres	Tyre pressure when cold (in bar) (1)	
			Front	Rear
F4R	7 J 17	225/55 R 17	2.2	2.0
	7.5 J 18	245/45 R 18	2.2	
V4Y	7 J 17	225/55 R 17	2.5	
	7.5 J 18	245/45 R 18	2.6	
G9T	7 J 17	225/55 R 17	2.3	
	7.5 J 18	245/45 R 18	2.4	
P9X	7 J 17	225/55 R 17	2.4	
	7.5 J 18	245/45 R 18	2.5	

(1) Under full load and/or on motorway.

Wheel bolt tightening torque: **11 daNm.**

Rim run-out: **0.8 mm**

Tyre pressures must be checked when cold. The increase in temperature during driving increases the pressure by **0.2 to 0.3 bar**.

If the pressure is checked when warm, take into account this increase in pressure and **never deflate the tyres**.

Special features of vehicles fitted with the tyre pressure monitor

Each set of four tyres is programmed by computer.

When the winter tyres or wheels are being fitted, and the programming has already been carried out, you only need to change to winter mode using the diagnostic tool. Similarly, when the summer tyres or wheels are being fitted, you need to change to summer mode using the diagnostic tool.

GETtheMANUALS.org

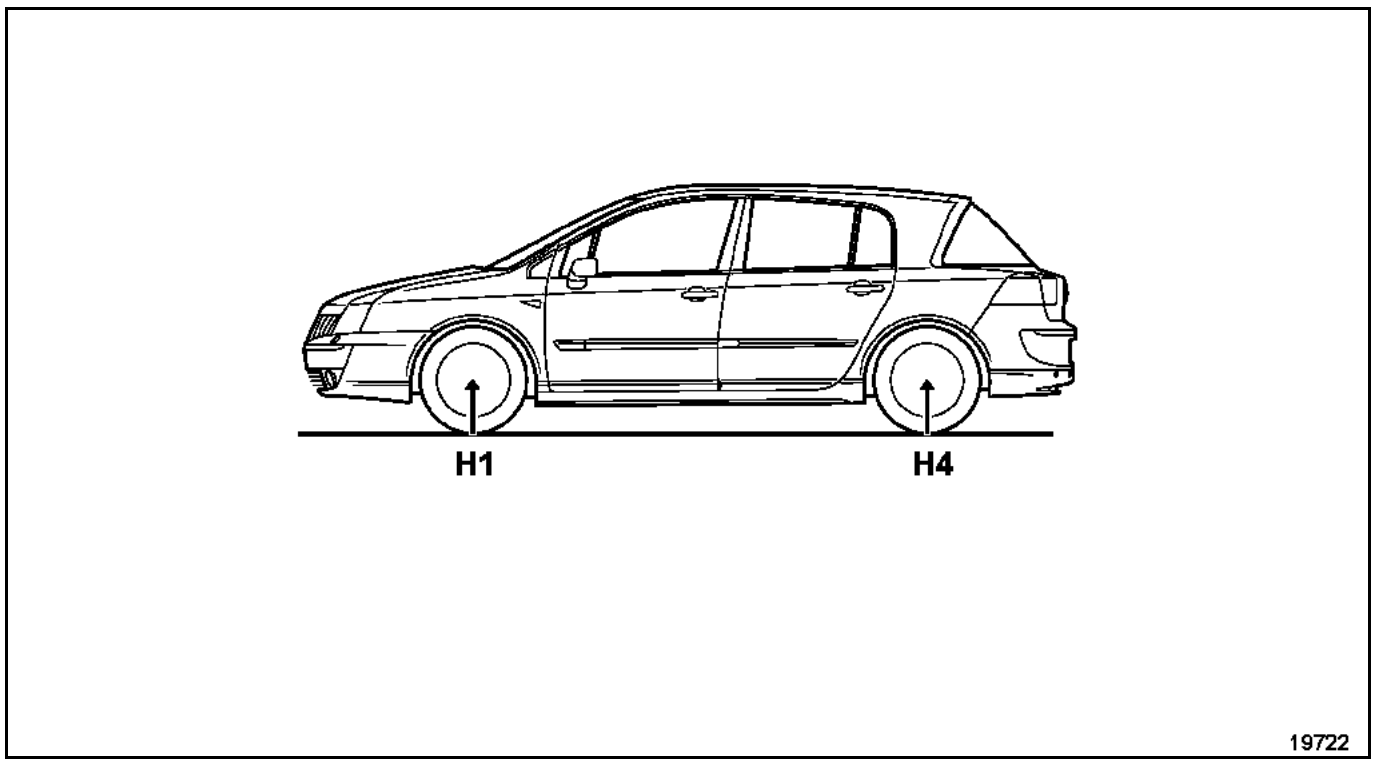
Vehicle type	Disc thickness (in mm)		Disc thickness (in mm)		Maximum disc run-out (in mm)
	Front		Rear		
	Normal	Minimum	Standard	Minimum	
ALL TYPES	28	25.4	11	9.5	0.2

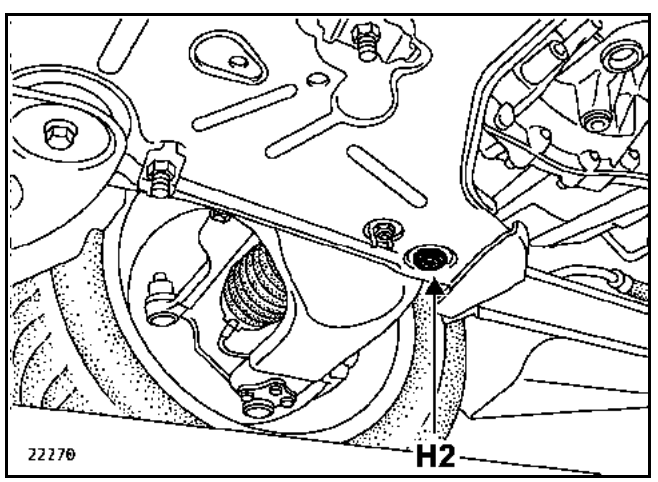
Vehicle type	Brake pad thickness (in mm) (including mounting)				Brake fluid
	Front		Rear		
	New	Minimum	New	Minimum	
ALL TYPES	17.5	8	16.6	8	SAE J 1703 DOT 4 (1)

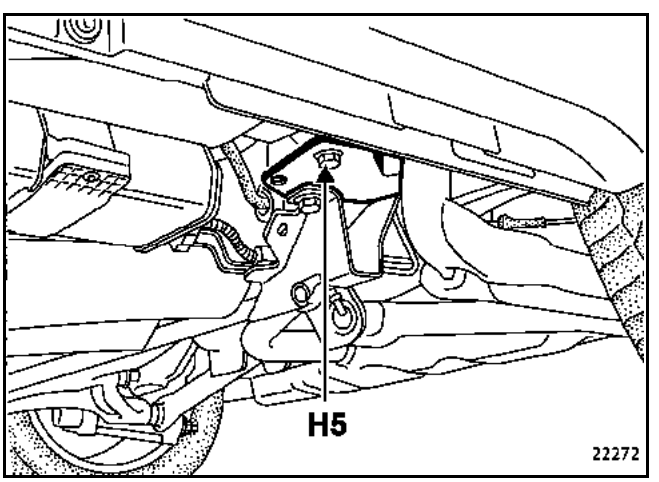
(1) For optimal performance of vehicles equipped with the electronic stability program, RENAULT recommends a brake fluid with low viscosity in cold conditions (maximum **750 mm^2/s at - 40 °C**).

GETtheMANUALS.org

MEASUREMENT POINTS







Dimensions H1 and H4 are measured between the floor and the wheel centrelines.
Dimension H2 is measured between the floor and the lower face of the front securing nut on the lower arm.
Dimension H5 is measured between the floor and the head of the longitudinal arm bearing screw furthest from the wheel.

GETtheMANUALS.org

Engine Workshop Repair Manuals to be consulted depending on the type of engine:
– F4R engine Engine manual **Mot. F4** and F4R engine technical note,
– G9T engine Engine manual **Mot. G9T**,
– P9X engine Engine manual **Mot. P9X**,
– V4Y engine Engine manual **Mot. V4Y**.

GETtheMANUALS.org

OIL CONSUMPTION MEASUREMENT PROCEDURE

a) Topping-up to the maximum level

The operation must be carried out while the engine is warm (after the **cooling fan** has cut in) and after leaving to stabilise for **15 minutes** to allow all the oil to drain into the sump.
Check visually using the dipstick.
Top up to the maximum level.
Seal the drain plug (with a paint mark on both the filler plug and the sump drain plug) in order to be able to check later that it has not been removed.

b) Customer driving

Ask the customer to drive for a period corresponding to about **1 250 miles (2 000 km)** or before the minimum level is reached.

c) Topping up to the maximum level

The operation must be carried out while the engine is warm (after the **cooling fan** has cut in) and after leaving to stabilise for **15 minutes**.
Check visually using the dipstick.
Top up to the maximum level.
Note the quantity of oil and the mileage covered since the last top-up to maximum level.

d) Measurement of oil consumption

$$\text{OIL CONSUMPTION} = \frac{\text{Quantity of oil added (in litres)}}{\text{km (in thousands)}}$$

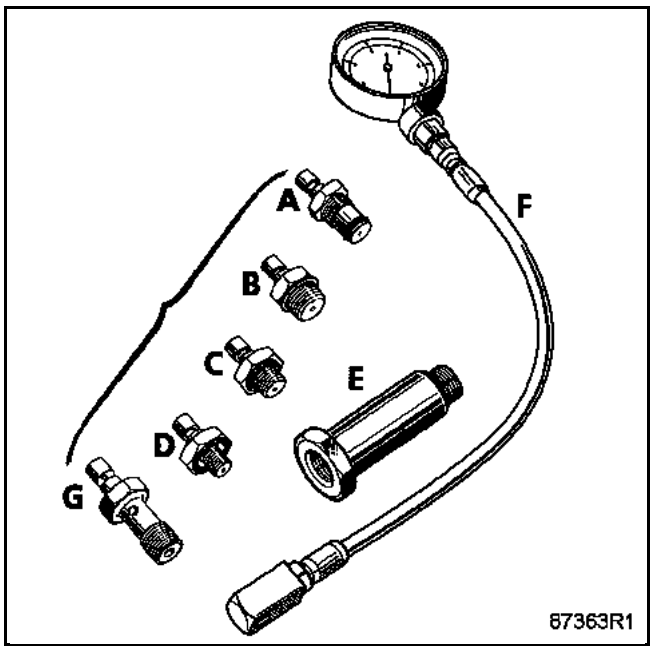
GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Mot. 836-05	Boxed kit for measuring oil pressure
Mot. 1658	Union for measuring oil pressure on P9X and V4Y engines
EQUIPMENT REQUIRED	
22 mm long socket	

CHECKING

The oil pressure should be checked when the engine is warm (approximately **80°C**).

Contents of kit **Mot. 836-05**.



USE

F4R engine	G9T engine	P9X engine	V4Y engine
C + F	F + E + C	Mot. 1658 + F	

Connect the pressure gauge in place of the oil pressure switch.

CHECKING THE ENGINE

F4R engine

Idle speed **1 bar**
3000 rpm **3 bar**

G9T engine

Idle speed **1.6 bar**
3000 rpm **4 bar**

P9X engine

Idle speed: **1.5 bar**
4700 rpm: **2.9 bar**

GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Mot.1202-01 Mot. 1202-02	Pliers for large hose clips
Mot. 1372	Set for removing tamperproof screws
Mot. 1448	Remote operation clip pliers for cooling system hose clips
Mot. 1390	Adjustable engine mounting bracket tool
Mot. 1599	Tool for unclipping heater matrix
T. Av. 476	Ball joint extractor tool

TIGHTENING TORQUES (in daNm or/and)	
Brake calliper mounting bolt	10.5
Shock absorber base bolt	18
Lower ball joint nut	11
Driveshaft gaiter mounting bolt	3
Steering ball joint nut	3.7
Suspended engine mounting upper linkage mounting bolt	10.5
Body mounting bolt for the suspended engine mounting movement limiter	2.1
Mounting bolts on the engine for suspended engine mounting cover	6.2
Engine tie-bar fixing bolts:	
– on the sub-frame	10.5
– on the engine:	18
Bolt mounting the aluminium side members to the lower cross member	4.4
Bolt mounting the aluminium side member tie-rods	4.4
Wheel bolt	11

REMOVAL

Put the vehicle on a two-post lift.

During this operation, the vehicle must be secured to the lift with a strap to prevent it from becoming unbalanced.

Refer to Section 02 Underbody lift for information on positioning the belt.

Remove:
– the battery;
– the front wheels,
– the engine undertray,
– the right and left wheel arch liners and side protectors

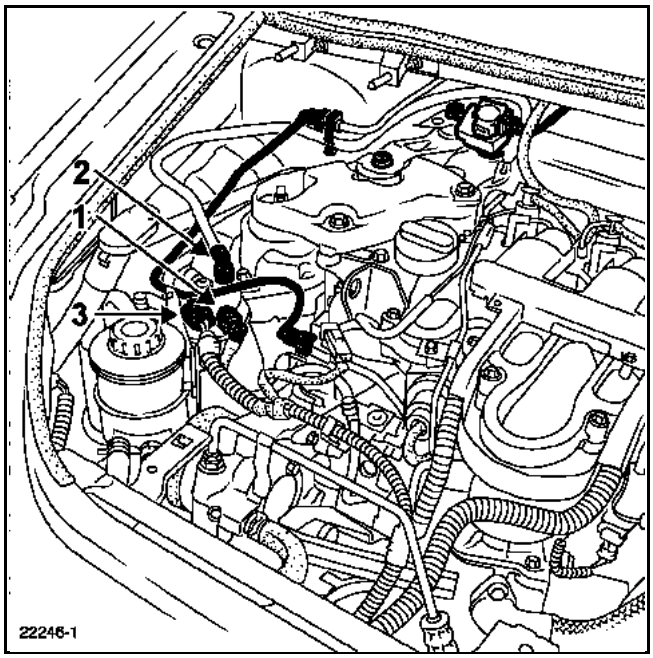
Drain:
– the coolant circuit using filling equipment,
– cooling system through the radiator bottom hose
– gearbox and engine if necessary.

GETtheMANUALS.org

Remove the fuel supply pipes.

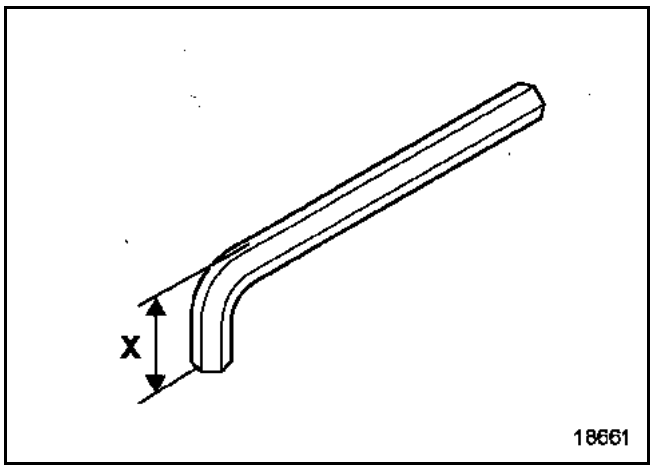
Diesel engines

Remove the inlet pipes (1) and return pipes (2) covering the filter, and the electrical connector (3).

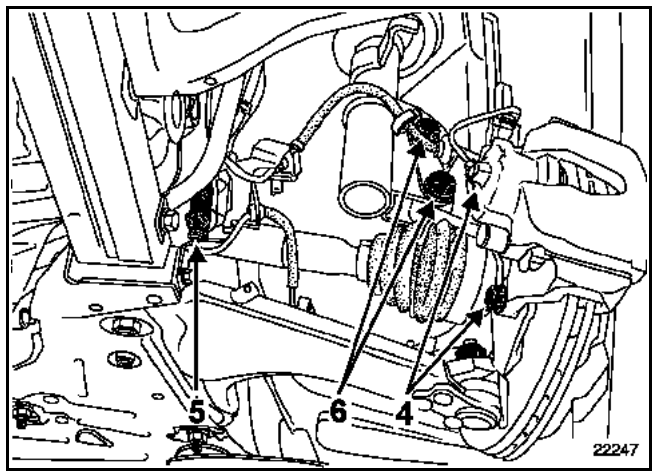


All engine types

Remove:
– the lower ball joint nuts (use an Allen key cut down to **X = 22 mm** to lock the ball joints if necessary),



– the brake calipers (4) and secure then to the suspension springs,
– the ABS sensor connectors (5),
– the two shock absorber base mountings (6),



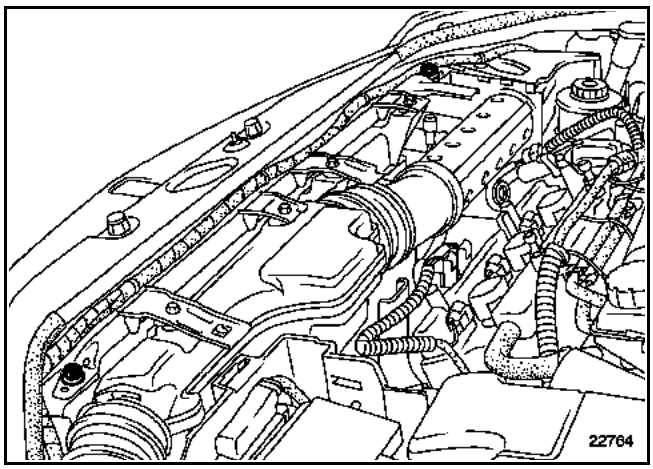
– the steering ball joints using tool **T. Av. 476,**
– the two mounting bolts securing the driveshaft mounting clamp to the bearing support (right-hand side of vehicle),
– the driveshaft gaiter mounting bolts (left-hand side of the vehicle on PK6 manual gearboxes).

Remove the driveshaft and then remove the hub unit assembled with the driveshaft.

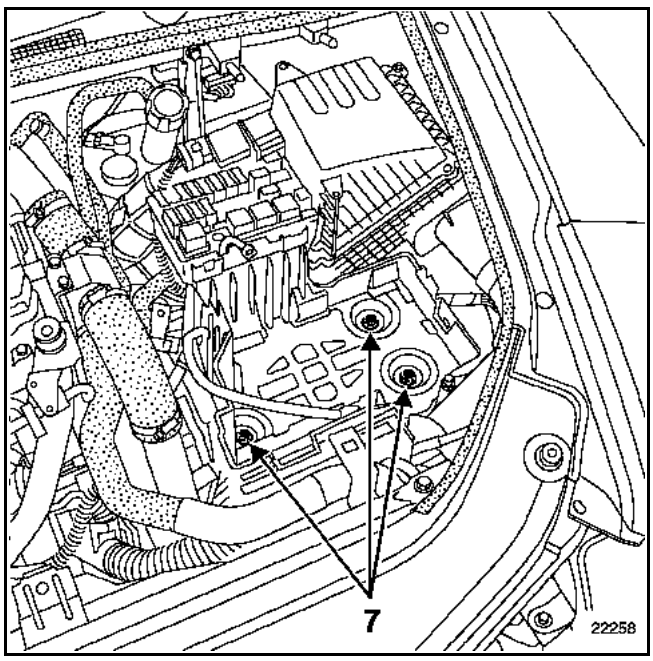
Disconnect the fog light connectors.

GETtheMANUALS.org

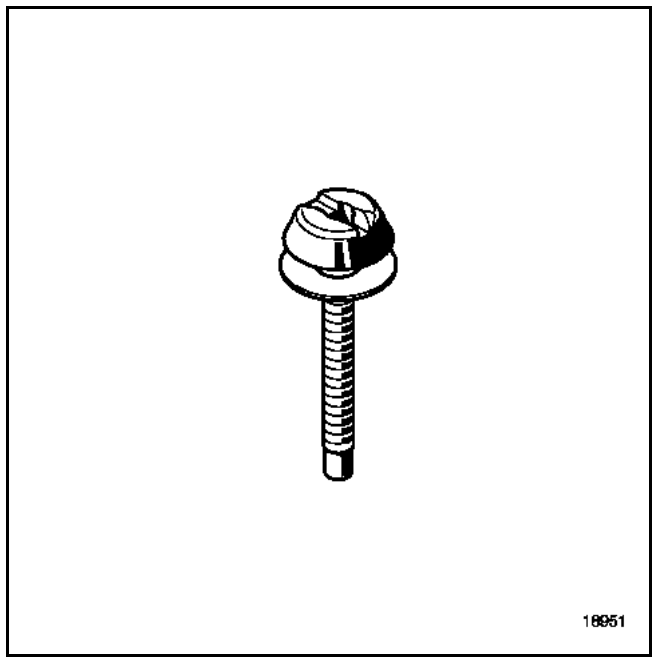
Remove:
– the bumper,
– the headlight washer pipe (only for vehicles fitted with xenon bulbs),
– the power steering reservoir;
– the cooling scoops,
– the air resonator (only ***V4Y***),



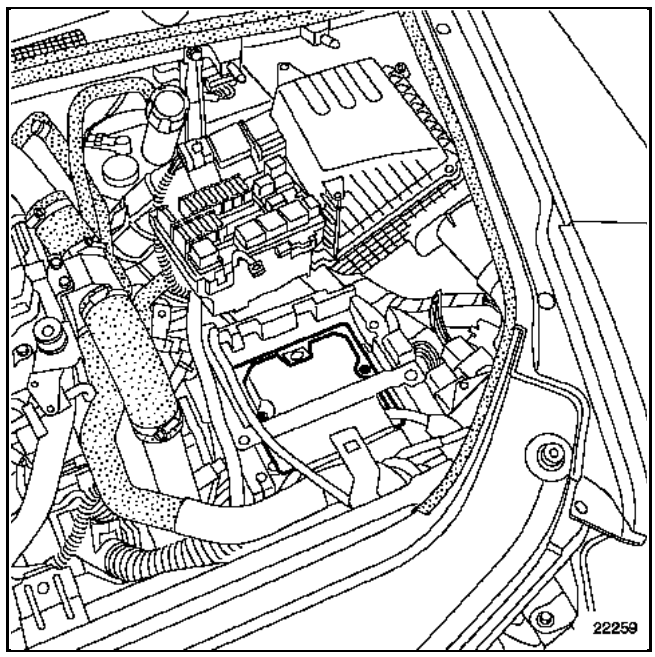
– the battery tray at (7).



To do this, drill out the three tamperproof bolts using a ∅ 5 mm diameter drill bit in the bolt shaft, then remove the bolt using Mot. 1372.

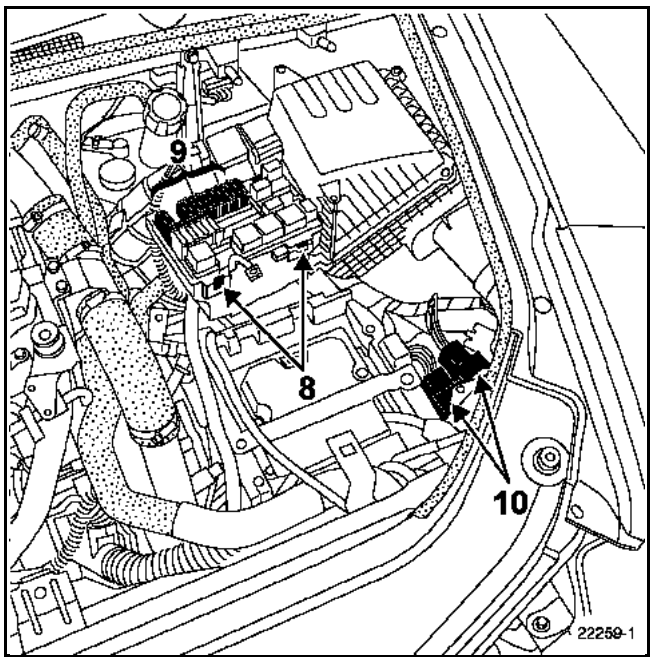


Remove:
– the air filter,
– the computer, followed by its mounting,
– the earthing braid on the body shell,



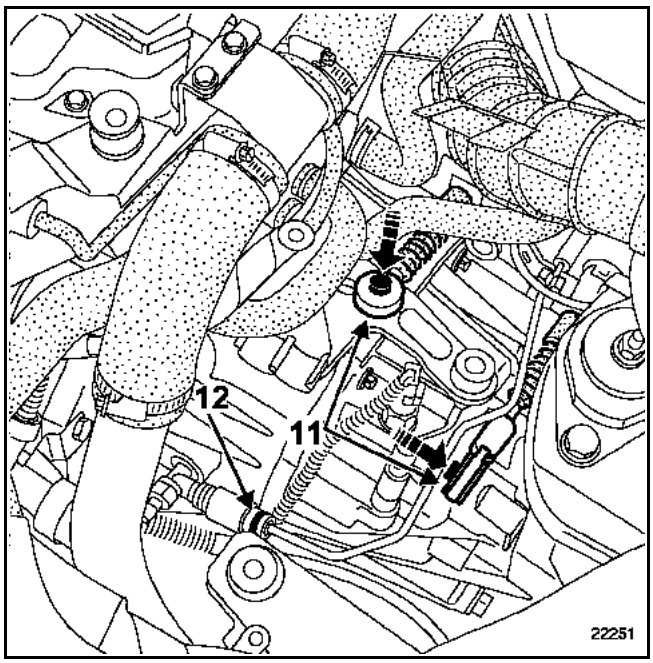
GETtheMANUALS.org

– the relay plate (8) and unclip the fuse holder at (9),
– the engine/passenger compartment wiring harness connectors (10).



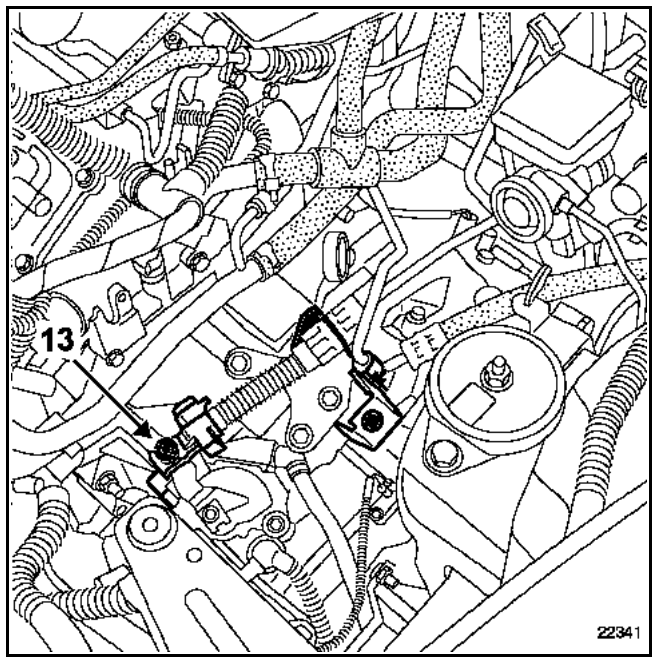
PK6 GEARBOX

Remove:
– the gearbox controls at (11).
– the hydraulic clutch control by removing the clip at (12).



SU1 GEARBOX

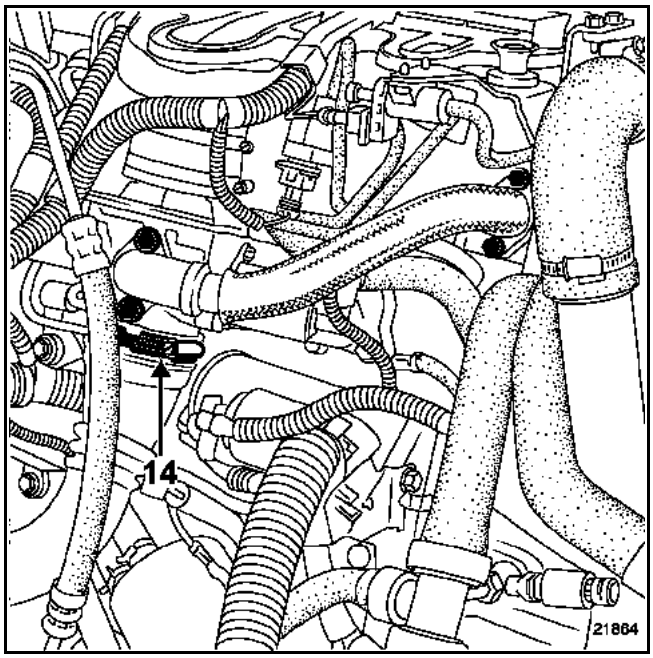
Remove:
– the gearbox control (13)



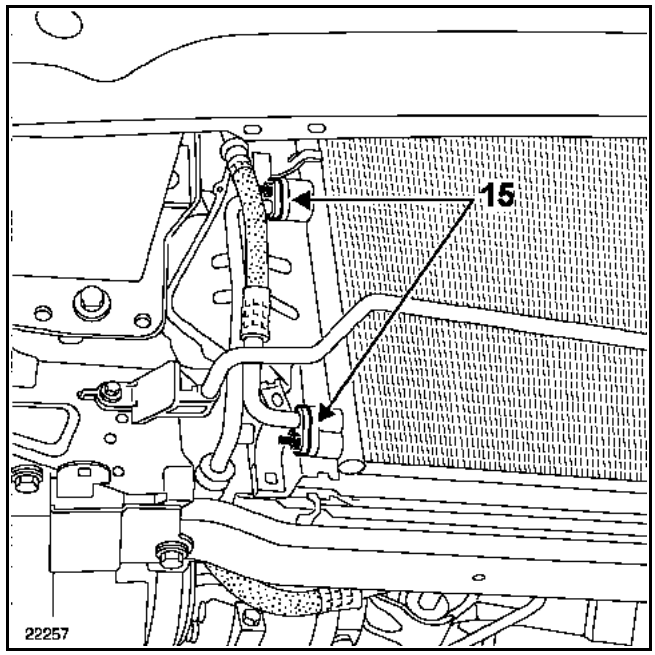
– the upper impact bar,

GETtheMANUALS.org

– the air hoses on the exchanger (***F4R***), on the engine shut-down idle switch at (14) (***G9T***),

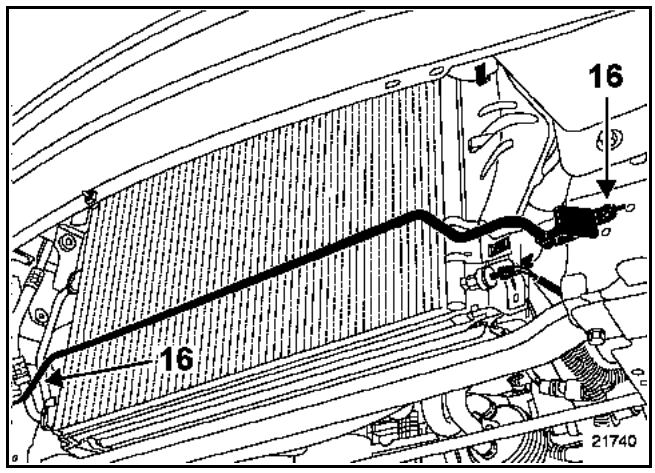


– the hoses on the inlet manifold and the turbo (***P9X***),
– the upper radiator hose,
– the electrical connector of the fan assembly resistor,
– the fan assembly,
– the air conditioning ducts on the compressor,
– the two ducts on the condenser at (15) and remove them.



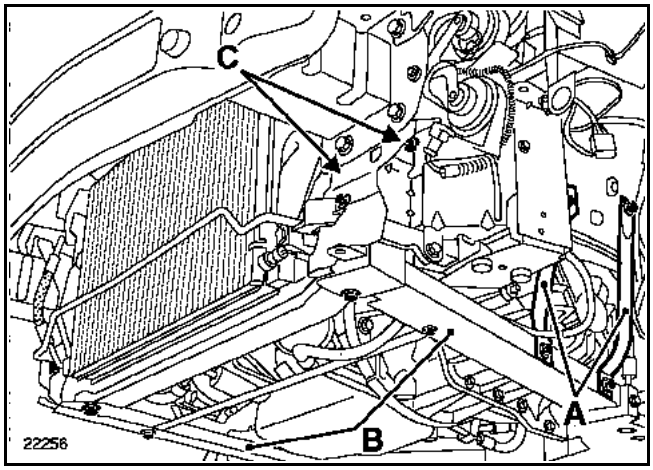
NOTE: plugs must be fitted onto the hoses and pressure relief valve to prevent moisture from entering the circuit.

Remove:
– the power steering hose at (16),

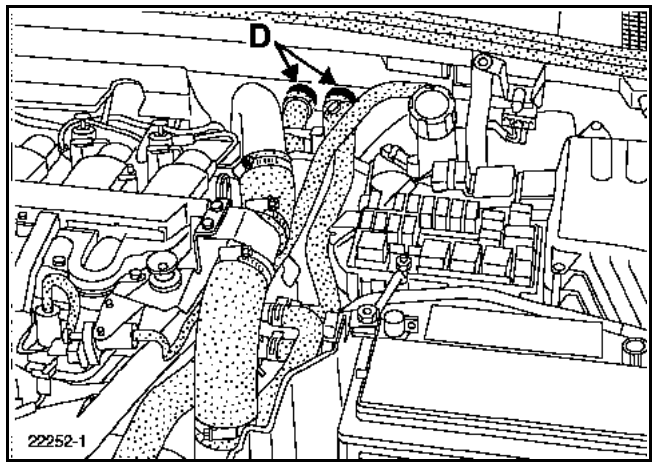


GETtheMANUALS.org

– the tie-bars (A),
– both aluminium side members (B),
– the three mounting bolts of the ABS assembly protection plate,
– the preheater unit connectors (***P9X engine***),
– the speed camera (see section **83D - Cruise control**),
– the lower mountings of the cooling assembly (C),



– the cooling assembly with the lower cross member,
– the torque reaction arm,
– both precatalyzers (***V4Y engine***),
– the exhaust manifold clamp,
– the exhaust silencer clamp (***G9T engine***),
– the heating radiator hoses using the tool **Mot. 1599** at (D).



Disconnect the water hoses.

Remove:
– the brake servo pipe on the vacuum pump,
– the flexible power steering hose on the pump.

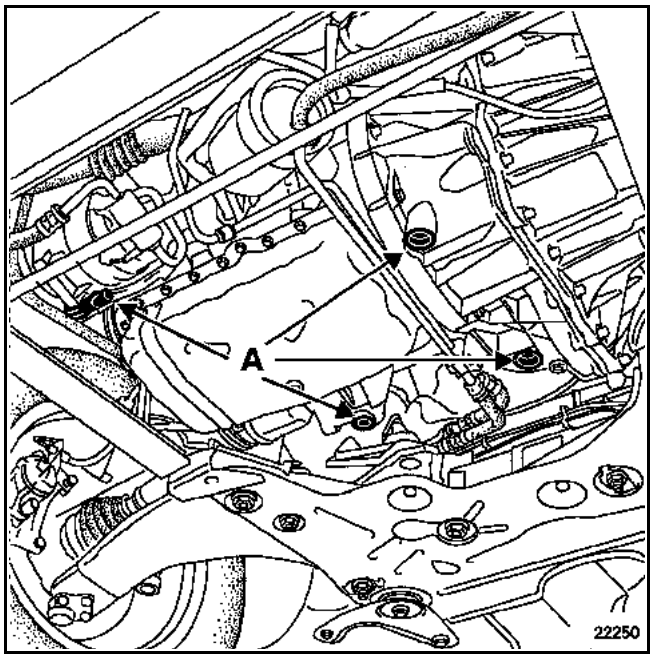
G9T engine

Remove both power steering ducts on the steering unit and unclip them under the oil sump.

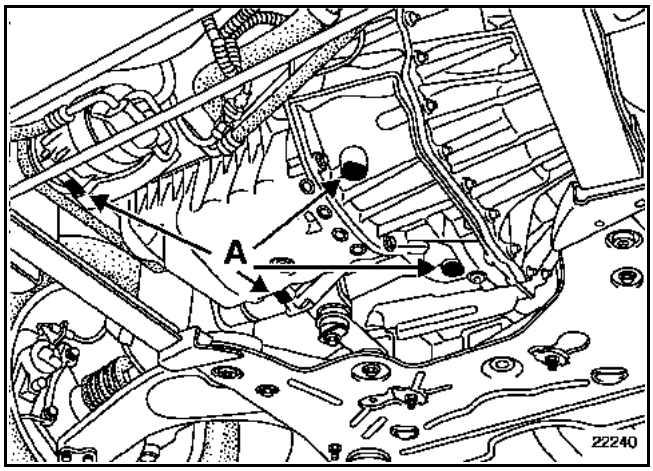
GETtheMANUALS.org

Fit **Mot. 1390** under the engine; it is essential to place the mounting pads as close as possible under the shaded areas (A) indicated below.

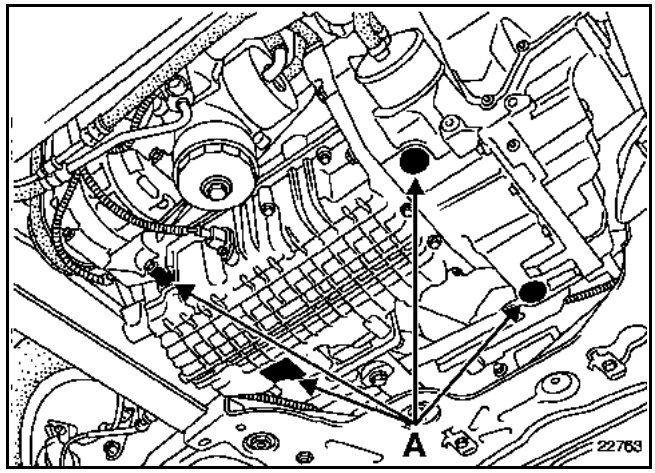
G9T engine



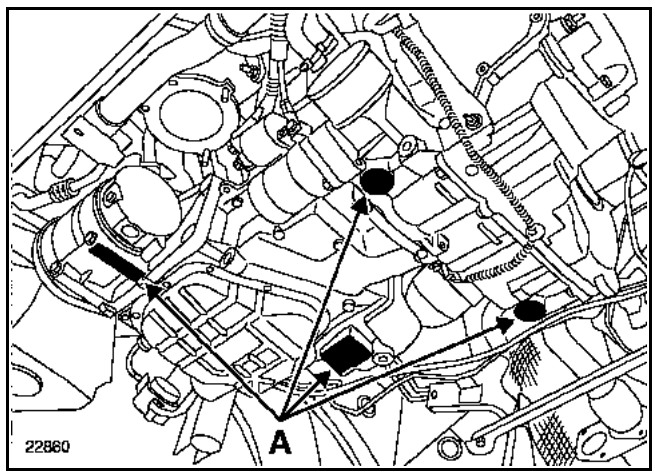
F4R engine



P9X engine



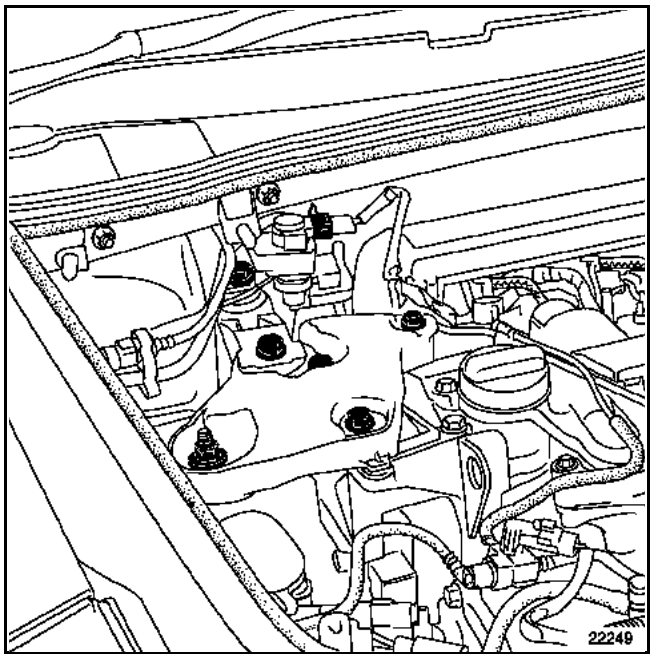
V4Y engine



GETtheMANUALS.org

Remove the front right-hand suspended mounting support.

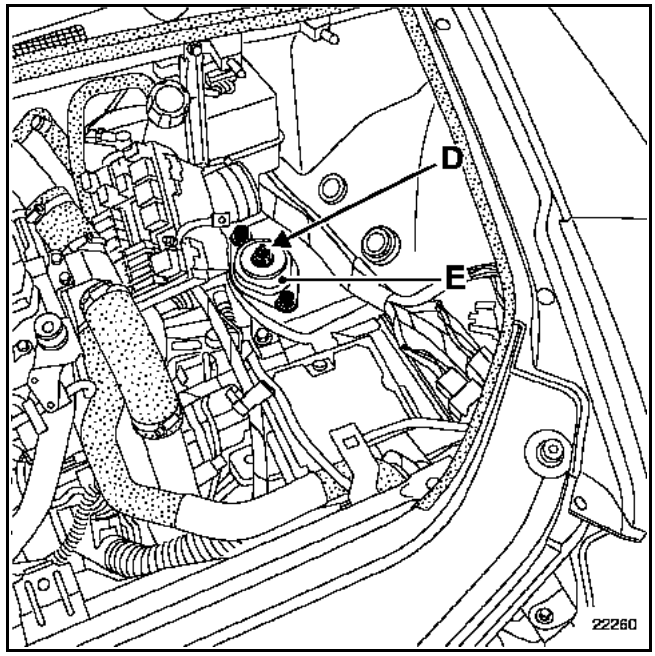
NOTE: check that the engine is fitted onto the Mot. 1390 support before undoing the bolts completely.



Remove the nut (D) and strike it with a copper hammer.

NOTE: the Mot. 1390 mounting pads should be almost touching the engine; when struck with the hammer, the engine rests on the support.

Remove the rubber mounting (E).



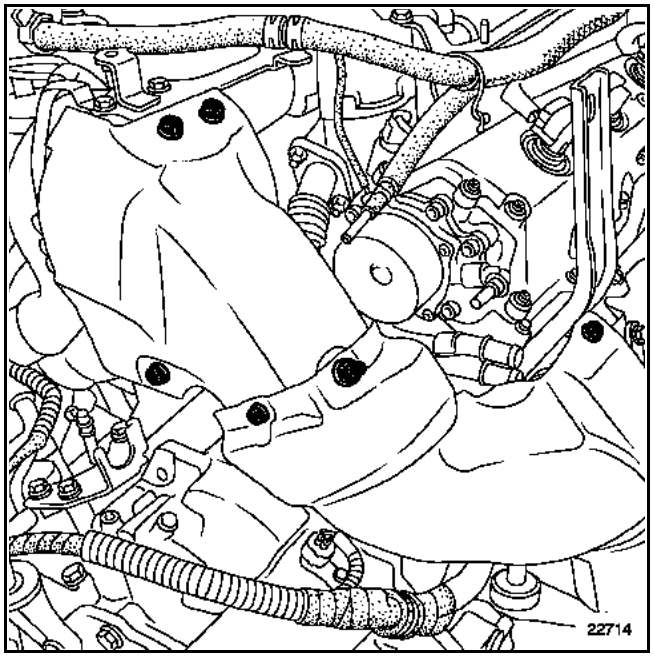
F4R, P9X and V4Y engines

Remove the gearbox mounting.

GETtheMANUALS.org

P9X engine

Shift the engine forwards, remove the heat screens, then remove the catalytic converter.



All engine types

Raise the body shell by shifting the engine slightly forwards to allow access between the engine mounting and the gearbox.

Remove the engine using **Mot. 1390.**

REFITTING

Refit the engine-gearbox assembly following the same method as for removal.

Refit:
– the left suspended mounting,
– the right suspended mounting,
– the engine tie-bar.

Refer to section **19D** Suspended mounting for tightening torques.

Top up the reservoir with brake fluid in order to bleed the clutch.

Bleed the clutch (see **section 37A Control of mechanical components**).

Top up the brake fluid.

Check that the clutch system is operating correctly.

Refit using the reverse of the removal procedure.

Replace the tamperproof screws with new ones.

Perform the following operations:
– fill the gearbox with oil,
– fill the engine with oil, if necessary,
– fill and bleed the cooling system (see **Section 19A Filling - bleeding**).
– fill and bleed the power assisted steering circuit,
– fill the refrigerant circuit using the filling equipment.

Apply **FRENBLOC Loctite** to the brake calliper mounting bolts before fitting and tighten them to the correct torque.

IMPORTANT: ensure that the brake pipe and the ABS sensor wiring are properly fixed.

Press the brake pedal several times to bring the pistons into contact with the brake pads.

Check the angles of the front axle (see **section 07B: Adjusting the axle assemblies**).

Depending on the vehicle equipment, check and adjust:
– the distance cruise control (see **section 83D: Cruise control**),
– xenon bulb headlights (see **section 83C: Fitted networking system**).

GETtheMANUALS.org

TIGHTENING TORQUES (in daNm)	
Sump bolt	**1.5**
Engine tie-bar mounting bolts:	
– on the sub-frame	**10.5**
– on the engine	**18**

REMOVAL

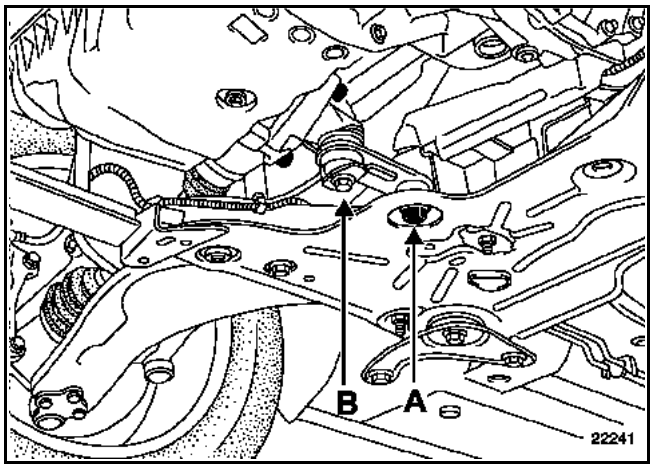
Put the vehicle on a two-post lift.

Disconnect the battery.

Remove the engine undertray.

Drain the engine.

Remove:
– the bolts (A) and (B) of the engine tie-bar,

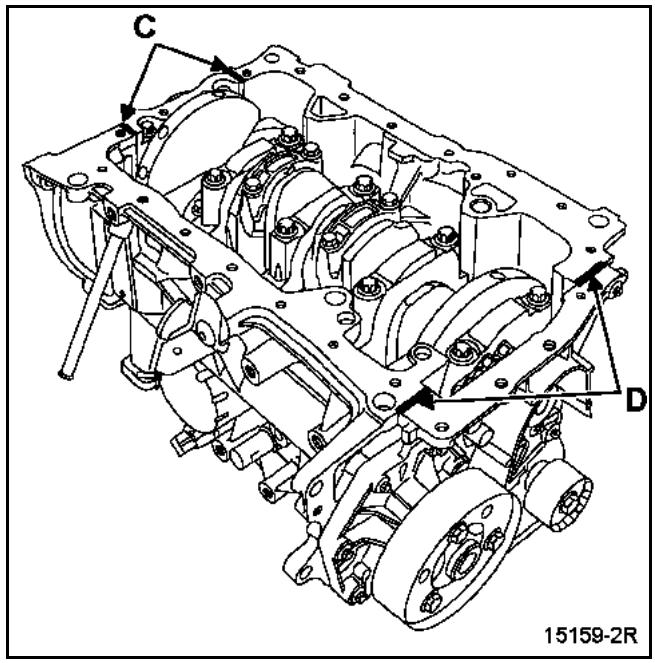


– the sump,

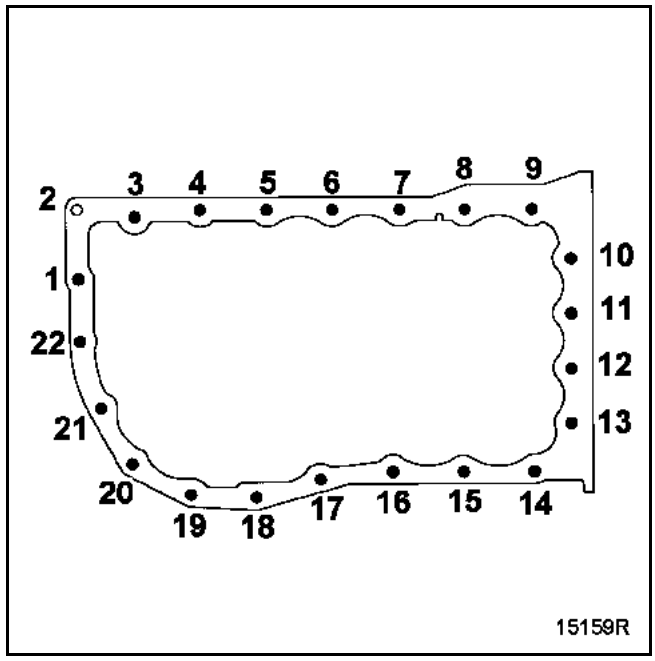
Clean the gasket face.

REFITTING

Put a drop of **RHODORSEAL 5661** on either side of bearing No. 1 at (A), and at the intersection of the crankshaft closure panel and the cylinder block at (B).



Refit the sump with a new gasket, pre-tightening bolts 1, 6, 10, 15, 18 to **0.8 daNm,** then finally tighten to a torque of **1.5 daNm** in the order recommended below.



GETtheMANUALS.org

TIGHTENING TORQUE (in daNm)	
Sump bolt	0.9

REMOVAL

Put the vehicle on a two-post lift.

Disconnect the battery.

Remove:
– the engine covers,
– the engine undertray,
– the power steering pipe mounting,

Drain the engine.

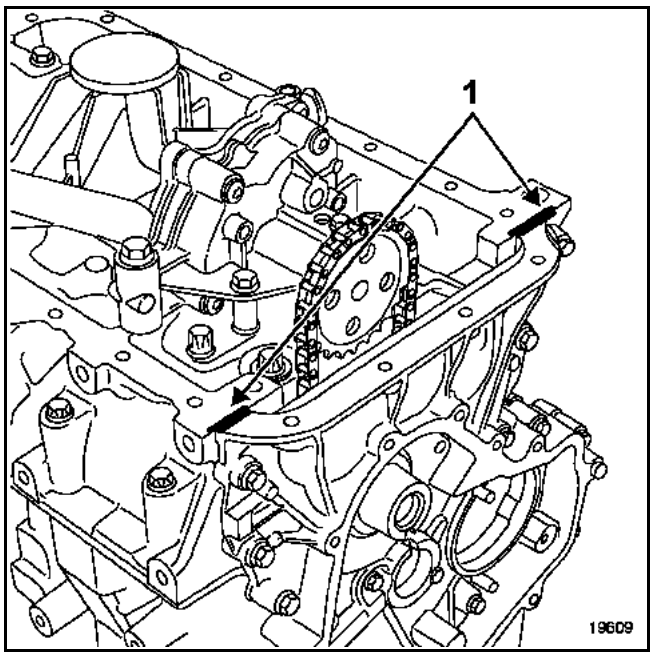
Unclip both power steering pipes and remove them.

Remove the sump.

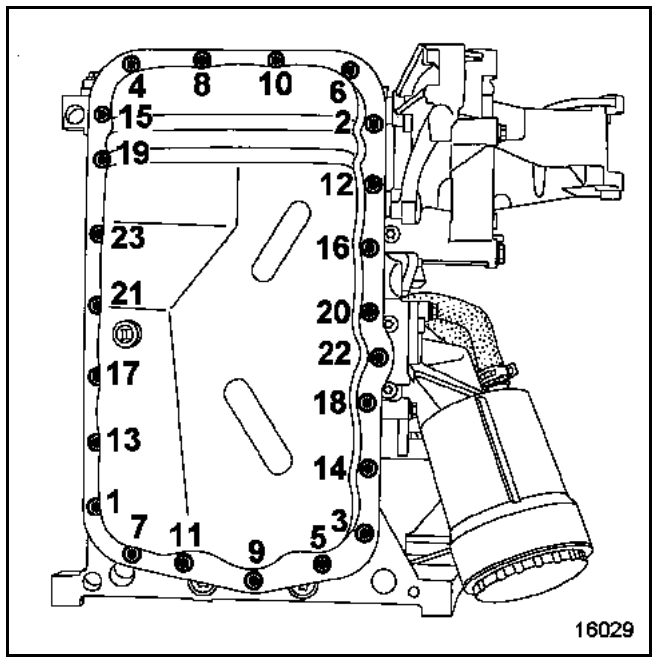
Clean the gasket face.

REFITTING

Put some **RHODORSEAL 5661** in (1).



Refit:
– the sump with a new gasket, pre-tightening the bolts to a torque of **0.5 daNm**, then finally tighten to a torque of **0.9 daNm in the recommended order.**



– the power steering pipe mountings,

Top up the engine oil.

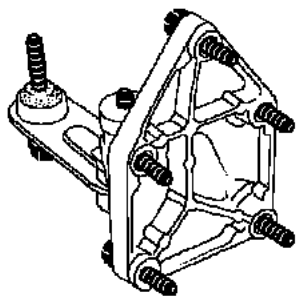
GETtheMANUALS.org

TIGHTENING TORQUES (in daNm)	
Sump bolt	**2.5**
Air conditioning compressor mounting bolt	
– diameter 10	**5**
– diameter 8	**2.5**
Oil level sensor bolt	**1**

Drain the oil from the engine.

REMOVAL

Remove:
– the air duct on the inlet manifold,
– the dipstick and dipstick mountings,
– the oil return pipe on the sump,
– the oil level connector,
– the torque reaction arm and its mounting on the lower sump,

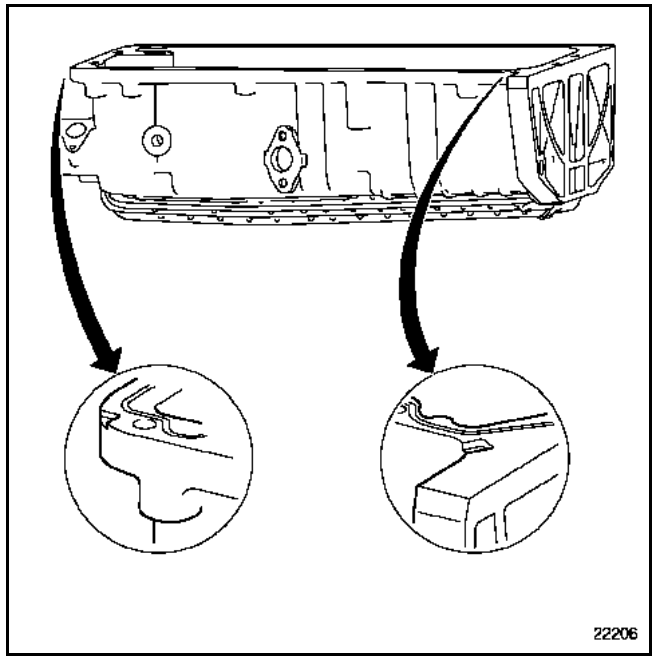


22454

– the accessories belt.

See section 07A: Tension of accessories belt for the method for removing the accessories belt.

Remove:
– the multifunction support mounting on the sump,
– the air conditioning compressor mountings in order to separate the multifunction support slightly from the sump,
– the sump mountings,
– the sump using the notches designed for this purpose.



22206

GETtheMANUALS.org

CLEANING

It is important not to scratch the gasket faces of the aluminium components.

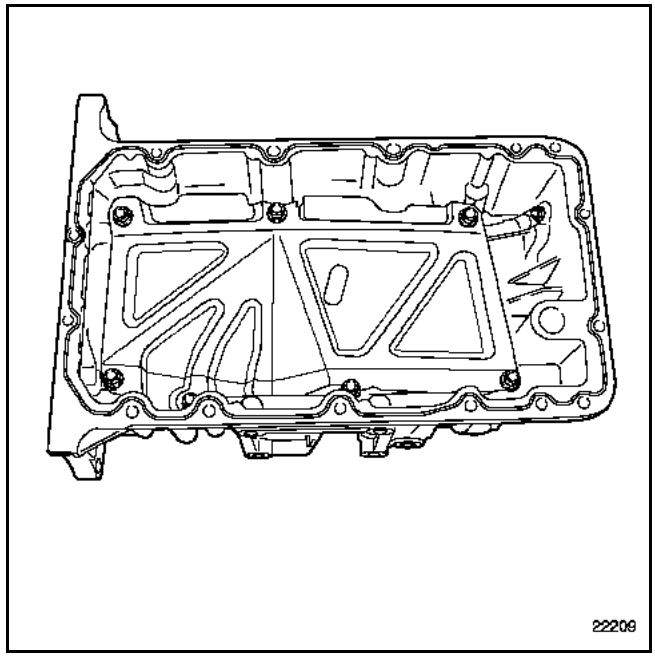
Clean the gasket faces with the product **Décapjoint** to dissolve the section of the gasket which is still attached to the sump and the cylinder block.

Apply the product to the part to be cleaned, wait approximately 10 minutes, then remove it using a wooden spatula.

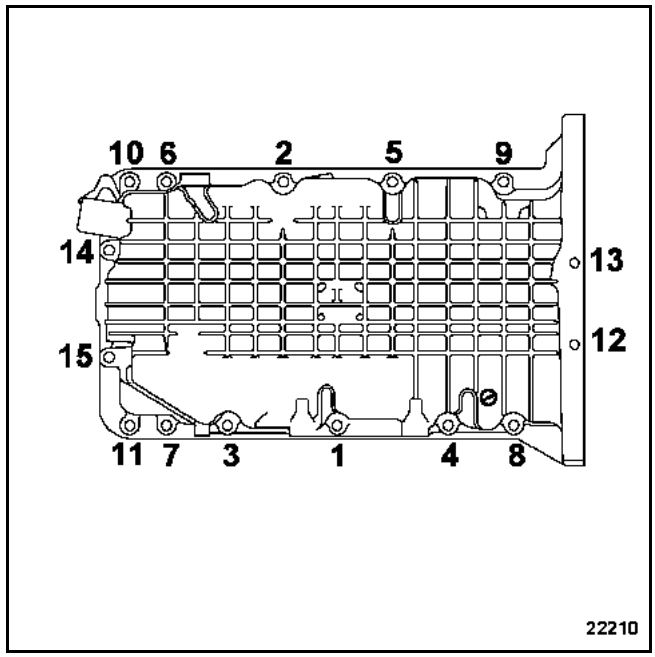
Wear gloves whilst carrying out this operation.

REFITTING

Put a ring of **RHODORSEAL 5661** approximately **3 to 4 mm** in diameter on the surface of the sump.



Tighten all the bolts on the sump to a torque of **2.5 daNm** in the order shown below.



GETtheMANUALS.org

The refitting procedure is in the reverse order to removal.

To refit the accessories belt, **see section 07A: Tension of accessories belt.**

Top up the engine oil.

GETtheMANUALS.org

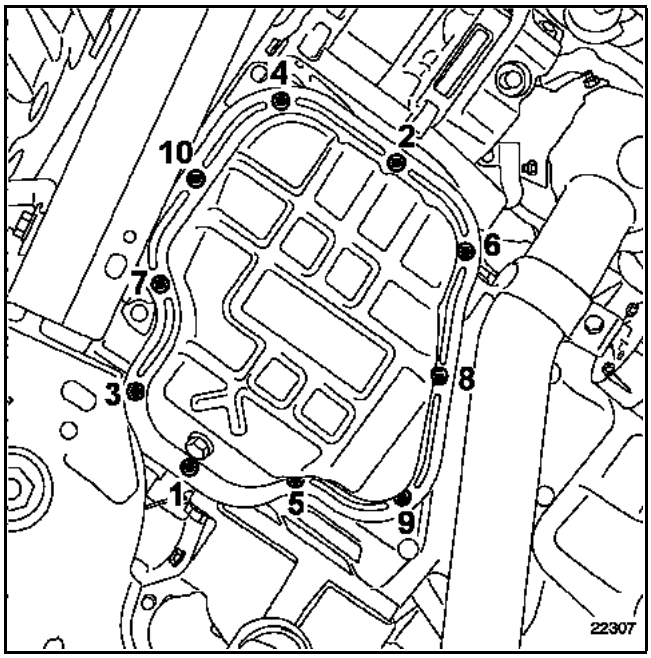
TIGHTENING TORQUE (in daNm)	
Sump bolt	**1**

Removing the sump is not difficult.

Clean the gasket face.

REFITTING

Tighten the bolts to a torque of **1 daNm** in the following order:



GETtheMANUALS.org

Put the vehicle on a two-post lift.

Disconnect the battery.

Remove the engine undertray.

Drain the engine.

Remove the sump (see **section 10A: Sump**).

Removing/refitting the oil pump does not present any difficulties.

Refit using the reverse of the removal procedure.

GETtheMANUALS.org

TIGHTENING TORQUE (in daNm or/and)	
Oil pump bolt	2.5

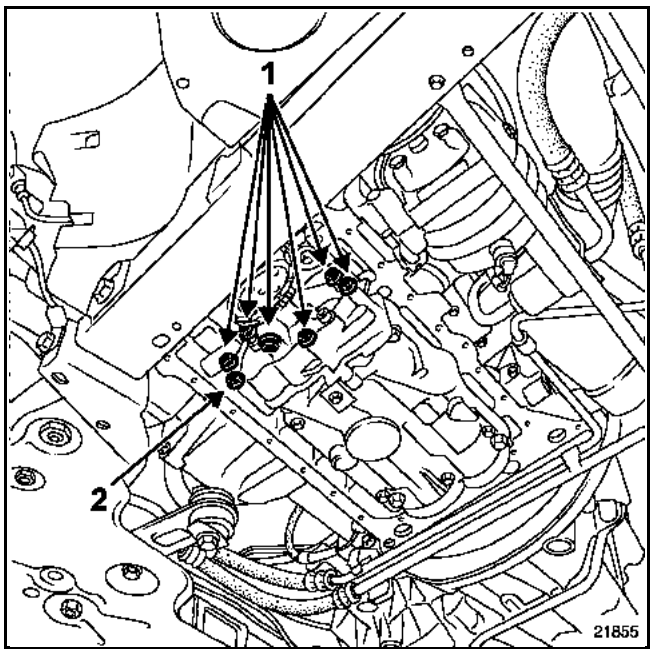
REMOVAL

Put the vehicle on a two-post lift.

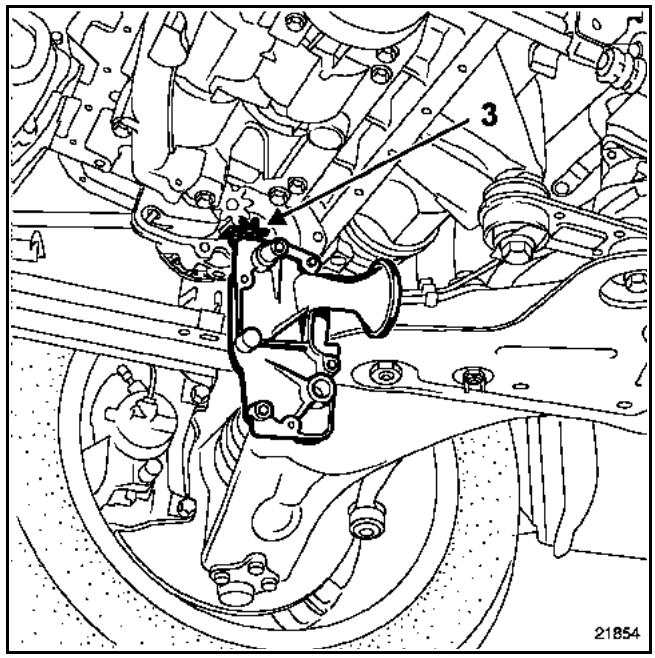
Disconnect the battery.

Change the engine oil.

Remove:
– the sump (see method in **section 10A: Sump**).
– the oil pump mounting bolts (1), simply loosen the bolt (2).



Swivel the oil pump casing (as shown below), taking care to keep the pinion (3) in place.



REFITTING

Refit in the reverse order to removal.

Refer to **section 10A: Sump** for the procedure for refitting the sump.

GETtheMANUALS.org

P9X engine

For information on the procedure for removing and refitting the oil pump, refer to engine manual **Mot. P9X**.

V4Y engine

For information on the procedure for removing and refitting the oil pump, refer to engine manual **Mot. V4Y**.

GETtheMANUALS.org

EQUIPMENT REQUIRED
Torque wrench 28 mm open-jawed spanner

TIGHTENING TORQUE (in daNm)	
Oil pipes on exchanger	3 ± 0.5

Put the vehicle on a two-post lift.

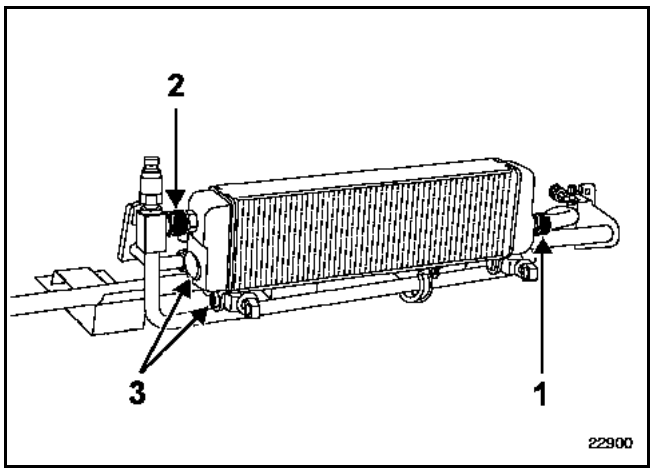
Disconnect the battery.

REMOVAL

Remove the bumper (**see section 54A.a: Removing front bumper**).

Drain the oil from the exchanger through the lower pipe at (1).

Remove:
– the upper pipe at (2),
– the two clips at (3),
– the oil exchanger.



REFITTING

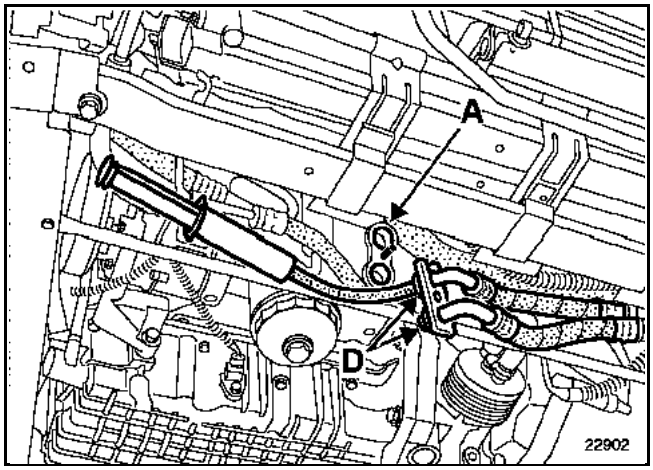
Refit:
– the radiator and the two clips,
– the lower piping.

NOTE: the oil by-pass unit is fitted with a temperature sensor which prevents engine oil passing to the exchanger if the oil temperature is below 110 °C. It is therefore essential to fill the exchanger before refitting it.

GETtheMANUALS.org

Method for filling the exchanger

Remove both pipes on the by-pass unit at (A) to facilitate filling the exchanger (exposed to air).



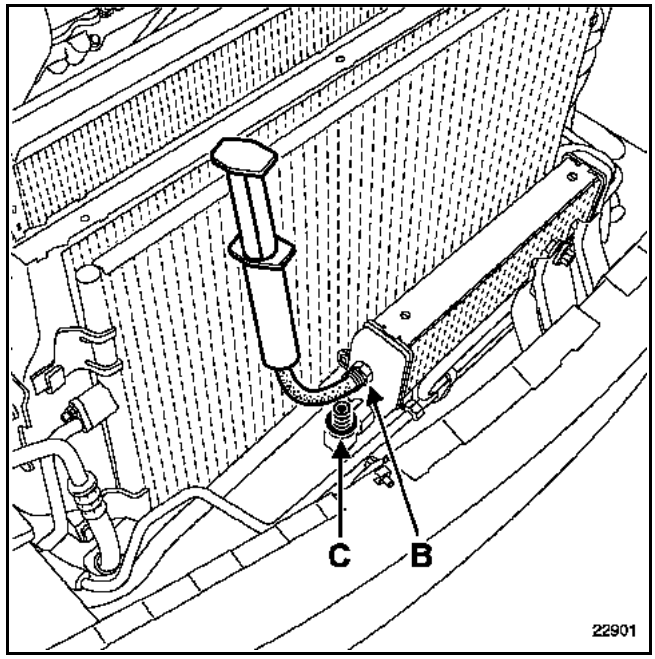
Fill the exchanger using a syringe at (B) until it overflows.

Refit the upper pipe then remove the filler neck (C) to continue filling with the syringe until it overflows.

Refit the filler neck.

Continue filling through the upper pipes of the by-pass unit (D) until they overflow.

The volume of the exchanger and pipes is approximately **0.8 litres**.



Refit the pipes to the by-pass unit.

Continue the refitting procedure in the reverse order to removal.

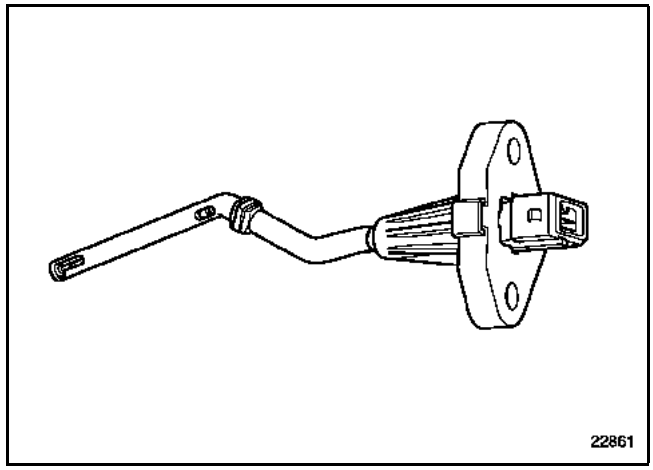
GETtheMANUALS.org

REMOVAL

Put the vehicle on a two-post lift.

Remove:
– the engine covers and the engine undertray,
– the electrical connector of the oil level sensor,
– both oil level sensor mounting bolts.

NOTE: to avoid destroying the sensor, it is very important to remove it without force by gently turning it anti-clockwise.



REFITTING

Refit in reverse order to removal.

GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Mot. 1647	Oil filter removing tool

TIGHTENING TORQUE (in daNm)	
Oil filter drain plug	3.9

REMOVAL

Drain the oil by removing the lower plug.

Remove the cover of the oil filter using **Mot. 1647**.

Replace the filter and both seals:
– the O-ring on the oil filter cover,
– the seal on the oil filter drain plug.

REFITTING

Refitting does not present any particular difficulties and is carried out in the reverse order to removal.

GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Mot. 1054	TDC setting pin
Mot. 1367-02	Engine support tool
Mot. 1496	Camshaft pulley adjustment tool
Mot. 1509	Camshaft locking tool
EQUIPMENT REQUIRED	
Angular torque wrench	

TIGHTENING TORQUES (in daNm and/or °)	
Tensioner wheel bolt	4.5
Crankshaft pulley bolt	2 + 135° ± 15°
Tension wheel nut	2.8
Suspended engine mounting upper tie-rod mounting bolt	10.5
Mounting bolts on the engine for suspended engine mounting cover	6.2
Body mounting bolt for the suspended engine mounting movement limiter	2.1
Wheel bolt	11

GETtheMANUALS.org

During this operation, a key must be fitted to the crankshaft (available from the Parts Store, separately or in a timing kit).

The following components must be replaced in this operation:
– the camshaft pulley nuts,
– the tension wheel and inertia reel.

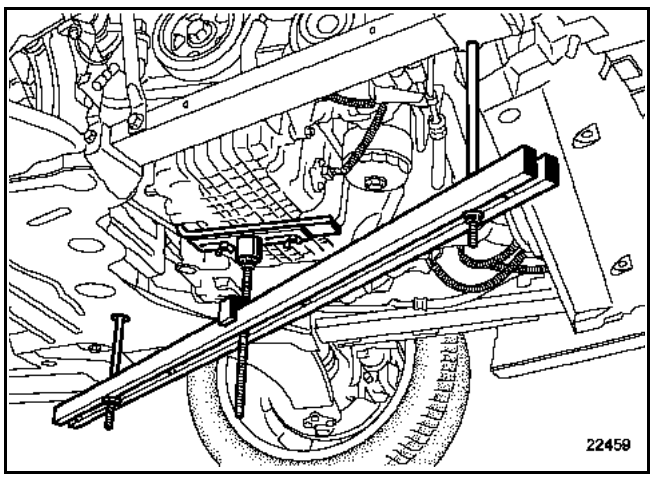
REMOVAL

Put the car on a two-post lift.

Disconnect the battery.

Remove:
– the engine undertray,
– the right-hand wheel and mudguard,
– the side protection.

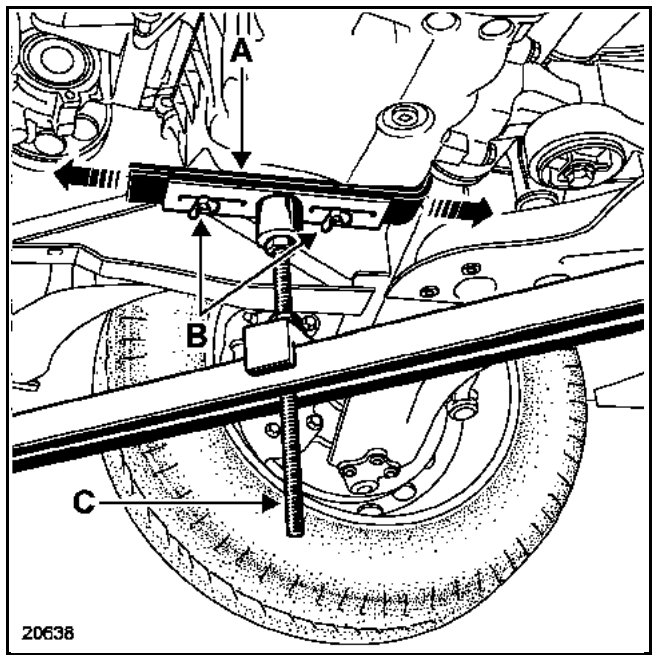
Fit the engine mountings **Mot. 1367-02**.



Bring the top part of the tool (A) into contact with the sump.

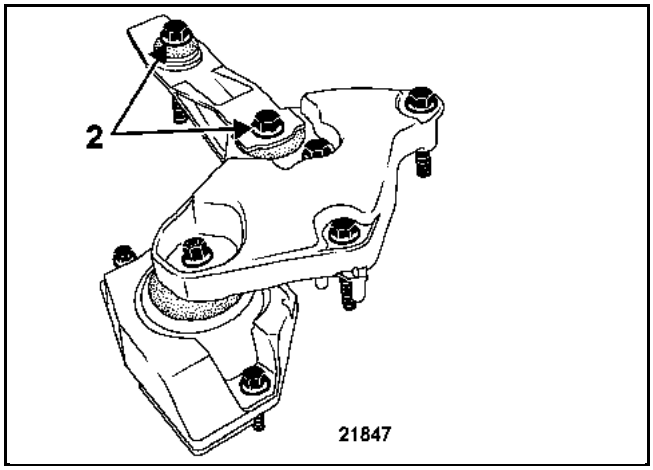
Adjust the position of part (A) on the sump using the mountings (B).

Gently lift the engine at (C) then tighten the nuts (D).



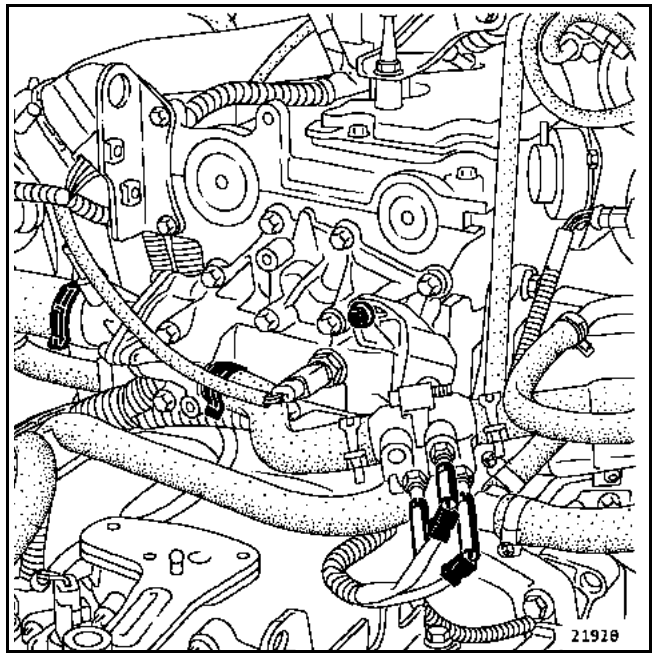
GETtheMANUALS.org

Remove:
– the tie-rod mounting bolts (2) then remove the suspended engine mounting - movement limiter assembly,

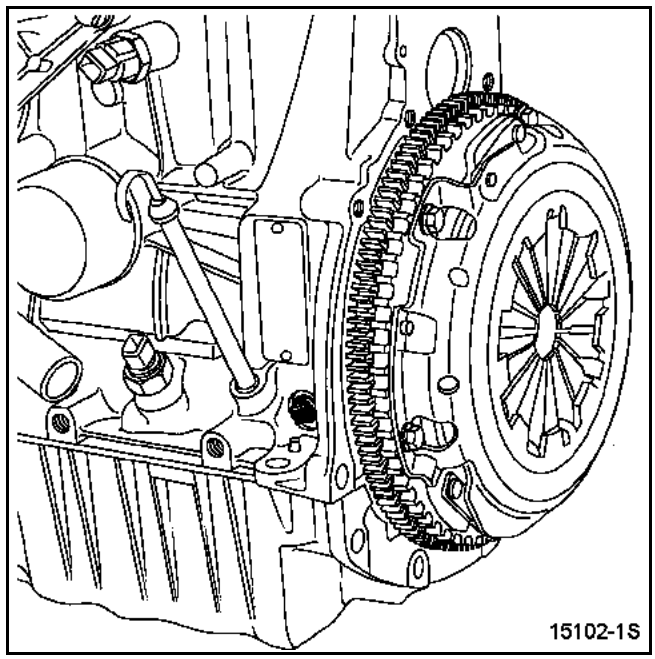


– the accessories belt (see **section 07A "Accessories belt tension procedure"**),

– the camshaft sealing plugs,



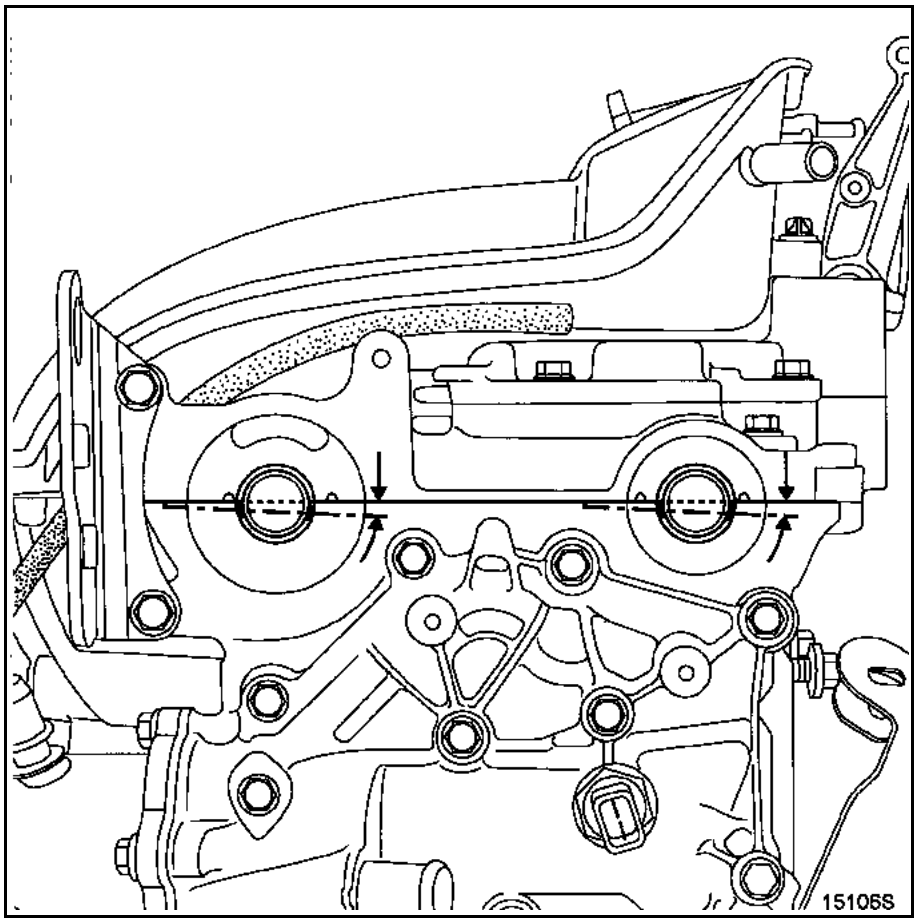
– the Top Dead Centre pin plug.

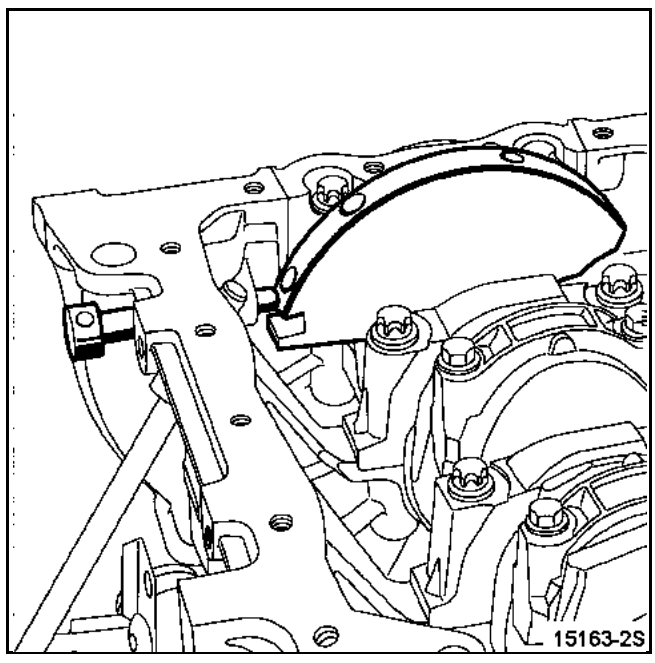


GETtheMANUALS.org

Adjusting the timing

Turn the engine over clockwise (timing side) so as to position the camshaft grooves towards the bottom in an almost horizontal position as shown on the diagram below. Insert the TDC pin **Mot. 1054** so that it is located between the balancing hole and the crankshaft timing groove.

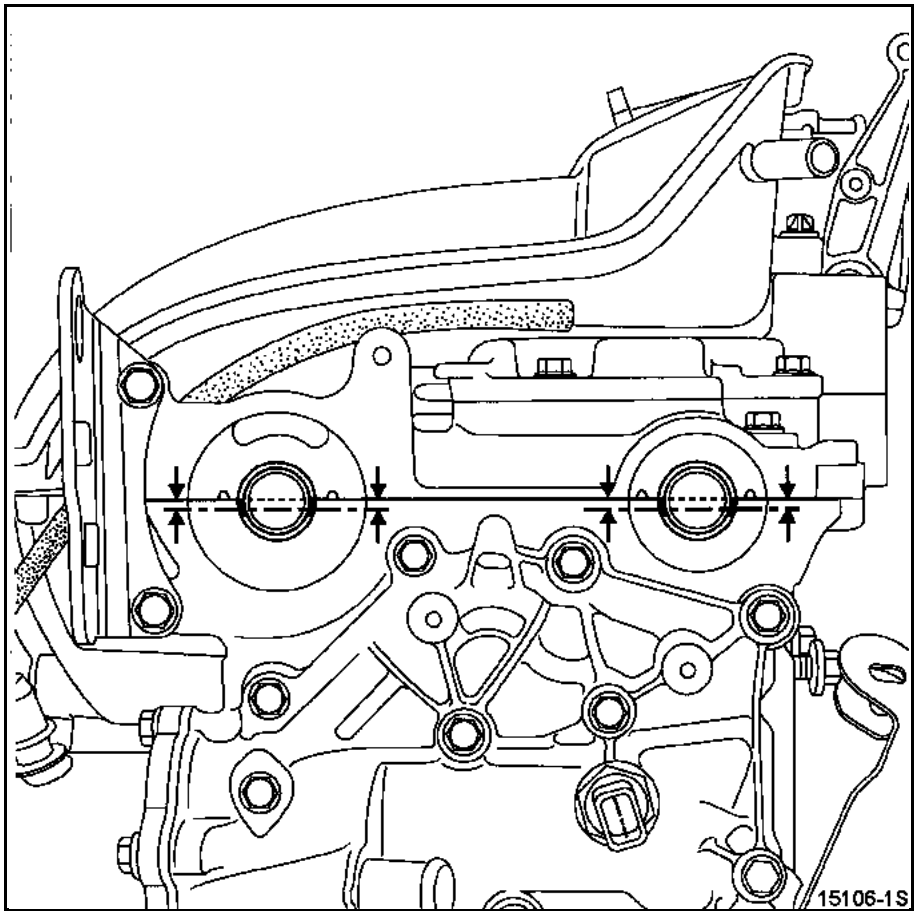




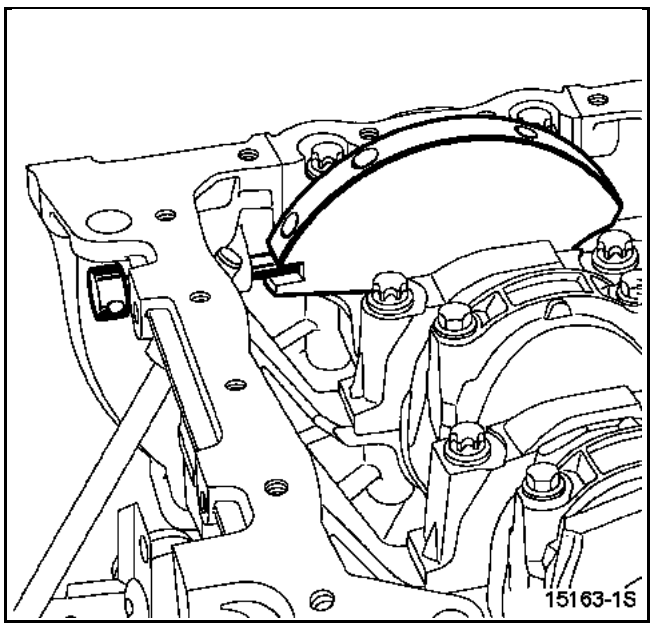
GETtheMANUALS.org

Rotate the engine slightly in the same direction, inserting the pin **Mot. 1054** to the setting point.

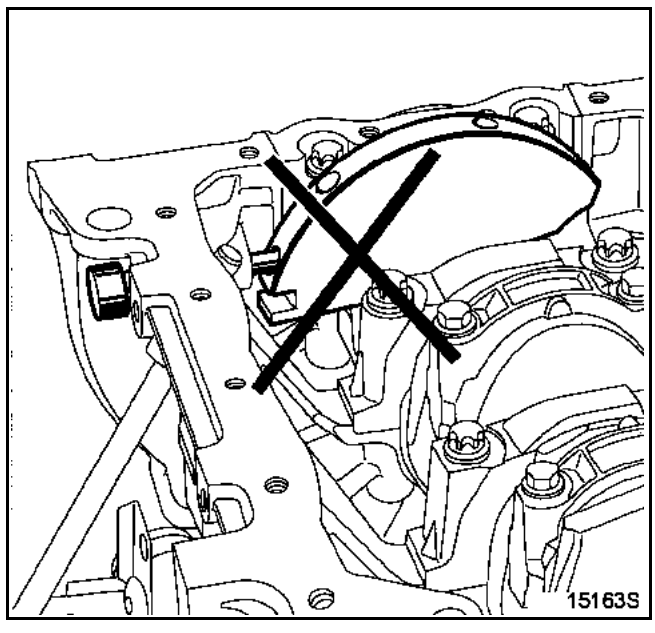
The grooves of the camshafts must, at the setting point, be horizontal and offset towards the bottom as shown on the diagram below.



Correct position

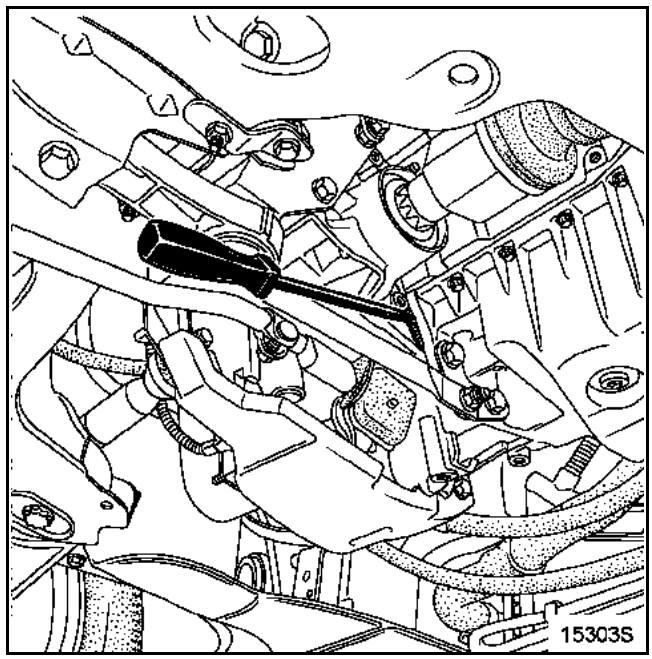


Incorrect position (the pin is in the balancing hole)

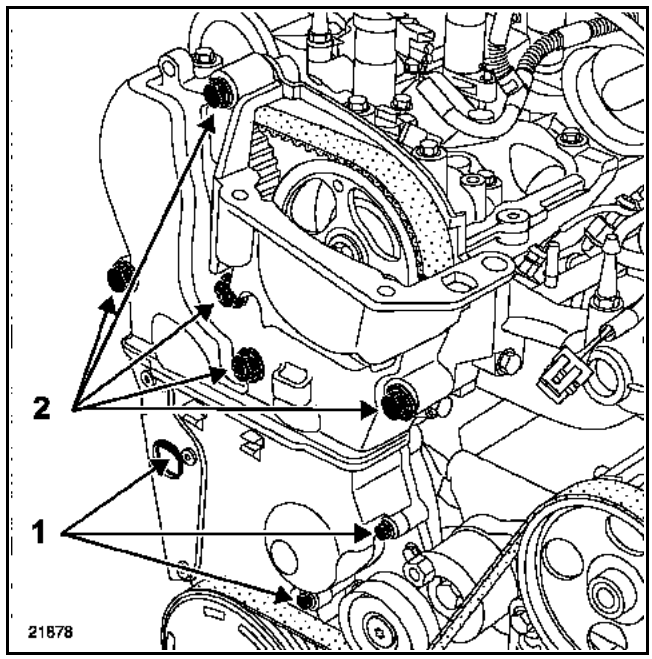


GETtheMANUALS.org

Remove:
– the crankshaft pulley, locking the flywheel using a screwdriver,



– the intermediate timing housing (1),
– the upper housing (2).

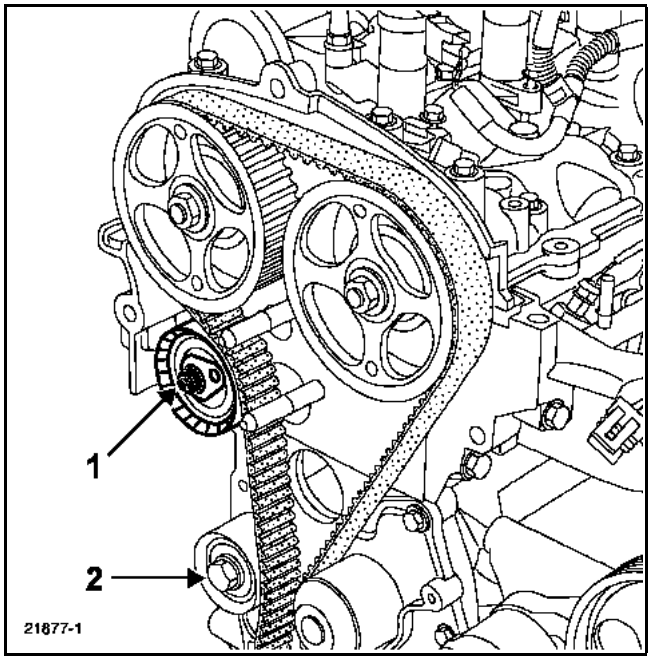


GETtheMANUALS.org

Slacken the timing belt by undoing the nut (1) of the tension wheel.

To remove the timing belt, remove the fixed roller (2) **taking care not to drop the crankshaft sprocket (as this does not have a key)**.

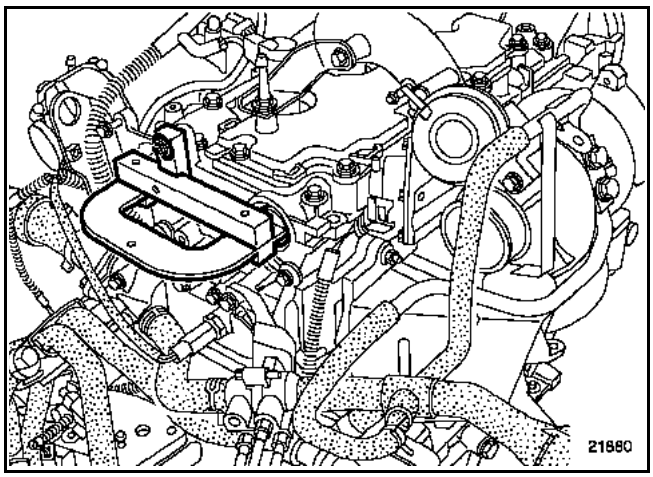
Remove the crankshaft timing sprocket.



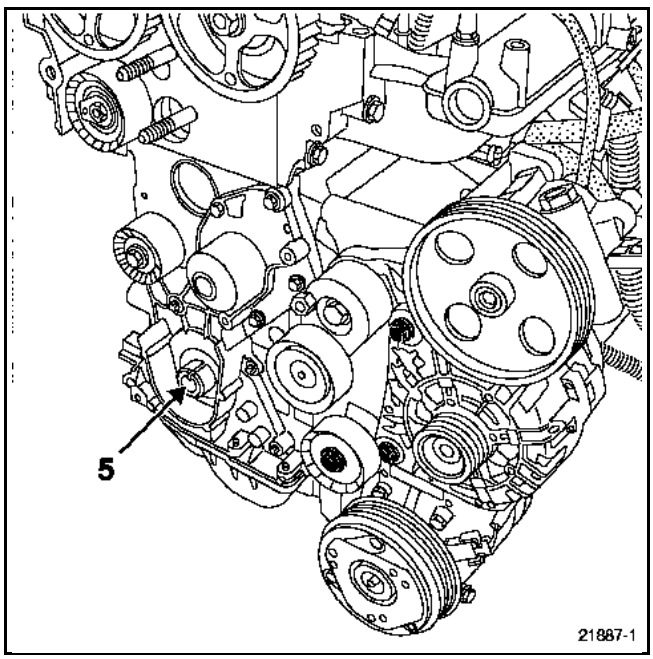
GETtheMANUALS.org

REFITTING

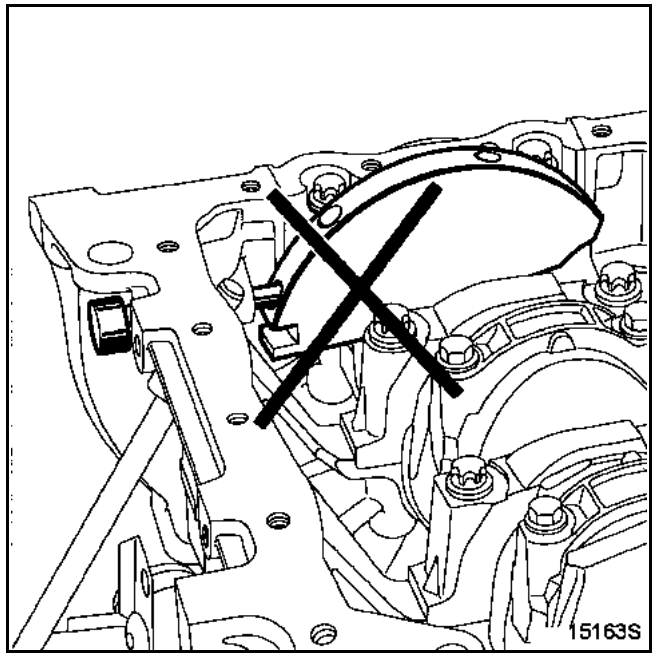
Place tool **Mot. 1496** at the ends of the camshafts.



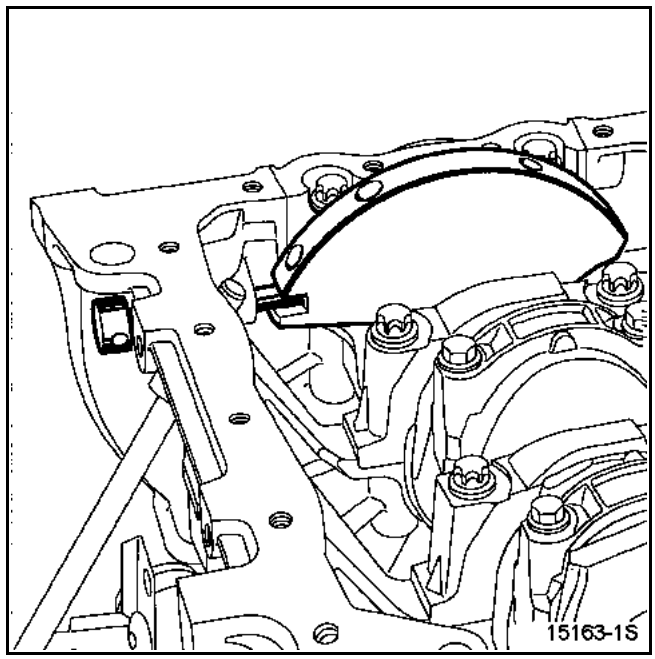
Check that the crankshaft is pinned to top dead centre and not in the balancing hole (crankshaft key (5) facing upwards).



Incorrect position



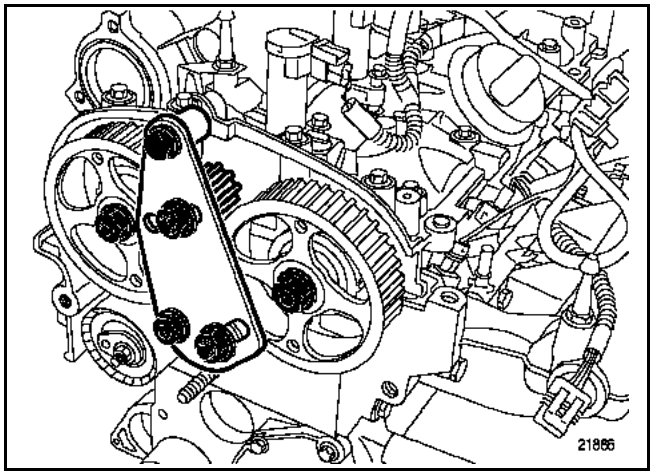
Pinned crankshaft



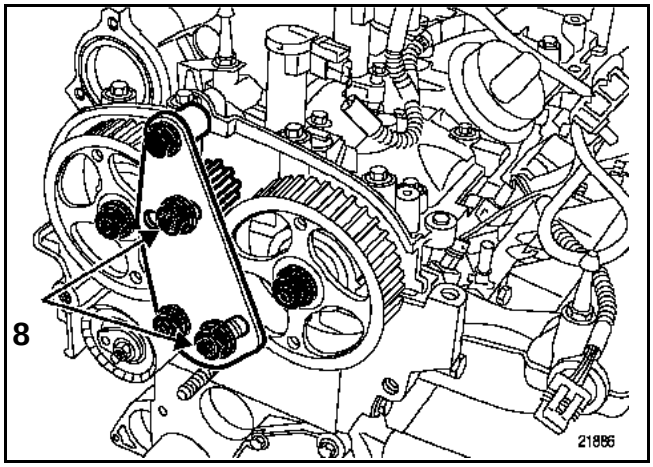
GETtheMANUALS.org

Method for unscrewing the outlet and inlet camshaft pulleys

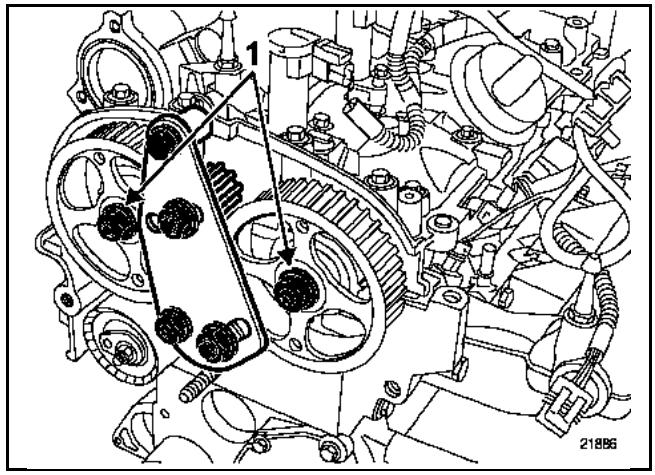
The operation is carried out using **Mot. 1509**.



Fit the camshaft locking tool **Mot. 1509** and tighten the nuts (8) to a torque of **8 daNm**.



Remove the nuts (1) from the outlet and inlet pulley.

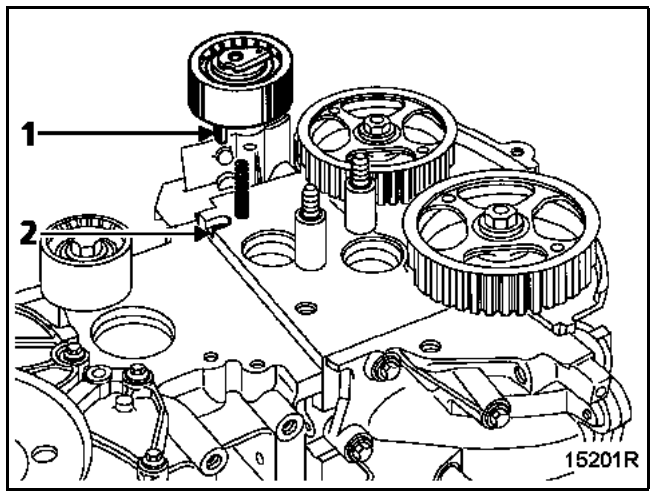


Remove tool **Mot. 1509**.

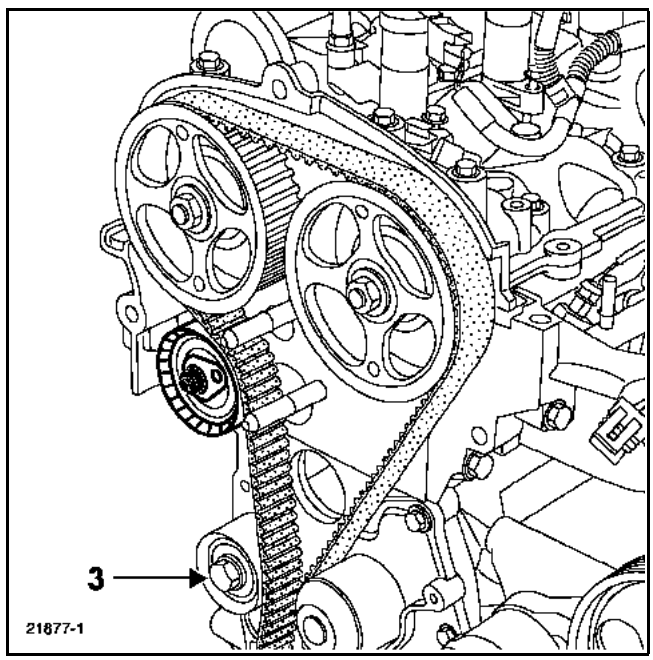
GETtheMANUALS.org

The tension wheel and the fixed roller must be replaced when the timing belt is replaced.

Ensure that the lug (1) of the tension wheel is correctly positioned in the groove (2).



Refit:
– the timing belt,
– the fixed roller (3) and tighten the mounting bolt to a torque of **4.5 daNm**.

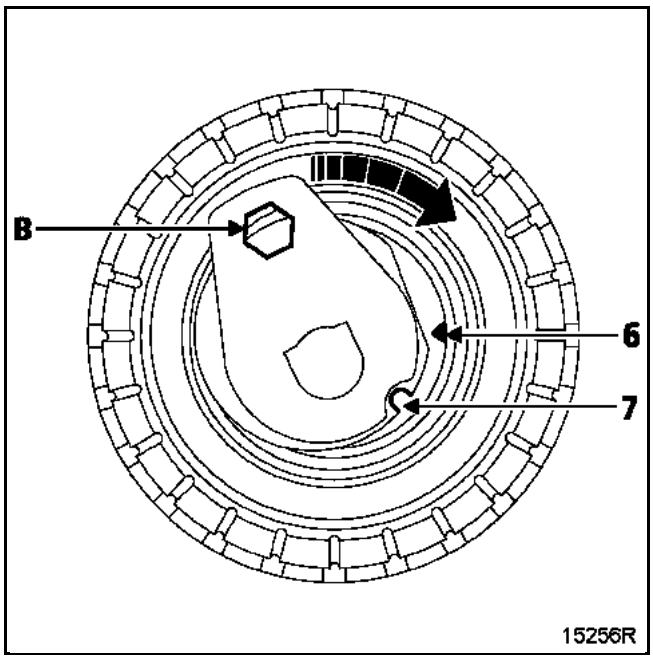


GETtheMANUALS.org

Belt tension

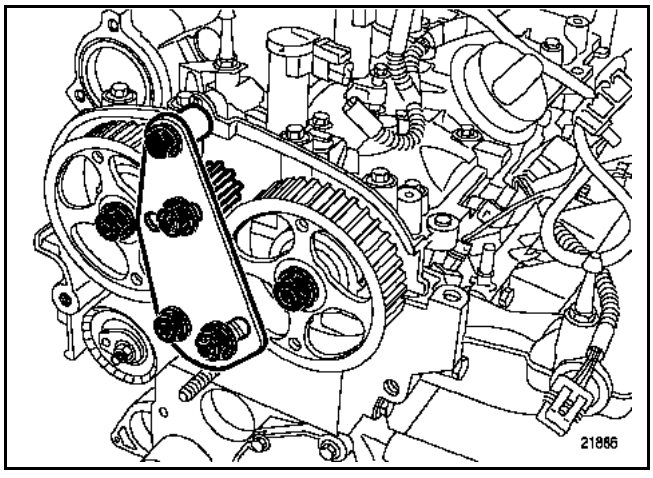
NOTE: do not turn the tension wheel in an anti-clockwise direction.

Align marks (6) and (7) of the tension wheel using a **6 mm** Allen key at (B).



Pretighten the pulley nut to a torque of **0.7 daNm**.

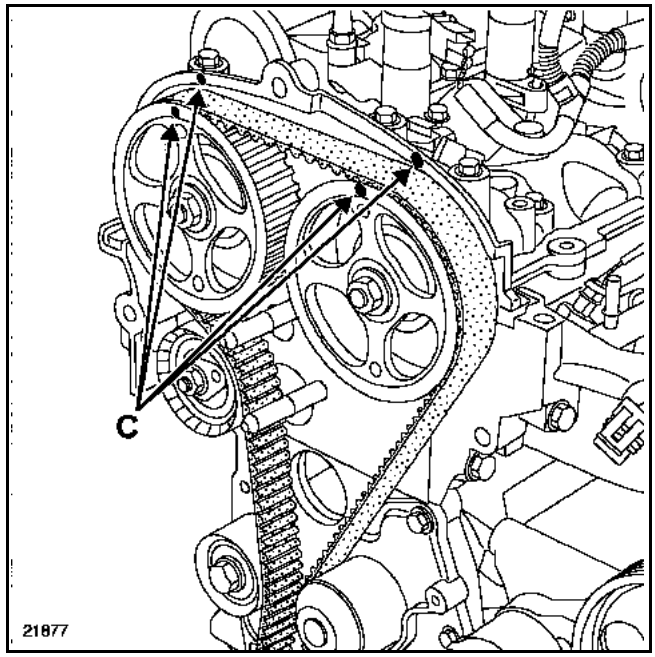
Fit the camshaft pulley locking tool **Mot. 1509**.



Pretighten the inlet and outlet camshaft pulley nuts to a torque of **3 daNm**.

Remove tools **Mot. 1509** and **Mot. 1496**.

Make a pencil mark (C) between the camshaft pulleys and the camshaft bearing.



REMOVE THE TDC PIN

Rotate the engine twice in a clockwise direction.

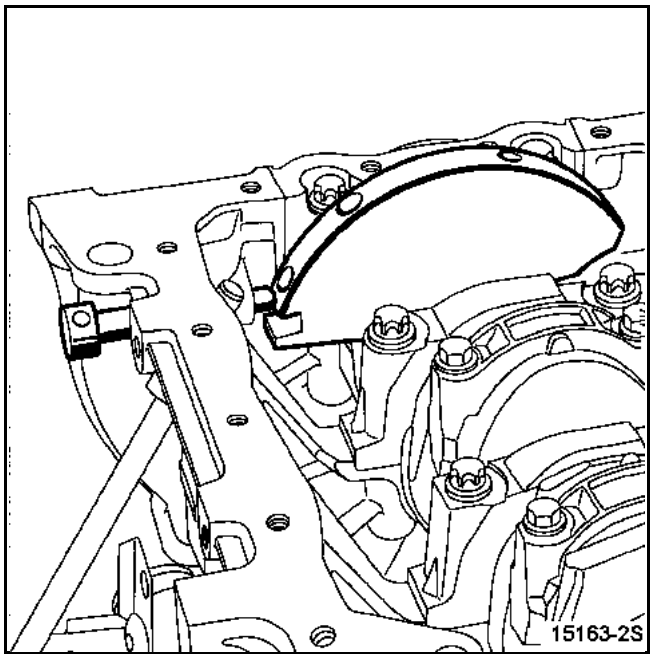
GETtheMANUALS.org

Checking the timing and the tension

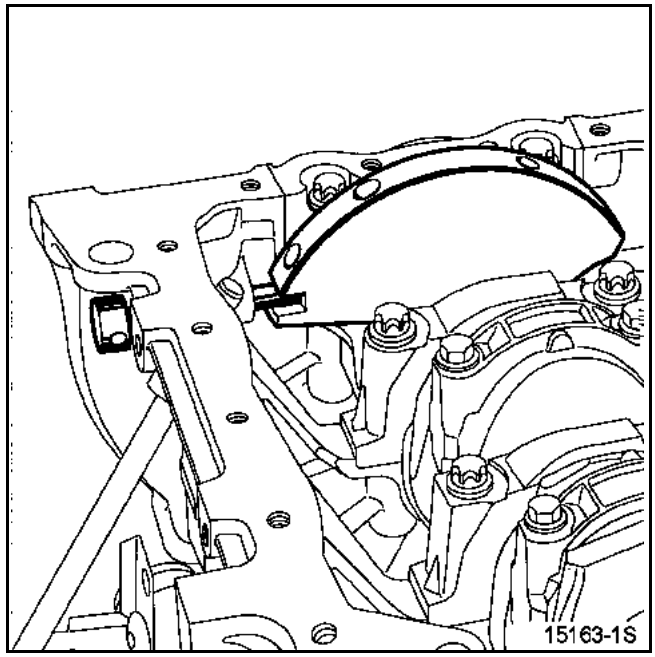
Checking the tension:

Rotate the crankshaft twice in a clockwise direction (timing end) and before the end of the second turn (in other words, half a tooth before the marks made previously are aligned), insert the crankshaft Top Dead Centre pin (so as to be between the balancing hole and the pinning hole) then move the timing to its setting point.

Before pinning



Pinned crankshaft



Remove the Top Dead Centre pin.

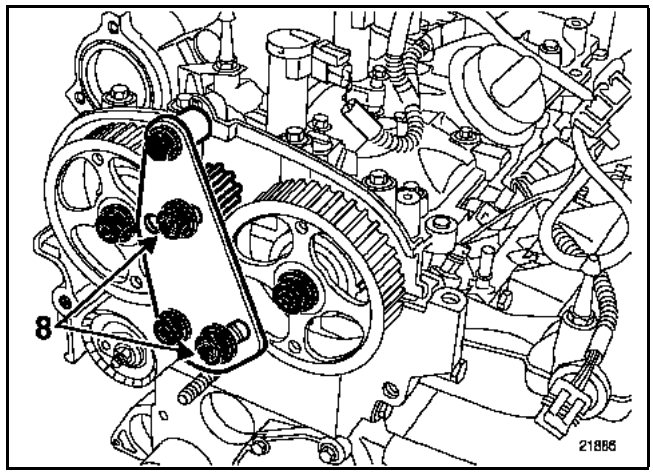
Check that the tension wheel marks are correctly aligned, otherwise repeat the tensioning procedure.

Slacken the tension wheel nut by a maximum of one turn, holding it with a **6 mm** Allen key.

Align the tension wheel marks and tighten the nut finally to a torque of **2.8 daNm**.

GETtheMANUALS.org

Fit the camshaft locking tool **Mot. 1509** and tighten the nuts (8) to a torque of **8 daNm**.



Take out the old pulley nuts and replace them with new ones.

Tighten the outlet and inlet camshaft pulley nuts to a torque of **3 daNm then turn them through an angle of 86 ± 16°**.

Remove the camshaft pulley locking tool **Mot. 1509** and the TDC pin **Mot. 1054**.

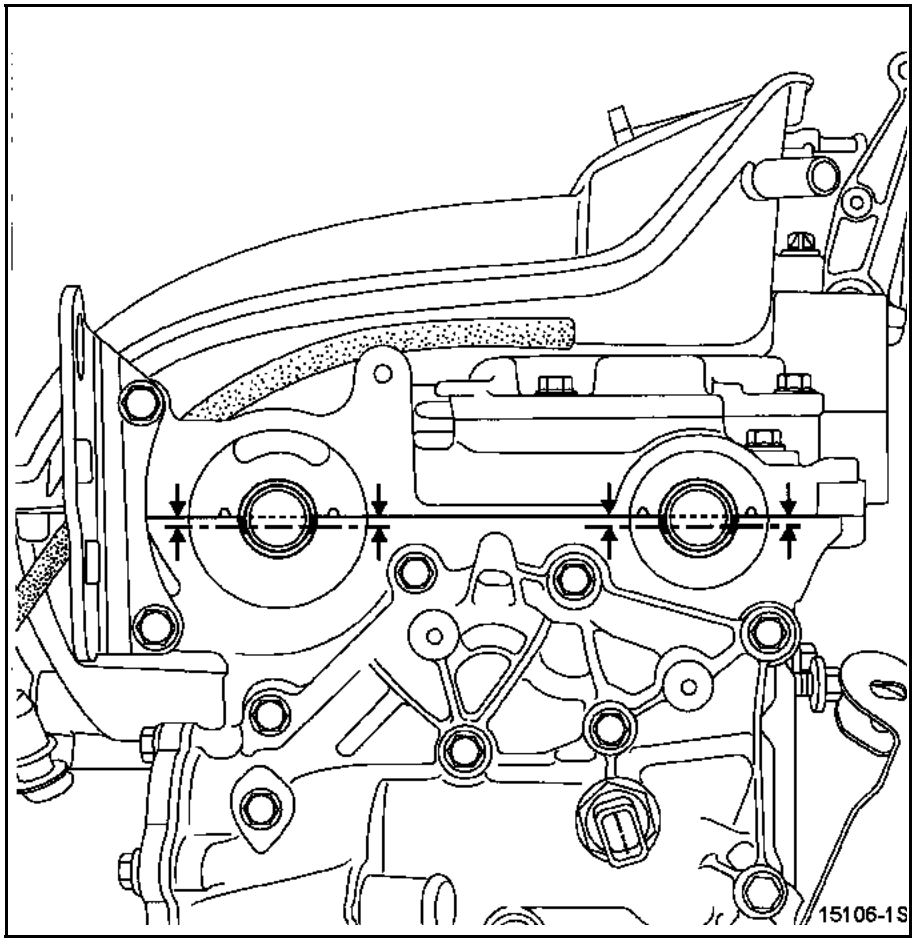
GETtheMANUALS.org

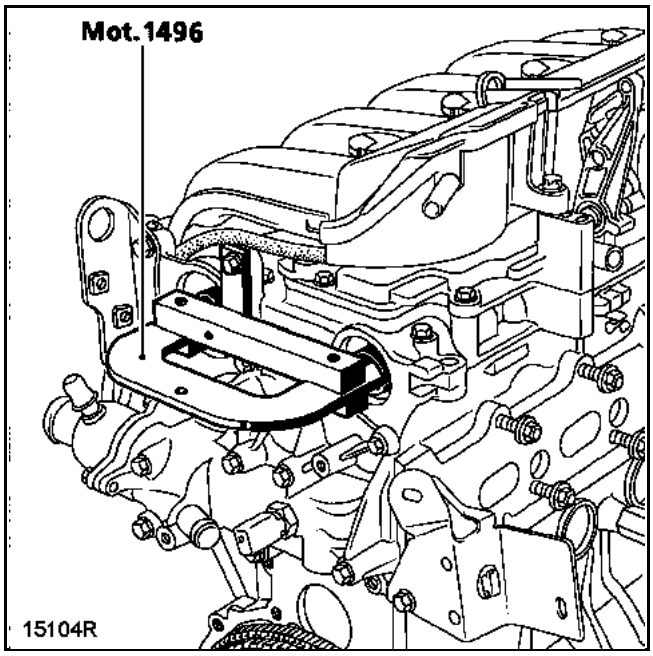
Checking the timing

Ensure that the tension wheel marks are in the correct position before checking the timing.

Fit the Top Dead Centre pin (check that the marks made previously on the camshaft pulleys are aligned).

Fit (without forcing) tool **Mot. 1496** for setting the camshafts (the camshaft grooves must be horizontal and offset towards the bottom). The timing setting and tensioning procedure must be repeated if the tool does not engage.



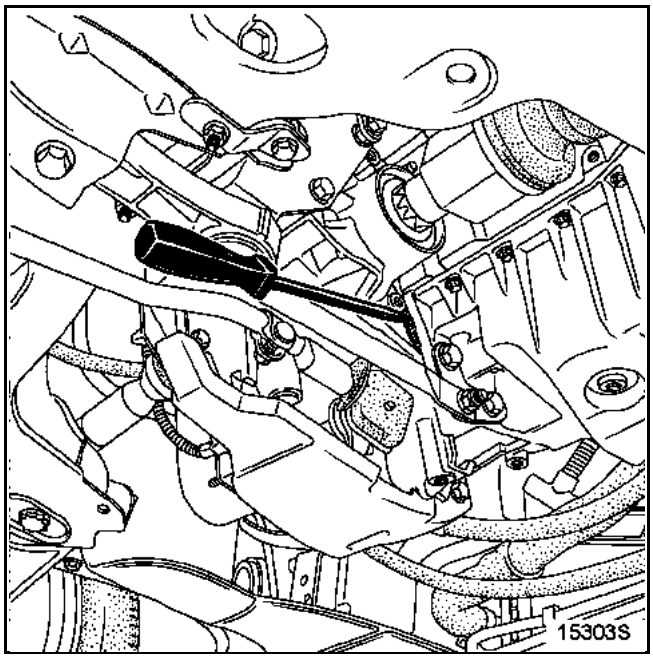


GETtheMANUALS.org

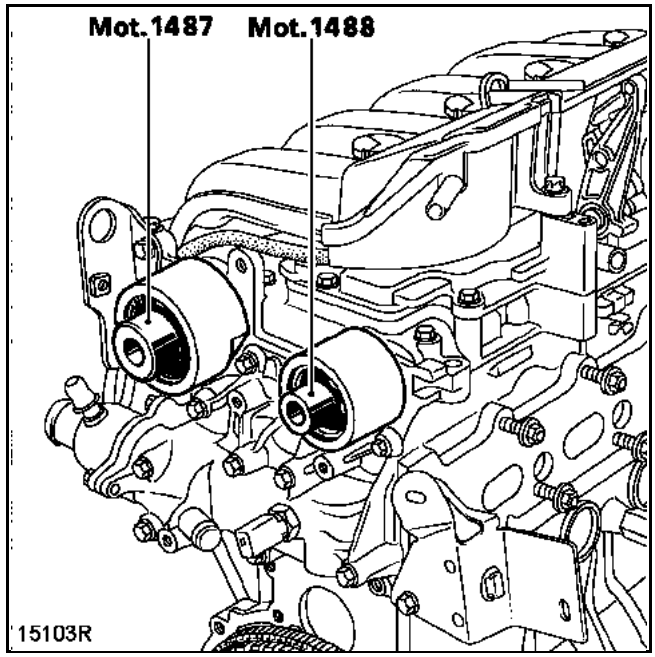
Refit:
– the lower timing cover,
– the upper timing cover,
– the crankshaft accessories pulley.

Lock the flywheel using a large screwdriver, then turn the bolt of the crankshaft accessories pulley though an angle of **115° ± 15°**.

NOTE:
The crankshaft accessories pulley bolt can be reused if the length under its head does not exceed **49.1 mm** (otherwise replace it),
Do not oil the new bolt. However, the bolt must be oiled on the threads and under the head if it is being reused.



Refit:
– the accessories belt (see **section 07A "Timing belt tensioning procedure"**),
– the plug of the Top Dead Centre pin, applying a drop of **RHODORSEAL 5661** to the thread,
– the new sealing plugs:
  ● of the inlet camshaft **(Mot. 1487)**,
  ● of the outlet camshaft **(Mot. 1488)**.



– the right-hand suspended engine mounting by tightening it to the correct torque (see **section 19D "Suspended engine mounting"**).

GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Mot. 1534	Inlet camshaft adjustment tool
Mot. 1537	Outlet camshaft adjustment tool
Mot. 1536	TDC setting pin
Mot. 1367-02	Engine support tool

TIGHTENING TORQUES (in daNm and/or °)	
Tension wheel nut	2.5
TDC pin hole bolt	2.2
Mounting bolts on the engine for suspended engine mounting cover	6.2
Body mounting bolt for the suspended engine mounting movement limiter	10.5
Wheel bolt	11

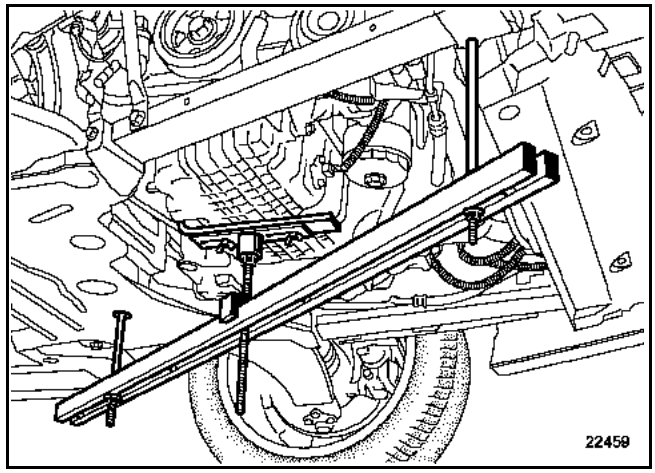
REMOVAL

Put the vehicle on a two-post lift.

Disconnect the battery.

Remove:
– the engine undertray,
– the engine cover,
– the front right wheel and the wheel-arch liner.

Fit the engine mountings **Mot. 1367-02**.



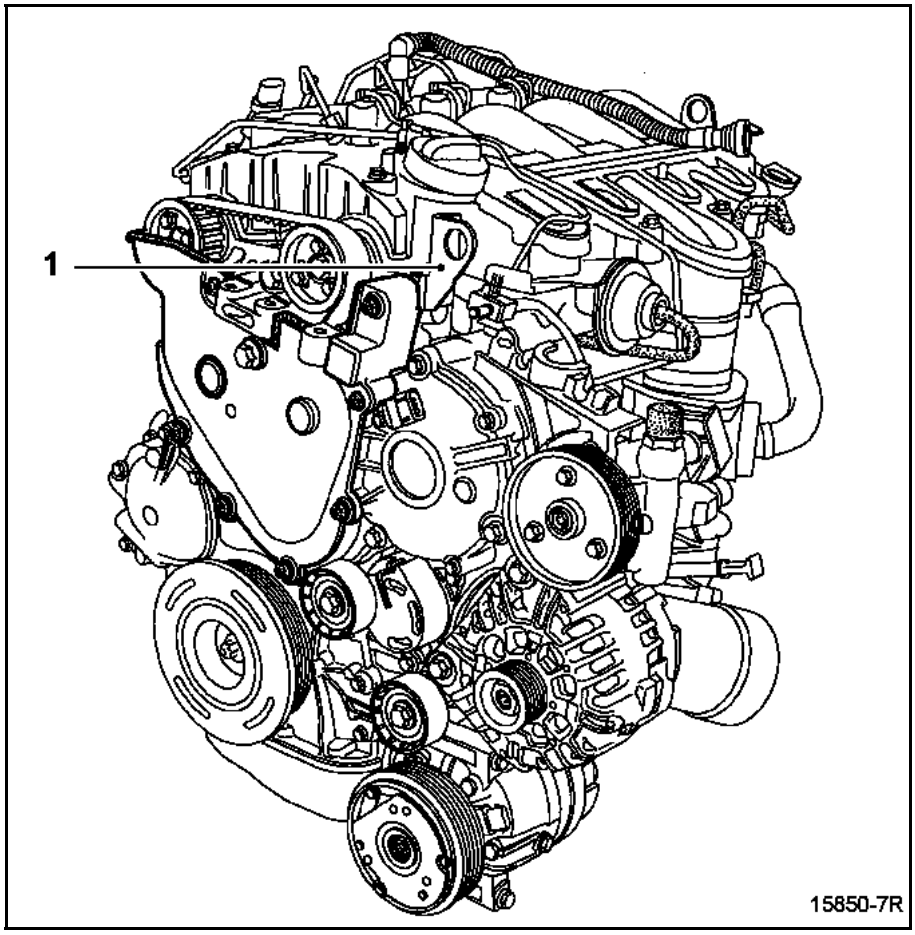
Remove the front right suspended mounting.

Unclip the turbocharger adjustment solenoid valve from its bracket.

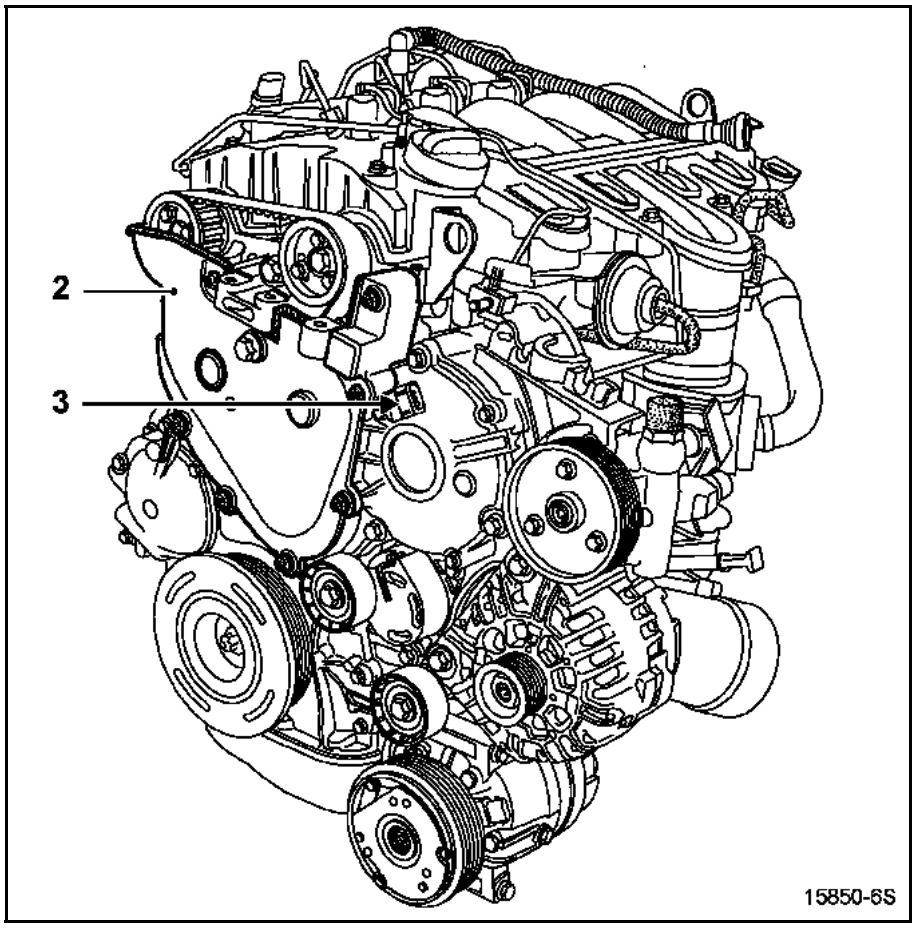
Remove:
– the rubber mounting bracket,
– the acoustic earth and its side member bracket.

GETtheMANUALS.org

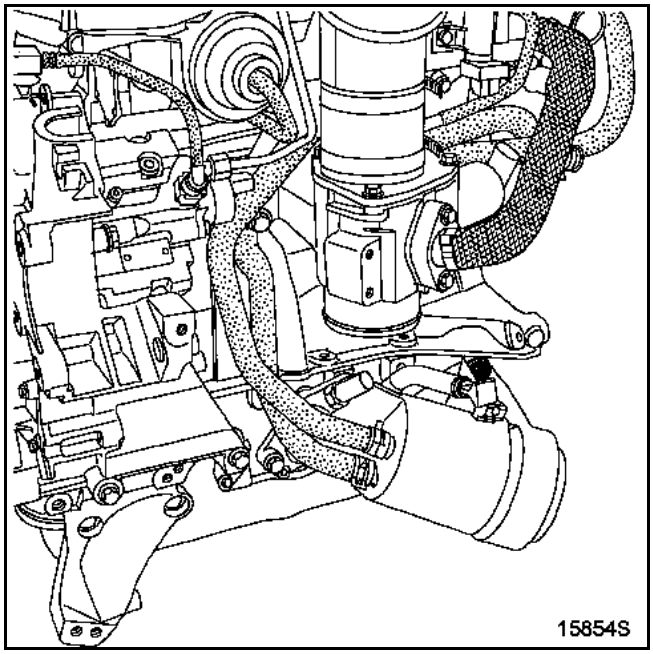
– the lifting ring (1),



– the valve timing cover (2),
– the cylinder head suspended mounting,
– the cylinder marking sensor (3).



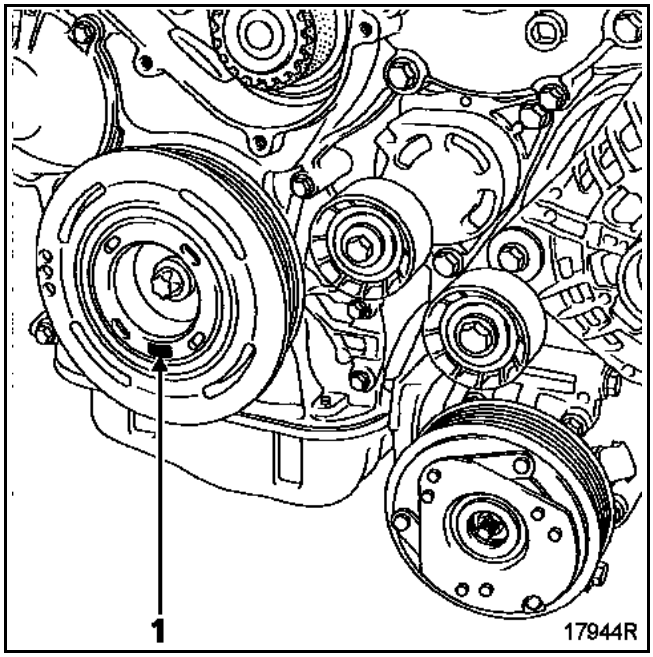
GETtheMANUALS.org



Remove the Top Dead Centre pin plug.

METHOD FOR ADJUSTING TIMING AT THE SETTING POINT

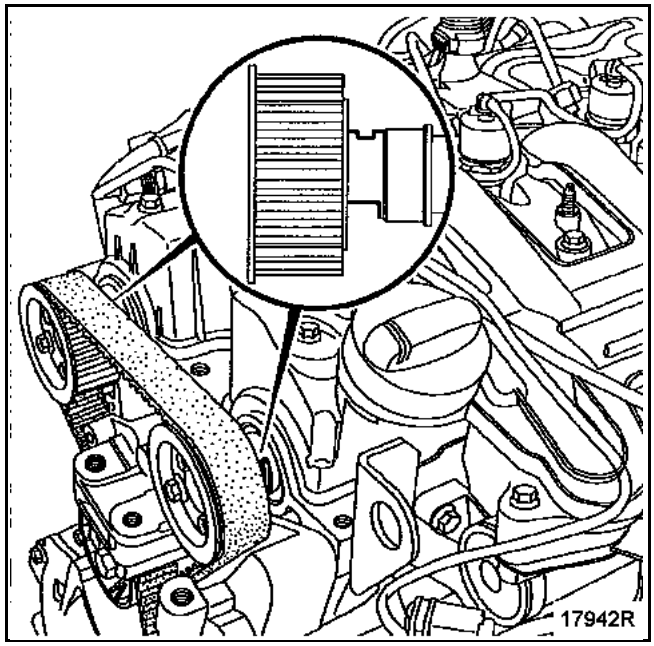
Position the top dead centre mark (1) on the crankshaft accessories belt pulley almost in line with the engine vertical as shown in the illustration below.



Fit the top dead centre pin **Mot. 1536**.

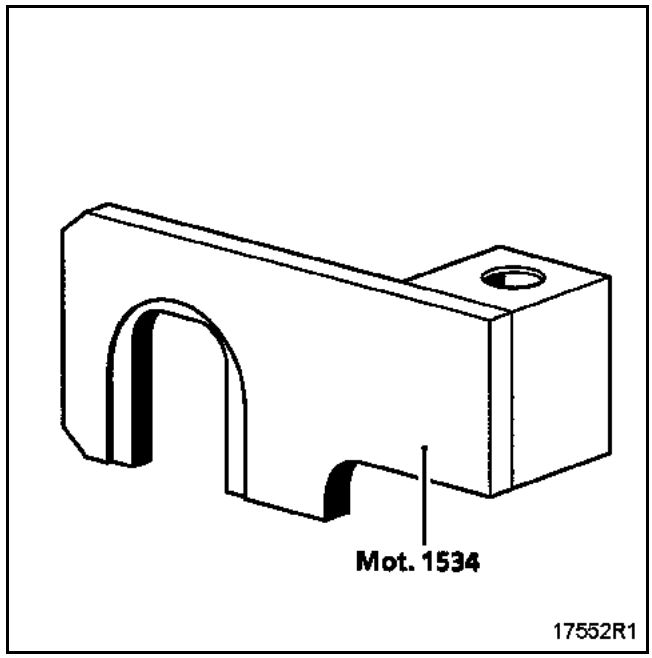
Turn the engine clockwise (timing side), pressing down on the TDC pin **Mot. 1536** until it reaches the timing setting point.

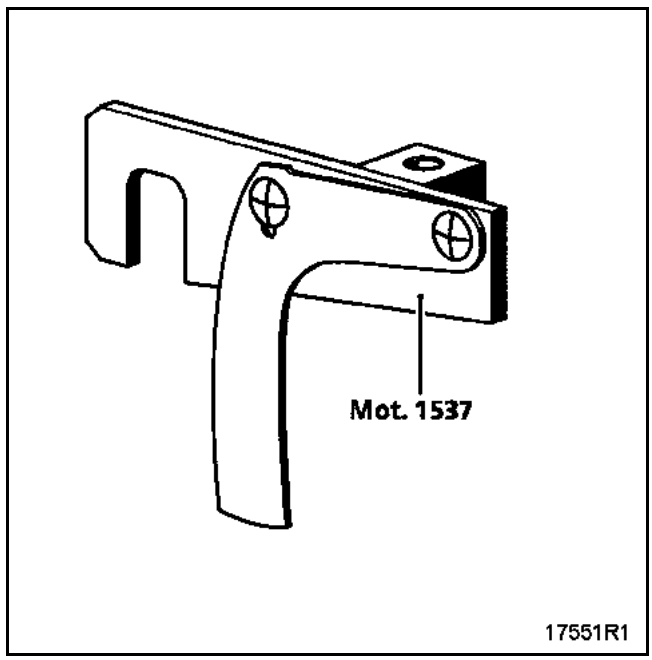
The camshaft grooves should be vertical as shown on the following diagram.



GETtheMANUALS.org

The inlet and outlet camshafts are adjusted using tools **Mot. 1534** and **Mot. 1537**.





Place **Mot. 1534** and **Mot. 1537** in the camshaft grooves as recommended.

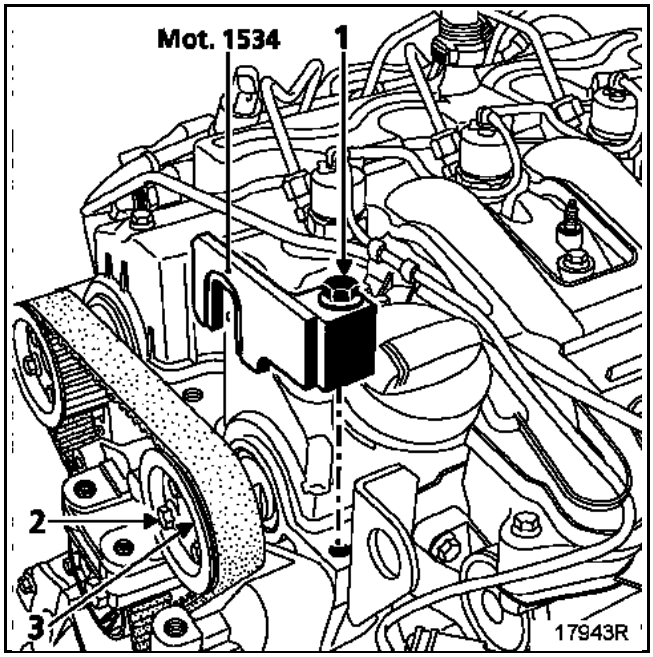
GETtheMANUALS.org

For the inlet camshaft:

Position **Mot. 1534** and finger-tighten the bolt (1).

Loosen the three camshaft sprocket bolts by a maximum of one turn.

Turn the inlet camshaft clockwise with the hub mounting bolt (3) (using a **16 mm** box spanner) so that the **Mot. 1534** tool is flat against the cylinder head, then tighten the bolt (1) of **Mot. 1534**.

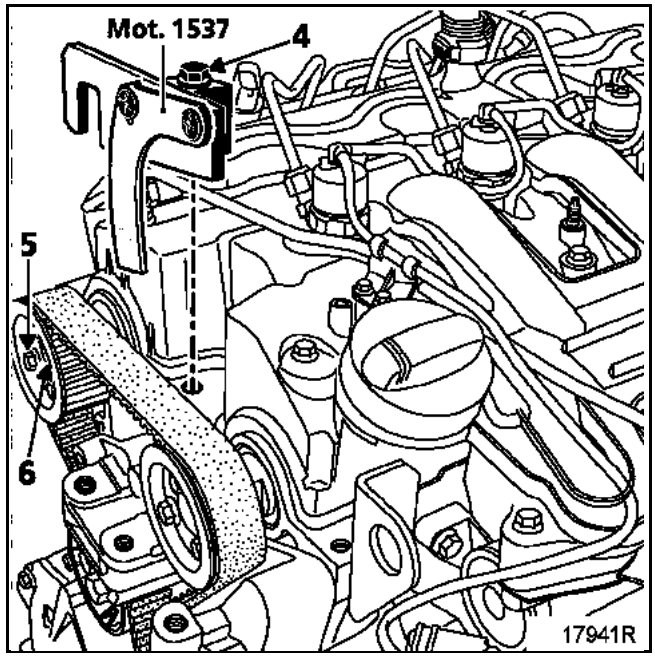


For the outlet camshaft:

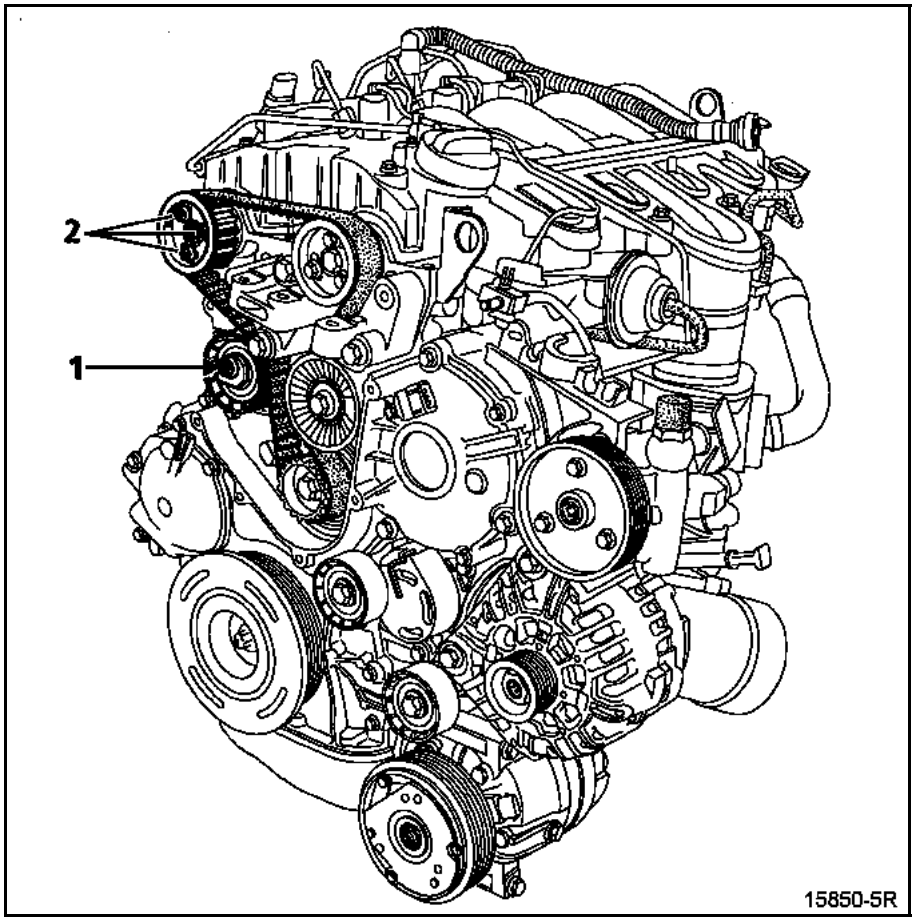
Set **Mot. 1537** by finger-tightening the bolt (4).

Loosen the three camshaft sprocket bolts (5) by up to one turn.

Turn the outlet camshaft clockwise with the hub mounting bolt (6) (using a **16 mm** box spanner) so that the **Mot. 1537** tool is flat against the cylinder head, then tighten the bolt (4) of **Mot. 1537**.



GETtheMANUALS.org



Slacken the timing belt by undoing the tension wheel bolt (1).

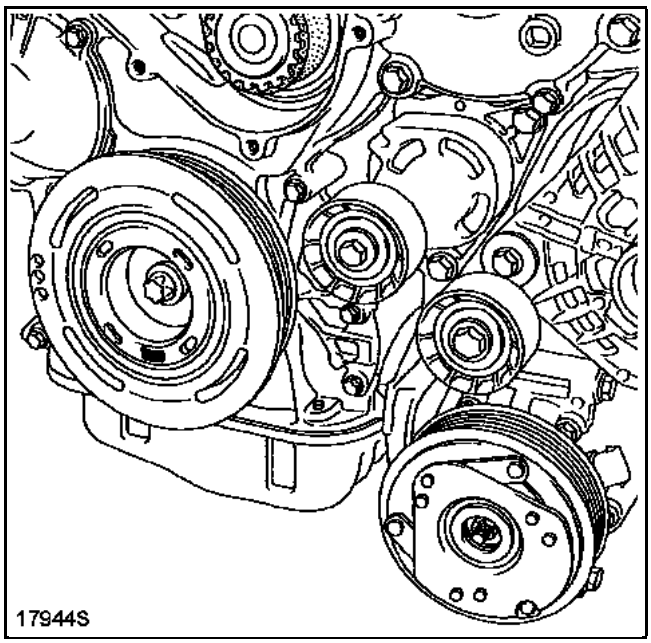
Remove:
– the three bolts (2), then take out the sprocket from the outlet camshaft,
– the timing belt.

GETtheMANUALS.org

REFITTING

TIMING ADJUSTMENT METHOD

Pin the crankshaft to top dead centre (the top dead centre mark on the crankshaft accessories pulley must be in the vertical axis of the engine).



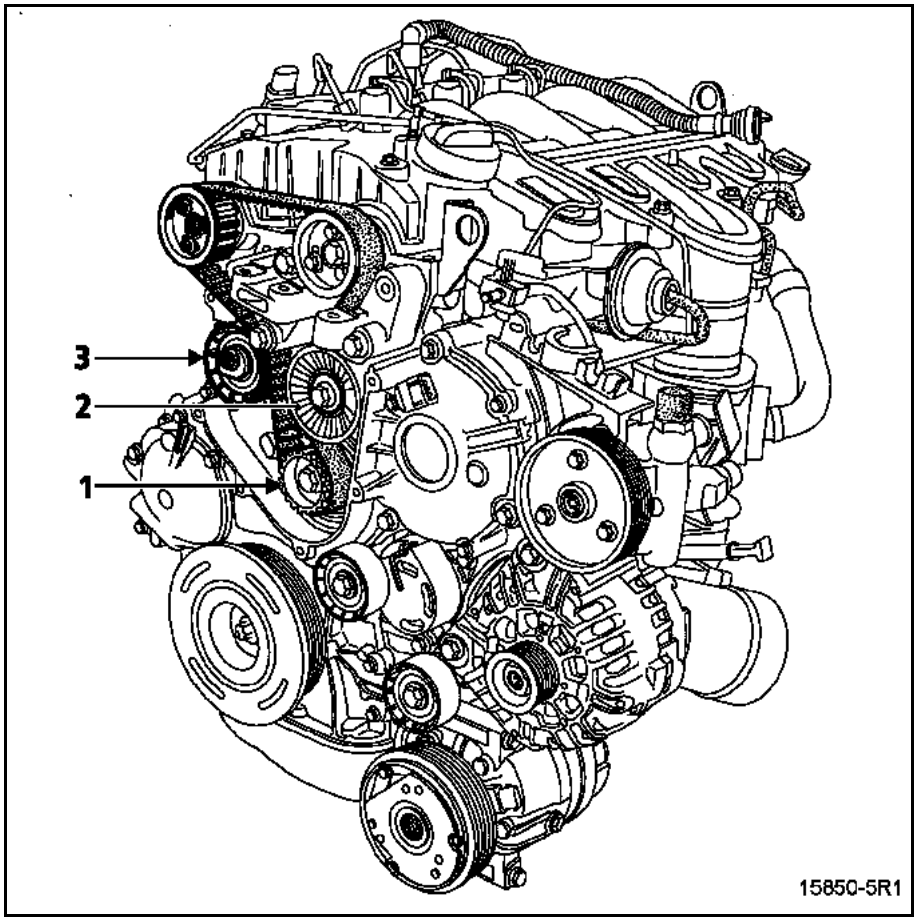
Loosen the three camshaft timing sprocket bolts by a maximum of one turn.

GETtheMANUALS.org

Set the timing belt, starting with the intermediate sprocket (1), the fixed roller (2), the outlet camshaft sprocket (try to keep the bolts in the middle of the sprocket lights) and the tension wheel (3).

Put the outlet camshaft sprocket on the belt, then place it on the camshaft hub, while trying to keep the bolts in the middle of the sprocket lights.

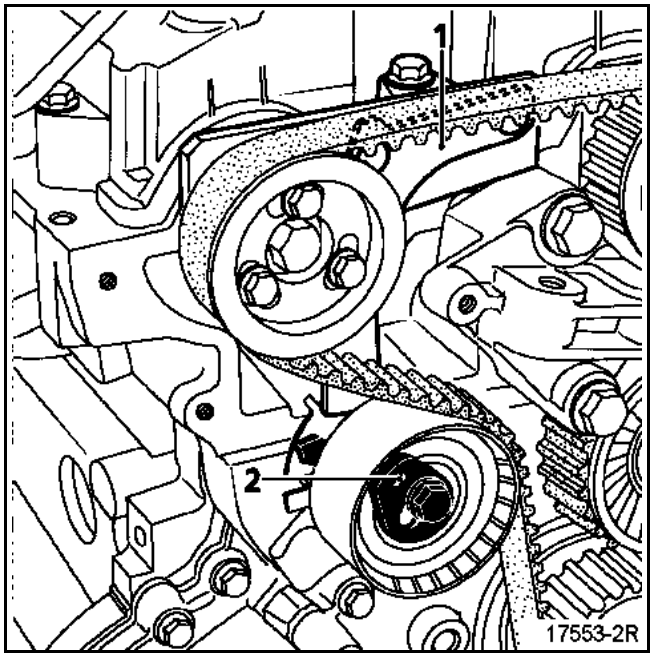
Replace the three sprocket mounting bolts without tightening them.



GETtheMANUALS.org

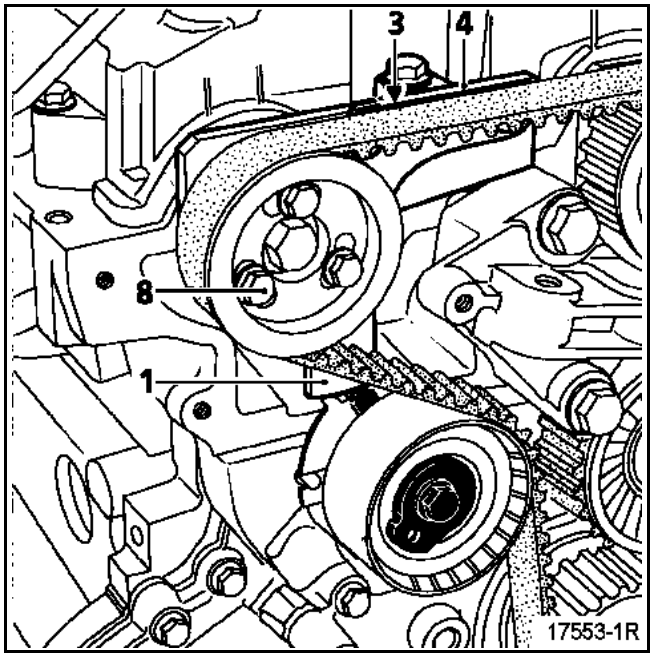
TIMING BELT TENSION

Check that the tab (1) of **Mot. 1537** moves vertically without constraint.

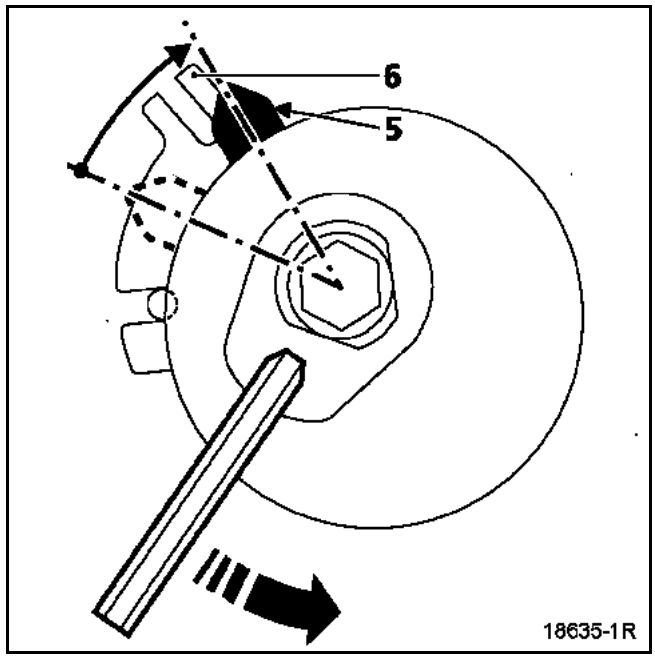


Put a **6 mm** Allen key in the hole (2) of the tensioner wheel eccentric.

Pivot the tension wheel eccentric anti-clockwise, until the surface (3) of the tab (1) is aligned with the upper surface (4) of **Mot. 1537**.

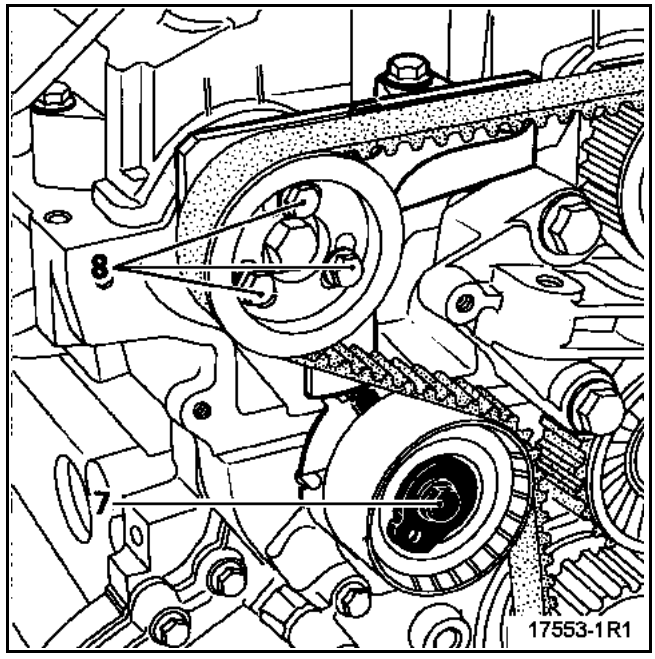


The movable index (5) of the tensioner wheel must be aligned with the prong (6).



Check that the bolts (8) are not at the stop at the bottom of the camshaft timing pin lights.

Tighten:
– tension wheel bolt (7),
– the camshaft timing sprocket bolts (8) to a torque of **1 daNm**.



GETtheMANUALS.org

Remove timing tools **Mot. 1534** and **Mot. 1537**, and the TDC pin **Mot. 1536** from the camshafts.

Rotate the crankshaft through two revolutions in a clockwise direction on the timing side.

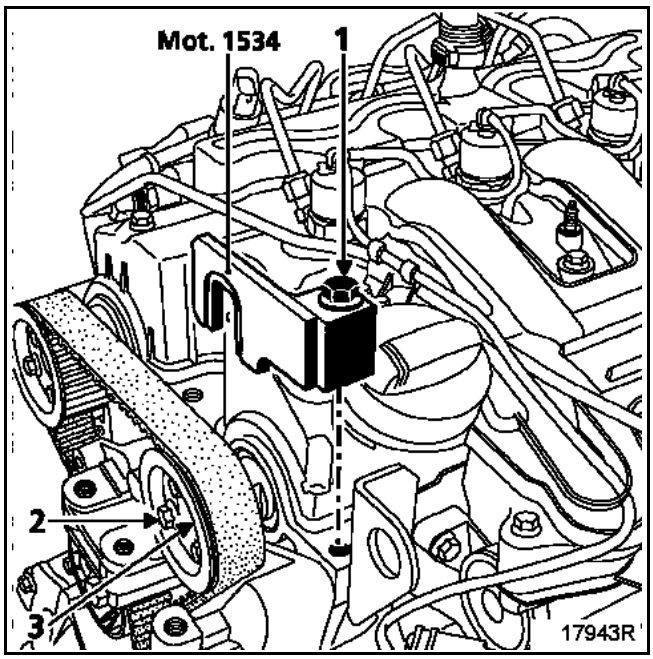
Pin the crankshaft to top dead centre (the top dead centre mark on the crankshaft accessories pulley must be on the vertical shaft of the engine).

For the inlet camshaft:

Position **Mot. 1534** and finger-tighten the bolt (1).

Loosen the three camshaft sprocket bolts by a maximum of one turn.

Turn the inlet camshaft clockwise with the hub mounting bolt (3) (using a **16 mm** tubular hexagon box spanner) in order to pin **Mot. 1534** to the cylinder head and lock the **Mot. 1534** bolt (1).

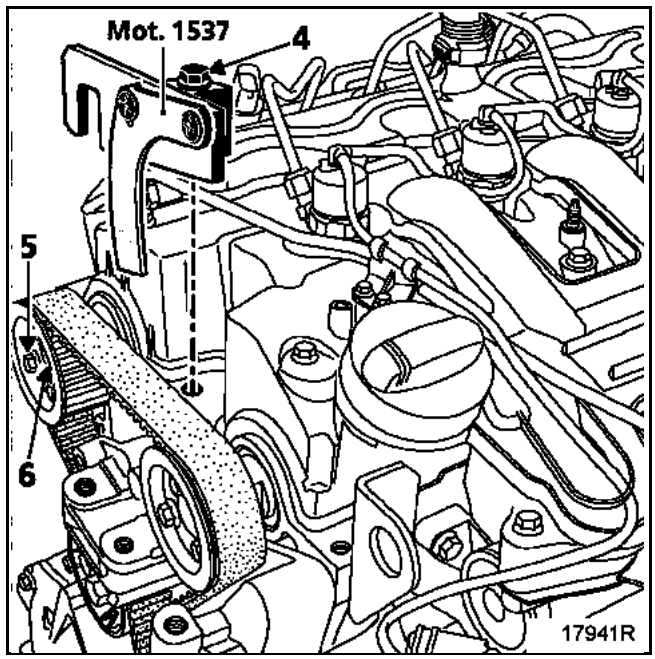


For the outlet camshaft:

Set **Mot. 1537** by finger-tightening the bolt (4).

Loosen the three camshaft sprocket bolts (5) by up to one turn.

Turn the outlet camshaft clockwise with the hub mounting bolt (6) (using a **16 mm** box spanner) so that the **Mot. 1537** tool is flat against the cylinder head, then tighten the bolt (4) of **Mot. 1537**.

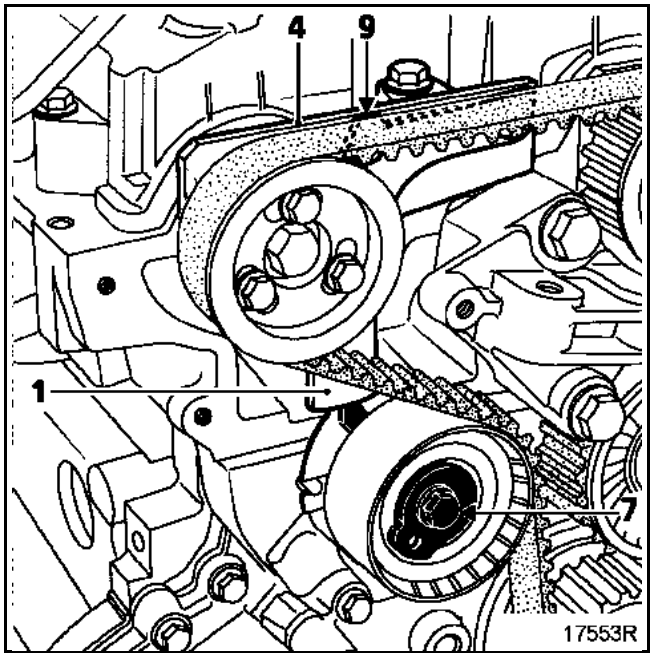


GETtheMANUALS.org

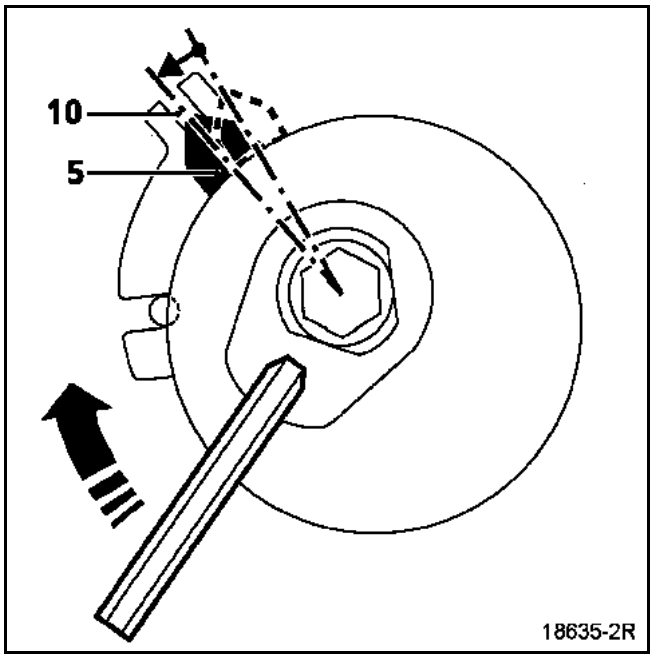
Checking the timing and the tension

Undo the tension wheel bolt (7) while holding the eccentric with a **6 mm** Allen key.

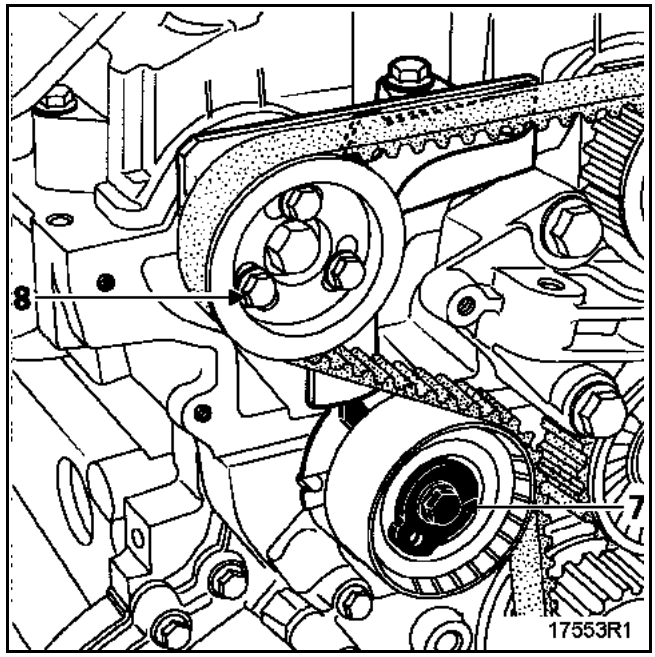
Turn the tension wheel eccentric clockwise until the face (9) of the tab (1) and the upper surface (4) of **Mot. 1537** are aligned.



The pointer (5) of the tensioner wheel must be located in the middle of the groove (10).

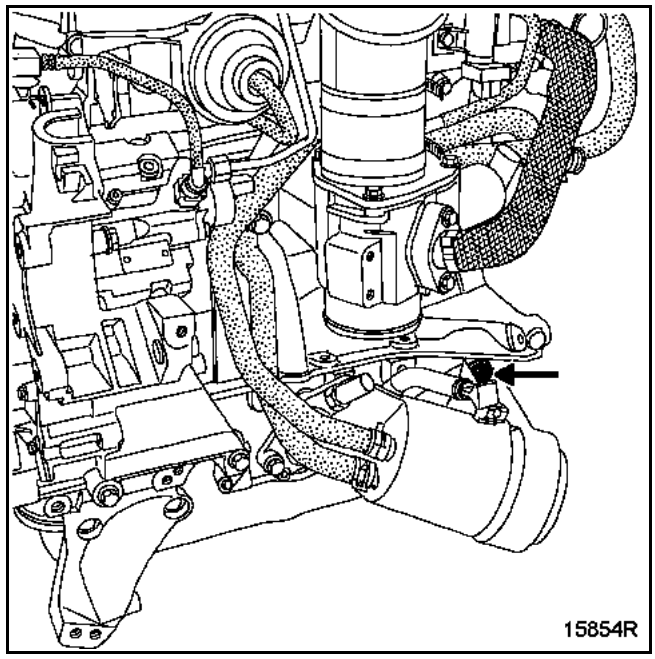


Tighten:
- the tension wheel bolt (7) to a torque of **2.5 daNm**,
- the camshaft timing sprocket bolts (8) to a torque of **1 daNm**.



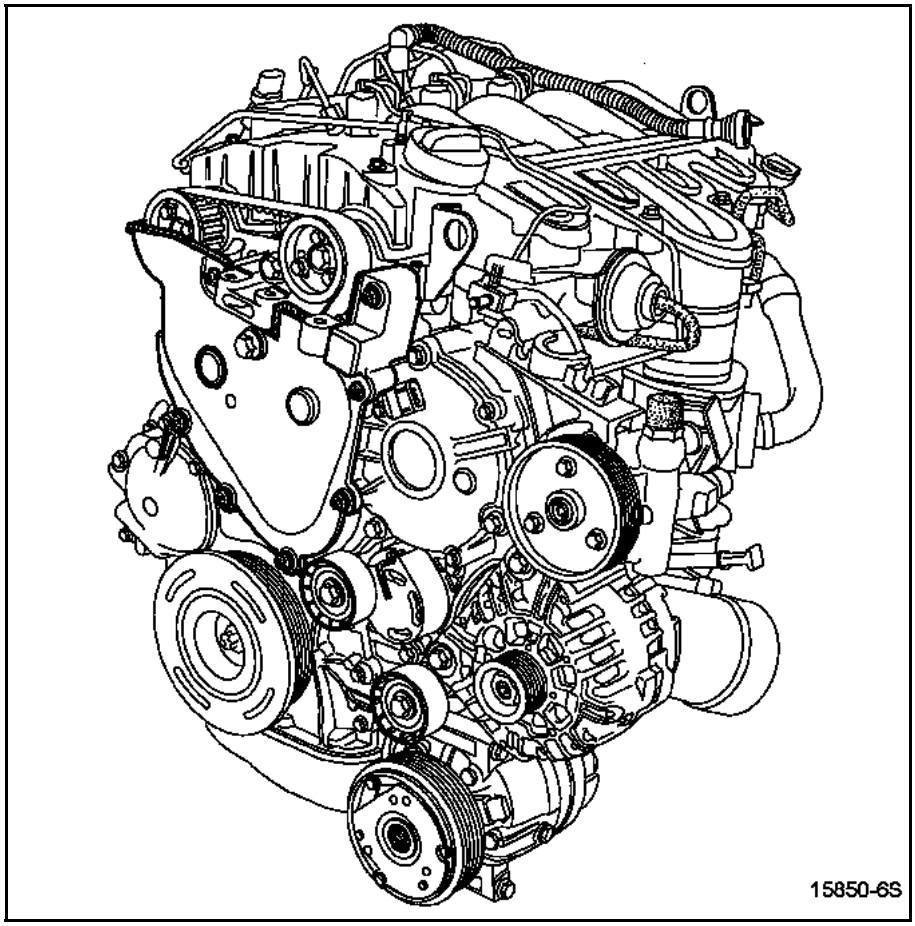
Remove the camshaft timing tools **Mot. 1534 and Mot. 1537** and the TDC pin **Mot. 1536**.

Refit the cap in the TDC pin opening applying **RHODORSEAL 5661** to the thread and by tightening to a torque of **2.2 daNm**.



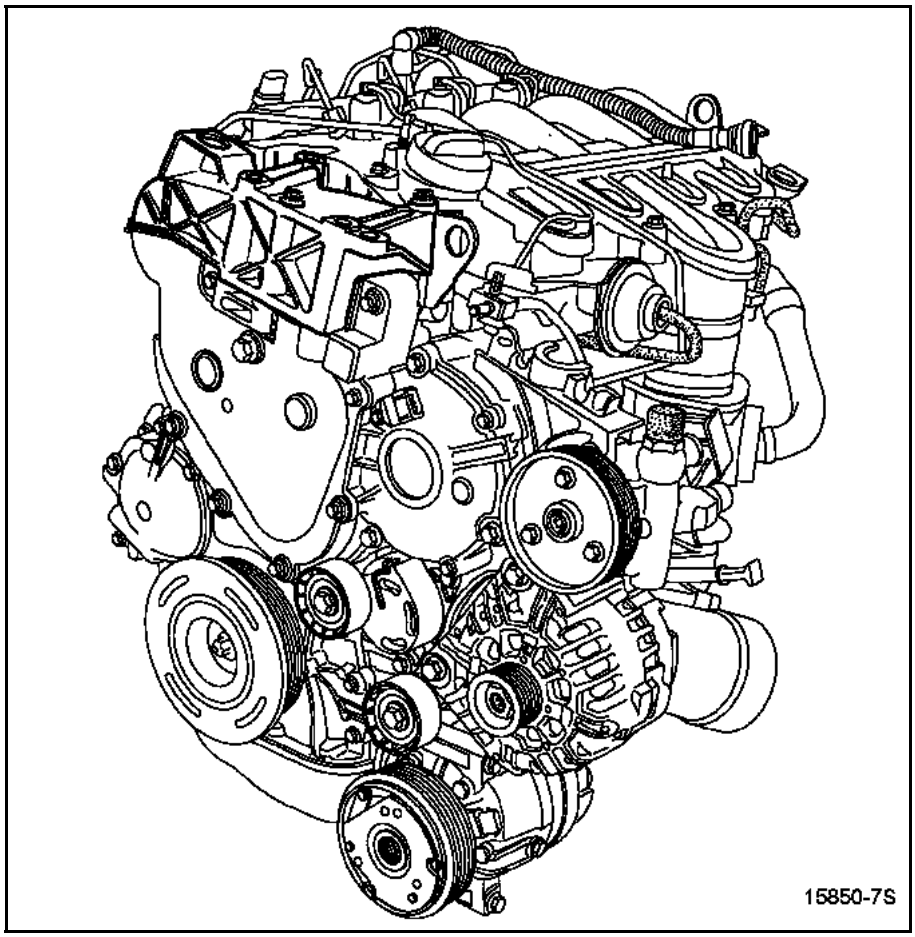
GETtheMANUALS.org

Refit:
– the timing housing, tightening the bolts to a torque of **1 daNm**,



– the cylinder head suspended mounting by tightening the bolts to a torque of **2.5 daNm**.

Refitting is the reverse of removal.



GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Mot. 1376	Engine rotating locking pin
Mot. 1367-02	Tool for securing engine from underneath
EQUIPMENT REQUIRED	
Torque wrench	

TIGHTENING TORQUE (in daNm and/or °)	▽
Fixed roller bolt	5
Tension wheel bolt	4.3
Body mounting bolt for the suspended engine mounting movement limiter	10.5
Acoustic mass mounting bolt	2.1
Engine tie-bar mounting bolt: – on the sub-frame – on the engine	 10.5 18
Wheel bolt	11

REMOVAL

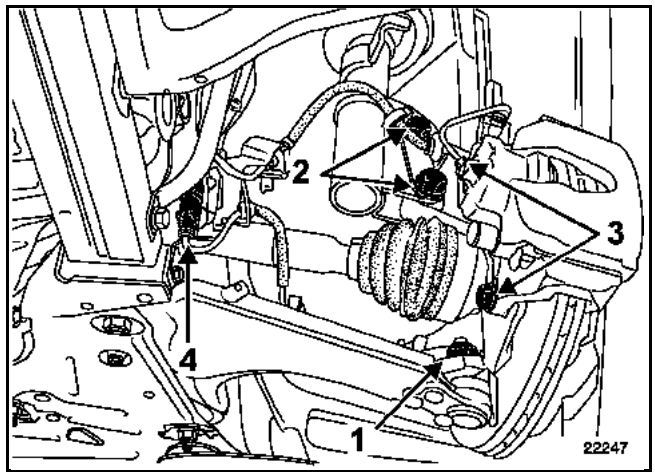
Put the vehicle on a two-post lift.

Remove the engine protections

Disconnect the battery.

Drain the oil from the engine.

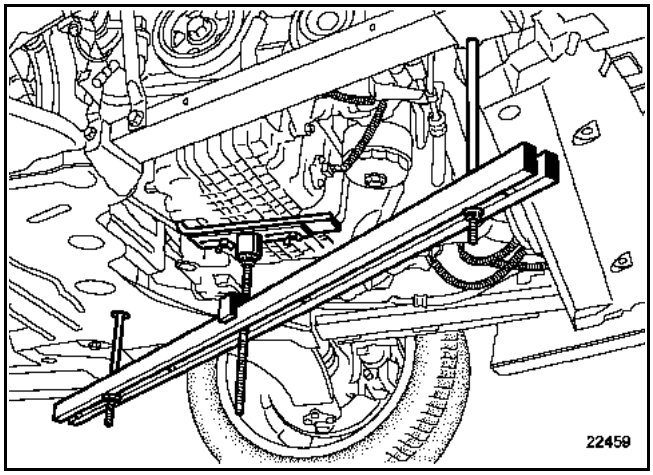
Remove:
– the front right wheel,
– the front right-hand wheel arch liner;
– the front right-hand steering ball joint,
– the front right-hand lower ball joint at (1),
– the two bolts from the base of the front right shock absorber at (2),
– the brake caliper then attach it to the suspension spring at (3),
– the ABS sensor connector at (4),



– the driveshaft relay bearing bracket,
– the front right driveshaft.

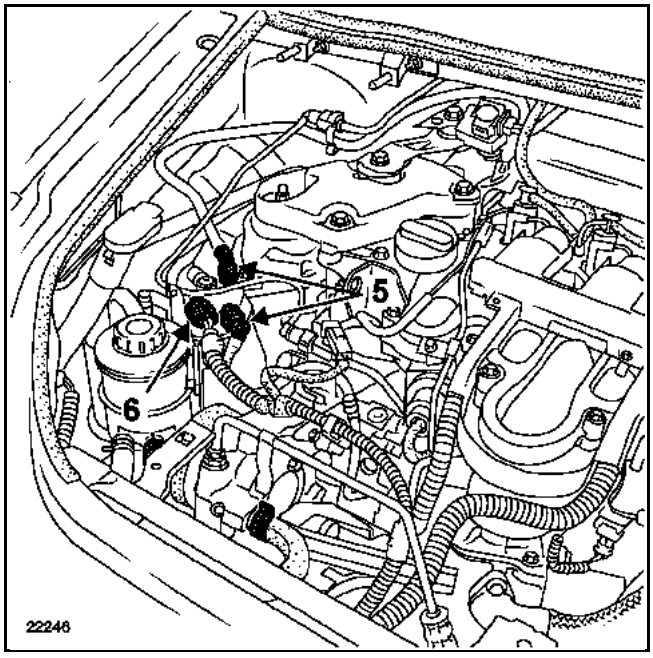
GETtheMANUALS.org

Fit the lower engine mountings tool **Mot. 1367-02**.

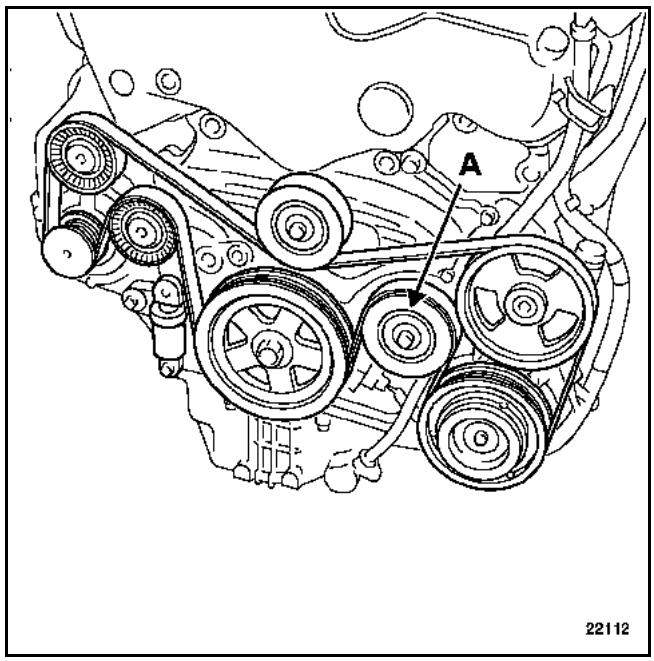


Remove:
- the front right suspended engine mounting and the acoustic earth,
- the diesel inlet and return pipes(5) on the filter,
- the electrical connector (6),
- the diesel filter.

Unclip the diesel supply and return pipes.



- the air hose on the manifold,
- the accessories belt,
- the fixed roller (A).

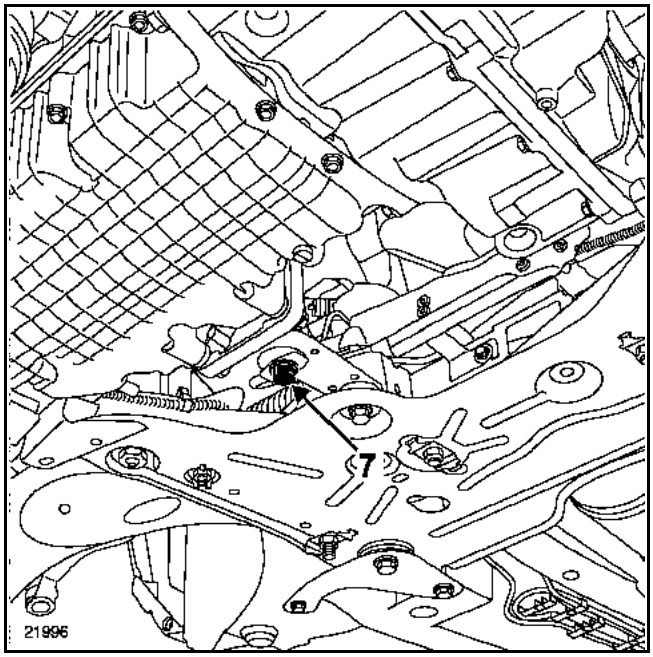


Disconnect the crankshaft sensor connector.

Remove:
- the mountings from the power assisted steering pump (see section **36B "Power assisted steering pump"**) then move the pump aside, taking care not to bend the rigid pipe,
- the gauge guide.

GETtheMANUALS.org

Remove the engine tie-bar bolt at (7).



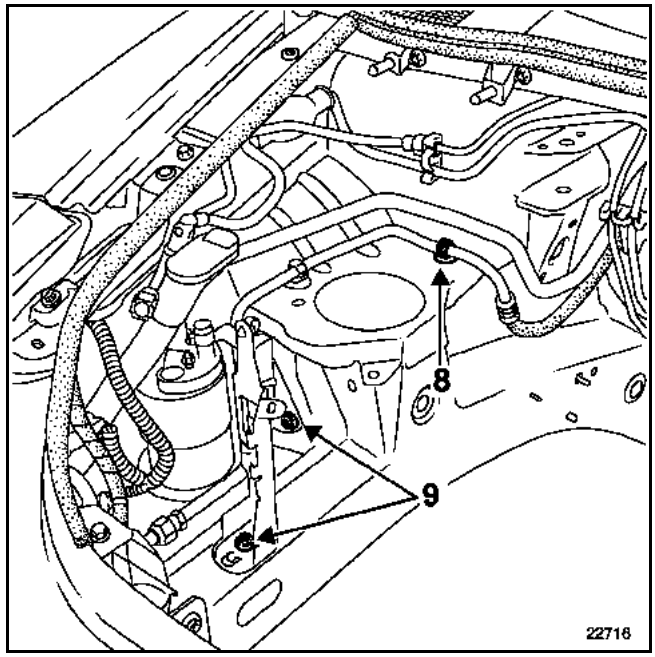
NOTE: fit the cleanliness plugs on the diesel pipes that have been removed.

WARNING: the outlet pipe could be damaged if the engine is lifted too high.

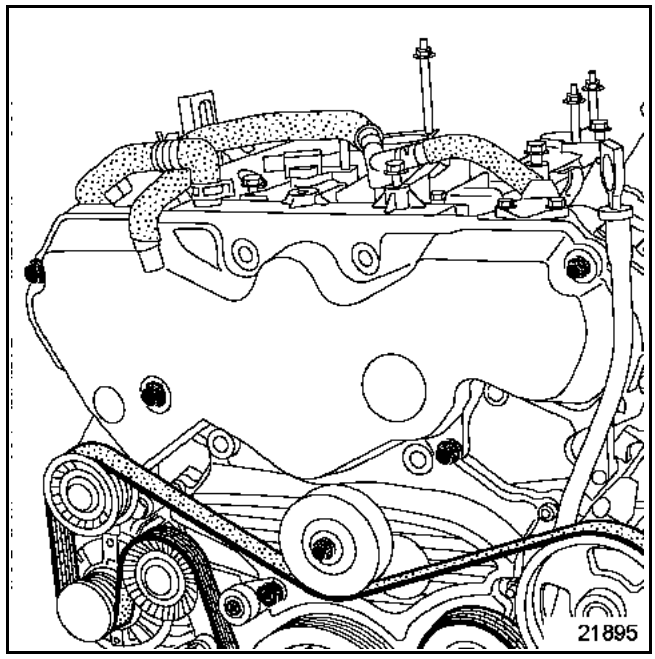
Lift the engine with **Mot. 1367-02** to enable the suspended engine mounting cover to be released.

Unclip the climate control pipe at (8).

Remove the power steering reservoir and its support (9).



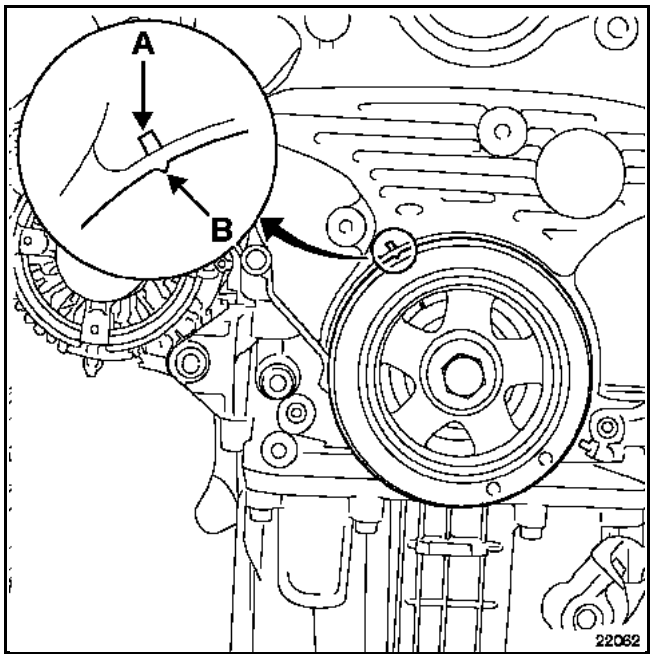
Remove:
– the suspended mounting on the cylinder head,
– the valve timing cover.



GETtheMANUALS.org

Lower the engine enough to release the access to the crankshaft accessories pulley bolt.

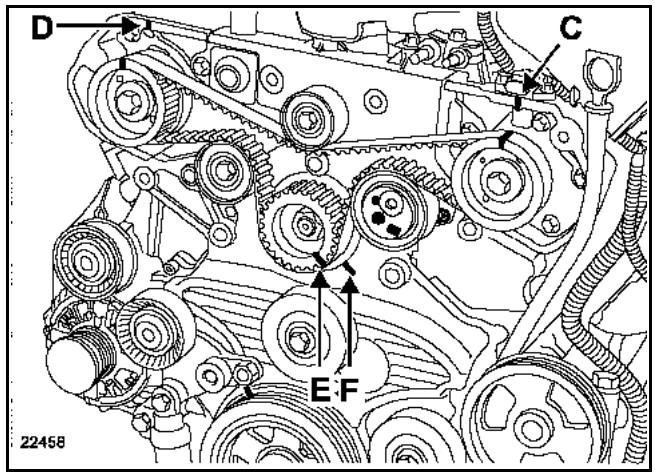
Align marks (A) and (B) by turning the engine clockwise with the crankshaft pulley bolt on the timing side.



The **LH** mark on the camshaft on the front bench should be aligned with mark (C).

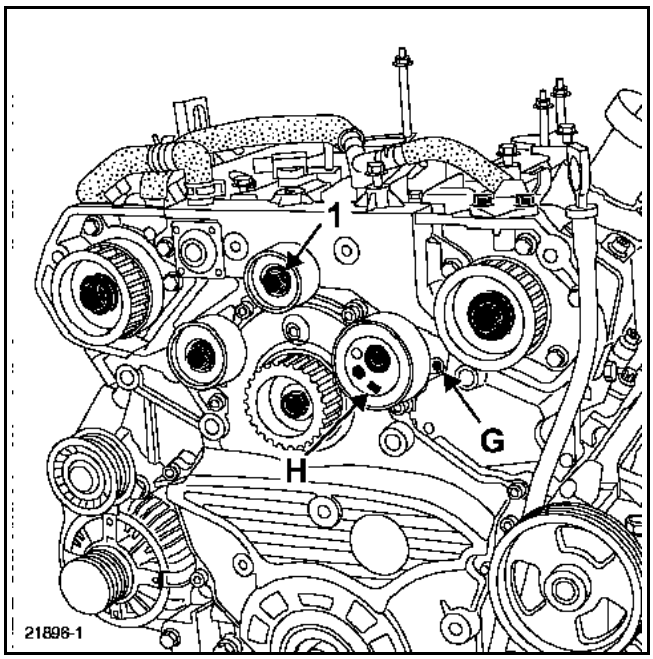
The **RH** mark on the camshaft on the rear bench should be aligned with mark (D).

Mark (E) on the injection pump sprocket should be aligned with the fixed mark (F) on the timing gear housing.



GETtheMANUALS.org

Loosen the timing belt by turning the auto tensioner anti-clockwise using a **10 mm** Allen key with a torque **no greater than 4 daNm** then by pinning the tension wheel with a **6 mm** Allen key at (G).



Remove the timing belt.

REFITTING

The tensioners and fixed rollers must be replaced when the timing belt is replaced.

Refit the fixed rollers and tighten them to a torque of **5 daNm**.

The smallest fixed roller is positioned at the top at (1).

Refit the tension wheel by correctly positioning the centring pin (G) in the tension hole and tightening it to a torque of **4.3 daNm**.

Compress the auto tensioner by turning it anti-clockwise using a **10 mm** Allen key with a torque **no greater than 4 daNm** then by pinning the tension wheel with a **6 mm** Allen key at (H).

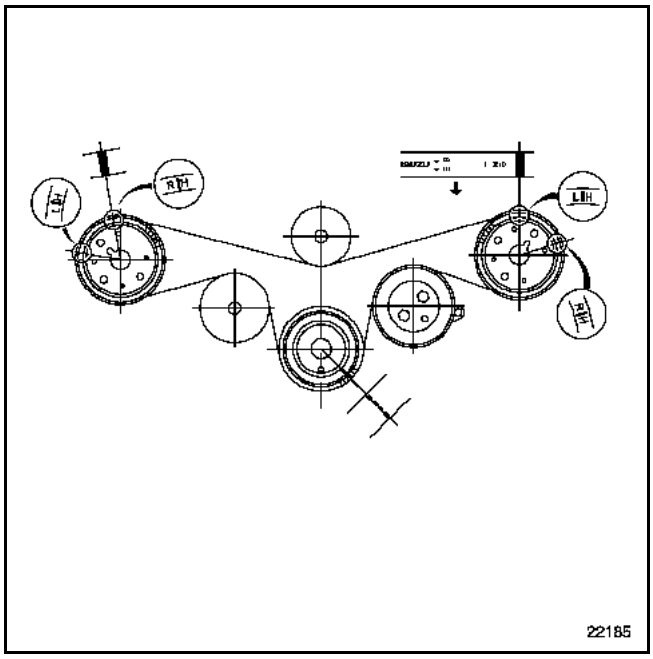
GETtheMANUALS.org

Fit the new timing belt by aligning the marks on the belt with those on the camshaft sprockets and the injection pump.

For the camshaft on the front bench, the **LH** mark should be aligned with the mark on the timing belt.

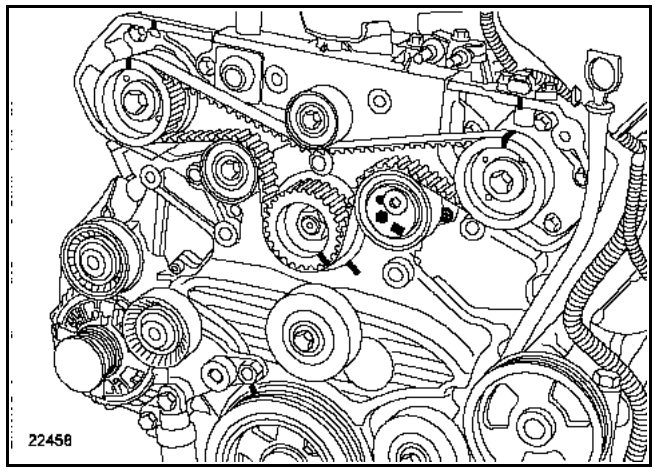
For the camshaft on the rear bench, the **RH** mark should be aligned with the mark on the timing belt.

The mark on the injection pump pulley should be aligned with the third mark on the timing belt.



Release the tension wheel by taking out the **6 mm** Allen key that was preventing it from moving.

Rotate the engine clockwise twice and confirm that the marks are aligned. If they are not aligned, repeat the procedure from when the belt was fitted.



Refit the right-hand suspended engine mounting by tightening it to the correct torque (see **section 19A "Suspended engine mounting"**).

Refit the front right driveshaft (see **section 29A "Driveshaft"**).

NOTE: it is essential to replace the two O-rings on the gauge guide.

Refit the power assisted steering pump mountings (see section **36B "Power assisted steering pump"**).

Refit the accessories belt (see section **07A "Accessories belt tension"**).

Fill up the engine oil.

Continue the refitting procedure in the reverse order to removal.

GETtheMANUALS.org

The engine-gearbox assembly must be removed when the timing chain is removed or refitted, to comply with engine hygiene conditions

Refer to **manual V4Y**.

GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Mot. 1054	TDC setting pin
Mot. 1367-02	Engine support tool
Mot. 1496	Camshaft pulley adjustment tool
Mot. 1509	Camshaft locking tool
EQUIPMENT REQUIRED	
Angular torque wrench	

TIGHTENING TORQUES (in daNm and/or °)	
Fixed roller bolt	4.5
Crankshaft pulley bolt	2 + 135° ± 15°
Tension wheel nut	2.8
Cylinder head cover bolt	1.2
Oil decanter bolt	1.2
Mounting bolt on the engine for suspended engine mounting cover	6.2
Body mounting bolt for the suspended engine mounting movement limiter	2.1
Suspended engine mounting upper linkage mounting bolt	10.5
Lower inlet manifold bolt	2.1
Coil bolt	1.2
Inlet manifold bolt	0.9
Turbocharger greasing return middle bracket mounting bolt	0.8
Turbocharger return mounting bolt	1
Catalytic converter mounting bolt	2.1
Camshaft pulley nuts	3 + 84°
Wheel bolt	11

GETtheMANUALS.org

The following components must be replaced in this operation:
– the exchanger hoses,
– the key on the crankshaft,
– the camshaft pulley nuts.

REMOVAL

Put the vehicle on a two-post lift.

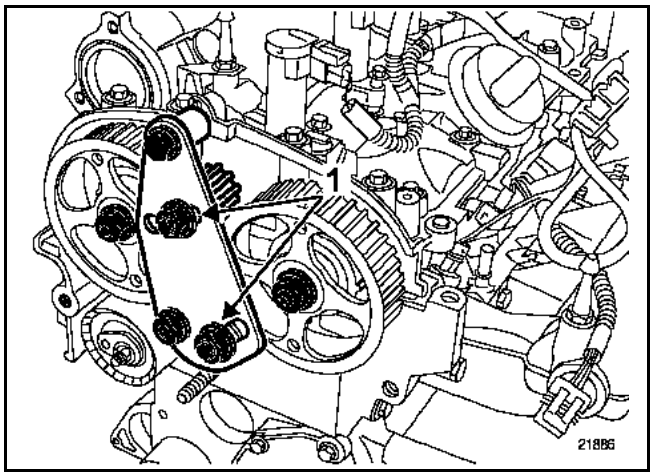
Disconnect the battery.

Remove:
– the engine undertray,
– the catalytic converter (see **section 19B "Exhaust"**).

Drain the cooling circuit (through the lower radiator hose).

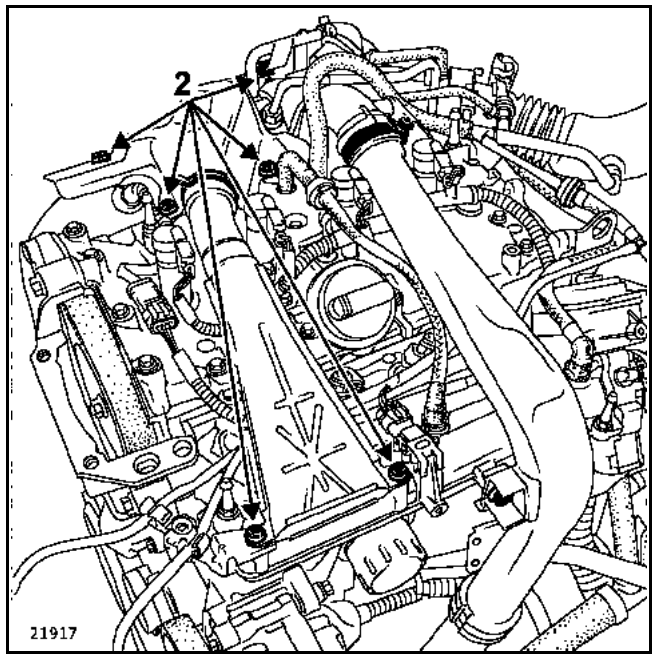
Remove:
– the timing belt (see method described in **section 11A "Timing belt"**).

Fit the camshaft locking tool **Mot. 1509** and tighten the nuts (1) to a torque of **8 daNm**.

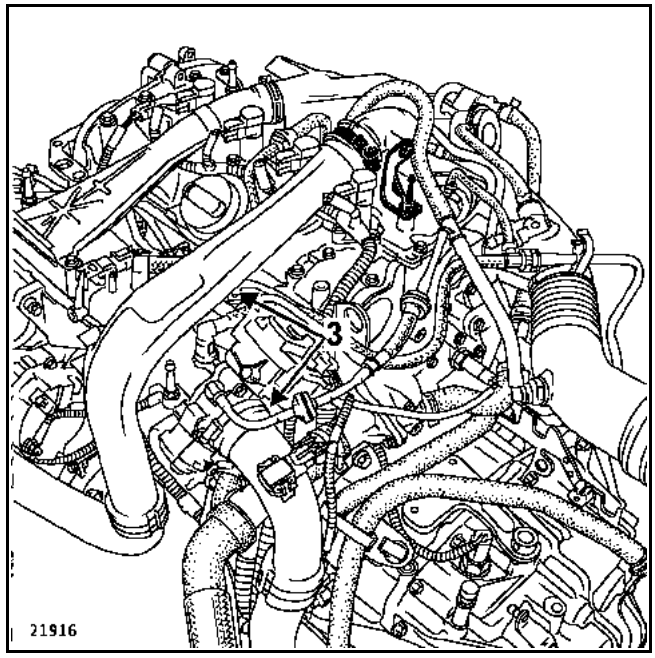


– the pulleys.

Remove:
– the turbocharger screen air duct (2),

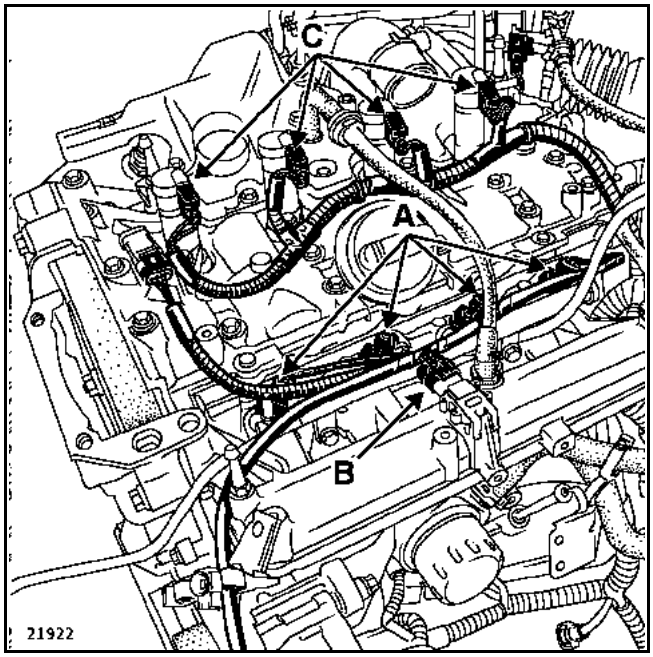


– the exchanger air intake and outlet ducts at (3).

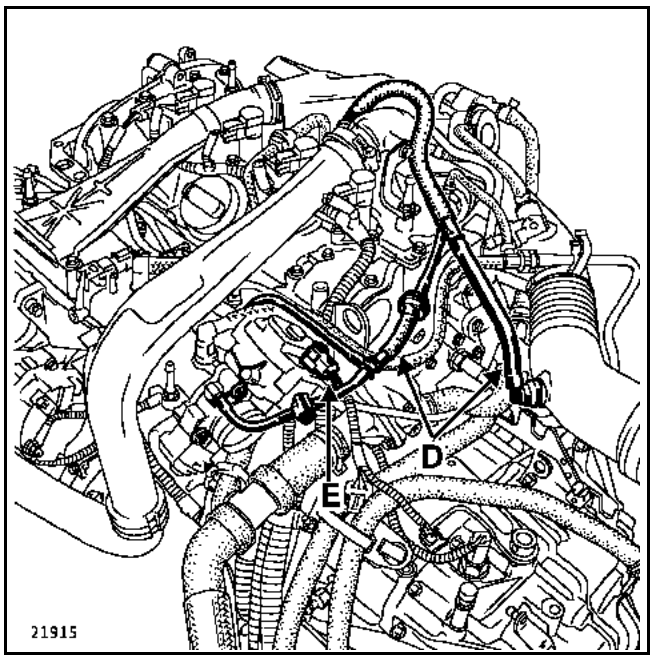


GETtheMANUALS.org

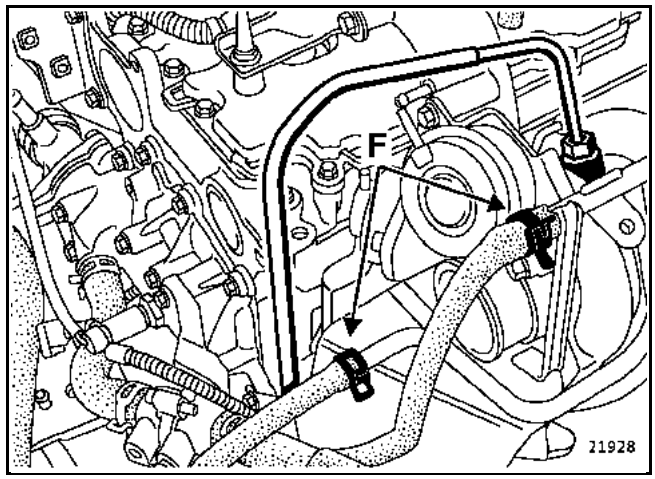
Disconnect the connectors:
– injectors (A),
– from the intake pressure sensor (B),
– from the ignition coils (C).



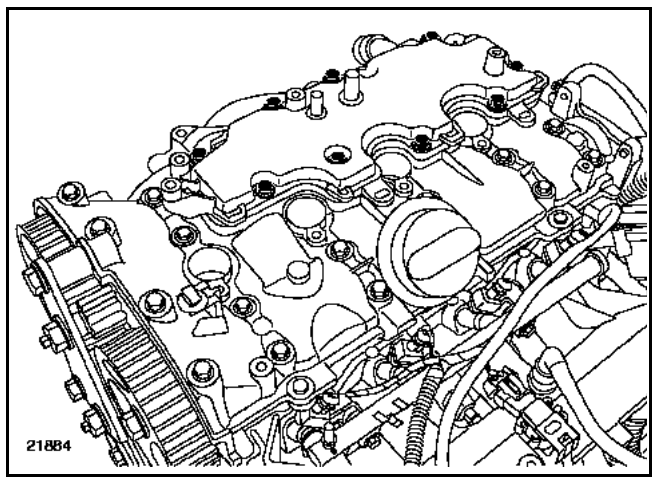
Remove:
– the petrol feed,
– the brake servo pipe
– the oil and petrol vapour rebreathing pipes (D),
– the motorised throttle body connector (E).



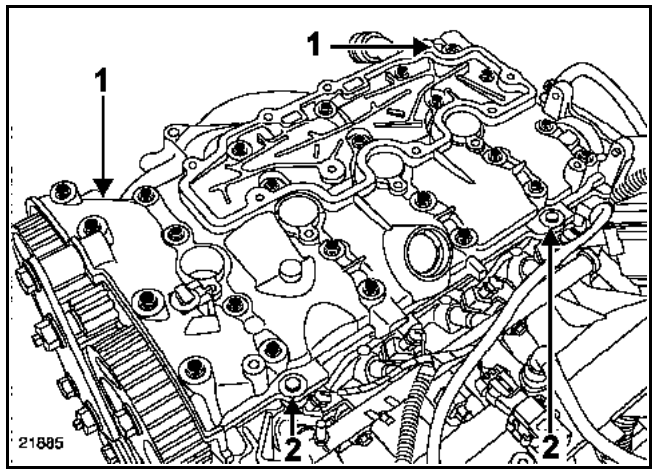
Remove:
– the turbocharger cooling hoses (F),



– the oil decanter,

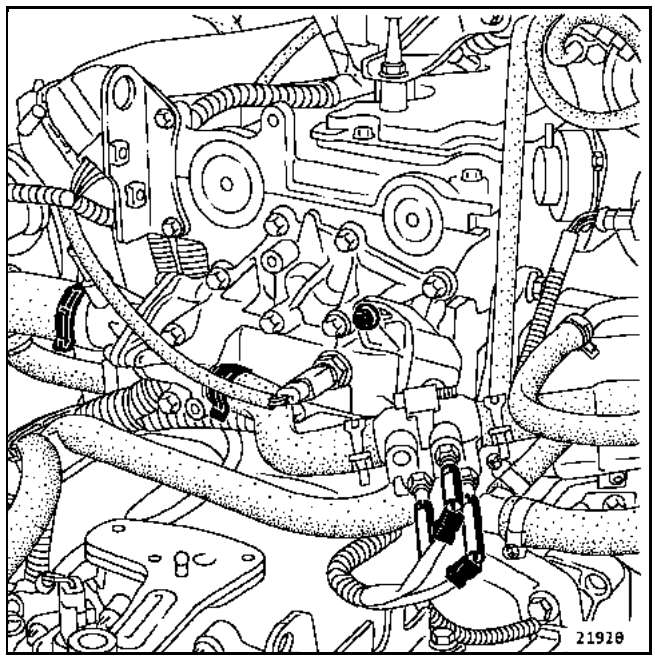


– the bolts of the cylinder head cover, then release it vertically by tapping on the **lugs** (1) using a copper hammer and lever it using a screwdriver at (2) (protect the screwdriver to avoid damaging the aluminium surfaces).



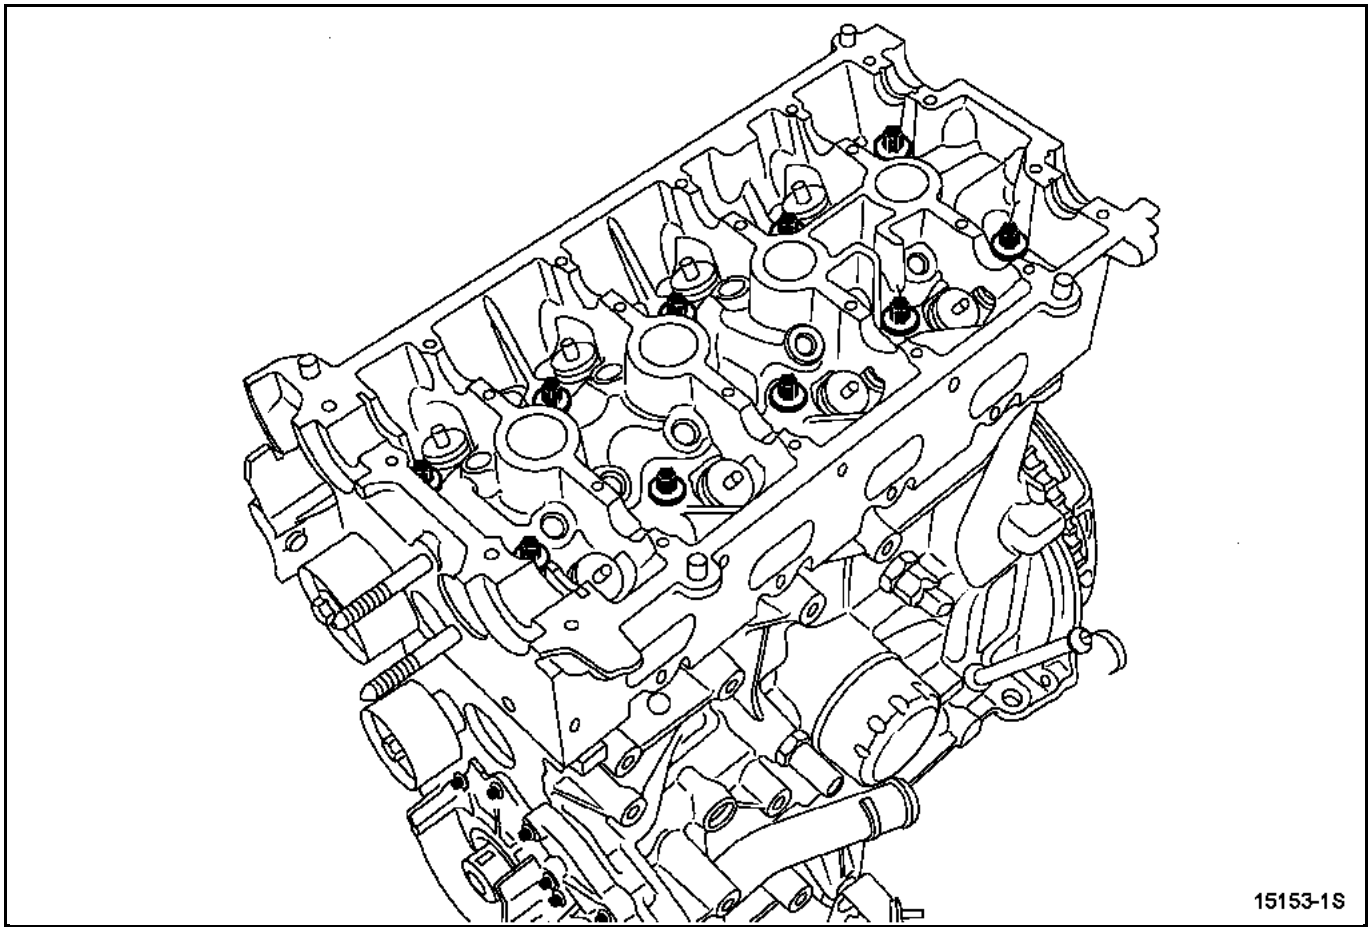
GETtheMANUALS.org

– the camshafts and the valve rockers,
– the hoses on the cylinder head water outlet housing as well as the coolant temperature sensor connector,
– the thermoplunger unit mountings.



GETtheMANUALS.org

Remove the cylinder head.



CLEANING

It is very important not to scratch the gasket faces of any aluminium component.

Use the **Décapjoint** product to dissolve any remains of the gasket still adhering.

Wear gloves whilst carrying out the following operation.

Apply the product to the parts to be cleaned; wait about ten minutes, then remove it using a wooden spatula.

Please take the greatest care during this operation to prevent the entry of foreign bodies into the oil galleries (channels located in the cylinder block and in the cylinder head).

CHECKING THE GASKET FACE

Check that there is no gasket face bow.

Maximum deformation: **0.05 mm**.

No regrinding of the cylinder head is permitted.

Check the cylinder head for cracks.

GETtheMANUALS.org

Position the pistons at mid-stroke to prevent any contact with the valves when the camshafts are being refitted.

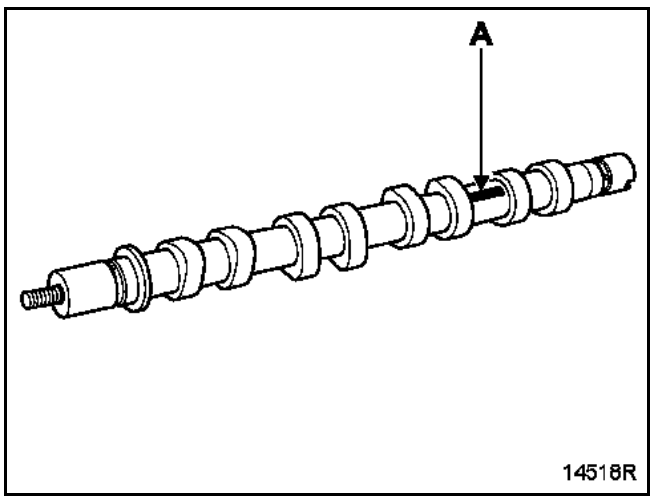
Position the cylinder head gasket then the cylinder head.

Check the bolts then tighten the cylinder head (see Section 07A "Tightening the cylinder head").

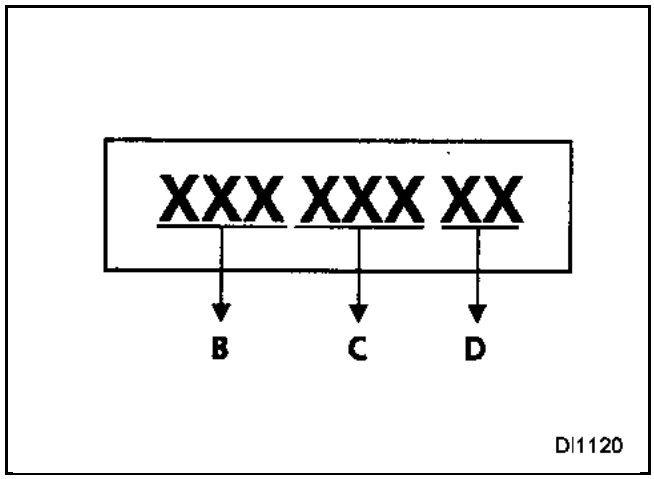
Refit:
– the valve rockers,
– the camshafts, oiling the bearings.

IMPORTANT: do not put oil on the gasket face of the cylinder head cover.

The camshafts are identified by a marking (A).



Detail of the marking:
– marks (B) and (C) are intended for the supplier only,
– mark (D) is used for identifying the camshafts:
AM = Inlet
EM = Outlet

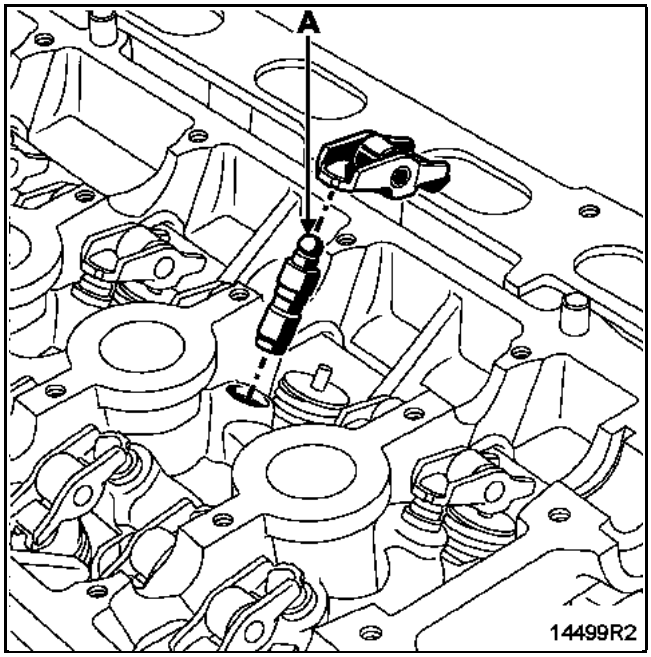


GETtheMANUALS.org

REFITTING

Observe the following points when dismantling and refitting the cylinder head:
- **it is essential to replace the camshaft nuts,**
- **it is essential to replace the exchanger hoses,**
- **It is essential to re-prime the hydraulic tappets as these may become drained if left for too long.**

To check whether a tappet needs repriming, press the top of the tappet at (A) with your thumb and if the tappet piston can be pressed down, immerse the tappet in a container filled with diesel then refit it.



GETtheMANUALS.org

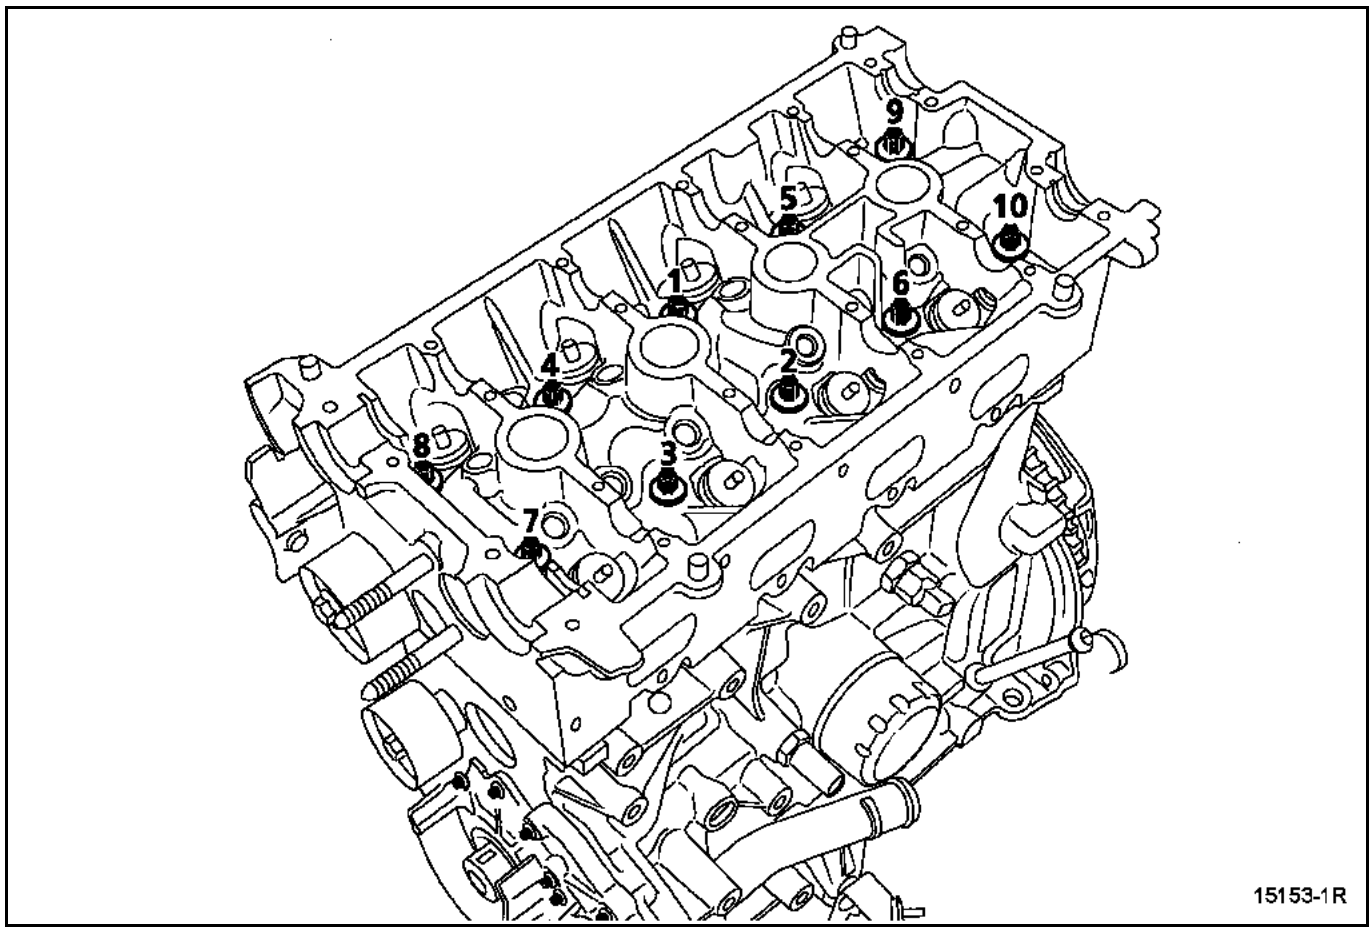
METHOD FOR TIGHTENING THE CYLINDER HEAD

The bolts can be reused if the length under the head does not exceed 118.5 mm (otherwise replace all the bolts).

REMINDER: Use a syringe to remove any oil which may have entered the cylinder head mounting bolt holes to achieve correct tightening of the bolts.

Do not oil the new bolts. However, the bolts must be oiled if they are being reused.

Tighten all the bolts to **2 daNm** in the order recommended below.

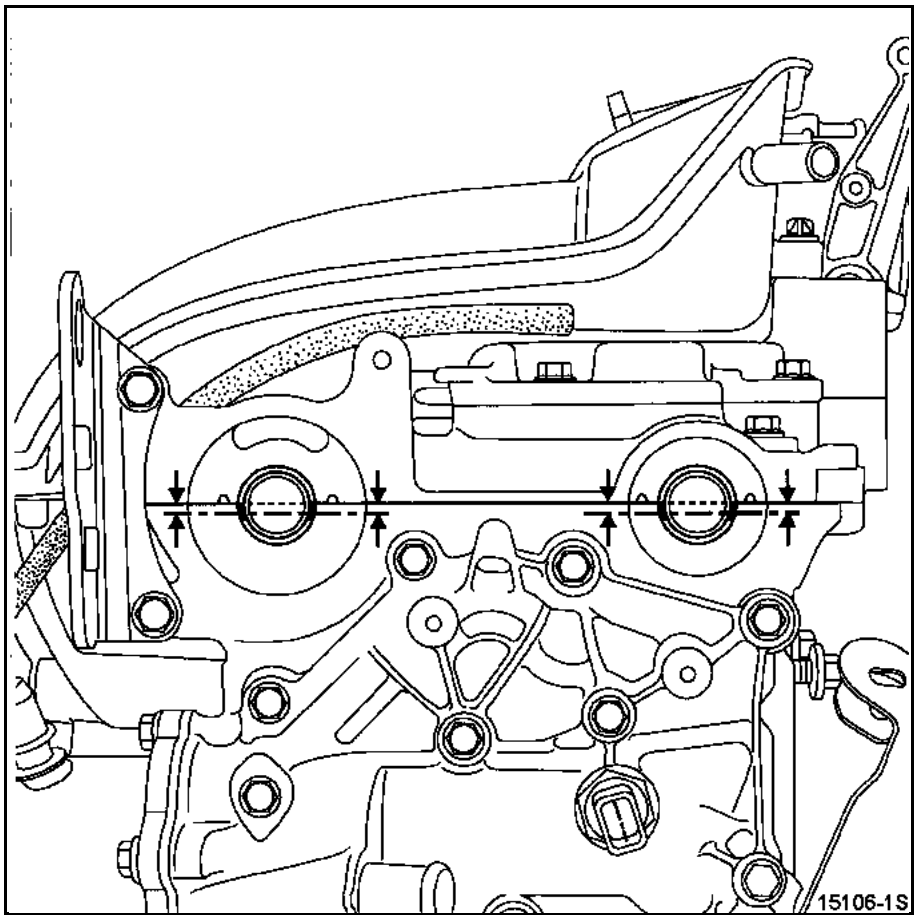


Check that all the bolts are correctly tightened to **2 daNm** then, bolt by bolt, tighten to an angle of **165° ± 6°**.

Do not tighten the cylinder head bolts after applying this procedure.

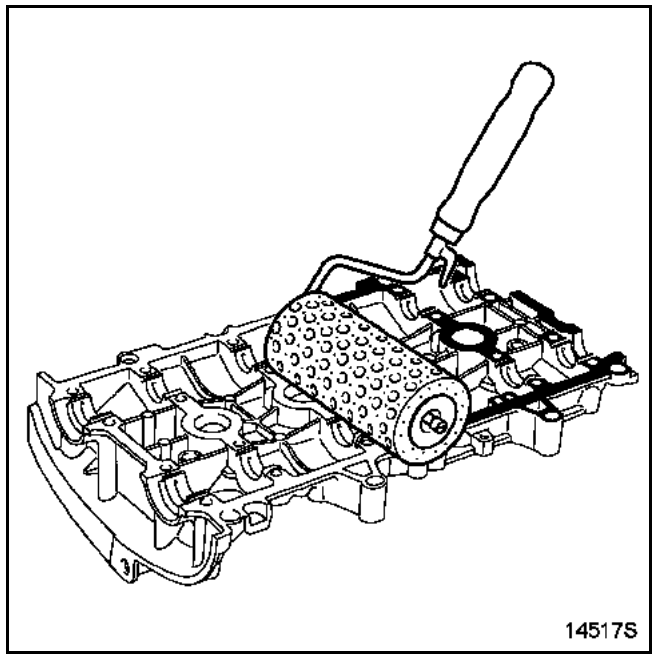
GETtheMANUALS.org

Position the grooves of the camshafts as shown in the diagram below.



NOTE: the gasket faces must be clean, dry and free from grease (avoid finger marks).

Apply **Loctite 518** using a stipple roller to the gasket face of the cylinder head cover until it turns **reddish in colour**.

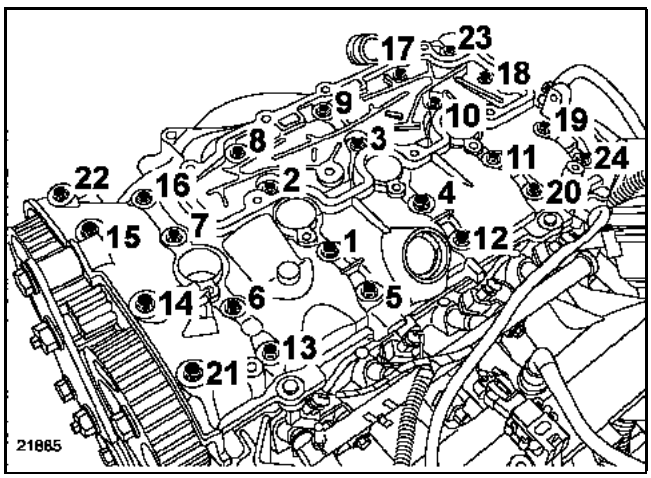


GETtheMANUALS.org

Fit the cylinder head cover tightening it to the correct torque.

Tightening procedure

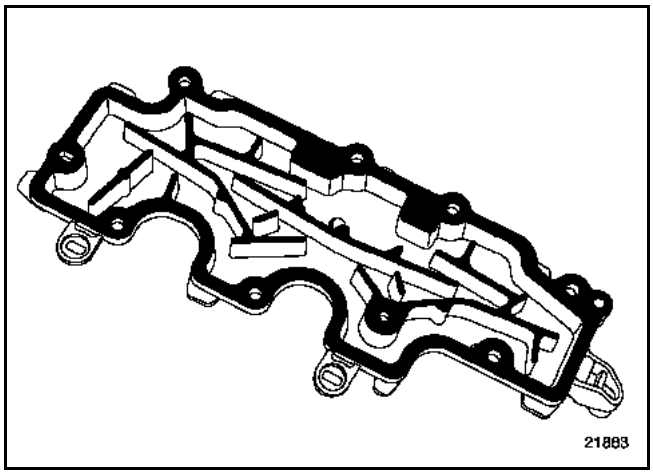
Assembly	Bolt tightening order	Bolt slackening order	Tightening torque (in daNm)
Operation no. 1	22 - 23 - 20 - 13	-	0.8
Operation no. 2	1 to 12 14 to 19 21 and 24	-	1.2
Operation no. 3	-	22 - 23 - 20 - 13	-
Operation no. 4	22 - 23 - 20 - 13	-	1.2



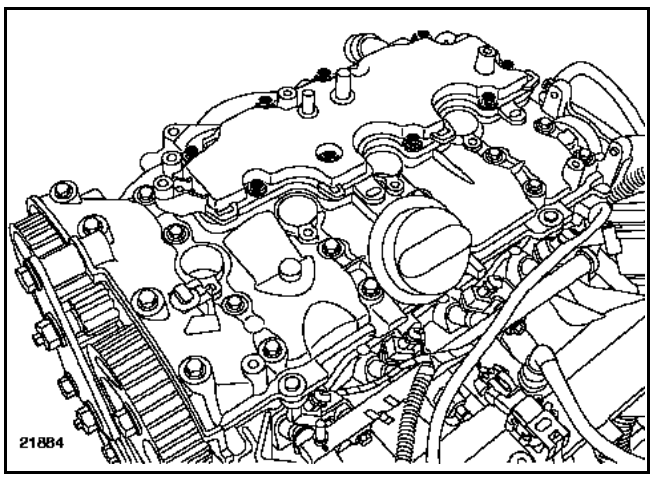
GETtheMANUALS.org

NOTE: the gasket faces must be clean, dry and free from grease (avoid finger marks).

Apply **Loctite 518** using a stipple roller to the gasket face of the cylinder head cover until it turns **reddish in colour**.

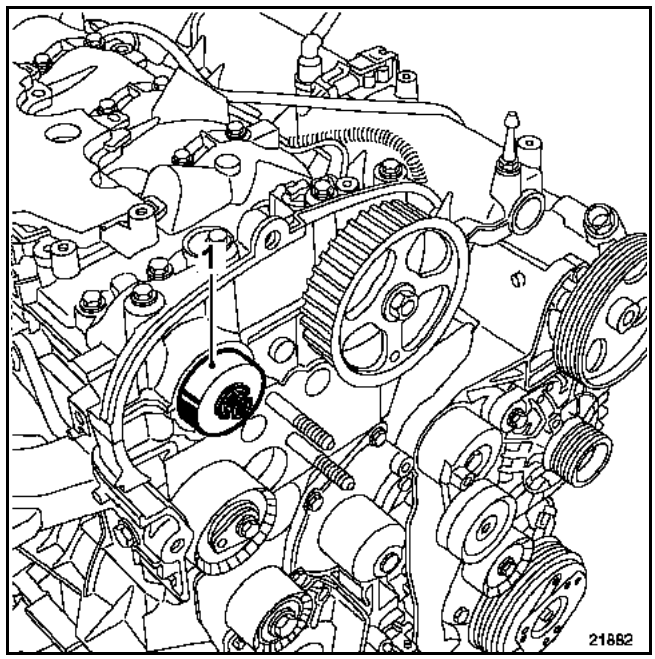


Fit the oil decanter and tighten it to a torque of **1.3 daNm** in the recommended order.

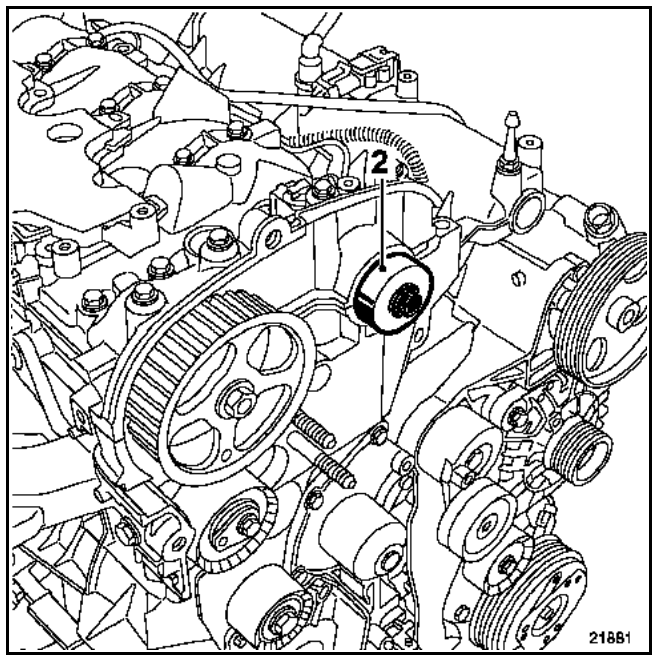


Replacing the camshaft seals

Fit the seal of the **outlet camshaft dephaser** using tool **Mot. 1512**, using the old nut (1).



Fitting the seal of the **inlet camshaft** using tool **Mot. 1517** and the old bolt (2).

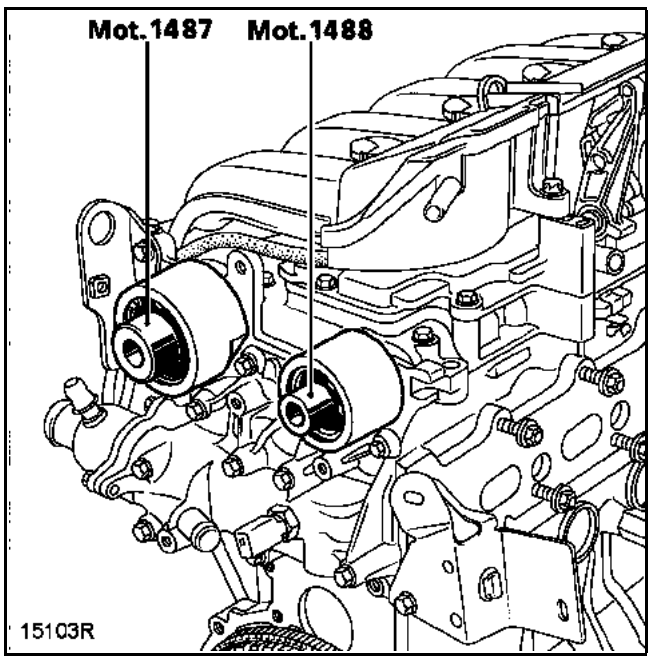


GETtheMANUALS.org

Adjusting the timing

IMPORTANT: it is essential to degrease the tip of the crankshaft, the bore of the timing pinion, the bearing faces of the pulley, the ends of the camshafts (timing side) and the bores of the camshaft pinions to prevent the timing from slipping, which could damage the engine.

Refit:
– the timing belt (following exactly the method described in section **07A "Timing belt tensioning procedure"**),
– the accessories belt (see **section 07A "Accessories belt tension"**),
– the new sealing plugs:
  ● of the inlet camshaft **(Mot. 1487)**,
  ● of the outlet camshaft **(Mot. 1488)**.



– the right-hand suspended engine mounting by tightening it to the correct torque (see **section 19D "Suspended engine mounting"**).

Refitting is the reverse of removal.

Fill and bleed the cooling system, (see **section 19A "Filling and Bleeding"**).

GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Mot. 1202-01 Mot. 1202-02	Hose clip pliers
Mot. 1534	Inlet camshaft timing tool
Mot. 1536	TDC setting pin
Mot. 1537	Outlet camshaft timing tool
Mot. 1448	Remote operation clip pliers for cooling system hose clips
Mot. 1505	Belt tension setting tool Hz measurement
Mot. 1549	Injector extractor
Mot. 1566	Tool for removing and refitting high pressure pipes

EQUIPMENT REQUIRED

18 Torx socket
Facom wrench for DM19 high pressure pipes
Angular torque wrench
Cylinder head testing tool

TIGHTENING TORQUES (in daNm and/or °)	
Tension wheel nut	2.5
Front right-hand support mounting bolt	4.4
Front right support mounting bolt on the side member	8.5
High pressure pipes	2.5
Injector bracket nut on the flywheel side	2.3
High pressure pipe mounting nut	2.5
Injection rail mounting bolt	2.3
Pump/rail pipe bracket bolt	2.5
Camshaft mounting bolt	1.3
Cylinder head cover mounting bolt	1.2
Turbocharger mounting nut	2.6
EGR pipe mounting bolt	2.5
TDC pin hole bolt	2.2
Wheel bolt	11

IMPORTANT: before carrying out any work, connect the After-Sales diagnostic tool, set up communication with the injection computer and check that the injection rail is not under pressure.

Take note of the fuel temperature.

Order the special high pressure injection circuit plug kit.

REMOVAL

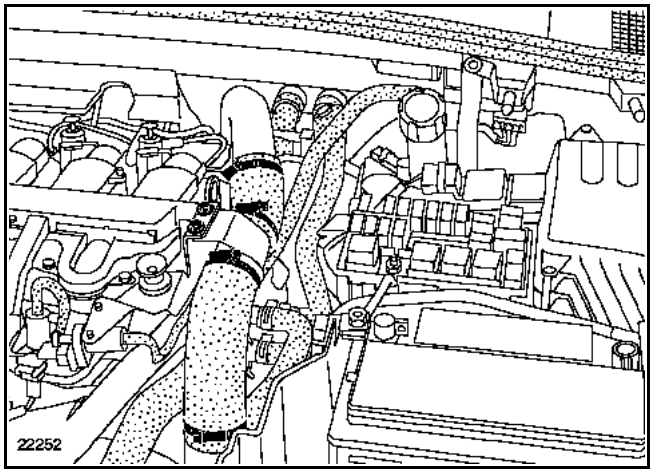
FOLLOW THE CLEANLINESS INSTRUCTIONS CLOSELY AS GIVEN IN SECTION 13B SPECIAL FEATURES AND CLEANLINESS

Put the vehicle on a two-post lift.

Disconnect the battery.

GETtheMANUALS.org

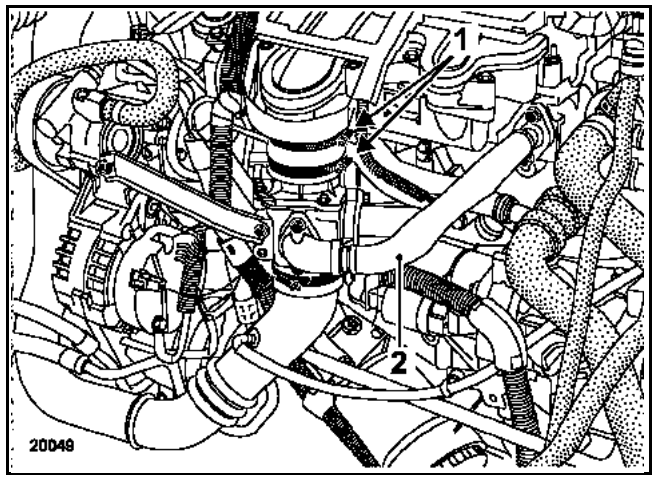
Remove:
– the front right wheel,
– the right-hand front wheel arch liner and side protector,
– the engine undertray,
– the engine cover;
– the timing belt (see **section 11A "Timing belt"**),
– the tension wheel,
– the air filter unit and the air intake tube,
– the turbocharging air ducts on the turbocharger and the exchanger inlet,



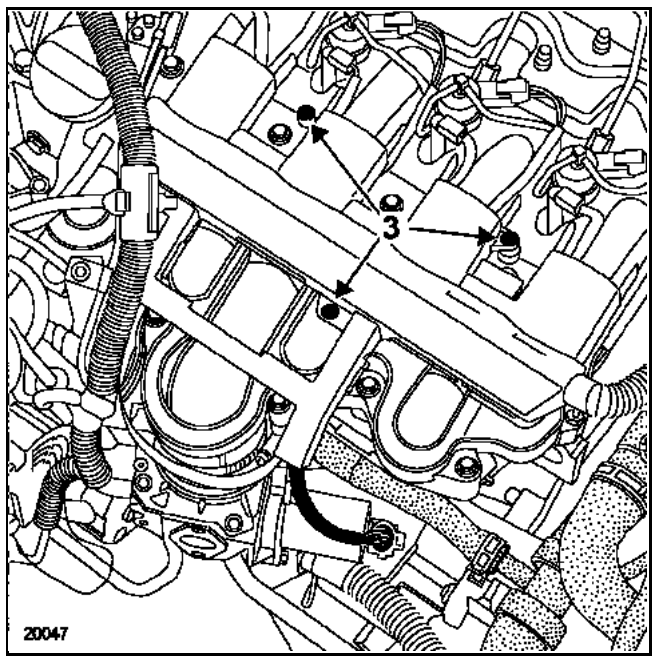
Unclip the rubber protector and push it back as far as possible.

Loosen the clamps (1).

Remove:
– the exhaust gas recirculation pipe (2),

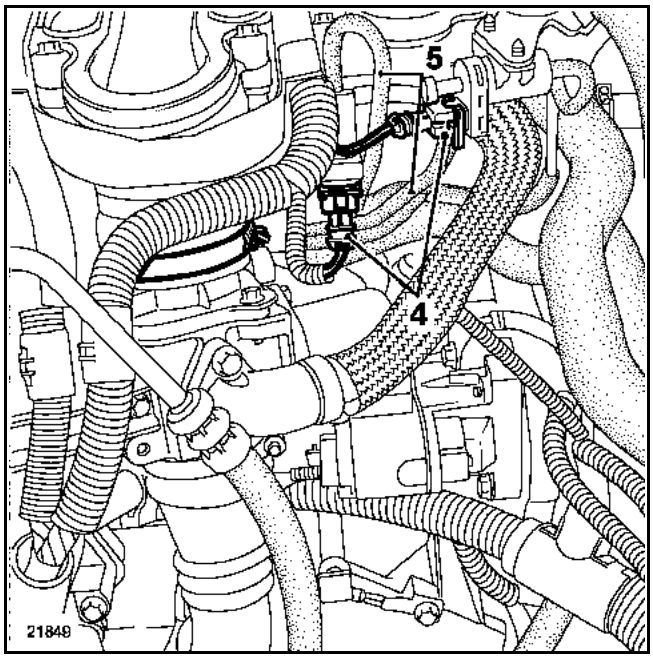


– the protector from the electrical harness at (3),



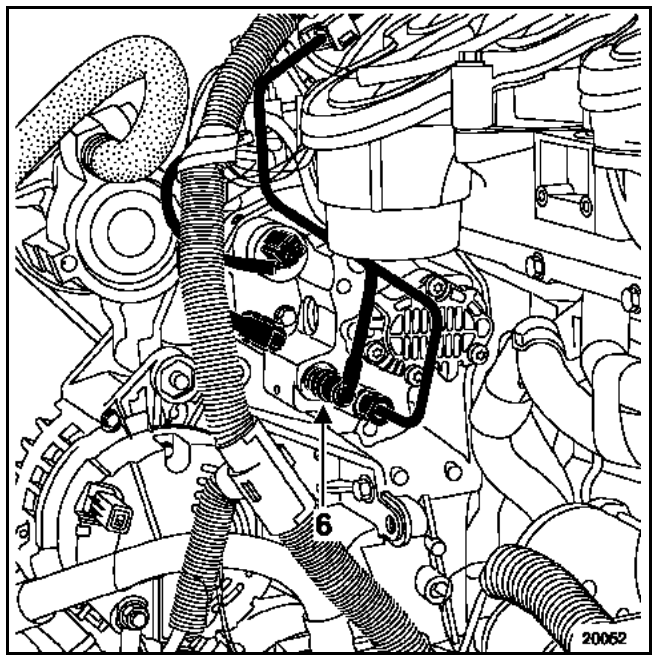
GETtheMANUALS.org

– the air solenoid valve connectors (4),
– the air pressure pipes (5),

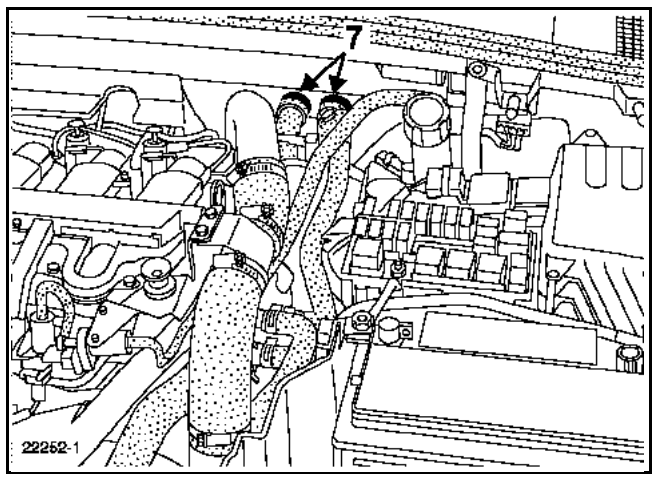


– the absorbent soundproofing.

Disconnect:
– the vacuum pipe on the vacuum pump,
– the fuel return pipe (6).

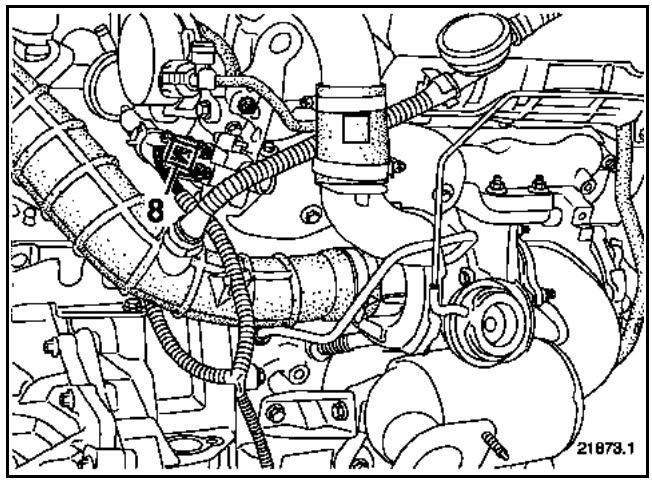


Remove the heater radiator pipes (7).

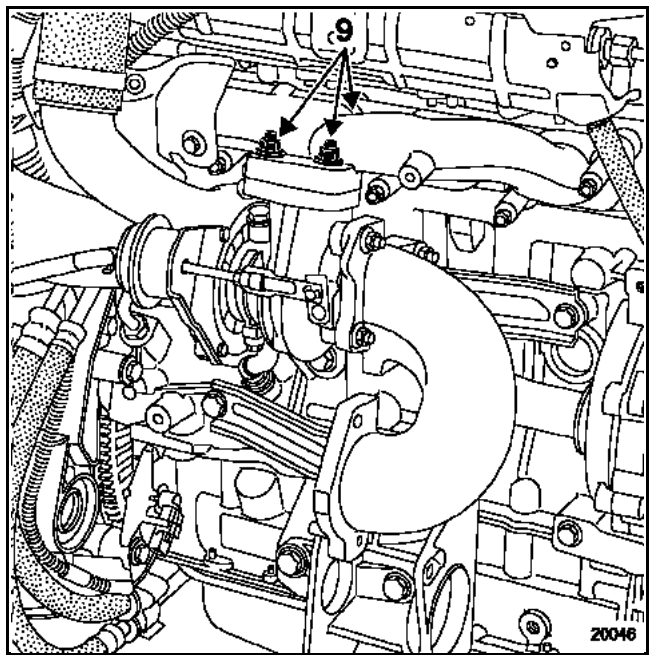


GETtheMANUALS.org

Remove:
– the thermoplunger connectors (8),



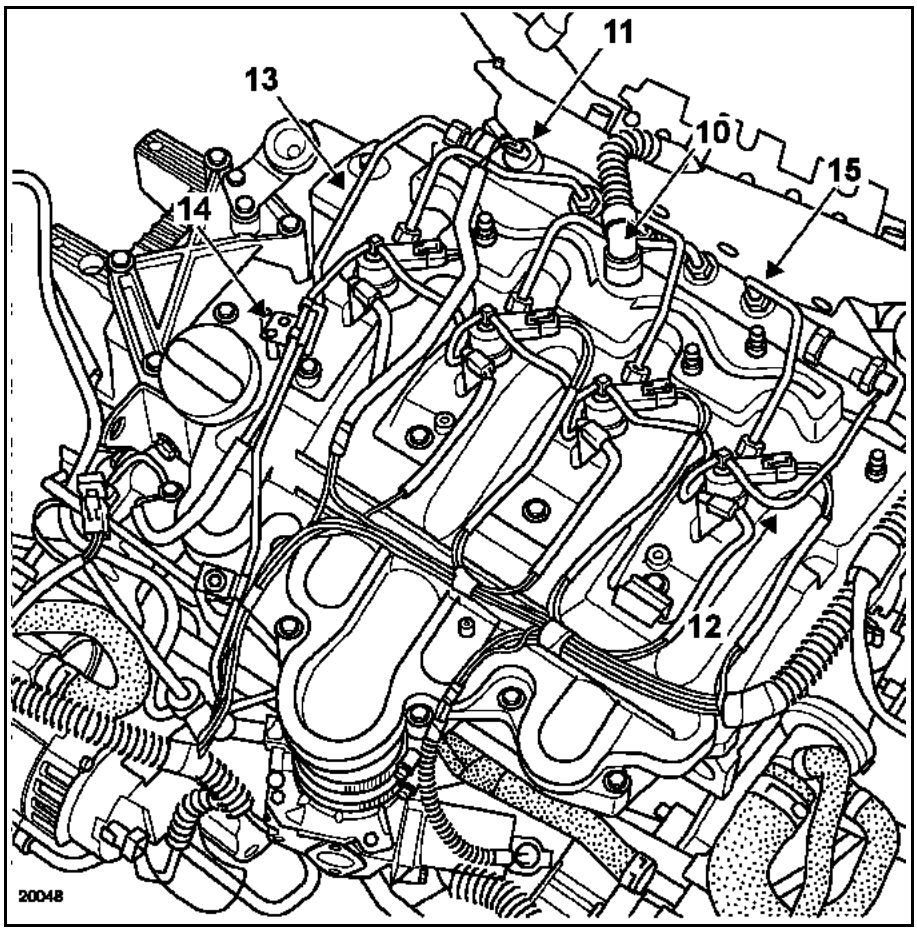
– the exhaust downpipe mountings,
– the mountings from the turbocharger on the exhaust manifold (9).



GETtheMANUALS.org

Remove:
– the oil vapour rebreathing pipe (10),
– the injector connectors, the heater plugs and the pressure sensor (11),
– the diesel fuel return pipe (12) on the injectors and the injector rail then remove it (allow for its replacement when removing it),
– the injection pipe (13) between the high pressure pump and the rail, taking care not to damage the bracket (14),
– the injector pipes (15).

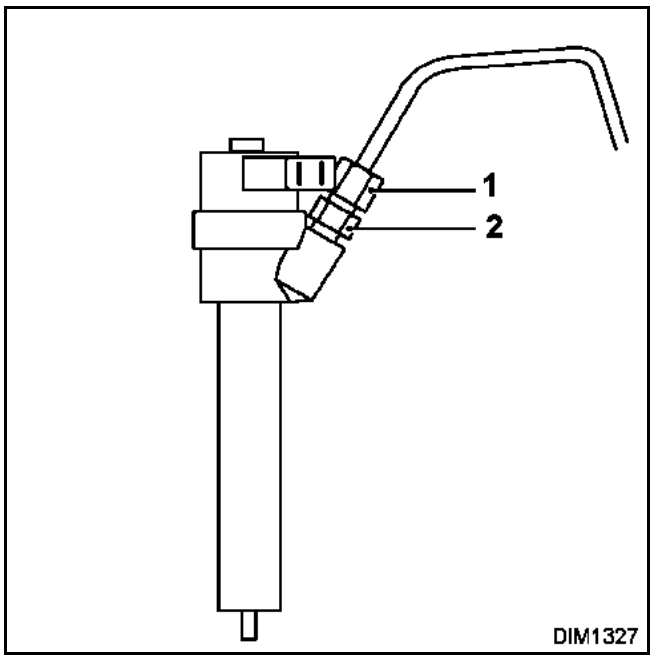
Fit plugs to maintain cleanness.



Remove:
– the injection rail,
– the rubber protector and its metal bracket.

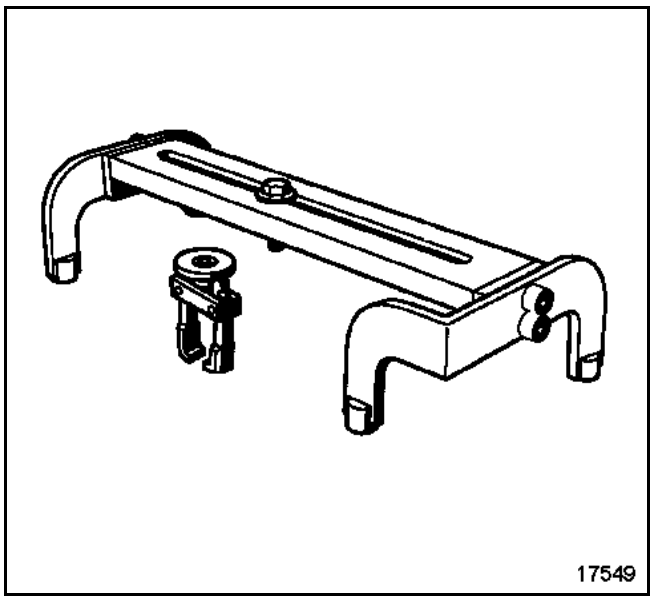
GETtheMANUALS.org

WARNING: when loosening the injection pipe unions (1) on the injector holders, you must hold the filter-rod supporting nuts (2) with a wrench.



Loosen the injection rail bolts.

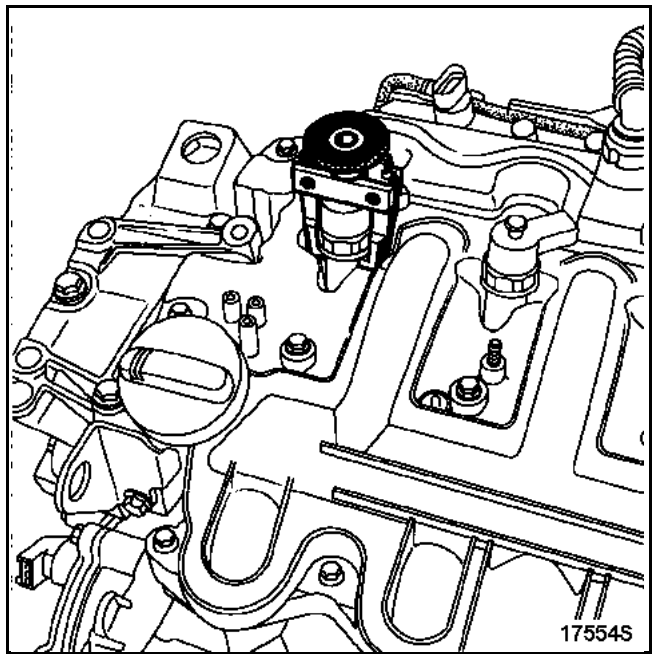
The injectors are removed using tool **Mot. 1549**.



Apply releasing agent around the injector.

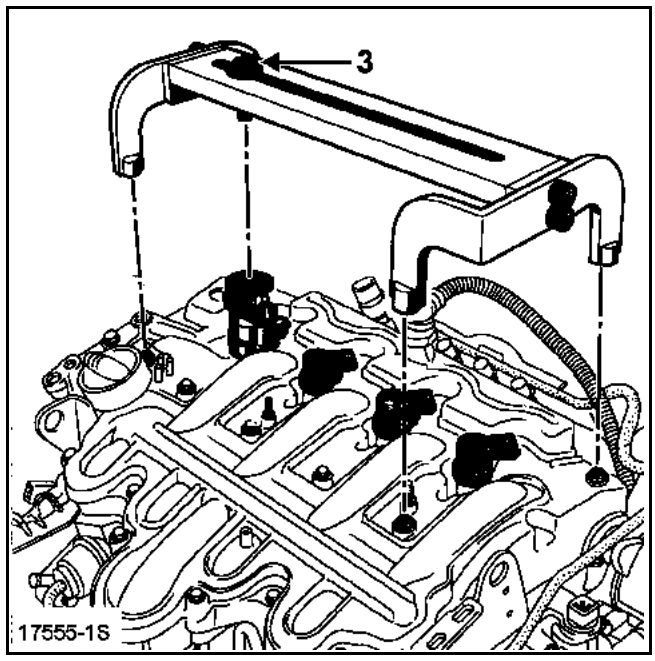
Loosen the injector bracket bolts completely, then place the **Mot. 1549** clamp as shown in the following diagram.

Tighten the knurled ring to bring the two jaws together on the flat surfaces without over-tightening.



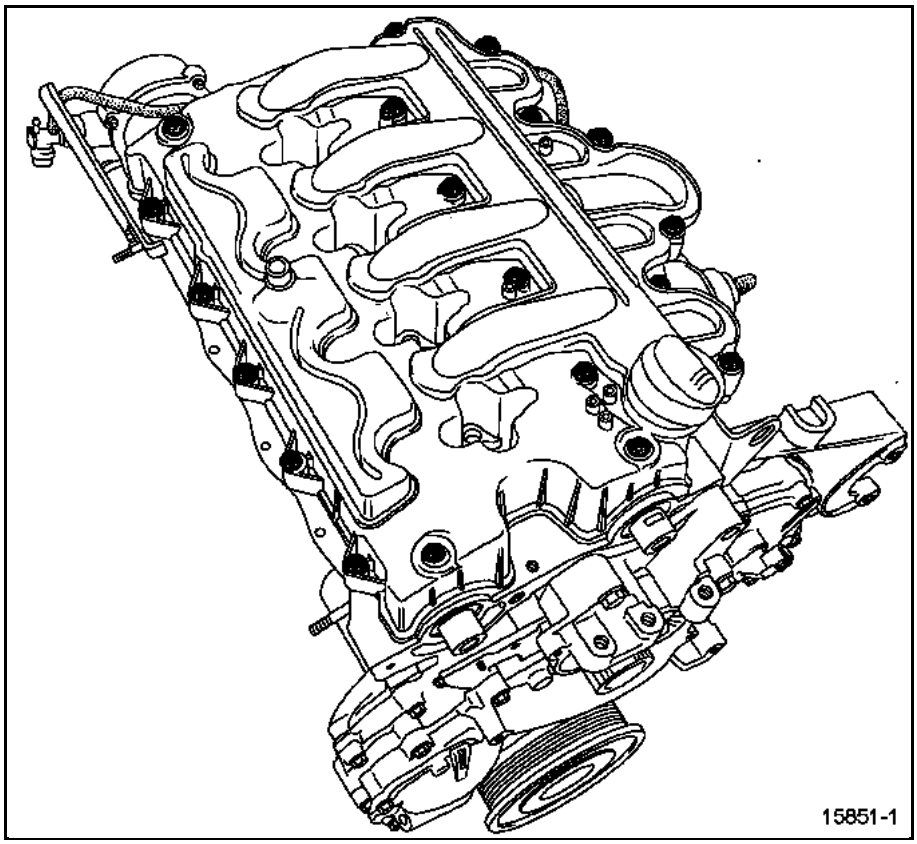
Put the **Mot. 1549** member on the cylinder head cover bolts (as shown in the following diagram).

Tighten the bolt in the clamp (3) until the injector is detached. Perform the same operation on the other injectors.

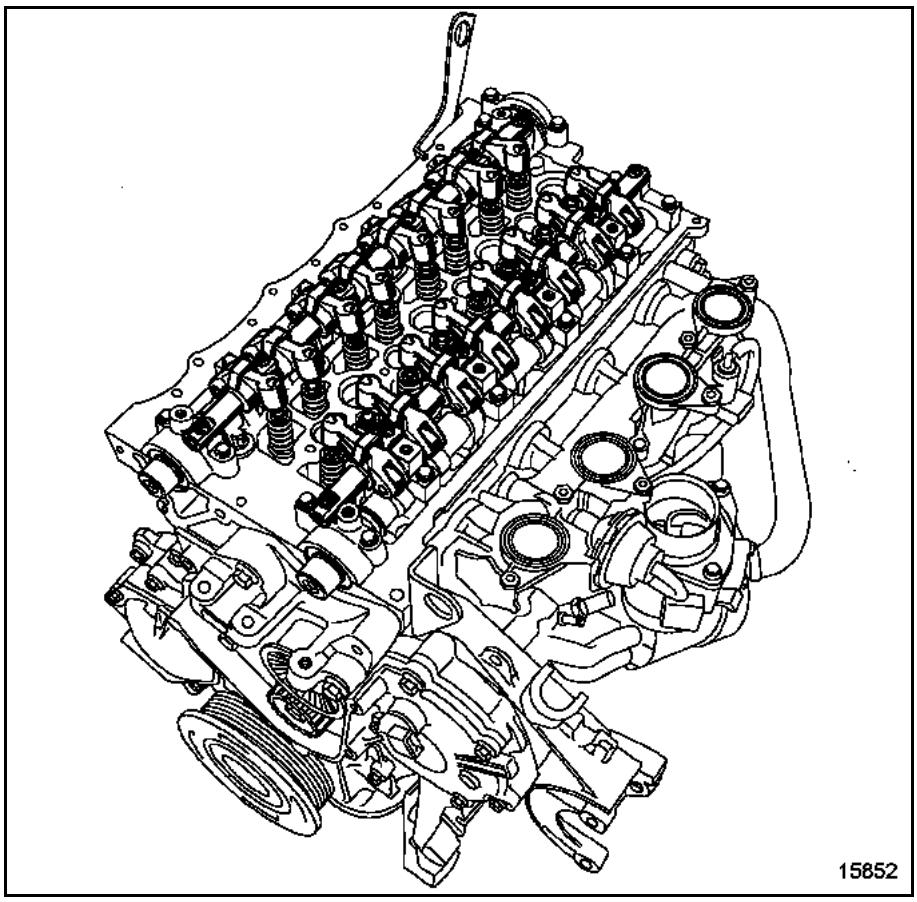


GETtheMANUALS.org

Remove:
– the cylinder head cover,

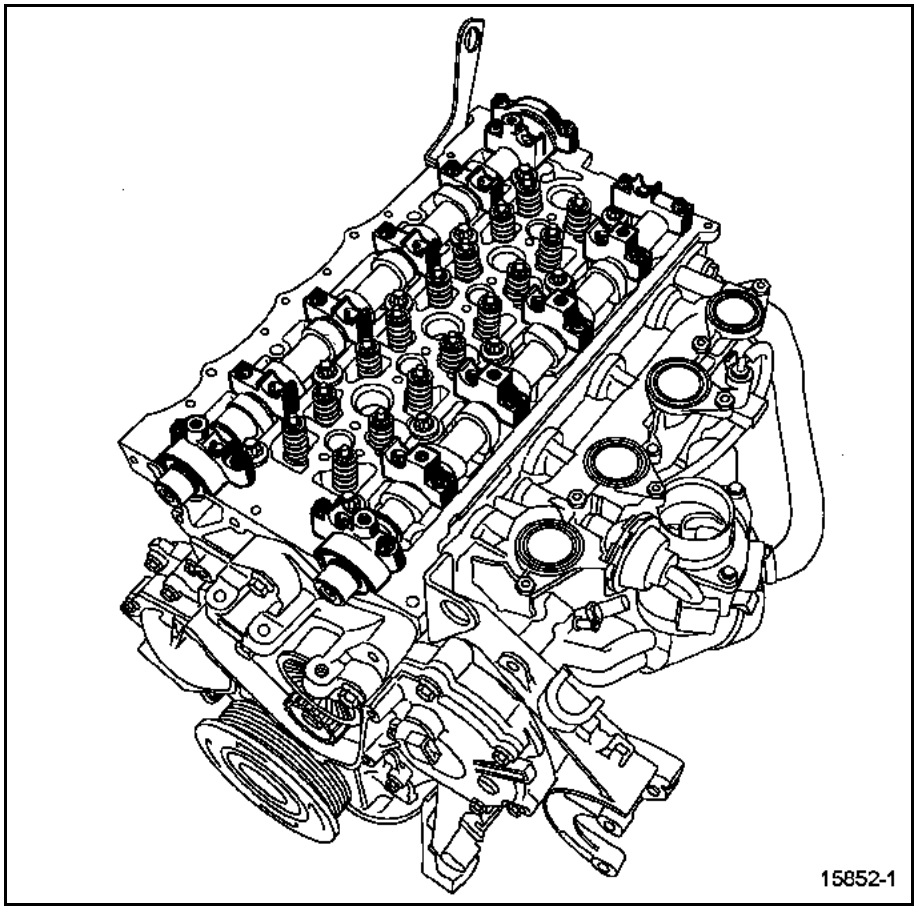


– the rocker shafts.



GETtheMANUALS.org

Remove:
– the mounting bolts from the cylinder head coolant unit,
– the cylinder head.



CLEANING

It is very important not to scratch the gasket faces of any aluminium component.

Use the **Décapjoint** product to dissolve any remains of the gasket still adhering.

Wear gloves whilst carrying out the following operation.

Apply the product to the parts to be cleaned; wait about ten minutes, then remove it using a wooden spatula.

Please take the greatest care during this operation to prevent the entry of foreign bodies into the oil galleries (channels located in the cylinder block and in the cylinder head).

CHECKING THE GASKET FACE

Check that there is no gasket face bow.

Maximum deformation: **0.05 mm**.

No regrinding of the cylinder head is permitted.

Test the cylinder head to detect possible cracks using the cylinder head test tools (a container and a kit for the particular cylinder head, plug, sealing plate, blanking plate). The approval number of the cylinder head test container is **664000**.

GETtheMANUALS.org

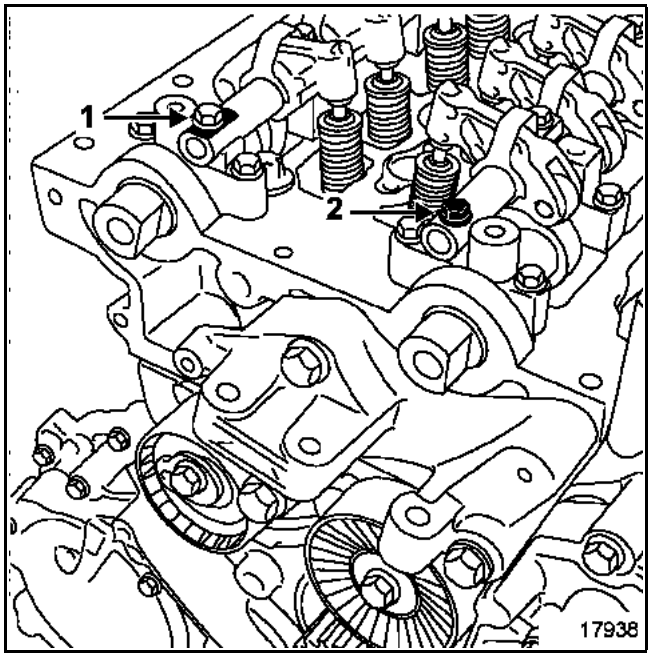
REFITTING

Fit the cylinder head gasket (with the markings on the seal facing upwards), then the cylinder head.

Bring the pistons to mid-stroke position to prevent them from coming into contact with the valves as the cylinder head is tightened.

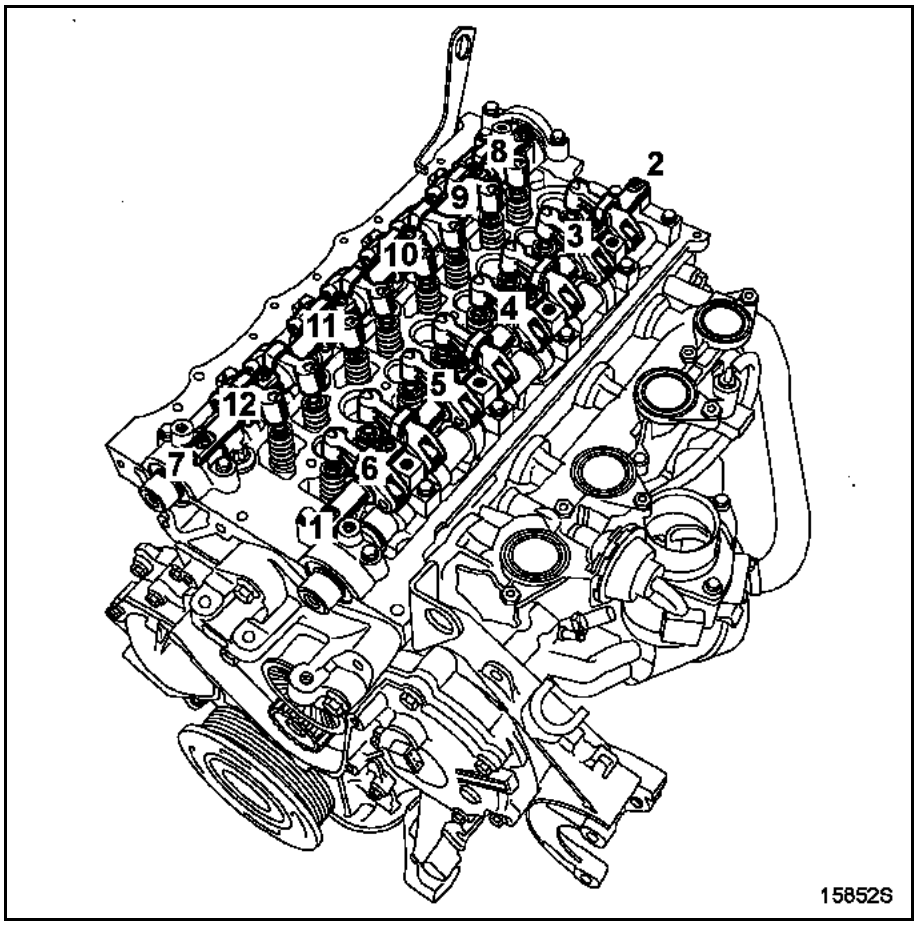
Tighten the cylinder head using an angular torque wrench (see section 07A "Tightening the cylinder head").

Refit the camshafts and position them as follows:
– for the outlet camshaft, put the end of the camshaft with the flat surface (1) on the timing side,
– for the inlet camshaft, put the end of the camshaft without the flat surface (2) on the timing side,



GETtheMANUALS.org

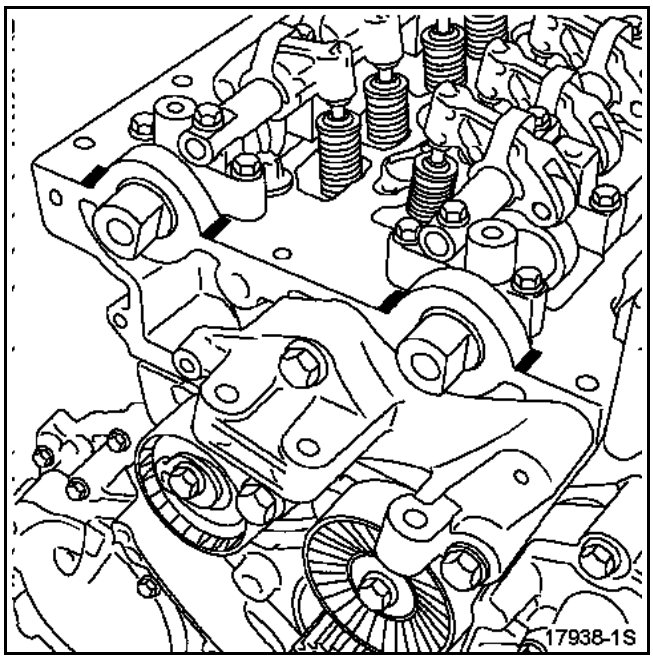
Tighten the camshaft bolts to a torque of **1.3 daNm** in the recommended order.



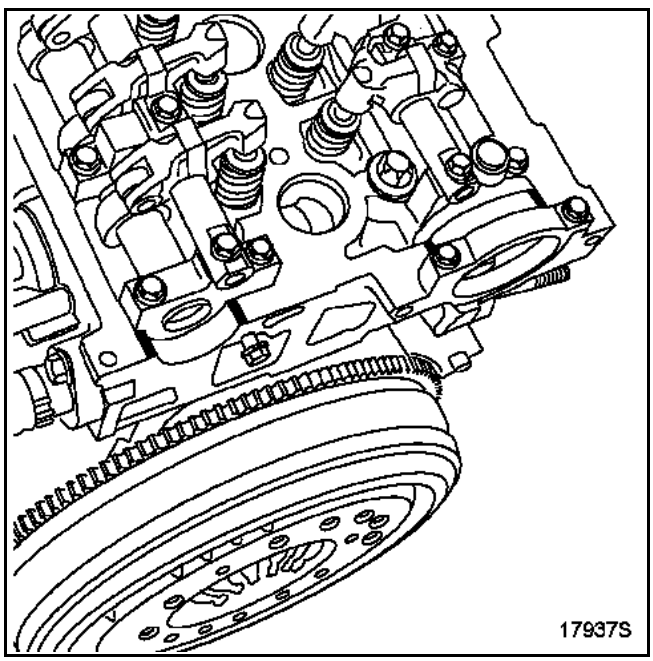
GETtheMANUALS.org

Put **Rhodorseal 5661** in the corners of the camshaft bearing caps and in the valve fastening.

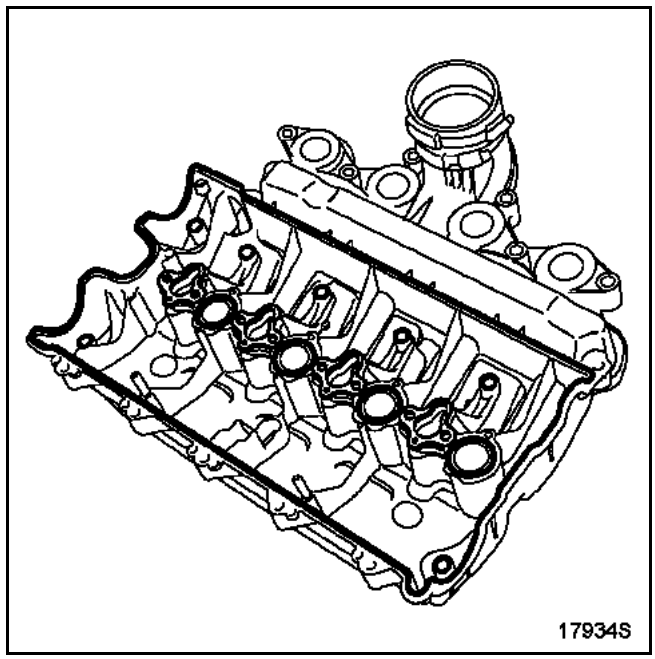
Timing side



Flywheel side



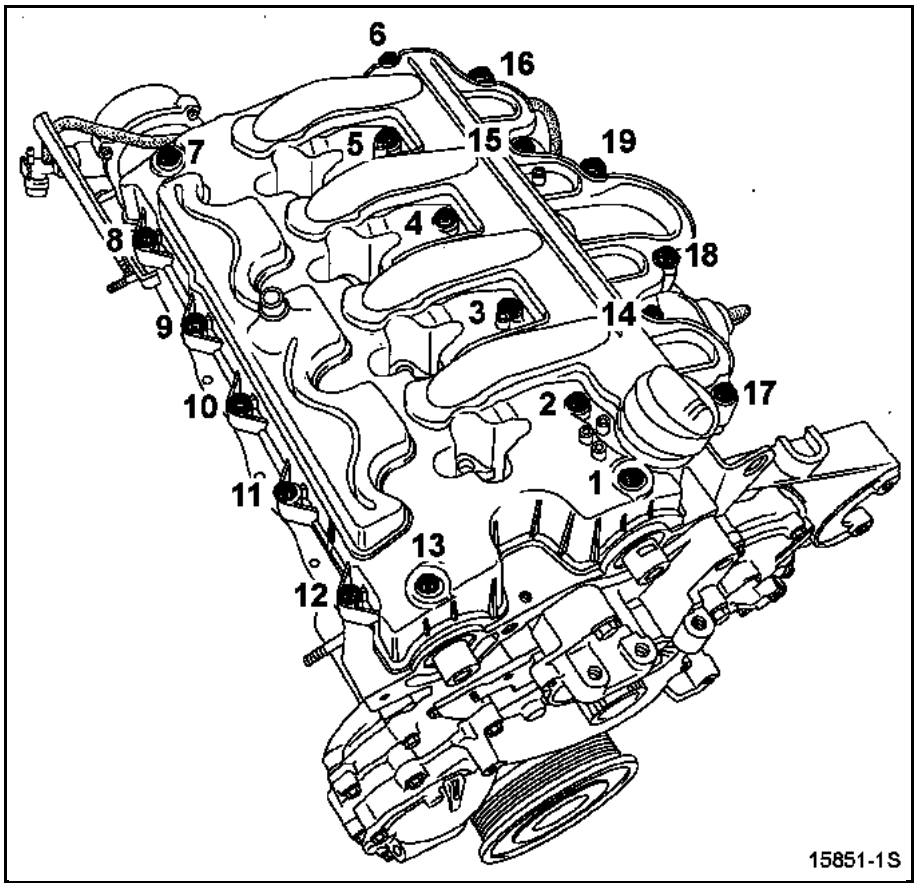
Fit all the seals on the cylinder head cover.



GETtheMANUALS.org

Refit:
– the cylinder head cover/inlet manifold,
– the cylinder head cover mounting bolts so that they touch, by applying a drop of **Loctite Frenbloc** on the bolts (1-2-4-6-8-10-12-13).

Tighten the bolts to a torque of **1.2 daNm** in the recommended order.



GETtheMANUALS.org

INJECTOR REFITTING PROCEDURE

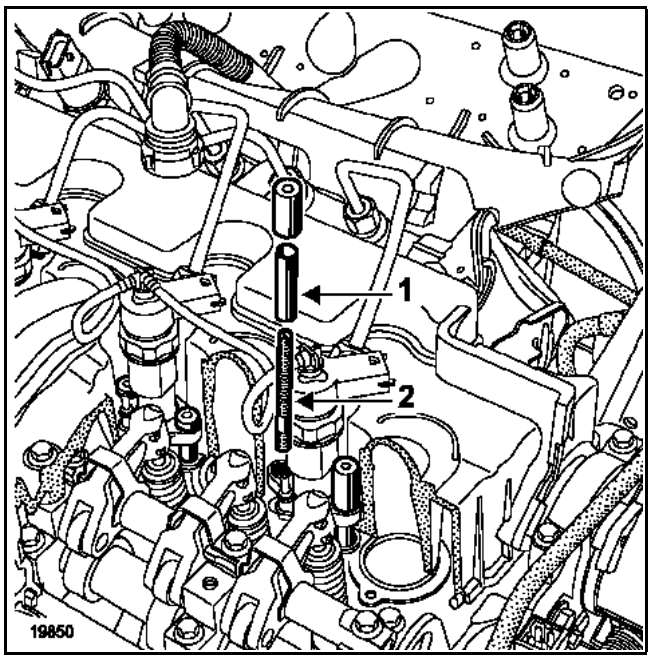
Leave removal of the protection plugs from any component until last.

Clean the injector sockets and the injector bodies, as well as their brackets using a lint-free cloth (use the wipes recommended for this purpose, part no. **77 11 211 707**) dipped in clean solvent.

Dry off using a different new wipe.

Clean one of the old injector mounting bolts and tighten it to the end of the mounting hole thread to clean the tappings.

Fit new studs (1) and injector mounting spacers (2) after coating them with oil on the thread and tighten them as tightly as possible by hand **(0.2 daNm)**. **The studs and nuts must be replaced every time they are removed.**



GETtheMANUALS.org

Fit a new injector head washer on every injector.

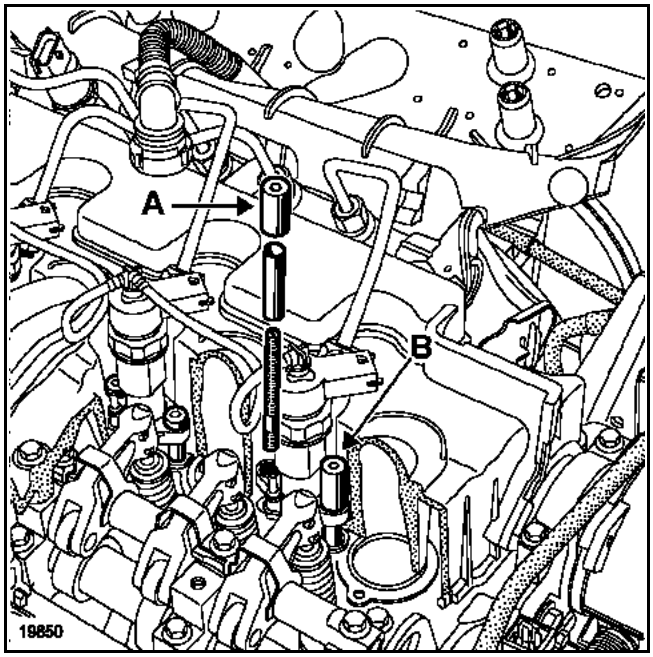
Fit the injector equipped with its bracket and locking spring ring.

Oil the threads of the nuts.

WARNING: tighten the nut (A) on the timing side first, then the bolt (B) on the flywheel side.

Tighten nut A to **0.6 daNm**, then nut B to **0.6 daNm**.

On the timing side first, then on the flywheel side.



Retighten nut B only to **360° ± 30° (nut on the flywheel side).**

Loosen the three rail mounting bolts in order to release it.

Remove the rail plugs, the injector holders and the injection pipes.

Fit the injection pipes between the rail and the injectors and pretighten by hand until they touch.

Tighten the three rail mounting bolts to a torque setting of **2.3 daNm**).

Tighten the injector pipe connections on the injectors and the high pressure pump to a torque setting of **2.5 daNm**

Tighten the injection pipe connections on the rail to **2.5 daNm**.

Clip the pump/rail pipes mounting clip and tighten the two mounting bolts.

Refit the sealing partition, attached to the cylinder head cover by two nuts.

Refix the side partitions of the rail shield correctly.

Fold to the front and clip the rubber protector of the rail protector.

During any operations on the rail protector, you must ensure that the system components are fitted properly after refitting (see section 13B "Rail protector").

Non-observance of this advice may have serious consequences.

Carry out the rest of the refitting operation in the reverse order to removal.

Throw away the bag of plugs used during the operation.

GETtheMANUALS.org

Refit:
– the timing belt (see method described in **section 11A "Timing belt"**),
– the suspended engine mounting by tightening it to the correct torque (see **section 19A "Suspended engine mounting"**).

Refitting is the reverse of removal.

Use the diagnostic tool to erase any faults which may be stored by the injection computer before restarting the engine.

Re-prime the system by switching on the ignition several times, or turn the low pressure pump over with the diagnostic tool using the **"Actuator Command"** menu.

After any intervention, check that there are no leaks in the diesel circuit.

Proceed as follows:
– run the engine at idle speed until the fan starts up,
– accelerate several times under no load,
– carry out a road test,
– switch the ignition off and check that there is no leakage of diesel,
– check that the absorbent soundproofing material is not saturated with diesel fuel.

Fill and bleed the cooling system, (see **section 19A "Filling and Bleeding"**).

GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Mot. 1659	Tool for locking the camshaft pulley
Mot. 1562	Tool for fitting the camshaft oil seal
Mot. 252-01	Tool for measuring piston protrusion
EQUIPMENT REQUIRED	
Torque wrench Angular torque wrench Cylinder head testing tool	

TIGHTENING TORQUES (in daNm)	
Camshaft casing bolt:	
– **M6**	**1.2**
– **M8**	**2.2**
Camshaft bearing stud	**4.3**
Camshaft bearing bolt	**2.2**
Coolant pipe bolt on the front cylinder head	**2.5**
Housing bolt	**2.5**
Camshaft pulley bolt	**12**

REMOVAL

Put the vehicle on a two-post lift.

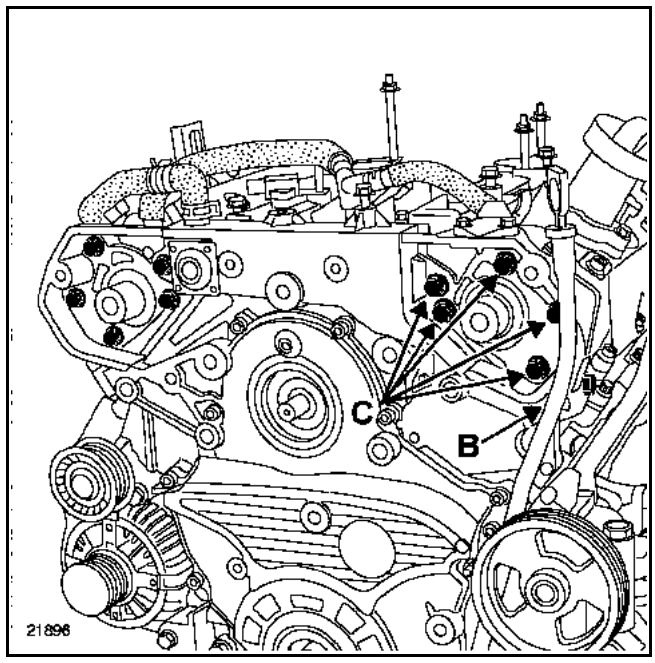
Disconnect the battery.

Drain the cooling circuit through the lower radiator hose.

Remove:
– the timing belt (see **section 11A "Timing belt"**),
– the inlet manifold (see **section 12A "Inlet manifold"**),
– the **EGR** solenoid valve (see **section 12B "EGR solenoid valve"**),
– the high pressure pipes (see **section 13B "High Pressure Pipes"**),
– the injector rail (see **section 13B "Injector rail"**),
– the injectors (see **section 13B "Injectors"**),
– the high pressure pipes on the injection pump.

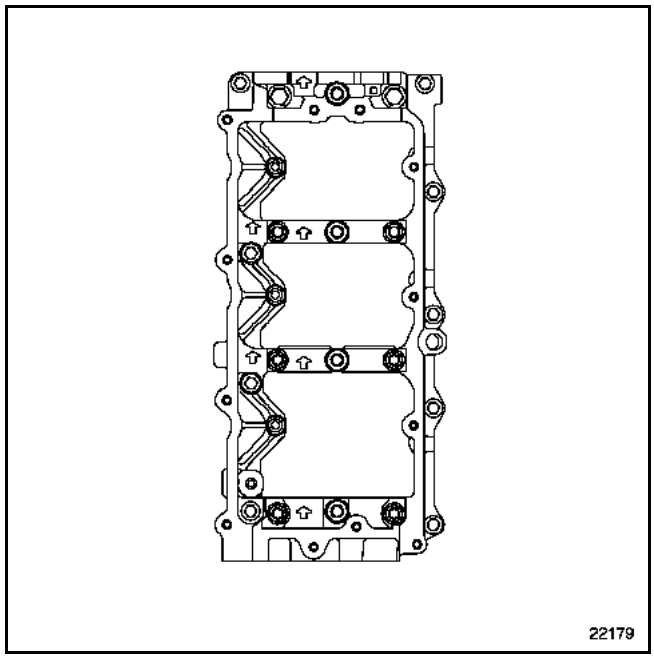
Method for the front bench cylinder head:

Remove:
– the camshaft pulleys using tool **Mot. 1659**,
– the camshaft position sensor,
– the bolt (B),
– the housing (C).

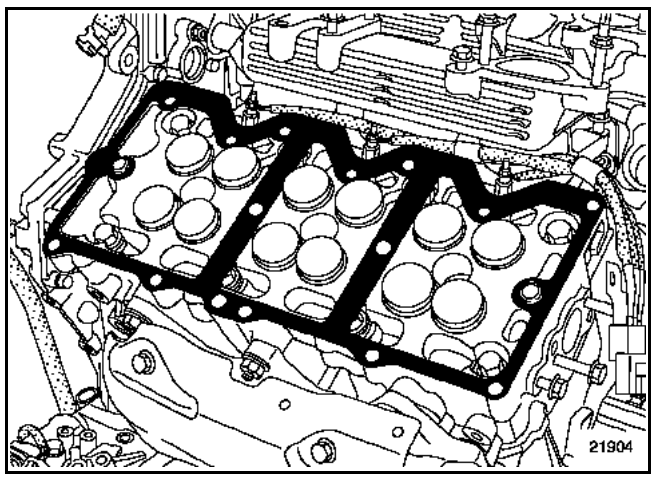


GETtheMANUALS.org

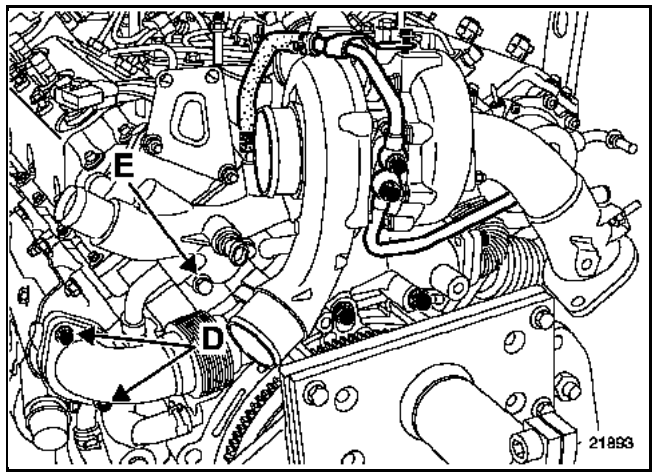
Remove:
– the camshaft casing,



– the pistons marking their positions,



– the front bench lifting bracket mountings,
– the front exhaust manifold heat shield,
– the front bench exhaust manifold mountings on the intermediate pipe connected to the turbocharger (D),
– the coolant pipe bolt on the front bench cylinder head (E),

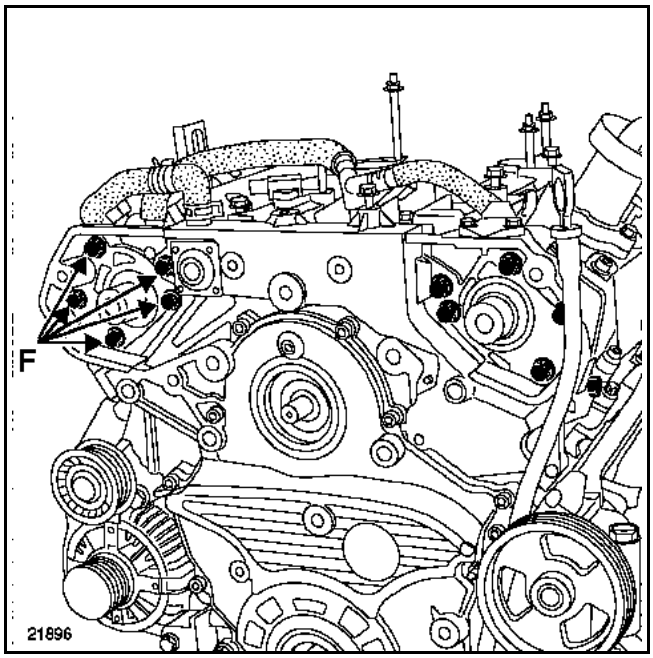


– the oil pipe bolts on the front bench cylinder head,
– the bolts on the front bench cylinder head,
– the front bench cylinder head.

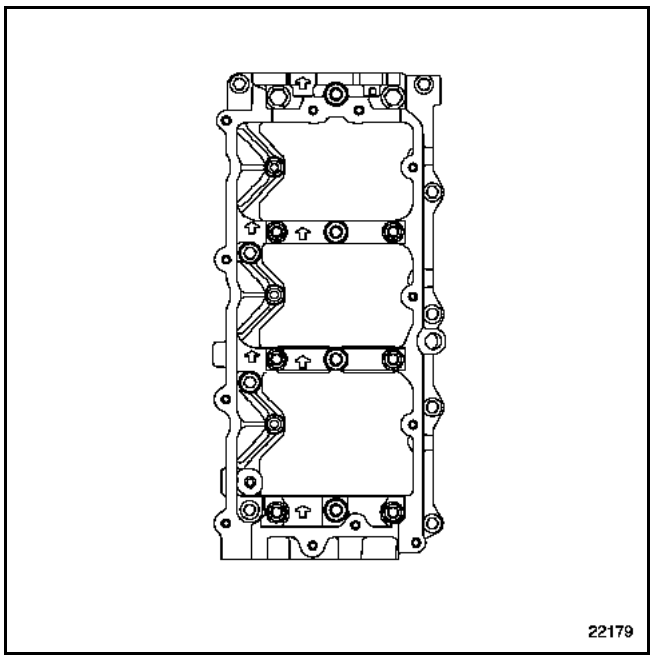
GETtheMANUALS.org

Method for the rear bench cylinder head:

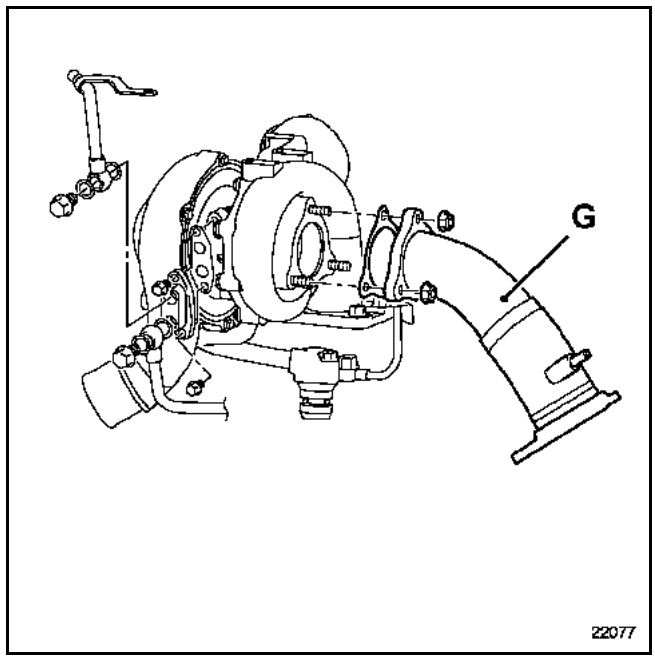
Remove:
– the camshaft pulley using tool **Mot. 1659**,
– the housing (F),



– the camshaft casing,



– the pistons, marking their positions,
– the alternator bracket bolt on the rear bench cylinder head,
– the turbocharger outlet pipe (G).



Release the coolant pipe from the rear cylinder head.

Remove:
– the bolts from the rear bench cylinder head,
– the rear bench cylinder head.

GETtheMANUALS.org

CLEANING

It is very important not to scratch the gasket faces of any aluminium component.

Use the **Décapjoint** product to dissolve any remains of the gasket still adhering.

Wear gloves whilst carrying out the following operation.

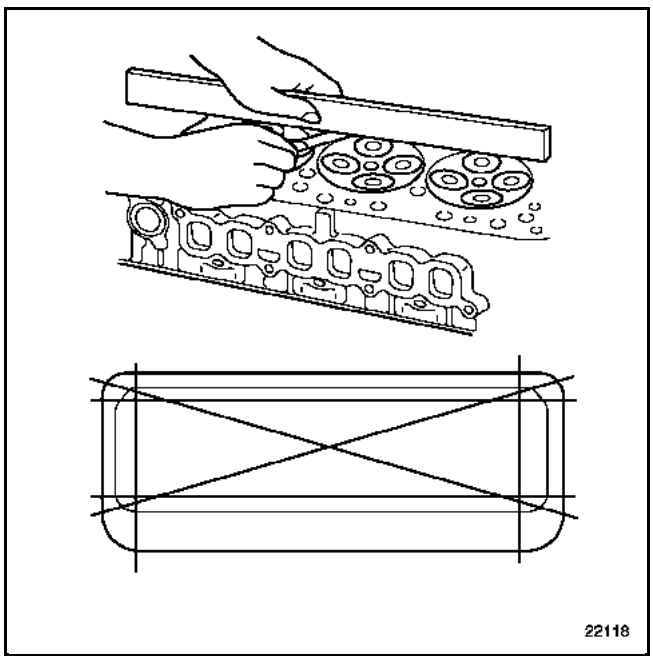
Apply the product to the parts to be cleaned; wait about ten minutes, then remove it using a wooden spatula.

Please take the greatest care during this operation to prevent the entry of foreign bodies into the oil galleries (channels located in the cylinder block and in the cylinder head).

CHECKING THE GASKET FACE

Check that there is no gasket face bow.

Maximum deformation: **0.07 mm**.



The maximum gasket face bow of the inlet and exhaust manifolds is: **0.075 mm**.

No regrinding of the cylinder head is permitted.

Test the cylinder head to detect possible cracks using the cylinder head test tools (a container and a kit for the particular cylinder head, plug, sealing plate, blanking plate). The approval number of the cylinder head test container is **664000**.

MEASURING PISTON MOVEMENT

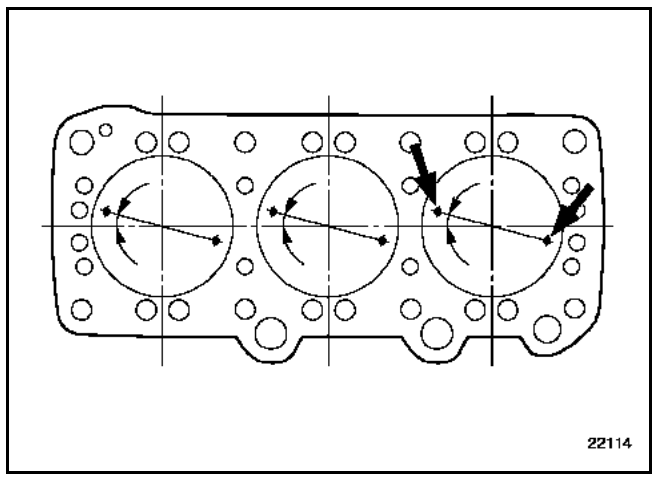
Clean the piston heads in order to eliminate any traces of deposits.

Turn the crankshaft one turn in its operating direction to bring piston no.1 close to Top Dead Centre.

Put tool **Mot. 252-01** in position.

Fit tool **Mot. 252-01** equipped with a gauge on its thrust plate **Mot. 252-01**, and find top dead centre of the piston.

NOTE: all the measurements should be carried out at **15°** in relation to the engine's longitudinal axis.

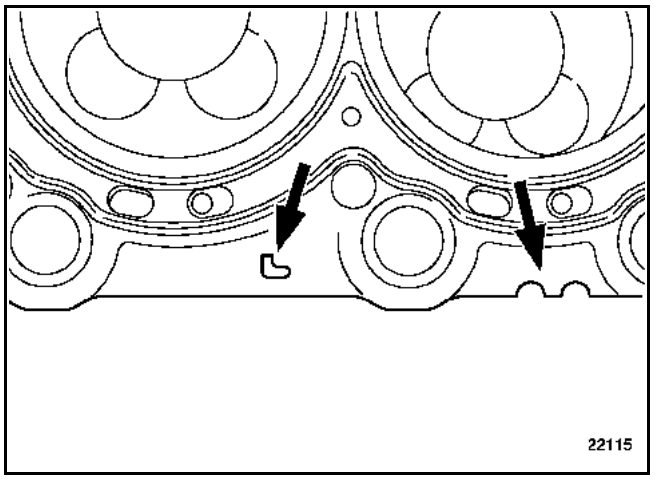


GETtheMANUALS.org

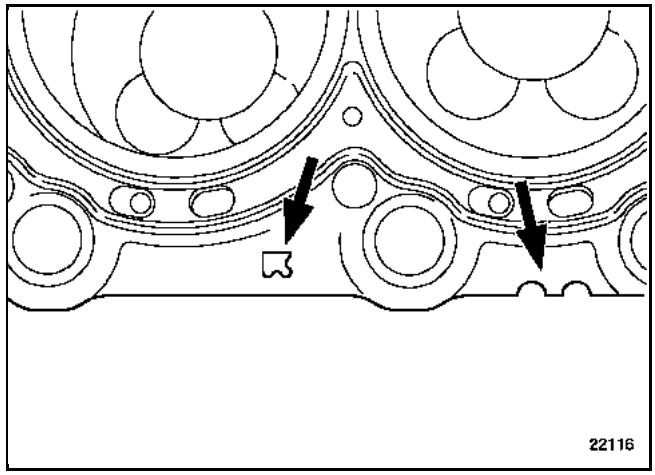
CHOICE OF CYLINDER HEAD GASKET

Marking	Thickness	Piston protrusion
1 hole	1.15 mm	0.40 to 0.46 mm
2 holes	1.2 mm	0.47 to 0.53 mm
3 holes	1.25 mm	0.54 to 0.60 mm

NOTE: the cylinder head gaskets are identified as follows:
– the number of holes denotes the thickness of the cylinder head gasket (1)
– the marking **L** is for the front bench (2),



– the **R** marking is for the rear bench (3).



REFITTING (special notes)

NOTE: Use a syringe to remove any oil which may have entered the cylinder head mounting bolt holes to ensure correct tightening of the bolts.

Fit the cylinder head gaskets, centred by two dowels.

Bring the pistons to mid-stroke position to prevent them from coming into contact with the valves as the cylinder head is tightened.

Centre the cylinder head on the dowels.

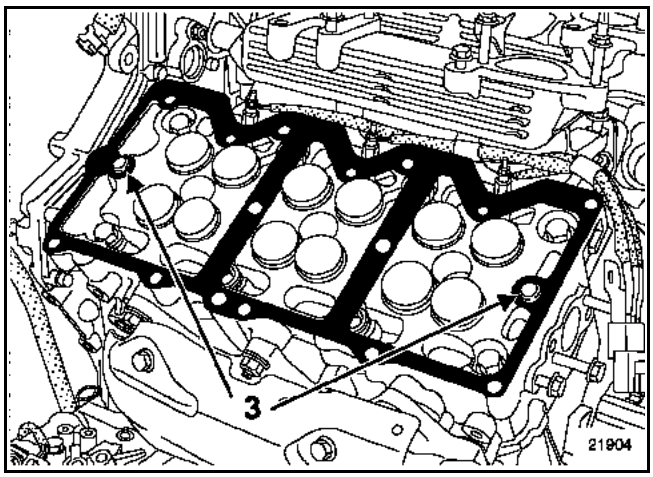
GETtheMANUALS.org

Tighten the cylinder heads using a torque wrench and an angular wrench (see **section 07A "Tightening the cylinder head"**).

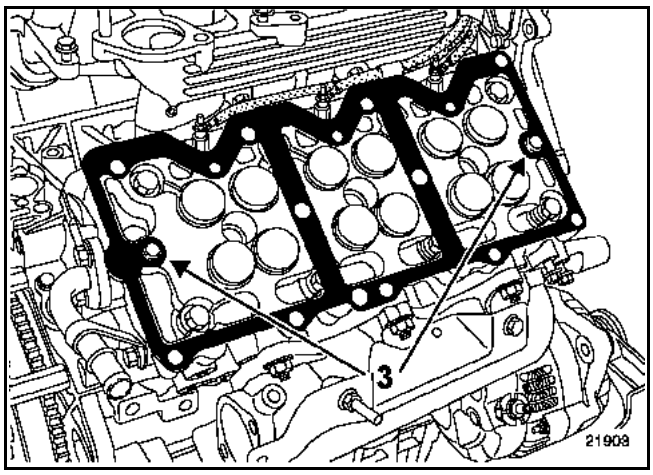
Lubricate the pistons then refit them.

Refit the camshaft casings having fitted them with new seals and centred them on dowels (3).

Front bench

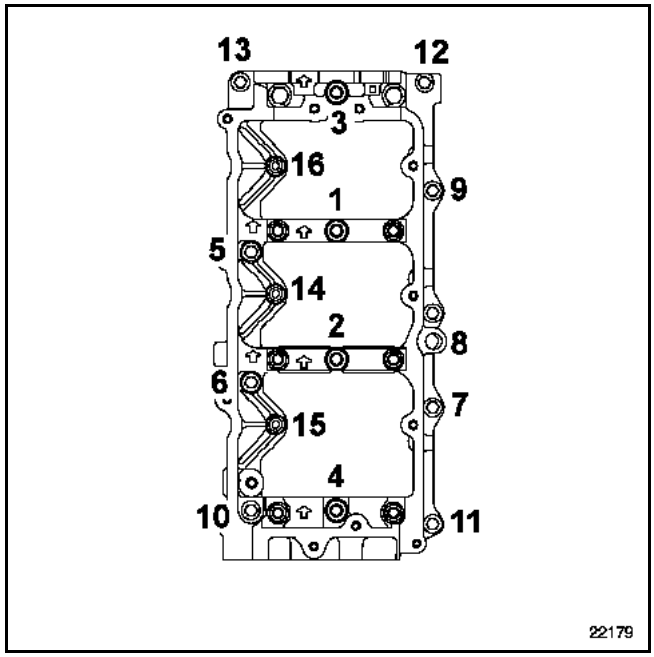


Rear bench

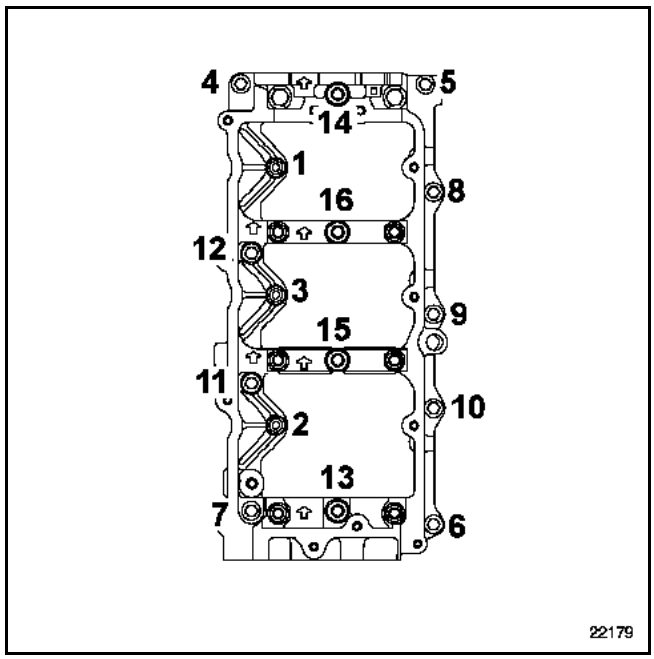


Tighten the casings to the correct torque in the order shown below.

Rear bench



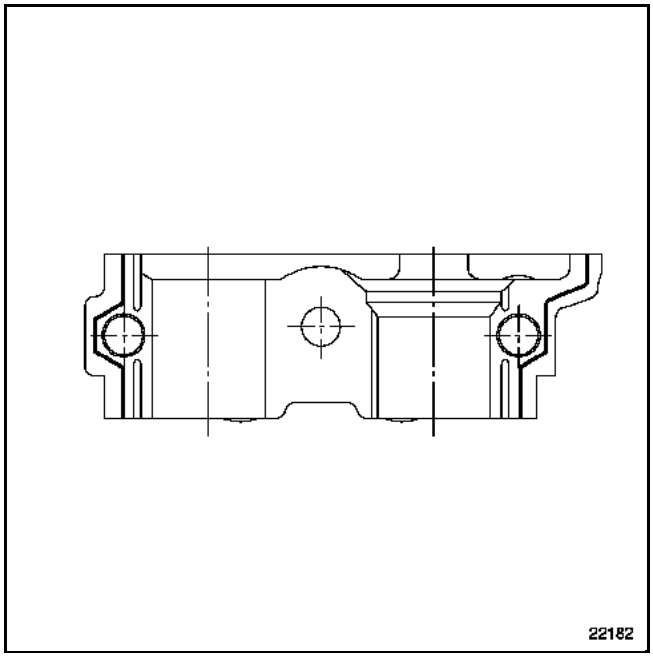
Front bench

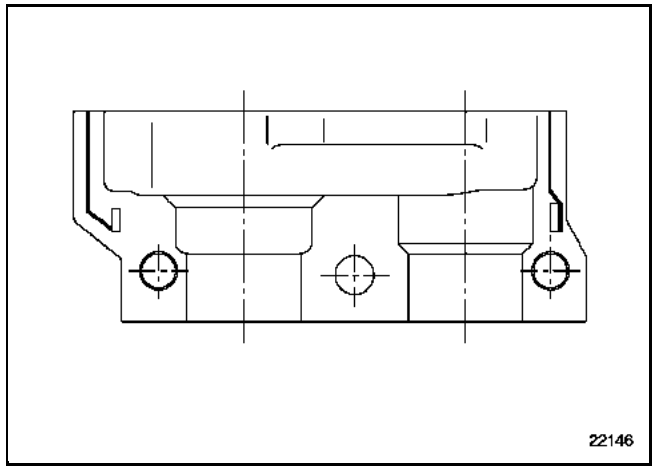


GETtheMANUALS.org

Refit the coolant pipe with new gaskets and tighten to a torque of **2.5 daNm**. on the front cylinder head.

Refit the housings using a **1.2 mm** diameter piece of cord with **THREEBOND** according to the diagram below, having first:
– cleaned and degreased the sealing surfaces,
– removed the camshaft seals and housings.

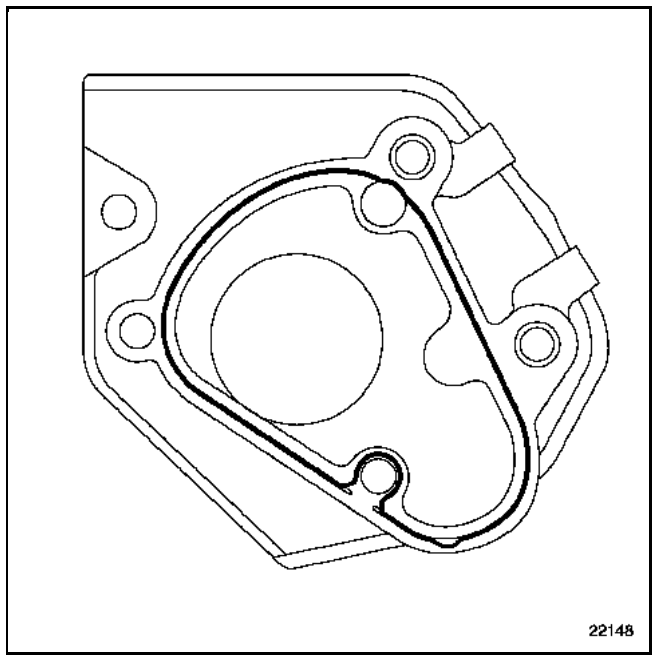




Tighten the bolts with diameter:
– **M6** to a torque of **1.2 daNm**,
– **M8** to a torque of **2.2 daNm**.

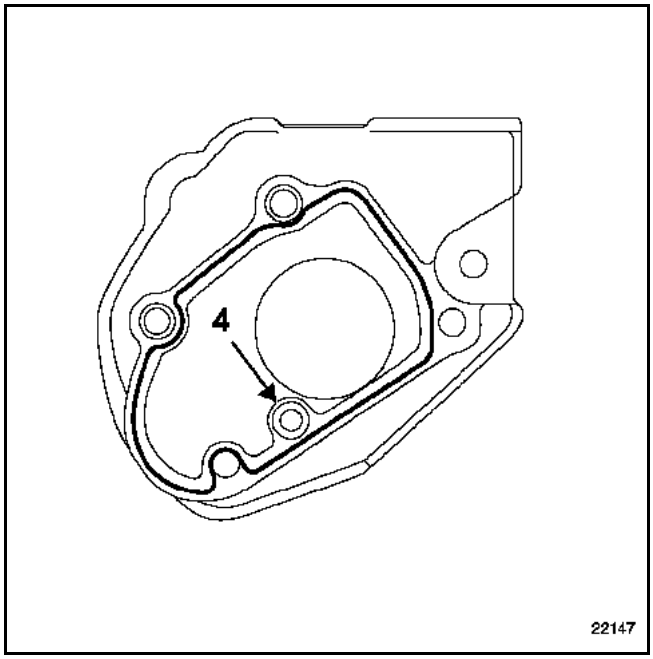
Tighten the camshaft bearings to a torque of **2.5 daNm**.

Tighten the studs to a torque of **4.3 daNm** except for the two outer bearing studs which should be tightened to a torque of **2.2 daNm**.



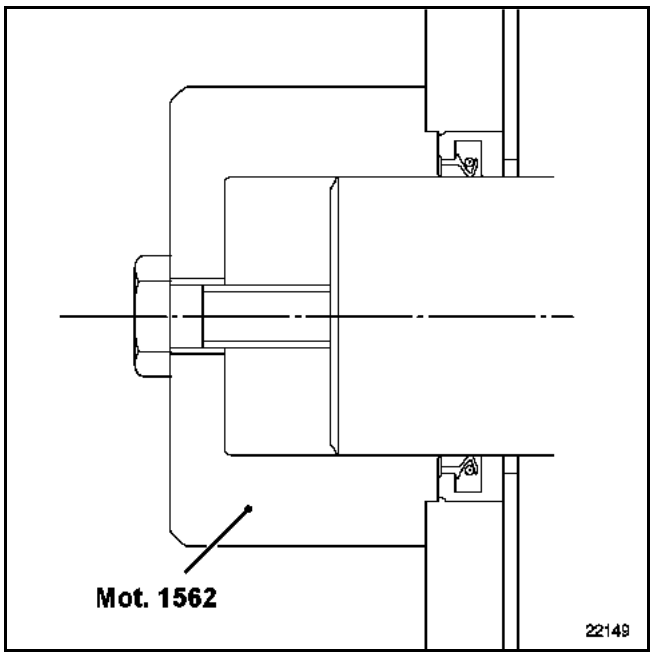
GETtheMANUALS.org

NOTE: the O-ring must be replaced (4).

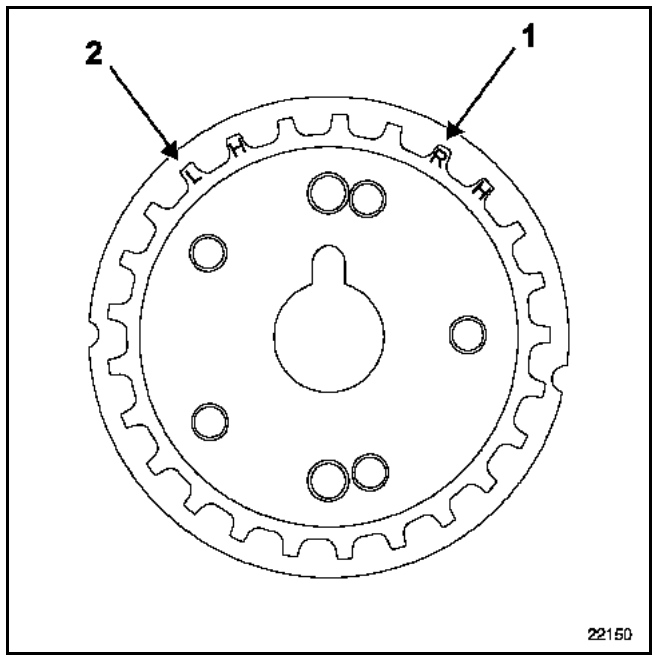


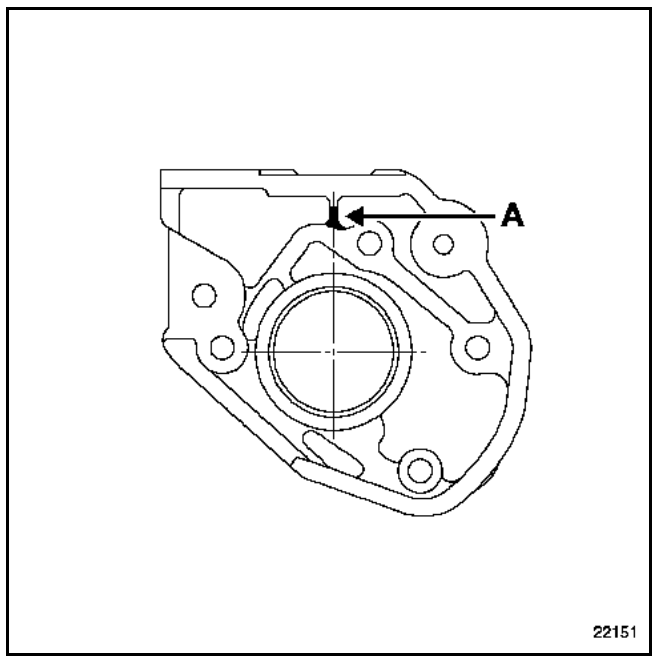
Tighten the housings to a torque of **2.5 daNm**.

Refit the camshaft seals with tool **Mot. 1562**.



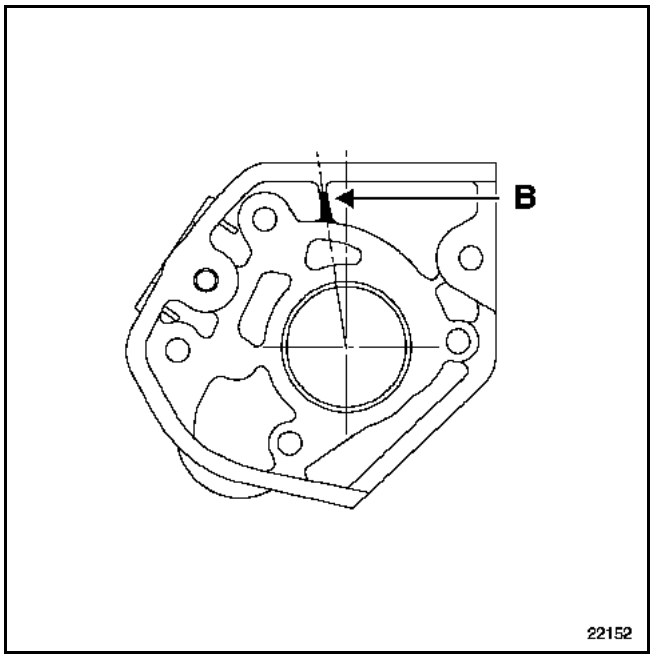
Refit the camshaft pulleys:
– on the rear bench, by aligning the mark at (1) (**RH**) on the pulley with the mark at (A),





GETtheMANUALS.org

– on the front bench, by aligning the mark at (2) (**LH**) with the mark at (B).



Tighten the camshaft pulleys to a torque of **12 daNm**.

Refit:
– the injectors (see **section 13B "Injectors"**),
– the high pressure pipes on the injection pump.
– the injector rail (see **section 13B "Injector rail"**),
– the high pressure pipes (see **section 13B "High Pressure Pipes"**),
– the **EGR** solenoid valve (see **section 12B "EGR solenoid valve"**),
– the inlet manifold (see **section 12A "Inlet manifold"**),
– the timing belt (see method described in **section 11A "Timing belt"**).

Continue the refitting procedure in the reverse order to removal.

Fill and bleed the cooling system, (see **section 19A "Filling and Bleeding"**).

GETtheMANUALS.org

Removing and refitting the cylinder head gaskets requires the removal of the engine - gearbox assembly. To follow the conditions for engine hygiene, refer to **manual V4Y**.

GETtheMANUALS.org

Refer to the **G9T manual** for the features of camshaft removal and refitting as well as for the procedure for replacing camshaft seals.

GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Mot. 929-01	Tool for positioning camshaft wear compensation sprockets
Mot. 1562	Tool for fitting camshaft oil seal
Mot. 1659	Tool for locking the camshaft pulley
Mot. 1662	Tool for adjusting the valve clearance
EQUIPMENT REQUIRED	
Torque wrench Angular torque wrench	

TIGHTENING TORQUES (in daNm)	
Camshaft casing bolt:	
– M6	**1.2**
– M8	**2.2**
Bearing stud inside the camshafts	**4.3**
Bearing stud outside the camshafts	**2.2**
Camshaft bearing bolt	**2.2**
Camshaft closure housing bolt	**2.5**
Camshaft pulley bolt	**12**

REMOVAL

Put the vehicle on a two-post lift.

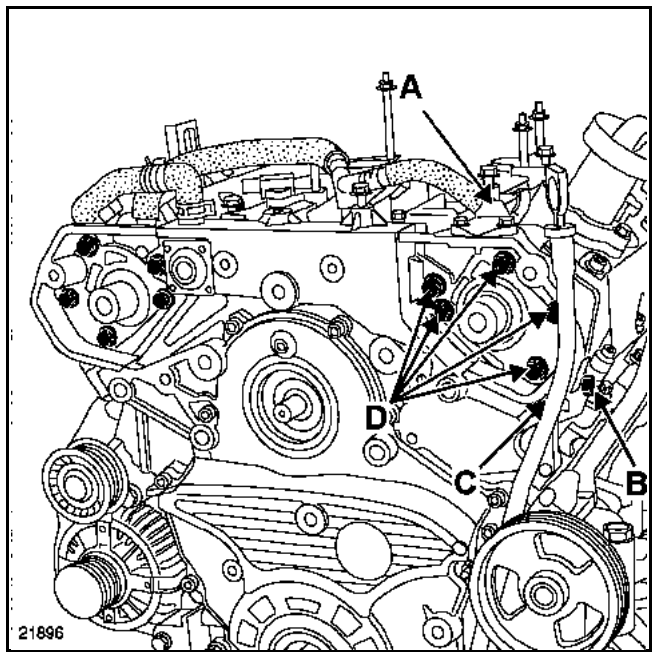
Disconnect the battery.

Drain the cooling circuit through the lower radiator hose.

Remove:
– the timing belt (see **section 11A "Timing belt"**),
– the inlet manifold (see **section 12A "Inlet manifold"**),
– the high pressure pipes (see **section 13B "High Pressure Pipes"**),
– the catalytic converter (see **section 19B "Catalytic converter"**).
– the injectors (see **section 13B "Injectors"**),

Method for the front bench camshafts:

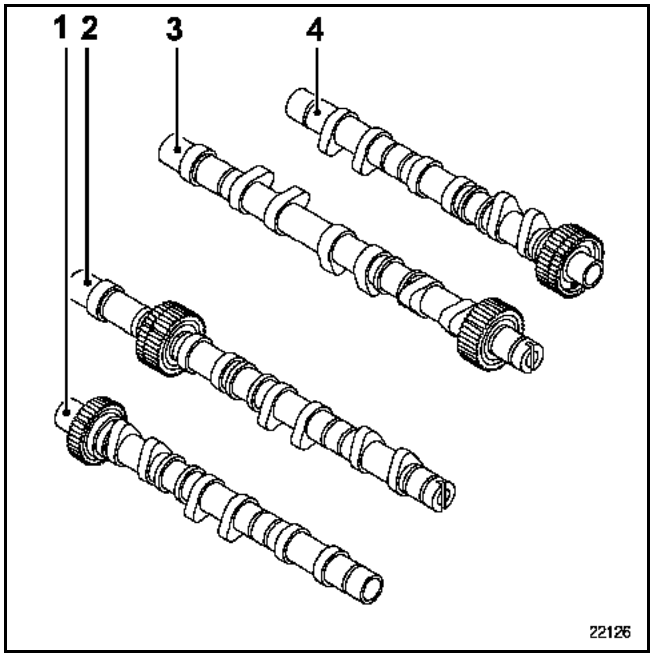
Remove:
– the camshaft pulley using tool **Mot. 1659**,
– the camshaft position sensor (A),
– the gauge guide mounting on the housing (B),
– the bolt (C),
– the housing (D).



GETtheMANUALS.org

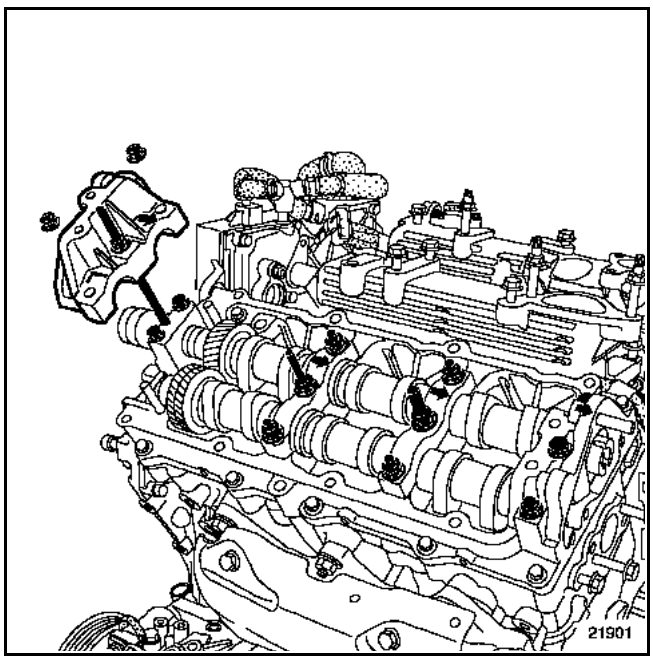
IDENTIFICATION OF THE CAMSHAFTS

Mark the camshafts before removing them from the engine.



1 Front bench outlet camshaft
2 Front bench inlet camshaft
3 Rear bench inlet camshaft
4 Rear bench outlet camshaft

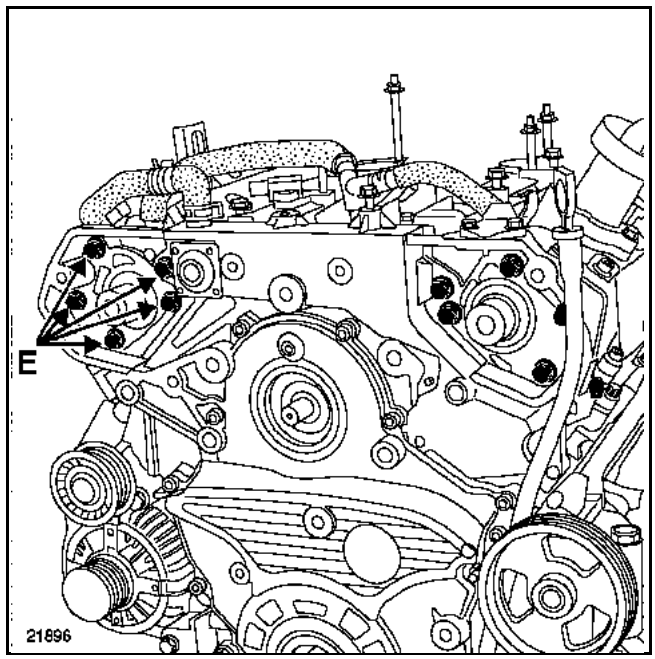
Remove:
– the camshaft bearings, marking their positions,



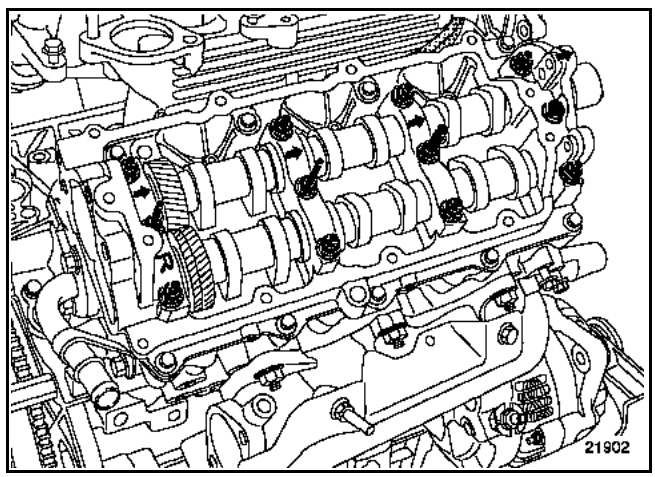
– the two camshafts, marking them.

Method for the rear bench camshafts:

Remove:
– the camshaft pulley using tool **Mot. 1659**,
– the housing (E),



– the camshaft bearings, marking their positions,



– the camshafts, marking them.

GETtheMANUALS.org

CLEANING

It is very important not to scratch the gasket faces of any aluminium component.

Use the **Décapjoint** product to dissolve any remains of the gasket still adhering.

Wear gloves whilst carrying out this operation.

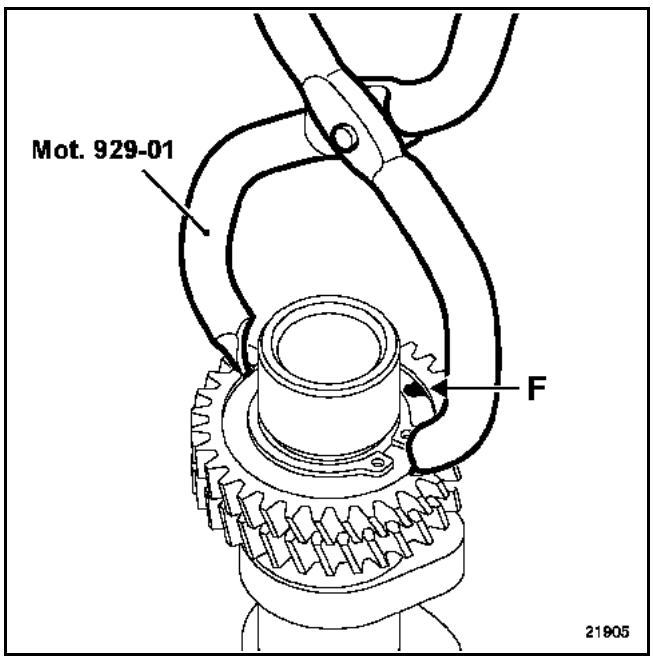
Apply the product to the parts to be cleaned; wait about ten minutes, then remove it using a wooden spatula.

REFITTING

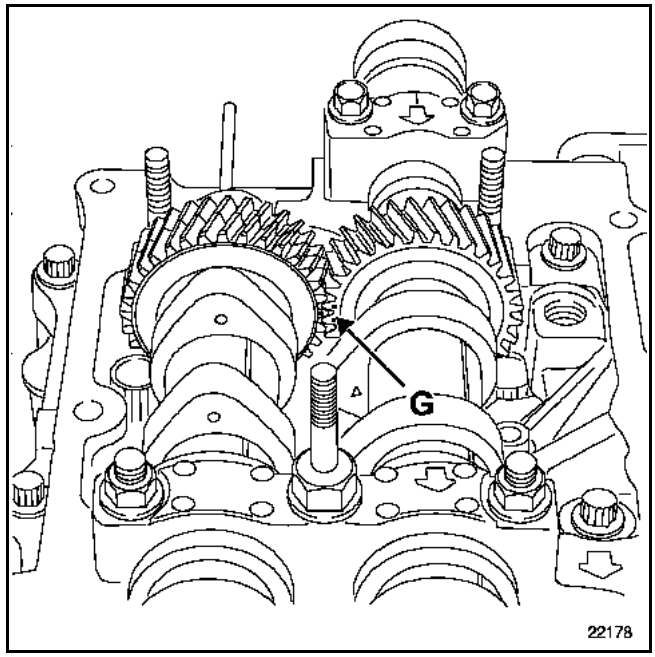
Lubricate the cams and bearings.

Correctly position the wear compensation sprocket, by aligning its teeth with those of the camshaft sprocket using tool **Mot. 929-01**

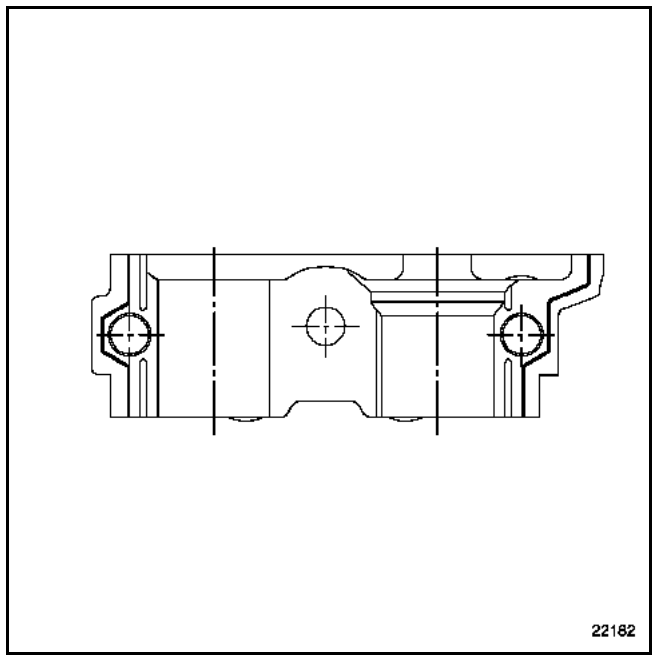
Insert a **3 mm** pin (F) to keep the wear compensation sprocket in place in relation to the camshaft sprocket.



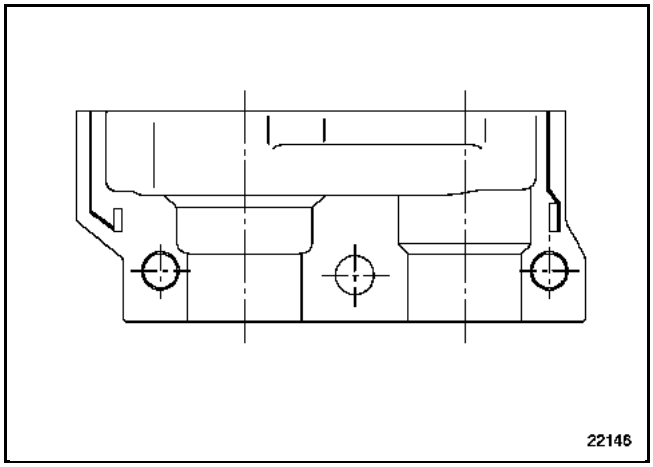
Position the camshafts according to the setting at (G).



Refit the timing housings using a **1.2 mm** diameter piece of **THREEBOND** cord according to the diagram below, having first:
– cleaned and degreased the sealing surfaces,
– removed the camshaft seals and housings.



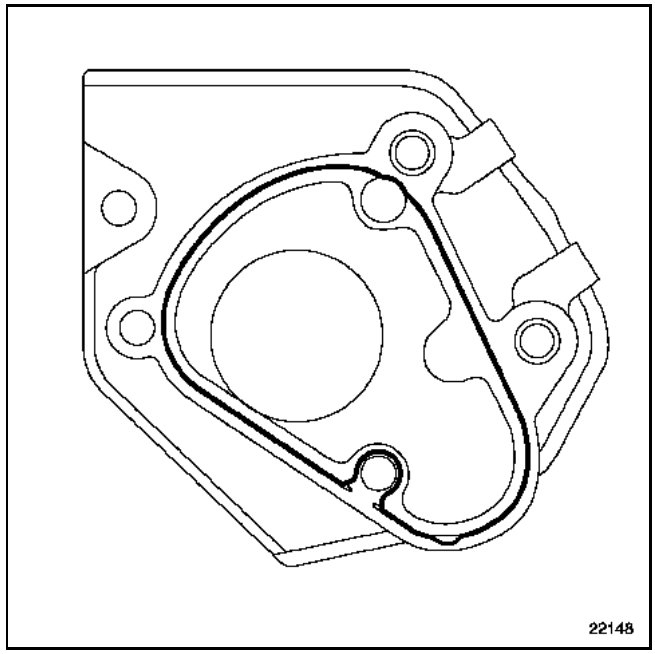
GETtheMANUALS.org



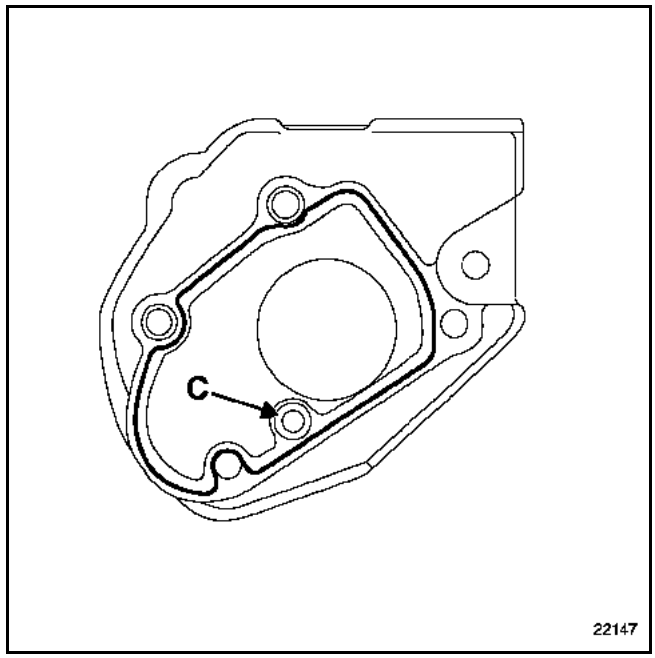
Tighten the bolts with diameter:
– **M6** to a torque of **1.2 daNm**,
– **M8** to a torque of **2.2 daNm**.

Tighten the camshaft bearings to a torque of **2.2 daNm**.

Tighten the studs to a torque of **4.3 daNm** except for the two outer bearing studs which should be tightened to a torque of **2.2 daNm**.



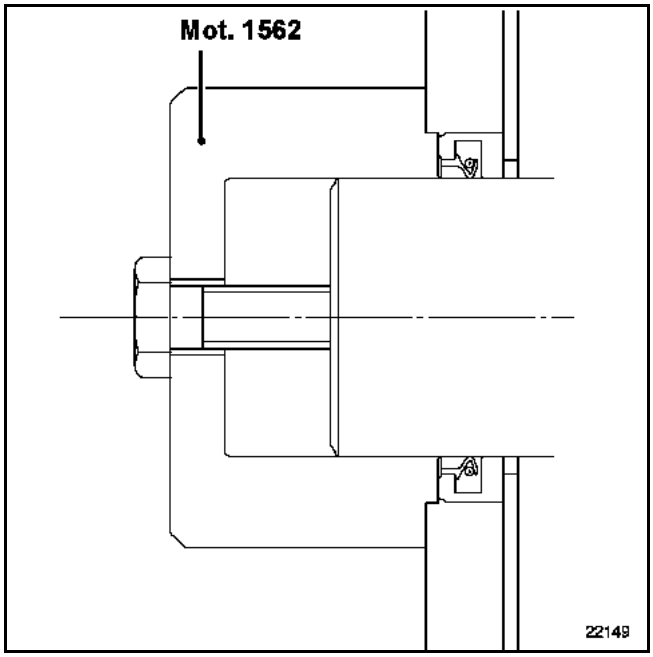
NOTE: the O-ring must be replaced (C).



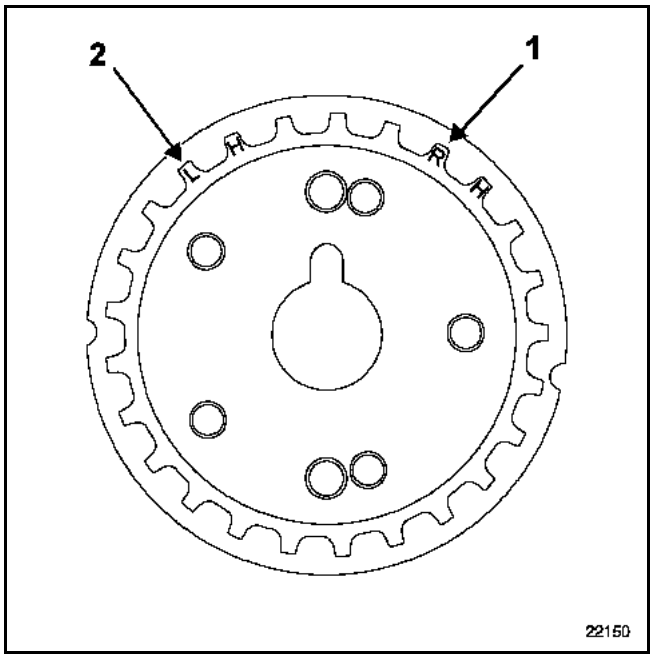
Tighten the housings to a torque of **2.5 daNm**.

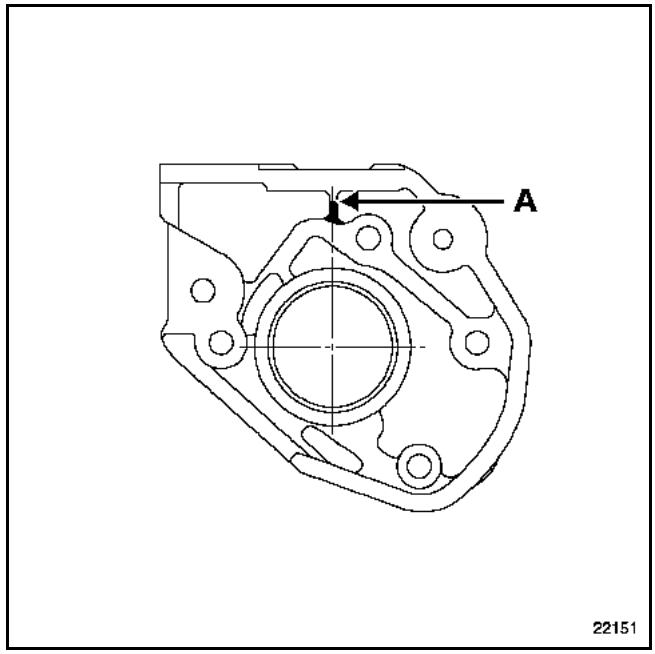
GETtheMANUALS.org

Refit the camshaft seals with tool **Mot. 1562**.

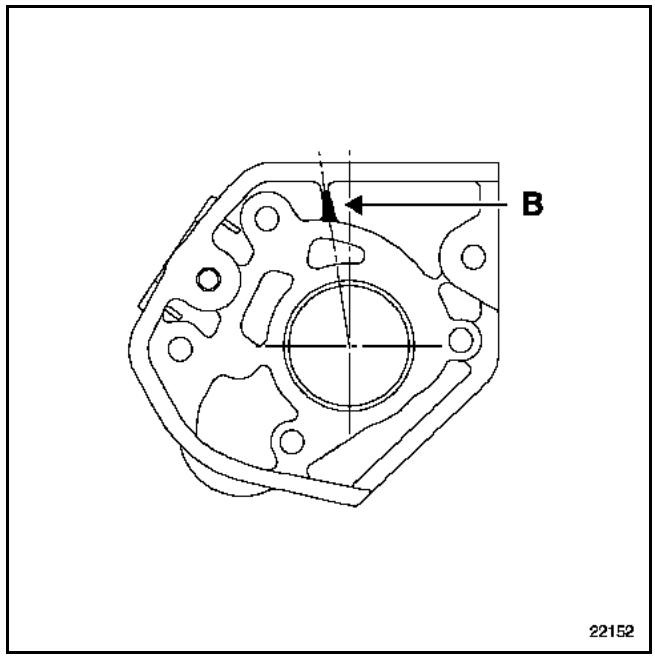


Refit the camshaft pulleys:
– on the rear bench, by aligning the mark at (1) (**RH**) on the pulley with the mark at (A),





– on the front bench, by aligning the mark at (2) (**LH**) with the mark at (B).



Tighten the camshaft pulleys to a torque of **12 daNm**, using tool **Mot. 1659** to immobilise the camshaft pulleys.

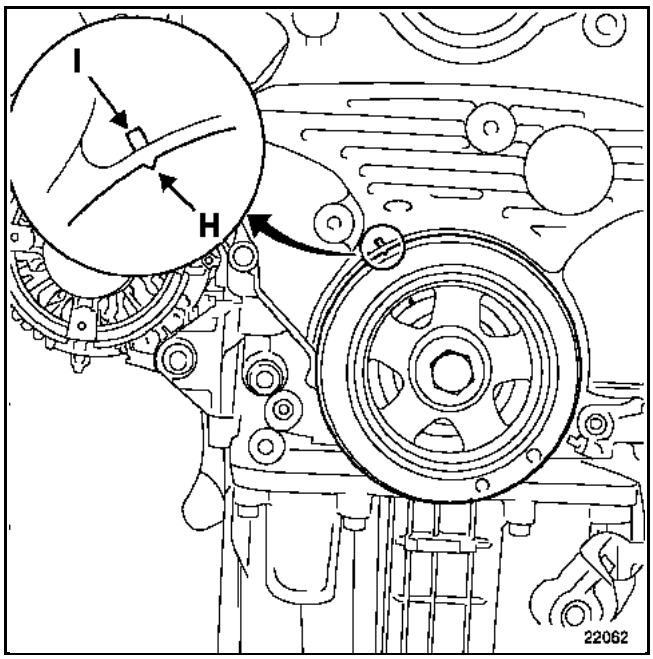
GETtheMANUALS.org

Refit the timing belt (see method described in section **11A "Timing belt"**).

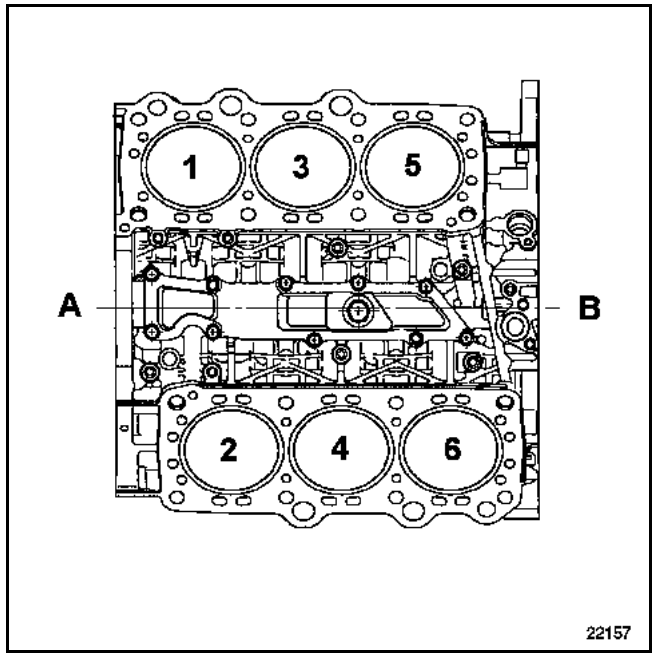
CHECKING THE VALVE CLEARANCE

NOTE: the valve clearance is carried out with the engine cold. The adjustment value is 0.4 mm.

Set the engine to top dead centre by aligning the mark (H) on the crankshaft pulley and the fixed mark (I).



Cylinder marking:



A: timing side
B: flywheel side

Measure the valve clearance of **cylinder no. 1**, the cam lobes should be rear facing.

Position the cam lobes of **cylinder no. 2** so that they are rear facing and turn the engine in the operating direction. Measure the valve clearance.

Repeat the operation for **cylinder nos. 3, 4, 5 and 6**, turning the engine in the operating direction and following the injection order:
1→2→3→4→5→6.

GETtheMANUALS.org

SETTING THE VALVE CLEARANCE

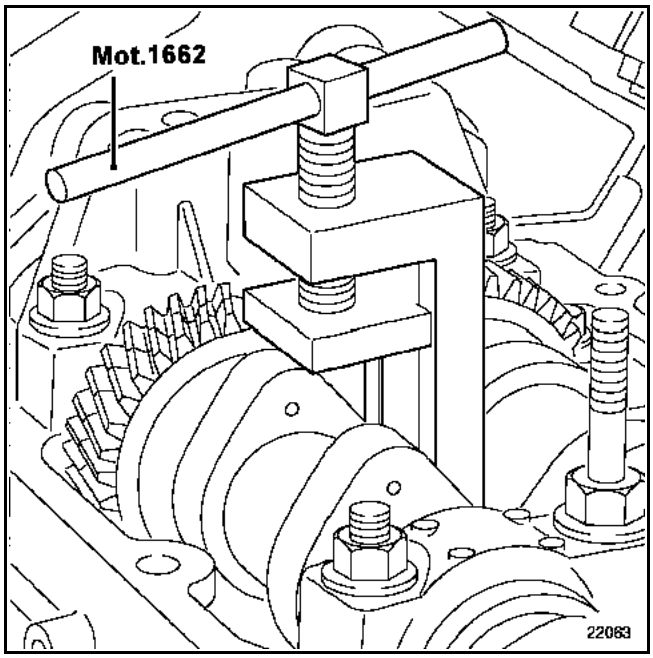
Position the cam lobes of the relevant cylinder so that they are rear facing then gently rotate the engine in the operating direction to prevent the valve and piston from touching while tool **Mot. 1662** is fitted.

Turn the two hydraulic pistons of the cylinder concerned and position the slot towards the outside of the camshafts to enable the valve to be released.

Compress the valve spring using tool **Mot. 1662**.

The tool marked "I" is used to change the valves of the inlet camshaft and the tool marked "E" is used to change the valves of the outlet camshaft.

Release the valve adjusters with a screwdriver and an extension magnet.



Refit:
- the injectors (see **section 13B "Injectors"**),
- the high pressure pipes (see **section 13B "High Pressure Pipes"**),
- the inlet manifold (see **section 12A "Inlet manifold"**),
- the catalytic converter (see **section 19B "Catalytic converter"**).

Continue the refitting procedure in the reverse order to removal.

GETtheMANUALS.org

Removing and refitting the camshafts requires the removal of the engine - gearbox assembly.

To follow the conditions for engine hygiene, refer to **manual V4Y**.

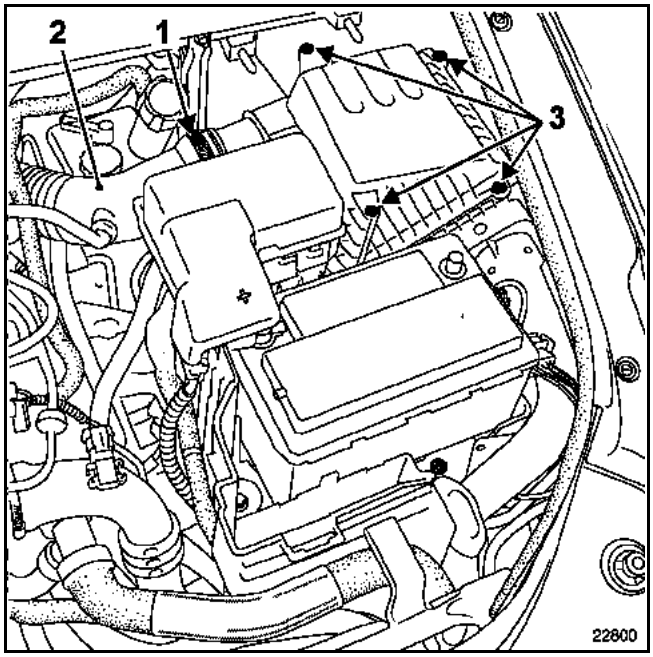
FILTER ELEMENT

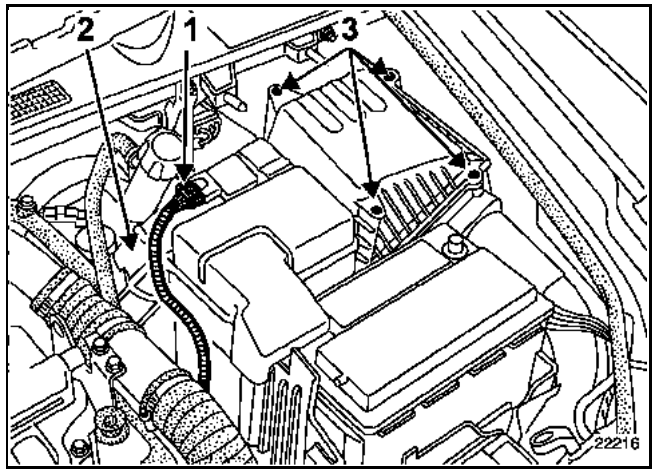
Turbocharged F4R engine



Unscrew the clamp (1) then remove the air hoses (2).

Remove the four mounting bolts (3) on the air filter cover to gain access to the filter element.

G9T engine



Disconnect the connector (1) from the air flowmeter.

Unscrew then remove the air hoses (2).

Remove the four mounting bolts (3) on the air filter cover to gain access to the filter element.

GETtheMANUALS.org

FILTER ELEMENT

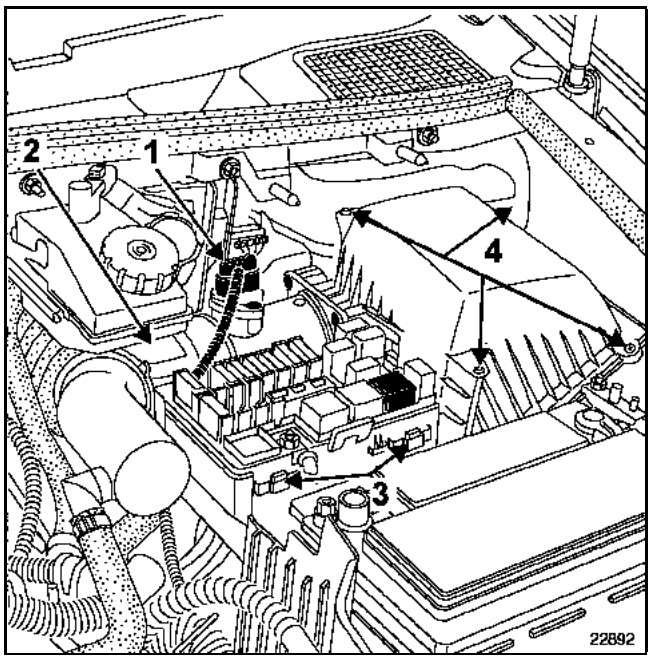
Remove the engine covers.

Disconnect:
– the battery,
– the air flowmeter connector (1),
– the air intake duct (2).

Unclip the relay unit mountings (3) then gently release it on the side.

Remove the four mounting bolts (4) from the air filter unit cover.

Release the air filter unit cover with the flowmeter then remove the filter element.



GETtheMANUALS.org

FILTER ELEMENT

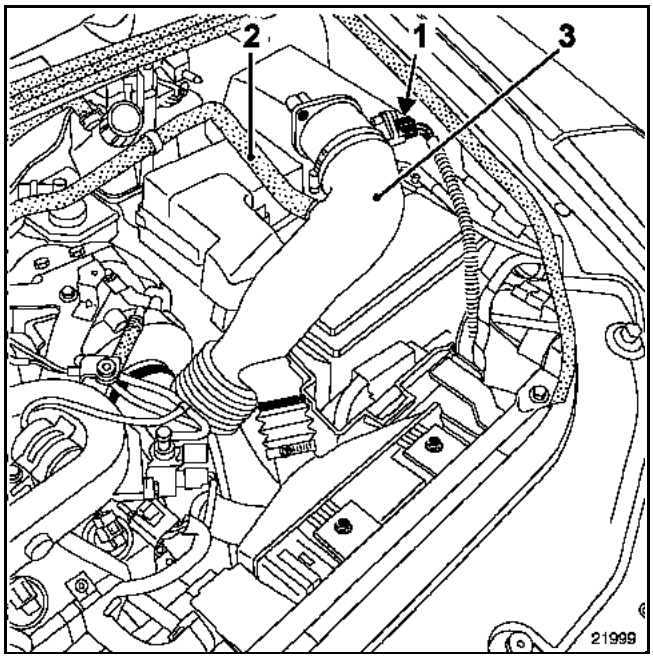
Remove the engine covers.

Disconnect:
– the battery,
– the air flowmeter connector (1).

Disconnect the oil vapour rebreathing duct (2).

Remove the air inlet duct (3) complete with the flowmeter.

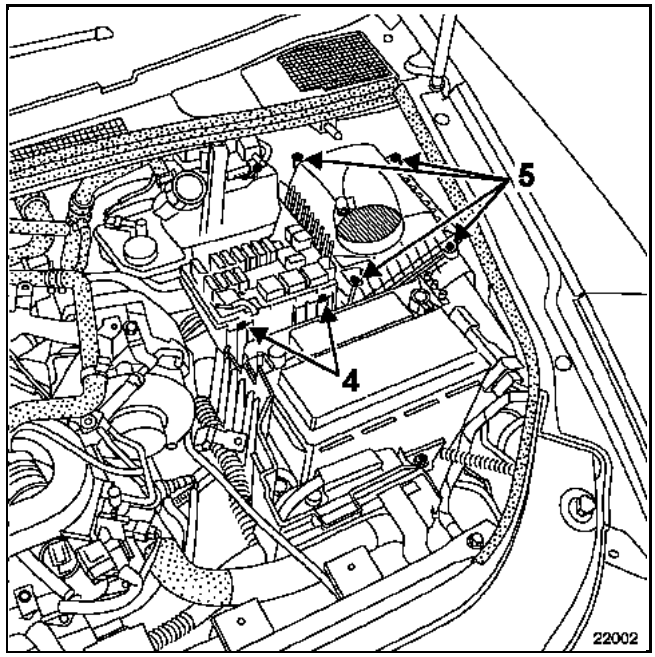
To do this, remove the two mounting bolts on the air flowmeter, attach it to the air resonator then the turbocharger.



Unclip the relay unit mountings (4) then gently release it on the side.

Remove the four mounting bolts (5) from the air filter unit cover.

Release the air filter unit cover then remove the filter element.



GETtheMANUALS.org

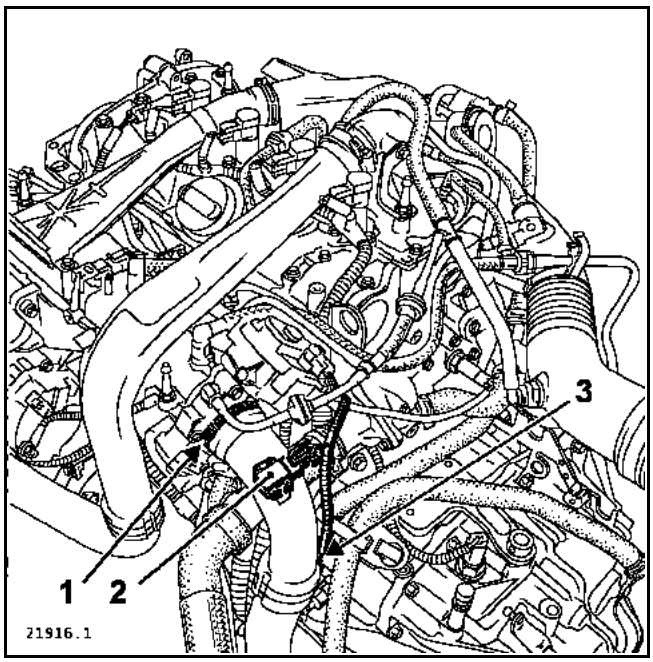
TIGHTENING TORQUE (in daNm)	
Throttle body bolt	1.5

REMOVAL

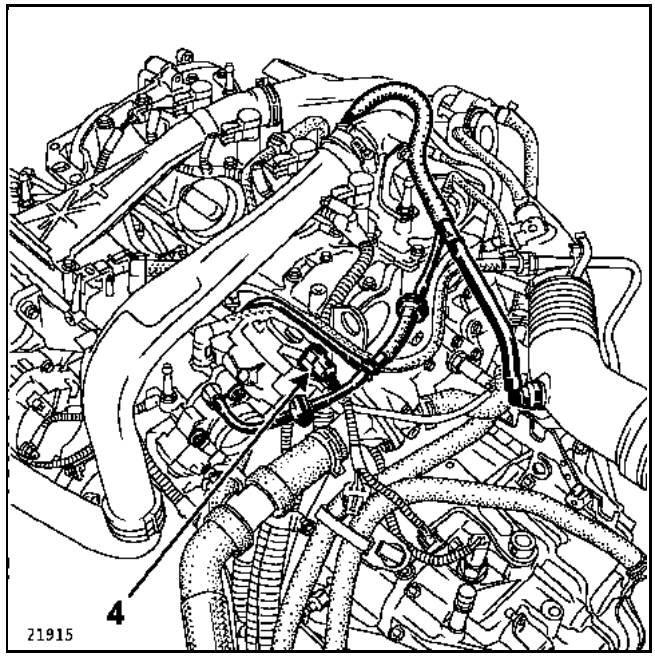
Disconnect the battery.

Loosen the clamp (1).

Disconnect:
– the connector from the turbocharger pressure sensor (2),
– the connector from the air temperature sensor (3),

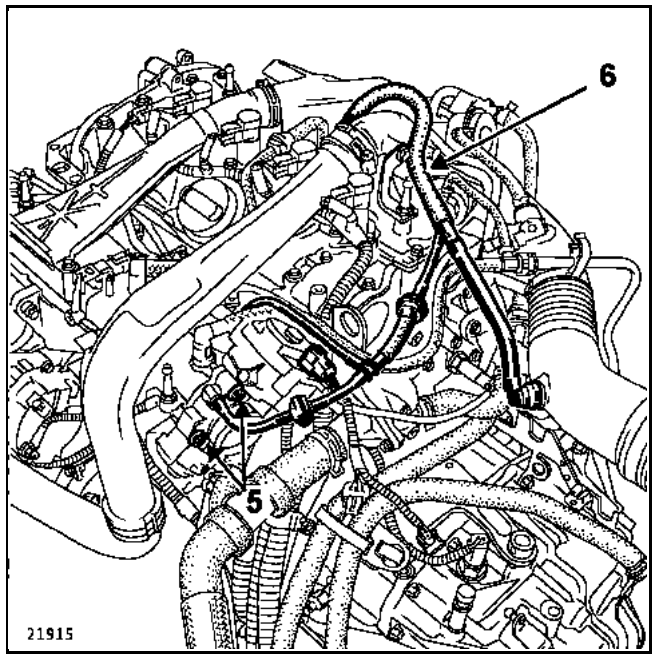


– the motorised throttle body connector (4).



Remove the air exchanger/manifold pipe.

Remove the throttle body's three mounting bolts (5).



Remove the throttle body with the petrol and oil vapour rebreather pipe (6).

Unclip the pipe (6) from the throttle body.

GETtheMANUALS.org

REFITTING

Proceed in the reverse order to removal.

Replace the gasket every time the throttle valve is removed.

Using the diagnostic tool, program the throttle body.

Each time the ignition is switched on, the throttle unit should go through a cycle of programming for its minimum and maximum positions.

GETtheMANUALS.org

TIGHTENING TORQUES (in daNm)	
Throttle body bolt	0.8 ± 0.1
Air filter unit bolt	1

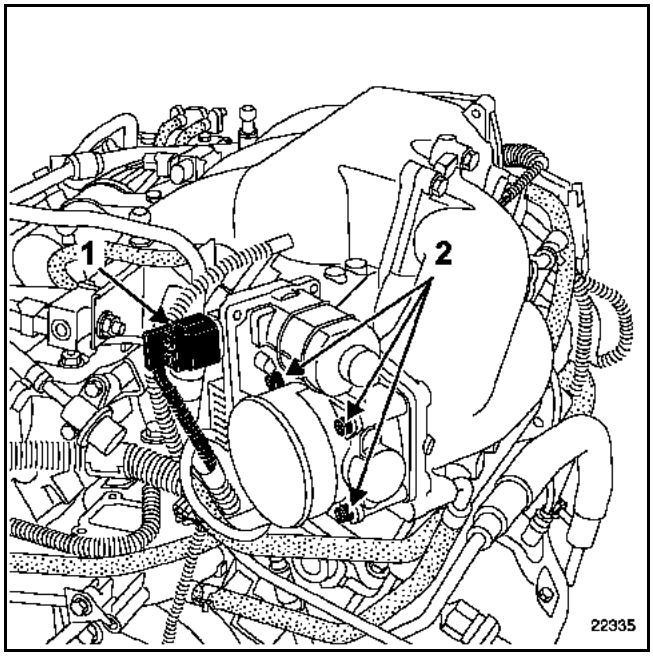
REMOVAL

Disconnect the battery.

Remove the air filter unit cover (see Section **12A: Fuel mixture Air filter**).

Remove the air inlet duct.

Disconnect the motorised throttle body connector (1).



Remove the throttle body's four mounting bolts (2).

REFITTING

Proceed in the reverse order to removal.

Replace the gasket every time the throttle valve is removed. Use grease to refit it more easily.

When the ignition is switched on, the throttle unit should go through a cycle of programming for its minimum and maximum positions.

Use the diagnostic tool to check that the programming has been carried out correctly.

GETtheMANUALS.org

IMPORTANT:
The motorised throttle body cannot be repaired. Modification of the position of stop screw (A) is forbidden.

TIGHTENING TORQUES (in daNm)	
Exhaust gas recirculation pipe mounting bolt	2.5 ± 0.5
Air vent unit mounting bolt	2.2 ± 0.4

AIR VENT UNIT

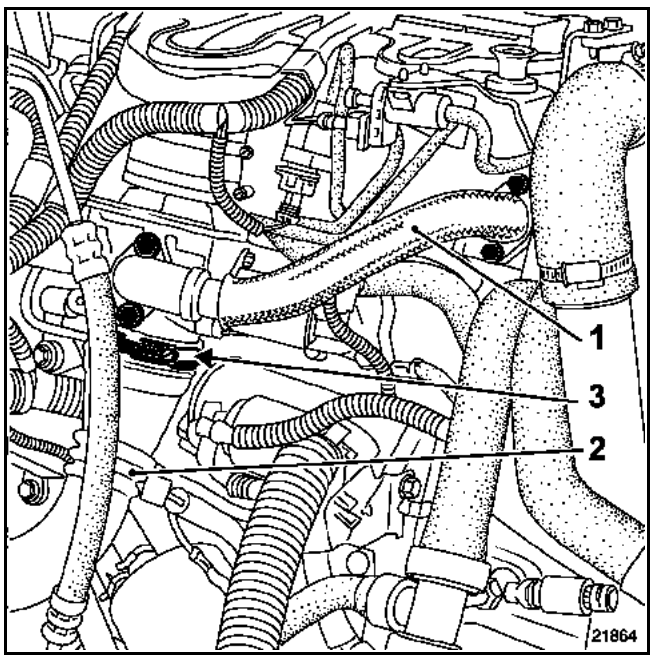
This unit is located between the air-to-air intercooler and the plenum chamber. It includes the exhaust gas recirculation electric valve and the engine stop system.

REMOVAL

Disconnect the battery.

Remove the exhaust gas recirculation pipe (1) and the seals. Plan for the replacement of the pipe and the seals when refitting.

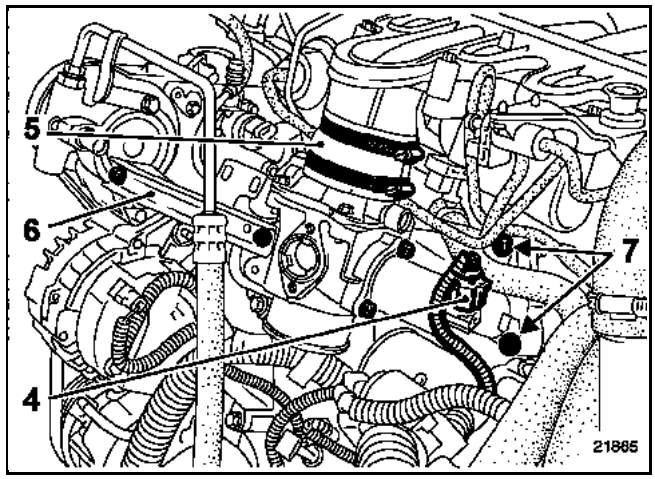
Remove the air exchanger/air vent unit pipe (2), by loosening the clamp (3).



Disconnect the exhaust gas recirculation control solenoid valve connector (4).

Loosen the clips from the connection pipe (5) with the inlet manifold.

Remove:
- the stiffening bracket (6) between the air vent unit and the power assisted steering pump,
- the three mounting bolts (7) from the air vent unit,
- the air vent unit with the exhaust gas recirculation electric valve.



REFITTING

Proceed in the reverse order to removal. Observe the tightening torques.

GETtheMANUALS.org

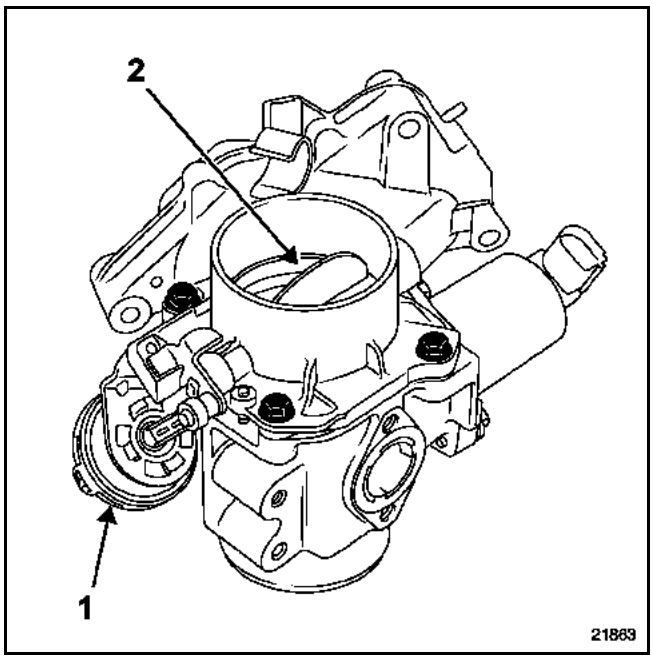
TIGHTENING TORQUE (in daNm)	
Damper flap mounting bolt	1.2

OBJECTIVE

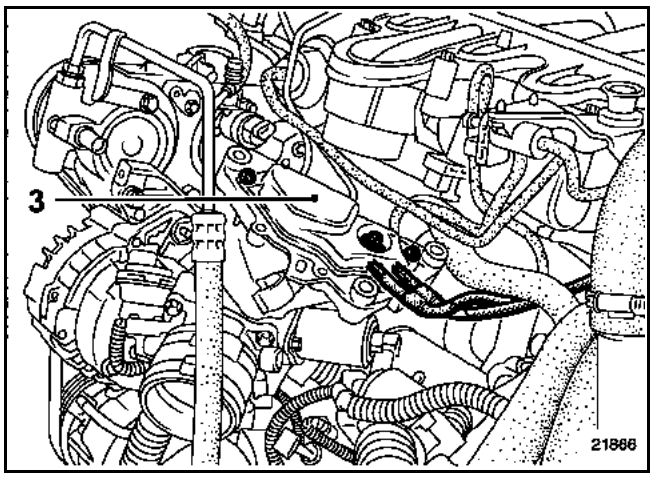
The aim of the system is to stop the engine quickly after the ignition is switched off.

DESCRIPTION

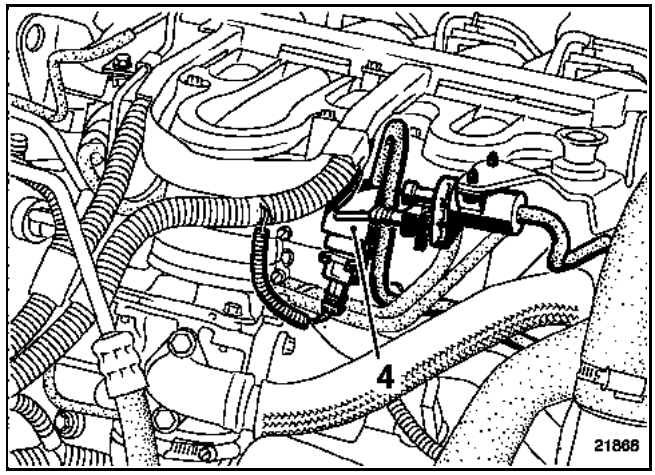
The system consists of:
– a diaphragm (1) activating the damper flap,
– a damper flap (2),



– a vacuum canister (3),



– a solenoid valve (4).



OPERATION

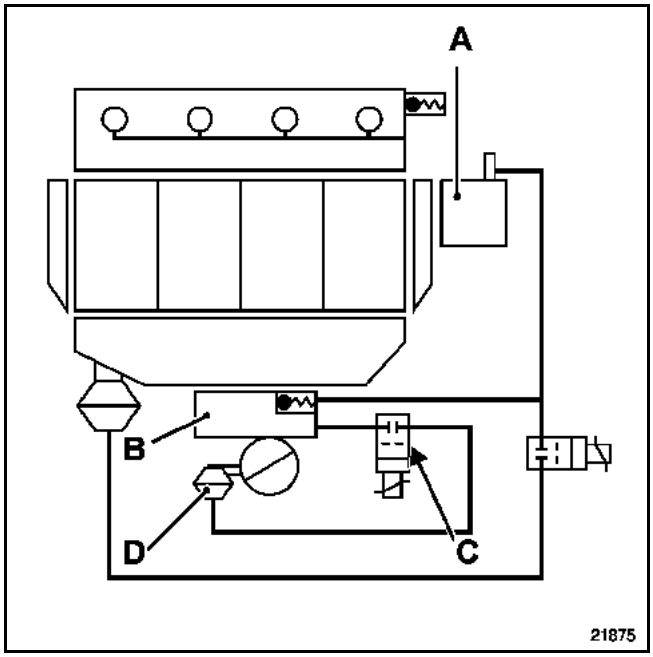
When the ignition is switched off, the solenoid valve connects the vacuum canister with the damper flap control diaphragm.

The latter is subject to the vacuum which results in the air intake valve being closed.

The engine can no longer breathe air and stops immediately.

GETtheMANUALS.org

DIAGRAM

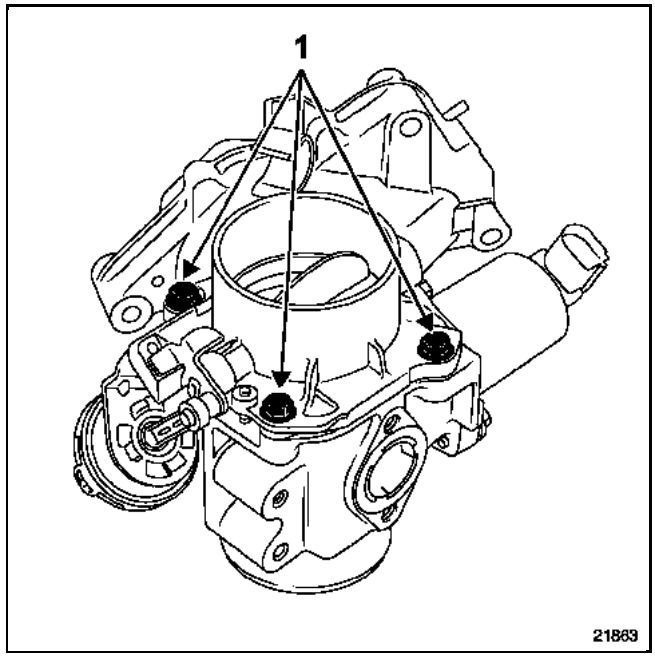


A Vacuum pump
B Vacuum canister fitted with an anti-return valve
C Engine stop solenoid valve
D Damper flap control diaphragm

REMOVING THE DAMPER FLAP

The air vent unit must be removed to allow removal of the damper flap (see Section **12A Fuel mixture Air vent unit**).

Remove the four bolts from the (1) damping flap then remove the throttle - diaphragm assembly.



REFITTING

Proceed in the reverse order to removal.

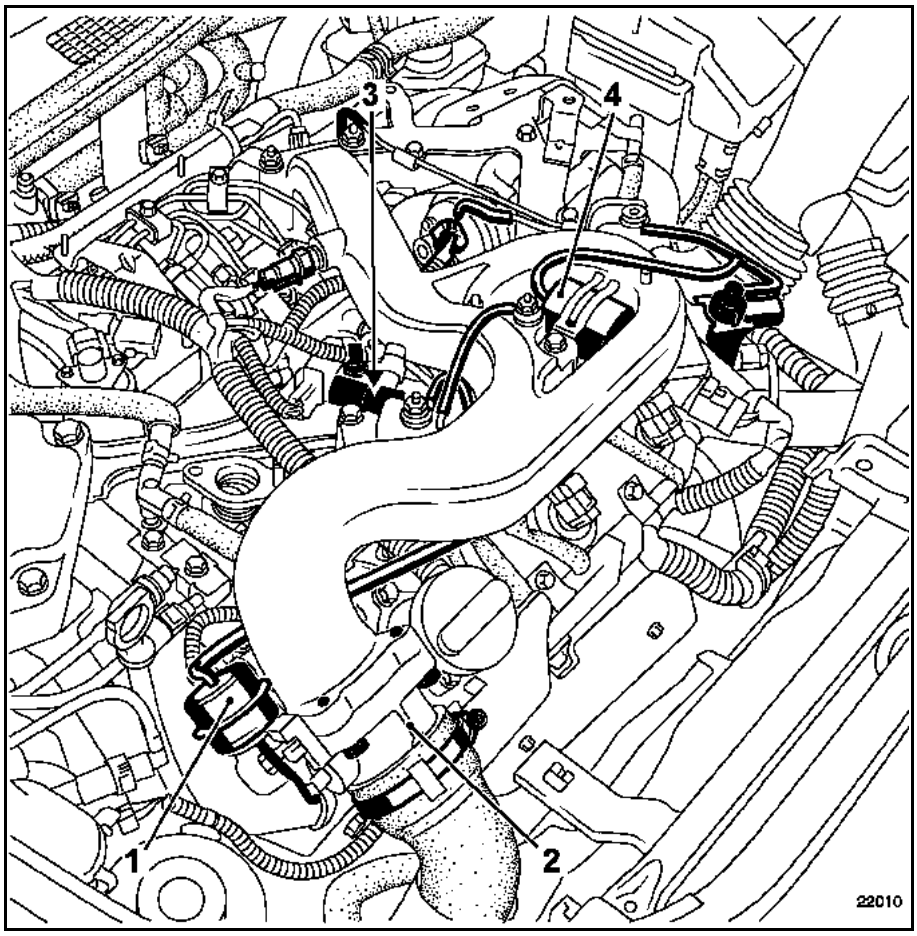
GETtheMANUALS.org

OBJECTIVE

The aim of the system is to stop the engine smoothly without jerking after the ignition is switched off.

DESCRIPTION

The system consists of:
– a diaphragm (1) activating the throttle,
– a damper flap (2),
– a control solenoid valve (3),
– a vacuum canister (4).



OPERATION

When the ignition is switched off, the solenoid valve connects the vacuum canister with the diaphragm.

The latter is subject to the vacuum which results in the air intake valve being closed.

The engine can no longer breathe air and stops immediately.

GETtheMANUALS.org

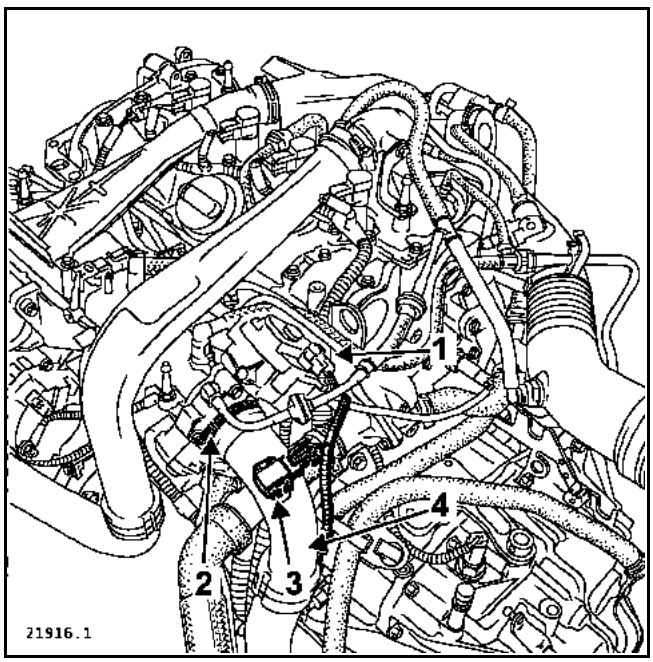
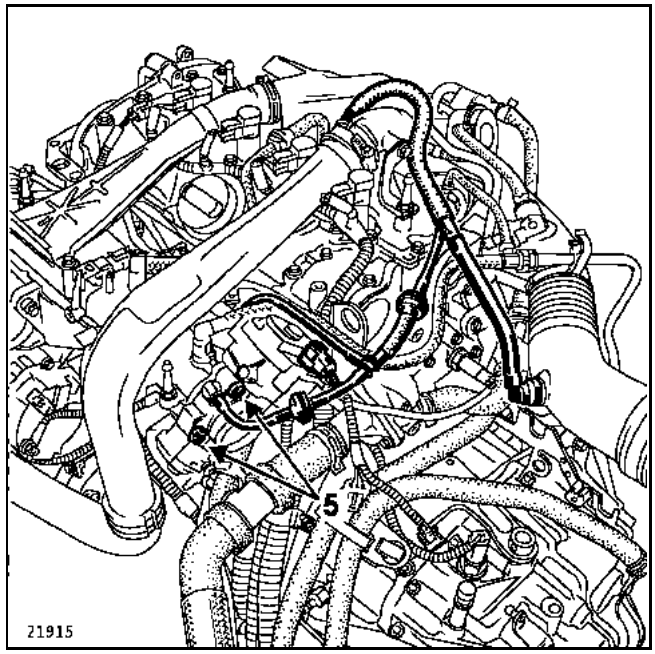
Plenum chamber bolt	2.1
Throttle body bolt	1
Injector rail bolt	0.8
Air exchanger/turbocharger pipe bolt	1
Air exchanger/turbocharger pipe clamp	0.5

REMOVAL

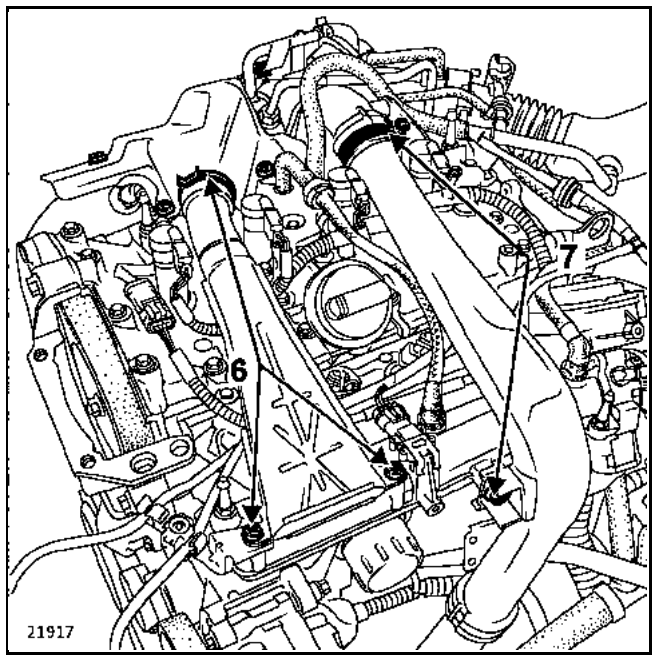
Disconnect:
– the battery,
– the motorised throttle body connector (1),
– the air exchanger/throttle body pipe (2),
– the connector from the turbocharger pressure sensor (3),
– the connector from the air temperature sensor (4).



Remove:
– the throttle body's three mounting bolts (5),
– the throttle body with the petrol and oil vapour rebreather pipe,

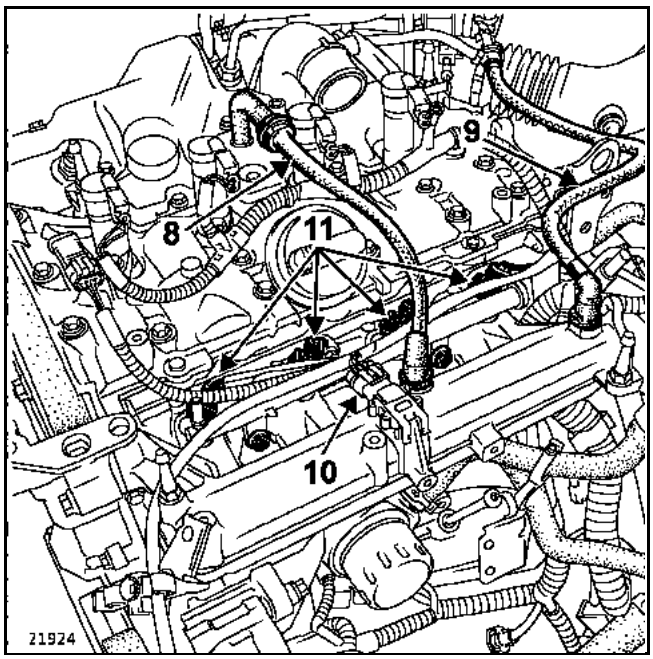


– the turbocharger heat shield air duct (6),
– the clamp and the mounting bolt from the air hoses on the exchanger/turbocharger (7).

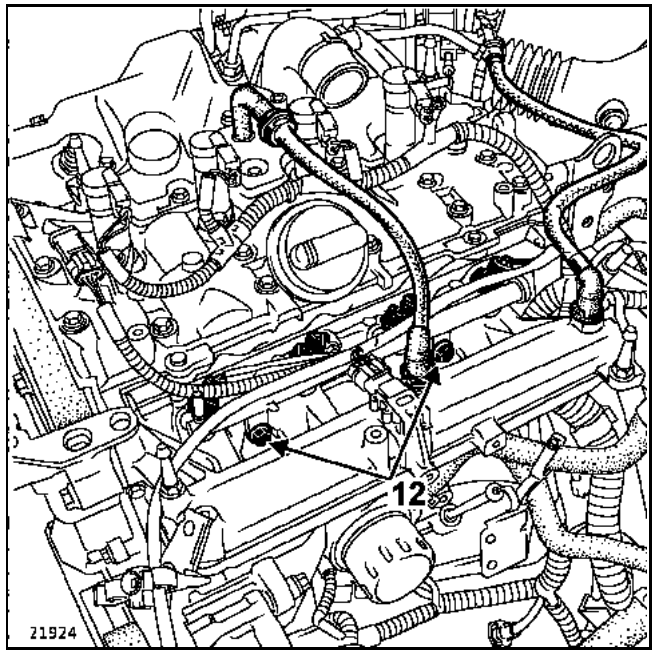


GETtheMANUALS.org

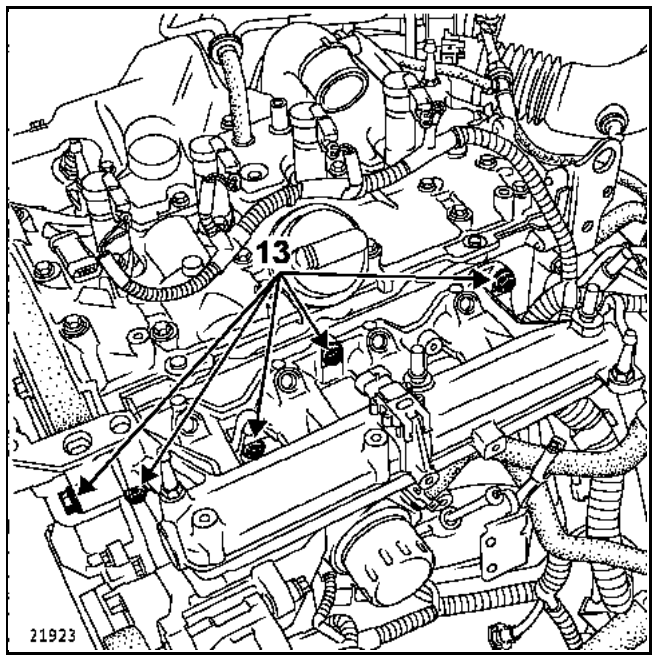
Disconnect:
– the oil vapour rebreathing pipe from the inlet plenum chamber (8),
– the vacuum pipe from the brake servo (9),
– the pressure sensor connector on the plenum chamber (10),
– the connectors from the injectors (11).



Remove:
– the two injection rail bolts (12),
– the injector rail,



– the eight mounting bolts on the inlet plenum chamber (13),
– the inlet plenum chamber.



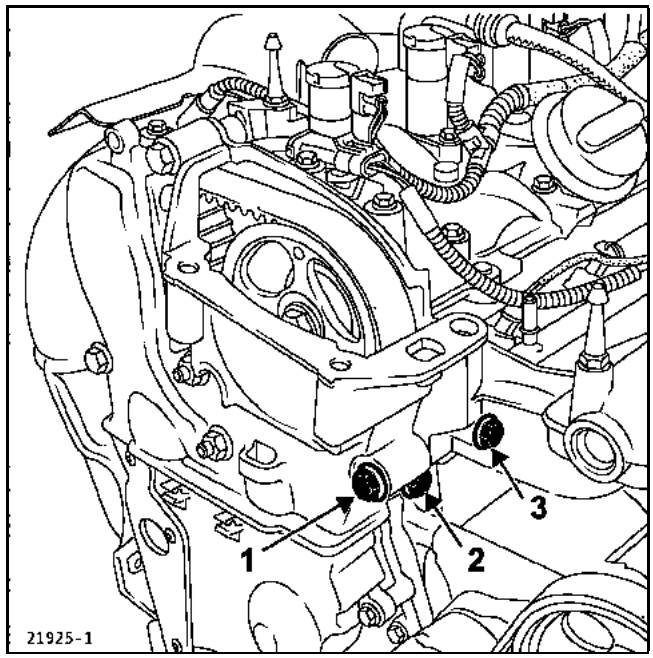
GETtheMANUALS.org

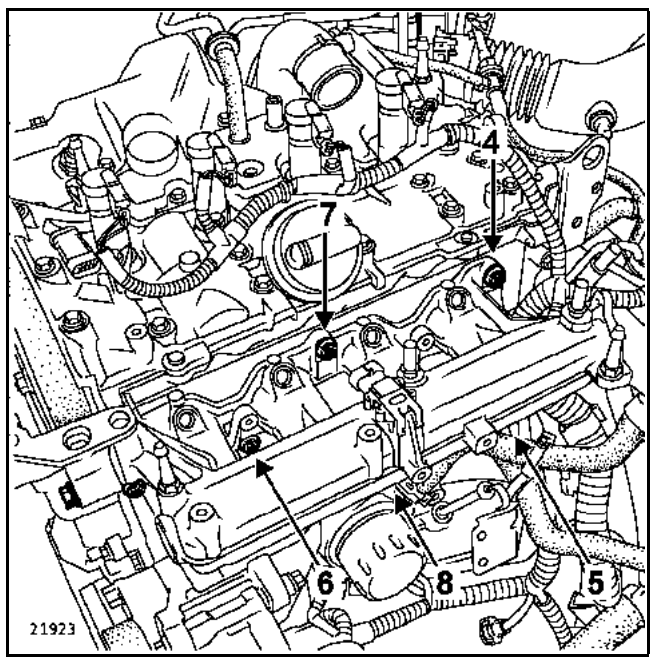
REFITTING

Replace the gaskets on the inlet plenum chamber and the throttle body.

Tighten the plenum chamber bolts.

Observe the order (1-2-3-4-5-6-7-8) and tightening torque for the plenum chamber mounting bolts.





Proceed in the reverse order to removal.

GETtheMANUALS.org

SPECIAL FEATURE:

The inlet plenum chamber is fitted with a variable air intake flap.

Downstream of the flowmeter, the inlet plenum chamber divides in two, each side supplying one bank of cylinders. An air flap allows the two banks of cylinders either to be isolated or to be in communication. This system is designed to optimise engine torque.

The injection computer controls a solenoid valve (1), which connects the inlet plenum chamber vacuum via a vacuum canister (2), with the control diaphragm (3) of the air flap (4).

OPERATING CONDITIONS

The solenoid valve is not controlled at rest, the air flap is open.

1. At idle speed or full load, the air flap is **open**.

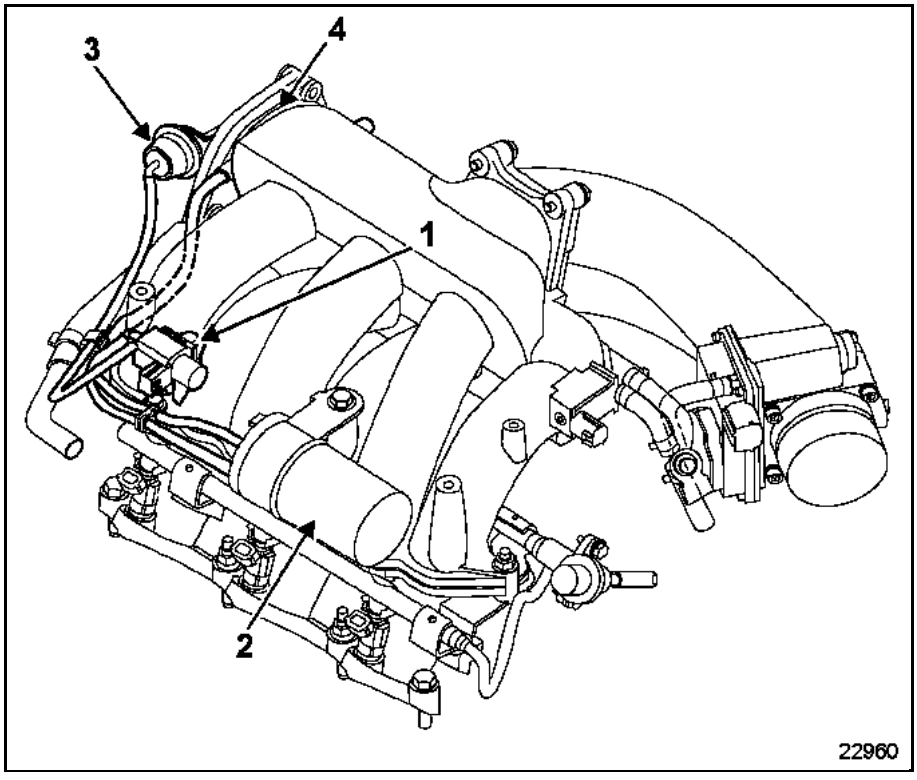
2. The solenoid valve is controlled, the air flap **closes**, under the following conditions:
– outside the starter motor run-up phase,
– throttle position potentiometer **outside the no load position**,
– coolant temperature **≥ to -49 °C**,
– engine speed between **1600 and 3600 ± 200 rpm**,
– injection timing **> 0.5 milliseconds**.

REMOVAL - REFITTING

Removing and refitting the air flap does not entail particular difficulties.

Replace the gaskets with new ones.

Tighten the flap mounting bolts to a torque of **1.9 ± 0.2 daNm**



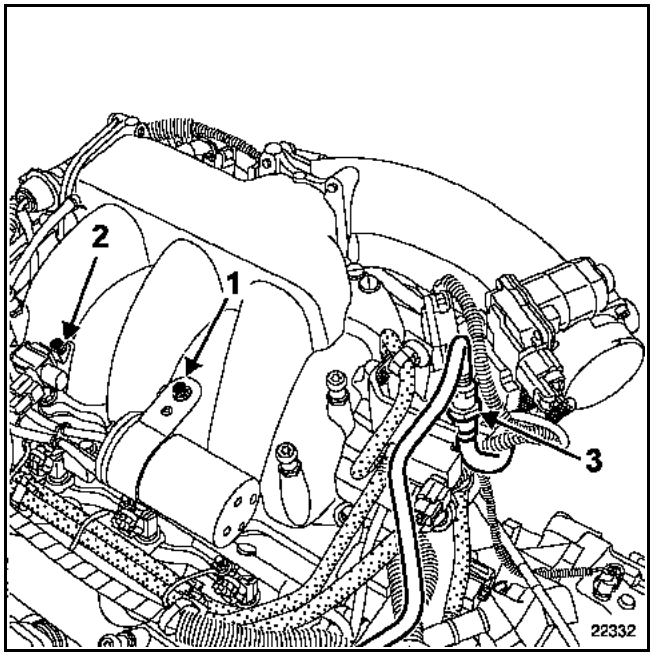
GETtheMANUALS.org

TIGHTENING TORQUE (in daNm)	
Plenum chamber nuts and bolts	2.2
Engine tie-bar:	
sub-frame side	10.5
engine side	18

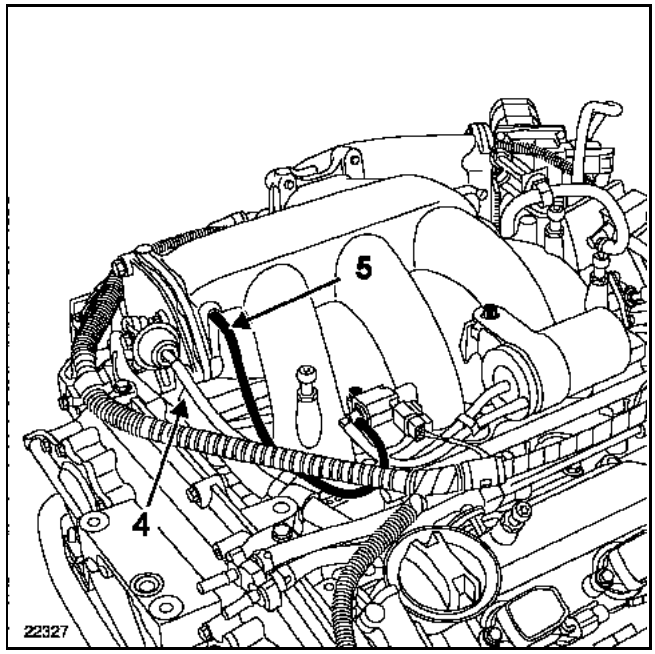
REMOVAL

Disconnect the battery.

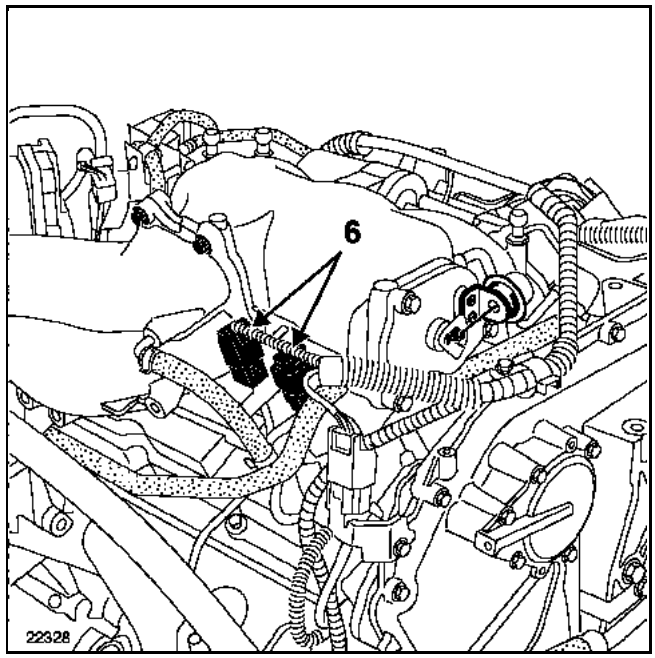
Remove:
– the vacuum canister (1),
– the air intake flap control solenoid valve (2),
– the vacuum pipe (3) for the brake servo.



Disconnect:
– the pipes on the control diaphragm (4),
– the pipe (5) on the plenum chamber,
– the fuel vapour control absorber solenoid valve



– the oxygen sensor connectors (6).

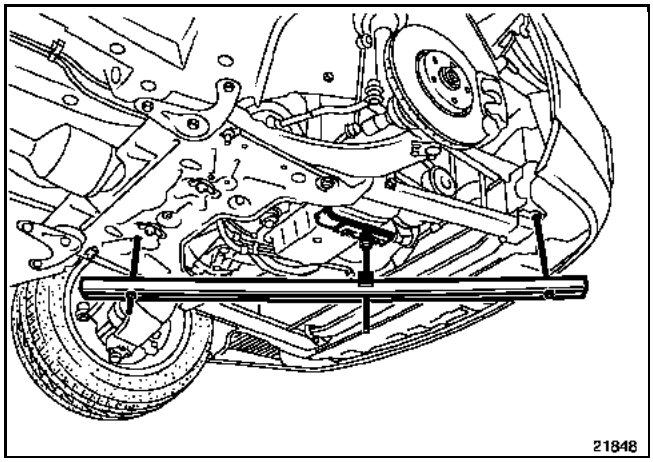


Fit the hose clips on the plenum chamber heater hoses.

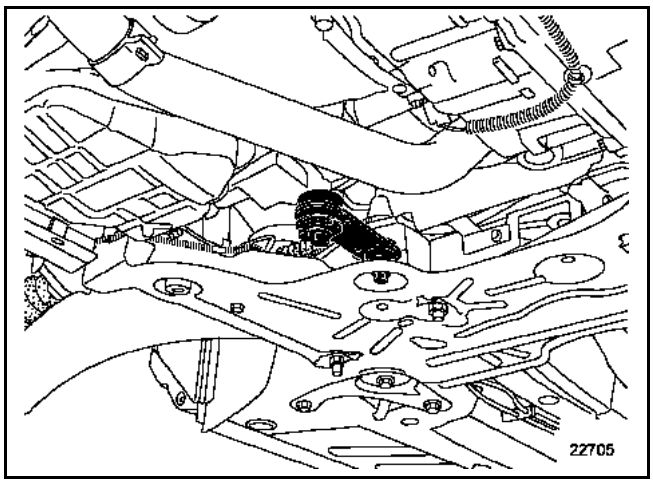
Disconnect the two hoses.

GETtheMANUALS.org

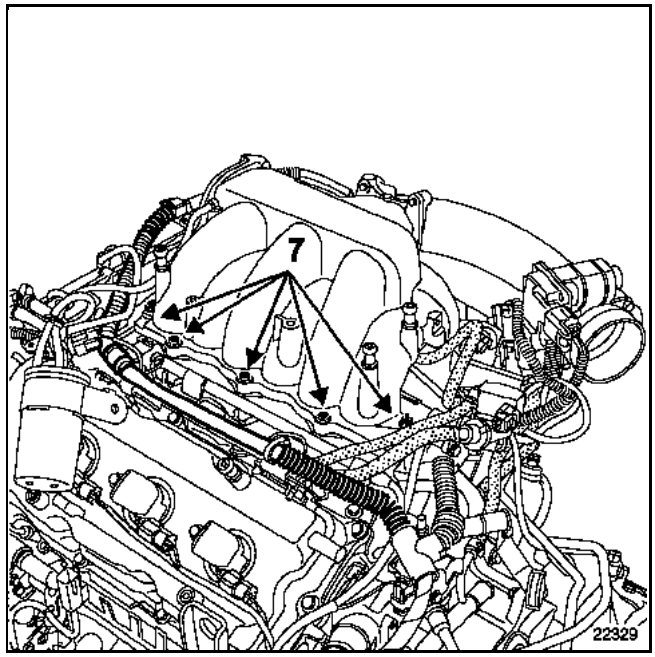
Fit the lower engine support **Mot. 1367-02**.



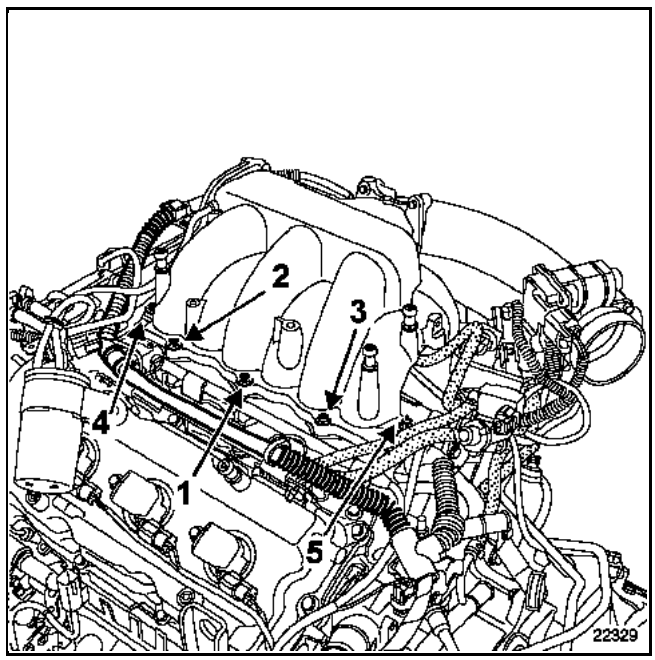
Remove:
– the torque reaction arm,



– the suspended mounting on the timing end,
– the inlet plenum chamber nuts and bolts (7),
– the plenum chamber.



REFITTING



Replace the gasket with a new one

NOTE:
Observe the tightening torques and sequence for the mountings on the plenum chamber.

The rest of the operations should be performed in the reverse order to removal.

Top up the cooling circuit.

GETtheMANUALS.org

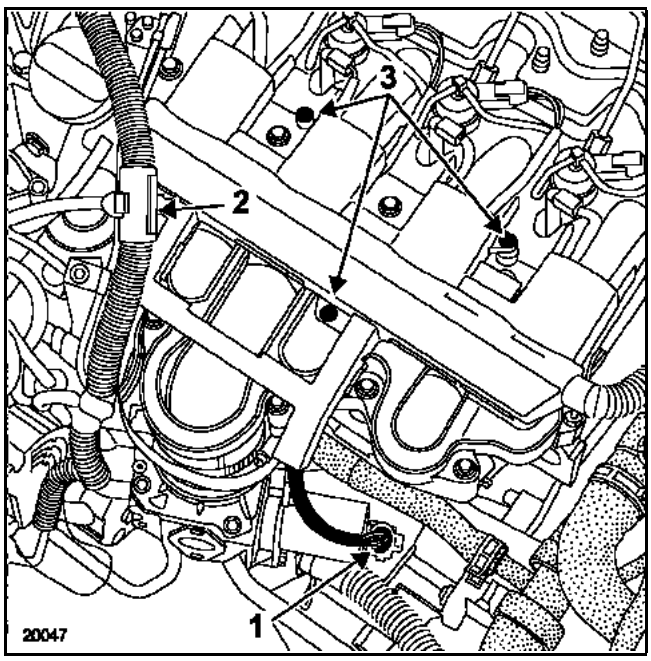
Injection rail mounting bolt	2.3
High pressure pipe nuts	2.5

REMOVAL

NOTE:
To remove the plenum chamber the injectors, high pressure pipes and the rail must be removed. (see Section **13B Diesel injection**).

Disconnect:
– the heater plug connectors,
– the exhaust gas recirculation valve connector (1),
– unclip the electrical harness (2) from the plastic protector.

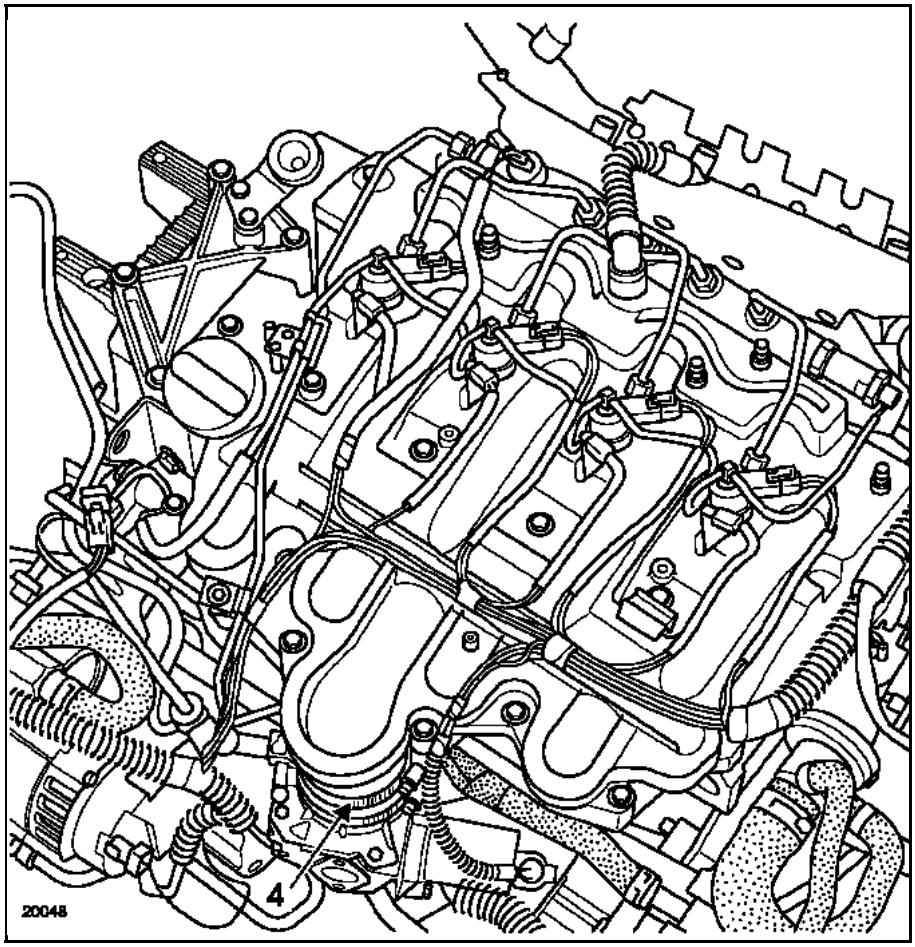
Remove:
– the protector (3) from the electrical harness.



GETtheMANUALS.org

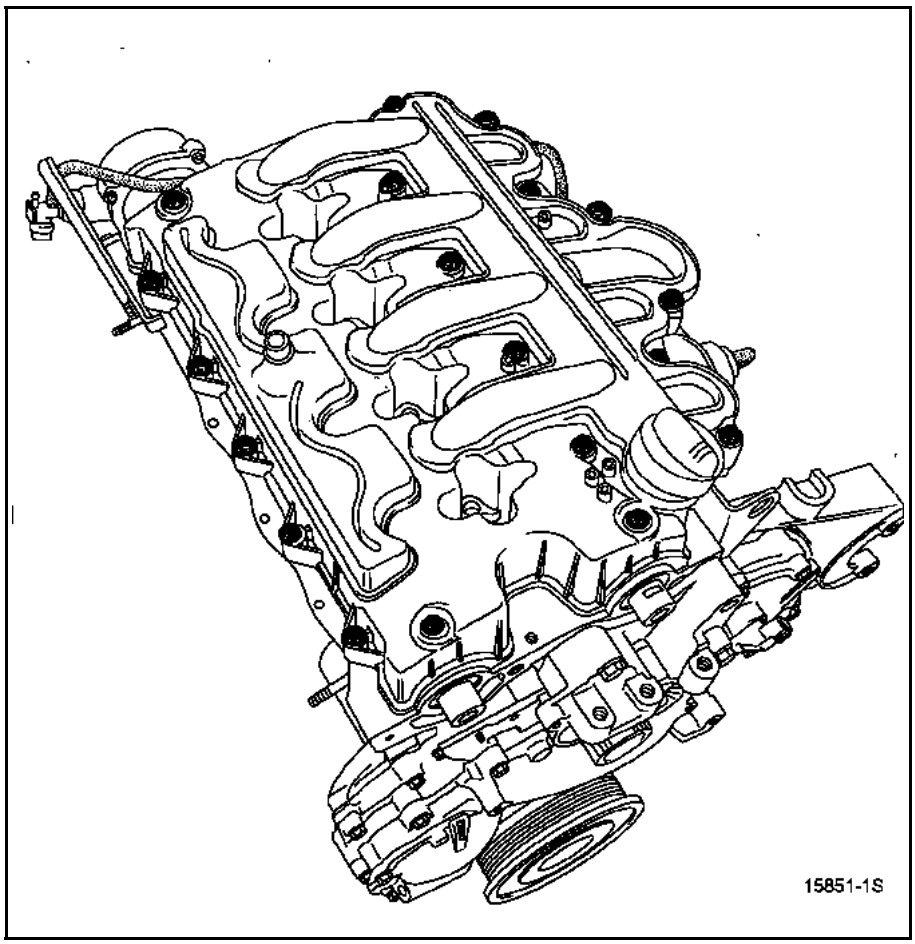
Move aside the electrical harnesses by releasing the top of the plenum chamber.

Loosen the clip (4) from the damper unit/inlet plenum chamber connection pipe.



Fit the engine support **Mot. 1367** and remove the suspended mounting.

Remove the manifold mounting bolts and then remove the manifold.

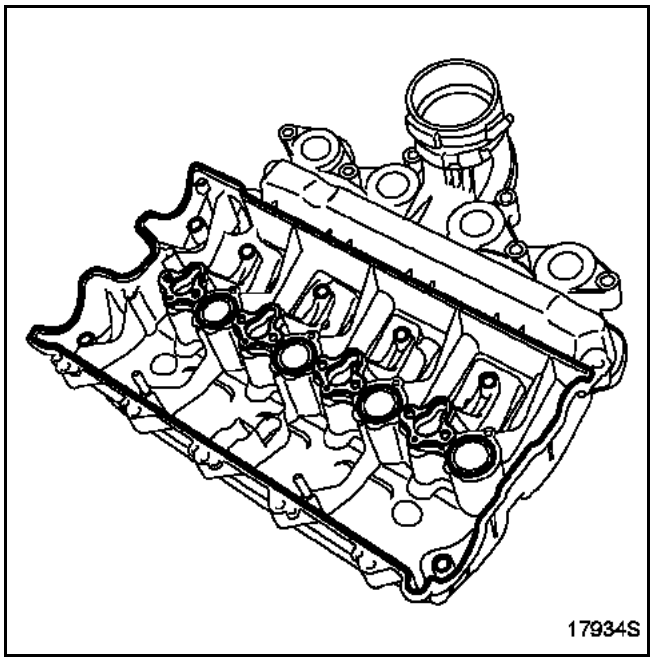


GETtheMANUALS.org

REFITTING

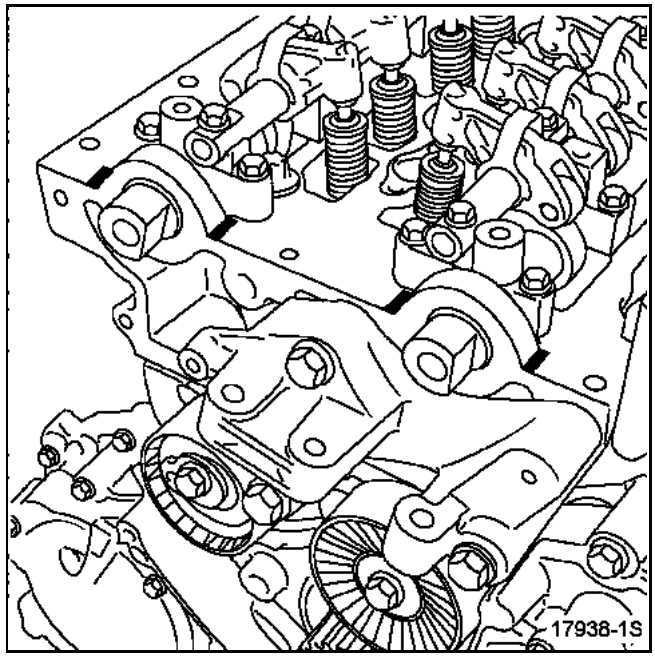
Replace the gaskets with new ones.

Fit all the gaskets on the cylinder head cover/inlet plenum chamber.

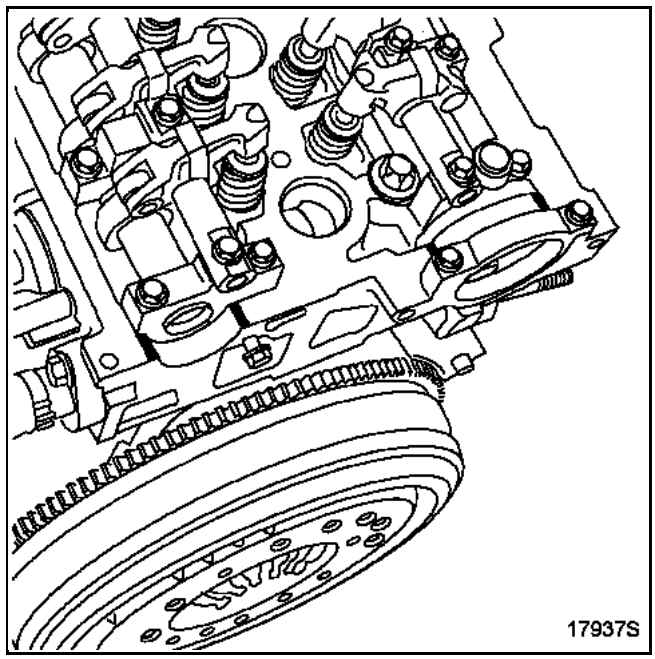


Put **Rhodorseal 5661** in the corners of the camshaft bearing caps and in the valve fastening.

Timing end



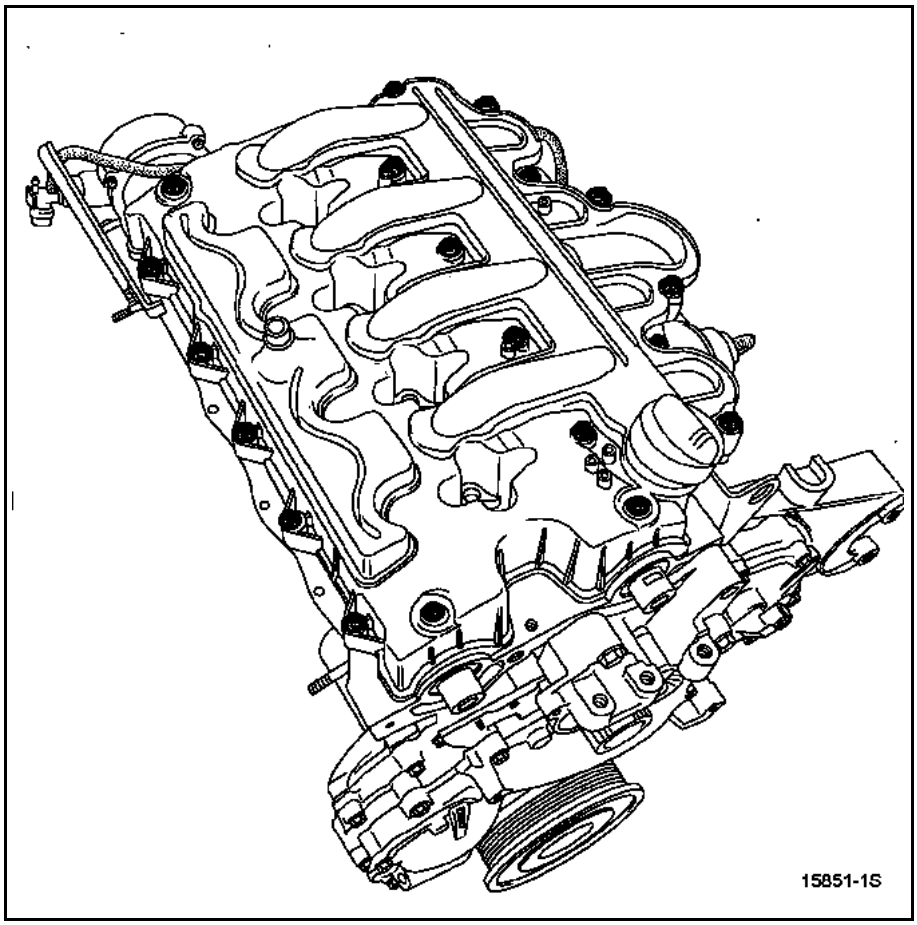
Flywheel end



GETtheMANUALS.org

Refit:
– the cylinder head cover/inlet plenum chamber,
– the cylinder head cover mounting bolts so that they touch, by applying a drop of **Loctite Frenbloc** on the bolts (1-2-4-6-8-10-12-13).

Tighten the bolts to a torque of **1.2 daNm** in the recommended order.



IMPORTANT:
When performing the other refitting operations, proceed in the reverse order to removal making **sure** you observe the order of fitting and recommended tightening torques for refitting the high pressure injector part (see Section **13B Diesel injection Injector**).

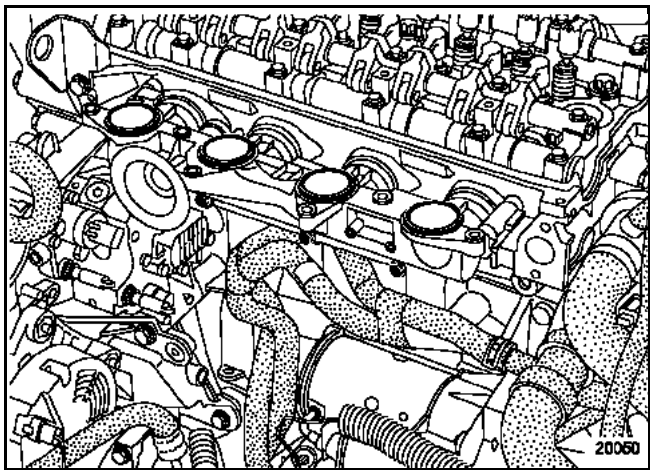
GETtheMANUALS.org

TIGHTENING TORQUE (in daNm)	
Inlet manifold mounting bolt	1.2

REMOVAL

NOTE:
To remove the inlet manifold the plenum chamber and the damper unit must be removed (see Section **12A Fuel mixture Plenum chamber** and **Air vent unit**).

Remove:
– the inlet manifold mounting bolts,
– the inlet manifold.



REFITTING

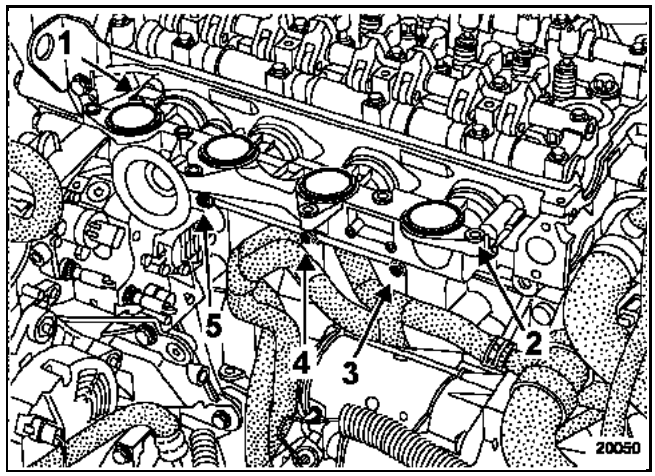
Replace the gaskets on the inlet manifold and the plenum chamber with new ones.

Refit the inlet manifold.

Put the mounting bolts in the inlet distributor **without locking them**.

Refit the plenum chamber/cylinder head cover observing the torques and the recommended order of tightening (see section **12A Fuel mixture "Plenum chamber**).

Tighten the mounting bolts on the inlet manifold to a torque of **1.2 daNm** in the recommended order (1, 2, 3, 4, 5).



Replace the damper unit (see Section **12A Fuel mixture Air vent unit**).

IMPORTANT:
When performing the other refitting operations, proceed in the reverse order to removal making **sure** you observe the order of fitting and recommended tightening torques for refitting the high pressure injector part (see Section **13B Diesel injection Injector**).

GETtheMANUALS.org

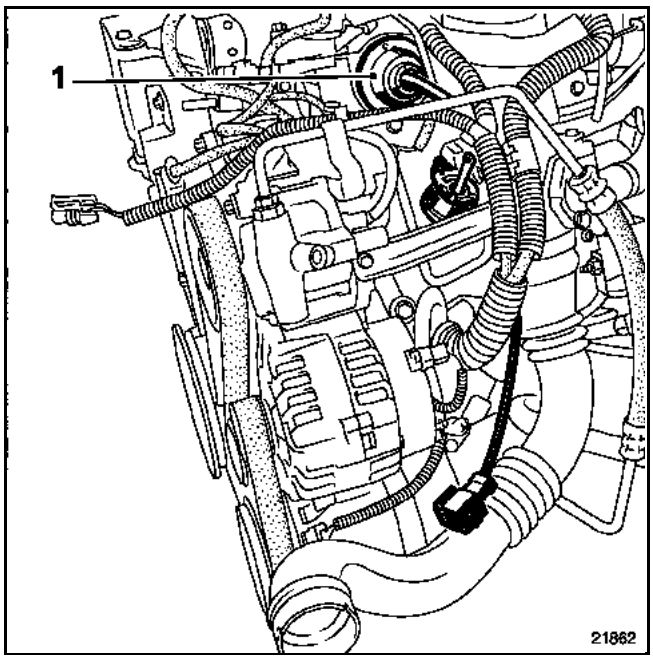
TURBULENCE VALVE

The inlet manifold is fitted with a turbulence valve that alters the flow of inlet gases and filling the cylinder under certain engine operating conditions.

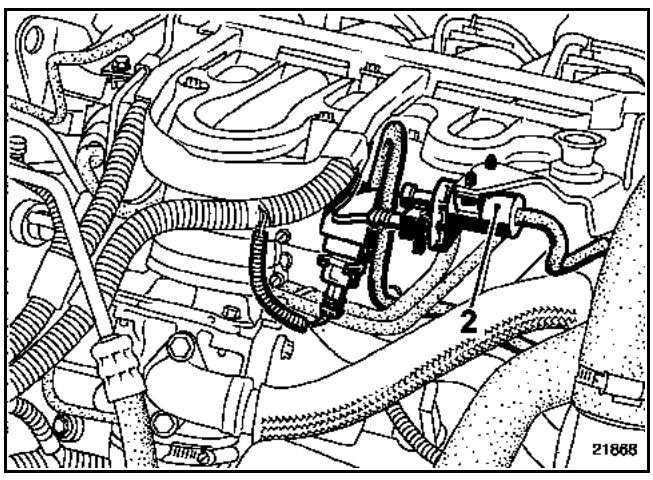
When the valve is closed, the section where air passes into the inlet manifold decreases in size.

DESCRIPTION

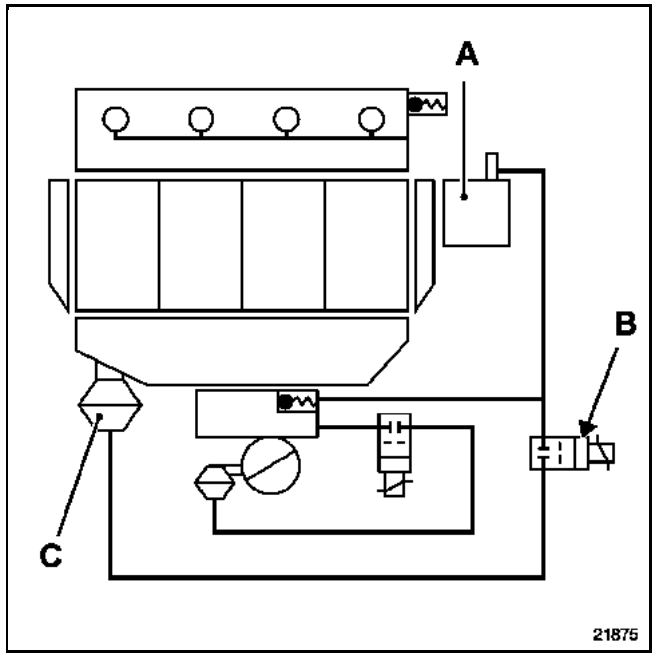
The system consists of:
– a turbulence valve incorporated in the inlet manifold,
– a diaphragm (1) activating the turbulence flap,



– and a solenoid valve (2).



DIAGRAM



A Vacuum pump
B Turbulence valve solenoid valve
C Swirl valve control diaphragm

OPERATION

The solenoid valve is in the closed position when de-energized. The turbulence valve is open and is not modifying the cross-section where the air passes into the inlet manifold.

When it is energized, the solenoid valve, controlled by the injection computer, connects the vacuum pump (A) and the turbulence valve control diaphragm (C).

The diaphragm is affected by the vacuum of the vacuum pump and closes the turbulence valve.

REMOVAL

The turbulence valve is incorporated in the inlet manifold.

The whole inlet manifold must be replaced in order to replace the turbulence valve.

GETtheMANUALS.org

TIGHTENING TORQUES (in daNm)	▽
Inlet manifold mountings	**2.1**
Engine cover mounting on the inlet manifold	**2.5**
Turbocharger mounting	**2.5**
Heat shield mountings on the turbocharger	**2.1**
Side bracket on the inlet manifold	**2.1**

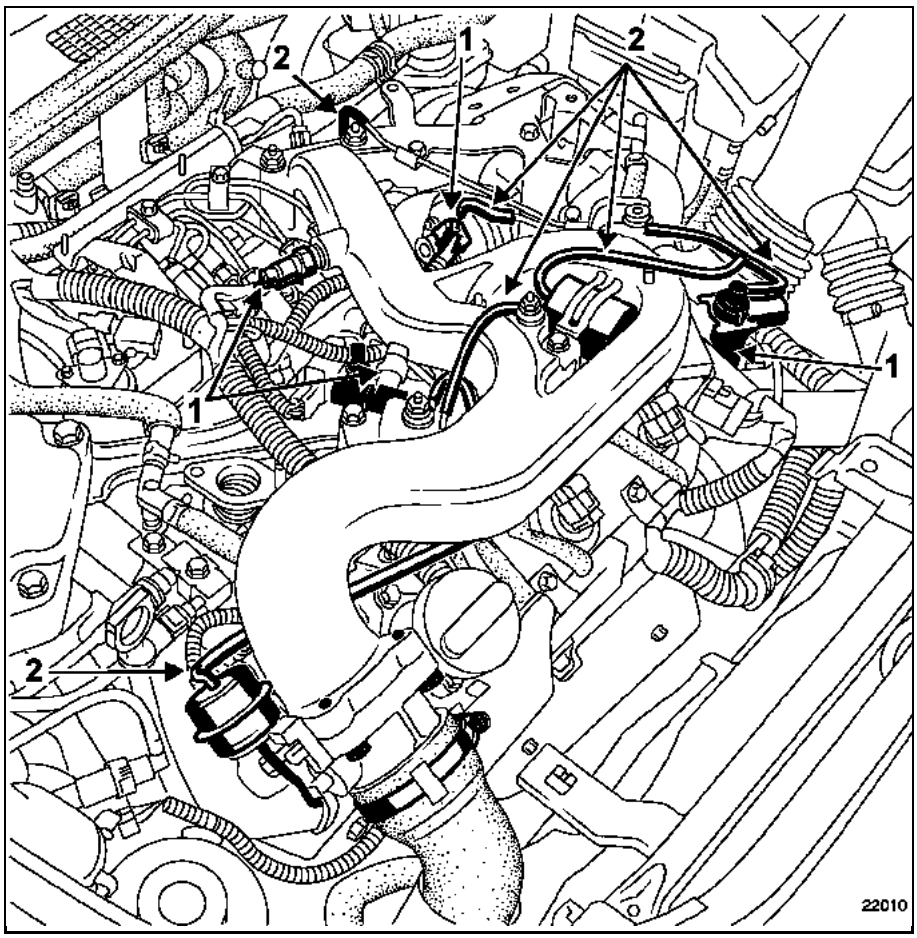
REMOVAL

Remove the engine covers.

Disconnect the battery.

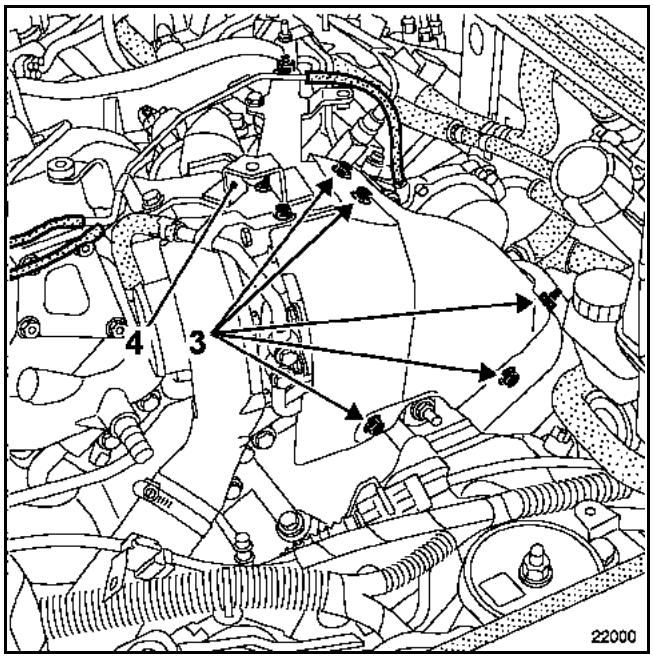
Disconnect the electrical connectors (1) from:
– the air temperature sensor,
– the turbocharging pressure adjustment solenoid valve,
– the wastegate position sensor,
– the damper control solenoid valve.

Disconnect the air hoses (2) on:
– the wastegate diaphragm,
– the turbocharging pressure adjustment solenoid valve,
– the vacuum canister,
– the diaphragm activating the damper flap,
– the vacuum pump.



GETtheMANUALS.org

Remove:
– the turbocharger heat shield mountings (3),

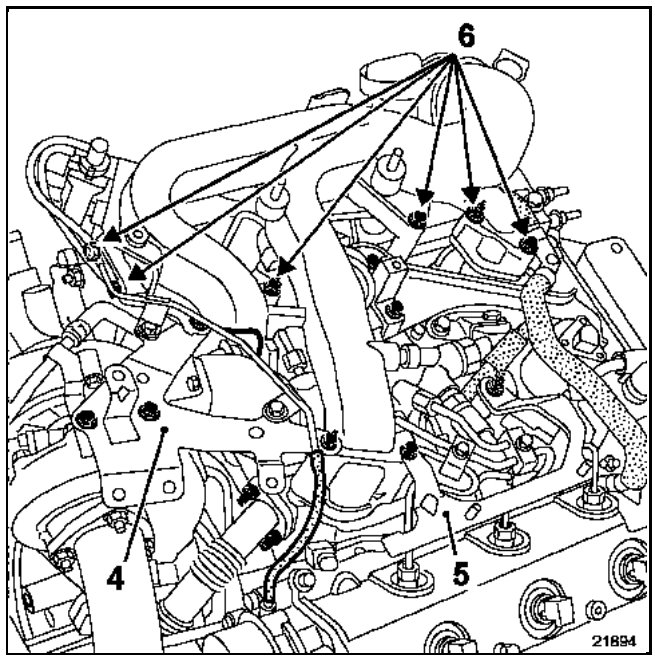


– the support mountings (4) on the turbocharger,
– the mounting,
– the heat shield on the turbocharger,
– the engine cover mounting (5) on the inlet manifold.

Disconnect the air intake duct on the damper.

Remove the mountings (6):
– from the side bracket on the inlet manifold
– from the inlet manifold on the exhaust gas recirculation pipe,
– from the inlet manifold.

Remove the inlet manifold then the gaskets.



Remove the following to the workbench:
– the solenoid valve,
– the vacuum canister,
– the damper (see **Engine shutdown system** operation).

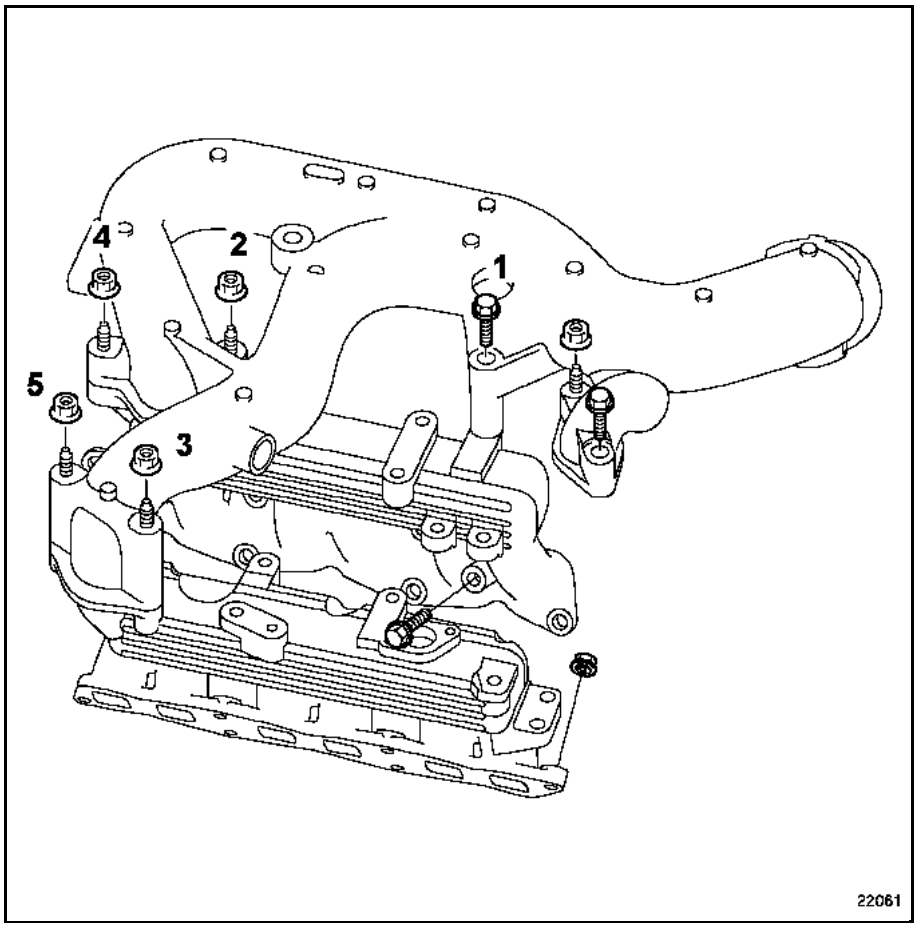
GETtheMANUALS.org

REFITTING

Replace the seals.

Replace the inlet manifold then tighten the mountings to a torque of **2.1 daNm** in the recommended order.

The rest of the operations should be performed in the reverse order to removal.



GETtheMANUALS.org

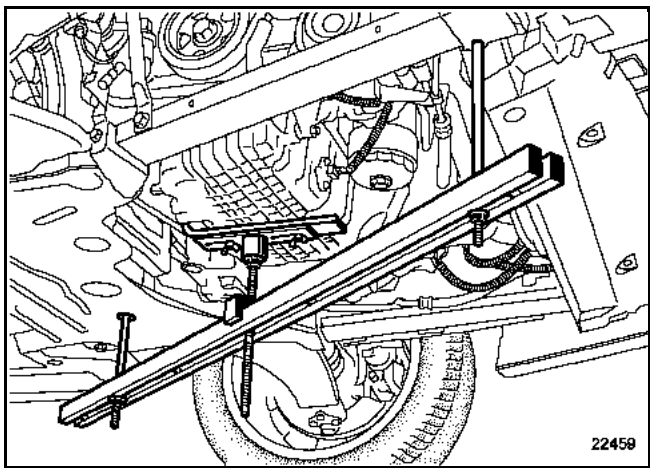
YOU SHOULD FOLLOW THE CLEANLINESS INSTRUCTIONS CLOSELY

REMOVAL

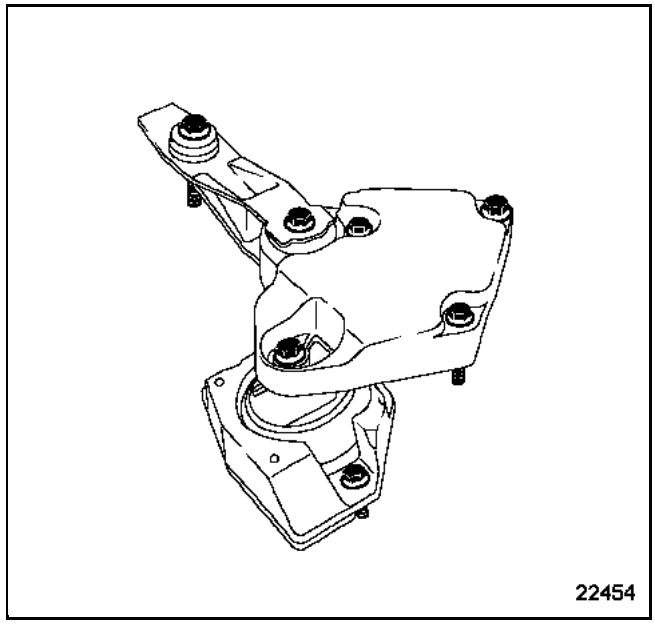
Put the vehicle on a two-post lift.

Disconnect the battery.

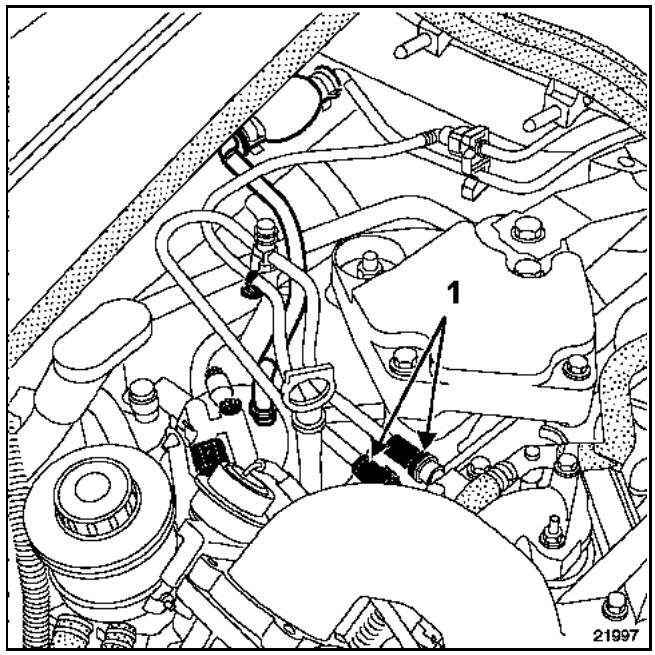


Fit the engine support **Mot. 1367-02**.

Release the diesel supply ducts on the suspended engine mounting.



Remove the engine suspension mounting-movement limiter assembly.



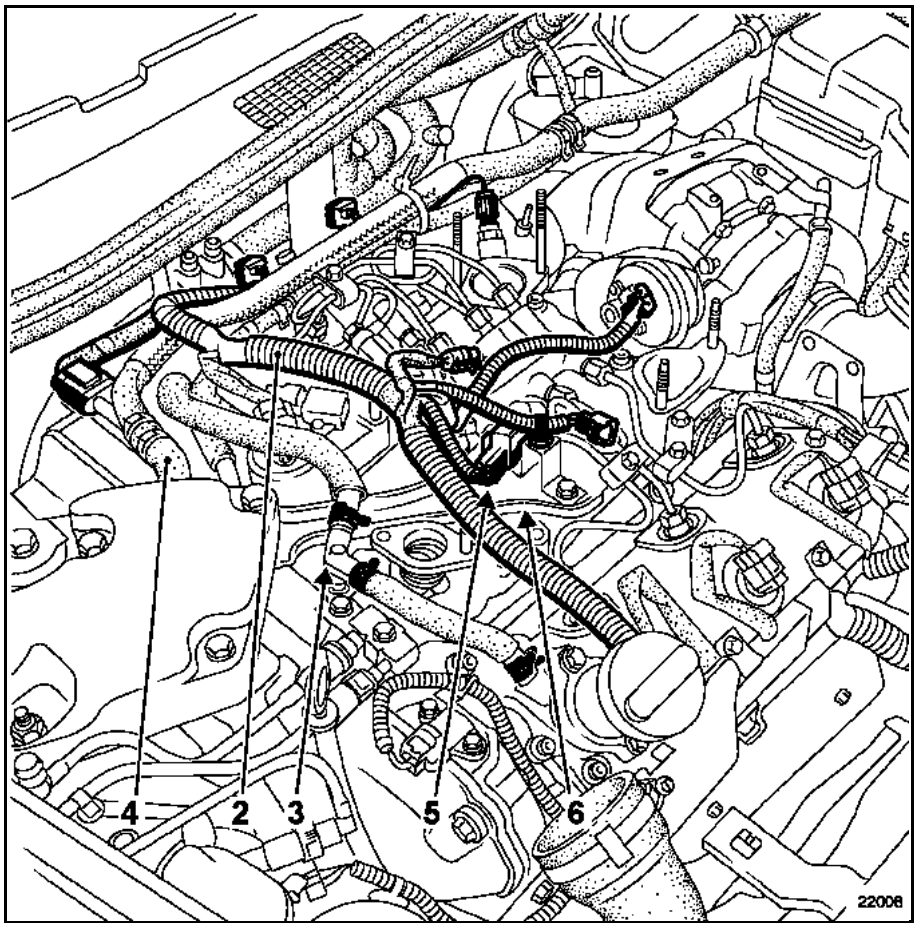
Disconnect the diesel supply and return ducts (1) then block the ducts using the cleanliness plugs kit, available from the Parts Department.

GETtheMANUALS.org

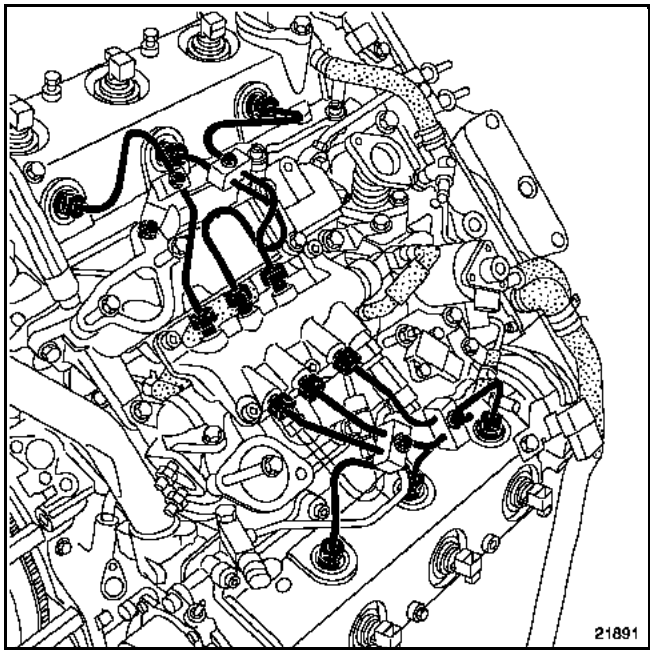
Remove the inlet manifold (see **Inlet manifold** operation).

Disconnect:
– the various connectors and actuators of the wiring harness (2) then release this from the side,
– the oil vapour rebreathing pipes on the union at "T" (3) then the pipe (4). Remove this from the side.

Release the connector (5) then remove the acoustic damper (6).



GETtheMANUALS.org



Undo the injector-rail high pressure pipe unions.

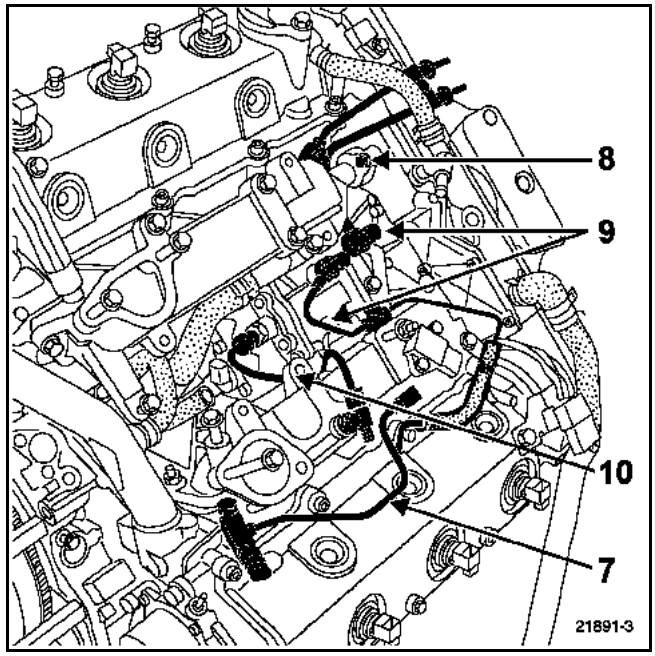
If necessary, undo the retaining brackets of the various pipes.

Remove the high pressure pipes.

Fit anti-pollution plugs.

Remove:
– the two mounting bolts from the wastegate diaphragm then release it on the side,
– the high pressure rail (see relevant operation in section **13B Diesel injection Injector rail**).

Remove:
– the exhaust gas recirculation - exchanger solenoid valve (**see the procedure Exhaust gas recirculation valve - Exchanger**),



– the return pipe (7) with the diesel temperature sensor,
– the oil vapour recirculation pipe mountings (8),
– the bracket then the unions on the pump and the cylinder head of the diesel return and supply pipes (9).

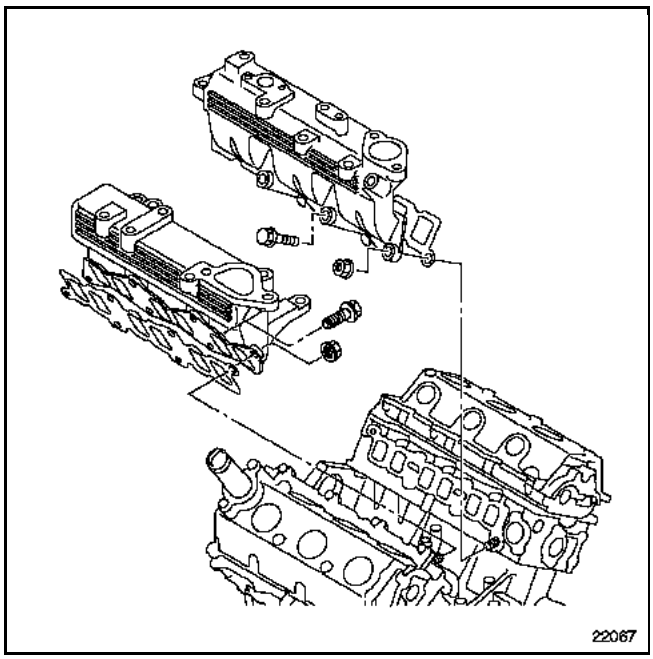
Release:
– the oil vapour recirculation pipe on the side,
– the diesel supply and return pipes.

Remove the pump outlet high pressure pipe (10) as well as the union on the plenum chamber.

Fit anti-pollution plugs.

GETtheMANUALS.org

Remove:
– the plenum chamber from the front and/or rear bank,
– the gaskets.



REFITTING

Replace all the seals on the air intake circuit.

Refit the plenum chamber(s) then tighten the mountings observing the recommended torque and order.

Refit the diesel supply and return pipes then tighten them to the recommended torques (see Section **13B Diesel injection Injection pump**).

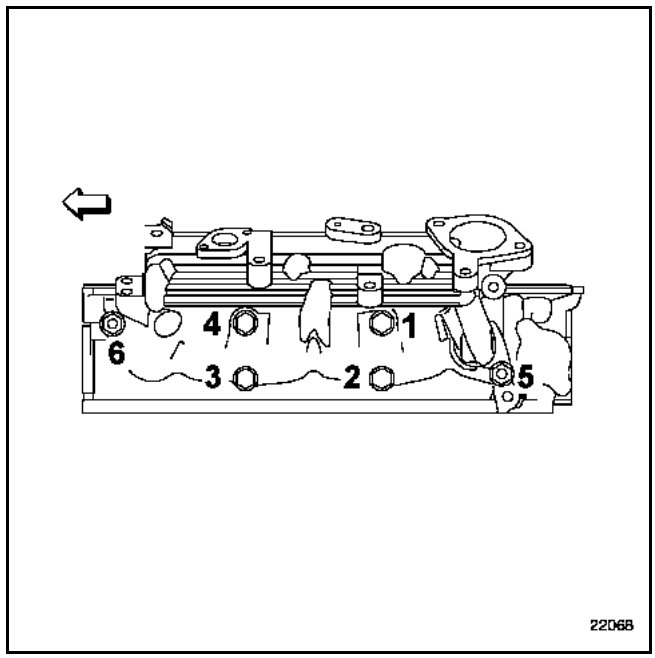
Refit the injector rail (see Section **13B Diesel injection Injector rail**).

Refit the high pressure pipes and tighten them to the recommended torque (see relevant operation in Section **13B Diesel injection High pressure pipes**).

Refit in the reverse order to removal for the other refitting operations.

Reprime the diesel circuit using the priming bulb.

Test the sealing of the high pressure circuit after repair (see Section **13B Diesel injection Special notes**).



GETtheMANUALS.org

TIGHTENING TORQUE (in daNm and/or°)

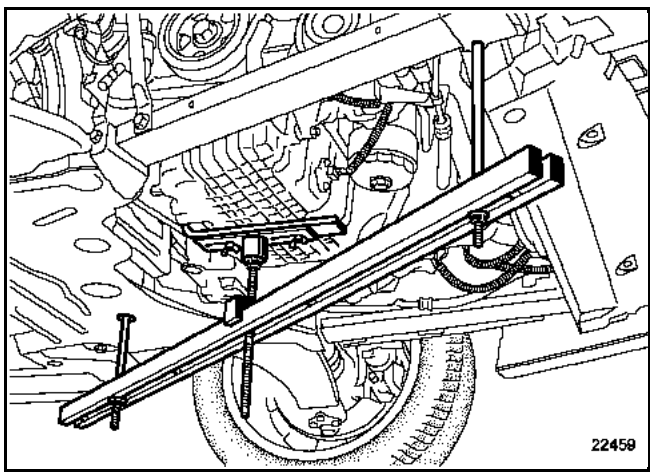
YOU SHOULD FOLLOW THE CLEANLINESS INSTRUCTIONS CLOSELY

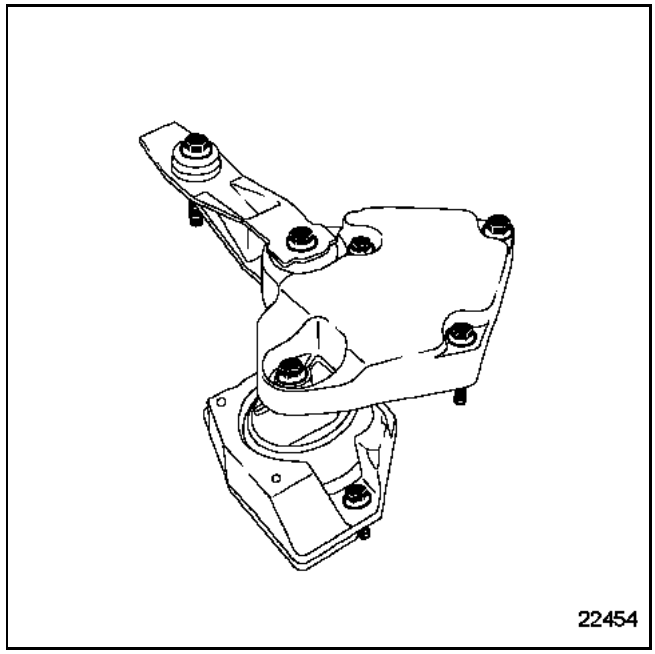
REMOVAL

Put the vehicle on a two-post lift.

Disconnect the battery.

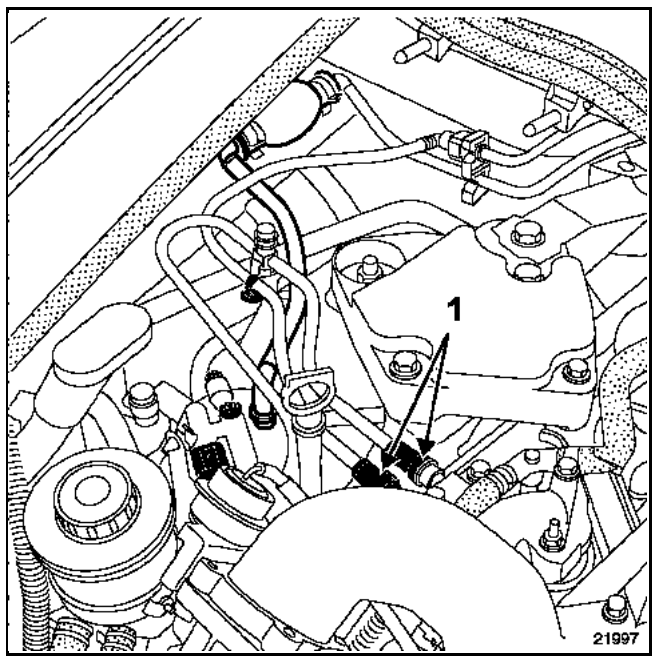


Fit the engine support **Mot. 1367-02**.



Release the diesel supply ducts on the suspended engine mounting.

Remove the engine suspension mounting-movement limiter assembly.



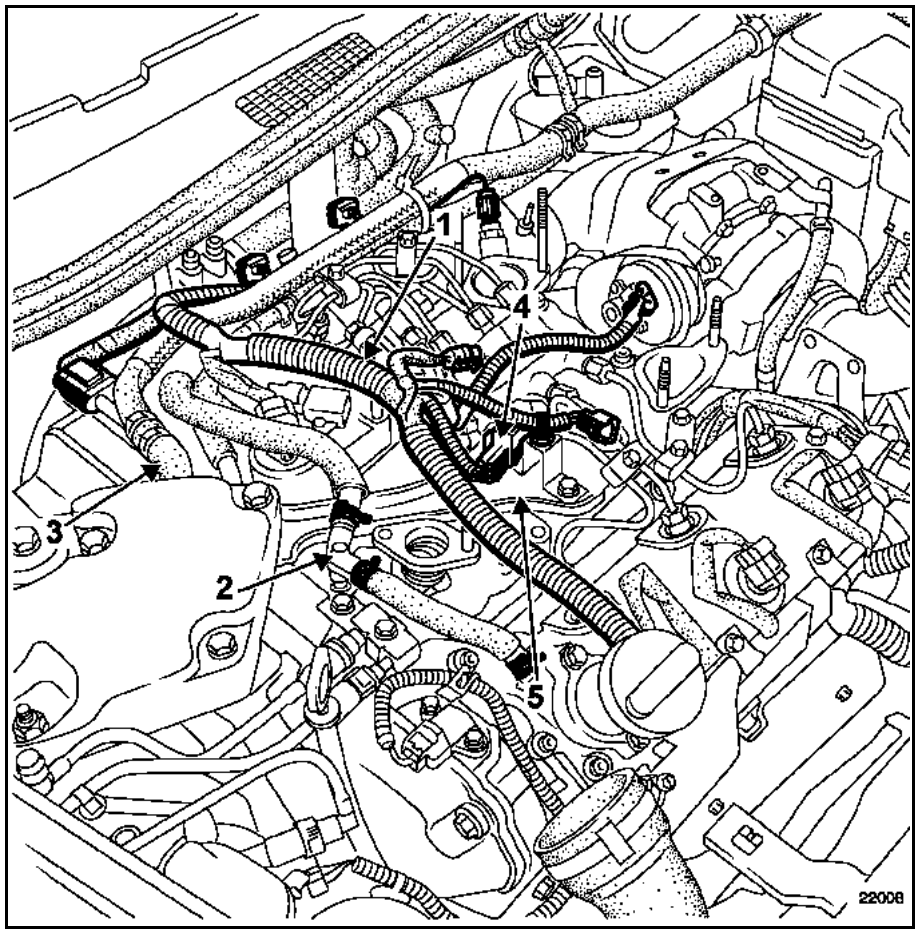
Disconnect the diesel supply and return ducts (1) then block the pipes using the cleanliness plugs kit, available from the Parts Department.

GETtheMANUALS.org

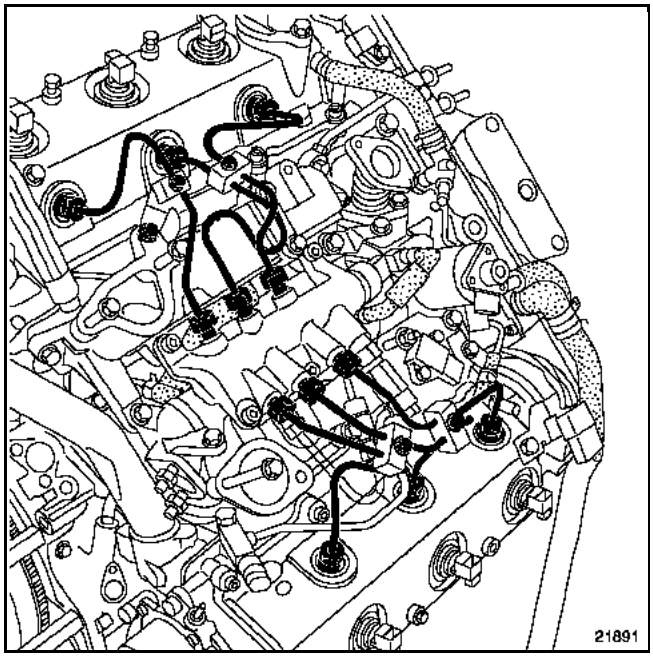
Remove the inlet manifold (see **Inlet manifold** operation).

Disconnect:
– the various connectors and actuators of the wiring harness (1) then release this from the side,
– the oil vapour rebreathing pipes on the union at "T" (2) then the pipe (3). Remove this from the side.

Release the connector (4) then remove the acoustic damper (5).



GETtheMANUALS.org



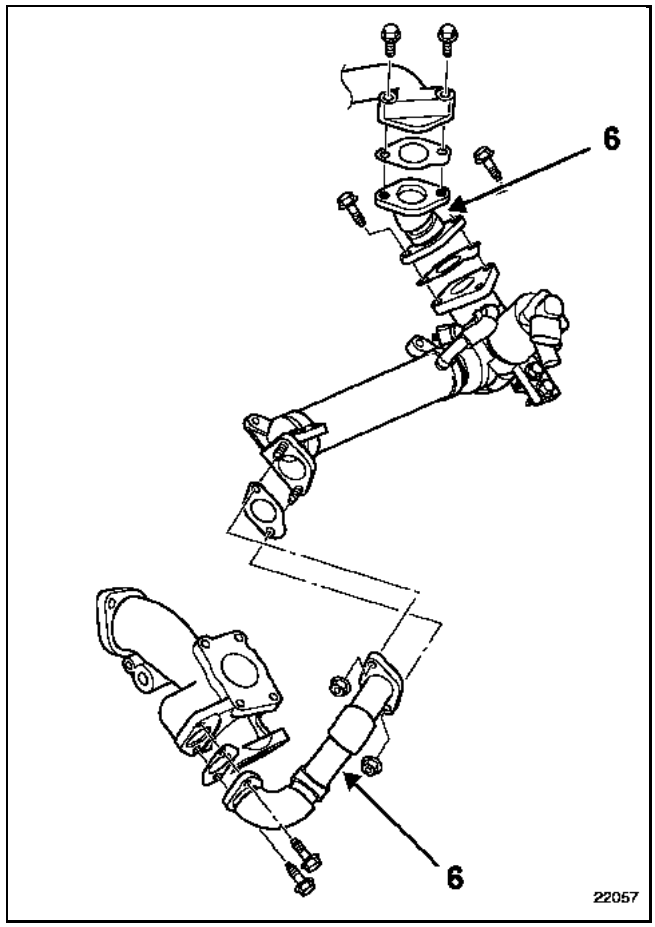
Undo the injector-rail high pressure pipe unions.

If necessary, slacken the retaining brackets on the different pipes.

Remove the high pressure pipes.

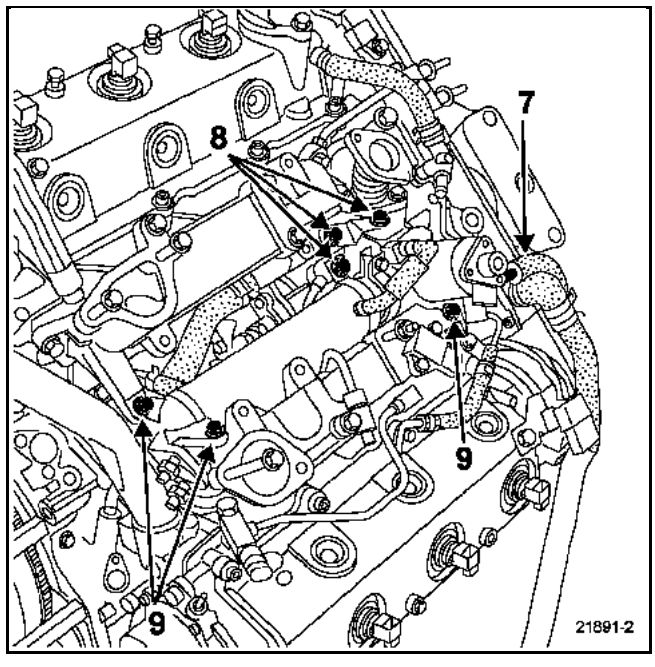
Fit plugs to maintain cleanliness.

Remove:
– the two mounting bolts from the wastegate diaphragm then release it on the side,
– the high pressure rail (see relevant operation in Section **13B Diesel injection Injector rail**).
– the exhaust gas recirculation pipes (6).



Disconnect the coolant pipe (7) on the exhaust gas recirculation valve.

Remove:
– the exchanger bracket mountings (8),
– the exhaust gas recirculation valve assembly -- exchanger mountings (9) .



GETtheMANUALS.org

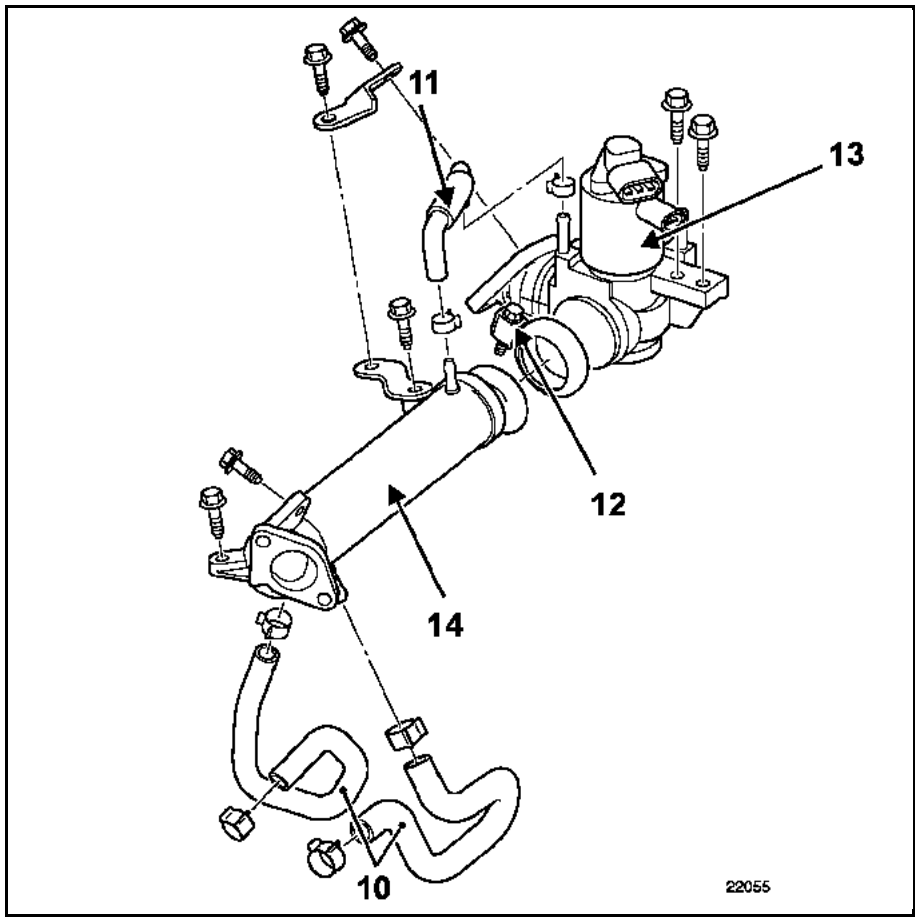
Release the exhaust gas recirculation valve - exchanger assembly mountings then disconnect the two coolant hoses (10).

Place hose clamps on the cooling hoses.

Remove the exhaust gas recirculation valve - exchanger assembly.

On the workbench:

Disconnect the cooling hoses (11).
Slacken the tightening clamp (12).
Remove the exhaust gas recirculation valve (13) from the exchanger (14).



REFITTING

Replace:
– the exhaust gas recirculation pipe seals,
– the exhaust gas recirculation valve - exchanger assembly locking clip.

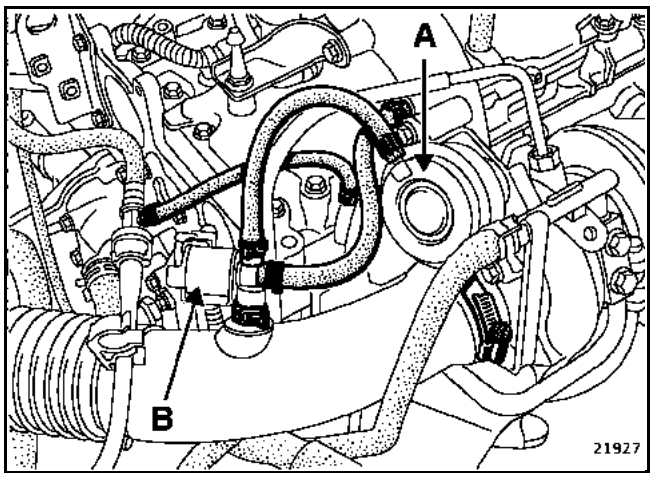
Refit the high pressure pipes and tighten them to the recommended torque (see relevant operation in Section **13B Diesel injection Replacing high pressure pipes**).

Fill and bleed the cooling circuit (see Section **19A Cooling Filling and bleeding**).

Refit in the reverse order to removal for the other refitting operations.

GETtheMANUALS.org

The diaphragm (A) of the pressure regulation valve is actuated by a solenoid valve (B) which is controlled by the injection computer.



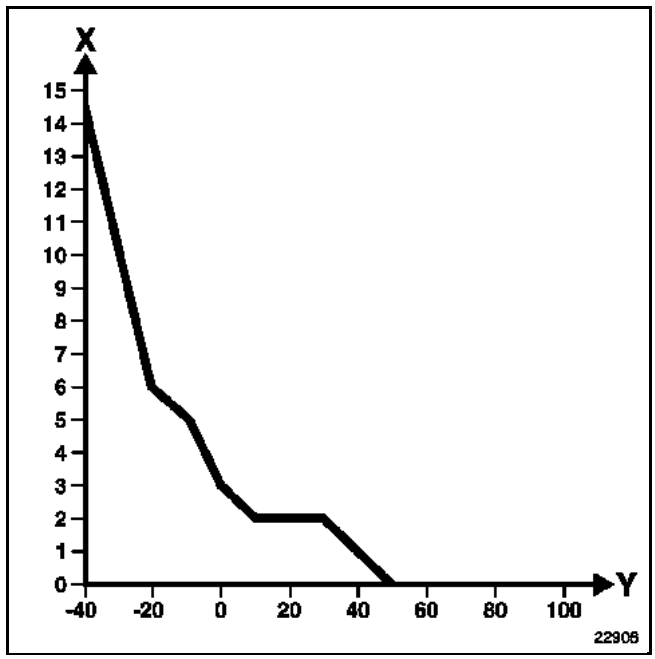
The pressure regulation valve (wastegate) is closed at rest.

The solenoid valve (B) is open in the rest position.

In the open position, the solenoid valve (B) connects the turbocharger outlet (turbocharging pressure) and the diaphragm (A). Consequently, the turbocharging pressure activates the diaphragm directly and the pressure adjustment valve (wastegate) opens.

When the solenoid valve (B) is controlled, the turbocharging pressure signal (taken at the turbocharger outlet) is diverted to the turbocharger inlet. Consequently, the diaphragm is no longer subject to turbocharging pressure and the pressure regulation valve (wastegate) closes.

The solenoid valve is open in the rest position and is supplied as soon as the engine starts. However, there is a delay depending on coolant temperature, during which the turbocharging pressure is limited and engine speed cannot exceed **2500 rpm**. This ensures that the oil has sufficient time to reach the turbocharger bearings.

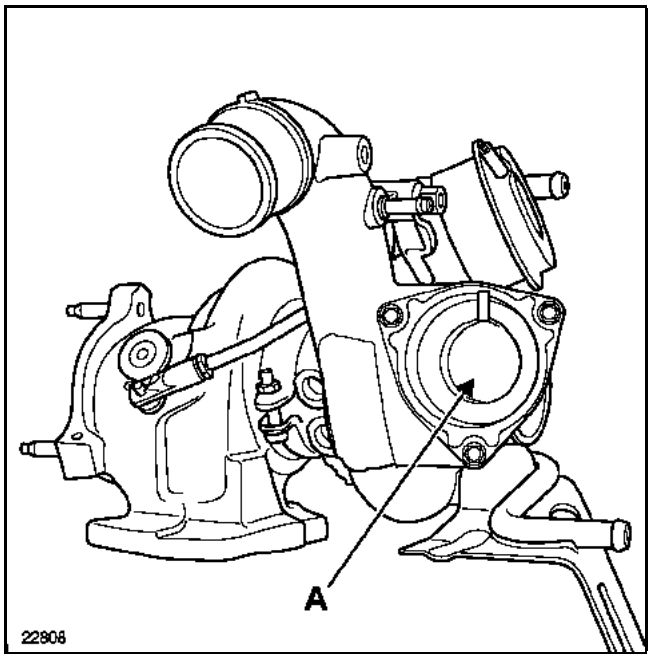


X Time in seconds
Y Temperature in °C

GETtheMANUALS.org

The turbocharger is fitted with an anti-pumping valve (A).

This valve is comprised of a spring and a diaphragm that control a valve to connect the outlet and inlet of the turbocharger via an internal duct.



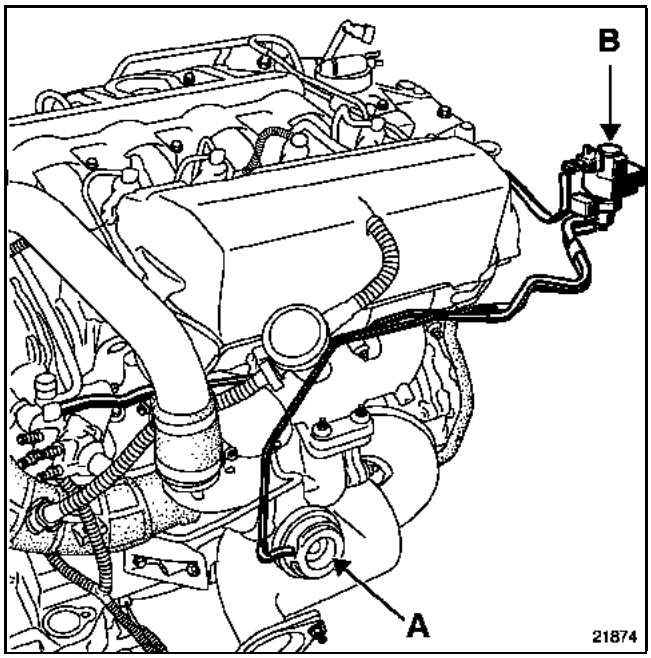
The anti-pumping valve diaphragm (A) is subject to the pressure in the manifold between the throttle body and the inlet valve (inlet manifold vacuum).

When the pressure starts to drop, if the difference between the turbocharging pressure and the inlet manifold vacuum is above **400 mb** the valve will open.

When the valve opens, it causes the pressure between the throttle body and the compressor blades to drop rapidly. This prevents a pumping problem that could destroy the turbocharger when the pressure starts to drop.

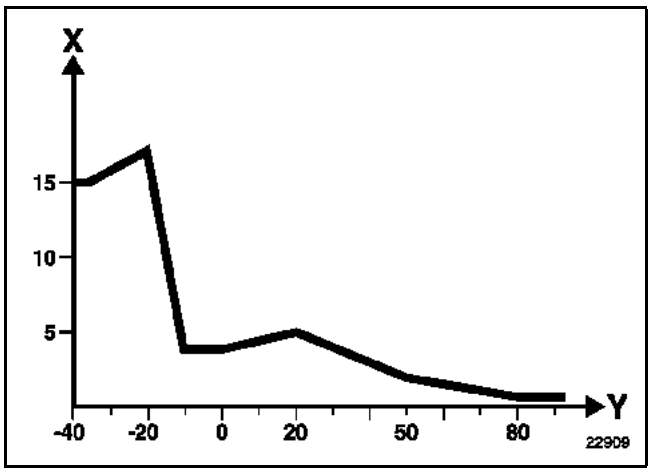
GETtheMANUALS.org

The diaphragm (A) of the pressure regulation valve is controlled by a solenoid valve (B) which is managed by the injection computer. This solenoid valve varies the vacuum according to the engine operating range, which enables the turbocharging pressure to be regulated.



The pressure regulation valve (wastegate) is open in the rest position. The engine is as normally aspirated.

The solenoid valve, closed in the rest position, is energised after the engine is started following a delay dependent on the coolant temperature.



X Time in seconds
Y Temperature in ˚C

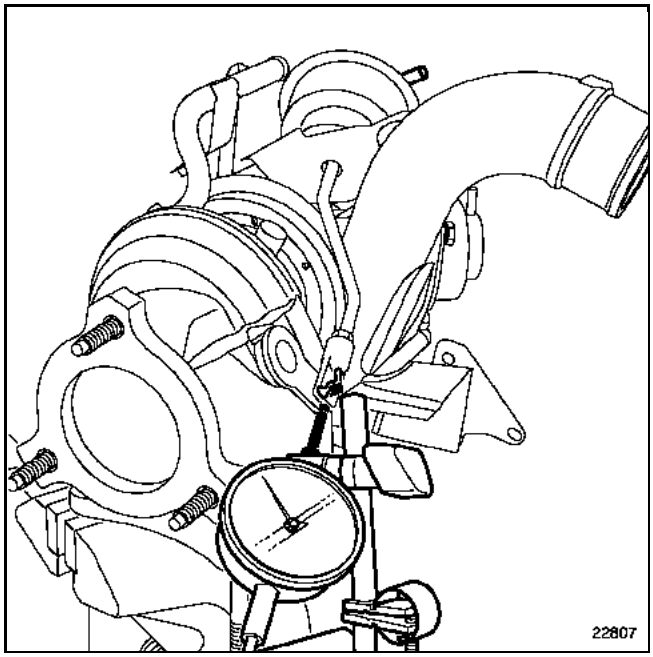
GETtheMANUALS.org

TURBOCHARGER PRESSURE CONTROL VALVE (WASTEGATE)

Calibration pressure check

The calibration pressure cannot be checked or adjusted when the turbocharger is in place.

To carry out either of these operations the turbocharger should be removed (see Section **12B Turbocharging Turbocharger**).



Use a magnetic base fitted with a gauge which should be positioned at the end of the wastegate rod (inserted as close as possible to the centre line of the wastegate).

Gradually increase the pressure to the wastegate using pressure gauge **Mot. 1014**.

Calibration value

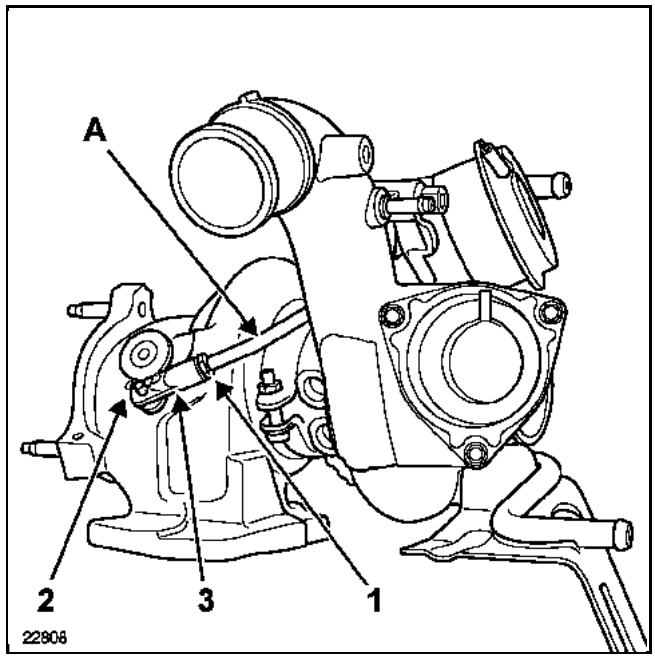
Pressure value (mbar)	Rod movement (mm)
290 to 370	1
500 to 580	5

Simulation

When checking the calibration pressure it may be necessary to adjust the wastegate rod length (A) (if it is not within tolerance).

Loosen the lock nut (1).

Remove the pin (2).



Carry out the adjustment by tightening or loosening the adjusting stop (3) half a turn at a time until the correct calibration pressure is obtained.

Tighten the stop to increase the calibration pressure.

Slacken the stop to reduce the calibration pressure.

NOTE:
Check the calibrating pressure after retightening the locknut (1).

Confirm the repair in a road test, checking the Wastegate opening cyclic ratio and the Turbocharging pressure parameters on the diagnostic tools.

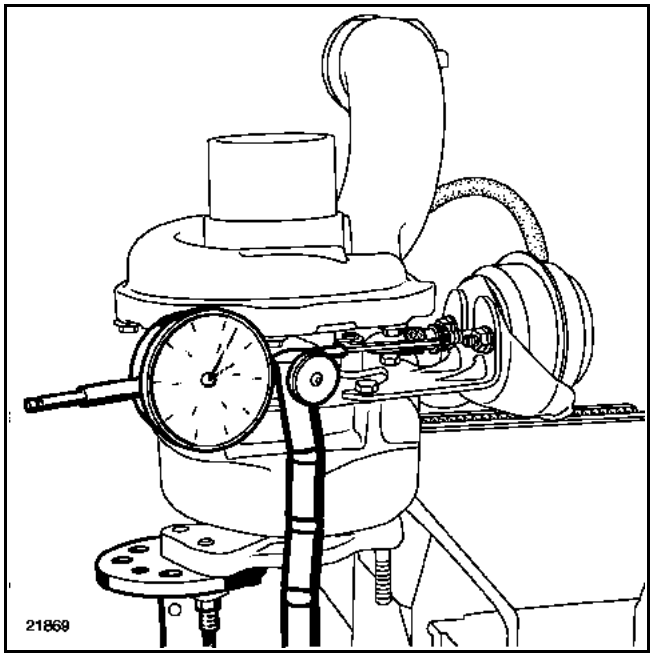
GETtheMANUALS.org

TURBOCHARGER PRESSURE CONTROL VALVE (WASTEGATE)

Calibration pressure check

The calibration pressure cannot be checked or adjusted when the turbocharger is in place.

To carry out either of these operations the turbocharger should be removed (see Section **12B Turbocharging Turbocharger**).



Use a magnetic base fitted with a gauge which should be positioned at the end of the wastegate rod (inserted as close as possible to the centre line of the wastegate).

Gradually increase the vacuum to the wastegate using pressure gauge **Mot. 1014**.

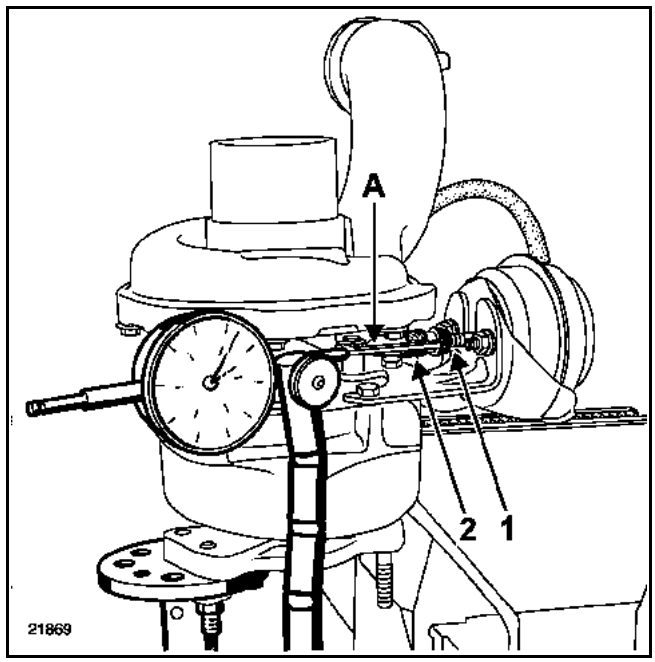
Calibration value

Vacuum value (mbar)	Rod movement (mm)
200	Between 1 and 3
500	Between 10 and 12
>550	Rod at stop

Simulation

When checking the calibration pressure it may be necessary to adjust the wastegate rod length (A) (if it is not within tolerance).

Loosen the lock nut (1).



Carry out the adjustment by tightening or slackening the adjustment stop (2) half a turn to attain the correct calibration pressure.

Tighten the wheel to increase the calibration pressure.

Loosen the wheel to reduce the calibration pressure.

NOTE:
Check the calibrating pressure after retightening the locknut (1).

Confirm the repair in a road test, checking the Wastegate opening cyclic ratio and the Turbocharging pressure parameters on the diagnostic tools.

GETtheMANUALS.org

NOTE: like all turbocharged engines, removal and refitting of the turbocharger requires the repair methods to be carefully followed to ensure the system is correctly sealed.
NON-OBSERVANCE OF THIS ADVICE MAY HAVE SERIOUS CONSEQUENCES FOR SAFETY

TIGHTENING TORQUES (in daNm)	
Turbocharger mounting nut	1 + 90°

Oil supply end piece on the turbocharger	3.2
Oil supply pipe bolt	4
Oil return pipe bolt	0.8
Cooling duct bolt	1.2 + 2.7
Exchanger/turbocharger clamp	0.55

REMOVAL

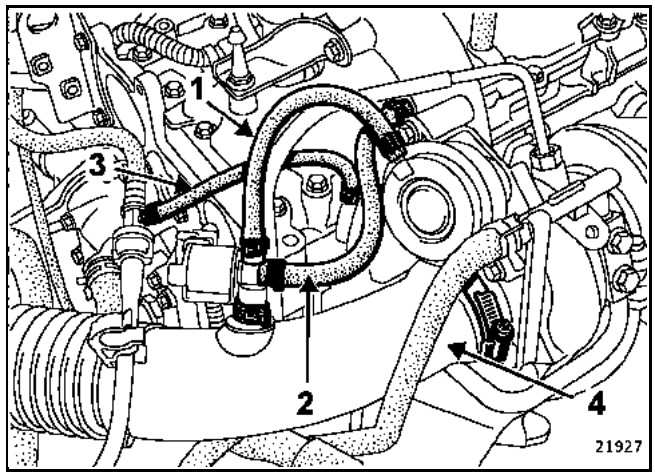
NOTE:
To loosen the turbocharger mounting nuts on the exhaust manifold, it helps to spray some unlocking fluid onto the nuts while they are still warm, just before removal.

Remove the catalytic converter (see Section **19B Exhaust: Catalytic converter**).

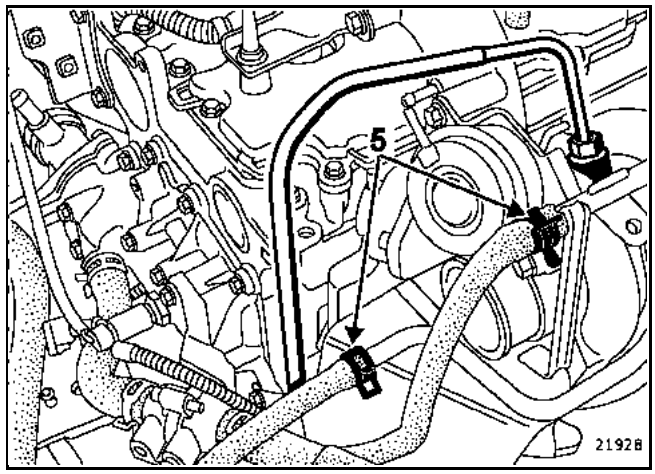
Disconnect the battery.

Disconnect:
– the wastegate control solenoid valve pipe (1),
– the solenoid valve/turbocharger pipe(2),
– the brake servo pipe (3).

Remove the air filter/turbocharger pipe (4).

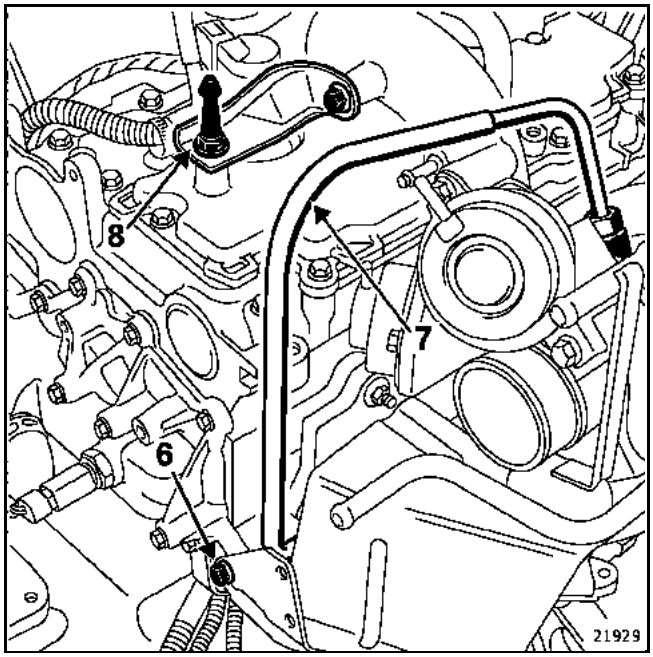


Fit hose clamps and remove the cooling hoses from the turbocharger (5).

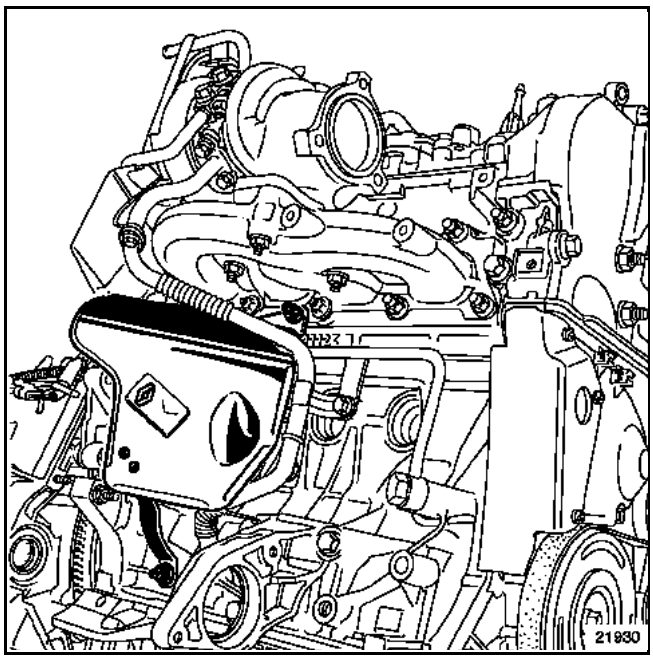


GETtheMANUALS.org

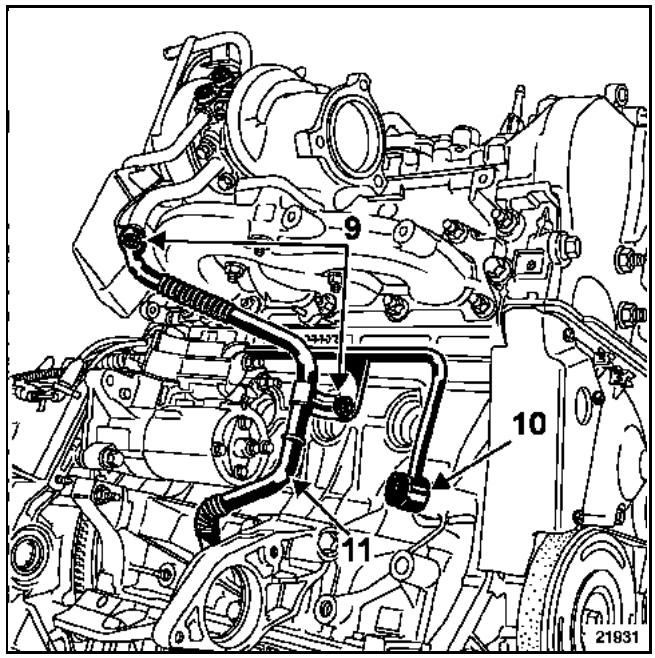
Remove:
– the thermoplunger unit bolt,
– the heat shield bolt (6),
– the two cooling duct bolts,
– the turbocharger oil supply pipe (7),
– the engine cover mounting and the turbocharger strut (8),
– the air exchanger/turbocharger pipe,



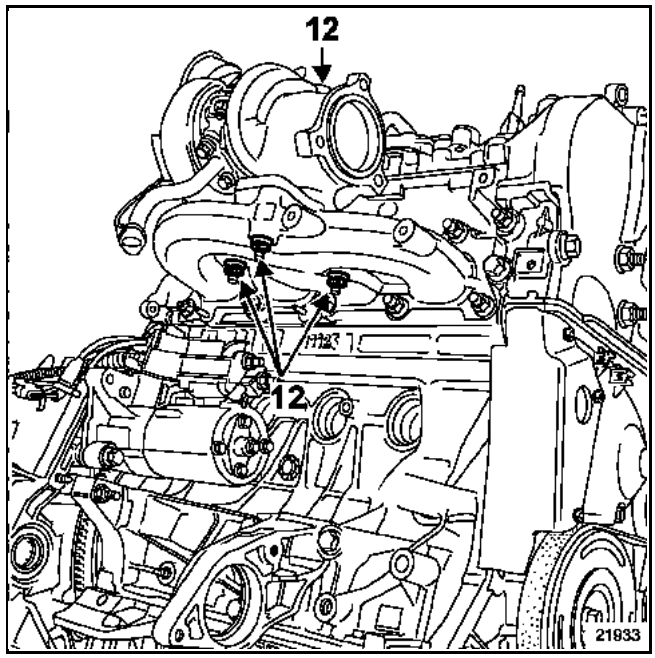
– the starter heat shield,



Remove:
– the three mountings (9) from the turbocharger oil return pipe,
– the turbocharger oil return pipe (11),
– the turbocharger oil supply pipe (10),



– the four nuts (12) securing the turbocharger to the manifold,



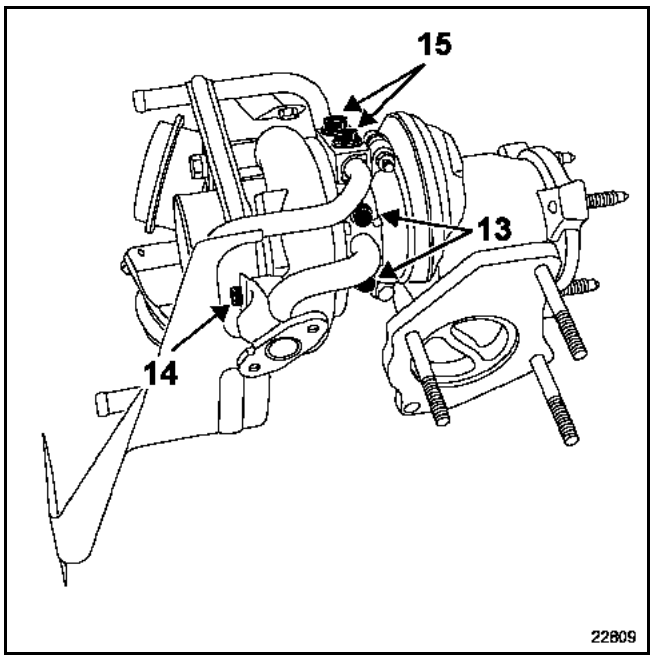
– the turbocharger from above.

GETtheMANUALS.org

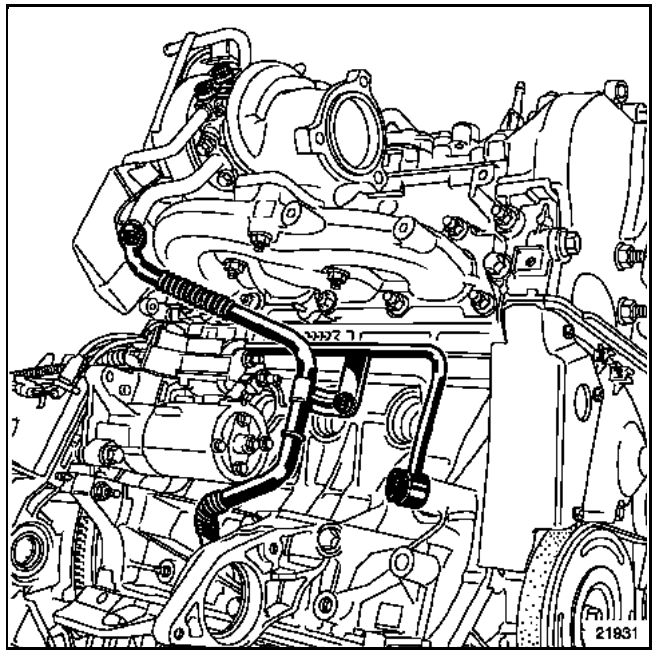
REFITTING

It is essential to replace the studs and the mounting nuts on the turbocharger as well as the seals.

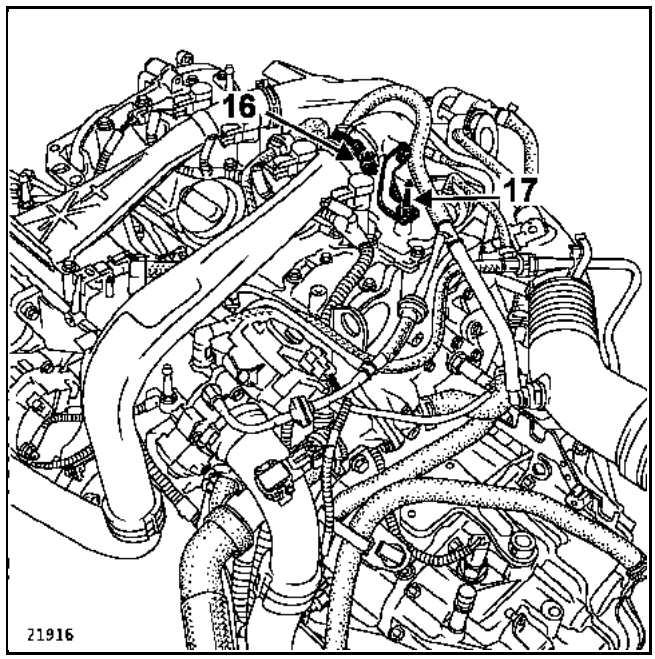
Refit the following on the workbench and tighten to torque:
– the two bolts (13) on the oil return pipe towards the cylinder block to **1.2 daNm**,
– the bolt (14) on the oil return pipe,
– the two bolts (15) on the turbocharger cooling pipe to **1.2 daNm**, then to **2.7 daNm**.



Position and insert the mounting bolts of the following parts:
– the turbocharger on the exhaust manifold,
– the oil supply pipe on the turbocharger,
– the return pipe to the cylinder block,
– the air exchanger/turbocharger pipe,
– the turbocharger strut.



Tighten the clamp (16) on the exchanger/turbocharger air pipe to position the turbocharger and the turbocharger strut (17).



GETtheMANUALS.org

Tighten the four turbocharger nuts to a torque of **1 daNm** then angle tighten by **90°**.

Tighten the oil supply and return pipes observing the tightening torques.

Refit the other components in the reverse order to removal.

NOTE:
When refitting, check that the heat shield air pipe and exchanger - turbocharger air pipe are not in contact with the ignition coils.

IMPORTANT:
It is vital to replace all the gaskets that have been removed including those on the cooling pipe.

IMPORTANT:

Before starting the engine, connect the diagnostic tool and lock the injection system.

Then run the starter motor until the oil pressure warning light goes out (persist for a few seconds) then lock the injection system.

Start the engine then accelerate with no load several times.

Switch off the ignition and check that there has been no oil leak.

Run the engine at idle speed until the fan starts up.

Accelerate several times with no load then perform a road test.

Switch off the ignition and check that there has been no oil leak.

Special precautions

- Ensure that no foreign bodies enter the turbine or compressor during the refitting operation.
- If there has been a fault in the turbocharger, check that the air-to-air intercooler is not full of oil. If the air-to-air intercooler is full of oil, it must be removed, flushed with a cleaning agent and then left to drain properly.
- Check that the turbocharger oil return pipe is not partially or completely blocked by scale. Also check that it is perfectly sealed. If not, replace it.

GETtheMANUALS.org

TIGHTENING TORQUES (in daNm)	
Turbocharger mounting nuts	**2.6**
The oil supply pipe bolt on the turbocharger	**1.5**
Oil supply pipe union	**2.2**
Oil supply union on the engine block	**4.2**
Oil return pipe bolt	**0.9**

REMOVAL

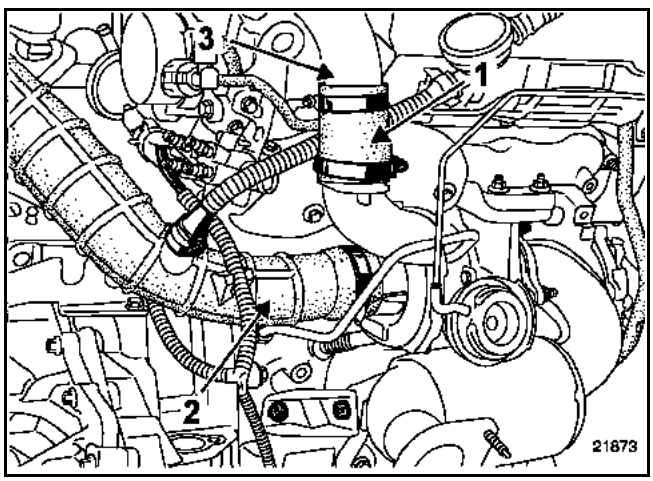
NOTE:
To remove the turbocharger the catalytic converter, the injection rail and the rail protector (see Section **19B Exhaust Catalytic converter**, Section **13B Diesel Injection Injector rail** and **Rail protector**).

NOTE:
Use an oil supply pipe and specific After-Sales turbocharger seals on the plenum chamber and catalytic converter sides available in the Parts Stores.

Put the vehicle on a two-post lift.

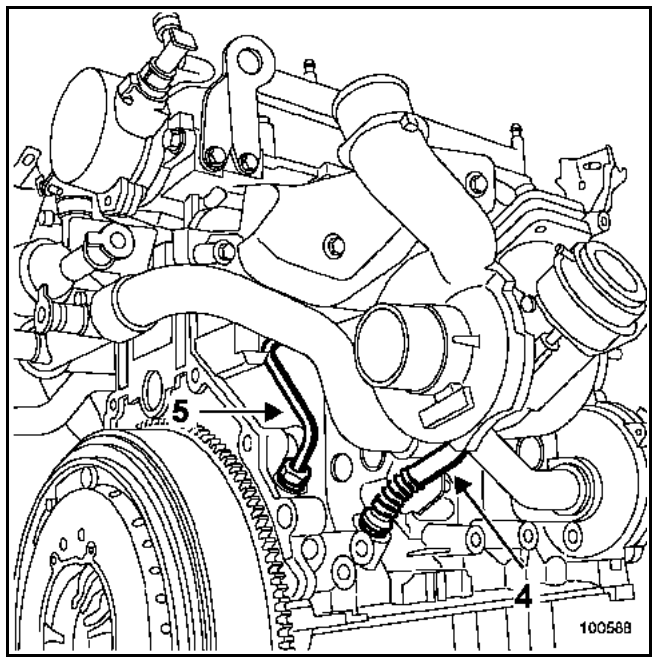
Disconnect the battery.

Remove:
– the front right-hand wheel,
– the engine undertray,
– the air intake (1) and outlet (2) sleeves connected to the turbocharger,
– the turbocharger outlet metal tube (3).



Remove the oil return pipe (4) from the turbocharger.

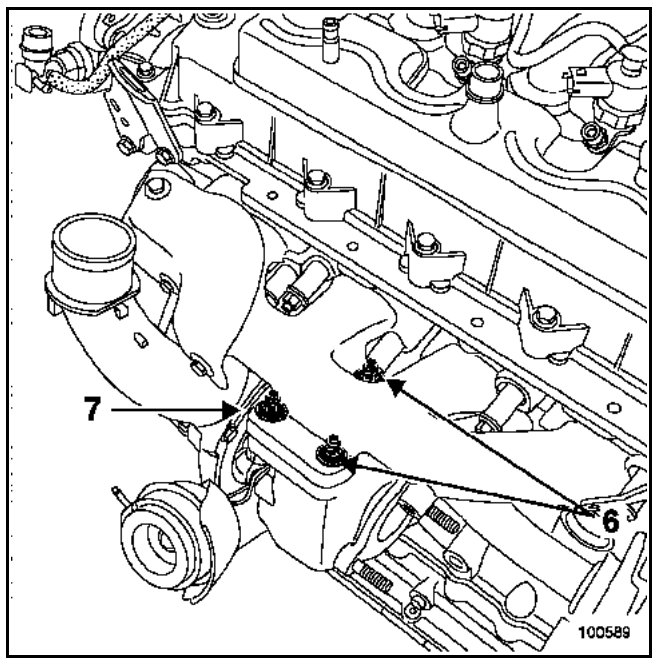
Unscrew the turbocharger oil supply pipe union (5) on the engine.



From above:

Remove the two turbocharger mounting nuts (6) on the exhaust manifold.

Slacken the nut (7) without removing it.



GETtheMANUALS.org

From below:

IMPORTANT:
It is not possible to remove the oil supply pipe with the turbocharger in place.
To remove the turbocharger, pressure needs to be applied to the oil supply pipe.
Use a new pipe, specific to After-Sales, available at Parts Stores.

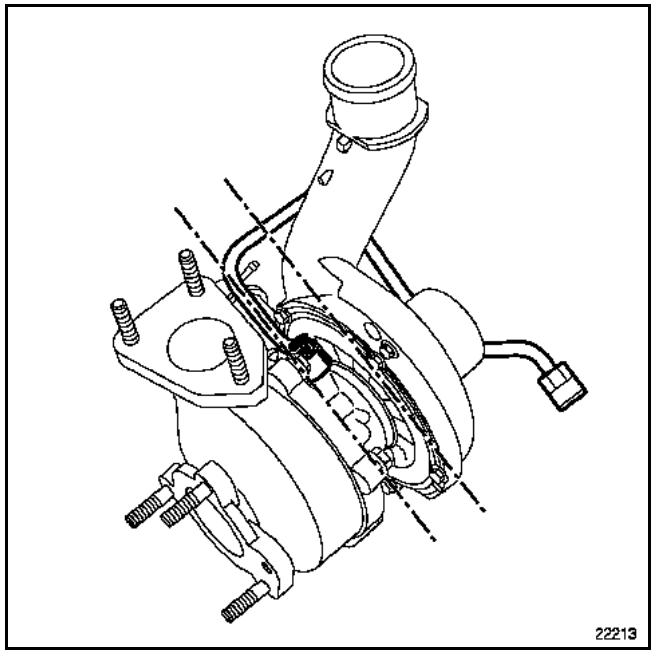
Remove nut (7).

Release the turbocharger from its studs.

Rotate it, then press the pipe to release the assembly.

Unscrew the pipe union on the turbocharger.

Remove the pipe then release the turbocharger.



REFITTING

IMPORTANT:
It is essential to replace the leather seals on the turbocharger oil inlet union and the oil return pipe seal.

Tighten the new supply union and its leather seal on the engine block at a torque of **4.2 daNm**.

Special notes
It is necessary to refit the turbocharger oil supply pipe before fitting the turbocharger to the vehicle. To do this, position the oil supply pipe perpendicular to the turbocharger turbine axis (see diagram) then tighten to a torque of **1.5 daNm**.

IMPORTANT:
In After-Sales, it is essential to fit the turbocharger plenum chamber side and catalytic converter side seals.

Refit the turbocharger making sure that it supports the plenum chamber and position the oil supply pipe in the cylinder block.

Fit the turbocharger mounting nut (7) on the manifold on the underside of the vehicle above the two other nuts (6).

Tighten the new oil supply pipe with its seal on the engine block union to a torque of **2.2 daNm**.

To refit the rail protector and injector rail, make **8** diameter **100 mm** length studs in order to centre the assembly.

GETtheMANUALS.org

Special precautions

- Before refitting, check that the turbocharger bearings are correctly greased. To do this, operate the starter motor while already having disconnected the fuel high-pressure regulator (position a container under it). The oil should flow through the oil pressure pipes.
- Ensure that no foreign bodies enter the turbine or compressor during the refitting operation.
- If there has been a fault in the turbocharger, check that the air-to-air intercooler is not full of oil. If the air-to-air intercooler is full of oil, it must be removed, flushed with a cleaning agent and then left to drain properly.
- Check that the turbocharger oil return pipe is not partially or completely blocked by scale. Also check that it is perfectly sealed. If not, replace it.

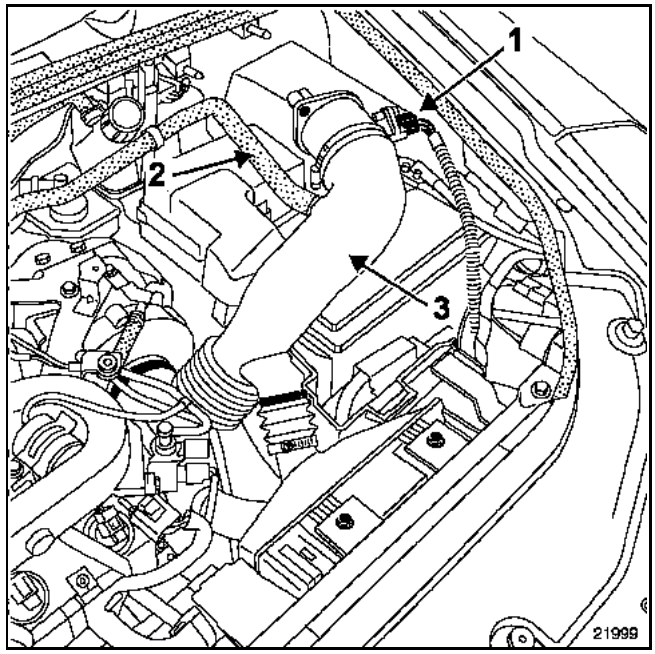
When performing the other operations, proceed in the reverse order to removal making sure you observe the order of fitting and the recommend tightening torques on the high-pressure injector part (see Section **13B Diesel injection Rail protector** and **Injector rail**)

IMPORTANT:

- Before starting the engine, leave the pressure regulator connector on the high pressure pump disconnected.
- Then run the starter motor until the oil pressure warning light goes out (do this for a few seconds).
- Reconnect the regulator, preheat and start the engine.
- Run the engine at idle speed and check that there are no leaks at the oil connections.
- Clear the stored fault on the injection computer using the diagnostic tool.

GETtheMANUALS.org

TIGHTENING TORQUES (in daNm)	
Heat shield mountings	2.1
Manifold/turbocharger intermediate pipe mountings	5.2
Turbocharger manifold mounting on the cylinder block	9.6
Exhaust downpipe mounting:	
– on the turbocharger	2.1
– on the preconverter	2.1
Turbocharger bearing cooling pipe unions on the turbocharger	3.4
Turbocharger bearing cooling pipe on the cylinder block	1
Turbocharger bearing oil inlet pipe on the cylinder block	2.4
Turbocharger bearing oil return pipe on the cylinder block	2.1
Turbocharger bearing oil inlet pipe on the turbocharger	0.9
Turbocharger bearing oil return pipe on the turbocharger	1.2
Turbocharger mounting on the turbocharger manifold	2.1



REMOVAL

Put the vehicle on a two-post lift.

Remove:
– the engine covers,
– the engine undertray.

Disconnect:
– the battery,
– the air flowmeter connector (1)

Disconnect the oil vapour rebreathing pipe (2).

Remove the air inlet duct (3) complete with the flowmeter. To do this, remove:
– the two mounting bolts on the air flowmeter,
– the clip on the air resonator and then on the turbocharger.

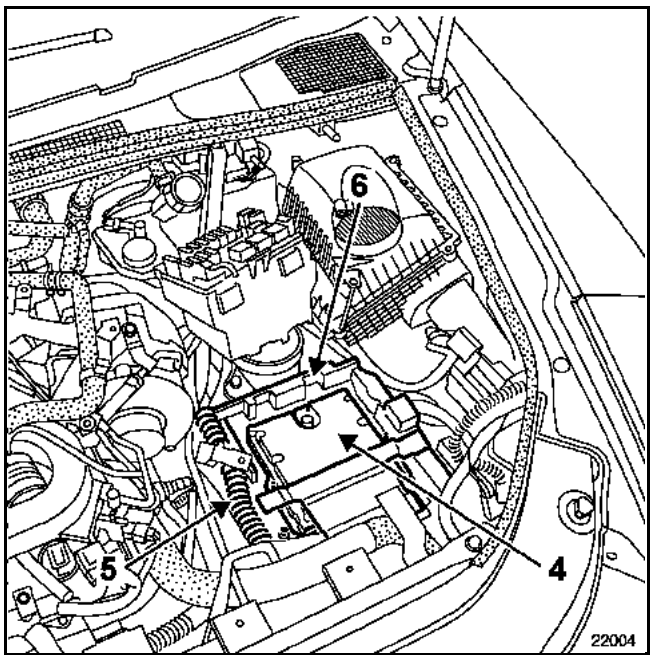
Unclip then remove the relay unit from the side.

GETtheMANUALS.org

Remove the injection computer (4) (see relevant operation in Section **13B Diesel injection Computer**).

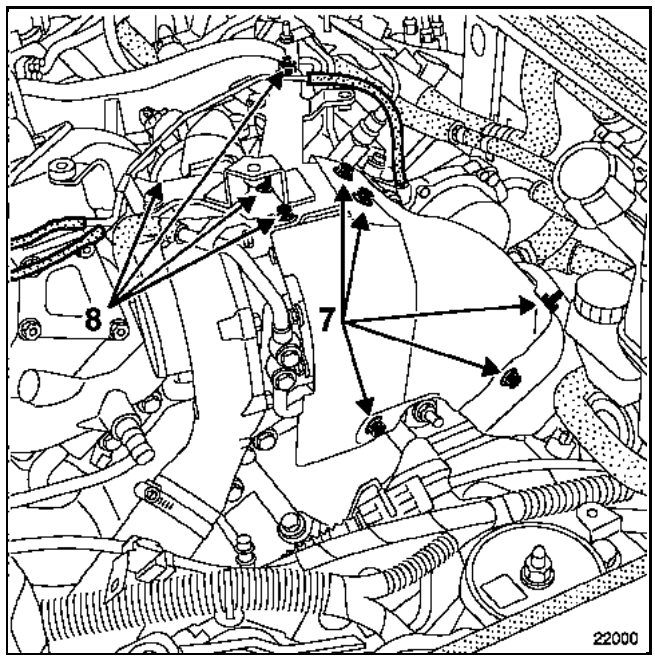
Release the electrical harness (5) from the plastic mountings of the computer.

Remove the computer mounting (6).

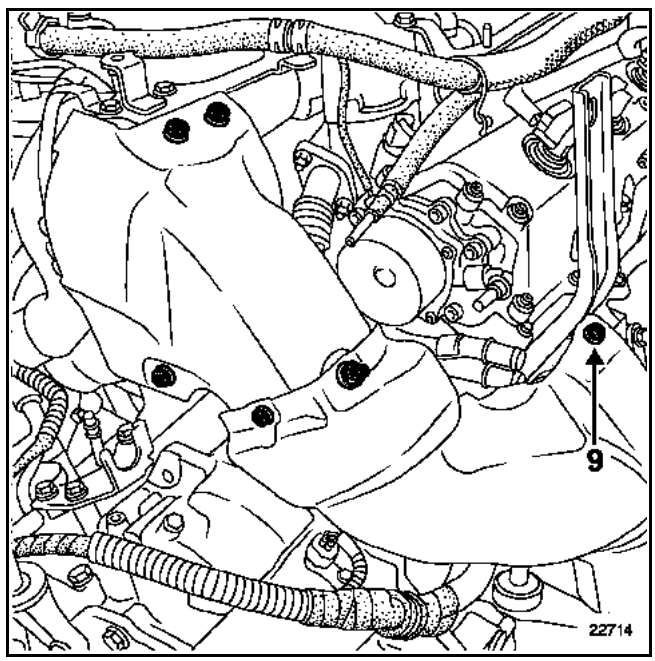


Disconnect the wastegate position sensor.

Remove:
– the mountings (7) from the heat shield on the turbocharger,
– the mountings (8),
– the turbocharger mounting. To do this, disconnect the various air hoses,
– the heat shield,



– the preconverter heat shield mounting (9),
– the heat shield,

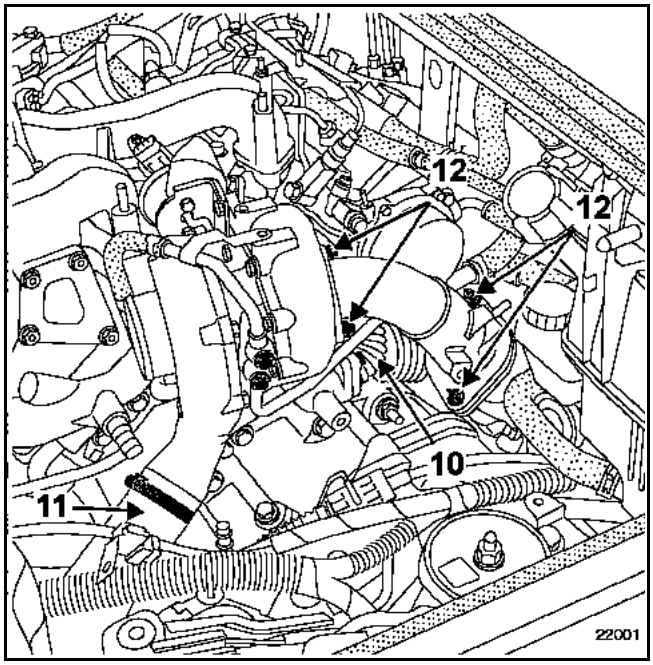


GETtheMANUALS.org

Remove the exhaust gas recirculation pipe (10).

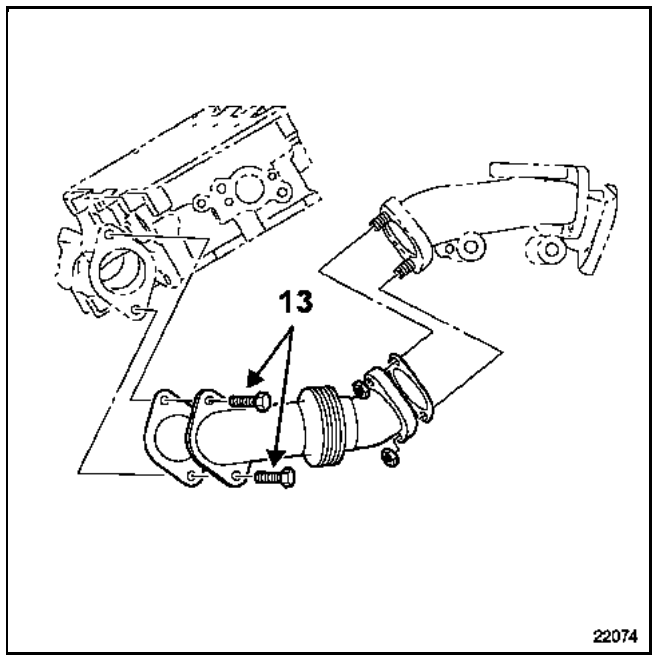
Disconnect the outlet turbocharging air duct (11) from the turbocharger.

Remove:
– the exhaust downpipe mountings (12) on the preconverter then on the turbocharger,

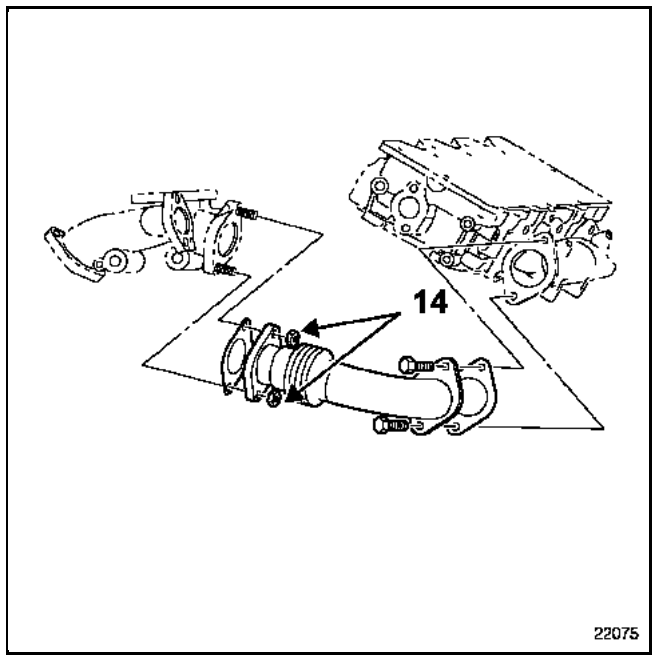


– the heat shield on the front bank manifold-turbocharger intermediate exhaust pipe.

Remove the mountings:
– (13) from the front manifold/turbocharger intermediate pip on the manifold,



– (14) from the rear manifold/turbocharger intermediate pipe on the turbocharger.

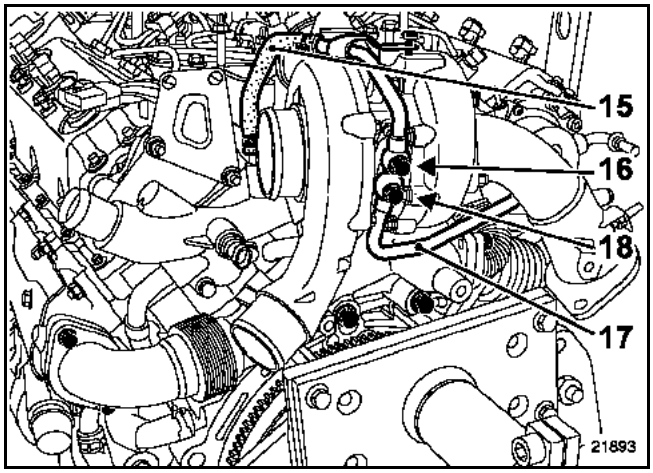


GETtheMANUALS.org

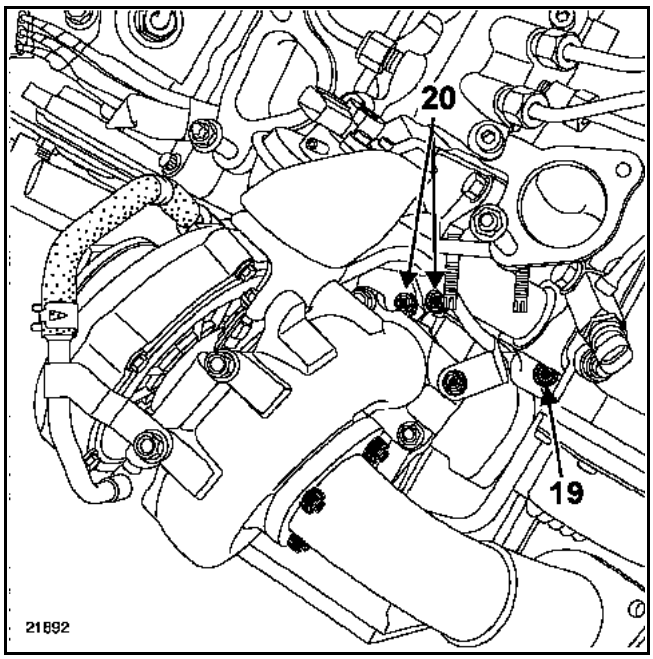
Remove the turbocharger bearing cooling pipe on the side (15).

To do this:
– first fit a hose clamp,
– remove the union (16).

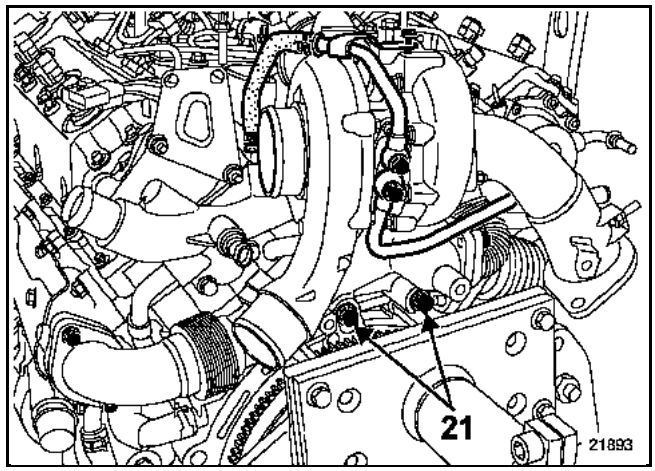
Remove:
– the turbocharger bearing cooling pipe (17). To do this, remove the union (18) and the mounting bolt (19),



– the mounting bolts (20) from the turbocharger oil supply and return pipes,



– the turbocharger manifold mounting bolts (21) on the cylinder block.



Release the turbocharger, then the exhaust downpipe.

On the workbench:

Remove:
– the front manifold/turbocharger intermediate exhaust pipe,
– the turbocharger oil supply and return pipes,
– the cooling pipe bracket,
– the turbocharger from the turbocharger manifold.

GETtheMANUALS.org

REFITTING

WARNING: BEFORE REFITTING THE TURBOCHARGER, IT IS ESSENTIAL TO LUBRICATE THE TURBOCHARGER BEARING WITH ENGINE OIL

Special precautions

- Ensure that no foreign bodies enter the turbine or compressor during the refitting operation.
- Check that the turbocharger oil return pipe is not partially or completely blocked by scale. Also check that it is perfectly sealed. If not, replace it.

NOTE:
All the seals must be replaced:
– on the exhaust pipes,
– on the turbocharger,
– on the turbocharger oil pipes,
– on the turbocharger bearing cooling pipes,
– on the cooling pipe bracket.

Refit the manifold/turbocharger intermediate pipe to the turbocharger then tighten to the recommended torque.

The remaining refitting operations are performed in the reverse order to removal.

Tighten all the mountings to the recommended torques.

Fill and bleed the cooling system, (see Section **19A Cooling Filling and Bleeding**).

IMPORTANT:
Before starting the engine, connect the diagnostic tool then disable the injection using the command **A614 Canceling injection** located in **Command modes/actuators**.
Then run the starter motor until the oil pressure warning light goes out (do this for a few seconds).
Switch off the engine for about **15 seconds** then restart it.
Run the engine at idle speed and check that there are no leaks at the oil connections.

GETtheMANUALS.org

GETtheMANUALS.org

REMOVAL

NOTE:
When removing the air to air intercooler the front bumper and headlights must also be removed (see Section **55A External protection Front bumper** and Section **80B Headlights Removal and Refitting**.

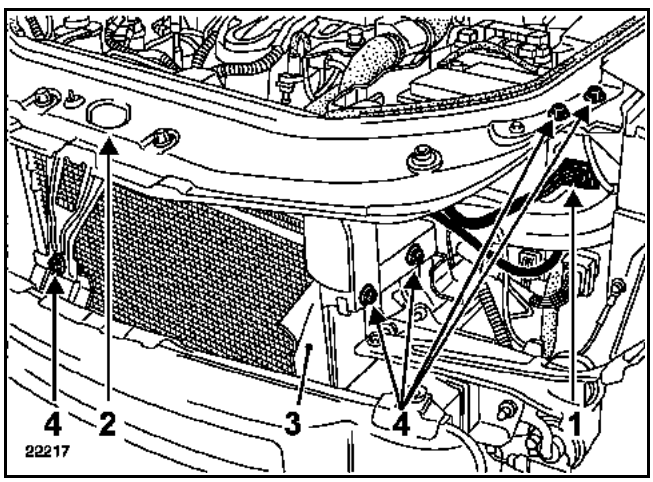
Put the vehicle on a two-post lift.

Disconnect:
– the battery,
– the connector (1).

Unclip the bonnet opening cable (2).

Remove:
– the spoilers (3),
– the nine mounting bolts (4) from the upper cross member.

Fit the upper cross member taking care not to damage the paintwork.



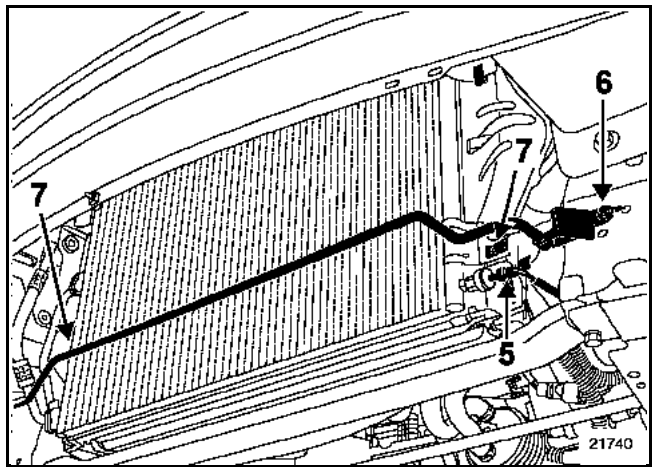
Disconnect the connector (5) from the coolant pressure sensor.

F4R and G9T engines

Remove:
– the mounting bolts (6) from the power steering pipe,
– the two condenser mounting clips (7).

Separate the condenser from the air-to-air intercooler by releasing it upwards. Leave the condenser on the ground.

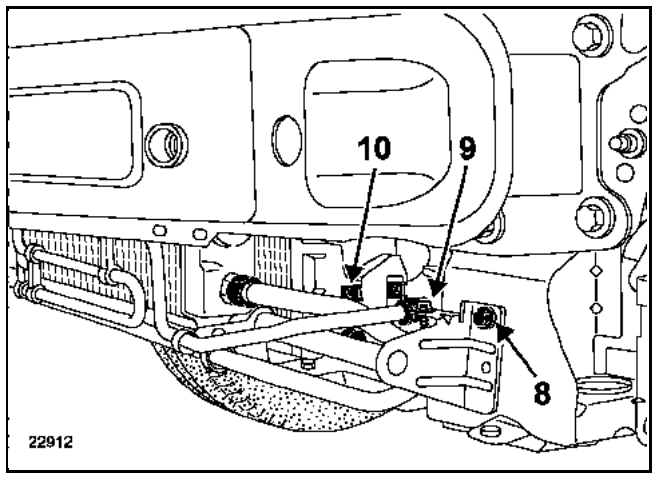
NOTE:
Take care not to damage the blades.



P9X engine

Remove:
– the two mounting bolts (8) from the support bar of the air-oil exchanger,
– the clamp (9) from the power assisted steering pipe,
– the two condenser mounting clips (10).

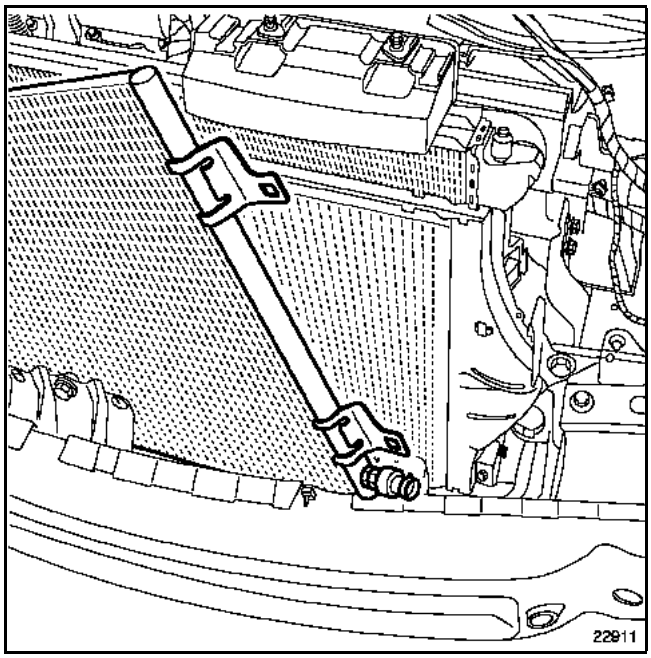
Free the rigid condenser pipes from the clips.



GETtheMANUALS.org

Separate the condenser from the air-to-air intercooler by releasing it upwards. Let the condenser rest on the front cross member.

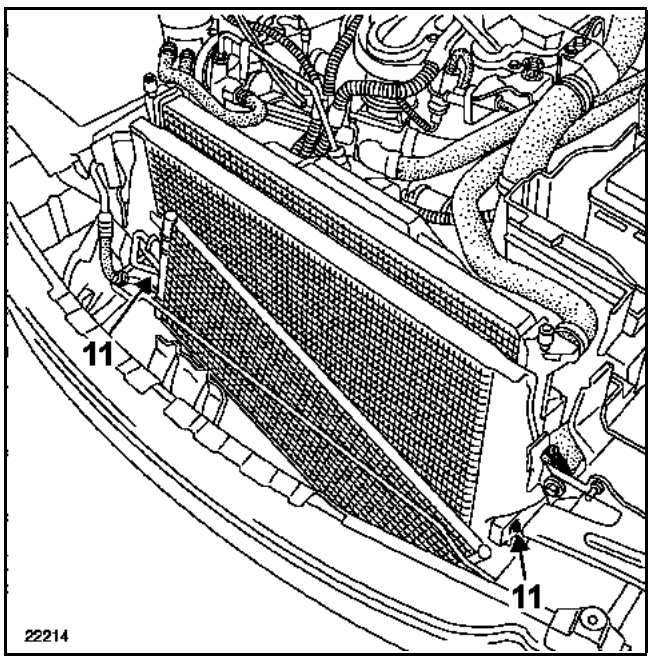
NOTE:
Take care not to damage the blades.



All engine types

Disconnect the air inlets and outlets from the exchanger.

Remove:
– the two mounting clips from the air-to-air intercooler (11),
– the air-air exchanger by releasing it upwards.

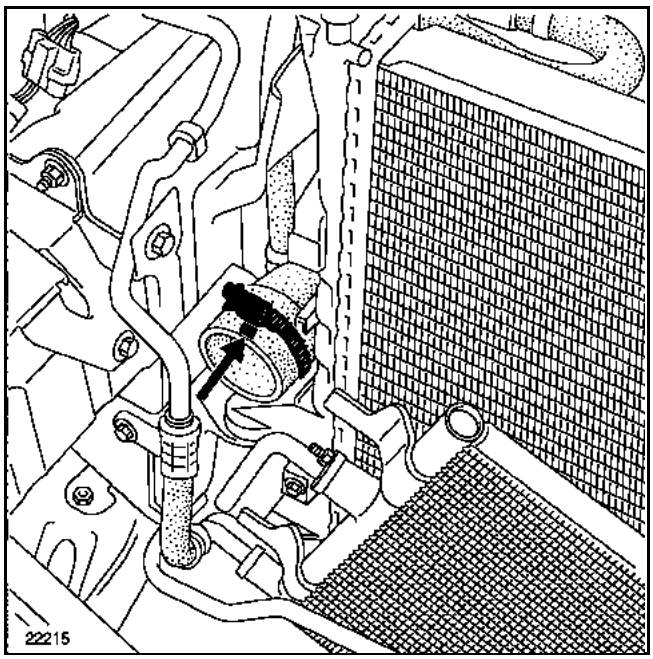


GETtheMANUALS.org

REFITTING

On the ***G9T engine***, be sure to replace the rubber sleeve and pipe mounting clip.

Position the moulding on top so that the plastic indexing lugs on the pipe hitch onto the clamp.



Proceed in the reverse order to removal for the other refitting operations.

IMPORTANT:
The lens units must be adjusted once they have been fitted:
– park the vehicle on level ground,
– set the adjustment control to 0,
– carry out the adjustment.

If the vehicle has Xenon headlights, the system must be initialised and the headlights adjusted (refer to **Headlights with Xenon bulbs, system initialisation**).

IMPORTANT:
It is forbidden to switch on the Xenon headlights unless the bulbs are fitted into the lens unit (**this can damage your eyesight**) .

GETtheMANUALS.org

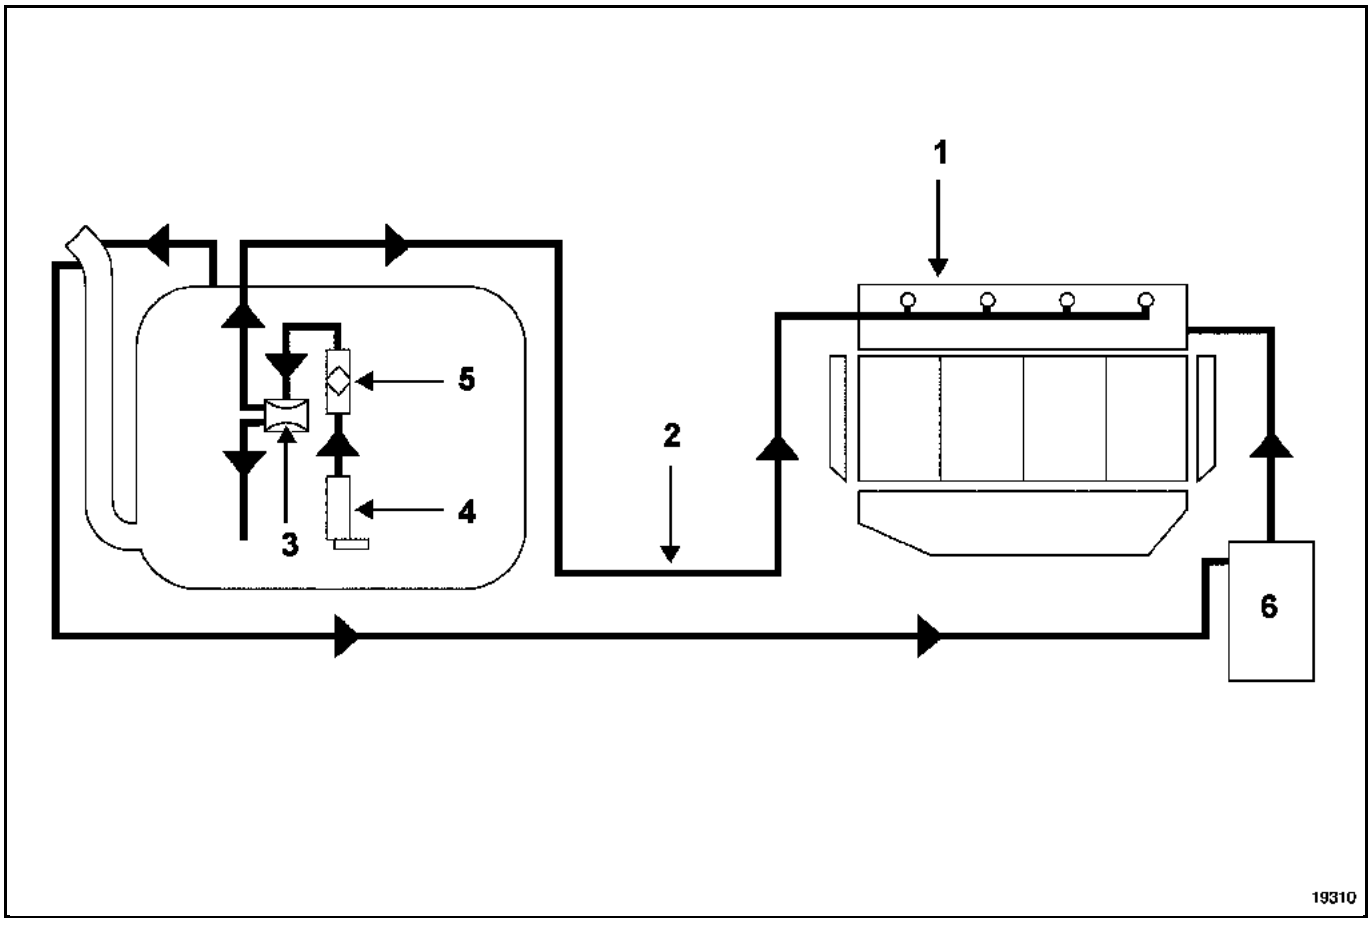
DESCRIPTION

The petrol system for the engine is a non-return circuit.

The petrol pressure no longer varies according to the engine load.

The circuit comprises:
– a rail (1) without a return pipe union and without a supply pressure regulator,
– a single pipe (2) coming from the tank,
– a fuel supply pump-sender unit/fuel filter assembly fitted with a pressure regulator (3), a pump (4) and a fuel filter (5) (all located in the tank),
– a tank for rebreathing fuel vapours (6).

OPERATING DIAGRAM



GETtheMANUALS.org

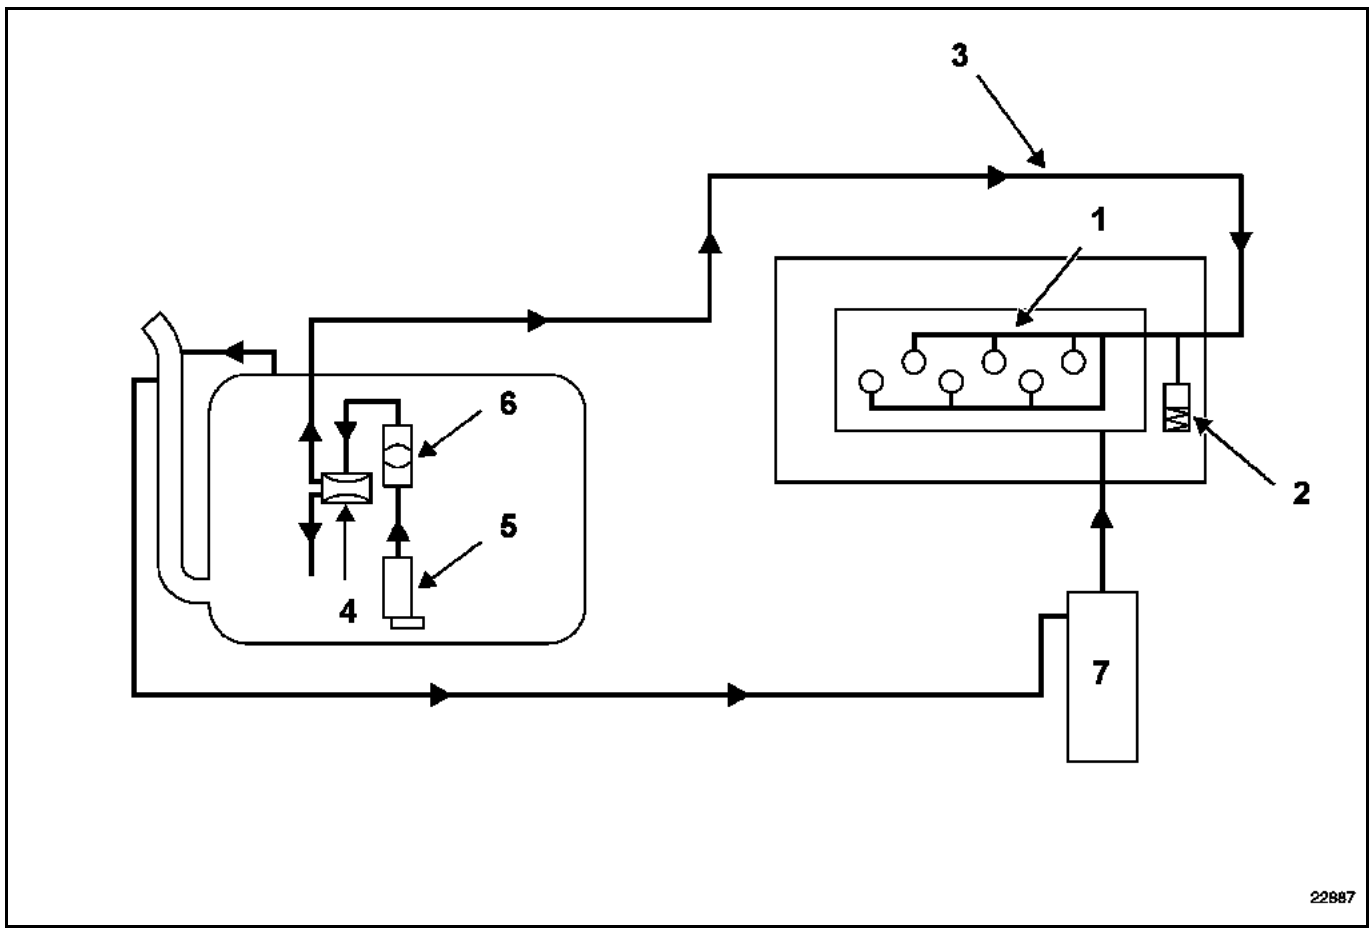
DESCRIPTION

The petrol system for the engine is a non-return circuit.

The petrol pressure no longer varies according to the engine load.

The circuit comprises:
– a rail (1) without a return pipe union and without a supply pressure regulator but with a pulse damper (2),
– a single pipe (3) coming from the tank,
– a fuel supply pump-sender unit/fuel filter assembly fitted with a pressure regulator (4), a pump (5) and a fuel filter (6) (all located in the tank),
– a tank for rebreathing fuel vapours (7).

OPERATING DIAGRAM



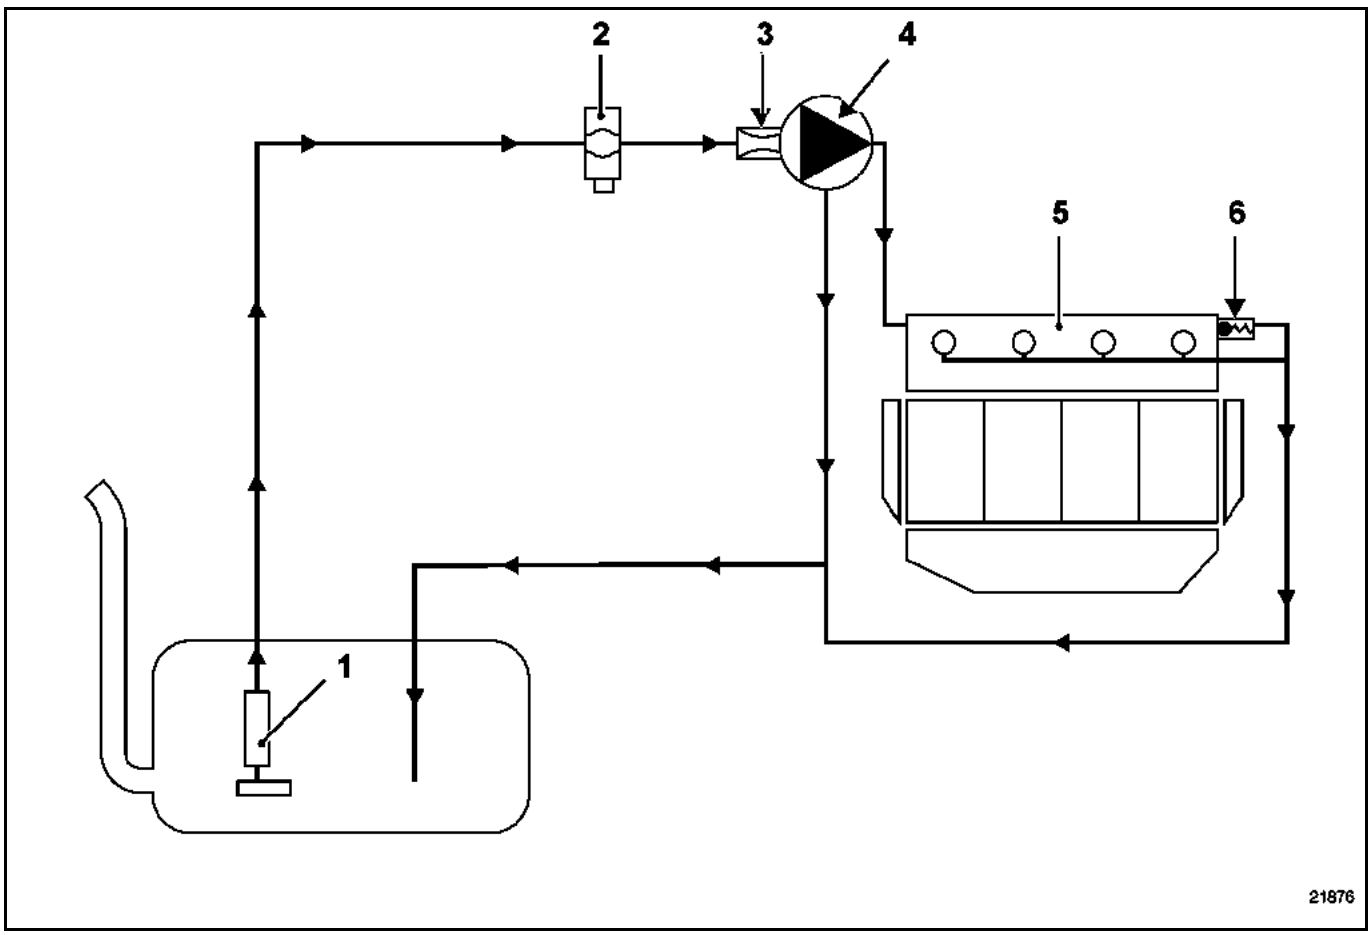
GETtheMANUALS.org

DESCRIPTION

The circuit comprises:
– a pump-sender supply assembly (1) (located in the fuel tank),
– a fuel filter (2),
– a high pressure regulator (3) mounted on the pump,
– a high pressure pump (4),
– an injector rail (5) fitted with a diesel pressure sensor and a pressure limiter (6),
– four solenoid injectors,
– various sensors,
– an injection computer.

Dismantling the interior of the high pressure pump and the injectors is prohibited.

OPERATING DIAGRAM



GETtheMANUALS.org

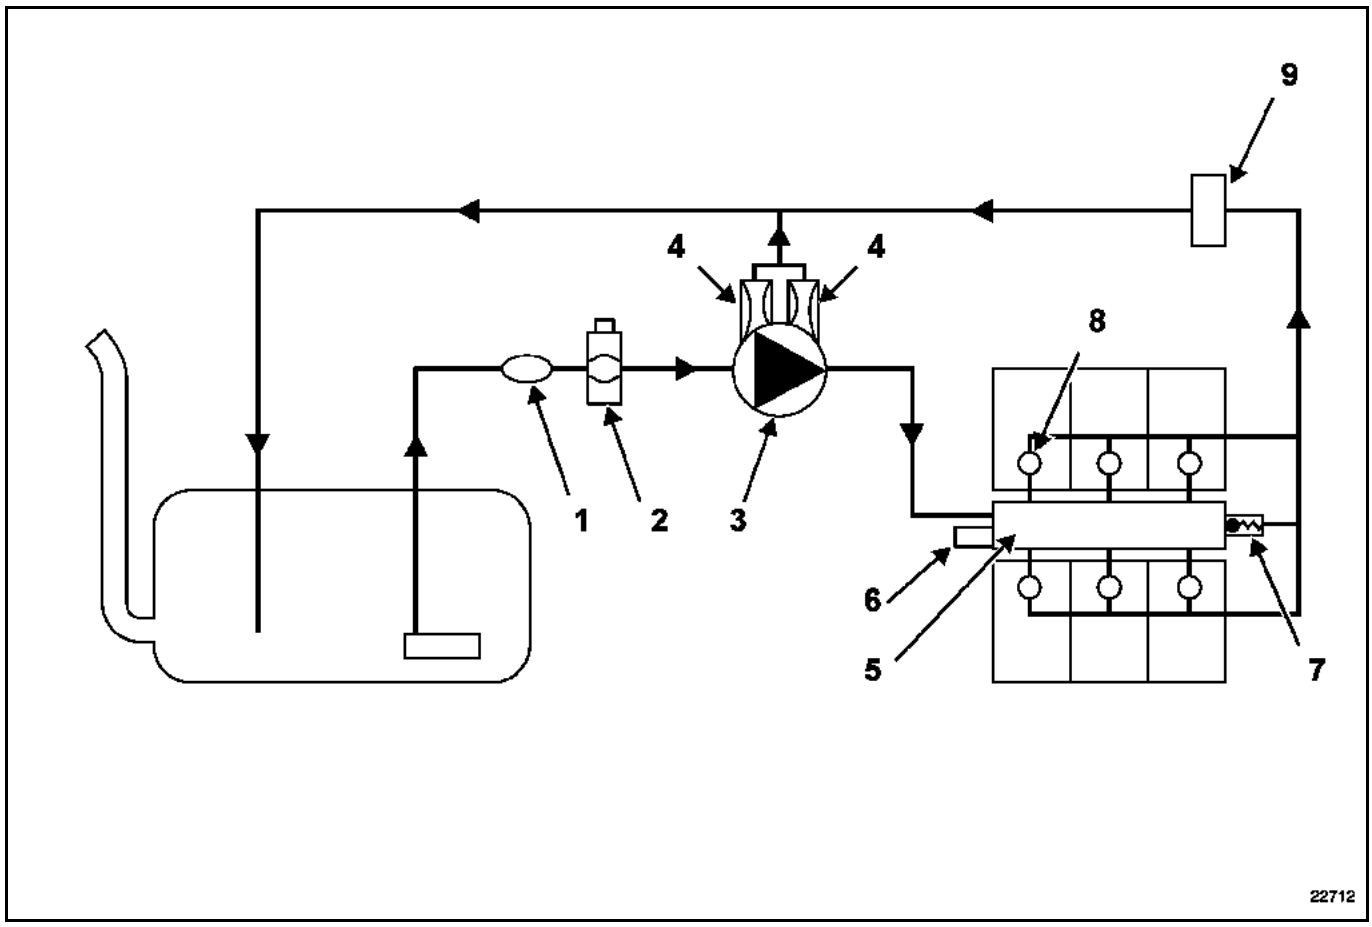
The "Common Rail" direct high pressure injection system is designed to deliver a specific quantity of diesel fuel to the engine at a specific time.

DESCRIPTION

The circuit comprises:
– a priming bulb (1),
– a diesel filter (2) fitted with a reheater,
– a high pressure pump with two pumping pistons (3),
– two pressure regulators (4),
– an injector rail (5) fitted with a pressure sensor (6),
– a pressure limiter (7),
– six solenoid injectors (8),
– a diesel temperature sensor (9).

NOTE:
The following must not be removed:
– the inside of the pump,
– the injectors,
– the pump pressure regulators.

OPERATING DIAGRAM



GETtheMANUALS.org

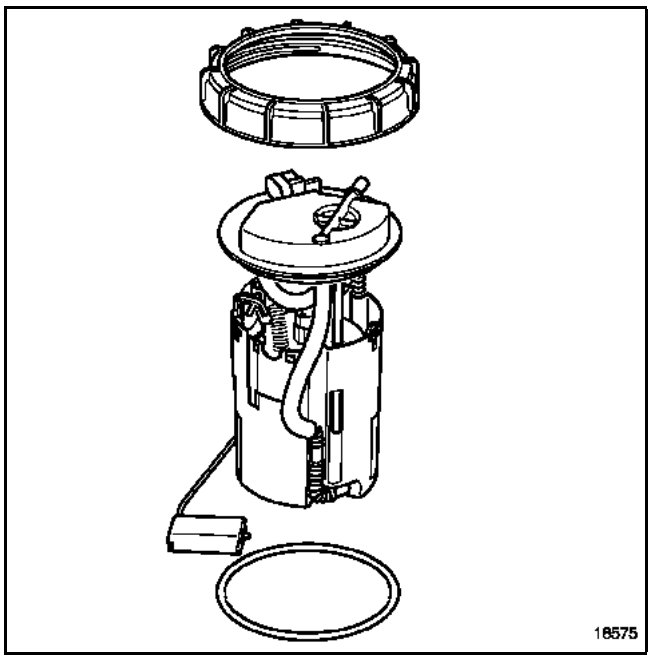
GENERAL INFORMATION

The petrol filter is located in the tank. It is incorporated into the fuel pump-sender unit assembly and cannot be removed.

If it needs to be replaced, then the whole fuel pump-sender unit assembly must be replaced.

It is designed to have a long lasting filtration capacity.

Nevertheless, checking the fuel pressure and the pump flow will enable you to run diagnostics on the fuel pump-sender unit assembly.



GETtheMANUALS.org

The fuel filter is housed in a removable cartridge. This cartridge contains a diesel fuel heater.

To replace the fuel filter it is therefore necessary to remove the whole unit.

REMOVAL

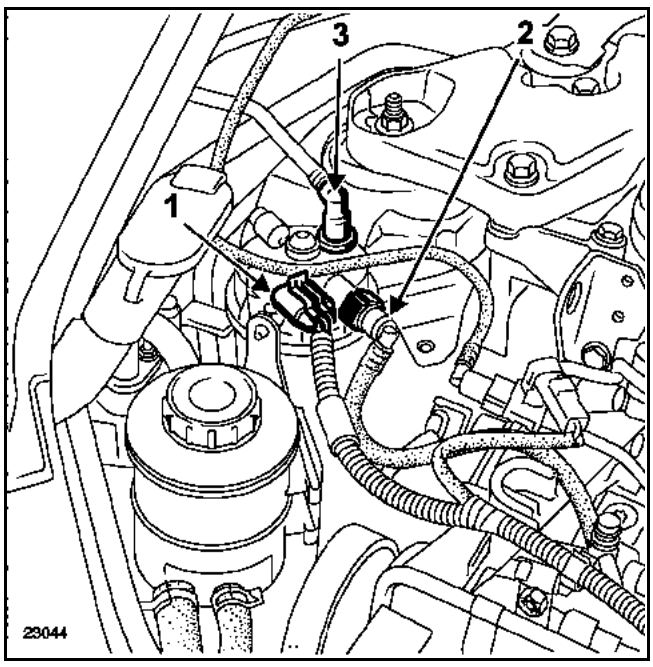
OBSERVE THE CLEANLINESS ADVICE CLOSELY

IMPORTANT:
Remember that there will be residual pressure and a quantity of diesel fuel remaining in the pipes.

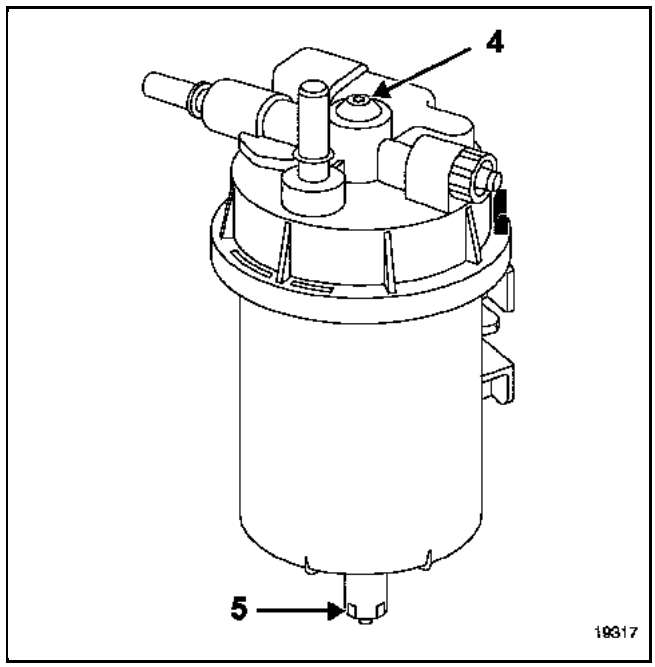
Disconnect the battery.

Disconnect from the filter:
– the diesel fuel heater connector (1),
– the fuel supply pipe to the engine (2),
– the pipes (3) coming from the tank.

Remove the filter by unclipping it from its support.



Unscrew filter cover screw (4) and remove the filter element.



REFITTING

Take care to line up the mark on the cover and the mark on the bowl correctly.

It is vital to observe the position of the unions to the filter.

Be careful not to squeeze or damage the pipes.

IMPORTANT:
Re-prime the system by switching on the ignition several times, or run the low pressure pump with the fault finding tool using the "**Actuator Commands**" menu.

It is necessary to periodically bleed the water trapped in the diesel filter via bleed cap (5).

GETtheMANUALS.org

The fuel filter is located in the engine compartment. It is contained in a removable cartridge. This cartridge incorporates a diesel fuel heater comprising a resistor and a temperature switch.

To replace the filter it is therefore necessary to remove the whole unit.

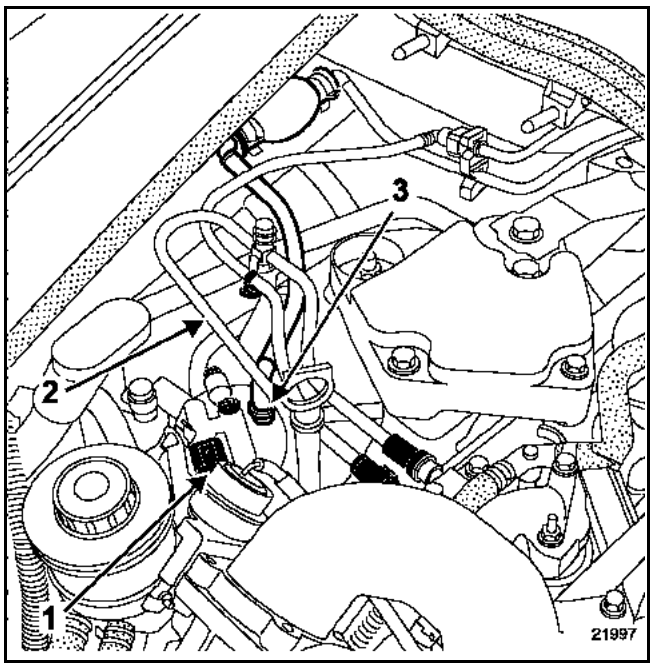
REMOVAL

OBSERVE THE CLEANLINESS ADVICE CLOSELY

IMPORTANT:
Remember that there will be residual pressure and a quantity of diesel fuel remaining in the pipes.

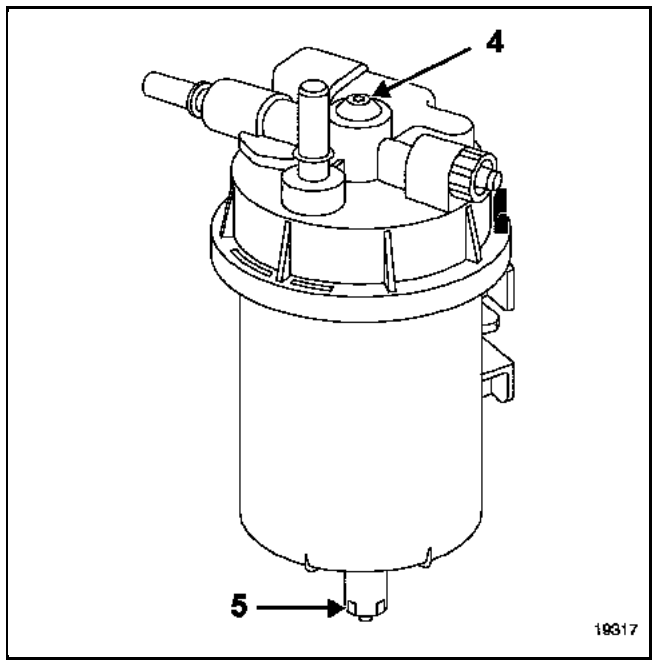
Disconnect from the filter:
– the diesel fuel heater connector (1),
– the fuel supply pipe to the engine (2),
– the pipes (3) coming from the tank.

Remove the filter by unclipping it from its support.



Mark the position of the element cover in relation to the bowl.

Undo bolt (4) and remove the filter element.



REFITTING

Take care to line up the mark on the cover and the mark on the bowl correctly.

It is vital to observe the position of the unions to the filter.

Be careful not to squeeze or damage the pipes.

IMPORTANT:
Reprime the fuel circuit using the priming bulb.

It is necessary to periodically bleed the water trapped in the diesel filter via bleed cap (5).

GETtheMANUALS.org

TIGHTENING TORQUE (in daNm)	
Injector rail bolt	0.9

The injectors mounted on the **F4R** engine are of the **MAGNETI MARELLI PICO** type.

They are attached to the injector rail by clips.

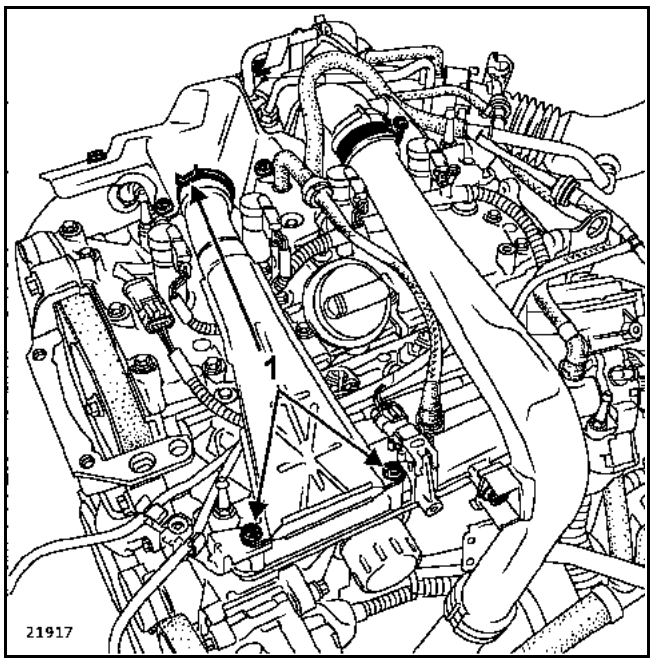
The fuel circulates constantly around the circumference of the injector body. Wiping the fuel prevents the formation of petrol vapour bubbles and helps cold starting.

REMOVAL

IMPORTANT:
Be careful when removing the injectors or the injector rail as there will be a quantity of fuel in the rail and the union. Protect the alternator.

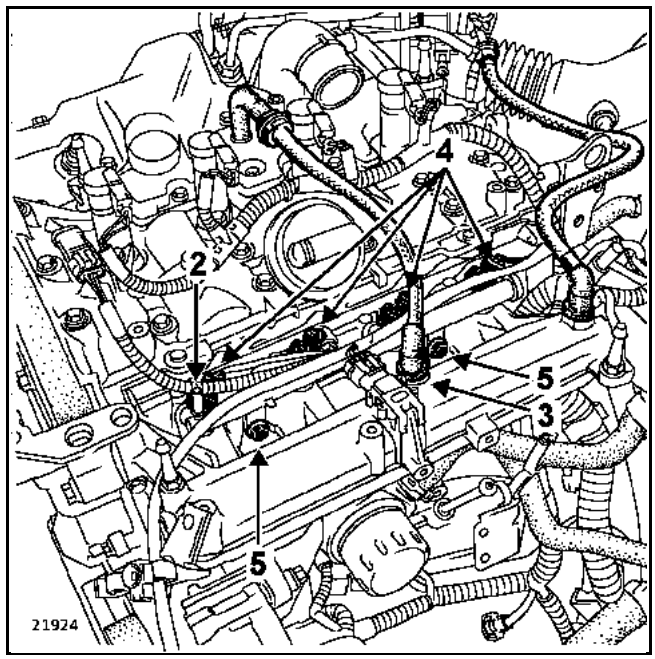
Disconnect the battery.

Remove the turbocharger cooling air duct (1).



Disconnect:
– the fuel supply union (2) from the injector rail,
– the oil vapour rebreathing union (3),
– the injector connectors (4).

Remove:
– the rail mounting bolts (5),
– the injector rail,
– the injector clips,
– the injectors.

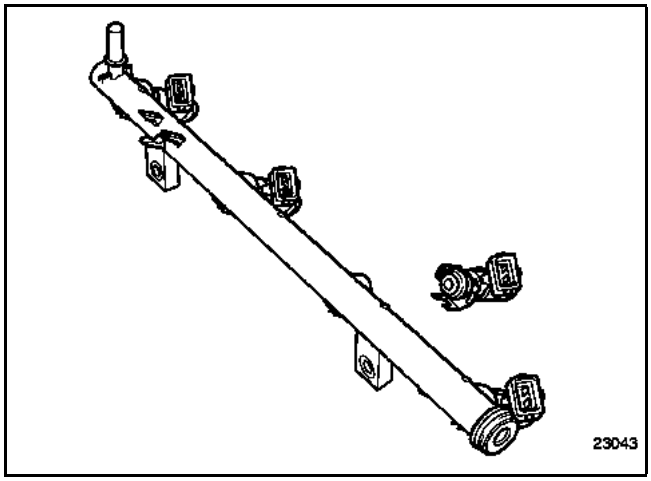


GETtheMANUALS.org

REFITTING

The O-rings and the injector mounting clips must be replaced.

Fit the new clip on the injector and then push the injector until the clip clips onto the rail.



Refit the rail using the correct tightening torque for the mounting bolts.

GETtheMANUALS.org

TIGHTENING TORQUES (in daNm)		
Rail bolts:	**pre-tightening**	**1**
	tightening	**2.3 ± 0.3**

REMOVAL

Disconnect the battery.

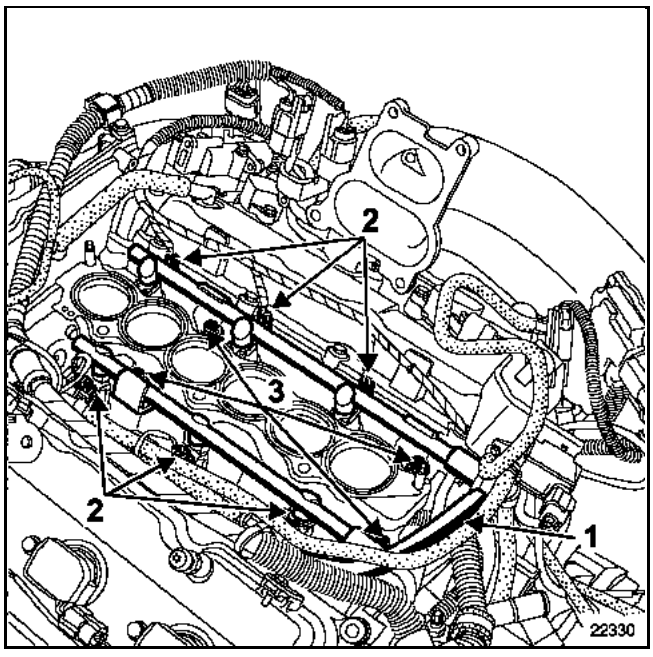
Remove the inlet manifold (see section **12A Fuel mixture "Inlet manifold"**).

IMPORTANT:
Be careful when removing the injectors or the injector rail as there will be a quantity of fuel in the rail and the union.

Disconnect:
– the petrol inlet union (1) from the injector rail,
– the injector connectors (2).

Remove the four bolts (3) securing the injector rail.

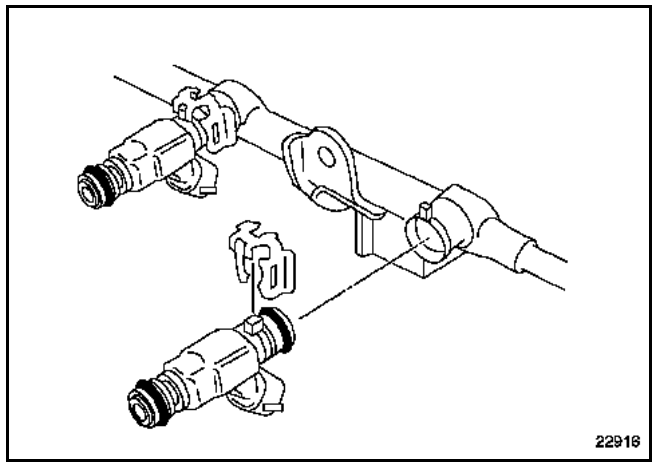
Remove the injector rail (be careful of the four shims under the rail).



Remove:
– the injector clips,
– the injectors.

REFITTING

The O-rings and the injector mounting clips must be replaced.



Observe the correct tightening torque for the rail bolts.

Also replace the manifold seals.

Proceed in the reverse order to removal.

GETtheMANUALS.org

F4R, V4Y and G9T engines have a fuel pump.

This pump is located in the fuel tank and is incorporated into the fuel supply assembly and cannot be separated from it.

When replacing it, the fuel pump sender unit assembly must also be replaced for the G9T engine and the fuel pump-sender-filter unit assembly must be replaced for the F4R and V4Y engines.

Checking the fuel pressure and the pump flow will enable a fault finding check of the fuel supply assembly performance to be carried out.

For the procedure of how to remove and refit the fuel pump, refer to Section **19C: Fuel tank: Pump-sender unit**.

ALLOCATION OF TRACKS FOR THE SUPPLY ASSEMBLY

Track	Description

C2	- pump

GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Mot. 1311-01	Fuel pressure testing unit with pressure gauge and sockets
Mot. 1311-08	Union for measuring fuel pressure

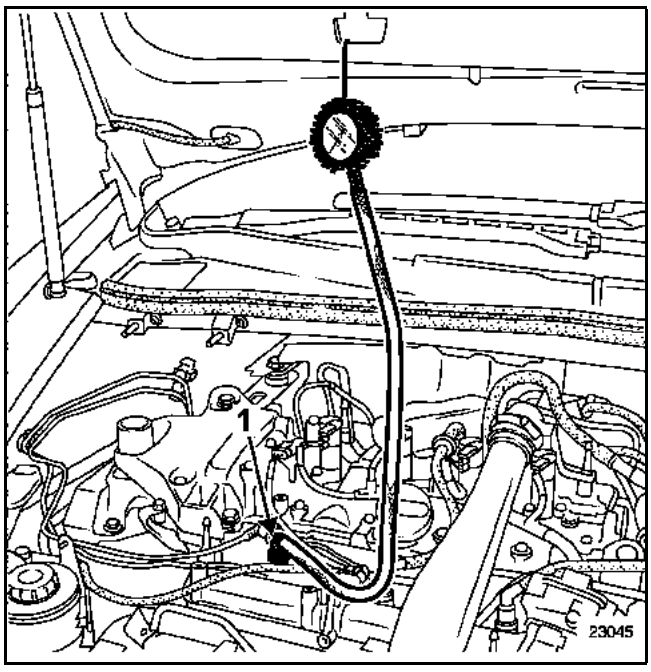
Disconnect the fuel supply union (1) and connect **"T" union (Mot. 1311-08)**, fitted with a pressure gauge.

IMPORTANT:
Be aware that there will be a quantity of fuel in the rail and in the union. Protect sensitive components.

Start the engine in order to start the fuel pump.

Read the pressure, which should be constant.

Pressure reads: **3.5 bar ± 0.06**.



NOTE:
It may take a few seconds to obtain a correct pressure reading in the injector rail.

When the engine is switched off, the fuel pressure should not fall immediately (pressure regulator or pump leak).

GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Mot. 1311-01	**Fuel pressure testing unit with pressure gauge and sockets**
Mot. 1311-08	**Union for measuring fuel pressure**

IMPORTANT:
During this operation, it is essential to:
– refrain from smoking or bringing hot objects close to the working area,
– use suitable protection against fuel splashes caused by the residual pressure in the pipes,
– protect sensitive areas from direction of fuel flow.

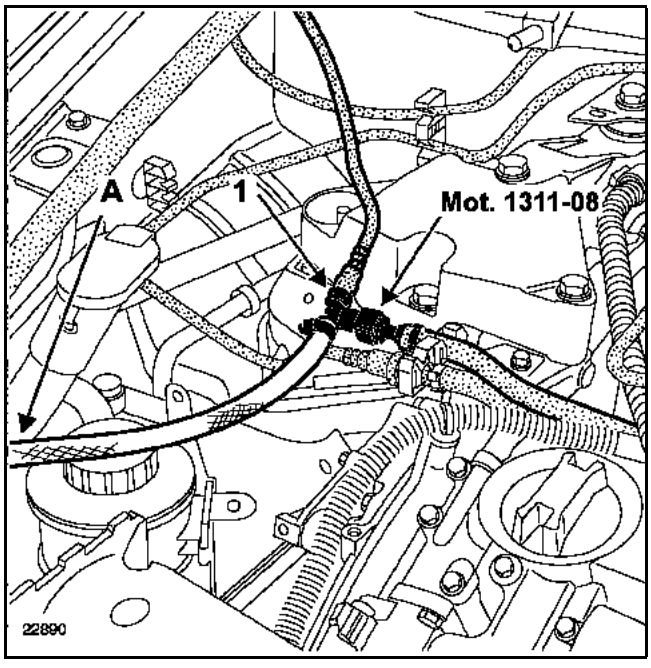
Disconnect the quick-release union (1) from the fuel supply pipe.

To the union (1), fit the **"T" adaptor Mot. 1311-08** along with the pressure gauge from the test kit **Mot. 1311-01** at (A).

Start the engine in order to start the fuel pump.

Read the pressure, which should be constant.

Pressure reads: **3.5 bar ± 0.06**.



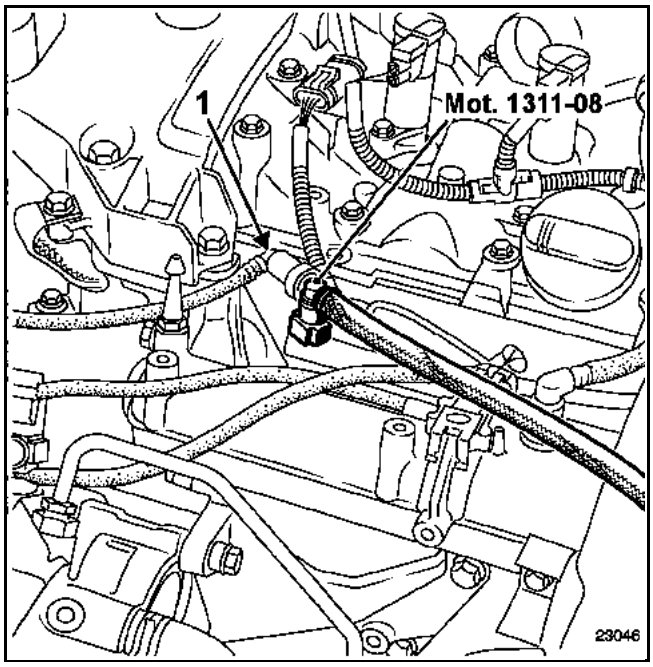
GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Mot. 1311-01	Fuel pressure testing unit with pressure gauge and sockets
Mot. 1311-08	Union for measuring fuel pressure
EQUIPMENT REQUIRED	
2000-ml graduated cylinder	

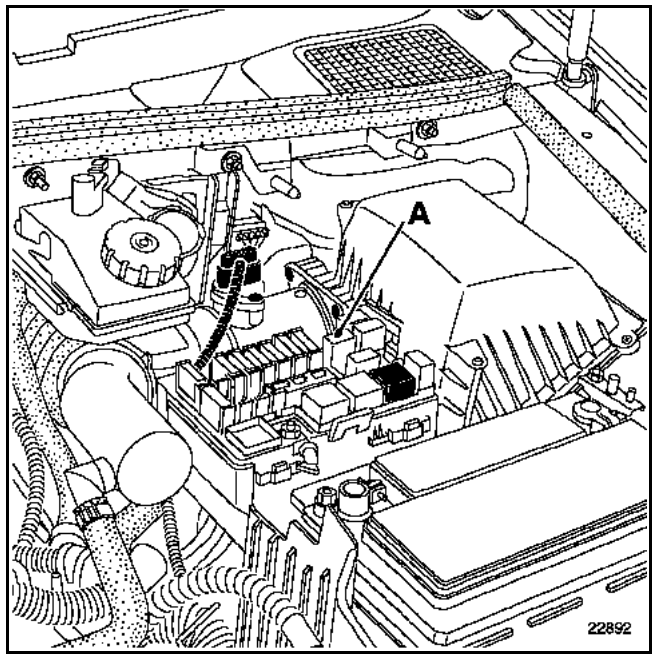
IMPORTANT:
Be aware that there will be a quantity of fuel in the rail and in the union. Protect sensitive components.

Disconnect fuel supply union (1) and connect a **"T" union (Mot. 1311-08)**.

To the union of the **"T" piece (Mot. 1311-08)** connect a sufficiently long pipe so that fuel can be pumped into a graduated measuring cylinder.



Operate the fuel pump by shunting tracks 3 and 5 of fuel pump relay (A).



Read the pump delivery rate.

Flow reading: **80 to 120 l/h**.

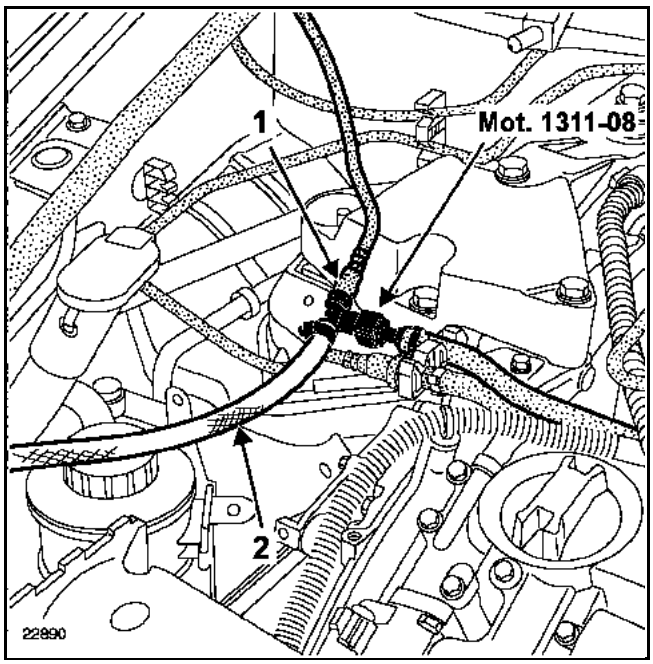
GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Mot. 1311-01	Fuel pressure testing unit with pressure gauge and sockets
Mot. 1311-08	Union for measuring fuel pressure
EQUIPMENT REQUIRED	
One 2000 ml graduated measuring cylinder	

IMPORTANT:
During this operation, it is essential to:
– refrain from smoking or bringing hot objects close to the working area,
– use suitable protection against fuel splashes caused by the residual pressure in the pipes,
– protect sensitive areas from direction of fuel flow.

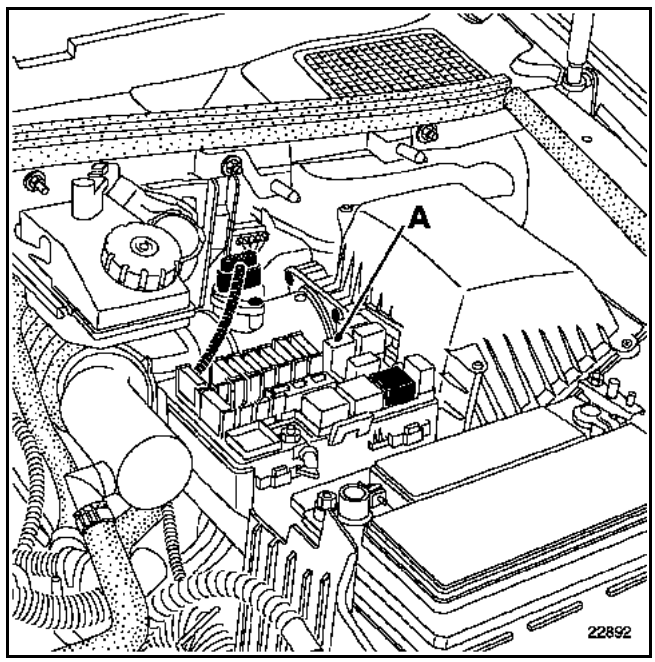
Disconnect the quick-release union (1) from the fuel supply pipe.

To the quick-release union (1), fit the **"T" union Mot. 1311-08** then connect a sufficiently long pipe (2) so that fuel can be pumped into the graduated measuring cylinder.



Operate the fuel pump by shunting tracks 3 and 5 of fuel pump relay (A). In one minute, the pump flow must be a minimum of **1.3 l** under **12 V**.

Flow reading: **80 to 100 l/h**.



Checking diesel fuel pressure and flow

GETtheMANUALS.org

It is possible to check the pressure and flow in the low pressure fuel circuit.

The low pressure is provided by the low pressure pump (electric pump fitted in the fuel tank) which feeds the high pressure pump during starting phases.

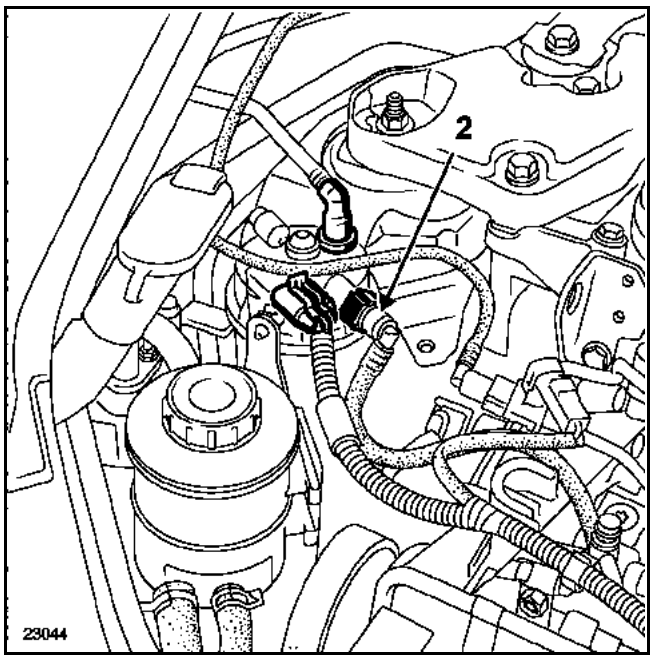
SPECIAL TOOLING REQUIRED	
Mot. 1311-01 or Mot. 1328	Pressure gauge
Mot. 1311-08	"T" union for fuel pressure test kit
EQUIPMENT REQUIRED	
2000-ml graduated cylinder	

LOW PRESSURE CHECK (LOW PRESSURE PUMP)

Fit a **T union, Mot. 1311-08**, to be able to connect the fuel pressure gauge **Mot. 1311-01** to the outlet (2) of the fuel filter.

Operate the pump using the fault finding tool or by shunting tracks 3 and 5 of the low pressure pump (A).

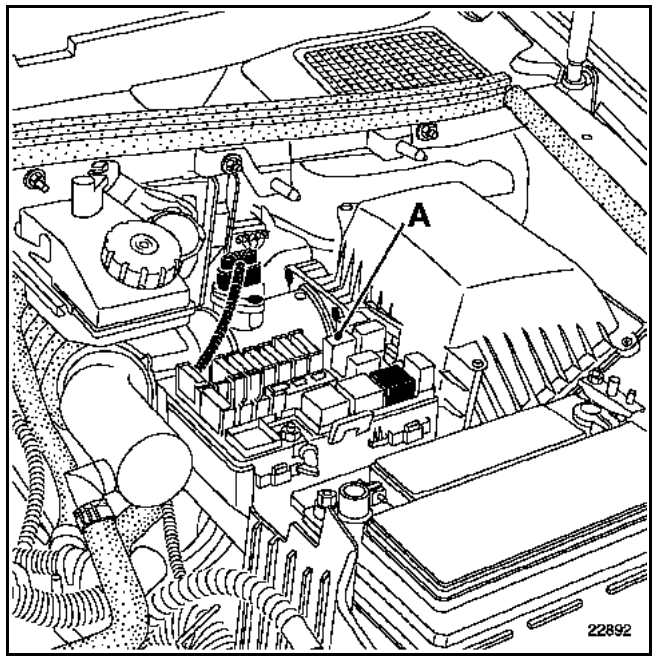
Increase the pressure, which should be between **2.5 and 4 bar**.



FLOW TEST (LOW PRESSURE PUMP)

Make the pump flow into a **2000 ml** graduated measuring cylinder.

To operate the pump, shunt tracks 3 and 5 of the low pressure pump relay (A).



The flow should read at least **80 to 100 l/h**.

IMPORTANT:
It is forbidden to measure the pressure and the flow of the high pressure pump.

GETtheMANUALS.org

OPERATING PRINCIPLE

The anti-percolation system is controlled directly by the injection computer.

The collant temperature signal is taken from the injection system's coolant temperature sensor (see section **17B "Centralised coolant temperature management"**).

After the engine is switched off the system enters monitoring mode.

If the coolant temperature exceeds **107 °C** within **49 seconds** of stopping the engine, the fan low speed relay is energised.

If the coolant temperature falls back below **85 °C**, the fan assembly relay is cut off (the fan assembly cannot operate for more than **10 minutes**).

GETtheMANUALS.org

OPERATING PRINCIPLE

The anti-percolation system is controlled directly by the injection computer.

The coolant temperature information is taken from the injection system's coolant temperature sensor (see section **17B "Centralised coolant temperature management"**).

The injection computer enters monitoring mode after the ignition is switched off.

If the coolant temperature exceeds **102 °C** within 2 minutes of stopping the engine, the fan low speed relay is energised.

If the coolant temperature falls back below **95 °C**, the fan assembly relay is cut off (the fan assembly cannot operate for more than **10 minutes**).

GETtheMANUALS.org

INJECTORS

A **6 figure** code called **IMA** (Injector Flow Correction) is marked on the G9T engine injectors. This code is specific to each injector, and takes into account differences in manufacture and specifies the flow of the injector.

When replacing one or more injectors, the code of the new injector or injectors must be programmed into the computer.

When a computer is reprogrammed or replaced, it is necessary to program the codes of the four injectors.

There are two possibilities:

- If it is possible to re-establish dialogue with the computer:
  - download the data from the old computer into the fault finding tool,
  - replace the computer,
  - transfer the data from the fault finding tool to the new computer,
  - using the fault finding tool, ensure that the computer has not detected faults relating to the injector codes and check that the instrument panel warning light is off.

- If it is not possible to re-establish dialogue with the computer:
  - replace the computer,
  - read the data from the injectors,
  - enter the data in the computer using the fault finding tool,
  - reconfigure the various components such as the air conditioning, thermoplungers, etc,
  - using the fault finding tool, ensure that the computer has not detected faults relating to the injector codes and check that the instrument panel warning light is off.

GETtheMANUALS.org

The high pressure direct injection system is intended to deliver a specific quantity of diesel fuel to the engine at a specific time.

DESCRIPTION

The system comprises:
– a pump-sender supply assembly (located in the fuel tank),
– a fuel filter,
– a pressure regulator mounted on the pump,
– a high pressure pump,
– an injector rail fitted with a diesel fuel pressure sensor and a pressure limiter,
– four solenoid injectors,
– various sensors,
– an injection computer.

OPERATION

The "**Common Rail**" high pressure direct injection system is a sequential diesel fuel injection system (based on the petrol engine multipoint injection system).

This new injection system reduces operating noise, reduces the volume of pollutant gases and particles and produces high engine torque at low engine speeds thanks to a pre-injection procedure.

The low pressure pump (also called the booster pump) supplies the **High Pressure** pump via the fuel filter **during the starting phase only**, under a pressure of between **2 and 4 bars**.

The **high pressure** pump generates the high pressure transmitted to the injector rail. The pressure regulator located on the pump modulates the high pressure pump supply flow. The rail supplies each injector through a steel pipe.

The computer:
– determines the injection pressure value necessary for the engine to run correctly and then controls the pressure regulator. It checks that the pressure value is correct by analysing the value transmitted by the pressure sensor located on the rail,
– determines the injection timing required to deliver the right quantity of diesel fuel and the moment when injection should start,
– electrically controls each injector individually after determining these two values.

The flow injected into the engine is determined by:
– the duration of injector control,
– the injector opening and closing speed,
– the needle stroke (determined by the type of injector),
– the injector nominal hydraulic flow (determined by the type of injector),
– the high pressure rail pressure controlled by the computer.

THE CLEANLINESS AND SAFETY ADVICE SPECIFIED IN THIS DOCUMENT MUST BE FOLLOWED DURING ANY WORK CARRIED OUT ON THE HIGH PRESSURE INJECTION SYSTEM.

GETtheMANUALS.org

CHECKING TIGHTNESS AFTER REPAIR

Re-prime the circuit. To do this, turn the low pressure pump over by switching on the ignition several times, or turn the low pressure pump over with the fault finding tool using the **Actuator Commands** menu.

After any operation, check that there are no diesel fuel leaks. Run the engine until the engine cooling fan starts up, then accelerate several times with no load.

IMPORTANT:
The engine must not run with diesel fuel containing more than 10% diester.

The system can inject the diesel fuel into the engine at a pressure of up to **1350 bar**. **Check that the injector rail is depressurised before carrying out any work.**

It is absolutely vital that you observe the tightening torque:
– of the high pressure pipes,
– of the cylinder head injector,
– of the pressure sensor and pressure regulator.

When the high pressure pump, injectors and high pressure supply, return and output unions are removed or repaired, all orifices should be fitted with appropriate new blanking covers to prevent contamination entering.

WARNING: ALL PIPES REMOVED MUST BE REPLACED.

When replacing a high pressure pipe, follow the method below:
– remove the high pressure pipe, holding the filter rod on the injector with a lock-wrench,
– insert the anti-contamination caps,
– loosen the high pressure rail,
– fit the new high pressure pipe,
– manually bring the unions together until they touch,
– tighten the high pressure rail mountings to the required torque value,
– tighten the union at the injector side to torque,
– tighten the high pressure rail union to torque.

Dismantling the interior of the pump is prohibited.

The fuel return pipe fitted to the injectors must be replaced when it is removed.

The diesel fuel temperature sensor cannot be removed. It is part of the fuel return rail.

Loosening a high pressure pipe union when the engine is running is prohibited.

GETtheMANUALS.org

The **DENSO ECD-2UP** high pressure injection system is designed to deliver a precise quantity of diesel fuel to the engine at a precisely determined moment.

DESCRIPTION

- **DENSO 121-track** flash EEPROM computer controlling the injection.

- The system comprises:
  - a priming bulb on the low pressure circuit,
  - a diesel filter fitted with a diesel fuel heater,
  - a high pressure pump with a built-in low pressure pump (transfer pump),
  - two pressure regulators mounted on the pump,
  - an injector rail,
  - a diesel rail pressure sensor,
  - a pressure limiter on the rail,
  - six solenoid injectors,
  - an injector power computer,
  - a diesel fuel temperature sensor,
  - a coolant temperature sensor,
  - an air temperature sensor,
  - an air flowmeter,
  - a cylinder reference sensor,
  - an engine speed sensor,
  - a turbocharging pressure sensor,
  - a wastegate position sensor,
  - a turbocharging pressure regulation solenoid valve,
  - an exhaust gas recirculation solenoid valve,
  - an exhaust gas recirculation valve position sensor,
  - a damping unit control solenoid valve,
  - a damping unit,
  - an accelerator pedal potentiometer,
  - an atmospheric pressure sensor,
  - a computer.

- The common rail direct high pressure injection system works sequentially (based on multipoint injection operation for petrol engines).

- This new injection system reduces operating noise, reduces the volume of pollutant gases and particles and produces high engine torque at low engine speeds thanks to a pre-injection procedure.

GETtheMANUALS.org

- The high pressure pump generates the high pressure and transmits it to the injector rail. The two pressure regulators located on the pump control the pressure according to the requirement determined by the computer. The rail supplies each injector through a steel pipe.

- The **injection computer** receives signals from various sensors. It calculates the injection characteristics (advance, pre-injection, injection timing) and sends a control signal to the **power computer** which controls the opening of the injectors.

- **A damping flap** closes when the ignition is switched off. It blocks the air supply in order to stop the engine gradually and smoothly. To close the flap, the computer controls a solenoid valve which lets the vacuum from the vacuum pump pass through to the control diaphragm.

- In order to reduce the percentage of pollutant emissions, the P9X engine uses **a recirculated exhaust fumes cooler**. The gas let into the cylinders by the exhaust gas recirculation valve crosses an exchanger cooled by coolant. This results in the combustion temperature lowering. In this way, NOx emissions are reduced.

- The P9X engine uses **a potentiometer** which measures the movement of the turbocharger **wastegate** pin. The injection computer uses this information to fine tune the turbocharging regulation.

- During manufacture, tolerances lead to flow differences between the injectors. These differences cause operation noise and excess pollution.
  To compensate for these differences, a **calibration resistor** is fitted during manufacture into the electrical connector of each injector.
  The injection computer reads the value of this resistor which corresponds to the injector's tolerance. It then adjusts the injection timing so that the flow is the same on each injector.

- The computer:
  – determines the injection pressure value necessary for the engine to operate correctly and then controls the pressure regulators. It checks that the pressure value is correct by analysing the value transmitted by the pressure sensor located on the rail,
  – determines the injection timing required to deliver the right quantity of diesel fuel and the moment when injection should start,
  – controls each injector electrically and individually, via the power computer, after determining these two values.

GETtheMANUALS.org

- The high pressure pump is supplied at low pressure by an integrated low pressure pump (transfer pump) which consists of **two pumping pistons**. The pump has **two pressure regulators** in order to regulate the pressure. Each pressure regulator controls the amount of diesel let into a pumping element.

- The computer manages:
  – idling regulation,
  – exhaust fumes flow re-injection to the inlet,
  – the fuel supply (advance, flow and rail pressure),
  – the fan assembly (central coolant temperature management function),
  – thermal regulation of the cooling circuit (thermoplungers),
  – the authorisation to engage the air conditioning compressor clutch,
  – the adaptive cruise control function,
  – the pre/postheating function.

- The fan assembly and the coolant temperature warning light on the instrument panel are controlled by the injection computer (GCTE = Central Coolant Temperature Management).

- The connections between the vehicle's various computers are multiplexed. The fault warning lights on the instrument panel are therefore activated via the multiplex network.

- In the event of an impact, the diesel supply circuit cut-off signal is provided by the air bag computer. The airbag computer gives the command via the multiplex network to the injection computer to lock the injection locking relay control.
  Unlocking is only possible after the ignition has been switched off for 10 seconds. This operation will cause the fault warning light to be come on for longer than usual when the ignition is switched on. The warning light will only return to normal operation when the fault has been cleared using the fault finding tool.

- The adaptive cruise control function is controlled by the injection computer.

GETtheMANUALS.org

IMPORTANT

- **The engine must not operate with:**
  - **diesel containing more than 10% diester,**
  - **petrol, even in tiny quantities.**

- **The system injects the diesel into the engine at a pressure of up to 1450 bar. Before each operation, check that the injector rail is depressurised and that the fuel temperature is not too high.**

- **You must respect the cleaning and safety advice specified in this document for any work on the high pressure injection system.**

- **Removal of the interior of the pump and injectors is prohibited.**

- **The following must not be removed:**
  - **the pressure regulators on the pump,**
  - **the wastegate position sensor.**

- **For safety reasons, it is strictly forbidden to undo a high pressure pipe union when the engine is running.**

- **All high pressure pipes removed must be replaced as a matter of course.**

- **It is forbidden to repair the wiring harness connecting the cylinder reference sensor and the engine speed sensor. In the event of a fault, replace the wiring harness.**

- **Applying 12 volts directly to any component in the system is prohibited.**

- **Ultrasonic descaling and cleaning are prohibited.**

- **Never start the engine unless the battery is connected correctly.**

- **Disconnect the injection system computer when carrying out any welding work on the vehicle.**

- **A resistance is marked on the injectors. This resistance is specific to each injector, and takes into account differences in manufacture and specifies the flow injected by each one.**

GETtheMANUALS.org

CHECKING TIGHTNESS AFTER REPAIR

After any operation, check that there are no diesel fuel leaks.

Version Vdiag 4 of ECD-2UP DENSO injection

Re-prime the circuit using the priming pump.

Start the engine and run it until it reaches operating temperature.

Check that there is no diesel leak.

Apply tracing fluid to the high pressure connections of the pipe that has been replaced.

Perform a road test passing through all of the engine operating ranges (observe the speed limits in force).

Perform a visual inspection after the road test to make sure that there are no high pressure leaks.

Clean off the indicator fluid.

Version Vdiag 8 of ECD-2UP DENSO injection

NOTE:
ECD-2UP DENSO injection version Vdiag 8 has a command which may be issued through the fault finding tool. It enables the high pressure circuit to be tested for leaks when the vehicle is stationary with the engine running.

Re-prime the circuit using the priming pump.

This command can only be used if the coolant temperature **is above 80 °C**.

Apply indicator solution to the high pressure connections.

Activate command **SC001 "High Pressure Circuit Tightness Test"**. The engine speed is automatically boosted to **2000 rpms** for **2 minutes** then drops to idling speed.

Check visually that there is no high pressure leak.

Clean off the indicator fluid.

INJECTOR TEST

NOTE:
The Vdiag 8 version of ECD-2UP DENSO injection has a command which may be issued through the fault finding tool which inhibits the injectors one by one.

This command can only be used if the engine coolant is above **80 °C**.

Connect the fault finding tool then inhibit the injectors one by one using the commands located in **Command modes / actuators**.

AC632	**INJECTOR NO. 1 TEST**
AC633	**INJECTOR NO. 2 TEST**
AC634	**INJECTOR NO. 3 TEST**
AC635	**INJECTOR NO. 4 TEST**
AC636	**INJECTOR NO. 5 TEST**
AC637	**INJECTOR NO. 6 TEST**

GETtheMANUALS.org

CLEANLINESS ADVICE THAT MUST BE FOLLOWED WHEN WORKING ON THE HIGH PRESSURE DIRECT INJECTION SYSTEM

Risks relating to contamination

The system is highly sensitive to contamination. The risks resulting from contamination are:
– damage to or destruction of the high pressure injection system,
– a component seizing or leaking.

All after sales operations must be performed under very clean conditions. This means that no impurities (particles a few microns in size) should penetrate the system during dismantling or get into the circuits via the fuel unions.

The cleanliness guidelines must be applied from the filter through to the injectors.

WHAT ARE THE SOURCES OF CONTAMINATION?

Contamination is caused by:
– metal or plastic chips,
– paint,
– fibres,
  ● from cardboard boxes,
  ● from brushes,
  ● from paper,
  ● from clothing,
  ● from cloth.
– foreign bodies such as hair,
– ambient air,
– etc.

IMPORTANT:
Cleaning the engine using a high pressure washer is prohibited because of the risk of damaging connections. Furthermore, moisture may collect in connectors and cause electrical connection problems.

NOTES TO BE FOLLOWED <u>BEFORE ANY WORK IS CARRIED OUT</u> ON THE INJECTION SYSTEM

● Ensure that you have the caps for the unions to be opened (bag of plugs sold by the Parts Department). Caps are to be used once only. After use, they must be thrown away (once used they are soiled and cleaning is not sufficient to make them reusable). Unused caps must be discarded.

● Ensure that you have resealable plastic bags for storing removed parts. There is less risk of parts stored in this way being exposed to contamination. These are single-use bags; after use they must be discarded.

● Make sure that lint-free towelettes are available (part number **77 11 211 707**). The use of conventional cloth or paper wipes is prohibited. They are not lint-free and may contaminate the system fuel circuit. Each rag must be used once only.

GETtheMANUALS.org

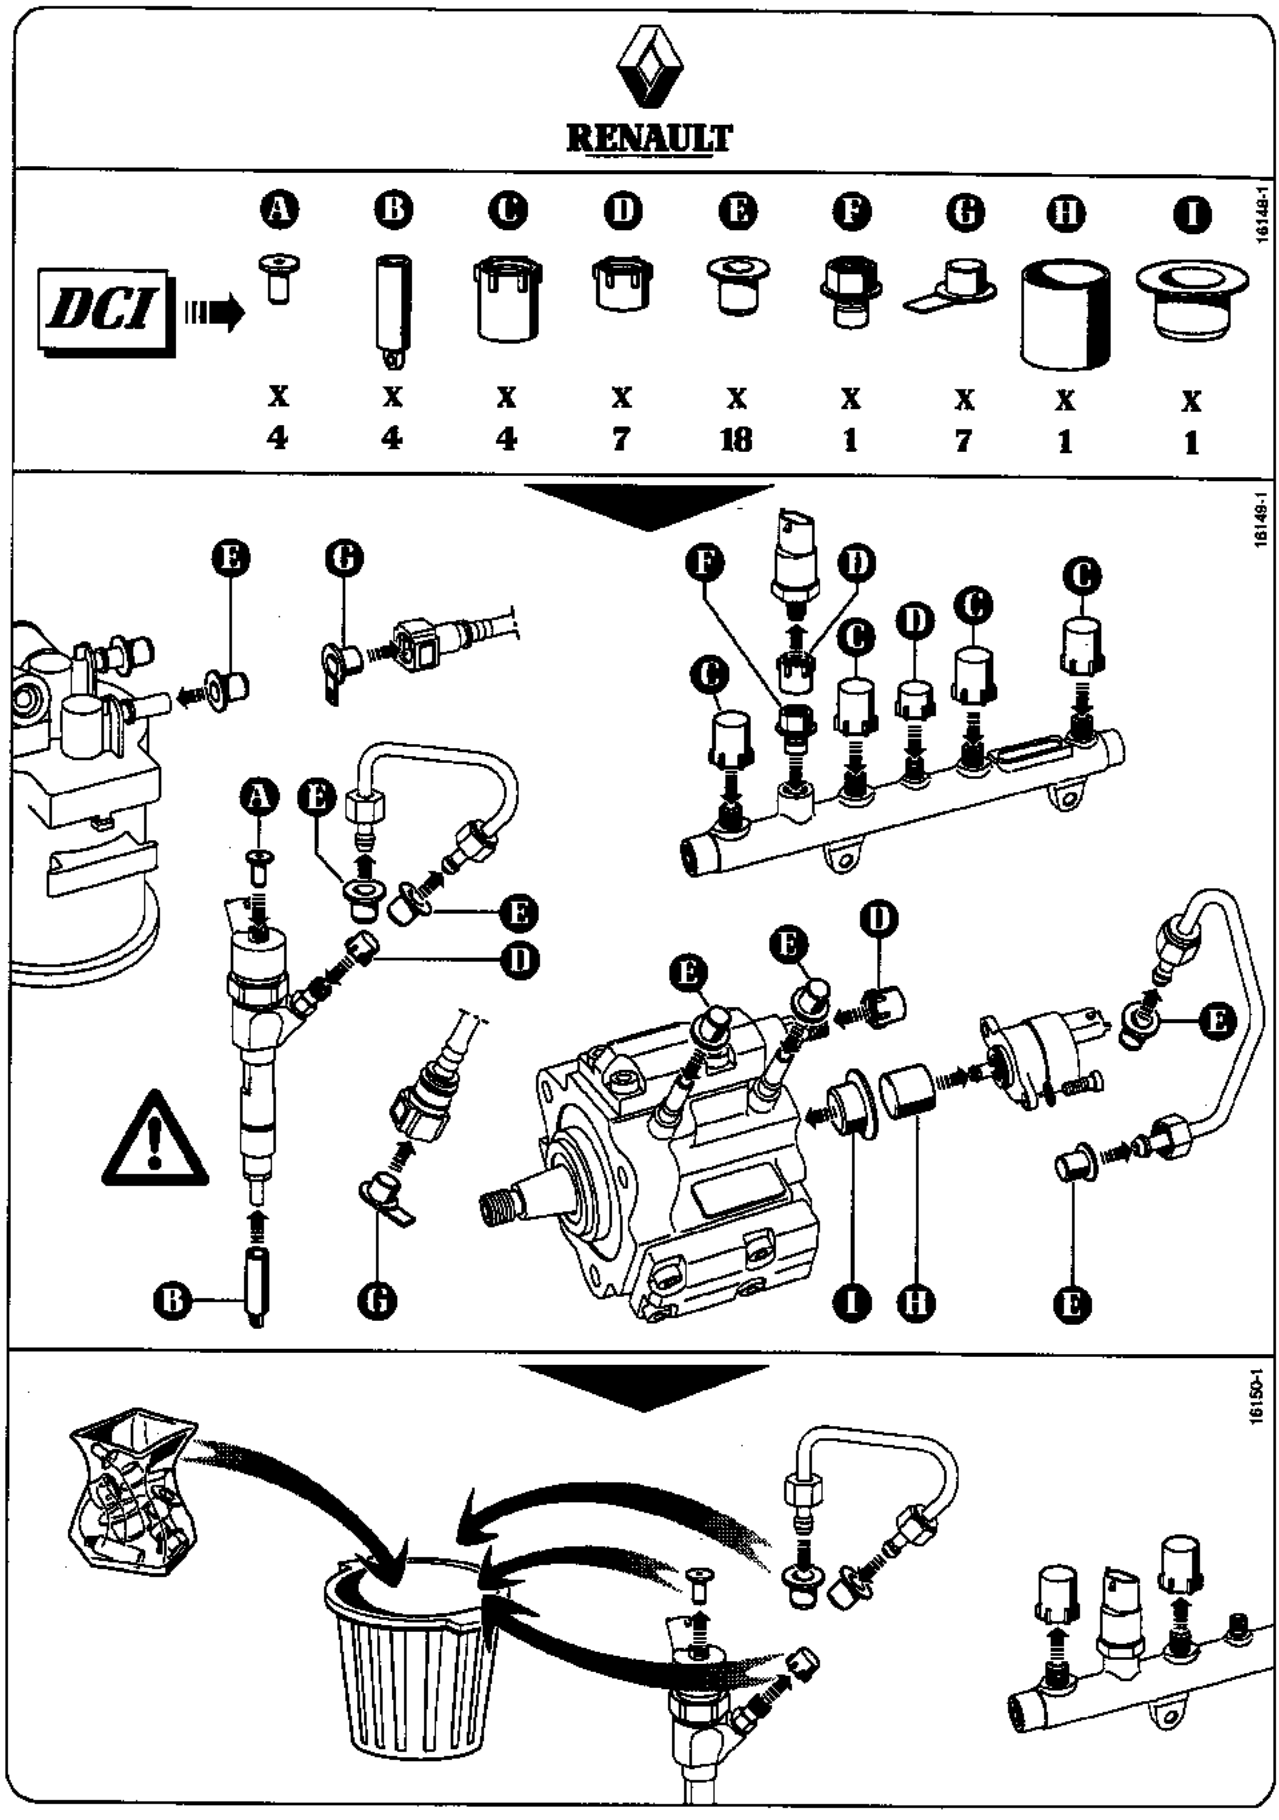
INSTRUCTIONS TO BE FOLLOWED BEFORE OPENING THE FUEL CIRCUIT

- Use fresh thinner for each operation (used thinner is contaminated). Pour it into an uncontaminated container.
- For each operation, use a clean brush in good condition (the brush must not shed its bristles).
- Use a brush and thinners to clean the unions to be opened.
- Blow compressed air over the cleaned parts (tools, workbench, and the parts, unions and injection system area). Check that there are no remaining bristles.
- Wash your hands before and during the operation if necessary.
- When wearing leather protective gloves, cover them with latex gloves.

NOTES TO BE FOLLOWED DURING THE OPERATION

- As soon as the circuit is open, all openings must be capped to prevent contamination. The caps to be used are available from the Parts Department. They must not be reused under any circumstances.
- Close the resealable bag, even if it has to be reopened shortly afterwards. The ambient air carries impurities.
- All components removed from the injection system must be stored in a hermetically sealed plastic bag once they have been capped.
- Using a brush, thinner, air gun, sponge or normal rag is strictly prohibited once the circuit has been opened. In fact, these elements are liable to cause the entry of impurities into the system.
- When replacing an old component with a new one, it must not be removed from its packaging until it is to be fitted on the vehicle.

GETtheMANUALS.org



GETtheMANUALS.org

INSTRUCTIONS FOR FITTING THE CAPS

The fitting instructions for the blanking plugs are contained in the plug kit available from the parts department.

DISMANTLING THE PUMP INTERNAL COMPONENTS IS PROHIBITED

SPECIAL TOOLING REQUIRED	
Mot. 1536	TDC setting rod
Mot. 1566	Tool for removing and refitting the high pressure pipes
Mot. 1548	G9T engine high pressure pump pulley extraction tool
Mot. 1503	Tool for fitting the rubber pads

EQUIPMENT REQUIRED
High pressure pipe wrench (for example, Facom DM 19 wrench) Socket for tightening high pressure pipe (for example, Facom "Crowfoot 18-17") Low torque wrench

TIGHTENING TORQUES (in daNm)	
High pressure pipe	
– on the injectors:	2.5
– on the pump:	2.7
– on the rail:	2.7
High pressure pump mounting	3
High pressure pump sprocket nut	9
the exhaust gas recirculation pipe bolt ().	2.5
High pressure pump rear mounting bolt	3

WARNING:
Before carrying out any work, plug in the After Sales fault finding tool, establish dialogue with the injection computer and check that the injector rail is depressurised.

Take note of the fuel temperature.

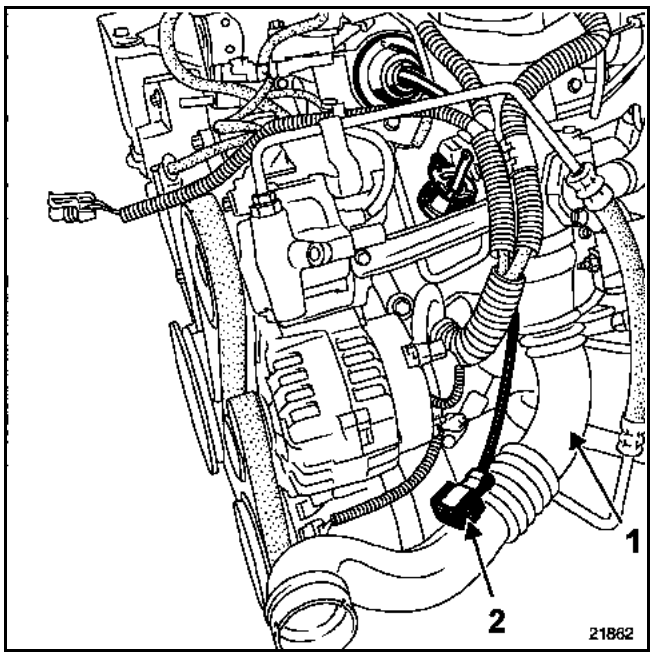
GETtheMANUALS.org

YOU MUST OBSERVE THE CLEANLINESS ADVICE GIVEN IN THIS SECTION

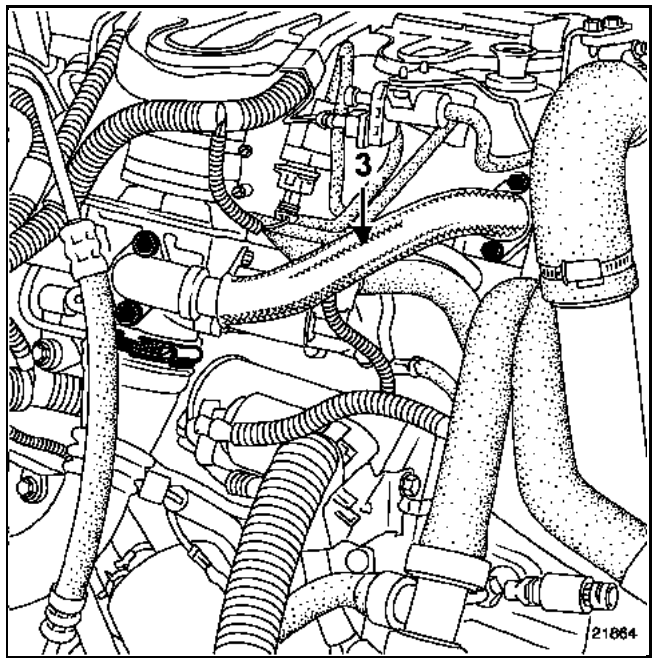
REMOVAL

Disconnect the battery.

Remove:
– the intercooler - damping unit air hose (1) by disconnecting the turbocharging pressure sensor (2),

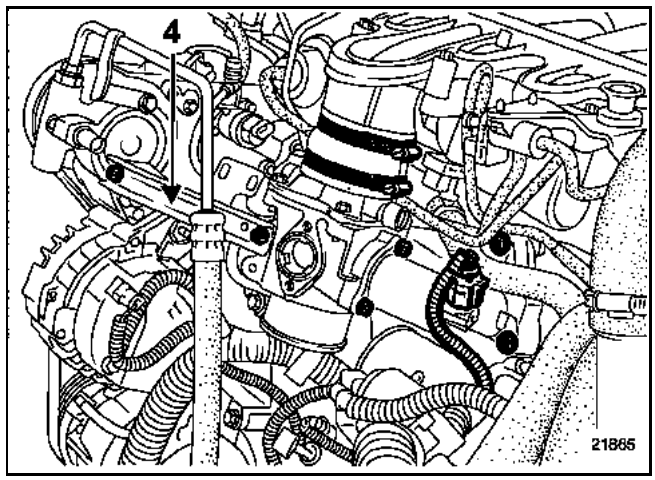


– the exhaust gas recirculation pipe (3) and its seals. Replace the pipe and the seals when refitting.



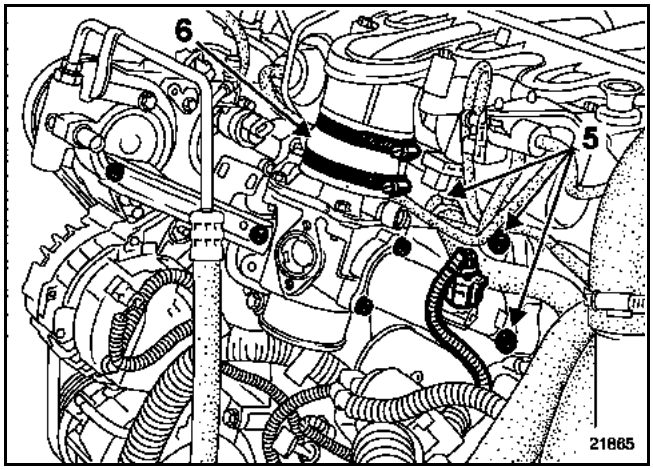
– the stiffening bracket (4) between the damper unit and the power assisted steering pump.

Disconnect the exhaust gas recirculation control solenoid valve connector.

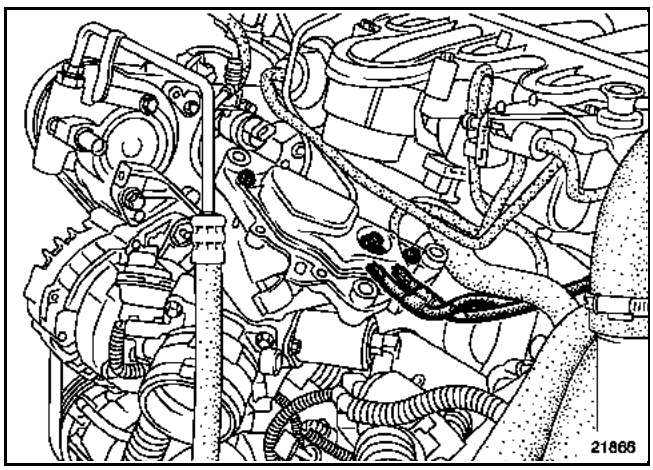


GETtheMANUALS.org

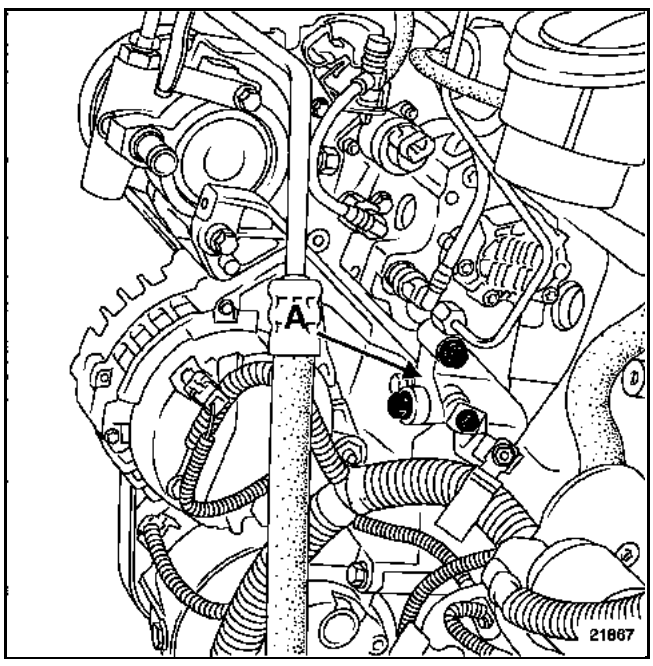
Remove:
– the damper unit mounting bolts (5),
– the connection pipe (6) with the inlet manifold.



Remove the diffuser unit by disconnecting the hoses from the vacuum reservoir.

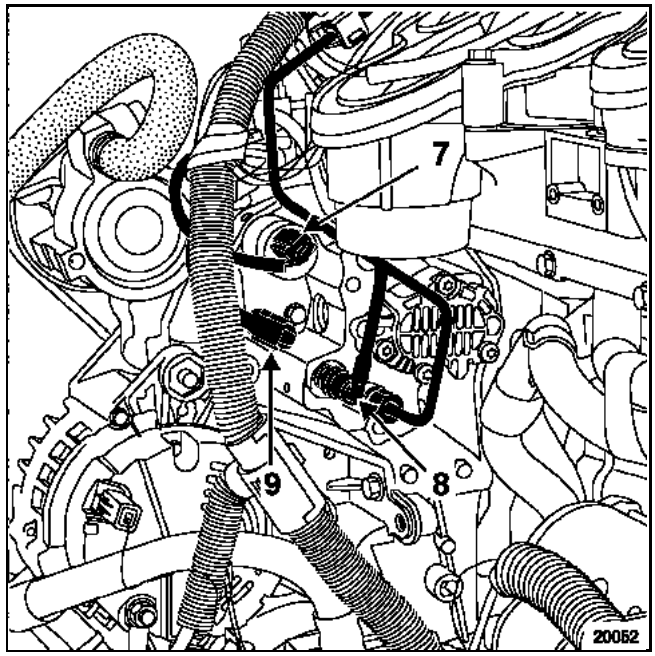


Remove the rear high-pressure pump support (A).



Set the engine to top dead centre using pin **Mot. 1536**.

Disconnect:
– the high pressure regulator (7),
– the diesel fuel temperature sensor,
– the fuel return pipe (8) and the fuel supply pipe (9) on the pump, then fit the blanking plugs.



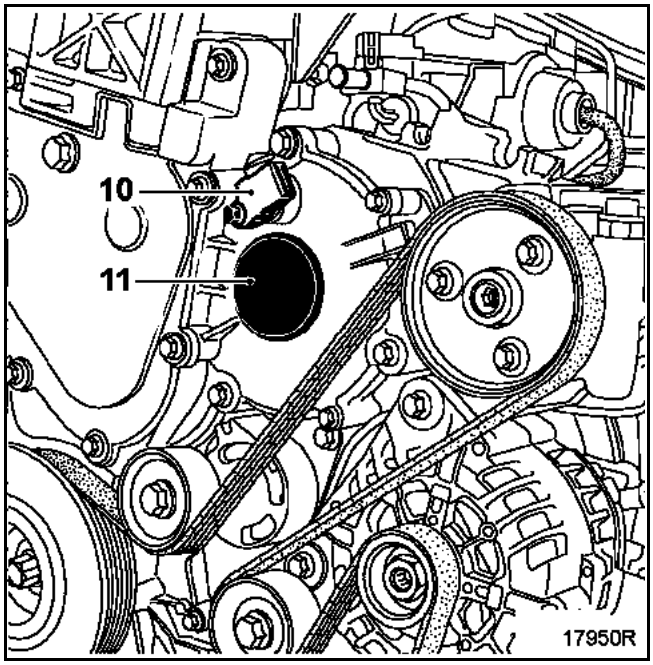
Unclip the rail protector and move it as far away as possible.

Remove the pump outlet/rail inlet high pressure pipe and fit the sealing plugs.

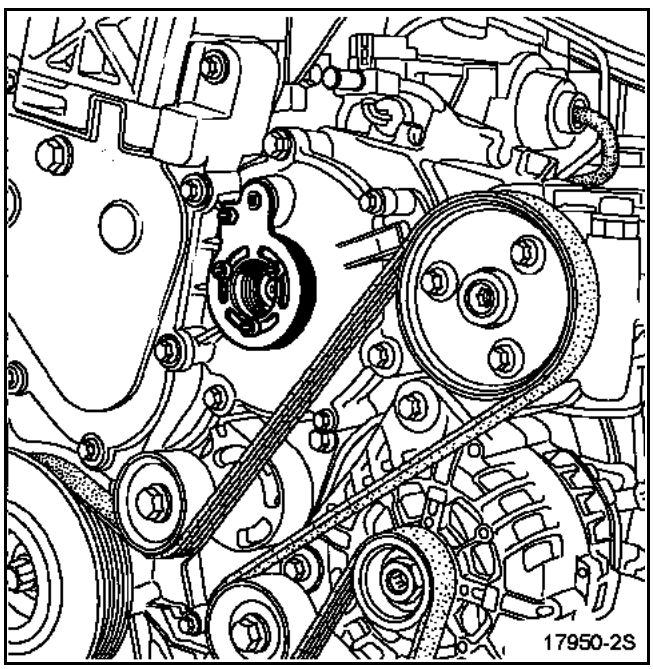
Unclip and move aside the power assisted steering oil reservoir, remove the diesel filter and then remove the supports for these items.

GETtheMANUALS.org

Remove:
– the position sensor (10) taking care not to drop the O-ring into the timing gear housing,
– the pump hub cover plug (11).



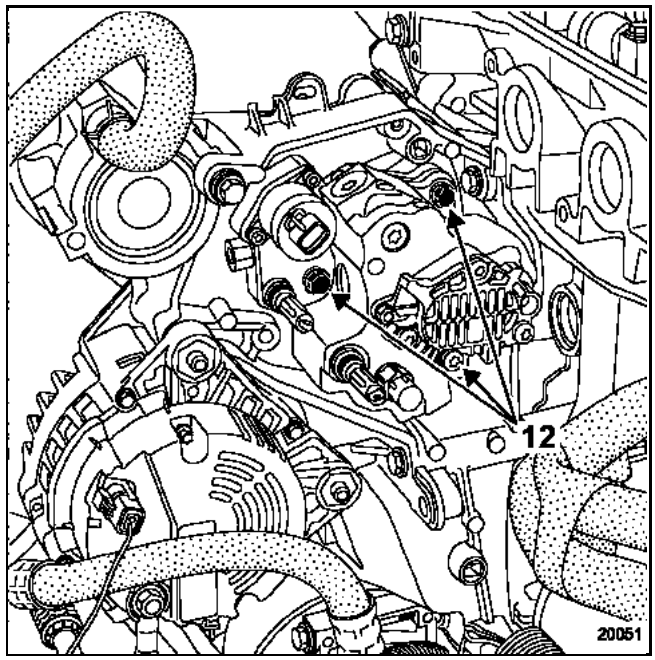
Fit tool **Mot. 1548**, using the central dowel, then remove the central dowel once the tool is in place.



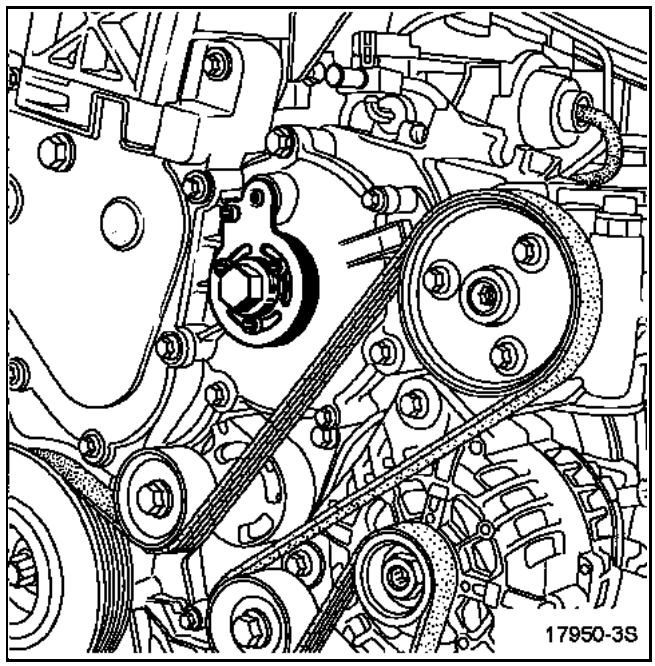
Remove the TDC setting pin **Mot. 1536**.

Remove the pump hub central mounting nut, locking the flywheel using a large screwdriver.

Loosen the three mounting bolts (12) on the multifunction support pump by a few turns.



Drive out the pump by tightening the dowel on tool **Mot. 1548**.



Remove the pump mounting bolts, then the high pressure pump.

GETtheMANUALS.org

REFITTING

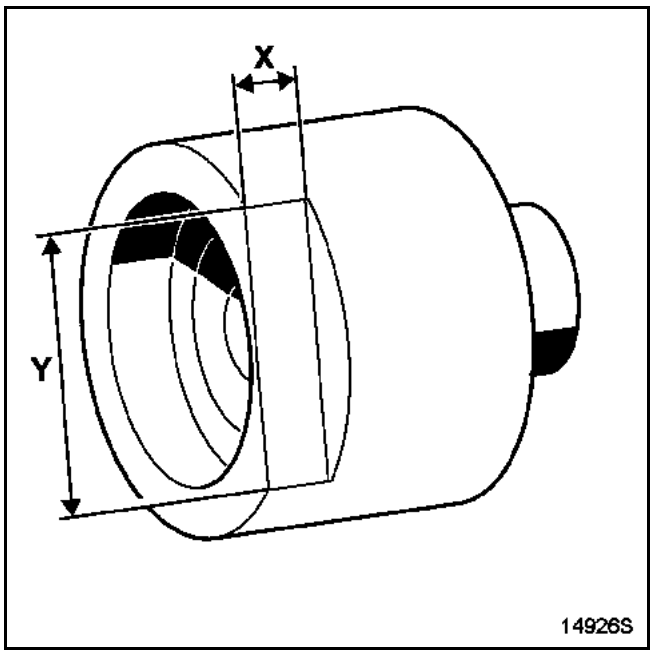
Proceed in the reverse order to removal using the central nut to engage the new pump.

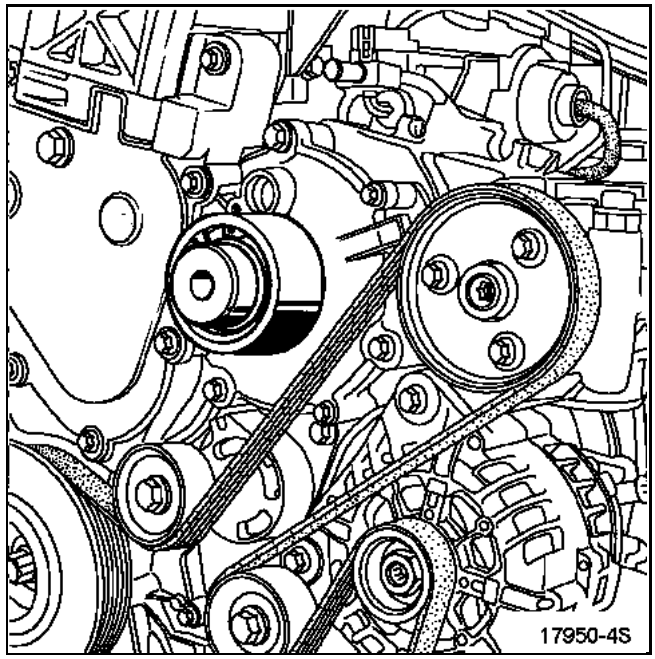
Check that the rear pump mounting holes are in the correct position.

Refit a new pump hub cover plug using tool **Mot. 1503** having adjusted it first.

Mot. 1503 tool adjustment:

Make a flat surface **X = 17 mm by Y = 40 mm**.





NOTE:
Be careful not to place the high pressure pipe under stress. To do this:
– loosen the high pressure rail,
– finger-tighten the high pressure pipe nuts to the pump and rail before tightening them to torque,
– tighten the rail to torque,
– tighten to the correct torque on the pump side,
– tighten to the correct torque on the rail side.

You must replace the fuel return pipe if it has been removed.

GETtheMANUALS.org

Before starting the engine, reprime the fuel circuit.
– Operate the low pressure pump by switching on the ignition several times, or with the fault finding tool using the **Actuator Commands** menu.
– Start the engine.

After carrying out any work, check that there are no leaks in the diesel circuit.
Proceed as follows:
– run the engine at idle speed until the engine cooling fan starts up,
– accelerate several times with no load,
– carry out a road test,
– switch the ignition off and check that there is no diesel fuel leakage,
– check that the absorbent soundproofing pads are not saturated with diesel fuel.

Check that there are no stored faults using the fault finding tool. Clear them if necessary.

GETtheMANUALS.org

DISMANTLING THE PUMP INTERNAL COMPONENTS IS PROHIBITED

SPECIAL TOOLING REQUIRED	
Mot. 1367-02	Lower engine support
Mot. 1376	Pin for immobilising flywheel.
Mot. 1651	Tool for fitting crankshaft seal, timing end.
Mot. 1653	Tool for fitting high pressure pump seal
EQUIPMENT REQUIRED	
"lorry" series 24 mm socket and sliding handle	

TIGHTENING TORQUES (in daNm)	
High pressure pump bolt	2.1
Timing intermediate pinion bolts	3.5
Pinion housing mountings	2.5
Crankshaft accessories pulley bolts	23.5
High pressure union bolt on the inlet manifold	2.1
High pressure pump gear mounting	16
Oil vapour recirculation pipe: M6 bolt	1
M8 bolt	2.5

IMPORTANT:
Before any operation, connect the After-Sales fault finding tool, establish dialogue with the injection computer and check that the injection rail is no longer under pressure.

Wait until the fuel temperature drops.

Order the special high pressure injection circuit caps kit.

GETtheMANUALS.org

REMOVAL

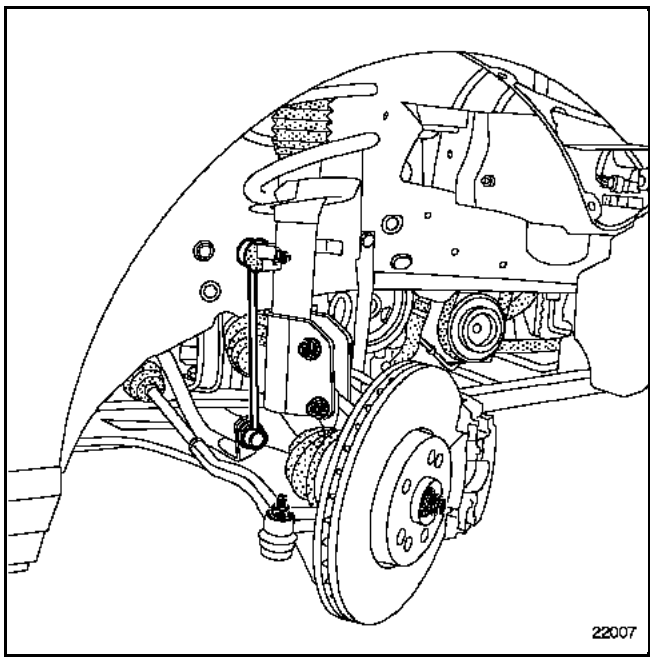
YOU MUST OBSERVE THE CLEANLINESS ADVICE

NOTE:
All high pressure pipes removed must be replaced as a matter of course.

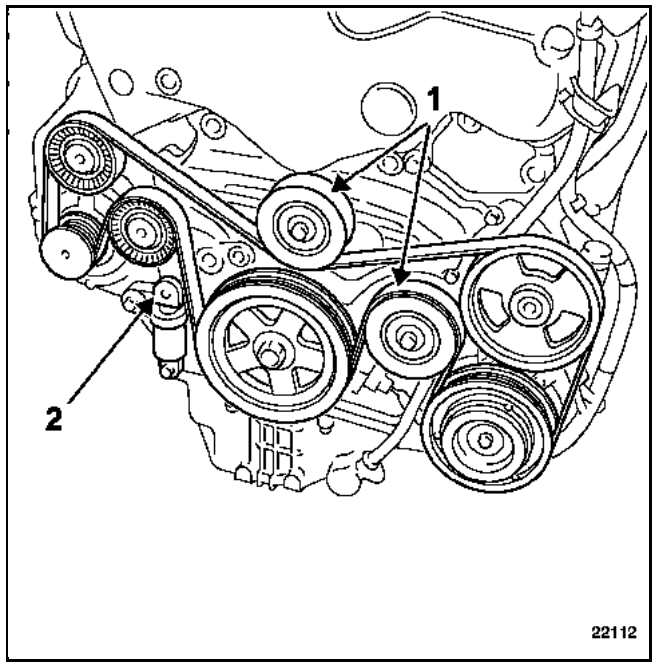
Remove the inlet manifolds (see section **12A Fuel mixture "Inlet manifold"**).

From the side

Disconnect the front right hand driveshaft, and to do this:
– remove the driveshaft nut,
– remove the driveshaft relay bearing flange,
– disconnect the track rod end,
– release the flexible brake pipe,
– remove the shock absorber base bolts.

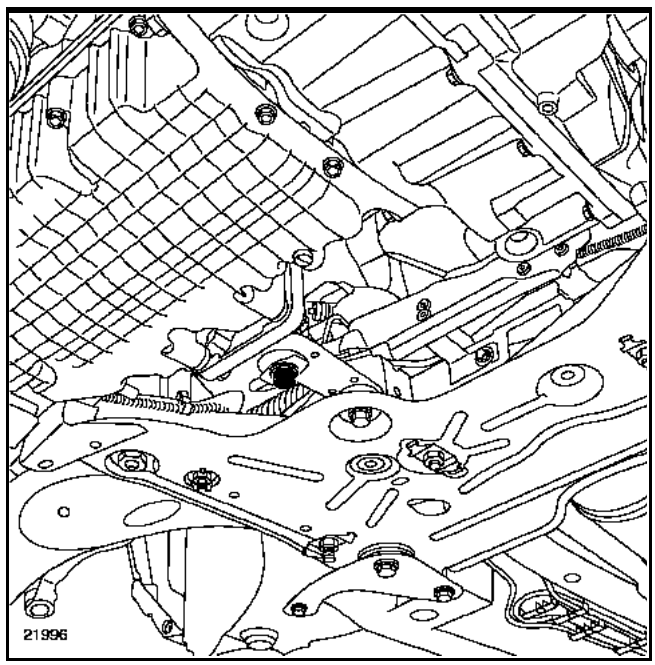


Remove:
– the accessories belt (see Section **07A Fan assembly values and adjustments: Accessories belt tension**),
– the accessories belt pulleys (1),
– the accessories belt tensioning device (2).



From below:

Remove the engine tie-bar mounting bolt on the engine.



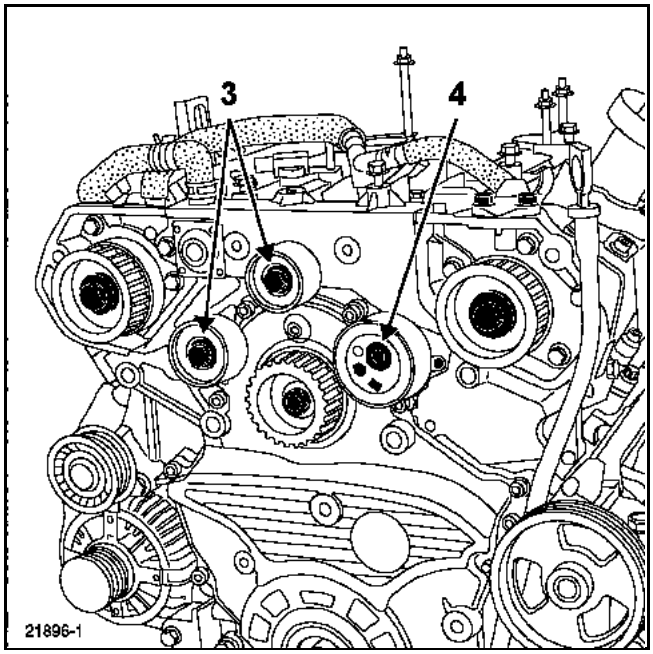
GETtheMANUALS.org

Remove the catalytic converter.

Lift the engine using the lifting tool.

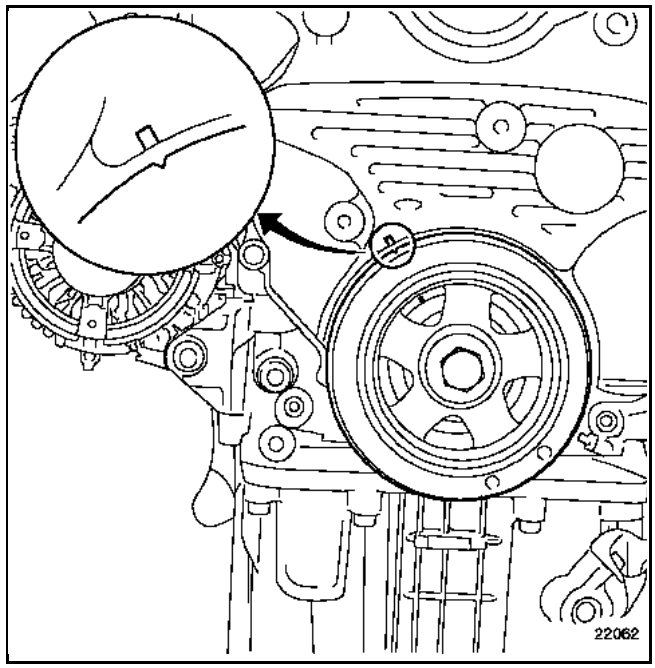
From above:

Remove:
– the timing belt (see section **11A Top and Front of Engine: "Timing Belt"**),
– the pulleys (3),
– the tension wheel (4).



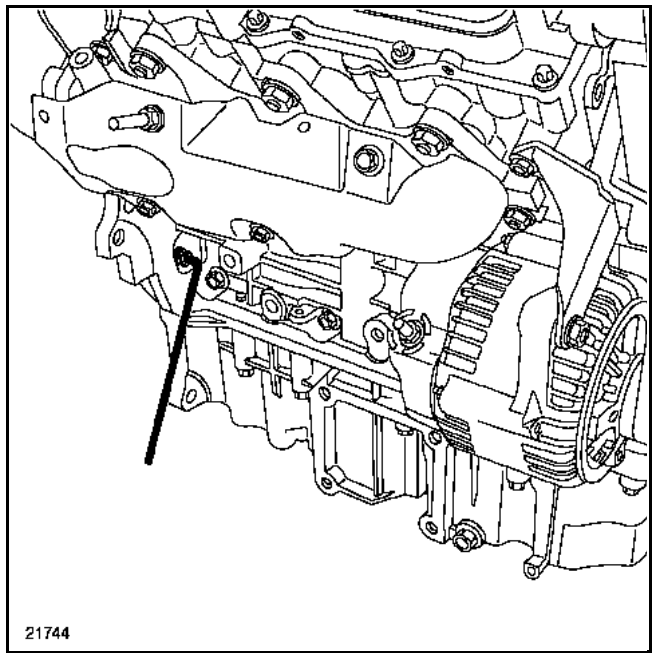
Using the lifting tool, lower the engine so as to be able to rotate the accessories pulley.

Ensure that the fixed and moving marks on the crankshaft accessories pulley are aligned.



Gently rotate the crankshaft in an anti-clockwise direction to bring the engine to the pegging point (access hole in the converter bolts).

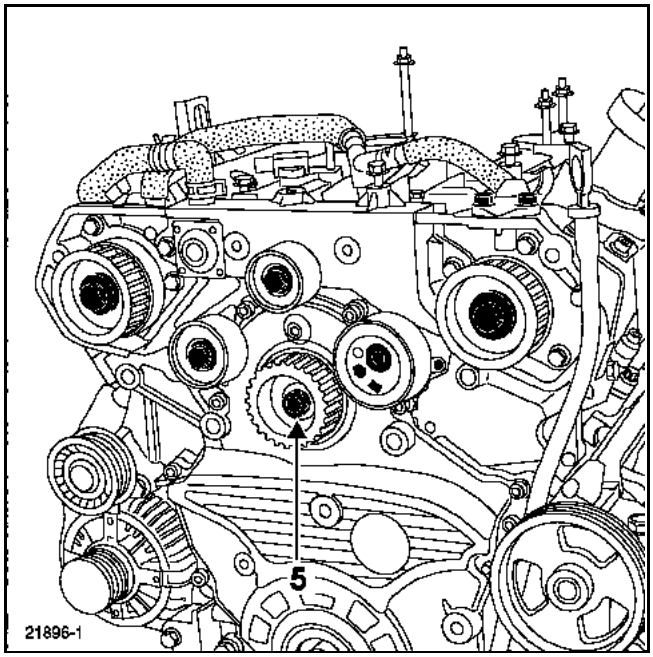
With the help of another operative, peg the engine using tool **Mot. 1376**.



GETtheMANUALS.org

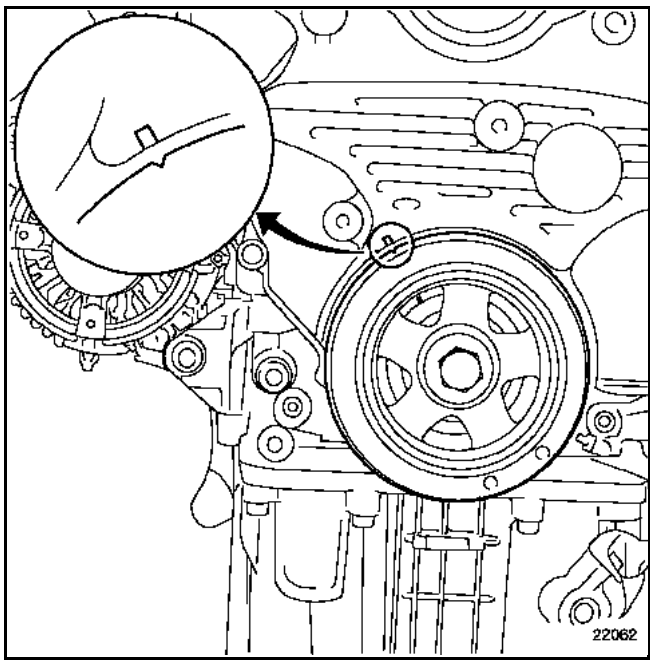
Undo:
– the crankshaft accessories pulley mounting bolt slightly,
– the high-pressure pump gear mounting nut (5).

Remove:
– the high-pressure pump gear,
– the engine locking tool **Mot. 1376**.



Rotate the engine to bring it back to Top Dead Centre.

Ensure that the fixed and moving marks on the crankshaft accessories pulley are aligned.



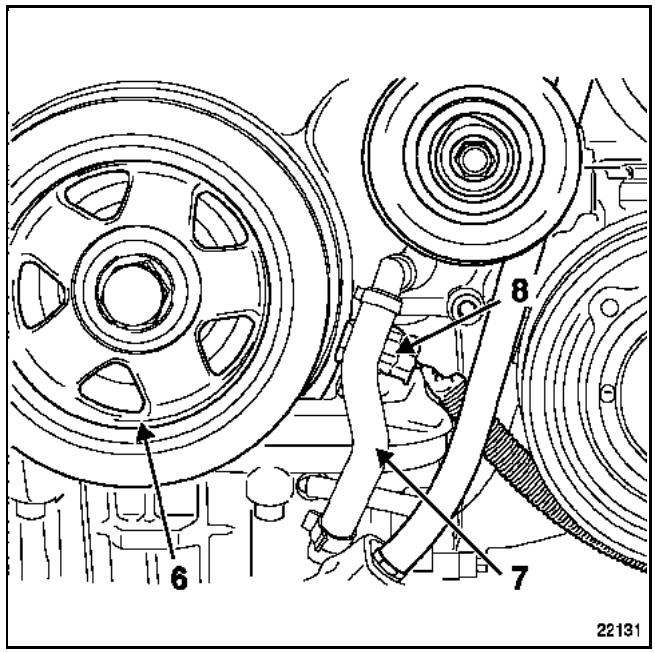
Completely undo the crankshaft accessories pulley mounting bolt.

Remove pulley (6).

Disconnect:
– the oil vapour recycling pipe (7) on the standard pinion housing,
– the engine speed sensor connector (8).

Remove the engine speed sensor.

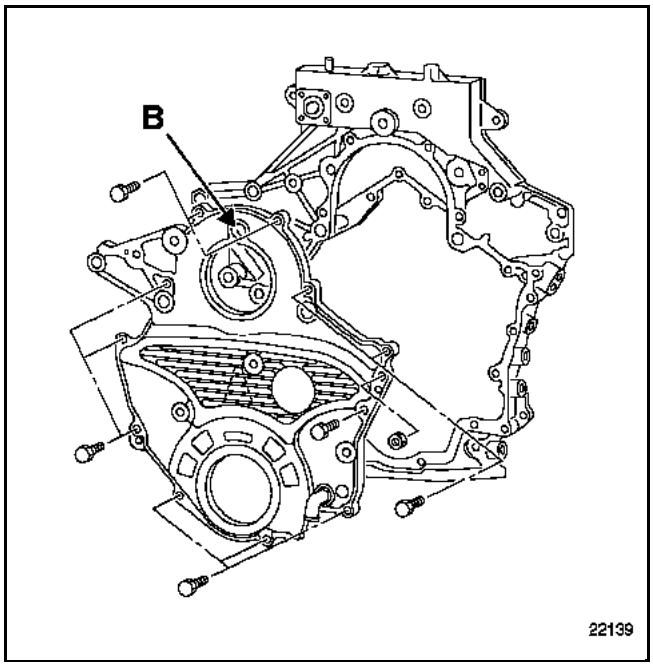
Block the oil vapour recirculation pipe.



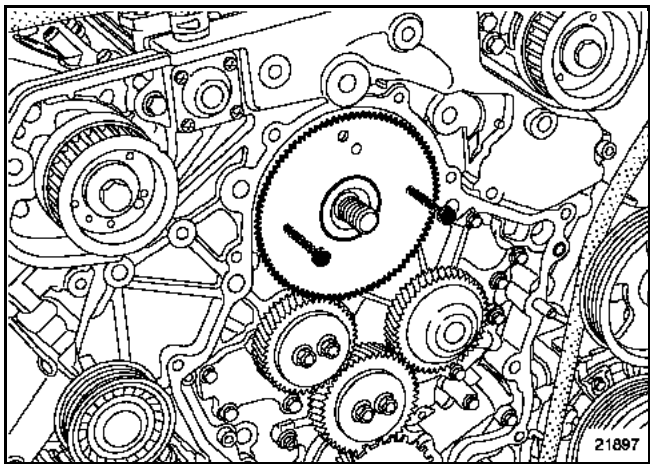
GETtheMANUALS.org

Undo then remove the standard pinion housing mountings.

Remove:
– the cap located at (B),
– the standard pinion housing.

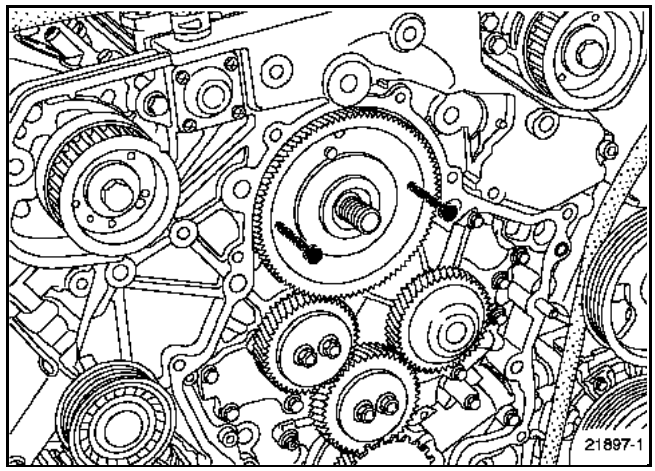


Screw two **M6 x 100**, **50 mm long** bolts into the high pressure pump pinion, so as to release the wear compensation system.



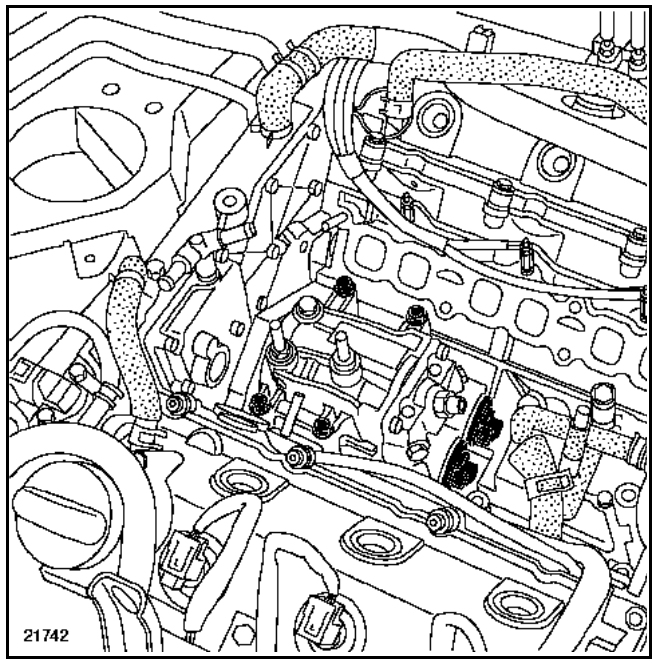
Retrieve the wear compensation spring.

Screw two **M6 x 100**, **50 mm long** bolts into the high-pressure pump pinion, so as to release it from the pump shaft.



Remove the high-pressure pump mountings.

NOTE:
Mark the position of the pump mounting bolts.



GETtheMANUALS.org

Release the pump from the engine.

Disconnect the two pressure regulators. Release the harness.

Remove the seal from the high-pressure pump.

CLEANING

It is very important not to scratch the gasket faces of any aluminium components.

Use **Décapjoint** to dissolve any part of the joint which remains cemented to the pinion housing.

Apply the product to the part to be cleaned, wait approximately ten minutes, then remove it using a wooden spatula.

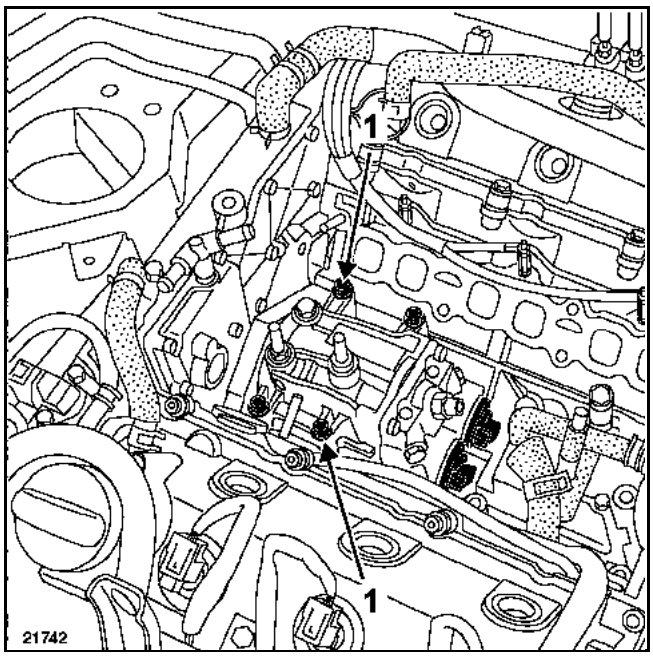
GETtheMANUALS.org

REFITTING

Fit the pump with a new seal.

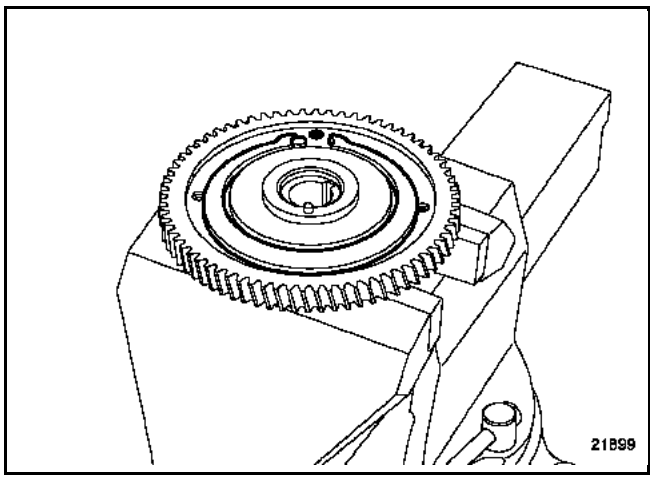
Fit:
– the pump centring bolts (1),
– the other mounting bolts.

Tighten the mounting bolts to a torque of **2.1 daNm**, distributing the torque evenly.

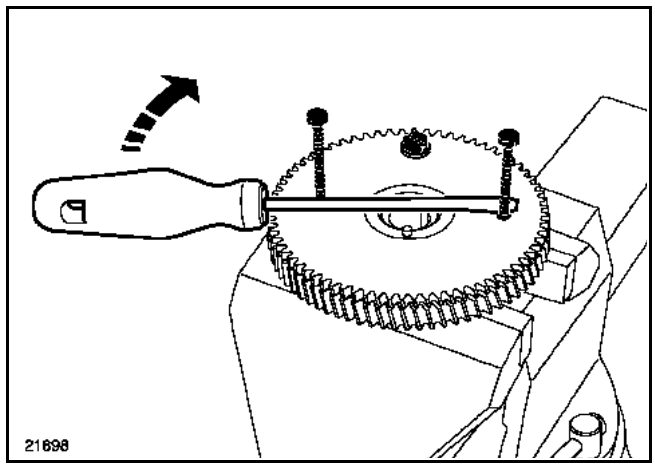


In a vice:

Match the pump gear with the wear compensation pinion. To do this:
– fit the spring in the pump gear,



– screw two **M6 x 100**, **50 mm long** bolts into the wear compensation pinion,
– fit the wear compensation pinion into the pump gear,
– using a screwdriver, rotate the wear compensation device so as to align the teeth on the two pinions,
– secure the assembly using a **M6 x 100**, **15 mm long** slotted head screw.



Remove the two **50 mm** bolts from the wear compensation pinion.

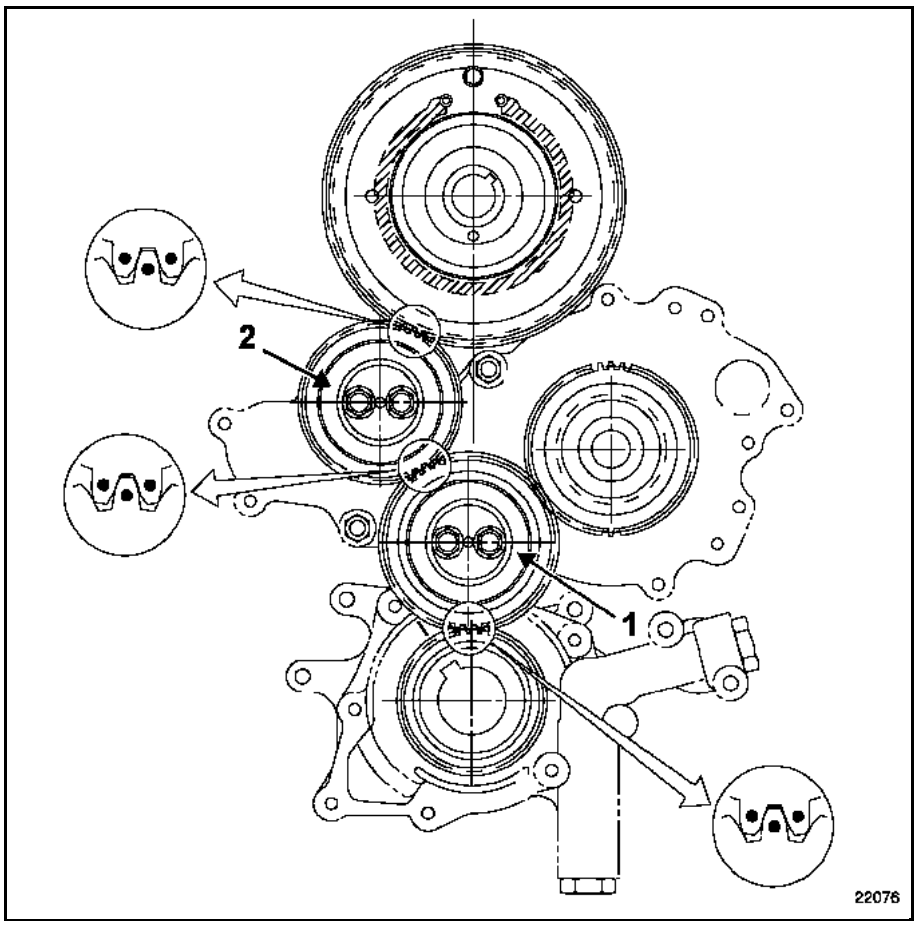
GETtheMANUALS.org

Remove the two intermediate pinions (1) and (2) from the pinion set.

Fit:
– the intermediate pinion (1) and align the marks in relation to the crankshaft sprocket,
– the intermediate pinion (2) and align the marks in relation to the intermediate pinion (1),
– the pump gear and align the marks in relation to the intermediate pinion (2).

Finger tighten the intermediate pinion mounting bolts then tighten them to a torque of **3.5 daNm**.

NOTE:
After tightening, ensure that the marks on the pinion set are correctly aligned.

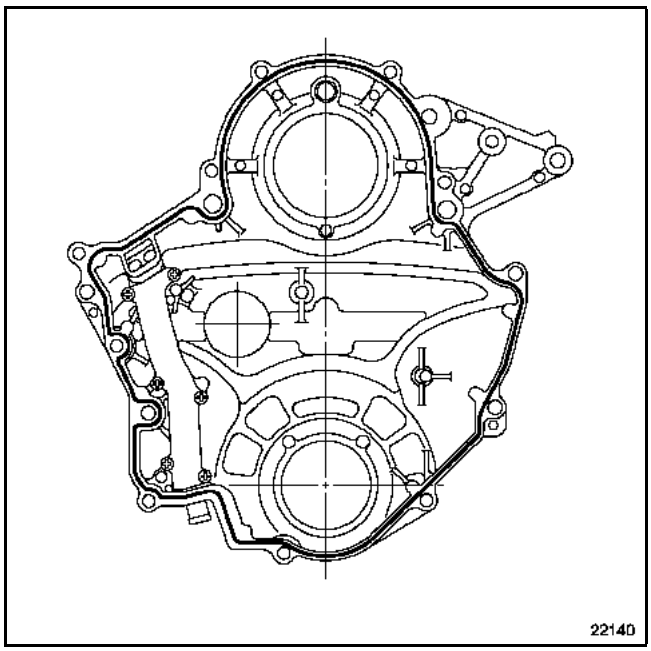


GETtheMANUALS.org

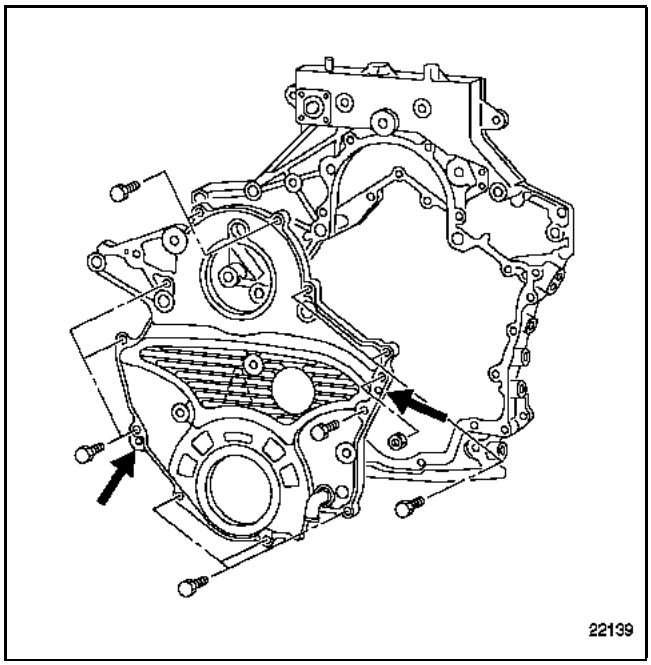
Clean and degrease the seal surfaces.

Remove the seals from the crankshaft accessories pulley and the high-pressure pump gear.

Apply a **3 mm** diameter bead of **THREEBOND** sealing paste to the pinion housing.

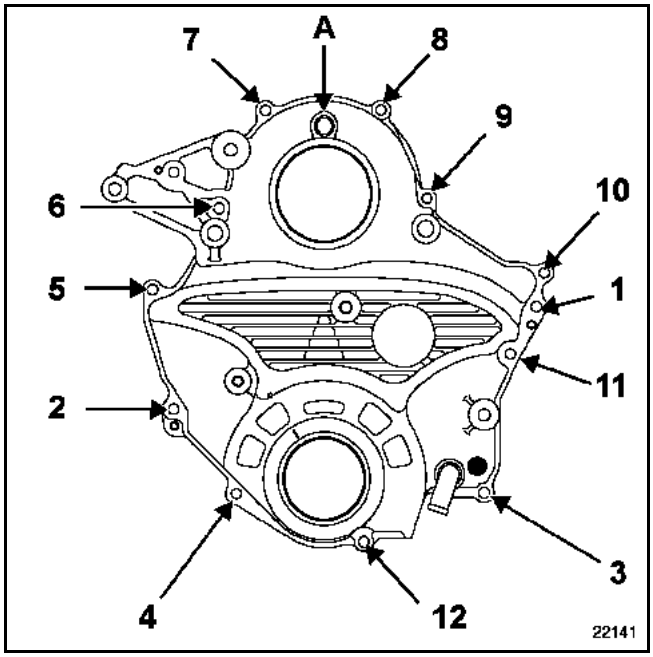


Fit the pinion housing on the centring pins then insert all the mounting bolts.



GETtheMANUALS.org

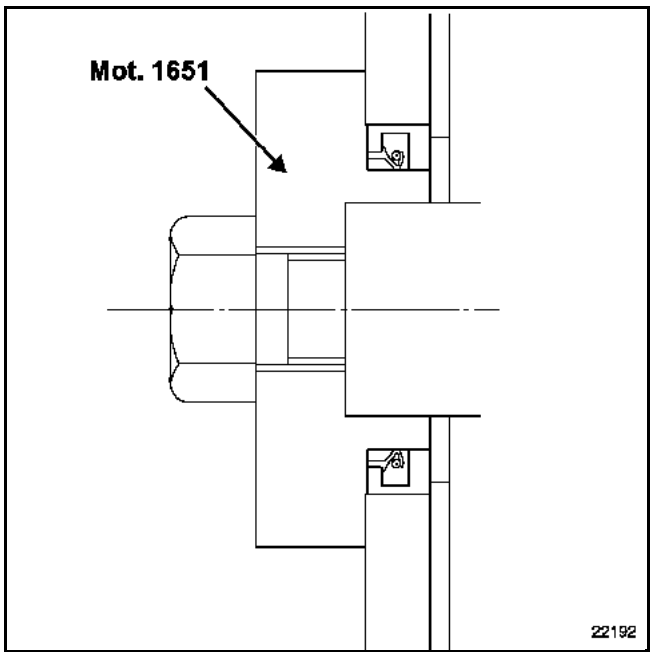
Tighten the bolts in order to a torque of **2.5 daNm**.



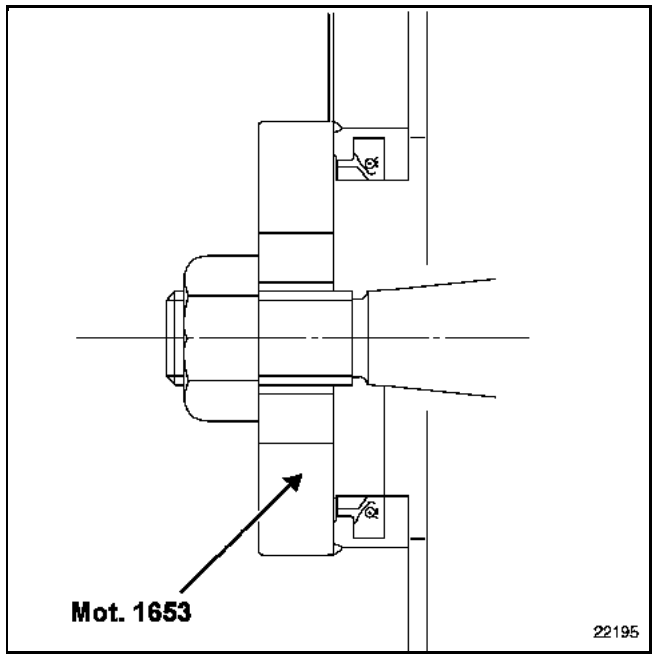
Remove the pump gear wear compensation securing bolt using a screwdriver at (A).

Refit the cap.

Fit a new seal:
– on the crankshaft accessories pulley using tool **Mot. 1651**,



– on the high-pressure pump gear using tool **Mot. 1653**.



Fit:
– the crankshaft accessories pulley,
– the pump gear.

Fit the mounting bolt and nut.

Ensure that the fixed and moving marks on the crankshaft accessories pulley and the pump gear are aligned.

Gently rotate the crankshaft in an anti-clockwise direction to bring the engine to the pegging point.

GETtheMANUALS.org

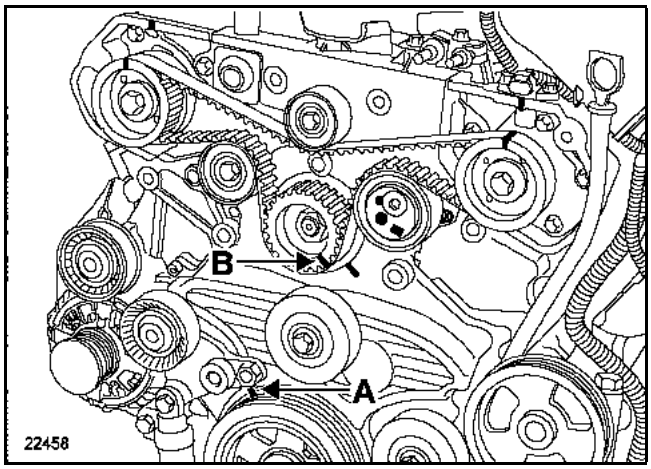
With the help of another operative, peg the engine using tool **Mot. 1376**.

Tighten:
– the crankshaft accessories pulley mounting bolt to a torque of **23.5 daNm**,
– the pump gear mounting nut to a torque of **16 daNm**.

Remove the engine pegging tool **Mot. 1376**.

Rotate the engine to bring it back to Top Dead Centre.

Ensure that the fixed and moving marks:
– on the crankshaft accessories pulley (A),
– and the pump pinion (B) are aligned.



GETtheMANUALS.org

Refit:
– the pulleys,
– the tension wheel,
– install the timing belt (see section **11A Top and front of engine "Timing belt"**),
– the accessories belt tensioning device,
– the accessories belt pulleys,
– the accessories belt (see section **07A Engine and transmission assembly values and adjustments "Accessories belt tension"**)

Fit the front right hand driveshaft (see section **29A "Driveshaft"**).

NOTE:
Remove the blanking plugs at the last moment.

Refit then tighten loosely by hand:
– the new pump outlet high-pressure hose,
– the diesel supply and return pipes with new seals,
– the oil vapour recirculation pipe with a new seal,
– the diesel supply and return pipe bracket then the nuts on the pump,
– the return hose with the diesel temperature sensor.

Tighten the various diesel pipe unions to the correct torques (see diagram).

Refit the injector rail (see relevant operation in section **13B "Injector rail"**).

Refit in the reverse order to removal for the other refitting operations.

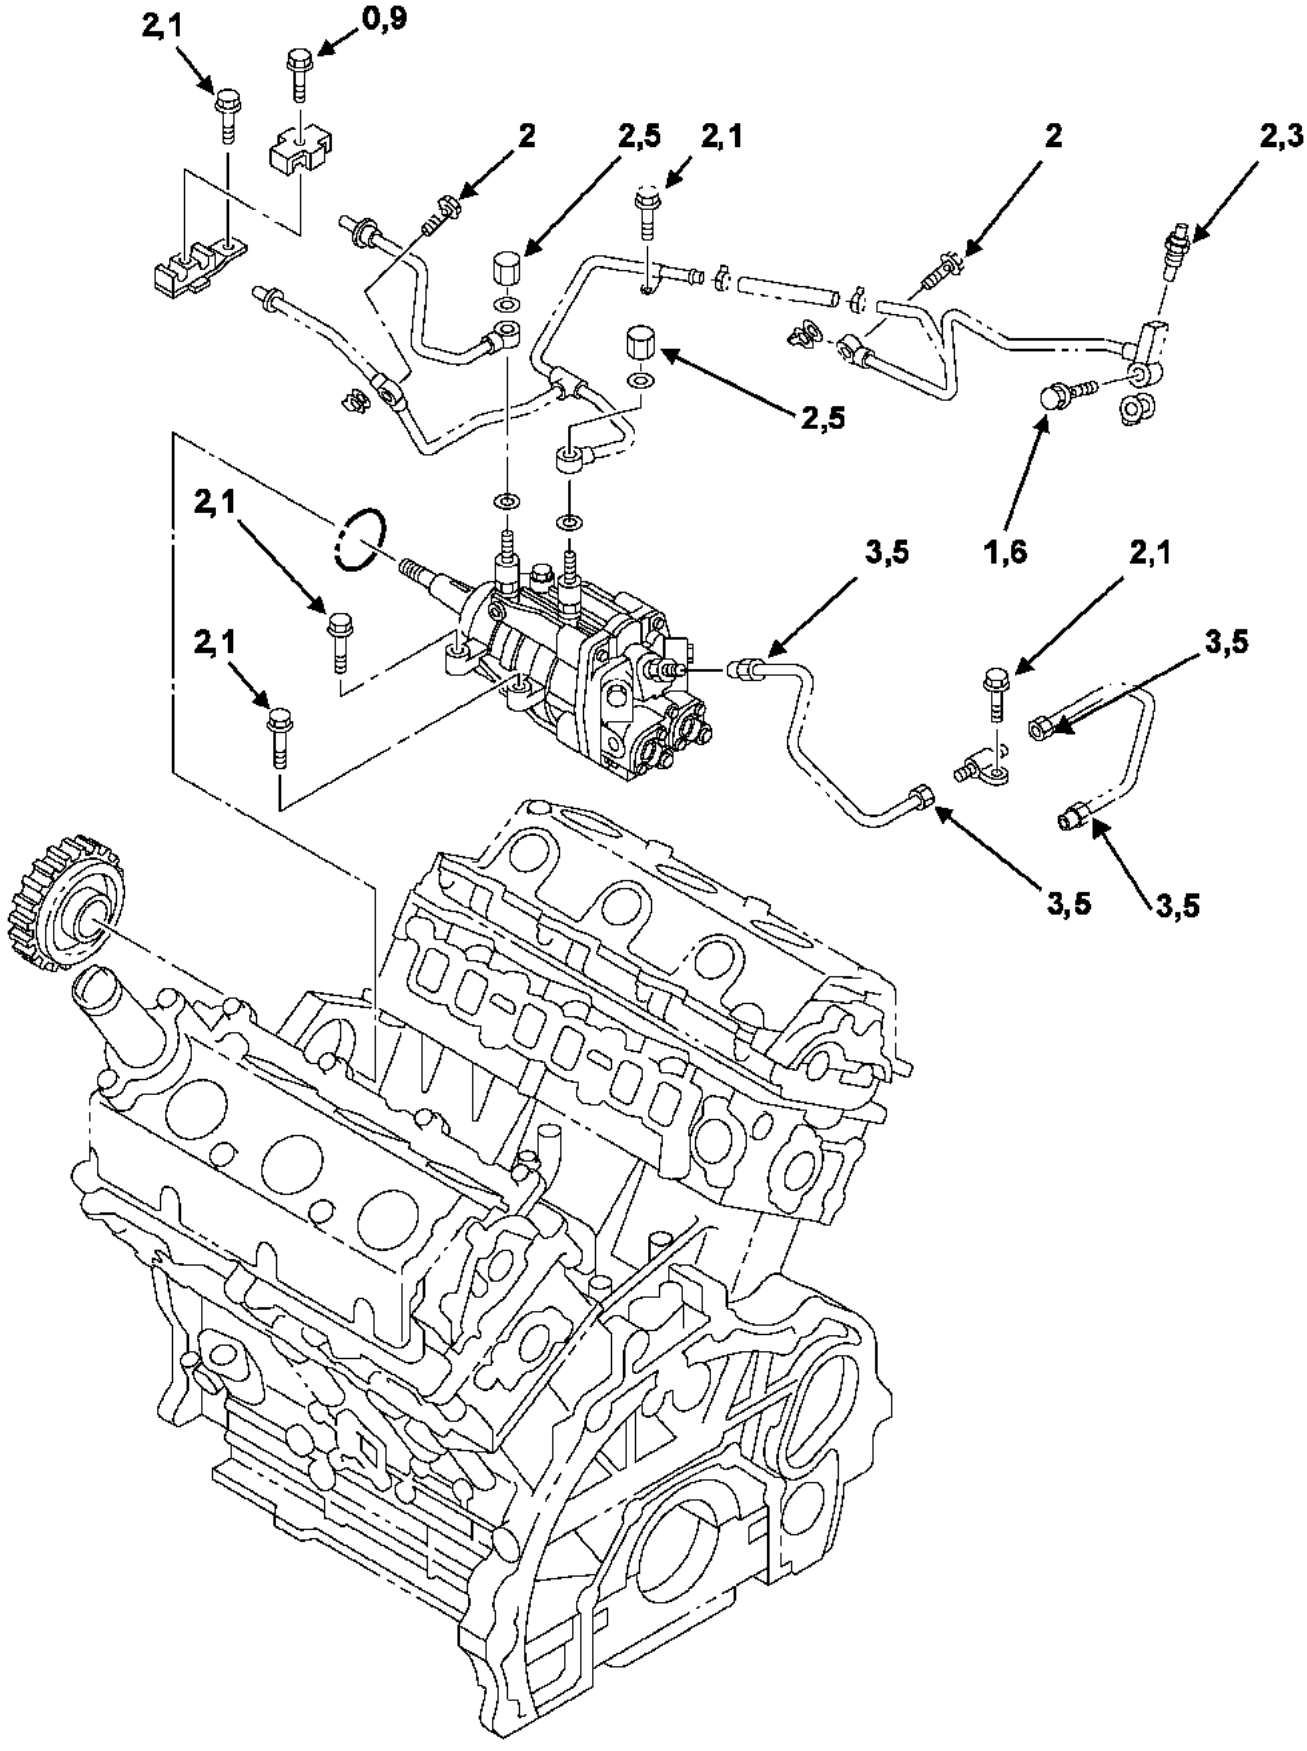
Reprime the diesel supply system using the priming bulb.

Adjust and bleed the cooling circuit (see section **19A Cooling "Filling bleeding"**).

Ensure there are no leaks in the high-pressure circuit after repair (see Section **13B Special notes**).

GETtheMANUALS.org

TIGHTENING TORQUES OF THE HIGH PRESSURE PUMP PIPES (in daNm)



22099

GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Mot. 1549	Injector extractor
Mot. 1566	Tool for removing and refitting the high-pressure pipes
EQUIPMENT REQUIRED	
Low torque wrench High pressure pip wrench (e.g. Facom DM 19 wrench).	

TIGHTENING TORQUES (in daNm)	
Injector bracket nut pretightening	0.6 ± 0.1
Injector bracket nuts on the flywheel end	360 ± 30°
Injector bracket studs	0.2 ± 0.05
High pressure pipe nuts	
– - on the injectors:	2.5
– on the pump:	2.7
– on the rail:	2.7
Injection rail mounting bolt	2.5
Rail-pump pipe bracket bolt	0.3

WARNING:
Before carrying out any work, plug in the After Sales fault finding tool, establish dialogue with the injection computer and check that the injector rail is depressurised.

Take note of the fuel temperature.

Order the special high pressure injection circuit caps kit.

REMOVAL

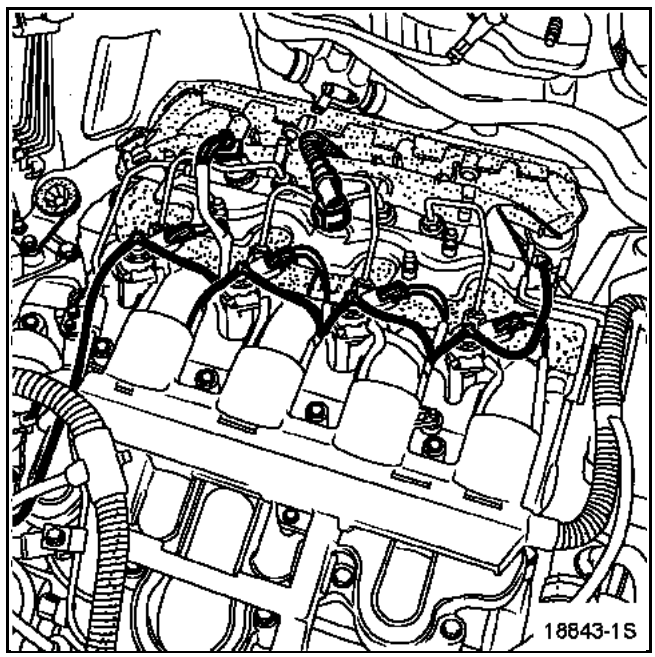
YOU MUST OBSERVE THE CLEANLINESS ADVICE

Disconnect the battery.

Unclip the side partitions of the rubber flap.

Unclip the rubber flap from the rocker cover and push it as far back as possible.

Remove the soundproofing material.



GETtheMANUALS.org

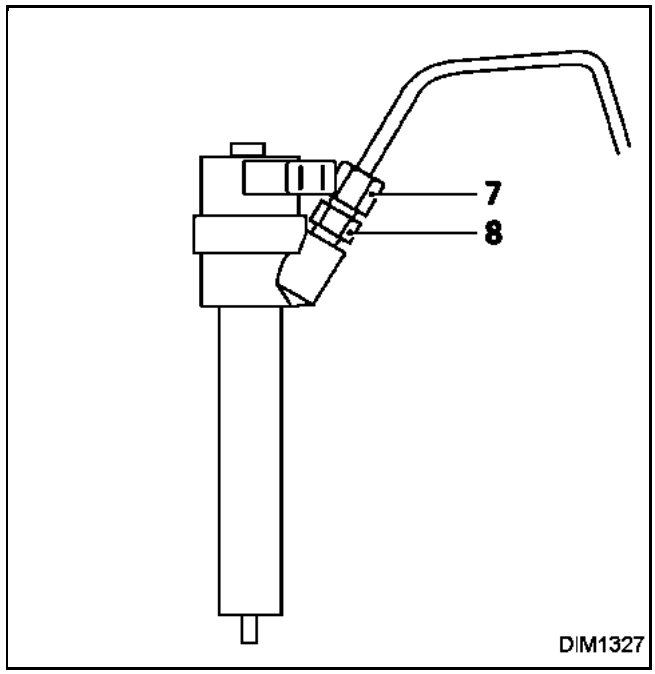
Disconnect the pressure sensor (1) and the injector wiring.

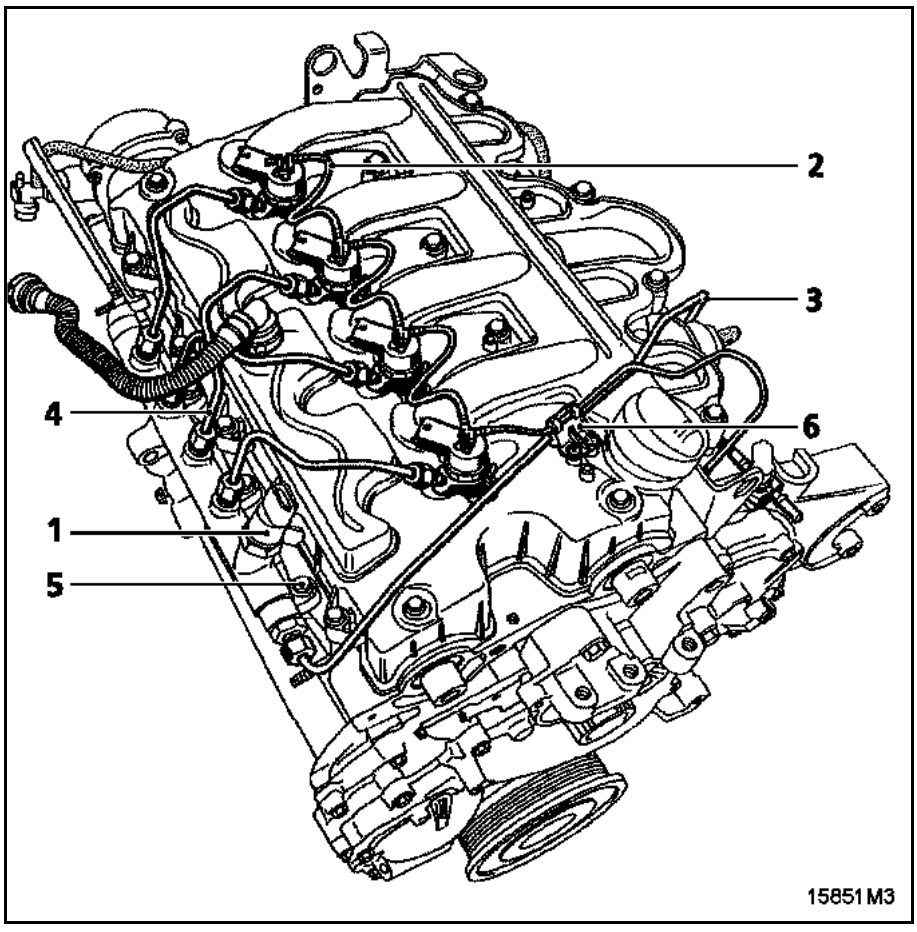
Remove:
– the injector diesel return pipe (2) (to be replaced),
– the injection pipe (3) between the high-pressure pump and the rail. WARNING: the cylinder head mounting clip (6) is very fragile,
– the injector pipes (4).

Fit anti-pollution plugs.

IMPORTANT:
When loosening the injection harness unions (7) on the injector holder, hold the filter-rod supporting bolts (8) with a lock wrench.

Loosen the injector rail bolts (5) without removing the injector rail.





GETtheMANUALS.org

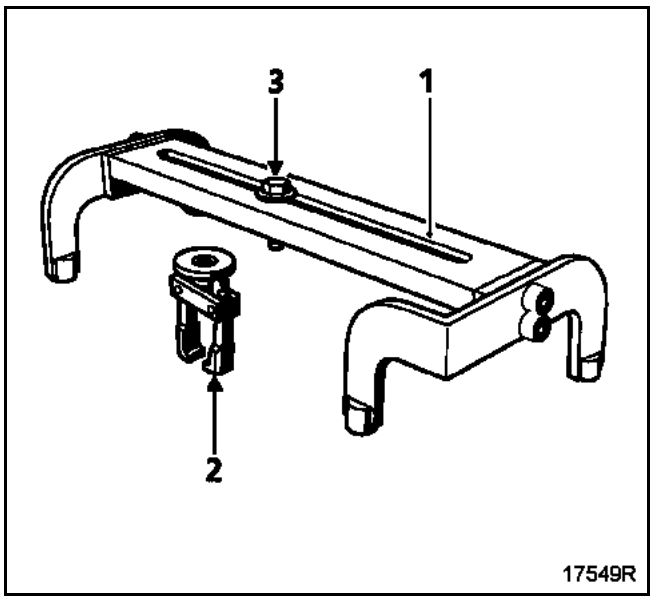
REMOVING THE INJECTOR HOLDERS (pipes removed)

Loosen the mounting bolts on each injector holder.

A special puller must be used to remove the injectors. Never attempt to remove an injector holder locked in its cylinder head well unless using the tool described below.

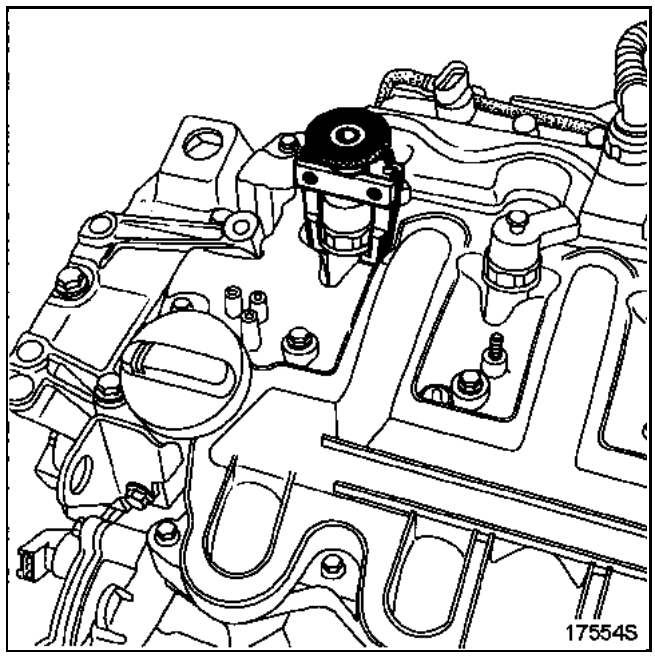
Description of tool **Mot. 1549**:

1 Extractor support chassis; this is fitted on the rocker cover mounting bolts. Check that it is fitted correctly before use.
2 Puller
3 Extraction bolt

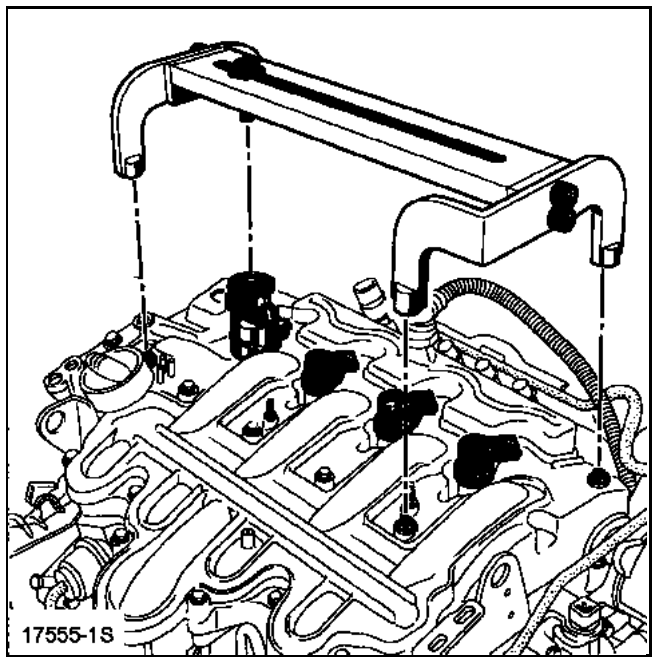


Apply releasing agent around the injector.

Fit the puller onto an injector holder. Tighten the knurled ring to bring the two jaws together on the flat surfaces without over-tightening.



Fit the chassis of tool **Mot. 1549** on the rocker cover mounting bolts. Tighten the extraction bolt until the injector is released from the cylinder head.



Remove the washer from the bottom of each injector well.

GETtheMANUALS.org

REFITTING

Do not remove the protective plugs from each component until the last moment.

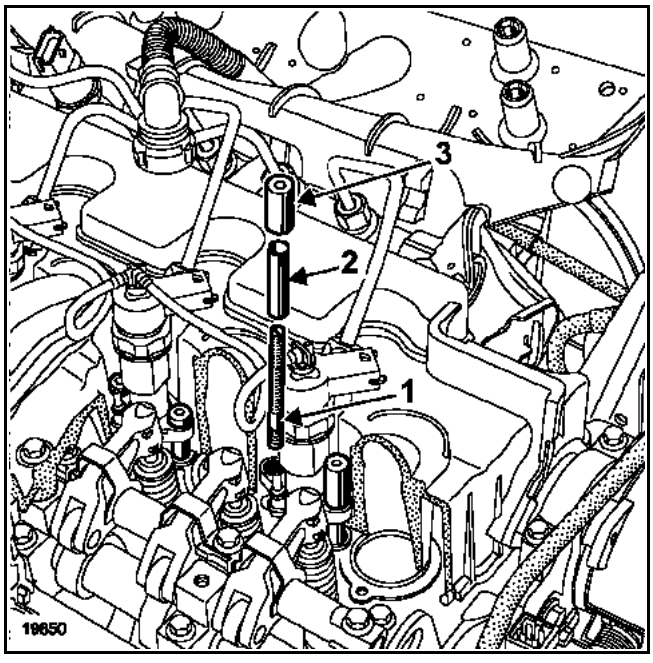
Clean the injector wells and the injector body, as well as their brackets using a lint-free cloth (use the wipes recommended for this purpose, part no. **77 11 211 707**) dipped in clean solvent.

Dry off using a new cloth.

Clean one of the old injector mounting bolts and screw it down to the end of the mounting hole to clean out the threaded holes.

WARNING:
Before fitting the stud to the cylinder head, make sure nut (3) screws smoothly onto the stud (1); if not, replace both.

Fit new studs (1) and injector mounting spacers (2) after coating the threads with oil and screw them in as far as possible by hand (**0.2 daNm**). **The studs and nuts must be replaced every time they are removed.**



Fit a new injector nose washer on every injector.

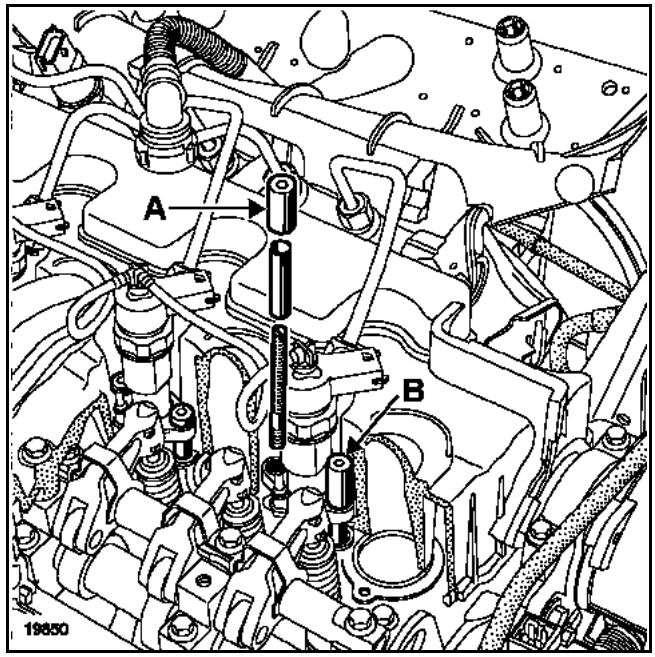
Fit the injector equipped with its bracket and locking spring ring.

Oil the threads of the nuts.

WARNING:
Tighten nut (A) on the timing end first, then nut (B) on the flywheel end.

Tighten nut (A) to **0.6 daNm**, then nut (B) to **0.6 daNm**.

Timing end first, then flywheel end.



Retighten only the nut (**B**) by (B) **360° ± 30° (flywheel end nut)**.

Loosen the three rail mounting bolts in order to release it.

Remove the rail caps, the injector holders and the injection pipes.

Fit the injection pipes between the rail and the injectors, and pretighten by hand until they touch.

Tighten the three rail mounting bolts to a torque of **2.5 daNm**.

Tighten the injector pipe connections on the injectors and the high-pressure pump to a torque of **2.5 daNm**.

Tighten the injection pipe connections on the high-pressure pump to a torque of **2.7 daNm**.

Tighten the injection pipe connections on the rail to **2.7 daNm**.

GETtheMANUALS.org

Clip the pump/rail pipes mounting clip and tighten the two mounting bolts.

Refit the side partitions of the rail shield correctly.

Fold the rail protector rubber flap forwards and secure it.

When working on the rail protector, ensure that the system components are correctly positioned after refitting (see the Rail protector section).

Non-observance of this advice may have serious consequences.

Continue the refitting procedure in the reverse order to removal.

Discard the bag of caps used during the operation.

Use the fault finding tool to clear any faults which may be stored in the injection computer before restarting the engine.

Re-prime the system by switching on the ignition several times, or run the low pressure pump with the fault finding tool using the "**Actuator Commands**" menu.

After carrying out any work, check that there are no leaks in the diesel circuit.
Proceed as follows:
– run the engine at idle speed until the engine cooling fan starts up,
– accelerate several times with no load,
– carry out a road test,
– switch the ignition off and check that there is no diesel fuel leakage,
– check that the absorbent soundproofing pads are not saturated with diesel fuel.

GETtheMANUALS.org

IT IS FORBIDDEN TO DISMANTLE THE INSIDE OF AN INJECTOR OR TO SEPARATE THE INJECTOR HOLDER FROM THE NOZZLE.

SPECIAL TOOLING REQUIRED	
Mot. 1566	Tool for removing and refitting high pressure pipes

EQUIPMENT REQUIRED
Low torque wrench Pipe socket for tightening high pressure unions (for example, Facom "Crowfoot 19-17" wrench). Pipe socket for tightening the high pressure unions (for example, Facom "Crowfoot 18-17" wrench).

TIGHTENING TORQUES (in daNm)	
High-pressure pipe unions	3.5
High-pressure pipe bracket bolts	0.9
High-pressure pipe unions	3.5
High-pressure pipe mounting bracket bolts on the front manifold	2.1
Filler neck mounting bolt	2.5
Single injector bracket nuts	0.5
Twin injector bracket nuts	2.9
Diesel return pipe unions:	
– on the injectors	1.3
– on the cylinder head	2
Rocker cover bolts	0.9

IMPORTANT:
Before any operation, connect the After-Sales fault finding tool, establish dialogue with the injection computer and check that the injection rail is no longer under pressure.

Wait until the fuel temperature drops.

Order the special high pressure injection circuit caps kit.

GETtheMANUALS.org

REMOVAL

YOU MUST OBSERVE THE CLEANLINESS ADVICE

NOTE:
– injectors may be replaced individually.
– all high-pressure pipes which are removed must always be replaced.

Remove the inlet manifold (see Section **12A Fuel mixture: Inlet manifold**).

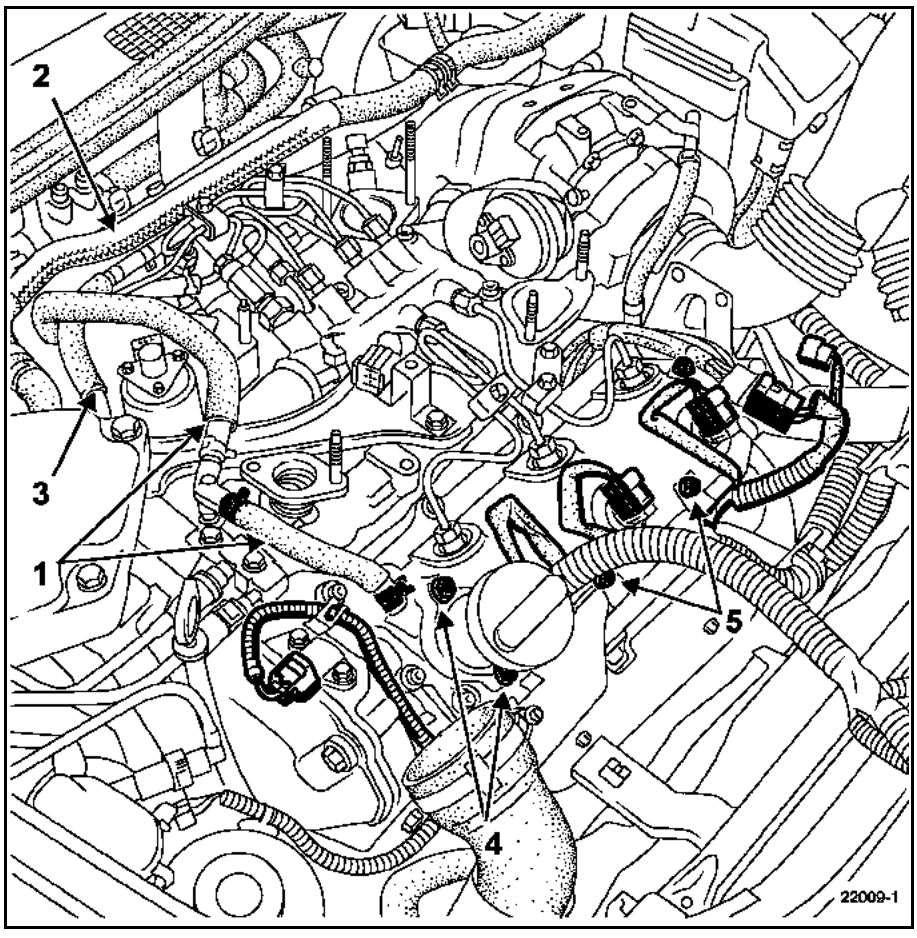
Drain the cooling circuit through the radiator bottom hose. There is a risk of coolant entering the cylinders if the injector cooling sockets come out at the same time as the injectors.

Remove the injector rail high-pressure pipes and the rail - intermediate union pipe (see Section **13B High-pressure pipes**).

Disconnect the oil vapour rebreathing pipes on the T union (1), pipe (2) and then cooling pipe (3) on the EGR valve. Remove them from the side.

Injectors on the front row

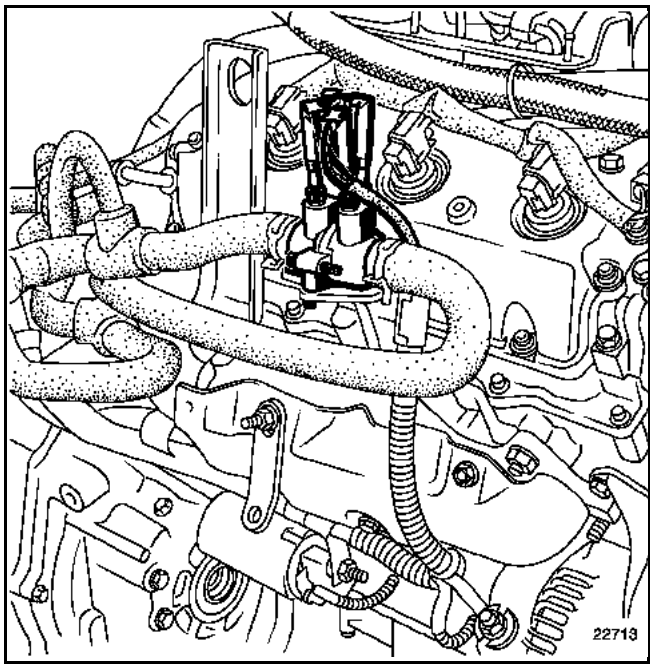
Remove the mounting bolts:
– (4) from the filler neck,
– (5) from the electrical wiring harness support.



GETtheMANUALS.org

Injectors on the back row

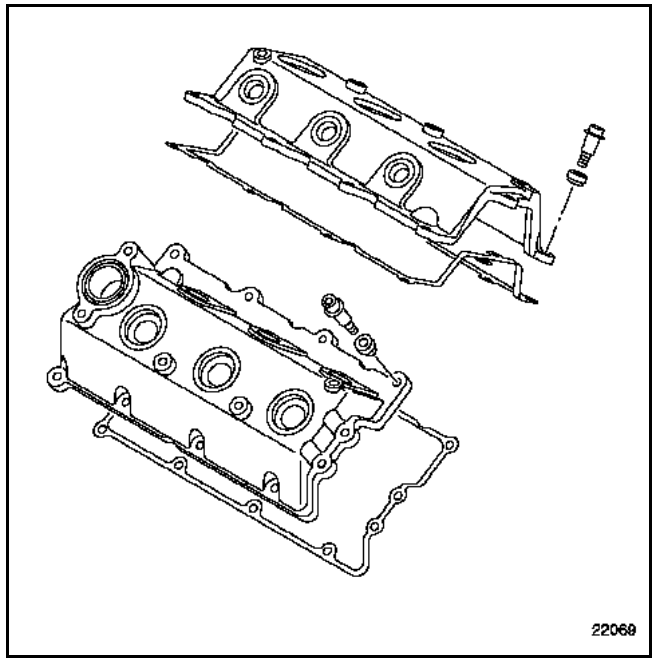
Release the thermoplunger unit from the side. To do this, remove the thermoplunger unit mounting bracket bolt on the cylinder head.



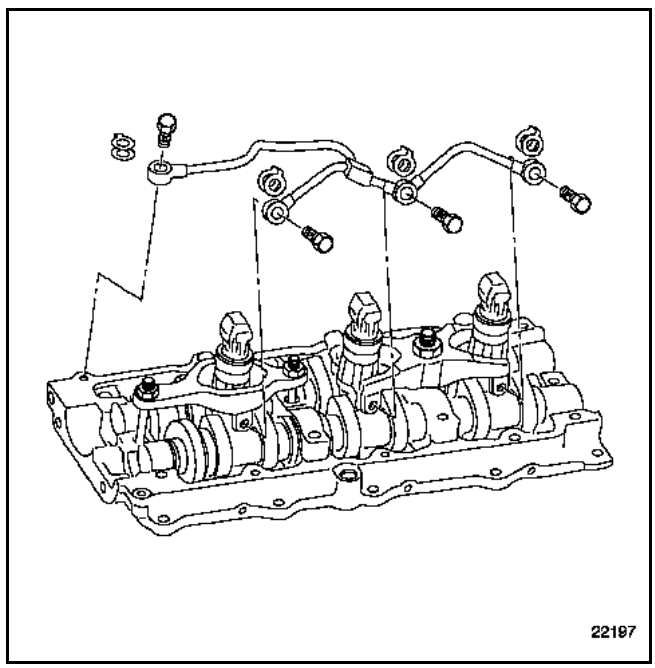
Injectors on the front or back row

Remove the rocker cover mounting bolts. Use a spherical head spanner (e.g. **FACOM 83SH.JP9**) for removing the bolt located near to the lifting bracket on the back row.

Remove the rocker cover.

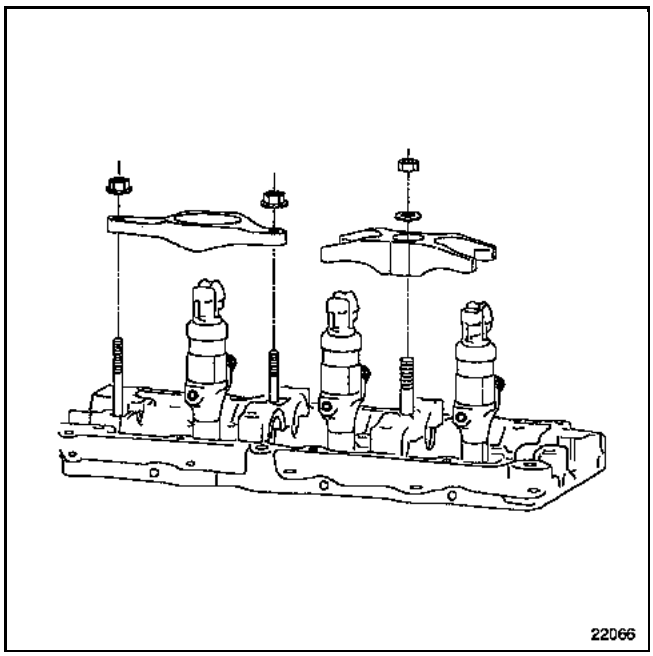


Remove the diesel return pipe.

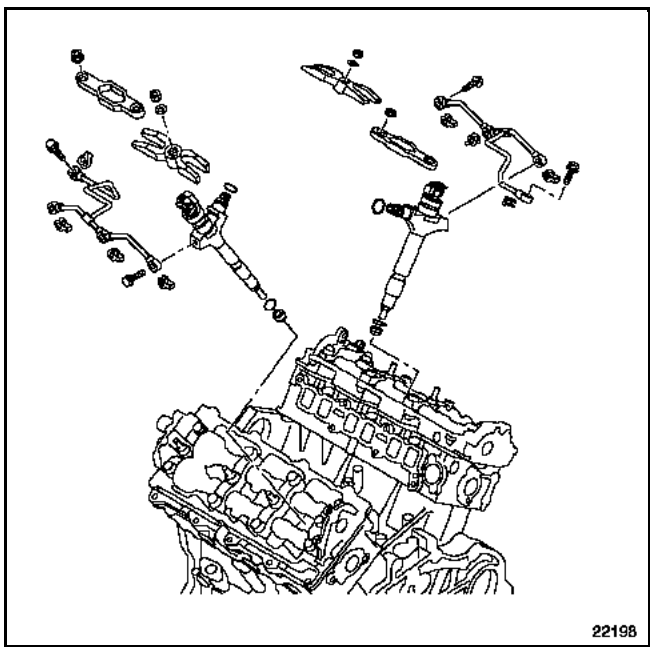


GETtheMANUALS.org

Remove:
– the injector bracket mounting nuts,
– the brackets,



– the injectors.



IMPORTANT:
When removing the injectors, the injector cooling sockets in the cylinder head may come out at the same time. If this happens, replace the O-rings then refit new sockets into the cylinder head using the correct tool **EMB.1518**

CLEANING

It is strictly forbidden to use the following when cleaning the injector:
– a wire brush,
– an emery cloth,
– an ultrasound cleaner.

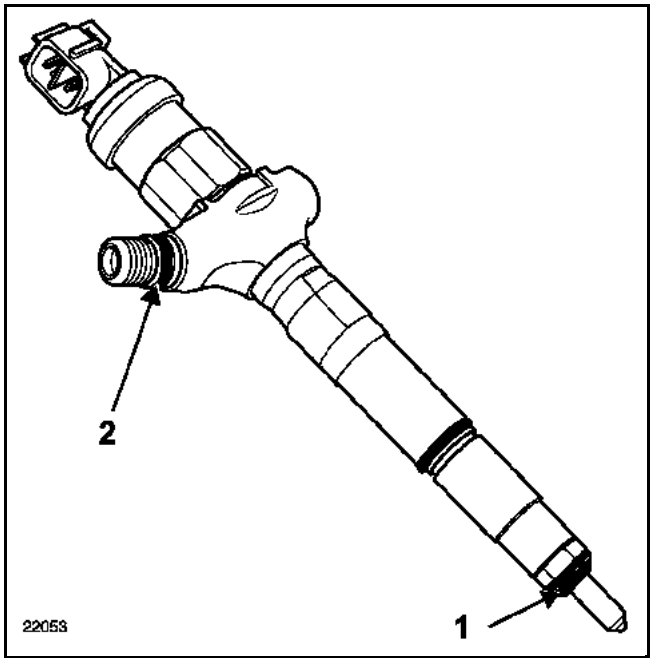
To clean the nose of the injector, let it soak in degreaser, then wipe it with a lint-free cloth.

GETtheMANUALS.org

REFITTING

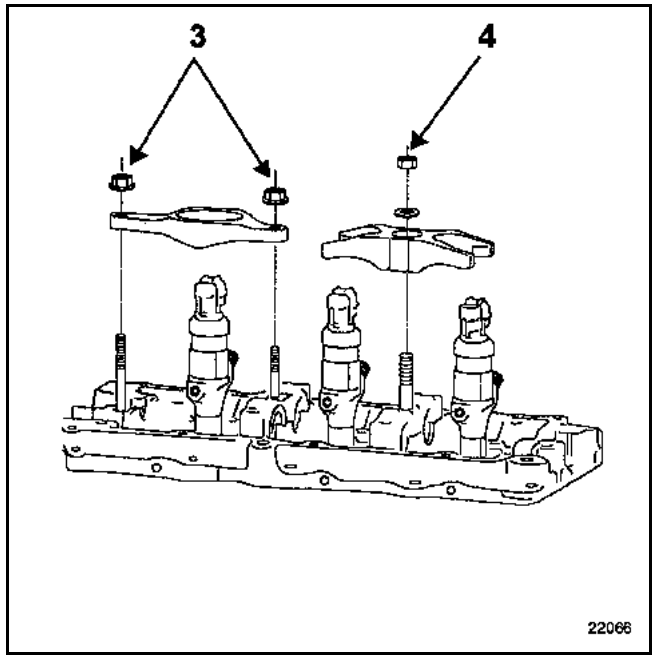
NOTE:
Remove the blanking plugs at the last moment.

On the injectors, replace:
– the heat protection washer (1),
– the O-ring (2).



Refit:
– the injectors,
– the injector brackets.

Tighten to torque:
– the nuts (3) on the single injector bracket to **0.5 daNm**,
– the nuts (4) on the twin injector bracket to **2.9 daNm**.



Replace the seals on the diesel return pipe.

Refit the diesel return pipe.

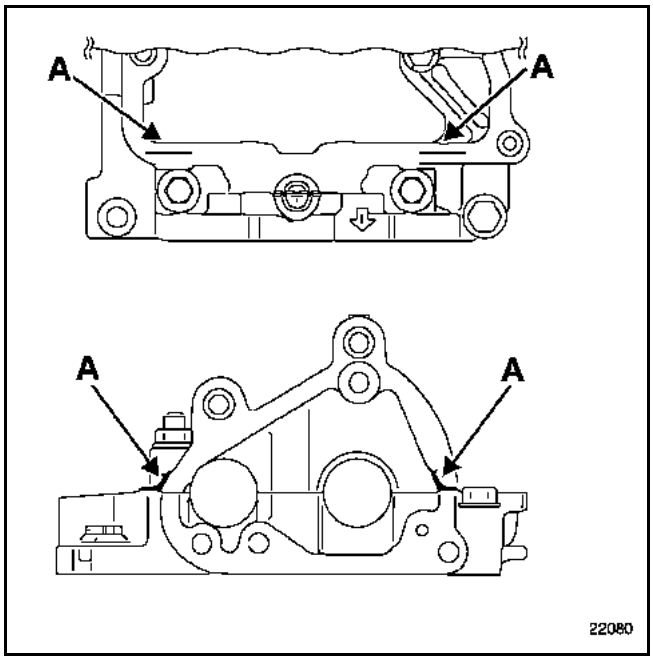
Tighten the diesel return pipe unions:
– on the injectors to a torque of **1.3 daNm**,
– on the cylinder head to a torque of **2 daNm**.

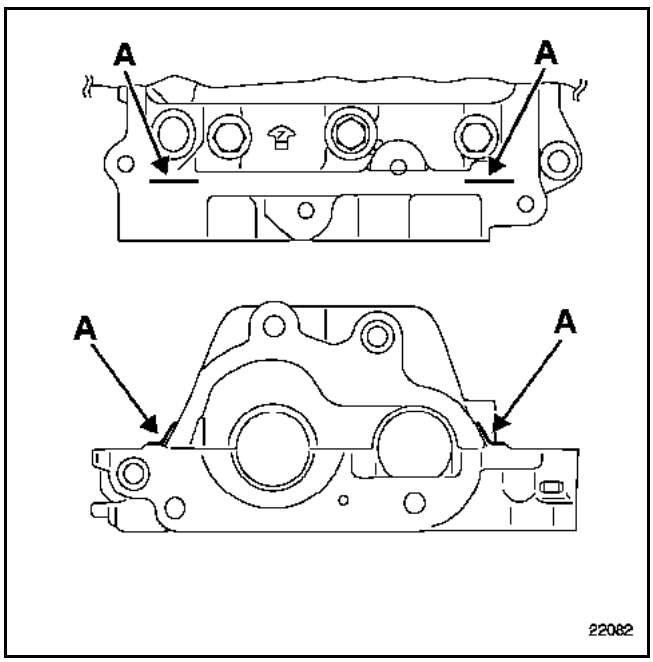
Clean the mating face of the rocker cover and the camshaft unit.

On the rocker cover, replace:
– the seals of the injectors and injector high-pressure unions using tool **Mot. 1649**,
– the rocker cover gasket.

GETtheMANUALS.org

To the camshaft unit, apply a **2 - 4 mm** bead of **THREEBOND** at (A).

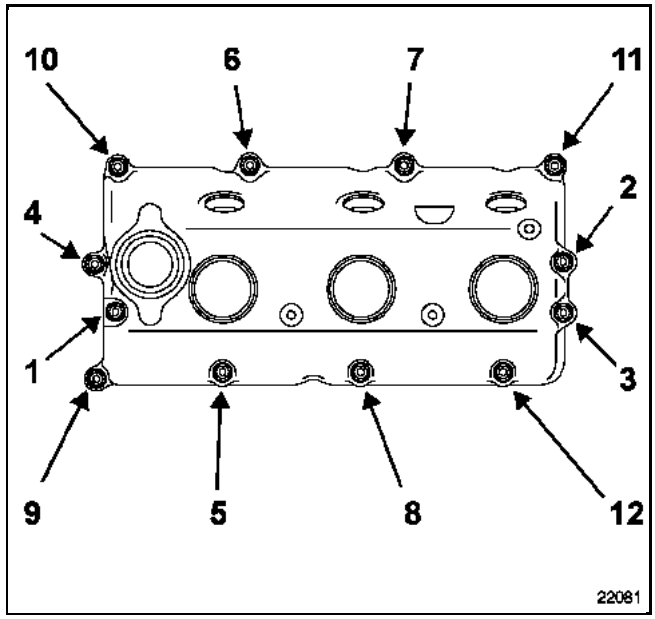




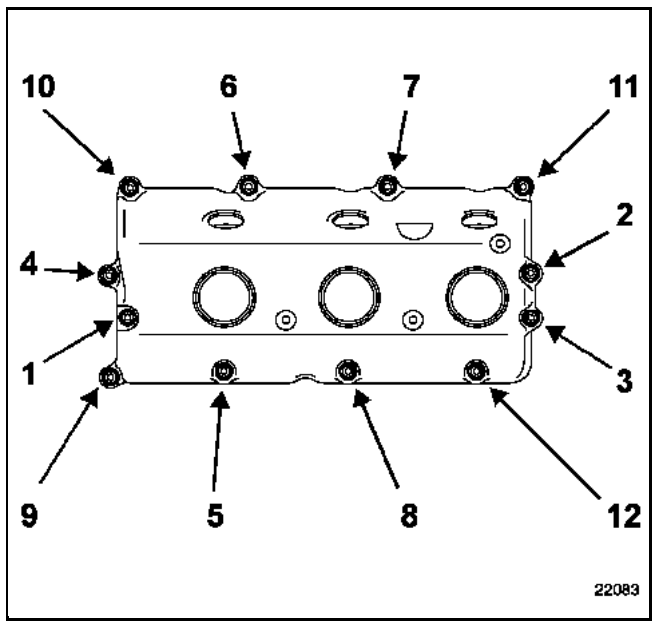
Refit the rocker cover.

Tighten the rocker cover in the correct order and using the correct tightening torque of **0.9 daNm**.

Front row



Back row



GETtheMANUALS.org

All high pressure pipes removed must be replaced as a matter of course.

Fit and tighten to the correct torques the rails - intermediate union and injector - rail high pressure pipes (see the relevant operation in **section 13B "High pressure pipes"**).

Replace the oil filler neck O-ring.

Refit in the reverse order to removal for the other refitting operations.

Reprime the diesel supply system using the priming bulb.

Fill and bleed the cooling system, (see **19A Cooling Filling and Bleeding**).

Test the sealing of the high-pressure circuit after it has been repaired (see Section **13B "Special notes"**).

GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Mot. 1566	Tool for removing and refitting high pressure pipes
EQUIPMENT REQUIRED	
Low torque wrench High-pressure pipe wrench (e.g. Facom DM19 wrench)	

FITTING WITH FIRST MODEL OF RAIL PROTECTOR

TIGHTENING TORQUES (in daNm)	
High pressure pipe nuts	
– on the injectors	**2.5**
– on the pump	**2.7**
– on the rail	**2.7**
Injection rail mounting bolt	**2.5**

WARNING:
Before carrying out any work, plug in the After Sales fault finding tool, establish dialogue with the injection computer and check that the injector rail is depressurised.

Take note of the fuel temperature.

Order the special high pressure injection circuit caps kit.

REMOVAL

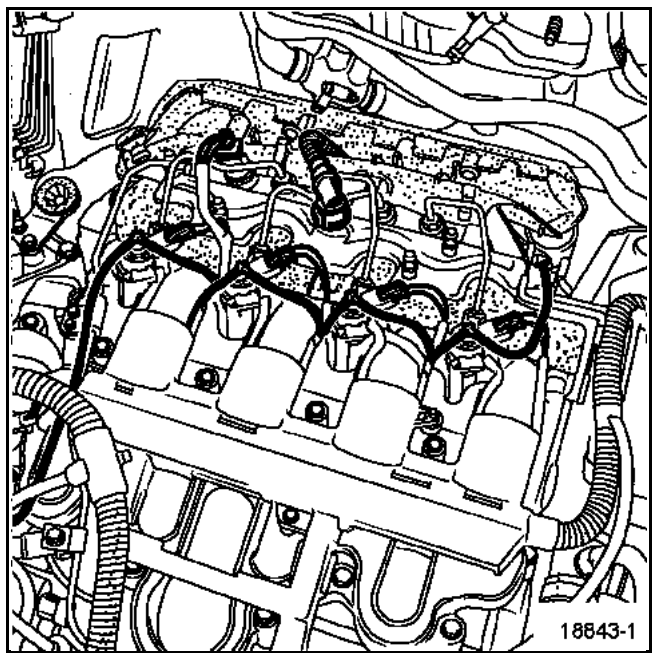
OBSERVE THE CLEANLINESS ADVICE CLOSELY

Disconnect the battery.

Unclip the side partitions of the rubber flap.

Unclip the rubber flap from the rocker cover and push it as far back as possible.

Remove the soundproofing material.



GETtheMANUALS.org

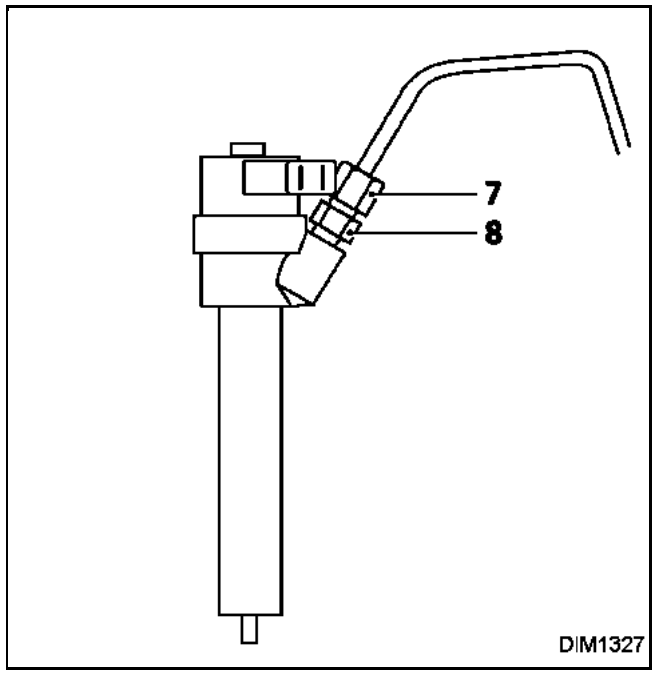
Disconnect the pressure sensor (1) and the injector wiring.

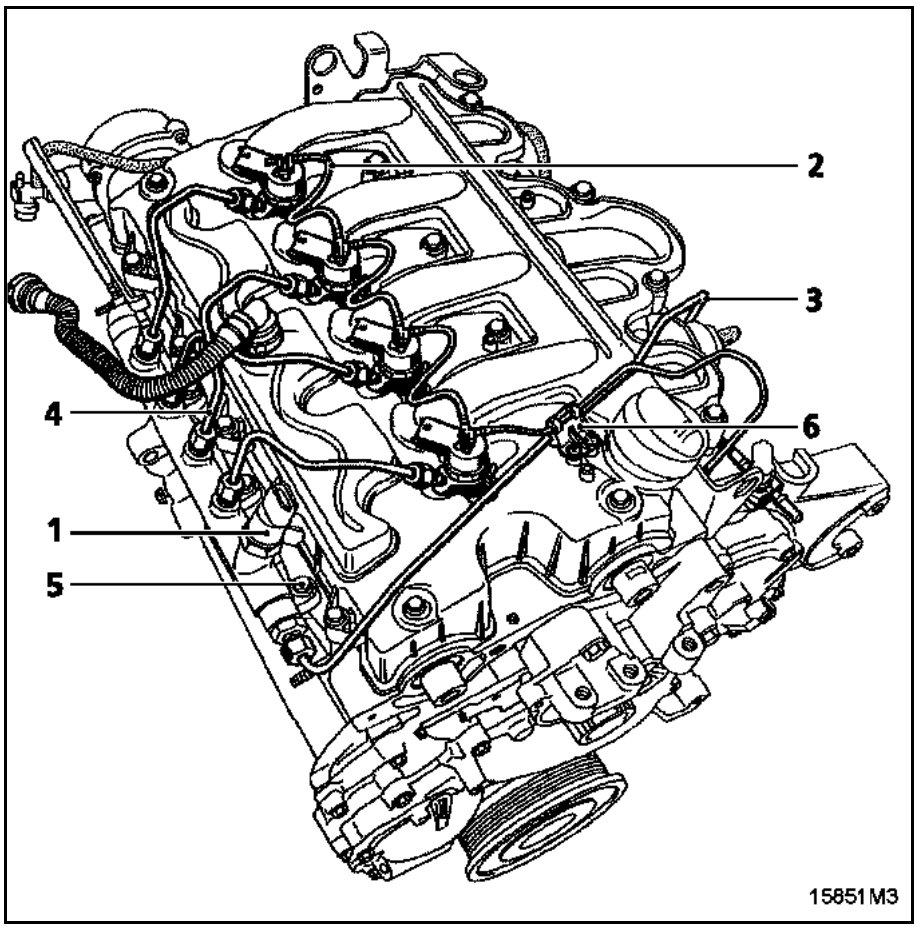
Remove:
– the injector diesel return pipe (2) (to be replaced),
– the injection pipe (3) between the high-pressure pump and the rail. WARNING: the cylinder head mounting clip (6) is very fragile,
– the injector pipes (4).

Fit anti-pollution plugs.

IMPORTANT:
When loosening the injection harness unions (7) on the injector holder, hold the filter-rod supporting bolts (8) with a lock wrench.

Loosen the injector rail bolts (5) without removing the injector rail.





GETtheMANUALS.org

REFITTING

Do not remove the protective plugs from each component until the last moment.

Refit:
– the injector rail and insert the mounting bolts **without** fully tightening them,
– the rail mounting clamp bolt on the metal lower protector.

Remove the rail caps, the injector holders and the injection pipes.

Fit the injection pipes between the rail and the injectors and between the pump and the rail, then pretighten the nuts by hand until they touch.

Tighten the three rail mounting bolts to a torque of **2.5 daNm**).

Tighten the injector pipe connections on the injector to a torque of **2.5 daN.m** and the high pressure pump to a torque of **2.7 daNm**.

Tighten the injection pipe connections on the rail to **2.7 daNm**.

Continue to refit the rail protector, referring to the removal - refitting method for the rail protector (see **Section 13B: Diesel injection: Rail protector**).

During any operations on the rail protector, you must ensure that the system components are fitted properly after refitting (see the Rail protector section).
Non-observance of this advice may have serious consequences.

Continue the refitting procedure in the reverse order to removal.

Discard the bag of caps used during the operation.

Re-prime the system by switching on the ignition several times, or run the low pressure pump with the fault finding tool using the "**Actuator Commands**" menu.

Use the fault finding tool to clear any faults which may be stored in the injection computer before restarting the engine.

After carrying out any work, check that there are no leaks in the diesel circuit.
Proceed as follows:
– run the engine at idle speed until the engine cooling fan starts up,
– accelerate several times with no load,
– carry out a road test,
– switch the ignition off and check that there is no diesel fuel leakage,
– check that the absorbent soundproofing pads are not saturated with diesel fuel.

GETtheMANUALS.org

ALL HIGH-PRESSURE PIPES REMOVED MUST BE REPLACED AS A MATTER OF COURSE.

SPECIAL TOOLING REQUIRED	
Mot. 1566	Tool for removing and refitting high pressure pipes

EQUIPMENT REQUIRED
Low torque wrench Pipe socket for tightening the high pressure unions (for example, Facom "Crowfoot 19-17" wrench). Pipe socket for tightening high pressure unions (for example, Facom "Crowfoot 18-17" wrench).

TIGHTENING TORQUES (in daNm)	
High-pressure pipe unions	3.5
High-pressure pipe bracket bolts	0.9
Injector rail mounting bolt	2.1
Pressure limiter union	2
High-pressure pipe bracket mountings	0.9
High-pressure outlet pipe mounting on the front manifold	2.1

IMPORTANT:
Before any operation, connect the After-Sales fault finding tool, establish dialogue with the injection computer and check that the injection rail is no longer under pressure.

Wait until the fuel temperature drops.

Order the special high pressure injection circuit caps kit.

GETtheMANUALS.org

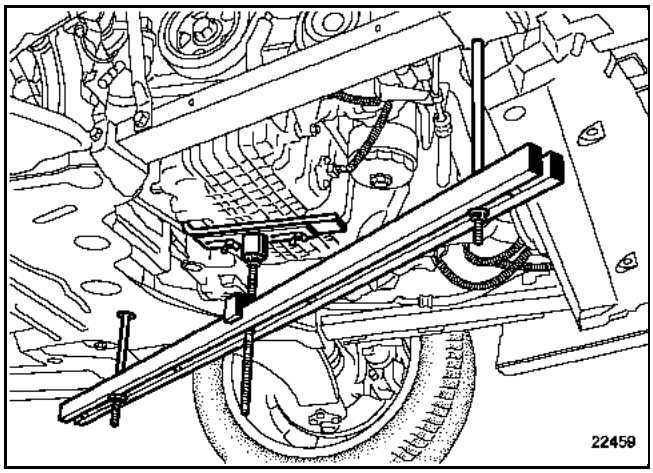
REMOVAL

YOU MUST OBSERVE THE CLEANLINESS ADVICE

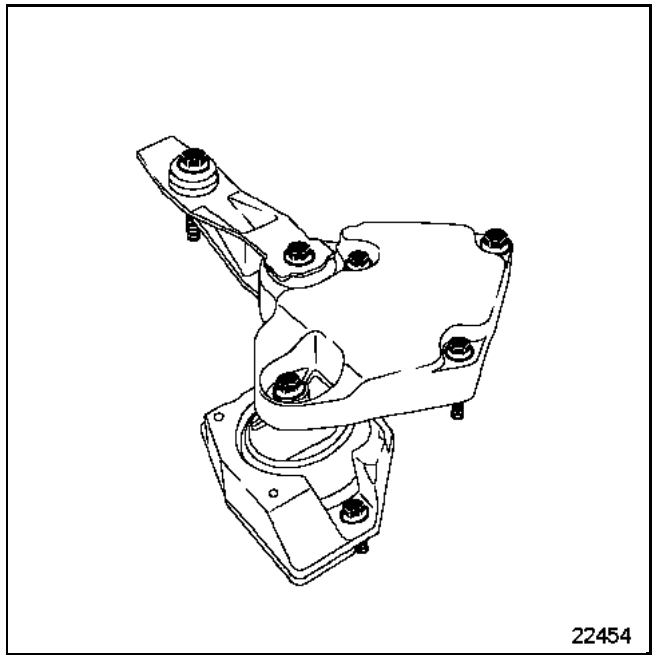
NOTE:
All high pressure pipes removed must be replaced as a matter of course.

Mount the vehicle on a two post lift.

Disconnect the battery.

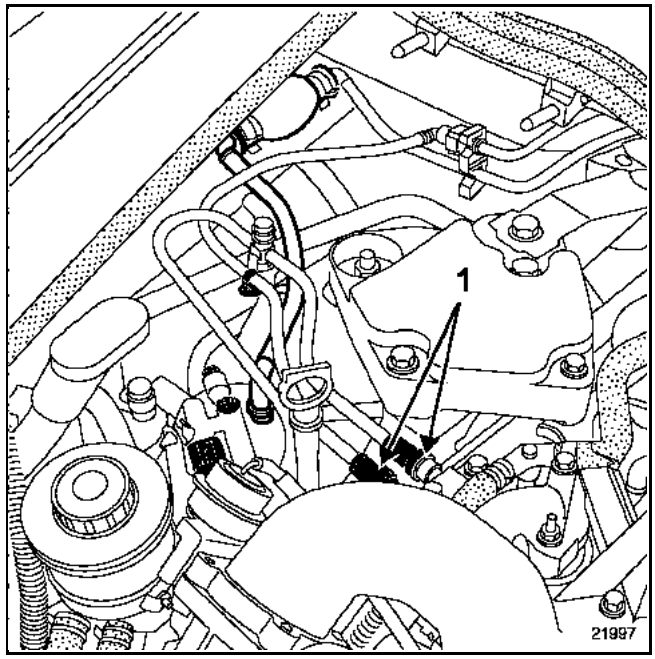


Fit the engine mounting **Mot. 1367-02**.



Release the diesel supply pipes on the suspended engine mounting.

Remove the suspended engine mounting-travel limiter assembly.



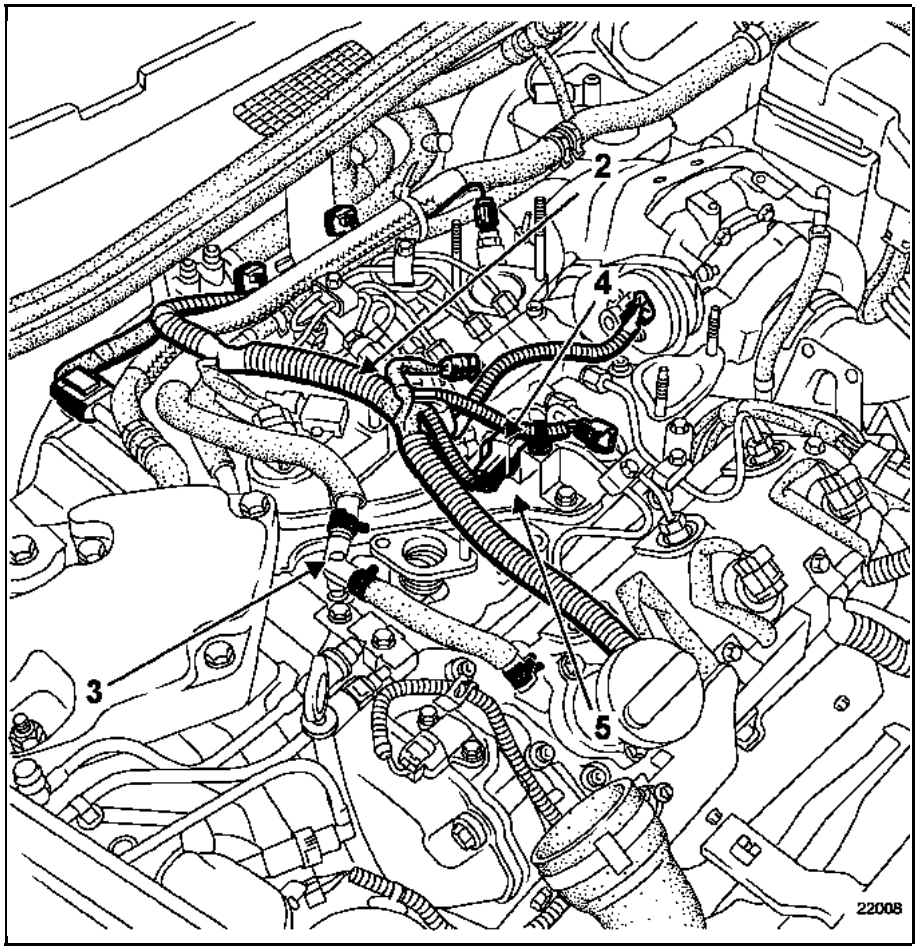
Disconnect the diesel supply and return pipes (1) from the bracket then blank the pipes using the blanking plug kit available from the parts department.

Remove the inlet manifold (see relevant operation in Section **12B Fuel mixture "Inlet manifold"**).

GETtheMANUALS.org

Disconnect:
– the various connectors and actuators of the electric wiring harness (2) then release this from the side,
– the oil vapour rebreathing pipes from the "T" union (3).

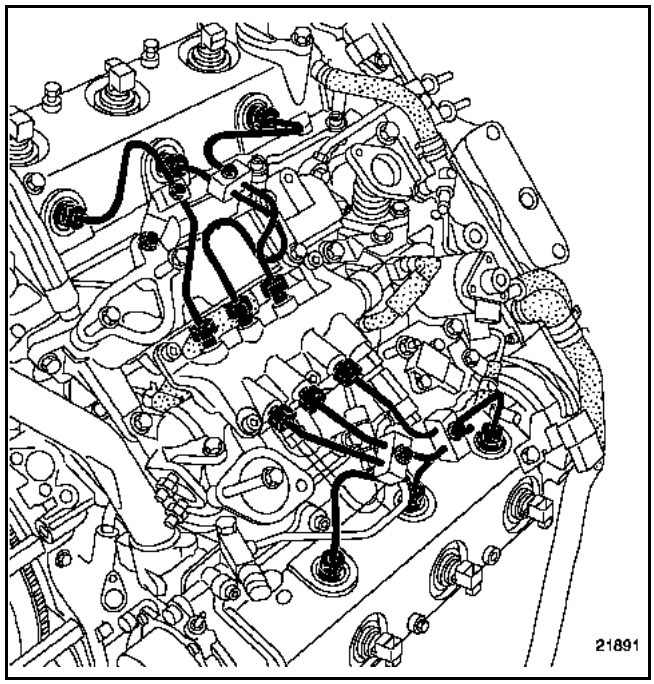
Release the connector (4) then remove the acoustic tie-rod (5).



Undo the injector rail high pressure pipe unions.

If necessary, undo the retaining brackets of the various pipes.

Remove:
– the high-pressure pipes,
– the two mounting bolts of the turbocharging regulation diaphragm then release it from the side.



GETtheMANUALS.org

Undo:
– the diesel return pipe unions (6) on the pressure limiter and cylinder head,
– the unions of the high-pressure pump outlet pipe (7) between the intermediate union and the rail.

Remove the high pressure pipe (7).

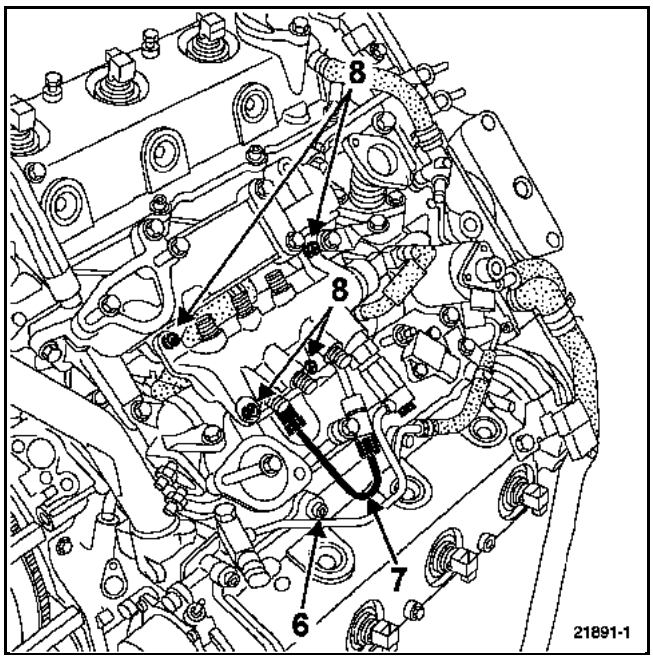
Undo the rail mounting bolts (8).

Remove the rail from the side.

Remove the heat shield from the rail pressure sensor.

Disconnect the pressure sensor connector.

Remove the injector rail.



REFITTING

NOTE:
Remove the blanking plugs at the last moment.
Replace all the seals.

Reconnect the pressure sensor connector on the rail.

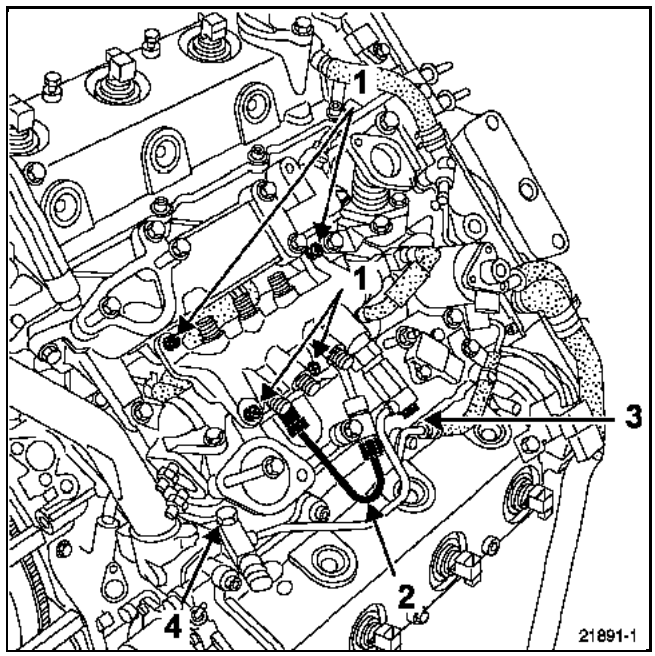
Refit the heat shield on the rail pressure sensor.

Fit the injector rail.

Tighten the rail mounting bolts (1) by hand.

Fit and hand tighten the pump pipe (2) between the intermediate union and the rail.

Tighten:
– the rail mounting bolts to a torque of **2.1 daNm**,
– the high pressure pipe unions to a torque of **3.5 daNm**, starting with the union on the rail side,
– the pressure limiter union (3) to a torque of **2 daNm**,
– the return pipe union (4) on the cylinder head to a torque of **1.6 daNm**.



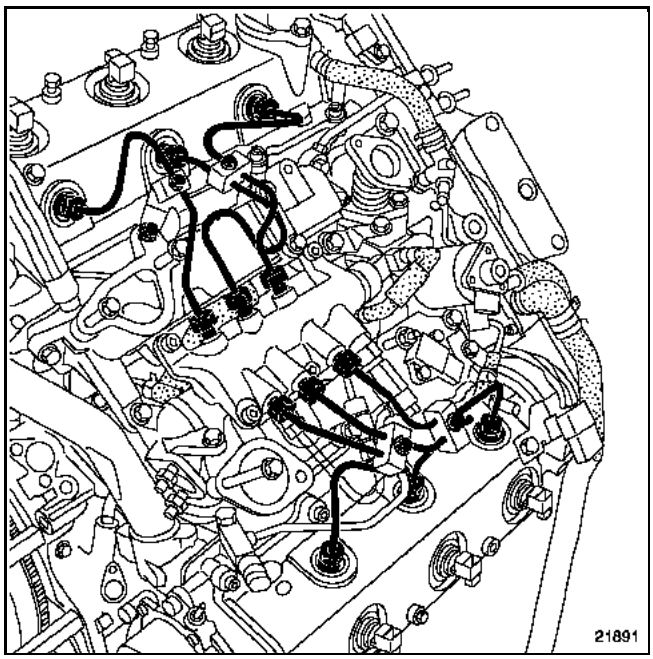
GETtheMANUALS.org

Undo the rail bolts again by a few turns.

Fit and hand tighten all the injector-rail high-pressure pipes.

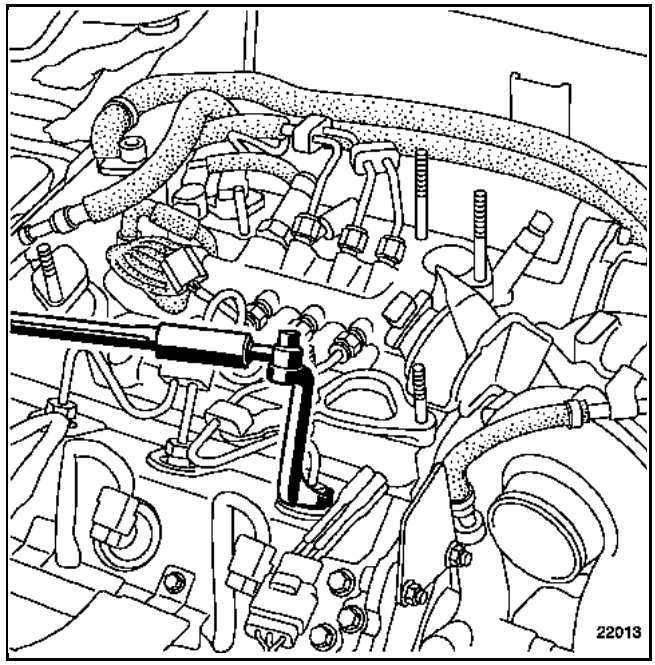
Fit the injector-rail high-pressure pipe retaining brackets and then tighten to a torque of **0.9 daNm**.

Tighten the rail mounting bolts to a torque of **2.1 daNm**.

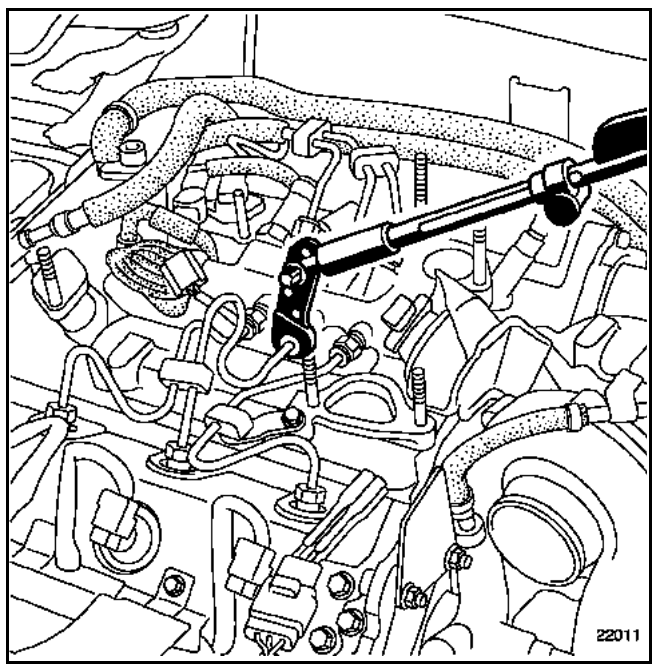


NOTE:
Tighten the high pressure pipes one by one.

Tighten in the correct order to a torque of **3.5 daNm**:
– the high pressure pipe union on the back row starting on the injector side,
– or the high pressure pipe union on the front row starting on the injector side,



– and the high pressure pipe unions on the rail.



GETtheMANUALS.org

Refit in the reverse order to removal for the other refitting operations.

Reprime the diesel fuel supply system using the priming bulb.

Test the sealing of the high pressure circuit after it has been repaired (see section **13B "Special notes"**).

GETtheMANUALS.org

ALL HIGH-PRESSURE PIPES REMOVED MUST BE REPLACED AS A MATTER OF COURSE.

THE HIGH-PRESSURE PIPES CAN BE REPLACED INDIVIDUALLY

SPECIAL TOOLING REQUIRED	
Mot. 1566	Tool for removing and refitting high pressure pipes

EQUIPMENT REQUIRED
"Low" torque wrench Pipe socket for tightening the high pressure unions (for example, Facom "Crowfoot 19-17" wrench). Pipe socket for tightening the high pressure unions (for example, Facom "Crowfoot 18-17" wrench).

TIGHTENING TORQUES (in daNm)	
High pressure pipe unions	3.5
High pressure pipe bracket bolts	0.9
High pressure pipe mounting on the manifold	2.1
Injector rail mounting bolt	2.1

IMPORTANT:
Before any operation, connect the After-Sales fault finding tool, establish dialogue with the injection computer and check that the injection rail is no longer under pressure.

Wait until the fuel temperature drops.

Order the special high pressure injection circuit caps kit.

GETtheMANUALS.org

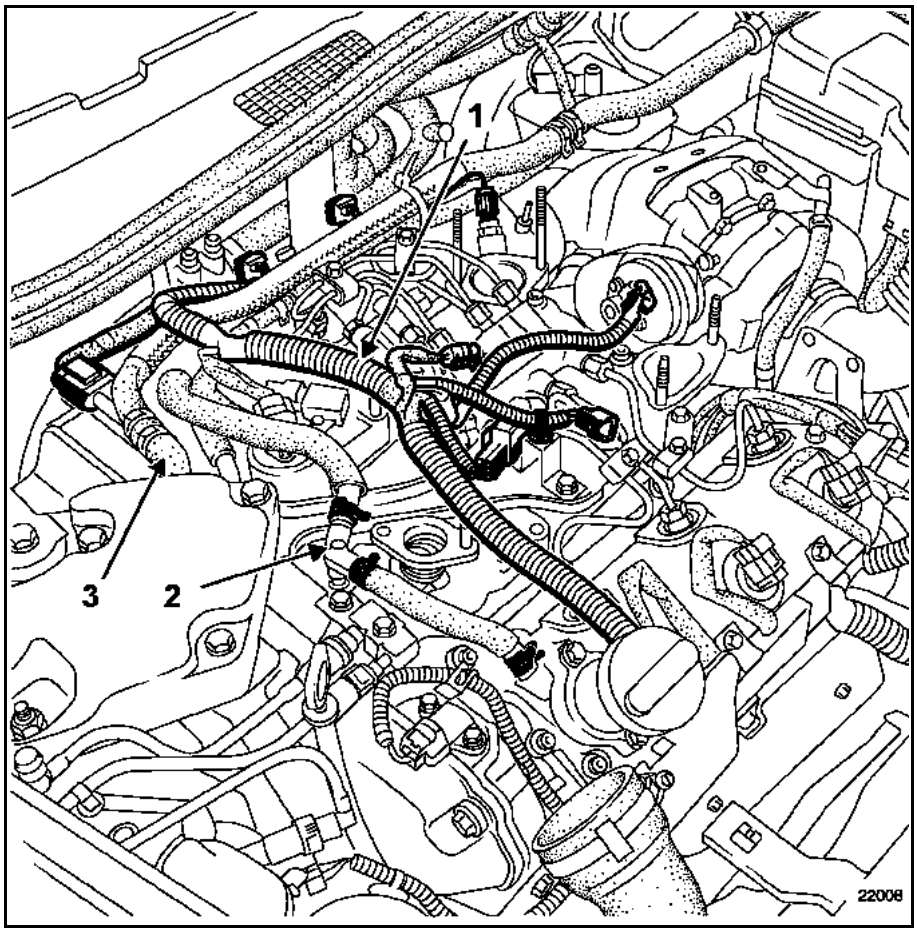
REMOVAL

YOU MUST OBSERVE THE CLEANLINESS ADVICE

NOTE:
– removed high pressure pipes can be replaced individually,
– all high pressure pipes which are removed must always be replaced.

Remove the inlet manifold (see section **12B Fuel mixture: Inlet manifold**).

Disconnect:
– the various connectors and actuators of the electric wiring harness (1) then release this from the side,
– the oil vapour rebreathing pipe on the "T" union (2), then the pipe (3).
Remove this from the side.



GETtheMANUALS.org

Injector rail pipes

Undo the high pressure pipe unions.

If necessary, undo the retaining brackets of the various pipes.

Remove the high pressure pipes.

Insert the anti-contamination caps.

Rail-pump pipes

Remove:
– the rail (see section **13B "injector rail"**),
– the EGR vale - exchanger (see section **12A Fuel mixture "EGR valve of the exhaust gas - Exchanger"**).

Remove the high-pressure pipe (1) between the injection pump and the intermediate union on the inlet manifold.

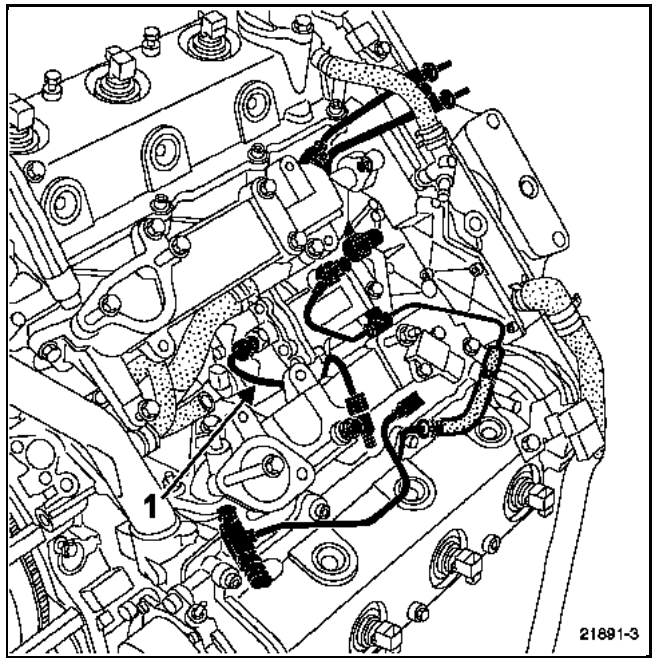
REFITTING

NOTE:
Remove the blanking plugs at the last moment.

Rail-pump pipes

Fit and hand tighten the high-pressure pipe between the pump and the intermediate union on the inlet manifold.

Tighten the pipe unions (1) between the pump and the intermediate union on the inlet manifold to a torque of **3.5 daNm**, starting on the intermediate union side and then the pump side.



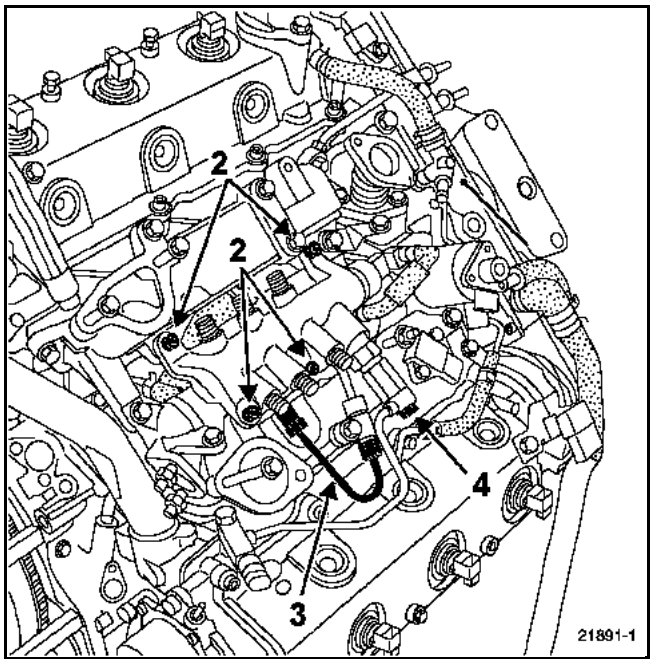
Refit the intercooler / EGR valve assembly (see section **12A Fuel mixture "Intercooler / EGR valve assembly"**).

Fit the injector rail. To do this:
– reconnect the pressure sensor connector,
– refit the heat shield,
– tighten the mounting bolts by hand.

Fit and hand tighten the pump pipe between the intermediate union and the rail.

GETtheMANUALS.org

Tighten:
– the rail mounting bolts (2) to a torque of **2.1 daNm**.
– the high pressure pipe unions (3) to a torque of **3.5 daNm**, starting with the union on the rail side,
– the pressure limiter union (4) to a torque of **2 daNm**.



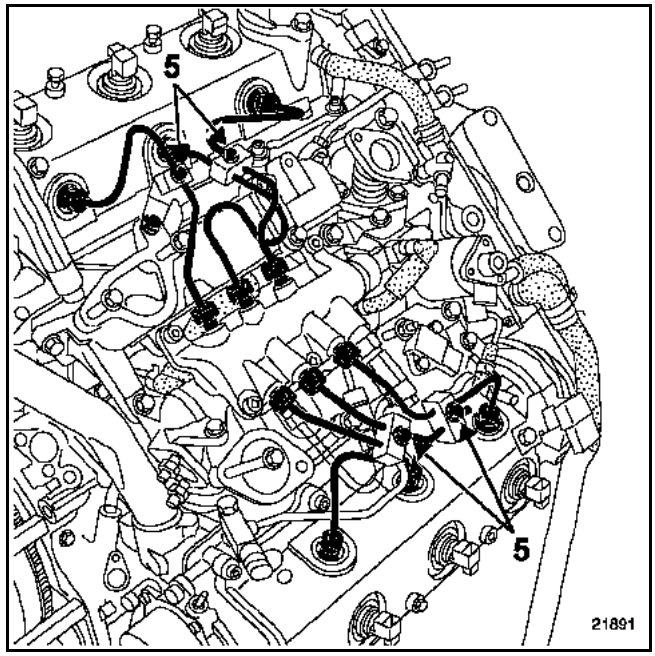
Injector-rail pipes

Undo the rail bolts by a few turns.

Fit and hand tighten all the injector-rail high-pressure pipes.

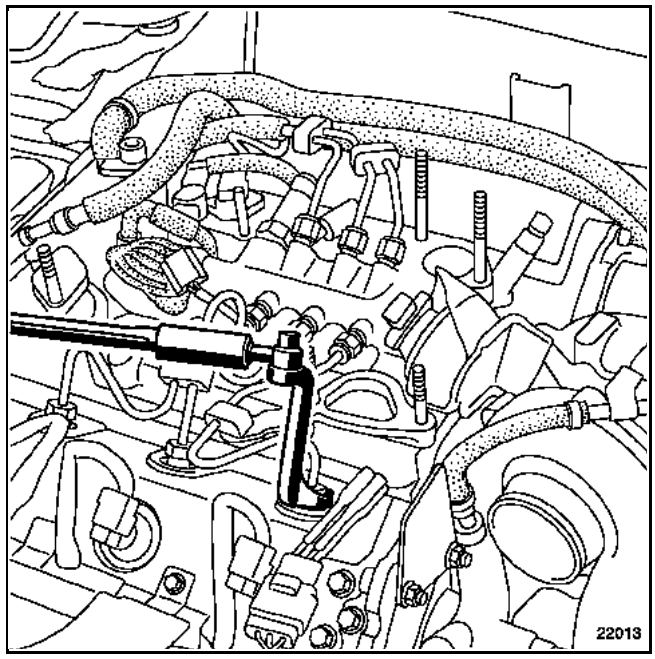
Fit the injector-rail high-pressure pipe retaining brackets (5) and then tighten to a torque of **0.9 daNm**.

Tighten the rail mounting bolts to a torque of **2.1 daNm**.



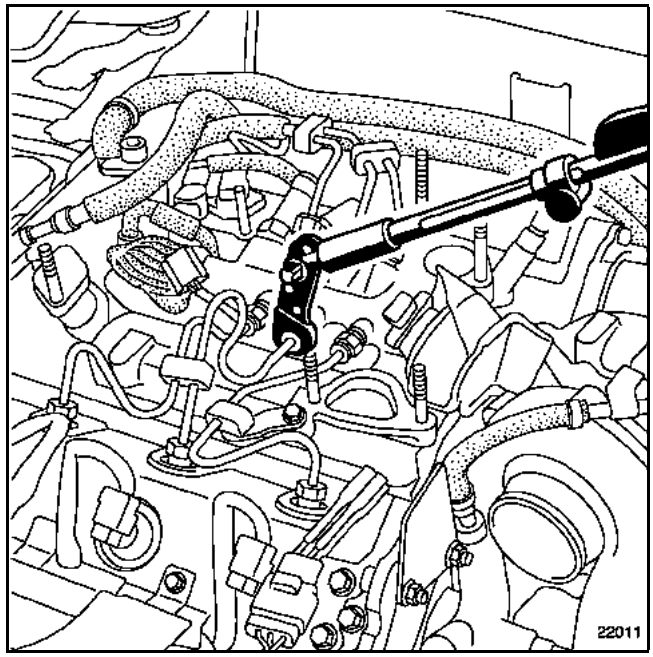
NOTE:
Tighten the high-pressure pipes one by one.

Tighten in the correct order to a torque of **3.5 daNm**:
– the high-pressure pipe union on the back row starting on the injector side,
– or the high-pressure pipe union on the front row starting on the injector side,



GETtheMANUALS.org

– and the high-pressure pipe unions on the rail.



Refit in the reverse order to removal for the other refitting operations.

Reprime the diesel supply system using the priming bulb.

Test the sealing of the high-pressure circuit after it has been repaired (see Section **13B "Special notes"**).

GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Mot. 1495	Tool for removing the lambda sensors

TIGHTENING TORQUES (in daNm)	
Pressure sensor	3.5 ± 0.5

IMPORTANT:
before any operation, connect the After-Sales fault finding tool, establish dialogue with the injection computer and check that the injector rail is not under pressure.

Take note of the fuel temperature.

Order the special high pressure injection circuit caps kit.

OBSERVE THE CLEANLINESS ADVICE CLOSELY

REMOVAL

Disconnect the battery.

Unclip the side partitions of the rubber flap.

Unclip the rubber flap from the rocker cover and push it as far back as possible.

Disconnect the pressure sensor.

Undo the pressure sensor with tool **Mot. 1495**.

Remove the pressure sensor.

Fit anti-pollution plugs.

REFITTING

Replace the seal.

Remove blanking plugs.

Screw in the sensor then tighten it to torque.

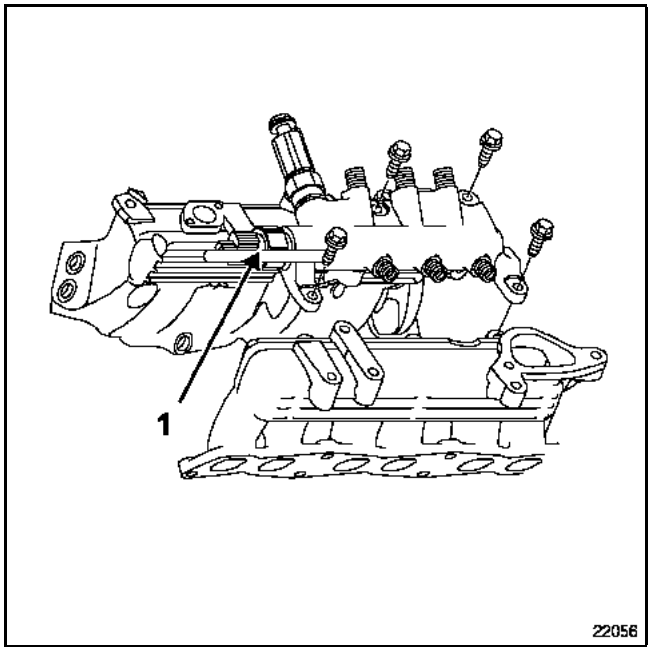
Connect the sensor connector.

Continue to refit the rail protector, referring to the removal - refitting method for the rail protector (see **Section 13B: Diesel injection: Rail protector**).

After carrying out any work, check that there are no leaks in the diesel circuit.
Proceed as follows:
- run the engine at idle speed until the engine cooling fan starts up,
- accelerate several times with no load,
- carry out a road test,
- switch the ignition off and check that there is no diesel fuel leakage,
- check that the absorbent soundproofing pads are not saturated with diesel fuel.

GETtheMANUALS.org

The pressure sensor (1) can be removed from the injector rail. If the pressure sensor develops a fault, the injector rail must be removed (see Section **13B Injector rail**).



GETtheMANUALS.org

TIGHTENING TORQUE (in daNm)	
Pressure regulator	**0.6**

IMPORTANT:
Before any operation, connect the After-Sales fault finding tool, establish dialogue with the injection computer and check that the injection rail is no longer under pressure.

Take note of the fuel temperature.

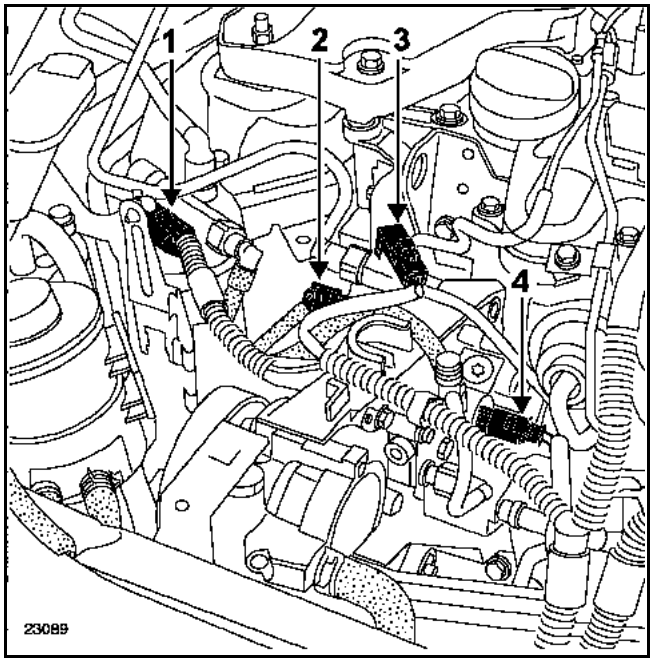
Order the special high pressure injection circuit caps kit.

OBSERVE THE CLEANLINESS ADVICE CLOSELY

REMOVAL

Disconnect:
– the diesel fuel heater connector (1),
– the position sensor (2),
– the fuel temperature sensor (3),
– the pressure regulator connector (4).

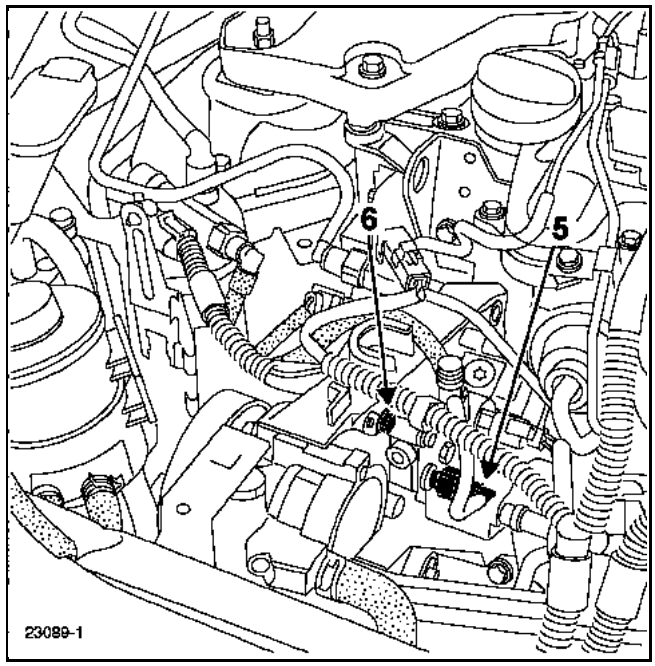
Move the electric wiring harness aside.



Disconnect the high pressure pump fuel supply pipe (5).

Fit anti-pollution plugs.

Remove the fuel supply pipe retaining bracket (6).



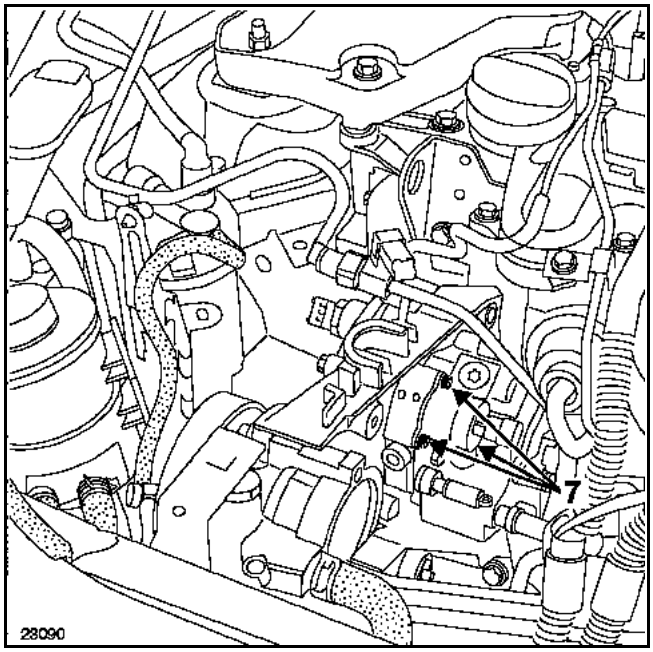
GETtheMANUALS.org

REMOVAL

Blow the area with compressed air to clean impurities away from the fuel pressure regulator.

Clean the area with brake cleaning product.

Remove:
– the three fuel pressure regulator mounting bolts (7),
– the fuel pressure regulator by hand (do not use a tool to lever it).



Clean and wipe the fuel pressure regulator bearing face on the high pressure pump, taking care not to contaminate it.

Rinse the fuel pressure regulator housing in the high-pressure pump by switching on the ignition several times or by operating the low pressure pump using the diagnostic tool in the "**Actuator commands**" menu. Use a container to collect any diesel that flows out.

REFITTING

– Preparing the new regulator:

  ● remove the protective cap and check the position of the gaskets, lubricate the O-rings with clean fuel.

    NOTE:
    Lubrication is very important in preventing external leakage.

– insert the regulator with a gentle twisting movement and slowly push it all the way in,

– pretighten the three new bolts to **0.3 daNm** then tighten to **0.6 daNm** using a torque wrench,

– clean the area with cleaning cloths.

Proceed with refitting in the reverse order to removal.

Use the fault finding tool to clear any faults which may be stored in the injection computer before restarting the engine.

After carrying out any work, check that there are no leaks in the diesel circuit.
Proceed as follows:
– run the engine at idle speed until the engine cooling fan starts up,
– accelerate several times with no load,
– carry out a road test,
– switch the ignition off and check that there is no diesel fuel leakage,
– check that the absorbent soundproofing pads are not saturated with diesel fuel.

GETtheMANUALS.org

EQUIPMENT REQUIRED
"Low torque" torque wrench

TIGHTENING TORQUE (in daNm)	
Diesel temperature sensor	2.3

IMPORTANT:
Before any operation, connect the After-Sales fault finding tool, establish dialogue with the injection computer and check that the injection rail is no longer under pressure.

Wait until the fuel temperature drops.

GETtheMANUALS.org

GENERAL INFORMATION

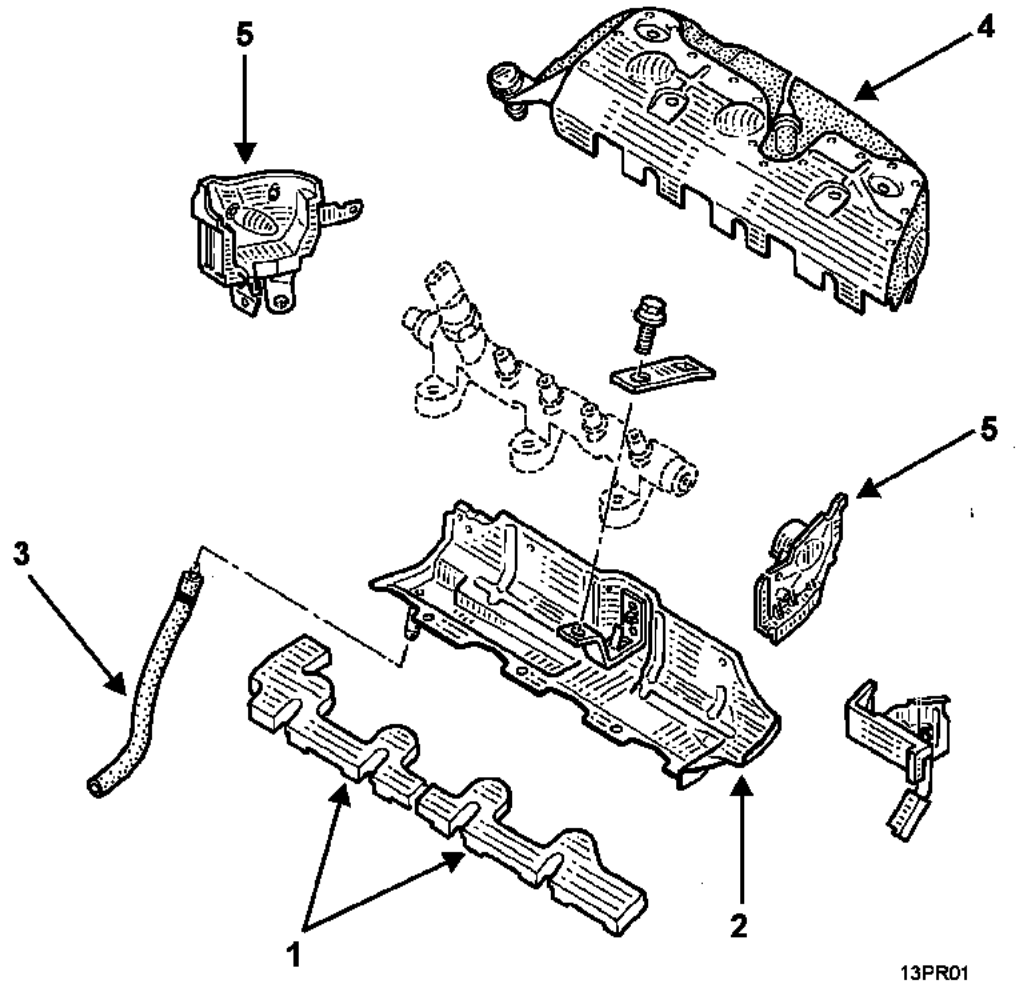
The rail protector consists of nine parts which isolate the high pressure injection system from the engine compartment.

THIS RAIL PROTECTOR ENSURES SAFE OPERATION AND REQUIRES SPECIAL ATTENTION WHEN BEING FITTED.

To ensure its safety function, the rail protector should consist of:
– two soundproofing pads (1) **to be replaced** if they are damaged or saturated with diesel,
– lower metal protector (2) fixed between the rail and the cylinder head,
– a diesel drain pipe (3) **to be replaced** if it is damaged or saturated with diesel,
– a rubber flap (4) fixed to the metal protector and the rocker cover,
– two side partitions (5),
– two retaining clips for attaching the side partitions to the rubber flap.

When working on the rail protector, ensure that the system components are correctly positioned after refitting.

FAILURE TO COMPLY WITH THESE INSTRUCTIONS MAY HAVE SERIOUS SAFETY-RELATED CONSEQUENCES.



GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Mot. 1566	Tool for removing and refitting high pressure pipes
EQUIPMENT REQUIRED	
"Low torque" torque wrench	

TIGHTENING TORQUES (in daNm)	
High pressure pipe nuts	2.5 ± 0.2
Injection rail mounting bolt	2.3 ± 0.3
Rail-pump pipe bracket bolt	2.5 ± 0.2

IMPORTANT:
Before any operation, connect the After-Sales fault finding tool, establish dialogue with the injection computer and check that the injection rail is no longer under pressure.

Take note of the fuel temperature.

Order the special high pressure injection circuit caps kit.

OBSERVE THE CLEANLINESS ADVICE CLOSELY

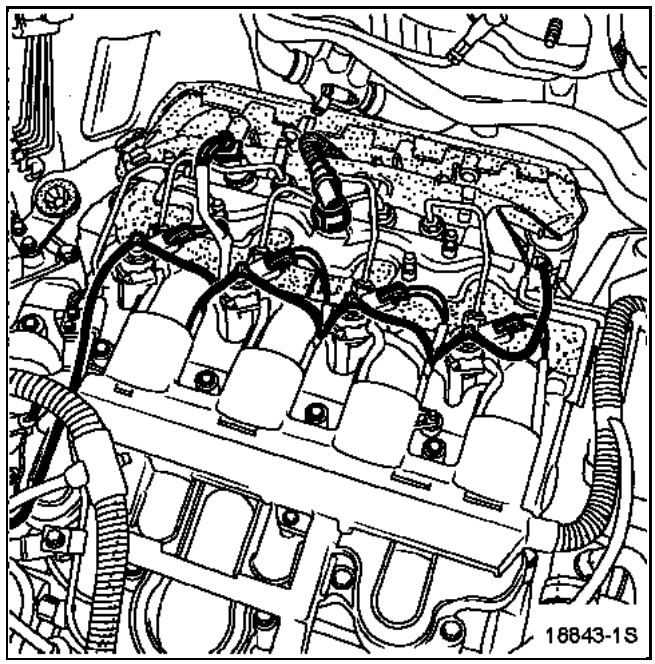
REMOVAL

Disconnect the battery.

Unclip the side partitions of the rubber flap.

Unclip the upper rubber protector from the rocker cover and push it as far back as possible.

Remove the soundproofing pads.



GETtheMANUALS.org

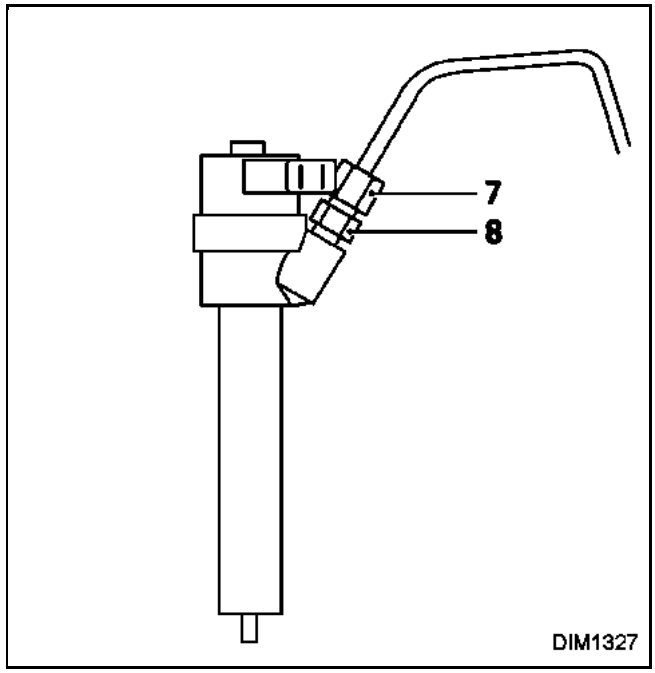
Disconnect the pressure sensor (1) and the injector wiring.

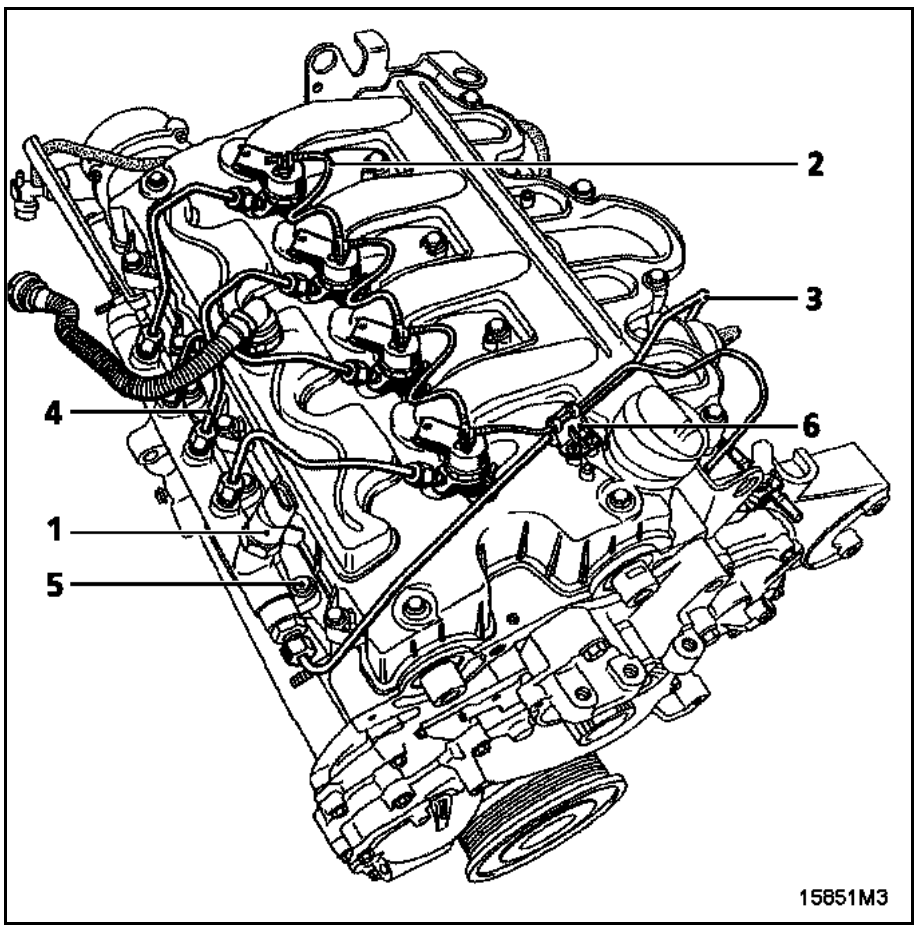
Remove:
– the injector diesel return pipe (2) (to be replaced),
– the injection pipe (3) between the high-pressure pump and the rail. WARNING: the cylinder head mounting clip (6) is very fragile,
– the injector pipes (4).

Fit anti-pollution plugs.

IMPORTANT:
When loosening the injection pipe unions (7) on the injector holder, hold the filter-rod supporting bolts (8) with a lock wrench.

Undo the injector rail bolts (5) without removing them.



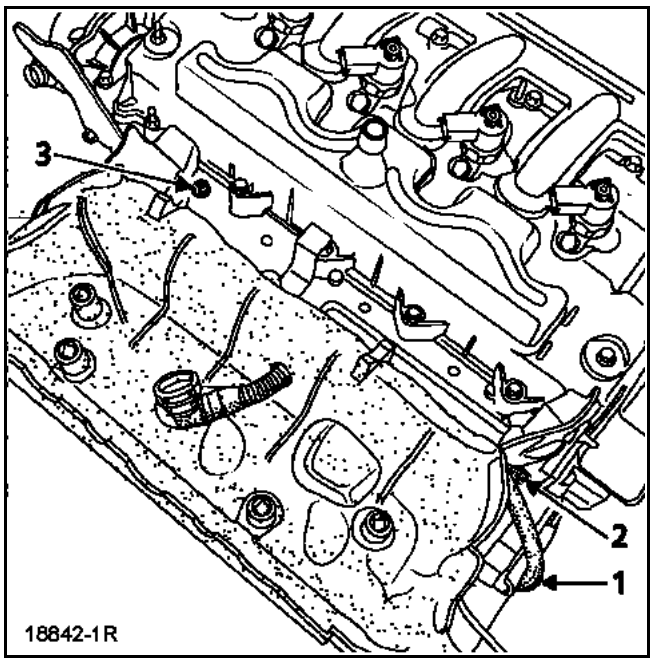


GETtheMANUALS.org

REMOVAL

Disconnect the diesel drain pipe (1).

Remove:
– the side partition mounting bolt (2),
– the lower metal protector mounting bolt (3),

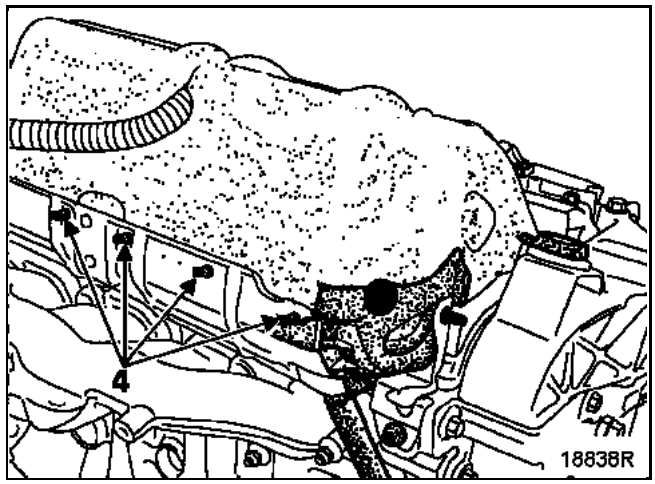


– the rail protector with the side partition, then remove the partition of the central section.

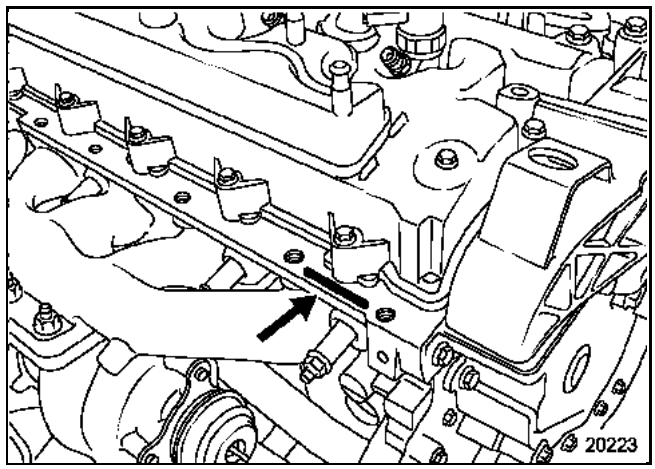
Separate the rubber flap from the lower metal protector.

REFITTING

Refit the rubber flap to the lower metal protector by pulling on the five rubber sockets (4). **Check that the rubber sockets are correctly positioned.**



Put **Rhodorseal 5661** on the cylinder head in the area marked by a black line on diagram.



Refit the rubber flap/lower metal protector assembly to the engine by refitting the lower metal protector mounting bolt (3).

GETtheMANUALS.org

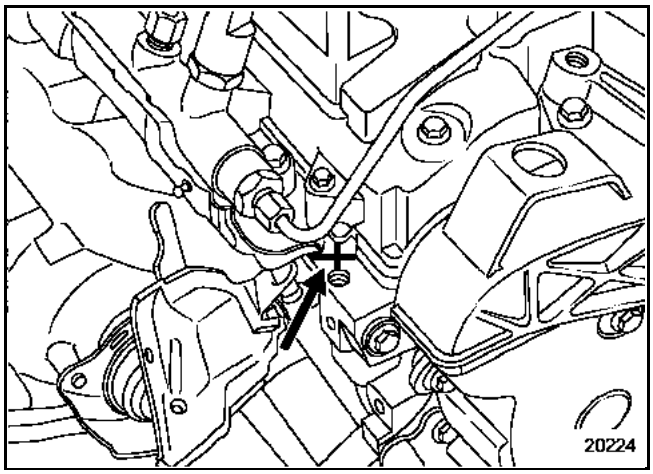
Refit the injection rail with its partition without tightening the rail mounting bolts.

Remove the caps from the rail, the injector holders, the pump and the injection pipes.

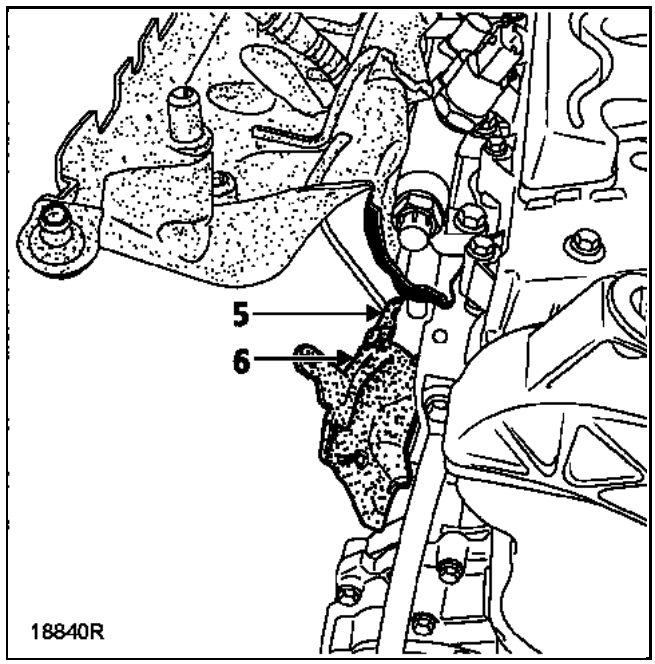
Fit the injection pipes between the rail and the injectors and between the pump and the rail, then pretighten by hand until they touch.

Tighten to a torque of:
– the three rail mounting bolts to **2.3 daNm**,
– the injection pipe unions on the injectors and the high pressure pump to **2.5 daNm**,
– the injection pipe unions on the rail to **2.5 daNm**.

Put **Rhodorseal 5661** on the cylinder head in the area marked by a black cross on the diagram.

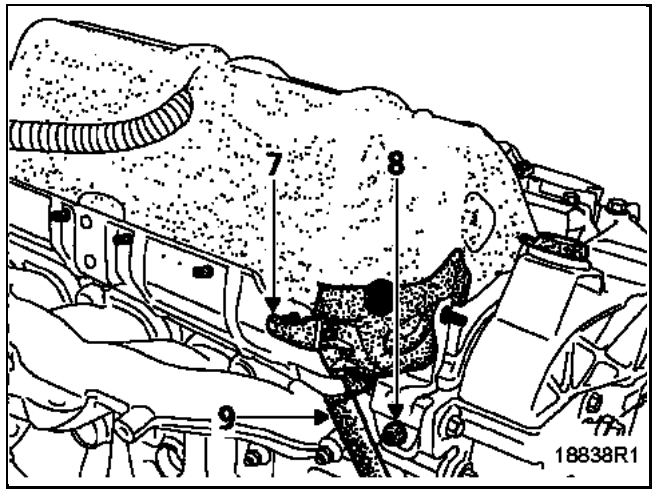


To refit the side partition on the lower metal protector it is **essential** that you use the following method:
– fit the lower strap (5),
– fit the rubber ring (6) of the partition onto the lower metal protector,
– then mount the upper section of the partition on the metal protector,



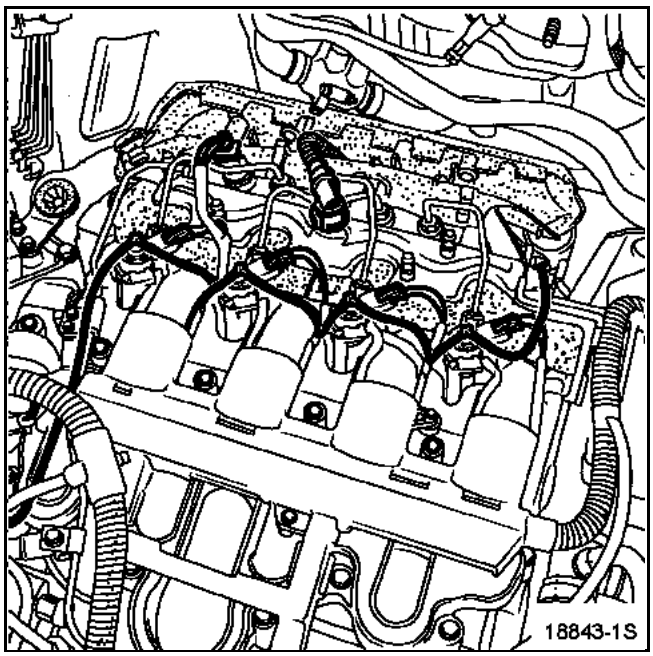
– fit the upper strap (7),
– refit the partition mounting bolts (8),
– reconnect the diesel drain pipe (9), checking that it is not blocked.

It is essential to replace this if it has been contaminated with diesel.

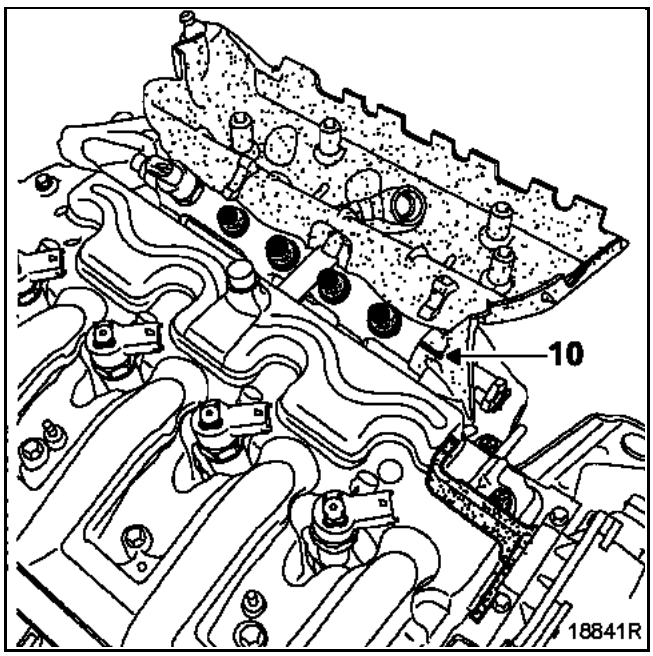


GETtheMANUALS.org

Refit:
– the sound-proofing pads, replacing the pieces if they are damaged or saturated with diesel,



Check that the mark (10) on the rail partition is positioned correctly (in the axis of the high pressure rail outlets).



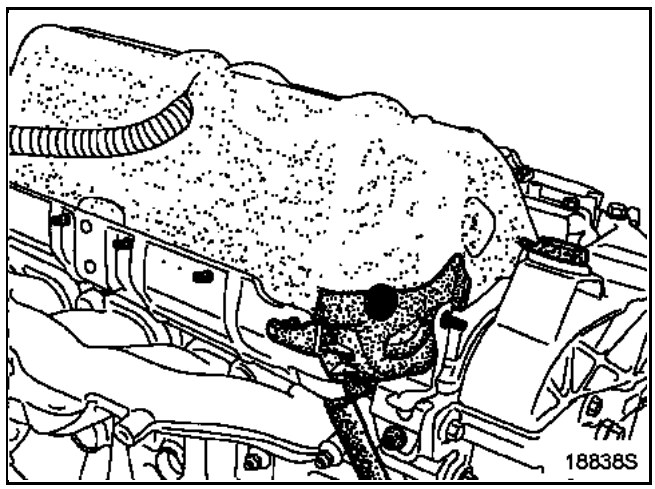
Reconnect the injectors and the rail pressure sensor.

Refit a new diesel return pipe ensuring that the mounting clips are properly fitted at the injectors and at the end of the rail at the overpressure valve.

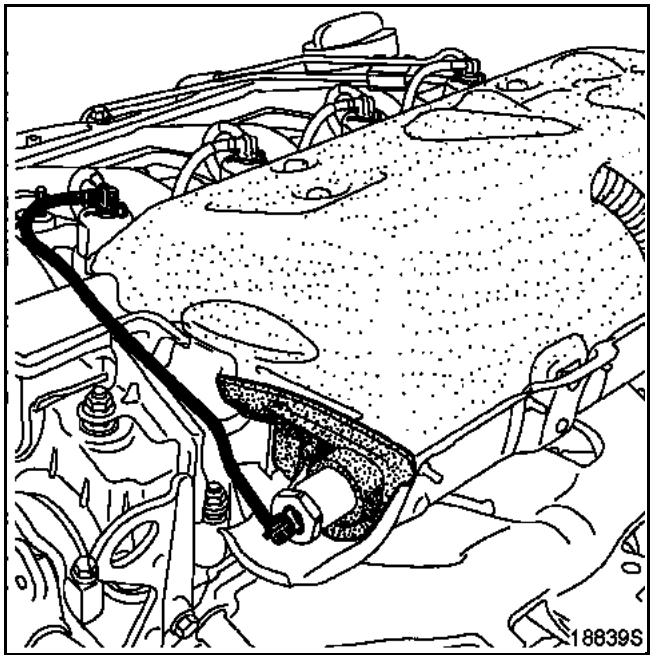
Fold the rubber flap to the front and clip the side sealing partitions to it.

Check that the clip buttons are correctly fastened to the partitions and that the rubber flap end panels are correctly positioned.

IMPORTANT:
Check that the diesel drain pipe is correctly reconnected and replace it if it has been contaminated with diesel.



GETtheMANUALS.org



Reclip the rubber flap to the rocker cover and the engine mounting.

Check that the rubber flap is correctly positioned on the rocker cover studs and the engine mounting.

Re-prime the system by switching on the ignition several times, or run the low pressure pump with the fault finding tool using the "**Actuator Commands**" menu.

Use the fault finding tool to clear any faults which may be stored in the injection computer before restarting the engine.

After carrying out any work, check that there are no leaks in the diesel circuit.

Proceed as follows:
– run the engine at idle speed until the engine cooling fan starts up,
– accelerate several times with no load,
– carry out a road test,
– switch the ignition off and check that there is no diesel fuel leakage,
– check that the absorbent soundproofing pads are not saturated with diesel fuel.

GETtheMANUALS.org

GENERAL INFORMATION

The accelerator pedal potentiometer is built into in the accelerator pedal. To replace it you must replace the accelerator pedal.

There are two types of pedal: **with or without hard point**.

Cars equipped with cruise control/speed limiter have an accelerator pedal with a hard point at the end of their travel (kickdown).

This hard point makes it possible to deactivate the speed limiter function if the driver has to increase his speed.

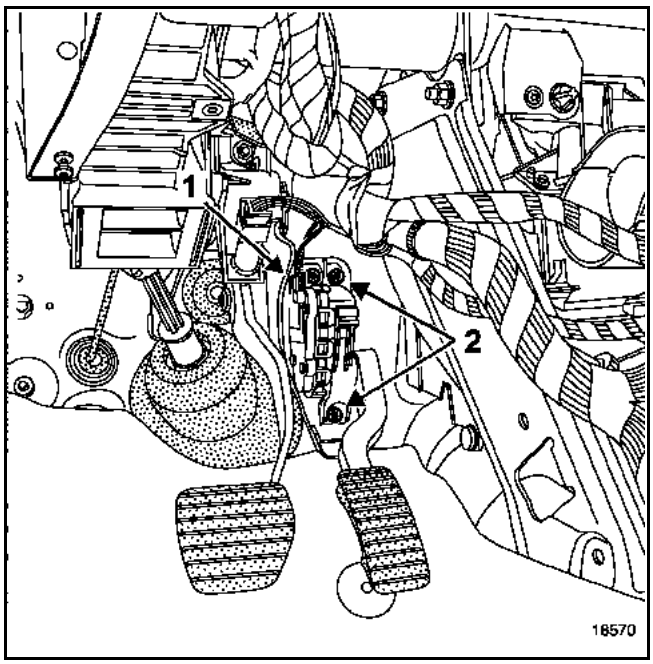
IMPORTANT:

A pedal fitted with a hard point may be fitted in place of a pedal without a hard point. However, fitting a pedal without a hard point in place of a pedal with a hard point is prohibited.

REMOVAL

Disconnect the battery.

Remove:
– disconnect the accelerator pedal connector (1),
– remove the three pedal mounting screws (2),
– remove the pedal.

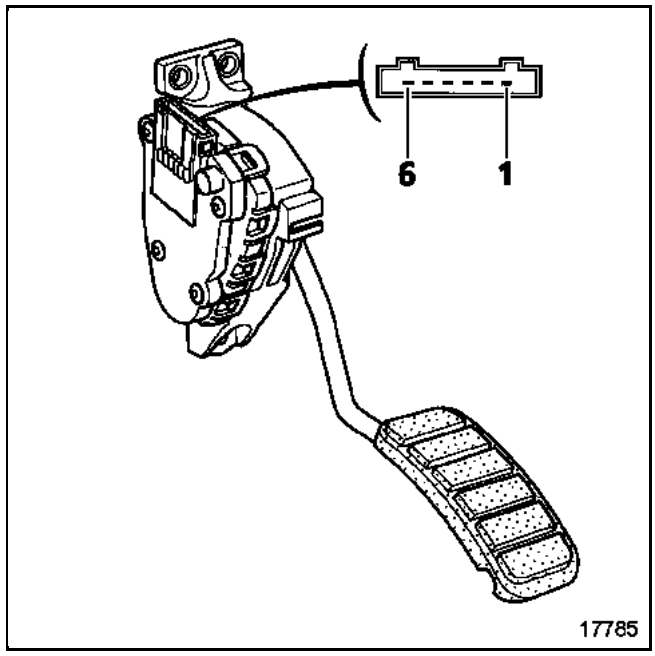


REFITTING

Refitting is the reverse of removal.

Allocation of tracks:

Track	Description
1	Track 2 earth
2	Track 1 earth
3	Track 1 signal
4	Track 1 supply
5	Track 2 supply
6	Track 2 signal



NOTE:

An accelerator position potentiometer fault causes changes in the idle speed or engine operation (see Section **13B "Idle speed adjustment"**).

GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Mot. 1372	Tamperproof bolt extractor

GENERAL INFORMATION

The injection computer is located under the battery tray. To remove it, the battery tray must be removed, which is held in place by three tamperproof screws.

REMOVAL

Remove the engine covers.

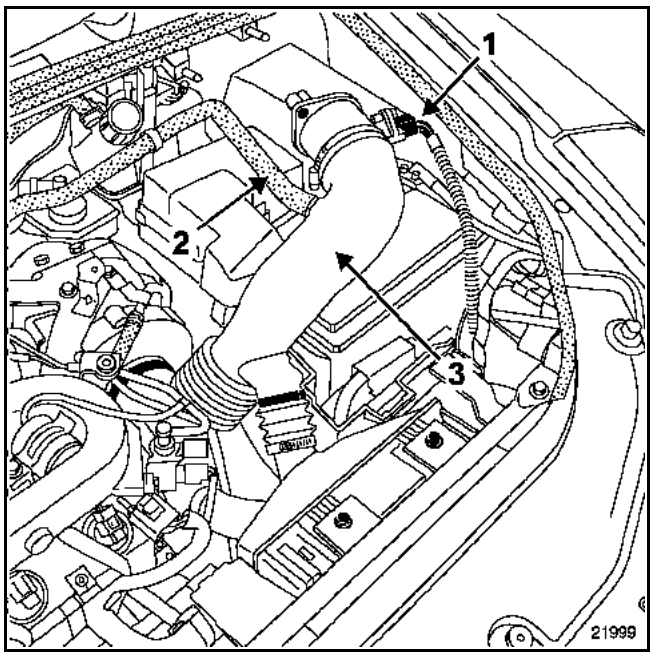
Disconnect the battery.

P9X engine

Disconnect the air flowmeter connector (1).

Disconnect the oil vapour rebreathing pipe (2).

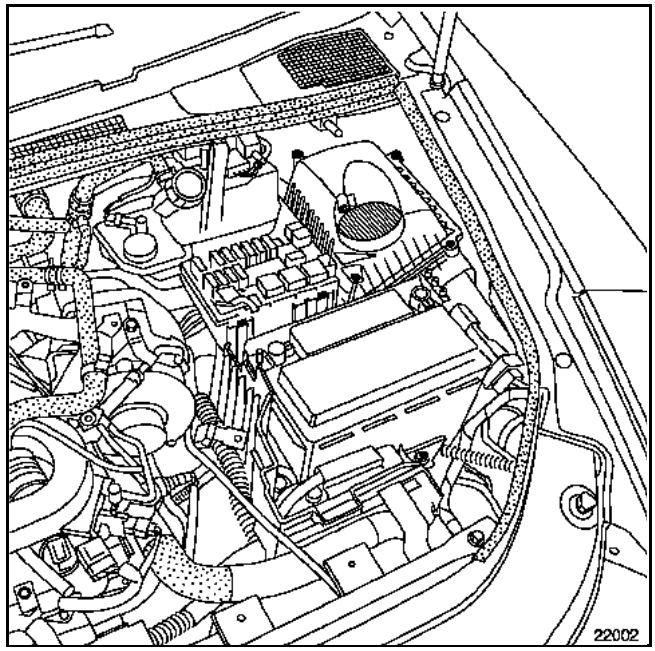
Remove the air inlet duct (3) complete with the flowmeter. To do this, remove:
– the two mounting bolts on the air flowmeter,
– the clip on the air resonator and then on the turbocharger.



All types

Unclip then remove the relay unit from the side.

Remove the battery.

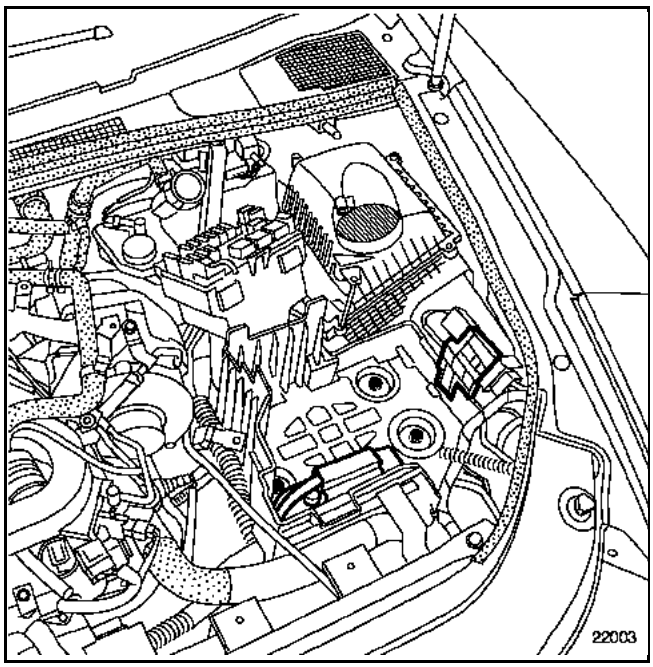


GETtheMANUALS.org

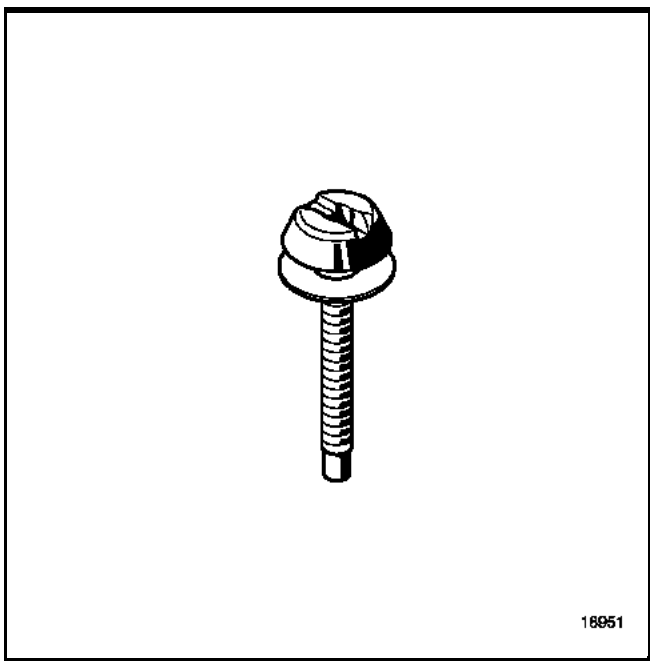
Disconnect then remove the automatic transmission computer (if fitted).

Remove the connector carrier on the battery tray.

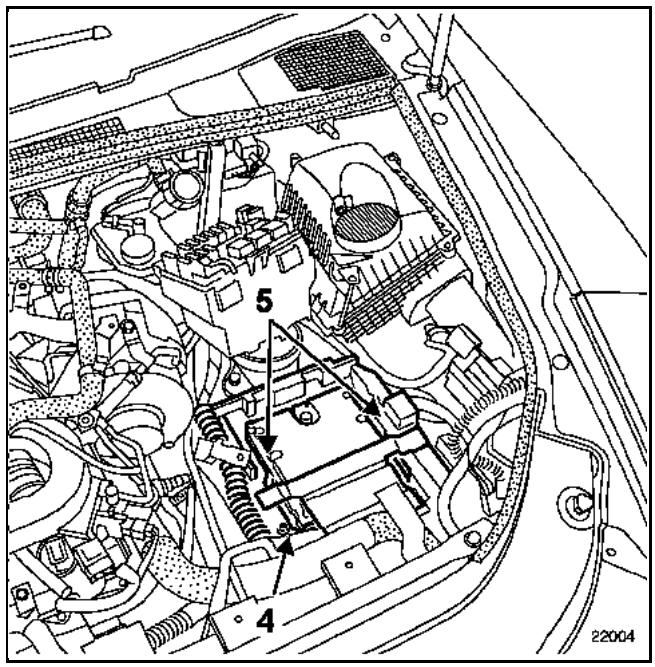
Pierce the three tamperproof bolts using a **5-mm** diameter drill bit in the bolt shaft.



Remove:
– the three battery tray mounting screws, using tool **Mot. 1372**,



– the battery tray,
– the electric wiring harness mounting clamp (4),
– the computer mounting nuts (5),
– the computer and disconnect it.



REFITTING

Proceed in the reverse order to removal.

Replace the tamperproof screws with new ones.

Carry out the programming on the immobiliser code following the procedure described in section **82A "Engine immobliser"**.

If necessary repair the faults that appear, then clear them.

Check that the vehicle is operating correctly.

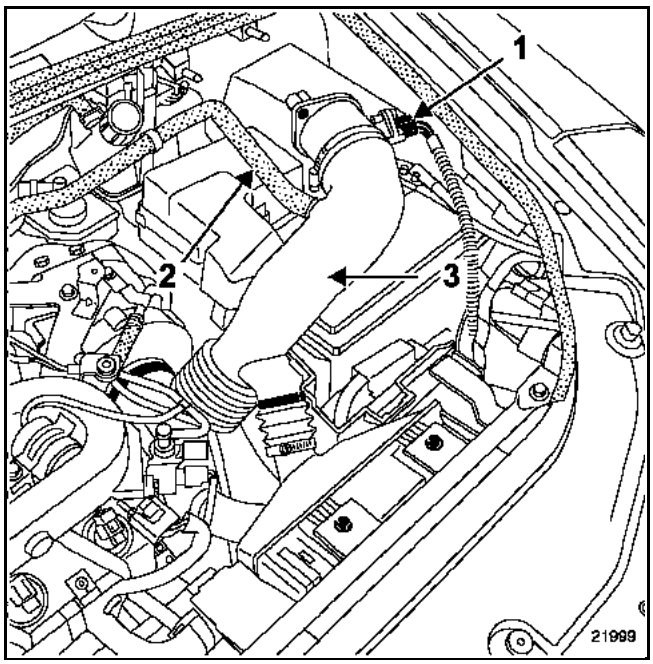
GETtheMANUALS.org

REMOVAL

Remove the engine covers.

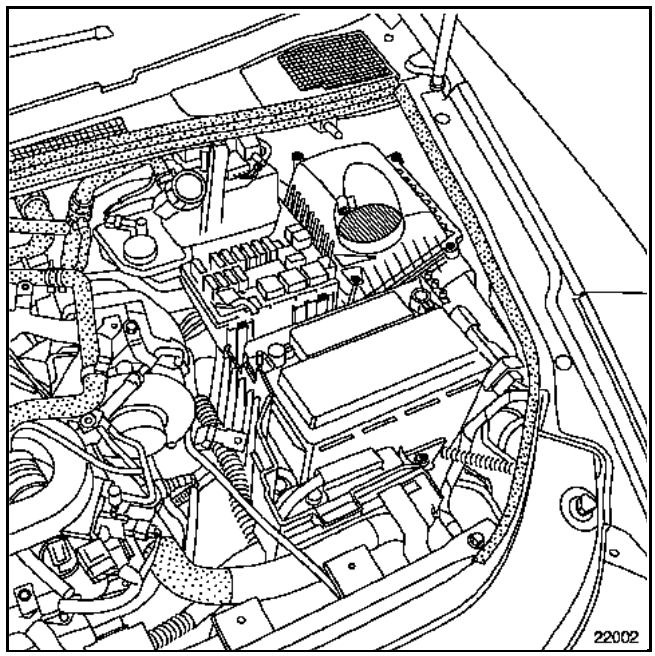
Disconnect:
– the battery,
– the air flowmeter connector (1),
– the oil vapour rebreathing pipe (2).

Remove the air inlet duct (3) complete with the flowmeter. To do this, remove:
– the two mounting bolts on the air flowmeter,
– the clip on the air resonator and then on the turbocharger.



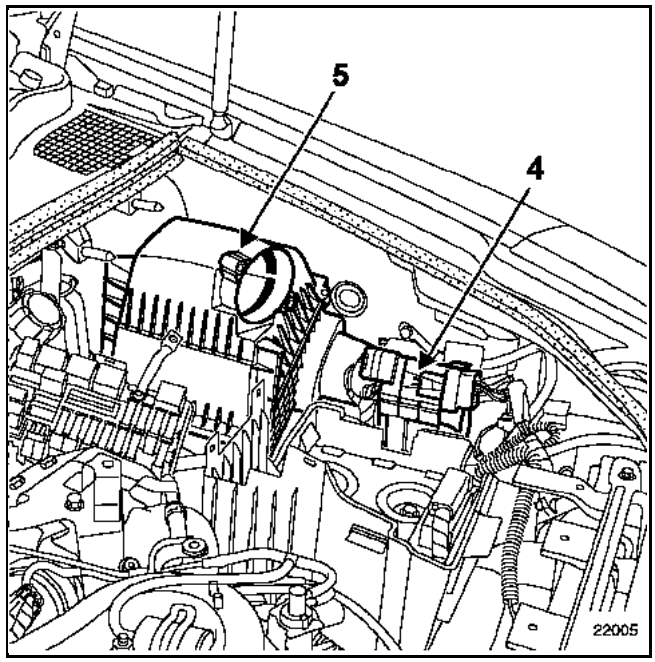
Unclip then remove the relay unit from the side.

Remove the battery.



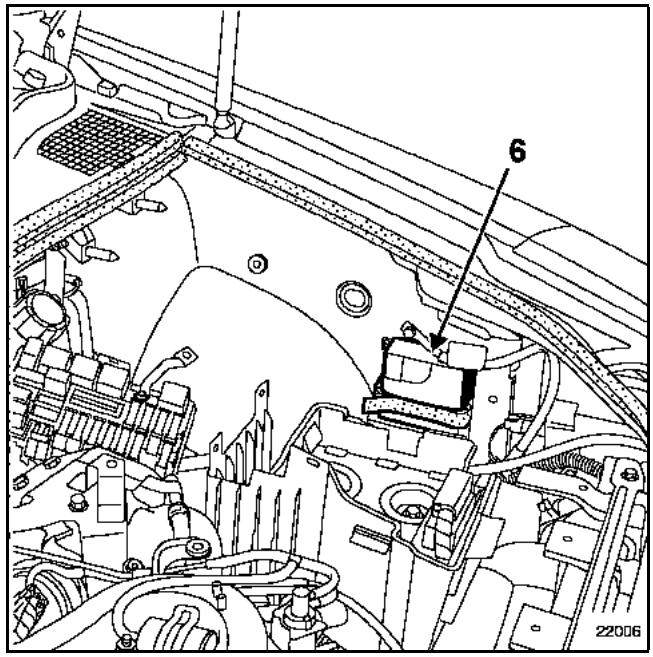
Release the connector carrier (4) from the side.

Remove:
– the air filter box (5),



GETtheMANUALS.org

– the power computer (6) having disconnected it.



REFITTING

Proceed in the reverse order to removal.

Turn the engine on and read the fault codes using the fault finding tool.

If necessary repair the faults that appear, then clear them.

Check that the vehicle is operating correctly.

GETtheMANUALS.org

Vehicles with the high pressure diesel injection system are fitted with a glow plugs "on" tell-tale light, two injection warning lights and a coolant temperature warning light which can all be seen on the instrument panel.

The glow plugs "on" tell-tale light is represented by an orange coil along with the "diesel preheating" message. The severity 1 injection fault warning light is represented by an orange sine curve along with the "injection fault" message. The level 2 injection fault warning light is represented by an engine with the word "stop" in red along with the "switch off engine" message. The coolant temperature warning light is represented by a red thermometer along with the "coolant temperature" message.

PRINCIPLE OF WARNING LIGHT ACTIVATION

- The glow plugs "on" light illuminates when the ignition is switched on, remains on during the preheating phase and then goes out (see **Section 13C "Pre-postheating control"**).

- If an injection fault (severity 1) occurs, the "injection fault" warning light comes on, requiring an inspection by a Renault dealer. These faults are:
  – internal computer fault,
  – engine immobiliser fault,
  – engine speed synchronisation fault,
  – accelerator potentiometer fault,
  – air flowmeter fault,
  – vehicle speed sensor fault (see ABS system),
  – exhaust gas recirculation valve fault,
  – turbocharging pressure regulation solenoid valve fault,
  – main relay fault,
  – after ignition key fault,
  – injector fault,
  – injector correction fault (IMA),
  – sensor feed fault,
  – inlet flap fault,
  – swirl flap fault.

- When an injection fault of severity 2 occurs, the "switch off ignition" warning light illuminates. The engine must be switched off immediately if this happens. These faults are:
  – internal computer fault,
  – injector fault,
  – rail pressure sensor fault,
  – rail pressure regulator fault,
  – engine speed synchronisation fault.

- When the engine overheats, the coolant temperature warning light comes on.

GETtheMANUALS.org

Vehicles with the high pressure diesel injection system have fault symbols and written messages which appear clearly on the instrument panel display.

PRINCIPLE OF WARNING LIGHT ACTIVATION

- The glow plugs "on" light comes on when the ignition is switched on, remains on during the preheating phase and then goes out (see **Section 13 Pre/post-heating control**).

- When there is an injection fault (level 1), the orange symbol (indicated by a sine curve), appears along with the words FUEL INJECTION FAULT then SERVICE. Depending on the vehicle equipment, the voice synthesiser gives out the message "Level 1 faults".
  These faults are:
  – air flowmeter fault,
  – wastegate position sensor fault,
  – coolant temperature sensor fault,
  – rail pressure sensor fault,
  – atmospheric pressure sensor fault,
  – turbocharging pressure sensor fault,
  – accelerator pedal potentiometer fault,
  – engine speed sensor fault,
  – cylinder reference sensor fault,
  – exhaust gas recirculation valve fault,
  – injection locking relay feed voltage fault,
  – turbocharging pressure regulation solenoid valve fault,
  – diesel pressure regulator fault,
  – injector fault,
  – power computer fault,
  – injection computer fault.

- When an injection fault of severity 2 occurs, the red symbol (represented by an engine and the word "STOP") appears with the written message "SWITCH OFF IGNITION" followed by the written message "STOP". Depending on the vehicle equipment level, the voice synthesiser gives out the message "Level 2 faults". In this event the vehicle will stop immediately.
  These faults are:
  – engine speed sensor and cylinder reference sensor signal consistency fault,
  – injection locking relay feed voltage fault,
  – computer feed voltage fault,
  – diesel pressure regulator fault,
  – injector fault,
  – power computer fault,
  – injection computer fault.

- When the engine overheats, the engine temperature fault symbol appears on the display as "COOLANT TEMPERATURE" followed by "STOP". In this event the vehicle will stop immediately.

NOTE:
The orange OBD warning light (symbolised by an engine), displayed when the ignition is switched on, is never displayed when the engine is running.

GETtheMANUALS.org

This vehicle is fitted with a 3rd generation engine immobiliser system, controlled by a RENAULT card recognition system with random rolling code which requires a specific method for replacing the computer.

REPLACING AN INJECTION COMPUTER

See Section **13B Injection "Computer"** for computer removal and reinstallation methods.
See **Section 82A "Immobiliser"** for the immobiliser functions.

Injection computers are supplied without a code, but they can all be programmed with one.

When the computer is replaced, the vehicle code must be programmed in and then a check must be made to ensure that the immobiliser system is operational.

To do this, switch on the ignition for a few seconds without starting the engine, then switch it off. With the ignition off, the engine immobiliser function comes into operation after approximately **10 seconds** (the red engine immobiliser warning light flashes).

WARNING:

With this engine immobiliser system, the computer keeps its immobiliser code for life.

In addition, this system does not have a security code.

Consequently, it is forbidden to perform tests with computers borrowed from the stores or from another vehicle which must then be returned.

It will no longer be possible to decode them.

GETtheMANUALS.org

THIS VEHICLE IS FITTED WITH A VARIABLE OUTPUT COMPRESSOR

AIR CONDITIONING - INJECTION COMPUTER CONNECTION

The injection computer controls the compressor clutch, taking into account the power absorbed by the compressor and the pressure of the refrigerant in the circuit.

The data used for the air conditioning function is exchanged via the multiplex network:
– track **A A4** multiplex connection CAN L (passenger compartment),
– track **A B4** multiplex connection CAN H (passenger compartment).

When the air conditioning is switched on, the air conditioning computer requests authorisation to engage the compressor clutch. The injection computer either authorises or denies the compressor clutch, and controls the fan assembly.

When the air conditioning function is selected, the idling speed is not altered.

COMPRESSOR OPERATION PROGRAMMING

During certain operating phases, the injection computer disables the compressor.

Engine starting program

Compressor operation is forbidden when the engine is started for a period of between **2 seconds** and **8 seconds**.

Recovery of performance

During a significant change in the position of the accelerator pedal, if the engine speed is less than **3000 rpm** and if the vehicle speed is less than **70 mph (110 km/h)**, operation of the compressor is prohibited.

Recovery of output when the vehicle starts moving

If the potentiometer is greater than **46 %**, if the engine speed is less than **2250 rpm**, and if the vehicle speed is less than **20 km/h**, (in 1st gear), the compressor is cut off.

Anti-stalling function

During throttle-off, if the engine speed is below **675 rpm**, the compressor clutch is disengaged. It is re-engaged when the engine speed exceeds this figure.

Thermal protection strategy

The compressor does not engage in cases where the coolant temperature is greater than **+110 °C**.

GETtheMANUALS.org

INJECTION COMPUTER / AIR CONDITIONING COMPUTER CONNECTION

The compressor is of variable displacement type.

The injection computer authorises or disallows operation of the compressor depending on the information supplied by the air conditioning computer and the engine operating conditions.

The data used for the function is exchanged via the multiplex network:
– track **A 67** multiplex connection CAN H,
– track **A 48** multiplex connection CAN L.

When the air conditioning is switched on, the air conditioning control panel requests authorisation to engage the compressor clutch. The injection computer either authorises or inhibits engagement of the compressor clutch, controls the fan unit and orders fast idle speed. This speed is **750 rpm**.

COMPRESSOR OPERATION PROGRAMMING

During certain operating phases, the injection computer disables the compressor.

Engine starting program

Operation of the compressor is inhibited for **1 second** after the engine is started.

Recovery of performance

During a significant change in the position of the accelerator pedal, if the engine speed is less than **4000 rpm**, operation of the compressor is inhibited for **4.5 seconds**.

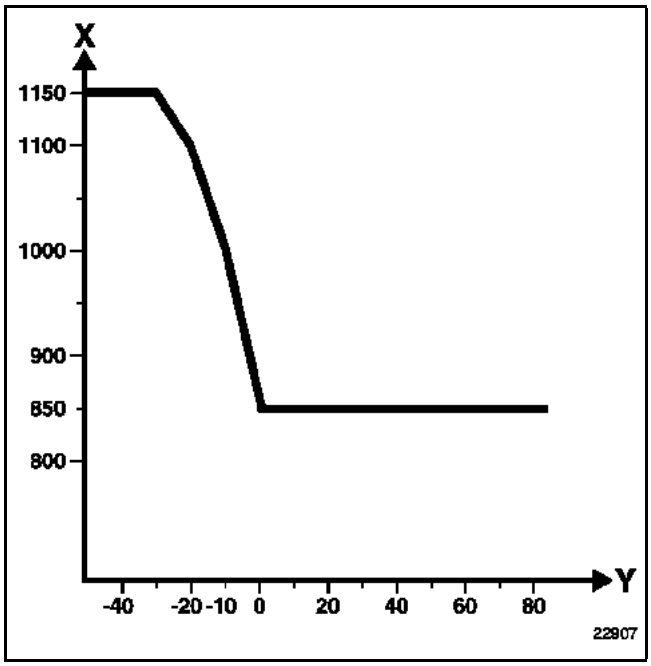
Thermal protection strategy

The compressor does not engage in cases where the coolant temperature is greater than **+113 °C**.

GETtheMANUALS.org

IDLE SPEED CORRECTION ACCORDING TO COOLANT TEMPERATURE

In all cases, this idling speed correction is deactivated **3 minutes** after the engine is started.



X: Engine speed in **rpm**.
Y: Coolant temperature in °**C**

IDLE SPEED CORRECTION WHEN THE POTENTIOMETER IS FAULTY

If the accelerator pedal potentiometer is faulty (both tracks), idle speed is set to **1200 rpm**.

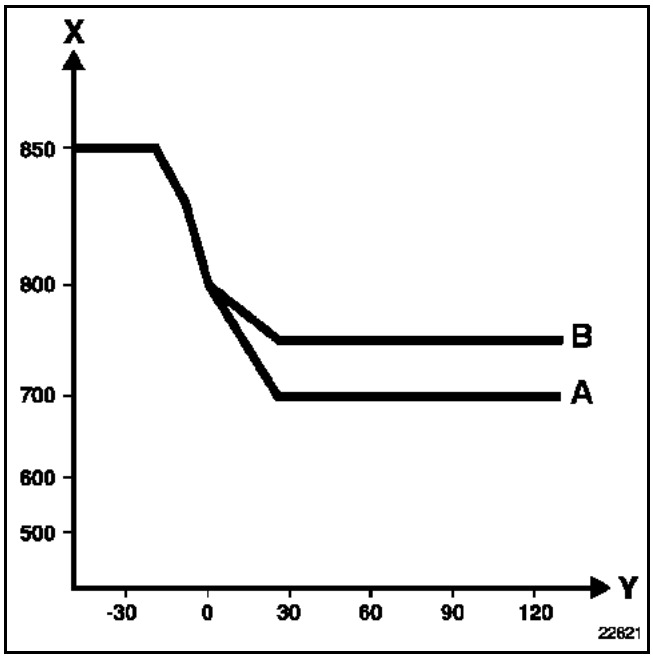
If the signal from the accelerator pedal position potentiometer and the brake switch signal are inconsistent, the speed is changed to **1250 rpm**.

IDLE SPEED CORRECTION WHEN DRIVING

The idle speed when driving is **850 rpm**, with the vehicle moving at more than **1.5 mph (2.5 km/h)**.

GETtheMANUALS.org

IDLE SPEED CORRECTION ACCORDING TO COOLANT TEMPERATURE



X: Engine speed in **rpm**.
Y: Coolant temperature in °**C**

A: without air conditioning
B: with air conditioning

IDLE SPEED CORRECTION IN THE EVENT OF A PEDAL POTENTIOMETER FAULT

If the accelerator pedal potentiometer is faulty, idle speed is held at **1000 rpm**.

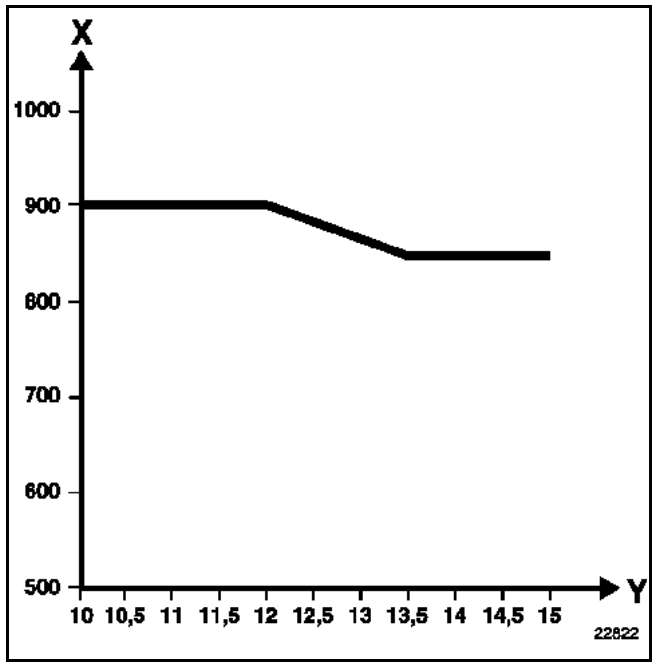
If the information from the accelerator pedal position potentiometer and the brake switch does not correspond, the speed is changed to **1000 rpm**.

IDLE SPEED CORRECTION IN THE EVENT OF A COMPONENT FAULT

In the event of a fault, short circuit or signal incoherence on a component in the engine management system, the idle speed is increased to **1000 rpm** (see Workshop Repair Manual **Fault Finding: Interpretation of faults**).

IDLE SPEED CORRECTION ACCORDING TO BATTERY VOLTAGE

The aim of this correction is to compensate for the drop in voltage caused when the rear screen de-icer is switched on.



X: Engine speed in **rpm**.
Y: Battery voltage

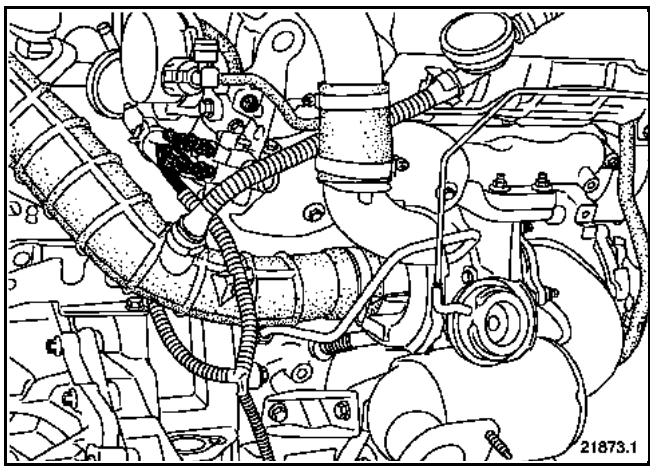
GETtheMANUALS.org

The four thermoplungers are located in a plenum chamber mounted on the engine lifting bracket next to the vacuum pump.

The purpose of the system is to reheat the coolant.

The thermoplungers are supplied with **12 V** by three relays. One relay controls two thermoplungers, the two other relays control one thermoplunger each. This enables control of one, two, three or four thermoplungers as required.

The resistance of the thermoplungers is:
0.45 ± 0.05 Ω at **20 °C**.

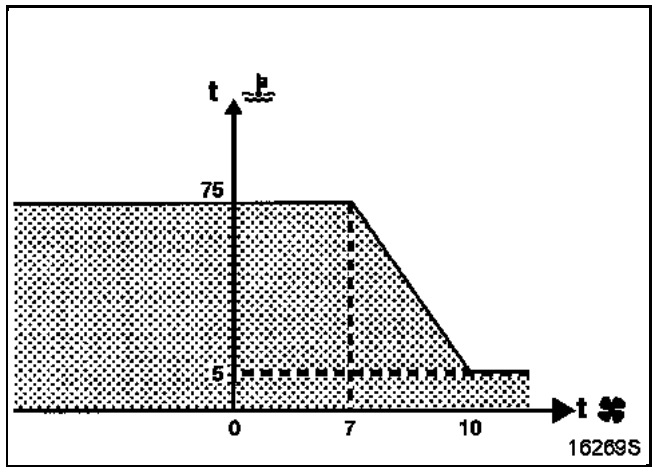


Control strategy

When the thermoplungers are operating, the idling speed is increased to **900 rpm**.

Thermoplungers cannot operate:
– preheating,
– if the engine speed is below **700 rpm**.

If the conditions mentioned above apply, the thermoplungers are controlled according to a cartographic map related to the air and coolant temperature.



Unshaded area: thermoplunger not supplied
Shaded zone: thermoplunger supplied

GETtheMANUALS.org

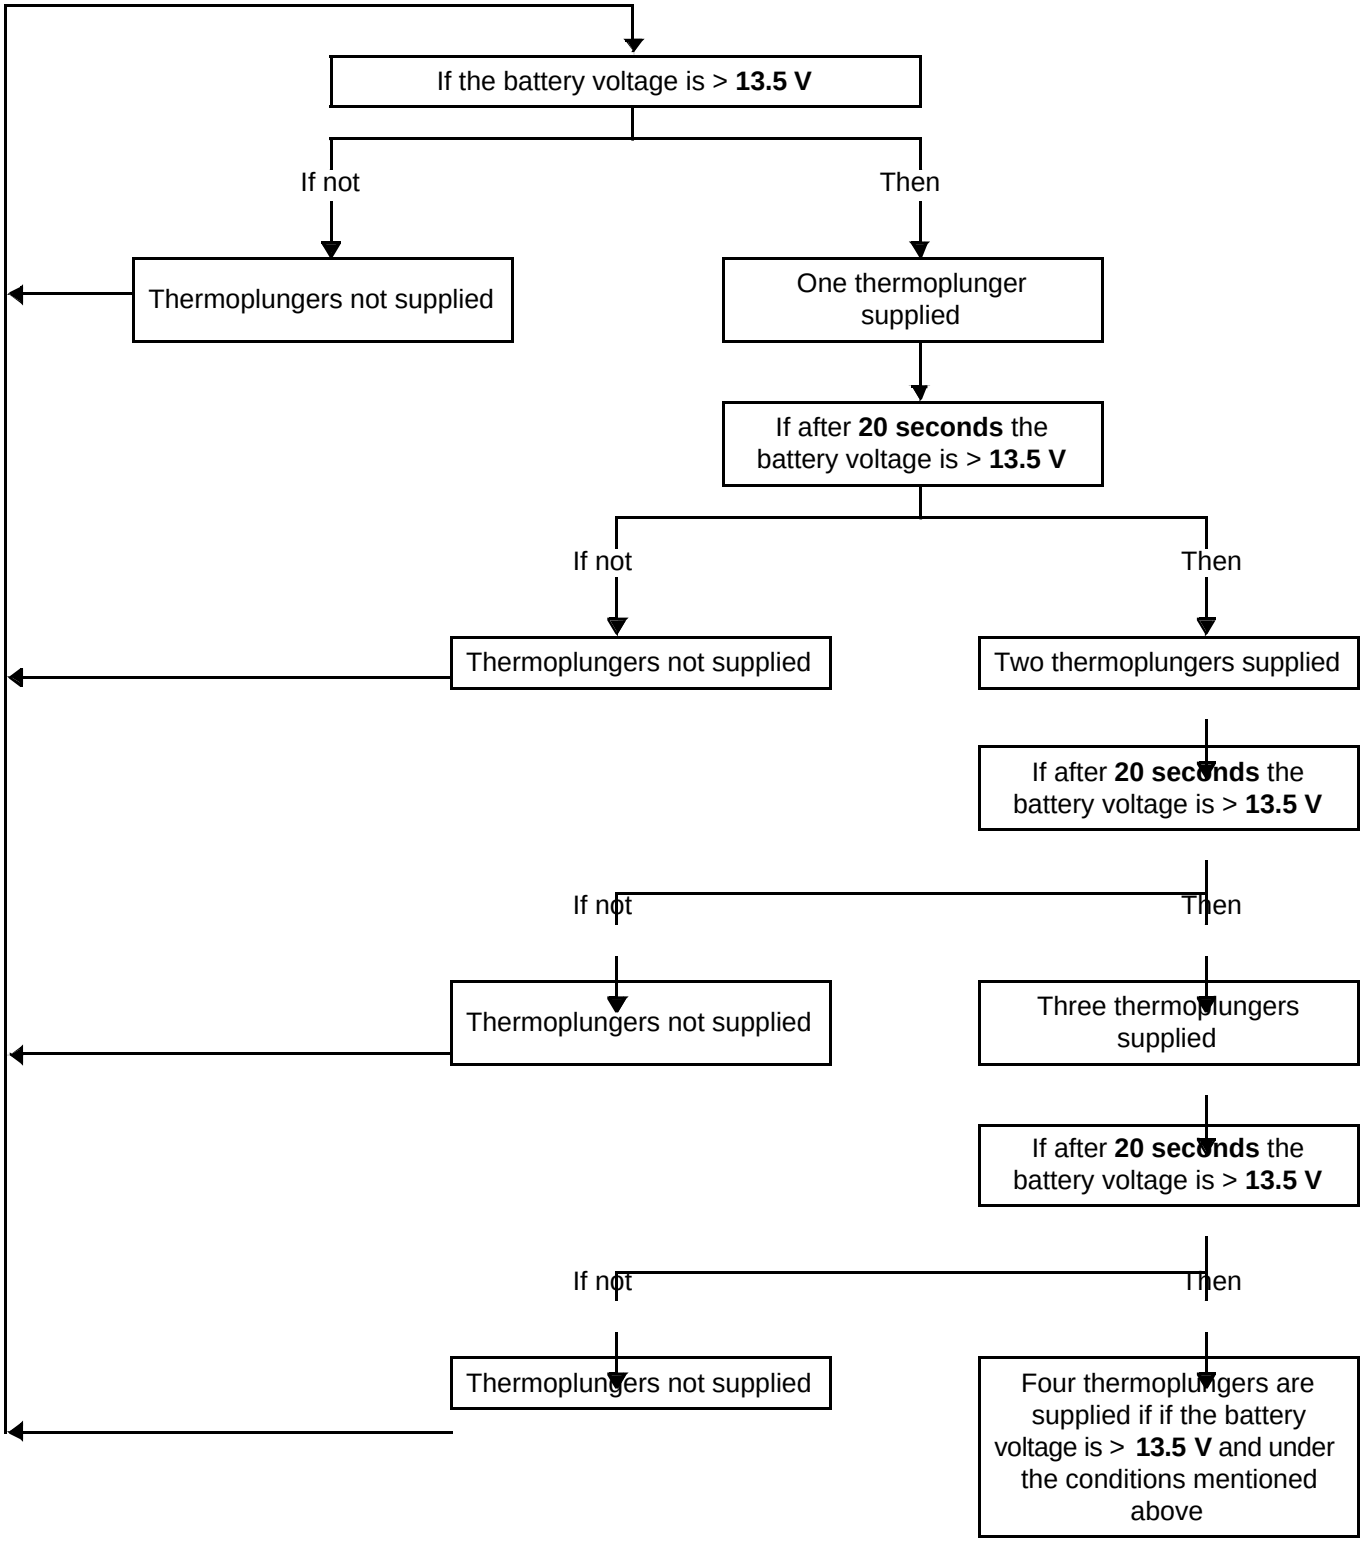
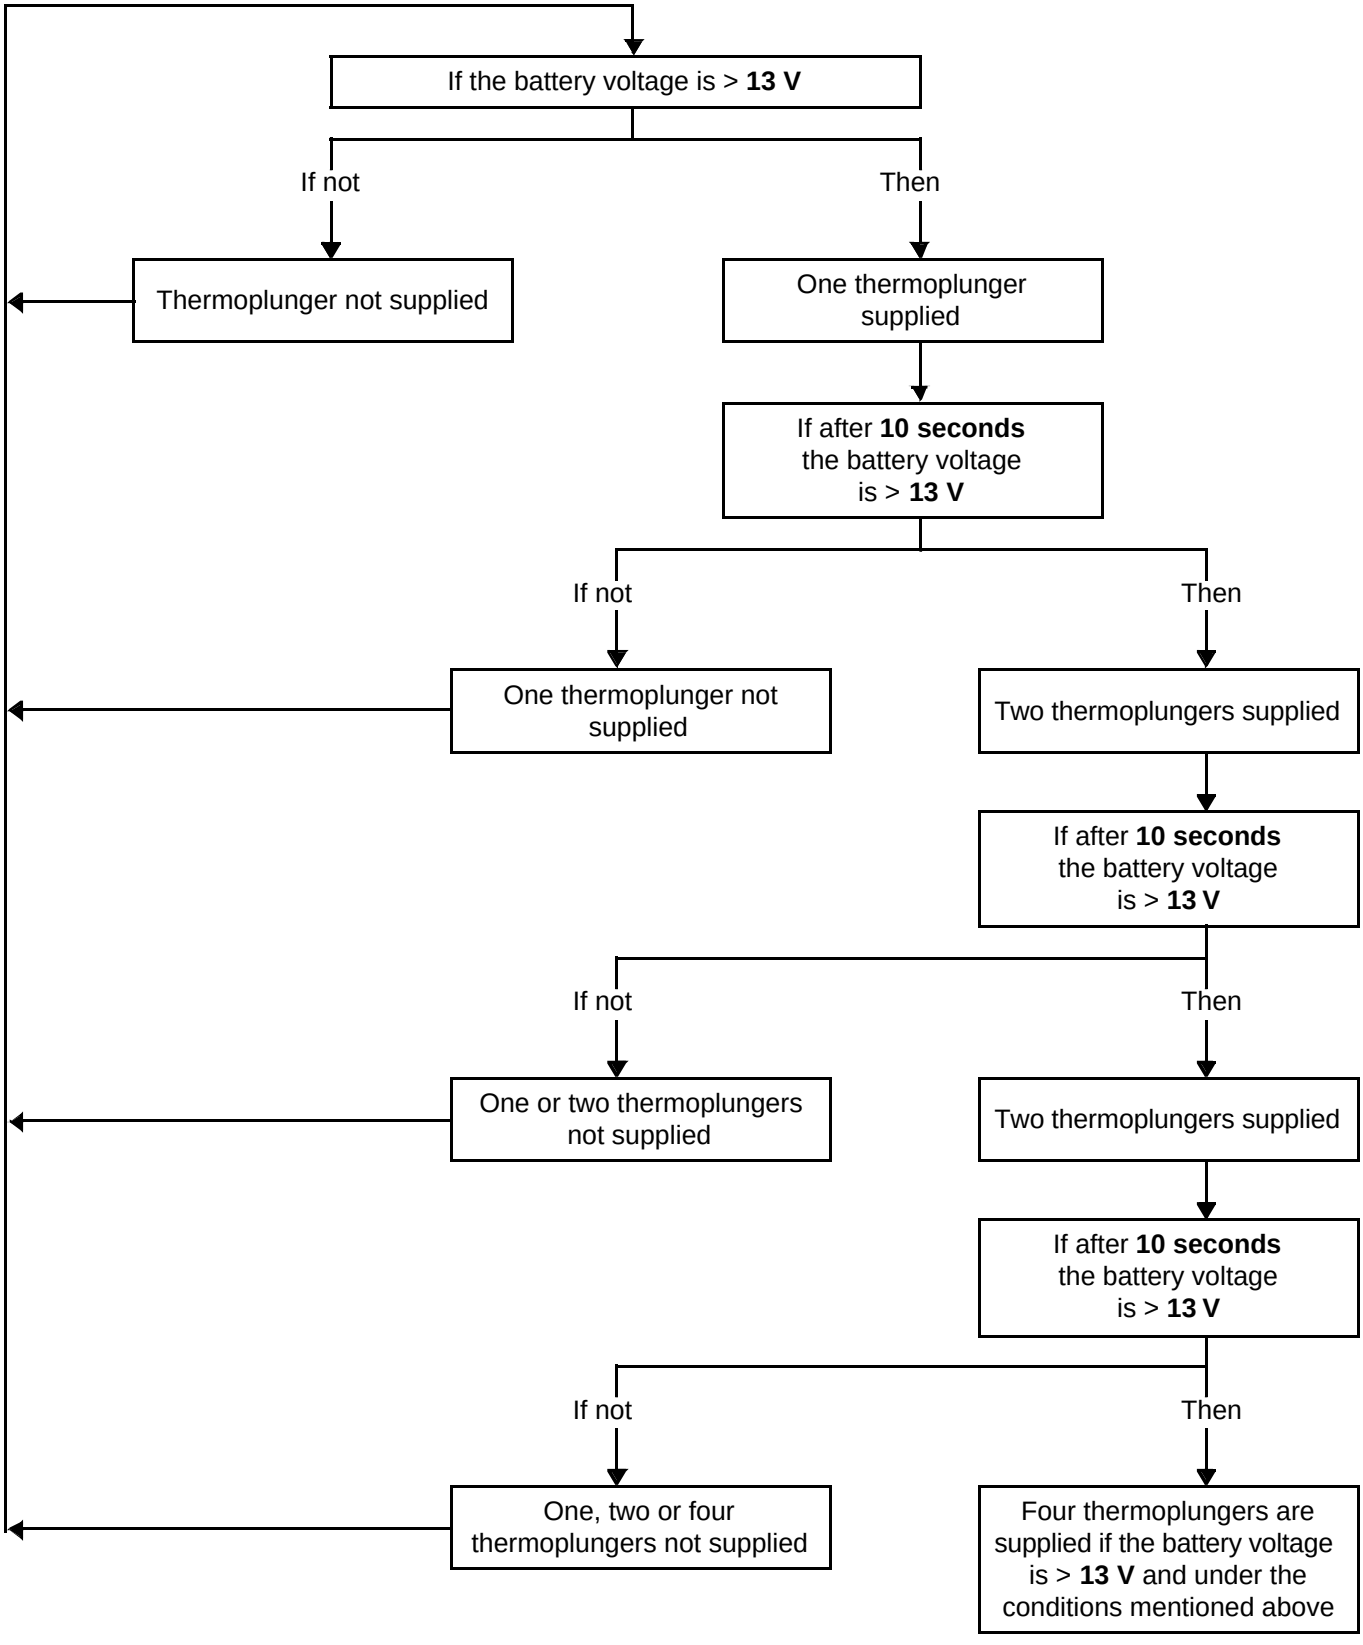
THERMOPLUNGER CONTROL PROGRAMMING



GETtheMANUALS.org

THERMOPLUNGER CONTROL STRATEGY



GETtheMANUALS.org

GENERAL INFORMATION

The cruise control or adaptive cruise control: can maintain a speed selected by the driver and can adapt vehicle speed to the speed of the moving vehicle in front in the case of adaptive cruise control. This function can be deactivated at any moment by depressing the brake pedal or the clutch pedal, or by using one of the system buttons.

Speed limiter: allows the driver to set a speed limit. The accelerator pedal has no effect above the set speed. The speed limit selected can be exceeded at any time by pressing the accelerator pedal beyond its point of resistance.

A warning light on the instrument panel lets the driver know the status of the cruise control/speed limiter with distance control:
– Green light: cruise control in operation.
– Amber light: speed limiter in operation.
– Indicator light flashing: the cruising speed cannot be maintained (e.g. going downhill).

To control these functions, the injection computer receives the following signals on the following tracks:
– **A F2:** Speed limiter On / Off
– **A D2:** Speed control On / Off or adaptive cruise control
– **A B2:** Steering wheel mounted switch supply
– **A A2:** Steering wheel switch signal
– **A F3:** Brake light switch open input
– **A E2:** Clutch switch input (depending on version)
– **A E1:** Pedal potentiometer 1 supply
– **A H2:** Pedal potentiometer 2 supply
– **A B3:** Pedal potentiometer 1 earth
– **A A3:** Pedal potentiometer 2 earth
– **A C1:** Pedal potentiometer 1 signal
– **A F1:** Pedal potentiometer 2 signal
– **A A4:** Multiplexing CAN L (passenger compartment)
– **A B4:** Multiplexing CAN H (passenger compartment)
– **B A1:** Multiplexing CAN H (engine)
– **B B1:** Multiplexing CAN L (engine)

The following signals are received by the injection computer via the multiplex network:
– Vehicle speed (ABS system).
– Brake switch closed signal (ABS).
– Which gear is engaged (Automatic gearbox)

The injection computer sends the following signals over the multiplex network:
– Cruise control or speed limiter setting to the instrument panel.
– Warning light coming on (amber, green or flashing).
– Gear change signals from the gearbox (depending on version).

The injection computer receives:
- signals from the accelerator pedal
- brake switch signal
- clutch switch signal
- Start/Stop switch signals
- signals from the steering wheel switches
- ABS computer signals
- signals from the automatic transmission computer.

The injection computer controls the solenoid injectors using these signals to maintain the speed set by the cruise control function and to adapt the vehicle speed to that of the vehicle in front in the case of adaptive cruise control, and not to exceed the cruising speed set by the speed limiter function.

GETtheMANUALS.org

GENERAL INFORMATION

The cruise control or adaptive cruise control: can maintain a speed selected by the driver and can adapt vehicle speed to the speed of the moving vehicle in front in the case of adaptive cruise control. This function can be switched off at any moment by depressing the brake pedal or by using one of the system buttons.

Speed limiter: allows the driver to set a speed limit. The accelerator pedal has no effect above the set speed. The speed limit selected can be exceeded at any time by pressing the accelerator pedal beyond its point of resistance.

A warning light on the instrument panel lets the driver know the status of the cruise control/speed limiter with distance control:
– Green light: cruise control in operation.
– Amber light: speed limiter in operation.
– Indicator light flashing: the cruising speed cannot be maintained (e.g. going downhill).

To control these functions, the injection computer receives the following signals on the following tracks:
– **A 23:** Speed limiter On / Off
– **A 81:** Speed control On / Off or adaptive cruise control
– **A 11:** Steering wheel switch earth
– **A 10:** Steering wheel switch signal
– **A 21:** Stop light switch open input

– **A 7:** Pedal potentiometer 1 supply
– **A 26:** Pedal potentiometer feed 2
– **A 31:** Pedal potentiometer earth 1
– **A 11:** Pedal potentiometer earth 2
– **A 27:** Pedal potentiometer signal 1
– **A 8:** Pedal potentiometer 2 signal
– **A 48:** CAN L multiplexing
– **A 67:** CAN H multiplexing

The following signals are received by the injection computer via the multiplex network:
– Vehicle speed (ABS system).
– Brake light switch closed signal (ABS system).
– Which gear ratio is engaged (Automatic transmission)

The injection computer sends the following signals over the multiplex network:
– Cruise control or speed limiter setting to the instrument panel.
– Warning light coming on (amber, green or flashing).
– Gear change signals from the gearbox (depending on version).

The injection computer receives:
- signals from the accelerator pedal
- brake switch signal
- signals from the Start / Stop switch
- signals from the controls at the steering wheel
- ABS system computer signals
- signals from the automatic transmission computer.

The injection computer controls the solenoid injectors using these signals to maintain the speed set by the cruise control function and to adapt the vehicle speed to that of the vehicle in front in the case of adaptive cruise control, and not to exceed the speed set by the speed limiter function.

GETtheMANUALS.org

CRUISE CONTROL OPERATION

Entry conditions
- switch on cruise control
- gear engaged >**2nd gear**
- minimum vehicle speed **18 mph (30 km/h)**, maximum **120 mph (200 km/h)** (for information purposes)
- cruise control warning light on (green)
- press on "+", "-" or "recall" button.

Output conditions
- press down on the accelerator pedal (temporary exit)
- brake or clutch pedal must be depressed
- press "0"
- switch on "Off"
- electronic stability program system must be switched on

DISTANCE CHECK ASSISTANCE OPERATION

Entry conditions
- switch on distance check assistance
- minimum vehicle speed **31 mph (50 km/h)** maximum **111 mph (180 km/h)** (for information purposes)
- cruise control warning light on (green)
- press on "+", "-" or "recall" button.

Output conditions
- press down on the accelerator pedal (temporary exit)
- brake pedal depressed
- press "0"
- switch on "Off"
- electronic stability program system must be switched on
- vehicle speed less than **18 mph (30 km/h)**

SPEED LIMITER OPERATION

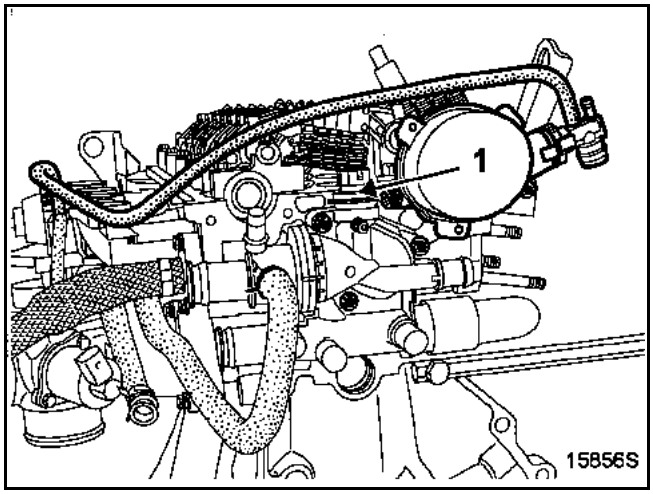
Entry conditions
- switch on speed limiter
- gear engaged >**2nd gear**
- minimum vehicle speed **18 mph (30 km/h)**, maximum **120 mph (200 km/h)** (for information purposes)
- limiter warning light on (amber)
- press on "+", "-" or "recall" button.

Output conditions
- brief sharp pressure on the accelerator pedal (past the hard point).
- extended pressure on the brake pedal
- press "0"
- switch on "Off"
- electronic stability program system must be switched on

NOTE:
The warning light flashes to inform the driver that the set speed cannot be maintained.

Defect mode
When there is a breakdown or fault on:
The directional stability control system, the injection system, the Anti-lock braking system.
The cruise control/speed limiter and adaptive cruise control can no longer be activated.

GETtheMANUALS.org



The coolant temperature sensor (1) (injection and coolant temperature indicator on the instrument panel) is a three-track sensor.
Two tracks for sending the coolant temperature signal to the computer (tracks **B E1** and **B K3**) and one track for display on the instrument panel.

This system allows the engine cooling fan to be controlled by the injection computer. It consists of a single temperature sensor used for the injection, the engine cooling fan, the temperature indicator and the temperature warning light on the instrument panel.

OPERATION

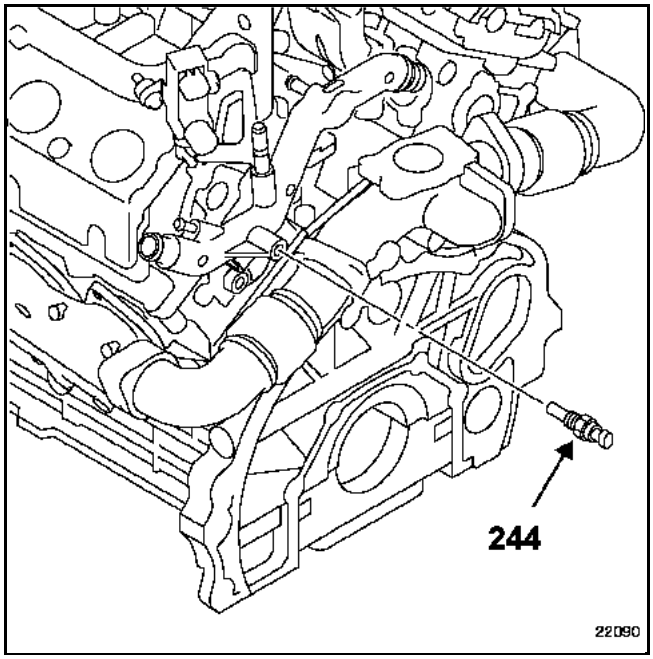
The injection computer controls the following according to the coolant temperature:
– the injection system,
– the engine cooling fan relay:
- the fan unit is switched on at slow speed if the coolant temperature exceeds **99°C** and is switched off when the temperature falls below **95°C**,
- the fan unit is switched on at high speed if the coolant temperature exceeds **102°C** and is switched off when the temperature falls below **99°C**,
- the fan assembly can be activated (at slow speed) for the air conditioning.

COOLANT TEMPERATURE WARNING LIGHT

The warning light is controlled by the injection computer on the multiplex network.

It illuminates when the coolant temperature exceeds **120°C** and goes out when the temperature falls below **115°C**.

GETtheMANUALS.org



Coolant temperature sensor (244) (injection and coolant temperature indication on instrument panel).

This system allows the engine cooling fan to be controlled by the injection computer. It consists of a single temperature sensor used for the injection, the engine cooling fan, the temperature indicator and the temperature warning light on the instrument panel.

The coolant temperature information is sent to the instrument panel by the injection computer on the multiplex network.

OPERATION

The injection computer controls the following according to the coolant temperature:
– the injection system,
– the engine cooling fan relays:
- the fan unit is switched on at low speed if the coolant temperature exceeds **99°C** and is switched off when the temperature falls below **96°C**.
- the fan unit is switched on at high speed if the coolant temperature exceeds **102°C** and is switched off when the temperature falls below **99°C**,
- the fan unit can be controlled for the air conditioning.

COOLANT TEMPERATURE WARNING LIGHT (shared with the injection fault warning light)

The warning light is controlled by the computer via the multiplex network.

It lights up when the coolant temperature exceeds **120°C** and goes out at **117°C**.

GETtheMANUALS.org

OPERATING PRINCIPLE

The antipercolation system is controlled directly by the injection computer.

The coolant temperature signal is taken from the coolant temperature sensor of the injection system (see section **13B "Centralised coolant temperature management"**).

The injection computer switches to monitoring mode for **2 minutes** after the ignition is switched off.

If the coolant temperature exceeds **112 °C**, the fan low speed relay is energised.

If the coolant temperature falls back below **105 °C**, the fan assembly relay is cut off (the aseembly cannot operate for more than **10 minutes**).

GETtheMANUALS.org

The heater plug resistance is **0.6 Ω** (connector disconnected).

TIGHTENING TORQUE (in daNm)	
Pre-heater plugs	**1.5**

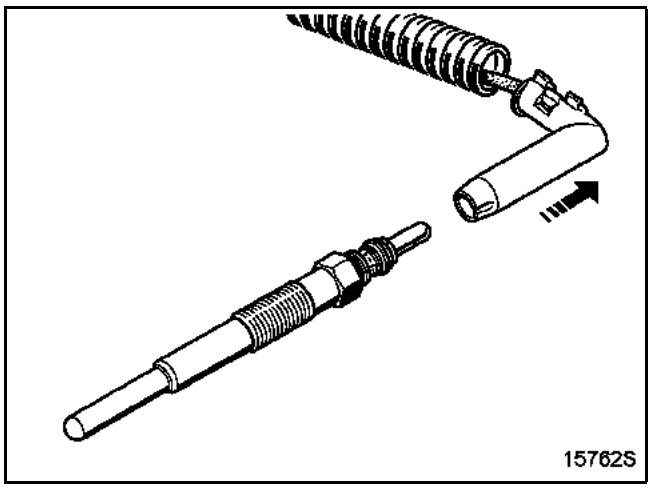
Spark plugs may be removed without having to open the high-pressure circuit.

REMOVAL

Unclip the spark plug electrical connector.

Clean the outside of the plug to avoid any impurities entering the cylinder.

Undo then remove the spark plugs using a long, radial **10 mm** socket or FACOM tool, part number **B10R10A** for example.



REFITTING

Proceed in the reverse order to removal.

Ensure that no contamination enters the cylinder during this operation.

GETtheMANUALS.org

The heater plug resistance is **0.6 ± 0.05 Ω**.

TIGHTENING TORQUE (in daNm)	
Pre-heater plugs	**1.8**

REMOVAL

Disconnect the battery.

Remove:
– the engine covers,
– the damper control solenoid valve mounting bolts.

Release the solenoid valve from the side.

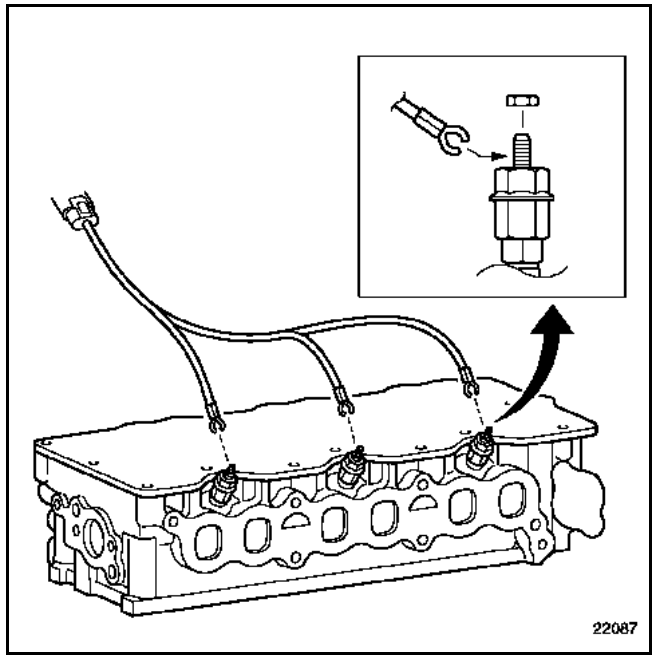
Undo the nuts on the heater plugs without removing them.

Release the feed wires.

Clean the outside of the plug to avoid any dirt entering the cylinder.

Remove the spark plugs. To do this, use a heater plug spanner such as **Facom B10R12B**.

NOTE:
The high-pressure pipe bracket has to be undone and moved to remove the spark plug located on the front row, timing end.



REFITTING

Proceed in the reverse order to removal.

Tighten the feed wire moutning nuts using a flexible extension, such as tool **Facom R216 150 mm** long.

GETtheMANUALS.org

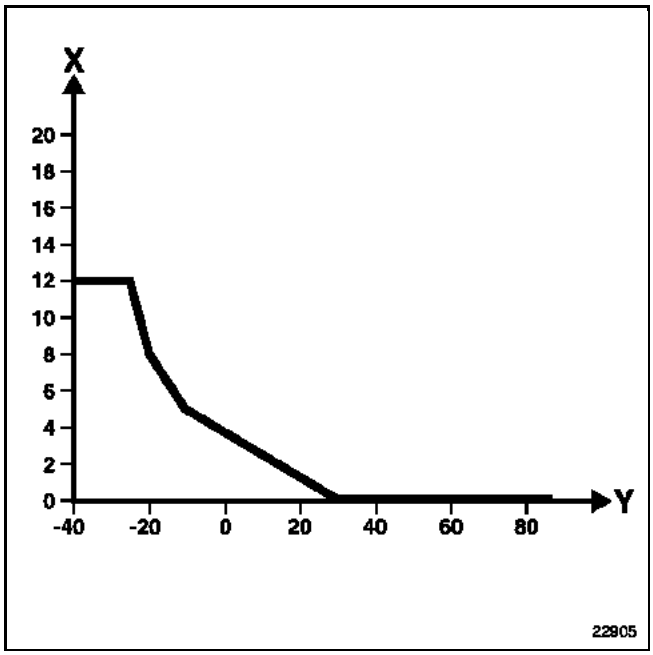
The pre-postheating function is controlled by the injection computer.

PRE-POSTHEATING OPERATING PRINCIPLE

1) Switching on "preheating"

a) Variable preheating

The time period during which the warning light is lit and the spark plugs are supplied is dependent on the coolant temperature.



X: Time in seconds
Y: Coolant temperature in °**C**

In all cases, the glow plugs "on" tell-tale light cannot remain on for more than **12 seconds**.

b) Fixed preheating

After the warning light goes out the spark plugs continue to be supplied for a fixed period of **10 seconds**.

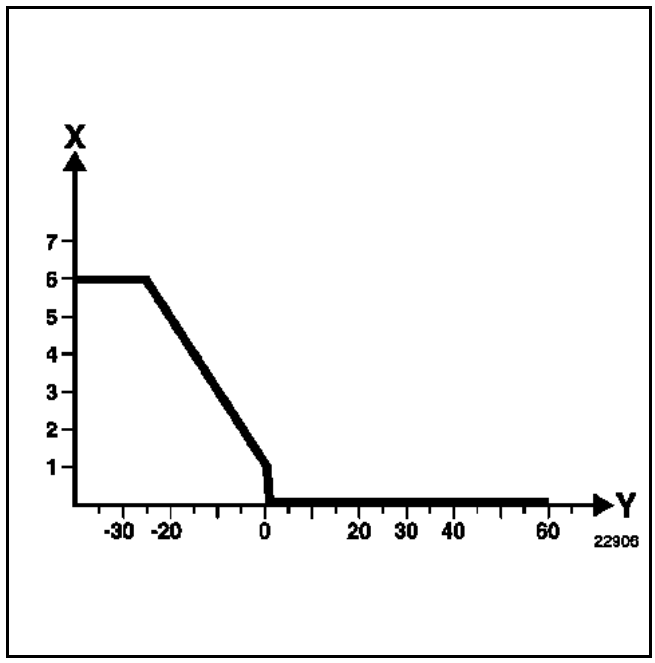
2) Starting the engine

The spark plugs continue to be supplied while the starter is being activated.

3) Engine running, "postheating"

During this phase, the spark plugs are supplied continuously according to the coolant temperature.

For idling speed without depressing the accelerator pedal.



X: Time in seconds
Y: Coolant temperature in °**C**

GETtheMANUALS.org

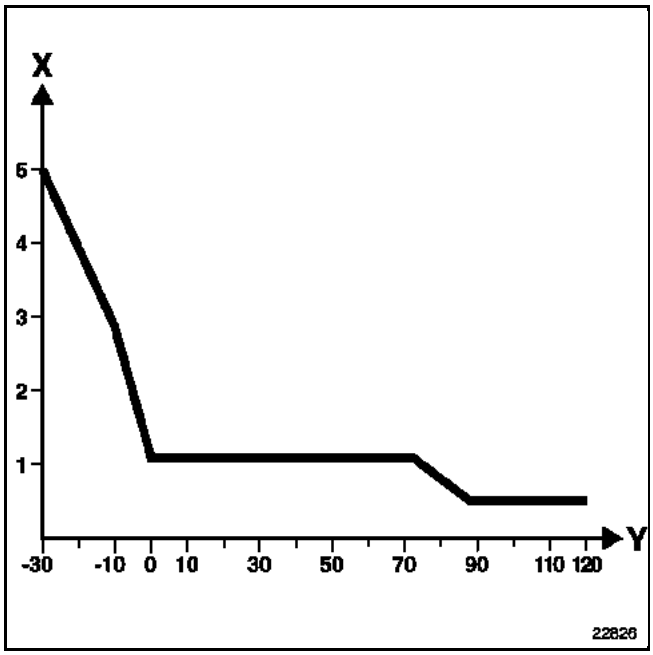
The pre/posting heating function is controlled by the injection computer.

PRE-POSTHEATING OPERATING PRINCIPLE

1) Switching on the ignition Preheating

a) Variable preheating

The time period during which the warning light is lit and the heater plugs are supplied is dependent on the coolant temperature and atmospheric pressure.



X: Time in seconds
Y: Coolant temperature in °**C**

In all cases, the glow plugs "on" tell-tale light cannot remain on for more than **10 seconds**.

b) Fixed preheating

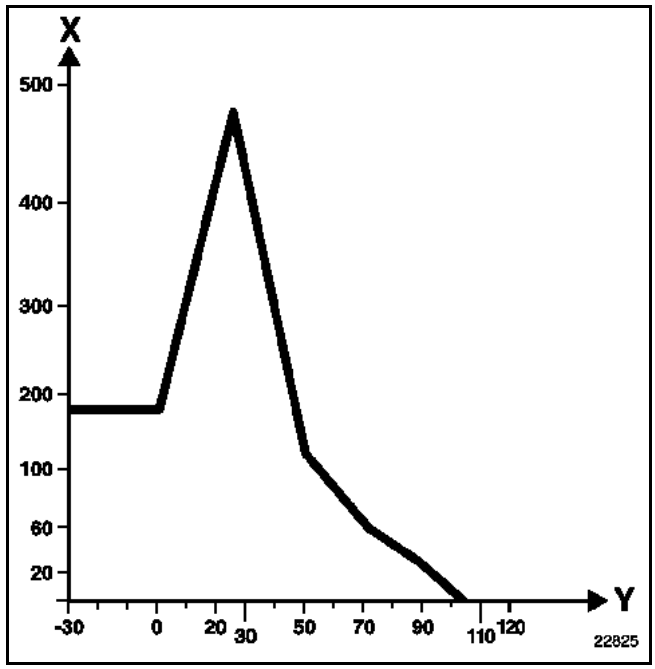
After the warning light has gone out, the plugs are supplied for a further **10 seconds** regardless of the conditions if the "START" button is not pressed.
If the "START" button is pressed after this time period has elapsed, the UCH starts a new cycle of **1 second + 10 seconds**.

2) Starting the engine

The spark plugs continue to be supplied while the starter is being activated.

3) "Postheating" while the engine is running

During this phase, the spark plugs are supplied continuously according to the coolant temperature.

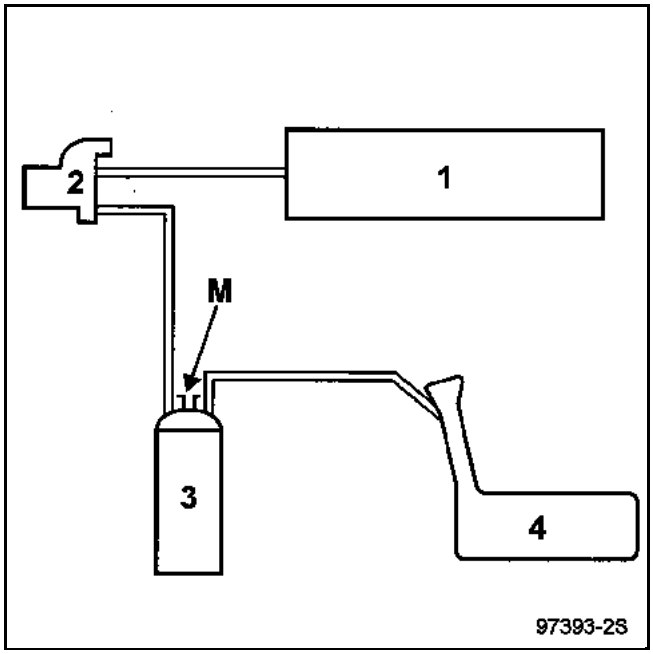


X: Time in seconds
Y: Coolant temperature in °**C**

For idle speed without pressing the accelerator pedal.

GETtheMANUALS.org

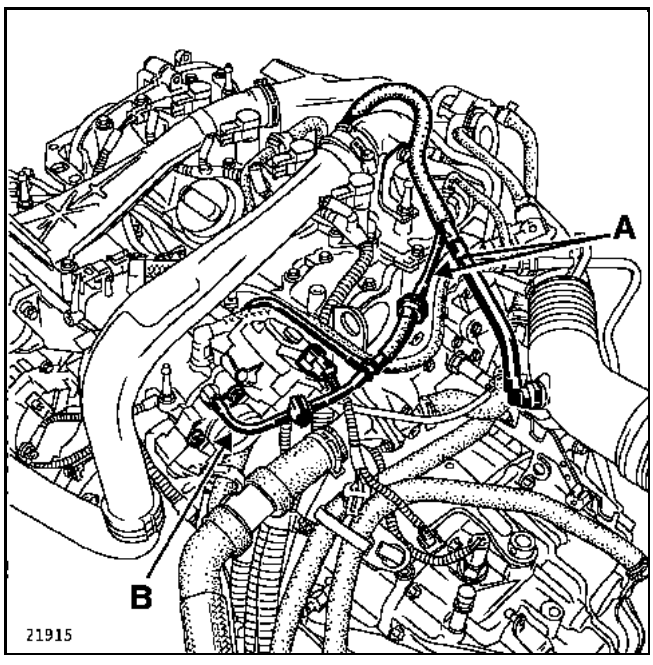
OPERATING DIAGRAM OF THE CIRCUIT

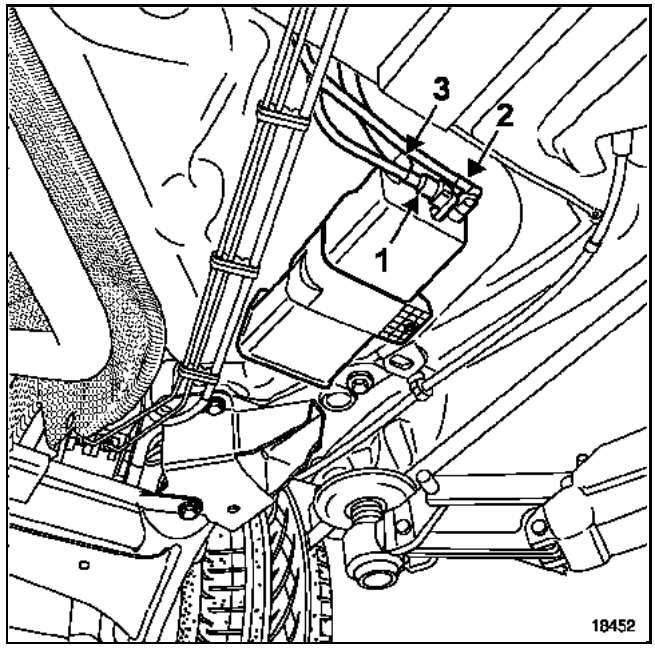


1 Inlet manifold
2 Absorber bleed solenoid valve
3 Absorber
4 Fuel tank
M Breather

Special notes on the F4R engine circuit

The circuit consists of a circuit A (turbocharger inlet) and a circuit B (throttle valve outlet) enabling it to rebreathe the fuel vapours regardless of the engine load.





1 Rebreathing the fuel vapors coming from the tank
2 Rebreathing the fuel vapours going to the engine.
3 Tank breather

IMPORTANT: the breather must not be blocked during normal operation.

GETtheMANUALS.org

OPERATING PRINCIPLE

The air is vented from the tank through the fuel vapour absorber (canister).

The fuel vapours are trapped by the active charcoal contained in the absorber (canister) as they pass.

The fuel vapours trapped in the absorber are flushed out and burnt by the engine.

This is done by connecting the absorber and the inlet manifold through piping and a solenoid valve. This solenoid valve is located between the front right shock absorber cup and the power assisted steering on the **F4R Turbo engine** and on the inlet manifold next to the brake fluid reservoir on the **V4Y engine**.

The purpose of the solenoid valve is to open a passage of variable size (as a function of the OCR signal sent by the injection computer).

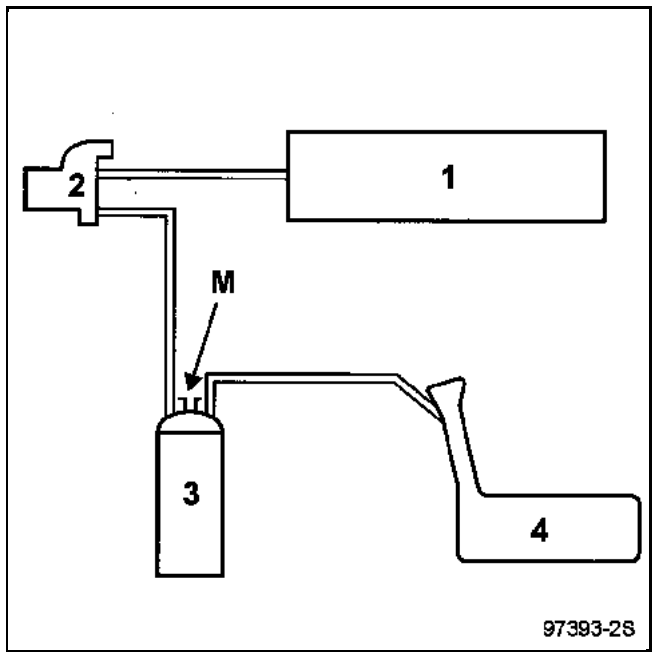
The variation in the passage made available to the fuel vapours in the solenoid valve is a result of the balance between the magnetic field created by the electrical supply to the coil and the return spring force attempting to close the solenoid valve.

CHECKING OPERATION OF FUEL VAPOUR REBREATHING

A system malfunction may result in an unstable idle or stalling of the engine.

Check the conformity of the circuit (see operating diagrams).

Check the condition of the pipes to the fuel tank.



1 Inlet manifold
2 Absorber bleed solenoid valve
3 Absorber
4 Fuel tank
M Breather

GETtheMANUALS.org

BLEED CONDITIONS OF ABSORBER

On the **F4R** engine, the absorber bleed solenoid valve is controlled by **track C-E1** of the computer when:
– the engine is not at idle speed,
– the engine is in loop mode,
– the coolant temperature is greater than **55 ºC**,
– the air temperature is greater than **10 ºC**,

On the **V4Y**, engine the absorber bleed solenoid valve is controlled by **track B 89** of the computer when:
– the engine is not at idle speed,
– the engine is in loop mode,
– the coolant temperatue is above **40 °C**,

Canister bleed is not authorised during an On Board Diagnostic procedure.

The opening cyclic ratio of the canister bleed solenoid valve can be displayed on the diagnostic tool by consulting the canister bleed solenoid valve OCR signal parameter.

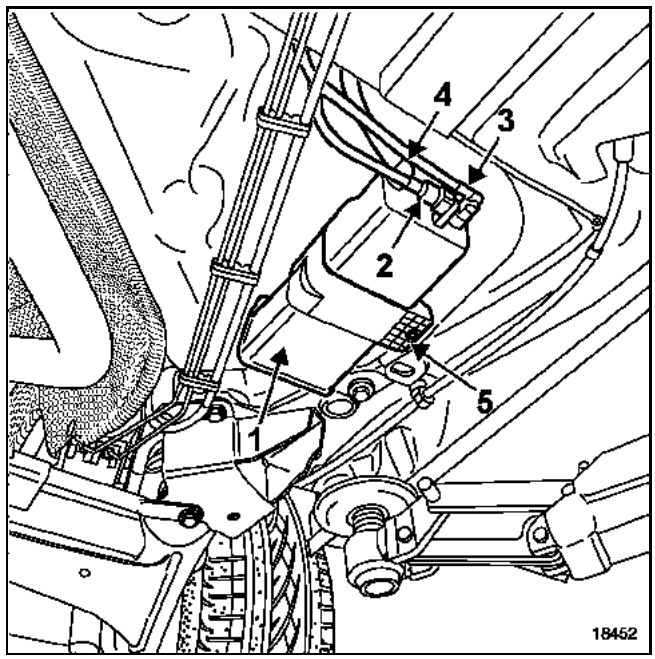
The solenoid valve is closed when the value is below **1.5%** (***F4R Engine***) and when the value is equal to **0%** (***V4Y Engine***).

REMOVING THE ABSORBER

The absorber (1) is located on the left section of the reservoir.

Disconnect:
– the pipe (2) bringing the fuel vapour from the tank,
– the pipe (3) taking the fuel vapours to the solenoid valve,
– the breather pipe (4).

Remove:
– the absorber mounting bolts (5),
– the absorber.



REFITTING

Refitting is the reverse of removal.

GETtheMANUALS.org

Check:
– at idle speed,
– by blocking, on the absorber, the circuit from the reservoir,
– connecting a pressure gauge (**Mot. 1311-01**) so that there is no vacuum pressure on the absorber breather outlet (M), (in the same way, the control value read by the diagnostic tool in parameter: **OCR canister bleed** stays minimal **X ≤ (1.5%) (*F4R engine*), X = 0% (*V4Y engine*).**

Is there a vacuum?

YES: with the ignition off, use a vacuum pump to apply a vacuum pressure of **500 mbar** to the solenoid valve output. The vacuum pressure should not vary by more than **10 mbar** for **30 seconds.**

Does the pressure vary?

YES: replace the solenoid valve as it is faulty.

NO: there is an electrical problem, check the circuit.

NO: in bleed conditions (see bleed conditions) an increase in the vacuum should be detected (at the same time, the value of the parameter should increase on the diagnostic tool).

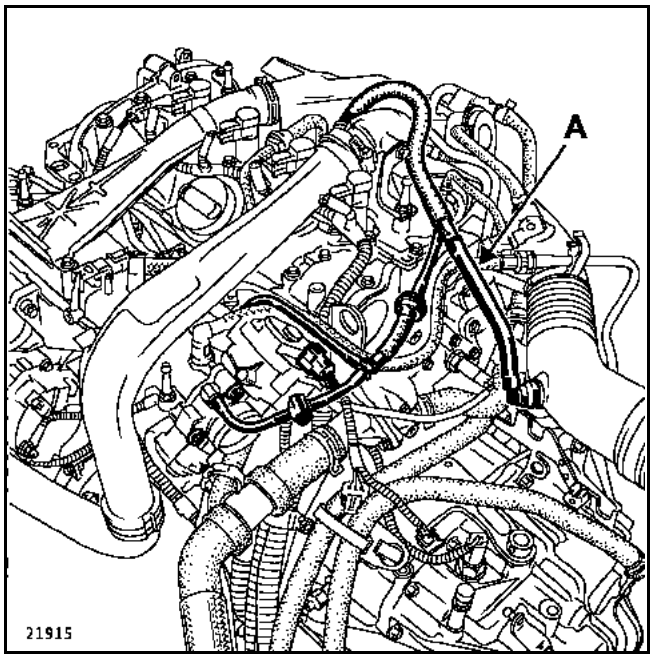
CHECKING THE RESERVOIR/ABSORBER CONNECTION

It is possible to check this connection by connecting a vacuum pump to the pipe going to the absorber.

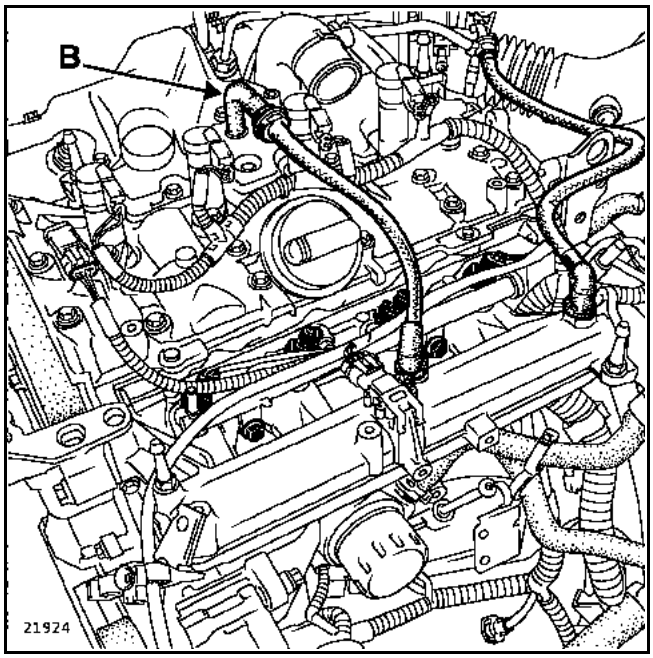
GETtheMANUALS.org

PRESENTATION OF CIRCUIT COMPONENTS

A The turbocharger inlet circuit is used for medium and heavy loads. The vapours are rebreathed by the vacuum in the inlet manifold.



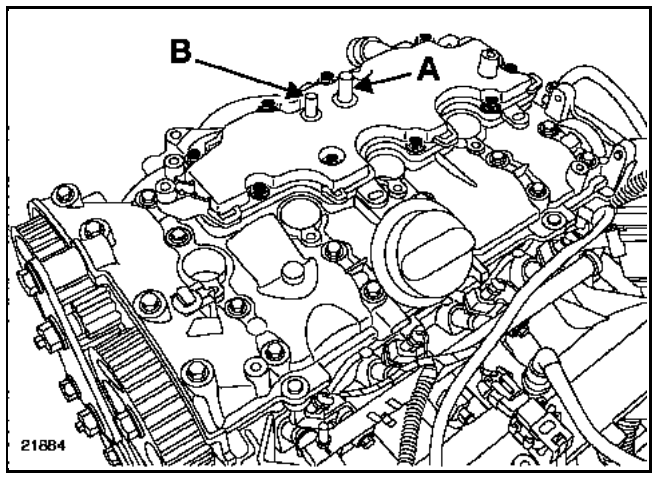
B The throttle valve outlet circuit is used for small loads. The vapours are rebreathed by the vacuum between the throttle and the engine.



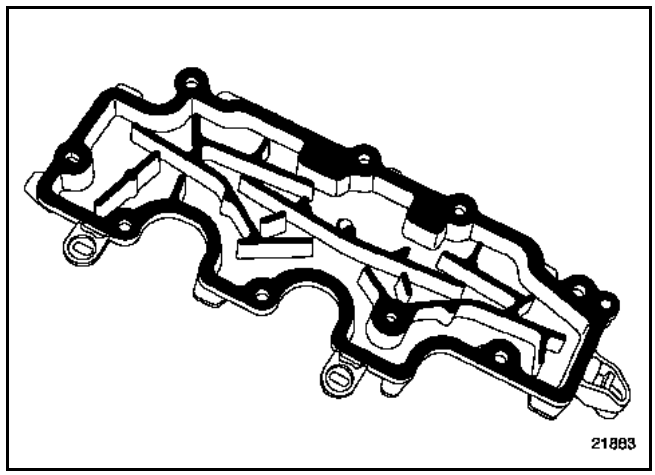
Oil vapour outlet holes:

A Upstream circuit oil vapour outlet hole.

B Downstream circuit oil vapour outlet hole.



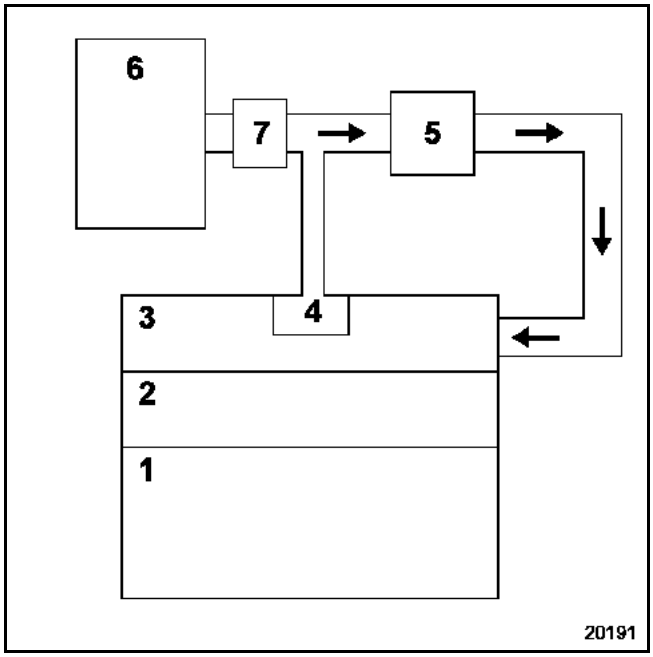
Oil vapour recovery plate located on the rocker cover.



Refer to section **11A Top and front of engine for instructions on removal.**

GETtheMANUALS.org

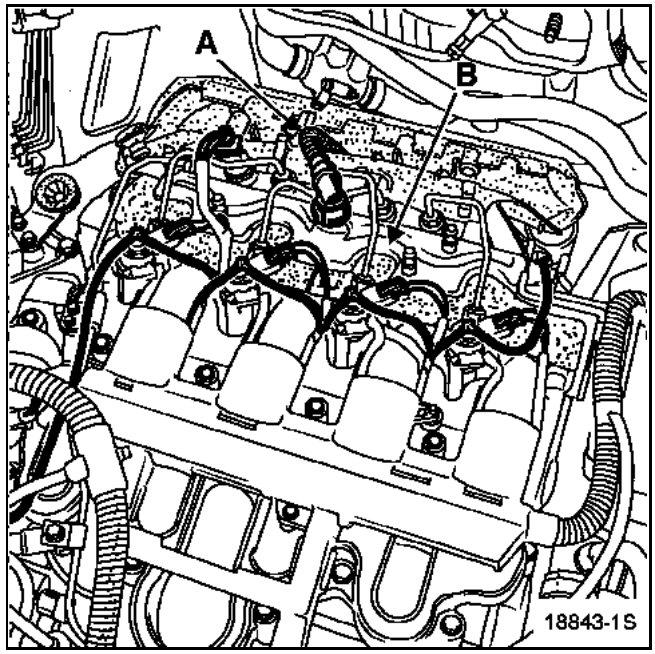
CIRCUIT DIAGRAM



1 Engine
2 Cylinder head
3 Rocker cover/inlet manifold
4 Oil decanter (incorporated into the rocker cover)
5 Turbocharger
6 Air filter
7 Air flowmeter

CHECKING

To ensure the correct operation of the anti-pollution system, the oil vapour rebreathing circuit must be kept clean and in good condition.



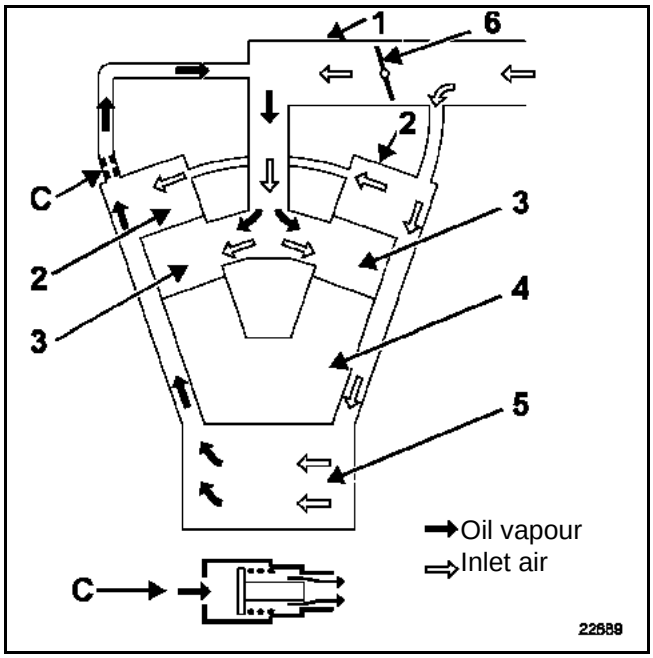
A Oil vapour rebreathing pipe linked to the inlet pipes.

B Oil decanter incorporated into the cylinder head cover/inlet manifold.

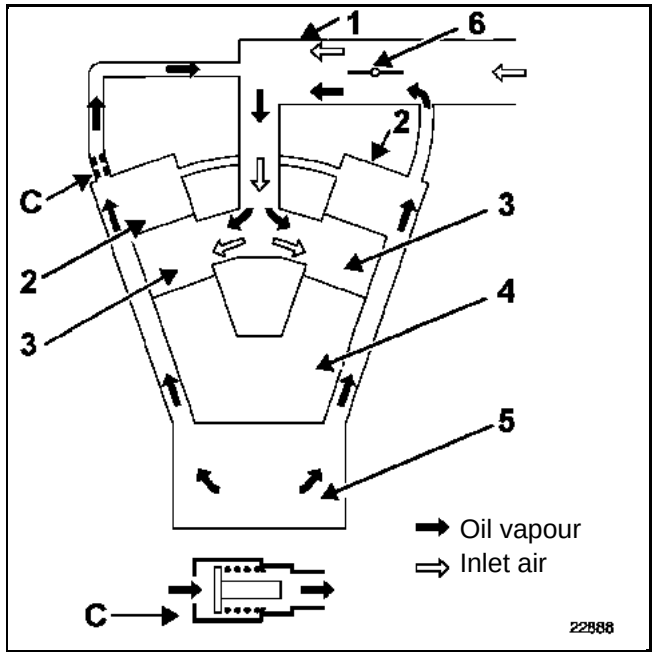
GETtheMANUALS.org

CIRCUIT DIAGRAM

A On small loads, the cool air located in the gas throttle inlet, clears the oil vapours located in the crankcase. The oil vapours are sucked up in small quantities by the vacuum in the gas throttle outlet, via a variable valve (C), then rebreathed into the cylinders.



B On medium and heavy loads, the oil vapours are sucked towards the cylinders. The variable valve (C) allows a large quantity of oil vapour to pass through.



1 Inlet manifold
2 Rocker cover
3 Cylinder head
4 Engine block
5 Crankcase
6 Gas throttle

CHECKING

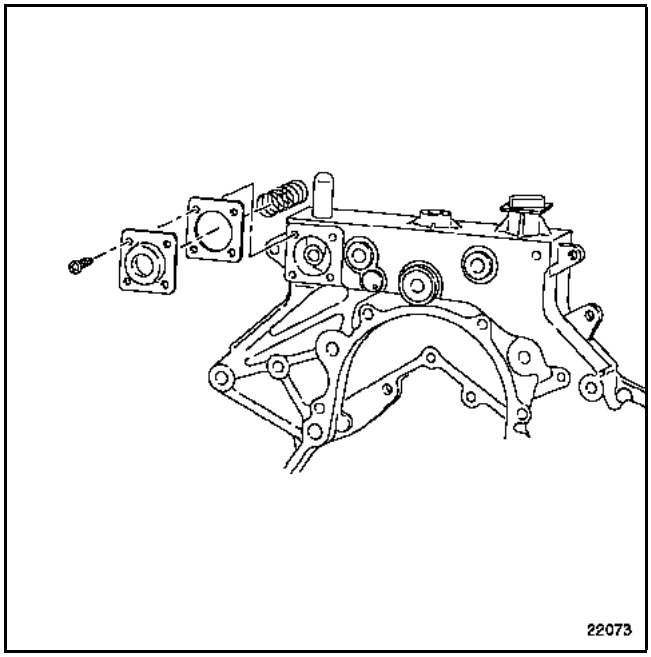
To ensure the correct operation of the anti-pollution system, the oil vapour rebreathing circuit must be kept clean and in good condition.

NOTE: the variable valve is located on the rear side of rock cover.In its resting position, it should be closed.

GETtheMANUALS.org

PRESENTATION

The crankcase gas returns to the inlet passing through a diaphragm valve.



A When there is a low load, the vacuum pressure in the air inlet duct is below the spring set point. The oil vapours are rebreathed in large quantities by the vacuum in the air inlet tract.

B With medium and heavy loads, the vacuum pressure in the air inlet tract draws in the diaphragm valve, the rebreathing tract is blocked. The oil vapours are not sucked in.

GETtheMANUALS.org

CHECKING

To ensure the correct operation of the anti-pollution system, the oil vapour rebreathing circuit must be kept clean and in good condition.

REMOVAL

To remove the EGR valve, the air vent housing must be removed.See section **12A Fuel mixture Air vent housing.**

GETtheMANUALS.org

OPERATING PRINCIPLE

The valve is controlled by Opening Cyclic Ratio (OCR) signal issued by the injection computer. The **OCR** signal modulates the opening of the valve and consequently the quantity of exhaust gas directed back to the inlet manifold.

The computer continuously carries out a test to detect the position of the **EGR** valve flap.

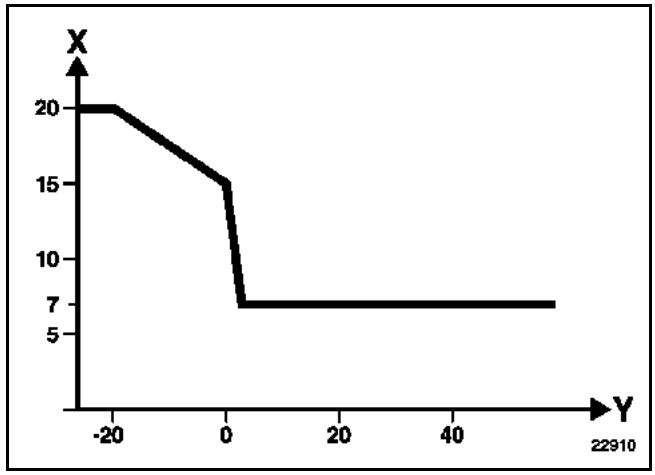
OPERATING CONDITIONS

The parameters which determine the activation of the **EGR** solenoid valve are as follows:
– coolant temperature,
– air temperature,
– atmospheric pressure,
– accelerator pedal position,
– engine speed,
– air flow,
– injection flow rate,
– turbocharging pressure.

The EGR function is cut if:
– the battery voltage is below **8.9 volts**,
– The engine speed is above **900 rpm** when pedal is released (low pedal value),
– graph (engine speed/load) exceeds a given threshold,
– the vehicle speed is below **3 mph (5 km/h)**, and the engine speed is below **900 rpm** for **40 seconds**.

The EGR valve is not controlled after engine start-up by a graph of the coolant temperature.

X Time
Y Coolant temperature (°C)



In the event of a fault, the EGR is cut:
– the coolant temperature sensor,
– the air temperature sensor,
– the atmospheric pressure sensor.

REMOVING THE EGR SENSOR/INTERCOOLER ASSEMBLY

See section **12A EGR valve intercooler**.

PURPOSE OF THE EGR SYSTEM

Exhaust gas recirculation is used to reduce the nitrogen oxide (NOx) content of the exhaust gases.

The injection computer allows gas to pass by controlling a solenoid valve.

GETtheMANUALS.org

OPERATING PRINCIPLE

The valve is controlled by an Opening Cyclic Ratio (**OCR**) signal sent by the injection computer. The OCR signal modulates the opening of the valve and consequently the quantity of exhaust gas directed back to the inlet manifold.

The computer continuously carries out a test to detect the position of the EGR valve flap.

In order to reduce the percentage of polluting emissions, the P9X engine uses **a recirculated exhaust gas cooler**. The gases emitted in the cylinder by the EGR valve cross an intercooler cooled by the coolant fluid. This results in the combustion temperature lowering. In this way, NOx emissions are reduced.

TRACK ALLOCATION

Position sensor (1)
1 Sensor signal

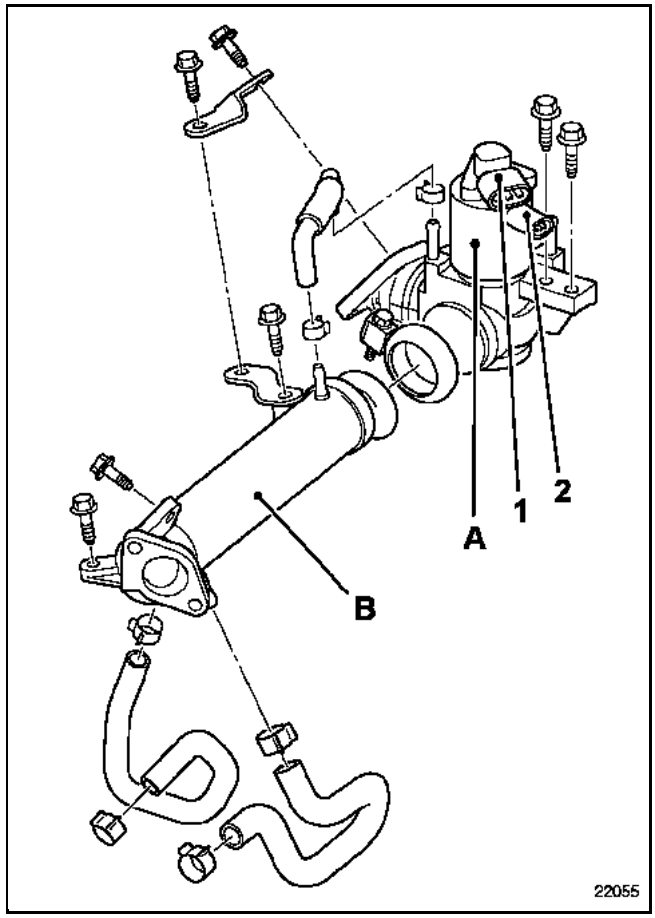
3 Sensor feed + **5 volts**

EGR solenoid valve (2)
1 EGR solenoid control
2 EGR solenoid valve feed **+ 12 volts**



A EGR valve
B Intercooler

GETtheMANUALS.org

OPERATING CONDITIONS

The parameters which determine the activation of the EGR solenoid valve are as follows:
– coolant temperature,
– atmospheric pressure,
– accelerator pedal position,
– the engine speed.

THE EGR FUNCTION IS CUT:
– during the starting phase,
– during the pre/post heating stage,
– if the engine speed is **below 450 rpm**,
– if the coolant temperature is **above - 120°C**,
– if the coolant temperature is **below - 0°C**,
– if the atmospheric pressure is **below 884 mbar**,
– during acceleration: pressure difference on the pedal **above 5.5 %** and quantity of diesel injected **above 10 mm^3/stroke**,
– after the ignition is switched off (computer self supply period).

IN THE EVENT OF A FAULT WITH:
– the air flowmeter,
– the turbocharging pressure sensor,
– the atmospheric pressure sensor,
– the air or diesel temperature sensor,
– the EGR valve,
– the EGR solenoid valve position sensor,
– the wastegate position sensor,
– the turbocharging pressure adjustment solenoid valve,

The EGR valve operates in defect mode or is not supplied.

GETtheMANUALS.org

OPERATION - FAULT FINDING

These vehicles are equipped with alternators with internal ventilation and integral regulator. There is also a warning light on the instrument panel which has the following functions:
– the warning light comes on when the ignition is switched on,
– the light goes out when the engine starts,
– if the warning light illuminates while the engine is running it shows there is a "**charging**" fault.

FAULT FINDING

The warning light does not come on when the ignition is switched on.

Check:
– that all electrical connections are good;
– whether the bulb is blown (to find out, connect the circuit to earth; the bulb should light up).

The warning light comes on when the engine is running.

This indicates a charging fault which could be caused by:
– broken alternator drive belt or charging circuit,
– damage inside the alternator (rotor, stator, diodes or brushes),
– regulator fault,
– overvoltage.

The customer complains of a charging fault but the warning light is operating correctly.

If the regulated voltage is less than **13.5 V**, check the alternator. The fault could be caused by:
– damaged diode,
– broken wire,
– charred or worn tracks.

Checking the voltage

Connect a voltmeter to the battery terminals and read the battery voltage.

Start the engine and increase the engine speed until the voltmeter needle registers a stable regulated voltage.

This voltage should be between **13.5 V** and **14.8 V.**

Switch on as many power consumers as possible; the regulated voltage should be between **13.5 V** and **14.8 V.**

IMPORTANT: the battery and regulator must be disconnected when arc welding work is carried out on the vehicle.

GETtheMANUALS.org

IDENTIFICATION

ENGINE	ALTERNATOR	CURRENT
F4R Turbo	Valeo SG 12 B017 Valeo SG 12 B0030 Valeo SG 12 B068	125 A
G9T	Valeo SG 12 B0030 Valeo SG 12 B068	125 A
P9X	Denso	150 A
V4Y	Hitachi LR 1150-702	150 A

CHECKING

After **15 minutes** heating at **13.5 V**.

Engine speed (rpm)	125 amps	150 amps
800	**64 A**	-
2000	**81 A**	**102 A**
4000	**118 A**	**145 A**
6000	**123 A**	**151 A**

GETtheMANUALS.org

FAULT FINDING

Diagnostic tools make it possible to check the alternator by measuring the voltage and the output current, with or without electrical consumers.

NOTE: the workstation's ampermetric clamp is of the inductive type (measurement range:**0** to **1,000 A**). It is fitted without disconnecting the battery, which allows **computer memories and adjustment programs to be saved.**

Fit the ampermetric clamp directly to the alternator output, with the arrow on the clamp pointing towards the alternator (the station will detect an incorrect position).

Measurement is carried out in three stages:
– measurement of the battery voltage, ignition off,
– measurement of the regulated voltage and the output current, without consumers,
– measurement of the regulated voltage and the output current with maximum consumers.

When the test is complete, the values displayed are followed, where appropriate, by diagnostic messages:
– battery voltage, no load < **12.3 V** = battery discharged.

Without consumers:
– regulated voltage > **14.8 V** ⇒ regulator faulty,
– (regulated voltage, no load < **13.2 V**) or (charging current < **2A**) ⇒ charging fault.

With consumers:
– regulated voltage > **14.8 V** ⇒ regulator faulty,
– regulated voltage < **12.7 V** ⇒ it is necessary to check the alternator output against its specification:

Engine / Current (amps)	F4R turbo	G9T	P9X	V4Y
minimum voltage needed for alternator with all consumers switched on (3000 rpm.)	80 A	80 A	80 A	80 A

GETtheMANUALS.org

Fault finding (continued)

If the measured output is too low, check:
– the condition of the alternator (brushes,etc),
– battery connections,
– engine earth strap,
– the alternator is functioning correctly,
– belt tension.

If the measured output is correct but the regulated voltage is too low, the alternator is not faulty.

The cause of the problem can be attributed to one of the following sources:
– the vehicle has too many electrical power consumers,
– the battery is discharged.

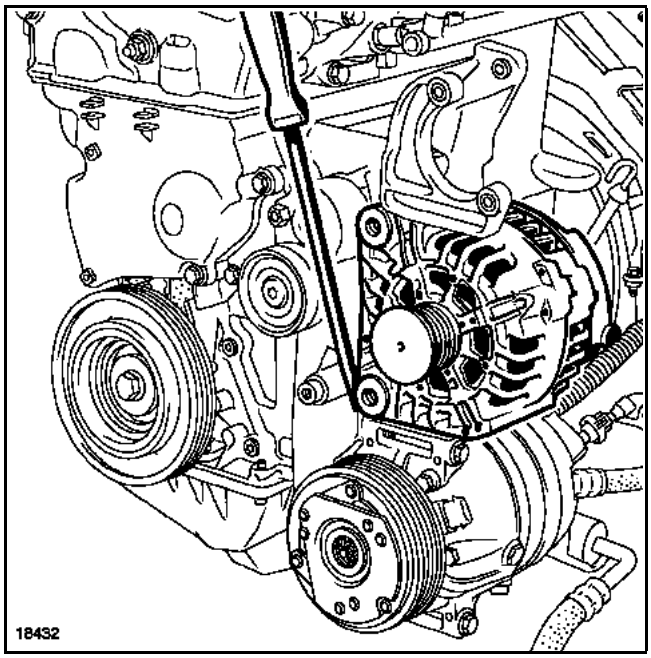
GETtheMANUALS.org

REMOVAL

Put the car on a two-post lift.

Disconnect the battery and all electrical connections on the alternator.

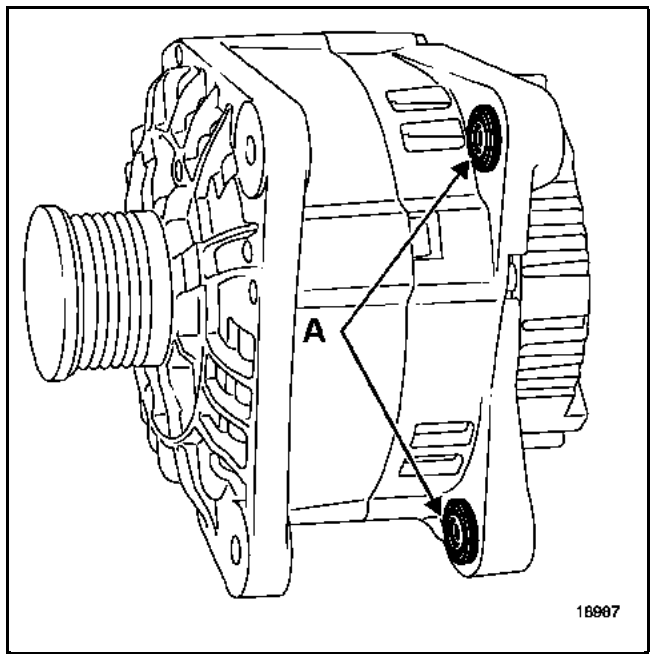
Remove:
– the engine cover plates,
– the engine undertray,
– the power steering mounting and reservoir,
– the accessories belt (see information on the accessories belt tension in section **07A**).
– the pulley,
– the alternator mounting bolts, then remove it using a screwdriver.



GETtheMANUALS.org

REFITTING

To install the alternator, compress the rings (A) using pliers or a vice.



For information the tensioning procedure, refer to accessory belt tension in section **07A**.

GETtheMANUALS.org

REMOVAL

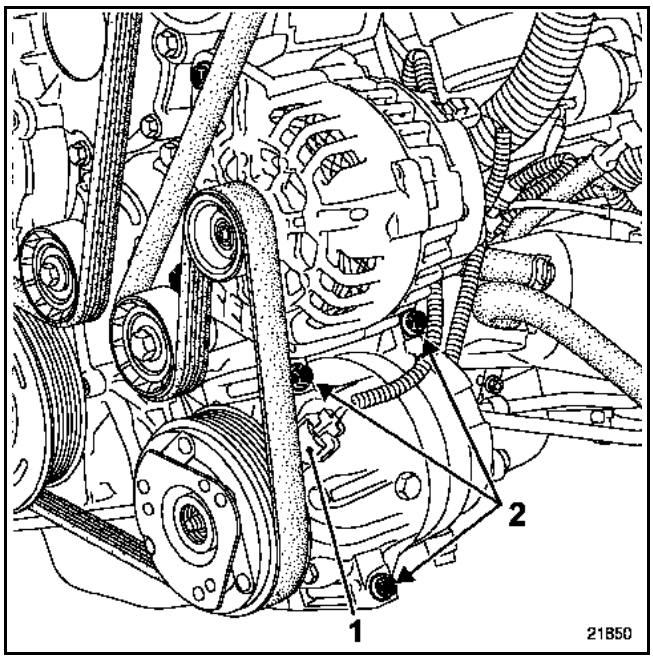
Put the car on a two-post lift.

Disconnect the battery.

Remove:
– the engine cover plates,
– the engine undertray,
– the front right wheel and the wheel-arch liner,
– the accessories belt.

For accessory belt removal refer to the information on accessory belt tension in section 07A.

Remove:
– the pulley,
– the alternator electrical connectors,
– the aluminium side members' stiffener,
– the air conditioning compressor connectors (1),
– the air conditioning compressor attachments(2).



NOTE: To avoid deforming the pipes, make sure you attach the air conditioning compressor to the side members.

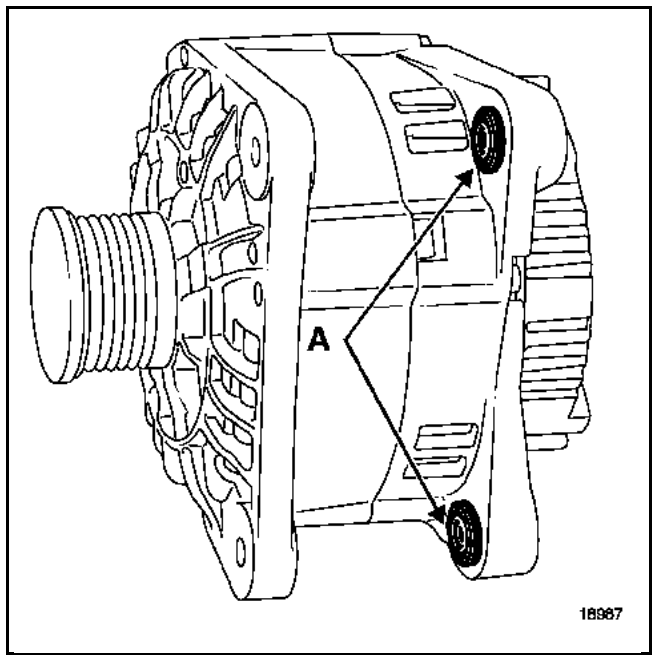
To detach the mounting remove the diesel filter and the power steering reservoir.

Remove the alternator attachments and then the alternator.

REFITTING

Refit in reverse order to removal.

To fit the alternator, compress the rings (A) using pliers or a vice.



For information on the tensioning procedure refer to the information on accessory belt tension in section **07A**.

GETtheMANUALS.org

REMOVAL

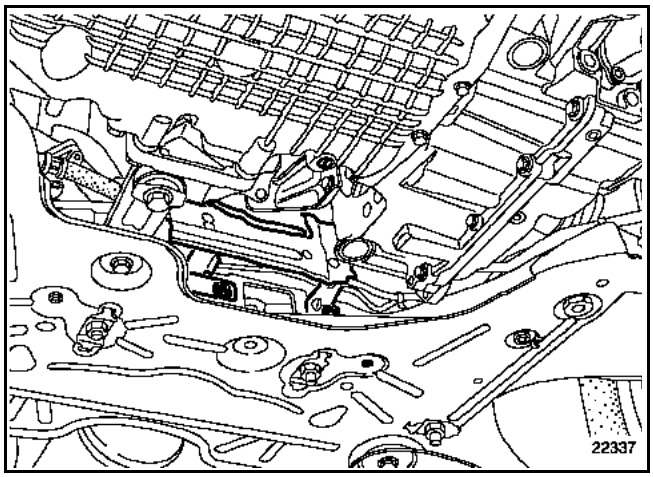
Put the car on a two-post lift.

Disconnect the battery.

Remove:
– the engine undertray,
– the front right wheel,
– the mudguard,
– the accessories belt.

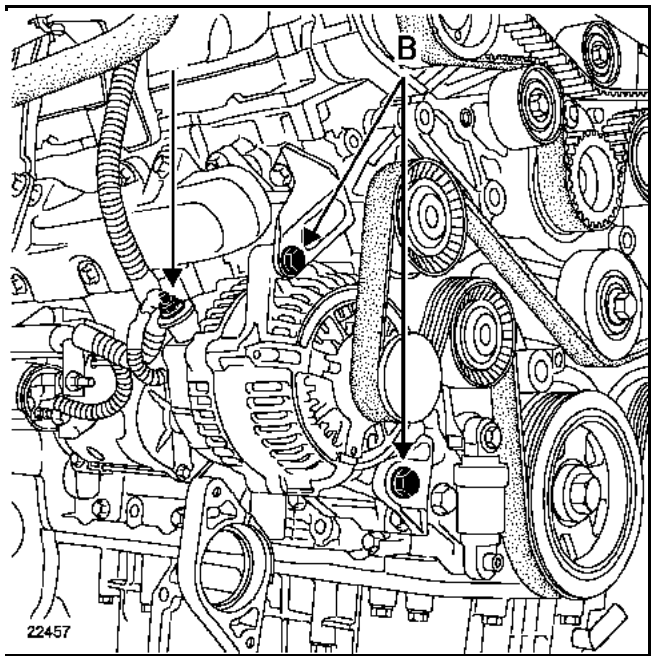
For accessory belt removal refer to the information on accessory belt tension in section 07A.

Remove the heat shield.



It is not necessary to completely remove the heat shield retaining bolt because the holes are open.

Remove:
– the torque reaction arm,
– the alternator connectors in (A),
– the alternator attachments in (B),
– the alternator.



REFITTING

Proceed in the reverse order to removal.

To tighten torque on the torque reaction link refer to the information on suspended engine mounting in section **19A**.

For the tensioning procedure refer to the accessory belt tension in section **07A**.

GETtheMANUALS.org

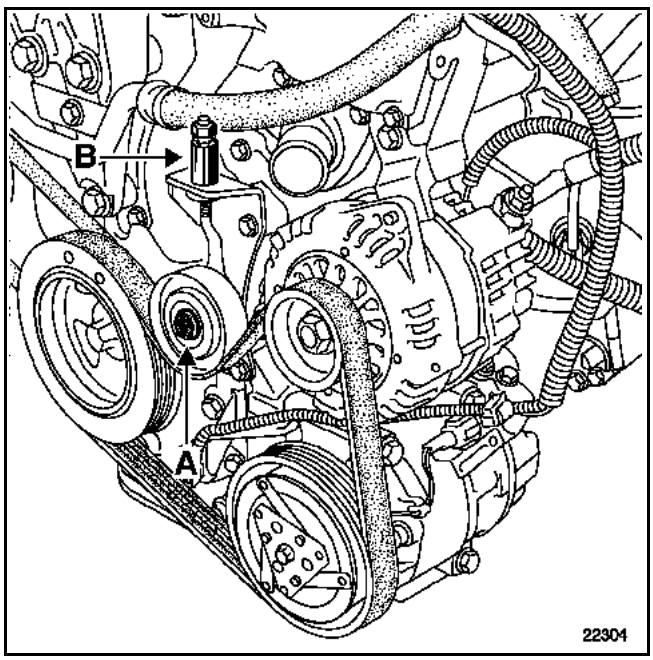
REMOVAL

Put the car on a two-post lift.

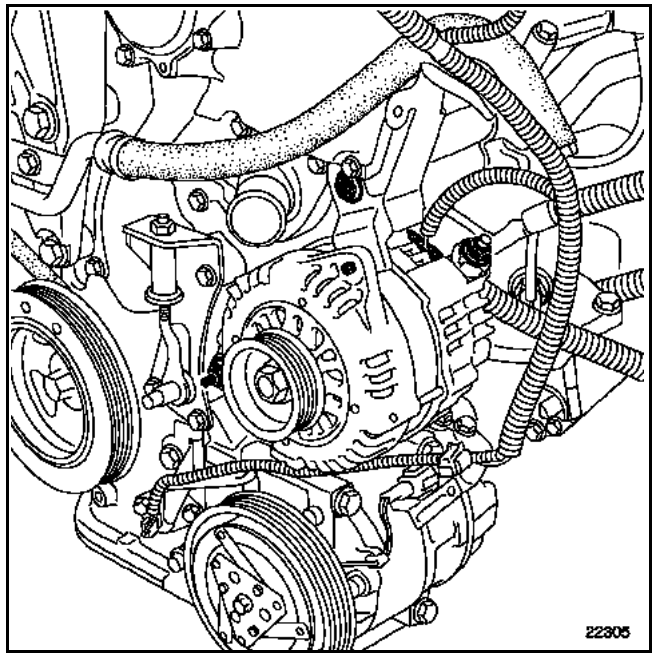
Remove the engine covers.

Disconnect the battery.

Remove:
– the engine undertray,
– the front right wheel,
– the right-hand front wheel arch liner and side protector,
– the resonator,
– engine fan connectors,
– the engine fan,
– the accessory belt by unscrewing the pulley nut (A) and the tensioner (B),



– the pulley,
– the alternator attachments and connections.



REFITTING

Proceed in the reverse order to removal.

For the tensioning procedure refer to the information on accessory belt tension in section **07A**.

GETtheMANUALS.org

GETtheMANUALS.org

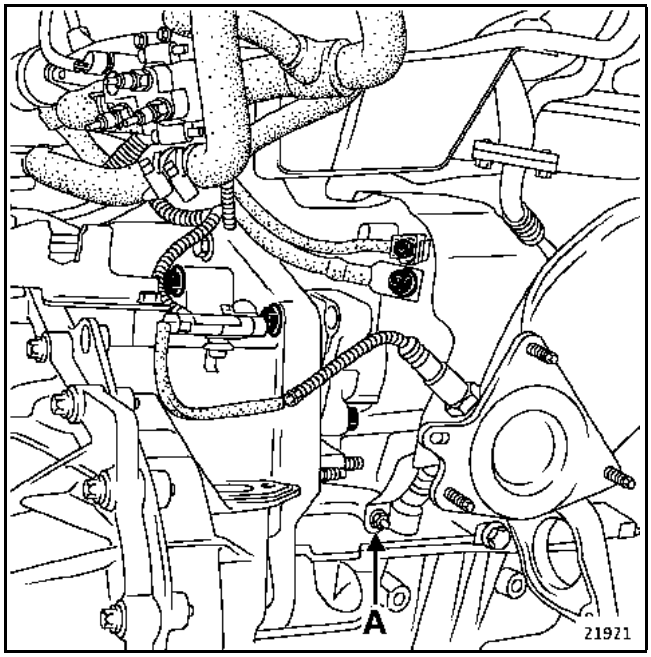
REMOVAL

Put the car on a two-post lift.

Disconnect the battery.

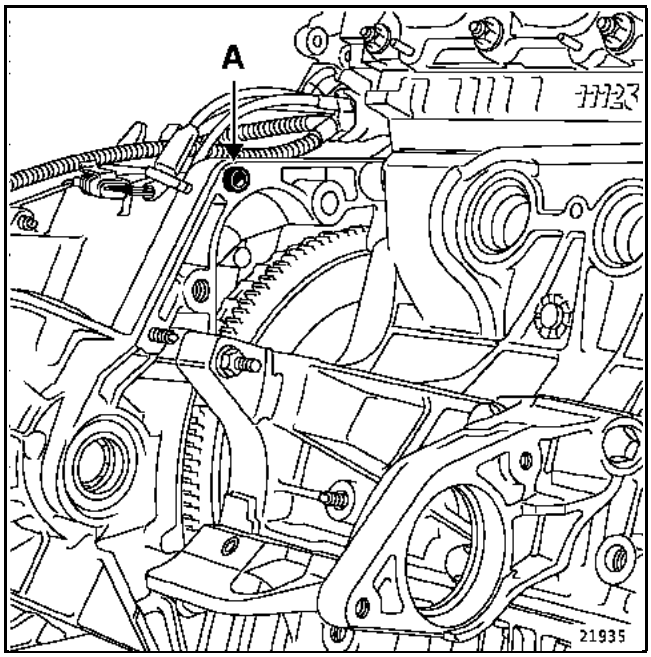
Remove:
– the engine cover,
– the engine undertray,
– the catalytic convertor rear strut,
– the oxygen sensor,
– the thermal shield mounting at (A).

Disconnect the starter motor feed.



Remove the starter motor.

GETtheMANUALS.org



REFITTING

Proceed in the reverse order to removal.

Check that the centring dowel is in position (A).

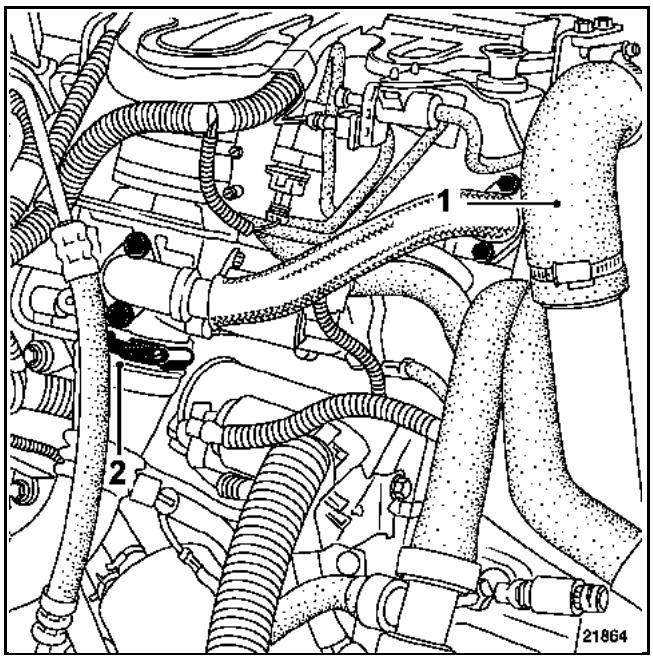
GETtheMANUALS.org

REMOVAL

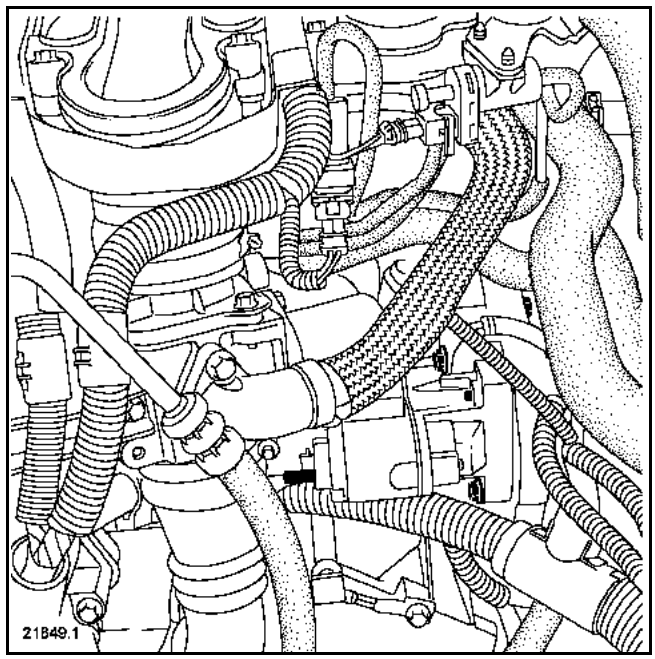
Put the car on a two-post lift.

Disconnect the battery.

Remove:
– the engine covers,
– the inlet hose (1),
– the damper hose (2),



– the wiring harness bracket,
– starter electrical connections,
– the earth strap,
– starter motor.



REFITTING

Refitting is the reverse of removal.

When refitting check that the centring dowel is in position.

GETtheMANUALS.org

REMOVAL

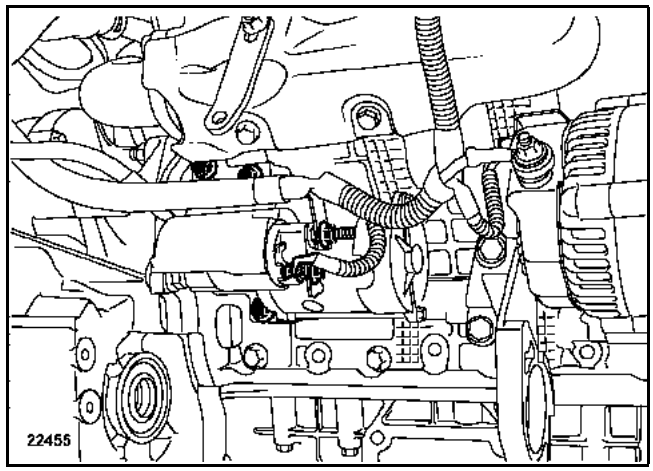
Put the car on a two-post lift.

Disconnect the battery.

Remove:
– the engine undertray,
– the starter motor connections.

Remove the wiring harness to gain access to the starter motor bolts.

Remove:
– the earth strap,
– the three starter motor mountings,



– starter motor.

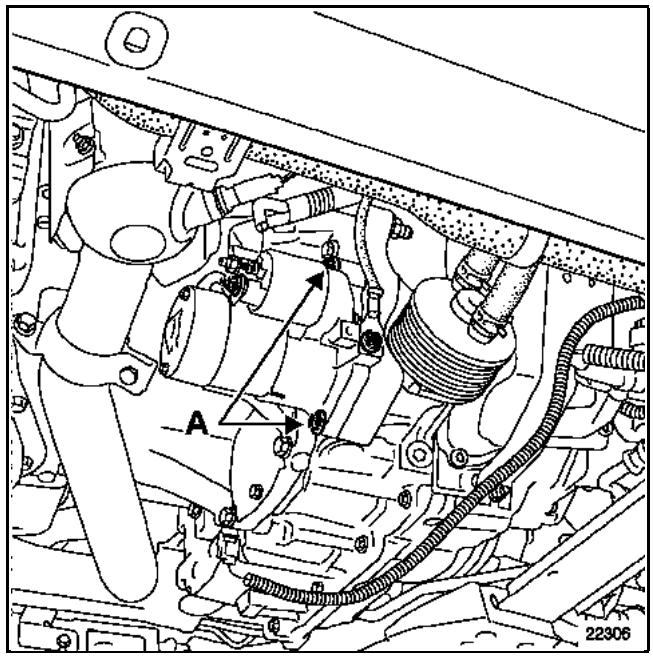
REFITTING

Tighten the starter motor bolts to a torque of **5 daNm**.

Proceed in the reverse order to removal.

GETtheMANUALS.org

The removal/refitting of the starter motor does not present any particular difficulties, remove the two mountings at (A).



When refitting, check that the centring dowel is in position.

GETtheMANUALS.org

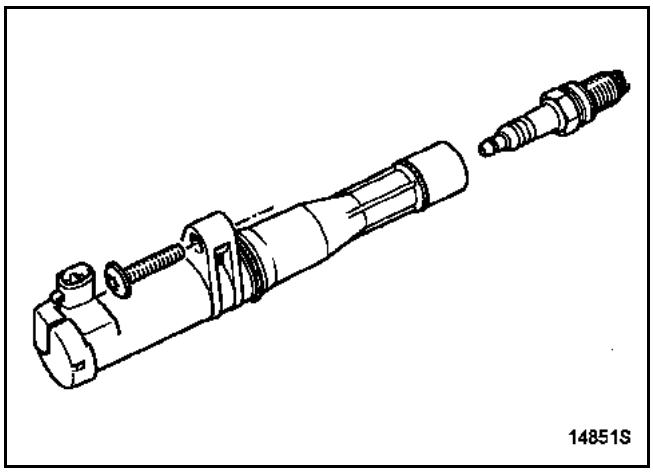
TIGHTENING TORQUES (in daNm)	
Ignition coil bolt	**1.5**
Spark plugs	**2.5 to 3**

DESCRIPTION

Static ignition is a system which increases the amount of power available to the spark plugs by eliminating all intermediaries between the spark plug and the coil.

The system also makes it possible to eliminate all moving components from the ignition.

The power module is incorporated in the injection computer. The ignition therefore uses the same sensors as the injection.



There are four ignition coils and each is mounted directly on the plug by a bolt on the cylinder head cover.

The coils are fed in series in pairs (twin static ignition) via tracks **C H2** and **C H3** of the injection computer:
– **track C H2** for cylinders (1) and (4),
– **track C H3** for cylinders (2) and (3).

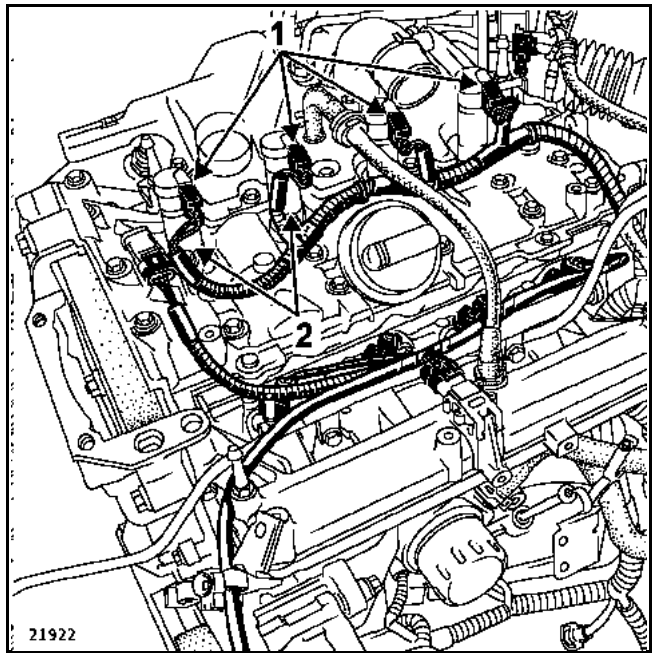
REMOVING A COIL

Disconnect the battery.

Disconnect the ignition coils.

IMPORTANT:
take care not to damage the connectors (1); if they are damaged, they must be replaced.

Remove the coil fastening bolts (2).



REFITTING

Proceed in the reverse order to removal. If necessary, replace the coil O-rings.

GETtheMANUALS.org

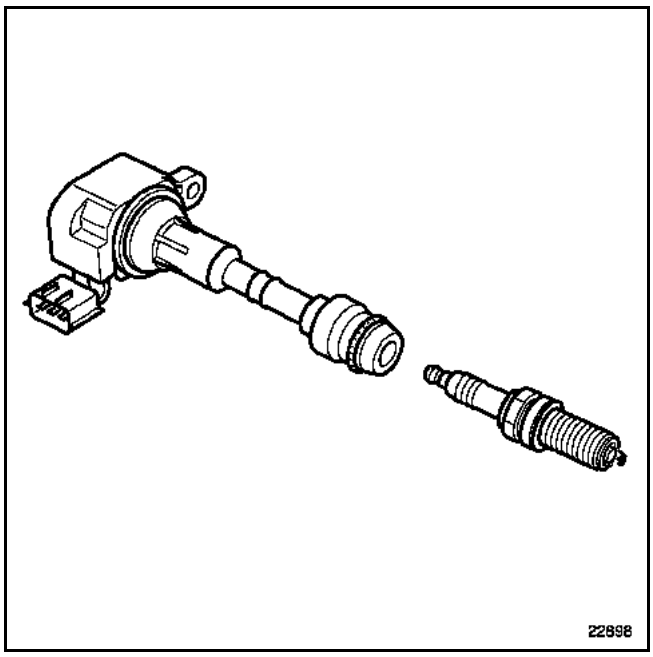
TIGHTENING TORQUES (in daNm)	
Ignition coil bolt	**0.7**
Spark plugs	**2.5 to 3**

DESCRIPTION

Static ignition is a system which increases the amount of power available to the spark plugs by eliminating all intermediaries between the spark plug and the coil.

The system also makes it possible to eliminate all moving components from the ignition.

The power module is incorporated in the injection computer. The ignition therefore uses the same sensors as the injection.



There are six ignition coils and each is mounted directly on the plug by means of a bolt on the cylinder head cover.

The firing order is: 1 - 2 - 3 - 4 - 5 - 6

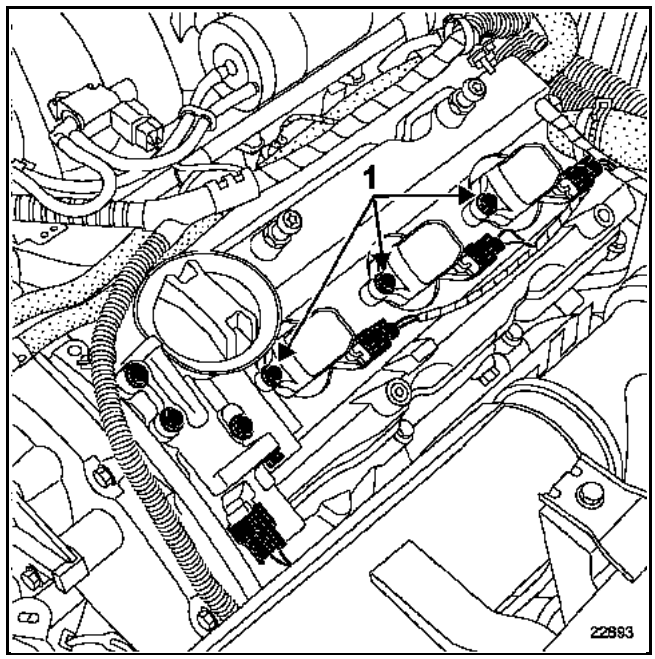
The coils are fed one by one in series by **tracks B84, B85, B92, B93, B94** and **B95** of the injection computer:
– **track B84** for cylinder (5),
– **track B85** for cylinder (6),
– **track B92** for cylinder (1),
– **track B93** for cylinder (2),
– **track B94** for cylinder (3),
– **track B95** for cylinder (4),

REMOVING A COIL

Disconnect the battery.

To remove the coils from the rear cylinders, it is necessary to remove the inlet manifold (see **section 12A Fuel mixture: inlet manifold**).

Disconnect the ignition coils and remove the coil mounting bolts (1).



REFITTING

Proceed in the reverse order to removal. If necessary, replace the coil O-rings.

GETtheMANUALS.org

To remove the spark plugs, it is necessary to remove the ignition coils (see **section 17 Ignition Static ignition**).

To remove the spark plugs, use the plug spanner: **Elé. 1382**.

GENERAL INFORMATION

The accelerator pedal potentiometer is incorporated in the accelerator pedal. Its replacement therefore requires replacement of the accelerator pedal.

There are two types of pedal: **with or without kickdown point**.

Cars equipped with cruise control/speed limiter have an accelerator pedal with a point of resistance at the end of their travel (kickdown).

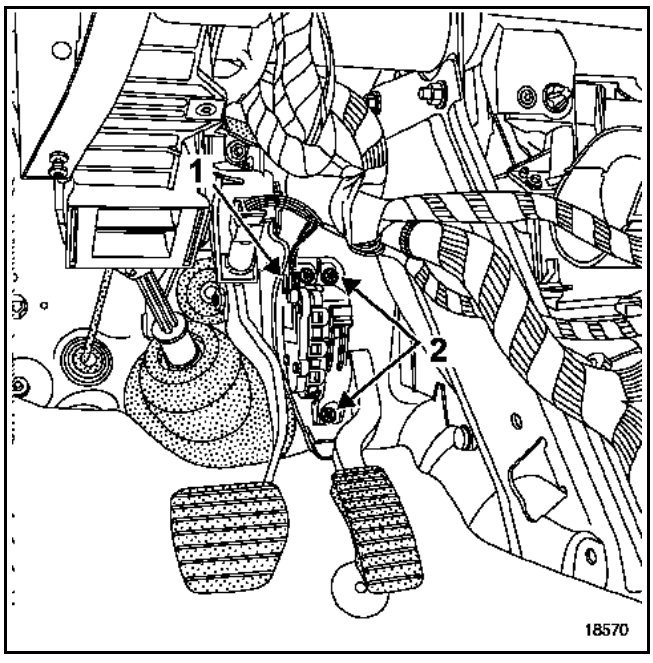
This kickdown point makes it possible to exit the speed limiter function if the driver has to increase his speed.

IMPORTANT:
it is possible to fit a pedal with a kickdown point in place of a pedal without a kickdown point. However, fitting a pedal without a kickdown point in place of a pedal with a kickdown point is forbidden.

REMOVAL

Disconnect:
– the battery,
– the accelerator pedal connector (1).

Remove:
– the three pedal mounting bolts (2),
– the pedal.



REFITTING

Proceed in the reverse order to removal.

GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Mot. 1372	Tamperproof bolt extractor

GENERAL INFORMATION

The injection computer is located under the battery tray. To remove it, it is necessary to remove the battery tray, which is held in place by three tamperproof bolts.

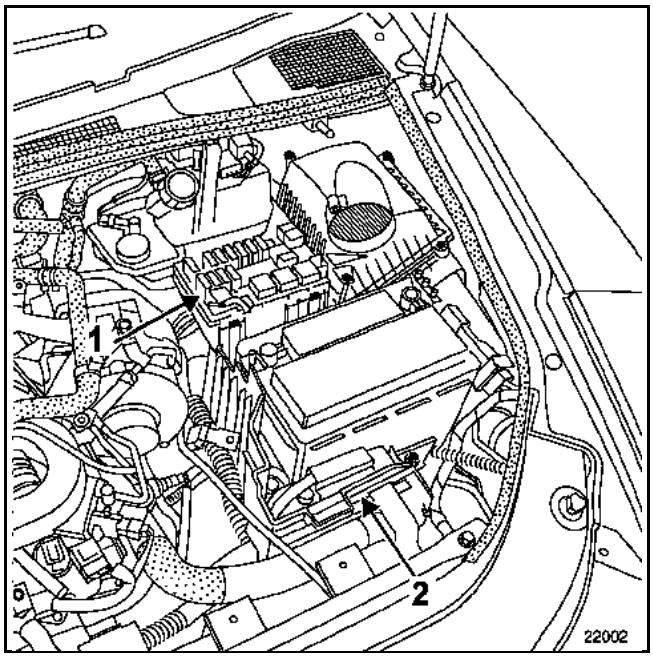
REMOVAL

Remove the engine covers.

Disconnect the battery.

Remove the battery.

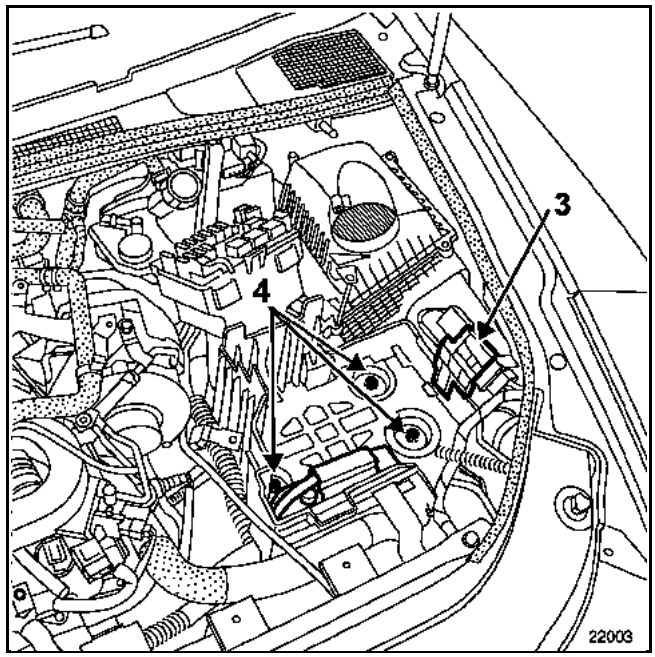
Unclip the relay unit (1) from the battery tray and move it out of the way.



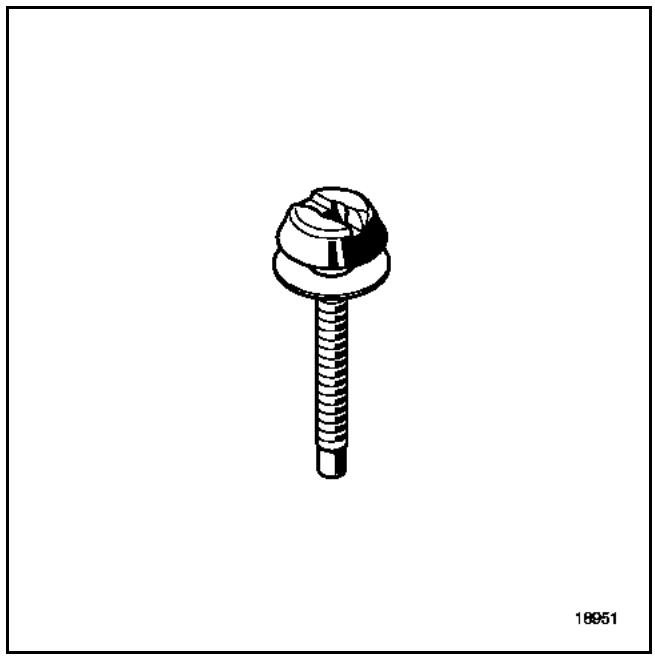
Disconnect and then remove the automatic transmission computer (2) (if fitted).

Unclip the connector holder (3) from the battery tray.

Pierce the three tamperproof bolts in the bolt shaft using a **5 mm** diameter drill bit.



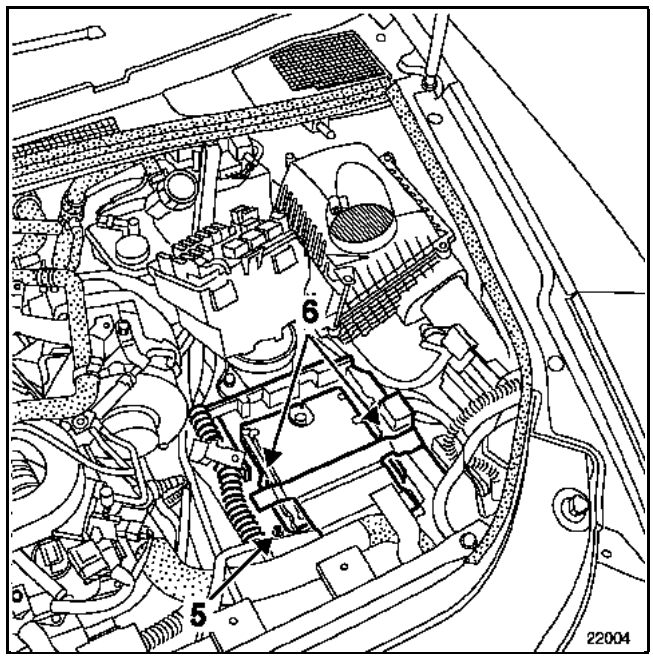
Remove:
– the three mounting bolts (4) from the battery tray using tool **Mot. 1372**,



– the battery tray.

GETtheMANUALS.org

Remove:
– the electric wiring retaining strap (5),
– the computer mounting nuts (6),
– the computer and disconnect it.



REFITTING

Proceed in the reverse order to removal.

Replace the tamperproof screws with new ones.

Program the immobiliser code following the procedure described in **section 82A Immobiliser "immobiliser"**.

GETtheMANUALS.org

SPECIAL FEATURES OF THE SAGEM "S 2000 T" MULTIPOINT INJECTION

- SAGEM "S 2000 T" type 112-track computer controlling the injection and the ignition.

- Multipoint injection operating in sequential mode without cylinder no. 1 marking sensor on camshaft. This means that phasing is controlled by software using the TDC sensor.

- Injection warning light on the instrument panel. Installation of a special injection warning light (**OBD O**n **B**oard **D**iagnostic warning light). Its presence is due to the fact that the **OBD O**n **B**oard **D**iagnostic fault finding system is fitted.

- Special precautions relating to the engine immobiliser:
  Installation of a 3rd generation immobiliser which requires a special method for replacing the computer.

- Fuel circuit without return to the tank (the pressure regulator is located on the pump/sender unit).

- Idle speed
  – nominal idle speed **750 rpm**
  – idle speed when automatic transmission is operating **750 rpm**
  Idle speed corrected according to:
  – the air conditioning,
  – the power assisted steering pressure switch,
  – battery voltage,
  – the heated windscreen,
  – the thermoplungers.

- Maximum engine speeds:
  When the coolant temperature is below **75 °C**, or for a maximum of **15 minutes**, the engine cut-off speed is **5900 rpm** which is the cut-off speed to protect a cold engine.

  Once the engine is warm, the cut-off returns to its normal value: **6200 rpm**

- Petrol vapour absorber bleed solenoid valve controlled by **O**pening **C**yclic **R**atio depending on the engine speed and manifold pressure.

- Control of the fan assembly and of the coolant temperature warning light on the instrument panel by the injection computer.

- Automatic configuration for the operation of the cruise control/speed limiter and for air conditioning operation.

- Use of two oxygen sensors located upstream and downstream of the catalytic converter.

- Motorised throttle body to regulate the airflow and the idle speed.

GETtheMANUALS.org

SPECIAL FEATURES OF THE HITACHI MULTIPOINT INJECTION

- HITACHI 121-track computer.
- Sequential multipoint injection controls the injectors one by one in firing order 1-2-3-4-5-6 (nos. 1 and 2 on the timing side, no. 1 on the rear bank).
- Static ignition with six pencil coils.
- Injection warning light on the instrument panel.
- Installation of a specific injection warning light (**OBD light O**n **B**oard **D**iagnostic) which is lit for **3 seconds** when the ignition is switched on. Its presence is due to the fact that the **OBD O**n **B**oard **D**iagnostic fault finding system is fitted.
- Special precautions relating to the engine immobiliser:
  Installation of a 3rd generation immobiliser which requires a special method for replacing the computer.
- Fuel circuit without return to the tank (the pressure regulator is located on the pump/sender unit).
- Idle speed
  – nominal idle speed **650 rpm**
- Idle speed corrected according to:
  – air conditioning, **700 rpm**
  – power assisted steering pressure switch **variable**
  – battery voltage, **variable**
- Maximum speed: **6600 rpm**
- Petrol vapour absorber bleed solenoid valve controlled by **O**pening **C**yclic **R**atio depending on operation of the engine.
- The fan unit and the coolant temperature warning light on the instrument panel are controlled by the injection computer (Central Coolant Temperature Management).
- Automatic configuration for the operation of the cruise control, distance check assistance and speed limiter and for air conditioning operation.
- Injection computer in control of the compressor depending on instructions from the air conditioning computer and engine operating conditions.
- Use of four oxygen sensors located upstream and downstream of the pre-catalytic converters.
- Continually variable inlet camshaft dephasers controlled by two solenoid valves managed by the computer according to engine speed and load.
- Motorised throttle body to regulate the airflow and the idle speed.
- Variable intake system for filling the cylinders with the optimum amount of air.

GETtheMANUALS.org

Vehicles are fitted with an injection warning light and a coolant warning light displayed on the instrument panel. With an **OBD O**n **B**oard **D**iagnostic warning light indicated by an orange engine displayed on the speedometer dial.

The injection fault warning light is indicated by an orange sine curve and the message "injection fault". The coolant warning light is indicated by a red thermometer along with the words "coolant temperature".

NOTE:
when the ignition is switched on, the **OBD** (**O**n **B**oard **D**iagnostic) warning light comes on then goes out after approximately **3 seconds**.

PRINCIPLE FOR WARNING LIGHTS COMING ON

- When there is an injection fault, the injection fault warning light comes on and you must contact a Renault dealer. These faults are:
  - turbocharging pressure sensor fault,
  - manifold pressure sensor fault,
  - air temperature sensor fault,
  - accelerator potentiometer fault,
  - internal computer fault,
  - motorised throttle body fault,
  - turbocharging pressure adjustment solenoid valve fault,
  - computer supply fault
  - turbocharging circuit fault.

- When the engine overheats , the coolant temperature warning light comes on.

- When a fault causing excessive pollution is detected, the **OBD** (**O**n **B**oard **D**iagnostic) warning light comes on:
  - **flashes** in the event of a fault which might cause damage to the catalytic converter (destructive misfires),
  - **continuously** if pollution standards are exceeded (polluting misfires, catalytic converter fault, oxygen sensor fault).

GETtheMANUALS.org

Vehicles that operate with the HITACHI fuel injection systems have fault symbols and written messages that appear clearly on an instrument panel display.

PRINCIPLE FOR WARNING LIGHTS COMING ON

- When there is an injection fault (level 1), the orange symbol (indicated by a sine curve), appears along with the words "FUEL INJECTION FAULT" then "SERVICE". Depending on the vehicle equipment, the voice synthesiser gives out the message "Level 1 faults". These faults are:
  - atmospheric pressure sensor fault,
  - camshaft sensor fault,
  - TDC sensor fault,
  - coolant temperature sensor fault,
  - air flowmeter fault,
  - accelerator pedal potentiometer fault,
  - motorised throttle body fault,
  - injector fault,
  - camshaft dephaser solenoid valve fault,
  - brake pedal switch fault,
  - variable air intake flap control solenoid valve fault
  - ignition coil fault,
  - sensor feed fault,
  - computer fault,
  - communication fault between the injection computer and automatic gearbox computer.

- When a serious injection fault occurs (level 2), the red symbol (indicated by an engine and the word "stop"), appears along with the message "SWITCH OFF ENGINE", then "STOP". Depending on the vehicle equipment level, the voice synthesiser issues the Level 2 faults message. In this event the vehicle must be stopped immediately. This fault is:
  - engine overheating fault.

- When the engine overheats, the engine temperature fault symbol appears on the display as "COOLANT TEMPERATURE" followed by "STOP". In this event the vehicle must be stopped immediately.

- When the ignition is switched on, the orange **O**n **B**oard **D**iagnostic warning light (represented by an engine), comes on for **3 seconds** then goes out.
  When a fault leading to excess exhaust gas pollution is detected, the orange **OBD** (**O**n **B**oard **D**iagnostic) warning light represented by an engine comes on:
  - **flashes** in the event of a fault which might cause damage to the catalytic converter (destructive misfires),
  - **continuously** if pollution standards are not maintained (polluting misfires, catalytic converter fault, oxygen sensor fault, fuel supply system fault, incoherence between the oxygen sensors and petrol vapour absorber fault).

GETtheMANUALS.org

This vehicle is fitted with a 3rd generation immobiliser system, controlled by a RENAULT card random rolling code recognition system, which requires a specific method for replacing the computer.

REPLACING AN INJECTION COMPUTER

See **Section 17B Injection Computer** for the procedure for removing and refitting the computer.

See **Section 82A Immobiliser** for the immobiliser functions.

Injection computers are supplied without a code, but they can all be programmed with one.

When the computer is replaced, the vehicle code must be programmed in and then a check must be made to ensure that the immobiliser system is operational.

To do this, switch on the ignition for a few seconds without starting the engine, then switch it off. With the ignition off, the engine immobiliser function comes into operation after approximately **10 seconds** (the red engine immobiliser warning light flashes).

WARNING:

With this engine immobiliser system, the computer keeps its immobiliser code for life.

In addition, this system does not have a security code.

Consequently, it is forbidden to perform tests with computers borrowed from the stores or from another vehicle which must then be returned.

It will no longer be possible to decode them.

GETtheMANUALS.org

THE COMPRESSOR IS OF VARIABLE DISPLACEMENT TYPE

AIR CONDITIONING - INJECTION COMPUTER CONNECTION

The injection computer controls the compressor clutch, taking into account the power absorbed by the compressor and the pressure of the refrigerant in the circuit.

The data used for the air conditioning function is exchanged via the multiplex network:
– **Track A A3** CAN L multiplex link (passenger compartment),
– **Track A A4** CAN H multiplex link (passenger compartment),

When the air conditioning is switched on, the air conditioning control panel requests authorisation to engage the compressor clutch. The injection computer either authorises or inhibits engagement of the compressor clutch, controls the fan unit and orders fast idle speed. This engine speed is **900 rpm**.

IMPORTANT:
The refrigerant fluid pressure and absorbed power values are never equal to **0**, whatever the state of the compressor, engaged or not.

COMPRESSOR OPERATION PROGRAMMING

During certain stages of operation, the injection computer prevents the compressor from operating.

Engine starting program

The compressor is prevented from operating for **10 seconds** after the engine is started.

Performance return programming during pulling away on a gradient.

To assist in pulling away on a gradient, the air conditioning compressor motor is not loaded for **10 seconds**.

Entry conditions
- Engine speed greater than **1600 rpm**
- AND vehicle speed less than **6 mph (10 km/h)**
- AND the throttle position is greater than **30 %**
- AND gearbox lower than **1st gear**

Output conditions
- **10 seconds** delay
- OR vehicle speed greater than **11 mph (18 km/h)**
- OR internal gearbox ratio above **1st gear**

Maximum engine speed protection programming

The compressor is disengaged if the engine speed is greater than **6304 rpm**.

Thermal protection program

The compressor does not engage if the coolant temperature is above **+ 115 °C** at high speed and full load.

GETtheMANUALS.org

THE COMPRESSOR IS OF VARIABLE DISPLACEMENT TYPE

AIR CONDITIONING COMPUTER - INJECTION COMPUTER CONNECTION

The injection computer controls the compressor depending on instructions from the air conditioning computer and engine operating conditions.

The data used for the function is exchanged via the multiplex network:
– **Track A12** CAN H multiplex link (passenger compartment).
– **Track A13** CAN L multiplex link (passenger compartment).

When the air conditioning is switched on, the air conditioning control panel requests authorisation to engage the compressor clutch. The injection computer either authorises or inhibits engagement of the compressor clutch, controls the fan unit and orders fast idle speed. This engine speed is **700 rpm**.

IMPORTANT:
The refrigerant fluid pressure and absorbed power values are never equal to **0**, whatever the state of the compressor, engaged or not.

COMPRESSOR OPERATION PROGRAMMING

During certain stages of operation, the injection computer prevents the compressor from operating.

Engine starting program

The compressor is prevented from operating for **10 seconds** after the engine is started.

Thermal protection program

The compressor does not engage if the coolant temperature is above **+ 115 °C**. It is engaged once again when the coolant temperature drops back below **110 °C**.

Recovery of performance

The compressor is disengaged for **5 seconds** if:

Entry conditions
– sharp pressure on the accelerator pedal, **above 67°**.

Output conditions
– **5-second** delay has passed,
– pressing the accelerator pedal, **below 59°**.

GETtheMANUALS.org

Engine overspeed protection programming

The compressor is disengaged if the engine speed exceeds **5400 rpm** then re-engaged when it drops below **4900 rpm**.

Anti-stall programming on the power-assisted steering

Engine coolant temperature **above 60°C**.

When the vehicle speed is less than **18 mph (30 km/h)** or when the accelerator pedal is in no load position, the compressor is disengaged for **5 seconds** if the power assisted steering is in use at the same time.

GETtheMANUALS.org

MOTORISED THROTTLE VALVE

The motorised throttle body carries out idle speed regulation and engine air inlet modulation functions. It is composed of an electric motor and two throttle position potentiometers.

When the engine is idling, the throttle position is adjusted according to the idle speed setting. This setting takes into account the major power consumers (air conditioning) and operating conditions (air temperature and coolant temperature).

When the driver depresses the accelerator pedal, his request is translated as the angle of the throttle opening. However, to improve driving pleasure, the throttle opening is not directly proportional to the driver's request.

To eliminate misfires, facilitate gear changes and perform the safety functions, the throttle valve modulates the engine torque.

MOTORISED THROTTLE BODY DEFECT MODES

The motorised throttle body has three types of defect mode.

- **Reduced Performance Mode:** this mode covers electrical faults for which there is a viable backup solution for the injection system (loss of one of the two tracks on the pedal or the throttle body).
  This mode results in reduced acceleration and limits the maximum opening of the throttle.

- **Loss of driver intervention mode:** this mode is also called the **Electrical Limp Home** mode. This mode is applied when the accelerator pedal signal disappears completely, but the injection computer still controls the intake of air to the engine (automatic throttle control is still operational).
  In this mode, the injection computer imposes a set engine speed for each gear ratio and imposes the idle speed when the brake pedal is pressed.

- **Mechanical Limp Home Mode:** this mode covers breakdowns which result in loss of the automatic throttle control (the throttle can no longer be controlled).
  In this case the throttle is in the mechanical rest position and the injection computer limits the engine speed by cutting off the injection.

NOTE:
Each of these modes results in illumination of the injection fault warning light on the instrument panel.

GETtheMANUALS.org

MOTORISED THROTTLE VALVE

The motorised throttle body carries out idle speed regulation and engine air inlet modulation functions. It is composed of an electric motor and two throttle position potentiometers.

When the engine is idling, the throttle position is adjusted according to the idle speed setting. This setting takes into account the major power consumers (air conditioning) and operating conditions (air temperature and coolant temperature).

When the driver moves the accelerator pedal, his request is translated as a call for torque which causes the throttle to open and the ignition to advance.

To eliminate misfires, facilitate gear changes and perform the safety functions, the throttle valve modulates the engine torque.

MOTORISED THROTTLE BODY DEFECT MODES

The motorised throttle body has three types of defect mode.

- **Reduced Performance Mode:** this mode covers electrical faults for which there is a viable backup solution for the injection system (loss of one of the two tracks on the pedal or the throttle body).
  This mode results in reduced acceleration and limits the maximum opening of the throttle.

- **Mechanical Limp Home Mode:** this mode covers breakdowns which result in loss of the automatic throttle control (the throttle can no longer be controlled) or faults related to loss of pedal signals.
  In these cases the throttle is in the mechanical rest position and the injection computer limits the engine speed by cutting off the injection.

NOTE:
Each of these modes results in illumination of the injection fault warning light on the instrument panel.

GETtheMANUALS.org

IDLE SPEED CORRECTION ACCORDING TO COOLANT TEMPERATURE

Coolant temperature in °C ± 1	-20°	20°	40°	80°	100°	120°
Engine speed in rpm	1072	976	896	752	752	848

ELECTRICAL CORRECTION ACCORDING TO BATTERY VOLTAGE AND ELECTRIC POWER BALANCE

The purpose of this adjustment is to compensate for the drop in voltage due to a power consumer being switched on when the battery is not charged sufficiently. It starts when the voltage falls below **12.7 V** and the engine speed may reach a maximum of **910 rpm**.

POWER ASSISTED STEERING PRESSURE SWITCH / INJECTION COMPUTER LINK

The injection computer receives a signal from the power assisted steering pressure switch and may increase the idle speed to compensate for this power consumption.

The idling speed is increased to **784 rpm**.

IDLE SPEED ADJUSTMENT ACCORDING TO THE HEATED WINDSCREEN SIGNAL

If the windscreen is selected and if the coolant temperature is lower than **60 °C**, the idle speed is fixed at **990 rpm**.

IDLE SPEED CORRECTION WHEN THERMOPLUNGERS ARE IN OPERATION

When the thermoplungers are operating (coolant temperature below **75°C**), the idle speed is fixed between **900 rpm and 1000 rpm**.

IDLE SPEED ADJUSTMENT WHEN THERE IS AN ACCELERATOR PEDAL POTENTIOMETER FAULT

If there is a fault on the two accelerator pedal position potentiometers, then the engine speed rises to about **1500 rpm**. When the brake pedal is depressed, this speed drops back to **750 rpm**.

ADJUSTMENT OF THE IDLE SPEED WHEN THERE IS A MOTORISED THROTTLE BODY FAULT

If there is a fault on the two throttle position potentiometers, the throttle body goes into limp-home mode (mechanical stop). The engine speed is then a maximum of **2500 rpm**.

NOTE:
After starting at cold and long operation at idle speed it is possible to notice a sharp drop in the engine speed of approximately **220 rpm**. This drop in engine speed is due to the presence of the automatic starter.

GETtheMANUALS.org

IDLE SPEED CORRECTION ACCORDING TO COOLANT TEMPERATURE

Coolant temperature in °C ± 1	-30	-20	- 10	0	10	30	40	50	60	70	90	110
Engine speed in rpm	1000	1000	950	950	950	950	850	800	750	650	650	650

ELECTRICAL CORRECTION ACCORDING TO BATTERY VOLTAGE AND ELECTRIC POWER BALANCE

The purpose of this adjustment is to compensate for the drop in voltage due to a power consumer being switched on when the battery is not charged sufficiently. It starts when the voltage falls below **12.8 V** for **10 seconds** and the engine speed may reach a maximum of **850 rpm**.

POWER ASSISTED STEERING PRESSURE SWITCH / INJECTION COMPUTER LINK

To compensate for the consumption of energy during a full lock manoeuvre, the injection computer receives a steering circuit pressure signal (track A18). It can increase the idle speed by several revs per minute.

IDLE SPEED ADJUSTMENT WHEN THERE IS AN ACCELERATOR PEDAL POTENTIOMETER FAULT

If there is a fault on the two accelerator pedal position potentiometer tracks, then the engine speed rises to **2000 rpm**.

ADJUSTMENT OF THE IDLE SPEED WHEN THERE IS A MOTORISED THROTTLE BODY FAULT

If there is a fault on the two throttle position potentiometer tracks, the throttle body enters Mechanical Limp Home Mode (throttle body mechanical stop).

The engine speed is limited to approximately **1800 rpm**.

GETtheMANUALS.org

ADAPTIVE IDLE SPEED CORRECTION

PRINCIPLE

Under normal hot engine operating conditions, the Opening Cyclic Ratio (OCR) value varies between a high value and a low value, so that the nominal idle speed is obtained.

It is possible that during variations in the operation of the vehicle (running in, engine wear, etc.), that the Opening Cyclic Ratio (OCR) could become close to the highest or lowest values.

The adaptive correction on the idle speed opening cyclic ratio (OCR) enables the engine's air requirement to be slowly varied, by bringing the opening cyclic ratio back to a nominal average value..

This adjustment only takes effect if the coolant temperature is above **75 ºC** and **32 seconds** after the engine has been started and during the idle speed regulation phase.

VALUE OF THE IDLING OPENING CYCLIC RATIO AND ITS ADAPTIVE CORRECTION

Nominal idle speed	**X = 750 rpm**
Idle speed plenum chamber pressure	X = **320 mbar**
Idling **Opening Cyclic Ratio**	**3 % ≤ X ≤ 30 %**
Idling adaptive **Opening Cyclic Ratio**	Min. stop: **- 7.8 %** Max. stop: **+ 7.8 %**

INTERPRETATION OF THESE PARAMETERS

If there is an excess of air (air intake or throttle stop incorrectly adjusted, etc.), the engine idling speed increases and the idle speed OCR value reduces in order to return to nominal idle speed; the adaptive adjustment value of the idle speed OCR signal reduces in order to reset the idle speed OCR signal.

If there is insufficient air (due to clogging, etc.), the logic is inverse: the idle speed OCR signal increases and the adaptive adjustment also increases in order to reset the idle speed regulation operation.

IMPORTANT:
After the computer memory has been cleared, it is imperative to start, stop, then leave the engine running at idle speed so that the adaptive adjustment can recalibrate itself correctly.

GETtheMANUALS.org

RICHNESS REGULATION

An engine using the "SAGEM S 2000 T" computer is equipped with two oxygen sensors, called the upstream and the downstream sensor.

SENSOR HEATING

Heating the oxygen sensors is controlled by the computer:
– the inlet manifold pressure is below a threshold which depends on a mapping of the engine speed,
– the road speed is below **83 mph (135 km/h)**,
– after a certain amount of engine operating time controlled by the mapping, depending on the engine's top dead centre (excluding No Load operation), and the coolant temperature.

Heating the oxygen sensors stops:
– if the vehicle speed is greater than **87 mph (140 km/h)** (value given for information purposes),
– when the engine is under heavy load.

UPSTREAM SENSOR VOLTAGE

Parameter reading: upstream oxygen sensor voltage on the diagnostic tool: the value displayed indicates the voltage sent to the computer by the oxygen sensor placed upstream of the catalytic converter. It is expressed in millivolts. When the engine is operating in a closed loop, the voltage must oscillate rapidly between two values:
– **100 mV ± 100** for a lean mixture,
– **800 mV ± 100** for a rich mixture.

The smaller the difference between the minimum and maximum values, the poorer the signal from the sensor (the difference is usually at least **500 mV**).

NOTE:
If the difference is small, check the sensor heater.

DOWNSTREAM SENSOR VOLTAGE

Parameter reading: downstream oxygen sensor voltage on the diagnostic tool: the value displayed indicates the voltage sent to the computer by the oxygen sensor placed upstream of the catalytic converter. It is expressed in millivolts.

The function of this sensor is to locate faults on the catalytic converter and to perform a second more precise check on the richness (slow regulation loop). This function is activated only after the engine has been operating for a certain time.

When the engine is operating in a closed loop, at stabilised speed, the voltage should vary within the range **600 mV ± 100**.

When the engine is decelerating, the voltage should be less than **200 mV**.

The voltage read on the diagnostic tool at idling speed should be ignored.

GETtheMANUALS.org

MIXTURE CORRECTION

The value given under the richness correction parameter on the diagnostic tool represents the average value of richness corrections made by the computer depending on the richness of the burnt mixture as seen by the oxygen sensor located upstream of the catalytic converter (the oxygen sensor actually analyses the oxygen content of the exhaust gases).

The correction value has a mid-point of **128** and limits of **0** and **255**:
– value less than **128** = request for mixture to be made leaner.
– value greater than **128** = request for mixture to be made richer.

ENTRY INTO RICHNESS REGULATION MODE

Loop phase

The richness regulation starts after a maximum timed starting period of **15 minutes** and when the coolant temperature is above **0 °C**.

Loop opening phase

In richness regulation mode, the operating phases during which the computer ignores the value of the voltage from the sensor are:
- at full load,
- under heavy acceleration,
- when decelerating with no load information,
- when the oxygen sensor is faulty.

DEFECT MODE WHEN THE OXYGEN SENSOR IS FAULTY

When the voltage from the oxygen sensor is incorrect (varying only slightly or not at all) during mixture regulation, the computer will only enter defect mode if the fault has been recognised as present for **3 minutes**. Only in that case will the fault be memorised. In this case the richness correction is **116 or 152**.

If an oxygen sensor fault is present and detected and if the fault has already been memorised, the system enters the open loop mode directly.

GETtheMANUALS.org

An engine using the **HITACHI** computer is equipped with two oxygen sensors, called the upstream and downstream sensor.

SENSOR HEATING

The upstream oxygen sensor heater is controlled by the computer if all of the following conditions are met:
– engine speed is below **2800 rpm.**
– the battery voltage is lower than **15 V**,
– after a starting period of **4 seconds**.
– if the oxygen sensors are not faulty.

The downstream oxygen sensor heater is controlled by the computer provided all of the following conditions are met:
– engine speed is below **3200 rpm.**
– the battery voltage is lower than **15 V**,
– after a starting period of **2 minutes**,
– if the oxygen sensors are not faulty.

UPSTREAM SENSOR VOLTAGE

Parameter reading: upstream oxygen sensor voltage on the diagnostic tool: the value displayed indicates the voltage sent to the computer by the oxygen sensor placed upstream of the catalytic converter. It is expressed in millivolts.

When the computer corrects the richness according to the two sensors, the engine is said to be in a closed loop.

When the engine is operating in a closed loop, the voltage must oscillate rapidly between two values:
– **100** and **600 mV** for a lean mixture,
– **350** and **800 mV** for a rich mixture.

The smaller the difference between the minimum and maximum values, the poorer the signal from the sensor.

NOTE:
If the difference is small, check the sensor heater.

DOWNSTREAM SENSOR VOLTAGE

Read the downstream oxygen sensor voltage parameter on the diagnostic tool: the value read represents the voltage supplied to the computer by the oxygen sensor downstream of the catalytic converter. It is expressed in millivolts.

The function of this sensor is to locate faults on the catalytic converter and to perform a second more precise check on the richness (slow regulation loop). This function is activated only after the engine has been operating for a certain time.

When the engine is operating in a closed loop, the voltage should vary within the range **430 mV and 480 mV**. When the engine is decelerating, the voltage should vary around **0 mV**.

The voltage read on the diagnostic tool at idling speed should be ignored.

GETtheMANUALS.org

MIXTURE CORRECTION

The value read on the diagnostic tool on parameters: **PR173** and **PR174**, **Richness regulation row 1** or **2**, indicates the average richness correction made by the computer according to the fuel mixture richness recorded by the oxygen sensor positioned upstream on the catalytic converter (the oxygen sensor gives a real analysis of the oxygen level in the exhaust gas).

The adjustment value has a midpoint of **100%**:
– value lower than **100%**: requires a leaner mixture,
– value greater than **100%**: requires a richer mixture.

ENTRY INTO RICHNESS REGULATION MODE

The mixture regulation starts after a given starting delay (depending on the coolant temperature), that can vary between **6 seconds** for a temperature above **80 °C** to **30 seconds** for a temperature below **- 10 °C**.

Loop opening phase

In richness regulation mode, the operating phases during which the computer ignores the value of the voltage from the sensor are:
– at full load,
– under heavy acceleration,
– during deceleration with injection cut-off,
– when the oxygen sensor is faulty.

DEFECT MODE WHEN THE OXYGEN SENSOR IS FAULTY

When the voltage from the oxygen sensor is incorrect (varying only slightly or not at all) during mixture regulation, the computer will only enter defect mode if the fault has been recognised as present for **3 minutes**. In this case, the **Richness regulation row 1 or 2 parameters are 100%**.

If an oxygen sensor fault is present and recognised and if the fault has already been stored, the system enters the open loop mode directly.

GETtheMANUALS.org

PRINCIPLE

In closed loop phase, the richness regulation adjusts the injection timing so as to obtain a mixture as close as possible to richness 1. The adjustment value is close to **128**, with limits of **0** and **255**.

Adaptive mixture adjustment makes it possible to offset the injection mapping to reset the richness regulation to **128**.

Adaptive adjustments take **128** as the average value after initialisation (erasing the memory) and have the following limit values:

Mixture adjustment	**60 ≤ X ≤ 190**
Operating adaptive richness	**82 ≤ X ≤ 224**
Idle adaptive richness	**32 ≤ X ≤ 224**

Conditions:
– engine warm: (coolant temperature above **70 ºC**),
– do not exceed an engine speed of **4000 rpm**,
– disconnect the fuel vapour absorber by the solenoid valve or block the inlet pipe on the engine.

Pressure zones which must be passed through during the test

There are five pressure zones to cover during road testing. These zones are defined by the following calibrations:

	Range No. 1 (mbar)	Range No. 2 (mbar)	Range No. 3 (mbar)	Range No. 4 (mbar)	Range No. 5 (mbar)
F4R ENGINE	**250 ---------- 400 ---------- 517 ---------- 635 ---------- 753 ---------- 1298**				
	Average 325	**Average 458**	**Average 576**	**Average 694**	**Average 1025**

Deactivation of the adaptive programs in the case of prolonged idle speed regulation with a hot engine

If the coolant temperature is above **80 °C** at idle speed for more than **10 minutes**, the adaptive programs are frozen until idling ends.

Following this test the adjustments will be operational. The test should be followed by normal, smooth and varied driving over **5** to **10 kilometres**.

After the test, record the values of the adaptive programs. Initially **128**, they may have changed. If not, repeat the readings taking care to observe the test conditions strictly.

INTERPRETATION OF VALUES OBTAINED FROM A ROAD TEST'

In the case of a lack of fuel (injectors clogged, pressure and flow of fuel too low, etc), the richness regulation increases to obtain a richness as close as possible to **1** and the adaptive richness correction increases until the richness correction again fluctuates at around **128**. If there is excess fuel, the opposite is true.

GETtheMANUALS.org

PRINCIPLE

In closed loop mode, the richness regulation (**PR173** and **174**) corrects the injection timing to give fuel metering which is as close as possible to richness **1**. The correction value is around **100 %**, with limits of **75 %** and **125 %**.

The adaptive richness correction (**PR177** and **178**) makes it possible to offset the injection mapping to reset the richness regulation to **100 %**.

Adaptive correction takes **100 %** as the average value after initialisation (erasing the memory) and has the following limit values: **74 %** and **139 %**.

Richness regulation bank 1 or 2	**75 % ≤ PR173 and 174 ≤ 125 %**
Richness regulation adaption bank 1 or 2	**74 % ≤ PR177 and 178 ≤ 139 %**

Programming conditions for adaptive richness correction:
– engine warm, coolant temperature above **70 ºC**),
– closed loop richness regulation,
– disconnect the fuel vapour absorber by the solenoid valve or block the inlet pipe on the engine.

Following this test the adjustments will be operational. The test should be followed by normal, smooth and varied driving over **5** to **10 kilometres**.

After the test, record the values of the adaptive programs. Initially **100 %**, they should have changed. If not, repeat the readings taking care to observe the test conditions strictly.

INTERPRETATION OF VALUES OBTAINED FROM A ROAD TEST'

If there is a lack of fuel, the richness regulation (**PR173** and **174**) increases to obtain a richness as close as possible to **1** and the adaptive richness correction increases until the richness correction again fluctuates at approximately **100 %**. If there is excess fuel, the opposite is true.

GETtheMANUALS.org

The fan unit is controlled by the injection computer.

ANTI-PERCOLATION FUNCTION

The anti-percolation system is controlled by the injection computer.

The coolant temperature signal used is the one from the injection system.

After the engine is switched off the system enters monitoring mode. If the coolant temperature exceeds the limit of **107 °C** during the **49 seconds** after the engine is switched off, the fan unit is controlled at slow speed.

If the coolant temperature falls below **85 °C**, the fan unit relay is cut off (the fan unit cannot be controlled for more than **10 minutes**).

OPERATION OF THE FAN UNITS

– The fan unit is switched on at slow speed if the coolant temperature exceeds **98 °C** and is switched off when the temperature falls below **95 °C**.
– the fan unit is switched on at high speed if the coolant temperature exceeds **102 °C** and is switched off when the temperature falls below **99 °C**,

OPERATION OF THE TEMPERATURE WARNING LIGHT

The temperature warning light lights up continuously if the coolant temperature exceeds **118 °C**. It goes out when the temperature drops below **115 °C**.

OPERATION OF THE ELECTRIC COOLANT PUMP (TURBOCHARGER COOLING)

The turbocharger cooling system is controlled by the injection computer.

The coolant temperature signal used is the one from the injection system.

After the engine is switched off the system enters monitoring mode. If the coolant temperature exceeds **107 °C** during the **3 minutes** following stopping the engine, the coolant pump is controlled.

If the coolant temperature falls below **80 °C**, the coolant pump control relay is cut off (the electric coolant pump cannot be controlled for more than **10 minutes**).

GETtheMANUALS.org

The fan unit is controlled by the injection computer.

ANTI-PERCOLATION FUNCTION

The anti-percolation system is controlled by the injection computer.

The coolant temperature signal used is the one from the injection system.

After the engine is switched off the system enters monitoring mode. If the coolant temperature exceeds the limit of **102 °C** during the **2 minutes** after the engine is switched off, the fan unit is run at slow speed.

If the coolant temperature falls below **95 °C**, the fan unit relay is cut off. The fan unit cannot be switched on for more than **10 minutes**.

OPERATION OF THE FAN UNITS

– The fan unit is switched on at slow speed if the coolant temperature exceeds **99 °C** and is switched off when the temperature falls below **95 °C**.
– the fan unit is switched on at high speed if the coolant temperature exceeds **102 °C** and is switched off when the temperature falls below **99 °C**.

OPERATION OF THE TEMPERATURE WARNING LIGHT

The temperature warning light is lit if the coolant temperature exceeds **118 °C** and goes out when the temperature falls below **114 °C**.

ENGINE SPEED RESTRICTION IN THE EVENT OF ENGINE OVERHEATING

If the engine overheats, the engine speed is restricted to about **6375 rpm**.

GETtheMANUALS.org

The camshaft dephasers are located on the inlet camshaft. Their function is to modify the timing adjustment.

They are **continuously** activated by the injection computer via two solenoid valves.

The valves are controlled by an **O**pening **C**yclic **R**atio) signal.

They authorise oil flow in order to control the dephasers during certain operational stages of the engine.

OPERATING CONDITIONS

The camshaft dephaser control solenoid valves are controlled if all of the following conditions are met:
– no speed sensor fault
– no injection system faults
– no camshaft position sensor fault
– after the engine has started,
– above idling speed,
– battery voltage between **10** and **16 V**,
– engine speed > **at 1200 rpm**,
– coolant temperature between **60** and **120 °C**.

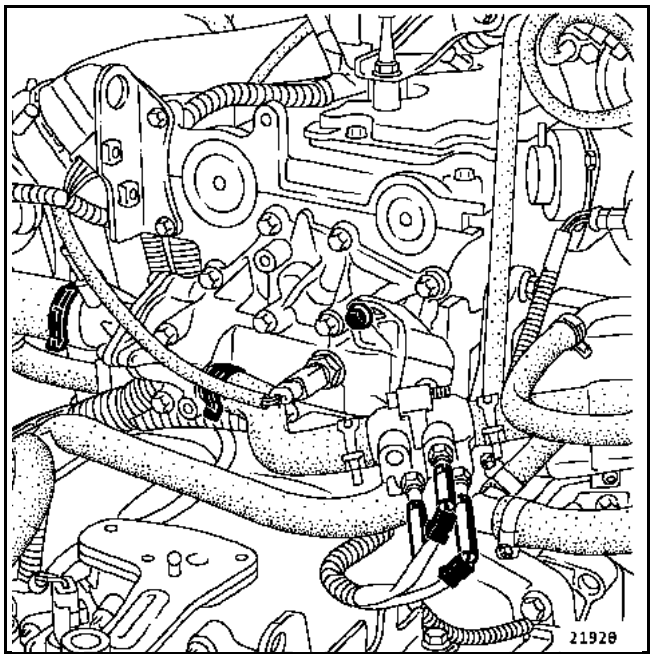
GETtheMANUALS.org

The three thermoplungers are located on a water unit fixed on the cylinder head at the engine - gearbox joint.

The purpose of the system is to reheat the coolant.

The thermoplungers are supplied with **12 V** by two relays. One relay controls two thermoplungers, the other relay controls one thermoplunger. This enables control of one, two or three thermoplungers as required.

The resistance of the thermoplungers is:
0.45 ± 0.05 Ω at 20 °C.

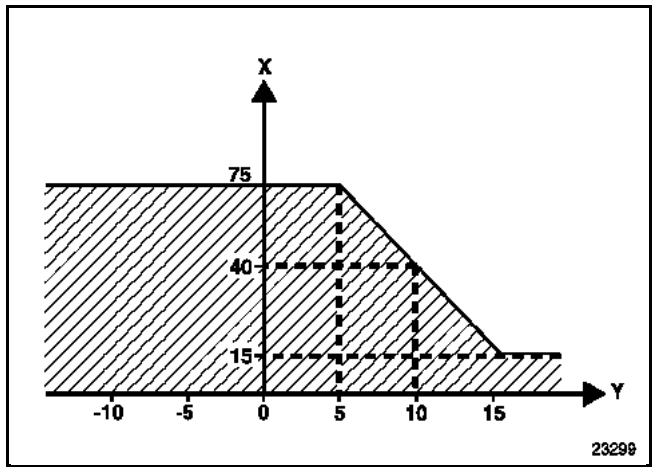


Control strategy

When the thermoplungers are operating, the idle speed is brought to **1000 rpm**.

Thermoplungers cannot operate:
– if heated windscreen is selected,
– if the temperature is greater than **75 °C**,
– if the battery voltage is less than **13 V**,

If the conditions mentioned above apply, the thermoplungers are controlled according to a mapping related to the air and coolant temperature.



X Coolant temperature in ˚C
Y Air temperature in ˚C

Non shaded area: thermoplunger not supplied
Shaded area: thermoplunger supplied

GETtheMANUALS.org

TURBOCHARGING PRESSURE REGULATION

The turbocharging pressure is adjusted via the position of the pressure regulation valve (wastegate).

PRINCIPLE

This pressure adjustment valve is linked via a rod to the wastegate diaphragm and is controlled by the injection computer via a solenoid valve. This solenoid valve is open in the rest position and is fitted to the inlet pipe between the air filter and turbocharger inlet.

In the rest position, (open), this solenoid valve links the turbocharger outlet (turbocharging pressure) and the pressure regulation valve control diaphragm.
The turbocharging pressure affects the diaphragm directly, the pressure regulation valve (wastegate) opens and the maximum possible pressure is between **1350 mbar - 1400 mbar** whatever the engine speed (minimum turbocharging for the engine).

When the solenoid valve is controlled, the turbocharging pressure signal (taken at the turbocharger outlet) is diverted to the compressor inlet. As a result, the diaphragm is not subject to turbocharging pressure, the pressure regulation valve (wastegate) closes back to a position imposed by the adjustment system.

In addition to turbocharging pressure management, the computer controls the engine for full load iso-torque operation.

This means that whatever the engine conditions (air temperature, atmospheric pressure etc) the maximum torque will always be **250 Nm** and the power **120 kW**. So for an air temperature of **20 °C**, the full load turbocharging pressure will be less than at **50 °C**. Except for controlled torque management, the turbocharging pressure can never exceed **1800 mbar**.

TURBOCHARGING PRESSURE REGULATION

The turbocharging pressure therefore depends on the position of the turbocharging pressure solenoid valve which is controlled with an Opening Cycle Ratio.

The turbocharging pressure is adjusted if:
– the coolant temperature is above **- 30 °C**,
– the turbocharging pressure is above **1100 mbar**.

IMPORTANT:
The closed solenoid valve value is never equal to **0**. The minimum value read is approximately **1.13 %** and the maximum value is not **100 %**, it is **98.8 %**.

GETtheMANUALS.org

ADAPTIVE CORRECTION OF THE TURBOCHARGING PRESSURE

Under normal operating conditions, the turbocharging pressure regulation solenoid valve OCR varies between a high and low value so that the desired turbocharging pressure is obtained.

It is possible that during variations in the operation (clogging up of the pipes, the solenoid valve, etc.) that the value of the **Opening Cyclic Ratio** could become close to the highest or lowest values.

The adaptive correction on the solenoid valve **Opening Cyclic Ratio** of the turbocharging pressure of the regulation enables these slow variations to be corrected, by bringing the OCR back to a nominal average value.

This correction is only effective if:
– the engine speed is greater than **2000 rpm**;
– the manifold pressure is stable, with a gap of less than **22 mbar**,
– the turbocharging pressure is above **1350 mbar**.

TURBOCHARGING PRESSURE REGULATION SOLENOID VALVE OCR VALUE AND ITS ADAPTIVE CORRECTION

Opening Cyclic Ratio turbocharging pressure regulation solenoid valve	**1.13 % ≤ X ≤ 98.83 %**
Adaptive **Opening Cyclic Ratio** turbocharging pressure regulation solenoid valve	Min. limit: **- 30 %** Max. limit: **+ 30 %**

GETtheMANUALS.org

GENERAL INFORMATION

The cruise control or distance control: Can maintain a speed selected by the driver and can adapt vehicle speed to the speed of the vehicle in front in the case of distance control. This function can be deactivated at any moment by depressing the brake pedal or the clutch pedal, or by using one of the system buttons.

Speed limiter: allows the driver to set a speed limit. The accelerator pedal will not function above the set speed. The speed limit selected can be exceeded at any time by pressing the accelerator pedal beyond its point of resistance.

A warning light on the instrument panel informs the driver of the status of the cruise control-speed limiter with distance control:
– Green light: cruise control in operation.
– Amber light: speed limiter in operation.
– Indicator light flashing: the set speed cannot be maintained (e.g. going downhill).

To control these functions, the injection computer receives the following signals on the following tracks:
– **A C3:** Speed limiter On/Off
– **A A2:** Cruise control or distance control assistance On/Off
– **A D2:** Steering wheel switch supply
– **A D3:** Steering wheel switch signal
– **A E4:** Stop switch open input
– **A C4:** Clutch switch input (depending on version)
– **A G2:** Pedal potentiometer 1 feed
– **A F2:** Pedal potentiometer 2 feed
– **A H3:** Pedal potentiometer 1 earth
– **A F4:** Pedal potentiometer 2 earth
– **A H2:** Pedal potentiometer 1 signal
– **A F3:** Pedal potentiometer 2 signal
– **A A3:** CAN L multiplexing (passenger compartment)
– **A A4:** CAN H multiplexing (passenger compartment)
– **B K4:** CAN H multiplexing (engine)
– **B K3:** CAN L multiplexing (engine)

The following signals are received by the injection computer via the multiplex network:
– The vehicle speed (Anti-lock Braking System).
– Stop switch closed signal (ABS).
– Which gear is engaged (Automatic Gearbox)

The injection computer sends the following signals over the multiplex network:
– Cruise control or speed limit setting to the instrument panel,
– Warning light illumination (amber, green or flashing).
– Gear change signals from the gearbox (depending on version).

The injection computer receives:
- signals from the accelerator pedal
- brake switch signal
- clutch switch signal
- signals from the Start/Stop switch
- signals from the steering wheel switches
- signals from the ABS computer
- signals from the automatic transmission computer.

The injection computer controls the motorised throttle using these signals to maintain the speed set by the cruise control function and to adapt the vehicle speed to the vehicle in front in the case of distance control, and not to exceed the speed set by the speed limiter function.

GETtheMANUALS.org

GENERAL INFORMATION

The cruise control or distance control: Can maintain a speed selected by the driver and can adapt vehicle speed to the speed of the moving vehicle in front in the case of distance control. This function can be deactivated at any moment by depressing the brake pedal or by using one of the system buttons.

Speed limiter: allows the driver to set a speed limit. The accelerator pedal will not function above the set speed. The speed limit selected can be exceeded at any time by pressing the accelerator pedal beyond its point of resistance.

A warning light on the instrument panel informs the driver of the status of the cruise control-speed limiter with distance control:
– Green light: cruise control in operation.
– Amber light: speed limiter in operation.
– Indicator light flashing: the set speed cannot be maintained (e.g. going downhill).

To control these functions, the injection computer receives the following signals on the following tracks:
– **A 29:** Speed limiter On/Off
– **A 30:** Cruise control or distance control On/Off
– **A 54:** Steering wheel switch earth
– **A 55:** Steering wheel switch signal
– **A 11:** Stop switch open input
– **A 43:** Pedal potentiometer feed 1
– **A 24:** Pedal potentiometer feed 2
– **A 37:** Pedal potentiometer earth 1
– **A 40:** Pedal potentiometer earth 2
– **A 38:** Pedal potentiometer signal 1
– **A 39:** Pedal potentiometer signal 2
– **A 13:** CAN L multiplexing (passenger compartment)
– **A 12:** CAN H multiplexing (passenger compartment)
– **A 32:** CAN L multiplexing (Engine)
– **A 31:** CAN H multiplexing (Engine)

The following signals are received by the injection computer via the multiplex network:
– The vehicle speed (Anti-lock Braking System)
– Stop switch closed signal (ABS)
– Which gear is engaged (automatic transmission)

The injection computer sends the following signals over the multiplex network:
– Cruise control or speed limit setting to the instrument panel
– Warning light illumination (amber, green or flashing)
– Gear change signals from the gearbox (depending on version).

The injection computer receives:
- signals from the accelerator pedal
- brake switch signal
- signals from the Start/Stop switch
- signals from the steering wheel switches
- signals from the ABS computer
- signals from the automatic transmission computer.

The injection computer controls the motorised throttle body using these signals to maintain the speed set by the cruise control function and to adapt the vehicle speed to the vehicle in front in the case of distance control, and not to exceed the speed set by the speed limiter function.

GETtheMANUALS.org

CRUISE CONTROL OPERATION

Entry conditions
- switch on cruise control
- internal gearbox ratio above **2nd gear**
- minimum vehicle speed **18 mph (30 km/h)**, maximum **120 mph (200 km/h)** (for information purposes)
- cruise control warning light on (green)
- press "+", "-" or "resume"

Exit conditions
- press down on the accelerator pedal (temporary exit)
- brake or clutch pedal must be depressed
- press "0"
- switch on "Off"
- electronic stability program system must be switched on

DISTANCE CONTROL OPERATION

Entry conditions
- switch on distance control
- minimum vehicle speed **31 mph (50 km/h)**, maximum **111 mph (180 km/h)** (for information purposes)
- cruise control warning light on (green)
- press "+", "-" or "resume"

Exit conditions
- press down on the accelerator pedal (temporary exit)
- depress the brake pedal,
- press "0"
- switch on "Off"
- electronic stability program system must be switched on
- vehicle speed less than **18 mph (30 km/h)**

SPEED LIMITER OPERATION

Entry conditions
- switch on speed limiter
- internal gearbox ratio above **2nd gear**
- minimum vehicle speed **18 mph (30 km/h)**, maximum **120 mph (200 km/h)** (for information purposes)
- limiter warning light on (amber)
- press "+", "-" or "resume"

Exit conditions
- brief sharp pressure on the accelerator pedal (past the point of resistance).
- extended pressure on the brake pedal
- press "0"
- switch on "Off"
- electronic stability program system must be switched on

NOTE:
A flashing warning light informs the driver that the set speed cannot be maintained.

Defect mode

When there is a breakdown or fault on:

The Electronic Stability Program system, the injection system, the ABS system.

The cruise control/speed limiter and cruise control with distance control can no longer be activated.

GETtheMANUALS.org

This vehicle is fitted with the **OBD (On Board Diagnostic)** fault finding system which has the following features:

When a fault causing excessive pollution is detected, a warning light on the instrument panel ("OBD" warning light) lights up. This warning light informs the driver that he must have the vehicle repaired.

This new computer diagnostic strategy operates as follows:

Only engine misfires are the subject of continuous fault finding. The other emission control components are tested once while driving (fault finding is not continuous). However, these test sequences are not always performed. The vehicle must drive under certain conditions for fault finding to be performed:
– temperature condition,
– speed condition (threshold, stability, etc.),
– delay after start,
– engine conditions (manifold pressure, engine speed, throttle angle, etc.).

The OBD management program supplements the management of conventional electrical failures. To meet this standard the requirements are:
– the OBD light coming on (or flashing for some faults),
– storing OBD faults.

CONSEQUENCES FOR FAULT FINDING AND REPAIRS

Special care is required when working on the car to prevent the OBD warning light from coming on after the car has been returned to the customer.

Some faults only appear when the car is being driven, when the adaptives are programmed: **it is therefore essential to validate the repair**.

In addition, the complexity of the system means that the customer has to be asked about the conditions which led to the illumination of the warning light. This information will enable faults to be found more quickly. The circumstances in which the fault occurred are recorded the computer's memory.

NOTE:
all electrical faults which result in exceeding the pollution limit cause the OBD warning light to come on.

The operational fault finding used for OBD is:
– diagnostics of misfires which destroy the catalytic converter,
– diagnostics of polluting misfires,
– fault finding for the upstream and downstream oxygen sensors,
– fault finding for the catalytic converter.

NOTE:
Misfire fault finding takes precedence over all other fault finding. This is performed almost continuously as soon as the driving conditions are reached.

IMPORTANT:
It is essential that the ignition is not switched off before the result is read on the diagnostic tool at the end of each test. Switching off the ignition causes incorrect interpretation of the results and loss of the information that the diagnostics have been performed.

GETtheMANUALS.org

CONDITIONS WHICH CAUSE ILLUMINATION OF "ON BOARD DIAGNOSTIC" WARNING LIGHT

● ELECTRICAL FAULT
Permanent illumination of the light after a fault is detected (depending on the component).

● **PERCENTAGE OF MISFIRES WHICH WILL DESTROY THE CATALYTIC CONVERTER**
Immediate illumination and flashing of the warning light.

● **CATALYTIC CONVERTER, OXYGEN SENSOR FAULT, MISFIRES**
Continuous illumination of the light after a fault is detected three times consecutively.

IMPORTANT:
Fault finding of the catalytic converter and the upstream oxygen sensor is sequential and takes place:
– once when driving (it lasts for several seconds per test),
– only under certain specific driving conditions.

During a road test, it may be the case that diagnostics for certain functions are not performed (e.g. when in a traffic jam).

⇒**Illumination of the light**
If the same **On Board Diagnostic** fault is detected during three consecutive driving periods or electrical fault.

⇒**The light flashes**
If misfires leading to destruction of the catalytic converter are detected.

⇒**The light goes out**
If the **On Board Diagnostic** fault does not reappear during three consecutive driving periods, the indicator light goes out (but the fault remains stored in the injection computer memory).
The fault must not be detected during **40 consecutive tests** for the fault to be cleared from the computer memory without the use of a diagnostic tool.

NOTE:
The fault may not be detected:
– if the fault is temporary,
– due to the way the customer drives, which does not include all of the fault detection conditions.

GETtheMANUALS.org

FAULT FINDING CONDITIONS

If, when the ignition is switched on and when the car is being driven, the air temperature read by the temperature sensor is not between **-7.5 °C and 119 °C**, or if the coolant temperature read by the sensor is not between **- 7.5 °C and 119 °C**, or if the difference between **1046 mbar** and the manifold pressure is more than **273 mbar** (altitude of about **2500 m**), then the **On Board Diagnostic** procedures are not authorised until the next time the ignition is switched on.

In order for the **On Board Diagnostic** system to function correctly, there must be no electrical faults in the injection system, even if the **On Board Diagnostic** warning light is not on.

When the catalytic converter and oxygen sensor fault finding procedures are in progress, the fuel vapour absorber bleed is closed and the richness adaptions are locked at their last value.

TEST PROCEDURE

– repair all electrical faults,
– erase all faults,
– program the injection,
– check the **On Board Diagnostic** system

FULL OBD INITIALISATION

– erase stored faults,
– erase **On Board Diagnostic** faults,
– erase programming.

PROGRAMMING REQUIRED FOR OBD FAULT FINDING

Engine target programming
This is programmed by:
– One deceleration with injection cut-off in **3rd gear** between **3500** and **3000 rpm** for at least **2 seconds**.
– A second deceleration with injection cut-off in **3rd gear** between **1800** and **1400 rpm** for at least **3 seconds**.
It is possible to carry out this programming procedure by decelerating from **3500 rpm** to **1400 rpm**.

Richness adaptives programming
The car must be driven while complying with the conditions specified in the **Injection: Adaptive mixture adjustment** section, for this programming to be carried out.

Torque/gas programming (State: Cylinder 1 detection):
To carry out this programming, the vehicle must be driven for **25 minutes**. Confirmation of the programming can be displayed on the diagnostic tool: **Target programming.....ACTIVE**.

GETtheMANUALS.org

The aim of detecting misfires is to detect a problem which would cause the **On Board Diagnostic** limit to be exceeded by **HC** pollutant emissions and which would damage the catalytic converter.

The diagnostic can detect:
– clogging or flooding of a spark plug,
– clogging of the injectors or an injector flow fault,
– a fault in the supply system (pressure regulator, fuel pump, etc.),
– a bad connection in the petrol or injection circuits (coil secondary, etc.).

Fault finding is performed by measuring the instantaneous variations in engine rotation speed.

Observation of a drop in torque detects misfires.

This fault finding is performed almost continuously while the car is being driven. If it is in operation, or if a fault is detected, other **On Board Diagnostic** diagnostics will be inhibited (catalytic converter and upstream oxygen sensor).

This fault finding strategy makes it possible to distinguish two types of fault:
– destructive misfires resulting in destruction of the catalytic converter. These cause the **OBD** warning light to come on immediately and flash,
– Polluting misfires which cause the On Board Diagnostic pollution limit to be exceeded. These cause the **OBD** warning light to come on if they are detected during three consecutive journeys.

DETECTION CONDITIONS

Before starting, the programming must be checked. The conditions prior to switching on the ignition and the current conditions must also be satisfied.

Destructive misfires are detected as soon as the coolant temperature exceeds -**7.5 °C**, over the three operating ranges between **idle speed** and **4500 rpm**.

The polluting combustion misfire test can also be carried out by maintaining the engine at idle speed with all the power consumers on for **10 minutes and 40 seconds**.

IMPORTANT:
It is essential that the ignition is not switched off before the result is read on the diagnostic tool at the end of this test. Switching off the ignition will lead to the results being misinterpreted.

CONFIRMATION OF THE REPAIR

– Misfiring being diagnosed . . . . . ACTIVE
– Polluting misfiring . . . . . No fault detected
– Destructive misfiring . . . . . No fault detected

If, after the test, the diagnostic tool has detected misfiring, refer to the fault finding procedure associated with this complaint.

GETtheMANUALS.org

The aim of catalytic converter fault finding is to detect a problem which would cause the **On Board Diagnostic** limit to be exceeded by **HC** pollutant emissions.

The ability of the catalytic converter to store oxygen indicates its condition. As the catalytic converter ages, its ability to store oxygen reduces along with its ability to treat pollutant gases.

CONDITIONS FOR STARTING FAULT FINDING

Fault finding of the catalytic converter can only take place after the **engine has been running** for **16 minutes and 30 seconds**, if all the conditions prior to switching on the ignition are satisfied and maintained:
– no electrical faults,
– no misfires detected,
– no catalytic converter fault finding performed since the ignition was switched on,
– programming done,
– main loop and double loop active,
– coolant temperature above **75 ºC**,
– car speed between **40 mph (63 kph)** and **81 mph (130 kph)**,
– pressure between **440** and **670 mbar**,
– engine speed read on the diagnostic tool is between **1472** and **3840 rpm**.

FAULT DETECTION

Fault finding is performed over a stabilised range in 5th gear at **43 mph (70 km/h)**. When the conditions for starting fault finding are satisfied, richness excitation peaks are applied, which has the effect of sending bursts of oxygen into the catalytic converter. If the catalytic converter is in good condition, it will absorb the oxygen and the downstream oxygen sensor value will remain at its average value. If it is worn, it will reject the oxygen and the oxygen sensor will start to vibrate. The voltage of the oxygen sensor will fluctuate. (The **On Board Diagnostic** warning light will light up after three journeys.)

The test cannot exceed **52 seconds** without exiting from the cycle again.

IMPORTANT:
It is essential that the ignition is not switched off before the result is read on the diagnostic tool at the end of this test. Switching off the ignition will lead to the results being misinterpreted.

CONFIRMATION OF THE REPAIR

– "On Board Diagnostic catalytic converter fault finding in progress" message .... ACTIVE
– "On Board Diagnostic catalytic converter fault finding: carried out" ..... ACTIVE
– "Catalytic converter operating fault" ..... INACTIVE
– "Confirmation of catalytic converter repair" ..... OK

If the diagnostic tool shows "Fault finding **On Board Diagnostic** catalytic converter: carried out ACTIVE" or "Confirmation of the repair to the catalytic converter... 1.DEF", the control cycle has not been performed correctly. In this case, repeat the cycle ensuring that the detection conditions are complied with.

If after the test, the diagnostic fault shows "Catalytic converter functional fault ... ACTIVE" or "Validation of catalytic converter repair ... 2DEF", refer to the fault finding method associated with this symptom.

GETtheMANUALS.org

The aim of oxygen sensor fault finding is to detect a problem which would cause the **On Board Diagnostic** limit to be exceeded by **HC, CO or NOx** pollutant emissions. It is carried out by measuring and comparing periods of upstream oxygen sensor vibration.

There are two types of possible faults of the upstream oxygen sensor:

– mechanical damage to an electrical component (breakage, cut in wire) which leads to an electrical fault,

– chemical damage to the component which causes the response time of the sensor to slow down, thus increasing its switching period.

When the required test conditions are met, the average of the sensor periods read is taken, subtracting the effects of interference, then compared with an average period of the **On Board Diagnostic** threshold.

TEST CONDITIONS

The fault finding procedure for the upstream oxygen sensor can only be carried out after **the engine has been running for 13 minutes and 40 seconds**, if the preliminary conditions on switching on the ignition are met and maintained:
– no electrical faults detected,
– programming done,
– no oxygen sensor fault finding performed since the ignition was switched on,
– no misfires detected,
– coolant temperature above **75 ºC**,
– average engine speed between **1440** and **3840 rpm**,
– pressure between **292** and **850 mbar**,
– vehicle speed between **40** mph and **81 mph (63 and 130 km/h)**.

FAULT DETECTION

Fault finding takes place during use by the customer, according to conditions previously described. The computer shows "oxygen sensor fault finding: in progress".

IMPORTANT:
It is essential that the ignition is not switched off before the result is read on the diagnostic tool at the end of this test. Switching off the ignition will lead to the results being misinterpreted.

CONFIRMATION OF THE REPAIR

– Have **On Board Diagnostic** oxygen sensor fault finding instruction in progress . . . . . ACTIVE
– **On Board Diagnostic** oxygen sensor fault finding: carried out . . . . . ACTIVE
– "Oxygen sensor operating fault" . . . . . INACTIVE
– "Validation of oxygen sensor repair" . . . . . OK

If the diagnostic tool shows "**On Board Diagnostic** oxygen sensor: not done ... ACTIVE" or "Validation of the repair to the oxygen sensor ... 1DEF", the control cycle has not been performed correctly. In this case, repeat the cycle ensuring that the detection conditions are complied with.

If after the test, the diagnostic tool shows "Oxygen sensor operating fault ... ACTIVE" or "Validation of repair ... 2.DEF", refer to the fault finding method associated with this symptom.

GETtheMANUALS.org

This vehicle is fitted with the **OBD** (**O**n **B**oard **D**iagnostic) fault finding system which has the following features:

When a fault causing excessive pollution is detected, a warning light on the instrument panel (**OBD** warning light) lights up. This warning light informs the driver that he must have the vehicle repaired.

This new computer diagnostic strategy operates as follows:

Only the fault finding procedures for misfires and the fuel supply circuit are carried out continuously. The other emission control components are tested once while driving (fault finding is not continuous). However, these test sequences are not always performed. The car must be driven under certain conditions for the test sequences to be executed:
– temperature condition,
– speed condition (threshold, stability, etc.),
– delay after starting,
– engine conditions (manifold pressure, engine speed, throttle angle, etc.).

The **OBD** (**O**n **B**oard **D**iagnostic) is managed alongside standard electrical faults. To meet this standard the requirements are:
– to light up the **OBD** (**O**n **B**oard **D**iagnostic) warning light (or cause it to flash in the case of some faults),
– stores **OBD** (**O**n **B**oard **D**iagnostic) faults.

CONSEQUENCES FOR FAULT FINDING AND REPAIRS

Special care is required when working on the vehicle to prevent the **OBD** (**O**n **B**oard **D**iagnostic) warning light from coming on after the vehicle has been returned to the customer..

Some faults only appear when the car is being driven, when the adaptives are programmed: **it is therefore essential to validate the repair**.

In addition, the complexity of the system means that the customer has to be asked about the conditions which led to the illumination of the warning light. This information will enable faults to be found more quickly. The circumstances in which the fault occurred are recorded the computer's memory.

NOTE:
All electrical faults that lead to pollution levels being exceeded cause the **OBD** (**O**n **B**oard **D**iagnostic) warning light to light up.

The functional fault finding operations used for the OBD (On Board Diagnostic) are:
– diagnostics of misfires which destroy the catalytic converter,
– diagnostics of polluting misfires,
– fault finding for the upstream and downstream oxygen sensors,
– diagnostics of the catalytic converter,
– fuel supply system fault finding

NOTE:
Misfire fault finding takes precedence over all other fault finding. This is performed almost continuously as soon as the driving conditions are reached.

IMPORTANT:
It is essential that the ignition is not switched off before the result is read on the diagnostic tool at the end of each test. Switching off the ignition causes incorrect interpretation of the results and loss of the information that the diagnostics have been performed.

GETtheMANUALS.org

CONDITIONS WHICH CAUSE ILLUMINATION OF "ON BOARD DIAGNOSTIC" WARNING LIGHT

- **ELECTRICAL FAULT**
  Permanent illumination of the light after several consecutive detections of a fault (one to two depending on the component).

- **PERCENTAGE OF MISFIRES WHICH WILL DESTROY THE CATALYTIC CONVERTER**
  Immediate illumination and flashing of the warning light.

- **CATALYTIC CONVERTER, OXYGEN SENSOR, MISFIRES AND FUEL SUPPLY CIRCUIT FAULTS**
  Illumination of the light after a fault is detected twice consecutively.

IMPORTANT:
Fault finding of the catalytic converter and the upstream oxygen sensor is sequential and takes place:
– once when driving (it lasts for several seconds per test),
– only under certain specific driving conditions.

During a road test, it may be the case that diagnostics for certain functions are not performed (e.g. when in a traffic jam).

⇒Illumination of the light
If the same **On Board Diagnostic** fault is detected during two consecutive driving periods or electrical fault.

⇒The light flashes
If misfires leading to destruction of the catalytic converter are detected.

⇒The light goes out
If the **On Board Diagnostic** fault does not reappear during two consecutive driving periods, the indicator light goes out (but the fault remains stored in the injection computer memory).
The fault must not be detected during **40 consecutive tests** for the fault to be cleared from the computer memory without the use of a diagnostic tool.

NOTE:
The fault may not be detected:
– if the fault is temporary,
– due to the way the customer drives, which does not include all of the fault detection conditions.

GETtheMANUALS.org

DIAGNOSTIC CONDITIONS

In order for the **OBD** (On Board Diagnostic), system to function correctly, there must be no electrical faults in the injection system, even if the **OBD** warning light is not on.

When the catalytic converter and oxygen sensor fault finding procedures are in progress, the fuel vapour absorber bleed is closed and the richness adaptions are locked at their last value.

TEST PROCEDURE

- repair all electrical faults,
- erase all faults,
- program the injection,
- check the OBD diagnostic system.

FULL OBD INITIALISATION

– erase stored faults,
– erase OBD faults,
– erase programming.

PROGRAMMING REQUIRED FOR OBD FAULT FINDING

Engine target programming
Engine target programming takes place automatically and cannot be carried out with the diagnostic tool.

Richness adjustment programming
To carry out this programming, refer to **the Petrol injection: adaptive richness correction section**.

GETtheMANUALS.org

The aim of detecting misfires is to detect a problem which would cause the **OBD** (On Board Diagnostic) limit to be exceeded by pollutant emissions and which would damage the catalytic converter.

The diagnostic can detect:
- clogging or flooding of a spark plug,
- clogging of the injectors or an injector flow fault,
- a fault in the supply system (pressure regulator, fuel pump, etc.),
- a bad connection in the petrol or injection circuits,
- a malfunction of the ignition coils.

Fault finding is carried out by measuring instantaneous variations in engine speed.
Observation of a drop in torque detects misfires.
This fault finding is performed almost continuously while the car is being driven.

This diagnostic strategy makes it possible to diagnose two types of fault:
– destructive misfires resulting in destruction of the catalytic converter. These cause the OBD warning light to light up immediately and flash,
– Polluting misfires which cause the On Board Diagnostic pollution limit to be exceeded. These cause the OBD warning light to come on if they are detected during two consecutive journeys.

IMPORTANT:
It is essential that the ignition is not switched off before the result is read on the diagnostic tool at the end of this test. Switching off the ignition will lead to the results being misinterpreted.

CONFIRMATION OF THE REPAIR

– DETECTION OF ENGINE MISFIRES	No fault detected
– CYLINDER MISFIRES 1, 2, 3, 4, 5 or 6	No fault detected

If after the test the diagnostic tool has found misfires, refer to the fault finding method associated to this symptom.

GETtheMANUALS.org

The aim of catalytic converter fault finding is to detect a malfunction which would cause pollutant emissions to exceed the **On Board Diagnostic** limit.

The ability of the catalytic converter to store oxygen indicates its condition. As the catalytic converter ages, its ability to store oxygen reduces along with its ability to treat pollutant gases.

CONDITIONS FOR STARTING FAULT FINDING

Catalytic converter fault finding can only be carried out if the conditions required prior to switching on the ignition are met and maintained:
– no electrical faults,
– no misfires detected,
– programming done,
– main loop and double loops active,
– engine speed read on the diagnostic tool is between **1000** and **2600 rpm**.
– coolant temperature between **70˚** and **100 ˚C**,
– vehicle speed greater than **20 mph (32 km/h)**.

FAULT DETECTION

Fault finding is carried out at a steady speed at between **15 % and 40 %** load and an engine speed between **1000 and 2600 rpm**. When the conditions for starting fault finding are satisfied, richness excitation peaks are applied, having the effect of sending bursts of oxygen into the catalytic converter. If the catalytic converter is in good condition, it will absorb the oxygen and the downstream oxygen sensor value will remain at its average value. If it is worn, it will reject the oxygen and the downstream oxygen sensor will start to vibrate. The voltage of the oxygen sensor will fluctuate. The On Board Diagnostic warning light will light up after two consecutive journeys.

Catalytic converter fault finding takes **60 seconds**.

IMPORTANT:
It is essential that the ignition is not switched off before the result is read on the diagnostic tool at the end of this test. Switching off the ignition will lead to the results being misinterpreted.

CONFIRMATION OF THE REPAIR

– On Board Diagnostic catalytic converter fault finding done	YES
– Catalytic converter no. 1 or 2	No fault detected

If the diagnostic tool shows "Fault finding" On Board Diagnostic catalytic converter: done" ... NO, then the control cycle has not been carried out correctly. In this case, repeat the cycle ensuring that the detection conditions are complied with.

If after the test, the diagnostic fault shows "CATALYTIC CONVERTER No. 1 or No. 2", refer to the fault finding method associated with this symptom.

GETtheMANUALS.org

The aim of the oxygen sensor fault finding is to detect a malfunction which would cause the **On Board Diagnostic** limit for hydrocarbon, carbon monoxide or nitrogen oxide pollutant emissions to be exceeded. It is carried out by measuring and comparing periods of upstream oxygen sensor vibration.

There are two types of possible faults of the upstream oxygen sensor:
– mechanical damage to an electrical component (breakage, cut in wire) which leads to an electrical fault,
– chemical damage to the component which causes the response time of the sensor to slow down, thus increasing its switching period.

When the required test conditions are met, the average of the sensor periods read is taken, subtracting the effects of interference, then compared with an average period of the On Board Diagnostic threshold.

TEST CONDITIONS

Upstream oxygen sensor fault finding can only be carried out if the conditions required prior to switching on the ignition are met and maintained:
– no electrical faults detected,
– no operational breakdown **On Board Diagnostic** (misfires, catalytic converter or fuel supply system) detected,
– programming done,
– coolant temperature between **70 °C and 100 °C**,
– average engine speed between **1200** and **3100 rpm.**
– engine load between **13 %** and **62 %**,
– car speed between **49.5 mph** (**80 km/h) and 75 mph (120 km/h)**,
– active closed loop richness regulation,
– battery voltage between **11** and **16 V**.

FAULT DETECTION

Fault finding takes place during use by the customer, under the conditions previously described. The computer shows "SENSOR FAULT FINDING COMPLETE".

IMPORTANT:
It is essential that the ignition is not switched off before the result is read on the diagnostic tool at the end of this test. Switching off the ignition will lead to the results being misinterpreted.

CONFIRMATION OF THE REPAIR

– SENSOR FAULT FINDING COMPLETE.	YES
– UPSTREAM OXYGEN SENSOR no. 1 or no. 2	No fault detected
– DOWNSTREAM OXYGEN SENSOR no. 1 or no. 2	No fault detected

If the diagnostic tool shows "OXYGEN SENSOR FAULT FINDING COMPLETE" ... NO, the control cycle has not been carried out correctly. In this case, repeat the cycle ensuring that the detection conditions are complied with.

If after the test, the diagnostic tool shows a "CATALYTIC CONVERTER No. 1 OR No. 2" fault or an "UPSTREAM OXYGEN SENSOR No. 1 OR No. 2" faults or "DOWNSTREAM OXYGEN SENSOR No. 1 or No. 2", refer to the fault finding method associated with this symptom.

GETtheMANUALS.org

This fault finding procedure continuously monitors the richness derivatives through the richness regulation adaptive values (programming).

TEST CONDITIONS

These conditions are fulfilled by a driving cycle that starts richness regulation of the upstream and downstream sensors.

The fault finding procedure can only be carried out if the preliminary conditions on ignition are met and maintained:
– no electrical faults detected,
– no **On Board Diagnostic** operational fault,
– coolant temperature between **70** and **100 °C**,
– coolant temperature at start higher than or equal to **-10 °C**,
– engine speed between **1000** and **3200 rpm**.
– engine load between **13** and **67 %**,
– car speed between **28** mph (**46 km/h) and 80 mph (130 km/h)**,
– battery voltage higher than or equal to **11 V**.

FAULT FINDING

Fault finding takes place during use by the customer, under the conditions previously described.

IMPORTANT:
It is essential that the ignition is not switched off before the results are read on the diagnostic tool at the end of this test. Switching off the ignition will lead to the results being misinterpreted.

CONFIRMATION OF THE REPAIR

– FUEL SUPPLY BANK A or B	No fault detected
– RICHNESS REGULATION BANK 1 or 2	No fault detected

If after the test, the fault finding procedure shows "FUEL SUPPLY BANK A or B" fault or "RICHNESS REGULATION BANK 1 or 2", refer to the fault finding method associated with this symptom.

GETtheMANUALS.org

VOLUME AND GRADE OF COOLANT

Engine	Volume (in litres)	Grade	Special notes
F4R	**6.8**	GLACEOL RX (type D) use coolant only	Protects down to **-20** °**C** ± **2** °**C** for temperate and very cold countries Protects down to **-37** °**C** ± **2** °**C** for cold countries
G9T	**7**		
P9X	**7**		
V4Y	**7.2**		

THERMOSTAT

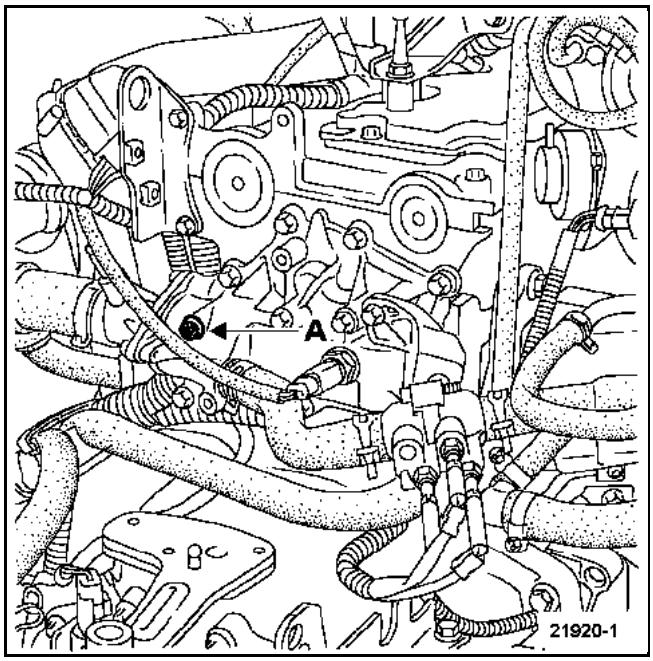
Engine	Starts opening (in °C)	Finishes opening (in °C)
F4R	**89**	**99** ± **2**
G9T	**89**	**99** ± **2**
P9X	**82**	**92** ± **2**
V4Y	**82**	**92** ± **2**

GETtheMANUALS.org

Coolant flows continuously through the heater matrix, which contributes to the cooling of the engine.

FILLING

The following bleed screws must be opened:
– on the top of the radiator,
– on the heater hoses,
– on the hose between the coolant unit and the auxiliary heater (**G9T engine**),
– on the thermoplunger unit hose (**P9X engine**),
– on the coolant unit (**F4R and G9T engines**) at (A).



Fill the circuit through the expansion bottle opening.

Close the bleed screw as soon as the fluid runs out in a continuous jet.

Start the engine **(2 500 rpm)**.

Adjust the level by overflow for a period of about **4 minutes**.

Close the bottle.

BLEEDING

Let the engine run for about **20 minutes** at **2500 rpm**, until the fans start (time needed for automatic degassing).

Verify that the liquid level is at or near the **Maximum** mark.

DO NOT OPEN THE BLEED SCREW WHILST THE ENGINE IS RUNNING

REPLACE THE EXPANSION BOTTLE CAP WITH THE ENGINE WARM

GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
M.S. 554-01	Adapter for M.S. 554-07
M.S. 554-06	Adapter for M.S. 554-07
M.S. 554-07	Kit for testing cooling circuit sealing

1 - Testing the circuit tightness

Replace the expansion bottle valve with adapter **M.S. 554-01**.

Connect this to tool **M.S. 554-07**.

Warm up the engine then switch it off.

Pump to pressurise the circuit.

Stop pumping at **0.1 bar** less than the valve rating.

The pressure should not drop; if it does, look for the leak.

Slowly unscrew the union of tool **M.S. 554-07** to decompress the cooling circuit, then remove tool **M.S. 554-01** and refit the expansion bottle valve with a new seal.

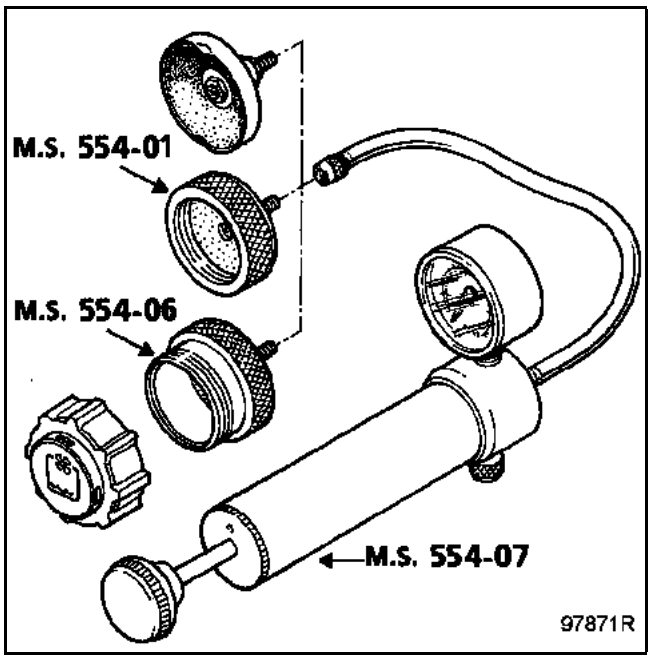
2 - Checking the valve rating.

If liquid passes through the expansion bottle valve, the valve must be replaced.

Fit tool **M.S. 554-06** on pump **M.S. 554-07** and fit both onto the valve to be checked.

Increase the pressure, which should stabilise at the valve rating, with a test tolerance of **± 0.1 bar.**

Valve rating: 1.4 bar for F4R, G9T and V4Y engines, and 1.8 bar for P9X.



GETtheMANUALS.org

TIGHTENING TORQUE (in daNm)	
Coolant unit mounting bolt	2.5

REMOVAL

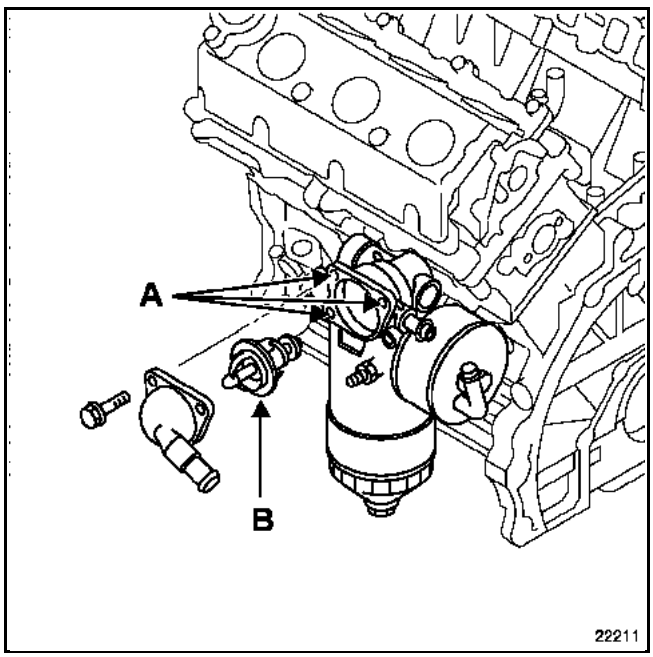
Put the car on a two-post lift.

Disconnect the battery.

Remove the engine undertray.

Drain the cooling circuit through the bottom radiator hose.

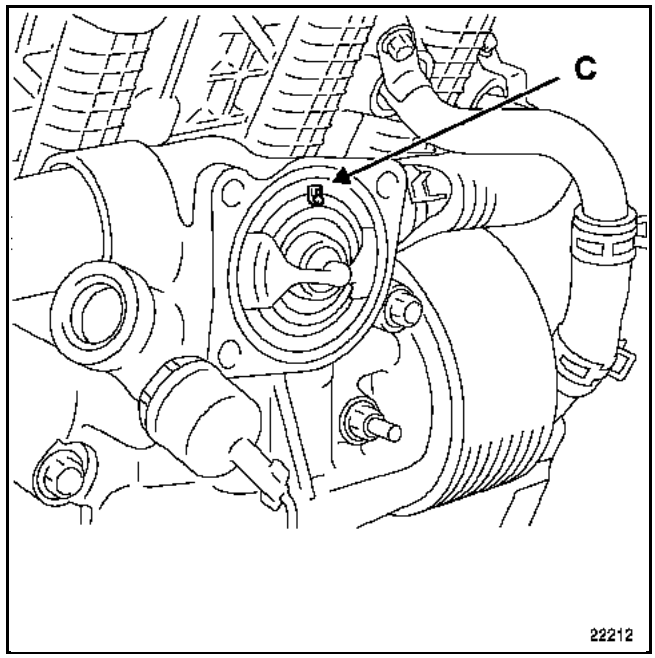
Remove:
– thermostat mountings at (A),
– thermostat (B).



REFITTING

Refit the thermostat with a new seal in place.

NOTE: degassing aperture (C) must always be oriented facing vertically upwards.



Tighten the coolant unit bolts to a torque of **2.5 daNm**.

Fill and bleed the cooling circuit (see Section **19A Filling - bleeding**).

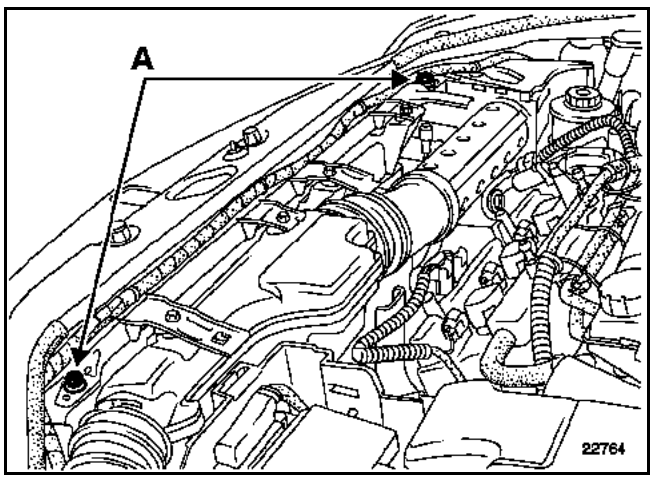
GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Mot. 1202-01 Mot. 1202-02	Hose clip pliers
Mot. 1448	Remote operation clip pliers for cooling system hose clips

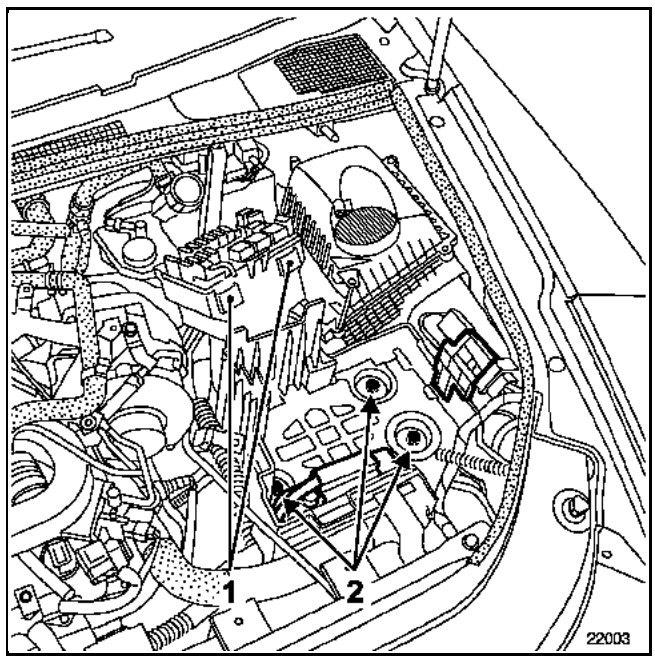
REMOVAL

Put the car on a two-post lift.

Remove:
– the engine covers,
– the battery and the engine undertray,
– both front wheels,
– the upper impact bar,
– the air resonator (**V4Y only**) at (A),



– the relay board at (1),
– the battery tray at (2),



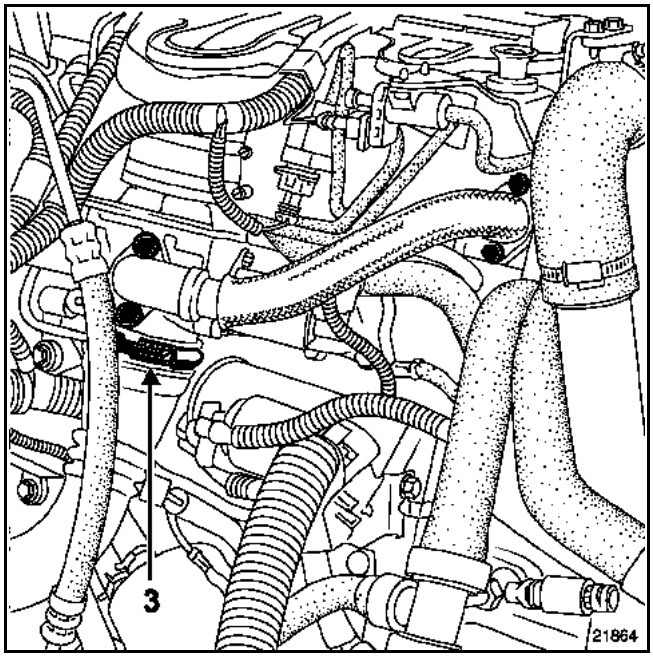
– the fan assembly connectors,
– the fan assembly resistor connections (**G9T only**),
– the fan assembly.

Drain the cooling circuit through the bottom radiator hose.

Remove:
– the front bumper (see Section **54A.A Front bumper**),
– the two headlamps,
– the upper cross member,
– the radiator top hose,
– the two radiator scoops,

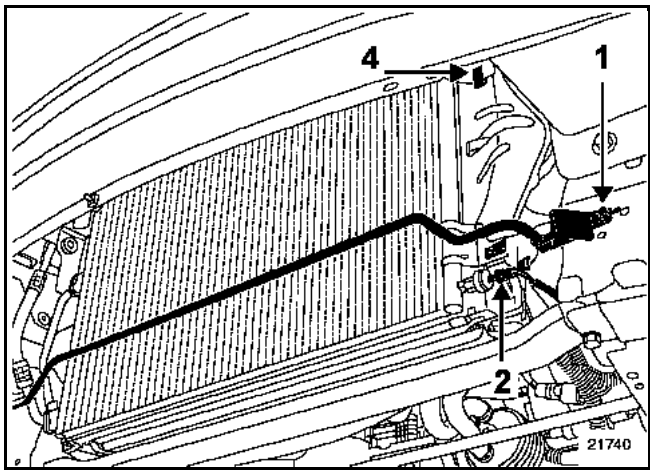
GETtheMANUALS.org

– the air hoses on the damper (**G9T only**) at (3),



– the two power assisted steering pipe mountings (1),
– condensor connector (2).

Unclip the air-air exchanger condenser at (4) then move it to one side attaching it to the front cross member.



Remove the two hoses on the air cooler (except for **V4Y**).

Unclip the radiator cooler then remove it.

Unpin the two ower radiator lmountings.

Remove the radiator.

REFITTING

Refit in the reverse order to removal.

Ensure that the fins of the radiator, the condenser or the cooler are not damaged during removal; protect them if necessary.

Fill and bleed the cooling circuit (see Section **19A Filling - bleeding**).

Reprogramming is essential after the battery has been disconnected (see **Section 80A Battery special notes**).

GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Mot. 1202-01 Mot. 1202-02	Hose clip pliers
Mot. 1448	Remote operation clip pliers for cooling system hose clips

TIGHTENING TORQUE (in daNm)	
Water pump bolts	0.9

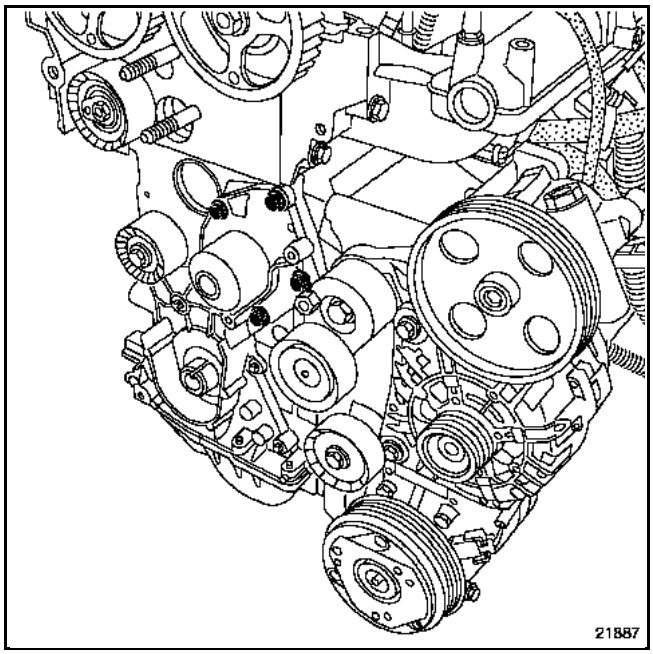
REMOVAL

Put the vehicle on a two-post lift.

Disconnect the battery.

Drain the cooling circuit through the radiator bottom hose.

Remove:
– the timing belt (see **Section 11A: Timing belt**),
– the coolant pump.



CLEANING

It is very important not to scratch the sealing faces.

Use **Décapjoint** to dissolve any remains of the seal still adhering.

Wear gloves whilst carrying out the following operation.

Apply the product to the part to be cleaned, wait approximately 10 minutes, then remove the product using a wooden spatula.

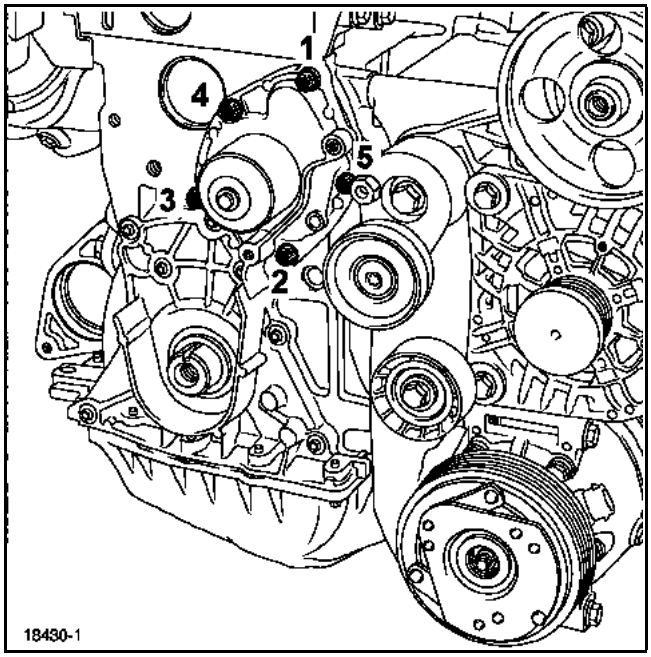
Do not allow this product to drip on to the paintwork.

GETtheMANUALS.org

NOTE: put a drop of Loctite FRENETANCH on bolts (3) and (4).

Fit the new seal.

Finger tighten the coolant pump mounting bolts in the recommended order shown below, then tighten them to a torque of **0.9 daNm** in tightening order shown.



Refit the timing belt (it is essential to follow the method described in **Section 11A Timing belt**),

Fill and bleed the cooling circuit (see **Section 19A Filling and bleeding**).

GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Mot. 1202-01 Mot. 1202-02	Hose clip pliers
Mot. 1448	Remote operation clip pliers for cooling system hose clips
EQUIPMENT REQUIRED	
Sprocket-wrench (e.g. FACOM U 14L)	

TIGHTENING TORQUES (in daNm)	
The coolant pump hub nut	5
The coolant pump mounting bolt	1
The coolant pump cover mounting bolt	1

REMOVAL

Put the vehicle on a two-post lift.

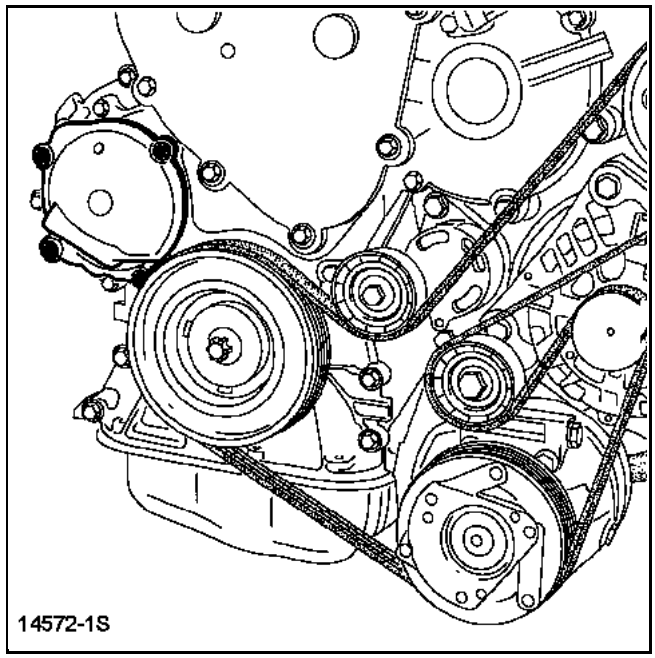
Disconnect the battery.

Fit the engine support tool **Mot. 1367-02**.

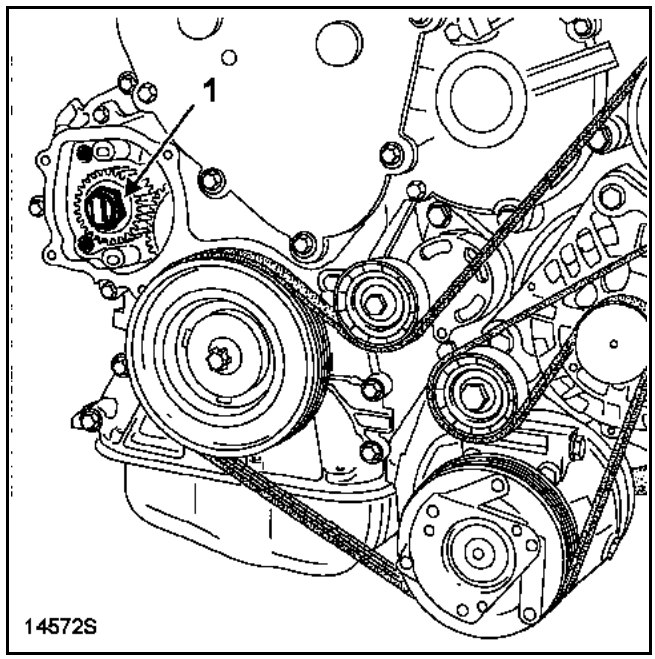
Drain:
– the cooling circuit through the radiator bottom hose,
– the engine oil (do not refit the oil drain plug).

Remove:
– the front right wheel,
– the mudguard,
– the front right suspended engine mounting.

Lower the engine to remove the coolant pump cover without damaging the engine tie-bar or the exhaust pipe.

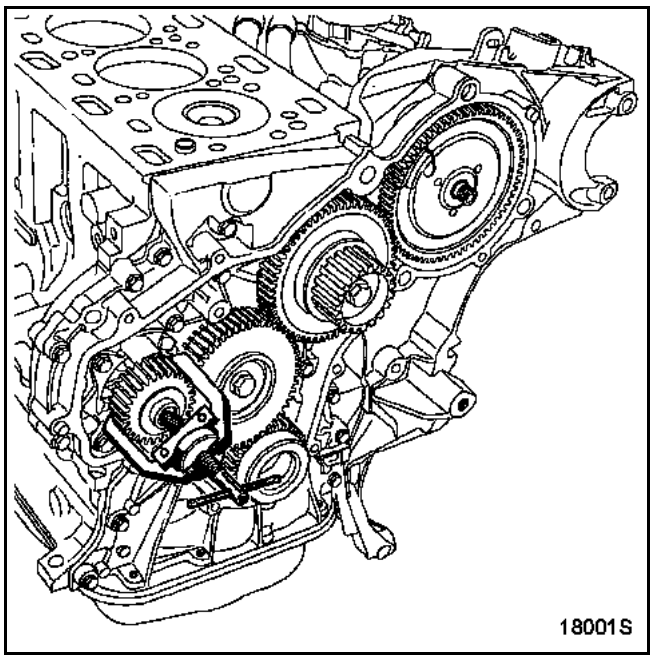


Remove:
– nut (1) of the coolant pump hub (lock the crankshaft with a screwdriver).

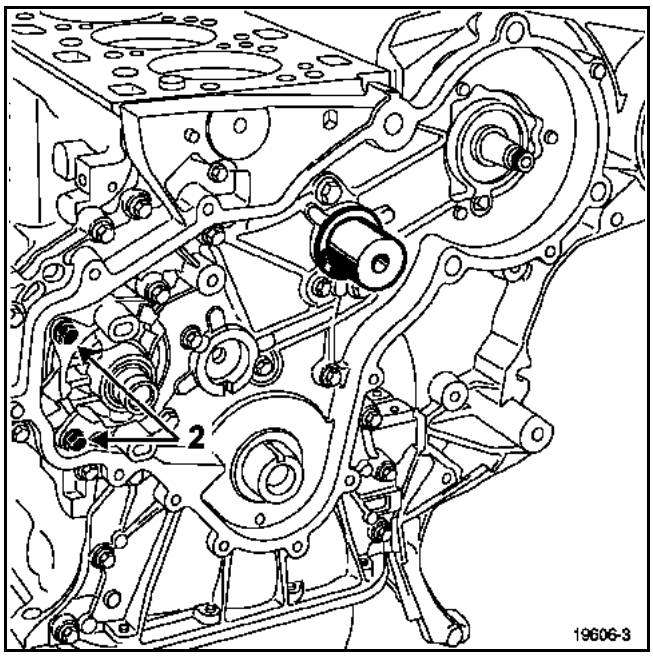


GETtheMANUALS.org

Remove:
– the sprocket from the coolant pump using the general purpose puller,



– the coolant pump bolts (2),



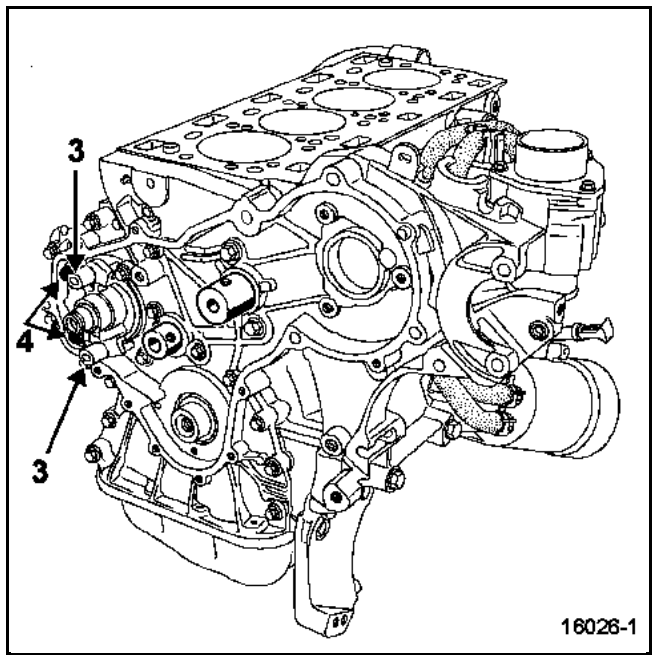
– the coolant pump.

WARNING: some coolant will escape into the oil sump. Make sure the sealing surface of the coolant pump is clean and that the coolant is drained from the sump.

REFITTING

Refit the coolant pump (fitted with a new seal) by pressing down on the bosses (3) to fit the pump properly to the lower timing cover.

Tighten the bolts (4) to a torque of **1 daNm**.



Refit:
– the coolant pump gear by tightening the nut to a torque of **5 daNm**,
– the coolant pump cover by tightening the bolts to a torque of **1 daNm**,

Top up the engine oil.

Fill and bleed the cooling circuit (see **Section 19A Filling - bleeding**).

GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Mot. 1376	Pin for locking engine rotation
Mot. 1367-02	Tool for securing engine from below
Mot. 1453	Tool for supporting engine from above
Mot. 1202-01 Mot. 1202-02	Hose clip pliers
Mot. 1448	Remote operation clip pliers for cooling system hose clips
Mot. 1651	Tool for fitting seal, timing end
Mot. 1653	High pressure pump seal fitting tool
EQUIPMENT REQUIRED	
Torque wrench	

TIGHTENING TORQUES (in daNm)	▽
Water pump bolts	1.1
Gear train mounting bolt	3.5
Gear train housing mounting bolt	2.5
Injection pump pulley nut	16
Crankshaft accessories pulley bolt	23.5

Put the vehicle on a two-post lift.

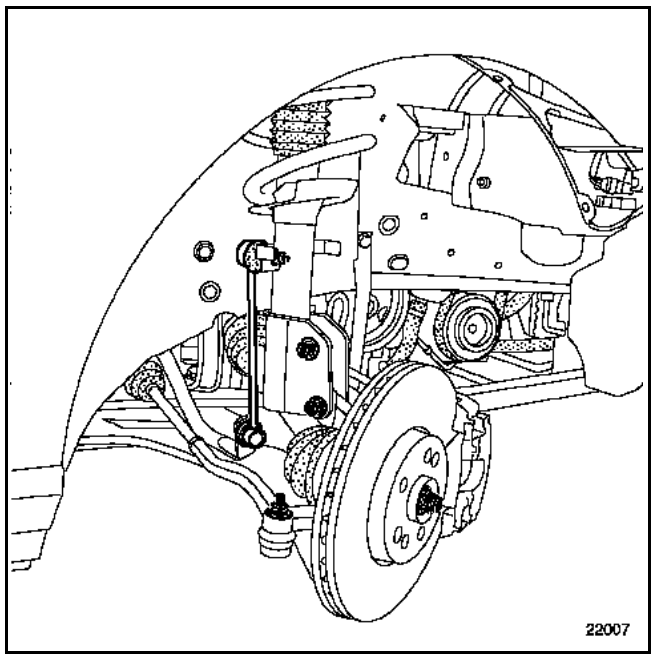
Disconnect the battery.

Drain the cooling circuit through the radiator bottom hose.

Engine oil must be changed when refitting to remove coolant from the sump.

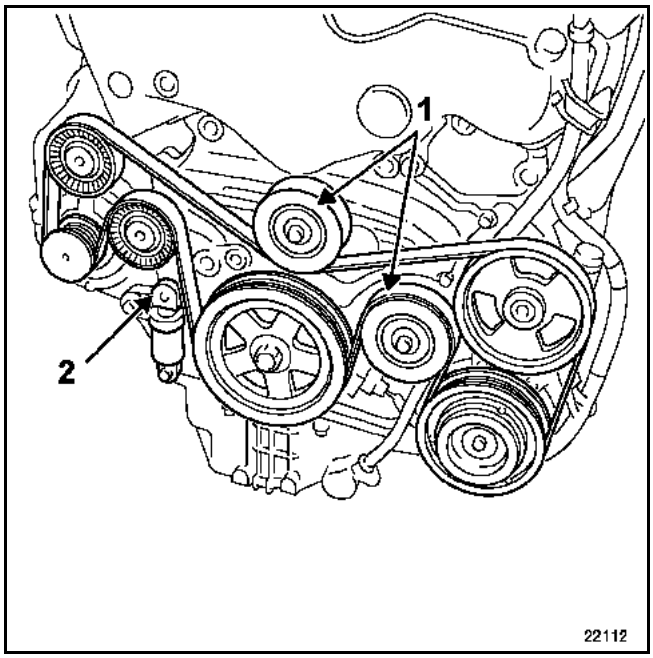
REMOVAL

Disconnect the front right driveshaft by removing:
- the driveshaft relay bearing bracket,
- the steering ball joint,
- the lower ball joint,
- the mounting bolts of the shock absorber base,
- the brake calliper mountings then attach it to the suspension spring,
- the ABS sensor connector.

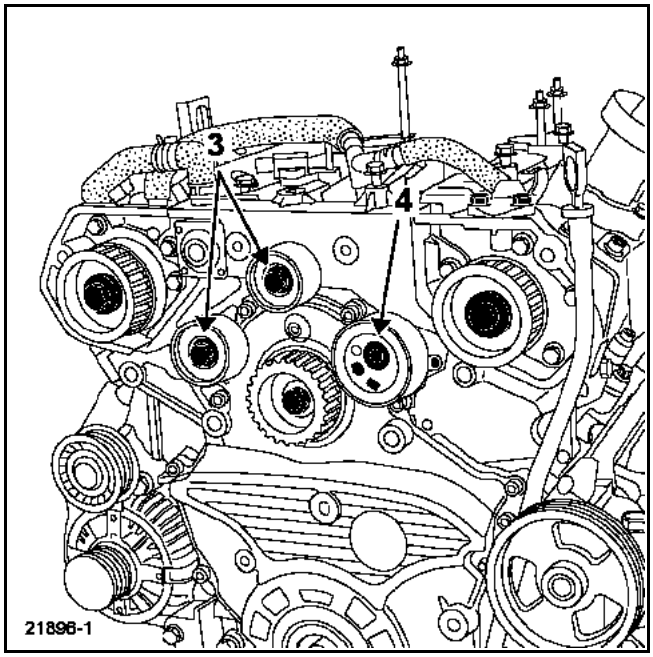


GETtheMANUALS.org

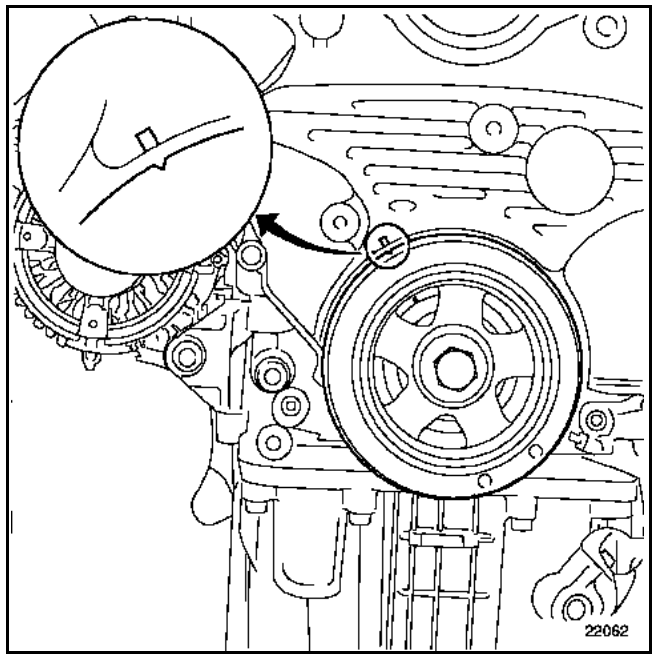
Remove:
– the accessories belt (see **Section 07A Accessories belt tension**),
– the pulleys (1),
– the tensioning device (2),



– the timing belt (see **Section 11A Timing belt**),
– the pulleys (3),
– the tension wheel (4).

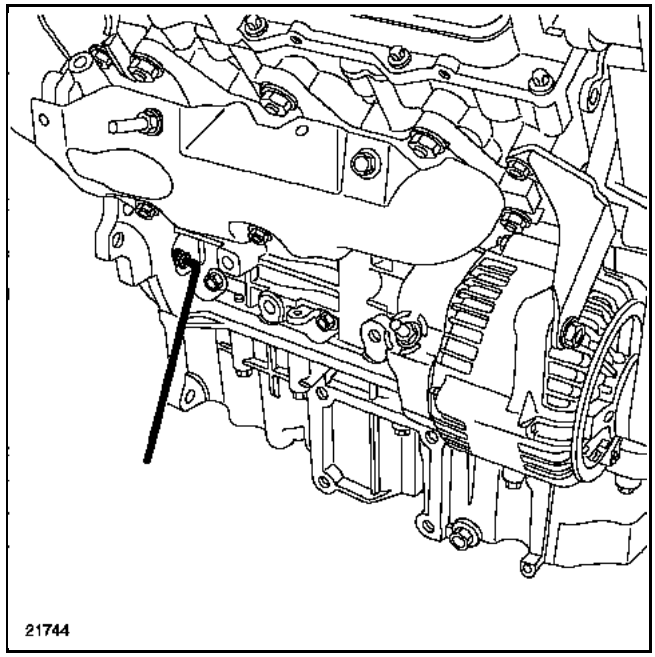


Ensure that the static and moving marks for the crankshaft accessories pulley are aligned.



Rotate the crankshaft slowly in an anti-clockwise direction to bring the engine to its locking point (access hole to the converter bolts).

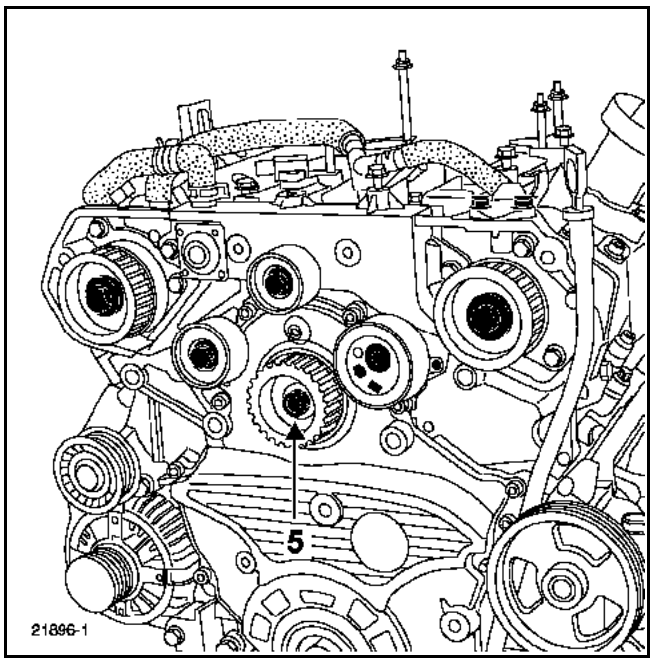
Lock the engine against rotation by inserting **Mot. 1376** in the access hole to the converter bolts.



GETtheMANUALS.org

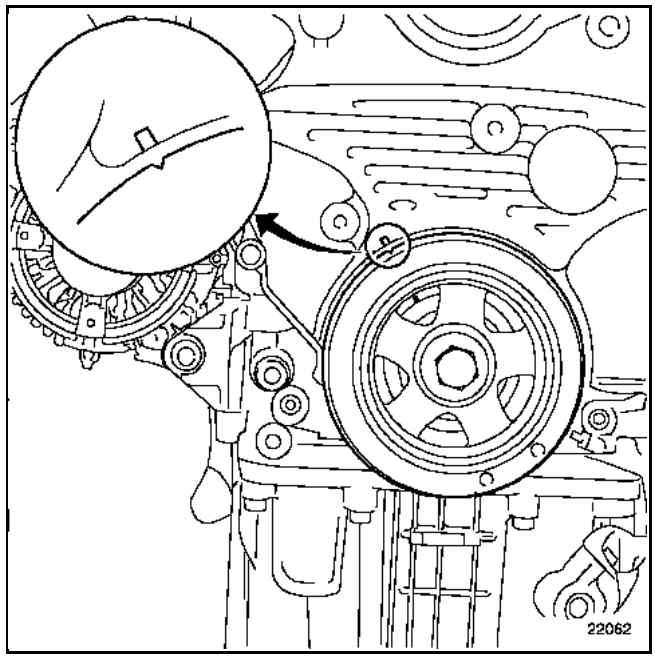
Undo:
– the crankshaft accessories pulley mounting bolt,
– high pressure pump gear mounting bolt (5).

Remove:
– the high pressure pump gear,
– engine locking tool **Mot. 1376**.



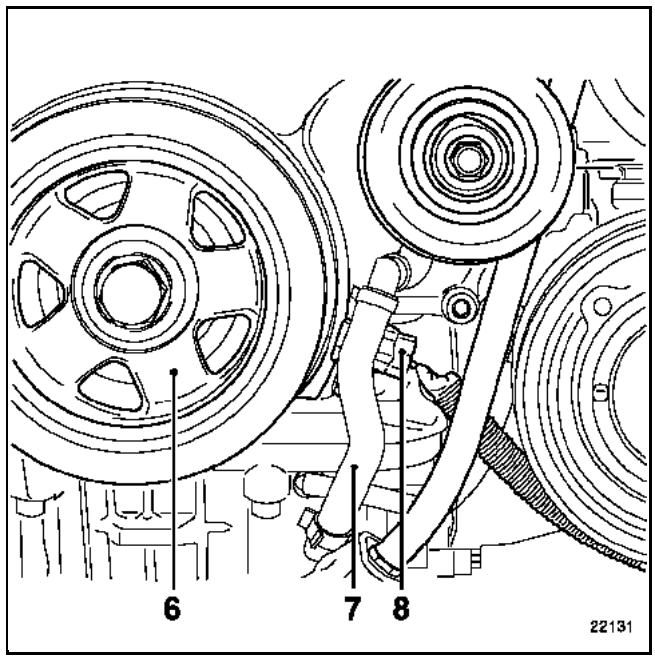
Rotate the engine to bring it to Top Dead Centre again.

Ensure that the static and moving marks for the crankshaft accessories pulley are aligned.



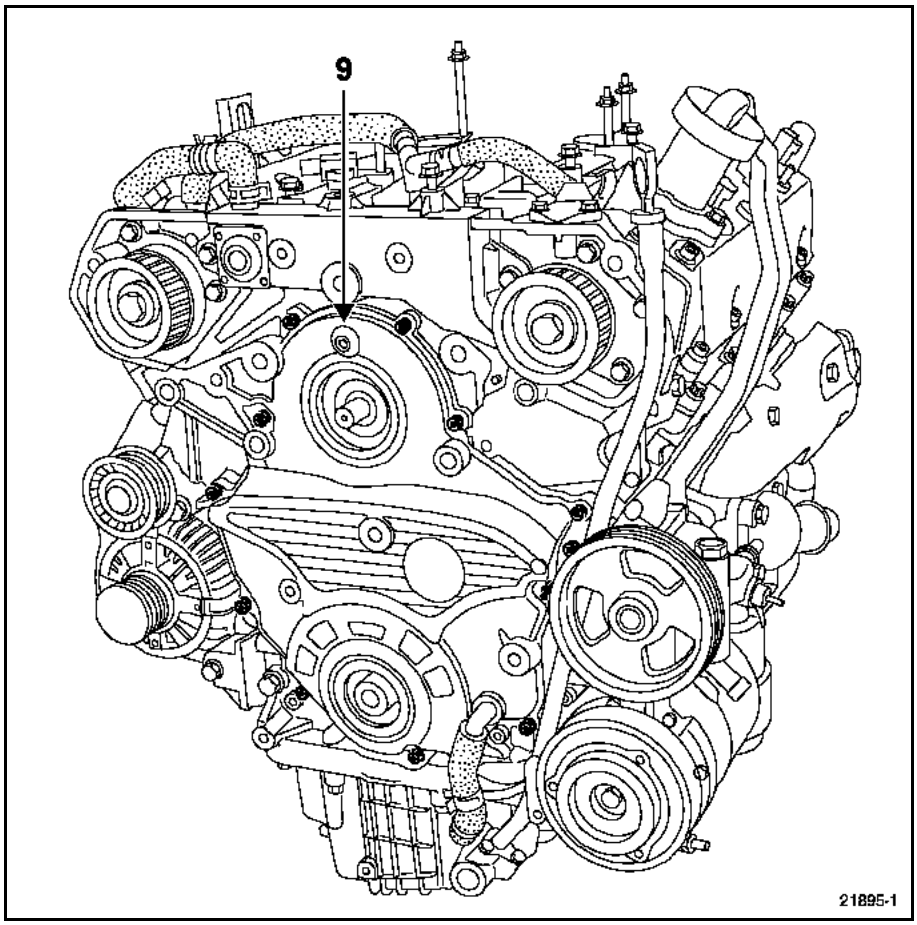
Remove:
– the crankshaft pulley at (6),
– the oil vapour recirculation pipe at (7),
– the crankshaft position sensor at (8),
– the crankshaft position sensor.

Plug the oil vapour recirculation pipe.



GETtheMANUALS.org

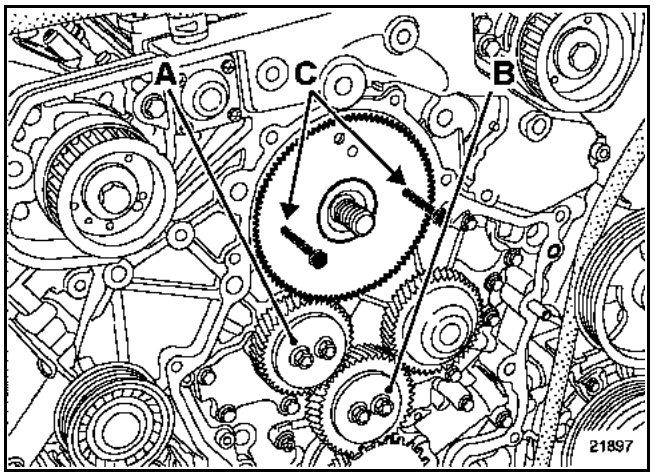
Remove:
– the gear train housing mountings,
– the plug at (9),



– the gear train housing.

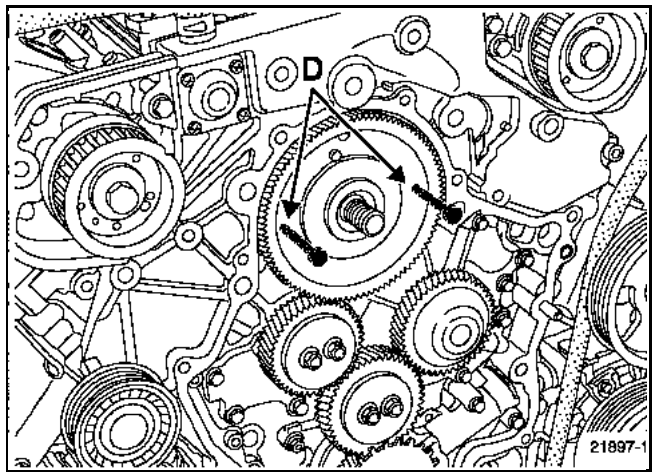
GETtheMANUALS.org

Remove:
– the Top Dead Centre target in front of the oil pump gear,
– timing gears (A) and (B),
– the play compensation sprocket by tightening two **M6x100x50** bolts at (C) to extract it.

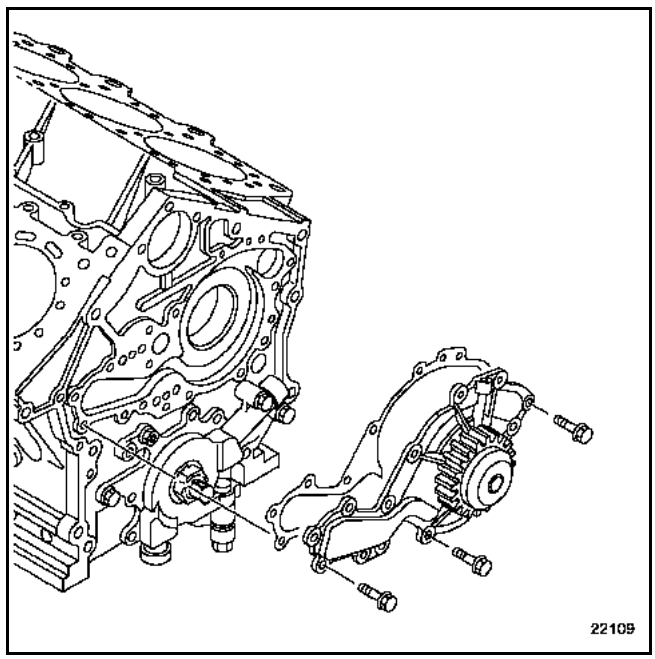


Recover the play compensation spring.

Remove:
– the injection pump pulley, by tightening two **M6x100x50** bolts (D) to force it from the pump shaft,



– the coolant pump.



GETtheMANUALS.org

CLEANING

It is very important not to scratch the mating surfaces of any aluminium components.

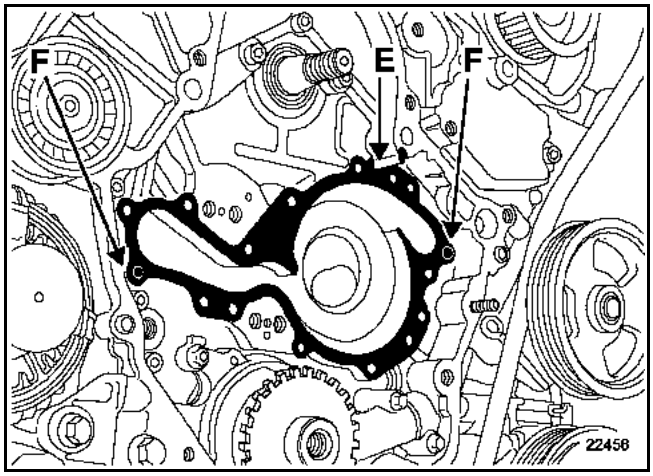
Use **Décapjoint** to dissolve any part of the seal which remains stuck to the gear train housing.

Apply the product to the part to be cleaned, wait approximately 10 minutes, then remove the product using a wooden spatula.

REFITTING

TAKE CARE when fitting the seal, it is very important to position it correctly under rib (E) and on centring pins (F).

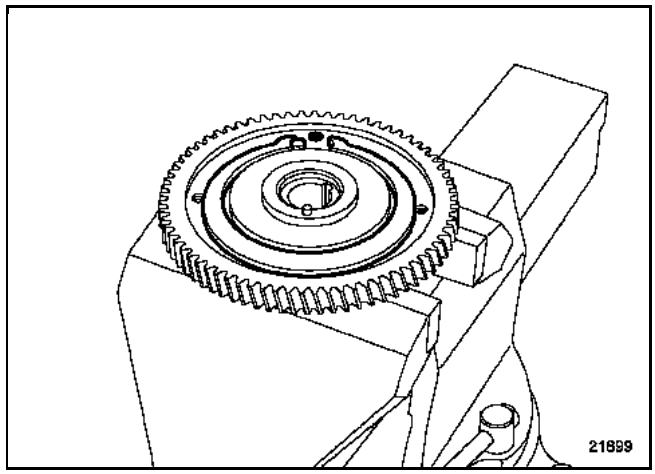
Refit:
– the coolant pump seal,



– the coolant pump by tightening the bolts to a torque of **1.1 daNm**.

METHOD FOR ADJUSTING PLAY COMPENSATION ON THE INJECTION PUMP PULLEY

In a vice:
– Fit the spring into the injection pump pulley.



GETtheMANUALS.org

Tighten two bolts (**M6x100x50**) at (G) in the play compensation sprocket.

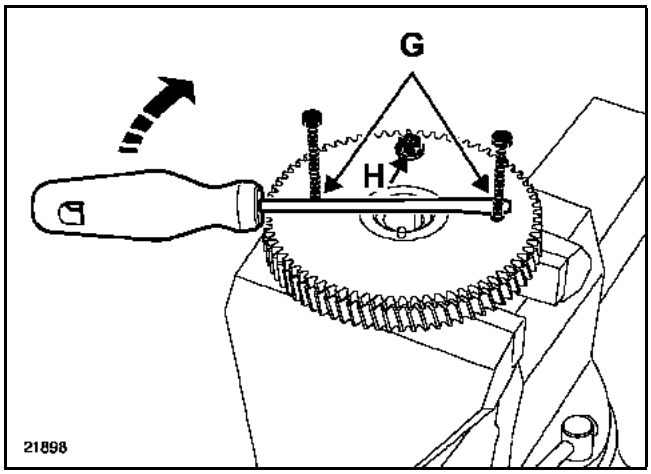
Fit the play compensation sprocket onto the injection pump pulley.

Rotate the play compensation sprocket using a screwdriver to align it with the injection pump pulley.

Screw one **M6x100x15** screw into (H) to join the assembly when the holes are in alignment.

NOTE: the retaining bolt in may be of local fabrication (a slot in the bolt head can be used to remove it).

Remove the two bolts used to position the screwdriver.

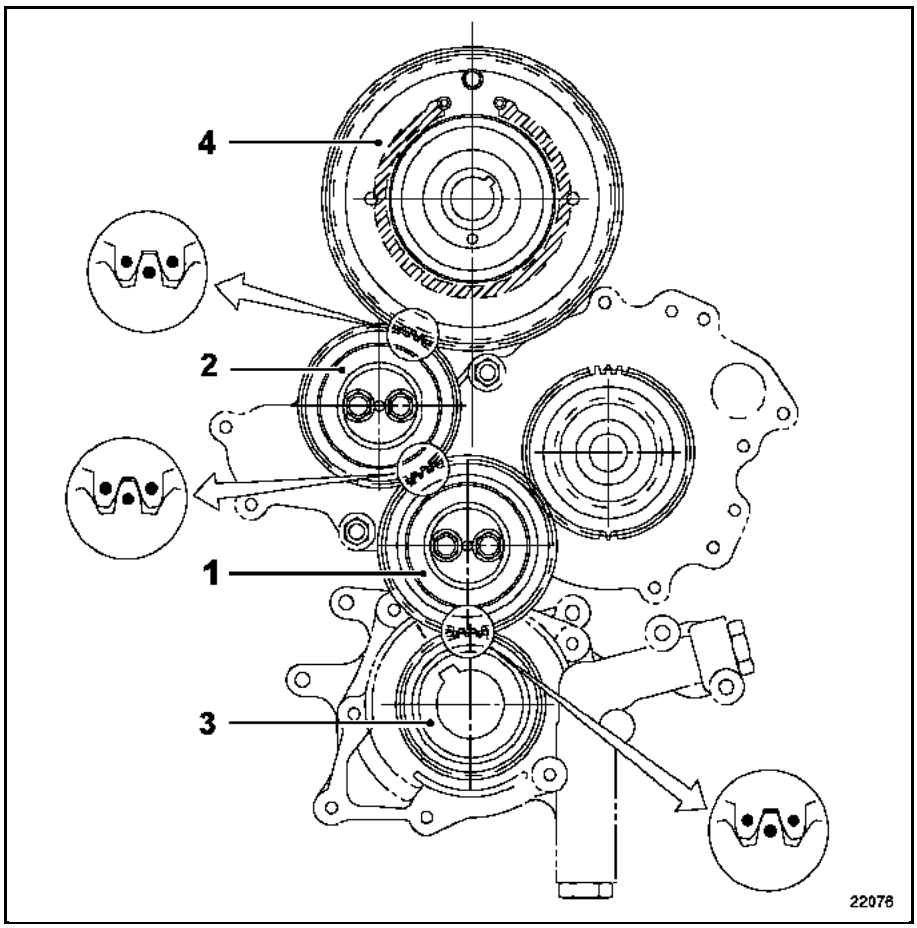


Refit the two aligned pulleys to the engine.

GETtheMANUALS.org

METHOD FOR GEAR TRAIN TIMING

Refit the two intermediate gears (1) and (2), aligning their reference marks with those on the gears of the oil pump (3) and the injection pump (4).

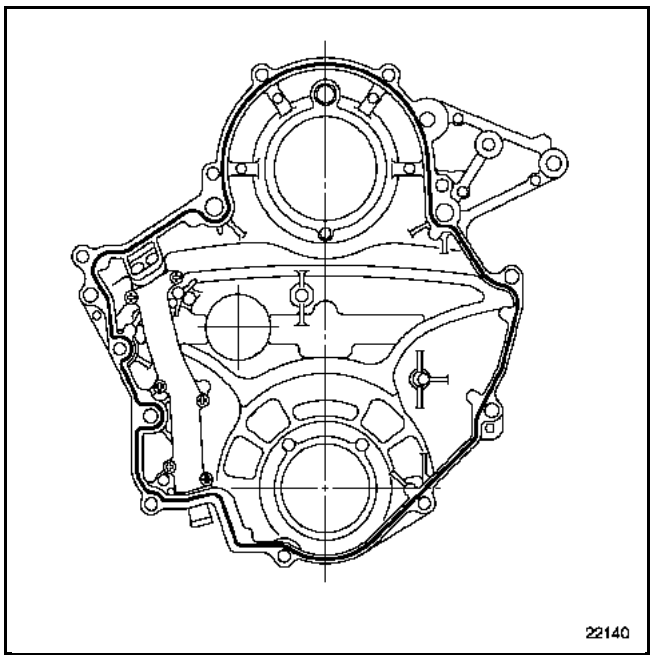


Tighten the two intermediate gear bolts to a torque of **3.5 daNm**.

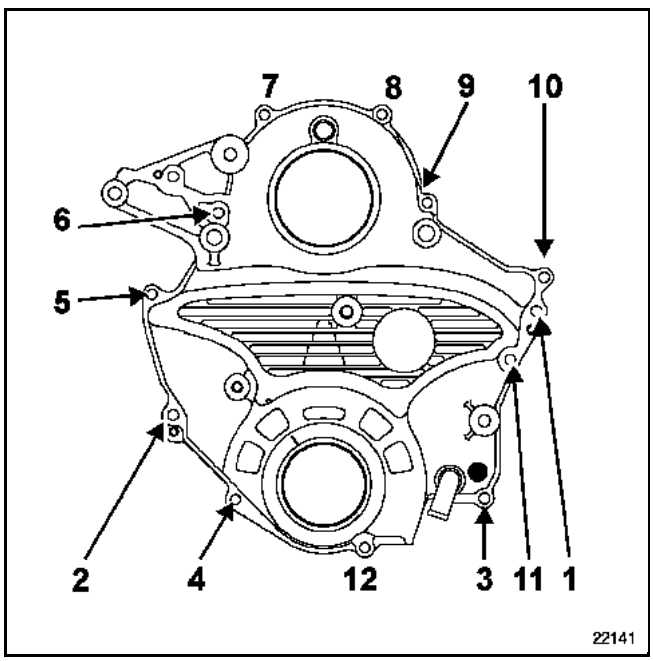
Refit the Top Dead Centre target in front of the oil pump gear with the marking facing outwards.

GETtheMANUALS.org

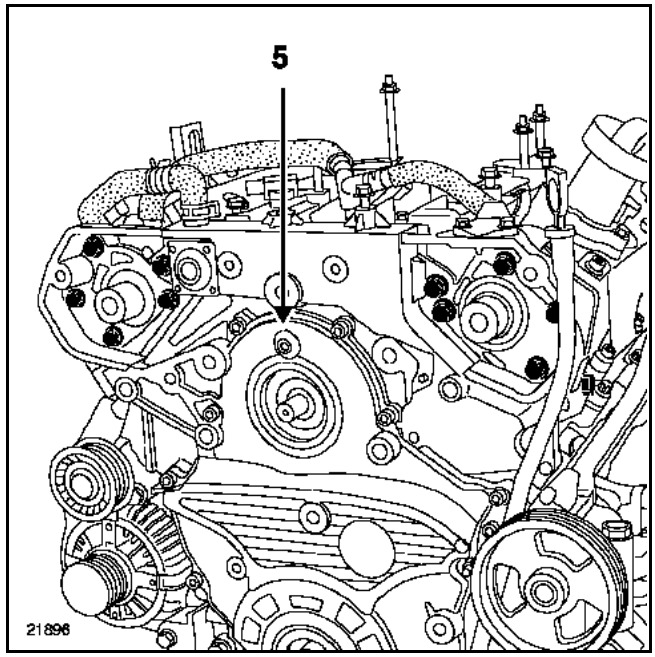
Refit the gear train housing by applying a **3 mm** diameter bead of **THREEBOND** as in the diagram below having first:
– cleaned and degreased the sealing surfaces,
– removed the crankshaft accessories pulley seals and the high pressure pump gear seals from the gear train housing.



Tighten the housing bolts to a torque of **2.5 daNm** in the order recommended below.

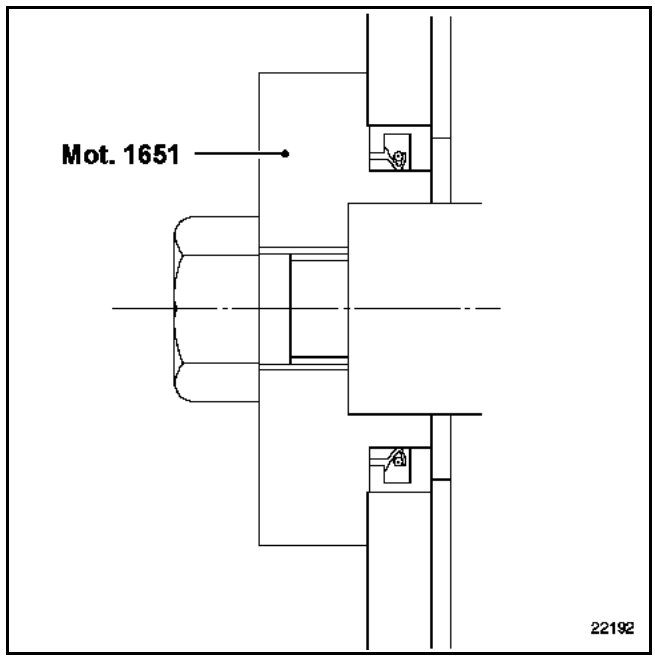


Remove the manufacturer's bolts through opening (5).



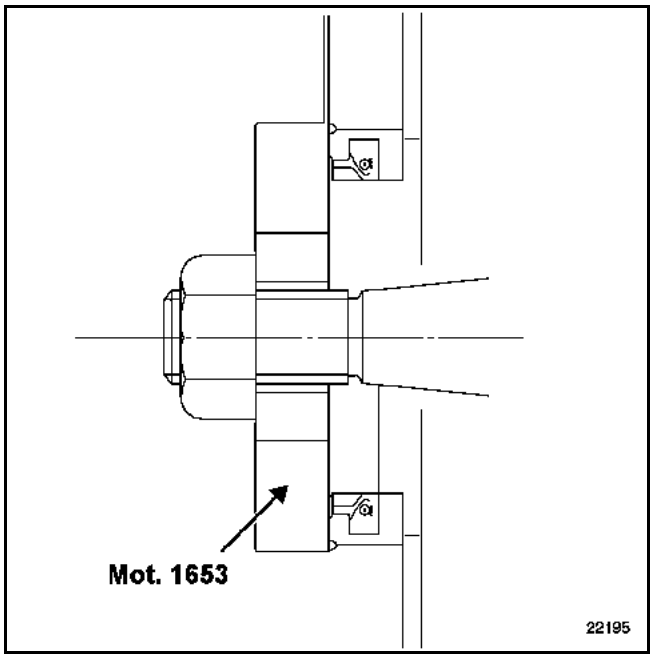
Refit the plug.

Fit the new seal:
– for the crankshaft accessories pulley using tool **Mot. 1651**,



GETtheMANUALS.org

– for the high pressure pump gear using tool **Mot. 1653**.



Fit the crankshaft accessories pulley, align the mounting bolt.

Ensure that the static and moving crankshaft accessories pulley marks and the high pressure pump gear marks are aligned.

Rotate the crankshaft slowly in an anti-clockwise direction to bring the engine to its locking point.

Fit tool **Mot. 1376**.

Refit:
– the injection pump pulley gear, tightening it to a torque of **16 daNm**,
– the crankshaft pulley, tightening it to a torque of **23.5 daNm**.

Remove tool **Mot. 1376**.

Rotate the engine to bring it to Top Dead Centre again.

Ensure that the static and moving marks:
– for the crankshaft accessories pulley,
– of the injection pump gear,
are aligned.

Refit:
– the timing belt tensioner wheels,
– the timing belt tension wheel,
– the timing belt (see **Section 11A Timing belt**),
– the accessories belt tensioning device,
– the accessories belt tensioner wheels,
– the accessories belt (see **Section 07A Accessories belt tension**),
– the suspended engine mounting(see **Section 19A Suspended engine mounting**).

Fit the front right driveshaft (see **Section 29A Transmission**).

Drain the oil from the engine.

NOTE: it is important to ensure that there is no longer any coolant in the sump before filling with oil.

Perform the following operations:
– fill and bleed the cooling system (see Section **19A Filling - bleeding**).
– top up the engine oil.

Continue the refitting procedure in the reverse order to removal.

GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Mot. 1202-01 Mot. 1202-02	Hose clip pliers
Mot. 1448	Remote operation clip pliers for cooling system hose clips
Mot. 1372	Set for removing tamperproof screws
Mot. 1390	Adjustable engine support tool
T. Av. 476	Ball joint extractor tool
EQUIPMENT REQUIRED	
Torque wrench	

TIGHTENING TORQUES (in daNm)	
Water pump bolts	0.9
Coolant pump housing bolt	1.1
Chain tensioner housing bolt	1.1
Chain tensioner bolt	0.8

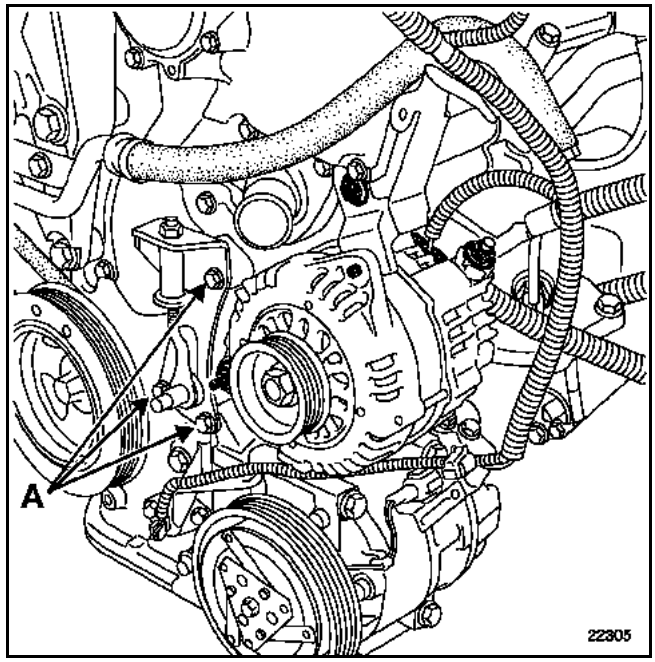
This operation involves removing the fan assembly.

REMOVAL

Put the vehicle on a two-post lift.

Disconnect the battery.

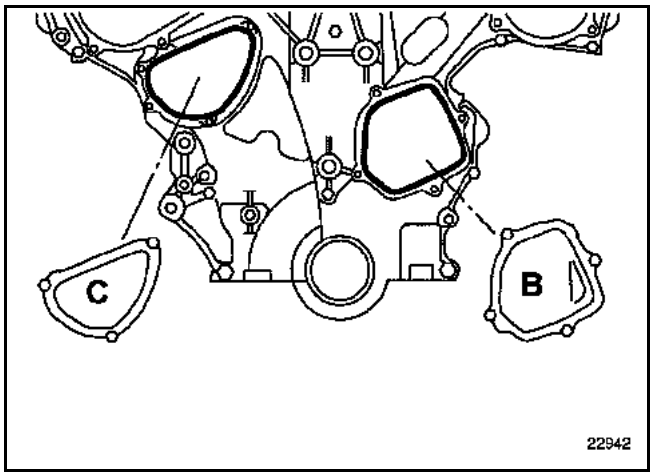
Remove:
- the engine (see **Section 10A Engine and gearbox**),
- the accessories belt (see **Section 07A Accessories belt tension**).
- the tension wheel and its mounting at (A),



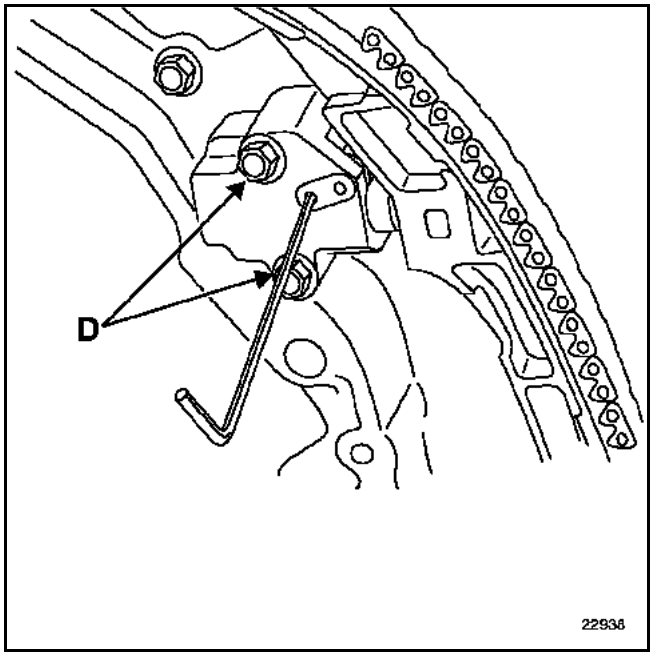
GETtheMANUALS.org

– Set the engine at Top Dead Centre.

Remove:
– the coolant pump housing at (B),
– the timing tensioner housing at (C),

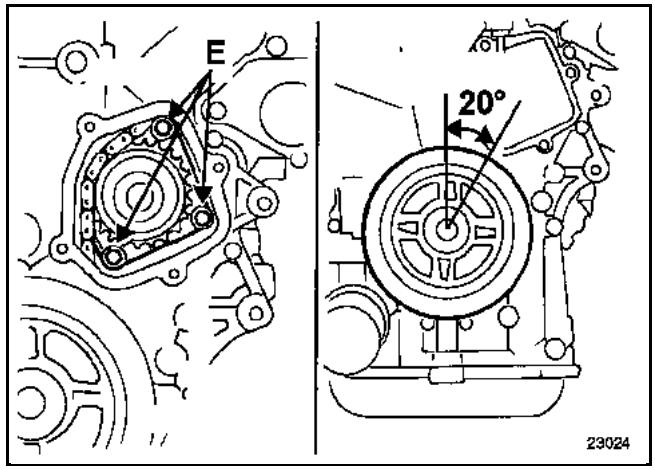


– the camshaft dephaser housings, then mark the position of the dephasers at Top Dead Centre,
– the chain tensioner at (D) (see **Section 11A Timing chain**),



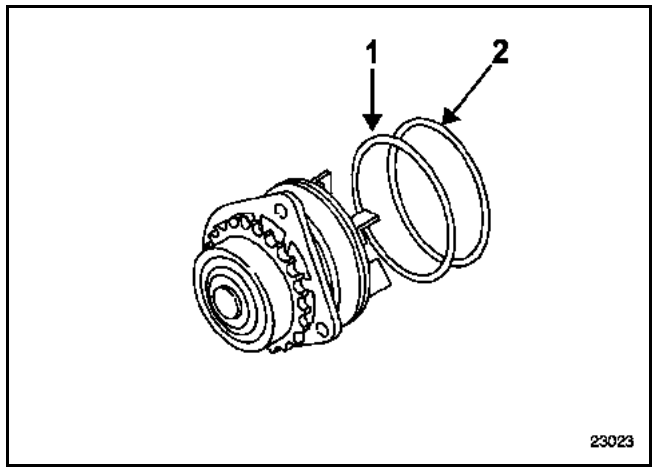
– the coolant pump mountings at (E),

Rotate the engine anti-clockwise approximately twenty degrees.



Remove the coolant pump.

NOTE: **before refitting the pump, apply engine oil to seal (1) and coolant to seal (2).**



GETtheMANUALS.org

REFITTING

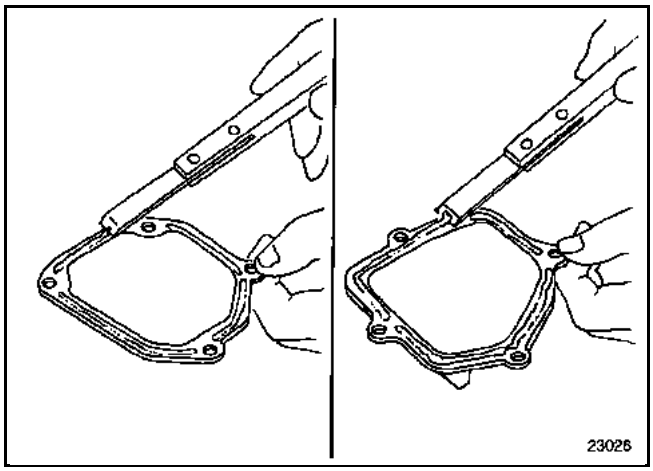
NOTE: take care not to damage the seals when refitting the pump.

Refit the coolant pump.

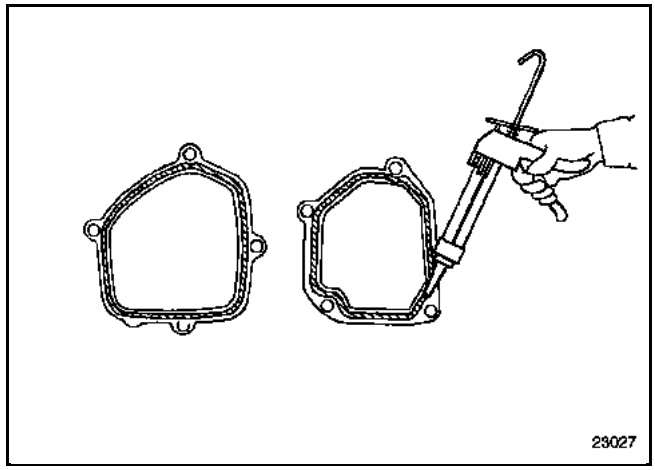
Reprime the timing chain tensioner with engine oil.

Refit the timing chain tensioner.

Clean the coolant pump cover and the timing chain tensioner cover using a scraper.



Apply a **3 mm** thick bead of **Loctite 518**.



Run the engine for **3 minutes** without exceeding **3000 rpm**, in order to bleed the chain tensioner lubrication circuit.

NOTE: pinking may occur during the operation.

Refitting is the reverse of removal.

Refit the engine (see the procedure described in Section **10A Engine and gearbox**).

Fill and bleed the cooling circuit (see Section **19A Filling and bleeding**).

GETtheMANUALS.org

The exhaust system is stainless steel throughout.

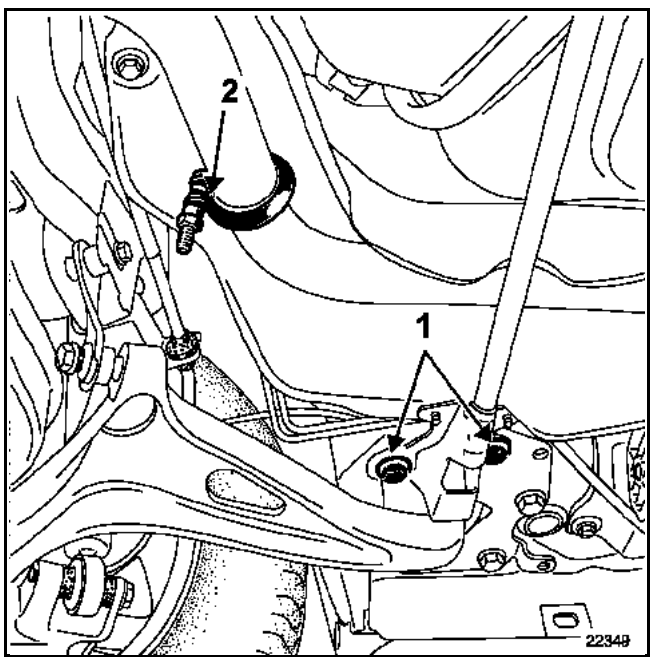
During operation, the catalytic converter reaches high temperatures, and consequently, it is vital not to park the vehicle in a place where combustible materials could come into contact with it and be ignited.

All damaged heat shields must be replaced.

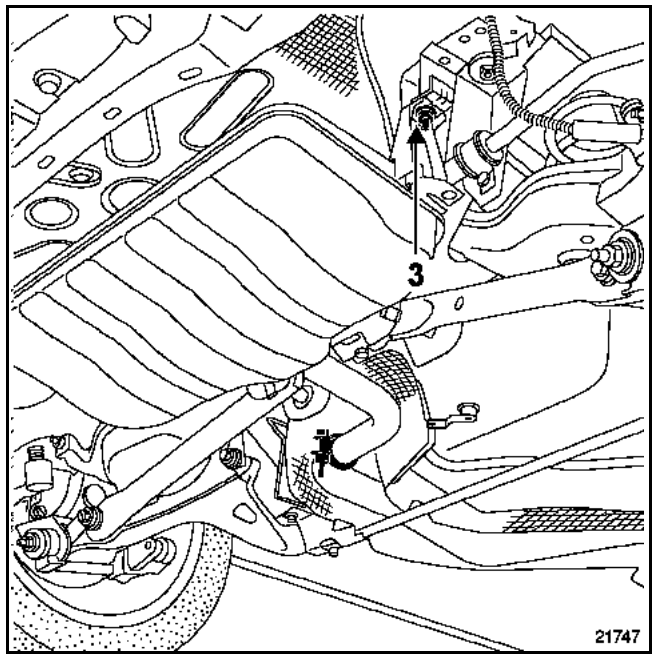
WARNING:
– the sealing between the exhaust manifold gasket face and the catalytic converter must be perfect.
– any gasket removed must be **REPLACED**,
– the catalytic converter must not be subjected to mechanical shock during removal or refirring, as this could damage it.

EXHAUST UNDERBODY MOUNTING

When removing the silencer, remove:
– acoustic damping bar (1),
– silencer - expansion chamber collar (2),



– the two mounting nuts (3) for the silencer silentbloc fittings.



When refitting the collars position them so that their tightening surface acts on both pipes equally.

Ensure that the collar bolt is torque tightened to: **2.5 daNm** to prevent the pipes from being deformed and the collars from leaking. Also ensure the correct torque tightening value of the acoustic damping bar (**6.2 daNm**).

REPLACING EXHAUST PIPE COMPONENTS

Removal of the various components is not particularly difficult.

There are one (or more) cut off points between the catalytic converter inlet and the silencer outlet.

No cutting zone is therefore required to replace the various components.

GETtheMANUALS.org

TIGHTENING TORQUES (in daNm)	
Three-point bracket nuts	2.1
Nuts securing catalytic converter to the turbocharger	3.2
Engine tie-bar	
sub-frame side	10.5
engine side	18
Turbocharger heat shield air duct	0.8
Three-point bracket brace	2.1
Catalytic converter brackets	0.8

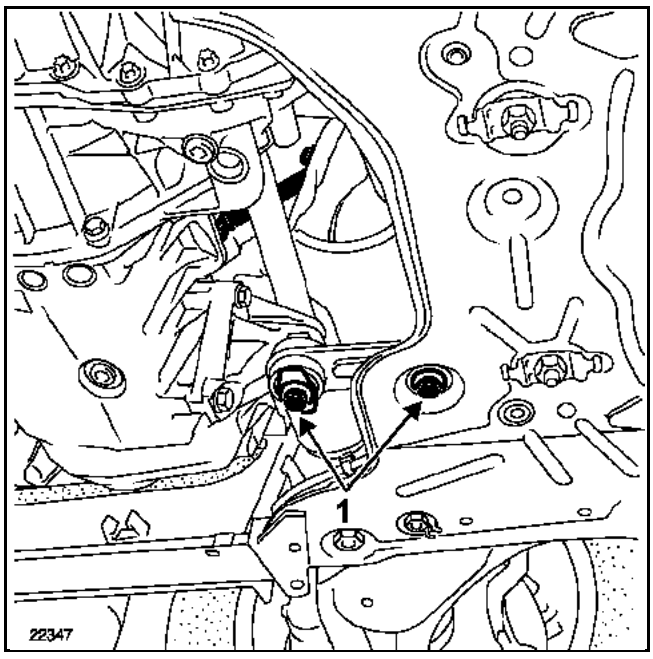
REMOVAL

Put the vehicle on a two-post lift.

Disconnect the battery.

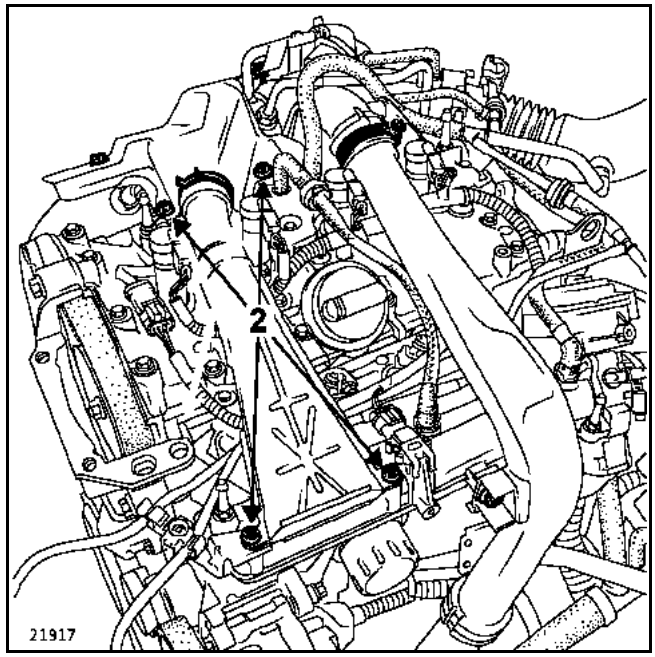
Removal of the catalytic converter requires the removal of the right-hand driveshaft (see **Section 29A Transmission: Driveshaft**).

Remove:
– the two engine tie-bar bolts (1),

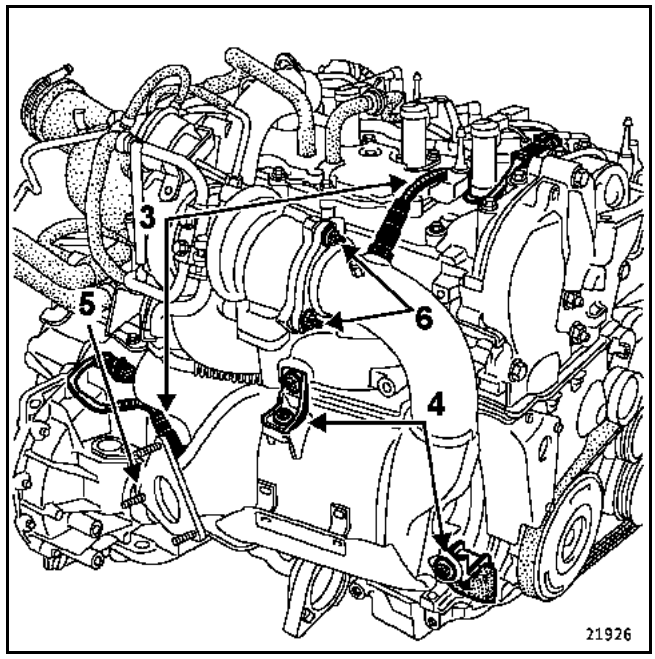


– the engine tie-bar mounting,
– the driveshaft bearing.

– the four turbocharger heat shield air duct bolts (2),

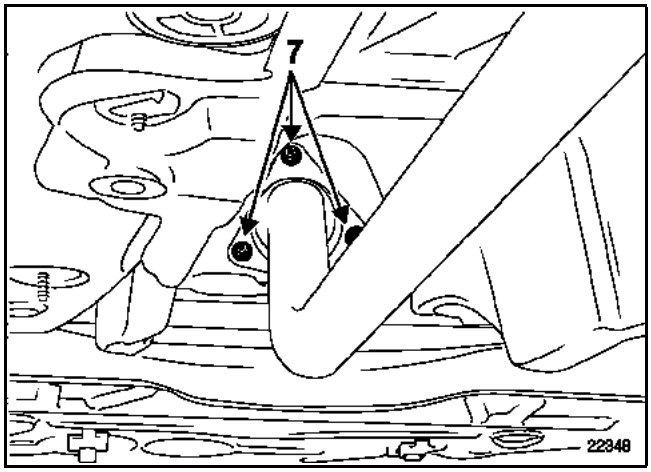


– the two oxygen sensors (3),
– the two catalytic converter brackets (4),
– the catalytic converter three-point bracket brace on the unit (5),
– the three nuts (6) securing the catalytic converter to the turbocharger.



GETtheMANUALS.org

Remove the three exhaust bracket mounting nuts (7).



Remove the catalytic converter.

REFITTING

Position the catalytic converter nuts on the turbocharger.

Torque-tighten in order:
– the catalytic converter brackets,
– the catalytic converter nuts on the turbocharger,
– the exhaust pipe bracket.

Proceed in the reverse order to removal.

Replace the exhaust and turbocharger bracket seals.

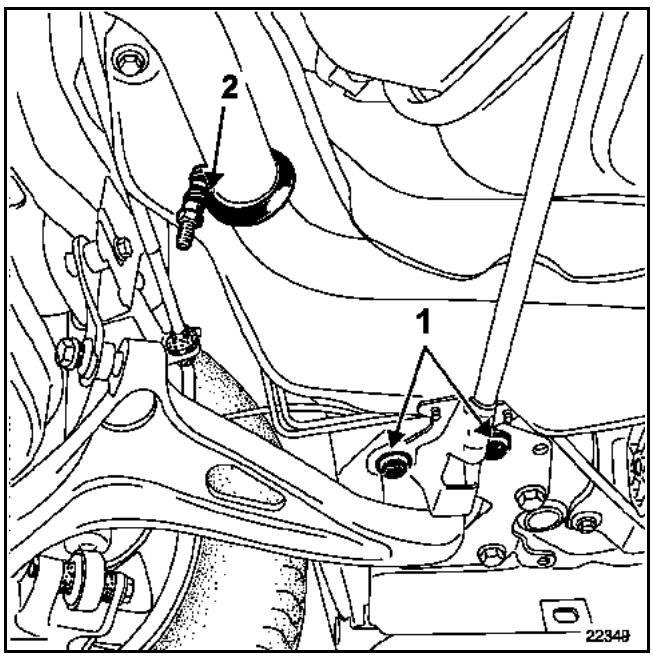
GETtheMANUALS.org

TIGHTENING TORQUES (in daNm)	
Nuts securing the catalytic converter to the expansion chamber	2.1
Nuts securing catalytic converter to the turbocharger	4.4
Pre-converter stay bolt	2.1
Engine tie-bar	
sub-frame side	10.5
engine side	18
Acoustic damping bar bolt	6.2

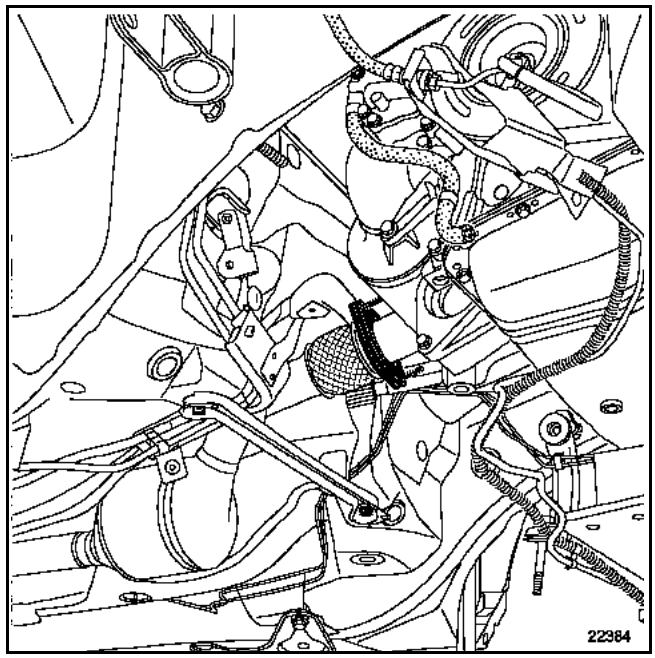
REMOVAL

Removal of the catalytic converter requires the removal of the right-hand driveshaft (see **Section 29A Transmission: Driveshaft**).

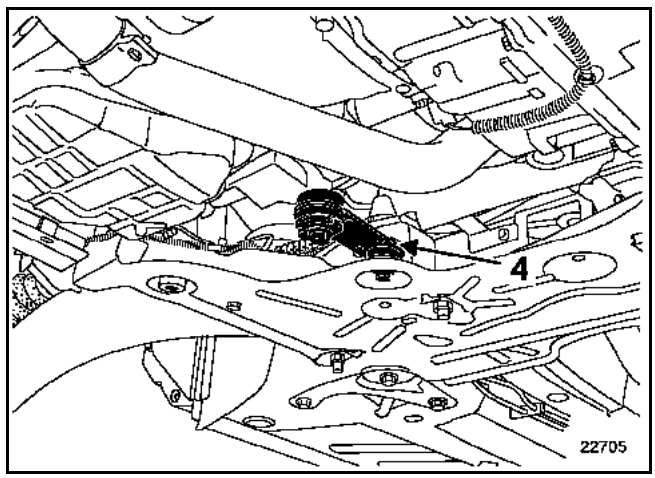
Remove:
– acoustic damping bar (1),
– exhaust pipe collar (2),



– the two-point flange (3) between the catalytic converter and expansion chamber.



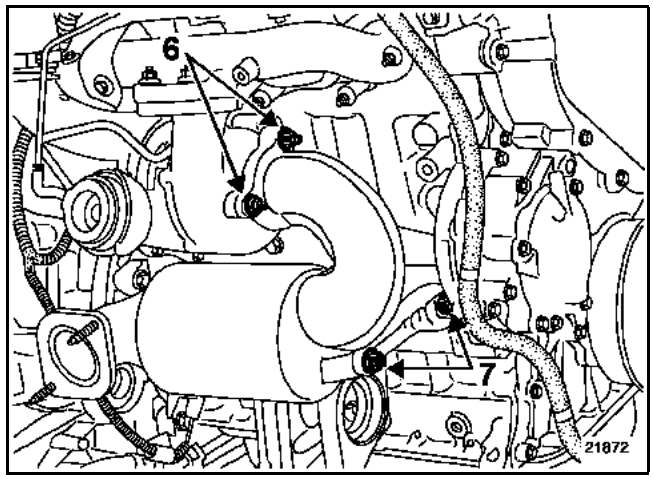
– the exhaust pipe,
– the engine tie-bar (4),



– the driveshaft bearing.

GETtheMANUALS.org

– the three nuts connecting the turbocharger to the catalytic converter (6),
– the two catalytic converter stays (7),



REFITTING

Proceed in the reverse order to removal.

Replace the seals with new ones.

Observe the tightening torques.

The other components involve no particular difficulties.

GETtheMANUALS.org

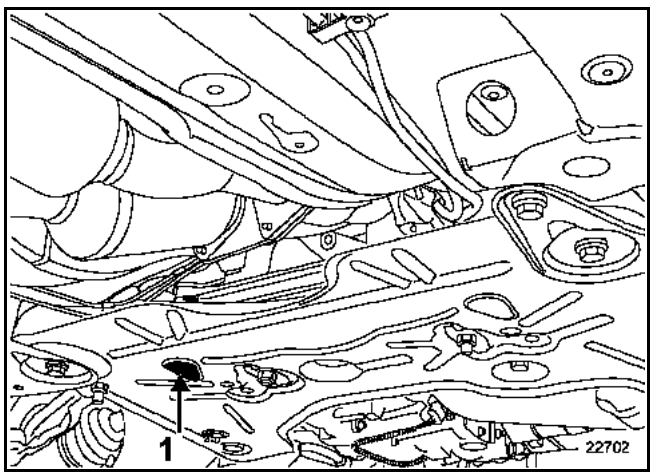
TIGHTENING TORQUES (in daNm)	
Catalytic converter/pre-converter flange bolts	2.1
Catalytic converter/expansion chamber collar	2.1
Heat shield mounting bolts	

REMOVAL

Put the vehicle on a two-post lift.

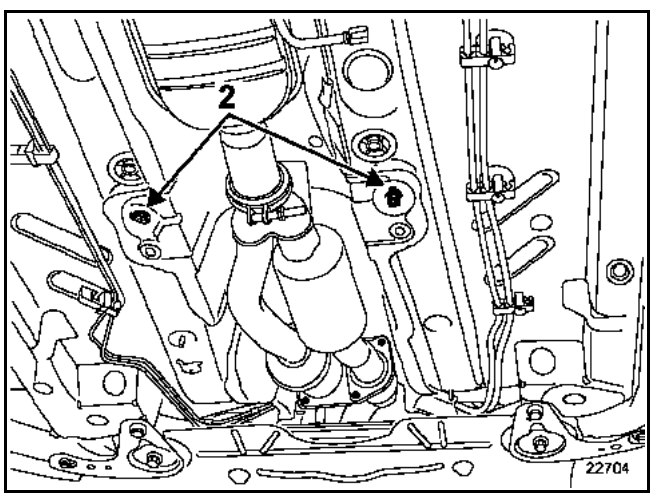
Disconnect the battery.

Remove:
– the under-engine fairing,
– the two heat shield mounting bolts using a spanner through the sub-frame (1),



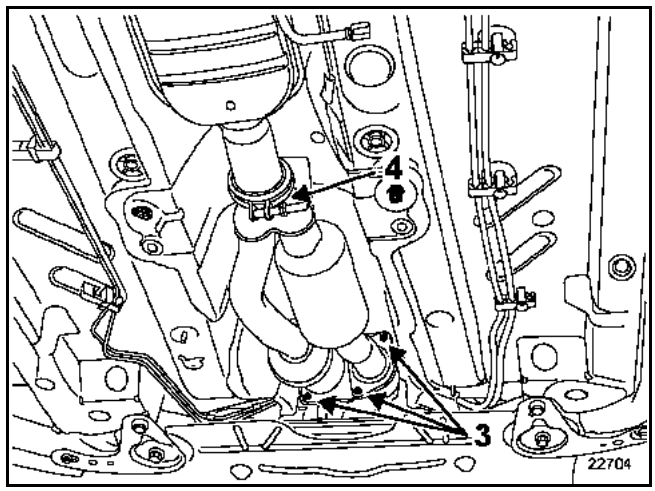
– the four heat shield retaining clips (2).

Withdraw the heat shield back.



Place a component jack under the exhaust pipe to support it and keep it in place.

Remove:
– the four catalytic converter/pre-converter bolts (3),
– the collar fixing the catalytic converter to the expansion chamber (4),



– the catalytic converter.

REFITTING

Proceed in the reverse order to removal.

Replace the gasket with a new gasket.

Fit a new collar.

Observe the tightening torques.

GETtheMANUALS.org

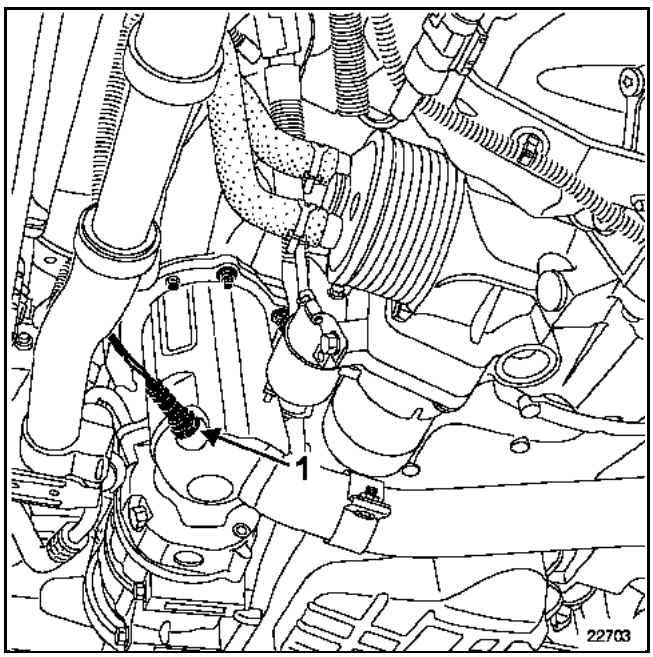
TIGHTENING TORQUES (in daNm)	
Catalytic pre-converter bolts	2.1
Oxygen sensors	4.4
Pre-converter stay bolts	2.1
Catalytic converter/pre-converter flange nuts	2.1

REMOVAL

Put the vehicle on a two-post lift.

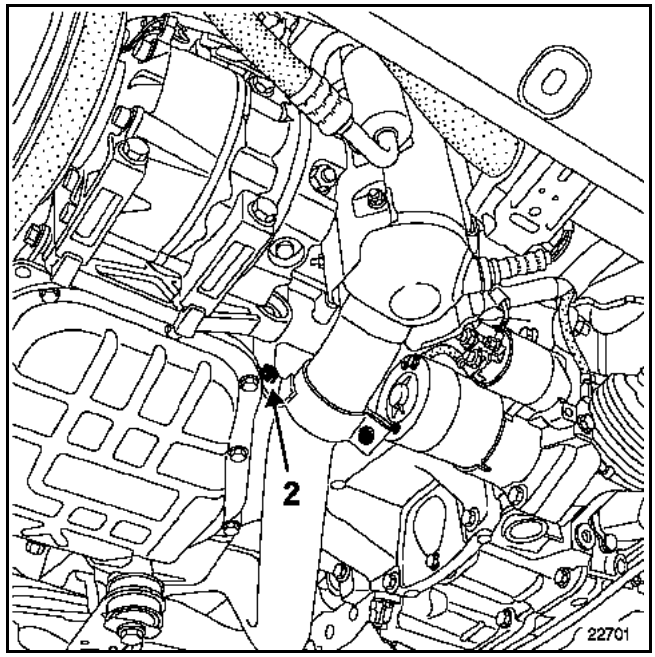
Disconnect the battery.

Remove:
– oxygen sensor (1),

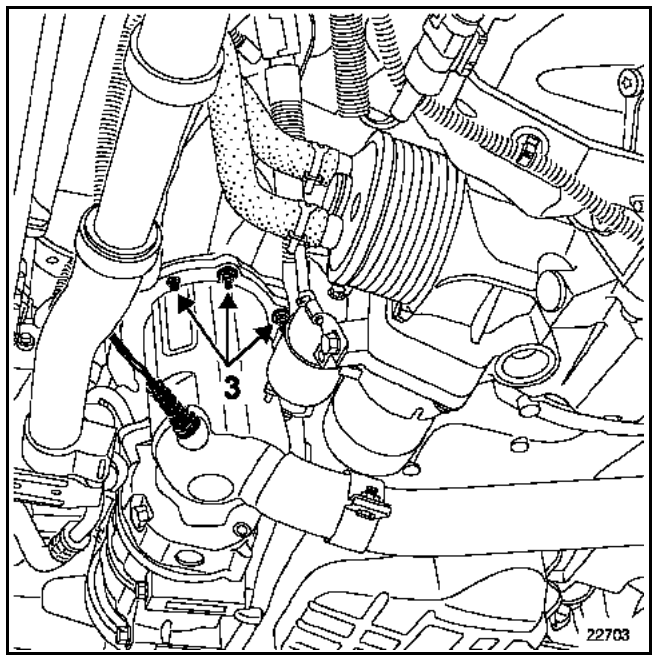


– the front exhaust manifold heat shield,

– front catalytic pre-converter mounting bracket (2),



– pre-converter mounting bolts (3).



REFITTING

Proceed in the reverse order to removal.

Replace the catalytic pre-converter/converter gasket with a new one.

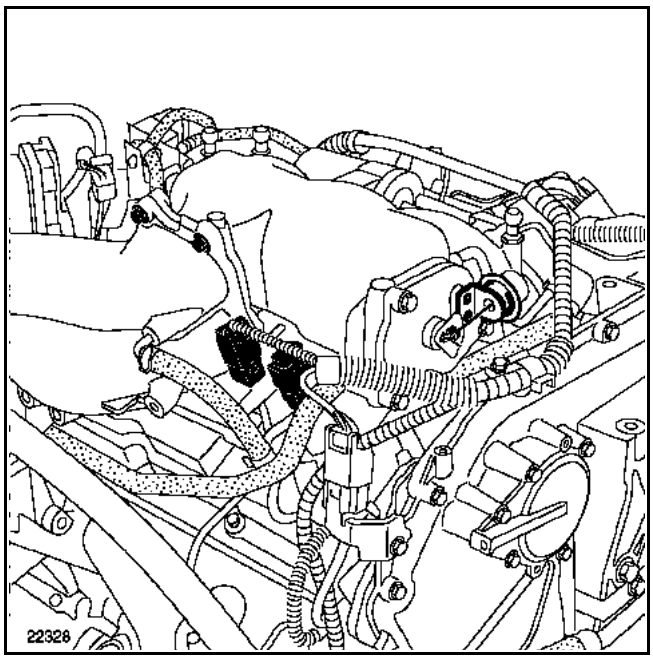
GETtheMANUALS.org

TIGHTENING TORQUES (in daNm)	
Oxygen sensors	4.4
Catalytic converter/pre-converter flange nut	2.1
Catalytic pre-converter bolts	2.1

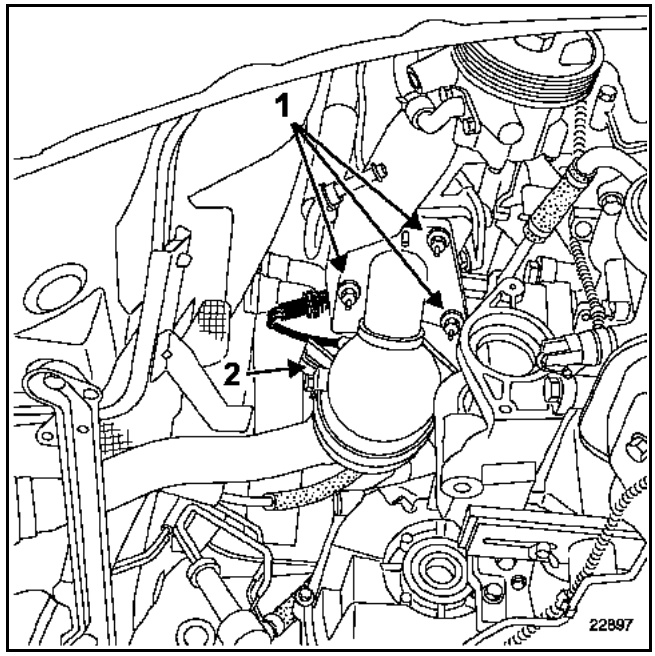
REMOVAL

Removal of the catalytic pre-converter requires the removal of the front catalytic pre-converter (see **Section 19 Exhaust: Front catalytic pre-converter**) and the right-hand driveshaft (see **Section 29A Transmission: Driveshaft**).

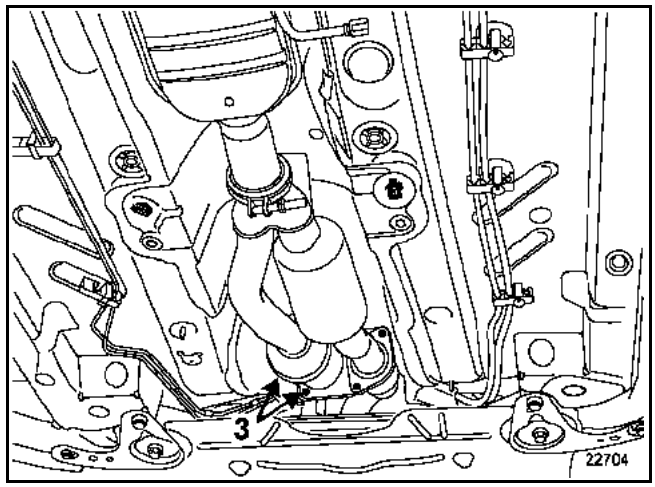
Disconnect the oxygen sensor.



Remove:
– the driveshaft bearing,
– the engine tie-bar mounting,
– catalytic pre-converter/converter bolts (1),
– catalytic converter bracket (2),



– the two catalytic pre-converter/converter nuts (3).



REFITTING

Refit:
– the catalytic converter/pre-converter flange nuts,
– rear exhaust manifold/catalytic pre-converter bolts.

Replace the gasket with a new gasket.

GETtheMANUALS.org

TIGHTENING TORQUES (in daNm)	▽
Shield mountings	2.1
Studs	0.7
Exhaust downpipe mounting nuts	2.1
Pre-converter stay mountings	2.1
Catalytic pre-converter bracket mountings	2.1

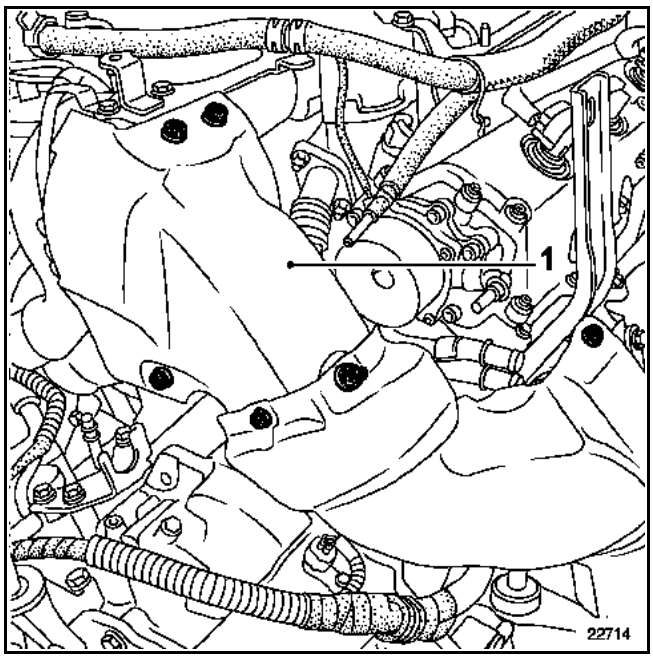
REMOVAL

Put the car on a two-post lift.

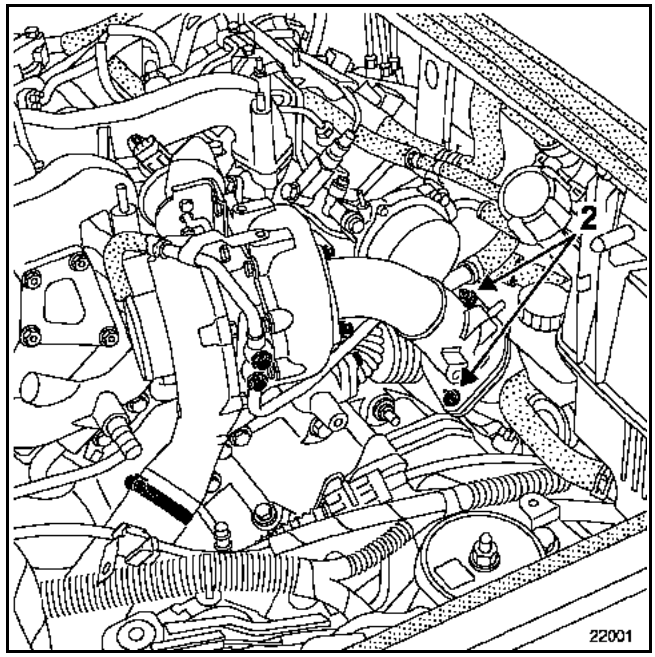
Remove the engine covers.

Disconnect the battery.

Remove:
– heat shields (1),

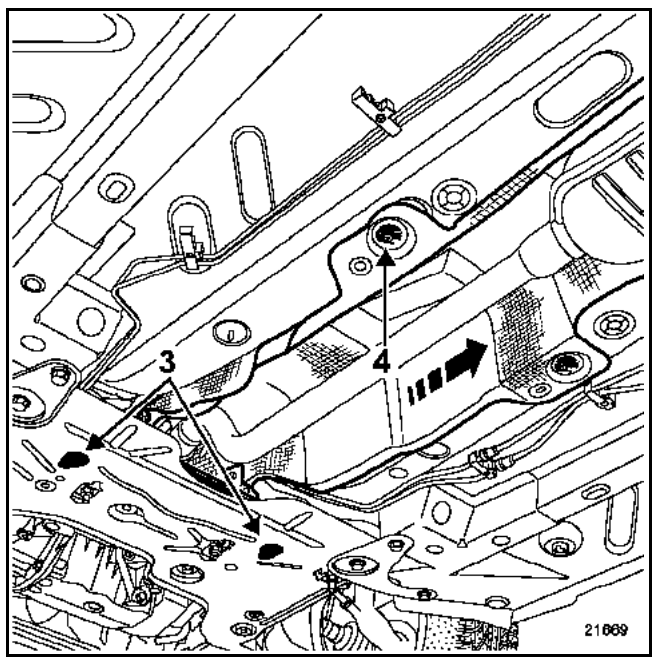


– exhaust downpipe mountings (2),



– the catalytic converter (see the operation concerned).

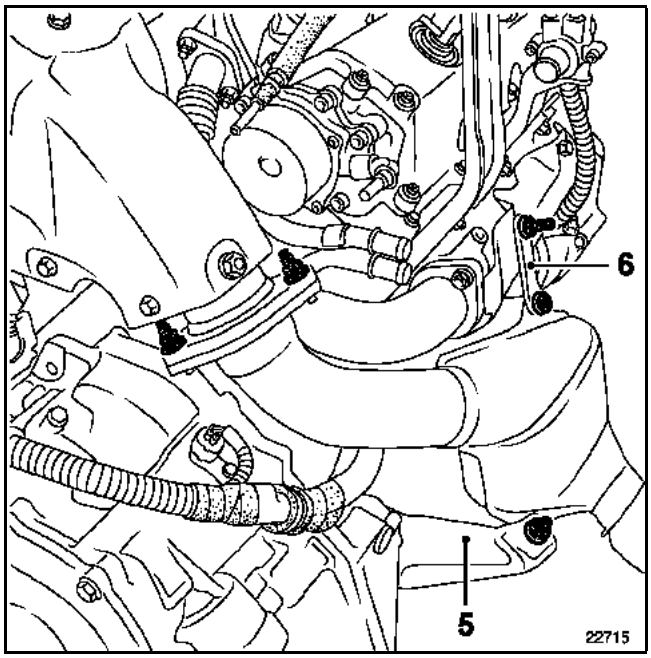
Release the heat shield backwards. To do this, remove:
– heat shield retaining plate mountings (3),
– the retaining plate,
– the four heat shield retaining clips (4).



GETtheMANUALS.org

Unclip the gearbox control cable on the heat shield.

Remove:
– the heat shield,
– the catalytic pre-converter stay (5) and plate (6),
– the pre-converter.



REFITTING

Refitting is the reverse of removal.

Replace the seals.

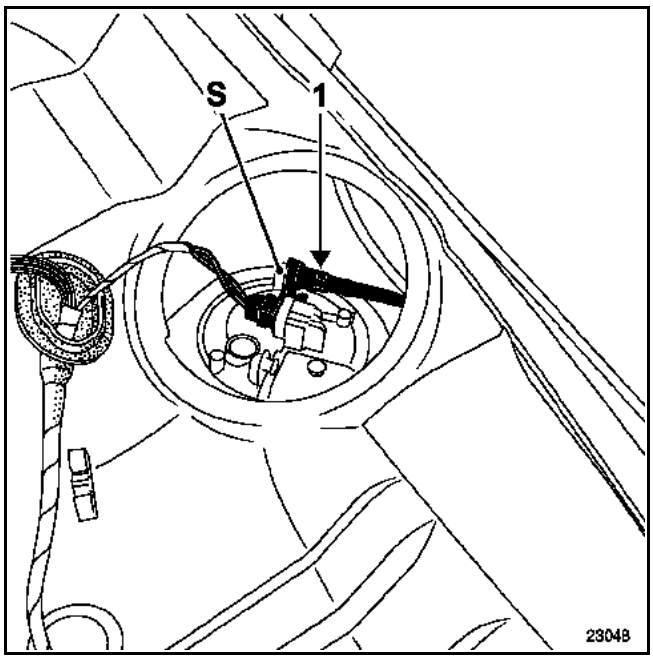
GETtheMANUALS.org

SPECIAL TOOLING REQUIRED
INTERCO pneumatic siphoning pump, for petrol or diesel tank draining system (see EQUIPMENT catalogue).

IMPORTANT:
During this operation, it is essential to:
– refrain from smoking or bringing incandescent objects close to the work area,
– use suitable protection against petrol splashes caused by the residual pressure in the pipes,
– protect sensitive areas from petrol.

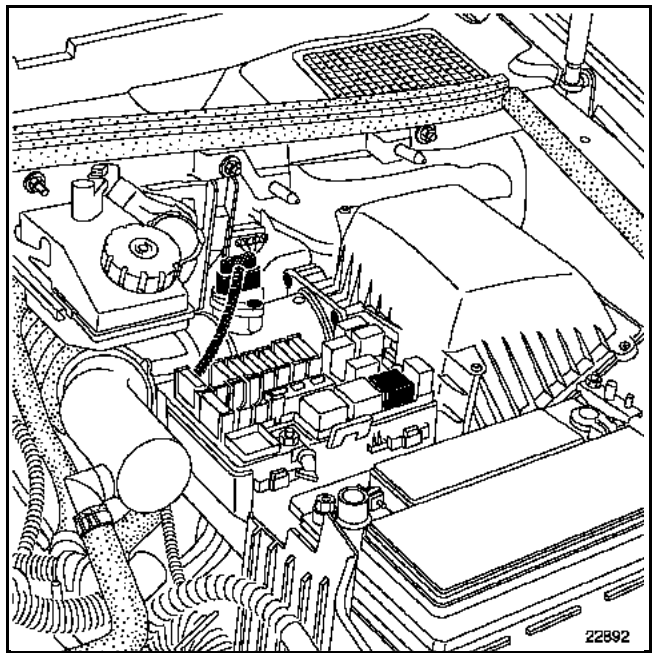
DRAINING THE FUEL TANK (petrol version)

Remove:
– the bench seat squab and the booster cushion (see remove/refit tank),
– the pump-sender unit assembly plastic access cover.



Disconnect the quick-release union (1), and fit to gauge outlet (S) a piece of tubing which is long enough to reach a container outside the vehicle.

In the engine compartment, disconnect the fuel pump relay located in the engine compartment connection unit (relay (A) for **FR4** engine, relay (B) for **V4Y**) engine.



Shunt tracks (3) and (5) and let the fuel flow until it runs out in intermittent jets.

Disconnect the shunt.

Reconnect the relay.

Disconnect the battery.

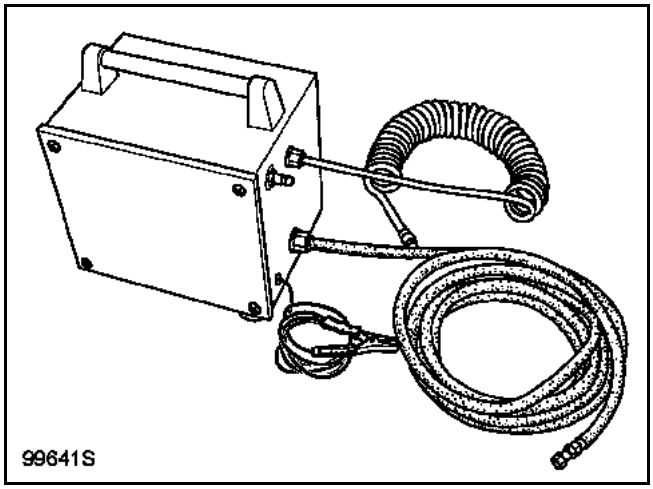
NOTE: it is also possible to use an **INTERCO** pneumatic decanting pump (see **EQUIPMENT** catalogue).

GETtheMANUALS.org

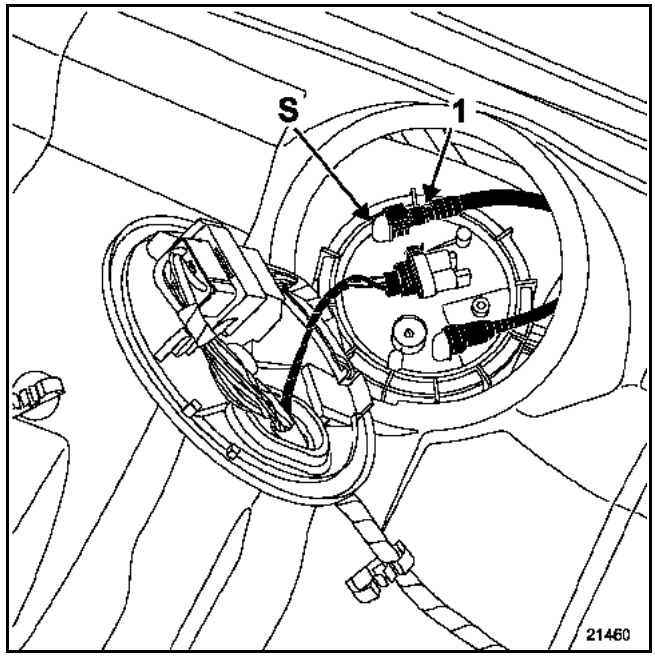
DRAINING THE FUEL TANK (diesel version)

Since certain diesel versions are not fitted with an electric fuel pump, a manual pump must be used to drain the tank.

For example, you can use the **INTERCO** pneumatic pump (see **EQUIPMENT** catalogue).



Remove:
– the bench seat squab and the booster cushion (see remove/refit tank),
– the sender plastic access cover.



Disconnect the quick-release union (1) and connect the rubber tubing of the pneumatic pump to outlet (S).

Drain the tank.

GETtheMANUALS.org

TIGHTENING TORQUES (in daNm)	
Seat squab securing nuts	**4.4**
Seatback mounting bolt and seat squab booster cushion	**4.4**
Heat shield mounting	**2.1**
Acoustic damping bar	**6.2**
Fuel tank mounting	**2.1**

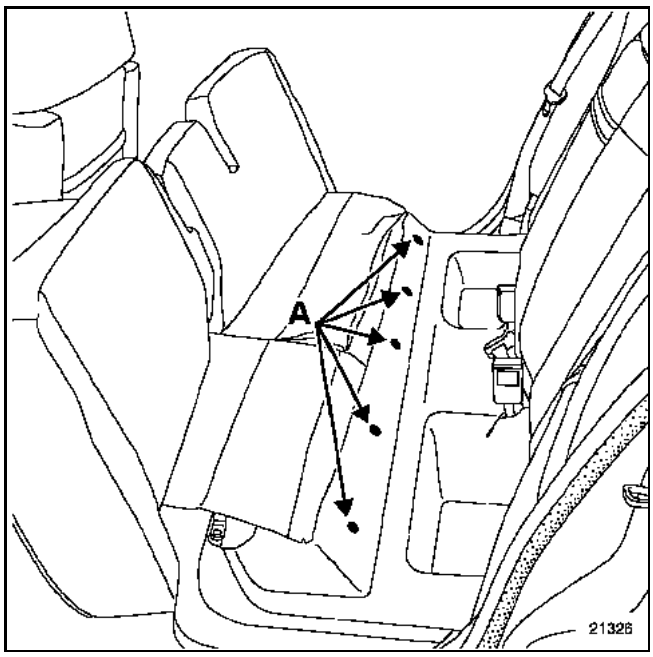
IMPORTANT:
During this operation, it is essential to:
– refrain from smoking or bringing incandescent objects close to the work area,
– use suitable protection against petrol splashes caused by the residual pressure in the pipes,
– protect sensitive areas from petrol.

NOTE: to access the sender located on the tank, it is necessary to remove the bench seat squab and the seat squab booster cushion.

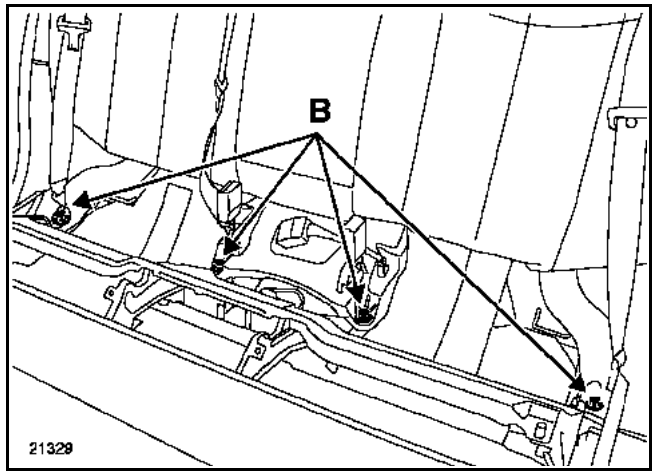
REMOVAL

Put the vehicle on a two-post lift.

Disconnect the battery.



Remove the seat squab of the rear bench seat. To do this, proceed as follows:
– tilt the two bench seat cushions.
– remove the clips (A), then remove the trim.



Remove the seatback and booster cushion mountings (B) to the body.

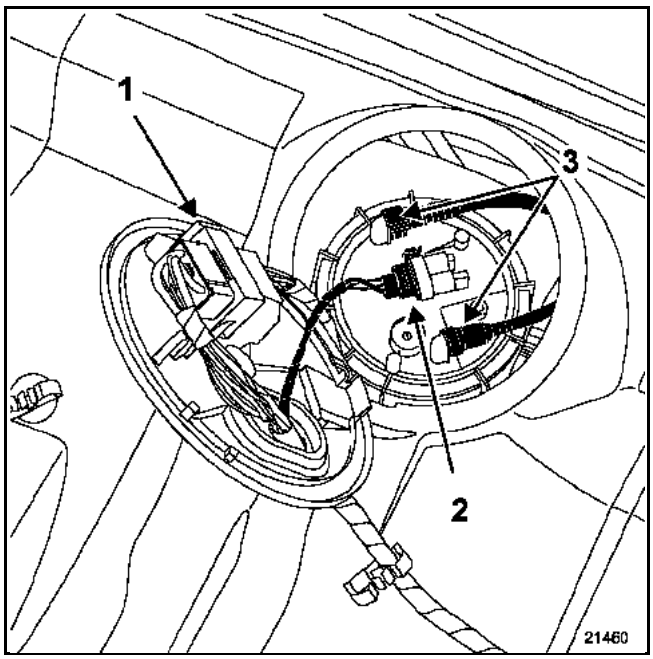
Release the tyre pressure monitor unit without disconnecting the connector (depending on equipment).

Release the seat squab booster cushion.

GETtheMANUALS.org

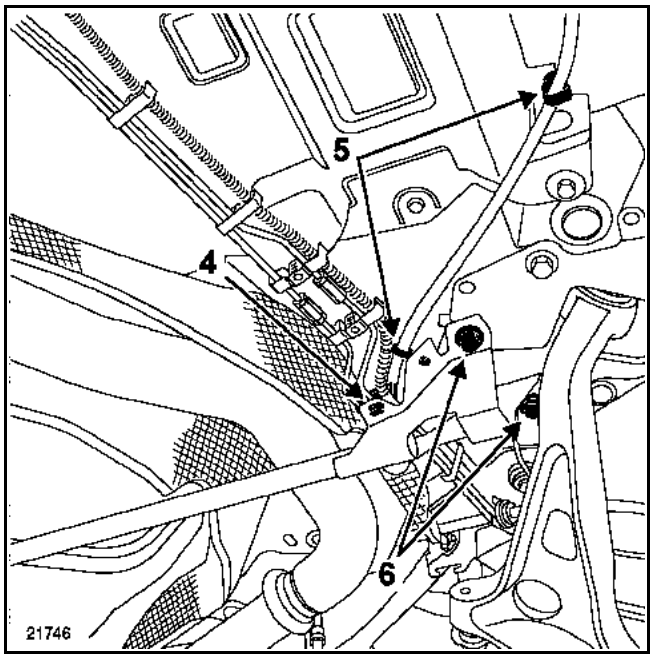
Remove the pump-sender assembly plastic access cover.

Disconnect:
– the electric parking brake electrical connector (1),
– the electric connector (2),
– the quick-release union(s) (3).



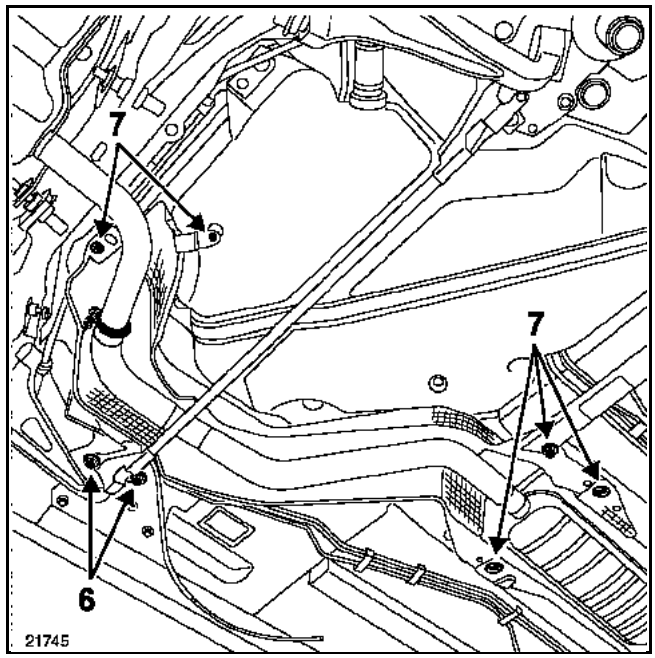
Raise the vehicle.

Remove the offside rear wheel.

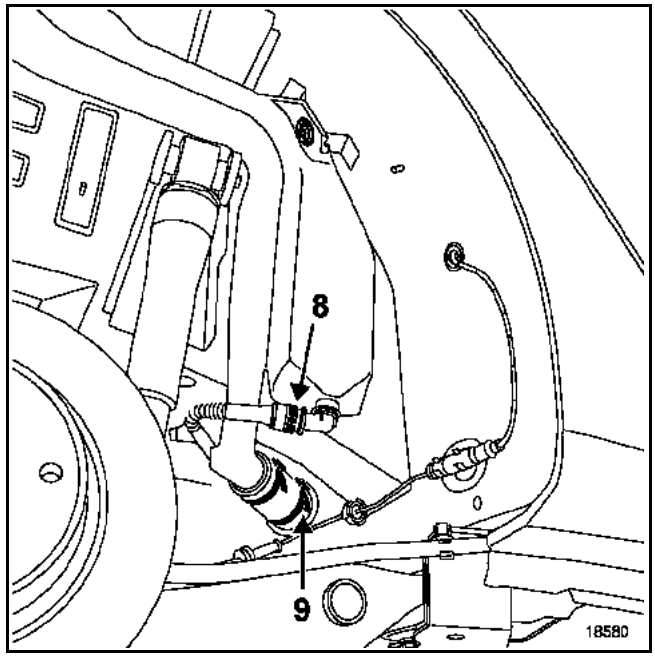


Release:
– the brake pipe clip (4),
– the parking brake cable clips (5).

Remove:
– the acoustic damping bar from the body (6),



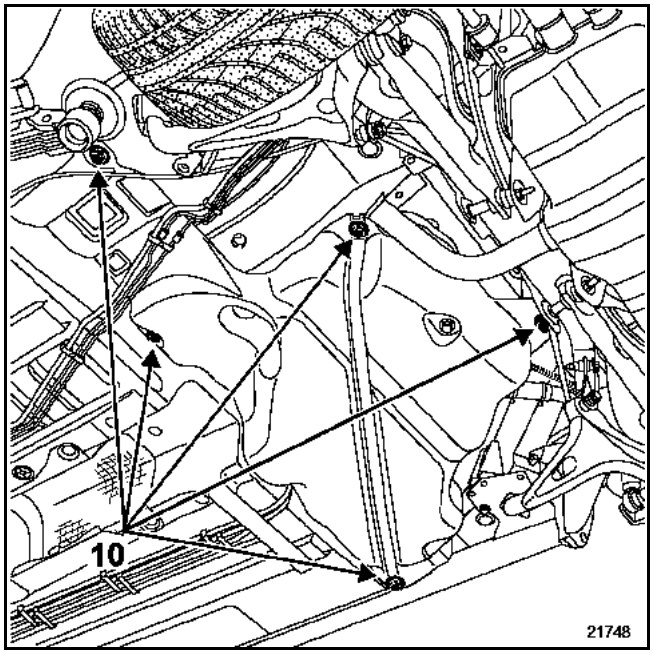
– the intermediate silencer (see operation concerned),
– the heat shield mountings, then remove the heat shield (7).



Disconnect the backflow preventer pipe (8).

Remove the filler neck clip (9).

GETtheMANUALS.org



Position the component support.

Remove the fuel tank mountings (10).

With the help of another person, remove the tank, tipping it onto its side.

IMPORTANT: take care not to pull out the brake pipes.

Release:
– the fuel tank electric wiring harness and its conduits,
– the fuel tank.

REFITTING

Proceed in the reverse order to removal, taking care to:
– Observe the tightening torques.
– Replace all the clamps.
– Avoid pinching the pipes.
– Fit the quick release unions by hand and ensure they are correctly latched.
– Refit the heat shield correctly.

GETtheMANUALS.org

SPECIAL TOOLING REQUIRED
Clip-removing pliers

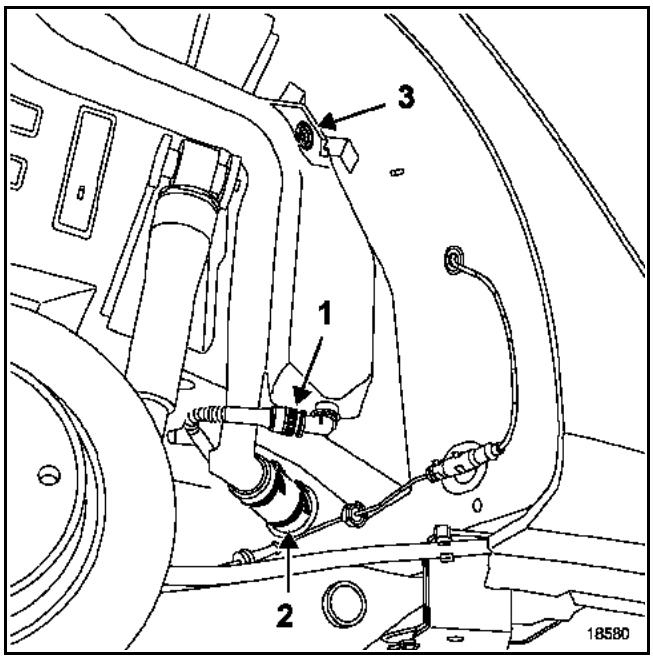
REMOVAL

Disconnect the battery.

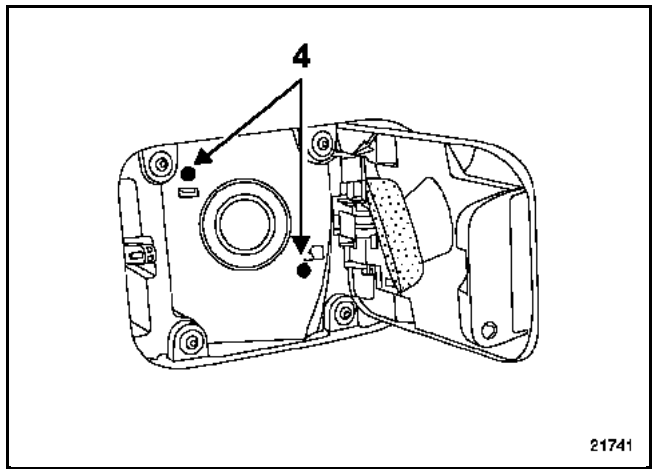
Remove:
– the offside rear wheel
– the offside rear wheel arch liner.

Disconnect the backflow prevention pipe (1).

Remove:
– the filler pipe collar (2),
– the filler neck mounting bolt (3),



– the filler neck mounting bolts (4),
– the filler neck.



REFITTING

Replace the filler pipe collar with a new one.

Refit in reverse order of removal.

GETtheMANUALS.org

TIGHTENING TORQUES (in daNm)	▽
Seat squab securing nuts	**4.4**
Seatback mounting bolt and seat squab booster cushion	**4.4**
Heat shield mounting	**2.1**
Acoustic damping bar	**6.2**
Fuel tank mountings	**2.1**

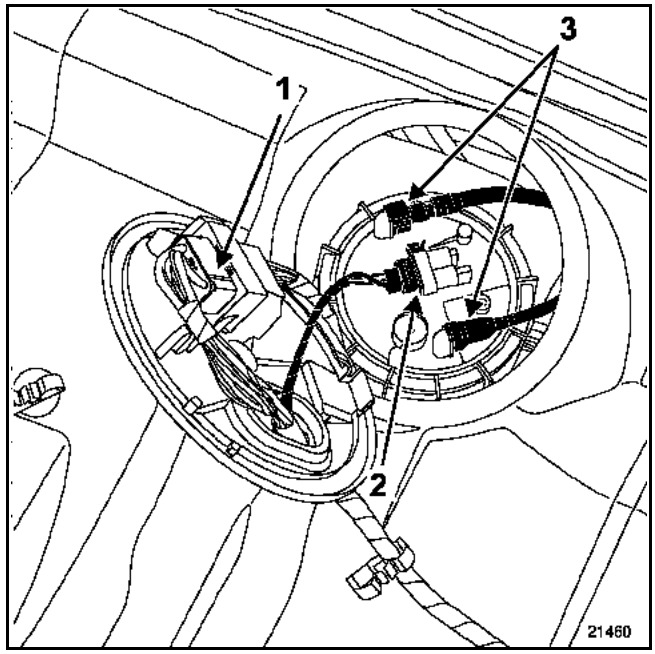
IMPORTANT:
During this operation, it is essential to:
– refrain from smoking or bringing incandescent objects close to the work area,
– use suitable protection against petrol splashes caused by the residual pressure in the pipes,
– protect sensitive areas from petrol.

NOTE: it is not necessary to remove the fuel tank to remove the pump-sender assembly. It is accessible from the rear seat. To do this, remove the bench seat seat squab and the seat squab booster cushion (see fuel tank removal operation).

REMOVAL

Remove the pump-sender assembly plastic access cover.

Disconnect:
– the electric parking brake electrical connector (1),
– the electrical connector (2),
– the quick-release union(s) (3).



Remove the sender unit mounting nut using tool **Mot. 1397** tool.

Allow any fuel in the sender unit to drain, then remove the pump-sender assembly, taking care not to damage the float.

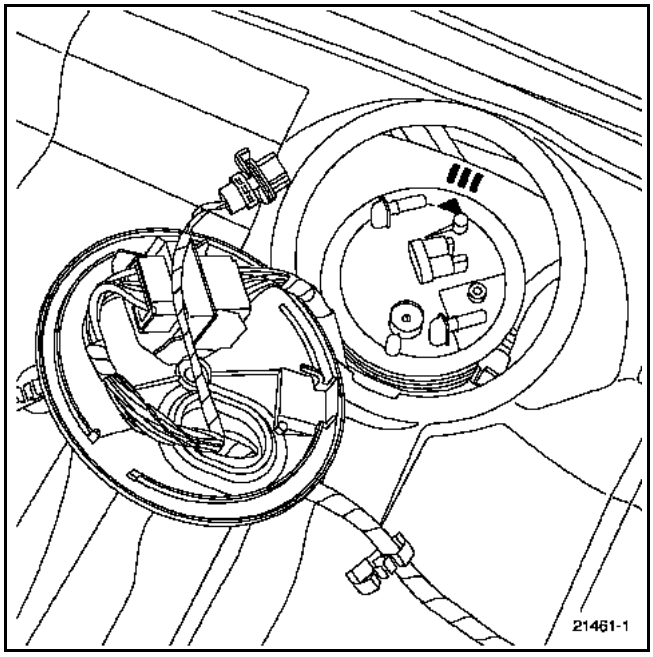
NOTE: if it is anticipated that there will be several hours will elapse between removal and refitting of the pump-sender assembly, screw the nut back on the fuel tank to prevent any distortion.

REFITTING

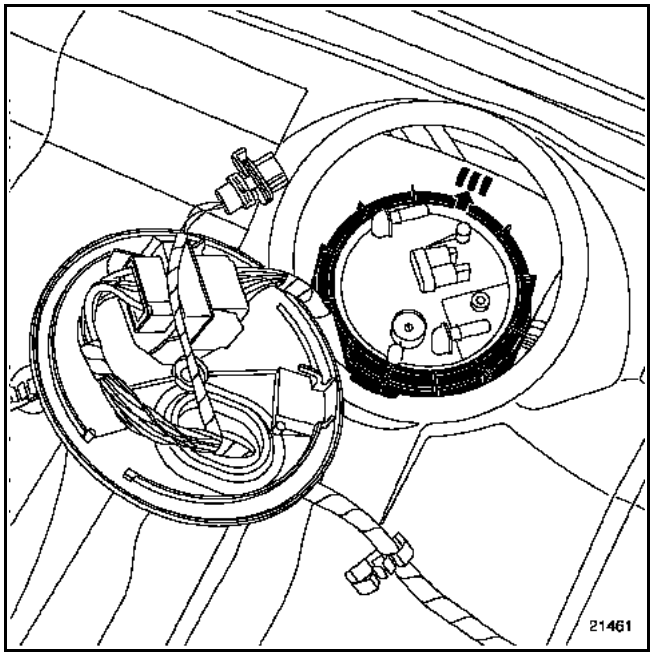
Replace the O-ring seal.

Replace the pump-sender assembly, positioning the mark on the sender opposite the three raised lines on the tank.

GETtheMANUALS.org



Position the nut and tighten it until the mark on it corresponds with the mark on the tank and the mark on the pump/sender assembly.



Reconnect the quick-release unions.

Reconnect the electrical connectors.

Refit:
– the plastic blanking cover,
– the seat squab booster cushion, then the seat squab

ALLOCATION OF CONNECTOR TRACKS

Fuel pump-sender unit assembly

Track	Description
A1	Sender + signal
A2	Not used
B1	Sender - signal
B2	Not used
C1	+ pump
C2	- pump

GETtheMANUALS.org

In the petrol version, the pump, the fuel filter and the pump and sender unit form an inseparable assembly.

In diesel versions, the **PX9** engine has no submerged pump in the tank, only a sender unit. Conversely, the **G9T** engine has a pump immersed in the fuel tank.

To remove the sender, refer to the **Pump-sender** section.

Checking the sender unit

Value across terminals A1 and B1 (in Ω) +10 Ω	Height (H) (mm)		Approximate tank capacity (in l)
	Unleaded petrol	Diesel	
20	210	202.5	80
87.5	166.5	159.5	62
155	132	125	44
222	94	88	26
256.3	65	65	17
290	44.5	40	8

Ensure that the resistance varies when the float is moved.

Measuring height H

Place the removed sender unit on a flat surface.
H is the height measured between the sender unit float pin and the sealing face.

NOTE: all the above values are given merely as an indication.

GETtheMANUALS.org

GENERAL

The fuel filter is located inside the tank; it forms part of the pump-sender assembly and cannot be separated.

If it needs to be replaced, then the whole pump-sender assembly must be replaced.

It is designed to provide efficient filtration for the whole life of the vehicle.

Nevertheless, checking the fuel supply pressure and the pump delivery will provide a diagnostic check of the pump-sender assembly performance.

REPLACEMENT

This operation is carried out after removing the sub-frame and disconnecting the gearbox from the engine.

SPECIAL TOOLING REQUIRED	
Mot. 1431	Immobilising tool
Mot. 1453	Engine mountings
Emb. 1604	Self-adjusting clutch mechanism compressors
EQUIPMENT REQUIRED	
Hydraulic jack	

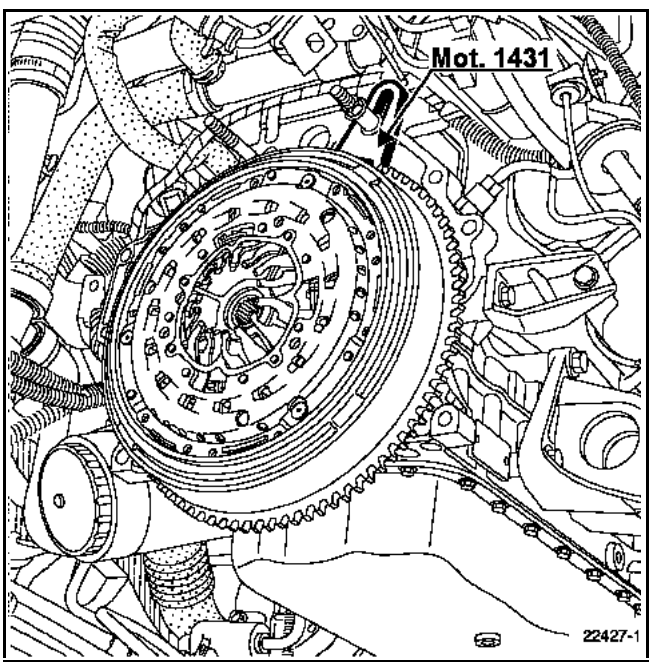
TIGHTENING TORQUES (in daNm)	
Bolt securing the mechanism to the engine flywheel	1.2
Shock absorber bolts	18
Front hub nut	28
Starter motor casing bolt	4.4
Gearbox casing edge bolt to gearbox	4.4
Wheel bolt	11

REMOVAL

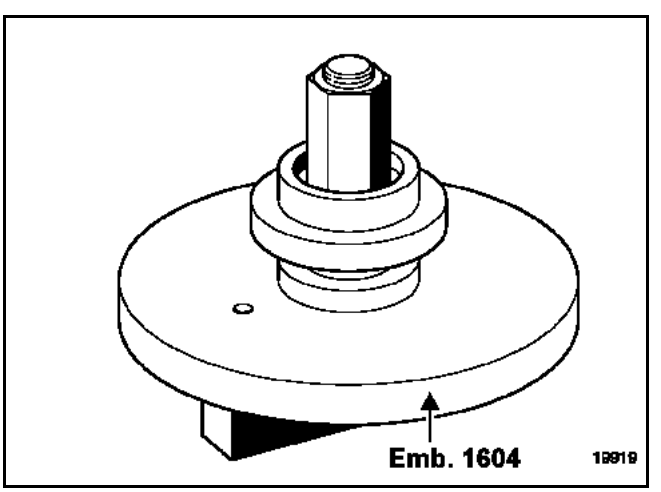
Fit the flywheel immobiliser tool **Mot. 1431**.

Remove the mechanism mounting bolts and remove the mechanism along with the clutch plate.

Check and replace any faulty parts.



Use tool **Emb. 1604** to refit the mechanism.

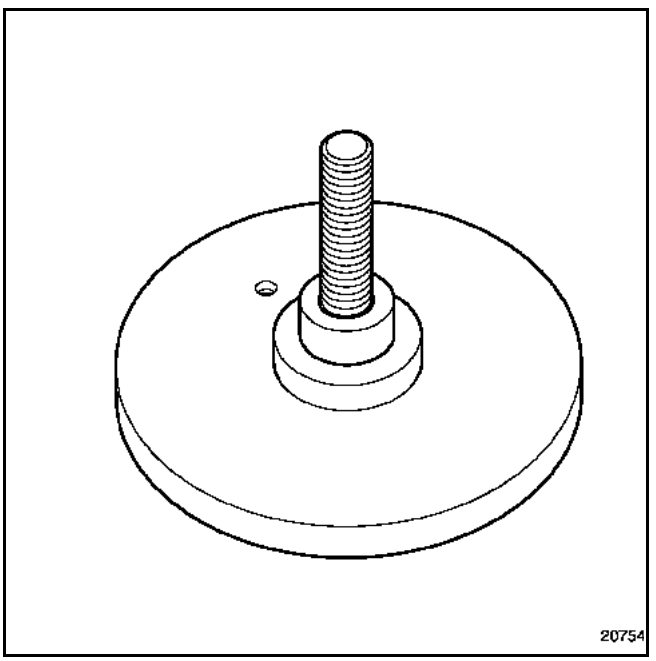


GETtheMANUALS.org

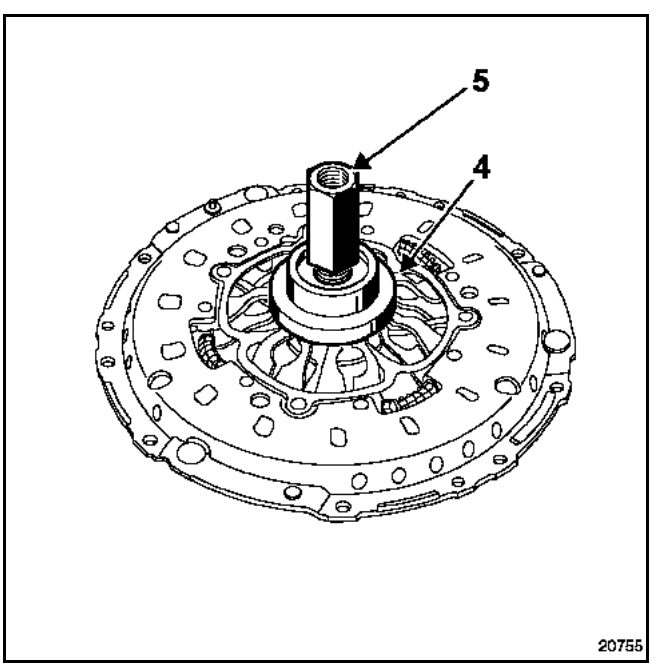
REFITTING

For automatic take-up clutch mechanisms, the clutch mechanism must be compressed with tool **Emb. 1604** in accordance with the method described below.

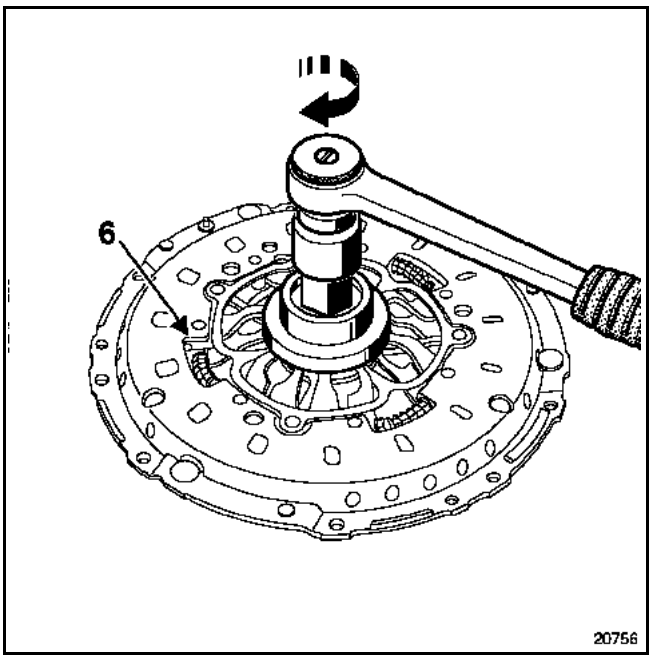
Place the baseplate of tool **Emb. 1604** in a vice.



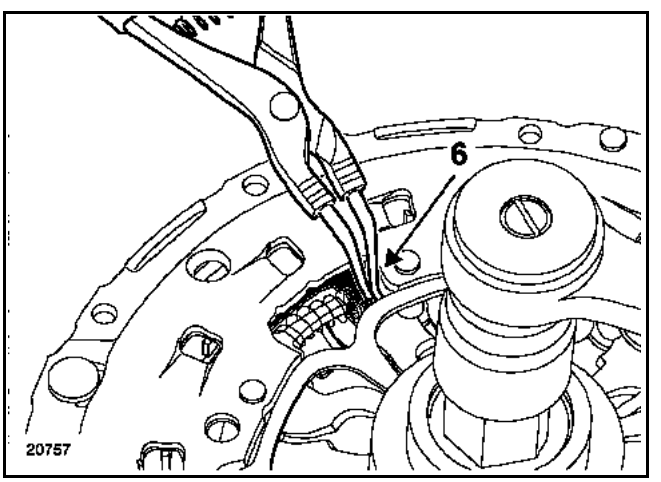
Place the mechanism on the baseplate then the thrust ball bearing (4) and (5).



Tighten the nut fully.

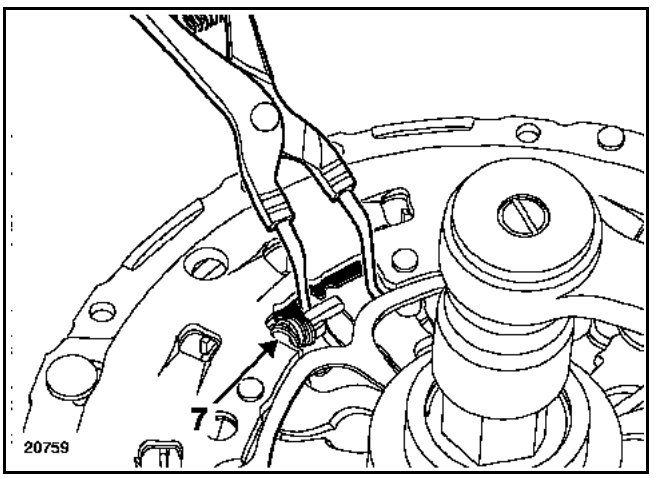


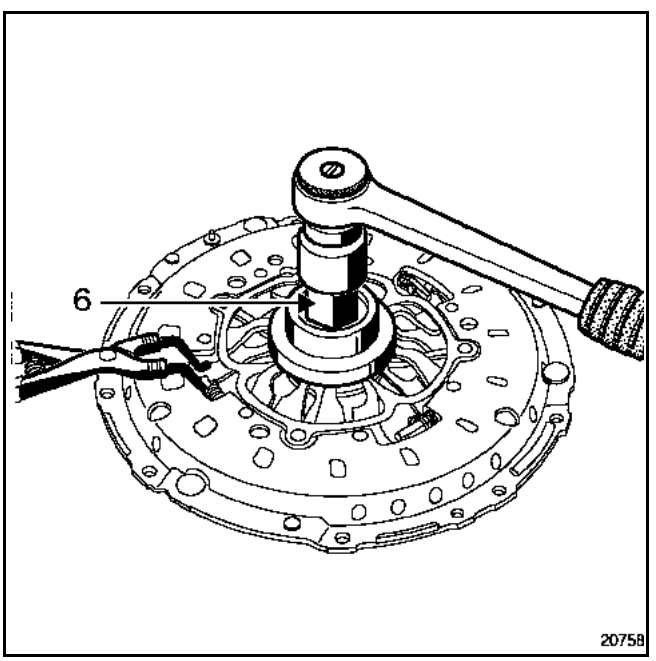
Insert clip pliers in (6).



GETtheMANUALS.org

Compress springs (7), and release the mechanism by completely unscrewing nut (6) while maintaining pressure on the springs.





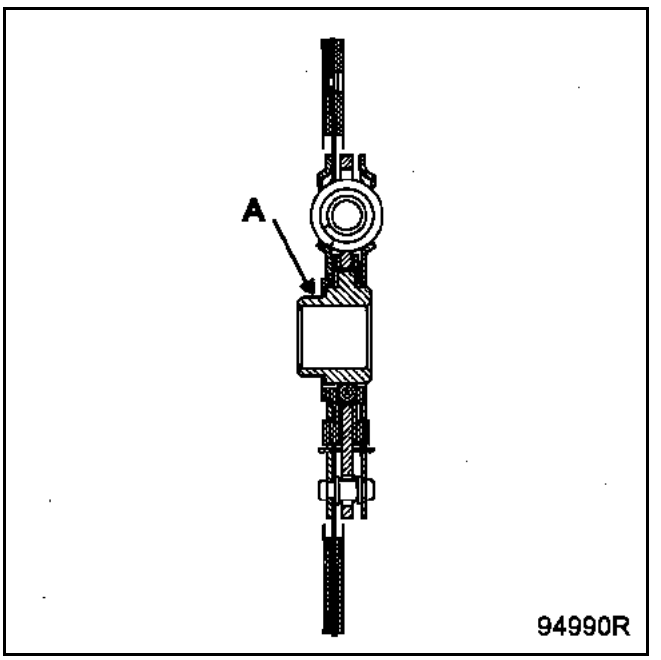
Remove the mechanism from the base plate (checking that the springs are correctly compressed).

Precautions that must be taken when repairing the clutch:

Clean the clutch shaft splines and refit the assembly without lubricant.

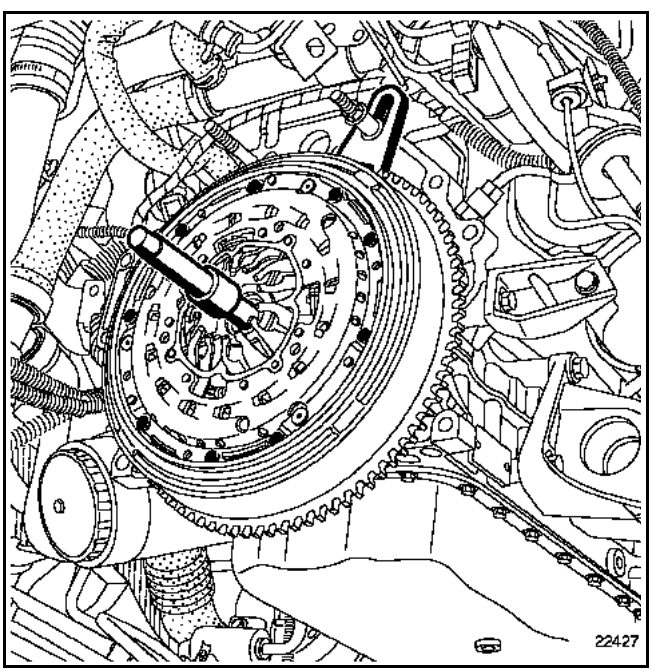
Degrease the friction face of the flywheel.

Insert the plate (offset (A) from the hub on the flywheel side).



ALIGNMENT

Use the plastic centring tool found in the clutch kit.



Fit the mechanism back on the flywheel, gradually tightening the bolts to a torque of **1.2 daN.m.**

Remove the immobilising tool **Mot. 1431**.

GETtheMANUALS.org

REPLACEMENT

This operation is carried out after removing the sub-frame and disconnecting the gearbox from the engine.

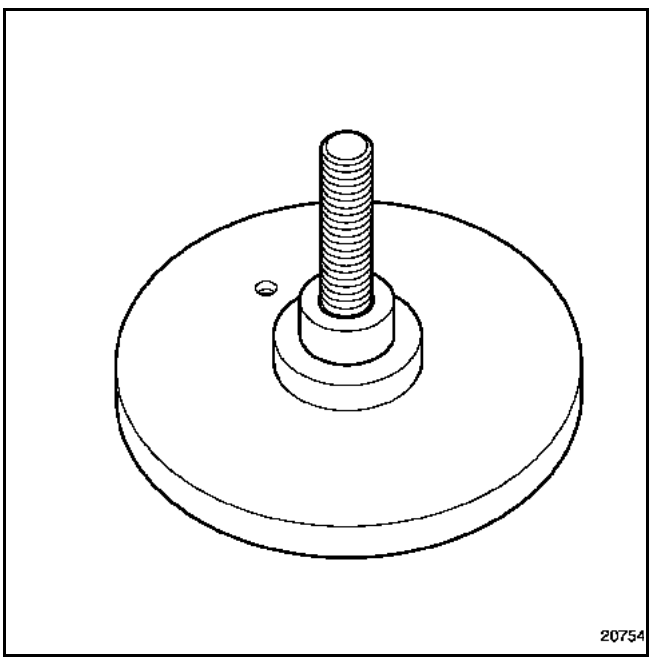
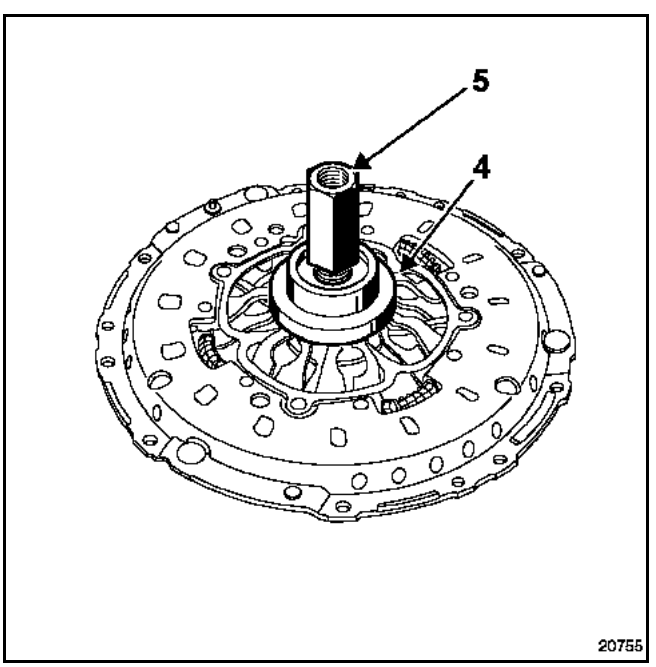
For automatic take-up clutch mechanisms, the clutch mechanism must be compressed with tool **Emb. 1604** in accordance with the method described below.

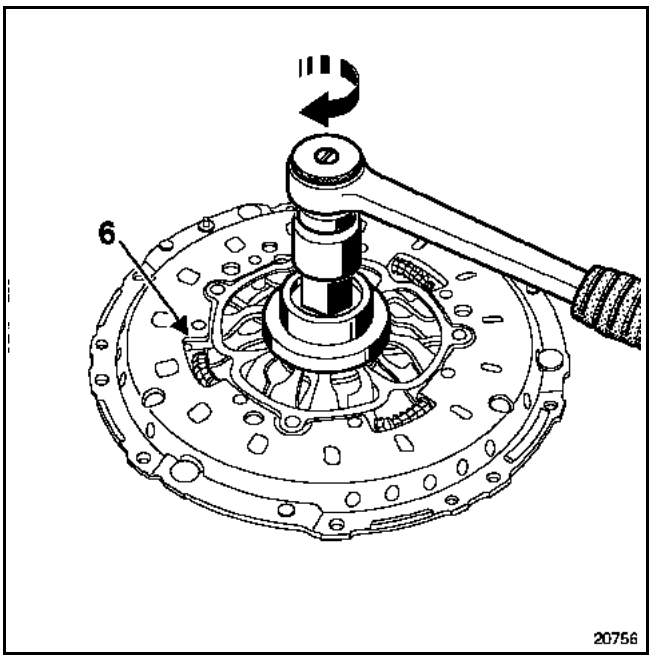
Place the baseplate of tool **Emb. 1604** in a vice



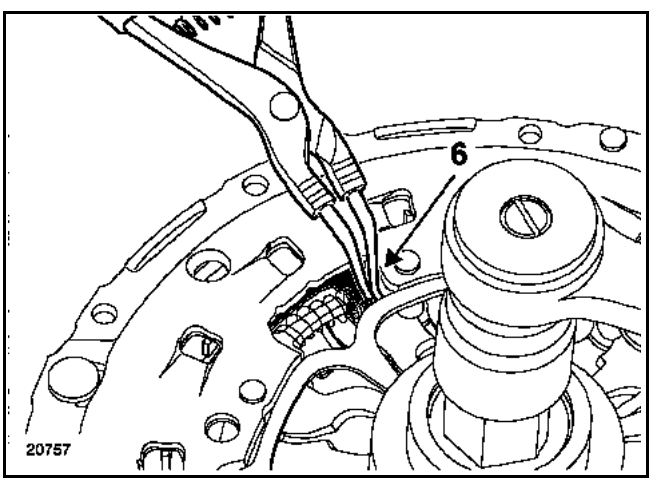
Place the mechanism on the baseplate, then the thrust ball bearing (4) and (5).



Tighten the nut fully.

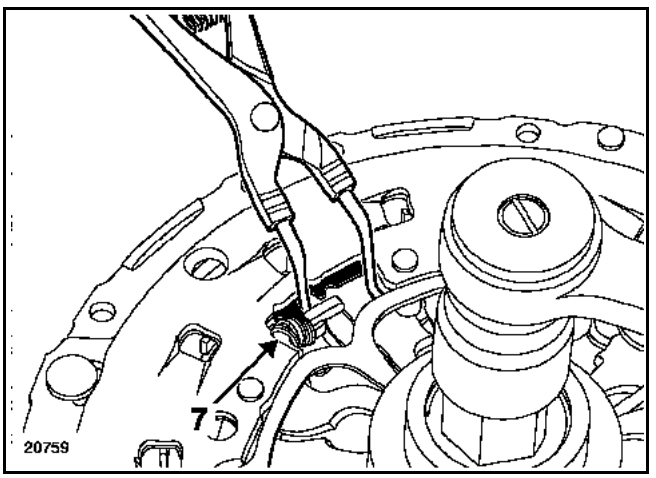


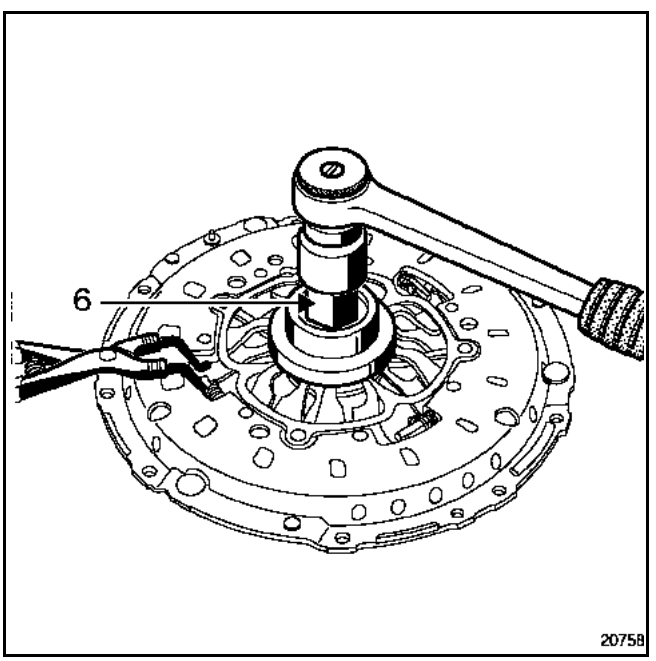
Insert clip pliers in (6).



GETtheMANUALS.org

Compress the springs (7), then release the mechanism by completely unscrewing the nut (6) while maintaining pressure on the springs.





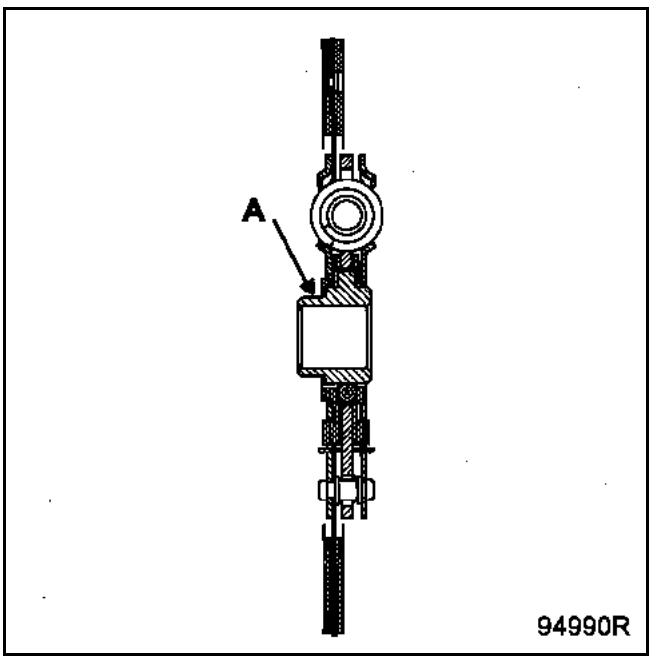
Remove the mechanism from the base plate (checking that the springs are correctly compressed).

Precautions that must be taken when repairing the clutch:

Clean the clutch shaft splines and **refit the assembly without lubricant.**

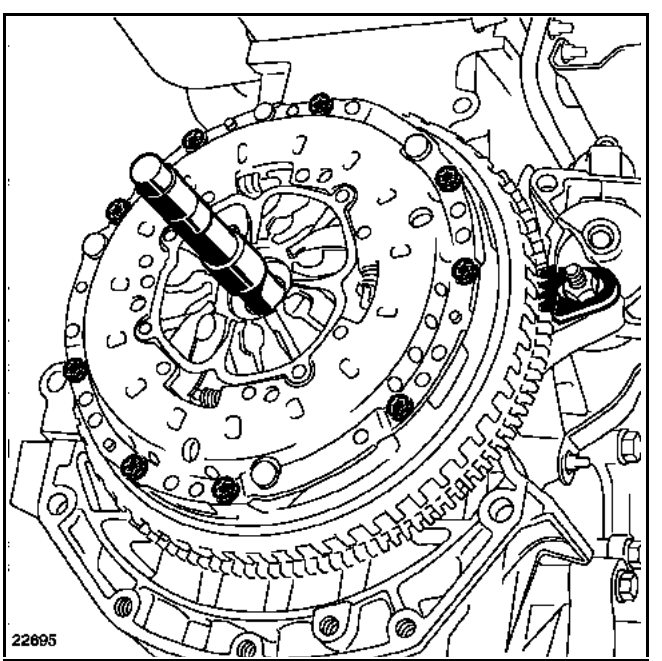
Degrease the friction face of the flywheel.

Fit the plate (offset (A) from the hub on the flywheel side).



ALIGNMENT

Use the plastic centring tool found in the clutch kit.



Fit the mechanism back on the flywheel, gradually tightening the bolts to a torque of **1.2 daN.m.**

Remove immobilising tool **Mot. 582-01**.

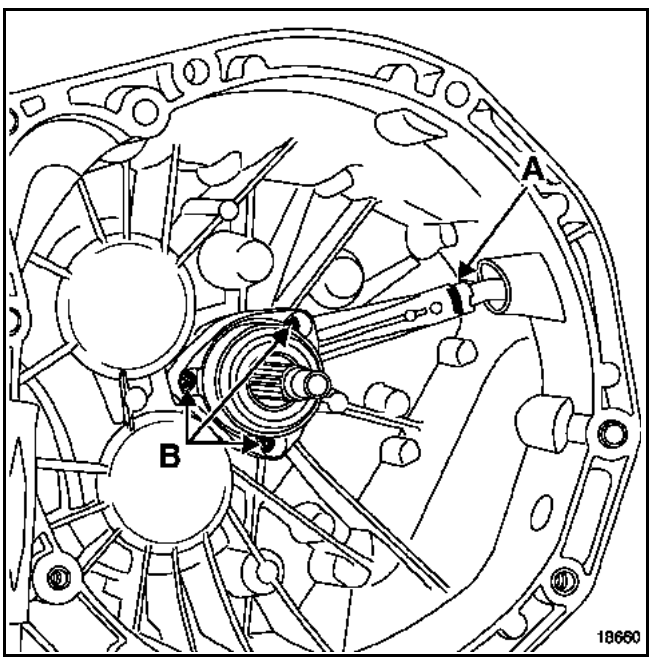
GETtheMANUALS.org

REPLACEMENT

This operation is carried out after the gearbox has been disconnected from the engine.

REMOVAL

Remove:
– the bleed screw (clip A),
– the thrust bearing (screws B).



REFITTING

Refit:
– the end stop,
– the bleed screw.

Ensure the thrust bearing slides correctly.

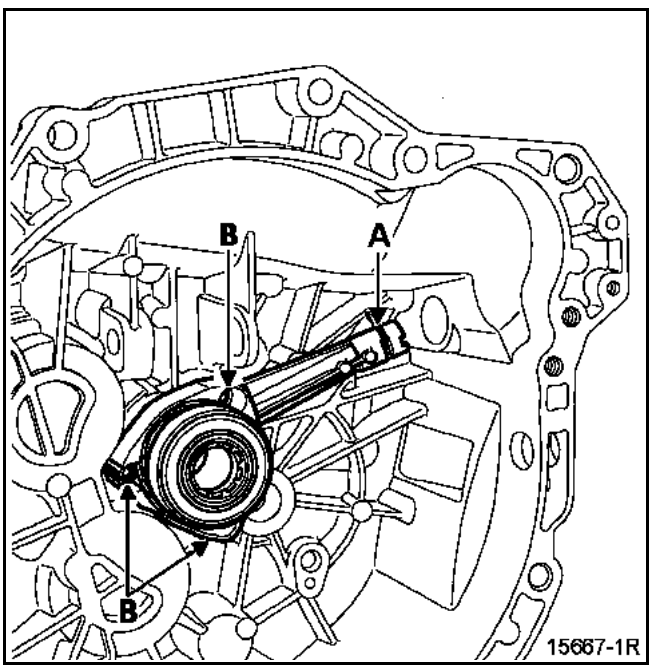
GETtheMANUALS.org

REPLACEMENT

This operation is carried out after the gearbox has been disconnected from the engine.

REMOVAL

Remove:
– the bleed screw (clip A),
– the thrust bearing (screws B).



REFITTING

Refit:
– the thrust bearing,
– the bleed screw.

Ensure the thrust bearing slides correctly.

GETtheMANUALS.org

REPLACEMENT

This operation is carried out after the gearbox has been disconnected from the engine and the clutch has been removed.

SPECIAL TOOLING REQUIRED

REMINDER

Before disconnecting the battery, you must:

– switch off the ignition,
– switch off all consumers,
– wait until the fan stops (after + after ignition is cut off),
– if the vehicle is fitted with Carminat, wait until the system has completely shut down (approximately **1 minute**) before disconnecting the battery.

IMPORTANT:
There is a risk that Carminat will not work if this delay is not respected.

GETtheMANUALS.org

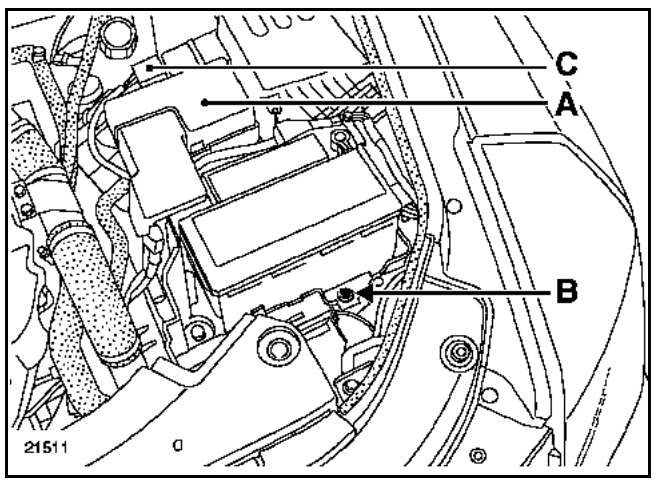
REMOVAL

Put the vehicle on a two-post lift.

Open the bonnet and remove:
– the engine covers,
– the fuse box cover (A),

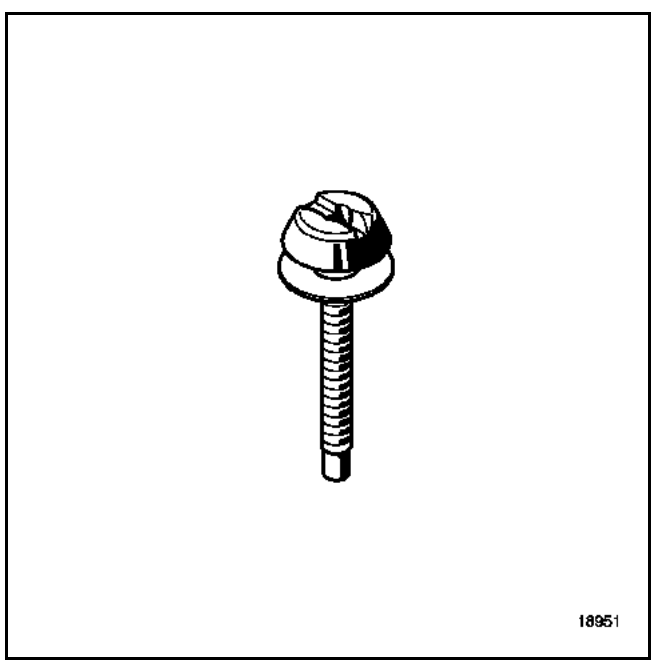
Disconnect the battery.

Remove:
– the battery bolt (B),
– the connections (C) on the air unit,



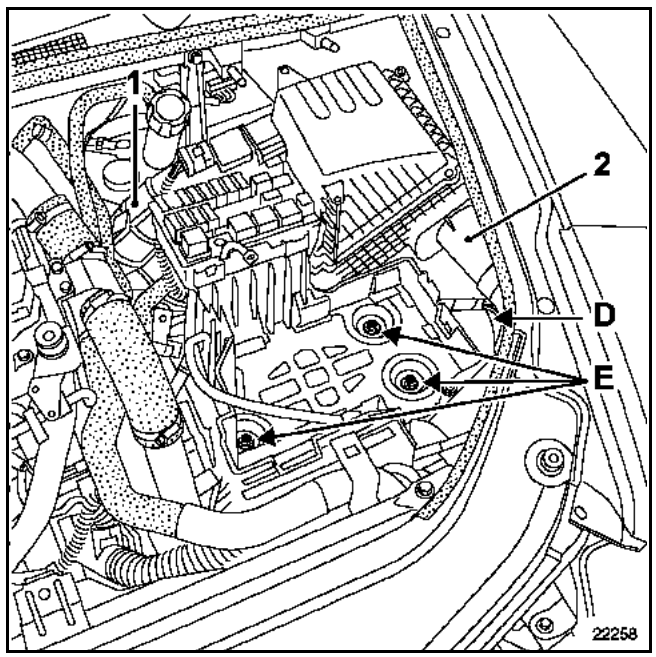
– the fuses and the fuse holder,
– the battery mounting fuse box,
– the electric wiring harness on the battery mounting at (D),
– the battery mounting bolt (E).

To do this, drill out the three tamperproof bolts using a **5 mm** diameter drill bit in the bolt shaft.
Then remove the bolts using tool **Mot. 1372**.

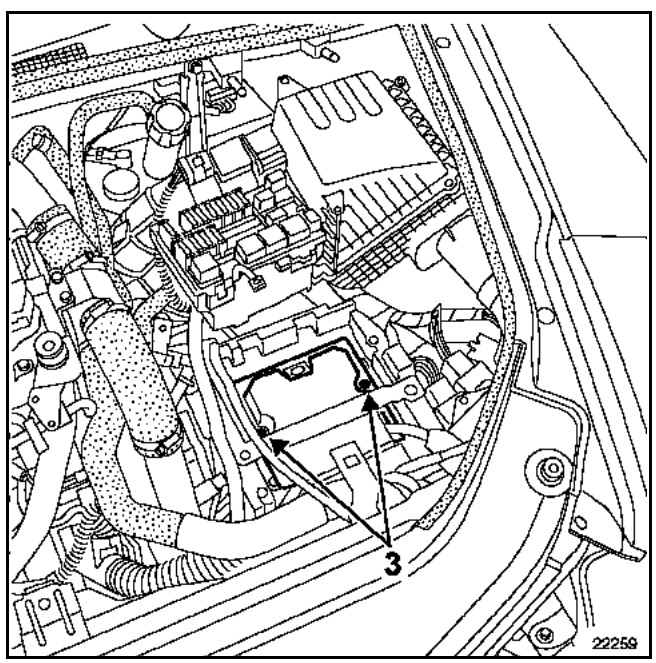


NOTE:
Replace all the bolts when refitting.

Release:
– air duct (1),
– the air duct (2) with the air filter unit,



– the computer (nuts 3) to remove the computer connectors,
– the electric wiring harness on the computer tray to remove it.



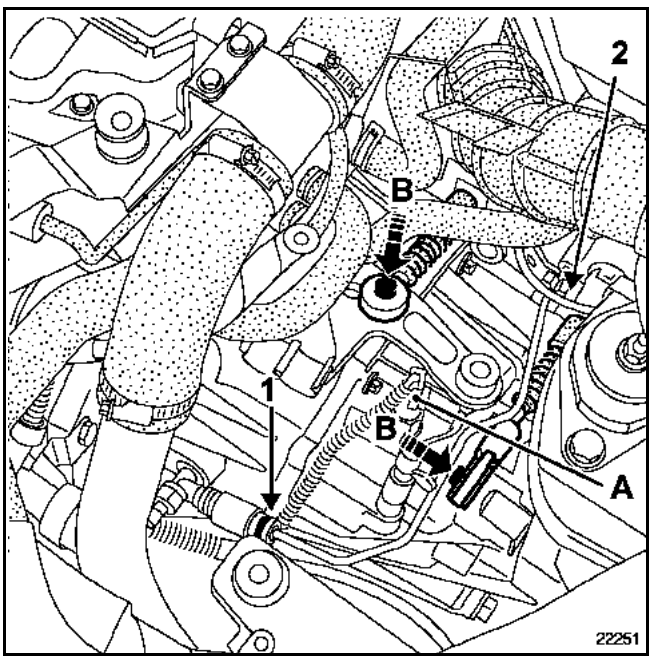
Drain the brake fluid reservoir down to the connector of the clutch master cylinder pipe using a syringe.

GETtheMANUALS.org

Unclip the clutch pipe at (1) and (2).

Remove:
– the reverse gear connector (A),
– the gear control cables (B) and remove them from their mounting on the gearbox.

Remove the different wiring harnesses that may be damaged when the engine is taken down.



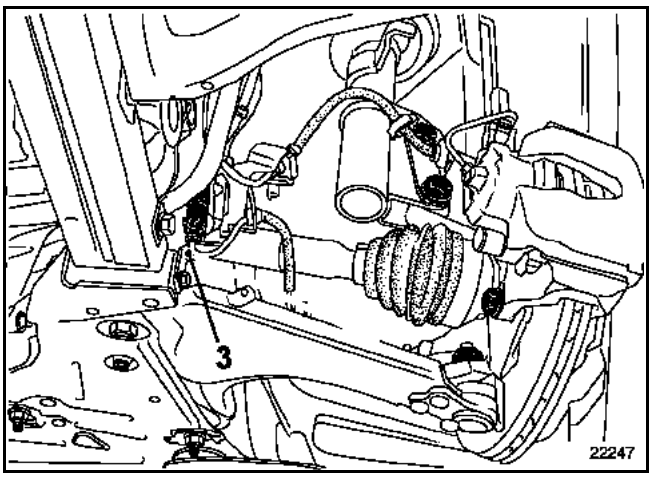
Remove:
– the wheels;
– the engine undertray.

Drain the gearbox.

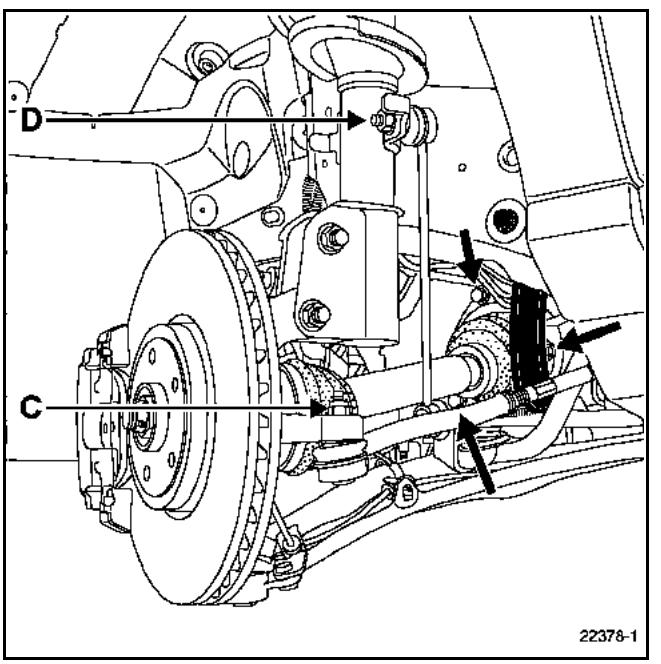
Unclip the brake pipes.

Remove:
– the left and right-hand mudguards,
– the protectors on the tie-rods,
– the brake callipers, securing them to the suspension spring to protect the hose,
– the wheel sensors (if the vehicle is fitted with Anti-lock Braking System) and release the ABS wiring harness from the sub-frame arms,
– the nut from the position sensor linkage (for vehicles fitted with Xenon lamps),
– the height sensor retaining plate (3).

Left-hand side of the vehicle

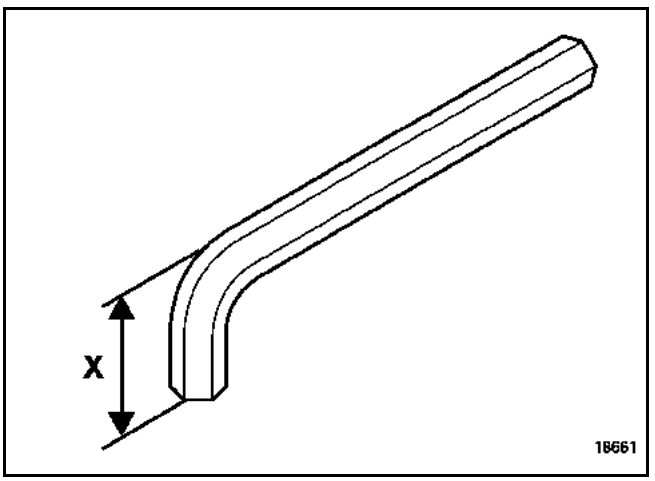


Remove:
– the driveshaft mountings on the gearbox,
– the steering ball joint (C),
– the upper nut (D) from the anti-roll bar tie-rod.



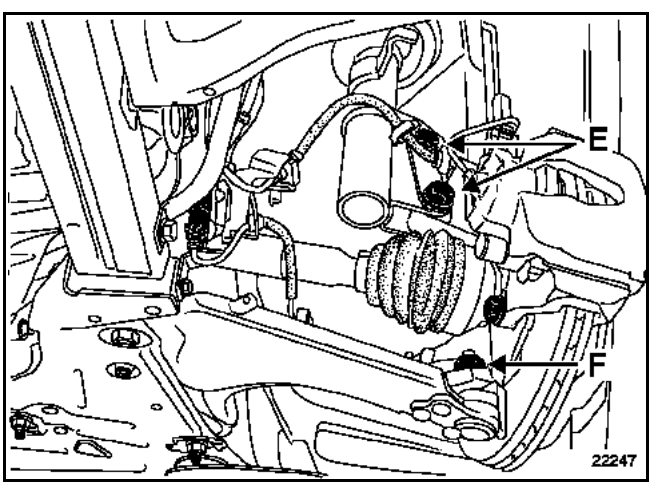
GETtheMANUALS.org

Remove:
– the lower ball joint (F) using a cut-down Allen key if the nut cannot be slackened.

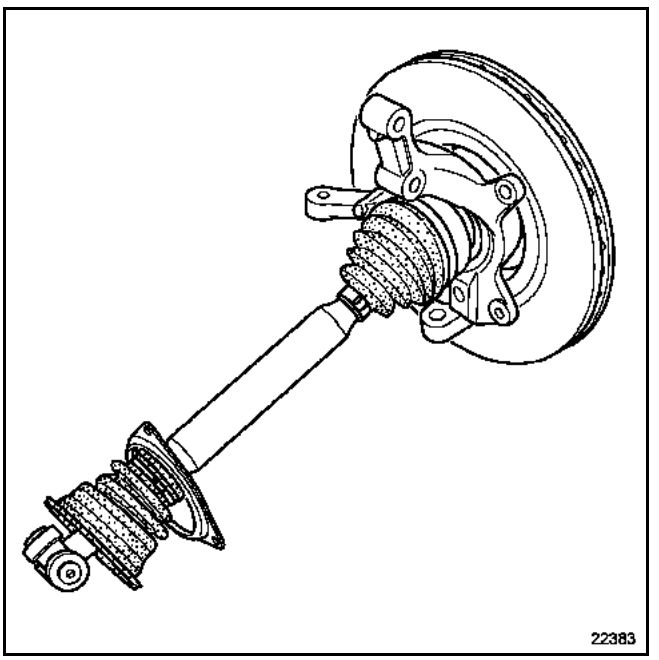


X = 25 mm

– the shock absorber base mountings (E),

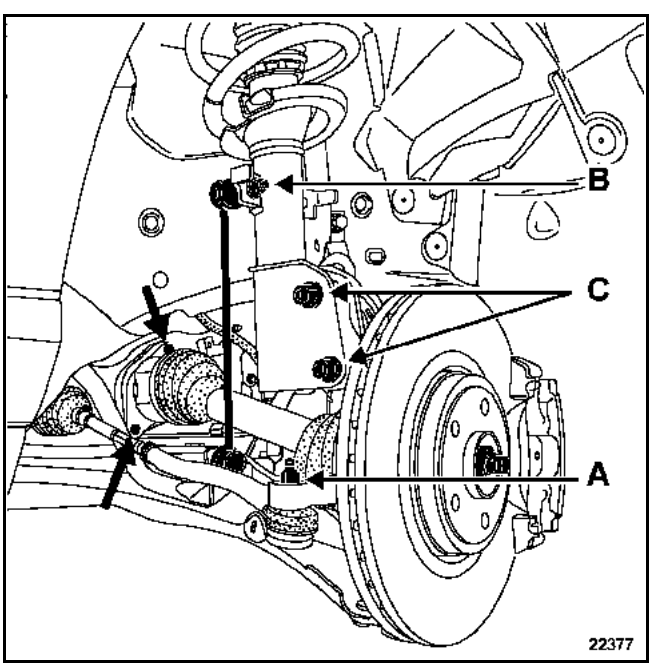


Remove the driveshaft, taking care to protect the gaiters.



Right-hand side of the vehicle

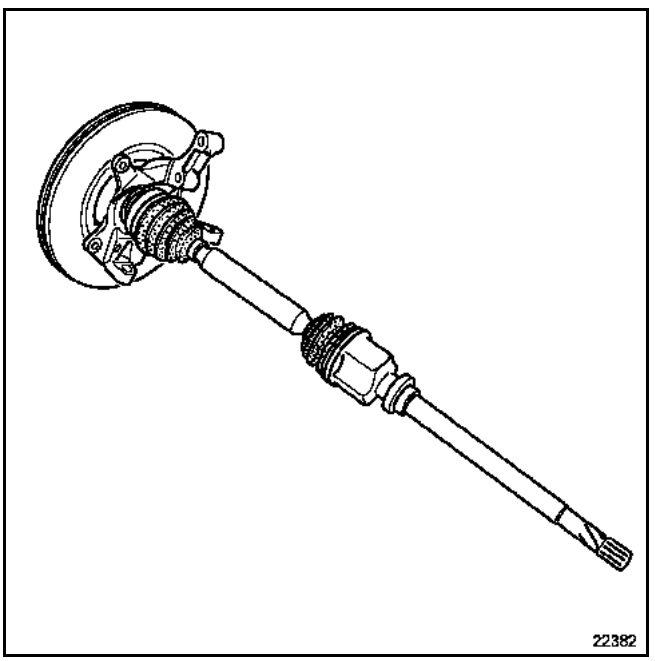
Remove:
– the intermediate bearing mountings on the engine arm,
– the steering ball joint (A),
– the upper nut (B) from the anti-roll bar tie-rod.



GETtheMANUALS.org

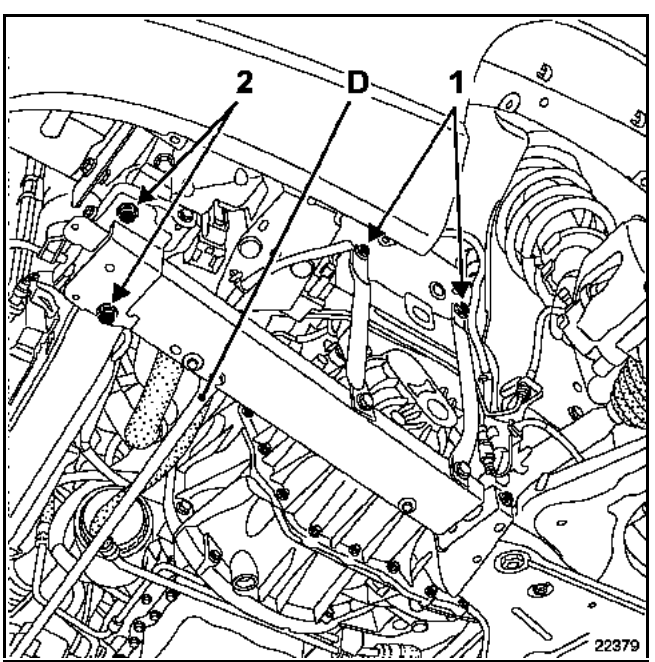
Undo:
– the lower ball joint, using a cut-down Allen key if the nut cannot be slackened.
– the shock absorber base mountings (C),

Remove the driveshaft, taking care to protect the gaiters.

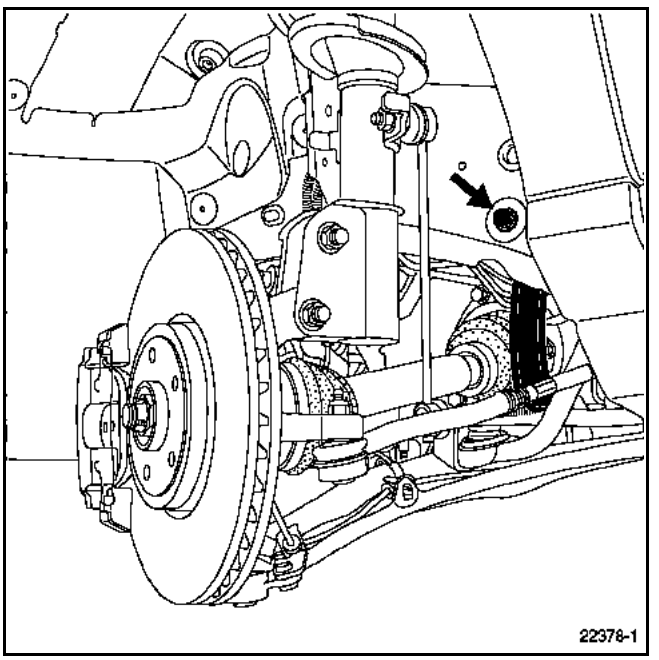


Remove the transverse bar (D) fitted on the side members.

On each side of the vehicle, remove:
– the tie-rod bolts (1) on the side member,
– the side member bolts (2) and remove the sidemembers.

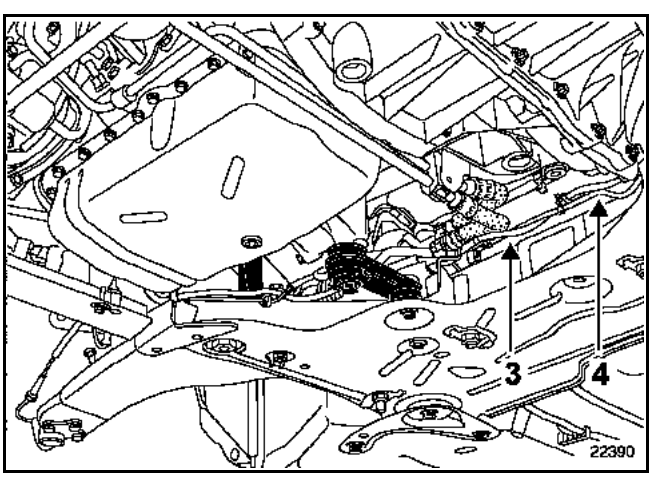


Slacken the sub-frame tie-rod mounting bolts on the body.



Remove:
– the acoustic tie-rod bolts,
– the sub-frame rear mounting bolts.

Unclip:
– the rear brake pipes on the sub-frame,
– the torque reaction arm,
– the steering heat shield.

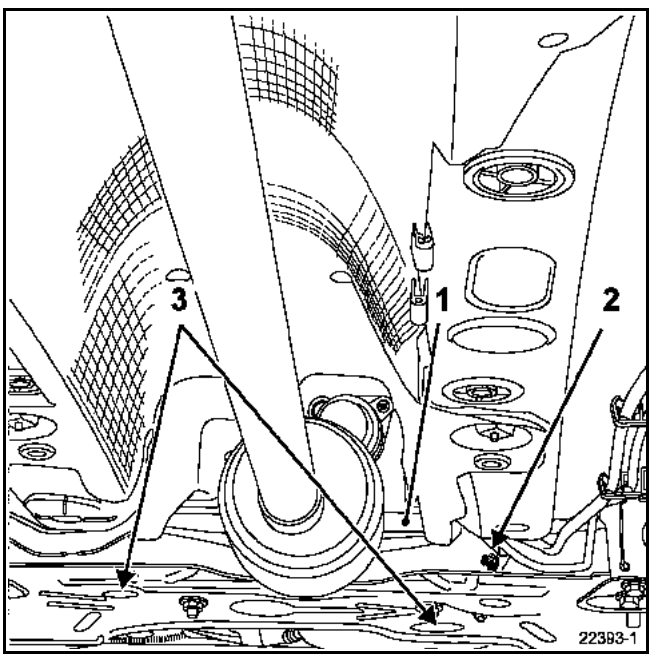


On the sub-frame, release the ABS wiring harness and the brake fluid supply hose at (3) and (4).

GETtheMANUALS.org

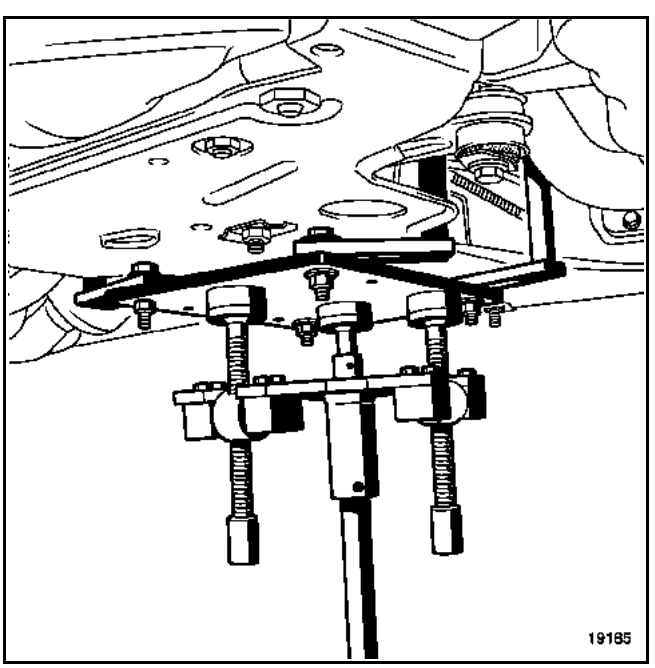
Remove the expansion chamber (see exhaust pipe: **catalytic converter Section 19B**).

Tilt the sub-frame slightly to remove the steering rack mountings.



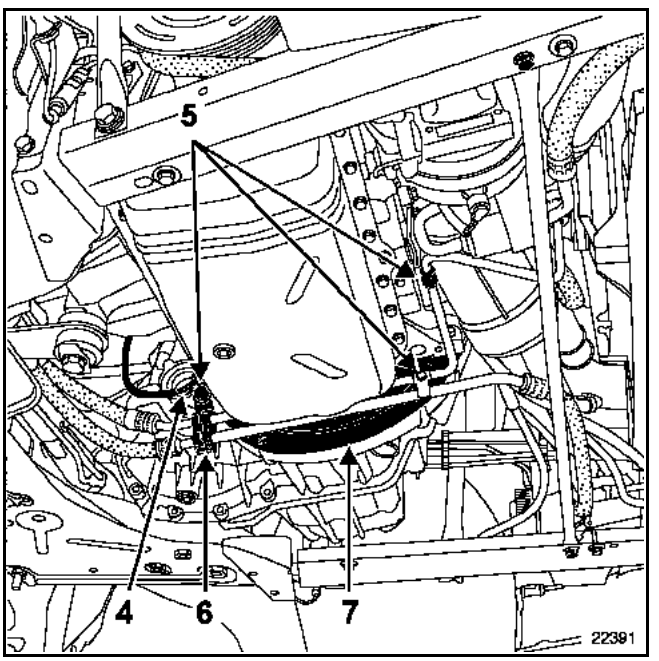
Remove:
- the exhaust heat shield plate (1),
- the diesel hose mounting bolt (2) on the sub-frame,
- the two exhaust heat shield retaining bolts (3).

Place a component jack under the sub-frame.



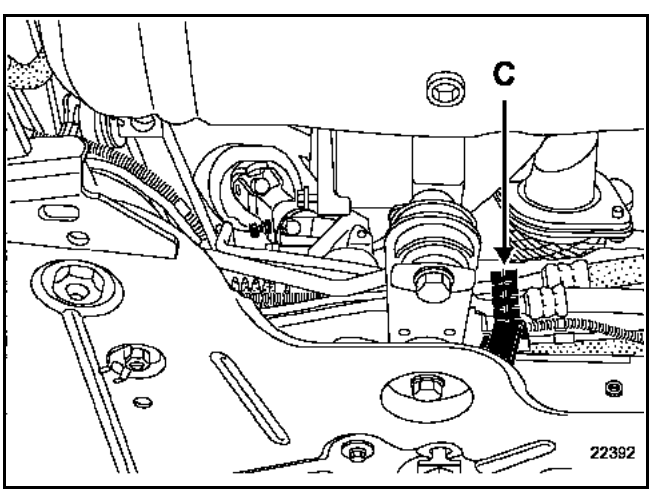
Fit the steering rack.

Remove:
- the two sub-frame tie-rods (first release the hoses on the left-hand side) or the bolt from the tie-rod fitted on the sub-frame,
- the engine sub-frame,
- the TDC sensor connections (4),
- the power assisted steering pipe mountings at (5) and open the mounting bracket (6),
- the gear box cover plate (7).



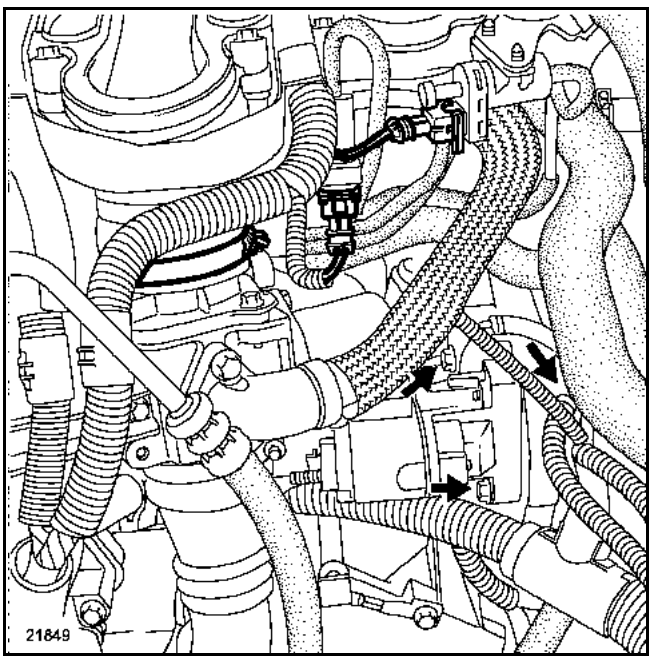
Special notes for right-hand drive vehicles

In addition, remove the mounting bracket (C).

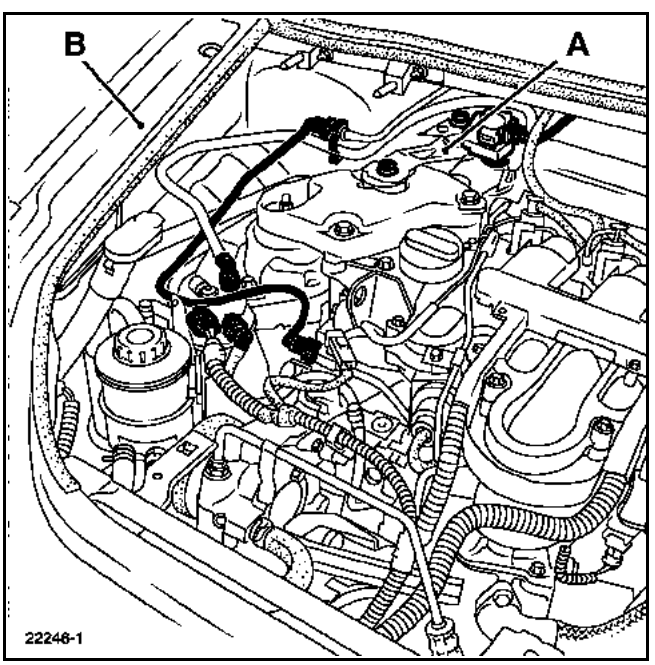


GETtheMANUALS.org

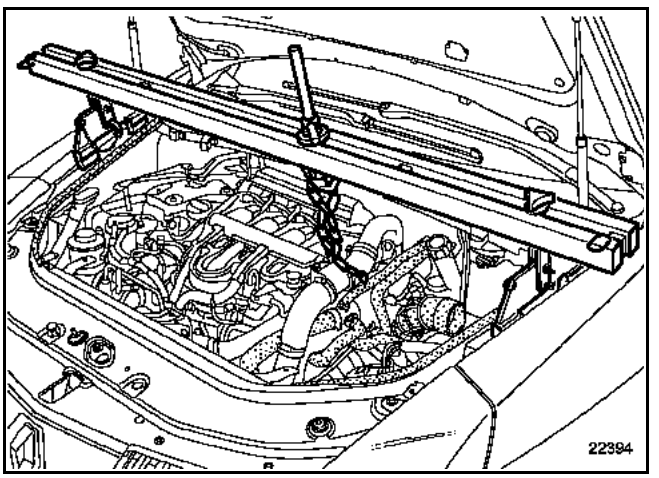
Remove:
– the bolts from the starter and release it while attaching it (it is not necessary to dismantle the starter wiring harness),



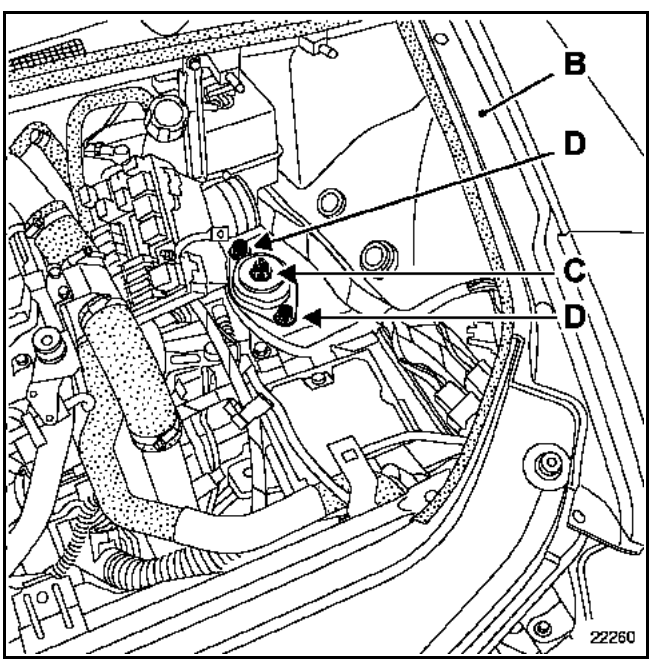
– the torque reaction arm (A) connected to the suspended engine mounting,
– the two side covers located at (B) to install the engine mounting.



Position the engine support tool **Mot. 1453** with the retaining straps.



Remove:
– the nut (C),
– the two bolts for the rubber mounting (D),
– the rubber mounting,



– the upper mountings of the gearbox.

GETtheMANUALS.org

Remove the gearbox mounting.

Position the hydraulic jack.

Remove the lower mountings of the gearbox.

For reasons of safety, removal of the gearbox is a two-person job.

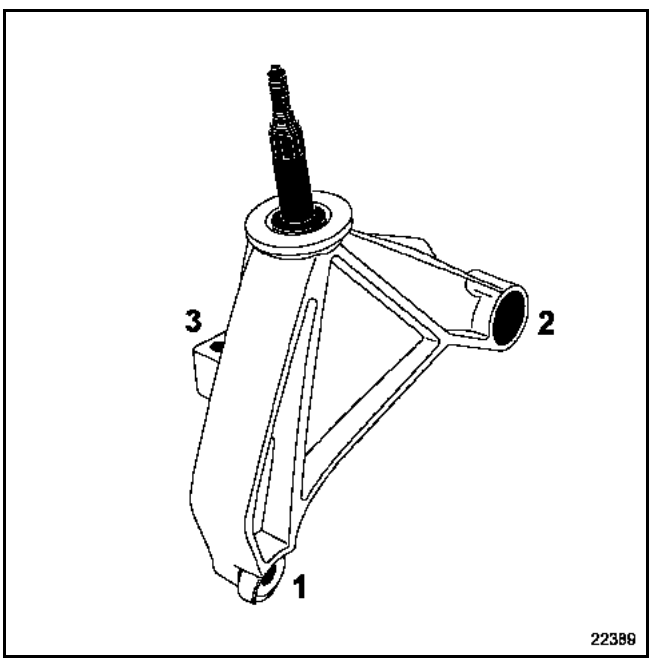
REFITTING

If the clutch has been removed, refer to **Section 20**.

Ensure that the engine/gearbox centring stud is fitted.

IMPORTANT:
Do not grease the clutch shaft splines.

Refit the gearbox support tightening the mounting bolts in the correct order.



Refitting is the reverse of removal.

Refill:
– the gearbox (see the Technical Note on **Lubricants**),
– the brake fluid reservoir.

Bleed the clutch system (see **Section 37A: Clutch master cylinder**).

IMPORTANT:
Ensure the brake pipes are correctly secured to the shock absorber bases.

IMPORTANT:

- Battery: reinitialize the electrical components (see **Section 80A: Special notes on the battery**).
- Adjusting the front axle geometry (see **Section 07B: Adjusting the axle assemblies**).
- If the vehicle is fitted with Xenon lamps, reinitialize the computer and the body height sensor (see **Section 80C: Headlights with Xenon bulbs**).
- If the vehicle is fitted with range finding equipment, reinitialize the range finder (see **Section 83D: Adaptive cruise control**).

GETtheMANUALS.org

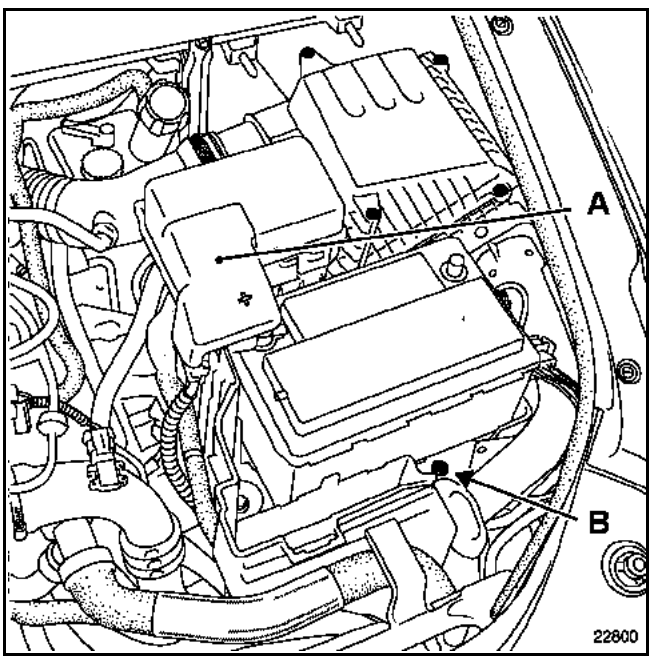
REMOVAL

Put the vehicle on a two-post lift.

Open the bonnet and remove:
– the engine covers,
– the fuse box cover (A).

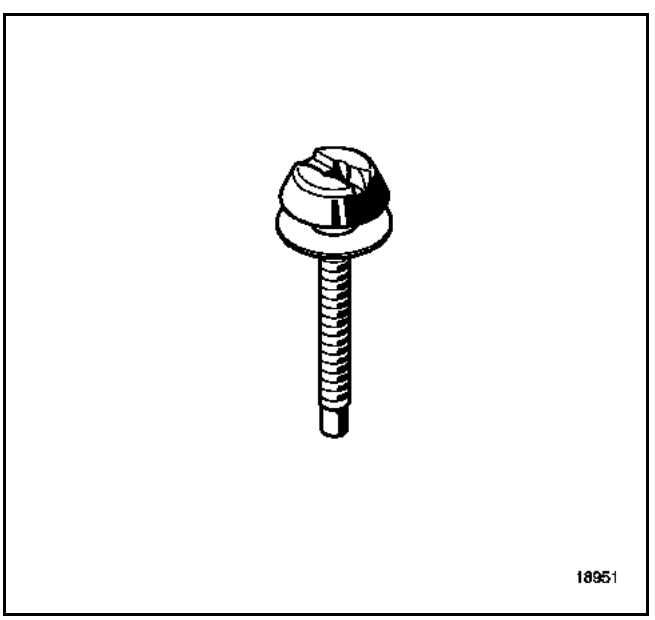
Disconnect the battery.

Remove:
– the battery bolt (B),



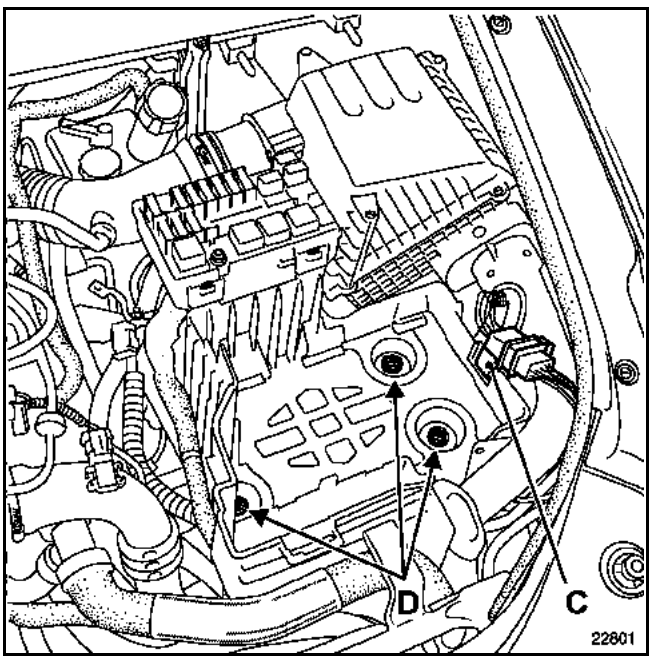
– the fuses and the fuse holder,
– the battery mounting fuse box,
– the air duct,
– the electric wiring harness on the battery mounting at (C).

To do this, drill out the three tamperproof bolts using a **5 mm** diameter drill bit in the bolt shaft.
Then remove the bolts using tool **Mot. 1372**.

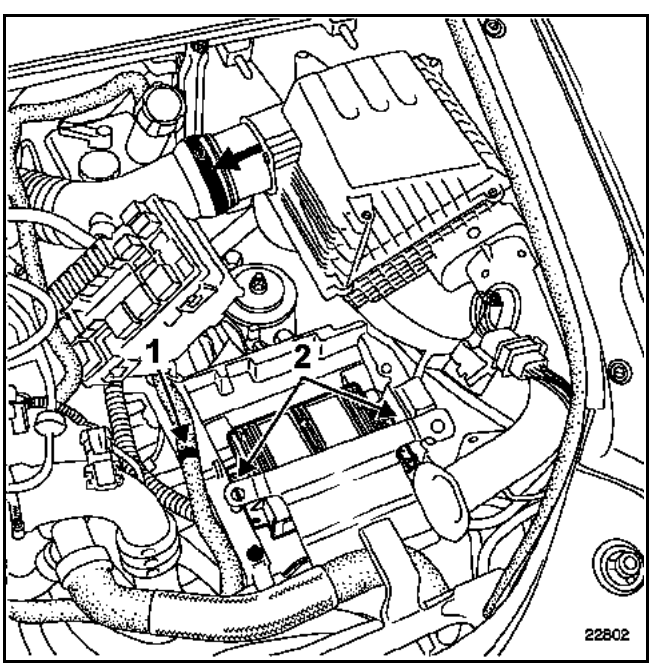


NOTE:
Replace all the bolts when refitting.

– the battery mounting bolt (D),
– the air filter unit.



Release:
– the electric wiring harness (1) on the computer tray to remove it.
– the computer (nuts 2) to remove the computer connectors.



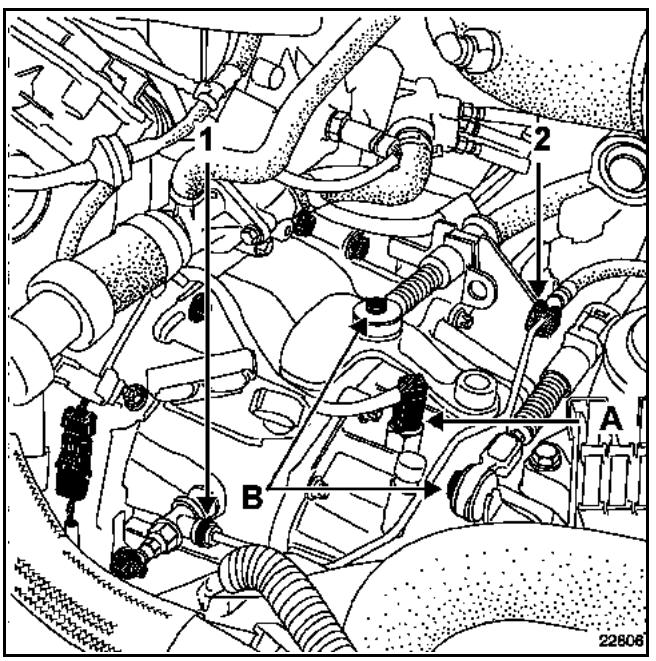
Drain the brake fluid reservoir down to the connector of the clutch master cylinder pipe using a syringe.

GETtheMANUALS.org

Remove the clutch hose after you have removed the clip (1) on the clutch slave cylinder and unclip the hose at (2).

Remove:
– the reverse gear connector (A),
– the gear control cables (B) and remove them from their mounting onthe gearbox.

Remove the various wiring harnesses that may be damaged when the engine is taken down.



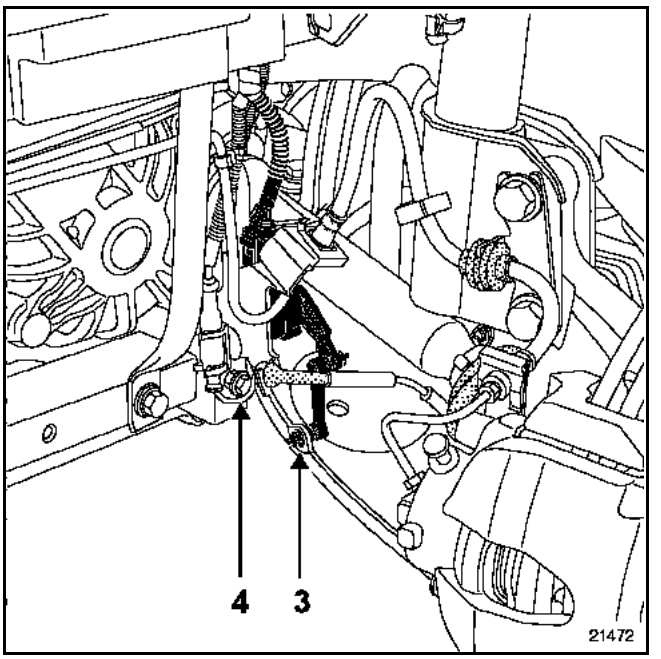
Remove:
– the wheels;
– the engine undertray.

Drain the gearbox.

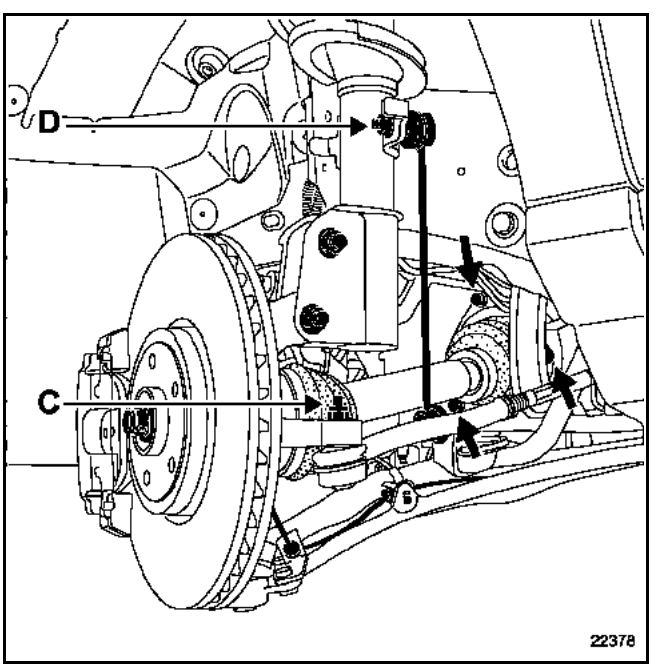
Unclip the brake pipes.

Remove:
– the left and right-hand wheel arch liners and the two protectors on the tie-rods,
– the brake callipers, securing them to the suspension spring to protect the hose,
– the wheel sensors (if the vehicle is fitted with Anti-lock Braking System) and release the ABS wiring harness from the sub-frame arms,
– the nut (3) from the position sensor linkage if the vehicle is fitted with Xenon lamps,
– the height sensor retaining plate (4).

Left-hand side of the vehicle

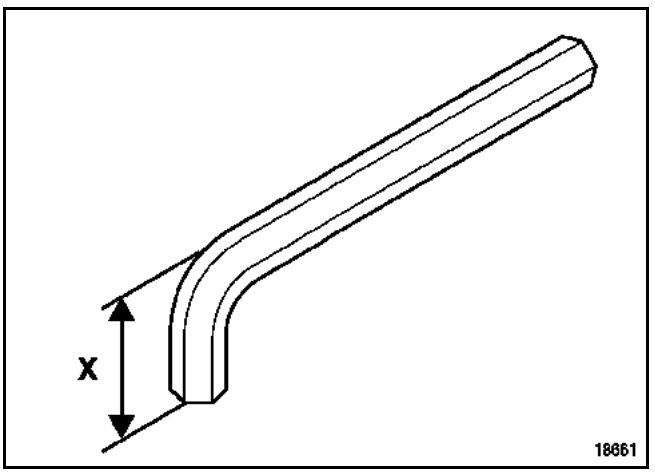


Remove:
– the driveshaft mountings on the gearbox,
– the steering ball joint (C),
– the upper nut (D) from the anti-roll bar tie-rod.

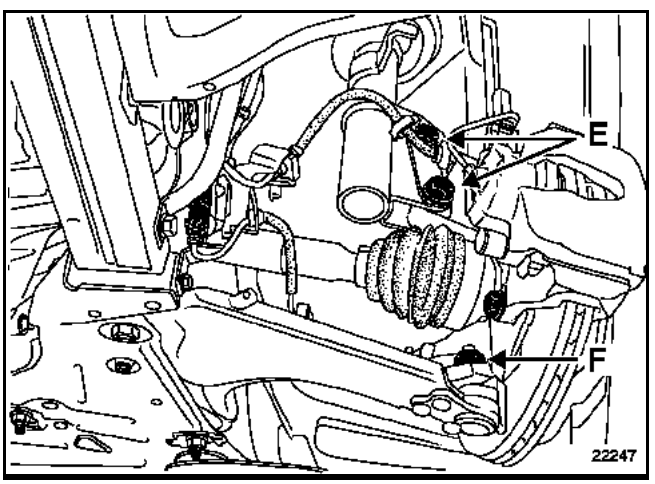


GETtheMANUALS.org

Remove:
– the lower ball joint (F) using a cut-down Allen key if the nut cannot be slackened and release it.

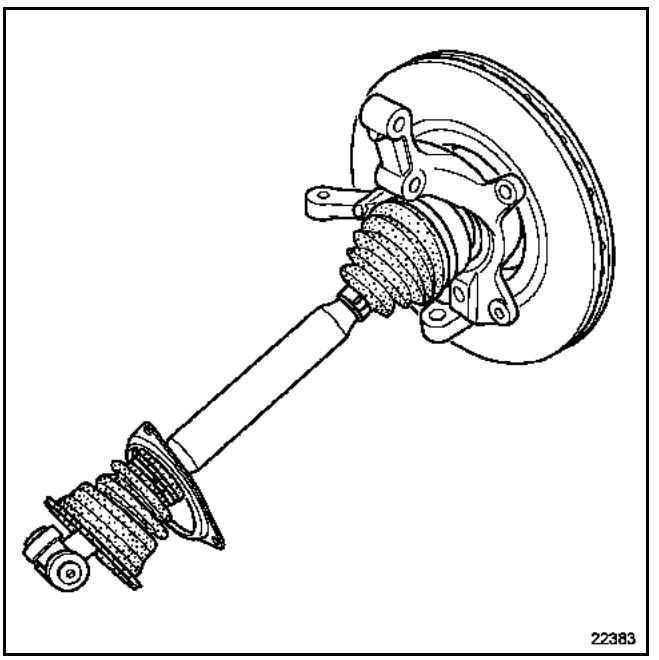


X = 25 mm



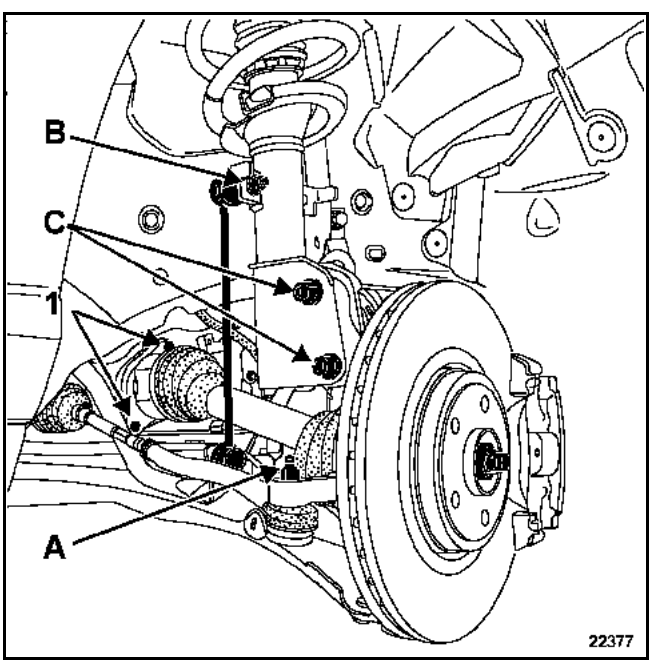
– the shock absorber base mountings (E),

Remove the driveshaft, taking care to protect the gaiters.



Right-hand side of the vehicle

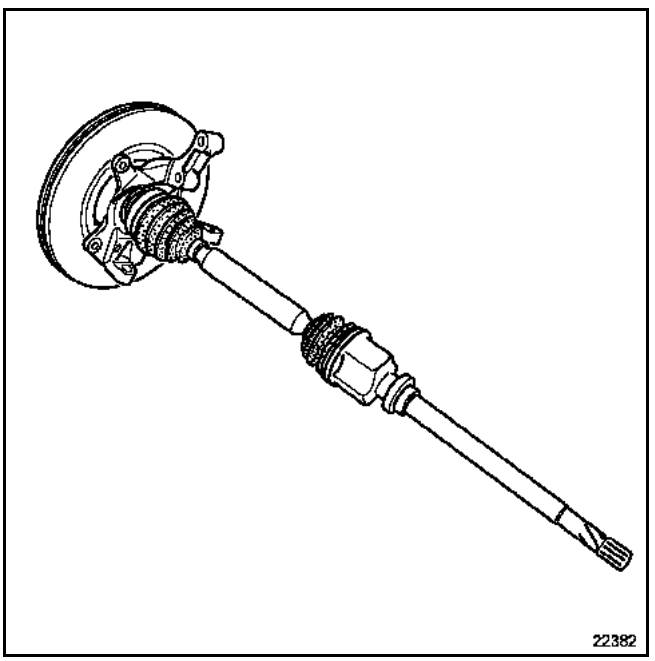
Remove:
– the intermediate bearing mountings (1) on the engine arm,
– the steering ball joint (A),
– the upper nut (B) from the anti-roll bar tie-rod.



GETtheMANUALS.org

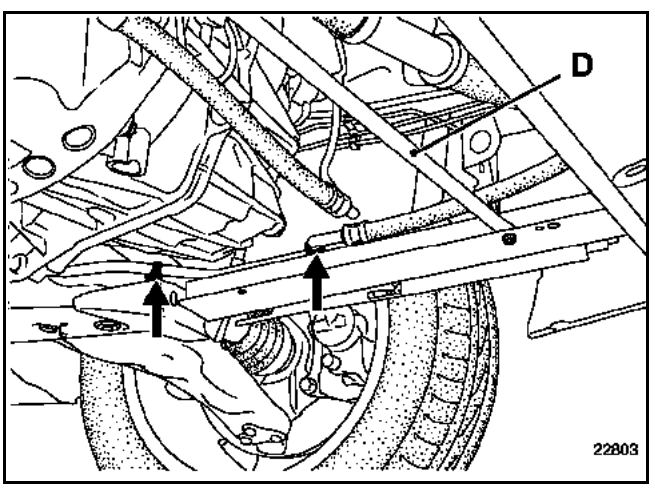
Undo:
– the lower ball joint, using a cut-down Allen key if the nut cannot be slackened.
– the shock absorber base mountings (C),

Remove:
– the driveshaft, taking care to protect the gaiters,

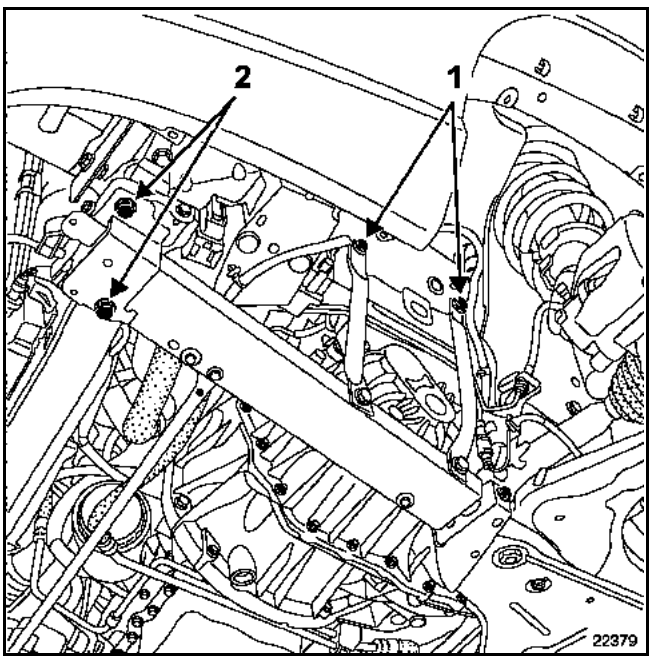


– the transverse bar (D) fitted on the side members.

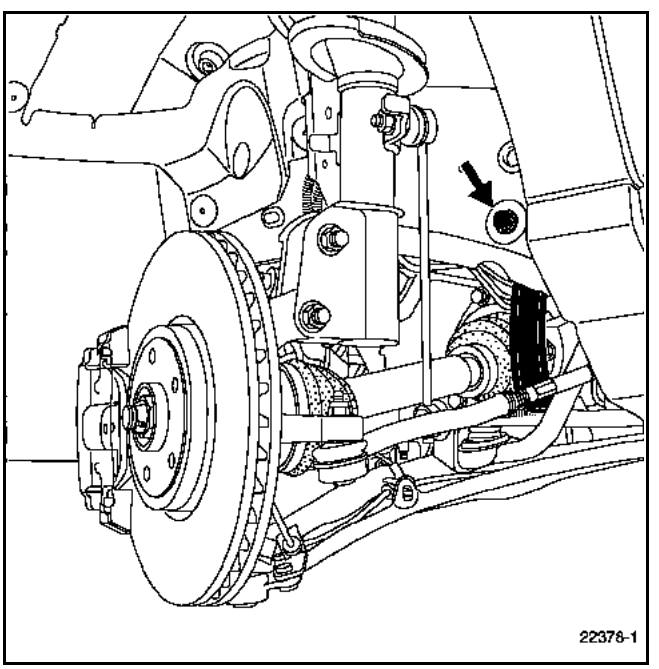
Release the power assisted steering hose on the side member.



On each side of the vehicle, remove:
– the tie-rod bolts (1) on the side member,
– the side member bolts (2) and remove the side members.



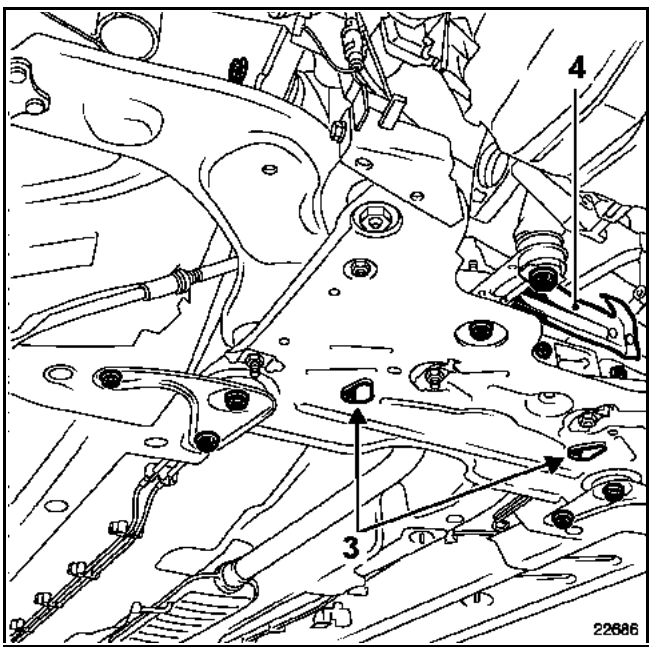
Slacken the sub-frame tie-rod mounting bolts on the body.



GETtheMANUALS.org

Remove:
– the two bolts from the exhaust heat shield at (3),
– the acoustic tie-rod bolts,
– the sub-frame rear mounting bolts.

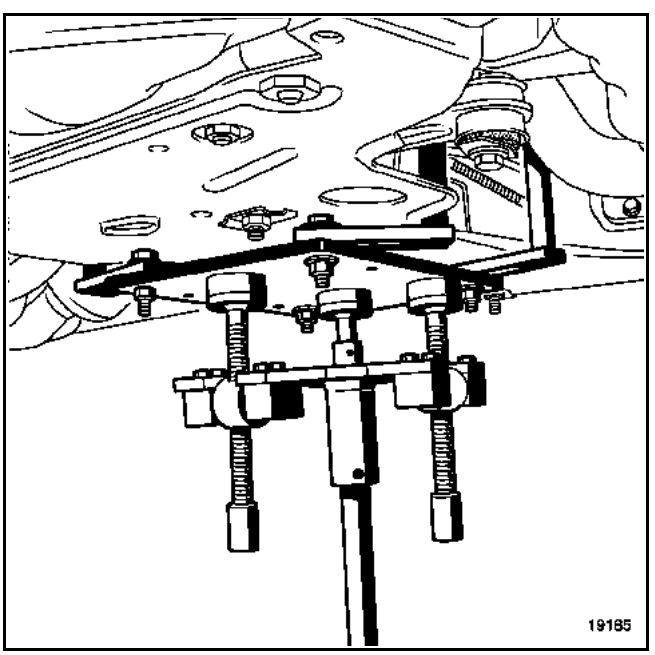
Release:
– the rear brake hoses on the sub-frame,
– the torque reaction arm,
– the heat shield on the steering rack,



– the heat shield (4) to release the ABS wiring harness and the brake fluid supply hose fitted on the sub-frame.

Tilt the sub-frame and remove the bolts from the steering rack.

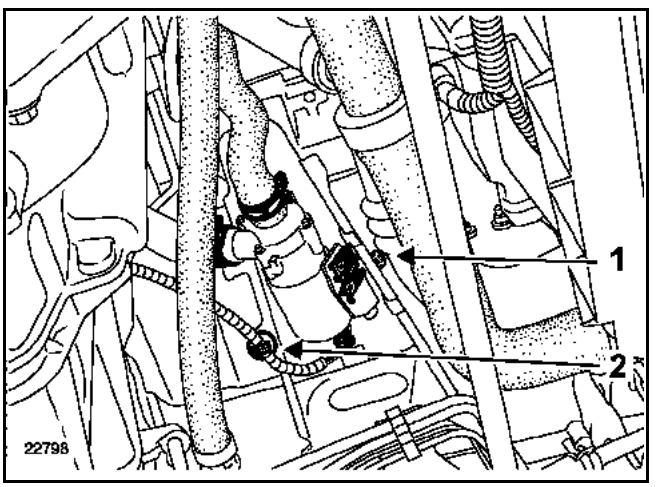
Place a component jack under the sub-frame.



Fit the steering rack.

Remove:
– the two sub-frame tie-rods (on the left-hand side: release the hoses on the tie-rod) or remove the bolt from the tie-rod fitted on the sub-frame,
– the engine sub-frame,
– the catalytic converter mounting stay.

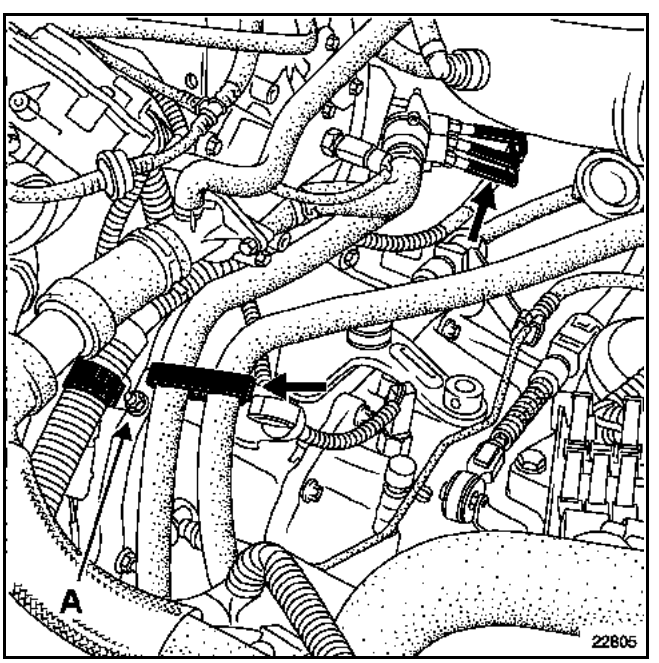
Release the coolant pump (nut 1) with its wiring harness at (2), (without removing the coolant pipes). Fasten it.



Release the coolant pipe.

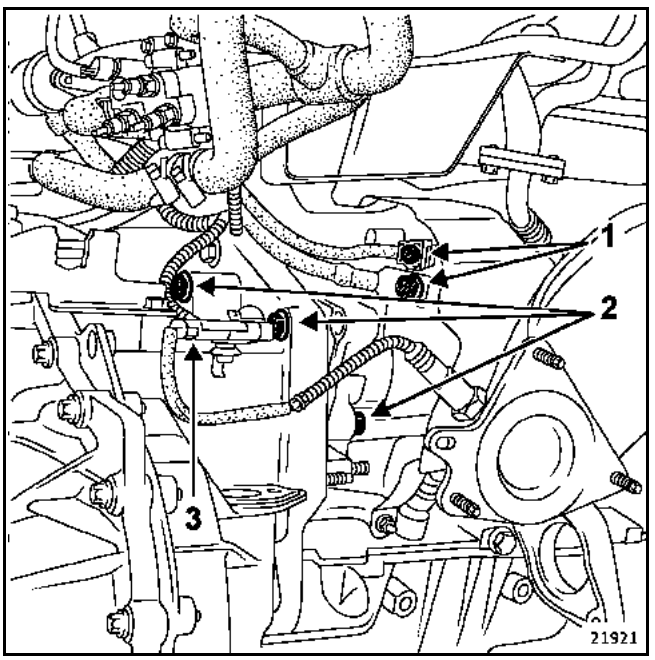
Remove the electric wiring harness on the thermoplunger plugs.

Remove the nut (A) to release the electric wiring harness.



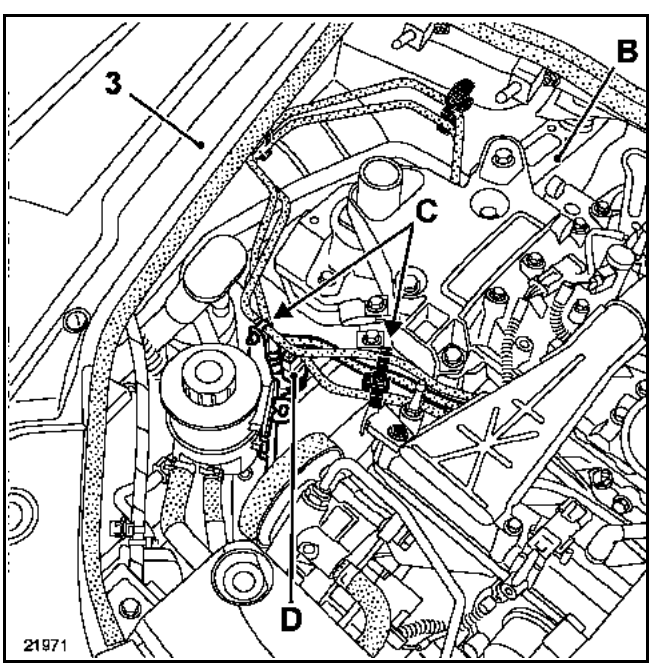
GETtheMANUALS.org

Remove:
– the connections (1) to the starter,
– the starter bolts (2),
– the oxygen sensor connections (3),



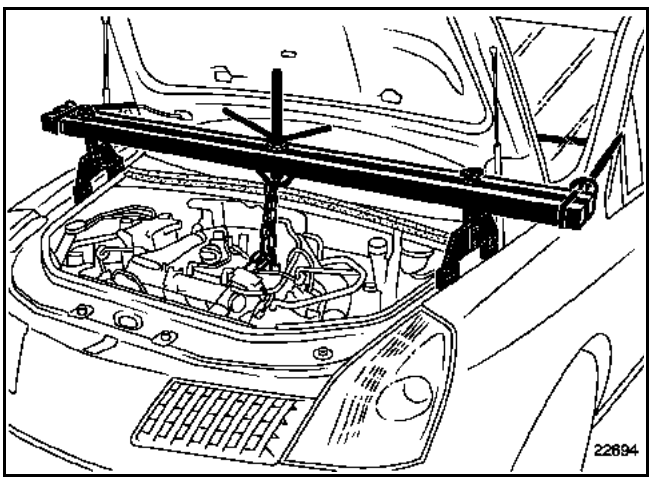
– the torque reaction arm (B) fitted on the suspended engine mounting.

Release:
– the mounting bracket hoses (C),
– the petrol vapour absorber solenoid valve (D).



Remove the two side covers (3).

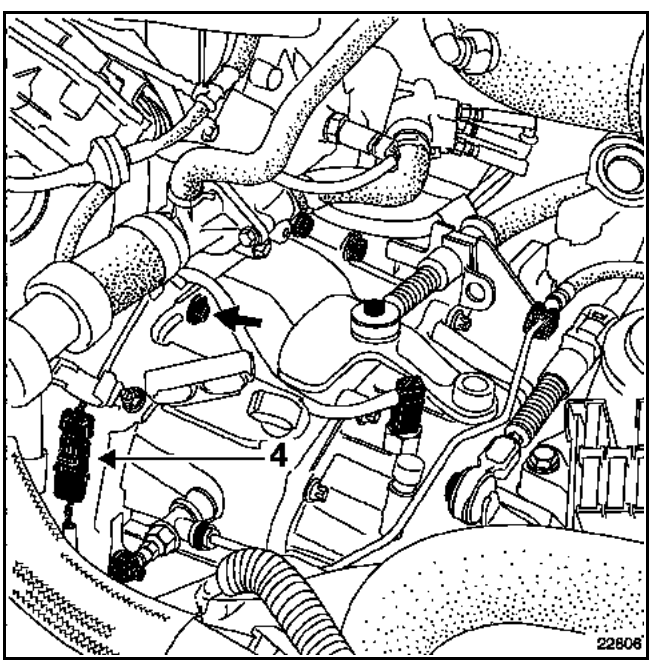
Position the engine support tool **Mot. 1453** with the retaining straps.



Remove the connections (4).

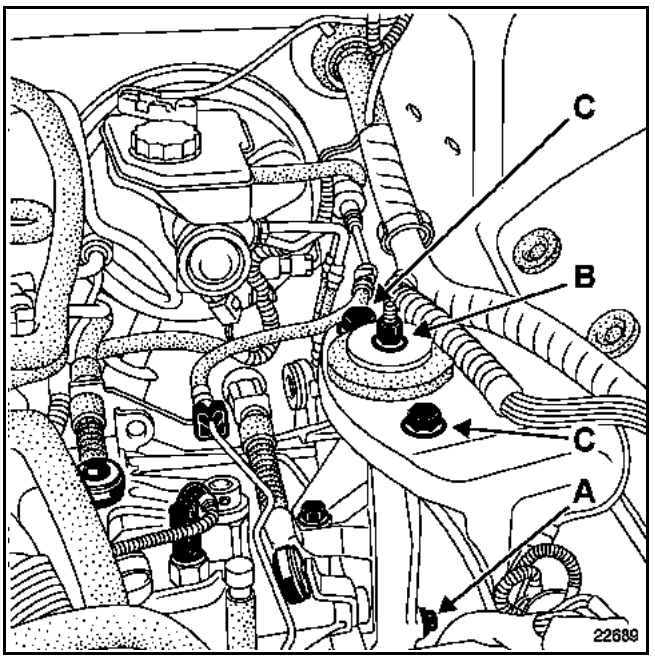
Remove the upper mounting from the gearbox.

Remove the electric wiring harness assembly.



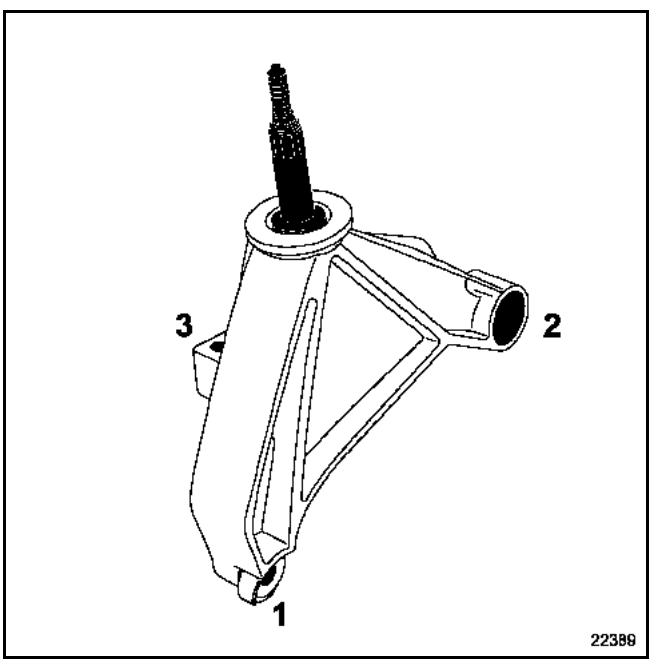
GETtheMANUALS.org

Remove:
– the power assisted steering pipe retaining bolt (A),
– the gearbox mounting nut (B),
– the two bolts for the rubber mounting (C),
– the rubber mounting.



Tilt the engine and gearbox assembly.

Remove:
– the gearbox mounting,



– the last bolt (2) from the starter (push back the starter and fasten it).

Position the hydraulic jack.

Remove:
– the lower mountings of the gearbox.
– the gearbox (remove the power assisted steering pipes taking care not to damage them).

REFITTING

If the clutch has been removed, refer to **Section 20**.

Ensure that the engine/gearbox centring stud is fitted.

IMPORTANT:
Do not coat the clutch shaft splines.

Refit the gearbox support tightening the mounting bolts in the correct order.

Refitting is the reverse of removal.

Refill:
– the gearbox (see the Technical Note on **Lubricants**),
– the brake fluid reservoir.

Bleed the clutch system (see **Section 37A: Clutch master cylinder**).

IMPORTANT:
Ensure the brake pipes are correctly secured to the shock absorber bases.

GETtheMANUALS.org

IMPORTANT:

- Battery: reinitialize the electrical components (see **Section 80A: Special notes on the battery**).
- Adjusting the front axle geometry (see **Section 07B: Adjusting the axle assemblies**).
- If the vehicle is fitted with Xenon lamps, reinitialize the computer and the body height sensor (see **Section 80C: Headlights with Xenon bulbs**).
- If the vehicle is fitted with range finding equipment, reinitialize the range finder (see **Section 83D: Adaptive cruise control**).

GETtheMANUALS.org

REPLACEMENT

This operation is carried out after the gearbox has been disconnected from the engine.

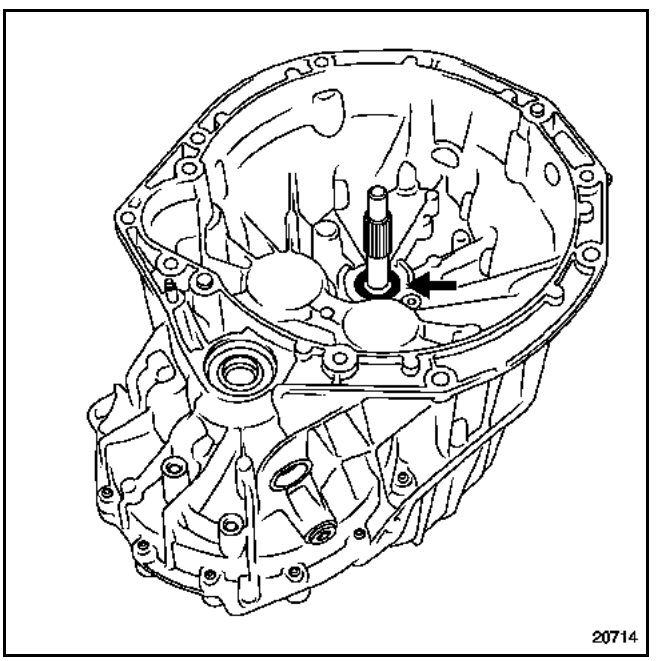
SPECIAL TOOLING REQUIRED	
B. Vi. 1236	**Primary shaft oil seal fitting tool**

REMOVAL

Using a ∅ **2.5 mm** drill bit, drill a hole in the gasket.

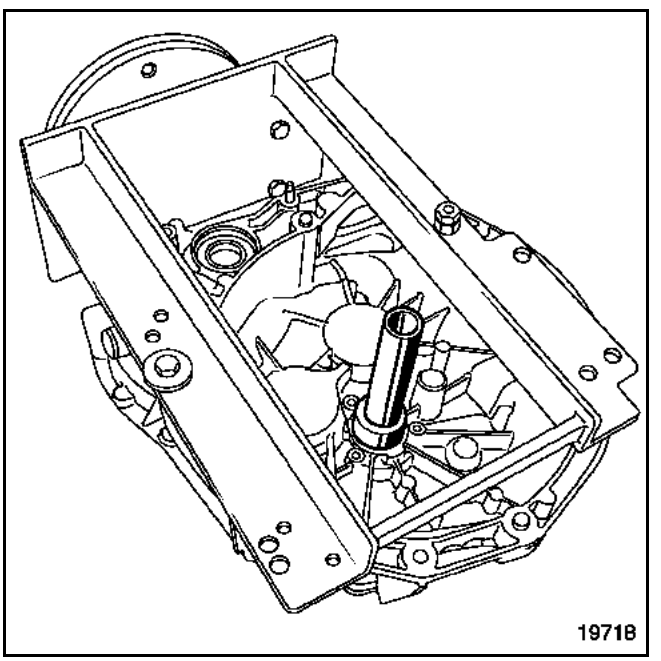
WARNING: DO NOT SCRATCH THE SHAFT OR THE SEAL BEARING SURFACE.

Insert a screw into the seal and extract the seal using a pair of pliers.



REFITTING

Fit a new seal along with its protector using tool **B. Vi. 1236**.



Remove the protector.

Refit the guide tube.

GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
B. Vi. 1630	Mandrel for fitting differential seal for PK gearbox
B. Vi. 1235	Mandrel for fitting differential seal for PK gearbox

TIGHTENING TORQUES (in daNm)		
Shock absorber base mounting bolts	M16x200	18
Wheel bolt		11

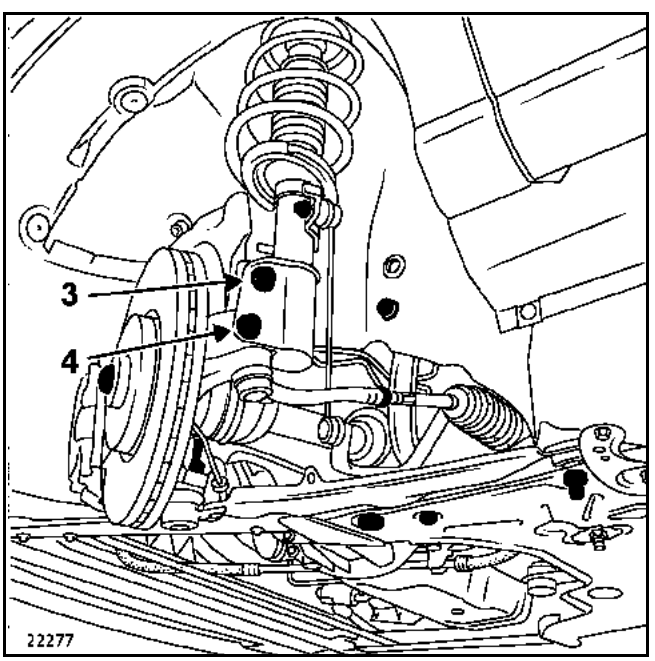
CONSUMABLES
Loctite FRENBLOC: Brake calliper mounting bolt **MOLYKOTE BR2:** Right-hand sunwheel splines

REMOVAL

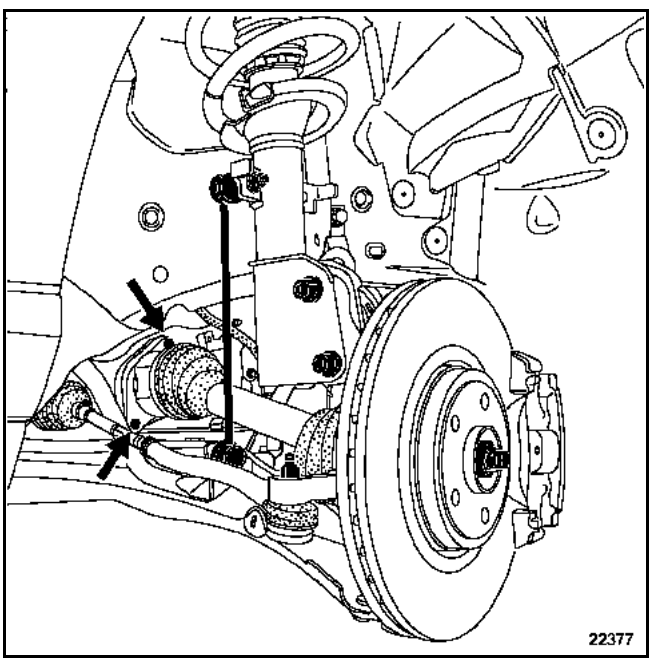
Remove the engine undertray.

Drain the gearbox.

Remove:
– the wheel arch liner side protectors,
– the front right-hand wheel,
– the upper bolt (3) of the shock absorber base and slacken the lower bolt (4),
– the wheel speed sensor,



– the intermediate bearing flange.



Tilt the stub axle carrier and disconnect the driveshaft (take care not to damage the gaiters during this operation - see **Section 29**).

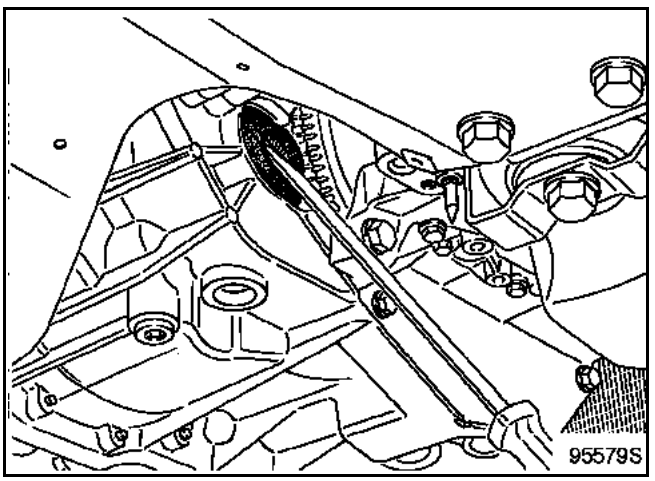
GETtheMANUALS.org

REPLACING THE SEAL

Remove the O-ring from the sunwheel.

Tap the base of the lip seal using a drift and a small hammer to pivot it in its housing.

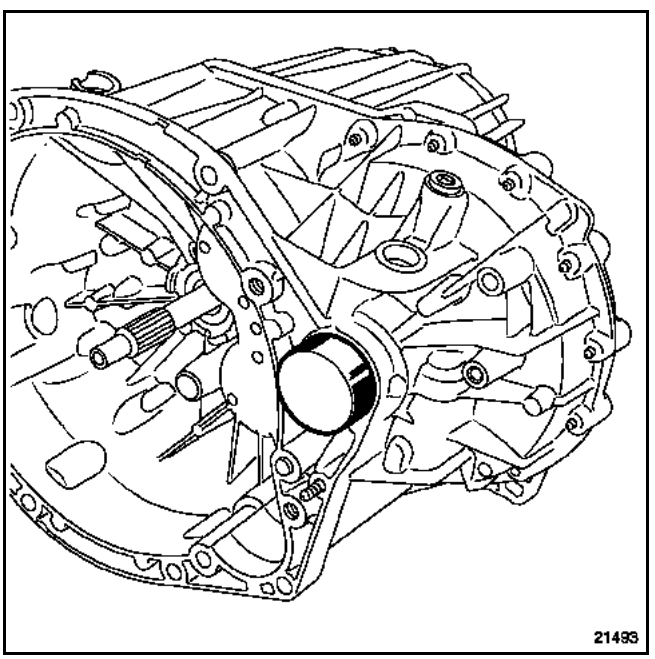
Then dislodge the seal using pliers taking care not to damage the splines of the sunwheel.



REFITTING

Fit the new seal using tool **B. Vi. 1235**.

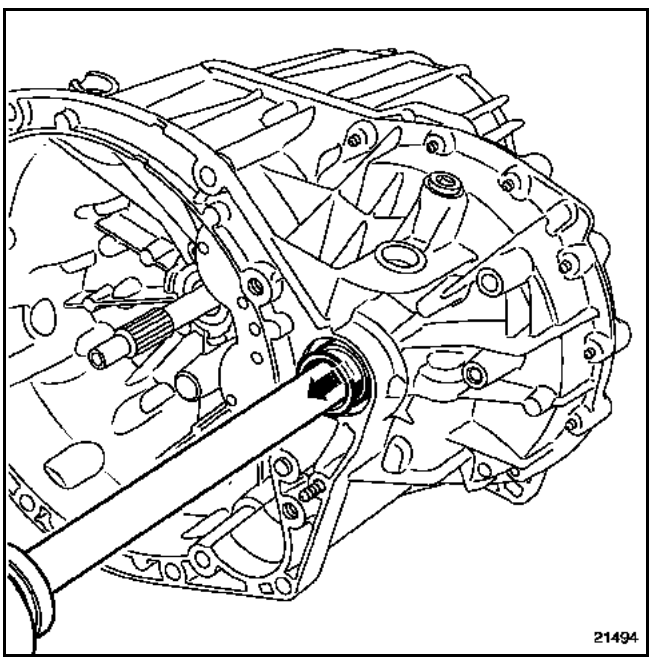
NOTE:
Do not lubricate the seal.



Refit the driveshaft in the reverse of removal.

For vehicles fitted with new seals, refit them using **B. Vi. 1630**.

Then gently remove the protective ring to clip it in the neck of the driveshaft.



Top up the level of the gearbox (see Section **21: Lubricants**).

GETtheMANUALS.org

SU1

Automatic transmission identification plate.

B Year of fabrication
C Month of production (Eg.: A = 1, B = 2.... M = 12, except I)
D Gearbox model (55-50 SN)
E Sequential number for one month's production.
F Automatic gearbox suffix

GETtheMANUALS.org

SU1				
Suffix	**Vehicle type**	**Engine**	**Step down**	**Final drive**
001	**BJ0J**	**P9X701**	**56/57**	**25/61**
010	**BJ0V**	**V4Y701**	**56/57**	**25/61**

GETtheMANUALS.org

SPECIFICATIONS

Weight: **90 kg**

VEL SATIS is fitted with an automatic gearbox **SU1** equipped with Shift Lock and Lock Up systems.

The aim of the Shift Lock is to prevent the gear selector lever from being moved without the brake pedal simultaneously being depressed. **For repair operations when the battery is faulty, refer to the notice on board the vehicle.**

The aim of the Lock Up is to connect the automatic gearbox directly to the engine. This function is carried out by a mini "clutch" in the converter. Lock Up is controlled by the automatic transmission computer.

As the automatic transmission is lubricated under pressure, lubrication is only provided when the engine is running.

Consequently, and to avoid serious damage, it is essential to comply with the following instructions:

– never coast the vehicle with the ignition off (i.e. when going down a hill), we cannot stress enough the damage that this may cause,
– never push the vehicle (i.e. to reach a petrol station, except when following the precautions in the **Towing** section).

In addition, the vehicle can only be driven if the engine is running. It is therefore impossible to start the engine of a vehicle with an automatic gearbox by pushing the vehicle.

TOWING

The vehicle should, in preference, be towed in all cases on a tow truck or with the front wheels raised.

However, if this is not possible, the vehicle may as an exception be towed at a speed below **12 mph (20 km/h)** for a maximum distance of **20 miles (30 km)** (lever in N).

IMPORTANT

TOWING WEIGHT (towing a caravan, boat, etc.).

The towed weight must be no more than:

1300 kg for **SU1** automatic transmission.

Exceeding this maximum load on a gradient of **7%** will cause the engine oil and gearbox oil maximum oil temperature to be passed, resulting in a drop in oil pressure and therefore quickly damaging the engine and gearbox.

GETtheMANUALS.org

SU1

Description	Component concerned
MOLYKOTE BR2 grease	Driveshaft relay shaft splines Converter centrer

Parts to be systematically replaced

Parts to be replaced when they have been removed:
– self-locking nuts,
– gaskets,
– rubber seals,
– converter bolts.

GETtheMANUALS.org

SU1

The oil level should be checked every **6000 miles (10 000 km)** in case there is a slight oil leak.

It is only necessary to top up the level in the event of a slight leak.

Capacity in litres

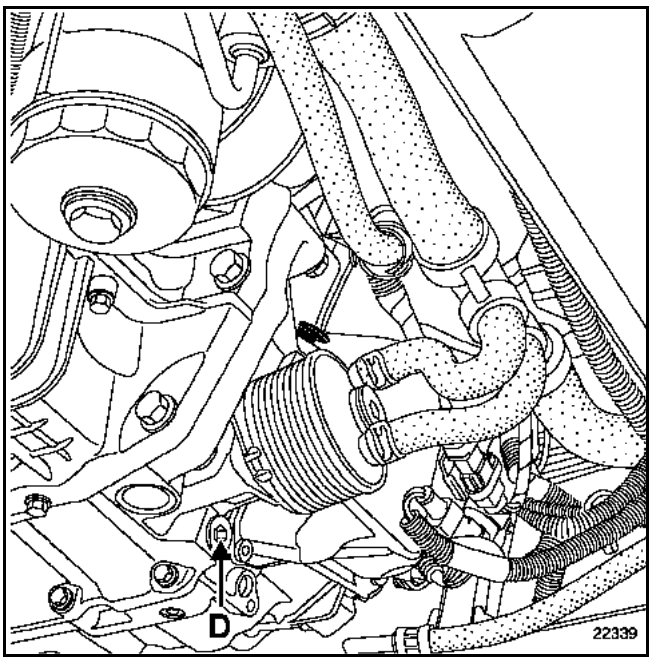
	Mechanism
Total volume*	7.6

* Quantities are given as guidelines. They may vary depending on the temperature.

GETtheMANUALS.org

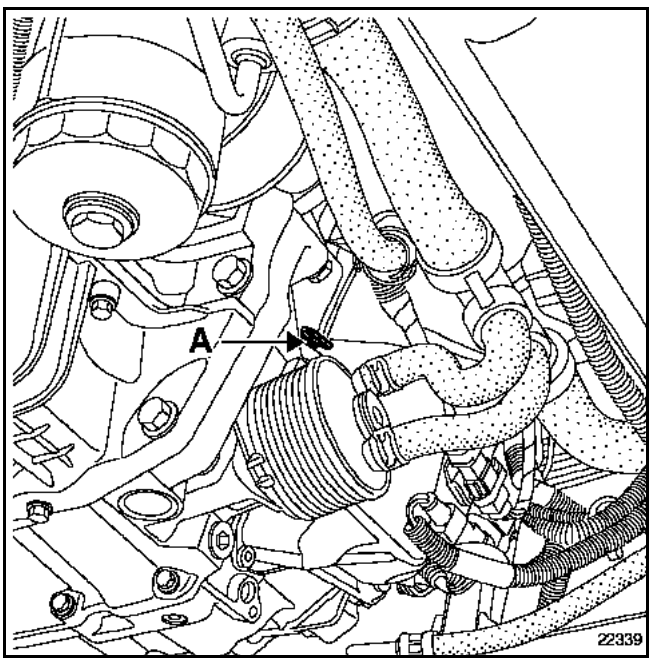
DRAINING

Oil change is carried out through cap (D).



GETtheMANUALS.org

Filling is carried out through gauge hole (A).



Use a funnel with a **15/100** filter to prevent impurities from entering the system.

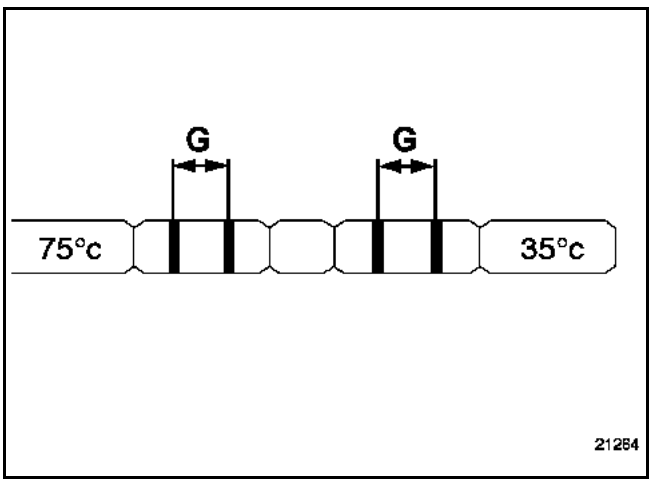
The level MUST be checked following the method described below:

1 Place the vehicle on level ground.
2 Fill up the automatic transmission with the same quantity of oil as that measured when draining the oil, to reach an approximate level (about **3.3 litres**).
3 Run the engine at idling speed.
4 Connect the diagnostic tool and establish dialogue with the automatic transmission computer.
5 When a temperature of **75°C ± 1°C** is reached, remove the gauge, the level should be in the area between the two upper graduations (G) (on the **75°C** side).

   If it is not, add oil with the engine running (ensure that the oil is checked at **75°C** and check the level again).

NOTE: the dipstick has a reading at **35°C**, this can only be used for checking and topping up the oil when the engine is running. It is essential to confirm this using the diagnostic tool.

G = maximum level zone



GETtheMANUALS.org

Put the vehicle on a two-post lift.

Lift the vehicle until the wheels are raised off the ground by a few centimetres.

Connect the diagnostic tool.

Establish dialogue with the automatic transmission computer

Monitor the transmission oil temperature parameter.

The check should be carried out when the oil temperature is between **60ºC** and **80ºC**.

Start the engine and put the lever in (D).

Monitor the engine speed parameter:

Establish dialogue with the computer.

Accelerate fully keeping the brakes on.

The front wheels should not rotate.

WARNING: Full load should not be maintained for more than **five seconds**. Beyond this, there is a **high risk of destroying** the converter or the automatic gearbox.

IMPORTANT: Once the measurement has been taken, release the accelerator and **keep the brakes applied until the engine speed is stabilised at idle speed** (risk of damage to the automatic transmission if this is not done).

The engine speed should stabilise at:

P9X 701: 2400 ± 150 rpm

V4Y 701: 2750 ± 150 rpm

A setting point outside the tolerance requires the converter to be replaced.

NOTE: a setting point which is too low may be associated with a lack of engine power.

GETtheMANUALS.org

TIGHTENING TORQUES (in daNm)	
Cover mounting bolt	1.2
Induction cover mounting bolt	1
Distributor mounting bolt	1
Dipstick mounting bolt	0.5

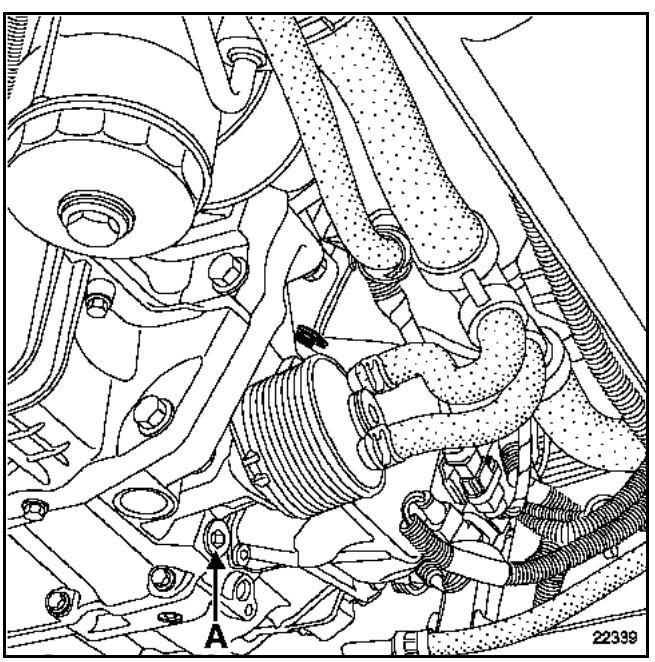
REMOVAL

Put the vehicle on a two-post lift.

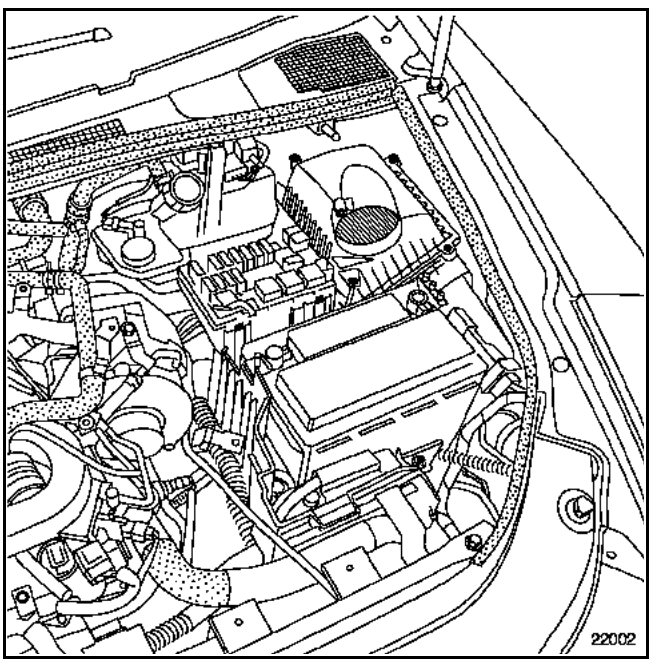
Disconnect the battery.

Remove the engine undertray.

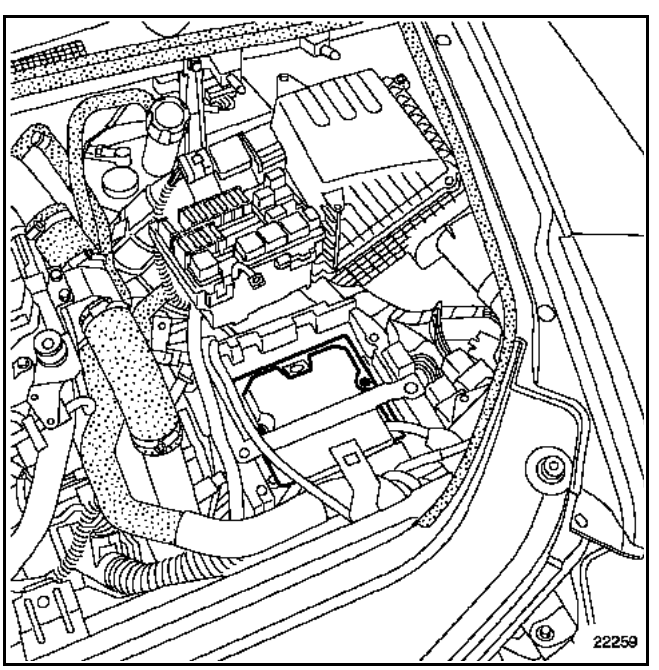
Drain the automatic transmission through the plug (A).



Remove:
– the battery;
– the fuse box,
– the automatic transmission computer,
– the battery mounting.



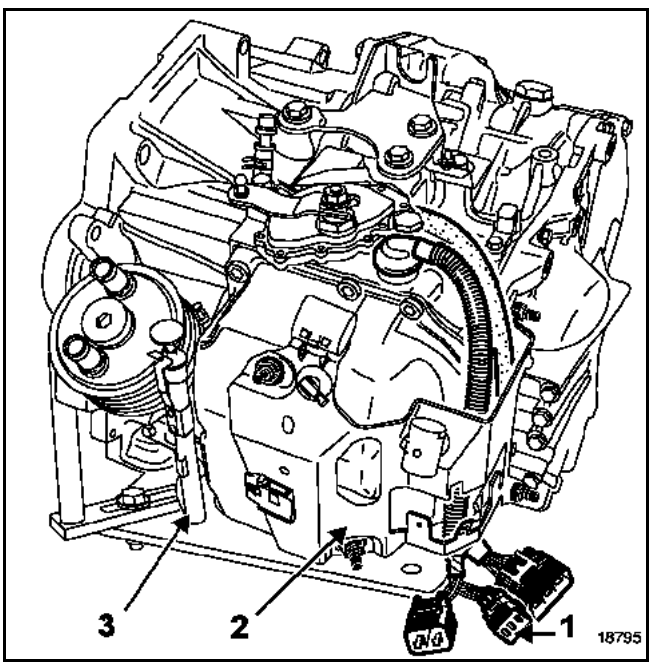
Release:
– the injection computer,
– the injection computer tray.



GETtheMANUALS.org

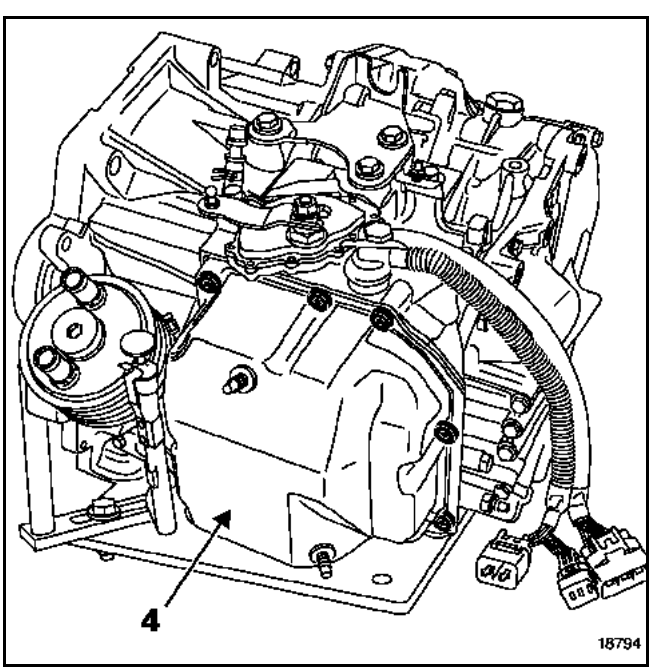
Disconnect the harness (1).

Remove:
– the wiring channel support (2) and release it,
– the engine undertray.



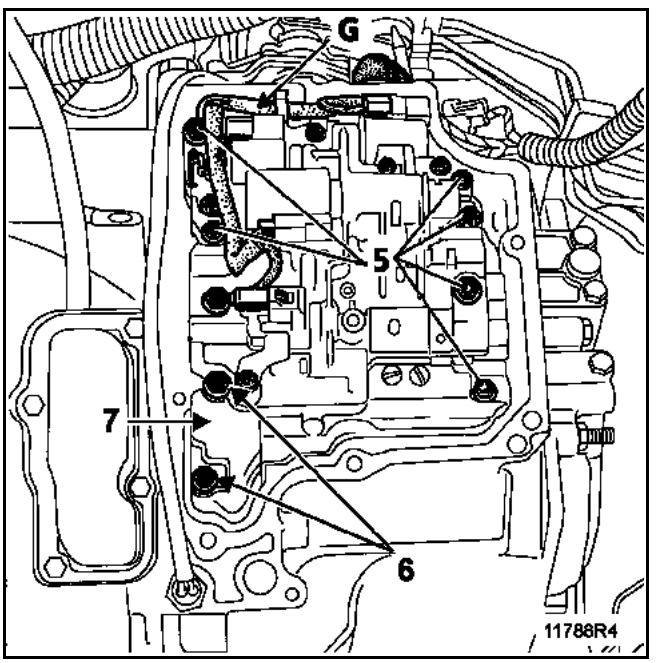
Place a clean container under the automatic gearbox to collect the oil.

Remove the housing (4) from the hydraulic distributor, by releasing it with a very thin blade (without damaging the contact surfaces).



Disconnect and separate the bulkhead (G).

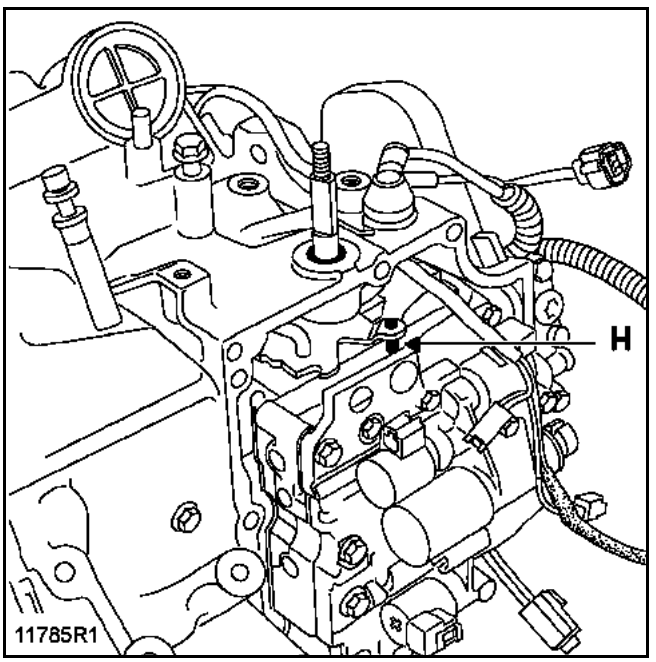
Remove:
– the six mounting bolts (5) of the hydraulic distributor,



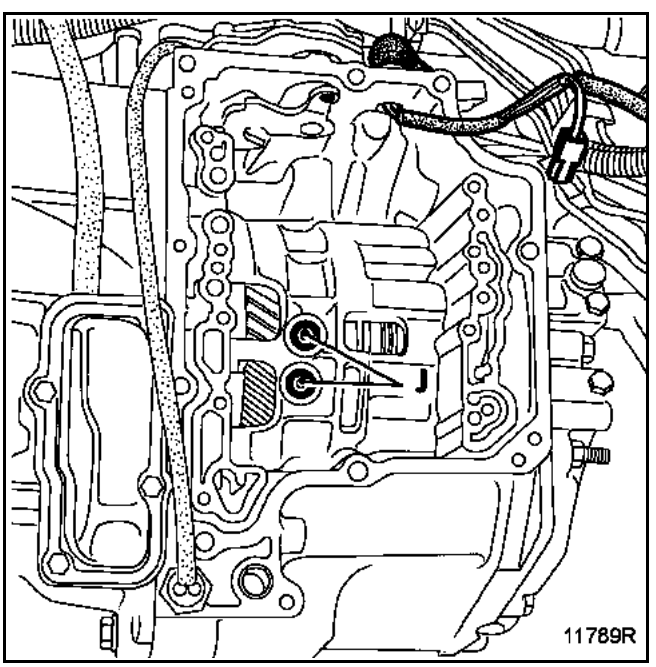
– the mounting bolts (6), the induction cover (7) and the paper gasket,

GETtheMANUALS.org

– the distributor by tilting it slightly in order to release the control (H) from the automatic gearbox selector,



– the two seals (J) ensuring that no dirt enters the automatic gearbox.



REFITTING

Clean the sealing surfaces on the automatic gearbox, taking care not to damage the surface.

Clean the sealing surfaces of the hydraulic distributor housing.

Clean the bolts of the hydraulic distributor, ensuring that all remaining glue particles are removed.

The seals (J) and the paper gasket of the induction cover must be replaced.

Refit in the reverse order to removal.

Tighten the bolts of the distributor to the recommended torque.

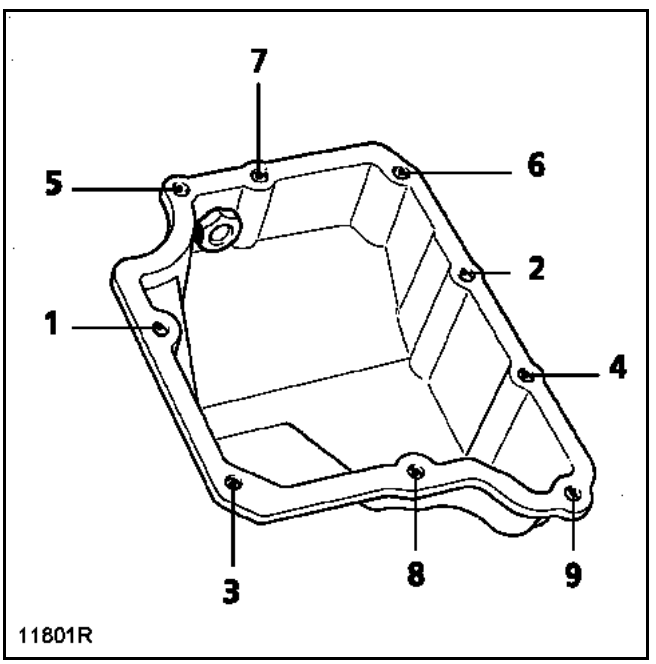
WARNING: the bolts are of different lengths.

GETtheMANUALS.org

Clean the surfaces of the automatic gearbox housing.

Apply a bead of **LOCTITE FRENETANCH** of approximately **3 mm** thickness.

Put a drop of **Loctite FRENETANCH** on the bolts of the hydraulic distributor housing and tighten them to the recommended torque in the order shown below.



Fill the automatic gearbox with oil, following the instructions (see relevant section).

GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Mot. 1367	Engine retaining device
Mot.1367-02	Engine support
T. Av. 476	Ball joint extractor
Mot. 1372	Set for removing tamperproof screws

EQUIPMENT REQUIRED
Hydraulic jack

TIGHTENING TORQUES (in daNm)	
Wheel bolt	11
Brake caliper mounting bolt	10.5
Steering ball joint nut	3.7
Lower ball joint nut	11
Shock absorber base bolt	18

Suspended mounting screw on box	6.2
Front left side member bolt	4.4
Sub-frame/engine tie-bar bolt	10.5
Starter mounting bolt	4.4
Engine/engine tie-bar bolt	18
Gearbox edge bolt Ø 10	4.4
Gearbox edge bolt Ø 12	6.2
Gearbox edge nut	6.2
Gearbox edge studs	0.6
Torque converter starter plate	2 + 40°
Engine sub-frame	10.5
Steering shaft yoke mounting bolt	2.5

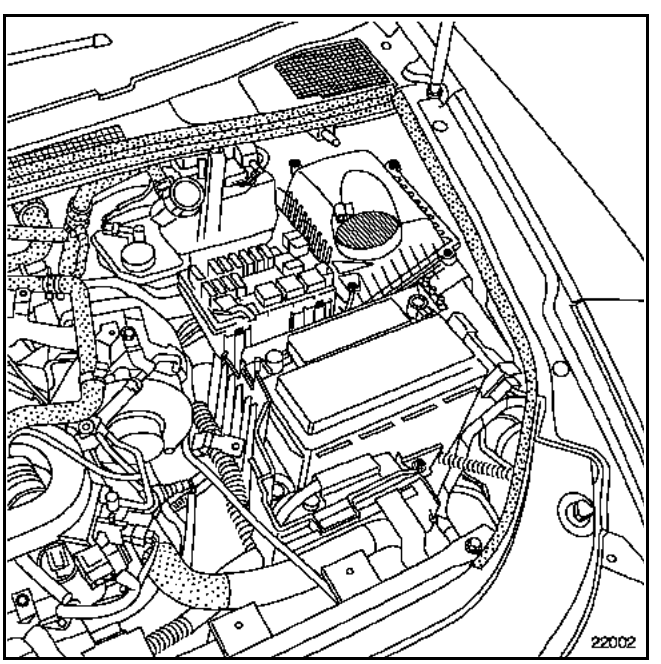
REMOVAL

This method applies only to the V4Y engine.

Put the vehicle on a two-post lift.

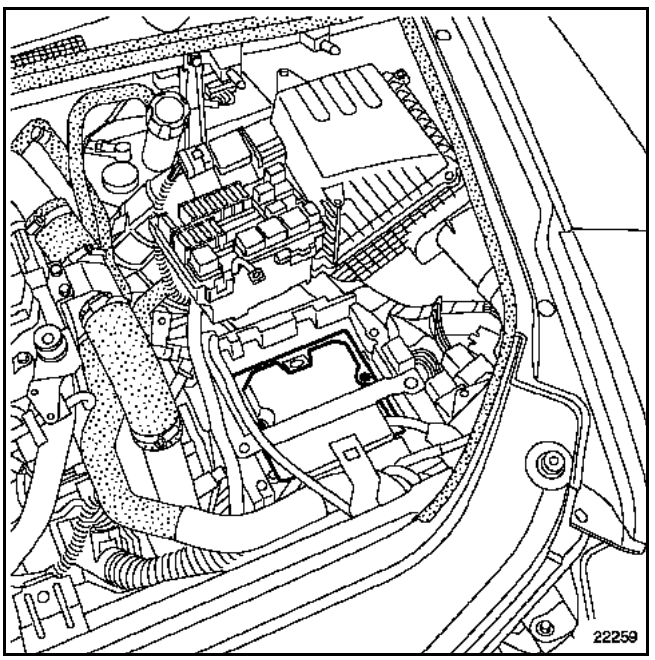
Disconnect the battery.

Remove:
– the front wheels,
– the style cover,
– the battery,
– the fuse box,
– the automatic transmission computer,
– the battery tray,
– the wiring harness from the battery tray,
– the air hose on the flowmeter,
– the air distribution unit and the flowmeter,
– the upper engine tie-bar.



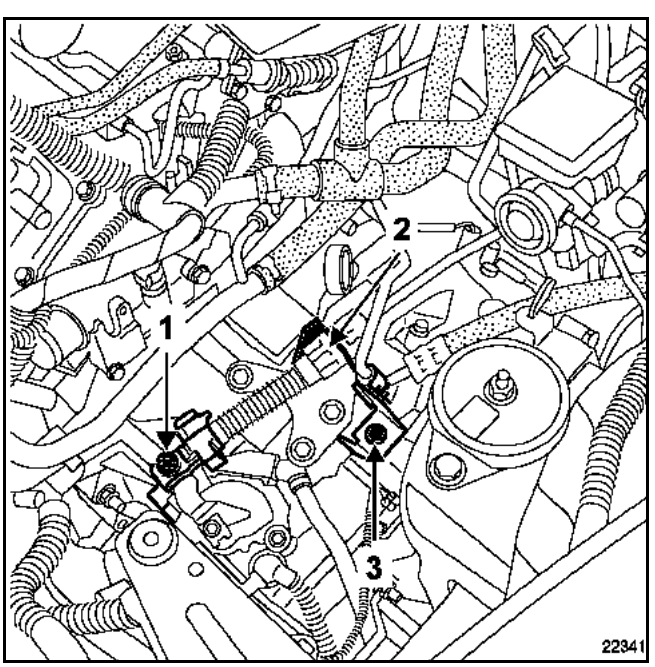
GETtheMANUALS.org

Remove the injection computer with its support from the side.



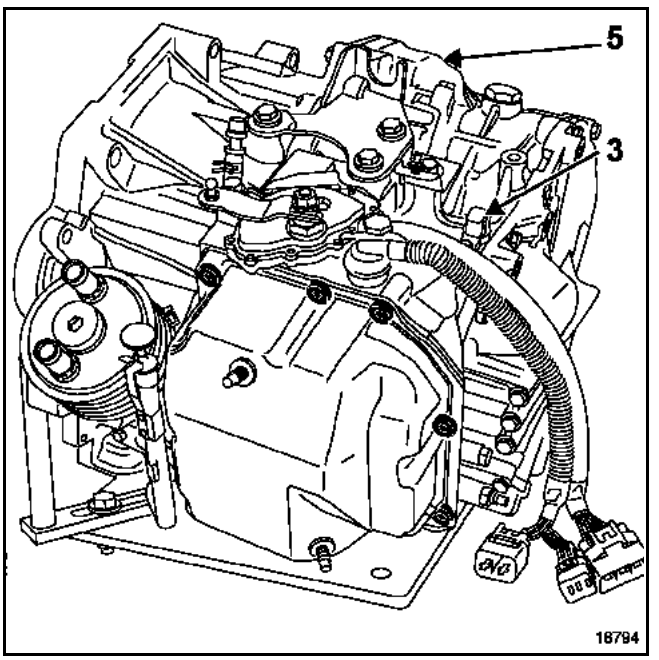
Disconnect:
– the ball joint (1) from the multifunction switch cable,
– the cable (2) of the multifunction switch by releasing the sleeve stop.

NOTE: do not move the orange ring during this operation. This could break during removal or refitting. If this happens, DO NOT REPLACE THE CONTROL CABLE, as its absence will not affect the operation of the system.



– remove the lug (3).

Disconnect:
– the input speed sensor connector (4),
– the output speed sensor connector (5).

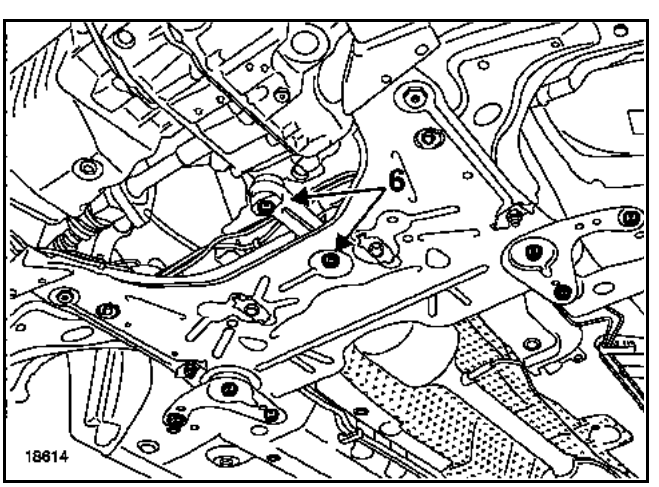


Fit the hose clamps and disconnect the water exchanger.

Remove the TDC located under the gearbox.

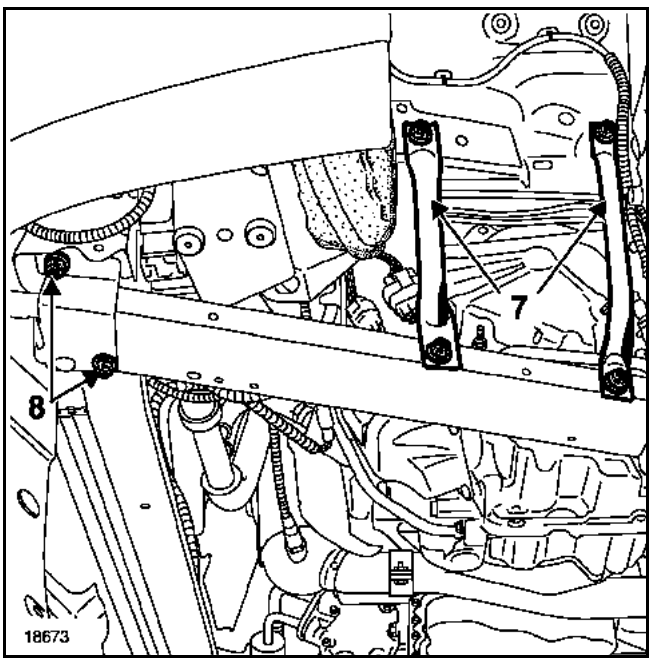
Unfasten the harness from the gearbox.

Remove:
– the TDC sensor,
– the engine undertray,
– the wheel arches,
– the left and right driveshafts,
– the engine tie-bar (6),



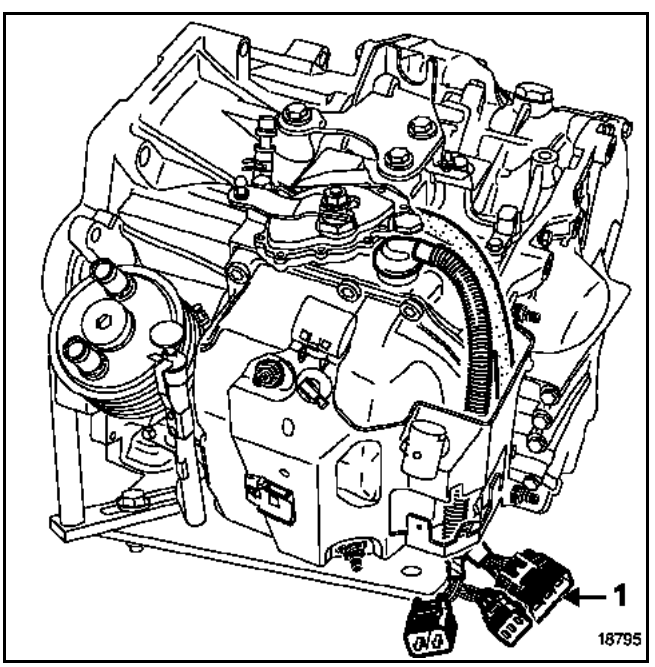
GETtheMANUALS.org

– the left-hand tie-rods (7),
– the aluminium side member (8).

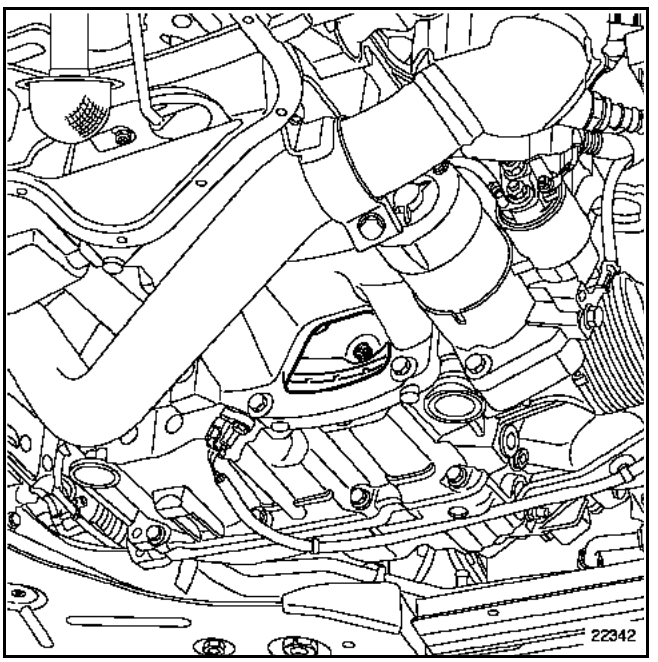


Remove the sub-frame (see **section 31**).

Release the automatic gearbox harness (1).



Remove the converter protection plate.

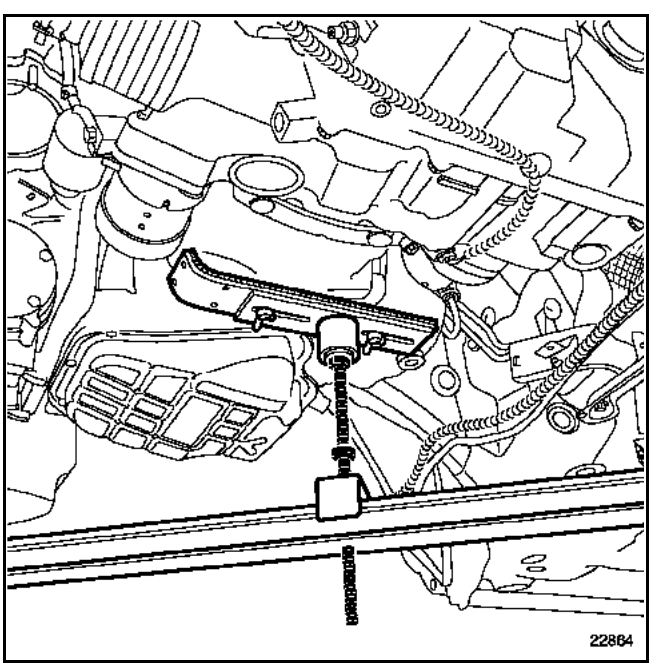


Rotate the crankshaft in a clockwise direction to access the six starter plate / converter connecting bolts and remove them.

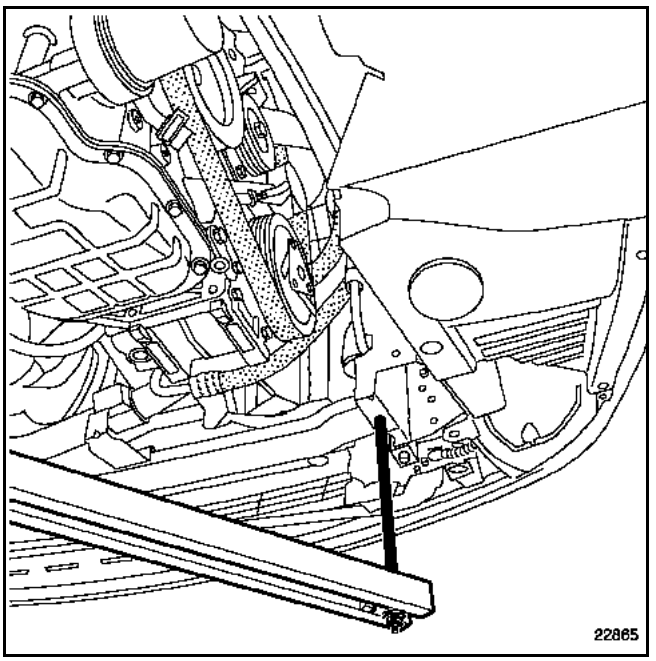
Remove the starter motor.

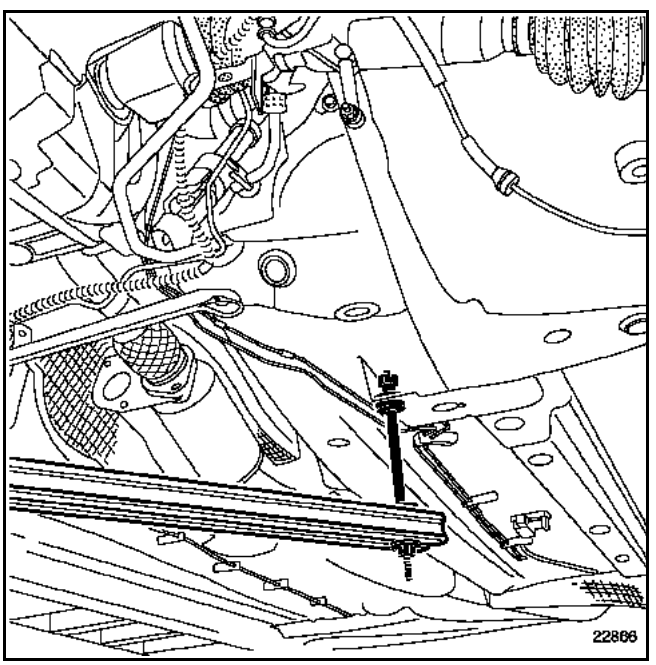
Remove the front precatalyzer (see **section 19B Exhaust**).

Put engine support tools **Mot. 1367 and 1367-02** in position.



GETtheMANUALS.org





IMPORTANT: the engine mounting must be positioned as illustrated.

Remove:
– the upper gearbox edge bolts and studs,
– the gearbox mounting,
– tilt the engine / automatic gearbox assembly as low down as possible.

IMPORTANT: Be careful not to damage the air conditioning compressor.

Position the hydraulic jack.

Remove the lower gearbox edge bolts and studs.

Disconnect the automatic gearbox from the engine, taking care not to release the converter.

GETtheMANUALS.org

REFITTING

Put the vehicle and automatic gearbox in position D.

Refitting is the reverse of removal.

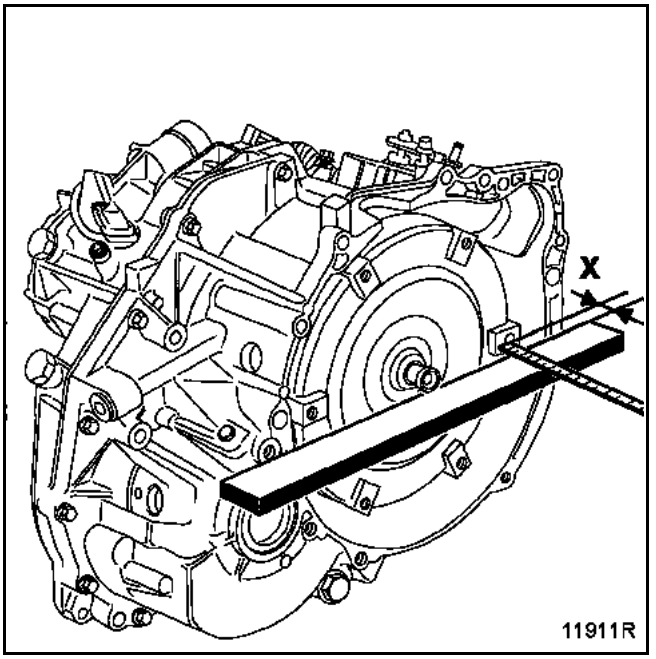
Special notes:

Check that the starter plate is not damaged (**warping tolerance 0.2 mm** on the external diameter).

Check that there is a centring dowel on either side of the cylinder block.

Using **MOLYKOTE BR2**, grease the converter centring pin in the crankshaft.

IMPORTANT: check that the converter is correctly inserted into the automatic gearbox using a flat rule and a tape measure. Check that the distance (X) between the stud and the rule is approximately 14 mm and that the contact surfaces are clean.



The six torque converter mounting bolts must be replaced.

Position the starter plate using a socket spanner on the crankshaft pulley.

Use the correct order when tightening the mounting bolts on the gearbox support (see section **19D Suspended engine mounting**).

GETtheMANUALS.org

NOTE: when refitting the driveshafts, ensure that they are inserted straight so as not to damage the differential seals.

TIGHTEN ALL THE BOLTS, NUTS AND STUDS TO THE RECOMMENDED TORQUE.

Check and if necessary adjust the control cable (see relevant section).

GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Mot.1202-01	Pliers for large hose clips
Mot.1202-02	Pliers for large hose clips

REMOVAL

This method applies only to the P9X engine.

During this operation, the vehicle must be secured to the lift with a strap to prevent it from becoming unbalanced.

Refer to Section 02 Underbody lift for positioning the belt.

REMOVING/REFITTING THE AUTOMATIC GEARBOX requires the removal/refitting of the engine and gearbox assembly (See section 10A: engine and lower engine assembly "Engine and gearbox").

NOTE: to assist separation of the engine and the gearbox, it is advisable to remove:
– the converter bolts (A) and the gearbox edge lower bolts (B) before removing the engine and gearbox assembly.

GETtheMANUALS.org

REFITTING

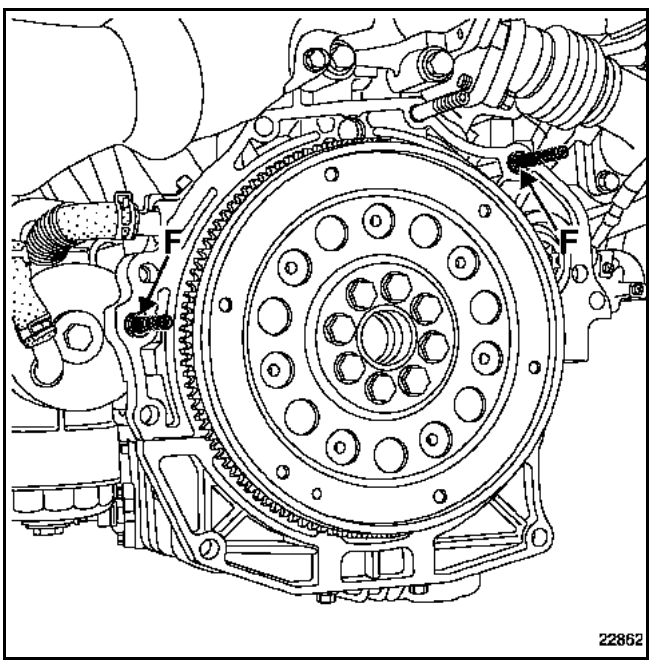
Put the vehicle and automatic gearbox in position D.

Refitting is the reverse of removal.

Special notes:

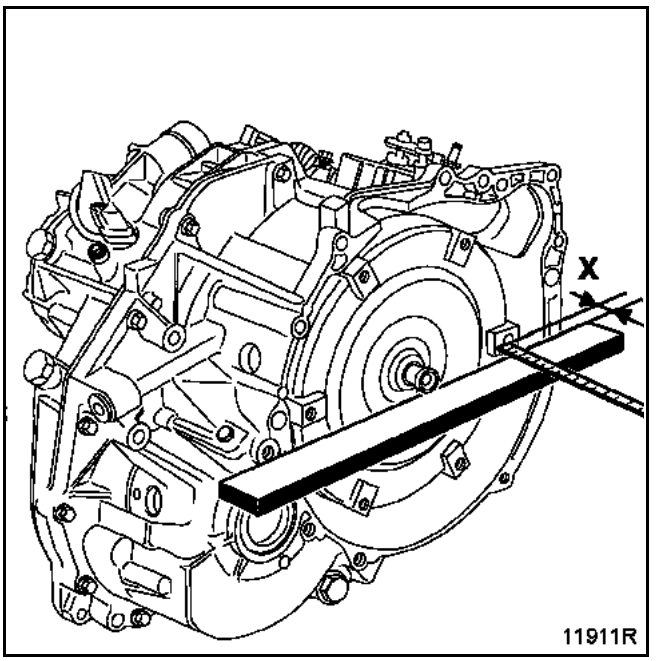
Check that the starter plate is not damaged (**warping tolerance 0.2 mm** on the external diameter).

Check for the presence of the centring dowels (F).



Using **MOLYKOTE BR2**, grease the converter centring pin in the crankshaft.

IMPORTANT: check that the converter is correctly inserted into the automatic gearbox using a flat rule and a tape measure. Check that the distance (X) between the stud and the rule is approximately 26.5 mm and that the contact surfaces are clean.



The six torque converter mounting bolts must be replaced.

Position the starter plate using a socket spanner on the crankshaft pulley.

Use the correct order when tightening the mounting bolts on the gearbox support (see section **19D Suspended engine mounting**).

GETtheMANUALS.org

NOTE: when refitting the driveshafts, ensure that they are inserted straight so as not to damage the differential seals.

TIGHTEN ALL THE BOLTS, NUTS AND STUDS TO THE RECOMMENDED TORQUE.

Check and if necessary adjust the control cable (see relevant section).

GETtheMANUALS.org

TIGHTENING TORQUE (in daNm and/or º)	
Starter plate bolt	4.5 + 50° ± 5°

This operation can only be performed after having removed the automatic gearbox (see relevant section).

REMOVAL

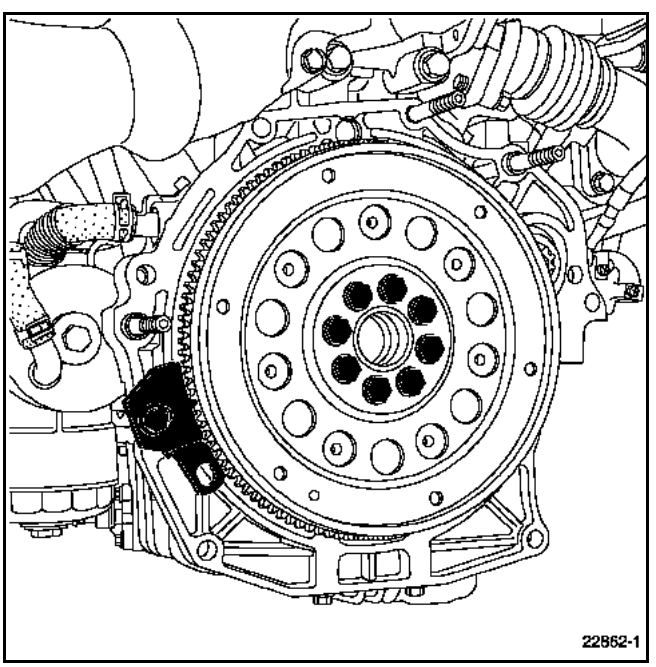
Remove:
– the eight bolts (V),
– the starter plate.



The maximum permissible warping on the starter plate is **0.2 mm** on the external diameter.

REFITTING

Fit the starter plate, ensuring it is correctly positioned in relation to the centring pin (3).

Insert the bolts into the starter plate and tighten them to the recommended torque (angular tightening).

Fit tool **Mot. 582** in order to lock the starter plate correctly.

TIGHTEN ALL THE BOLTS, NUTS AND STUDS TO THE RECOMMENDED TORQUE.

GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Mot. 1367	Engine retaining device
Mot.1367-02	Engine support
Mot. 1372	Set for removing tamperproof screws
T. Av. 476	Ball joint extractor tool
B. Vi. 1611	Differential output seal mounting tool

THIS METHOD APPLIES ONLY TO THE V4Y ENGINE.

REMOVAL

The removal/refitting of the automatic transmission is necessary for the replacement of the differential output seal.

To carry out this operation, refer to section **23A Automatic gearbox - Removing/refitting**.

NOTE: to make the gearbox oil change easier, it is advisable to carry out this operation before removing the automatic transmission from the vehicle.

To carry out this operation, refer to section **23A Automatic gearbox - Oil changes**.

REFITTING

The seal is inserted in position with tool **B. Vi. 1611.**

Guide the assembly until the tool is touching the automatic gearbox housing.

Refit the gearbox to the vehicle by referring to Section **23A Automatic gearbox - Removing/refitting**.

TIGHTEN ALL NUTS, BOLTS AND STUDS TO THE RECOMMENDED TORQUE.

Fill the automatic gearbox and check the level.

To carry out this operation, refer to section **23A Automatic gearbox - Filling up**.

GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
T. Av. 476	Ball joint extractor tool
B. Vi. 1611	Differential output seal mounting tool

TIGHTENING TORQUES (in daNm)	
Brake caliper column bolts	0.7
Lower ball joint nut	11
Shock absorber base bolt	18
Wheel bolt	11
Steering ball joint nut	3.7
Drain plug	2.2

The right-hand driveshaft must be removed to replace a differential output seal.

REMOVAL

Put the vehicle on a two-post lift.

Disconnect the battery.

Drain the automatic gearbox (see section **23A Automatic gearbox - Oil changes**).

Remove the faulty differential output seal using a screwdriver or a hook, taking care not to scratch the contact surfaces.

Warning: do not drop the spring of the seal into the automatic gearbox.

REFITTING

The seal is inserted in position with tool **B. Vi. 1611.**

Guide the assembly until the tool is touching the automatic gearbox housing.

Refitting is the reverse of removal.

TIGHTEN ALL NUTS, BOLTS AND STUDS TO THE RECOMMENDED TORQUE.

Fill up the automatic gearbox and check the level (see section **23A Automatic gearbox - Filling up**).

GETtheMANUALS.org

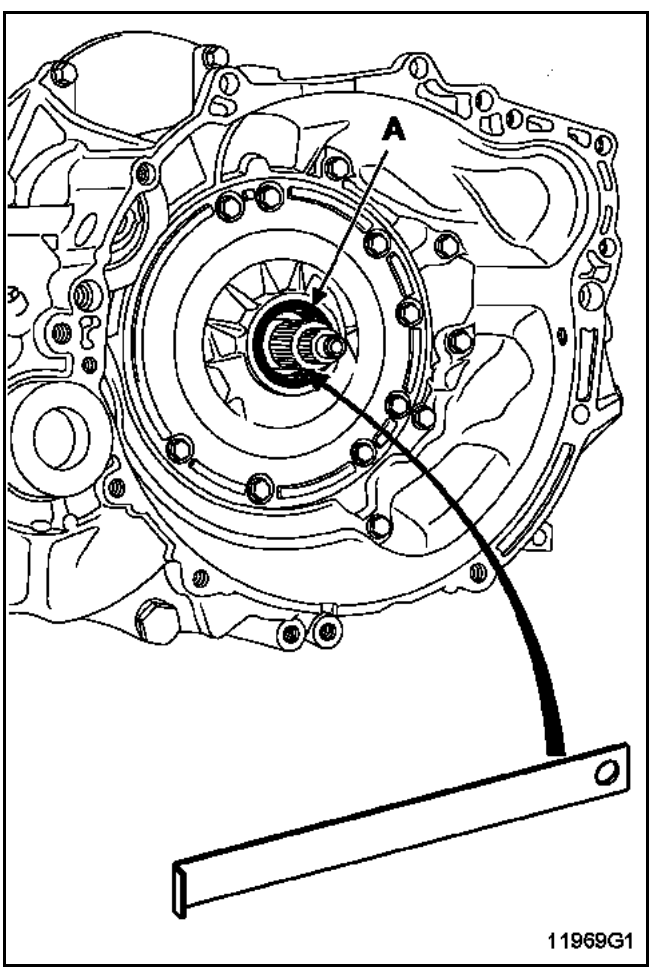
SPECIAL TOOLING REQUIRED	
B. Vi. 465	Tool for extracting a converter seal
B. Vi. 1402	Tool for centring a converter ring (from kit B. Vi. 1400-01)

This operation is carried out with the automatic gearbox removed.

REMOVAL

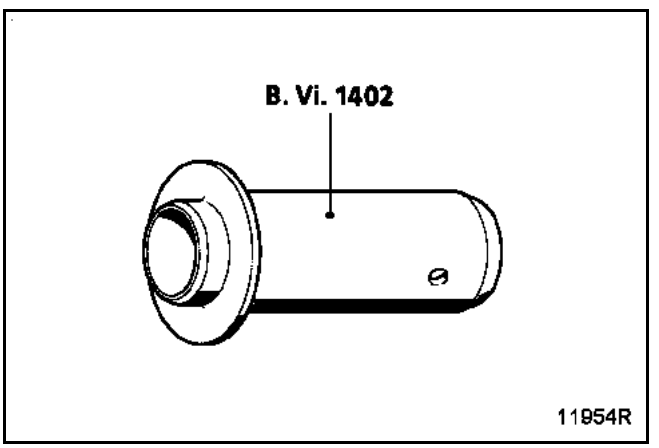
Remove:
– the converter,
– the sealing ring (A) using tool **B. Vi. 465,** with the ring marked 1, by inserting it straight and then turning it through approximately half a turn and extracting the seal by progressively tightening the extractor bolt.

IMPORTANT: TAKE CARE to remove the spring from the seal.



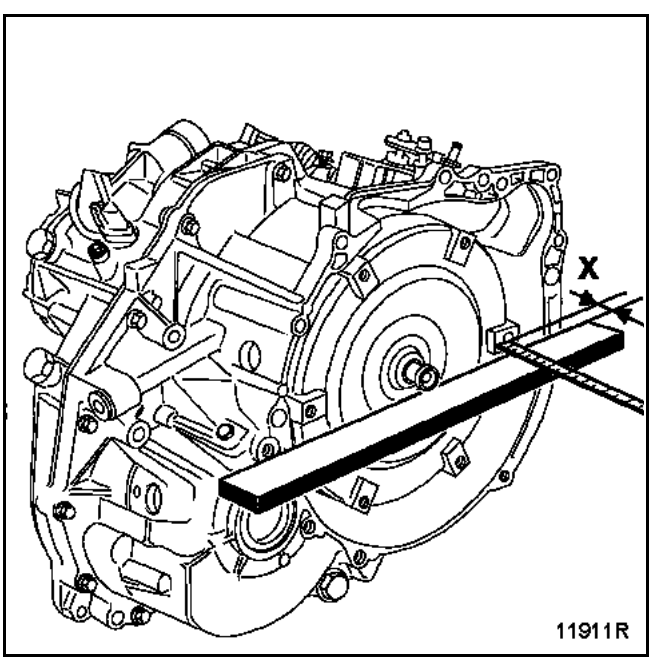
REFITTING

The lip seal (oiled) is inserted in position with tool **B. Vi. 1402**; take care not to introduce any dirt when inserting the seal.



Refit the converter, lubricating its channel with automatic transmission oil.

Check using a ruler: distance X must be approximately **14 mm** for the **V4Y** engine and **26.5 mm** for the **P9X** engine.



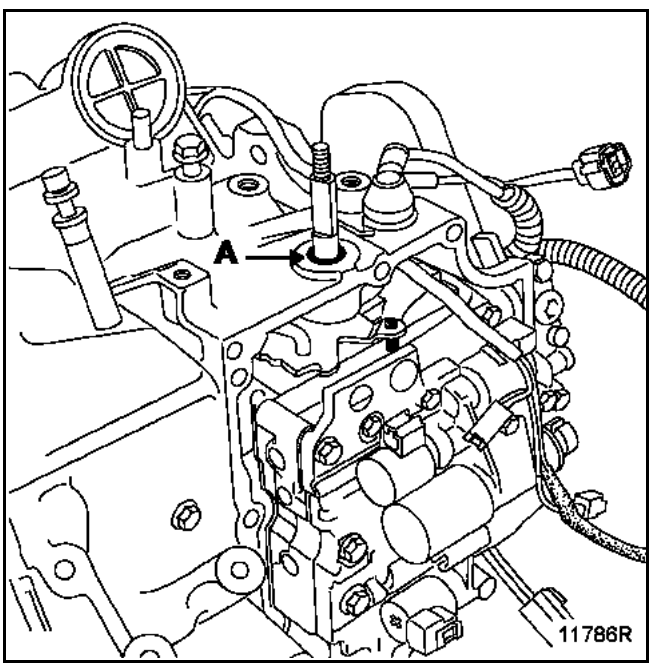
GETtheMANUALS.org

SPECIAL TOOLING REQUIRED
B. Vi. 1401 Guide tube

This operation is performed after having removed the multifunction switch (see relevant section).

REMOVAL

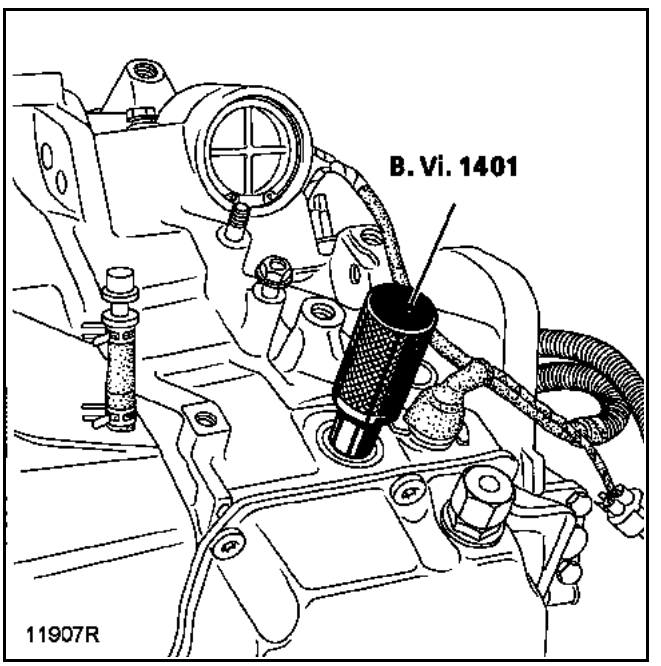
Remove selector shaft seal (A) using a small screwdriver, taking care not to damage the shaft and the seal face.



REFITTING

Refit the seal (lubricated with automatic gearbox oil).

Insert tool **B. Vi. 1401** and tap it gently with a rubber mallet to ensure it is inserted fully.



GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
B. Vi. 1612	Multifunction switch adjusting tool

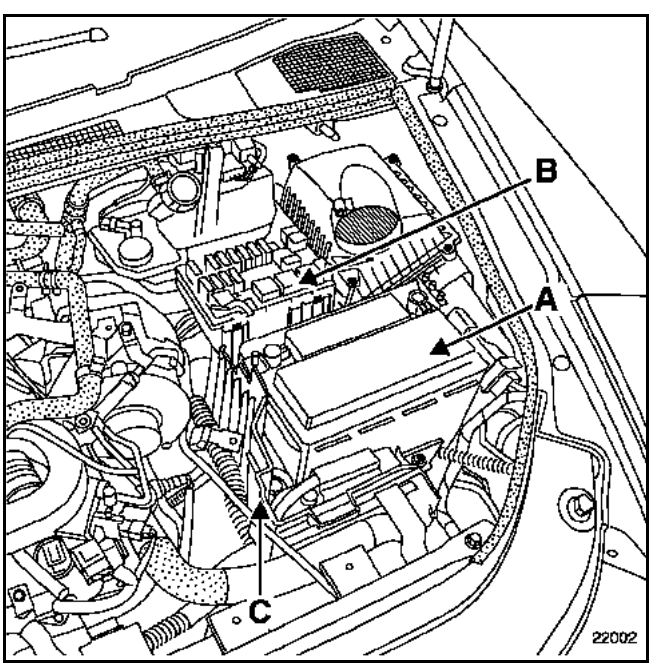
TIGHTENING TORQUES (in daNm)	
Multifunction switch mounting bolt	2.5
Dipstick guide-tube mounting bolt	0.5
Selector lever mounting bolt	1.5

REMOVAL

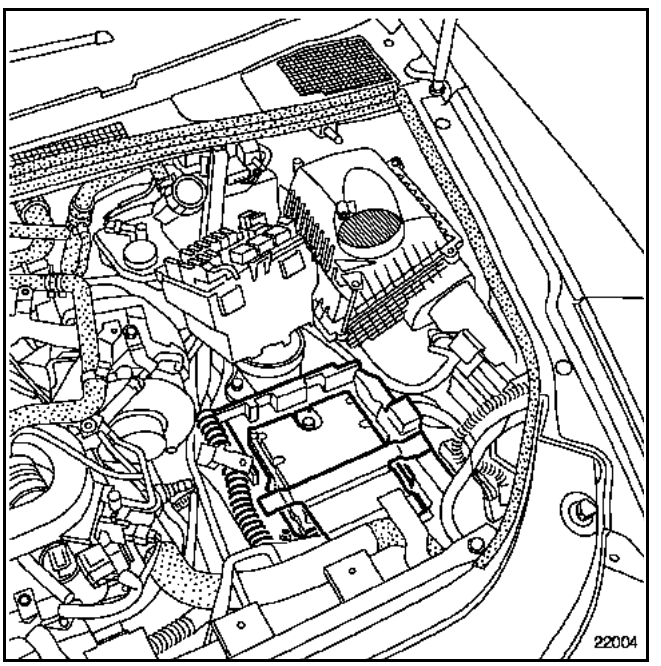
Put the vehicle on a two-post lift.

Shift the lever to N.

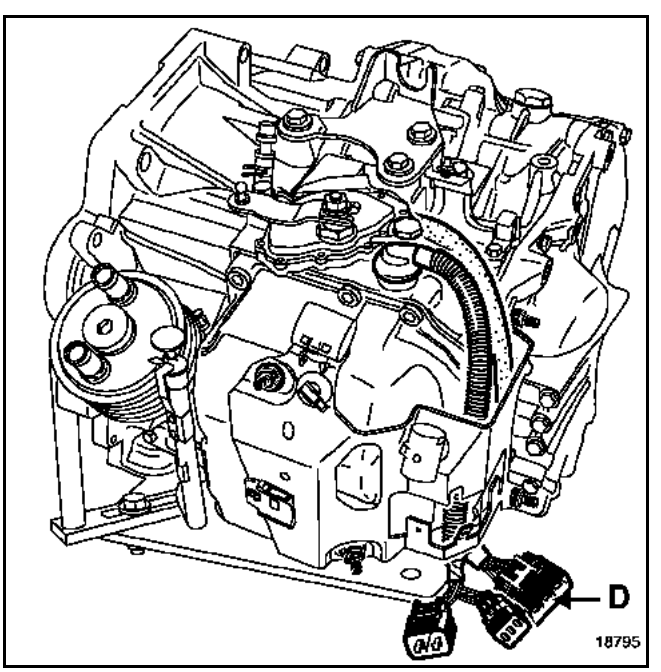
Remove:
– the engine covers,
– the battery (A),
– the fuse box (B)
– the automatic gearbox computer,
– the battery tray (C),
– the wiring harness from the battery support.



Remove the injection computer and its support.

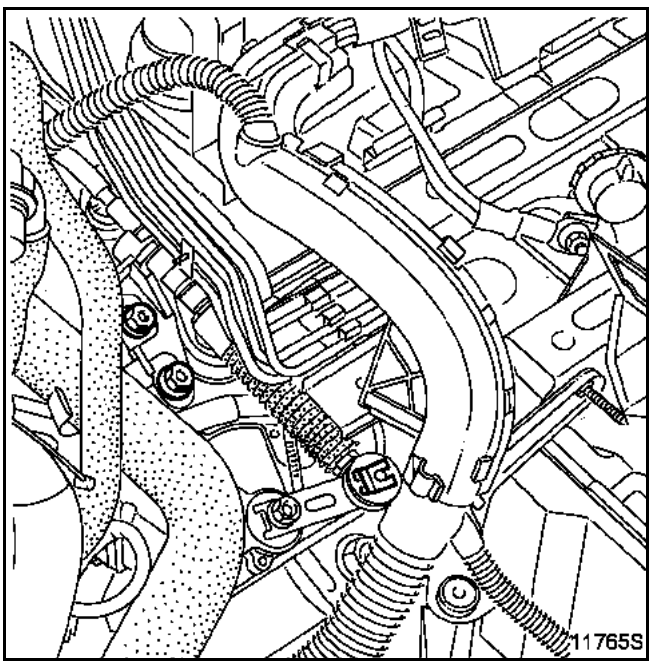


Unclip and disconnect the wiring (D).



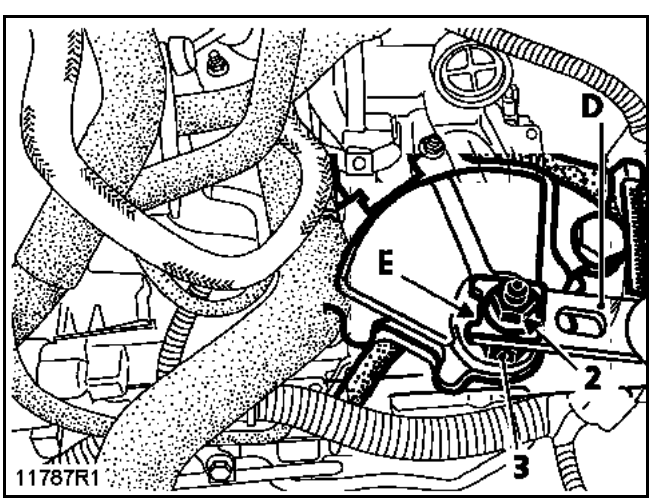
GETtheMANUALS.org

Remove:
– the control cable,



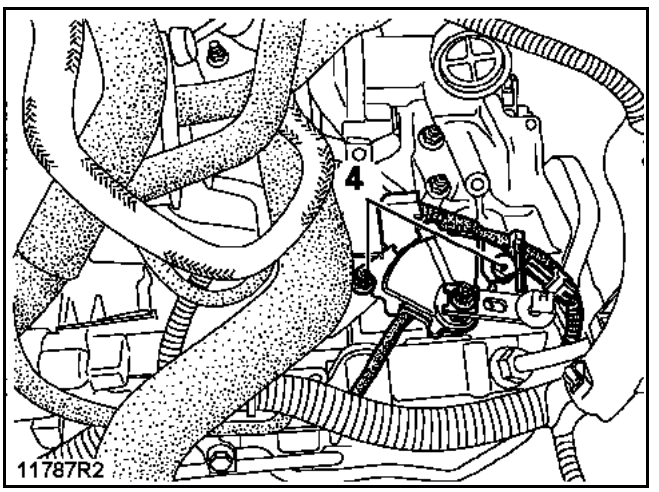
– the selector lever (D), holding it using a flat spanner at (E) on the selector shaft and slacken the nut (2).

Release the lock washer and remove the nut (3).



IMPORTANT: never slacken the selector lever bolt without holding it as this may damage the automatic gearbox.

Remove the two bolts (4) and release the multifunction switch.



REFITTING

Refitting is the reverse of removal.

Ensure the wiring is correctly positioned when refitting.

Replace the selector shaft seal if it is damaged (see relevant section).

NOTE: it is important to remember to lock the selector shaft nut.

Tighten all nuts and bolts to the recommended torque.

Adjust the multifunction switch (see relevant section).

Check and if necessary adjust the control cable (see relevant section).

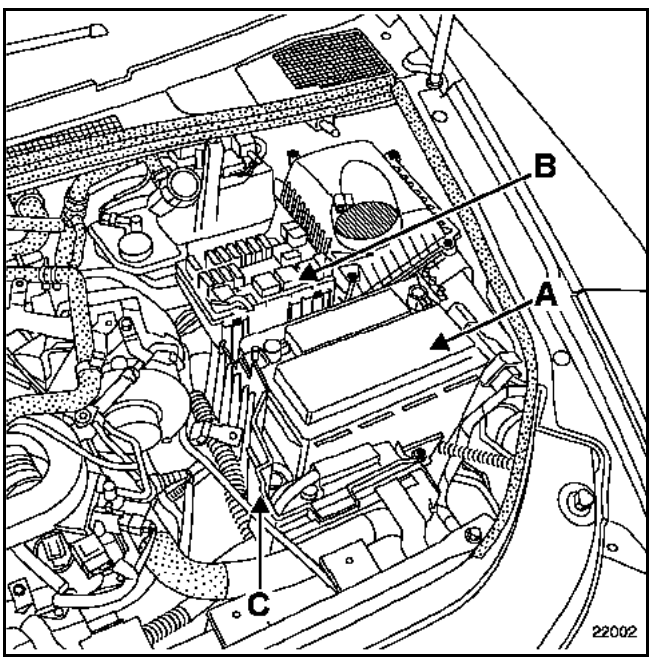
Check that it works and that the gears can be changed correctly.

GETtheMANUALS.org

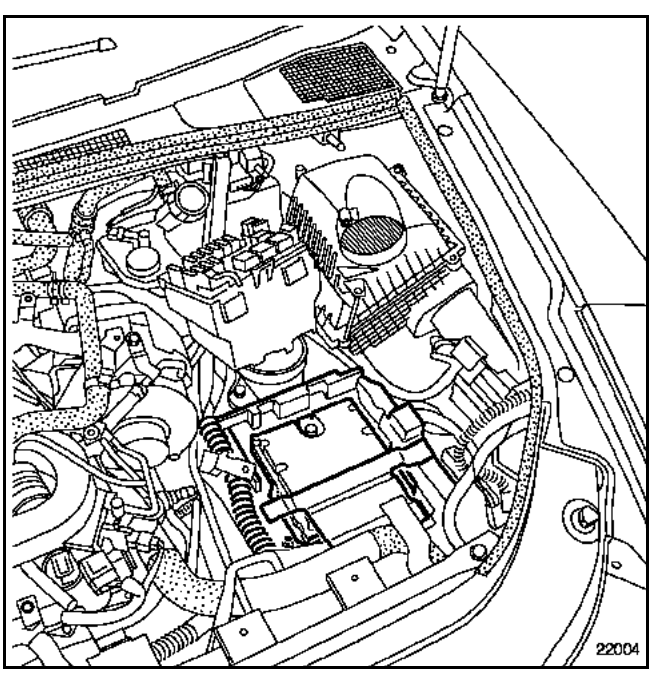
ADJUSTMENT

Shift the lever to N.

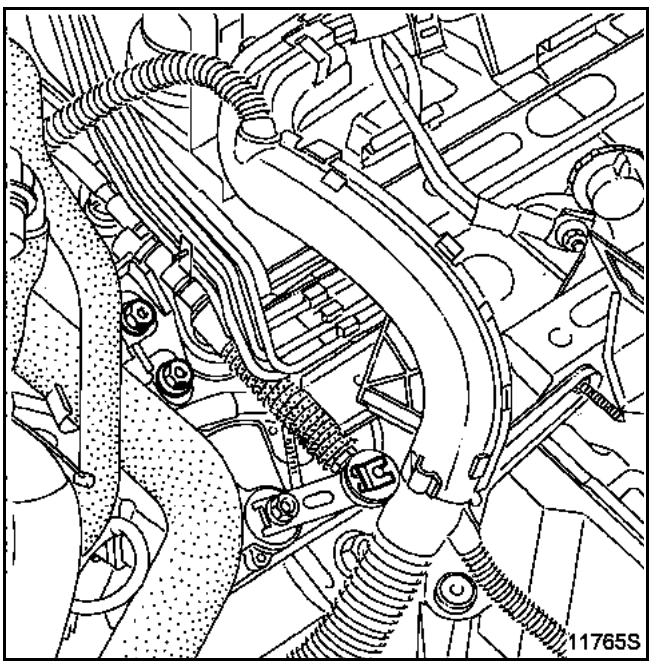
Remove:
– the style cover,
– the battery (A),
– the fuse box (B),
– the automatic gearbox computer,
– the battery tray (C),
– the wiring harness from the battery support.



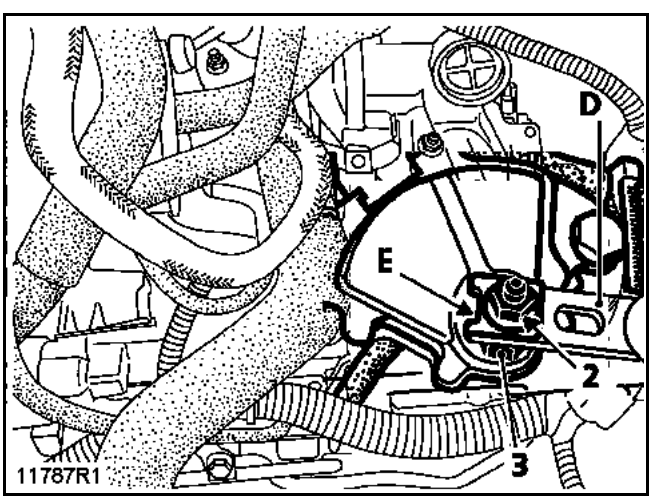
Remove the injection computer and its support.



Remove:
– the control cable,



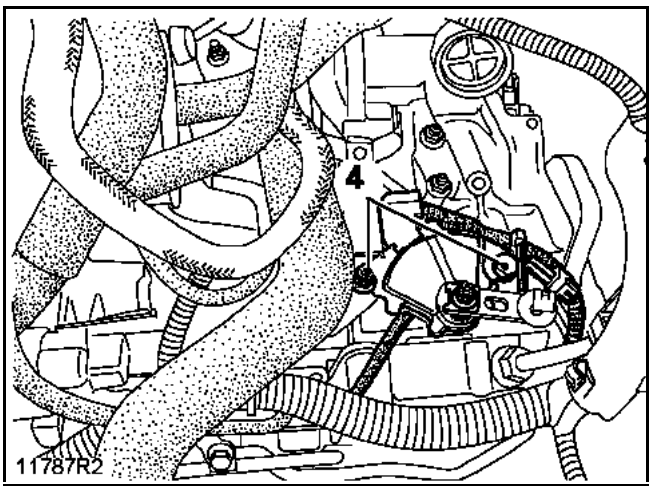
– the selector lever (D), holding it using a flat spanner at (E) on the selector shaft and slacken the nut (2).



IMPORTANT: never slacken the selector lever bolt without holding it as this may damage the automatic gearbox.

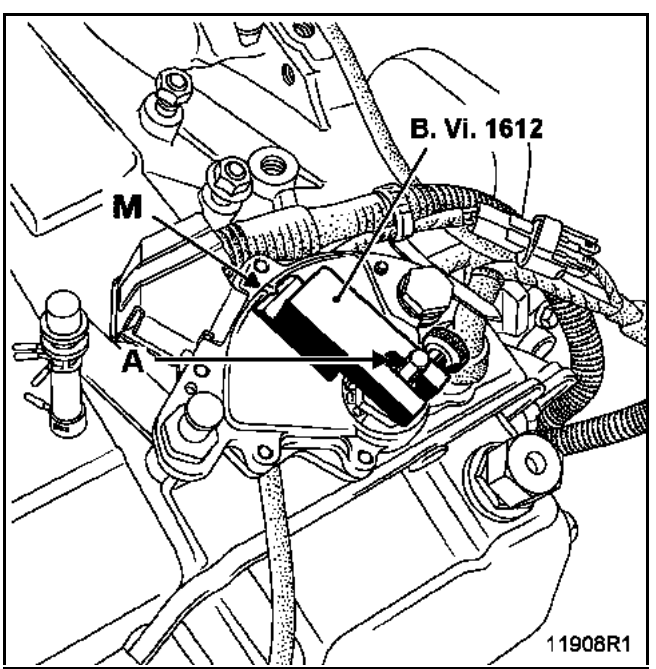
GETtheMANUALS.org

Slacken both bolts (4).



Check that the selector shaft is in position N and position tool **B. Vi. 1612** on the selector shaft.

Line up the mark (M) engraved on the multifunction switch with the slot (A) of the tool.



Tighten the two multifunction switch mounting bolts.

REFITTING

Refitting is the reverse of removal.

Ensure the wiring is correctly positioned when refitting.

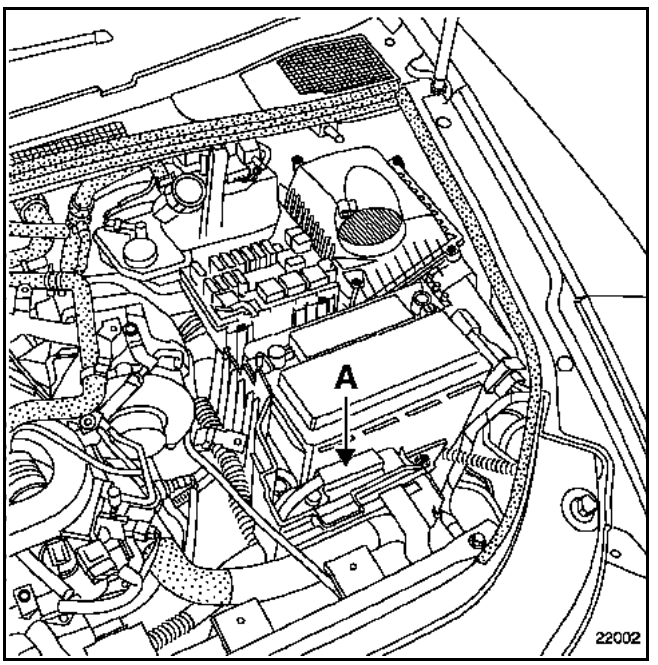
Tighten the bolts to the correct torque.

Check that it works and that the gears can be changed correctly.

GETtheMANUALS.org

LOCATION

This is located between the battery and the left-hand headlight (A).



The cover must be removed from the battery to access the computer.

GETtheMANUALS.org

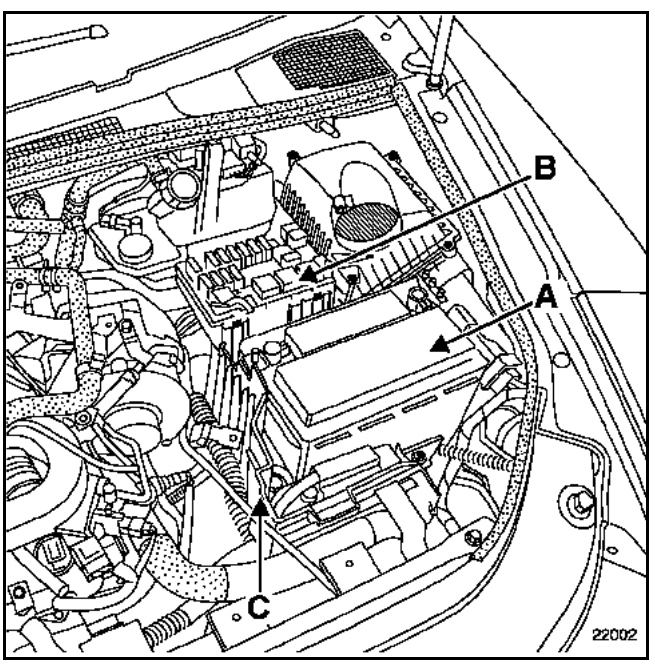
TIGHTENING TORQUE (in daNm)	
Input sensor mounting bolt	0.55

REMOVAL

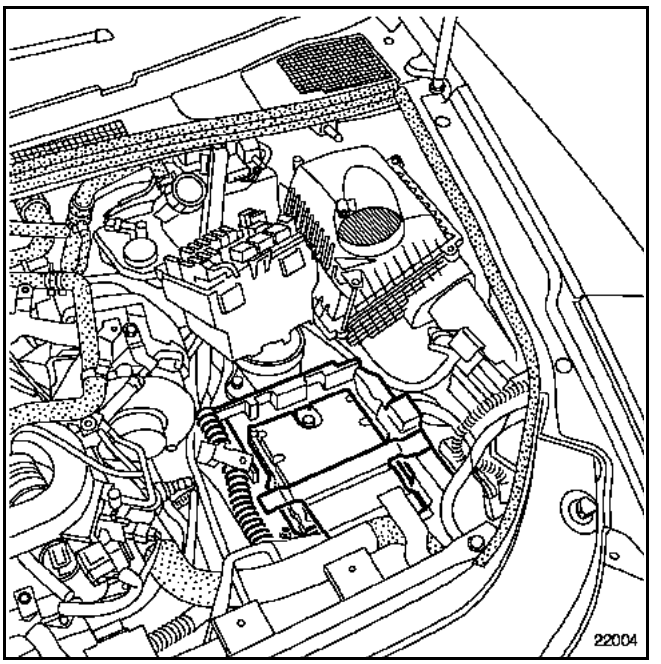
Put the vehicle on a two-post lift.

Disconnect the battery.

Remove:
– the engine covers,
– the battery (A),
– the fuse box (B),
– the automatic gearbox computer,
– the battery tray (C),
– the wiring harness from the battery support.



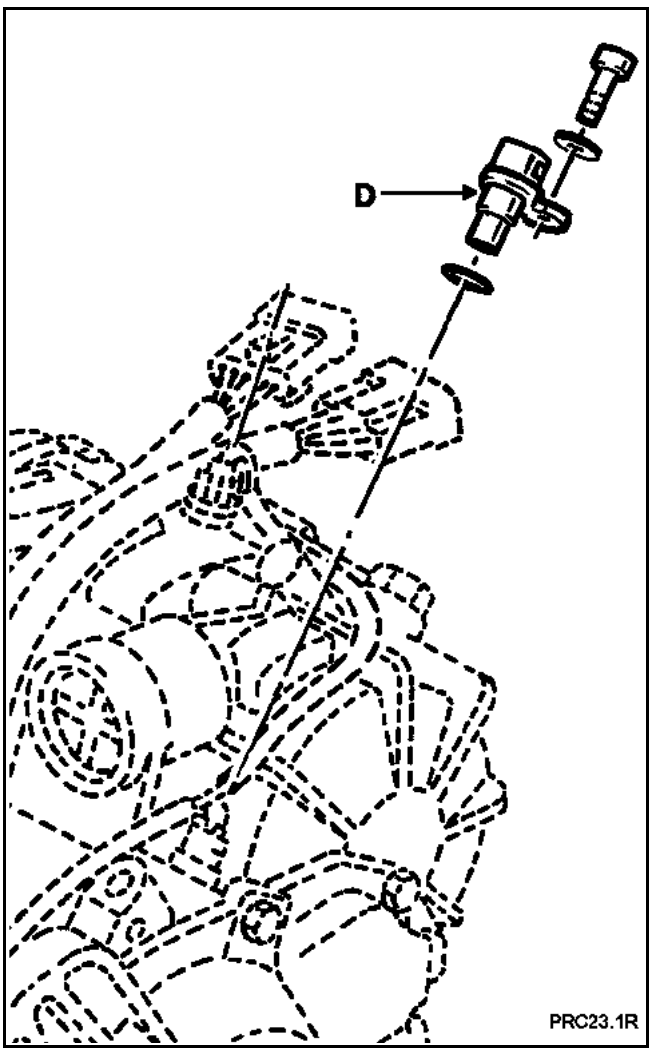
Remove the injection computer and its support.



GETtheMANUALS.org

Clean the area around the sensor to prevent dirt from entering the automatic gearbox.

Loosen and remove the speed sensor (D).



REFITTING

Oil the O-ring of the speed sensor.

Refitting is the reverse of removal.

TIGHTEN ALL THE BOLTS TO THE RECOMMENDED TORQUE.
Speed sensor: 0.5 daNm.

GETtheMANUALS.org

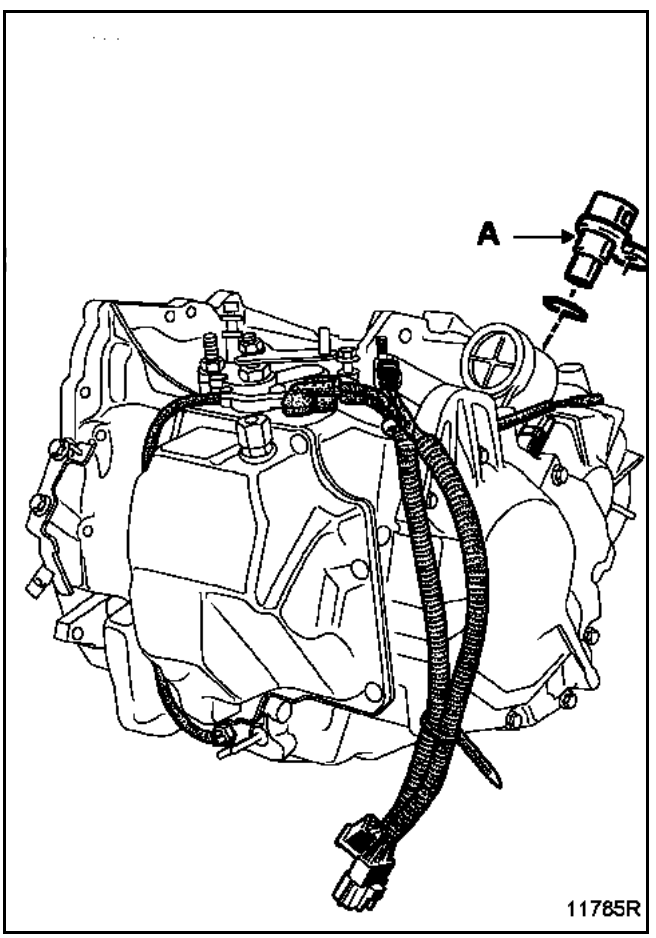
TIGHTENING TORQUE (in daNm)	
Speed sensor (output)	0.55

REMOVAL

Disconnect the battery.

Clean the area around the sensor to prevent dirt from entering the automatic gearbox.

Disconnect the sensor (A) and remove it.



REFITTING

Oil the O-ring of the speed sensor.

Refitting is the reverse of removal.

Tighten the speed sensor to a torque of 0.5 daNm.

GETtheMANUALS.org

TIGHTENING TORQUE (in daNm)	
Cover mounting bolt	1.2

REMOVAL

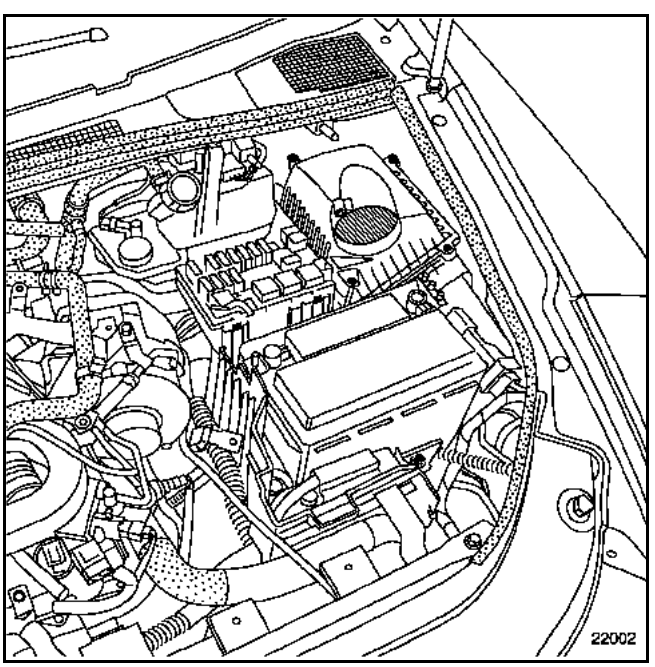
Put the vehicle on a two-post lift.

Disconnect the battery.

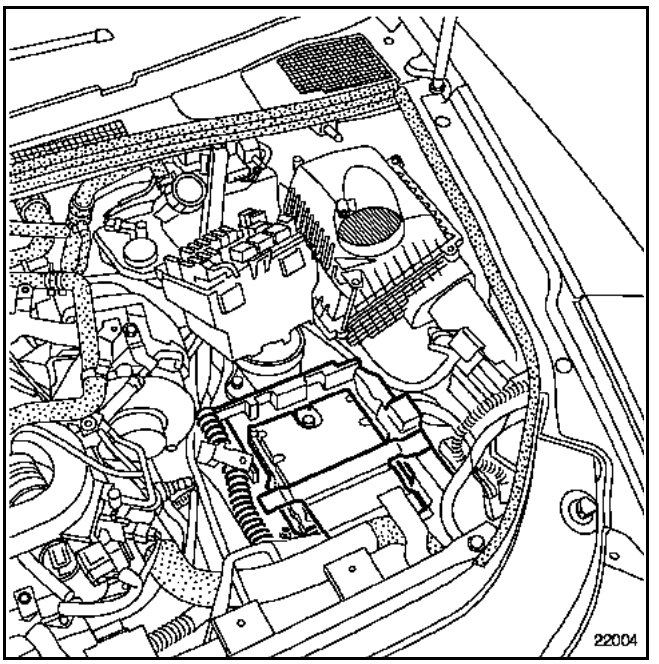
Remove the engine undertray.

Drain the automatic gearbox (see the relevant section).

Remove:
– the battery;
– the fuse box,
– the automatic gearbox computer,
– the battery mounting.



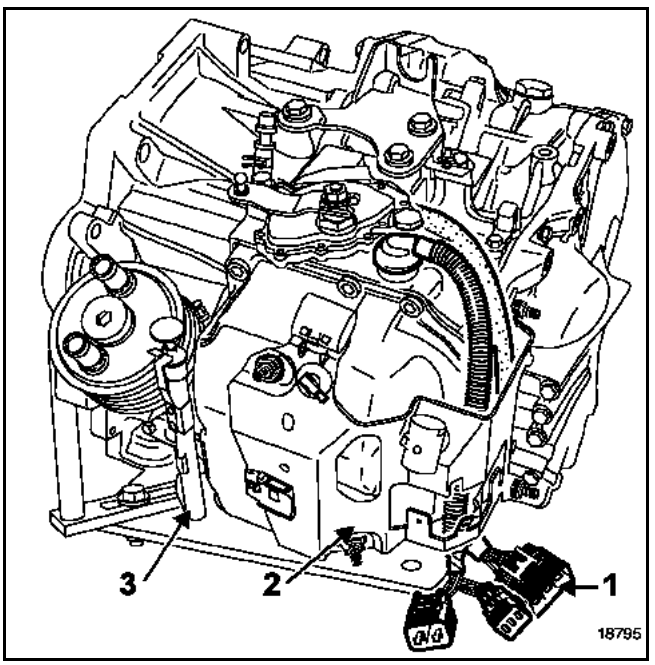
Remove the injection computer and its support.



GETtheMANUALS.org

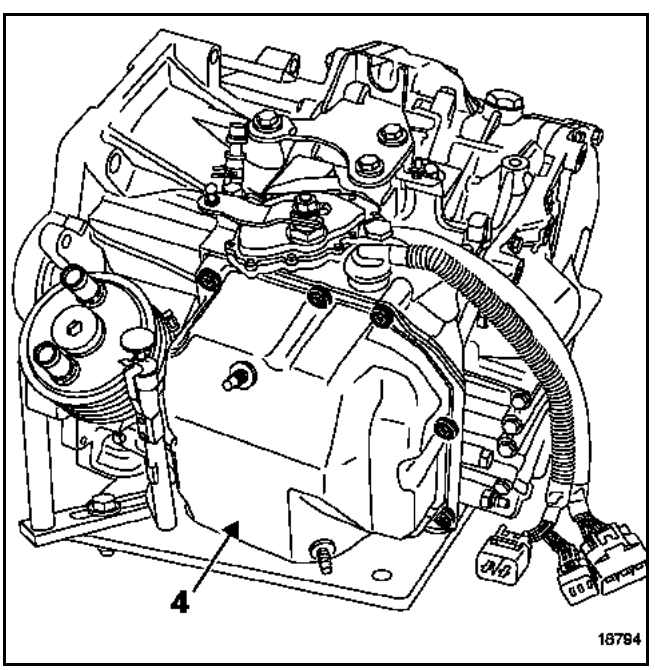
Disconnect the harness (1).

Remove:
– the wiring channel support (2) and release it,

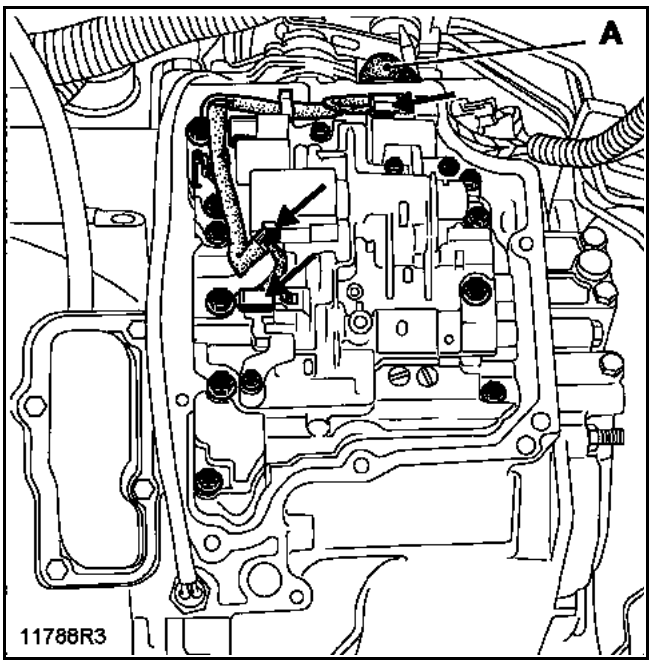


Place a clean container under the automatic gearbox to collect the oil.

Remove the housing (4) from the hydraulic distributor, by releasing it with a very thin blade (without damaging the contact surfaces).



Disconnect and separate the transverse seal (A).



NOTE: be careful when routing the wiring as it must be replaced in the same position (the speed sensors do not have polarity reversal protection).

REFITTING

Refit in the reverse order to removal, following the instructions given in the various sections relating to this operation.

Fill with oil (see section **Filling - Levels**).

GETtheMANUALS.org

TIGHTENING TORQUES (in daNm)	
Housing mounting bolt	1.2
Distributor mounting bolt	1
Solenoid valve mounting bolt	1

REMOVAL

This operation is performed after having removed the distributor housing (see relevant section).

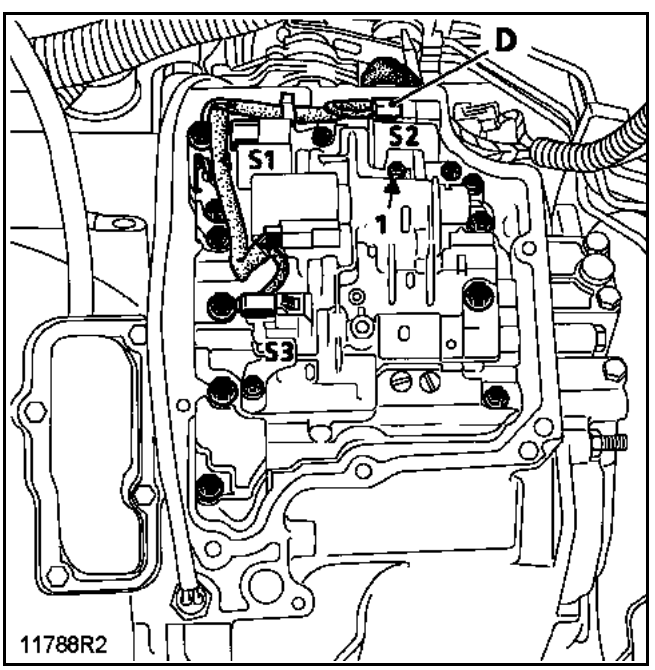
There is no specific procedure for removing the solenoid valves and it is the same for all:

S1 = sequence solenoid valve

S2 = sequence solenoid valve

S3 = converter lock-up solenoid valve.

Remove:
– the socket (D),
– the bolt (1),
and remove the solenoid valve.



REFITTING

Refit in the reverse order to removal and tighten to the correct torque.

Check that the wiring is correctly inserted in the clips.

Special notes:

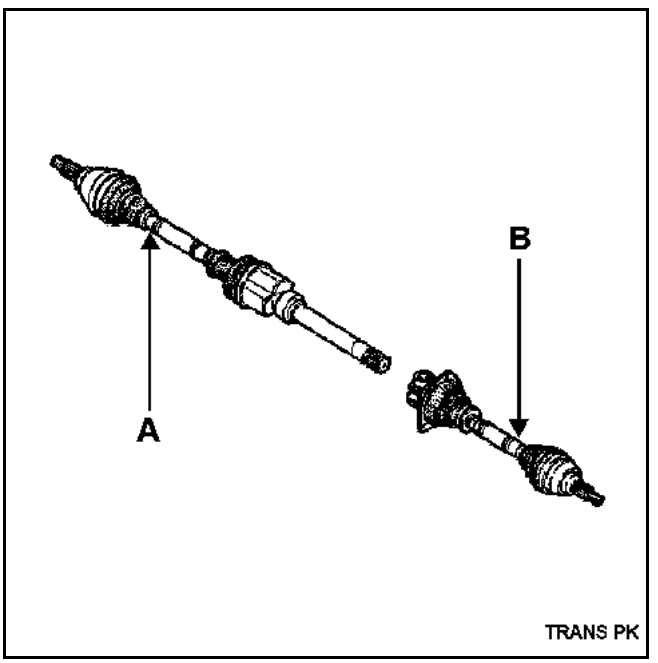
Put Vaseline on the solenoid valve seals for better positioning.

Fill the automatic gearbox with oil, following the instructions (see relevant section).

GETtheMANUALS.org

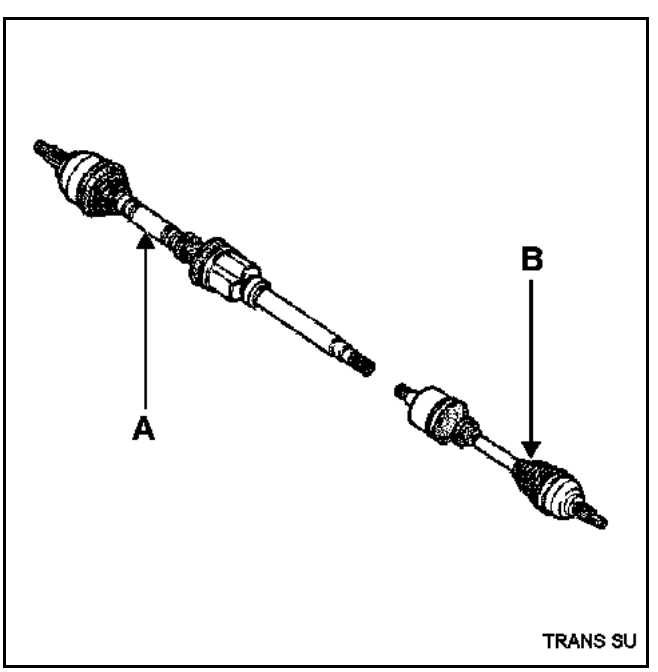
DRIVESHAFT PK GEARBOX

A Driveshaft right-hand side
B Driveshaft left-hand side



DRIVESHAFT SU1 GEARBOX

A Driveshaft right-hand side
B Driveshaft left-hand side



GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
T. A.v. 476	Ball joint extractor
Rou. 604-01	Hub locking tool

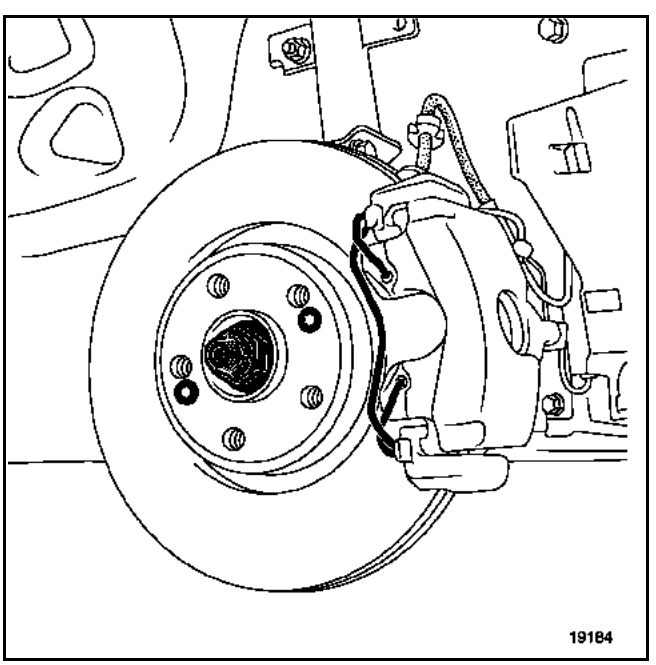
TIGHTENING TORQUES (in daNm)	
Shock absorber lower bolt	18
Track rod end nut	3.7
Wheel bolts	11
Mounting bolt on gearbox	3
Mounting bolt on intermediate bracket	3

REMOVAL

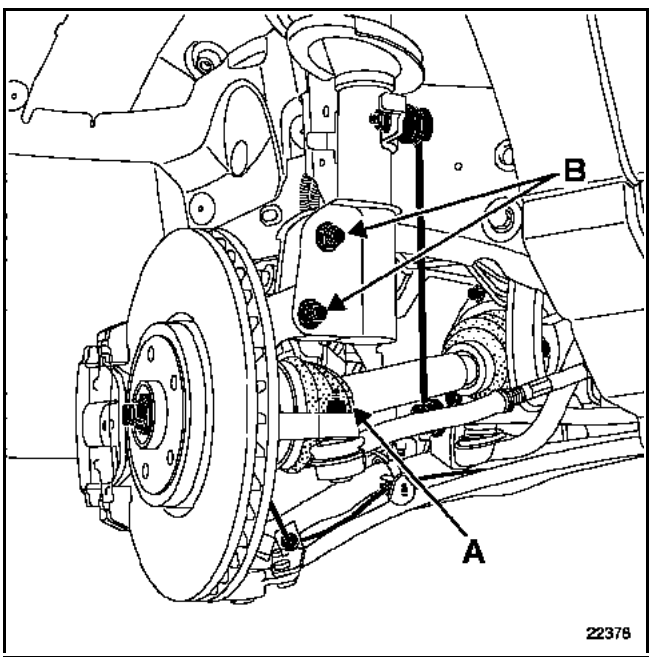
Wheel side

Put the vehicle on a two post lift.

Remove:
– the front wheels,
– the hub nut,



– the track rod end nut (A),
– the shock absorber lower mounting bolts (B).



Push the driveshaft back into the stub-axle carrier, whilst tilting the stub axle carrier.

NOTE: mind the flexible brake hose.

Remove the driveshaft (wheel side).

Refit one of the shock absorber lower mounting bolts to avoid damaging the flexible brake hose.

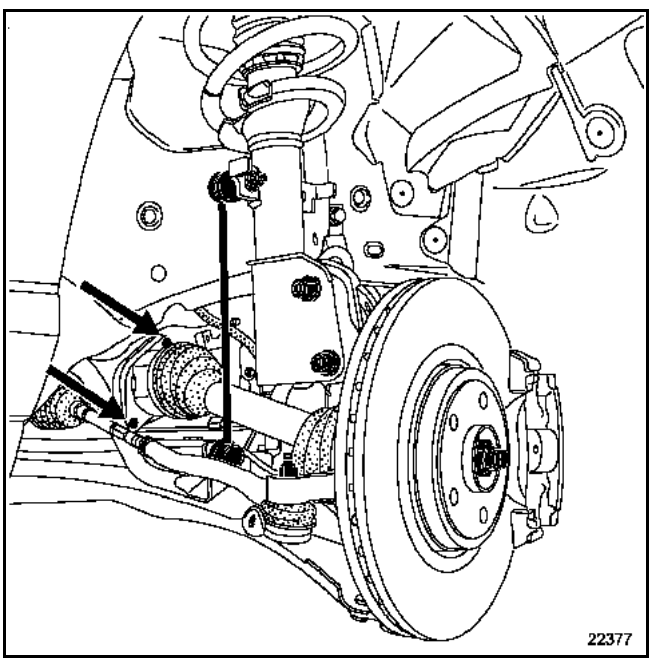
GETtheMANUALS.org

REMOVAL

Right-hand side

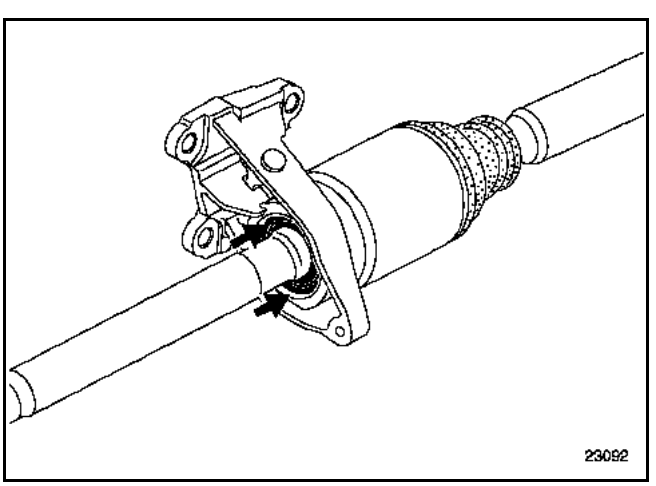
Drain the gearbox.

Remove:
– the two intermediate bearing mounting bolts on the lower engine,



– the driveshaft on the gearbox side.

NOTE: if the bearing is jammed in the bearing relay, drive it out with a sledgehammer and automatically replace the bearing (see **Chapter 29A: Relay shaft bearing**).



REFITTING

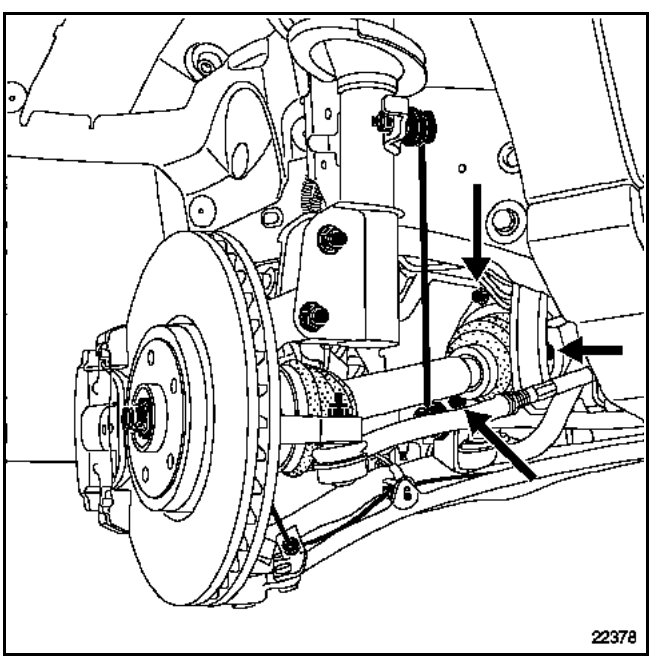
NOTE:
– Clean the bore of the bearing into which the bearing is inserted.
– Check the condition of the contact surface of the lip seal on the relay shaft.
– It is recommended that the differential output lip seal is automatically replaced (see corresponding section).

Proceed in the reverse order to removal.

Left-hand side

Drain the gearbox.

Remove:
– the three gaiter mounting bolts on the gearbox,



– the driveshaft on the gearbox side.

REFITTING

Proceed in the reverse order to removal.

GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
T. A.v. 476	Ball joint extractor
Rou. 604-01	Hub locking tool

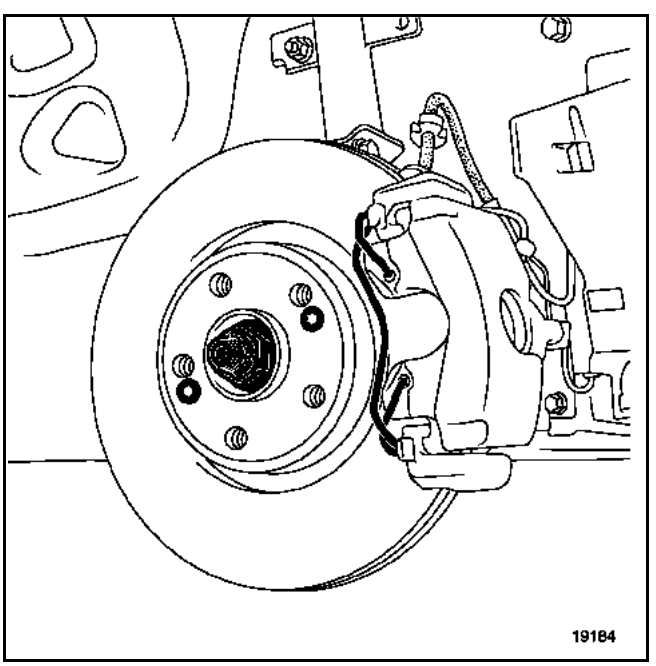
TIGHTENING TORQUES (in daNm)	
Shock absorber lower bolt	18
Track rod end nut	3.7
Wheel bolts	11
Mounting bolt on intermediate bracket	3

REMOVAL

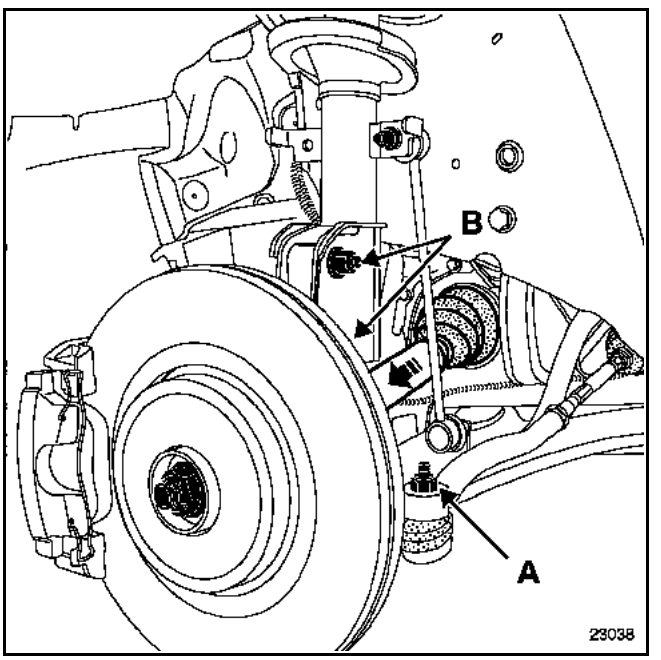
Wheel side

Put the vehicle on a two post lift.

Remove:
– the front wheels,
– the hub nut,



– the track rod end nut (A),
– the shock absorber lower mounting bolts (B).



Push the driveshaft back into the stub-axle carrier, whilst tilting the stub-axle carrier.

NOTE: mind the flexible brake hose.

Remove the driveshaft (wheel side).

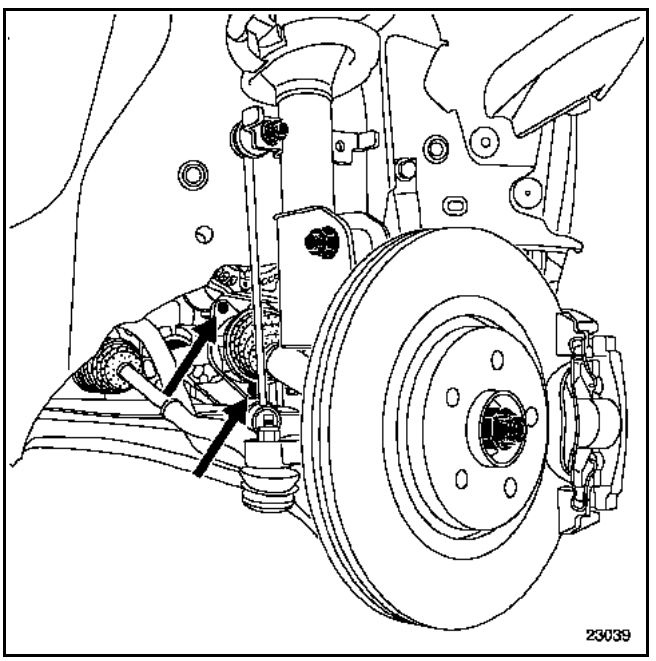
Refit one of the shock absorber lower mounting bolts to avoid damaging the flexible brake hose.

GETtheMANUALS.org

REMOVAL

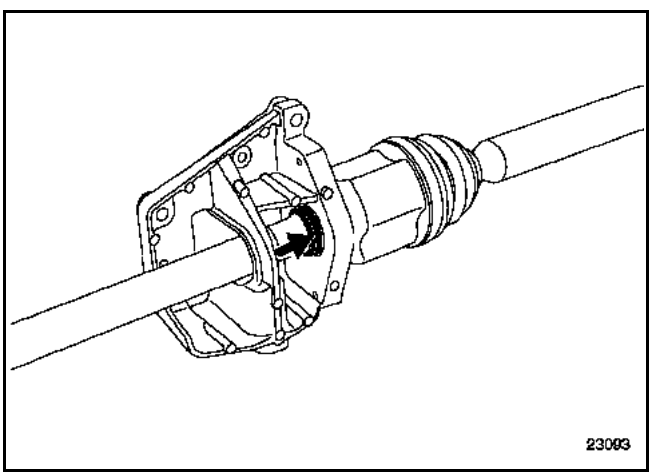
Right-hand side

Remove:
– the two retaining plate mounting bolts on the intermediate bearing,



– the driveshaft on the gearbox side.

NOTE: if the bearing is jammed in the bearing relay, drive it out with a sledgehammer and automatically replace the bearing (see **Section 29A: Relay shaft bearing**).



Above, intermediate bearing V4Y, intermediate bearing P9X is identical to the G9T and F4R.

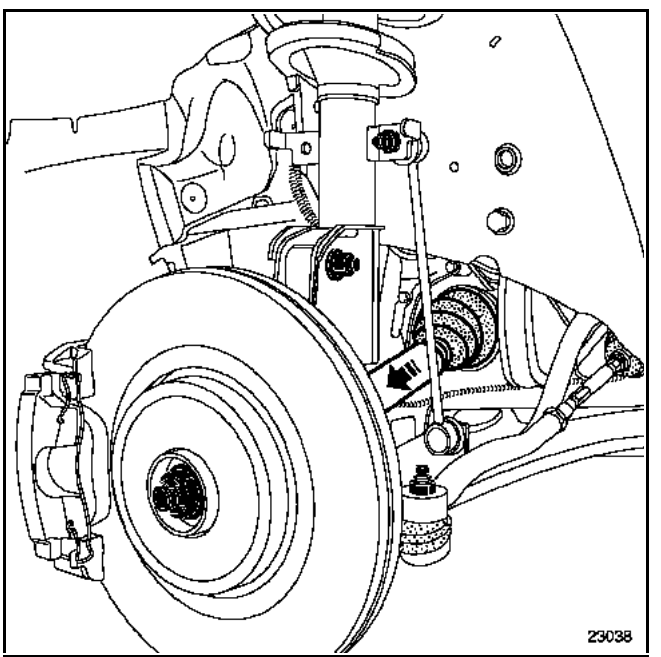
REFITTING

NOTE:
– Clean the bore of the bearing into which the bearing is inserted.
– Check the condition of the contact surface of the lip seal on the relay shaft.
– It is recommended that the differential output lip seal is automatically replaced (see corresponding section).

Proceed in the reverse order to removal.

Left-hand side

Remove the driveshaft (gearbox side).



REFITTING

Proceed in the reverse order to removal.

GETtheMANUALS.org

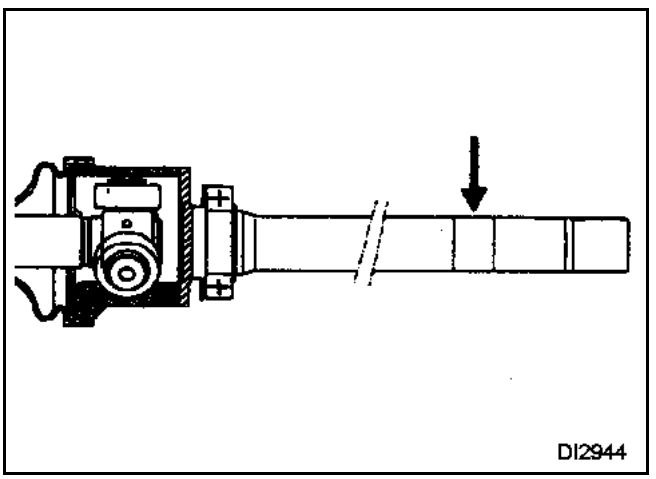
RELAY SHAFT BEARING

REPLACEMENT

Remove the whole driveshaft.

Extract the bearing with a press using an extractor for support.

Take care not to scratch the contact surface of the lip seal on the relay shaft.



REFITTING

Lubricate the section of the shaft into which the bearing is inserted.

Engage the new bearing then position it fully in the shaft using a tube (see diagram below) so that it makes contact with the inner bearing ring.

Before refitting the driveshaft, clean and grease the bearing hole into which the bearing is inserted.

GETtheMANUALS.org

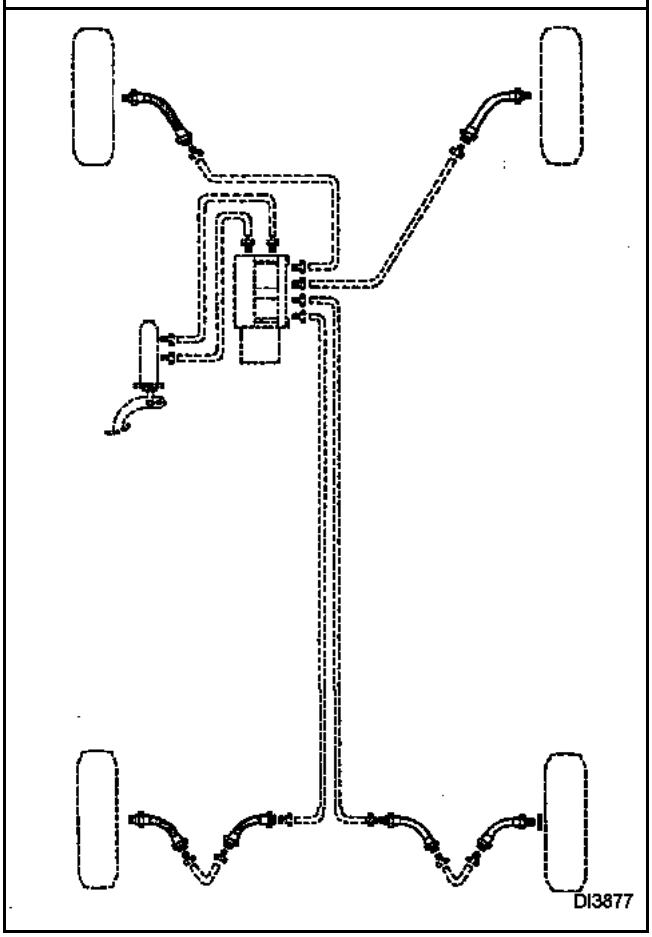
NOTE: the diagram below shows the general layout; in no case should it be taken as reference for the take-off points and allocation of circuits. When replacing one of the components of a vehicle's braking circuit, always mark the pipes before removing them so that they can be reconnected in their original positions.

"X"-SHAPED BRAKING CIRCUIT

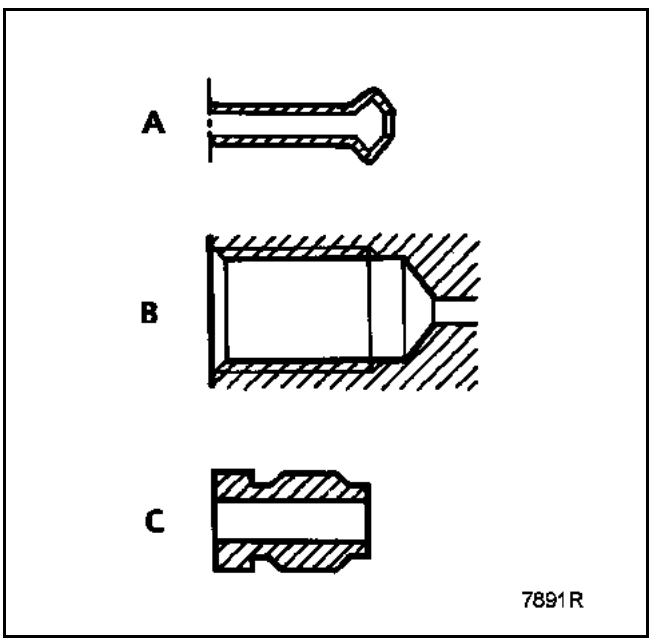


GETtheMANUALS.org

The pipes between the master cylinder, callipers and the hydraulic unit are connected using threaded unions with a METRIC THREAD.

Consequently, only parts specified in the Parts Catalogue for this vehicle should be used.

Parts identification:
- SHAPE of steel or copper PIPE end piece (A).
- SHAPE of the component CONNECTING POINTS (B).
- GREEN or BLACK coloured pipe UNIONS: hexagonal exterior, 6 x **11 mm** (C).



GETtheMANUALS.org

SPECIFICATIONS

Complies with **SAE J 1703-DOT4** standards (1).

BRAKE FLUID REPLACEMENT FREQUENCY

Our braking technology, in particular for our disc brakes (hollow pistons that transmit little heat, a low quantity of fluid in the cylinder, sliding callipers that remove the need for a fluid reserve in the least cooled area of the wheel), has enabled us to prevent the risk of vapour lock as far as possible, even in case of heavy braking (in mountainous areas). Current brake fluids do deteriorate slightly during the first few months of use, however, due to a slight take-up of moisture, so the fluid needs changing: see the vehicle's warranty and servicing booklet.

Topping up the level

Brake pad wear will cause a gradual drop in the brake fluid level in the reservoir. There is no point compensating for this drop, since the level will rise again when the pads are next changed. However, the level should not of course be allowed to fall below the minimum mark.

Approved brake fluids

Mixing two incompatible brake fluids in the braking circuit may can be a major risk of leaks, mainly due to deterioration of the cups. To prevent this risk, be sure to only use brake fluids that have been checked and approved by our laboratories and which comply with standard **SAE J 1703 DOT 4** (1).

(1) To get the best out of vehicles equipped with ESP, RENAULT recommends a brake fluid with low viscosity when cold (**maximum 750 mm^2/s at - 40°C**).

GETtheMANUALS.org

FRONT BRAKES (mm)	
Piston diameter	**60**
Disc diameter	**324**
Disc thickness	**28**
Minimum disc thickness*	**25.4**
Maximum disc run-out	**0.2**
Brake pad thickness (including support)	**17.5**
Minimum brake pad thickness (including support)	**8**
REAR BRAKES (mm)	
Piston diameter	**38**
Disc diameter	**300**
Disc thickness	**11**
Minimum disc thickness*	**9.5**
Maximum disc run-out	**0.2**
Brake pad thickness (including support)	**16.6**
Minimum brake pad thickness (including support)	**8**
MASTER CYLINDER (mm)	
Diameter	**25.4**

(*) Brake discs cannot be reground. If they are excessively worn or scored they must be replaced.

GETtheMANUALS.org

SPECIAL TOOLING REQUIRED
Braking circuit bleeding device (approved by Renault) Fault finding tool

To work properly a braking circuit must be free of gas (external air in circuit, steam, etc.). Whenever the circuit has been opened, therefore, the air contained in the circuit must be bled out when the circuit is closed.

As the brake fluid ages (see servicing frequency) it absorbs a significant amount of moisture which may create steam in the circuit, under certain extreme conditions. This ageing process means that the circuit must be drained completely and then the air contained in it must be bled out.

Prerequisites for any braking circuit air bleeding:
– check the circuit sealing,
– fill the brake fluid reservoir (1) to its maximum level,
– depress the brake pedal several times to bring the moving parts of the braking system into contact (pistons, brake shoes, discs),
– add brake fluid (1) to top up the level in the reservoir,
– set up the bleeding device and top up the brake fluid level (1) to maximum (consult the driver's handbook, the recommended pressure setting being between **2 bar** and **2.5 bar**).

There are two distinct types of braking circuit air bleed:
– a "conventional" air bleed; this does not bleed air from the hydraulic unit regulation circuit (2),
– a hydraulic unit regulation circuit air bleed (2); this bleed should only be carried out if the brake pedal travel is deemed correct after a "conventional" bleed (3), then becomes incorrect.

The two air bleed procedures can be looked up in **section 38C**.

(1) Brake fluid **SAE J 1703 DOT4**
To get the best out of vehicles equipped with ESP, Renault recommends a brake fluid with low viscosity when cold (maximum **750 mm^2/s at - 40°C**).
(2) The regulation circuit is an internal part of the hydraulic unit. It is isolated from the conventional circuit until the solenoid valves are activated by the computer or the fault finding tool.
(3) Confirmed by a road test with the hydraulic unit regulation activated.

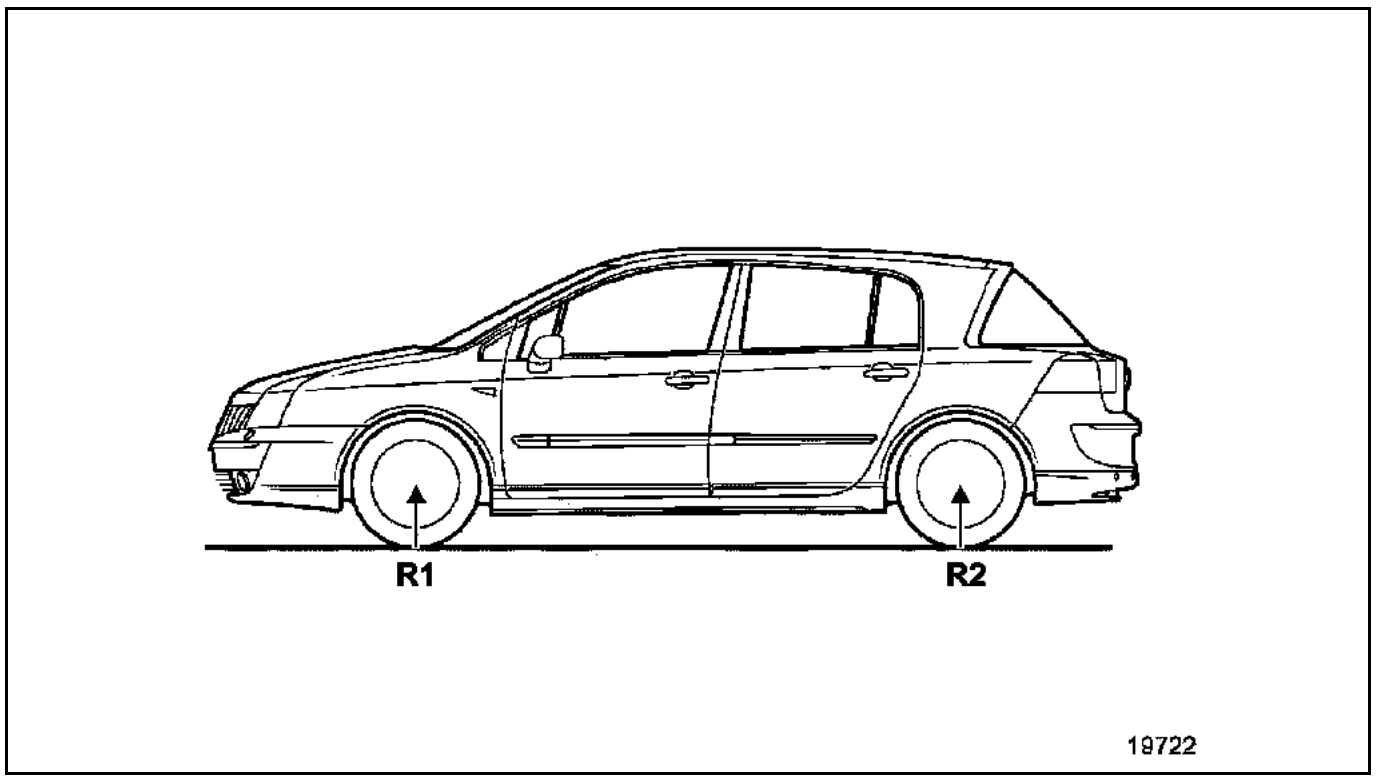
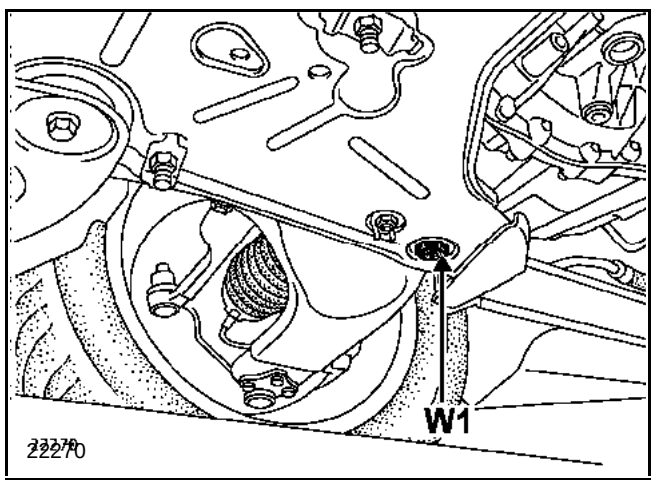
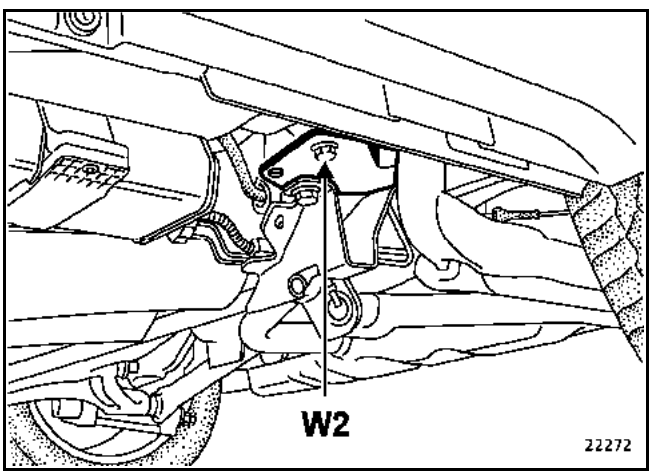
Measuring points







R1 and **R2** are taken between the ground and the wheel axes.
W1 is taken between the ground and the lower face of the lower arm front mounting nut.
W2 is taken between the ground and the longitudinal arm bearing bolt head furthest from the wheel.

GETtheMANUALS.org

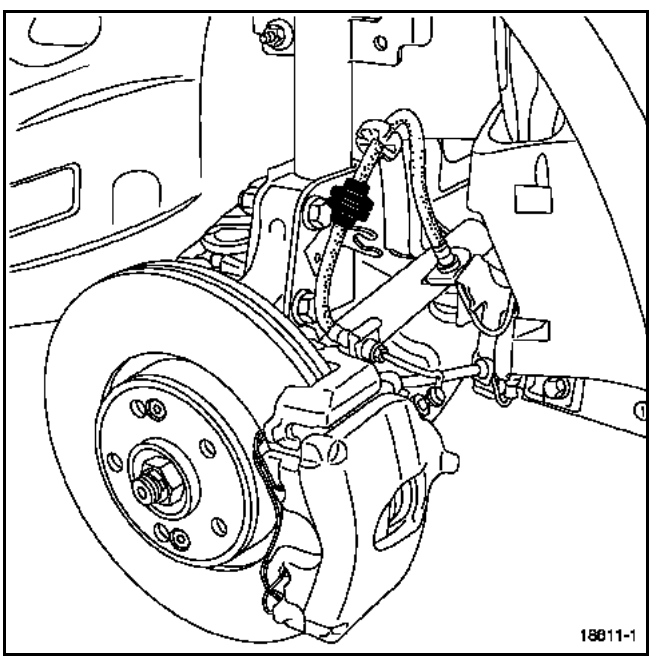
SPECIAL TOOLING REQUIRED	
Rear brake calliper piston return tool - BREMBO type1190-01	**Brake calliper piston return tool**

TIGHTENING TORQUES (in daNm)	
Mounting bolt	**2.8**
Wheel bolt	
∅ 12	**11**
∅ 14	**13**

Put the vehicle on a two post lift.
Remove the front wheels.

REMOVAL

Remove:
– the spring on the front face of the calliper,
– the flexible brake pipe from the shock absorber,

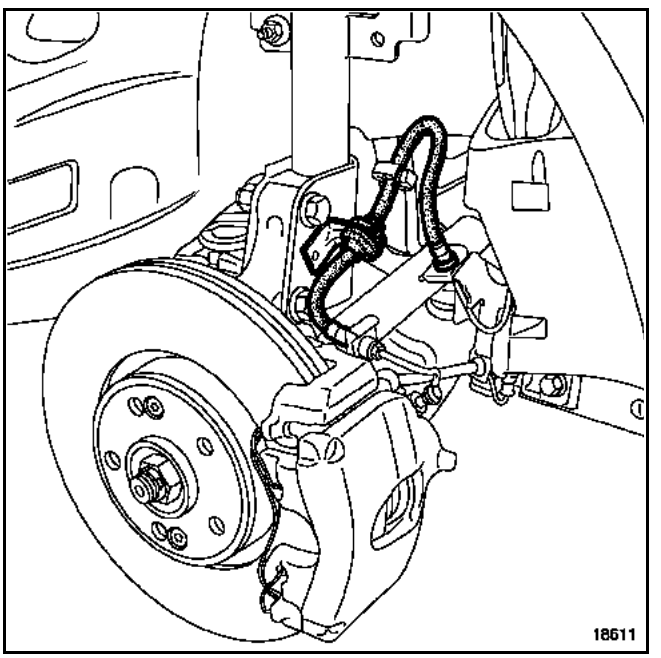


– the two plugs at the end of the pillars,
– both pillar bolts.

Hang up the calliper. Remove the pads.

REFITTING

IMPORTANT: Make sure the flexible brake pipe and wheel speed sensor wiring are properly mounted, if they have been unfastened.



Check the condition of the braking components.

Push the piston back using tool **Fre. 1190-01** until it is at the bottom of its bore.

Fit the new trim pieces, beginning with the internal trim.

Refit:
– the bottom pillar bolt,
– the top pillar bolt,
– the spring on the front face of the calliper, starting from the bottom.

IMPORTANT: Press the brake pedal several times to bring the pistons into contact with the brake pads and discs.

GETtheMANUALS.org

SPECIAL TOOLING	
Rear brake calliper piston return tool - BREMBO type1190-01	**Rear brake calliper piston return tool**

TIGHTENING TORQUES (in daNm)	
Wheel bolt	
∅ 12	**11**
∅ 14	**13**
Brake calliper mounting bolt (pillars)	**2.8**
Flexible brake pipe	**1.4**

REMOVAL

Put the vehicle on a two post lift.

Fit a pedal press to limit brake fluid running out.

Remove the front wheels.

Remove:
– the spring on the front face of the calliper,
– the hose mounting bracket on the calliper,
– the calliper flexible brake pipe,
– the two plugs at the end of the pillars,
– the two pillar bolts (for calliper mounting),
– the calliper,
– the pads.

Check condition of flexible brake pipe. Replace if necessary. The flexible brake pipe must also be replaced when the calliper is replaced.

Check condition of brake pads, disc, piston dust seals, and guide dust seals.

REMINDER: when replacing brake pads or discs, the brake pads and disc on the opposite side must be changed.

Clean the calliper mountings and callipers.

REFITTING

Push the piston back using tool **Fre. 1190-01** until it is at the bottom of its bore.

Refit:
– the brake pads,
– the calliper,
– the pillar bolts.

GETtheMANUALS.org

Tighten to the recommended torque.

Refit the flexible brake pipe. Tighten to the recommended torque.

IMPORTANT: Press the brake pedal several times to bring the pistons into contact with the brake pads and discs.

Perform a partial circuit bleed of the brakes, if the compensation reservoir has not been drained completely during the operation. Otherwise perform a complete bleeding operation (see **bleeding method**).

Refit the wheels.

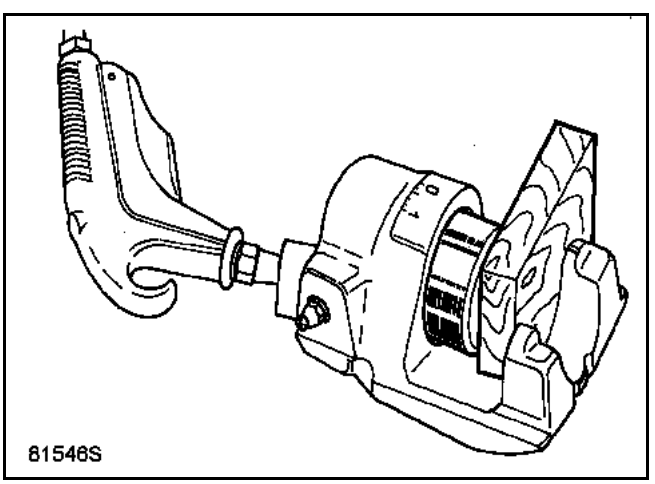
Tighten the wheel bolts to the recommended torque.

REPAIR

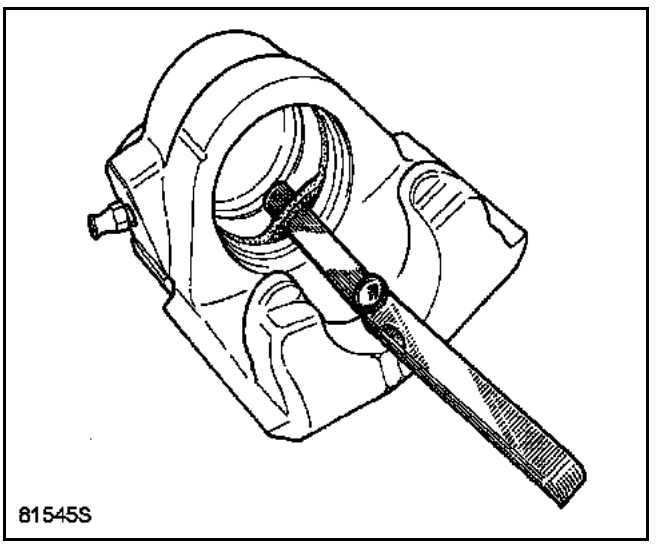
Any scoring of the calliper bore systematically requires the replacement of the complete calliper.

Remove the rubber dust seal.

Remove the pistons using compressed air, taking care to insert a wooden block between the calliper and the pistons to prevent damage to the pistons. Any trace of impact on the end panel will render the piston unfit for use.



Using a flexible strip with a rounded edge (such as a feeler gauge), remove the rectangular section seal from the calliper groove.



GETtheMANUALS.org

SPECIAL TOOLING	
Rear brake caliper piston return tool - BREMBO type1190-01	**Tool for pushing calliper pistons back**

TIGHTENING TORQUES (in daNm)	
Wheel bolt	
∅ 12	**11**
∅ 14	**13**
Calliper support mounting bolt	**10.5**
Flexible brake pipe	**1.4**

REMOVAL

Put the vehicle on a two post lift.

Fit a pedal press to limit brake fluid running out.

Remove the front wheels.

Remove:
– the calliper bracket mounting bolts,
– the brake pads,
– the calliper mounting.

Check condition of flexible brake pipe. Replace if necessary. The flexible brake pipe must also be replaced whenever the calliper is replaced.

Check condition of brake pads, disc, piston dust seals, and guide dust seals.

REMINDER: when replacing brake pads or discs, the brake pads and disc on the opposite side must be changed.

Clean the calliper mountings and callipers.

REFITTING

Push the piston back using tool **Fre. 1190-01** until it is at the bottom of its bore.

Refit:
– the calliper mounting,
– the calliper support mounting bolts.

Tighten to the recommended torque.

Refit:
– the brake pads,
– the calliper,
– the calliper mounting bolts.

Tighten to the recommended torque.

IMPORTANT: Press the brake pedal several times to bring the pistons into contact with the brake pads and discs.

Perform a partial circuit bleed of the brakes, if the compensation reservoir has not been drained completely during the operation. Otherwise perform a complete bleeding operation (see bleeding method).

Refit the wheels.

Tighten the wheel bolts to the recommended torque.

GETtheMANUALS.org

TIGHTENING TORQUES (in daNm)	
Brake disc mounting bolt	**1.5**
Calliper yoke bolt	**10.5**
Wheel bolt	
Ø 12	**11**
Ø 14	**13**

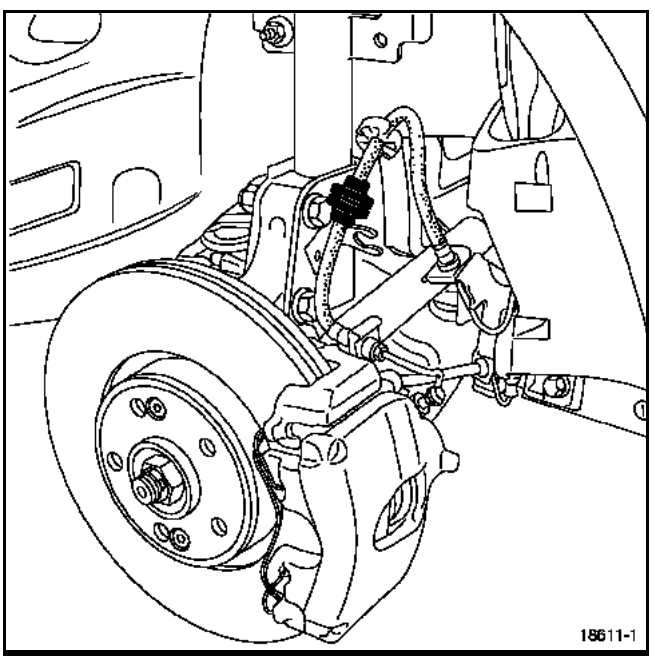
REMOVAL

Put the vehicle on a two post lift.

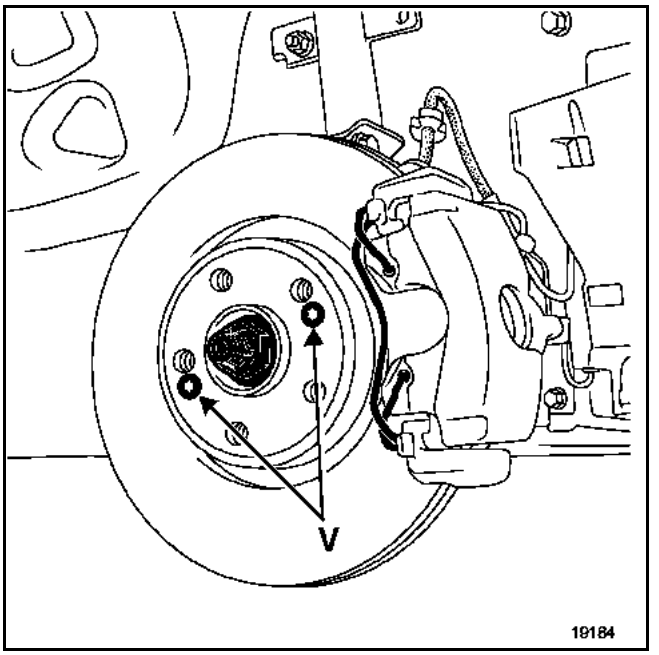
Remove:
– the front wheels,
– the calliper (see **calliper removal method**).

Hang up the calliper.

IMPORTANT: Make sure the flexible brake pipe and wheel speed sensor wiring are properly mounted, if they have been unfastened.



Remove:
– the two disc mounting bolts (V),



– the disc.

REFITTING

Carry out the removal procedure in reverse.

IMPORTANT: Press the brake pedal several times to bring the pistons into contact with the brake pads and discs.

Refit the wheels.

Tighten the wheel bolts to the recommended torque.

GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
T.Av. 476	Ball joint extractor
Rou. 604-01	Wheel hub locking tool

TIGHTENING TORQUES (in daNm)	
Shock absorber lower bolt	18
Lower ball joint nut	11
Track rod end nut	3.7
Brake disc mounting bolt	1.5
Calliper yoke bolt	10.5
Hub nut	28
Wheel bolt ∅ 12 ∅ 14	 11 13

REMOVAL

Put the vehicle on a two post lift.

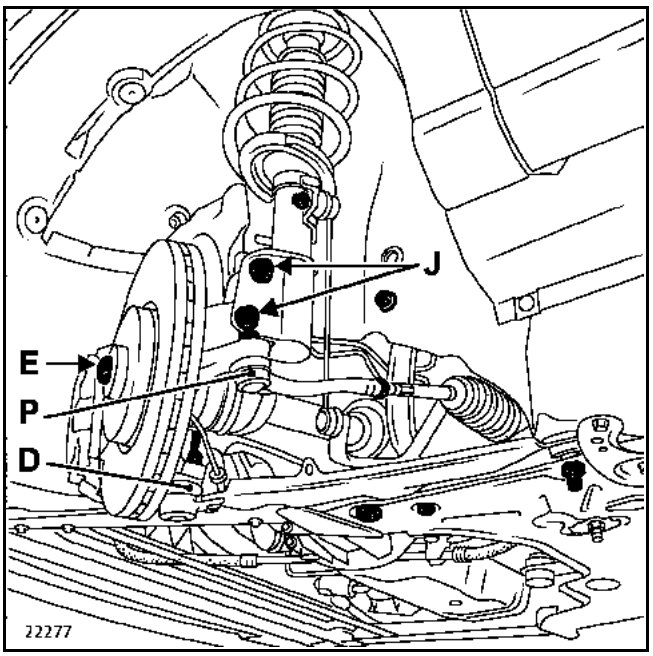
Remove the front wheels.

Unclip the wheel speed sensor on the stub axle carrier.

Remove the calliper (see **calliper removal method**).

Hang up the calliper.

Remove:
– the hub nut (E),
– the two brake disc mounting bolts,
– the disc,
– track rod end nut (P),
– lower ball joint nut (D),
– shock absorber lower mounting bolts (J).



– the stub axle carrier.

REFITTING

Carry out the removal procedure in reverse.

The calliper fork bolts must be coated with a product such as **FRENEBLOC** before they are fitted.

IMPORTANT: Press the brake pedal several times to bring the pistons into contact with the brake pads and discs.

N.B.: if the vehicle is equipped with discharge bulbs, it is essential to initialise the system. See repair method in Section 80C, "Initialisation".

GETtheMANUALS.org

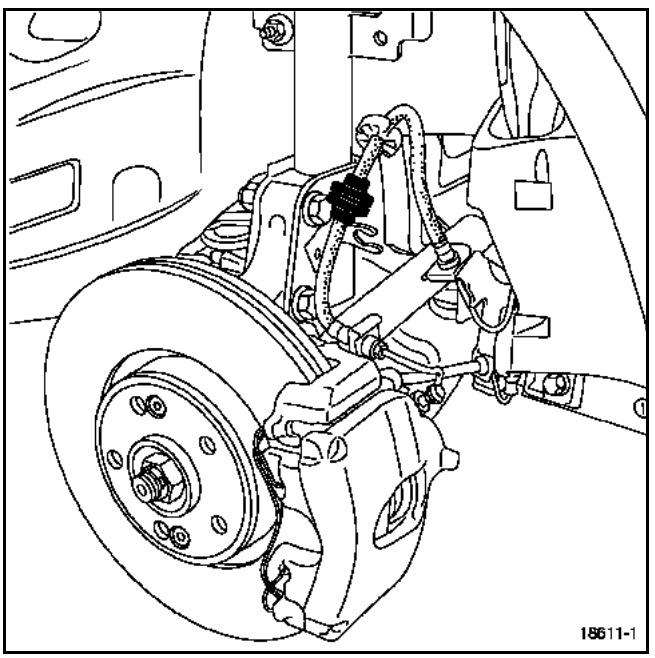
TIGHTENING TORQUES (in daNm)	
Shock absorber upper mounting bolt	2.1
Shock absorber rod nut	6.2
Shock absorber bolt	18
Lower ball joint nut	11
Anti-roll bar return linkage nut	4.4
Wheel bolt ∅ 12 ∅ 14	 11 13

REMOVAL

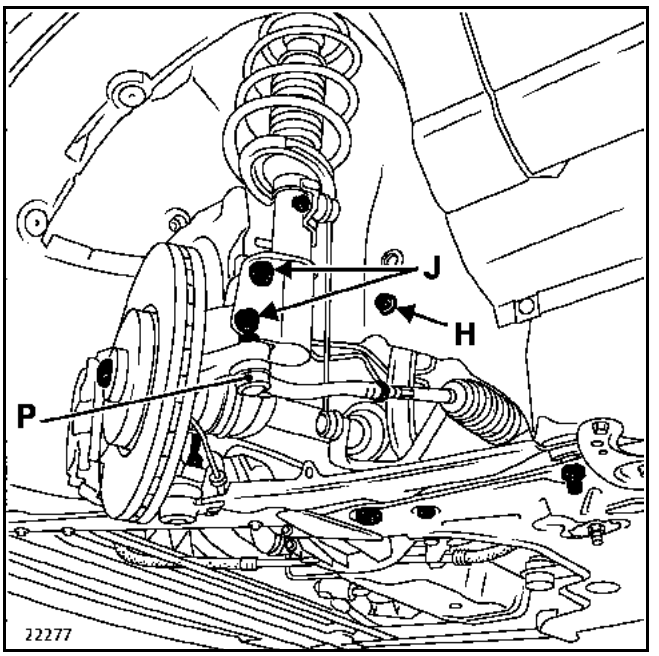
Put the vehicle on a two post lift.

Remove the front wheels.

Unfasten the shock absorber flexible brake pipe.

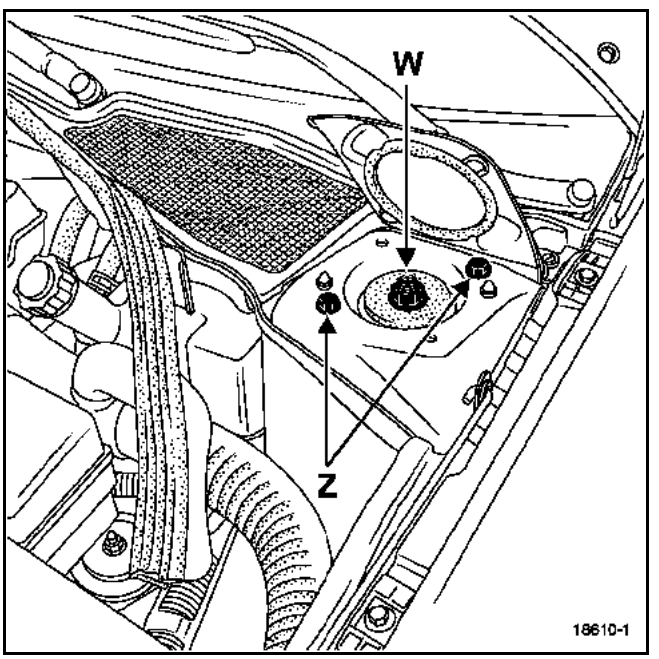


Remove:
– the upper mounting (H) of the stabiliser bar return linkage,
– track rod end nut (P),
– the shock absorber lower mounting bolts (J).



Left-hand side

Remove:
– the plastic grille,



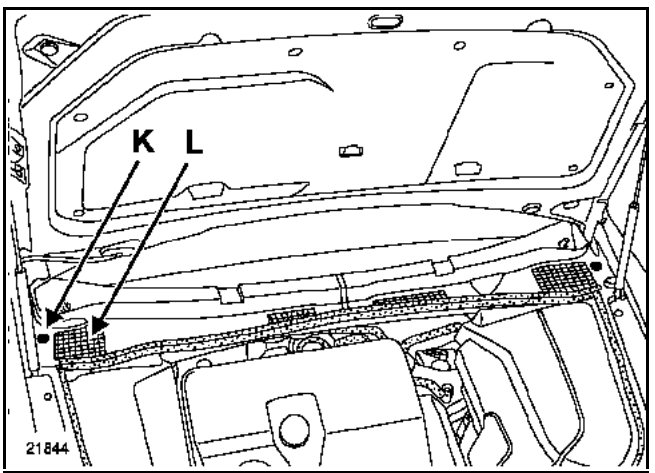
– the shock absorber rod mounting nut (W),
– the shock absorber rod upper thrust bearing,
– the two upper mounting bolts (Z) fastening the shock absorber to the body,
– the shock absorber and spring assembly.

GETtheMANUALS.org

Right-hand side

Remove:
– the plastic grille,
– the clip (K).

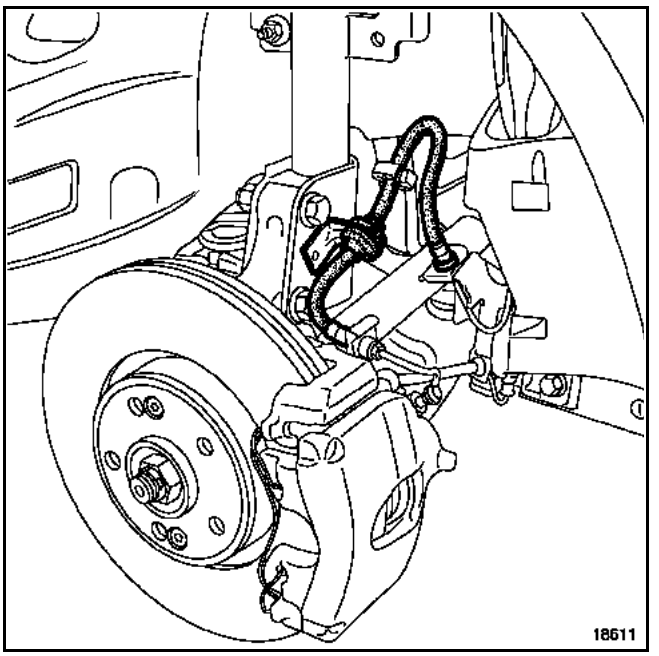
Raise the plastic cover (L) to access the shock absorber rod nut.



Remove:
– the shock absorber rod mounting nut,
– the shock absorber rod upper thrust bearing,
– the two upper mounting bolts fastening the shock absorber to the body,
– the shock absorber and spring assembly.

REFITTING

IMPORTANT: Make sure the flexible brake pipe and wheel speed sensor wiring are properly mounted, if they have been unfastened.



Carry out the removal procedure in reverse.

Tighten to the recommended torque.

N.B.: if the vehicle is equipped with discharge bulbs, it is essential to initialise the system. See repair method in Section 80C, "Initialisation".

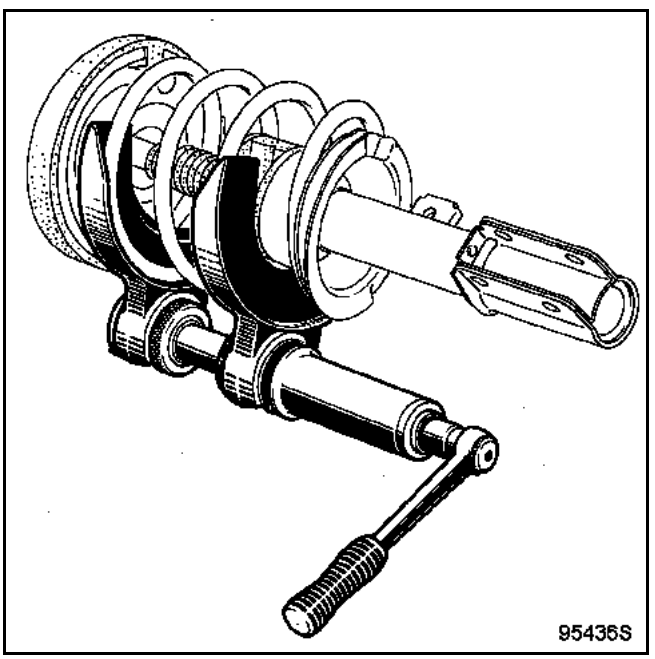
GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Sus. 578	Spanner for shock absorber mounting head flat
EQUIPMENT REQUIRED	
Compressor spring Tool for removing the shock absorber rod nut	

TIGHTENING TORQUE (in daNm)	
Shock absorber rod nut	2.1

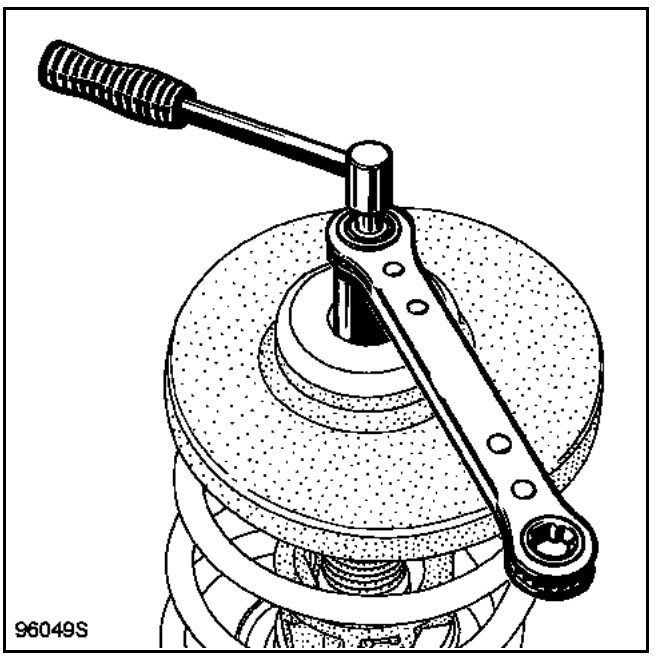
REMOVAL

Place the appropriate cups on the compression tool and position the assembly on the spring.



Press down on the spring until it detaches onto the cup mountings.

Using the tool, remove the shock absorber rod nut.



GETtheMANUALS.org

Separate the elements that make up the spring and shock absorber assembly.

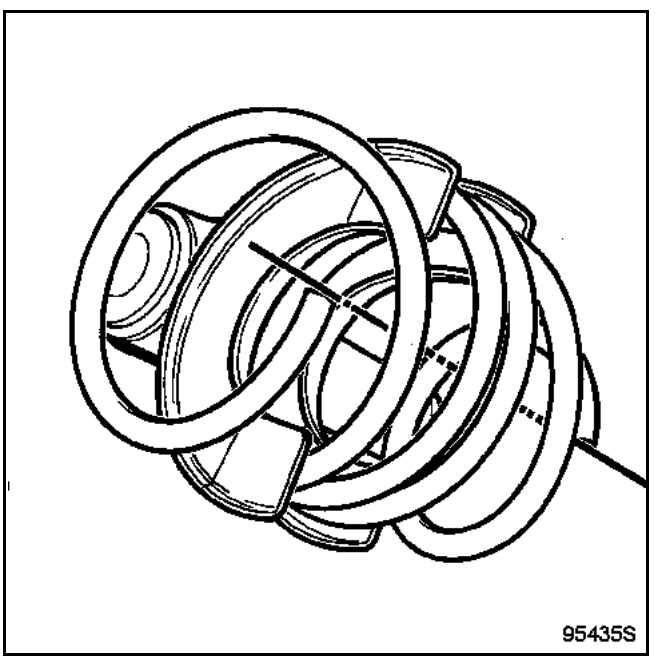
REFITTING

Precautions to take before assembly:

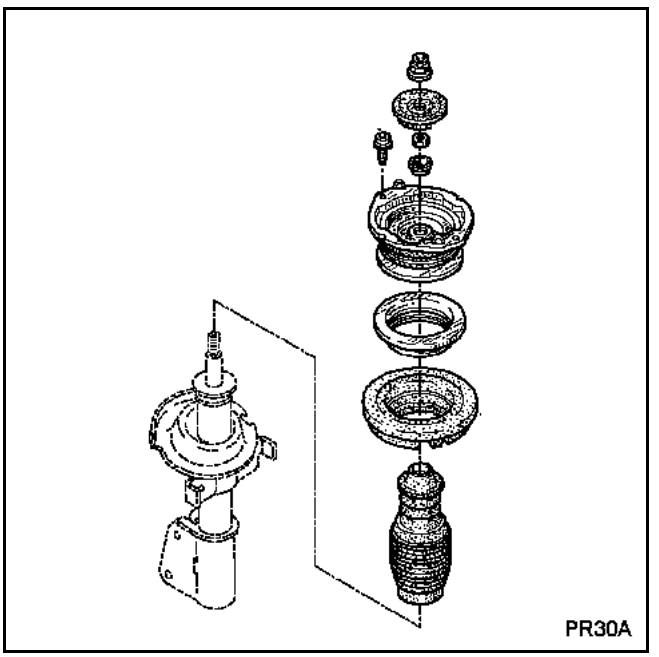
Shock absorbers are stored horizontally. Under these conditions, it is possible that shock absorbers designed to work vertically become drained.

As a result, you just need to manually pump the shock absorber rod a few times in a vertical position before fitting the spring.

When the spring is to be replaced, respect the position of the spring and the tool cups in order to refit it easily.

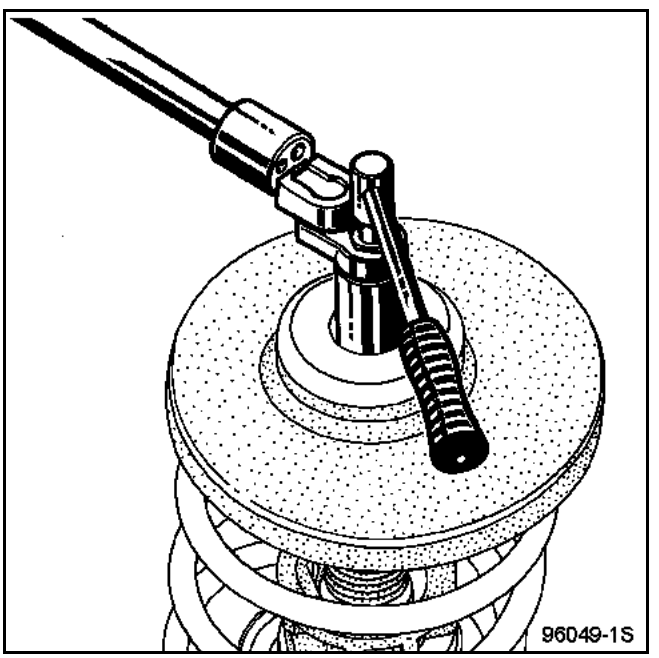


Follow the order and the direction of fitting of the constituent parts.



Torque tighten the new nut.

Decompress the spring and retrieve the tool.



GETtheMANUALS.org

TIGHTENING TORQUES (in daNm)	
Front mounting bolt for lower arm on sub-frame	10.5
Rear mounting bolt for lower arm on sub-frame	10.5
Lower ball joint nut	11
Stabiliser bar return linkage nut	4.4
Track rod nut	3.7
Steering shaft yoke bolt	2.1
Wheel bolt ∅ 12 ∅ 14	11 13
Aluminium side member mounting bolt	4.4
Engine sub-frame tie-bar bolt	10.5
Engine tie-bar bolt	18

IMPORTANT: if the bolts from the sub-frame or the arms are removed, they must be replaced and tightened to torque.

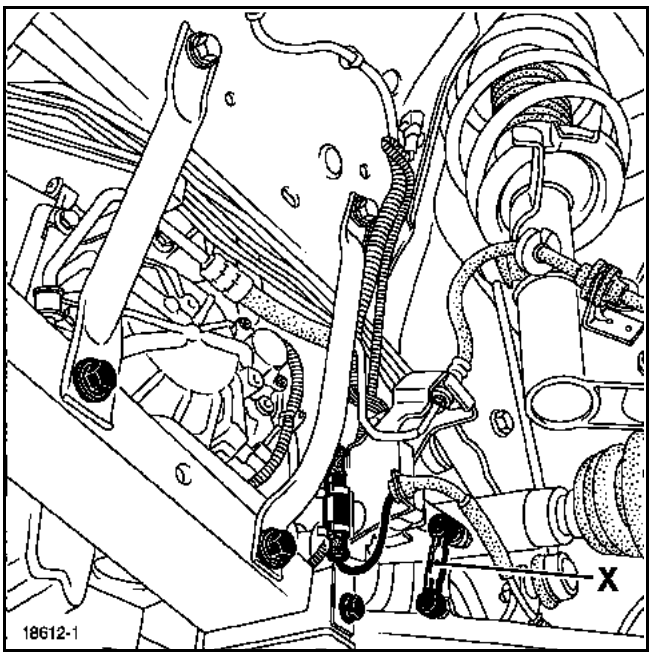
REMOVAL

Put the vehicle on a two post lift.

Remove:
– the engine undertray,
– the lower mountings of the bumpers,
– the wheels.

Fit a steering wheel immobiliser.

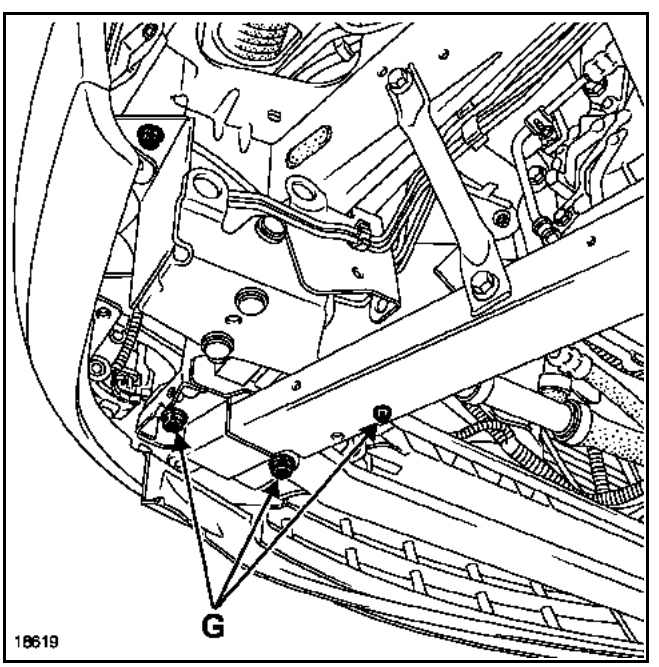
Remove:
– the front mudguards,
– both left-hand tie-rods,



– the right-hand tie-rod,
– the bolts from the flexible brake pipe mounting bracket and wheel speed sensor,
– the linkage (X) for the discharge bulb position sensor if fitted to the vehicle.

Unclip the wheel speed sensors from the lower arm.

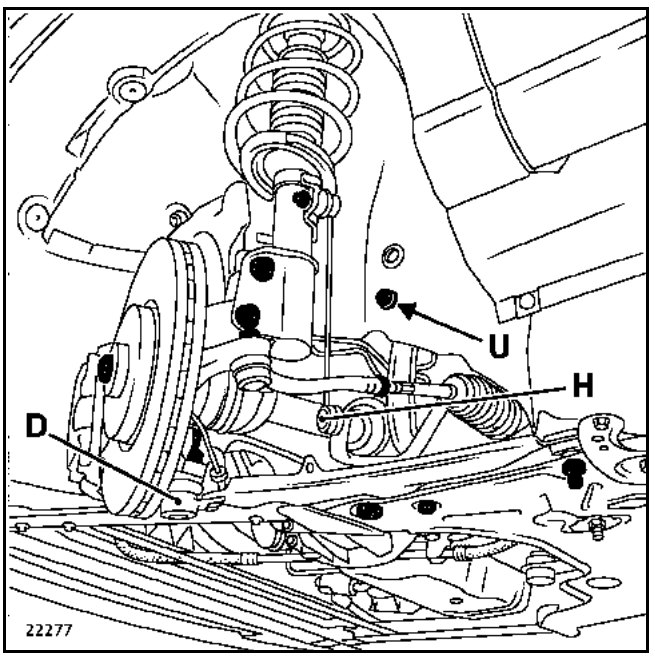
Remove:
– the bolts (G),
– the aluminium side members,



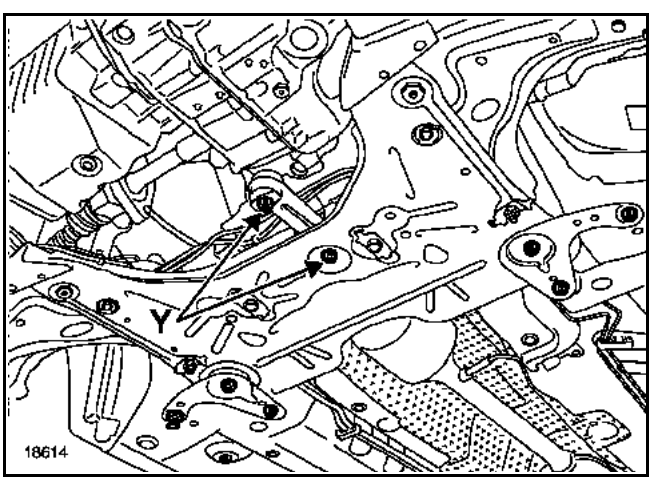
GETtheMANUALS.org

– the lower nut (H) of the stabiliser bar return linkage,
– the lower ball joint nut (D).

Loosen the upper bolt (U) on the front tie-rod.



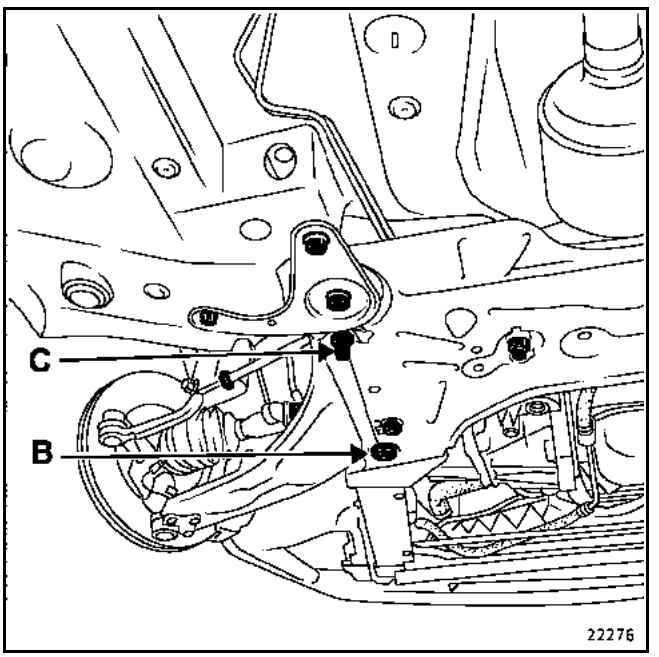
Remove:
– the steering shaft yoke bolt,
– the engine tie-bar bolts (Y),



– the acoustic tie-rod bolts,
– the sub-frame rear mounting bolts.

Tilt the sub-frame forward.

Remove the two mounting bolts (C) and (B) from the lower arm.



REFITTING

Replace bolts on the:
– arm,
– sub-frame,
– steering shaft yoke.

Carry out the removal procedure in reverse.

Tighten to the recommended torque.

IMPORTANT: THE STEERING SHAFT FORK BOLT REQUIRES ADJUSTMENT OF THE STEERING COLUMN. See repair method 36B, "steering column" section

N.B.: if the vehicle is equipped with discharge bulbs, it is essential to initialise the system. See repair method in Section 80C, "Initialisation".

Mounting bolt for tie-rod on aluminium side member	4.4
Steering shaft yoke bolt	2.1
Wheel bolt ∅ 12 ∅ 14	 11 13
Tie-rod bolt for placing on fork	3.2

The anti-roll bar is also called a stabiliser bar.

IMPORTANT: if the bolts from the sub-frame or the arms are removed, they must be replaced and tightened to torque.

REMOVAL

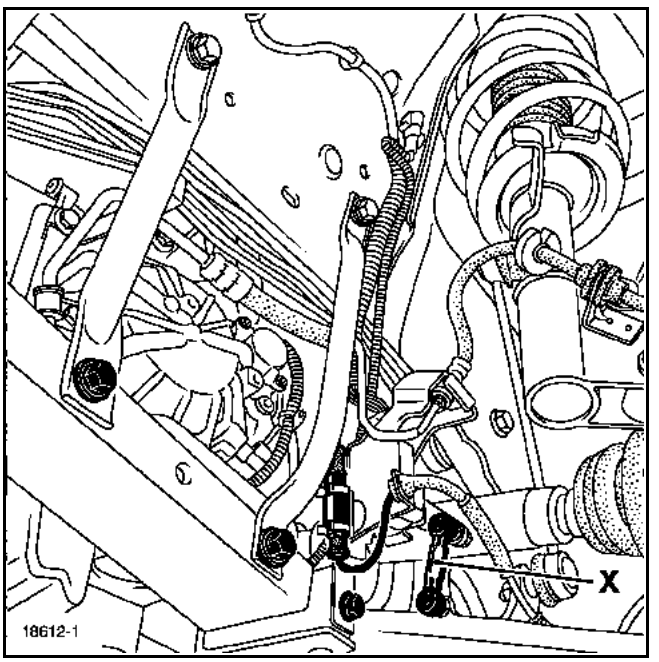
Put the vehicle on a two post lift.

Fit a steering wheel immobiliser.

Disconnect the battery.

Remove the wheels.

Remove:
– the engine undertray,
– the front mudguards,
– both left-hand tie-rods,



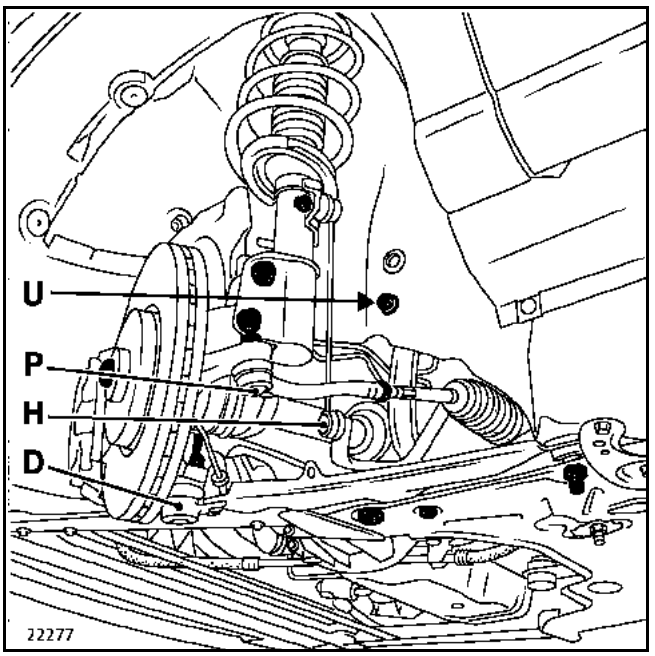
– the right-hand tie-rod,
– the bolts from the brake pipe mounting bracket and wheel speed sensor,
– the linkage (X) for the discharge bulb position sensor, if fitted to the vehicle.

Unclip the wheel speed sensors from the lower arm and sub-frame.

Remove:
– the return stabiliser bar linkage nuts (H),
– the track rod end nuts (P),
– the lower ball joint nuts (D).

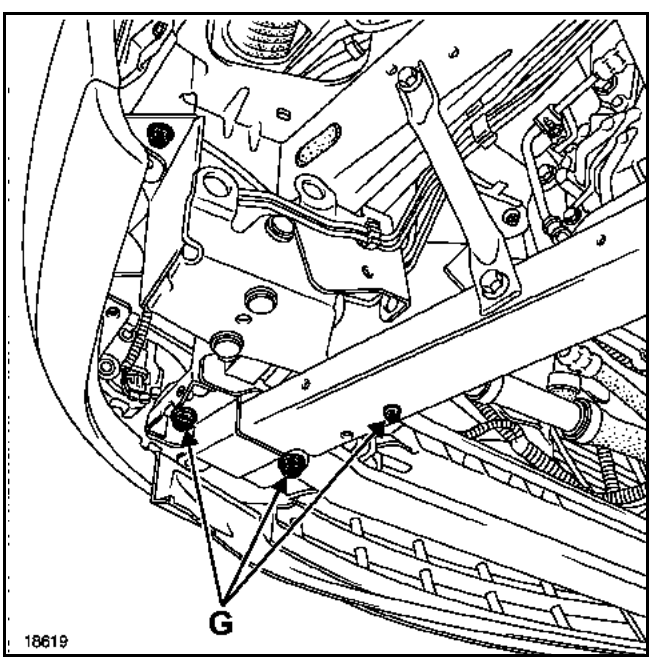
GETtheMANUALS.org

Loosen bolts (U) on the front tie-rod.

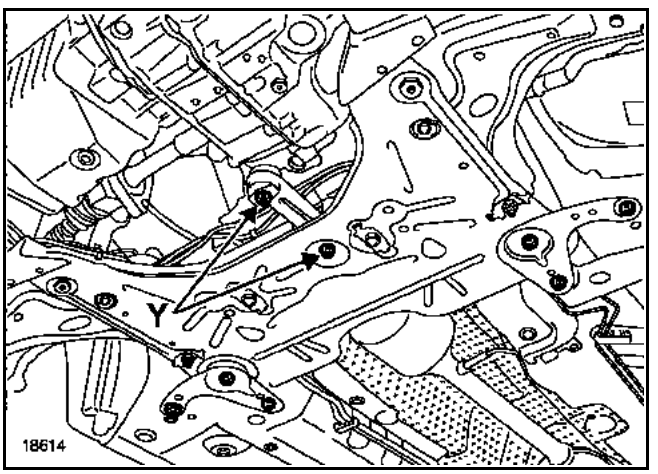


Place the hose clamp pliers **Mot. 453-01** on the low pressure hose of the power assisted steering circuit, as close as possible to the steering rack.

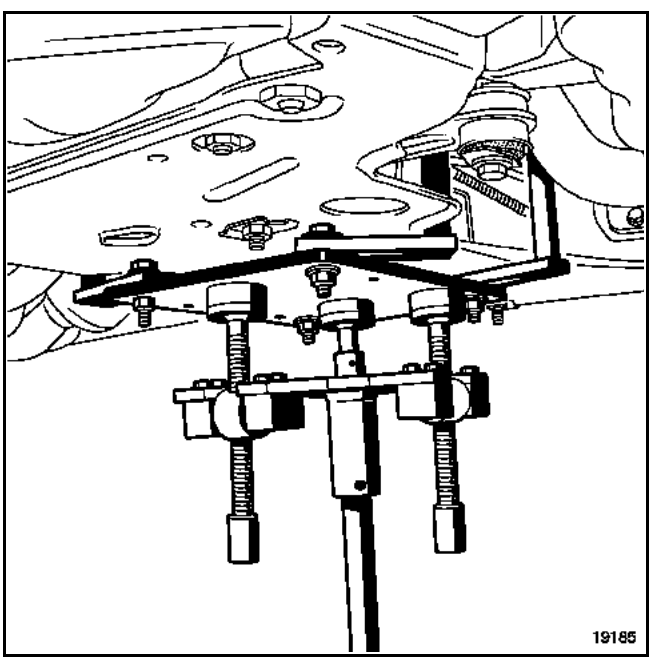
Remove:
– the bolts (G) from the aluminium side members,
– both aluminium side members,



– the steering shaft yoke bolt,
– the mounting bolts for the power assisted steering pipes on the steering rack,
– the engine tie-bar bolts (Y),
– the tie-bar bolts (R), (S), (T) for placing on fork,
– the sub-frame rear mounting bolts.

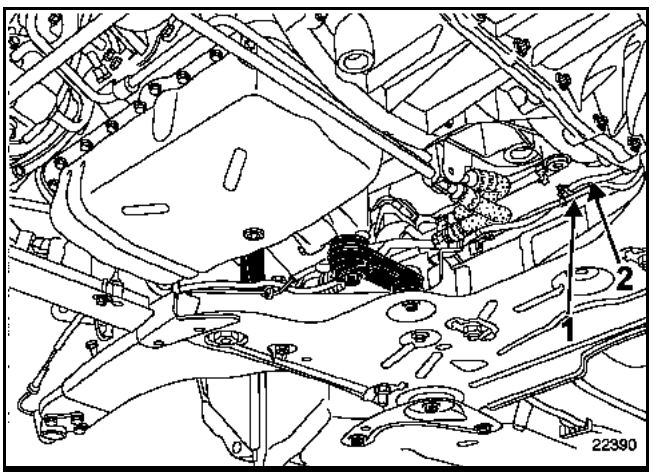


Place a component jack under the sub-frame.



GETtheMANUALS.org

Remove the heat shield fasteners from the steering rack.

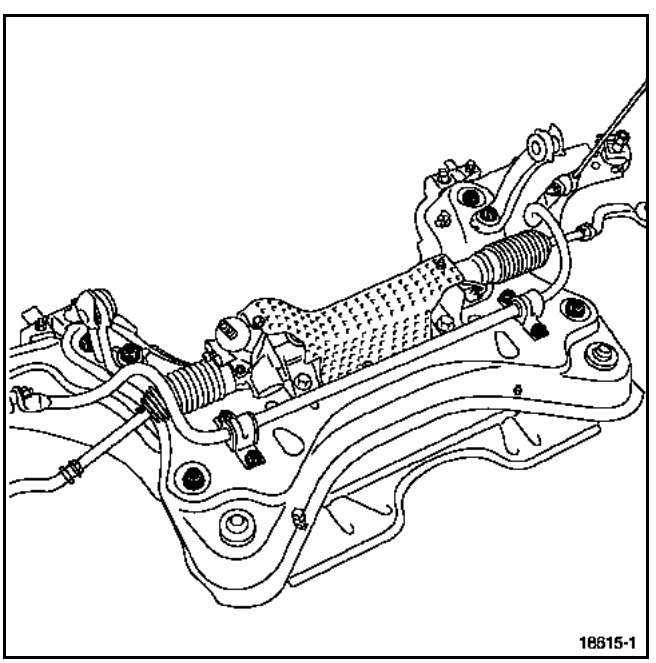


Unclip:
– the brake pipes (1),
– the wires (2) from the wheel speed sensors attached to the steering rack heat shield.

Remove the tie-rod bolts (U).

Lower the sub-frame by **20 cm**.

Remove the four stabiliser bar bolts.



REFITTING

Fit the new sub-frame.

Replace:
– the sub-frame bolts,
– the steering shaft yoke bolt,
– the steering shaft yoke nut.

Carry out the removal procedure in reverse.

Tighten to the recommended torque.

IMPORTANT: Fitting the steering shaft yoke bolt requires adjustment of the steering column. See repair method 36B, "steering column" section.

N.B.: if the vehicle is equipped with discharge bulbs, it is essential to initialise the system. See repair method 80C, "Initialisation" section.

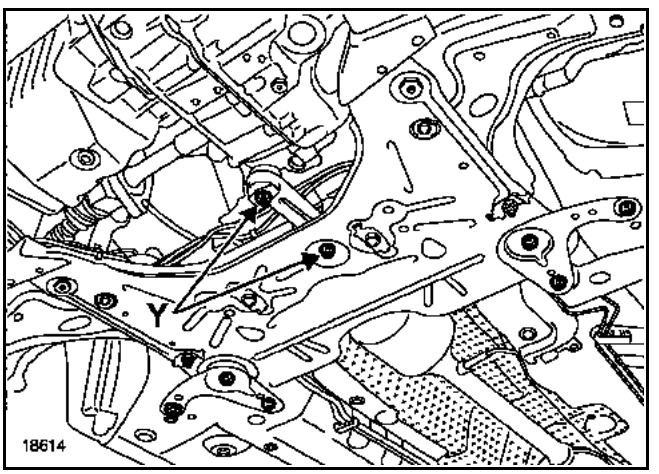
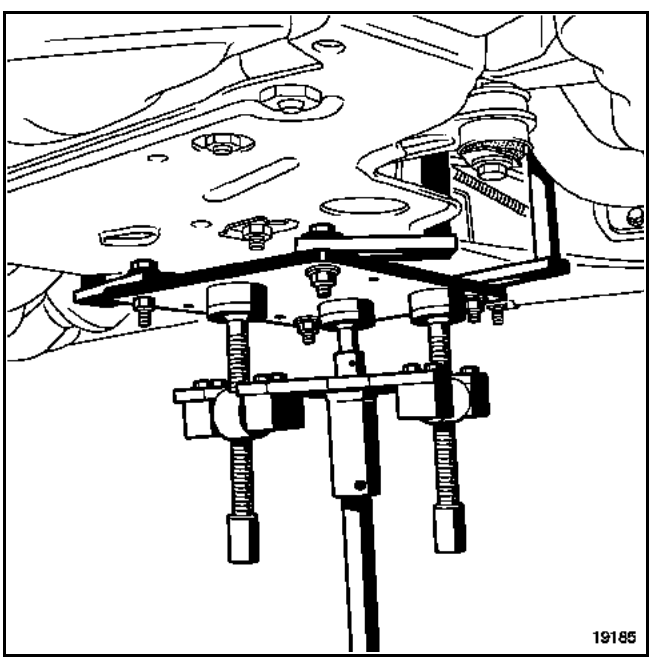
– the acoustic tie-rod bolts (R), (S), (T),
– the sub-frame rear mounting bolts.

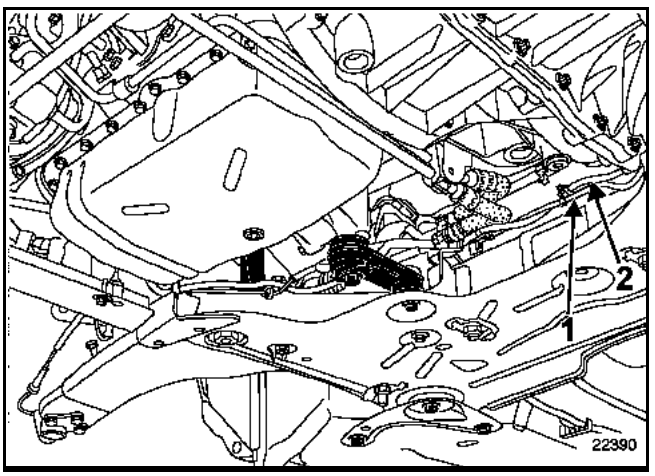


Place a component jack under the sub-frame.



GETtheMANUALS.org

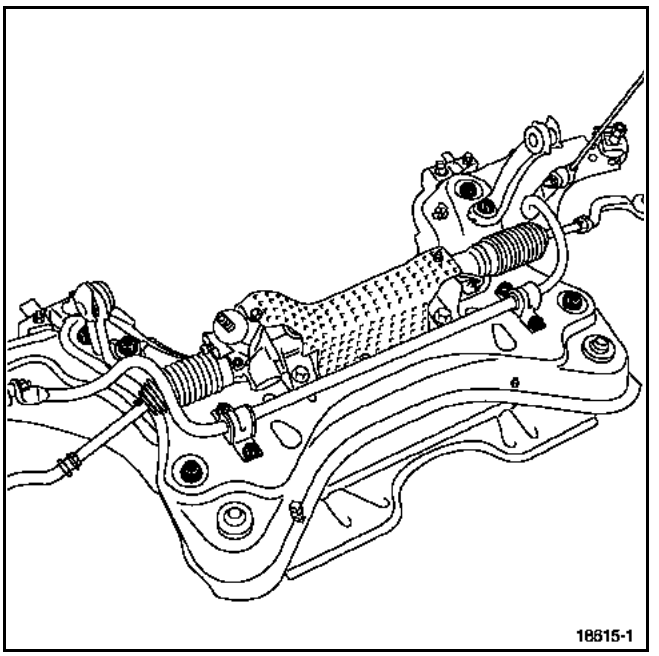
Remove the heat shield fasteners from the steering rack.



Unclip:
– the brake pipes (1),
– the wires (2) from the wheel speed sensors attached to the steering rack heat shield.

Remove:
– the plate covering the pipes and cables,
– the tie-rod bolts (U),
– the sub-frame.

Remove equipment from the sub-frame.



REFITTING

Fit the new sub-frame.

Replace:
– the sub-frame bolts,
– the steering shaft yoke bolt,
– the steering shaft yoke nut.

Carry out the removal procedure in reverse.

Tighten to the recommended torque.

IMPORTANT: Fitting the steering shaft yoke bolt requires adjustment of the steering column. See repair method 36B, "steering column" section.

IMPORTANT: Reinitialise the electrical components after connecting the battery. See repair method **80A, "Special Notes" section**.
Adjust the running gear. See repair method **07B, "angle checking value" section**.

N.B.: if the vehicle is equipped with discharge bulbs, it is essential to initialise the system. See repair method 80C, "Initialisation" Section
If the vehicle is equipped with cruise control, it is essential to initialise the range finder. See repair method 83D, "initialisation" section.

GETtheMANUALS.org

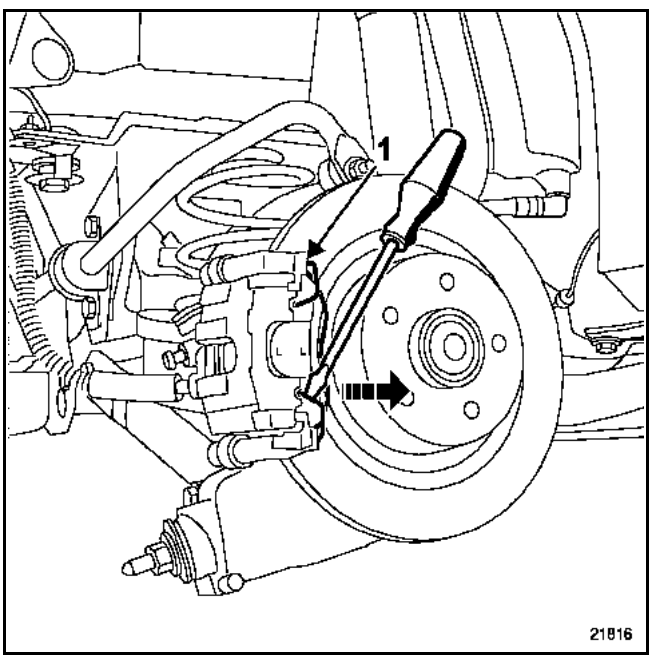
SPECIAL TOOLING REQUIRED	
Rear brake caliper piston return tool - BREMBO type	Piston return tool

TIGHTENING TORQUES (in daNm)	
Wheel bolt	
M12 x 150	**11**
M14 x 150	**13**
Brake calliper mounting bolt (pillars)	**2.8**

REMOVAL

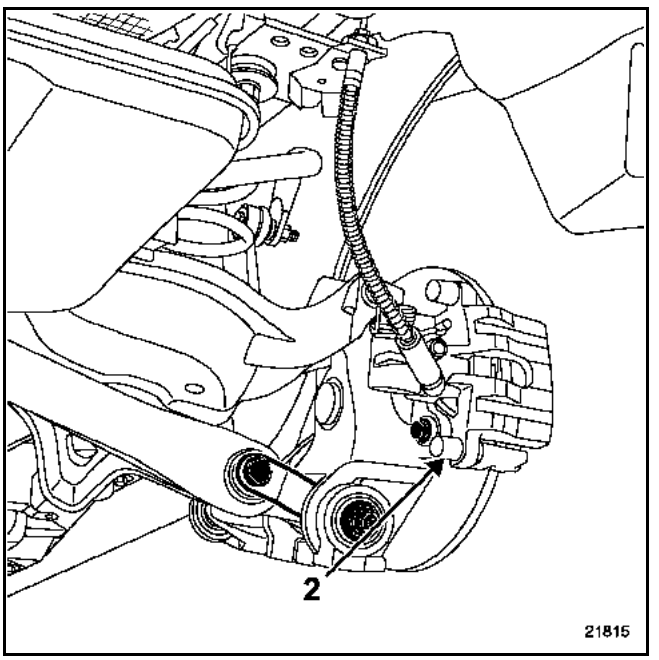
Put the car on a two post lift.

Release the parking brake. Remove the rear wheels.

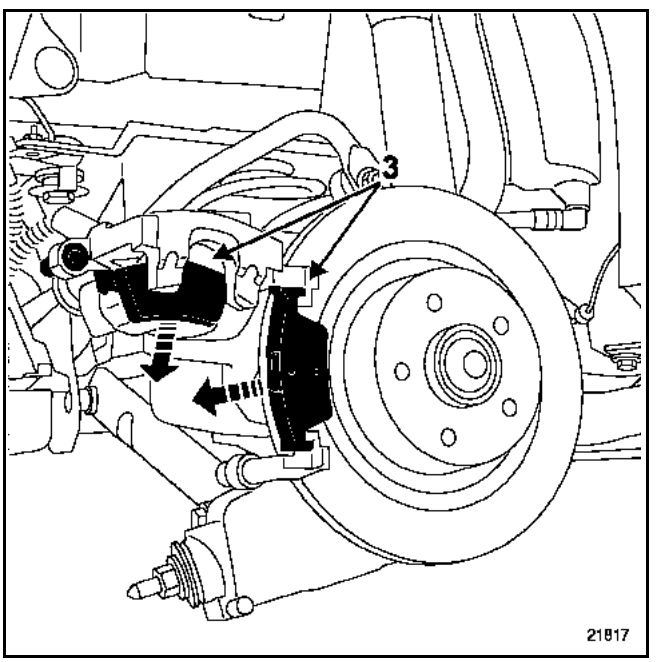


To prevent the spring from slipping, it is essential to hold the parking brake in position during the removal operation using pliers.

Remove the retaining springs (1) using a wide, flathead screwdriver.



Remove the calliper lower mounting bolts (pillars) (2).



Turn the callipers upwards.

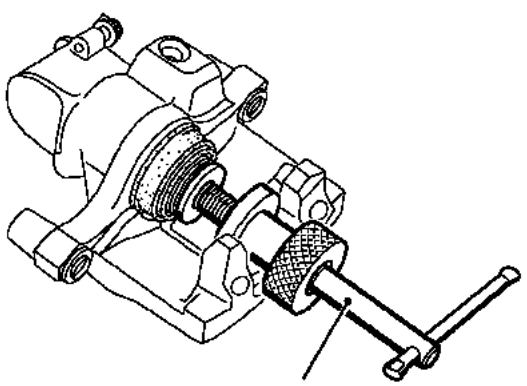
Remove the brake pads (3) from both sides of the vehicle.

GETtheMANUALS.org

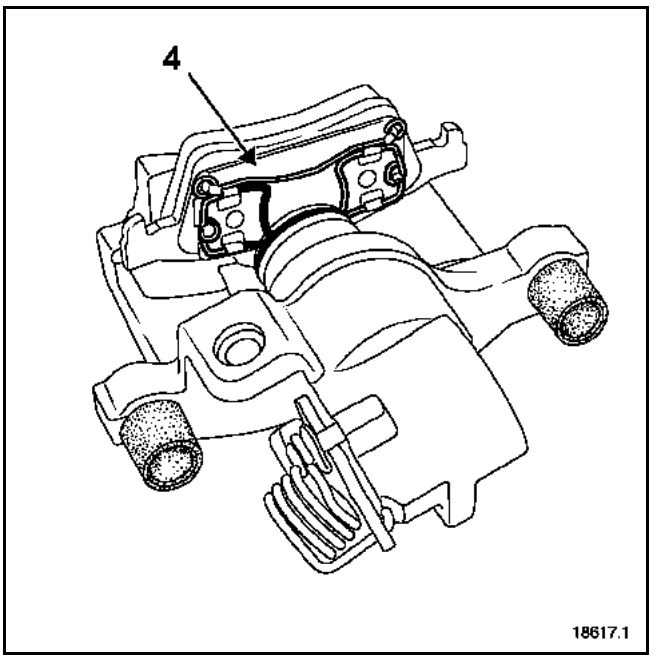
Check:
– the condition of the hose and replace it if necessary,
– the condition of the brake pads (**if they need replacing, it is essential to replace the pads on the opposite side as well**),
– the condition of the disc (**if it needs replacing, it is essential to replace the disc on the opposite side as well, plus the pads**),
– the condition and fitting of the piston dust seals,
– the condition of the guides.

Clean the calliper mountings and callipers.

REFITTING



Reinsert the pistons in the callipers using tool **rear break caliper piston return tool - BREMBO type**.



CAUTION: the inner brake pad is fitted with a retaining spring (4); it is essential to fit it to the calliper piston.

Refit:
– the new brake pads,
– the callipers,
– the calliper mounting bolts and tighten to the recommended torque.

Depress the brake pedal several times to bring the pistons into contact with the brake pads and discs. Check the brake fluid level.

Refit the wheels.

Tighten the wheel bolts to the recommended torque.

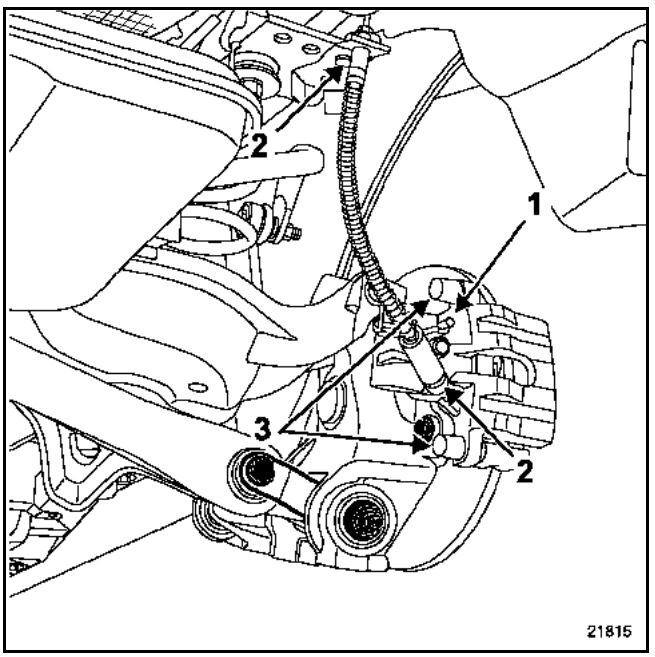
Rear brake caliper piston return tool - BREMBO type	Piston return tool

TIGHTENING TORQUES (in daNm)	
Wheel bolt	
M12 x 150	**11**
M14 x 150	**13**
Brake calliper mounting bolt (pillars)	**2.8**
Flexible brake pipe	**1.4**

REMOVAL

Put the car on a two post lift.

Release the parking brake. Remove the rear wheels.



Disconnect the handbrake cable (1).

Remove:
- the calliper support mounting bolts (pillars) (3),
- the calliper and the brake pads (refer to the relevant procedure).

Depress the brake pedal using a pedal press (this limits the flow of brake fluid).

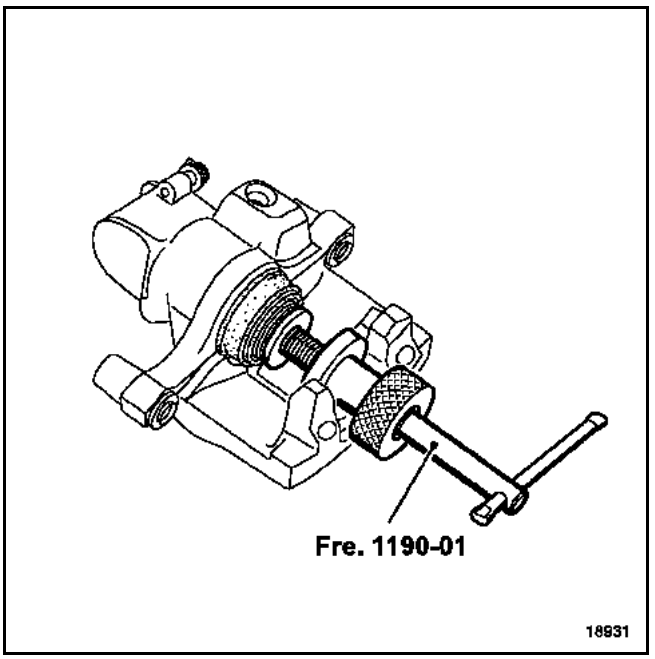
Disconnect the flexible brake pipe (2). Fit caps to limit the flow of brake fluid.

Check:
- the condition of the hose and replace it if necessary,
- the condition of the brake pads (**if they need replacing, it is essential to replace the pads on the opposite side as well**),
- the condition of the disc (**if it needs replacing, it is essential to replace the disc on the opposite side as well, plus the pads**),
- the condition and fitting of the piston dust seals,
- the condition of the guides.

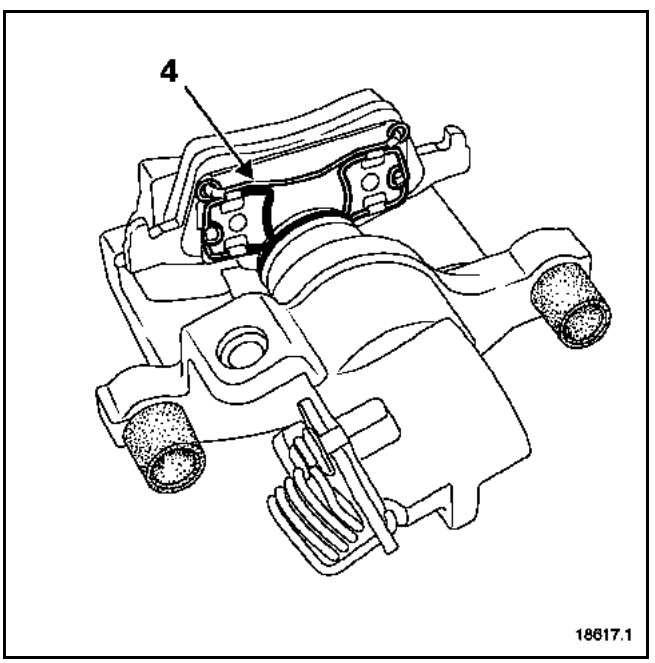
Clean the calliper mountings and callipers.

GETtheMANUALS.org

REFITTING



Force the calliper pistons back using tool **rear brake caliper piston return tool - BREMBO type**.



CAUTION: the inner brake pad is fitted with a retaining spring (4); it is essential to fit it to the calliper piston.

Refit:
– the brake pads,
– the calliper,
– the calliper mounting bolts, tighten to the recommended torque,
– the flexible brake pipe; tighten to the recommended torque.

Bleed the brake circuit (refer to the relevant method).

Depress the brake pedal several times to bring the pistons into contact with the brake pads and discs. Check the brake fluid level.

Refit the wheels.

Tighten the wheel bolts to the recommended torque.

– the calliper,
– the calliper mounting bolts, tighten to the recommended torque,
– the handbrake cable.

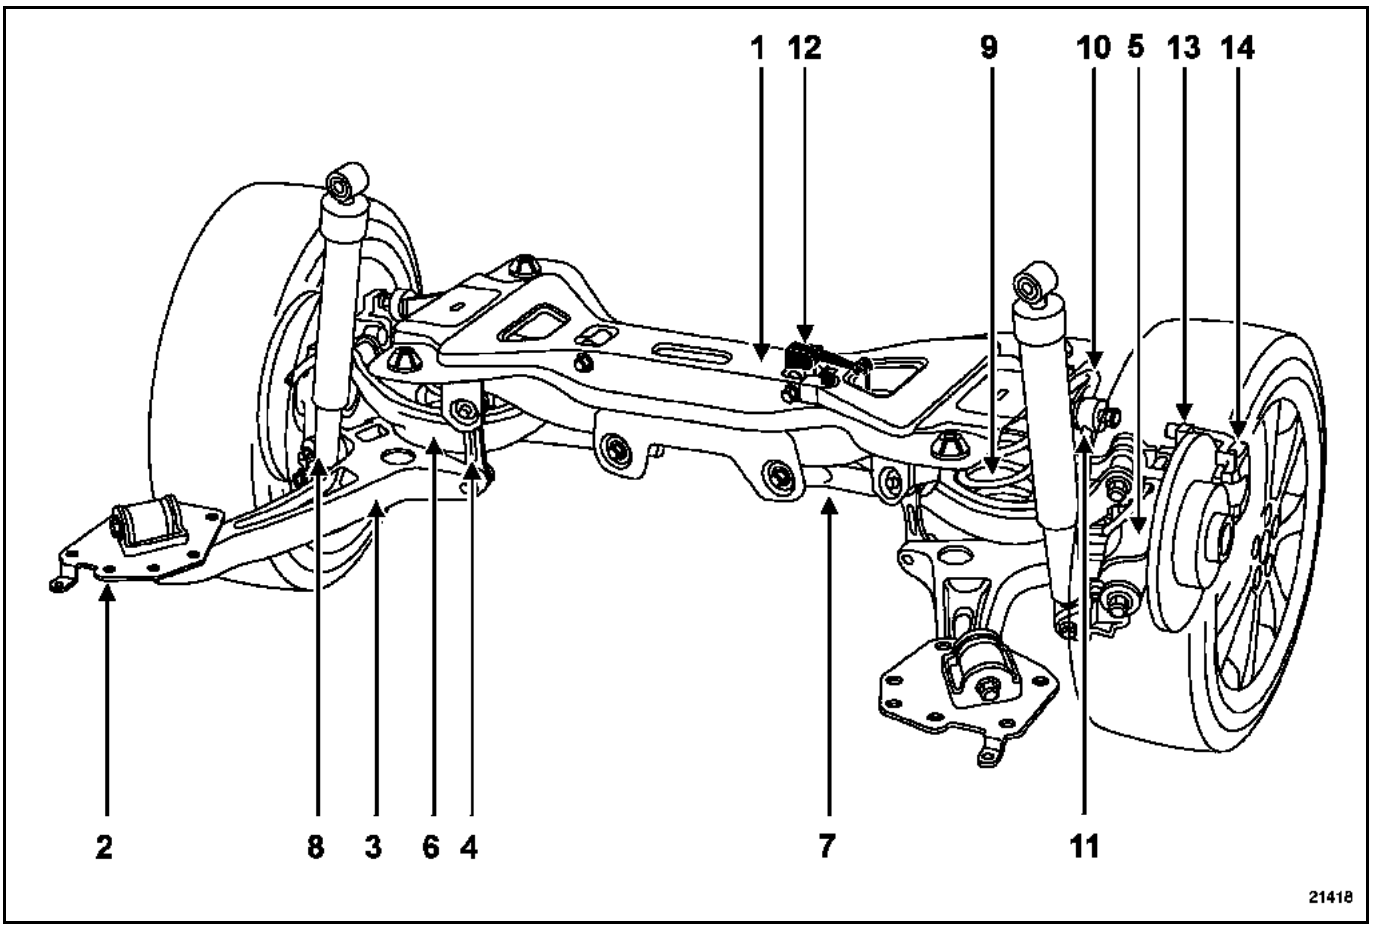
Depress the brake pedal several times to bring the pistons into contact with the brake pads and discs. Check the brake fluid level.

Refit the wheels.

Tighten the wheel bolts to the recommended torque.

GETtheMANUALS.org

PRESENTATION



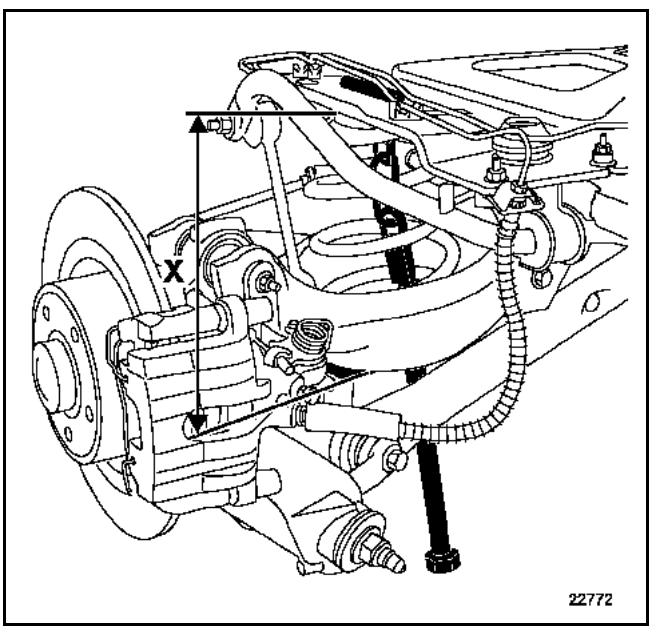
Description of the main rear axle components:

Mark number	Description	Single part	Left and right-hand parts	
			identical	different
1	Sub-frame	X		
2	Bearing			X
3	Longitudinal arm			X
4	Vertical arm			X
5	Stub axle carrier			X
6	Upper transverse arm		X	
7	Lower transverse arm		X	
8	Shock absorber		X	
9	Spring		X	
10	Anti-roll bar	X		
11	Anti-roll bar tie rod		X	
12	Attitude sensor	X		
13	Brake discs		X	
14	Brake calliper			X

GETtheMANUALS.org

TOOL: Sus. 1656 Spring compression tool

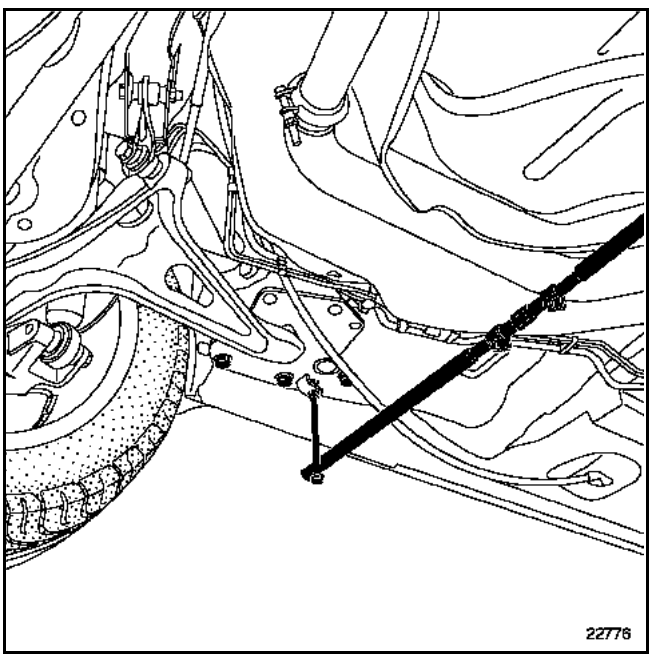
This tool should be used when removing the following components:
– the complete rear axle,
– stub axle carrier,
– longitudinal arm,
– upper arm,
– lower arm,
– vertical arm,
– shock absorber,
– sub-frame,
– spring,
– bearing,
– anti-roll bar tie rod.



Fit tool **Sus. 1656**. Tighten or untighten the tool to obtain the X measurements specified in the procedures. The X measurement is measured between the lower sub-frame surface and the upper arm lower surface is closest to the tool shaft.
It is advisable to lubricate the thread with high pressure lubricating grease.

TOOL: T. Ar. 1655 Adjustment bar

This tool should be used to adjust the wheel alignment of the rear axle.



Fit tool **T. Ar. 1655**. Tighten or loosen the tool to set the wheel alignment angle for each wheel specified in the procedures (refer to **Section 07B**). To make adjustments, it is necessary to unscrew the longitudinal arm bearing mounting bolts.

Check the angles of the camber then the rear and front wheel alignment.

Adjustment of the rear camber requires the adjustment of the front and rear wheel alignment.

Depending on the vehicle equipment, check and adjust:
– the adaptive cruise control (refer to the relevant procedure in **Section 83D**),
– the discharge bulb headlights (refer to the relevant procedure in **Section 83C**).

GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Sus. 1656	Spring compression tool

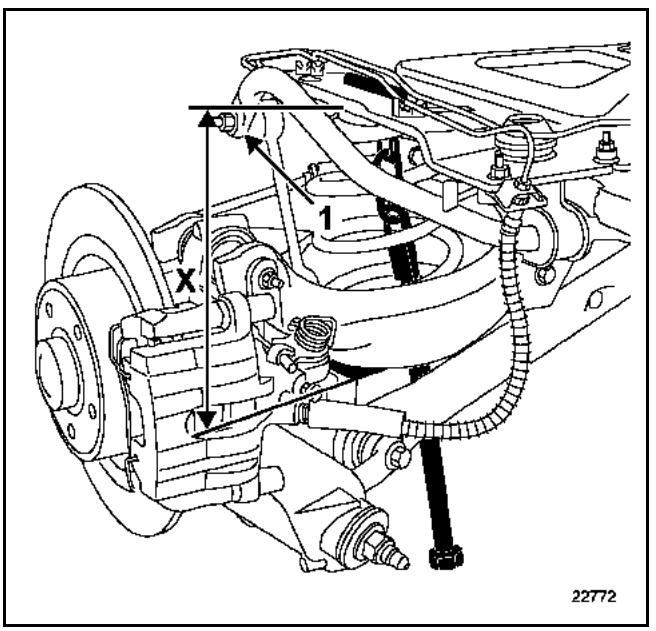
TIGHTENING TORQUES (in daNm)	
Wheel bolt	
M12 x 150	**11**
M14 x 150	**13**
Shock absorber mounting bolt	**10.5**
Upper mounting nut for anti-roll bar tie rod	**6.2**

This procedure enables you to work on one shock absorber at a time. This procedure must be repeated in full when working on the second shock absorber.

REMOVAL

Put the car on a two post lift.

Remove:
– the wheel,
– the anti-roll bar tie rod (1) upper nut.



Fit tool **Sus. 1656**. Operate the tool to obtain the measurement **X = 21 cm ± 0.5 cm**.

Remove:
– the shock absorber mounting bolts,
– the shock absorber.

NOTE: the shock absorbers are fitted horizontally. Under these conditions it is possible that the shock absorbers, which are designed to operate in a vertical direction, will have de-primed.

As a result, before fitting the shock absorber on the rear axle, pump the shock absorber rod a few times in vertical position.

REFITTING

Refit:
– the shock absorber,
– the shock absorber mounting bolts and tighten to the recommended torque.

Remove the tool.

Refit:
– the upper nut on the anti-roll bar tie rod, tighten to the recommended torque,
– the wheel; tighten to the recommended torque.

GETtheMANUALS.org

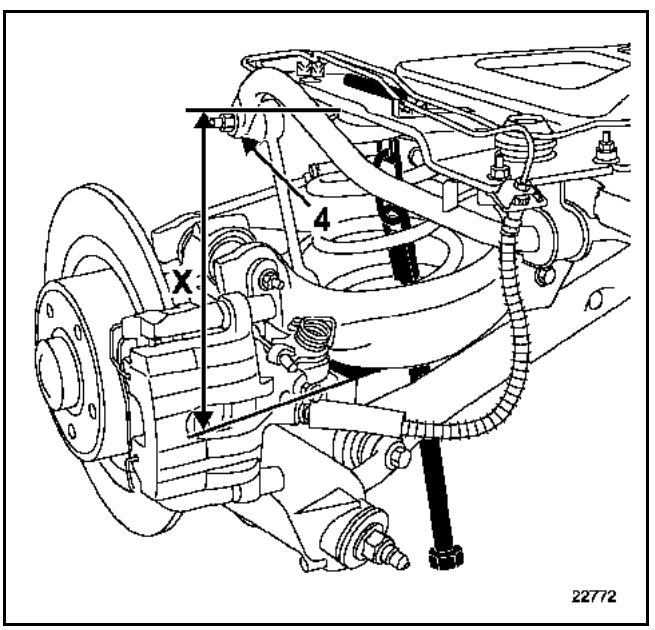
Stub axle carrier lower mounting bolt	**23**
Stub axle carrier upper mounting bolt	**10.5**
Shock absorber mounting bolt	**10.5**

REMOVAL

Put the car on a two post lift.

Remove:
– the wheel,
– the anti-roll bar tie rod (4) upper nut.



Fit tool **Sus. 1656**. Operate the tool to obtain the measurement **X = 21 cm ± 0.5 cm**.

Remove:
– the brake disc (refer to the relevant procedure),
– the shock absorber (refer to the relevant procedure).

Unclip the wheel speed sensor.

Remove:
– the stub axle carrier upper mounting bolt,
– the stub axle carrier lower mounting bolt,
– the stub axle carrier.

REFITTING

Carry out the removal procedure in reverse.

Remove tool **Sus. 1656**.

Check the angles of the camber then the rear and front wheel alignment.

Adjustment of the rear camber requires the adjustment of the front and rear wheel alignment.

Depending on the vehicle equipment, check and adjust:
– the adaptive cruise control (refer to the relevant procedure in **Section 83D**),
– the discharge bulb headlights (refer to the relevant procedure in **Section 83C**).

GETtheMANUALS.org

TIGHTENING TORQUES (in daNm)	
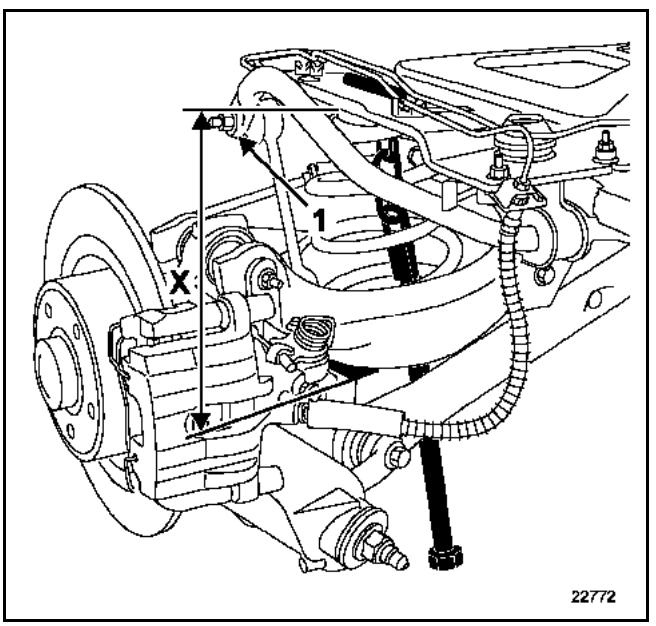
Wheel bolt	
M12 x 150	**11**
M14 x 150	**13**
Upper mounting nut for anti-roll bar tie rod	**6.2**
Bearing mounting bolt	**6.2**
Tie-rod mounting bolt	**6.2**
Vertical arm lower mounting bolt	**10.5**
Lower arm lower mounting bolt	**10.5**
Stub axle carrier lower mounting bolt	**23**

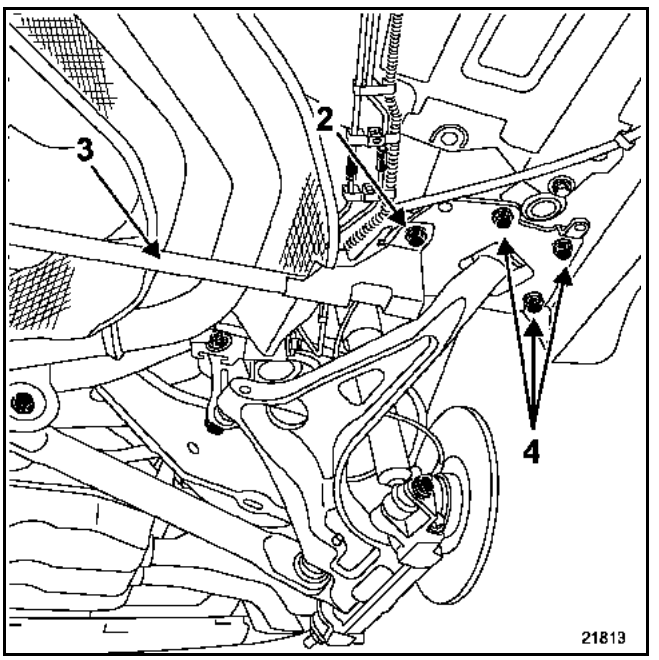
REMOVAL

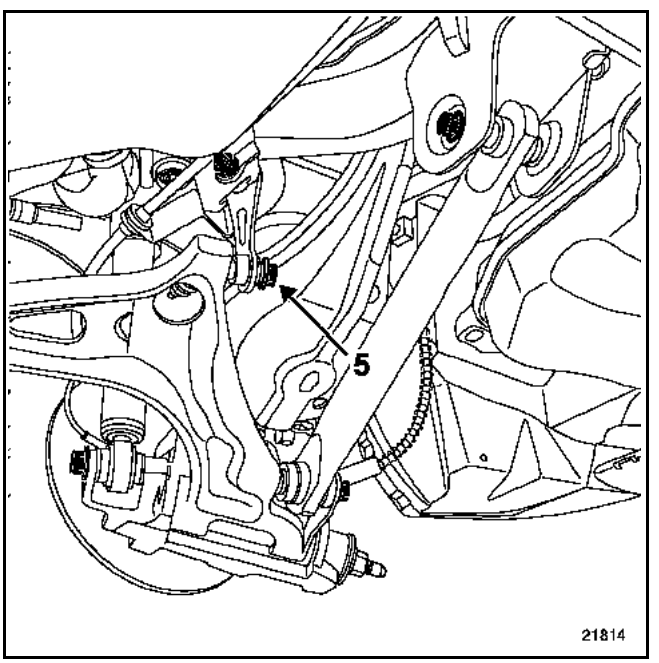
Put the car on a two post lift.

Remove:
– the wheel,
– the anti-roll bar tie rod (1) upper nut.



Fit tool **Sus. 1656**. Operate the tool to obtain the measurement **X = 21 cm ± 0.5 cm**.

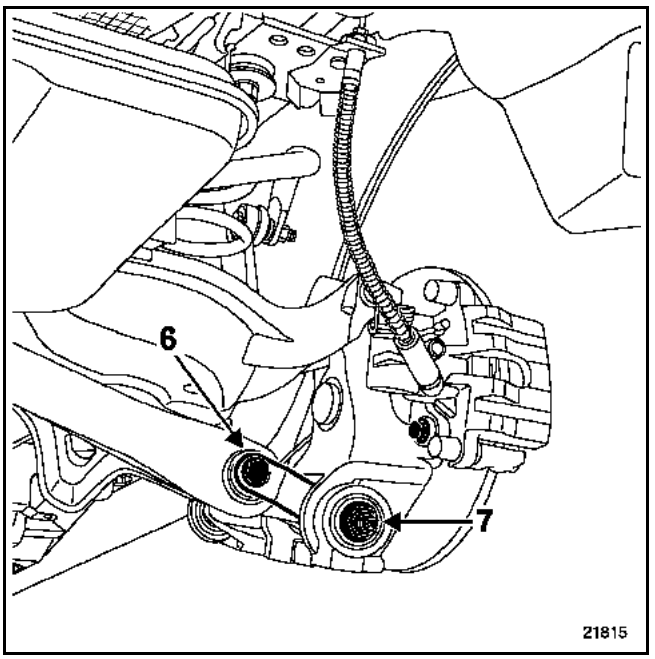




Disconnect the wheel speed sensor harness.

Remove:
– tie-rod (2) mounting bolts,
– the tie-rod (3).
– the bearing (4) mounting bolts,
– the vertical arm (5) mounting bolts.

GETtheMANUALS.org



Remove:
– lower arm mounting bolts (6),
– stub axle carrier lower mounting (7); check the position of the mounting bolt,
– the longitudinal arm.

REFITTING

Refit:
– the longitudinal arm,
– the stub axle carrier lower mounting bolt,
– the lower arm mounting bolt,
– the vertical arm mounting bolt,
– the bearing mounting bolts,
– the tie-rod,
– the tie-rod mounting bolts,
– unclip the wheel speed sensor harness.

Torque tighten the mounting bolts.

Remove tool **Sus. 1656**.

Refit the anti-roll bar tie rod upper nut. Tighten to the recommended torque.

Refit the wheels.

Tighten the wheel bolts to the recommended torque.

Check the angles of the camber then the rear and front wheel alignment.

Adjustment of the rear camber requires the adjustment of the front and rear wheel alignment.

Depending on the vehicle equipment, check and adjust:
– the adaptive cruise control (refer to the relevant procedure in **Section 83D**),
– the discharge bulb headlights (refer to the relevant procedure in **Section 83C**).

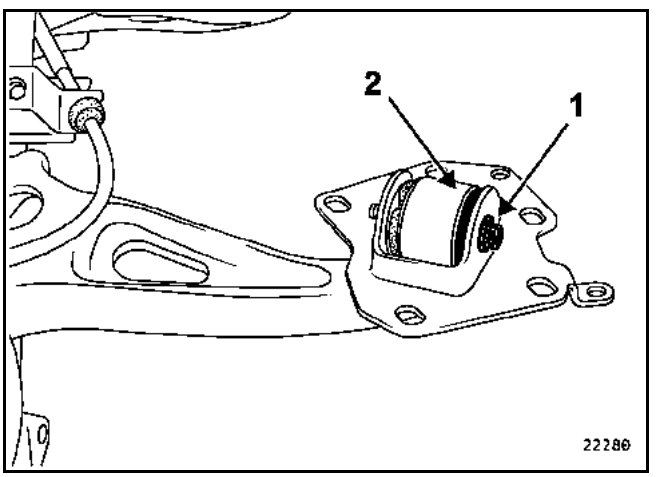
GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Sus. 1656	Spring compression tool

TIGHTENING TORQUE (in daNm)	
Longitudinal arm mounting bolt on the bearing	10.5

REMOVAL

Remove the longitudinal arm (refer to the relevant procedure).



Remove:
– mounting bolt (1) noting its position,
– the bearing.

REFITTING

Check the position of the spring washer (2) and the mounting bolt.

Refit:
– the bearing,
– mounting bolt (1); tighten to the recommended torque,
– the longitudinal arm (refer to the relevant procedure).

NOTE: bolt (1) can only be fitted in one direction. It is essential to refit bolt (1) by positioning the bolt head towards the rear of the vehicle.

GETtheMANUALS.org

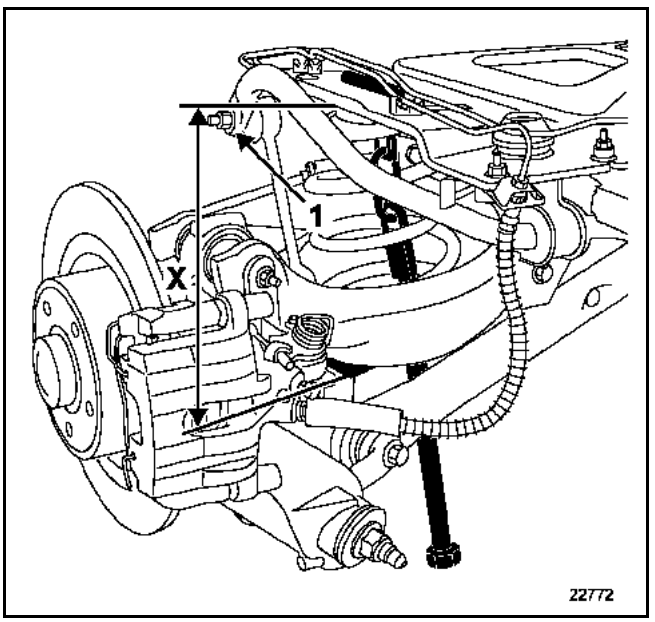
SPECIAL TOOLING REQUIRED	
Sus. 1656	Spring compression tool

TIGHTENING TORQUES (in daNm)	
Wheel bolt	
M12 x 150	**11**
M14 x 150	**13**
Anti-roll bar tie rod upper mounting nut	**6.2**
Stub axle carrier upper mounting bolt	**10.5**

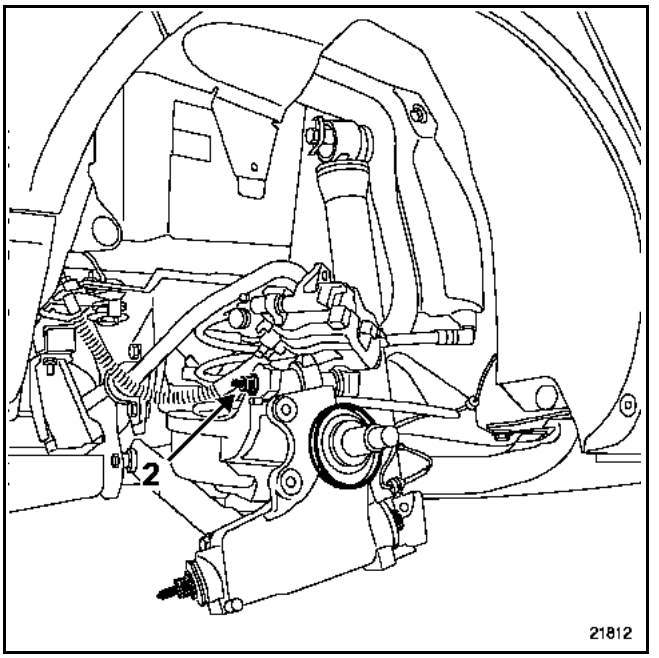
REMOVAL

Put the car on a two post lift.

Remove:
– the wheel,
– the anti-roll bar tie rod (1) upper nut.



Fit tool **Sus. 1656**. Operate the tool to obtain the measurement **X = 21 cm ± 0.5 cm**.



Remove the stub axle carrier (2) upper mounting bolt. Note the direction of the mounting so that it can be refitted correctly.

Turn the stub axle carrier outwards.

Remove:
– the anti-roll bar tie rod lower nut,
– the anti-roll bar tie rod.

REFITTING

Carry out the removal procedure in reverse.

Remove tool **Sus. 1656**.

Check the angles of the camber then the rear and front wheel alignment.

Adjustment of the rear camber requires the adjustment of the front and rear wheel alignment.

Depending on the vehicle equipment, check and adjust:
– the adaptive cruise control (refer to the relevant procedure in **Section 83D**),
– the discharge bulb headlights (refer to the relevant procedure in **Section 83C**).

GETtheMANUALS.org

TIGHTENING TORQUES (in daNm)

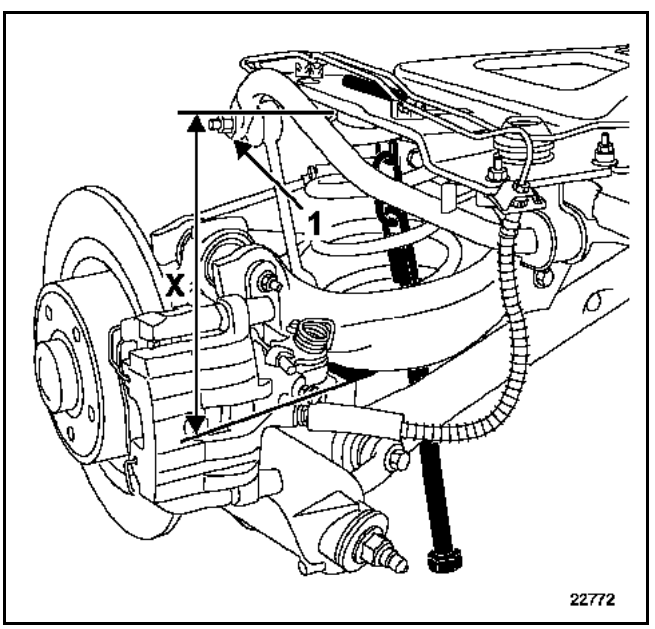
Shock absorber lower mounting bolt	**10.5**

REMOVAL

Put the car on a two post lift.

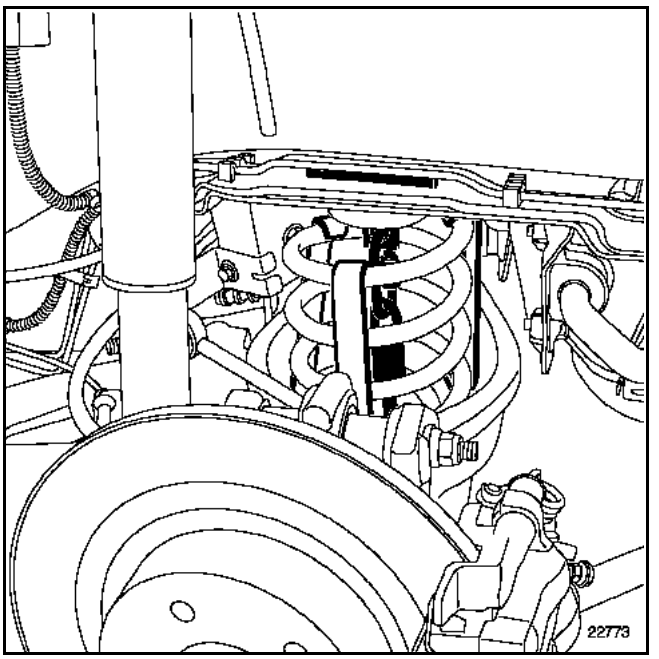
Remove:
– the rear wheels,
– the anti-roll bar left and right tie-rod upper mounting nuts (1).

Turn the anti-roll bar.



Fit tool **Sus. 1656**. Operate the tool to obtain the measurement **X = 21 cm ± 0.5 cm**.

Remove the shock absorber lower mounting bolt.

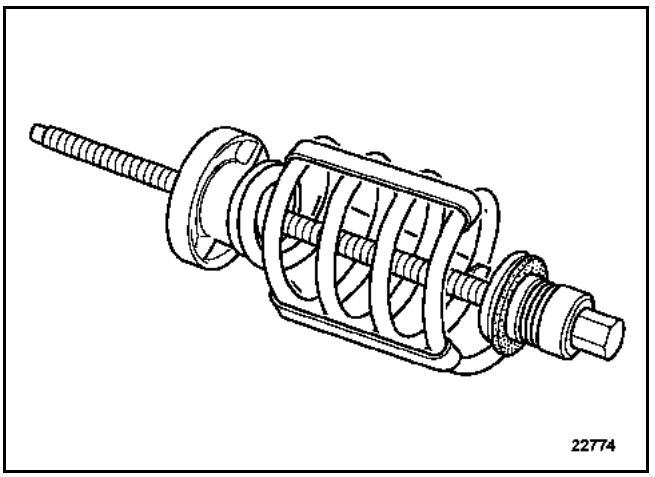


Tighten tool **Sus. 1656** to fit the three clips on the spring.

Loosen tool **Sus. 1656** to release the spring and clip assembly. Press the driveshaft and remove the spring and clip assembly.

GETtheMANUALS.org

REPLACING SPRINGS

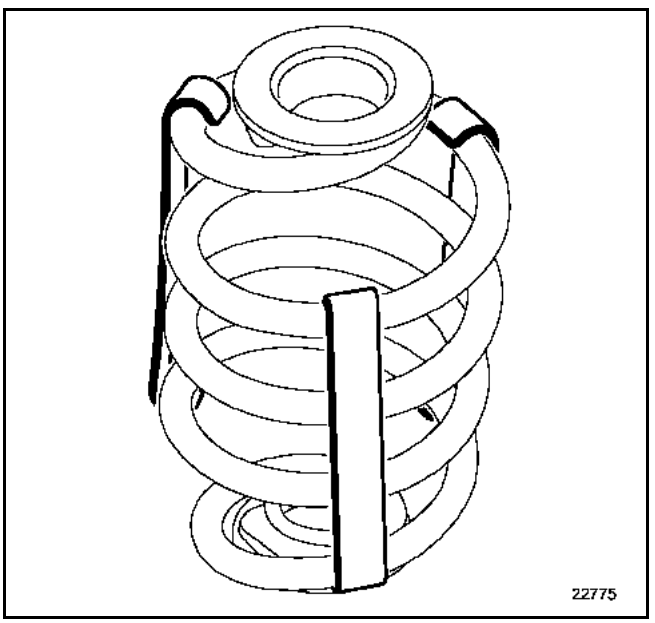


Fit tool **Sus. 1656** on the spring.

Tighten the tool to release the claws.

Loosen tool **Sus. 1656**. Replace the spring.

Fit tool **Sus. 1656** on the new spring.



Tighten the tool to fit the claws.

Remove tool **Sus. 1656**.

REFITTING

Check the condition of the rubber washers and replace them if necessary.

Press the driveshaft and insert the spring and clip assembly.

Fit tool **Sus. 1656**. Operate the tool to release the claws.

Loosen tool **Sus. 1656** to obtain the measurement **X = 21 cm ± 0.5 cm**.

Refit the shock absorber lower bolt and tighten to the recommended torque.

Remove tool **Sus. 1656**.

Turn the anti-roll bar.

Refit:
– the anti-roll bar left and right tie-rods upper mounting nuts and tighten to the recommended torque,
– the rear wheels; tighten to the recommended torque.

GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Sus. 1656	Spring compression tool
Mot. 1390	Component removal - refitting support

TIGHTENING TORQUES (in daNm)	
Wheel bolt	
M12 x 150	**11**
M14 x 150	**13**
Calliper support mounting bolts	**10.5**
Brake calliper mounting bolt (pillars)	**6.2**
Flexible brake pipe	**1.4**
Bearing mounting bolt	**6.2**
Tie-rod mounting bolt	**6.2**
Shock absorber mounting bolt	**10.5**
Sub-frame mounting bolt	**6.2**

REMOVAL

Put the car on a two post lift.

Secure the vehicle to the lift using safety straps (refer to **Section 02A**).

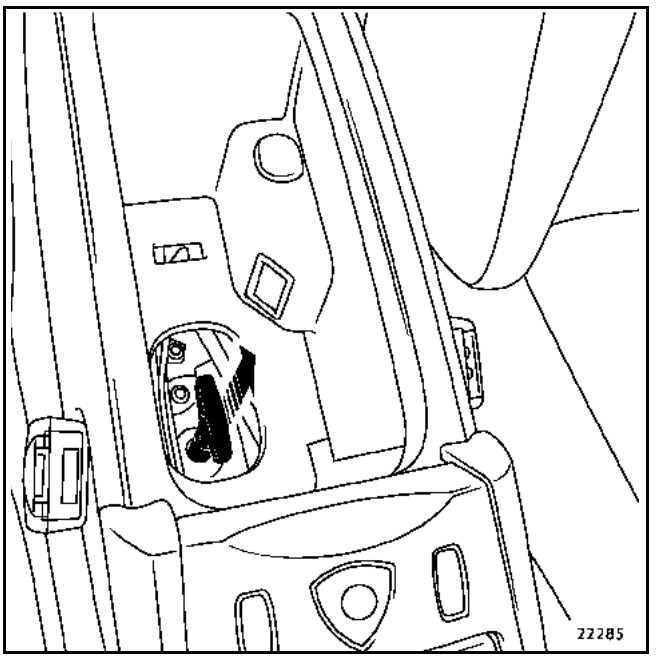
Disconnect the battery.

Fit a pedal press to limit the flow of brake fluid.

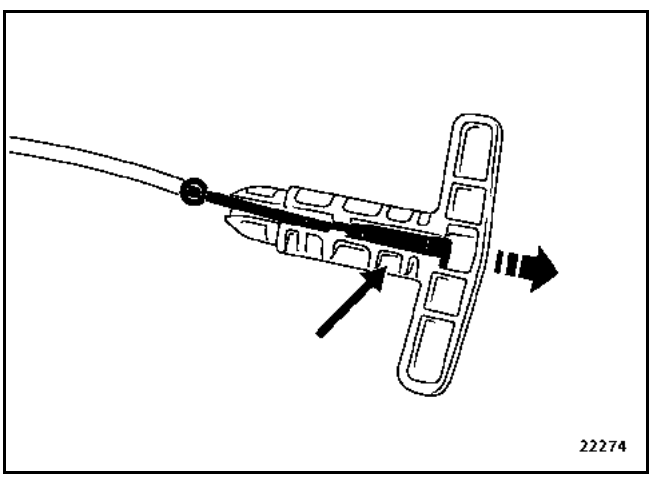
Remove the rear wheels.

Remove the silencer (refer to the relevant procedure).

Remove the heat shield.

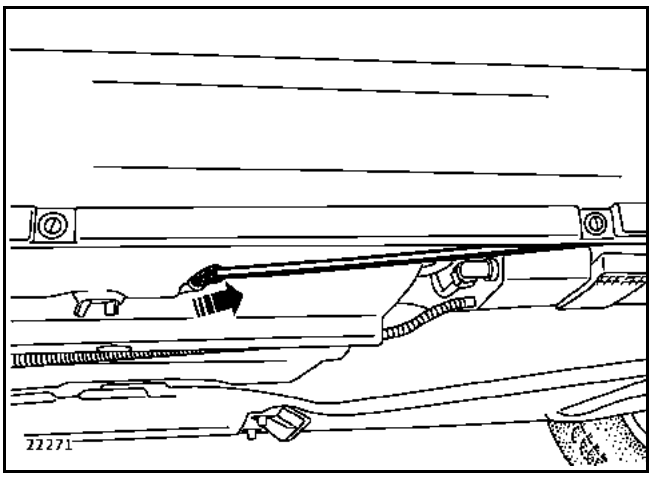


Pull the emergency handle; release the parking brake.



Disconnect the ring from the emergency cable.

GETtheMANUALS.org

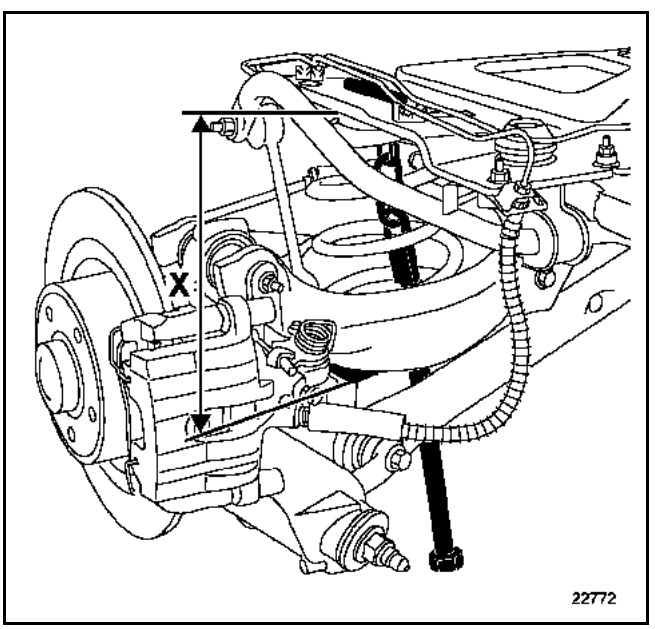


Release the emergency cable from the guide pipe.

Unclip the wheel speed sensors.

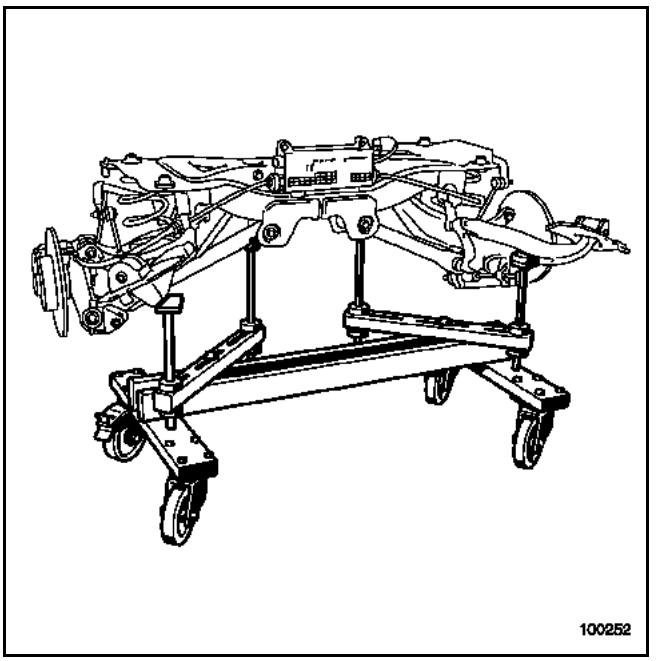
Disconnect:
– the attitude sensor (depending on equipment),
– the parking brake control unit connector,
– the hydraulic unions.

Unclip:
– the hydraulic pipes,
– the electric wiring harnesses.



Fit tool **Sus. 1656**. Operate the tool to obtain the measurement **X = 21 cm ± 0.5 cm**.

Remove:
– the bearing mounting bolts,
– the rear tie-rod,
– the shock absorber mounting bolts,
– the shock absorbers.

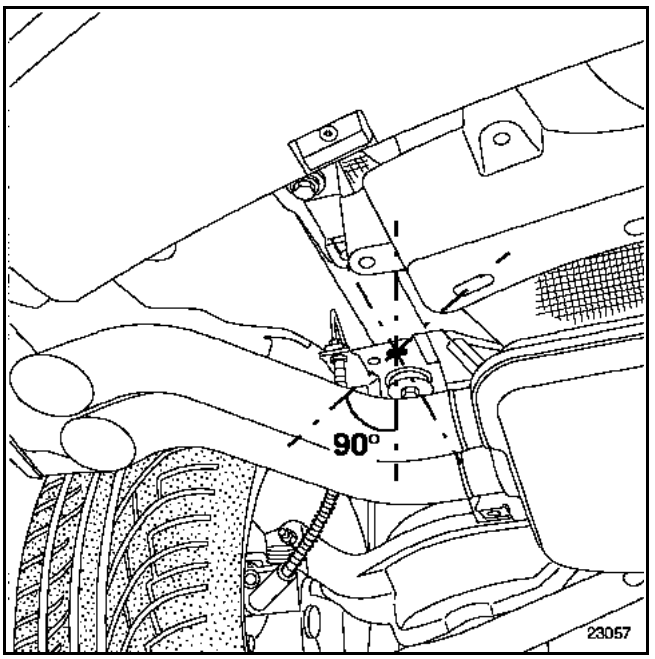


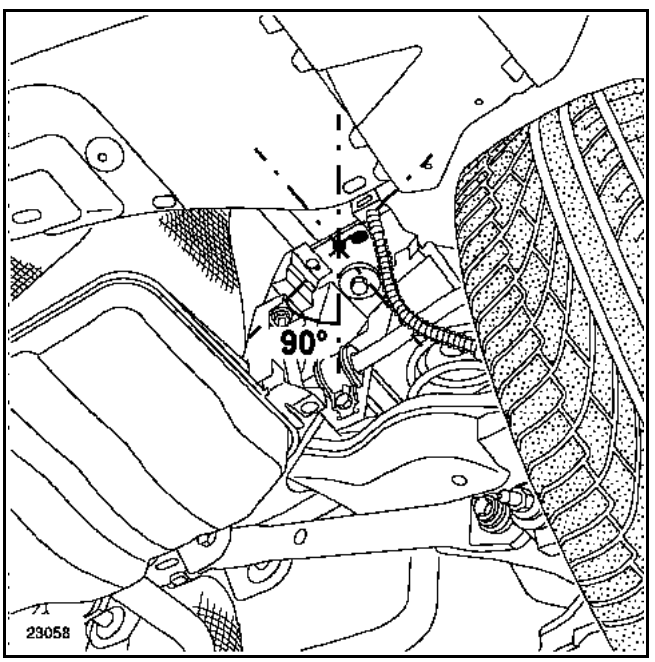
Fit **Mot. 1390** under the sub-frame.
Make sure that the axle/sub-frame assembly is fastened correctly to the tool.

Remove:
– the sub-frame mounting bolts,
– the rear axle.

GETtheMANUALS.org

REFITTING





Fit the centring pins (pipe or cylinder **10.2 mm** in diameter). Position the pins at right angles to the sub-frame and the rear side members. This operation enables the correct alignment of the rear axle and the body shaft.

CAUTION: be careful not to damage the petrol vapour absorber in the fuel tank filler neck.

Refit:
– the rear axle,
– the two sub-frame mounting bolts at the rear of the sub-frame (wide washer),
– the two sub-frame mounting bolts at the front of the sub-frame (narrow washer),
– the rear tie-rod,
– the bearing mounting bolts,
– the shock absorbers,
– the shock absorber mounting bolts.

Connect:
– the attitude sensor (depending on equipment),
– the automatic parking brake control unit connector,
– the hydraulic unions.

Clip into position:
– the hydraulic pipes,
– the electric wiring harnesses.

Refit:
– the wheel speed sensors,
– the emergency cable,
– the handle,
– the heat shield,
– the silencer.

Remove tool **Sus. 1656**.

Bleed the brake circuit (refer to the relevant method).

Depress the brake pedal several times to bring the pistons into contact with the brake pads and discs. Check the brake fluid level.

GETtheMANUALS.org

Connect the battery.

Refit the wheels.

Tighten the wheel bolts to the recommended torque.

Check the angles of the camber then the rear and front wheel alignment.

Adjustment of the rear camber requires the adjustment of the front and rear wheel alignment.

Depending on the vehicle equipment, check and adjust:
– the adaptive cruise control (refer to the relevant procedure in **Section 83D**),
– the discharge bulb headlights (refer to the relevant procedure in **Section 83C**).

GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Sus. 1656	Spring compression tool
EQUIPMENT REQUIRED	
Component jack

Sub-frame mounting bolt	**6.2**
Calliper bleed screw	**0.8**
Longitudinal arm bearing mounting bolts	**6.2**
Calliper support mounting bolts	**10.5**
Brakes hydraulic union	**1.4**
Upper arm mounting bolt	**10.5**

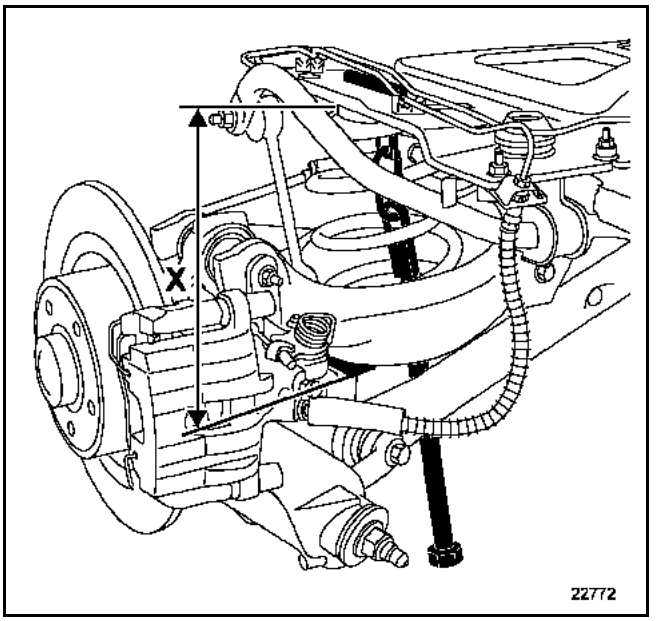
REMOVAL

Put the car on a two post lift.

Secure the vehicle to the lift using safety straps (refer to **Section 02A**).

Remove:
- the springs (refer to the relevant procedure),
- the stub axle carrier on the same side as the upper arm being removed (refer to the relevant procedure),
- the rear tie-rod (refer to the relevant procedure),
- the anti-roll bar tie rod,
- depending on the vehicle equipment; the attitude sensor control lever,
- the upper arm mounting bolt,
- the upper arm.

REFITTING



Refit the upper arm.

Fit tool **Sus. 1656** on the upper arm. Operate the tool to obtain the measurement **X = 21 cm ± 0.5 cm**.

Refit the upper arm mounting bolt to the sub-frame. Position the bolt head at the front of the sub-frame. Tighten this mounting to the recommended torque.

Refit:
- the anti-roll bar tie rod to the upper arm,
- depending on the vehicle equipment; the attitude sensor control lever,
- the rear tie-rod (refer to the relevant procedure),
- the stub axle carrier on the same side as the upper arm being removed (refer to the relevant procedure),
- the springs (refer to the relevant procedure).

GETtheMANUALS.org

Remove tool **Sus. 1656**.

Bleed the brake circuit (refer to the relevant method).

Depress the brake pedal several times to bring the pistons into contact with the brake pads and discs. Check the brake fluid level.

Connect the battery.

Refit the wheels.

Tighten the wheel bolts to the recommended torque.

Check the angles of the camber then the rear and front wheel alignment.

Adjustment of the rear camber requires the adjustment of the front and rear wheel alignment.

Depending on the vehicle equipment, check and adjust:
– the adaptive cruise control (refer to the relevant procedure in **Section 83D**),
– the discharge bulb headlights (refer to the relevant procedure in **Section 83C**).

Upper arm mounting bolt	**10.5**

REMOVAL

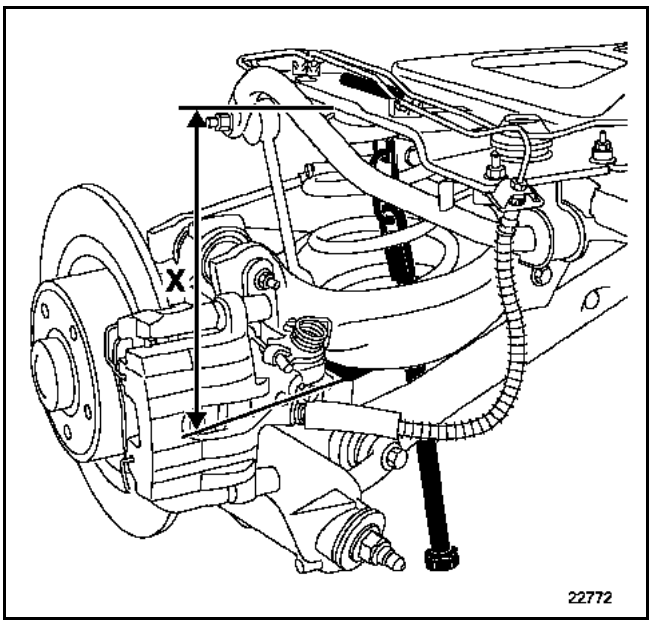
Put the car on a two post lift.

Secure the vehicle to the lift using safety straps (refer to **Section 02A**).

Remove:
- the springs (refer to the relevant procedure),
- depending on the vehicle equipment; the attitude sensor tie-rod,
- the stub axle carriers (refer to the relevant procedure),
- the rear tie-rod (refer to the relevant procedure),
- the anti-roll bar,
- the bolts mounting the lower arm on the sub-frame,
- the bolts mounting the vertical arm on the sub-frame,
- the lower and vertical arms,
- the upper arm mounting bolts,
- the upper arms,
- the automatic parking brake control unit.

GETtheMANUALS.org

REFITTING



Refitting can be carried out on each driveshaft in turn or on parts with the same designation on each driveshaft. Fit tool **Sus. 1656** on the driveshaft on which the supports are tightened to the recommended torque. Operate the tool to obtain the measurement **X = 21 cm ± 0.5 cm**. Repeat this operation as many times as necessary.

Refit the upper arms.

Refit the upper arm mounting bolts to the sub-frame. Position the bolt head at the front of the sub-frame. Tighten the mountings to the recommended torque.

Refit:
– the lower and vertical arms,
– the bolts mounting the vertical arm on the sub-frame,
– the bolts mounting the lower arm on the sub-frame,
– the anti-roll bar,
– the rear axle (refer to the relevant procedure),
– the stub axle carriers (refer to the relevant procedure),
– depending on the vehicle equipment; the attitude sensor tie-rod,
– the springs (refer to the relevant procedure),
– the automatic parking brake control unit.

Remove tool **Sus. 1656**.

Bleed the brake circuit (refer to the relevant method).

Depress the brake pedal several times to bring the pistons into contact with the brake pads and discs. Check the brake fluid level.

Connect the battery.

Refit the wheels.

Tighten the wheel bolts to the recommended torque.

Check the angles of the camber then the rear and front wheel alignment.

Adjustment of the rear camber requires the adjustment of the front and rear wheel alignment.

Depending on the vehicle equipment, check and adjust:
– the adaptive cruise control (refer to the relevant procedure in **Section 83D**),
– the discharge bulb headlights (refer to the relevant procedure in **Section 83C**).

GETtheMANUALS.org

WHEEL RIMS

There are two types of wheel identification marking:

- Engraved markings for steel rims.
- Cast marking for alloy rims.

The marking gives the main dimensional specifications of the wheel rim.

The marking may be complete:

Example: 5 1/2 J 14 4 CH 36

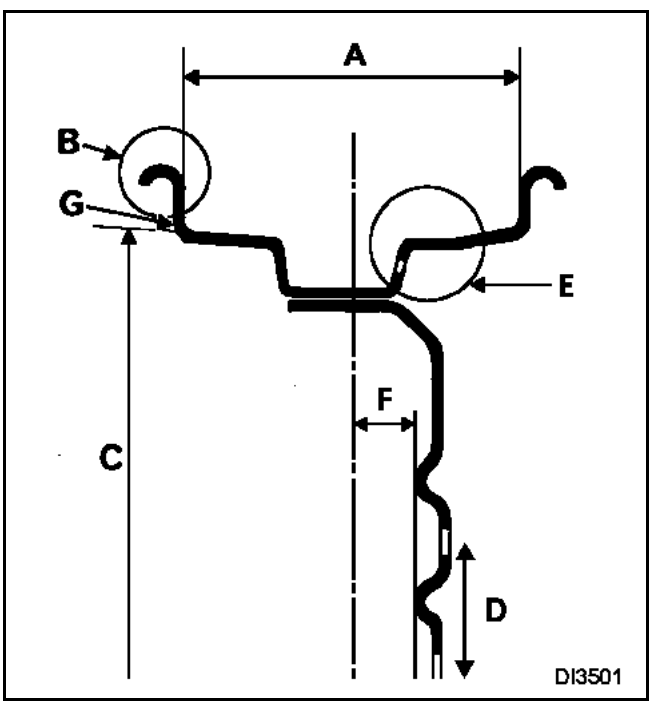
or in abbreviated form:

Example: 5 1/2 J 14

	A	B	C	D	E	F
RIM TYPE	**WIDTH (in inches)**	**RIM EDGE PROFILE**	**Ø NOMINAL (in inches) under tyre bead**	**Circle diameter where holes are located**	**Tyre bead profile**	**Offset in mm**
5 1/2 J 14 4 CH 36	**5 1/2**	**J**	**14**	**4**	**CH**	**36**

Maximum run-out: measured at the rim edge (at G).

The wheel bolts are **108 mm** in diameter



GETtheMANUALS.org

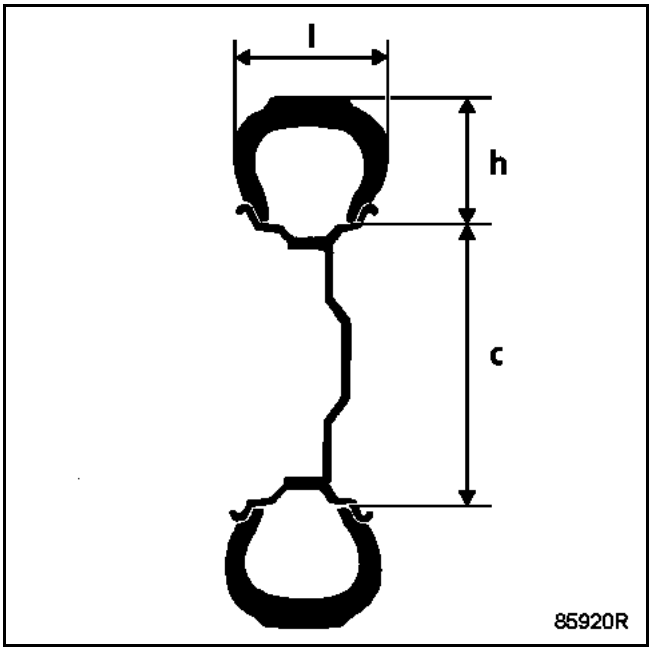
TYRES

The identification marking can be in two forms for the same type of tyre.

Example:

185	/	70	H	R	14	
①		②	③	④	⑤	
185	/	70	R	14	88	H
①		②	④	⑤	⑥	③

① Tyre width in mm **(l)**
② Ratio **h/l**
③ Speed suffix
④ Structure suffix
⑤ Wheel rim diameter in inches
⑥ Load index



Example of a structure suffix:

SUFFIX	STRUCTURE
None.	CROSS PLY
R	RADIAL
B	BIAS BELTED

Example of a speed suffix:

SUFFIX	MAXIMUM SPEED
R	170
S	180
T	190
U	200
H	210
V	240
Z	MORE THAN 240

GETtheMANUALS.org

Engine type	Rim	Tyres	Tyre pressure when cold (in bar) (1)	
			Front	Rear
F4R	J 7 17	225/55 R 17	**2.2**	**2.0**
F4R	7.5 J 8	245/45 R 18	**2.2**	**2.0**
V4Y	J 7 17	225/55 R 17	**2.5**	**2.0**
V4Y	7.5 J 18	245/45 R 18	**2.6**	**2.0**
G9T	J 7 17	225/55 R 17	**2.3**	**2.0**
G9T	7.5 J 18	245/45 R 18	**2.4**	**2.0**
P9X	J 7 17	225/55 R 17	**2.4**	**2.0**
P9X	7.5 J 18	245/45 R 18	**2.5**	**2.0**

(1) Under full load and/or on motorway.

Tightening torque for the wheel nuts: **10.5 daNm**

Rim run-out: **1.2 mm**

Tyre pressures must be checked when cold. The increase in temperature during driving increases the pressure by **0.2** to **0.3 bar**.

If the pressure is checked when the tyres are warm, take this increase into account and **never deflate the tyres.**

Special features of vehicles fitted with the tyre pressure monitoring system

Each set of four tyres is programmed by computer.

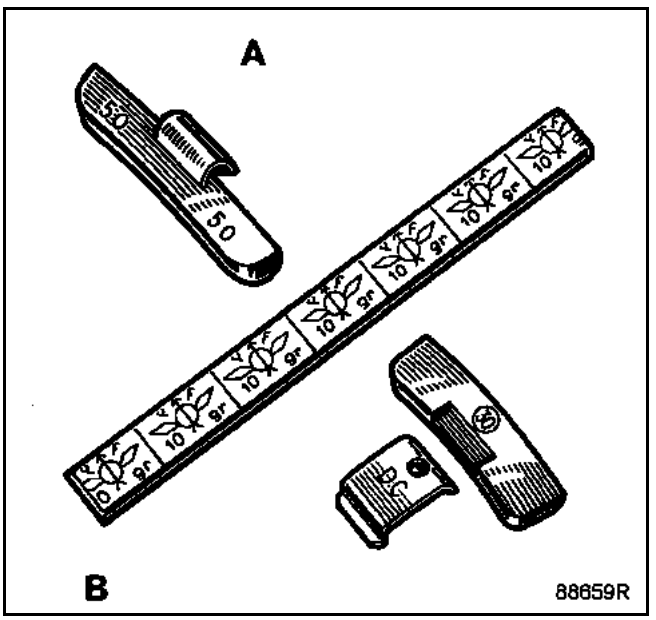
When the winter tyres or wheels are being fitted, and the programming has already been carried out, you only need to change to winter mode using the diagnostic toolSimilarly, when the summer tyres or wheels are being fitted, you need to change to summer mode using the diagnostic tool

GETtheMANUALS.org

BALANCE WEIGHTS

Only use weights supplied by the Parts Department:
- secured to the metal rims by hooks (hooks incorporated in the weight),
- fixed using hooks (flat) or self-adhesive for alloy wheel rims.

A Steel rim
B Aluminium alloy



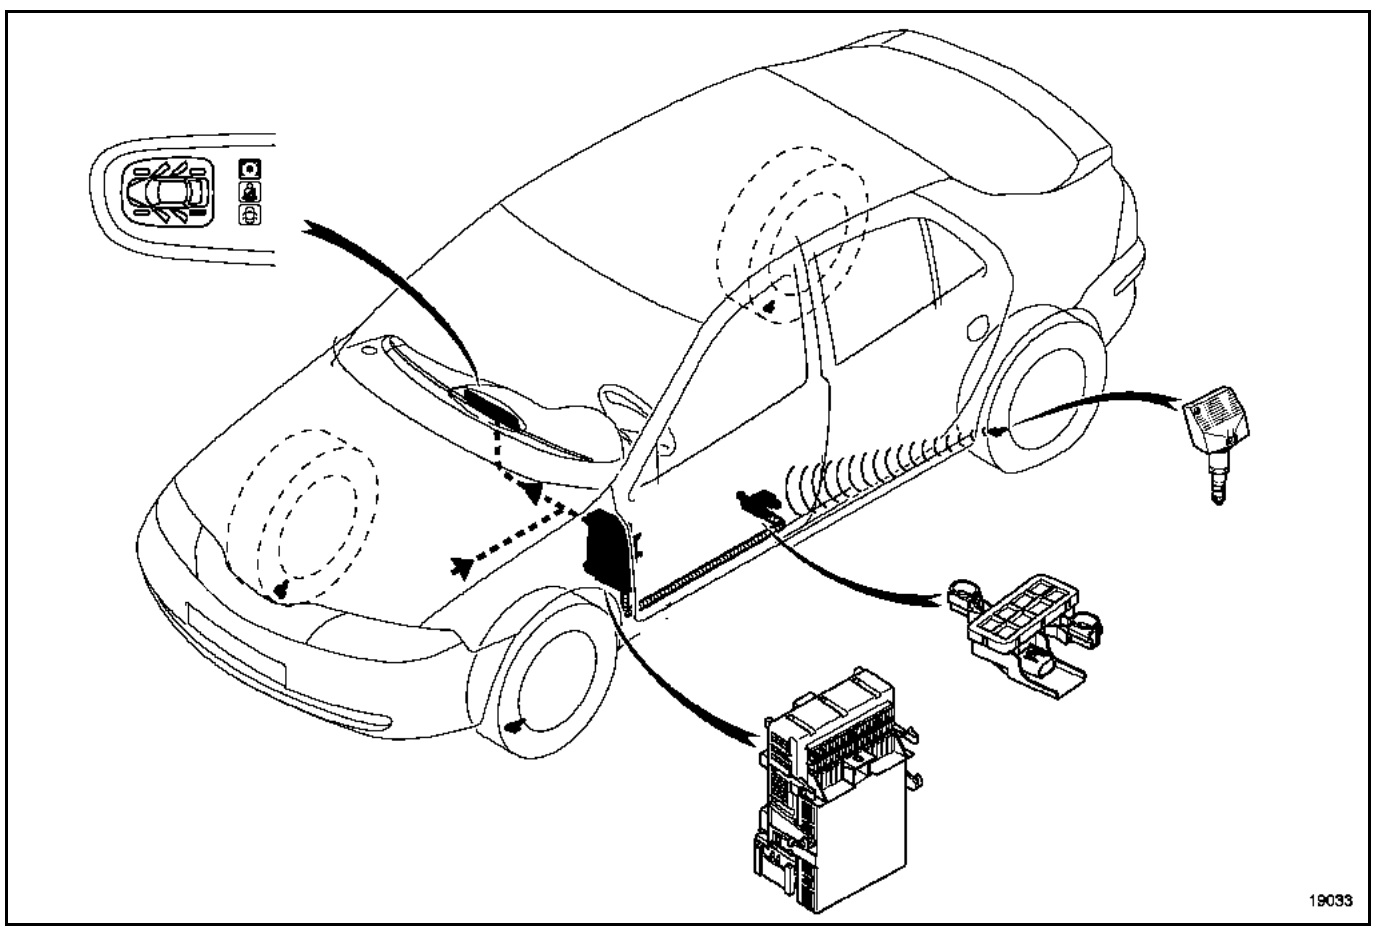
GETtheMANUALS.org

This system constantly monitors the pressure of the vehicle's four tyres (the spare wheel is not monitored). It warns the driver when:

- the pressure is 0.3 bar **below the recommended pressure (orange warning) or 0.6 bar below (red warning)**,
- the pressure is too high,
- a tyre is not running normally,
- there is a difference in pressure between the left and right side tyres.

In operation, the system uses:

– four pressure sensors (incorporating the inflation valve), one in each of the vehicle's wheels,
– a radio frequency signal transmitter located under the vehicle,
– a computer,
– a display which indicates the tyre concerned.It also displays the pressure values each time the engine is started and in the event of an emergency.



GETtheMANUALS.org

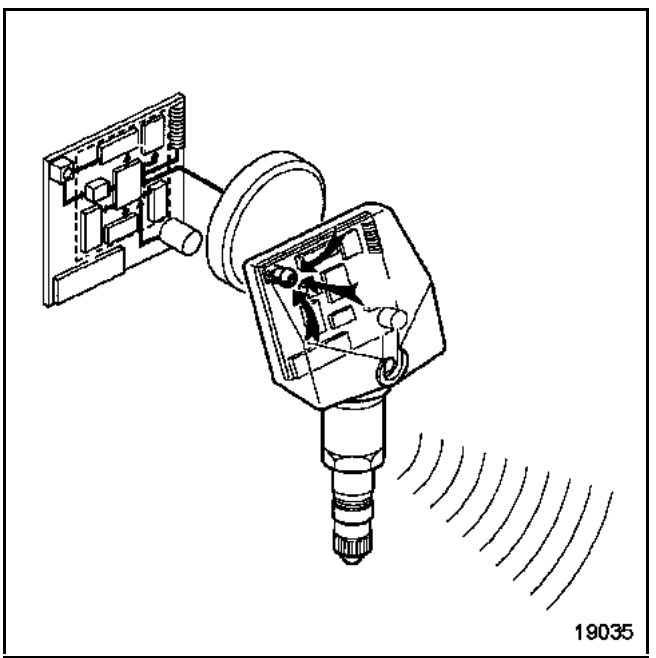
IMPORTANT
Each sensor is identified by a coloured marking round the valve:
– green = front left,
– yellow = front right,
– red = rear left,
– black = rear right.

IMPORTANT: these colour codes must be strictly observed so that the correct information can be read on the display. Each sensor has its own computer code.

GETtheMANUALS.org

The sensors regularly measure the tyres' internal pressure. They transmit their identification code and the pressure signal to the transmitter using radio frequency waves.

The pressure sensor consists of:
– a conventional valve,
– a non-removable battery,
– a pressure measuring tool,
– a radio frequency transmitter (on each wheel).



IMPORTANT:
When removing, do not swap the wheels.
In the event of the valves being removed, program the code (which corresponds to the position of the sensors), using the diagnostic tool and valve exciter **MS.1607**. Refer to the Repair Method in **FAULT FINDING section 35B on programming sensors.**

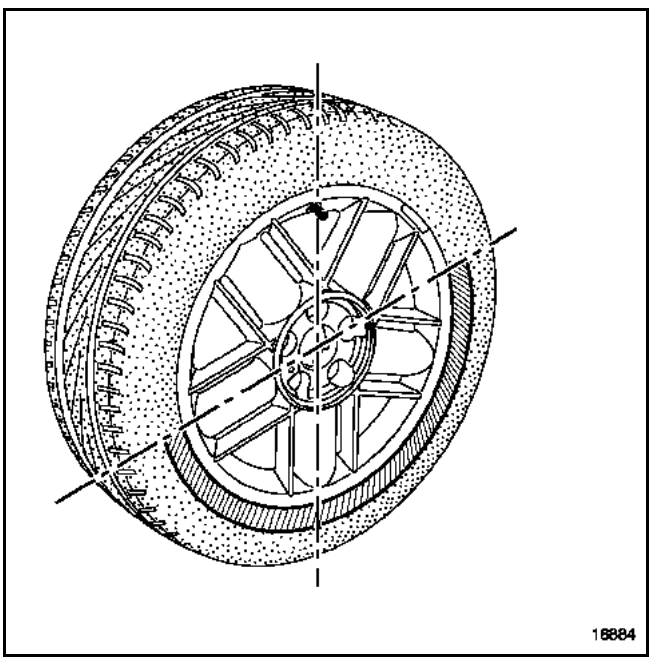
NOTE: a second set of pressure sensors can be identified by the computer

GETtheMANUALS.org

REMOVAL

Detaching the outer bead from the tyre

When removing the wheel rim bead always begin on the opposite side to the valve.Make sure that the tyre bead does not pull on the sensor at any time.

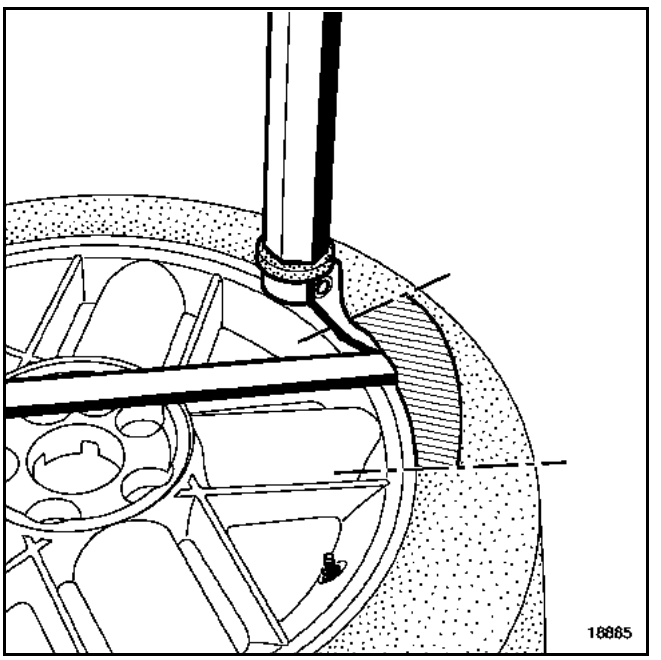


Detaching the bead from inside the tyre

Detaching the bead from the inside is not too difficult. But, it is important that the outer tyre bead does not pull on the sensor.

Detaching the outer tyre bead

Position the tyre lever approximately **15 cm** from the valve. Remove the bead finishing at the valve.It is important that the tyre bead does not pull on the sensor.



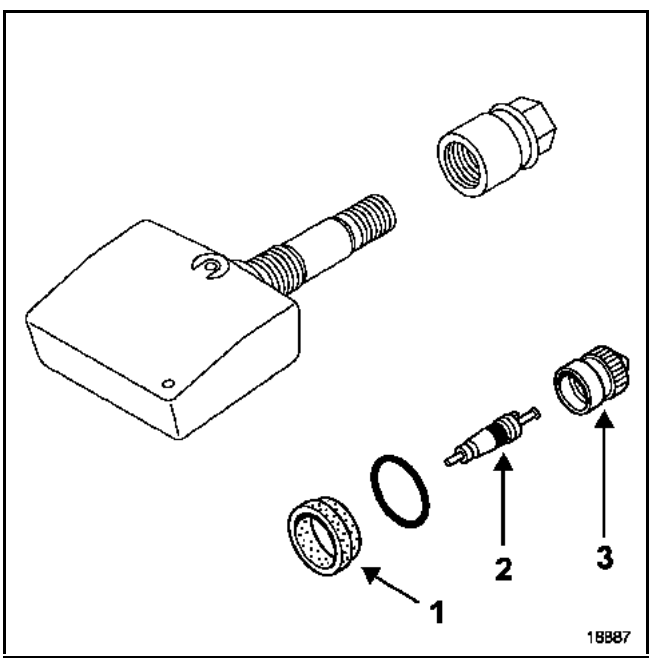
GETtheMANUALS.org

Detaching the inner tyre bead

This method is exactly the same as the method for removing the outer bead described in the preceding paragraph

REPLACEMENT

The following parts must be replaced:
– seal (1),
– mechanism (2),
– cap (3).



REFITTING

TIGHTENING TORQUE (in Nm)	
Pressure sensor nut	**6.5**

Clean the tyre beads.

Position the inner bead approximately **15 cm** away from the valve. Refit the tyre finishing at the valve. Make sure that the tyre bead does not pull on the sensor at any time.

Fit the outer bead using the same method.Inflate the tyre to the recommended pressure.

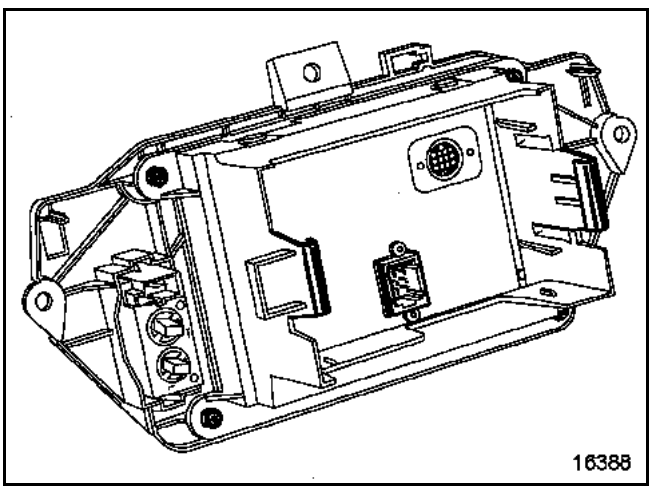
NOTE:
The pressure gauge should be correctly calibrated
The gauge inaccuracy should be less than 0.1 bar.

GETtheMANUALS.org

OPERATION

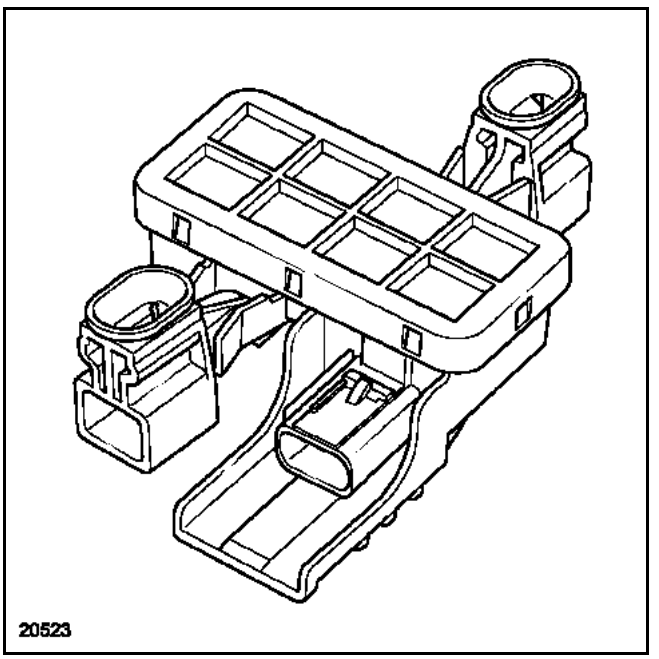
The transmitter is located underneath the vehicle. It receives signals from the tyre pressure sensors.

It transmits them to the computer



CONNECTION

TRACK	Description
1	Computer connection
2	Not used
3	Earth
4	+ Before ignition



REMOVAL

Pull out the two transmitter clips.

Disconnect the connector.

REFITTING

To refit, proceed in the reverse order of removal.

GETtheMANUALS.org

CONNECTION

TRACK	Description
1	+ Battery
2	Earth
3	+ After ignition

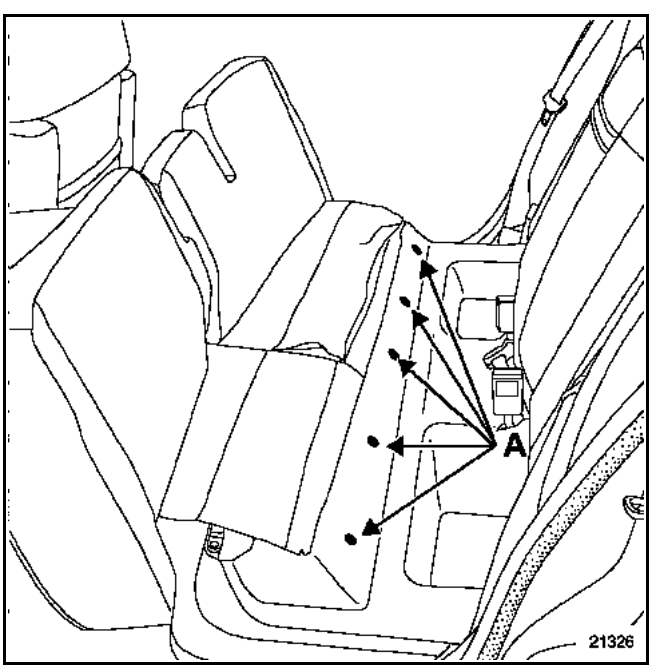
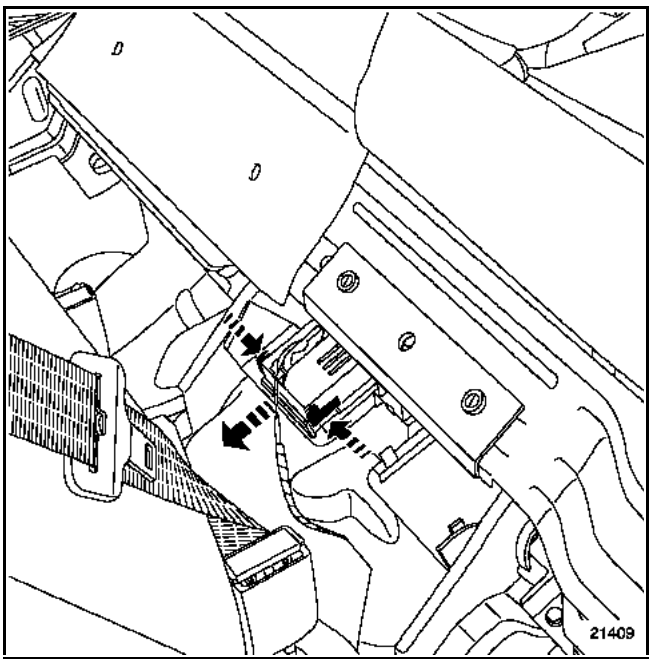
REMOVAL

Lift the rear bench seat.



Remove clips (A). Lift up the carpet.

Disconnect the computer connector.



Remove:
– the computer mounting,
– the computer.

Pull out the computer.

REFITTING

To refit, proceed in the reverse order of removal.

When replacing the computer, programme the code (which corresponds to the position of the sensors) using the diagnostic tool and valve exciter **MS.1607**. Refer to the repair method in **FAULT FINDING section 35B, Programming the sensors**.

GETtheMANUALS.org

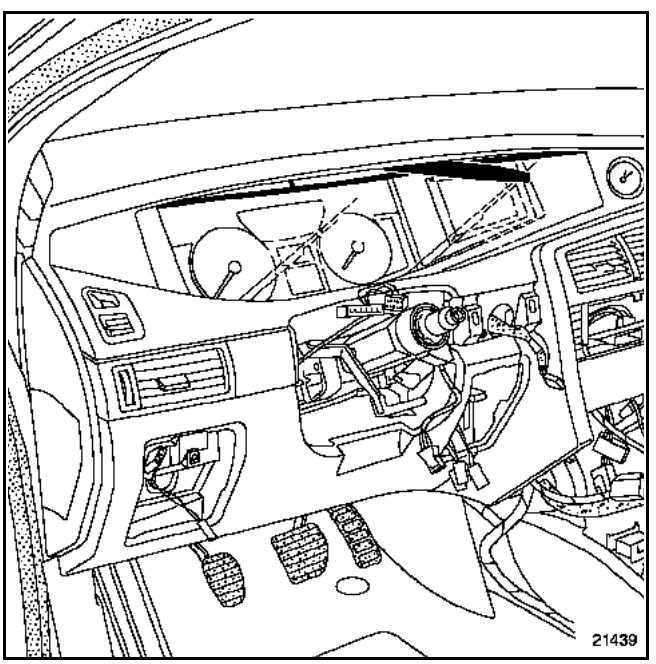
The display function is located on the instrument panel.

The display indicates:
– -the tyre concerned,
– -the tyre pressure values each time the car is started.

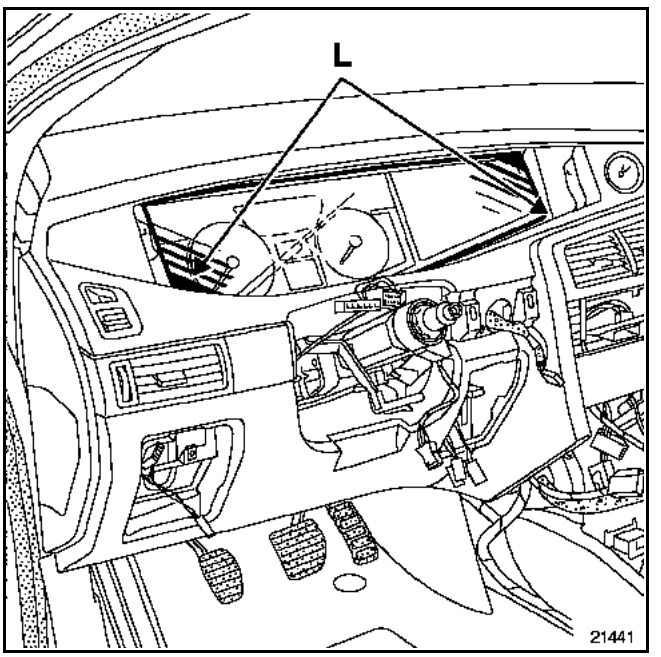
REMOVAL

Disconnect the battery.

Using a stiff spatula, remove:
– -the upper instrument panel trim clipped onto the dashboard,



– -the lower instrument panel trim clipped onto the dashboard,



– screws (L).

GETtheMANUALS.org

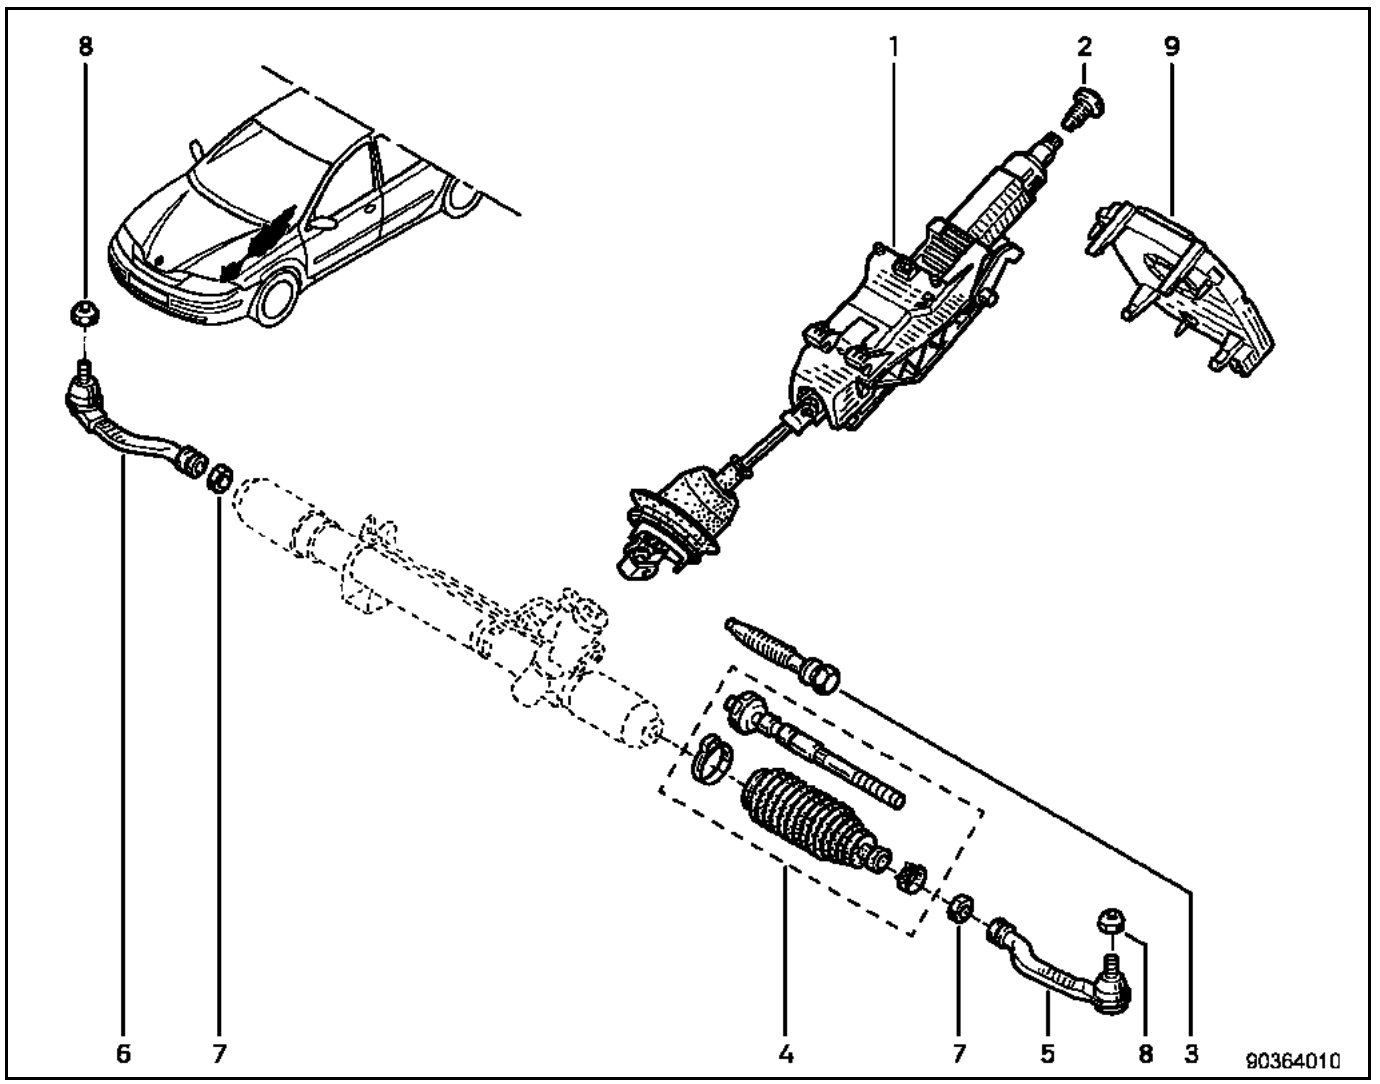
SPECIAL TOOLING
MS.1607 exciter valve tool

When replacing:
– a sensor, obtain the sensor code and position from the computer
– a computer, obtain the respective sensor codes and positions from the computer and the recommended tyre pressures using the diagnostic tool and the exciter valve tool **MS.1607**.

Refer to the Repair Method in **FAULT FINDING** or **section 35B Programming the sensors**.

GETtheMANUALS.org

The axial ball joint is replaced with the steering box in position on the vehicle. With tool **Dir. 1305**, the axial ball joints can be loosened via the wheel arch.



GETtheMANUALS.org

SPECIAL TOOLING REQUIRED		
Dir.	1305-01	Axial ball joint removal/refitting tool
Dir.	1306-02	SMI steering rack support tool
T. Av.	476	Ball joint extractor

TIGHTENING TORQUES (in daNm)	
Wheel bolt	11
Steering ball joint nut	3.7
Wheel alignment adjustment sleeve bolt	2
Axial ball joint	5

Put the vehicle on a two-post lift.

REMOVAL

Disconnect the track rod end using tool **T. Av. 476.**

Loosen the bolt on the wheel alignment sleeve. Hold the axial ball joint with an open wrench. Loosen the steering ball joint.

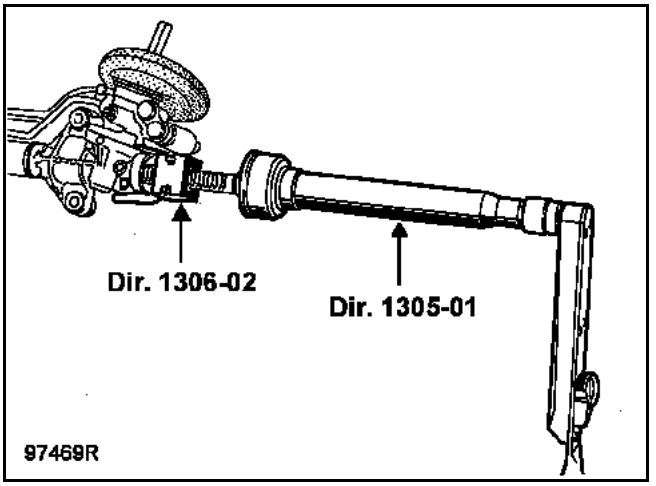
Make a mark or count the number of turns of thread taken up so that the wheel alignment can be readjusted on refitting.

Withdraw the metal collars clamping the gaiter. Remove the gaiter.

Turn the wheels so the rack teeth are freed on the valve side.

Fit tool **Dir. 1306-02**.

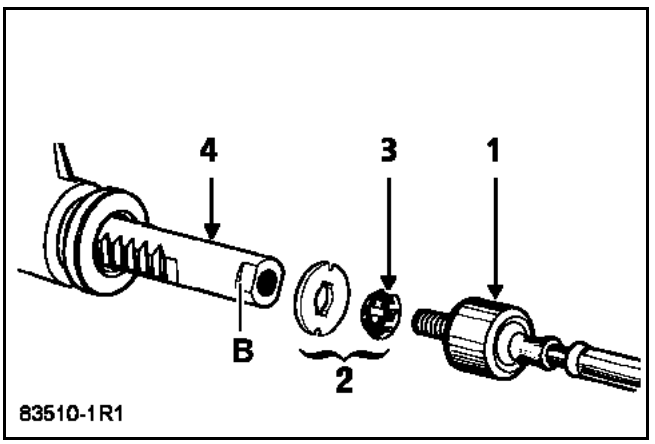
In this position, release the axial ball joint using tool **Dir. 1305-01**.



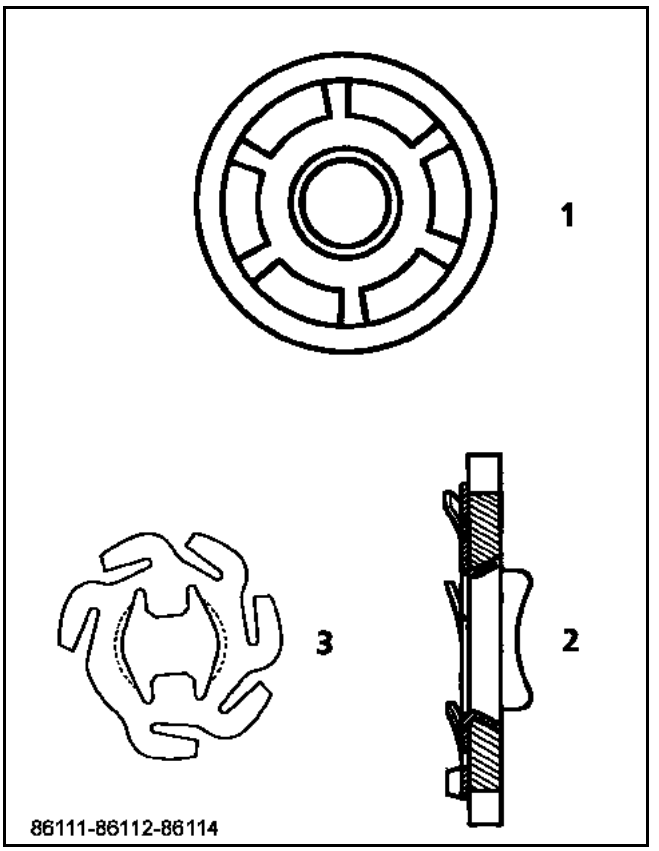
GETtheMANUALS.org

REFITTING

NOTE: Before refitting the new tie-rods, pass a **12 x 100 mm** tap over the threads at the ends of the steering rack in order to remove any trace of **LOCTITE** from the original fitting and so prevent seizure of the threaded sections on refitting. Always replace them all (2). If the ball joint notch (1) is not warn, it can be reused.



Refit the following to rack (4):
– stop washer (2),
– the stop (3),
– the axial ball joint (1) whose threads have been coated with **LOCTITE FRENBLOC**.



Check that the tabs of locking washer (2) correctly coincide with the flat surfaces (B) of the steering rack. Definitively tighten the axial ball joint using tool **Dir. 1305.**

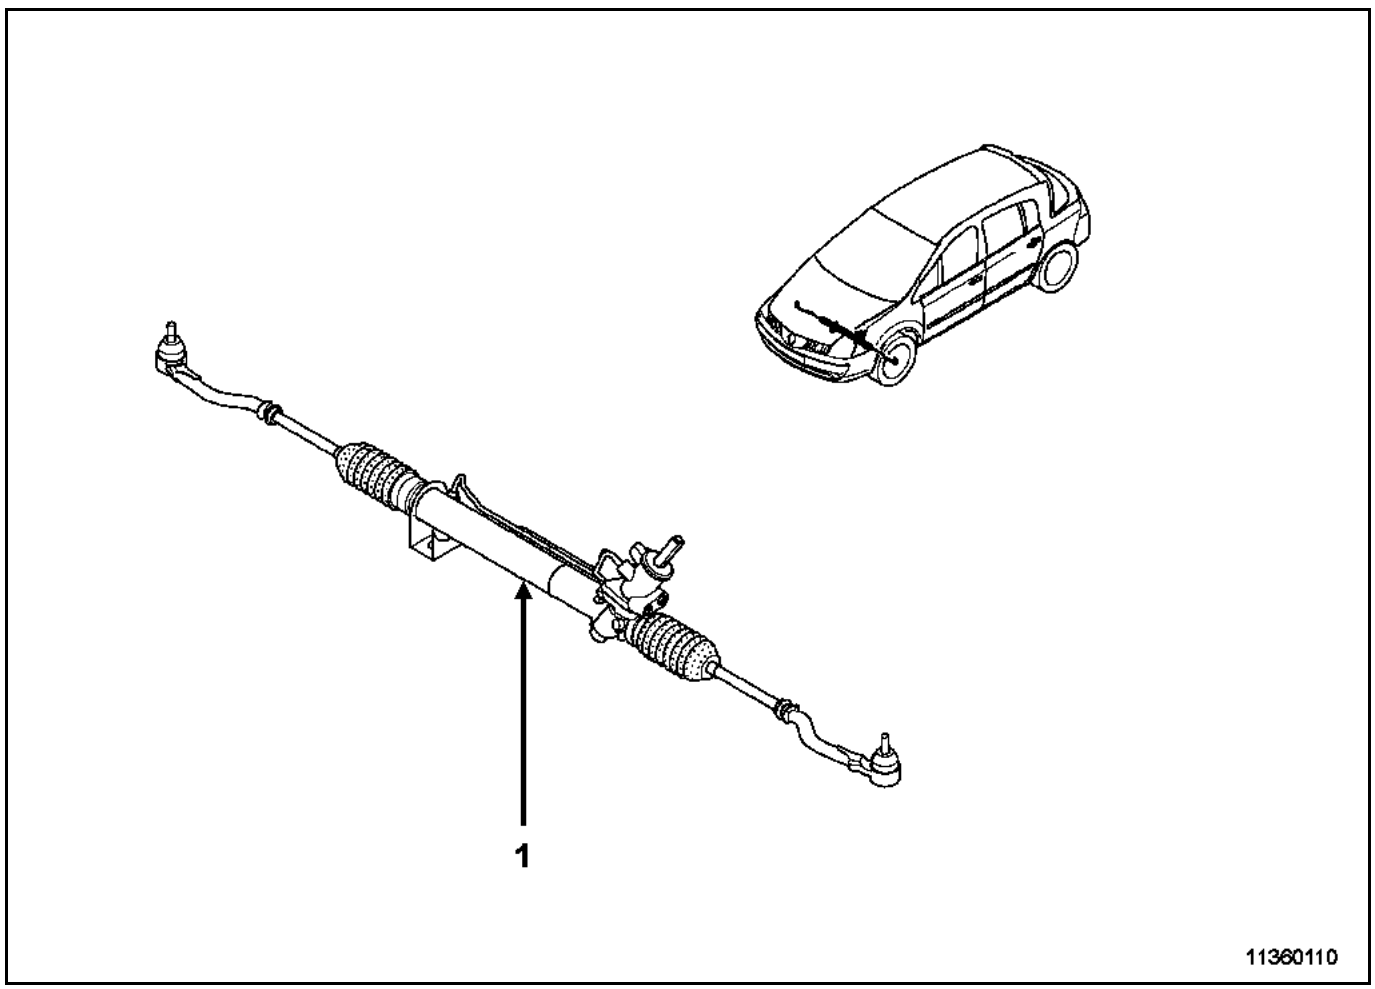
Refit the gaiter back with new clips. Retighten the ball joint housing by the same number of turns used when removing it.

Connect the ball joint.

Check and adjust wheel alignment.

Tighten the bolt on the wheel alignment sleeve to the tightening torque.

GETtheMANUALS.org



GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Mot. 453-01	Set of 2 hose clamps for general use
T. Av. 476	Ball joint extractor
EQUIPMENT REQUIRED	
Hydraulic jack

LH and RH tie-rod bolt	4.4
Steering shaft yoke bolt	2.1
Wheel bolt	11

IMPORTANT: After removing the sub-frame bolts, the steering rack bolts and the steering shaft yoke bolts and nuts, it is essential to replace them and tighten them to the recommended torque.

REMOVAL

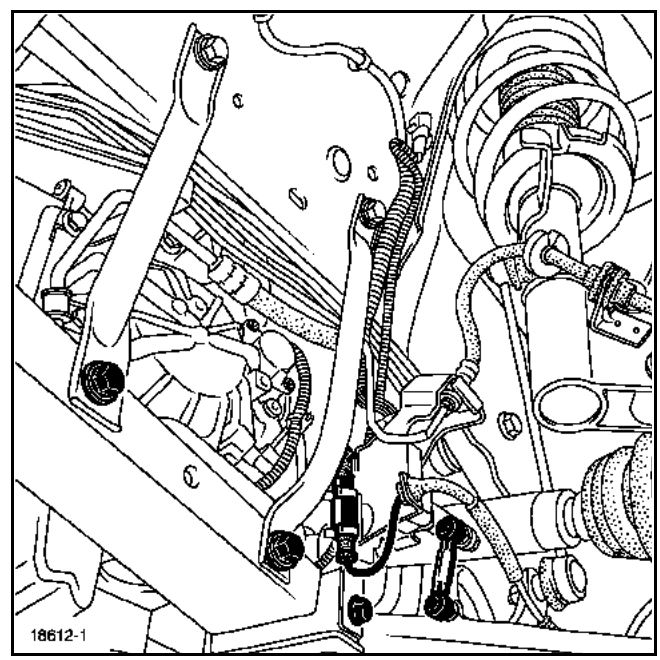
Put the vehicle on a two-post lift.

Disconnect the battery.

Remove:
– the engine undertray,
– the lower mountings of the bumpers;
– the wheels.

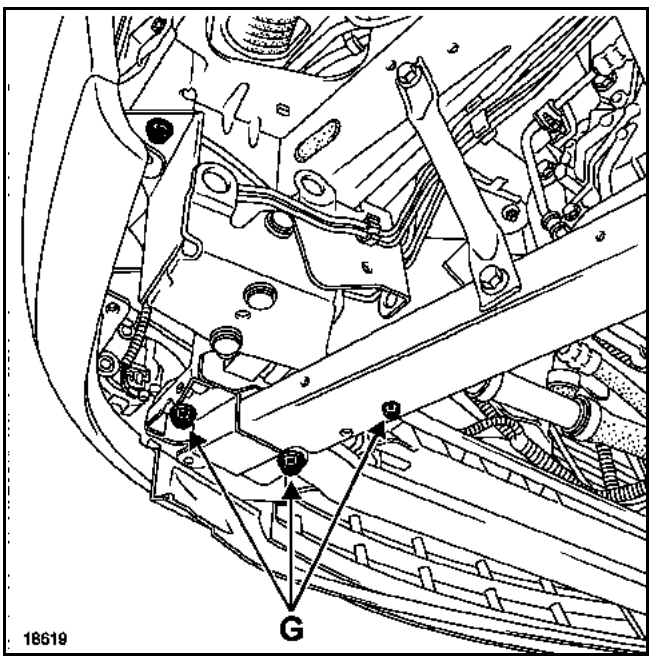
Fit a steering wheel immobiliser.

Remove:
– the front mudguards,
– the left-hand tie-rod bolts,
– the right-hand tie-rod,



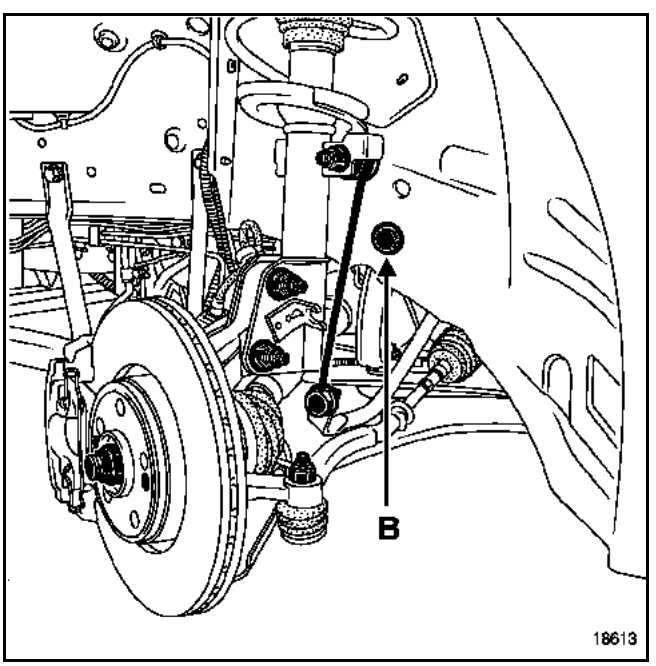
GETtheMANUALS.org

– the side member bolts (G),
– both aluminium side members,



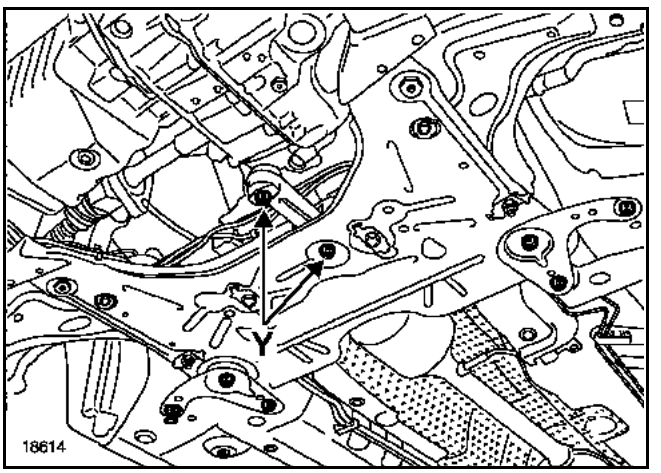
– the return stabiliser bar tie-rod nuts,
– the steering ball joint nuts.

Loosen the front tie-rod mounting bolts (B).

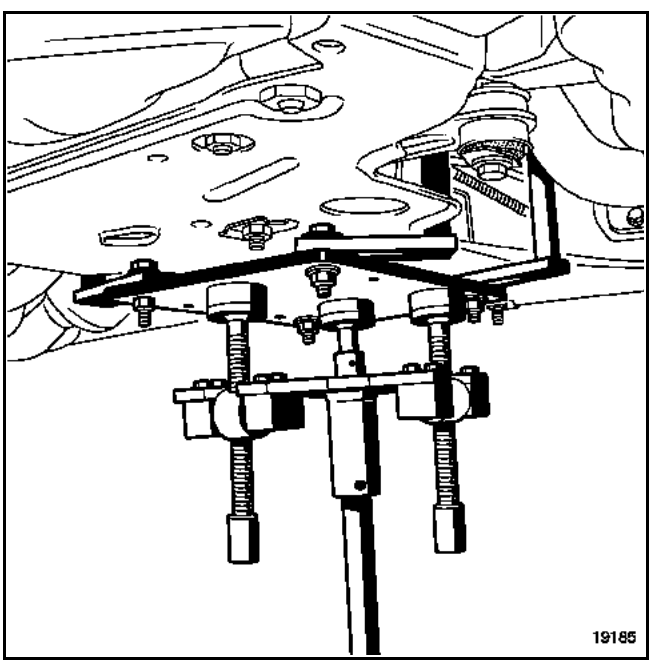


Position the **Mot. 453-01** hose clamp.

Remove:
– the steering shaft yoke bolt,
– the power assisted steering mounting bolt,
– the engine tie-bar bolts (Y),
– the acoustic tie-rod bolts,
– the sub-frame rear mounting bolts.



Place a component jack under the sub-frame.

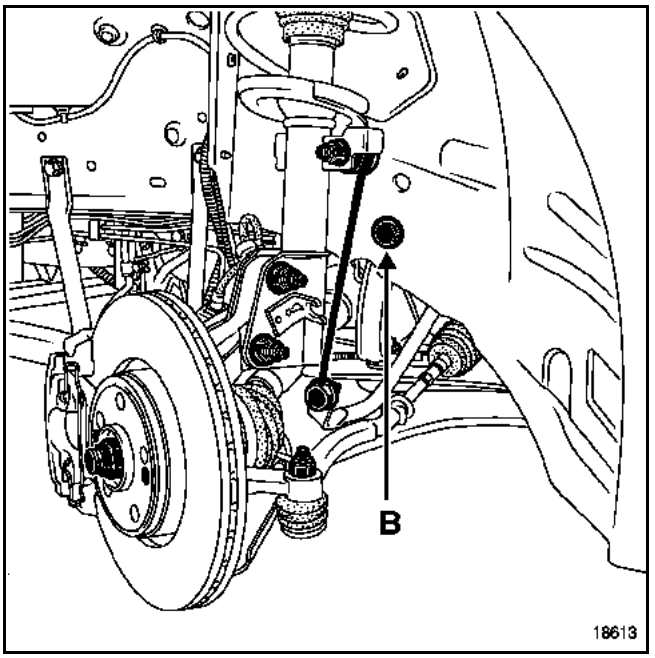


Unclip the brake pipes and sensor wiring from the sub-frame and the tie-rods.

GETtheMANUALS.org

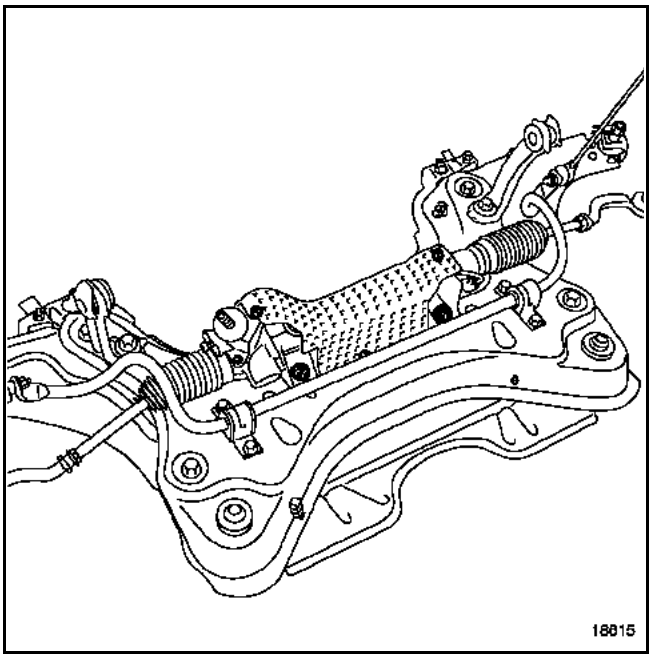
Remove the two front tie-rod bolts (B).

Lower the sub-frame by **20 centimetres**.



Tilt the stabiliser bar forwards.

Remove:
– the heat shield on the steering rack,
– the steering rack.



REFITTING

IMPORTANT: the steering shaft yoke bolt and nut, the steering wheel bolt, the sub-frame bolts and the steering rack bolts must be replaced. Tighten to the recommended torque.

In the engine compartment, align the universal joint and the pinion stem on the steering rack. Position the yoke nut and bolt.
Move the yoke nut and bolt up to the loctite glue. Hold the nut tight. Tighten to the recommended torque.

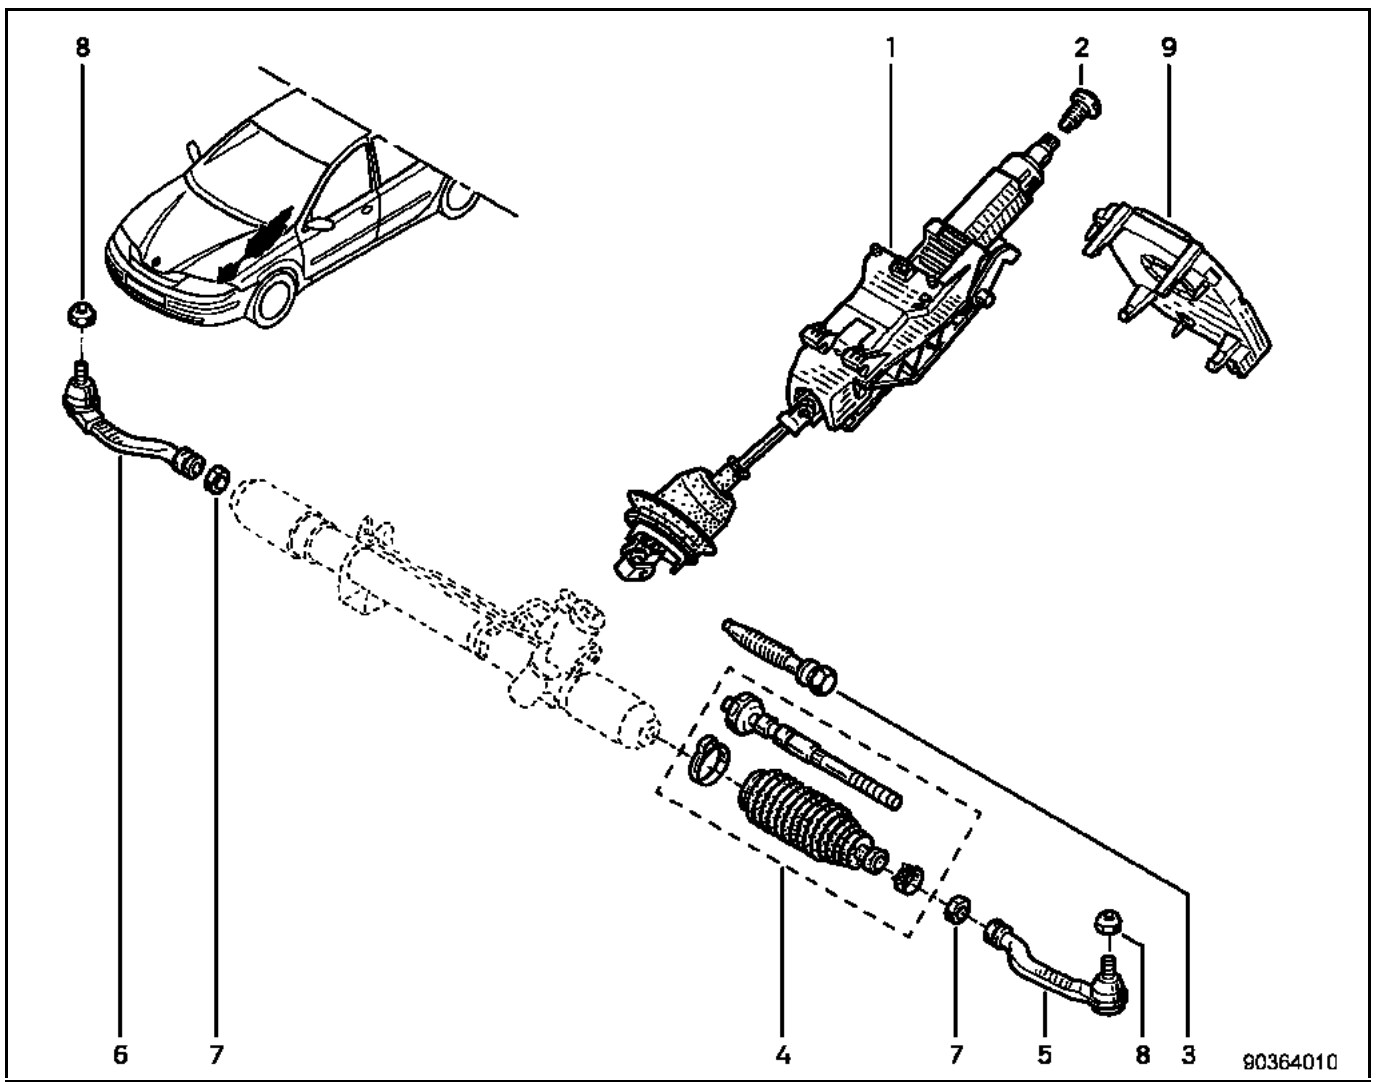
Refit the heat shield correctly.

NOTE: the cover (C) on the yoke nut is not to be replaced during reassembly.

With the engine running, fill and drain the power assisted steering circuit by turning the steering wheel fully in one direction then the other.

IMPORTANT: The steering column must be adjusted to replace the steering rack yoke bolt. See repair method 36B, steering column section.

GETtheMANUALS.org



GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Dir. 1594	Steering shim

TIGHTENING TORQUES (in daNm)	
Fork bolt	2.1
Steering column mounting bolt	2.1
Electric lock bolt	0.8
Lower shell bolt	0.2
Steering wheel bolt	4.4

Put the vehicle on a two-post lift.

Set the vehicle wheels straight.

Unlock the column.

REMOVAL

Lock the airbag computer using a fault finding tool. See fault finding manual, Section 88C.

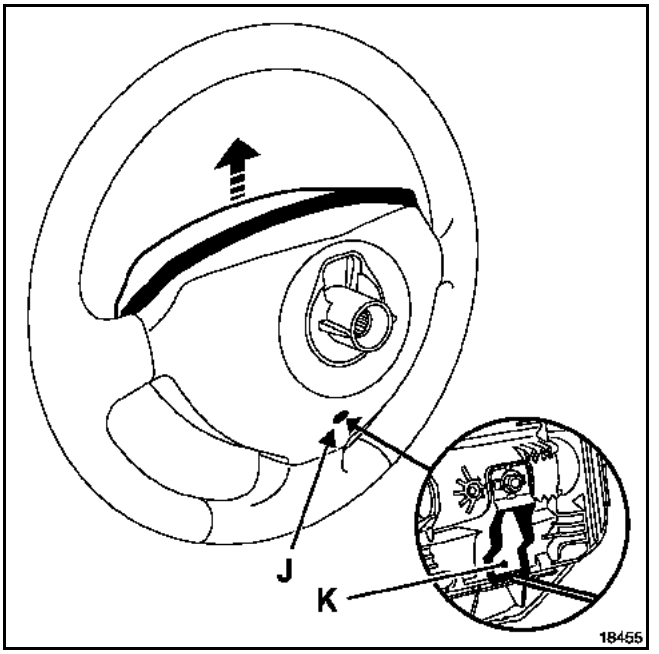
Unlock the steering column as follows.

Insert the Renault Card as far as it will go (+ after ignition).

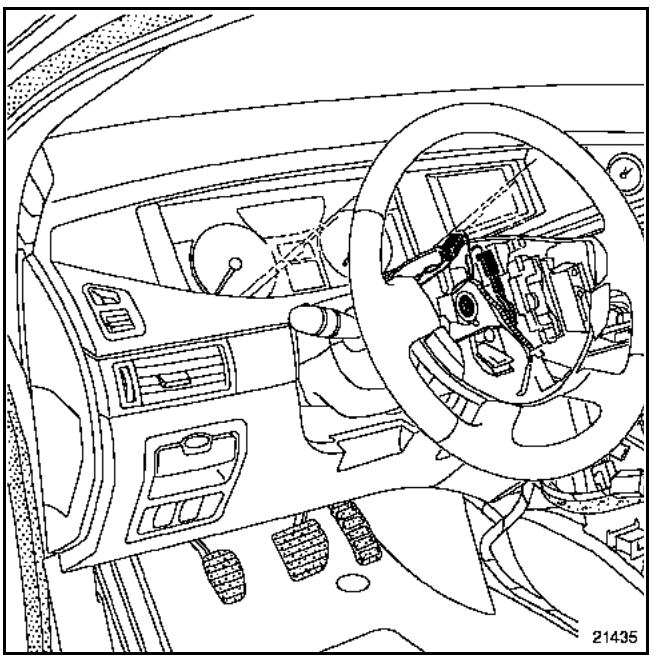
Withdraw the Renault Card to the first notch (+ accessories).

Disconnect the battery.

Remove:
– the driver's front airbag module by inserting a screwdriver into opening (J) to release system (K),

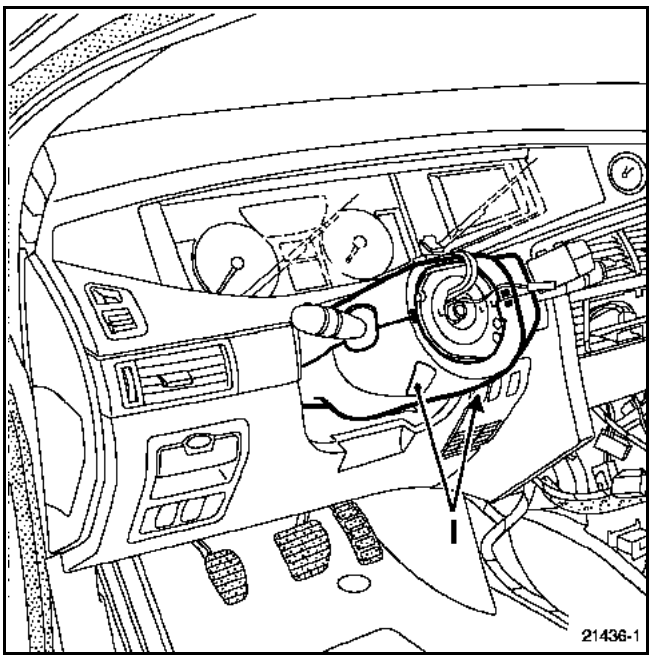


– the airbag connectors,
– the connectors in the steering wheel,
– the steering wheel bolt,



– the two casing mounting bolts (I),

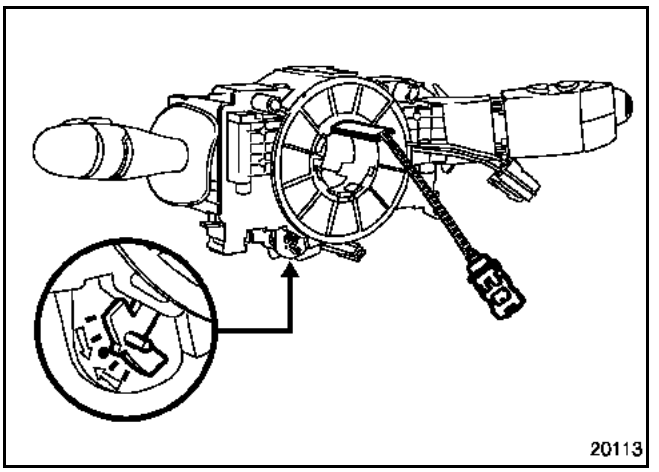
GETtheMANUALS.org



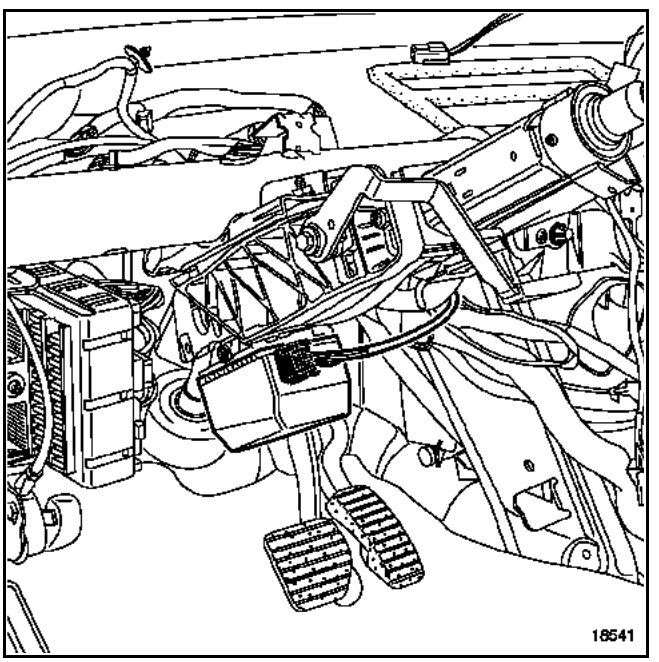
– the upper cowling,
– the lower cowling.

Disconnect the connectors from the switches.

Remove:
– the mounting bolt from the switch assembly (the bolt is accessible at the centre point of the airbag sensor);



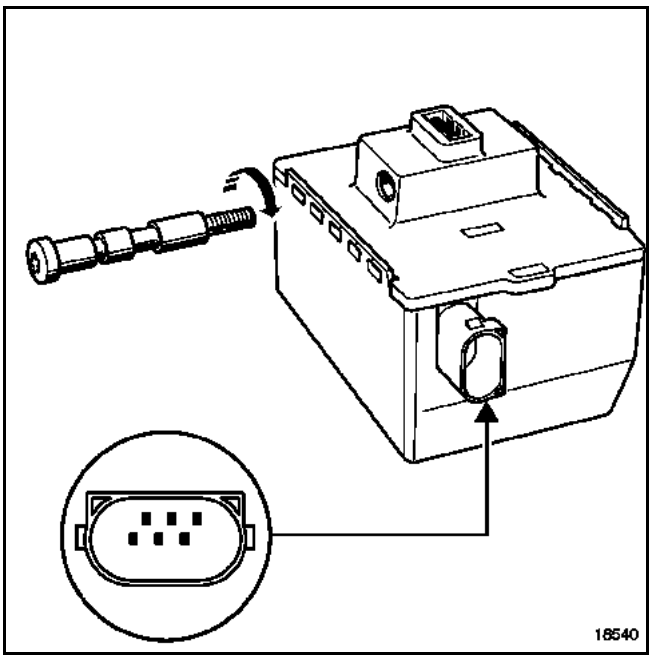
– the mounting bolt for the electric steering column lock.



IMPORTANT: the mounting bolt for the electric steering column lock has a left-hand thread. To loosen the bolt, turn in a clockwise direction.

REMINDER: the lock must be released.

GETtheMANUALS.org

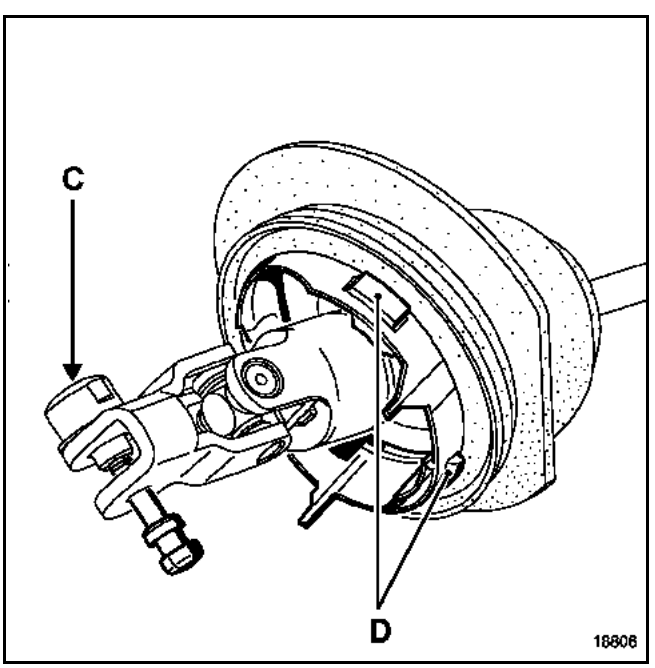


Remove the electric steering column lock.

In the engine compartment, remove:
– the steering rack yoke bolt,
– the steering rack yoke nut.

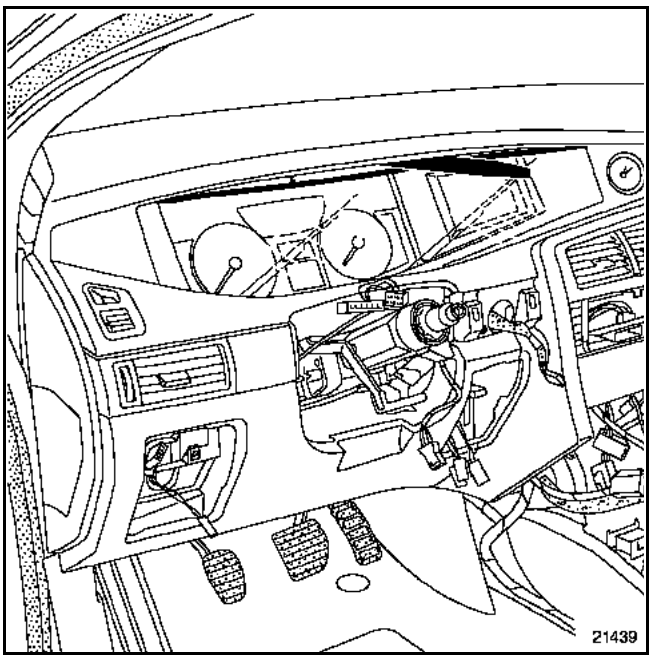
Tighten the yoke bolt by a few turns.
To release the nut, tap on the bolt head.
Eject and throw away the cover (C). Keep the nut.

Unclip the gaiter: three clips (D) on the white ring, located at 120˚.
Push the plastic ring in the passenger compartment.

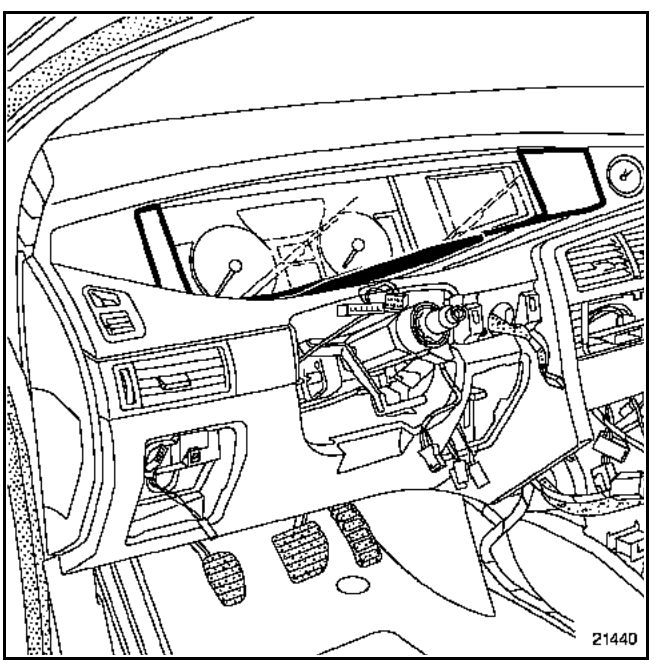


Suspend the gaiter from the steering column on the front scuttle panel in the passenger compartment.

Remove:
– the instrument panel upper trim,



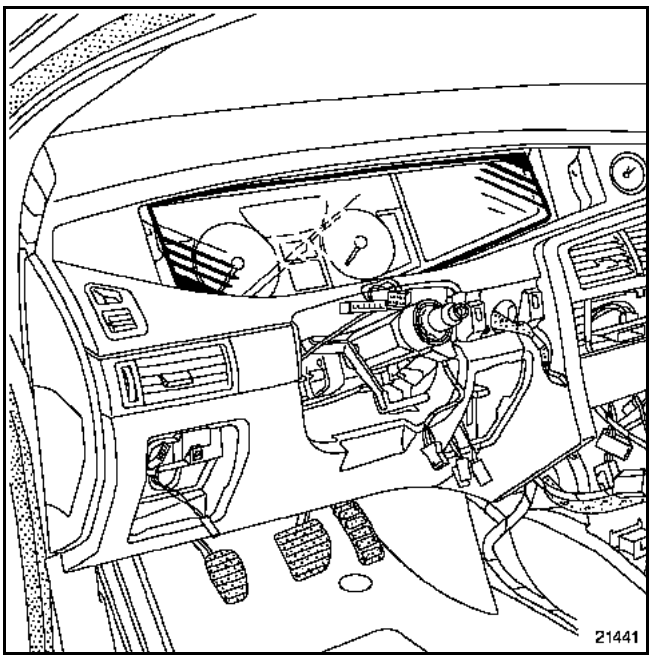
– the instrument panel lower trim,



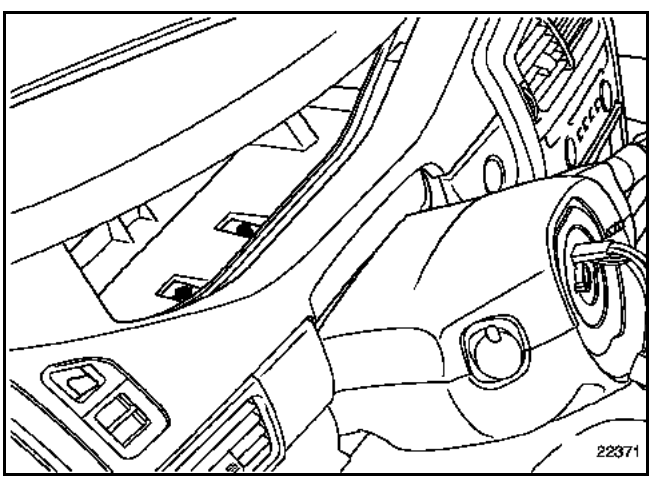
– the two instrument panel mountings.

Swivel the instrument panel upward.

GETtheMANUALS.org

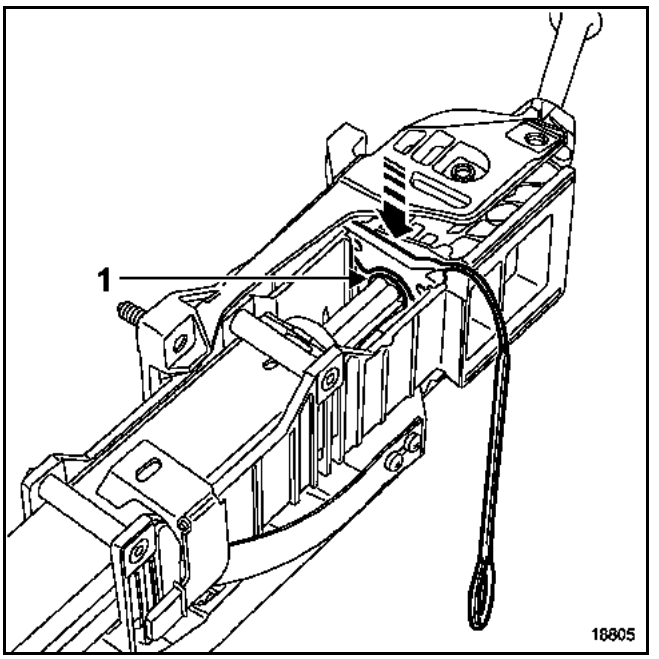


Remove:
– the two mounting bolts from the steering column,



– the steering column.

Centre and lock the column by means of steering column shim **Dir. 1594** (the shaft (1) ring must be visible in front of the shim).



REFITTING

IMPORTANT: the steering shaft yoke bolt and nut and the steering wheel bolt must be replaced. Tighten to the recommended torque.

In the passenger compartment, insert the steering column universal joint in the scuttle panel opening, as close as possible to the steering rack pinion stem.

Fit:
– the two hooks on the column in the slots;
– the centring device in the slot located between the column mounting nuts.

Refit the column nuts.

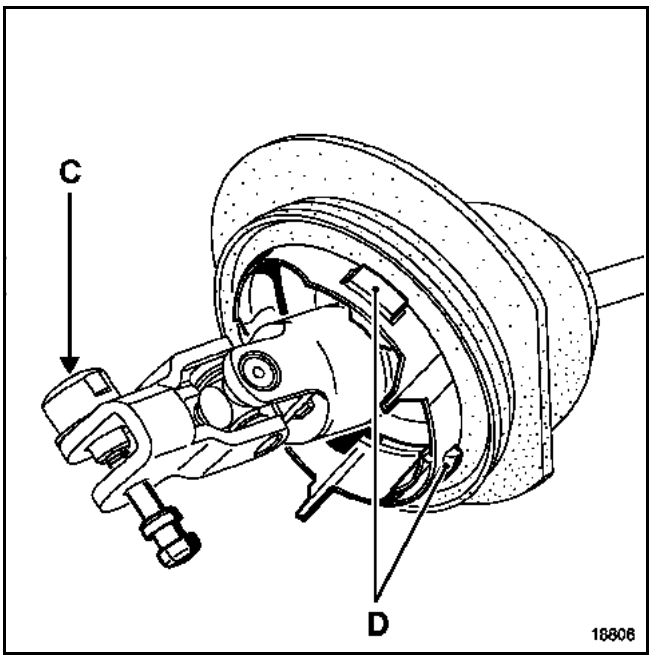
Align the arrow on the steering column gaiter with the arrow on the scuttle panel (under the floor carpet). Clip the steering column gaiter.

In the event of replacement of the steering column, the screw, the steering rack yoke nut and the shim are pre-assembled.

In the engine compartment, align the universal joint and the pinion stem on the steering rack.

Position the yoke nut and bolt.
Move the yoke nut and bolt up to the loctite glue. Hold the nut tight. Tighten to the recommended torque.

GETtheMANUALS.org



NOTE: the cover (C) on the yoke nut is not to be replaced during reassembly.

Refit:
– the steering shaft yoke, torque tightened (**2.1 daNm**),
– the two mounting bolts on the steering column;
– the instrument panel bolts,
– the instrument panel trims,
– the electric lock with its left-hand thread bolt;
– the rotary switch,
– the switch connectors,
– the cowlings,
– the cowling screws,
– the steering wheel bolt and washer,
– the steering wheel connectors,
– the airbag connectors,
– the driver's front airbag module.

GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Mot. 453-01	**Hose clamp pliers**

Put the vehicle on a two-post lift.

REMOVAL

Remove:
– the two mounting bolts of the power steering reservoir,
– the accessories belt.

Fit a **Mot. 453-01** clamp to the supply pipe.

Disconnect the supply and high pressure pipes. Be prepared for fluid to drain from the power assisted steering.

IMPORTANT: as the alternator is located below the pump, it is essential to protect it against the flow of power steering fluid.

Remove the three pump mounting bolts.

Remove the pump.

REFITTING

Refitting is the reverse of removal. The belt tension is adjusted automatically (spring tensioner).

With the engine running, fill and bleed the circuit by turning the steering wheel from lock to lock.

GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Mot.453-01	Hose clamp pliers

TIGHTENING TORQUE (in daNm)	
Wheel bolt	11

Put the vehicle on a two-post lift.

REMOVAL

Unclip:
– the diesel filter wiring harness from the power steering reservoir retainer,
– the diesel filter from the power steering reservoir retainer.

Remove:
– the front right wheel,
– the wheel arch covers,
– the accessories belt.

Fit a **Mot. 453-01** clamp to the supply pipe.

Disconnect the supply and high pressure pipes. Be prepared for fluid to drain from the power assisted steering.

IMPORTANT: as the alternator is located below the pump, it is essential to protect it against the flow of power steering fluid.

Remove the reinforcement bar (between the reservoir mounting and the recirculation unit).
Remove the three pump mounting bolts.
Remove the pump.

REFITTING

Refitting is the reverse of removal. Tighten the gear tensioner again correctly.
The belt tension is adjusted automatically (spring tensioner).

With the engine running, fill and bleed the circuit by turning the steering wheel from lock to lock.

GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Mot. 453-01	Hose clamp pliers
Mot. 1505	Belt tension checking device (FREQUENCY METER)

TIGHTENING TORQUE (in daNm)	
Wheel bolt	11

Put the vehicle on a two-post lift.

REMOVAL

Put the vehicle on a two-post lift.

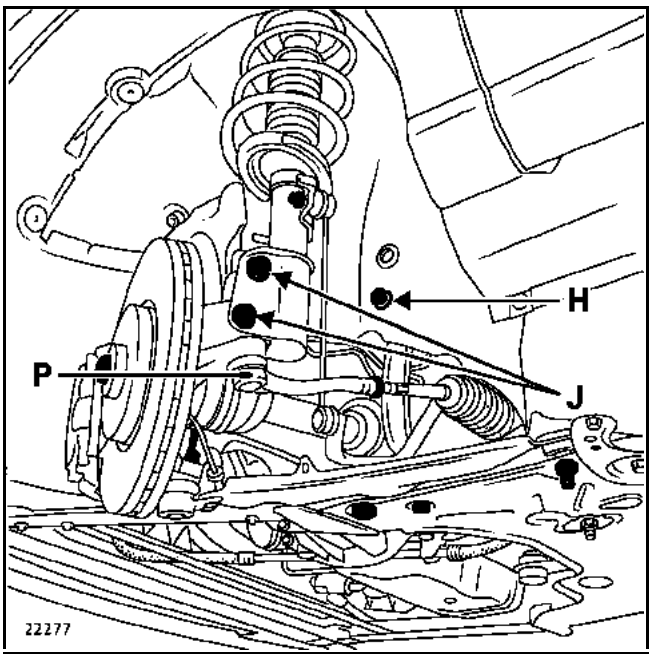
Disconnect the battery.

NOTE: before disconnecting the battery, you must:
- **switch off the ignition,**
- **switch off all consumers,**
- **wait until the fan stops (after switching off the + after ignition),**
- **if the vehicle is equipped with Carminat, wait until the system stops after switching off the + after ignition (approximately 1 minute).**

Remove:
- the front right wheel,
- the front right-hand wheel arch liner,
- the engine cover,
- the right-hand brake calliper.

Disconnect the speed sensor connectors from the right-hand front wheel.

Remove:
- the lower ball joint,
- the right-hand steering ball joint (P),
- the right-hand driveshaft intermediate bearing,
- the shock absorber lower mounting bolts (J),
- the front right driveshaft,
- the right-hand tie-rod (H),



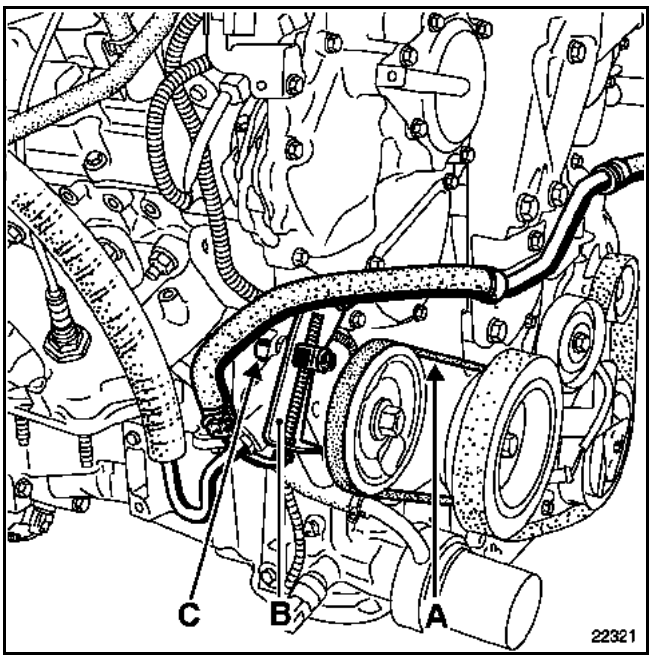
- the belt (A).

Fit a **Mot. 453-01** clamp to the supply pipe.

Disconnect the supply and high pressure pipes. Be prepared for fluid to drain from the power assisted steering.

Remove:
- the tension adjustment system (B);
- the pump mounting bolt (C).

GETtheMANUALS.org



Remove the pump.

REFITTING

Fit:
– the pump,
– the pump mounting bolt (C),
– the tension adjustment system (B),
– the belt.

Stretch the belt. See **Section 07A**.

With the engine running, fill and bleed the circuit by turning the steering wheel from lock to lock.

GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Mot. 453-01	Hose clamp pliers
EQUIPMENT REQUIRED	
Crowfoot pipe socket from Facom for example, for loosening high pressure pipe	

Put the vehicle on a two-post lift.

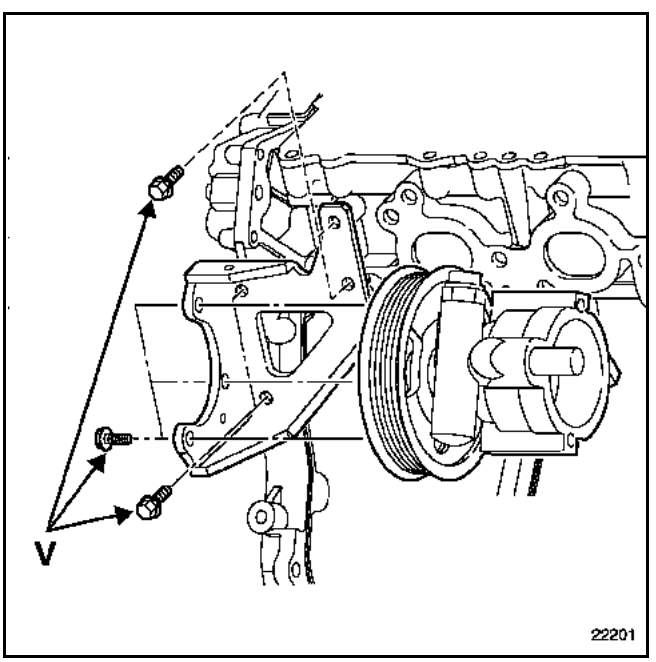
REMOVAL

Remove:
– the front right wheel,
– the front right-hand wheel arch liner,
– the engine cover,
– the air pipe.

Release the injector electric wiring harness.

Unclip:
– the power steering reservoir,
– the diesel filter.

Remove:
– the two mounting bolts of the power steering reservoir,
– the accessories belt.



Fit a **Mot. 453-01** clamp to the supply pipe.

Disconnect the supply and high pressure pipes. Be prepared for fluid to drain from the power assisted steering.

Remove:
– the three pump mounting bolts (V),
– the pump.

REFITTING

Fit:
– the pump,
– the pipes,
– the accessories belt.

The belt tension is adjusted automatically (spring tensioner).

Fit:
– the reservoir bolts,
– the wiring harness,
– the air pipe.

With the engine running, fill and bleed the circuit by turning the steering wheel from lock to lock.

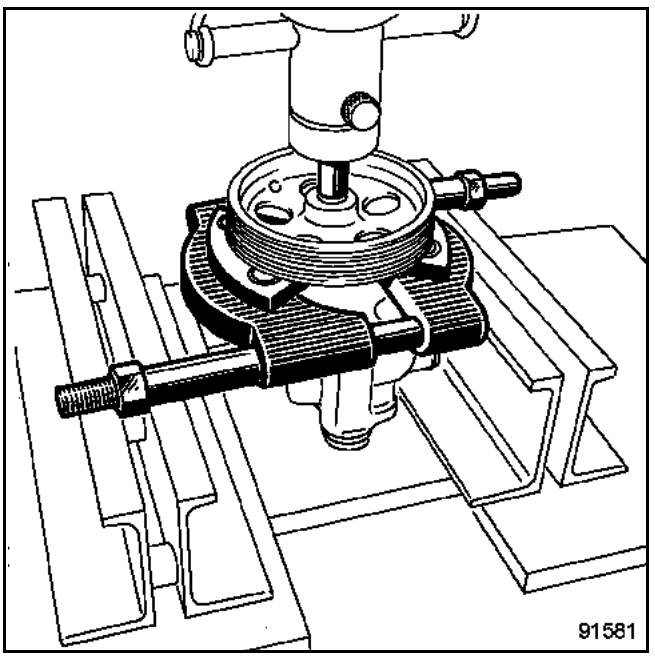
GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Dir. 1083 -01	PAS pump pulley fitting tool.

REMOVAL

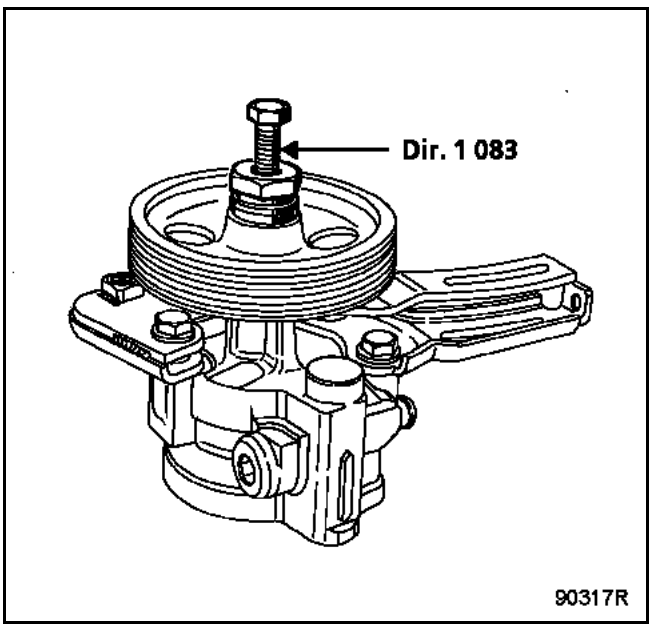
Note the dimension relative to the end of the shaft.
Extract the pulley.

Use the press fitted with an extractor.



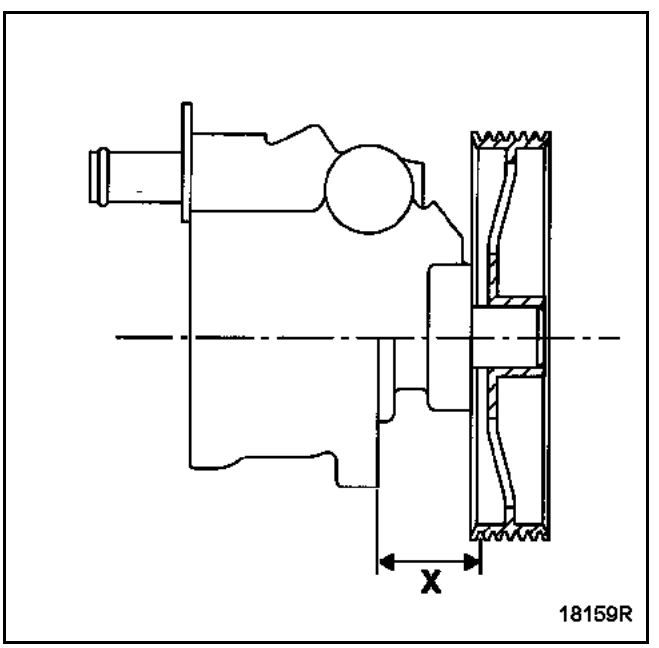
REFITTING

Grasp the pulley with tool **Dir. 1083-01** until you reach the dimension measured before it was removed (liberally grease the thread and the pad on the pulley).



Observe the pulley shank dimension.

X = 55.85 ± 3 mm.



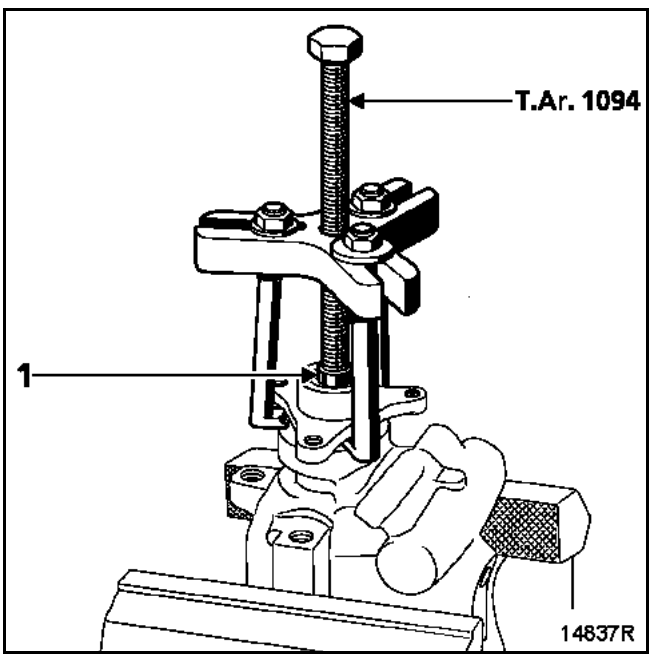
GETtheMANUALS.org

SPECIAL TOOLING REQUIRED		
T. Ar.	1094	Puller with 3 sliding jaws
Dir.	1083-01	PAS pump pulley fitting tool.

Place the pump in a vice on the bench.

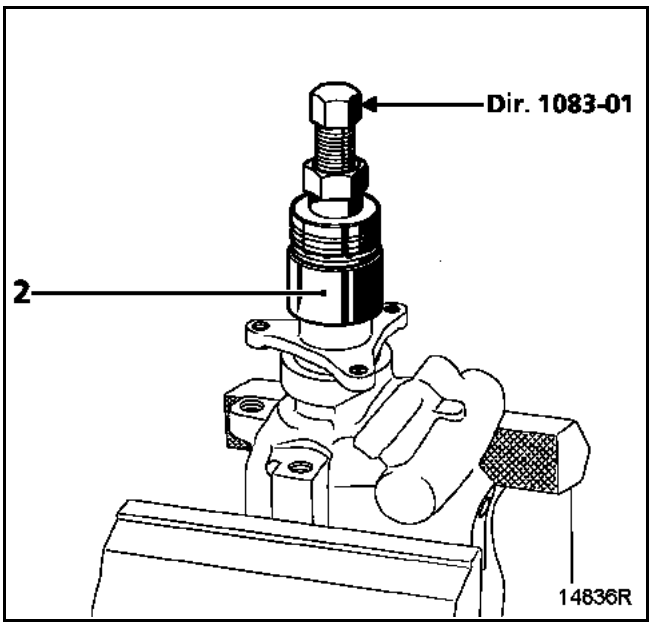
Fit tool **T. Ar. 1094**.

Extract the hub.

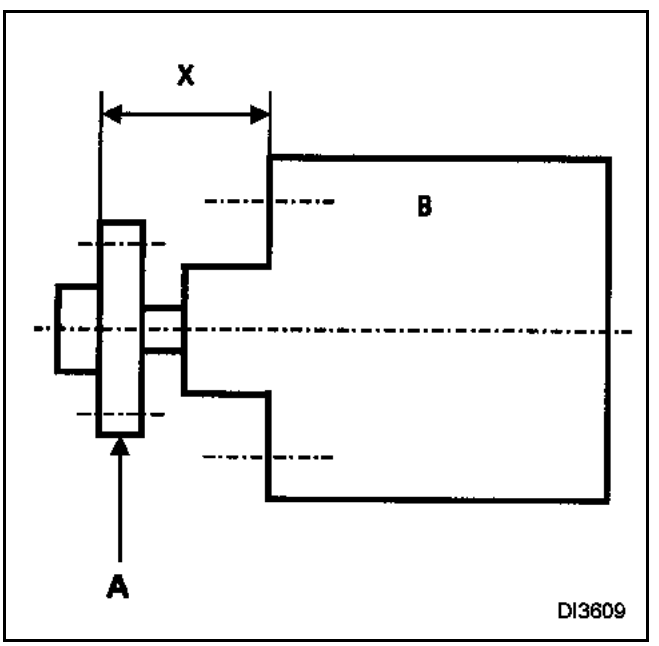


NOTE: insert a bolt (1) between the pump shaft and the pushrod of tool **T. Ar. 1094**.

Fit the hub (new) and press it in using tool **Dir. 1083-01**. Coat it beforehand with multifunction grease to aid refitting.



Maintain the fitting dimension by inserting a **76.5 mm** shim between the hub and the pump body when reassembling it.



A Hub
B Power assisted steering pump
X = **76.5 mm**

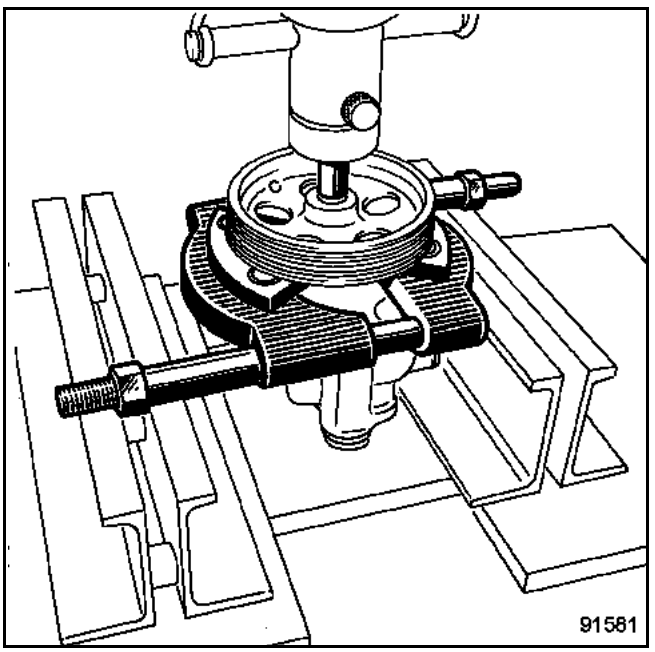
GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Dir. 1083 -01	**PAS pump pulley fitting tool.**

REMOVAL

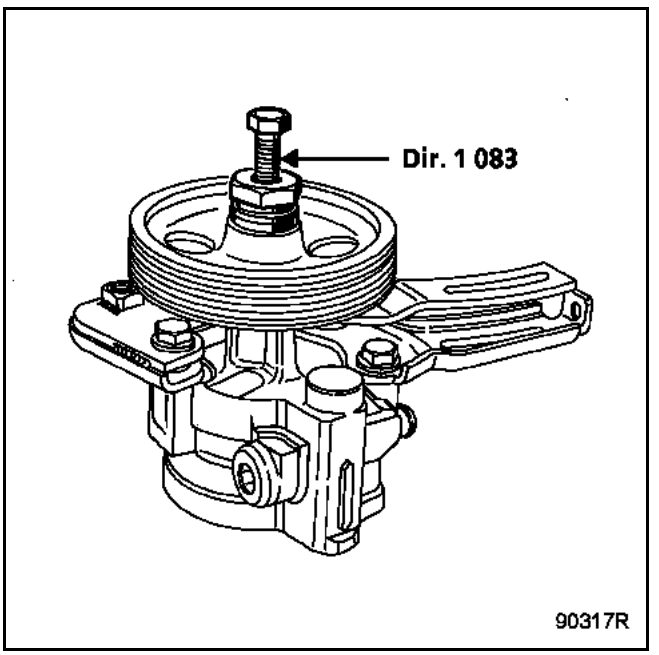
Note the dimension relative to the end of the shaft. Extract the pulley.

Use the press fitted with an extractor.



REFITTING

Grasp the pulley with tool **Dir. 1083-01** until you reach the stop on the shaft (liberally grease the thread and the pad on the pulley).

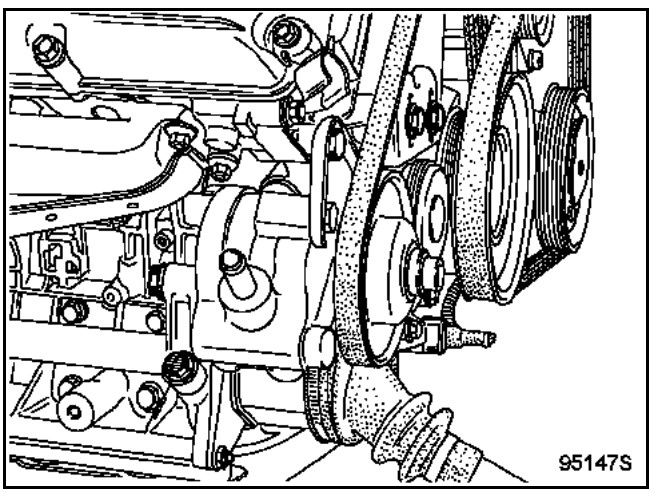


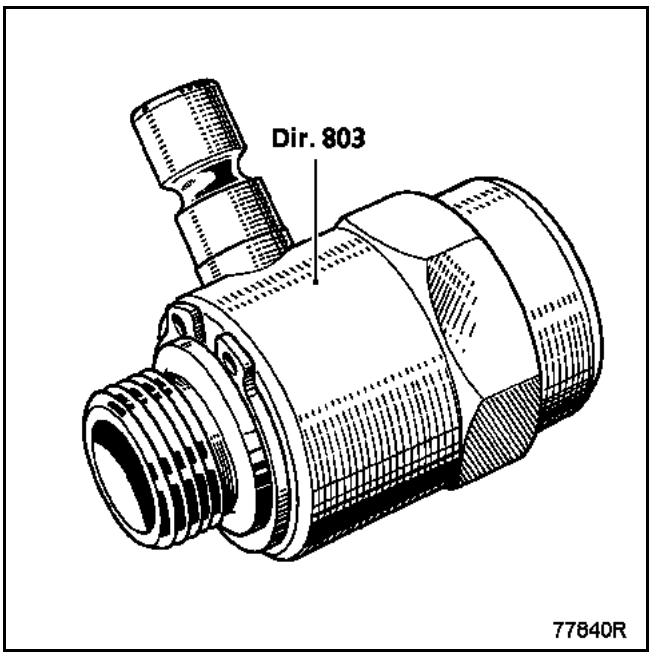
GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Dir. 803	PAS pump pressure gauge adapter
Dir. 1 204	Pressure measuring connector
Mot. 453-01	Hose clamp pliers
Fre. 1 085 or Fre. 244-03	Pressure gauge
Fre. 284-06	Connecting hose

Place a **Mot. 453-01** clamp on the lower hose of the pump.

Disconnect the high pressure pipes (be prepared for oil to drain out).

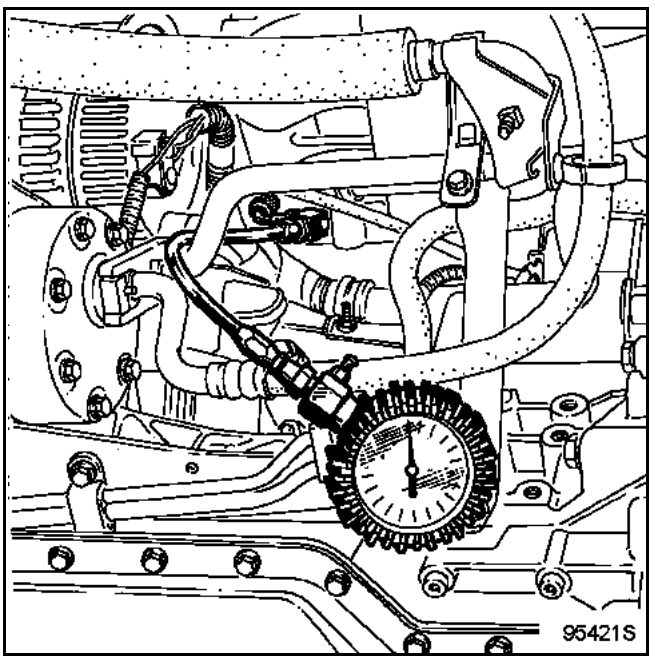




Connect the pressure gauge **Fre. 1085** or **Fre. 244-04**.

GETtheMANUALS.org

On the rigid pipework (high pressure) at the pump outlet, remove the pressure switch and connect the pump pressure test adapter **Dir. 1021** and the oil pressure gauge **Fre. 1 085** or **Fre. 244-04**.



Be prepared for oil to drain out.

ALL TYPES

Remove clamp **Mot. 453-01**.

Adjust the pump to the correct level and run the engine to check the pressure.

With the wheels set straight, whatever the engine speed, the pressure should not exceed: **5** to **7 bar**.

With the wheels at full lock on one side, hold them in position, and the maximum pressure should be:
– **96 to 103 bar** for F4R and G9T engines;
– **105 to 115 bar** for the P9X engine;
– **95 to 101 bar** for the V4Y engine.

This operation should not be prolonged to avoid a significant increase in oil temperature.

Remove the adapter **Dir. 803** or **Dir. 1024** and the pressure gauge by cutting off the pump supply with a **Mot. 453-01** (V6 Engine) clamp.

Reconnect the high pressure pipes or the pressure switch (accordingly) and remove the **Mot. 453-01** clamp.

Top up the reservoir.

GETtheMANUALS.org

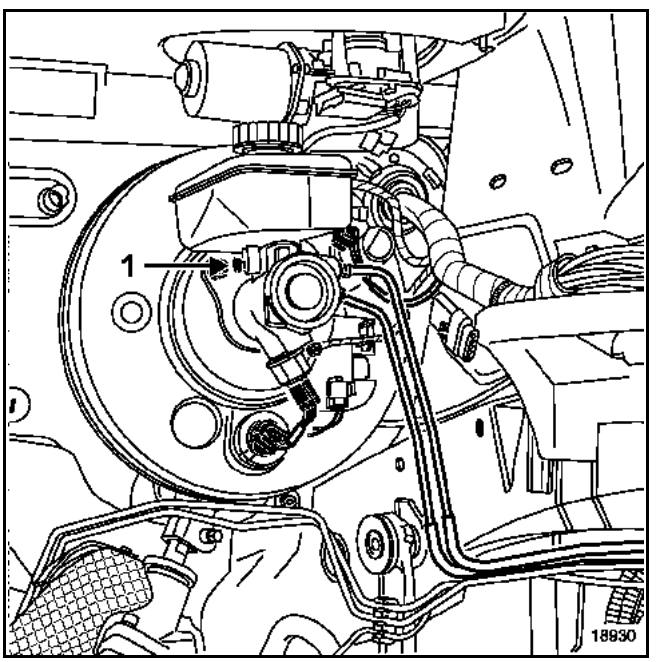
TIGHTENING TORQUES (in daNm)	
Brake reservoir bolt	**0.35**
Brake pipe	**1.4**
Master cylinder mounting nuts	**2.1**

IMPORTANT: drain the brake fluid to prevent damage to the mechanical parts and bodywork around the braking system.

REMOVAL

Place the vehicle on a lift.

Remove:
– the air resonator housing,
– the expansion bottle,
– the brake fluid level connector,
– the bolt fixing the reservoir to the master cylinder (1).

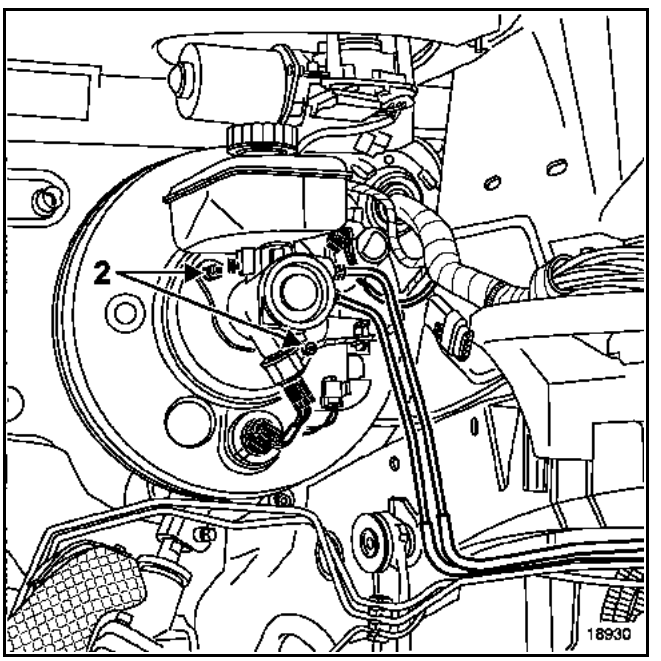


Drain the brake fluid reservoir. Remove it using a cloth.

Remove the pressure sensor connector on the master cylinder.

Repair the master cylinder brake pipes.

Remove:
– the master cylinder brake pipes,
– the brake cylinder mounting nuts on the brake servo.(2).



Remove the master cylinder.

GETtheMANUALS.org

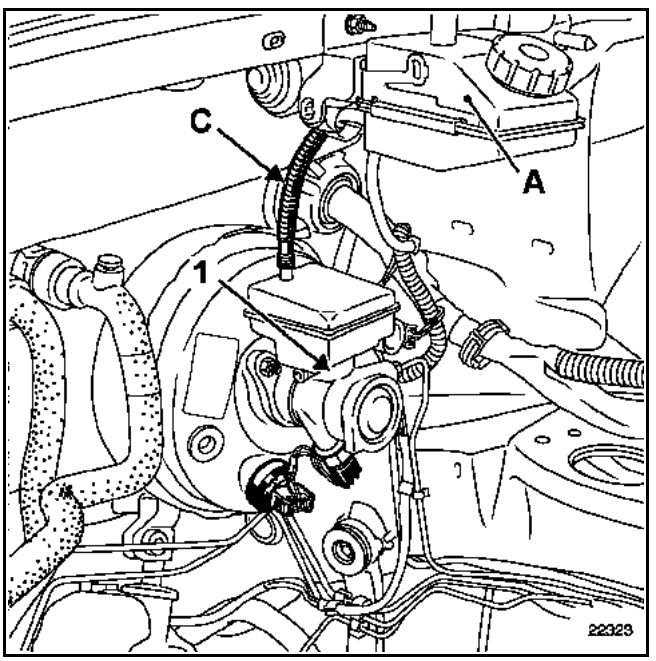
Special notes for the V4Y engine

IMPORTANT: drain the brake fluid to prevent damage to the mechanical parts and bodywork around the braking system.

REMOVAL

Place the vehicle on a lift.

Remove:
– the air resonator housing,
– the expansion bottle,
– the brake fluid level connector,
– mounting bolt (1) connecting the reservoir to the master cylinder.



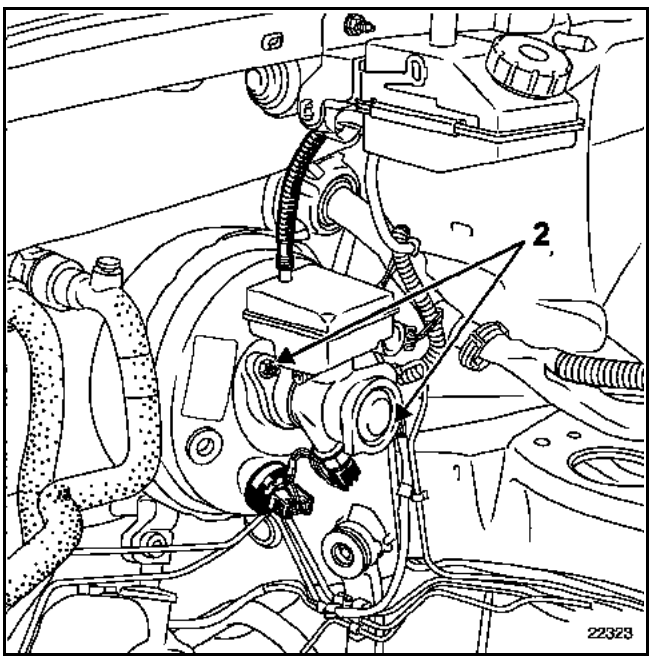
Simultaneously remove:
– upper brake fluid reservoir (A),
– connecting pipe (C) between the upper and lower reservoirs.

Drain the upper reservoir.

Remove the pressure sensor connector on the master cylinder.

Repair the master cylinder brake pipes.

Remove:
– the master cylinder brake pipes,
– the brake cylinder mounting nuts on the brake servo.(2).



– the master cylinder.

Drain the brake fluid from the lower reservoir and master cylinder.

REFITTING

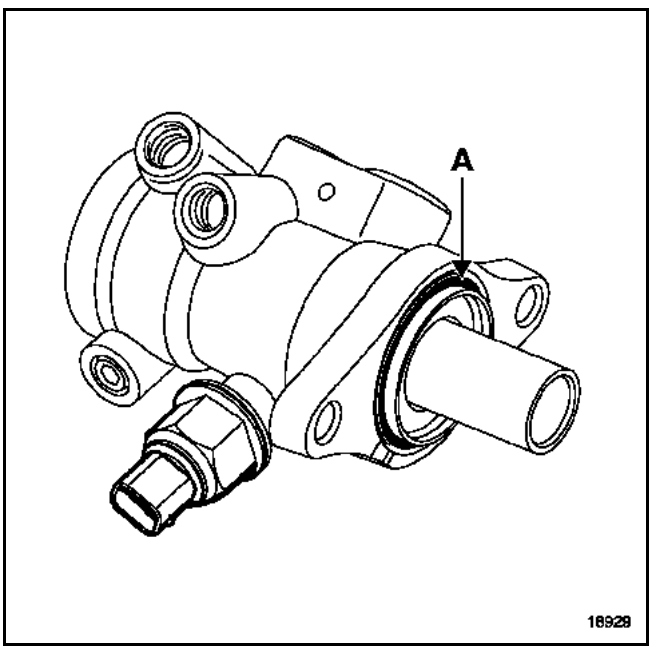
Make sure you replace the connecting pipe O-ring between the two reservoirs. Ensure the O-ring is correctly positioned in the pipe grooves.

Bleed the brake circuit following the procedure.

GETtheMANUALS.org

REFITTING

NOTE: when the master cylinder is removed, its seal (A) must always be replaced with a new one on refitting.



Align the master cylinder with the brake servo so that push rod enters the master cylinder housing.

Refit:
– the brake pipes according to their markings,
– the brake fluid reservoir by pressing down on it to click it into the master cylinder,
– the brake fluid reservoir mounting bolt.

Bleed the braking system (see bleeding method).

GETtheMANUALS.org

TIGHTENING TORQUES (in daNm)	
Brake reservoir bolt	0.35
Brake pipe	1.4
Master cylinder mounting nuts	2.1
Brake servo mounting nuts	2.9

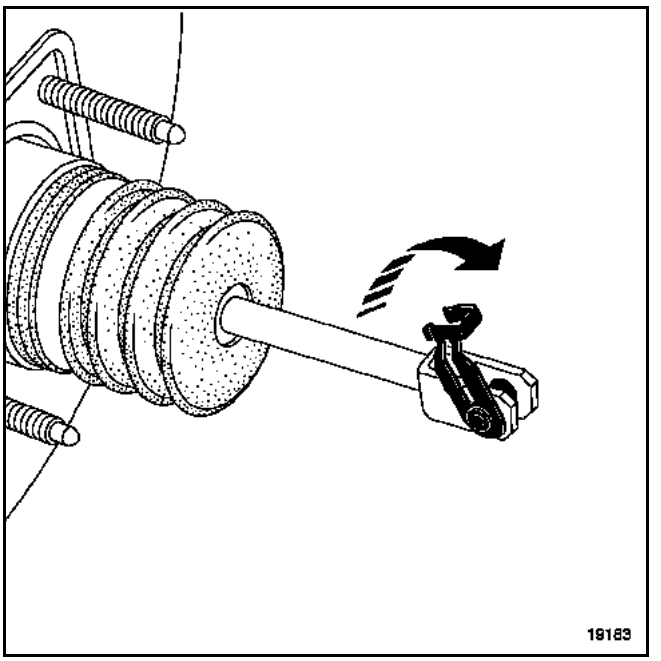
Place the vehicle on a lift.

IMPORTANT: remember to anticipate that brake fluid will flow out; protect the mechanical parts and bodywork around the braking system to prevent damage.

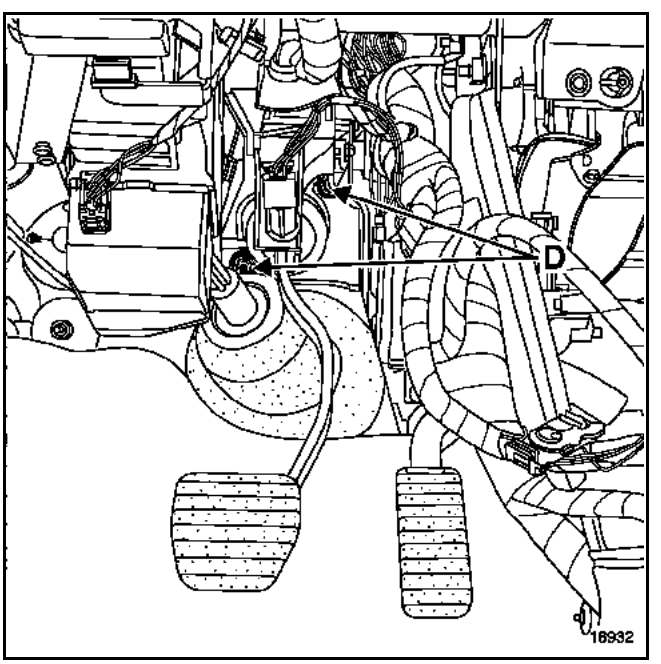
REMOVAL

Remove:
– the air filter hose,
– the air filter unit,
– the fuse holder unit,
– the master cylinder (see method),
– the non-return valve on the brake servo,
– the brake servo connectors.

In the passenger compartment, remove:
– the brake pedal yoke shaft of the push rod on the brake servo,



– the two brake servo mounting bolts (D) .

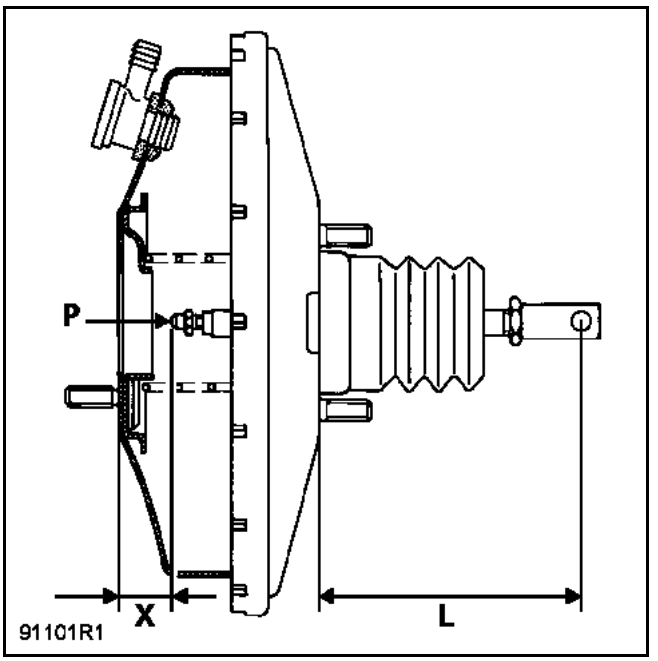


Remove the brake servo.

GETtheMANUALS.org

REFITTING

Sides X and L are not adjustable.



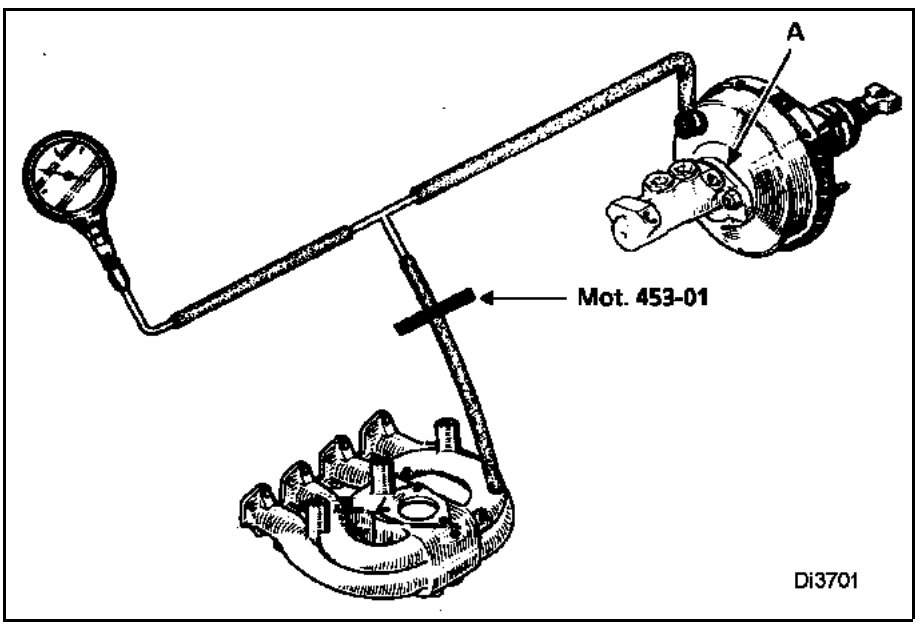
To reassemble the brake servo and master cylinder, follow the opposite procedure to removal.

GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Mot. 453-01	Hose pliers
EQUIPMENT REQUIRED	
Vacuum pump	

SEALING CHECK

Check the sealing of the brake servo, ensuring a perfect seal between it and the master cylinder. If there is a leak, replace seal (A).



The sealing of the brake servo is checked on the vehicle when the hydraulic circuit is operating.

Connect the vacuum pump between the brake servo and the vacuum source (inlet manifold) using a "I" union and the shortest possible pipe.

Run the engine at idle speed for one minute.

Clamp the pipe (**Mot. 453-01** clamp) between the "I" union and the vacuum source.

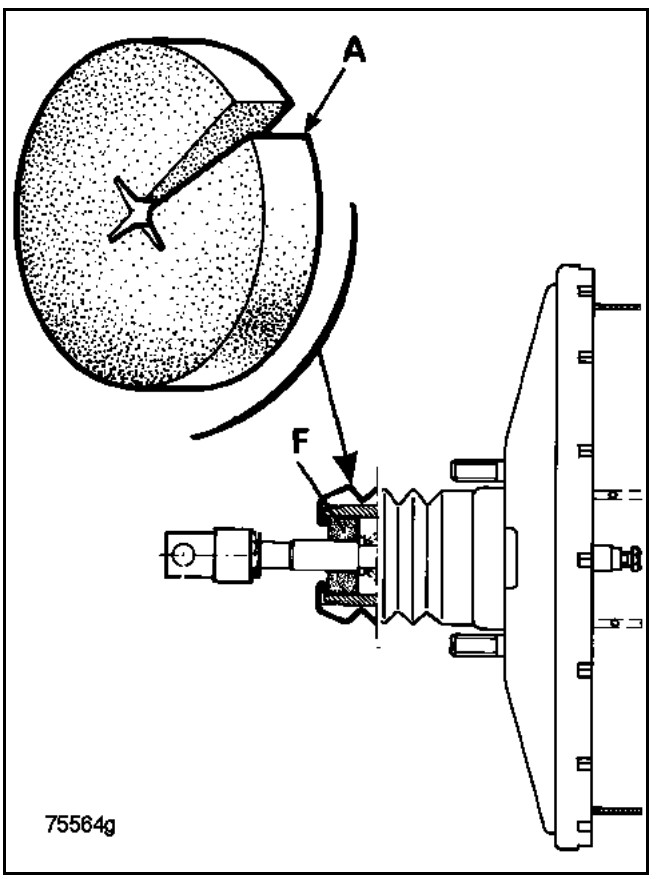
Turn the engine off.

If the vacuum drops by more than **33 mbar** in **15 seconds**, there is a leak located either:
– at the non-return valve (replace it),
– or at the pushrod diaphragm (replace the brake servo).

If the brake servo is not operational, the braking system will operate but the force required at the pedal to obtain the equivalent deceleration as for assisted braking is considerably higher.

GETtheMANUALS.org

REPLACING THE AIR FILTER



It is not necessary to remove the brake servo to change air filter (F).

Under the pedal mounting, use a screwdriver or a metal hook to remove the worn filter (F).

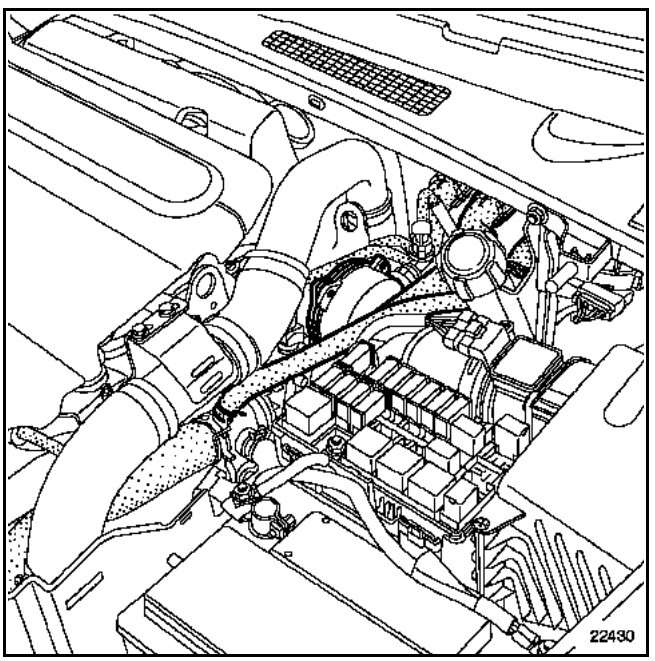
Cut the new filter at (A) (see diagram) and engage it around the rod then insert it into its housing taking care to extend it right across the bore to prevent the passage of unfiltered air.

GETtheMANUALS.org

G9T engine

REMOVAL

Remove:
– the vacuum pump mountings,



– the pump.

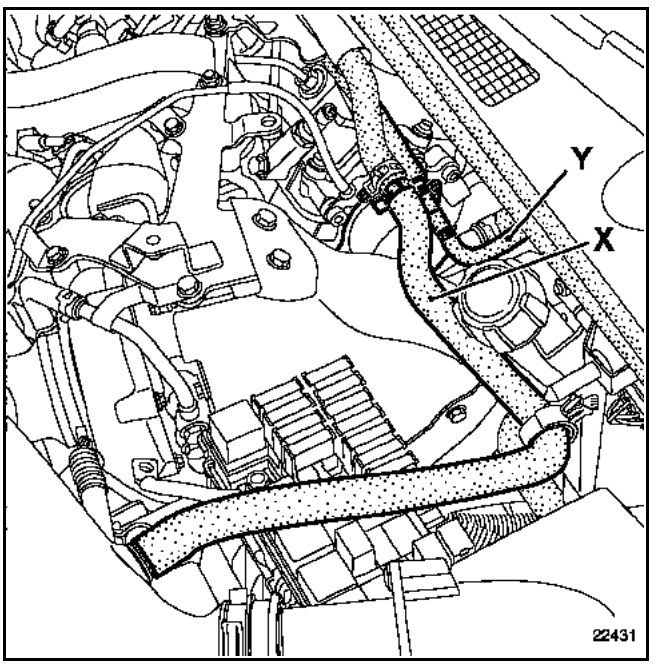
REFITTING

Refitting is the reverse of removal.

P9X engine

REMOVAL

Remove:
– radiator hose (X),
– hose (Y),
– the vacuum pump mountings,

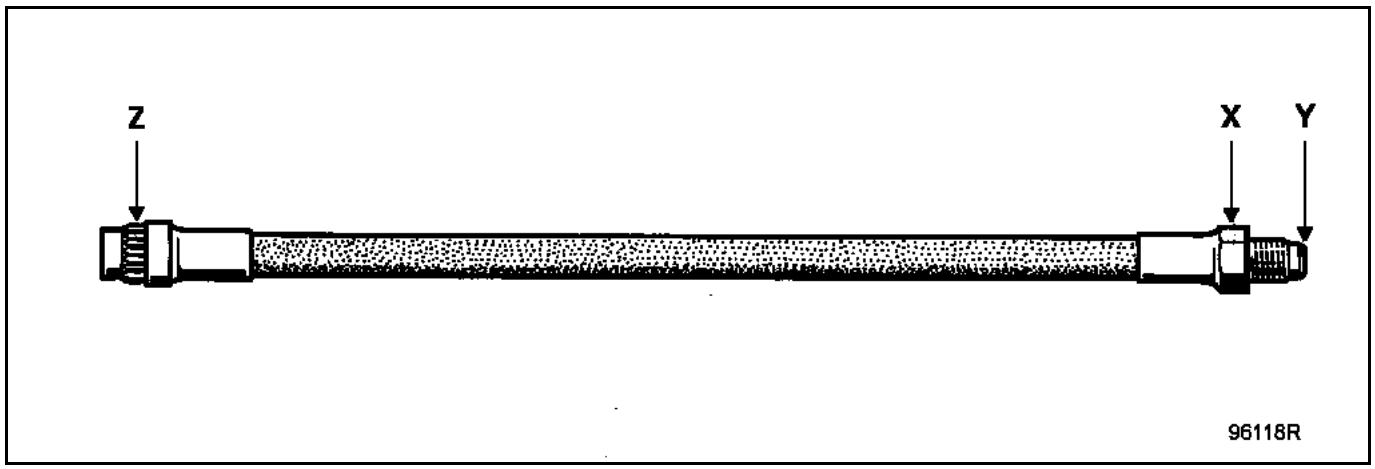


– the pump.

REFITTING

Refitting is the reverse of removal.

GETtheMANUALS.org



PRECAUTIONS TO BE TAKEN WHEN REMOVING - REFITTING A BRAKE CYLINDER OR A BRAKE PIPE.

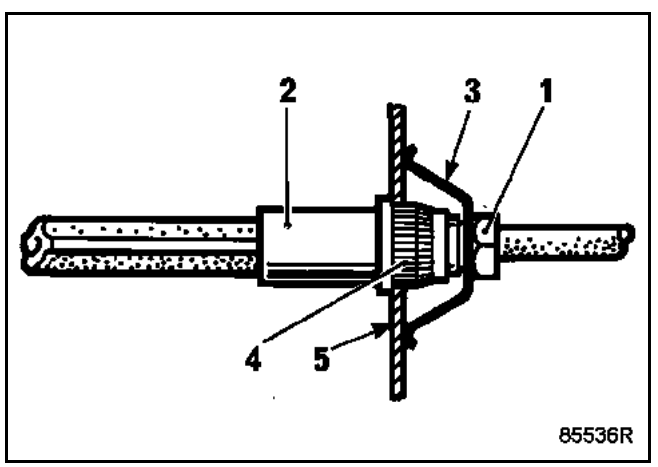
For safety reasons and to ensure that the brake pipe is not twisted and is not liable to touch a suspension component, the following order of operations must be observed:

REMOVAL

Unscrew rigid piping union (1) on pipe (2) using a pipe wrench.

Unclip pin (3) lifting off the brackets.

The pipe is released from the indicator flat.



Remove the hose from the caliper and if necessary remove the caliper.

REFITTING

Fit the calliper onto the brake. Screw the pipe onto it. Tighten to a torque of **1.4 daNm**.

The brake pipes are fitted when the axle assembly is in position:
– wheels suspended (suspension in place),
– axle in line (wheels straight).

Place the brake pipe the female end piece on retaining bracket (5), without torsion pressure. Check that end piece (4) can move freely in the bracket splines. Refit:
– the pin (3),
– the rigid pipe on the brake pipe.

Ensure that the brake pipe does not move when it is being tightened.

Torque tighten the union.

Bleed the brake circuit.

GETtheMANUALS.org

REMOVAL

On the brake pedal mounting, disconnect the brake pedal position sensor.

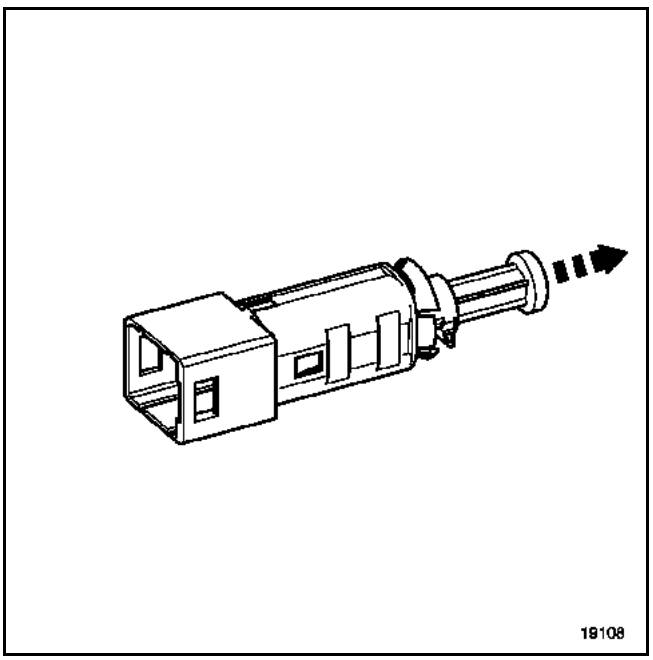
Turn it one quarter turn anticlockwise.

Remove the pedal position sensor.

REFITTING

The brake pedal position sensor has automatic adjustment which adapts according to the pedal position.

Before the sensor is refitted, it must by set to its minimum position by pulling on it.



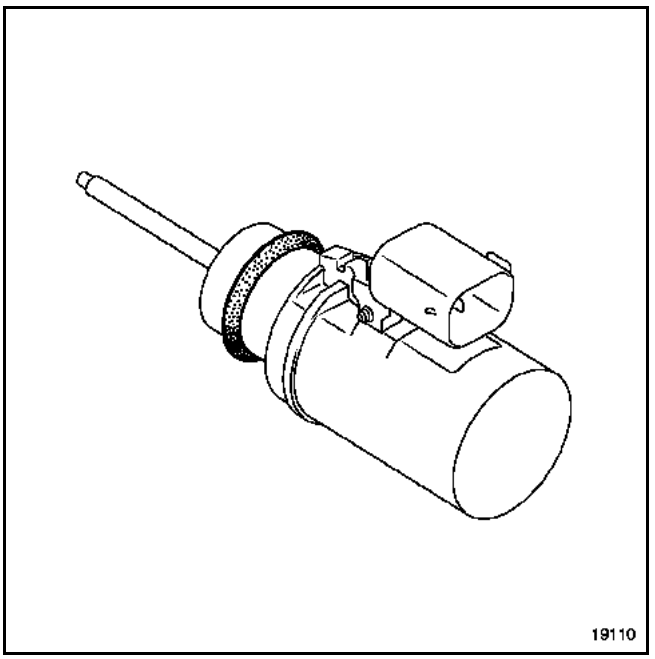
REFITTING

Put the sensor in its housing and turn it one quarter turn clockwise.

Reconnect the brake pedal position switch connector.

GETtheMANUALS.org

DIAPHRAGM MOVEMENT SENSOR



REMOVAL

Remove:
– the air filter hose,
– the air filter unit,
– the fuse holder unit,
– the expansion bottle.

Disconnect the sensor.

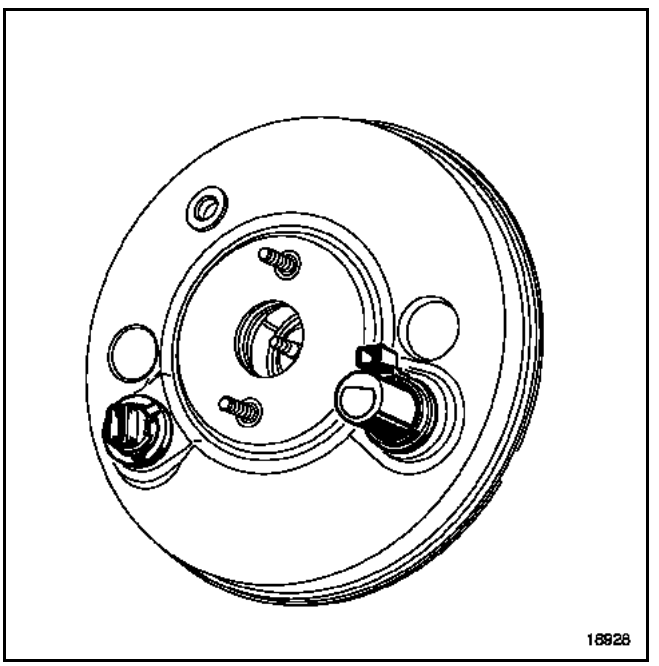
Using a small screwdriver, push back the sensor mounting clip.

Remove the diaphragm movement sensor.

REFITTING

IMPORTANT: It is essential to replace the seal before refitting the diaphragm movement sensor.

Position the sensor on the brake servo. Clip it on by pressing on the top of the sensor.



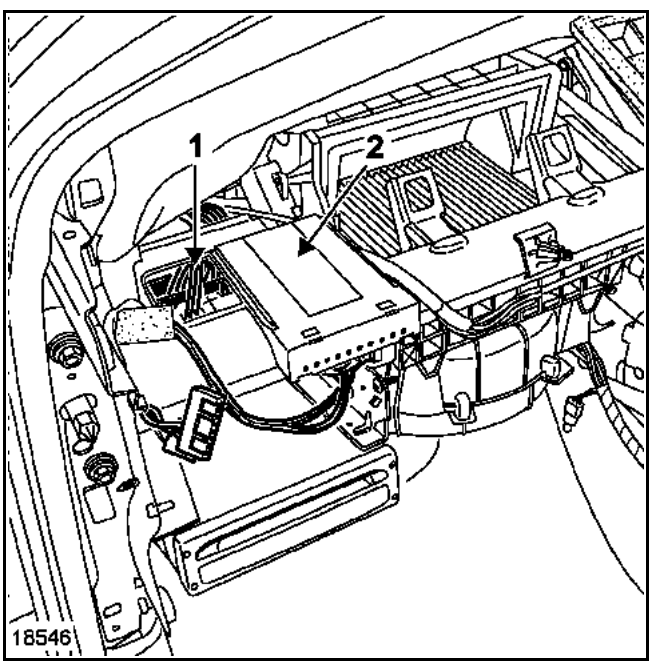
GETtheMANUALS.org

TIGHTENING TORQUES (in daNm)	
fork bolt	2.1
Steering column mounting bolt	2.1
Electric lock bolt	0.8
Lower shell bolt	0.2
Steering wheel bolt	4.4
Reinforcement plate bolts	2.1
Reinforcement plate nut	2.1
Reinforcement beam bolts	2.1
Reinforcement plate side bolts	0.8

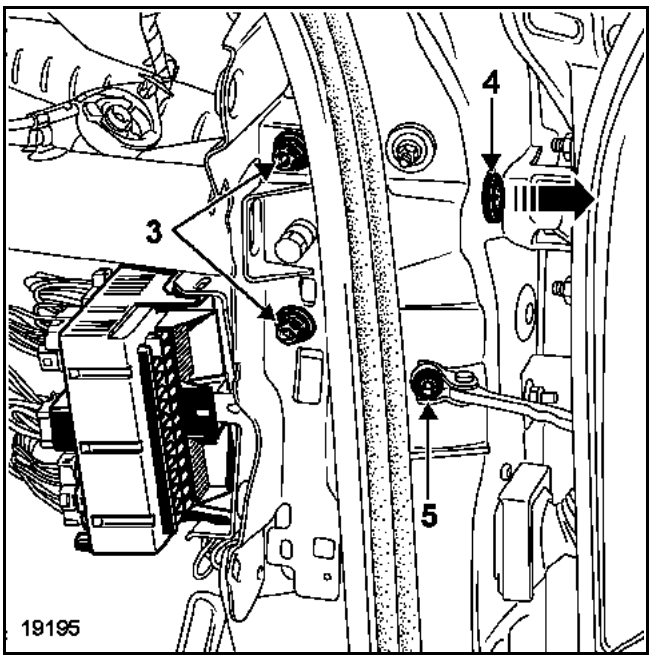
REMOVAL

Remove the steering column (refer to **Section 36B**).

Remove:
– the central console,
– the central air distribution unit,
– the instrument panel (refer to **Section 83A**).

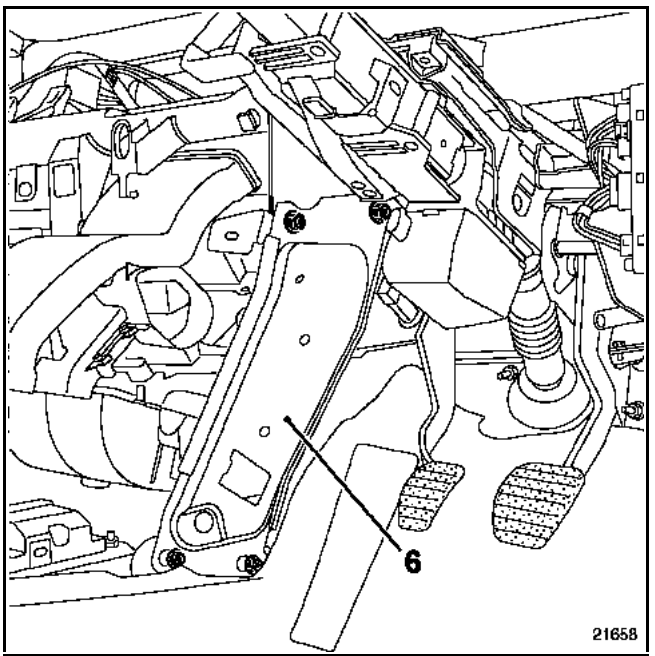


Remove:
– the relay/fuse box (1),
– the voice synthesiser unit (2).



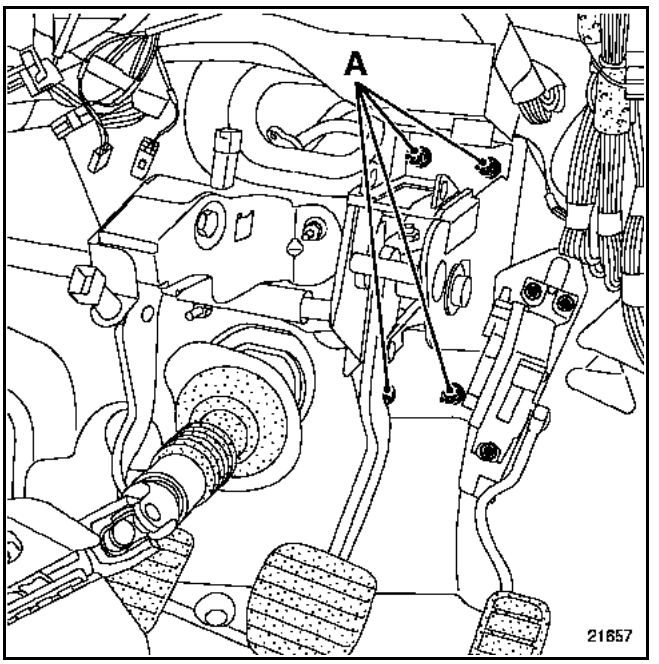
Remove:
– the door check strap bolts (5) enabling the beam bolts (4) to be unscrewed,
– the beam mounting screws (3) and (4),
– instrument panel beam.

GETtheMANUALS.org



Remove the protection flange (6).

DRIVER'S SIDE

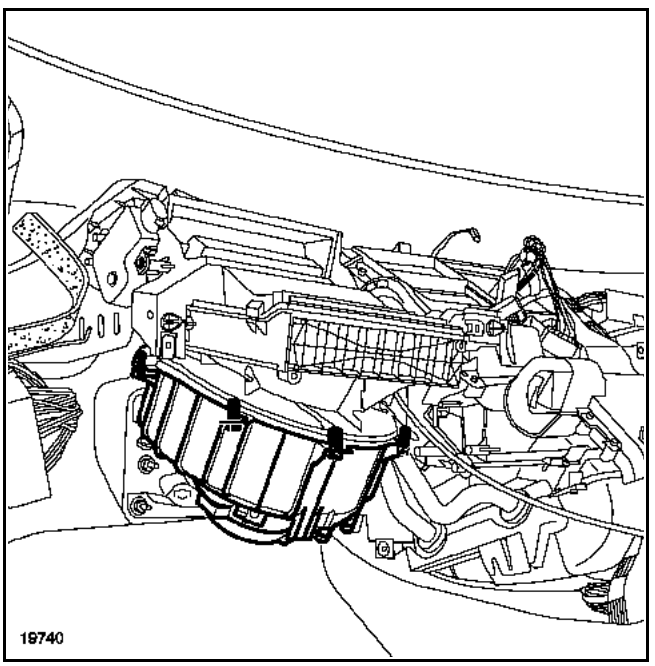


Disconnect the clutch, brake and accelerator pedal sensors.

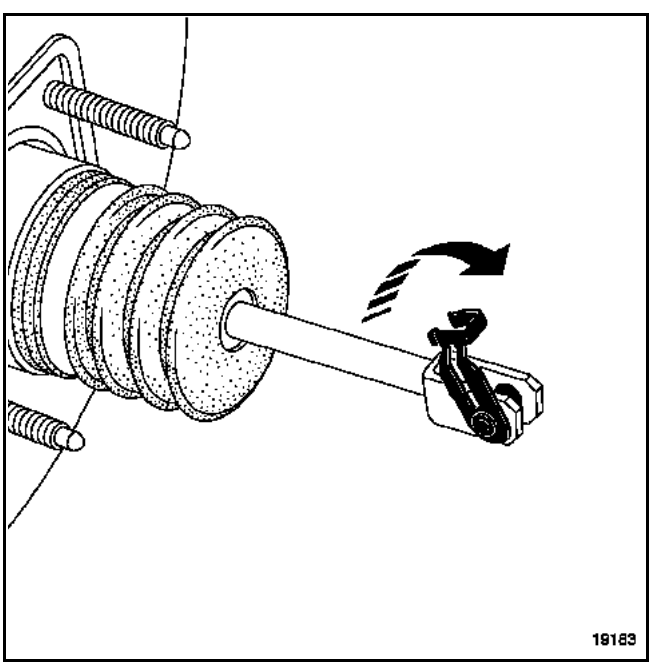
Remove the pedal release mounting screws (A).

GETtheMANUALS.org

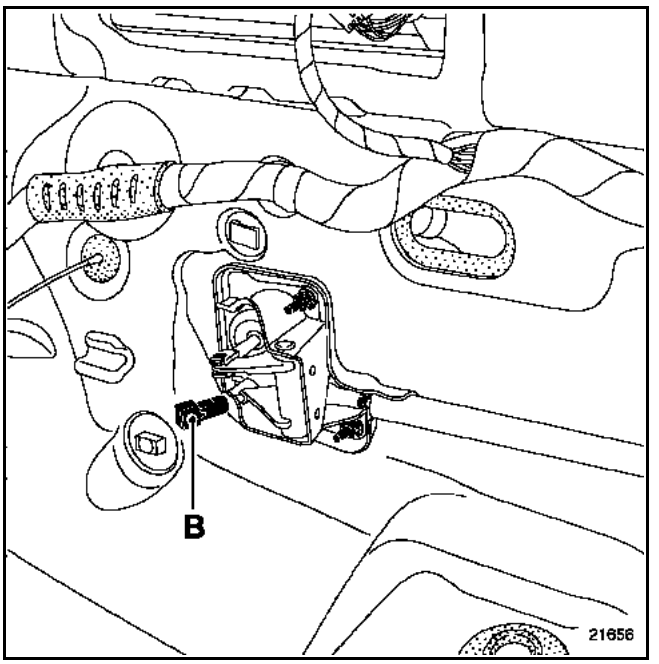
Passenger side



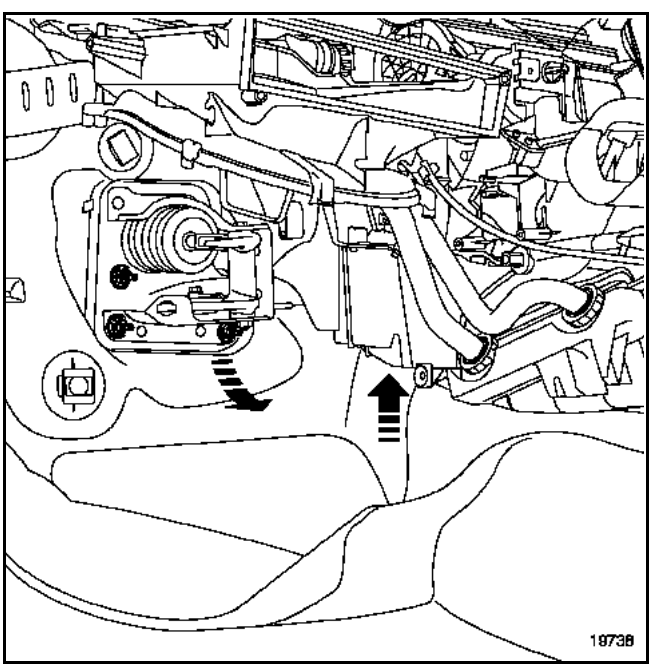
Remove:
– the fan assembly,



– the brake pedal yoke shaft of the push rod on the brake servo,



– switch (B),



– the four brake servo mountings,
– the pedal release mountings,
– the distribution.

With the assistance of another person, lift up the heating unit and slide the pedal release device between the heating unit and the tunnel.

Remove:
– the pedal assembly pedal release,
– the brake pedal.

GETtheMANUALS.org

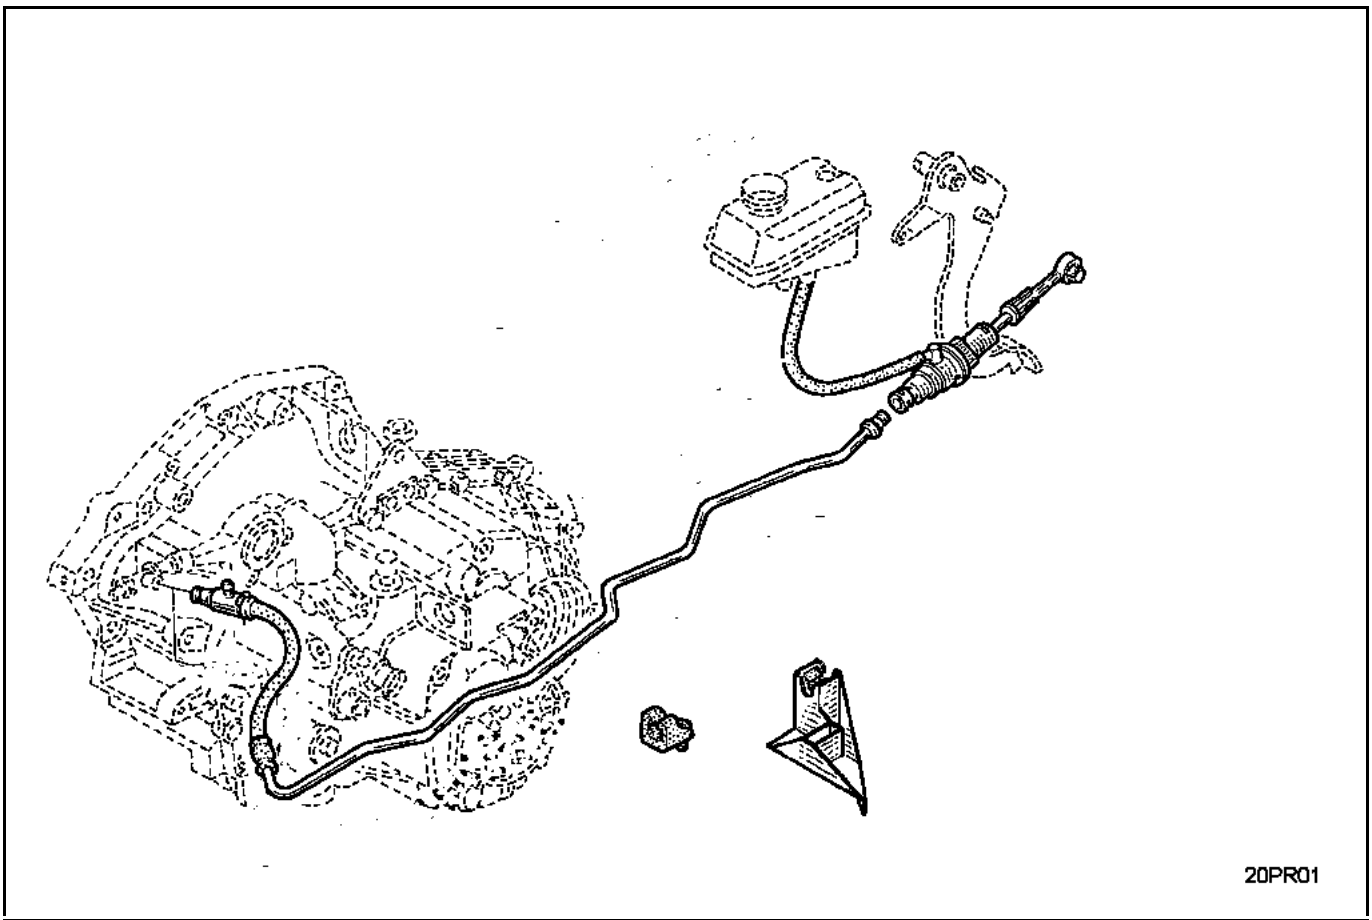
TIGHTENING TORQUES (in daNm)	
Yoke bolt	2.1
Steering column mounting bolt	2.1
Electric lock bolt	0.8
Lower shell bolt	0.2
Steering wheel bolt	4.4

REFITTING

Proceed in the reverse order to removal, respecting the tightening torques.

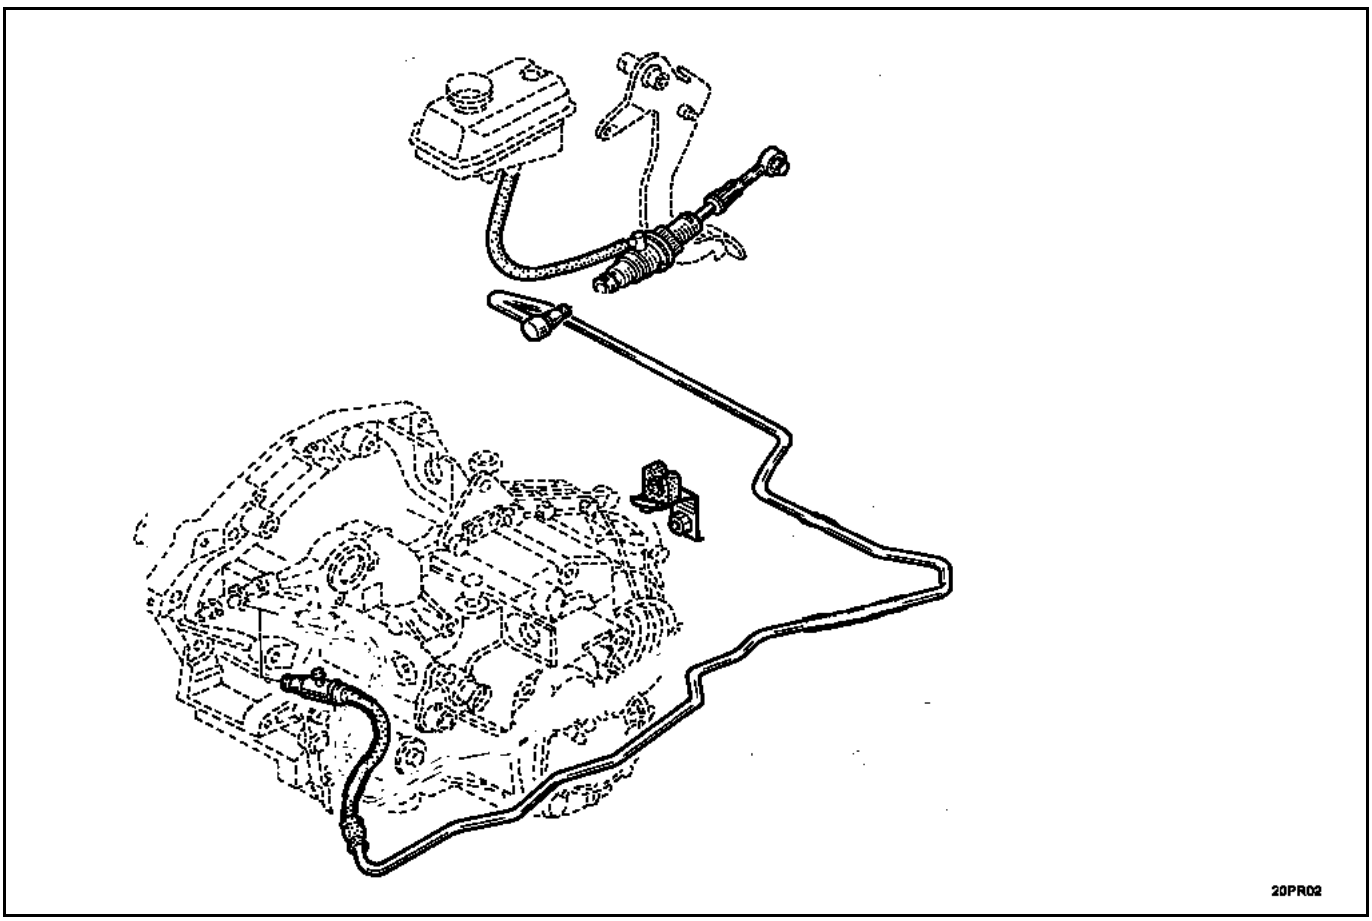
Exploded view of clutch master and slave cylinders

GETtheMANUALS.org



Exploded view of clutch master and slave cylinders

GETtheMANUALS.org



GETtheMANUALS.org

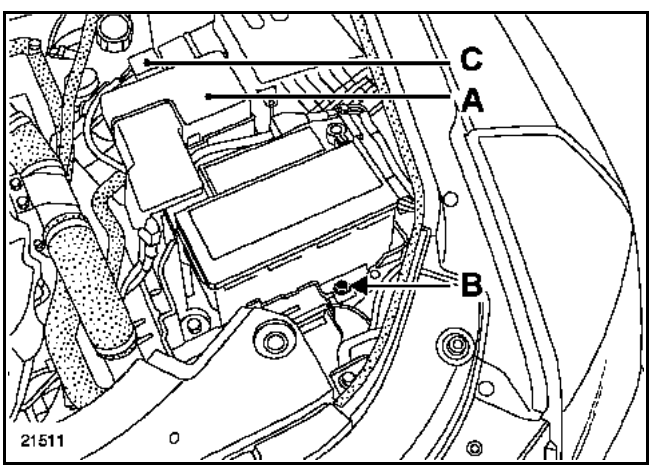
REMOVAL

In the engine compartment

Open the bonnet and remove:
– the engine cover plates,
– fuse box cover (A),

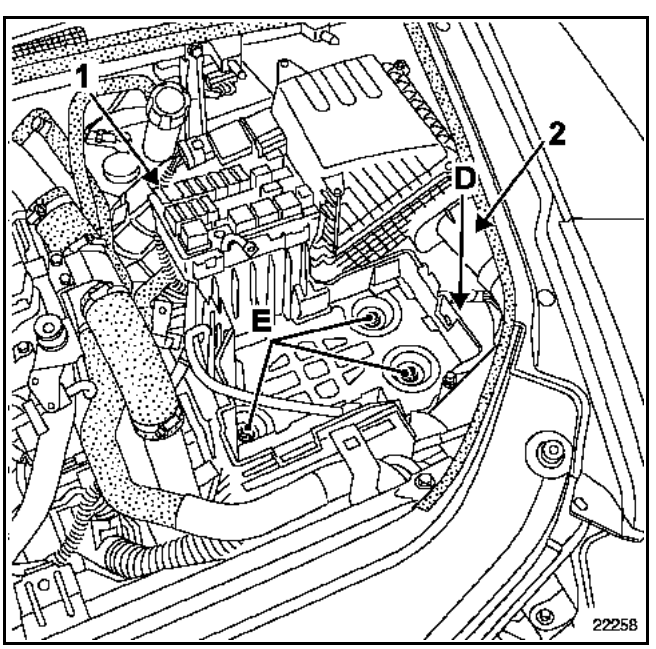
Disconnect the battery.

Remove:
– the battery bolt (B),
– the connections (C) on the air unit (only **G9T engines**),



– the fuses and the fuse holder,
– the battery mounting fuse box,
– the electric wiring harness on the battery mounting at (D),

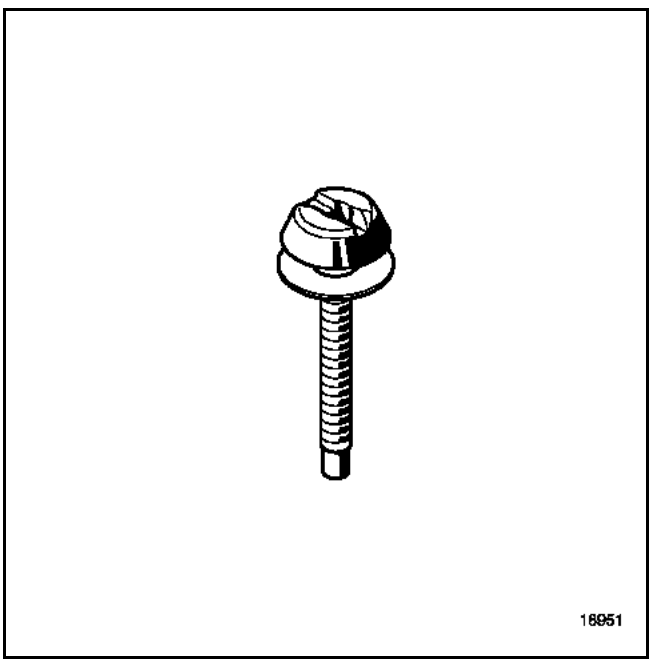
Release:
– air duct (1),
– air duct (2) with the air filter unit,



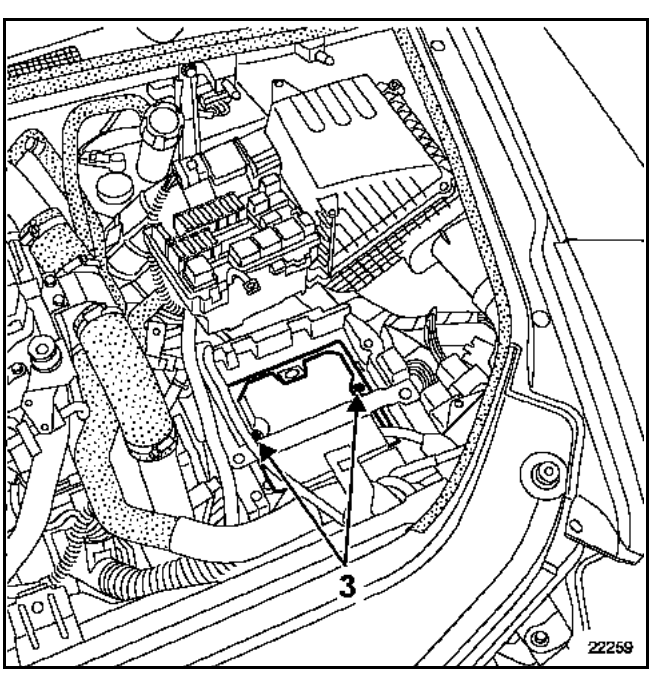
Remove battery tray bolt (E).

To do this, drill out the three tamperproof bolts using a **5 mm** diameter drill bit in the bolt shaft.

Remove the bolt using tool **Mot. 1372.**



Release:
– the computer (nuts 3) to remove the computer connectors,
– the electric wiring harness on the computer tray to remove it.



GETtheMANUALS.org

Drain the coolant in the reservoir.

Drain the brake fluid reservoir until the level is below the master cylinder supply opening.

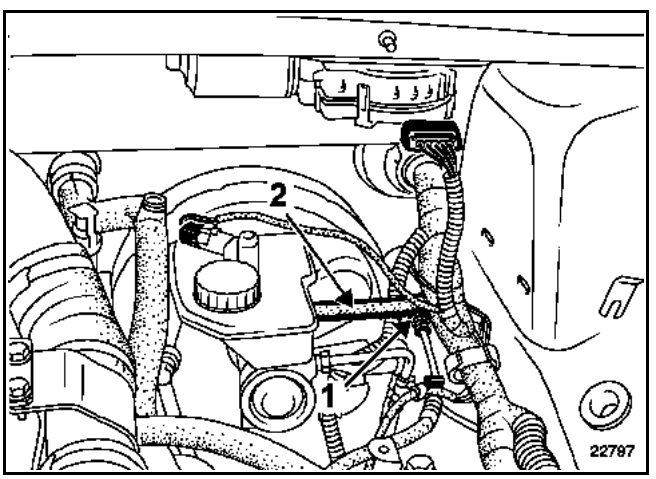
Place a cloth under this opening then disconnect the pipe from the brake fluid reservoir and fit plugs.

Bleed the slave cylinder and operate the pedal with your hand (this empties the master cylinder and the pipe).

In the passenger compartment

Disconnect the master cylinder ball joint from the clutch pedal.

Engine compartment (contd)



Remove the electrical harness.

Remove the master cylinder pressure sensor connectors.

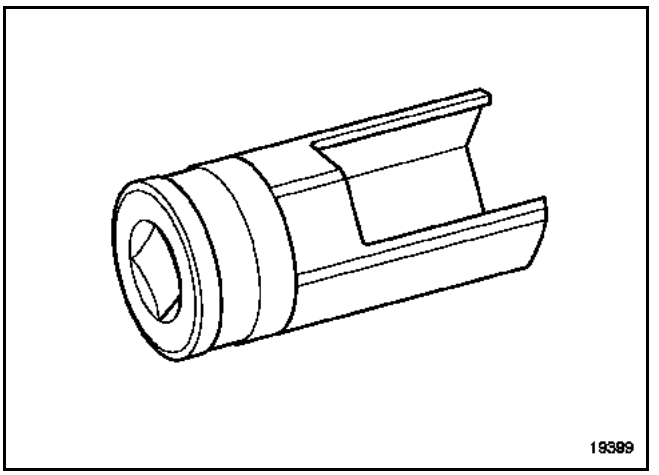
Remove the master-slave connecting pipe holding clip (1) on the master.

Place a cloth under the master cylinder. Disconnect the brake pressure gauge connecting hose on the master cylinder.

Place plugs in each opening.

Remove the hose at (2).

Remove the master cylinder from the bulkhead by turning it one quarter of a turn clockwise (bayonet type mounting) using tool **Emb. 1596**.

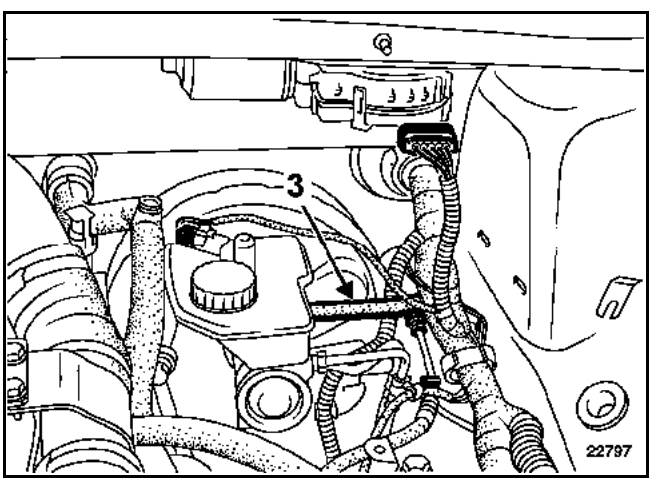


REFITTING

Check the condition of the seals.

Proceed in the reverse order to removal.

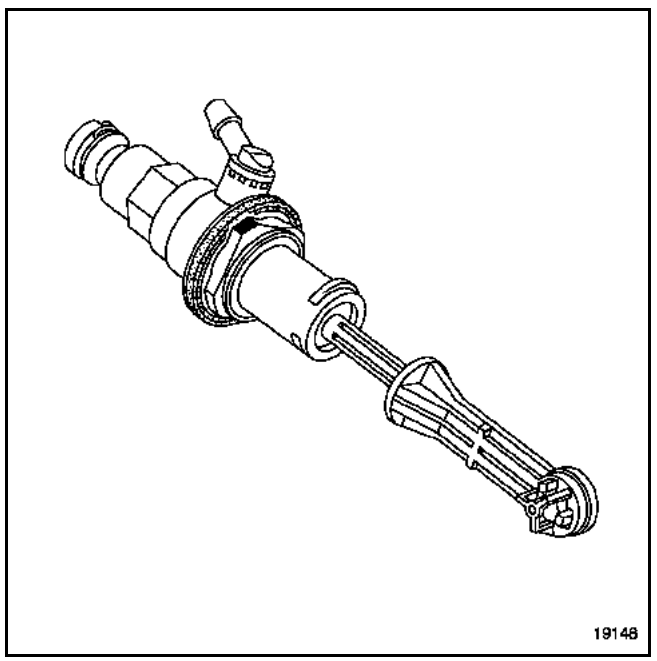
NOTE: lubricate the two clutch master cylinder supply hose ends (3) with brake fluid to facilitate fitting the brake fluid reservoir to the take-off pipe.



GETtheMANUALS.org

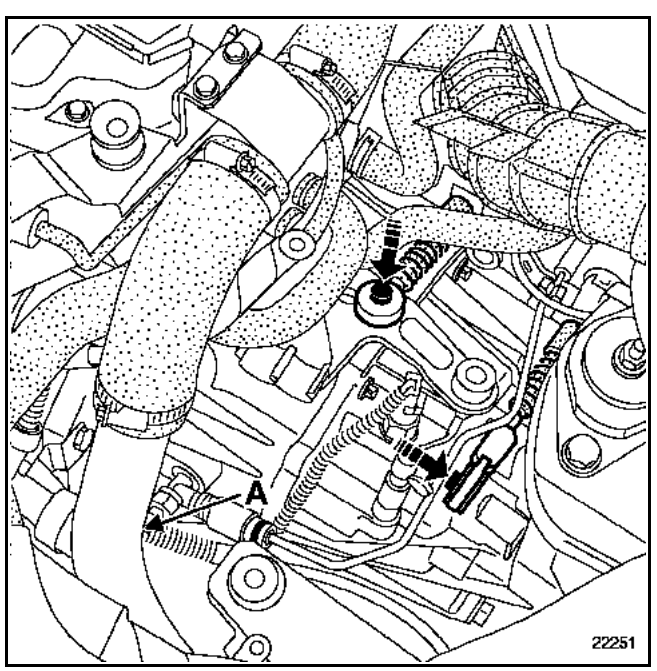
CAUTION: do not use the take-off pipe as support when fitting.

The master cylinder is fitted with a foolproofing device. There is only one possible position.



Add brake fluid to the reservoir.

Bleed the hydraulic circuit:
– remove the bleed cap,
– connect a pipe linked to a reservoir containing brake fluid to opening A,



– install the bleeding device onto the brake fluid reservoir,
– operate the bleeding device,
– wait until the air is completely expelled from the hydraulic circuit.

Top up the brake fluid.

Check that the clutch system is operating correctly.

GETtheMANUALS.org

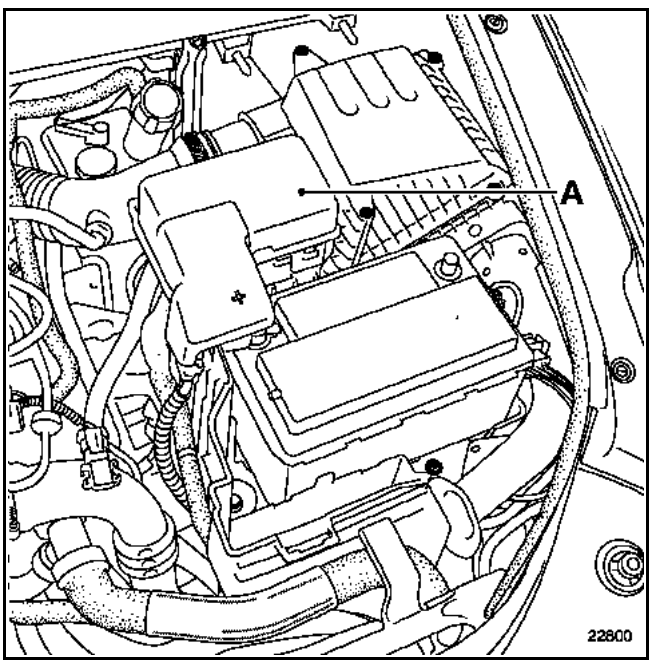
REMOVAL

Place the vehicle on a lift.

In the engine compartment

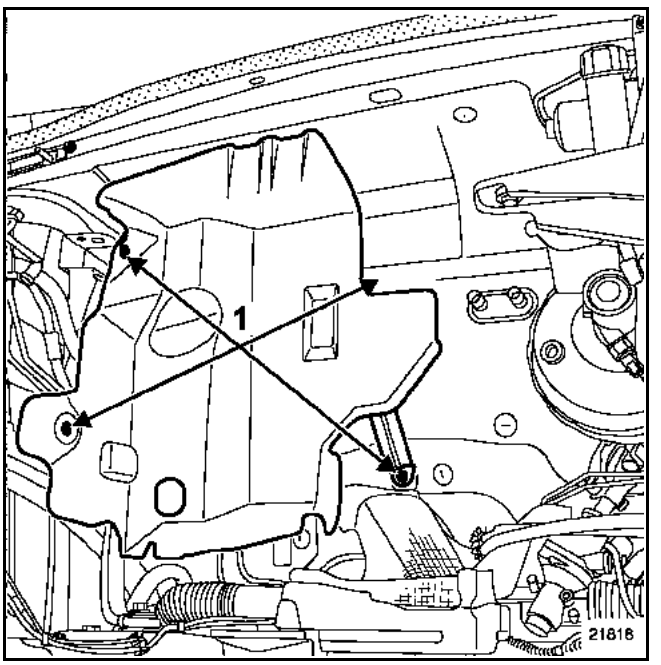
Open the bonnet and remove:
– the engine cover plates,
– fuse box cover (A),

Disconnect the battery.



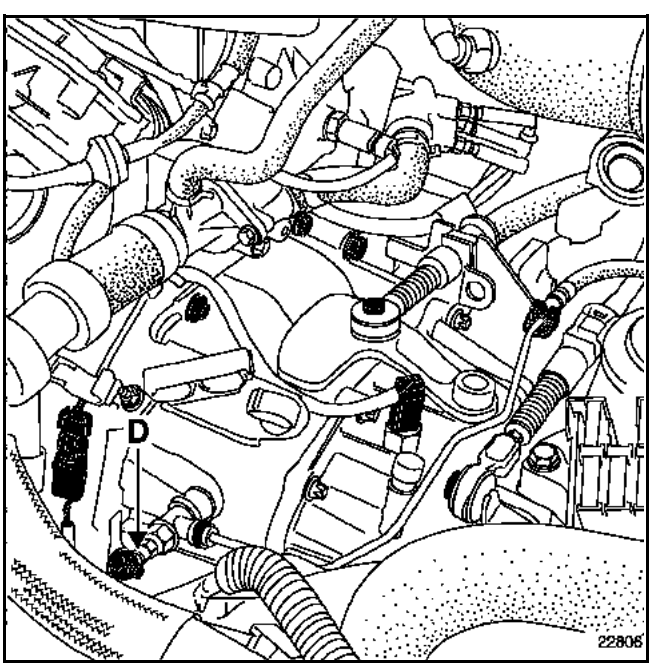
Remove:
– the catalytic converter (see **Section 19B: Exhaust Catalytic converter**),
– turbocharger (see **Section 12B: Turbocharging: Turbocharger**).

Pull off the engine heat shied mountings (1) to extract it.



Drain the brake fluid reservoir using a syringe until the fluid level is below the level of the master cylinder supply opening.

Open bleed (D) on the slave cylinder side and pump the clutch pedal two or three times keeping the pedal in your hand (this enables emptying of the master cylinder and the pipe).

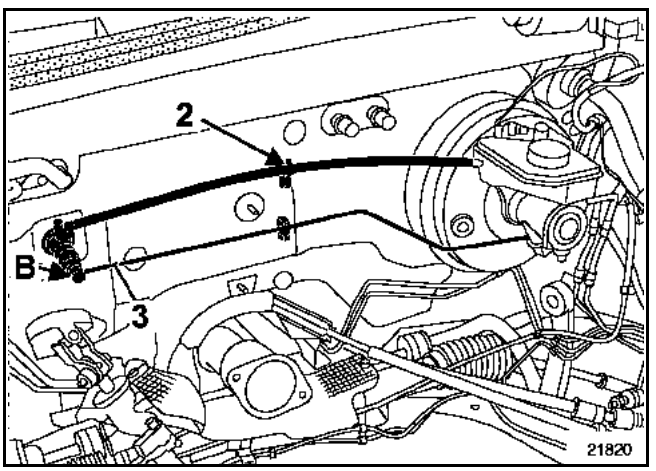


GETtheMANUALS.org

In the passenger compartment

Disconnect the master cylinder ball joint from the clutch pedal.

Engine compartment (contd)

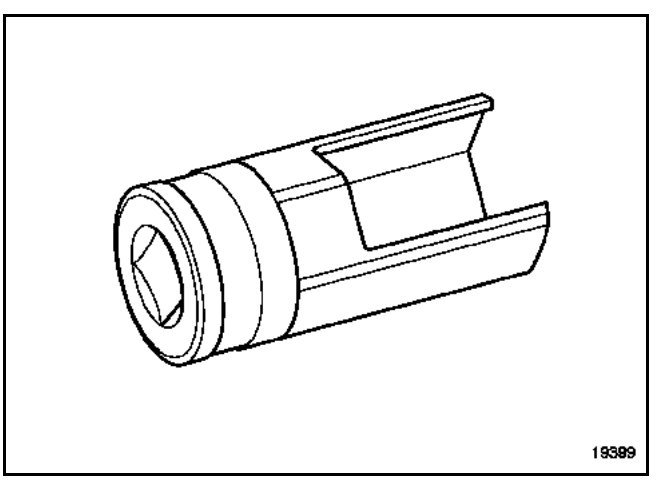


Unclip the hose connecting the brake fluid reservoir and the master cylinder at (2).

Place a cloth under the master cylinder.

Release retaining clip (B) of the clutch control pipe (3) and remove it.

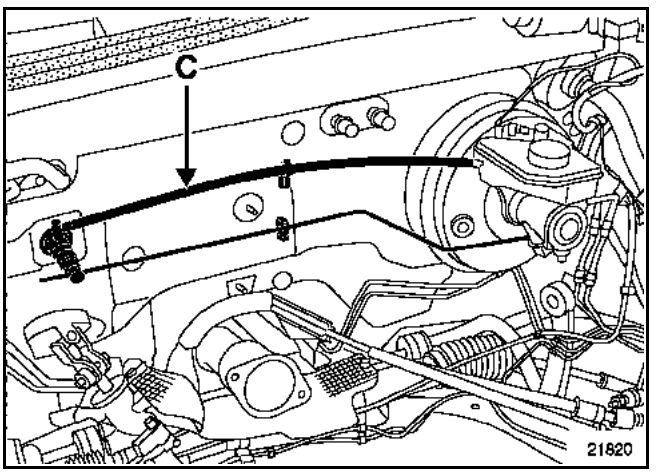
Remove the master cylinder from the bulkhead by turning it one quarter of a turn clockwise (bayonet type mounting) using tool **Emb. 1596**.



Remove master cylinder take-off hose (C).

REFITTING

Check the condition of the seals.

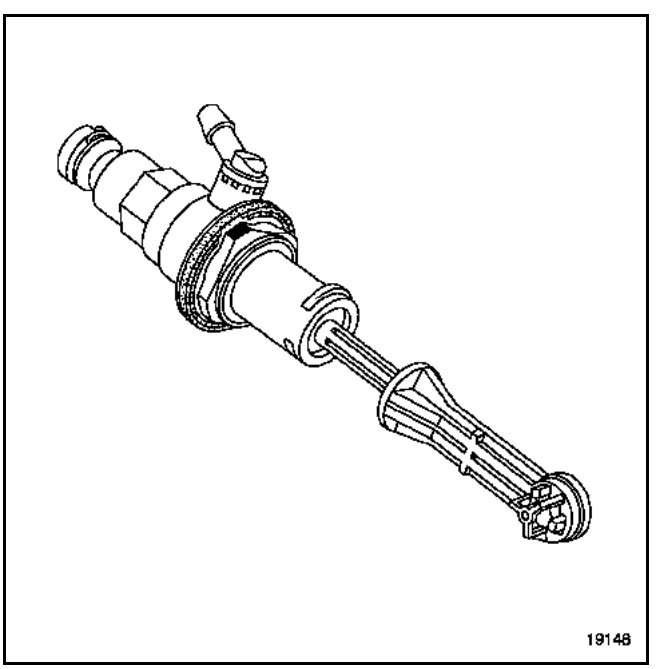


Proceed in the reverse order to removal.

NOTE: lubricate the clutch master cylinder supply hose end (C) with brake fluid to enable the brake fluid reservoir be fitted to the take-off pipe.

CAUTION: do not use the take-off pipe as support when fitting.

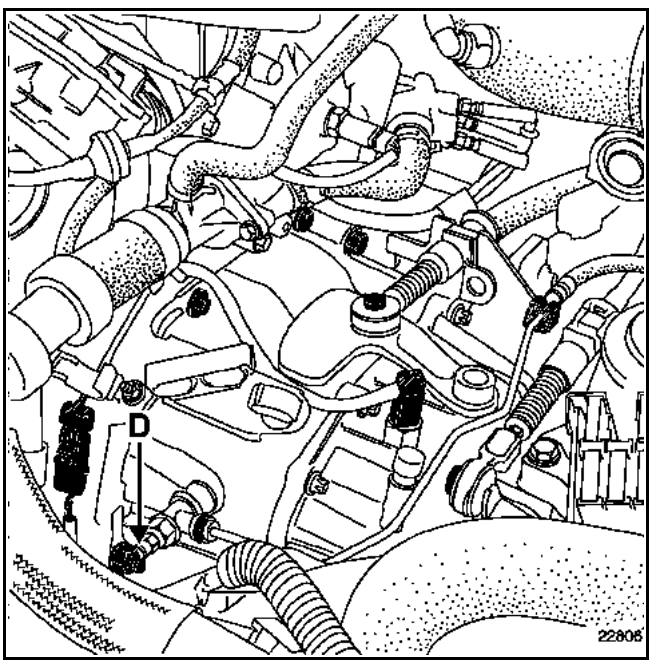
The master cylinder is fitted with a foolproofing device. There is only one possible position.



GETtheMANUALS.org

Add brake fluid to the reservoir.

Bleed the hydraulic circuit:
– remove the bleed cap,
– connect a pipe linked to a reservoir containing brake fluid to opening (D),



– install the bleeding device onto the brake fluid reservoir,
– operate the bleeding device,
– wait until the air is completely expelled from the hydraulic circuit.

Top up the brake fluid.

Check that the clutch system is operating correctly.

In the passenger compartment

Connect the master cylinder ball joint to the clutch pedal.

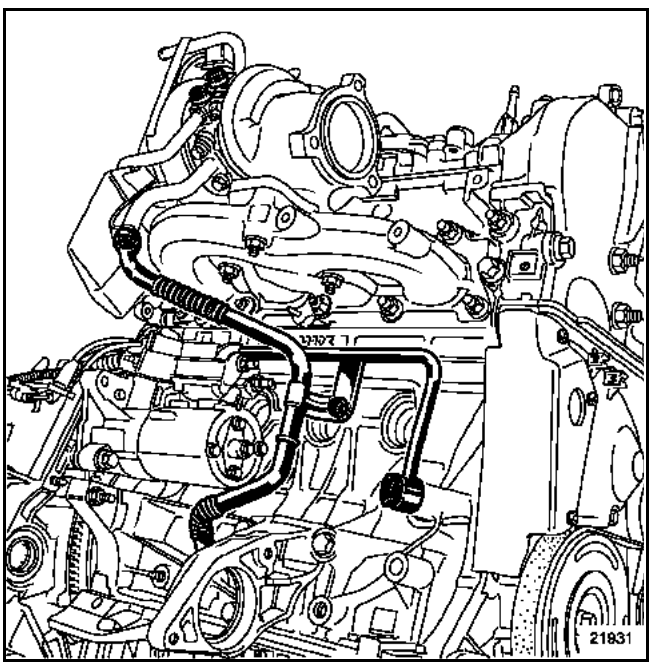
NOTE: remove the clutch pedal sensors to position them (see **Section 37A: Mechanical components control Clutch Pedal**).

Engine compartment (contd)

Fit:
– the heat shield,
– the turbocharger.

IMPORTANT

Fit:
– the turbocharger to the exhaust manifold,
– the oil supply pipe to the turbocharger,
– the return pipe to the cylinder block.



Tighten the turbocharger/ air exchanger clip to position the turbocharger.

NOTE: check the turbocharger sealing (see **Section 12A: Turbocharging Turbocharger**).

Position the catalytic converter by tightening the catalyser struts and then tightening the turbocharger and exhaust pipe clamps (see **Section 19B: Exhaust Catalytic Converter**).

IMPORTANT: do not forget to carry out the programming needed for the vehicle to operate correctly after connecting the battery (refer to **Section 80A**).

GETtheMANUALS.org

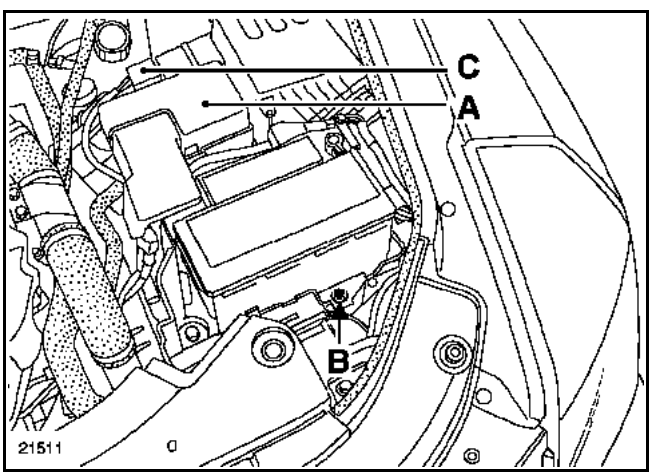
REMOVAL

In the engine compartment

Open the bonnet and remove:
– the engine cover plates,
– fuse box cover (A),

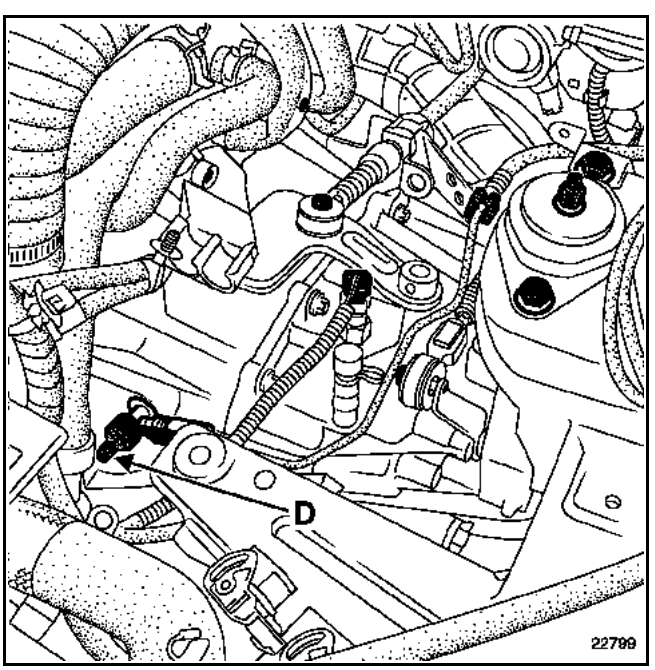
Disconnect the battery.

Remove:
– the battery, bolt (B),
– the connections (C) on the air unit,



Drain the brake fluid reservoir until the fluid level is below the level of the master cylinder supply opening.

Open bleed (D) on the slave cylinder side and pump the clutch pedal two or three times keeping the pedal in your hand (this enables emptying of the master cylinder and the pipe).



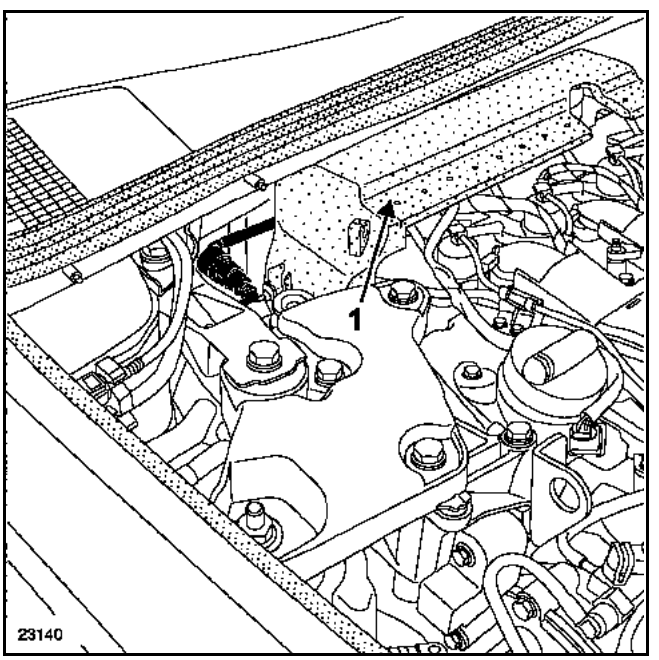
In the passenger compartment

Disconnect the master cylinder ball joint from the clutch pedal.

Engine compartment (contd)

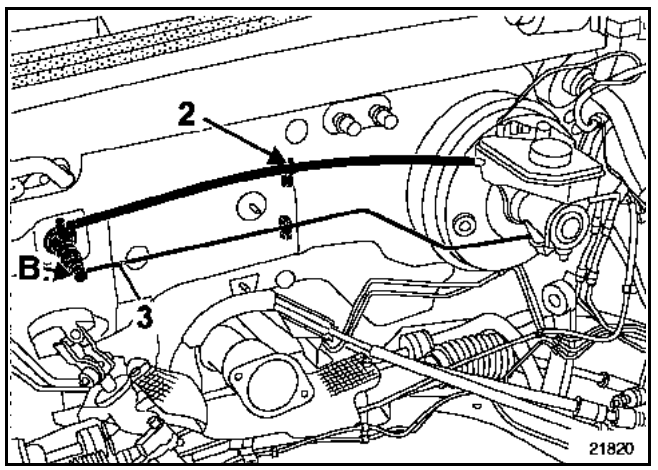
Remove rubber rail protector (1) (see **Section 13B: Diesel injection Rail Protector**).

THE RAIL PROTECTOR PERFORMS A SAFETY FUNCTION AND REQUIRES PARTICULAR ATTENTION WHEN BEING FITTED.



GETtheMANUALS.org

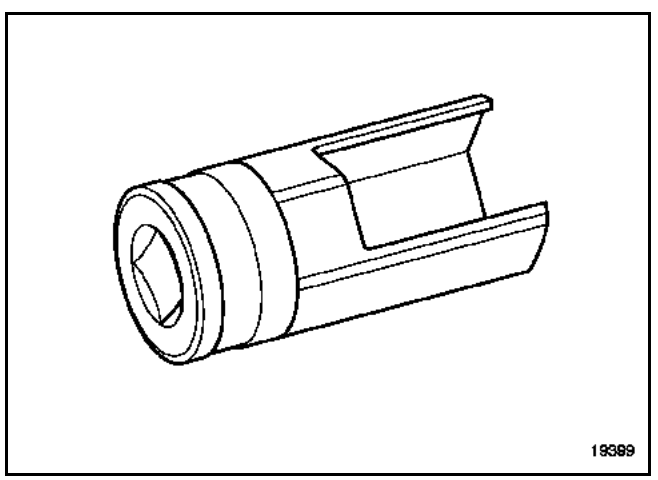
Unclip the hose connecting the brake fluid reservoir and the master cylinder at (2).



Place a cloth under the master cylinder.

Release clutch control pipe retaining clip (3) at (B) and remove it.

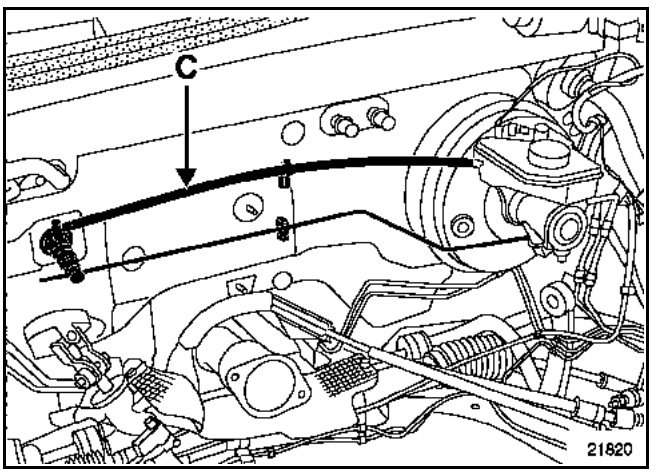
Remove the master cylinder from the bulkhead by turning it one quarter of a turn clockwise (bayonet type mounting) using tool **Emb. 1596**.



Remove master cylinder take-off hose (C).

REFITTING

Check the condition of the seals.



Proceed in the reverse order to removal.

In the passenger compartment

Connect the master cylinder ball joint to the clutch pedal.

NOTE: remove the clutch pedal sensors to position them (see **Section 37A: Mechanical components control Clutch Pedal**).

To refit the rail protector (see **Section 13B: Diesel Injection: Rail Protector**).

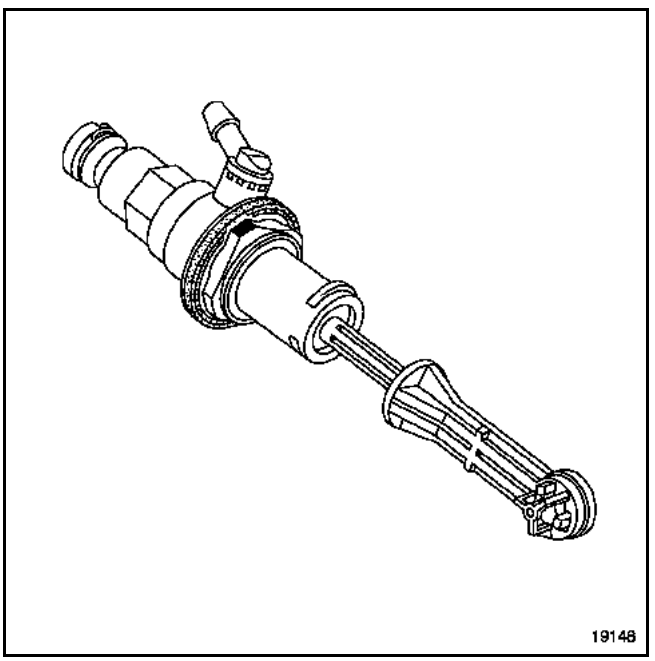
IF THE NOTES IN SECTION 13B ARE NOT ADHERED TO THIS COULD HAVE SERIOUS CONSEQUENCES ON SAFETY CONDITIONS.

NOTE: lubricate the clutch master cylinder supply hose end (C) with brake fluid to enable the brake fluid reservoir to be fitted to the take-off pipe.

GETtheMANUALS.org

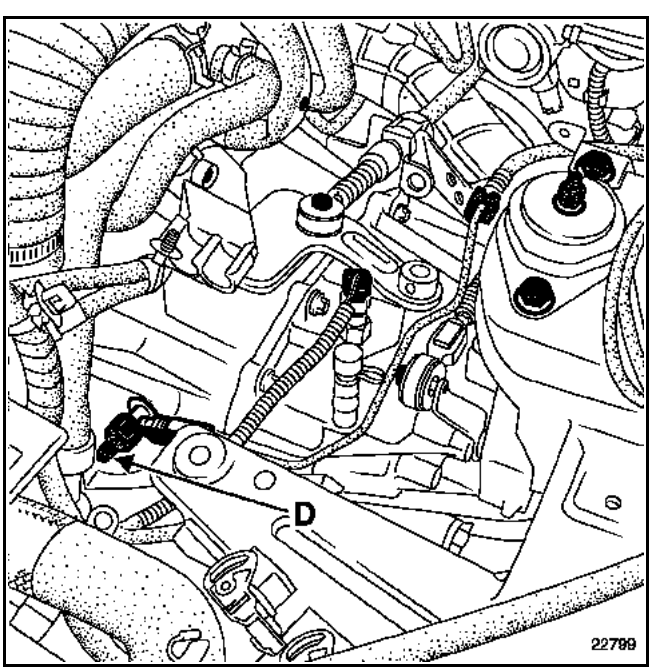
CAUTION: do not use the take-off pipe as support when fitting.

The master cylinder is fitted with a foolproofing device. There is only one possible position.



Add brake fluid to the reservoir.

Bleed the hydraulic circuit:
– remove the bleed cap,
– connect a pipe linked to a reservoir containing brake fluid to opening (D),



– install the bleeding device onto the brake fluid reservoir,
– operate the bleeding device,
– wait until the air is completely expelled from the hydraulic circuit.

Top up the brake fluid.

Check that the clutch system is operating correctly.

IMPORTANT: do not forget to carry out the programming needed for the vehicle to operate correctly after connecting the battery (refer to **Section 80A**).

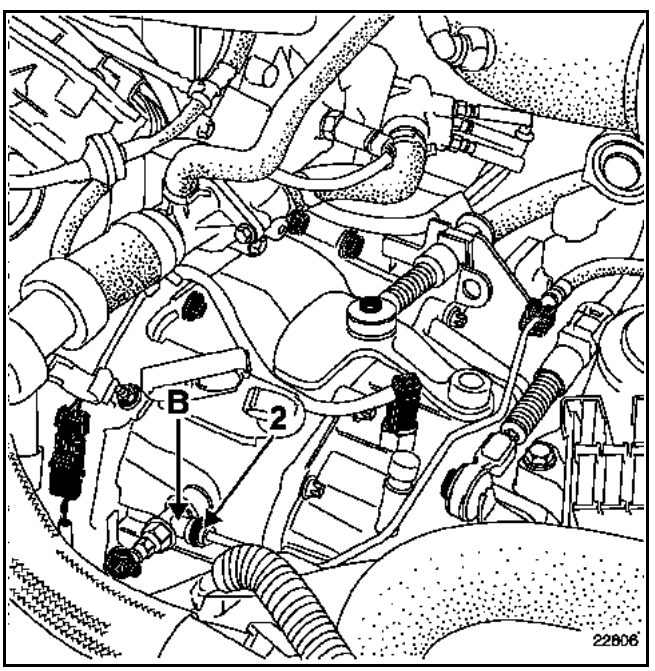
GETtheMANUALS.org

TIGHTENING TORQUE (in daNm)	
Retaining bolt of the slave cylinder on the clutch housing	0.9

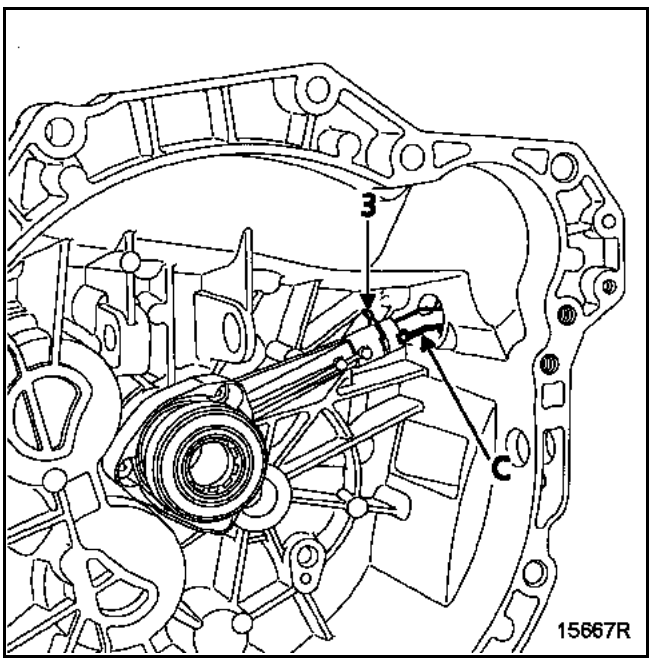
REMOVAL

The clutch slave cylinder can only be removed after the gearbox has been removed.

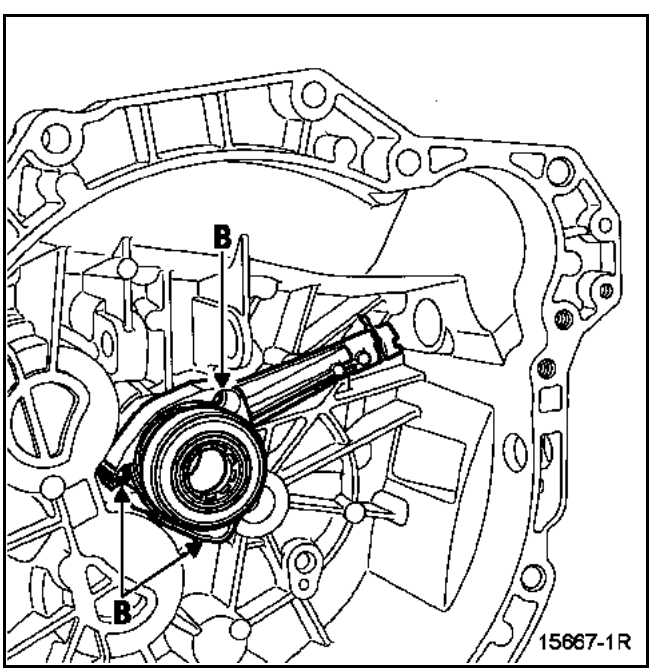
Disconnect the master-slave connecting pipe by releasing clip (2) located on union (B).



Remove:
– the union (C) of the clutch slave cylinder, by removing clip (3),



– the three slave cylinder mounting bolts (B) then remove it.



WARNING: never operate the system when the slave cylinder is removed (even if it is connected to the clutch pedal). There is a risk that the hydraulic piston and the stop will be ejected from the slave cylinder.

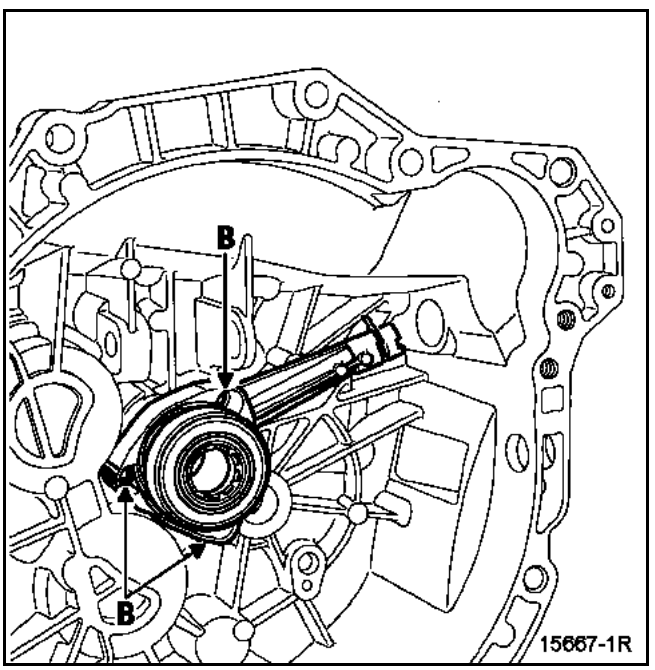
GETtheMANUALS.org

REFITTING

Check the condition of the seals.

Proceed in the reverse order to removal.

Torque tighten the two slave cylinder mounting bolts (B) to **0.9 daNm**.

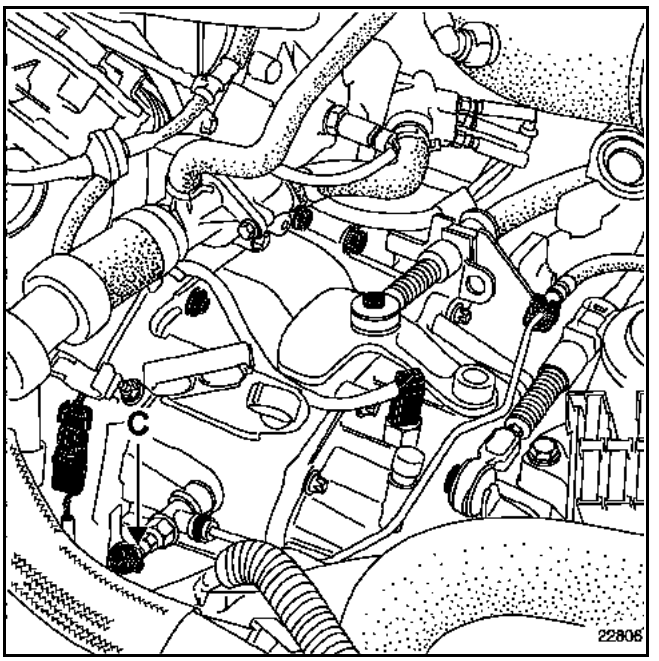


NOTE: to avoid damaging the slave cylinder, do not coat the gearbox output shaft with grease.

NOTE: to avoid leaks, replace the slave cylinder after replacing the clutch mechanism.

Add brake fluid to the reservoir.

Bleed the hydraulic circuit:
– connect a pipe linked to a reservoir containing brake fluid to opening (C),
– fit the bleeding device,
– operate the bleeding device,
– wait until the air is completely expelled from the hydraulic circuit.



Top up the brake fluid reservoir.

Check that the clutch system is operating correctly.

IMPORTANT: do not forget to carry out the programming needed for the vehicle to operate correctly after connecting the battery (refer to **Section 80A**).

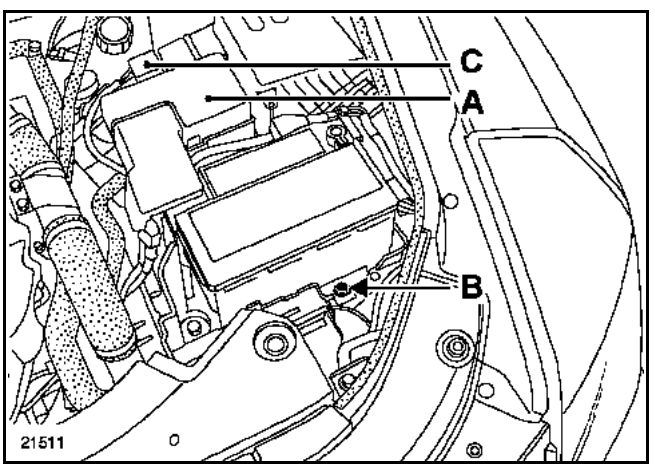
GETtheMANUALS.org

REMOVAL

Open the bonnet and remove:
– the engine cover plates,
– the fuse box cover (A),

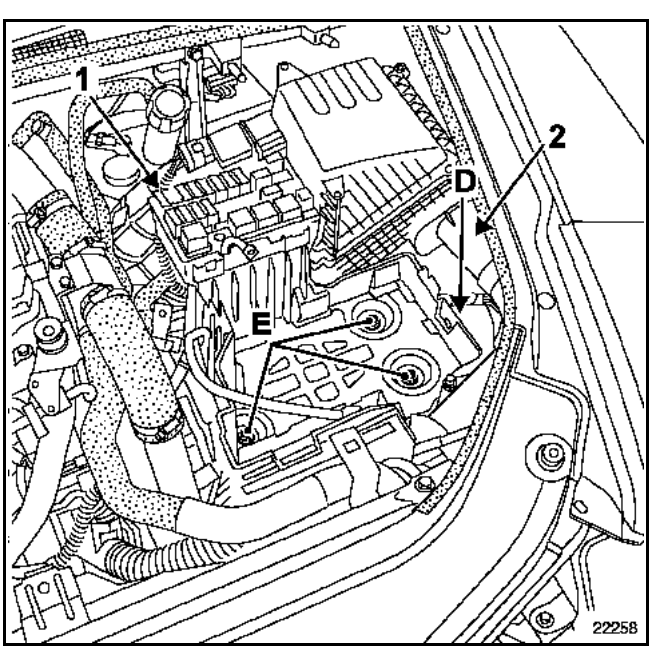
Disconnect the battery.

Remove:
– the battery, bolt (B),
– the connections (C) on the air unit (only on **G9T engines**),



– the fuses and the fuse holder,
– the battery mounting fuse box,
– the electric wiring harness on the battery mounting at (D),

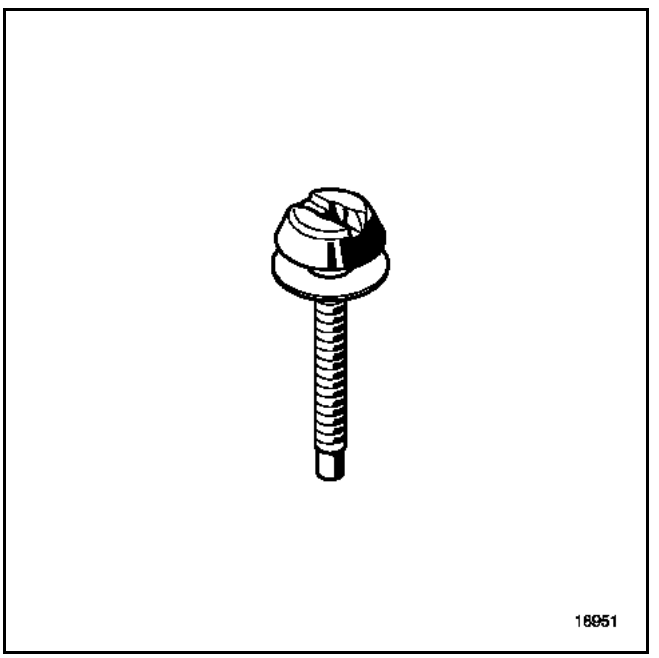
Release:
– the air duct (1),
– the air duct (2) with the air filter unit,



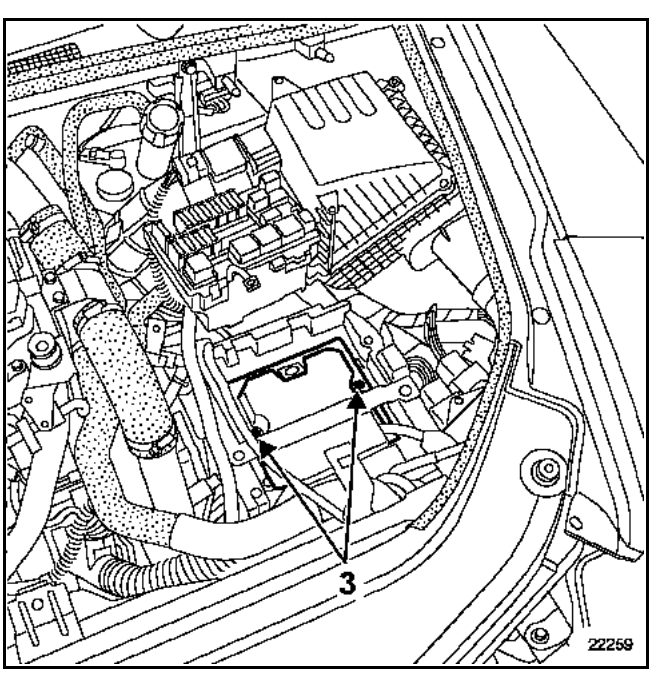
Remove the battery tray bolt (E).

To do this, drill out the three tamperproof bolts using a 5 mm diameter drill bit in the bolt shaft.

Remove the bolt using tool **Mot. 1372**.



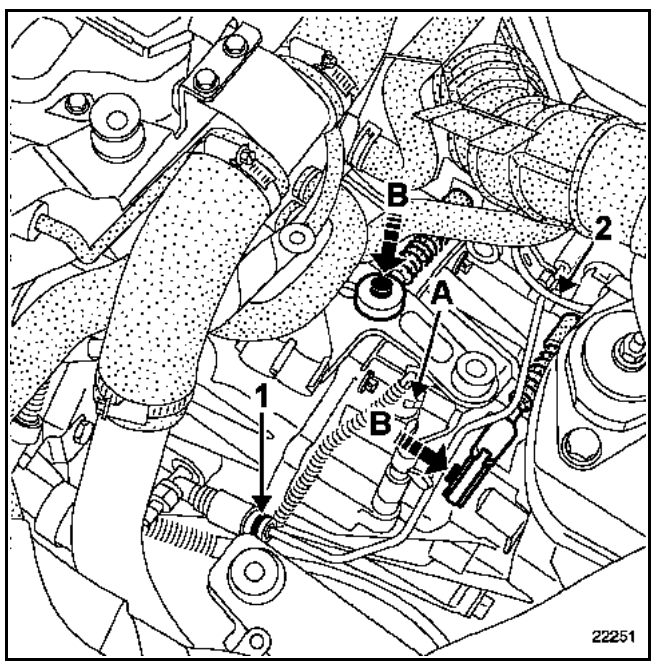
Release:
– the computer (nuts 3) to remove the computer connectors,
– the electric wiring harness on the computer tray to remove it.



GETtheMANUALS.org

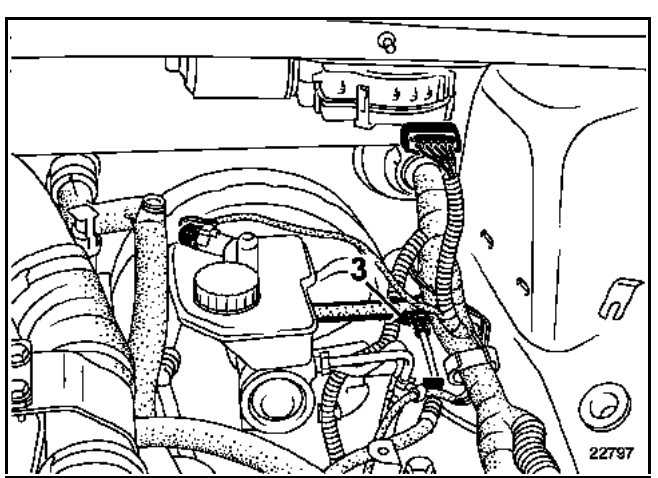
Drain the brake fluid reservoir with a syringe until the fluid level is below the level of the master cylinder supply opening.

Connect a pipe linked to a reservoir to opening (A) . Open bleed screw on the slave cylinder side and pump the clutch pedal two or three times keeping the pedal in your hand (this helps to empty the master cylinder and the pipe).



Place a cloth under the slave cylinder supply openings. Disconnect the brake fluid reservoir pipe. Fit plugs.

Release the master-slave connector pipes retaining clips (1, 2 and 3) on the master and slave cylinders.



Place a cloth under each opening, then disconnect the pipe.

Carefully remove the master-slave connecting pipe taking care not to damage anything.

REFITTING

Check the condition of the seals.

Proceed in the reverse order to removal.

WARNING

When refitting:
– do not damage the various pipes,
– make sure they are connected correctly,
– position the various mounting clips correctly.

Add brake fluid to the reservoir.

Bleed the hydraulic circuit:
– connect a pipe linked to a reservoir containing brake fluid to opening (C),
– install the bleeding device onto the brake fluid reservoir,
– operate the bleeding device,
– open the bleed screw,
– wait until the air is completely expelled from the hydraulic circuit.

Top up the brake fluid reservoir.

Check that the clutch system is operating correctly.

IMPORTANT: do not forget to carry out the programming needed for the vehicle to operate correctly after connecting the battery (refer to **Section 80A**).

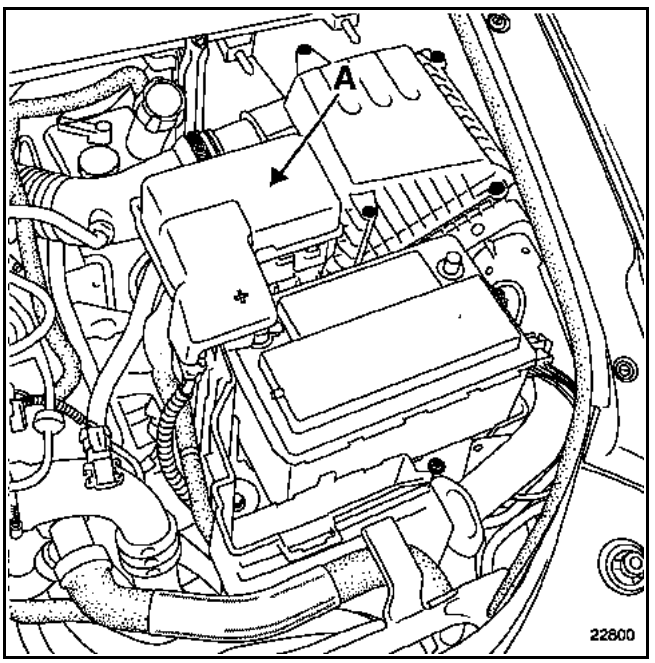
GETtheMANUALS.org

REMOVAL

Place the vehicle on a lift.

In the engine compartment

Open the bonnet and remove:
– the engine cover plates,
– the fuse box cover (A),

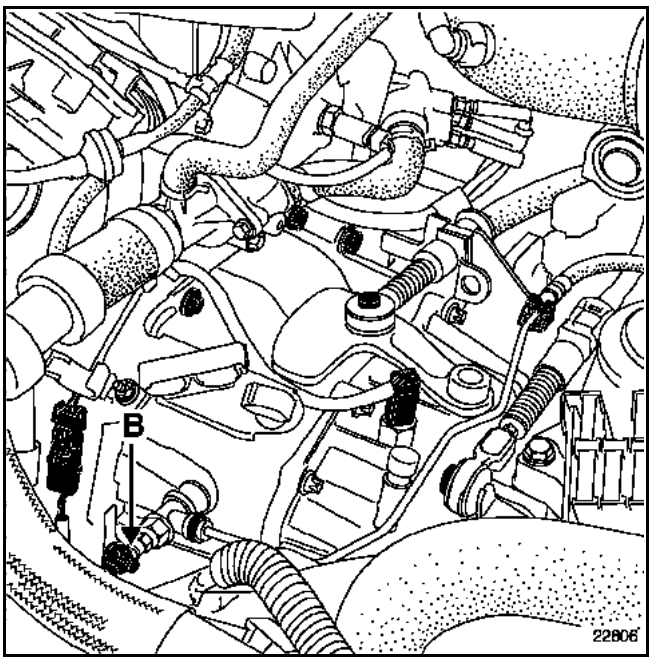


Disconnect the battery.

Drain the brake fluid reservoir using a syringe until the fluid level is below the level of the master cylinder supply opening.

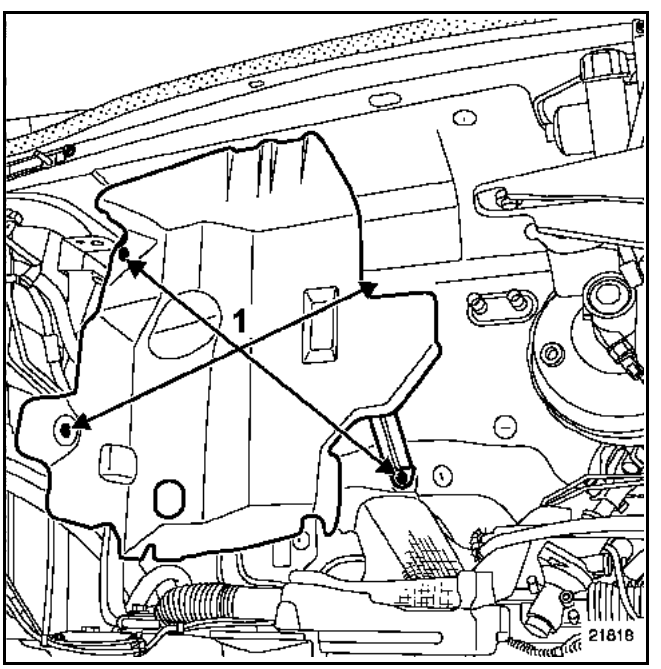
Connect a pipe linked to a reservoir to opening (B).

Open the bleed screw on the slave cylinder side and pump the clutch pedal two or three times keeping the pedal in your hand (this enables emptying of the master cylinder and the pipe).



Remove:
– the catalytic converter (see **Section 19B: Exhaust: Catalytic Converter**),
– the turbocharger (see **Section 12B: Turbocharging: Turbocharger**),
– the heat shield.

Remove the engine heat shield mountings (1).

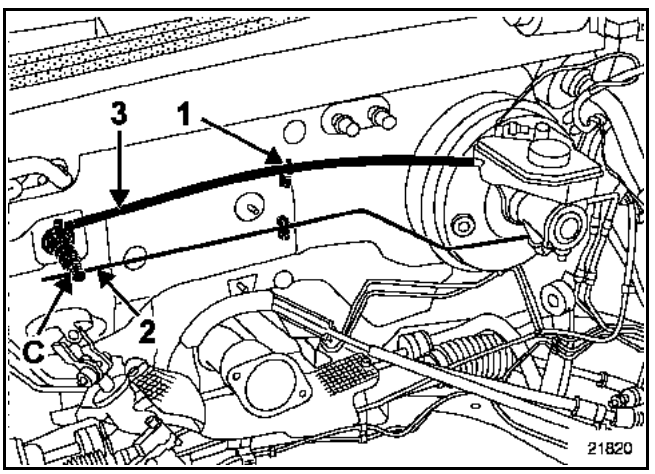


GETtheMANUALS.org

In the passenger compartment

Disconnect the master cylinder ball joint from the clutch pedal.

Engine compartment (contd)

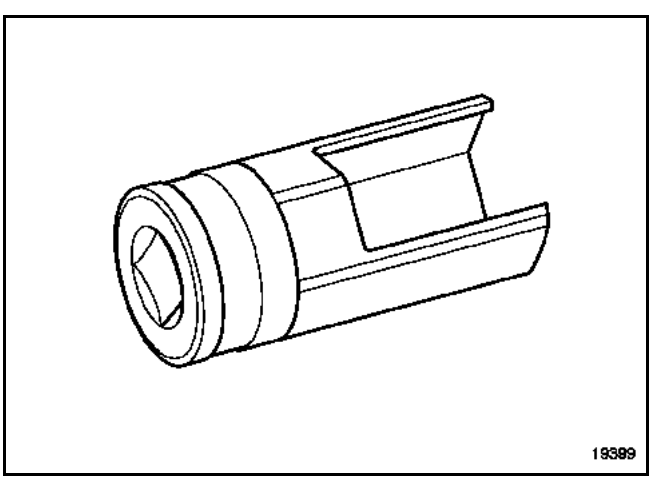


Unclip the master cylinder supply hose at (1).

Place a cloth under the master cylinder.

Release clutch control pipe (2) retaining clip at (C) and remove it.

Remove the master cylinder from the bulkhead by turning it one quarter of a turn clockwise (bayonet type mounting) using tool **Emb. 1596**.



Remove the master cylinder supply hose (3).

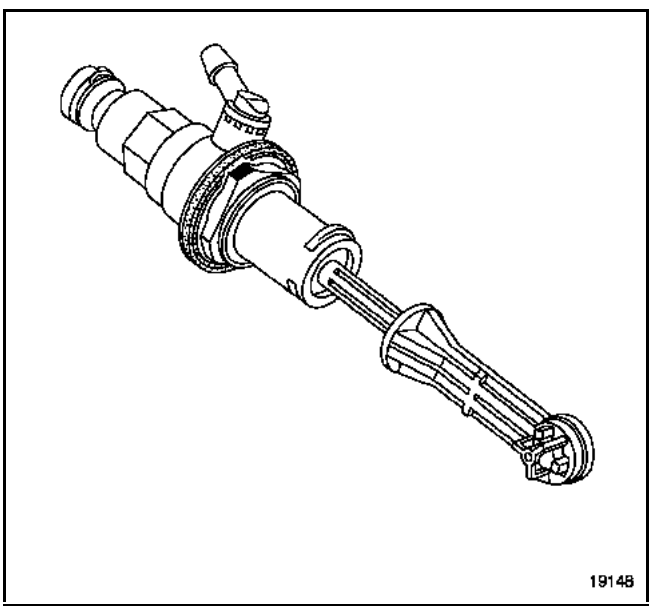
REFITTING

Proceed in the reverse order to removal.

NOTE: lubricate the two clutch master cylinder supply hose ends (4) with brake fluid to fit the brake fluid reservoir to the take-off pipe.

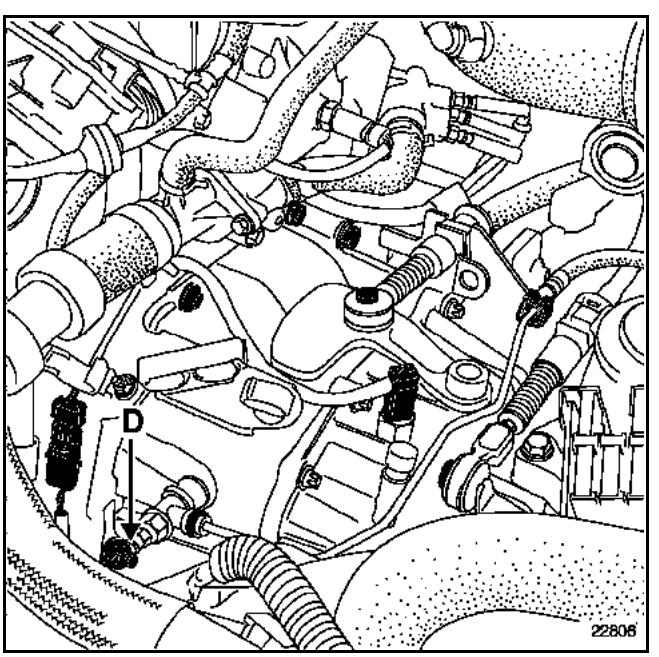
CAUTION: do not use the take-off pipe as support when fitting.

The master cylinder is fitted with a foolproofing device. There is only one possible position.



Add brake fluid to the reservoir.

Bleed the hydraulic circuit:
– remove the bleed cap,
– connect a pipe linked to a reservoir containing brake fluid to opening (D),



GETtheMANUALS.org

– install the bleeding device onto the brake fluid reservoir,
– operate the bleeding device,
– wait until the air is completely expelled from the hydraulic circuit.

Top up the brake fluid.

Check that the clutch system is operating correctly.

In the passenger compartment

Connect the master cylinder ball joint to the clutch pedal.

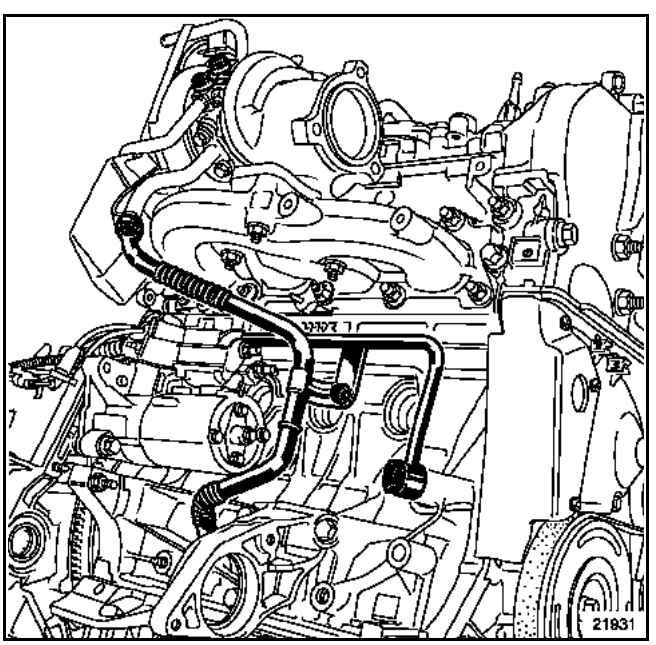
NOTE: remove the clutch pedal sensors to position them (see **Section 37A: Mechanical components control: Clutch Pedal**).

Engine compartment (contd)

Fit:
– the heat shield,
– the turbocharger.

IMPORTANT

Fit:
– the turbocharger to the exhaust manifold,
– the oil supply pipe on the turbocharger,
– the return pipe to the cylinder block.



Tighten the turbocharger/air exchanger clip to position the turbocharger.

NOTE: check the turbocharger sealing (see **Section 12A: Turbocharging:Turbocharger**).

Position the catalytic converter by tightening the catalyser struts and then tightening the turbocharger and exhaust pipe clamps. (see **Section 19B: Exhaust: Catalytic Converter**).

IMPORTANT: do not forget to carry out the programming needed for the vehicle to operate correctly after connecting the battery (refer to **Section 80A**).

GETtheMANUALS.org

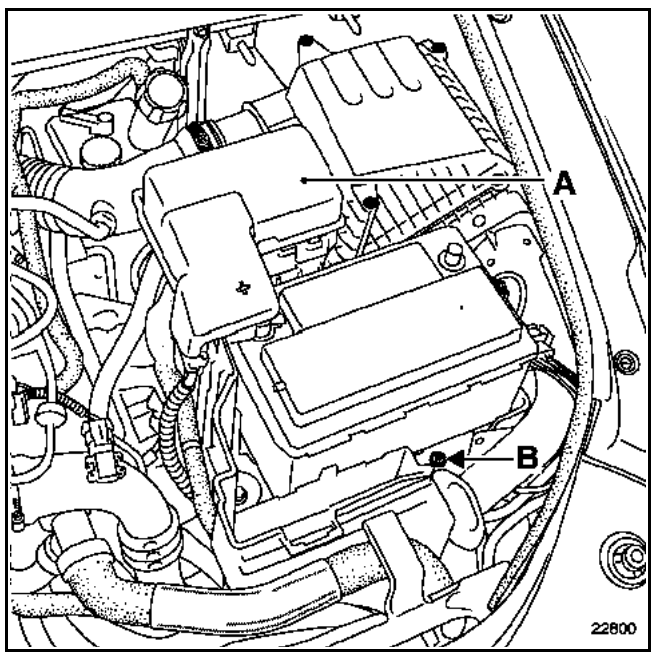
REMOVAL

Place the vehicle on a lift.

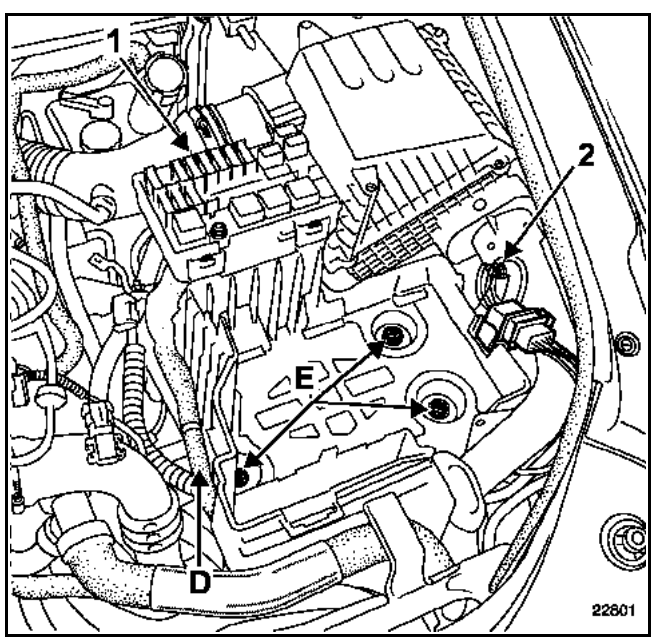
Open the bonnet and remove:
– the engine cover plates,
– the fuse box cover (A),

Disconnect the battery.

Remove:
– the battery bolt (B),



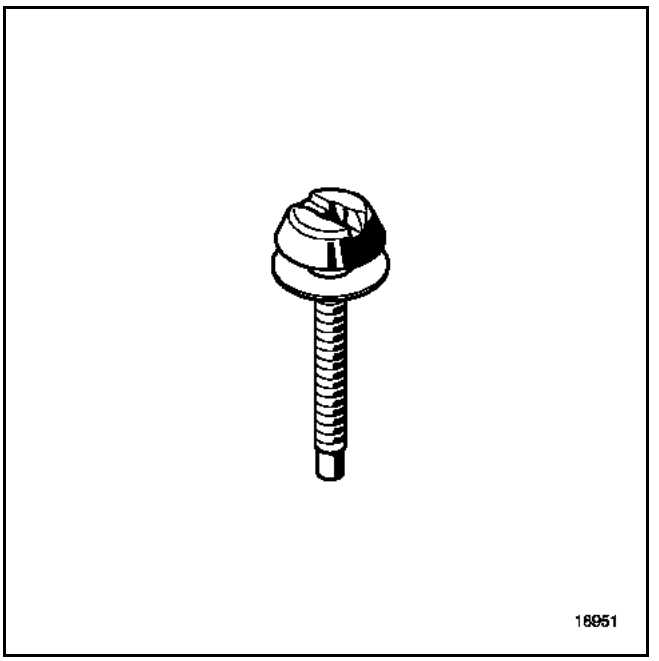
– the battery mounting fuse box,
– the electric wiring harness on the battery mounting at (D),
– the air duct (1) and (2),



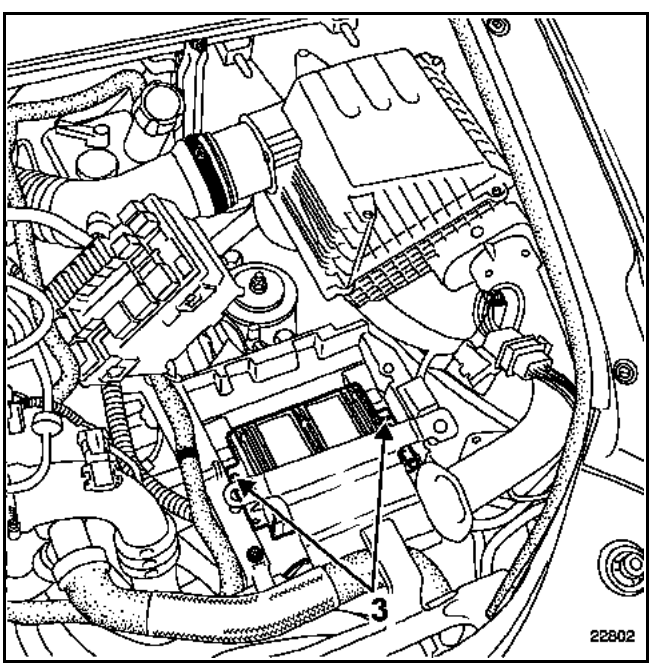
– the battery mounting bolt (E).

To do this, drill out the three tamperproof bolts using a 5 mm diameter drill bit in the bolt shaft.

Remove the bolt using tool Mot. 1372.



Release:
– the computer (nuts 3) to remove the computer connectors,
– the electric wiring harness on the computer tray to remove it.

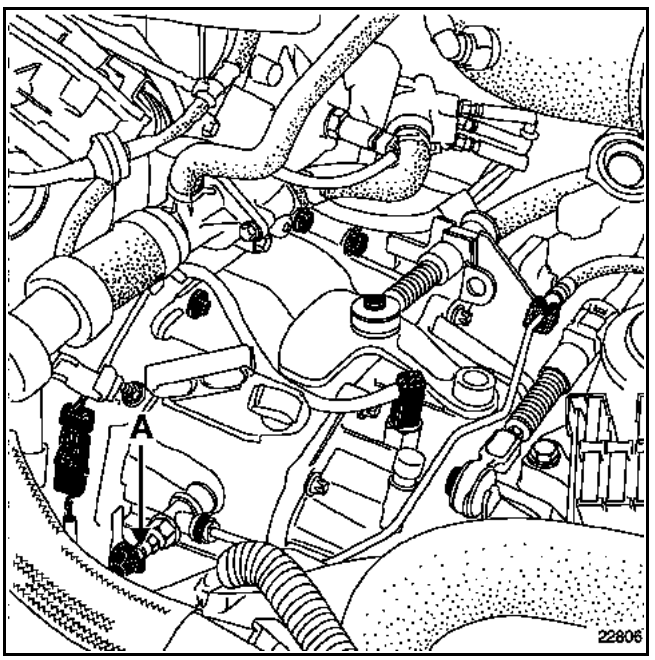


GETtheMANUALS.org

Drain the brake fluid reservoir using a syringe until the fluid level is below the level of the master cylinder supply opening.

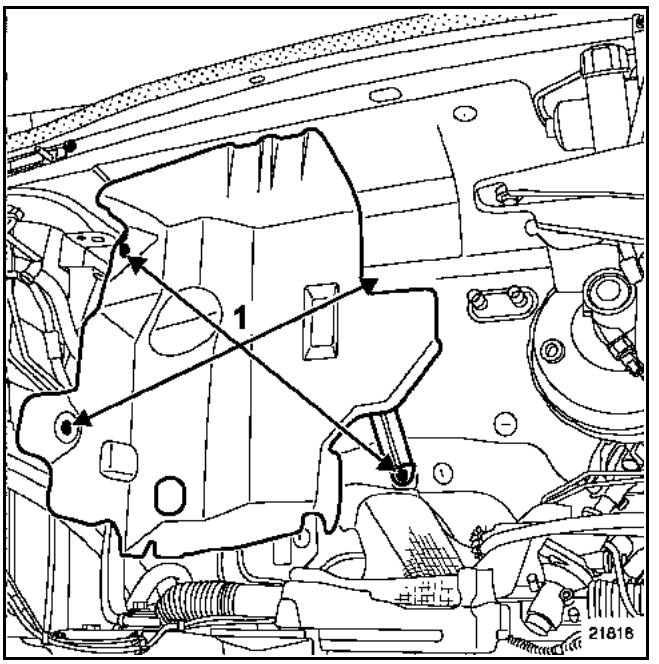
Connect a pipe linked to a reservoir to opening (A).

Open the bleed screw on the slave cylinder side and pump the clutch pedal two or three times keeping the pedal in your hand (this enables emptying of the master cylinder and the pipe).



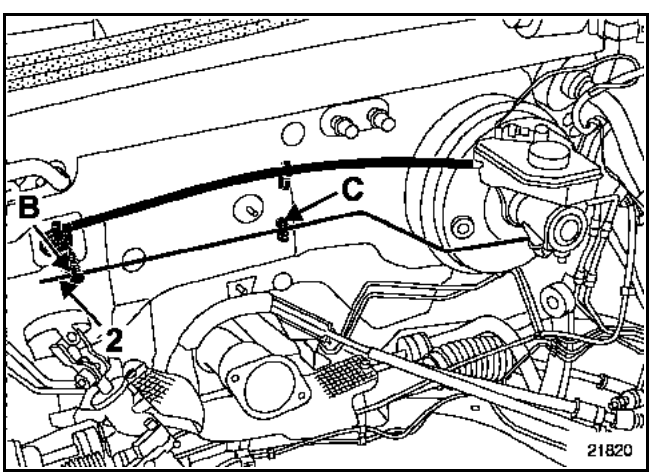
Remove:
– the catalytic converter (see **Section 19B: Exhaust: Catalytic Converter**),
– the turbocharger (see **Section 12B: Turbocharging: Turbocharger**).
– the heat shield.

Remove the engine heat shield mountings (1).



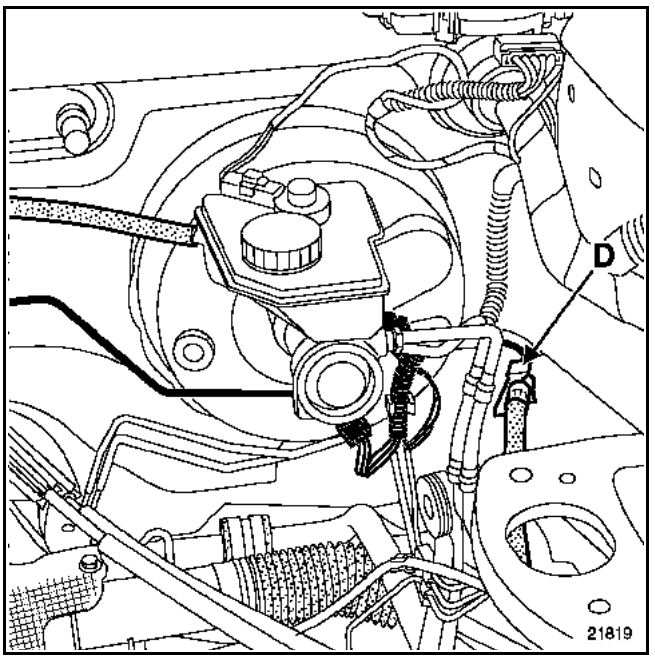
Place a cloth under the master cylinder.

Release:
– the clutch control pipe from the clip at (B),
– clutch control pipe (2) retaining clip at (C) and remove it.



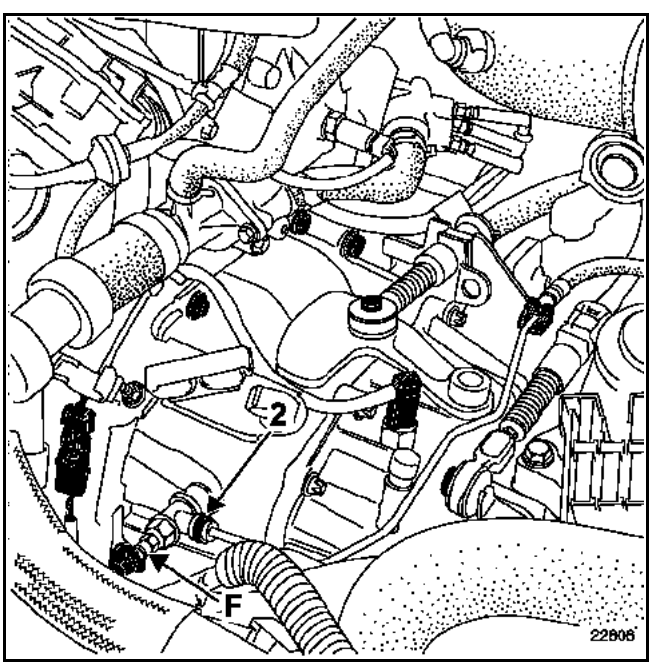
GETtheMANUALS.org

Release the clutch control pipe from the clip at (D).



Place a cloth under each opening, then disconnect the pipe.

Release the clip at (2).



Carefully remove the master-slave connecting pipe taking care not to damage anything.

REFITTING

Check the condition of the seals.

Proceed in the reverse order to removal.

WARNING:

When refitting:
– do not damage the various pipes,
– take care to connect them correctly,
– position the various mounting clips correctly.

Add brake fluid to the reservoir.

Bleed the hydraulic circuit:
– Connect a pipe linked to a tank containing brake fluid to opening (F),
– install the bleeding device onto the brake fluid reservoir,
– operate the bleeding device,
– open the bleed screw,
– wait until the air is completely expelled from the hydraulic circuit.

Top up the brake fluid reservoir.

Check that the clutch system is operating correctly.

IMPORTANT: do not forget to carry out the programming needed for the vehicle to operate correctly after connecting the battery (refer to **Section 80A**).

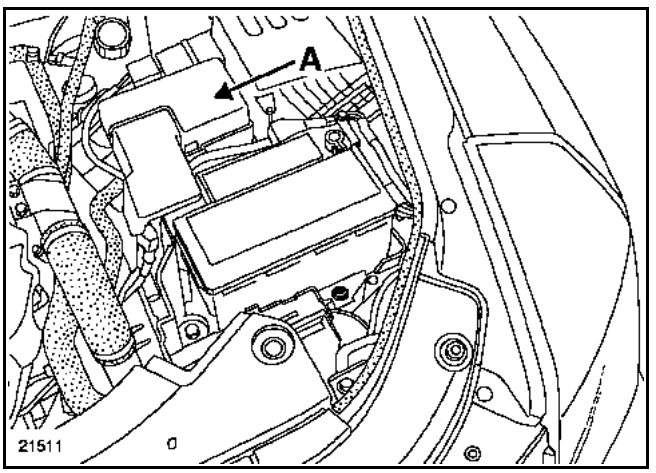
GETtheMANUALS.org

REMOVAL

In the engine compartment

Open the bonnet and remove:
– the engine cover plates,
– the fuse box cover (A),

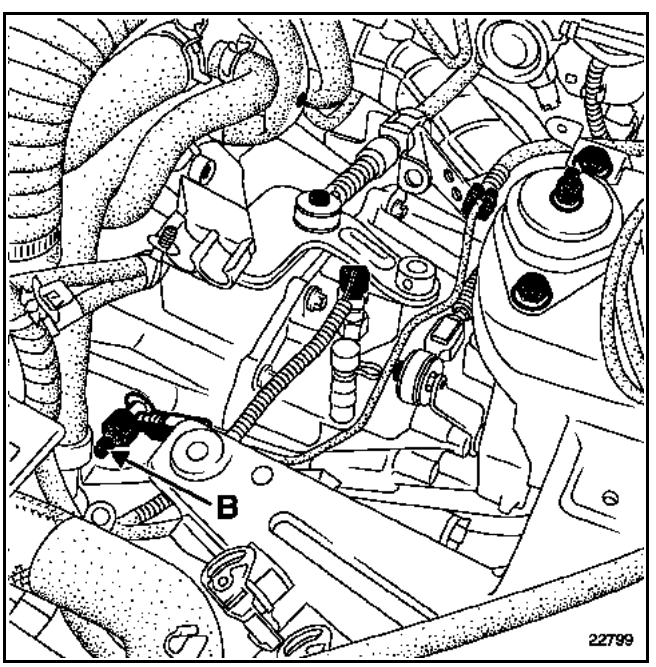
Disconnect the battery.



Drain the brake fluid reservoir using a syringe until the fluid level is below the level of the master cylinder supply opening.

Connect a pipe linked to a tank to opening (B).

Open the bleed screw on the slave cylinder side and pump the clutch pedal two or three times keeping the pedal in your hand (this enables emptying of the master cylinder and the pipe).



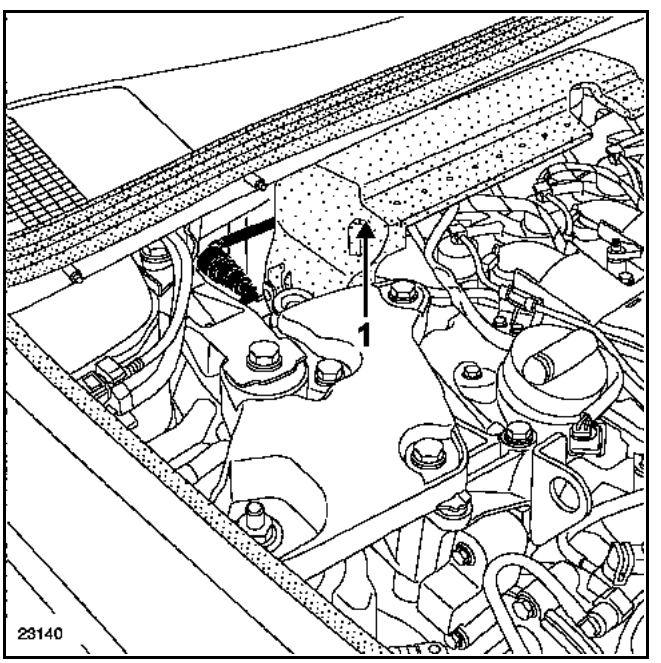
In the passenger compartment

Disconnect the master cylinder ball joint from the clutch pedal.

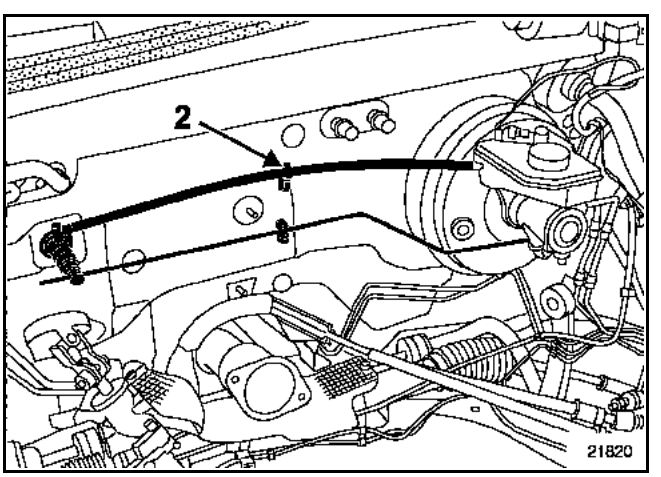
Engine compartment (contd)

Remove rubber rail protector (1) (see **Section 13B: Diesel injection Rail Protector**).

THE RAIL PROTECTOR PERFORMS A SAFETY FUNCTION AND REQUIRES PARTICULAR ATTENTION WHEN BEING FITTED.



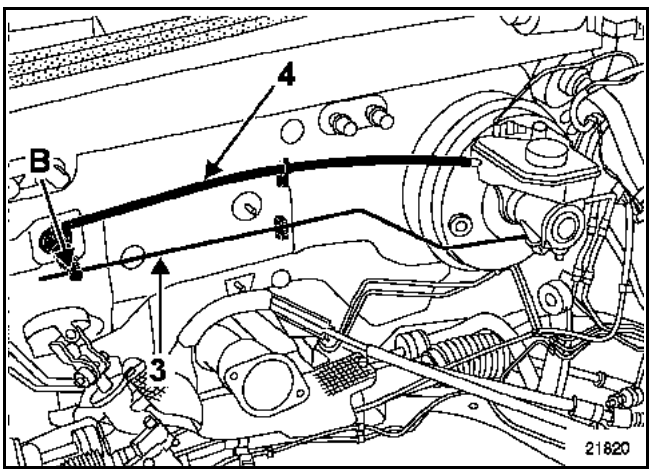
Unclip the hose connecting the master cylinder brake fluid reservoir at (2).



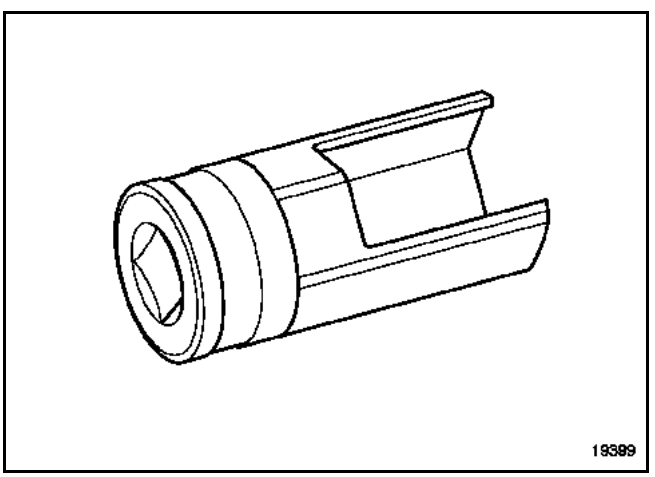
GETtheMANUALS.org

Place a cloth under the master cylinder.

Release clutch control pipe mounting clip at (B) and remove it.



Remove the master cylinder from the bulkhead by turning it one quarter of a turn clockwise (bayonet type mounting) using tool **Emb. 1596**.



Remove the master cylinder supply hose (4).

REFITTING

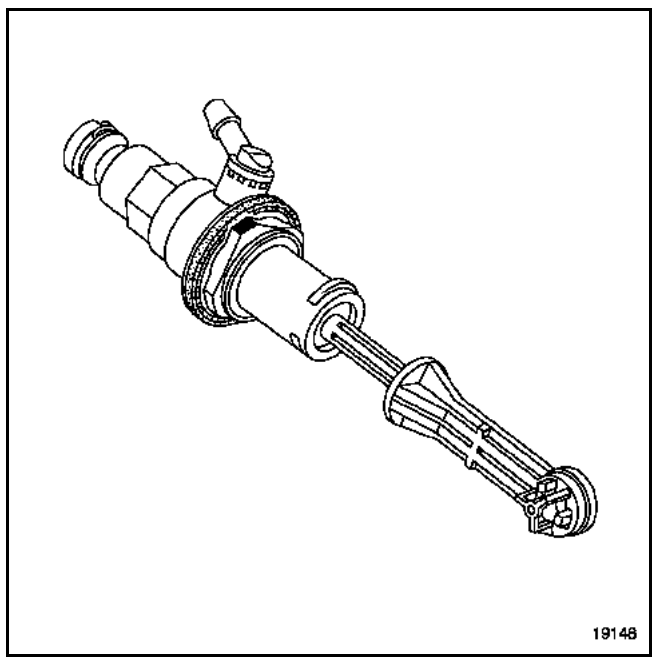
To refit the rail protector (see **Section 13B: Diesel Injection Rail Protector**).

IF THE NOTES IN SECTION 13B ARE NOT ADHERED TO THIS COULD HAVE SERIOUS CONSEQUENCES ON SAFETY CONDITIONS.

NOTE: lubricate the clutch master cylinder supply hose end (4) with brake fluid to facilitate fitting the brake fluid reservoir to the take-off pipe.

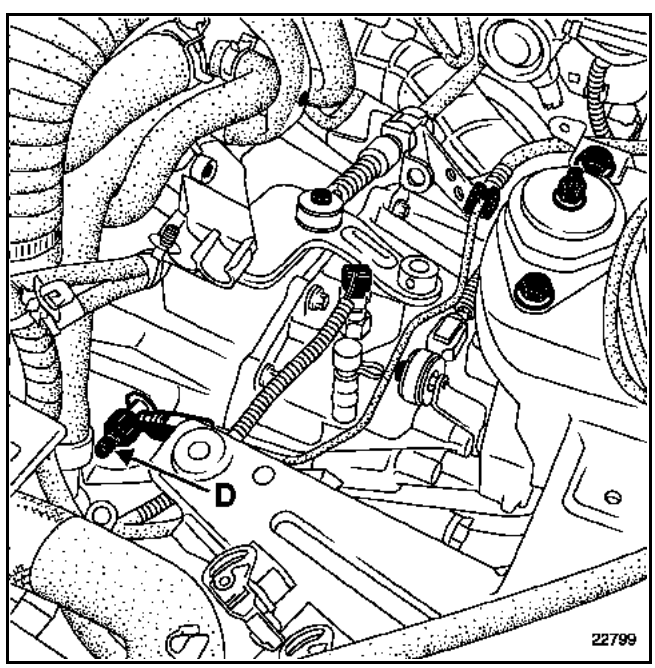
CAUTION: do not use the take-off pipe as support when fitting.

The master cylinder is fitted with a foolproofing device. There is only one possible position.



Add brake fluid to the reservoir.

Bleed the hydraulic circuit:
– remove the bleed cap,
– connect a pipe linked to a reservoir containing brake fluid to opening (D),



GETtheMANUALS.org

– install the bleeding device onto the brake fluid reservoir,
– operate the bleeding device,
– wait until the air is completely expelled from the hydraulic circuit.

Top up the brake fluid.

Check that the clutch system is operating correctly.

IMPORTANT: do not forget to carry out the programming needed for the vehicle to operate correctly after connecting the battery (refer to **Section 80A**).

GETtheMANUALS.org

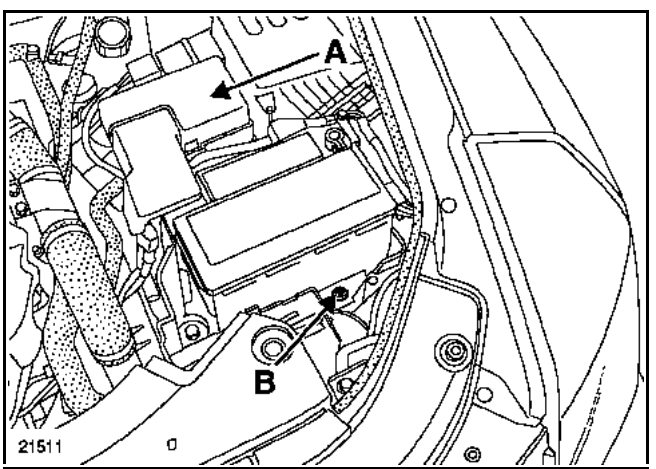
REMOVAL

Place the vehicle on a lift.

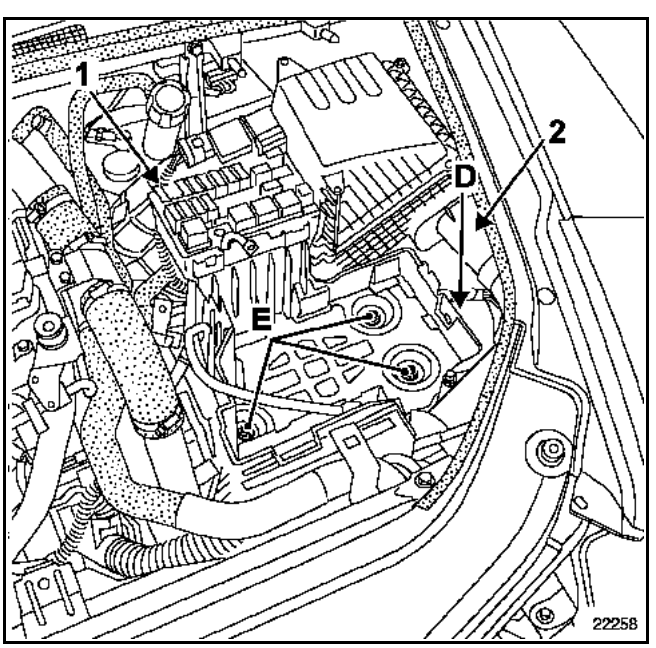
Open the bonnet and remove:
– the engine cover plates,
– the fuse box cover (A),

Disconnect the battery.

Remove:
– the battery bolt (B),



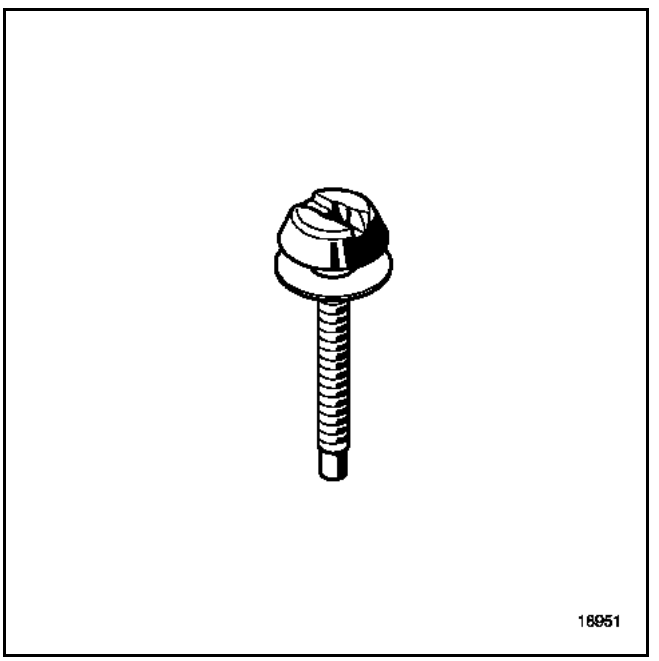
– the battery mounting fuse box,
– the electric wiring harness on the battery mounting at (D),
– the air duct (1) and (2),



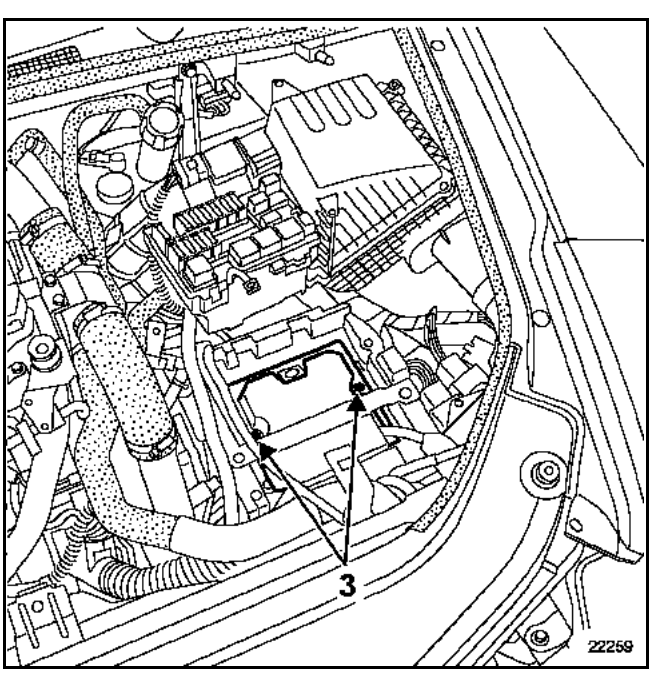
– the battery mounting bolt (E).

To do this, drill out the three tamperproof bolts using a 5 mm diameter drill bit in the bolt shaft.

Remove the bolt using tool Mot. 1372.



Release:
– the computer (nuts 3) to remove the computer connectors,
– the electric wiring harness on the computer tray to remove it.

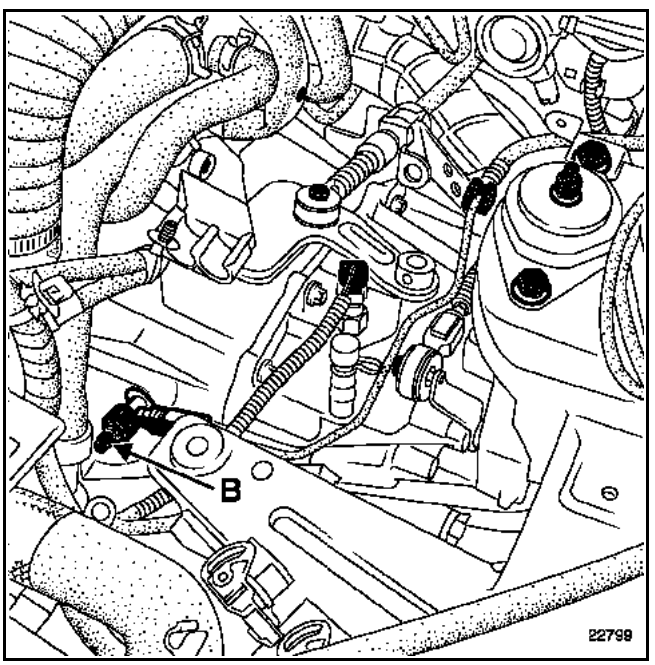


GETtheMANUALS.org

Drain the brake fluid reservoir using a syringe until the fluid level is below the level of the master cylinder supply opening.

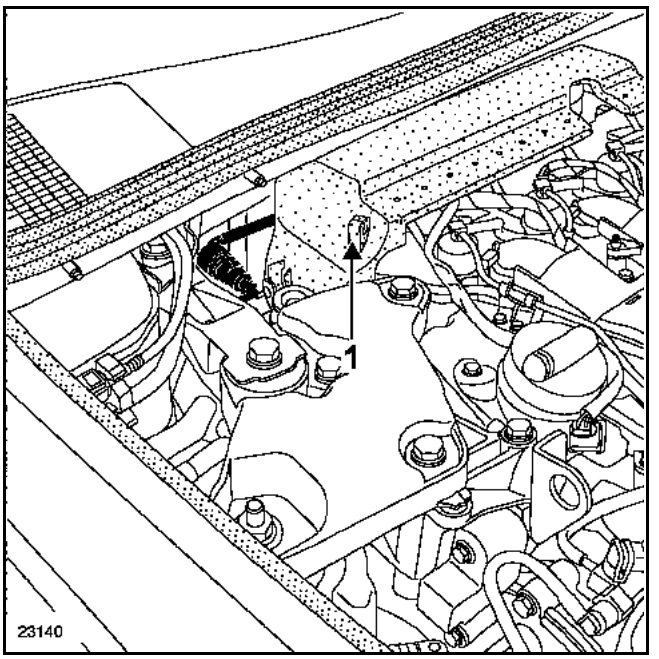
Connect a pipe linked to a tank to opening (B).

Open bleed on the slave cylinder side and pump the clutch pedal two or three times keeping the pedal in your hand (this enables emptying of the master cylinder and the pipe).



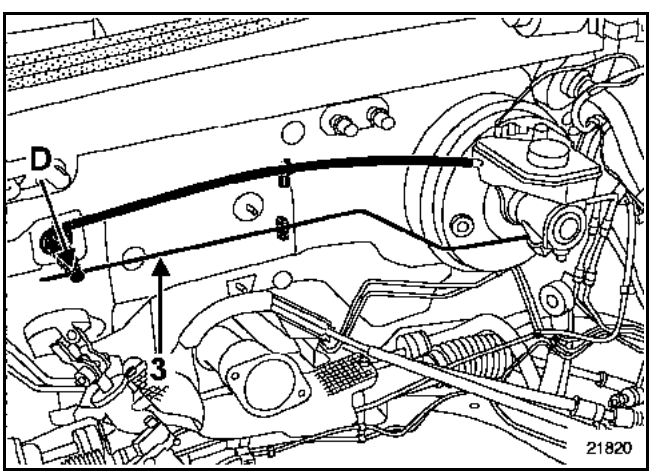
Remove rubber flap (1) (see **Section 13B: Diesel Injection Rail protector**).

THE RAIL PROTECTOR PERFORMS A SAFETY FUNCTION AND REQUIRES PARTICULAR ATTENTION WHEN BEING FITTED.



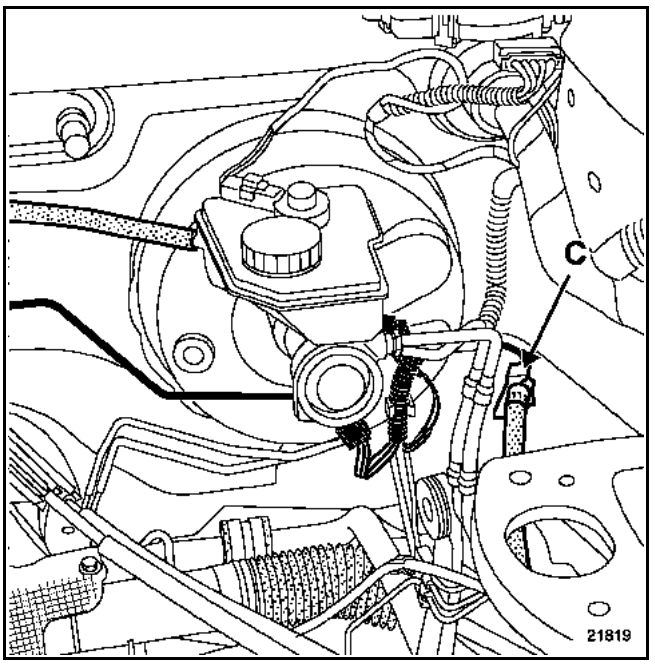
Place a cloth under the master cylinder.

Release clutch control pipe mounting clip at (B) and remove it.



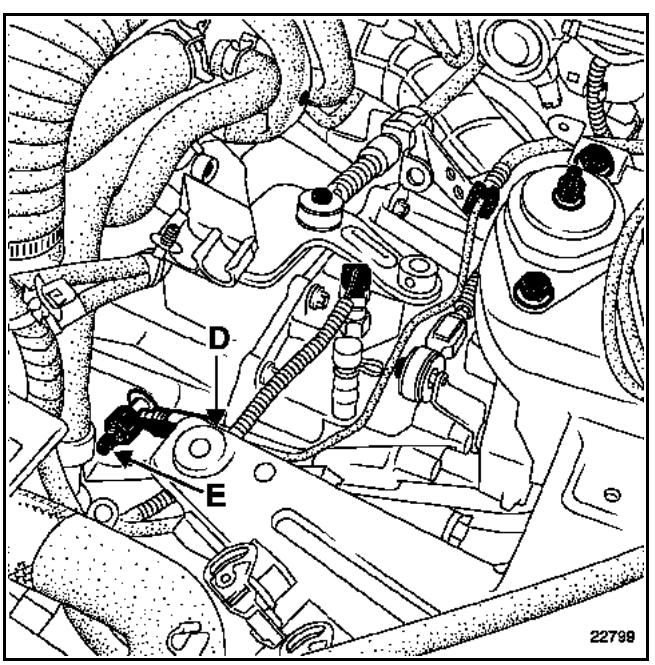
GETtheMANUALS.org

Release the clutch control pipe from the clip at (C).



Place a cloth under each opening, then disconnect the pipe.

Release the clip at (D).



Carefully remove the master-slave connecting pipe taking care not to damage anything.

REFITTING

Check the condition of the seals.

Proceed in the reverse order to removal.

WARNING

When refitting:
– do not damage the various pipes,
– take care to connect them correctly,
– position the various mounting clips correctly.

Add brake fluid to the reservoir.

Bleed the hydraulic circuit:
– connect a pipe linked to a reservoir containing brake fluid to opening (E),
– install the bleeding device onto the brake fluid reservoir,
– operate the bleeding device,
– open the bleed screw,
– wait until the air is completely expelled from the hydraulic circuit.

Top up the brake fluid reservoir.

Check that the clutch system is operating correctly.

IMPORTANT: do not forget to carry out the programming needed for the vehicle to operate correctly after connecting the battery (refer to **Section 80A**).

GETtheMANUALS.org

TIGHTENING TORQUE (in daNm)	
Plate nut	2.1

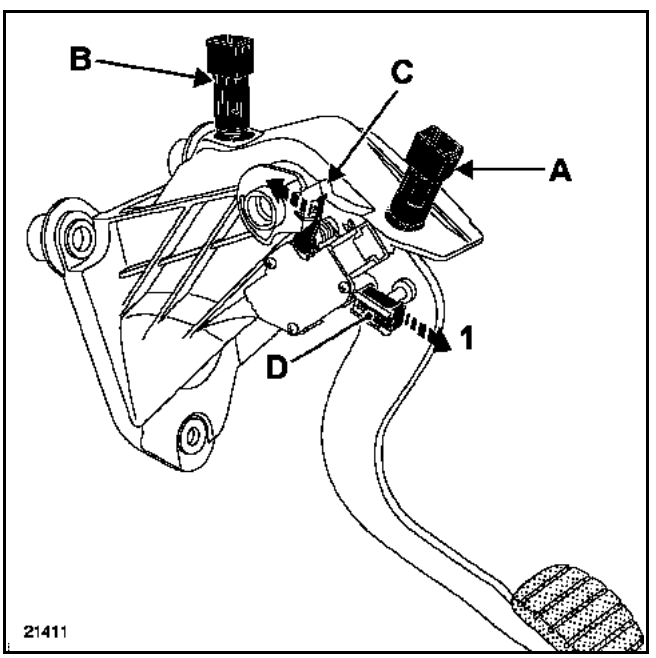
REMOVAL

Disconnect the battery.

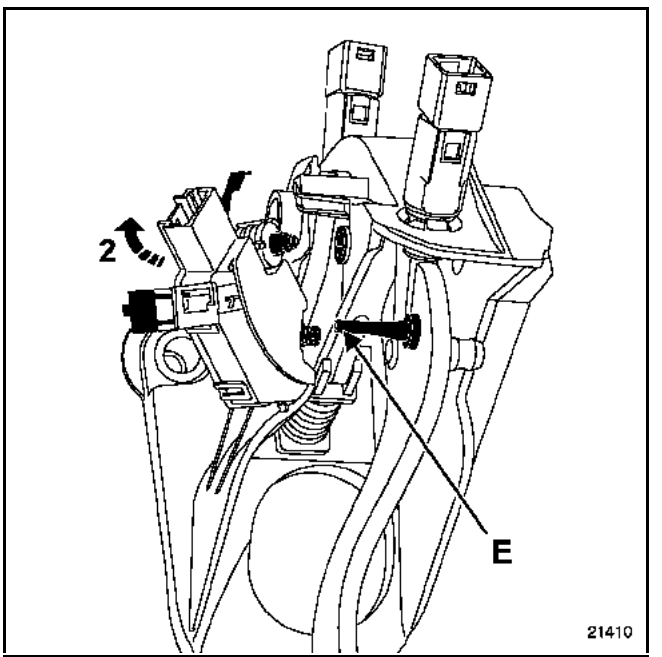
Remove the clutch master cylinder ball joint on the pedal.

Remove:
– grey switch (A) at the start of travel while making a quarter turn,
– sensor connectors (A),
– blue switch (B) at the start of travel while making a quarter turn,
– sensor connectors (B).

Unlock:
– the section linked to the pedal by moving bolt (C) and (1) and sliding it,
– the sensor body by moving bolt (D).



Tilt the sensor (2). Be careful not to break the lower mounting bracket (E).



GETtheMANUALS.org

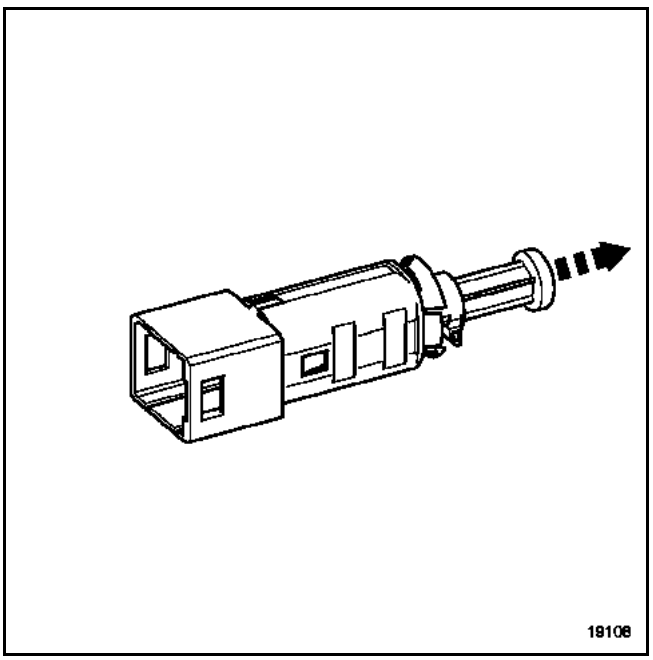
REFITTING

Proceed in the reverse order to removal.

Torque tighten the nuts to **2.1 daNm**.

NOTE: the clutch pedal sensors have an automatic adjustment function which adjusts according to the position of the pedal.

Before refitting the sensor, it is necessary to set its minimum position by pulling the piston.



REFITTING

Position the sensors in their housing and turn it one quarter turn clockwise.

Reconnect the clutch pedal switch connectors.

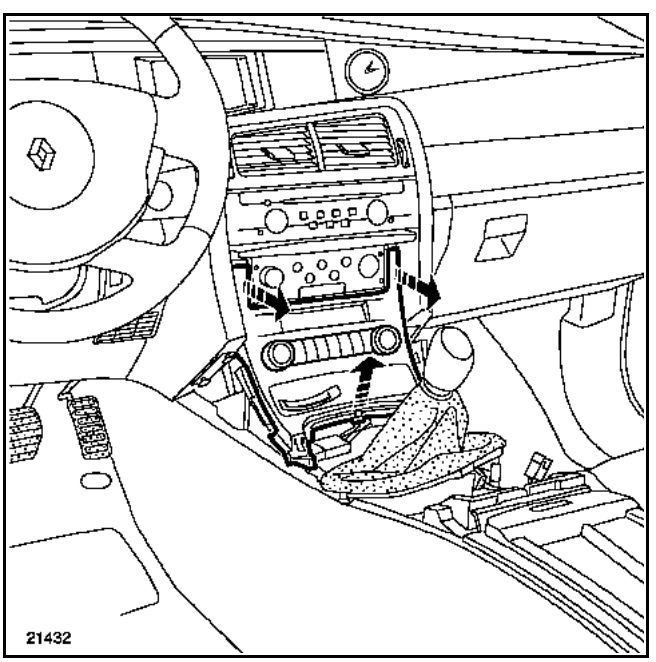
GETtheMANUALS.org

TIGHTENING TORQUES (in daNm)	
Plate nut	2.1
Yoke bolt	2.1
Steering column mounting bolt	2.1
Electric lock bolt	0.8
Lower shell bolt	0.2
Steering wheel bolt	4.4
Reinforcement plate bolts	2.1
Reinforcement plate nuts	2.1
Beam bolts	2.1
Beam side bolt	0.8

REMOVAL

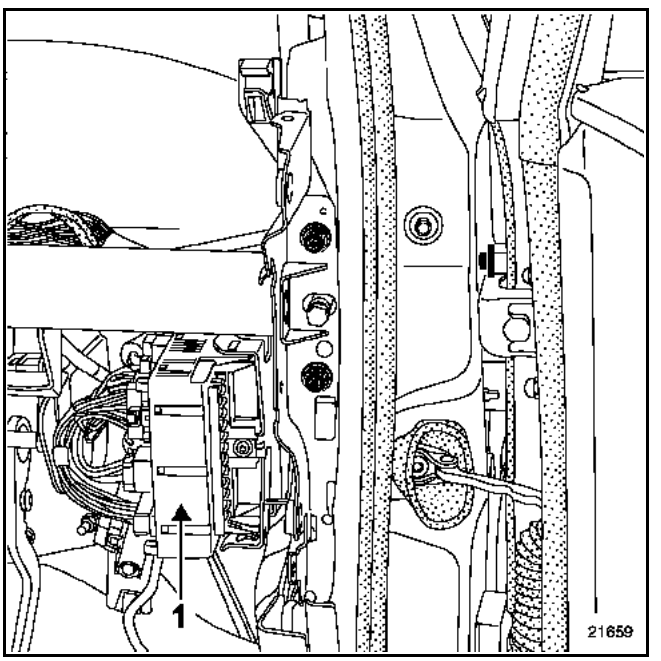
Disconnect the battery.

Remove:
- the steering column (see **Section 36B: Steering column**),
- the central console (see **Section 57A: Central console**),
- the instrument panel (see **Section 57B: Instrument panel**).



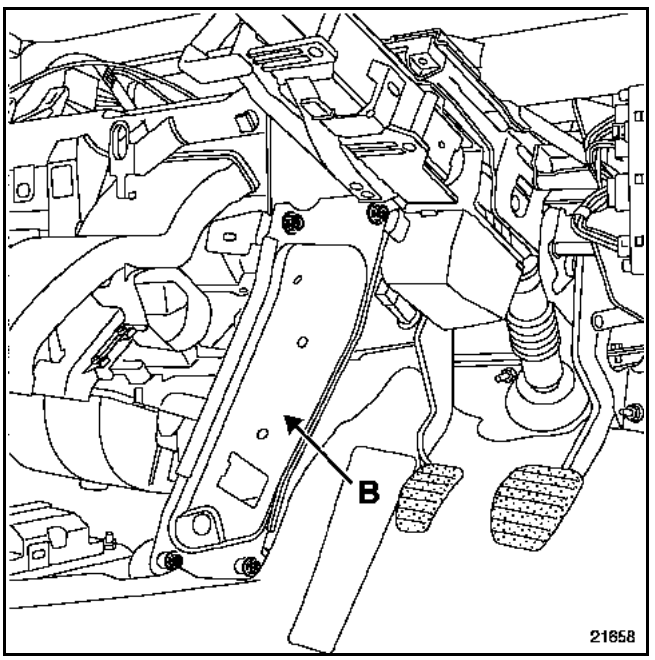
Remove, one after the other:
- the fuse/relay boxes at (1) on both sides of the beam,
- the voice synthesiser unit (if fitted).

Release the various electrical harnesses attached to instrument panel beam.

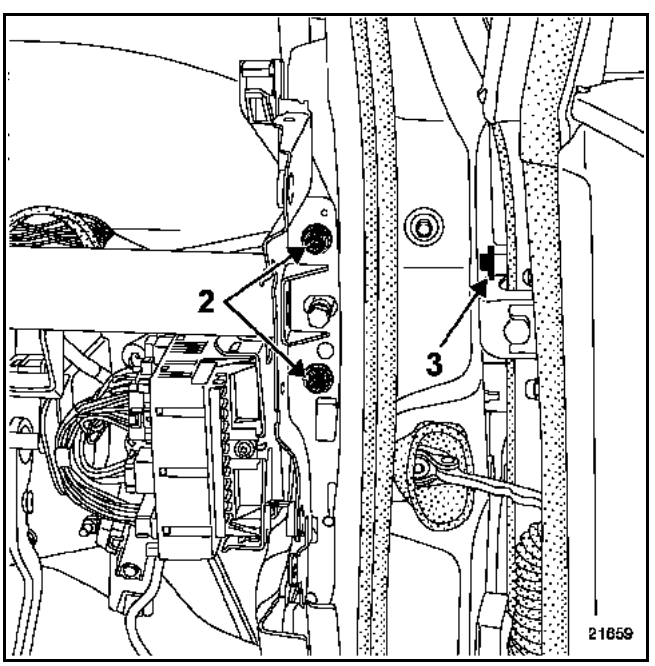


GETtheMANUALS.org

Remove:
– plate (B) from the beam reinforcement,



– the beam mounting screws (2) and (3),
– the three distribution unit bolts on the instrument panel beam.

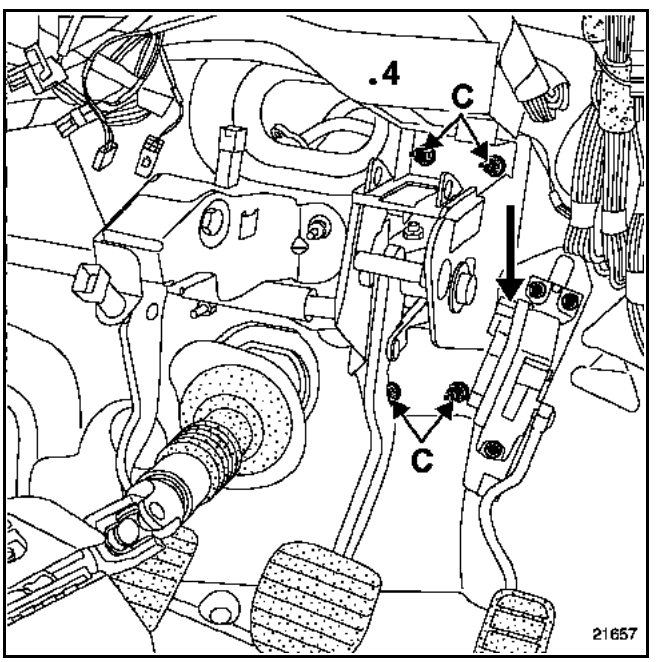


Driver's side

Remove:
– the accelerator pedal connector,
– the pedal return assembly nuts (C).

Release the wiring harness assembly (4).

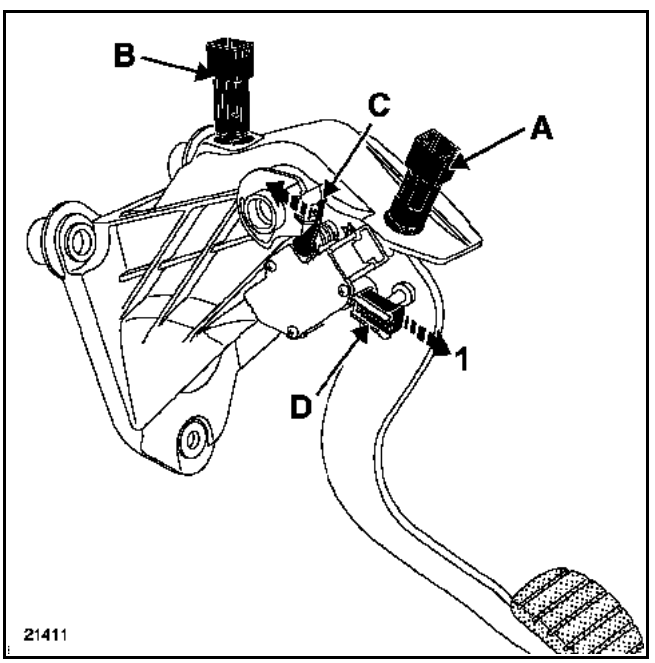
Remove the clutch master cylinder ball joint from the pedal.



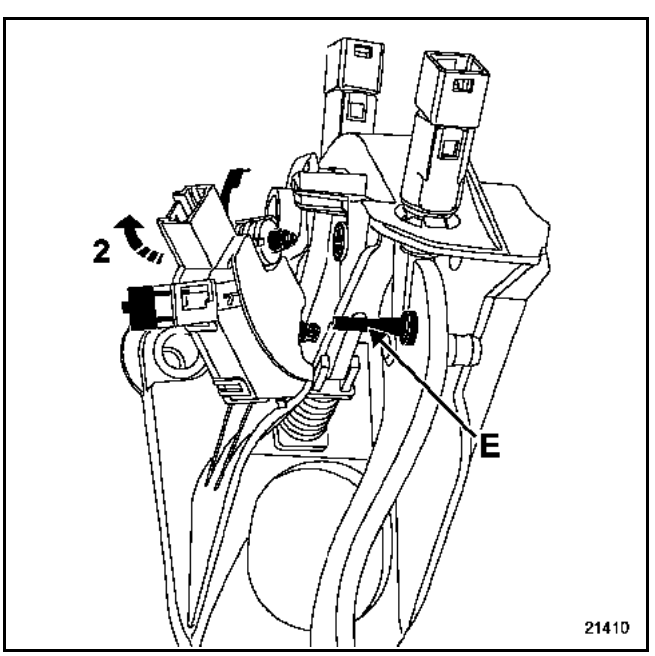
GETtheMANUALS.org

Remove:
– grey switch (A) at the start of travel while making a quarter turn,
– sensor connectors (A),
– the blue sensor (B) at the end of travel while making a quarter turn,
– sensor connectors (B).

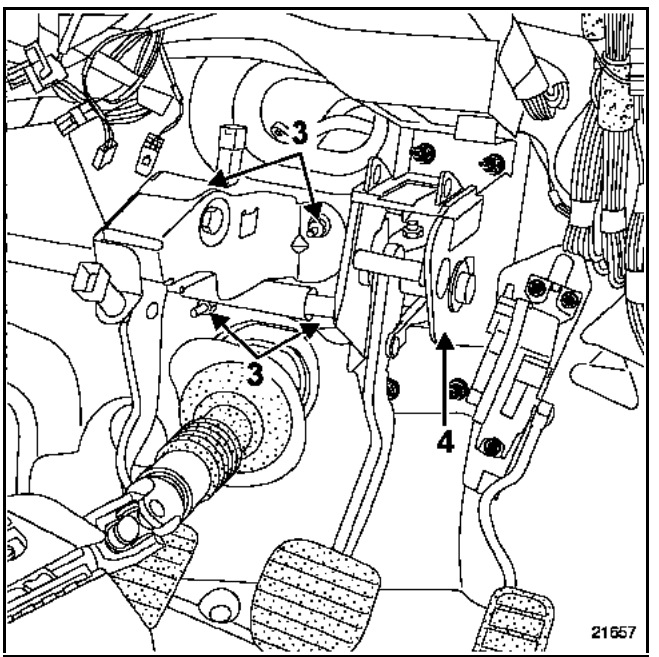
Unlock:
– the section linked to the pedal by moving lock (C) and (1), and sliding it,
– the sensor body by moving lock (D).



Tilt sensor (2). Be careful not to break the lower mounting bracket (E).



Remove the four mounting nuts (3) from the clutch pedal.



With the assistance of another person, lift up the heating unit and separate the pedal return device (4) to extract the clutch pedal system.

GETtheMANUALS.org

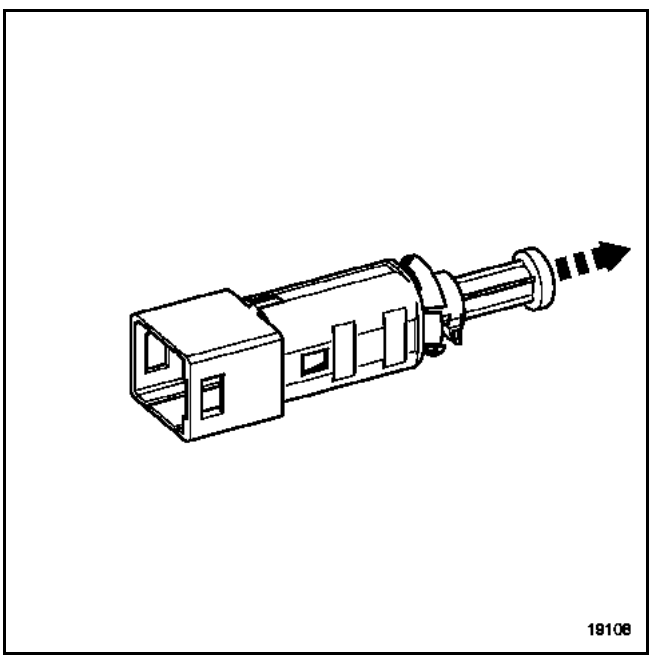
REFITTING

Carry out the removal procedure in reverse.

Torque tighten the nuts to **2.1 daNm**.

NOTE: the clutch pedal sensors have an automatic adjustment function which adjusts according to the position of the pedal.

Before refitting the sensor, it is necessary to set its minimum position by pulling the piston.



REFITTING

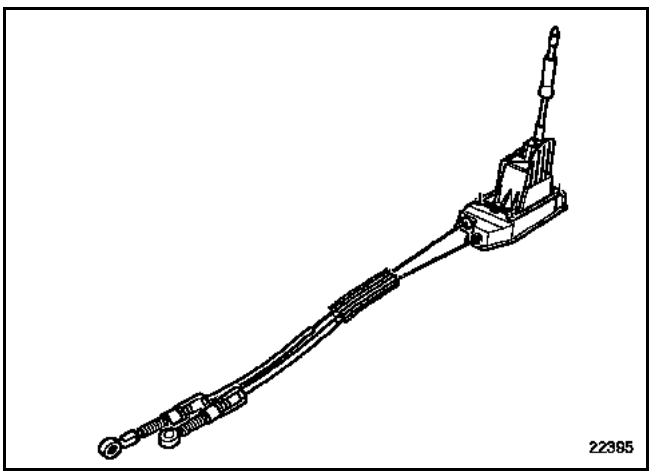
Position the sensors in their housing and turn it one quarter turn clockwise.

Reconnect the clutch pedal switch connectors.

IMPORTANT: do not forget to carry out the programming needed for the vehicle to operate correctly after connecting the battery (refer to **Section 80A**).

GETtheMANUALS.org

EXTERNAL CONTROL CABLES ON PK6 GEARBOX



GETtheMANUALS.org

TIGHTENING TORQUE (in daNm)	
Unit mounting bolt	3

REMOVAL

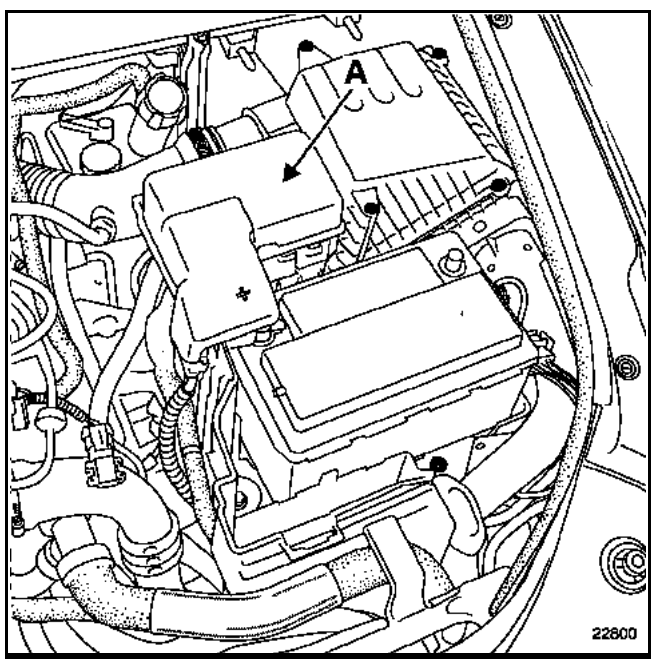
Place the vehicle on a lift.

In the engine compartment

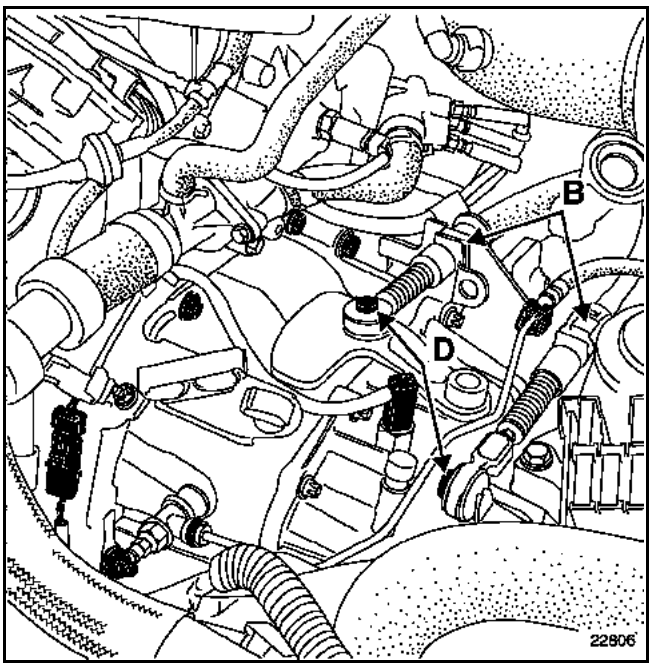
Open the bonnet and remove:
– the cover located above the battery (LH side),
– fuse box cover (A),

Disconnect the battery.

Remove:
– the fuses along with the fuse holder and release the fuse box from the battery mounting,



– the two external gear control ball joints (D),
– the two external gear control cable clips (B).

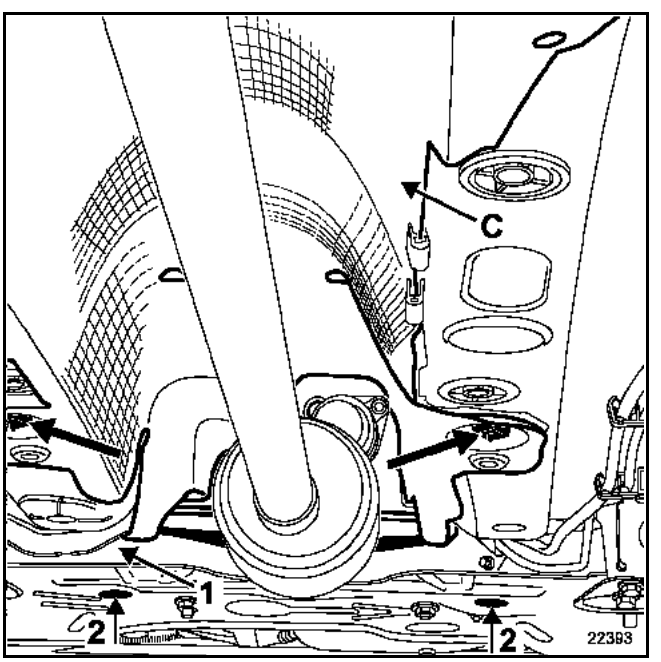


Under the vehicle:

Remove:
– the engine undertray,
– the expansion chamber (see **Section 19B: Exhaust pipe Catalytic converter**).

Unclip the hoses at (1). Cut the plastic retaining clip from the control cable connection sheath. Remove the two mounting screws from the heat shield at (2) and the four clips.

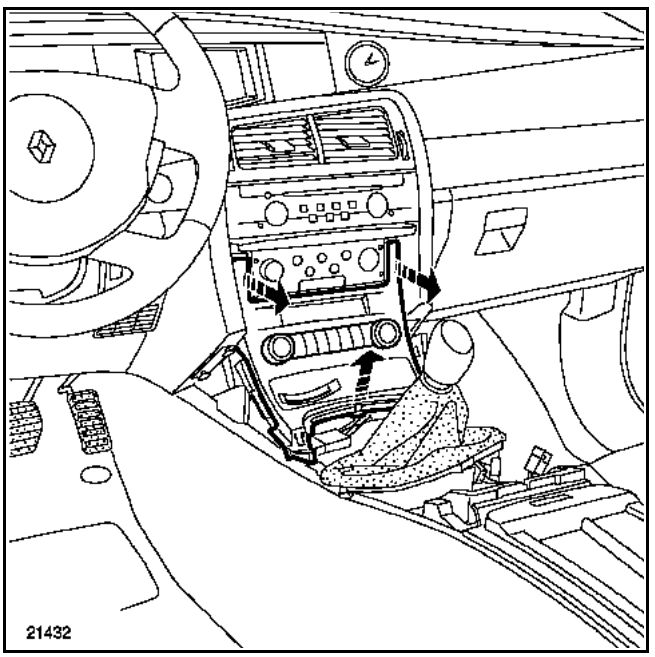
Remove heat shield (C).



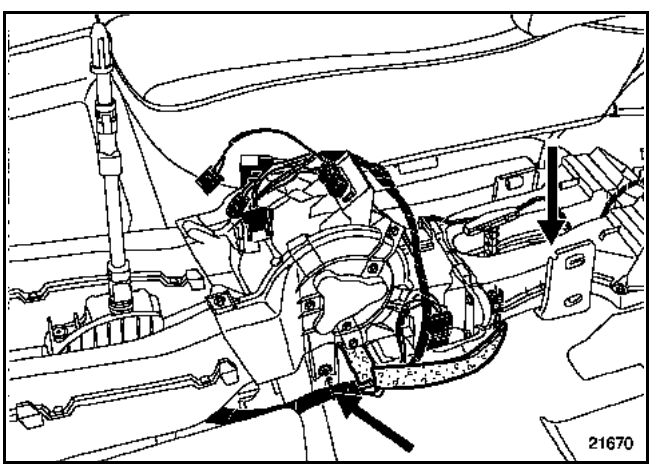
GETtheMANUALS.org

Passenger compartment side

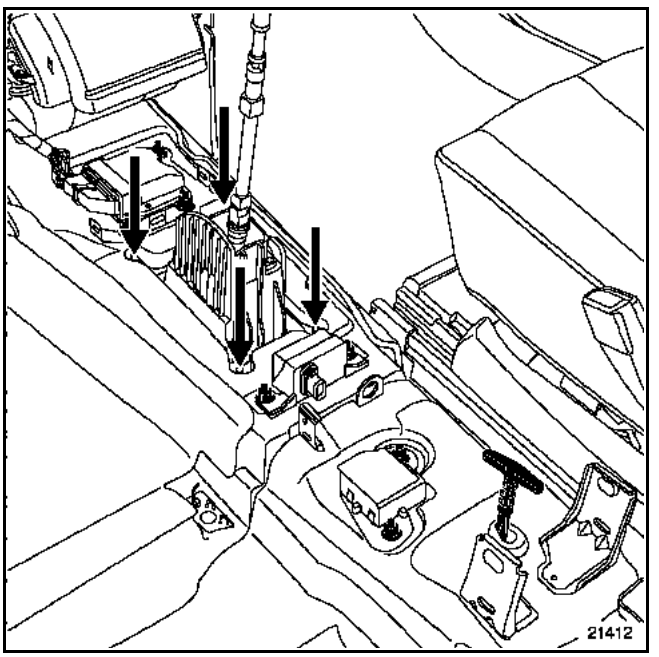
Remove:
– the centre console (see **Section 57A**),



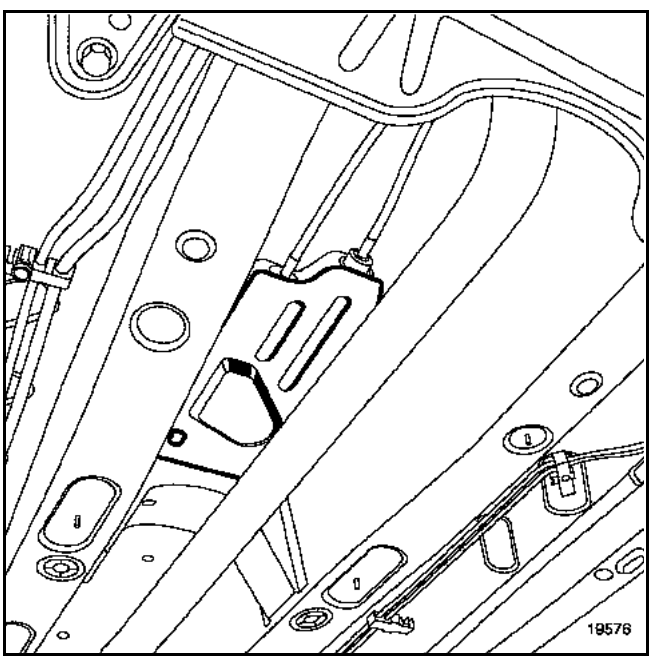
– the blower assembly (see **relevant section**),



– the control lever cover,
– the four control unit mounting nuts.



Remove the control unit.



REFITTING

Proceed in the reverse order to removal.

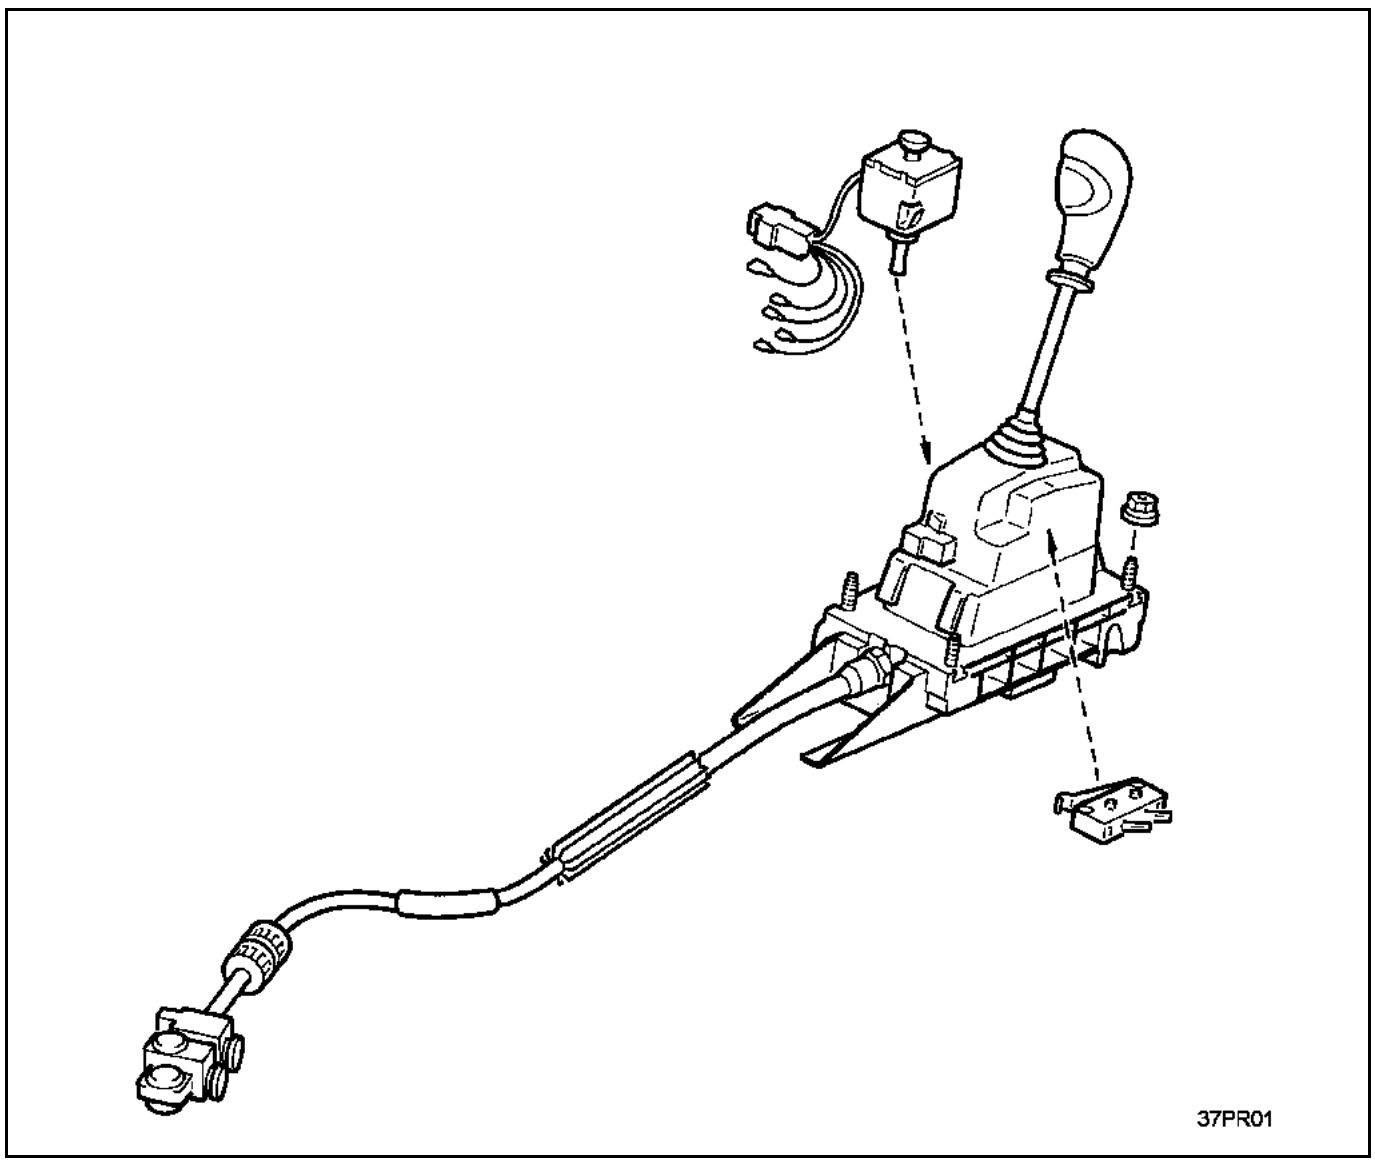
NOTE: when refitting do not forget to attach the control cable sheath to the heat shield.

IMPORTANT: Battery: reinitialise the electrical components see Section 80A: Special notes on the battery.

GETtheMANUALS.org

EXPLODED VIEW

EXTERNAL CONTROL CABLES ON SU1 GEARBOX

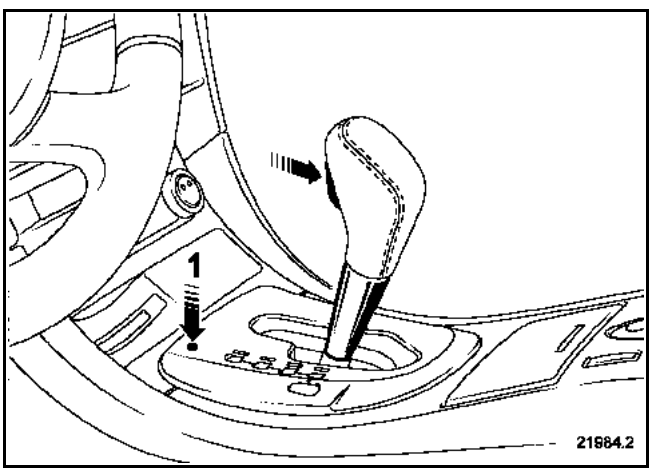


GETtheMANUALS.org

TIGHTENING TORQUE (in daNm)	
Unit mounting bolt	3

SPECIAL FEATURE:

When the vehicle is immobilised, it is possible to unlock the gear lever using a screwdriver by pressing on mark (1).



REMOVAL

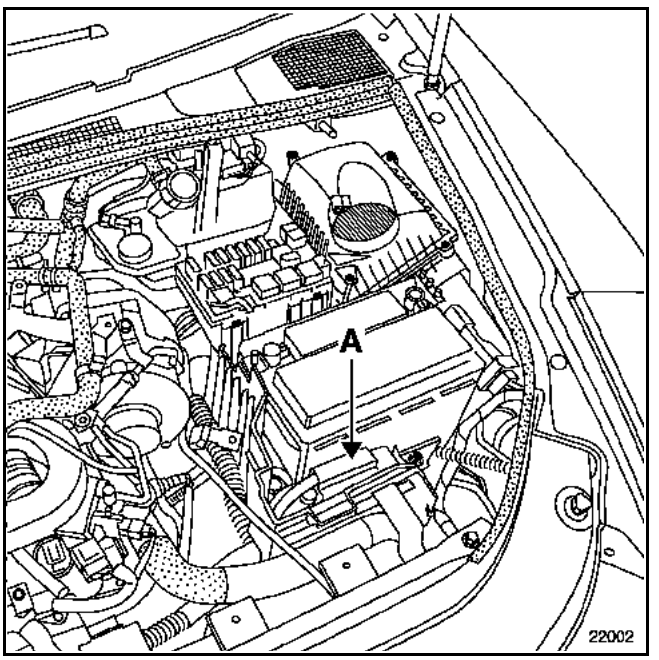
Place the vehicle on a lift.

In the engine compartment

Open the bonnet and remove:
– the cover located above the battery (LH side),
– the fuse box cover.

Disconnect the battery.

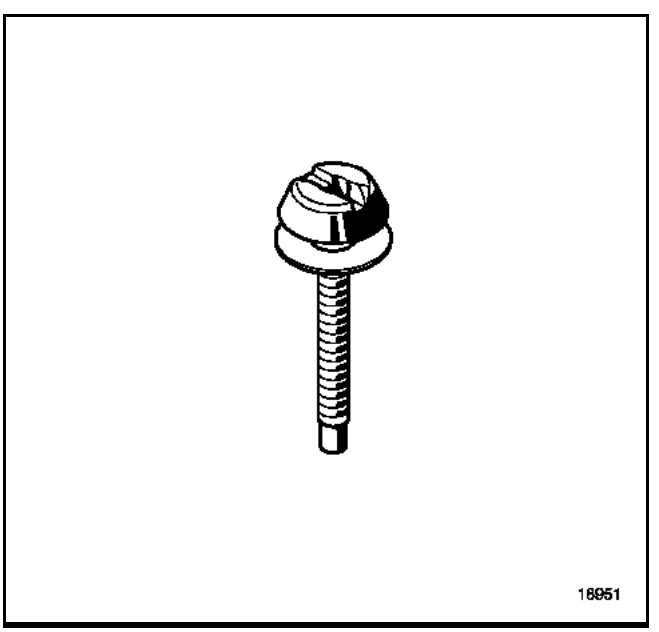
Remove:
– the battery;
– the fuse box,
– automatic gearbox computer (A),



– the battery mounting.

To do this, drill out the three tamperproof bolts using a **5 mm** diameter drill bit in the bolt shaft.

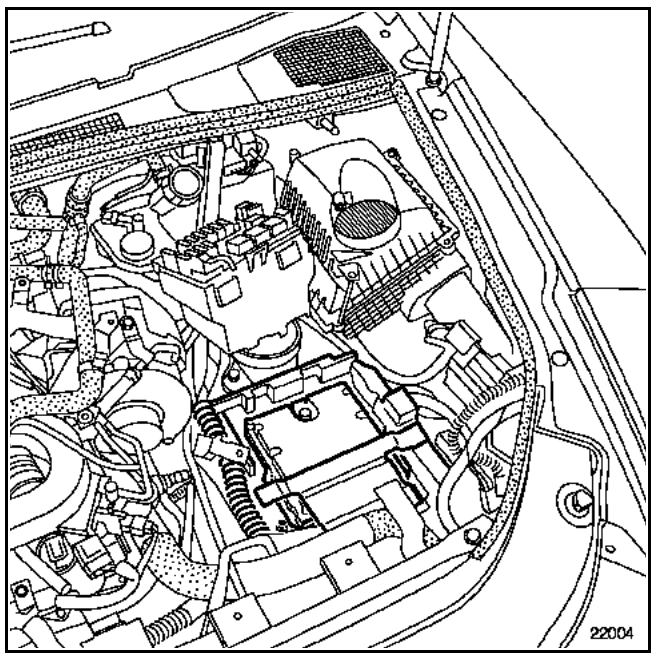
Remove the bolts using **Mot. 1372**.



NOTE: replace all the bolts when refitting.

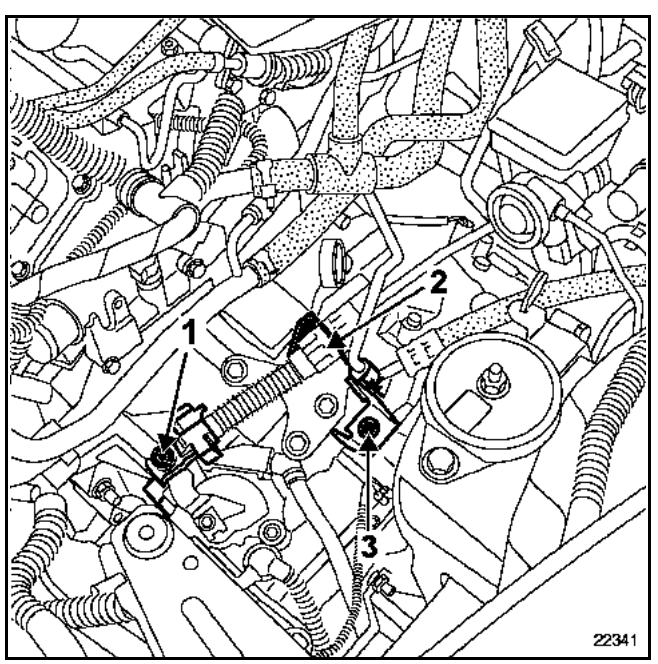
GETtheMANUALS.org

Release:
– the injection computer,
– the injection computer tray.



Put the control lever in D position and disconnect:
– ball joint (1) from the multifunction conductor cable,
– cable (2) of the multifunction switch by releasing the sleeve stop.

NOTE: do not move the orange ring during this operation. This could break during removal or refitting. DO NOT REPLACE THE CONTROL CABLE, the absence of this part will not affect the operation of the system.

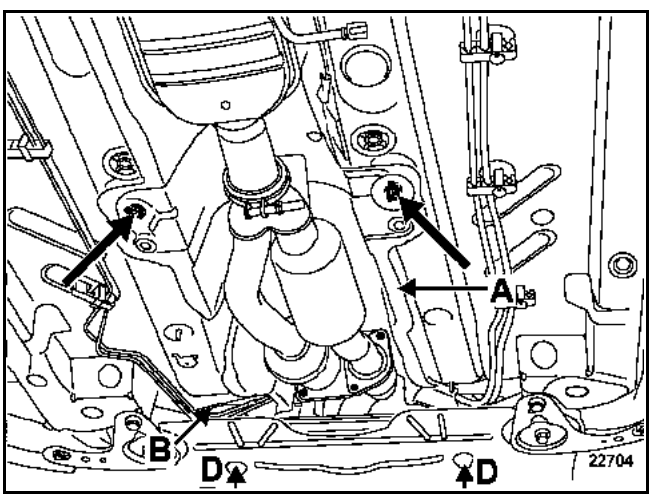


Under the vehicle:

Remove:
– the engine undertray,
– the catalytic pre-converter (see **Section 19B: Exhaust pipe Pre-converter**).

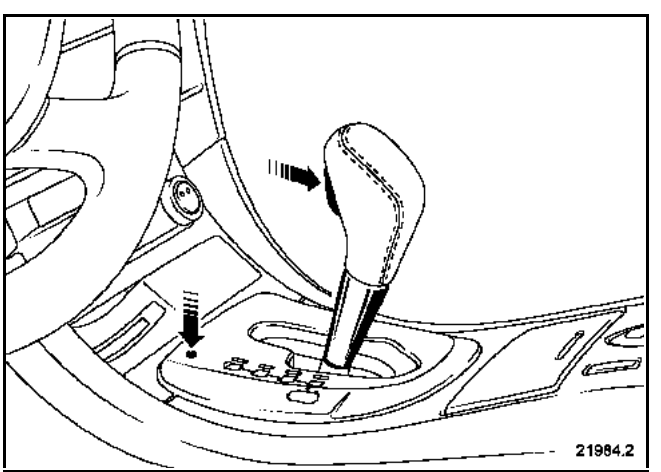
Unclip the hose at (B), cut control cable connection sheath and remove the two heat shield mounting bolts at (D) and the four clips.

Remove heat shield (A).



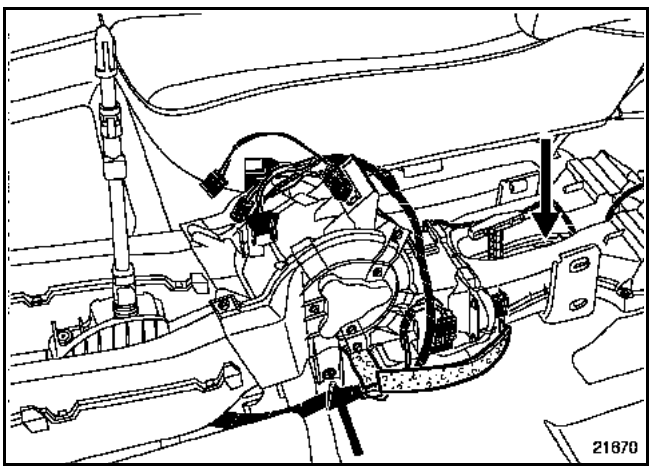
Passenger compartment side

Remove:
– the gear knob (see **Section 57A**) from the centre console (Notes on the automatic gear box lever),
– the centre console (see **Section 57A**).

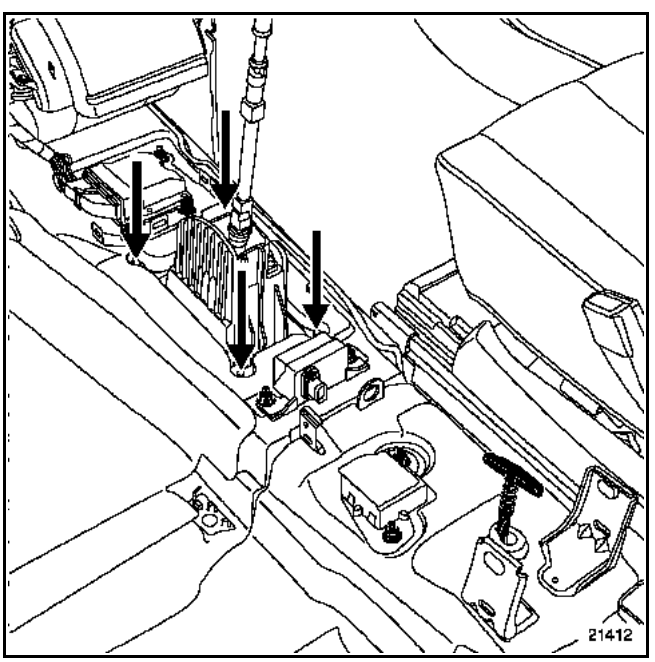


GETtheMANUALS.org

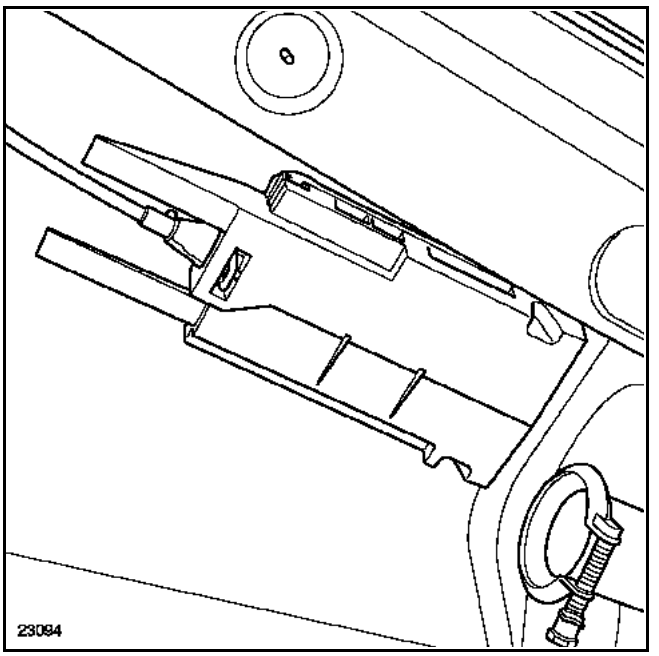
Remove:
– the central fan assembly (see **Section 61A Central fan assembly**),



– the control lever cover,
– the four control unit mounting nuts.



Remove the control unit.



REFITTING

Proceed in the reverse order to removal.

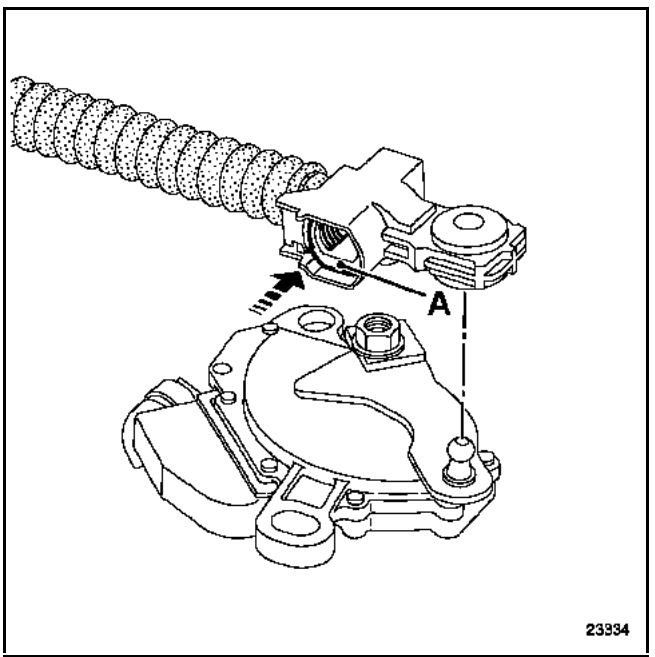
NOTE: when refitting do not forget to attach the control cable sheath to the heat shield.

GETtheMANUALS.org

CONTROL ADJUSTMENT

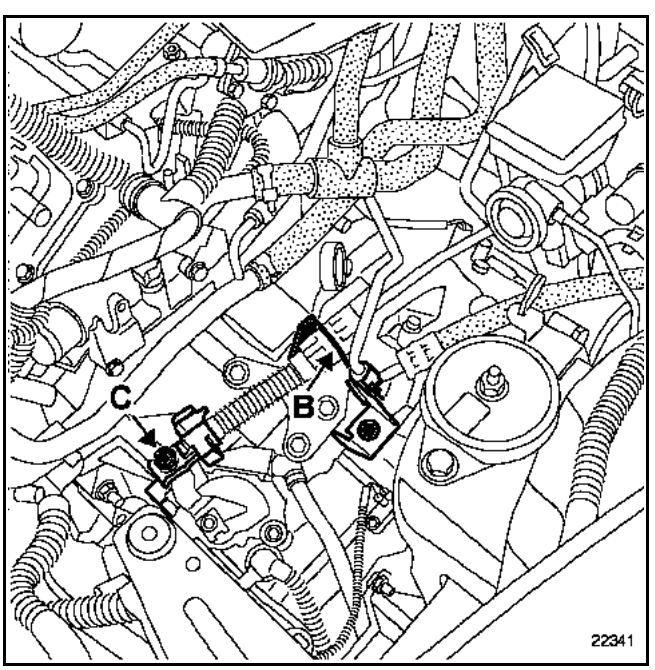
NOTE: the control lever and the multifunction switch must be in D position.

Press slide valve (A) to release the cable.

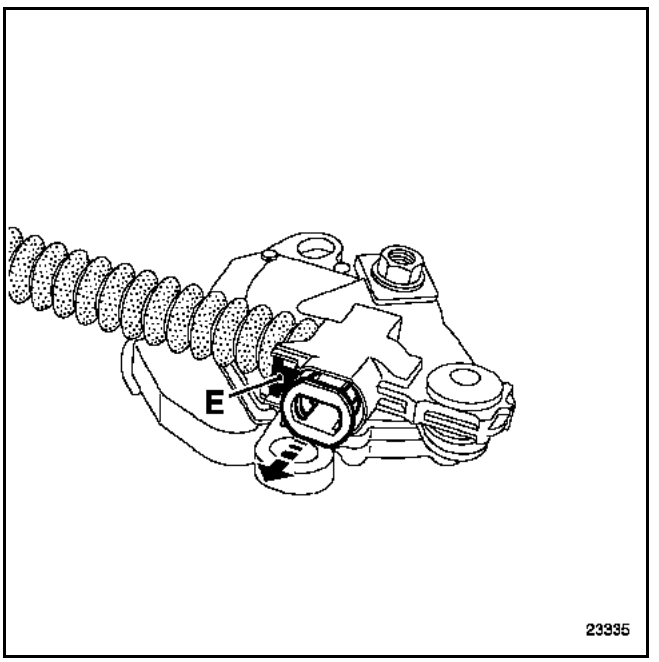


1) fasten the control cable in the sleeve stop at (B),

2) clip the cable end piece to the multifunction switch ball joint at (C),



3) apply clip (E) to secure the cable end piece.



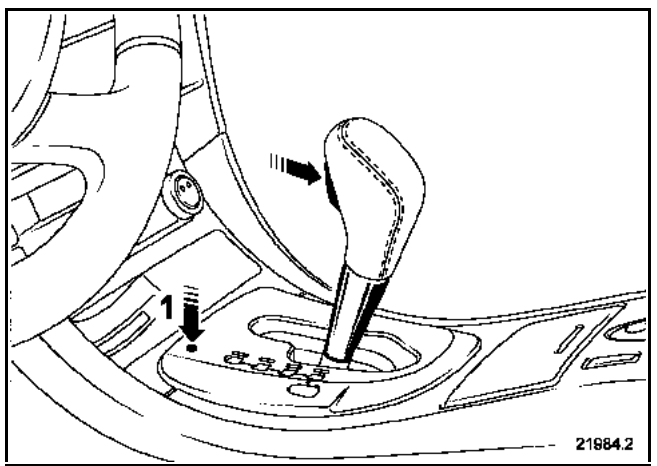
IMPORTANT: Battery: reinitialise the electrical components: see Section 80A: Special notes on the battery.

GETtheMANUALS.org

REMOVAL OF GEAR SELECTION CABLE

SPECIAL FEATURE:

When the vehicle is immobilized, it is possible to unlock the gear selector lever using a screwdriver by pressing on mark (1).



REMOVAL

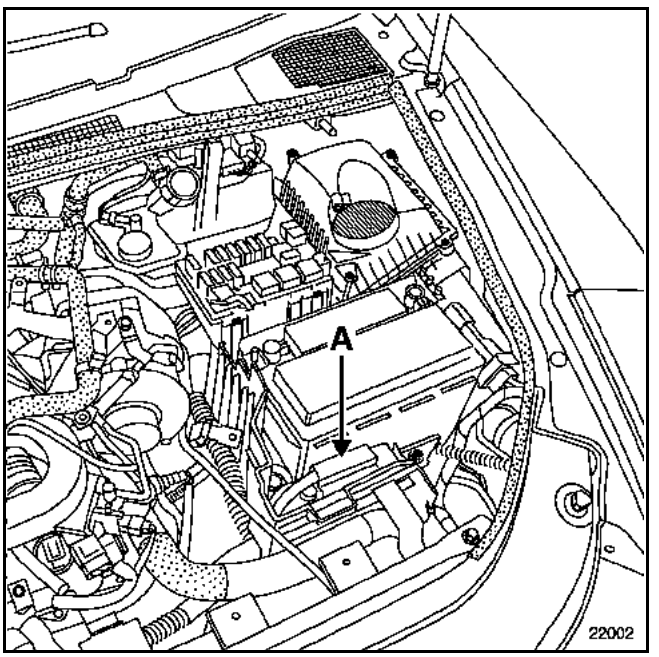
Place the vehicle on a lift.

In the engine compartment

Open the bonnet and remove:
– the cover located above the battery (LH side),
– the fuse box cover.

Disconnect the battery.

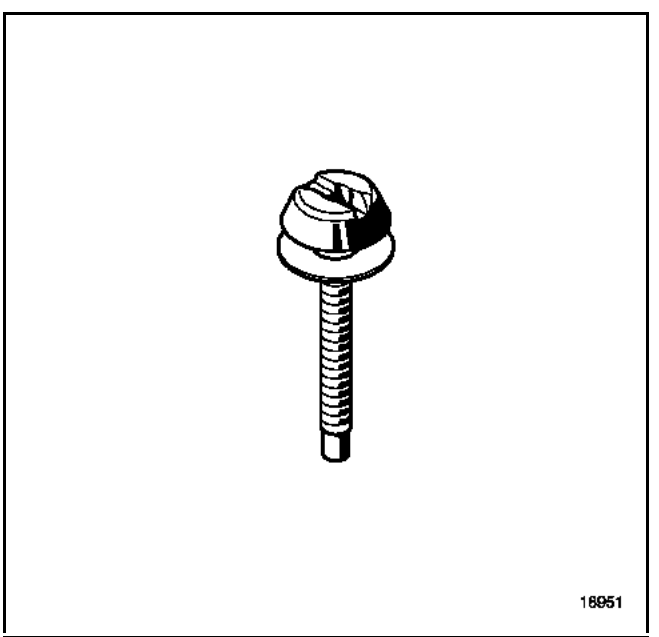
Remove:
– the battery;
– the fuse box,
– automatic gearbox computer (A),



– the battery mounting.

To do this, drill out the three tamperproof bolts using a **5 mm** diameter drill bit in the bolt shaft.

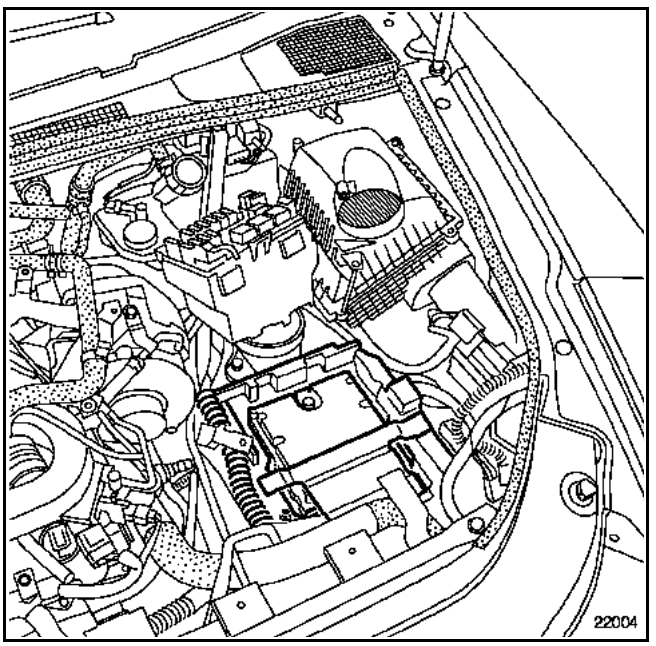
Remove the bolts using **Mot. 1372**.



NOTE: replace all the bolts when refitting.

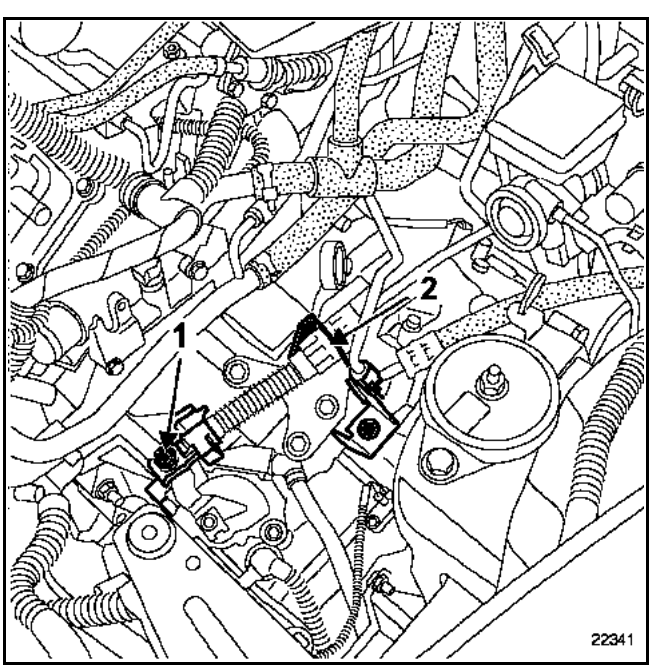
GETtheMANUALS.org

Release:
– the injection computer,
– the injection computer tray.



Put the control lever in D position and disconnect:
– ball joint (1) multifunction switch side,
– cable (2) sleeve stop side releasing the hook system.

NOTE: do not move the orange ring during this operation. This could break during removal or refitting. If this happens, DO NOT REPLACE THE CONTROL CABLE, as its absence will not affect the operation of the system.

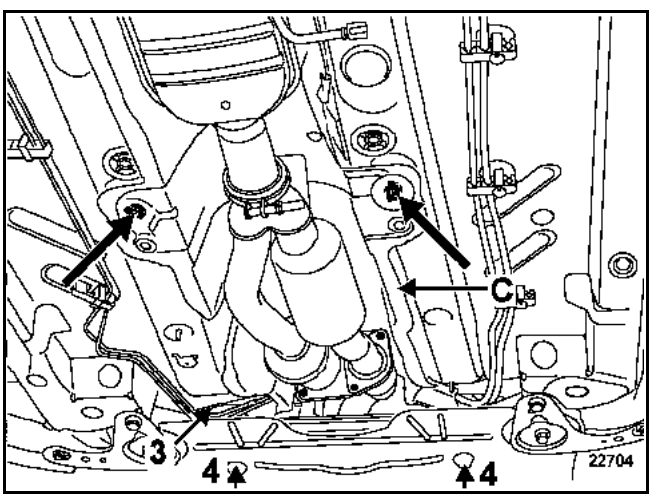


Under the vehicle:

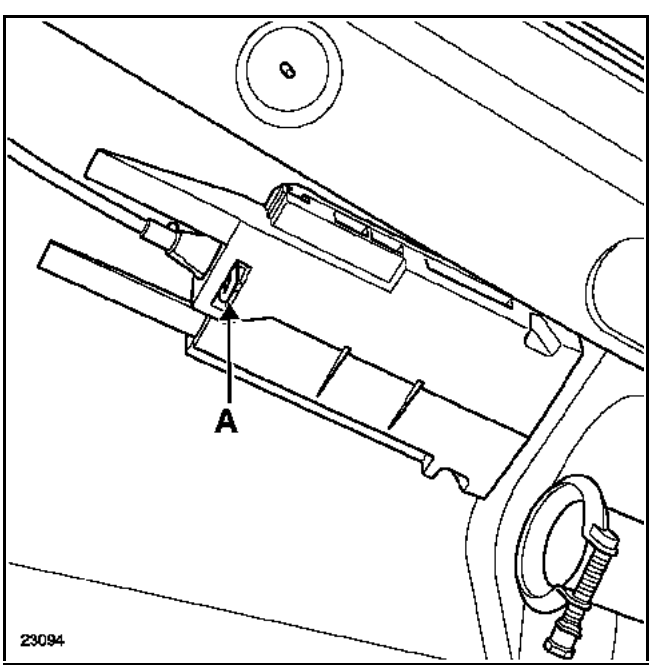
Remove:
– the engine undertray,
– the catalytic pre-converter (see **Section 19B: Exhaust pipe Pre-converter**).

Unclip the hoses at (3). Cut the plastic retaining clip from the control cable connection sheath. Remove the two mounting screws from the heat shield at (4) and the four clips.

Remove heat shield (C).



Remove clip (A). Cut the housing underbody along the circular mark.



GETtheMANUALS.org

REFITTING

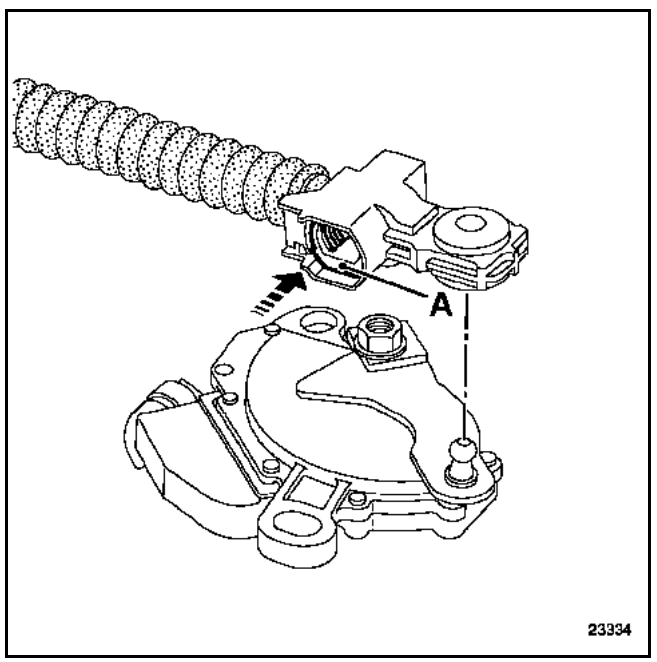
Proceed in the reverse order to removal.

NOTE: when refitting do not forget to attach the control cable sheath to the heat shield.

CONTROL ADJUSTMENT

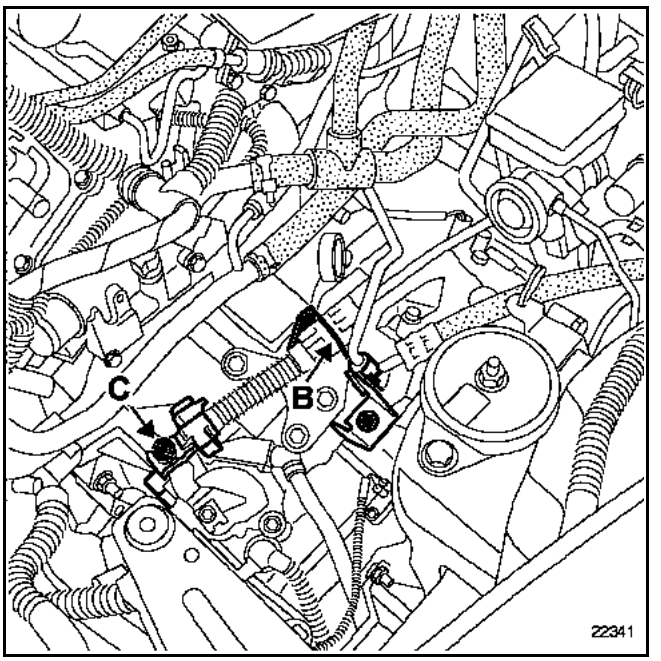
NOTE: the control lever and the multifunction switch must be in D position.

Press slide valve (A) to release the cable.

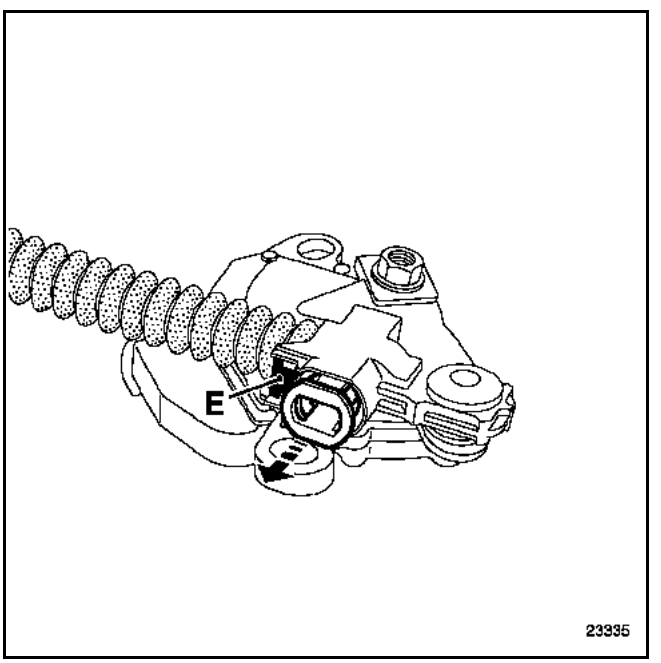


1) fasten the control cable in the sleeve stop at (B),

2) clip the cable end piece on the multifunction switch ball joint at (C),

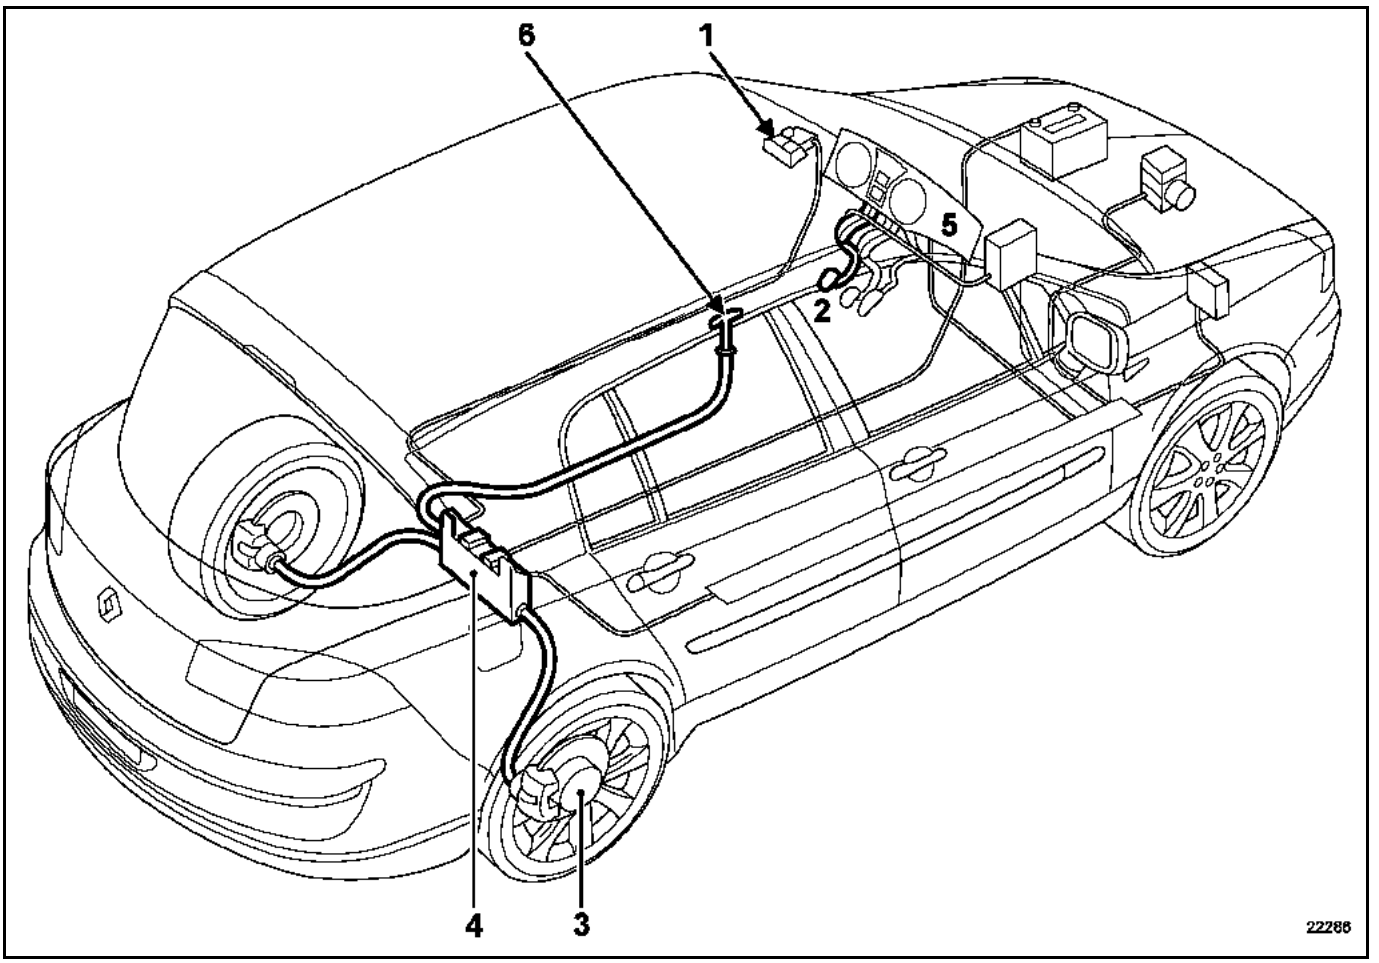


3) apply clip (E) to secure the cable end piece.



IMPORTANT: Battery: reinitialise the electrical components see Section 80A: Special notes on the battery.

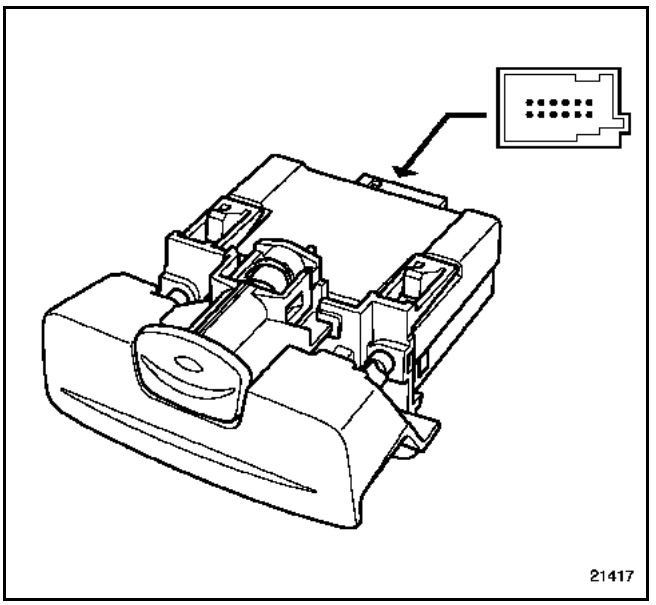
GETtheMANUALS.org



1 The unit
2 The clutch pedal position sensor
3 The wheel speed sensor
4 The control unit
5 The instrument panel indicator lights
6 The emergency parking brake cable control (manual)

The parking brake is controlled by a handle. This replaces the handbrake lever. The lever is located on the instrument panel, next to the steering wheel.

GETtheMANUALS.org



The unit consists of two main components:
– a locking control component, called a handle,
– an unlocking control button, with a red indicator light which shows the status of the parking brake.

To lock the parking brake, pull the lever. To unlock the parking brake, pull the lever and press the button.

In the event of a battery fault, the emergency parking brake control cable is situated between the two front seats, at the back of the storage compartment, under the carpet.

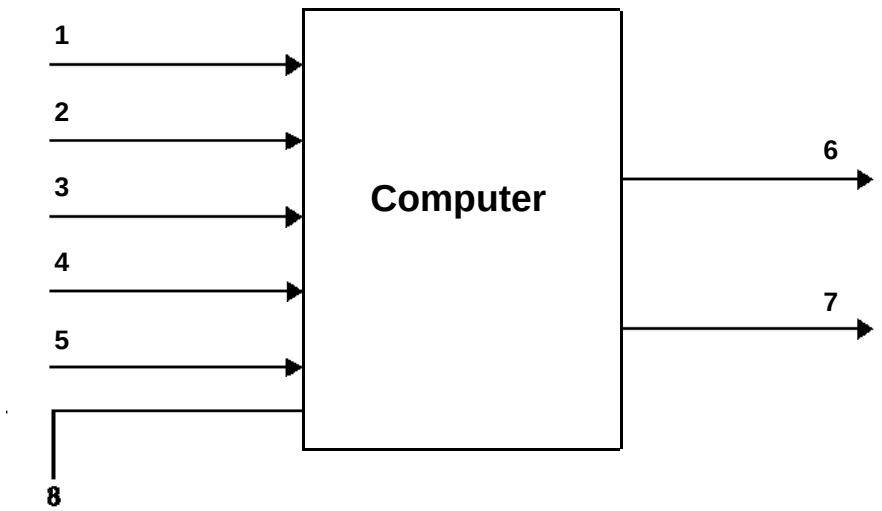
Each time the emergency parking brake cable is used, it is essential to clear the generated fault with a diagnostic tool.

The parking brake locks automatically when the engine is switched off. It automatically unlocks when the vehicle starts moving.

When performing a hill start, pressing the panel will immobilise the vehicle on the gradient. The brake unlocks automatically when the torque required to move the vehicle reaches the driven wheels.Nevertheless, this function does not prevent stalling.

In the event of a fault in the principal braking circuit while driving, the automatic parking brake system offers a dynamic emergency braking system. It is also equipped with a system preventing unwanted rear wheel locking.

GETtheMANUALS.org



1 the panel is controlled manually.
2 The gradient sensor controls locking according to the angle of the gradient.
3 The force sensor checks and corrects the force applied to the brakes.
4 The clutch pedal position sensor measures the slippage point curve.
5 The wheel speed sensor is the ABS sensor. It measures abnormal movement of the vehicle when parking.
6 The control unit contains the electric motor, the rear brake cables and the gradient and force sensors.
7 The instrument panel indicator lights indicate locking, unlocking and a fault with the automatic braking system.
8 the emergency parking brake cable control (manual)

The parking brake cable play compensation is performed automatically by the control unit.

Recommendations and safety issues

On vehicles fitted with the automatic parking brake, the Renault card must be removed to prevent the rapid discharge of the battery and to prevent the system unlocking erratically.

The automatic parking brake can only be unlocked when the steering column is unlocked.

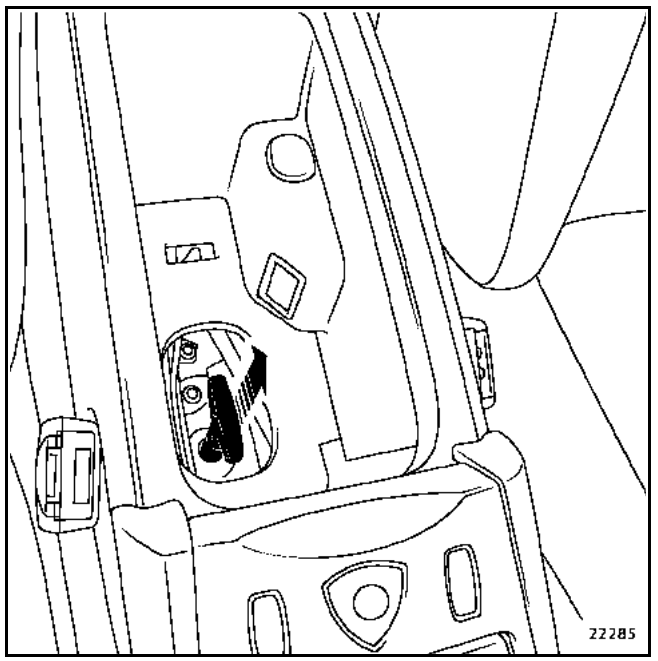
When the vehicle exceeds the Maximum permissable all-up weight (MMAC), it is possible to access an overlocking function by holding the lever in pull position for three seconds.

When parking in very cold conditions, it is advisable to unlock the brake **after** switching off the engine and **before** removing the Renault card to prevent the rear wheels becoming locked by ice.

In the case of vehicles fitted with automatic gear boxes, if the engine is running, the parking brake is locked, a gear is selected and the driver's door is open, unlocking is not possible.To return to normal operating mode (automatic unlocking on starting), move the gear selector lever to the P or N position.

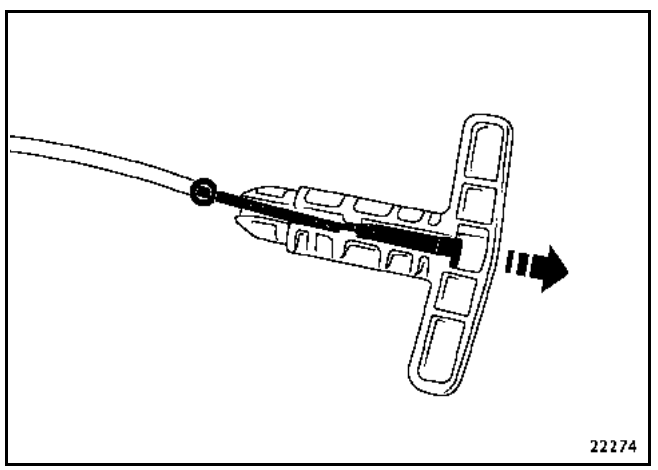
GETtheMANUALS.org

REMOVAL



Gently pull the handle and pull out less than two centimetres of cable.

Remove the handle.



REFITTING

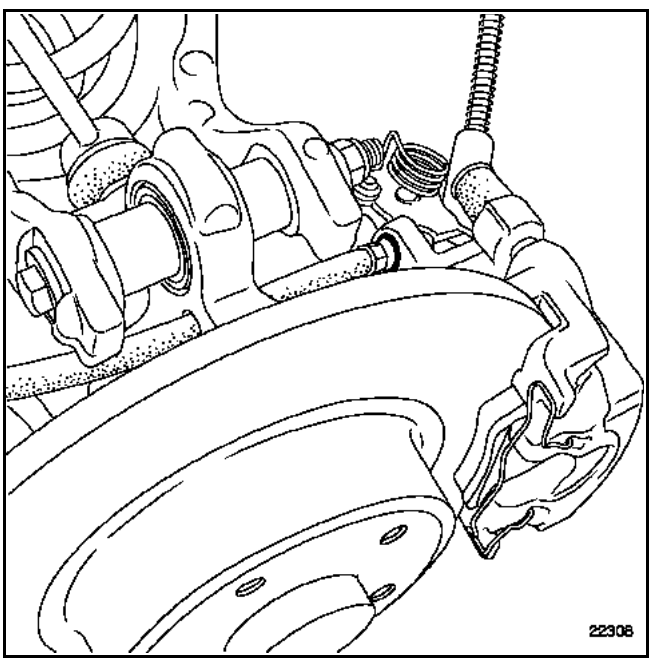
Carry out the removal procedure in reverse.

If you are not able to handle properly (cable too stretched), carry out the following operations.

With the ignition on, unlock the parking brake.
Proceed as follows:
pull the handle; press the button.

The automatic parking brake locking function is indicated by a sound. It lasts for several seconds and ends with a clicking sound.

The play compensation is set automatically.



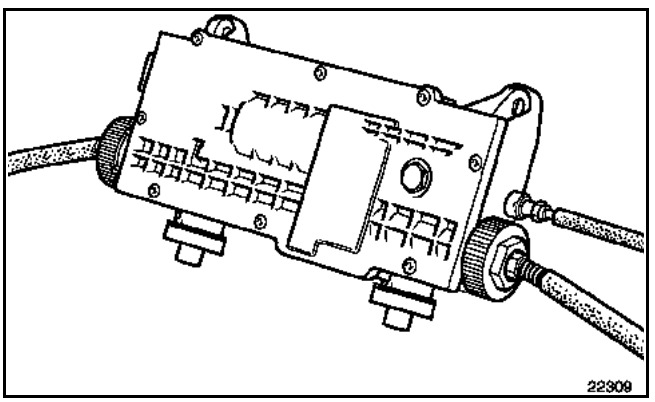
IMPORTANT: check that the cables are correctly fitted in their housing.

IMPORTANT: using a diagnostic tool, carry out a complete check and clear the generated fault.

GETtheMANUALS.org

TIGHTENING TORQUE (in daNm)	
Wheel bolts	**10.5**

The control unit is located near to the rear axle, behind the fuel reservoir.



The following operations are carried out with the mounting in place.

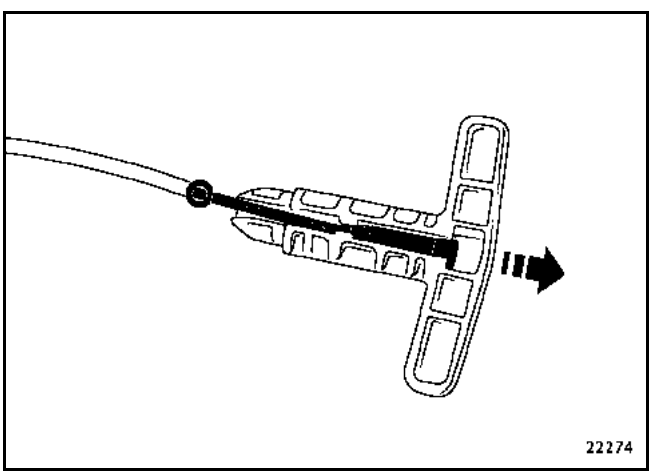
REMOVAL

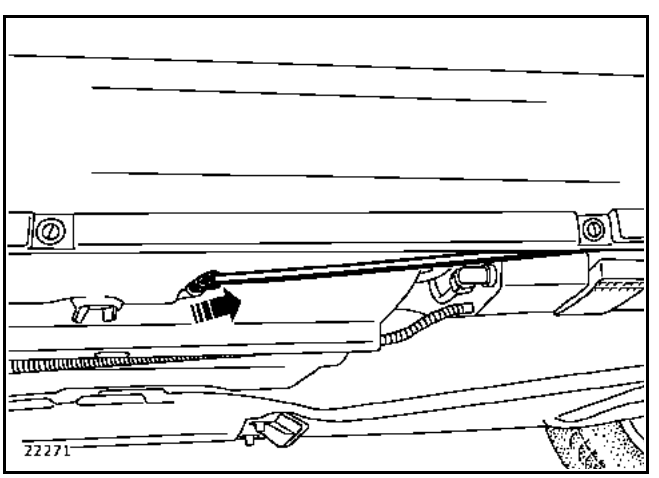
Disconnect the battery.

Remove:
– the rear hub caps (depending on equipment),
– the rear wheel mountings,
– the rear wheels.

Pull the emergency control. The slackened parking brake cable produces a sound. The handle is situated between the two front seats, at the back of the storage compartment, under the carpet.

Remove the handle.





Pull on the emergency control cable from underneath the vehicle.

Remove the emergency control cable from its clips. Follow the routing observed during removal.

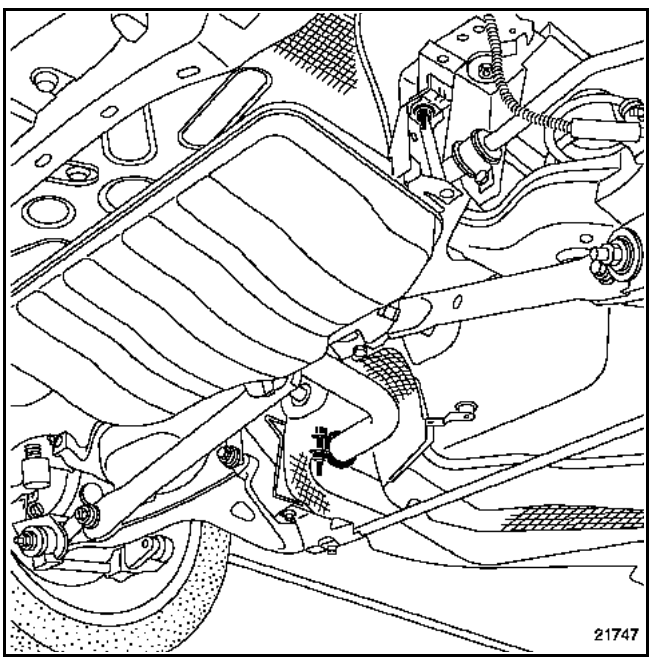
GETtheMANUALS.org

Unhook the parking brake cable ends.

Release the brake cables from the stub axle carriers.

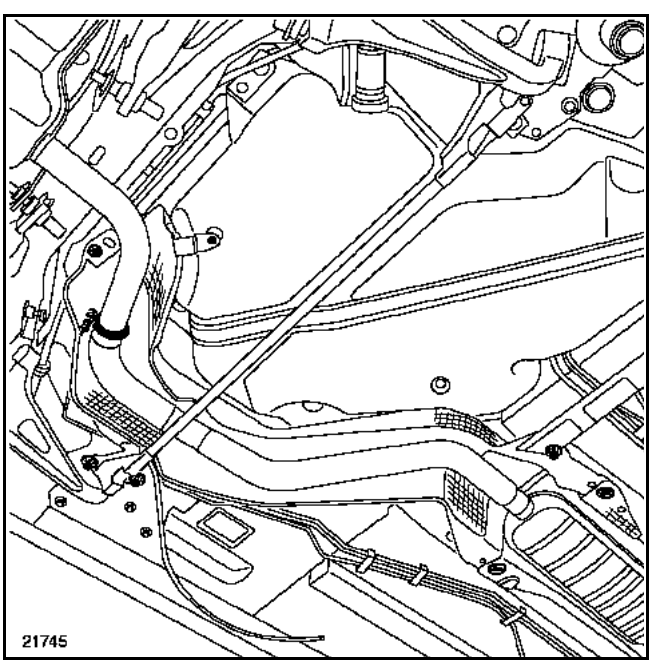
Remove the left and right cables from the brackets.

Let the parking brake cables hang freely.



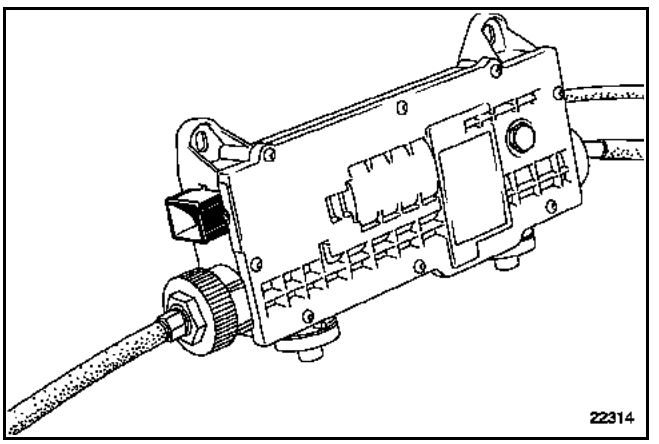
Disconnect the silencer from the exhaust pipe.

Remove the silencer.

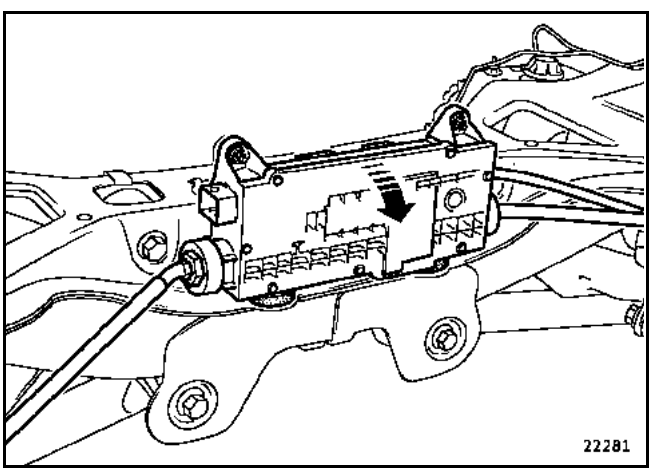


Remove the five heat protector mountings.

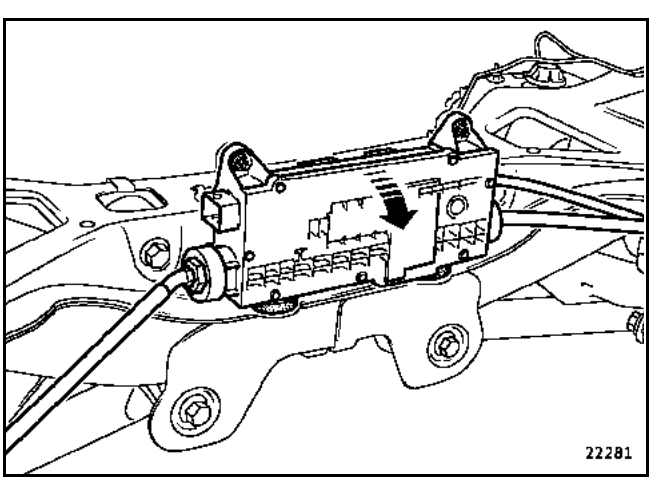
Release the heat shield at the bottom.



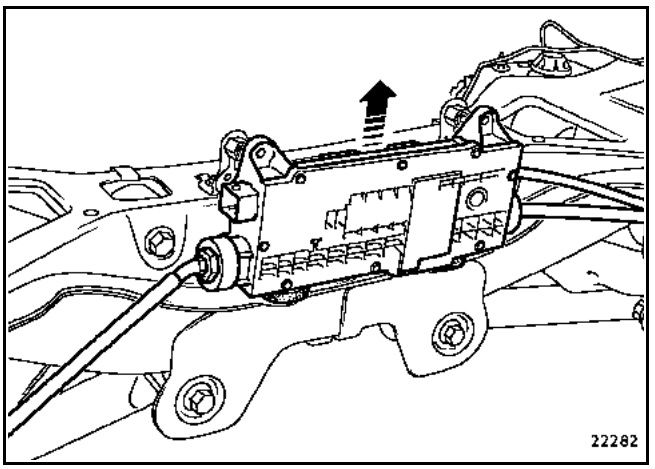
Disconnect the connector from the control unit.



Remove the two control unit bolts (using a **10 mm** gauge and **45 mm** long socket).

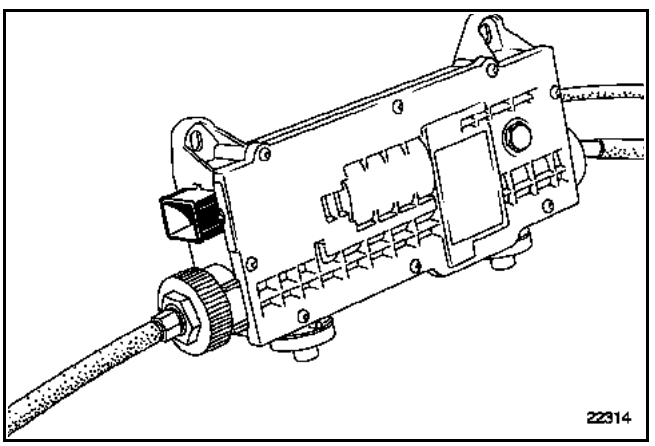


GETtheMANUALS.org



To remove the control unit, turn the unit towards the front. Push the control unit upwards. Release the rubber mountings from the mounting openings.

Simultaneously remove the two parking brake cables and the emergency brake cable.

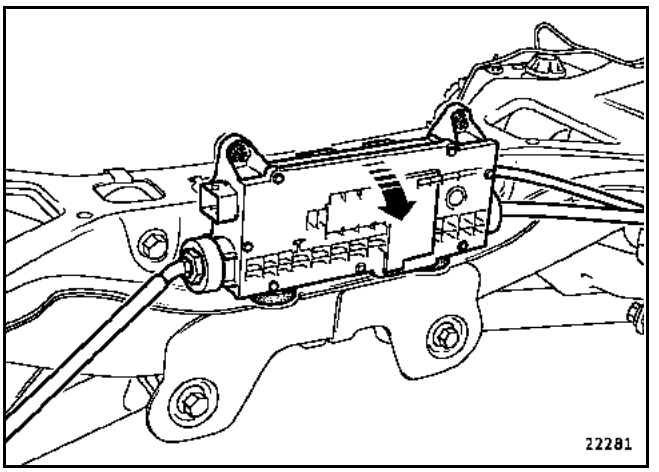


REFITTING

Replace the three above mentioned cables as follows. Place the control cable back in its clips. Follow the routing observed during removal.

Place the parking brake cables back in their mounting.

Insert the control unit into its housing and push it towards the back so that the rubber mountings can be inserted into the openings.



Refit the two control unit nuts.

Put the emergency control cable back in the passenger compartment entry opening.

Insert the emergency control cable sheath end in the opening to immobilise this cable.

Position the parking brake cables. Attach the parking brake cables.

Refit the five heat protector mountings.

Connect the silencer and the exhaust pipe.

Refit:
– the rear wheels,
– the wheel mountings (torque tighten),
– the hub caps (depending on equipment).

In the passenger compartment, replace the emergency control cable in the handle. Refit the carpet.

Connect the battery.

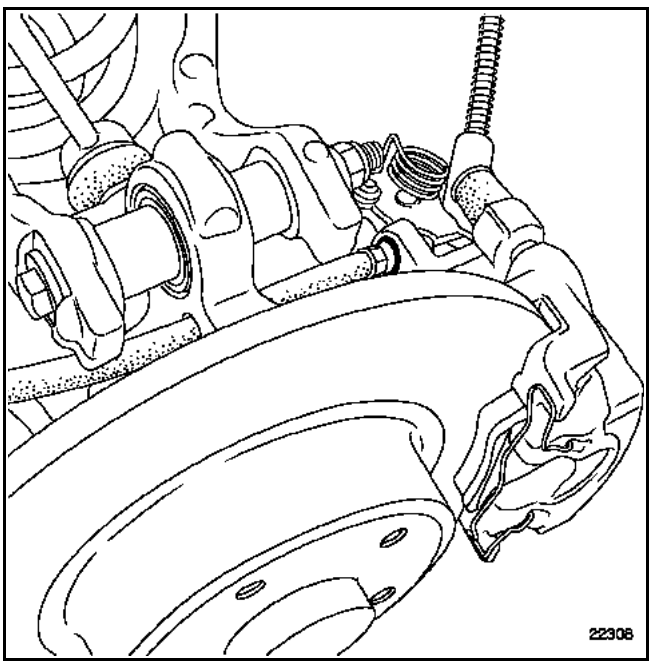
With the ignition on, release the parking brake. Proceed as follows:
pull the handle; press the button.

NOTE: the automatic parking brake locking function is indicated by a sound. It lasts for several seconds and ends with a clicking sound.

The play compensation is set automatically.

GETtheMANUALS.org

IMPORTANT: check that the cables are correctly fitted in their housing.



IMPORTANT: using a diagnostic tool, carry out a complete check and clear the generated fault.

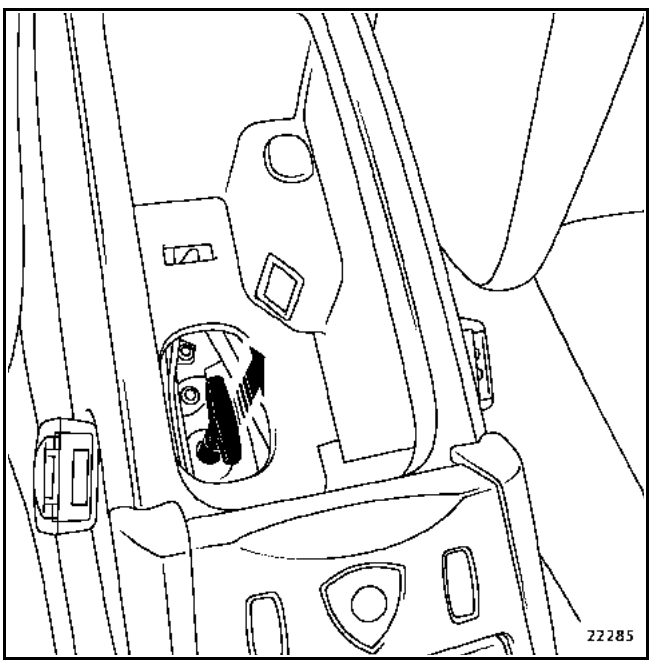
Configure the new control unit using a diagnostic tool. Refer to the Workshop Repair Manual **Fault Finding in Section 37B**.

GETtheMANUALS.org

Exchanging two automatic parking brake cables

The following operations are carried out with the mounting in place.

REMOVAL



Pull the emergency control handle.

This handle is located between the two front seats, at the back of the storage compartment, under the carpet.

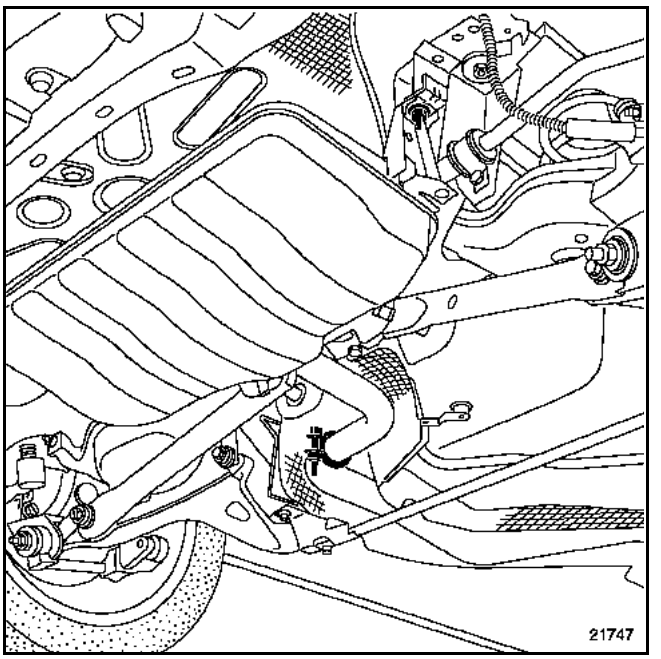
Remove:
– the handle,
– the rear hub caps (depending on equipment),
– the wheel mountings,
– the wheel.

Unhook the parking brake cable ends.

Release the parking brake cables.

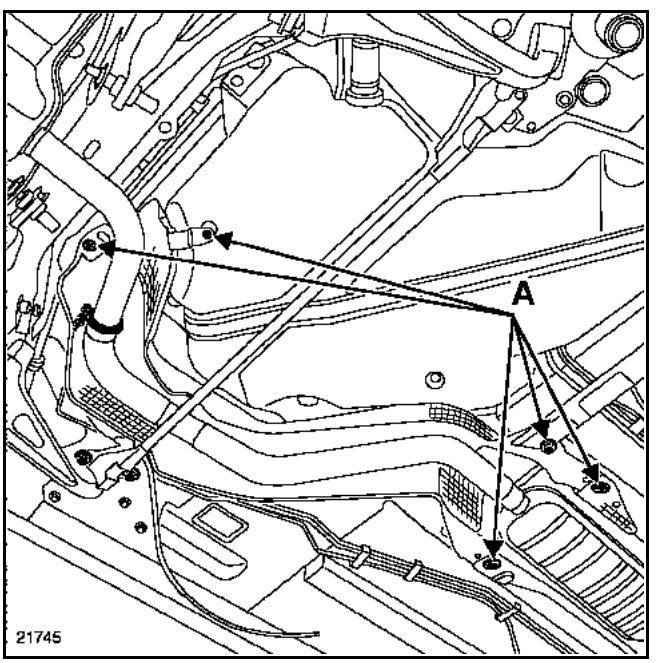
Remove the left and right cables from the brackets.

Let the parking brake cables hang.



Disconnect the silencer from the exhaust pipe.

Remove the silencer.

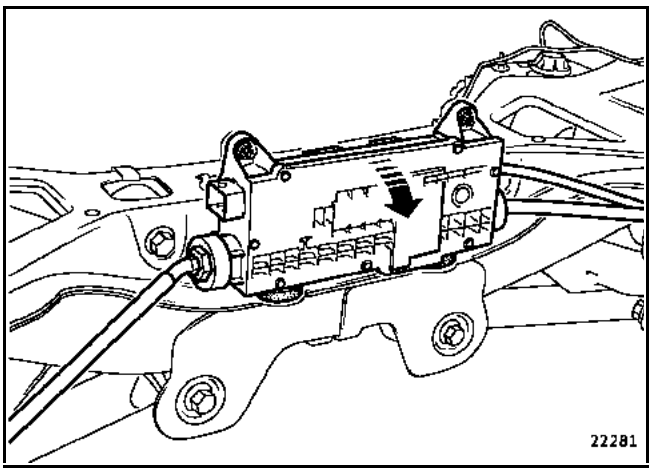


Remove the five heat shield mountings (A).

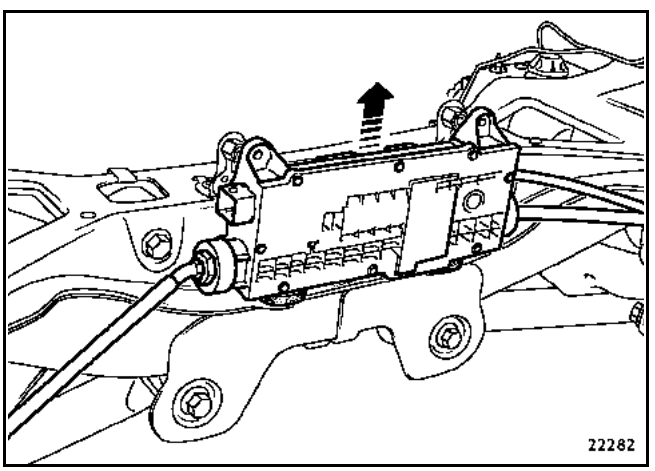
Release the heat shield at the bottom.

Disconnect the connector from the control unit.

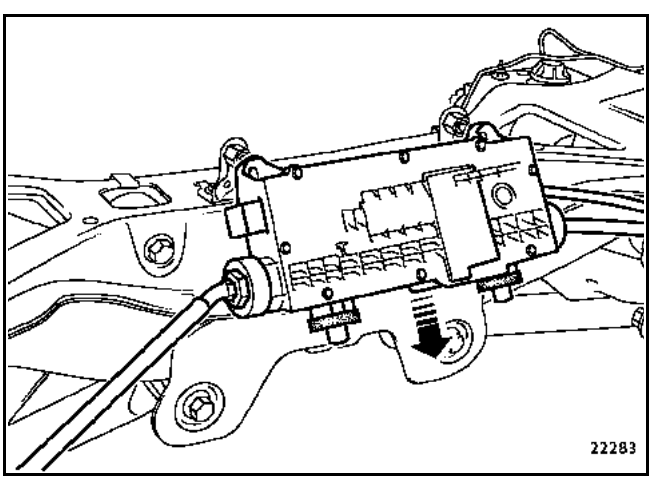
GETtheMANUALS.org



Remove the two control unit bolts.



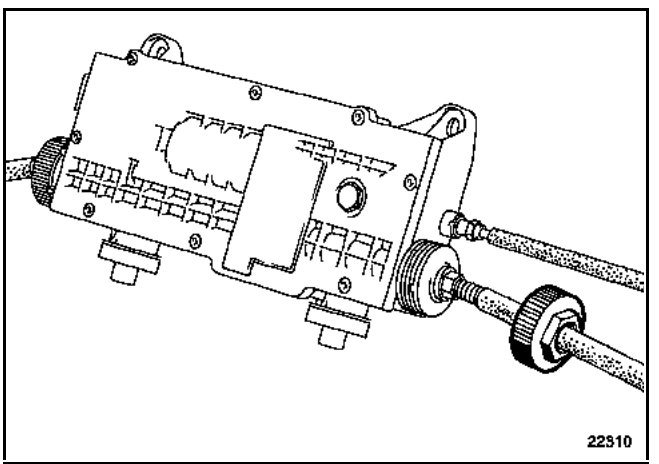
To remove the control unit, pull the unit upwards. Release the rubber mountings. Turn the control unit towards the front.



Pull out, but do not remove, the control unit.

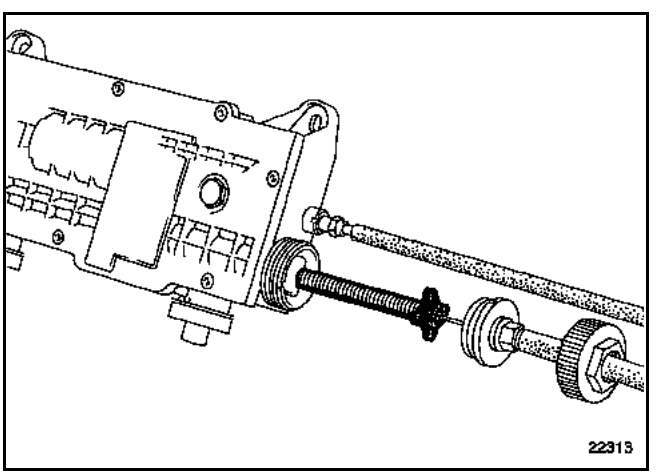
Suspend the control unit.

Simultaneously remove the two parking brake cables and the emergency brake cable.



Insert the control unit shaft in fully on the LH side.

On the LH side, undo the plastic nut on the control unit.

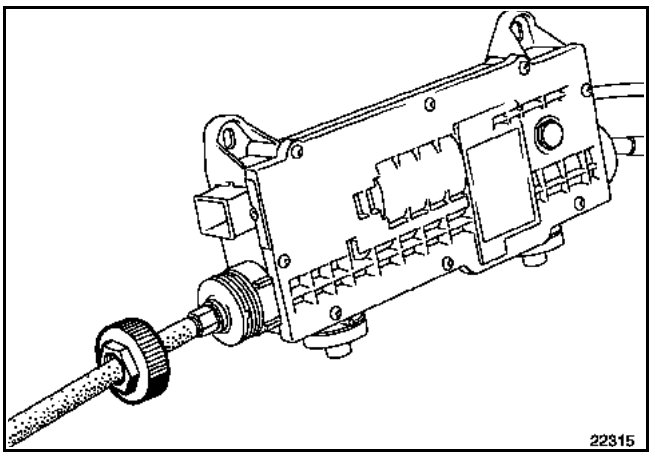


Remove the threaded rod on the splined shaft.

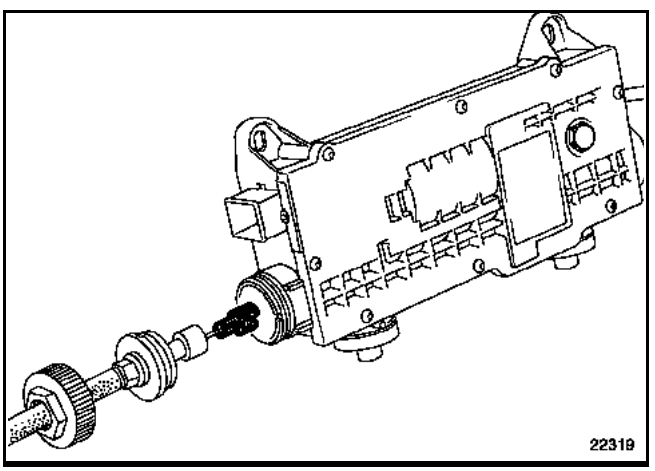
Remove the LH cable.

Insert the control unit shaft in fully on the RH side.

GETtheMANUALS.org



On the RH side, undo:
– the plastic nut on the control unit,
– the locking ring.

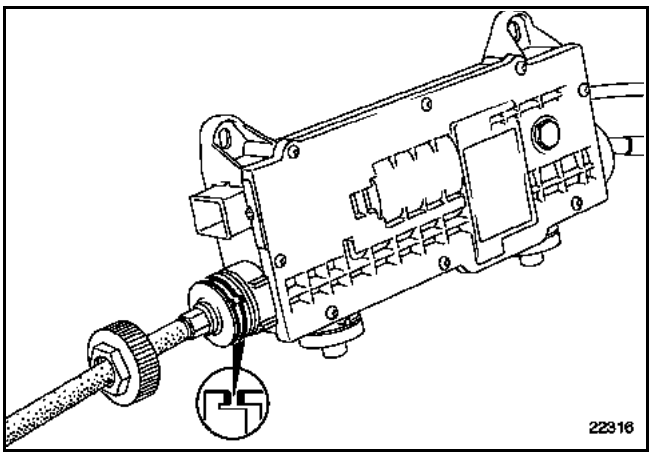


Uncouple the force sensor cable.

REFITTING

Insert the control unit shaft in fully on the LH side.

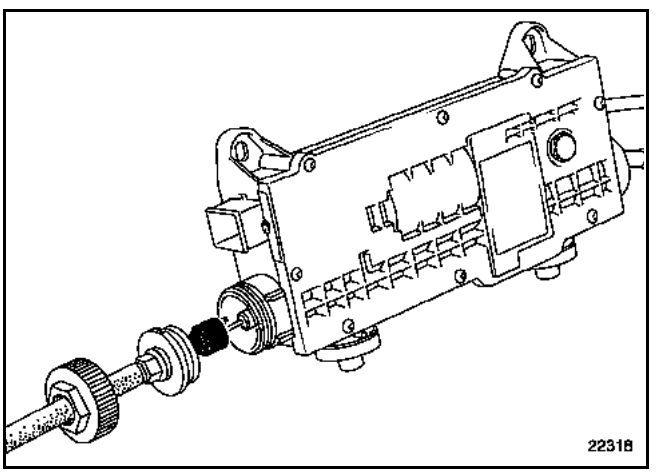
On the LH side, refit:
– the threaded rod in the splined rod, tighten five turns,
– and the crosspiece correctly.



Check the condition of the O-ring. Place the pin in notch (T).

Refit the plastic nut on the control unit.

Insert the control unit shaft fully into the RH side.



From the RH side, pull the locking ring.

Attach the brake cable to the force sensor cable.

Check the condition of the O-ring. Place the pin in notch (T).

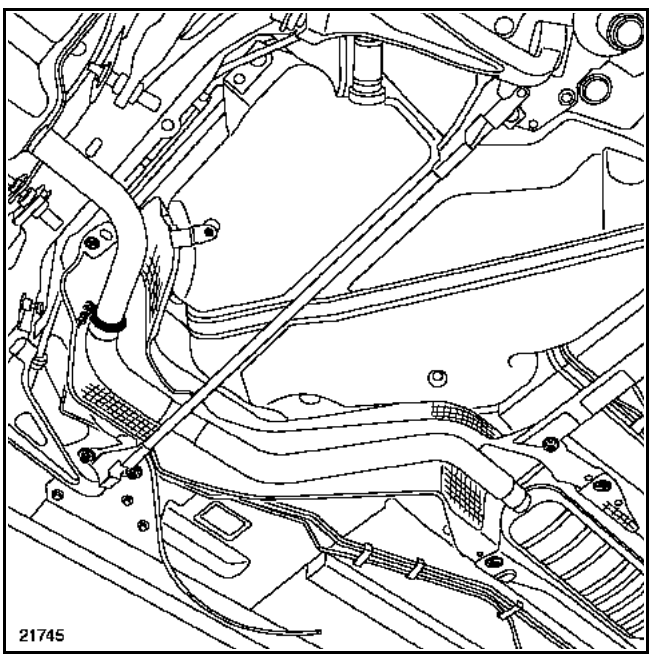
Refit the plastic nut.

GETtheMANUALS.org

Place the cables on the cable supports.

Connect the brake cables. Reattach the brake parking brake cable ends.

Connect the silencer to the exhaust pipe.



Refit:
– the five rear heat shield mountings.
– the rear wheels,
– the wheel mountings (torque tighten),
– the hub caps (depending on equipment).

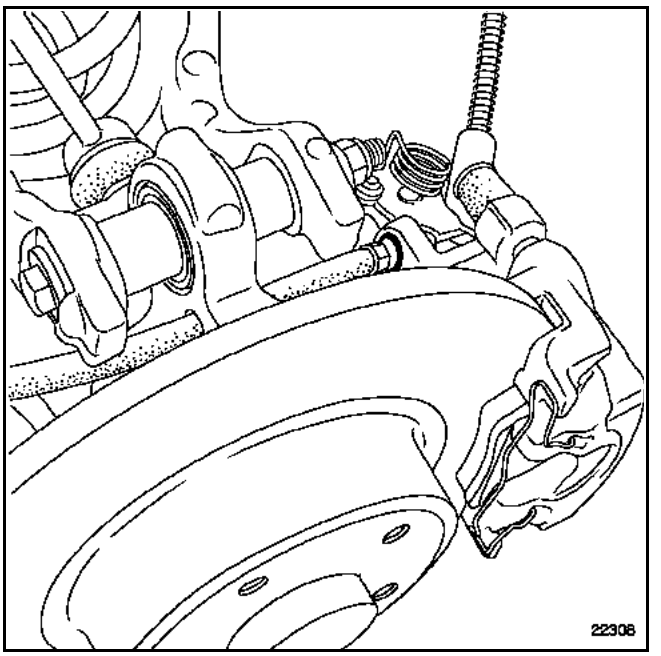
In the passenger compartment, replace the emergency control cable in the handle. Refit the carpet.

Connect the battery.

With the ignition on, release the parking brake. Proceed as follows:
pull the handle; press the button.

NOTE: the automatic parking brake locking function is indicated by a sound. It lasts for several seconds and ends with a clicking sound.

The play compensation is set automatically.



IMPORTANT: check that the cables are correctly fitted in their housing.

If they are not, remove the LH parking brake cable. Refit it turning the screw the correct number of times: five turns.

IMPORTANT: using a diagnostic tool, carry out a complete check and clear the generated fault.

GETtheMANUALS.org

the unit is located on the instrument panel, to the left of the steering wheel.

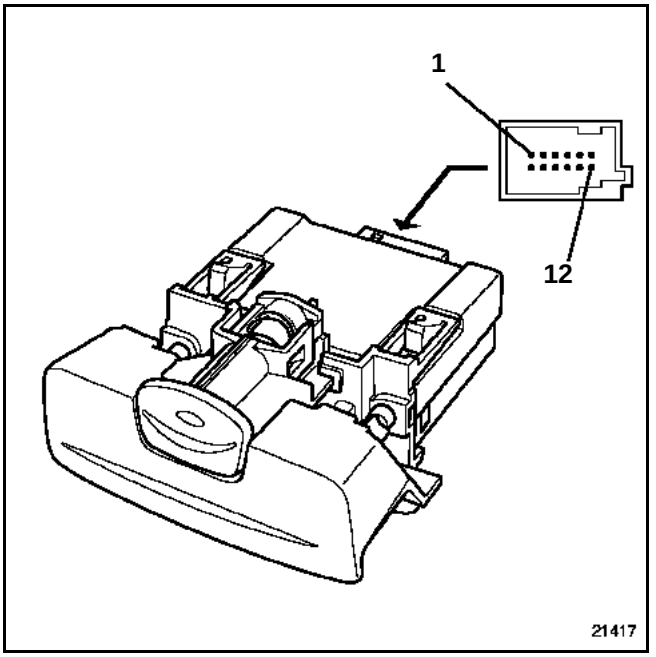
REMOVAL



Remove:
– the cover, located on the lower section of the panel,
– the two bolts located on the lower section.

Pull out the panel system.

Disconnect the connector.

Remove the panel system.

REFITTING

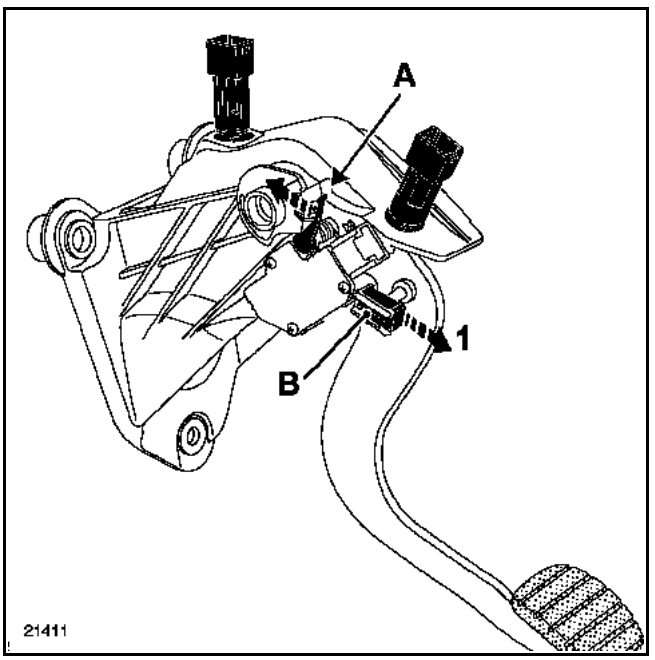
Proceed in the reverse order to removal.

GETtheMANUALS.org

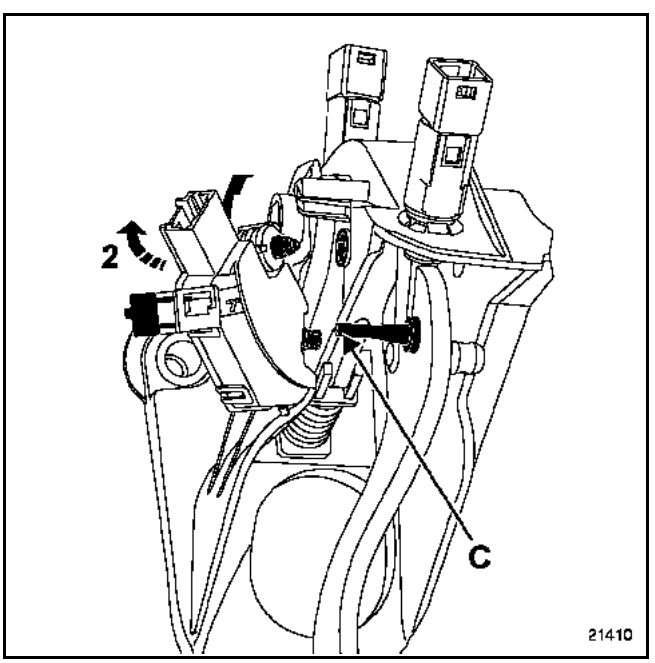
REMOVAL

Disconnect:
– the battery;
– the connector.

Unscrew:
– the section linked to the pedal by moving lock (A) and (1), and sliding it,
– the sensor body by moving bolt (B).



(2) Tilt the sensor. Be careful not to break the lower mounting bracket (C).



REFITTING

Proceed in the reverse order to removal.

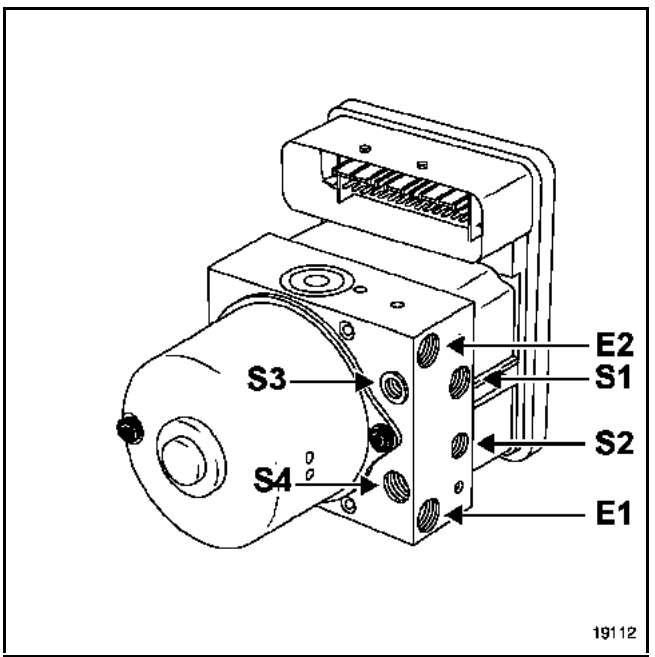
TIGHTENING TORQUES (in daNm)	
Brake pipes on the unit	**1.4**
Aluminium side member tie-rod bolts	**4.4**
Aluminium side member bolts	**4.4**

The MK 60 hydraulic unit incorporates twelve solenoid valves.



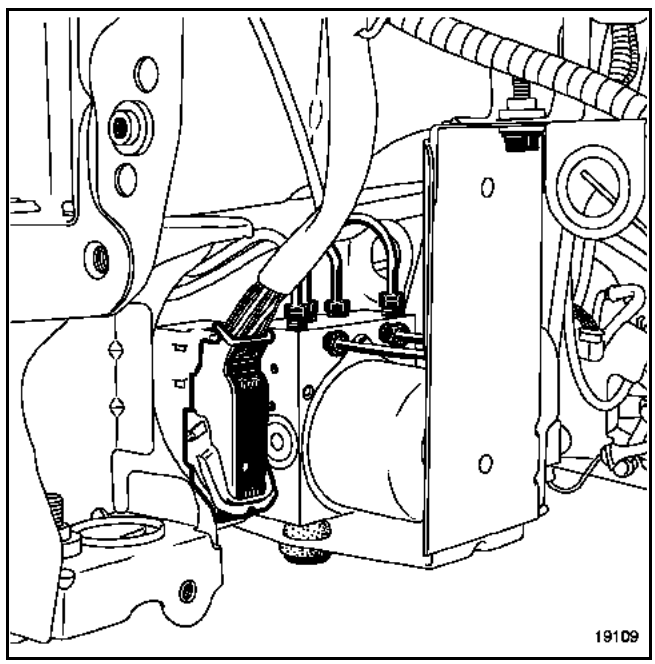
E1 master cylinder primary circuit
E2 master cylinder secondary circuit
S1 output to left-hand front wheel
S2 output to right-hand front wheel
S3 output to right-hand rear wheel
S4 output to left-hand rear wheel

The hydraulic unit is located at the front left-hand side of the vehicle, behind the front bumper.

REMOVAL

Disconnect the battery.

Remove:
– the wheels,
– the left wheel arch,
– the front of the right-hand wheel arch,
– the fog light connections,
– the bumper,
– the Anti-lock Braking System hydraulic unit connector,

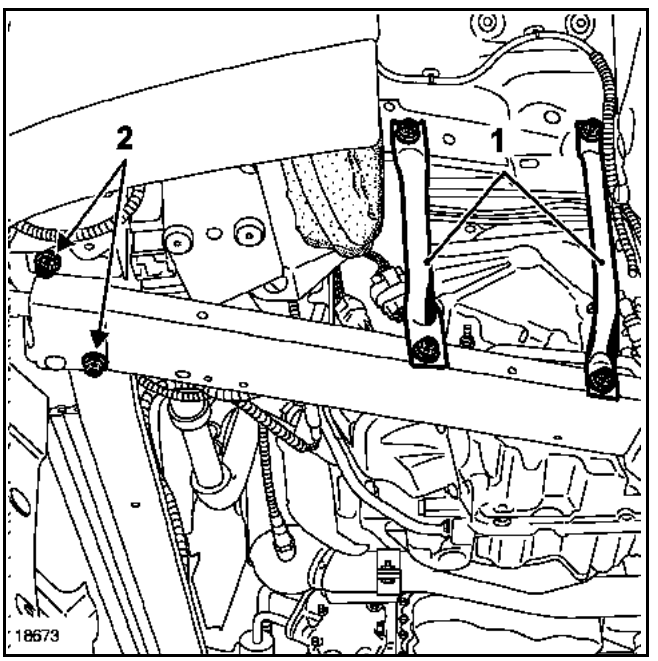


– the Anti-lock Braking System hydraulic unit upper pipes,
– the Anti-lock Braking System hydraulic unit lower pipes,

GETtheMANUALS.org

– the pipe mounting clips on the mounting,
– both left-hand tie-rods (1)

Unscrew but do not remove the two front bolts (2) of the aluminium side member.



Remove:
– the three Anti-lock Braking System hydraulic unit mounting bolts,
– the three Anti-lock Braking System hydraulic unit mounting bolts on its mounting,
– the Anti-lock Braking System hydraulic unit.

REFITTING

Carry out the removal procedure in reverse.

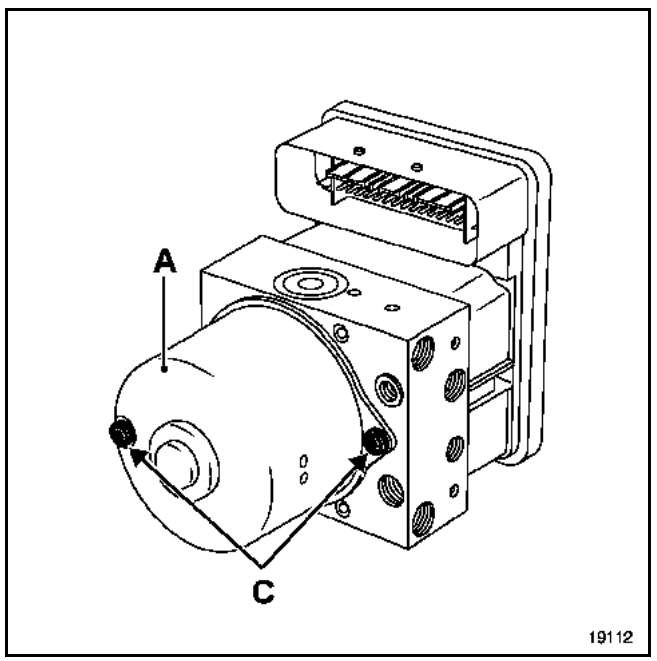
Bleed the braking system (see relevant procedure).

GETtheMANUALS.org

REMOVAL

Removing the computer does not require the entire hydraulic unit to be removed.

Remove:
– the two bolts (C) on the hydraulic pump,

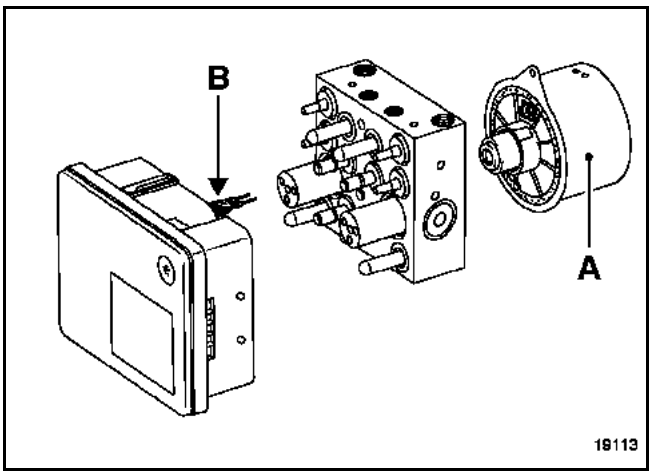


– the computer.

IMPORTANT: when it is being removed, hydraulic pump (A) must be pressed onto the pressure modulation unit.

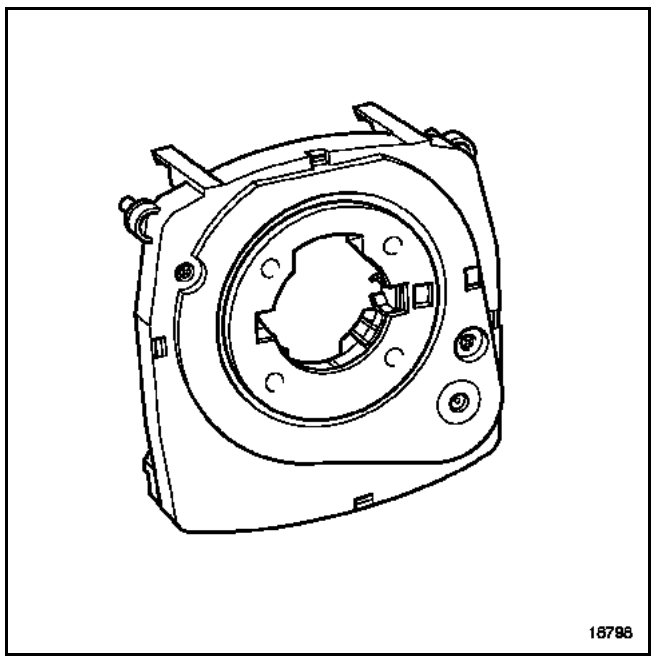
REFITTING

When a new computer is being fitted, remember to attach interconnection fork (B) between the pressure modulation unit and the computer.



GETtheMANUALS.org

The Electronic Stability Program uses a steering wheel angle sensor to measure the direction selected by the driver. This signal is interpreted as a driver command.



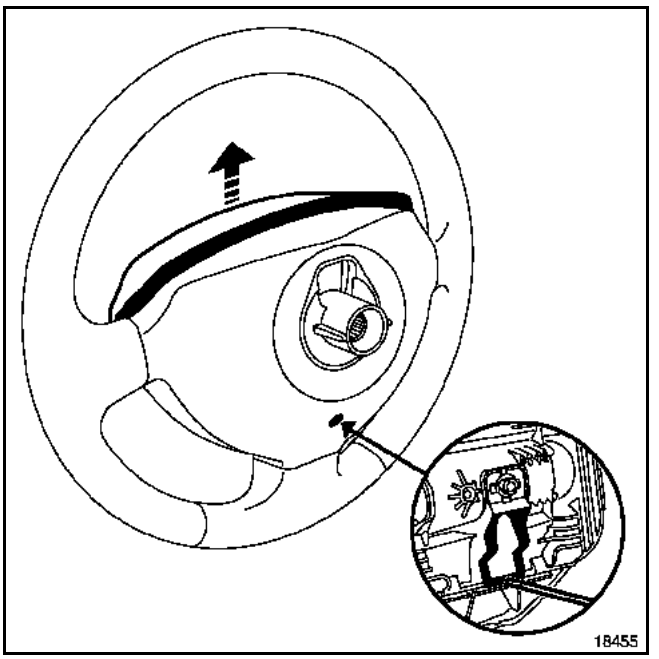
This sensor is located on the steering column and is clipped onto the rotary switch assembly.

REMOVAL

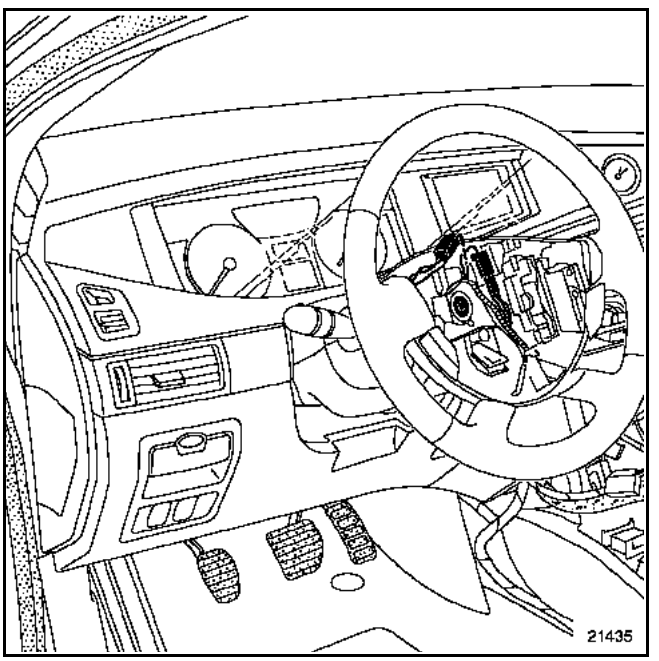
Set the vehicle wheels straight.

Before performing any operation on the airbag systems, lock the computer using the diagnostic tools.
Refer to **Section 88C**.

Remove:
– the driver's front airbag module,

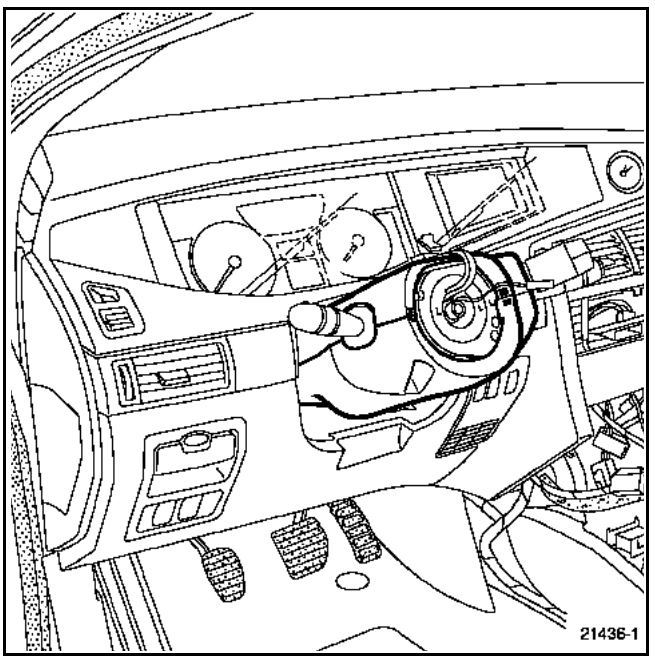


– the air bag connectors,
– the connectors in the steering wheel,
– the steering wheel bolt,

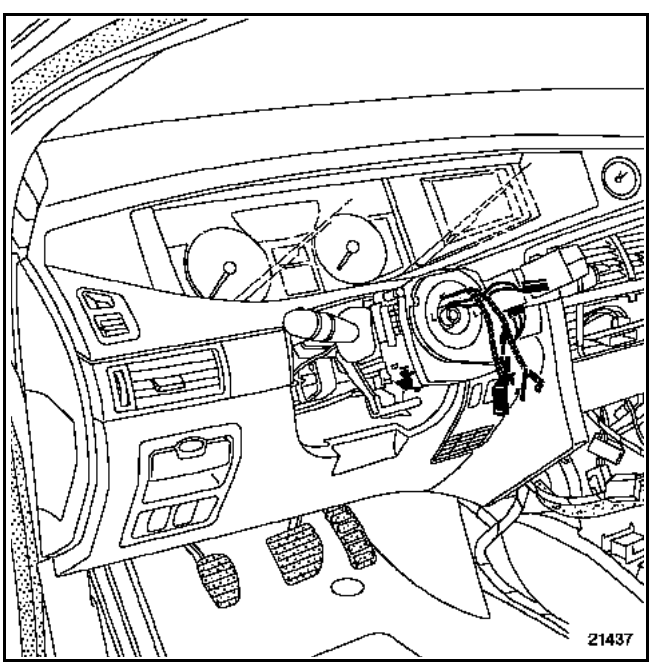


GETtheMANUALS.org

– the two mounting bolts for the half-shells,
– the upper half-shell,
– the lower cowling.



Disconnect the connector from the steering wheel angle switch.



Lift up the upper and lower clips in pairs by gently tilting the sensor body.

Remove the steering wheel angle sensor.

REFITTING

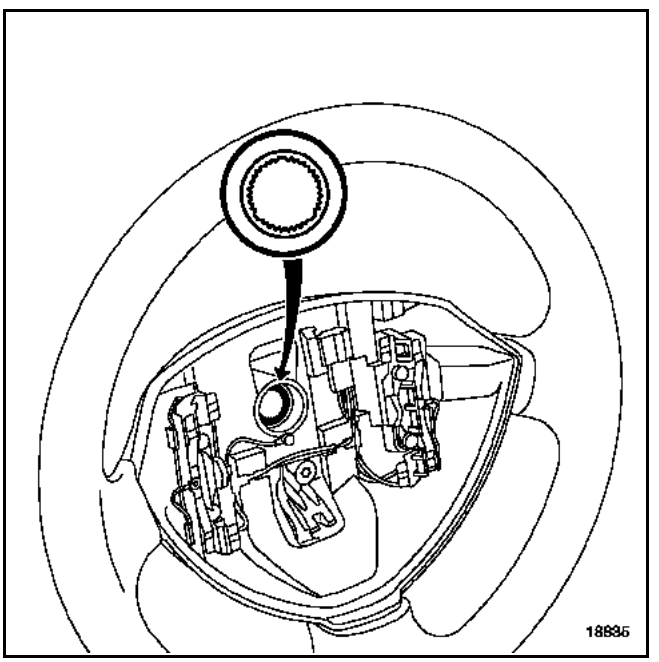
If the sensor is new, remove its pin. Keep the yellow mark visible in the centre of the window.

Centre the sensor using the guides.

Lock the four clips.

Carry out the removal procedure in reverse.

IMPORTANT: the steering wheel splines are made so that the wheel can only be fitted one way. **The steering wheel should fit back into the splines easily.** Take care not to damage the splines.



The steering wheel bolt and washer must be replaced each time they are removed. Torque tighten (to 4.4 daNm).

GETtheMANUALS.org

STEERING WHEEL ANGLE SENSOR CALIBRATION

Switch on the ignition.

Turn the steering wheel to an angle greater than **4°**, corresponding to approximately 1 cm of the circumference of the steering wheel rim. This activates the sensor.

Position the vehicle with the wheels straight and the steering wheel horizontal (with a tolerance of less than **± 15°** on this angle).

Establish dialogue with the Electronic Stability Program computer using the diagnostic tool.

Run sensor programming procedure: **UP003**.

When the operation has been successfully completed, clear the faults from the air bag computer.

Unlock the air bag computer.

Refer to **section 88C**.

Switch off the ignition.

GETtheMANUALS.org

TIGHTENING TORQUE (in daNm)	
Sensor nut	0.8

The combined unit for the two sensors is located behind the gear lever.

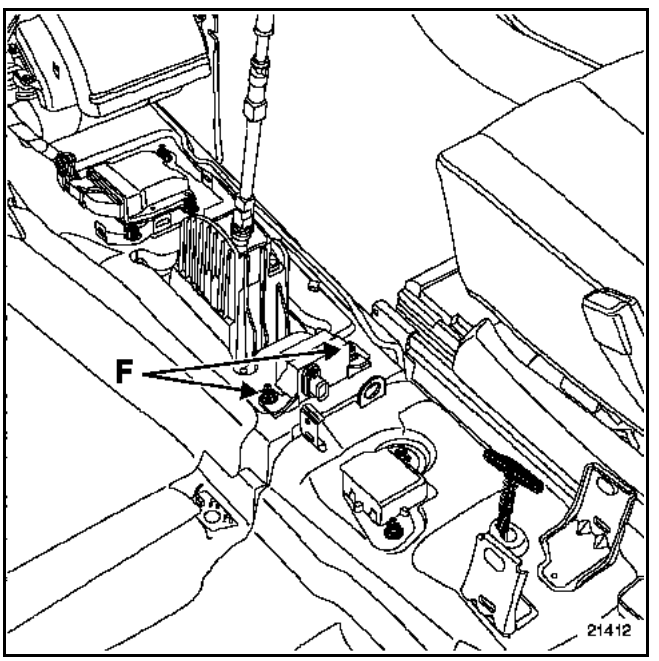
REMOVAL

In the passenger compartment

Remove:
– the gear lever gaiter,
– the centre console upper plate.

Disconnect the connectors.

Remove:
– the two mounting nuts (F) for the combined sensor plate,

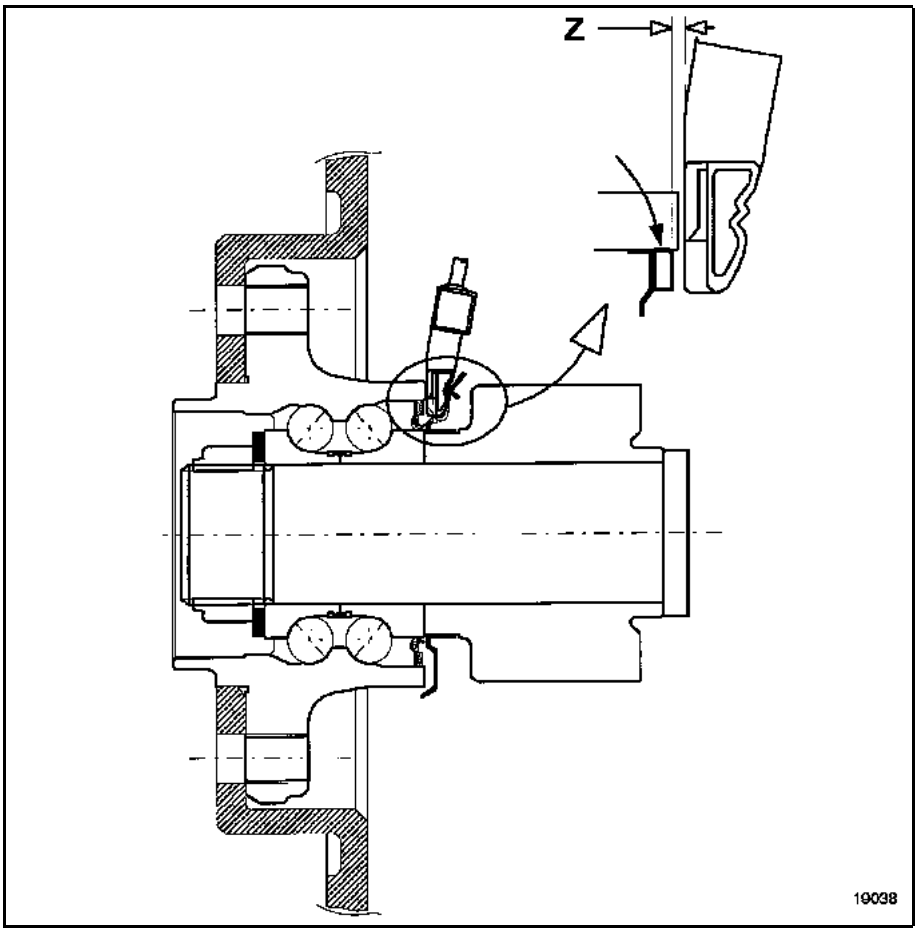


– the combined sensor plate.

REFITTING

Carry out the removal procedure in reverse.

GETtheMANUALS.org

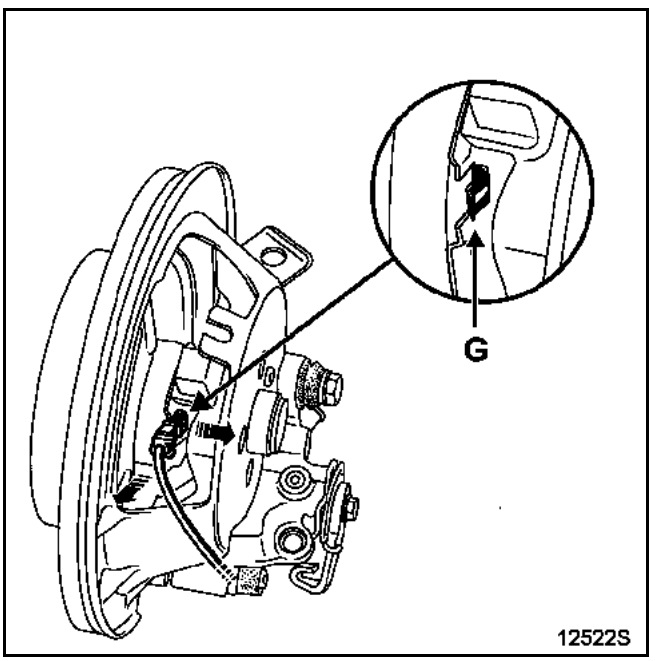


GETtheMANUALS.org

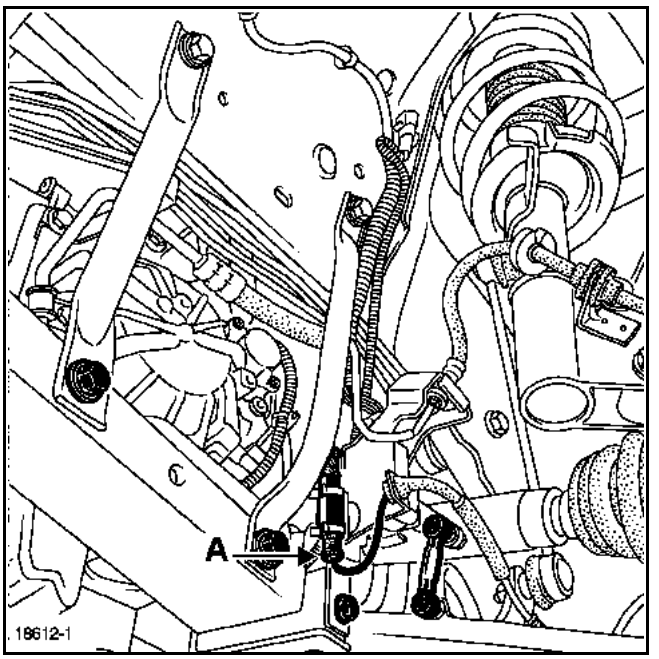
REMOVAL

Using a flathead screwdriver, free the sensor holder tab at (G).

Remove the sensor without pulling on the wire.



Disconnect the sensors:
– at the front, from the connector housings behind the wheel arch (A),



– at the rear, in the wheel arches behind the wheel arch liner.

REFITTING

Clip the connectors in place.

Connect the connectors in the same order they were removed.

(The air gap for the front **Z = 0.6 mm**, the rear **Z = 0.8 mm** with a tolerance of **± 0.5 mm**).

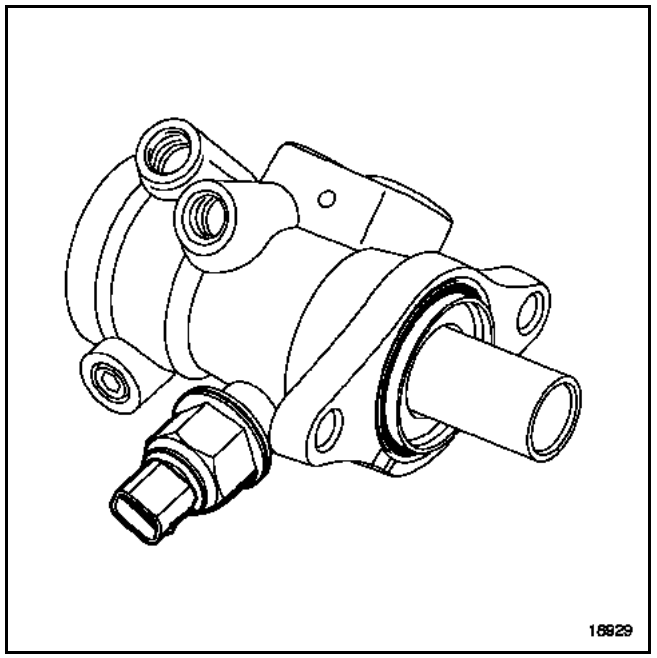
NOTE: It is essential to make sure that the connectors are correctly connected to prevent risk of breakdowns.

The sensor must be fitted manually. Do not knock it when installing it.

Do not pull on the ABS wiring because it is easily damaged.

GETtheMANUALS.org

TIGHTENING TORQUE (in daNm)	
Pressure sensor	2.5



It informs the computer of the hydraulic pressure in the master cylinder.

REMOVAL

Place the vehicle on a lift.

Attach the pedal lock to prevent fluid from escaping.

IMPORTANT: drain the brake fluid to prevent damage to the mechanical parts and bodywork around the braking system.

Remove:
– the air filter hose,
– the expansion bottle.

Fill the new sensor using a syringe to avoid causing any air bubbles in the circuit.

NOTE: when the sensor has been filled, the brake fluid should form a dome on the sensor outlet.

Remove the pressure sensor using a cloth. Replace it immediately with the new pressure sensor.

REFITTING

Carry out the removal procedure in reverse.

GETtheMANUALS.org

SPECIAL TOOLING REQUIRED
Brake circuit bleeding device (approved by Renault) Diagnostic tool

To ensure its correct operation, a brake circuit must be free of gas (external air, water vapour etc.). Whenever the circuit is opened, the air entering the circuit must therefore be bled out after it is closed. When the brake fluid is old (see service intervals), this leads to a high level of humidity which may create steam in the circuit, in certain extreme conditions. When the fluid is old, the circuit must be drained completely and then the air contained in it must be bled.

Prerequisites for any bleeding of air from the brake circuit:
– make sure that there are no leaks in the fuel system,
– fill brake fluid reservoir (1) to maximum level,
– depress the brake pedal several times, so that the moving components of the braking system (pistons, brake shoes, discs or drums) all make contact with each other,
– Add brake fluid (1) to adjust the level in the reservoir.
– set up the bleeding device and top up brake fluid level (1) to its maximum (refer to the driver's handbook, the advised pressure being between **2 bar** and **2.5 bar**).

We distinguish between two types of air bleeding from the brake circuit:
– a conventional air bleed, which does not allow bleeding of air from the ABS hydraulic unit secondary circuit (2),
– bleeding of air from the regulation circuit; this bleed should be performed only if the brake pedal travel, considered correct following conventional bleeding (3), becomes incorrect.

(1) Brake fluid **SAEJ 1703 DOT4**
For optimized operation on vehicles fitted with the Electronic Stability Program, Renault recommends a brake fluid with low viscosity in cold conditions (maximum **750 mm^2/s at - 40°C**).

(2) The regulation circuit is inside the hydraulic unit. It is isolated from the conventional braking circuit insofar as the solenoid valves are not controlled by the diagnostic tool computer.

(3) Confirmed by a road test with the hydraulic unit regulation in operation.

GETtheMANUALS.org

THE CLASSIC OR CONVENTIONAL BLEED

This procedure must be used after one of the following components has been removed or replaced:
– the master cylinder,
– the pressure sensor,
– the hydraulic unit (new and pre-filled),
– a rigid pipe,
– a hose,
– a calliper.

Precautions to be taken during this braking circuit bleeding operation:
– The vehicle ignition must be off to ensure that the hydraulic unit solenoid valves do not operate.
– Check the brake fluid levels of the braking circuit and the bleeding device.

Connect the bleeding device to the braking circuit, paying attention to the features of this equipment (refer to the operating instructions).

Bleed the circuit by opening the bleed screws in the following order (remember to close them after the operation):
– rear right-hand circuit,
– front left-hand circuit,
– rear left-hand circuit,
– front right-hand circuit.

With the engine switched off, check the pedal travel, if it is not correct, restart the bleeding procedure.

Top up the brake fluid level in the reservoir having disconnected the bleeding device. Check the tightness of the bleed screws and that the sealing caps are all present.

Confirm the efficient regulation of the hydraulic unit by performing a road test.

The effectiveness and balance of the vehicle braking system may be checked on a brake test bench or by performing a road test.

NOTE: the braking circuit is the X type, therefore it is possible to carry out an isolated bleeding operation on a single circuit (when the hose, calliper etc. are being replaced).

GETtheMANUALS.org

BLEEDING THE REGULATION CIRCUIT

NOTE: this bleed must only be carried out if the brake pedal travel, judged to be correct at the end of a classic bleed (confirmed by a road test with hydraulic unit regulation in operation), becomes incorrect.

This procedure must be used if the hydraulic unit is suspected of containing air (whether or not it has been removed).

Precautions to be taken during this braking circuit bleeding operation:
– Check the brake fluid levels of the braking circuit and the bleeding device.

Connect (refer to the operating instructions):
– the bleeding device to the vehicle braking circuit,
– the diagnostic tool.

Carry out a Conventional bleed.

Repeat these operations (1) on each circuit following the described order (2):

(1) Repeat these operations:
– Depress the brake pedal several times.
– Activate the circuit solenoid valve using the diagnostic tool.
– Open the bleed screw*. Once the air has been removed, close the bleed screw again.

* While the solenoid valve is being activated, keep the pedal fully depressed.

(2) Bleed the circuits in the following order:
– rear right-hand (diagnostic tool command **AC156**),
– front left-hand (diagnostic tool command **AC153**),
– rear left-hand (diagnostic tool command **AC155**),
– front right-hand (diagnostic tool command **AC154**).

Top up the brake fluid level in the reservoir having disconnected the bleeding device. Check the tightness of the bleed screws and that the sealing caps are all present.

During a road test, trigger braking regulation to confirm that the brake pedal travel is correct. If this is not correct, bleed the regulation circuit again.

The effectiveness and balance of the vehicle braking system may be checked on a suitable brake test bench.

GETtheMANUALS.org

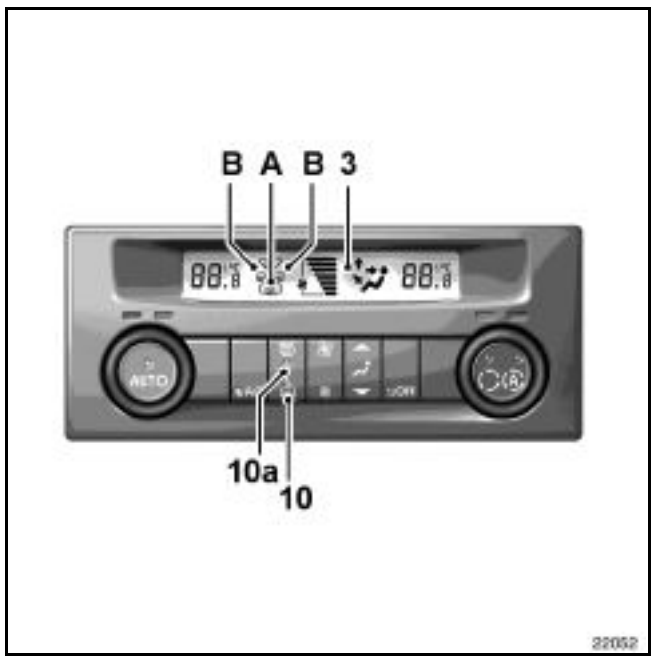
VEHICLE WITHOUT HEATED WINDSCREEN

REAR SCREEN DE-ICING/DEMISTING



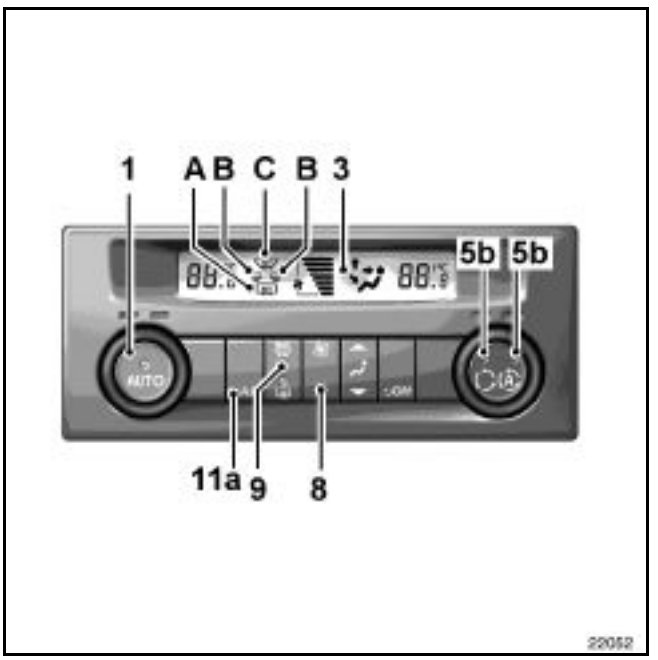
Press button (10), in operation indicator lamp (10a) comes on and indicator lights (A) and (B) appear on the display (3).

This function allows rapid electric demisting of the the rear screen and the de-icing electric rear-view mirror.

To exit this function:
– it switches off automatically after a time determined by the system,
– press again on button (10).

VEHICLE WITH HEATED WINDSCREEN

WINDSCREEN AND REAR SCREEN DE-ICING/ DEMISTING



"SEE CLEAR" FUNCTION

Press button (9), the in operation indicator lamp comes on, and indicator lights (A), (B) and (C) appear on display (3).

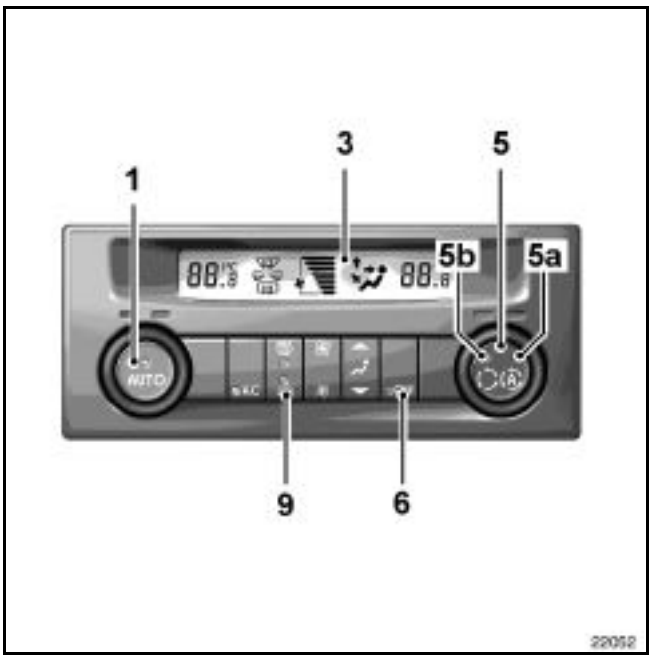
The **Auto** button indicator light switches off: the air distribution operating mode is no longer automatic.

This function allows the windscreen, front side windows, rear-view mirrors and rear screen to demist and de-ice rapidly. To increase efficiency, it operates the air conditioning automatically (indicator light 11a on) and disables air recirculation (indicator lights 5a and 5b off).

To exit this function:
– it switches off automatically after a time determined by the system,
– press button (9) again.

GETtheMANUALS.org

AIR RECIRCULATION



Air is taken from the passenger compartment and is recycled, with no outside air entering the vehicle.

In automatic mode, the system controls the going into recycling mode according to the exterior vehicle emissions (exhaust fumes).

Successive presses on button (5) obtain:
– automatic recycling (in operation indicator lamp 5a on),
– manual recycling (in operation indicator lamp 5b on),
– the external air (indicator lamps off).

Prolonged use of the air recirculation mode may cause the windows to mist up or lead to odours, as the air is not renewed.

You are therefore advised to return to normal mode (external air or automatic recirculation) as soon as air recycling is no longer required, by pressing button (5).

Stopping the system

Press button (6).

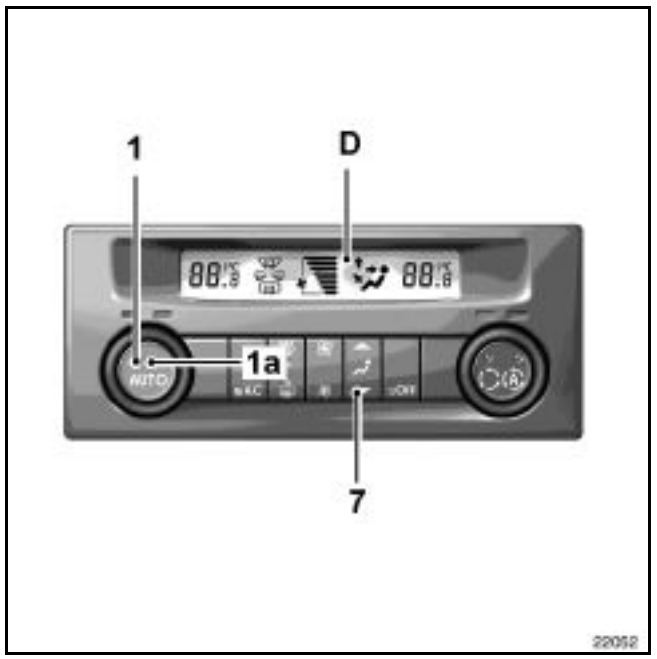
The in operation indicator lamp comes on. No signal is displayed on the display (3).

The installation has been switched off. This function isolates the passenger compartment from the external environment.

To exit this function, press button (1) or (9).

GETtheMANUALS.org

PERSONALISED AIR DISTRIBUTION OPERATION



The normal operation of the system is automatic mode, but it is possible to modify the choice offered by the system (amount of air, distribution, etc).

Press button (7) to exit automatic mode (indicator light 1a switches off).

There are six possible air distribution options which are obtained by pressing button (7) successively.

The indicator arrows (D) display the option selected:
– the arrow pointing upwards represents air flow circulating from the windscreen demisting outlet,
– the arrow pointing downwards represents air flow circulating around the footwell,
– the horizontal arrow represents air flow circulating from the vents on the dashboard.

The manual air distribution option turns off automatic mode button in operation indicator lamp (1), but only air distribution is no longer controlled automatically by the system.

To return to automatic mode, press button (1).

GETtheMANUALS.org

Fitted in front of the external air intake, it filters the air and ensures the air is totally clean before being let into the passenger compartment.

REMOVAL

IMPORTANT: do not disconnect the CD rom reader until the system has shut down completely (approximately 45 seconds).

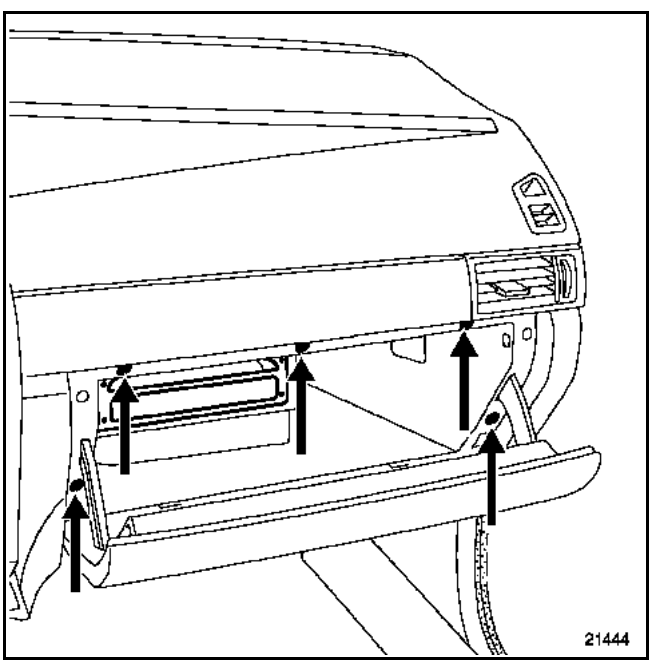
Open the glovebox.

Remove the navigation CD player on the versions concerned.

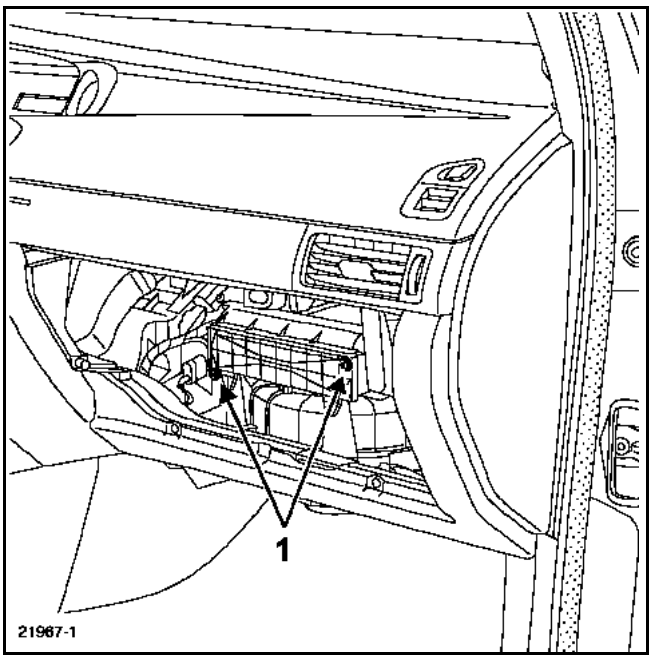
Disconnect the connections and remove the CD player.

Remove the glovebox bolts and connectors.

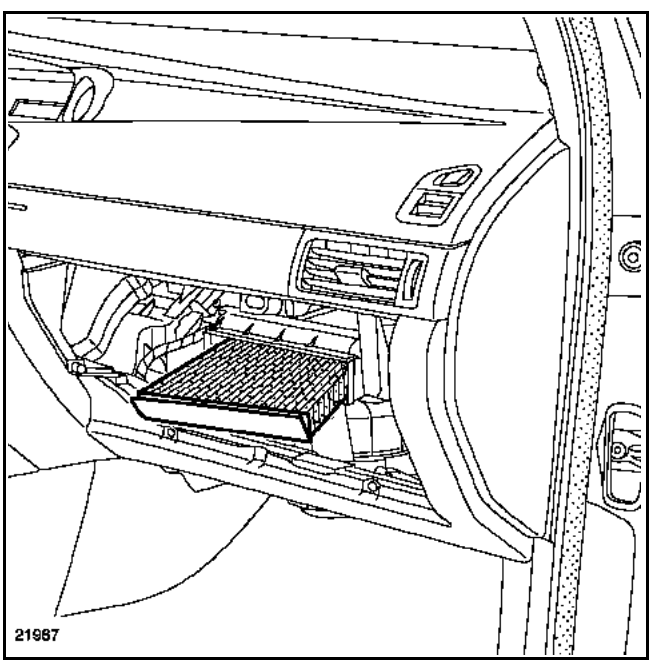
Remove the glovebox.



Remove the two passenger compartment filter cover bolts (1).



Remove the passenger compartment filter.



REFITTING

Carry out the removal procedure in reverse.

NOTE: to initialise the system, refer to the "**Initialisation**" section.

GETtheMANUALS.org

Fitted in front of the external air intake, it filters the air and ensures the air is totally clean before being let into the passenger compartment.

REMOVAL

IMPORTANT: do not disconnect the CD rom reader until the system has shut down completely (approximately 45 seconds).

Open the glovebox.

Remove the navigation CD player on the versions concerned.

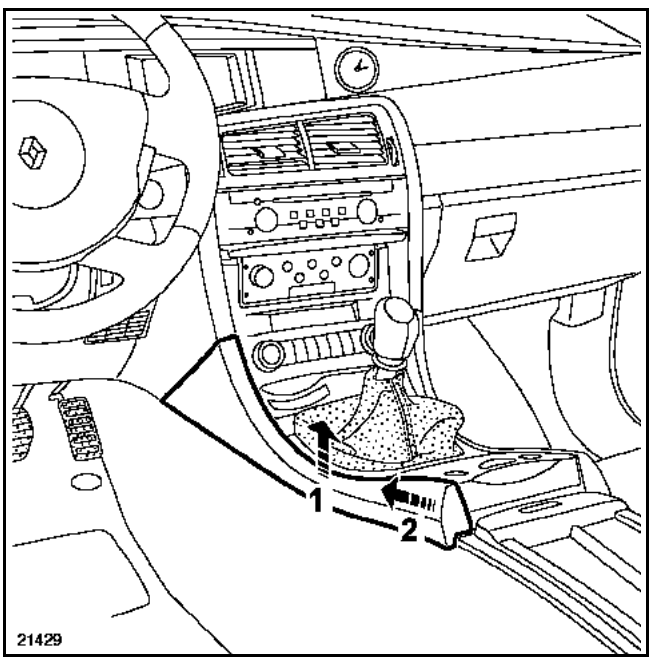
GETtheMANUALS.org

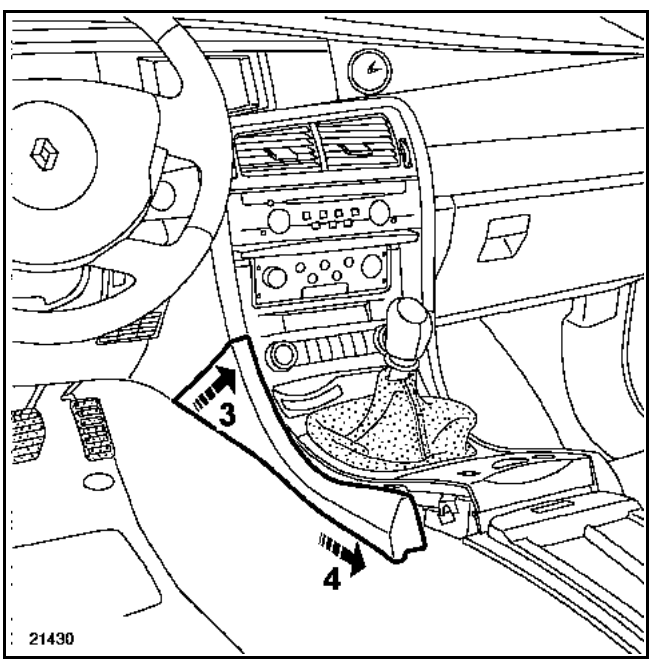
REMOVAL

Disconnect the battery.

Unclip the rear section of the rear lining by pulling (1) then (2).

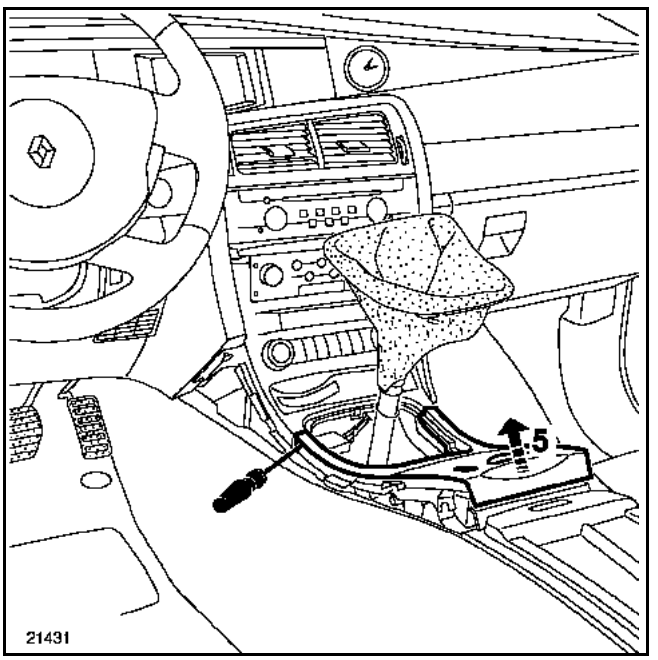


Unclip:
– the front section lining at (3) then at (4),

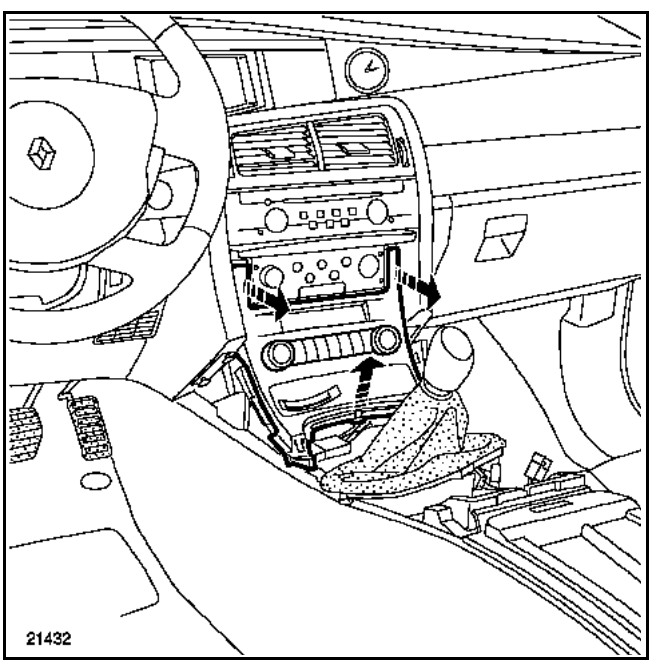


– the gear selector lever connecting line.

Using a flat screwdriver unclip the front and rear sections of the ashtray support (5).



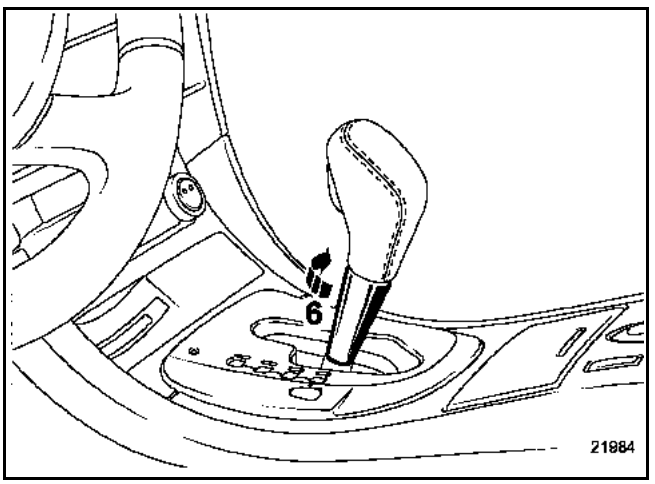
Unclip the card reader mounting from the upper and lower sections.



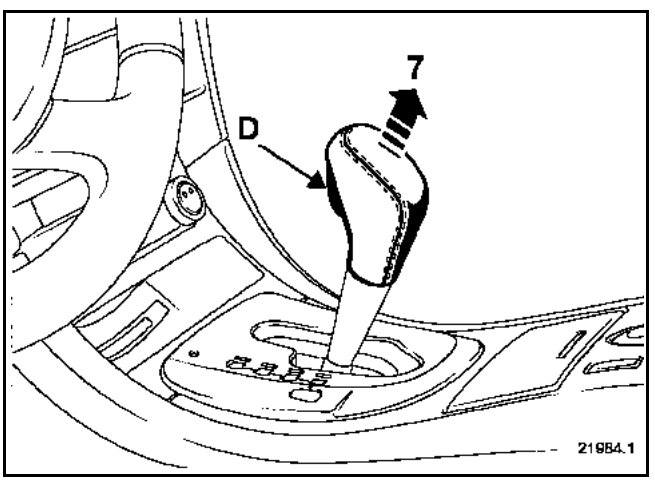
GETtheMANUALS.org

SPECIAL NOTES ON THE AUTOMATIC GEAR LEVER

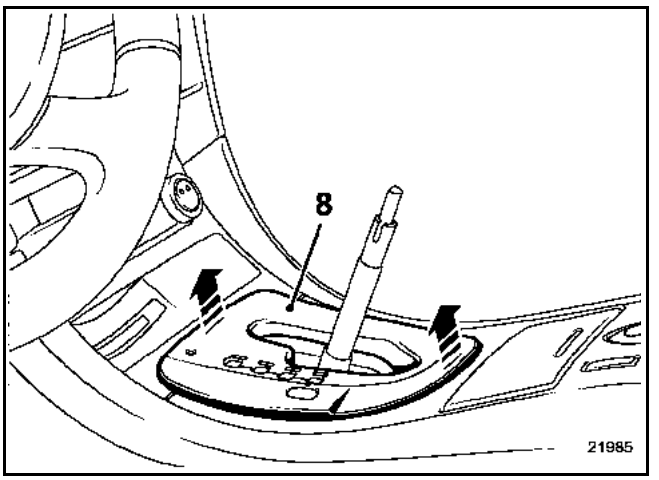
REMOVAL



Rotate lower section (6).



Press command unlocking button (D); pull out lever (7).



Unclip gear lever plate (8).

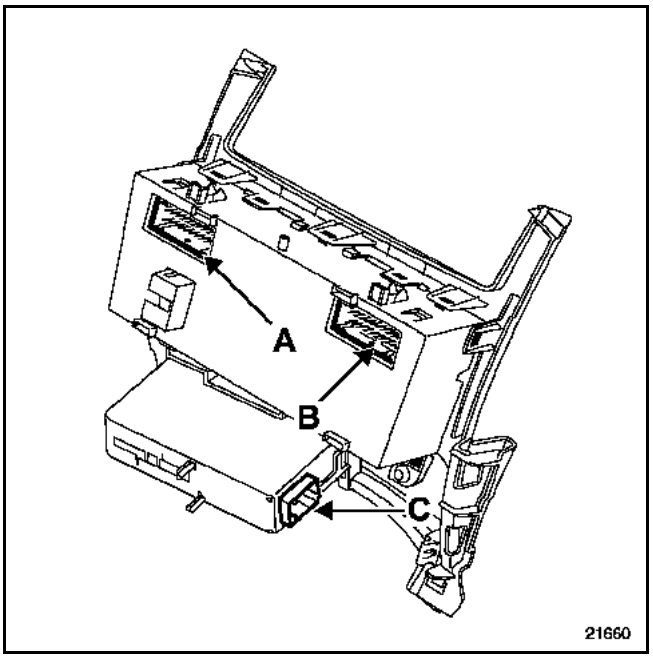
REFITTING

Clip on the gear lever plate.

Assemble the two gear lever sections: clip together.

GETtheMANUALS.org

Remove the card reader/control panel mounting in order to disconnect connectors (A), (B) and (C) from the air conditioning control panel and the card reader.



Unclip the control panel from its mounting.

REFITTING

Carry out the removal procedure in reverse.

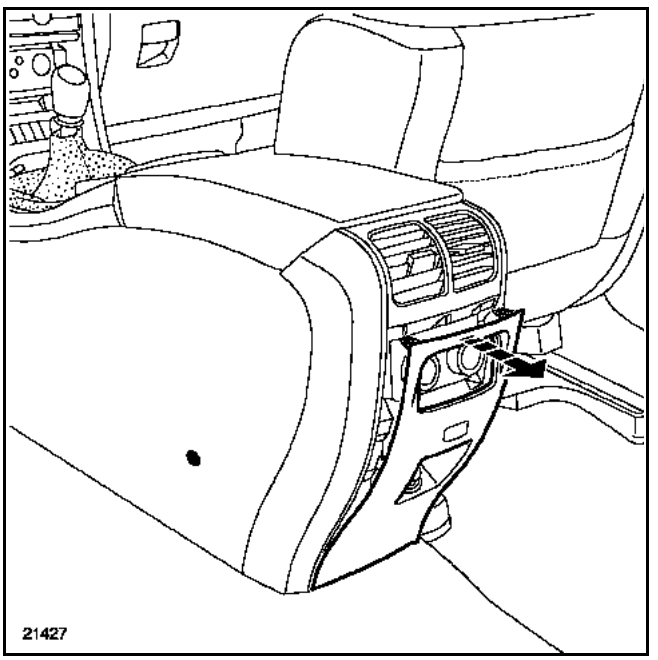
NOTE: reinitialise after connecting the battery.

IMPORTANT: do not forget to carry out the programming needed for the vehicle to operate correctly after connecting the battery (refer to **section 80A**).

GETtheMANUALS.org

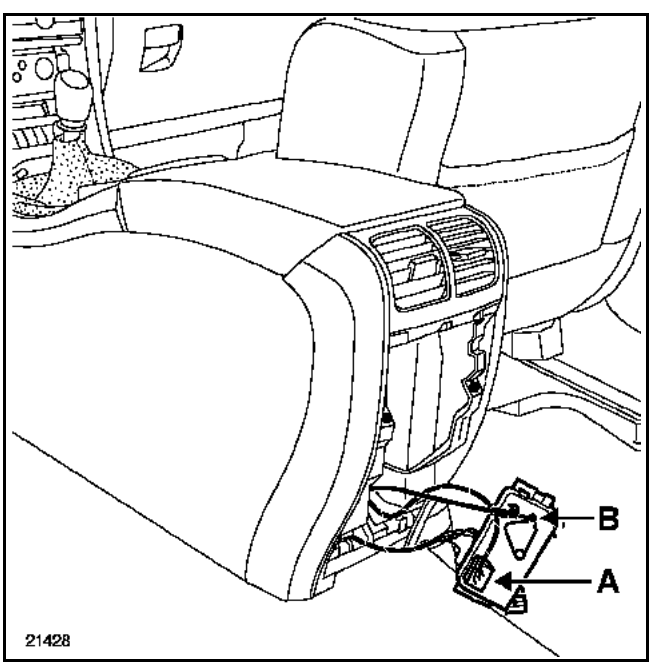
REMOVAL

Unclip the cigarette lighter mounting.



Remove the centralised door locking switch connections and the cigarette lighter.

Unclip and remove the heater control.



Disconnect connector (A) and remove control cable (B).

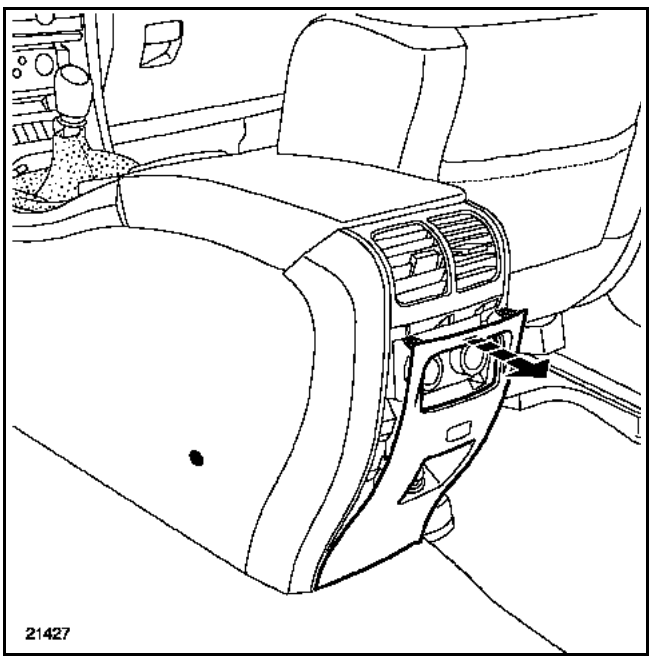
REFITTING

Carry out the removal procedure in reverse.

GETtheMANUALS.org

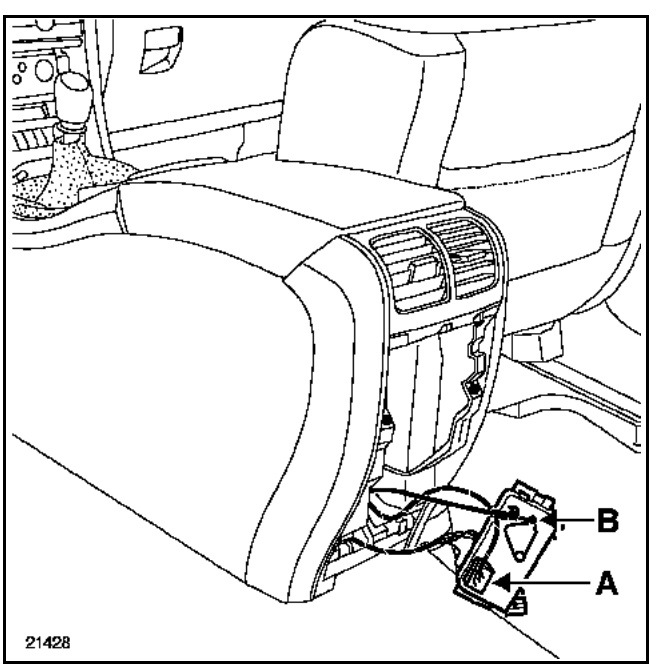
REMOVAL

Unclip the cigarette lighter mounting.



Remove the centralised door locking switch connections and the cigarette lighter.

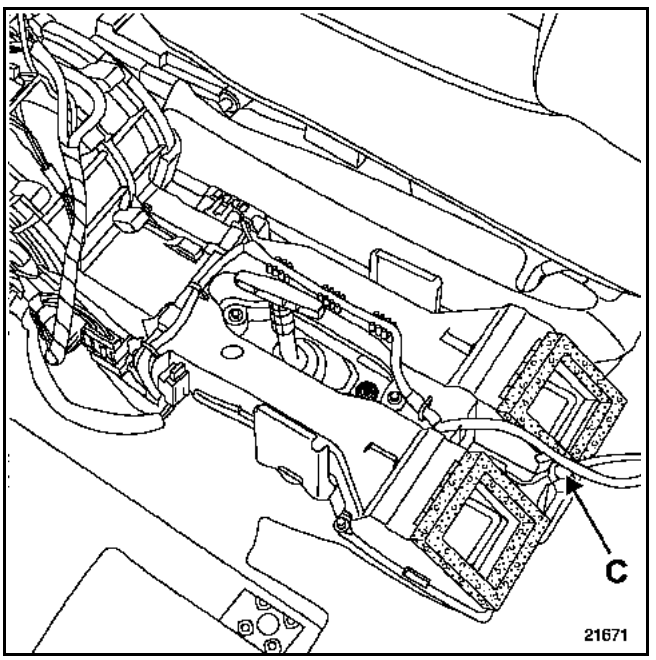
Unclip and remove the heater control.



Disconnect connector (A) and remove control cable (B).

GETtheMANUALS.org

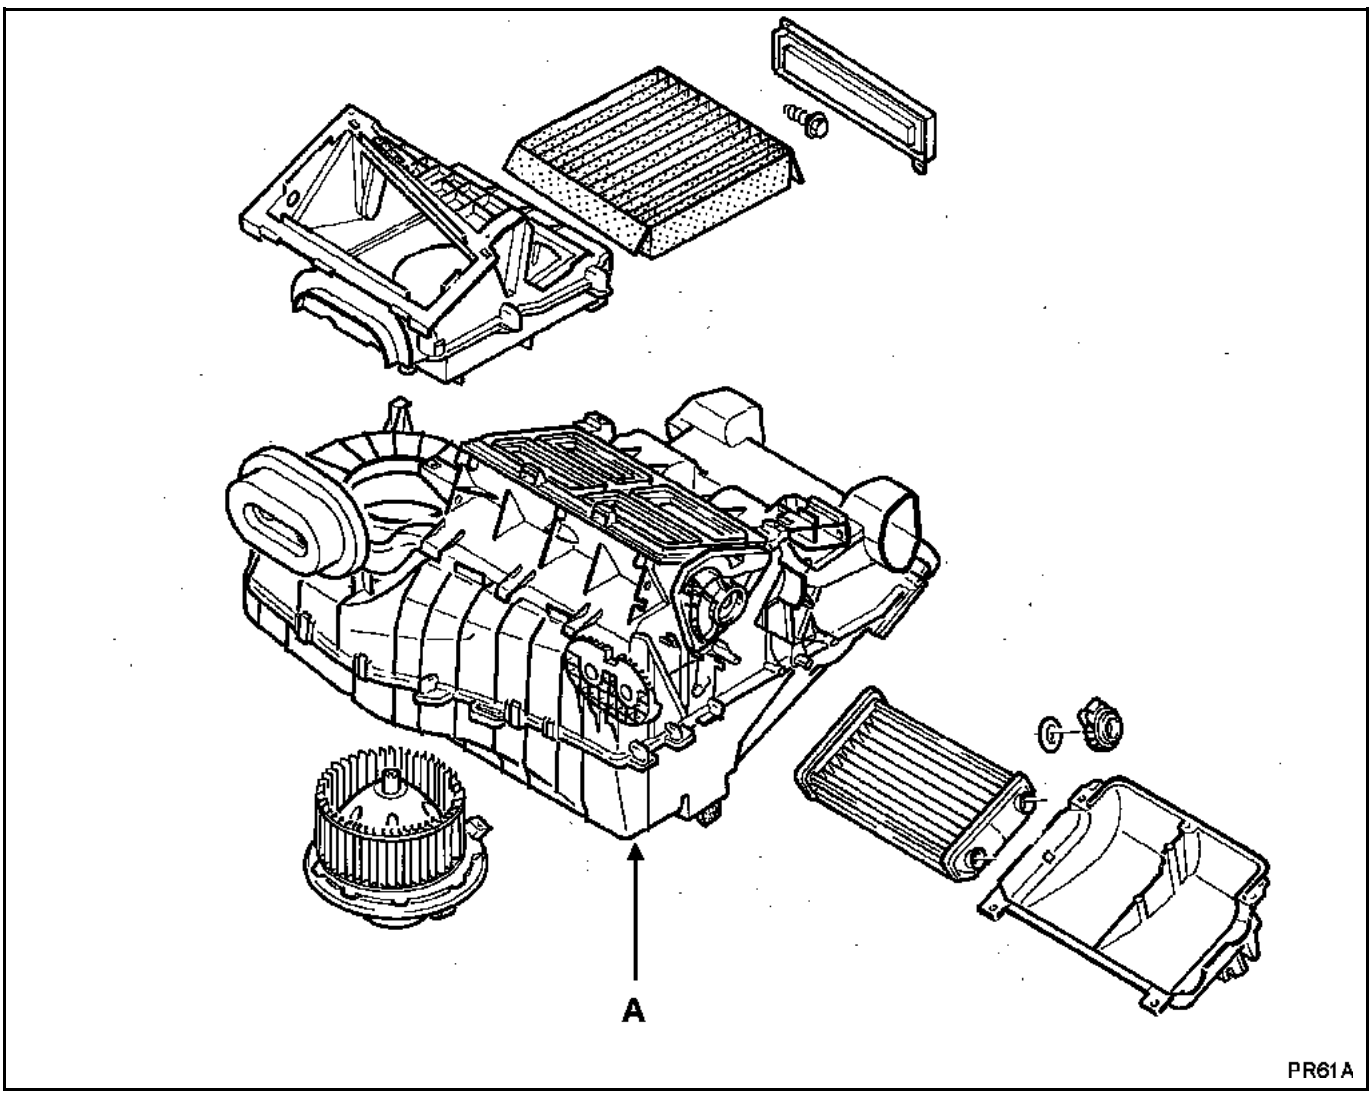
Remove:
– the centre console (see **section 57A: "Centre console"**),
– control cable (C).



REFITTING

Carry out the removal procedure in reverse.

GETtheMANUALS.org



REMOVAL - REFITTING

The air distribution unit (A) can be accessed after removing the dashboard and the passenger compartment reinforcement beam.

Follow the remove and refit instructions in **section 62: "Removal and refitting the evaporator unit"**.

IMPORTANT: before reconnecting the air bag cushion, it is necessary to apply the procedure for checking the correct operation of the system:

- Check that the air bag warning light on the instrument panel lights up when the ignition is switched on (computer unlocked). Connect a dummy ignition module to the connector for each air bag cushion and check that the warning light goes out.
- Switch off engine, connect the air bag cushion in place of the dummy ignition module and fix the air bag to the steering wheel.
- Switch on the ignition, check that the air bag warning light lights up for 3 seconds when the ignition is switched on and then goes out and remains out.
- Refer to **section 88** if the light fails to operate in this way.

GETtheMANUALS.org

ADJUSTMENT AND DISTRIBUTION OF THE HEATING OUTPUT

There are two ways of varying the heating output:
– air flow,
– the air temperature.

The air temperature is adjusted using the various settings of the mixing flaps. In the air distribution unit, the air is diverted depending on the position of the mixing flaps, passes through to the heater radiator and is then mixed with cold air to obtain the air temperature requested by the user.

Air is supplied and distributed to the passenger compartment through:
– a five-mode air distributor,
– four front air vents, two rear air vents,
– two front footwell ducts,
– two rear footwell ducts,
– a windscreen demisting/de-icing vent,
– two front side window demisting/de-icing vents.

GETtheMANUALS.org

REMOVAL

Put the car on a two post lift.

Disconnect the battery.

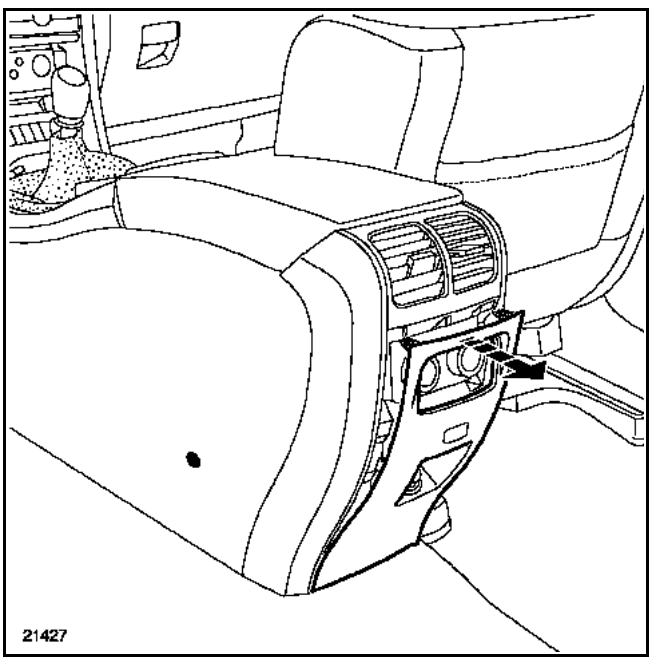
Remove the engine undertray.

Drain the cooling circuit.

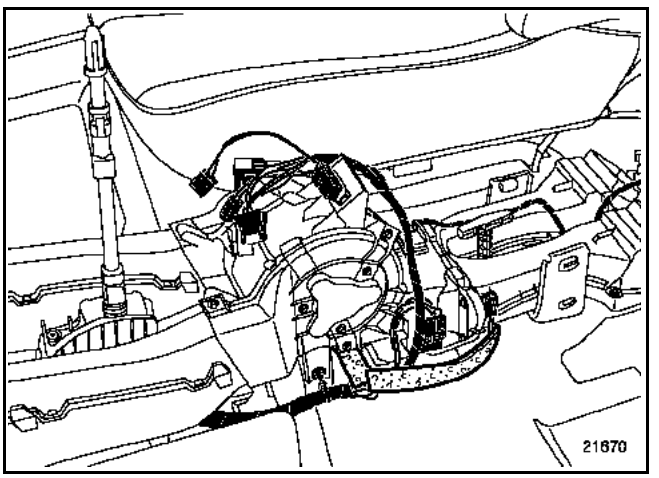
Passenger compartment side

The radiator can be removed without removing the dashboard.

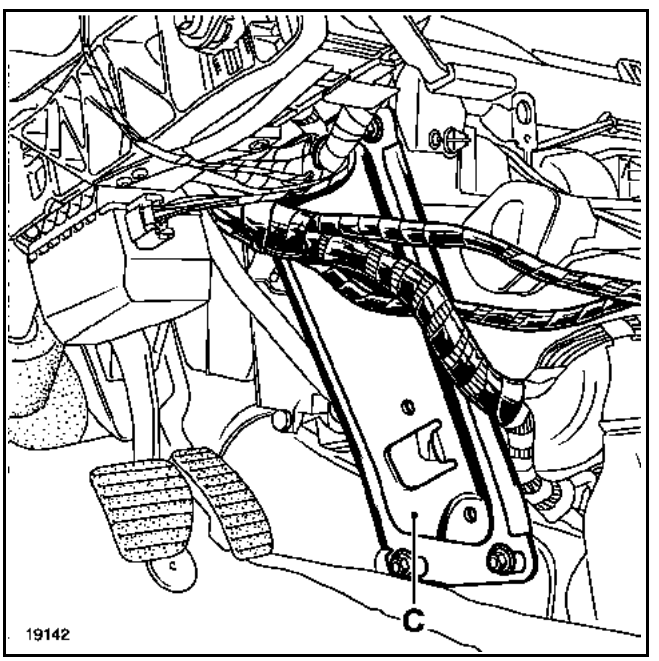
Remove:
– the two left and right side covers,



– the centre console (see **section 57A: "Centre console"**),
– the central fan assembly (see **Rear fan assembly section**),

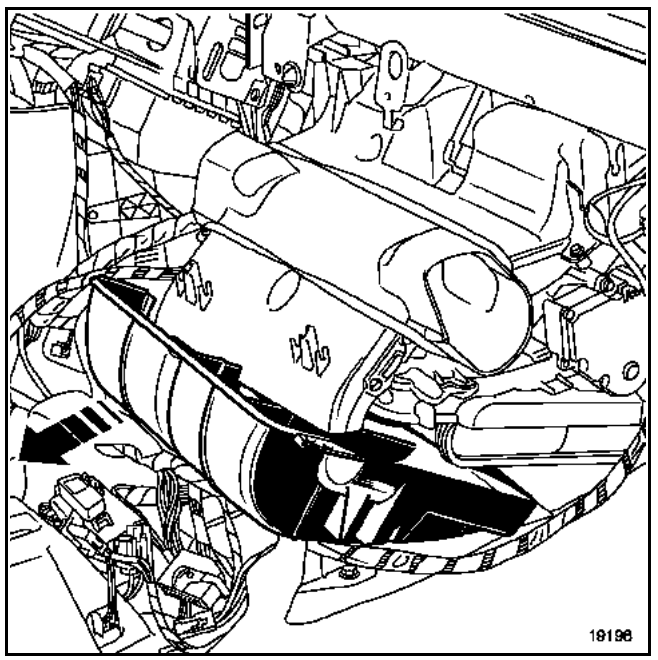


– the four retaining bolts of the beam reinforcement doubler panel,
– beam reinforcement doubler panel (C).

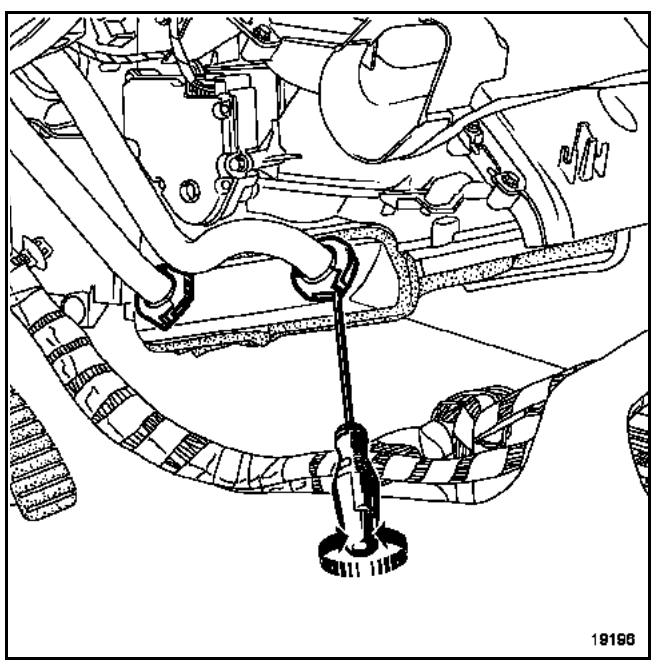


GETtheMANUALS.org

Remove:
– the radiator sump by pulling it towards you (five bolts),



– the two clips of the radiator coolant circuit pipes using a screwdriver,



– the radiator.

REFITTING

The radiator is refitted in the reverse order to removal.

IMPORTANT: it is essential to refit the electric wiring harness correctly to avoid the risk of contact with the radiator (heat source).

IMPORTANT: do not forget to carry out the programming needed for the vehicle to operate correctly after connecting the battery (refer to **section 80A**).

GETtheMANUALS.org

REMOVAL

Put the car on a two post lift.

Disconnect the battery.

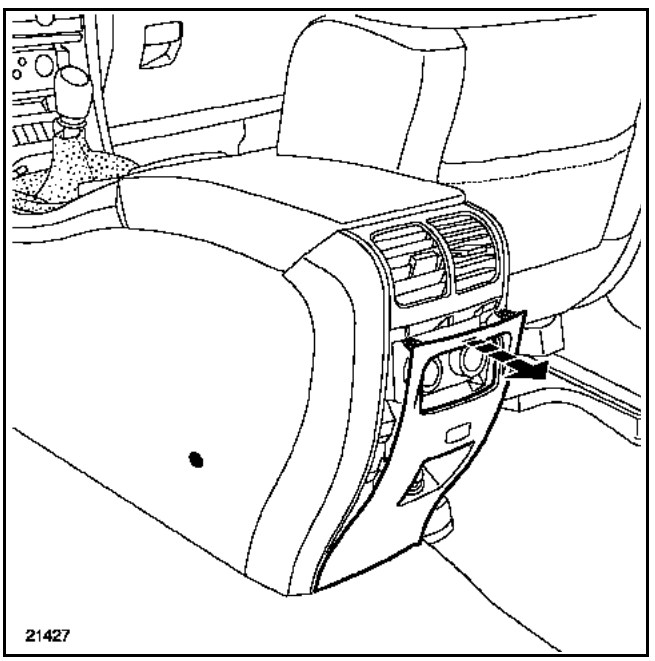
Remove the engine undertray.

Drain the cooling circuit.

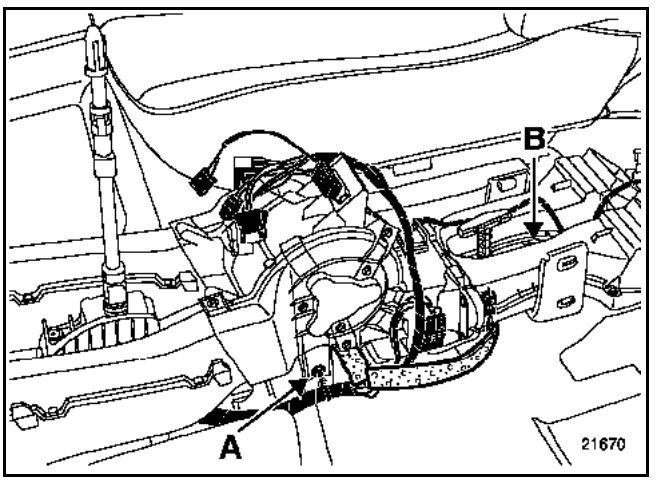
Passenger compartment side

The dashboard does not need to be removed before removing the radiator.

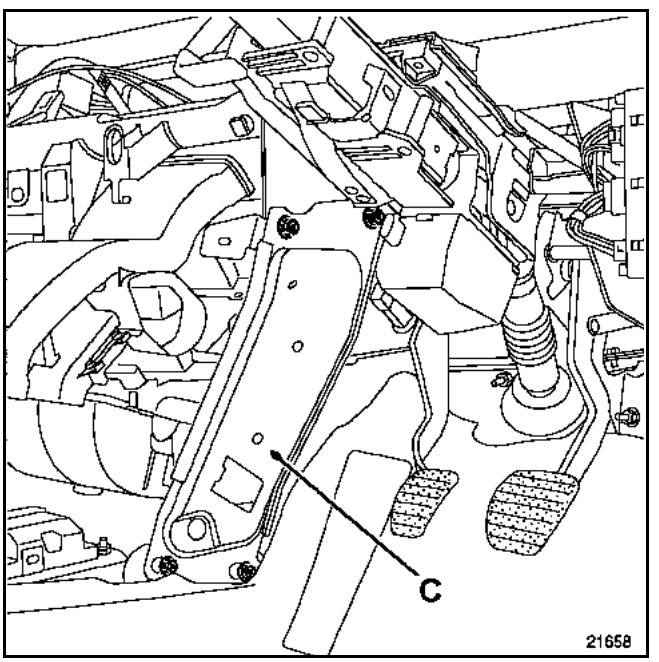
Remove:
– the two left and right side covers,



– the centre console (see **section 57A: "Centre console"**),
– the central fan assembly (bolts A and B) (see **"Rear fan assembly" section**),

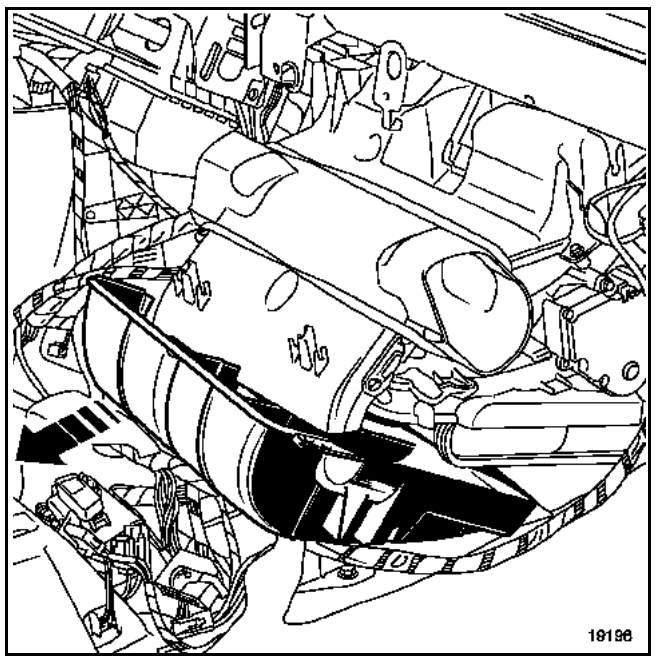


– the four retaining bolts of the beam reinforcement doubler panel (C),
– the beam reinforcement doubler panel.

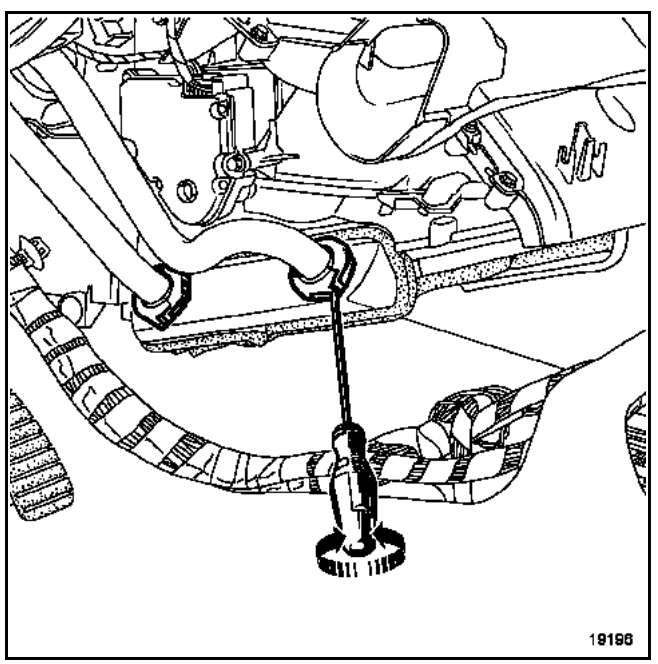


GETtheMANUALS.org

Remove:
– the radiator sump by pulling it towards you (five bolts),



– the two clips of the radiator coolant circuit pipes using a screwdriver,



– the radiator.

REFITTING

The radiator is refitted in the reverse order to removal.

IMPORTANT: it is essential to refit the electric wiring harness correctly to avoid the risk of contact with the radiator (heat source).

IMPORTANT: do not forget to carry out the programming needed for the vehicle to operate correctly after connecting the battery (refer to **section 80A**).

GETtheMANUALS.org

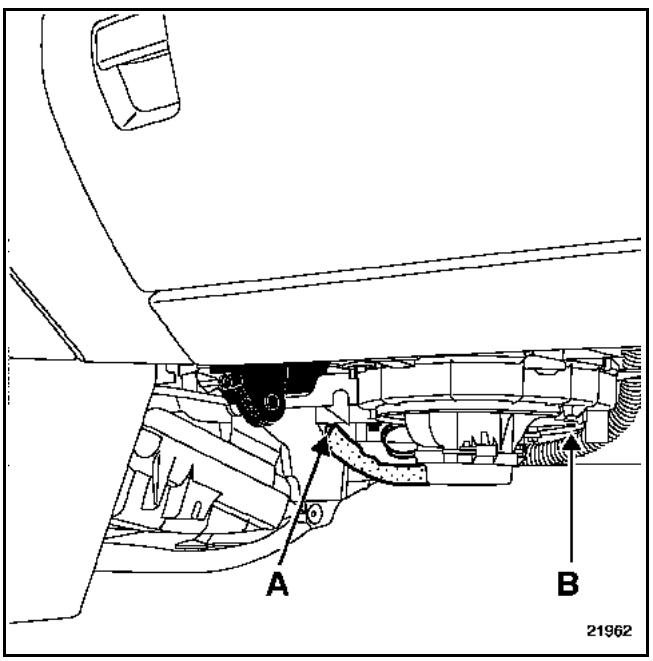
REMOVAL

The engine cooling fan can be accessed from underneath the dashboard.

Disconnect:
– the battery,
– engine cooling fan connector (A).

Remove engine cooling fan mounting bolt (B).

Rotate the engine cooling fan in a clockwise direction to unclip the unit and remove it from underneath.



NOTE: when removing the fan assembly, press against the carpet with both feet to avoid damaging the fan assembly blades.

REFITTING

Carry out the removal procedure in reverse.

IMPORTANT: do not forget to carry out the programming needed for the vehicle to operate correctly after connecting the battery (refer to **section 80A**).

GETtheMANUALS.org

REMOVAL

The engine colling fan can be accessed from underneath the dashboard.

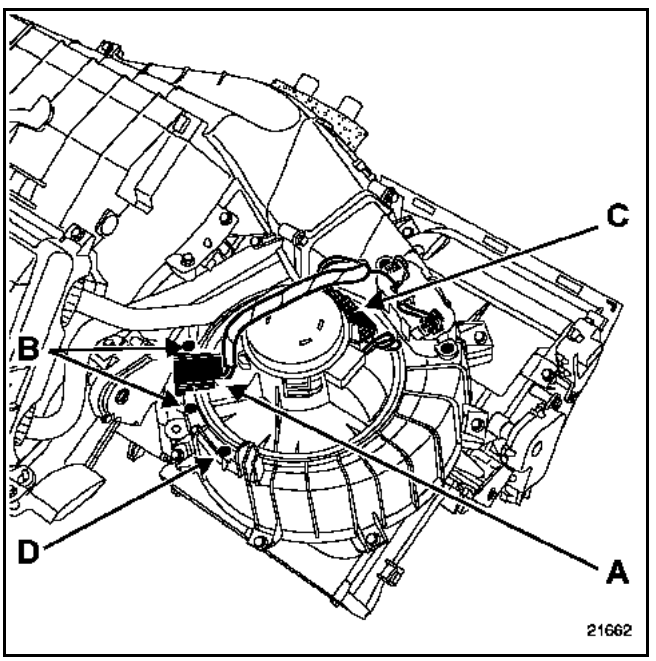
Disconnect:
– the battery,
– engine cooling fan connector (A).

Remove connector mounting (B).

Disconnect the connections (C).

Remove engine cooling fan mounting bolt (D).

Rotate the engine cooling fan in a clockwise direction to unclip the unit and remove it from underneath.



NOTE: when removing the fan assembly, press against the carpet with both feet to avoid damaging the fan assembly blades.

REFITTING

Carry out the removal procedure in reverse.

IMPORTANT: do not forget to carry out the programming needed for the vehicle to operate correctly after connecting the battery (refer to **Section 80A**).

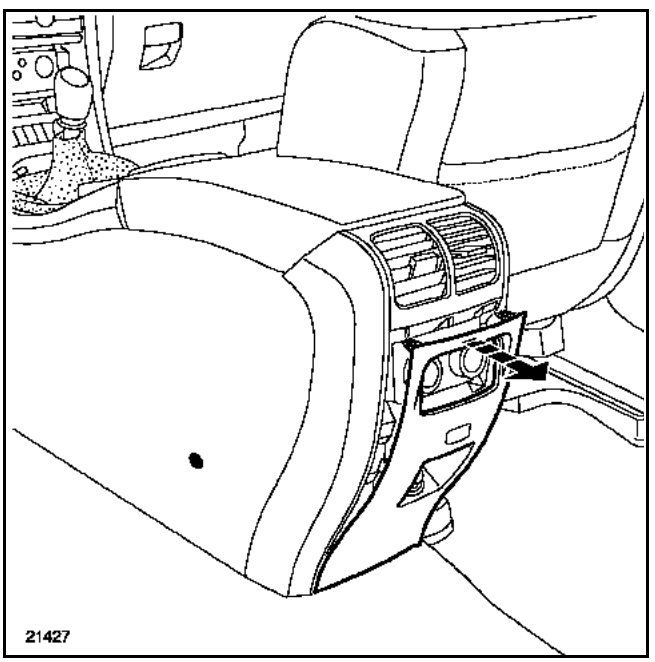
GETtheMANUALS.org

REMOVAL

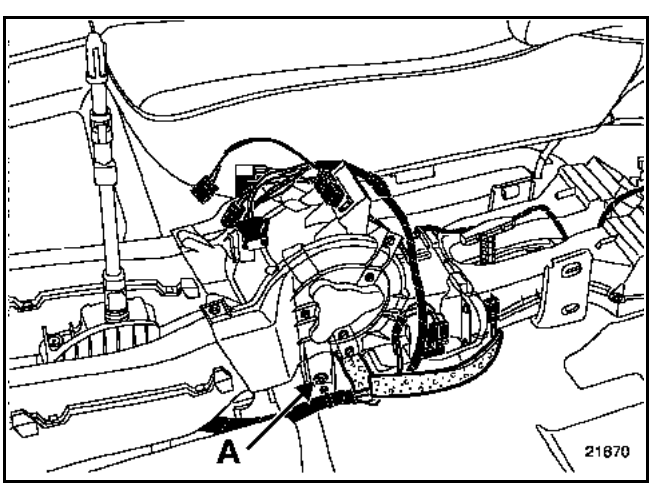
The engine cooling fan can be accessed after removing the centre console.

Disconnect the battery.

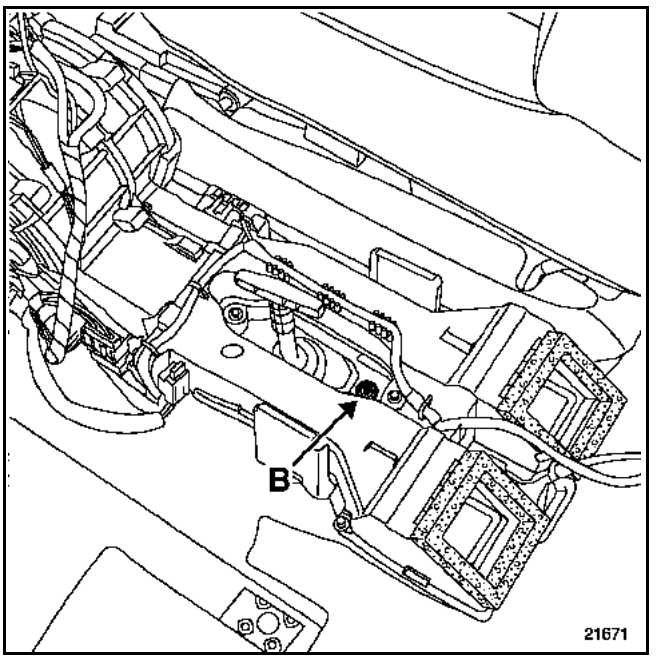
Remove:
– the two left and right side covers,



– the centre console (see **section 57A: "Centre console"**),



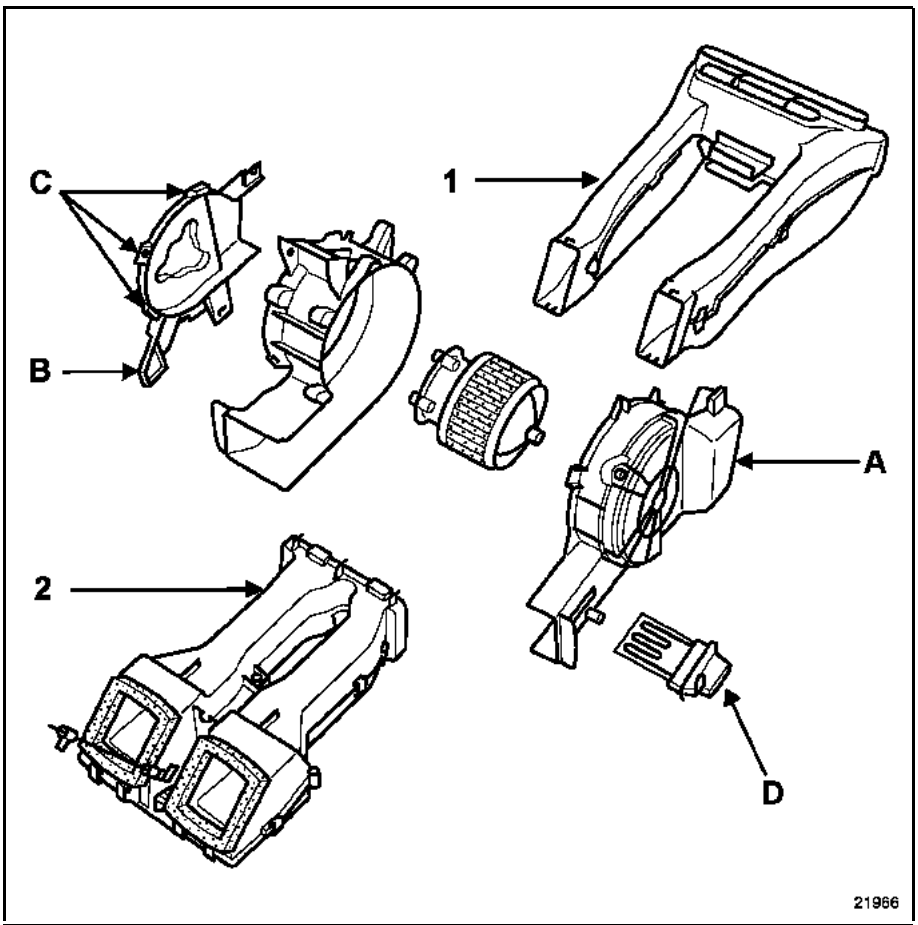
– assembly side retaining bolt (A),



– assembly retaining bolt (B),
– the electric wiring harness assembly.

Withdraw the unit.

GETtheMANUALS.org



Remove:
– front section of the fan assembly (1),
– rear section of the fan assembly (2),
– cover (A),
– cover (B),
– the three engine retaining bolts (C),
– the two engine terminals,
– the electronic speed variation module (D).

Remove the engine.

REFITTING

Carry out the removal procedure in reverse.

IMPORTANT: do not forget to carry out the programming needed for the vehicle to operate correctly after connecting the battery (refer to **section 80A**).

GETtheMANUALS.org

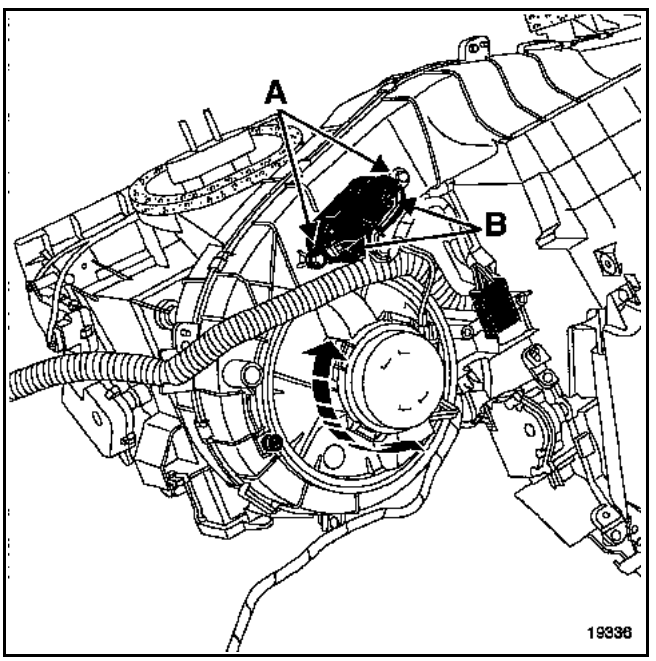
ELECTRONIC SPEED VARIATION MODULE

Disconnect the battery.

The electronic speed variation module is accessible from under the dashboard.

Disconnect the battery.

Remove:
– the two resistor unit mounting bolts (A),
– the two resistor unit connectors (B).



REFITTING

Carry out the removal procedure in reverse.

NOTE: do not forget to refit the clutch sensor on its mounting.

IMPORTANT: do not forget to carry out the programming needed for the vehicle to operate correctly after connecting the battery (refer to **section 80A**).

GETtheMANUALS.org

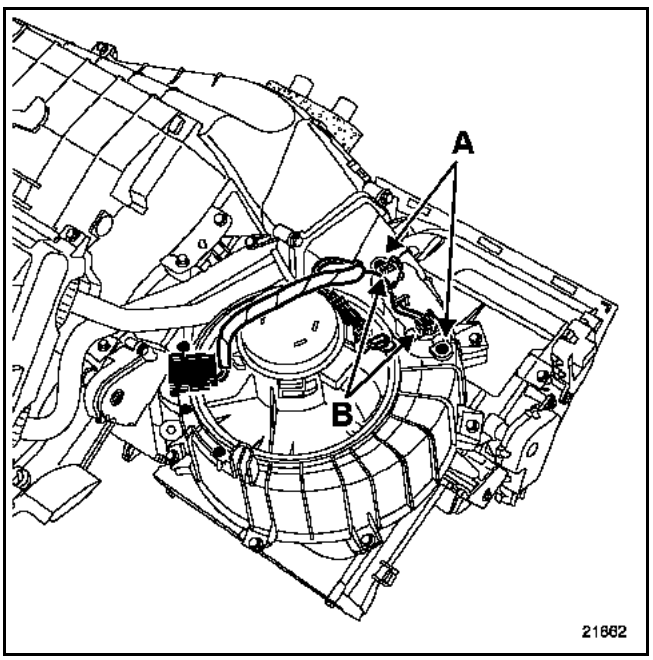
ELECTRONIC SPEED VARIATION MODULE

Disconnect the battery.

The electronic speed variation module is accessible from under the dashboard.

Disconnect the battery.

Remove:
– the braking sensor by turning it a quarter of a turn,
– the two electronic speed variation module mounting (A) bolts,
– the two electronic speed variation module connectors (B).



REFITTING

Carry out the removal procedure in reverse.

NOTE: do not forget to refit the braking sensor on its mounting.

IMPORTANT: do not forget to carry out the programming needed for the vehicle to operate correctly after connecting the battery (refer to **Section 80A**).

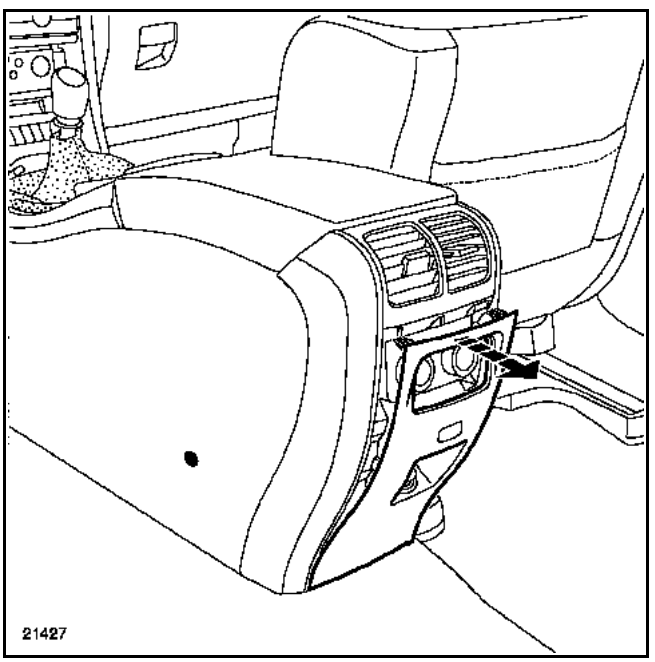
GETtheMANUALS.org

REMOVAL

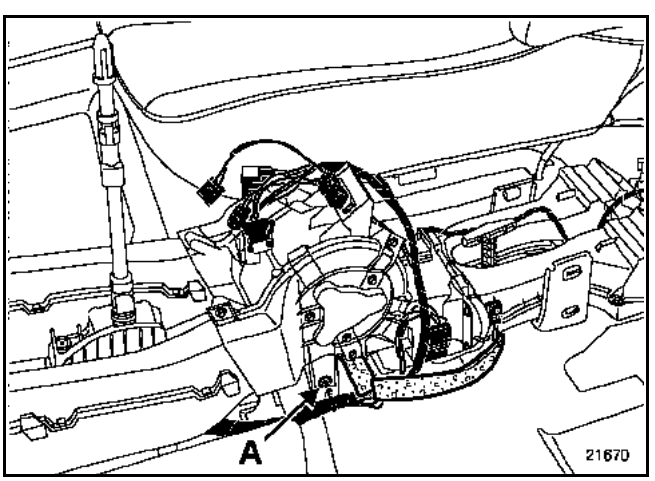
The engine cooling fan can be accessed after removing the centre console.

Disconnect:
– the battery.

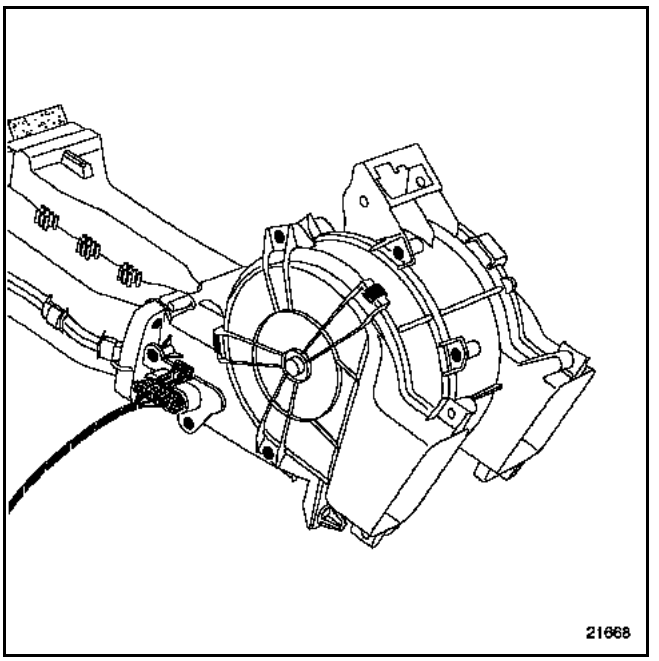
Remove:
– the two left and right side covers,



– the centre console (see **section 57A "Centre console"**).



NOTE: it is not necessary to remove the fan assembly to remove the resistor unit.



Recline the front right-hand seat.

Remove:
– the resistor unit connections (A),
– the module bolt (B) to extract it.

REFITTING

Carry out the removal procedure in reverse.

IMPORTANT: do not forget to carry out the programming needed for the vehicle to operate correctly after connecting the battery (refer to **section 80A**).

GETtheMANUALS.org

INFORMATION ON THE FLUID

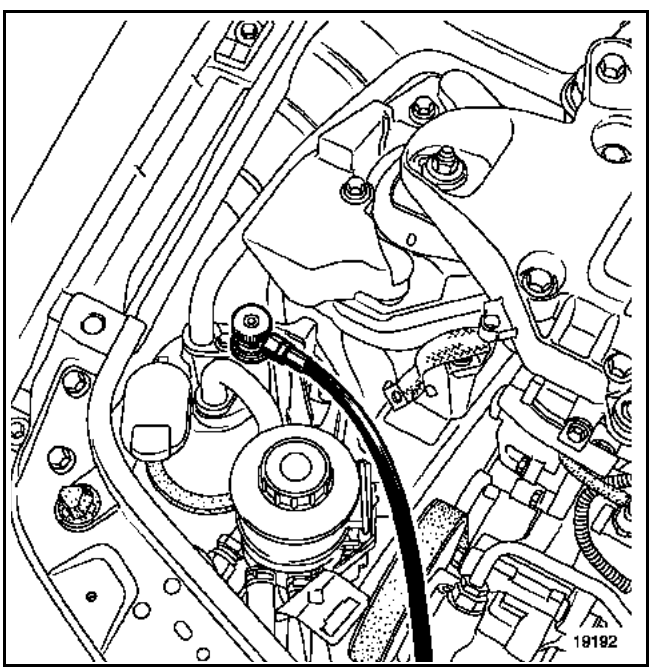
A label in the engine compartment shows the technical specifications of the refrigerant.

More detailed information about this fluid is contained in the "**Air conditioning - new R134a refrigerant**" section.

USING A FILLING STATION

The special feature of the "Vel Satis" vehicle is that it only has one union for the whole air conditioning circuit.

For retrieval, vacuum creation and refilling the **R134a** gas, use only the high pressure hose at the filling station (**example for Robinair R134a**).



For all other filling stations, follow the instructions and contact the equipment supplier.

NOTE:
When removing a component, seal the openings to prevent moisture entering the circuit.

The caps on spare parts must be removed at the last moment for the same reason.

Perform a leak test with the engine running and air conditioning and blower at maximum, and check with a leak detector within five minutes after the filling operation.

Strictly follow the instructions about oil top-ups when working on air-conditioning circuit components.

GETtheMANUALS.org

Turbocharged F4R engine

– Compressor:
DELPHI HARRISON V5E

– Oil for **DELPHI HARRISON** compressor:
Oil capacity 265 cm^3.
For topping up, use PLANETELF PAG 488 oil.

– Refrigerant:
R134a: 650 g ± 35

G9T engine

– Compressor:
DELPHI HARRISON V5E

– Oil for **DELPHI HARRISON** compressor:
Oil capacity 265 cm^3.
For topping up, use PLANETELF PAG 488 oil.

– Refrigerant:
R134a: 650 g ± 35

V4Y engine

– Compressor:
CALSONIC KANSEI V6

– Oil for **CALSONIC KANSEI** compressor:
Oil capacity 220 cm^3.
For topping up, use PLANETELF PAG 488 oil.

– Refrigerant:
R134a: 650 g ± 35

P9X engine

– Compressor:
DENSO 7SBU16

– Compressor oil **DENSO**:
Oil capacity 245 cm^3.
For topping up, use ND OIL 8 oil.

– Refrigerant:
R134a: 650 g ± 35

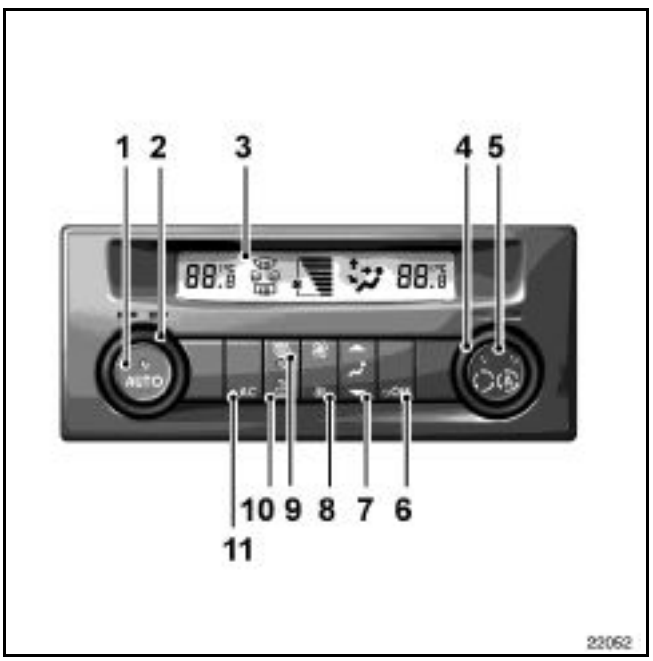
CONTROL PANEL

The aim of automatic control is to provide users with a stable constant and effective heating regardless of external conditions and the conditions under which the vehicle is being used.

In addition, it ensures good visibility through the vehicle's windows.

This automatic control is managed electronically by a computer integrated into the control panel.



1 Automatic mode operation key
2 Left-hand side temperature adjustment button
3 Display
4 Right-hand side temperature adjustment button
5 Air recycling and automatic recycling start key
6 System OFF button
7 Air distribution adjustment key
8 Ventilation speed adjustment key
9 "See Clear" button to de-mist and de-ice the windows
10 Rear screen de-icing button
11 Air conditioning key

GETtheMANUALS.org

Fitted in front of the external air intake, it filters the air and ensures the air is totally clean before being let into the passenger compartment.

REMOVAL

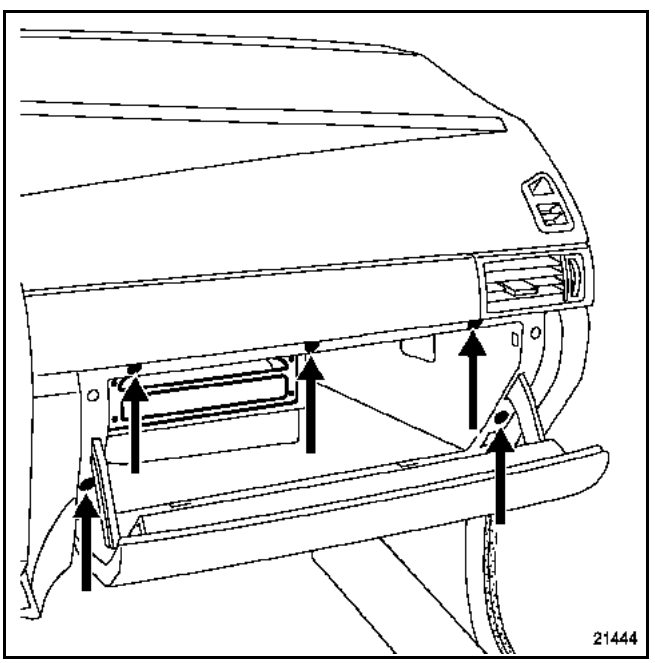
Open the glovebox.

Remove the navigation CD player on the versions concerned.

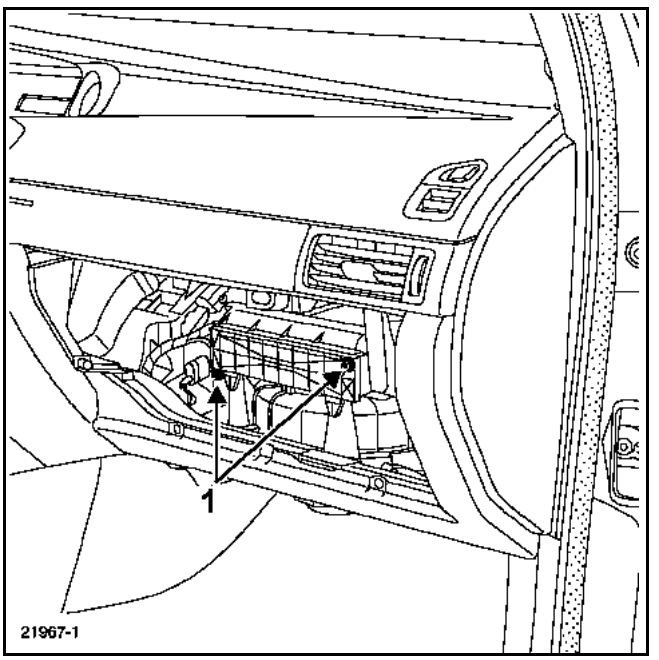
Undo the connections and remove them from the CD player.

Remove the glovebox bolts and connectors.

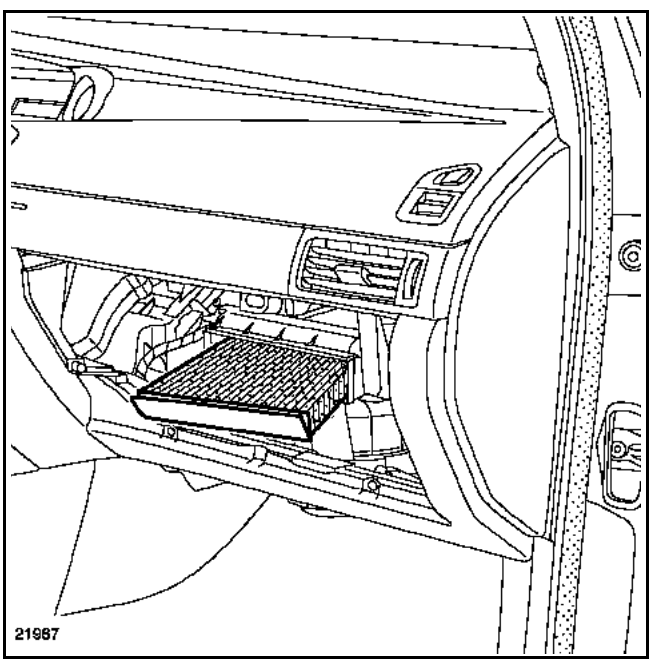
Remove the glovebox.



Remove the two passenger compartment filter cover bolts (1).



Remove the passenger compartment filter.



REFITTING

Carry out the removal procedure in reverse.

NOTE:
To initialise the system, refer to the **Initialisation** section.

GETtheMANUALS.org

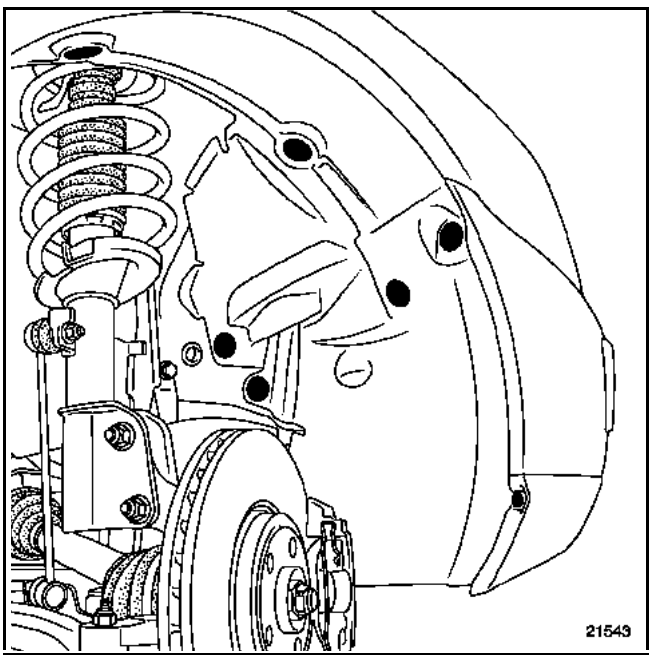
TIGHTENING TORQUE (in daNm)	
Mounting nut of the pipes on the condenser	0.8

REMOVAL

Disconnect the battery.

Drain the refrigerant circuit using a filling station.

Remove:
– the engine undertray,
– part of the wheel arch liners.

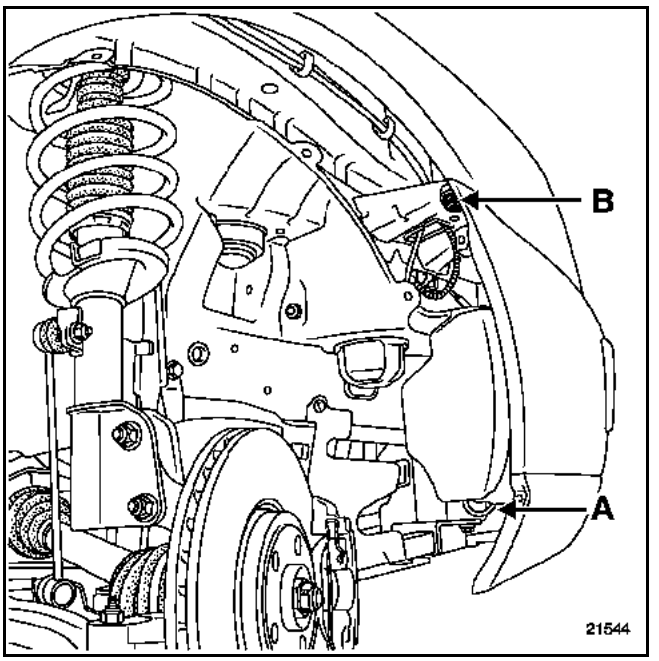


Disconnect the fog light supply connectors (A) (**if fitted**).

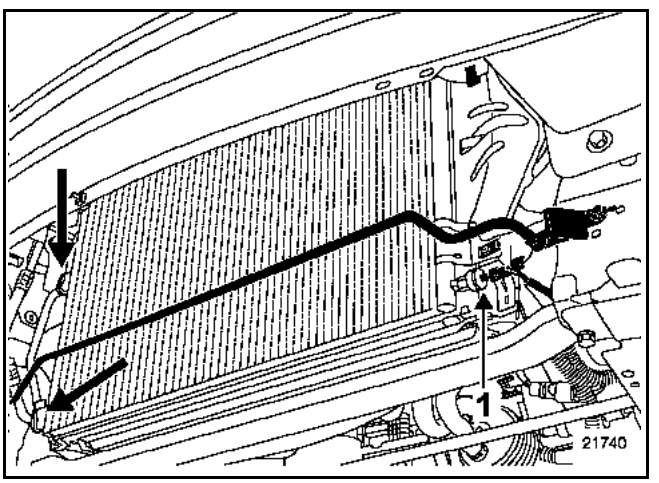
Remove the two side mounting bolts (B).

Partially release the bumper (see **section 55A**).

Disconnect the supply to the headlight washer jets (**if fitted on the vehicle**).



Remove the grille/bumper assembly (**this operation requires two people**).



Remove the unions of the coolant circuit pipes on the condenser and seal them.

Disconnect the pressure sensor (1).

Remove:
– the lower mounting clips of the condenser,
– the condenser (**from below**).

GETtheMANUALS.org

REFITTING

Check that the condenser is correctly secured.

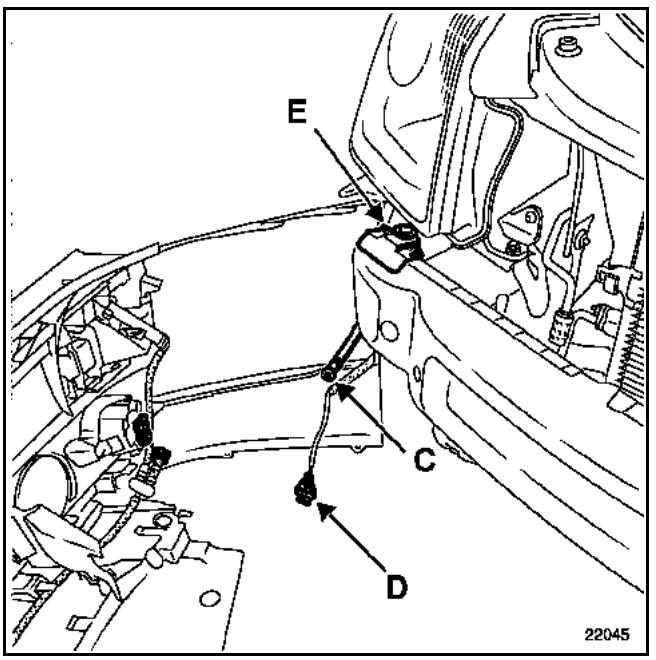
Oil the pipe seals with the recommended oil.

Carry out the removal procedure in reverse.

Refit the bumper (**this operation requires two people**).

Connect:
– the pressure sensor,
– the supply to the headlight washer jets (C) (**if fitted to the vehicle**),
– the fog light connections (D) (**if fitted to the vehicle**).

Offer up the bumper in front of the cross member, then line up the guide plates with the indexing components (E).



Check the side centring clips and the bumper are correctly secured.

Fill the refrigerant circuit using a filling station.

When replacing the condenser, add **30 ml** of recommended oil to the compressor.

IMPORTANT:
Connect the battery; carry out the necessary programming (see section **8**).

NOTE:
Perform a leak test, with the engine running and with the air conditioning and blower on full, using a leak detector, within 5 minutes after the filling operation.

GETtheMANUALS.org

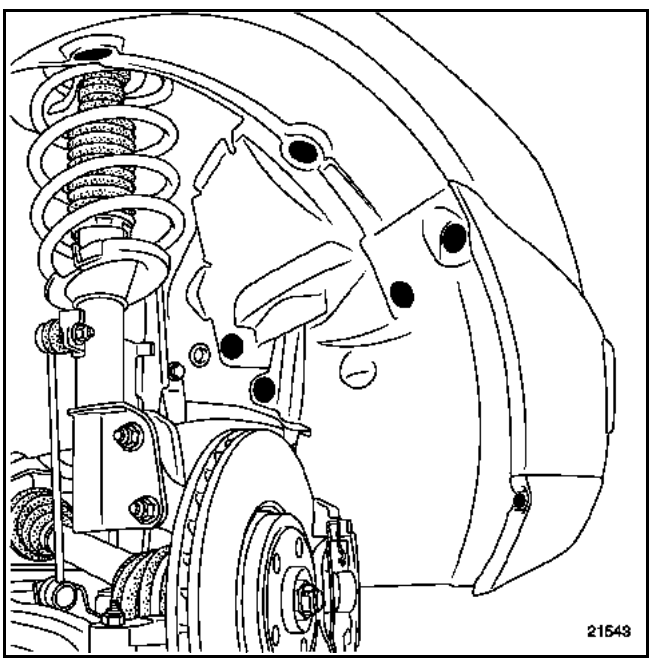
TIGHTENING TORQUE (in daNm)	
Mounting nuts of the pipes on the condenser	0.8

REMOVAL

Disconnect the battery.

Drain the refrigerant circuit using a filling station.

Remove:
– the engine undertray,
– part of the wheel arch liners.

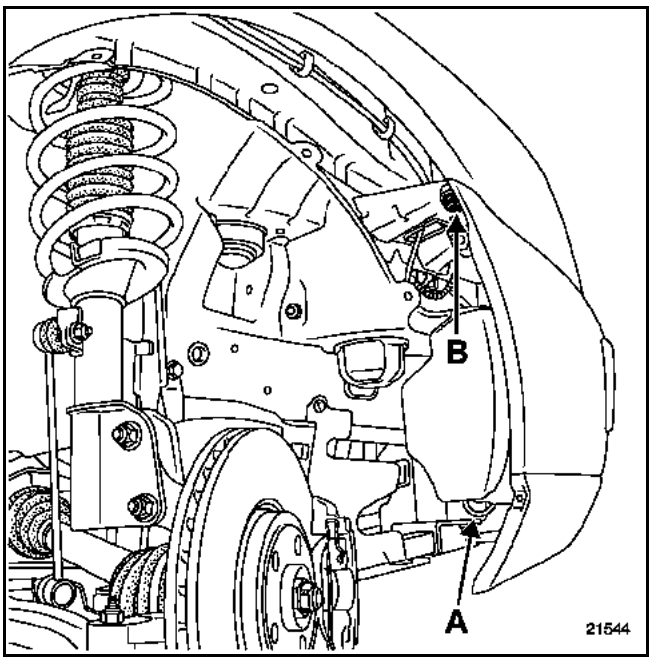


Disconnect the fog light supply connectors (A) (**if fog lights fitted**).

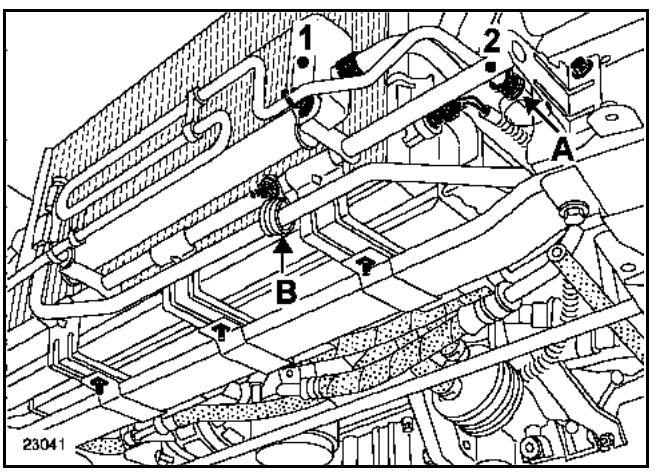
Remove the two side mounting bolts (B).

Partially detach the bumper.

Disconnect the supply to the headlight washer jets (**if fitted on the vehicle**).



Remove the grille/bumper assembly (**this operation requires two people**).



Remove:
– the bumper/grille assembly (this operation requires two people),
– the radar (see section concerned),
– the clip (A) and (B),
– the oil cooler (1) (see section concerned),
– the oil cooler mounting (2),
– the unions of the cold circuit pipes on the condenser and seal them,
– the lower mounting clips of the condenser,
– the condenser (**from below**).

GETtheMANUALS.org

REFITTING

Check that the condenser is correctly secured.

Oil the pipe seals with the recommended oil.

Carry out the removal procedure in reverse.

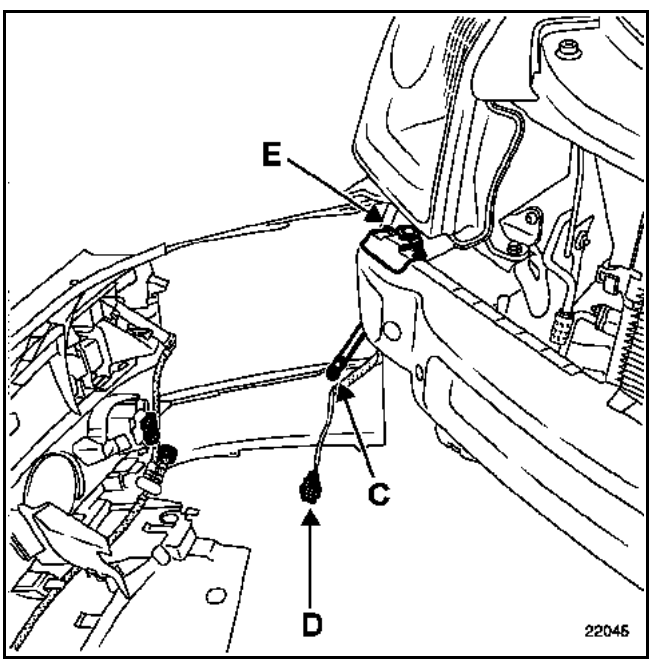
Refit the oil cooler (see **section 19A**).

Ensure the radiator and condenser fins are not damaged during refitting; protect them if necessary.

Refit the bumper (**this operation requires two people**).

Connect:
– the supply to the headlight washer jets (C) (**if fitted**),
– the fog light connections (D) (**if fitted to the vehicle**).

Offer up the bumper in front of the cross member, then line up the guide plates with the indexing components (E).



Check the side centring clips and the bumper are correctly secured.

Fill the refrigerant circuit using a filling station.

When replacing the condenser, add **30 ml** of recommended oil to the compressor.

IMPORTANT:
Connect the battery; carry out the necessary programming (see section **8**).

NOTE:
Perform a leak test, with the engine running and with the air conditioning and blower on full, using a leak detector, within 5 minutes after the filling operation.

GETtheMANUALS.org

TIGHTENING TORQUES (in daNm)	
Mounting nut on the dehydration canister	**0.8**
Bolt on the dehydration canister	**0.8**

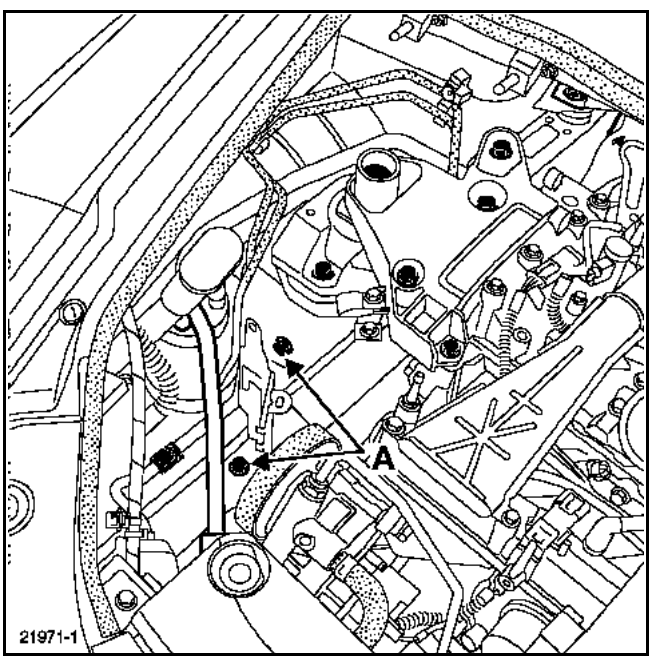
REMOVAL

Disconnect the battery.

Drain the refrigerant circuit using a filling station.

Remove from their mountings:
– the power assisted steering reservoir,
– the fuel vapour absorber bleed solenoid valve (for F4R engines),
– the diesel fuel filter (for G9T engines).

Remove:
– the two engine undertray bolts (A),
– the two clamps securing the pipes to the dehydration canister,
– the canister with its mounting.



REFITTING

Oil the pipe seals with the recommended oil.

Carry out the removal procedure in reverse.

Fill the refrigerant circuit using a filling station.

When changing the dehydration rechargeable battery, add **15 ml** of recommended oil to the compressor.

IMPORTANT:
Connect the battery; carry out the necessary programming (see section **8**).

NOTE:
Perform a leak test with the engine running and air conditioning and blower at maximum, and check with a leak detector within 5 minutes after the filling operation.

GETtheMANUALS.org

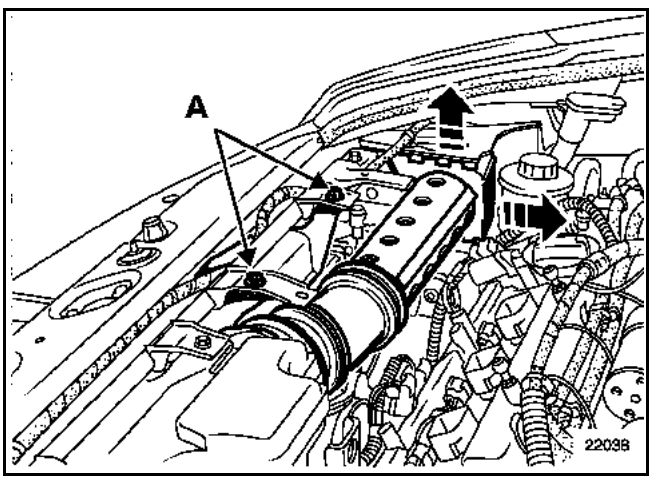
TIGHTENING TORQUES (in daNm)	▽
Mounting nut on the dehydration canister	0.8
Bolt on the dehydration canister	0.8

REMOVAL

Disconnect the battery.

Drain the refrigerant circuit using a filling station.

Remove:
– the two bolts (A) of the air inlet tract,
– the air inlet tract,



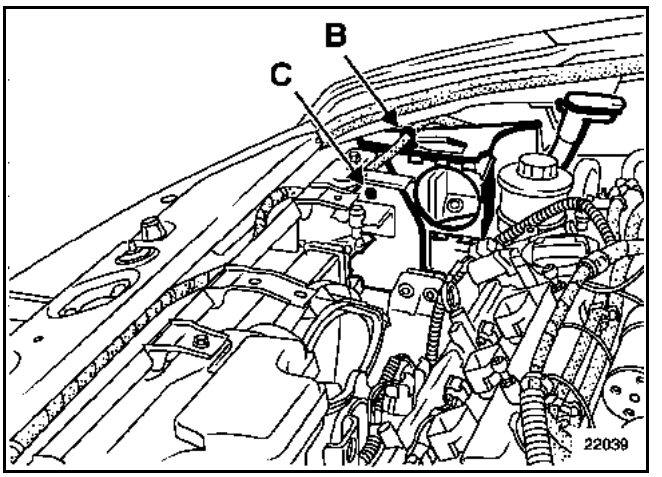
– the electrical harness (B) on the air inlet unit cover.

Partially release the windscreen washer reservoir pipe.

Remove:
– the inlet unit cover,
– the bolt (C) inside the air inlet unit,
– the air inlet unit.

Release the power assisted steering reservoir.

Remove:
– the two power assisted steering reservoir mounting plate bolts,
– the two clamps securing the pipes to the dehydration canister,
– the dehydration canister with its mounting.



REFITTING

Oil the pipe seals with the recommended oil.

Carry out the removal procedure in reverse.

Fill the refrigerant circuit using a filling station.

When changing the dehydration canister, add **15 ml** of recommended oil to the compressor.

IMPORTANT:
Connect the battery; carry out the necessary programming (see section **8**).

NOTE:
Perform a leak test with the engine running and air conditioning and blower at maximum, and check with a leak detector within 5 minutes after the filling operation.

GETtheMANUALS.org

TIGHTENING TORQUES (in daNm)	
Mounting nuts on the dehydration canister	0.8
Bolt on the dehydration canister	0.8

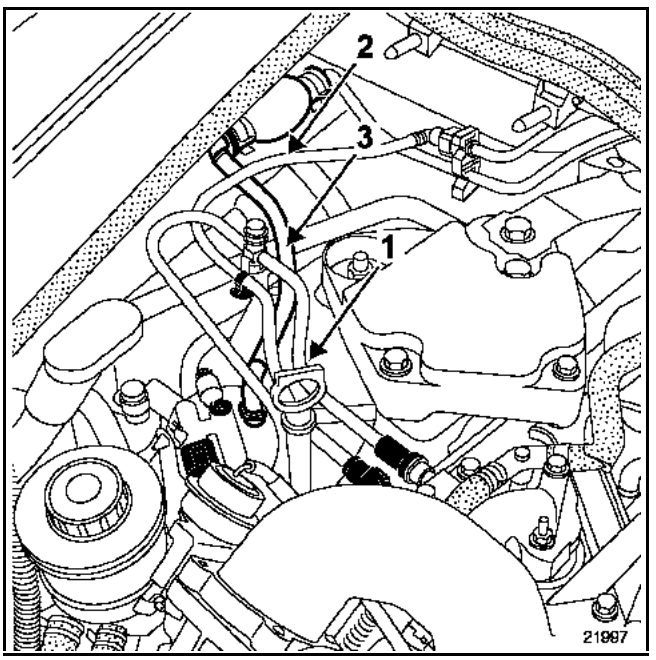
REMOVAL

Disconnect the battery.

Drain the refrigerant circuit using a filling station.

Remove the diesel pipes (1) and (2).

Release:
– the power steering reservoir,
– the diesel pipe (3) with the priming pump,
– the diesel filter.



Remove the two power assisted steering reservoir mounting plate bolts.

Remove the power assisted steering reservoir mounting plate.

Remove:
– the two clamps securing the pipes to the dehydration canister,
– the dehydration canister with its mounting.

REFITTING

Oil the pipe seals with the recommended oil.

Carry out the removal procedure in reverse.

Fill the refrigerant circuit using a filling station.

When changing the dehydration canister, add **15 ml** of recommended oil to the compressor.

IMPORTANT:
Connect the battery; carry out the necessary programming (see section **8**).

NOTE:
Perform a leak test with the engine running and air conditioning and blower at maximum, and check with a leak detector within 5 minutes after the filling operation.

GETtheMANUALS.org

REMOVAL

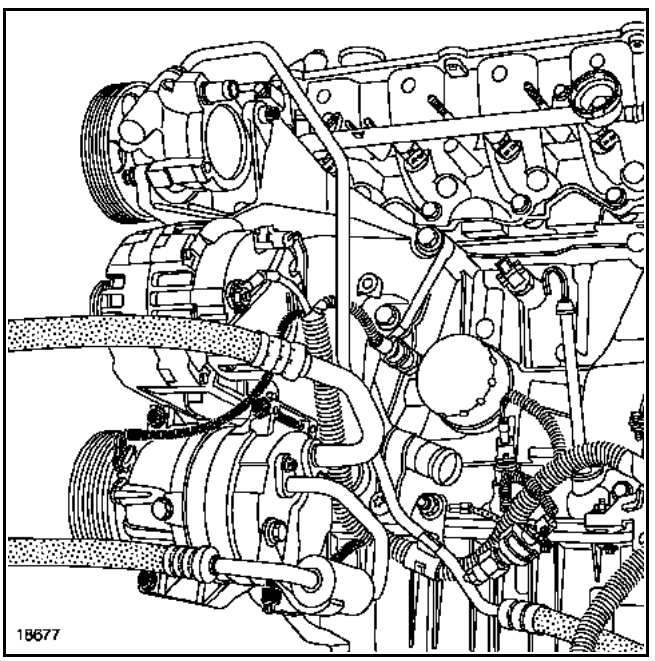
Mount the vehicle on a two post lift.

Disconnect the battery.

Drain the refrigerant circuit using a filling station.

Remove the accessories belt (see **section 07A: "Accessories belt tension"**).

Remember that any belt removed must be replaced.



Remove:
– the engine undertray,
– the air conditioning pipes on the compressor,
– the two compressor connectors,
– the transverse bar under the compressor,
– the three compressor mounting bolts.

Remove the compressor.

REFITTING

If the compressor is changed, it is supplied filled with oil for refitting.

IMPORTANT:
Strictly follow the instructions about oil top-ups when working on air-conditioning circuit components.

Oil the hose seals with the recommended oil.

Carry out the removal procedure in reverse.

Tighten the compressor mounting bolts to **2.5 daNm**.

Tighten the refrigerant pipe mounting bolts on the compressor to **0.8 daNm**.

Fill the refrigerant circuit using a filling station.

IMPORTANT:
Connect the battery; carry out the necessary programming (see section **8**).

NOTE:
Perform a leak test with the engine running and air conditioning and blower at maximum, and check with a leak detector within 5 minutes after the filling operation.

GETtheMANUALS.org

REMOVAL

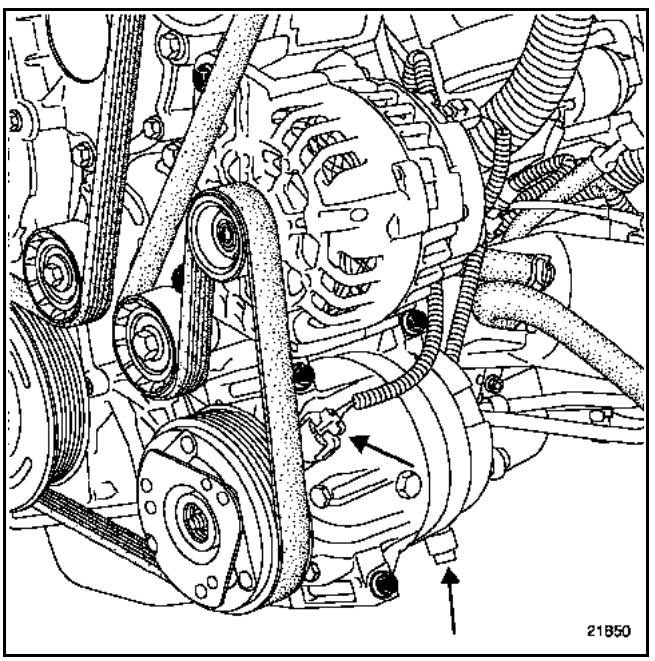
Mount the vehicle on a two post lift.

Disconnect the battery.

Drain the refrigerant circuit using a filling station.

Remove the accessories belt (see **section 07A: "Accessories belt tension"**).

Remember that any belt removed must be replaced.



Remove:
– the engine undertray,
– the air conditioning pipes on the compressor and seal them,
– the two compressor connectors,
– the transverse bar under the compressor,
– the three compressor mounting bolts.

Remove the compressor.

REFITTING

If the compressor is changed, it is supplied filled with oil for refitting.

IMPORTANT:
Strictly follow the instructions about oil top-ups when working on air-conditioning circuit components.

Oil the hose seals with the recommended oil.

Carry out the removal procedure in reverse.

Tighten the compressor mounting bolts to **2.5 daNm**.

Tighten the refrigerant pipe mounting bolts on the compressor to **0.8 daNm**.

Fill the refrigerant circuit using a filling station.

IMPORTANT:
Connect the battery; carry out the necessary programming (see section **8**).

NOTE:
Perform a leak test with the engine running and air conditioning and blower at maximum, and check with a leak detector within 5 minutes after the filling operation.

GETtheMANUALS.org

REMOVAL

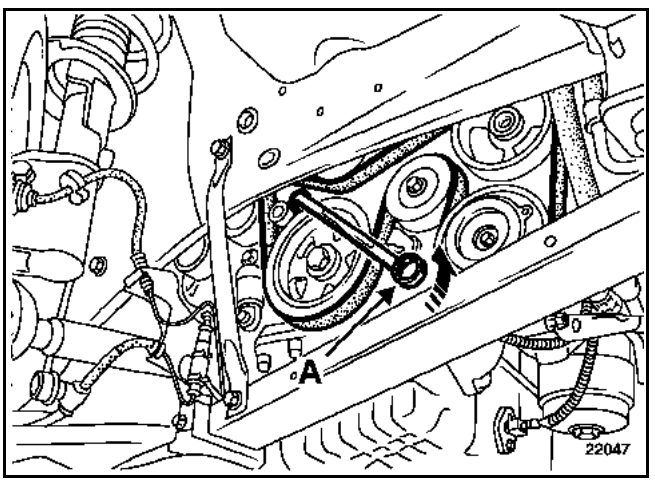
Mount the vehicle on a two post lift.

Disconnect the battery.

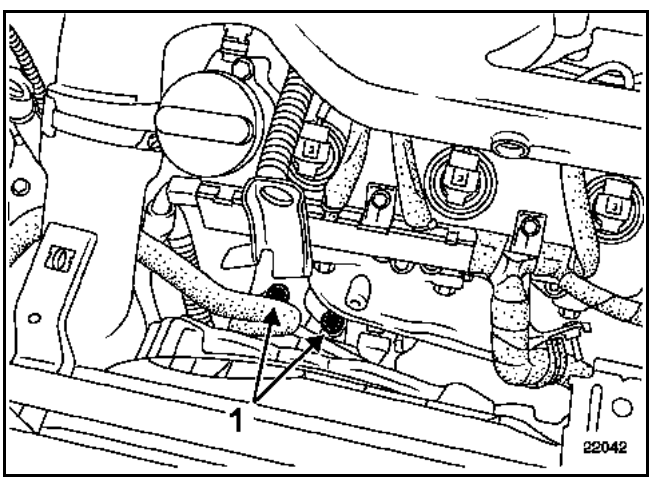
Drain the refrigerant circuit using a filling station.

Remove the accessories belt (see **section 07A: "Accessories belt tension"**).

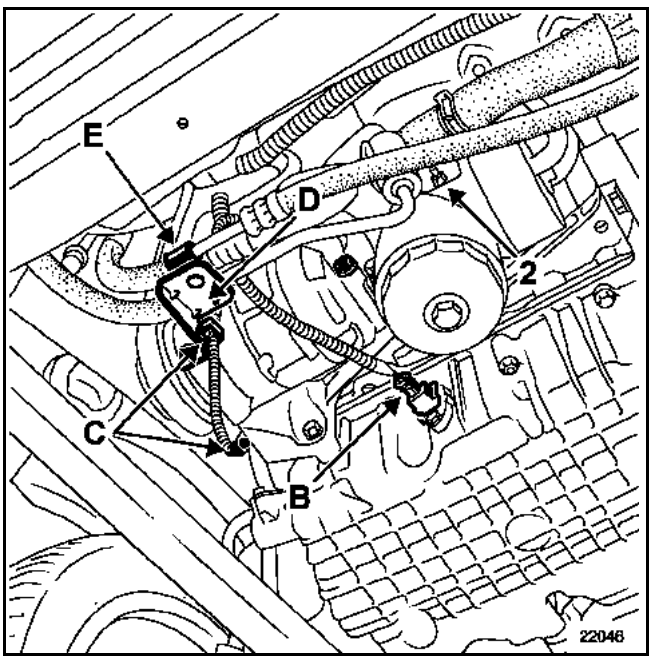
Remember that any belt removed must be replaced.



Remove:
– the engine undertray,
– the air conditioning pipes (1) on the compressor and seal them,
– the air conditioning pipe nut (2).



Remove:
– the connection (A),
– the connection (B)
– the two electrical harness clips (C),
– the power assisted steering oil pipe clip (D),
– the refrigerant pipe nut (E) ,



– the transverse bar under the compressor,
– the three compressor mounting bolts.

REFITTING

If the compressor is changed, it is supplied filled with oil for refitting.

IMPORTANT:
Strictly follow the instructions about oil top-ups when working on air-conditioning circuit components.

Oil the hose seals with the recommended oil.

Carry out the removal procedure in reverse.

Tighten the compressor mounting bolts to:
– **2.5 daNm**, for the two bolts located one above the other on the other side of the accessories belt,
– **5 daNm**, for the bolt located next to the oil filter.

Tighten the refrigerant pipe mounting bolts on the compressor to **2.1 daNm**.

Fill the refrigerant circuit using a filling station.

IMPORTANT:
Connect the battery; carry out the necessary programming (see section **8**).

NOTE:
Perform a leak test with the engine running and air conditioning and blower at maximum, and check with a leak detector within 5 minutes after the filling operation.

GETtheMANUALS.org

REMOVAL

Mount the vehicle on a two post lift.

Disconnect the battery.

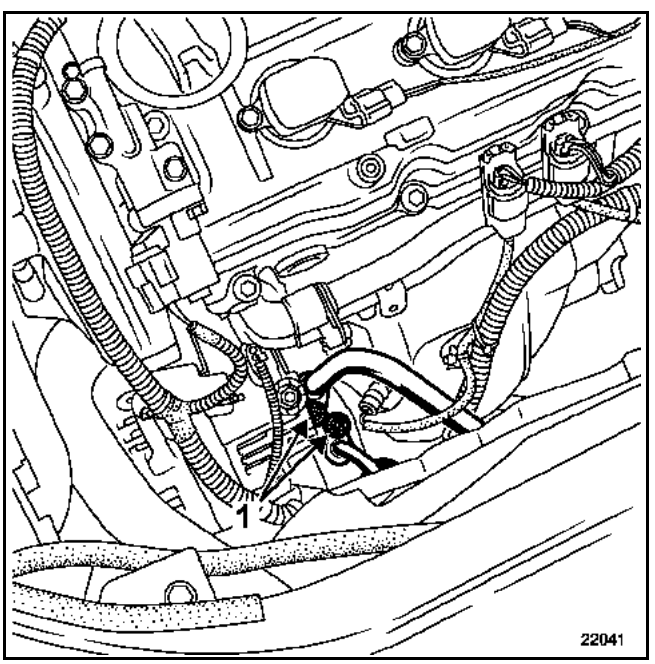
Drain the refrigerant circuit using a filling station.

Remove the accessories belt (see **section 07A: "Accessories belt tension"**).

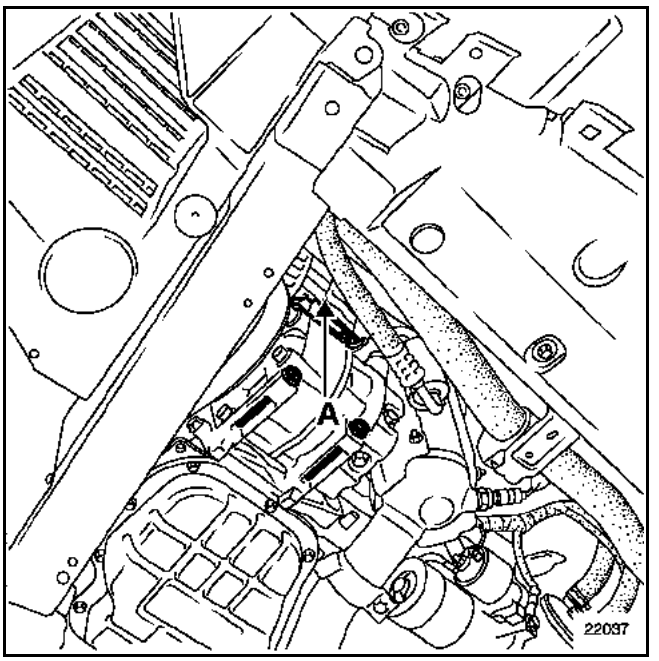
Remember that any belt removed must be replaced.

Remove:
– the air inlet tract (see **section 62A: "Rechargeable battery for V4Y engine"**),
– the engine undertray,
– the air conditioning pipe mountings (1) on the compressor.

Remove the compressor pipes.



Remove:
– the compressor connections (A),
– the four compressor mounting bolts.



REFITTING

If the compressor is changed, it is supplied filled with oil for refitting.

IMPORTANT:
Strictly follow the instructions about oil top-ups when working on air-conditioning circuit components.

Oil the hose seals with the recommended oil.

Carry out the removal procedure in reverse.

Tighten the compressor mounting bolts to between **6.96** and **8.92 daNm**.

Tighten the refrigerant pipe mounting bolts on the compressor to **2.1 daNm**.

Fill the refrigerant circuit using a filling station.

IMPORTANT:
Connect the battery; carry out the necessary programming (see section **8**).

NOTE:
Perform a leak test, with the engine running and with the air conditioning and blower on full, using a leak detector, within 5 minutes after the filling operation.

GETtheMANUALS.org

REMOVAL

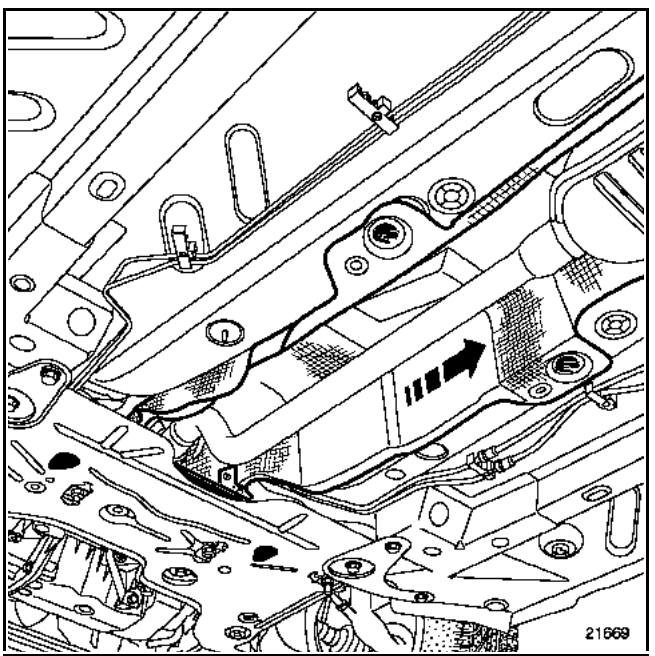
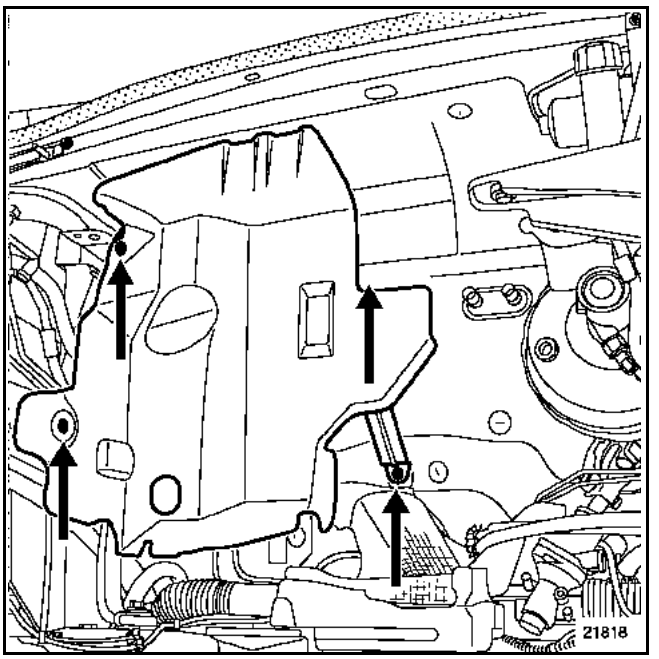
For (F4R Turbocharged) versions only

Place the vehicle on a two-post lift in order to push back the heat shield on the front section of the exhaust system.



Remove the engine heat shield mountings and move it slightly in order to be able to reach the air conditioning pipe nuts located at the bulkhead junction.



For all versions

Drain the refrigerant circuit using a filling station for **R134**.

Remove the engine undertray.

Drain the cooling circuit.

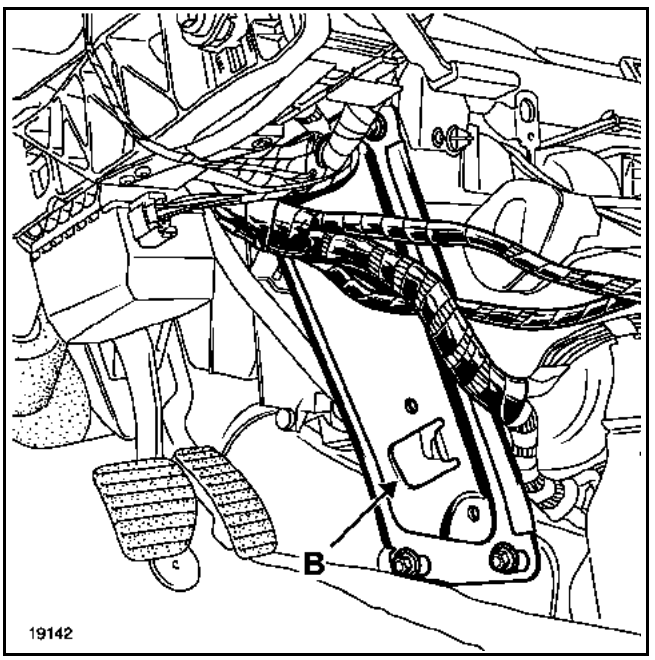
IMPORTANT:
Follow the recommendations contained in section 88C relating to the air bag system.

Disconnect the battery.

GETtheMANUALS.org

Passenger compartment side

Remove:
– the steering column (see **section 36B: "Steering column"**),
– the central console (see **section 57A: "Central console"**),
– the central fan assembly,
– the dashboard (see **section 57B: "Dashboard"**),
– the electrical harness assembly,
– the fuse and relay unit(s),
– the voice synthesiser (depending on version),
– the reinforcement beam plate (B) nuts,
– the plate.

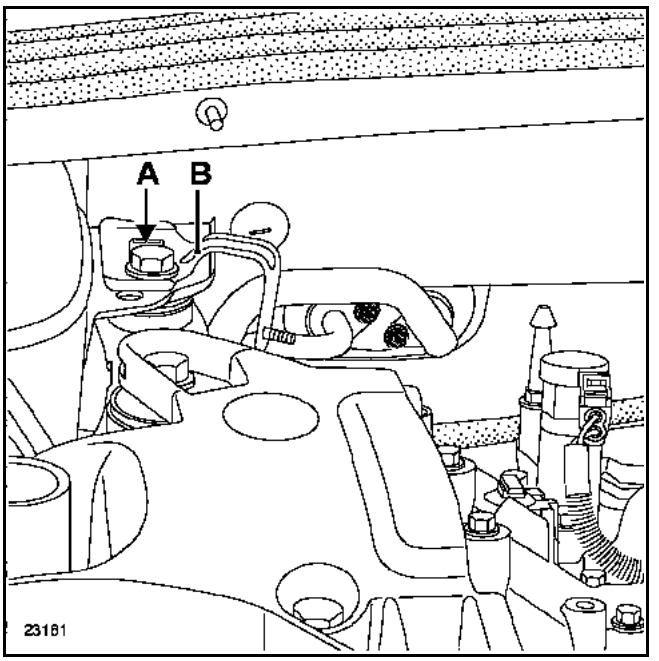


In the engine compartment

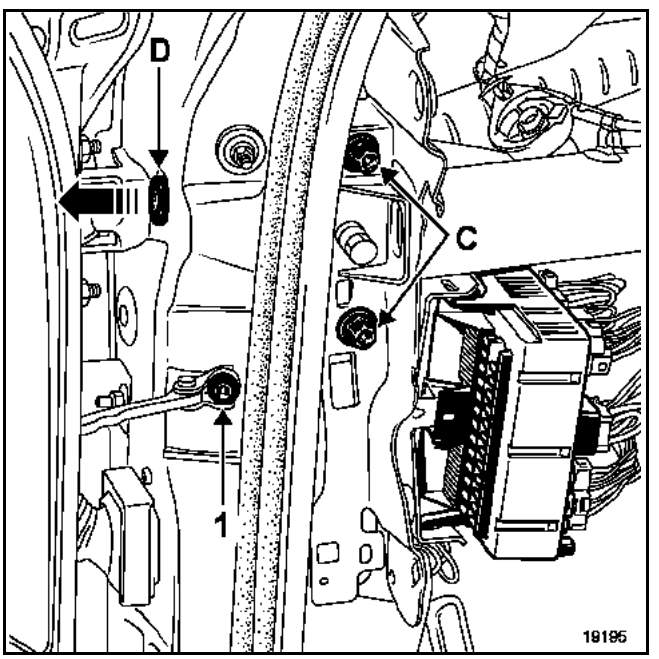
For F4R Turbocharged versions only

Loosen the engine tie-bar bolt (A) in order to turn the plate (B) to facilitate access to the two air conditioning pipe mounting nuts located at the bulkhead junction.

Remove:
– the air conditioning pipes at the bulkhead junction and seal them,



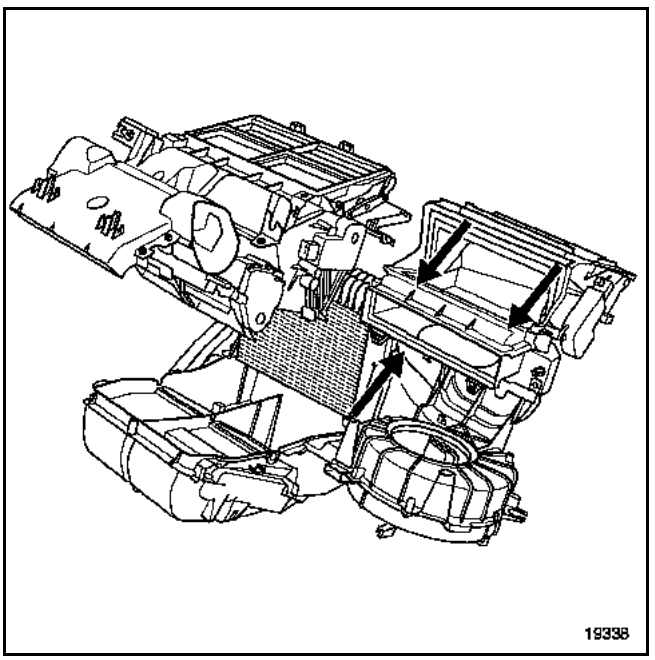
– the door check strap bolt (1) to allow tightening of the beam bolt (D),
– the reinforcement beam mounting bolts (C) and (D).



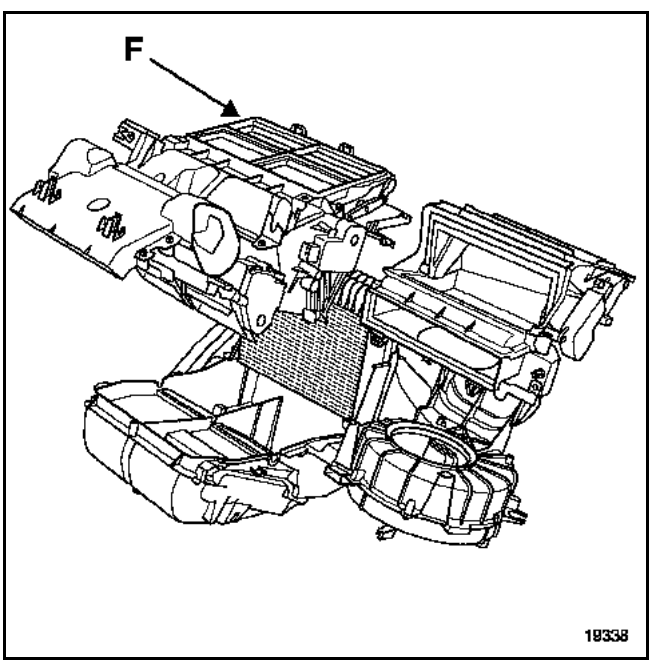
Remove:
– the reinforcement beam,
– the air conditioning unit.

GETtheMANUALS.org

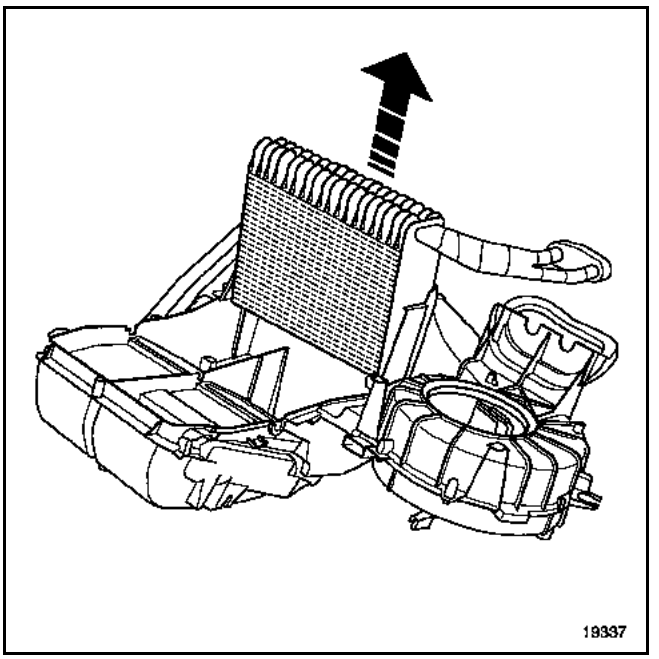
Remove:
– the passenger compartment filter,
– the fan assembly,
– the three mounting bolts of the air recirculation flap.



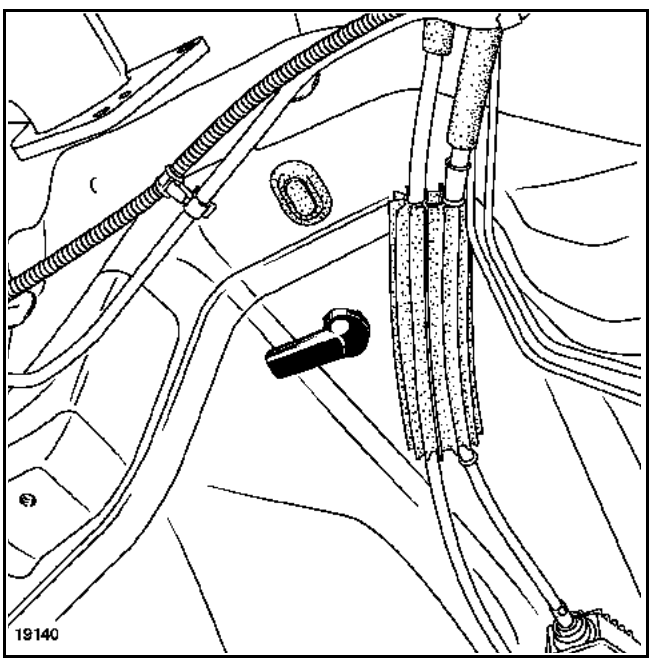
Open the air conditioning unit (F) according to the diagram below.



Remove the evaporator.



NOTE:
The condenser outlet is located under the exhaust heat shield.



REFITTING

Oil the hose seals with the recommended oil.

Carry out the removal procedure in reverse.

GETtheMANUALS.org

IMPORTANT:
It is essential to fit the electrical harness correctly to avoid any possible damage.

Refitting the dashboard

Before replacing the instrument panel, position the harnesses for the tweeters, the display and the insolation sensor.

IMPORTANT:
Connect the battery; carry out the necessary programming (see section **8**).

NOTE:
Perform a leak test with the engine running and air conditioning and fan at maximum, and check with a leak detector within 5 minutes after the filling operation.

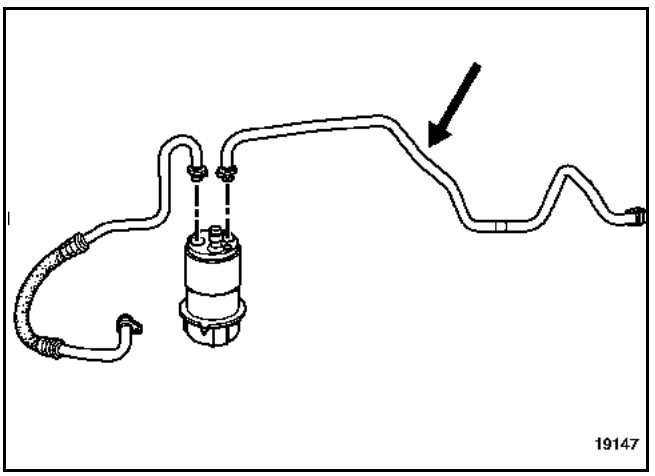
LOW PRESSURE HOSE BETWEEN THE EVAPORATOR AND THE DEHYDRATION CANISTER

TIGHTENING TORQUES (in daNm)	
Mounting nut at the scuttle panel junction	0.8
Bolt on the dehydration canister	0.8

REMOVAL

Place the vehicle on a lift.



Remove:
– the covers,
– the two heat shields (move only) (see **section 62A: "Evaporator unit"**),

Position engine support tool Mot. 1367-02.

Remove:
– the engine upper tie-bar.
– the suspended mounting cover.

Partially remove the petrol pipes.

Remove:
– the mounting nut on the evaporator where it meets the scuttle panel,
– the bolt on the dehydration canister,
– the hose.

Fit caps on the ports.

REFITTING

Carry out the removal procedure in reverse.

Oil the hose seals with the recommended oil.

When changing a pipe, add **10 ml** of oil or when a pipe bursts (rapid leak), add **100 ml**.

IMPORTANT:
Connect the battery; carry out the necessary programming (see section **8**).

NOTE:
Perform a leak test with the engine running and air conditioning and blower at maximum, and check with a leak detector within 5 minutes after the filling operation.

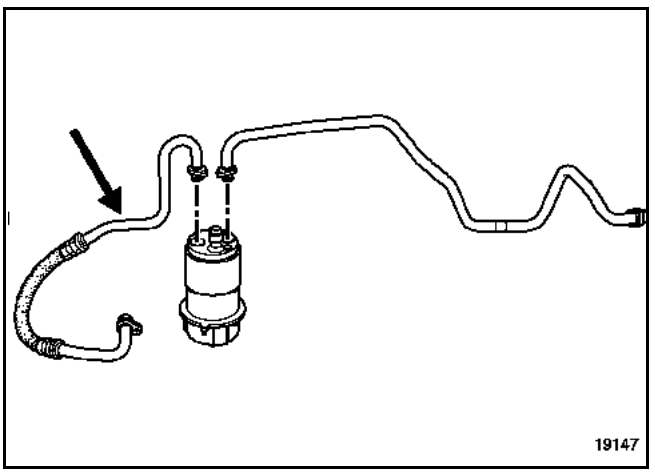
GETtheMANUALS.org

LOW PRESSURE HOSE BETWEEN THE DEHYDRATION CANISTER AND THE COMPRESSOR

TIGHTENING TORQUES (in daNm)	
Nut on the dehydration canister	0.8
Mounting bolt on the compressor	0.8

REMOVAL

Place the vehicle on a lift.



Remove the covers.

Unclip the power assisted steering reservoir.

Remove:
– the mounting nut on the dehydration canister,
– the mounting bolt on the compressor,
– the hose.

Fit caps on the ports.

REFITTING

Carry out the removal procedure in reverse.

Oil the hose seals with the recommended oil.

When changing a pipe, add **10 ml** of oil or when a pipe bursts (rapid leak), add **100 ml**.

IMPORTANT:
Connect the battery; carry out the necessary programming (see section **8**).

NOTE:
Perform a leak test with the engine running and air conditioning and blower at maximum, and check with a leak detector within 5 minutes after the filling operation.

GETtheMANUALS.org

With the vehicle on a two-post lift.

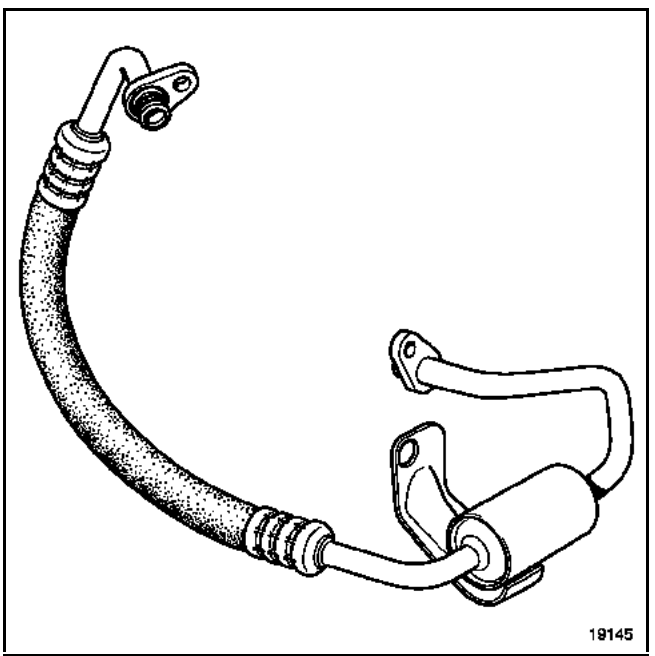
Disconnect the battery.

Drain the **R134a** refrigerant circuit using a filling station.

HIGH PRESSURE HOSE BETWEEN THE COMPRESSOR AND THE CONDENSER

TIGHTENING TORQUES (in daNm)	
Mounting nut on condenser	**0.8**
Bolt on compressor	**0.8**

REMOVAL



Remove:
- the covers,
- the engine skidplate,
- the front bumper (see **section 55A: "Removing the front bumper"**),
- the mounting nut on the condenser (see **section 62A: Condenser**),
- the bar under the compressor,
- the two mounting bolts on the compressor,
- the hose.

Fit caps on the ports.

REFITTING

Carry out the removal procedure in reverse.

Oil the hose seals with the recommended oil.

When changing a pipe, add **10 ml** of oil or when a pipe bursts (rapid leak), add **100 ml**.

IMPORTANT:
Connect the battery; carry out the necessary programming (see section **8**).

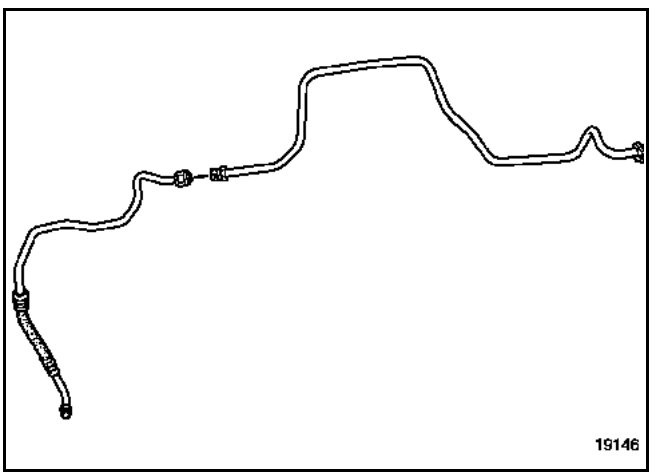
NOTE:
Perform a leak test with the engine running and air conditioning and blower at maximum, and check with a leak detector within 5 minutes after the filling operation.

GETtheMANUALS.org

HIGH PRESSURE HOSE BETWEEN THE CONDENSER AND THE EVAPORATOR

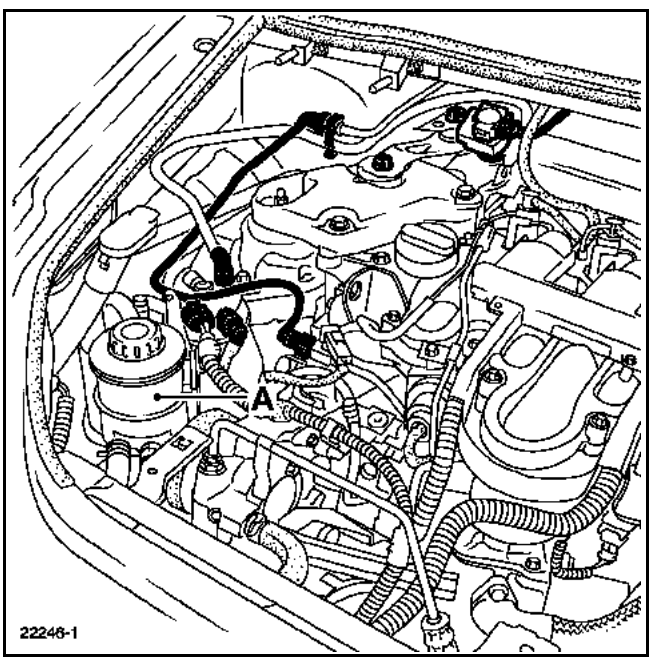
TIGHTENING TORQUES (in daNm)	▽
Mounting nut at the scuttle panel junction	0.8
Bolt on condenser	0.8
Calibrated opening union	2.1

REMOVAL

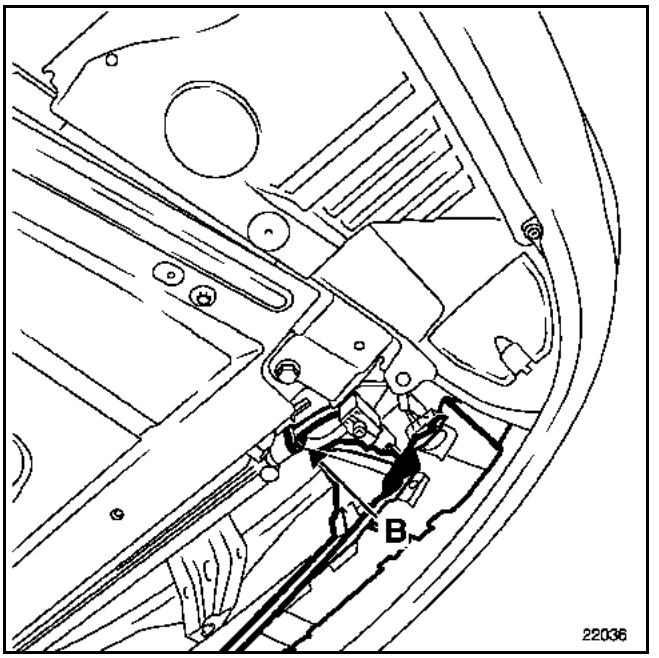


Remove the covers.

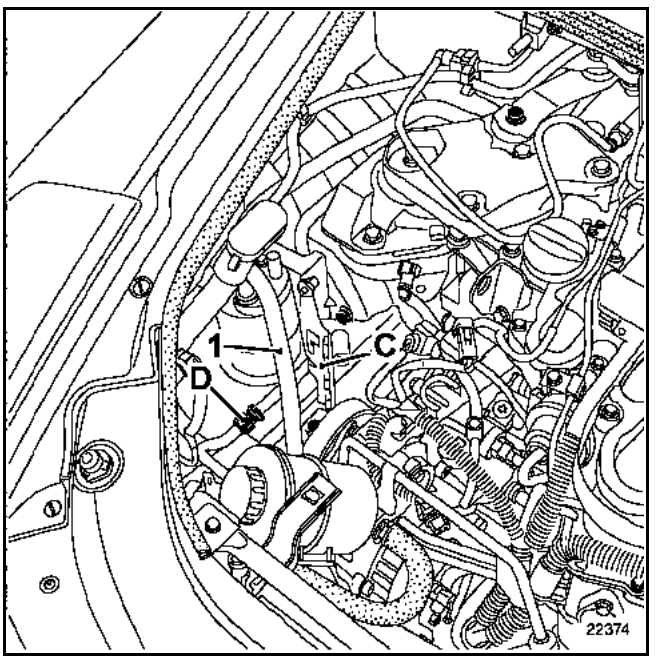
Disconnect the power assisted steering reservoir (A).



Remove:
– the engine undertray,
– partially, the deflector fixed to the front bumper,



– the mounting nut (B) on the condenser,



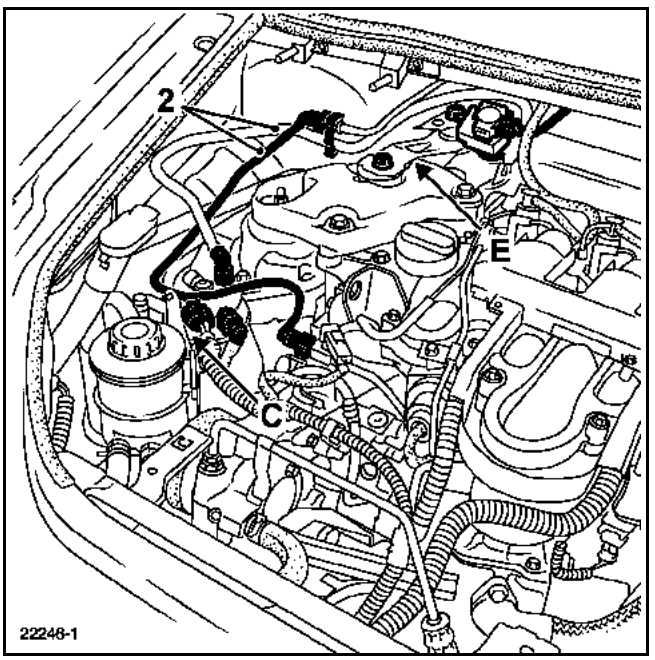
– the power assisted steering reservoir mounting (C),
– the nut on the dehydration canister (1) and remove the pipe on the canister side.

Slacken the union (D).

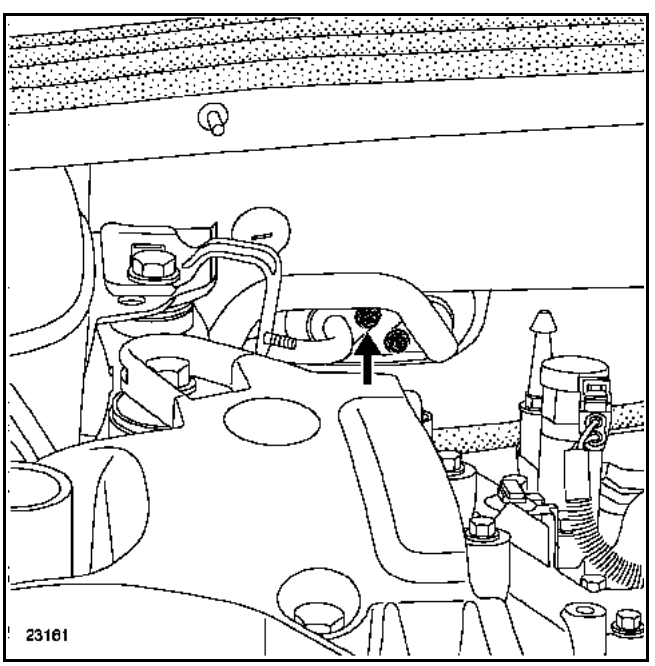
GETtheMANUALS.org

Remove the engine upper tie-bar (E).

Partially remove the diesel pipes (2).



Remove:
– the mounting nut on the evaporator where it meets the scuttle panel,



– the hose.

Fit caps on the ports.

REFITTING

Carry out the removal procedure in reverse.

Oil the hose seals with the recommended oil.

When changing a pipe, add **10 ml** of oil or when a pipe bursts (rapid leak), add **100 ml**.

IMPORTANT:
Connect the battery; carry out the necessary programming (see section **8**).

NOTE:
Perform a leak test with the engine running and air conditioning and blower at maximum, and check with a leak detector within 5 minutes after the filling operation.

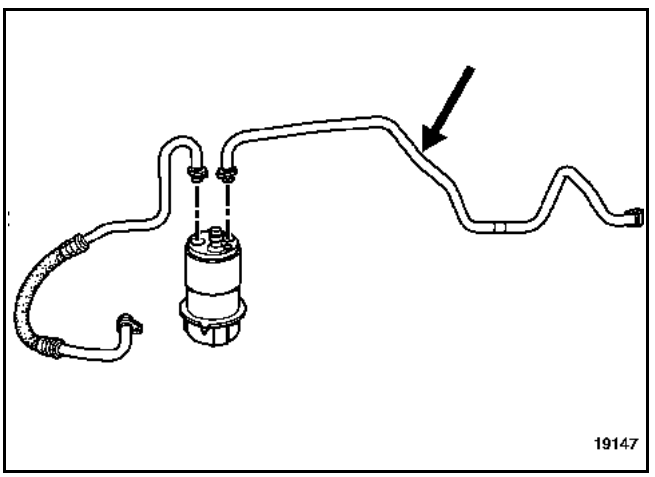
LOW PRESSURE HOSE BETWEEN THE EVAPORATOR AND THE DEHYDRATION CANISTER

TIGHTENING TORQUES (in daNm)	▽
Mounting nut at the scuttle panel junction	0.8
Bolt on the dehydration canister	0.8

REMOVAL

Place the vehicle on a lift.



Remove:
– the covers,
– the engine upper tie-bar.

Partially remove the diesel pipes.

Remove:
– the mounting nut on the evaporator where it meets the scuttle panel,
– the bolt on the dehydration canister,
– the hose.

Fit caps on the ports.

REFITTING

Carry out the removal procedure in reverse.

Oil the hose seals with the recommended oil.

When changing a pipe, add **10 ml** of oil or when a pipe bursts (rapid leak), add **100 ml**.

IMPORTANT:
Connect the battery; carry out the necessary programming (see section **8**).

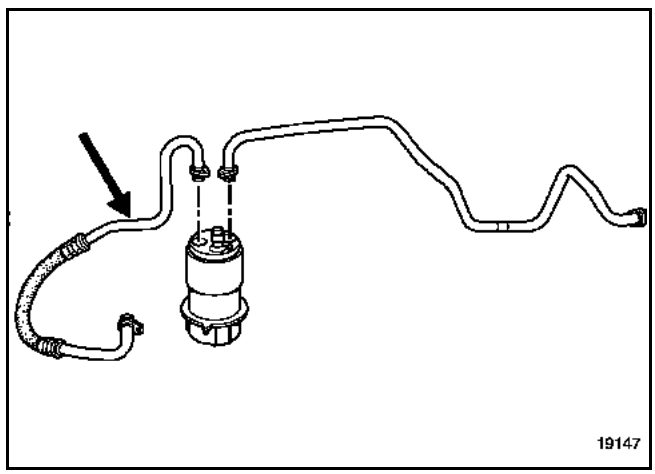
NOTE:
Perform a leak test, with the engine running and with the air conditioning and blower on full, using a leak detector, within 5 minutes after the filling operation.

LOW PRESSURE HOSE BETWEEN THE DEHYDRATION CANISTER AND THE COMPRESSOR

TIGHTENING TORQUES (in daNm)	▽
Nut on the dehydration canister	0.8
Mounting bolt on the compressor	0.8

REMOVAL

Place the vehicle on a lift.



Remove the covers.

Unclip the power assisted steering reservoir.

Remove:
– the mounting nut on the dehydration canister,
– the ski under the engine,
– the mounting bolt on the compressor,
– the hose.

Fit caps on the ports.

REFITTING

Carry out the removal procedure in reverse.

Oil the hose seals with the recommended oil.

When changing a pipe, add **10 ml** of oil or when a pipe bursts (rapid leak), add **100 ml**.

IMPORTANT:
Connect the battery; carry out the necessary programming (see section **8**).

NOTE:
Perform a leak test with the engine running and air conditioning and blower at maximum, and check with a leak detector within 5 minutes after the filling operation.

GETtheMANUALS.org

With the vehicle on a two-post lift.

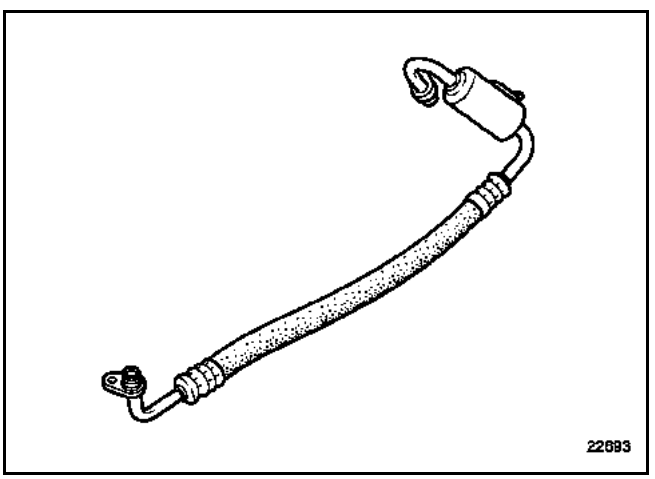
Disconnect the battery.

Drain the **R134a** refrigerant circuit using a filling station.

HIGH PRESSURE HOSE BETWEEN THE COMPRESSOR AND THE CONDENSER

TIGHTENING TORQUES (in daNm)	▽
Mounting nut on condenser	**0.8**
Bolt on compressor	**0.8**

REMOVAL



Remove:
– the covers,
– the air inlet tract (see **Section 62A: "Dehydration canister: V4Y engine"**),
– the front bumper (see **Section 55A: "Removing the front bumper"**),
– the mounting nut on the condenser (see **section 62A: Condenser**),
– the mounting bolt on the compressor (see **section 62A: "Compressor: V4Y engine"**),
– the hose.

Fit the caps in the ports.

REFITTING

Carry out the removal procedure in reverse.

Oil the hose seals with the recommended oil.

When changing a pipe, add **10 ml** of oil or when a pipe bursts (rapid leak), add **100 ml**.

IMPORTANT:
Connect the battery; carry out the necessary programming (see section **8**).

NOTE:
Perform a leak test with the engine running and air conditioning and blower at maximum, and check with a leak detector within 5 minutes after the filling operation.

LOW PRESSURE HOSE BETWEEN THE DEHYDRATION CANISTER AND THE COMPRESSOR

TIGHTENING TORQUES (in daNm)	
Nut on the dehydration canister	0.8
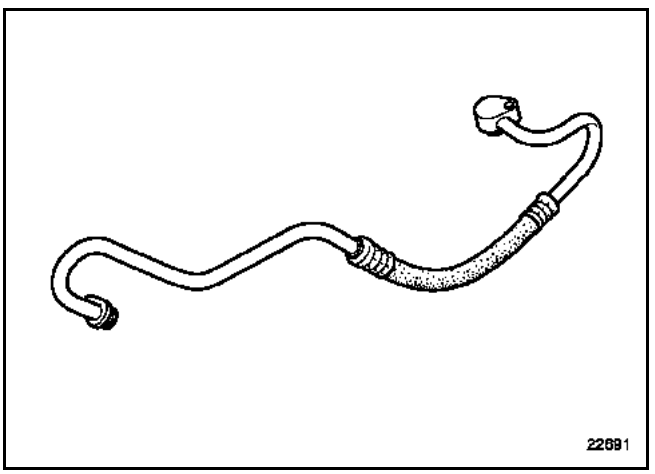
Mounting bolt on condenser	0.8

REMOVAL



Remove the covers.

Unclip the power assisted steering reservoir.

Remove:
– the mounting nut on the dehydration canister,
– the mounting bolt on the compressor,
– the hose.

Fit caps on the ports.

REFITTING

Carry out the removal procedure in reverse.

Oil the hose seals with the recommended oil.

When changing a pipe, add **10 ml** of oil or when a pipe bursts (rapid leak), add **100 ml**.

IMPORTANT:
Connect the battery; carry out the necessary programming (see section **8**).

NOTE:
Perform a leak test with the engine running and air conditioning and blower at maximum, and check with a leak detector within 5 minutes after the filling operation.

GETtheMANUALS.org

TIGHTENING TORQUE (in daNm)	
Pressure sensor	0.9

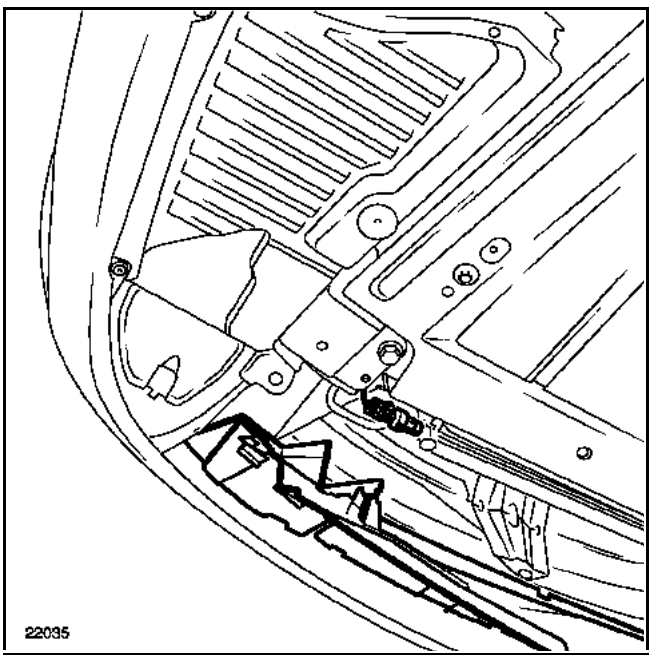
REMOVAL

Place the vehicle on a lift.

Remove the four front engine cover mounting bolts.

Move the front engine cover to one side.

Disconnect the pressure sensor connection then remove the pressure sensor.



The pressure sensor fitted at the condenser output protects the refrigerant circuit.

– Low-pressure cut-off: **2 bar**

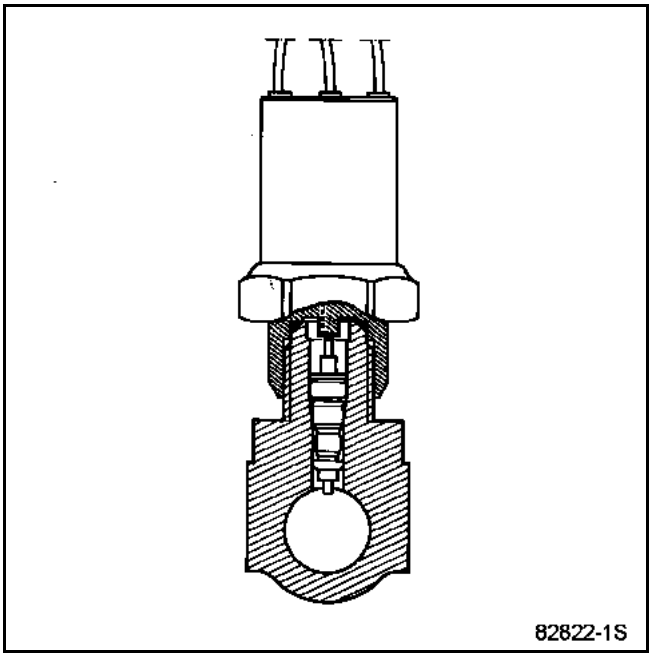
– High-pressure cut-off: **27 bar**

It informs the injection computer of the pressure in the refrigerant circuit.

The injection computer controls the engine cooling blowers depending on the high pressure in the refrigerant circuit and the vehicle speed.

The pressostat switch can be removed without draining the refrigerant circuit.

An automatic shut-off valve isolates the circuit from the environment when the switch is removed.



REFITTING

Refit in reverse order to removal.

Replace the seal if it is damaged, protecting the pressure sensor end piece filter to avoid damaging the seal during fitting.

Oil the seal with the recommended oil.

IMPORTANT:
Connect the battery; carry out the necessary programming (see section **8**).

NOTE:
Perform a leak test with the engine running and air conditioning and blower at maximum, and check with a leak detector within 5 minutes after the filling operation.

GETtheMANUALS.org

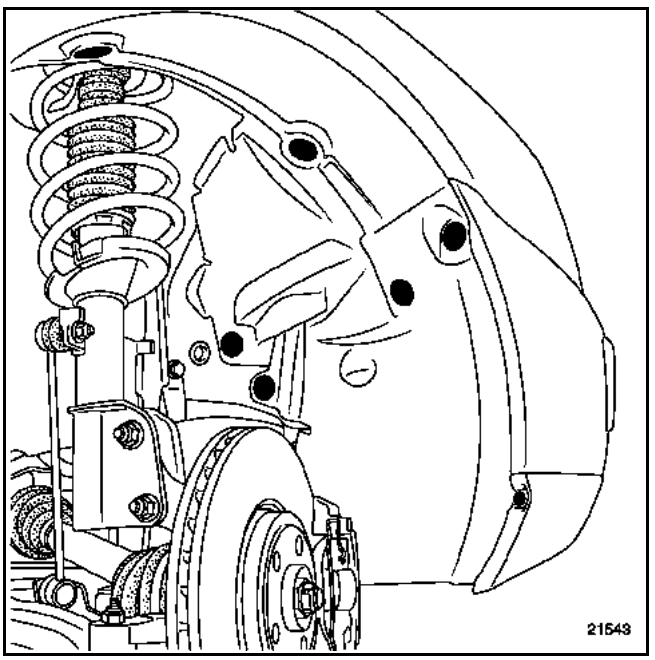
TIGHTENING TORQUE (in daNm)	
Pressure sensor	0.9

REMOVAL

Disconnect the battery.

Drain the refrigerant circuit using the filling station.

Remove:
– the engine undertray,
– part of the wheel arch liners.

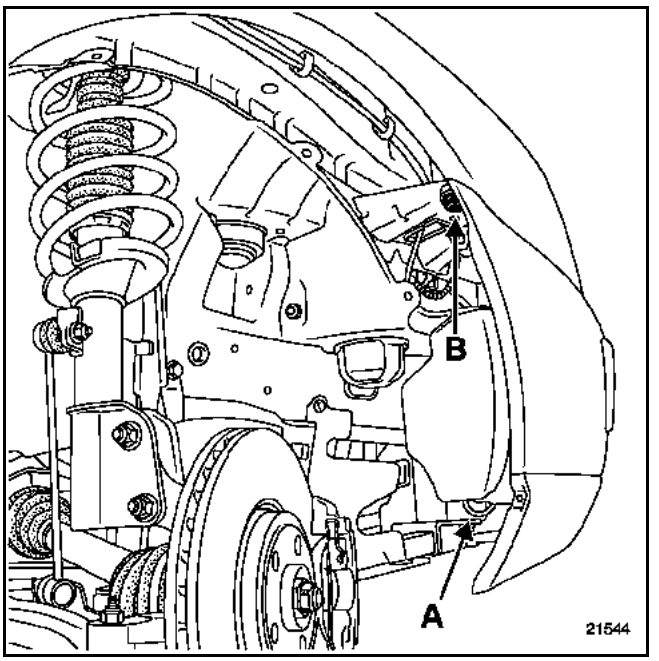


Disconnect the fog light supply connectors (A) (if fog lights fitted).

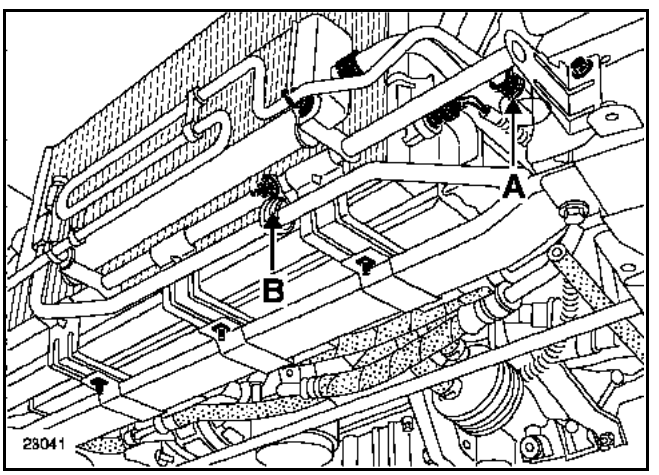
Remove the two side mounting bolts (B).

Partially detach the bumper.

Disconnect the supply to the headlight washer jets (if fitted).



Remove the bumper/grille assembly (this operation requires two people).

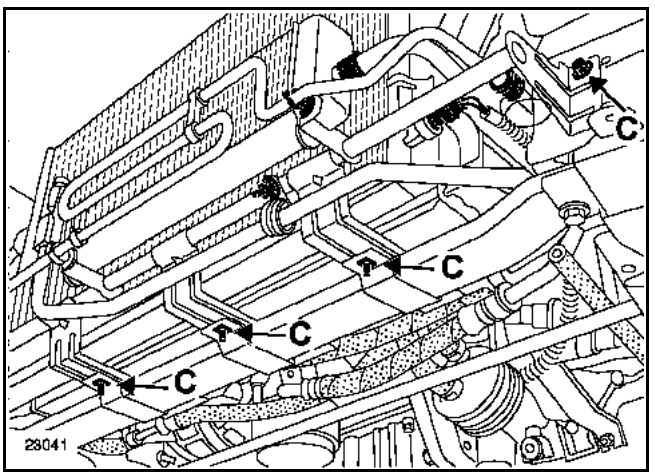


Remove:
– the bumper/grille assembly (this operation requires two people),
– the radar (see section concerned),
– the pressure sensor connections,
– the clip (A) and (B).

Separate the oil radiator from its mounting without removing it and leave it suspended.

GETtheMANUALS.org

Remove:
– the radiator mounting attachments at (C) in order to move it,
– the pressure sensor.



The pressure sensor fitted at the condenser output protects the refrigerant circuit.

– Low-pressure cut-off: **2 bar**

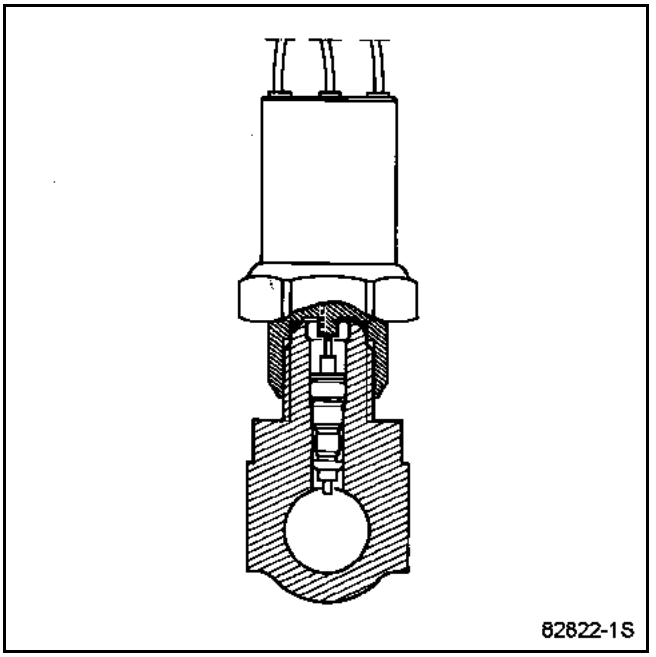
– High-pressure cut-off: **27 bar**

It informs the injection computer of the pressure in the refrigerant circuit.

The injection computer controls the engine cooling fans depending on the high pressure in the refrigerant circuit and the vehicle speed.

The pressostat switch can be removed without draining the refrigerant circuit.

An automatic shut-off valve isolates the circuit from the environment when the switch is removed.



REFITTING

Refit in reverse order to removal.

Replace the seal if it is damaged, protecting the pressure sensor end piece filter to avoid damaging the seal during fitting.

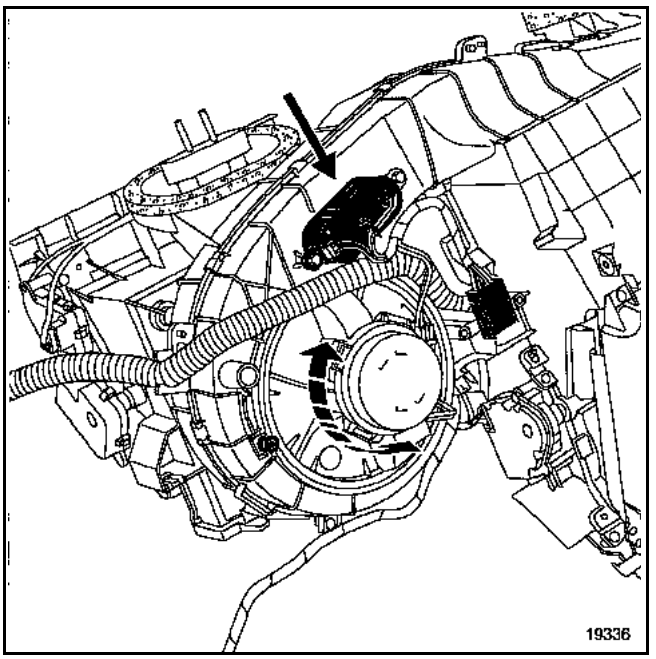
Oil the seal with the recommended oil.

IMPORTANT:
Connect the battery; carry out the necessary programming (see section **8**).

NOTE:
Perform a leak test with the engine running and air conditioning and blower at maximum, and check with a leak detector within 5 minutes after the filling operation.

GETtheMANUALS.org

SPEED VARIATION MODULE



The speed variation module controls the speed of the blower depending on the requirements determined by the automatic control.

It can be accessed from underneath the instrument panel.

REMOVAL

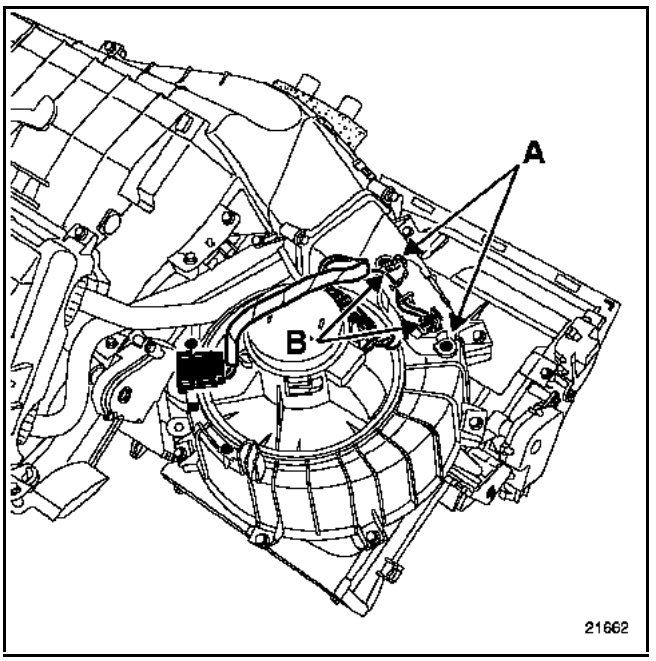
Remove:
– the protective cover under the instrument panel,
– the two mounting bolts under the instrument panel,
– the speed variation module.

REFITTING

Carry out the removal procedure in reverse.

GETtheMANUALS.org

SPEED VARIATION MODULE



The speed variation module controls the speed of the blower depending on the requirements determined by the automatic control.

It can be accessed from underneath the instrument panel.

REMOVAL

Remove:
– the braking sensor by turning it a quarter turn,
– the two power module mounting bolts (A),
– the speed variation module.

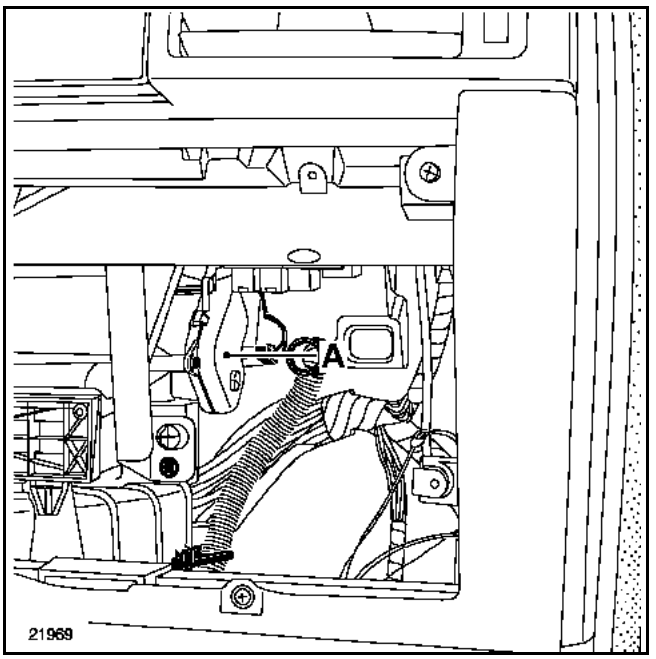
Disconnect the two power module connections (B).

REFITTING

Carry out the removal procedure in reverse.

NOTE:
Do not forget to refit the braking sensor on its mounting.

GETtheMANUALS.org



The recycling motor positions the air intake flap depending on the requirements determined by automatic control or the user.

The recycling motor is accessible after removing the glovebox (see "**Method for removing passenger compartment filter"**).

REMOVAL

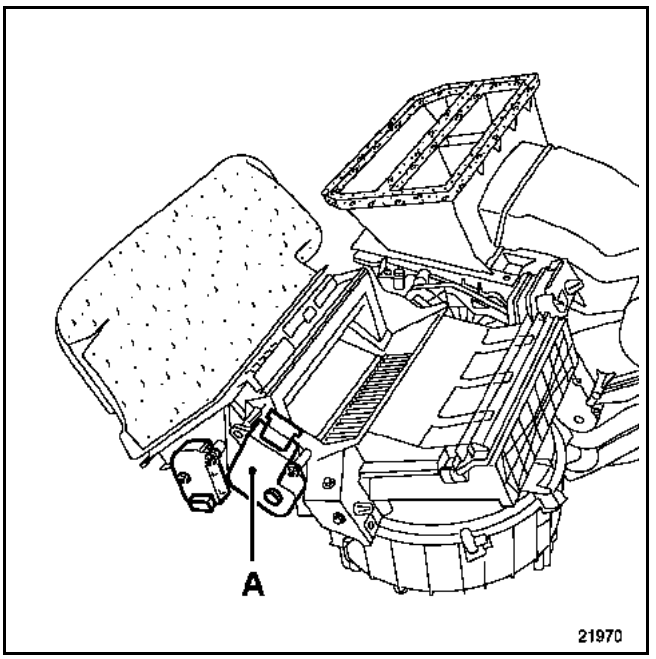
Disconnect the connections.

Remove:
– the two recirculation motor, mounting bolts,
– the recirculation motor (A).

REFITTING

Carry out the removal procedure in reverse.

GETtheMANUALS.org



The recycling motor positions the air intake flap depending on the requirements determined by automatic control or the user.

REMOVAL

Remove:
– the glovebox (see **section 62A: "Removing the passenger compartment filter"**),
– the two recirculation motor, mounting bolts,
– the recirculation motor (A).

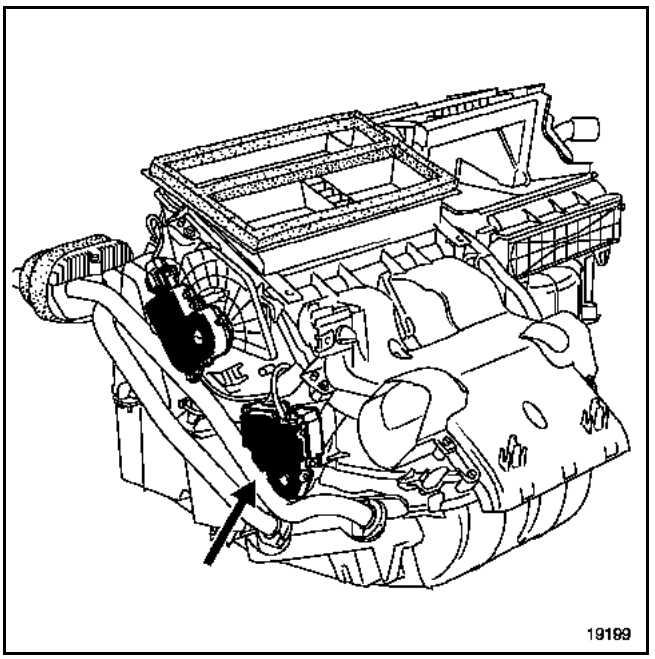
Disconnect the connections.

REFITTING

Carry out the removal procedure in reverse.

GETtheMANUALS.org

LEFT-HAND MIXER MOTOR

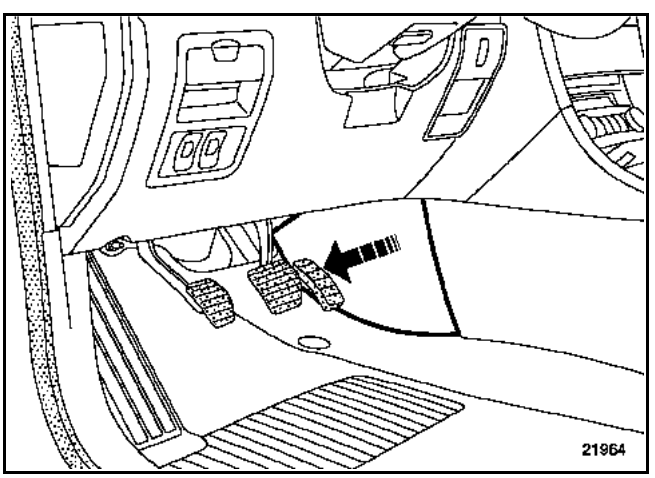


The mixing motor positions the air mixing flap depending on the requirements determined by automatic control.

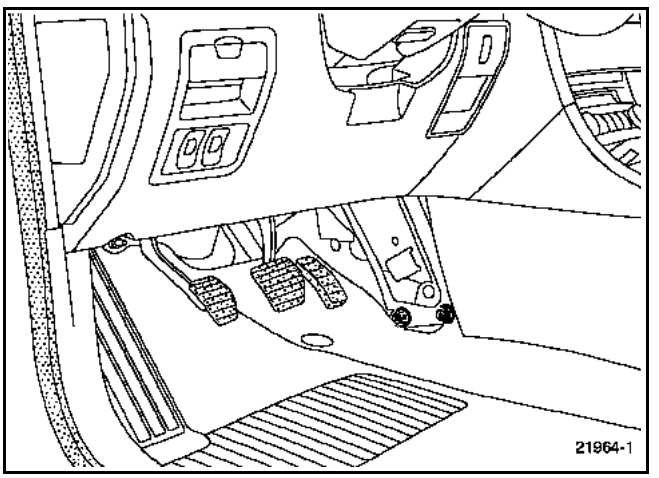
TIGHTENING TORQUE (in daNm)	▽
Reinforcing plate nuts	2.1
Reinforcing plate bolts	2.1

REMOVAL

Remove:
– the trim,



– the four bolts of the beam reinforcement retaining plate.



Disconnect the connections.

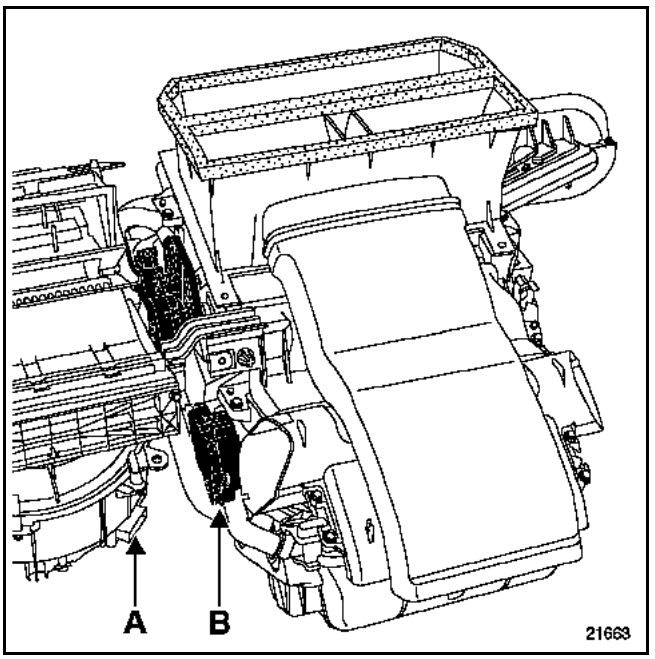
Remove:
– the two mounting bolts of the mixer motor,
– the mixer motor.

REFITTING

Carry out the removal procedure in reverse.

GETtheMANUALS.org

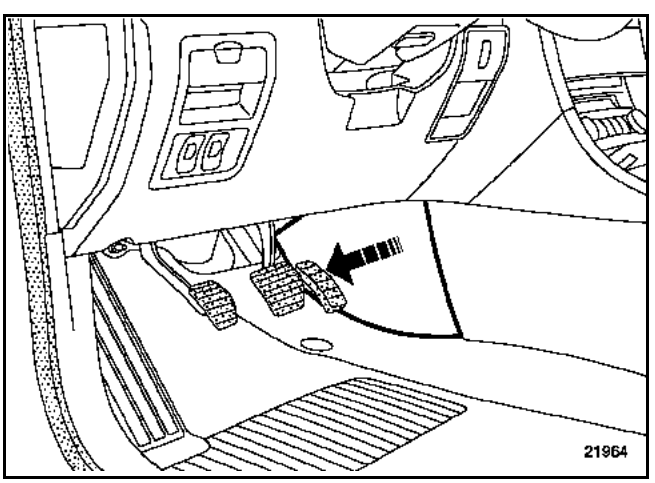
LEFT-HAND MIXER MOTOR



The mixing motor positions the air mixing flap depending on the requirements determined by automatic control.

REMOVAL

Remove the trim.



Disconnect the connections (A) of the fan assembly.

Remove:
– the two mounting bolts of the mixer motor,
– mixer motor (B),
– the mixer motor connections.

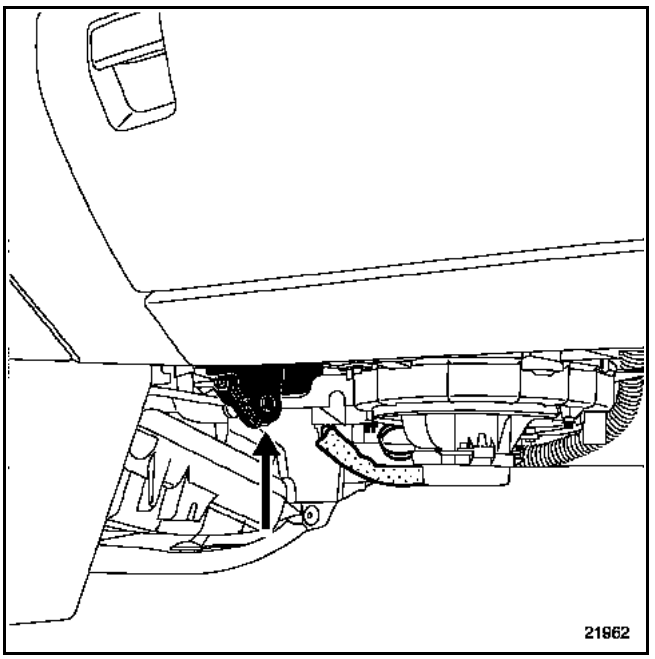
REFITTING

Carry out the removal procedure in reverse.

NOTE:
Remember to connect the connections (A).

GETtheMANUALS.org

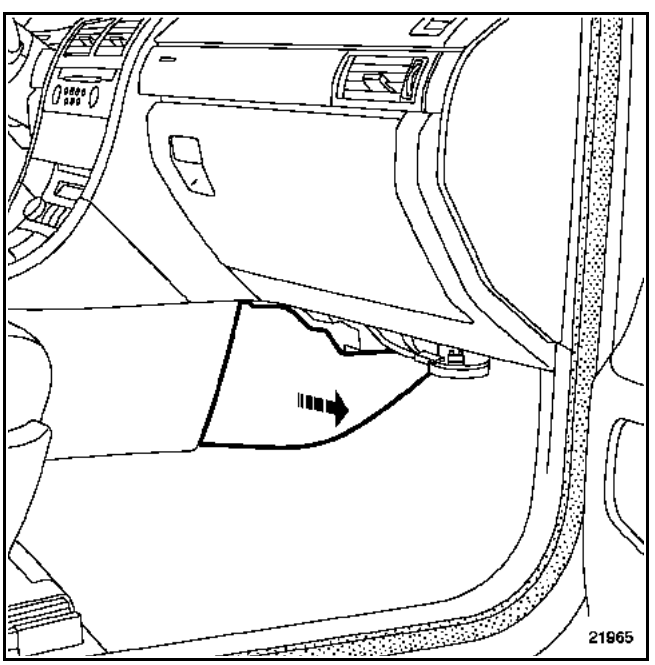
RIGHT-HAND MIXER MOTOR



The mixing motor positions the air mixing flap depending on the requirements determined by automatic control.

REMOVAL

Remove the trim.



Remove:
– the two mounting bolts of the mixer motor,
– the mixer motor.

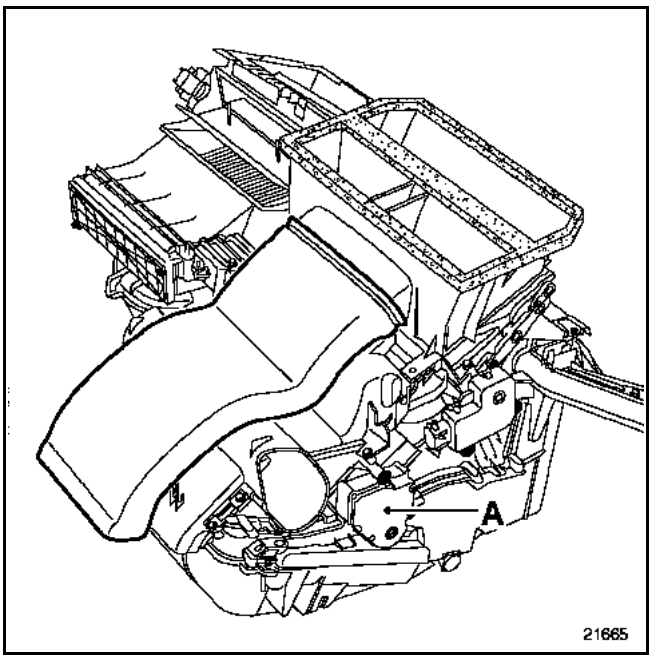
Disconnect the connections.

REFITTING

Carry out the removal procedure in reverse.

GETtheMANUALS.org

RIGHT-HAND MIXER MOTOR



The mixing motor positions the air mixing flap depending on the requirements determined by automatic control.

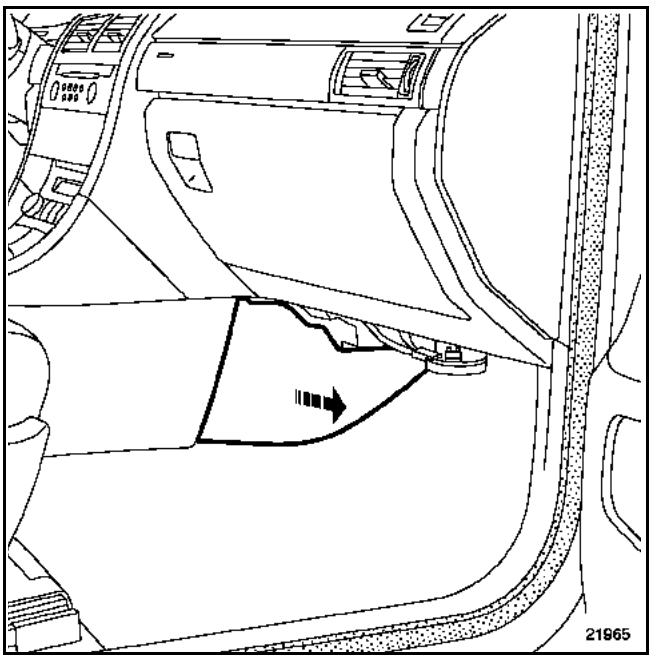
This operation is performed without removing the instrument panel.

TIGHTENING TORQUE (in daNm)	▽
Reinforcing plate nuts	2.1
Reinforcing plate bolts	2.1

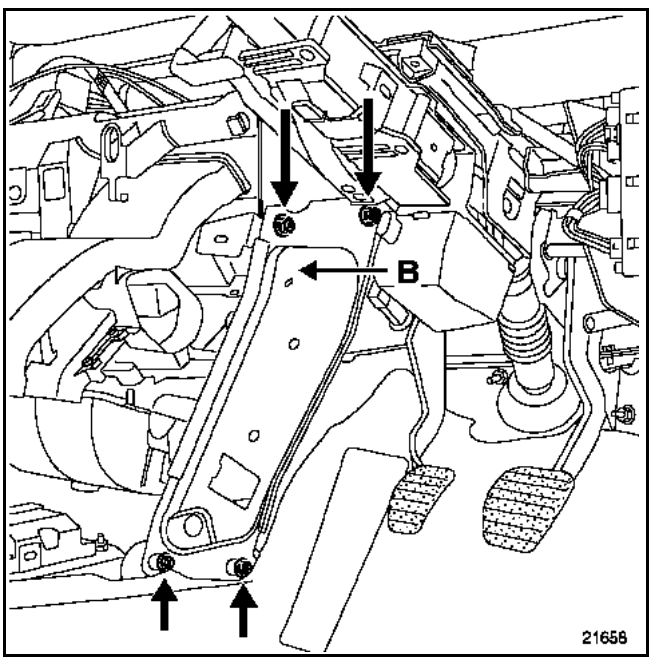
REMOVAL

Remove the trim.

Move the carpet to one side to remove the reinforcement plate.



Remove:
– the electrical harness on the plate (location B),
– the four bolts of the beam reinforcement plate.



Remove the reinforcement plate.

Remove:
– the two mounting bolts of the mixer motor,
– mixer motor (A).

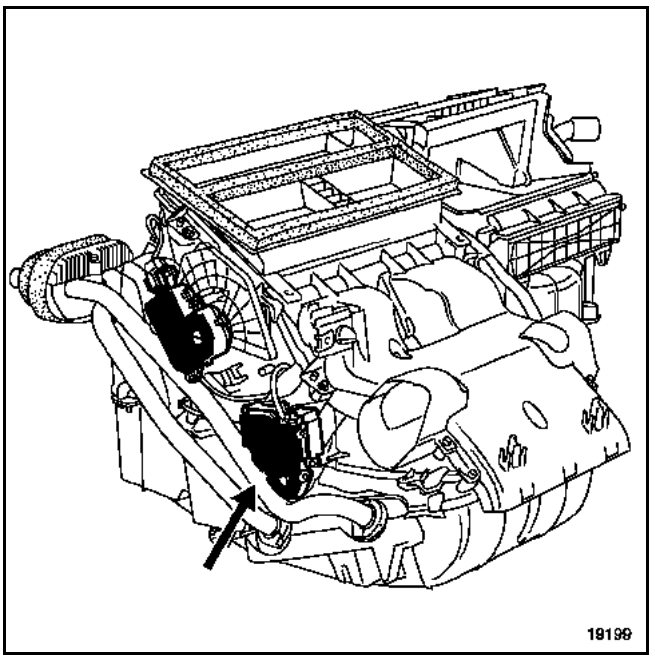
Disconnect the connections.

REFITTING

Carry out the removal procedure in reverse.

GETtheMANUALS.org

DE-ICING DISTRIBUTION MOTOR



The distribution motor positions the de-icing flap depending on the requirements determined by the automatic control.

The air distribution motor can be accessed after removing the beam (see **method for removing the evaporator**).

REMOVAL

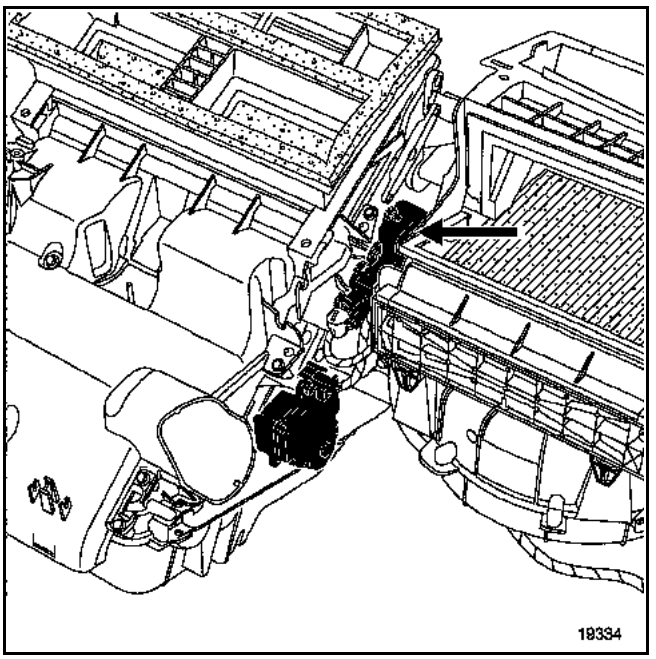
Disconnect the connections.

Remove:
– the two mounting bolts of the distribution motor,
– the distribution motor.

REFITTING

Carry out the removal procedure in reverse.

FOOT WELL DISTRIBUTION MOTOR/VENTILATION



The distribution motor positions the distribution flap depending on the requirements determined by the automatic control.

The air distribution motor can be accessed after removing the beam (see **method for removing the evaporator**).

REMOVAL

Disconnect the connections.

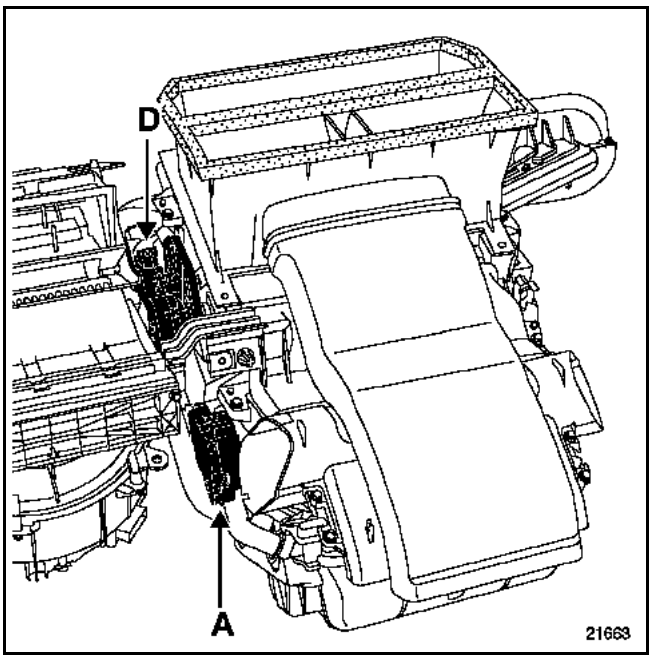
Remove:
– the two mounting bolts of the air distribution motor,
– the air distribution motor.

REFITTING

Carry out the removal procedure in reverse.

GETtheMANUALS.org

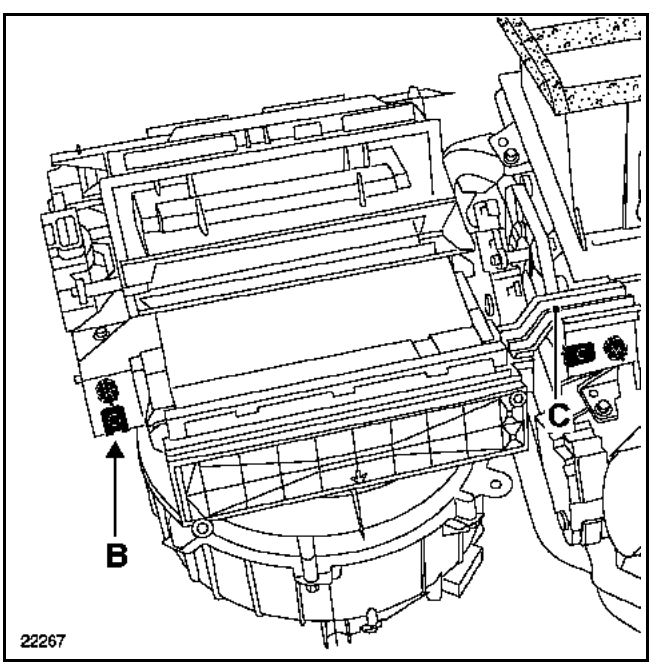
DE-ICING DISTRIBUTION MOTOR



The distribution motor positions the de-icing flap depending on the requirements determined by the automatic control.

REMOVAL

Remove:
– the glovebox (see **section 62: "Removing the passenger compartment filter"**),
– the left-hand side cover,
– mixer motor (A).



– bolt (B) of the filter unit on the reinforcement beam,
– strengthening bracket (C).

Move the filter unit back slightly.

Remove:
– the two mounting bolts of the distribution motor,
– air distribution motor (D).

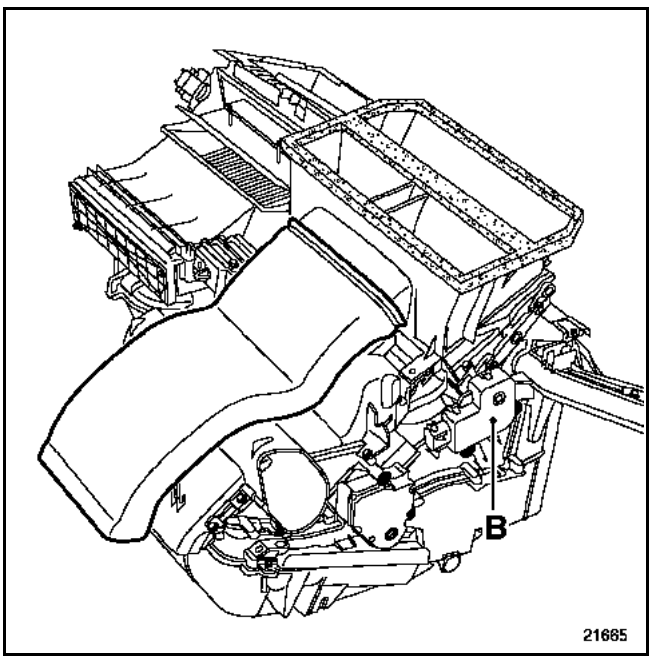
Disconnect the connections.

REFITTING

Carry out the removal procedure in reverse.

GETtheMANUALS.org

FOOT WELL AIR DISTRIBUTION MOTOR/ VENTILATION



The distribution motor positions the distribution flap depending on the requirements determined by the automatic control.

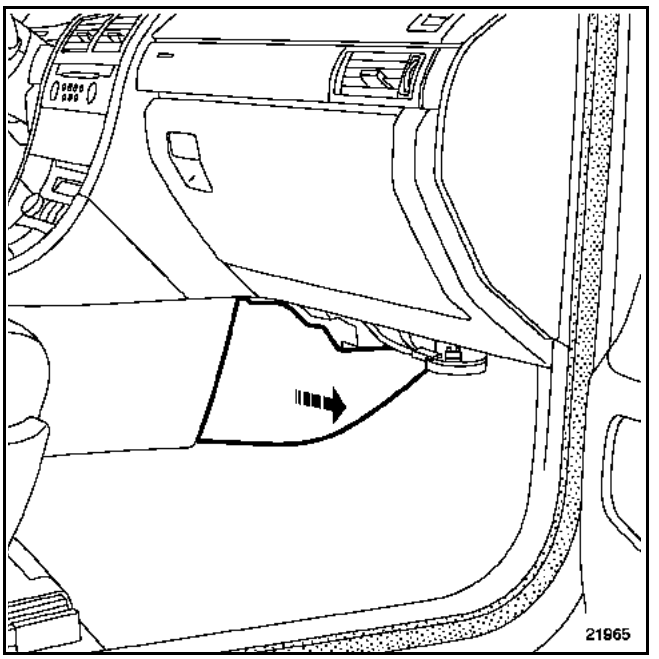
This operation is performed without removing the instrument panel.

TIGHTENING TORQUE (in daNm)	
Reinforcing plate nuts	**2.1**
Reinforcing plate bolts	**2.1**

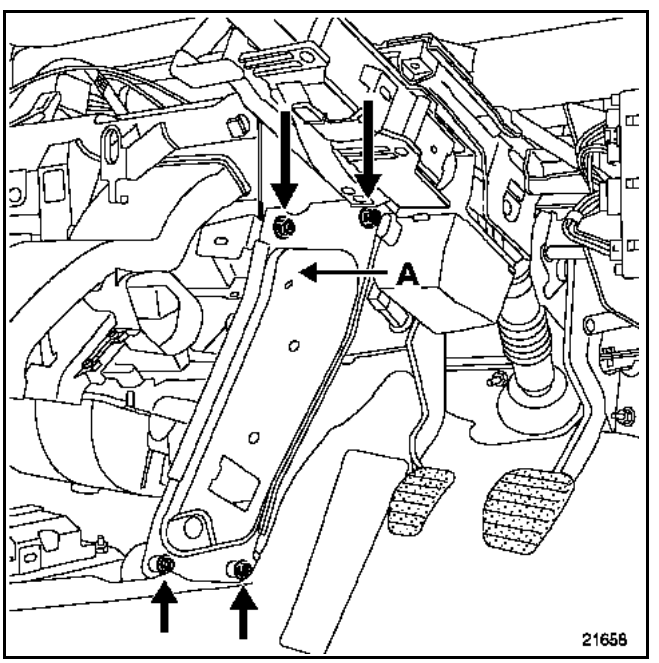
REMOVAL

Remove the trim.

Move the carpet to one side to remove the reinforcement plate.



Remove:
– the electrical harness on the plate (location A),
– the four reinforcement retaining bolts.



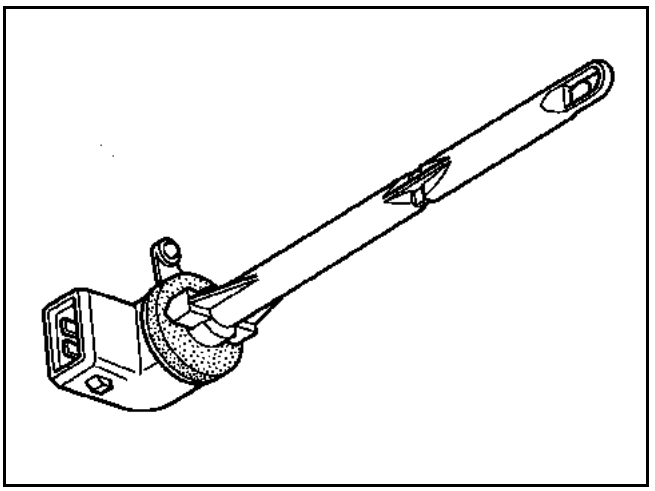
Disconnect the connections.

Remove:
– the two mounting bolts of the air distribution motor,
– the air distribution motor.

REFITTING

Carry out the removal procedure in reverse.

GETtheMANUALS.org



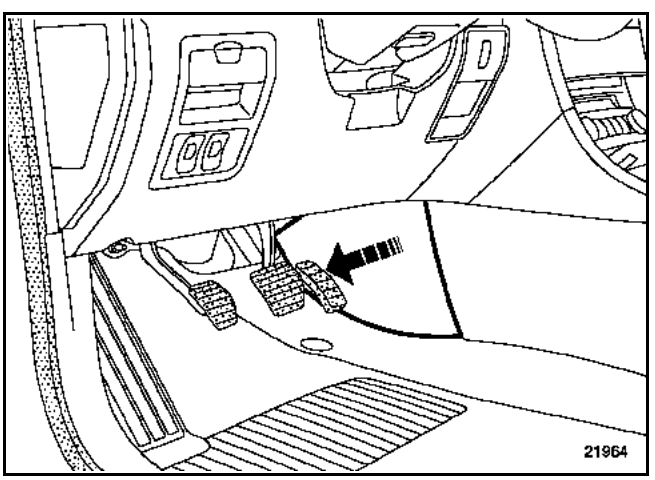
The evaporator sensor provides information about the air temperature at the evaporator outlet.

It is a negative temperature coefficient thermistor.

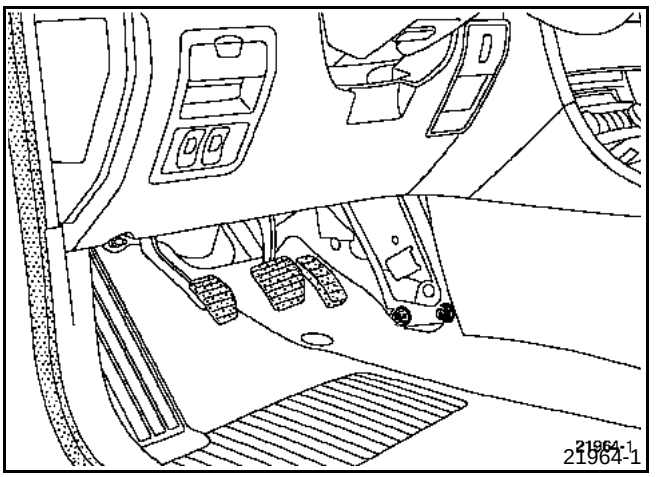
TIGHTENING TORQUE (in daNm)	▽
Reinforcing plate nuts	2.1
Reinforcing plate bolts	2.1

REMOVAL

Remove:
– the trim,

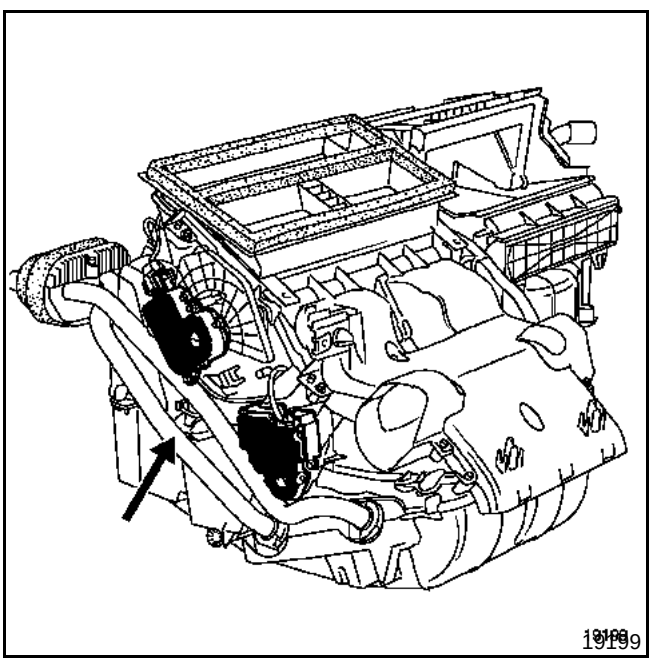


– the four reinforcement retaining bolts.



Disconnect the connections.

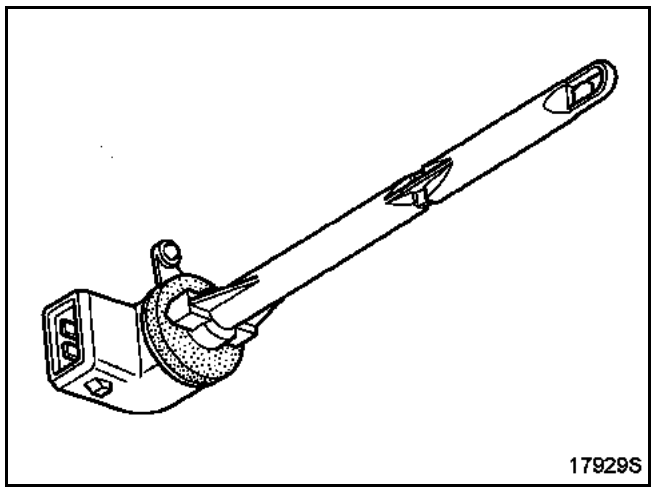
Turn the sensor a quarter turn to remove it.



REFITTING

Carry out the removal procedure in reverse.

GETtheMANUALS.org

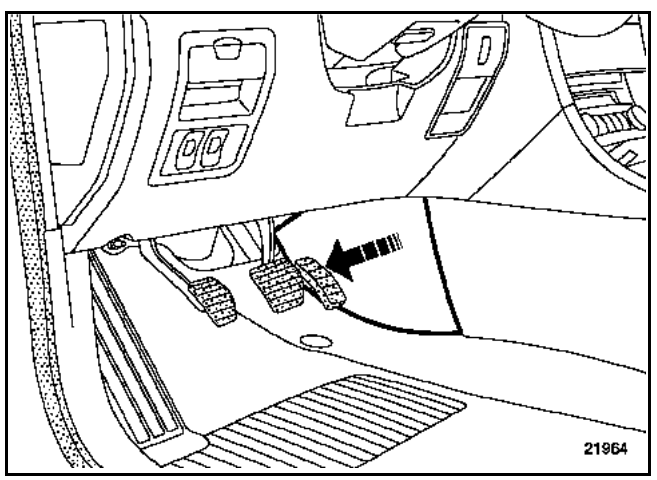


The evaporator sensor provides information about the air temperature at the evaporator outlet.

It is a negative temperature coefficient thermistor.

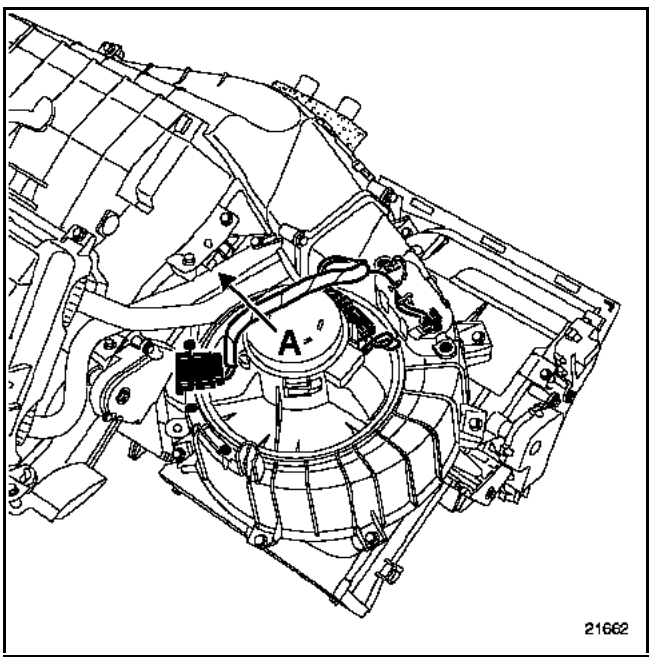
REMOVAL

Remove the trim.



Disconnect the connections.

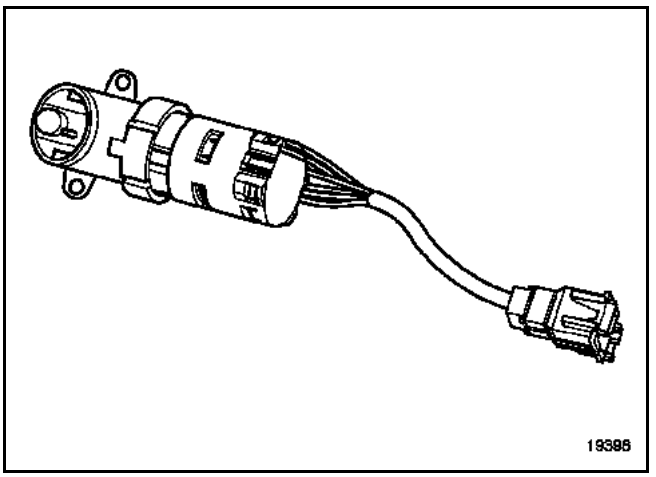
Remove the sensor (location A) by turning it a quarter turn.



REFITTING

Carry out the removal procedure in reverse.

GETtheMANUALS.org

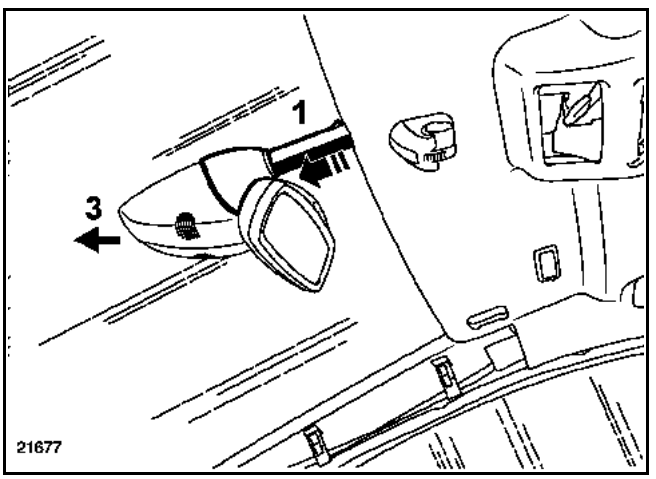


The passenger compartment sensor measures the temperature inside the vehicle.

It is a negative temperature coefficient thermistor.

LOCATION

The sensor is located in the courtesy light.



REMOVAL

Remove:
– the upper cover at (1),
– the lower cover (3) (see **section 58A: "Method of removing interior rear-view mirror"**),
– the two micro-turbine mounting bolts located inside the cover (3),
– the micro-turbine assembly.

Disconnect the connections.

REFITTING

Carry out the removal procedure in reverse.

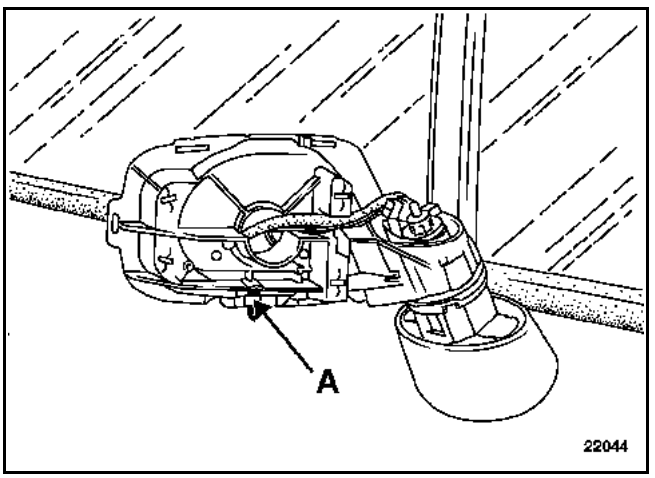
GETtheMANUALS.org

The exterior sensor provides information about the temperature outside the vehicle.

It is a negative temperature coefficient thermistor.

LOCATION

The sensor is located in the left-hand door mirror.

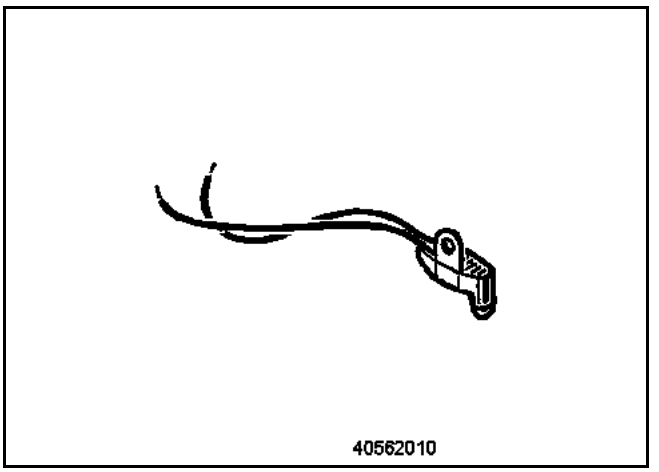


REMOVAL

Remove:
– the two covers of the door mirror (see **section 56A: "Method of removing door mirrors"**),
– the rear view mirror glass (see **section 56B: "Method of removing rear view mirror glass"**),
– the sensor using a flat screwdriver and push at (A).

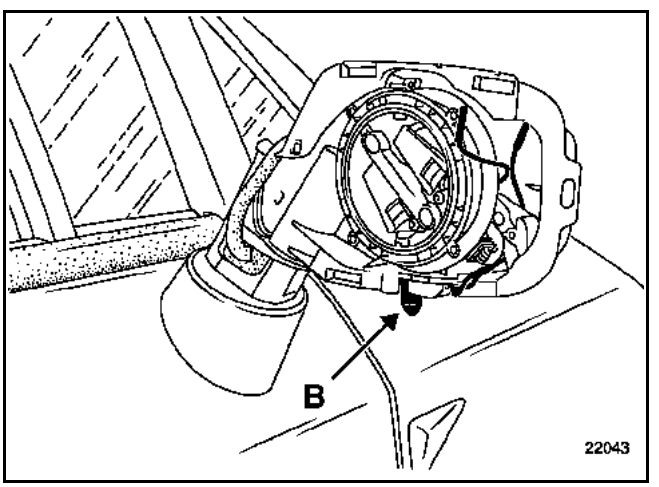
The temperature sensor is removed from below.

Cut the sensor wiring.



REFITTING

Make a wire joint with the new sensor.

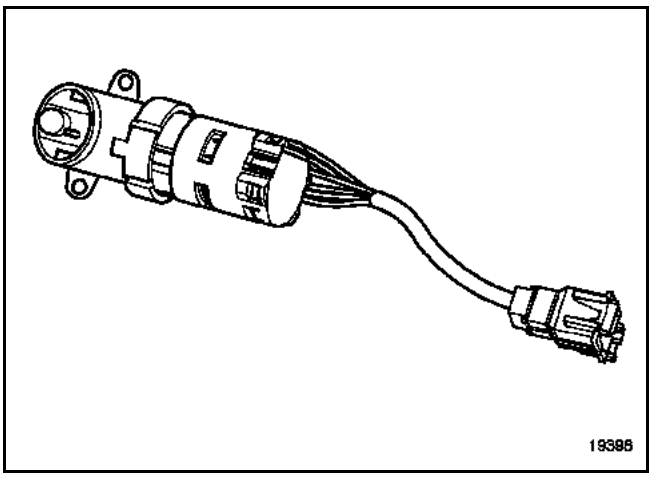


Position the temperature sensor from below and, using a flat screwdriver, push at (B).

Carry out the removal procedure in reverse.

GETtheMANUALS.org

The humidity sensor is located in the micro-turbine.

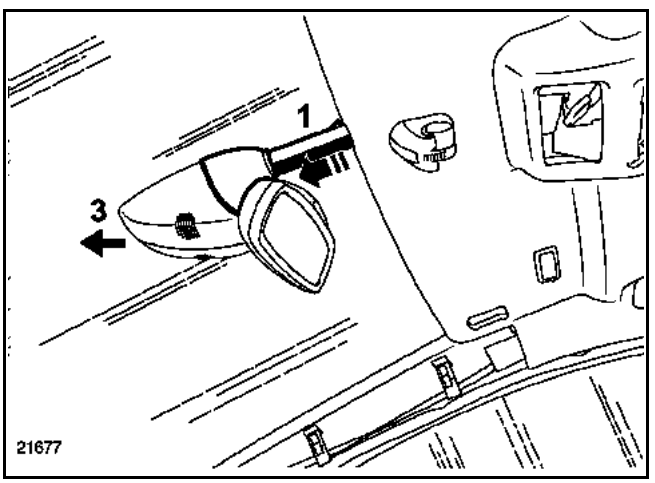


The sensor measures the humidity in the passenger compartment.

It is a capacitive sensor: the resistance changes with humidity.

LOCATION

The sensor is located in the courtesy light.



REMOVAL

Remove:
– the upper cover at (1),
– the lower cover (3) (see **section 58A: "Method of removing interior rear-view mirror"**),
– the two micro-turbine mounting bolts located inside the cover (3),
– the micro-turbine assembly.

Disconnect the connections.

REFITTING

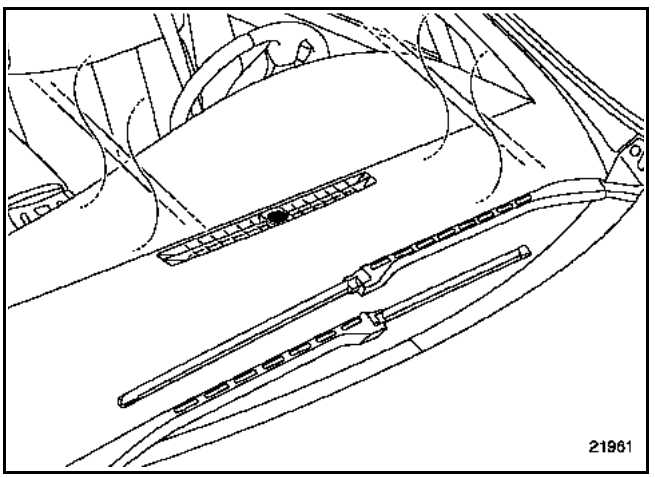
Carry out the removal procedure in reverse.

GETtheMANUALS.org

The sunshine sensor measures the amount of sunlight and informs the computer so that the air flow from the vents can be corrected.

LOCATION

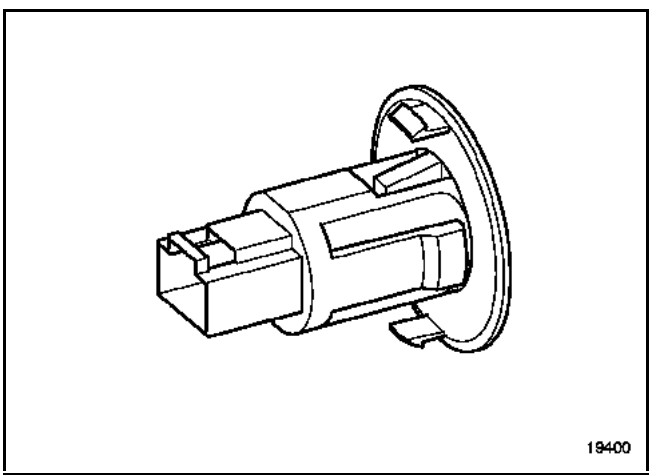
The sensor is located in the centre of the instrument panel.



REMOVAL

Remove:
– the instrument panel grille,
– the insolation sensor.

Disconnect the insolation sensor connector.



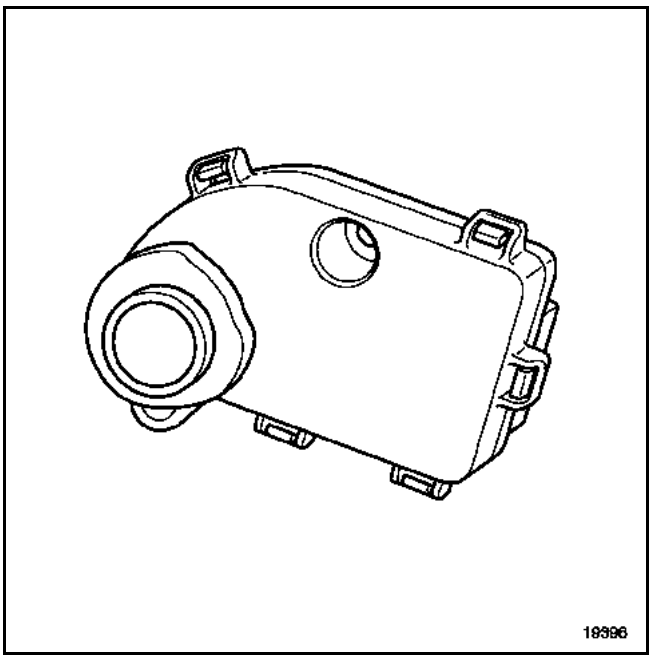
REFITTING

Refit:
– the grille,
– the insolation sensor connections,
– the insolation sensor.

GETtheMANUALS.org

The sensor continuously analyses levels of engine exhaust fumes and informs the computer for the control of the air intake flap.

The sensor is protected by a membrane which allows gas molecules through but traps humidity and dust.

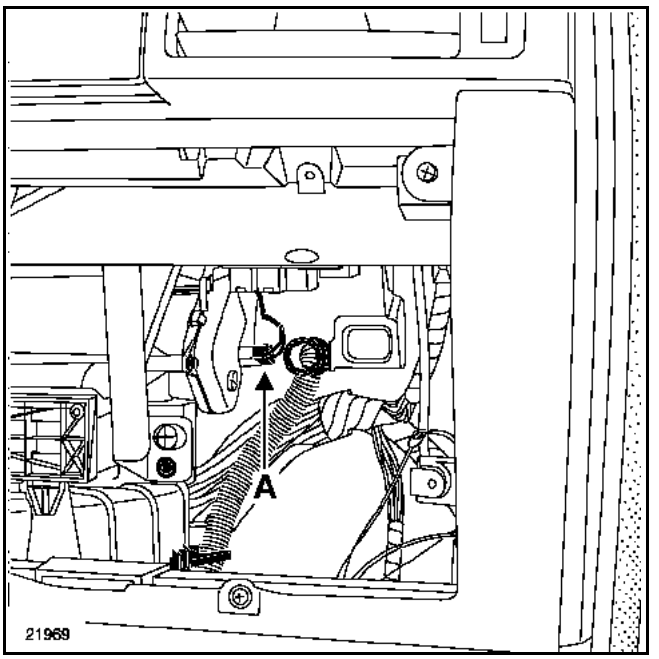


Access to it is through the glovebox.

REMOVAL

Remove:
– the glovebox (see **section 62A: "Removing the passenger compartment filter"**),
– the two air quality sensor mounting bolts,
– air quality sensor (A).

Disconnect the air quality sensor connector.



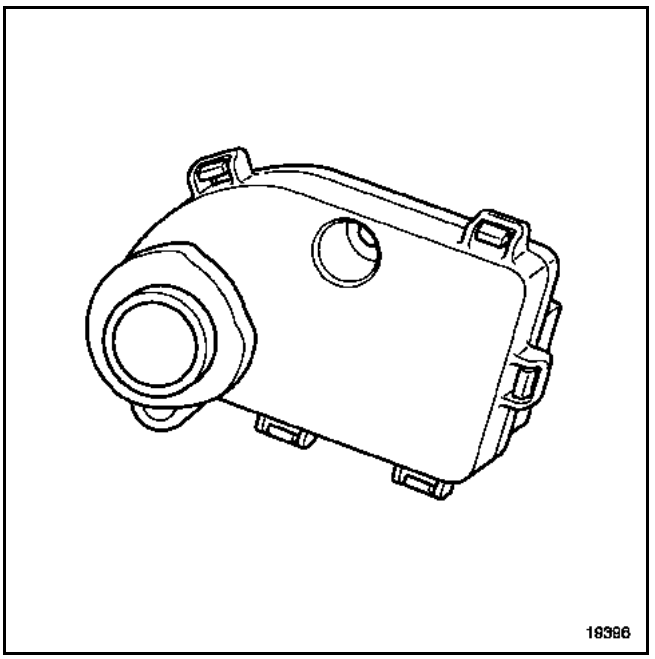
REFITTING

Carry out the removal procedure in reverse.

GETtheMANUALS.org

The sensor continuously analyses levels of engine exhaust fumes and informs the computer for the control of the air intake flap.

The sensor is protected by a membrane which allows gas molecules through but traps humidity and dust.

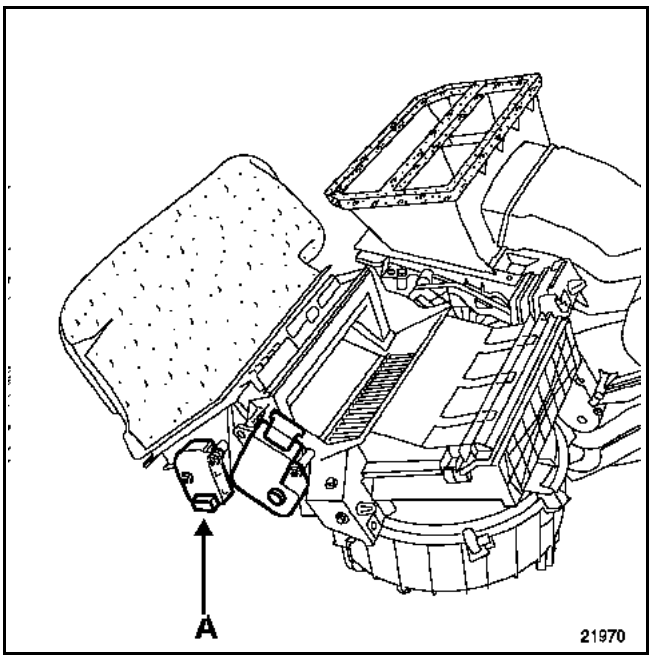


Access to it is through the glovebox.

REMOVAL

Remove:
– the glovebox (see **section 62A: "Removing the passenger compartment filter"**),
– the two air quality sensor mounting bolts,
– air quality sensor (A).

Disconnect the air quality sensor connector.



REFITTING

Carry out the removal procedure in reverse.

REMOVAL

These vehicles are fitted with lead-calcium batteries with a low water consumption. Topping up the electrolyte level is therefore prohibited.

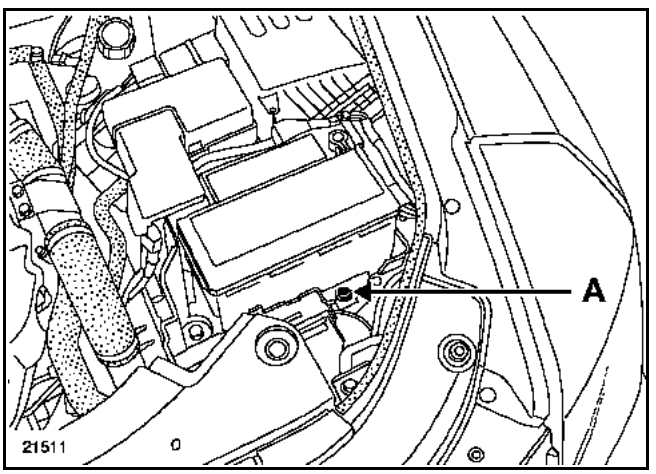
If the vehicle must be moved, insert the Renault card into the reader until the ignition is switched on before disconnecting the battery (except vehicles fitted with **Carminat Navigation**).

Pull out the card until it is in the **accessories** position: the electric column lock is now unlocked.

Switch off all the consumers.

To remove the battery, remove the covers and undo the mounting (A).

Disconnect the battery starting with the negative terminal.



NOTE:
locking the airbag computer also allows the electric steering column lock to be unlocked.

NOTE:
For vehicles fitted with **Carminat**, wait until the system is completely shut down (40 seconds approximately) before disconnecting the battery.

REFITTING

Correctly position the battery and tighten the mounting to a torque of **1.2 daN**.

When the battery is refitted and after every time it has been disconnected, a certain number of simple programming operations, which do not require the diagnostic tool, will have to be carried out for the vehicle to work properly:

- setting the time on the clock,
- entering the four figure radio code (using the remote controls at the steering wheel),
- initialising the one touch electric window motors:
  - close the windows completely,
  - the windows move jerkily to the upper limit,
  - keep the buttons pressed for a few seconds,
  - lower the windows to the lower stop,
  - keep the buttons pressed for a few seconds,
  - the motors are initialised.
- initialising the electric sunroof motor:
  - set the sunroof switch to the maximum tilt position,
  - press the switch. After two seconds, the sunroof will tilt to the maximum position step-by-step, then drop down a few centimetres,
  - release the switch,
  - press the switch again within five seconds,
  - keep the switch depressed, the sunroof will open then close in the slide position,
  - the motor is initialised,
  - set the switch to stop.
- enter the four digit video system code.

GETtheMANUALS.org

SAFETY

It should be remembered that a battery:
– contains sulphuric acid, which is dangerous,
– produces oxygen and hydrogen as it is charged. The mixture of these two gases is a detonating gas, hence the risk of explosion.

1) DANGER - ACID

Sulphuric acid is a highly corrosive and toxic product which corrodes most metals.

It is also very important, when handling a battery, to take the following precautions:
– protect your eyes with goggles,
– wear acid-proof gloves and clothing.

If acid splashes on to your clothing, rinse all contaminated areas thoroughly in water. If your eyes are affected, consult a doctor.

2) DANGER - RISK OF EXPLOSION

When a battery is charging (either in a vehicle or elsewhere), oxygen and hydrogen are produced. Gas production is at a maximum when the battery is completely charged and the quantity of gas produced is proportional to the strength of the charging current.

The oxygen and hydrogen mix in the open air and on the surface of the plates and form a detonating mixture. This mixture is highly explosive.

The smallest of sparks or heat sources can cause an explosion. The explosion is strong enough to shatter the battery and spray the acid into the surrounding atmosphere.

People nearby are at risk (shattered casing parts, acid splashes). Acid splashes are harmful to the eyes, face and hands. They also attack clothing.

Protection against the danger of explosion, which can be caused by a poorly handled battery, must be taken very seriously. Avoid all risks of sparks.

- Check that all consumers are completely switched off.
- When a battery is being charged in a room, switch off the charger before connecting or disconnecting the battery.
- Do not put any metallic items onto the battery to avoid a short circuit across the terminals.
- Never hold a naked flame, a welding iron, hot air gun, a cigarette or a lighted match near to a battery.

GETtheMANUALS.org

INSPECTION AND MAINTENANCE

Visual inspection

1. mounting bolt

- the battery must be correctly secured (**tightening torque 12 Nm**). Excessive tightening is pointless and dangerous because it deforms, and may even break, the battery tray.
  Conversely, an insecure mounting leads to too much clearance, and there may be wear caused by the battery tray moving and breakage caused by impact.

2. cleanliness

- check for the absence of crystallising salts (sulphation) on the terminals and then clean them and grease them if necessary,
- check that the nuts are correctly tightened on the terminals. Incorrect contact could cause starting faults or charging faults which could cause sparks and the risk of the battery exploding.

If acid splashes on to your clothing, rinse all contaminated areas thoroughly in water. If your eyes are affected, consult a doctor.

BATTERY CHARGE

For the battery checking procedure and the equipment to use, refer to the note headed **Systematic battery check on New Vehicles before delivery**.

Charger validation test reminder.

During charging, heating is much more rapid and greater, the higher the charge. This is why it is **essential** to use a constant voltage charger.

Test

- set the maximum charge intensity adjustment potentiometer,
- Read off the voltage displayed on your charger or at the battery terminals.

If the voltage displayed is above **15 volts**, your charger does not have a constant voltage (**use is dangerous for the battery**).

Stop the charging operation.

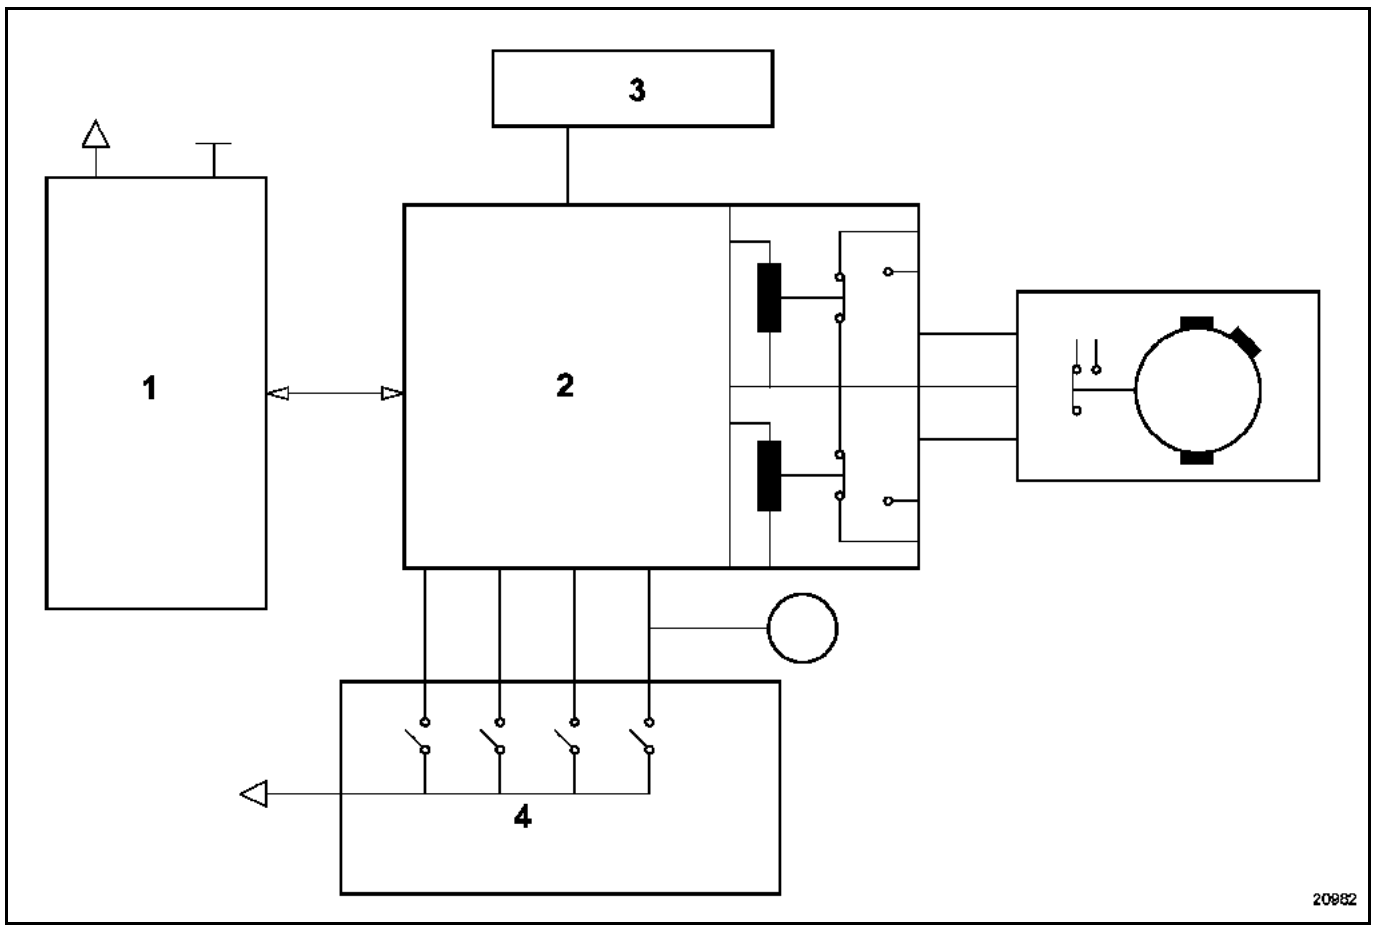
GETtheMANUALS.org

AUTOMATIC HEADLIGHTS WHEN DRIVING

Vehicles may be fitted with automatic dipped headlights and sidelights that turn on automatically when daylight fades, if the engine is running.

Activation

The function is operated via the light sensor (built in to the rain sensor) and the UCH.



1 Rain sensor
2 UCH
3 Headlights
4 Lighting stalk

The function can be switched on or off with the lighting stalk, if the UCH is correctly configured (see **section 87B**):
– switch on the ignition,
– Using the stalk, turn the ignition on and off twice in under **4 seconds**
– if the function has changed state, the instrument panel beeps.

For details on replacing the light sensor, refer to the rain sensor information in **Section 85A Rain Sensor**.

GETtheMANUALS.org

AUTOMATIC VEHICLE LIGHTS ("Follow me home" function)

Depending on the version, vehicles may be fitted with dipped headlights that come on automatically when the engine is switched off. This function only works when the ignition is switched off and operates in blocks of **30 seconds** (maximum 2 minutes).

Activation

It is switched on with the lighting stalk:
– switch off the ignition,
– turn on the main beam headlights twice using the stalk,
– the instrument panel beeps,
– the lights will be supplied for **30 seconds**,
– another **30 seconds** are added each time the main beam headlights are turned on with the stalk.

GETtheMANUALS.org

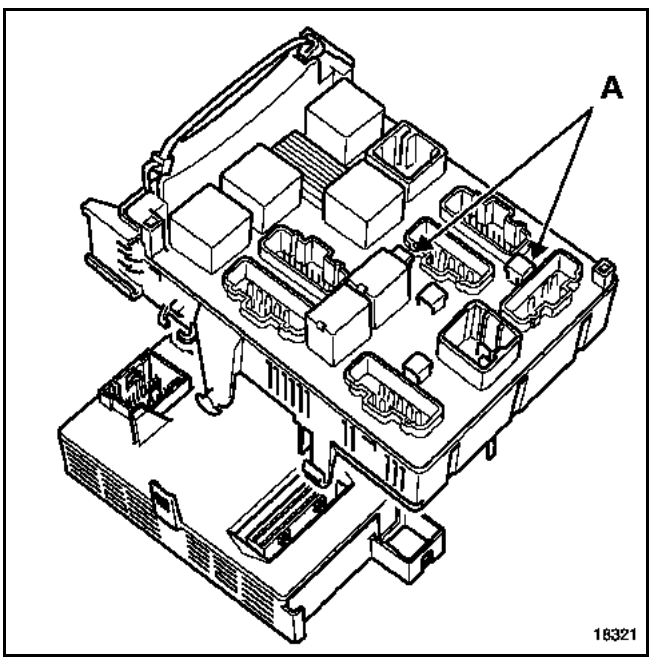
The daytime running lights function for some countries is operated by the UCH.

In addition, the relay/fuse box contains specific shunts to supply the lighting stalk
(part number **77 00 821 578**).

To activate or deactivate this function:

- fit the shunts (A):
  – operating without daytime running lights: shunt fitted,
  – operating with daytime running lights: shunt not fitted,

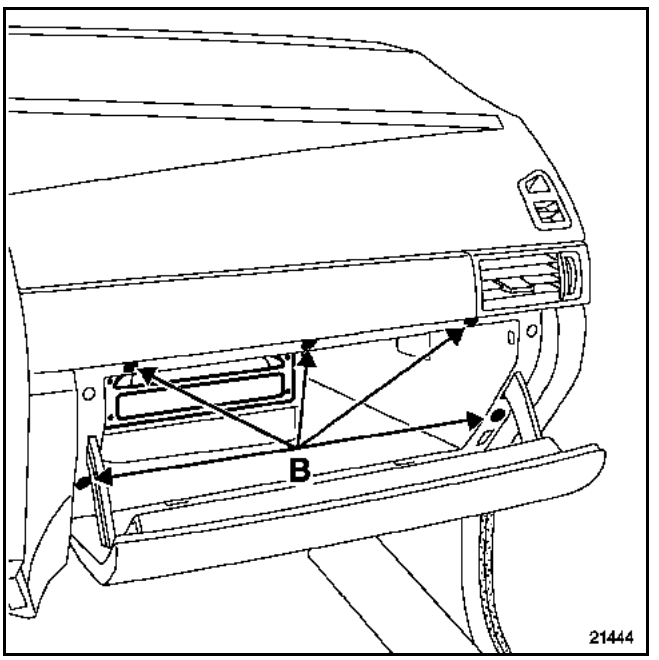
- configure the UCH using the diagnostic tool and the **Command**, **System configuration** menu, then select with or without **daytime running lights** (refer to **Section 87**).



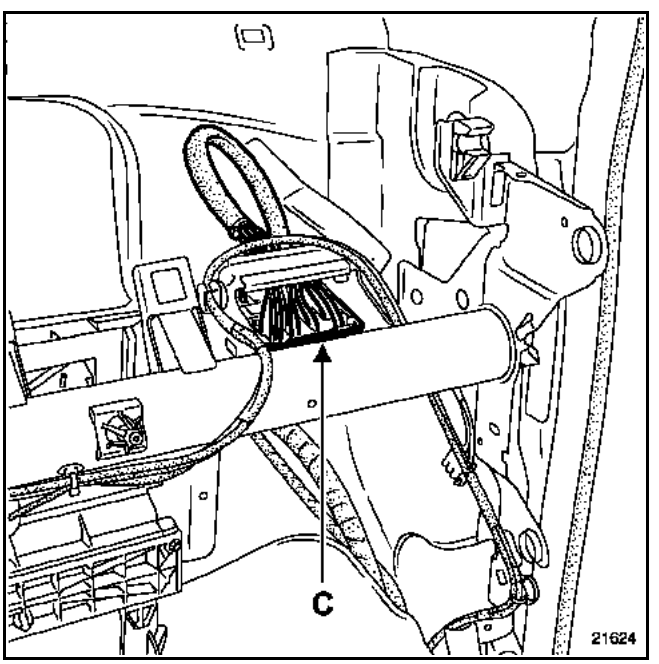
- Fit the relays on the Options Fuse and Relay Box. Refer to **Section 81C** (Check the presence of wiring) for their location.

To access the Fuse and Relay Box

Remove:
– the glove compartment secured by bolts (B),



– fit the two specific relays on their bases (C).



GETtheMANUALS.org

REMOVAL (all types)

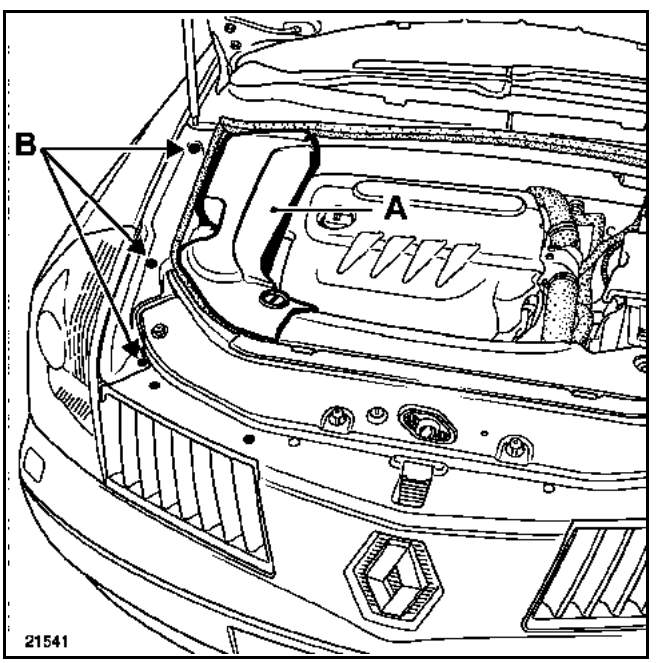
Special features of headlights with xenon bulbs (refer to the **Xenon headlights section**).

IMPORTANT:
Xenon bulbs operate at a voltage of **20 000 volts** when switched on, then **85 volts** AC. when operating.

It is therefore essential to disconnect the battery before any operation.

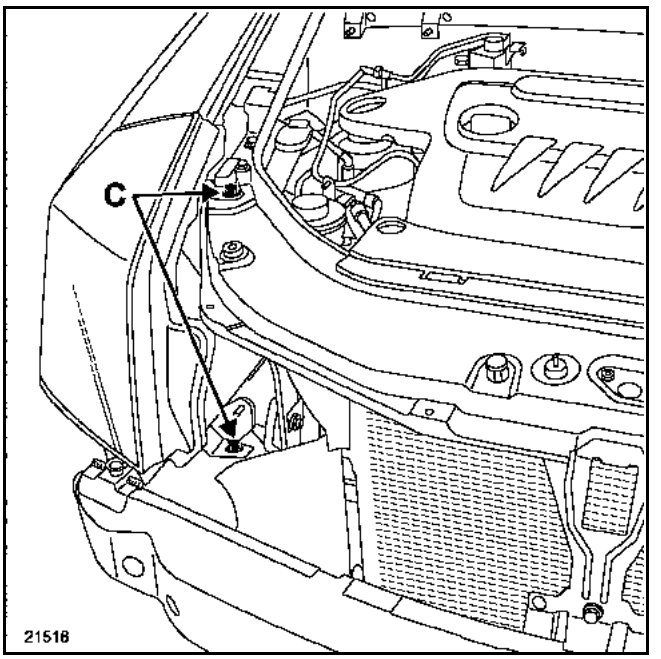
Switching on the lamp when it is not in the light unit is prohibited (**dangerous to the eyes**).

Remove:
– cover (A),
– the drip moulding held by three bolts (B).



Disconnect the battery.

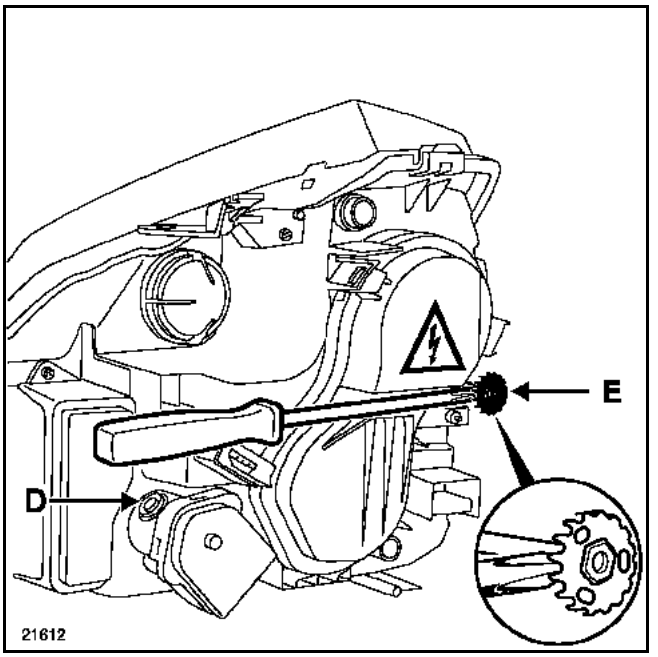
Remove:
– the bumpers (refer to **Bodywork section**),
– the mounting bolts (C).



Unclip the light unit by pulling it forwards.

GETtheMANUALS.org

REFITTING



IMPORTANT:
The lens units must be adjusted once they have been fitted:
- park the vehicle on level ground,
- ensure that the vehicle is empty with a full tank if possible,
- set the adjustment control to 0,
- turn screw (D) to adjust the height,
- turn screw (E) to adjust the direction.

NOTE:
Use a Phillips screwdriver to adjust the direction (screw E).

If the vehicle has Xenon bulbs, the system must be initialised (refer to the **section on Initialising the Xenon bulbs system**).

CONNECTION

Track	Description
1	Earth
2	Main beam headlight
3	Direction indicator light
4	Dipped beam headlight
5	Side light

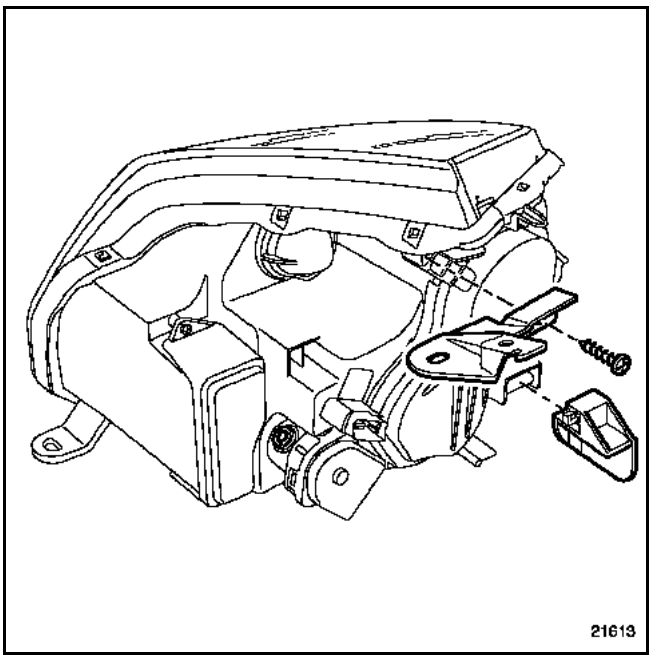
NOTE:
Track numbers are read from left to right on all headlights.

GETtheMANUALS.org

Mounting brackets for the light units are sold as spare parts.

The mounting of these brackets is identical to the original.

Repair kit part numbers:
– right hand light unit mounting brackets (**77 01 207 176**),
– left hand light unit mounting brackets (**77 01 207 177**).



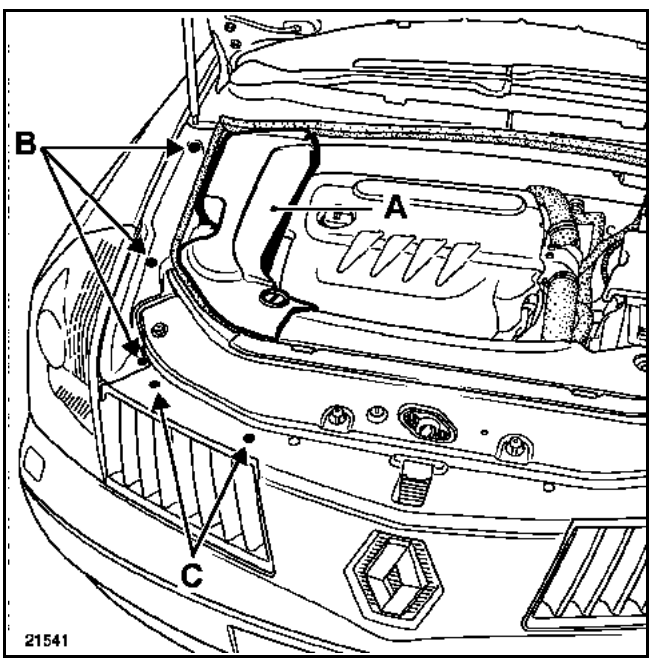
GETtheMANUALS.org

REPLACEMENT

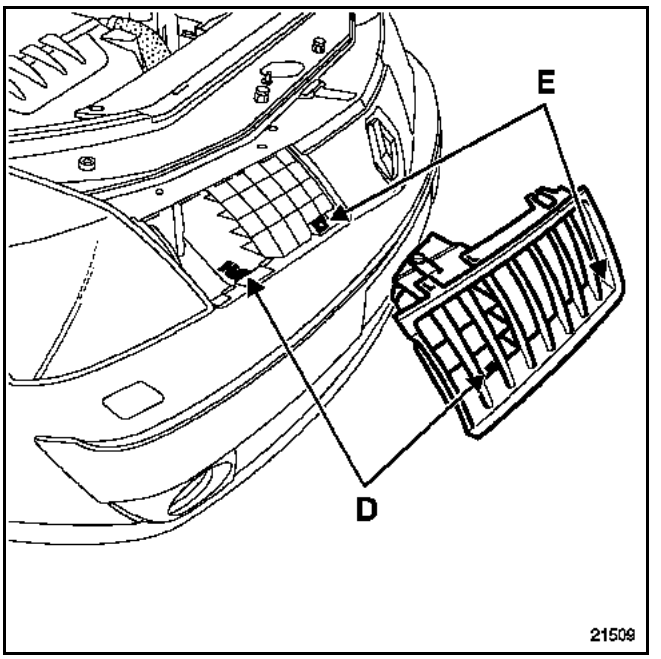
It is necessary to partially remove the light unit to replace the bulbs.

IMPORTANT:
Before beginning the operation, the bumpers (section underneath the lens unit) must be protected with masking tape.

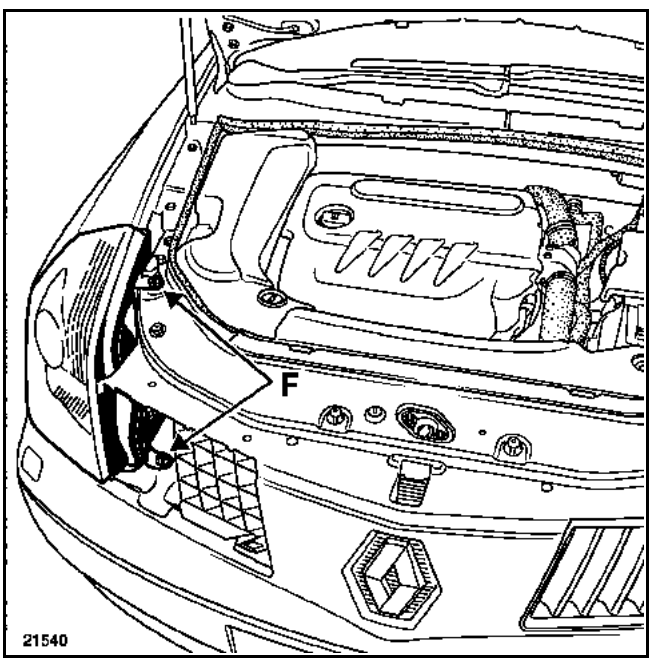
Remove:
– cover (A),
– the three bolts (B) holding the drip moulding,
– the radiator grille bolts (C),



– the radiator grille by pressing on bolts (D) and (E),



– the bolts (F) holding the light unit.



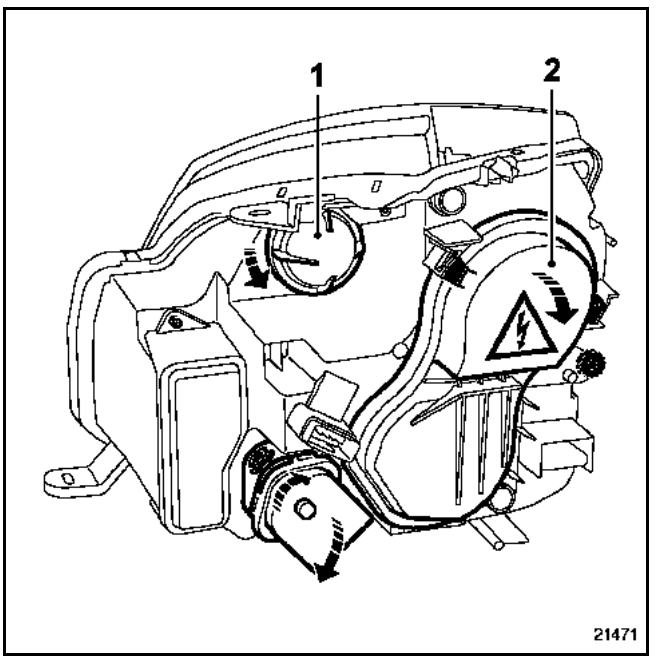
Unclip the light unit by pulling it forward, until it comes to rest on the bumper.

GETtheMANUALS.org

DIRECTION INDICATOR LIGHTS

Only the direction indicator lights do not require removal of the light unit.

Remove:
- the watertight cover (1) (1/4 turn anti-clockwise),
- the bulb mounting (1/4 turn anti-clockwise),



SIDE LIGHT, DIPPED BEAM HEADLIGHT, MAIN BEAM HEADLIGHT BULBS

The bulbs are replaced after the sealing cover has been removed (2).

NOTE:
For information on replacing the Xenon bulbs, refer to the section **Xenon bulbs**.

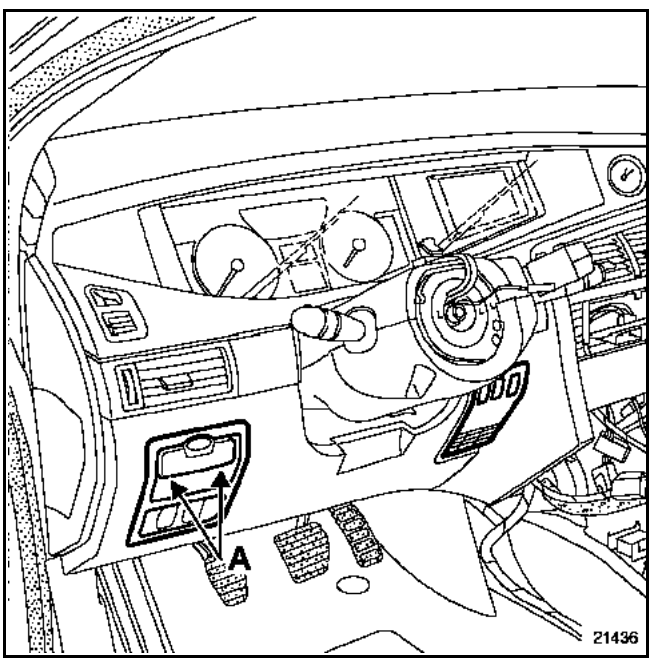
GETtheMANUALS.org

REMOVING AND REFITTING THE BEAM ADJUSTMENT CONTROL

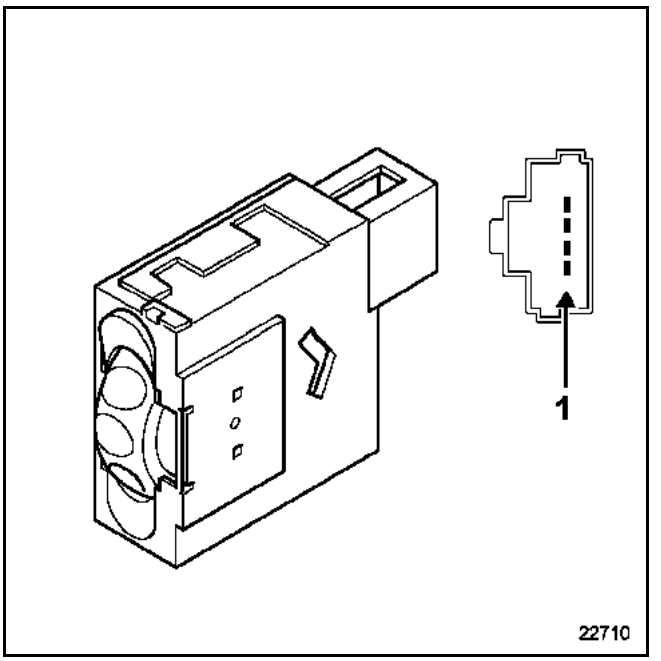
To remove the control, you must first remove the mounting.

Remove:
- the screw covers,
- the fixing screws (A).
- the automatic parking brake handle,
- the beam adjustment control mounting.

Disconnect the connector, then release the control from the mounting.



CONNECTION



WHEEL POSITION	CONTROL OUTPUT VOLTAGE (in volts)
4	11 volts
3	8.5 volts
2	6 volts
1	3.5 volts
0	1.1 volts

Track	Description

2	Earth
3	+ After ignition
4	Control output

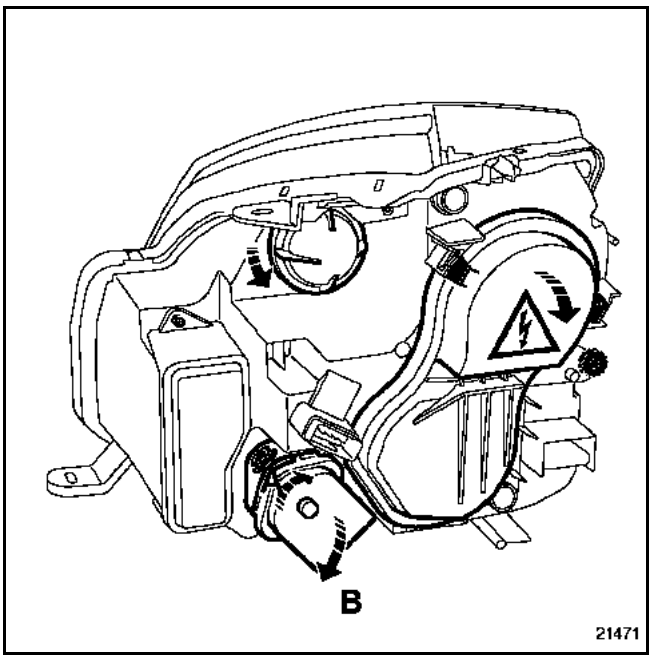
GETtheMANUALS.org

ACTUATOR

REMOVAL

NOTE:
To remove the actuator, it is necessary to remove the lens unit.

Disconnect the connector from the remote adjustment actuator.



Turn the actuator through an eighth of a turn towards the outside (A) to release it from the light unit.

Disconnect the ball joint from the reflector shell, tilting the actuator slightly (B).

REFITTING

Keep the reflector shell towards the rear of the lens unit by pulling on the bulb base.

Click the ball joint into the headlight clip.

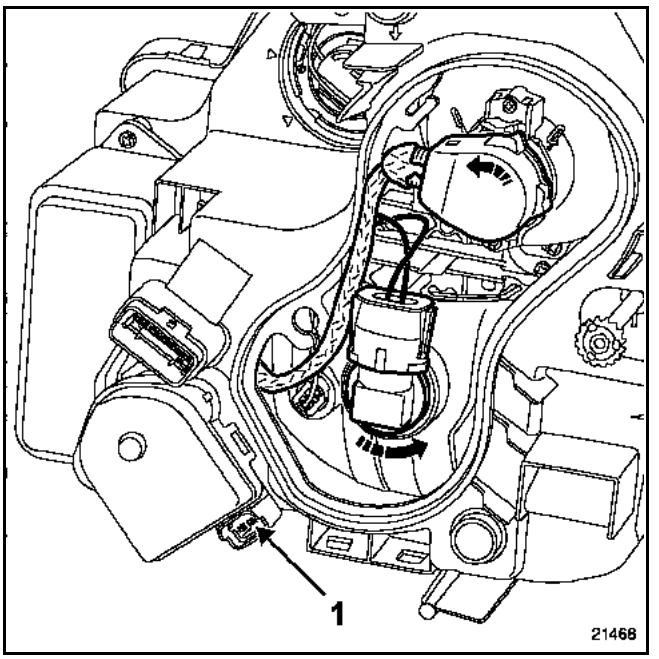
Position the actuator on the lens unit.

Turn the actuator through an eighth of a turn towards the inside to engage it in the light unit.

Reconnect the connector.

Carry out adjustments.

CONNECTION



Track	Description
1	Earth
2	Actuator control
3	Supply

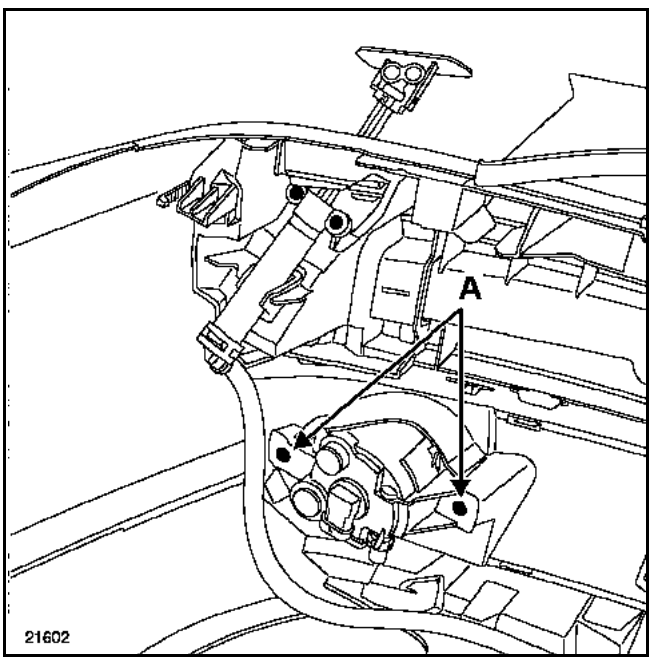
NOTE:
The actuators of light units fitted with Xenon bulbs are specific.

GETtheMANUALS.org

REMOVAL

Remove the front bumper (refer to the **Bodywork section**).

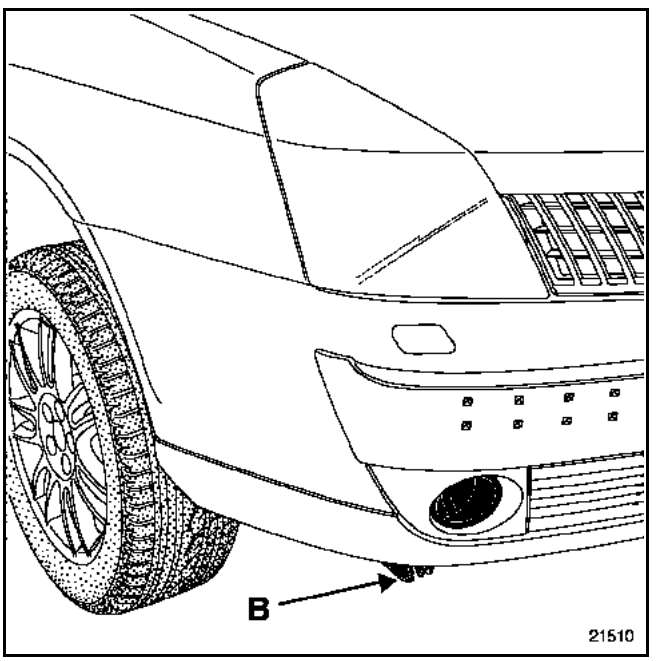
Unscrew the mounting bolts (A).



REFITTING

There are no specific points to mention here, but remember to adjust the fog lights.

Open the access flap (B) then carry out adjustments.



NOTE:
adjustments can be carried out with a **6 mm** elbow Allen key.

GETtheMANUALS.org

These vehicles are required to have the following fitted:
– automatic headlight beam correction as a function of vehicle ride height,
– headlight washers.

WARNING:
it is forbidden to fit a headlight with a Xenon bulb to a version not designed for this purpose.

These bulbs do not contain a filament. The light from these bulbs is generated by two electrodes in a quartz bulb which contains high pressure gas (xenon).

The electronic module, or ballast, incorporated into the headlight is supplied by the vehicle's battery (**12 volts**) and generates a controlled voltage of **20,000 volts** when the light is switched on, then an alternating voltage of **85 volts** during operation.

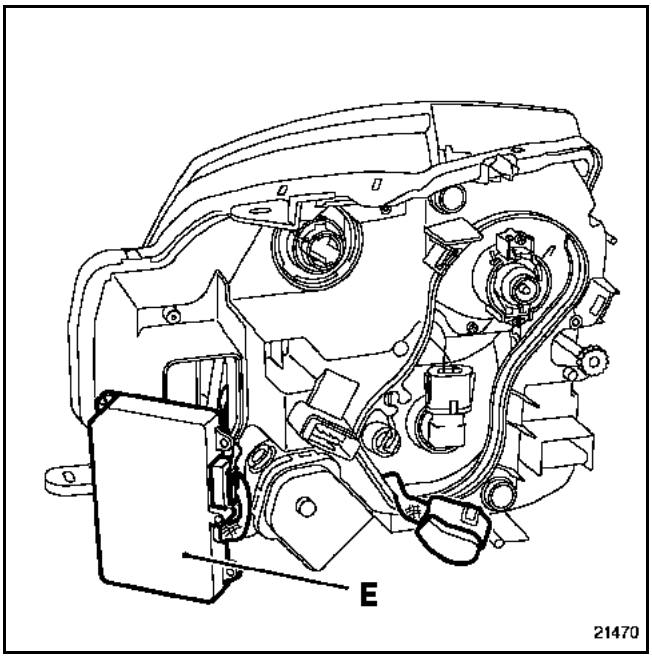
Automatic headlight beam correction as a function of vehicle ride height:
The automatic adjustment system maintains a constant beam height in relation to the initial adjustment set in the factory or by the After-Sales network, irrespective of changes in vehicle load and height.

Fault finding tools are compatible with this system.

Every time a fault is cleared, the actuators move downwards.

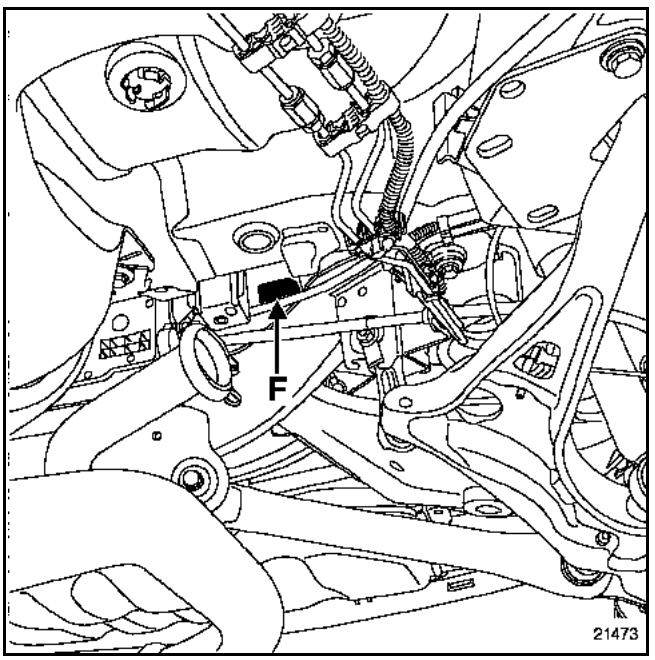
DESCRIPTION

The system consists of:
- two light units fitted with a normal side light bulb, an H1 type main beam bulb, a D2S type xenon dipped beam bulb and an orange indicator bulb,
- two electronic units (ballast) incorporated into the headlights (E) (one per headlight),

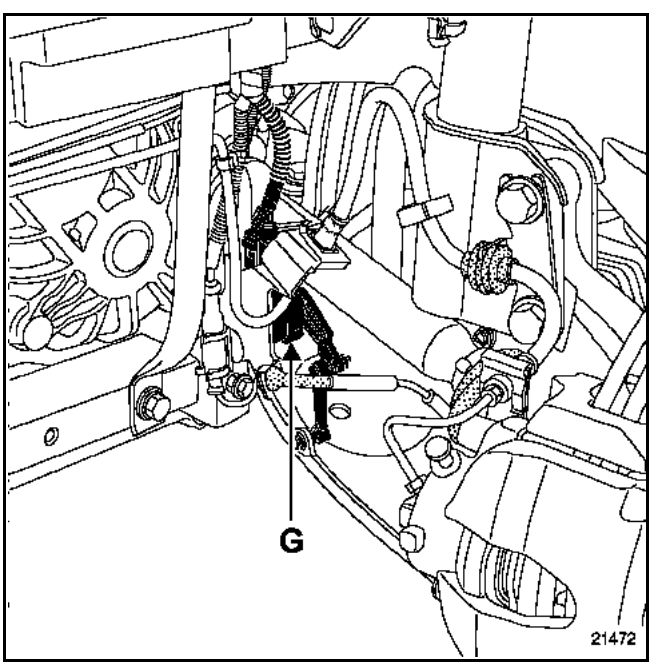


GETtheMANUALS.org

- a rear height sensor (F) located under the left hand side of the vehicle. It records the height of the body and sends it to the sensor/computer

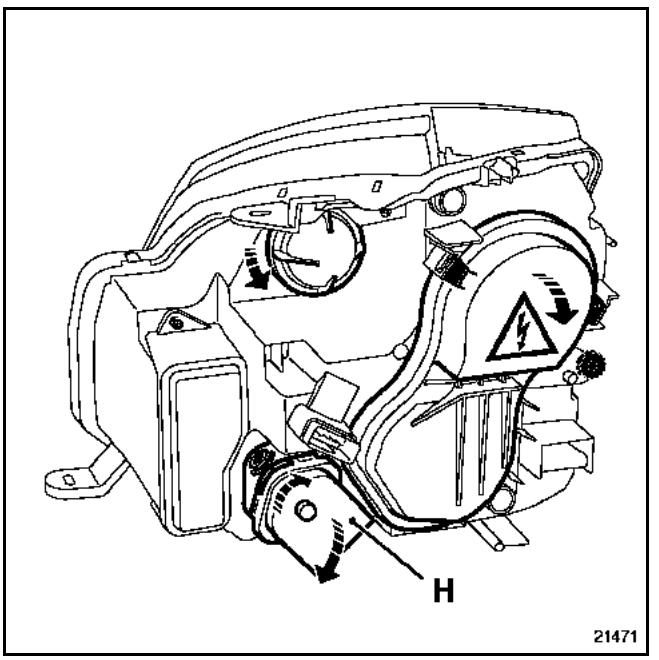


- a front sensor/computer (G) which records the height of the front axle. The computer adjusts the headlights in line with variations in ride height due to acceleration, braking and variations in load.

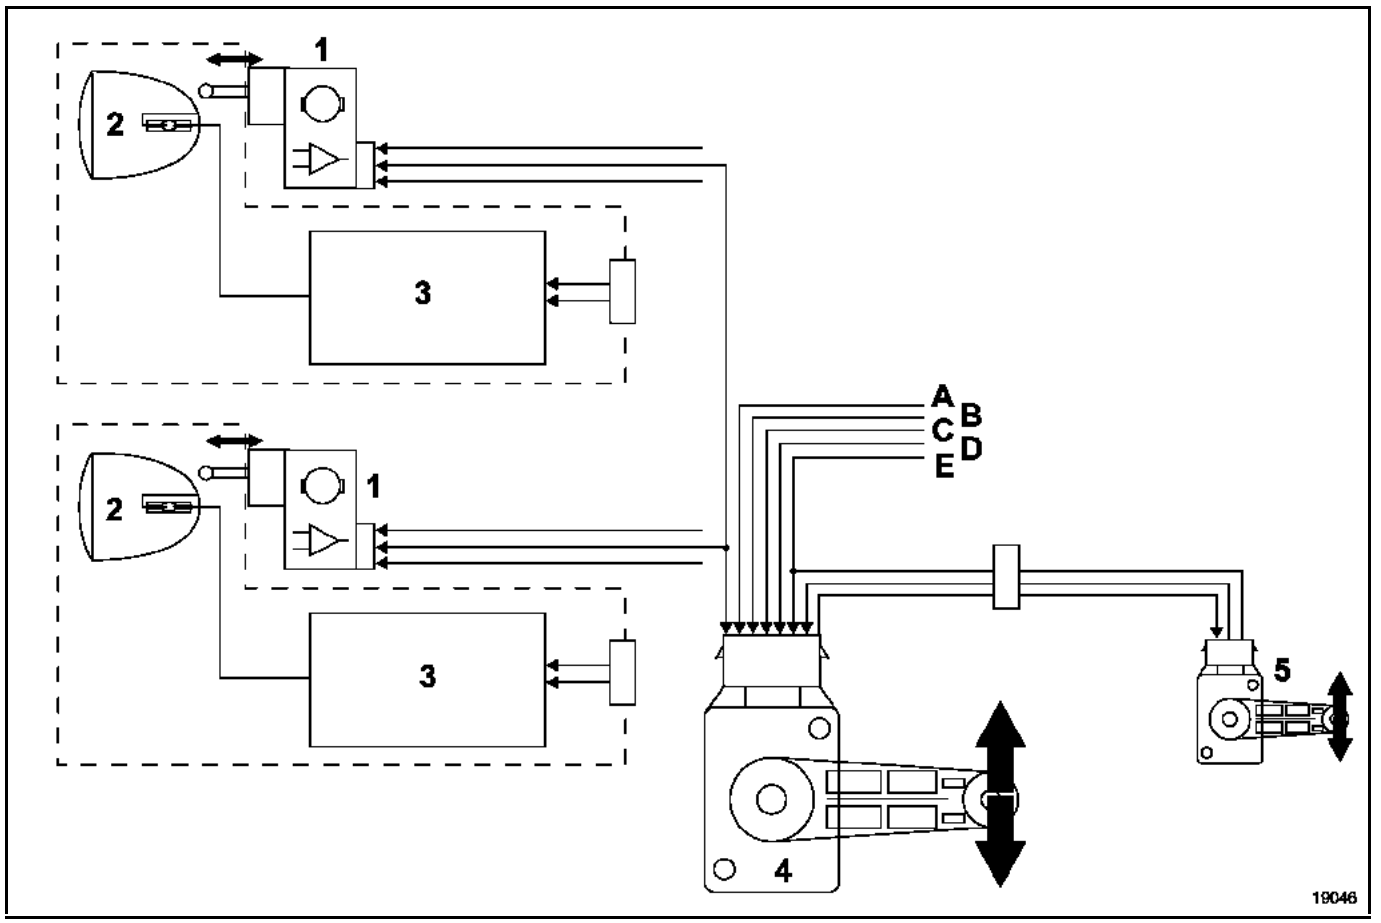


NOTE:
The vehicle speed signal is used to vary the beam height at high speed.

- two specific adjustment actuators (H) mounted on the back of each lens unit.



GETtheMANUALS.org



1 actuator
2 headlight
3 electronic unit (ballast)
4 front sensor/computer
5 rear sensor
A + lighting

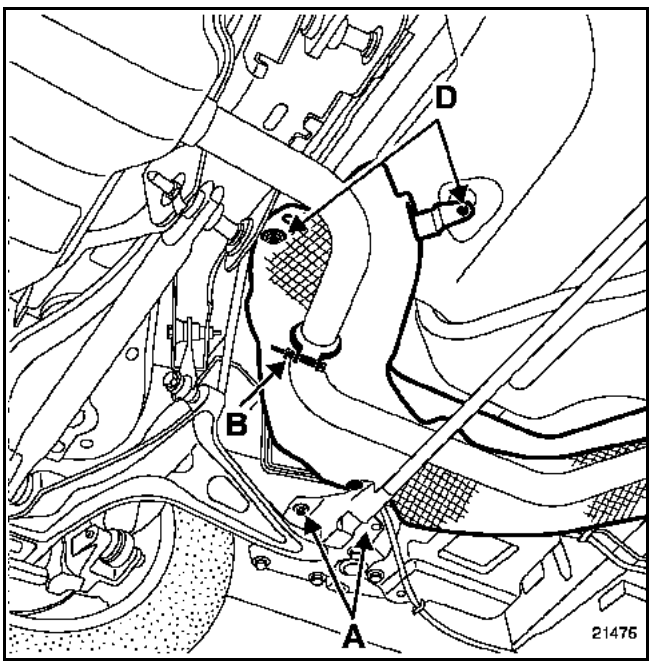
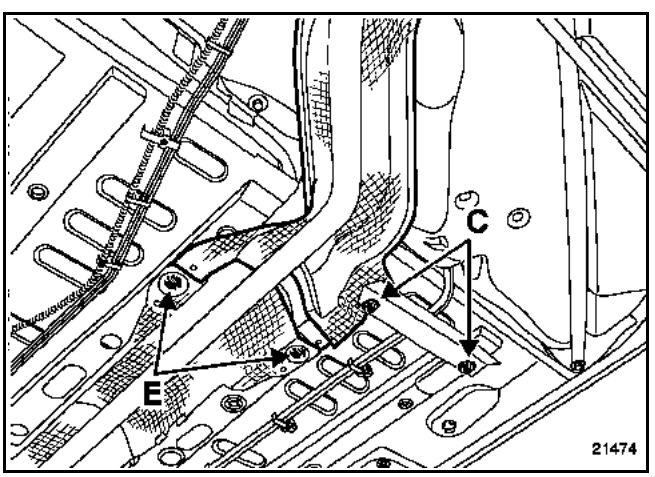
GETtheMANUALS.org

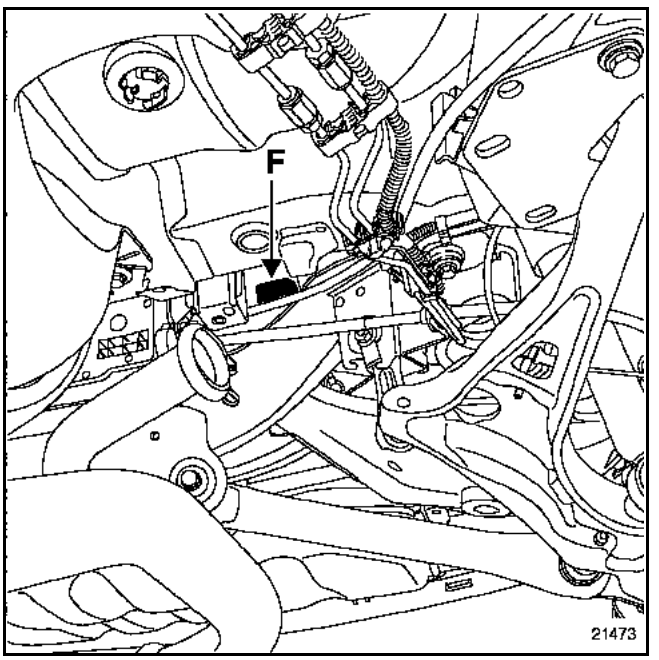
REMOVAL

Remove:
– the acoustic bar held by bolts (A),
– the exhaust clamp (B),
– the rod securing the fuel pipes (bolt C),
– heat shield rear mounting (bolt D) and central mounting (clips E),





– the rear height sensor (F) held in place by a mounting bolt.



REFITTING

IMPORTANT:
If the heat shield is damaged, it must be replaced and correctly refitted.

IMPORTANT:
After the whole assembly has been refitted, the system must be initialised and the lens units adjusted (**refer to initialisation section**).

GETtheMANUALS.org

8	Rear sensor supply

IMPORTANT:
After the front computer sensor has been replaced, the vehicle type must be configured using the diagnostic tool and the system must be initialised.

GETtheMANUALS.org

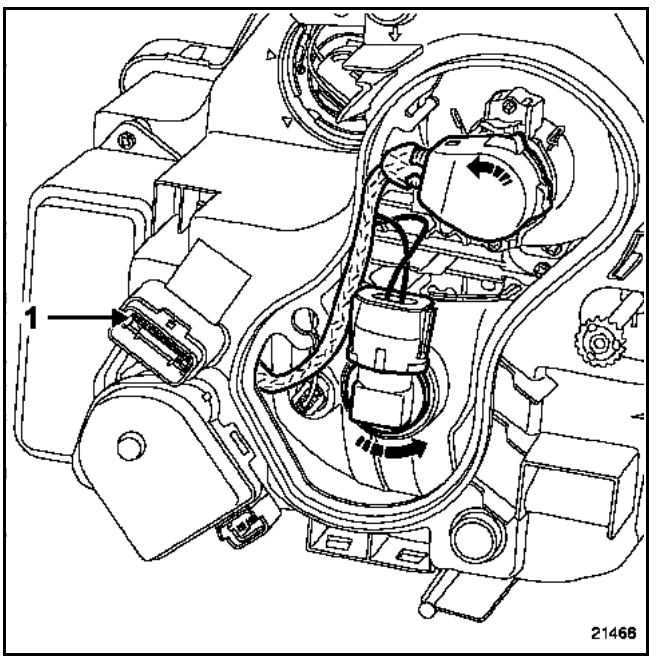
REMOVAL - REFITTING

The method for removing/refitting headlights with xenon bulbs is the same as the method for all other headlight types.

WARNING:
Xenon lamps operate at a voltage of **20,000 volts** when switching on, then **85 volts** AC. when operating.

It is therefore essential to disconnect the lens unit and wait for the computer (ballast) to cool down before removal.

It is forbidden to switch the bulb on when it is not in the light unit (dangerous to the eyes).



CONNECTION

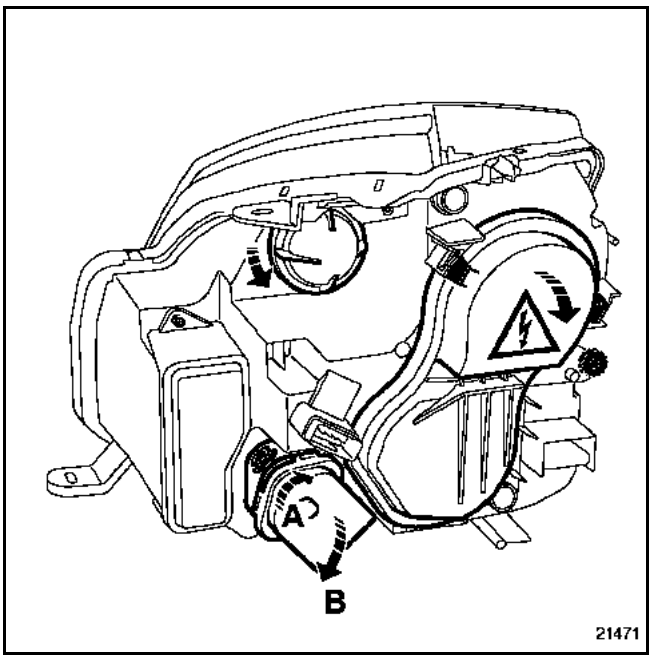
Track	Description
1	Earth
2	Main beam headlight
3	Direction indicator light
4	Dipped beam headlight
5	Side light

NOTE:
track numbers are read from left to right on all headlights.

GETtheMANUALS.org

REMOVAL

NOTE:
To remove the actuator, it is necessary to remove the lens unit.



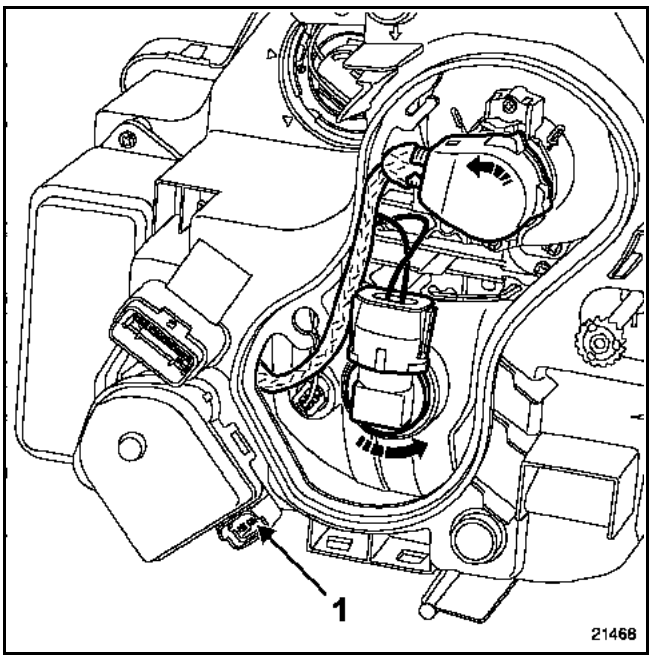
Turn the actuator through an eighth of a turn towards the outside (A) to release it from the light unit.

Disconnect the ball joint from the reflector shell, tilting the actuator slightly (B).

REFITTING

To assist removal of the actuator, remove the sealed cover and hold the headlight reflector.

IMPORTANT:
After the actuators have been removed, the system must be initialised and the headlights adjusted (refer to the **Initialisation section**).



CONNECTION

Track	Description
1	Earth
2	Actuator control
3	Supply

NOTE:
the actuators of light units fitted with Xenon bulbs are specific.

NOTE:
If the dipped beam headlights are on when the ignition is switched on, the actuators are set to their lowest position and then return to an intermediate position.

GETtheMANUALS.org

REMOVAL

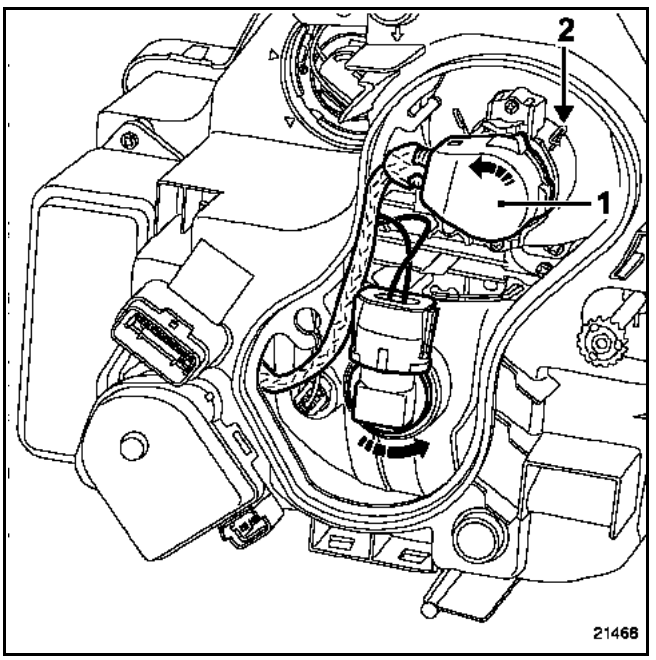
IMPORTANT:
Xenon bulbs operate at a voltage of **20,000 volts** when switched on, then **85 volts** AC. when operating.

It is therefore essential to disconnect the light unit before removal.

It is forbidden to switch the bulb on when it is not in the light unit (dangerous to the eyes).

Disconnect the bulb connector (1) by turning it through a quarter of a turn in an anti-clockwise direction.

Remove the bulb by unclipping the mounting clip (2).



IMPORTANT:
Do not jolt or knock the bulb as the external conductor (3) is very fragile and must not be damaged.

REFITTING

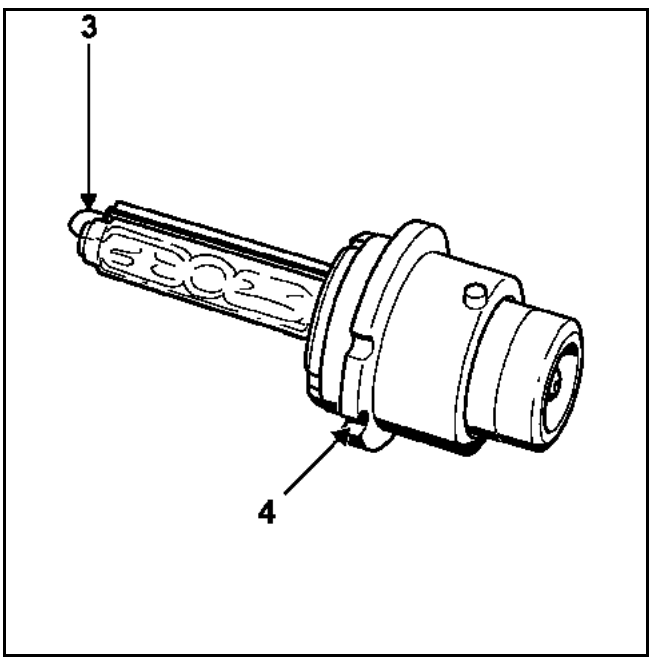
Hold the bulb by the cap (if you touch the bulb, you must clean it with alcohol and a soft lint-free cloth).

Position the bulb. The lug (4) must be opposite the groove in the headlight.

Position the bulb connector by turning it through a quarter of a turn.

NOTE:
The lens unit must be partially removed to remove the bulb (see **the section on Headlights**, **Bulbs**).

IMPORTANT:
After a Xenon bulb is replaced, the system must be initialised and the headlights adjusted (see **Initialisation Section**).

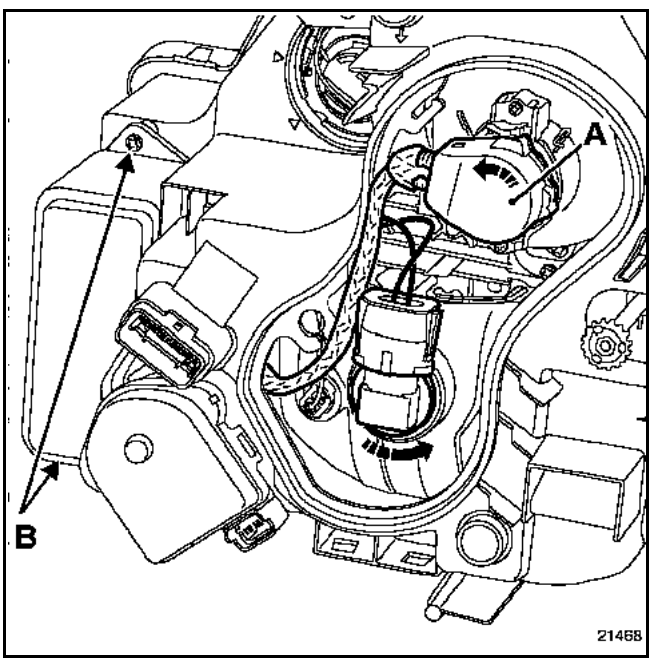


GETtheMANUALS.org

IMPORTANT:
Xenon bulbs operate at a voltage of **20,000 volts** when switched on, then **85 volts** AC. when operating.
It is therefore essential to disconnect the battery before any operation.
Switching on the lamp when it is not in the light unit is prohibited (**dangerous to the eyes**).

REMOVAL

Remove:
– the relevant headlight,
– the sealing cover,
– the bulb connector (A) by turning it through a quarter of a turn in an anti-clockwise direction,
– the two bolts (B) to access the electronic unit.

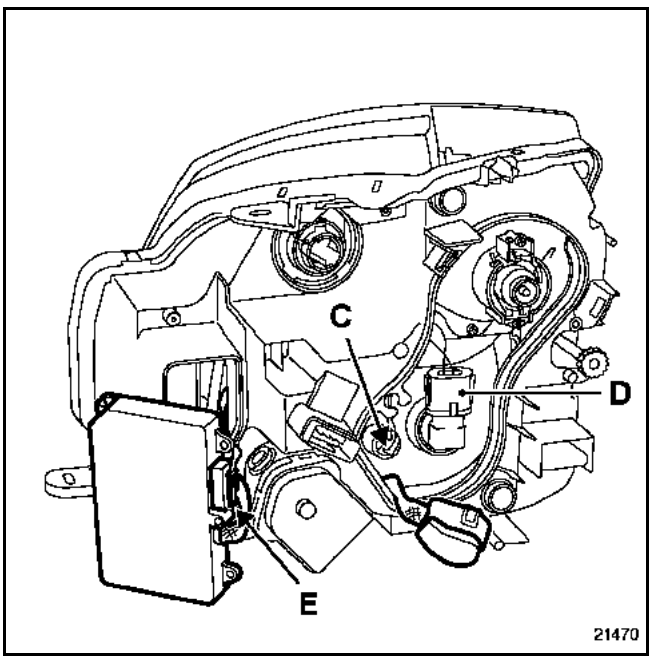


Disconnect the side light connector (C) and the main beam headlight connector (D) to make way for the connector (A).

Take out the electronic unit.

Disconnect connector (E).

Remove the electronic unit by following the route of the high voltage wiring harness



REFITTING

Route the high voltage wiring correctly.

IMPORTANT:
After an electronic unit has been removed, the system must be initialised and the lens units adjusted (refer to the **Intialisation Section**).

GETtheMANUALS.org

This procedure should be performed after operations on the headlights, on a sensor or on any part of the suspension.

Park the vehicle on level ground.

IMPORTANT:
Do not apply the parking brake.

Ensure that the vehicle luggage compartment is empty.

Do not get into the vehicle throughout the operation.

Check the tyre pressures and open the bonnet.

Adjust and fit the beam adjuster.

Connect the diagnostic tools and check that there are no faults.

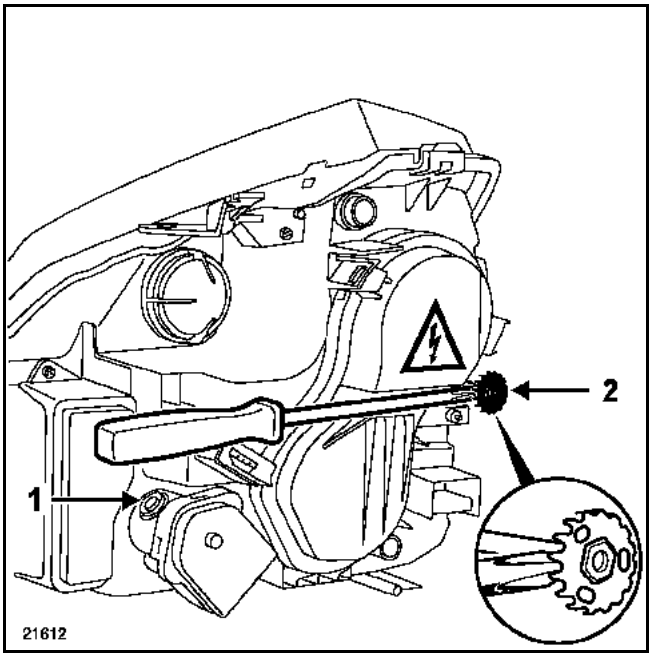
Switch on the ignition, switch on the dipped beam headlights, select and confirm the **discharge bulb** computer.

Enter command **AC010: Computer Calibration**.

NOTE:
It is possible to check that the system has been initialised:
– the front sensor value read by parameter **PR017: Front height** should be identical to the initial front height value (**PR004**),
– the rear sensor value read by parameter **PR018: Rear height** should be identical to the initial rear height value (**PR005**).

Without switching off the ignition, adjust the beam height using screw (1) and the direction using screw (2) with a Phillips scewdriver.

IMPORTANT:
the level of the vehicle must not change between initialisation and adjustment of the headlights. The two procedures are inextricably linked.



IMPORTANT:
The system cannot be initialised if:
– the vehicle speed is not present or is not at zero,
– the position of a sensor is outside permitted tolerance values,
– the computer has not been correctly configured.

GETtheMANUALS.org

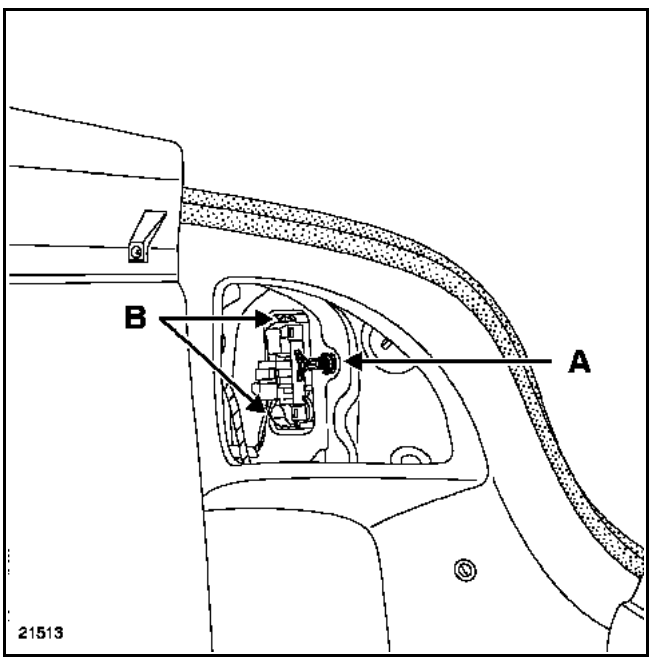
The rear lights are split into two sections, one on the wing and the other on the tailgate.

REMOVAL

Disconnect the connector.

Remove the rear mounting bolt (A).

Remove the light.



To access the bulbs, unclip the bulb holder by pressing on the tab (B).

GETtheMANUALS.org

REMOVAL

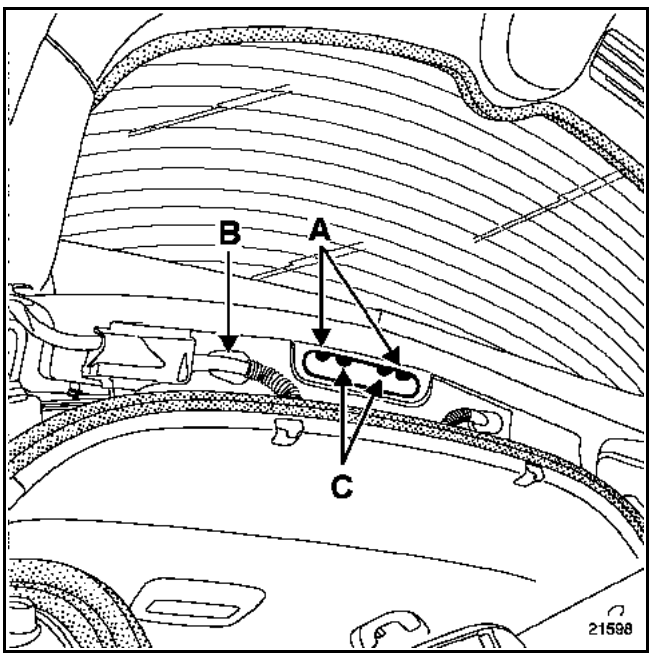
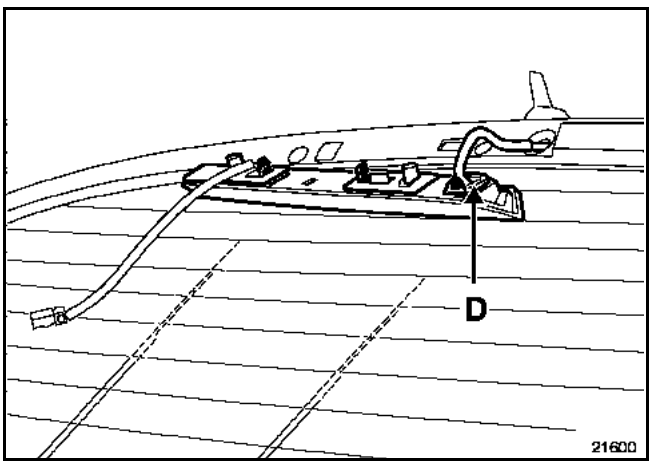
Remove:
– the access flap;
– the two mounting bolts (A).

Release the blanking cover (B) and disconnect the light's supply connector.

Unclip the light by pressing on the catches (C).



Unclip the windscreen washer nozzle (D) and remove the light.



NOTE:
The vehicles are equipped with a brake light containing diodes.

GETtheMANUALS.org

SPECIAL NOTES

Depending on version, vehicles can have:
– independent door sill lights (which light up when the relevant door is opened);
– timed courtesy lights (front and rear);
– under-dashboard lights and lights under the front seats linked to the courtesy lights;
– lights in the luggage compartment;
– courtesy lights on each sun visor.

TIMER OPERATION

The interior lights (courtesy lights and footwell lights) are lit instantly by the UCH:
– when a door or the tailgate is opened,
– when the opening elements are unlocked with the remote control (or the hands-free function),
– when the Renault Card is removed from the reader.

The UCH switches the interior lights off after a delay
– switch off without delay:
  ● when the opening elements are locked using the remote control (opening elements closed)

– switch off with delay:
  ● after the last opening element is closed,
  ● when the opening elements are unlocked with the remote control,
  ● when the ignition is switched on (gradually).

NOTE:
If an opening element is left open for a long time without the ignition being switched on or off, the UCH switches off the interior lights after a **45-minute** delay (approximately).

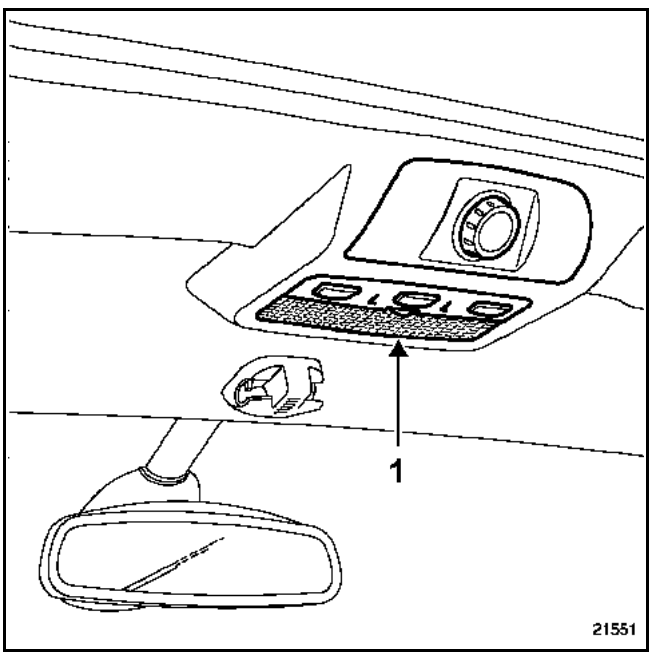
GETtheMANUALS.org

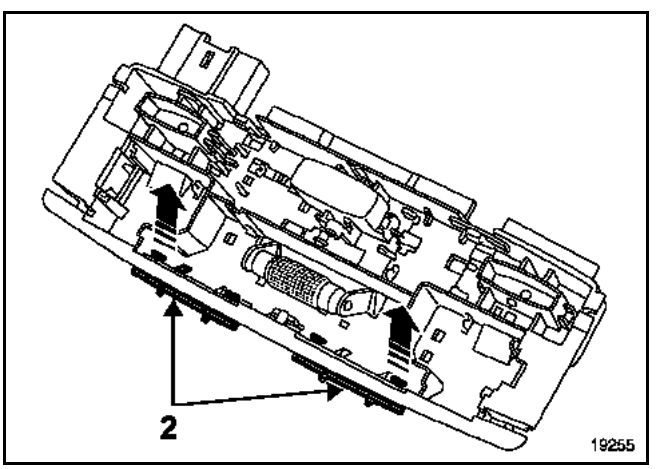
COURTESY LIGHTS

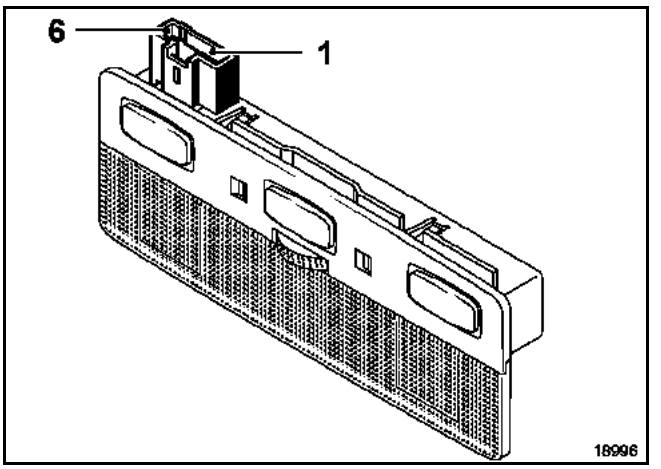
Depending on the position of the courtesy light and the vehicle equipment, the lighting may have:
– a single central lighting switch;
– a central lighting switch and a map reading light;
– a central lighting switch and two map reading lights;
– a central lighting switch with dimmer and two map reading lights.

REMOVAL - REFITTING

To remove the ceiling courtesy light:
– unclip the translucent cover (1);
– pull out the mounting bolts (2);
– rotate to release the connector.







CENTRAL COURTESY LIGHT

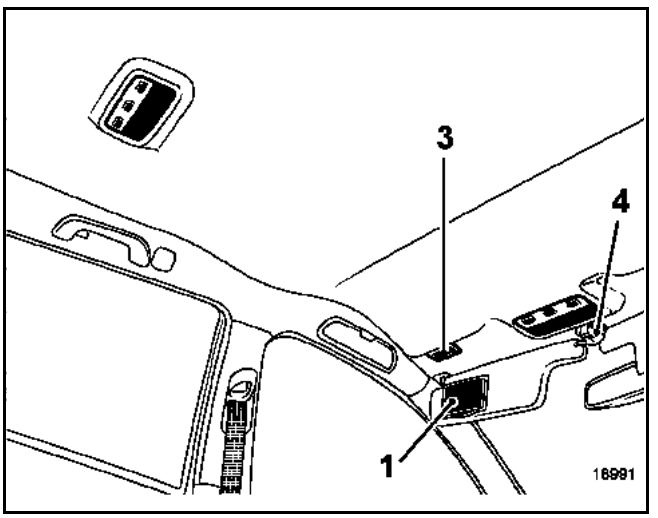
GETtheMANUALS.org

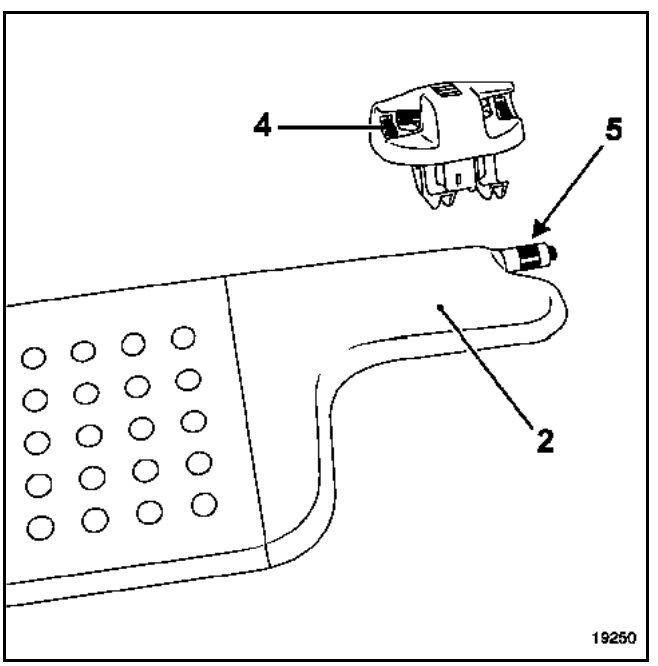
Depending on the version, the vanity mirrors may be fitted with a light incorporated into the headlining.

The switch is located on the mirror cover (1) on the sun visor (2). The current is transmitted to the light (3) by the central mounting (4) of the sun visors.



NOTE: It is possible to check the switch's operation by connecting a multimeter at (5):

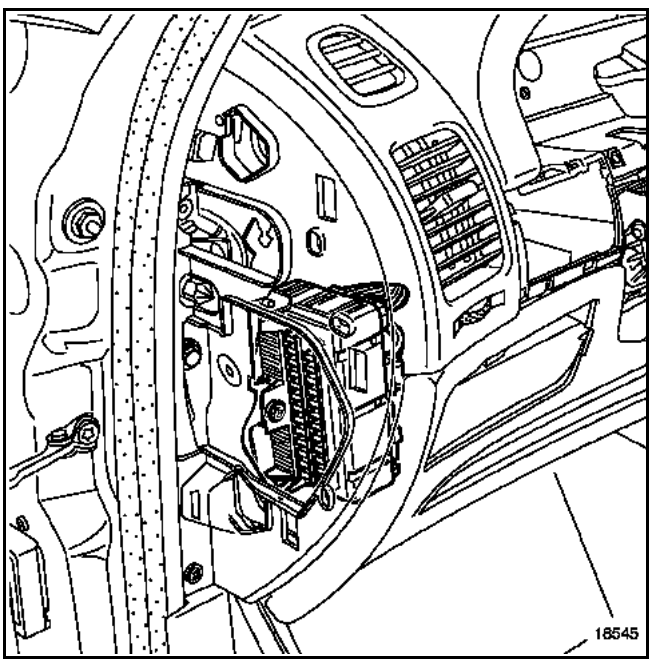
- mirror cover closed (switch open) = light off = infinite resistance,
- mirror cover open (switch closed) = light on = zero resistance.



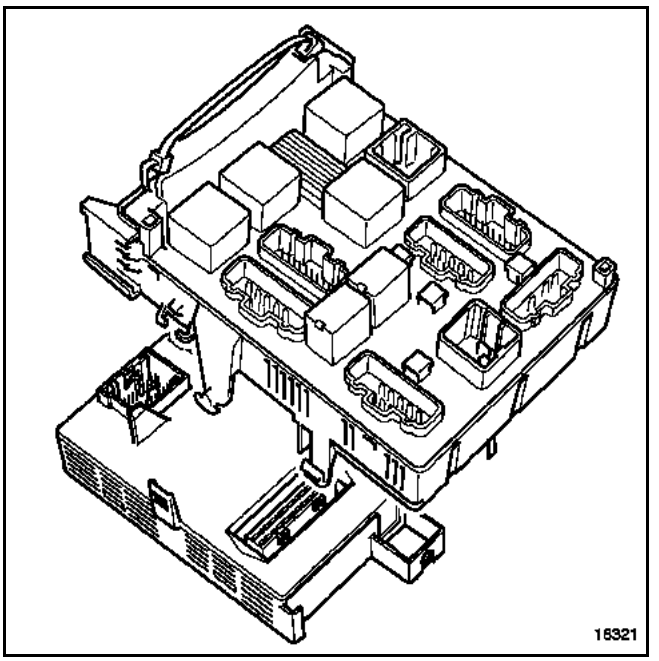
GETtheMANUALS.org

DESCRIPTION

The relay/fuse box is clipped onto the UCH on the driver's side of the dashboard.



Fuses and shunts fitted in the relay/fuse box, depending on vehicle equipment. They must be positioned in the same place on the new component.



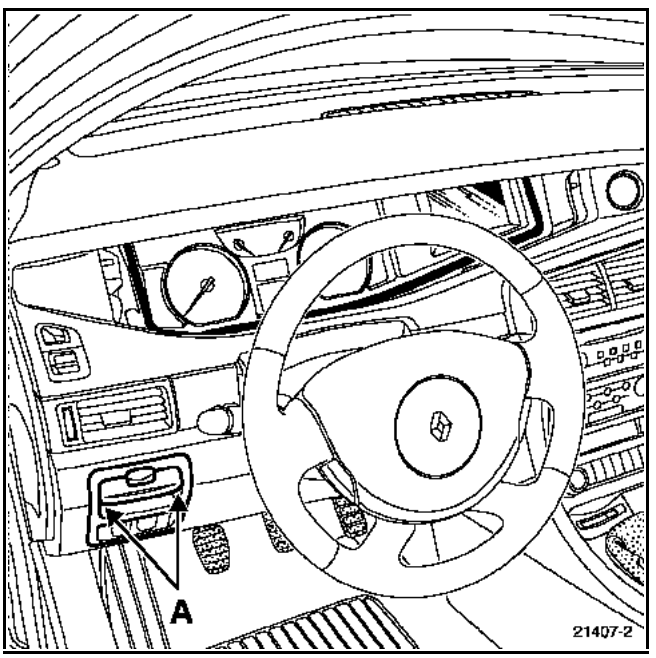
GETtheMANUALS.org

REMOVAL

NOTE:
- It is essential to read the configurations using the diagnostic tool when replacing the UCH;
- the relay/fuse box is clipped onto the UCH. One has to be removed to remove the other.

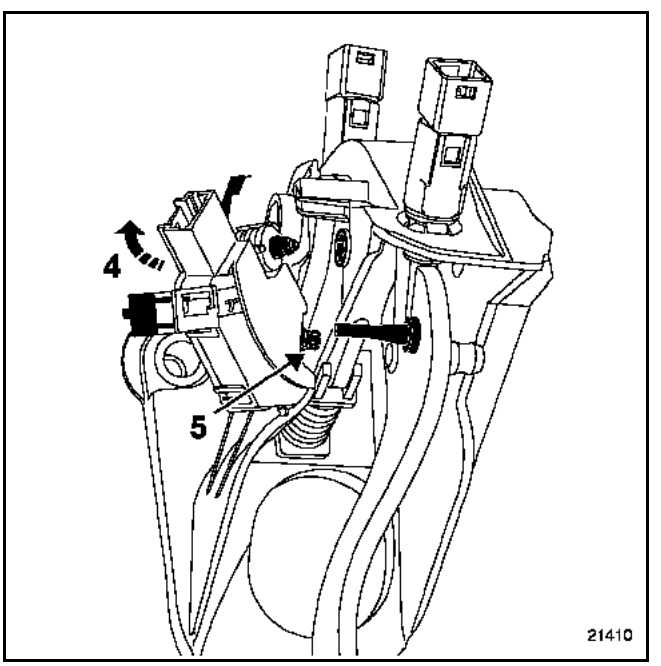
Disconnect the battery.

Remove:
– the dashboard side panel, driver's side;
– the cover under the dashboard;
– the handle of the automatic handbrake fastened by bolts (A);
– the mounting for the beam height adjustment control (**clipped**);



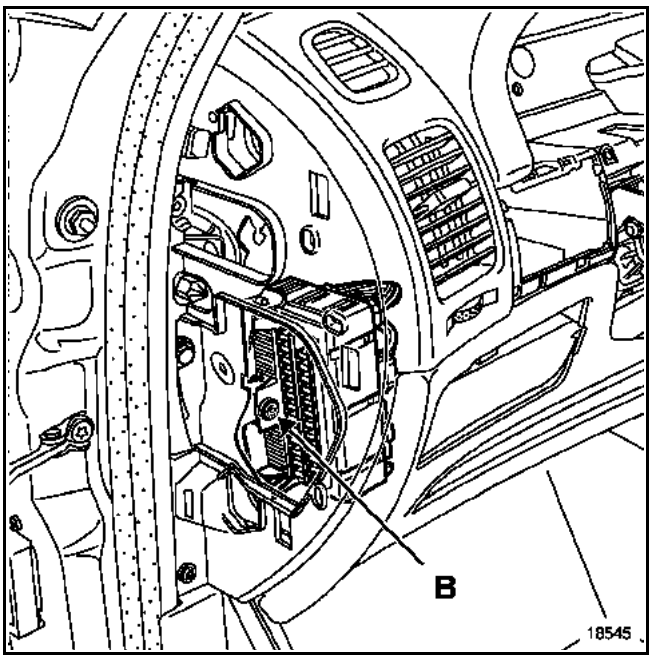
– the clutch pedal travel sensor, by proceeding as follows:
  - disconnect the connector;
  - unlock the section linked to the pedal by moving the bolt (1), and slide it (2);
  - unlock the sensor body by moving the bolt (3);

  - tilt the sensor (4), taking care not to break the lower retaining bracket (5).

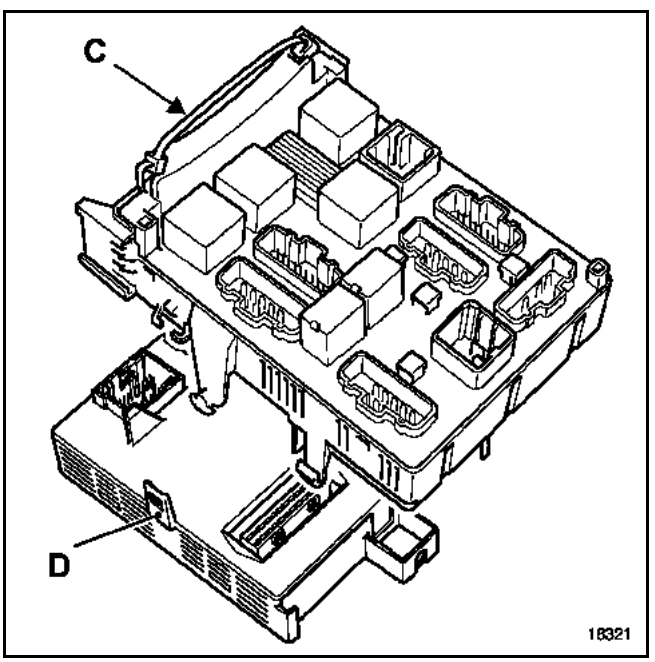


GETtheMANUALS.org

Remove mounting bolt (B) from the UCH.



Cut the plastic clip (C) holding the wiring harness.



Disconnect the UCH and the fuse and relay box connectors.

Separate the UCH and the fuse and relay box by pressing on the bolts (D).

REFITTING

On the new part, place the relays and shunts in their original position.

Reconnect the wires and fit a large clip (C) to keep the harness firmly in place.

GETtheMANUALS.org

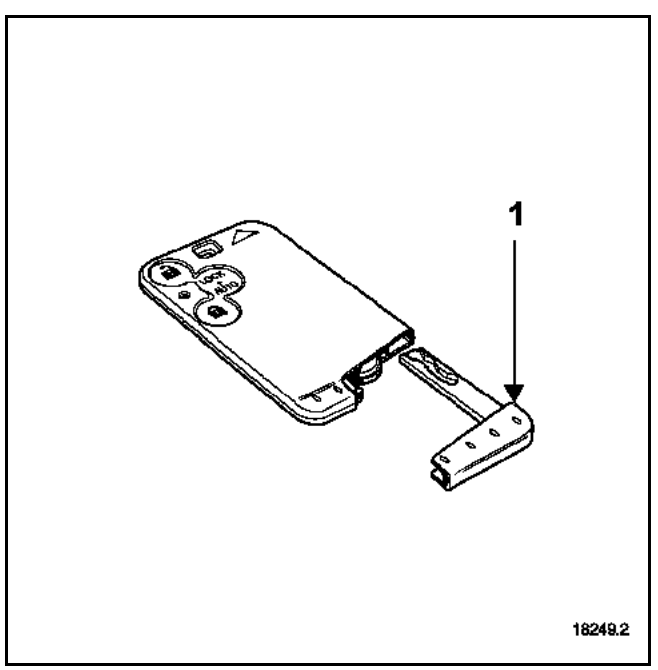
Special notes

- The security code no longer exists but has been replaced by a repair code allocated to the vehicle for life during manufacture:
– no numbers are written on the RENAULT Card,
– at the time of delivery, the vehicle does not have a label showing the code.

When repairing this system, this repair code number can be requested from the local assistance network (**refer to Technical Note 3315E**).

When requesting the code number, it is now essential to provide the vehicle's VIN as well as its fabrication number. This allows the operator to identify the vehicle in order to provide the correct code.

- Renault Cards are fitted with a backup key (1) enabling the door to be opened in the event of an operating fault. Replacement RENAULT Cards are supplied non-coded and without an emergency metal key. The rechargeable battery for the hands-free function is charged. A green cover is fitted in the place of the backup key. When replacing a RENAULT Card, it is necessary to replace the green cover with the customer's backup key and fit the green cover on the faulty RENAULT Card in case it should need to be returned for analysis.



NOTE: a backup key can be ordered at Parts Stores by quoting the vehicle security number.

- This system can have up to four Renault Cards. The remote control function, the battery and the rechargeable battery (on the hands-free version) have no effect on the engine immobiliser.

- This system can, depending on the version, be combined with a RENAULT Card with the hands-free function. **The car cannot have more than one RENAULT Card with the hands-free function.**

- In the event of a card being stolen or lost or upon the customer's request, a RENAULT Card can be unallocated from a vehicle. It can be reassigned to the same vehicle if necessary.

- **IMPORTANT:**
  With this system, it is not possible to replace more than one (UCH and RENAULT Cards or UCH and injection computer) at the same time. These parts are sold uncoded.

It is not possible to code these components when replacing them, if none of them has the vehicle's original code in its memory (see allocation table).

- There is no way of erasing the code programmed into the system components. **The programmed code cannot be erased.**

GETtheMANUALS.org

GENERAL

It consists of an engine immobiliser system controlled by a RENAULT Card with random rolling code recognition system.

A coded chip (operating without a battery) independent of the remote control function is incorporated into each of the vehicle's RENAULT Cards.

The engine immobiliser is active a few seconds after the RENAULT Card is removed from the card reader. Its status is shown by the flashing red light on the instrument panel and by the locking of the electric steering column lock.

During manufacture, a 12-character hexadecimal code is allocated to the vehicle to make the engine immobiliser operational.

This repair code is required in After-Sales to:
– add RENAULT Cards,
– replace one or more RENAULT Cards,
– unallocate one or more RENAULT Cards (e.g. if lost or stolen),
– replace a UCH.

NOTE: To obtain the repair code, it is essential to know the vehicle identification number. There are several ways depending on the country (refer to **Technical Note 3315E**):
– Minitel,
– voice server,
– Techline.

GETtheMANUALS.org

SYSTEM DESCRIPTION

With this system, the engine immobiliser is activated several seconds after the ignition is switched off (shown by the red engine immobiliser light flashing and the locking of the electric steering column lock).

The system comprises:

- two specific RENAULT Cards (A) fitted with a coded chip used for controlling the engine immobiliser,
  - only one of the RENAULT Cards can have the hands-free function,
  - two further cards can be added (maximum of four),
- an engine immobiliser receiver located in the card reader (B), fitted with electronics for transmitting the code of the RENAULT Cards to the UCH (C).

  NOTE: The RENAULT Card reader is not coded.

- a UCH (C) located under the dashboard on the driver's side.

  For the engine immobiliser function, the UCH carries out the following functions:
  - decodes the signal of the RENAULT Card from the card reader,
  - controls the engine immobiliser by sending a code to the electric steering lock,
  - communicates with the injection computer,
  - operates the engine immobiliser indicator light and the card reader light,
  - communicates with the diagnostic tool.

  NOTE: Refer to **section 87B** for the other functions controlled by the UCH.
- an engine immobiliser warning light (D) located on the instrument panel indicating:
  - activation of the engine immobiliser,
  - non-recognition of the RENAULT Card,
  - a system fault,
  - a problem with the injection computer or the electric steering lock.
- a coded injection computer (E).
- a diagnostic socket (G) used for fault finding operations and configuring the system.
- a coded electric steering column lock (F).
- clutch pedal and gearbox position sensors (I) and a stop/start button (H) to supply the starter.

GETtheMANUALS.org

OPERATION

When the engine immobiliser is operational, the engine immobiliser indicator light flashes (slowly: once a second). The electric steering column lock is locked.

- Once the RENAULT Card is inserted into the reader, the code of the RENAULT Card is sent to the UCH.
- If the code is recognised by the UCH, it sends a coded signal to the electric steering column lock via the multiplex network.
- If the coded signal received by the electric lock is identical to the one it has in its memory, the lock releases the steering column and sends a confirmation message to the UCH.
- When the UCH receives this message, it applies the + after ignition feed and switches off the red engine immobiliser indicator light.
- When the ignition is on, the UCH and the injection computer send coded signals to each other via the multiplex network.
- If the signals issued by the UCH and the injection computer match, the UCH authorises the engine to start and the injection is unlocked.

SPECIAL CASES

- If the injection computer or the electric steering column lock do not have a stored reference code: the code which is sent is entered into the memory.
- If the codes do not match, the system remains locked. The engine immobiliser indicator light flashes (quickly). The vehicle is not authorised to start and the electric steering column lock remains locked.
- If the indicator light is on, without the presence of + after ignition feed, there is a problem with the vehicle electric steering column lock.
- If the indicator light is on, with the presence of + after ignition feed, there is a problem with the vehicle injection.

IMPORTANT: when the vehicle battery has a low charge, the drop in voltage caused by operating the starter may set the immobiliser. If the voltage is too low, the engine cannot be started, even by pushing the vehicle.

GETtheMANUALS.org

REPLACEMENT AND CONFIGURATION OFTHE UCH

New parts are not coded. Once fitted on the vehicle, they must be programmed with a code to become operational.

To perform this procedure, it is essential that some parts on the vehicle are already correctly coded (with the vehicle code). Refer to the allocation table.

WARNING: If a part is programmed with a code, the part is then allocated to the vehicle and the code cannot be erased nor can the part be programmed with a second code. **The programmed code cannot be erased.**

ALLOCATION TABLE

AFTER-SALES OPERATION	COMPONENT STATUS				REPAIR CODE NEEDED
	UCH	RENAULT Card	Injection computer	Electric steering column lock	
Programming the UCH	Blank	Coded	Coded	-	YES
Allocation or de-allocation of a RENAULT Card	Coded	Blank*	Coded	-	YES
Programming the electric steering column lock	Coded	Coded	-	Blank	NO
Programming the injection computer	Coded	Coded	Blank	Coded	NO

* The RENAULT Card allocated to a vehicle must be blank or already programmed on this vehicle.
NOTE: a card may be programmed on a vehicle but not operational (not allocated).

REMINDER: only the RENAULT Cards used during the allocation process will be operational.

GETtheMANUALS.org

REPLACEMENT AND CONFIGURATION OFTHE UCH

A new UCH is not programmed with a code. You must therefore program a code into a new UCH fitted to a vehicle to make the UCH operational.

To perform this procedure, at least one of the vehicle's old RENAULT Cards and the repair code are required and the injection computer must be correctly coded (refer to the allocation table).

WARNING: if a code is programmed into the UCH, the UCH is assigned to the vehicle and it is impossible to erase the code or program in another one.

IMPORTANT: RENAULT Cards submitted during this procedure will only work if:
– they have already been coded on this vehicle,
– or they are new (not coded).

UCH PROGRAMMING PROCEDURE

- Set up a dialogue with the **Engine immobiliser** system.
- In the **Command**, **Specific command** menu, select and confirm **SC027: program UCH** line.
- The tool displays **Please enter the After-Sales code** .
  With no card in the reader , enter the secret After-Sales code (12 hexadecimal characters) and confirm it.
- If the code format is correct, the tool displays **Insert a card which has already been programmed on the vehicle**, and the programming procedure will commence.
- The tool displays **UCH programmed**; the UCH is coded. You must now enter RENAULT Card programming mode to assign the other cards (maximum of four). Several seconds may elapse before this message appears.

WARNING: the maximum time between each operation is **2 minutes**, otherwise the procedure will be cancelled and the tool will display the message **Procedure interrupted: warning, the cards assigned to the vehicle are the ones assigned before performing the procedure. The cards submitted before interruption of the procedure are no longer blank and can only be assigned to this vehicle**. This message also appears where dialogue with the UCH is lost or the battery power supply fails.

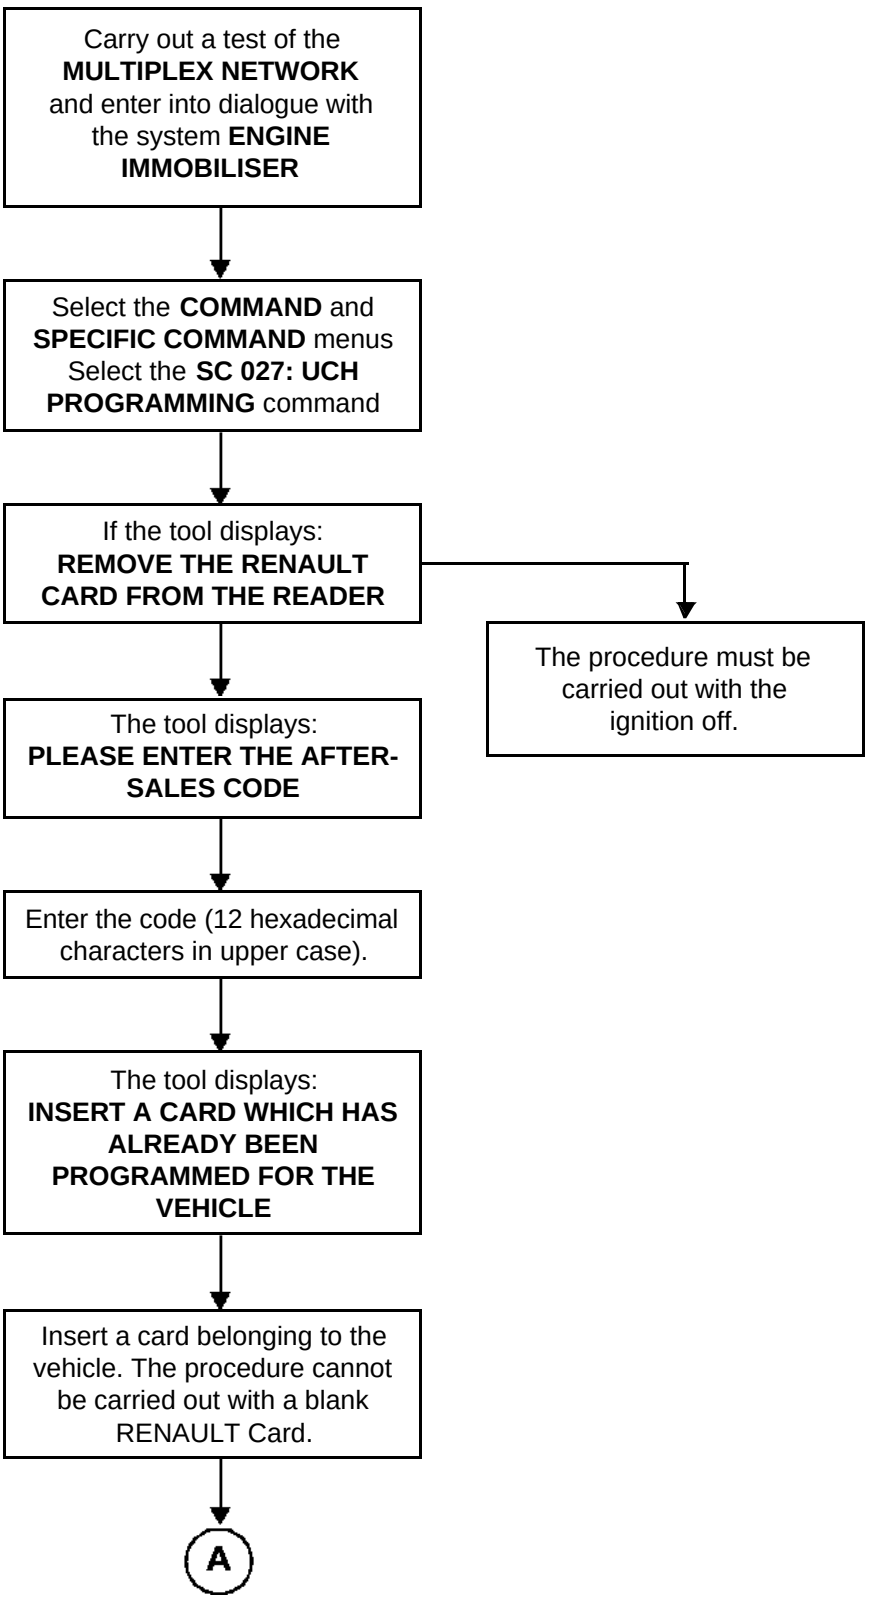
SPECIAL CASES

If the screen displays:
- **Remove the card from the reader**, a card is already present in the reader,
- **Verify the After-Sales code and ensure that the card belongs to the vehicle:** the code has not been read correctly or the UCH has already been coded on another vehicle. Verify the code then retry input.
- **Do you want to check the cards before assigning them to the vehicle?** the UCH is already coded on this vehicle, the UCH enters RENAULT Card reallocation mode.
- **Card not usable on this vehicle:** the card code does not correspond to the current vehicle.
- **The card inserted is blank. Please insert another card which has already been programmed on the vehicle:** insert a card which has already been coded.
- **UCH Programming failure:** repeat the whole procedure.

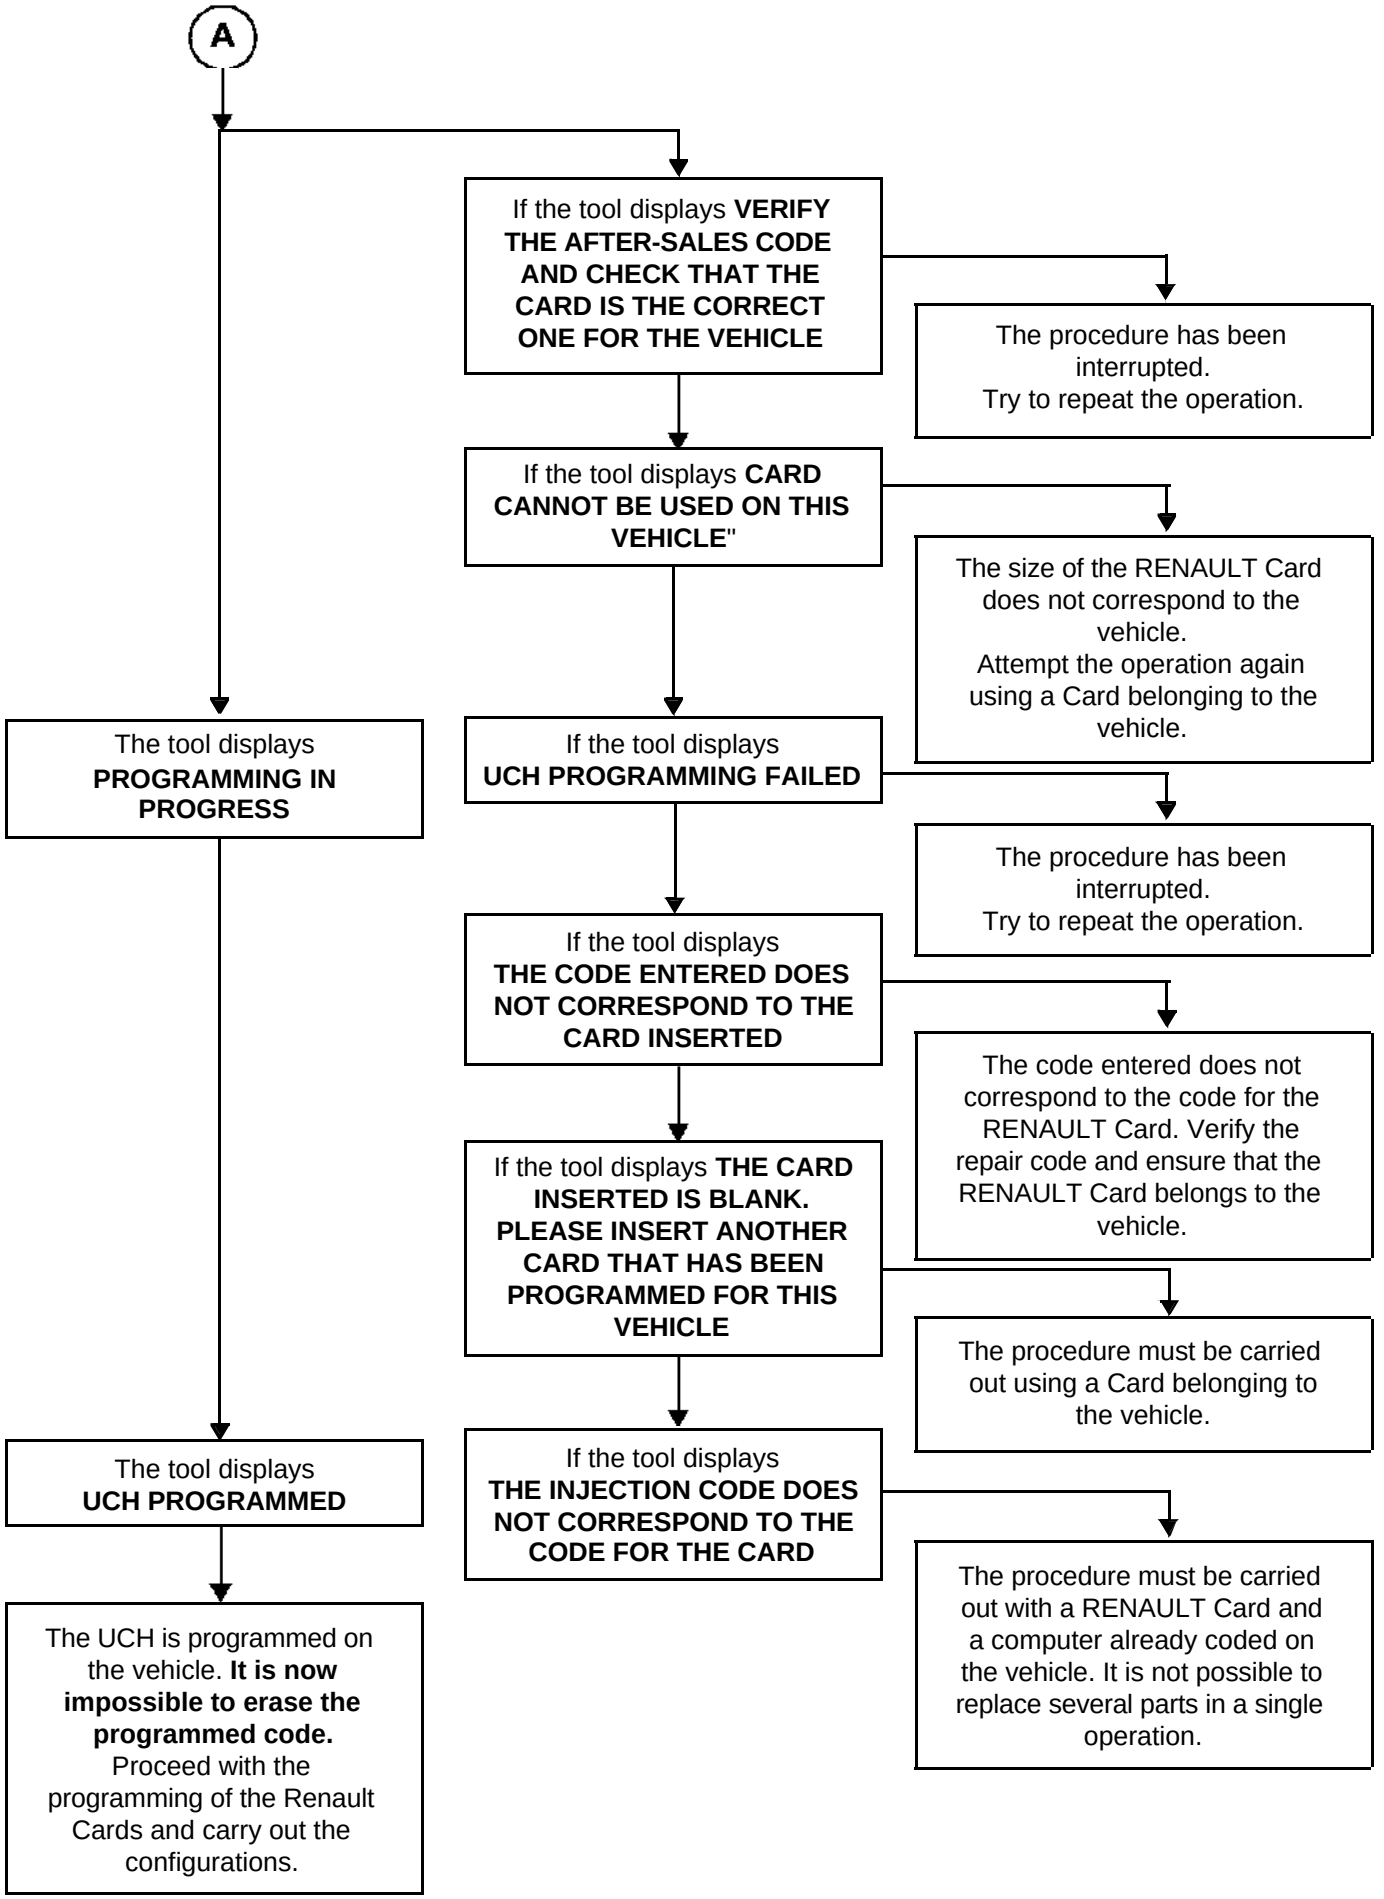
WARNING: when a UCH has been programmed with the RENAULT Card code, it is impossible to erase it or to store another code in its place.

GETtheMANUALS.org

UCH PROGRAMMING PROCEDURE



GETtheMANUALS.org



GETtheMANUALS.org

RENAULT CARD ALLOCATION PROCEDURE

NOTE: it is possible to find out whether a Renault Card is blank or not by using the state: **ET115: blank card**.

IMPORTANT: in the event that not all the RENAULT Cards are available, it will be necessary to carry out a subsequent reallocation procedure using all the cards.

- Confirm the **SC001: Card programming** line in the **Specific command** item of the **Command** menu.

- The screen displays **Do you want to check the cards before assigning them to the vehicle?**

- If you want to check the cards, the tool displays **Insert the card fully into the reader**. Insert a RENAULT Card until the ignition is switched on:
  - If the allocation is not possible, the screen displays **Verify the After-Sales code and make sure the card belongs to the vehicle**. Insert another card.
  - If the card is accepted, the screen displays **Remove the card from the reader**.

- The tool displays **Insert the card fully into the reader**. Insert a RENAULT Card fully into the reader and confirm:
  - If the RENAULT Card is not accepted, the red indicator light remains off.
  - If the RENAULT Card is accepted, the red indicator light flashes rapidly and the tool displays **1 card programmed** then **Remove the card from the reader**.

- The tool displays **Insert the card fully into the reader**. Insert a second RENAULT Card until the ignition is switched on:
  NOTE: If the same RENAULT Card is submitted twice, the system does not acknowledge the second card and the immobiliser indicator light remains off.

- Insert the RENAULT Card or the other Cards to be assigned to the vehicle (maximum of 4) into the Card reader. The screen displays **2, 3 or 4 cards programmed** then **Remove the card from the reader**.

WARNING: these must be old RENAULT Cards for the vehicle or new **uncoded** RENAULT Cards.

NOTE: the vehicle can only accept a single RENAULT Card with the hands-free function. If a second RENAULT Card is assigned to the vehicle, it will function as an ordinary RENAULT Card.

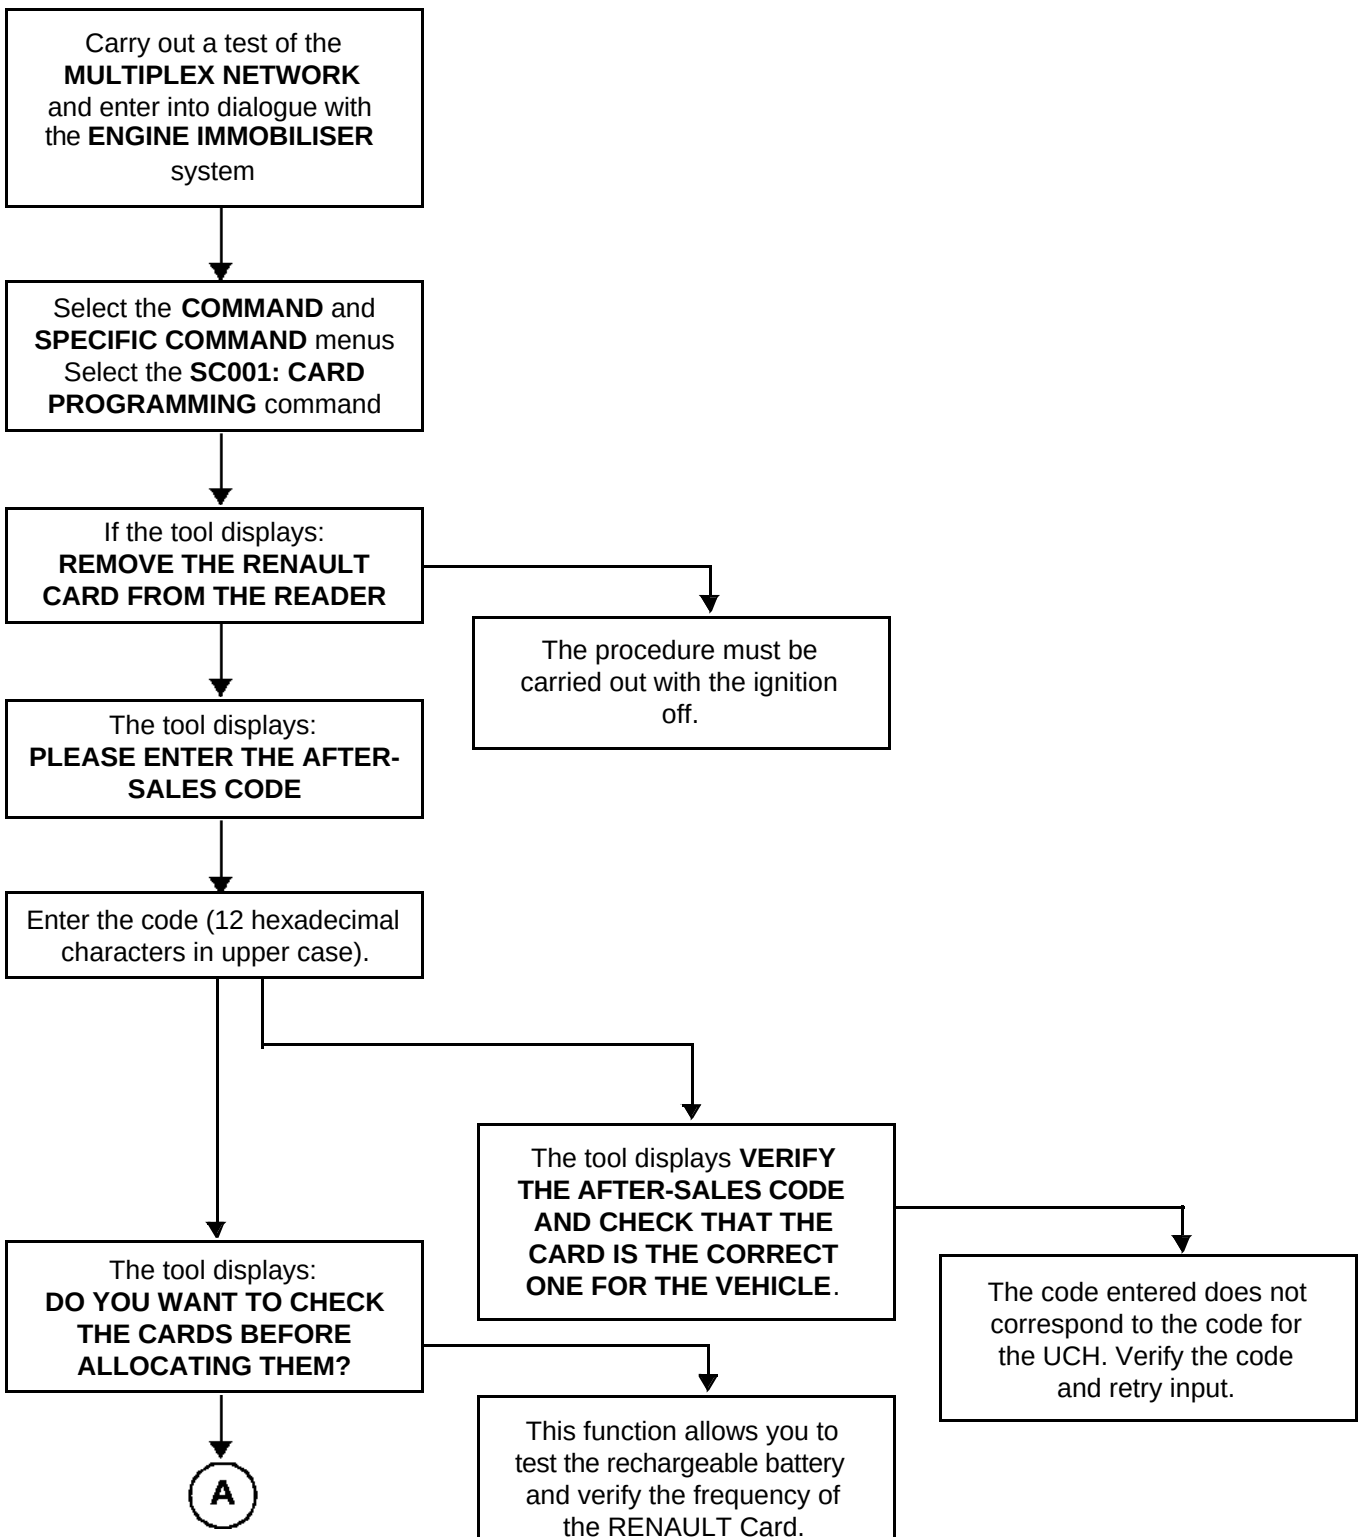
WARNING: the maximum time between each operation is **five minutes**, otherwise the procedure will be cancelled and the tool will display the message **Procedure interrupted: warning, the cards assigned to the vehicle are the ones assigned before the procedure was performed. The cards submitted before interruption of the procedure are no longer blank and can only be assigned to this vehicle**. This message also appears where dialogue with the UCH is lost or the battery power supply fails.

- **Configure the UCH in accordance with the vehicle options and equipment** (refer to **section 87**).

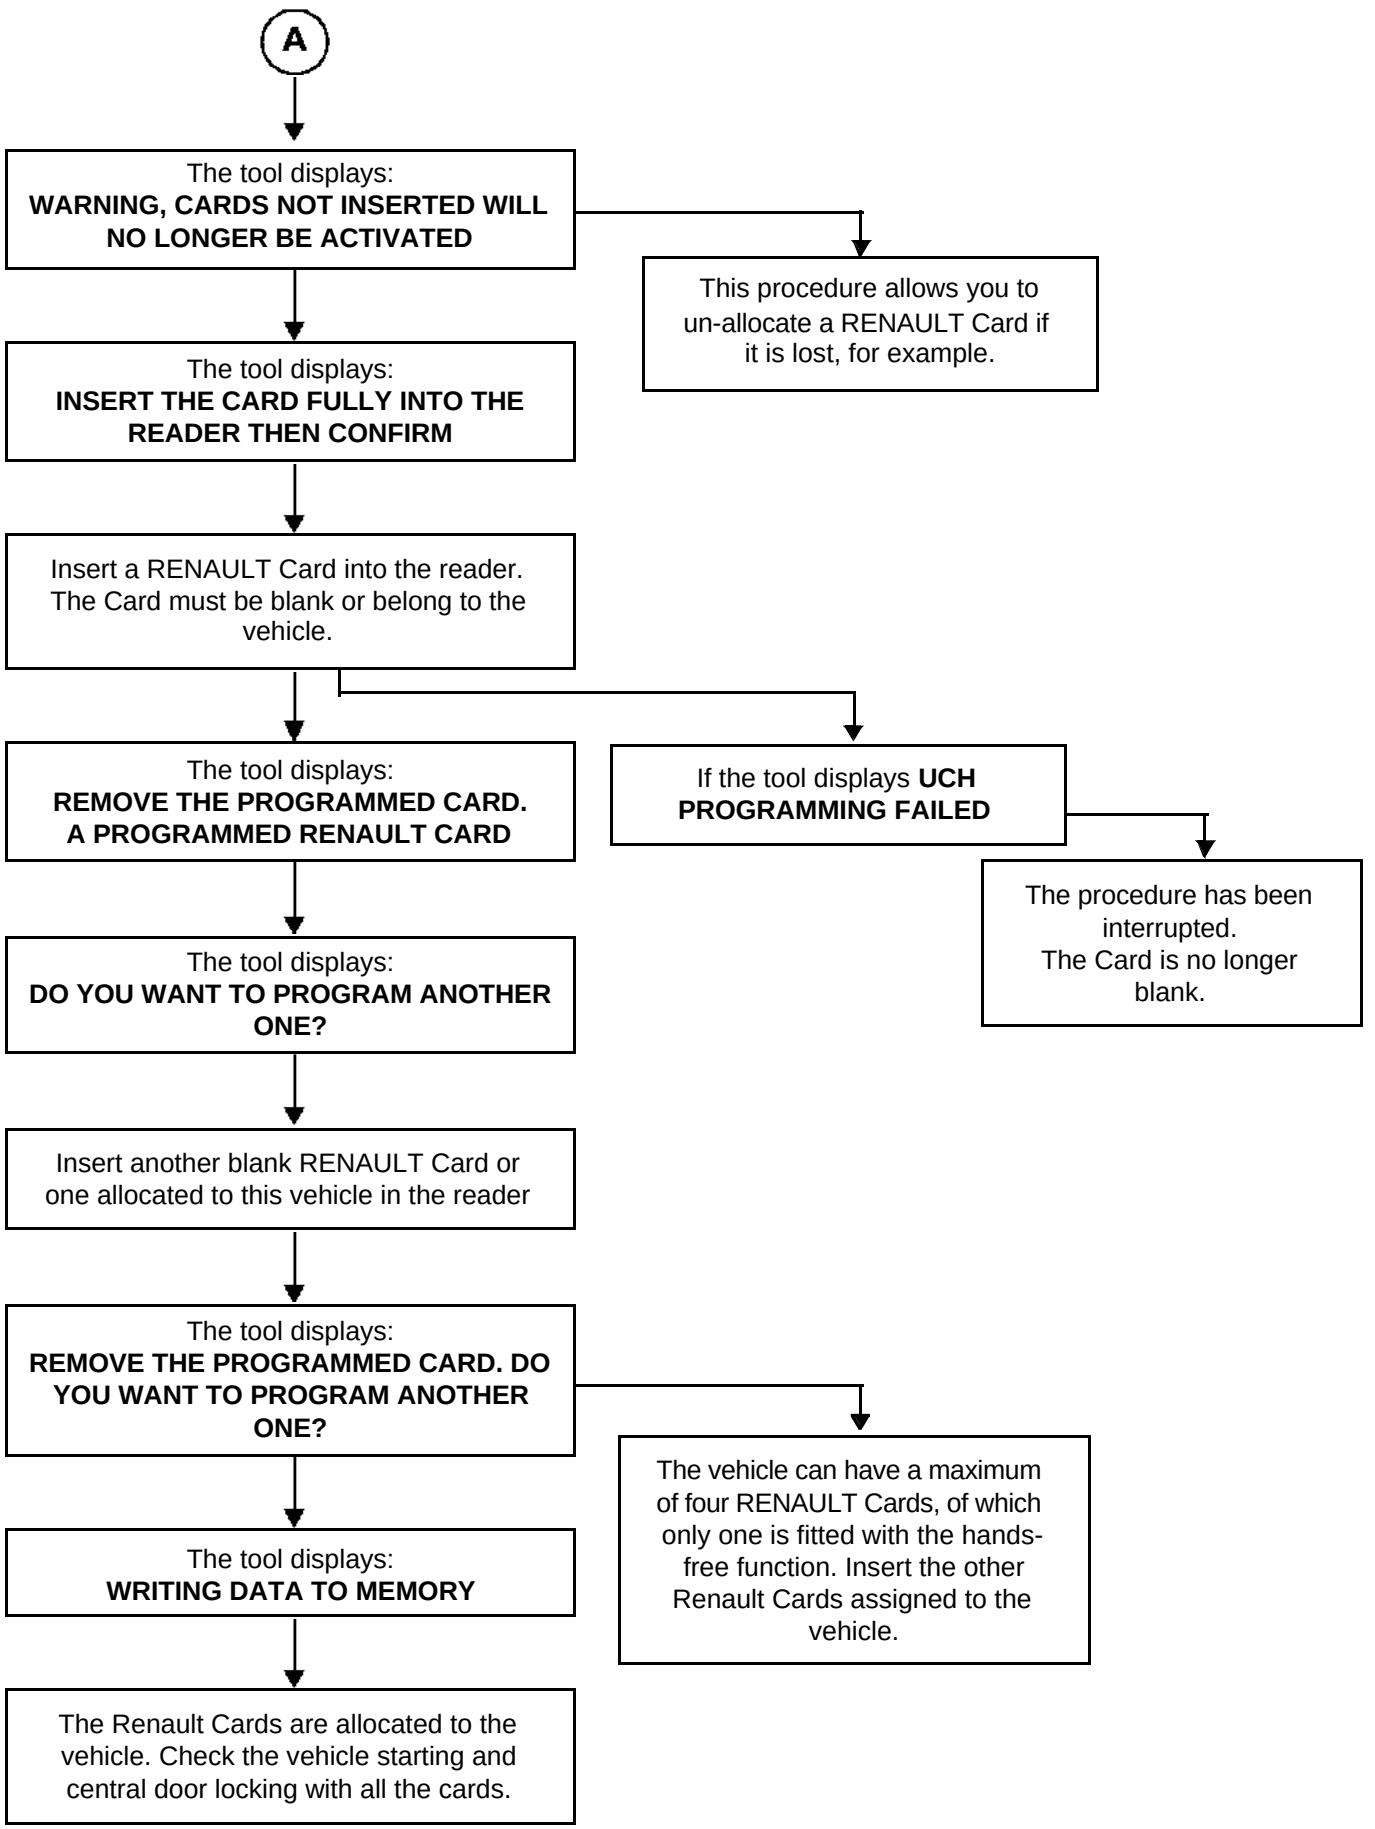
NOTE: there is no operation to perform on the injection computer when the UCH alone is replaced, it retains the same immobiliser code.

GETtheMANUALS.org

RENAULT CARD ALLOCATION PROCEDURE



GETtheMANUALS.org



GETtheMANUALS.org

CODING THE INJECTION COMPUTER

The injection computer is supplied uncoded. It therefore has to be programmed with the engine immobiliser code when it is installed to allow the vehicle to be started.

Simply switch on the ignition for a few seconds without starting the engine. Switch the ignition off, the immobiliser will be activated after a few seconds.

Checking

The status of the injection computer can be ascertained using the diagnostic tools:

1 Select and confirm **Passenger compartment connection unit**
2 Select the **STATUS** menu and check:
- if the computer is not coded, the state **ET111 Injection blank** is active,
- if the computer is coded, the state **ET111 Injection blank** is not confirmed.

IMPORTANT:

With this engine immobiliser, the vehicle keeps its immobiliser code for life.
In addition, this system does not have a security code.

Consequently, it is forbidden to carry out tests with injection computers borrowed from stores and subsequently returned.

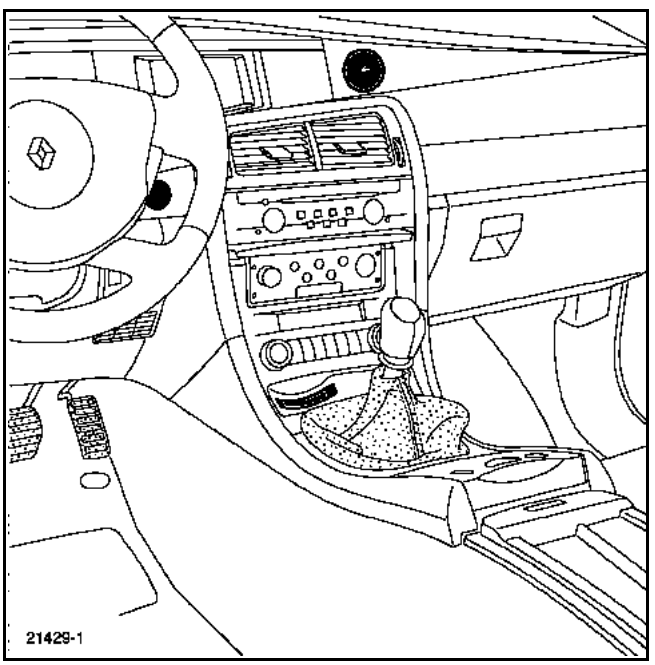
The programmed code cannot be erased.

GETtheMANUALS.org

The RENAULT Card reader contains two contacts which control vehicle operation:
– a contact located half-way into the card slot, which controls power supply to accessories (+ ACCESSORIES),
– a contact at the end of the card slot (+ AFTER IGNITION).

NOTE: the RENAULT Card is locked in the reader once the UCH has received the **engine running** signal from the injection computer. It is released when the engine is stopped.

A specific configuration means that RENAULT Cards are not locked on vehicles with automatic transmission.



The RENAULT Card reader is used:
– to act as a radio frequency receiver for locking and unlocking the doors,
– as a transponder aerial for the engine immobiliser function and recognition of the RENAULT Card.

Operation of the reader lighting:

- When the doors are unlocked, the reader lights up for approximately **30 seconds**.
- If the reader lights up when a RENAULT Card is inserted, this signifies that the code corresponds to the code stored in the UCH.
- If the reader flashes quickly (at the same frequency as the engine immobiliser indicator light) when a RENAULT Card is inserted, this means that the code has not been recognised by the UCH.
- The reader lights up after the engine is switched off.
- If the RENAULT Card is in the reader when a door is open (engine off), the reader flashes as a reminder.

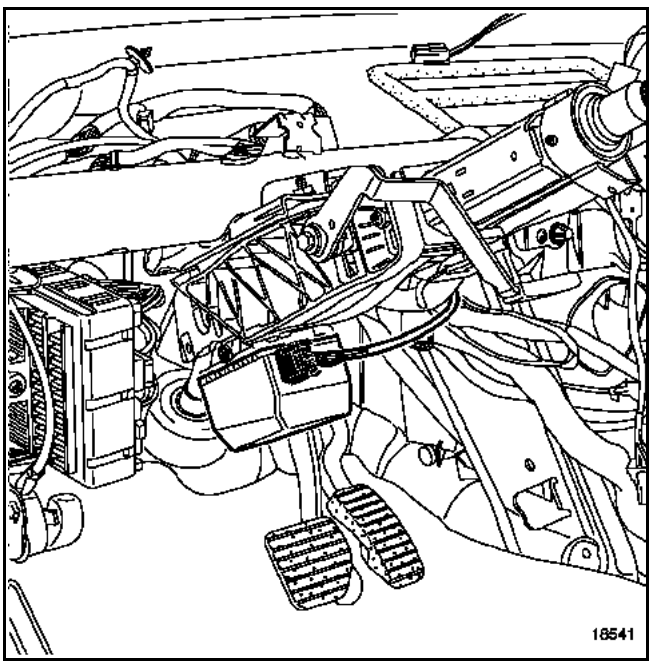
NOTE: The reader must be replaced if the reader light develops a fault.

REMINDER: the card reader is not coded.

Refer to **section 84A** for removal operations and reader track allocations.

GETtheMANUALS.org

The steering column lock is located at the base of the steering column. It is controlled by the UCH.
This lock is coded by the UCH and cannot be made blank again.



OPERATION

The steering is unlocked when the RENAULT Card is fully inserted into the reader and the transponder is recognised by the UCH.
The steering is locked when the RENAULT Card is fully withdrawn from the reader, the engine is stopped and the vehicle speed is zero.

NOTE: if the UCH has received an **impact** signal from the air bag computer, the steering column lock remains unlocked.

NOTE: a faulty or disconnected steering column lock prevents the engine from being started.

NOTES:
- If the lock does not release when the RENAULT Card is inserted into the reader, the engine immobiliser indicator light comes on but the + after ignition feed is not established.
- If the retaining lock of the device is released when the car is moving, the **Stop** and engine immobiliser indicator lights come on (the steering wheel does not lock).
- If an internal switch develops a fault, the service warning light comes on.

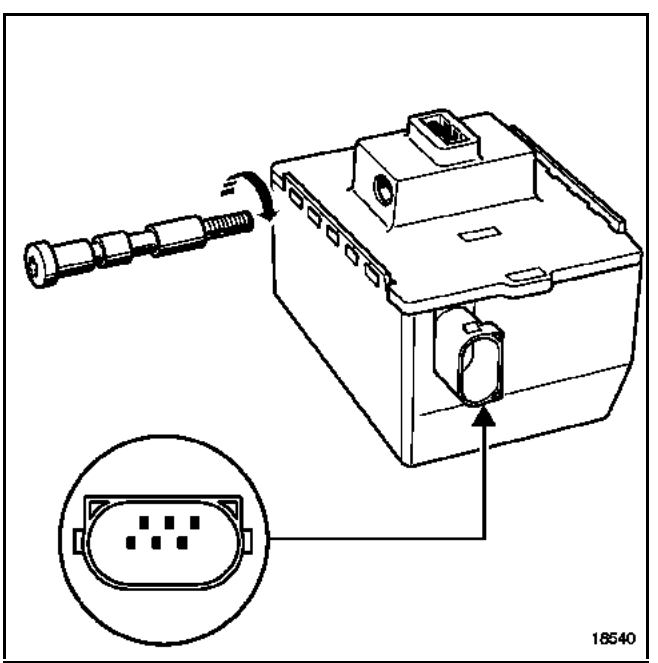
PRECAUTIONS DURING REPAIR

Proceed as follows to prevent the steering lock from being applied when the battery is disconnected:
- if the vehicle is not fitted with a navigation system, insert the RENAULT Card fully (+ after ignition) then withdraw it as far as the 1st position (+ accessories feed). The steering column is not locked as long as the card remains in the first position in the reader. Disconnect the battery and the steering column will remain unlocked for as long as the battery remains disconnected and the RENAULT Card inserted.
- lock the air bag computer using a diagnostic tool.

Refer to **section 84A** for the connector allocations.

REMOVAL

WARNING: the steering column lock is secured with a reverse thread bolt (left-hand thread). Furthermore, it can only be removed if it has been released beforehand.



REFITTING

Tighten the bolt to a torque of **0.8 daNm.**

GETtheMANUALS.org

CODING OF THE ELECTRIC STEERING COLUMN LOCK

The electric lock is supplied uncoded. It therefore has to be programmed with the engine immobiliser code when it is fitted to allow the ignition to be switched on.

Simply insert the RENAULT Card into the reader for a few seconds. Remove the RENAULT Card and the engine immobiliser will be activated after a few seconds. The electric lock is coded and the steering column is locked.

IMPORTANT:

With this engine immobiliser, the vehicle keeps its immobiliser code for life.
Furthermore, this system does not have a security code.

Consequently, it is forbidden to perform tests with an electric lock borrowed from the stores which must be returned.

The programmed code cannot be erased.

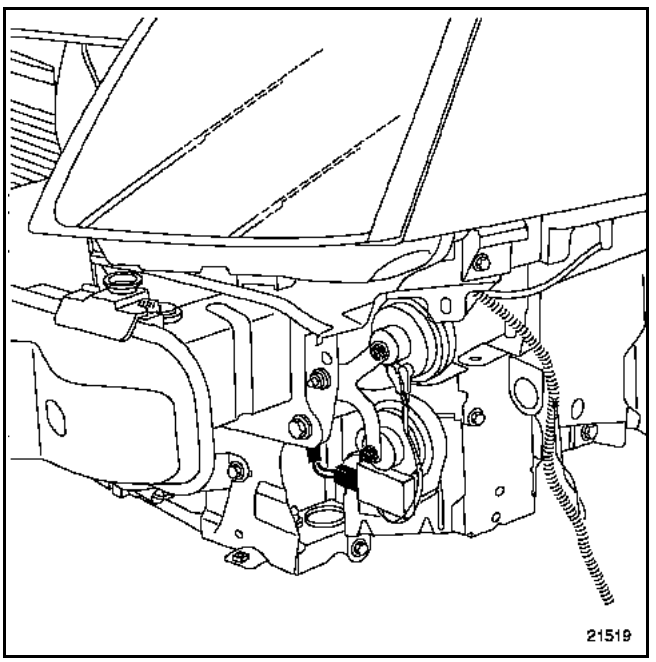
To check the coding of the electric steering column lock:

- select **Engine immobiliser**
- in the **States** menu, check that the **ET089 steering column lock blank** line has not been confirmed.

GETtheMANUALS.org

DESCRIPTION

The horn is located behind the front bumper on the left-hand side.



Depending on the model, vehicles can have:
– one or two simple horns,
– two horns controlled by the UCH via a coded line.

These horns are operated:
– when controlled by the lighting stalk,
– via a coded line from the UCH when the doors are closed by the hands-free function (depending on version).

NOTE: the tone as well as the volume of this closing signal can be modified via UCH configuration using diagnostic tools. To do this:

- set up a dialogue with the UCH,
- Open the **command** menu and select and confirm the **configuration** line.

CONNECTION (simple)

Track	Description
A	Supply (stalk)
B	Earth

CONNECTION (coded line)

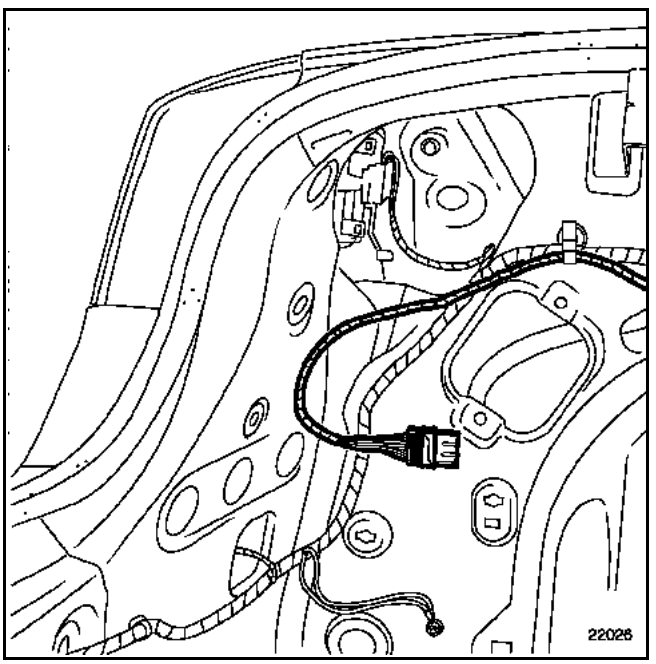
Track	Description
1	Power supply
2	Earth
3	Control (stalk or UCH)

GETtheMANUALS.org

DESCRIPTION

Vehicles are pre-wired to be fitted with a Renault approved alarm.

The specific connector (A) is located behind the trim, next to the rear left-hand pretensioner.



OPERATION

The alarm is connected to the UCH via a serial connection.

The command to deactivate the alarm is given by the UCH via a coded line when the vehicle is unlocked using the radio frequency remote control.

The command to activate the alarm is given by the UCH when:
– the vehicle is locked using the radio frequency remote control.
– upon automatic relocking.

The UCH informs the alarm control unit of the status of the doors after being locked with the radio frequency remote control.

CONNECTION

Track	Description
1	Direction indicators switch
2	Locking indicator light control
3	+ After ignition
4	+ Caravan (not used for the alarm)
5	+ Battery
6	Bonnet switch signal

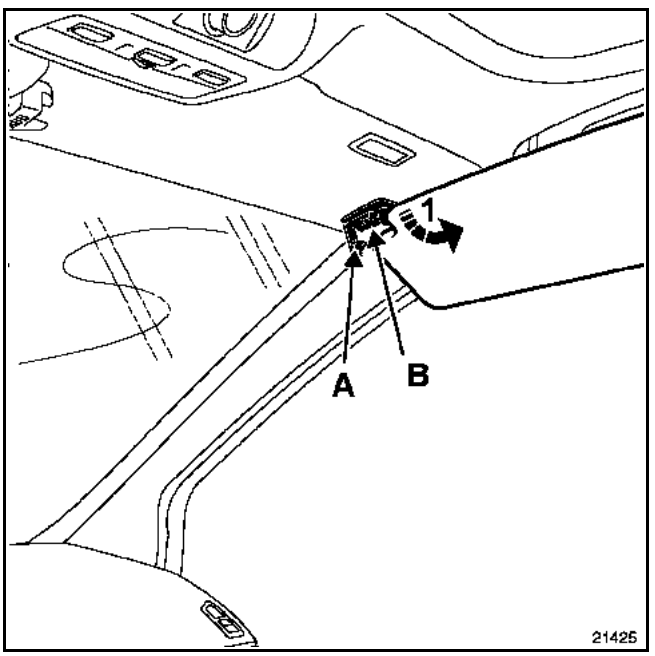
GETtheMANUALS.org

IMPORTANT:
pyrotechnic systems (air bags and pretensioners) must not be handled near to a heat source or flame - there is a risk of triggering.

IMPORTANT:
Before beginning to remove the dashboard, it is essential to lock the air bag computer with a fault finding tool (for instructions, see section **88C**).

NOTE:
Locking the air bag electronics casing also unlocks the electric steering column lock.

REMOVAL

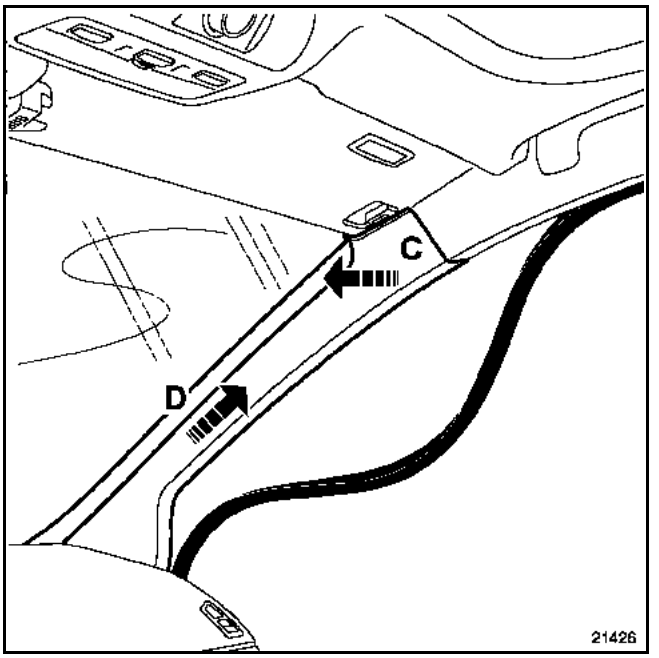


Move the sun visor round to the door.

Unclip:
– mounting cover (A).
– clip (B).

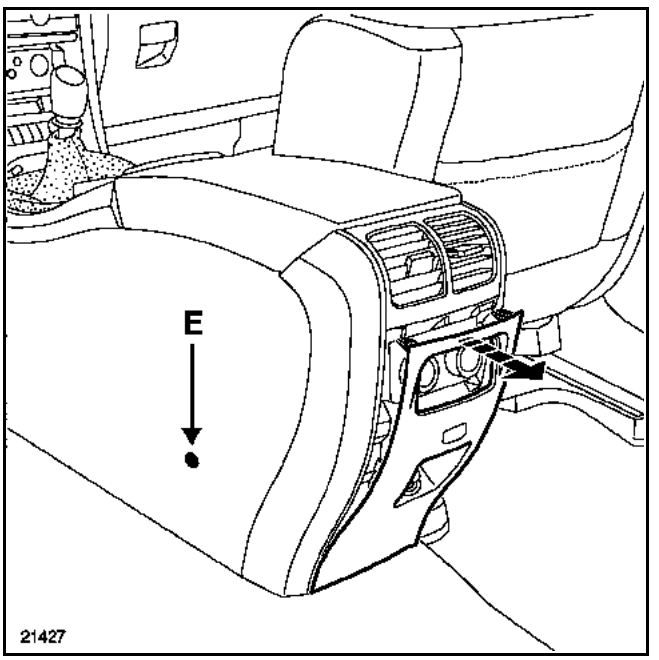
Turn the sun visor back to the windscreen.

Remove sun visor (1).



Release:
– the door frame seal partially,
– the upper section of the trim (C),
– trim (D) keeping the upper section detached.

Push the seats forward.



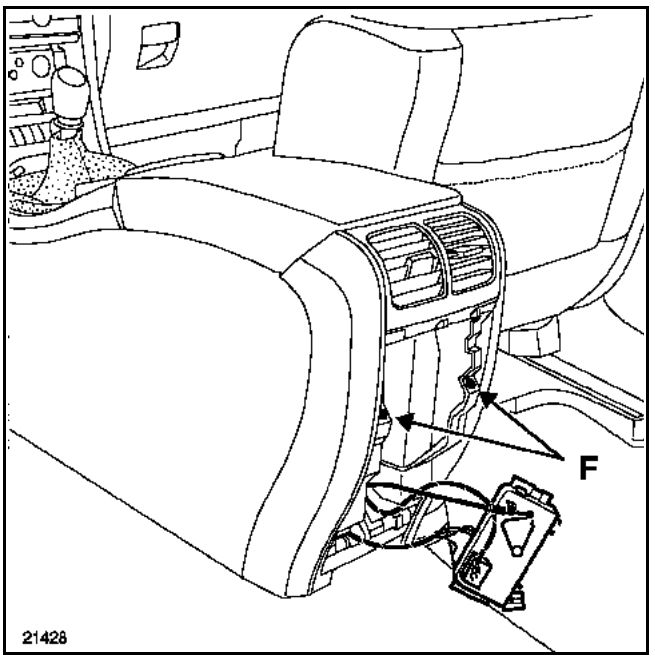
Remove bolts (E).

Push the seats back.

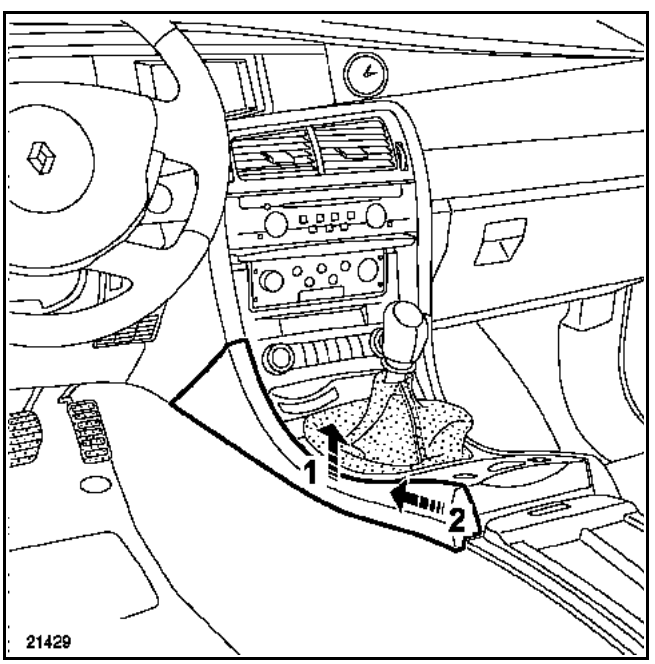
Disconnect the battery.

Unclip:
– the rear face of the console,

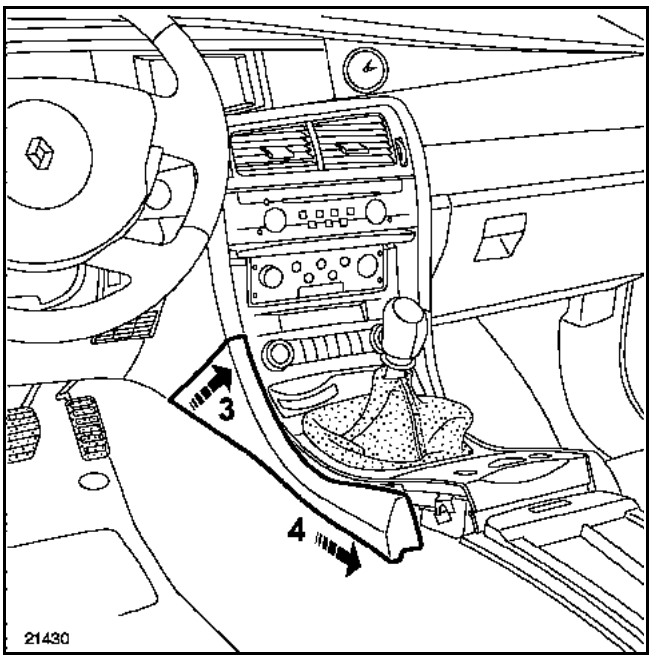
GETtheMANUALS.org



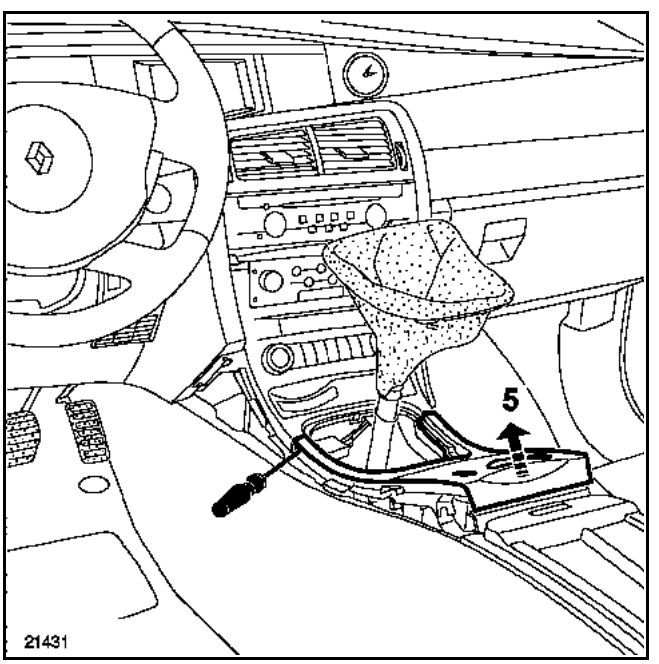
– the heater control, to gain access to the bolts (F)



– the rear section of the console side panel by gently pulling at (1) then (2).



– the front section of the console side panel by gently pulling at (3) then (4),



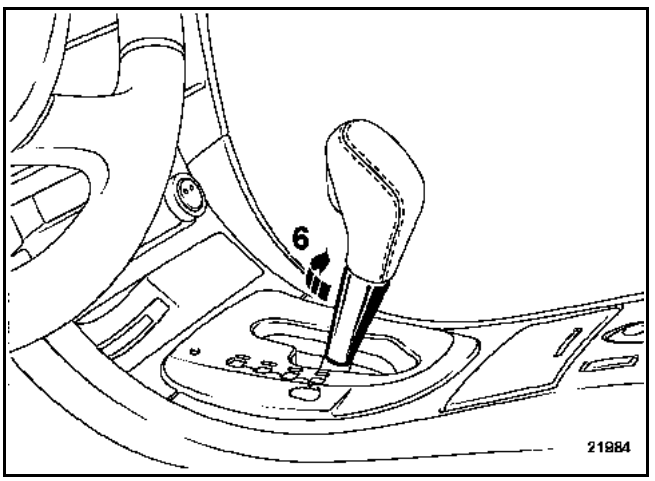
– the speed control gaiter.

Using a flat screwdriver unclip the front then rear section of the central console section (5).

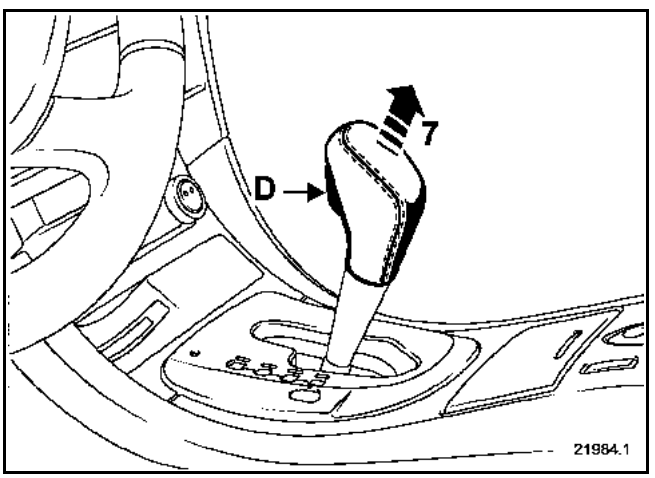
GETtheMANUALS.org

SPECIAL NOTES ON THE AUTOMATIC GEAR LEVER

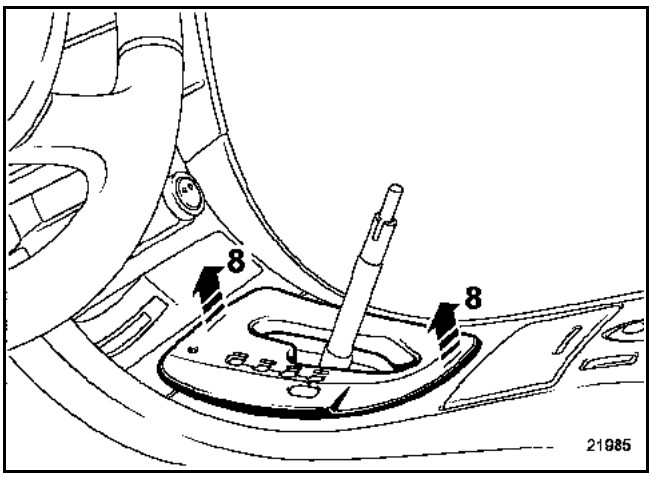
REMOVAL



Rotate lower section (6).



Press control unlocking button (D); pull out lever (7).



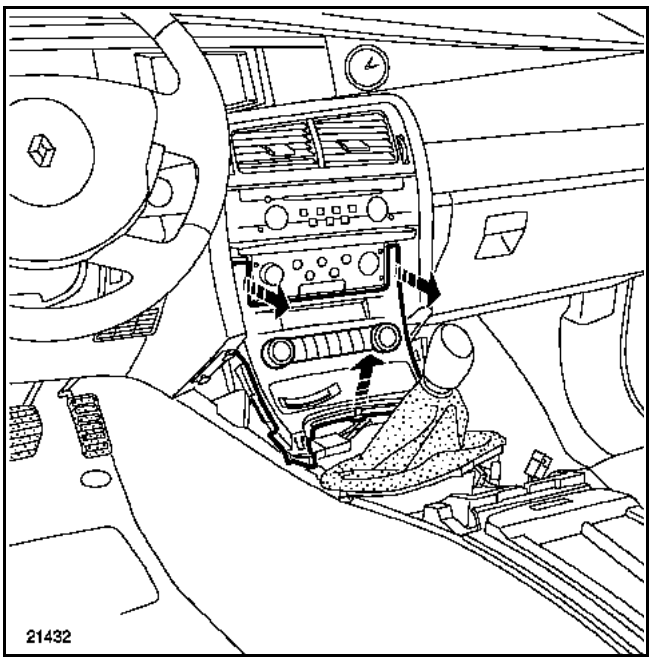
Unclip gear lever plate (8).

REFITTING

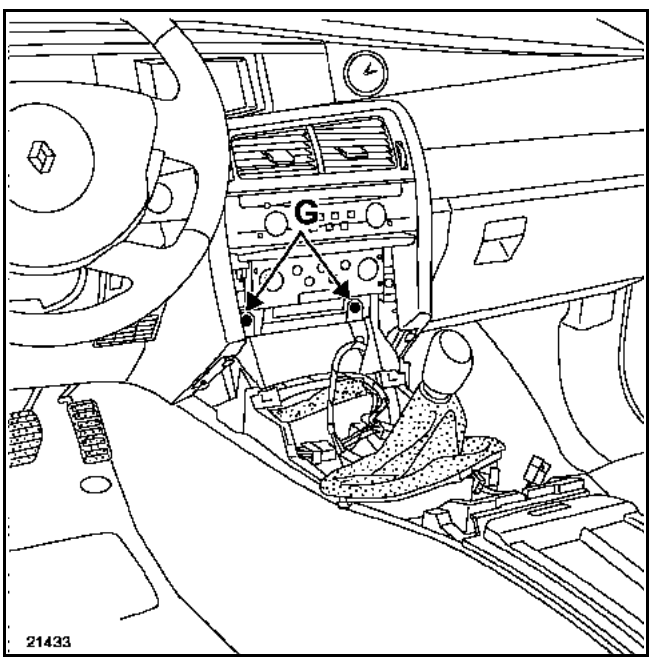
Clip on the gear lever plate.

Assemble the two gear lever sections; clip together.

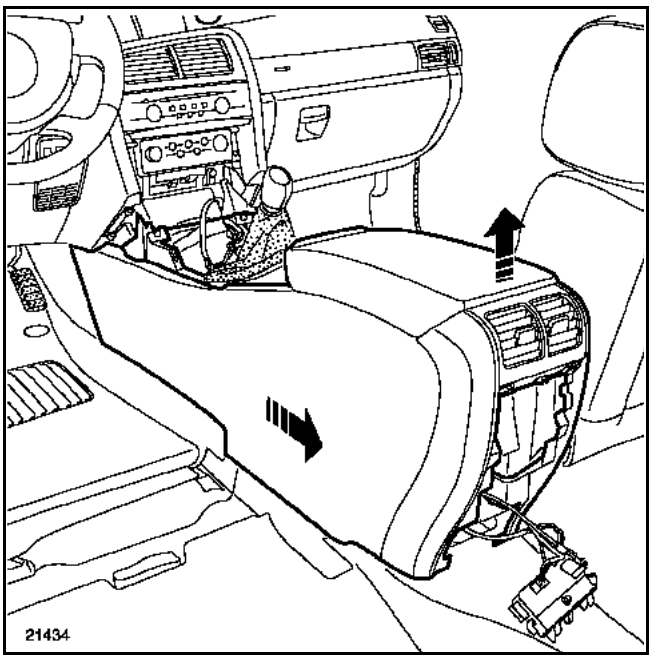
GETtheMANUALS.org



Unclip the Renault card reader at the top and bottom sections.

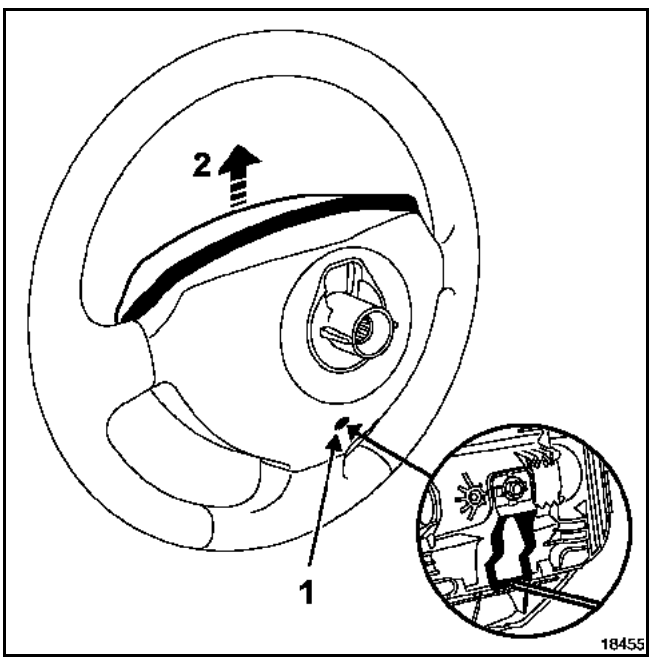


Remove bolts (G).



Lift the rear section of the console slightly, then slide it towards the rear of the vehicle.

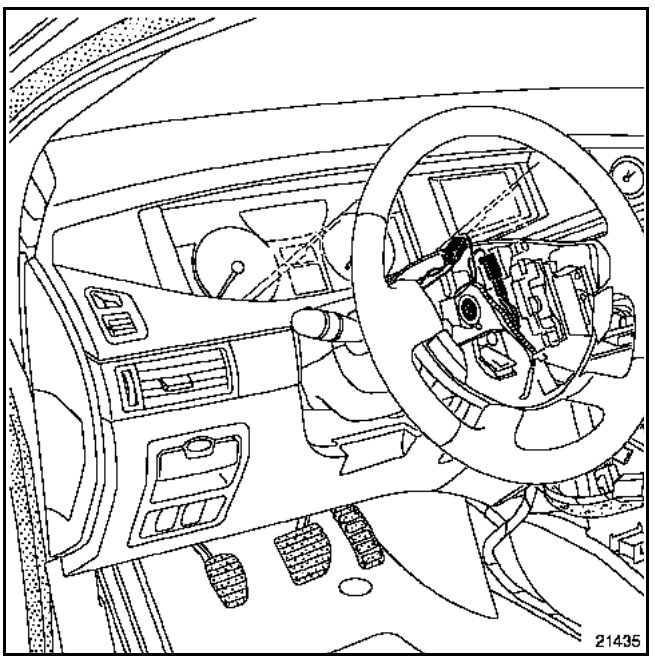
Remove:
- the radio using the **Ms. 1373** or **Ms. 1639** tools (depending on the version),
- the central communications unit (depending on the version), using the **Ms. 1373** tool



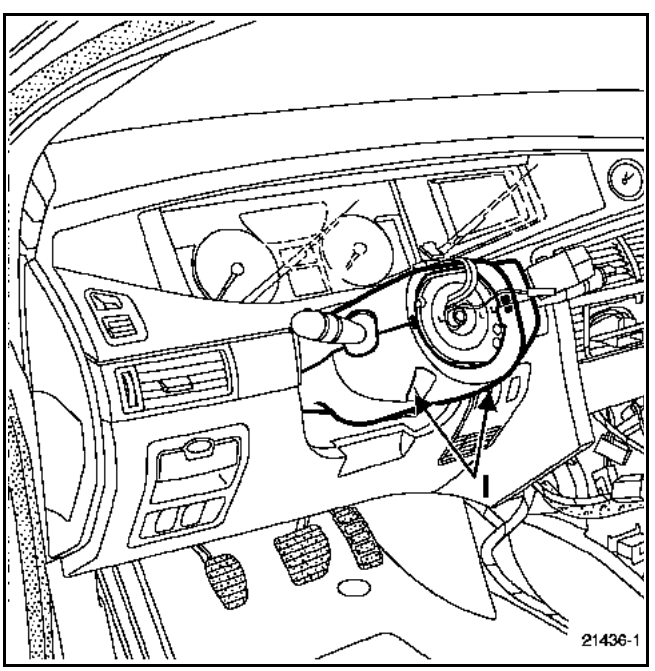
- the steering wheel air bag cushion. To do this, insert a screwdriver into hole (1) then move it upwards (2).

GETtheMANUALS.org

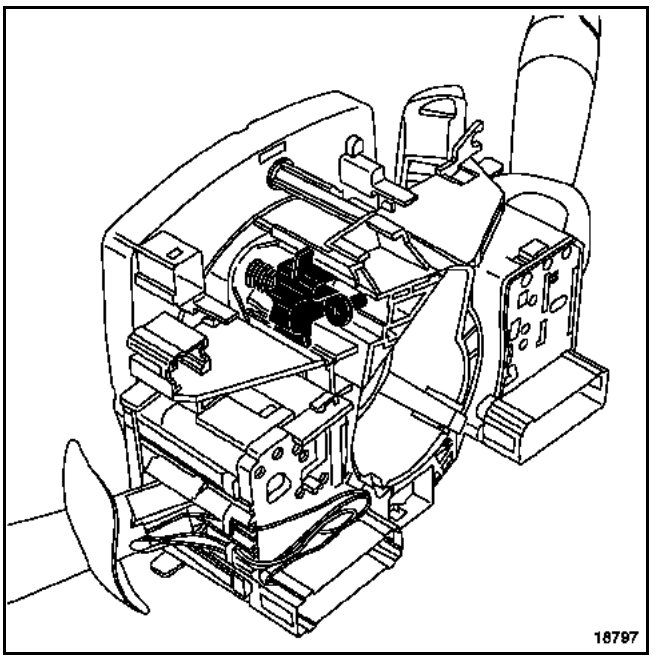
Disconnect the steering wheel air bag connectors and the cruise control button connectors



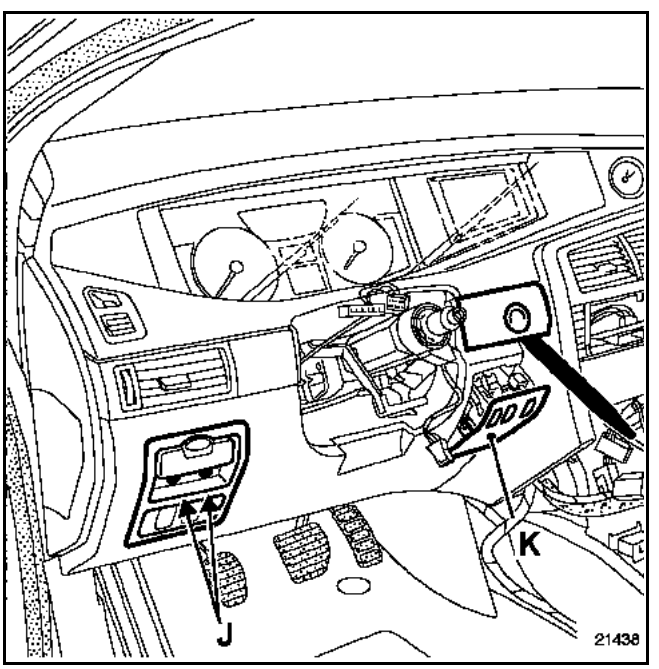
Remove:
– the steering wheel bolt,
– the steering wheel after setting the wheels straight,



– the bolts (I), then release the upper and lower cowlings,

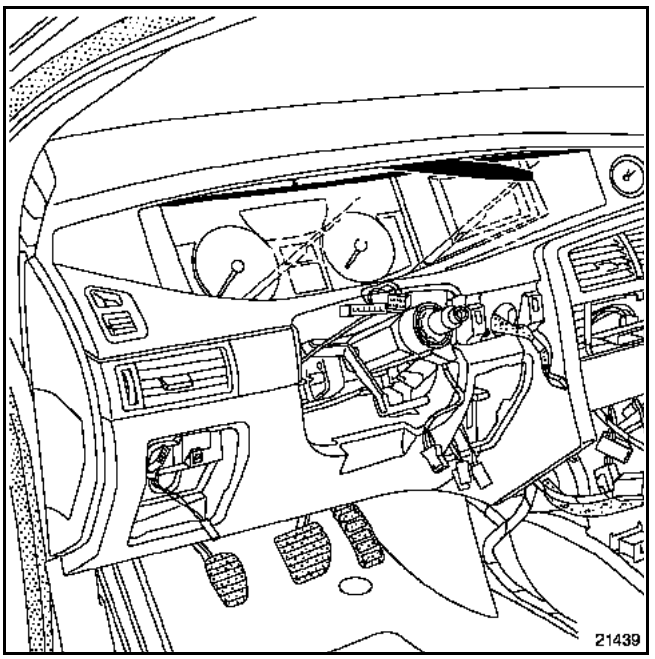


– the rotary switch, marking its position,

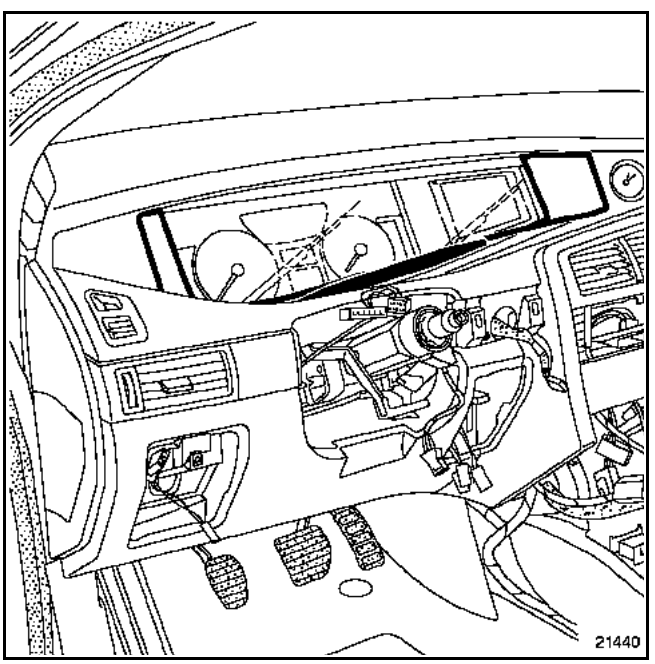


– The starter button mounting,
– the automatic parking brake control bolts (J) after removing the cover,
– switch mounting (K).

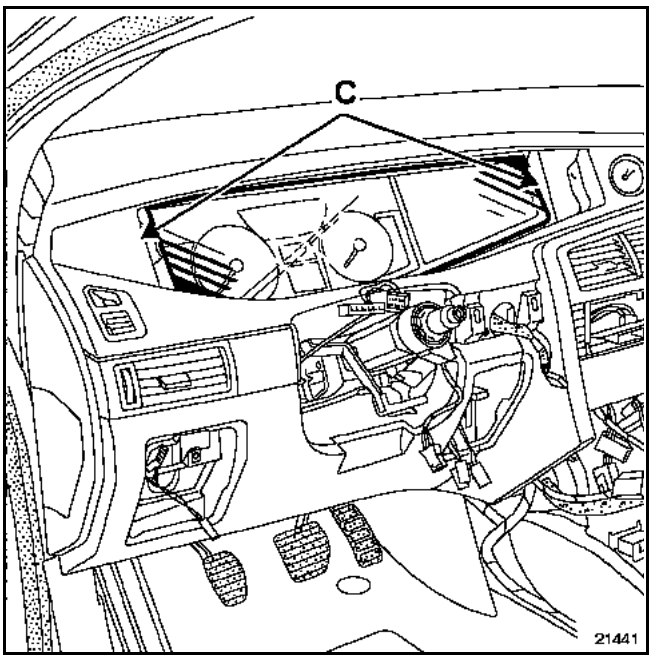
GETtheMANUALS.org



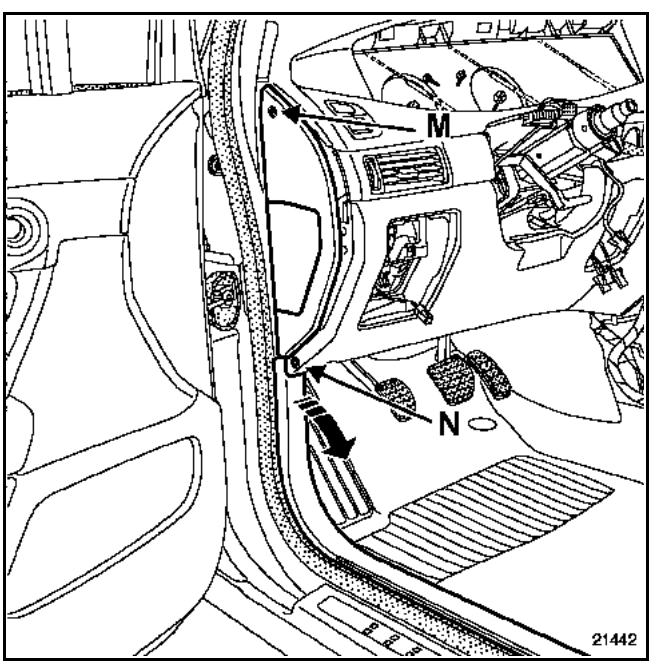
Unclip:
– the instrument panel upper trim,



– the instrument panel lower trim strip.

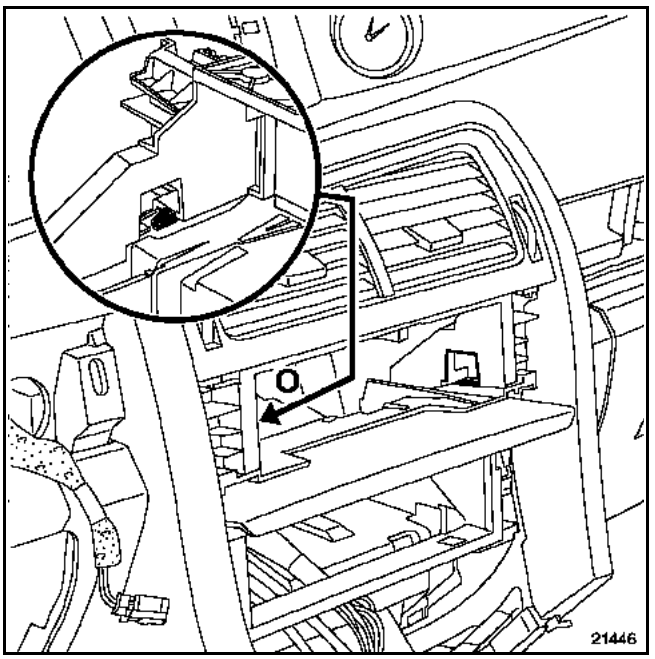


Remove:
– the bolts (C), then release the instrument panel,
– the bolt located behind the instrument panel.

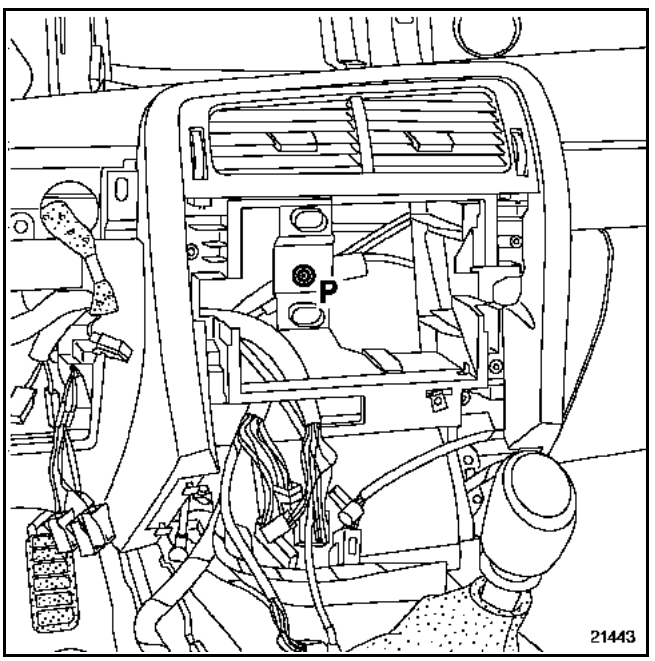


– the sides of the dashboard, to gain access to bolts (M),
– the front door pillar trims (partially) and unscrew bolt (N).

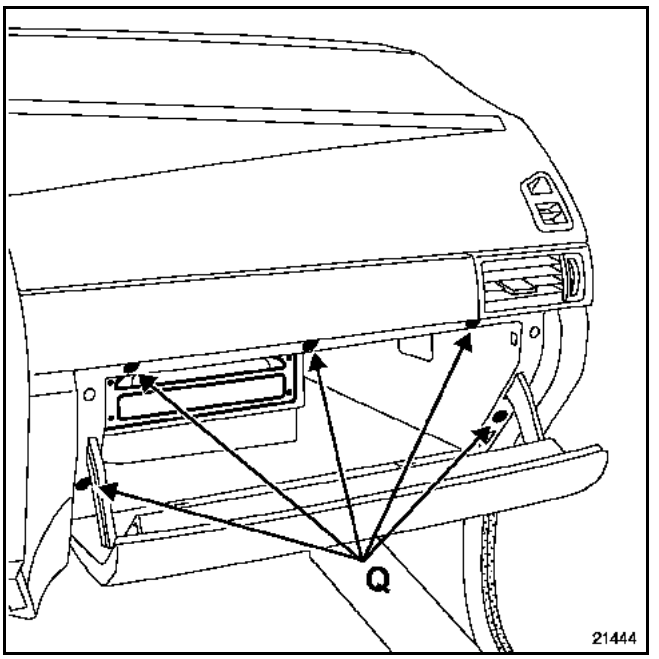
GETtheMANUALS.org



Unclip the two clips (O), then remove the cover from the central communications unit or storage unit.

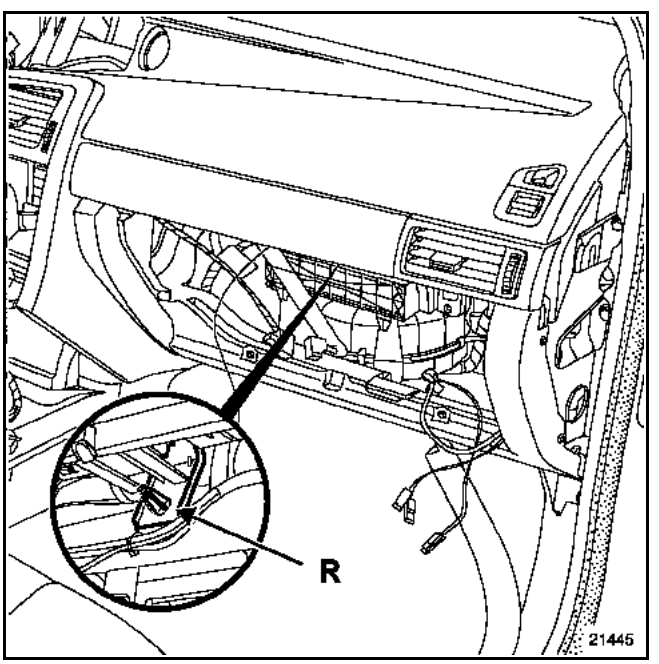


Remove:
– the bolt (P),



– the CD-ROM drive with tool **Ms. 1373** (according to version),
– the bolts (Q), then remove the glovebox.

IMPORTANT:
the GPS aerial lead is very fragile, do not bend or pinch it.



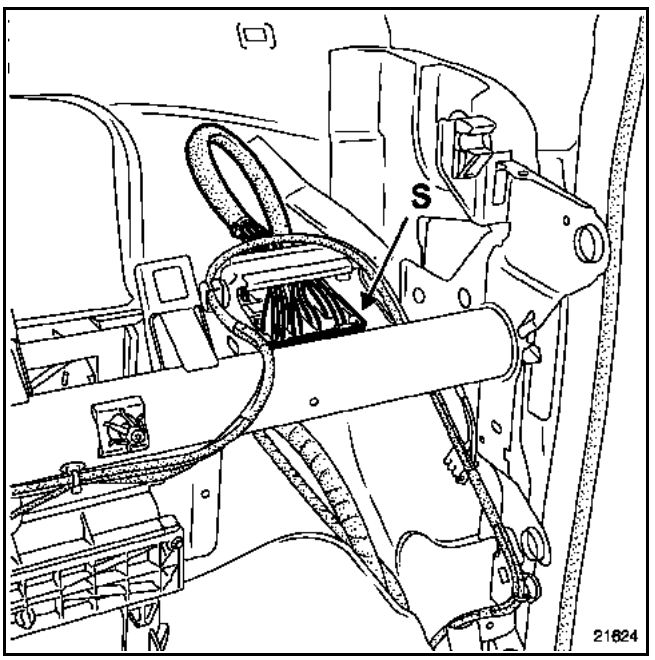
Fit a ring spanner (R) to lock the air bag mounting clip on the beam.

GETtheMANUALS.org

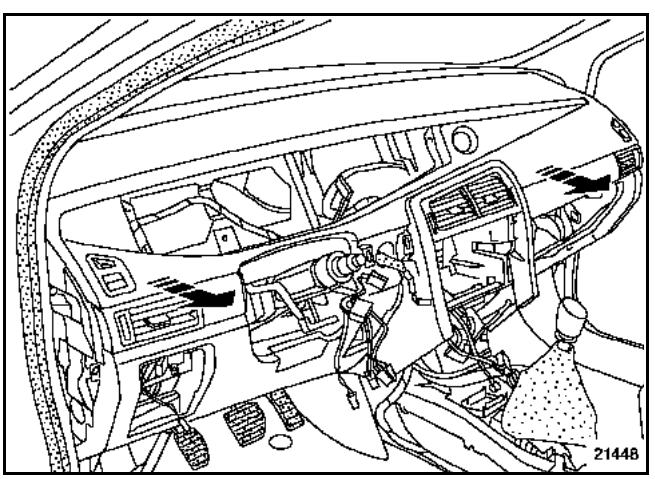
Disconnect:
– the passenger air bag connector attached to the dashboard beam next to the Fuse Box - Option Relay (S),

IMPORTANT:
Do not disconnect the connector located on the passenger air bag module.

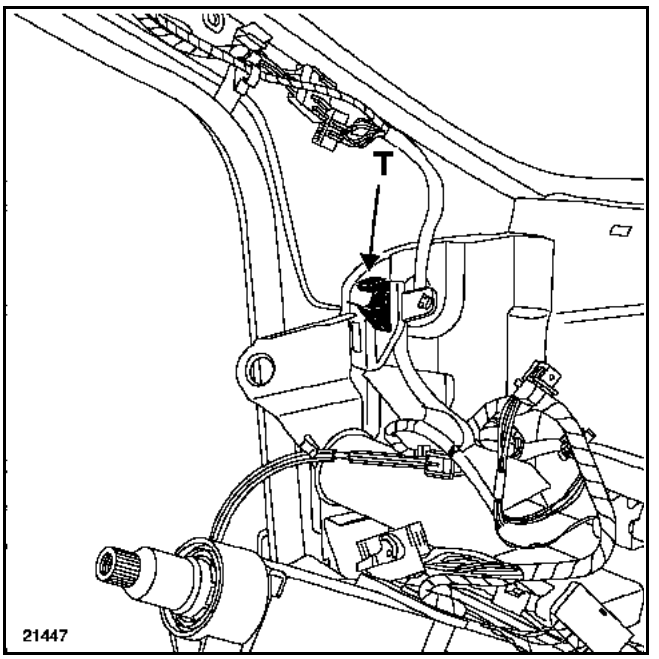
– the two tweeters,



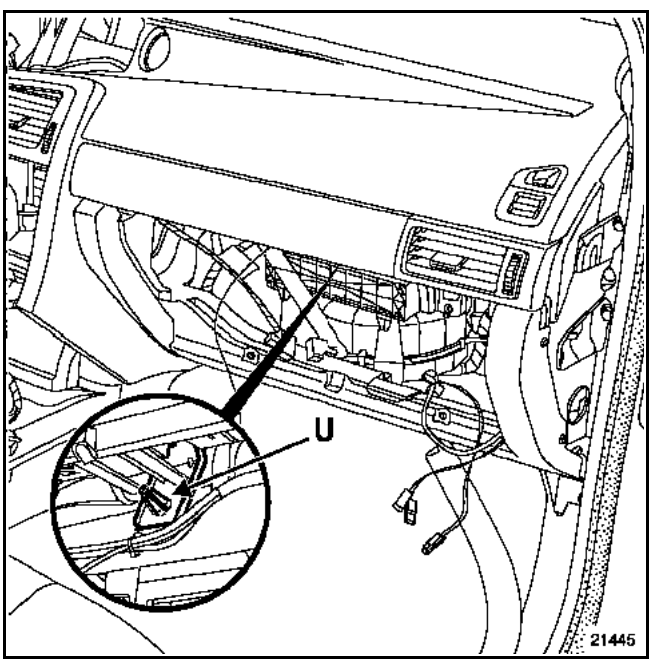
– the dashboard union connector, then remove it (requires two people).



REFITTING



Before refitting the dashboard, check that the clips are in good condition (T).



IMPORTANT:
It will be necessary to replace indexing guide (U), whenever it is removed and tighten it to a torque **2 Nm** using tool **Mot. 1608**.

Offer the dashboard up (requires two people).

GETtheMANUALS.org

Make sure that the dashboard is securely attached to the indicator guide.

IMPORTANT:
Before attaching the dashboard, place the harness in the correct position and remember to connect the passenger air bag connector.

SPECIAL FEATURE OF THE ROTARY SWITCH

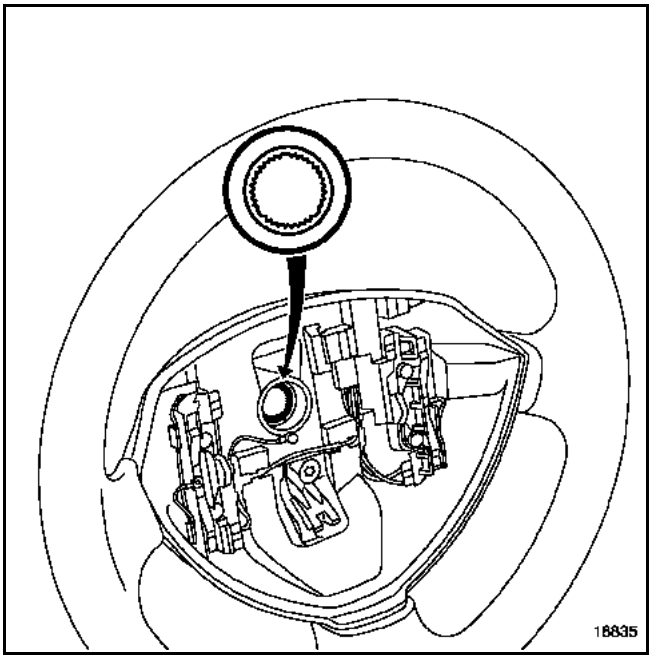
Before refitting the rotary switch, ensure that the wheels are straight.

SPECIAL FEATURE OF THE STEERING WHEEL

IMPORTANT:
The steering wheel splines have foolproofing devices so that the wheel can be fitted in one position only.

The steering wheel should be inserted freely into the splines.

Be careful not to damage them.



IMPORTANT:
The steering wheel bolt must be replaced and tightened to a torque of 44 Nm each time the steering wheel is removed.

GETtheMANUALS.org

SPECIAL NOTES ON THE AIR BAG

IMPORTANT:
Before unlocking the air bag computer, test it using the fault finding tool.
If everything is correct, unlock the computer. If not, refer to the fault finding section.

IMPORTANT:
If these instructions are not followed the system may not operate normally and could even be triggered incorrectly.

When replacing a dashboard fitted with a passenger air bag, it is essential to replace the sticker (on the side of the dashboard), see section 88C

NOTE:
After reconnecting the battery, it may be necessary to perform some basic programming which does not require a fault finding tool:
– setting the time on the clock,
– entering the four figure radio code,
– initializing the one touch window lift motors,
– initializing the sunroof.

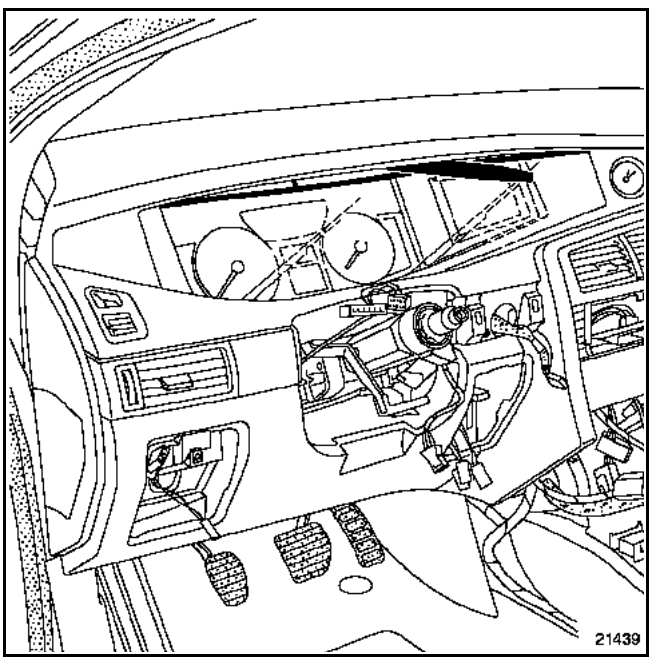
GETtheMANUALS.org

NOTE:
Only the glass may be replaced on these instrument panels. If other components fail, the whole instrument panel must be replaced.

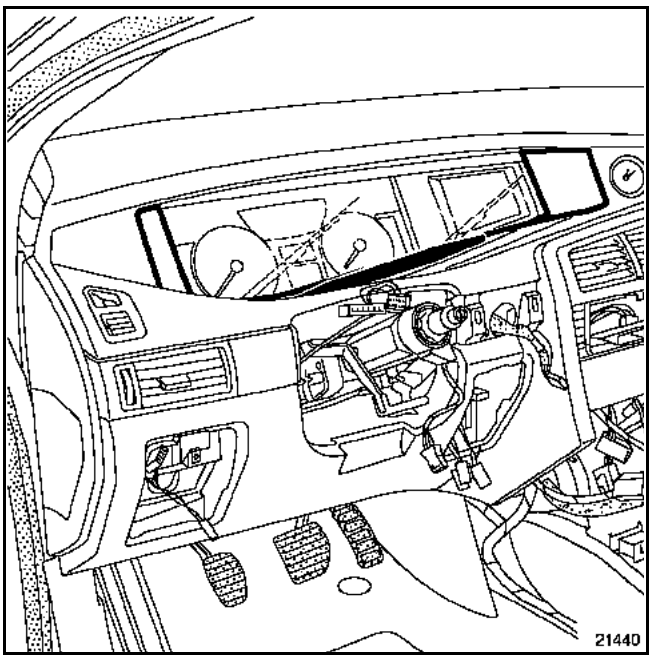
REMOVAL

Disconnect the battery.

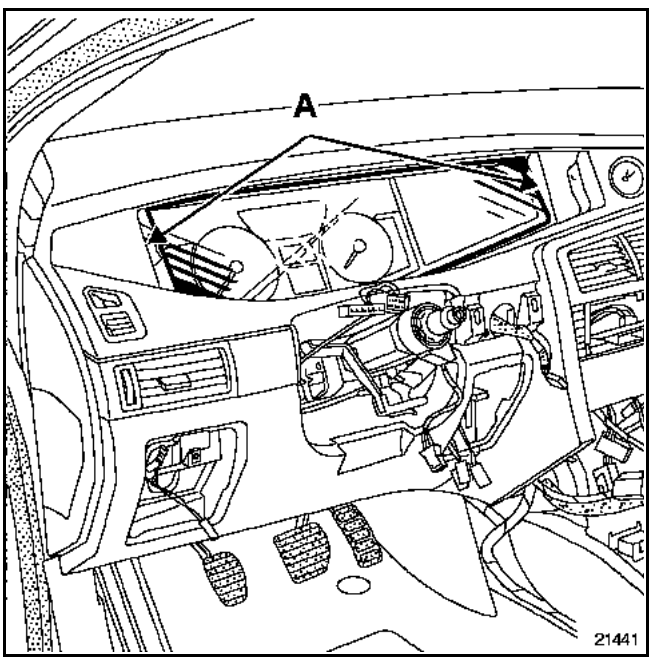
Using a stiff spatula, remove:
– the upper instrument panel trim clipped onto the dashboard,



– the lower instrument panel trim strip clipped onto the dashboard.



Remove the bolts (A), then release the instrument panel,



REFITTING

IMPORTANT:
When replacing the instrument panel, make the necessary configurations.

If the vehicle is fitted with a voice synthesiser, refer to section **83B**.

GETtheMANUALS.org

GENERAL INFORMATION

The instrument panel contains the following functions:

- needle gauge functions:
  - vehicle speed
  - rev counter
  - Coolant temperature,
  - fuel level

- audible function:
  - indicators
  - lights on reminder when the door is opened (except vehicles fitted with a voice synthesiser),
  - Renault Card in reader reminder,
  - seat belt reminder on the driver's side,
  - automatic locking when driving confirmation,
  - child safety fault warning,
  - overspeed (Arabia, depending on version)
  - automatic headlight switch-on warning
  - cruise control/speed limiter or adaptive cruise control warning (depending on the version),
  - automatic parking brake on or off.

NOTE:
The **warning reminder for the seat belt on the driver's side** function warns that the seat belt on the driver's side has not been buckled once the vehicle exceeds approx. **6 mph (10 km/h)**:
- by a **signal** (the buzzer is in the instrument panel) which lasts about **90 seconds**,
- by **flashing of the seat belt reminder warning light**, (returns to being lit continuously once buzzer goes off).

- warning and indicator light function

- display function:
  - oil level reading
  - odometer
  - "**Trip Computer**" on-board computer.

- symbol functions:
  - insertion of the RENAULT Card,
  - press on the start/stop button,
  - **SERVICE** or **STOP** symbols,
  - operating indicators
  - tyre inflation pressure (refer to Section **35B**)
  - gearbox engaged (depending on version)
  - cruise control/speed limiter or adaptive cruise control symbols (depending on the version),

- cruise control or speed limiter speed (refer to the **cruise control/speed limiter** section).

- voice synthesiser (depending on the version) (for more about the electronics casing, refer to the "**voice synthesiser**" section).

NOTE:
A page of the Trip Computer function can override the symbol warnings (depending on the version).

When the distance is less than **1500 km** or **1000 miles** or when **22 months** have elapsed (depending on the engine type and country), the key flashes for **30 seconds** on switching on the ignition or when the "**oil service interval**" page is displayed on the Trip Computer.

The key flashes continuously if the range reaches **0** or after **24 months** (depending on the engine type and country).

To reset the oil service interval:
- switch on the ignition,
- select the **oil service interval** page,
- press the "**RESET**" button for **5 seconds**,
- the range flashes for **4 seconds** then remains permanently lit,
- release the **RESET** button when the relevant value appears.

NOTE:
The oil service interval is stored in the injection computer. It is impossible to alter it.

GETtheMANUALS.org

FUNCTIONS SHOWN BY SYMBOLS

The large display is used to view certain functions. These functions are represented by symbols:

- **Insertion of the RENAULT Card**
- **Monitored functions test phase**
  - coolant temperature state
  - fuel level low warning
  - injection fault
  - automatic transmission fault
  - low screen wash level
- **monitored functions ok**
- **press on start/stop button**
- **Stop** warning light
- **Service** warning light
- red **Battery charge** warning light flashes alternately with the **Stop** warning light
- red **Oil pressure** warning light flashes alternately with the **Stop** warning light
- red **Coolant temperature** warning light flashes alternately with the **Stop** warning light
- amber **preheating** warning light
- amber **Fuel level low** warning light
- amber **injection fault** warning light
- amber **Automatic transmission fault** warning light
- amber **low screen wash level** warning light
- display of the automatic transmission lever position
- tyre inflation pressures (refer to Section **35B**)
- notes for **Cruise control or Speed limiter** (refer to Section **83D**)
- notes for **Adaptive Cruise Control / Speed Limiter** (refer to Section **83D**)

NOTE:
Depending on the version, this display may be deactivated by the scroll button on the Trip Computer menu (unless it displays certain fault symbols).

CONFIGURATIONS

Correct configurations must be set depending on the vehicle's equipment level:

- vehicle type:
  - Laguna (CF 072)
  - Vel Satis (CF 071)

- voice synthesiser language:
  - French (CF 066)
  - English (CF 073)
  - Italian (CF 075)
  - German (CF 074)
  - Spanish (CF 076)
  - Dutch (CF 077)
  - Portuguese (CF 078)
  - Turkish (CF 079)

- gearbox type:
  - manual gearbox (CF 132)
  - automatic transmission (except for the P9X engine)
  - automatic transmission (P9X/V4Y engine)

- tyre inflation pressure units:
  - pressure in bar (CF 069)
  - pressure in psi (CF 070)

- cruise control type:
  - without proximity control (CF 068)
  - with proximity control (CF 067) (see Section **83D**).

NOTE:
For the voice synthesiser to work correctly, the electronics casing located under the dashboard must be correctly connected every time the battery is disconnected.

IMPORTANT:
For the new configurations are taken into account, the battery must be reconnected.

GETtheMANUALS.org

OPERATION OF THE DISPLAY

❶ Oil level warning

This function is displayed for approximately **30 seconds** when the ignition is switched on or after the engine is started.

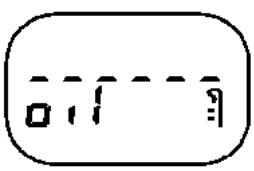
If the level is between the permitted maximum and minimum, the display shows "**oil ok**".

13141a

If, during this time the **Trip Computer** or **RESET** buttons are pressed, the display shows **oil ok** and then the oil level is shown by squares. These disappear as the oil level drops and are replaced by dashes.

13141b

If the oil level is at a minimum when the ignition is switched on, the dashes and the word **oil** flash for 30 seconds. The **service** warning light comes on and remains lit after the engine is started.



13141c

NOTE:
- under normal operating conditions, the oil level is only measured if the ignition has been switched off for more than one minute; otherwise the old oil level value is redisplayed.
- however, when a fault in the gauge is detected, the display switches directly to the mileometer function when the ignition is switched on.
- It is normal to find that the oil level is not always the same: Various parameters may be involved:
  – parking on a slope,
  – too short a wait after running the engine for a short time (especially when the oil is cold), etc.

❷ Mileometer

Mileometer

The odometer will be displayed for approximately **30 seconds** when the ignition is switched on (after the oil level signal). Pressing the **Trip Computer** or **RESET** button reduces this display time.

Trip meter

The trip meter is displayed instead in the place of the mileometer if the **Trip Computer** button is pressed briefly.

It is reset by pressing the **RESET** button. Resetting the trip meter is different from resetting the Trip Computer.

NOTE:
It is not possible to select the display in kilometres or miles. The instrument panel must be replaced.

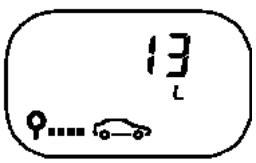
GETtheMANUALS.org

❸ On-board computer ("Trip Computer")

The various sequences of the on-board computer may be displayed instead of the mileage recorders by successively pressing the button on the end of the wiper stalk ("**Trip Computer**" key).
It is reset (reset button) by pressing the **ZEROING** key.

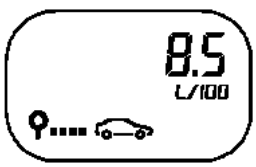
The signals from the on-board computer is displayed after the trip meter as follows:

– **Fuel consumed** (in litres or gallons*) since the last time the reset button was pressed.



13141d

– **Average consumption** (in **l per 100 km** or mpg *) since the last reset.



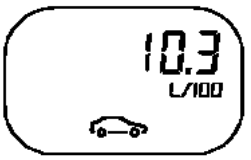
13141st

This is only displayed after the vehicle has travelled approximately **400 m**. Below this, fixed dashes appear on the display.

This takes into consideration the distance travelled and the fuel consumption since the last reset.

* UK version.

– **Instantaneous consumption** (in **l per 100 km**)



13141f

This is only displayed when the vehicle speed exceeds **18 mph (30 kph)**. Below this, fixed dashes appear on the display.

If the accelerator pedal is in the no load position and the speed exceeds **20 mph (30 km/h)**, the instantaneous consumption is 0.

NOTE:
This function is not available on the UK version.

– **Estimated range with remaining fuel** (in km or miles*).

13141g:

This is displayed after the vehicle has travelled approximately **400 m**. Below this, fixed dashes appear on the display.

This is the potential distance remaining calculated by taking into account the distance travelled, the amount of remaining fuel in the tank and the fuel consumed.

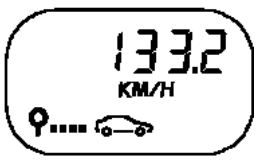
NOTE:
The range remaining is not displayed when the fuel level warning light is lit.

GETtheMANUALS.org

– **Distance travelled** since the last reset (resetting the "**Trip Computer**").

13141h

– **Average speed** since the last reset.



13141j

This is displayed after the vehicle has travelled approximately **400 m**. Below this, fixed dashes appear on the display.

This is obtained by dividing the distance travelled by the time elapsed since the last reset.

The on-board computer internal time base.

– **Oil service interval** informs the driver of the distance (in km or in miles*) which can be travelled before the next oil change.

When the distance is less than **1,500 km** or **1000 miles** or when **22 months** have elapsed, the key flashes for **30 seconds** when the ignition is switched on or when the **oil service interval** page is displayed on the Trip Computer. The key flashes continuously if the range reaches **0** or after **24 months** (depending on the engine type and country).

To reset the oil service interval:
– switch on the ignition,
– select the "**oil service interval**" page on the Trip Computer,
– press the **RESET** button for approximately **5 seconds**,
– the range flashes for **4 seconds** then remains permanently lit,
– release the **RESET** button when the relevant value appears.

GETtheMANUALS.org

FAULT FINDING PROCEDURE

To access the fault finding procedure, press and hold the "**Trip Computer**" button on the end of the wiper stalk, with the ignition on but the engine off.

– The needles move in ranges of **1000 rpm**, **25 mph (40 km/h)**, **25°** and each quarter of the tank.

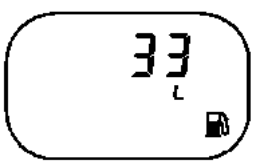
– The **liquid crystal display** test appears.

13141l

All the segments on the display should be lit up.

To go to the next test, press the "**Trip Computer**" button.

– The **amount of fuel** remaining in the tank test appears.



13141m

The value displayed should correspond to the amount of fuel remaining in the tank in litres (even for the UK version).

To go to the next test, press the "**Trip Computer**" button.

– The **fuel flow** in litres / hour test appears (engine running).

13141N

A value should be displayed when the engine is running.

To go to the next test, press the "**Trip Computer**" button.

– **Viewing stored faults.**

13141o

If the letter **t** is displayed, this means that an **injection** signal fault has been stored for at least **4 seconds**.

If the letter **J** is displayed, this means that a fault has been detected on the fuel sender (disconnected for more than **100 seconds**). The resistance should be between **5 and 350 Ω**.

If the letter **d** is displayed, this means that an injection signal fault has been detected.

If the letter **h** is displayed, this means that an oil level sensor fault has been detected. The resistance should be between **6 and 20 Ω**.

If only fixed dashes are displayed, this means that no faults have been detected.

Press the **RESET** button to exit the fault finding procedure and erase any stored faults.

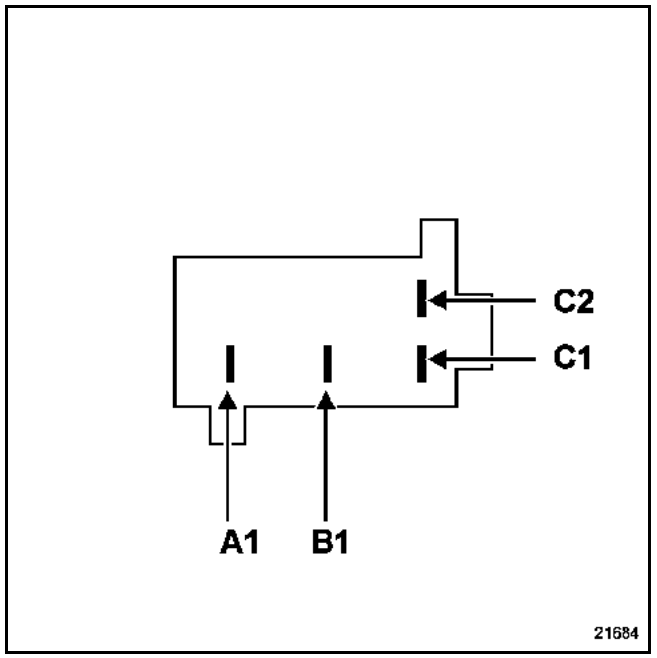
IMPORTANT:

– The on-board computer shows a fault by displaying flashing dashes.
– If no signal is received from the injection computer via the multiplex network, the fuel gauge, instantaneous consumption and fuel range functions do not work.
– If no signal is received from the ABS computer via the multiplex network, the mileometer and oil service interval functions will not work.
– Each time the "Trip Computer" button is pressed a display symbol appears (START (white), BATTERY CHARGE FAULT (red) and FUEL LEVEL LOW (amber)).

To exit the fault finding procedure, press the **RESET** button.

GETtheMANUALS.org

The rear seat base must be removed to remove the gauge (petrol or diesel). See Section **19C** for the procedure.



Track	Description
A1	Fuel level signal
A2	Not used
B1	- Fuel sender
B2	Not used
C1	+ Fuel pump
C2	- Fuel pump

Checking

Ensure that the resistance varies when the float is moved.

Level	Resistance (± 10 Ω)	Useful volume (± 5 l)
Full tank	20 Ω	80
$^3/_4$ tank	87.5 Ω	62
$^1/_2$ tank	155 Ω	44
$^1/_4$ tank	222.5 Ω	26
Tank empty	290 Ω	7

NOTE:
All the above values are given merely as an indication.

For a more precise measurement, the instrument panel uses a different resistance/position ratio for the needle:

Instrument panel input resistance in Ω	Needle position
20	Full tank
57.5	7/8
95	3/4
132.5	5/8
170	1/2
207.5	3/8
245	1/4
282.5	Enter reserve

GETtheMANUALS.org

OPERATION

The sensor consists of a wire with a high coefficient of resistance. The live wire does not display the same thermal conductivity when it is immersed in a liquid or the air.

After a fixed time a voltage difference is obtained at the sensor terminals depending on the depth of immersion of the wire. This voltage difference is processed by the instrument panel computer which manages the level display function and the "low oil level" warning on the central display.

When the ignition is switched on, the central display shows the message "**oil ok**" for approximately **30 seconds** before switching to the mileometer function.

NOTE:
If a short circuit or an open circuit is detected when the oil level is measured, the display will immediately show the mileometer function.

If the battery voltage is less than **8 V**, the level will not be displayed.

CHECKING

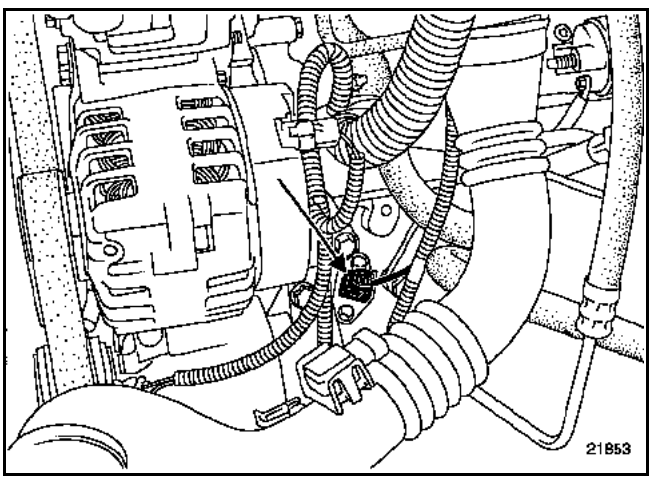
The sensor resistance must be between **6** and **20 Ω**.

The sensor is deemed to be in short circuit for a value lower than **3 Ω**.

The sensor is deemed to be in open circuit for a value higher than approximately **20 Ω**.

LOCATION

Example: G9T engine.



GETtheMANUALS.org

GENERAL INFORMATION

Depending on vehicle equipment, three types of display can be fitted:

- a display specific to the **entry level** radio with the following functions:
  - opening elements closure warning light,
  - radio display,
  - seat belt reminder warning light.
- a display specific to the **top of the range** radio.
- a Carminat navigation screen with the following functions (see Section **83C**):
  - navigation,
  - opening elements closure warning light,
  - radio display,
  - seat belt reminder warning light.

NOTE:
The **top of the range** radio display uses a special multiplex link. See **Section 86A**.

The instrument panel must be removed to remove the display. Refer to the "**Instrument panel**" section.

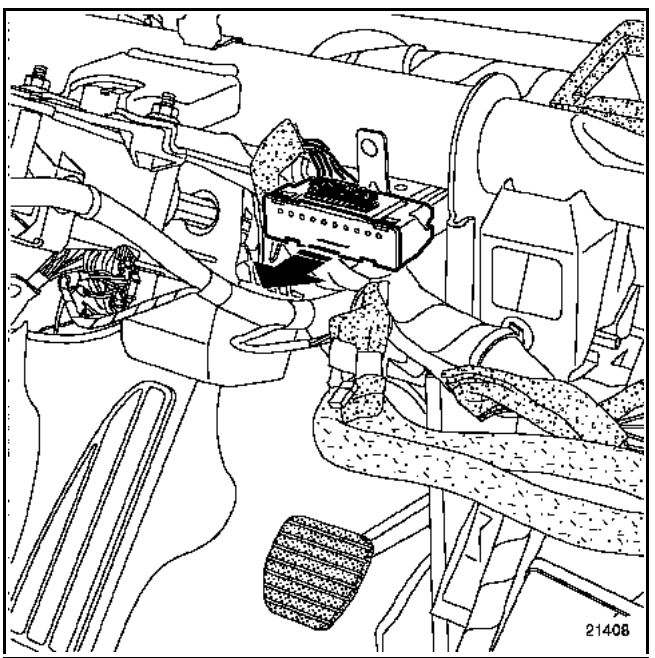
GETtheMANUALS.org

GENERAL INFORMATION

The voice synthesiser function is provided by three components:
– the instrument panel which processes the message conditions and selects the language,
– the voice synthesiser unit which process the signal from the instrument panel and issues the message,
– the voice synthesiser speaker.

The instrument panel and the voice synthesiser unit are connected via the vehicle's multiplex network.

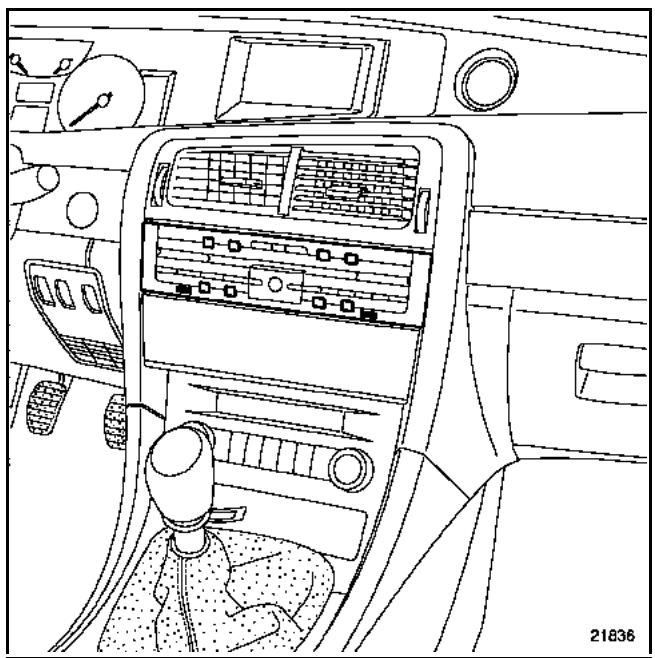


The radio **mute** function is implemented via a wire from the voice synthesiser unit. A signal from the voice synthesiser can be interrupted by a message from the navigation system, telephone, etc. which has priority.

If the vehicle has the navigation function, messages pass through the central communications unit. If the central communications unit is disconnected, no messages are sent. See Section **83C**.

The message volume is increased in stages, depending on engine speed of rotation.

NOTE:
When the discreet key is pressed, messages are replaced by an audible signal.



Configuration

One of the eight available languages must be selected:
- French (CF 066)
- English (CF 073)
- Italian (CF 075)
- German (CF 074)
- Spanish (CF 076)
- Dutch (CF 077)
- Portuguese (CF 078)
- Turkish (CF 079)

NOTE:
If the voice synthesiser unit is not connected to the battery connection, the instrument panel does not recognise the function and is configured without voice synthesiser.

- Fault detected in "discretion" mode (gong)

GETtheMANUALS.org

The "**Carminat**" navigation assistance system comprises a screen and a voice synthesiser to provide guidance for the driver.

This system can:

- find a specific location, such as:
  - a road, street or avenue
  - a hotel,
  - public services,
  - a garage or petrol station,
  - etc.

- select guidance modes in order to:
  - optimise journey time,
  - select the shortest distance
  - plan a route travelling on main roads
  - or take the scenic route,
  - avoid tolls.

Each mode is symbolised by a different icon that appears on the state line on the lower part of the screen.

- store addresses in the address book.

- display road maps of:
  - the present location,
  - or the destination,

- display the journey time

- receive written or spoken messages from the "**traffic information**" system.

N.B.: for information on operating the system and descriptions of the various menus, refer to the driver's handbook.

The **Carminat** system uses the **Vehicle speed** signal provided by the ABS computer to calculate the distance travelled along with the **Reversing** signal.

A multiplex network used exclusively by the "**Carminat**" system links the navigation computer to the Central Communications Unit and the display.

This system uses the following to function:

- a Central Communications Unit

- a console (an integral part of the Central Communications Unit),

- an electronic navigation computer comprising acceleration sensors (gyroscope) and a CD-ROM player,

- a satellite link (GPS aerial) that can locate the vehicle,

- a screen to display written data and maps,

- a speaker for giving voice instructions,

- a CD ROM with the cartographic map of the country the vehicle is delivered to,

- an FM aerial for traffic information messages.

NOTE

- If the vehicle has been moved with the ignition switched off, the navigation system may need a few minutes to find its exact location (see section on "**Re-location**")
- If the vehicle battery has been disconnected, the system may need up to **20 minutes** to calculate its exact location. The vehicle must be outdoors, with the navigation system switched on, in order to pick up satellite signals with the GPS aerial.
- The system can also operate without valid GPS data. Under these circumstances, there may be a loss of precision in pinpointing exact locations.
- Once the exact position has been located by the GPS system, the on-screen satellite symbol turns from red to green.
- When travelling on the motorway, the distance data provided by the system to indicate exits will differ from the information on the signs. This is because motorway signs calculate distance from the start of the motorway exit, while the **Carminat** system calculates from the end of the exit.

GETtheMANUALS.org

BASIC PRINCIPLES OF THE TRAFFIC INFORMATION SERVICE

In conjunction with navigation, the system uses information on traffic conditions: **TMC: Traffic Message Channel**.

The system uses:
- the navigation computer which receives, locates and recognises the information received,
- the TMC locators on the cartographic map CD-ROM,
- the information collected and disseminated (by public authorities) in RDS - TMC format (communications protocol).

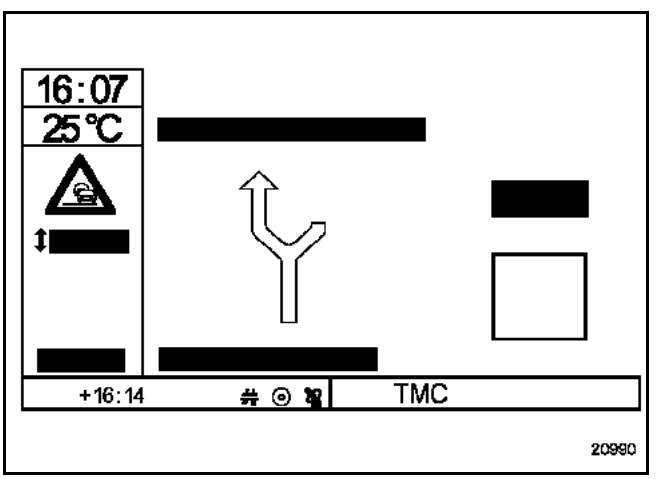
IMPORTANT:
Renault is not responsible for the information collection and dissemination services in Europe, which are still in development.

TRAFFIC INFORMATION TERMINAL PROCESSING REMINDER

- the system should be fitted with the 2001-A or more recent cartographic map CD-ROM,
- TMC pictogram display logic:
  - ⇒ **red** = no traffic information available in this geographical location or poor reception,
  - ⇒ **black** = no traffic information locators on the CD,
  - ⇒ **green** = the system is locked onto a frequency that can supply traffic information.

The term **TMC** is replaced by the name of the service operator that the system has locked onto (if the operator uses a name).

The system can display in either text or pictogram form. It suggests a detour if a fault is located on the proposed itinerary.



GETtheMANUALS.org

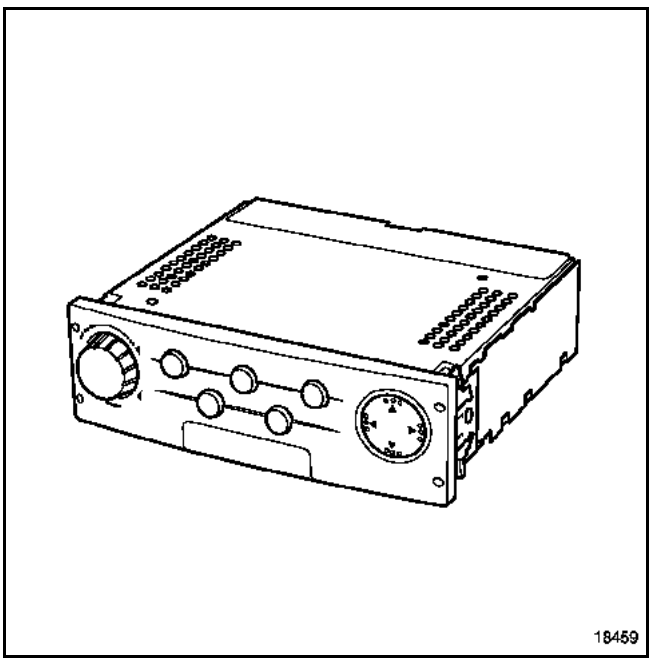
To be operational, the **Carminat** navigation computer must be connected to a central communications unit.



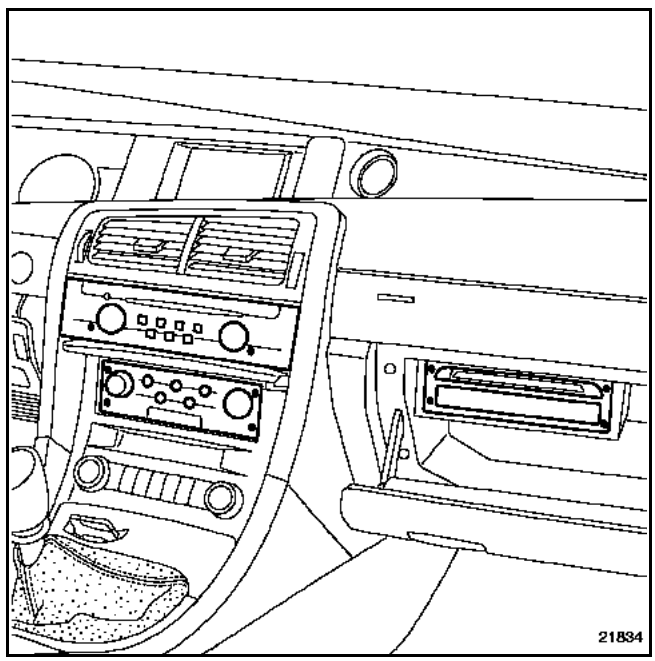
The Central Communications Unit can:
- act as a go-between for the vehicle's multiplex network and the Carminat system network,
- use multiplex data,
- control the steering wheel command for the radio or console,
- control braking conditions, and the vehicle and system configurations,
- control the display on the screen (via the CD-ROM player),
- receive written or spoken messages from the **traffic information** system (via the radio aerial)
- manage voice synthesiser and navigation messages,
- transfer data from the radio for display.

REMOVAL

The Central Communications Unit is located behind the cover, under the radio or CD changer.

IMPORTANT:
Do not disconnect the central communications unit before the system has completely stopped (about 45 seconds).

Removal is carried out using tool **Ms.1373**



REFITTING

Set the system. Refer to the "**Initialisation**" section.

GETtheMANUALS.org

NAVIGATION COMPUTER (CD ROM player)

This system operates by using sensors which detect the vehicle's movements. The vehicle's engine speed sensor (or ABS) sensor calculates the distance travelled while the gyroscope (inert compass) in the computer registers the movements made when the vehicle turns bends and corners.

By making comparisons with the digital map (on the CD-ROM), the system corrects inaccuracies, (tyre pressure and wear, temperature etc.) in order to pinpoint the vehicle's location.

IMPORTANT:
If the battery has been disconnected or the navigation computer replaced, relocation of the vehicle is automatic (refer to the **Relocation** section).

The system will be programmed in French by default after the navigation computer has been replaced.
To change the language, refer to the **Change of language** section.

IMPORTANT:
A new navigation system computer will not be able to recall addresses stored in the old unit.

NOTE:
- With the ignition off, the CD-ROM player lights up automatically when the eject button is pressed and will remain lit for about **1 minute** (if the ignition is not switched back on).
- The player lights up automatically when the ignition is turned on.
- After the ignition is switched off, the player remains on for **approximately 45 seconds, during which time the battery must not be disconnected**.

GETtheMANUALS.org

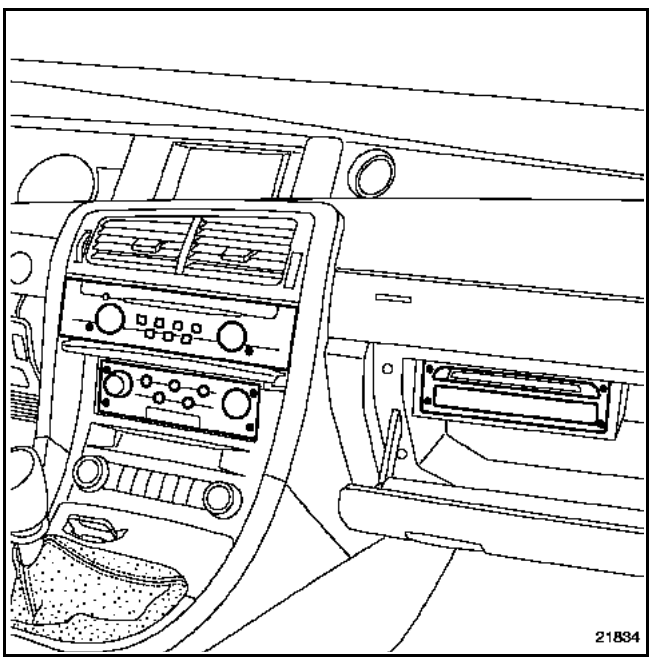
REMOVAL

The computer including the CD-ROM player is located in the glovebox.

IMPORTANT:
Do not disconnect the computer before the system has completely shut down (about **45 seconds**).

Removal is carried out using tool **Ms.1373**



REFITTING

Set the system. Refer to the **Initialisation** section.

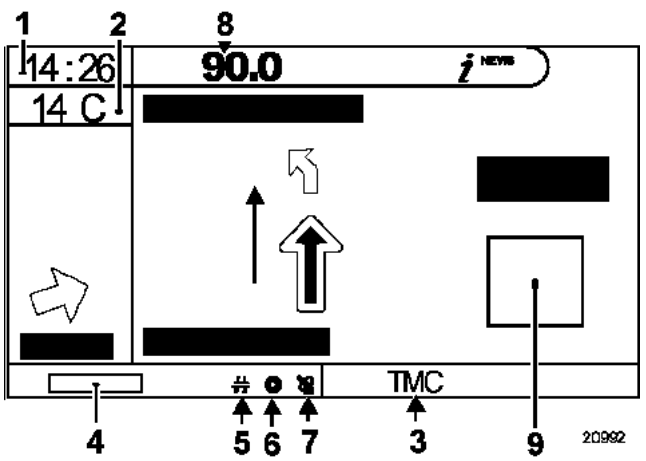
GETtheMANUALS.org

The screen can display:
– the various menus,
– the destination direction
– the distance from the destination
– the journey maps
– the distance remaining until the next change of direction,
– the cartographic maps
– etc.

It lights up for a few seconds after the "Auxiliaries" position or the radio is switched on and displays the security message.

It extinguishes completely after approximately **45 seconds** after the feed is switched off.

NOTE:
The screen colour and brightness can be altered using the **Screen configuration** menu.
– daytime blue or dark blue (side lights off).
– night time blue or dark blue (side lights on).



1 Not used
2 External temperature
3 Traffic Information message pictogram
4 Arrival time

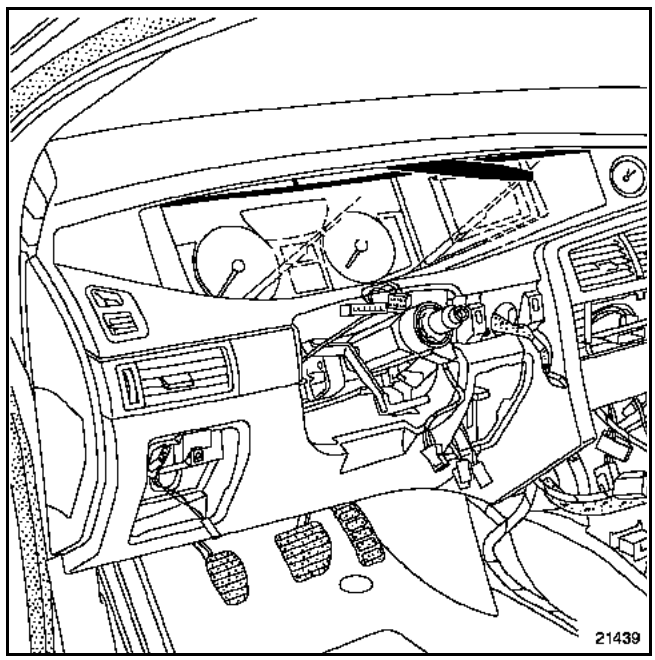
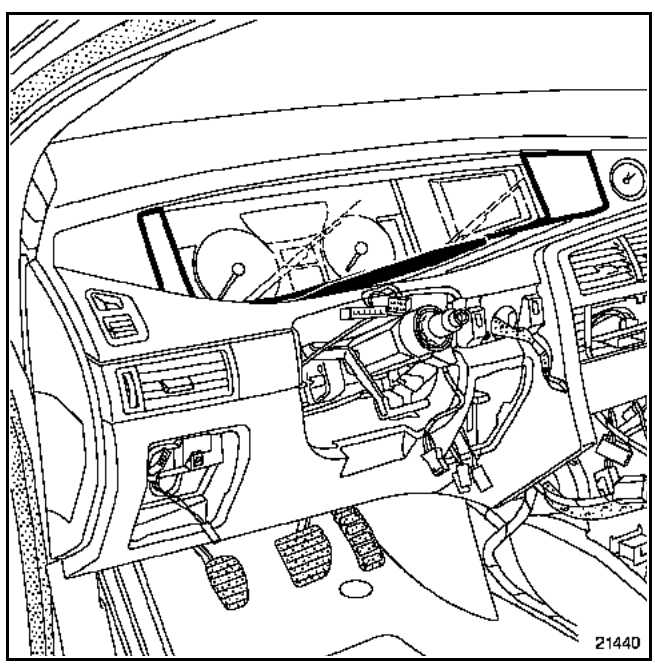
REMOVAL - REFITTING

The instrument panel must be removed to remove the screen.

Remove:
– the upper instrument panel trim clipped onto the dashboard,

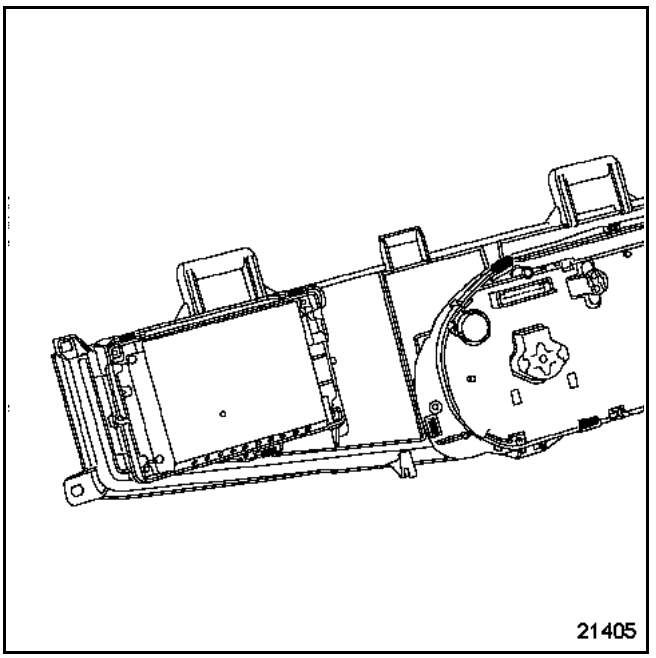


– the lower instrument panel trim clipped onto the dashboard,



GETtheMANUALS.org

– the instrument panel mounting bolts.
– the screen mounting bolts on the instrument panel.



GETtheMANUALS.org

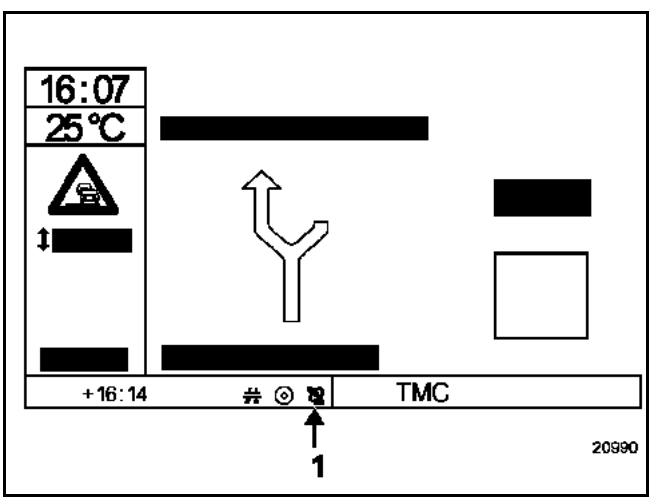
GPS AERIAL

It picks up satellite signals to allow the electronic navigation computer (CD-ROM player) to locate the position of the vehicle.

When the GPS reception (satellite) is good, a **green** pictogram (1) is displayed on screen.

When the satellite reception is poor (caused by going through a tunnel or along a street hemmed in by tall buildings, etc.), a **red** pictogram is displayed on screen.

NOTE:
After the battery has been disconnected or navigation computer replaced, relocation is automatic: park the vehicle in an open area outdoors with the ignition off and wait a few minutes. When the GPS reception (satellite) is good, a **green** pictogram will be displayed on screen.

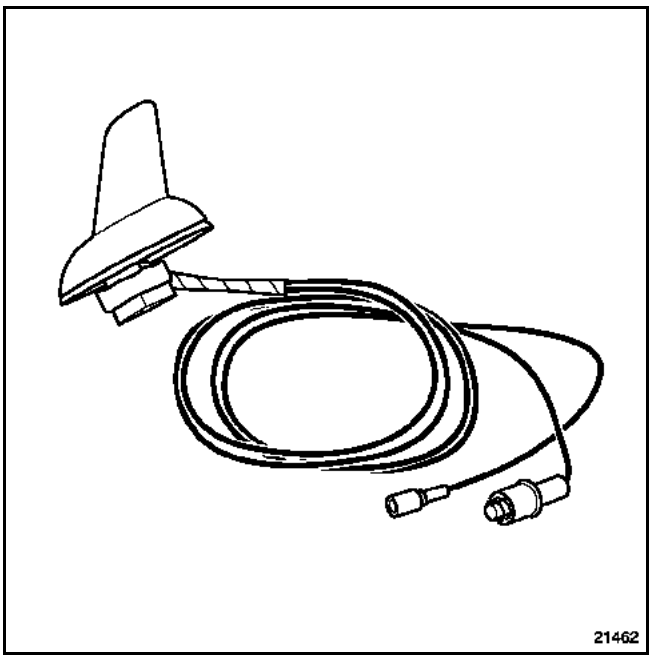


IMPORTANT:
The GPS aerial wire is very fragile, do not bend or pinch it.

NOTE:
The GPS aerial is also used for the hands-free telephone.

DUAL BAND AERIAL

The aerial is fitted on the roof. The headlining and rear right-hand quarter panel must be partially removed to remove the aerial. See the bodywork section.



GETtheMANUALS.org

This procedure must be carried out each time any operation is performed on the system.

IMPORTANT:
If the vehicle is fitted with a radio, it must be switched on during initialisation. If it is not, the steering wheel radio control will not function and the screen will not display radio data.

1 Switch off ignition,
2 Wait until the **system shuts down completely (about 45 seconds)**,
3 Switch the radio on,
4 Switch on the ignition (wait approximately **20 seconds**),
5 Press the **M** and **C** buttons at the same time,
6 Read the vehicle part number

System configurations	
Entry level radio	**Top of the range radio**
0102	0107

7 Carry out the steering wheel control test,
8 The GPS aerial connection displays on the screen (Connected - not connected),
9 Ignore radio aerial and telephone tests,
10 Exit setting using the rotary switch,
11 Switch off ignition (**1 minute**).

NOTE:
If the configuration does not match, test the vehicle wiring (multiplex lines) and part numbers.

GETtheMANUALS.org

The system will be programmed in French by default after the navigation computer has been replaced.

1 With the ignition switched on, press the eject button to remove the electronic navigation computer map CD

2 The screen will display the message **No CD in the player**.

3 Confirm **OK** by pressing the knob.

4 Select the **Configurations** menu then **Language**.

NOTE:
If the desired language does not appear in the menu, do the following:

1 Select **other language**.

2 The system will tell you to insert the language CD.

3 Insert the CD, and then press the rotary knob to confirm.

4 Select the language to be replaced (language 1 or 2) by turning the knob.

5 Use the **load** rotary knob to select the correct language to load from the list of available languages stored on the CD.

6 Wait a few seconds. The screen will turn black and then white and display a message in black and red with a horizontal bar to show the loading time remaining.

7 When loading is complete, the language CD will be ejected from the player and the screen will read **OK**.

8 Continue with voice message changing procedure.

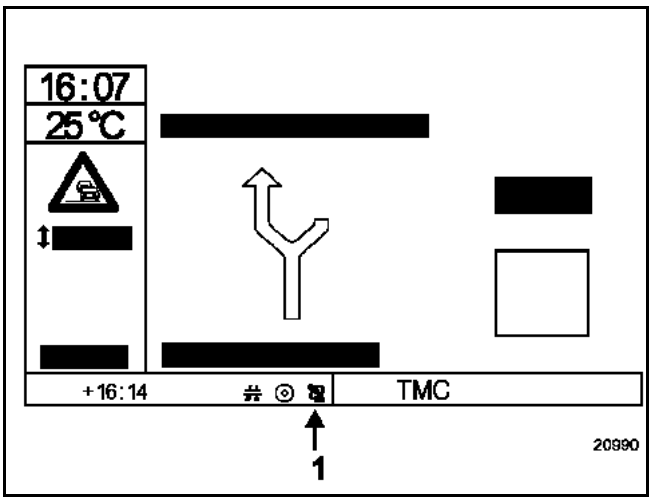
9 Re-insert the map CD into the player.

GETtheMANUALS.org

The vehicle has to be relocated after the electronic navigation computer has been replaced or the battery disconnected.

Drive the vehicle to an open area outdoors and wait for a few minutes with the ignition switched on.

When the GPS reception (satellite) is good, a **green** pictogram (1) is displayed on screen.



If the vehicle is not correctly located on the cartographic map, drive the vehicle to along different main roads on the mapped routes (**0.6 to 1.8 miles (1 to 3 km)** necessary).

NOTE:
The localisation operation may take up to **20 minutes** maximum.

GETtheMANUALS.org

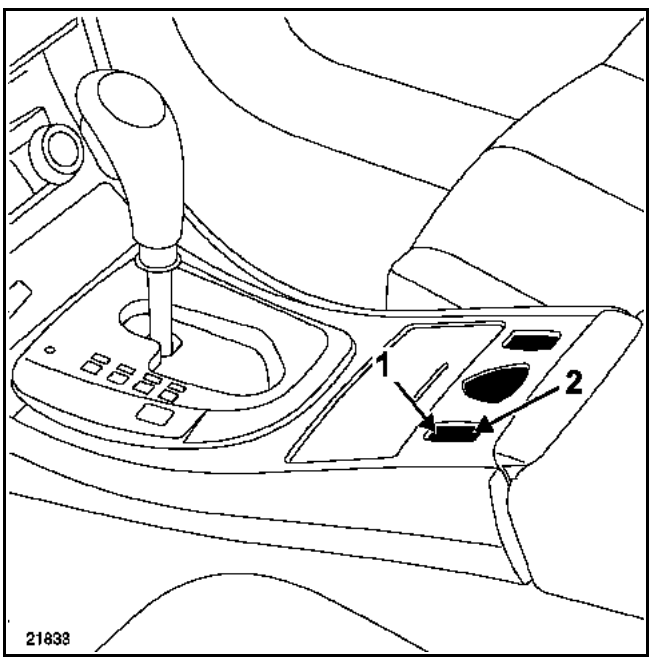
These vehicles are fitted with three types of equipment:

- the **Cruise control** option allows the driver to maintain a speed he has selected. This function can be switched off at any moment by depressing the brake pedal or the clutch pedal, or by using one of the system buttons,
- the **Speed limiter** allows the driver to set a speed limit. The accelerator pedal has no effect above the set speed. The speed limit selected can be exceeded at any time by depressing the accelerator pedal beyond its hard point,
- **Adaptive cruise control** can maintain a speed selected by the driver while also maintaining a consistent following distance behind the vehicle in front. This function can be switched off at any moment by depressing the brake pedal or by using one of the system buttons.



1 Cruise control or adaptive cruise control warning (depending on the version),
2 Speed limiter

The **Cruise control** and **Speed limiter** functions are controlled by the injection computer. The injection computer exchanges information with the ABS computer, the automatic transmission computer and the instrument panel. It applies the set values by acting on the motorised throttle valve.

NOTES:

- a flashing of the cruising speed on the instrument panel informs the driver that the speed cannot be maintained (e.g. when going downhill).
- a vehicle cannot be fitted with the **Cruise control** and **Adaptive cruise control** functions.
- when replacing the injection computer, you must:
  - demonstrate that the **Cruise control and speed limiter** functions are present. To do this, start the functions using the dashboard switch,
  - configure it with or without **adaptive cruise control**.

GETtheMANUALS.org

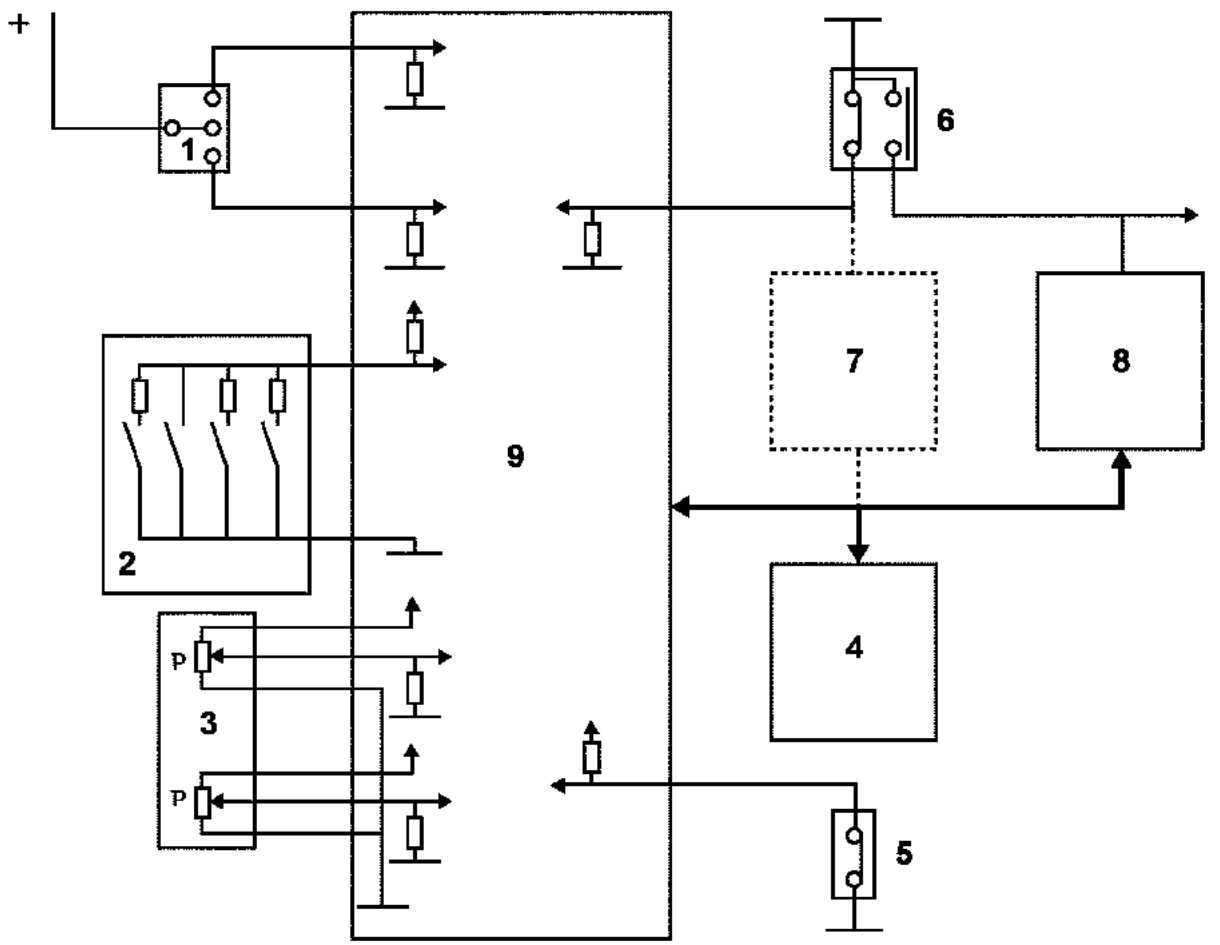
1 Cruise control/speed limiter off switch
2 Steering wheel switch
3 Accelerator pedal
4 Instrument panel
5 Clutch pedal switch (depending on version)
6 Brake pedal switch
7 Automatic transmission computer (depending on version)
8 ABS computer
9 Injection computer



19308

GETtheMANUALS.org

DESCRIPTION

The ABS computer sends:
– the **vehicle speed** signal,
– the **depressed brake pedal** signal.

The Automatic Transmission computer sends the **gear engaged** signal.

The instrument panel:
- displays the reference value (cruise control or speed limiter) (see section **83A instrument panel**),
- lights up a two colour warning light:
  – Cruise control = green
  – Speed limiter = amber

Each time these functions are switched on, the on-board computer display switches to the relevant page.

NOTE:
The cruise control / speed limiter functions do not have a fault warning light.

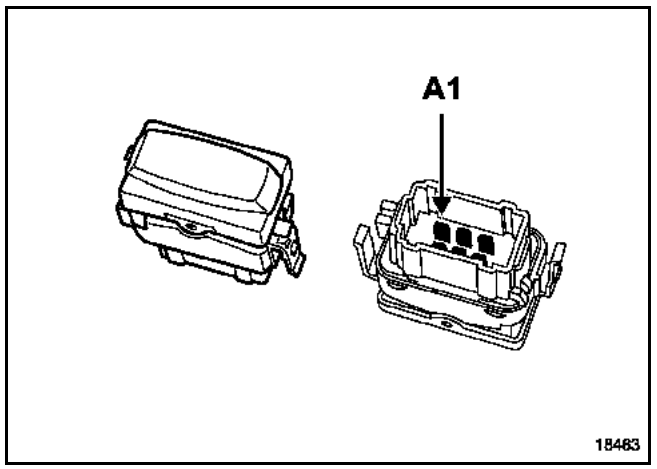
The controls:
- a three position switch (off/cruise control/speed limiter)
- steering wheel switches that can be used to adjust the cruising speed, cancel the cruise control or speed limiter functions, or recall the stored speed,
- accelerator pedal switches that are used to control the injection and the brake lights,
- a clutch switch (according to model) that is used only for the cruise control function.

NOTES:
– the vehicle has two clutch sensors: one for starting the engine (end of travel) and one for the cruise control function (start of travel),
– the accelerator pedal must incorporate a hard point at the end of its travel.

The injection computer:
- receives signals from the accelerator pedal,
- receives a signal from the brake switch ,
- receives a signal from the clutch engagement switch (according to model),
- receives signals from the three-position switch,
- receives signals from the steering wheel switches,
- receives signals from the ABS computers,
- receives signals from the automatic transmission computer.
- sends signals to the instrument panel
- controls the motorised throttle valve or the injection output.

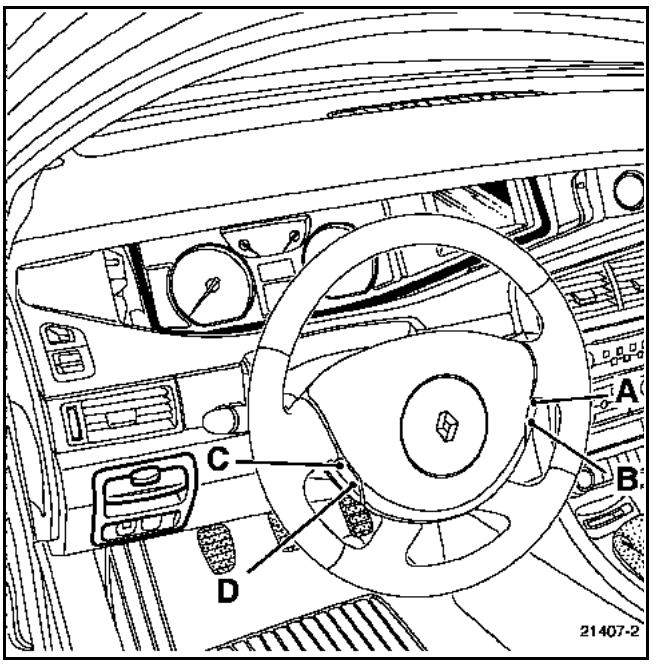
GETtheMANUALS.org

THREE POSITION SWITCHES



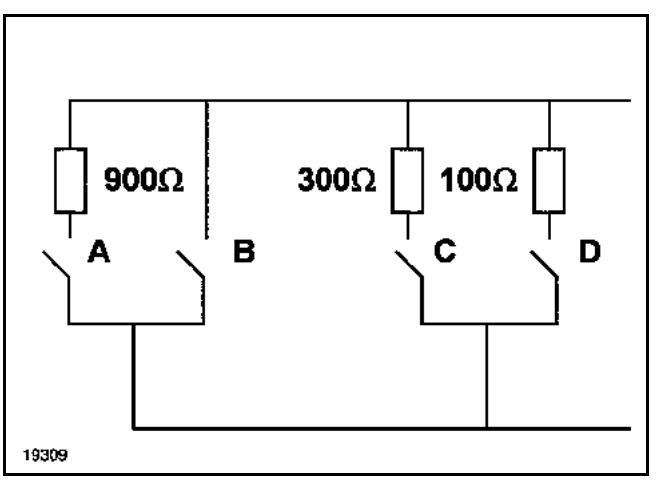
Track	Description
A1	+ Side light
A2	+ After ignition (braking circuit)
A3	Cruise control on/off switch
B1	Speed limiter On/Off switch
B2	Earth
B3	Not used

STEERING WHEEL SWITCHES



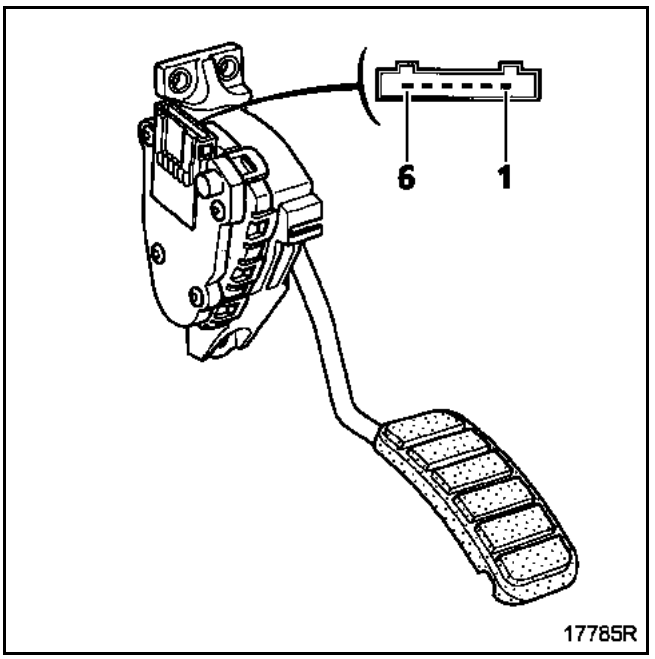
A: Resume button = approximately **900 Ω**
B: O button: approximately **0 Ω**
C: + button = approximately **300 Ω**
D: button "**-**" = approximately **100 Ω**

NOTE:
To remove the rotary switch, refer to Section **84A Signals-control**.



GETtheMANUALS.org

ACCELERATOR PEDAL



Track	Description
1	Potentiometer earth 2
2	Potentiometer earth 1
3	Potentiometer pedal signal 1
4	Potentiometer supply 1
5	Potentiometer supply 2
6	Potentiometer pedal signal 2

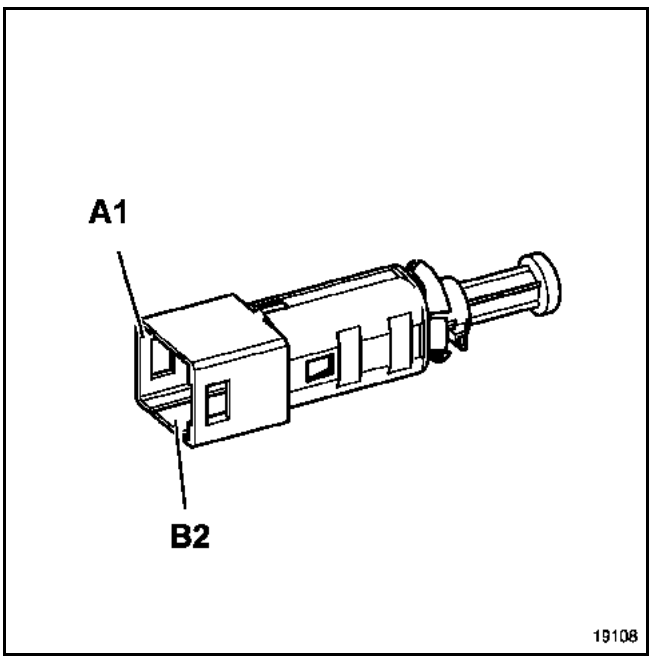
Track 1 resistance = **1200 ± 480 Ω**
Track 2 resistance = **1700 ± 680 Ω**

IMPORTANT:
In order to operate, the vehicle must be fitted with an accelerator pedal incorporating a hard point at the end of travel.

BRAKE LIGHT SWITCH (DOUBLE)

The **cruise control** function uses the open contact (together with the lights), while the ABS computer uses the closed sensor.

The two signals are compared by the injection computer.



Track	Description
A1	Close contact
A2	Open contact
B1	Open contact
B2	Close contact

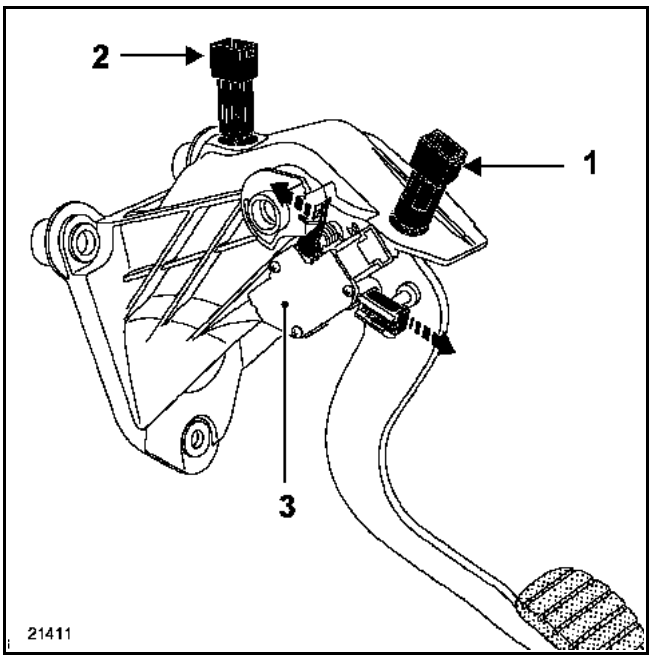
When the switch is fitted, pull on the pushrod to take up the clearance.

GETtheMANUALS.org

CLUTCH SWITCH

The clutch pedal has two switches and a potentiometer:

- start of travel switch (1) that is used only for the **cruise control function** (grey connector),
- end of travel switch (2) for the **Keyless vehicle** function (blue connector),
- a potentiometer (3) for the automatic parking brake.



When the switch is fitted, pull on the pushrod to take up the clearance.

GETtheMANUALS.org

Activation conditions:
– switch in **Cruise control** position (green indicator light),
– speed must be between **18 mph (30 kph)** minimum and **120 mph (200 kph)** maximum (for information purposes),
– press on the **+** or **R** buttons.

Deactivation conditions:
– full step on the accelerator,
– brake or clutch pedal pressed,
– press **O**,
– switch to **Off**,
– electronic stability program system operation,
– injection computer operation (fault or overspeed),
– Gearbox in "**neutral**", "**Parking in neutral (manual)**".

NOTE:
A flashing of the cruising speed on the instrument panel informs the driver that the cruising speed cannot be maintained.

GETtheMANUALS.org

Activation conditions:
– switch in **Speed limiter** position (amber indicator light),
– speed must be between **18 mph (30 kph)** minimum and **120 mph (200 kph)** maximum (for information purposes),
– press **+ -** or **R**.

Deactivation conditions:
– accelerator must be depressed quickly (beyond hard point)
– switch to **Off**,
– press the **O** button,
– injection computer operation (fault or overspeed),
– when the cruising speed warning light is flashing, it informs the driver that the cruising speed cannot be maintained.

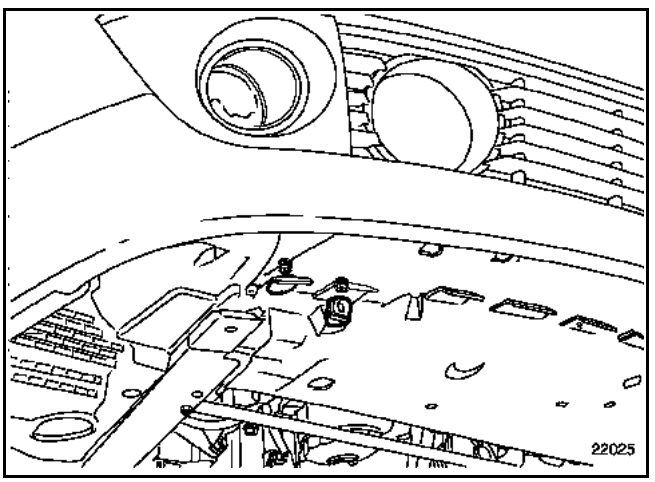
9 Steering wheel angle sensor
10 Lateral acceleration and yaw sensor

GETtheMANUALS.org

SYSTEM DESCRIPTION

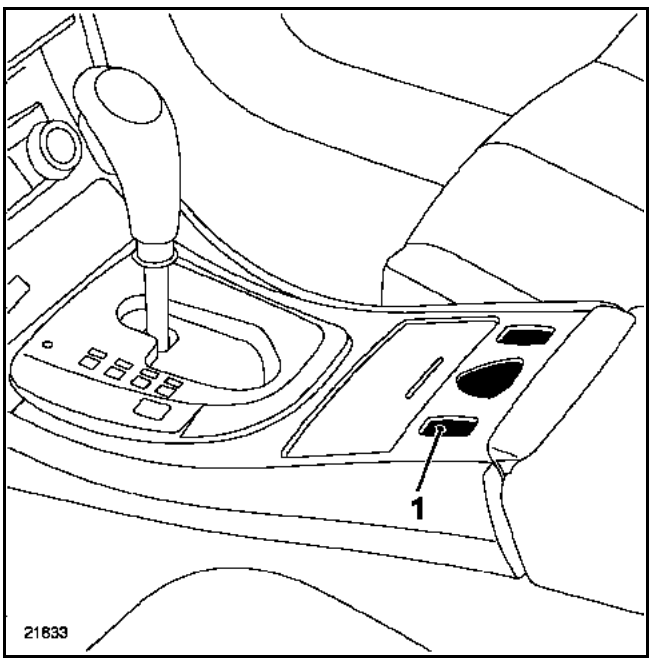
On certain vehicles the **adaptive cruise control** replaces **Cruise control**.

The system uses a range finder (radar) (A) designed to detect moving vehicles on the vehicle trajectory.



NOTE:
The system can only detect vehicles moving at a speed above approximately **9 mph (15 km/h)**.

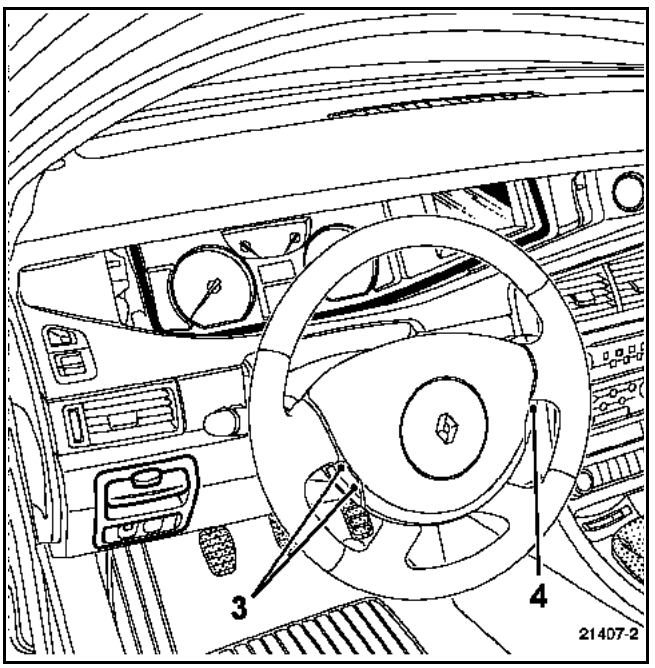
The system is activated by positioning the three position switch to **adaptive cruise control** (1).



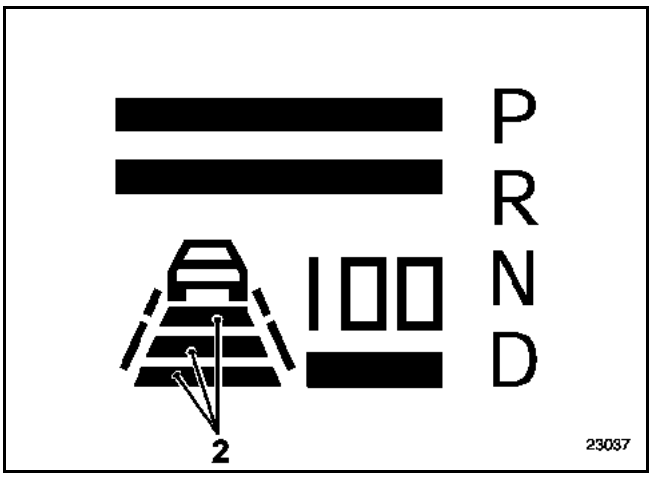
REMINDER:
The **Adaptive cruise control** function replaces the **Cruise control** function.

GETtheMANUALS.org

The cruising speed can be altered using the + and - buttons on the steering wheel (3).

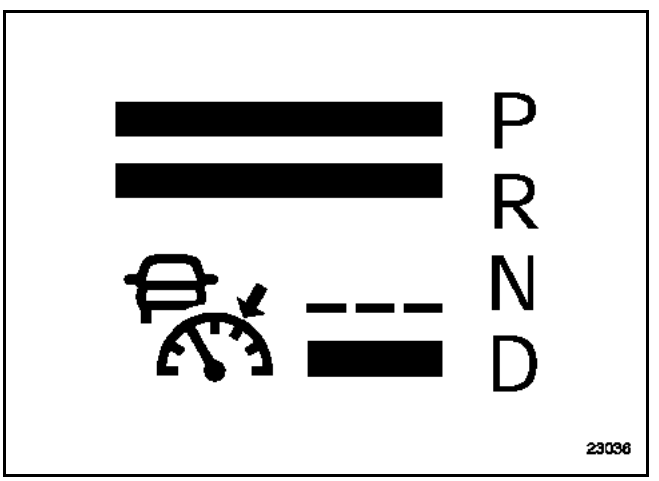


The following distance, denoted by horizontal bars (2) on the instrument panel display, can be altered by pressing button (4):
– one bar on the display for a short following distance
– two bars on the display for an average distance,
– three bars on the display for a long following distance



REMINDER:
The following distance is not fixed and cannot be expressed in metres. It depends how fast the vehicles are moving.

This function can be switched off at any moment by depressing the brake pedal, pressing the 0 button on the steering wheel, or by using the three position switch.



GETtheMANUALS.org

When operating normally, the vehicle adapts itself to the speed of the moving vehicle in front:

- If the vehicle in front accelerates, the vehicle accelerates without the driver's intervention until the cruising speed is displayed and memorised by the system.
- If the vehicle in front slows down or another cuts in, the vehicle slows down with no intervention by the driver until it has stabilized at the set following distance.
- In the event of sharp deceleration, the vehicle may temporarily enter this following distance.
- The vehicle brakes without driver intervention, but in the case of sharp deceleration, the system warns the driver with a bleep and a message on the display that it is essential to resume control of the system.

IMPORTANT: this is not an anticollision system. It only detects moving vehicles (about **9 mph (15 km/h)**) and cannot brake more sharply than **3 m per s^2** (it cannot activate the emergency brake assist).
The monitored distance is not fixed. It varies according to vehicle speed. It is a monitored period of time.

Overtaking assistance programming
When a speed is stored in the system but the vehicle in front is causing the speed to drop, the indicator on the driver's side is activated to request vehicle acceleration. This enables the driver to overtake.

Lights and wiper programming
When the fast wiping speed or side lights are on (either in manual or automatic mode) the following distance is automatically increased by about 25% by the system without altering the display on the instrument panel.

Activation conditions:
– switch on **adaptive cruise control warning**.
– speed must be between **30 mph (50 km/h)** minimum and **110 mph (180 km/h)** maximum (for information purposes),
– green cruise control light must lit,
– press the **-**, **+** or **summarise** button (if a cruising speed is already stored).

Deactivation conditions:
– depress the accelerator pedal (temporary output),
– depress the brake pedal,
– press to **0**,
– switch to **Off**,
– electronic stability program system operation,
– speed less than approximately **18 mph (30 km/h)**,
– voluntary deactivation of the electronic stability program system.

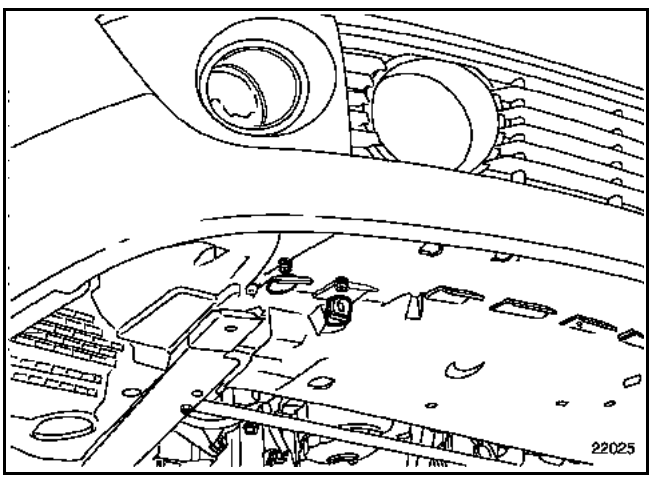
NOTES:
- The period of time monitored can be altered using the **Summarise** button on the steering wheel.
- If the electronic stability program, injection, or ABS systems are faulty, the **adaptive cruise control** system does not work or is deactivated.
- The components (steering wheel buttons, pedal switches etc.) are the same for the **Speed limiter** system.
- The green warning light only comes on when the engine is running.

GETtheMANUALS.org

REMOVING THE RANGE FINDER (RADAR)

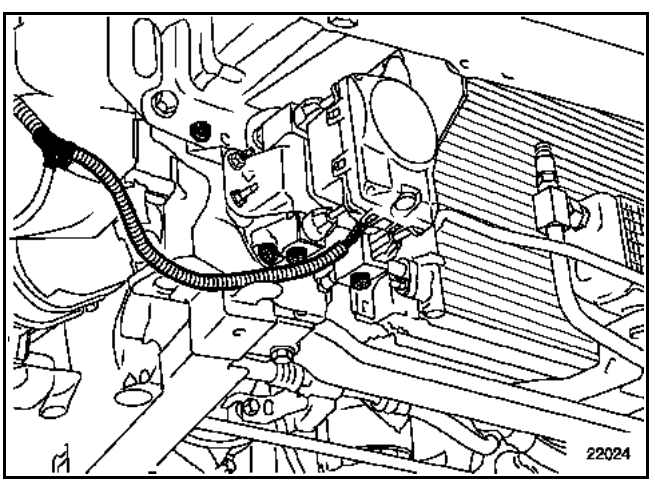
IMPORTANT:
Any operation that adjusts the front and rear axle assemblies, the range finder or a body element (cross member) in the range finder area requires the system alignment to be adjusted.

The front bumper must be removed to remove the range finder (refer to the **bodywork** section).

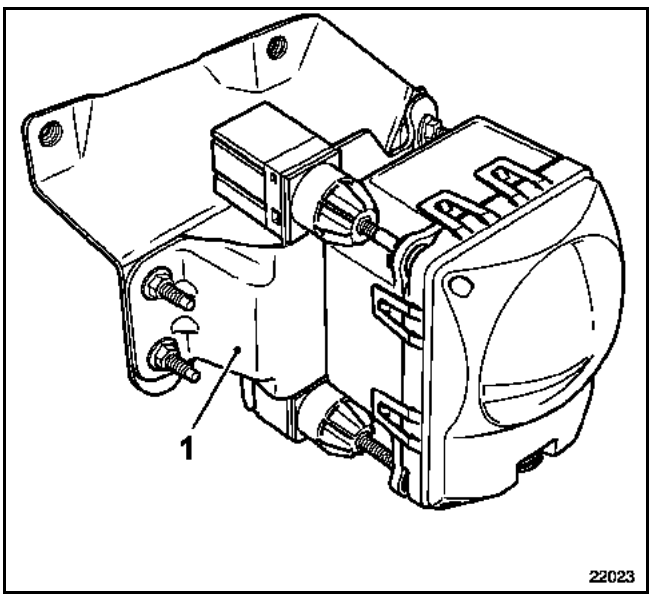


Disconnect the connector.

Remove the range finder + mounting assembly (1).



NOTE:
When sold as a spare part, the range finder is supplied pre-adjusted with its mounting.



REFITTING

Take off the plastic protective film from the radar.

Visually check the condition of the front cross member, the range finder metal mounting and the bumper.

Take care of the headlight washer supply pipes.

Carry out the necessary configurations with the fault finding tool in the "**Proximity control**" menu. Select **Left-hand drive** or **Right-hand drive**.

It is essential to check that the system is aligned.

GETtheMANUALS.org

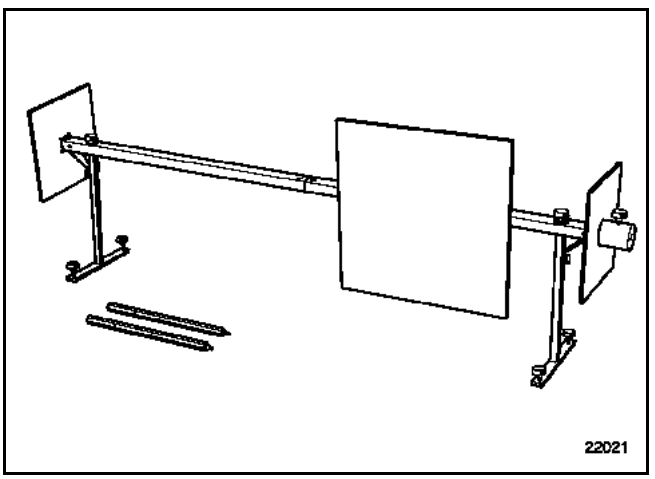
ADJUSTING THE RANGE FINDER

To adjust the system, it is essential to remove:
- special **Bem Muller** equipment made up of an aluminium bar with mounting, a reflective plate and magnetic read head brackets and a spirit level,

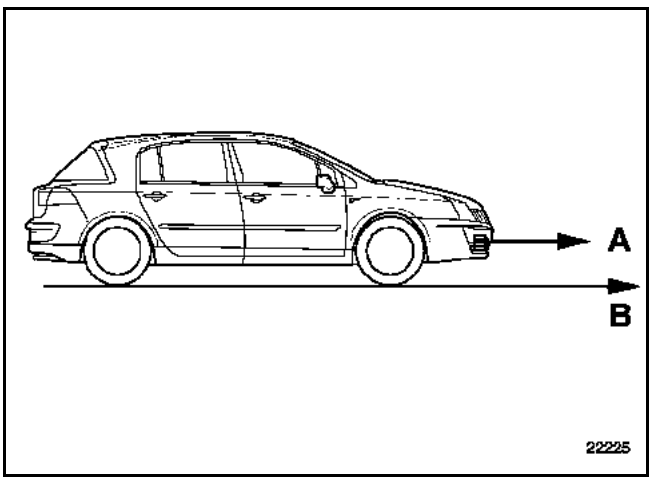


- tester for axle assembly angles
- a fault finding tool to communicate with the range finder (radar) and the computer.

IMPORTANT:
Any operation that adjusts the front and rear axle assemblies, the range finder or a body element (cross member) in the range finder area requires the radar alignment to be adjusted.

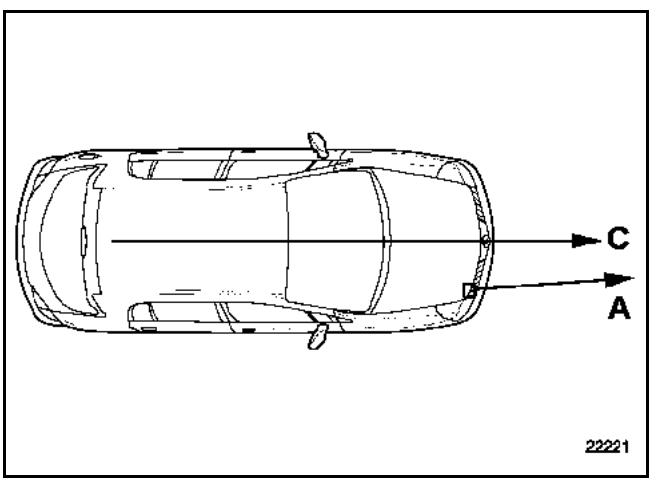
PREPARING THE VEHICLE

The vehicle should be on a flat level surface.



A Radar axis
B Base plane

The area should be cleared sufficiently to place the mirror **120 cm** away from the vehicle and leave **100 cm** for handling the instruments.



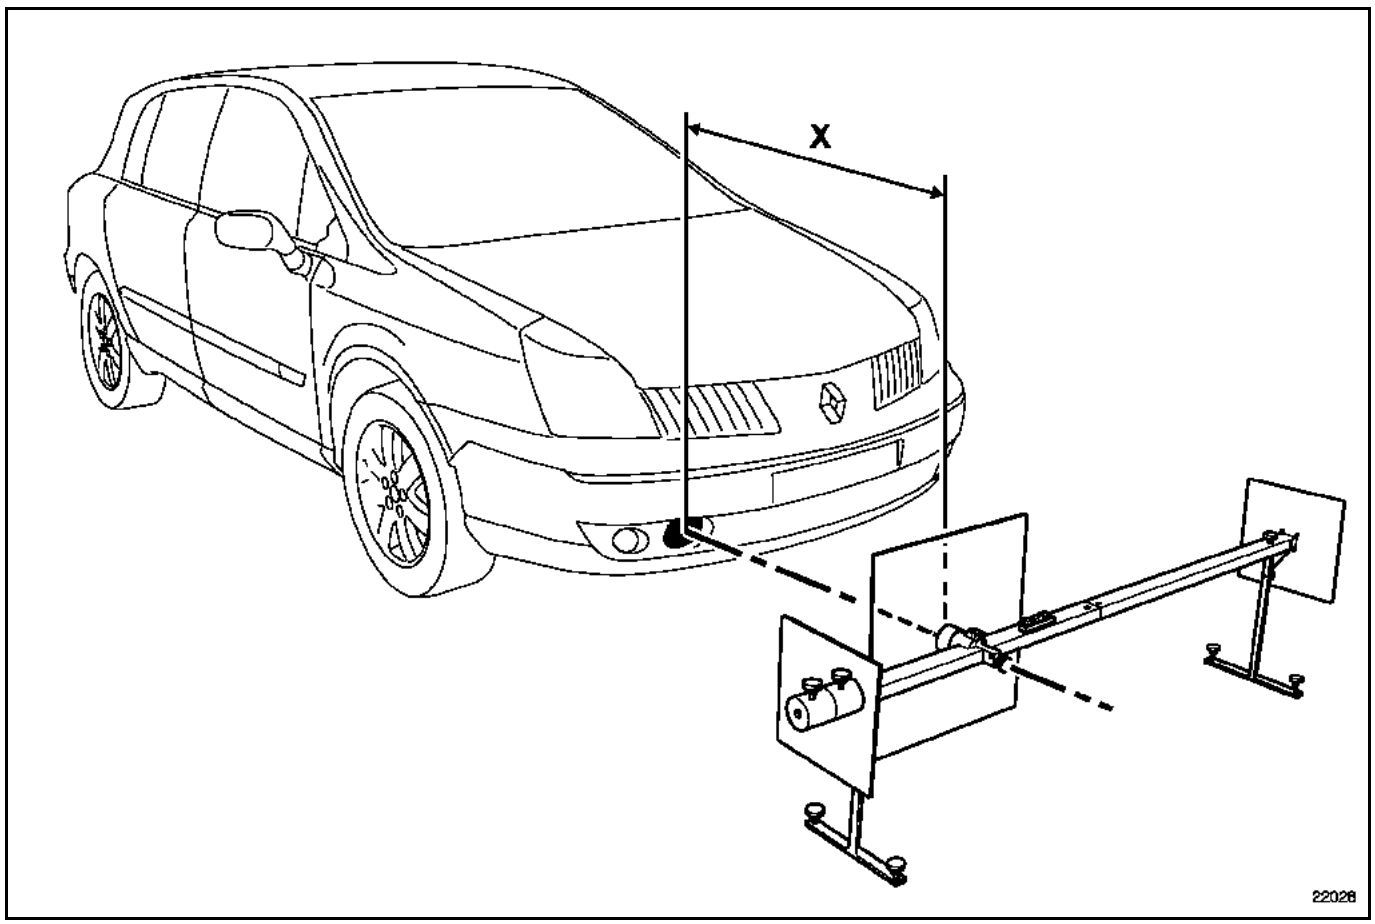
C Thrust axis
A Radar axis

REMINDER:
Before testing or adjusting the alignment of the range finder, check the tyre pressures, body height and the rear axle geometry settings.

GETtheMANUALS.org

FITTING THE EQUIPMENT

IMPORTANT:
Any operation that adjusts the front and rear axle assemblies, the range finder or a component requires the system alignment to be adjusted.



IMPORTANT:
Unscrew the electric handbrake from the vehicle.

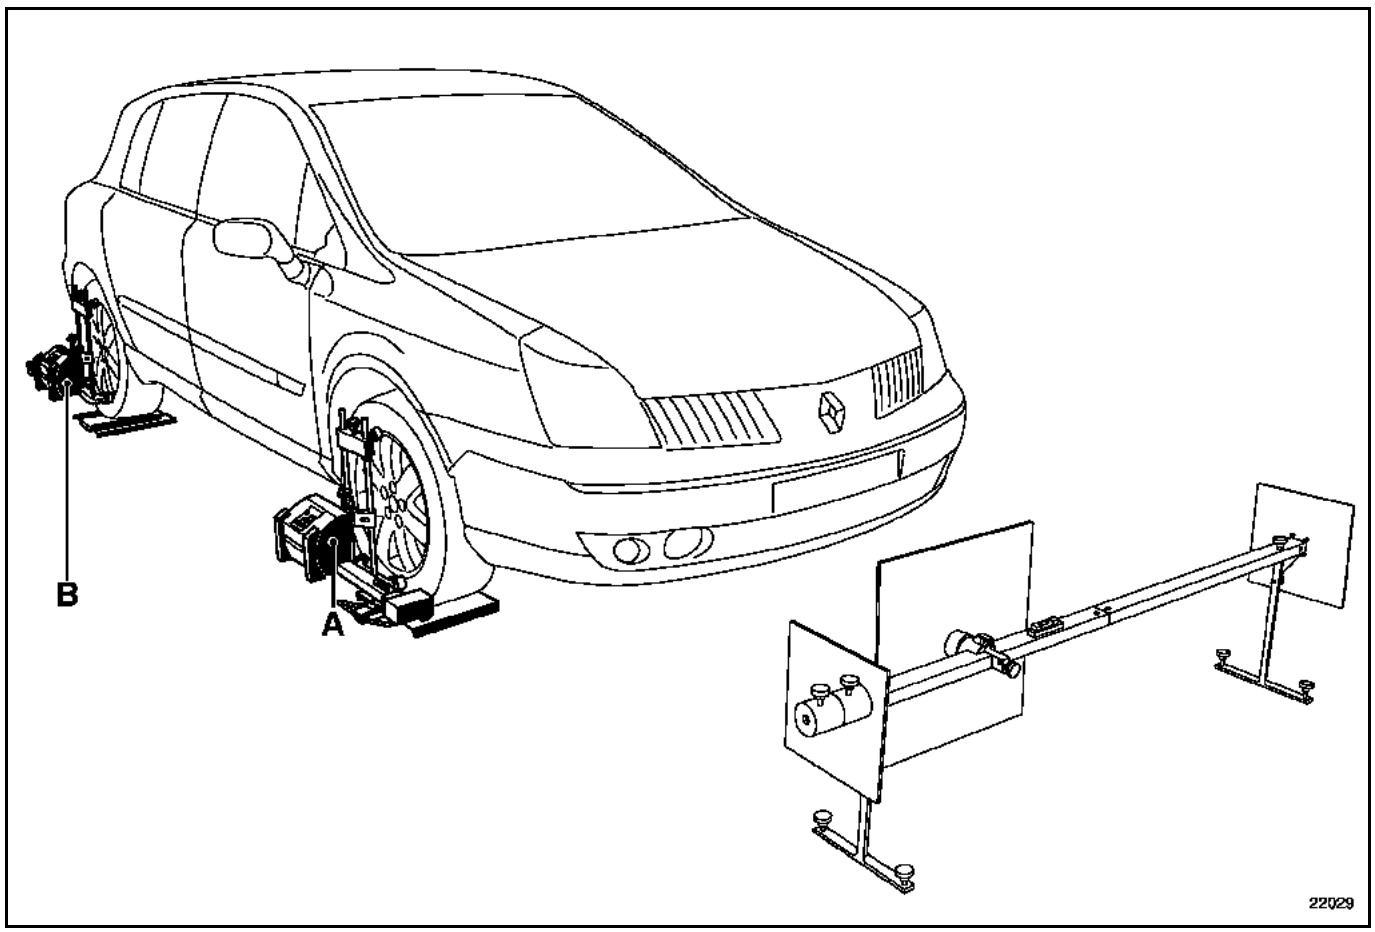
1 Place the vehicle in the axle assembly checking area

2 Put the aluminium bar on its mounting **120 cm** (X) away from the front of the vehicle and check its level.

GETtheMANUALS.org

3 Position the front (A) and rear (B) magnetic heads of the checking tool.

4 Check the angles fully (clearing, parallelism front and rear etc.).

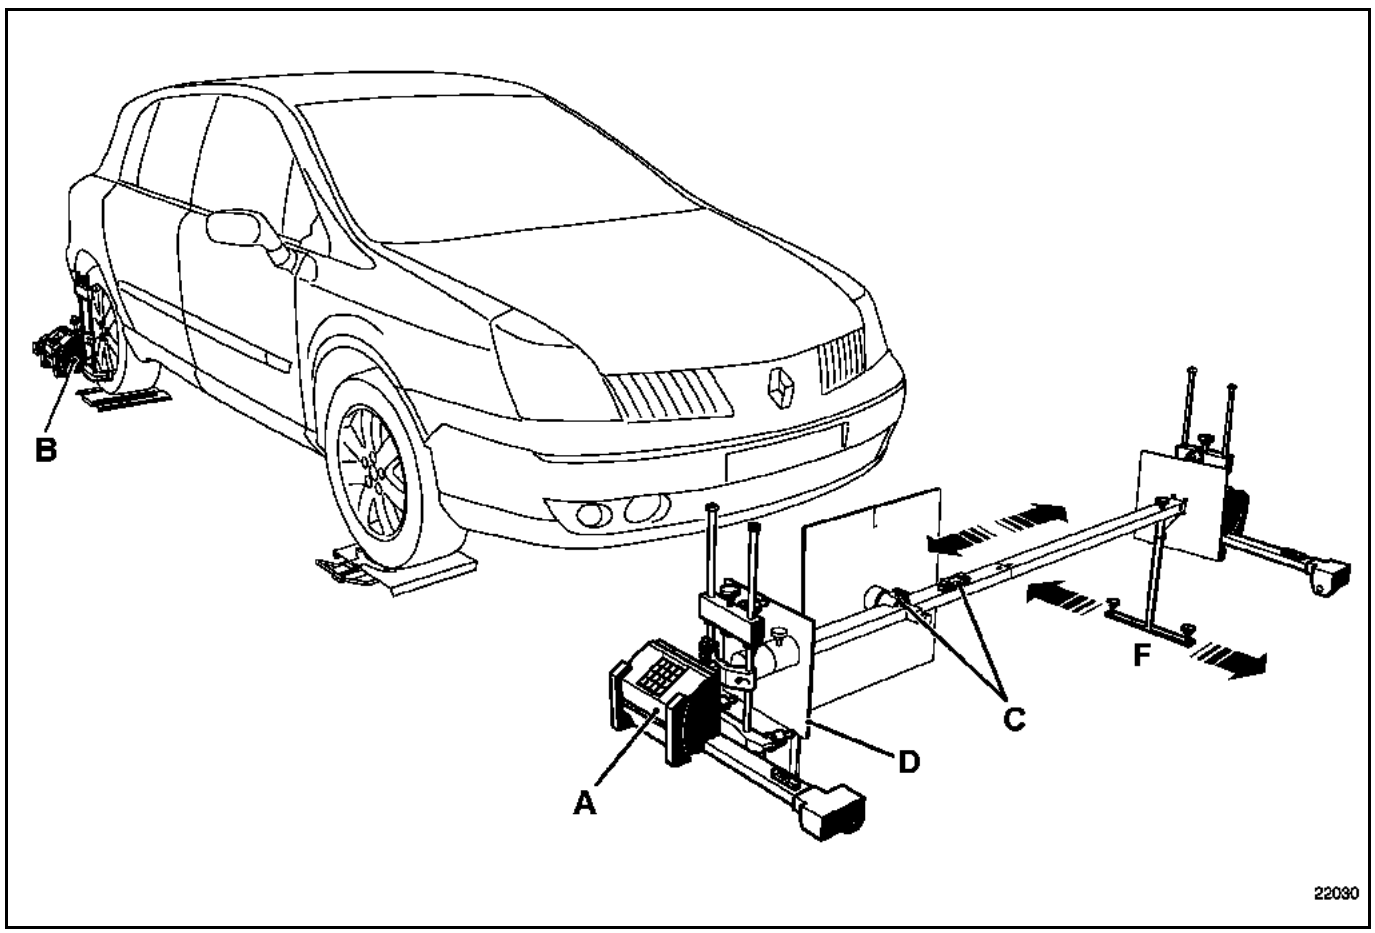


REMINDER:
Remember to check the tyre pressures, body heights, to clean the wheel heads and to compress the suspension.

GETtheMANUALS.org

5 Without removing the rear magnetic heads (B), put the axle checking tool magnetic heads (A) at the ends of the bar.

6 Expose the front magnetic heads by turning the brackets (D) without leaving the axle assemblies angles menu.



7 Display the axle assemblies angles screen or the menu for the adaptive cruise control system (according to the axle adjustment equipment).

8 Adjust the bar using the spirit level (C) by moving the adjustment wheels on the base of the pillars (not supplied).

9 Turn and gently move the bar (E) or at (F) in order to read on the checking screen:
- a gap * between the front and rear axles close to 0,
- equal front parallelism values.

* the gap between the front and rear axles may, depending on the equipment be called asymmetric between axle assemblies, front and rear parallelism gaps etc.

10 Test spirit levels (C) (not supplied).

IMPORTANT:
It is very important to position the reflective plate facing the radar.

GETtheMANUALS.org

TESTING AND ADJUSTING THE ALIGNMENT

WARNING: the battery voltage should never be lower than **12 v** during any operation.

1 Establish dialogue using the fault finding tool to ensure that there is no fault, then enter the "**Proximity control**" menu.

2 In the **Command** menu confirm the **Special command** line.

3 Then in the **Special command** menu, confirm the **Radar alignment with geometric instrument** (**SC001**) line.

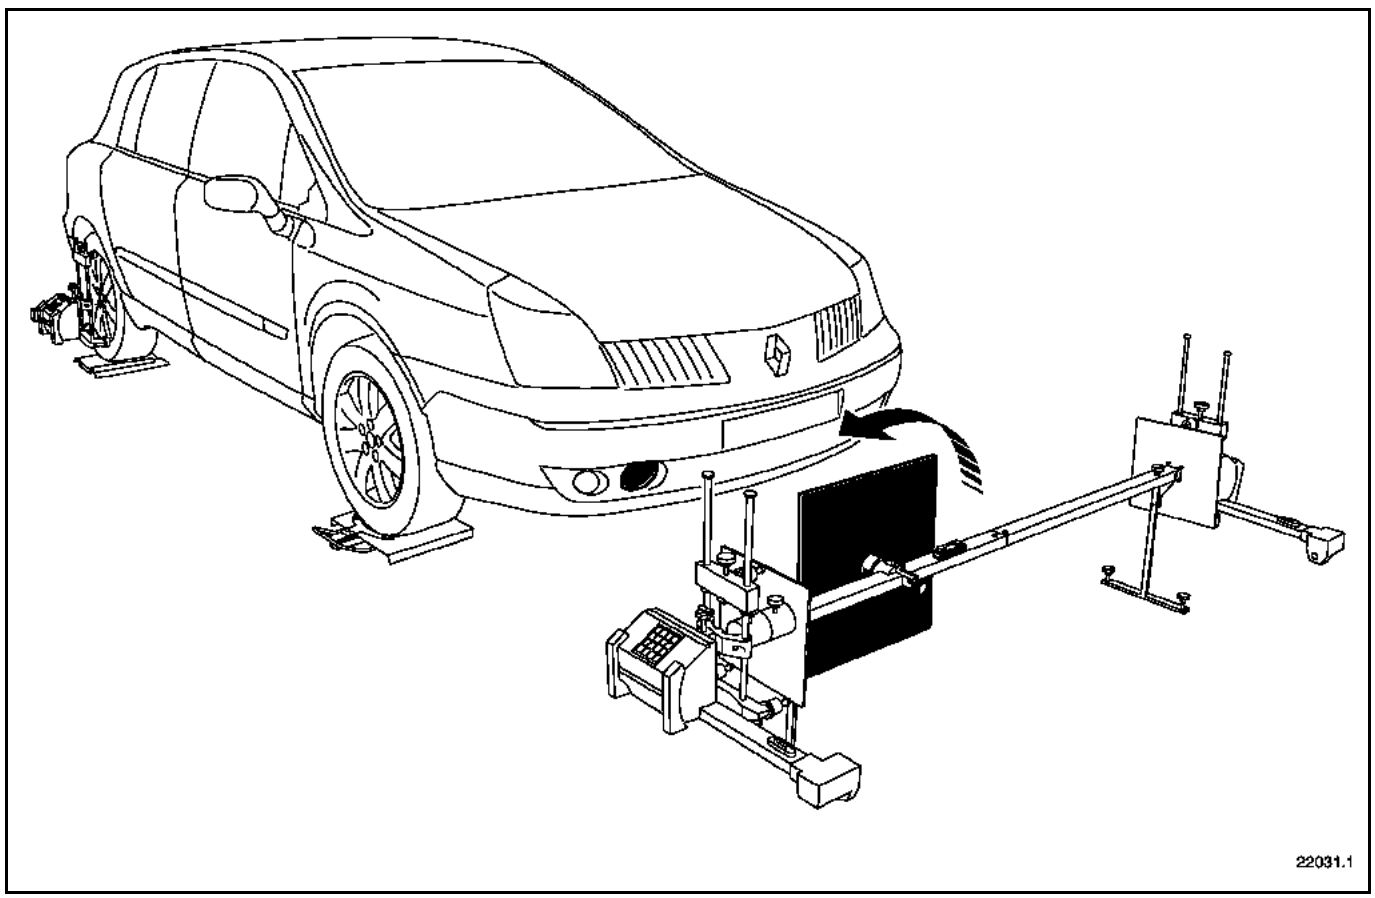
4 Position the reflective plate pointing **upwards** and facing the radar.
Using the screen (axle assemblies tool), check that the bar is correctly positioned, then confirm to access the next step and wait until the indicator (green light) goes red (20 seconds).

NOTE: when the indicator on the fault finding apparatus goes red, it means that the radar is taking measurements. It is very important not to move the reflective plate, as there is a risk of false readings.

5 Turn it a quarter of a turn to the right (clockwise so that it is opposite the mirror in the vehicle's forward axis). The label on the rear of the mirror is on the **left** when looking at the back of the mirror. Check the bar position again, then confirm to access the next step or wait until the light goes red.

6 Turn it a quarter of a turn to the right (clockwise so that it is opposite the mirror in the vehicle's forward axis). The label on the rear of the mirror is at the **bottom** Check the bar position, then confirm to access the next step or wait until the light goes red.

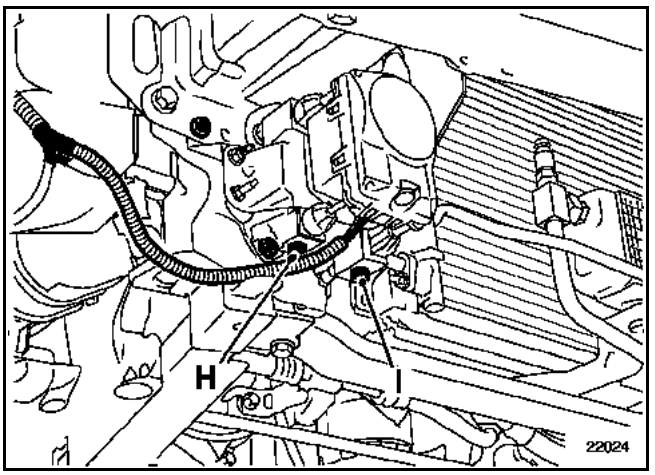
7 Turn it a quarter of a turn to the right (clockwise so that it is opposite the mirror in the vehicle's forward axis). The label behind the mirror is on the **right** when looking at the back of the mirror. Check the bar position, then confirm to access the next step or wait until the light goes red.



GETtheMANUALS.org

The fault finding tool then displays the operations for aligning the range finder:

- Screw or unscrew the vertical adjustment bolt (H).
- Screw or unscrew the horizontal adjusting screw (I).



Example:

Adjustment Adjustment	Screw	
Adjustment value	1	Turns
Final adjustment value	30	Minutes

Adjustment Adjustment	End	
Adjustment value	0	Turns
Final adjustment value	0	Minutes

REMINDER: 1 Turn = 60 minutes
1/2 Turn = 30 minutes
1/4 Turn = 15 minutes

IMPORTANT:
If the fault finding tool displays "procedure interrupted", check the distance between the vehicle and the reflective plate (120 cm) and the alignment of this plate in relation to the radar.

NOTE:
The adjustment should be made with the bumper in place.

After the adjustments have been made, confirm.

The tool displays **the adjustment is not complete, do you still wish to exit**?

Enter **NO**, in order to check again and see if the prior adjustments were correct.

If it does not read **horizontal adjustment complete and vertical adjustment complete** in the columns, repeat the operations as many times as necessary.

After an adjustment has been made or a steering wheel angle sensor replaced, the fault must be erased using the **RZ005 steering wheel angle offset** command.

GETtheMANUALS.org

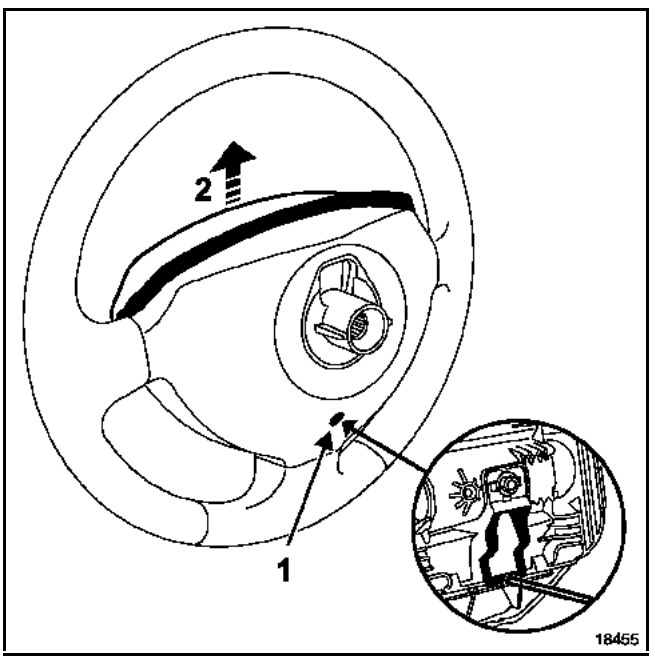
IMPORTANT: all work on the airbag and pretensioner systems must be carried out by qualified personnel who have received the proper training.

WARNING: Handling the pyrotechnic systems (pretensioners or airbags) near a source of heat or a flame is forbidden; there is a risk of triggering.

NOTE: locking the airbag computer also unlocks the electric steering column lock.

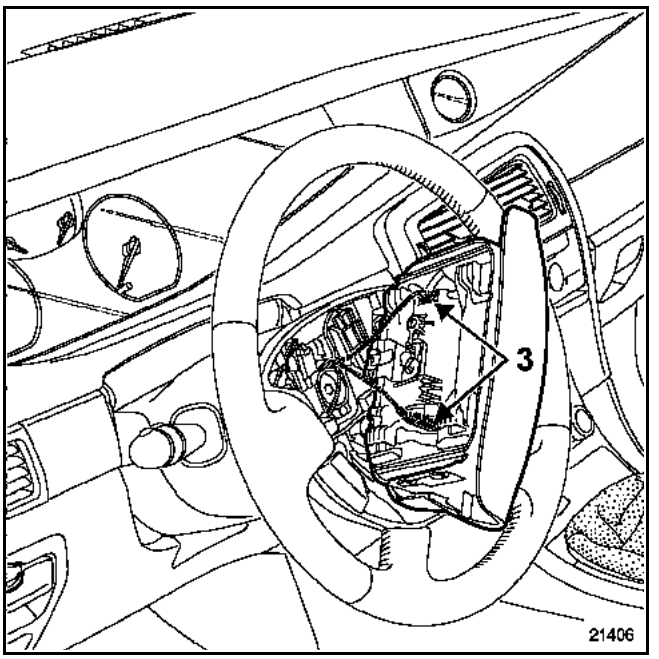
REMOVAL

Remove the steering wheel airbag. To do this, insert a screwdriver into hole (1) then move it upwards (2).



Disconnect the steering wheel airbag connectors (3) and the connectors of the cruise control buttons (according to model).

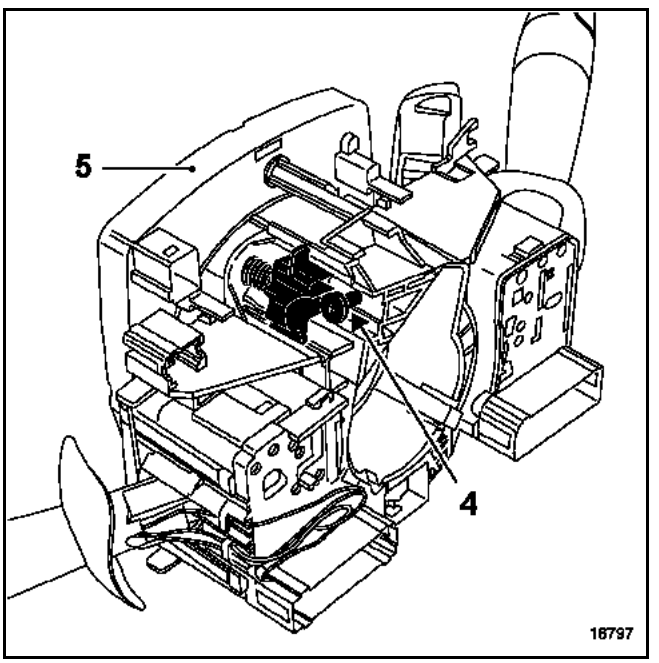
Remove:
– the steering wheel bolts after setting the wheels straight,
– the steering wheel,
– the steering wheel half-shell casings.



Disconnect the stalks (wipers, radio and lighting controls), the rotary switch connectors (airbag and cruise control).

Before removing the rotary switch assembly, mark its position, checking that the wheels are straight.

Undo the bolt (4) then release the steering column assembly.



NOTE: it is not necessary to separate the sensor from the steering wheel (5). If it is separated, carry out the initialisation procedure (refer to section **38C ABS**).

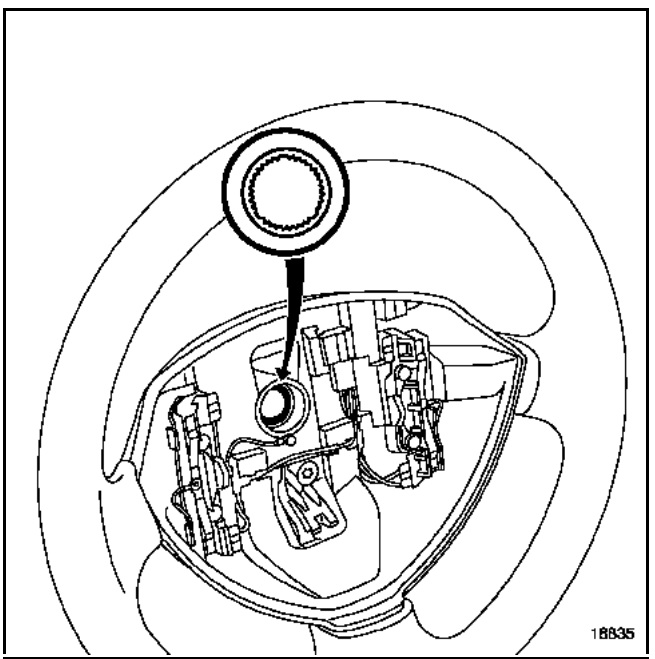
GETtheMANUALS.org

REFITTING

Check that the wheels are still straight before positioning and attaching the rotary switch.

Special notes on the steering wheel

IMPORTANT: the splines on the steering wheel have foolproofing devices. **The steering wheel should be inserted freely into the splines.** Be careful not to damage them.



It is essential to replace the steering wheel bolt each time it is removed and to tighten it to a torque of 4.4 daNm.

Special notes on the airbag

IMPORTANT: before reconnecting the driver's airbag, the correct operation of the system must be checked:
- Check that the airbag warning light on the instrument panel is on (ignition on, computer unlocked), switch off the ignition, connect a dummy ignition module to the connector for each airbag. Switch on the ignition and check that the warning light goes out,
- switch off the ignition, connect the airbag in place of the dummy ignition modules and position it on the steering wheel,
- switch on the ignition and check that the warning light comes on for **3 seconds** when the ignition is switched on then goes out.

If the warning light does not go out, refer to the **fault finding** section.

WARNING: If these instructions are not followed the system may not operate normally and could even trigger accidentallly.

Connect the two steering wheel airbag connectors (3) according to their colours.

Ensure that the connectors click in properly.

NOTE: if a fault occurs on the reader lighting, the reader must be replaced.

REMINDER: the reader is not coded.

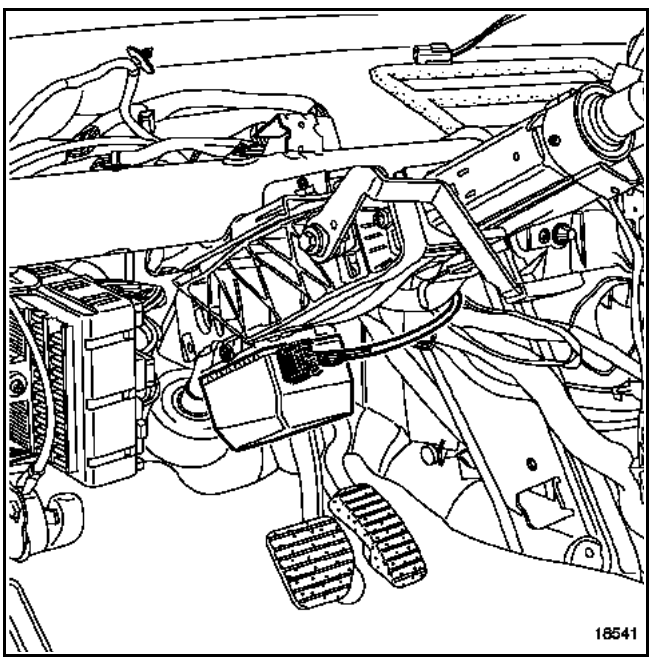
GETtheMANUALS.org

PRECAUTIONS DURING REPAIR

To stop the steering wheel from locking when the battery is disconnected (***vehicle without CARMINAT***), you must:
– fully insert the RENAULT card (+ after ignition) then withdraw it as far as the 1st notch, (+ Accessories). The steering column is not locked for as long as the card remains in the 1st position in the reader. Disconnect the battery, the column remains locked while the battery is not connected and the Renault card is removed, *(**vehicle with CARMINAT**):*
– lock the airbag computer using a diagnostic tool (all types).

REMOVAL

WARNING: the steering column lock is secured with a reverse thread bolt (left-hand thread). Furthermore, it can only be removed if it has been released beforehand.



REFITTING

Tighten the bolt to a torque of **0.8 daNm**.

Refer to Section **82A** for information on programming the steering column lock code.

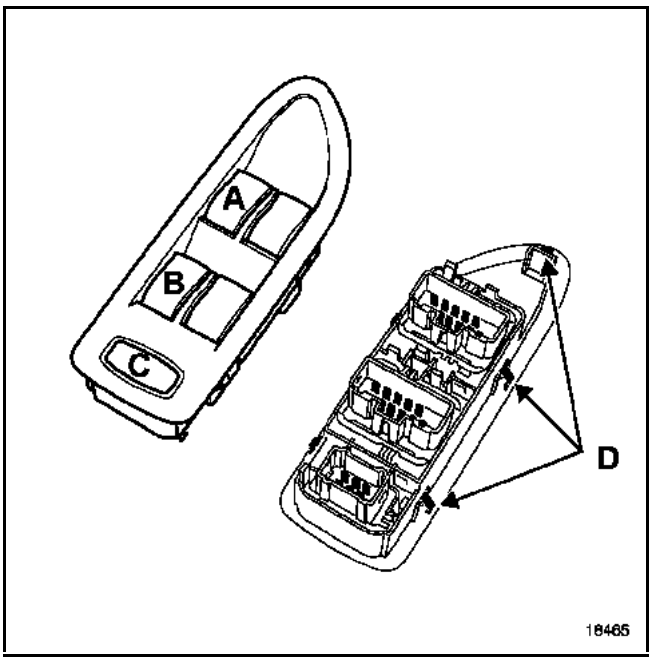
ELBOW REST (the fullest version)

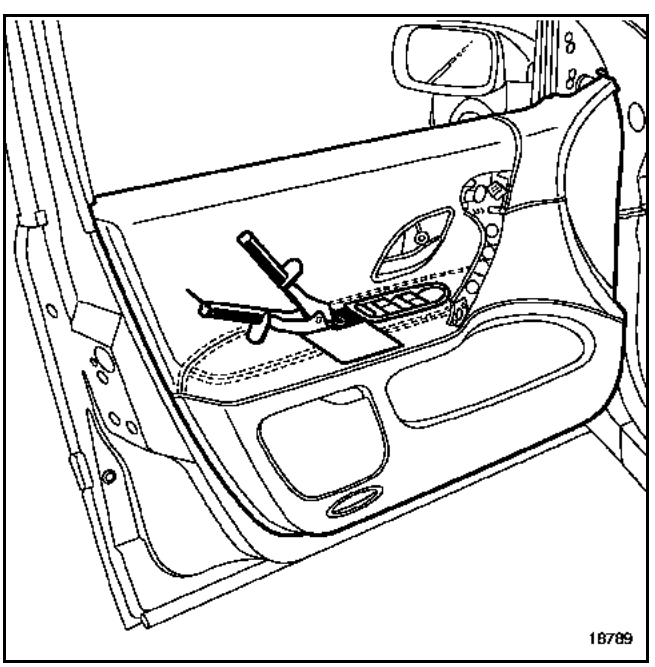


A Driver's and front passenger electric windows switch
B Rear left and right electric windows switch
C Rear electric windows and doors locking switch (according to model)

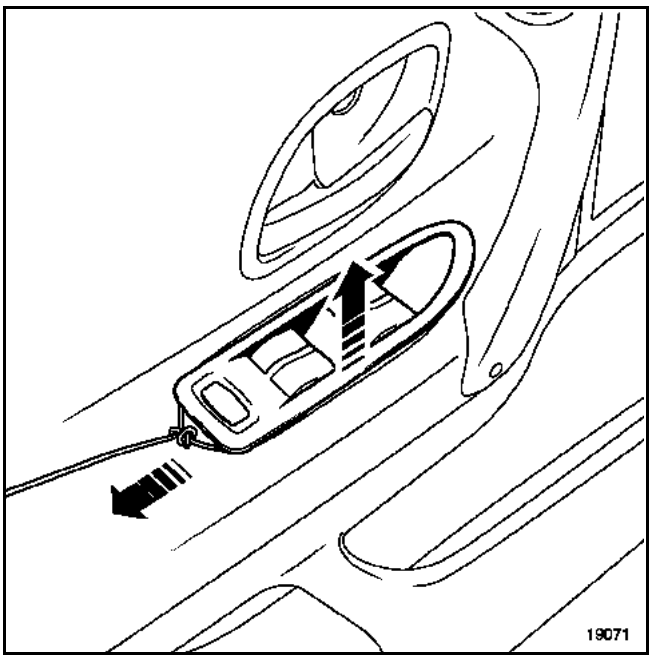
SWITCH REMOVAL

The electric window control plate is clipped onto the door panel by tabs (D).

There are two simple methods of removing the plate:
– 1) with a pair of crimping pliers,



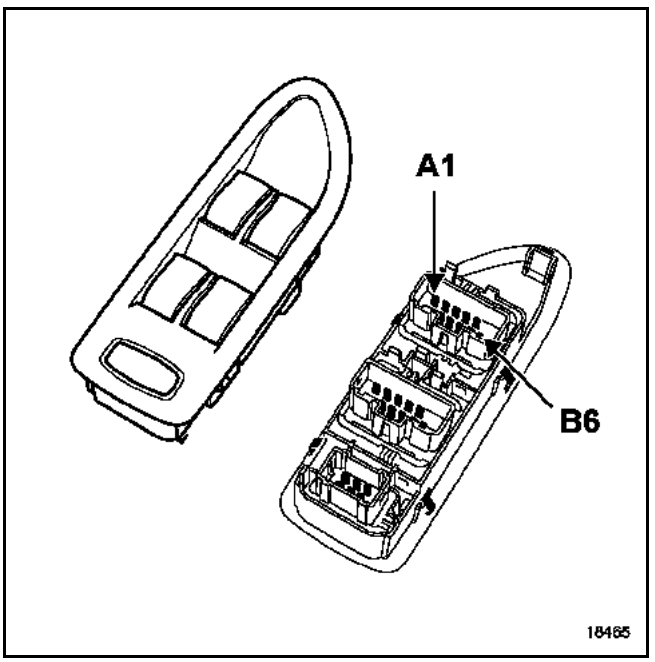
– use an electric wire to press on the latches (D).



Disconnect the connectors.

GETtheMANUALS.org

ELECTRIC WINDOW SWITCHES ON DRIVER'S DOOR



The vehicle may be fitted with two types of front electric window switch:

- **Driver and passenger one touch window without multiplex connection**

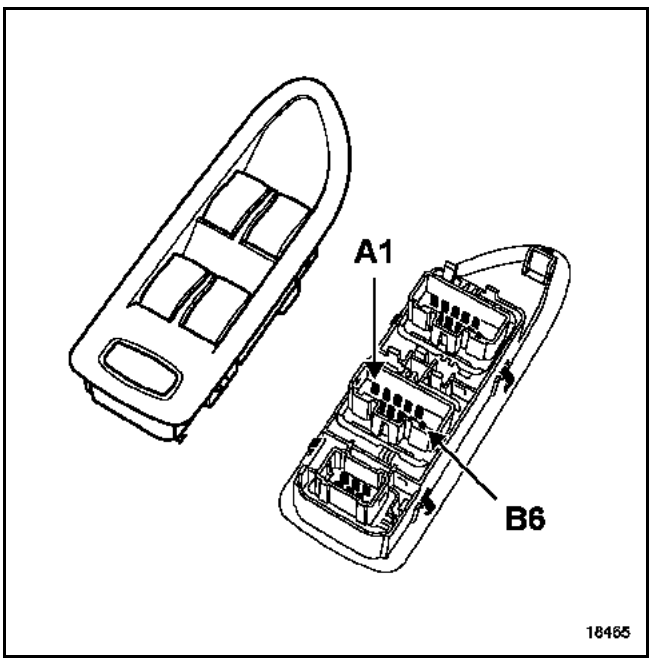
Driver and passenger dual control electric window (normal and one touch).

- **Multiplex driver and passenger one-touch electric window**

This is outwardly identical to the model without a multiplex connection, but it is wired differently.

NOTE: These switches light up when the ignition is turned on (not night lighting).

REAR ELECTRIC WINDOW SWITCHES ON DRIVER'S DOOR



The vehicle may be fitted with two types of dual switches:

- **Electric window**

Rear left and right switches (one position only).

- **One touch electric window**

Two position rear left and right switches (normal and one touch functions for the rear windows).

NOTE: These switches light up when the ignition is turned on (not night lighting).

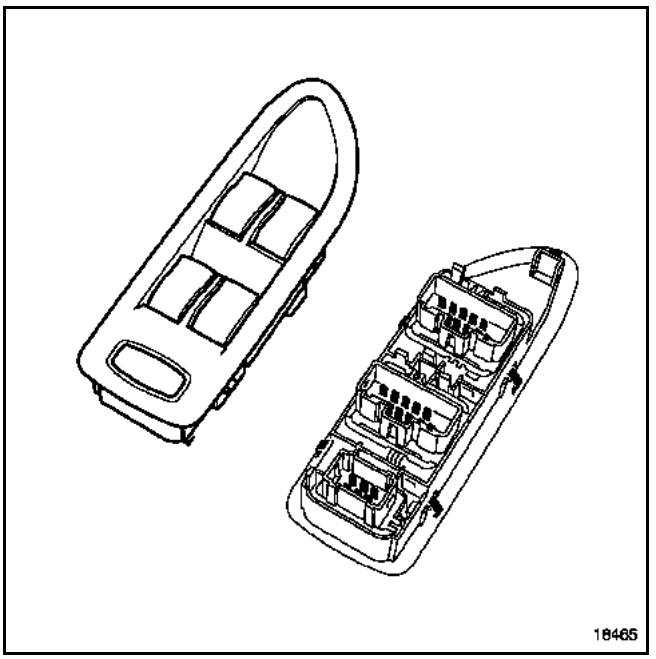
***IMPORTANT:**
It is not possible to check the switches with a multimeter.

However, it is possible to shunt the corresponding tracks, to determine the condition of the switch.

GETtheMANUALS.org



A red light on the switch, operated by the UCH, is lit when the lock is applied. This switch is used to prevent the opening of the windows and rear doors (depending on the car model).

● **Electric window**
Pressing the child lock switch sends a message to the UCH, which operates the child lock relay.

● **One touch electric window**
The child lock switches on or off, the control earth on the one touch rear electric window switches and sends a signal to the UCH to inform it of the present state.

NOTE: These switches light up when the ignition is turned on (not night lighting).

Track	Description

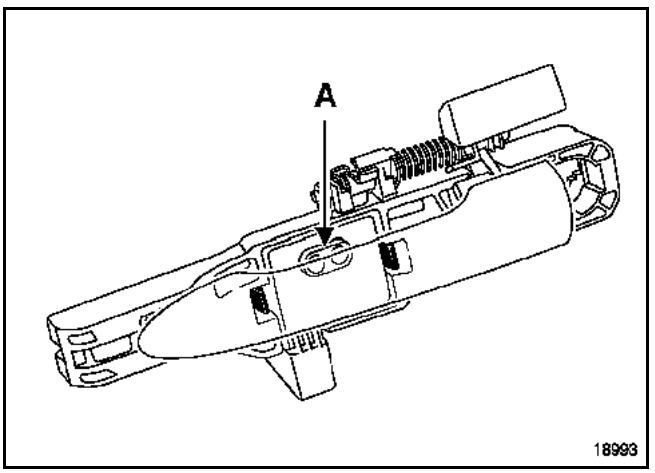
GETtheMANUALS.org

To allow the use of the hands-free option, the door handles must be fitted with the following types of sensor:
– the presence sensor (A), accompanied by a door handle reflector, which detects the user's hand,
– the movement sensor, to open the door when the presence sensors no longer operate (this occurs when the car has not been used for a long period of time).

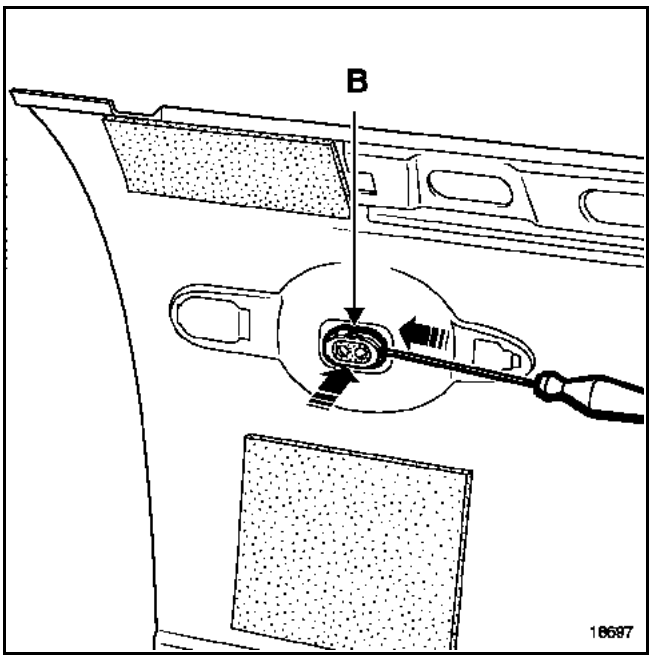


NOTE: Refer to the **Bodywork** section for removal of the handle.

CONNECTION

Track	Description
1	Sensor signal
2	Earth
3	+ Battery

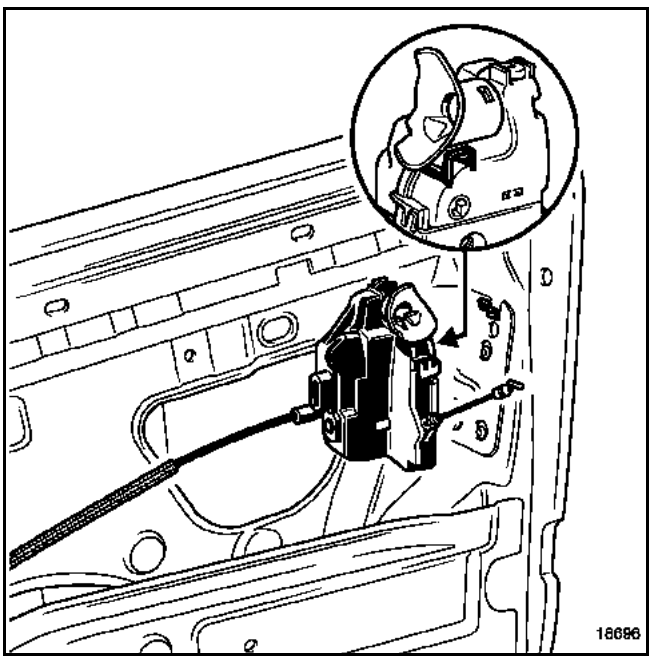
IMPORTANT: The presence sensor must be accompanied by a translucent cover and a reflector fitted to the handle to detect the user's hand. Cracks or scratches may impair the working of the hands-free opening device.



GETtheMANUALS.org

Each car has a different door locking system appropriate to the equipment level fitted.

- **the basic version** (4 track connector) is fitted with electric locks and a closing sensor, but not with body flange sensors.
- **the top of the range version** (6 track connector) is fitted with a central locking system that can disable the internal door handles. This system can also control the child lock system.



CONNECTION

GETtheMANUALS.org

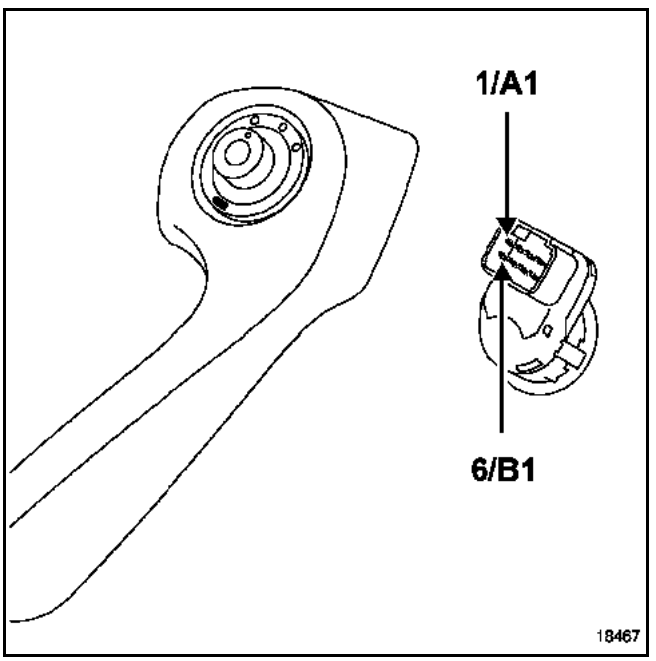
ELECTRIC DOOR MIRROR CONTROLS

There are several types of door mirror control, according to the level of equipment fitted:

- **Basic electric door mirror control**
- **Non-multiplex tilting electric door mirror control**
- **Multiplex tilting electric door mirror control**



- **Basic electric door mirror control**

Track	Description
A1	Up/down movement of the driver's door mirror
A2	+ before ignition
A3	Left/right movement of the driver's door mirror
A4	Not used
B1	Left/right movement of the passenger's door mirror
B2	Up/down movement of the passenger's door mirror
B3	Earth
B4	Motor common line

NOTE: the controls for the multiplex and non-multiplex door mirrors are identical, but they have different wiring.

- **Tilting electric door mirror multiplex control (option: store driver's seat position)**

Track	Description
1	Driver's and passenger door mirror signals
2	+ After ignition
3	Earth
4	Door mirror motor common line
5	Tilting rear-view mirror common line
6	Up/down control for the passenger's door mirror
7	Up/down control for the driver's door mirror
8	Left/right control for the passenger's door mirror
9	Left/right control for the driver's door mirror
10	Not used

- **Non-multiplex tilting electric door mirror control (no memory)**

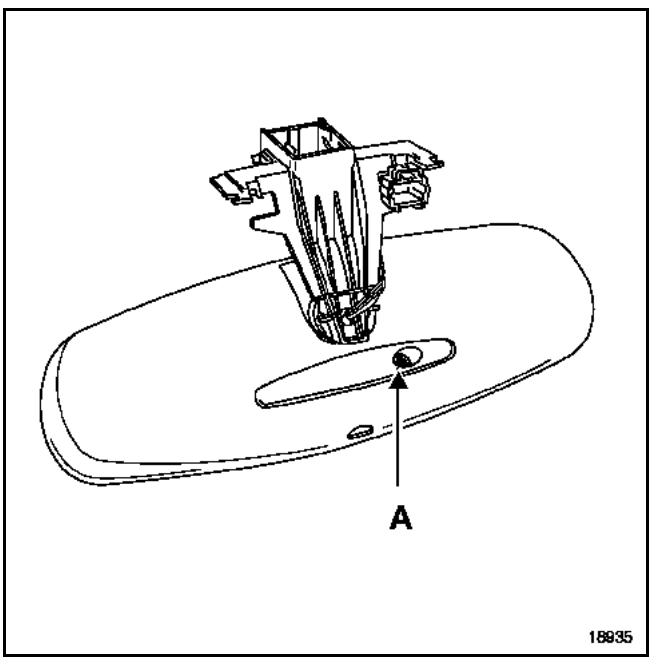
Track	Description
1	Tilting motors common line (track 3B)
2	+ After ignition
3	Door mirrors common line (track 2C)
4	Earth
5	+ before ignition
6	Up/down movement of the passenger's door mirror (track 2B)
7	Up/down movement of the driver's door mirror (track 2B)
8	Left/right movement of the passenger's door mirror (track 2A)
9	Left/right movement of the driver's door mirror (track 2A)
10	Door mirror tilt control (track 3C)

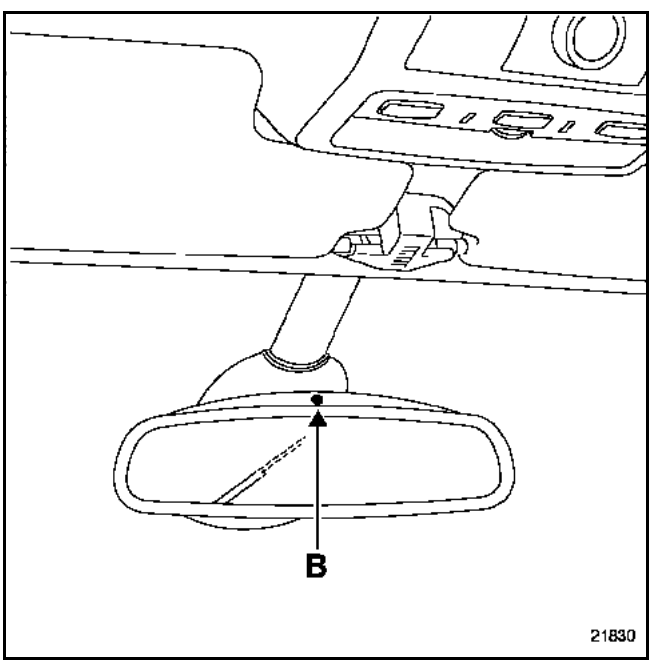
NOTE: These switches light up when the ignition is turned on (not night lighting).

GETtheMANUALS.org

The interior rear-view mirror can be fitted with the autodimming (electro-chrome) system.

This system works by comparing levels of brightness gauged by two sensors:
– sensor A on the windscreen side,
– sensor B on the mirror side.





NOTE: the door mirrors can also be fitted with this system. In this case, the mirror dimming is controlled by the interior rear-view mirror. (There are no light sensors on the door mirrors).

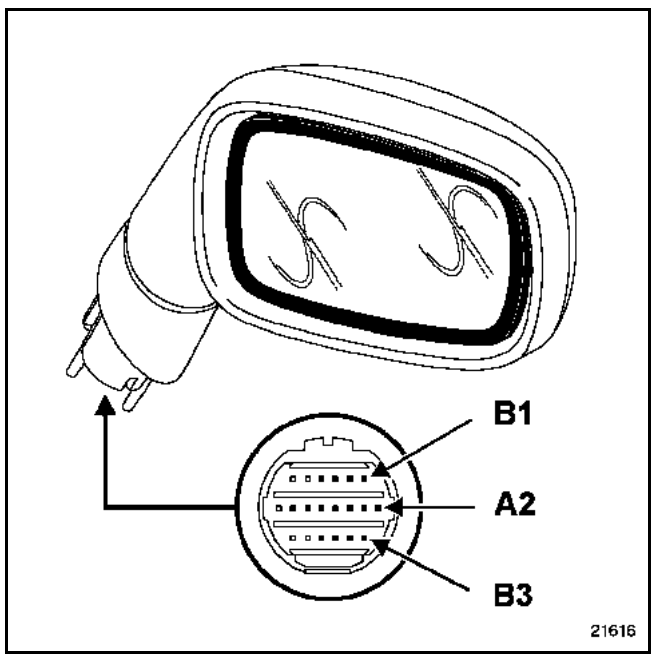
CONNECTION

Track	Description
1	Supply
2	Earth
3	Brightness information (track 3E door mirror)
4	Brightness information (track 3D)

GETtheMANUALS.org

The components of the electric door mirrors are:
– two motors for vertical and horizontal movement,
– an external temperature sensor (right hand side),
– a tilt motor (according to model),
– a heating system (according to model),
– an autodimming system linked to the interior rear-view mirror to dim the mirrors in bright light (according to model),
– a multiplex connection (according to model).

NOTE: The door trim does not need to be removed to remove the door mirrors.



IMPORTANT: on cars fitted with the **Driving position memory** option, the passenger's door mirror is fitted with a multiplex connection. This connection allows information stored in the electric window motor (see Section **88D: Driving position memory**) to be collected.

CONNECTION (fullest version)

Track	Description
1B	Door mirror demisting
1C	Door mirror demisting
1D	Temperature sensor (right-hand side)
1E	Temperature sensor (right-hand side)

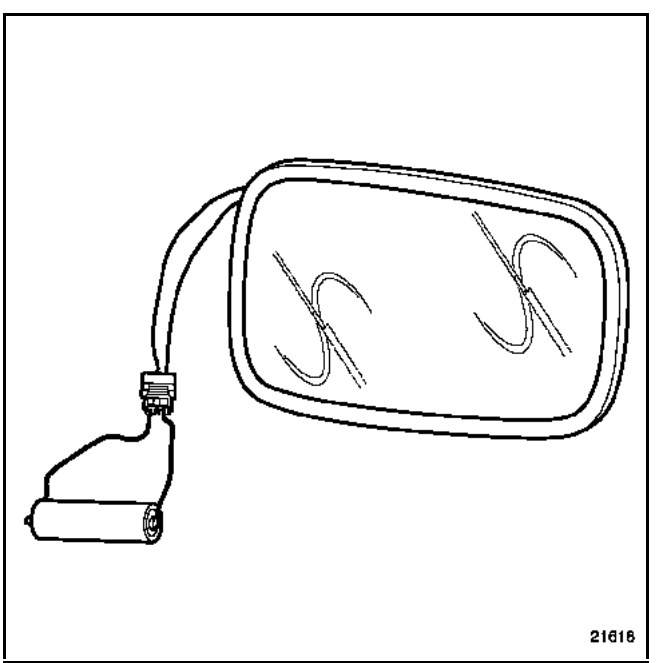
2H	Not used
3B	Tilt motor
3C	Tilt motor
3D	Brightness information (interior rear-view mirror)
3E	Brightness information (interior rear-view mirror)
3F	Not used
3G	Not used

The resistance of the heating system is approximately **10 Ω**.

The autodimming system can be checked with a **1.5 V** (R6) battery on **tracks 3D** and **3E**.

The mirror should progressively darken.



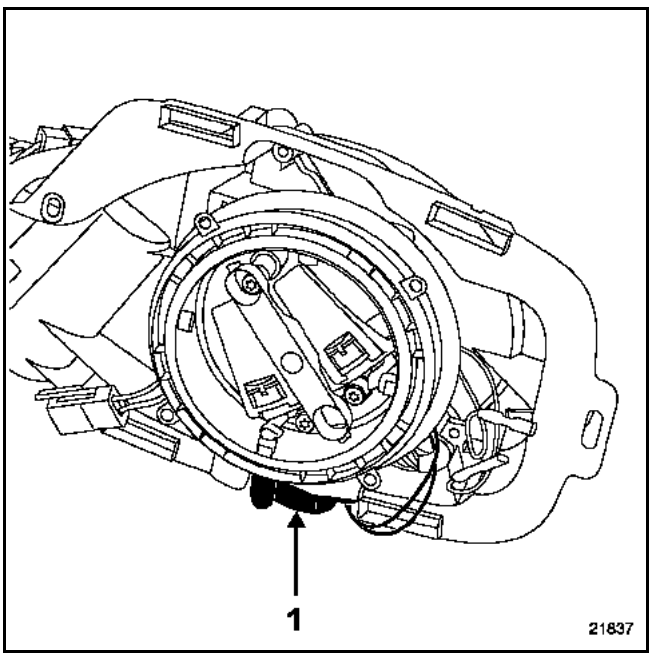
GETtheMANUALS.org

The tailgate external temperature sensor is located in the right-hand side door mirror.

It is necessary to remove the half shell and the reflective glass to access the sensor (see **Bodywork section**).

REMOVAL

Unclip the sensor (1) and cut the wires.



REFITTING

Reconnect the two temperature sensor wires using heat-shrink sleeves.

Check the resistance of the temperature sensor

Approximate temperature in °C	Sensor resistance in ohms
between 0 and 5	between 5400 and 6200
between 6 and 10	between 4400 and 5400
between 11 and 15	between 3700 and 4400
between 16 and 20	between 3000 and 3700
between 21 and 25	between 2500 and 3000
between 26 and 30	between 2100 and 2500
between 31 and 35	between 1700 and 2100
between 36 and 40	between 1450 and 1700

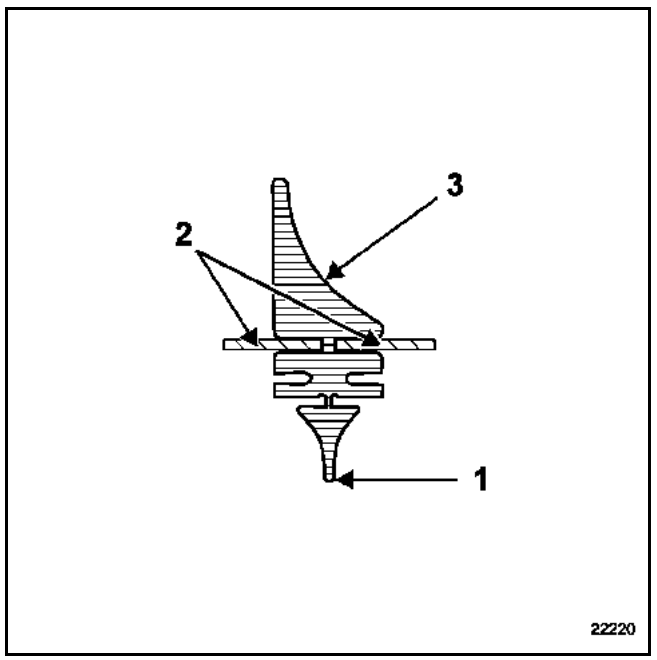
BLADES

These blades consist of:
– a wiper blade (1);
– two metal inserts (2);
– a deflector (3) directed towards the front of the vehicle.

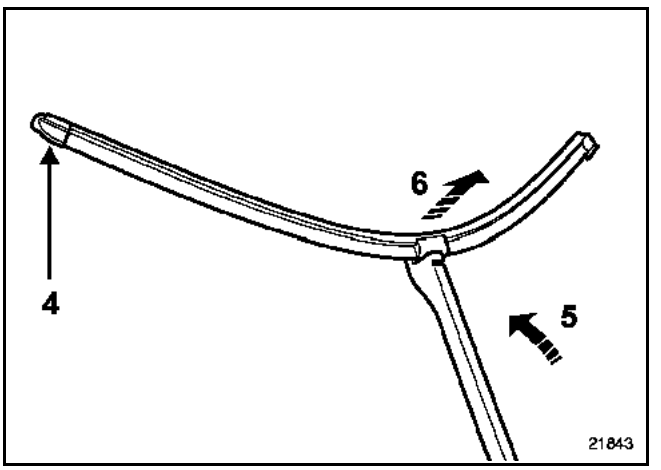
These blades increase the efficiency of wiping and greatly reduce wind noise, even at high speeds.



REMOVAL

Raise the windscreen wiper arm.

Unclip the blade (4) from the windscreen wiper arm, so as to swivel the arm (5) as far as the horizontal stop. Then slide the arm (6) so as to release it from its hingepin.



REFITTING

Special notes:
- The upper blade (the largest one) is positioned on the left-hand side of the vehicle;
- The most curved wiper arm is positioned on the left-hand side of the vehicle.

GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Elé. 1552	**Tool for removing windscreen wiper arms**

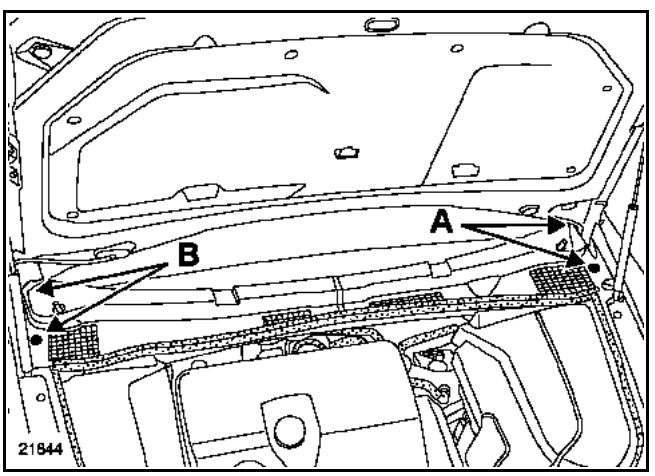
REMOVAL OF THE WIPER MECHANISM WITH MOTOR

The mechanism is identical for all vehicles, both left hand drive and right hand drive.

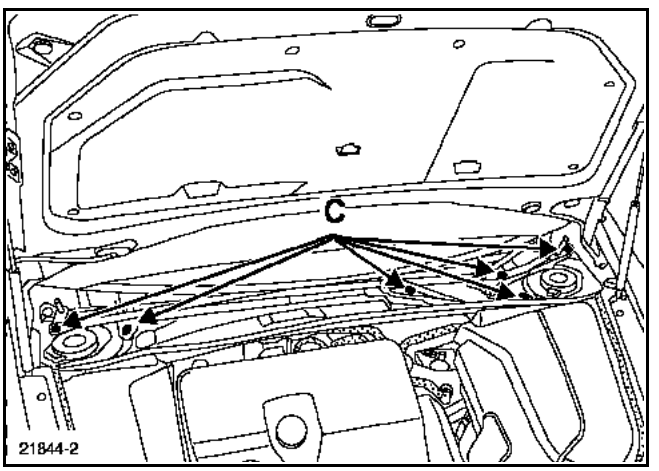
REMOVING THE MECHANISM

Disconnect:
– the battery,
– the wiper motor.

Remove:
– the wiper arms with the tool **Ele. 1552**,
– the half-grilles of the plenum chamber, on the LH side and then the RH side, by unscrewing mounting bolts (A) and (B) (by a quarter of a turn);



– the bolts (C) attaching the windscreen wiper mechanism.



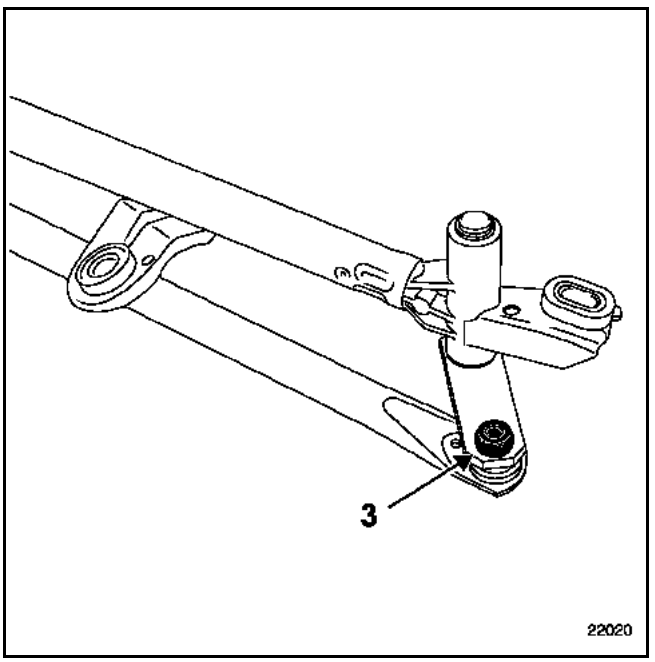
Tilt the mechanism to remove it from its housing.

IMPORTANT: for vehicles equipped with windscreen de-icing, do not damage the feed wires.

GETtheMANUALS.org

Fit the mechanism's linkage onto the drive linkage.

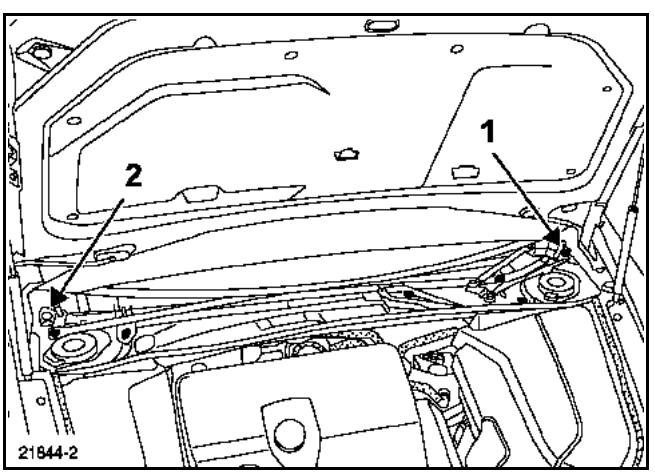
IMPORTANT: it is prohibited to alter the settings of the mechanism; ball joint (3) is adjusted in factory.



Tilt the mechanism to insert it in position.

Place all the bolts on the mechanism in position.

Tighten bolts (1) and (2) to torque of **0.8 daNm** then the other four bolts to the same torque.

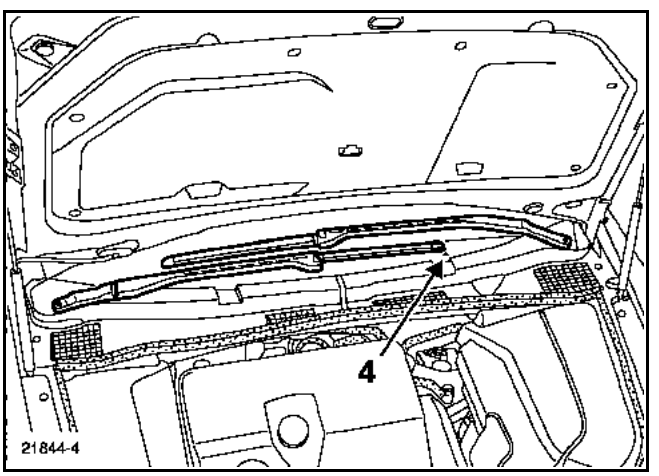


Refit the half-grilles of the plenum chamber (**see bodywork chapter**).

Reconnect:
– the wiper motor connector,
– the battery.

IMPORTANT: before refitting the windscreen wiper arms, it is very important to check once again that the windscreen wiper motor is still positioned in the park position.

Position the lower arm (RH) rlative to the locating point (4) on the windscreen and tighten the nut to a torque of **2 daNm**.



NOTE: to help distinguish between the two windscreen wiper arms, that on the left is the most curved.

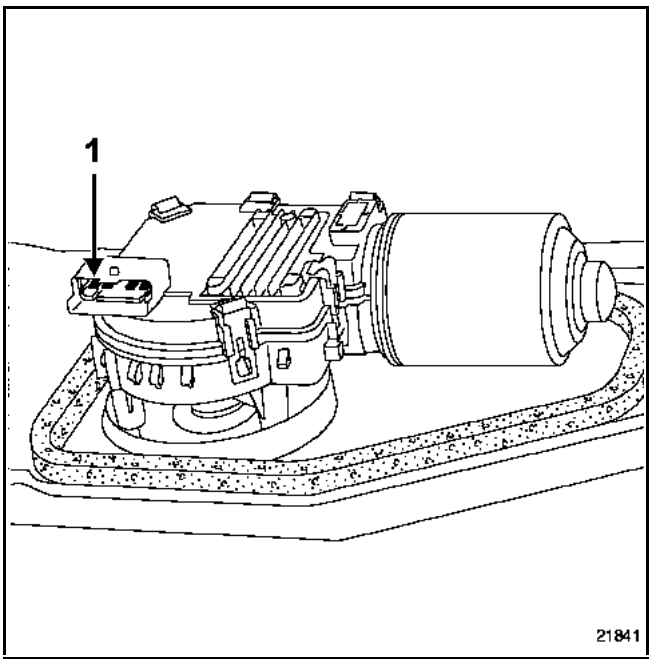
Fit:
– the upper arm (LH) parallel to the lower arm and tighten the nut to a suitable torque;
– the nut covers.

IMPORTANT: after connectingthe battery, make sure to carry out the necessary programming (set the clock time, enter the radio code, etc.) so that the vehicle may operate correctly (see **Chapter 80A**).

GETtheMANUALS.org

CONNECTION

The motor connection is the same on left-hand and right-hand drive versions.



Track	Description
1	+ Battery feed
2	Earth
3	Not used
4	+ After ignition feed
5	Control signal coming from the rain sensor or the UCH

GETtheMANUALS.org

RAIN DETECTOR

OPERATION

The UCH collects the information supplied by the rain sensor. It thus enables automatic operation of the wipers and control of wiping speed in accordance with the quantity of water on the windscreen.

To activate this function, position the wiper stalk in intermittent position. Any movement of the wiper stalk cancels this function.

SPECIAL NOTES:

- If the wiper arms are subjected to too great a force (e.g., high-speed operation), the UCH automatically switches to a lower speed.
- In the event of the windscreen wiper mechanism's motor becoming locked (e.g., if the windscreen freezes over), the UCH automatically cuts of the motor's poewr supply.

IMPORTANT: the wiper blades must be regularly replaced for the rain sensor to work properly.

GETtheMANUALS.org

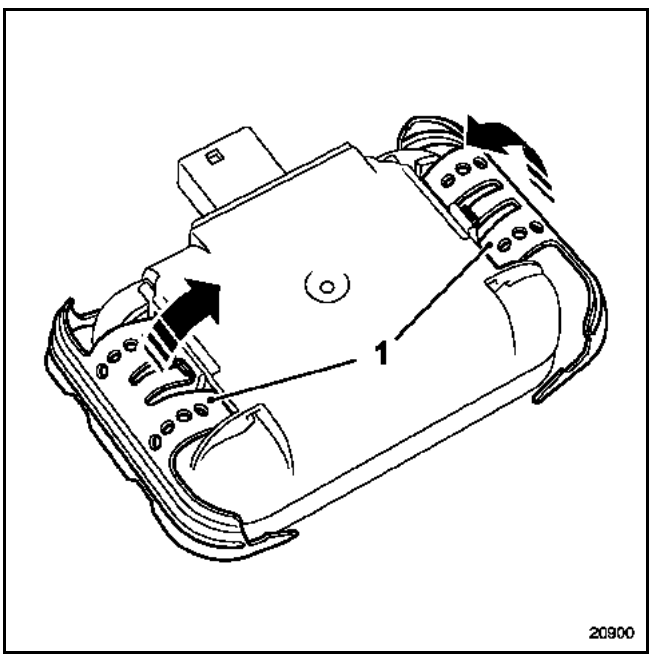
GETtheMANUALS.org

REMOVAL

Remove the interior rear-view mirror cover (see **Bodywork** chapter).

Unclip the two side clips (1) from the sensor using a small screwdriver.



Disconnect the connector.

WARNING: do not touch the light sensor. Fit it on the vehicle as soon as it is removed from its packaging.

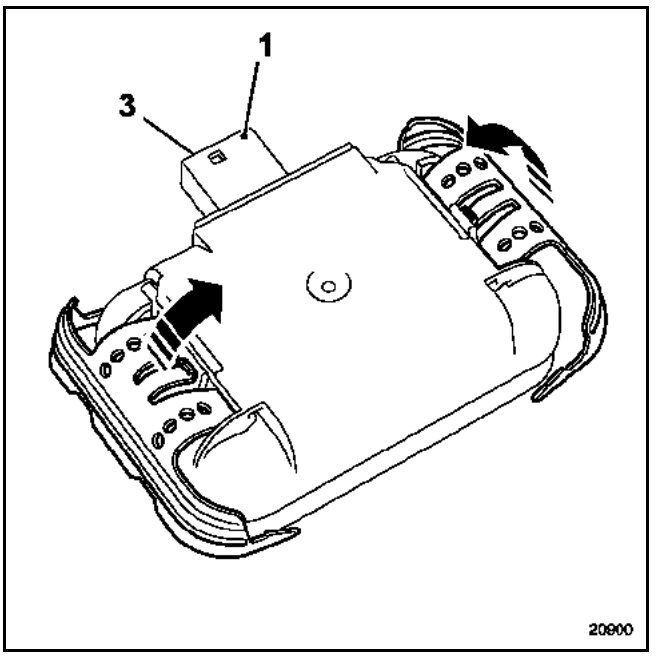
REFITTING

Clean the contact surface between the windscreen and the rain detector.

Place the sensor on the mounting and pull back the clips.

Reconnect the connector and put back the rear-view mirror cover.

CONNECTION



Track	Description
1	+ Battery supply
2	Earth
3	Connection between UCH and wiper motor

GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Elé. 1552	Tool for removing windscreen wiper arms

OPERATION

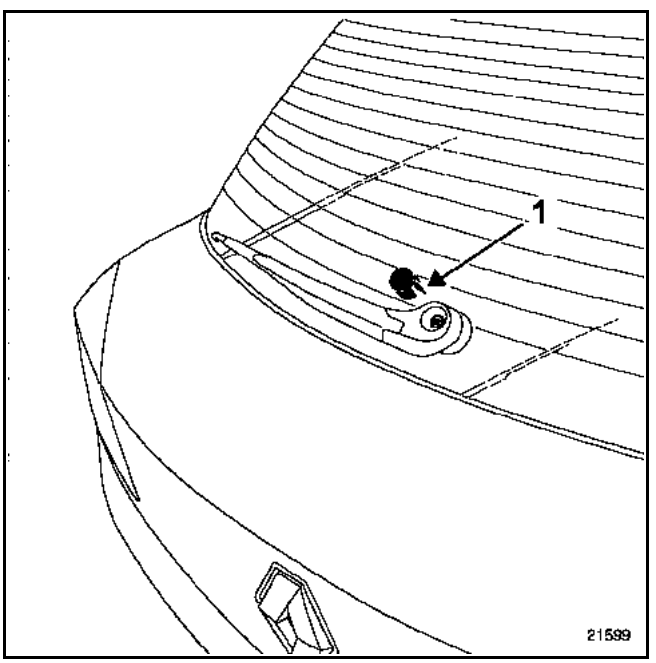
In normal operation, the rear screen wiper works intermittently.

When the windscreen wipers are switched on, the rear wipers are also switched on automatically when reverse gear is selected.

REMOVAL

Unclip the battery.

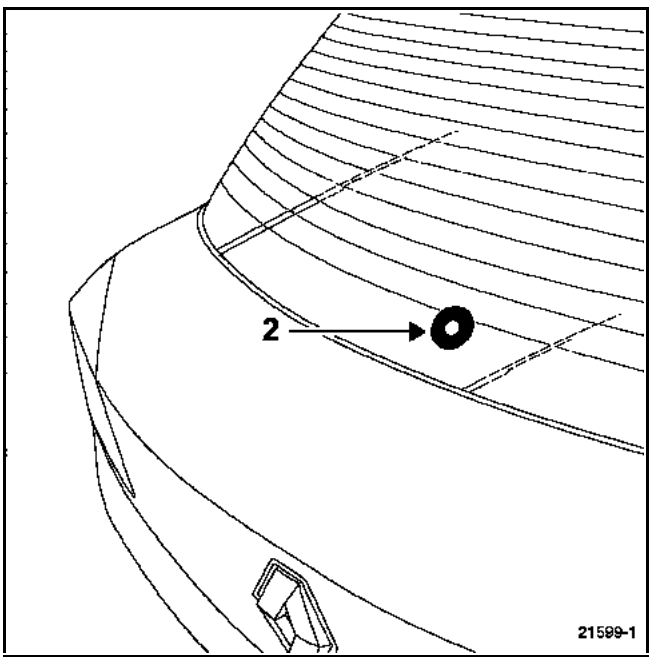
Remove:
– the nut cover, passing a finger under the windscreen wiper arm to press on catch (1);
– the mounting nut and the windscreen wiper arm, using tool **Elé. 1552**,



– the boot trim (see **bodywork chapter**);
– the wiper motor mounting bolts. Disconnect the motor.

REFITTING - Special notes

IMPORTANT: Seal (2) must be replaced after each time the motor has been removed.



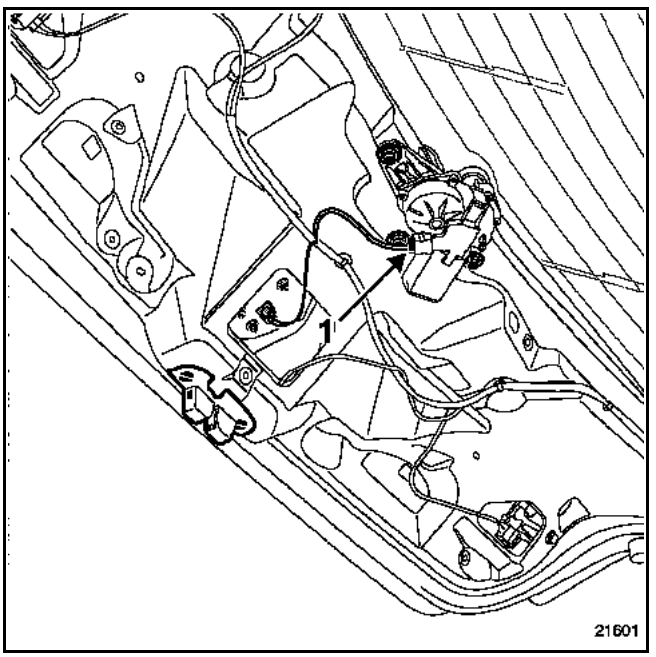
After setting the motor to a torque of **0.8 daNm**, check that the motor is set in the park position.

Clean the motor shaft splines.

Place the windscreen wiper arm in rest position with a new nut and tighten the nut to a torque of **1.2 daNm**.

GETtheMANUALS.org

CONNECTION



Track	Description
1	+ Control
2	Park position information for the UCH
3	Earth

GETtheMANUALS.org

OPERATION

This vehicle is fitted with a bidirectional electric pump which feeds fluid from the same reservoir to both the windscreen and rear screen washers according to the electrical supply to the **two track** connector.

The windscreen and rear screen washers are controlled from the wiper stalk.

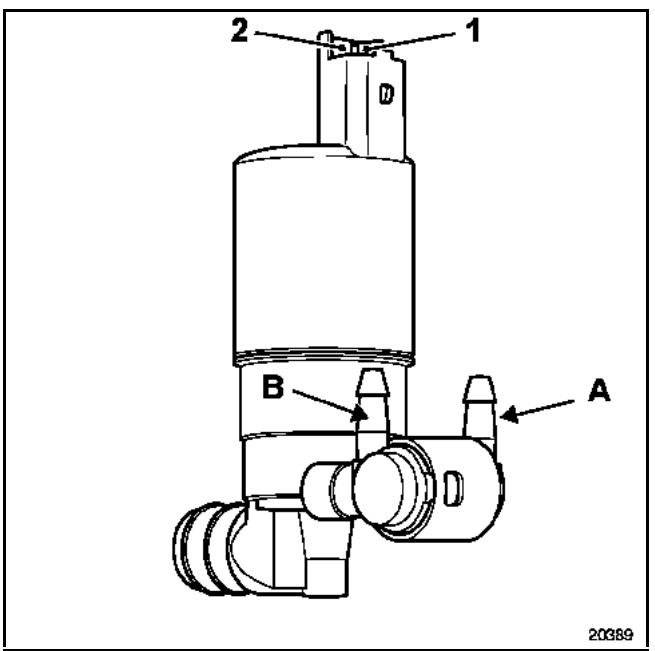
There are two scenarios:

- when the pipes are fed via the socket (A), the windscreen washer operates.

Track	Description
1	Power supply
2	Earth

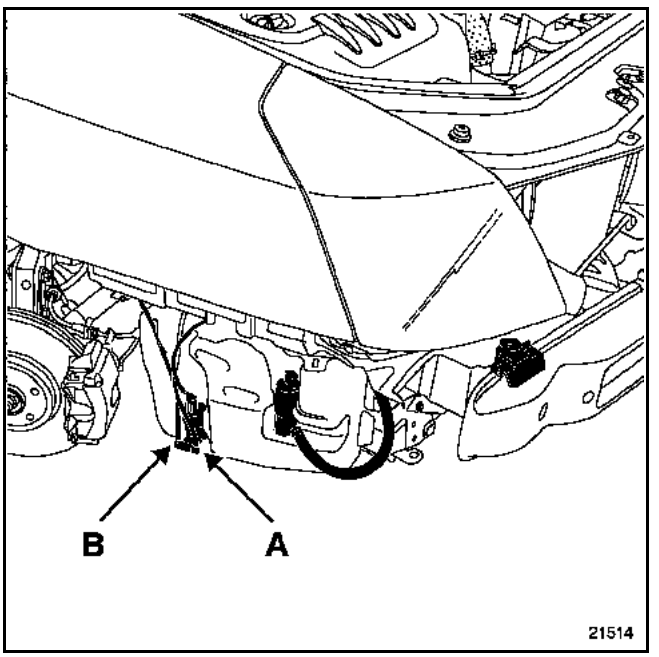
- when the pipes are fed via the socket (B), the rear screen washer operates.

Track	Description
1	Earth
2	Power supply



REMOVING/REFITTING THE PUMP

To obtain access to the washer pump, the front bumper must be removed (see **bodywork chapter**).



When removing the washer pump, mark the two pipes before disconnecting them.

NOTE: some models, such as cold climate cars, are fitted with electric heating air vents.

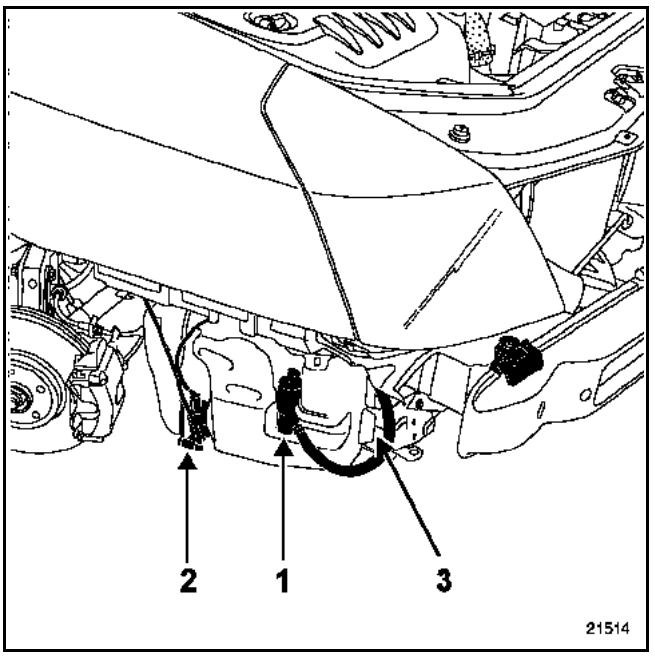
GETtheMANUALS.org

SPECIAL NOTES

The headlight washer pump (1) is supplied via the UCH when the windscreen washer and the main beam headlights or dipped beam lights are switched on.

The electric pump for the headlight washers is located next to the windscreen washer pump (2).

The front bumper must be removed in order to remove the pumps.



CONNECTOR ALLOCATIONS

Track	Description
1	Power supply
2	Earth

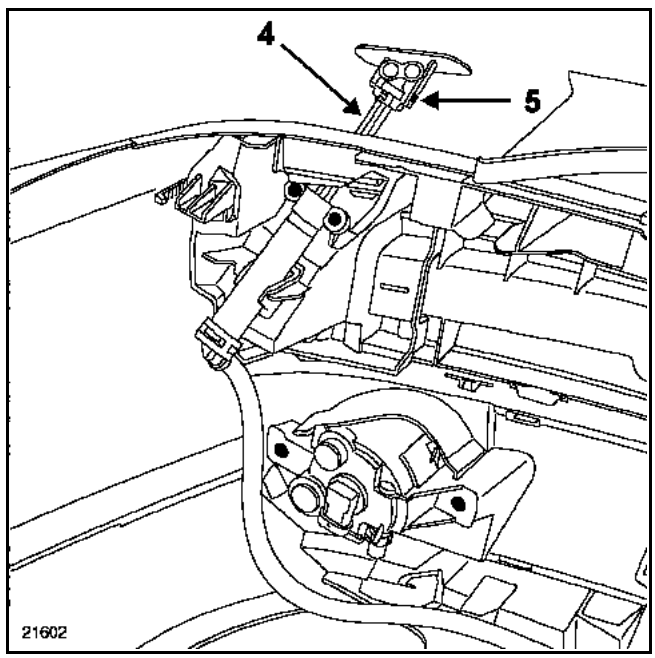
NOTA: only vehicles fitted headlight washers have a fluid level sensor (3).

REMOVAL/REFITTING

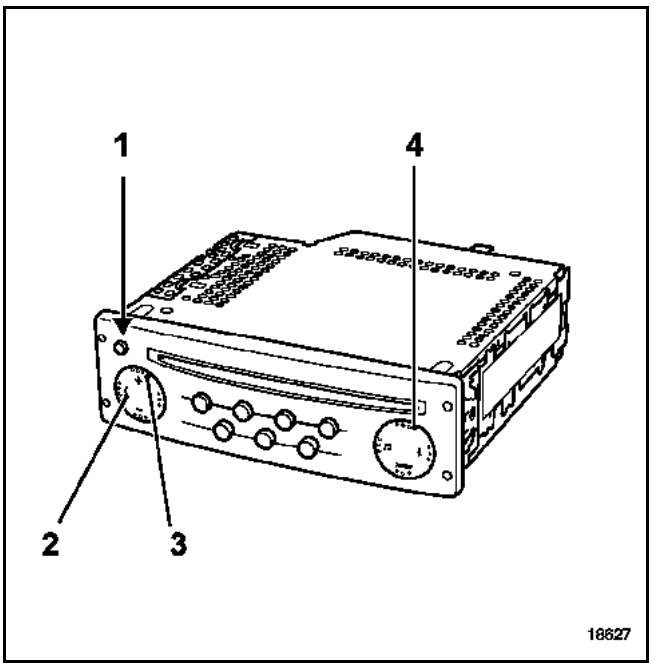
The headlight washers comprise two parts:
- a visible part including the jets;
- a section behind the front bumper.

To remove the jets alone, the rigid fuel supply pipe (4) must be clamped with a vice and a rag (to protect the bumper paint) in order to remove holding clip (5).

The front bumper must be removed in order to remove the lower section.



GETtheMANUALS.org



1 on/off
2 < and > buttons are used to change the configuration and access menus
3 + and - buttons alter the settings
4 "**source**" button

The radio features allow you to:
– listen to the radio (four geographical zones can be programmed for FM radio)
– display the name of the station using RDS which automatically switches to the best transmitter (AF function),
– receive traffic news ("I Traffic" function),
– receive news flashes and emergency bulletins ("I News" function).
– receive public safety emergency bulletins ("PTY 31").

RADIO FUNCTION

REMINDER: four geographical zones can be programmed for the radio.

The Tuner has three selection modes visible on the screen and accessible from the radio front panel:
– manual mode (MANU),
– preset mode (PRESET),
– alphabetical mode (LIST).

CD FUNCTION (SINGLE DISC)

The CD player can play conventional discs and any audio tracks on a CD-ROM.

CDs can be played in order or tracks can be chosen at random.

NOTE: when a CD changer is being used, tracks from one disc only are played at random.

HEAT SHIELD

If the radio temperature is too high for it to function properly, the volume is automatically reduced (without changing the volume shown in the display).

Should one of the speaker tracks short circuit, the supply to the amplifier will be cut off.

GETtheMANUALS.org

CODED PROTECTION

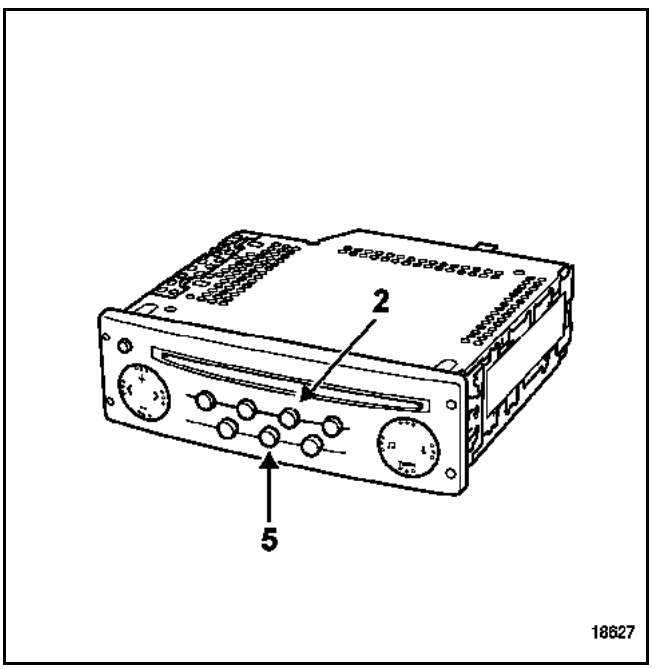
The radio is protected by a four digit code. This code must be entered via the control planet wheel or the radio keypad each time the battery is disconnected.

Entering the code with the control on the steering wheel:
press the bottom button on the control to confirm an entry.

If the code is entered incorrectly, the radio will be locked (1 minute for the first mistake, 2 minutes for the second mistake, 4 minutes for the third mistake etc.).

Some settings must be made after the code has been entered for the first time (see "**configuration**" section). These settings are stored when the battery is disconnected.

NOTE: if there is a configuration error, you can retum to scrambled mode by pressing the **2** and **5** buttons at the same time as switching the power on. Then wait 2 minutes.



CONFIGURATION

NOTE: to select the zone in which the radio is to be used, press the **2** and **5** buttons while switching the power on. Then wait approximately 2 minutes. Enter the four digit code and then:

- select the tone curve appropriate for the vehicle
  - 0: no regulation
  - 1: Twingo
  - 2: Clio
  - 3: Megane
  - 4: Laguna
  - 5: Vel Satis

- Select the relevant zone:
  - **America**
  - **Japan**
  - **Asia**
  - **Arabia**
  - **Others** (Europe, Africa, other)

- configuration of the rear speakers: "REAR ON/OFF"

NOTE: these configurations are not required when the secret code is entered after the power supply has been cut.

"EXPERT" MODE

To move to configuration mode ("**Expert**" mode), press and hold the "**source**" key for about four seconds until you hear a bleep. This allows you to adjust the following functions:

- **AF** mode activation (automatic retuning),
- vehicle speed-dependent volume (**5** for maximum change, **0** for no change),
- activation of **Loudness** mode,
- activation of **Assisted tuner** mode
- configuration of the number of **speakers** (2 or 4),
- selection of manual or dynamic list.

NOTE: pressing the source button when entering the configurations cancels the changes.

GETtheMANUALS.org

CONFIGURATIONS

Configuration is required after the security code has been entered for the first time or after buttons "**2**", "**5**" and "**radio ON**" have been pressed. Wait approximately 2 minutes then enter the security code.

↓

Select the appropriate tone curve for the vehicle model:

0: no regulation
1: Twingo
2: Clio
3: Megane
4: Laguna
5: Vel Satis

↓

Confirm by pressing and holding the lower button on the steering wheel control.

↓

Select the geographical zone for tuner operation:
– **Others** (Europe, Africa, other)
– **America**
– **Japan**
– **Asia**
– **Arabia**

↓

Configuration of the rear speakers:
"**REAR ON/OFF**"

SETTINGS

Press and hold the "**Source**" button to modify parameters.

↓

Activate or deactivate monitoring of automatic resynchronisation of stations (RDS): **AF ON/ OFF** using the "+" and "-" buttons.

↓

Scroll to the next parameter using the tumble wheel or the ↑ and ↓ buttons.

↓

Select the curve for speed-dependent volume control then confirm:
– **SPEED 0:** no regulation.
– **SPEED 5:** maximum regulation.

↓

Activate or deactivate the "**Loudness**" function:
LOUD ON/OFF.

↓

Select the Tuner operating mode:
TUNE MAN/AUTO

↓

Configure the use of rear speakers:
REAR ON/OFF

↓

Configure the list update:
"**LIST MAN/DYN**"

GETtheMANUALS.org

VOLUME CONTROL

The volume can be increased according to the vehicle speed. To operate this function:
select the desired volume adjustment curve by using the "**expert**" mode (press and hold the "**source**" button until a bleep is heard): **5** for maximum increase, **0** to suppress the increase.

NOTE: check that the radio is correctly wired to ensure that this function is operational.

NOTE: the radio is equipped with tone modification according to the vehicle. To change vehicle type, refer to the "**Configuration**" section.

SELF-DIAGNOSTIC MODE

The self-diagnostic mode checks some of the main functions:

- **testing the speakers**
  the speakers are fed one at a time if you press buttons **2** and **4** simultaneously. This is confirmed by the display. Compare the sounds from each speaker.

- **testing the reception level (after display of the frequency)**
  The display shows the radio reception information if you press buttons **1** and **6** simultaneously:
  – 9 or letter: good reception
  – lower than 3: poor signal
  – if 2: total loss of stereo

GETtheMANUALS.org

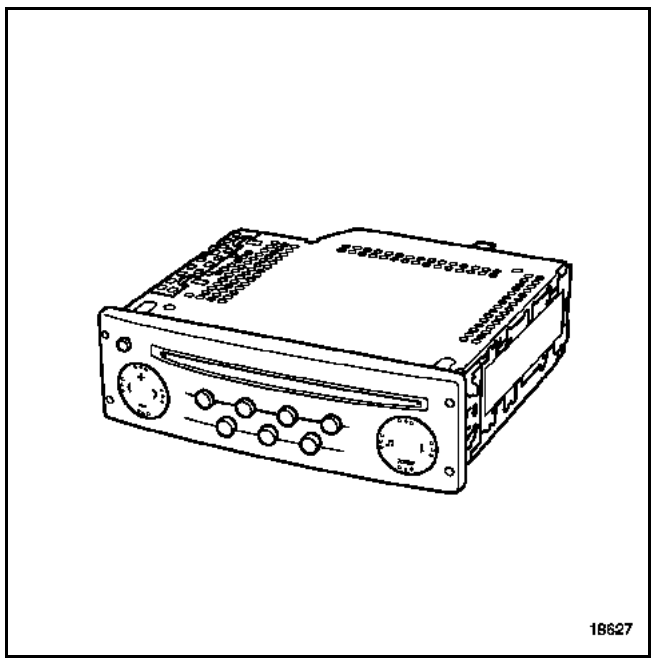
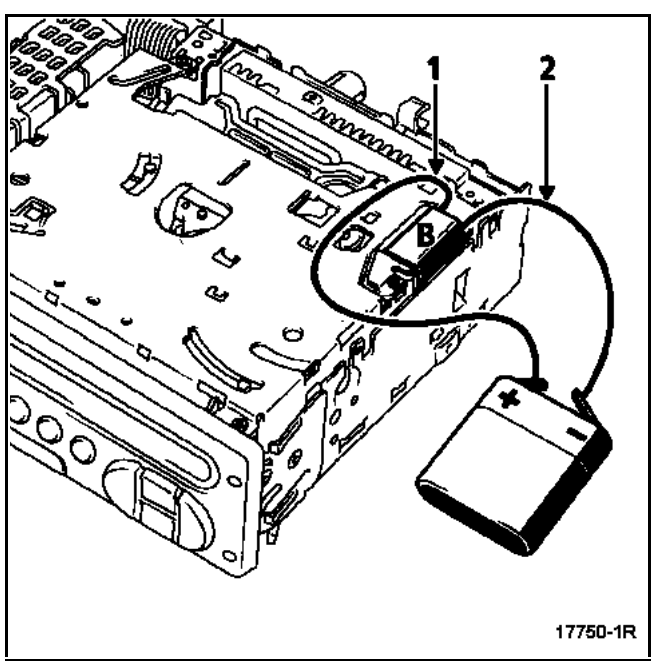
RECOVERING A DISC LOCKED IN FAULTY AUDIO EQUIPMENT



Remove the upper section of the radio.

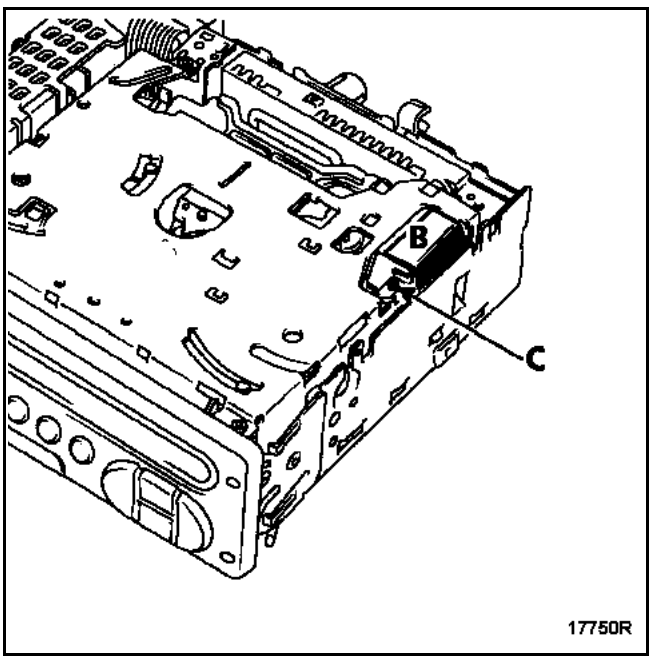
First solution

If the electric ejector motor is operational, eject the CD using a **4.5 V** battery to supply electric motor (B) (place the + wire on contact (1) and the - wire on contact (2) while ejecting the CD).

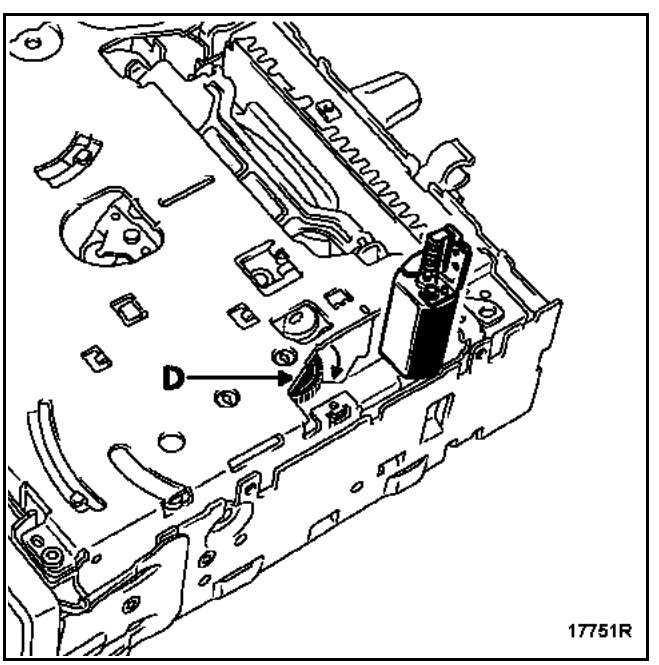


Second solution

If the electric ejector motor is not working, remove bolt (C) and disconnect the electric motor (B).



Turn toothed wheel (D) manually in a clockwise direction until the CD is ejected.



Before replacing the radio:

– refit the electric motor and attach it using the bolt (second solution only),
– refit the casing.

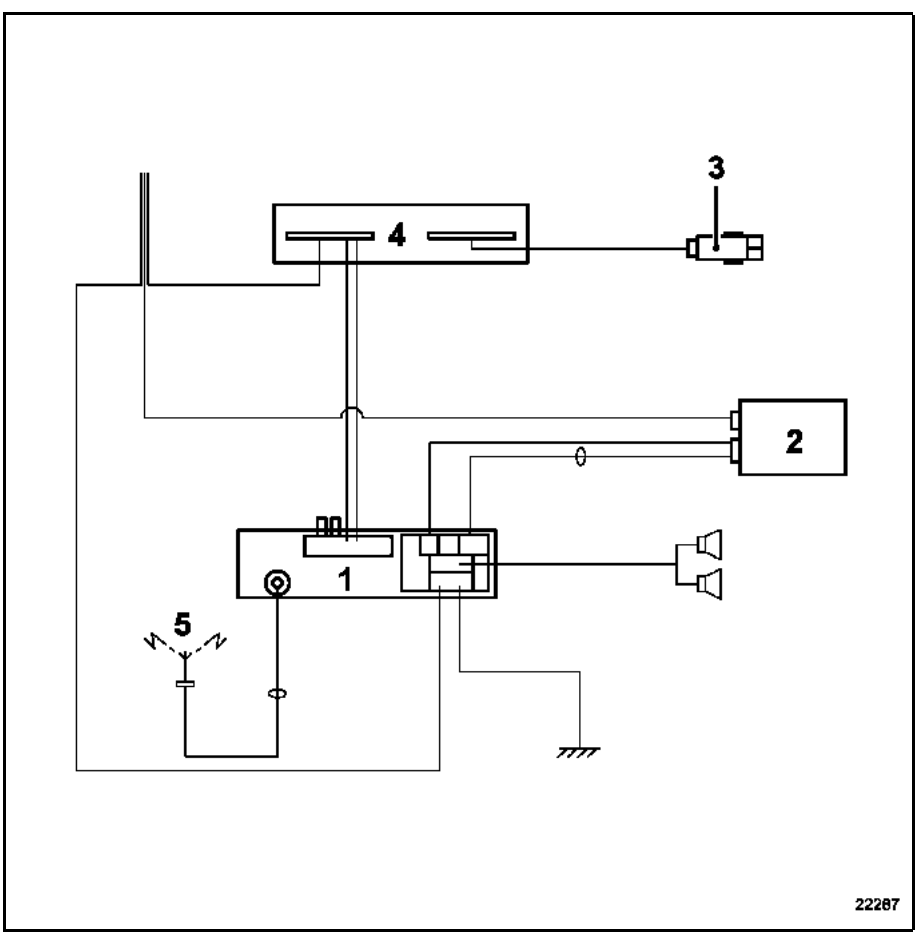
GETtheMANUALS.org

The "**Top of the Range**" audio equipment consists of:
– a tuner-amplifier (1) located under the rear seat base of the vehicle,
– a CD changer (2) in the dashboard panel,
– a planet wheel (3) control at the steering wheel,
– a remote display (4),
– an amplified radio aerial (5).

The amplifier-tuner includes a test menu for repair purposes. Refer to the "**self-diagnostic**" section. It is not permitted to work on a system component. Incorrectly operating components should be replaced.

DIAGRAMS

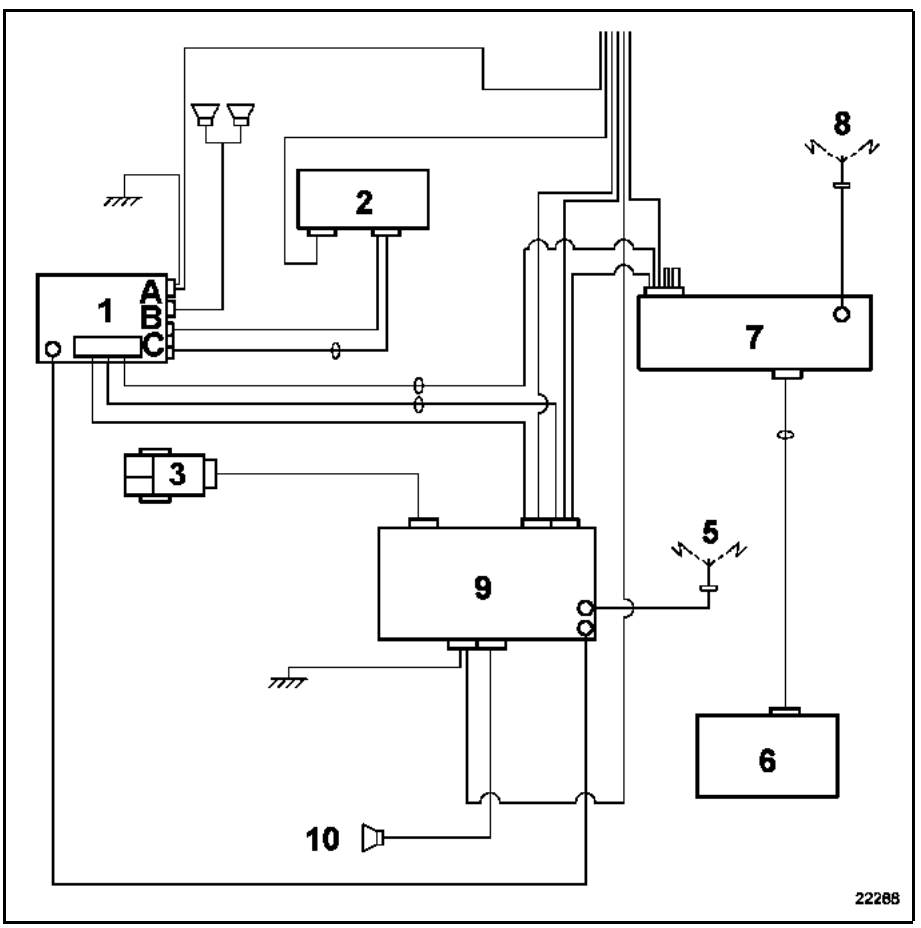
1 Basic audio equipment



GETtheMANUALS.org

2 Audio equipment with navigation assistance

The top of the range audio equipment with navigation assistance consists of:
– a tuner-amplifier (1) located under the rear seat base of the vehicle,
– a CD changer (2) in the dashboard panel,
– a planet wheel (3) control at the steering wheel,
– an amplified radio aerial (5).
– a navigation screen (6),
– a navigation computer (7),
– a GPS receiver aerial (8),
– a central communications unit (9),
– a voice synthesiser speaker (10).



When the vehicle is fitted with a central communications unit (navigation assistance), the data associated with the audio equipment (presets, parameters, tone adjustment) can be stored on the Renault card (depending on version).

GETtheMANUALS.org

The radio will operate for approximately **20 minutes** without the ignition being switched to the accessories position. The radio beeps then switches off.

RADIO FUNCTION

This system uses two different tuners:
– the radio tuner,
– the Tuner for "**traffic information**" system messages.

The radio Tuner has three selection modes indicated on the screen and accessible from the front panel:
– manual mode (**Manu**),
– preset mode (**Preset**),
– manual or dynamic alphabetical mode (**List**), (refer to the "**Parameters**" **section**).

CD OPERATION

The CD changer can hold up to six discs (insert through the front panel).

The CD changer can play conventional discs and any audio tracks on a CD-ROM; the tracks can be played in order or at random.

NOTE:
– tracks from one disc only are played at random. When one CD is finished, random play continues on the next disc,
– the "**mute**" function stops playing of the disc and the display shows "**pause**" (depending on version).

Inserting compact discs

Press button (A) "LOAD".

"SELECT" is displayed.

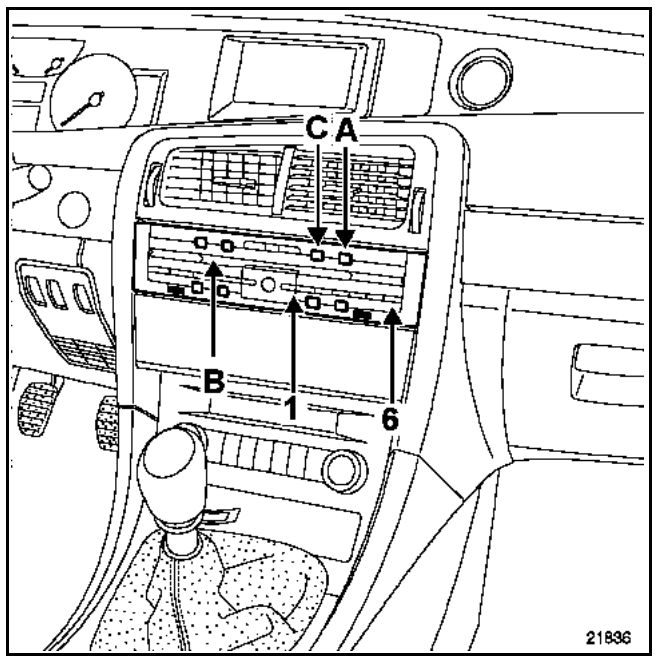
Select the CD desired using buttons (1) to (6).

The messages "**WAIT**" then "**INSERT**" are displayed.

Insert the CD through slot (B).

The display shows "LOAD" then plays the disc.

Repeat this procedure for other discs.



Ejecting compact discs

Press button (A).

Select the disc position using buttons (1) to (6).

The disc ejects. If it is left for a delay of approximately **15 seconds**, the disc is automatically reinserted.

NOTES:
– the sound is automatically muted during all of these processes,
– it is possible to eject all compact discs by pressing button (C) "ALL".

GETtheMANUALS.org

CONFIGURATIONS

Radio configuration is only required when entering the security code for the first time. It is then stored in case the power is cut.

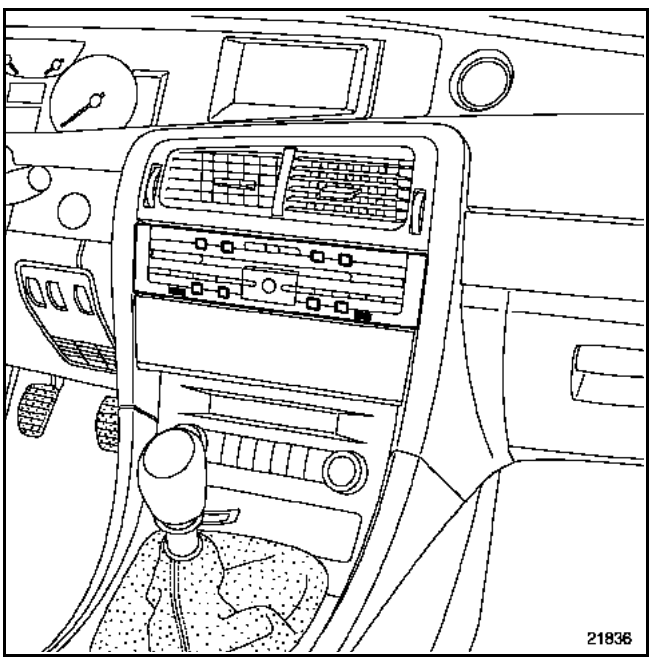
- Select the volume ranges according to the vehicle: the system has a default parameter of "**0**".

- Select the relevant zone:
  - **Others** (Europe, Africa, other)
  - **America**
  - **Japan**
  - **Asia**
  - **Arabia**

NOTE: these configurations can be modified by pressing and holding the "**source**" button on the front panel or buttons "2" and "5".

SETTINGS

To enter "**Parameter**" mode ("**Expert**" mode), briefly press the "**Expert**" button until a beep is heard. This allows you to adjust the following functions:
- activation of **AF** mode (automatic retuning of stations: RDS),
- change the **volume range** according to vehicle speed (5 for maximum change, 0 for no change),
- activation of **Loudness** mode,
- activation of **manual or automatic tuner** mode,
- activate **AUX** (auxiliary) function for the DVD option.



GETtheMANUALS.org

CONFIGURATIONS

The equipment may be configured after the security code has been entered for the first time or by pressing and holding the "**source**" button.

↓

Select the tone curve for the appropriate vehicle model. This graph has a default setting of "CURVE = 0".

↓

Confirm by pressing and holding the lower button on the steering wheel control.

↓

Select the geographical zone for tuner operation:
- **Others** (Europe, Africa, other)
- **America**
- **Japan**
- **Asia**
- **Arabia**

↓

Confirm by pressing and holding the lower button on the steering wheel control.

↓

Configure equipment with rear speakers: "**REAR ON/OFF**".

↓

Confirm by pressing and holding the lower button on the steering wheel control.

SETTINGS

Parameters can be altered by pressing the "**Expert**" button briefly.

↓

Activate or deactivate monitoring of automatic resynchronisation of stations (RDS): **AF ON/ OFF** using the "+" and "-" buttons.

↓

Scroll to the next parameter using the tumble wheel or the ↑ and ↓ buttons.

↓

Select the curve for speed-dependent volume control then confirm:
- **SPEED 0:** increase inactive.
- **SPEED 5:** maximum increase.

↓

Activate or deactivate the "**Loudness**" function: **LOUD ON/OFF**.

↓

Select the Tuner operating mode: **TUNE MAN/AUTO**

↓

Select the auxiliary input operating mode: **AUX AUTO/ON/OFF**

GETtheMANUALS.org

VOLUME CONTROL

When the audio equipment is switched on, the volume is the same as when it was previously switched off, with a maximum volume of 15.

NOTES:

– The "**mute**" function stops the CD from playing.

– The "**traffic information**" messages are played at the audio equipment's current volume setting. If the volume is altered during a message, the setting is stored until it is reset.

– Navigation messages are played at volume setting 7. If the volume is altered (between 0 and 10) during a message, the setting is stored until it is reset.

– The amplifier is fitted with a heat shield system which lowers the volume if the system overheats.

– Should one of the speakers short circuit, the supply to the amplifier will be cut off.

Volume correction

The volume can be corrected according to vehicle speed. Select the volume control variation desired using the "**Expert**" mode (briefly press the "**Expert**" button): SPEED 5 for maximum variation, 0 to cancel the variation.

Equaliser controls

The audio equipment has a range of settings depending on the type of music being played: CLASSIC/JAZZ/POP/VOICE/FLAT/PERSO

Balance/fader

For a simplified operation, the audio equipment allows all or some of the speakers to be activated or deactivated:

- < **FRONT** >: only the front speakers are used
- < **FRONT** >: only the front left-hand speakers are used
- **FRONT** >: only the front right-hand speakers are used
- < **REAR** >: only the rear speakers are used
- **ALL CAR**: all speakers are used (balance and fader centred)
- **PERSO**: previous personal settings

Auxiliary Output

The operating mode of the auxiliary source can be selected in the "Expert" menu:

– **AUX ON:** scroll to select source (radio → CD → AUX → radio etc.) even if there is no source signal → to the radio.
– **AUX AUTO:** automatic connection to the radio when a source signal is present.
– **AUX OFF:** inhibits source (radio → CD → radio).

GETtheMANUALS.org

CODED PROTECTION

Two components of the audio equipment are protected by a code:

- An initial 4 digit security code is linked to the tuner-amplifier. The user is asked for this code every time the power is cut. This code must be entered via the control planet wheel. The display shows "**CODE**" then "0000".

IMPORTANT: if an incorrect code is entered, the radio beeps, displays "**CODE**" and locks:

– 1st error: **1 min**,
– 2nd error: **2 min**,
– 3rd error: **4 min**... (**32 min** maximum).

When the code has been entered, certain parameters must be reprogrammed. Configuration is only required after the code has been entered for the first time (see the "**Configurations**" section).

NOTE: the code can be scrambled by pressing buttons **2** and **5** at the same time as the equipment is switched on. Then wait approximately **2 min**.

REMINDER: the audio equipment will operate for approximately **2 min** without the code having been entered (with regular warning beeps).

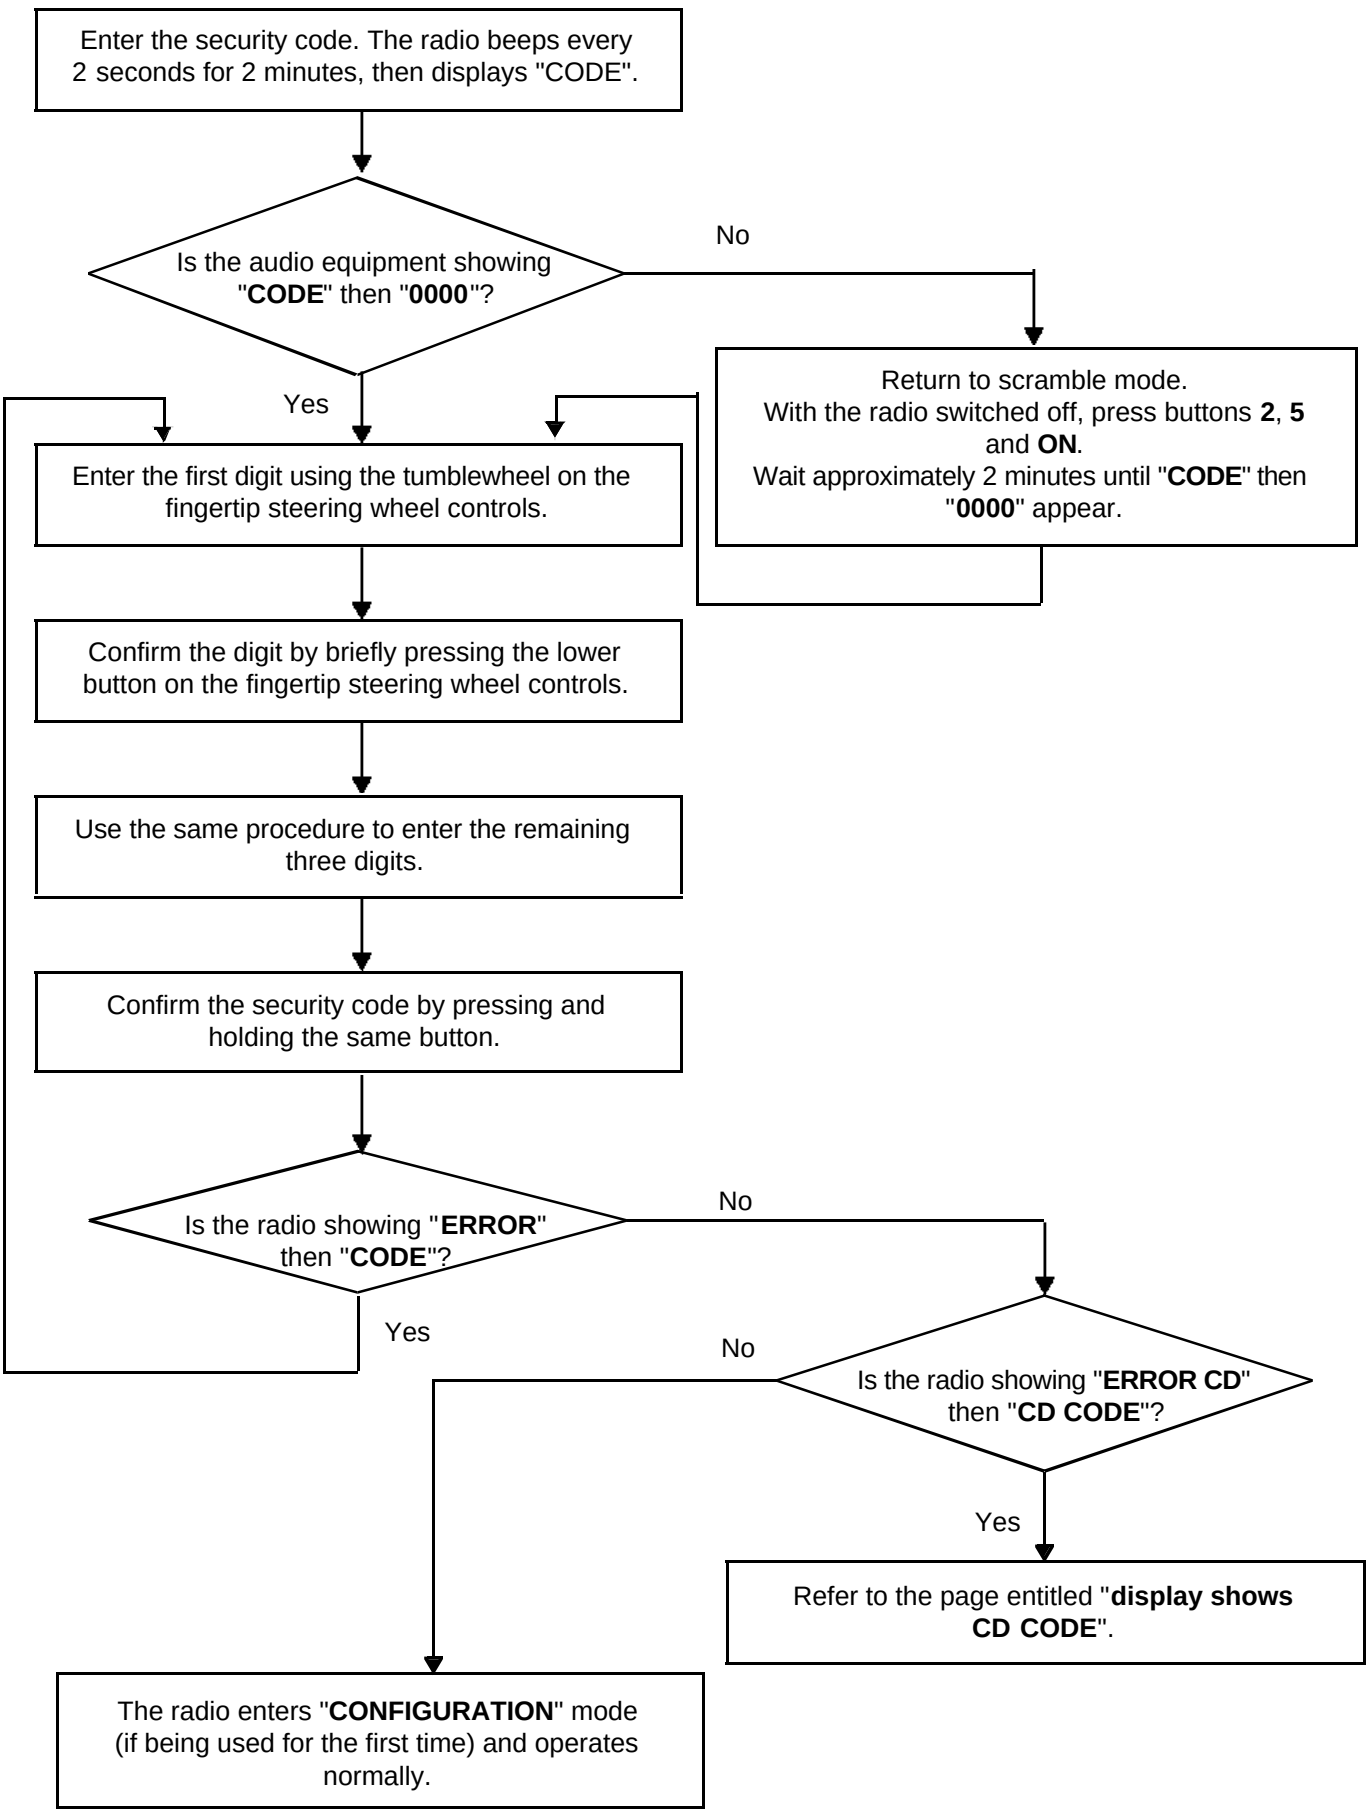
- A code that is exchanged between the CD changer and the tuner-amplifier.

– If a new CD changer is fitted, the amplifier code is programmed when the battery or CD changer is connected.
– If the tuner-amplifier is replaced, the security code of the old amplifier connected to the CD changer may be entered. The CD changer is programmed with the code for the new amplifier.
– If the old amplifier code is lost, the connection code can be cleared by the clearing code. The clearing code is transmitted by Techline, server etc.

IMPORTANT: the CD changer is supplied uncoded. As soon as it is installed into the vehicle, the CD changer is programmed with the tuner-amplifier connection code.

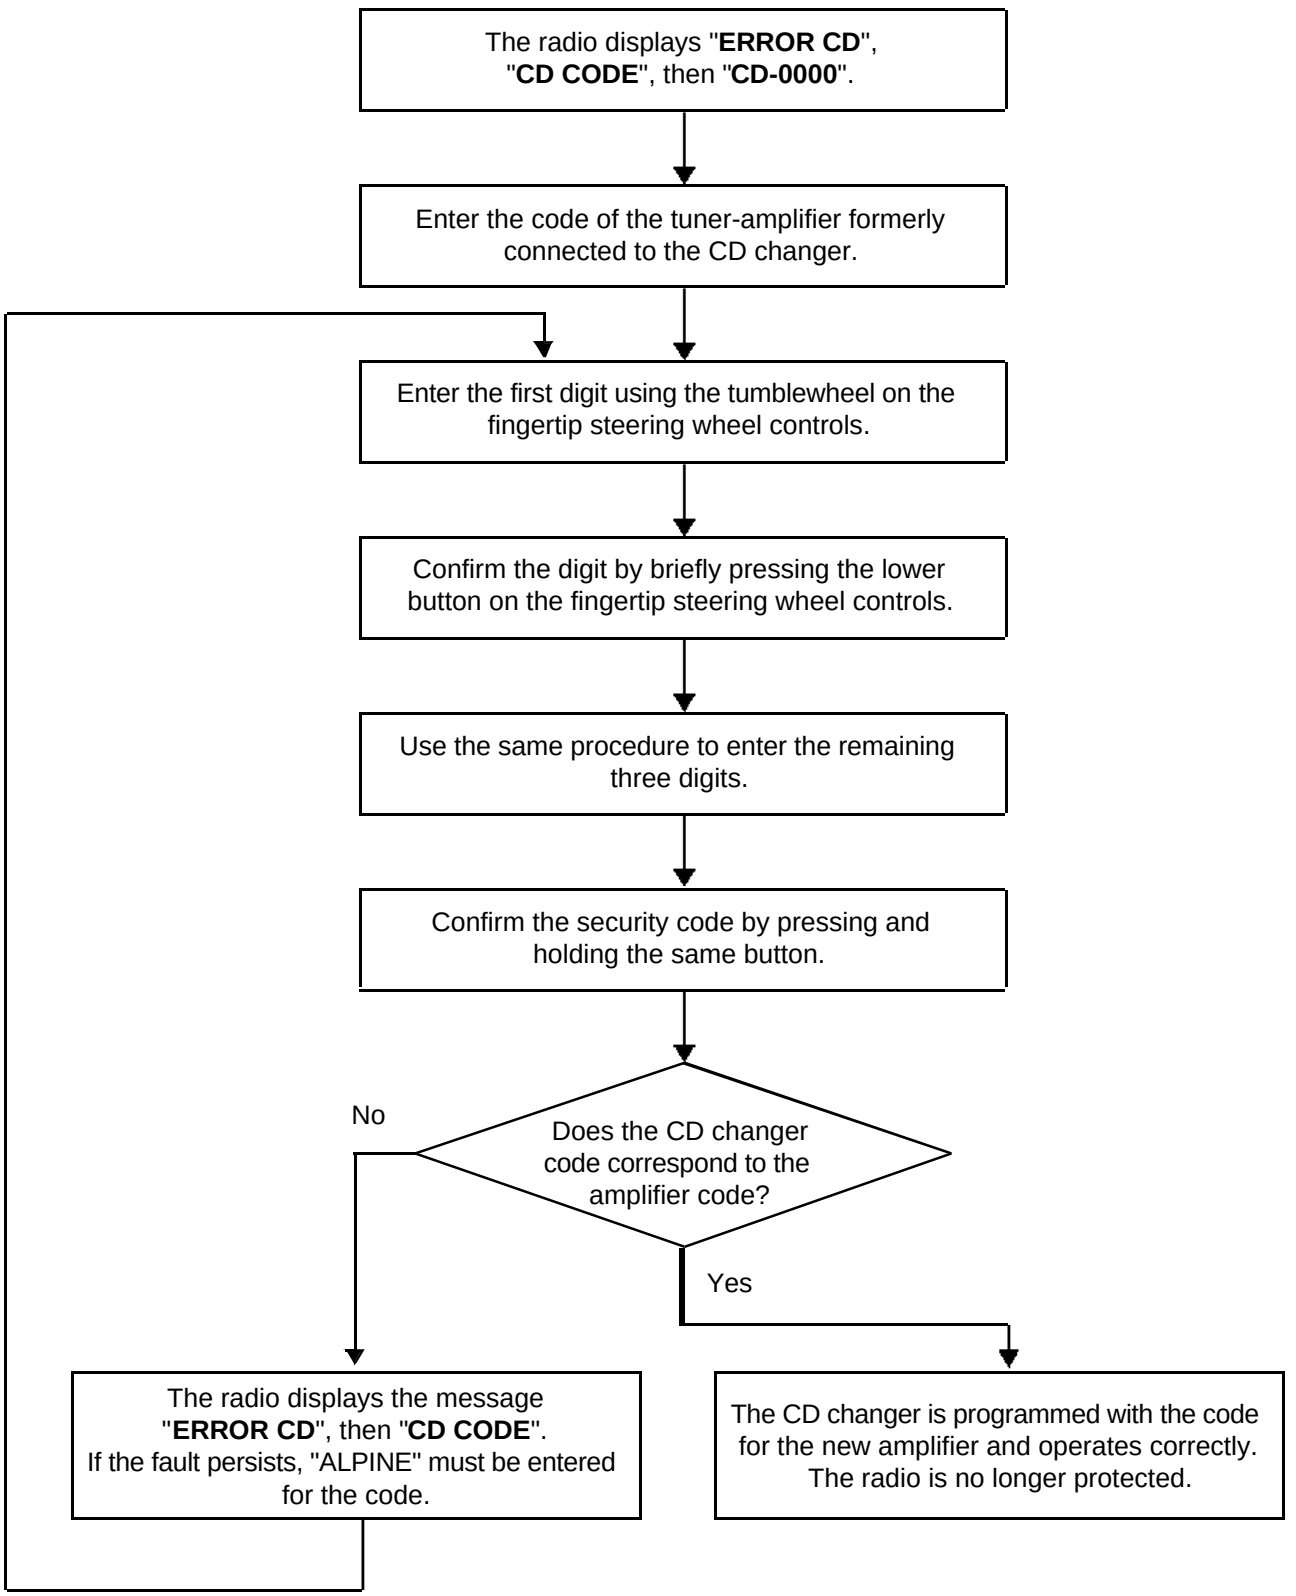
GETtheMANUALS.org

THE DISPLAY SHOWS "CODE" OR "0000"



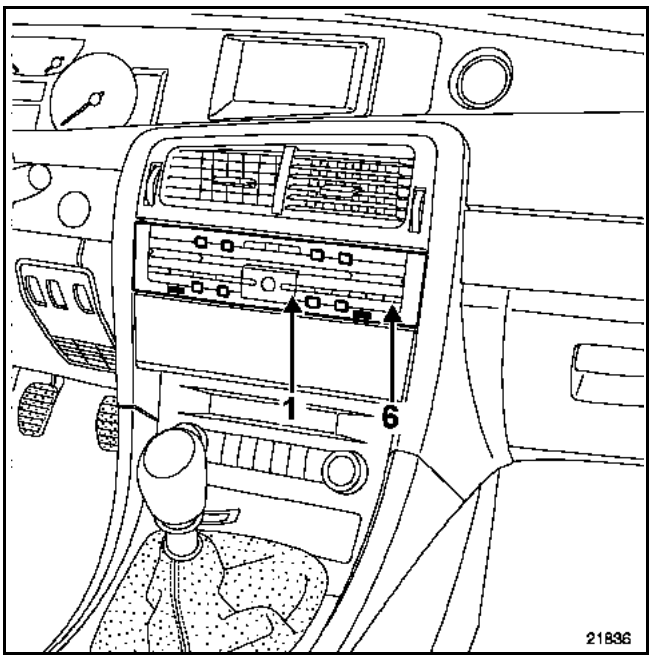
GETtheMANUALS.org

THE DISPLAY SHOWS "CD CODE"



GETtheMANUALS.org

SELF-DIAGNOSTIC MODE



The self-diagnostic mode checks some of the main functions:

- **Testing the speakers**

Pressing and holding the "**Expert**" button powers speakers one-by-one. This is confirmed by the display. Compare the signals on each speaker.

- **Testing the level of reception**

Fault finding can be performed on the tuner by pressing the "**Expert**" button for a second time.

- The first four digits indicate the station.
- The next digit indicates the level of reception: 9 or a letter for an adequate level, lower than 3 indicates a poor level.

- **CD changer operation**

CD changer operation is shown by the presence of CDs being indicated by LEDs on the front panel and the display which indicate the presence of a disc:

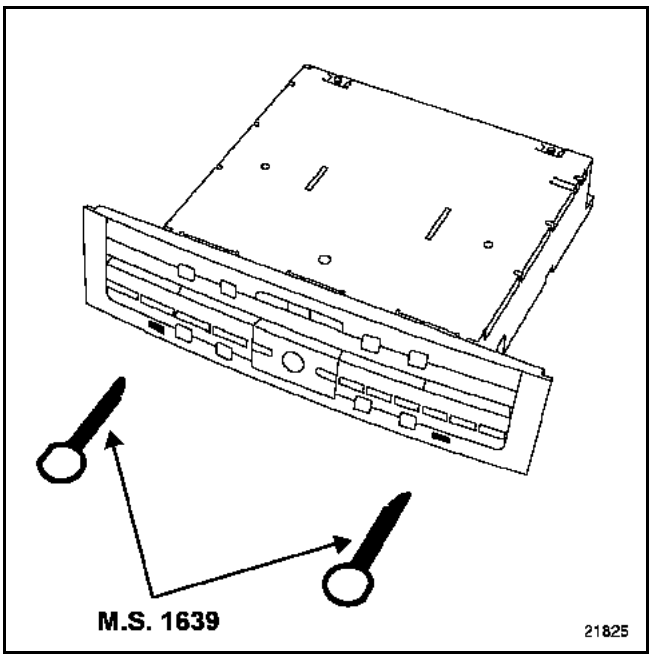
- disc LED is not lit: no CD
- disc LED flashing: mechanism working (disc being inserted)
- "**ERROR CD**" message: no audio track on the disc
- "**LINK_ERR**": CD changer-amplifier connection broken
- "**HI TEMP**": CD changer temperature too high

GETtheMANUALS.org

IMPORTANT: the CD changer is supplied uncoded. As soon as the CD changer is installed, it is programmed with the tuner-amplifier code.

The clearing code is required if the security code is lost.

The CD changer is removed by the front panel using special tool **M.S. 1639**.



IMPORTANT: before connecting a new CD changer, bracket (A) must be removed otherwise the CD changer may be damaged.

GETtheMANUALS.org

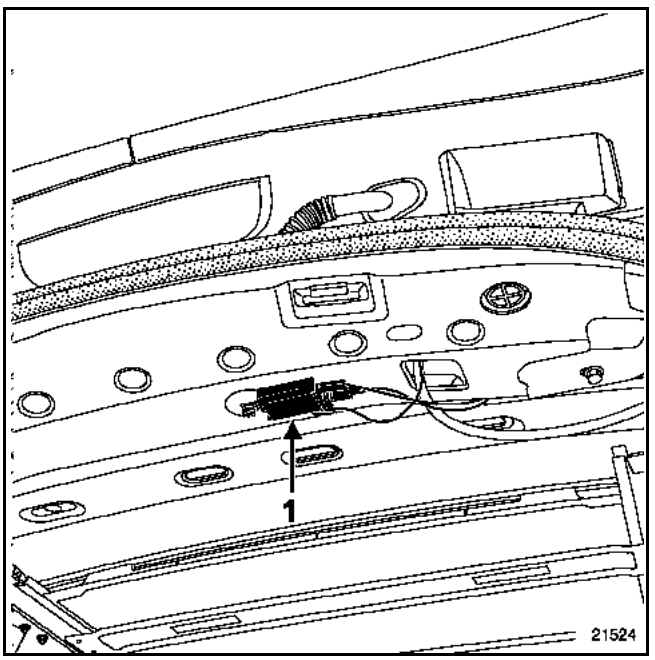
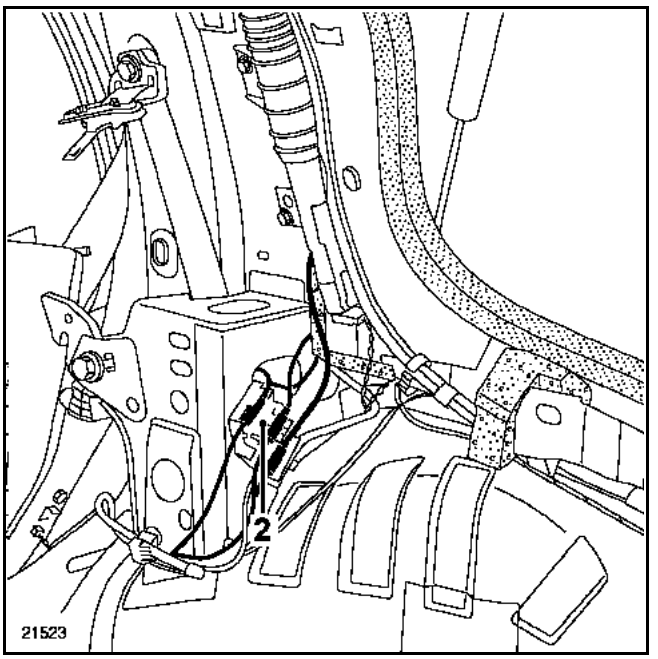
The vehicles are fitted with a radio reception-specific aerial located in the tailgate.

Amplifier (1) is mounted on the roof, behind the lining.



The amplifier is supplied:
– by the radio in vehicles without navigation assistance,
– by the central communications unit in vehicles fitted with navigation assistance. Refer to **section 83C "Navigation assistance"**.

The aerial rod is connected at connection plate (2).



NOTE: if the vehicle is fitted with the navigation assistance system, the radio aerial is connected to the radio through the central communications unit. Refer to **section 83C "Navigation assistance"**.

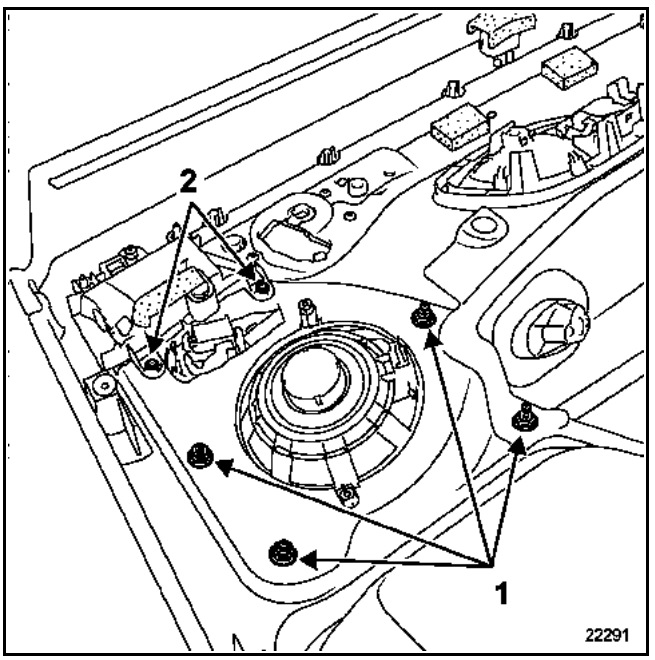
GETtheMANUALS.org

The vehicles are fitted with:
- front tweeters in the dashboard,
- front door speakers,
- tweeters and speakers in the rear doors.

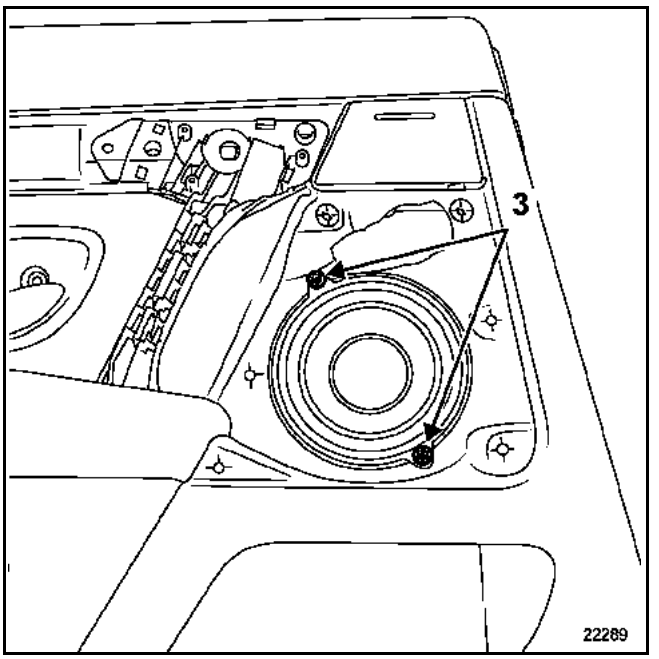
IMPORTANT: removal of the door speakers requires the removal of the door linings. (Refer to the **bodywork** section).

Special notes for the rear speakers

Remove:
– the speaker grille by undoing nuts (1),
– ashtray support screws (2),



– speaker mounting screws (3).

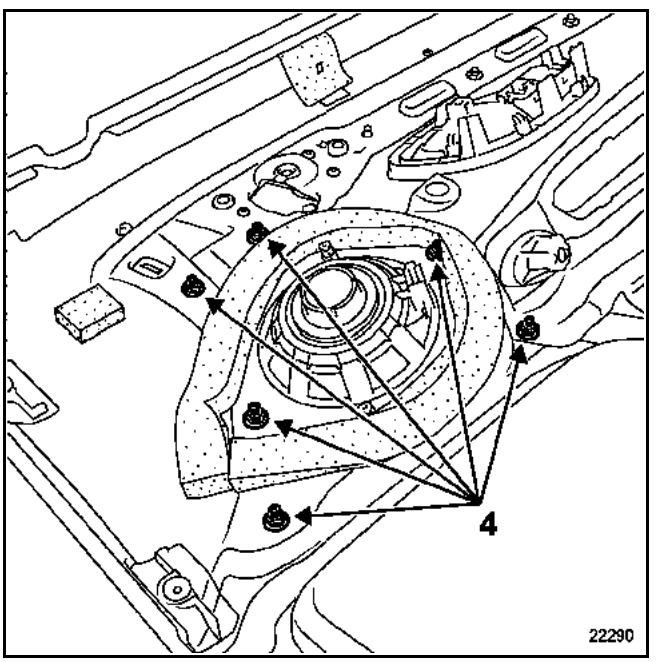


When refitting the speakers, tighten screws (1) lightly.

NOTE: the tweeter is clipped into the grille.

Special notes for the front speakers

Remove:
– the speaker grille by undoing nuts (4),
– speaker mounting screws.

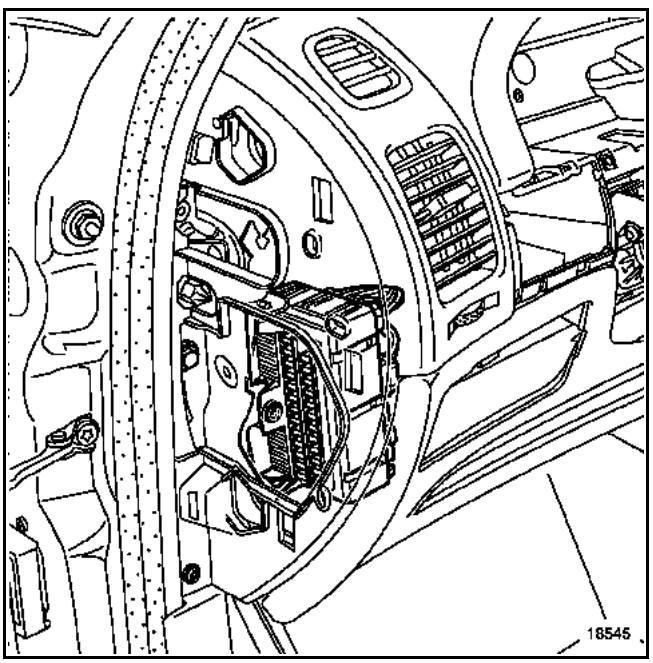


When refitting the speakers, tighten screws (4) lightly.

GETtheMANUALS.org

DESCRIPTION

The UCH is located in the dashboard on the driver's side.



This computer contains most of the computers, including the engine immobiliser decoder.

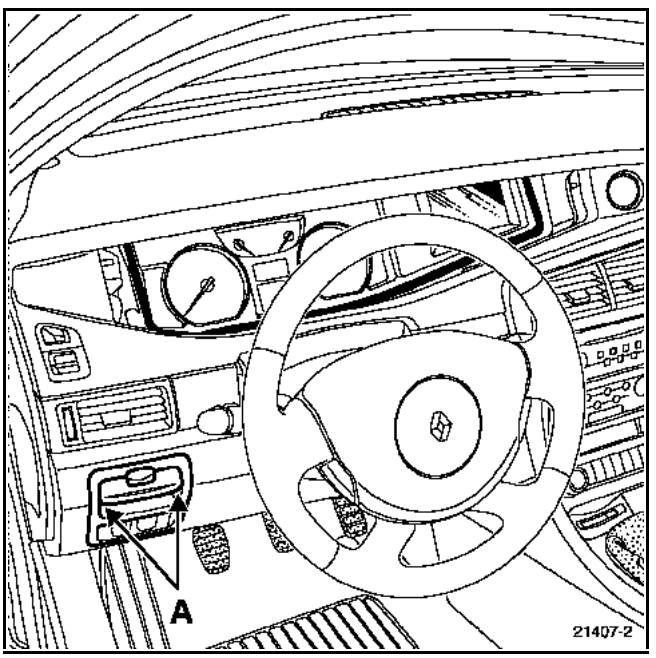
REMOVAL

NOTE:
- It is essential to read the configurations using the diagnostic tool when replacing the UCH.
- The relay/fuse box is clipped onto the UCH. One has to be removed to remove the other.

Disconnect the battery.

Remove:
– the driver's side dashboard facing,
– the cover under the dashboard,
– the handle of the automatic parking brake fastened by bolts (A),
– the mounting for the beam height adjustment control (**clipped**),

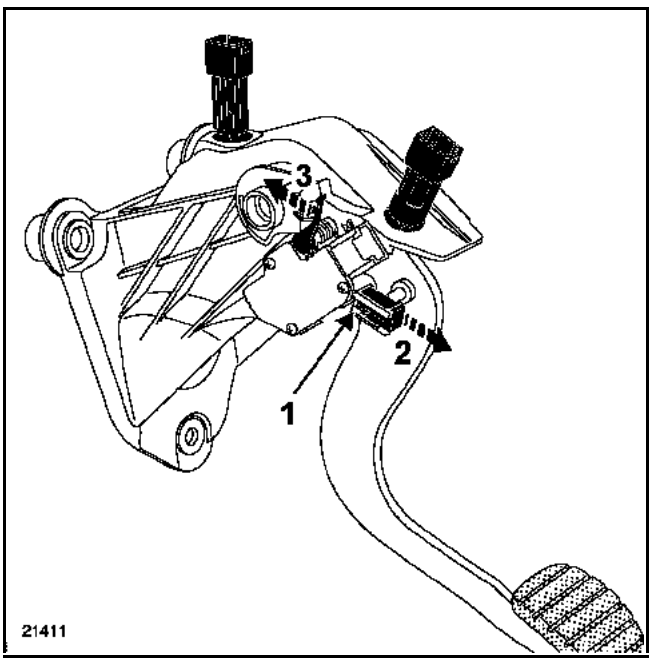


– the clutch pedal travel sensor (manual gearbox) as follows:

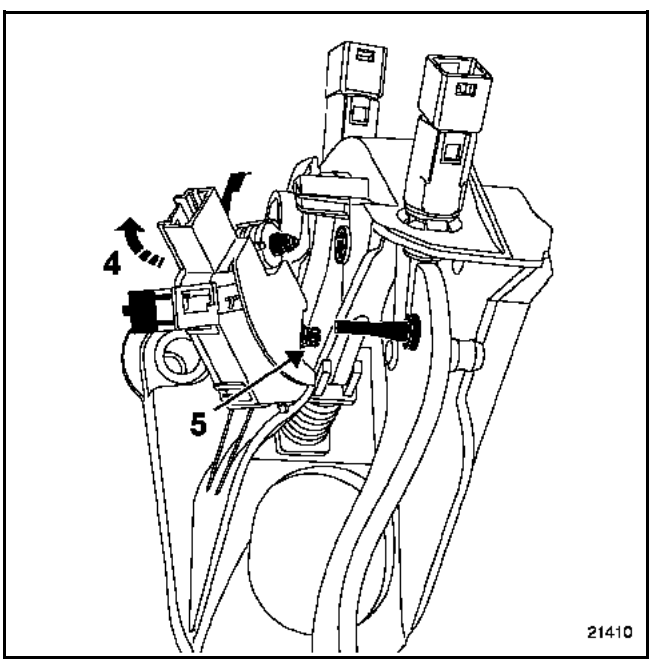
Disconnect the connector.

Unlock the section linked to the pedal by undoing the bolt (1) and sliding it out (2).

Unlock the sensor body by undoing bolt (3).

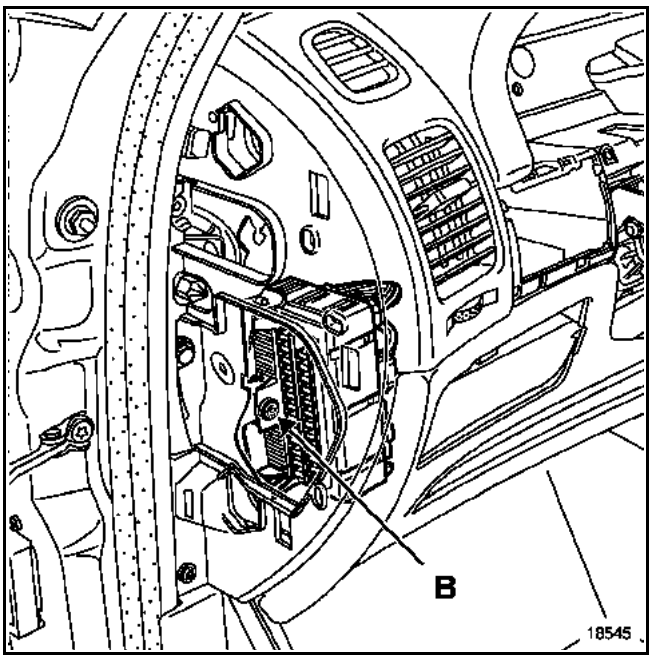


Tilt the sensor (4), taking care not to break the lower mounting bracket (5).

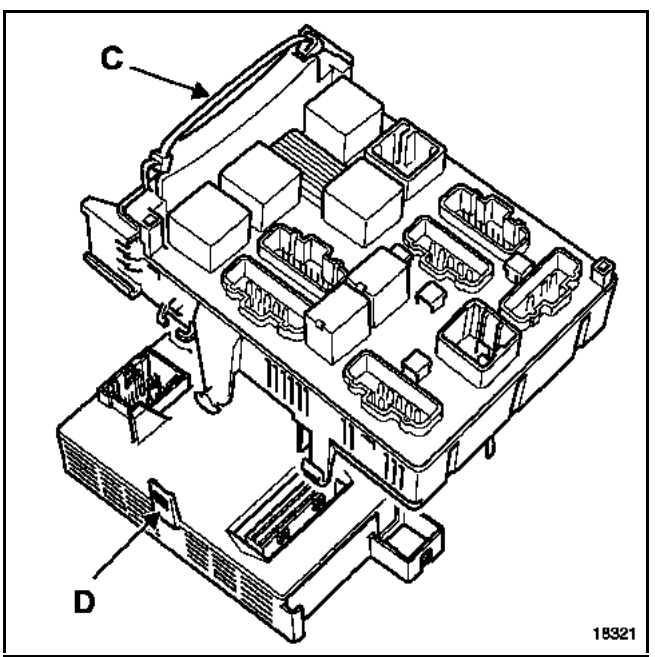


GETtheMANUALS.org

Remove mounting bolt (B) from the UCH.



Cut wiring harness support plastic clip (C).

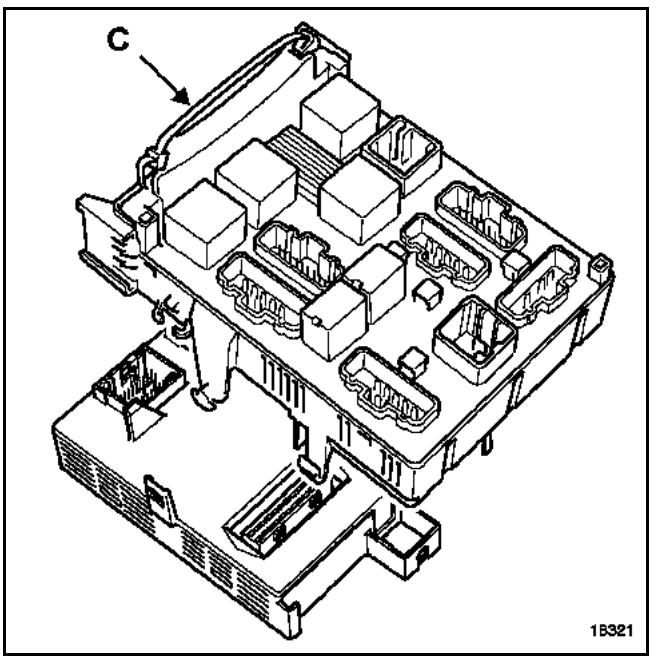


Disconnect the UCH and the passenger compartment fuse and relay box connectors.

Separate the UCH and the fuse and relay box by pressing on the locks (D).

REFITTING

Reconnect the wires and fit a large clip (C) to retain the harness firmly in place.



Next, program the codes for the vehicle and for the RENAULT Card, and configure the UCH according to the options.

GETtheMANUALS.org

REPLACEMENT AND CONFIGURATION OF THE UCH

A new UCH is not programmed with a code. You must therefore program a code into a new UCH fitted to a vehicle to make the UCH operational.

You must have at least one of the old RENAULT Cards for the vehicle, plus the repair code, and the injection computer must be correctly coded before you can perform this procedure.

WARNING: if a code is programmed into the UCH, it is assigned to the vehicle and it is impossible to clear the code or program another one.

IMPORTANT: only RENAULT Cards submitted during this procedure will work if:
– they have already been coded on this vehicle,
– or they are new (not coded).

UCH PROGRAMMING PROCEDURE

- Establish dialogue with the **Immobiliser** system.
- In the **Command**, **Specific command** menu, select and confirm **SC027: program UCH** line.
- The tool displays **Please enter the After-Sales code**.
  With no RENAULT card in the reader, enter the secret After-Sales code (12 hexadecimal characters) and confirm it.
- The tool displays **Insert a card which has already been programmed for the vehicle**. The programming procedure will now be performed.
- The tool displays **UCH programmed**; the UCH is coded. You must now enter RENAULT Card programming mode to assign the other cards (maximum of four). Several seconds may elapse before this message appears.

WARNING: the maximum time between each operation is **5 minutes**, otherwise the procedure will be cancelled and the tool will display the message **Procedure interrupted: warning, the cards assigned to the vehicle are the ones assigned before the procedure was performed. The cards submitted before interruption of the procedure are no longer blank and can only be assigned to this vehicle**. This message also appears where dialogue with the UCH is lost or the battery power supply fails.

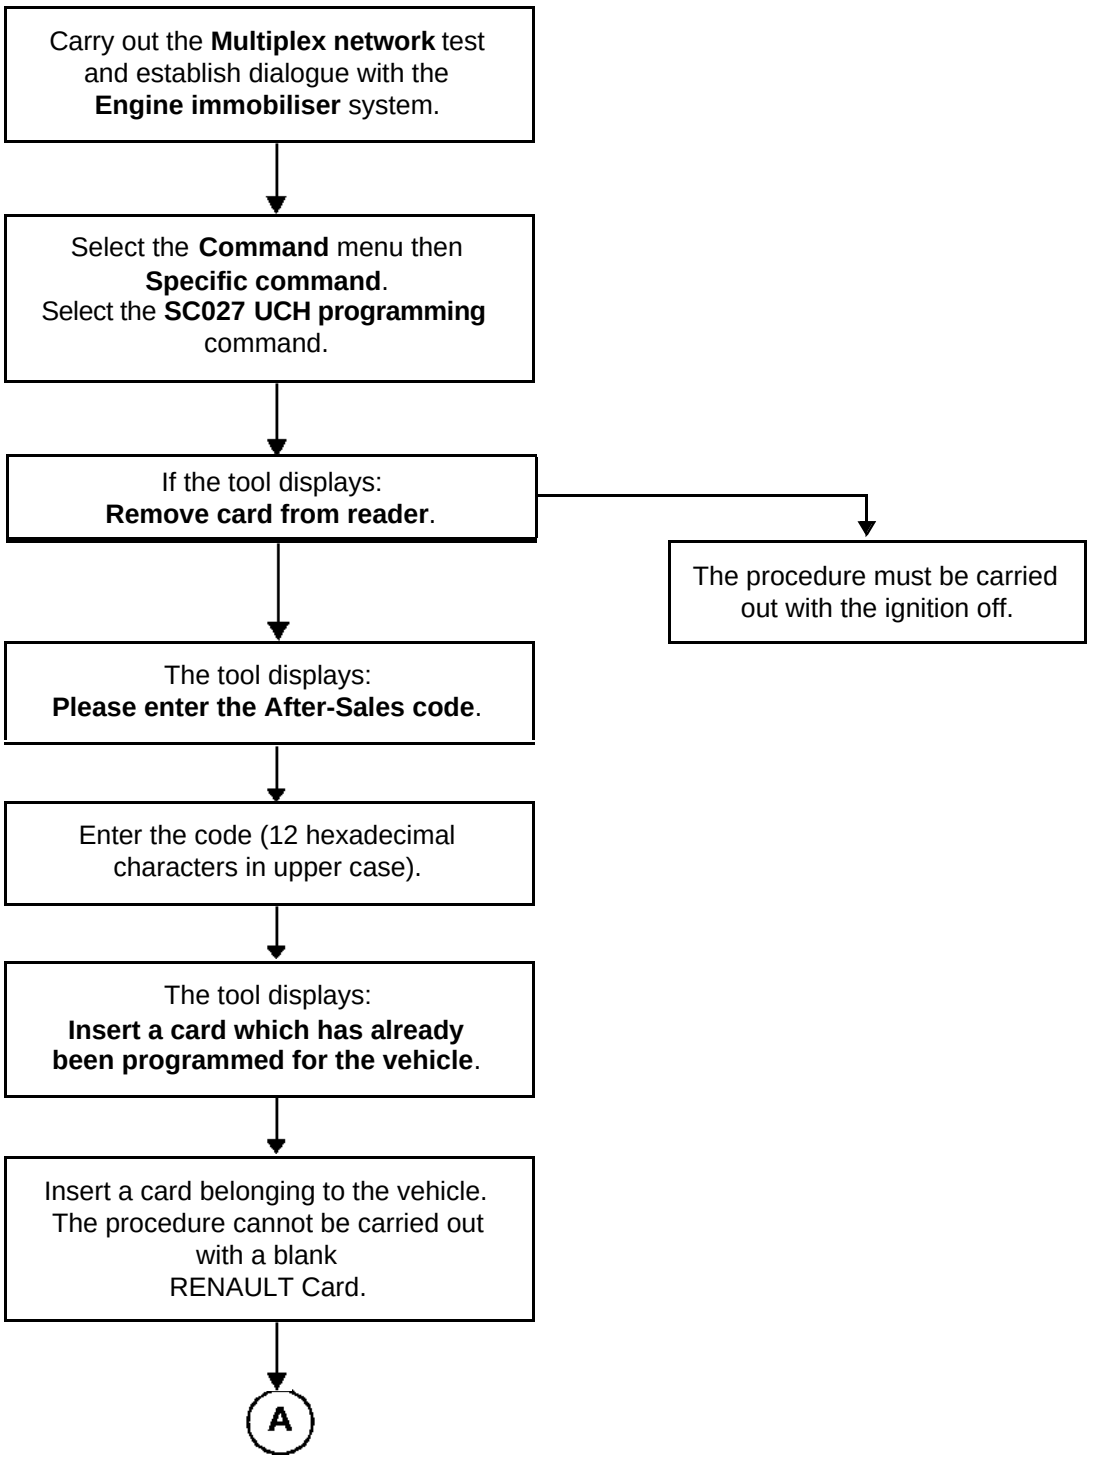
SPECIAL CASES

If the screen displays:

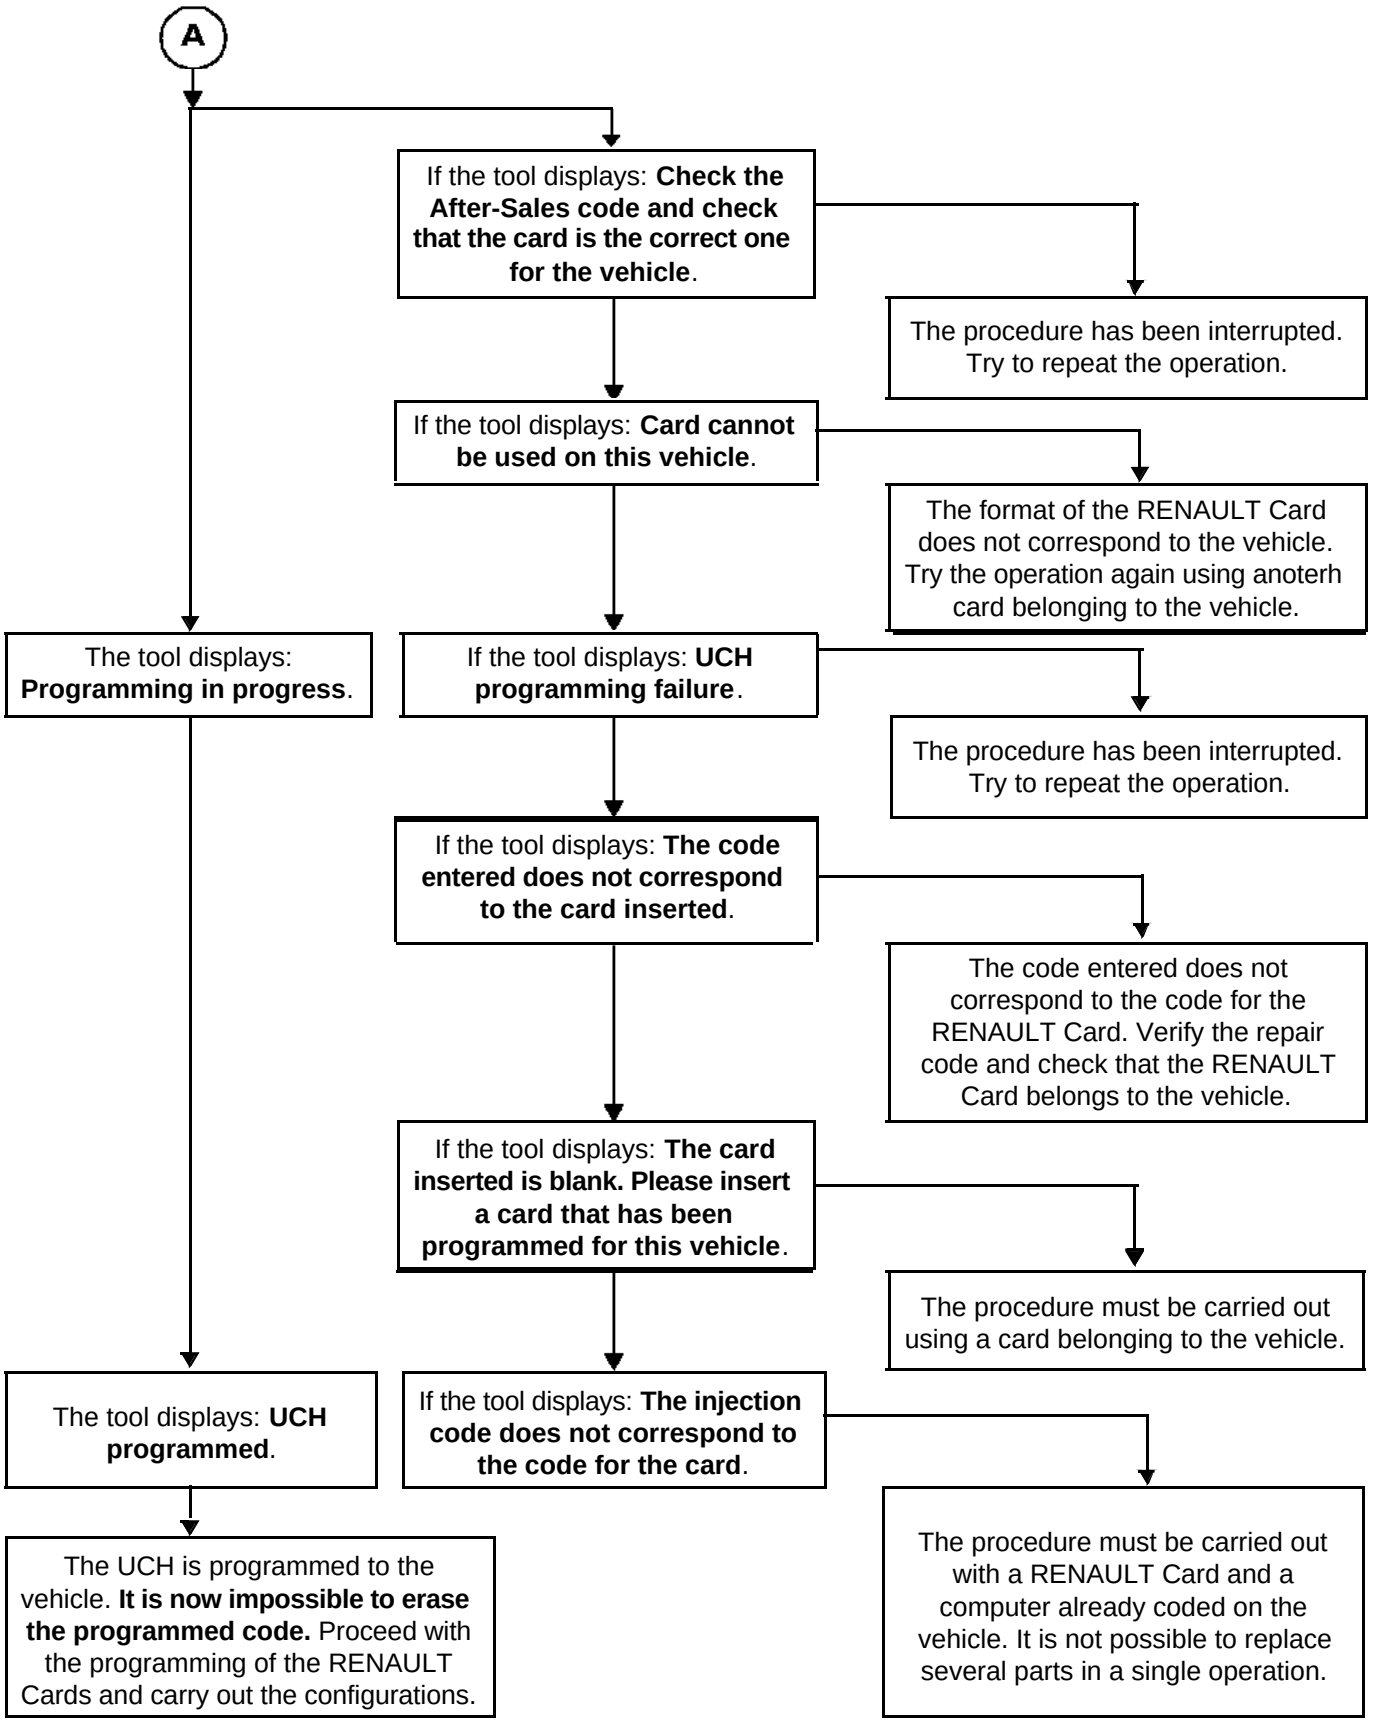
- "**Remove the card from the reader**", a card is already present in the reader,
- **Check the After-Sales code and ensure that the card belongs to the vehicle**: the code has not been read correctly or the UCH has already been coded on another vehicle. Check the code then try entering the data again.
- **Do you want to check the cards before assigning them to the vehicle?**: the UCH is already programmed on this vehicle and the UCH suggests reassigning the RENAULT Card.
- **Card cannot be used on this vehicle**: the card code does not correspond to the current vehicle.
- "**The card inserted is blank. Please insert another card which has already been programmed on the vehicle**": insert a card which has already been coded.
- **UCH Programming failure**: repeat the whole procedure.

WARNING: when a UCH has been programmed with the RENAULT Card code, it is impossible to clear it or to store another code in its place.

GETtheMANUALS.org



GETtheMANUALS.org



GETtheMANUALS.org

RENAULT CARD ASSIGNMENT PROCEDURE

NOTE: it is possible to find out whether a RENAULT Card is blank or not by means of the **ET115: blank card** state.

IMPORTANT: in the event that not all the RENAULT Cards are available, it will be necessary to carry out a subsequent reassignment procedure using all the cards.

- Confirm the **SC001: Card programming** line in the **Specific command** item of the **Command** menu.

- The screen displays **Do you want to check the cards before assigning them to the vehicle?**

- If you want to check the cards, the tool displays **Insert the card fully into the reader**. Insert a RENAULT Card until the ignition is switched on:
  – If the assignment is not possible, the screen displays **Verify the After-Sales code and make sure the card belongs to the vehicle**. Insert another card.
  – If the card is accepted, the screen displays **Remove the card from the reader**.

- The tool displays **Insert the card fully into the reader**. Insert a RENAULT Card in the reader and confirm:
  – If the RENAULT Card is not accepted, the red indicator light remains off.
  – If the RENAULT Card is accepted, the red indicator light flashes rapidly and the tool displays **1 card programmed** then **Remove the card from the reader**.

- The tool displays **Insert the card fully into the reader**. Insert a second RENAULT Card until the ignition is switched on:
  NOTE: If the same RENAULT Card is inserted twice, the system does not acknowledge this and the immobiliser indicator light remains off.

- Insert the RENAULT Card or the other Cards to be assigned to the vehicle in the Card reader (maximum of 4). The screen displays **2, 3 or 4 cards programmed** then **Remove the card from the reader**.

WARNING: these must be previous RENAULT Cards for the vehicle or new **uncoded** RENAULT Cards.

NOTE: the vehicle can only accept a single RENAULT Card with the hands-free function. If a second RENAULT Card is assigned to the vehicle, it will function as an ordinary RENAULT Card.

WARNING: the maximum time between each operation is **2 minutes**, otherwise the procedure will be cancelled and the tool will display the message **Procedure interrupted: warning, the cards assigned to the vehicle are the ones assigned before the procedure was performed. The cards submitted before interruption of the procedure are no longer blank and can only be assigned to this vehicle**. This message also appears where dialogue with the UCH is lost or the battery power supply fails.

- **Configure the UCH according to the vehicle options and equipment**.

NOTE: there is no operation to perform on the injection computer when the UCH only is replaced, it retains the same immobiliser code.

Driving position memory (CF 036)	passenger compartment connection unit (LC 015)	none

GETtheMANUALS.org

POWER ASSISTED STEERING CONFIGURATION

Using the diagnostic tools

- Establish dialogue with the vehicle and run the **Multiplex network** test
- Select and confirm the **Variable power assisted steering** menu
- In the **Command** menu, select and confirm the **Configuration** line,
- Presence of variable power assisted steering:
  – **CF 075: with variable power assisted steering**
  – **CF 074: with normal power-assisted steering**
- Configuration of type of variable power assisted steering (VEL SATIS):
  – **CF 078: strategy number 3**
- Confirm the configurations on the **Command** menu, **Reading configuration**

CONFIGURATION OF DOOR MANAGEMENT

Using the diagnostic tools

- Establish dialogue with the vehicle and run the **Multiplex network** test
- Select and confirm the **Door management** menu
- In the **Command** menu, select and confirm the **Configuration** line,
- Operation of hands-free function:
  – **CF 001: with hands-free function**
  – **CF 002: without hands-free function**
- Operation of hands-free locking function:
  – **CF 019: with hands-free locking**
  – **CF 020: without hands-free locking**
  This configuration allows the hands-free function to be used for unlocking the vehicle only.
- Automatic door locking warning beep:
  – **CF 035: tone n° 1 to n° 5**
  This configuration allows the doors locked beep using the hands-free function to be changed or cancelled.
- Configuration of the deadlocking function
  – **CF 005: with deadlocking**
  – **CF 006: without deadlocking**
  For right-hand drive vehicles fitted with specific door cabling, this configuration allows the internal handles to be released by pressing on the remote control unit twice.

GETtheMANUALS.org

- Configuration of electric child safety:
  - **CF 007: with electric child safety**
  - **CF 008: without electric child safety**

  This configuration allows, depending on the version, disablement of the operation of the rear windows from the rear seats and the release of the internal handles.

- Configuration of closure of the windows by means of a long press on the remote control unit. To operate, the vehicle must be fitted with one-touch (anti-pinch) windows:
  - **CF 009: with central closing of the windows**
  - **CF 010: without central closing of the windows**

- Configuration of automatic door locking while driving:
  - **CF 028: Authorise automatic door locking while driving**
  - **CF 029: Inhibit automatic door locking while driving**

  This configuration allows the operation of automatic locking while driving. Unlocking occurs as soon as the **impact signal** is received from the airbag computer.
  Activate or deactivate this function from the passenger compartment with the centralised door locking button.

- Configuration of interior lighting when a door is opened:
  - **CF 013: with interior lighting**
  - **CF 014: without interior lighting**

- Configuration of interior timed lighting when the doors are closed:
  - **CF 015: with courtesy light timer**
  - **CF 016: without courtesy light timer**

- Configuration of country of use:
  - **CF 018: left-hand drive**
  - **CF 017: right-hand drive**

  This configuration allows operation of the **deadlocking** and the **open door only** functions.

- Driver's seat position memory:
  - **CF 036: with/without**

- Configuration of the driver's seat position memory function:
  - **CF 003: seat position automatic recall**
  - **CF 004: without seat automatic recall**

- Configuration of **open door only**:
  - **CF 030: unlocking of all four doors**
  - **CF 031: driver's door unlocking**

  This configuration allows the driver's door and boot lid only to be unlocked on right-hand drive versions when the vehicle is unlocked (normal or hands-free). Press again to unlock the other opening elements.

- Configuration of **open door only** with the hands-free function:
  - **CF 032: hands-free unlocking of the four doors**
  - **CF 027: driver's hands-free unlocking**

  This configuration is identical to the previous configuration for the hands-free function.

- Confirm the configurations on the **Command** menu, **Reading configuration**

GETtheMANUALS.org

WARNING: certain configuration errors, such as the wrong transmission type, can prevent the engine starting.

CONFIGURATION OF THE CONNECTION UNIT

Using the diagnostic tools

- Enter into dialogue with the vehicle and run the **Multiplex network** test
- Select and confirm the **Connection unit** menu
- Confirm the **Computer configuration** line in the **Command** menu.
- Configuration of overspeed:
  - **CF 618: without overspeed (Arabia)**
  - **CF 619: with overspeed (Arabia)**
- Configuration of daytime running lights:
  - **CF 600: without daytime running lights**
  - **CF 601: with daytime running lights**
- Configuration of voice synthesiser:
  - **CF 694: with voice synthesiser**
  - **CF 695: without voice synthesiser**
- Configuration of rain sensor:
  - **CF 696: with rain sensor**
  - **CF 697: without rain sensor**
- Automatic headlights:
  - **CF 724: with / without**
- Lighting extension:
  - **CF 723: with / without**
- Emergency braking hazard warning lights:
  - **CF 772: with / without**
- Confirm the configurations by selecting **read configuration** in the **command** menu.

CONFIGURATION OF THE ENGINE IMMOBILISER

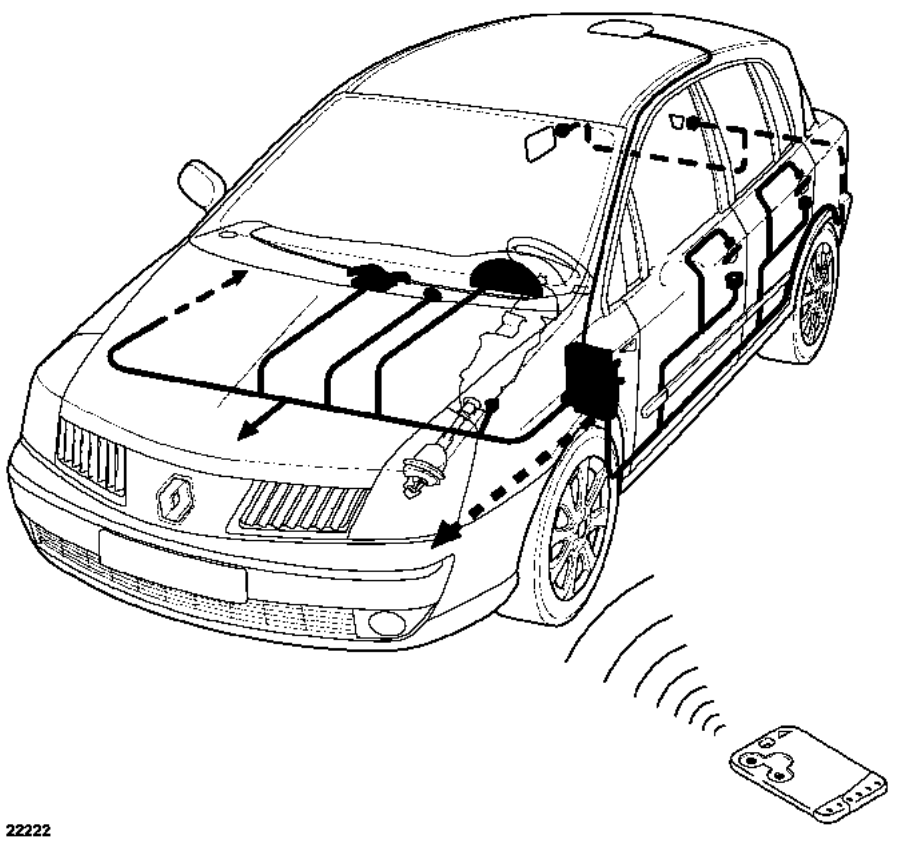
Using the diagnostic tools

- Enter into dialogue with the vehicle and run the **Multiplex network** test
- Select and confirm the **Engine immobiliser** menu
- Confirm the **Computer configuration** line in the **Command** menu.
- Configuration of gearbox type:
  - **CF 703: with automatic gearbox**
  - **CF 704: without automatic gearbox**
- Configuration of RENAULT Card lock in the reader (only for automatic gearbox version):
  - **CF 709: with card lock**
  - **CF 710: without card lock**
- Configuration of the reminder warning that the RENAULT Card is still in the reader after stopping the engine:
  - **CF 711: with card reminder warning**
  - **CF 712: without card reminder warning**
- Confirm the configurations on the **Command** menu, **Reading configuration**

GETtheMANUALS.org

The system fitted to the keyless vehicle consists of:

– the UCH,
– an uncoded card reader (radio frequency receiver and transponder),
– a push-button to start and stop the engine,
– the steering column lock which mechanically locks the steering wheel,
– door locking / unlocking motors,
– RENAULT Cards comprising two or three buttons (hands-free version),
– two special transmission aerials (communication) to the RENAULT Card with the hands-free version (depending on the version),
– specific exterior door handles for the hands-free option (depending on vehicle version),
– inside door locks specific to the deadlocking function (depending on the version).



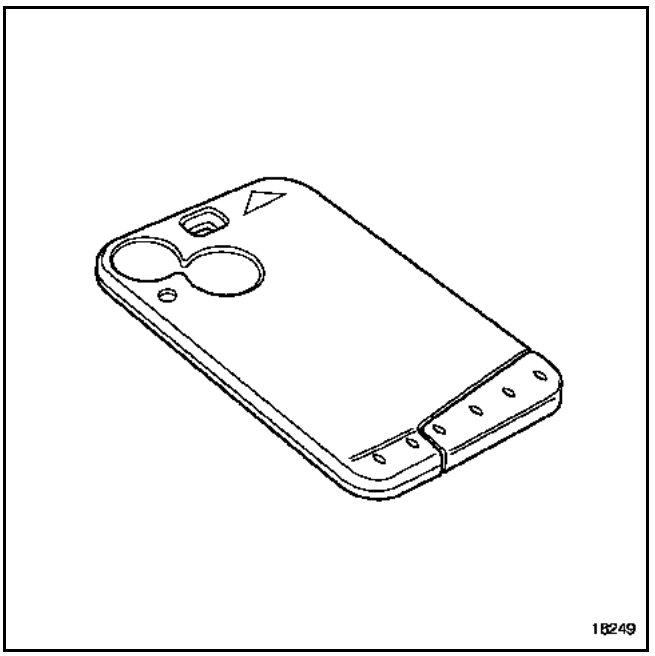
22222

GETtheMANUALS.org

DESCRIPTION

Two RENAULT Cards are assigned to the vehicle in the factory. Depending on its equipment level, the vehicle may be supplied with:

- **two RENAULT Cards with two buttons (without hands-free system)** fitted with:
  - a coded chip which works without a battery and operates the immobiliser (refer to **Section 82**),
  - a plip remote control unit which operates the locking and unlocking of the doors.



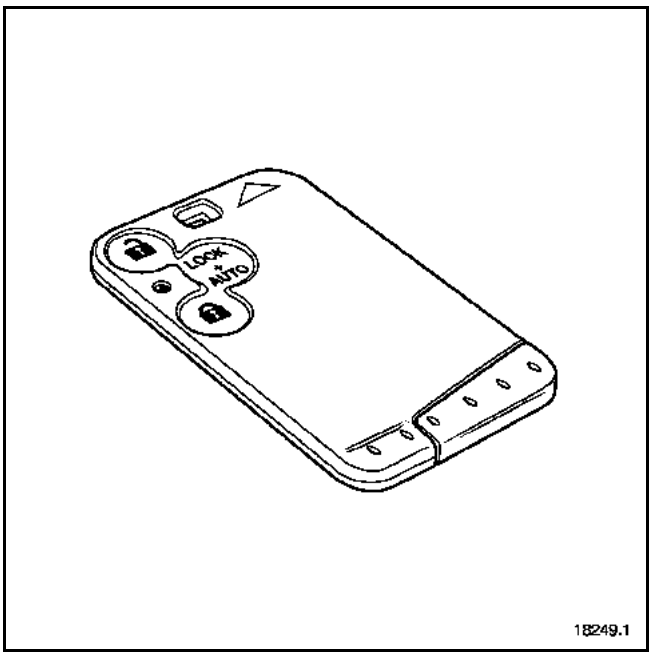
The radio frequency code transmitted by these RENAULT Cards is continuously changed to avoid possible copying.

With this system, the remote control units are resynchronised automatically.

The remote control unit is only used for locking and unlocking the doors (it has no effect on the immobiliser).

NOTE: the UCH can manage four different codes (maximum of four RENAULT Cards).

- **two RENAULT Cards, one of which is fitted with a hands-free system (three buttons)**. This system allows the opening surfaces to be opened without action on the remote control unit. (It is not possible to fit a vehicle with several hands-free remote control units, see the **Hands-free RENAULT Card** section).



NOTE: if the vehicle battery charge is low, it is not possible to unlock the steering column lock. It is not possible to push-start the vehicle.

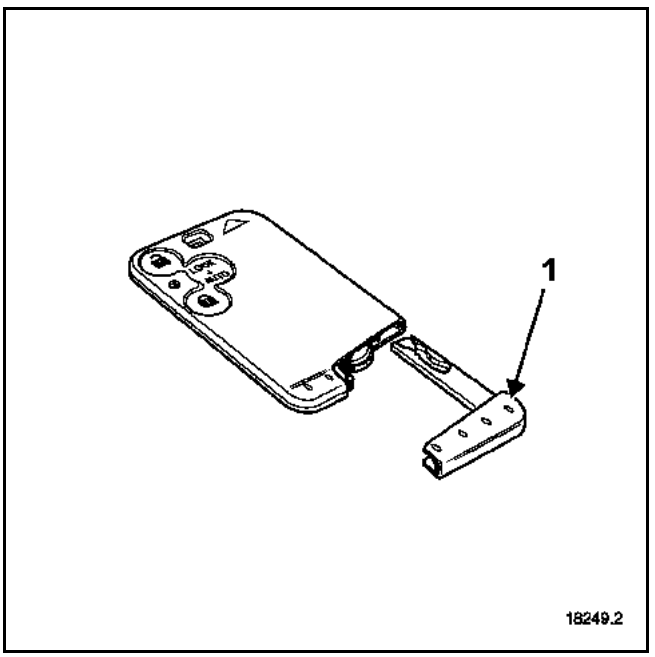
GETtheMANUALS.org

RENAULT Cards are fitted with a backup key (1) enabling the door to be opened in the event of an operating fault.

Replacement RENAULT Cards are supplied non-coded and without an emergency metal key.

The rechargeable battery for the hands-free function is charged. A green cover is fitted in the place of the backup key.

When replacing a RENAULT Card it is necessary to replace the green cover with the customer's backup key and to fit the green cover on the faulty RENAULT Card when returning it for analysis.

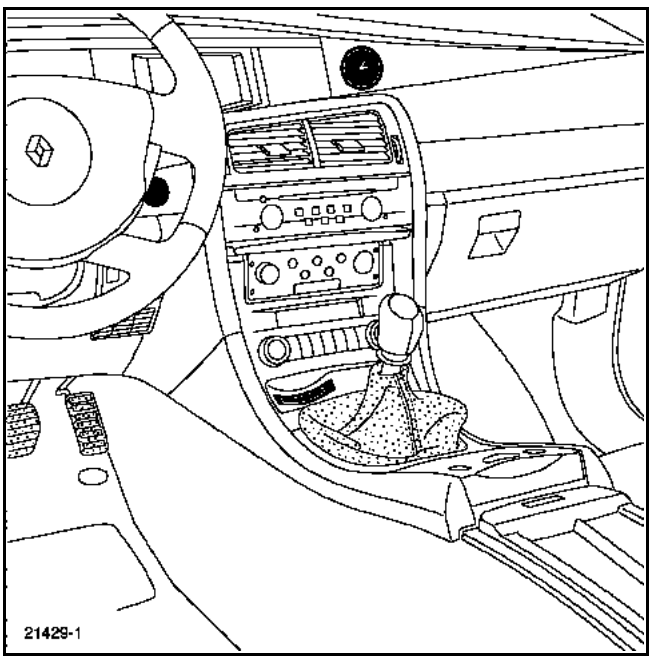


NOTE: a backup key can be ordered at Parts Stores by quoting the vehicle security number.

IMMOBILISER SYSTEM USING A TRANSPONDER

The immobiliser system using a transponder incorporated in the RENAULT Card unlocks the steering lock, switches on the ignition and authorises starting of the vehicle.

The RENAULT Card is recognised by the receiver integrated into the reader when the card is inserted (see **Section 82: Immobiliser**).



GETtheMANUALS.org

OPERATION: SWITCHING ON THE IGNITION AND STARTING

The RENAULT Card reader has two positions:

- the **+ accessories** position via the accessories relay (when the RENAULT Card is about half-way in). The + acessories position supplies:
  – the radio,
  – the electric windows,
  – the passenger compartment fan,
  – the electric seats.

  NOTE: the supply to the accessories relay is cut off during the starting phase. If the RENAULT Card is inadvertently left in the reader, supply to the accessories relay is cut after a delay of about 40 seconds.

- the **after ignition feed** position. This position authorises starting of the engine via the push-button.

  The after ignition relay is supplied as soon as the RENAULT Card is fully inserted into the reader, provided the card is identified by the UCH and the steering lock is unlocked.

  Supply to the relay is cut as soon as the **pressure button** is pressed to stop the engine, if the vehicle speed is zero (see the **Engine start pressure button section**) or after a delay of 40 minutes without the engine having been started.

- the engine start push-button supplies the starter motor until it receives the **engine running** signal. If the vehicle does not start, the supply to the starter motor is cut after a delay which varies according to the coolant temperature.

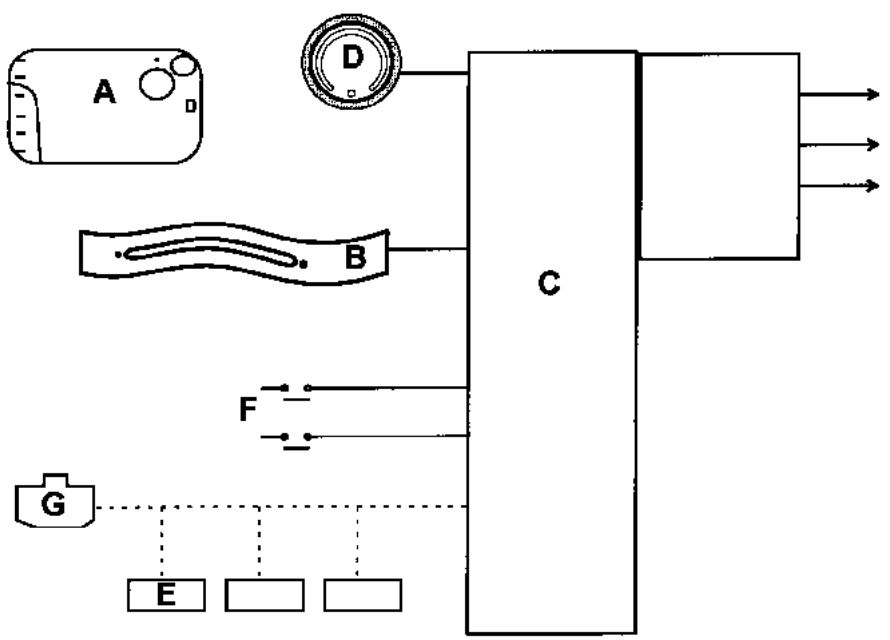
  For engine starting to be authorised, certain conditions must be met (see the **Engine start pressure button section**).

  NOTE: the RENAULT Card is locked in the reader when the engine is running. It is unlocked when the engine is stopped, if the vehicle speed is zero or nearly zero.

GETtheMANUALS.org

OPERATION OF SIMPLE REMOTE CONTROL UNITS (WITHOUT HANDS-FREE SYSTEM)

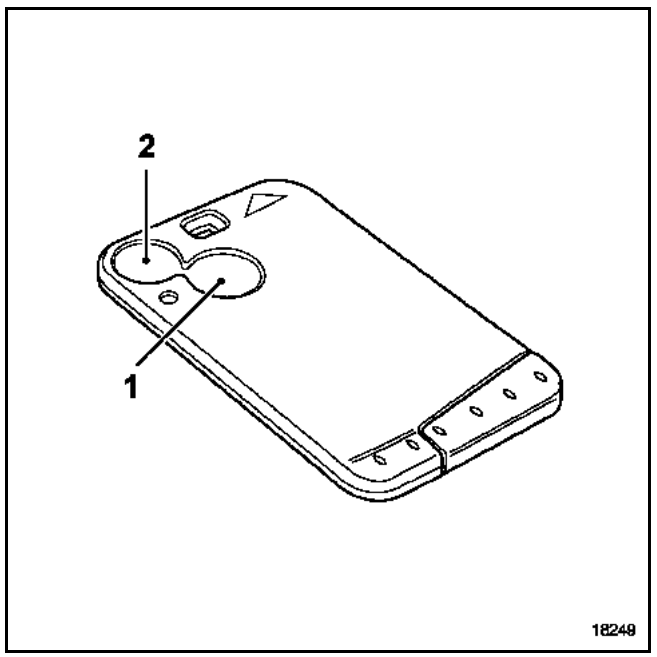
In operation, this system uses:
– a RENAULT Card (A),
– a radio receiver integrated into the RENAULT Card reader (B),
– an electronic controller integrated into the UCH (C),
– an engine start push-button (D),
– the door locks,
– a red 'door locked' warning light,
– the vehicle direction indicators,
– the injection computer (E),
– the clutch pedal sensors (F) and gearbox neutral position sensors,
– the electric steering lock (G).



19242

GETtheMANUALS.org

The simple RENAULT Card has two buttons:
– a locking button (1),
– an unlocking button (2).



Press the **Lock** button to lock the vehicle doors.
The locking of the doors by remote control may be indicated by flashing of the hazard lights (provided all the doors are closed properly). The red locking warning light is illuminated.
If one or more of the doors is not locked properly, the hazard lights remain off after remote control locking.

To unlock the vehicle doors, press the Unlock button.
Unlocking of the doors may be indicated by a flash of the hazard lights.

NOTE: The UCH controls the hazard warning lights flashing when the remote control unit is requested (refer to the **Indicators section**).

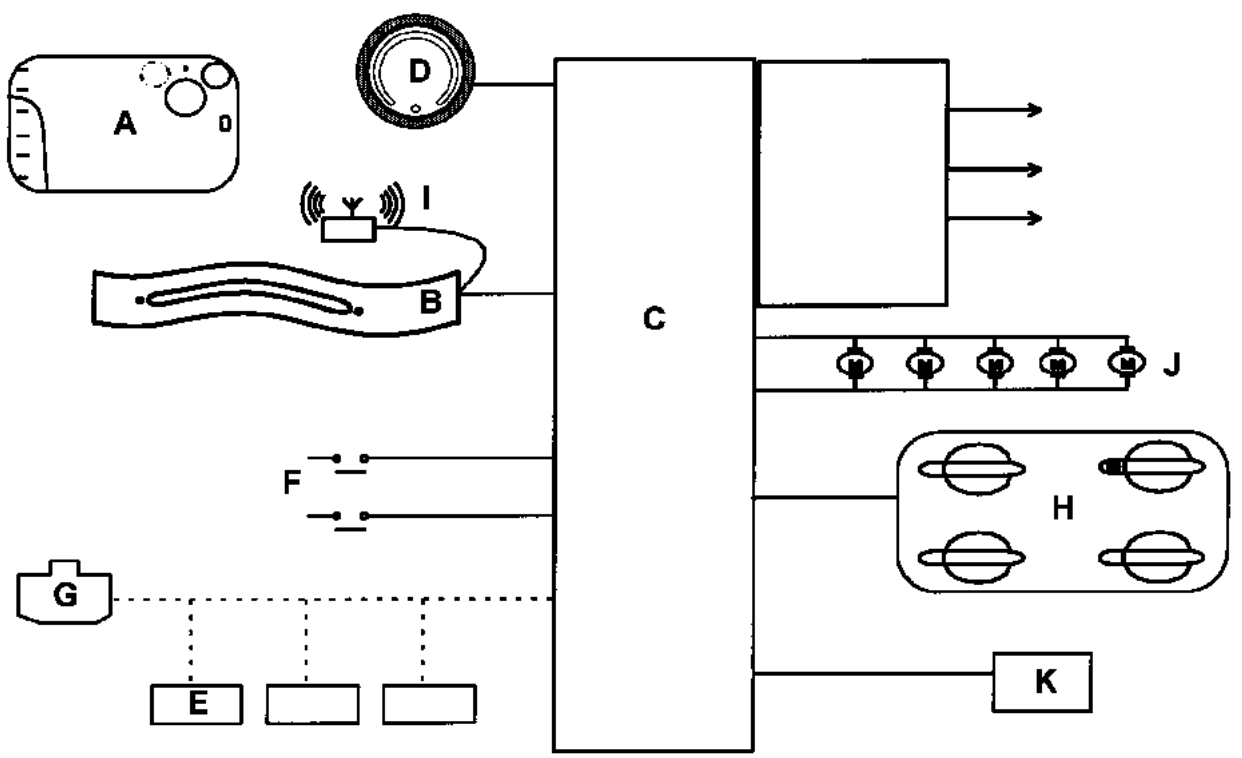
NOTES:

- The central door locking button is blocked once the doors have been locked by the remote control.
- Certain vehicles (right-hand drive version) are fitted with a **deadlocking** function which locks the doors in such a way as to prevent them being opened from inside the vehicle. To deadlock the vehicle, press twice in succession or press and hold the **Lock** button (1). This function uses additional specific locking motors.
- Right-hand drive vehicles may be fitted with **driver's door unlocking only**. This function allows the driver's door only to be unlocked when the RENAULT Card is pressed briefly. The button must be pressed twice in succession to unlock all the doors.
- For vehicles fitted with one-touch electric windows or an electric sunroof, pressing and holding the **Lock** button (1) will lock all the opening elements (these must have been initialised).
- If a door is not properly shut when the **Lock** button is pressed, the doors will lock then unlock automatically.

GETtheMANUALS.org

OPERATION OF REMOTE CONTROL UNIT FITTED WITH HANDS-FREE SYSTEM

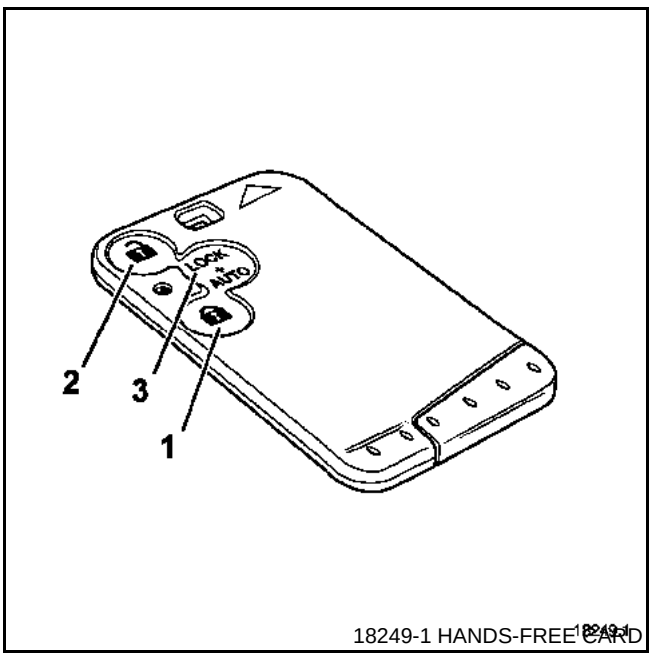
In operation, this system uses:
– a hands-free RENAULT Card (A),
– a card reader (B),
– an electronic controller integrated into the UCH (C),
– an engine start push-button (D),
– the injection computer (E),
– the clutch pedal sensors (F) and gearbox neutral position sensors,
– the electric steering lock (G),
– presence sensors for each door handle (H),
– a red 'door locked' warning light,
– the vehicle direction indicators,
– two specific aerials for hands-free transmission (I),
– specific interior door locks for the deadlocking function (J),
– a buzzer (K).



19242-1

GETtheMANUALS.org

The RENAULT hands-free card has three buttons:
– a **locking** button (1). This button allows the doors to be locked and inhibits the hands-free function,
– an **unlocking** button (2). This button allows the doors to be unlocked and inhibits the **hands-free** function,
– a locking button with **activation of the hands-free system** (3).



18249-1 HANDS-FREE CARD

NOTES: this remote control unit can be used without the hands-free system after this function has been inhibited by buttons (1) and (2). In this case, operation is then identical to that of the simple remote control unit.

To lock the vehicle doors using the hands-free system (press button (3) if the hands-free function has been deactivated):

– close the doors and the luggage compartment,
– take the RENAULT Card away from the vehicle. Once the card is out of communication range with the UCH (via the radio aerials), the doors and the luggage compartment lock.

Locking of the doors by the remote control unit is indicated by the hazard warning lights flashing, the horn sounding and the red warning light coming on.
If one or more of the doors is not locked properly, the hazard lights remain off after remote control locking.

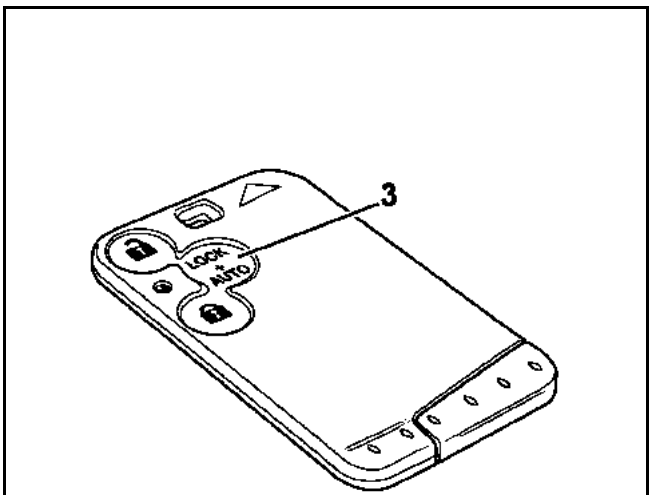
NOTE: pressing the **close** button or **open** button on the RENAULT Card deactivates the hands-free function. The **hands-free** RENAULT Card then functions as a **simple** RENAULT Card. Pressing the auto button on the RENAULT Card reactivates the system after approximately **3 seconds**.

IMPORTANT: diagnostic tools can be used to inhibit the locking with the hands-free function.

GETtheMANUALS.org

To unlock the vehicle doors using the hands-free system (press button (3) if the hands-free function has been deactivated):

- approach the vehicle so that the RENAULT Card enters the area of communication with the UCH,
- place your hand behind one of the door handles or open the luggage compartment,
- the presence sensors in the handles initiate the **hands-free** query on the vehicle.
- If the card is recognised, the vehicle unlocks. This is shown by the hazard warning lights flashing.

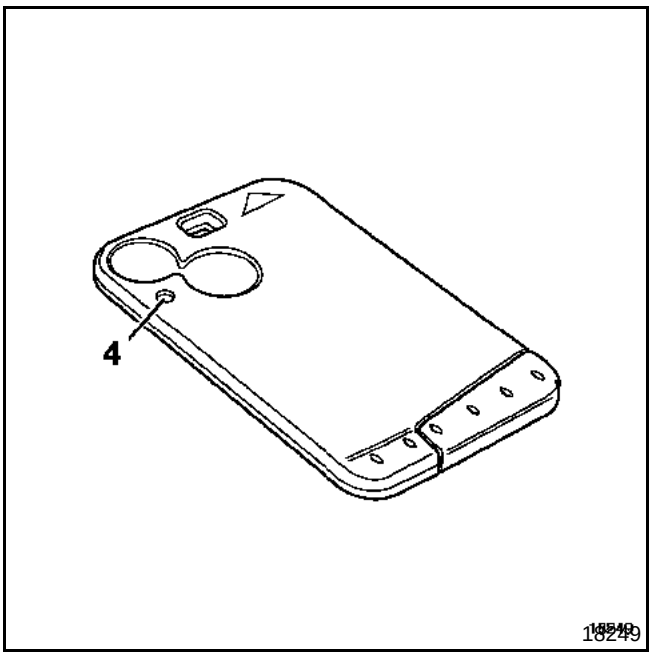


18249-1 HANDS-FREE CARD 18249-1

NOTE: The UCH controls the hazard warning lights flashing when the remote control unit is requested (refer to the **Indicators section**).

RENAULT CARD POWER SUPPLY

RENAULT Card remote control units are powered by a battery. The battery charge status is indicated by warning light (4).



18249

The three-button RENAULT Card is fitted with a rechargeable battery for the hands-free function. It is charged when the RENAULT Card is inserted in the reader. The rechargeable battery recovers one day's discharge in 20 minutes of charging. Correct recharging can take 24 hours. This rechargeable battery cannot be removed.

The transponder, engine immobiliser system in the RENAULT Card, does not comprise an electrical supply.

WARNING: the battery is also used for the hands-free function.

GETtheMANUALS.org

To check the opening and closing of opening elements, the direction indicators and the side repeaters are controlled by the UCH.

Press on the RENAULT Card		Effect on the locks	Operation of the direction indicators	Operation of the side repeaters	Operation of the horn
Closing	1 short press	locking of the doors and luggage compartment	2 flashes	2 flashes	-
	2 short presses	deadlocking of the doors and luggage compartment	rapid flashing	rapid flashing	-
	1 long press****	closing of the windows and sunroof*	2 flashes	rapid flashing	-
	hands-free mode	locking of the doors and luggage compartment	2 flashes	lit continually for about 10 seconds	1 signal (configurable)
Opening	1 short press	unlocking of the doors and luggage compartment or the driver's door**	1 flash	1 flash	-
	2 short presses	unlocking of the doors and luggage compartment***	-	-	-
	hands-free mode	unlocking of the doors and luggage compartment or the driver's door**	1 flash	1 flash	-

* for this function, the vehicle must be fitted with a one-touch electric window control and anti-pinch electric sunroof.

** Some right-hand drive vehicles may be fitted with **driver's door unlocking only**. This function allows the driver's door and luggage compartment only to be unlocked by pressing the RENAULT Card briefly.

*** unlocking of the doors and luggage compartment for vehicles fitted with **driver's door only** unlocking.

**** on certain **right-hand drive** versions, this function is preceded by **deadlocking**.

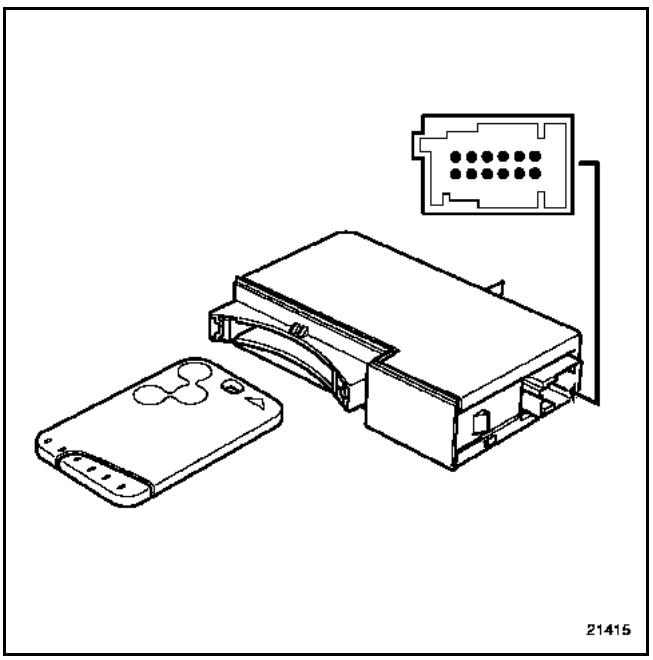
Defect mode operation

When the lock command is given:
– none of the doors, nor the tailgate, will lock if the driver's door is open,
– an open luggage compartment or an open door inhibit the operation of the direction indicators and side repeaters and prevents hands-free unlocking.

GETtheMANUALS.org

The RENAULT Card reader contains two switches which control vehicle operation:
– a switch located half-way into the card slot, which controls power supply to accessories (+ ACCESSORIES),
– a switch at the end of the card slot (+ AFTER IGNITION).

NOTE: the RENAULT Card is locked in the reader once the UCH has received the **engine running** signal from the injection computer. It is released when the engine is stopped.



The RENAULT Card reader also functions as:
– a radio receiver for locking and unlocking the doors,
– a transponder aerial for the engine immobiliser function and detection of the RENAULT Card (see **Engine immobiliser section**),
– a RENAULT Card non-detection warning light,
– interior lighting.

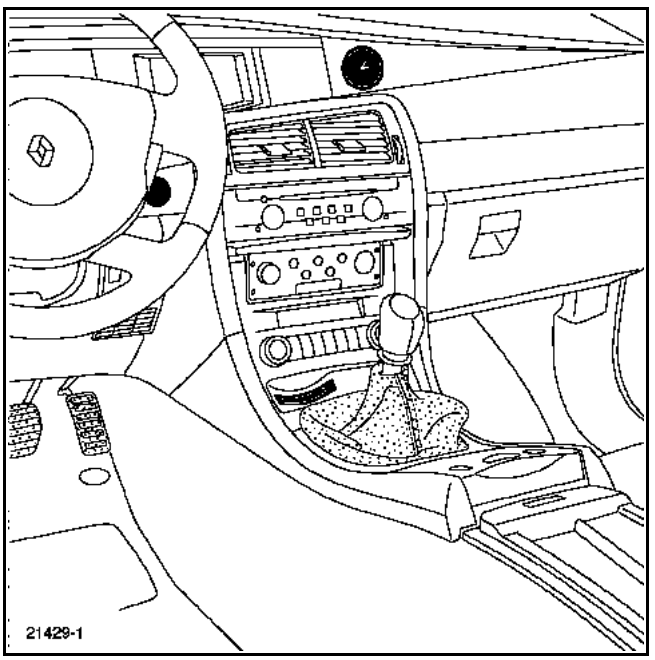
GETtheMANUALS.org

DESCRIPTION

The single pressure button (START / STOP) is used for both starting and stopping the engine.

There are two indicator light possibilities:
– white upper light: invitation to start,
– green lower light: engine running.

This lighting is dimmed when the side lights are on.



OPERATION

Engine start is authorised when the upper part of the button is lit.

Starting is one-touch: A single press of the button is enough to start the engine.

To start the engine:

- insert the card all the way into the reader to switch on the ignition and release the steering lock.

- check that the start-up conditions are met:

  NOTE:
  – on diesel vehicles, the starter motor cannot be operated during the preheating phase.
  – if the gearbox type is incorrectly configured in the UCH, it may not be possible to start the engine.
  – the gearbox must be in neutral or the clutch pedal depressed.

GETtheMANUALS.org

- The electric steering lock must be released and the ignition must be on.

- Ensure that the system has authorised engine starting:
  – If the upper section of the button lights up, it is possible to start up.

- Press the button to send the start command to the UCH. The UCH analyses the engine state (running, stalled, stopped). If the engine is stopped and the conditions are met, the UCH orders the starting relay to be supplied.

NOTE:
– It only possible to start the engine if the steering lock is released.
– The RENAULT Card is locked when the engine is running.
– If the engine stalls, a single press on the starting button will restart the engine.

To stop the engine:

Press the button to send the Stop Engine command to the UCH. This checks that the vehicle speed is less than **3 mph (5 km/h)** before cutting the + after ignition feed supply.

REMINDER: engine starting is assisted by the push-button. When the invitation to start is present, the press on the button (START/STOP) is memorised by the UCH. The starter motor is supplied with power as soon as the UCH authorises it, and until receipt of the engine running signal. If the engine does not start, the supply to the starter motor is cut after a period which varies according to the engine coolant temperature.

NOTE: certain vehicle faults originating in the RENAULT Card reader, the clutch pedal or NEUTRAL position sensors (automatic gearbox version) can affect engine starting. In this case, the starter motor is supplied by continuous pressure on the engine start push-button.

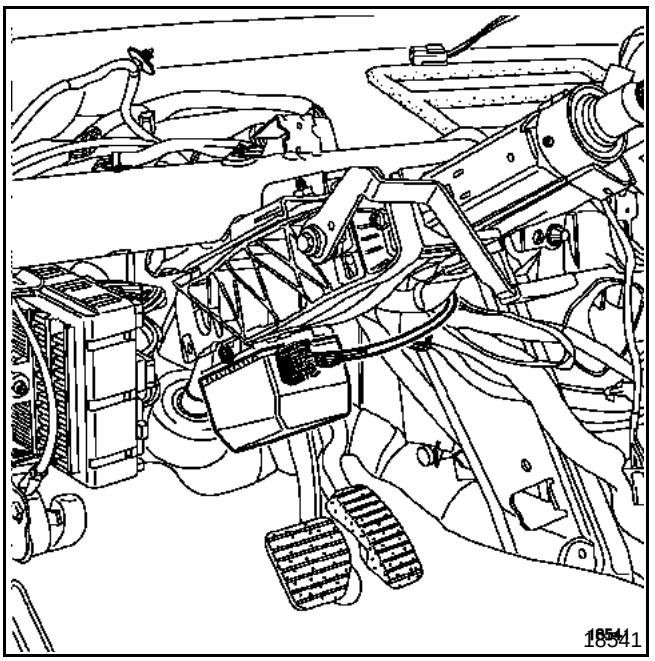
CONDITIONS REQUIRED FOR STARTING THE ENGINE
– RENAULT Card fully inserted into the reader,
– + after ignition connected,
– transponder (integrated into the RENAULT Card) detected,
– manual gearbox in Neutral position,
– automatic gearbox in Neutral or Park position,
– clutch pedal depressed, for the manual gearbox.

GETtheMANUALS.org

The steering column lock is located at the base of the steering column. It is controlled by the UCH.

This lock is coded by the UCH and cannot be cleared (refer to **Section 82A**).

IMPORTANT: a faulty or disconnected steering lock will prevent the engine being started.



OPERATION

The steering is unlocked when the RENAULT Card is fully inserted into the reader and the transponder is recognised by the UCH.
The steering is locked when the RENAULT Card is fully withdrawn from the reader, the engine is stopped and the vehicle speed is zero.

NOTE: if the UCH has received an **impact** signal from the airbag computer, the steering column lock remains unlocked. The vehicle must be driven to reset it.

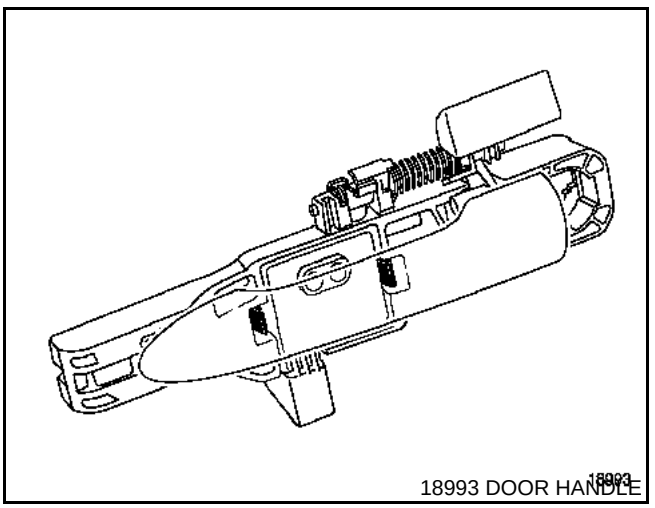
NOTES:

If the lock is not released when the key-card is fully inserted into the reader, the red immobiliser warning light will stay on but the + after ignition feed will not be authorised.

If internal steering lock faults occur, the **Stop** and **Service** warning lights may come on. The steering lock remains unlocked.

GETtheMANUALS.org

To allow operation of the **hands-free** RENAULT Card, each of the door handles is fitted with a presence sensor. This sensor detects the presence of the driver's hand and initiates the hands-free query.



18993 DOOR HANDLE

The presence sensor, located on the back of the handle, is accompanied by a reflector and a handle movement switch.

After a long period of inactivity, the door handle sensor is relayed by a door handle movement sensor.

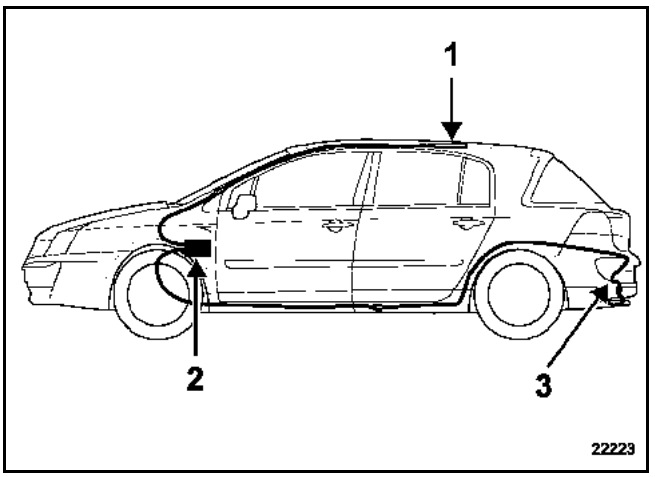
NOTE: For removal of the handle, refer to the **Bodywork** section. For opening sensor and handle track allocations, refer to **Section 84A**.

For the luggage compartment, the sensor is replaced by a switch integrated into the electric opening handle.

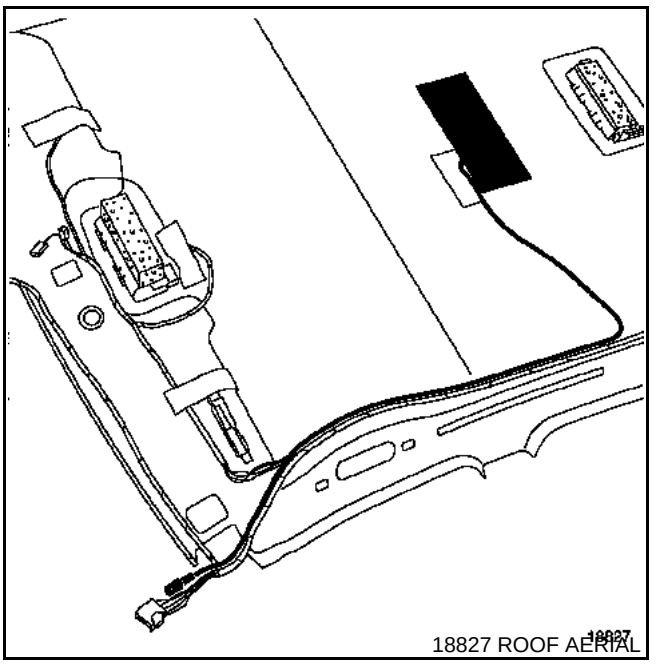
NOTE: For removal of the handle, refer to the **Bodywork** section. For boot handle track allocations, refer to **Section 84A**.

GETtheMANUALS.org

To operate in hands-free mode, vehicles are fitted with two specially placed aerials:
– in the roof for detection close to the front doors,
– in the rear bumper to cover the rear of the vehicle and to allow opening of the luggage compartment.



1 Roof aerial
2 Card reader
3 Bumper aerial



18827 ROOF AERIAL

To replace the roof aerial, it is necessary to remove the interior trim.

Attach the new aerial, respecting the routing and connection of the wiring. (refer to the **Bodywork section or Section 88A**).

WARNING: the reception range of a hands-free aerial is not fixed. It changes constantly, depending on the presence of objects close to the vehicle and climatic conditions.

GETtheMANUALS.org

Replacement, reallocation or addition of one or more RENAULT Cards

IMPORTANT: only RENAULT Cards inserted during this procedure will work. To be assigned to the vehicle, they must meet the following conditions:
- they have already been coded on this vehicle,
- or they are new (not coded).

Using the diagnostic tool:

- Establish dialogue with the engine immobiliser (UCH).

– Confirm the **SC001: Card programming** line in the **Command Specific command** menu.

– The tool displays **Please enter the After-Sales code**; ensure that there is no RENAULT Card in the reader and enter the secret After-Sales code (hexadecimal characters) and confirm it.
  – If a card is present in the reader, the screen displays **Remove card from reader**.
  – If re-reading of the code is incorrect, the screen displays **check After-Sales code and check that the card belongs to the vehicle**. Check the code then try entering the data again.
  – If the UCH is unprogrammed, the tool displays **Insert a card already programmed to the vehicle** (refer to **Section 83**).

WARNING: the maximum time delay between each operation is 5 minutes, otherwise the procedure will be cancelled and the tool will display the message **Procedure interrupted: warning, the cards assigned to the vehicle are the ones assigned before starting the procedure. The cards submitted before interruption of the procedure are no longer blank and can only be assigned to this vehicle**.

- If the code entered is correct and the UCH is not unprogrammed, the reallocation procedure can commence, the screen displays. **Do you want to check the cards before assigning them to the vehicle?**
- If you want to check the cards, the tool displays **Insert the card fully into the reader**. Insert a RENAULT Card until the ignition is switched on:
  – If the Allocation is not possible, the screen displays **check the After-Sales code and check that the card belongs to the vehicle**. Insert another card.
  – If the card is accepted, the screen displays **Remove the card from the reader**.

- The tool displays **Insert the card fully into the reader**. Insert a RENAULT Card fully into the reader.
  – If the RENAULT Card is not accepted, the red indicator light remains off.
  – If the RENAULT Card is accepted, the red indicator flashes rapidly and the tool displays **1 card programmed** then **remove card from reader**

- The tool displays **Insert the card fully into the reader**. Insert another RENAULT Card fully into the reader.

  NOTE: if the same RENAULT Card is inserted twice, the system does not take this into account and the engine immobiliser indicator light remains off.

GETtheMANUALS.org

- Insert the RENAULT Card or the other Cards to be assigned to the vehicle (maximum 4) into the reader. The screen displays **2, 3 or 4 cards programmed** then **Remove the card from the reader**.

  WARNING: these must be old RENAULT Cards for the vehicle or new non-coded RENAULT Cards.

  NOTE: the vehicle can only accept a single RENAULT Card with the hands-free function. If a second card is assigned to the vehicle, it will function as an ordinary RENAULT Card.

  IMPORTANT: in the event that not all the RENAULT Cards are available, it will be necessary to carry out a subsequent reassignment procedure using all the cards.

  NOTE: it is possible to cancel the RENAULT Card reallocation procedure while it is in progress.

GETtheMANUALS.org

Carry out the **Multiplex network** test and establish dialogue with the **Engine immobiliser** system.

Select the **Command** menu then **Specific command**. Select the command **SC001: Card programming**.

If the tool displays: **Remove card from reader**.

- The procedure must be carried out with the ignition off.

The tool displays: **Please enter the After-Sales code**.

Enter the code (12 hexadecimal characters in upper case).

- The tool displays: **Check the After-Sales code and check that the card belongs to the vehicle**.
  - The code entered does not correspond to the code for the UCH. Check the code and try programming again.

The tool displays: **Do you want to check the cards before assigning them?**

- This function allows you to test the rechargeable battery and check the frequency of the RENAULT Card.

A

GETtheMANUALS.org

GENERAL INFORMATION

The electric sunroof has two positions, controlled by the same motor: tilt (three positions) or sliding (six positions).

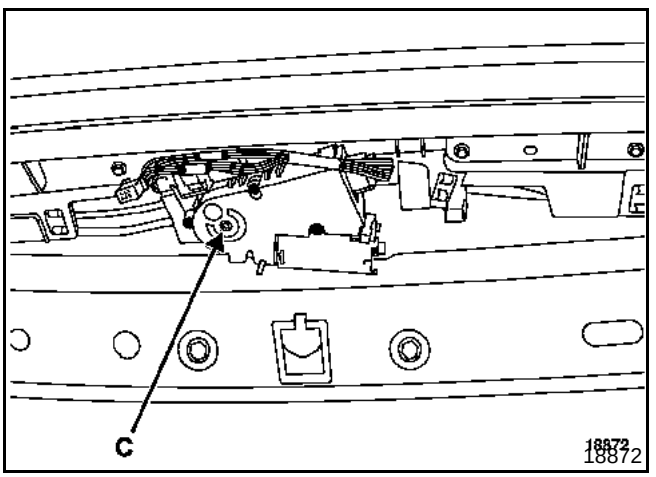
The electric sunroof has an anti-pinch function which is adjusted according to the speed of the vehicle.

WARNING: the anti-pinch mode is only operational if the sunroof has been correctly initialised.

NOTE: the sunroof (slide or tilt) can be closed by pressing and holding down (about 2 seconds) the lock button of the RENAULT Card.This signal is controlled by the UCH (refer to **Section 87B**) if it is correctly configured.

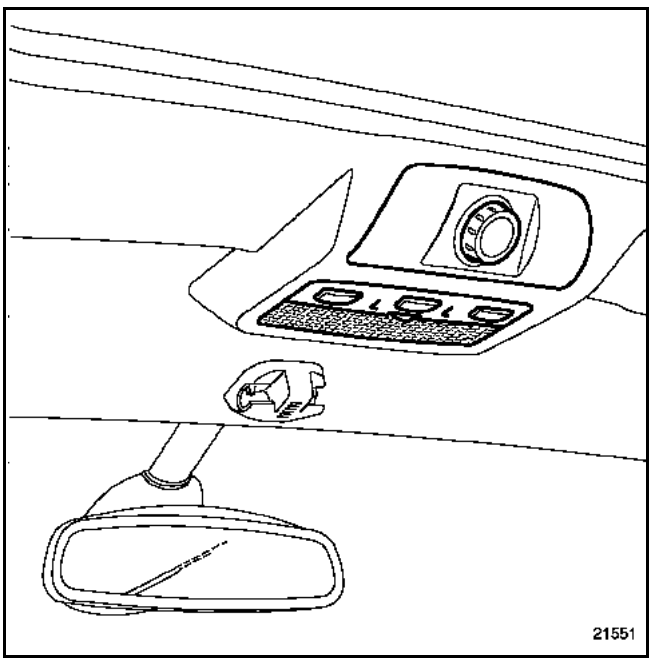
In this case, the switch remains in the open position, press it to return to the open position.

IMPORTANT: the sunroof can be operated manually at (C) using an Allen key in the event of a fault in the sunroof motor.



OPERATING PRINCIPLE

Operation of the sunroof is controlled by the switch.



tilt area (three positions)
slide area (six positions)

To operate, the sunroof motor must receive authorisation from the UCH:

– **0 volt** signal: authorisation for sunroof movement (open or close)

– **+ 12 volt** signal: no authorisation for movement of the sunroof

– Opening Cyclic Ratio signal: automatic closure of the sunroof by long pressing and holding down the remote control unit.

GETtheMANUALS.org

ANTI-PINCH

Obstacle detection is based on analysis of the motor rotation speed. An encounter with an obstacle causes a significant variation in motor speed.

Two Hall effect sensors incorporated into the motor generate periodic signals. The speed can thus be determined within half a revolution.

During the initialisation phase, a speed curve is stored by the computer integrated into the motor.

For the anti-pinch function, the computer compares the actual speed of movement with the stored speed.

Depending on the speed variation detected, the system triggers anti-pinch mode.

IMPORTANT: anti-pinch mode is only active if the system is correctly initialised.

NOTE: the anti-pinch function can be disabled in order to overcome a point of resistance (bent rail, foreign body in the runners). To do this, keep pressing until the sunroof is closed in step-by-step mode. The anti-pinch function is reactivated when the switch is released.

INITIALISATION PROCEDURE

In the event of battery disconnection, an electrical fault or servicing of the sunroof, the system will only operate in manual mode, in short jerky movements.

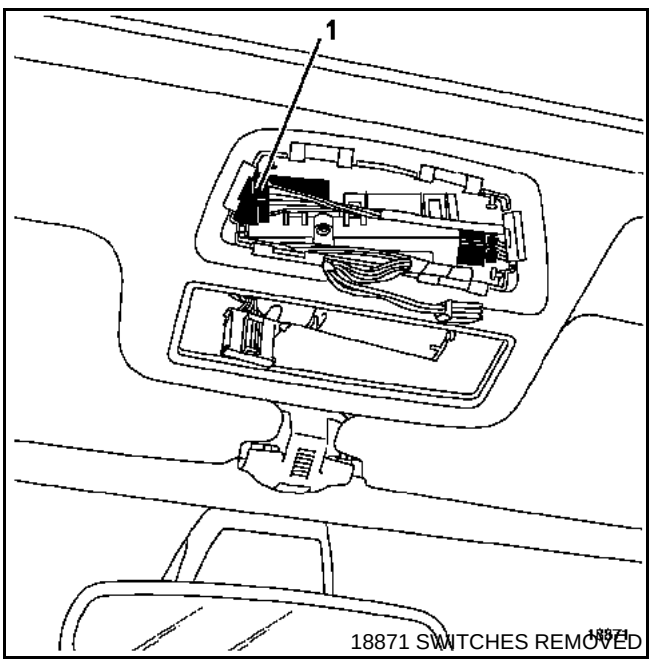
To perform initialisation:
– set the sunroof switch to the maximum tilt position,
– press and hold the switch. After two seconds, the sunroof will tilt to the maximum position step-by-step, then drop down a few centimetres,
– release the switch,
– press the switch again within five seconds,
– keep the switch depressed, the sunroof will open then close in the slide position,
– the motor is initialised,
– set the switch to stop.

NOTE: during the initialisation procedure, the time between the two actions must not exceed 5 seconds, or the computer will start a new initialisation cycle.

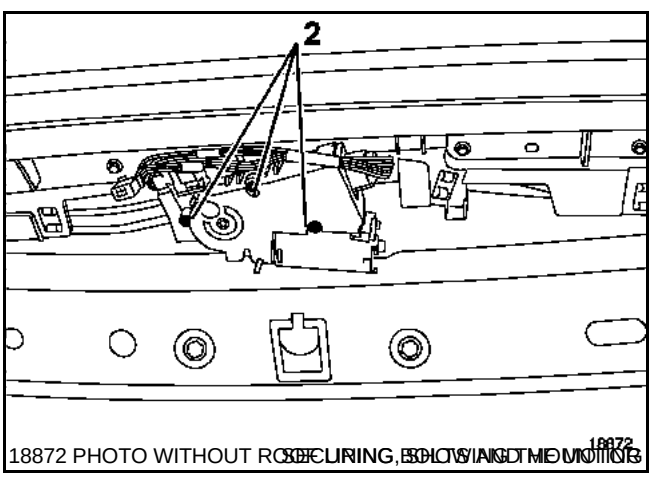
GETtheMANUALS.org

REMOVING THE MOTOR

Remove:
– the sunroof switch and its connector,
– the roof console and its connector.



Release the connector (1) from its mounting, then disconnect the sunroof motor connector.



Remove the mounting bolts (2).

Release:
– the connector mounting,
– the sunroof motor.

SPECIAL NOTES FOR REFITTING

The system must be initialised after the motor is refitted.

GETtheMANUALS.org

GETtheMANUALS.org

GENERAL INFORMATION

Certain vehicles are fitted with a parking aid to inform the driver of any obstacles behind the vehicle during reversing (posts, stone posts, another vehicle, etc).

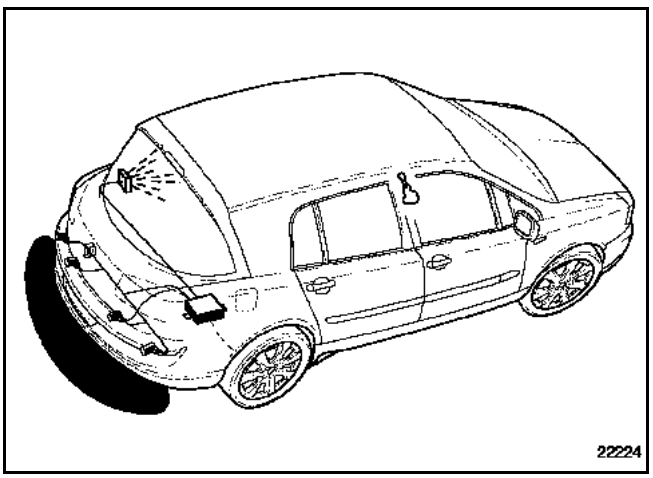
OPERATION

The system consists of:
- four ultrasonic sensors incorporated into the rear bumper,
- an independent computer (with a diagnostic function),
- an acoustic warning signal,
- an inhibitor switch.

The system is activated automatically when reverse gear is selected (this activation is indicated by a short start-up tone). The ultrasonic sensors located in the rear bumper measure the distance between the vehicle and a potential obstacle.

The frequency of the acoustic signal varies with the distance: it is activated when an obstacle is about 5 feet (150 centimetres) from the bumper, its pulse frequency rising until a continuous tone is emitted when the obstacle is about 10 inches (25 centimetres) from the bumper.

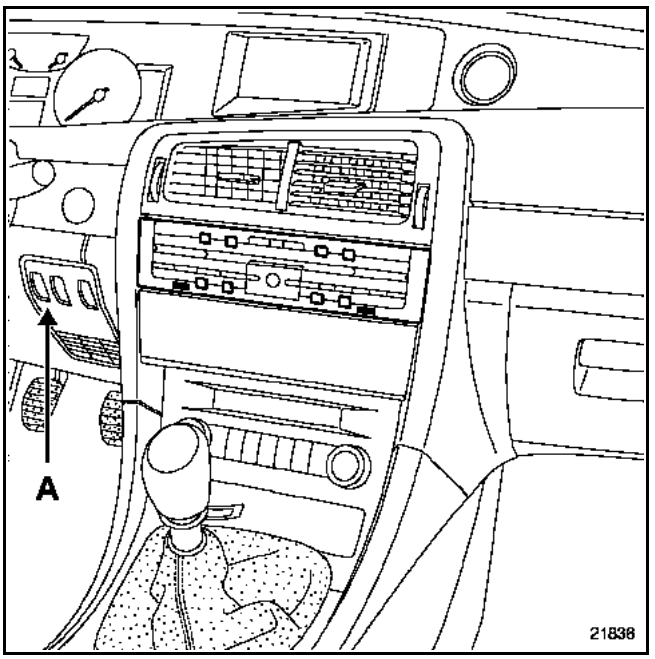
NOTE:
- to ensure correct operation of the system, check that the ultrasonic sensors are clean,
- when the system detects an operating fault, a beep sounds for approximately 5 seconds,
- sensor function can be intermittent in bad weather or when a bicycle carrier is fitted.



1 Sensors
2 Computer
3 Audible alarm (beeper)

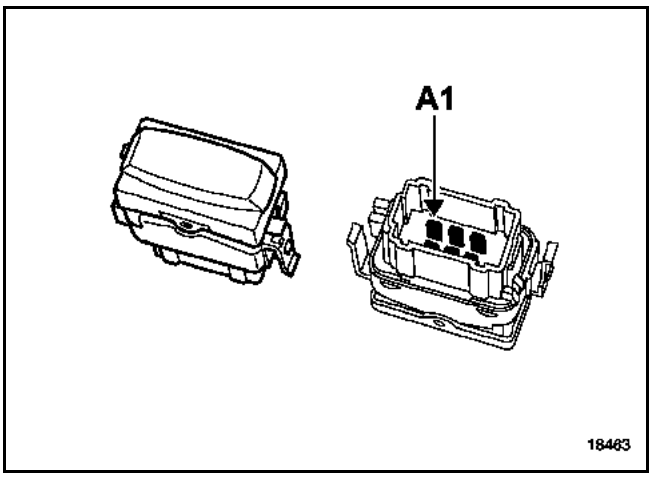
GETtheMANUALS.org

The system is fitted with a switch (A) to inhibit the function:
– with a short press, the function is inhibited until the ignition is switched off,
– with a long press, the function is inhibited continually.



NOTE: any inhibitions made can be displayed with the diagnostic tool.

CONNECTION



Track	Description

NOTE: the resistance of the lighting bulb is approximately **30 Ω** between tracks A1 and A2.

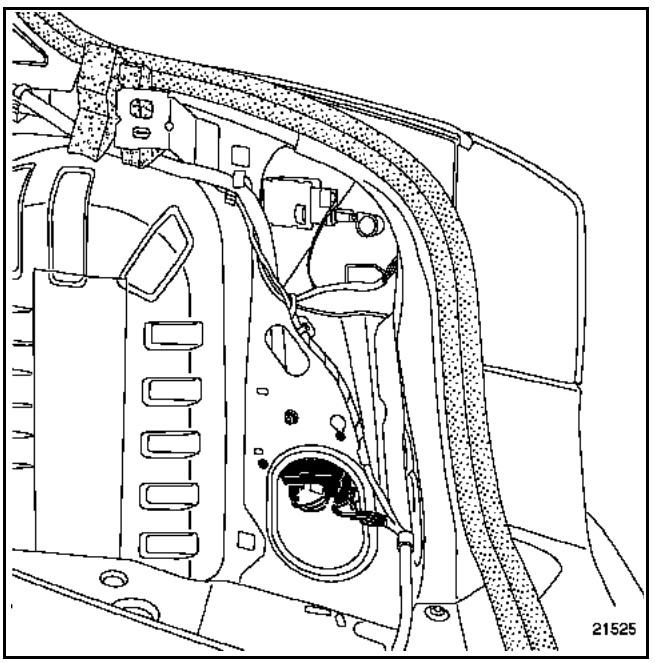
GETtheMANUALS.org

COMPUTER

REMOVAL

Remove the interior trim of the right-hand side of the luggage compartment (refer to the **Bodywork section**).

Disconnect the computer connectors and undo the mounting bolts.



REFITTING

Refitting the computer does not pose any special problems.

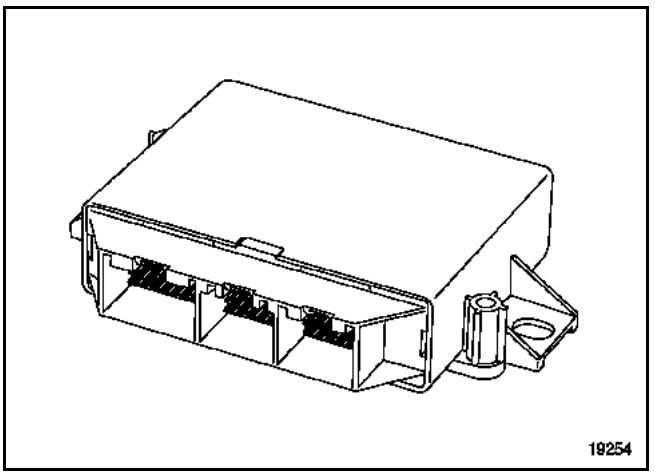
The computer must be configured using the diagnostic tools after it has been replaced.

Using the **NXR, Clip** or **Optima 5800** diagnostic tools:

- select and confirm **parking assistance**,
- select and confirm the **Command** menu, then **System configuration**,
- select and confirm the vehicle type.
- check that the configuration is correct with the **reading configuration** menu.

GETtheMANUALS.org

CONNECTION



NOTE: connector (2) is not used.

The system can be inhibited with the diagnostic tool or with the switch.

NOTE: the vehicle speed signal is not used.

GETtheMANUALS.org

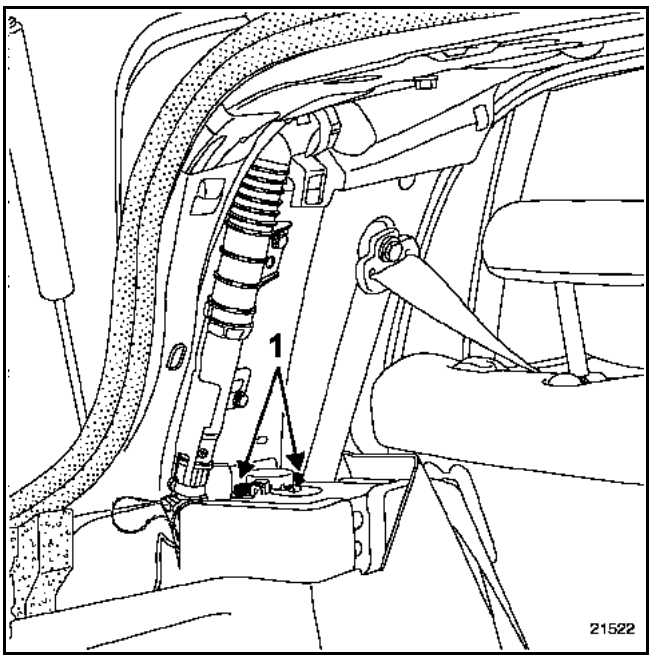
WARNING BUZZER

REMOVAL

Remove the interior trim of the left-hand side of the luggage compartment (refer to the **Bodywork section**).

Disconnect the connector.

Remove the plastic mounting rivets (1).



REFITTING

Refitting the acoustic signal buzzer does not pose any special problems.

Replace the plastic rivets with traditional rivets.

The volume and tone frequency of the acoustic signal can be changed or disabled using the diagnostic tools.

Using the **NXR, Clip** or **Optima 5800** diagnostic tools:

- select and confirm **parking assistance**,
- select and confirm the **command** menu, **CF001: buzzer volume** and select the line MEDIUM LOUD,
- select and confirm **CF 006: buzzer tone** and select the line 500 Hz,
- check that the configuration is correct with the **reading configuration** menu.

GETtheMANUALS.org

ULTRASONIC SENSORS

The sensors are all identical.

They are integrated into the bumper strip.

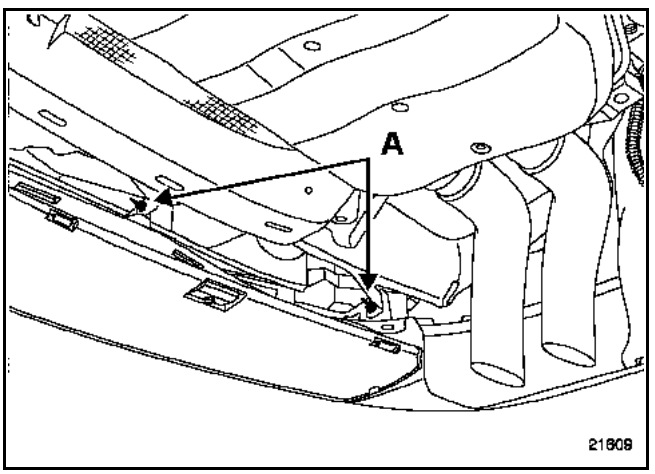
WARNING: the sensors are fragile.

The outer metal part of the sensor cannot withstand tool impact.

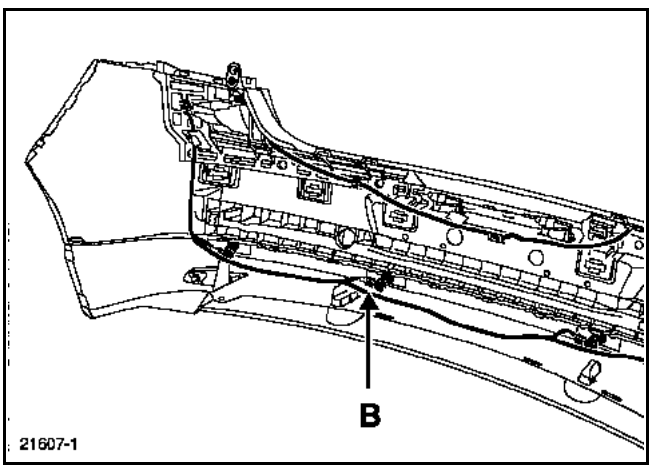
REMOVAL

It is not necessary to remove the bumper in order to remove the sensors.

Remove the clips (A) retaining the lower section of the bumpers.



Disconnect the connector (B).

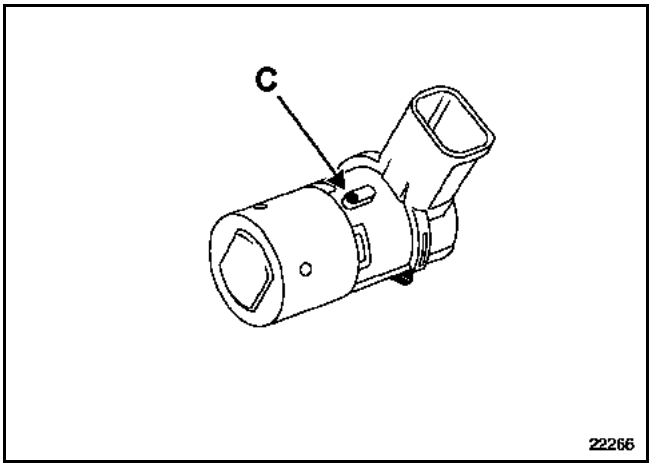


Unclip the sensor, taking care not to scratch it.

NOTE: each detector is retained in a housing composed of two side clips and a positioning pinion.

REFITTING

Position the pinion (C) opposite its housing and insert the sensor until the clips are in place.



IMPORTANT: the sensors are heat sensitive (temperature above **80°C**).

WARNING: When removing a seat, take care not to damage the connector which would create static electricity; this could trigger the airbag.

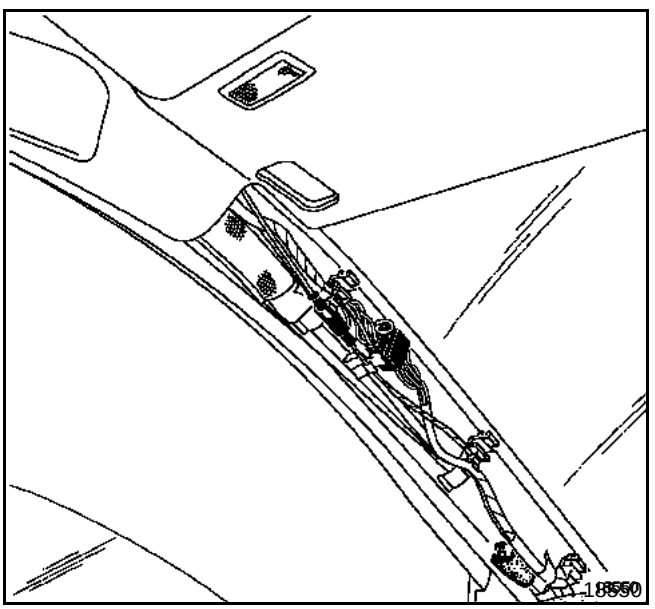
GETtheMANUALS.org

The headlining is not glued to the vehicle. It is held in place by the door seals, the sun visor and the grab handles (use tool **Car. 1597**).

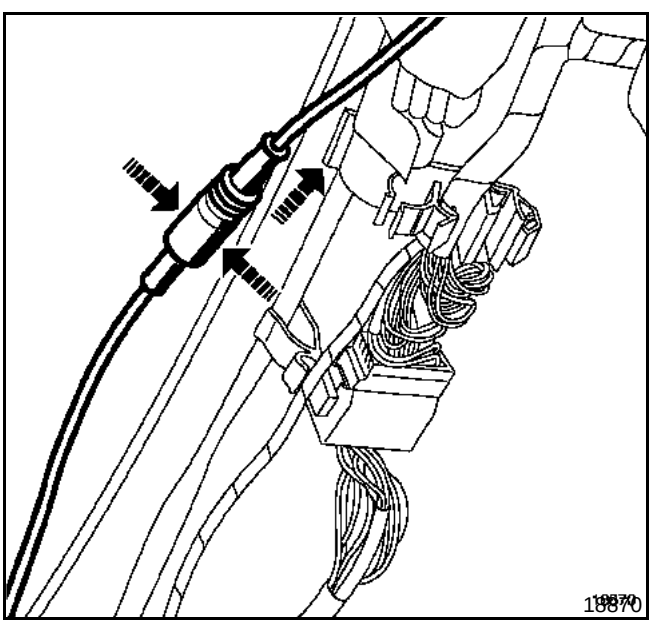
It is possible to replace the headlining and keep the harness or replace the harness and keep the headlining.

REMOVAL

The harness is glued to the headlining. To remove it, heat the glue using a hot air gun, then cut the glue bead taking care not to damage the harness.

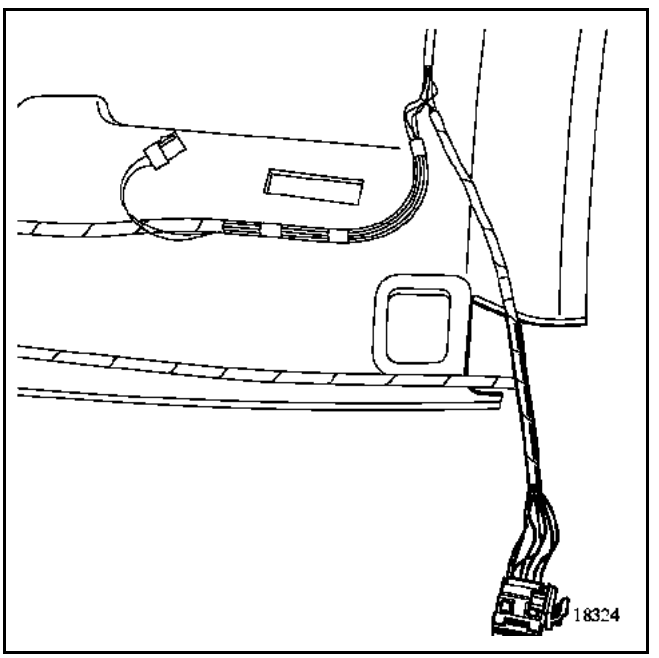


It is also possible to leave the faulty harness in place, and to glue the new harness alongside it.



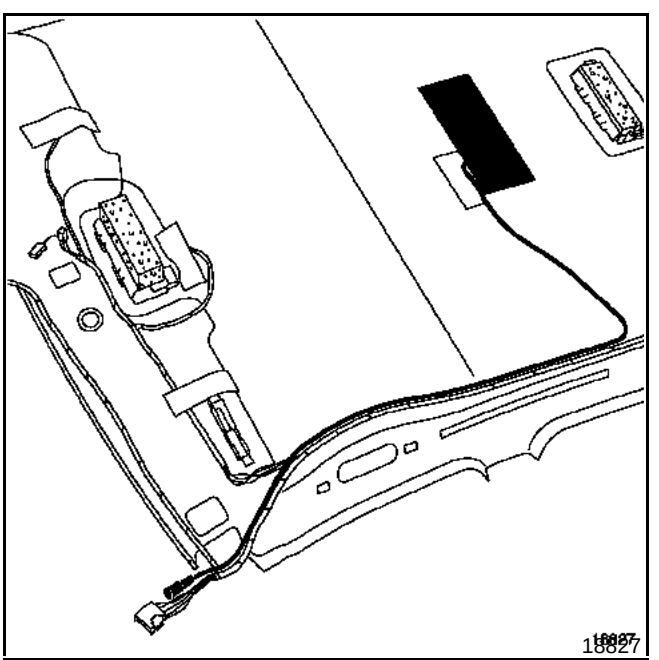
REFITTING

When refitting the harness on the headlining, it is essential to observe the location of the connectors with respect to the edge of the headlining. A mark on the harness must coincide with the edge of the headlining.



Special features of the hands-free aerial

The hands-free aerial is glued to the headlining. It can be replaced on its own.



GETtheMANUALS.org

DESCRIPTION

Vehicle computers are becoming increasingly powerful, and can perform increasingly complex calculations. To perform these calculations, they need to acquire information from sensors or from other computers.

The multiplex network allows the computers to:
– exchange signals through a two-wire connection common to all the computers known as the **BUS**,
– reduce the number of cables and connectors.

If the computers are to communicate between each other using the multiplex network, they must speak the same language (protocol). RENAULT has chosen the **CAN** protocol.

● The CAN protocol

The BUS consists of a twisted pair of non-interchangeable wires, called *CAN H* and *CAN L*.

The information is transmitted in the form of long-tail pair square wave signals, which gives greater protection against electromagnetic interference and limits radiation. The voltages of the signals transmitted on the bus are strictly differentiated: between **2.5 and 3.5 V** for the CAN H line and between **2.5 and 1.5 V** for the CAN L line.

At each end of the multiplex connections are impedances of **120 ohms**.
– UCH side ≈ **120 ohms** on the CAN UCH line, (disconnected from the network).
– injection computer side ≈ **120 ohms** on the CAN line of the computer (disconnected from the network).

See the **Repairing the multiplex network** section for measuring the line impedance and performing a multiplex network test.

● The CAN frame:

The message sent on the multiplex network is called a **frame**. It consists of a series of logical levels organized into **5 fields**.
⇒ An arbitrage field indicating the addressee(s) and the frame's priority of access to the network.
⇒ A control field.
⇒ A field containing the message data.
⇒ A control field contributing to the security of the transmission.
⇒ An acknowledgement field indicating that the frame has been correctly sent over the network.

Special cases:
– If several computers attempt to send a frame at the same time, the frame with the highest arbitrage field value will have priority. The other transmissions (with lower priority) will be sent as soon as the most important frame has been sent. Each computer is able to send and receive.
– If a message is incorrect or incorrectly received by a computer, the acknowledgement field will not be validated and the whole message will be rejected.
– The airbag and wheel locking computers comprise the topology of the multiplex network. It is essential to check it during the first multiplex network test when it is first installed. Refer to the **Fault finding** section.

GETtheMANUALS.org

● **Repair of the multiplex network**

The multiplex network is connected to each of the computers by means of cable joints in the harness.

The fault finding procedure for these lines consists of verifying:
– continuity line by line,
– insulation from earth and voltage,
– line impedance:
  ≈ **60 Ohms** between CAN H and CAN L (battery disconnected between terminals 6 and 14 of the diagnostic socket),
  UCH side ≈ **120 Ohms** on the CAN UCH line, (disconnected from the network),
  ≈ **120 Ohms** on the CAN engine Electronic Central Unit, on the computer side (disconnected from the network),
– the frames can be displayed using an oscilloscope,
– the remaining fault finding operations can only be performed with the diagnostic tools (actuator test, measurement of parameters, etc.).

● **Fault finding**

Multiplex computers fitted with a diagnostic connection incorporate a multiplex network fault finding procedure.

Each computer permanently monitors its capacity to transmit and the regular arrival of messages from other computers. Any fault detected results in one or more present or stored faults on the multiplex network. These faults are grouped in a frame dedicated to the multiplex network fault finding procedure, using a format common to all the computers.

After-Sales, these faults can be displayed on fault finding tools in order to identify the faulty inter-computer connection(s) and to locate and ascertain the nature of the fault.

Each time a diagnostic tool is connected to a vehicle, a multiplex network test is performed by the tool.

● **The different multiplex connections on the vehicles**

Depending on the level of equipment, several multiplex networks may be present on the vehicles:

⇒ The vehicle multiplex network or intersystems
  – Injection
  – Automatic transmission (depending on version)
  – Anti-lock braking system
  – UCH
  – Electric steering column lock
  – Airbag
  – Air conditioning
  – Instrument panel
  – Central Communication Unit
  – Voice synthesiser
  – Tyre pressure monitoring system
  – Remote-controlled speed regulator
  – Electric window (driving position memory)

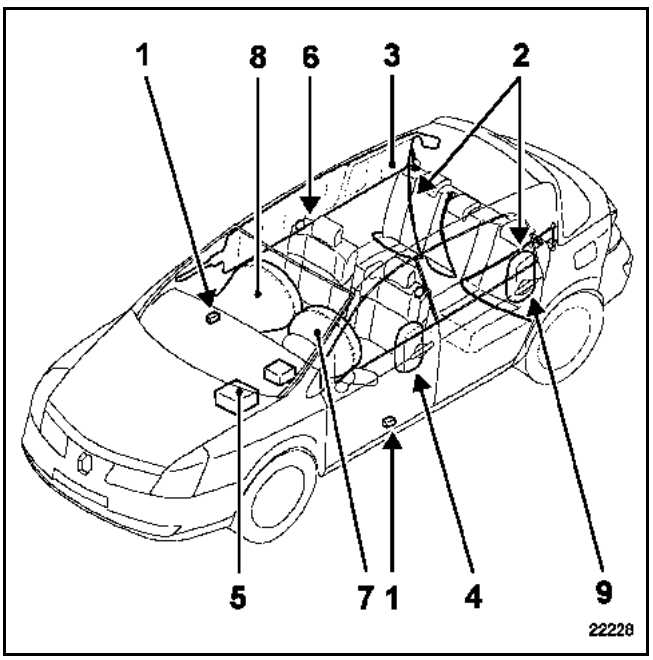
⇒ The private multiplex network (connecting the anti-lock braking system computer and the steering wheel angle sensor).

⇒ The multiplex network for the navigation system.

⇒ The multiplex network associated with the driver's seat position memory option.

GETtheMANUALS.org

These vehicles are fitted with a passive safety system of the PRS (Renault Protection System) type, comprising:
– front seat belt retractors (6) controlled by a special computer (12 tracks),
– front buckle pretensioners (driver and passenger) and lap-belt pretensioner (driver),
– seat belts in the front (**400 daN**) and rear (2) seatbelts (**600 daN**),
– dual generator front airbags (two volumes) (driver (7) and passenger (8)),
– pyrotechnic retractors on the rear seatbelts (side seats),
– a computer (5) (75 tracks) and two impact sensors (1),
– chest side airbags (4) in the lower seatback of the front seats),
– side curtain airbags (3),
– chest side airbags (9) in the rear seats (depending on the version),
– a driver's seat position sensor,
– a system fault warning light,



Note: Certain connectors are fitted with a new generation locking system. It is essential to unclip the lock before removing the connector and ensure it is correctly positioned after fitting. An unlocked connector will not supply the trigger line.

GETtheMANUALS.org

PRECAUTIONS DURING REPAIR

All operations on airbag and pretensioner systems must be carried out by qualified trained personnel.

WARNING: it is forbidden to handle the pyrotechnic systems (pretensioner or airbag) near a flame or heat source, as there is a risk of triggering them.

The airbags have a pyrotechnic gas generator with an ignition module and airbag which must not be separated.

IMPORTANT: before removing a safety system component, lock the airbag computer using the diagnostic tool.
When this function is activated all the triggering lines are disabled and the airbag warning light on the instrument panel lights up (ignition on).

When the airbag or pretensioner is triggered, the airbag computer is permanently locked and lights up the **airbag** warning light on the instrument panel. The airbag computer must be replaced. (Some components lose their nominal specifications after experiencing trigger energy).

After refitting all the parts, carry out a diagnostic check using the diagnostic tool.

If everything is correct, unlock the computer, if not, refer to the **fault finding** document.

IMPORTANT: refer to the **Destruction procedure** section when scrapping a pyrotechnic system that has not been triggered.

Any operation, even minor, is forbidden on the triggering lines of the pyrotechnic components.

WARNING

– The computers and impact sensors contain sensitive components, **do not drop them**.

– Do not put covers on the front seats (except for Renault products).

– Do not place objects in the airbag deployment area.

– When working under the vehicle (on the bodywork, sill panel etc.), it is vital that you lock the airbag computer using a fault finding tool and switch off the ignition.

– For special notes on the removal and replacement of seat trims, it is essential to read the **Bodywork** section.

IMPORTANT: It is vital that pyrotechnic systems (front pretensioners and airbags) are checked using the diagnostic tools:
– following an accident which did not trigger the devices,
– following theft or attempted theft of the vehicle,
– before selling a used vehicle.

After an impact:
– when the buckle pretensioner is triggered, the seat frame must be replaced and also the seat belt if it was being worn,
– when the rear pyrotechnic retractors are triggered, the seat belt - pyrotechnic retractor assembly and the rapid connection must be removed,
– if the driver front airbag is triggered, the steering wheel and its mounting bolt must be replaced,
– if the passenger front airbag was triggered, the dashboard and cross member must be replaced,
– if a side seat airbag is triggered, the seat frame must be removed.

GETtheMANUALS.org

OPERATION

During a front impact of sufficient severity:

- **Seat belts** fitted with **electrical locking retractors** hold the driver and the passenger.
- **The front pretensioners** and the **rear pyrotechnic retractors** tighten the seat belts so that they fit tightly against the body.
- **The Renault Protection System** (PRS) limits the force of the seat belt against the body.
- **The front airbags** inflate:
  - from the centre of the steering wheel to protect the driver's head
  - from the dashboard to protect the front passenger's head.

NOTE: the inflation volume of the driver's airbag may be modified by the computer according to:
- the position of the driver's seat (see **Under-seat switch**) section,
- the severity of the impact.

During a side impact of sufficient severity:

- The **front side chest airbag**, located in the corresponding front seat (impact side) deploys on the door side in order to protect the front seat occupant's chest.
- Depending on the version, the **rear side chest airbag**, located on the vehicle body (impact side) deploys on the side door in order to protect the rear seat occupant's chest.
- The **curtain airbag** (impact side) deploys on the door side to protect the front and rear passengers' heads.

The **front pyrotechnic retractors** and the **rear pyrotechnic retractors** may be triggered during a side impact, a rear impact or a turn (depending on the severity).

WARNING: when triggered, a pyrotechnic gas generator produces a detonation and a small amount of smoke.

NOTE: Power supply to the computer and ignition modules is usually provided by the vehicle battery. Nevertheless, a power reserve capacity is incorporated into the airbag computer in case of battery failure on impact.

GETtheMANUALS.org

AIRBAG COMPUTER LOCKING PROCEDURES

Before removing the computer or before any operation on the airbag and pretensioner systems, it is vital that you lock the computer using the diagnostic tools:

1 Select the **Renault vehicle fault finding** menu,
2 Select and confirm the vehicle model
3 Carry out the multiplex network test,
4 Select and validate the **Airbag** system to be checked
5 Select the **command** menu.
6 Select and confirm the **Set up** (NXR) or Actuators (Clip) function,
7 Confirm the **VP006 Computer locking** line,
8 In the **State** menu, check that the unit is locked. The **ET073 Computer locked with tool** state must be active and the airbag warning light on the instrument panel must be on (new computers are delivered in this state).

NOTE: to unlock the airbag computer, use the same method, but confirm the **VP007 Computer unlocking** line.

The **ET073 Computer locked with tool** state should not be active and the airbag warning light on the instrument panel should switch off.

NOTE:
In the event of incorrect operation of these systems during an impact, it is possible to check that no fault was present before the impact using the diagnostic tools.
After locking following an impact, it is possible to check the supplied trigger lines with the breakdown contexts reading command on the diagnostic tool.

WARNING LIGHT ON THE INSTRUMENT PANEL

This warning light verifies correct operation of:
- front **pretensioners**,
- **rear** pyrotechnic retractors,
- **front airbags**,
- **front chest airbags**,
- **side curtain airbags,**
- **rear chest airbags** (depending on the version),
- the **battery** (checks the supply voltage),

It should light up for a few seconds when the ignition is switched on, then switch off (and remain off).

If it does not come on when the ignition is switched on or if it comes on when the vehicle is in motion, this means there is a fault in the system (see **fault finding** document).

NOTE: under certain starting conditions, the warning light may come on briefly and then go out.

IMPORTANT: a front seat belt fault or seat belt computer fault does not switch on the airbag warning light.

GETtheMANUALS.org

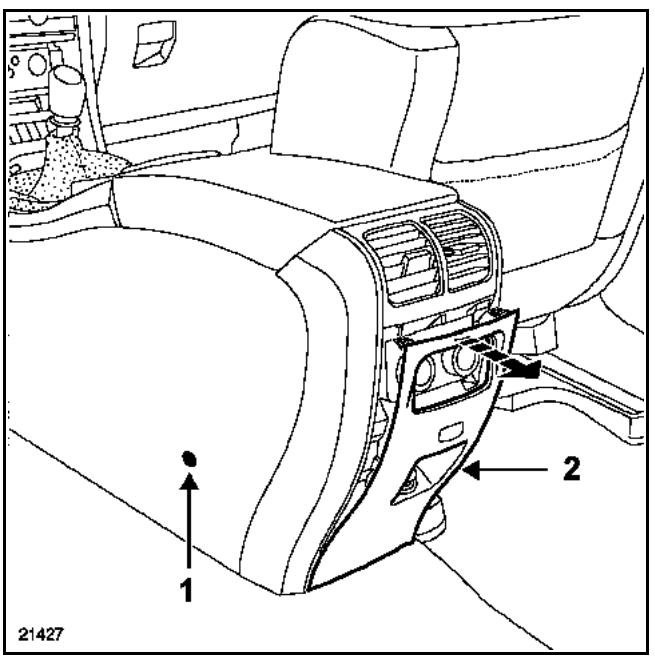
REMOVAL

IMPORTANT: before removing a safety system component, lock the airbag computer using the diagnostic tool.
When this function is activated all the triggering lines are disabled and the airbag warning light on the instrument panel lights up (ignition on).

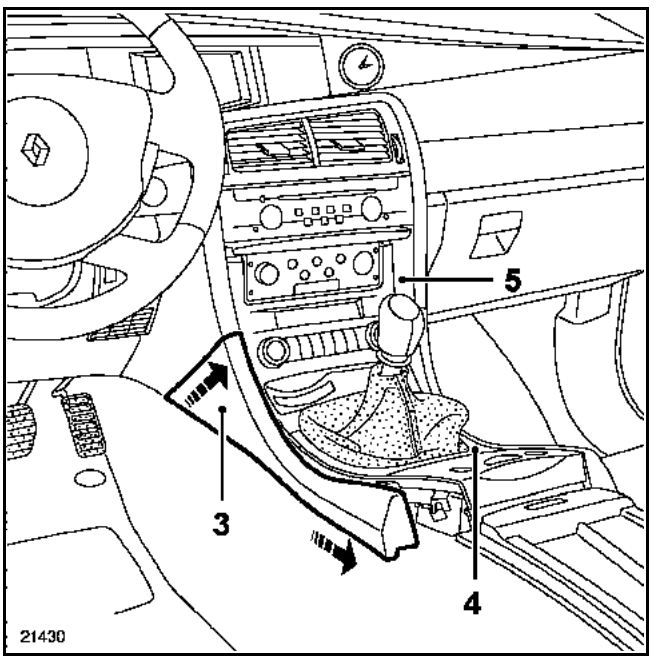
Move the seats fully forward.

Remove the screws (1) located to the rear of the console.

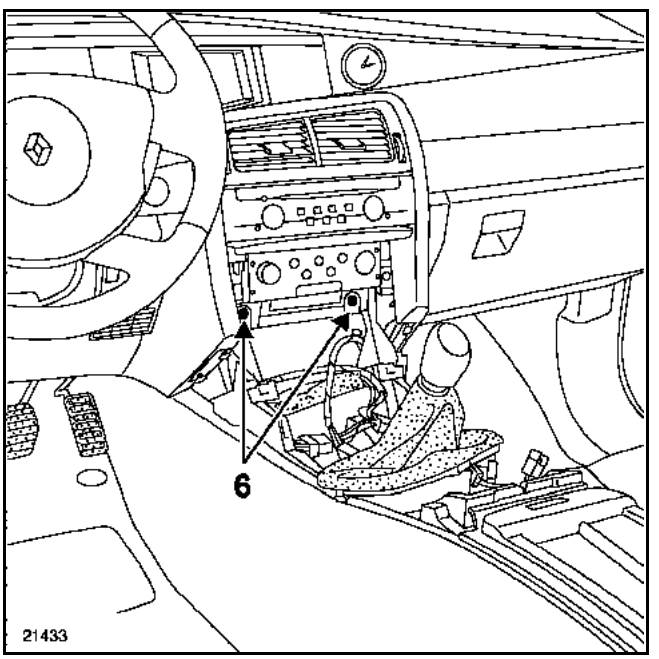
Remove the rear console cover (2):
– pull the central section,
– unclip the upper section,
– remove the cover.



Remove:
– the clip-on sides of the console (3) by pulling upwards along the instrument panel,
– the speed control bellows,
– the Central Communication Unit (depending on the version), using the **MS tool 1373** tools,
– the upper side of the console (4),
– the front mounting (5) of the air conditioning and RENAULT Card reader control panel,

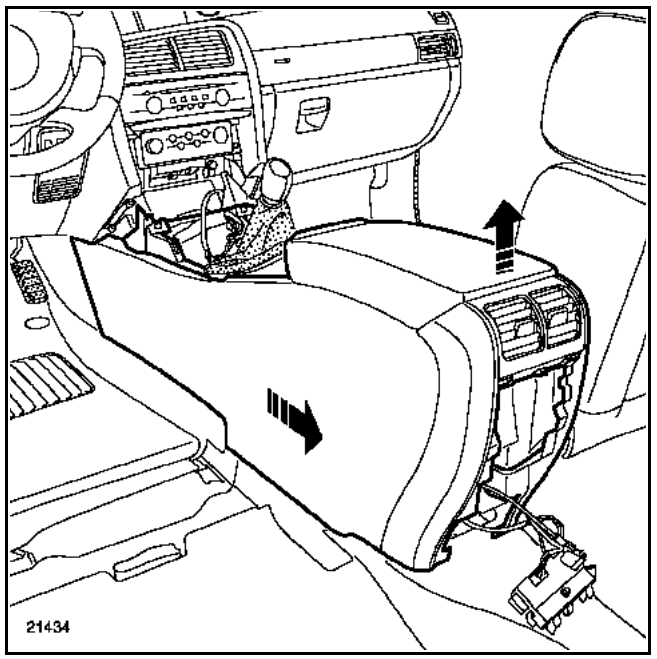


– the console mounting bolts (6).



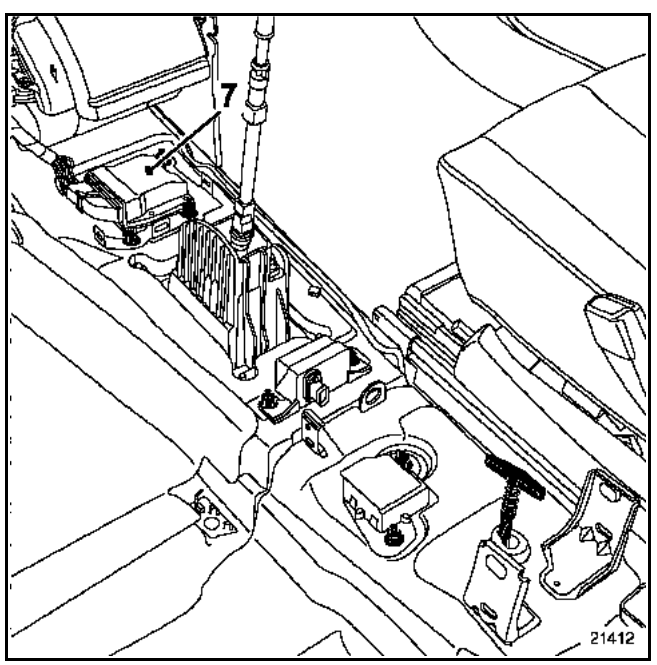
GETtheMANUALS.org

Lift the rear of the console. Remove the assembly.



Disconnect the airbag computer (7), then remove the mountings.

NOTE: it is not necessary to remove the air duct.



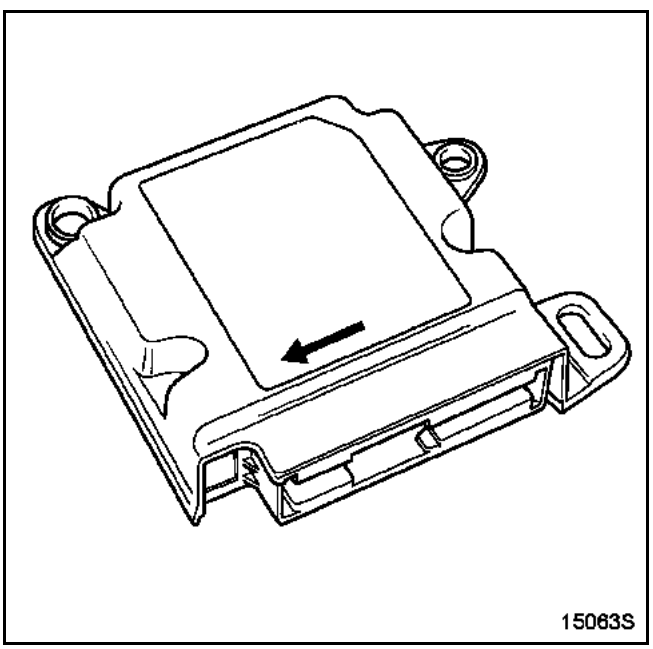
WARNING:

- When working under the vehicle (exhaust system, bodywork, etc.), do not use a hammer or transmit impacts to the floor without having locked the computer using the diagnostic tool.
- An electrical aftermarket accessory (speaker, alarm unit or any device which could generate a magnetic field) must not be installed in the immediate vicinity of the airbag/pretensioner computer.

REFITTING

Fit the computer in the direction shown by the arrow.

Put the computer in place and then torque tighten the mountings to **0.8 daNm** before reconnecting the connector.



Disconnect the airbag computer, then check that there are no faults.

NOTE: a special feature of the computer and distributor connectors is that they short circuit the various ignition lines which are disconnected. Shunts located opposite each pretensioner line or airbag line prevent incorrect triggering of these systems (by aerial effect for example).

GETtheMANUALS.org

CONFIGURING THE COMPUTERS

New computers identified as **ACU3** by the diagnostic tools (except **XR25**) are provided with **pretensioners/ rear seat belt retractors** and **side** and **rear chest airbags** already configured and with no disabling system.

If these configurations have not been performed, the airbag warning light will stay on.

With NXR diagnostic tools

1 Select the **Renault vehicle fault finding** menu.
2 Select and confirm the vehicle type.
3 Select and confirm the **Airbag** system.
4 Select the **Command** menu.
5 Select and confirm the **Method** function, then **System components configuration**.
6 Check the **present** configurations.
7 Select the line to be changed and confirm.
8 The tool displays the **desired** configuration.
9 Press the **continue** button. The tool displays the **desired** configuration, then **Are you sure you want to perform the above configuration?**
10 Press the **yes** button to activate the configuration.
11 Switch the ignition off and on again to validate the configuration
12 Return to the **System components configuration** menu to check the changes.

With CLIP diagnostic tools

1 Select the **Renault vehicle fault finding** menu.
2 Select and confirm the vehicle type.
3 Select and confirm the **Airbag** system.
4 Select the **Command** menu.
5 Select and confirm the **Programming** function.
6 In the **Ignition module configuration** menu.
7 Check the configurations. Select **Reverse**, then **Configure** to make the changes.
8 Press the **yes** button to activate the configuration.
9 Switch the ignition off and on again to validate the configuration
10 Return to the **Ignition module configuration** menu to check the changes.
11 Carry out the same procedure to configure the side impact sensors in the **Side sensor configuration** menu and for the **impact information** connection in the **System components configuration** menu.

These vehicles are not fitted with **ISOFIX** or **KEY** systems.

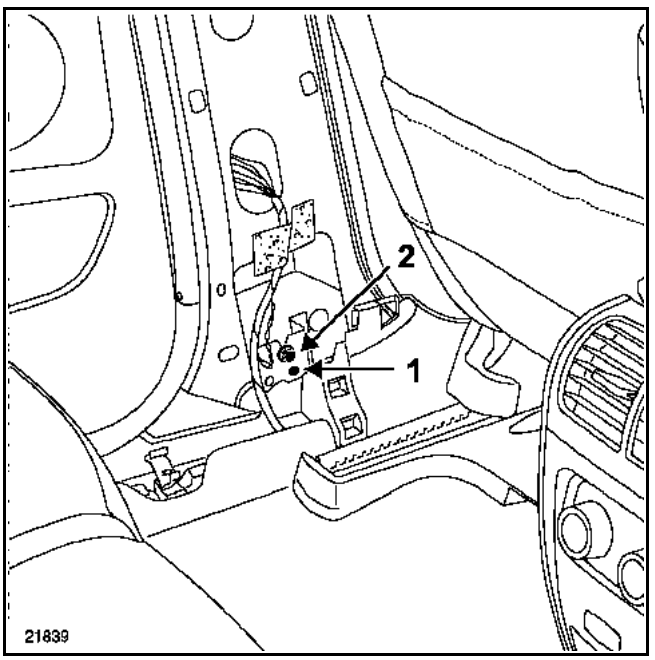
NOTE: the topology of the multiplex network is stored in the airbag computer. It is essential to check it during the first multiplex network test when the computer is replaced. Refer to **Section 88B**.

GETtheMANUALS.org

IMPORTANT: before removing a safety system component, lock the airbag computer using the diagnostic tool.
When this function is activated all the triggering lines are disabled and the airbag warning light on the instrument panel lights up (ignition on).

REMOVAL

They are located on either side behind the B-pillar lining.



WARNING:
When a side airbag is triggered, the computer locks permanently and switches on the airbag warning light on the instrument panel.
The side impact sensor and the computer must then be replaced (certain components lose their nominal settings after transmission of ignition power).

REFITTING

To refit it, position the sensor by means of its lug (1) and attach its mounting (2) to the vehicle before reconnecting its connector (**tightening torque: 0.8 daNm**).

After connecting the computer connector, run a systems check and then unlock the computer.

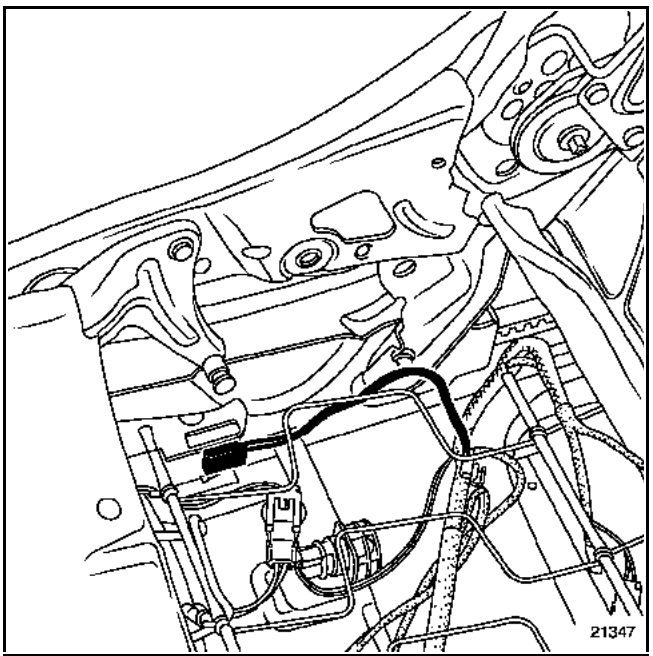
NOTE: these sensors do not need to be programmed by the diagnostic tool.

GETtheMANUALS.org

UNDER-SEAT SWITCH

The driver's seat is fitted with a runner position sensor. This switch adjusts the inflation of the driver's front airbag (high or low volume) according to the position of the driver's seat.

NOTE: the inflation volume of the driver's airbag is not modified by the seat position.



The resistance of the seat position sensor can be checked using the diagnostic tools:

- Seat forward: sensor resistance = **400 Ω**
- Reclined seat: sensor resistance = **100 Ω**

GETtheMANUALS.org

A special computer is used to manage the electrically locked front seat belt retractors fitted to the seats. It comprises:
– an electronic safety sensor,
– a connection to the airbag computer,
– two control lines (lock/unlock) for the front seat belt retractors.

REMINDER: the airbag warning light does not switch on if there is a fault on one of these components.

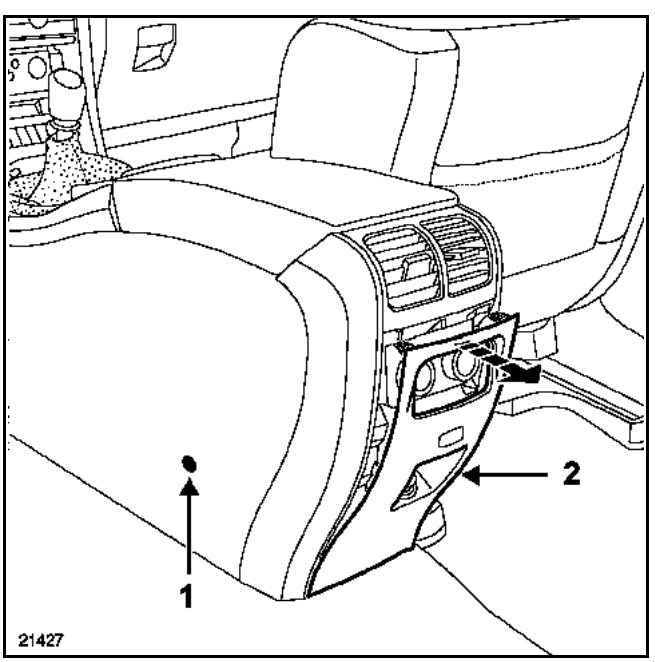
REMOVAL

IMPORTANT: before removing a safety system component, lock the airbag computer using the diagnostic tool.
When this function is activated all the triggering lines are disabled and the airbag warning light on the instrument panel lights up (ignition on).

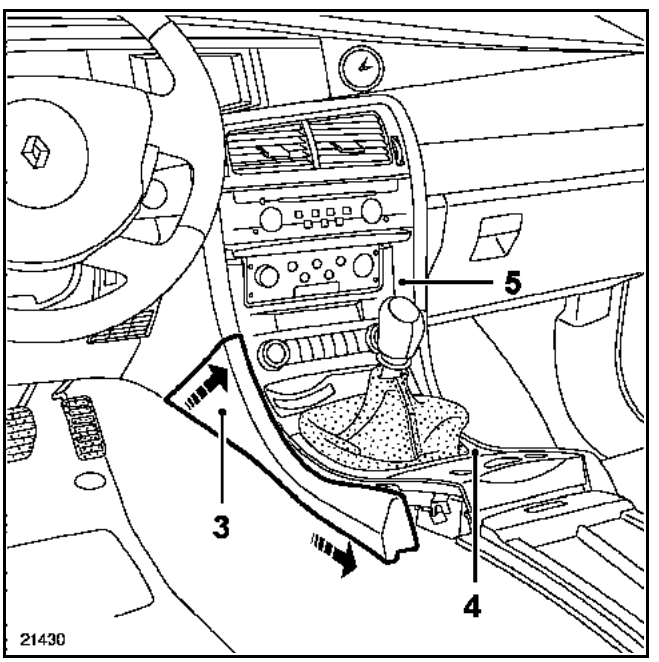
Move the seats fully forward.

Remove the screws (1) located to the rear of the console.

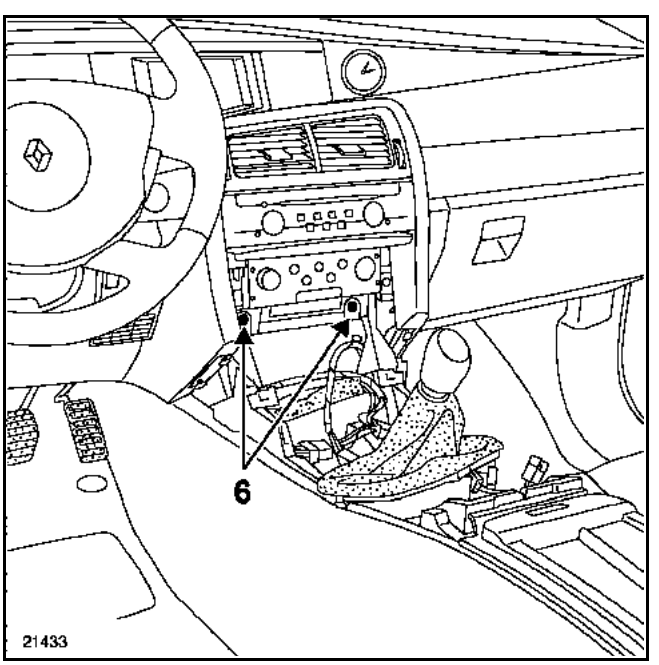
Remove the rear console cover (2):
– pull the central section,
– unclip the upper section,
– remove the cover.



Remove:
– the clip-on sides of the console (3) by pulling upwards along the instrument panel,
– the speed control bellows,
– the Central Communication Unit (depending on the version), using **MS tool 1373**,
– the upper side of the console (4),
– the front mounting (5) of the air conditioning and RENAULT Card reader control panel,

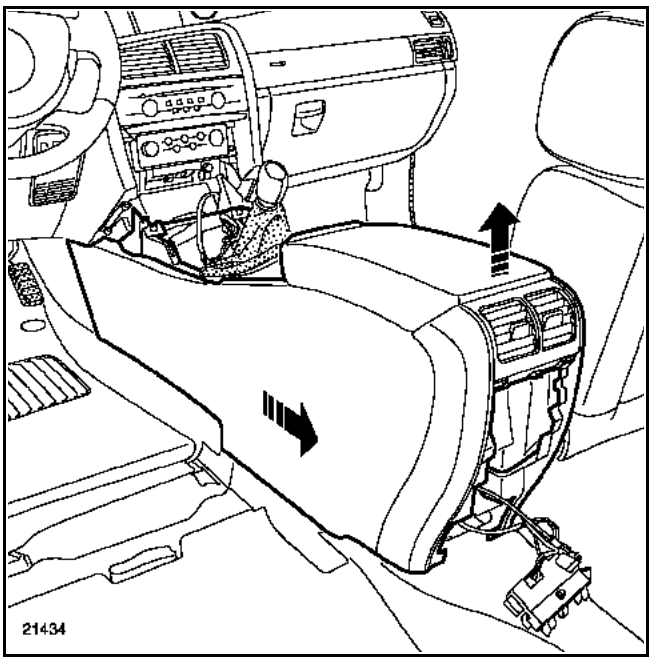


– the console mounting screws (6).



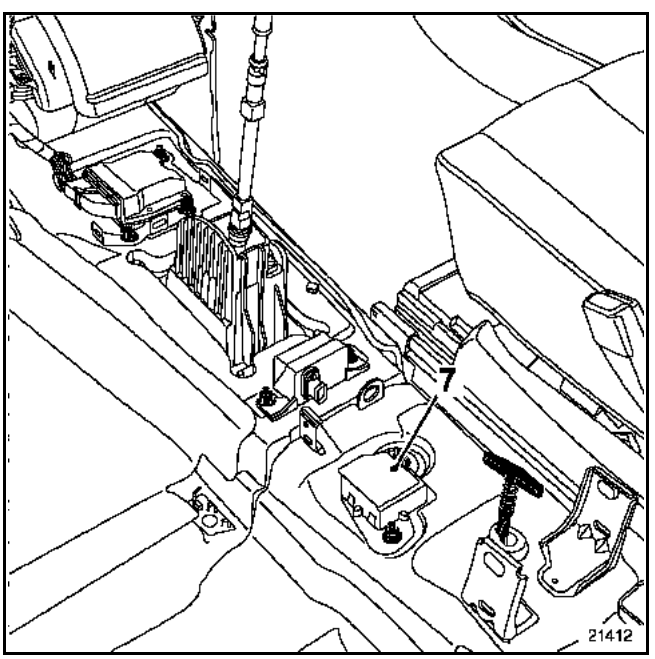
GETtheMANUALS.org

Lift the rear of the console. Remove the assembly.



Remove the air duct.

Disconnect the computer (7), then remove the mountings.

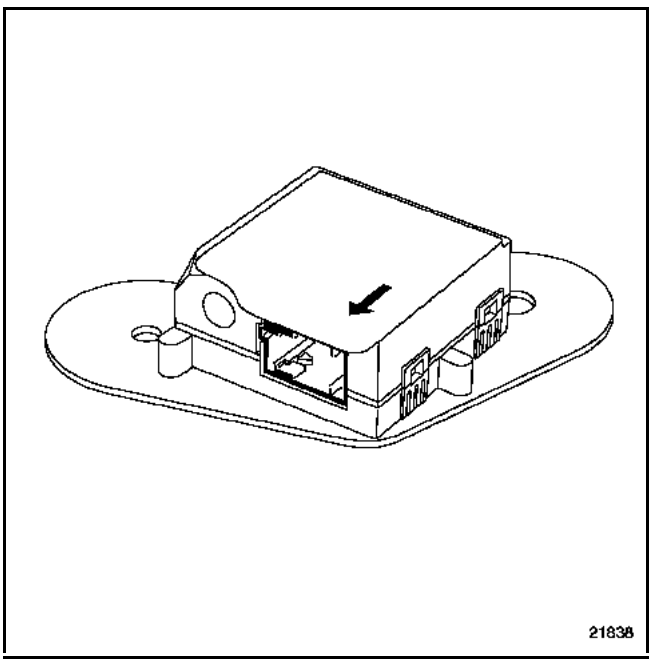


REFITTING

Tighten the mountings to **a torque of 0.8 daNm** before connecting the connector.

CONNECTION

12-track connector



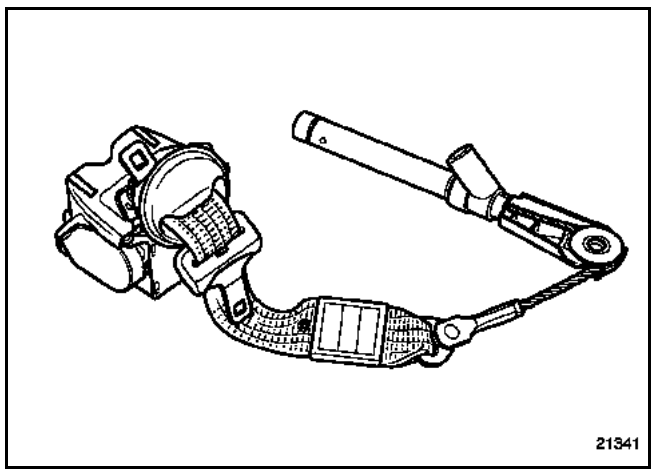
Track	Description
1	Earth
2	Not used
3	UCH supply
4	Not used
5	Passenger's side retractor control
6	Passenger's side retractor control
7	Not used
8	Airbag computer connection (track 55)
9	Not used
10	Not used
11	Driver's side retractor control
12	Driver's side retractor control

GETtheMANUALS.org

The seat belt retractor can be controlled electrically.

The retractor is controlled by a special computer (12 tracks) connected to the airbag computer.

The electric retractor cannot be separated from the seat belt and the lap-belt pretensioner for the purposes of replacement.



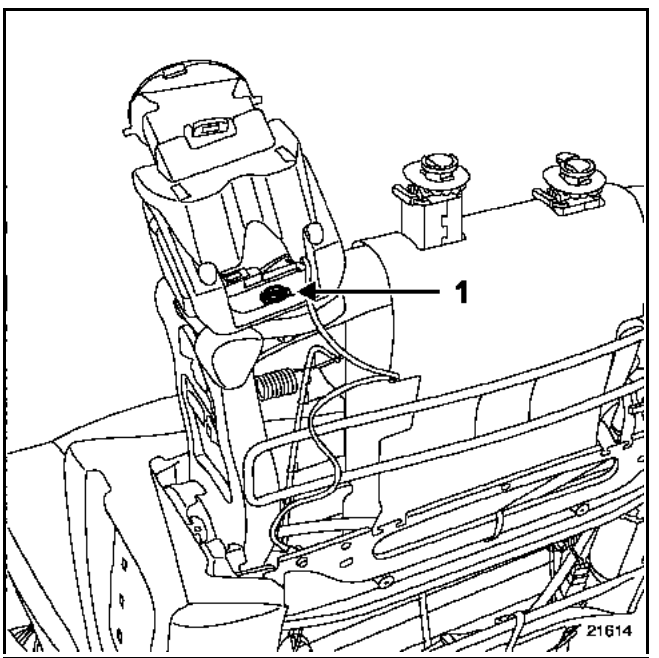
REMINDER: the airbag fault warning light does not come on if there is a fault on the electric retractor or seat belt computer.

REMOVAL

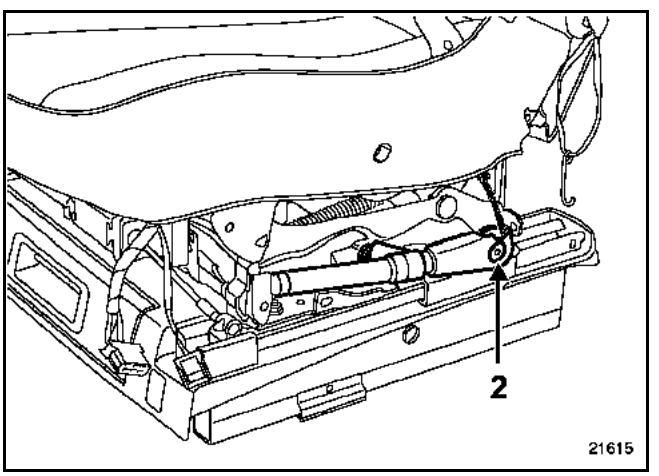
It is necessary to strip and remove the seat in order to remove the electrically locking seat belt retractor/seat belt/lap-belt pretensioner assembly. Refer to the section on **Bodywork**.

Disconnect the electric retractor and pretensioner connectors.

Remove:
– the retractor mounting (1),



– the pretensioner mounting (2).

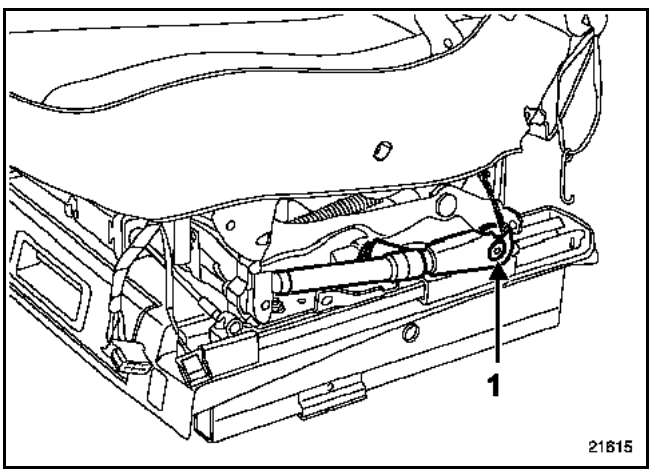


GETtheMANUALS.org

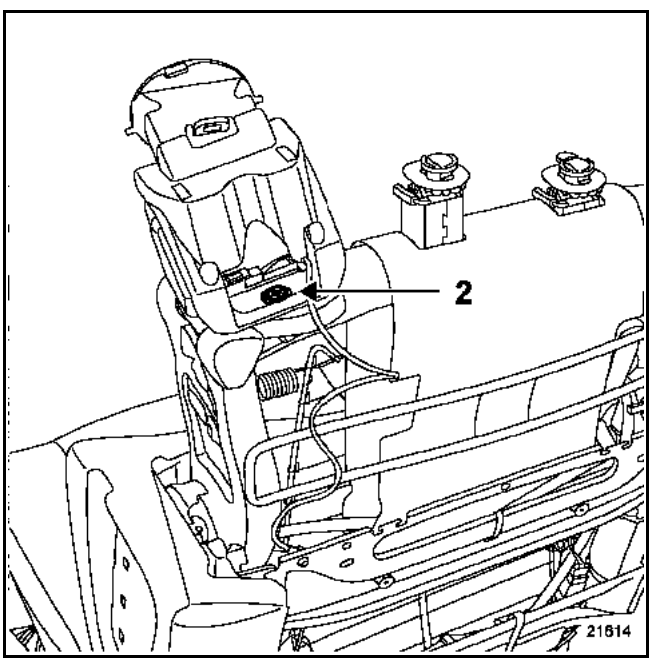
REFITTING

IMPORTANT: refer to the Destruction procedure section when scrapping a pretensioner that has not been triggered.

Tighten the pretensioner mounting screw (1) to a torque **of 2.1 daNm**.



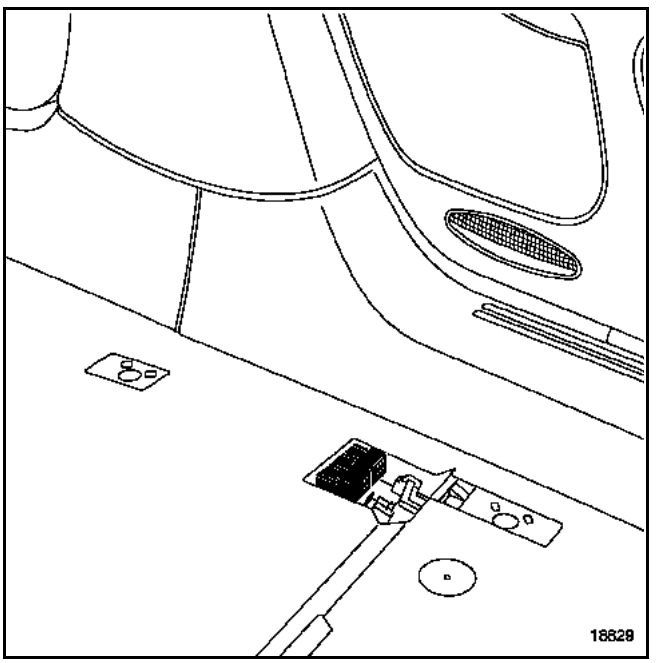
Tighten the retractor mounting screw (2) to a torque of **2.1 daNm**.



REMINDER: if the seat belt pretensioners are triggered, it is essential to replace certain parts. Refer to the section on **Precautions for repair**.

Follow the correct routing of the wiring and the wiring mounting points under the seat.

Before removing the seat, visually check the condition of the connectors on the seat base and the vehicle body.



Refit the seat and conform to the mounting tightening torques.

After replacing faulty parts and reconnecting the connectors, carry out a check using the diagnostic tool.

If everything is correct, unlock the airbag computer.

GETtheMANUALS.org

The vehicles are fitted with front seat belt pretensioners:
- a buckle pretensioner (driver and passenger),
- a lap-belt pretensioner (driver) which is inseparable from the seat belt (refer to the section on the **front seat belt retractor**).

REMOVAL

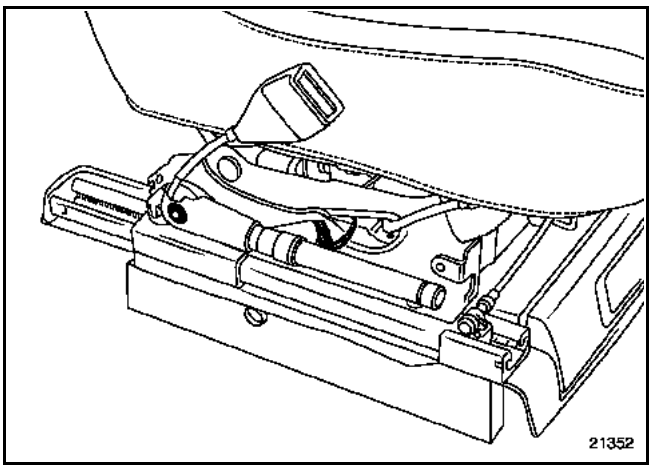
IMPORTANT: Before removing a safety system component, lock the airbag computer using the diagnostic tool.
When this function is activated all the triggering lines are disabled and the airbag warning light on the instrument panel lights up (ignition on).

Fold down the seat with the seat runner adjustment in the middle.

Remove the seat and its mounting (refer to the **Bodywork** section).

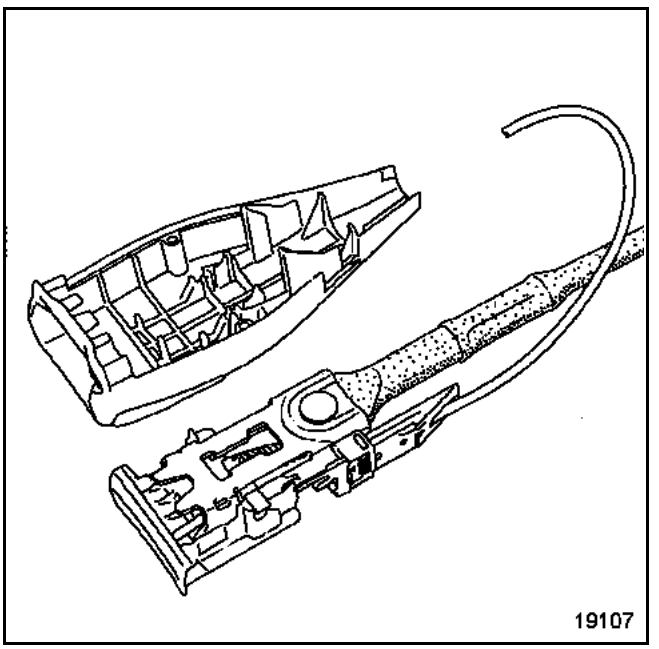
REMINDER: the seat is fitted with an automatic connector which does not authorize operations.

After removing the seat, remove:
– the plastic cover,
– the pretensioner connector located under the front seat,
– the pretensioner assembly.



Special features of the seat belt connector

To unclip the connector, remove the mounting bolts from the two buckle half-shells.



GETtheMANUALS.org

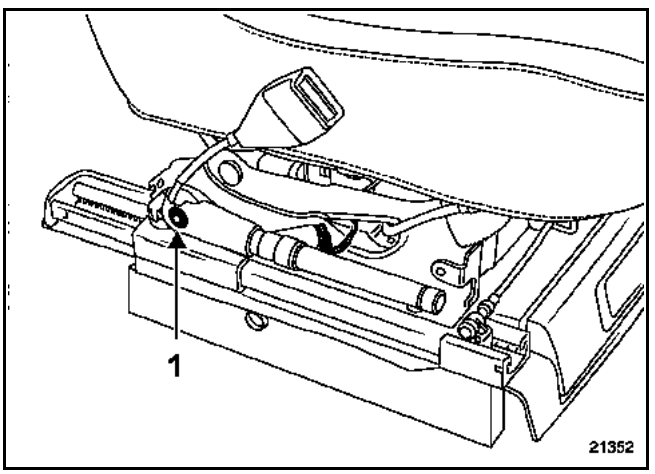
REFITTING

IMPORTANT: Refer to the Destruction procedure section when scrapping a pretensioner that has not been triggered.

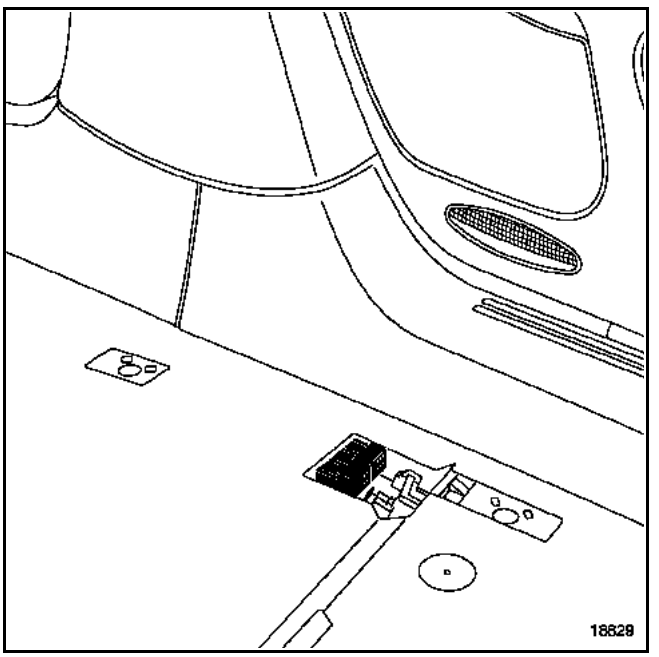
REMINDER: if the seat belt pretensioners are triggered, it is essential to replace certain parts. Refer to the section on **Precautions for repair**.

Follow the correct routing of the wiring and the wiring mounting points under the seat.

The mounting screw (1) to a **torque of 2.1 daNm**.



Before removing the seat, visually check the condition of the connectors on the seat base and the vehicle body. Refer to **Section 88A**.



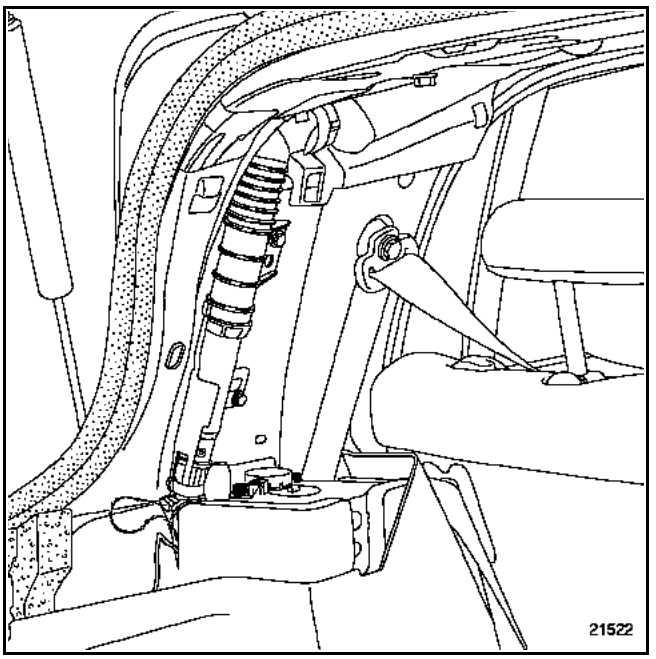
Refit the seat and conform to the tightening torques (**tightening torque: 4.4 daNm**).

After replacing faulty parts and reconnecting the connectors, carry out a check using the diagnostic tool.

If everything is correct, unlock the airbag computer.

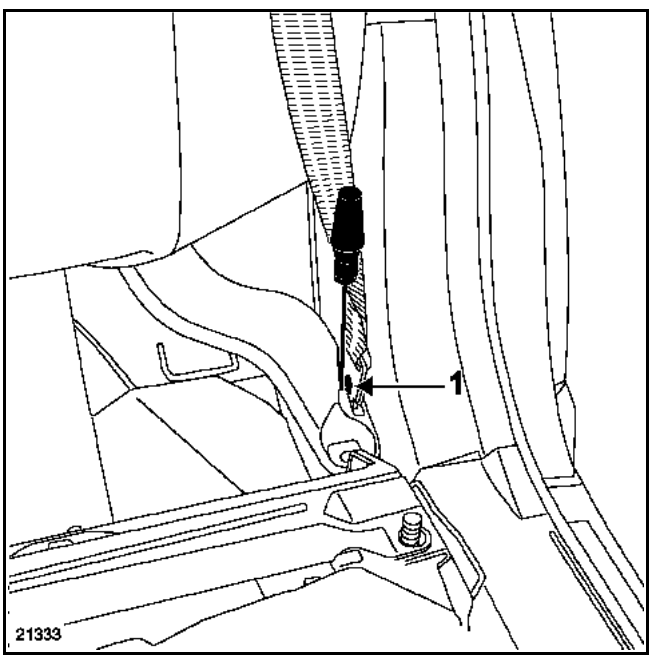
GETtheMANUALS.org

The rear seat belts (side seats) are fitted with pyrotechnic retractors. To remove the assembly, it is necessary to remove the luggage compartment trim and quarter panel trim. Refer to the method described in the **Bodywork** section.



Disconnect the connector and earth wire and remove the mounting bolt.

Separate the seat belt from the rear seat squab by pressing on the bolt (1).



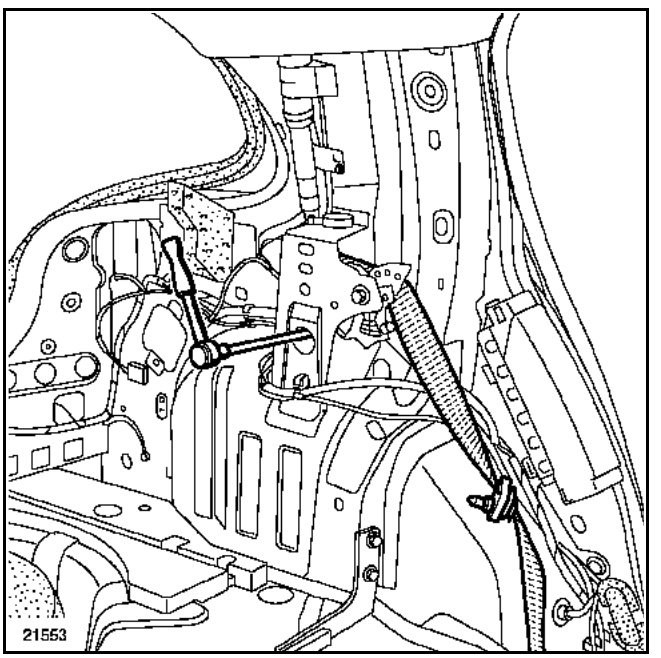
REFITTING

IMPORTANT: Refer to the Destruction procedure section when scrapping a pyrotechnic retractor that has not been triggered.

REMINDER: If the pyrotechnic retractors are triggered, it is essential to replace certain parts. Refer to the section on **Precautions for repair**.

Follow the correct routing of the wiring and the wiring mounting points under the seat.

The mounting bolt **to a torque of 2.1 daNm**.



After replacing faulty parts and reconnecting the connectors, carry out a check using the diagnostic tool.

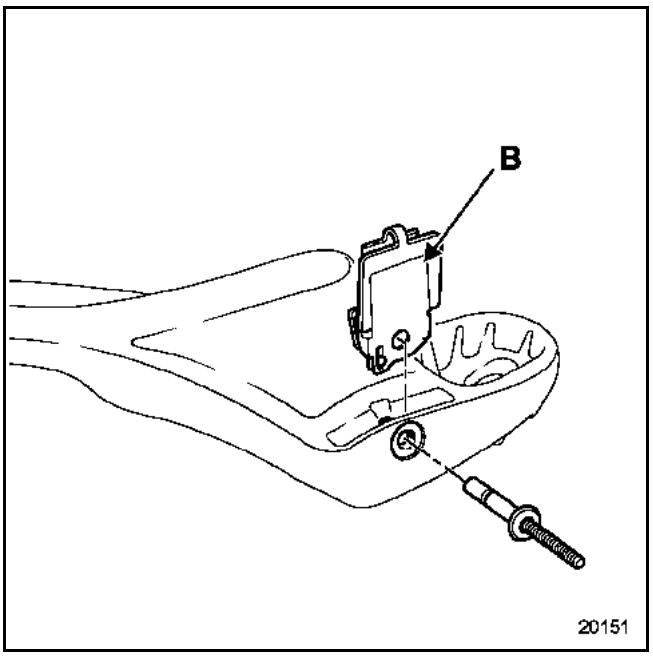
If everything is correct, unlock the airbag computer.

GETtheMANUALS.org

RAPID CONNECTION

If the seat belt pretensioners are triggered, the rapid connection and rear seat belts must always be replaced, if they were being worn at the time. If you have any doubts about whether the seat belt was being worn, you should replace it.

REMOVAL



Grind down the head and drive the rivet out.

REFITTING

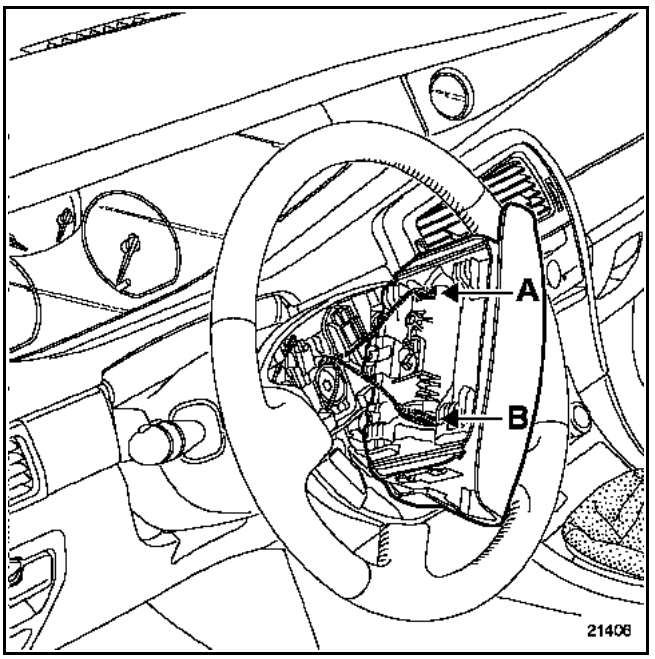
Position the connection (B) in its housing **part number: 82 00 024 242**.

Assemble the connection with the specific rivet **part number: 77 01 049 320**.

GETtheMANUALS.org

The **driver's airbag** module is fitted with an inflatable bag in two volumes (small or large volume).

It inflates according to the severity of the impact or the adjustment position of the driver's seat.



When triggered, the inflatable bag deploys by bursting through the steering wheel cover.

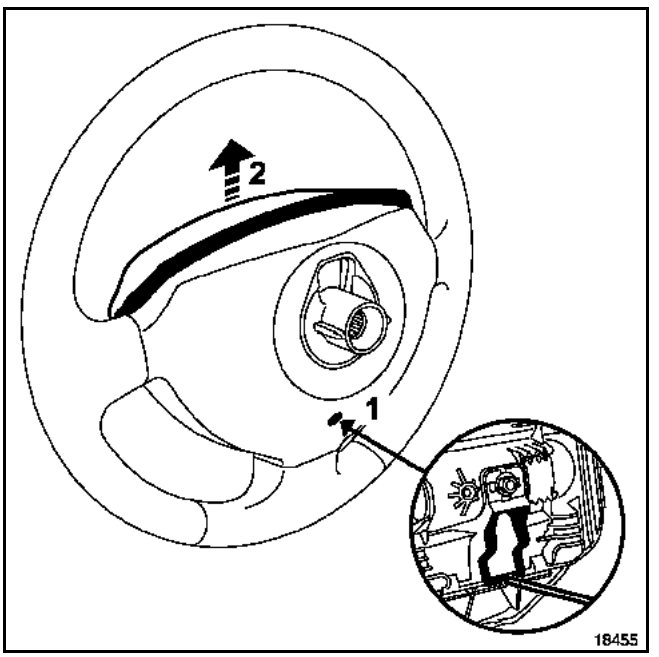
REMOVAL

IMPORTANT: Before removing a safety system component, lock the airbag computer using the diagnostic tool.
When this function is activated all the triggering lines are disabled and the airbag warning light on the instrument panel lights up (ignition on).

IMPORTANT: Whenever the steering wheel is removed, it is essential to disconnect the airbag connectors (A) and (B).
The airbag has a connector which short circuits if it is disconnected to prevent accidental triggering.

Insert a screwdriver into the opening (1) behind the steering wheel.

Raise (2) the airbag in order to slide it out.



Unclip the connector safety clips.

Disconnect the two generator power supply connectors.

IMPORTANT: refer to section describing the Destruction procedure when scrapping a driver's airbag that has not been triggered.

GETtheMANUALS.org

REFITTING

REMINDER: if the driver's airbag is triggered, it is essential to replace certain parts. Refer to the section on **Precautions for repair**.

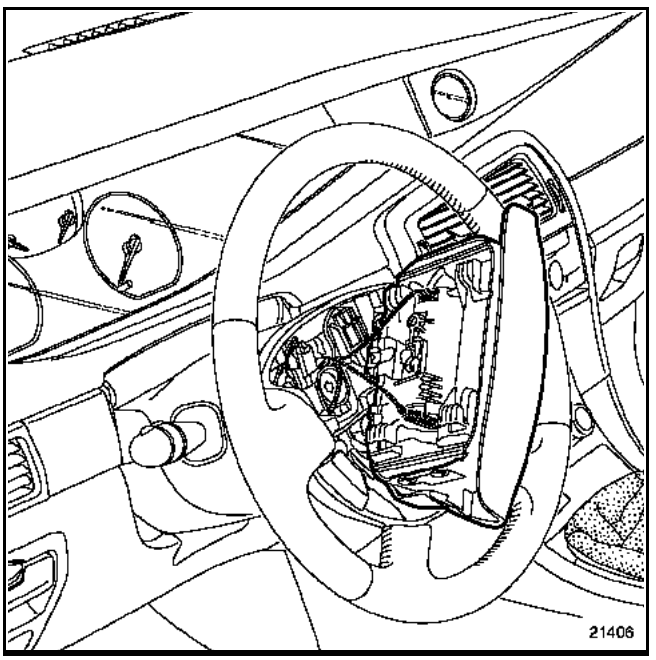
It is essential to replace the steering wheel mounting bolt (tightening torque of **4.4 daNm**) when the steering wheel is removed.

Position the two connectors and lock the safety clips,

Position the cushion on the steering wheel.

slide it backwards in order to clip it in place.

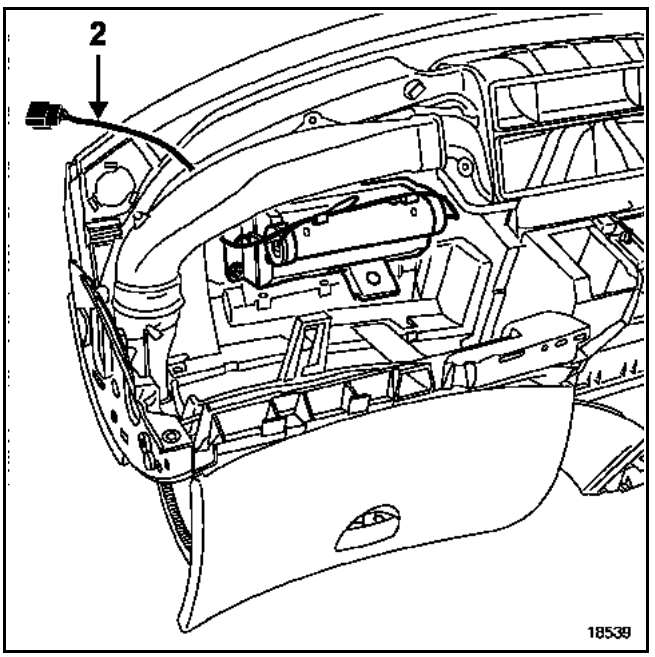
IMPORTANT:
After everything has been refitted, carry out a check using the diagnostic tool.
If everything is correct, unlock the airbag computer.



GETtheMANUALS.org

The **passenger's airbag** (PRS) is fitted with an inflatable bag in two volumes. It is mounted in the dashboard opposite the front passenger.

In this assembly, the airbag cushion is linked to the seat belt located opposite it. The Renault Protection System seat belt is calibrated specifically and is complementary to this type of airbag cushion.



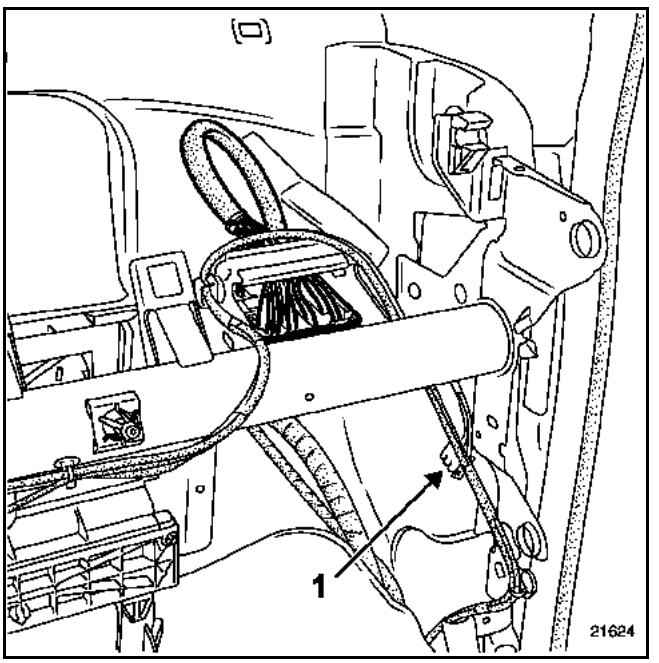
REMOVAL

IMPORTANT: Before removing a safety system component, lock the airbag computer using the diagnostic tool.
When this function is activated all the triggering lines are disabled and the airbag warning light on the instrument panel lights up (ignition on).

To remove the passenger airbag module it is necessary to remove the dashboard. To do this, refer to the method described in **Section 83A**.

Remove:
– the connector (1),
– the mounting screws.

NOTE: the passenger's airbag module is sold with its wiring (2) in spare parts.



IMPORTANT: refer to section describing the Destruction procedure when scrapping a passenger's airbag that has not been triggered.

GETtheMANUALS.org

REFITTING

REMINDER: If the passenger airbag is triggered, it is essential to replace certain parts. Refer to the section on **Precautions for repair**.

Tighten the module to the correct torque (**0.8 daNm**) before reconnecting the connectors.

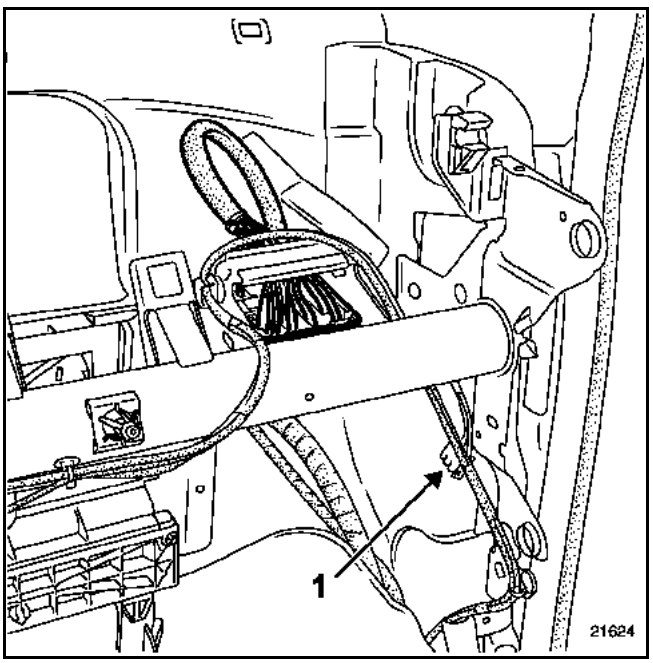
IMPORTANT: Attach a blue adhesive System suitability certified label sold under part number **77 01 040 153** (other vehicles).

Check the module using the diagnostic tool. If everything is correct, unlock the airbag computer.

Ignition module accessibility

It is possible to access the ignition module (at two levels) or the intermediate connector (1) of the passenger airbag module for fault finding behind the glovebox.

Remove the glovebox. The connector is located on the passenger side of the dashboard (near to the option relay/fuse box if present.



REMINDER: it is necessary to use the diagnostic tool to check the ignition module, as described in the **fault finding** section.

GETtheMANUALS.org

The **front side chest airbag** is fixed to the lower section of the seatback of each front seat on the door side.

When it is deployed, the inflatable bag tears the module cover and the foam and unfastens the trim.

NOTE: the system is operational when the ignition is switched on.

REMOVAL

IMPORTANT: Before removing a safety system component, lock the airbag computer using the diagnostic tool.
When this function is activated all the triggering lines are disabled and the airbag warning light on the instrument panel lights up (ignition on).

IMPORTANT: to service a seat fitted with an air bag and to ensure that it deploys correctly, **it is essential to follow the instructions** described in the **Bodywork** section (position, number, type of clips to be used, etc.).

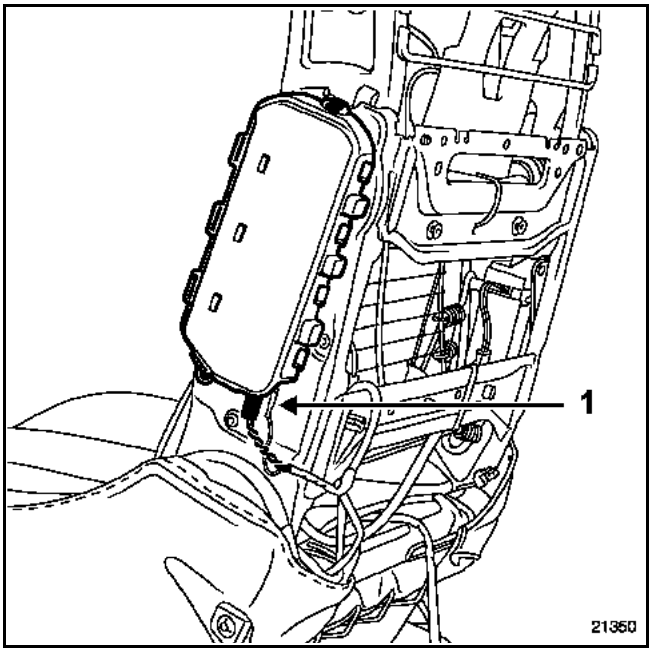
Disconnect the vehicle battery.

Remove the seat.

Disconnect the airbag module and its earth wire (1) after disconnecting its connector (mark the wiring route and the mounting points).

IMPORTANT: If the system has not been triggered, and is to be refitted, do not open the airbag module. The airbag cushion must be folded in a special way.

Remove the attachment rivet then slide the airbag out.



IMPORTANT: refer to the section describing the Destruction procedure when scrapping an airbag module which has not been triggered.

GETtheMANUALS.org

REFITTING

REMINDER: if the front chest airbag is triggered, it is essential to replace certain parts. Refer to the section on **precautions for repair**.

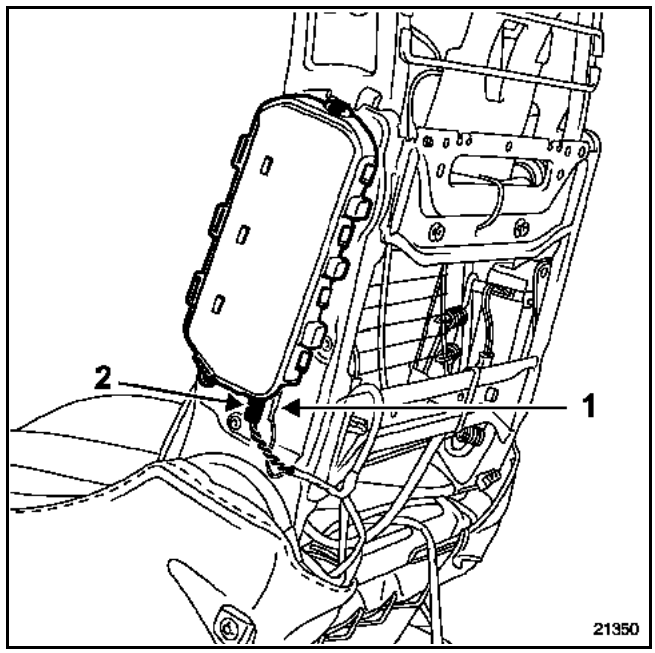
Position the airbag module on the frame.

Position the mounting rivet fitted to the module (special rivet).

Ensure that the earth wire is correctly connected to the airbag module.

Refit the wiring under the seat as before and respect the routing and the mounting points.

Reconnect the earth wire (1) and check that the connector is locked (2).



Reattach the trim, following the advice given in the **Bodywork** section (types of clip, their location, etc.).

Check the automatic seat connector (connection with vehicle wiring).

Refit the seat on the vehicle. Refer to the method described in the **Bodywork** section.

Check the module using the diagnostic tool.

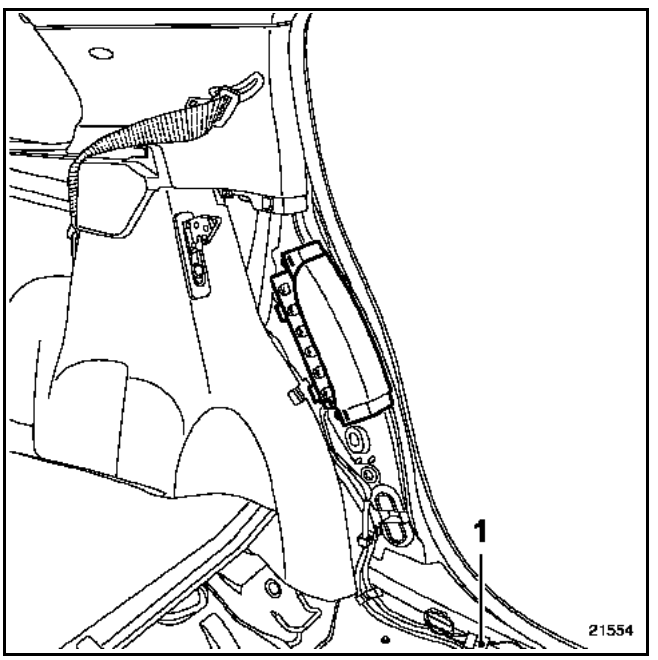
If everything is correct, unlock the airbag computer. Otherwise see the **Fault finding** section.

WARNING: If these instructions are not followed the system may not operate normally and could even cause accidental triggering.

GETtheMANUALS.org

The rear side **chest** and **curtain** airbags are supplied by an 8-track connector.

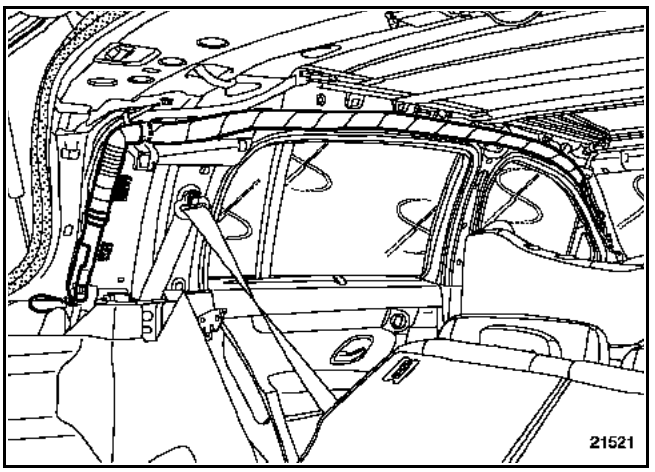
This connector (1) is located behind the trim at the bottom of the left-hand rear step.



GETtheMANUALS.org

The **rear side chest airbag** is mounted behind the trim next to the rear seat squab.

When triggered, the inflatable bag deploys by bursting through the module cover.



REMOVAL

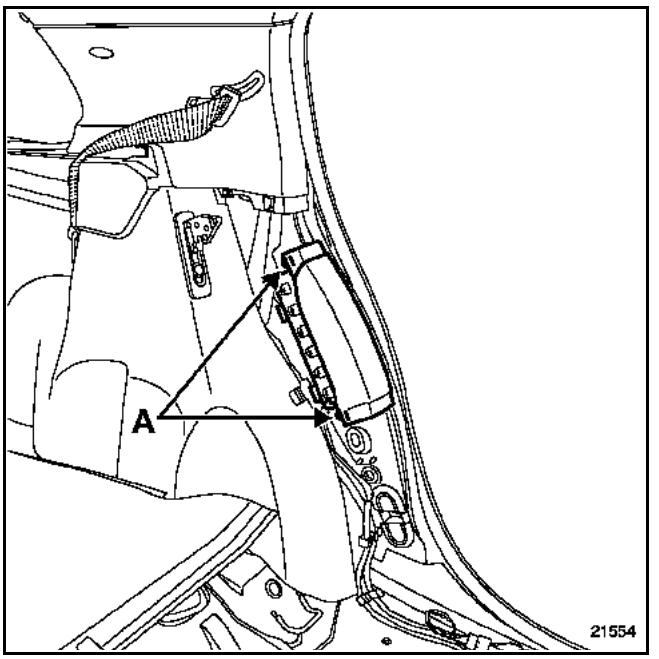
IMPORTANT: Before removing a safety system component, lock the airbag computer using the diagnostic tool.
When this function is activated all the triggering lines are disabled and the airbag warning light on the instrument panel lights up (ignition on).

Fold the seat squab and the seatback of the rear seat.

Unclip the lining.

Release the airbag module wiring and its earth wire after disconnecting its connector.

Remove the airbag by unscrewing the two nuts (A).



IMPORTANT: refer to the section describing the Destruction procedure when scrapping an airbag module which has not been triggered.

REFITTING

Attach the airbag module (**tightening torque: 0.4 daNm**).

Check that the earth wire is correctly reconnected to the airbag module by following the wiring route and the mounting points.

Connect the earth wire.

Verify that connector is locked correctly.

Check the module using the diagnostic tool.

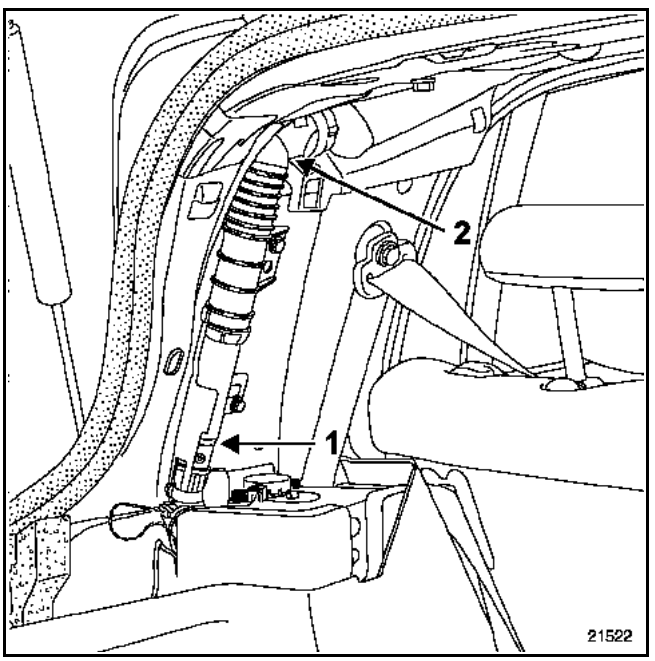
If everything is correct, unlock the computer. Otherwise see the **Fault finding** section.

GETtheMANUALS.org

The **side curtain airbag** or **head airbag** module is attached behind the headlining.

The airbag detaches the headlining when it deploys.

To access the gas generator (1) it is necessary to remove the rear trim.

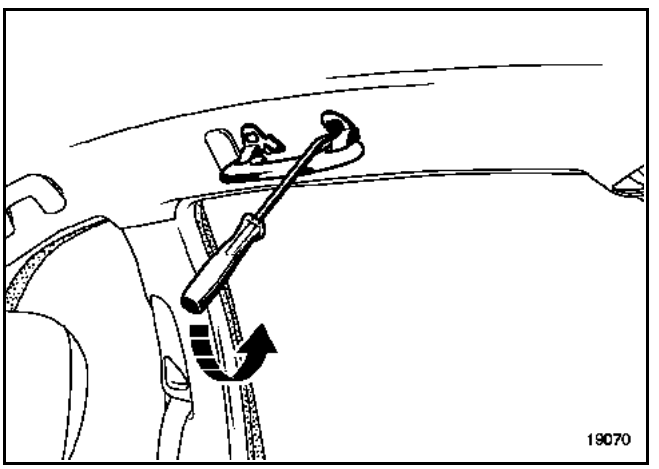


REMOVAL

IMPORTANT: Before removing a safety system component, lock the airbag computer using the diagnostic tool.
When this function is activated all the triggering lines are disabled and the airbag warning light on the instrument panel lights up (ignition on).

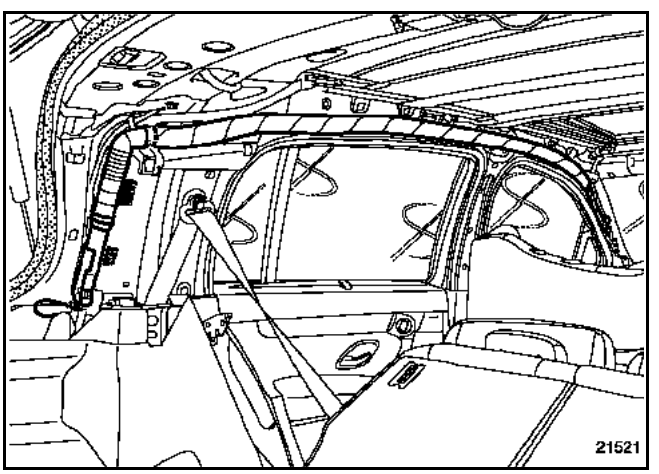
It is necessary to remove the headlining to remove the air bag module (2) and inflatable bag (refer to the **Bodywork** section).

Use tool **Car. 1597** to remove the grab handles. Refer to **section 88A**.



Detach the airbag module wiring after disconnecting its connector.

Remove the airbag assembly.



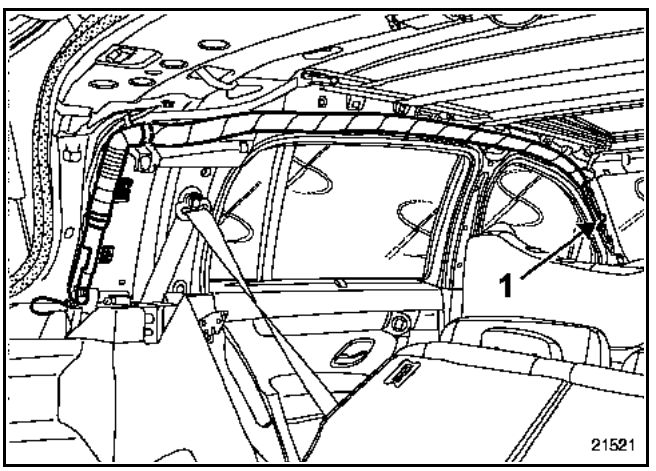
GETtheMANUALS.org

REFITTING

IMPORTANT: refer to the section describing the Destruction procedure when scrapping an airbag module which has not been triggered.

Position the airbag module without tightening the mounting screws.

Position the airbag starting with retainer (1).



Position all the clips.

Tighten the mounting screws (**tightening torque: 0.8 daNm**).

Reconnect the connector, ensuring the locking clip is correctly located.

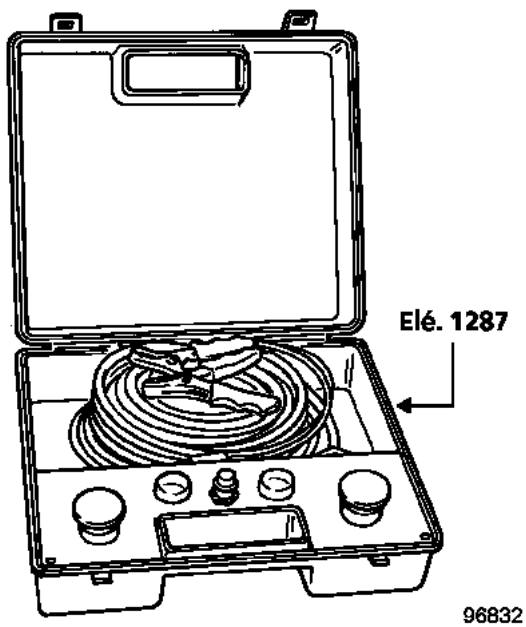
Check the module using the diagnostic tool. If everything is correct, unlock the airbag computer.

GETtheMANUALS.org

WARNING: Do not perform this operation if local regulations require a special procedure which is confirmed and circulated by the Diagnostic and Repair Methods Department.

In order to avoid any risk of an accident, the pyrotechnic gas generators must be triggered before the vehicle is scrapped or the part is scrapped.

Tool **Elé. 1287** and adapter leads **Elé. 1287-01** and **Elé. 1287-02 must be used.**



IMPORTANT: Do not reuse the pyrotechnic components as replacement parts. The pretensioners or airbags on a vehicle which is to be scrapped must be destroyed.

REMINDER: Each part is intended for a specific type of vehicle and should not be fitted onto another vehicle under any circumstances.
The parts are not interchangeable.

WARNING: Do not trigger pretensioners which are to be returned under warranty because of a problem with the seat belt catch. This makes it impossible for the supplier to analyse the part.
Return the part in the packaging of the new part.

PRETENSIONERS AND PYROTECHNIC RETRACTORS

Destruction of part fitted to the vehicle:

Move the vehicle outside the workshop.

Connect the destruction tool **Elé. 1287** to the pretensioner after removing the seat runner cover.

Unwind all the tool wiring so that it is far enough away from the vehicle (approx. 10 metres) during triggering.

Connect the two supply wires on the tool to a battery.

After checking that there is no-one nearby, destroy the pretensioner by pressing the two buttons on the tool at the same time.

Destruction of part removed from the vehicle:

Proceed in the same way as for the front airbag, in a stack of old tyres.

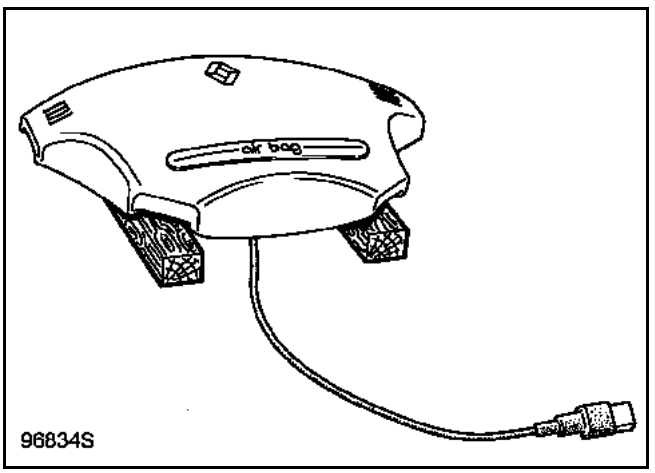
GETtheMANUALS.org

FRONT AIRBAGS or CHEST AIRBAGS (front or rear)

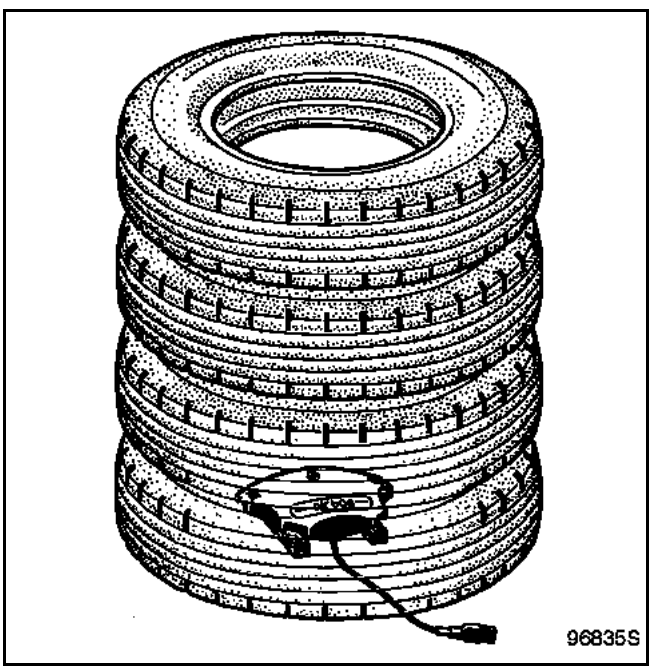
These parts can only be destroyed outside the workshop, once they have been removed from the vehicle.

Connect the corresponding wiring **Elé. 1287**.

Fit the airbag on the two wooden shims.



Destruction is carried out in a stack of old tyres.



Make sure that deployment of the inflatable cushion will not be hindered.

Unwind all the tool wiring so that it is far enough away from the unit (approx. 10 metres) during triggering and connect it to the airbag.

Reconnect the two destruction tool supply wires **Elé. 1287** to a battery.

After checking that there is no-one nearby, destroy the airbag by pressing the two buttons on the tool at the same time.

NOTE: if triggering is impossible (faulty ignition module), return the part in the packaging of the replacement part to the warranty department.

SIDE CURTAIN AIRBAGS

These parts can only be destroyed outside the workshop, once they have been removed from the vehicle.

Proceed in the same way as for the front airbag, in a stack of old tyres.

GETtheMANUALS.org

GENERAL INFORMATION

This system consists of a driver's seat and door mirrors with storable positions. The seat is controlled electrically without adjustment memory.

The driver has two options:
- at the request, position the driver's seat and the door mirrors. This is called **manual** mode,
- to set or recall the position of the driver's seat and door mirrors in one operation. This is called **automatic** mode.

Three computers constantly control the position of the adjustable components, analyse the requests of the driver and operate the motors of:
– the driver's seat (computer located underneath the driver's seat),
– the door mirrors (computer integrated into the motor of each multiplex one touch electric window).

The seat comprises five electric motors. Only four of these motors are supplied during memory recall:
– rear height adjustment,
– longitudinal adjustment,
– seatback incline,
– upper seatback incline.

This system does not support fault finding with diagnostic tools.

REMINDER:
To store the driving position, it is necessary to adjust + workbench accessories, the four seat shafts and the two door mirror shafts with the manual keyboard. Then press the memo button (press and hold) to store the positions. These will be stored by the RENAULT Card present in the reader. Storage is confirmed by a beep from the instrument panel.

NOTE: the test keypad does not include a stop/start button.

GETtheMANUALS.org

THE UCH

Each time the remote controlled keyless entry system tries to open the door and each time the + accessories is activated, the UCH checks the RENAULT Card number.

When the driver's door is opened, the UCH transmits this number through a wire connection to the seat computer in order to identify the adjustment positions to restore.

Check the configurations. Refer to **Section 87B**.

SEAT COMPUTER

It is located under the driver's seat (clipped to the chassis).

Depending on the way in which it is controlled, this computer may be:
– on standby (inactive),
– in active mode (active).

It changes from standby to active mode when it detects the following information:
– + accessories switched on
– driver's door open signal,
– receipt of a RENAULT Card remote control signal.

It switches to standby mode around **40 minutes** after the ignition has been switched off, if the driver's door is not opened. If the driver's door is opened, it immediately changes to standby mode.

Removal of the computer does not require removal of the seat.

DOOR MODULES

These are integrated into the electric window motors and allow information on the door mirror positions to be stored. The two electric window motors must be fitted with computers for the driving position storage function.

NOTE: a dedicated multiplex network for driver's seat position memory allows information to be exchanged between the two front door modules.

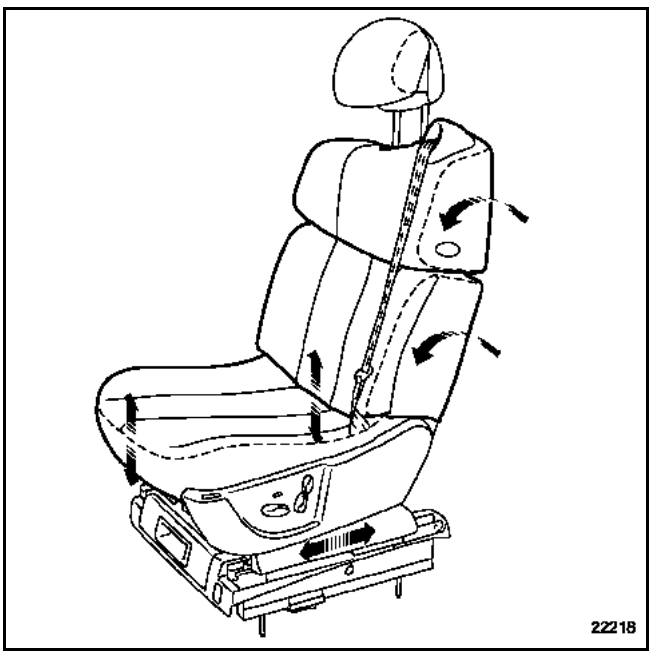
GETtheMANUALS.org

THE SEAT

It comprises five motors:
– longitudinal (runners),
– height of rear of seat,
– seatback incline,
– upper seatback incline,
– height of front of seat.

REMINDER: The height adjustment of the front of the seat is not stored.

Each motor has a flexible harness and a reducing gear for transmitting the movement. The motors include position sensors.

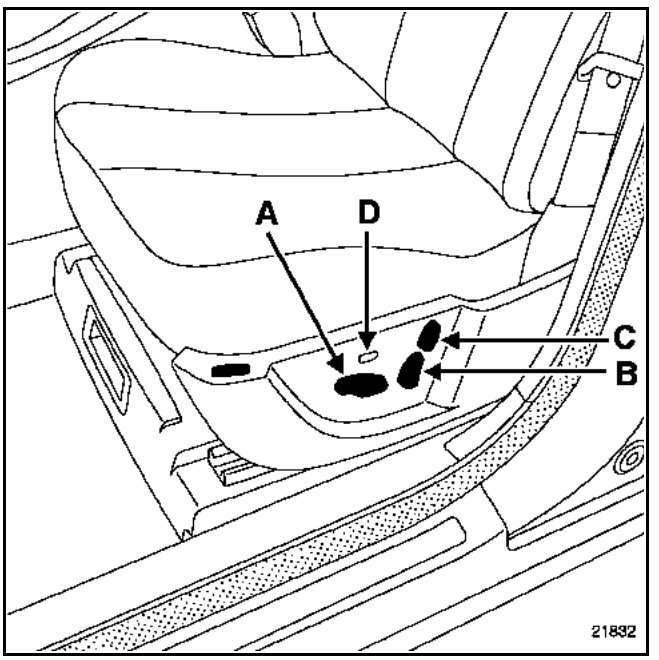


To remove the motors, refer to the **Bodywork** section.

CONTROL KEYPAD

It is located on the external side of the driver's seat.

It comprises:
- a **seat squab** switch (A), allowing longitudinal movements and adjustment of the height of the front and rear of the seat,
- a **seatback switch** (B) allowing tilting (reclining) of the seatback,
- an **upper seatback** switch (C),
- a **memo** button (D), allowing the driving position adjustments (driver's seat and door mirrors) to be stored or recalled.



This button is used:
– by pressing and holding **(2 seconds) to store the driving position**. A beep confirms that the position has been stored,
– by a one touch press to recall the driving position.

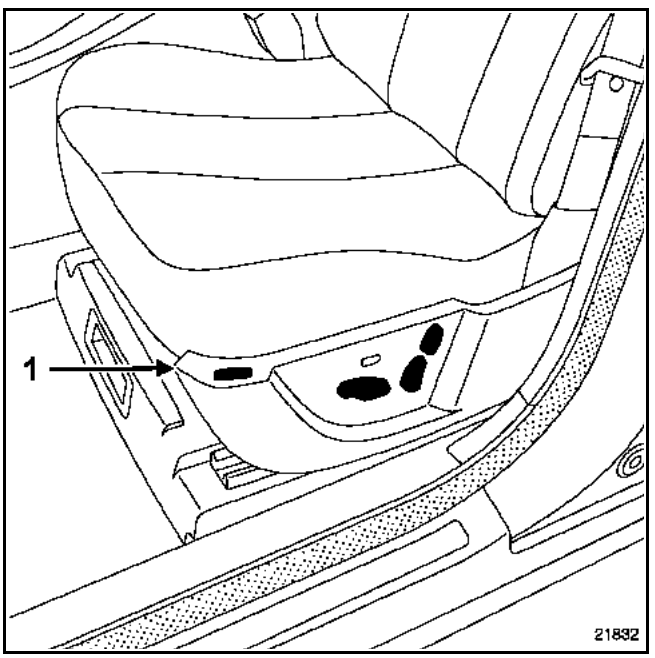
NOTE: pressing a button during recall of the driving position halts movement of the seat and door mirrors.

NOTES:
– It is impossible to recall the positions when the vehicle is moving.
– If the stored positions are recalled when the door mirrors are folded down, the motors will move after they have been put back in place.

GETtheMANUALS.org

REMOVAL

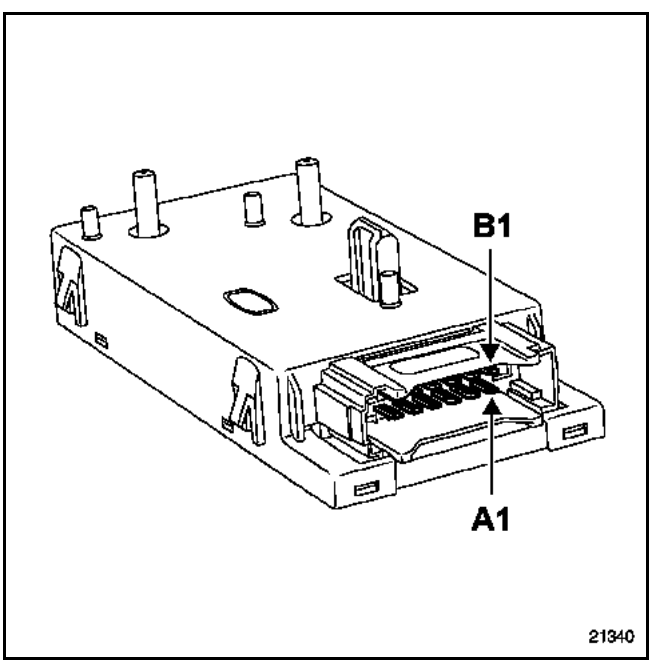
Remove:
– the control buttons,
– the mounting screws (1).



Gently pull away the trim in order to unclip the control keypad.

CHECKING THE MEMORY KEYPAD
(using a multimeter)

IMPORTANT: it is essential to disconnect the keypad before checking it.



Storable section

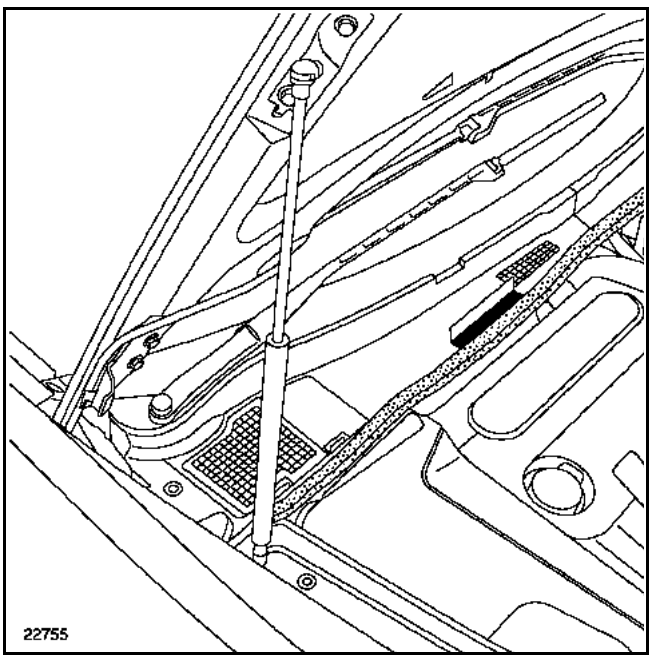
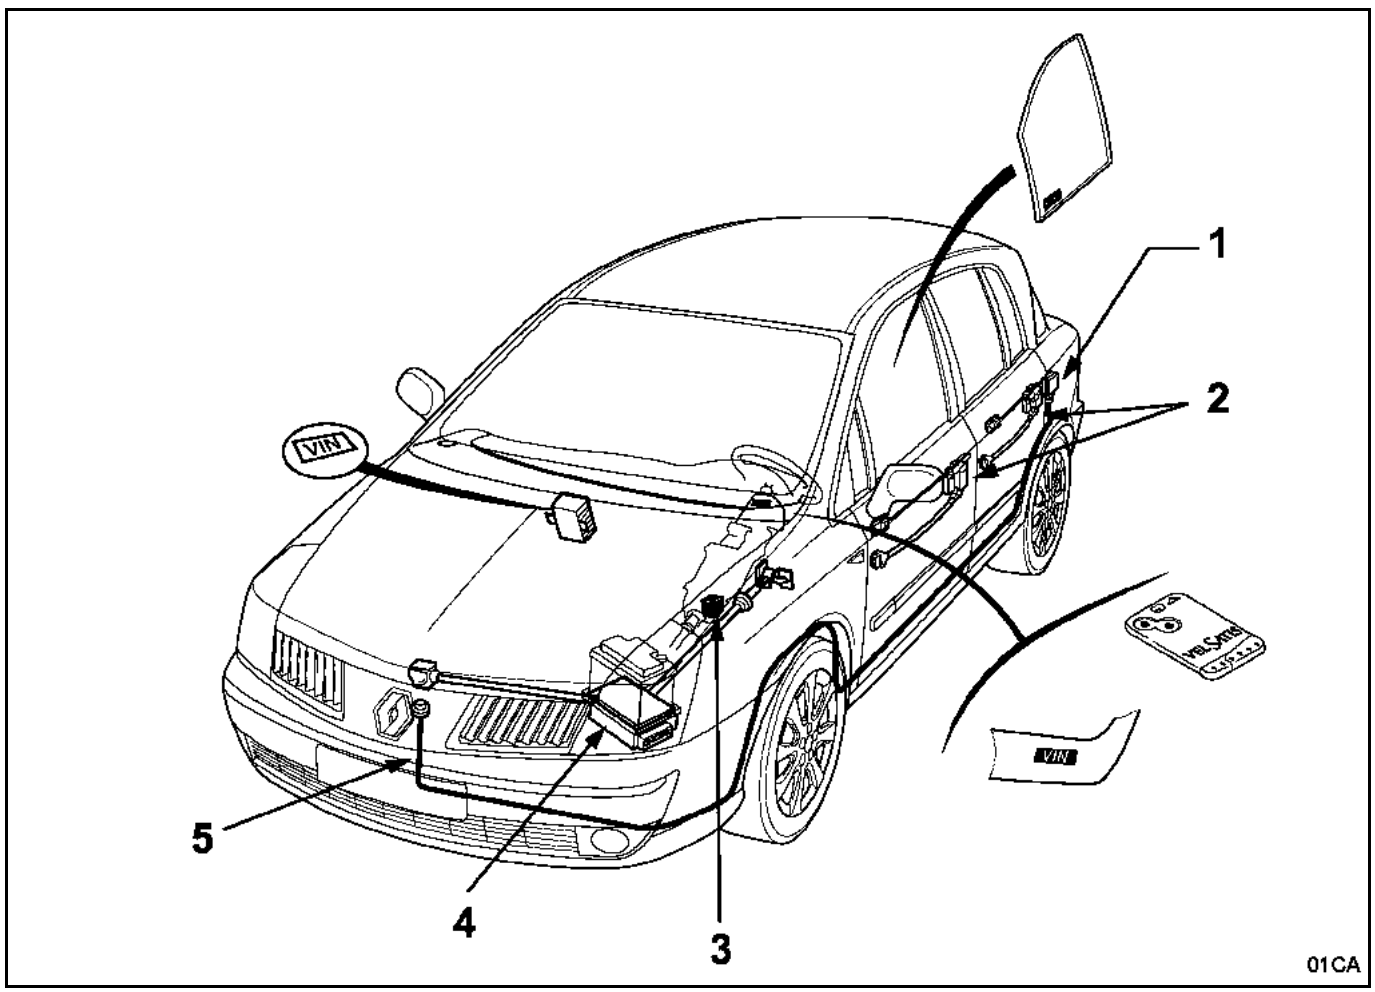
COLD-MARKING OF THE BODY



If replacing the complete body, the marking must be carried out in compliance with the current regulations.

GETtheMANUALS.org

VEHICLE IDENTIFICATION NUMBER



1 Fitted alarm
2 Lock and handle security
3 Steering column protection
4 Computer protection
5 Alarm wiring protection

GETtheMANUALS.org

Safety symbol (special precautions to be taken when carrying out operations).

SPECIAL TOOLING REQUIRED	
Cha. 280 -02	**Adaptor cup for trolley jack**

If a trolley jack is used, appropriate axle stands must always be used.

IMPORTANT:
The sub-frame of this vehicle is protected by products with a 12 year anti-corrosion warranty.

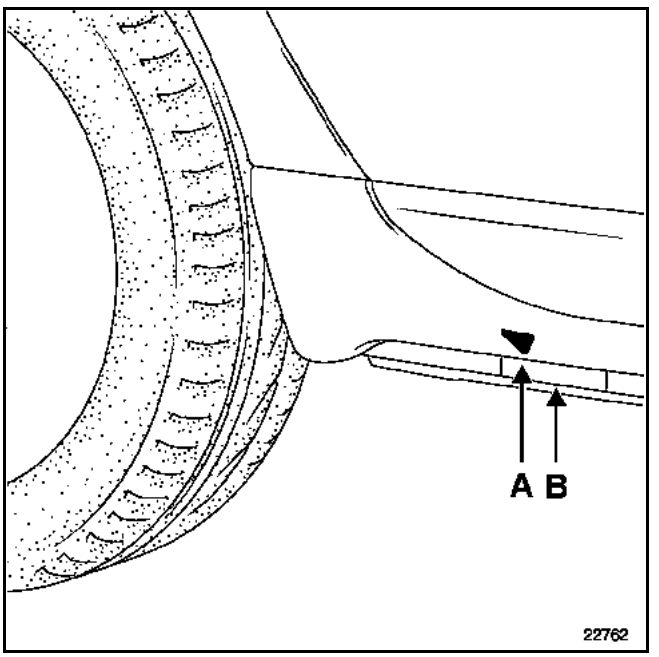
Never use equipment which is not fitted with rubber pads, in order to avoid the direct contact of metal with metal which would damage the protection originally fitted.

The vehicle **must not** be raised by placing the jack beneath the front suspension arm or under the rear axle.

– To raise a front or rear wheel, place the jack on (B) on the sub-frame body flange in alignment with marks (A).
– To raise the front and rear laterally, use cross piece **cha 280-02**.

Place the jack under the sill body flange in the centre of the front door.

IMPORTANT:
Position the flange correctly in the groove of the cup.



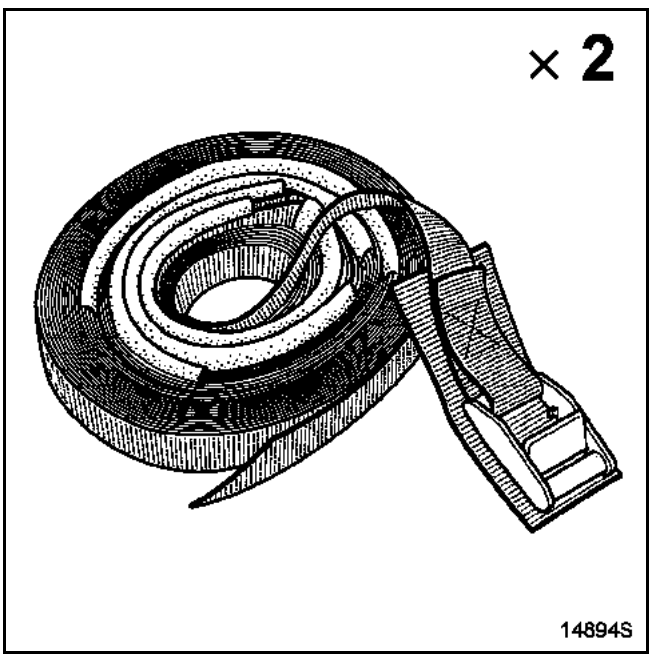
To mount the vehicle on axle stands, the entire vehicle must be lifted laterally and axle stands must be placed under the reinforced body flanges used for jacking points at (B).

GETtheMANUALS.org

SAFETY ADVICE REMINDER

As far as possible, when heavy components must be removed from the vehicle, it is preferable to use a four-post lift. When this type of component has been removed (eg.: engine and transmission assembly, rear axle, fuel tank etc.) the vehicle will be relieved of a large part of its load and there is a risk of it tipping if secured in a two-post lift (see the positioning of the arms in the following diagram).
This is even more dangerous when the vehicle is raised high.

When the vehicle is raised from underneath on a two-post lift, securing straps available from Parts Stores Part No.: **77 11 172 554** must be fitted.



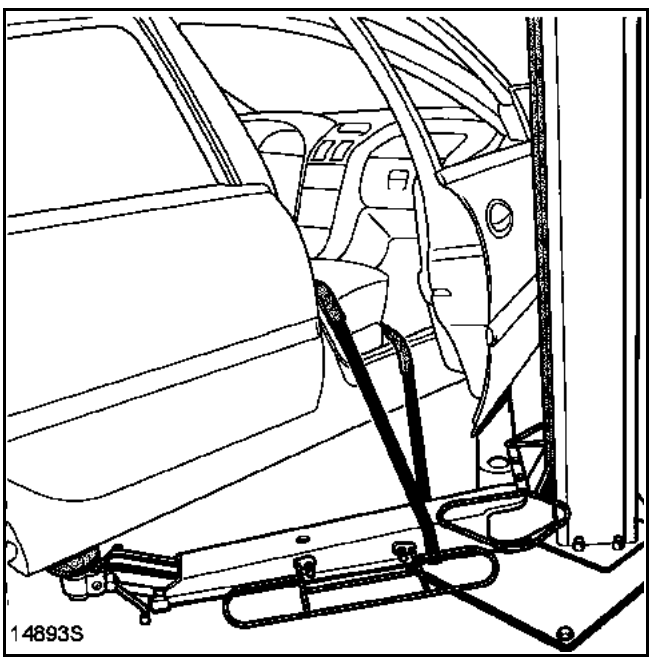
FITTING STRAPS

For obvious safety reasons, these straps must be in perfect condition (replace them as soon as they begin to shred).

When fitting them, check that the seats and breakable parts of the vehicle are protected. Do not overtighten the straps.

Thread the straps under the lift arms and loop them through the vehicle.

The following example shows a vehicle secured at the front.

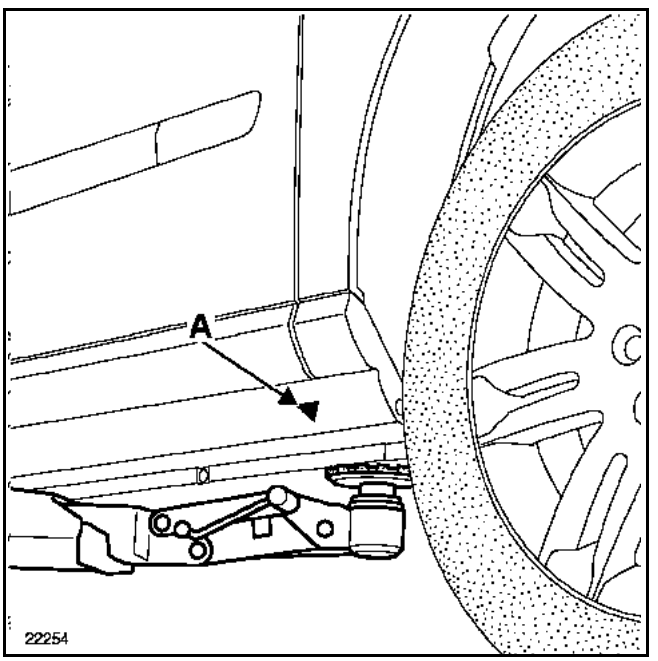


GETtheMANUALS.org

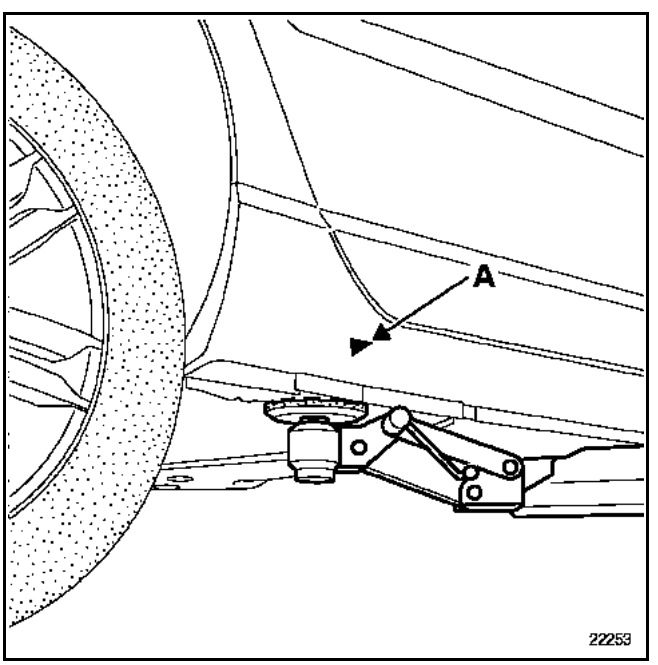
POSITIONING THE LIFTING ARMS

Position the lifting arm on the sub-frame body flange in alignment with marks (A).

FRONT



REAR



GETtheMANUALS.org

OBSERVE THE TOWING GUIDELINES OF THE COUNTRY YOU ARE IN.

NEVER USE THE DRIVESHAFTS AS ATTACHMENT POINTS.

The towing points may only be used for towing the vehicle on the road. They should never be used for removing the vehicle from a ditch or for any other similar breakdown operation or to lift the vehicle, either directly or indirectly.

GETtheMANUALS.org

The vehicle structure is made up partly of VHTS (very high tensile steel) panelling components (refer to the information on the description of parts).

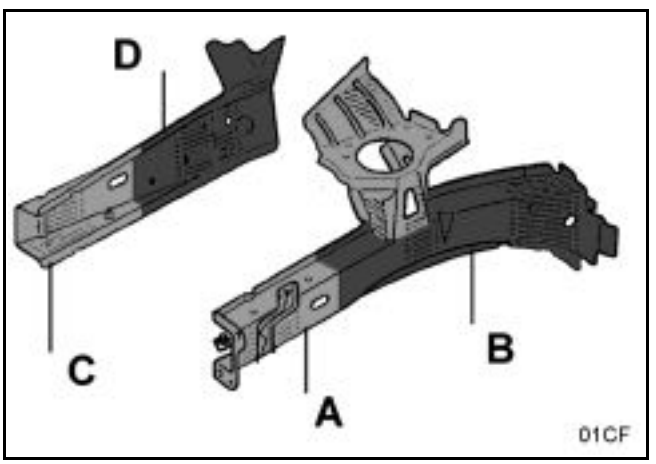
FEATURES OF VERY HIGH TENSILE STEEL PANELS (VHTS)

As their name suggests, these panels are very strong and very flexible and require special pressing techniques. They cannot be straightened using traditional bodywork repair tools. (**REMINDER:** it is strongly recommended that this type of panel is not heated in order to straighten it as annealing may affect the properties of the metals).

This means that damaged parts must always be replaced, either completely or using partial cuts.

It is recommended that HSS type spot weld removal bits are used to remove original spot welds on this type of panel, otherwise use tungsten carbide mills or cutters.

This vehicle is also built from structural elements made by laser butt welding thick panels together which are often of different types, e.g. front side member:



Section A: XE 280P HTS panel	**thickness 1.8 mm**
Section B: HE 450M VHTS panel	**thickness 1.8 mm**
Section C: XE 280P HTS panel	**thickness 1.5 mm**
Section D: HE 450M VHTS panel	**thickness 2.5 mm**

When two panel thicknesses are shown for the same part in the detailed procedure descriptions, this means that this part consists of two panels which were originally butt welded.
Thicknesses are shown starting from the outer end of the part going towards the inside of the vehicle (direction of the impact).

GETtheMANUALS.org

LOWER STRUCTURE

The vehicle structure is made up partly of VHTS (very high tensile steel) panelling components (refer to the section on the description of parts).

FEATURES OF VERY HIGH TENSILE STEEL PANELS (VHTS)

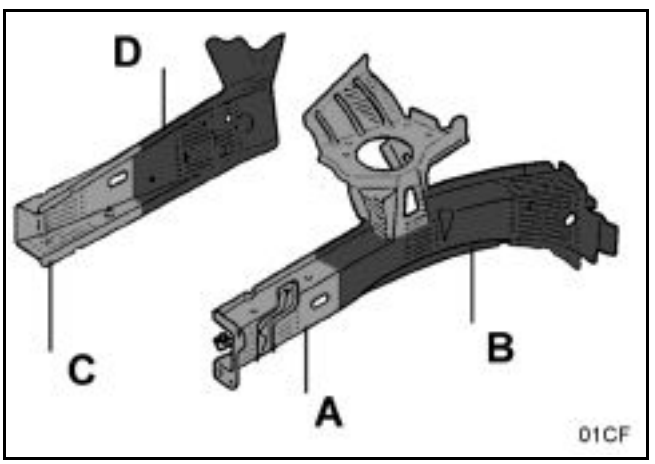
As their name suggests, these panels are very strong and very flexible and require special pressing techniques. They cannot be straightened using traditional bodywork repair tools.

REMINDER:
It is strongly recommended that this type of panel is not heated in order to straighten it as annealing may affect the properties of the metals.
This means that damaged parts must always be replaced, either completely or using partial cuts.

It is recommended that HSS type spot weld removal bits are used to remove original spot welds on this type of panel, otherwise use tungsten carbide mills or cutters.

Regarding their weldability: for MAG arc welding there are no special instructions: for electric-resistance spot welding, the adjustment parameters (current and pressure) are as stated on the so-called HTS (high tensile strength) sheets, provided the sheets are squeezed under perfect conditions.

This vehicle is also built from structural elements made by LASER butt welding thick panels together which are often of different types, e.g. front side member:



Section A: XE 280P High Tensile steel	**thickness 1.8 mm**
Section B: HE 450M Very High Tensile steel	**thickness 1.8 mm**
Section C: XE 280P High Tensile steel	**thickness 1.5 mm**
Section D: HE 450M Very High Tensile steel	**thickness 2.5 mm**

When two panel thicknesses are shown for the same part in the detailed procedure descriptions, this means that this part consists of two panels which were originally butt welded.
Thicknesses are shown starting from the outer end of the part going towards the vehicle passenger compartment (direction of the impact).
Example of presentation in the manuals:
front side member closure panel 1.5 / 2.5 mm: 1.5 corresponds to section (C) and 2.5 to section (D).

REMINDERS

1 Vehicles fitted with the card opening control have an electrically locking steering column. To be able to move the vehicle when the battery is removed or simply disconnected, it is necessary to insert the card in the reader. Put it in accessories position, lock the steering and remove the card before disconnecting the battery. The steering column remains unlocked as long as the battery is disconnected.

2 During welding operations on the vehicle bodywork, it is advisable to disconnect the two battery terminals and disconnect and remove the electronic computer components located close to the structural parts which have been replaced. These may be damaged by the flow of current from the electrical weldings through resistance points or the arch.

POSITION OF COMPUTERS IN THE VEHICLE

8 UCH
9 Discharge bulb beam adjustment
10 Automatic parking brake
11 Proximity sensor
12 Tyre pressure monitor

GETtheMANUALS.org

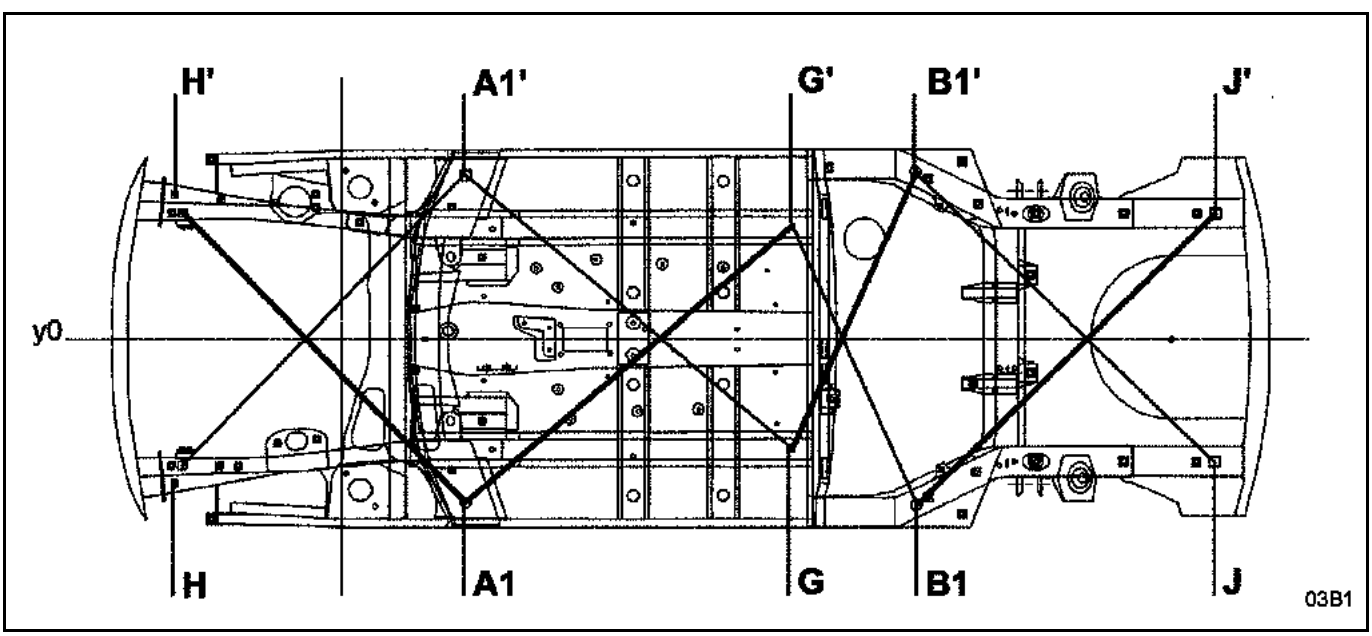
Before carrying out repairs to the bodywork of a car, even if the damage seems slight, it is necessary to carry out a series of tests:

VISUAL INSPECTION
This inspection involves examining the sub-frame of the vehicle where mechanical components are mounted and in the crumple zones or vulnerable areas in order to detect creases where materials have been damaged.

TRAMMEL GAUGE CHECK
The visual inspection may be completed using a trammel gauge which enables some damage to be measured by symmetrical comparisons (for more detail on each check point, see the repair bench paragraph below).

CHECKING THE ANGLES OF THE RUNNING GEAR
This is the only check that can determine if the impact on the vehicle has affected the vehicle road holding.

IMPORTANT: In limit cases, it will also be necessary to check the running gear components, which may also have suffered damage.
In principle, no welded component in the body shell should be replaced without ensuring that the sub-frame has not been affected by the impact.

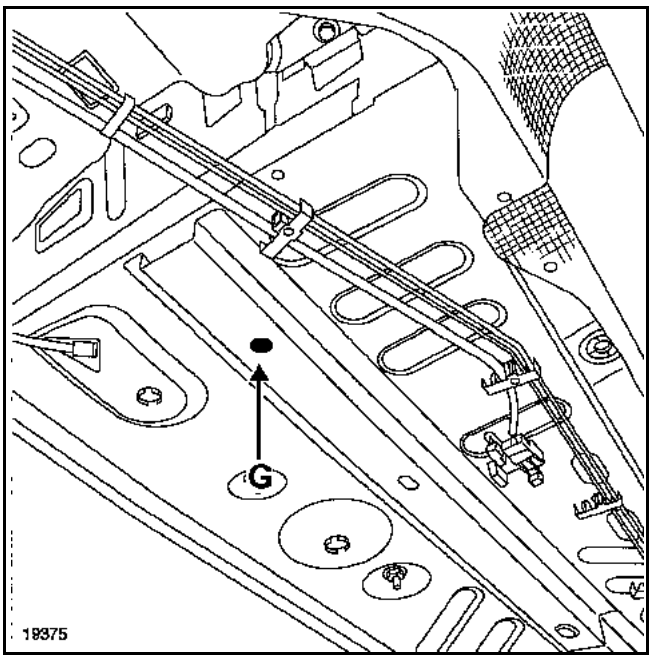


Chronological order of checks:

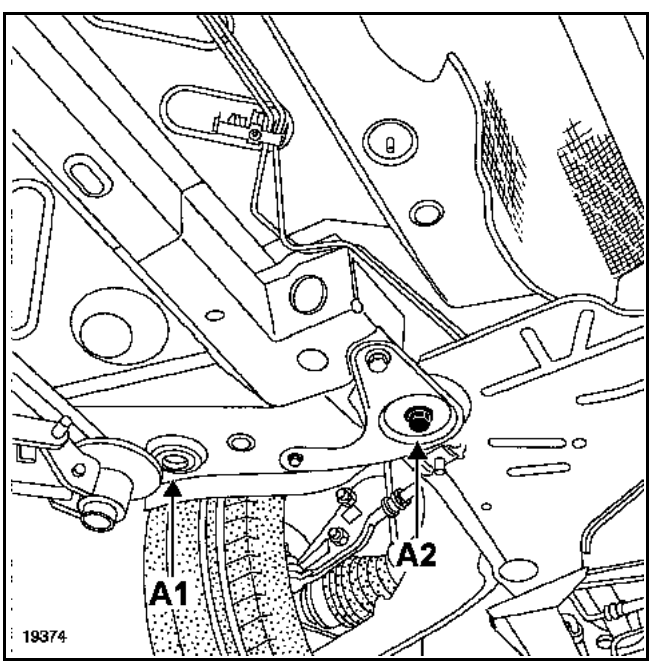
FRONT impact:
1: G - A1' = G' - A1
2: A1'- H=A1H'
REAR impact:
1: G - B1' = G' - B1
2: B1' - J = B1 - J'

GETtheMANUALS.org

GAUGE POINTS

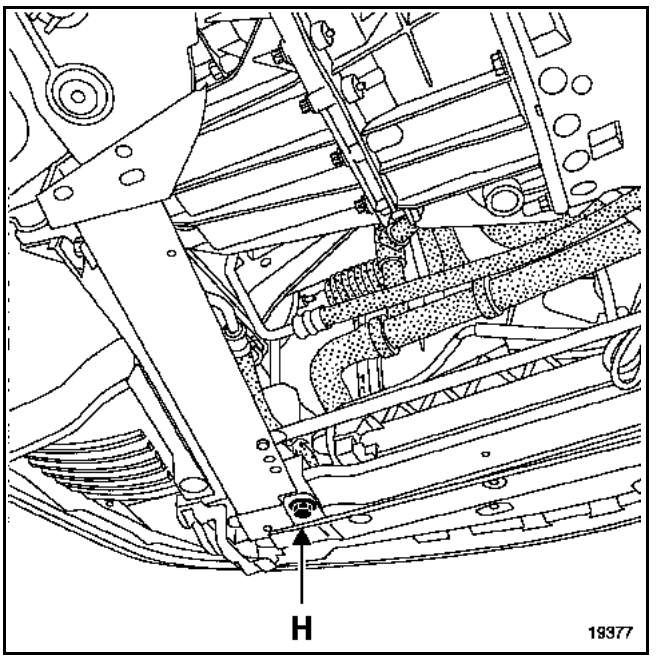


Point G
Start point for checking points (A1) and (B1).

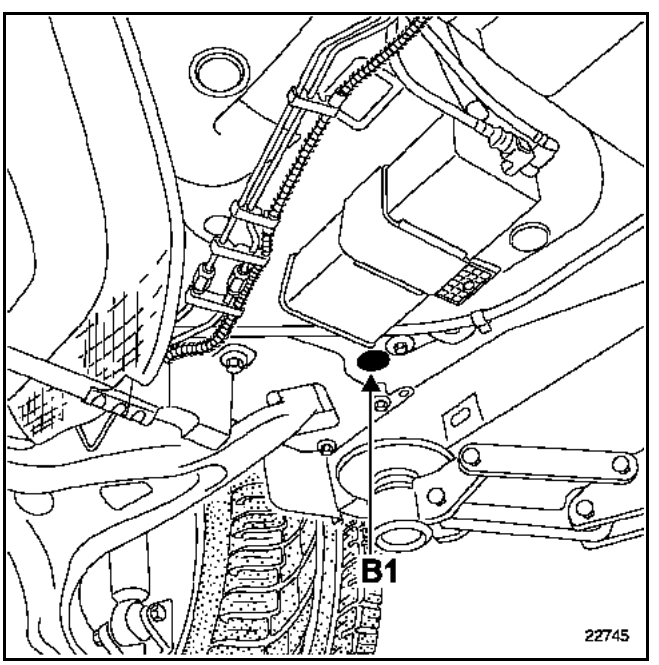


Point A1
Front body reference.

NOTE: The point A2 can also be used as a reference point if point A1 is found not to be correct.

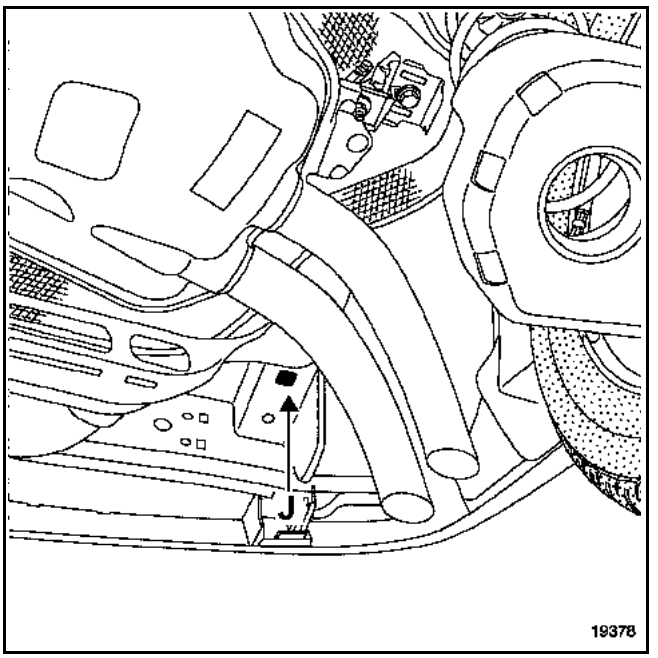


Point H
Front end of front side member.



Point B1
Rear axle assembly leader pin.

GETtheMANUALS.org



Point J
Rear end of rear side member.

REMINDER

The underbody holes are fitted with plastic blanking covers to ensure that all cavities are watertight.

Some of these blanking covers have to be removed during testing.

If any of the blanking covers have deteriorated, they must be renewed in order to maintain the vehicle's anti-corrosion warranty.

GETtheMANUALS.org

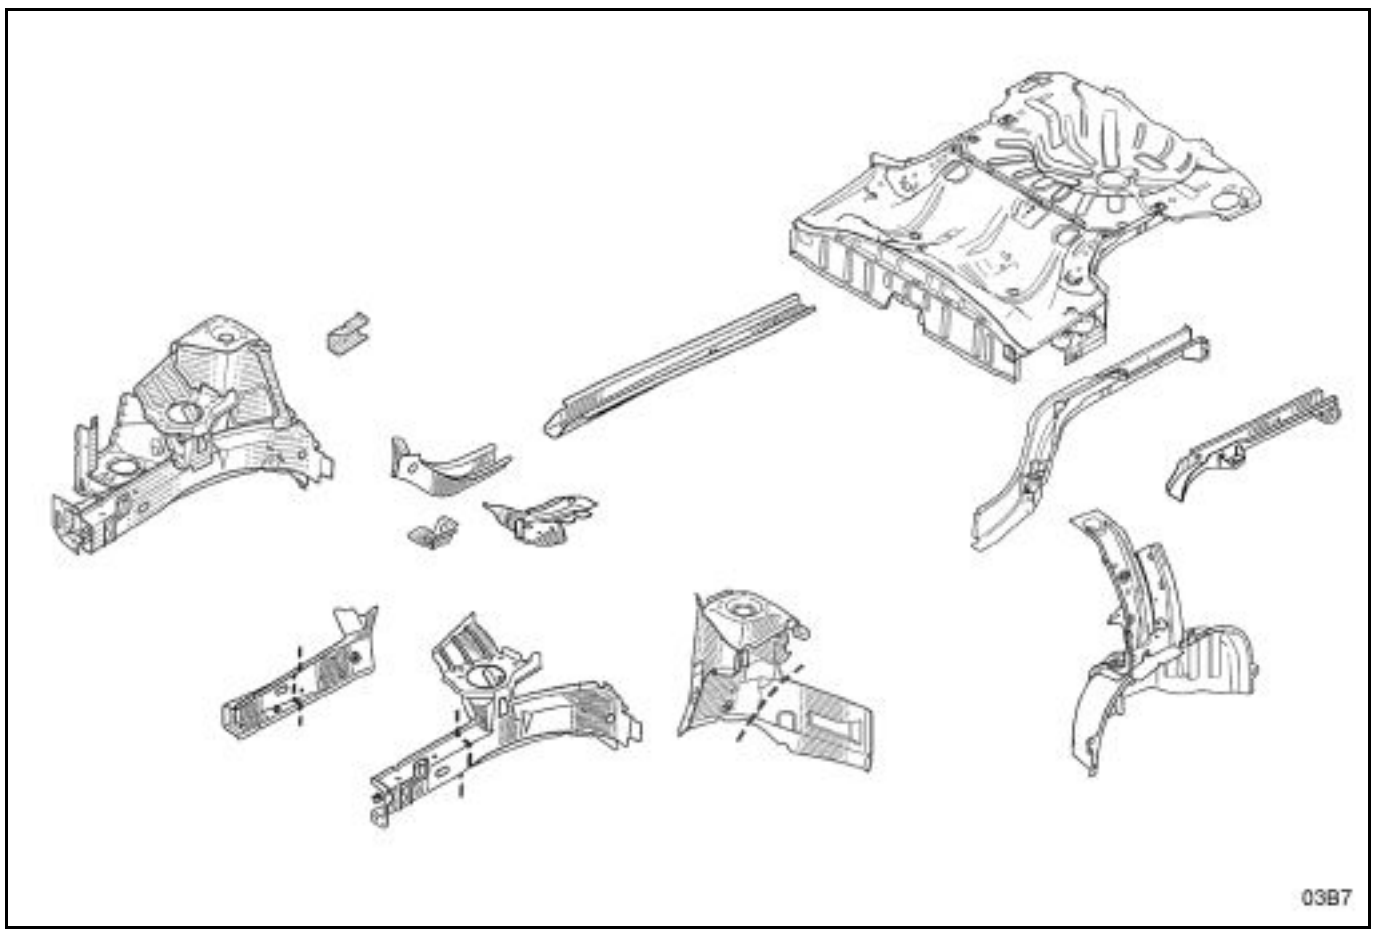
PARTS REQUIRING A STRAIGHTENING PLATE

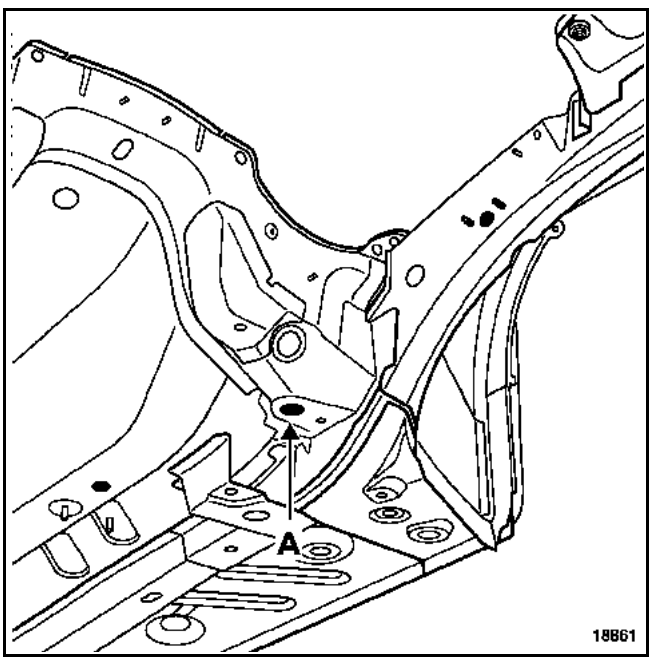


GETtheMANUALS.org

1. PRINCIPLE REFERENCE POINTS FOR SETTING VEHICLE TRIM LEVEL

A - FRONT SUB-FRAME REAR MOUNTING

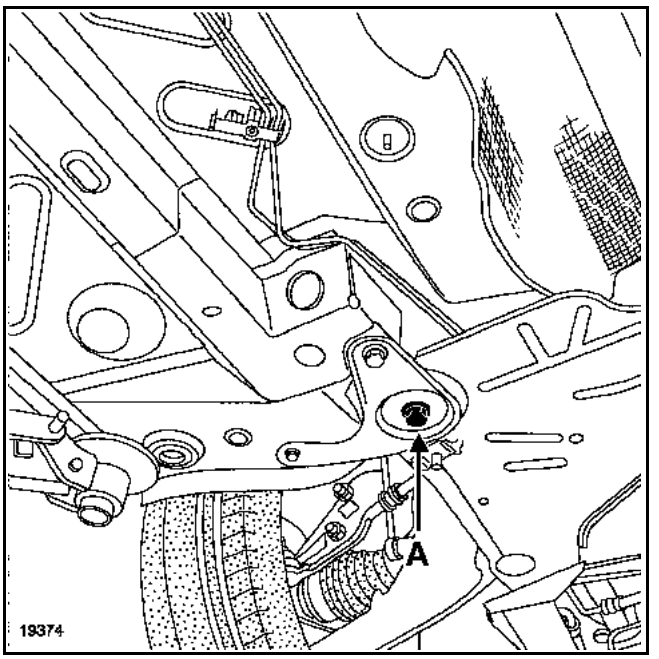
This is the main front reference point for setting the vehicle trim level.



1 - Front mechanical components removed

NOTE:
on the left-hand side, the hole is round;
on the right-hand side, it is slotted.

If replacing the subframe rear support, this reference point is replaced temporarily by point (M), located on the rear section of the front side member, point (A) thus being used for positioning the replaced part.



2 - Front mechanical components in place

The bracket covers the sub-frame mounting bolt.

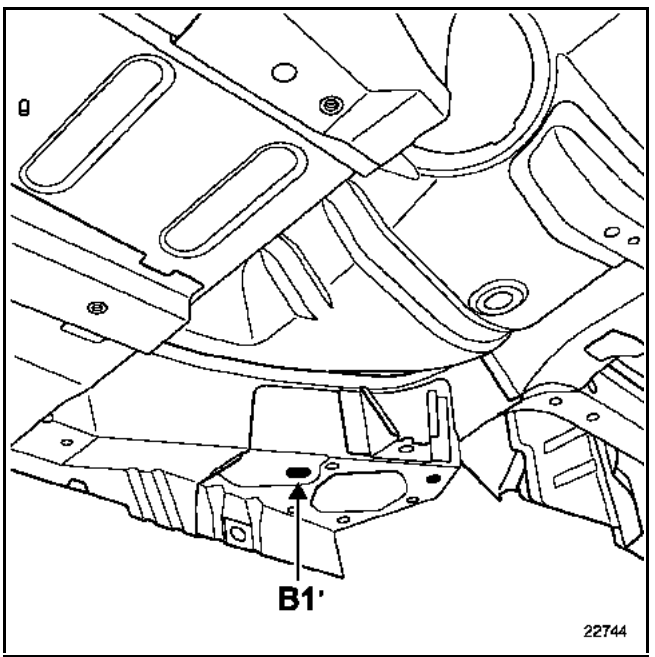
Two possible cases can arise:
1 If the rear of the vehicle is being rebuilt, these two points alone can be used to align and support the front of the vehicle.
2 For a light frontal impact not requiring removal of the front axle sub-frame.

if in doubt regarding the damage to one of the main reference points (A or B), it is advisable to use the two additional points located in the area not affected by the impact to confirm the trim level.

GETtheMANUALS.org

B - REAR AXLE FRONT MOUNTING

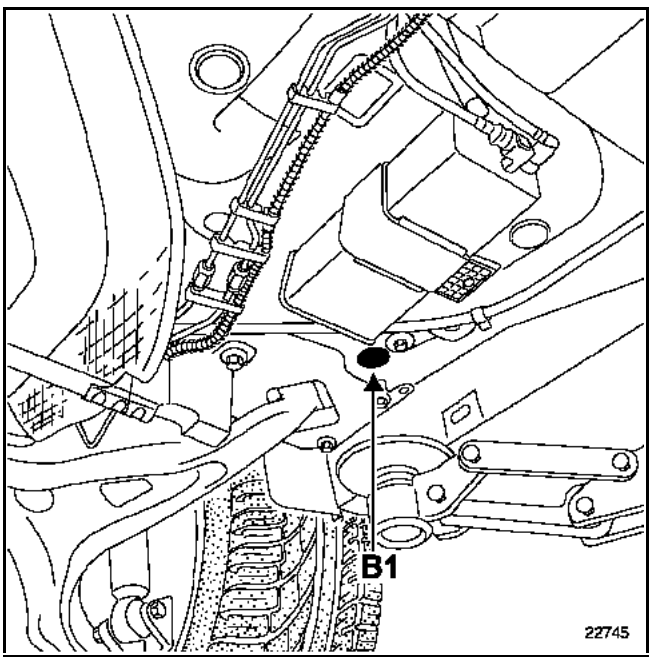
This is the main rear reference point for setting the trim level.



1 - Rear mechanical components removed

The bracket bears on the underside of the rear subframe assembly mounting unit, centred in the axle-assembly pilot hole.

If replacing the complete rear side member or the rear floor unit, this reference point is replaced by point (G), located on the front side member, point (B) being used to position the replaced component.



2 - Rear mechanism in place

GETtheMANUALS.org

2. ADDITIONAL REFERENCE POINTS FOR SETTING VEHICLETRIM LEVEL

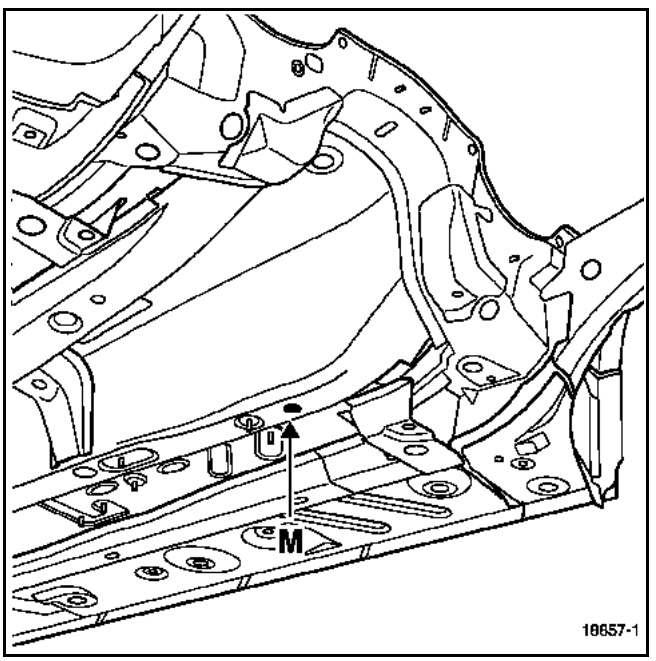
These are the provisional reference points which are used when the principle reference points have been affected by the impact.

These points allow additional vehicle support to the main reference point on the impact side, but allow only a roughly accurate vehicle alignment.

IMPORTANT NOTE: These reference points should only be used in the cases mentioned above. They are not required when both the main reference points (points A and B) are correct.

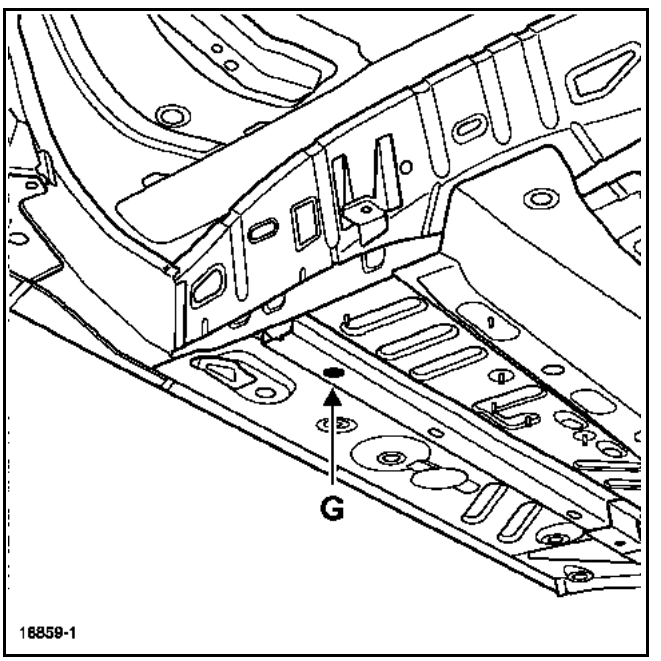
This additional reference function may also be filled by the front side member ends check points for a rear impact, and vice-versa.

LEADER PIN UNDER FRONT FLOOR (front side member - central section)



The point (M) can also be used to position the replacement part.

G. REAR END OF FRONT SIDE MEMBER

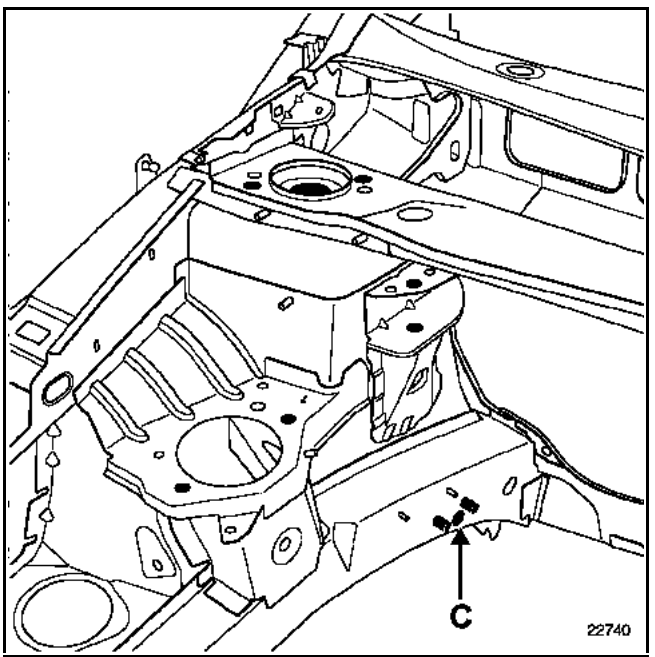


This point is also used as a positioning reference when replacing a rear section of the front side member.

GETtheMANUALS.org

3. REFERENCE POINTS FOR POSITIONING REPLACED PARTS

C - FRONT SUB-FRAME FRONT MOUNTING

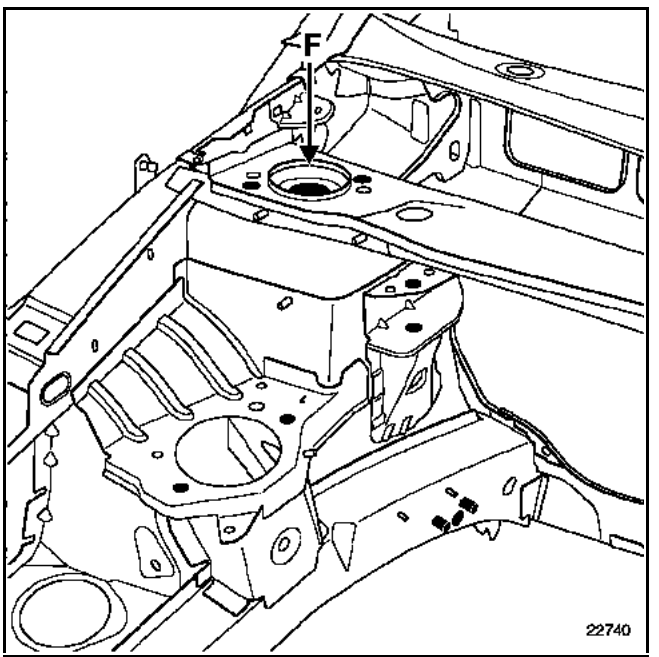


1 - Front mechanical components removed

The bracket rests under locating studs (1) for the front part of the subframe and can be fixed in the subframe attachment hole.

It is used when replacing:
– a partial or complete front side member,
– a half unit.

F - FRONT SHOCK ABSORBER UPPER MOUNTING



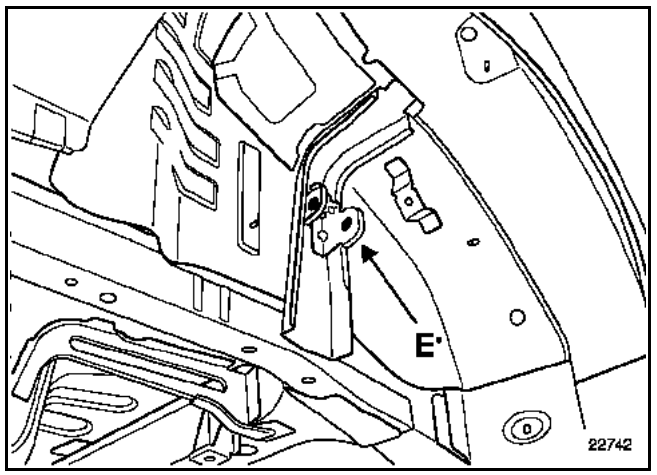
The bracket rests under the shock absorber cup and is centred in the shock absorber mounting holes.

It is used when replacing:
– a wheel arch,
– a front half unit.

It is also used when straightening.

GETtheMANUALS.org

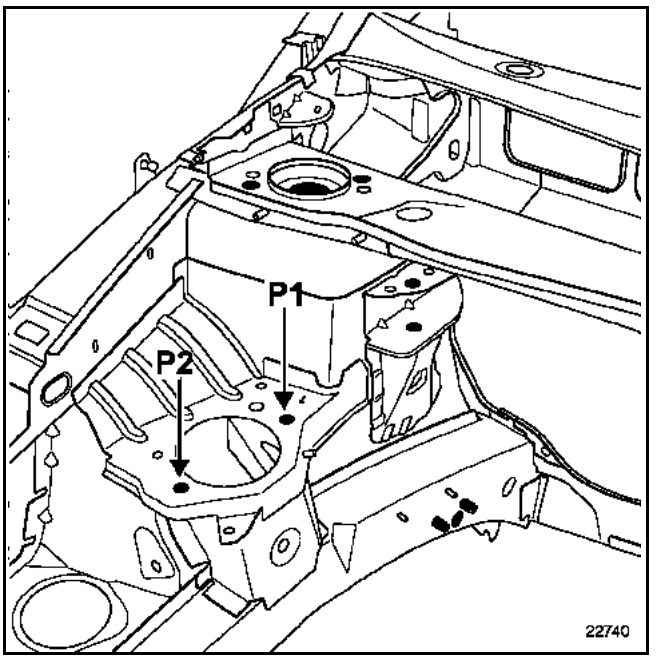
E. REAR SHOCK ABSORBER MOUNTING



The bracket is centred and attached inside the shock absorber shaft.

It is used when replacing the inner rear wheel arch.

P. ENGINE MOUNTING

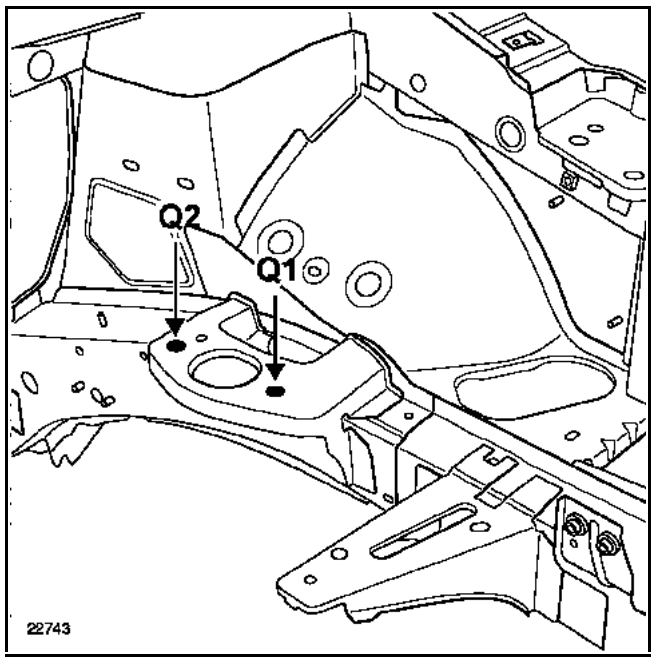


The bracket is positioned from above the engine mounting and is centred in the mounting holes of the pad.

It should be used with the mechanical components removed to replace a front half unit.

GETtheMANUALS.org

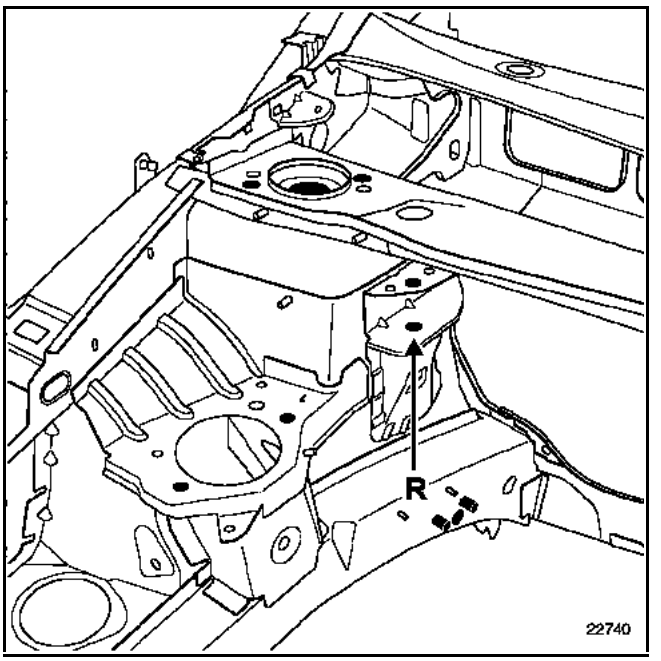
Q - GEARBOX MOUNTING



The bracket is positioned from below the gearbox, centred in the mounting holes of the shoe.

It should be used with the mechanical components removed to replace a front half unit.

R - ENGINE TIE-ROD MOUNTING

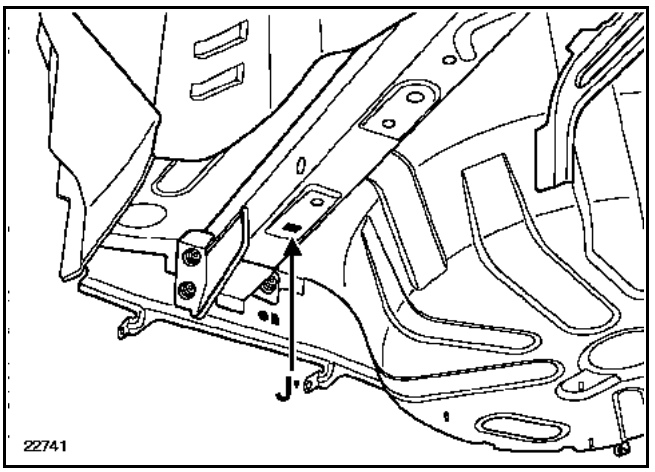


The bracket is placed in the tie-rod fork, and is fixed in place of the latter.

It is used for setting up the geometrical reference for the tie-rod fork.

GETtheMANUALS.org

J - REAR SIDE MEMBER END

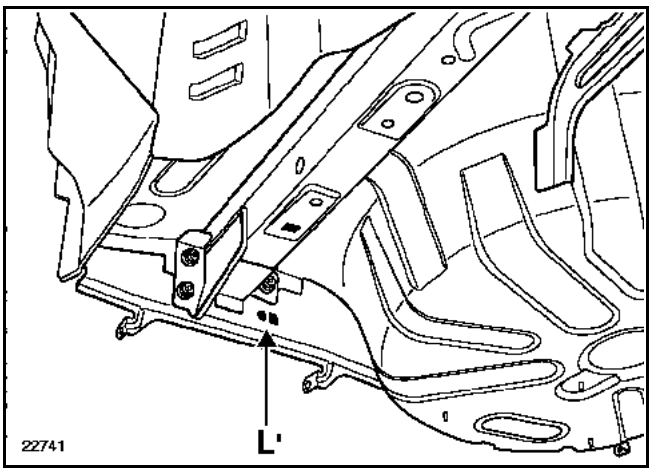


The bracket rests under the side member and is centred in the pilot hole.

it is used with the mechanical parts in place:
– for realigning the side member.

It is also used with the mechanical parts removed, in the same conditions, to replace the side member.

L - REAR END CROSS MEMBER



The bracket bears vertically against the rear end cross member, then is centred in the stamped area for securing the towing connection.

It is used for replacing the whole rear end, with or without mechanical units.

GETtheMANUALS.org

Below you will find detailed explanations required to understand the procedures.

These change and are updated as and when necessary from edition to edition.

This means that the most recently published Workshop Repair Manual should be used as reference.

1. Basic rules for the replacement of structural components

As a general rule, when a welded bodywork component is replaced, the repair must be identical to the original both in terms of the number of welds and the type of welding used, for reasons of appearance and safety.

If this rule cannot be followed fully during repair for practical reasons, the replacement solutions will be shown in the repair procedures.

These solutions ensure that the repairs are performed correctly and release the repairer from liability.

Therefore, you will only find particular instances where spot welds differ from the original indicated in the procedures, electrical resistance spot welds will no longer be demonstrated in the diagrams.

Most frequently encountered cases when replacing an electrical resistance weld:

1 Plug welding
2 Bead
3 Gluing
4 Riveting

In some cases, the following will be indicated:
– the tools and equipment used for the operations,
– the cross sections of the specific panel overlaps requiring an explanation,
– the dimensions for positioning certain components,
– the location of the cutting lines for partial replacements,
– the location of the gluing areas specific to the repair.

When a part is symmetrical (left and right sides are identical), only one side will be dealt with in the procedure (eg.: partial replacement of the rear floor rear section).

This means that the operations for the other side are the same (number of spot welds, etc), unless specific indications to the contrary are given.

This applies to both left and right-hand drive versions.

In the document, the drawings illustrate the replacement of the various parts as clearly as possibly following a typical impact described in each introduction.

The diagram should illustrate the part to be replaced without the neighbouring components as if they have already been removed.

However, some diagrams may not follow this rule in order to better depict the part in its location.

The structural repair procedures are carried out using uncoated steel bodywork panels.

The original mastics are not illustrated.

Special notes for replacements made with cuts:

Generally, the areas to be cut are described in the procedures as guidelines. They can be adapted according to the damage sustained through impacts if the main safety regulations detailed in the General Information section of the bodywork guide are observed.

When the position of the cut is specified in the procedure, it must be followed.

IMPORTANT:
The codified times for operations (TM) are specified according to the position of the cuts illustrated in the manual.
This means that if the operator chooses to cut a different area, the time given to do the job will no longer correspond.

GETtheMANUALS.org

2. Meaning of symbols explained

You will find below several representative examples of how to replace parts.

All explanations are written in italics.

EXAMPLE No.1: Front wheel arch front section (Section 42A-H):

The replacement of this part is a complementary operation to the replacement of the scuttle side panel for a side impact.

This implies that there is a basic operation, in which the preliminary operations will be covered, associated with the replacement of this part.

From which the two following paragraphs are taken:

In the procedure described below, you will only find the descriptions and the joints which are specific to the part concerned.

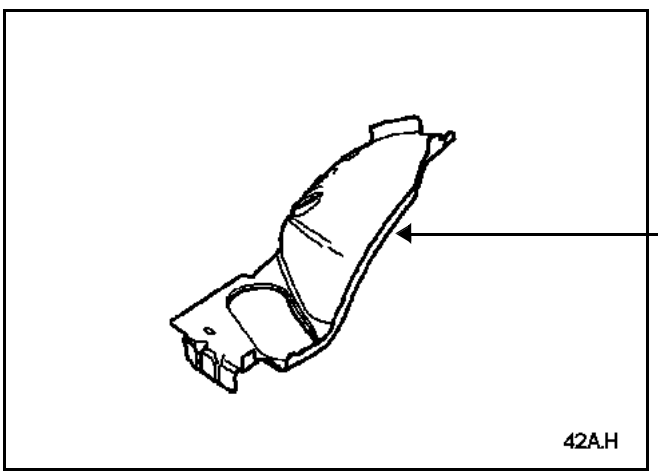
The information on the additional parts will be dealt with in the respective sections (refer to contents).

The "supplementary" parts are those affected by the impact, which are assumed to have been removed already.

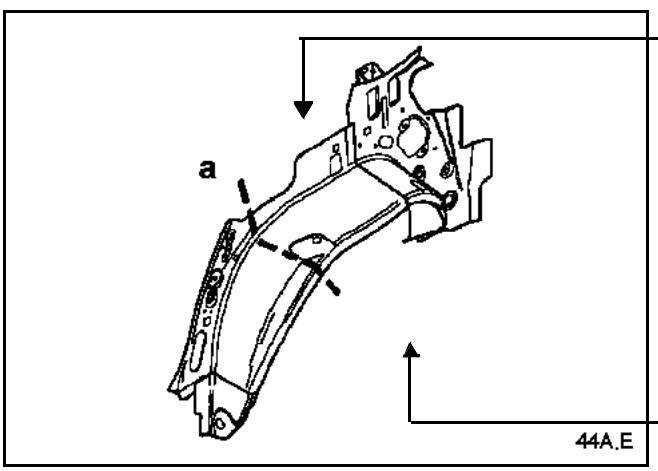
COMPOSITION OF THE REPLACEMENT PART

Part supplied on its own.

Knowledge of the composition of the replacement part allows work to be carried out before receiving the part and ensures that the most suitable part is ordered.



The image used in the introduction is that used in the Replacement Parts Catalogue.



A simplified dotted line on the diagram indicates the possibility of a partial replacement (Outer wheel arch 44A-E).
This symbolisation is repeated in the exploded views of the parts in the Repair Times section.
This cutting line is always accurately detailed in the procedure, and it is important to refer to this as it indicates exactly the position of the cut and the method for joining.
(see EXAMPLE No. 4 described below).

These cuts are marked by a lower case letter.

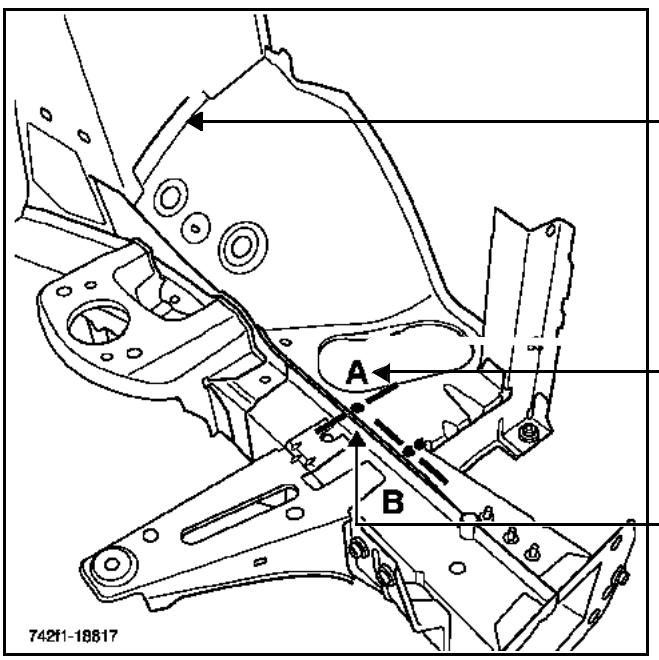
GETtheMANUALS.org

PARTS CONCERNED (thickness in mm):

The list of PARTS CONCERNED refers only to the parts marked in the diagrams.

1	Scuttle side panel	**1.5/2.5**
2	Windscreen pillar lining	1
3	Windscreen aperture lower cross member	0.9
4	Sill panel closure panel	1.2
5	Front wheel arch rear section	1.2
6	Windscreen aperture lower cross member reinforcement	0.9

When two panel thicknesses are shown for the same part, this means that this part consists of two panels which were originally butt welded. Thicknesses are shown starting from the outer end of the part going towards the passenger compartment of the vehicle (direction of the impact).



The join between the wheel arch and the shock absorber turret is not dealt with because it can be made as originally.

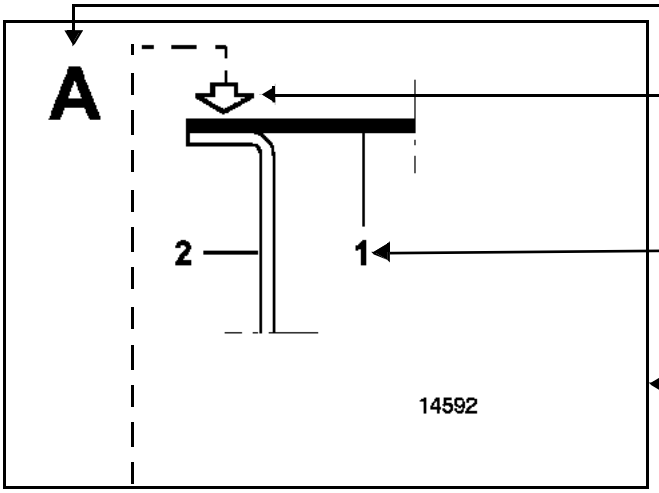
This letter designates the diagram which corresponds to the section (this is repeated in the upper left-hand corner of each diagram).

The dashed line shows the centre line of the sections.
The dashed line shows the exact placement for the join.

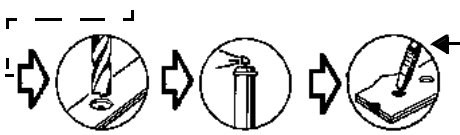
This letter designates the diagram of the section which corresponds to the drawing (this is repeated in each drawing).

This arrow indicates the location and direction of operations to be carried out (this is repeated under each section followed by one or more icon(s) signifying an exact operation).

This number corresponds to the number of the part in the list of parts involved.



The use of sections allows for the necessary precision for panel butt welding joints which are complex or different from the original.



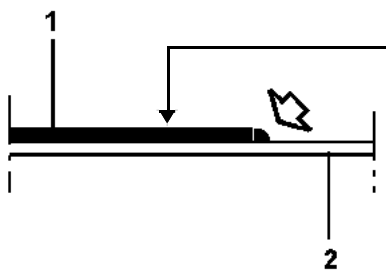
The symbol represents the specific operation to be performed and the type of tool (Section 40A-B Key for icons and symbols).

x 3

"X3" specifies the number of spot welds required for the attachment concerned.
Here, resistance spot welds are replaced with plug welds.

GETtheMANUALS.org

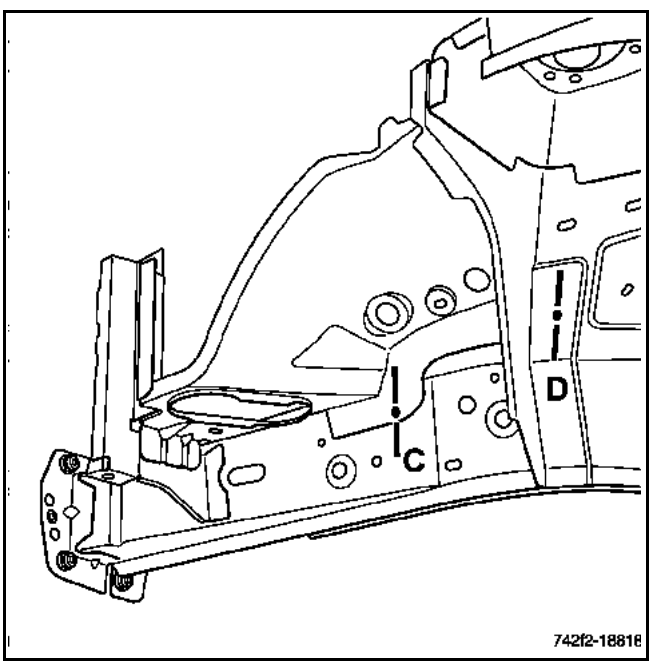
B



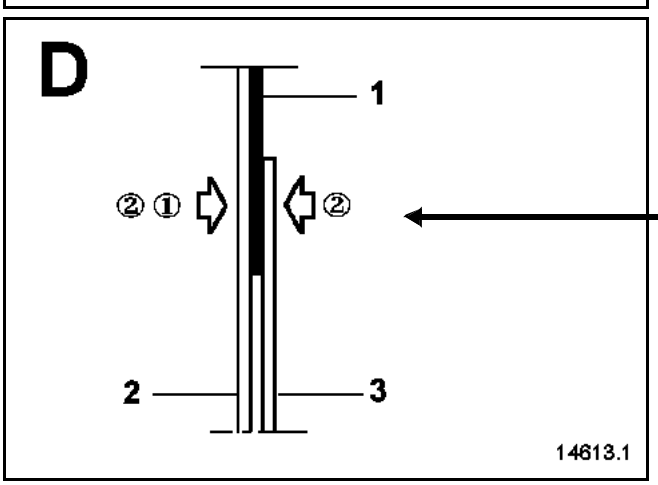
The part shown in black is the one removed during the operation.
The other panels shown in white represent the parts remaining in position on the vehicle.

"L25" specifies the length in millimetres of the bead to be welded for the relevant connection.

If several welds are required, the number will appear before the L25, eg.: X4 L25 means that there are four 25 mm lengths of beading required.



D



This special numbering system indicates the order in which the various tasks must be carried out
① Drill
② Protect and plug the two sides

∅ 10 indicates the diameter in millimetres of the hole to be drilled for the operation.

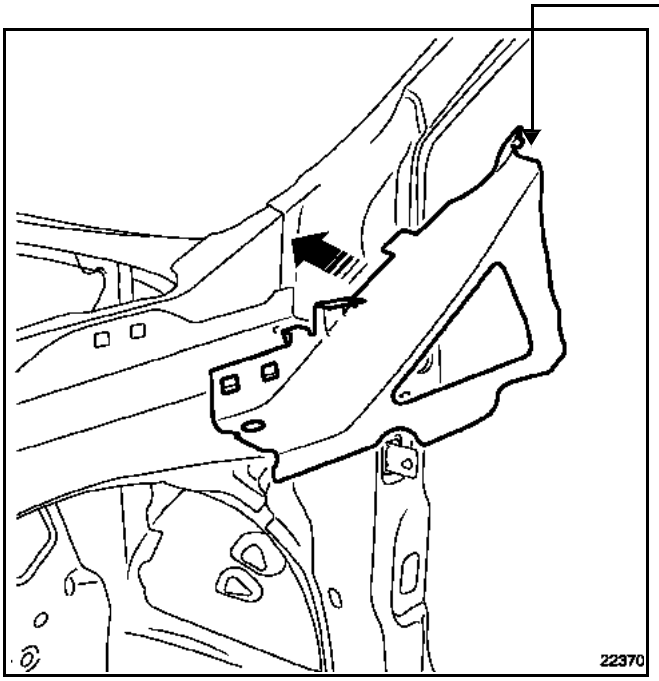
GETtheMANUALS.org

EXAMPLE No.2: Scuttle side panel upper rear reinforcement (Section 42A-G).

NOTE:
This operation presents no particular difficulties.

Where spot welds cannot be made with the spot welder, they can be replaced by plug welds.

For your information, you will find one or more diagrams of the part in the procedure either on the vehicle or removed from it.

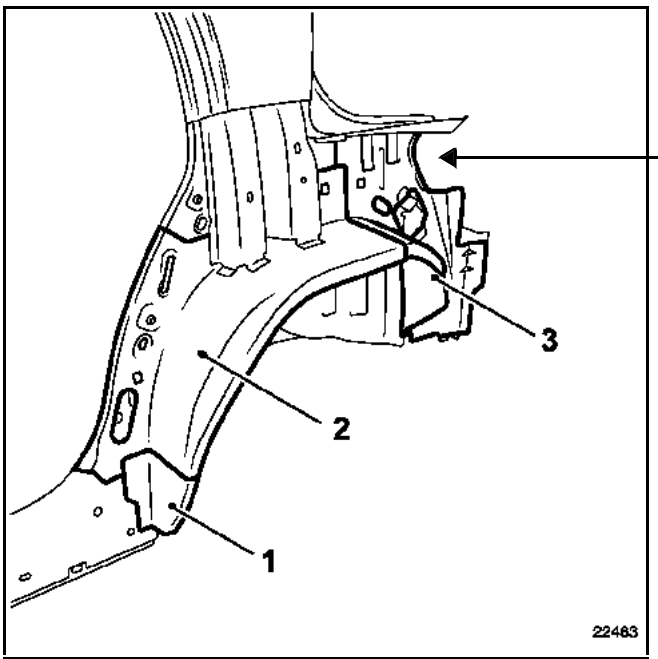


Specific case:
When the original spot welds are replaced with plug welds and the operation presents no particular problems in respect of the Basic rules for replacing structural components (see paragraph 1).
Nothing is detailed in the procedure.

If this is the case, one or more diagrams of the part in position on the vehicle or off the vehicle will be provided for information purposes.

GETtheMANUALS.org

EXAMPLE No.3: Outer wheel arch (Section 44A-E)



The highlighted part shown in position is also used when the replacement procedure is not particularly difficult.

This representation allows the part to be seen in position on the bodywork with hidden areas and ridges visible.
Here, it can be seen that the outer wheel arch is supplied by the Parts Store assembled in three sections.

The outer rear wheel arch consists of three sections:
Lower component (**1**)
Front section (**2**)
Rear section (**3**)

NOTE:
Depending on the level of impact, it is possible to replace the damaged parts only.

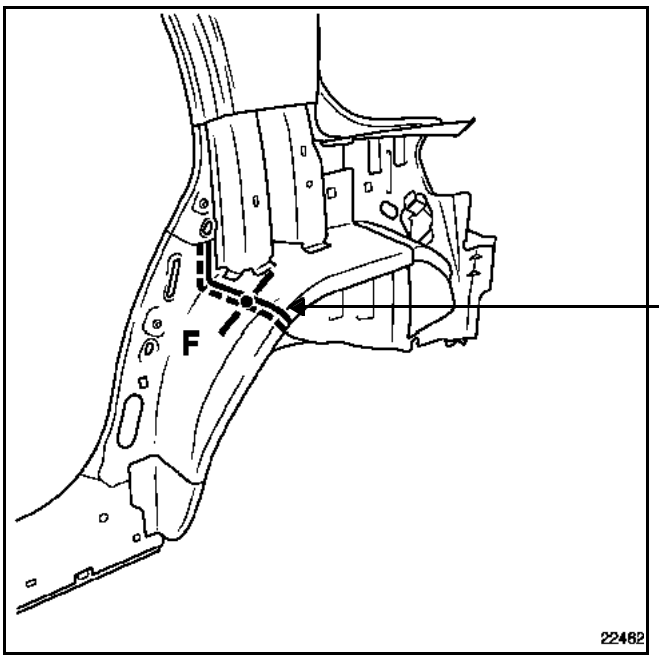
It is an example of partial replacement by unpicking (without cutting).

This type of operation requires that the components to be replaced are unpicked from the outer rear wheel arch assembly supplied by the Parts Store.

This process is used on Parts Store parts which are made up of several components.

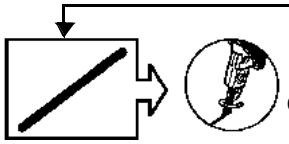
GETtheMANUALS.org

EXAMPLE No.4: Outer wheel arch (Section 44A-E)

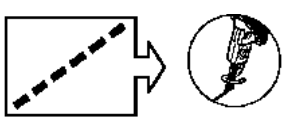


The symbol represents the area or the exact outline of the operation to be performed (see Section 40A-B Key for icons and symbols).

The icon corresponds with the figure to indicate the type of operation to be carried out at this point

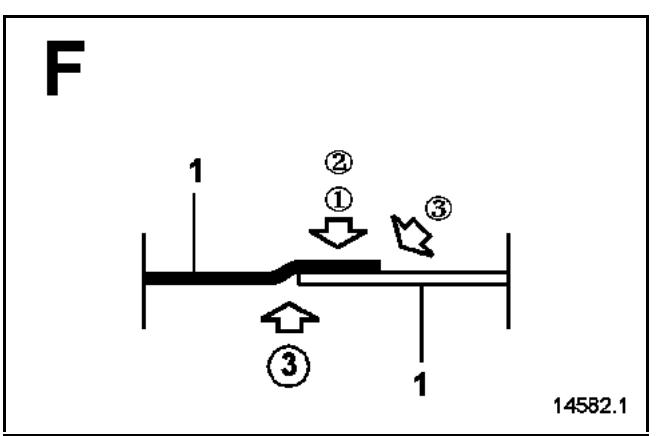


on the replacement part

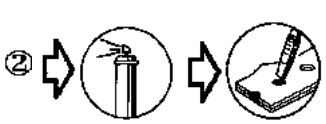


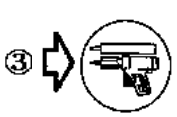
on the vehicle

This illustration shows the panel overlap for replacement by drilling and superposition.



on the replacement part





GETtheMANUALS.org

NOTE:
The number of plug welds is not specified. It is essential to leave a gap of approximately **60 mm** between the spot welds, then after welding apply a mastic bead to the edge (operation ③) to ensure sealing and finish.

Use M.J.Pro type mastic (**part number: 77 11 172 676**)

A specified gap is given if the number of spot welds is not specified by the symbol.

The part numbers of the products or equipment are valid at the time the document is issued. They are liable to be changed in the event of further developments. These part numbers can be tracked by the product and equipment catalogue updates.

GETtheMANUALS.org

1. Symbols:

	Usually represents a visible panel edge. The symbol may be followed by an action to be carried out along this line (eg.: cutting).
	Usually represents a hidden panel edge. The symbol may be followed by an action to be carried out along this line (eg.: cutting).
	Represents a bead of glue or mastic. The symbol may be followed by an action to be carried out along this line (eg.: extrusion).
	Usually represents an edge to edge cut or a simple bead of chain weld.

GETtheMANUALS.org

2. Symbols:

	Cut with chisel. Open out with a chisel. Flat chisel.
	Cut with a saw. Pneumatic power hacksaw.
	Unpick the spot welds. Hardened steel bit. Speed of rotation 800 to 1000 rpm.
	Grind back the beading or spot welds (grinding discs). Cut (disc saw). Pneumatic straight grinder. Maximum speed 20 000 rpm.
	Mill the bead or spot welds. Pneumatic straight grinder. Maximum speed 20 000 rpm.
	Drill ≤ ∅ 8 mm. Steel drill bit. Speed of rotation 800 to 1000 rpm.
	Drill ≥ ∅ 8 mm. Tapered drill bit. Speed of rotation 800 to 1000 rpm.
	Decrimping. Decrimping pliers Car. 1657.
	Grind the bead or spot welds. Surface finish the bead or spot welds. Pneumatic angle grinder.

GETtheMANUALS.org

	Clean the mating faces before welding. Pneumatic straight grinder. Speed of rotation 2 500 rpm.
	Detach the spot welds. Pincers.
	Peel away the areas of mastic or adhesive strips. Heat gun.
	Protect the mating faces before welding. Aluminium-based aerosol.
	Add a bead to the mating faces. Manual or pneumatic spray gun. Mono or bi-component filling or structure mastic.
	Apply weldable mastic (electrical conductor) between the two panels to be spot welded. Spray gun. Mono-component bonding mastic.
	Extrude a mastic bead. Manual or pneumatic spray gun. Monocomponent filling or sealing mastic.
	Planish a component. Crimp an outer door panel. Hammer and stake.
	Braze or unbraze the weld. Oxyacetylene equipment.
	Apply electrical resistance spot welds. Pneumatic spot welder.
	Chain weld or apply a bead of weld with MAG shielding gas. Semi-automatic welding station.
	Plug weld with MAG protective gas. Semi-automatic welding station.
	Tin plate the surface finished area. Heat gun. Spatula + 33 % tin strip + tallow.
	Spray a mastic. Spray gun. Bi-component anti-chipping and anti-corrosion mastic.

GETtheMANUALS.org

	Spray the hollow sections with wax. Spray gun.
	Safety symbol. Follow the advice indicated.

GETtheMANUALS.org

IMPORTANT:
This vehicle shares components with Laguna II, some diagrams in this document are taken from the Laguna II Workshop Repair Manual where the procedure is identical.

Three cases are taken into account:

① The part is identical to that on Laguna II, the procedure is the same for both vehicles.
② The part is slightly different to that on Laguna II, but the procedure is identical.
③ The part is specific to the vehicle, the procedure is specific.

For cases ① and ②, the diagrams are not exact representations of the actual vehicle, but do not affect the understanding of the procedure.

Only cases ① and ② will be indicated in the procedure introduction for each part concerned. When there is no indication in the introduction, this means that the part is new (case ③).

REMINDER:
All sections are to be found opposite each part, to make them easier to refer to more quickly.

GETtheMANUALS.org

GETtheMANUALS.org

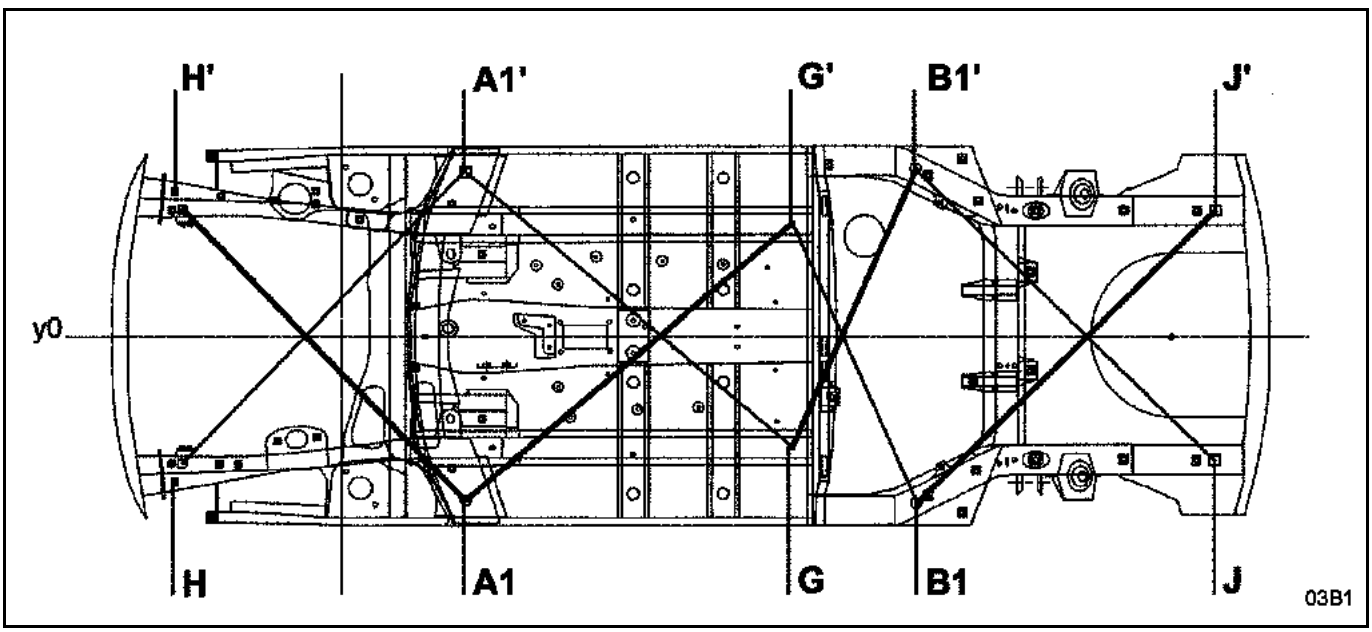
Before carrying out repairs to the bodywork of a car, even if the damage seems slight, it is necessary to carry out a series of tests:

VISUAL INSPECTION
This inspection involves examining the sub-frame of the vehicle where mechanical components are mounted and in the crumple zones or vulnerable areas in order to detect creases where materials have been damaged.

TRAMMEL GAUGE CHECK
The visual inspection may be completed using a trammel gauge which enables some damage to be measured by symmetrical comparisons (for more detail on each check point, see the repair bench paragraph below).

CHECKING THE ANGLES OF THE AXLES
This is the only check which determines whether the impact suffered by the vehicle has or has not affected its road holding.

IMPORTANT:
In borderline cases, it will also be necessary to check the axle components, which may also have suffered damage. In principle, no welded component in the body shell should be replaced without ensuring that the sub-frame has not been affected by the impact.

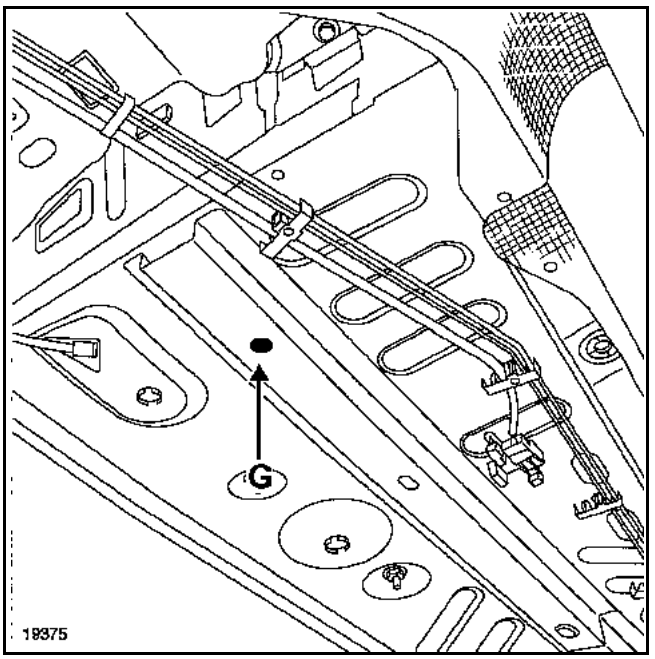


Chronological order of checks:

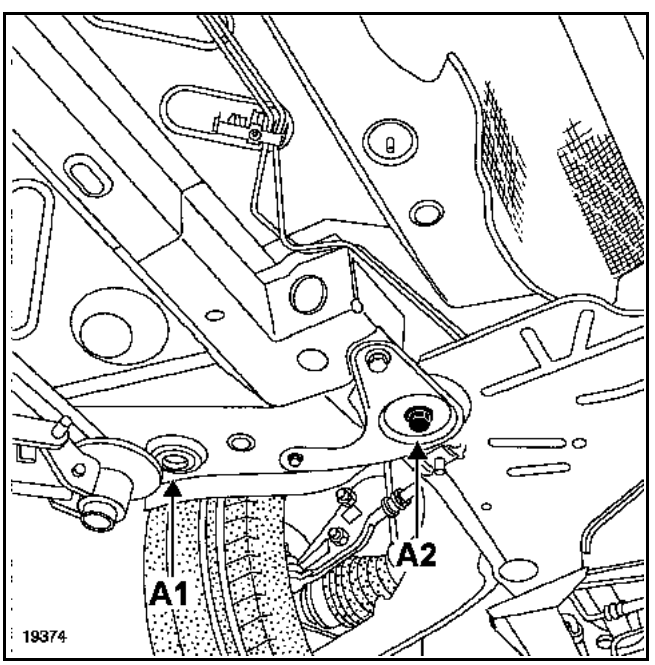
FRONT impact:
1: G - A1' = G' - A1
2: A1' - H = A1H'
REAR impact:
1: G - B1' = G' - B1
2: B1' - J = B1 - J'

GETtheMANUALS.org

GAUGE POINTS

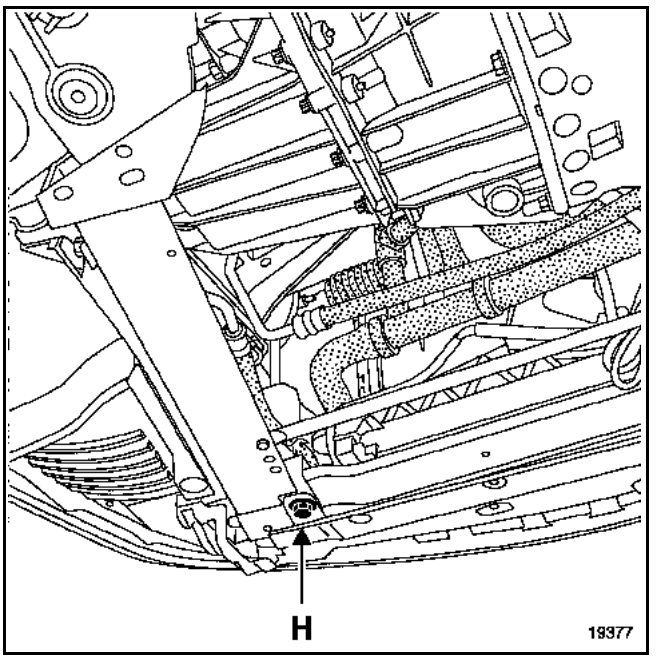


Point G
Start point for checking points (A1) and (B1).

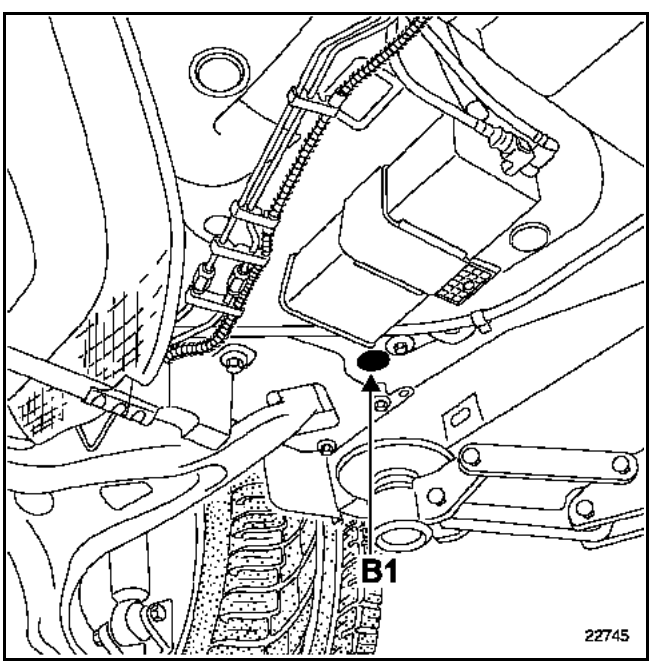


Point A1
Front body reference.

NOTE:
The point A2 can also be used as a reference point if point A1 is found not to be correct.

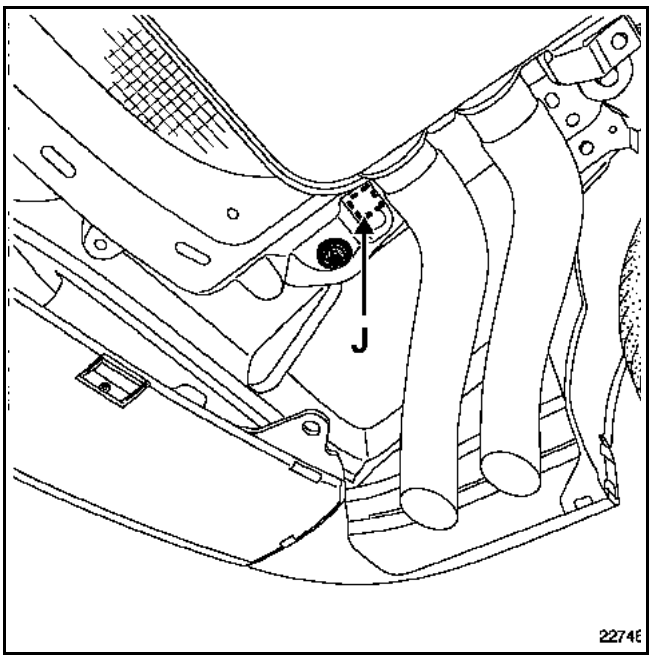


Point H
Front end of front side member.



Point B1
Rear axle assembly leader pin.

GETtheMANUALS.org



Point J

Rear end of rear side member

The plastic protection must be partially removed for access to point J.

REMINDER:
The underbody holes are fitted with plastic blanking covers to ensure that all cavities are watertight.

Some of these blanking covers have to be removed during testing.

If any of the blanking covers have deteriorated, they must be renewed in order to maintain the vehicle's anti-corrosion warranty.

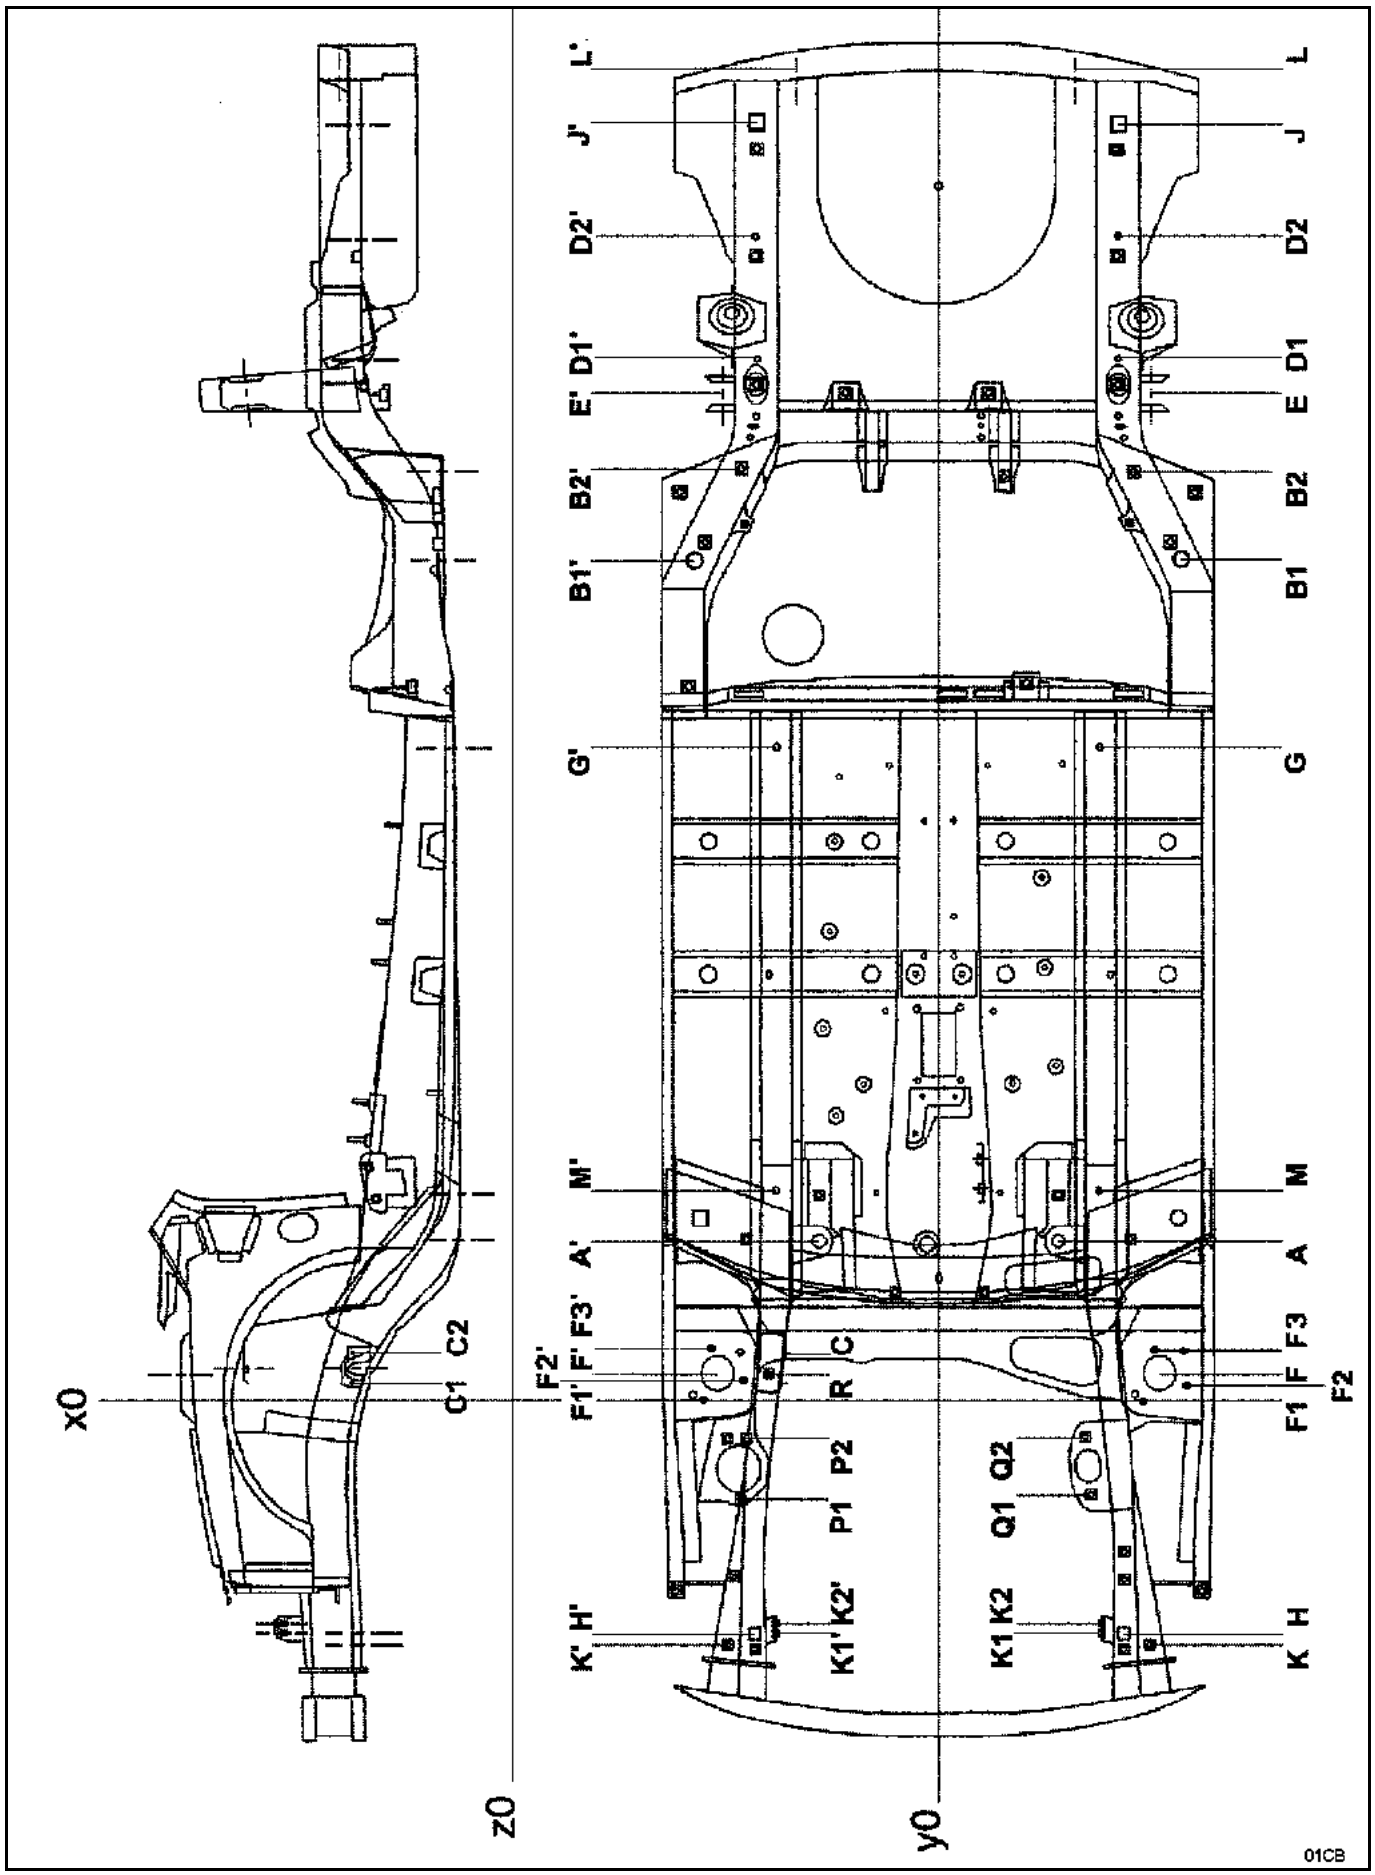
A and B = vehicle trim-setting reference

GETtheMANUALS.org

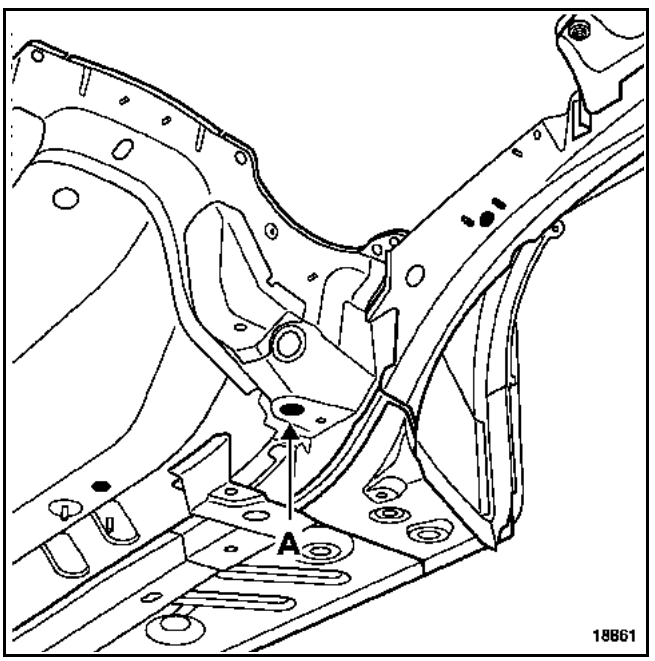


GETtheMANUALS.org

1. PRINCIPLE REFERENCE POINTS FOR SETTING VEHICLE TRIM LEVEL

A - FRONT SUB-FRAME REAR MOUNTING

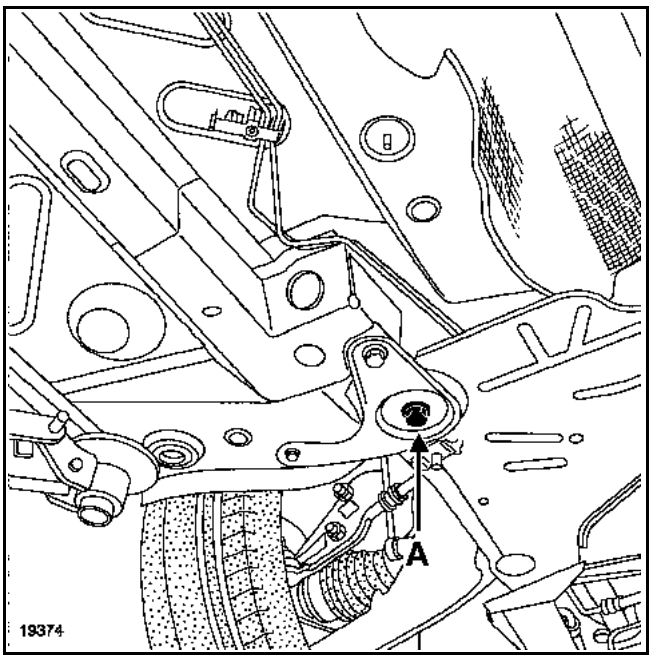
This is the main front reference point for setting the vehicle trim level.



1 - Front mechanical components removed

NOTE:
on the left-hand side, the hole is round;
on the right-hand side, it is slotted.

If replacing the sub-frame rear support, this reference point is replaced temporarily by point (M), located on the rear section of the front side member, point (A) thus being used for positioning the replaced part.



2 - Front mechanical components in place

The bracket covers the sub-frame mounting bolt.

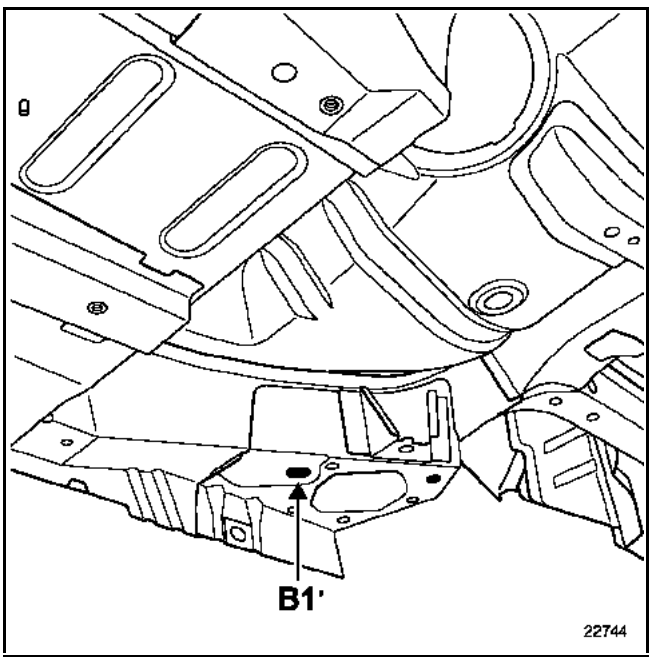
Two possible cases can arise:
1 If the rear of the vehicle is being rebuilt, these two points alone can be used to align and support the front of the vehicle.
2 For a light frontal impact not requiring removal of the front axle sub-frame.

If in doubt about the damage to one of the main reference points (A or B), it is advisable to use the two additional points located in the area not affected by the impact to confirm the trim level.

GETtheMANUALS.org

B - REAR AXLE FRONT MOUNTING

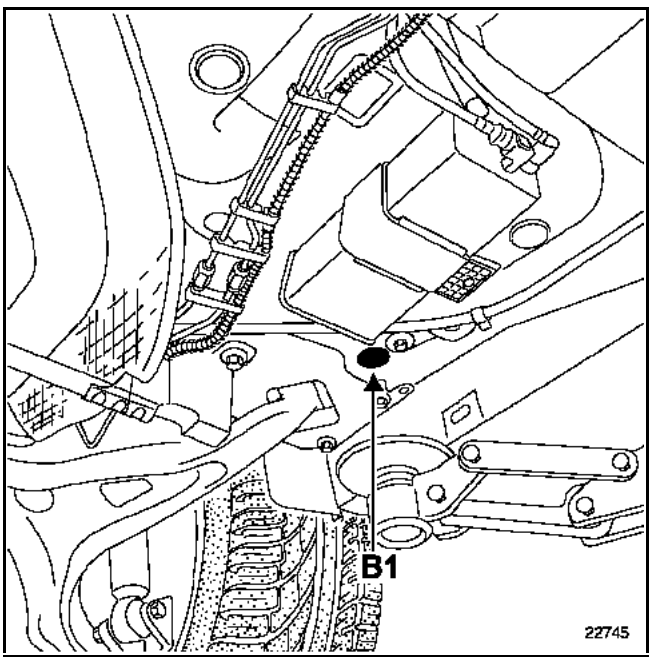
This is the main rear reference point for setting the trim level.



1 - Rear mechanical components removed

The bracket rests on the underside of the rear sub-frame assembly mounting unit, centred in the axle-assembly pilot hole.

If replacing the complete rear side member or the rear floor unit, this reference point is replaced by point (G), located on the front side member, point (B) being used to position the replaced component.



2 - Rear mechanism in place

GETtheMANUALS.org

2. ADDITIONAL REFERENCE POINTS FOR SETTING VEHICLE TRIM LEVEL

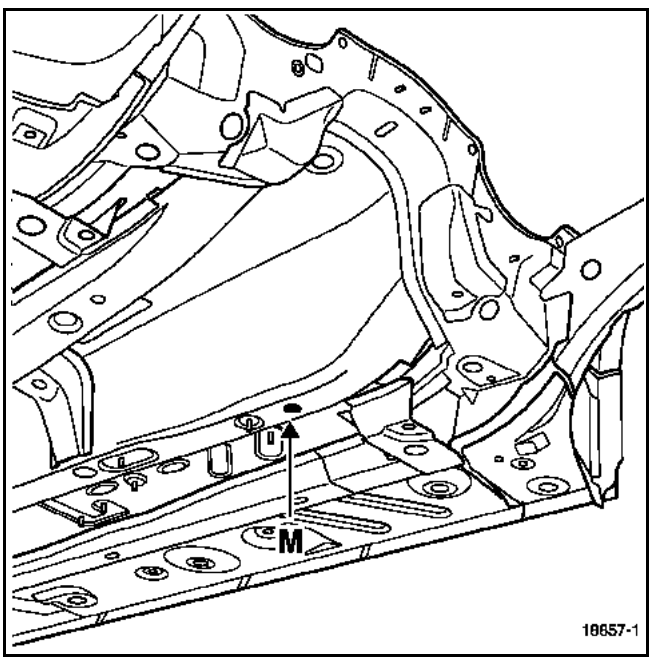
These are the provisional reference points which are used when the principle reference points have been affected by the impact.

These points allow additional vehicle support to the main reference point on the impact side, but allow only a roughly accurate vehicle alignment.

IMPORTANT NOTE:
These reference points should only be used in the cases mentioned above, they are not required when both main reference points (points A and B) are correct.

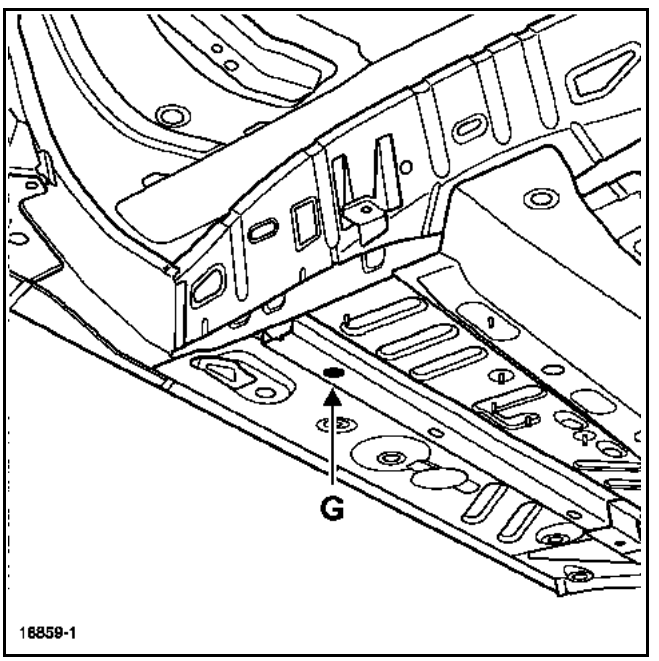
This additional reference function may also be filled by the front side member ends check points for a rear impact, and vice-versa.

LEADER PIN UNDER FRONT FLOOR (front side member - central section)



The point (M) can also be used to position the replacement part.

G. REAR END OF FRONT SIDE MEMBER

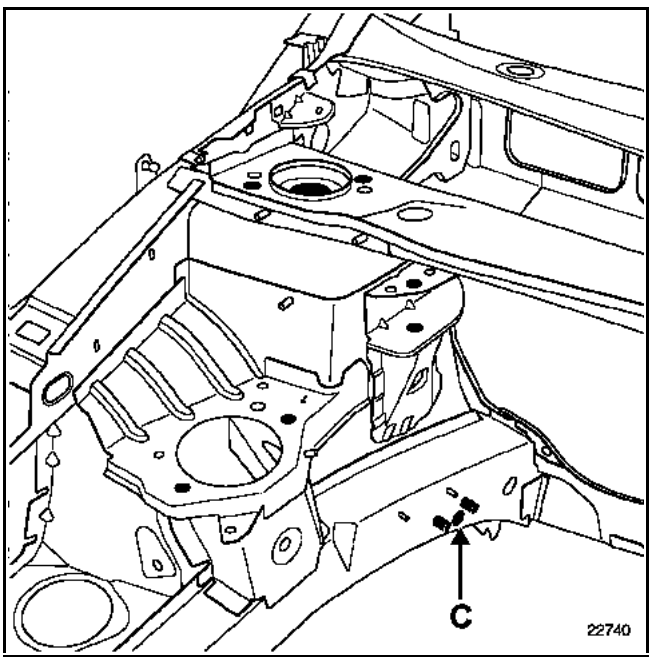


This point is also used as a positioning reference when replacing a rear section of the front side member.

GETtheMANUALS.org

3. REFERENCE POINTS FOR POSITIONING REPLACED PARTS

C - FRONT SUB-FRAME FRONT MOUNTING

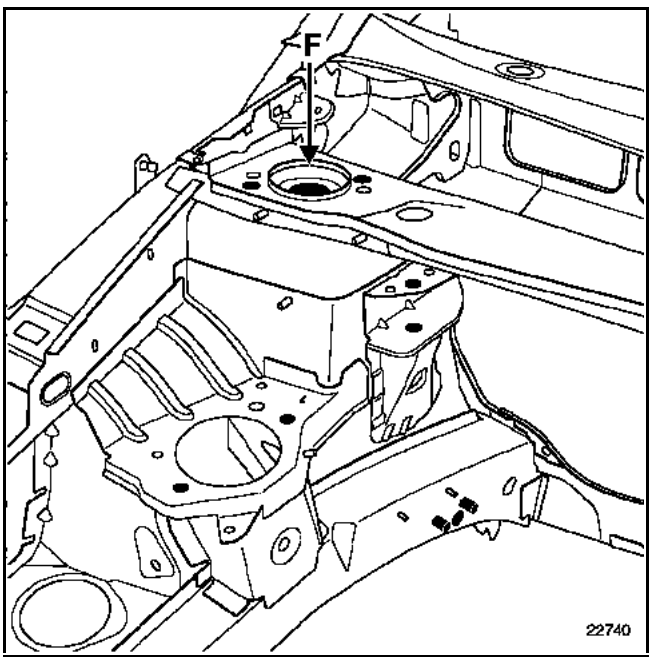


1 - Front mechanical components removed

The bracket rests under locating studs (1) for the front part of the sub-frame and can be fixed in the sub-frame attachment hole.

It is used when replacing:
– a partial or complete front side member,
– a half-unit.

F - FRONT SHOCK ABSORBER UPPER MOUNTING



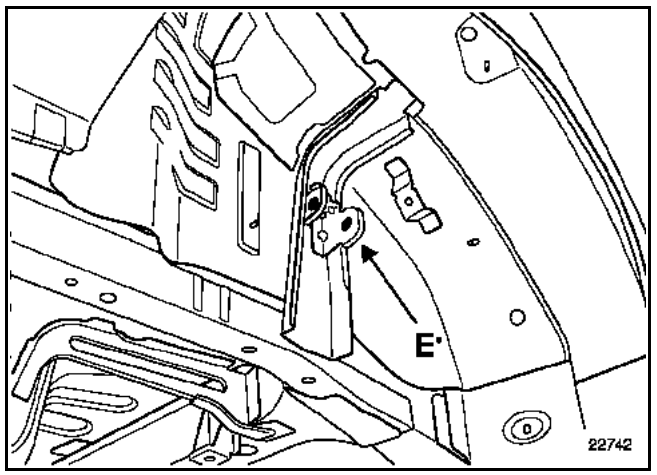
The bracket rests under the shock absorber cup and is centred in the shock absorber mounting holes.

It is used when replacing:
– a wheel arch,
– a front half-unit.

It is also used when straightening.

GETtheMANUALS.org

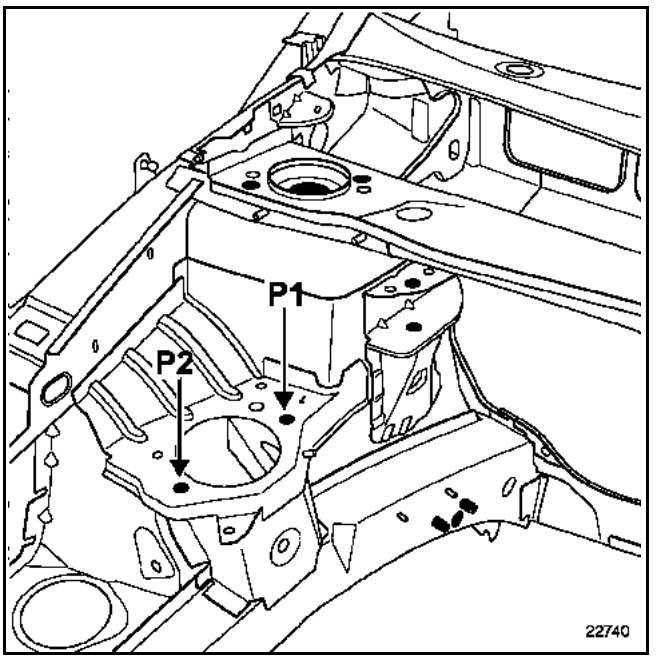
E. REAR SHOCK ABSORBER MOUNTING



The bracket is centred and mounted inside the shock absorber shaft.

It is used when replacing the inner rear wheel arch.

P. ENGINE MOUNTING

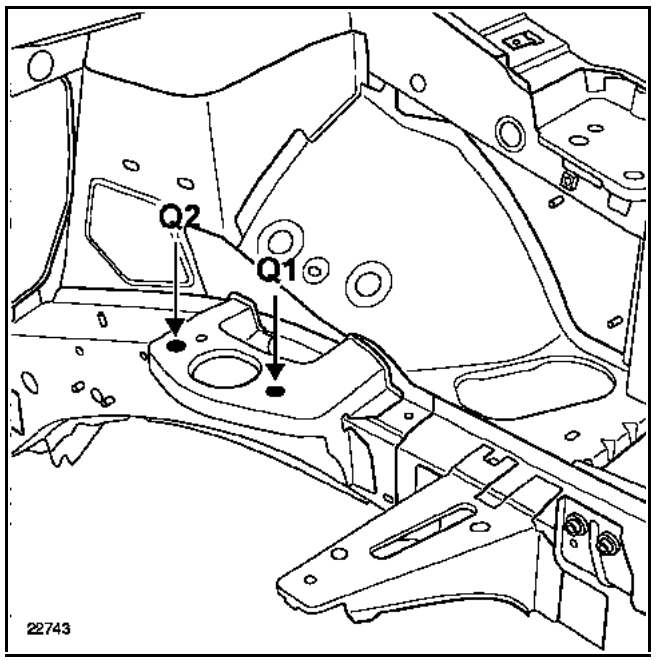


The bracket is positioned from above the engine mounting and is centred in the mounting holes of the pad.

It should be used with the mechanical components removed to replace a front half-unit.

GETtheMANUALS.org

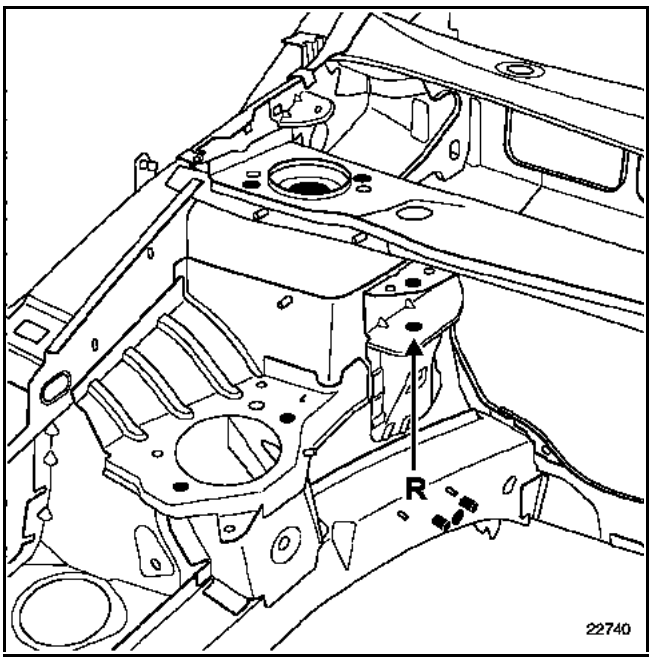
Q - GEARBOX MOUNTING



The bracket is positioned from below the gearbox, centred in the mounting holes of the shoe.

It should be used with the mechanical components removed to replace a front half-unit.

R - ENGINE TIE-ROD MOUNTING

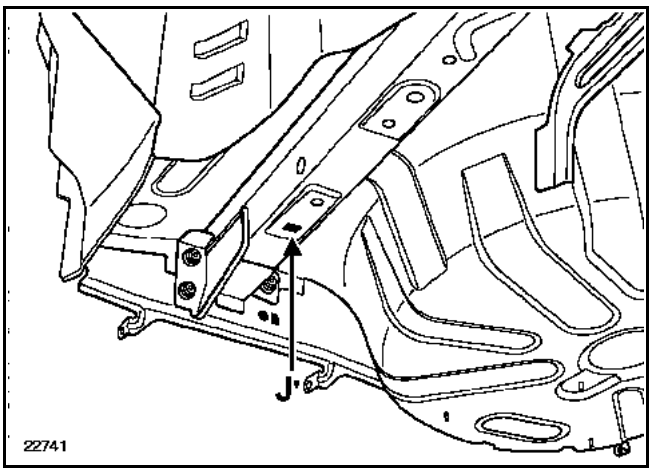


The bracket is placed in the tie-rod fork, and is fixed in place of the latter.

It is used for setting up the geometrical reference for the tie-rod fork.

GETtheMANUALS.org

J - REAR SIDE MEMBER END

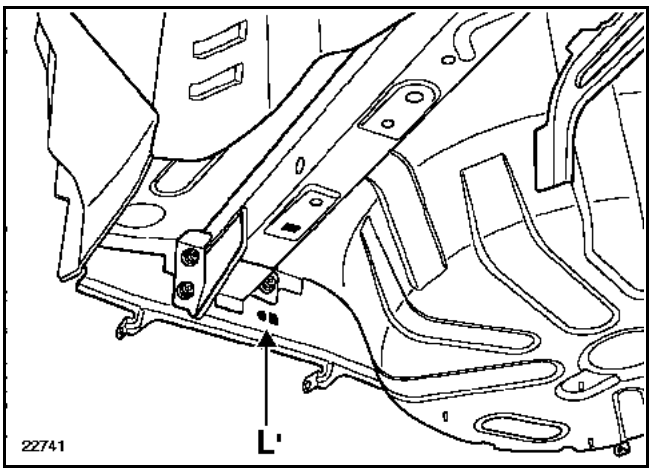


The bracket rests under the side member and is centred in the pilot hole.

It is used with the mechanical parts in place:
– for realigning the side member.

It is also used with the mechanical parts removed, in the same conditions, to replace the side member.

L - REAR END CROSS MEMBER



The bracket rests vertically against the rear end cross member, then is centred in the stamped area for securing the towing connection.

It is used for replacing the whole rear end, with or without mechanical units.

GETtheMANUALS.org

The replacement of this part is a basic operation for a frontal impact.

The door is a removable component. It is part of case no. ① (see the introduction to **Section 40A-C: Description of parts**).

In the operation described below, there are only descriptions of the connections specific to the part concerned.

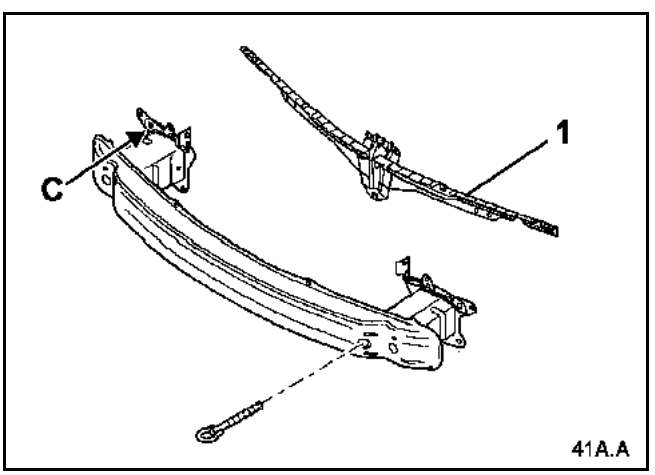
The information on the additional parts will be dealt with in their respective sections (refer to contents).

NOTE:
When the cross member only is being replaced, a bead of M.J. Pro mastic (**part number: 77 11 172 676**) must be applied at the join in order to ensure anti-corrosion protection of the connection face.

The part supplied by the Parts Store is black and does not need painting when fitted.

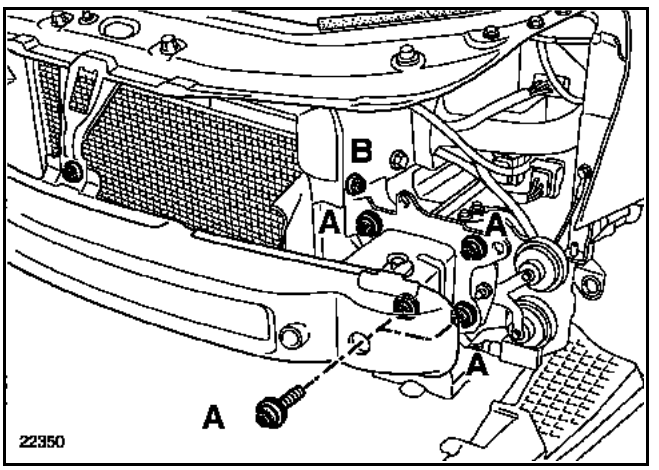
COMPOSITION OF THE REPLACEMENT PART

Part assembled with:
Front end cross member
Interior housings
Bumper mounting
Exterior housings
Mounting components
Towing hitch tapped ring
Headlight carrier panel mounting angle bracket



NOTE:
The bumper mounting bracket (1) is also available separately.

TIGHTENING TORQUES (in daNm)	▽
Cross member bolt A	3.5
Cross member bolt B	2.0



IMPORTANT:
Before any operation on the cross member, it is necessary to ease the engine away from its support points or to strap the ends of the side members so that they do not separate.

NOTE:
To make it easier to fit the cross member, it is advisable to remove the headlight carrier panels.

REMOVAL

Removal is carried out by removing the side mounting bolts (A) (four on each side) and the upper cross member mounting bolts (B).

REFITTING

IMPORTANT:
when positioning mounting bolts, it is easier to always start by positioning the pilot hole bolt C (located on the outer upper right-hand side).

The cross member contributes to the rigidity of the engine compartment structure. It is therefore essential to observe the tightening torques after carrying out any work.

GETtheMANUALS.org

The replacement of this part is a basic operation for a frontal impact to the lower section.

Case no. ① (see the introduction to **Section 40A-C: Description of parts**).

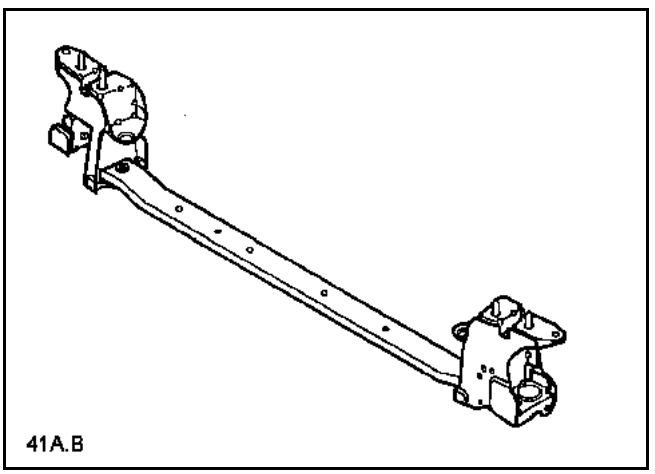
In the procedure described below, you will only find positions of the mountings specific to the component.

The information on the additional parts will be dealt with in their respective sections (refer to contents).

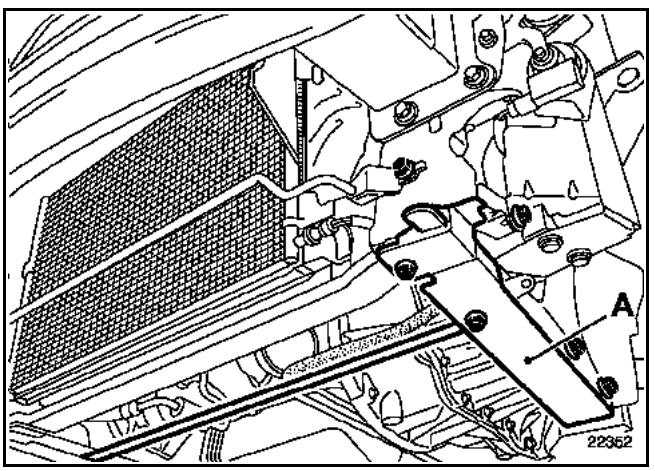
It is a removable component made of galvanized panels.

COMPOSITION OF THE REPLACEMENT PART

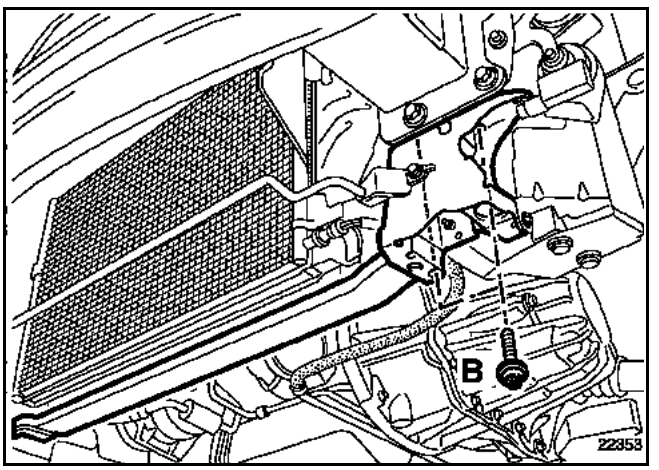
Part supplied on its own.



TIGHTENING TORQUE (in daNm)	▽
Cross member bolt	4.4



NOTE:
To access the cross member mountings, it is necessary to remove the following:
– the bumper,
– the engine undertray,
– both longitudinal cross members connecting the mounting (A),
– the radiator lower mountings,
– the air conditioning hose,
– the mounting unit.



REMOVAL - REFITTING

Removal/refitting is carried out by removing/refitting bolts (B).

GETtheMANUALS.org

The replacement of this part is a complementary operation associated with the replacement of the front side member closure panel due to a frontal impact.

Case no. ① (see introduction to **section 40A-C: Description of parts**).

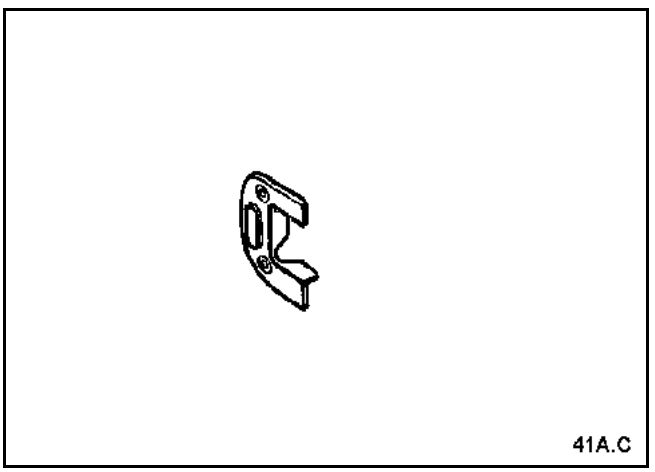
In the procedure described below, you will only find the descriptions and the joints which are specific to the part concerned.

The information on the additional parts will be dealt with in their respective sections (refer to contents).

NOTE:
The front end cross member must be used as a template for positioning the part.

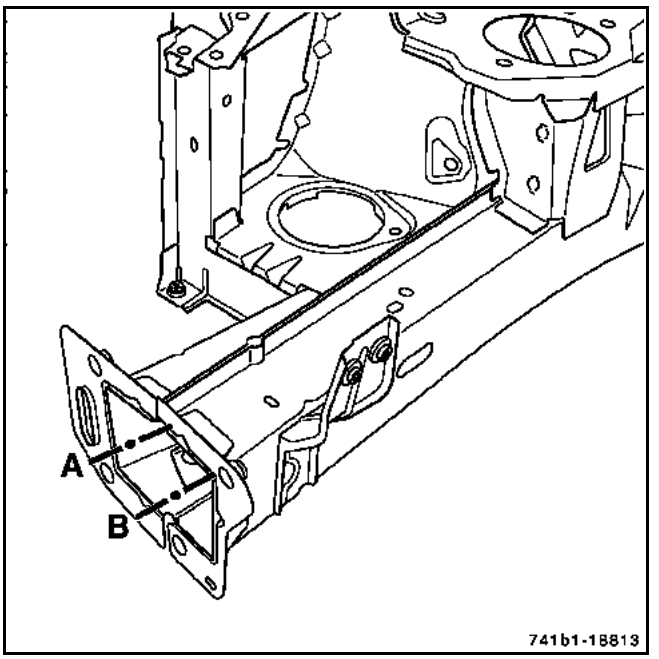
COMPOSITION OF THE REPLACEMENT PART

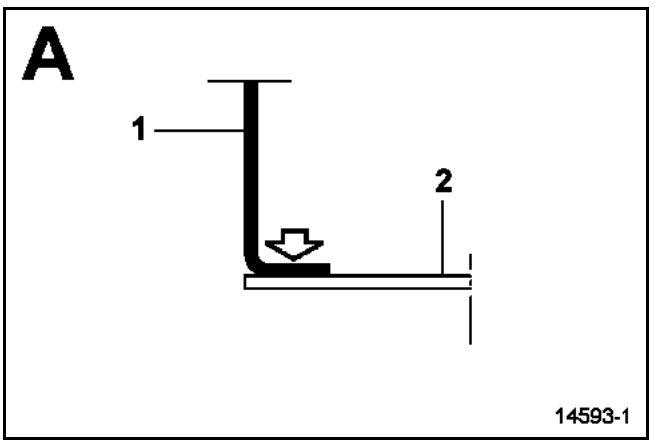
Part assembled with:
Support plate
Crimped nuts

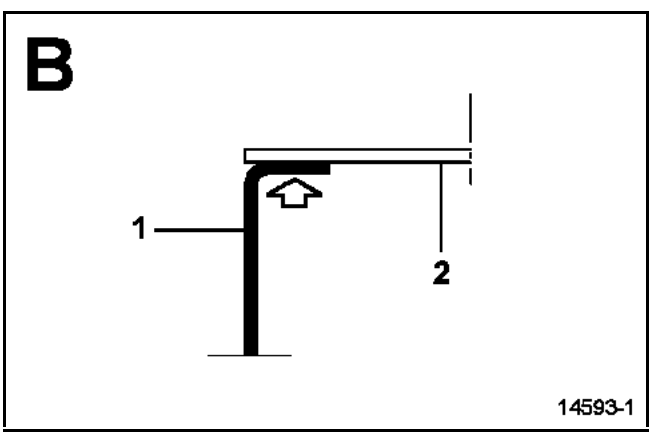


PARTS CONCERNED (thickness in mm):

1	Front end cross member mounting reinforcement	2.5
2	Front side member closure panel	1.5







GETtheMANUALS.org

The replacement of this part is a complementary operation to the reinforcement of the front end cross member mounting and the wheel arch due to a front side impact.

Case no. ① (see the introduction to **Section 40A-C: Description of parts**).

In the procedure described below, you will only find descriptions of the connections which are specific to the part concerned.

The information on the additional parts will be dealt with in their respective sections (refer to contents).

To perform this operation, the front end cross member mounting reinforcement (1) must also be ordered.

This operation can be carried out in two possible ways:
– partially, using cut (a),
– or complete.

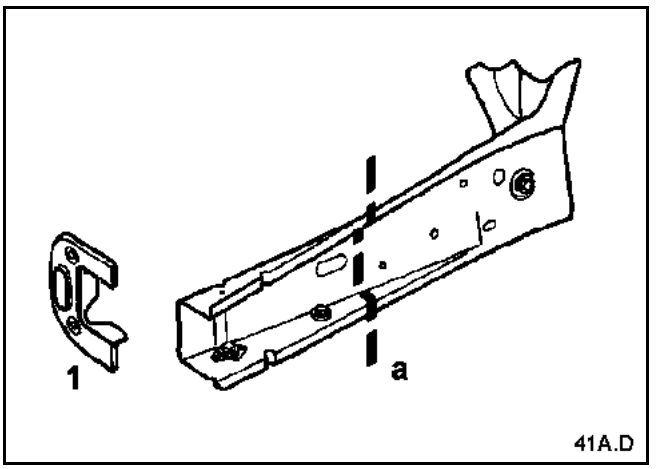
IMPORTANT:
The front side member closure panel consists of two panels of different thicknesses which are butt welded together.

Cut (a) is made just behind this line of butt weld.

It is essential to use the body jig bench when replacing this part.

COMPOSITION OF THE REPLACEMENT PART

Part assembled with:
Inner reinforcement
Closure panel components
Crimped nuts



PARTS CONCERNED (thickness in mm):

1	Front section of front side member closure panel	1.5/2.5
2	Wheel arch	1.8

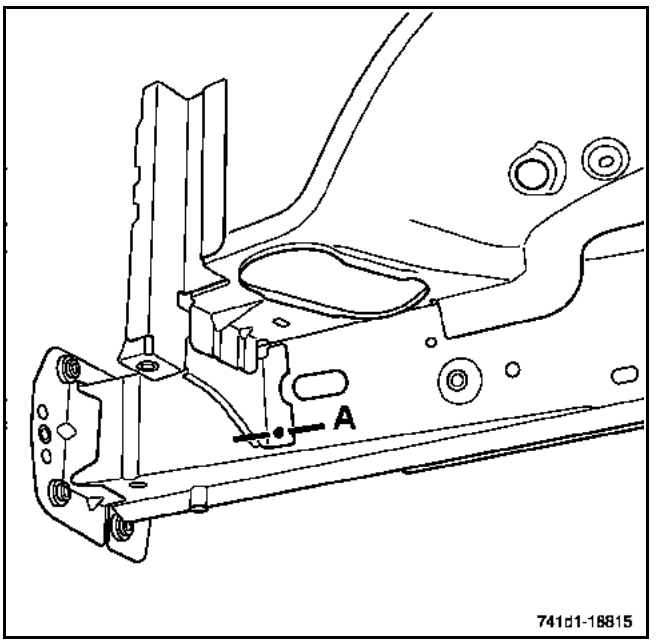
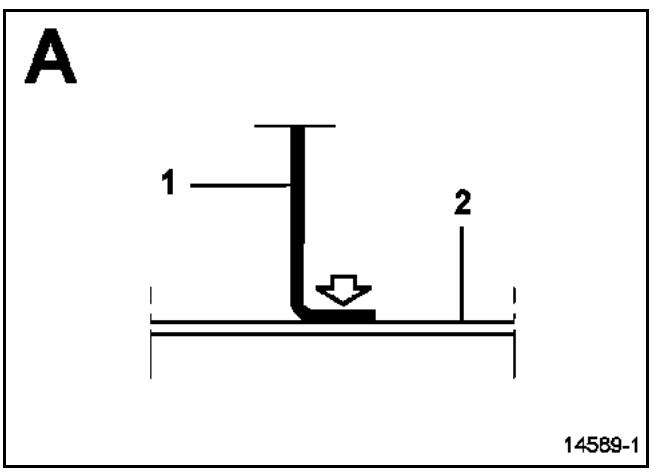
2	Front side member closure panel	1.5





GETtheMANUALS.org

The replacement of this part is a complementary operation to the replacement of the front upper cross member following a frontal impact.

Cas n° ① (see the introduction to **Section 40A-C: Description of parts**).

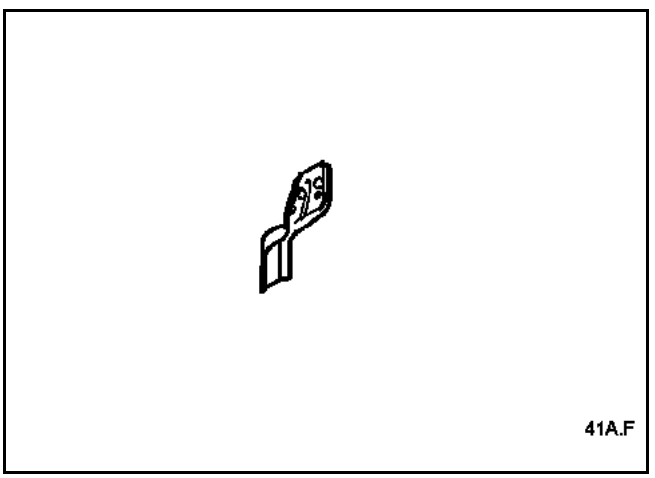
In the procedure described below, you will only find the descriptions and the joints which are specific to the part concerned.

The front upper cross member must be used for positioning the part.

The information on the additional parts will be dealt with in their respective sections (refer to contents).

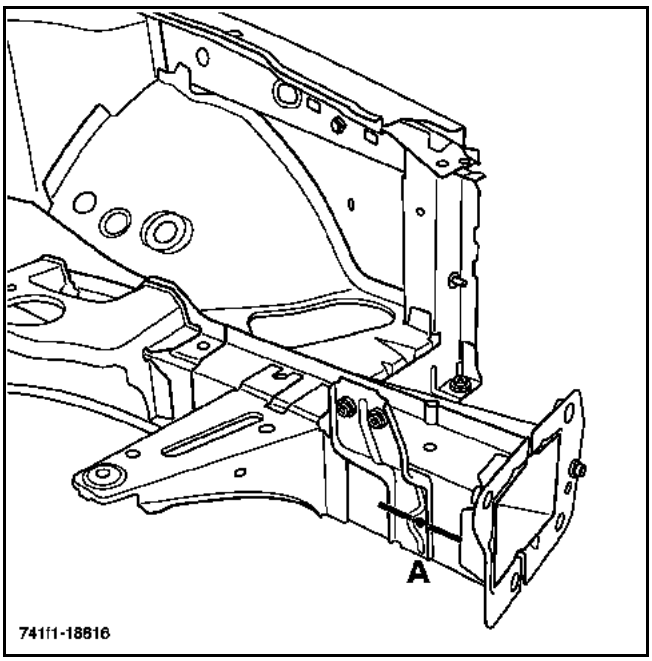
COMPOSITION OF THE REPLACEMENT PART

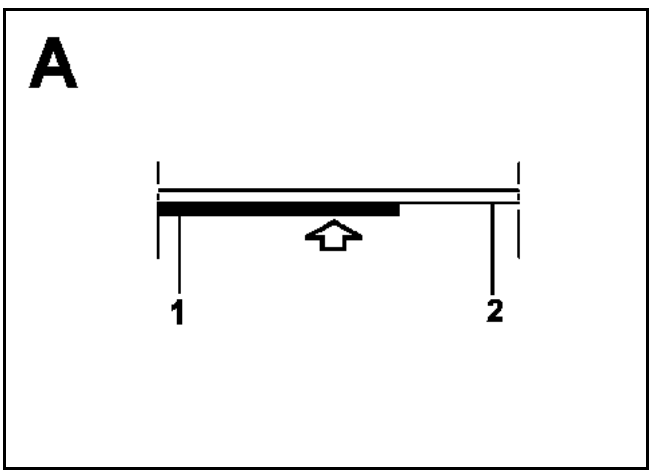
Part supplied on its own.



PARTS CONCERNED (thickness in mm):

1	Front upper cross member mounting element	1.5
2	Front side member	2





GETtheMANUALS.org

The replacement of this part is a complementary operation to the replacement of the front side member following a frontal impact.

Cas n° ① (see the introduction to **Section 40A-C: Description of parts**).

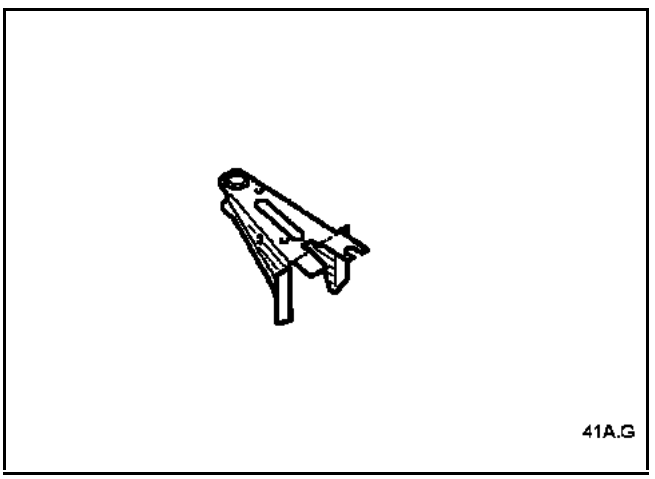
In the procedure described below, you will only find the descriptions and the joints which are specific to the part concerned.

The battery tray can be used as a template for positioning the part.

The information on the additional parts will be dealt with in their respective sections (refer to contents).

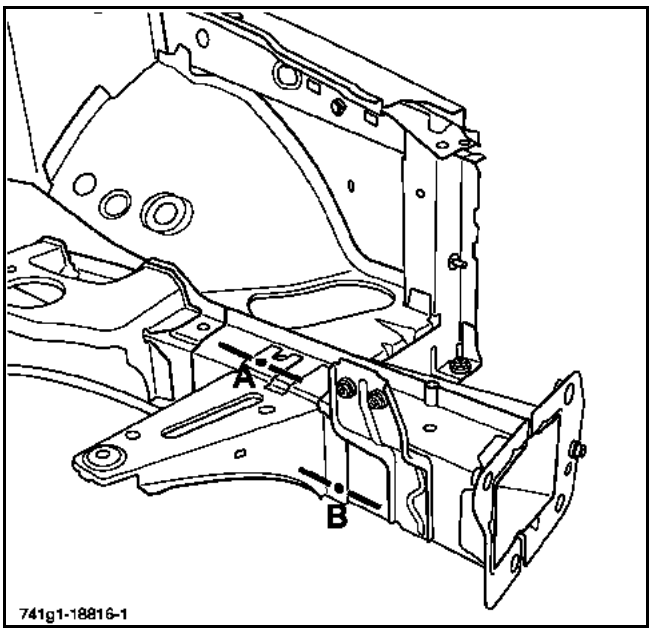
COMPOSITION OF THE REPLACEMENT PART

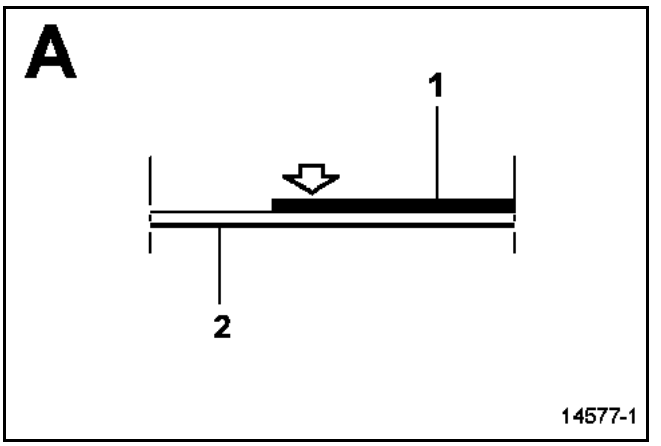
Part supplied on its own.

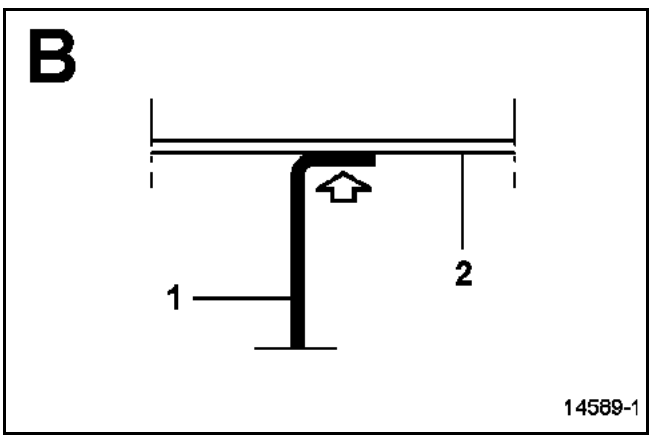


PARTS CONCERNED (thickness in mm):

1	Battery tray support	1.5
2	Front side member	2







GETtheMANUALS.org

The replacement of this part is a complementary operation to the replacement of the front end cross member mounting reinforcement and the wheel arch, front section, following a frontal impact.

Cas n° ① (see the introduction to **Section 40A-C: Description of parts**).

In the procedure described below, you will only find the descriptions and the joints which are specific to the part concerned.

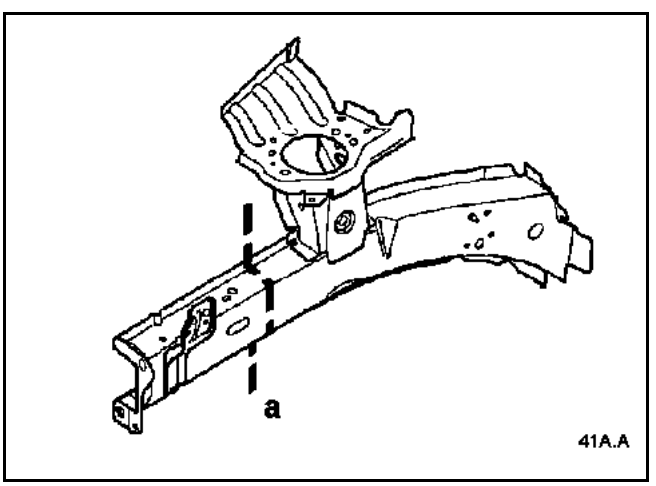
The information on the additional parts will be dealt with in their respective sections (refer to contents).

This operation can be carried out in two possible ways:
– partially, using cut (a),
– or complete.

The body jig bench must be used.

COMPOSITION OF THE REPLACEMENT PART

Part assembled with:
Side member reinforcement
Engine mounting
Cross member support
Gearbox mounting (LH side)
Battery support (LH side)
Inner reinforcement
Impact arm
Sub-frame mounting spacer
Centring device
Captive nut



PARTS CONCERNED (thickness in mm):

1	Front side member	1.8
2	Side member reinforcement	2
3	Engine mounting	2.5
4	Wheel arch, front section	0.8
5	Scuttle side panel	1.2/2
6	Wheel arch	2
7	Engine support reinforcement	1.5
8	Side member closure panel	1.5/2.5
9	Front side member, central section	4
10	Wheel arch, rear section	1
11	Central floor, side section	1.2/0.8
12	Tunnel stiffener	1.2
13	Front side cross member	1.5

GETtheMANUALS.org

GETtheMANUALS.org

GETtheMANUALS.org

The replacement of this part is a basic operation for a side impact.

It is part of case no. ② (see the introduction to **Section 40A-C: Description of parts**).

In the procedure described below, you will find only the descriptions and the connections which are specific to the part concerned.

The information on the additional parts will be dealt with in their respective sections (refer to contents).

To perform this operation, the lower expanding insert must also be ordered.

Replacement is made using cuts (a, b, and c).

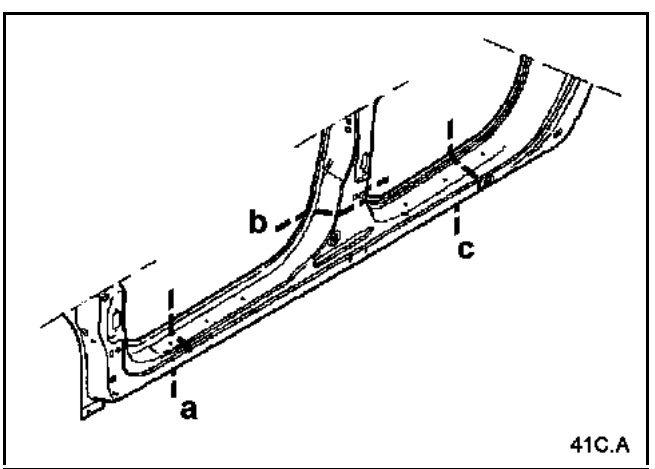
The positions of the cuts given in the procedure can be modified according to the severity of impact.

In the Method of a replacement under the front door, it is possible to make cut (a) twice in zone **X1** (see example at the end).

NOTE:
Where spot welds cannot be made with the spot welder, they can be replaced by plug welds.

COMPOSITION OF THE REPLACEMENT PART

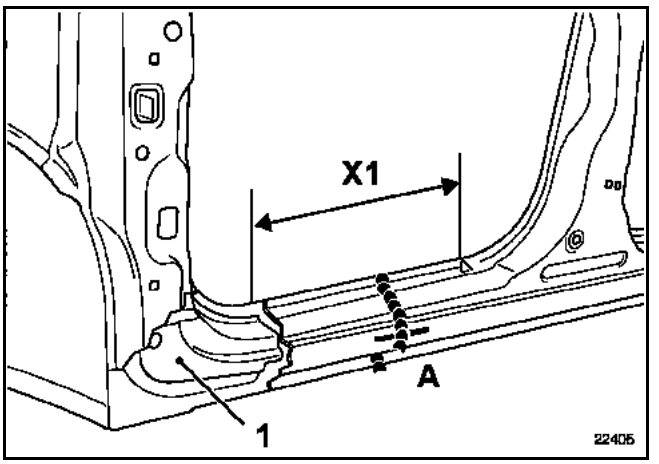
Part assembled with weld stud.

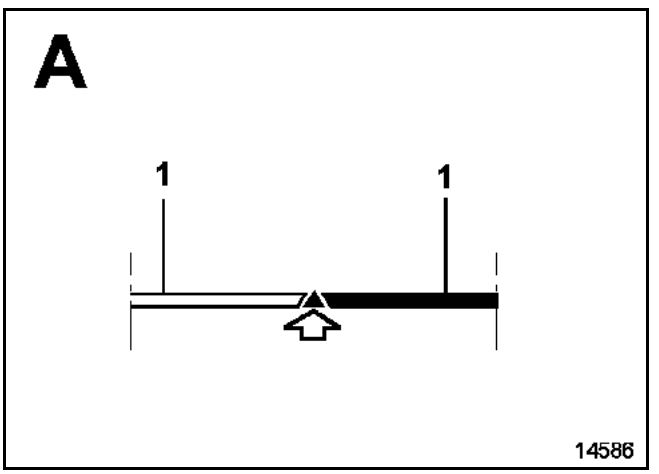


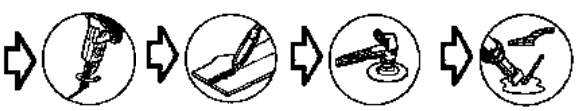
PARTS CONCERNED (thickness in mm):

1 Sill panel 0.9

Replacement using cuts (a, b and c)



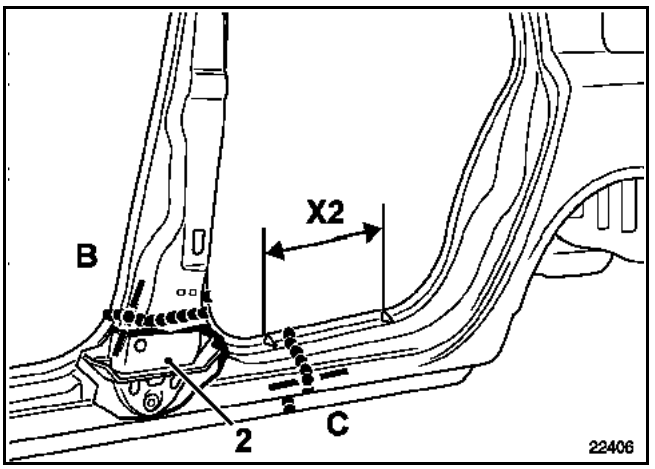


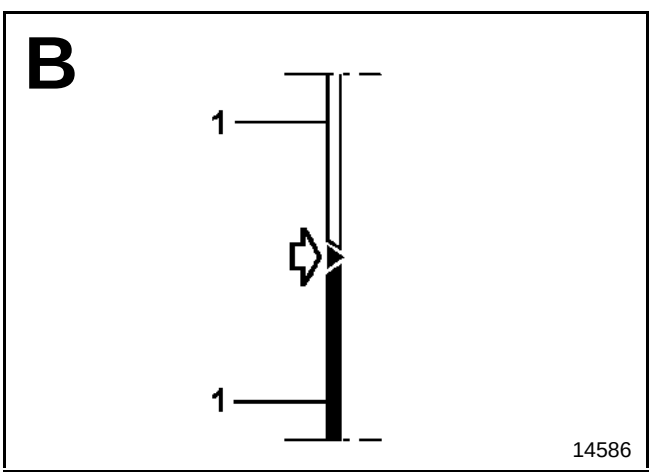


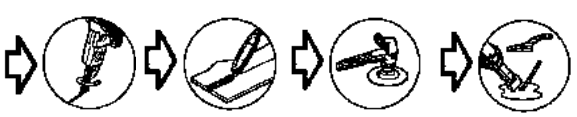
NOTE:
It is advisable to make the cut in zone **X1** if possible (zone not visible).

IMPORTANT:
It is possible to make the cut level with the A-pillar or underneath the hinge; in this case, be careful to **protect the pillar stiffener (1)**.

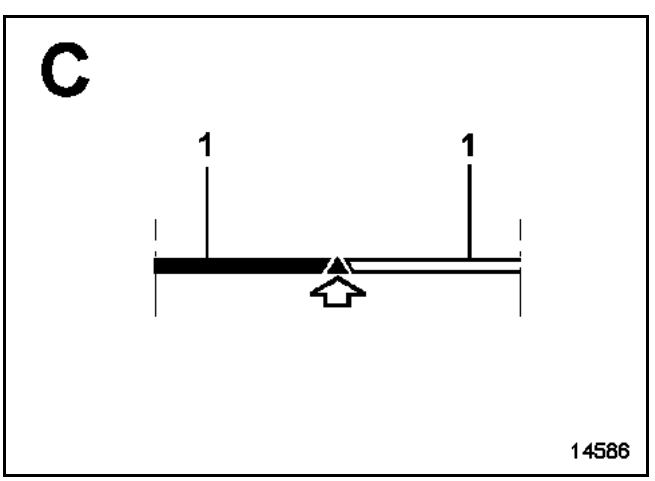
GETtheMANUALS.org







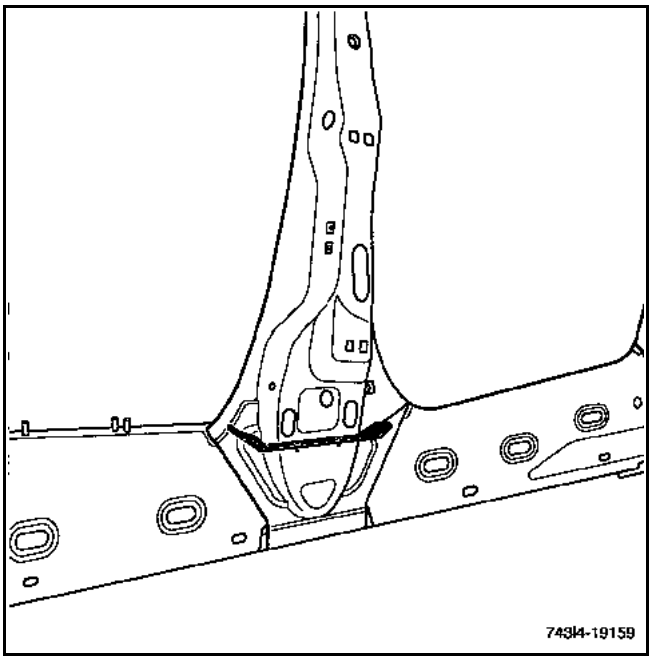
NOTE:
When performing the cutting operation, protect the B-pillar stiffener (2).



NOTE:
it is advisable to make cut C in zone **X2** if possible (zone not visible).

Depending on the severity of the impact, it is possible to make a cut at the bottom of the rear wing panel.

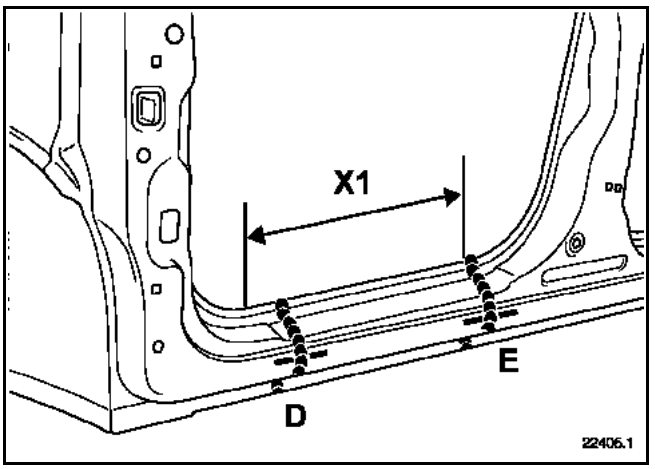
GETtheMANUALS.org

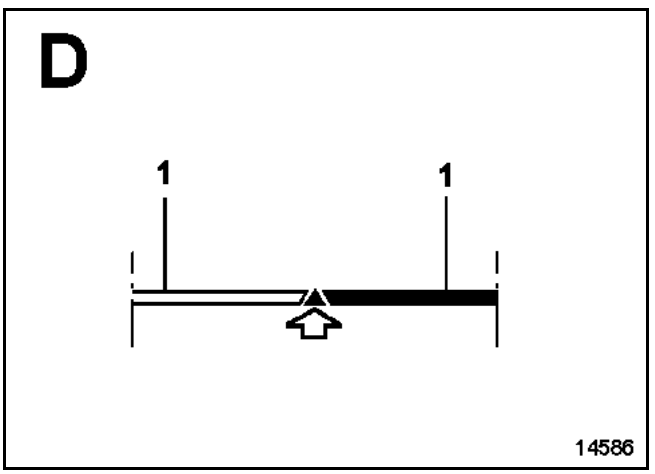


REMINDER:
It is essential to replace the expanding insert (see procedure described in **Section 43A-A A-pillar**).

GETtheMANUALS.org

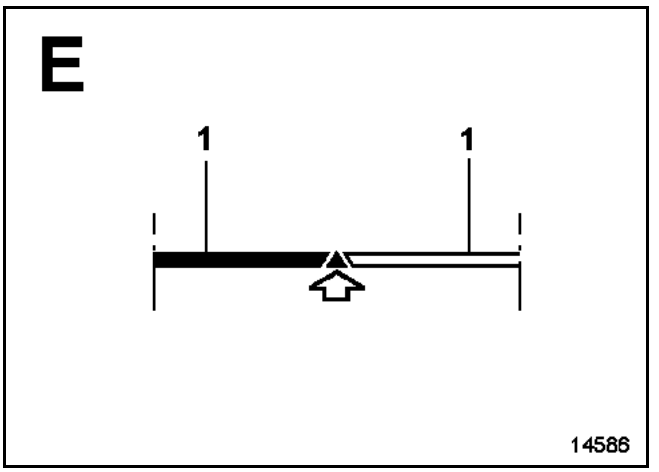
Partial replacement under front door





NOTE:
If the impact is very localised, it is possible to carry out a partial replacement in zone **X1**.

This procedure can also be applied underneath the rear side door.



GETtheMANUALS.org

The replacement of this part is an additional operation to the replacement of the sill panel following a side impact.

Cas n° ① (see the introduction to **section 40A-C: Description of parts**).

In the procedure described below, you will only find the descriptions and the joints which are specific to the part concerned.

The information on the additional parts will be dealt with in their respective sections (refer to contents).

This operation can be carried out in three possible ways:
– using cut (a).
– using cut (b),
– or complete.

NOTE:
– For the partial front operation, the lower expanding insert must also be ordered.
– For the partial rear operation, the wheel arch lower extension must be removed.
– There is no specific procedure for complete replacement, the connections are all made in the same way as originally.

It is part of case no. ② (see the introduction to **Section 40A-C: Description of parts**).

In the procedure described below, you will only find the descriptions and the joints which are specific to the part concerned.

Where spot welds cannot be made with the spot welder, they can be replaced by plug welds.

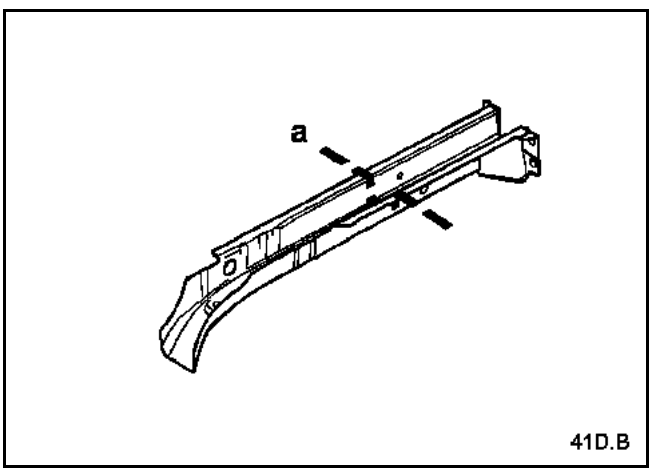
The information on the additional parts will be dealt with in their respective sections (refer to contents).

This operation is carried out using cut (a).

The body jig bench must be used.

COMPOSITION OF THE REPLACEMENT PART

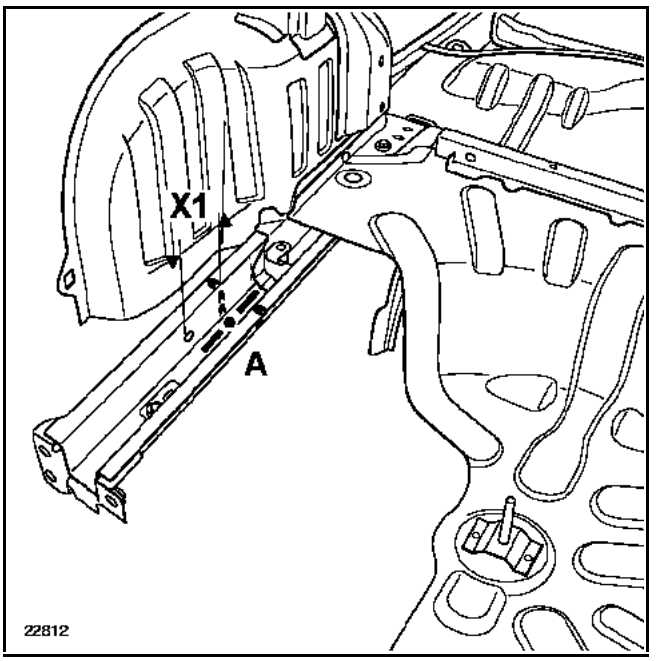
Part assembled with:
Side member bracket
Sleeve
Reinforcement plate
Crimped nut

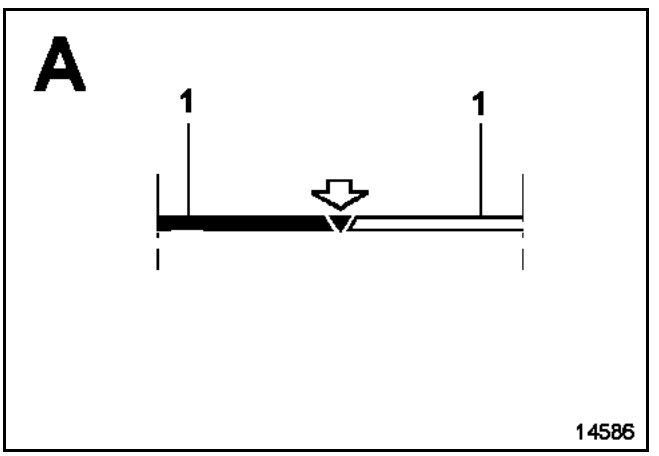


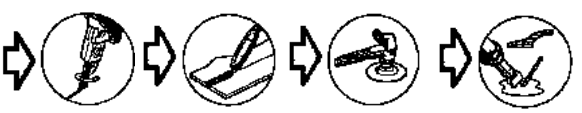
PARTS CONCERNED (thickness in mm):

1 Rear side member, rear section 1.8

Replacement using cut a







X1: 105 mm

IMPORTANT:
the cut is made in the zone between the side member reinforcement and the pilot hole.
Use dimension **X1** to locate the middle of this zone.

GETtheMANUALS.org

The replacement of this part is a complementary operation to the replacement of the rear section of the rear floor following a rear impact. It is part of case no. ② (see the introduction to **Section 40A-C: Description of parts**).

In the procedure described below, you will only find the descriptions and the joints which are specific to the part concerned.

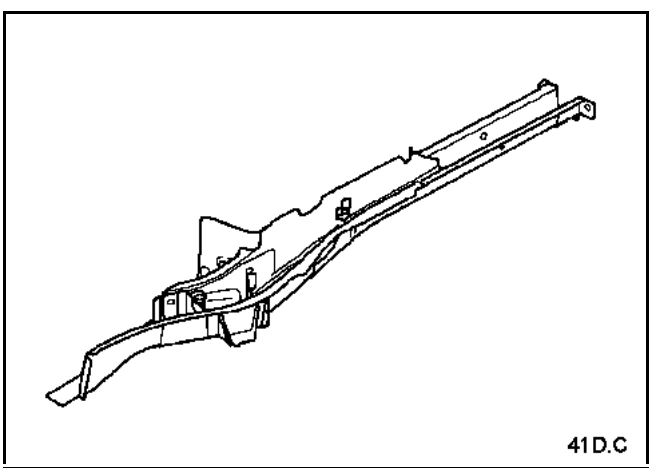
The information on the additional parts will be dealt with in their respective sections (refer to contents).

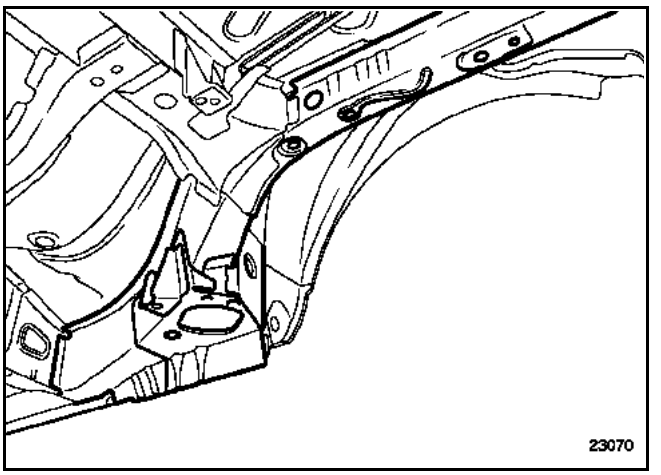
The body jig bench must be used.

NOTE: where welds cannot be made by the spot welder, they can be replaced by plugs.

COMPOSITION OF THE REPLACEMENT PART

Part assembled with:
Side reinforcement
Mounting spacer
Inner reinforcement
Rear side cross member
Front spacer
Spacer reinforcements
Rear spacer
Mounting connecting arch
Outer reinforcement
Axle assembly mounting unit
Side member bracket
Sleeve
Reinforcement plate
Crimped nut





GETtheMANUALS.org

The replacement of this part is an operation linked to the replacement of a rear side member for a rear impact and the rear floor, front section following a rear side impact.

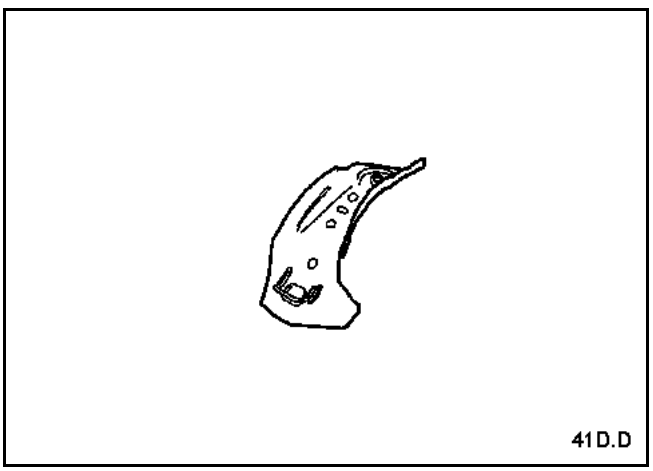
It is part of case n° ① (see the introduction to **Section 40A-C: Description of parts**).

In the procedure described below, you will only find the descriptions and the joints which are specific to the part concerned.

The information on the additional parts will be dealt with in their respective sections (refer to contents).

COMPOSITION OF THE REPLACEMENT PART

Part assembled with:
Exterior hook
Seatback frame mounting reinforcement
Welded nuts



PARTS CONCERNED (thickness in mm):

1	Front section of rear side member closure panel	1.5
2	Rear floor rear section	0.8
3	Inner rear wheel arch	0.8
4	Rear floor, front section	0.7
5	Rear side member	1.8
6	Rear floor centre cross member	1.2

GETtheMANUALS.org

The replacement of this part is a complementary operation to the replacement of the sill panel closure panel or the inner wheel arch following a rear side impact.

It is part of case n° ② (see the introduction to **Section 40A-C: Description of parts**).

In the procedure described below, you will only find the descriptions and the joints which are specific to the part concerned.

The information on the additional parts will be dealt with in their respective sections (refer to contents).

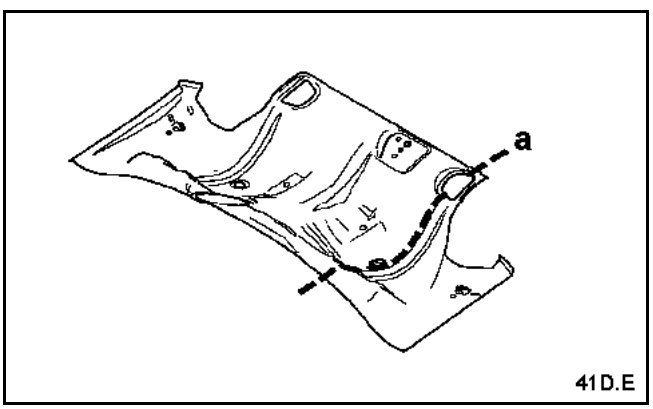
This operation may be carried out in two ways (refer to the procedure below):
– using cut (a),
– or complete.

NOTE:
To perform this operation, it is essential to remove the side closure panel of the rear side member, which must then also be ordered.

For a replacement along cut (a) which is performed by overlapping panels, the number of plug welds is not specified in the procedure.
A distance of approximately **60 mm** must be used between the welds.

COMPOSITION OF THE REPLACEMENT PART

Part assembled with:
Reinforcements
Interior hook



PARTS CONCERNED (thickness in mm):

1	Rear floor, front section	0.7
2	Rear floor front cross member	1.2
3	Rear floor front cross member closure panel	1
4	Rear side member	1.8

GETtheMANUALS.org

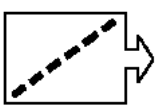
on replacement part



on the vehicle

GETtheMANUALS.org

The replacement of the cross member under the rear floor is a complementary operation to the rear side member for a rear impact or the rear floor, front section for a rear side impact.

It is part of case no. ② (see the introduction to **Section 40A-C: Description of parts**).

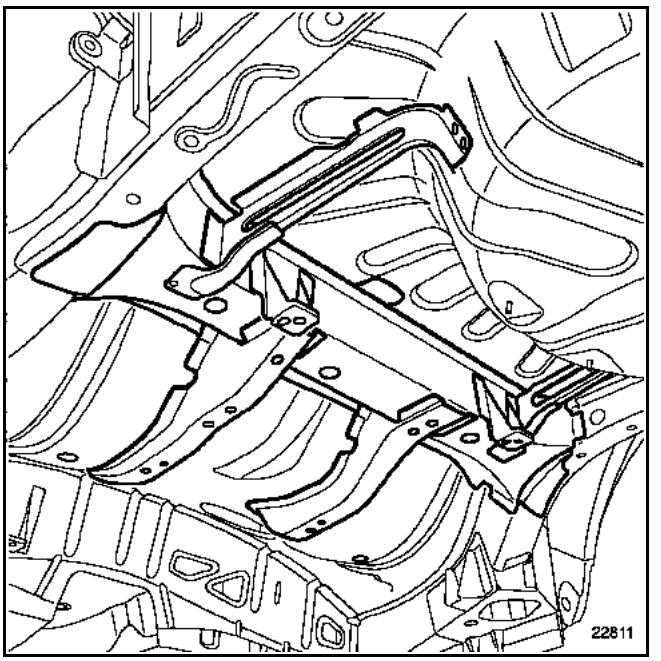
The information on the additional parts will be dealt with in their respective sections (refer to contents).

NOTE: this operation presents no particular difficulties.

You will find one or more diagrams of the part either on the vehicle or removed from it in the procedure for your information.

Where spot welds cannot be made with the spot welder, they can be replaced by plug welds.

The body jig bench must be used.



COMPOSITION OF THE REPLACEMENT PART

Part assembled with:
Cross member
Acoustic angle bracket
Mounting support
Crimped nut
Central reinforcement
Seatback mounting reinforcement
Welded nut
Spacers
Reinforcement plates

GETtheMANUALS.org

The replacement of the rear floor unit is a complementary operation to the rear end panel for a rear impact or the inner wheel arch for a rear side impact.

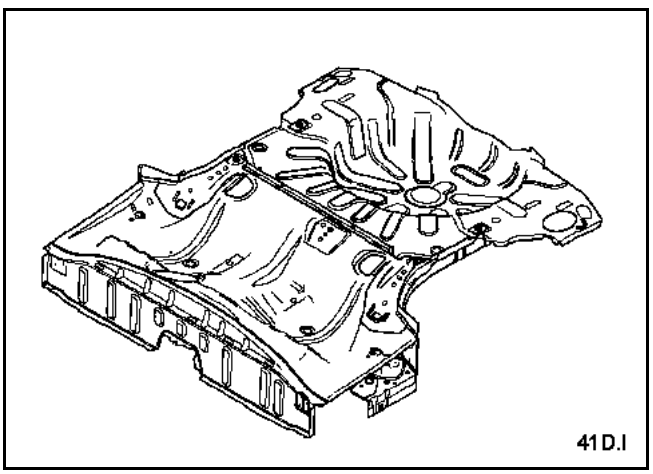
It is part of case no. ② (see the introduction to **Section 40A-C: Description of parts**).

The information on the additional parts will be dealt with in their respective sections (refer to contents).

The body jig bench must be used.

COMPOSITION OF THE REPLACEMENT PART

Part assembled with:
Complete rear floor
Rear floor, complete front section
Complete side members
Complete cross member and closure panel



GETtheMANUALS.org

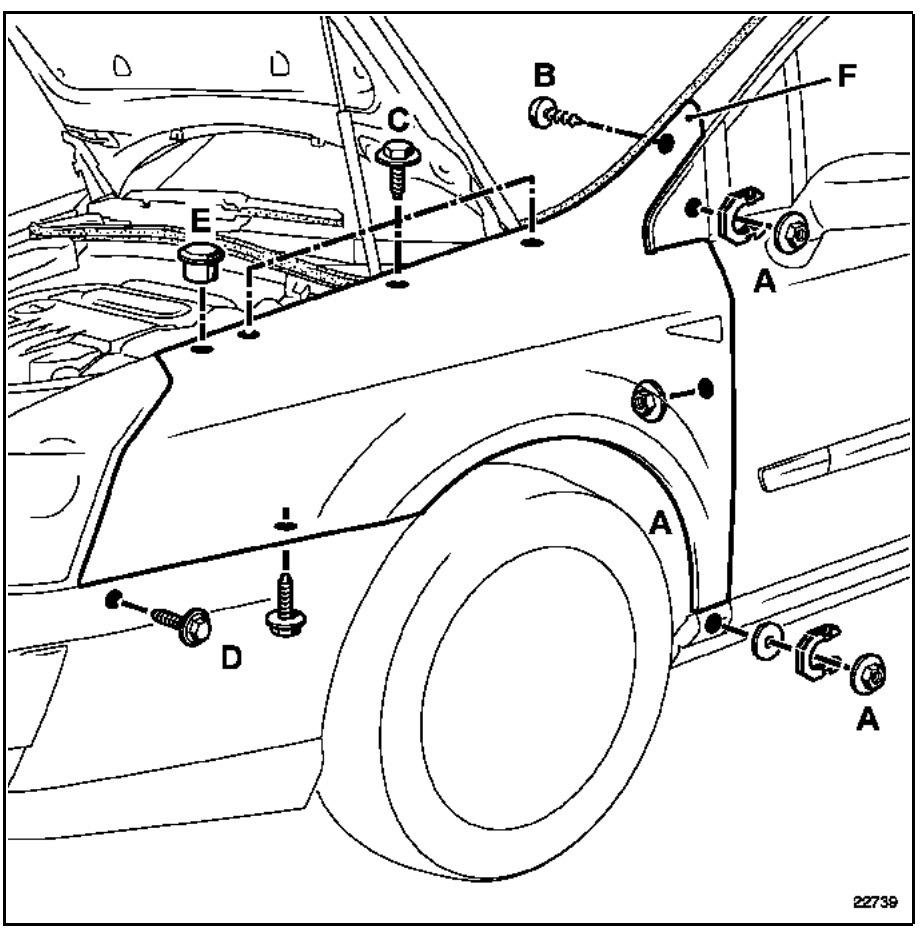
The replacement of this part is a basic operation after a frontal and side collision. Information on additional parts or stripping parts will be dealt with in the appropriate sections.

It is a detachable bodywork component made from a sheet moulded polyester compound (SMC).

NOTE: The removal/refitting operations present no particular problems, only the adjustment options are described in the procedure.
All the clearances are shown in **section 40A-E**.

REPAIR

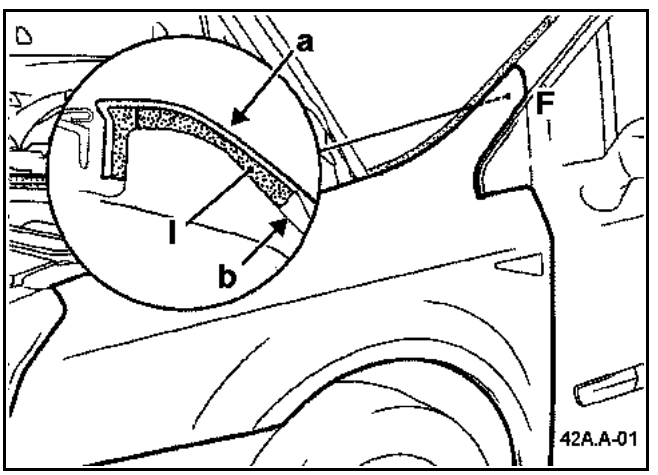
To repair this component refer to the Workshop Repair Manual **502**.



GETtheMANUALS.org

NOTE:
To access the wing mountings it is first necessary to remove:
– the scuttle grille side section,
– the engine side cowling,
– the A-pillar trim,
– the upper wing trim,
– the wheel arch liner,
– the front section of the sill panel protector,
– the side mounted indicator,
– the front bumper,
– the headlight unit.

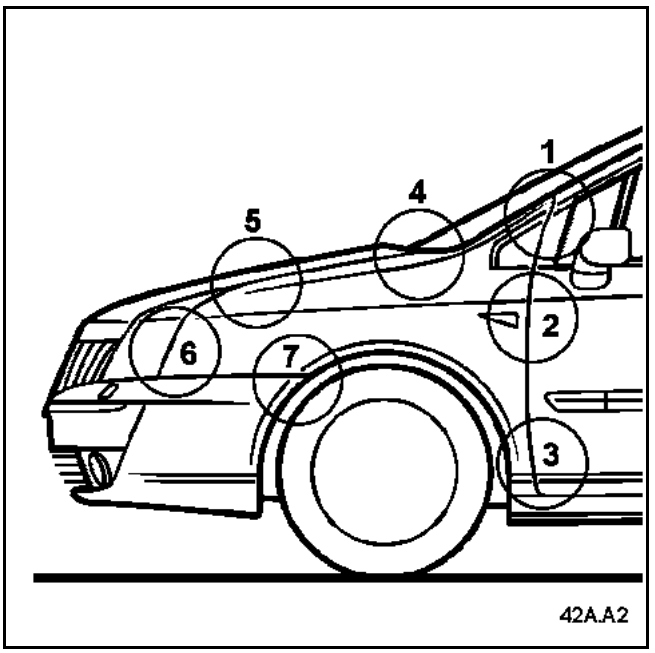
WARNING: after refitting the wing, it is essential to replace the original mastic bead located on the upper section (F), with the special foam blanking cover (I) after-sales part no.: **82 00 218 945.**



a: front wing
b: scuttle side panel upper rear stiffener

GETtheMANUALS.org

ADJUSTMENT



Fit the interior mounting pressure piece (G) and all the clips onto the wing.
Position the wing on the vehicle.
Finger tighten all the attachments.

REMINDER: All the clearances and flush fitting positions are listed in **section 40A-E**.

Adjust in the following sequence:

1. **Wing - Door adjustment**
   Ensure the clearances and flush fitting of areas 2 and 3 by aligning the wing stop with the door (nuts A).
   Check the adjustment and clamp the area.

2. **Wing - A-pillar adjustment:**
   Ensure the clearances and flush fitting of area 1 (bolt B).
   Check the adjustment and clamp the area.

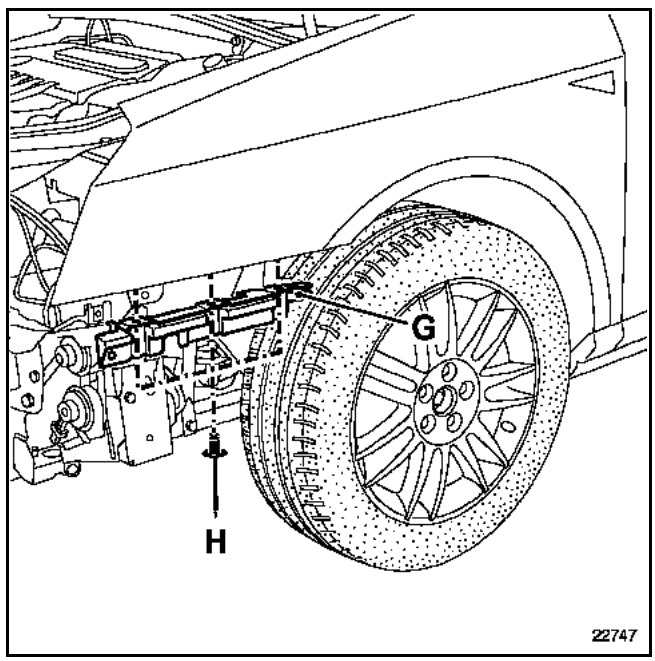
3. **Wing - Bonnet adjustment:**
   Check the flush fitting and a regular clearance of areas 4 and 5 (bolt C), if necessary modify the bonnet adjustment
   Fit the front upper cross member indexing dowel (E).
   Check the adjustment and clamp the area.

4. **Wing - Headlight - Bumper adjustment:**
   Check the play and flush fitting of areas 6 and 7 (bolt D).

Change the light unit setting if necessary.

NOTE: the bumper cannot be adjusted, it is fitted into the lower wing pressure piece.

Replacing the lower pressure piece



NOTE: If the bumper has suffered an impact it is possible to just replace the pressure piece (G) which is available from the Parts Department.
The pressure piece can be replaced with the front wing in position on the vehicle. It is essential to use special rivets (H) part no: **77 01 054 372.**

GETtheMANUALS.org

Replacing this part is a supplementary operation to changing a wing or front bumper after a frontal collision.

It is included in case no. ② (see the introduction to **section 40A-C Description of parts**).

The information on the additional parts will be dealt with in the corresponding sections (refer to contents).

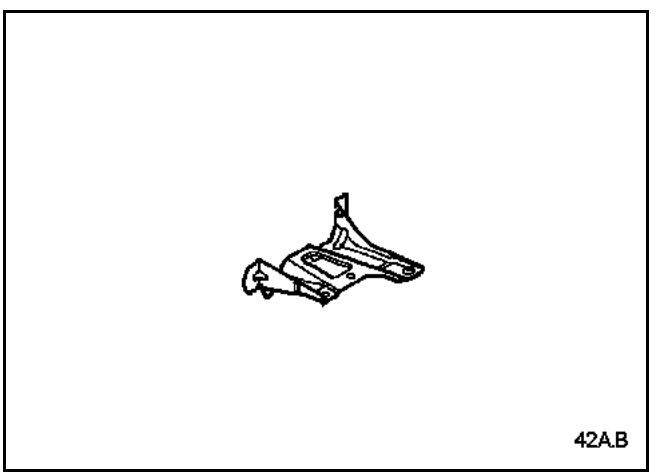
NOTE: this operation presents no particular difficulties.

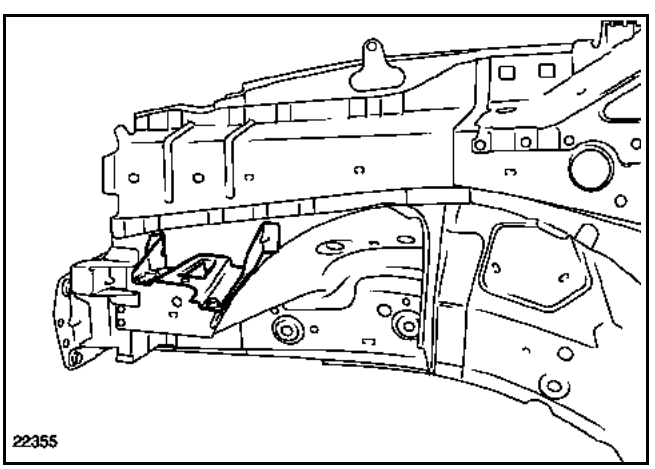
You will find in the procedure one or more drawings showing the part either on the vehicle or offset.

Where spot welds cannot be made with the spot welder, they can be replaced by plug welds.

STRUCTURE OF THE REPLACEMENT PART

Part assembled with crimped screw.





NOTE: to correctly position the replacement part it is advisable to use the marks left by the removed part. If not, carry out clean mounting of the bumper and wing.

GETtheMANUALS.org

The replacement of this part is a supplementary operation after a frontal impact

It is a removable bodywork component.

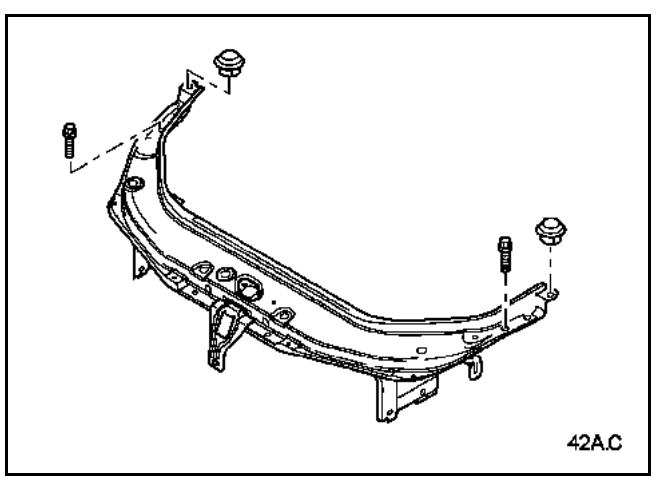
It is included in case no. ② (see introduction to **section 40A-C Description of parts**).

The information on the additional parts will be dealt with in the corresponding sections (refer to contents).

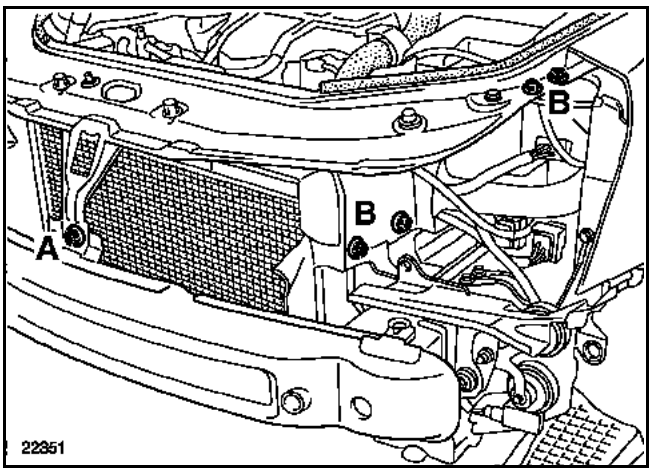
In the following operation, you will only find the positions of the mountings specific to the component.

STRUCTURE OF THE REPLACEMENT PART

Part assembled with:
Cross member supports
Hook retaining element
Support bracket
Mounting bridge pieces
Index bracket
Inviolability bracket
Crimped nuts



NOTE: to remove the front upper cross section, it is necessary:
- firstly to remove:
  - the front bumper,
  - the headlight units.
- and to disengage:
  - the bonnet catch,
  - the electrical wiring harnesses and the various parts attached to the cross member.



Removal/refitting is by way of central bolt (A) and the side mounting bolts (B).

GETtheMANUALS.org

Replacing this part is a supplementary operation to replacing the front wing and bumper after a frontal impact.

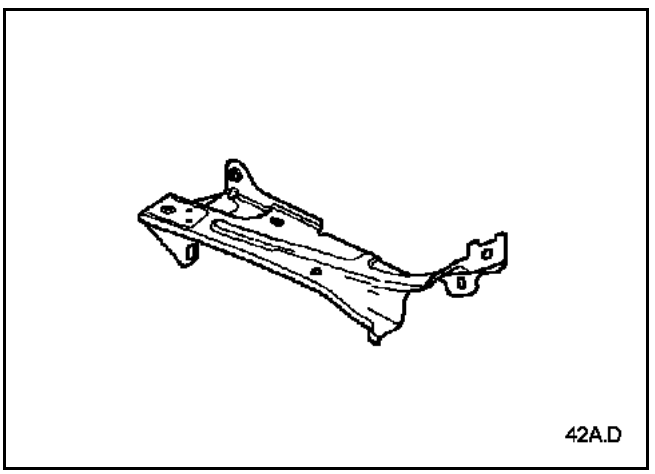
It is a removable bodywork component.

The information on the additional parts will be dealt with in the corresponding sections (refer to contents).

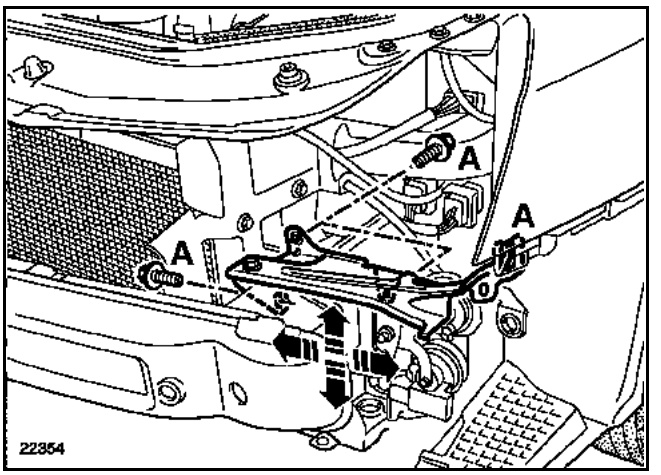
In the following operation, you will only find the mounting positions specific to that component and the adjustment options.

STRUCTURE OF THE REPLACEMENT PART

Part assembled with:
Crimped nuts
Mounting bracket



NOTE: to access the headlight carrier panel, the following needs to be removed first:
– the front bumper,
– the headlight unit.



Removal/refitting is by way of bolts (A).

Only side-to-side (**YO**) and height adjustments (**ZO**) are possible.

GETtheMANUALS.org

The replacement of the front section of this part is a basic operation for a frontal impact. The replacement of the rear section is a supplementary operation to replacing the A-pillar after a side impact.

The operation involves removing the scuttle side panel upper stiffeners.

In the following procedure, you will find only the descriptions and the joints which are specific to the part concerned.

The information on the additional parts will be dealt with in their corresponding sections (refer to contents).

The replacement can be carried out in two ways (refer to procedure below):
– complete removal, in addition to the A-pillar,
– along cut (a) in addition to the partial removal of the side scuttle panel upper stiffener.

NOTE: cut (a) cannot be offset (refer to the details in the procedure), if the damage goes beyond this area, it is necessary to replace the complete part.
Where spot welds cannot be made with the spot welder, they can be replaced by plug welds

STRUCTURE OF THE REPLACEMENT PART

Part assembled with:
Mounting bracket upper stiffener
Wing lower mounting component
Cross member support
Upper cross member mounting
Ball-joint mounting
Mounting bridge pieces
Wheel arch closure panel component
Control shaft
Cage
Tapped plate
Crimped nuts
Welded studs

②

NOTE: After welding, it is necessary to apply mastic bead in the flange (operation ②) to ensure the mounting face sealing and shape.
Use a M.J.Pro type mastic (**part no.: 77 11 172 676**).

GETtheMANUALS.org

The complete replacement of this part requires the removal of the side scuttle panel rear upper stiffener for a front side impact.

In the procedure described below, you will find only the descriptions and the joints which are specific to the part concerned.

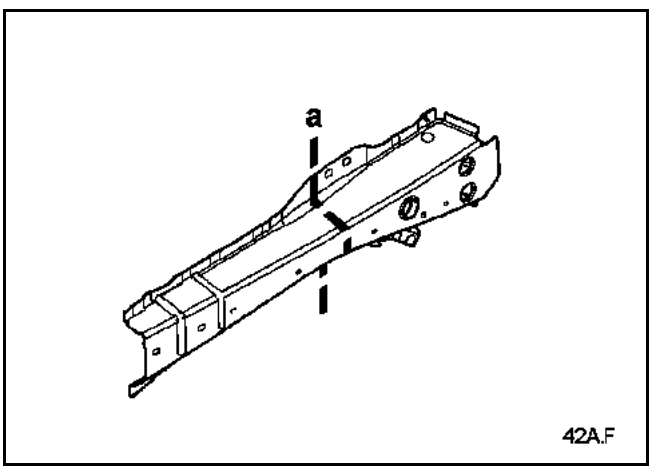
The information on the additional parts will be dealt with in the corresponding sections (refer to contents).

The replacement can be carried out in two ways (refer to procedure method below):
– complete removal, in addition to the scuttle side panel rear upper stiffener,
– along cut (a) additionally, avoiding the removal of the rear upper stiffener.

NOTE: where the welding spots cannot be accessed with the spot welder, they can be replaced by plug welds.

STRUCTURE OF THE REPLACEMENT PART

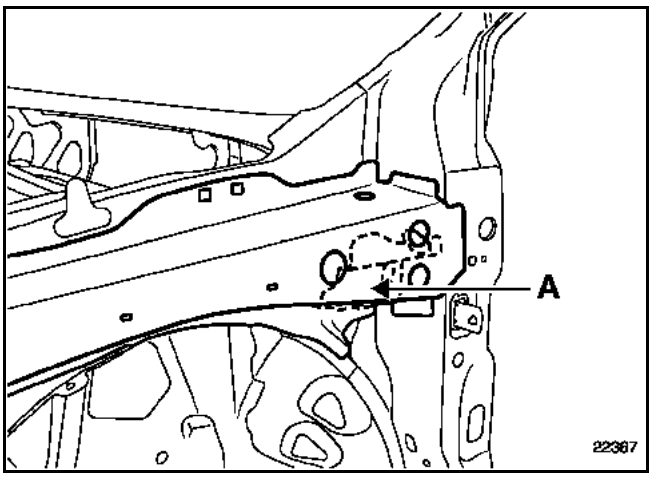
Part assembled with impact stiffener.



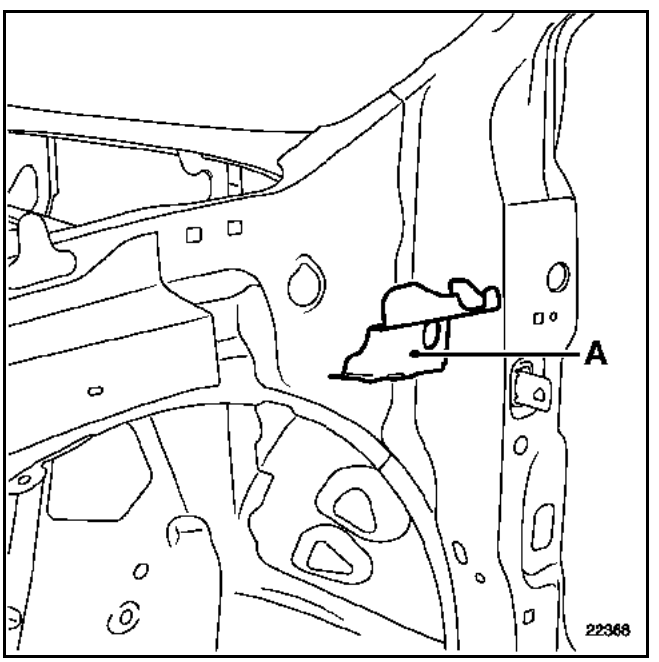
PARTS CONCERNED (thickness in mm):

1	Scuttle side panel upper stiffener	1.2
2	Impact stiffener	1.5

Complete replacement



ATTENTION: the two parts have to be disassembled to allow access to the impact stiffener spot welds (A) on the A-pillar.



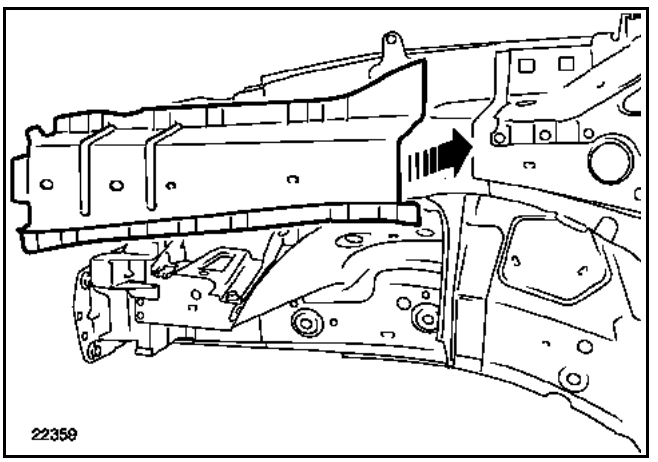
NOTE: In any event, it needs to be detached from the replacement part.

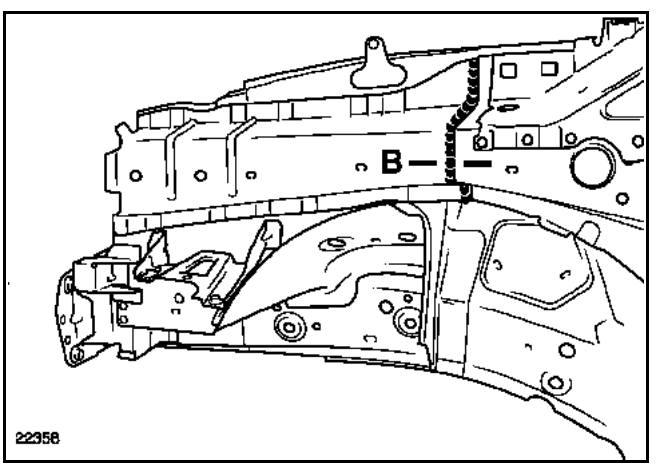
If the impact stiffener is not damaged, leave it on the vehicle.

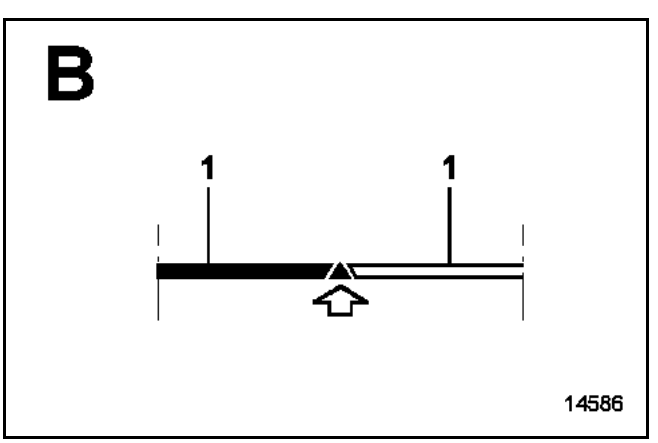
If it is damaged, plug weld the impact stiffener already removed from the replacement part assembly onto the pillar.

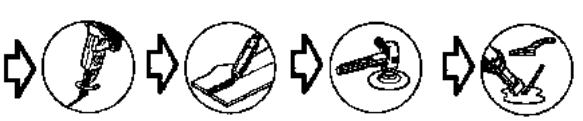
GETtheMANUALS.org

Replacing along cut (a)









GETtheMANUALS.org

Removal of this part is an operation associated with the replacement of the scuttle side panel upper stiffener after a front side impact.

The information on the additional parts will be dealt with in their corresponding sections (refer to contents).

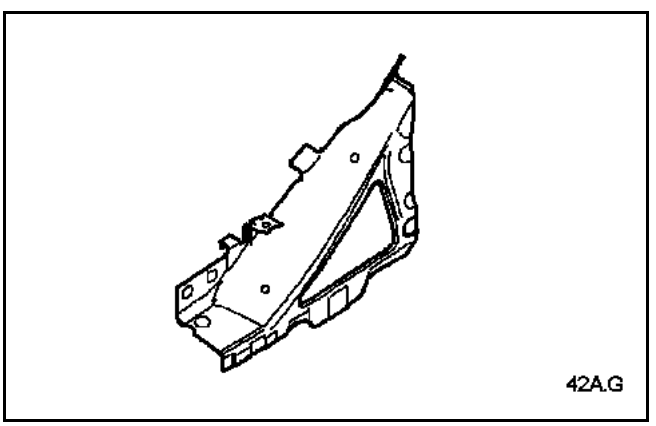
NOTE: this operation presents no particular difficulties.

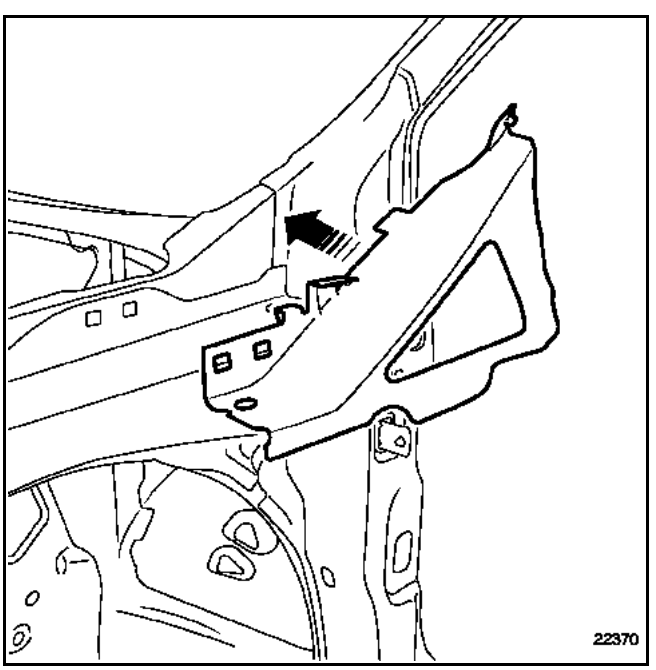
You will find one or more drawings of the part either on the vehicle or removed from it in the method for your information.

Where spot welds cannot be made with the spot welder, they can be replaced by plug welds.

STRUCTURE OF THE REPLACEMENT PART

Part supplied on its own.





GETtheMANUALS.org

The replacement of this part is supplementary operation to the replacement of a scuttle side panel for a side collision.

It is included in case no. ① (see the introduction to **section 40A-C Description of parts**).

Use M.J.Pro mastic (**part no.: 77 11 172 676**).

Then, in addition, perform a mastic atomisation (Mag). Pro (operation ③).

Use M.J.Pro mastic (**part no.: 77 11 172 679**).

GETtheMANUALS.org

The replacement of this part is a supplementary operation to the replacement of the A-pillar side panel after a front side impact.

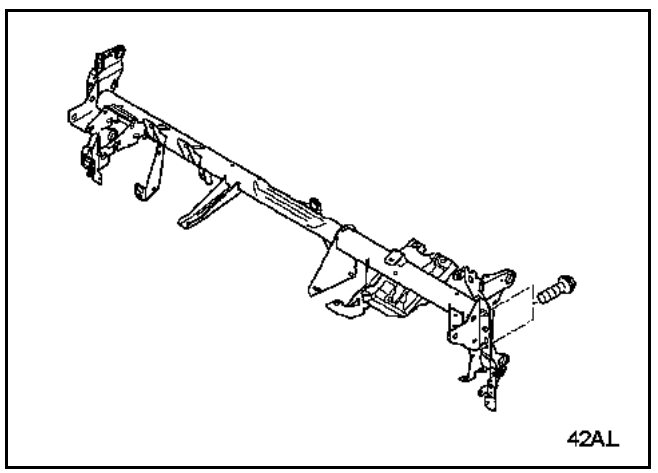
The information on the additional parts will be dealt with in their corresponding sections (refer to contents).

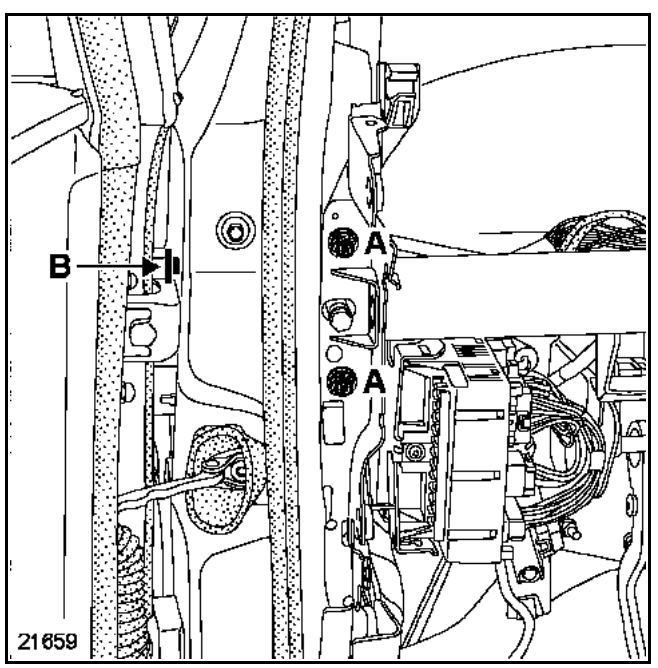
It is a removable bodywork component.

NOTE: this part can be used as a positioning template for the A-pillar with side scuttle panel.

STRUCTURE OF THE REPLACEMENT PART

Part supplied on its own.





Removal/refitting is by way of the bolts (A) and (B).

NOTE:
to access the mountings, it is first necessary to remove:
– the whole instrument panel,
– the front side door, to access the mounting bolts (B).
The mounting is located only on the driver's side.

TIGHTENING TORQUES (in daNm)	
Bolt A	**2.1**
Bolt B	**0.8**

GETtheMANUALS.org

The replacement of this part is linked to the removal of the steering column mounting.

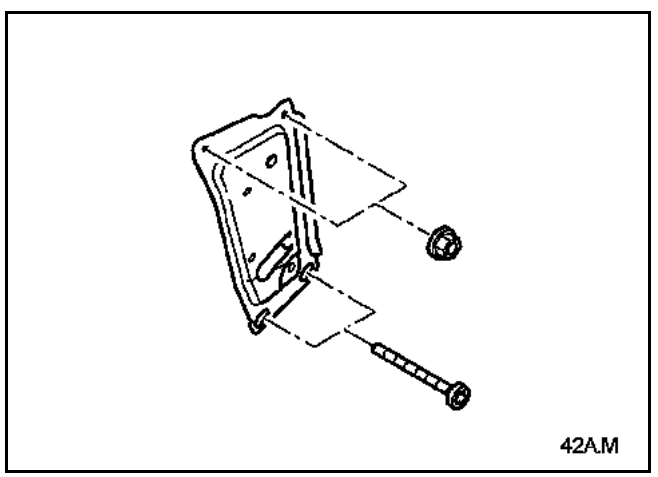
The information on the additional parts will be dealt with in the corresponding sections (refer to contents).

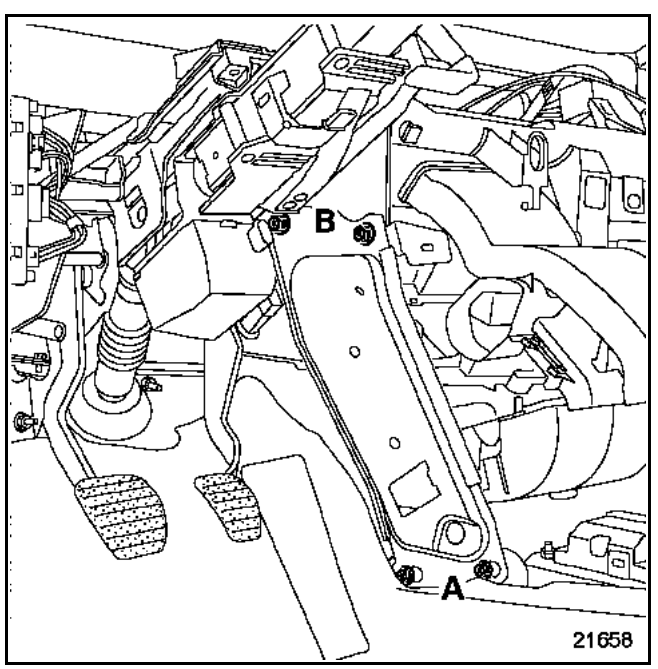
It is a removable bodywork component.

The removal of this part does not present any particular difficulties.

STRUCTURE OF THE REPLACEMENT PART

Part is supplied on its own.





Removal/refitting is by way of two bolts (A) and two nuts (B).

NOTE: to access the mountings, the instrument panel needs to be partially removed beforehand.

GETtheMANUALS.org

The replacement of this part is a supplementary operation to the replacement of the front wheel arch rear section after a side impact.

The information on the additional parts will be dealt with in their corresponding sections (refer to contents).

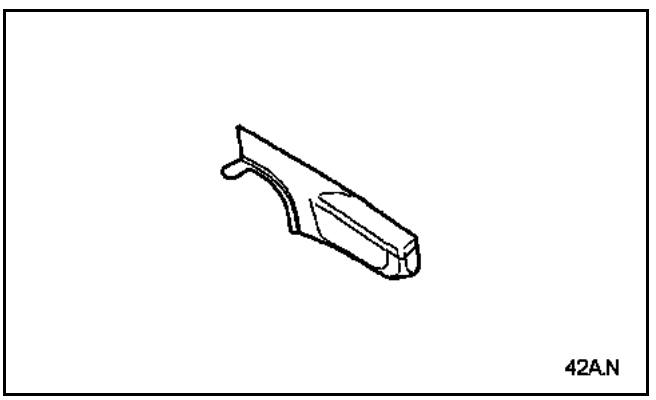
NOTE: this operation presents no particular difficulties.

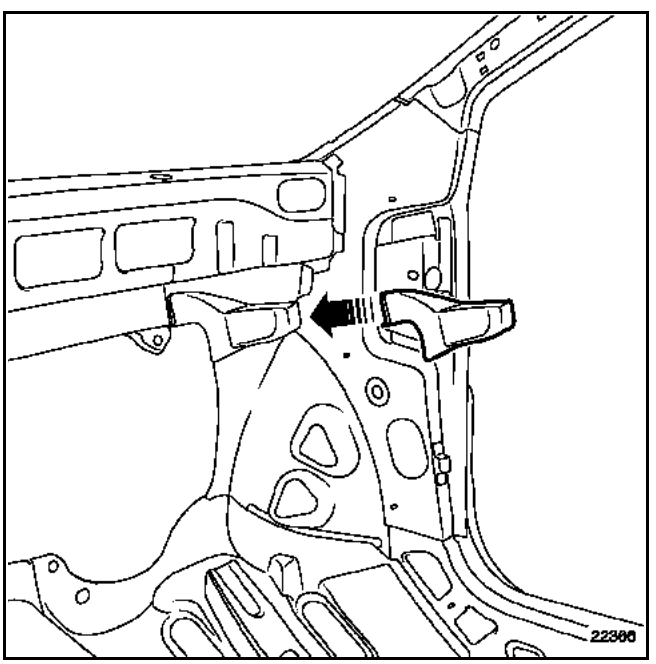
You will find one or more drawings of the part either on the vehicle or removed from it in the method for your information.

Where spot welds cannot be made with the spot welder, they can be replaced by plug welds.

STRUCTURE OF THE REPLACEMENT PART

Part supplied on its own.





GETtheMANUALS.org

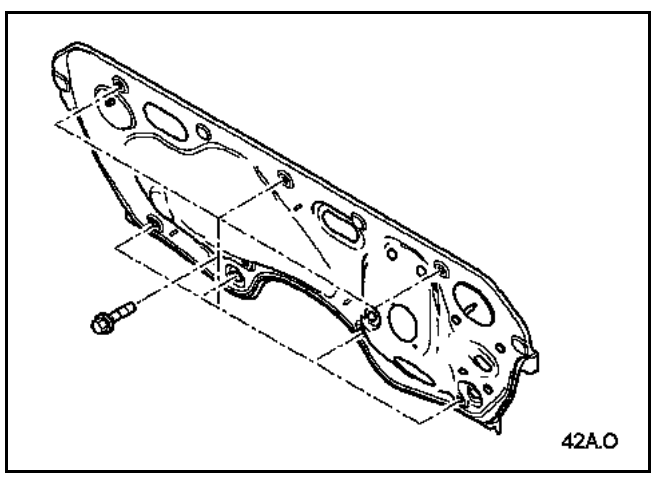
The removal/refitting of this part is an operation linked to the replacement of the complete body structure. It is included in case no. ② (see the introduction to **section 40A-C Description of parts**).

The information on the additional parts will be dealt with in the corresponding sections (refer to contents).

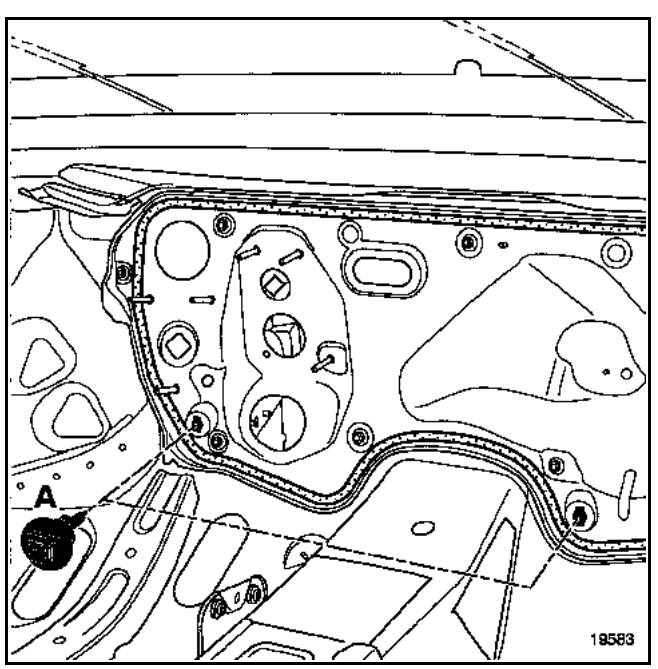
It is a structural component which is bonded and bolted.

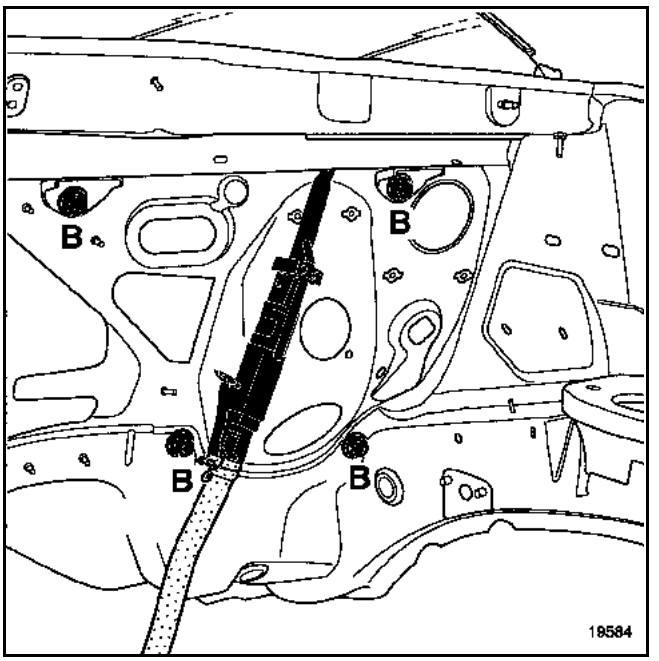
STRUCTURE OF THE REPLACEMENT PART

Part supplied on its own.



REMOVAL





Remove:
– the two indexing clips (A),
– the mounting bolt (B).

Cut through the cement bead with the pneumatic tool (refer to **Technical Note 414A**).

NOTE: Cutting the bond can be difficult due to the shape of the surrounding components.

REFITTING

To refit, the bonding method is the same as replacing the windscreen (refer to **Technical Note 371A**).

Refit:
– the mounting bolts (A),
– the two indexing clips (B).

GETtheMANUALS.org

The replacement of this part is a basic operation for a side impact.

In the procedure described below, you will find only the descriptions and the joints which are specific to the part concerned.

The information on the additional parts will be dealt with in their corresponding sections (refer to contents).

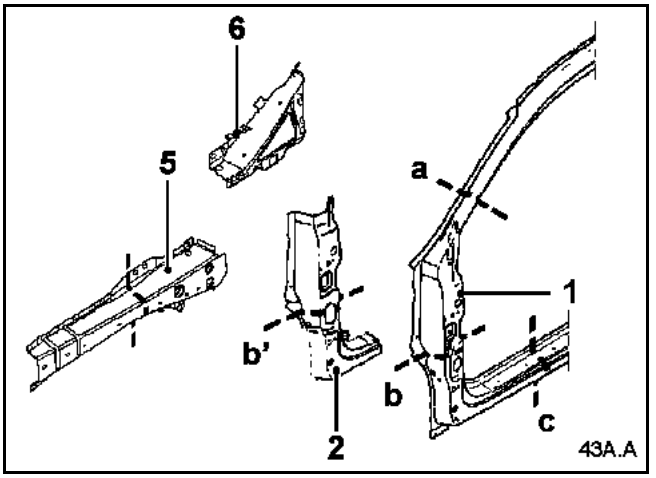
To perform this operation, the following must also be ordered:
– the two scuttle side panel upper reinforcements (5 and 6),
– the lower expanding insert,
– the A-pillar reinforcement (only for cuts b-c).

Replacement can be made following two methods:
– along cuts (a and c),
– along cuts (a and b) or (b and c), cut (b and b') is made offset under the upper door hinge.

IMPORTANT: the positions of the cuts given in the methods cannot be offset, they are determined according to the positions of the linings and reinforcements, except for cut (c) which can be offset along the deformation caused by impact.

COMPOSITION OF THE REPLACEMENT PART

Part assembled with:
Pillar upper reinforcement
Welded studs
Welded pins.
Welded bolts
Crimped nuts
Pillar reinforcement
Hinge reinforcements
Hinge mounting plate
Hinge mounting cage
Door stop reinforcement



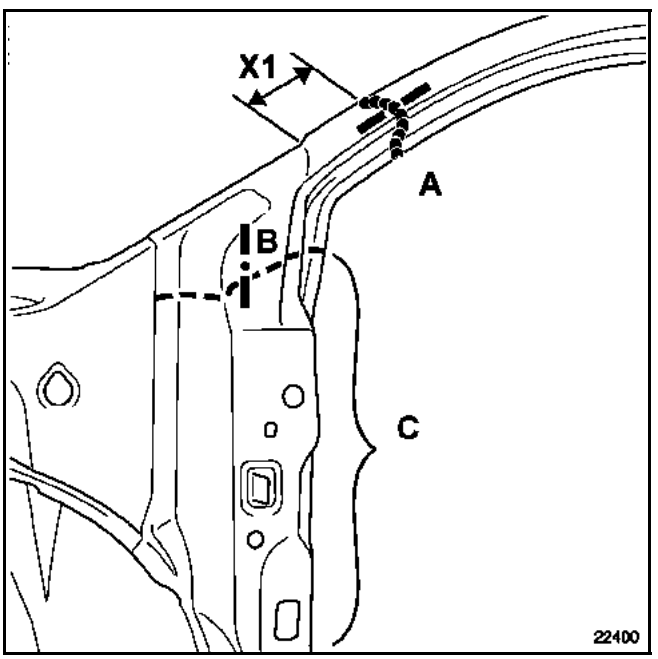
PARTS CONCERNED (thickness in mm):

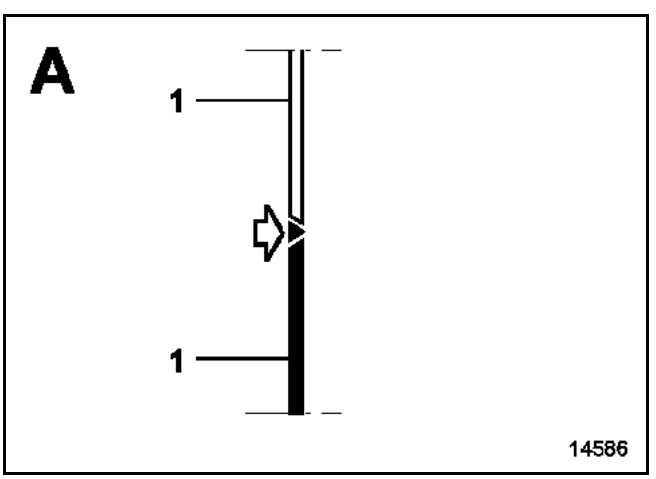
1	A-pillar	0.8
2	Pillar reinforcement	1
3	Windscreen aperture pillar lining reinforcement	1.2
4	Lower hinge reinforcement	1.5
5	Scuttle side panel upper reinforcement	1.2
6	Scuttle side panel upper rear reinforcement	1

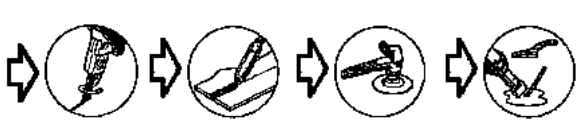
GETtheMANUALS.org

Replacement using cuts (a and c)

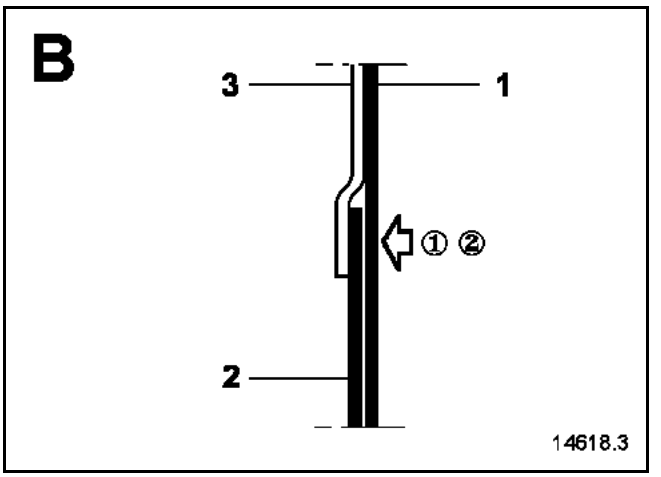
IMPORTANT: this part is within an area of bodywork that sustains a considerable amount of stress.
The spot welds not indicated in the method can all be made as originally.
However, for reasons of safety, it is advisable to make additional plug welds in area (C) to maintain the mechanical properties of the structure.







X1: **200 mm**



① X6 on the vehicle

② X6 on the replacement part

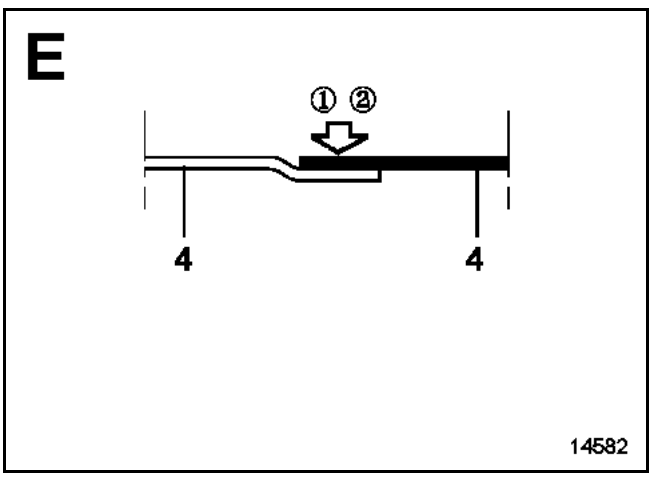
IMPORTANT: in operation ① pillar reinforcement (2) is welded to A-pillar lining (3), to remove the pillar, the two thicknesses of panels (1 and 2) must be unfastened.

 on the replacement part

 on the vehicle

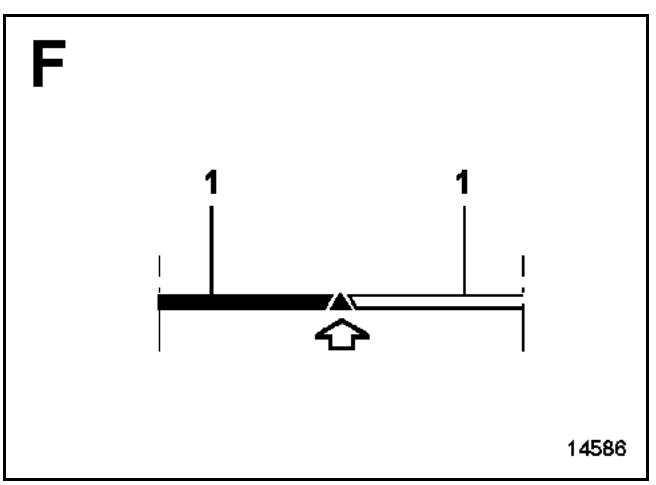
GETtheMANUALS.org

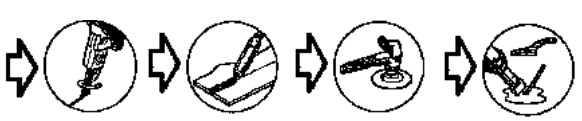
IMPORTANT: hinge reinforcement (4) assembled with pillar reinforcement (3) is welded at the lower section to the sill panel, the cutting operation depicted in the diagram can be carried out through opening (D) from inside the vehicle.

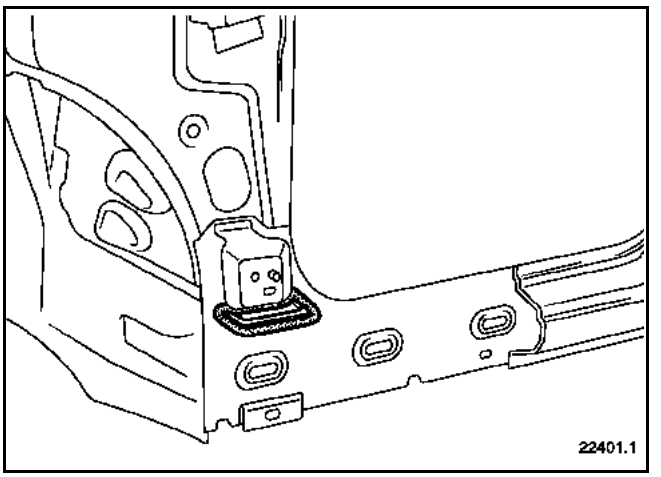


① X2 on the replacement part

②







REMINDER: the expanding inserts ensure that the vehicle cavities are sealed and soundproofed.

These react to temperature when the body is immersed in the cataphoresis baths during manufacture.

These conditions cannot be reproduced in the workshop.

Because the inserts are not reusable they must always be replaced.
The inserts supplied by the Parts Department are identical to the original parts.

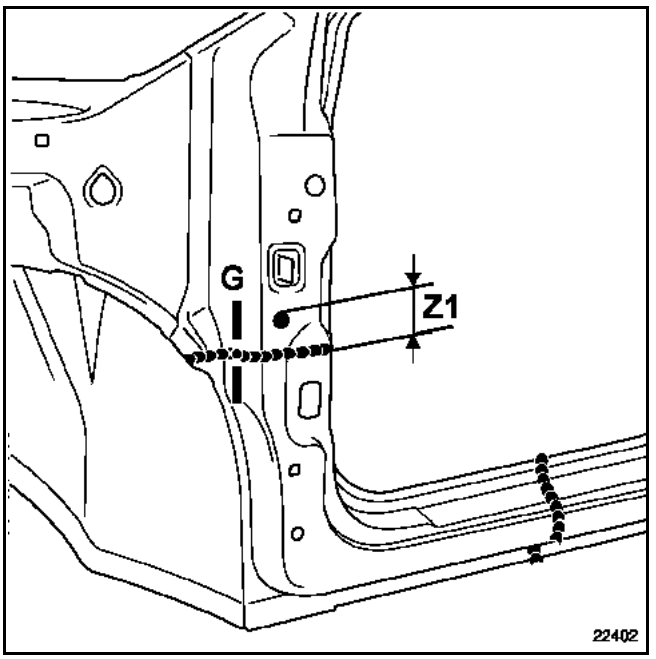
In order to reproduce the soundproofing and sealing properties the following range of operations must be performed:

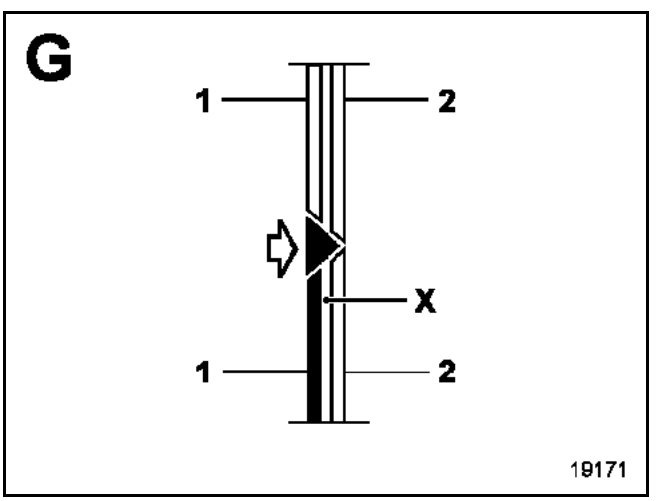
1 Clean the bonding surfaces with heptane (**part no.: 77 11 170 064**).
2 Seal the holes in the insert if necessary, by cutting out a piece of soundproofing pad **(part no.: 77 01 423 546**)
3 Apply lining sealing mastic (**part no.: 77 01 423 330**) to the periphery of the insert.
4 Fit the insert by compressing the mastic.

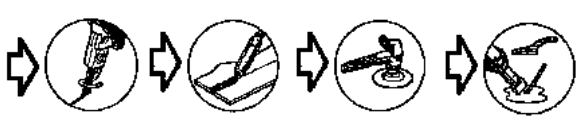
IMPORTANT: when MIG welding, protect the inserts from melting metal spatter and heat dispersion.
Use a thermal protection paste, for example (**part no.: 77 11 172 826**).

GETtheMANUALS.org

Replacement using cuts b and c



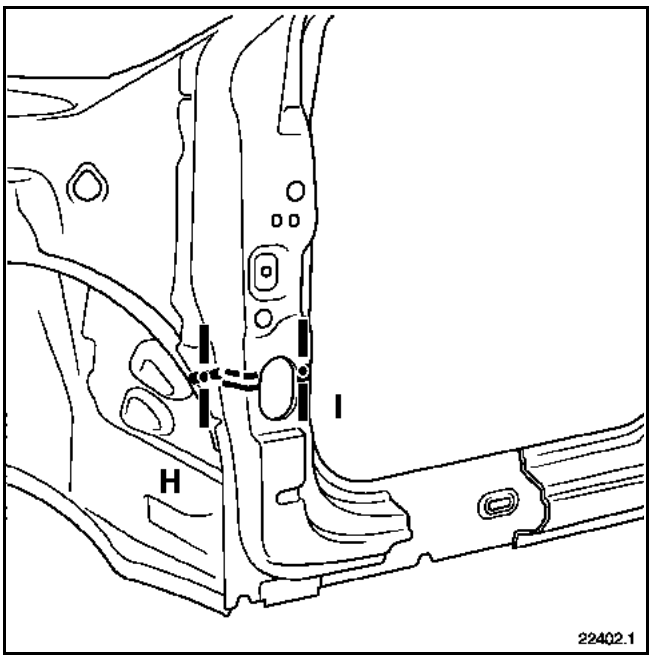


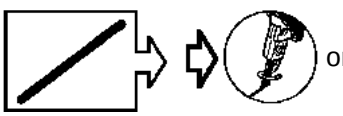


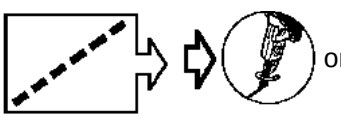
NOTE:
Z1: 40 mm
Area **X** is empty.

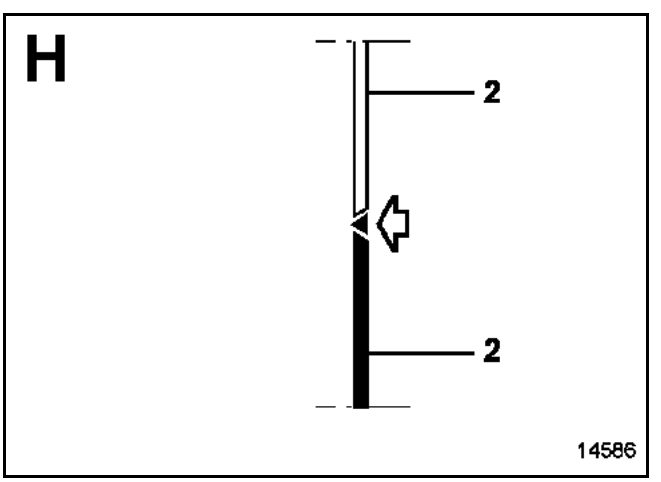
The cut at the sill panel is not detailed, it is identical to the partial replacement described previously.

IMPORTANT:
When performing the cutting operation take care **not to damage pillar reinforcement 2.**





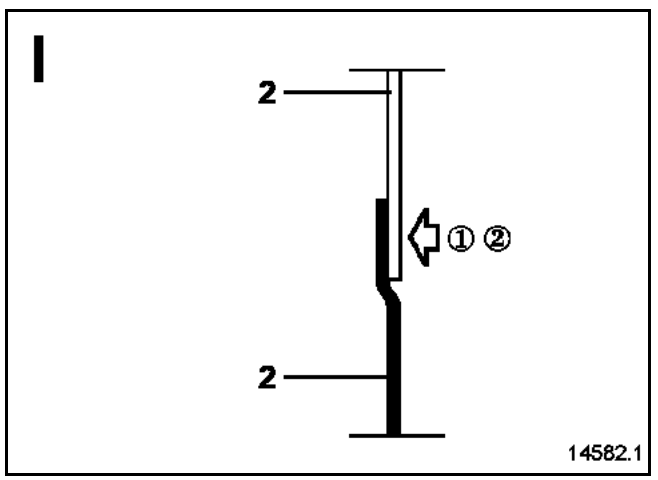




GETtheMANUALS.org

NOTE:
For every offset cut, it is essential to:
– detach the pillar reinforcement on the replacement part,
– detach the pillar reinforcement on the vehicle,
– also order a new retail reinforcement.

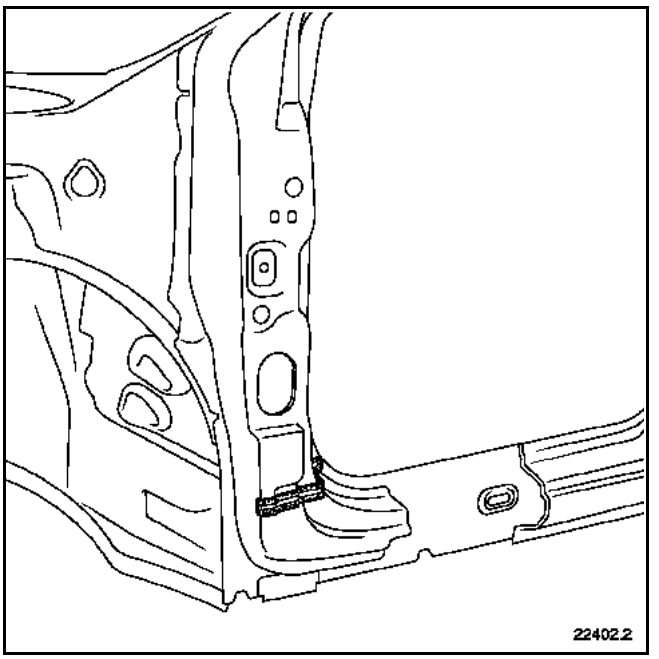
IMPORTANT: it is advisable not to re-use the reinforcement once removed.



① on the replacement part

②

NOTE: the number of plug welds is not specified, a gap of approximately **40 mm** must be left between spot welds.



REMINDER: it is essential to replace the expanding insert (see method previously outlined).

GETtheMANUALS.org

The replacement of this part is an operation linked to the replacement of the A-pillar along cuts (b and c) for a side impact.

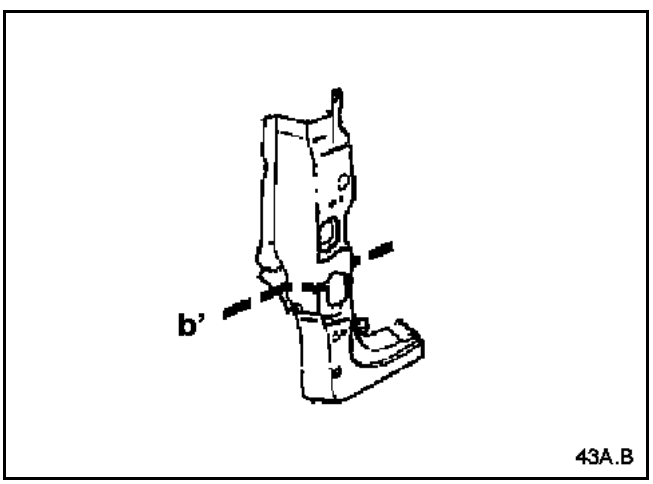
It is carried out following cut (b') only.

For more detail, refer to the method of partially replacing the A-pillar.

NOTE: the complete replacement of this part is not dealt with, it is preferable to replace the A-pillar assembled with the reinforcement.

COMPOSITION OF THE REPLACEMENT PART

Part assembled with:
Pillar upper reinforcement
Welded studs
Crimped nuts
Hinge reinforcements
Hinge mounting plate
Hinge mounting cage
Door stop reinforcement



GETtheMANUALS.org

This part is replaced in the event of a side impact, and is carried out in several possible ways:
– complete, complementary to replacement of the body top,
– using cut (a) complementary to replacing the A-pillar.

The information on the additional parts will be dealt with in their corresponding sections (refer to contents).

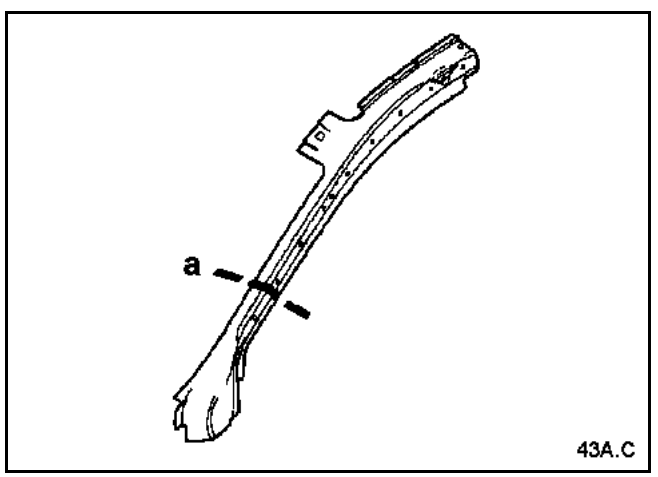
NOTE: for information purposes, there are one or more diagrams of the part fitted to the vehicle or removed.

Where spot welds cannot be made with the spot welder, they can be replaced by plug welds.

Partial detachment of this part may be useful when straightening the A-pillar lining.

COMPOSITION OF THE REPLACEMENT PART

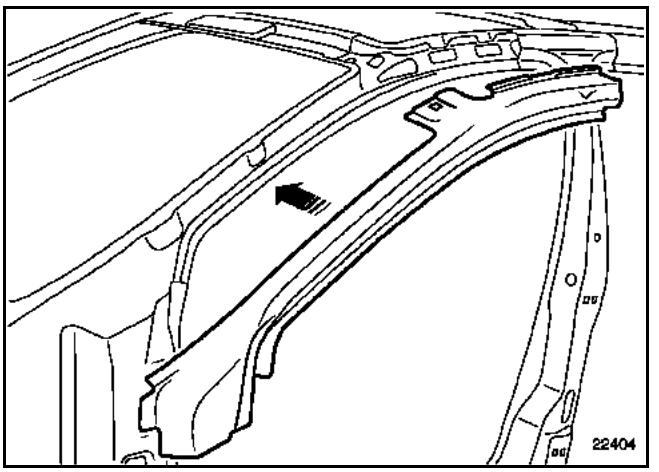
Part supplied on its own.



PARTS CONCERNED (thickness in mm):

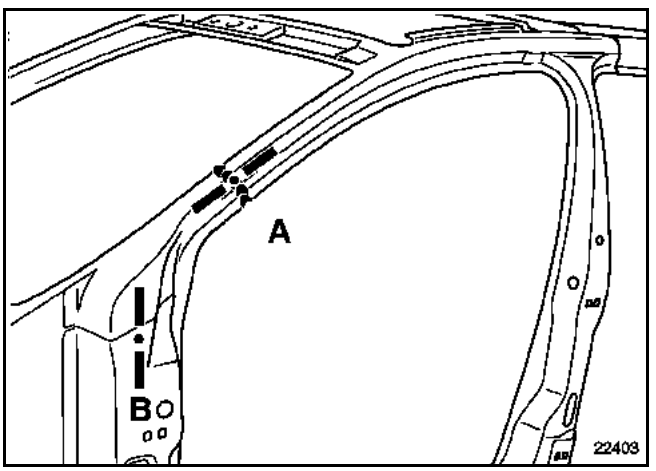
1	Windscreen aperture pillar lining reinforcement	1.2
2	A-pillar reinforcement	1

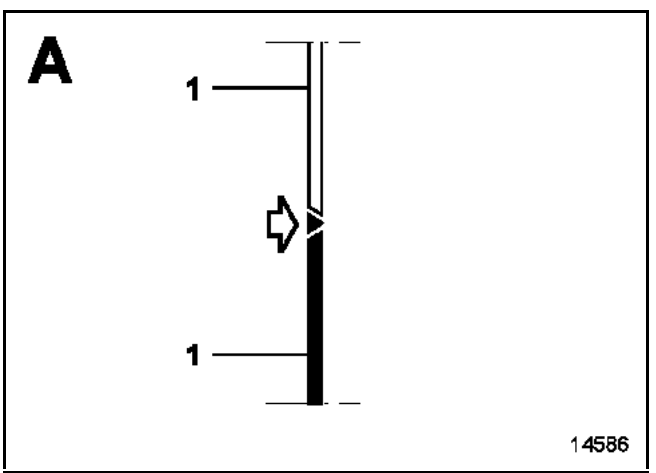
Complete replacement



GETtheMANUALS.org

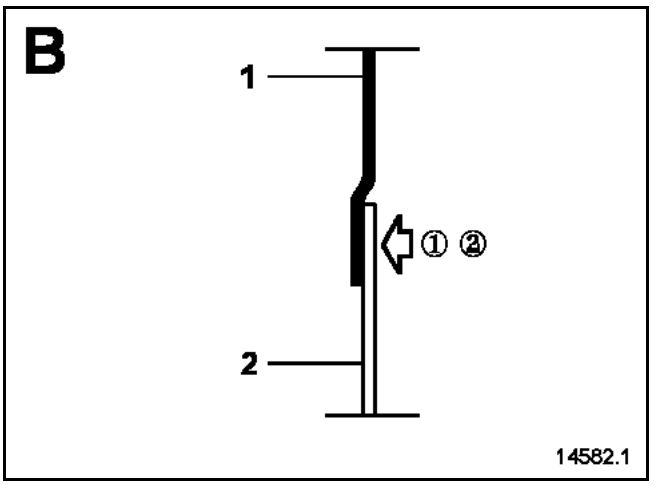
Replacement using cut a





REMINDER: the position of the cut can vary according to the section to be replaced, this should not be carried out across a slot.

IMPORTANT: the cuts must be offset when partially replacing the A-pillar.



①  X6 on the vehicle

② X6 on the replacement part

GETtheMANUALS.org

The replacement of this part is a complementary operation to the complete replacement of the A-pillar lining reinforcement for a side impact.

It is part of the process of method no. ② (see the introduction to **section 40A-C: Description of parts**).

In the procedure described below, you will only find the descriptions and the joints which are specific to the part concerned.

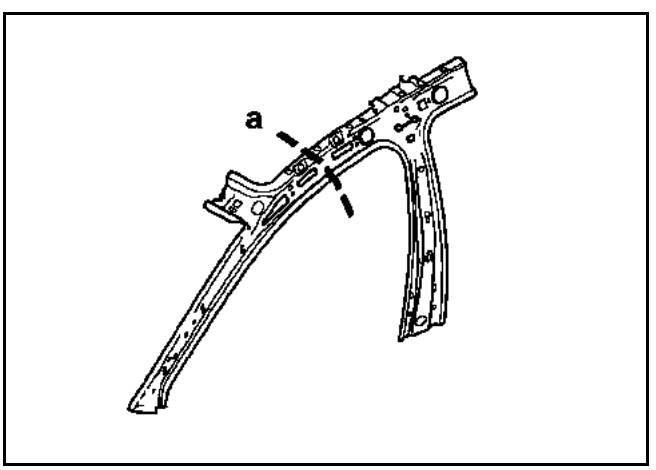
The information on the additional parts will be dealt with in their corresponding sections (refer to contents).

This operation can also be carried out partially in addition to replacing an A or B-pillar along cut (a) (keep the front or rear part depending on the case).

IMPORTANT:
The A-pillar lining consists of two panels of different thickness which are butt-welded together.
Cut (a) is made **20 mm** in front of the butt weld line.

COMPOSITION OF THE REPLACEMENT PART

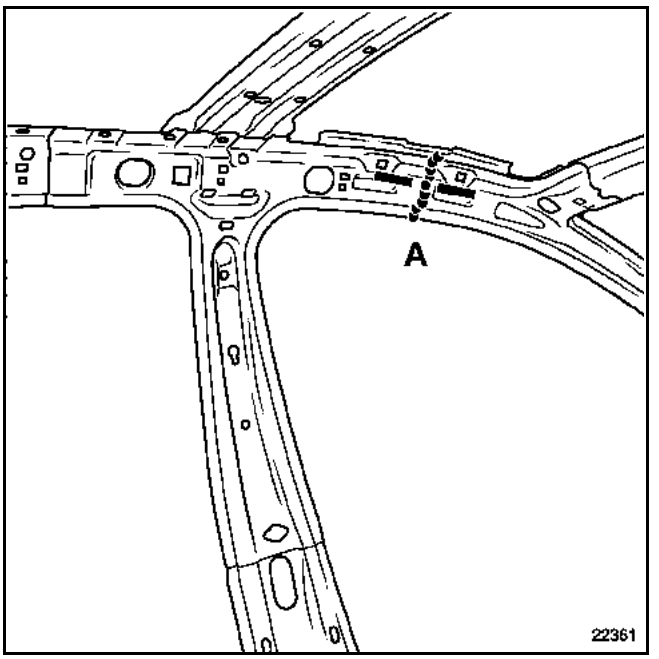
Part assembled with seat belt mounting nut.

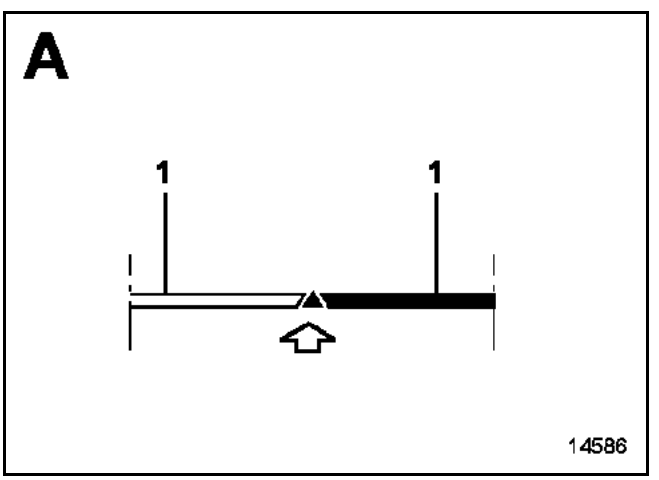


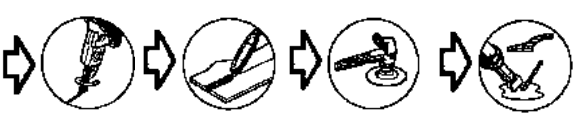
PARTS CONCERNED (thickness in mm):

1	Windscreen aperture pillar lining	1.2/1.5
2	Scuttle side panel	1

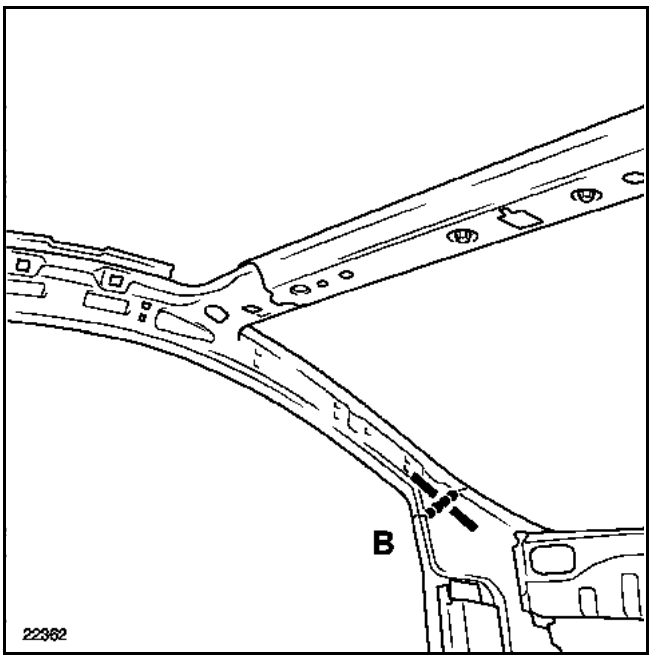
Replacement using cut a

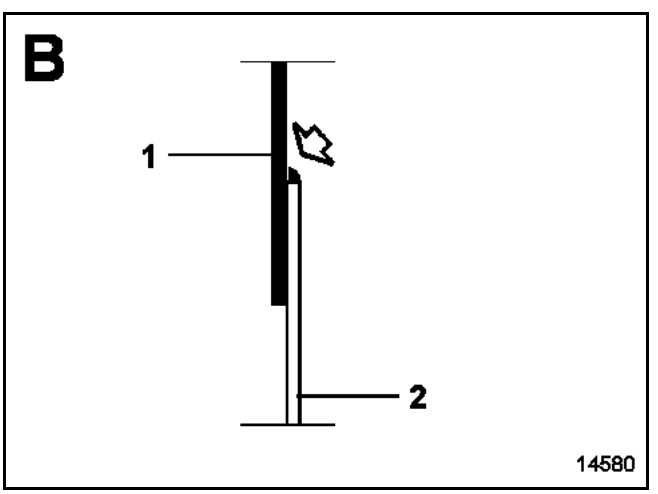






GETtheMANUALS.org





L 60 mm

GETtheMANUALS.org

The replacement of this part is a basic operation for a side impact.
It is part of the process of method no. ② (see the introduction to **section 40A-C: Description of parts**).

In the procedure described below, you will find only the descriptions and the joints which are specific to the part concerned.
The information on the additional parts will be dealt with in their corresponding sections (refer to contents).

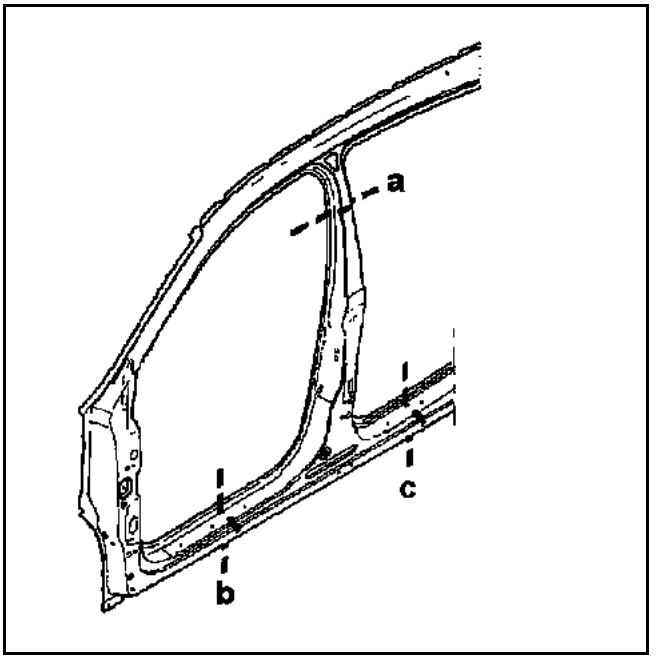
To perform this operation, the following must also be ordered:
– the lower expanding insert.

Replacement is made using cuts (**a, b, and c**).

NOTE: for reasons of Parts Department standardization, the B-pillar is to be cut body side at the front section. The latter covers several types of sales.

COMPOSITION OF THE REPLACEMENT PART

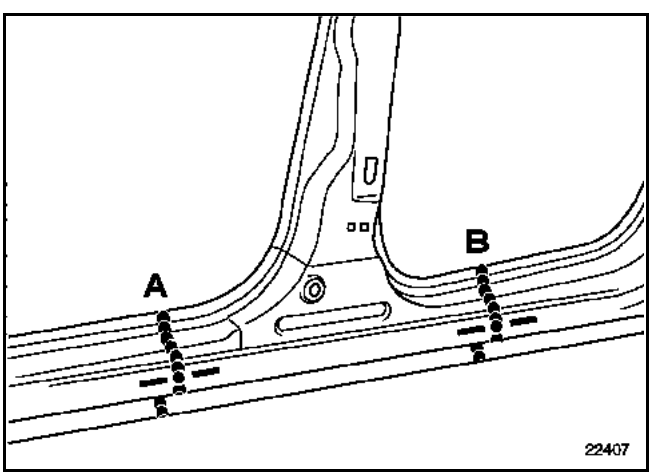
Part assembled:
A-pillar upper reinforcement
Welded studs
Welded pins
Welded bolts
Crimped nuts
A-pillar reinforcement
Hinge reinforcements
Hinge mounting plate
Hinge mounting cage
Door stop reinforcement



PARTS CONCERNED (thickness in mm):

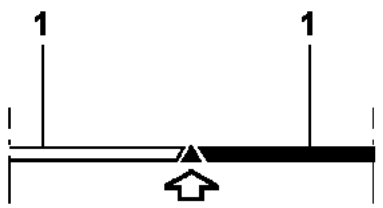
1	B-pillar	0.9
2	B-pillar reinforcement.	1.8

Replacement using cuts (a, b, c)

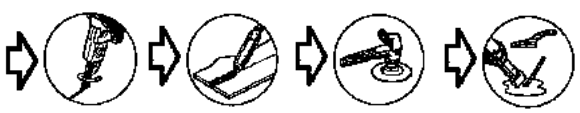


GETtheMANUALS.org

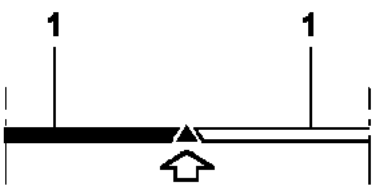
A



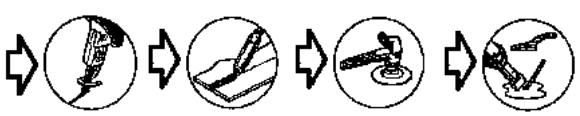
14586



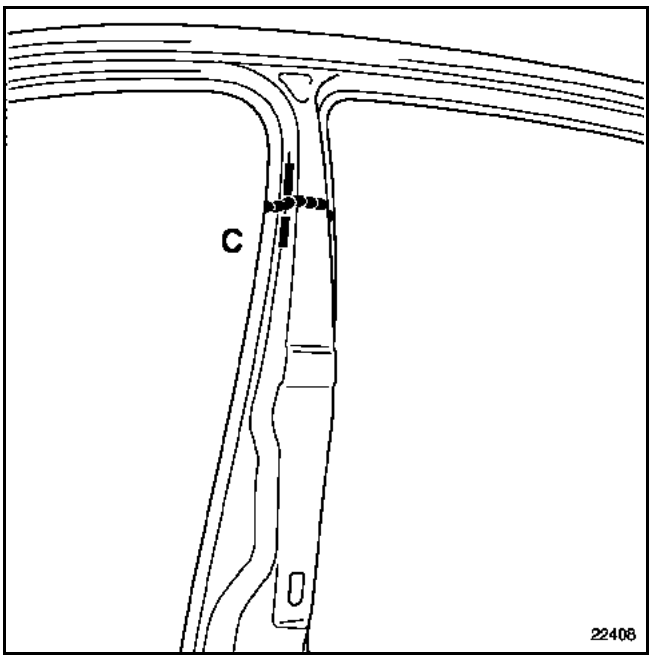
B



14586

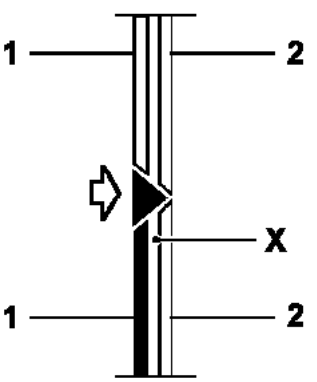


IMPORTANT: cut (c) should be made between the two location holes for the door sill lining mounting clips, to ensure that the replacement part covers it.

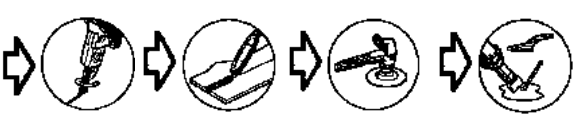


22408

C



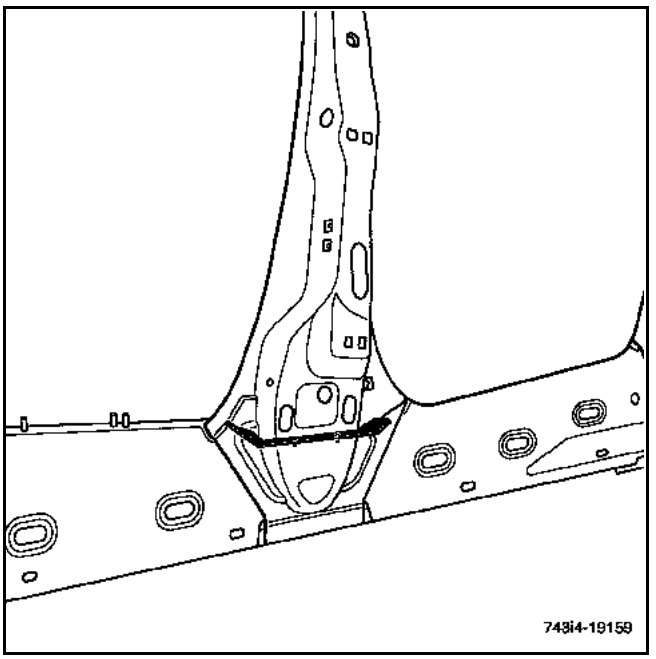
19171



NOTE: area **X** is empty.

REMINDER: the position of the cuts can vary according to the section to be replaced, this should not be carried out across a slot.

GETtheMANUALS.org



REMINDER: it is essential to replace the expanding insert (see method described in **section 43A-A**).

GETtheMANUALS.org

The complete replacement of this part is an operation complementary to the replacement of the body top and requires the removal of the A-pillar lining reinforcement for a front side impact or the removal of the roof drip moulding stiffener for a rear side impact.

It is part of the process of method no. ③ (see the introduction to **section 40A-C: Description of parts**).

In the procedure described below, you will only find the descriptions and the joints which are specific to the part concerned.

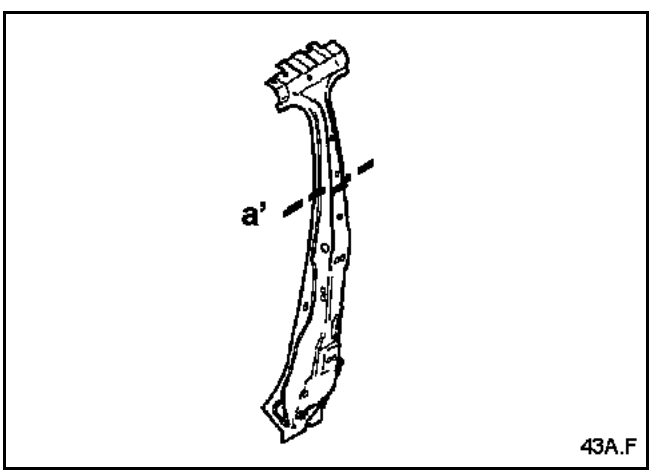
The information on the additional parts will be dealt with in their corresponding sections (refer to contents).

To perform this operation, the lower expanding insert must also be ordered.

Replacement can be made following two methods:
– complete,
– using cut (a') in addition to B-pillar cuts (a, b and c).

COMPOSITION OF THE REPLACEMENT PART

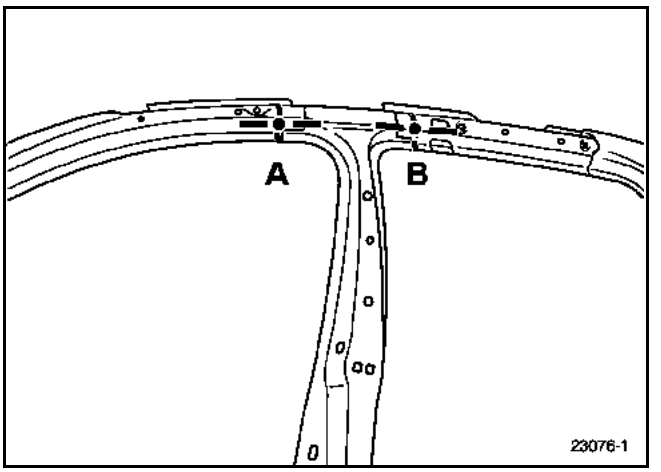
Part assembled with:
Hinge reinforcement
Satellite mounting piece
Plate
Nut



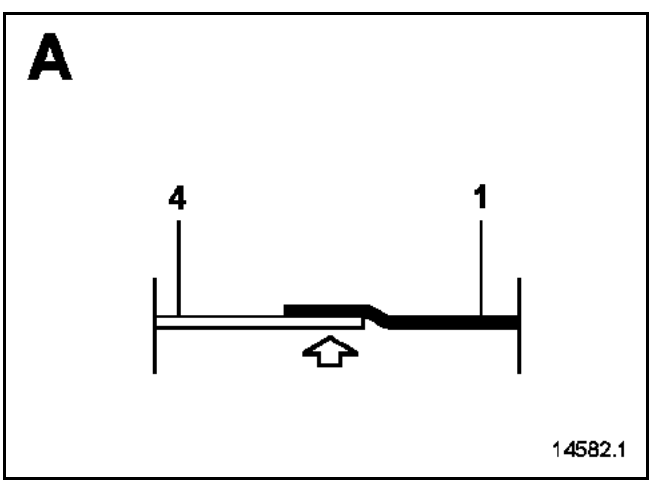
PARTS CONCERNED (thickness in mm):

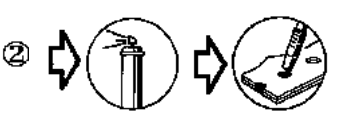
1	B-pillar reinforcement.	1.8
2	Hinge reinforcement	1.5
3	Inner sill panel	1
4	Windscreen aperture pillar lining reinforcement	1.2
5	Roof panel lining	1

Complete replacement

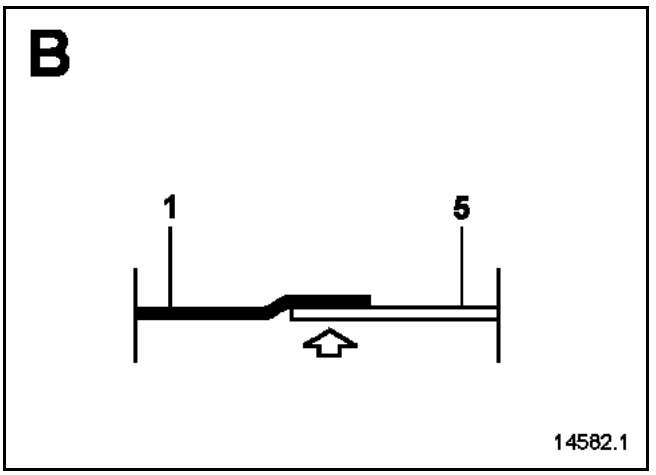


NOTE: the B-pillar reinforcement passes under the A-pillar and the roof drip moulding stiffener, which requires the removal of A-pillar lining reinforcement (5) or roof drip moulding stiffener (4).



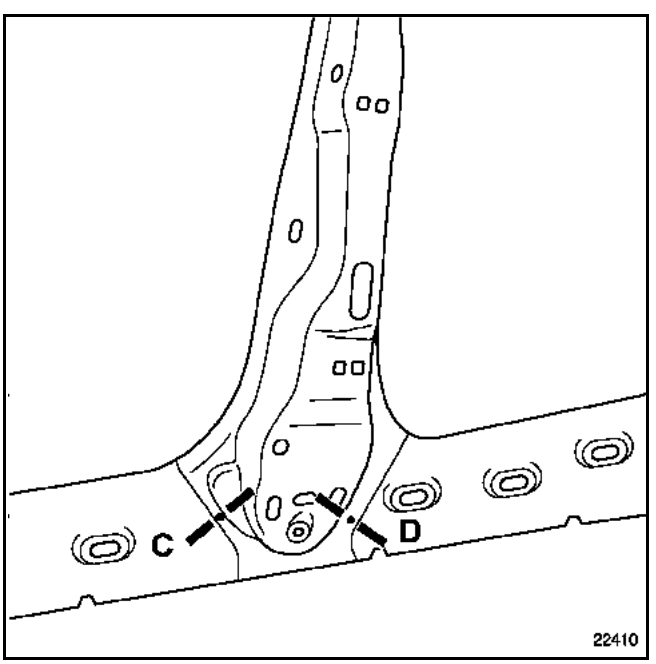


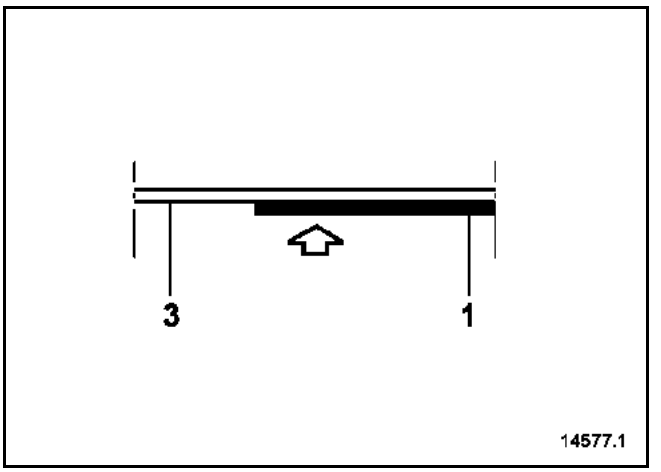
GETtheMANUALS.org



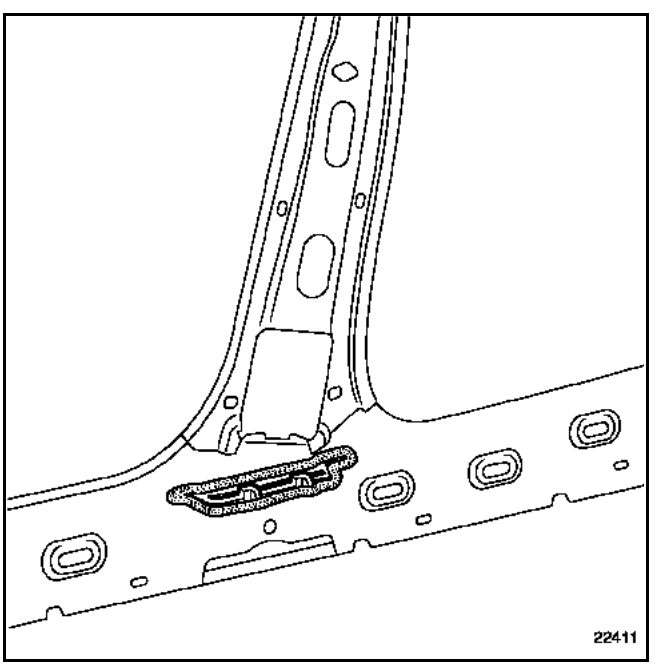
① on the vehicle

② X4





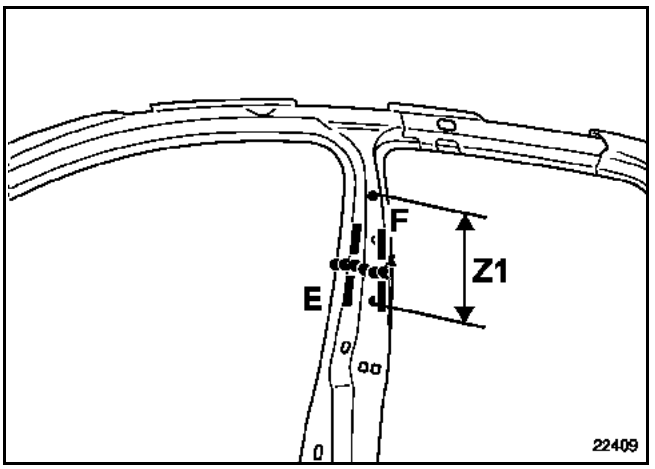
X2

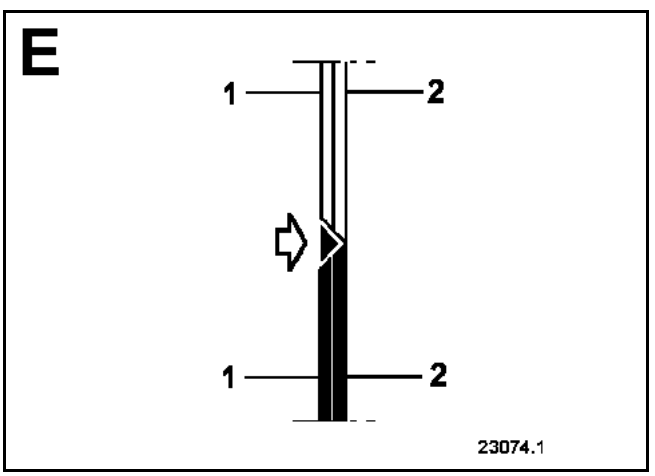


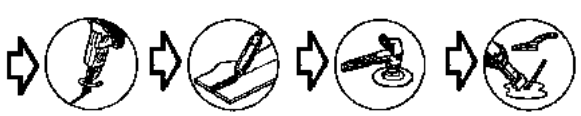
REMINDER: it is essential to replace the expanding insert (see method described in **section 43A-A**).

GETtheMANUALS.org

Replacement using cut (a')

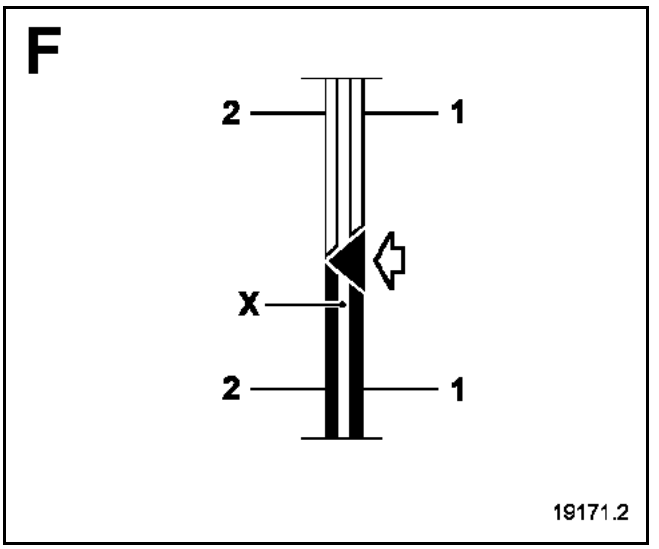


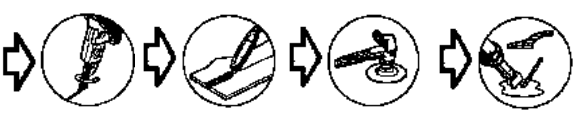




NOTE: the position of cut (a') can vary in area **Z1** according to the part to be replaced, this must not be made across a slot.

IMPORTANT: the cuts must be offset in the case of a partial replacement of the B-pillar.





NOTE: area **X** is empty.

GETtheMANUALS.org

The replacement of this part is a complementary operation to the replacement of the B-pillar reinforcement for a side impact.

It is part of the process of method no. ② (see the introduction to **section 40A-C: Description of parts**).

In the procedure described below, you will only find the descriptions and the joints which are specific to the part concerned.

The information on the additional parts will be dealt with in their corresponding sections (refer to contents).

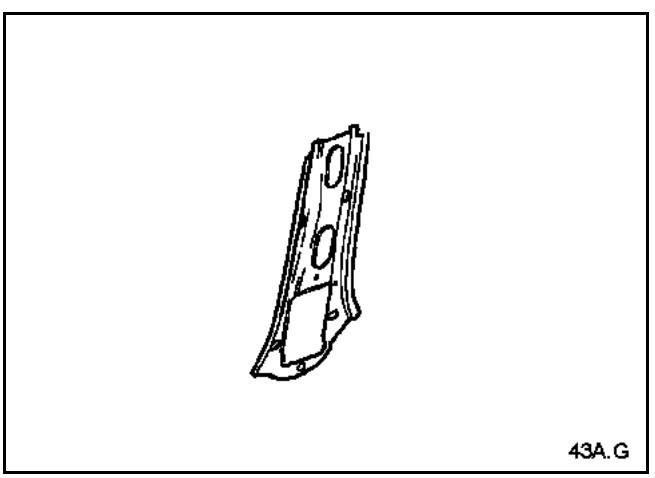
NOTE: this operation raises no particular difficulties.

For information purposes, there are one or more diagrams of the part fitted to the vehicle or removed.

Where spot welds cannot be made with the spot welder, they can be replaced by plug welds.

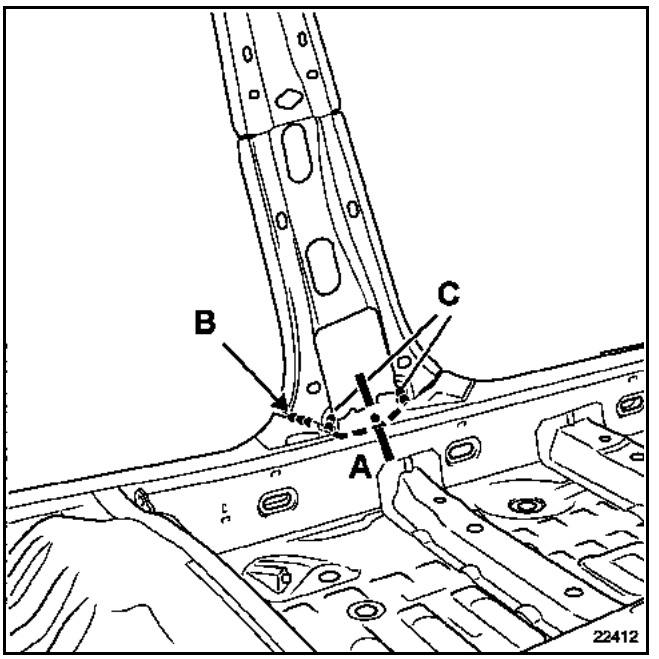
COMPOSITION OF THE REPLACEMENT PART

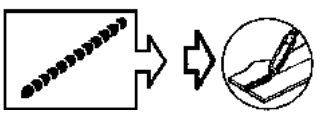
Part supplied on its own.

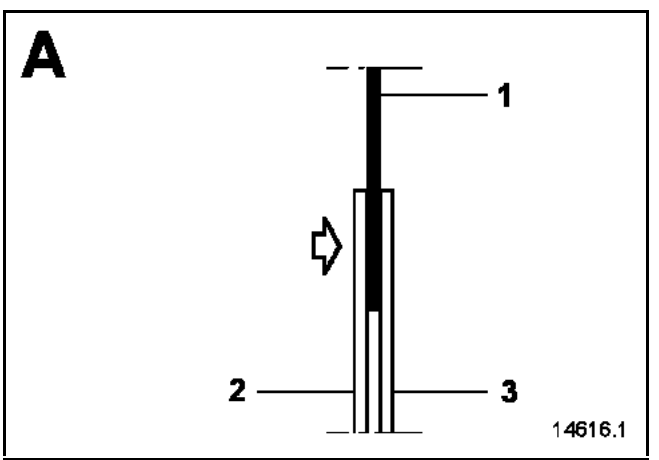


PARTS CONCERNED (thickness in mm):

1	B-pillar lining	0.7
2	Inner sill panel	1
3	Sill panel reinforcement	1.5







NOTE:
The two plug welds **A** are specific to the repair.

It is advisable to create a weld bead **B** in addition to the two original ones **C**.

GETtheMANUALS.org

The replacement of this part is a complementary operation to the roof for a side impact.

In the procedure described below, you will only find the descriptions and the joints which are specific to the part concerned.

The information on the additional parts will be dealt with in their corresponding sections (refer to contents).

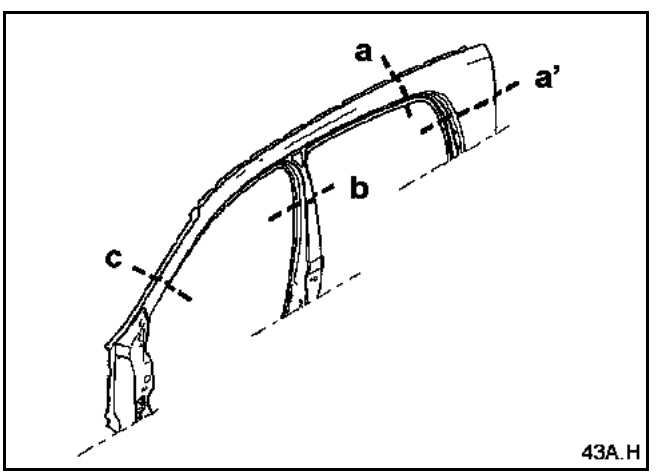
To perform this operation, the upper front expanding insert must also be ordered.

Replacement can be made following two methods:
– using cuts (a, b and c) or (a', b and c).

NOTE: where welds cannot be made by the spot welder, they can be replaced by plug welds.
The positions of the cuts given in the method can be modified according to the extent of impact.

COMPOSITION OF THE REPLACEMENT PART

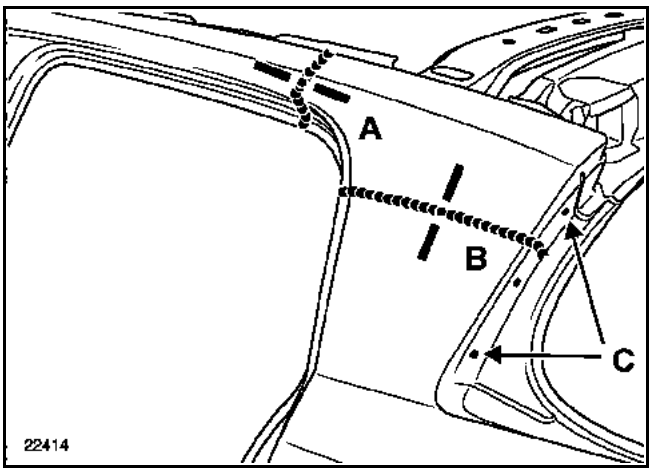
Part assembled with:
Welded pin
Welded stud

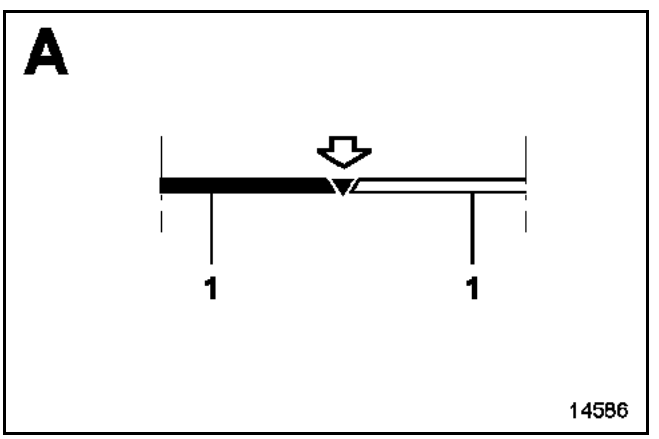


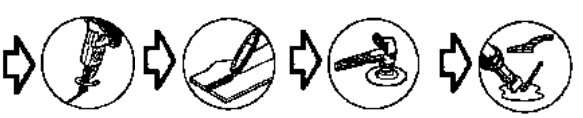
PARTS CONCERNED (thickness in mm):

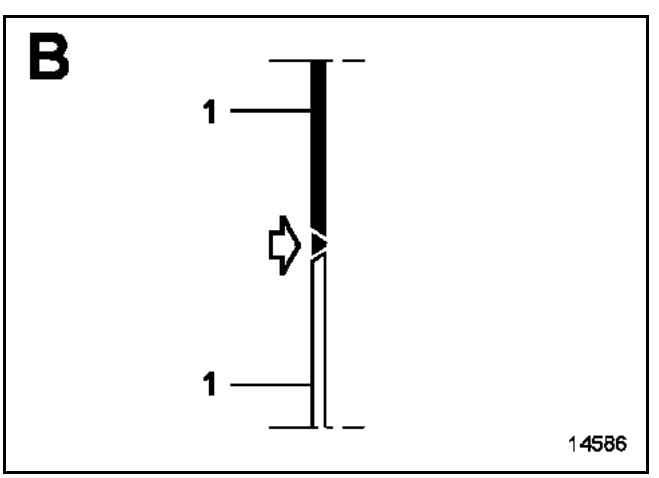
1	Body top	0.8

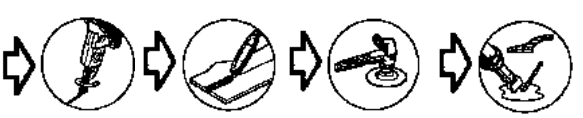
Replacement using cuts (a, b and c) or (a', b and c)





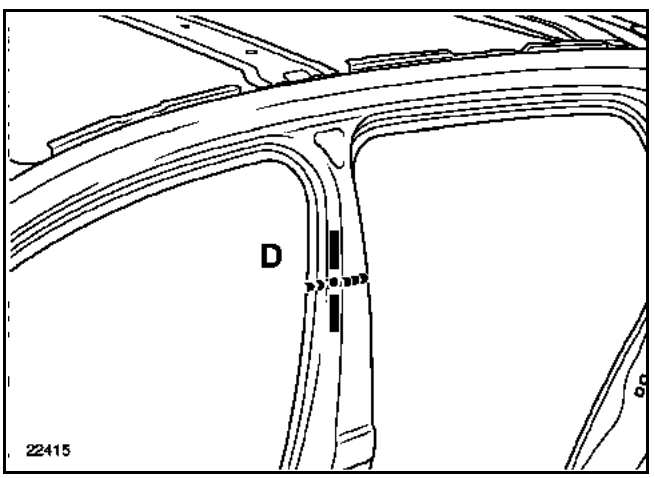


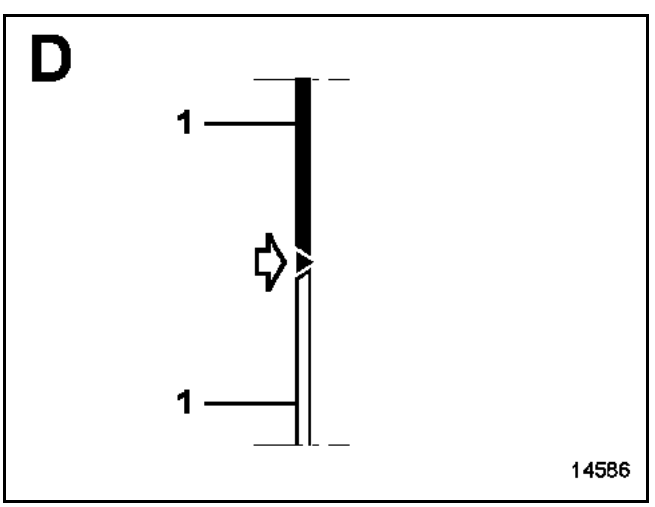


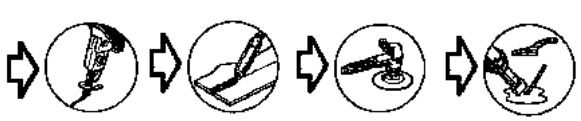


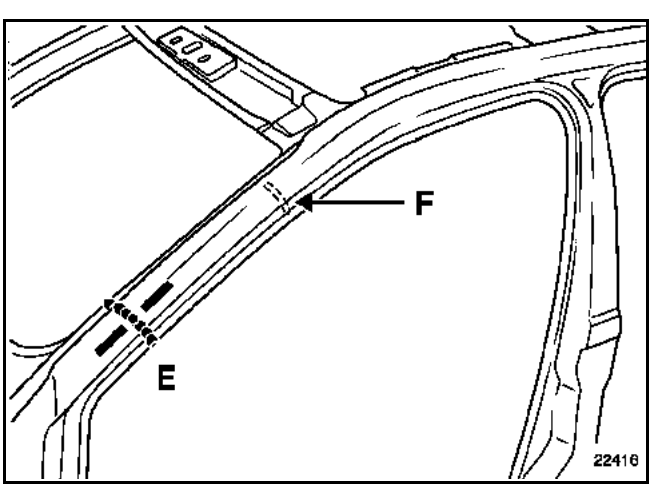
GETtheMANUALS.org

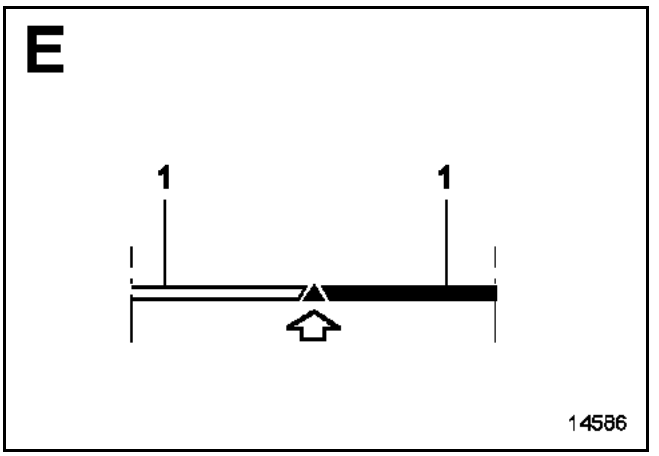
IMPORTANT: cut (a') should be made between the two square slots **C** of the wing panel upper rain channel to ensure that it is covered by the replacement part.

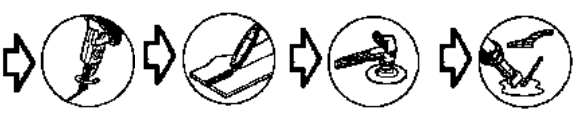




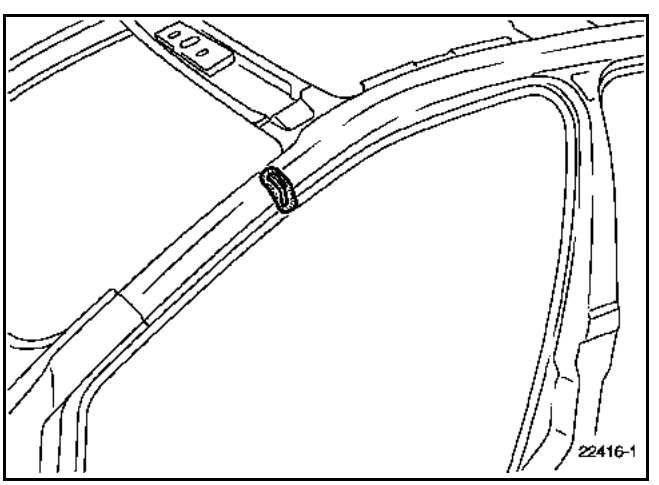








IMPORTANT: avoid making cut (c) near to expanding insert **F** shown as a dotted line in the diagram.



REMINDER: it is essential to replace the expanding insert (see method described in **section 43A-A**).

GETtheMANUALS.org

The replacement of this part is a complementary operation to the replacement of the quarter panel reinforcement for a side impact.

The information on the additional parts will be dealt with in their corresponding sections (refer to contents).

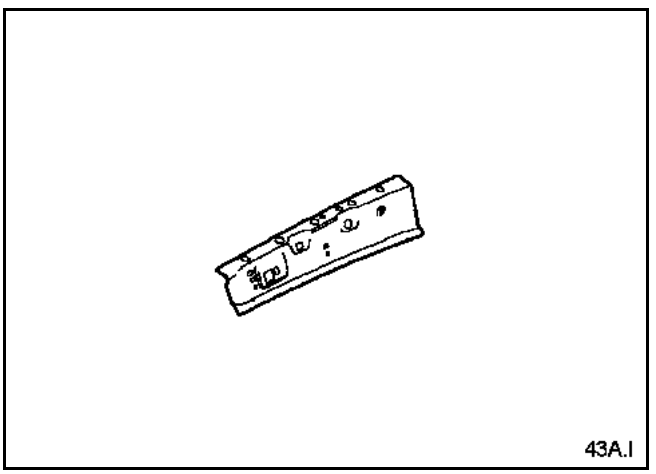
NOTE: this operation is not particularly difficult.

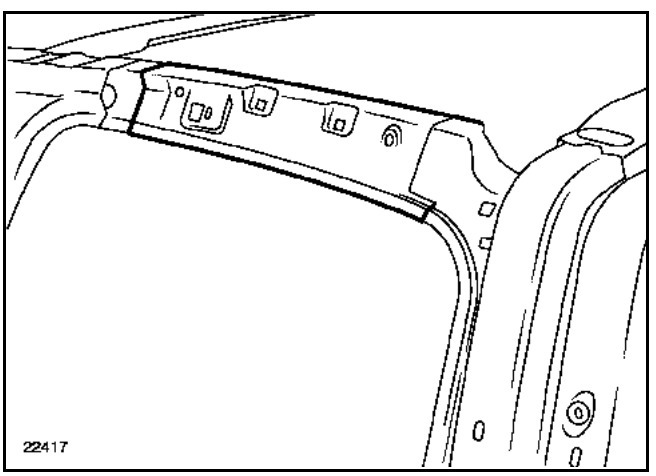
For information purposes, there are one or more diagrams of the part fitted to the vehicle or removed.

Where spot welds cannot be made with the spot welder, they can be replaced by plug welds.

COMPOSITION OF THE REPLACEMENT PART

Part supplied on its own.





GETtheMANUALS.org

The replacement of this part is a complementary operation to the roof and scuttle side panel reinforcements for a front side impact.

It is part of the process of method no. 2 (see the introduction to **section 40A-C: Description of parts**).

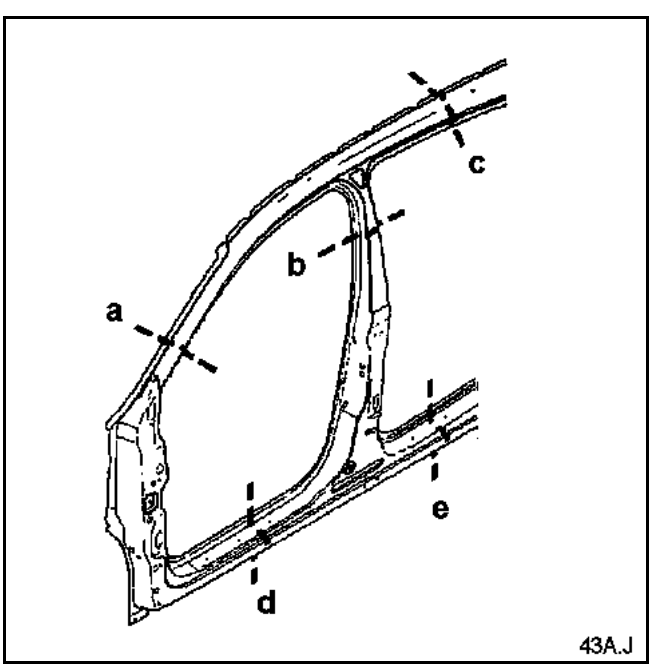
NOTE: the part covers two types of sales, (B-pillar and body side, front section).

The following sections must be referred to for details of the cuts in this part:
– Section 43A-A A-pillar (cuts a, d),
– Section 43A-E B-pillar (cuts b, d and e),
– Section 43A-H Body top (cuts a, b and c).

The following must also be ordered:
– Windscreen pillar expanding insert,
– A-pillar expanding insert,
– B-pillar expanding insert,

COMPOSITION OF THE REPLACEMENT PART

Part assembled:
A-pillar upper reinforcement
Welded studs
Welded pins.
Welded bolts
Crimped nuts
A-pillar reinforcement
Hinge reinforcements
Hinge mounting plate
Hinge mounting cage
Door stop reinforcement



GETtheMANUALS.org

The replacement of this part is a basic operation for a rear side collision.

In the procedure described below, you will only find the descriptions and the joints which are specific to the part concerned.

The information on the additional parts will be dealt with in their respective chapters (refer to contents).

To perform this operation, the following must also be ordered:
– the central expanding insert,
– the lower expanding insert.

There are several possible cutting points (refer to the following procedure):
– cut (c) avoids the need to restore the anti-chip protection under the body,
– cut (e) avoids removal of the roof panel,
– cut (b) avoids removal of the tailgate,
– cut (a) requires removal of the roof,
– Cut (d) requires restoration of the anti-chip protection under the body.

The combination of cutting points are selected according to the damage.

NOTE:
It is recommended that cut (b) is made in the lower section of the rear wing pillar to reduce the length of the cut and limit the risks of deformation during welding.

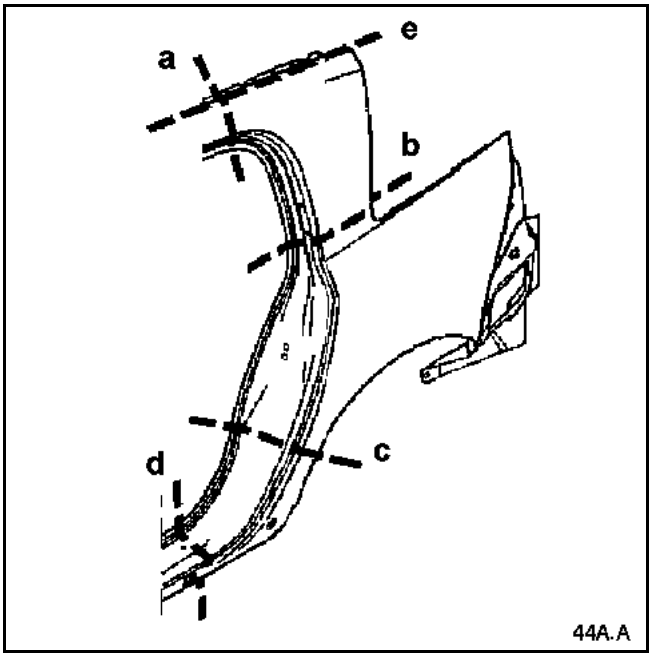
From this position, it is also possible to carry out conventional butt welding.

Where spot welds cannot be made with the spot welder, they can be replaced by plug welds.

For the sections which require bonding, it will be necessary to use bodywork cement **MCT 514** (**part no.: 77 11 172 674**).

COMPOSITION OF THE REPLACEMENT PART

Part assembled with:
Door striker plate reinforcement
Wing panel rear lower extender



PARTS CONCERNED (thickness in mm):

1	Rear wing panel	0.8
2	Outer wheel arch	0.7
3	Wing panel extender	0.7

②

③

NOTE:
The number of plugging points is not specified, it is necessary to leave a gap of approximately **60 mm** between the welding points, then after welding apply a mastic bead along the edge (operation ③) to ensure sealing and finish.
Use M.J. Pro type mastic (**part no.: 77 11 172 676**).

GETtheMANUALS.org

The replacement of this part is a basic operation for a front side impact to the lower section.

In the procedure described below, you will only find the descriptions and the joints which are specific to the part concerned.

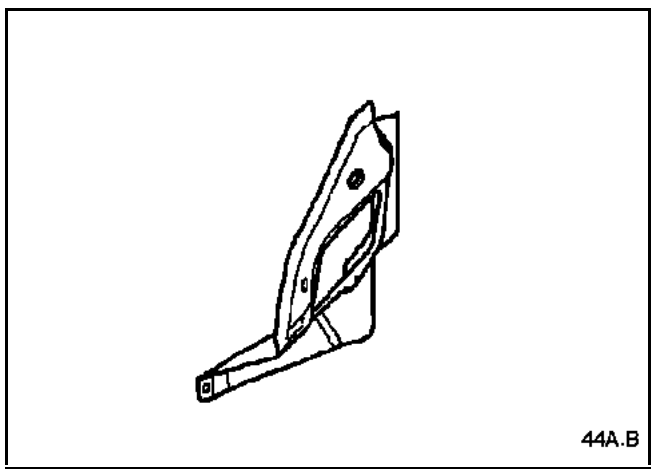
NOTE:
The operation presents no particular difficulties. You will find one or more drawings of the part either on the vehicle or removed from it in the method for your information.

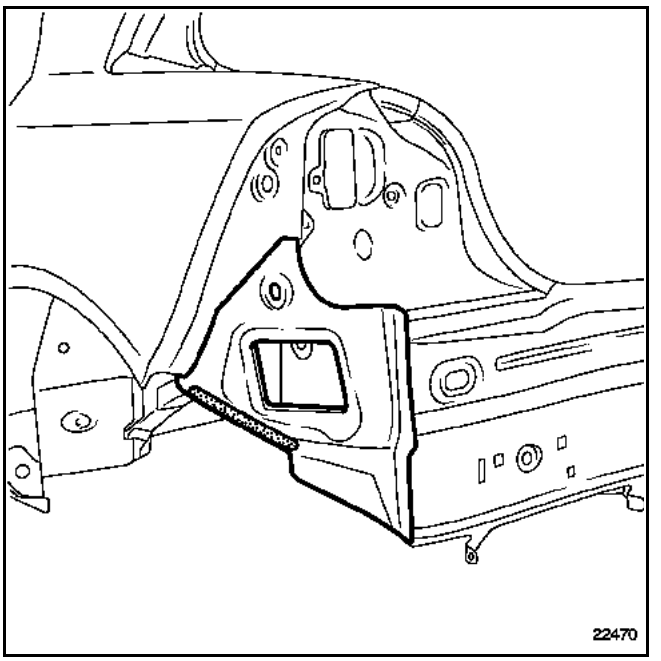
Where spot welds cannot be made with the spot welder, they can be replaced by plug welds.

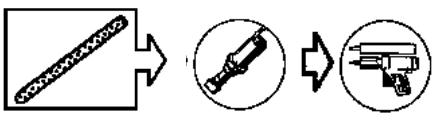
For the sections which require bonding, it will be necessary to use bodywork cement **MCT 514** (**part no.: 77 11 172 674**).

COMPOSITION OF THE REPLACEMENT PART

Part supplied on its own.







GETtheMANUALS.org

The replacement of this part is a complementary operation to the replacement of the rear wing panel with lamp mounting for a rear impact.

The information on the additional parts will be dealt with in their respective chapters (refer to contents).

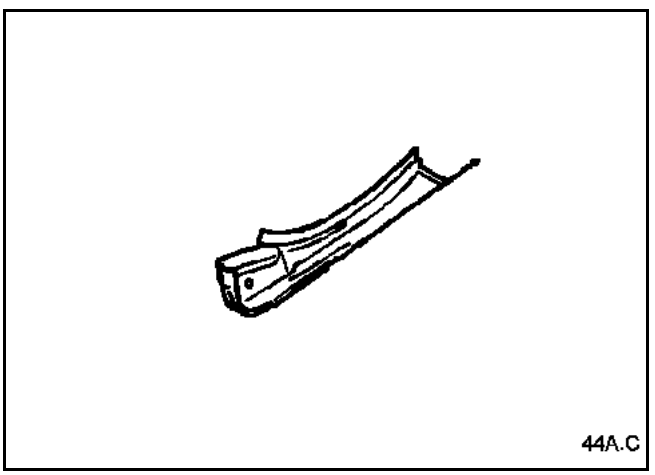
NOTE:
The operation presents no particular difficulties.

You will find one or more drawings of the part either on the vehicle or removed from it in the method for your information.

Where spot welds cannot be made with the spot welder, they can be replaced by plug welds.

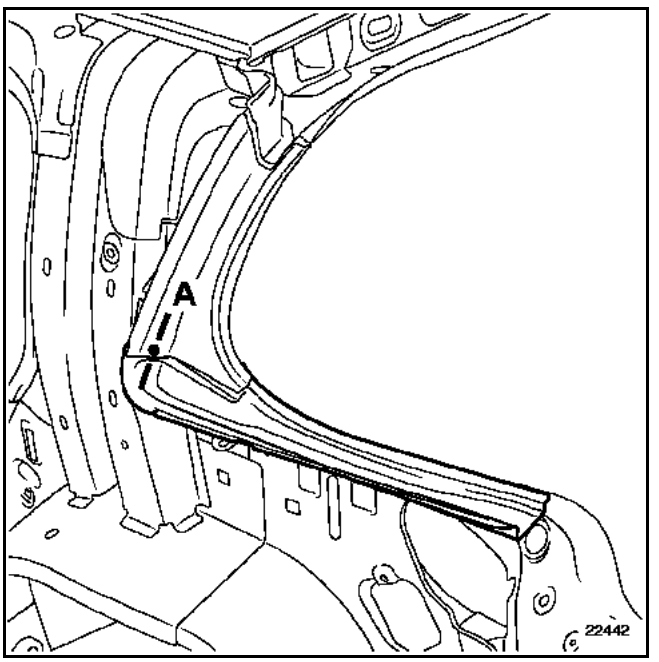
COMPOSITION OF THE REPLACEMENT PART

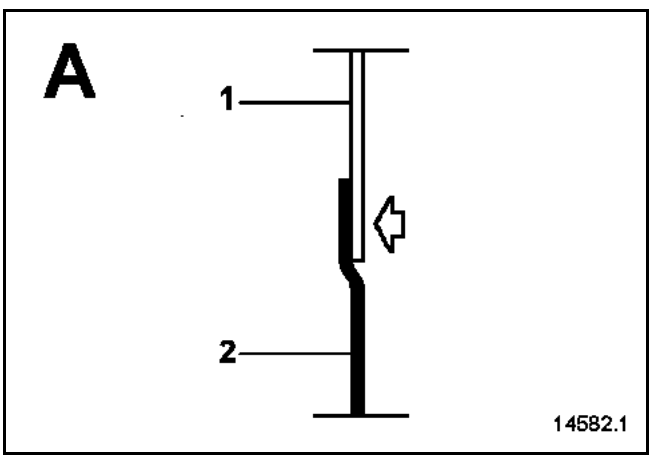
Part supplied with:
Rear side rain channel
Welded shaft

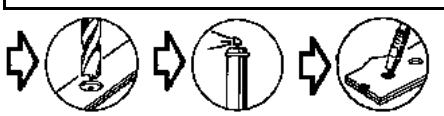


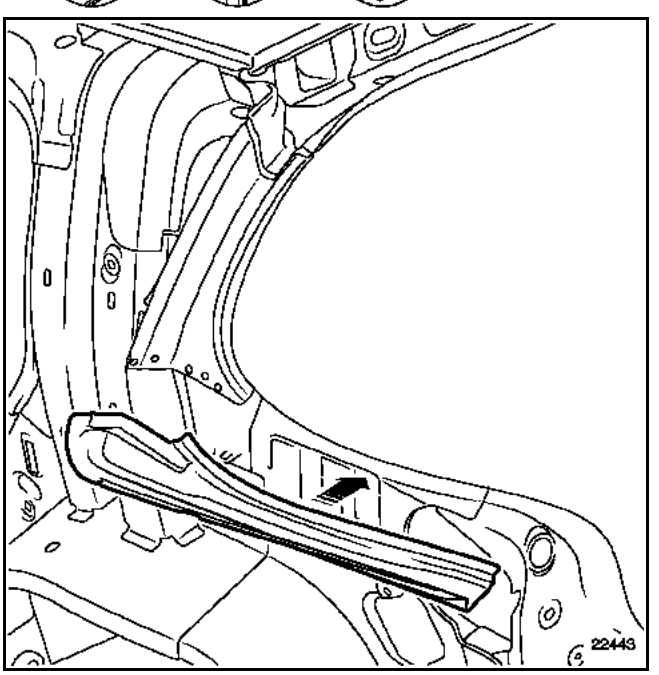
PARTS CONCERNED (thickness in mm):

1	Wing panel lower rain channel	0.7
2	Wing panel upper rain channel	0.7









GETtheMANUALS.org

The replacement of this part is a complementary operation to the replacement of the rear wing panel or the end panel for a rear side impact.

In the procedure described below, you will only find the descriptions and the joints which are specific to the part concerned.

The information on the additional parts will be dealt with in their respective chapters (refer to contents).

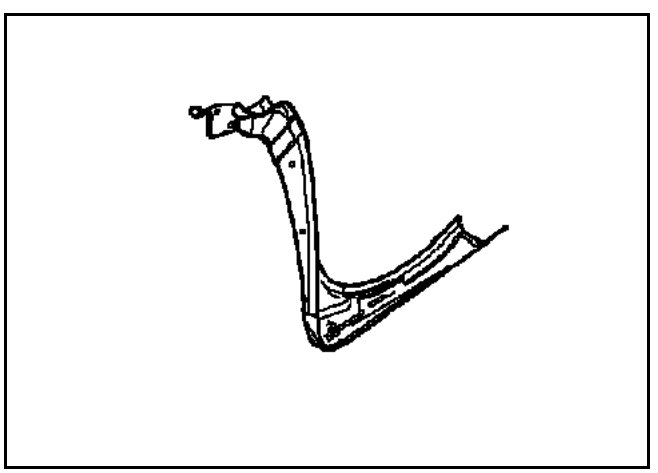
NOTE:
The operation presents no particular difficulties.

You will find one or more drawings of the part either on the vehicle or removed from it in the method for your information.

Where spot welds cannot be made with the spot welder, they can be replaced by plug welds.

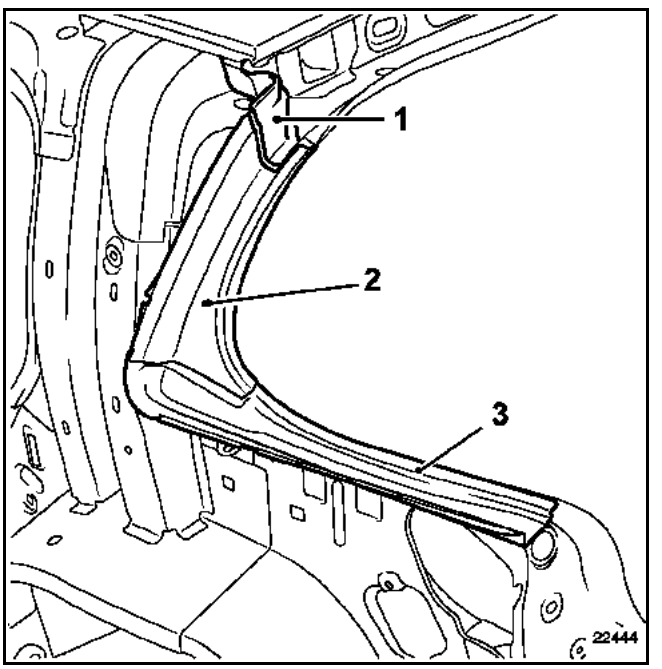
COMPOSITION OF THE REPLACEMENT PART

Part supplied with:
Lower rain channel
Central rain channel
Rear side rain channel
Ball joint mounting reinforcement
Ball joint
Conical spring washer
Welded shaft
Crimped nut



PARTS CONCERNED (thickness in mm):

1	Upper section of wing panel drip moulding	1.5
2	Central section of wing panel drip moulding	0.7
3	Lower section of wing panel drip moulding	0.7
1	Roof panel rear cross member	1
2	Roof rear cross member lining	1.2



The wing panel upper rain channel consists of three sections:
– upper section (1),
– centre section (2),
– lower section (3).

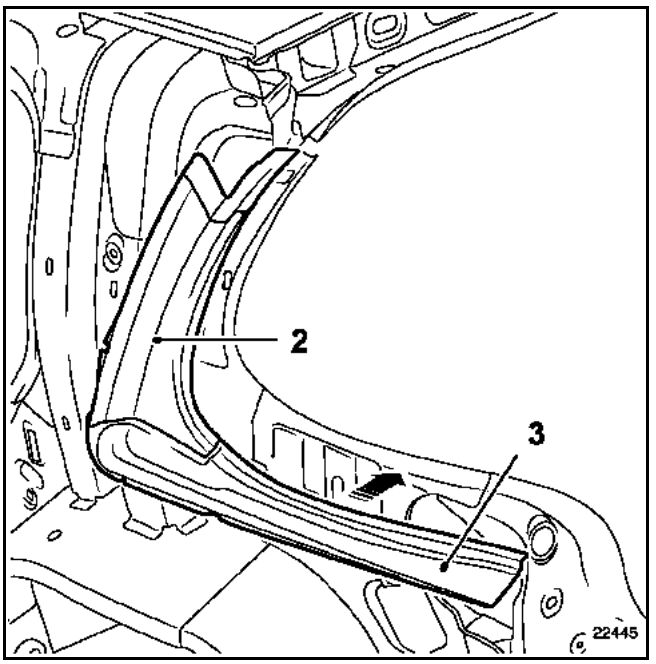
Depending on the level of impact, it is possible to replace only the damaged parts.

This type of operation requires the removal of the replacement parts from the assembly supplied by the Parts Department.

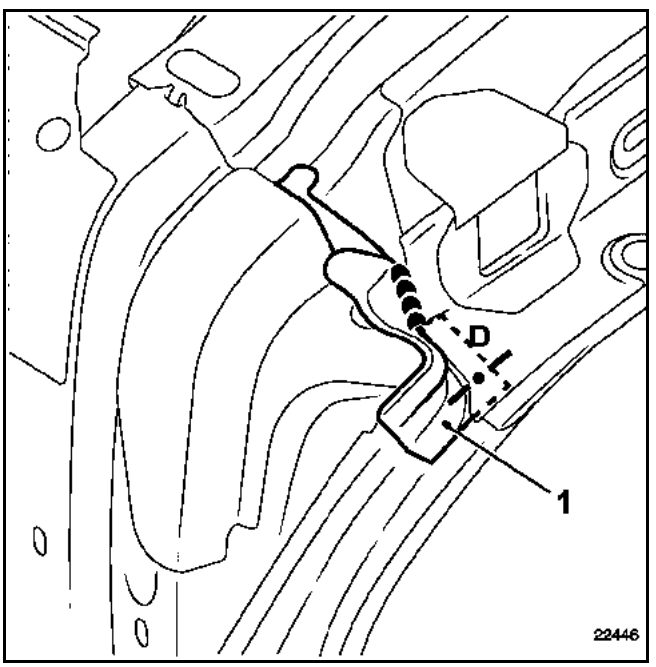
In the following you will find an example of how to replace the central and lower sections (2 and 3).

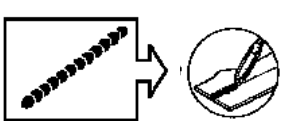
GETtheMANUALS.org

Replacing sections 2 and 3



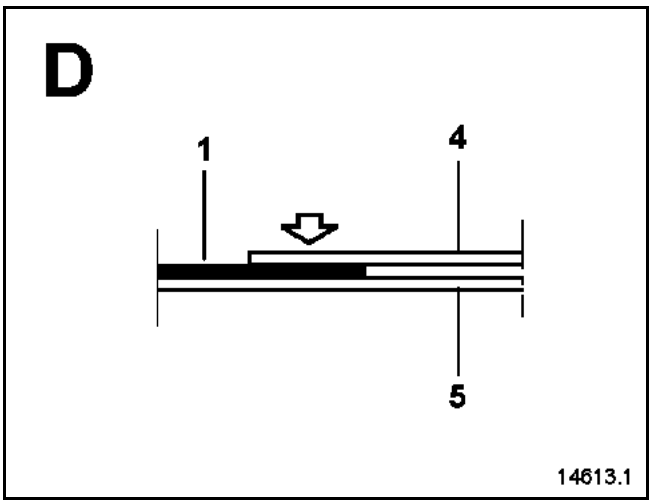
Note on replacing section 1

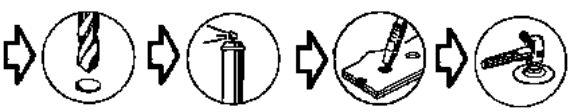




L 30

IMPORTANT:
The complete replacement of the upper section (1) is an operation complementary to replacement of the roof.





X 2

GETtheMANUALS.org

The complete replacement of this part is a complementary operation to the replacement of the rear wing panel for a rear side impact.

The information on the additional parts will be dealt with in their respective chapters (refer to contents).

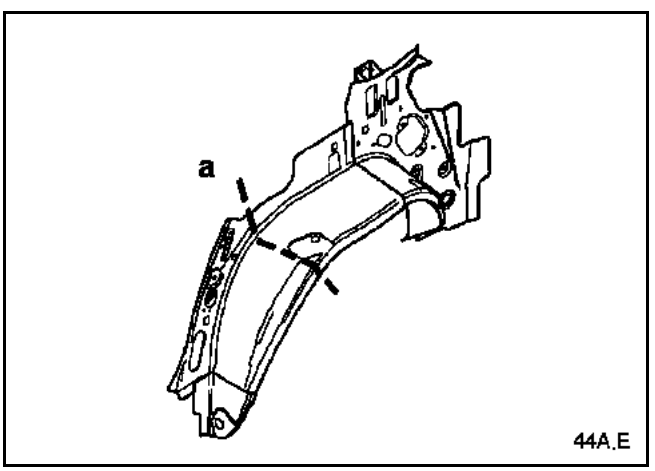
This operation may be carried out in two ways (refer to the procedure given below):
– complete, complementary to the quarter panel reinforcements and the complete rear wing panel,
– complete, complementary to the quarter panel reinforcements and the partial removal of the rear wing panel,
– front section using cut (a),
– sections (1) or (3).

NOTE:
The operations in the procedure are carried out on the left-hand part. The right-hand side of the vehicle has a slightly different shape due to the fuel filler neck, but the replacement method is the same.

Where spot welds cannot be made with the spot welder, they can be replaced by plug welds.

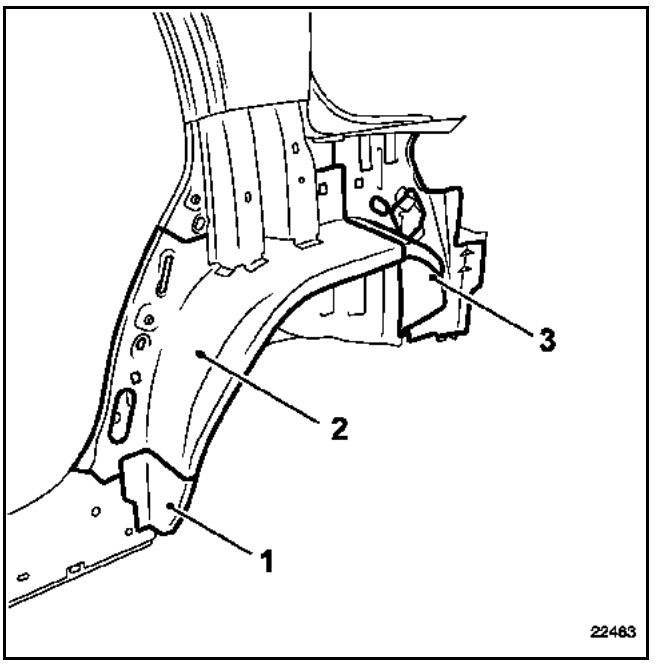
COMPOSITION OF THE REPLACEMENT PART

Part assembled with:
Front section
Rear section
Centre section (right side only)
Welded earth stud
Parcel shelf bridge piece
Lower component
Crimped nut
Welded studs



PARTS CONCERNED (thickness in mm):

1	Rear wheel arch lower component	1.2
2	Rear wheel arch	0.7
3	Rear wheel arch rear section	0.7



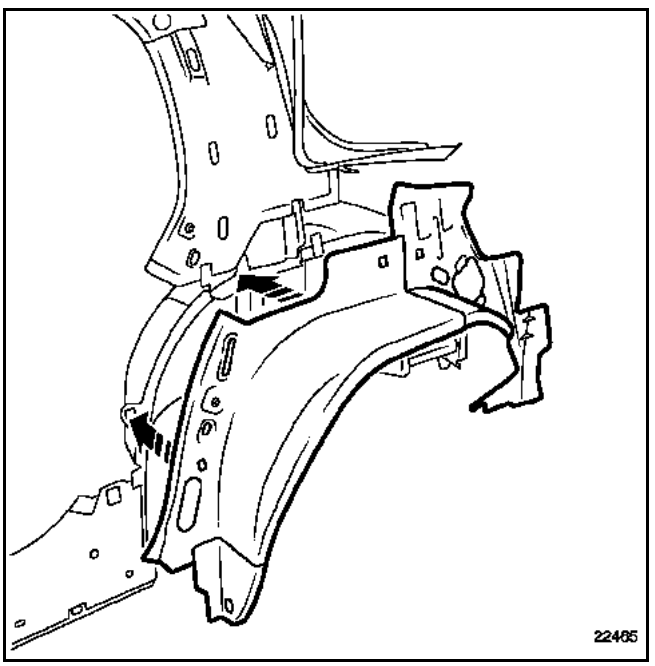
The outer rear wheel arch consists of three sections:
– lower component (1),
– front section (1 and 2),
– rear section (3).

Depending on the level of impact, it is possible to replace only the damaged parts.

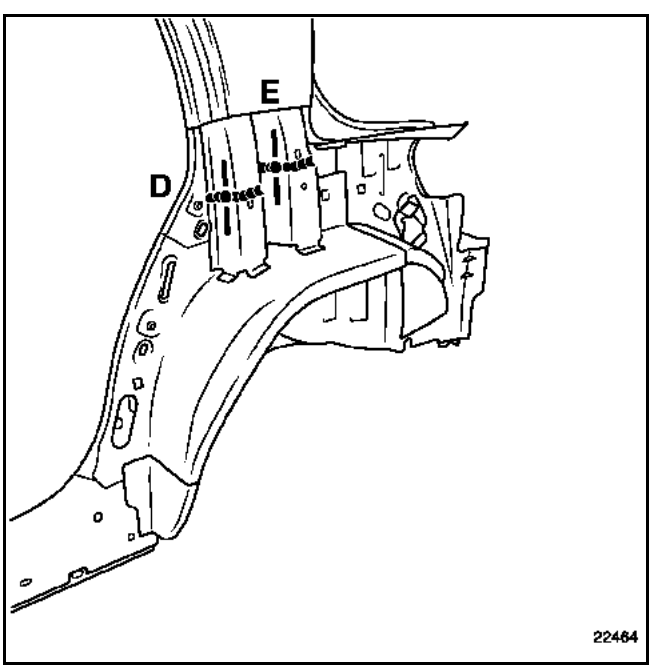
This type of operation requires the removal of the replacement parts from the assembly supplied by the Parts Department.

GETtheMANUALS.org

Complete replacement, complementary to the quarter panel reinforcements and the complete rear wing panel

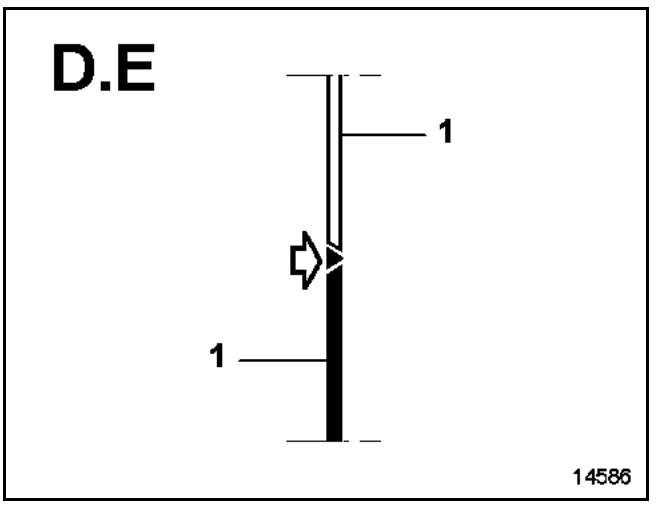


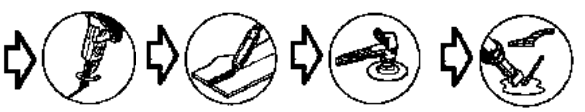
Complete replacement, complementary to the quarter panel reinforcements and the partial removal of the rear wing panel



It is possible to cut both of the quarter panel reinforcements to avoid removing them completely.

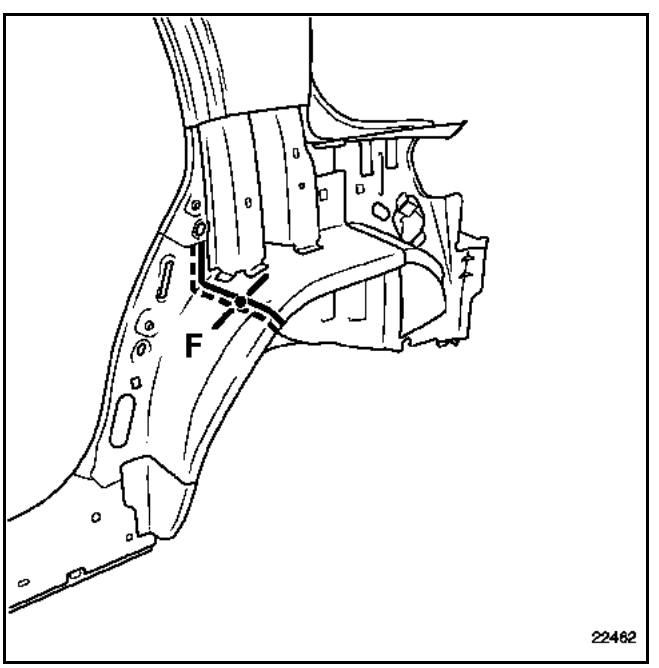
IMPORTANT:
The cuts on the stiffeners should not be made at the same level.

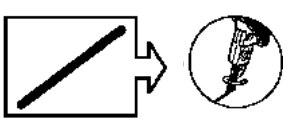




NOTE:
It is recommended that you re-use the stiffeners cut out previously, depending on their condition. If they are not in a satisfactory condition, the reinforcements assembly will also have to be ordered.

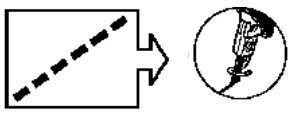
Replacing front sections 1 and 2 using cut (a)



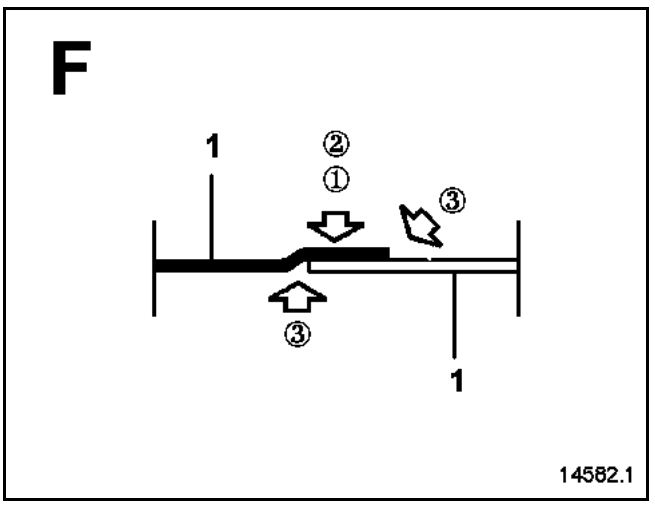


on replacement part

GETtheMANUALS.org



on the vehicle



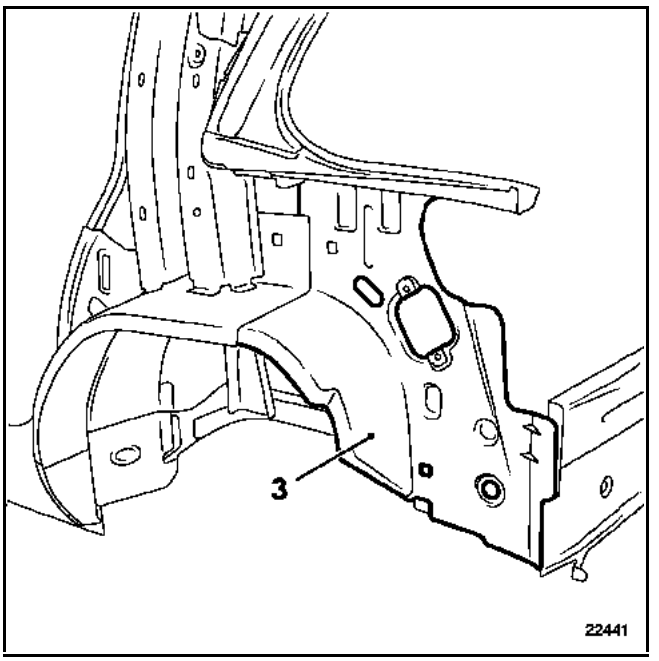
① on replacement part

②

③

NOTE:
The number of plug welds is not specified. It will be necessary to leave a gap of approximately **60 mm** between the welds, then after welding, apply a bead of mastic in the flange (operation ③) to ensure sealing and finish.
Use M.J. Pro type mastic (**part no.: 77 11 172 676**).

Partial replacement (3) for example



GETtheMANUALS.org

The complete replacement of this part is a complementary operation to the replacement of the outer wheel arch for a rear side impact.

The information on the additional parts will be dealt with in their respective chapters (refer to contents).

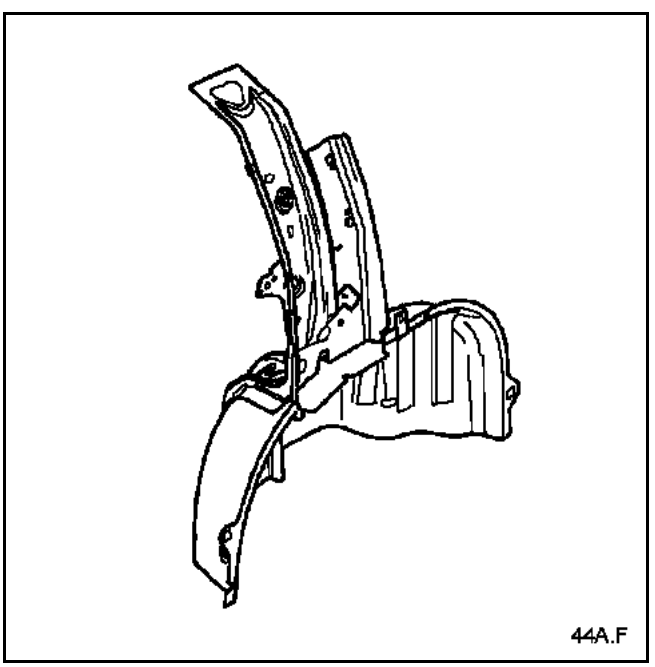
This operation may be carried out in two ways (refer to the procedure given below):
– complete, complementary to the quarter panel lining,
– lower section.

NOTE:
The operations in the method are carried out on the left-hand inner wheel arch. The right-hand side of the vehicle has a slightly different shape due to the fuel reservoir filler neck, but the replacement method is the same.

Where spot welds cannot be made with the spot welder, they can be replaced by plug welds.

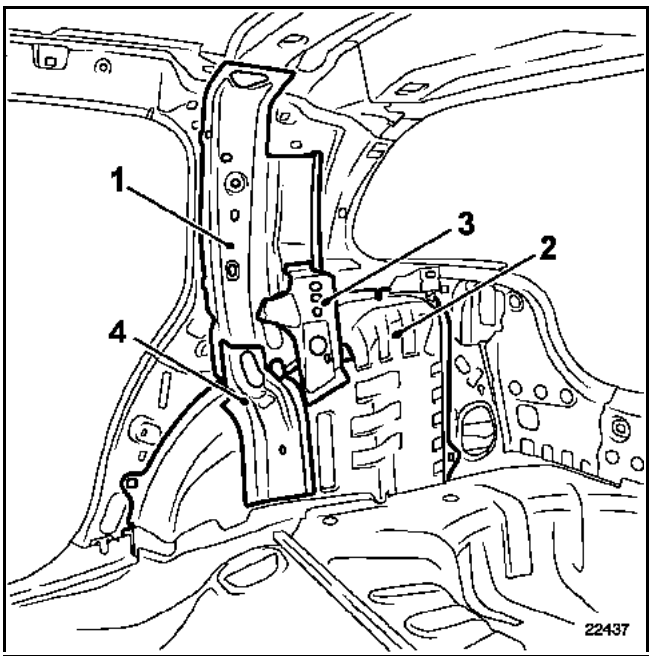
COMPOSITION OF THE REPLACEMENT PART

Part supplied with:
Seatback mounting reinforcement
Inner arch
Wheel arch stiffener
Inner wheel arch
Stiffener
Shock absorber mounting reinforcement
Shock absorber clevis
Nuts



PARTS CONCERNED (thickness in mm):

1	Inner wheel arch	0.7
2	Wheel arch	0.7
3	Seatback mounting reinforcement	1.5
4	Wheel arch reinforcement	1.5



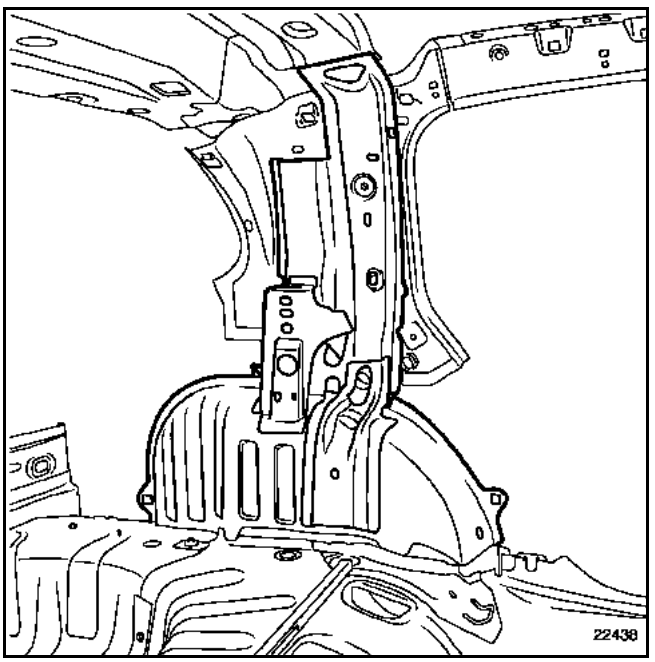
The inner rear wheel arch consists of four sections:
– inner arch (1),
– wheel arch (2),
– seatback mounting reinforcement (3),
– wheel arch reinforcement (4).

Depending on the level of impact, it is possible to replace only the damaged parts.

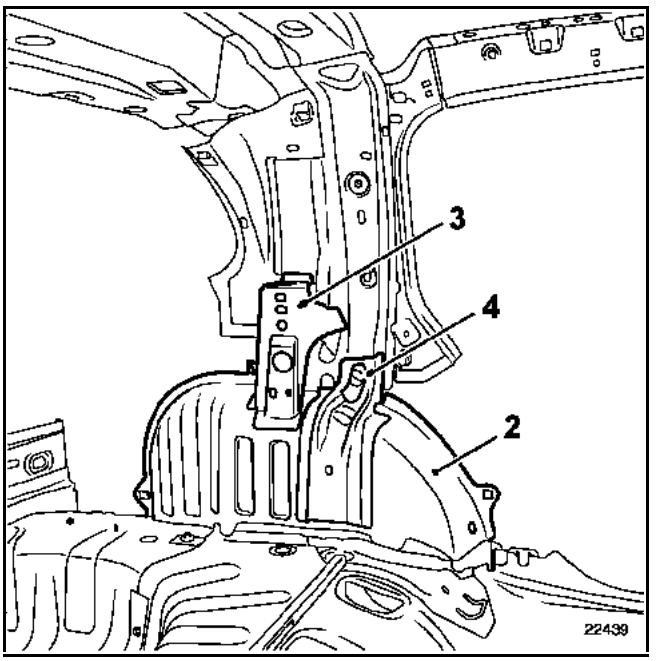
This type of operation requires the removal of the replacement parts from the assembly supplied by the Parts Department.

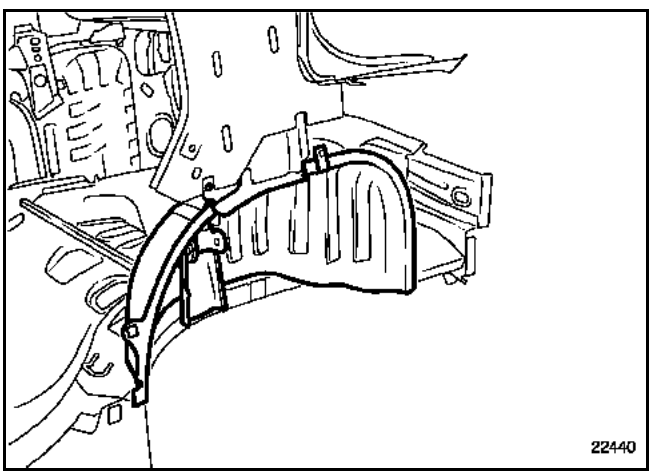
GETtheMANUALS.org

Complete replacement, complementary to the quarter panel lining



Replacing section 2, 3 and 4 for example





GETtheMANUALS.org

The replacement of this part is a complementary operation to the replacement of the outer wheel arch and the quarter panel lower reinforcement for a side impact.

The information on the additional parts will be dealt with in their respective chapters (refer to contents).

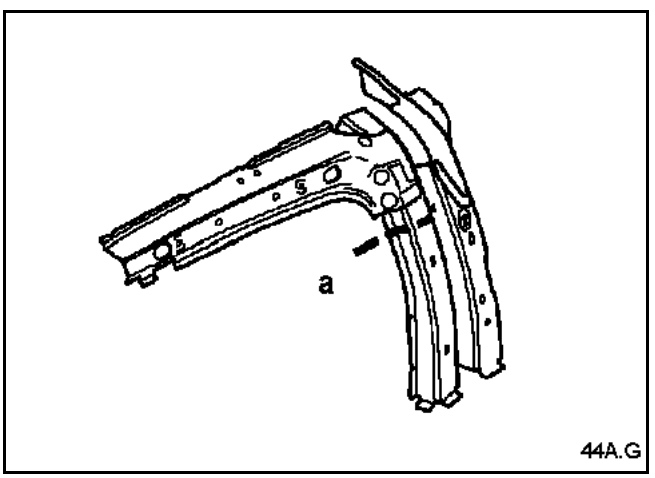
This operation may be carried out in two ways (refer to the procedure given below):
– complete, complementary to the roof panel and the rear outer wheel arch,
– sections 1 and 2 using cut (a), with the rear outer wheel arch, avoiding the removal of the roof panel,
– section 3, with the roof panel and body top.

NOTE:
The operations in the procedure are carried out on the left-hand part. The right-hand side of the vehicle has a slightly different shape, but the replacement method is the same.

Where spot welds cannot be made with the spot welder, they can be replaced by plug welds.

COMPOSITION OF THE REPLACEMENT PART

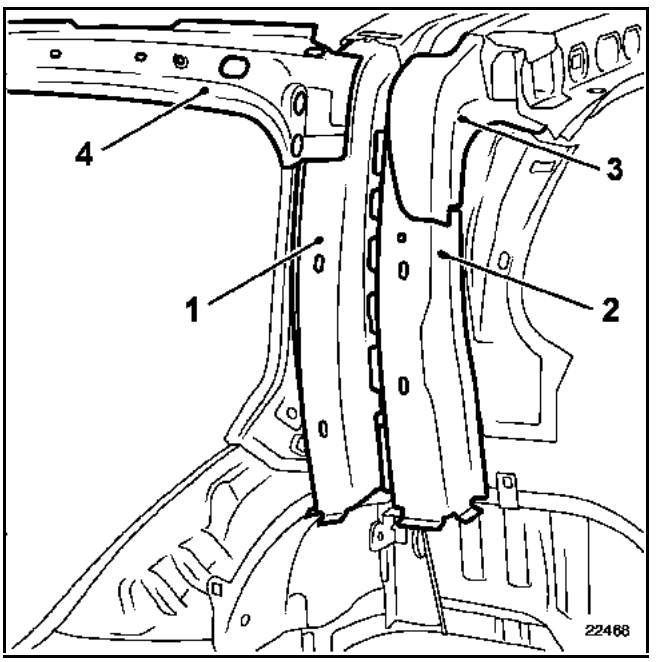
Part assembled with:
Roll bar extender
Roof drip moulding reinforcement
Front reinforcement
Rear reinforcement



PARTS CONCERNED (thickness in mm):

1	Front quarter panel reinforcement	1
2	Rear quarter panel reinforcement	1
3	Roll bar extender	1.5
4	Roof drip moulding reinforcement	1

Complete replacement complementary to roof panel and outer rear wheel arch



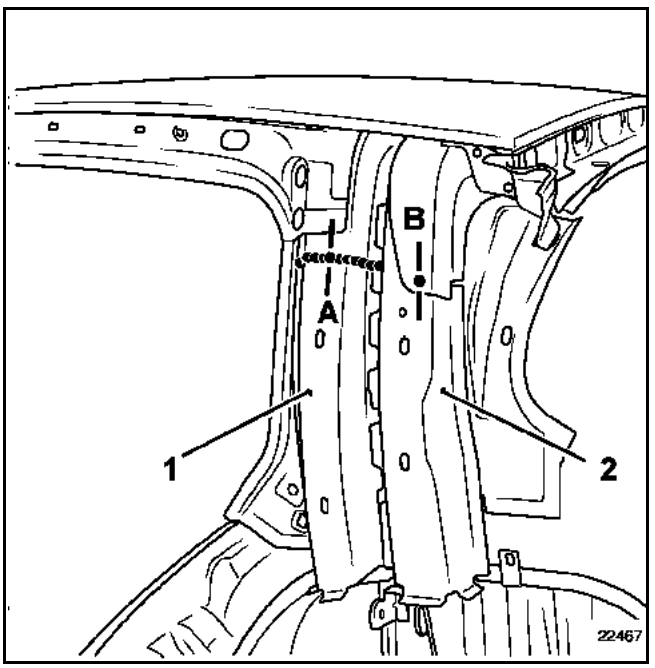
The quarter panel channel consists of several components:
– Front reinforcement (1),
– Rear reinforcement (2),
– Roll bar extender (3),
– Roof drip moulding reinforcement (4).

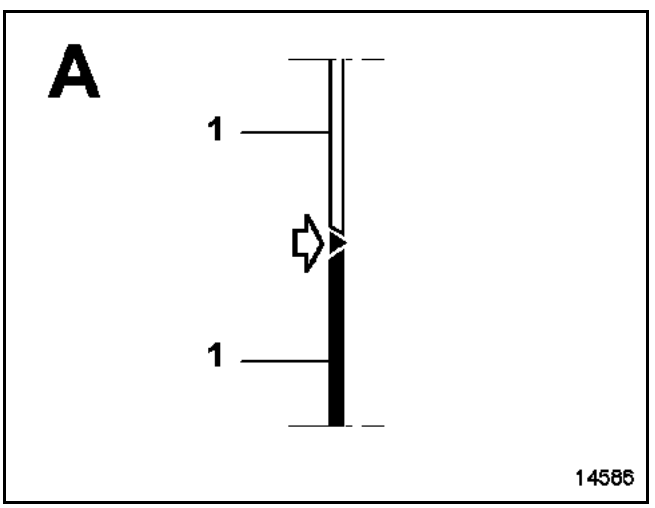
Depending on the level of impact, it is possible to replace only the damaged parts.

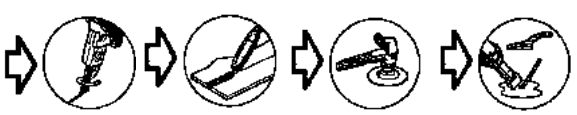
This type of operation requires the removal of the replacement parts from the assembly supplied by the Parts Department.

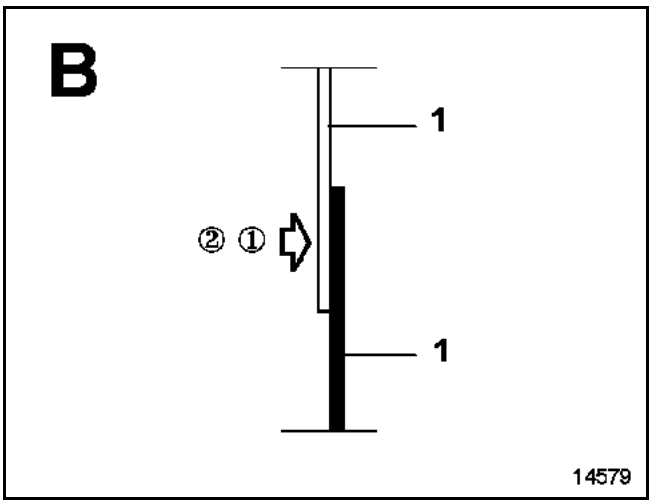
GETtheMANUALS.org

Replacing sections 1 and 2 in using cut (a) with the outer rear wheel arch





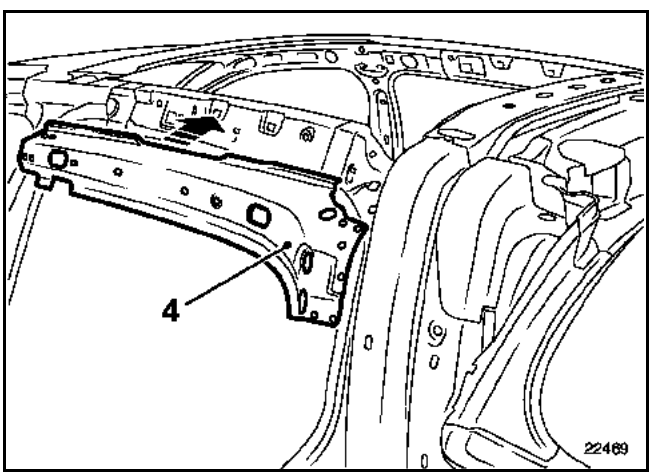




① on the vehicle

② X4

Replacing section 3 complementary to the removal of roof panel and body top, for example



GETtheMANUALS.org

The replacement of this part is a complementary operation to the replacement of the quarter panel reinforcement for a rear side impact.

The information on the additional parts will be dealt with in their respective chapters (refer to contents).

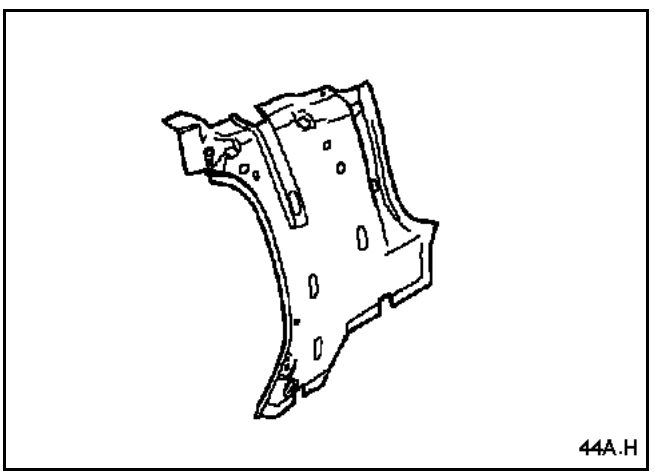
NOTE:
The operation presents no particular difficulties.

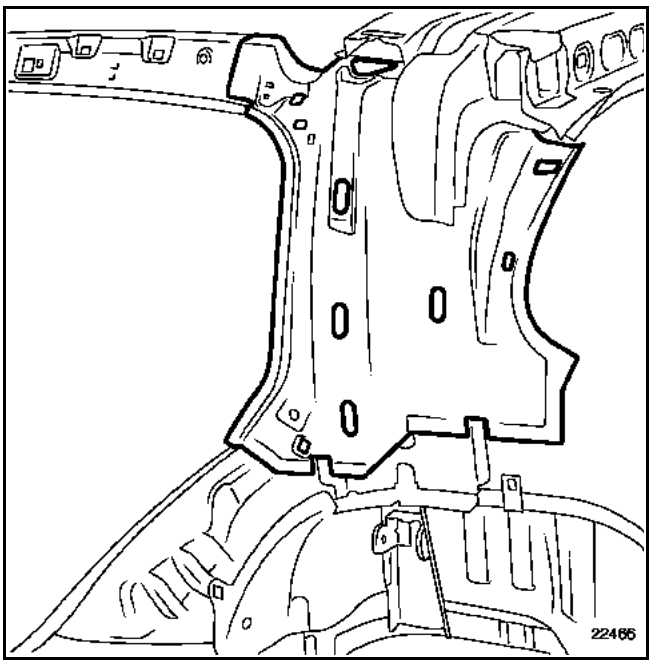
You will find one or more drawings of the part either on the vehicle or removed from it in the method for your information.

Where spot welds cannot be made with the spot welder, they can be replaced by plug welds.

COMPOSITION OF THE REPLACEMENT PART

Part supplied with crimped nut.





GETtheMANUALS.org

The replacement of this part is a complementary operation to the replacement of the end panel for a rear side impact and to the replacement of the rear wing panel for a rear side impact.

The information on the additional parts will be dealt with in their respective chapters (refer to contents).

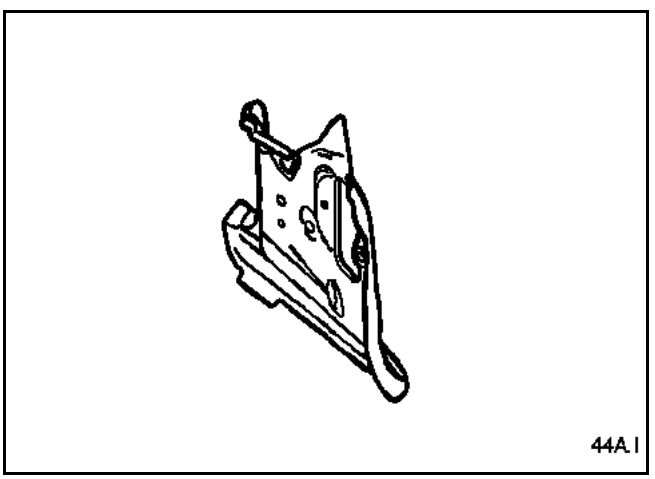
NOTE:
The operation presents no particular difficulties.

You will find one or more drawings of the part either on the vehicle or removed from it in the method for your information.

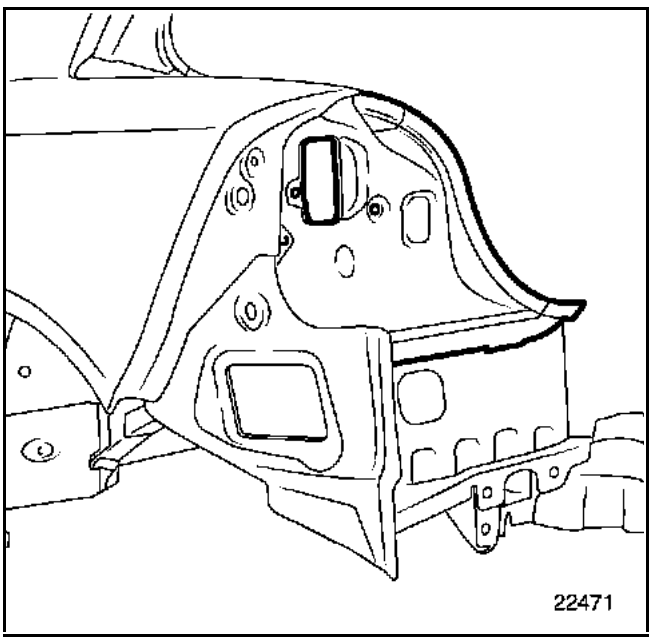
Where spot welds cannot be made with the spot welder, they can be replaced by plug welds.

COMPOSITION OF THE REPLACEMENT PART

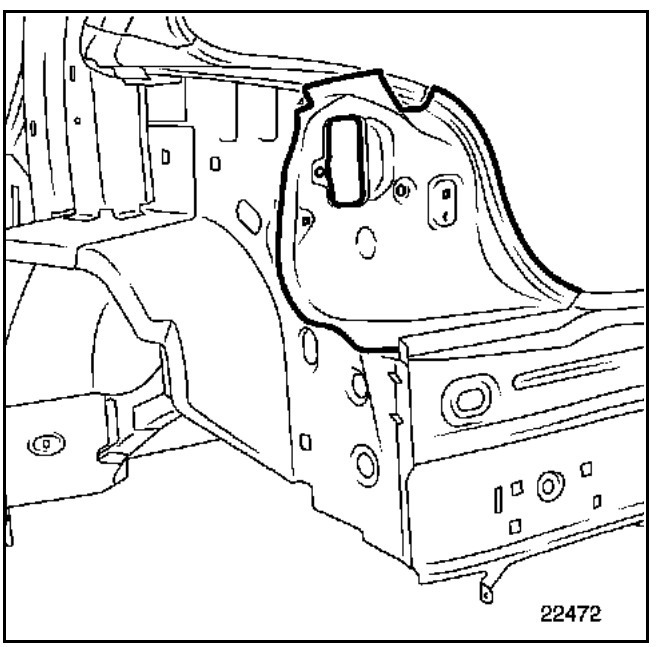
Part supplied with:
Tailgate centring fitting reinforcement
Plate cage
Pad
Welded earth stud



Replacement can be carried out when replacing the end panel



Replacement can be carried out when replacing the rear wing panel



GETtheMANUALS.org

The replacement of this part is a basic operation for a rear impact.

The information on the additional parts will be dealt with in their respective chapters (refer to contents).

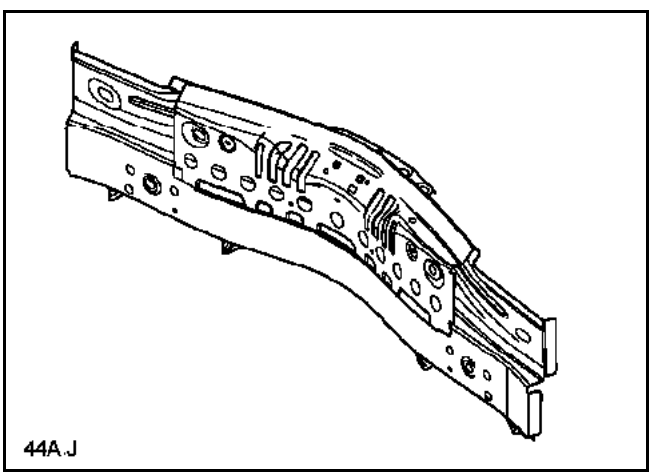
NOTE:
The operation presents no particular difficulties.

You will find one or more drawings of the part either on the vehicle or removed from it in the method for your information.

Where spot welds cannot be made with the spot welder, they can be replaced by plug welds.

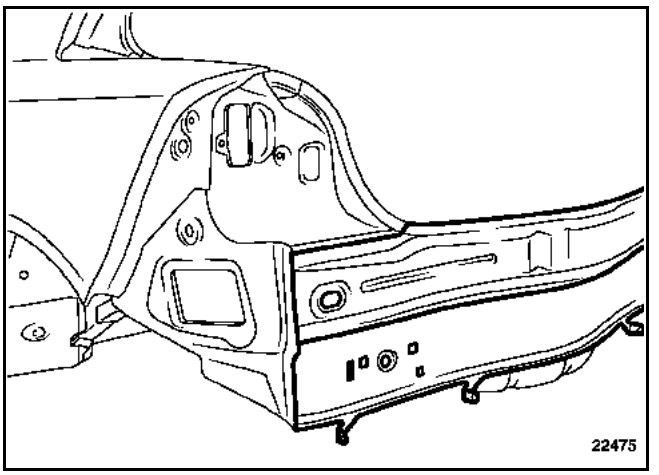
COMPOSITION OF THE REPLACEMENT PART

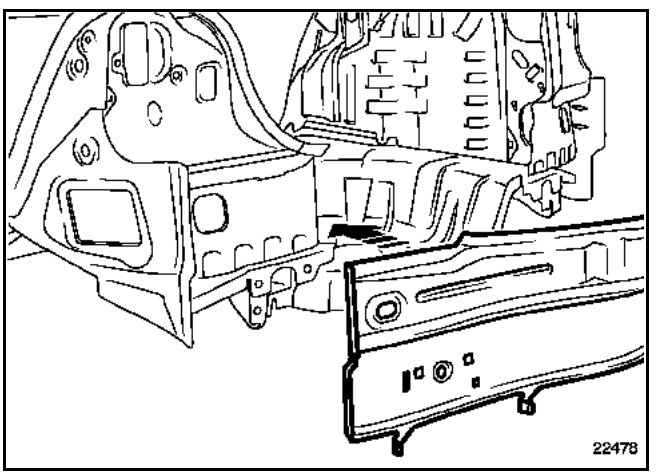
Part supplied with:
Rear skirt
End panel lining
Rear end cross member
Striker support
Crimped nuts
Bumper mounting



PARTS CONCERNED (thickness in mm):

1	Rear end panel lining	0.7
2	Rear end panel side lining	1





GETtheMANUALS.org

 X2 L 30

NOTE:
The two weld beads are applied on each side from inside the vehicle.

GETtheMANUALS.org

The replacement of this part is a basic operation for a rear side collision.

The information on the additional parts will be dealt with in their respective chapters (refer to contents).

This operation may be carried out in two ways (refer to the procedure given below):
– complete,
– along cut (a).

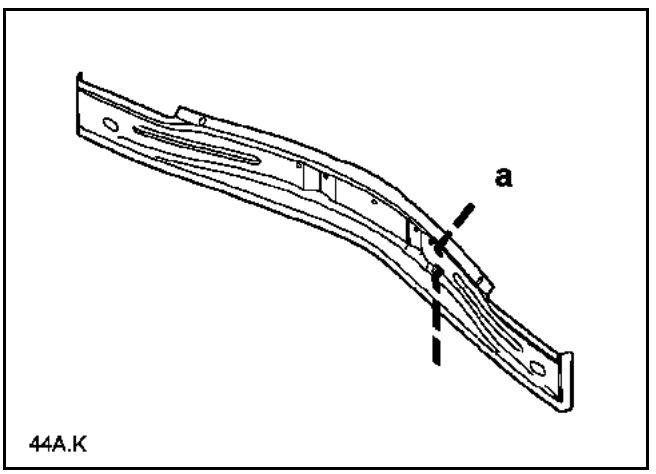
NOTE:
The operation presents no particular difficulties.

You will find one or more drawings of the part either on the vehicle or removed from it in the method for your information.

Where spot welds cannot be made with the spot welder, they can be replaced by plug welds.

COMPOSITION OF THE REPLACEMENT PART

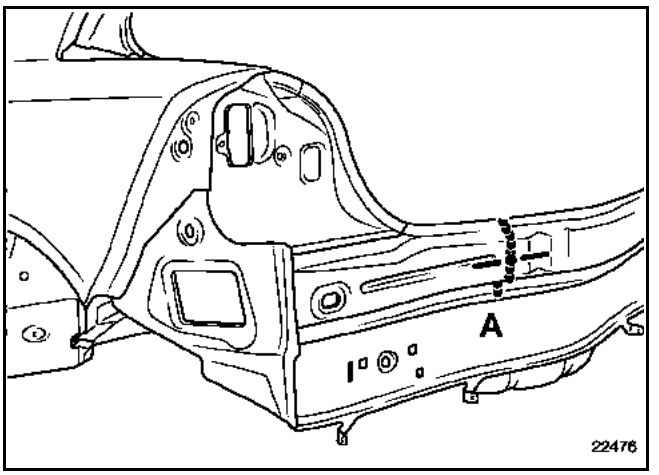
Part supplied on its own.

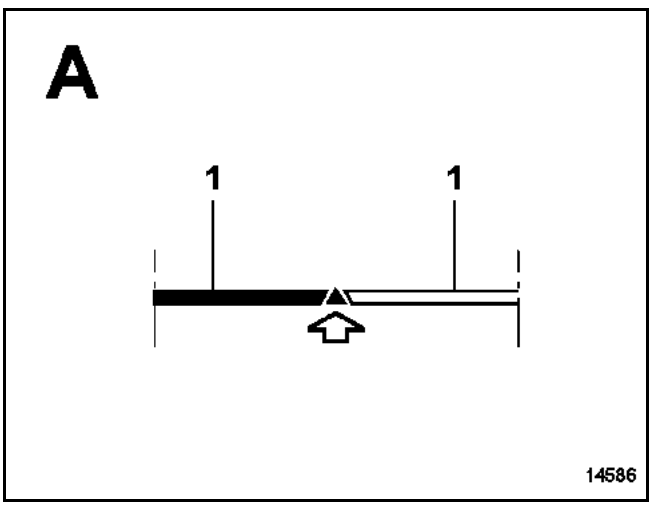


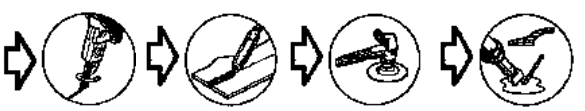
PARTS CONCERNED (thickness in mm):

1 Rear end panel 0.7

Replacment according to cut a



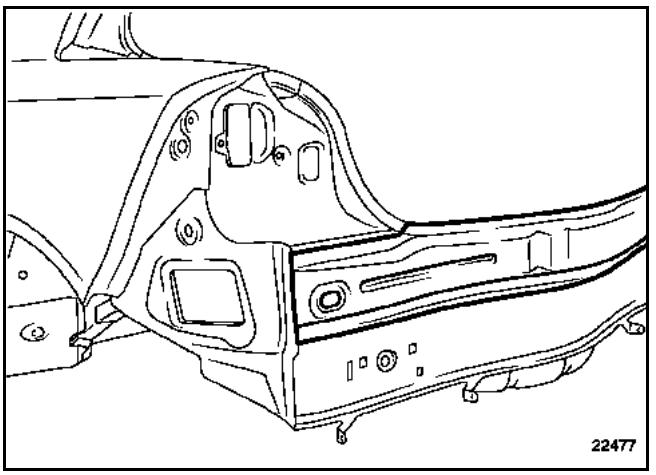


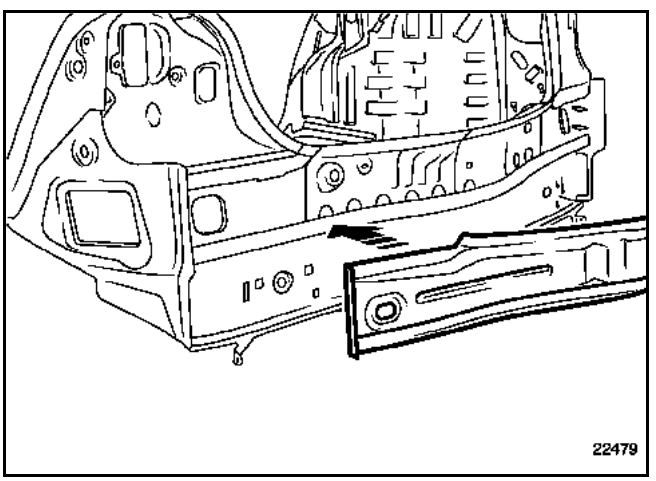


NOTE:
The position of the cut may vary depending on the section to be replaced. It should not be made on a slot.

GETtheMANUALS.org

Complete replacement





GETtheMANUALS.org

The replacement of this part is a complementary operation to the replacement of the end panel for a rear impact or the light support for a side impact.

The information on the additional parts will be dealt with in their respective chapters (refer to contents).

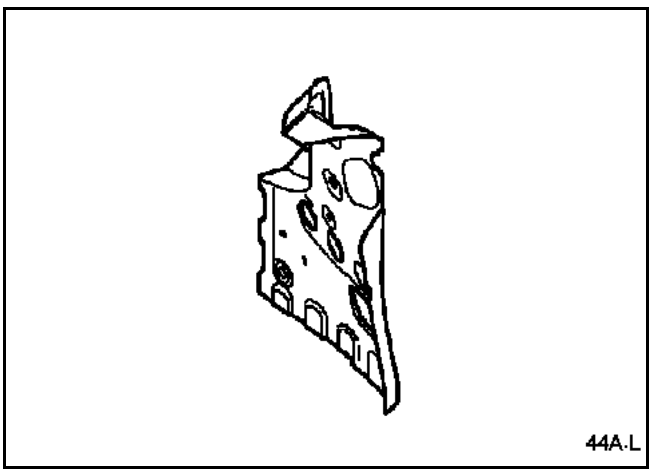
NOTE:
The operation presents no particular difficulties.

You will find one or more drawings of the part either on the vehicle or removed from it in the method for your information.

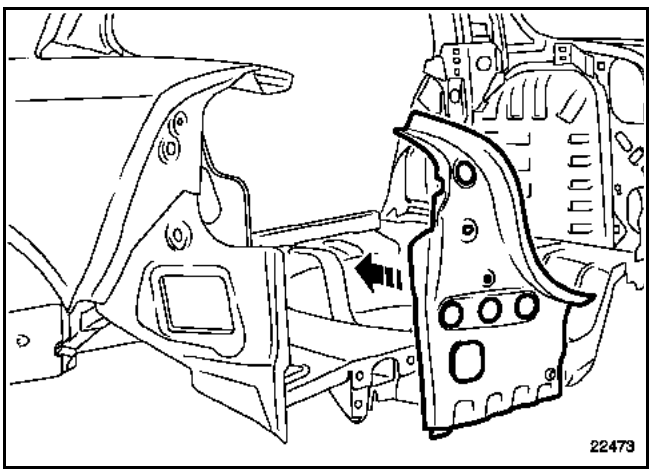
Where spot welds cannot be made with the spot welder, they can be replaced by plug welds.

COMPOSITION OF THE REPLACEMENT PART

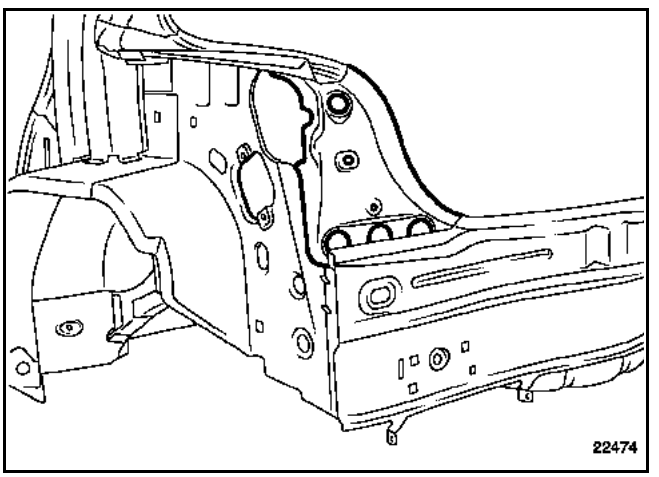
Part supplied with crimped nut.



Replacement can be carried out when removing the rear end panel assembly



Replacement can be carried out when removing the light support without removing the rear end panel



GETtheMANUALS.org

The replacement of this part is a basic operation for a rear impact.

The door is a removable component.

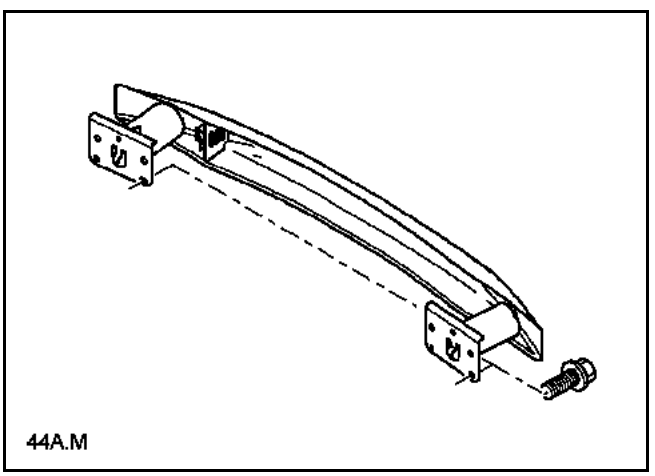
In the operation described below, there are only descriptions of the connections specific to the part concerned.

The information on the additional parts will be dealt with in their respective chapters (refer to contents).

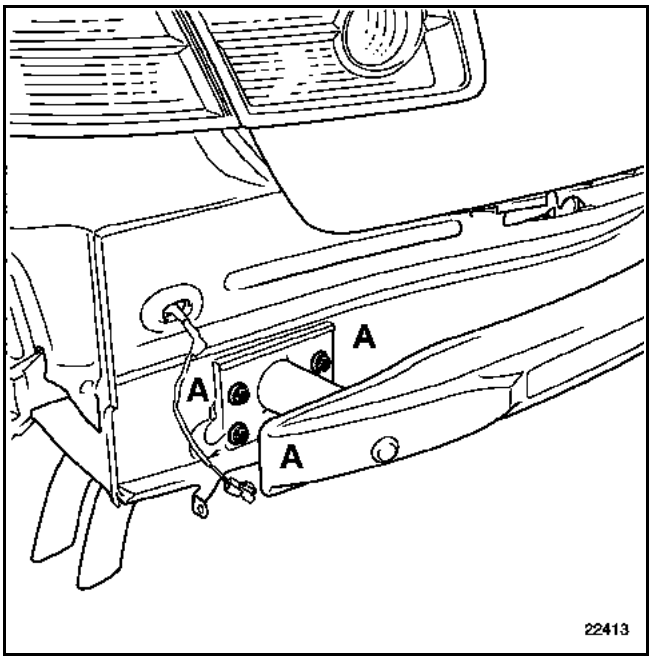
NOTE:
The part supplied by the Parts Store is black and does not need painting when fitted.

COMPOSITION OF THE REPLACEMENT PART

Part supplied with:
Rear end cross member
Shock absorber housing
Housing mounting
Towing hitch tapped ring
Bracket reinforcement
Flanges



TIGHTENING TORQUE (in daNm)	
Cross member bolt A	4.2



REMOVAL
Removal is by means of side mounting bolts (A) (three on each side).

REFITTING

IMPORTANT: the crossmember contributes to the rigidity of the structure. Therefore, after carrying out any work on it is essential to adhere to the tightening torques.

GETtheMANUALS.org

Replacing this part is a basic operation.

In the procedure described below, you will find only the descriptions and the joints which are specific to the part concerned.

The information on the additional parts will be dealt with in their corresponding sections (refer to contents).

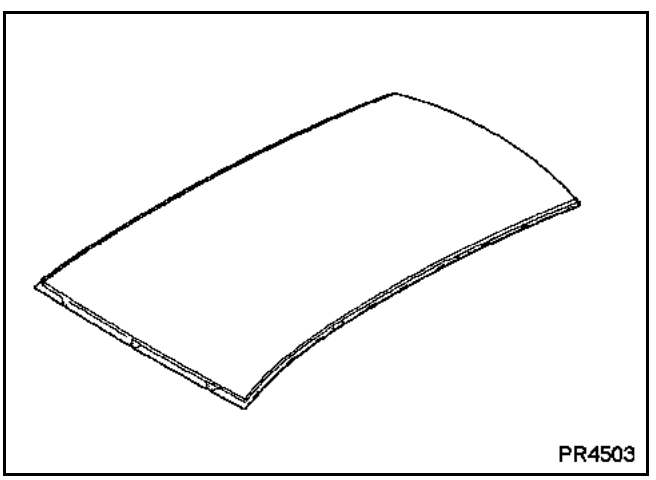
NOTE: this operation raises no particular difficulties.

Where spot welds cannot be made with the electric spot welder, they can be replaced by plug welds.

Bonds must be made using setting adhesive: **M. J. Pro (part number: 77 11 172 676).**

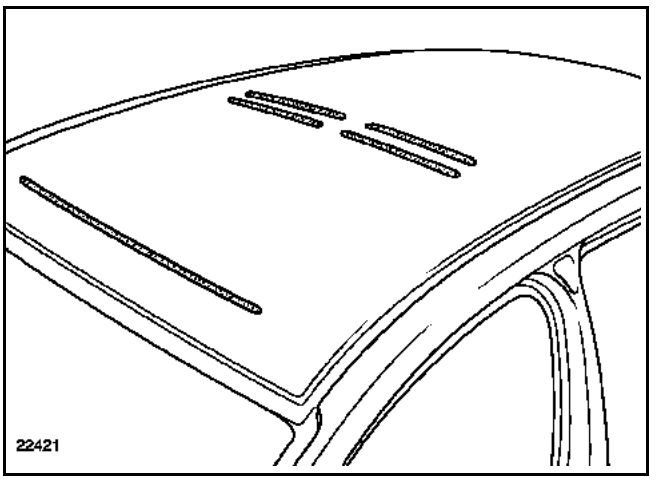
COMPOSITION OF THE PART FROM THE PARTS DEPARTMENT

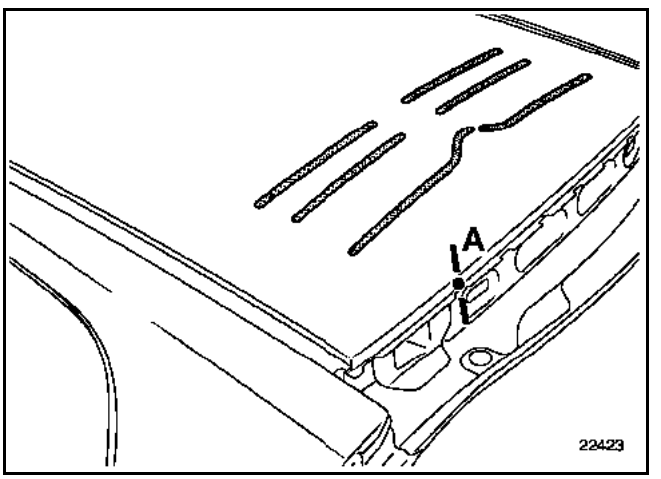
Part supplied on its own.

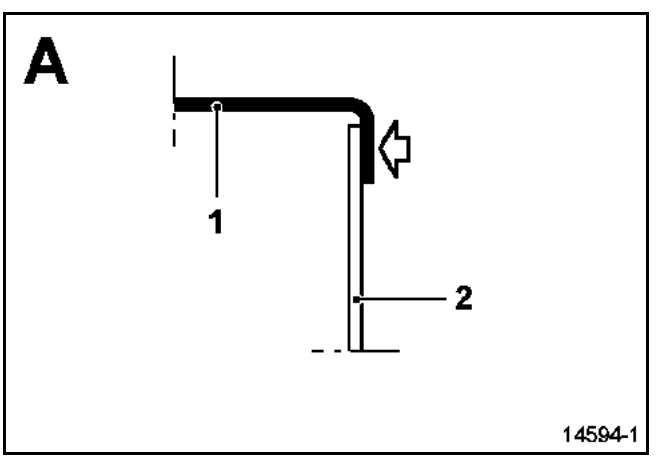


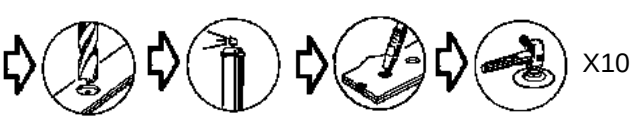
PARTS CONCERNED (thickness in mm):

1	Roof	0.9
2	Roof rear cross member	1



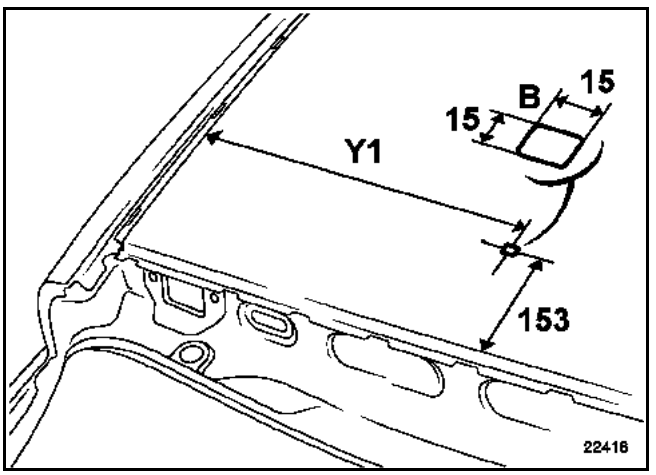






GETtheMANUALS.org

Adaptation for versions with aerials



NOTE: for reasons of standardisation, the Parts Department supplies only roofs without pre-drilled holes.

Therefore, for the aerial version it is neccessary to:

1 Either make a square slot (B) following the dimensions marked on the diagram.
Y1 = 497 mm (the length of each side must be the same).

2 Or make only one hole.

IMPORTANT: in the second method, the joint must be sealed with mastic filler before final fitting of the aerial, (refer to **Technical Note no. 396A**).

REMINDER: anti-corrosion protection is vital for all operations which expose the bare metal of the bodywork.

Protect against corrosion by applying the following products:

Pre-treatment primer	**77 01 423 933**
Reactive thinner	**77 01 423 955**

GETtheMANUALS.org

The replacement of this part is a complementary operation to the replacement of the roof.

It is part of the process of the first method (see introduction **section 40A-C "Description of parts"**).

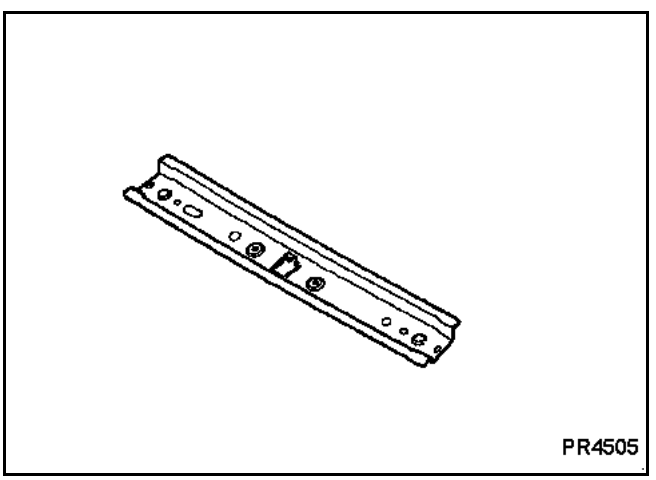
For information purposes, there is a diagram of the part fitted to the vehicle in the procedure.

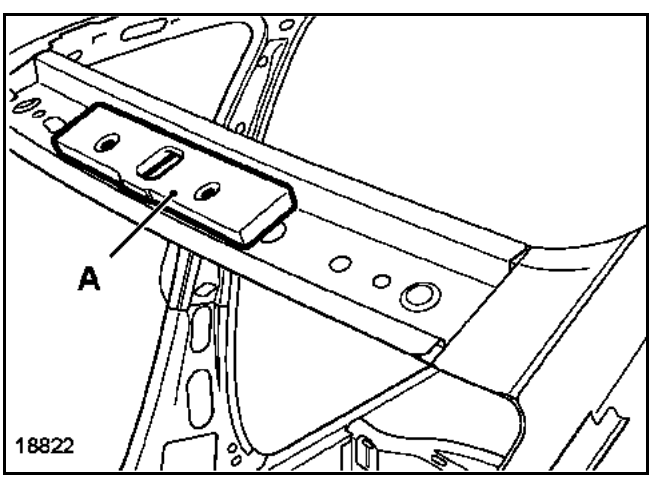
The information on the additional parts will be dealt with in their respective sections (refer to contents).

NOTE: there is no specific procedure for replacing this part, and joints can all be made as originally.

COMPOSITION OF THE PART FROM THE PARTS DEPARTMENT

Assembled part with:
Cross member closure panel





WARNING: sound insulation (A) must be fitted before the roof is refitted.

GETtheMANUALS.org

The replacement of this part is a complementary operation to the replacement of the roof.

For information purposes, there is a diagram of the part fitted to the vehicle in the procedure.

The information on the additional parts will be dealt with in their corresponding sections (refer to contents).

The information on the additional parts will be dealt with in their corresponding sections (refer to contents).

NOTE: there is no specific procedure for replacing this part, and joints can all be made as originally.

COMPOSITION OF THE PART FROM THE PARTS DEPARTMENT

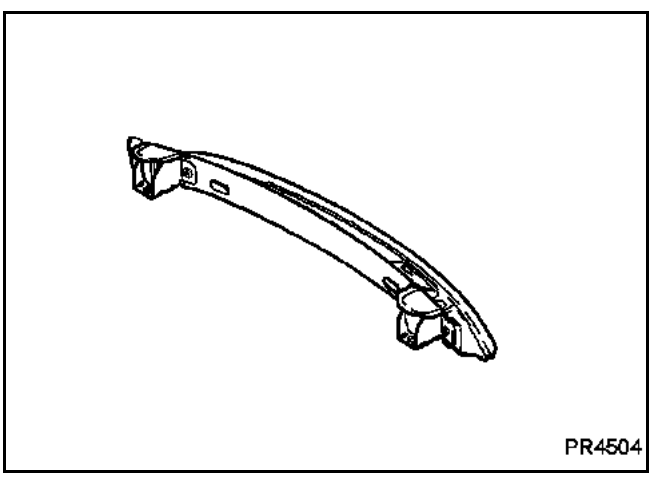
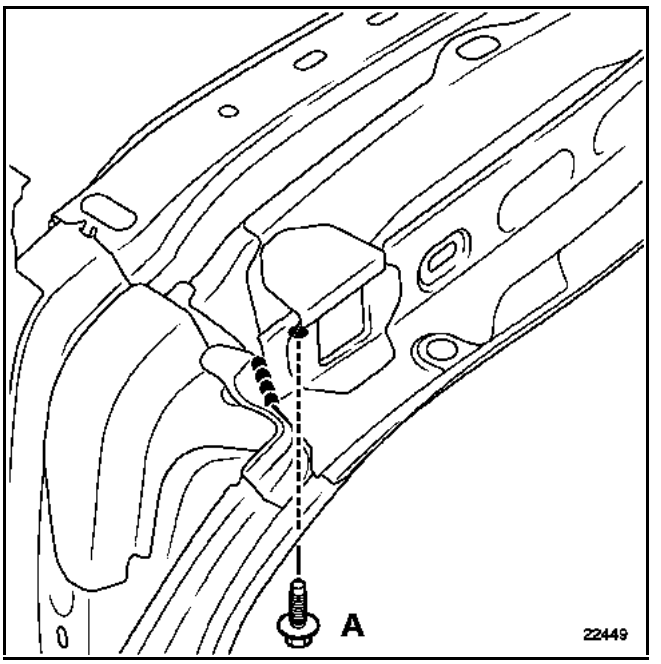
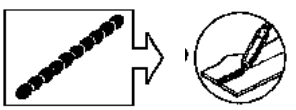
Part assembled with:
Casing closure panel components
Casings
Cross member
Tailgate hinge mounting brackets
Crimped nuts

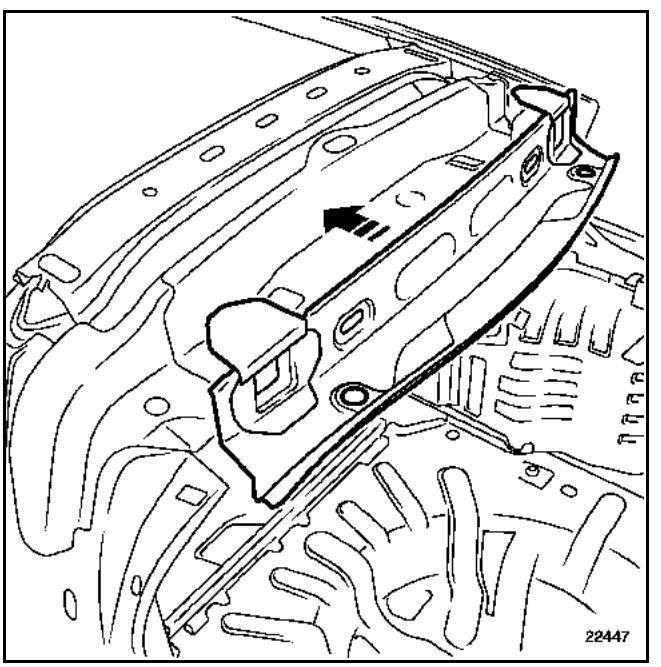






NOTE: the bead is applied to both sides.

Remove lower mounting bolts (A) from each side.



GETtheMANUALS.org

The replacement of this part is a complementary operation to the replacement of the roof.

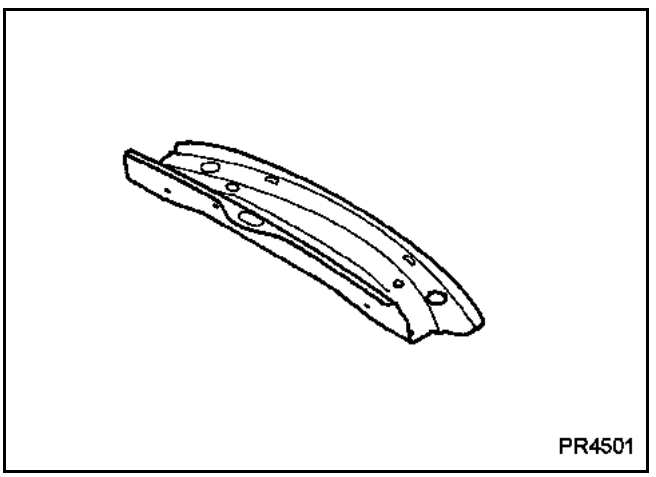
The information on the additional parts will be dealt with in their corresponding sections (refer to contents).

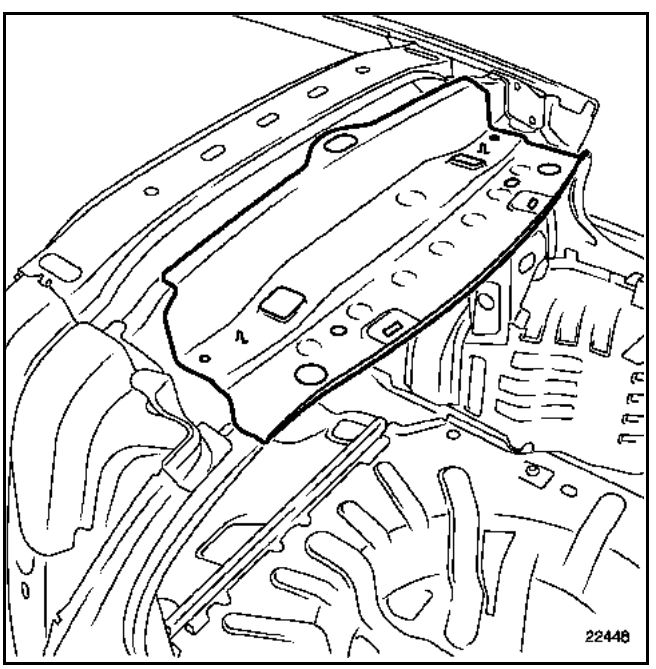
NOTE: there is no specific procedure for replacing this part, and joints can all be made as originally.

For information purposes, there is a diagram of the part fitted to the vehicle in the procedure.

COMPOSITION OF THE PART FROM THE PARTS DEPARTMENT

Assembled part.





GETtheMANUALS.org

The replacement of this part is a basic operation for a side impact.

It is a removable aluminium structural component.

Information on dismantling or additional parts is dealt with in their respective sections.

NOTE: The removal/refitting operations present no specific problems and only the adjustment options are described in the procedure.

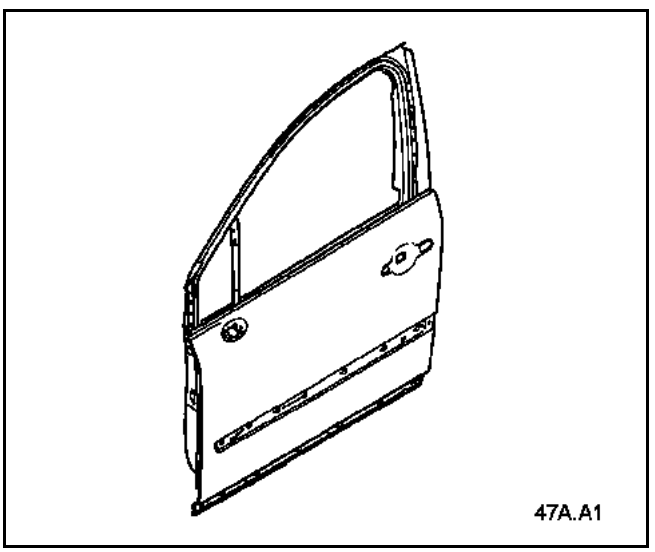
All clearances are given in **section 40A-E**.

To repair the aluminium, refer to
Technical Note 527A.

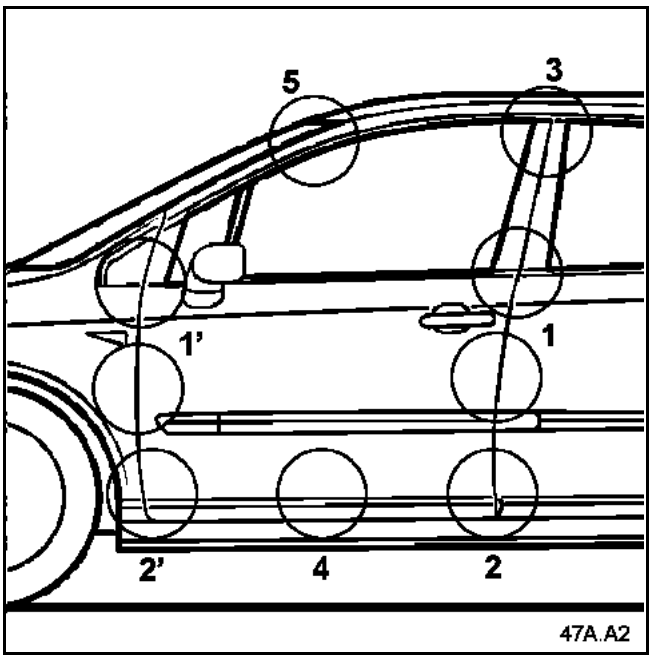
REMINDER:
Use only tools, abrasive discs and abrasives designed for repairing aluminium, to avoid any contamination by steel particles, which would cause galvanic corrosion.
The sensor and filtration systems must be adapted to the aluminium and must never be contaminated, even slightly, by steel dust.

COMPOSITION OF THE REPLACEMENT PART

Part supplied whole with its soundproofing plates.



ADJUSTMENT ZONES



1. FITTING THE DOOR

This operation can be carried out single-handed using the door mounting tool.
Renault approval no.: **661000**
Supplier: **Z INTERNATIONAL**
Part Number: **SUP01**
otherwise two people are needed to put the door in place.

REMINDER: before final refitting, the area between the A-pillar and the hinges must be sealed again with mastic (refer to **technical note n° 396A**).

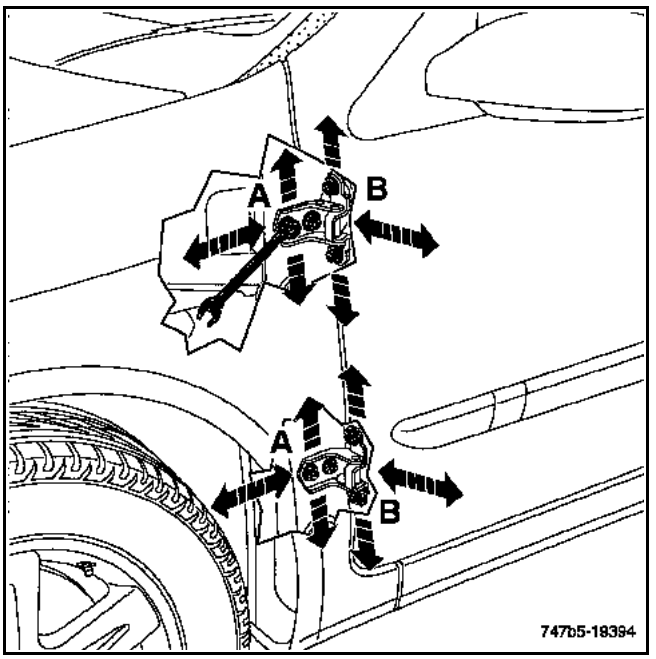
Finger tighten all mountings without tightening them.

Fit all the parts to the door

Remove the striker before adjusting the hinges.

GETtheMANUALS.org

2. SETTINGS



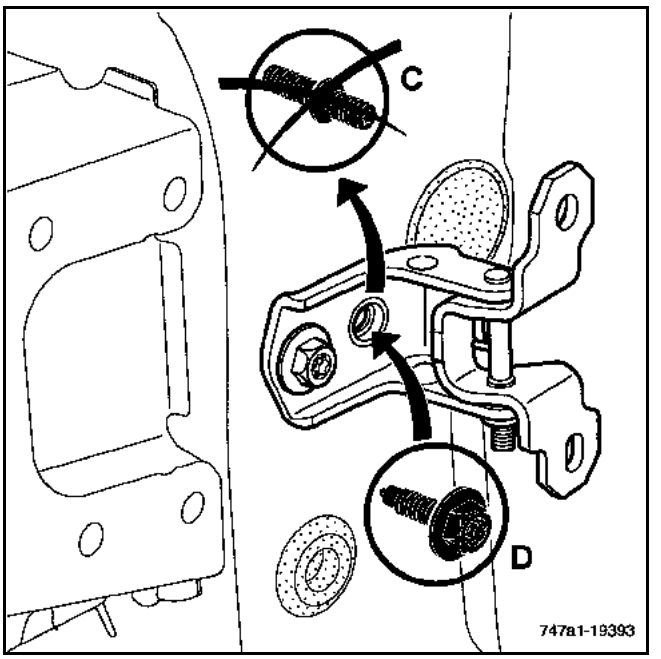
All door gap adjustments (zones 1 to 5, see introduction) are made using the hinge mounting bolts (A) and (B).

REMINDER: front to back adjustment (**OX**) of the door is performed using only hinge mounting bolts (A) on the A-pillar.

Check the adjustments and tighten in position.

NOTE: the hinge mountings on the pillar can be accessed with a flat spanner after removing the front wheel arch liner.

Special note on the upper hinge:



To allow the opening element to be replaced during repair, it is necessary to replace the original indexing bolts (C) with a special After Sales bolt (D) part no.: **77 03 002 296**.

To adjust the door clearance (**OY**), the hinge holes on the door box section side can be counter-drilled to **∅ 12 mm** if necessary.

REMINDER: anti-corrosion protection is vital for all operations which expose the bare metal of the bodywork.

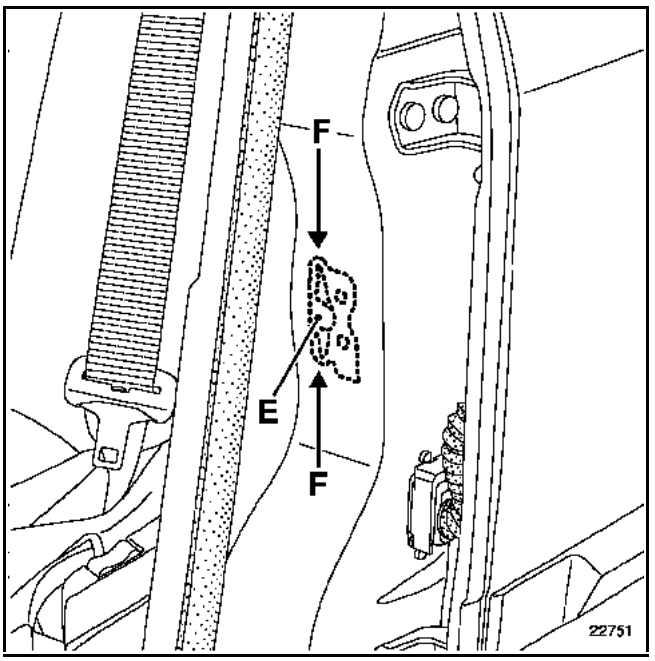
Protect against corrosion by applying the following products:

Pre-treatment primer	**77 01 423 933**
Reactive thinner	**77 01 423 955**

NOTE: after sales hinges are delivered with square slots which allow adjustment to be carried out.

GETtheMANUALS.org

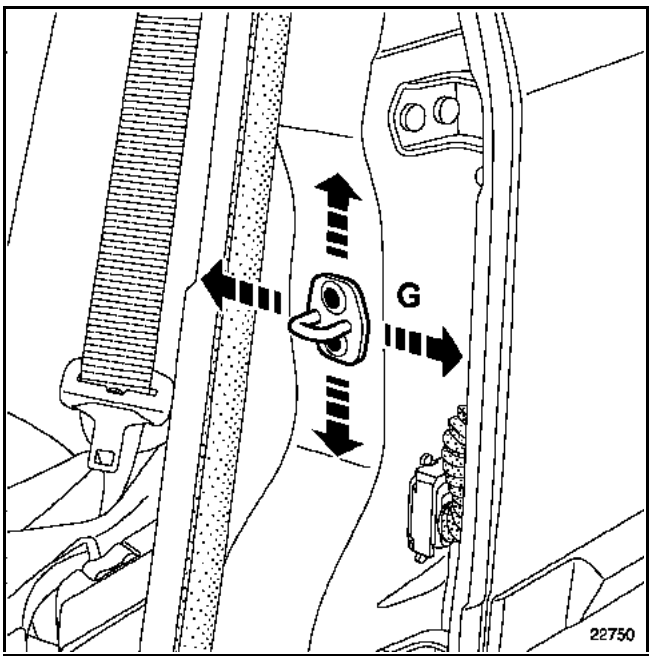
Special notes on the striker plate



The striker plate is welded at point (E) on the reinforcement inside the B-pillar.

To carry out adjustments, it is necessary to bend the fuse sections (F) of the plate.

This operation can only be performed by exerting a relatively strong force on the striker (e.g. by using a hammer.



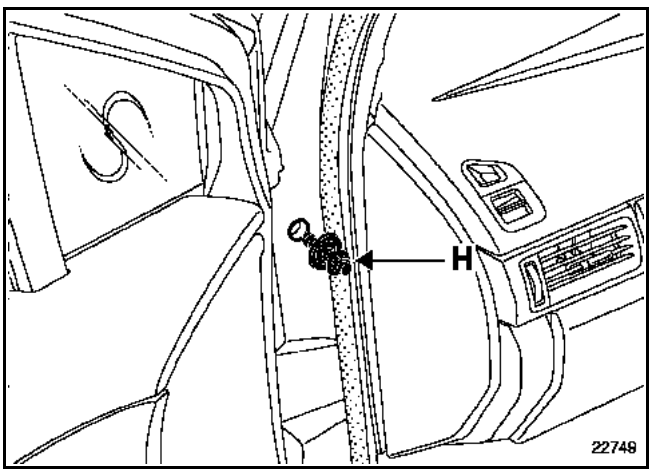
This operation consists of adjusting the flushness, beading and firmness of closure.

To do this, untighten the screws (G) and move the striker, following the direction of the arrows.

Check the adjustment and tighten the door in position.

GETtheMANUALS.org

3 PASSIVE SAFETY



IMPORTANT: at the end of the operation, check the presence and condition of the door-retention device (H).

REMINDER: the function of this part is essential in the event of frontal impact. the door-retention device keeps the door in its longitudinal plane, thereby absorbing impact energy efficiently.

TIGHTENING TORQUE (in daNm)	
Door-retention device bolts	**0.8**

GETtheMANUALS.org

The replacement of this part is a basic operation for a side impact.

Information on dismantling or additional parts is dealt with in their respective sections.

It is an aluminium structural component.

To repair the aluminium, refer to
Technical Note 527A.

REMINDER:
Use only tools, abrasive discs and abrasives designed for repairing aluminium to avoid any contamination by steel particles, which would cause galvanic corrosion.
The sensor and filtration systems must be adapted to the aluminium and must never be contaminated, even slightly, by steel dust.

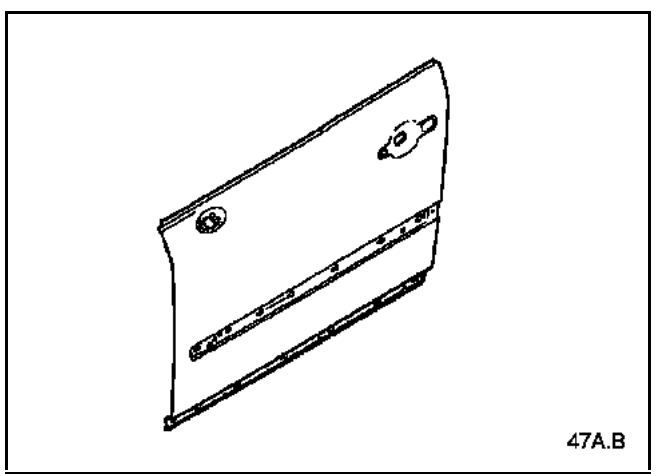
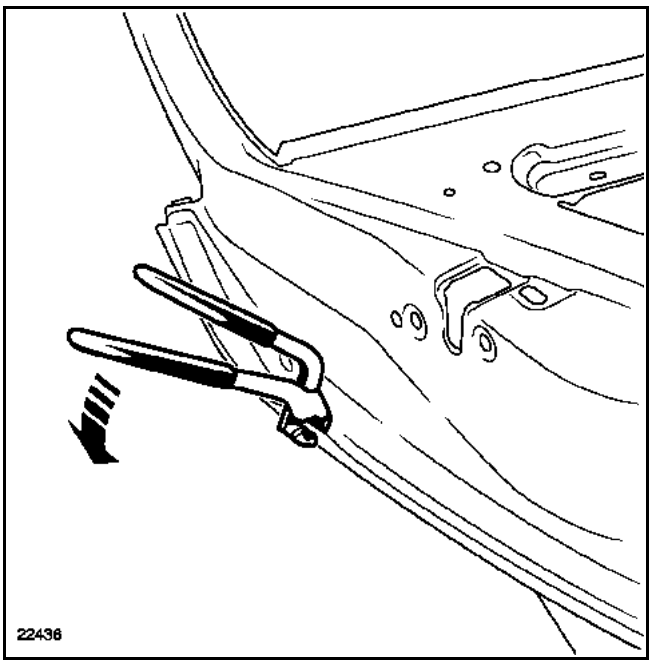
Part supplied with:
Upper reinforcement
Panel stiffener
Soundproofing plates
Handle reinforcement
Rivets
Pre-formed mastic



47A.B

PARTS CONCERNED (thickness in mm):

1	Door panel	1.1
2	Door box section	1.2
3	Panel stiffener	2

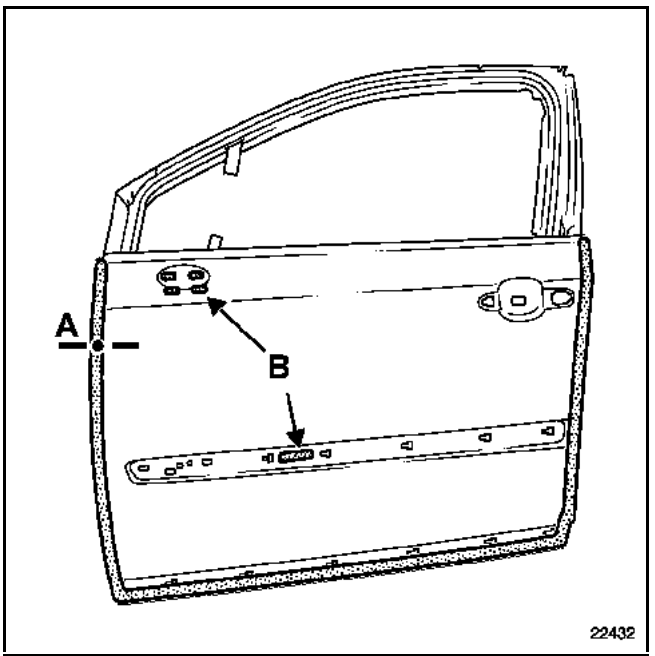


22436

IMPORTANT: the door panel should be removed with the special uncrimping tool part no.: **CAR. 1657**.

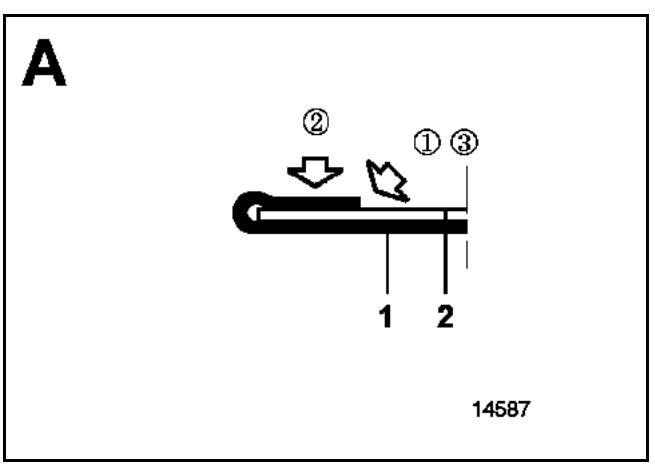
It is forbidden to use the angle grinder in the absence of sensor and filtration systems which are not adapted to aluminium.

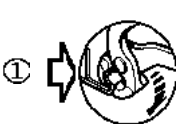
GETtheMANUALS.org

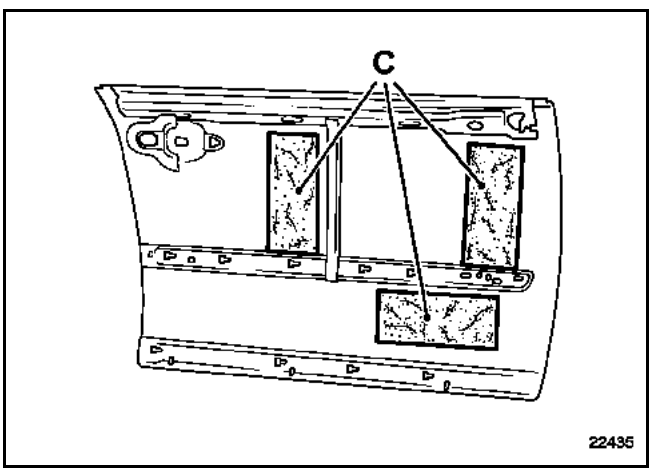


NOTE: it is necessary to use a bi-composite structural adhesive designed for aluminium on the edge (crimping zone), **part no.: 77 11 219 885.**

For zones (B), use a setting adhesive type **MJPro** (**part no.: 77 11 172 376**).







IMPORTANT: ensure that panel soundproofing plates are fitted (C).

If it is necessary to even partially remove one or more soundproofing plates, they should be systematically replaced.

For information, the dimensions of the plates (C) are **130 x 300 mm.**

GETtheMANUALS.org

The replacement of this part is a basic operation for a side impact.

It is a removable aluminium structural component.

Information on dismantling or additional parts is dealt with in their respective sections.

NOTE: The removal/refitting operations present no specific problems and only the adjustment options are described in the procedure.

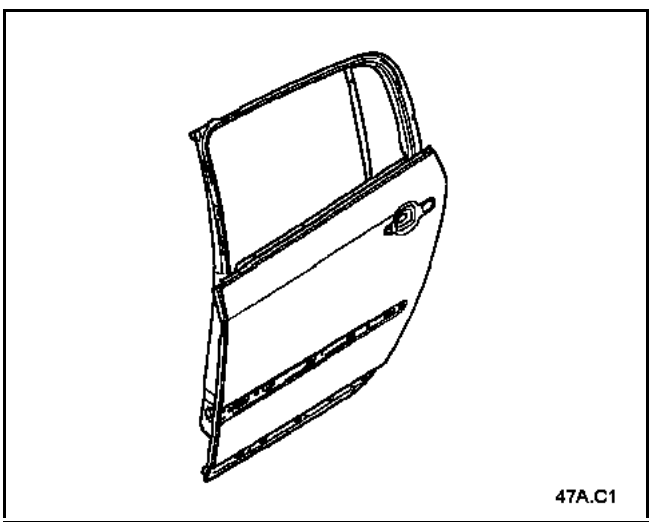
All clearances are given in **section 40A-E**.

To repair the aluminium, refer to
Technical Note 527A.

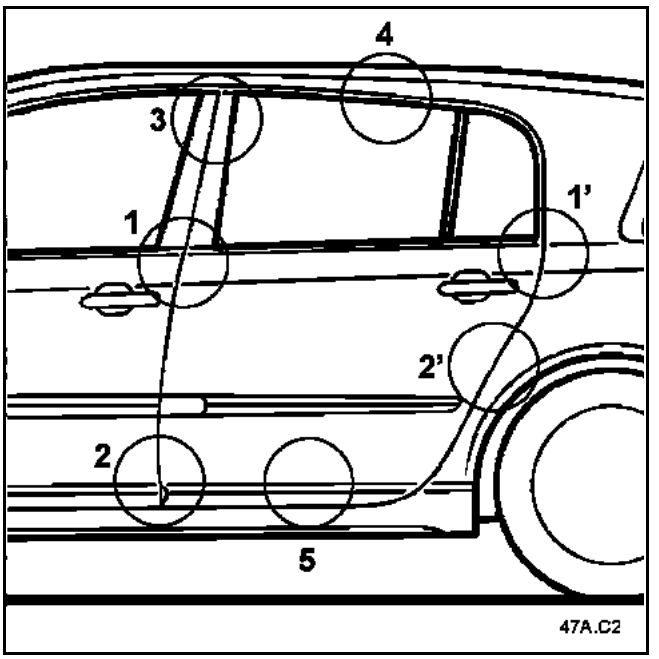
REMINDER:
Use only tools, abrasive discs and abrasives designed for repairing aluminium, to avoid any contamination by steel particles, which would cause galvanic corrosion.
The sensor and filtration systems must be adapted to the aluminium and must never be contaminated, even slightly, by steel dust.

COMPOSITION OF THE REPLACEMENT PART

Part supplied whole with its soundproofing plates.



ADJUSTMENT ZONES



1.FITTING THE DOOR

This operation can be carried out single-handed using the door mounting tool.
Renault approval no.: **661000**
Supplier: **Z INTERNATIONAL**
Part Number: **SUP01**
otherwise two people are needed to put the door in place.

REMINDER: before final refitting, the area between the A-pillar and the hinges must be sealed with mastic (refer to **Technical Note n° 396A**).

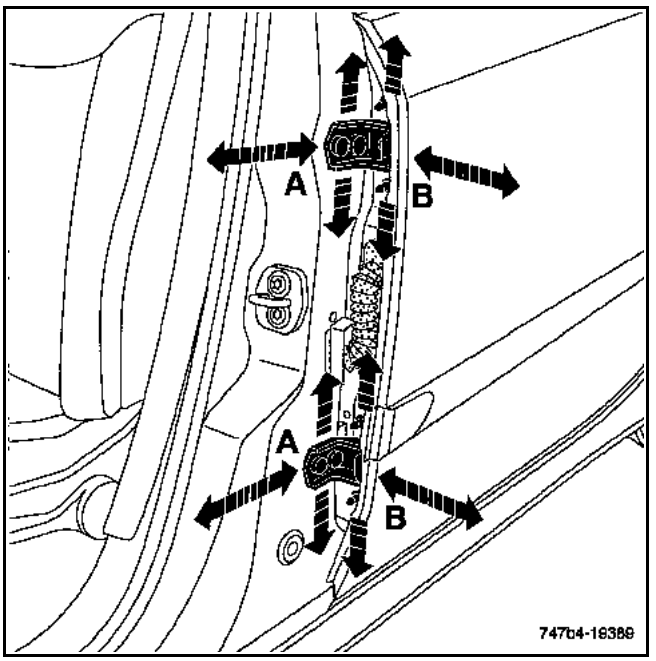
Finger tighten all mountings without tightening them.

Fit all the parts to the door.

Remove the striker before adjusting the hinges.

GETtheMANUALS.org

2. SETTINGS



All door gap adjustments (zones 1 to 5, see introduction) are made using the hinge mounting bolts (A) and (B).

REMINDER: front to back adjustment (**OX**) of the door is made using only hinge mounting bolts (A) on the B-pillar.

To adjust the upper hinge, the holes on the B-pillar can be counter-drilled to ∅ **12 mm**.

REMINDER: anti-corrosion protection is vital for all operations which expose the bare metal of the bodywork.

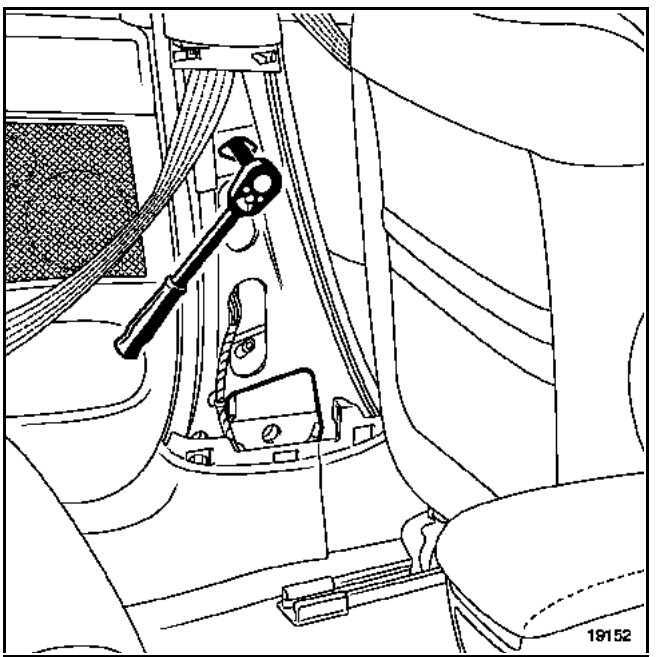
Protect against corrosion by applying the following products:

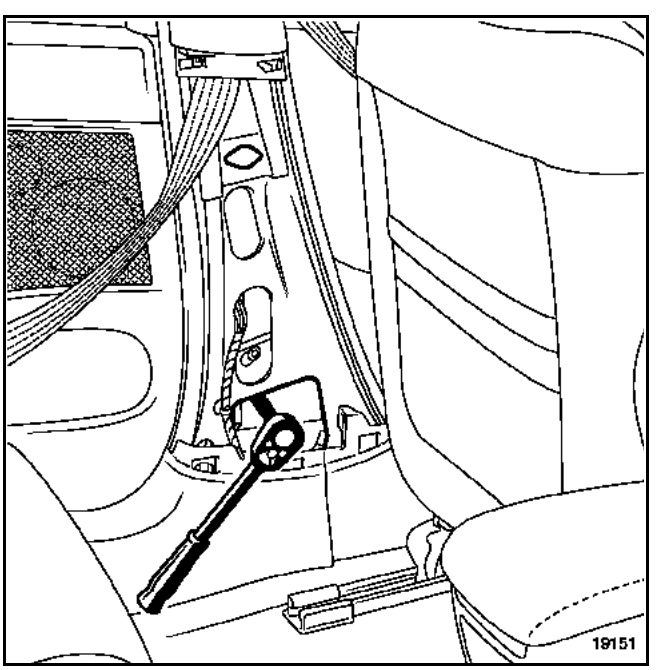
Pre-treatment primer	**77 01 423 933**
Reactive thinner	**77 01 423 955**

Check the adjustments and tighten in position.

NOTE: it is necessary to first remove the lower lining of the pillar to access the hinge mountings on the pillar.

The pillar-side hinge mountings can be accessed from inside the vehicle.



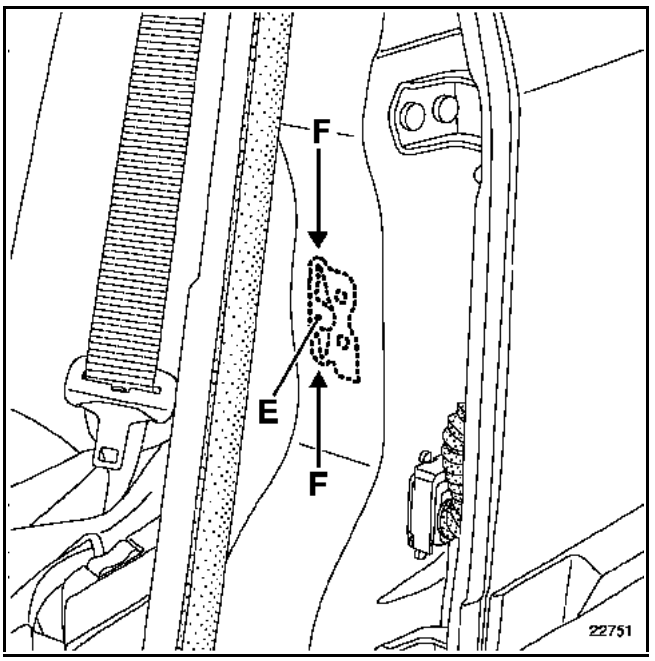


To adjust the door clearance (**OY**), the hinge holes on the door box section side can be counter-drilled to ∅ **12 mm** if necessary.

NOTE: after sales hinges are delivered with square holes for adjustment.

GETtheMANUALS.org

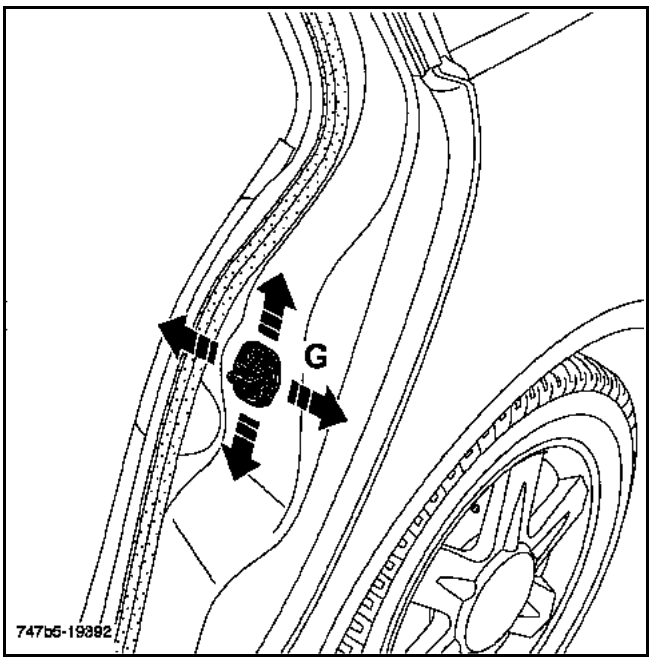
Special notes on the striker plate



The striker plate is welded at point (E) on the reinforcement inside the B-pillar.

To carry out adjustments, it is necessary to bend the fuse sections (F) of the plate.

This operation can only be performed by exerting a relatively strong force on the striker (e.g. by using a hammer.



This operation consists of adjusting the flushness, beading and firmness of closure.

To do this, untighten the screws (G) and move the striker, following the direction of the arrows.

Check the adjustment and tighten the door in position.

GETtheMANUALS.org

The replacement of this part is a basic operation for a side impact.

Information on dismantling or additional parts is dealt with in their respective sections.

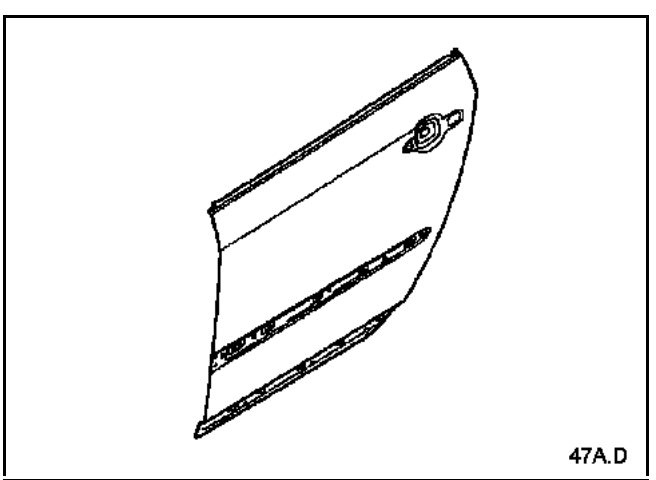
It is a removable aluminium structural component.

To repair the aluminium, refer to
Technical Note 527A.

REMINDER:
Use only tools, abrasive discs and abrasives designed for repairing aluminium, to avoid any contamination by steel particles, which would cause galvanic corrosion.
The sensor and filtration systems must be adapted to the aluminium and must never be contaminated, even slightly, by steel dust.

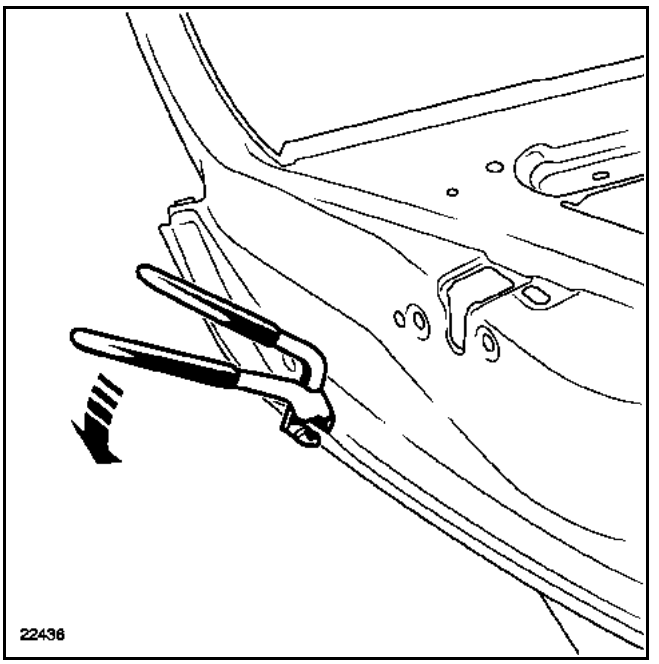
COMPOSITION OF THE REPLACEMENT PART

Part supplied with:
Upper reinforcement
Panel stiffener
Shock absorbers
Opening control reinforcement
Rivets
Pre-formed mastic



PARTS CONCERNED (thickness in mm):

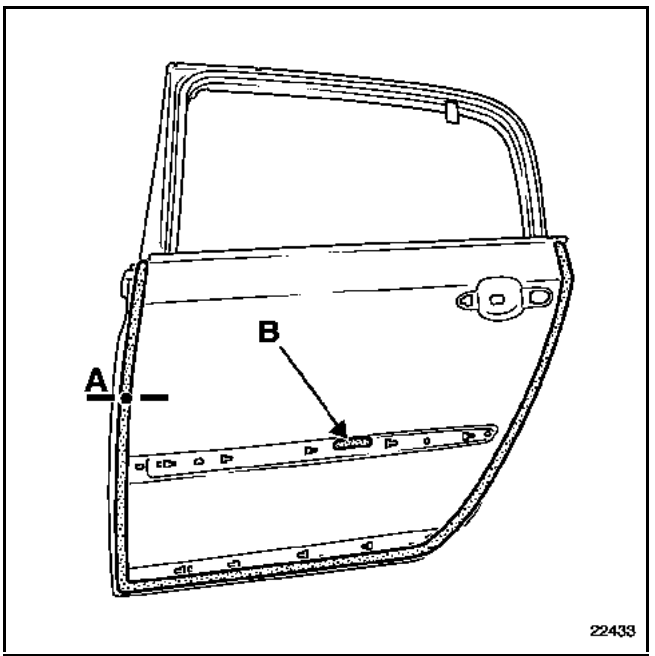
1 Door panel	1.1
2 Door box section	1.2



IMPORTANT: the door panel should only be removed with the special uncrimping tool part no.: **CAR. 1657**.

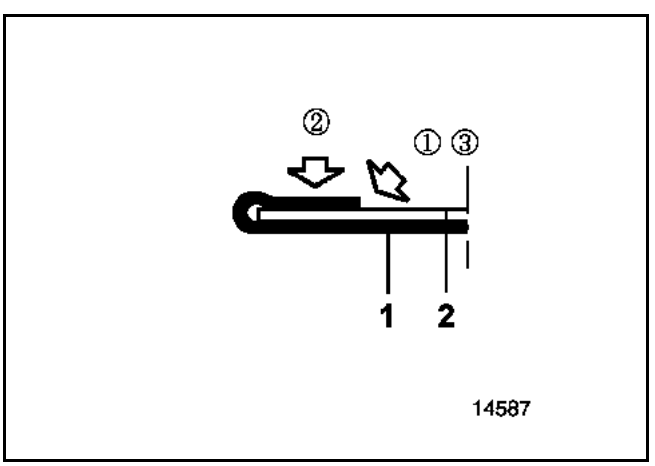
It is forbidden to use the angle grinder in the absence of sensor and filtration systems which are not adapted to aluminium.

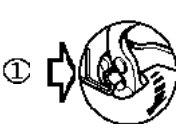
GETtheMANUALS.org

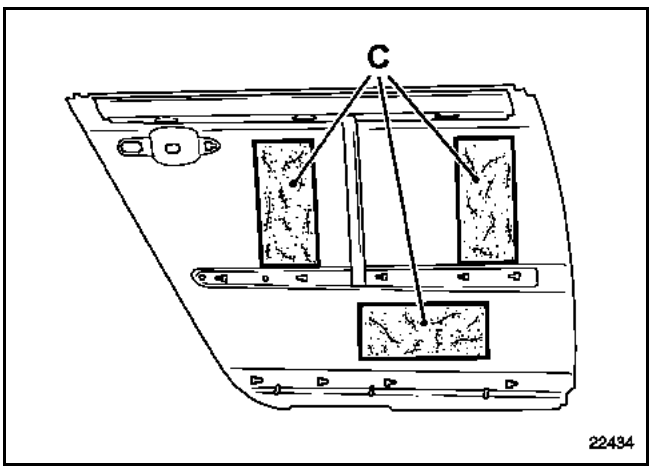


NOTE: it is necessary to use a bi-composite structural adhesive designed for aluminium on the edge (crimping zone), **part no.: 77 11 219 885.**

For zone (B), use a setting adhesive type **MJPro** (**part no.: 77 11 172 376**).







IMPORTANT: ensure that panel soundproofing plates are fitted (C).

If it is necessary to even partially remove one or more soundproofing plates, they should be systematically replaced.

For information, the dimensions of the plates (C) are: **130 x 300 mm.**

GETtheMANUALS.org

The replacement of this part is a basic operation for a rear side collision.

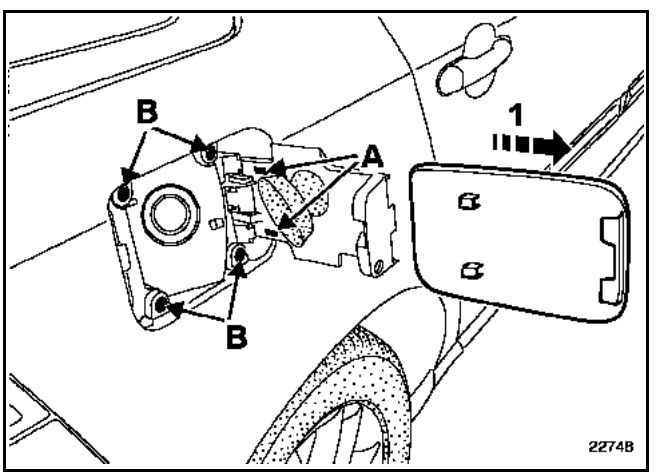
In the procedure described below, you will only find descriptions of the connections which are specific to the part concerned.

Information on dismantling or additional parts is dealt with in their respective sections (see summary).

It is a removable plastic component.

COMPOSITION OF THE REPLACEMENT PART

Part supplied on its own (pre-primed).



REMOVAL

Apply pressure with your fingers to release the two clips (A).

Pull the filler flap outwards (arrow **1**).

REFITTING

Proceed in the reverse order to removal.

NOTE: the aperture clearances are adjusted with the filler neck screws (B).

REPAIR

The filler flap is made of NORYL GTX, for paint products refer to **technical note 473A.**

GETtheMANUALS.org

The replacement of this part is a basic operation for a frontal impact.

Information on additional parts or stripping of parts is dealt with in the relevant sections.

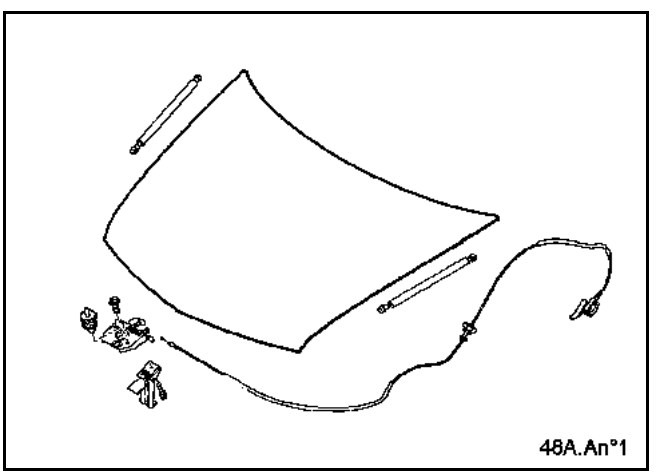
It is a removable aluminium component.

NOTE: The removal/refitting operations present no specific problems and only the adjustment options are described in the procedure.

All clearances are shown in **Section 40A-E**.

For repair of aluminium components refer to **Technical Note 527A.**

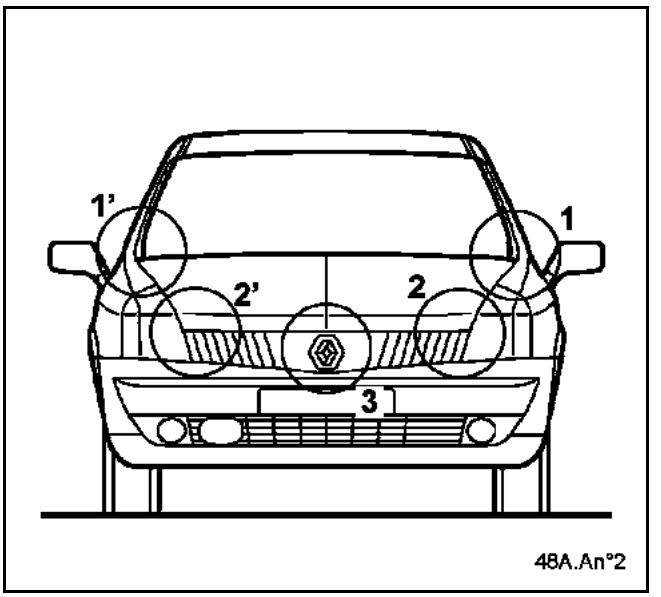
REMINDER:
To avoid contaminating the aluminium with steel particles which could lead to bimetallic corrosion, use only tools abrasive disks, or abrasives reserved specifically for repairing aluminium. The separator and filtration systems must be specifically for aluminium and should never be contaminated even in small quantities, by steel particles.



48A.An°1

WARNING: It will be necessary to first remove the scuttle panel grille, to access the bonnet hinge lower mountings.

ADJUSTMENT ZONES



48A.An°2

1. FITTING THE ELEMENT

REMINDER: before final refitting, the seal must be made between the cowl side panel and the hinges with mastic (refer to **Technical Note no. 396A**).

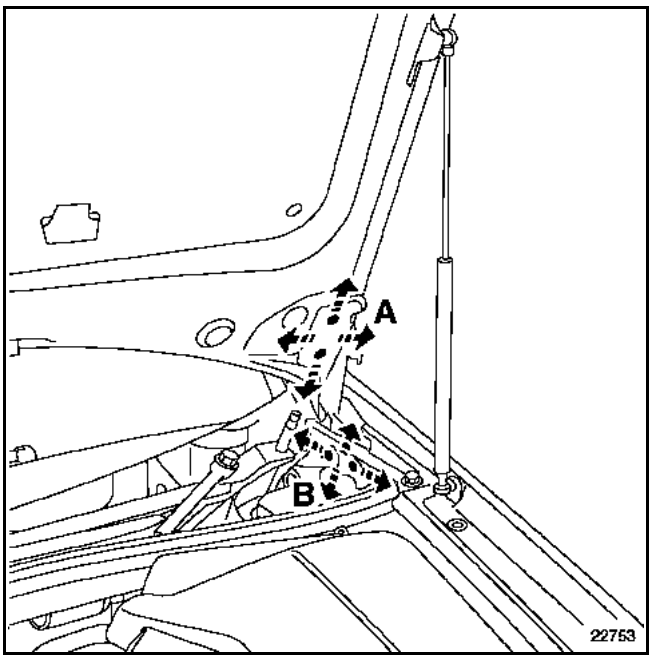
Finger tighten all mountings without locking them.

Attach all the bonnet components.

Remove the bonnet catch before starting adjustment.

GETtheMANUALS.org

2. ADJUSTMENTS



All bonnet gap adjustments (zones 1 to 3, see introduction) are carried out on the bonnet hinge mounting bolts (A) and (B).

NOTE: the height adjustment (**OZ**) of the rear section of the bonnet is performed using the bonnet hinge mounting screws on the cowl panel.

REMINDER: Always begin by adjusting the bonnet hinge supports on the car body.

NOTE: to gain access to the bonnet hinge lower mountings (B) the scuttle panel grille needs to be removed.

Check the adjustments and tighten in position.

During this repair it is possible to adjust the front wings if required.

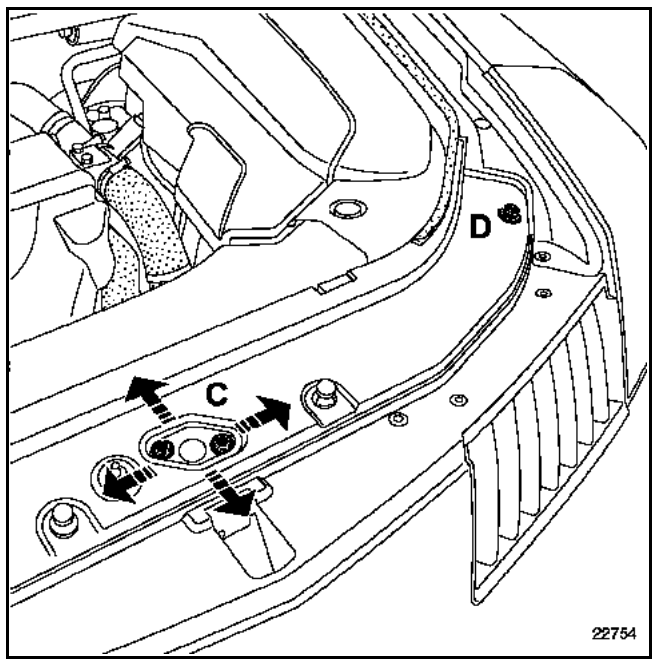
To carry out clearance adjustment on the door (**OY**), it is possible to counter drill the original ∅ **12 mm** hinge holes.

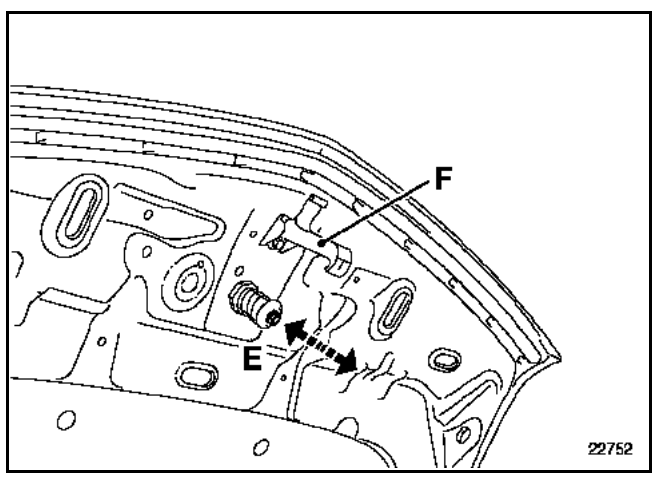
REMINDER: anti-corrosion protection is vital for all operations which expose the bare metal of the bodywork.

Protect against corrosion by applying the following products:

Pre-treatment primer	**77 01 423 933**
Reactive thinner	**77 01 423 955**

NOTE: after sales hinges are fitted with square holes enabling adjustment.





Check the front section of the bonnet is fitted correctly with the stops (D).

Refit the bonnet catch (E)

The removal of suspension and the adjustment of the closure length is carried out by the bonnet catch (E) and the lock (C).

GETtheMANUALS.org

Check the adjustment and the correct operation of the bonnet then lock the door in position.

IMPORTANT:
Do not forget to refit the safety hook (F).
When closed, the bonnet should rest on the stops (D).

GETtheMANUALS.org

The replacement of this part is a basic operation for a rear impact.

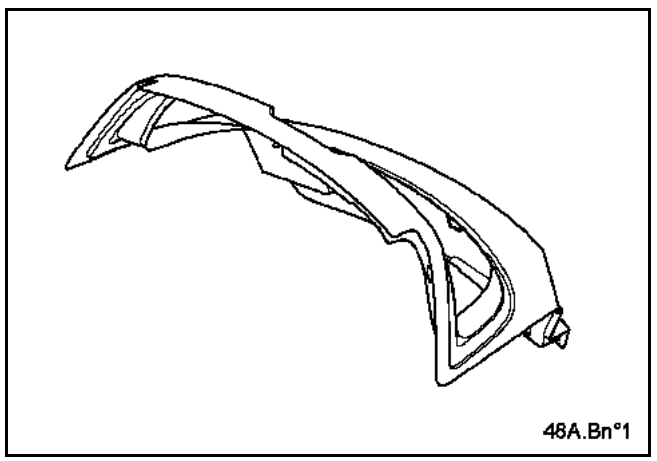
Information on additional parts or stripping is dealt with in the relevant sections.

It is a removable part made from sheet moulded polyester (SMC type).

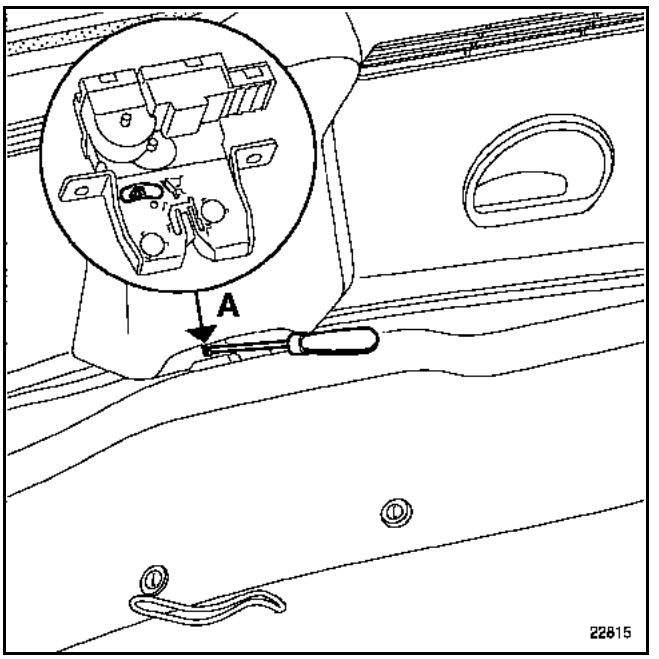
NOTE: The removal/refitting operations present no specific problems and only the adjustment options are described in the procedure.

All clearances are shown in **Section 40A-E**.

REPAIR
For repairing the box section external panel refer to Workshop Repair Manual **502.**



OPENING DURING A FAULT



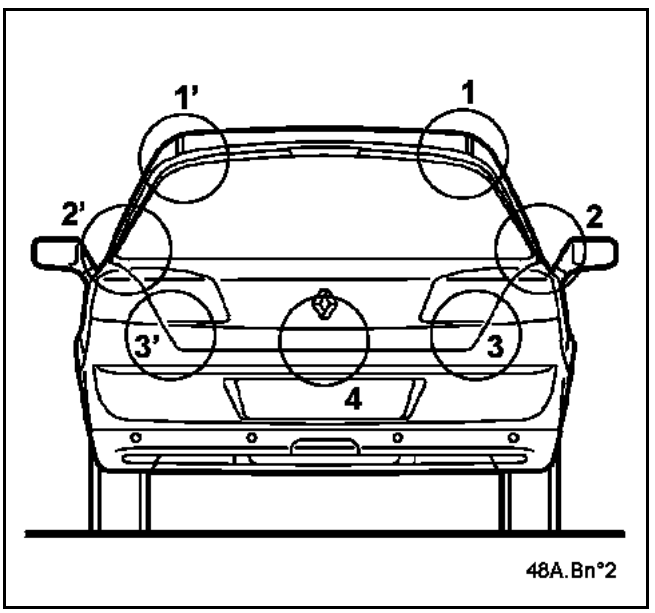
REMINDER: it is possible during an electrical fault, to open the tailgate manually.

Unscrew the tailgate lock using a screwdriver and pushing on catch (A).

This operation is carried out from inside the vehicle.

GETtheMANUALS.org

ADJUSTMENT ZONES



1. PRE-FITTING PREPARATION

On the vehicle:
Remove:
– the end panel trim,
– the striker panel,
– the rear wing lower trim flaps,
– the side centre lining stops,
– The bracket protectors,

On the tailgate:
Remove:
– the lock cover,
– the lock,
– the side centre lining stops,
– the hatch gas struts.

Attach the rest of the tailgate components.

2. FITTING THE COMPONENT

REMINDER: before final refitting, the seal must be made between the cowl side panel and the hinges with mastic (refer to **Technical Note no. 396A**).

Finger tighten all mountings without locking them.
A second person is required for this operation.

3. SETTINGS

NOTE: when setting special points, linked to an incident (e.g. rear flush-fitting), refer to the method for more detailed instructions.

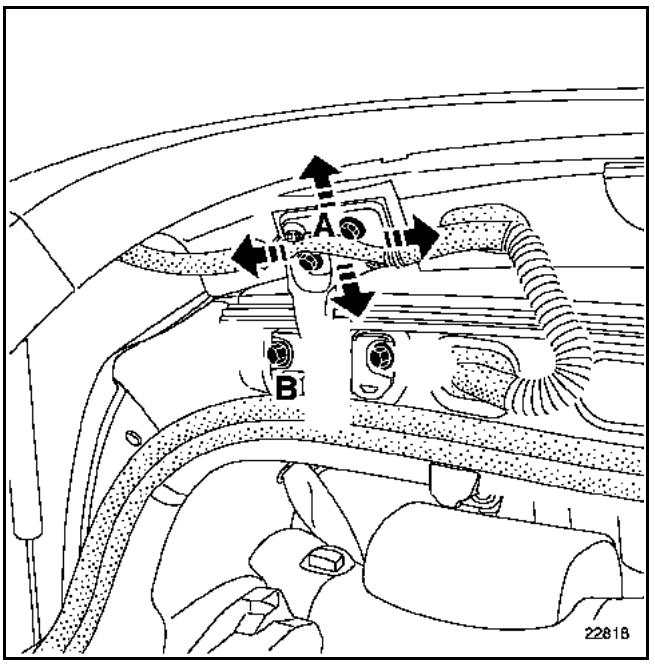
It is important, even in the event of a fault, to check the whole adjustment sequence.

Perform the following settings in this order:

1 Tailgate central zones (1, 1' and 2, 2')
2 Adjusting the tailgate upper section clearance (1, 1')
3 Adjusting the tailgate lower section clearance and the closure panel (3, 3' and 4)
4 Additional adjustment of the tailgate lower section side clearance (3, 3')

GETtheMANUALS.org

1. Tailgate central zones (1, 1' and 2, 2')



Ensure the positioning and the join with the roof panel and the zone 1, 1' and 2, 2 wing panels (see the adjustment zones diagram in the introduction).

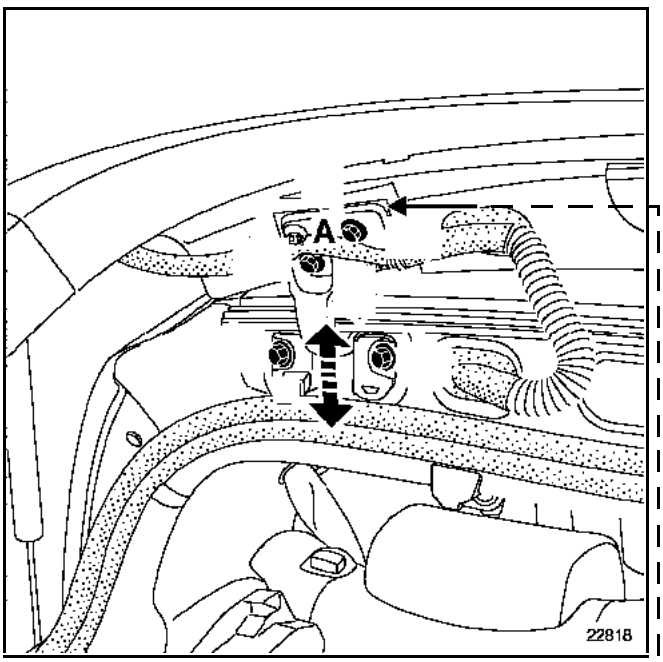
IMPORTANT:
This is carried out by the upper bracket bolts (A) and also by the screws (B).
The original brackets are aligned along the holes on the lower section, making it possible only to adjust the bolts (A).

RAPPEL: Always begin by adjusting the hinges at the bodywork mounting points.

REMINDER: the striker plate, the lock, the stabilisers ... should be removed to avoid any obstruction.

Check the adjustments and pre-tighten in position.

2. Adjusting the tailgate upper section clearance (1, 1')



Ensure the clearance the tailgate in the upper section of zones 1, 1' (see the adjustment diagram in the introduction).

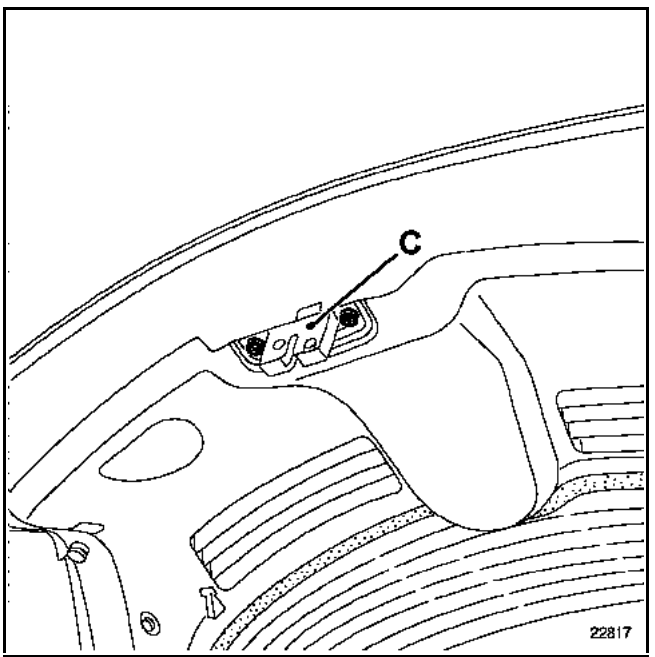
IMPORTANT:
This adjustment is carried out at the **upper joint between the hinges and the tailgate by using** special shims.
These shims are available in the Parts Catalogue.

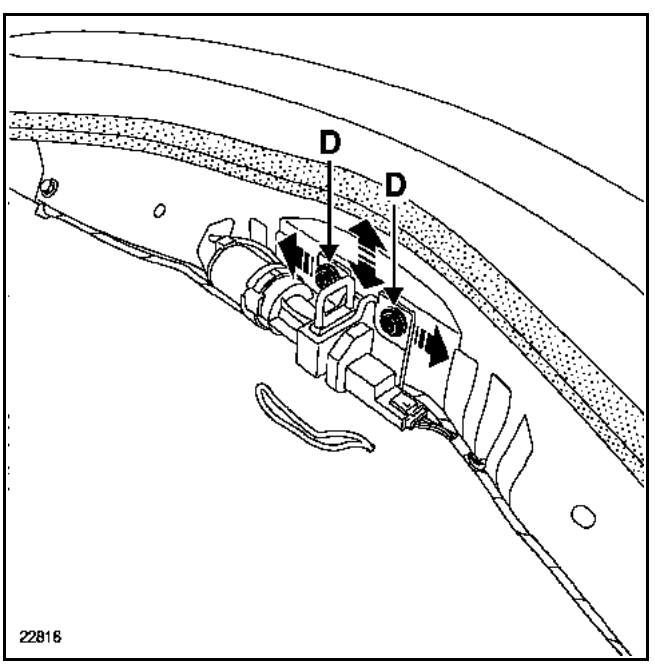
Check the adjustments and screw all the bolts in position.

GETtheMANUALS.org

3. Adjusting the tailgate lower section clearance and the closure panel (3, 3' and 4)

NOTE: the stabilisers must be fitted for this operation.





Ensure the play and clearance of the tailgate upper section in zones 2, 2', 3, 3' and 4 (see the adjustment diagram in the introduction) by the striker plate bolt (D).

CAUTION: It is not possible to adjust the lock (C).

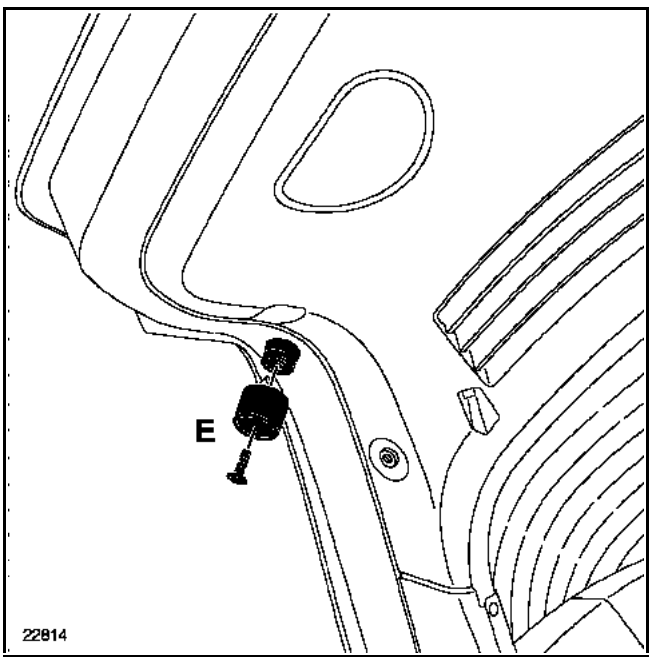
The fitting of the striker plate (D) and the lock (C) must be as tight as possible to avoid any scraping.

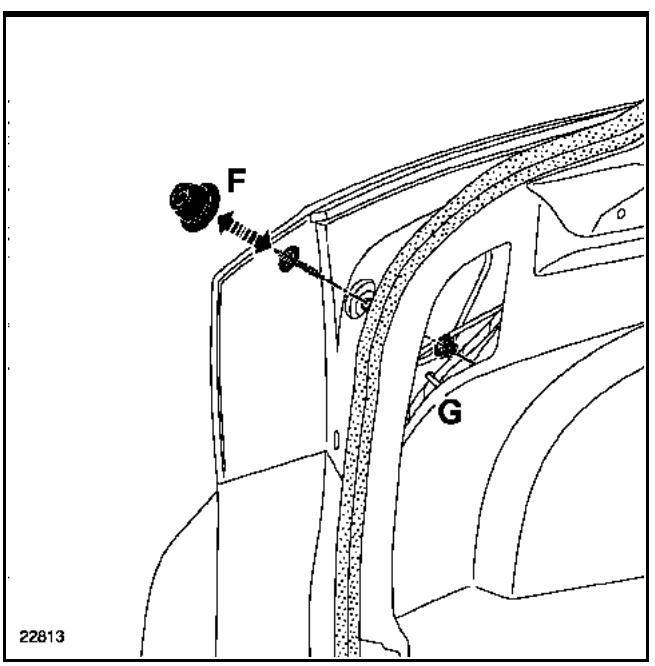
Check the adjustments and tighten in position.

During this operation it is also possible to adjust the headlights.

GETtheMANUALS.org

4. Additional adjustment of the tailgate lower section side clearance (3, 3')





Ensure the play and clearance of the tailgate rear lower section in zones 2, 2', 3, 3 and 4 (see the adjustment diagram in the introduction) by the lower centering stops (F).

NOTE: this operation is complementary to the previous adjustment procedure.

CAUTION the fitting of the upper (E) and lower (F) centre pieces must be optimal (self-centring) to avoid any scraping.

Adjustment involves adjusting the centring devices (F):
– from the side on the bodywork by unscrewing the bolts (G),
– from above by tightening or untightening them on their shaft.

Check the adjustment and the correct operation then lock the tailgate in position.

GETtheMANUALS.org

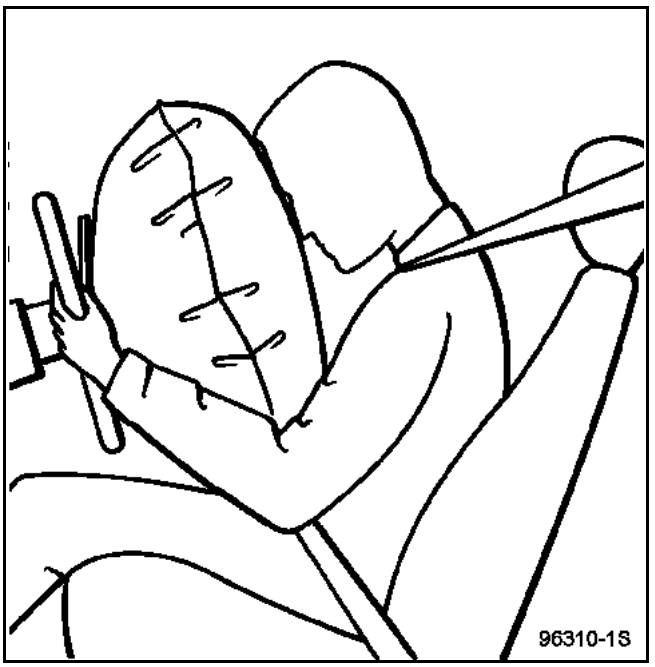
AIR BAG AND PRETENSIONERS



IMPORTANT: all operations on air bag and pretensioner systems must be carried out by qualified trained personnel.

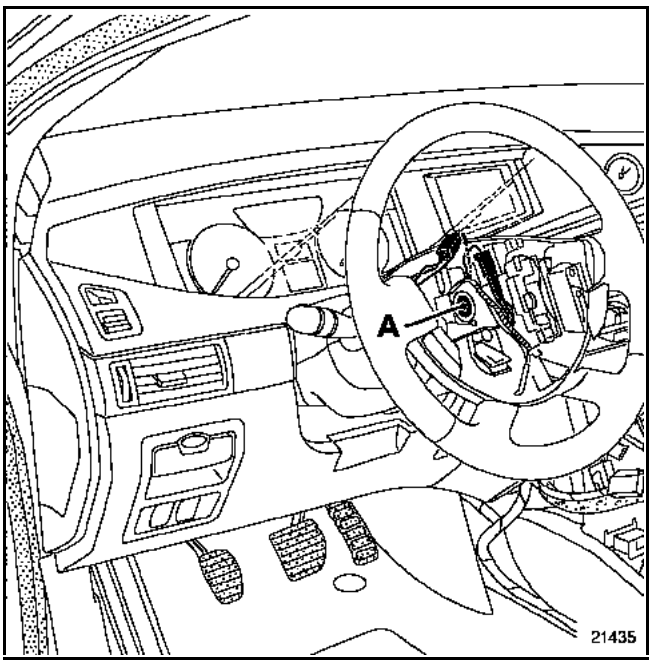
IMPORTANT: when working under the vehicle do not hit the floor panels without having locked the computer using the diagnostic tool.
Refer to section 80

IMPORTANT: pyrotechnic systems (pretensioners or airbags) must not be handled near to a heat source or flame as they may be triggered.

AIR BAG LABEL SET

The adhesive labels must be reapplied to the windscreen or dashboard if these have been replaced, if airbags are fitted.

All of these labels are available as a set (see **SPARE PARTS CATALOGUE**).



The steering wheel bolt must be replaced every time the steering wheel is removed.
See sections 88 and 57B-B.

HEAT SHIELDS

Heat shields must be refitted, whether they are for bodywork or mechanical components.

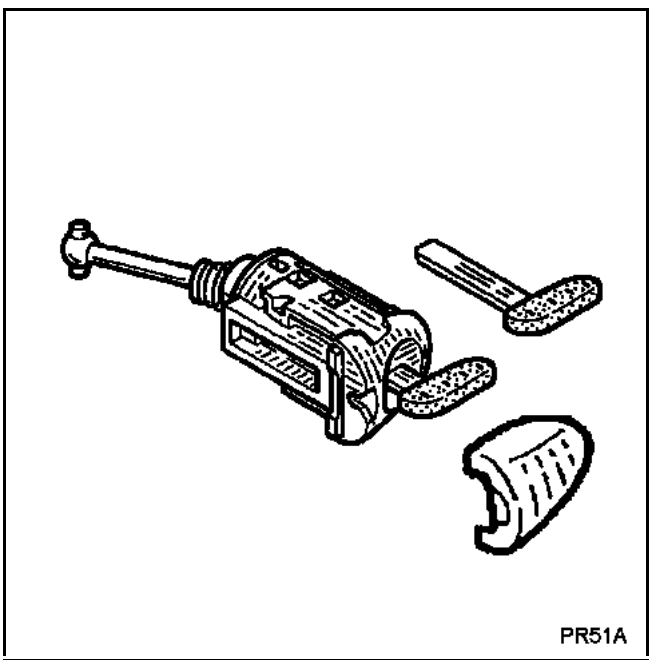
TIGHTENING TORQUES

The recommended tightening torques must be observed.

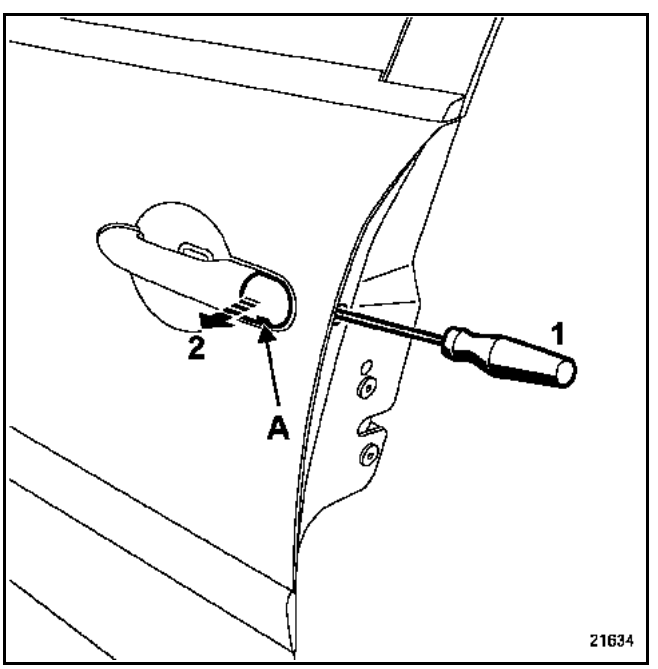
PRODUCTS

Read the precautions for use with care and observe the safety instructions by using the appropriate protection (gloves, mask, etc.).

GETtheMANUALS.org



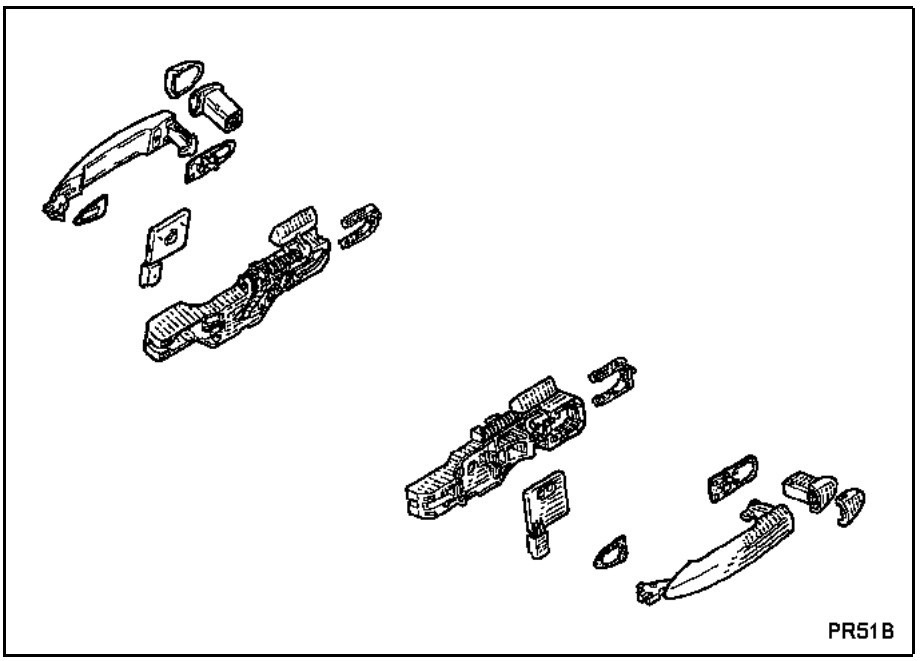
REMOVAL



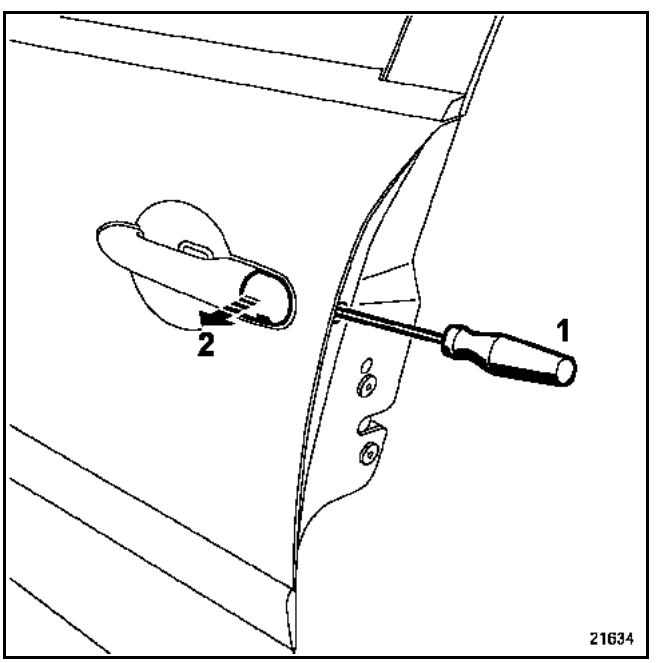
Remove:
– lock barrel cover (A),
– the blanking cover; unscrew screw (1), (**Torx T20**) without removing it.

Release lock barrel (2).

GETtheMANUALS.org

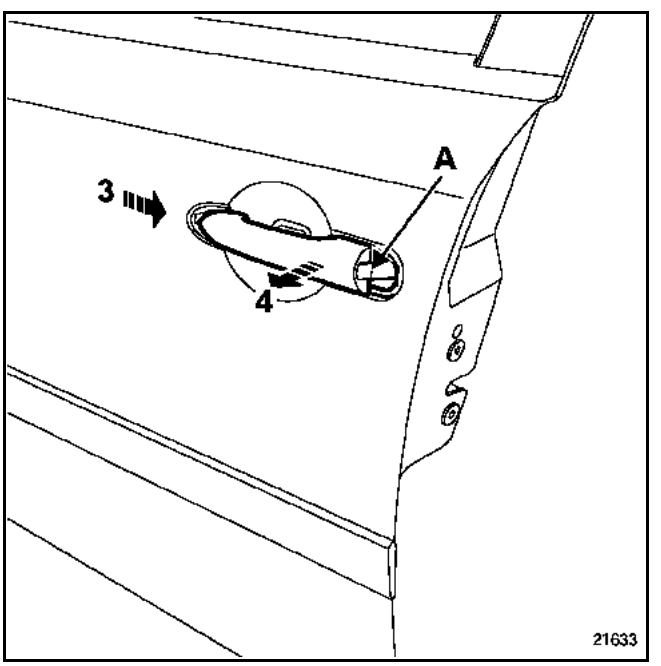


REMOVAL



Remove:
– the lock barrel cover,
– the blanking cover; unscrew screw (1), (**Torx T20**) without removing it.

Release lock barrel (2).



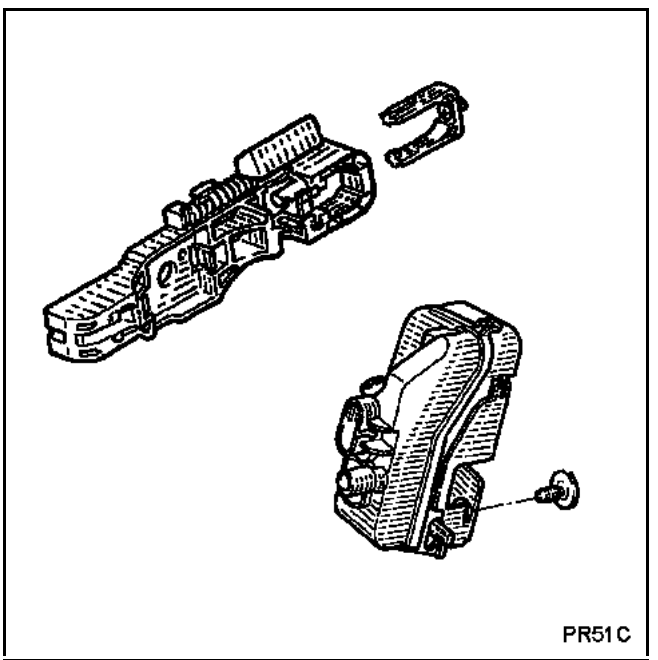
Release the handle by moving in directions (3) and (4).

REFITTING

Position handle seal (A).

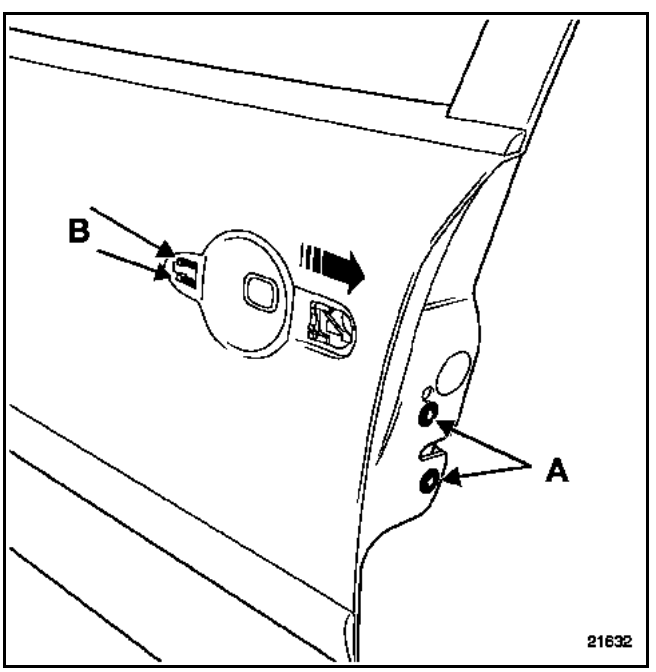
Proceed in the reverse order to removal.

GETtheMANUALS.org



REMOVING THE FRONT DOOR LOCK

Remove:
– the door trim (**section 72A.A**),
– the exterior handle (**section 51A.B**),



– the two mountings (A), (**Torx T30**).

Press on the two module latches (B).

Release the lock and the module through the door box section.

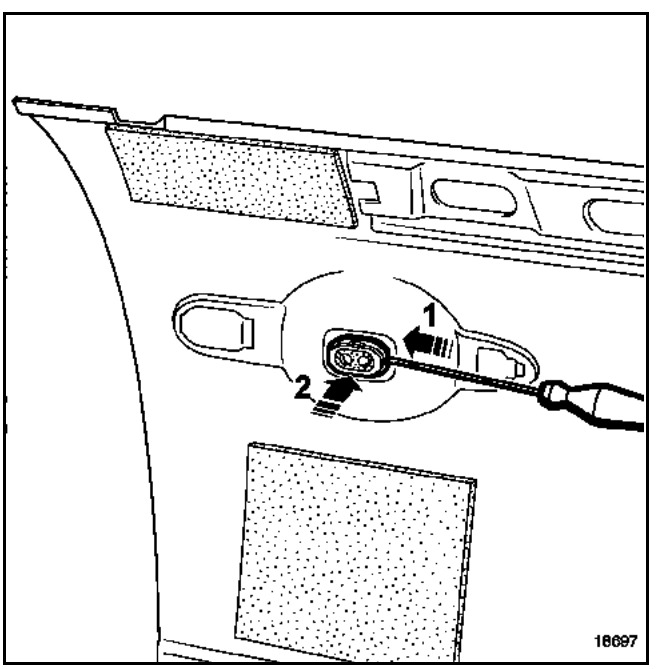
Disconnect the connectors.

REMOVING THE REAR DOOR LOCK

First remove:
– the door trim (**section 72A.B**),
– the exterior handle (**section 51A.B**),

Release the lock with the module.

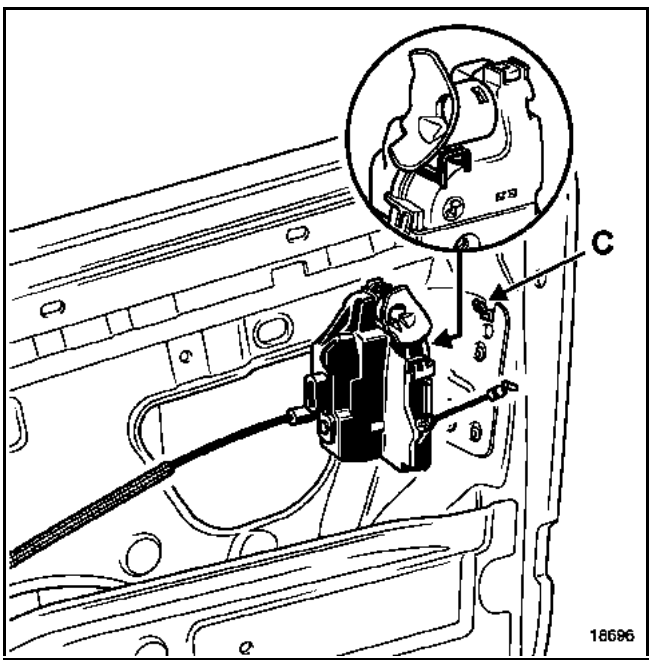
REMOVING THE PRISM



Unclip the prism at (1) then (2) using a screwdriver.

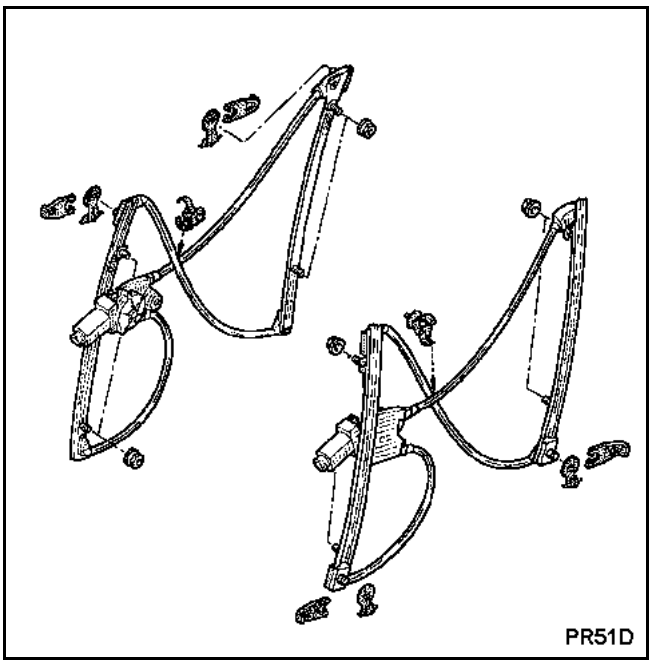
GETtheMANUALS.org

REFITTING THE LOCK



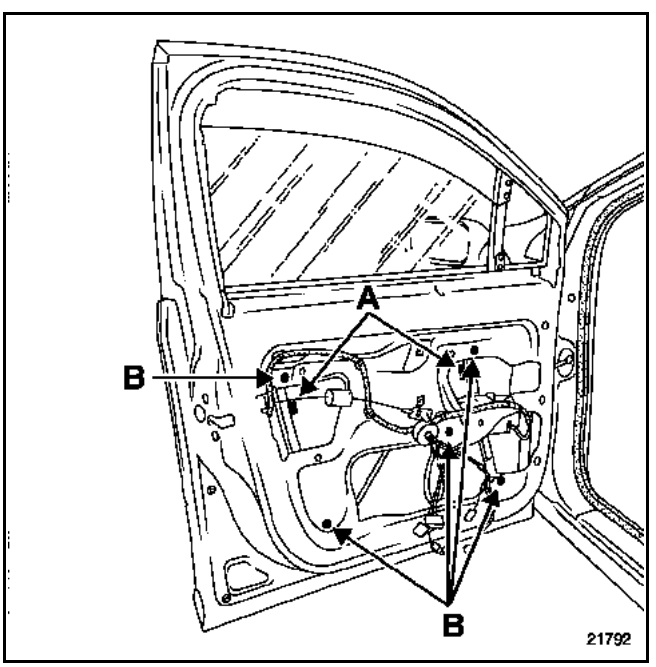
Position the lock on door box section holding hook (C), then proceed in the reverse order to removal.

GETtheMANUALS.org



REMOVAL

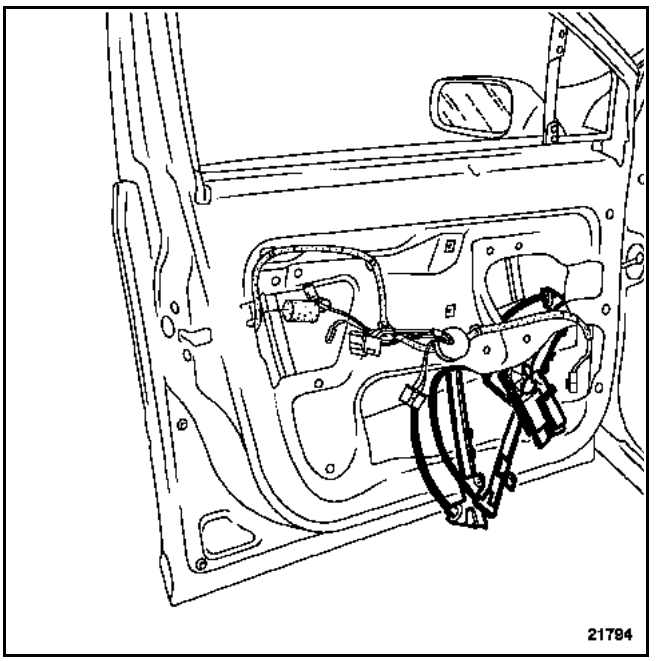
Remove:
– the door trim (**section 72A.A**),



– the two window mounting clips (A), release the window from the runners for the window riser moving slides.

Align the window manually in the upper position, block it with masking tape.

Remove mechanism screws (B).



Disconnect the power supply connector.

Remove the window via the lower opening of the door box section.

REFITTING

To refit, proceed in the reverse order to removal.

INITIALIZATION OFWINDOW-RISER MOTOR

Ignition on.

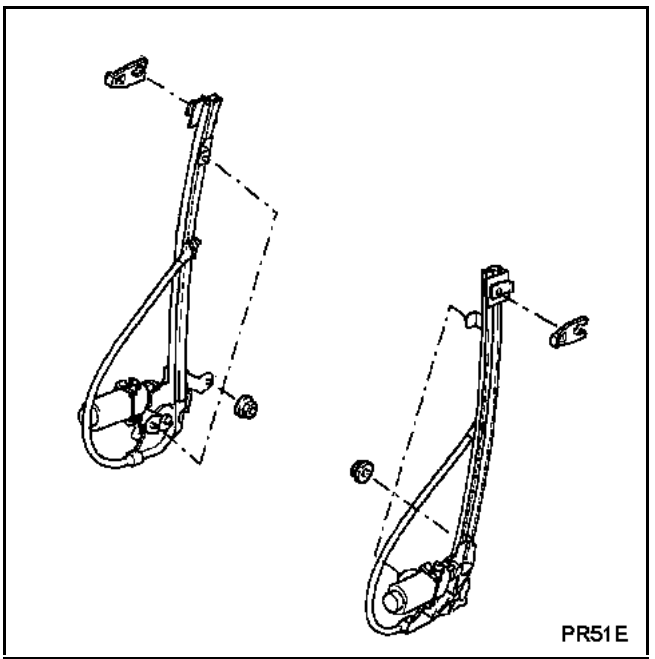
Close the window as far as the upper stop (it rises in jerky movements).

Hold the switch (for 2 seconds).

Lower the window to the bottom stop, hold the switch (for 2 seconds).

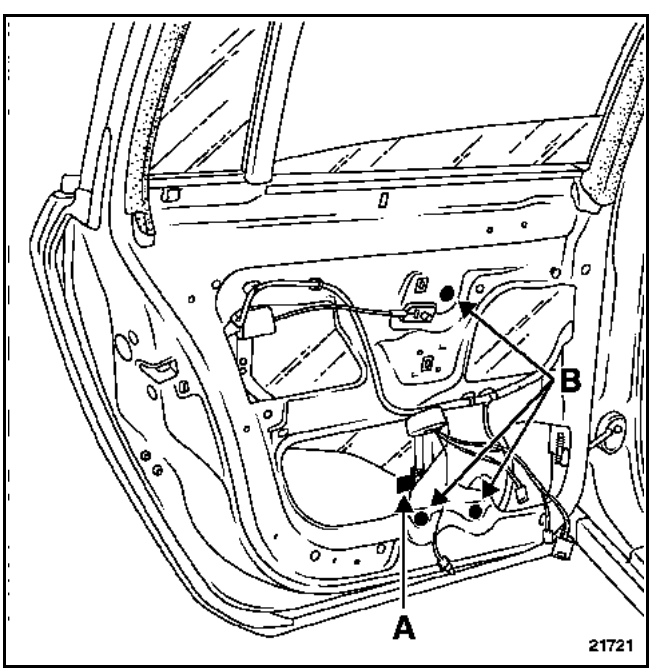
The motor is initialized.

GETtheMANUALS.org



REMOVAL

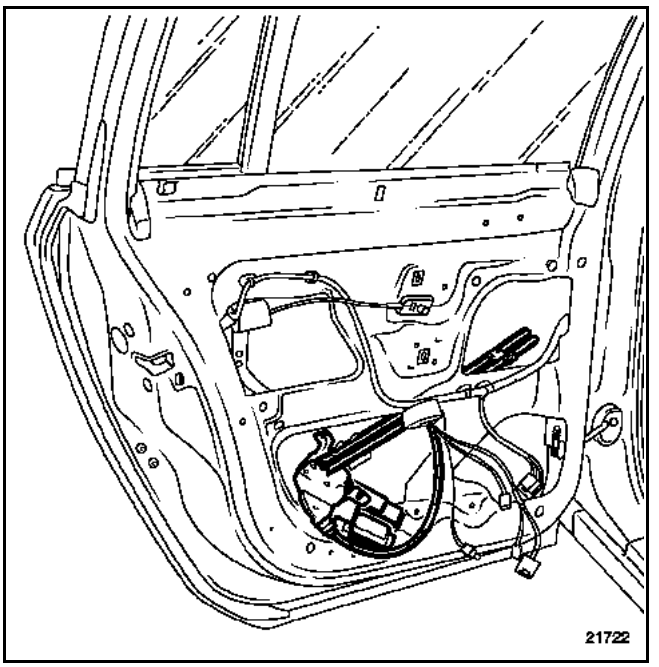
Remove:
– the door trim (**section 72A.B**),



– window mounting clip (A), then release the window from the runners for the window riser moving slides.

Lock the window in the closed position (with masking tape).

Remove mechanism nuts (B).



Disconnect the power supply connector.

Remove the window via the lower opening of the door box section.

REFITTING

To refit, proceed in the reverse order to removal.

INITIALIZATION OFWINDOW-RISER MOTOR

Ignition on.

Close the window to the upper stop.

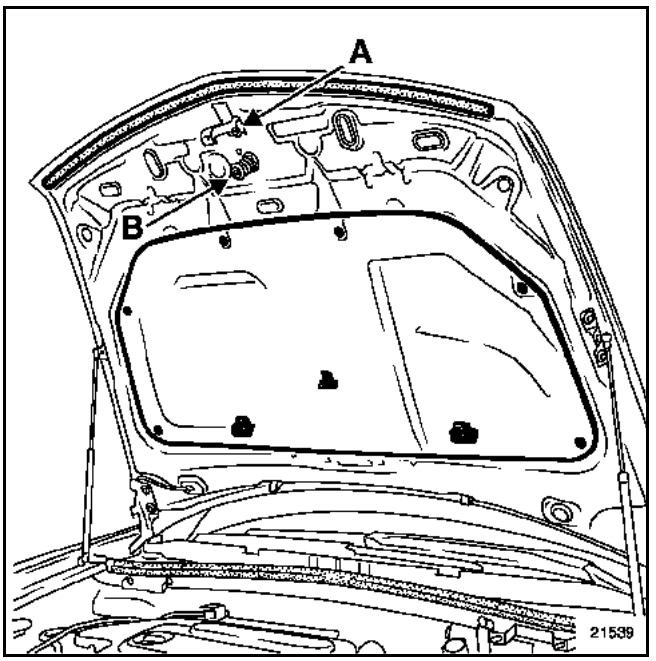
Hold the switch (for 2 seconds).

Lower the window to the bottom stop, hold the switch (for 2 seconds).

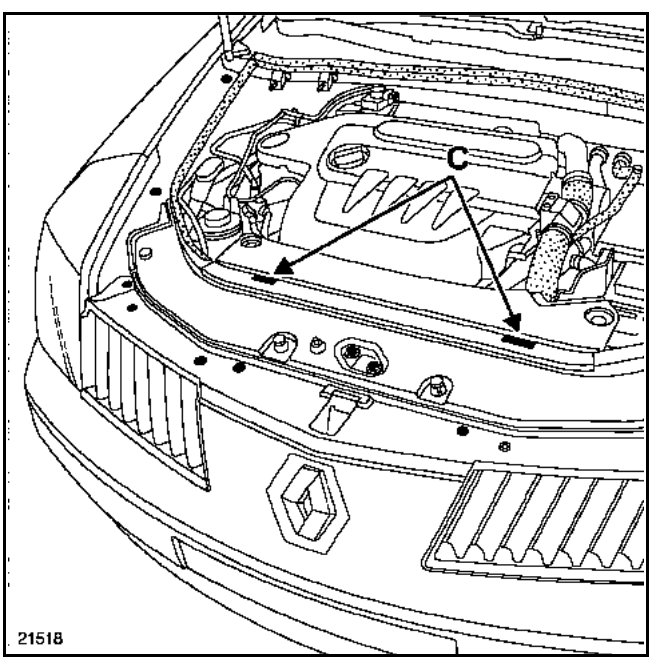
The motor is initialized.

GETtheMANUALS.org

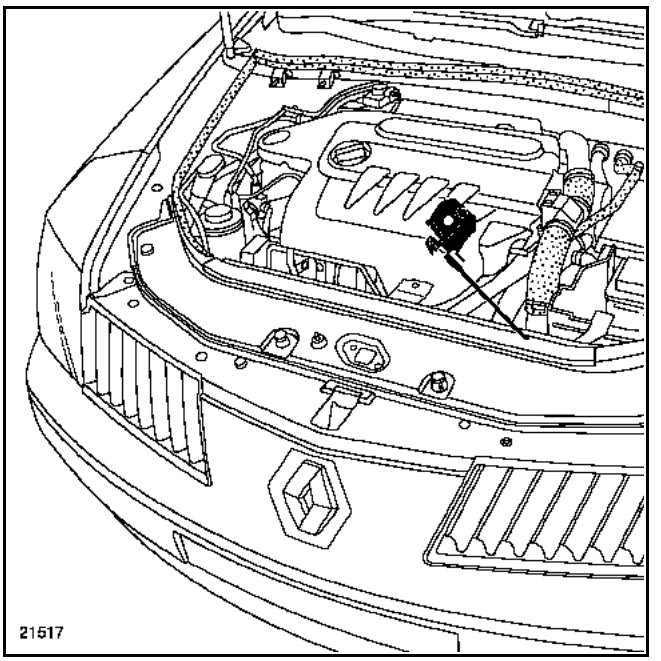
REMOVAL



Remove:
– bolt (A): release the safety catch;
– striker plate (B);



– the engine compartment lining (C);
– the lock mounting bolts.

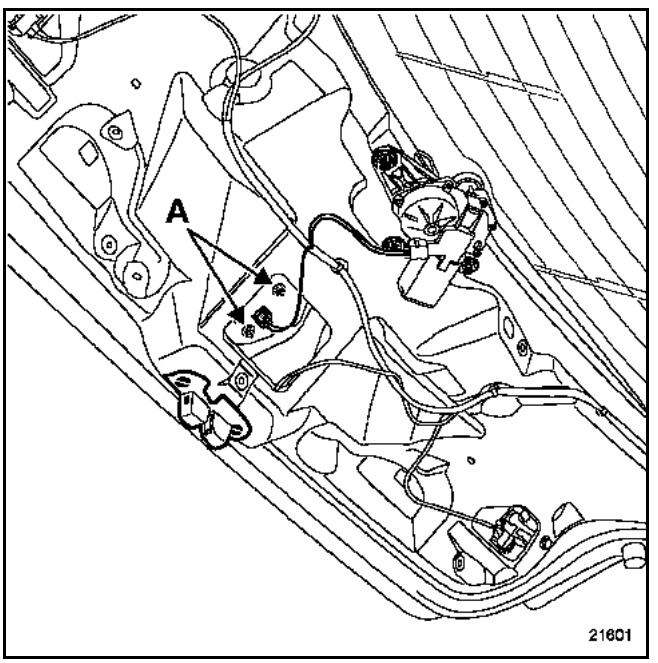


Release the cable and lock.

GETtheMANUALS.org

REMOVAL

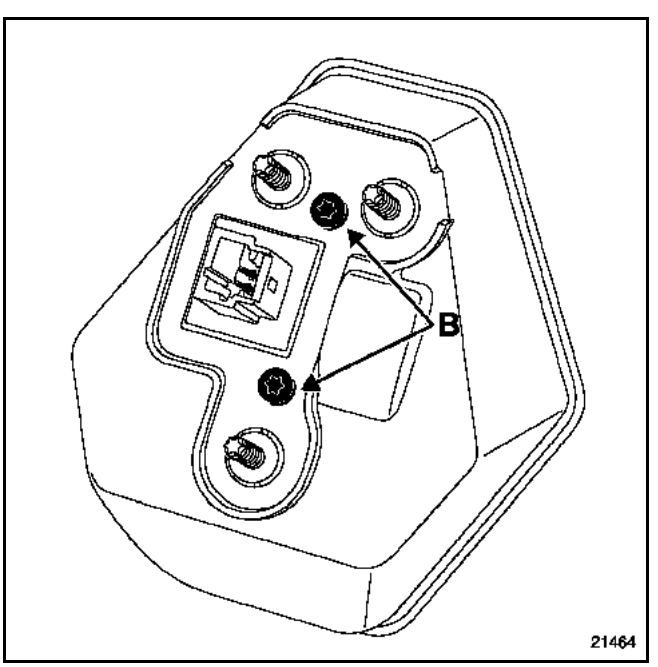
Remove:
– the tailgate trim (**section 73A.B**);



– the bolts (A).

Disconnect the motor.

Withdraw the opening control.

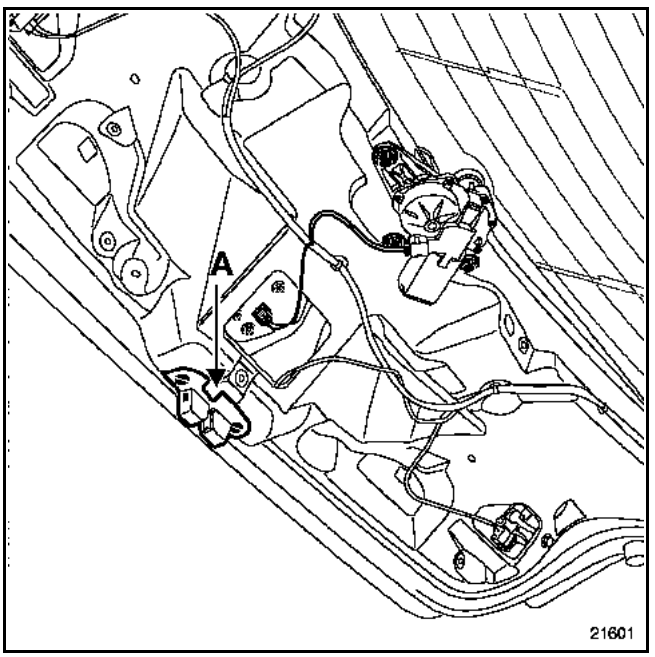


Remove the bolts (B).

Withdraw the badge.

GETtheMANUALS.org

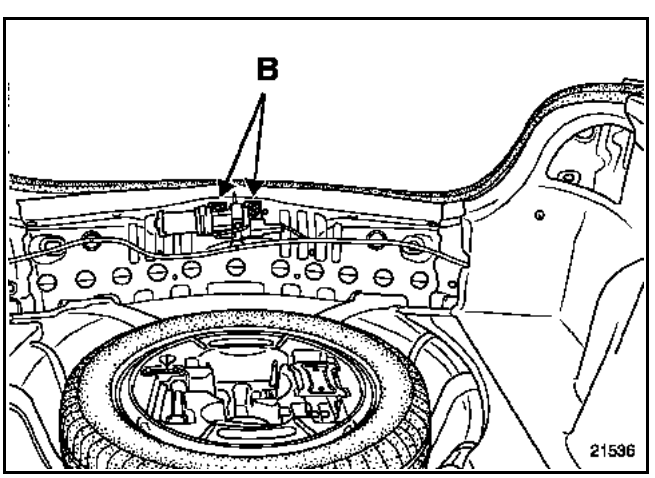
NOTE: in the event of a failure, it is possible to open the tailgate manually.



Operate the catch (A) from the interior of the vehicle, using a small screwdriver.

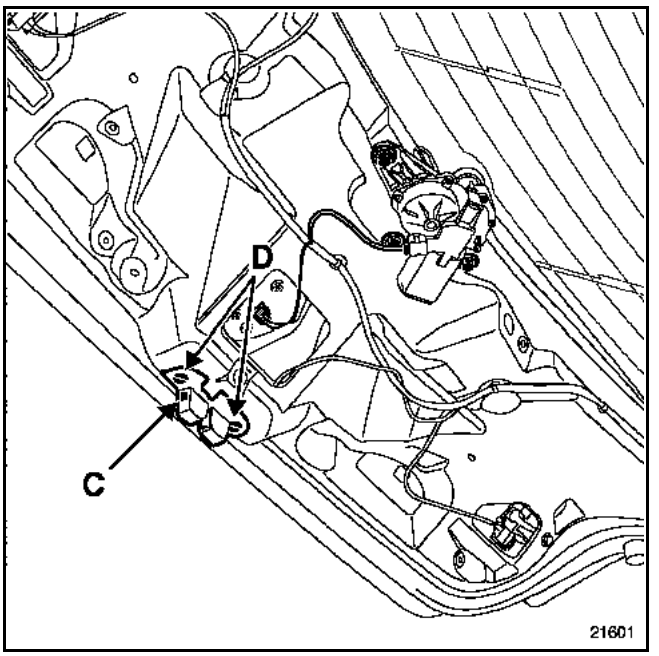
REMOVAL

Remove:
– the rearend panel lining (**section 71A.H**);



– the mounting fittings (B), and disconnect the connector.

Withdraw the striker plate.

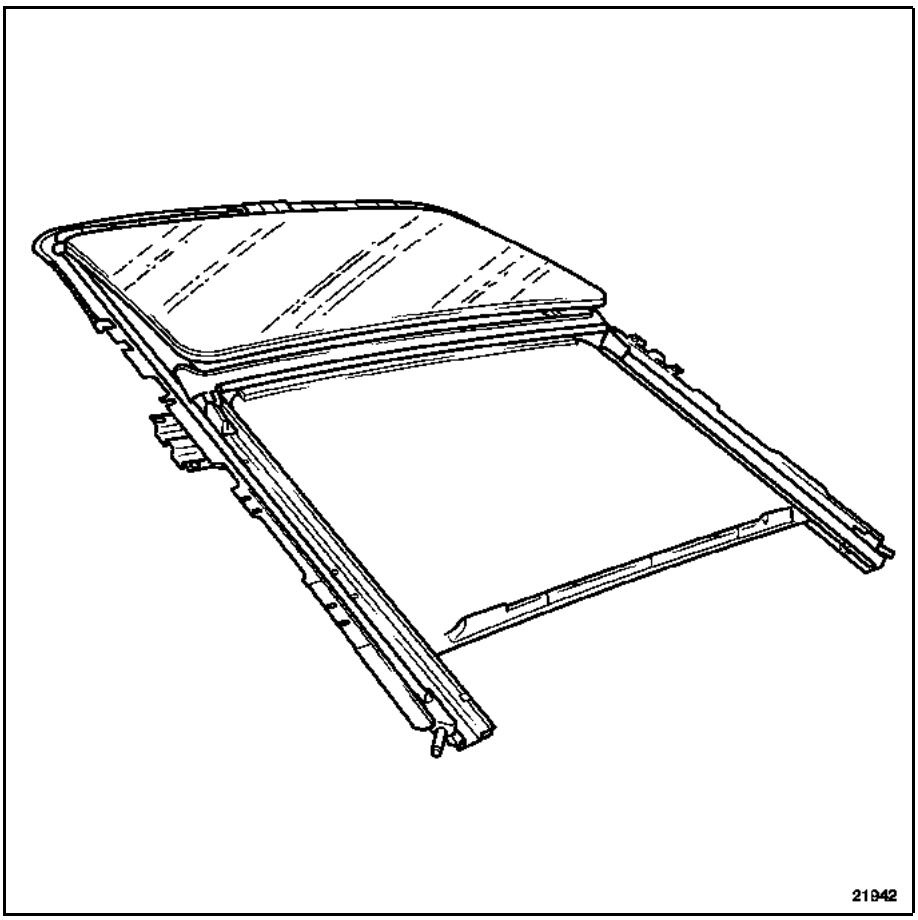


Using a small flat screwdriver, release the cover from the lock (C).

Remove the mounting fittings (D).

Withdraw the lock.

GETtheMANUALS.org

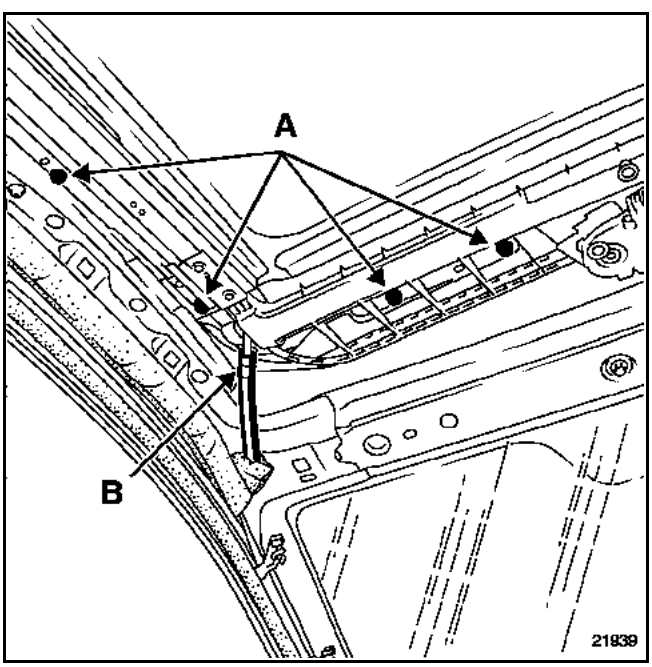


REMOVAL

Remove the head lining (**section 71A.J**).

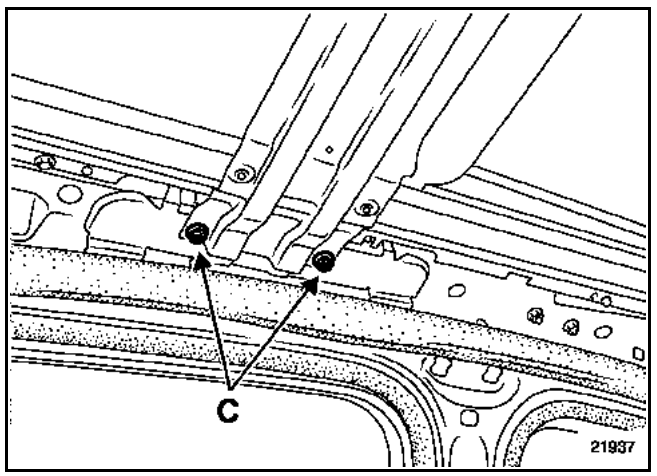
Disconnect the sunroof motor connectors.

Tilt the rear seatbacks.



Remove:
– the twelve mounting bolts (A) (M5 hexagon-head, **8 mm**);
– the four water drainage pipes (B).

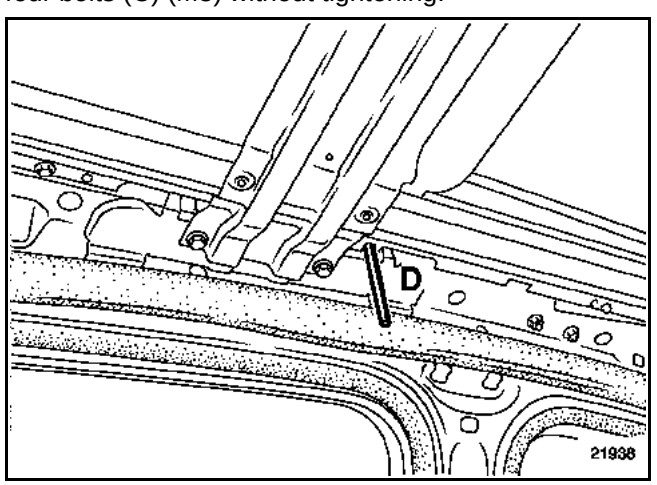
GETtheMANUALS.org



With two people:
– remove the four mounting bolts from the centre cross member (C) (M8);
– release the sunroof to the rear of the vehicle.

REFITTING

With two operators, position the whole assembly; refit the twelve bolts (A) (M5 hexagon-head, **8 mm**) and the four bolts (C) (M8) without tightening.



Centre the sunroof using two pins (**dia. 10 mm**) in the locating holes (D) for sunroof adjustment along the Y axis.

First tighten the four bolts (C) (M8) of the central crossmember; then tighten the twelve bolts (A) (M5 hexagon-head, **8 mm**) of the sunroof, proceeding diagonally.

Position the four water drainage pipes.

NOTE: when a bolt (A) (M5 hexagon head, **8 mm**) does not fulfil its locking role, it is possible to change hole.

Take the hole located nearby, which is designed for the purpose.

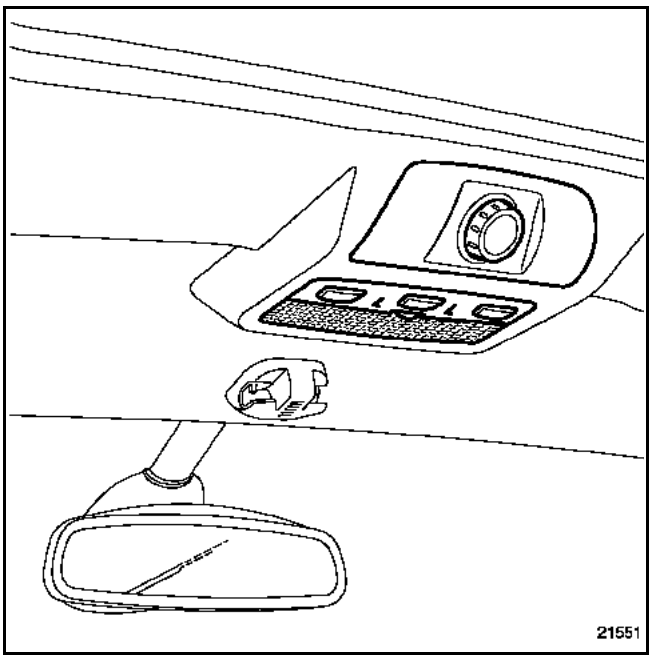
Perform finishing settings on the moving panel (**section 52A.F**).

After setting the moving panel:
– Perform a roof sealing check;
– Refit the head lining (**section 71A.J**);
– Initialise the engine (**section 52A.E**).

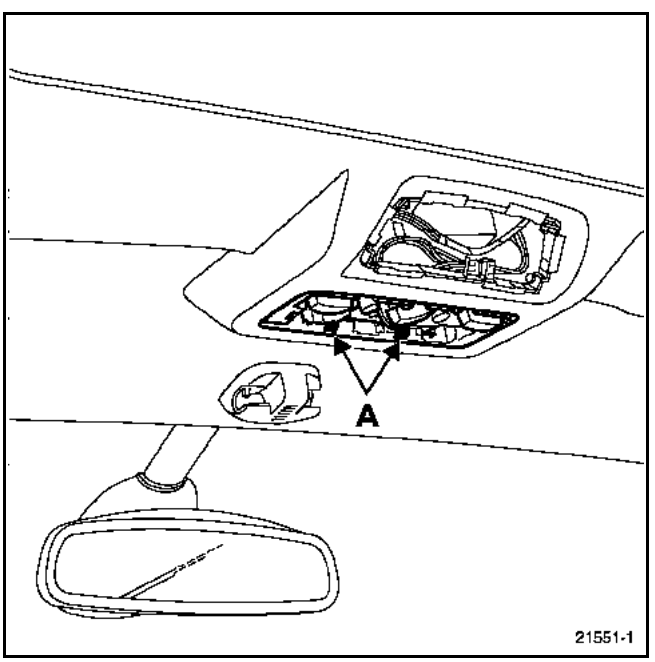
TIGHTENING TORQUES (in N.m)	
Blind holder box bolt (A) (M5 hexagon head, 8 mm)	**4 ± 20%**
Bolt (C) located on the centre cross member (M8)	**21 ± 20%**
Lug bolt on rail (M6)	**8 ± 20%**

GETtheMANUALS.org

REMOVAL

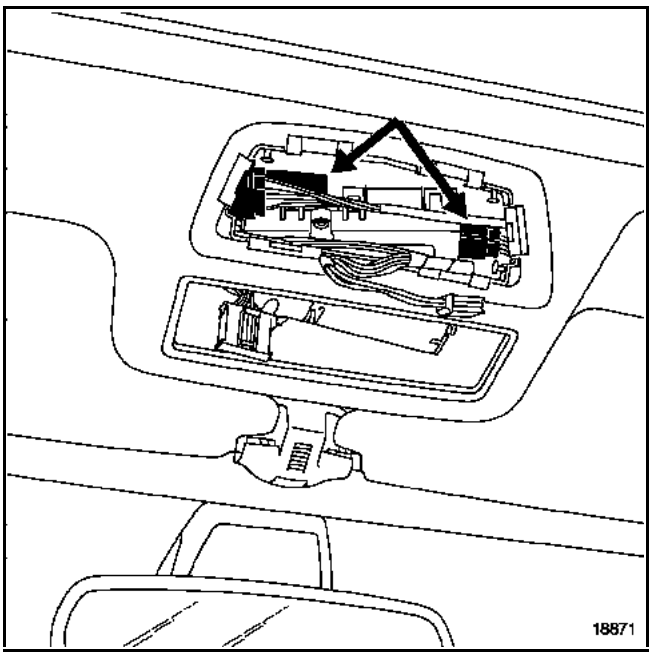


Remove the sunroof control unit.

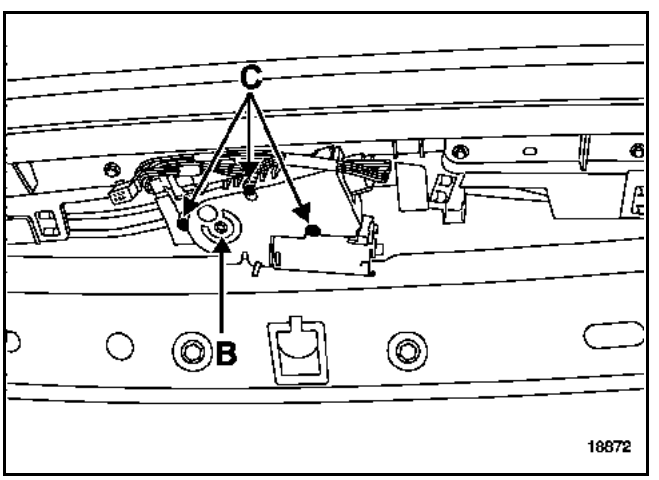


Remove the courtesy light cover to access the clips (A).

Disconnect the various connectors; withdraw the courtesy light.



Disconnect the two motor connectors.



Using a **4mm** Allen key, turn the bolt (B) to close the moving panel (if it is open).

Remove the three bolts (C) (star T20); remove the motor through the courtesy light hole.

In the event of battery disconnection, an electrical fault or servicing of the sunroof, the system will only operate in manual mode, in short jerky movements.

GETtheMANUALS.org

INITIALISATION PROCEDURE

1 - Set the switch to maximum tilt position.

2 - Press the switch (for about 5 seconds).

The motor gradually moves until it tilts completely and then redescends a few centimetres

3 - Release the switch.

4 - Press the switch and hold it down **(if it is released during cycle execution, the cycle will stop, and the preceding corrections will need to be repeated).**

The sunroof completes one full cycle of sliding opening and closing.

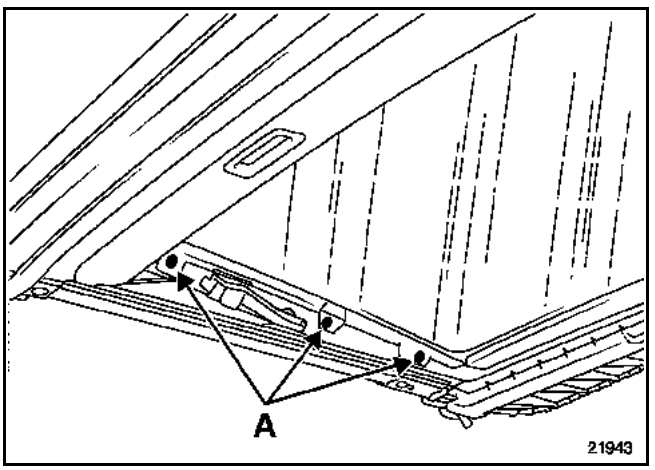
5 - The sunroof is initialised.

NOTE: the time between two successive actions must not exceed **five seconds** during the initialisation procedure, otherwise the computer will start a new initialisation cycle.

GETtheMANUALS.org

REMOVAL

Remove the two covers from the mechanism.



Remove the six fasteners (A).

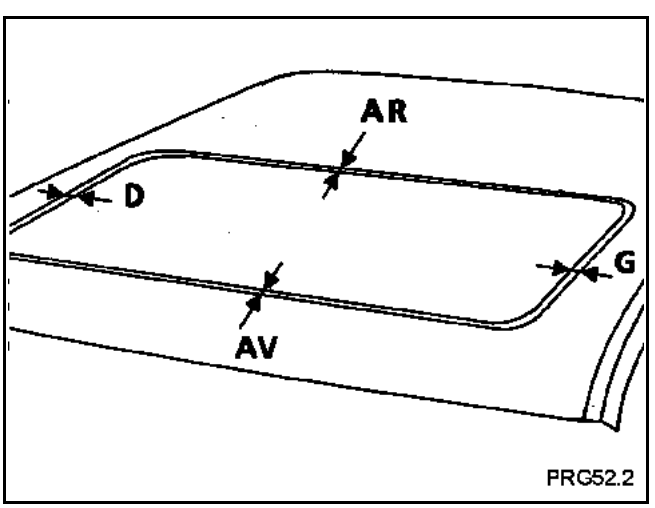
Withdraw the moving panel.

REFITTING (two people)

To refit, proceed in the reverse order to removal.

ADJUSTMENT OF THE MOVING PANEL

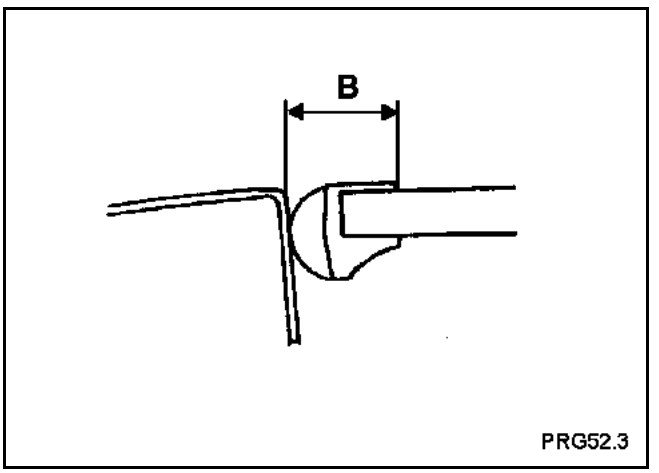
To perform this adjustment, the panel must be in closed position.



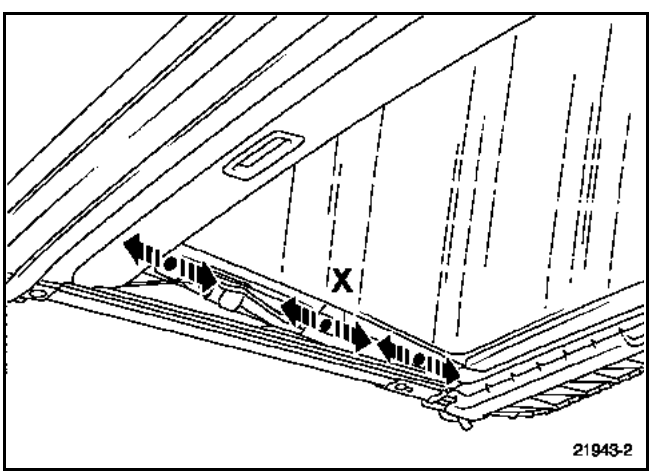
Using a ruler, check the clearances between the roof panel frames and the upper part of the moving panel encapsulation (B).

Front: **11 ± 0.5** LH line: **10 ± 0.5**

Rear: **11 ± 0.5** RH line: **10 ± 0.5**



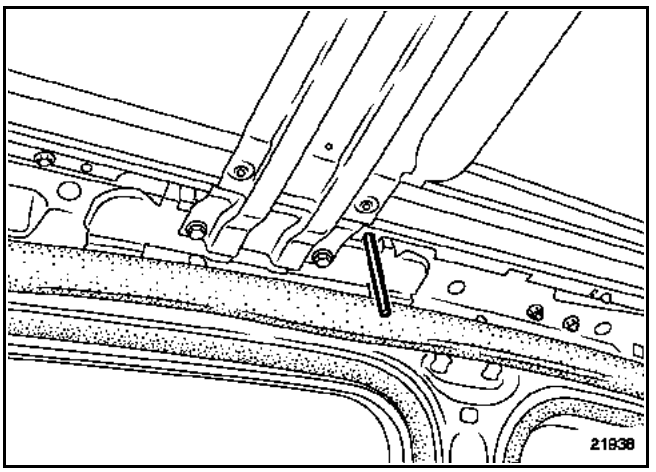
1 Adjustment of front and rear gap (on X)



With the bolts slightly loosened, position the panel on X.

GETtheMANUALS.org

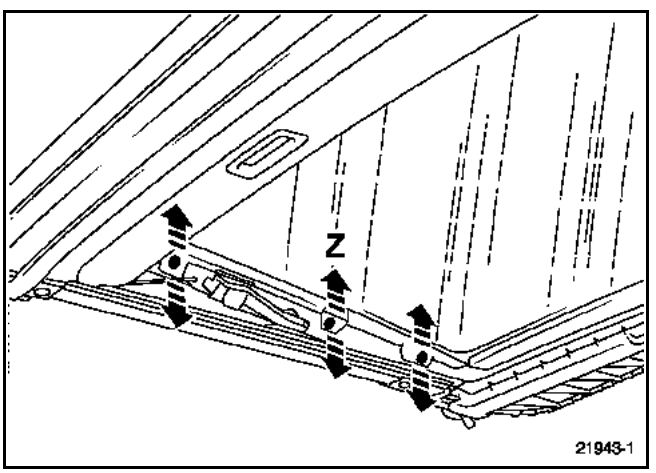
2 Adjustment of side gap (on Y)



Remove the headlining.

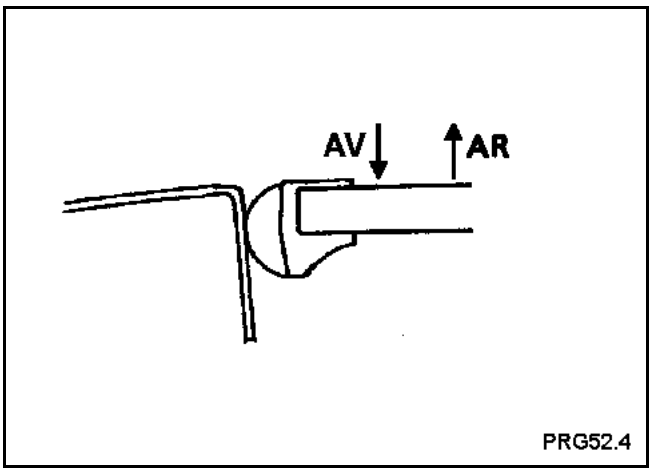
Loosen the roof mounting bolts; install two pins (dia. 10 mm) in the holes provided for the purpose and position the roof on Y.

3 Adjustment of opening gap (at Z)



Adjust the bolts and panel as described above for the front and rear gap.

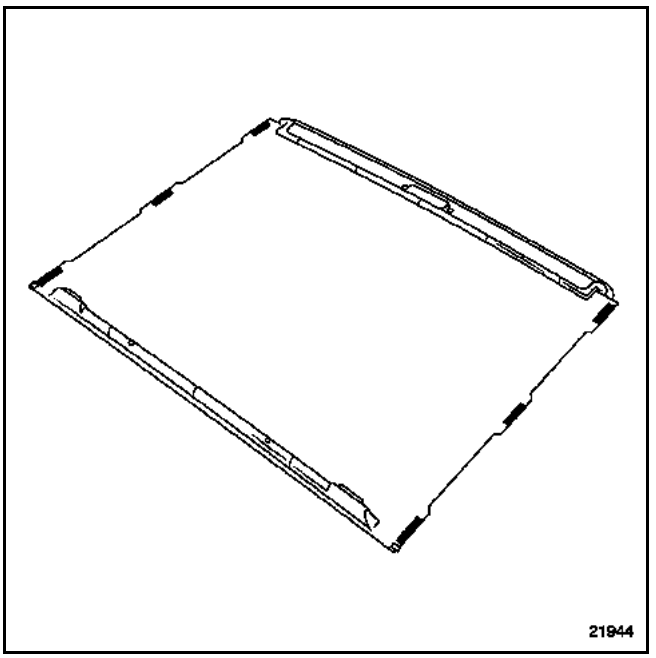
Place the ruler on its edge level with the roof frame to determine whether it is flush with the moving panel.



Rear tolerance: **1 mm** protrusion by the panel.
Front tolerance: **1 mm** protrusion by the panel.

TIGHTENING TORQUES (in N.m)	
Blind holder box bolt (A)	**4 ± 20%**
Bolt (C) located on the centre cross member (M8)	**21 ± 20%**

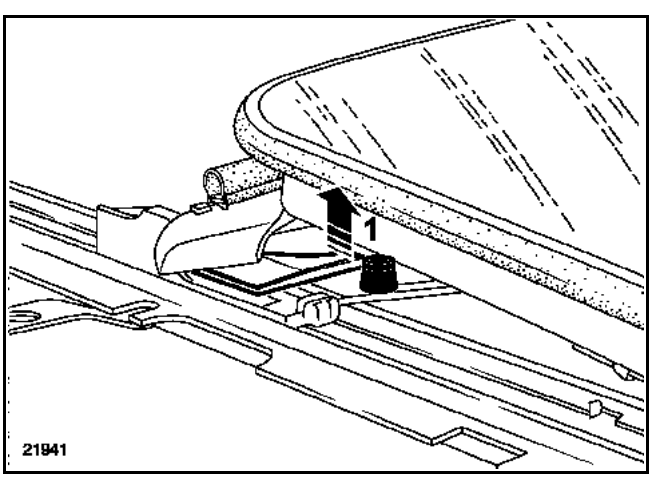
GETtheMANUALS.org



REMOVAL

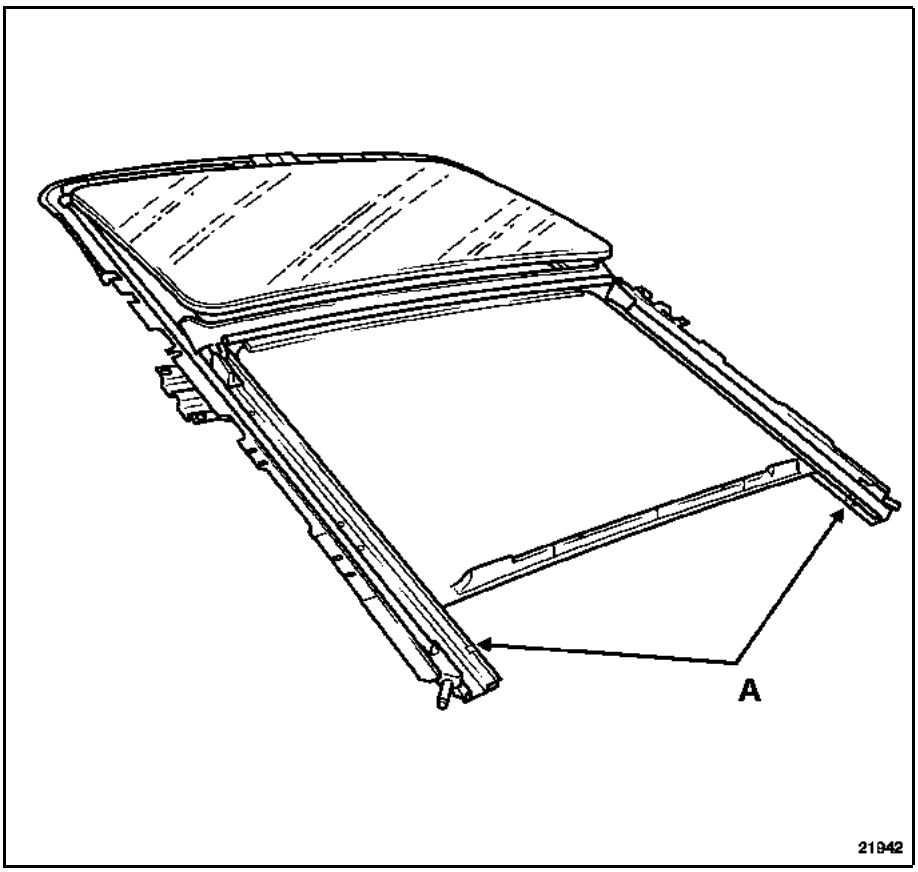
Remove:
– the head lining (**section 71A.J**);
– the sunroof (**section 52A.D**).

Place the moving panel in the tilt position.



Release:
– the tabs (1) (at both ends of the roof);
– the sunblind partially.

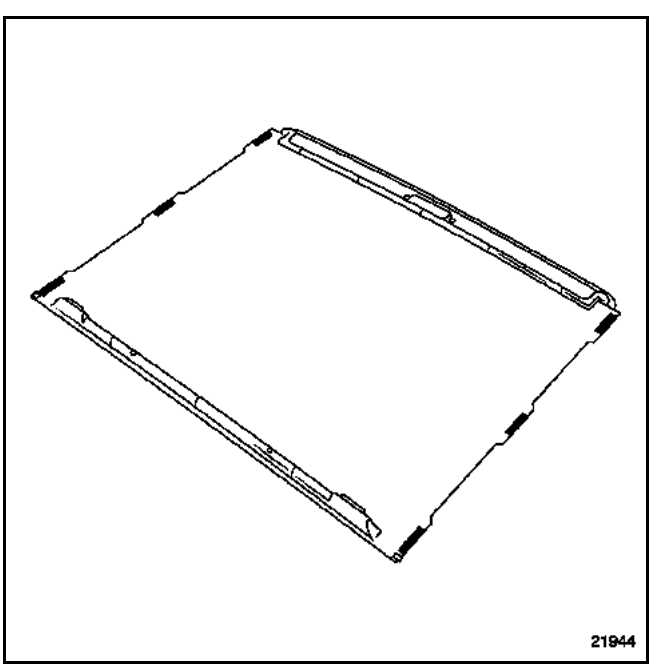
GETtheMANUALS.org



Remove the two thrust stops (A).

Release the sunblind by sliding it towards the rear of the box.

REFITTING



Before refitting the sunblind, check that the six slide pads are in sound condition (replace them if necessary).

Insert the sunblind in the box's slide rails; take care not to dislodge the six pads.

Carry out a sunblind sliding test before refitting the sunroof.

Adjust the sunroof.

Refit the linings.

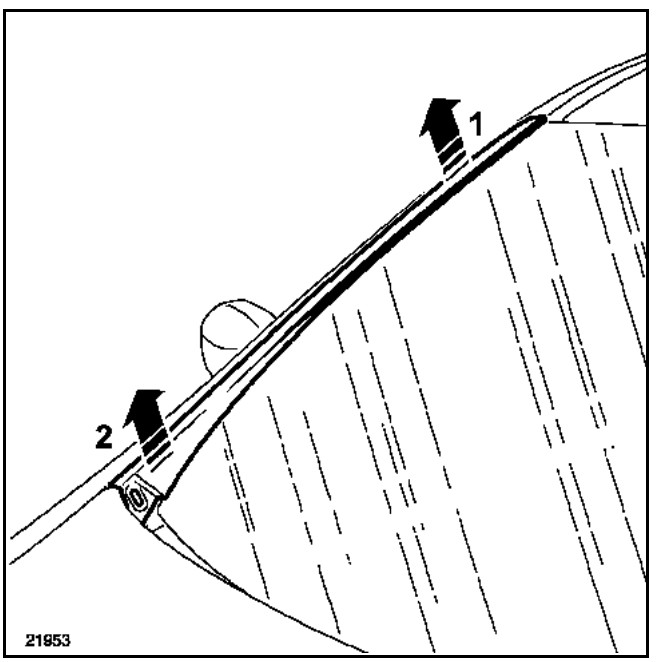
GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Ele. 1552	Tool for removing windscreen wiper arms
Car. 1640	Instrument panel protector

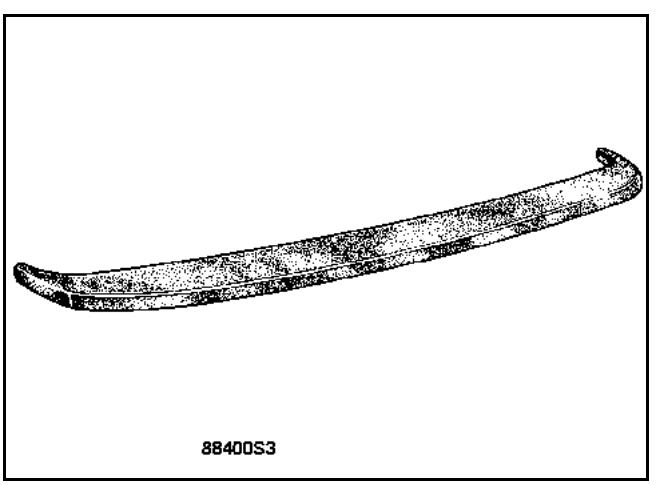
REMOVAL

NOTE: when a windscreen is replaced, the windscreen will be fitted with the upper seal.

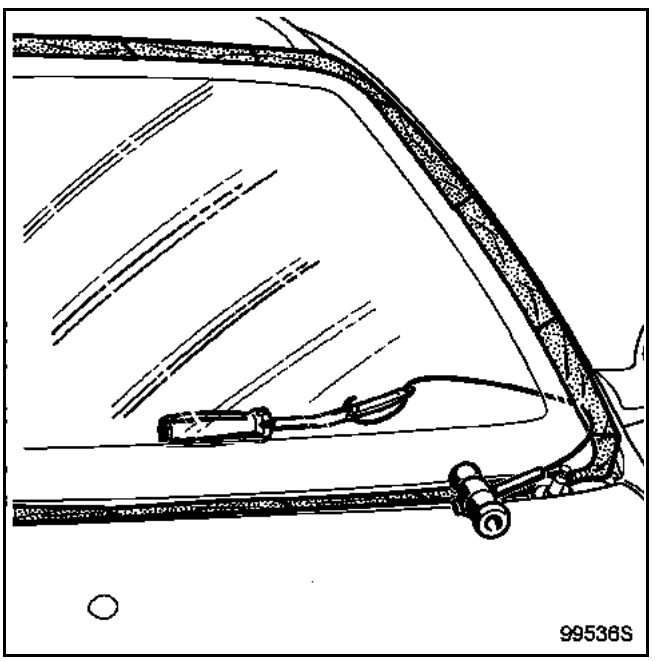
Remove:
– the windscreen pillar trims (see section **71A.A**),
– the interior rear-view mirror (see **section 57A.C**),
– the windscreen wiper arms **(Ele. 1552)**
– the scuttle panel grille (see **section 55A.C**).



Unclip windscreen surround (**1**) then (**2**).



Fit the instrument panel protector (**Car. 1640**).



Protect the wings, the pillar apertures and the edge of the roof.

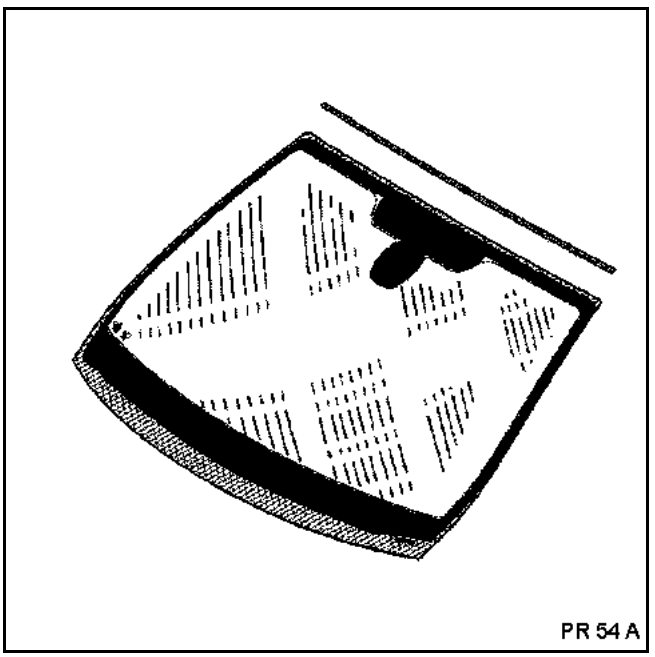
Cut through the bead of adhesive.

GETtheMANUALS.org

REFITTING

See Technical Note **560 A for information on preparation and bonding**.

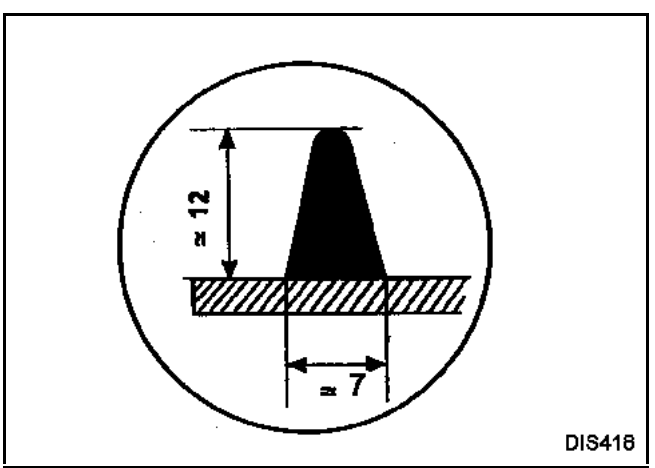
CAUTION: it is essential to use a **high tensile** adhesive for gluing windows.



If the windscreen is removed during operations on the bodywork, the upper seal will have to be replaced (adhesive).

Fit the lower crosspieces (adhesive) onto the aperture:
– one in the centre,
– one on each side **400 mm** from the centre.

Replace the acoustic foam (if necessary).

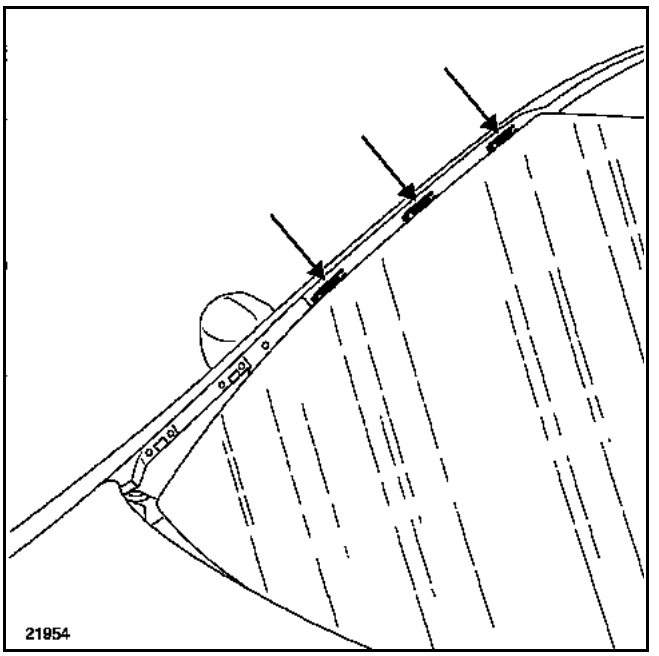


Keep to the size of the glue bead.

Glue the windscreen in place (two people required).

Distribute the gap to either side.

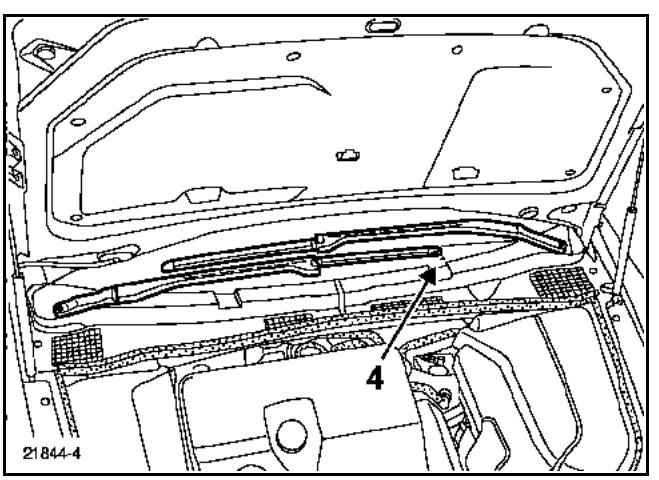
IMPORTANT: Replace the safety labels which are available from the replacement parts store catalogue.



Replace the exterior surround clips.

TIGHTENING TORQUE (in Nm)	
Windscreen wiper arm nuts	**20**

Position the lower arm (RH) on mark (4) on the windscreen.



NOTE: to help distinguish between the two windscreen wiper arms, the left arm is more curved.

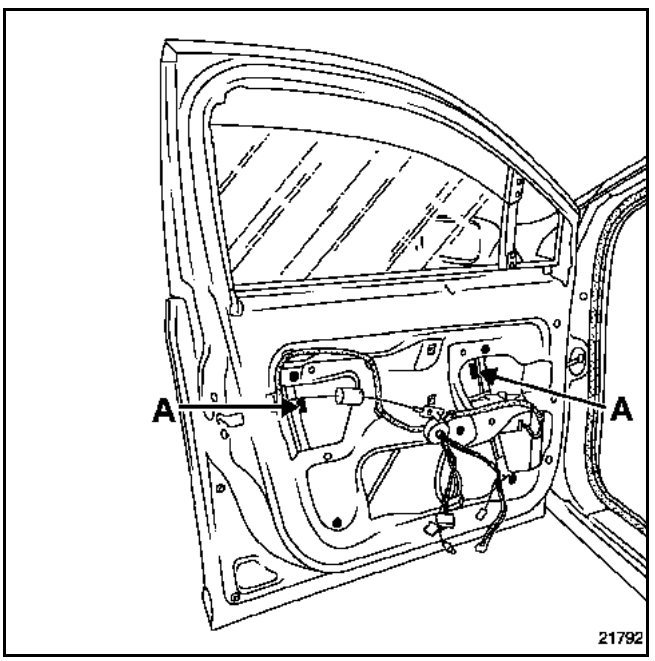
Fit:
– the upper arm (LH) parallel to the lower arm and tighten the nut to a suitable torque;
– the nut covers.

GETtheMANUALS.org

REMOVAL

Remove:

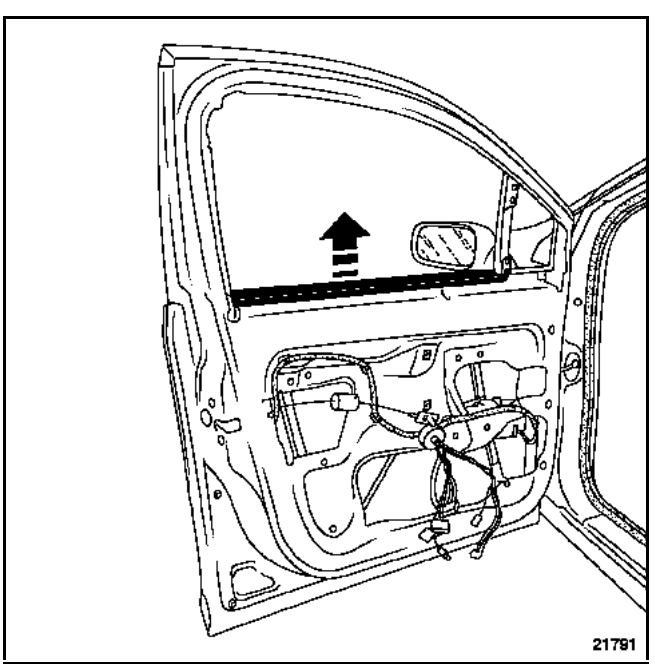
– the door trim (see **section 72A.A**);



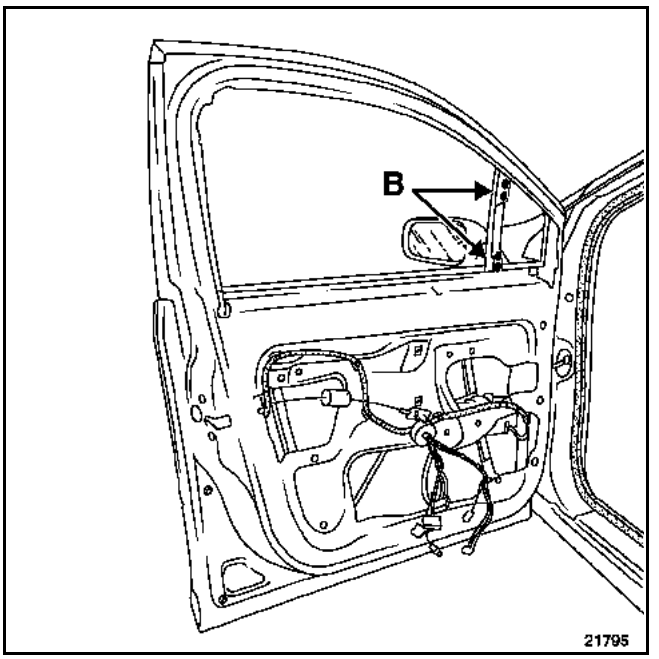
– the two window mounting clips (A).

Release the window from the window riser moving slide spindles,

Refit the glass at the bottom of the inner door shell.

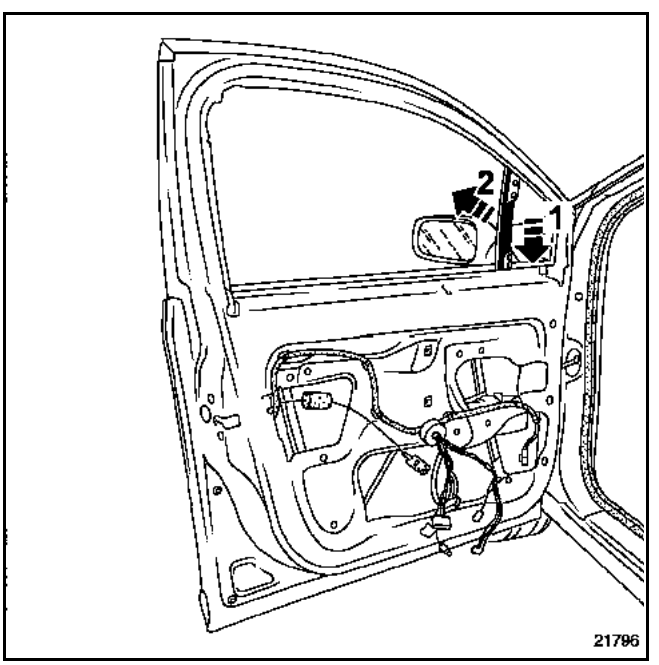


Release the interior weatherstrip.



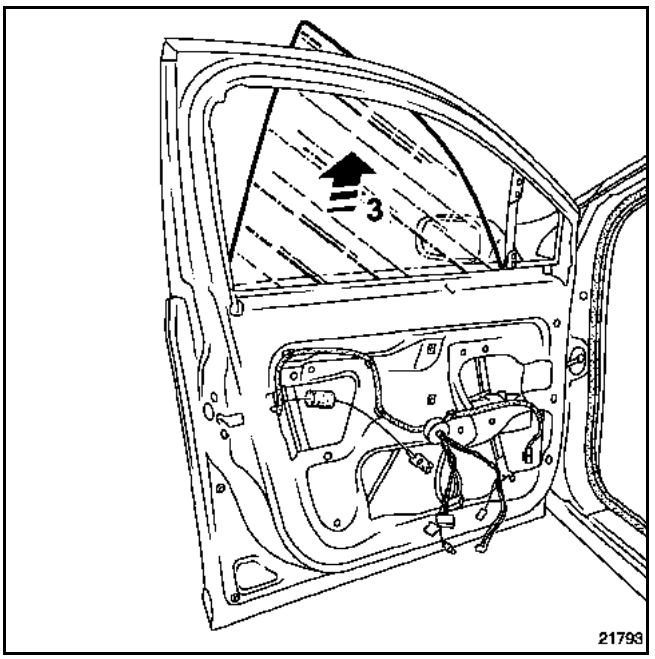
Remove the entire seal above the fixed upright glass run channel.

Remove the mountings (B).



Release the fixed upright glass run channel at (1) then (2).

GETtheMANUALS.org



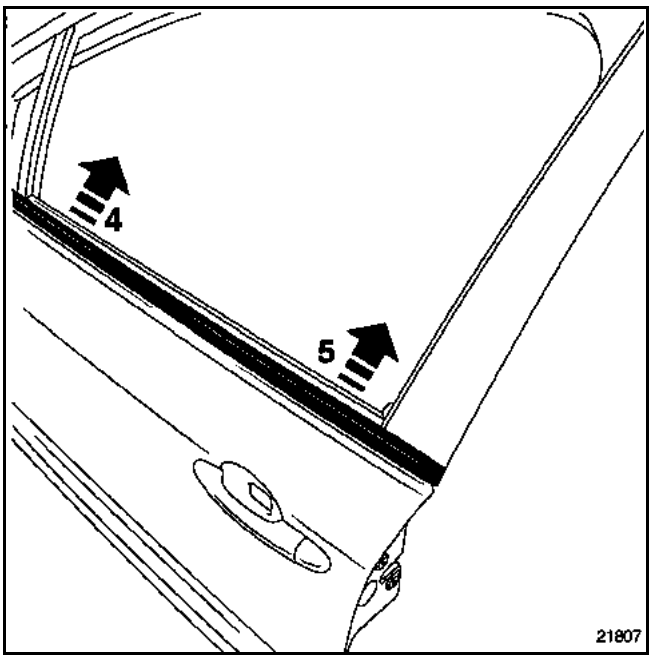
Remove window (3).

REMOVING THE FIXED WINDOW

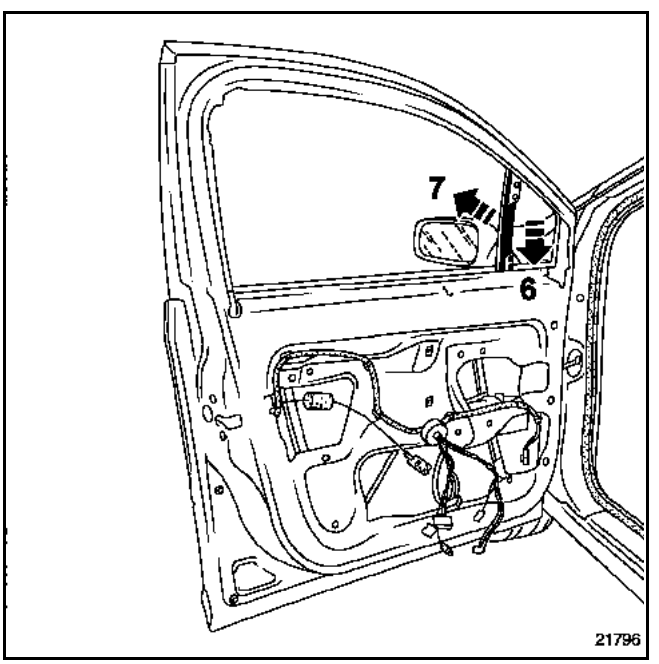
NOTE: to remove the fixed window, the sliding window does not have to be removed.

Move the sliding window to the lowered position

Remove:
– the exterior door trim (front section) (see **section 56A.C**),
– the door seal (partially) (see **section 65A.A**).

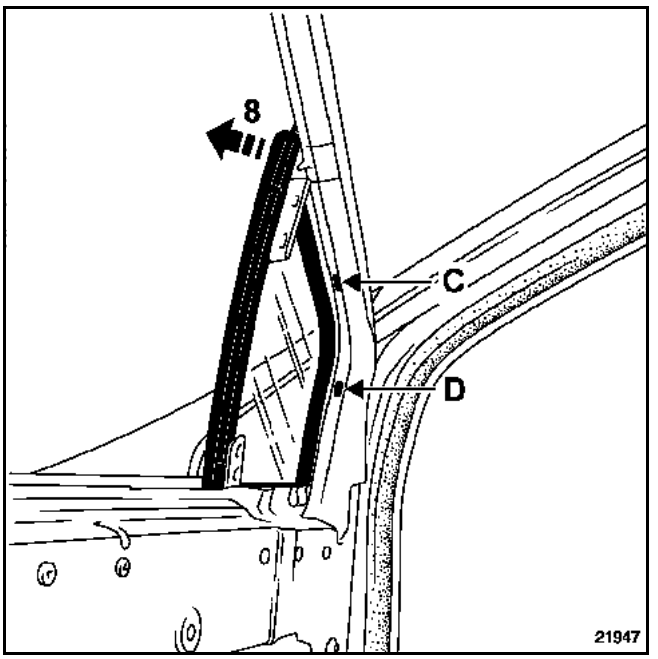


Using tool **Car. 1363** carefully remove the weatherstrip at (4) and (5).



Remove the mounting bolts and the fixed upright glass run channel (6) and (7).

GETtheMANUALS.org



Remove the door frame interior trim (adhesive).

Using a flat screwdriver, release clips (C) then (D) pulling the upper section of the window away (8).

REFITTING

Before refitting the fixed window, check the condition of the mounting clips.

Replace the door frame interior trim (adhesive).

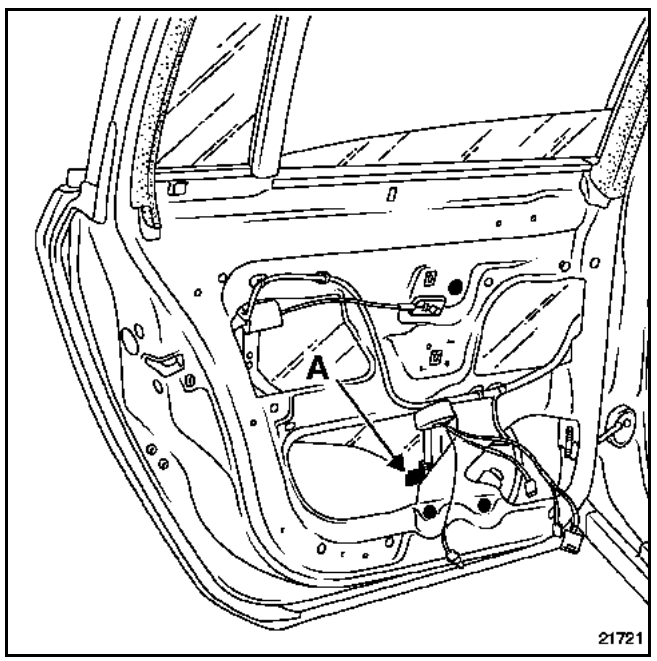
Proceed in the reverse order to removal.

GETtheMANUALS.org

REMOVAL

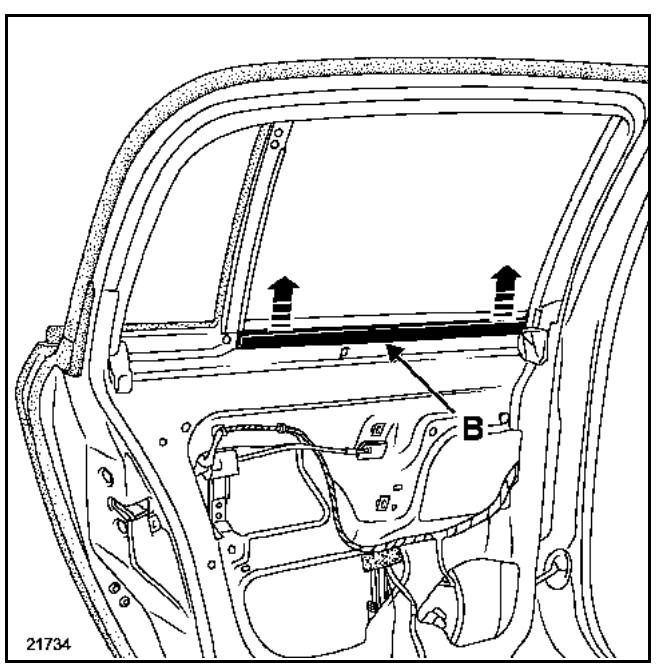
Remove:

– the door trim (**section 72A.B**),

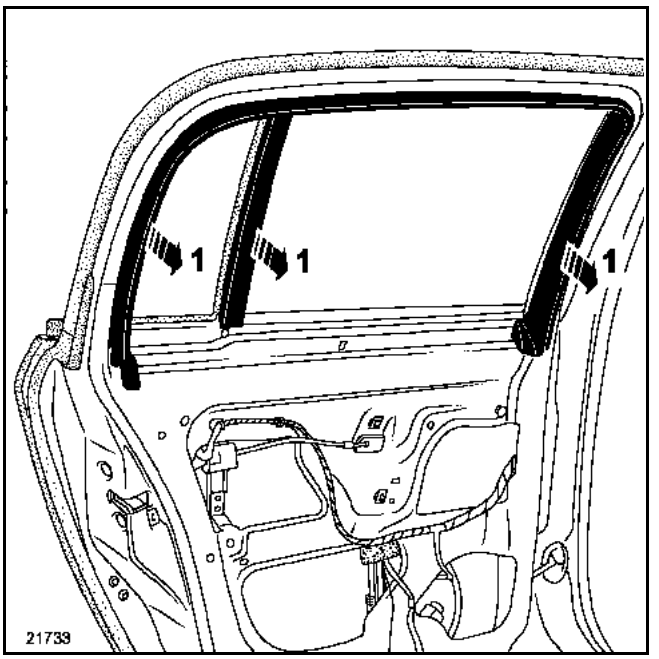


– window mounting clip (A), then release the window from the window riser moving slide spindle.

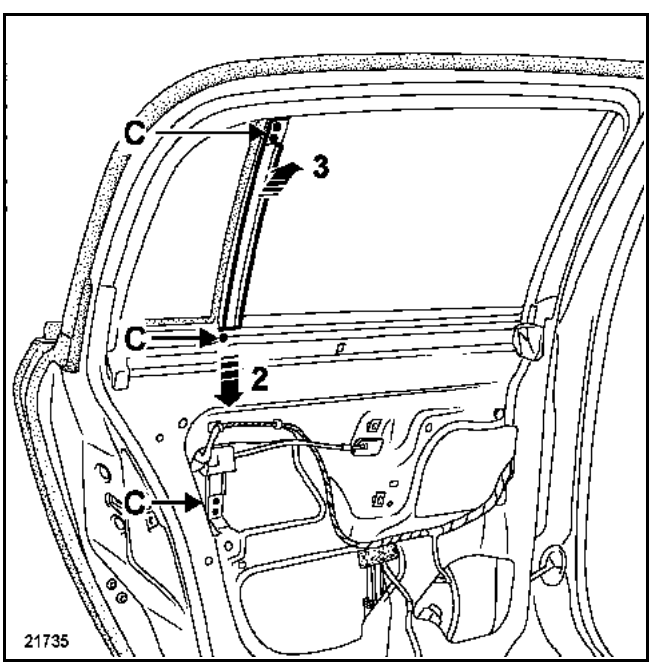
Refit the glass at the bottom of the inner door shell.



Remove the window interior weatherstrip (B).



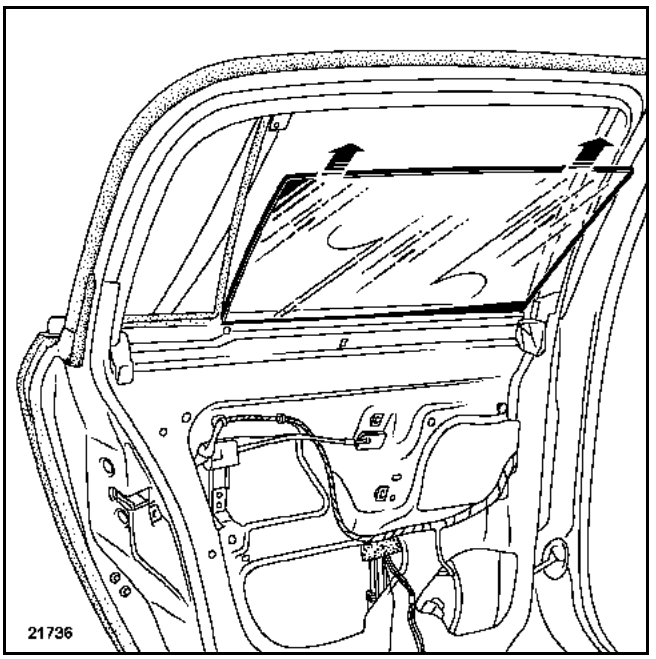
Unclip the door frame interior trim (1).



Partially remove the entire seal from the fixed upright glass run channel.

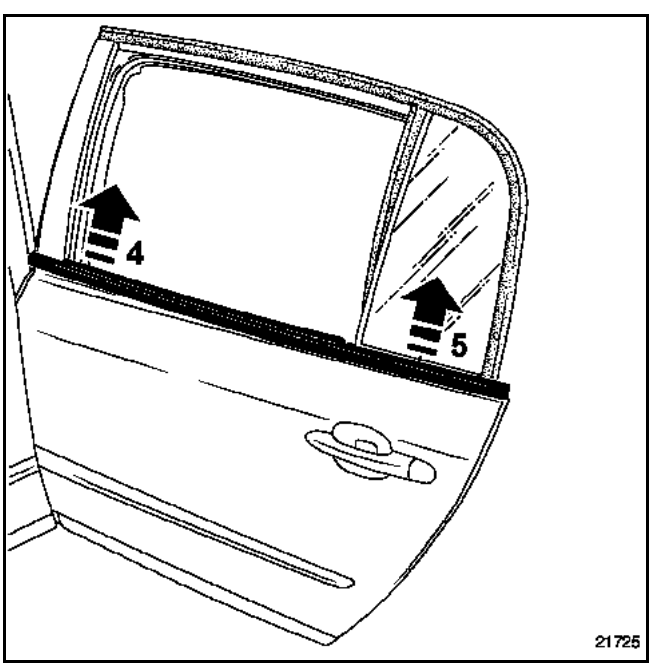
Remove the five fixed upright mounting bolts (C), then release at (2) and (3).

GETtheMANUALS.org



Release the window.

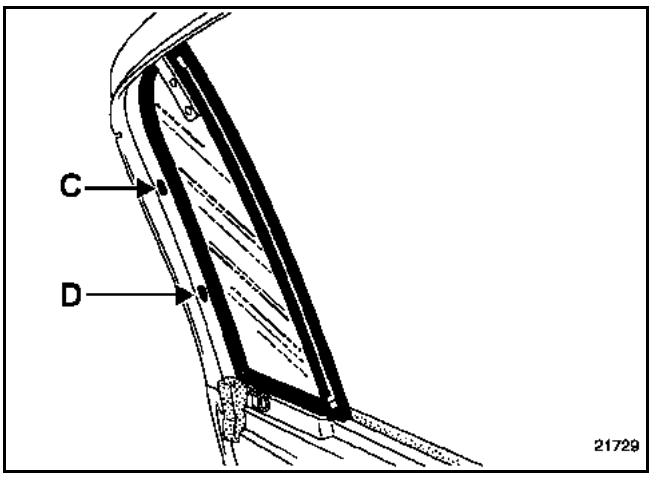
REMOVING THE FIXED WINDOW



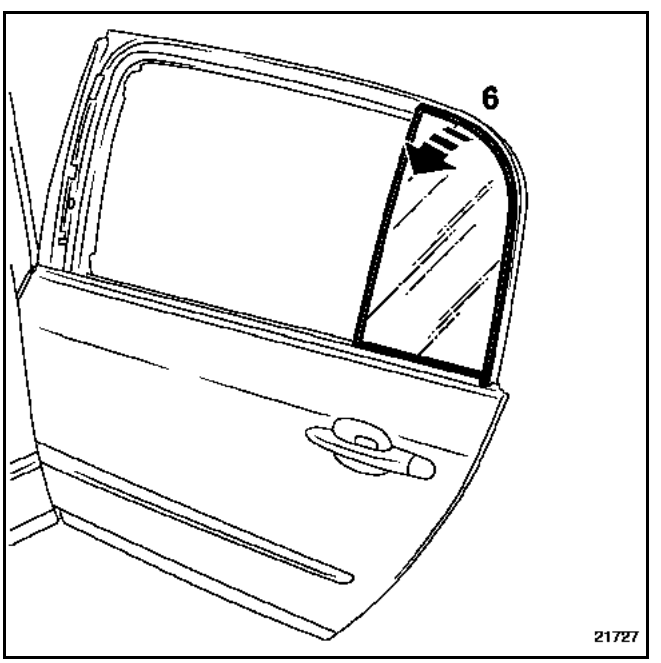
Using tool **Car. 1363** carefully remove the weatherstrip at (4) and (5).

Partially remove the exterior door frame seal (see **section 65B**).

Remove the door frame interior trim (adhesive).



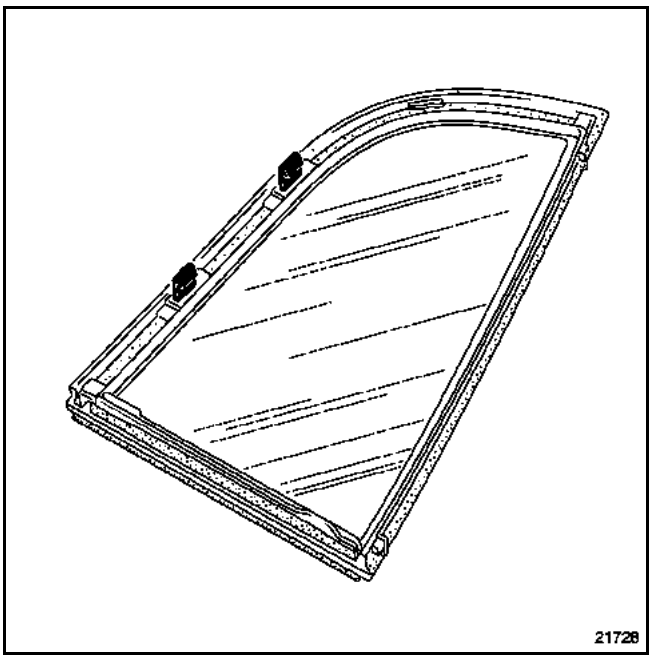
Using a flat screwdriver, apply pressure to the clip (C) then (D) pulling the upper section of the window away.



Remove the window (6).

GETtheMANUALS.org

REFITTING



Before refitting the fixed window, check the condition of the mounting clips.

Replace the door frame interior trim (adhesive).

Proceed in the reverse order to removal.

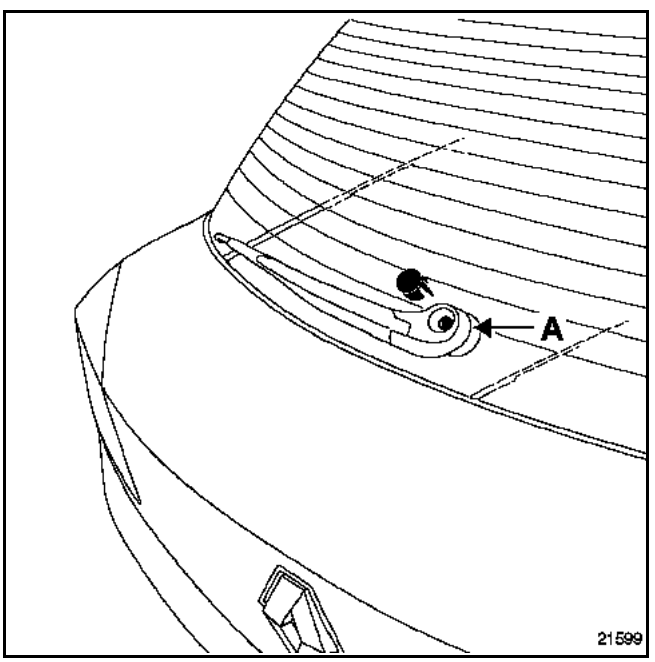
GETtheMANUALS.org

SPECIAL TOOLING REQUIRED	
Ele. 1552	Tool for removing windscreen wiper arms

REMOVAL

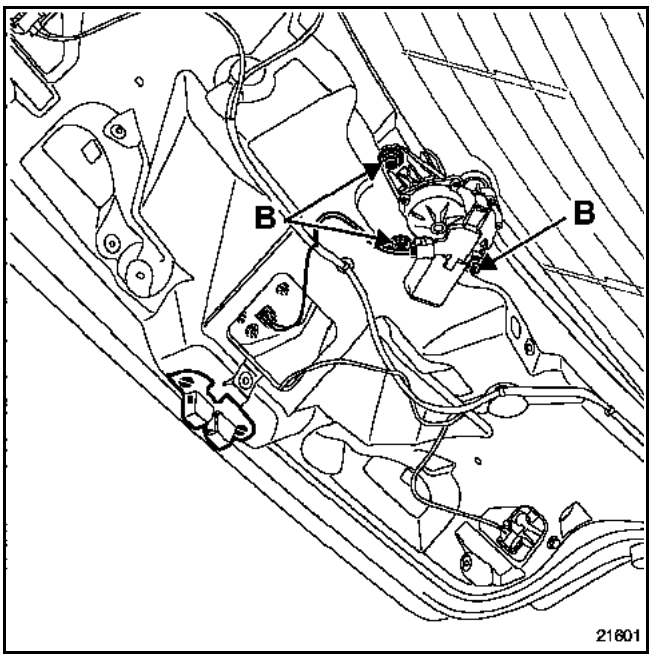
NOTE: When it is replaced, the rear screen will be fitted with the frame seal, the two crosspieces and the central indexing dowel.

Remove the tailgate trim (see **section 73A.B**).



Unclip the cover by pressing the tab under the windscreen wiper arm (A).

Using the tool (**Ele. 1552**), remove the windscreen wiper arms.



Disconnect the motor connector.

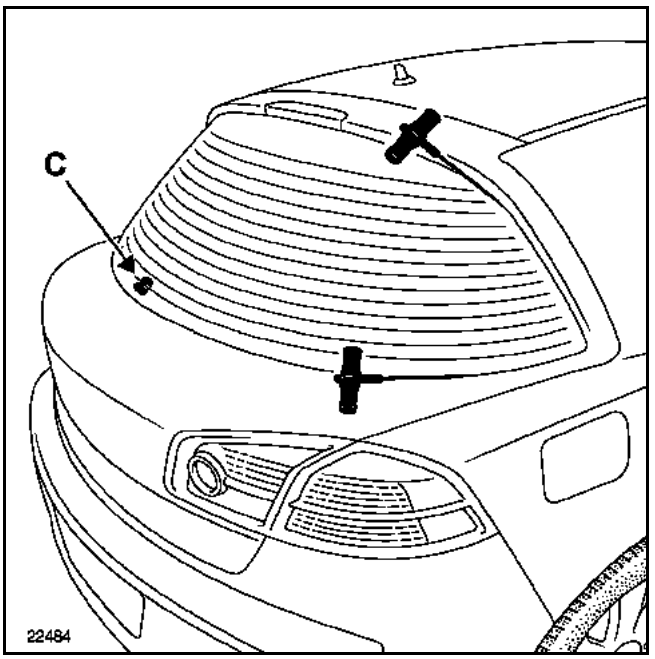
Remove the mountings (B), and release the motor.

Disconnect the de-icer connectors and attach the two discs to the rear screen.

Protect the window surround with masking tape.

NOTE: prepare the cutting wire and two tension handles.

GETtheMANUALS.org



Feed the cutting wire through the rear screen angle taking care to slide it under the lip moulding.

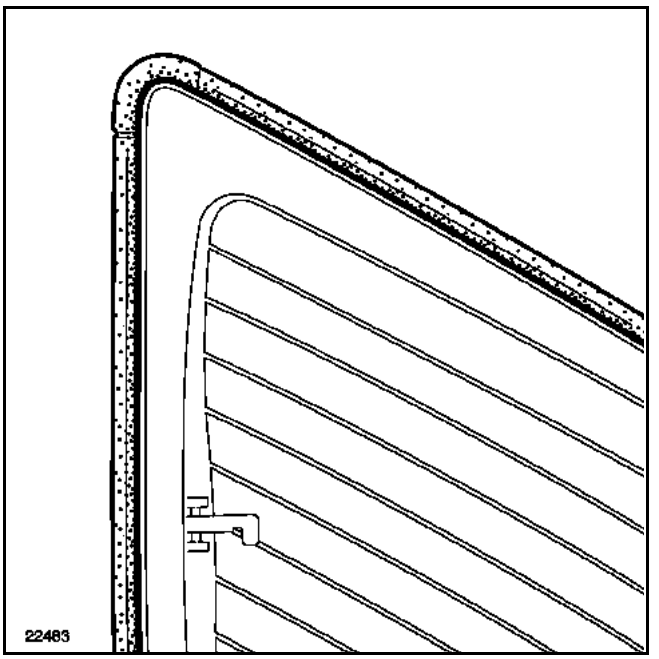
Cut the glue bead (**two people required**).

NOTE: when cutting the glue bead, watch out for the indexing guide (C) which will create some resistance.

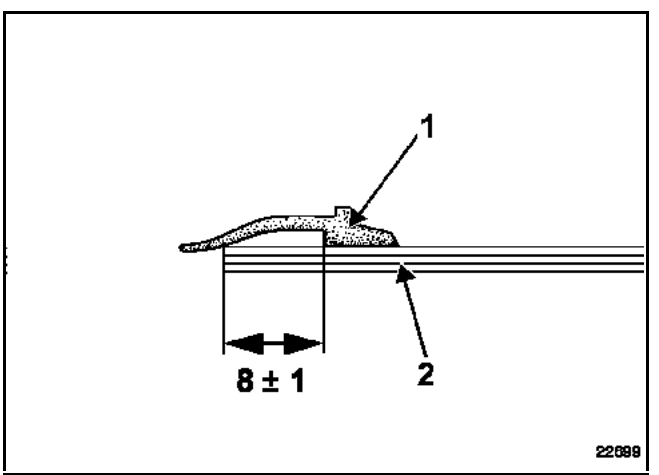
REFITTING

See Technical Note **560 A for information on preparation and bonding**.

CAUTION: it is essential to use a high tensile adhesive for gluing windows.



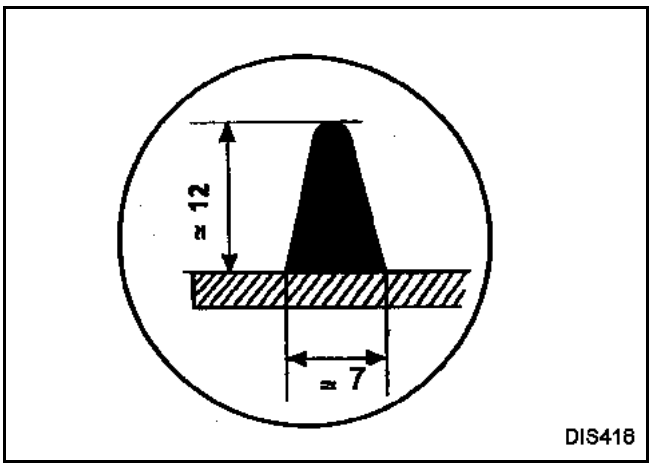
After leveling off the glue bead and cleaning the rear screen, glue the surround seal starting with the angles.



Keep to the following gluing distance between the rear screen flange and the gluing area (**8 ± 1 mm**).

1 Frame joint
2 Rear screen

GETtheMANUALS.org



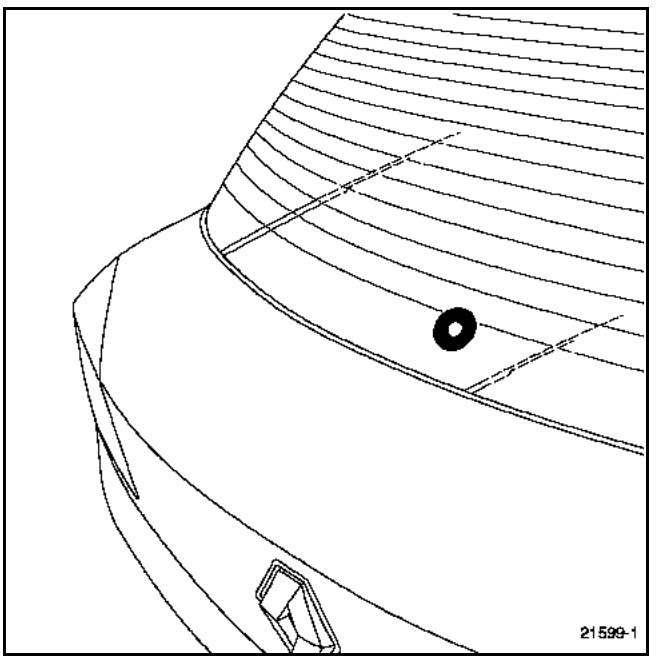
Keep to the size of the glue bead.

Glue the rear screen in place (**two people required**).

Place three cross pieces on the lower section (**3 mm** thick) to distribute the gap to either side.

Strap the rear screen if necessary.

SPECIAL NOTES ON REFITTING THE WINDSCREEN WIPER MOTOR



It is essential to replace the seal every time the motor is removed.

After fitting the motor, check that it is in stop position.

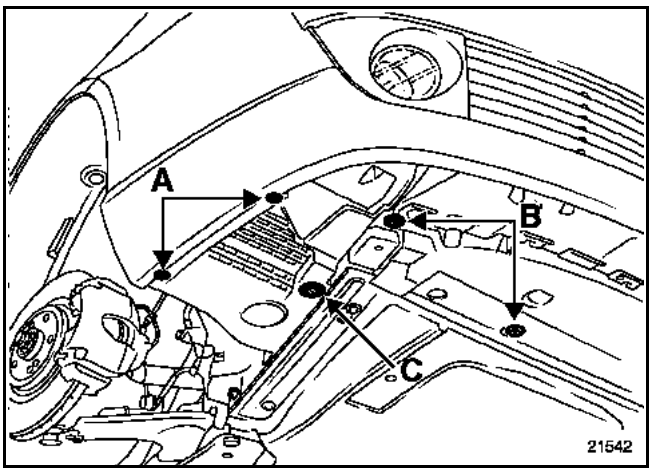
Clean the motor shaft splines.

Affix the windscreen wiper arms to the rest position with a new nut

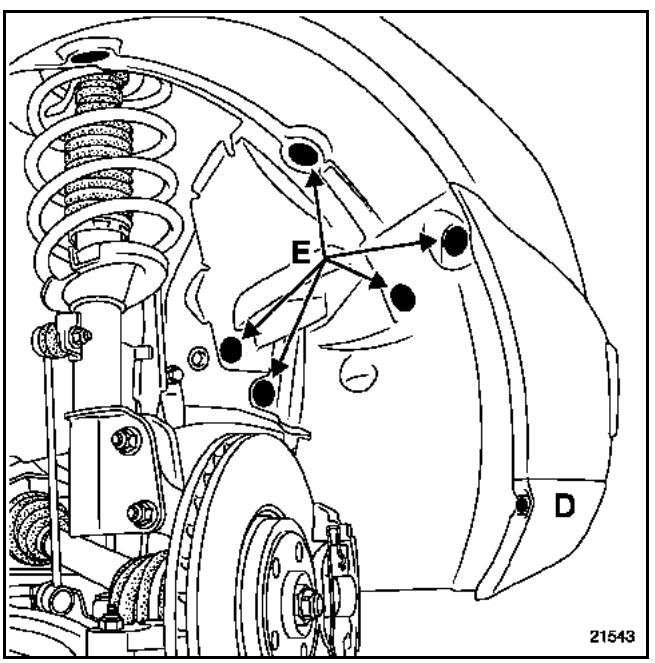
TIGHTENING TORQUES (in Nm)	▽
Windscreen wiper motor nuts	**8**
Windscreen wiper arm nuts	**12**

GETtheMANUALS.org

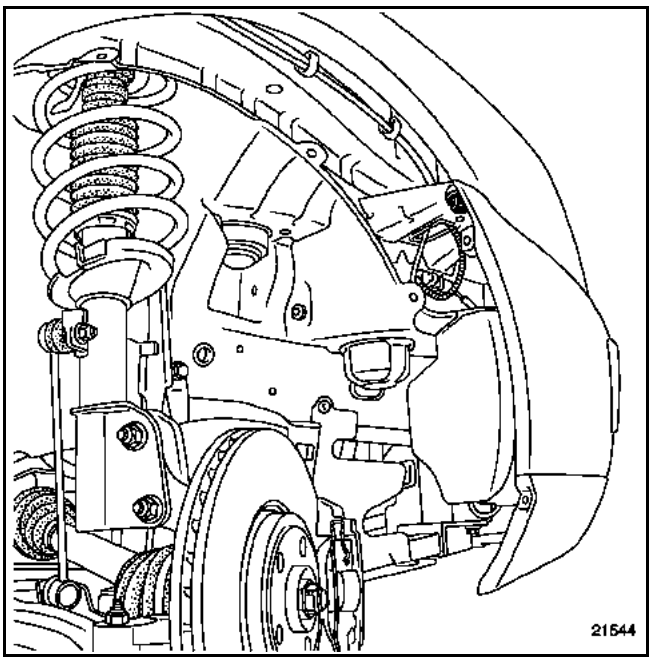
REMOVAL



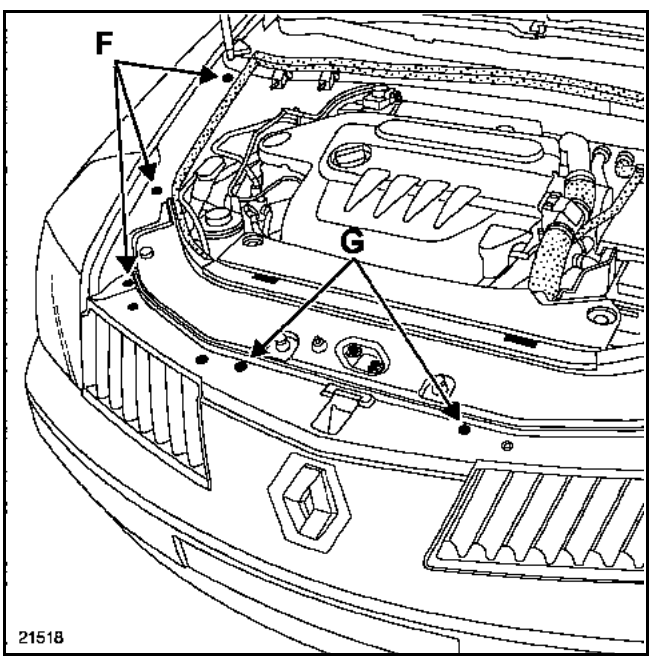
Remove:
– the bolts (A) and (B);
– the clip (C);



– the bolt (D),
– the clips (E), then partially release the wing interior protector;

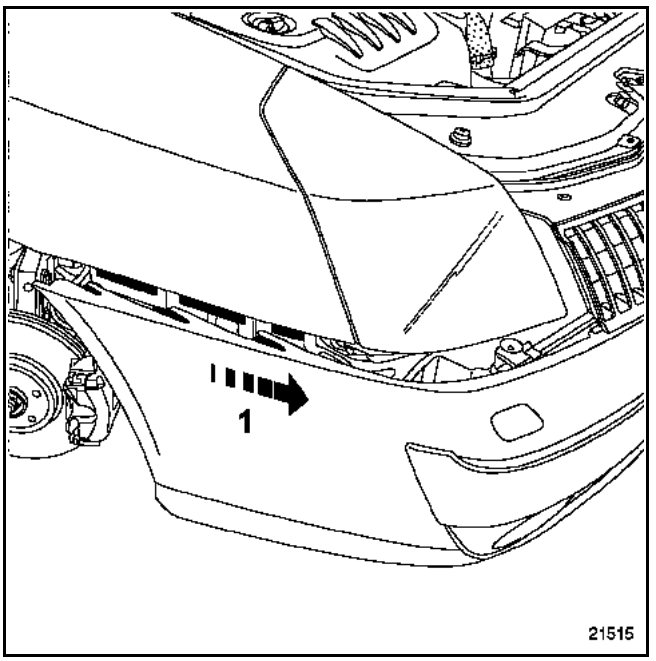


– the side bolt.



Unclip:
– the clips (F), then release the wing interior trim;
– the clips (G).

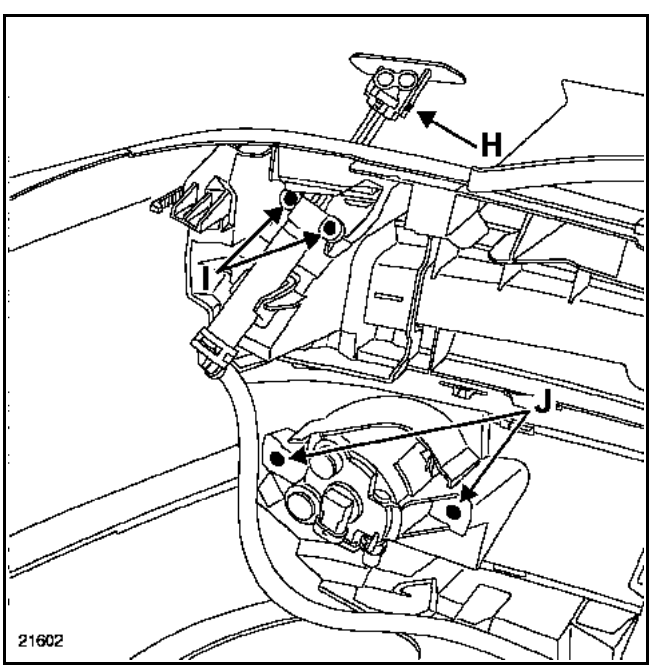
GETtheMANUALS.org



Partially release the bumper (1).

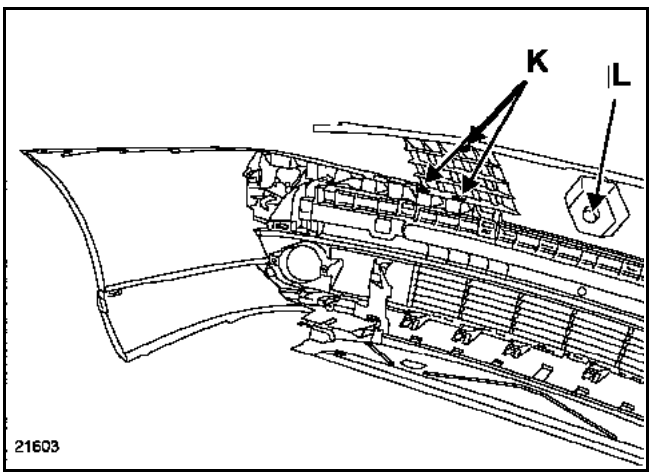
Disconnect:
– the foglight connectors;
– the power supply to the headlight washer jets.

DISMANTLING



Lift the jet manually, then unclip the trim at (H).

Remove:
– the bolts (I) and disconnect the water pipe;
– the bolts (J) and withdraw the foglight;

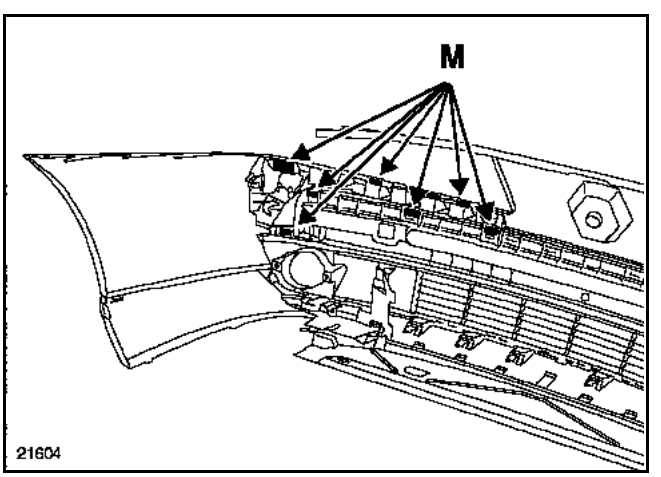


Grind the two pins, then release the badge.

Release the clips (K), then withdraw the grille.

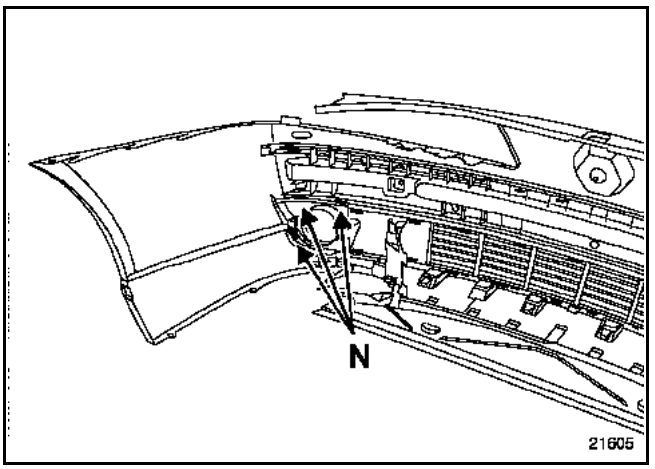
Special requirement for refitting the badge

Reweld the two pins or screw in the badge through the aperture provided for the purpose (L).

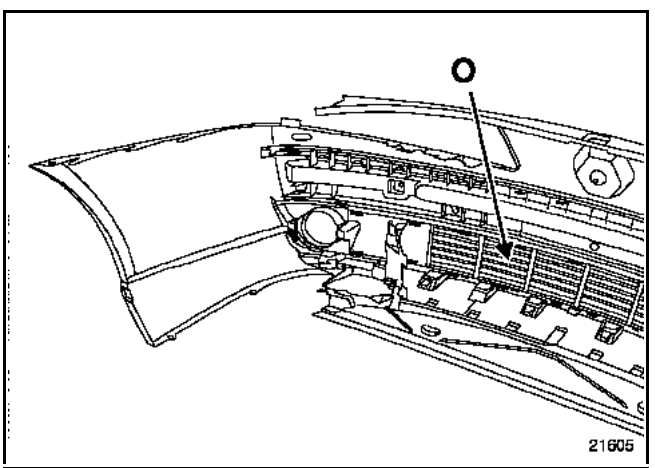


Remove the clips (M), then withdraw the absorber;

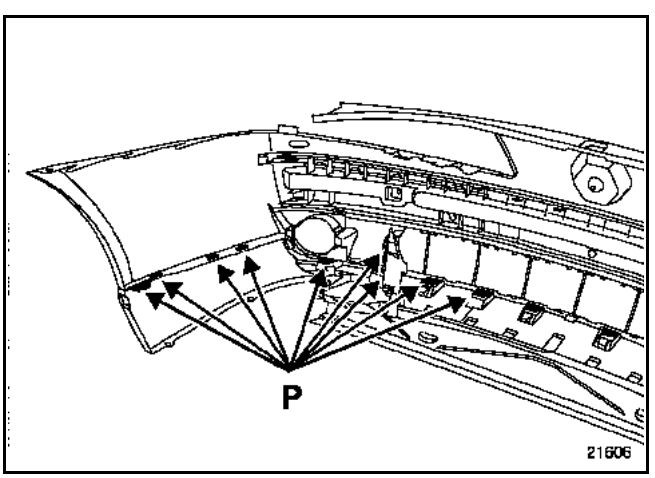
GETtheMANUALS.org



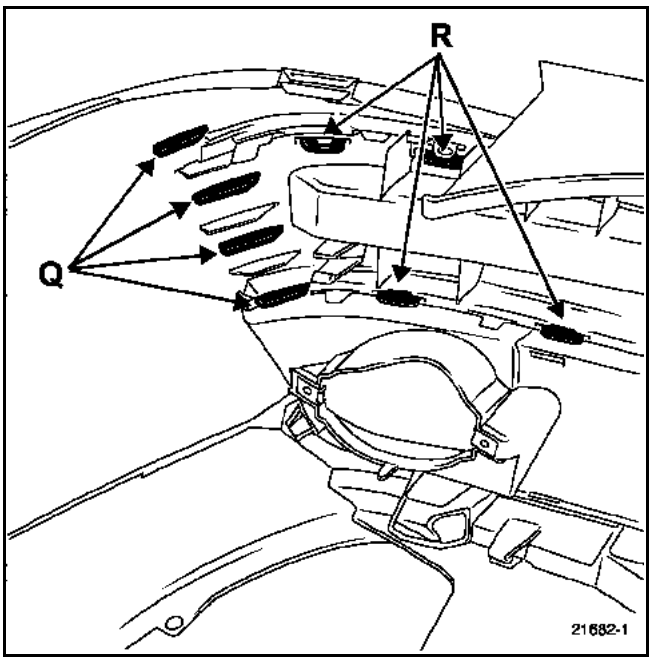
– the clips (N), then release the foglight trim;



– the clips (O), then withdraw the grille;



– the fasteners (P), and withdraw the lower trim strip.



IMPORTANT: to remove the protective inset, it will be necessary to grind the four tabs (Q), then unclip the fasteners (R).

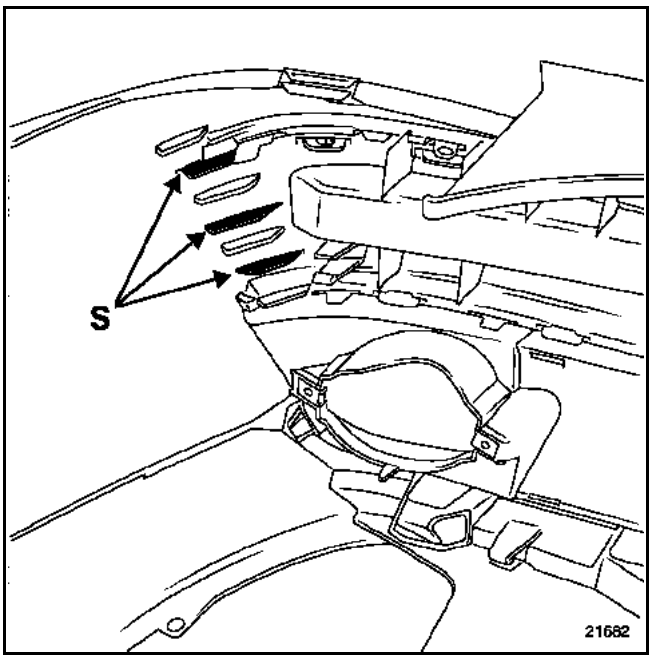
REFITTING THE PROTECTIVE INSET

NOTE: the following method applies when removing/ refitting the protective inset.

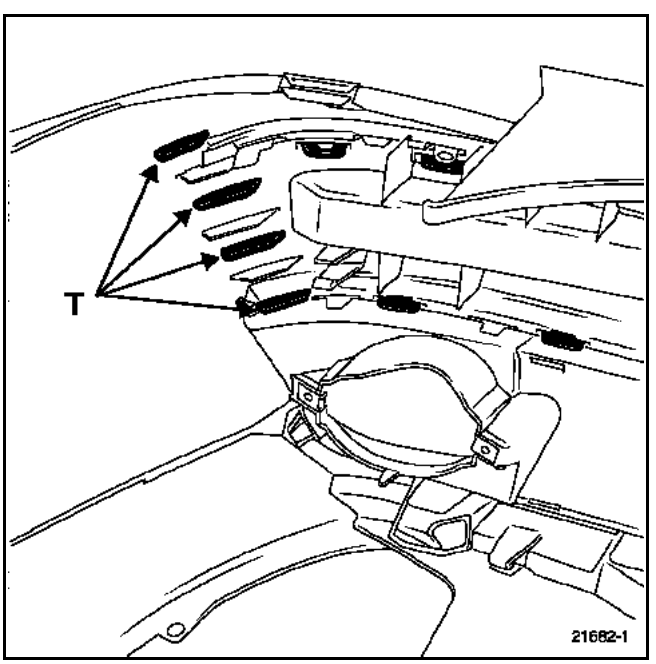
Position the protective inset and clip the fasteners (R).

Weld or clip (with a pig's snout clip) the four tabs (Q) (see above).

GETtheMANUALS.org



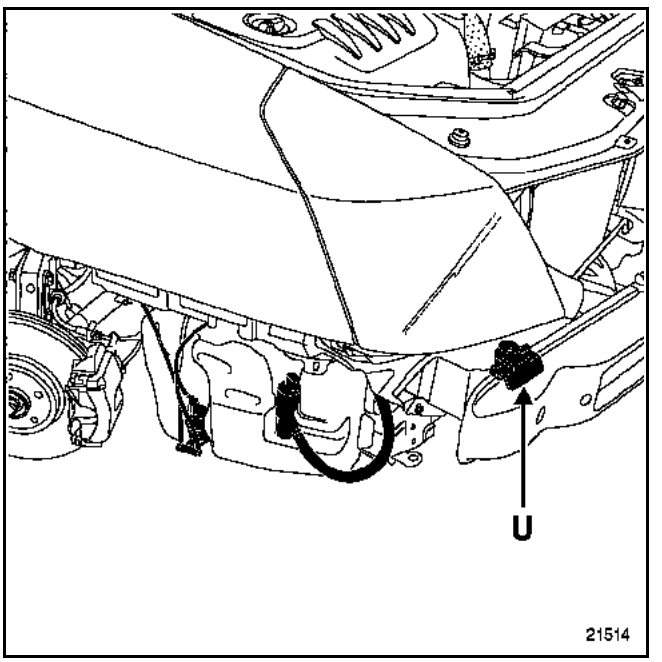
IMPORTANT: to reinforce the protective inset fastening on the bumper, weld or clip (with a pig's snout clip) the three tabs (S).



NOTE: when replacing the protective inset, weld or clip (with a pig's snout clip) only the four tabs (T).

SPECIAL REQUIREMENT FOR REFITTING THE BUMPER

NOTE: two operators are needed for refitting.



Before refitting the bumper, check that the guide plates (U) are in sound condition.

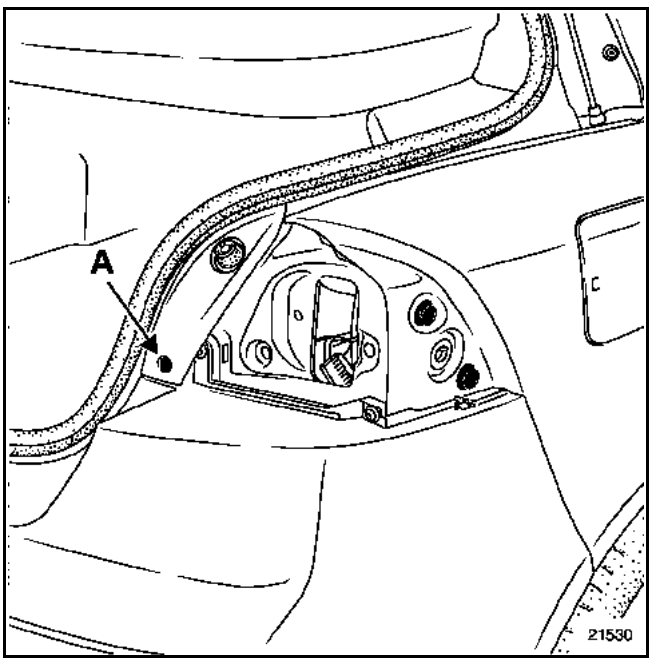
Connect the headlight washer hose and the foglight connectors.

Proceed in the reverse order to removal.

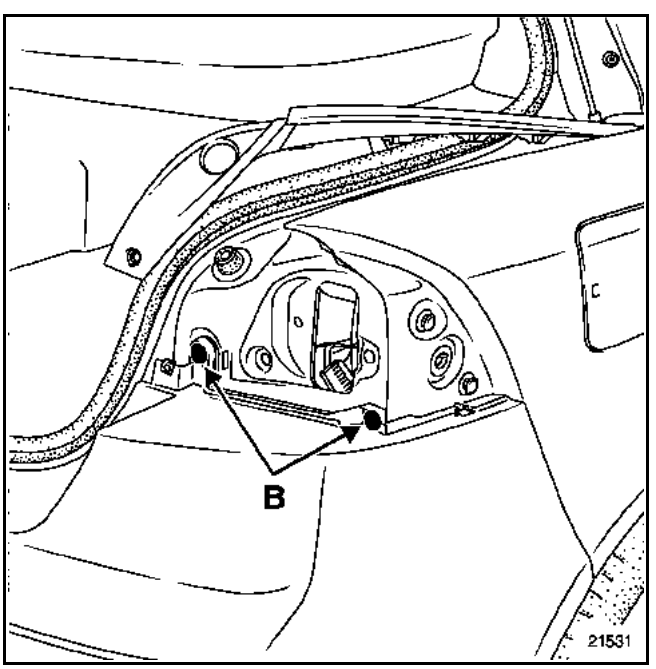
GETtheMANUALS.org

REMOVAL

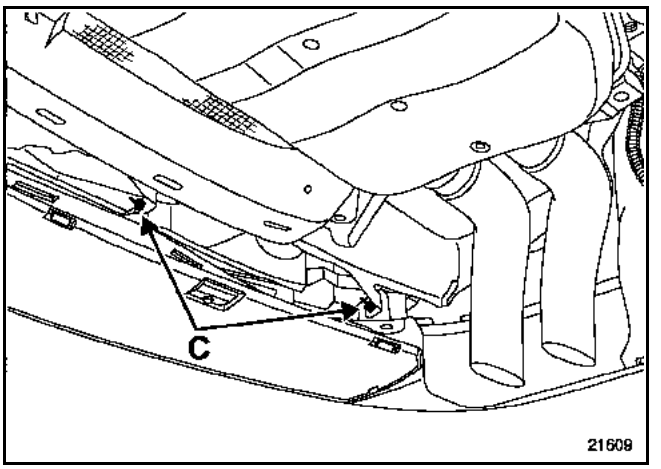
Remove:
– the rear lights;



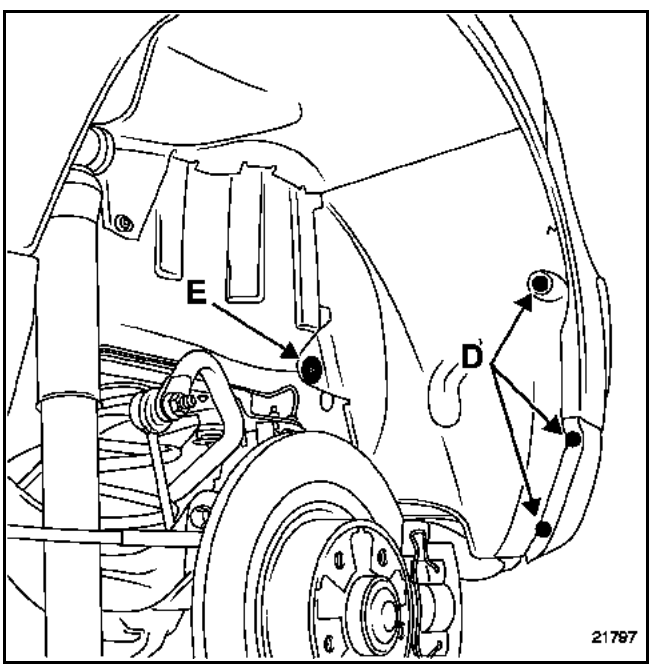
– the clip (A), then lift the trim slightly;



– the upper bolts (B);



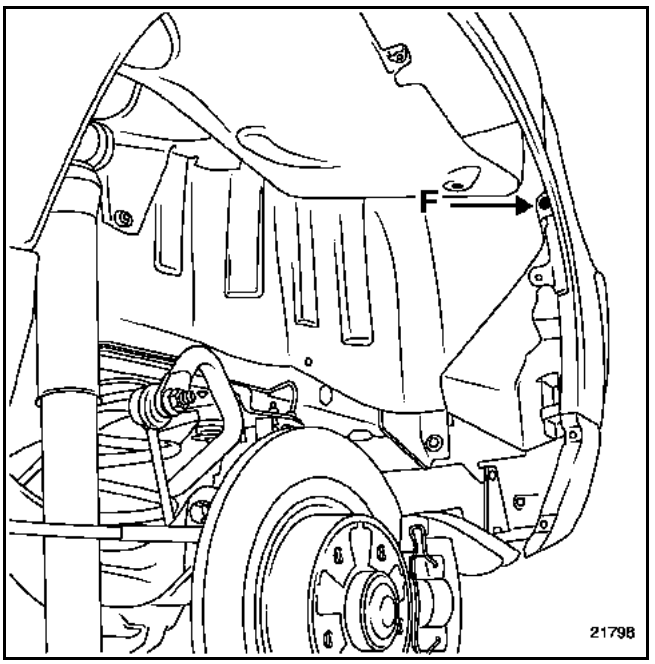
– the lower clips (C);



– the two side mounting bolts (D) (**Star T20**);
– the clips (E) (with the clip removal pliers).

Partially release the wing interior protector.

GETtheMANUALS.org

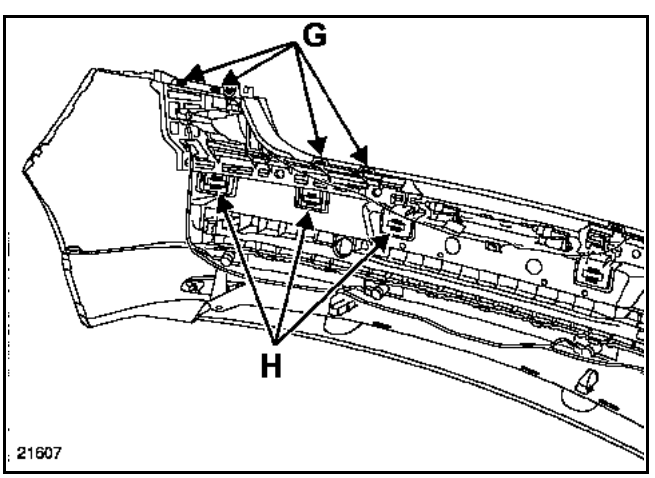


Remove the side interior bolt (F), then partially release the bumper.

Disconnect the number plate and proximity sensor supply connectors (if fitted).

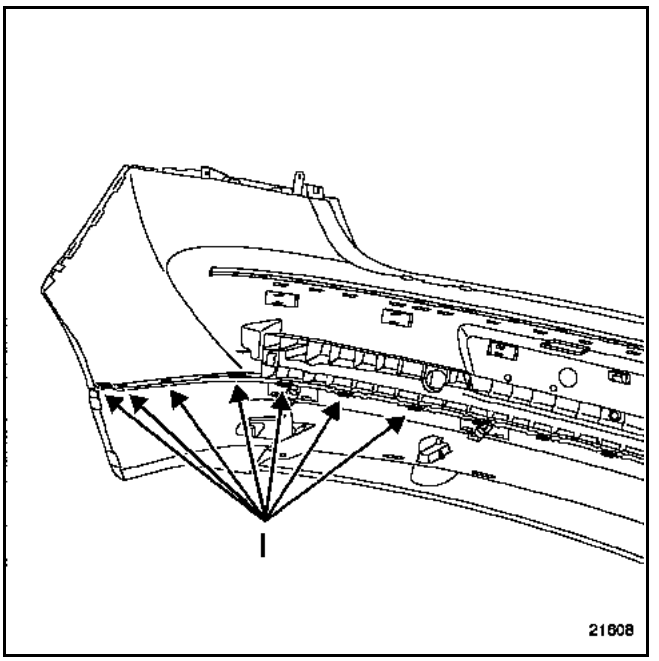
DISMANTLING

Remove the interior wiring harness.



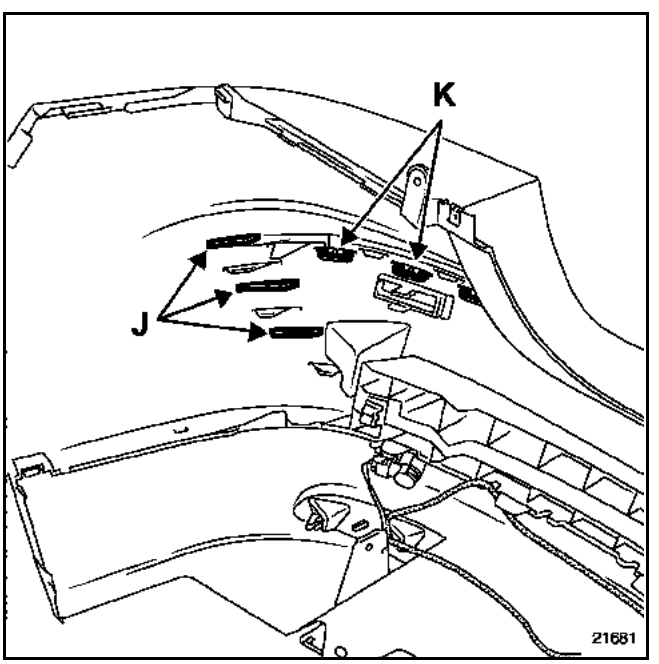
Separate the upper section of the absorber (G).

Unclip the lower section (H).



Release the fasteners (I), then remove the lower trim strip.

REMOVING THE PROTECTIVE INSET

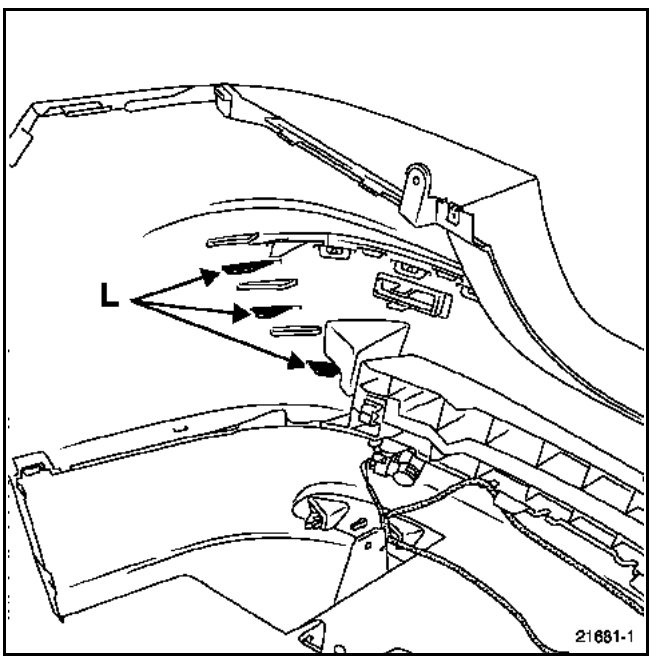


IMPORTANT: to remove the protective inset, it will be necessary to grind the tabs (J), then unclip the fasteners (K).

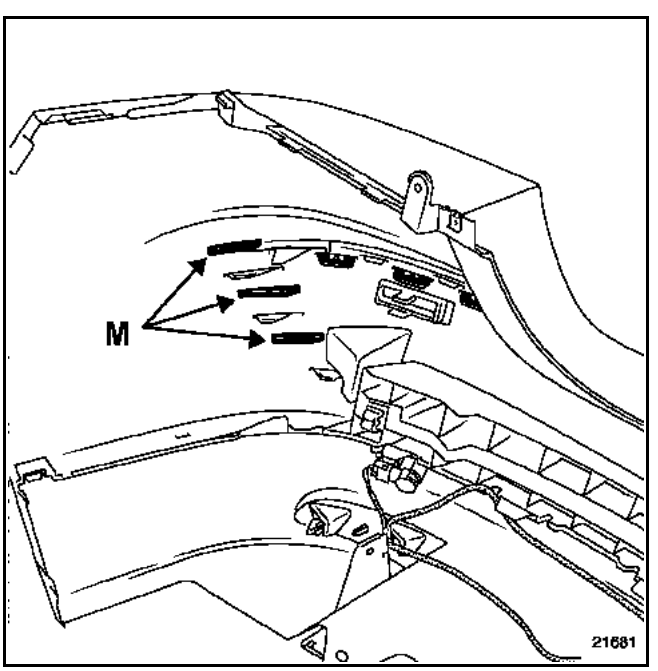
GETtheMANUALS.org

REFITTING THE PROTECTIVE INSET

NOTE: the following method applies when removing/ refitting the protective inset.



IMPORTANT: to reinforce the protective inset fastening on the bumper, weld or clip (with a pig's snout clip) the three tabs (L).

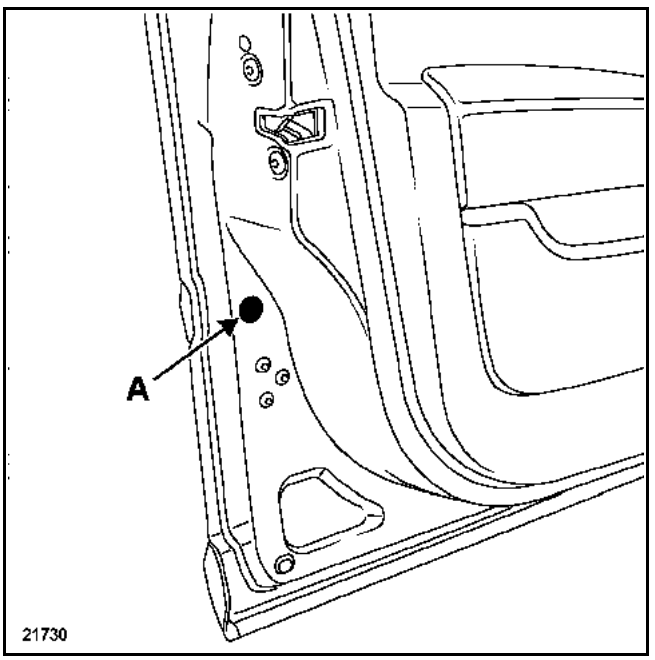


IMPORTANT: when replacing the protective inset, weld or clip (with a pig's snout clip) only the three tabs (M).

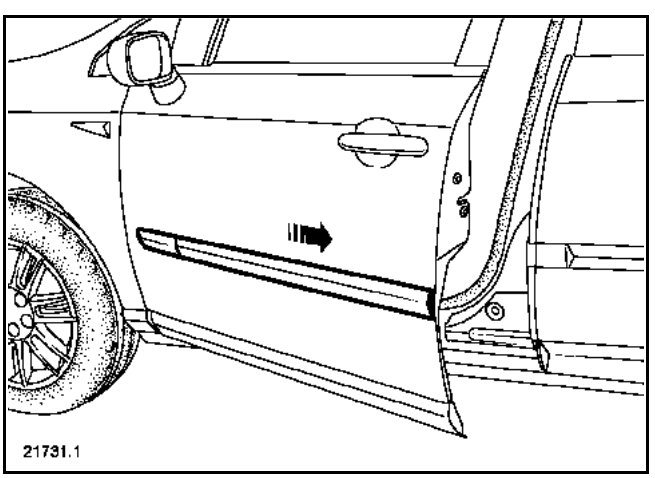
GETtheMANUALS.org

REMOVING THE FRONT DOOR MOULDINGS

Method One

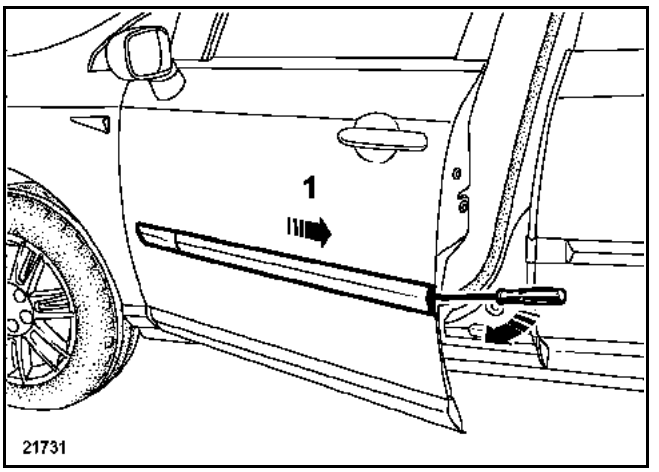


Remove the blanking plate (A), then press on the lock catch with a screwdriver.



Slide the moulding towards the rear of the vehicle.

Method Two

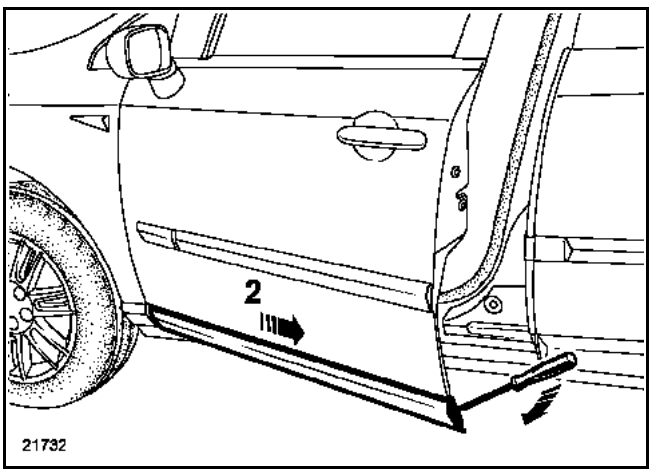


Protect the door rabbet (masking tape).

Insert the tool (**Car. 1597**), then exert pressure on the tool to release the moulding (1).

GETtheMANUALS.org

REMOVING THE FRONT DOOR LOWER MOULDING



Insert the tool (**Car. 1597**), then exert pressure on the tool to release the moulding (2).

Extricate the seal from the lower rabbet of the door.

REMOVING THE REAR DOOR UPPER MOULDING

NOTE: use one of the two methods for removing the front door moulding.

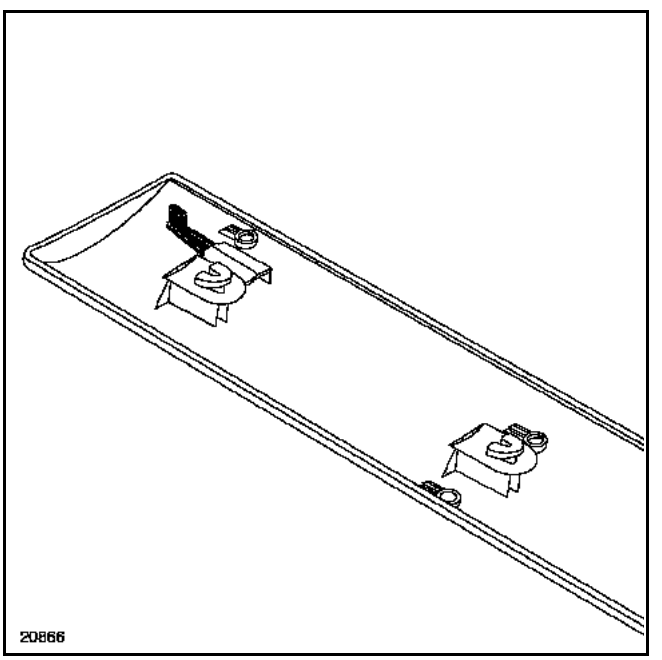
The blanking plate and the opening for access to the locking catch are located in the front section of the rear door.

Slide the moulding towards the front of the vehicle.

REMOVING THE REAR DOOR LOWER MOULDING

The method is the same as for the front door moulding.

REFITTING

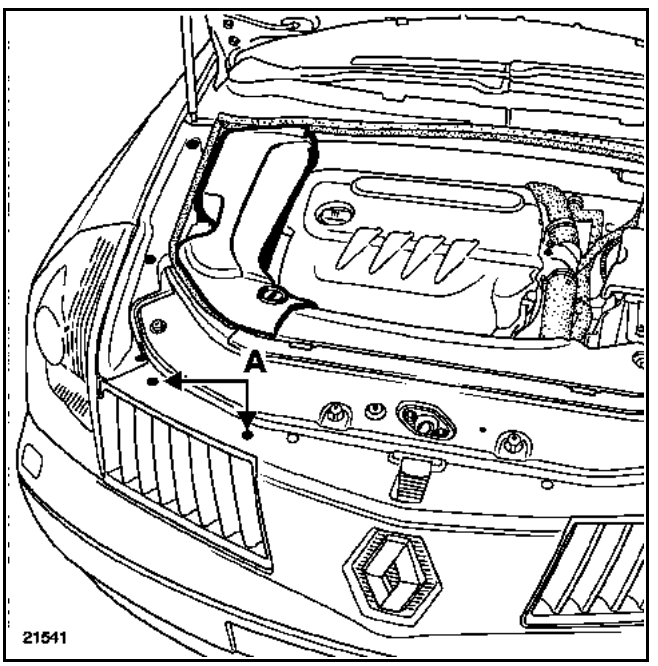


IMPORTANT: before refitting the mouldings, it will be necessary to pull the locking catches out slightly.

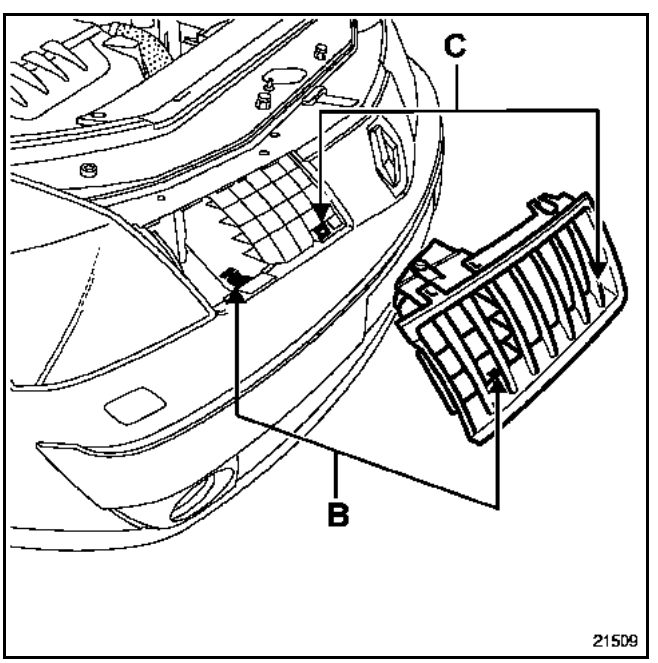
GETtheMANUALS.org

REMOVAL

NOTE: it is possible to remove the radiator grille without removing the bumper.



Remove the mountings (A).



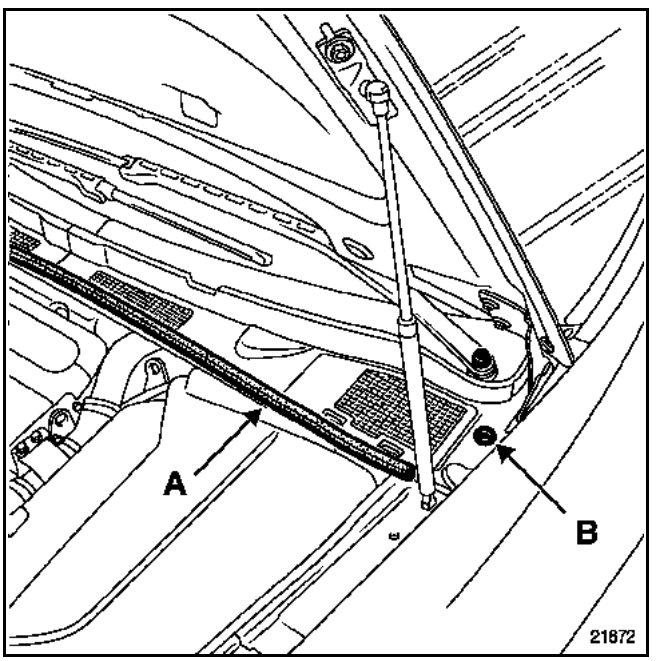
Extricate the radiator grille by pressing on the two bolts (B) and (C).

REFITTING

Proceed in the reverse order to removal.

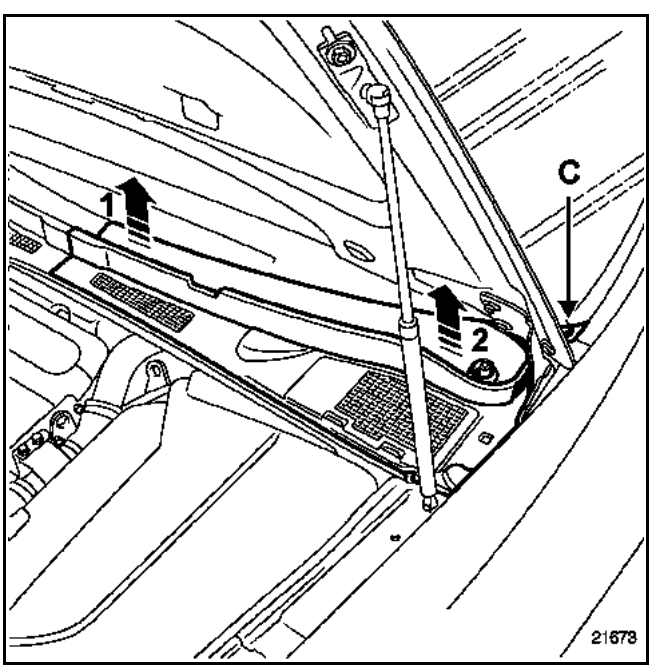
GETtheMANUALS.org

REMOVAL



Using the tool (**Elé. 1552**), remove the windscreen wiper arms.

Remove:
– the plenum chamber seal (A);
– the clip (B).



Unscrew by a 1/4 turn the clip (C).

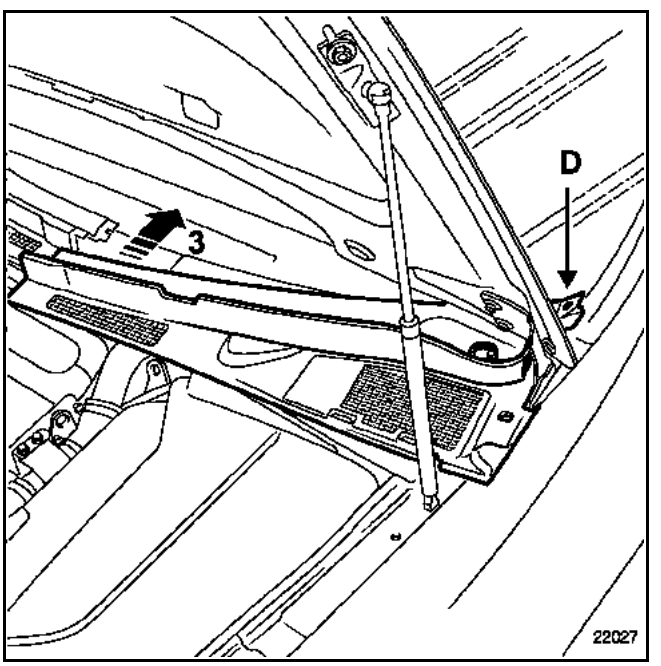
Raise slightly the half-grille (1); pull the half-grille out toward the front of the vehicle, to release the retaining clips located under the windscreen.

Withdraw the half-grille (2).

Proceed in the same way for the right-hand half grille.

REFITTING

IMPORTANT: clean the windscreen and scuttle grilles before refitting.



Engage the half grille in the wing pin (D).

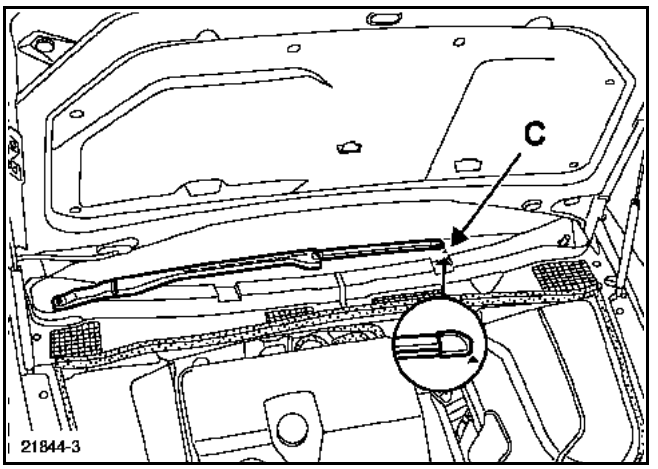
Slide the half-grille (3) so that the retaining clips are positioned under the windscreen.

IMPORTANT: avoid having the retaining clips come into contact with the windscreen rabbet.

Proceed in the same way for the left-hand grille.

Check that the scuttle grille is attached to the windscreen.

GETtheMANUALS.org

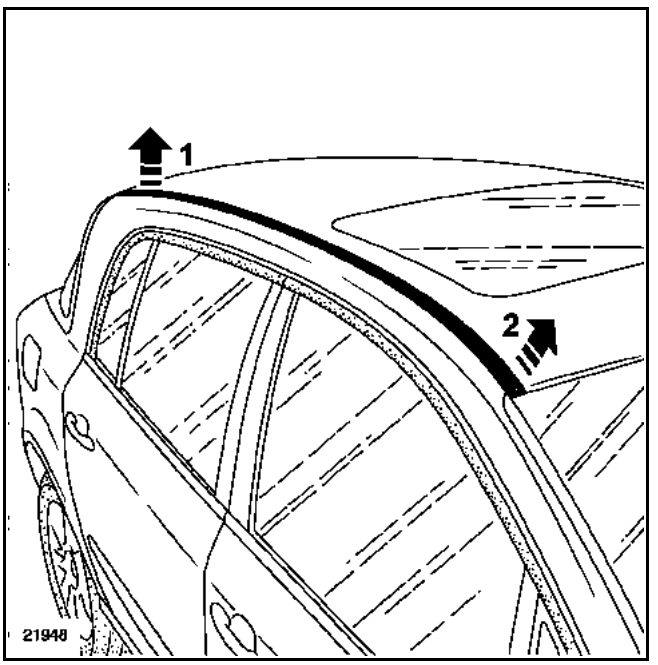


Rest the RH windscreen wiper arm on the windscreen reference point (C), and position the LH windscreen wiper arm parallel to the RH windscreen wiper arm.

Arm tightening torque (12 Nm ± 15%).

GETtheMANUALS.org

REMOVAL



Protect the trim surround (masking tape).

Unclip the trim over its entire length (1) then (2).

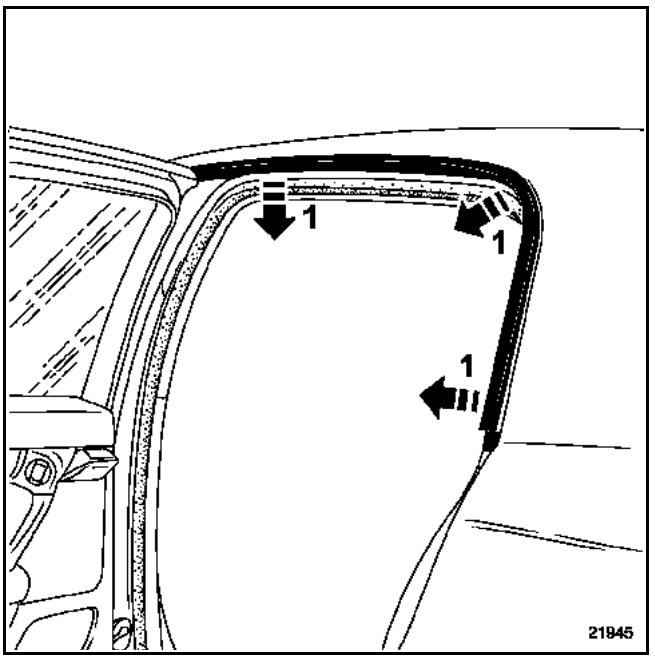
REFITTING

Before fitting:
– Check condition of retaining clips;
– Position the clips on the trim.

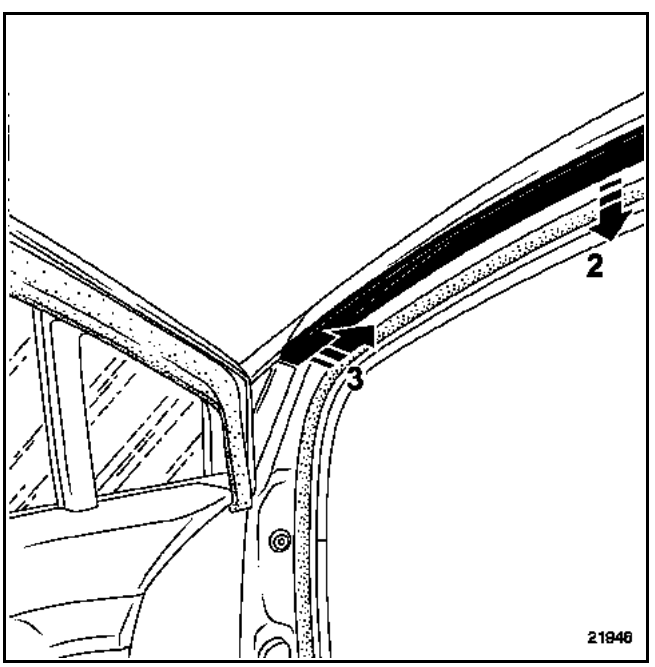
Clip the trim.

GETtheMANUALS.org

REMOVAL

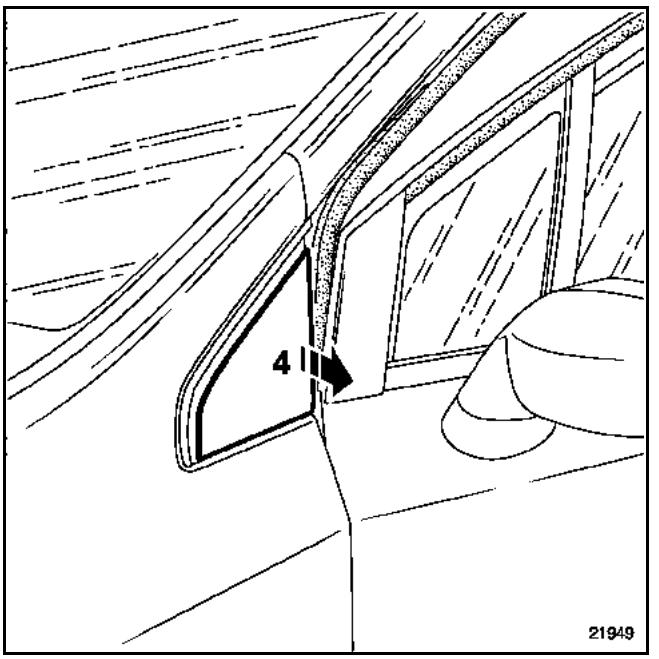


Using the tool (**Car. 1363**), unclip the trim (1).

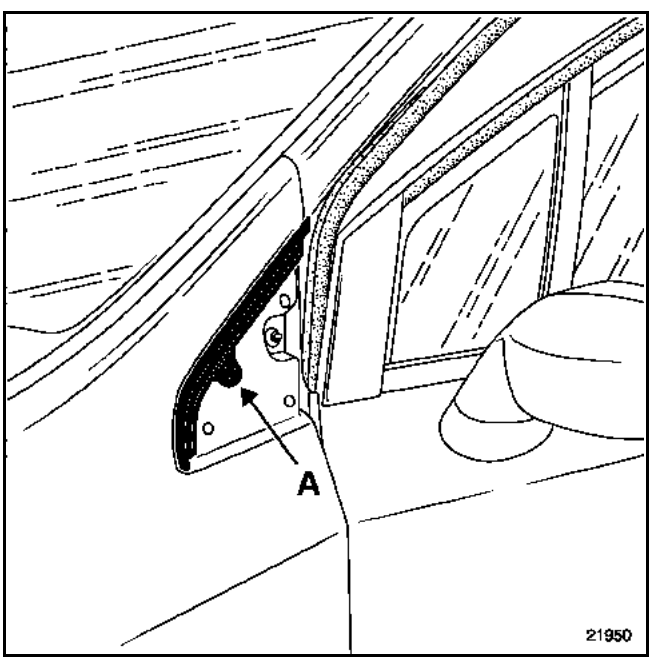


Unclip trim (2).

Remove trim (3).



Unclip the front wing trim (4).



Remove clip (A).

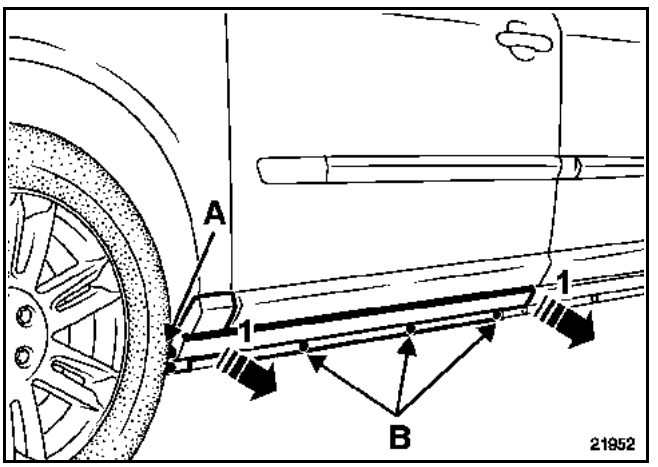
Release the chrome strip.

REFITTING

Before refitting the trims, the retaining clips will have to be replaced.

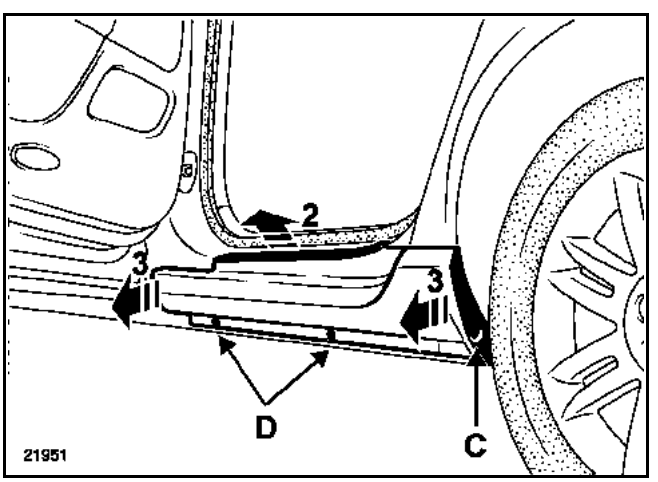
GETtheMANUALS.org

REMOVAL



Remove:
– the bolt (A);
– the clips (B).

Open the door; unclip the front sill half-panel at the door entrance level; release the sill panel (1).



Remove:
– the bolt (C);
– the clips (D).

Release the rear sill half-panel (2) and (3).

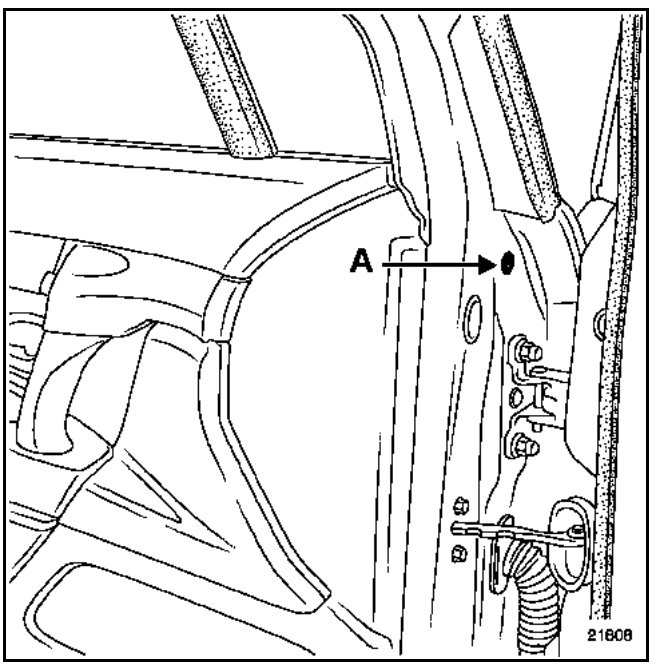
REFITTING

Replace the mounting clips; position the clips on the two sill half-panels.

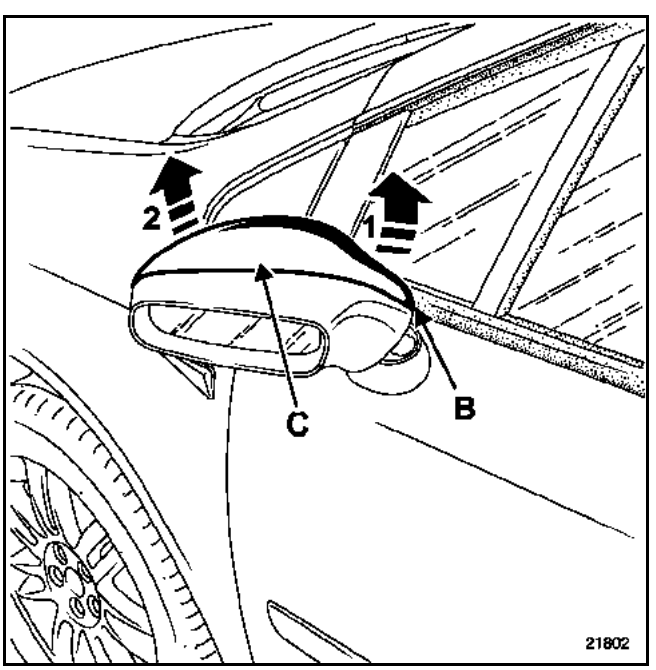
Proceed in the reverse order to removal.

GETtheMANUALS.org

REMOVAL



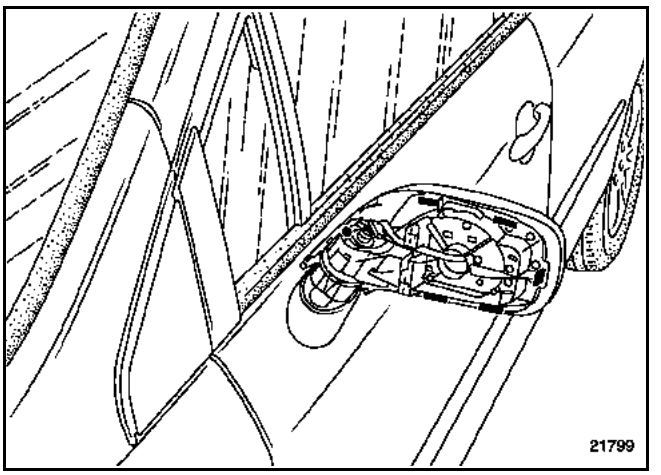
Remove the blanking cover and tamper proof bolt (A).



Face the door mirror forwards.

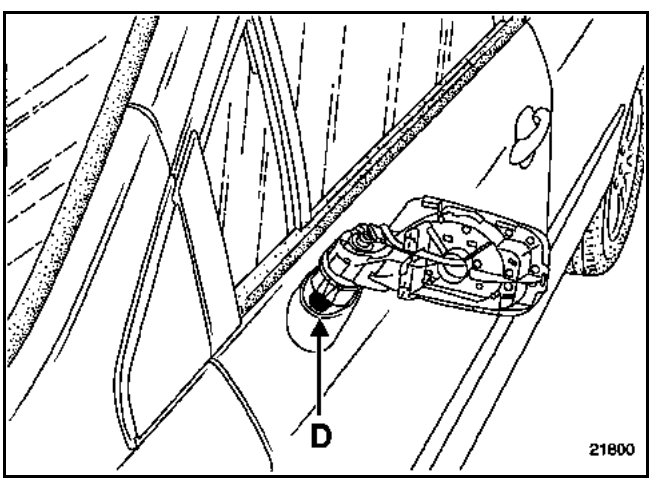
Put a finger in lower opening (B).

Disengage the shell casing at (1); press gently at (C); disconnect the shell casing at (2).



Release the clips.

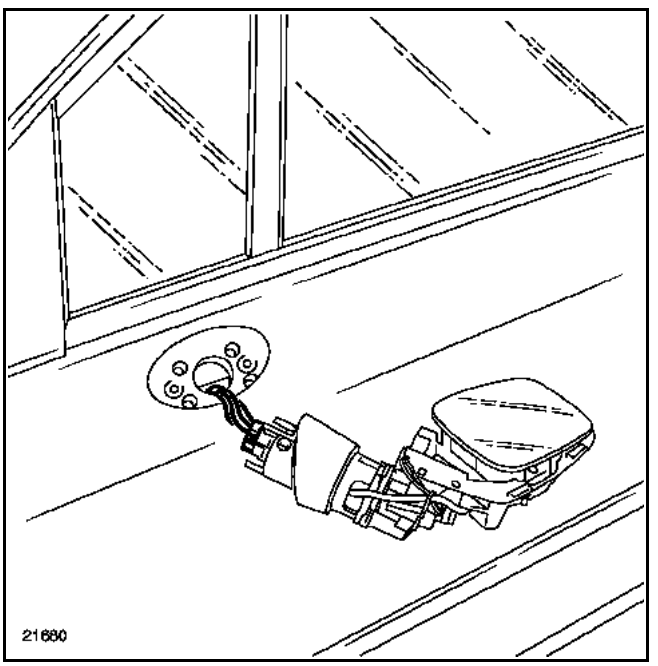
Carefully remove the skirt framing the mirror.



Remove the two blanking covers and two bolts (D).

Release the door mirror.

GETtheMANUALS.org



Disconnect the connector.

IMPORTANT: secure the wiring harness with masking tape so that it does not fall into the door box section.

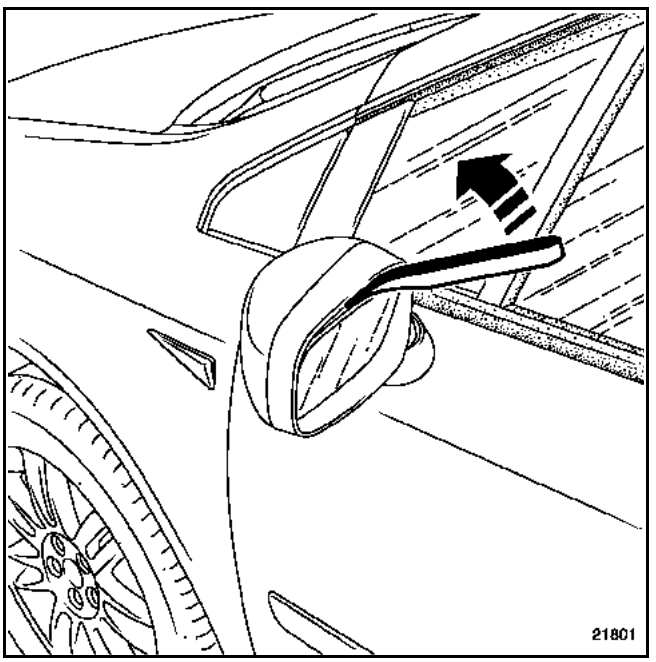
REFITTING

To refit, proceed in the reverse order to removal.

GETtheMANUALS.org

IMPORTANT: to distinguish between the two mirror glasses, the electrochrome glass has a plastic border.

REMOVING THE STANDARD GLASS



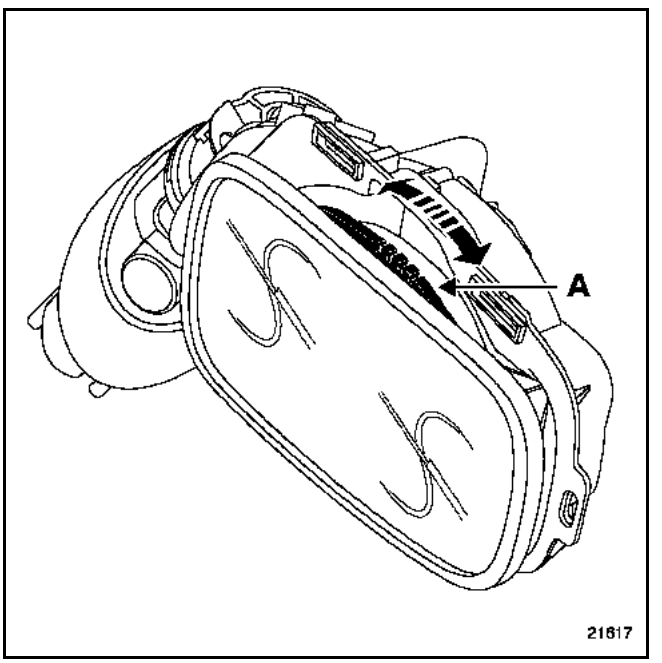
Protect the upper border of the door mirror with masking tape.

Use tool (**Car. 1363**) as a lever (as shown above); unclip the glass.

Disconnect the feed terminals.

REMOVING THE ELECTROCHROME GLASS

NOTE: to remove the electrochrome glass, it is necessary to remove the shell casing and the door mirror skirt.

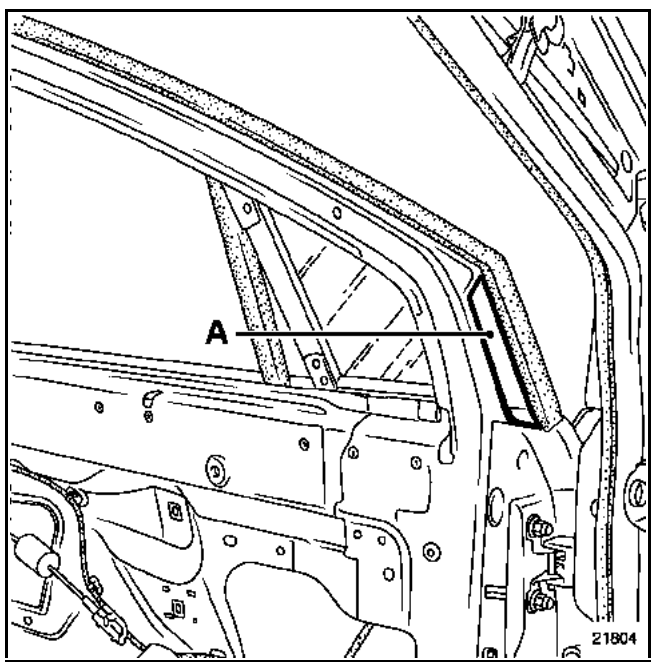


Using a flat blade screwdriver, push anti-clockwise until bayonet fitting (A) unlocks (the method is identical for the left and right sides).

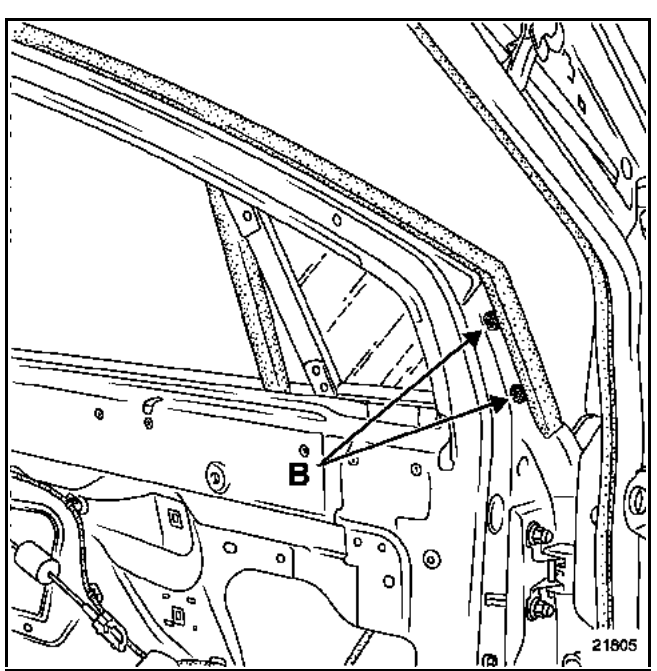
GETtheMANUALS.org

REMOVAL

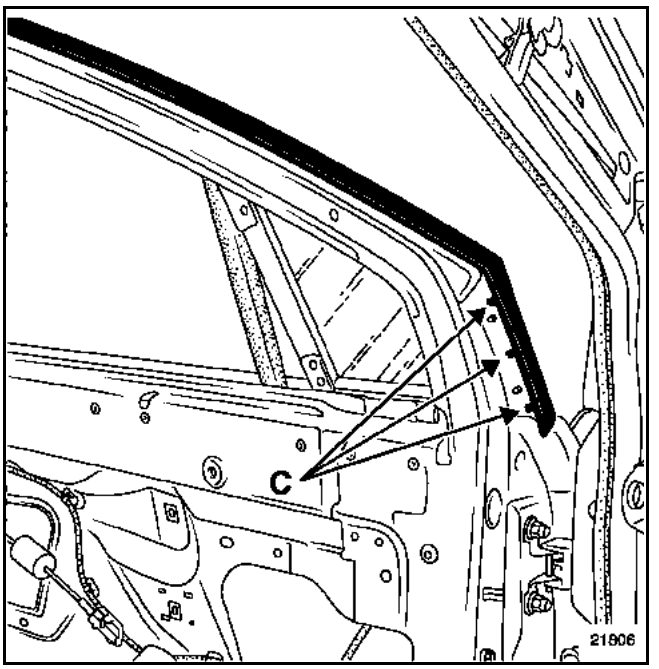
Remove the exterior front door weather strip (**Section 66A.A**).



Remove:
– cover (A),

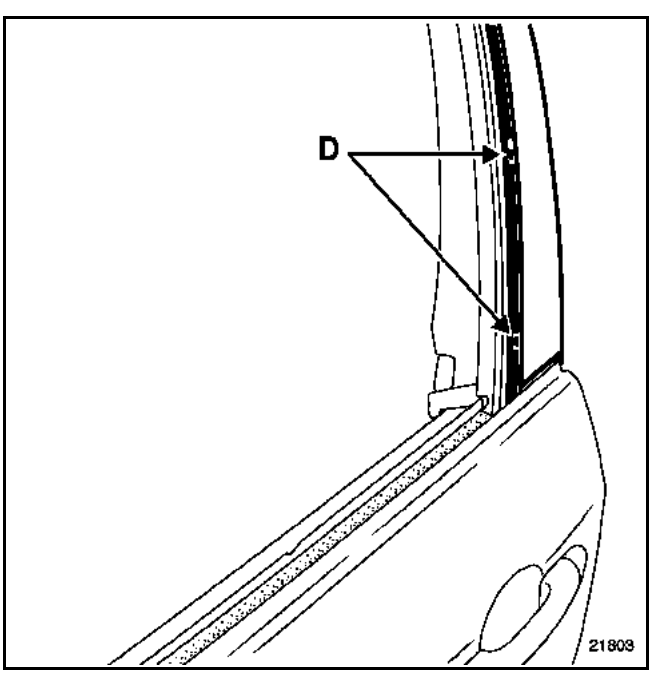


– the two mountings (B).



Release the three door frame mounting clips (C).

Remove the front section exterior trim.



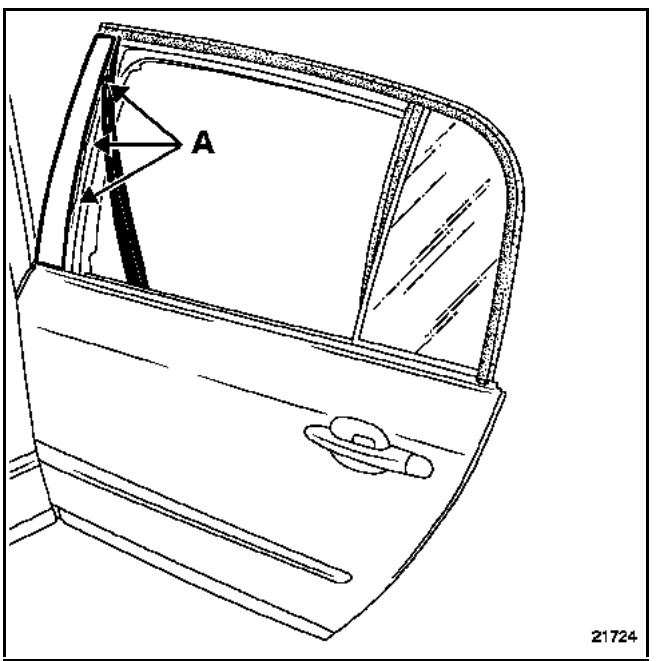
Remove:
– the seal,
– the mountings (D).

Remove the rear section exterior trim.

GETtheMANUALS.org

REMOVAL

Remove the exterior rear door weather strip (**Section 66A.B**).



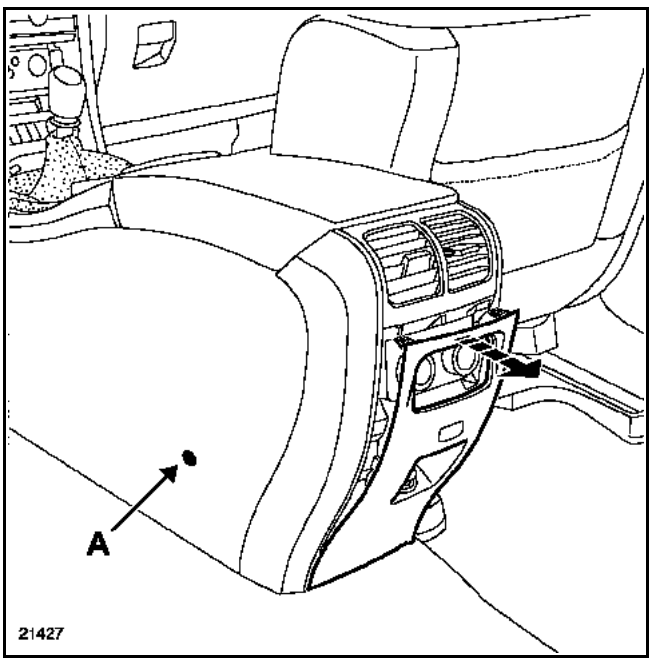
Remove the door frame seal; remove mountings (A).

Remove the trim.

GETtheMANUALS.org

REMOVAL

Push the seats forward.

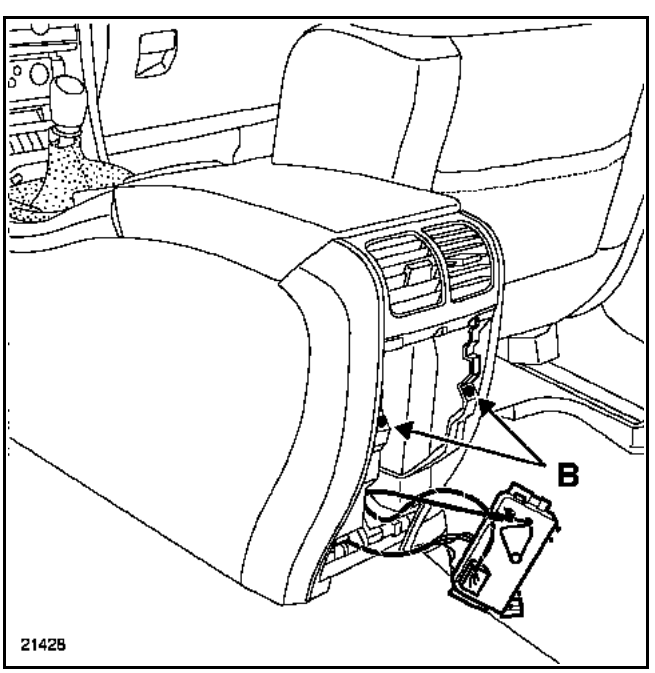


Remove the bolts (A).

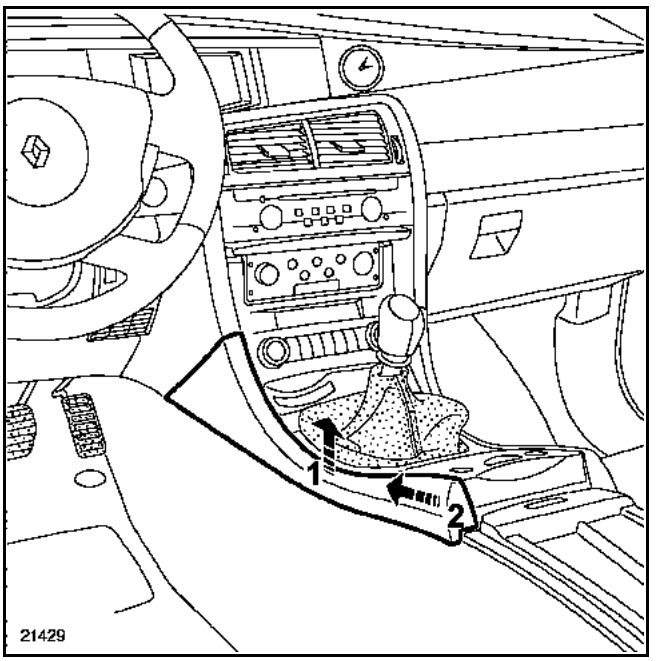
Unclip the cigarette lighter mounting.

Push the seats back.

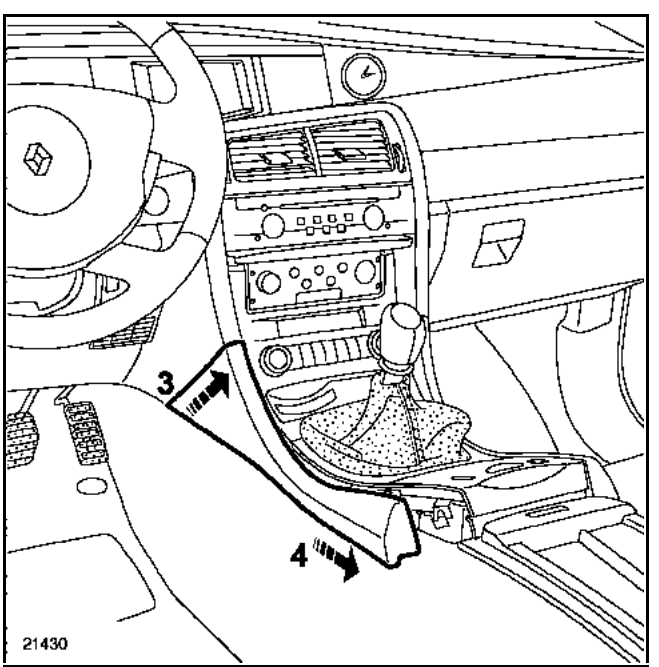
Disconnect the battery.



Unclip the heater control and remove the screws (B).

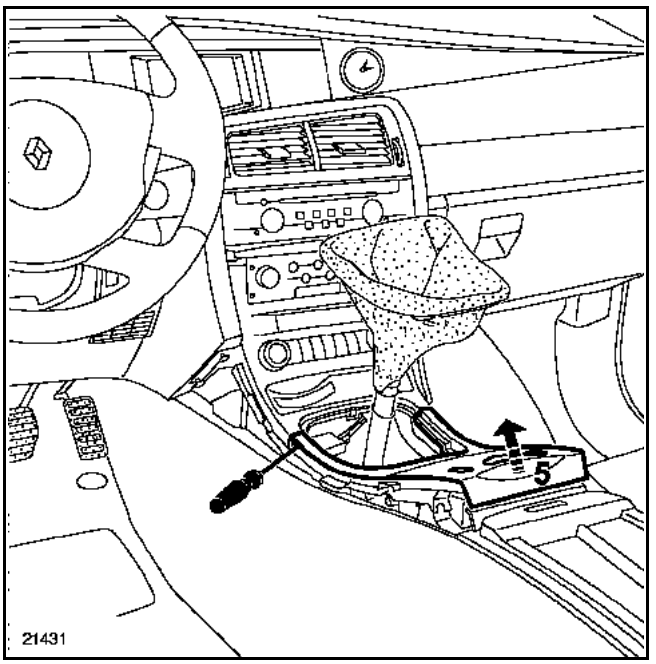


Unclip the rear section lining by gently pulling (1) then (2).



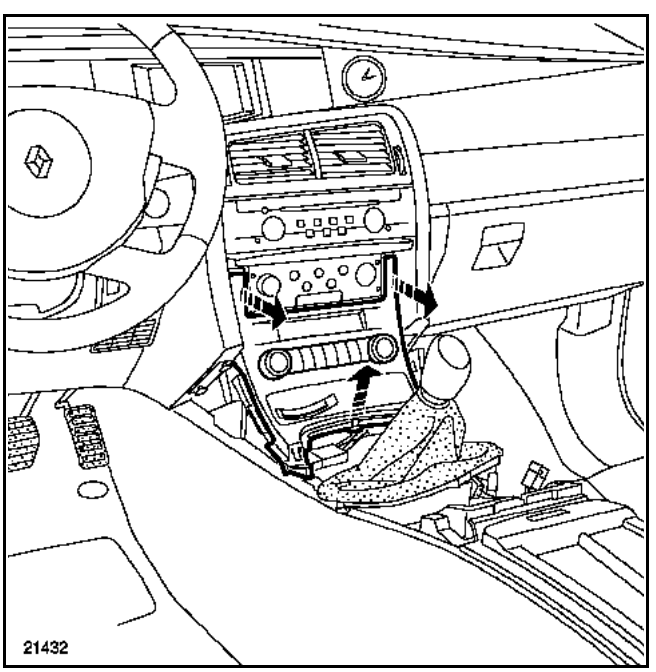
Remove the front section lining by gently pulling (3), then (4).

GETtheMANUALS.org

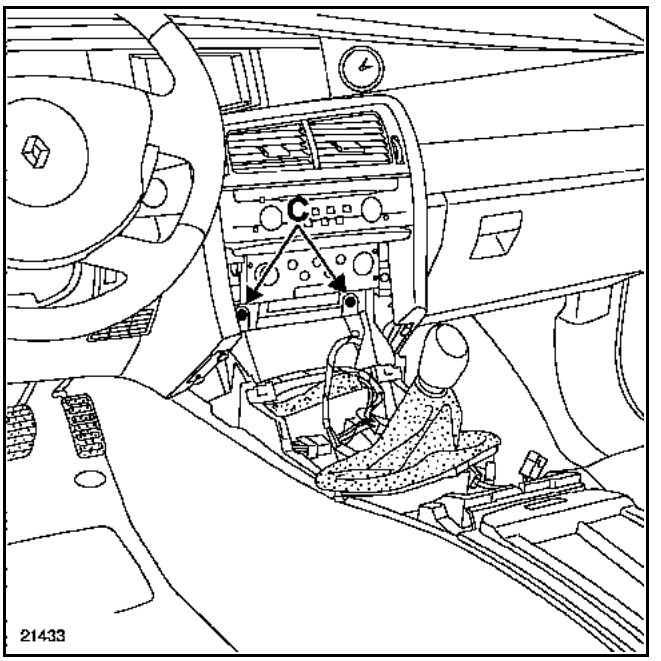


Unclip the speed control gaiter.

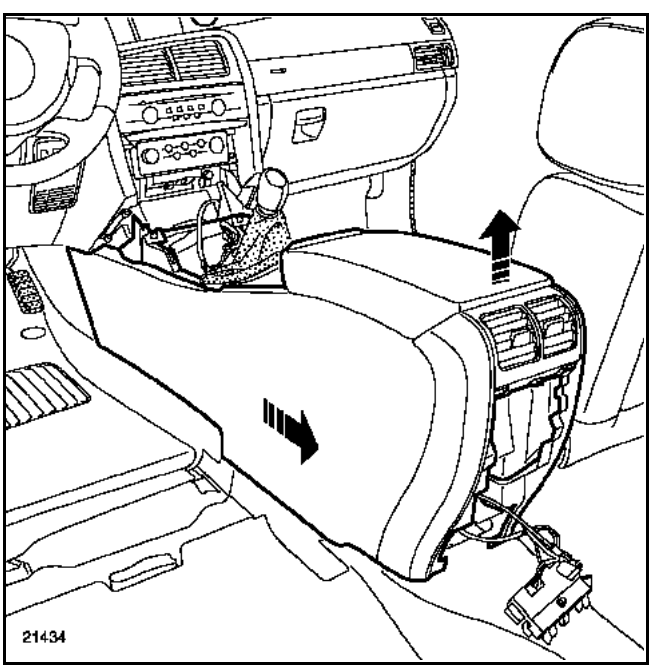
Using a flat screwdriver unclip the front and rear section seatbelt mountings (5).



Unclip the card reader mounting from the upper and lower sections.



Remove the bolts (C).



Lift the rear section of the console slightly, then slide the console towards the rear of the vehicle.

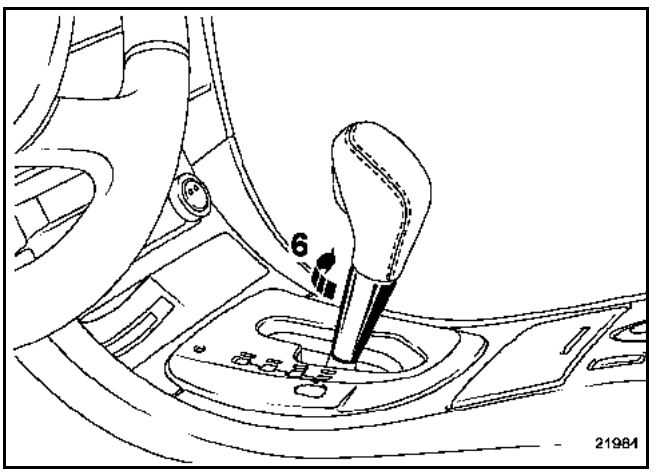
REFITTING

To refit, proceed in the reverse order to removal.

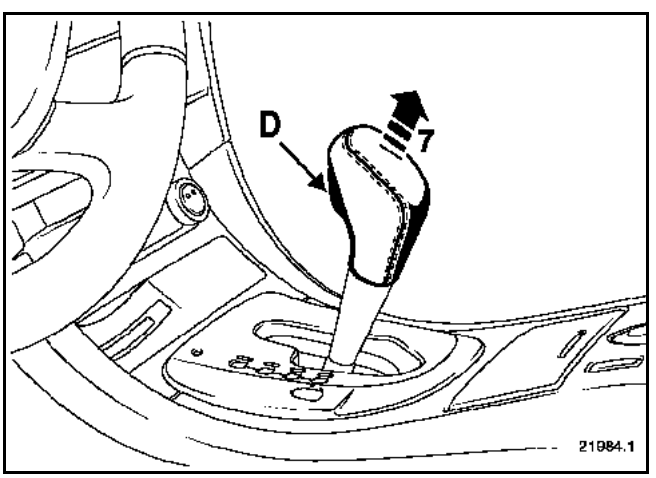
GETtheMANUALS.org

SPECIAL NOTES ON THE AUTOMATIC GEARBOX LEVER

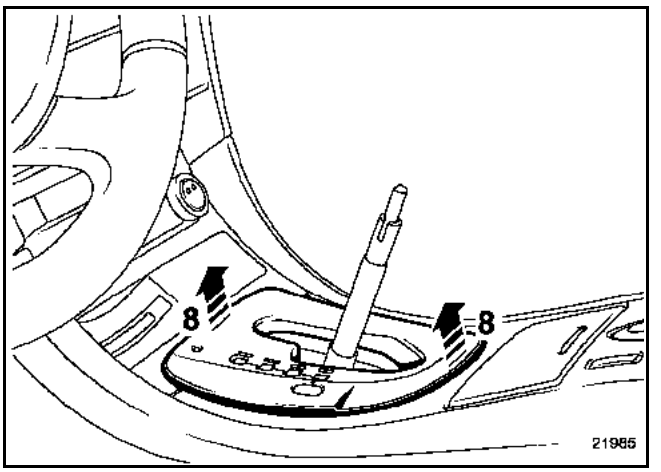
REMOVAL



Rotate the lower section (6).



Press the command unlocking button (D); pull out the lever (7).



Unclip the gear lever plate (8).

REFITTING

Clip on the gear lever plate.

Assemble the two gear lever sections: clip together.

GETtheMANUALS.org

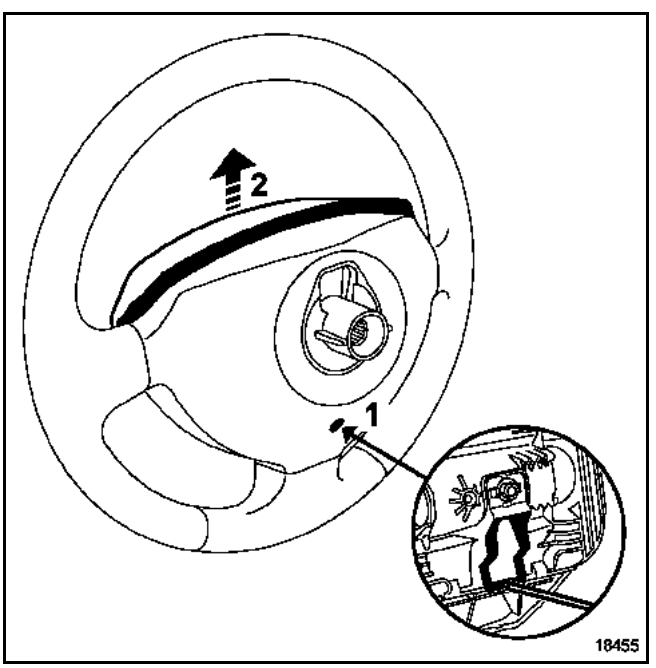
REMOVAL

IMPORTANT: It is inadvisable to handle the pyrotechnic systems (air bags and pretensioners) near a source of heat or flame as there is a risk of triggering.

IMPORTANT: before the dashboard can be removed, it is essential to lock the air bag computer using the fault finding tool (for instructions, refer to **section 88**)

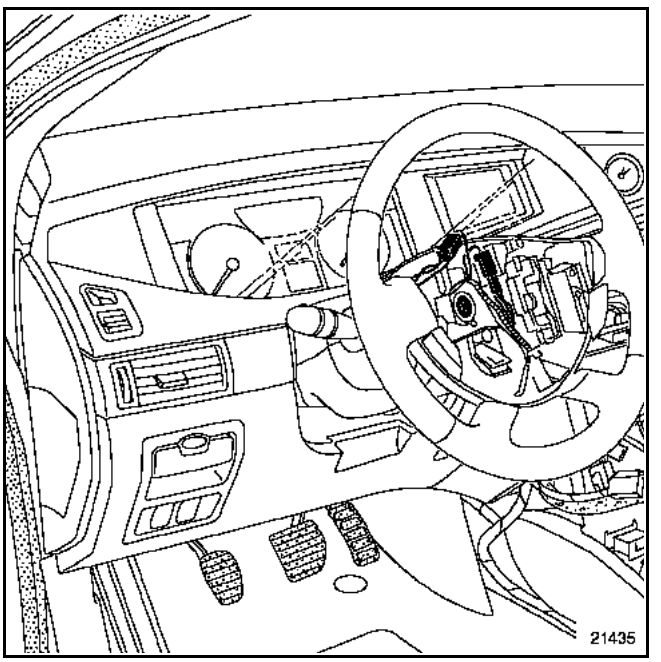
NOTE: locking the air bag computer also unlocks the electric steering column lock.

Remove:
– the windscreen pillar trims (see **71A.A**),
– the central console (**section 57A.A**),
– the radio using the **M.S. 1363** or **M.S. 1639 tools** (depending on the version),
– the central communication unit (depending on the version), using the **M.S. 1363.** tool

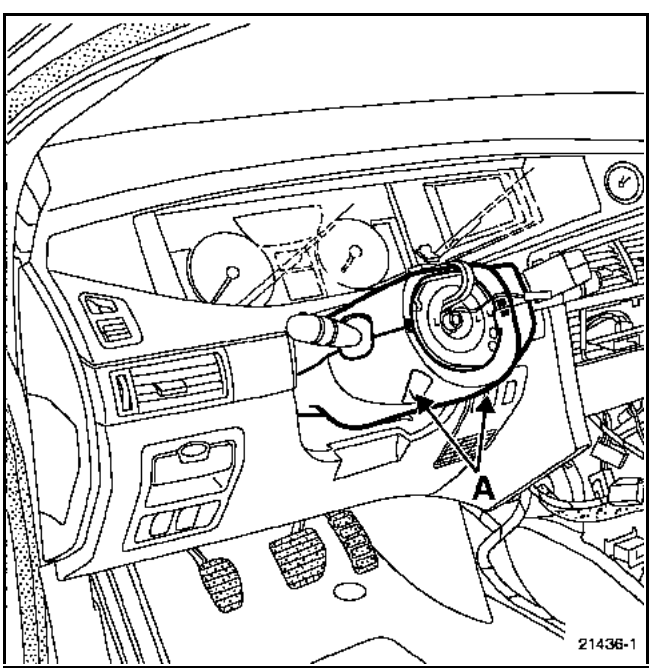


Remove the steering wheel air bag cushion. To do this, insert a screwdriver into the hole (1) then move it upwards (2).

Disconnect the steering wheel air bag connectors and the cruise control button connectors

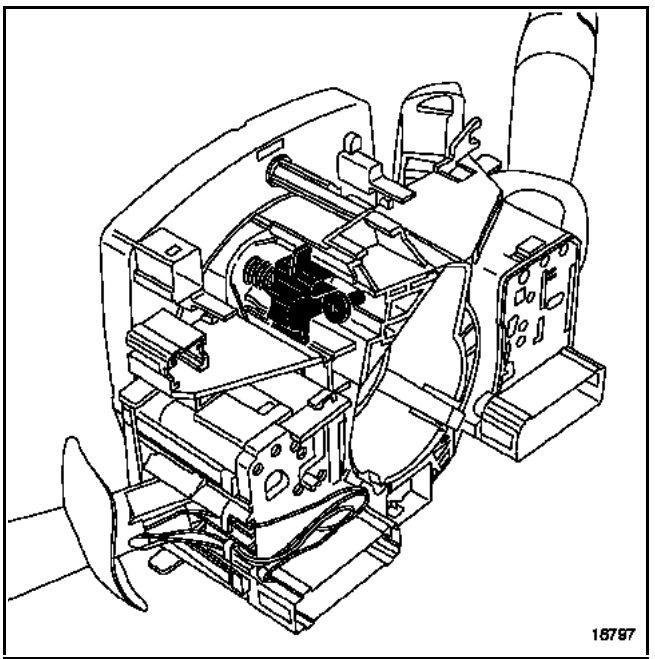


Remove:
– the steering wheel bolt,
– the steering wheel after setting the wheels straight,

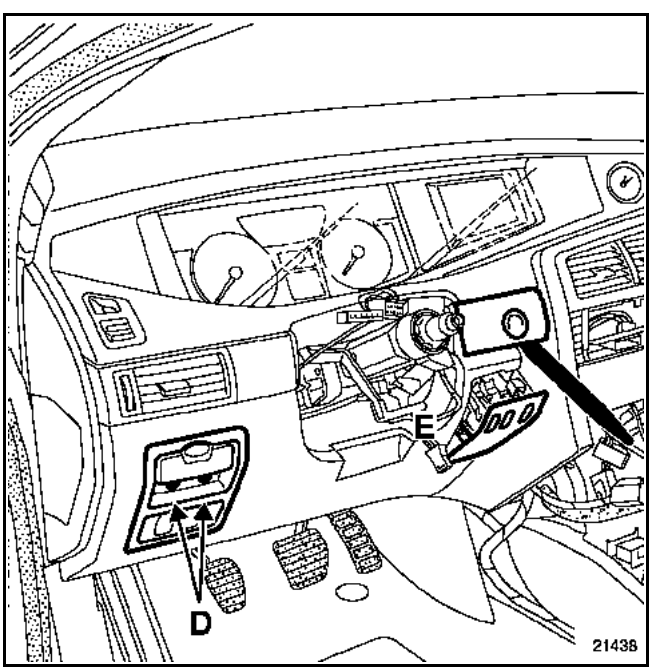


– the bolts (A); remove the upper and lower steering column shrouds

GETtheMANUALS.org

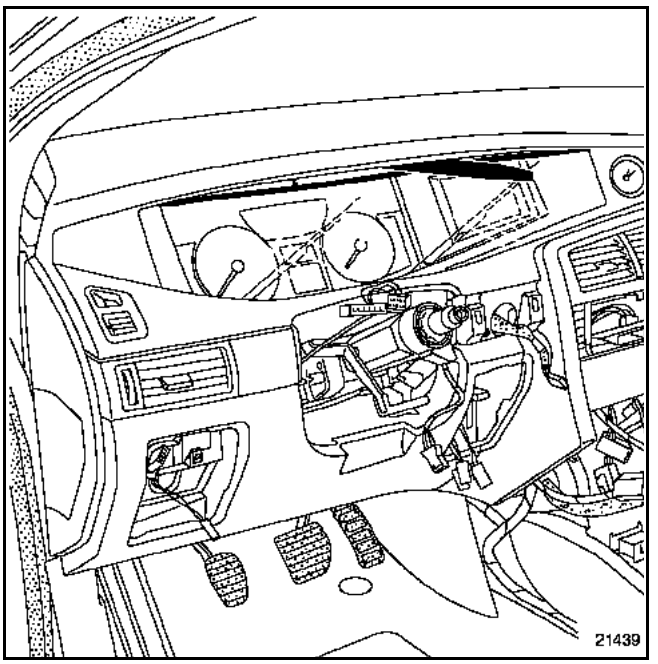


Remove the rotary switch, marking its position.

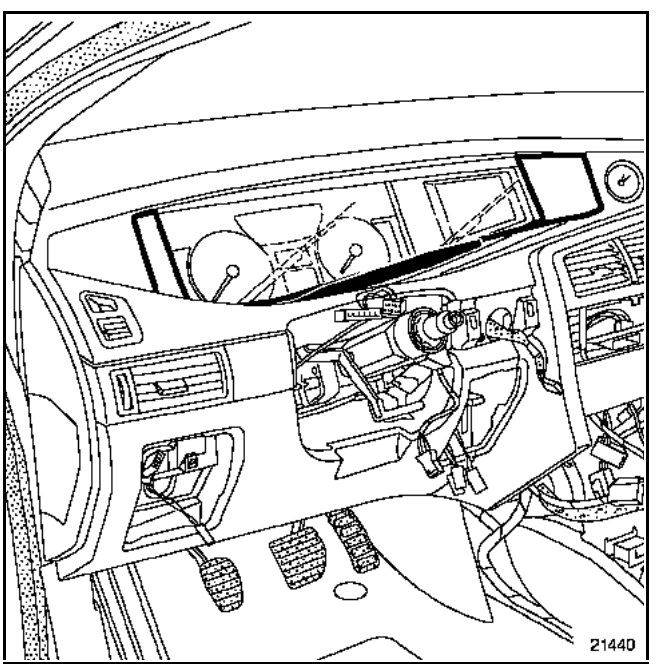


Remove:
– The starter button bracket,
– the automatic parking brake control bolts (D) after the cover has been removed,
– the switch mounting (E).

Disconnect the speech synthesis speaker located behind the switch mounting

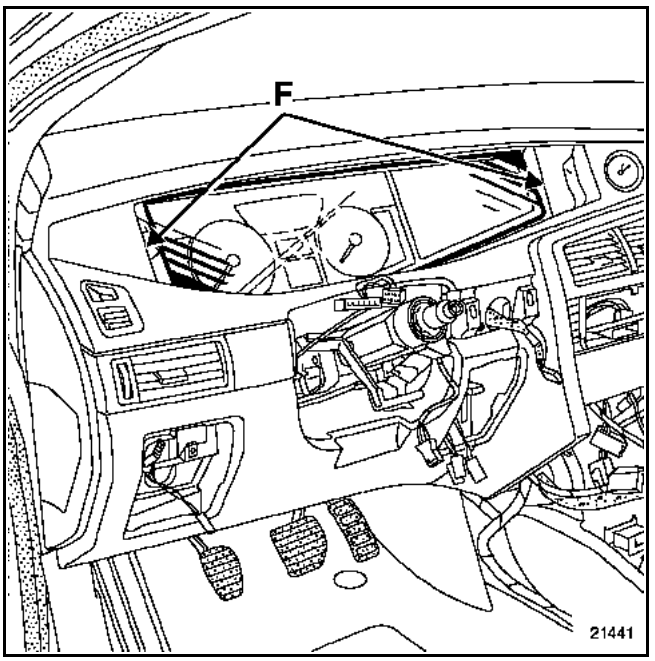


Unclip the dashboard frame upper trim.

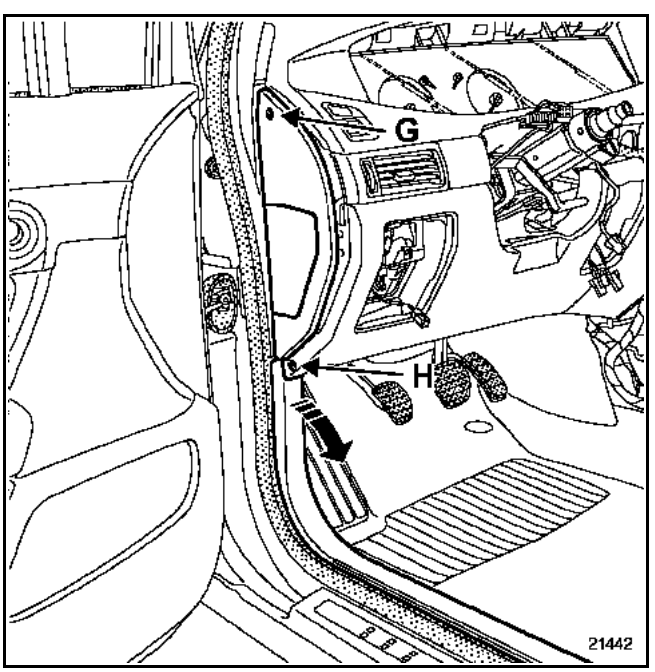


Unclip the dashboard frame lower trim

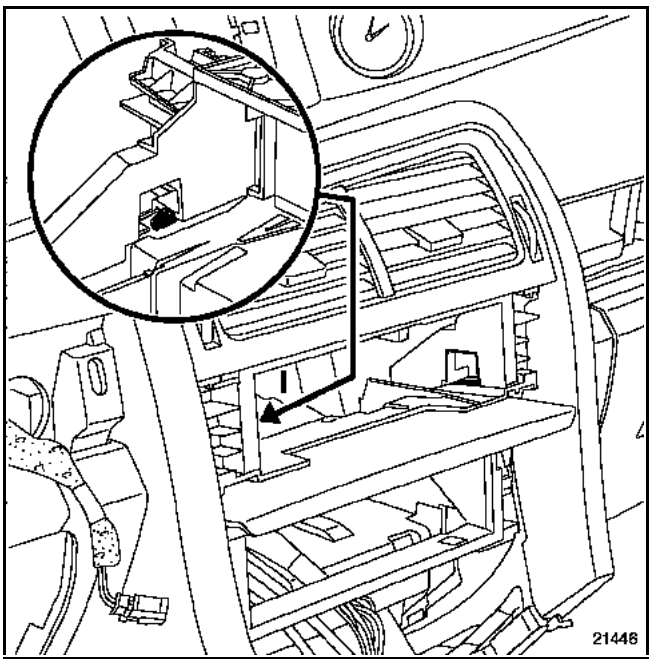
GETtheMANUALS.org



Remove:
– the bolts (F); remove the dashboard,
– the bolts located behind the dashboard.

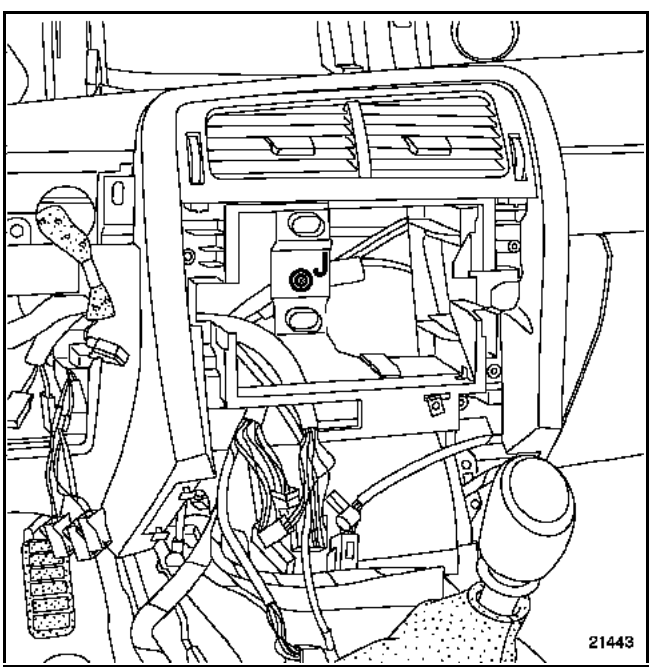


– the side trim to gain access to the bolts (G),
– the door trim (partially) to unscrew bolts (H).



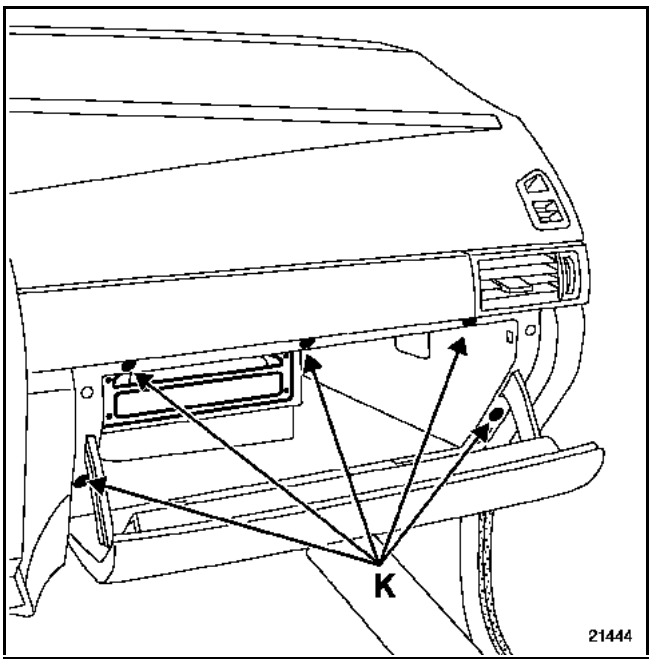
Remove the two clips (I).

Remove the central communication unit cover or the storage compartment.



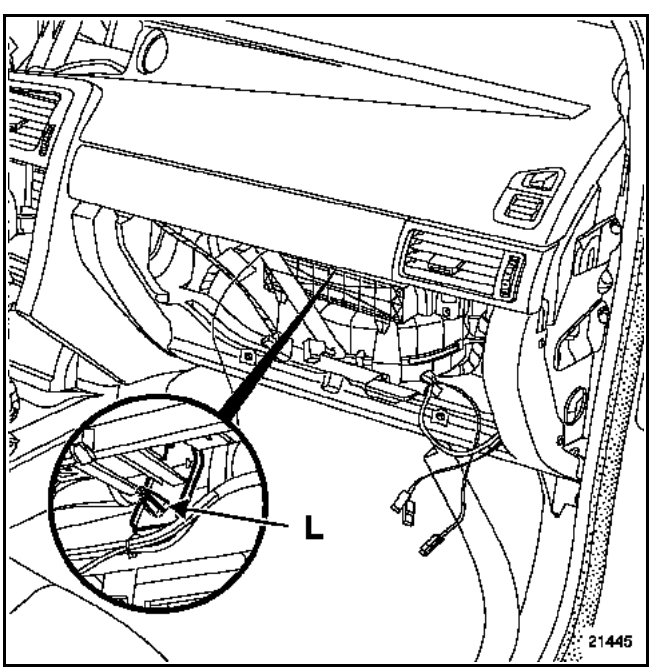
Remove the bolt (J).

GETtheMANUALS.org

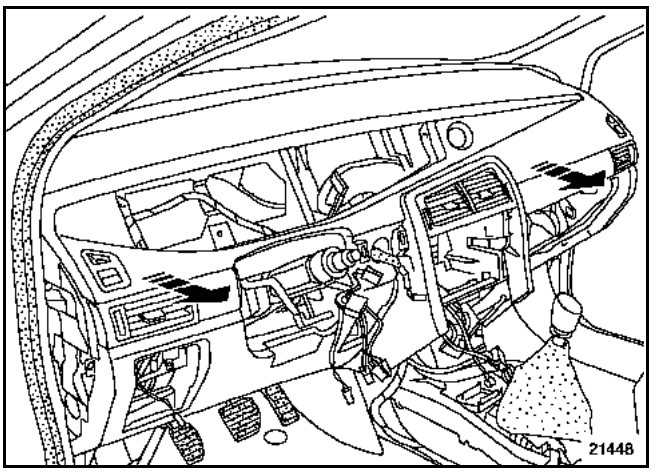


Remove:
– the CD ROM drive using the **M.S. 1363 tool**,
– the bolts (K), then remove the glovebox.

WARNING: the GPS aerial wire is very fragile. Do not bend or restrict it.



Use a **13 mm** spanner to lock the airbag clip (L) on the beam



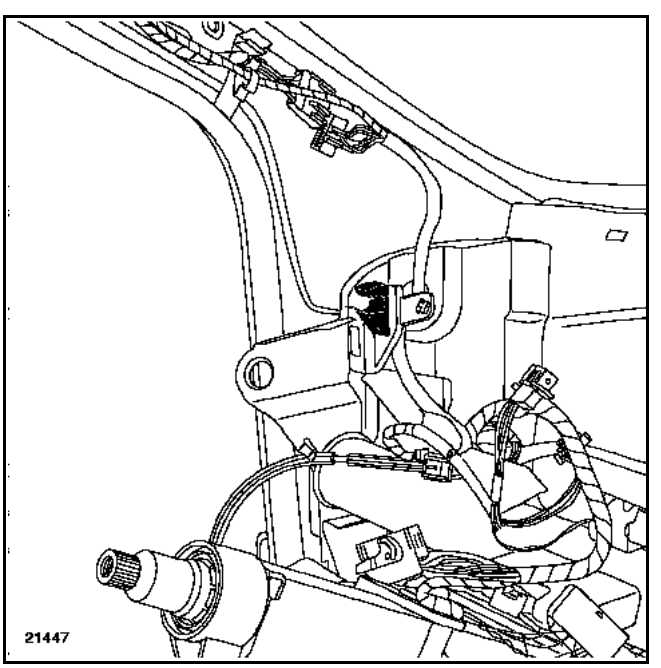
WARNING: before removing the instrument panel, remove the wiring to prevent it from being damaged.

Partially release the dash board.

Disconnect:
– the passenger air bag connector (**be careful not to disconnect the connectors located on the passenger airbag itself**),
– the two tweeters.

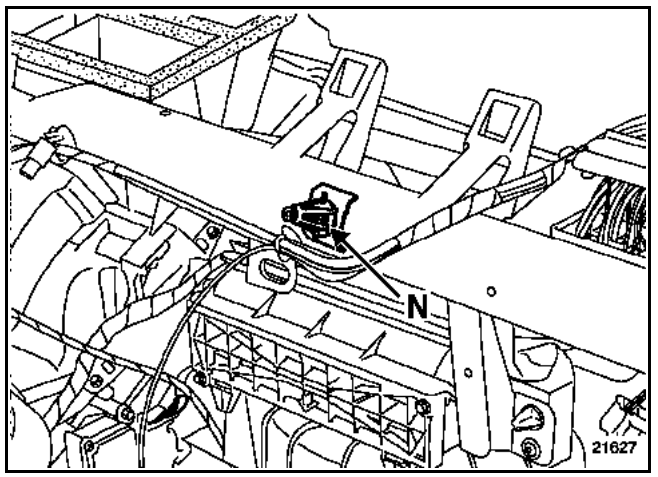
Remove the dash board (**requires two people**).

REFITTING (requires two people)



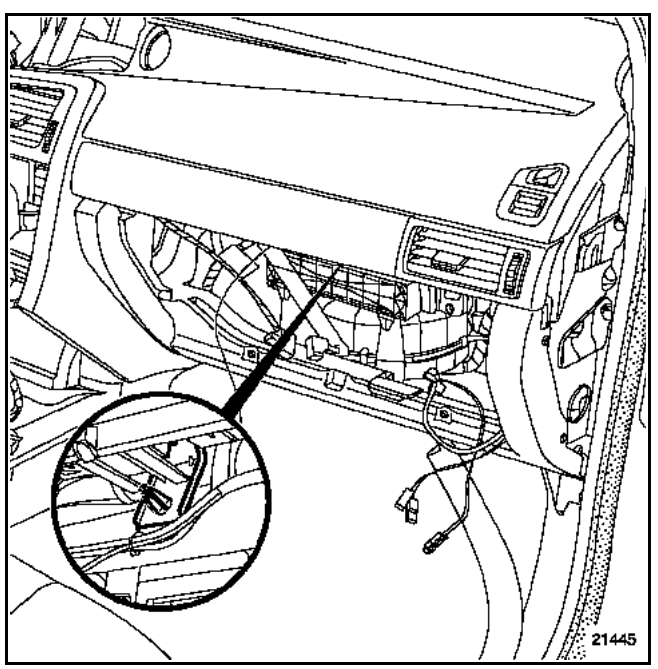
Before refitting, check that the clips (M) are in good condition.

GETtheMANUALS.org



IMPORTANT: replace the indicator guide (N) each time the indicator panel is removed.

Using the **Mot. 1608** tool tighten the indicator guide to a torque of **2 NM ± 20 %**.



Make sure that the dashboard is securely attached to the indicator guide.

IMPORTANT: before attaching the dash board, place the harness in the correct position and connect the passenger air bag connector.

Features of the rotary switch

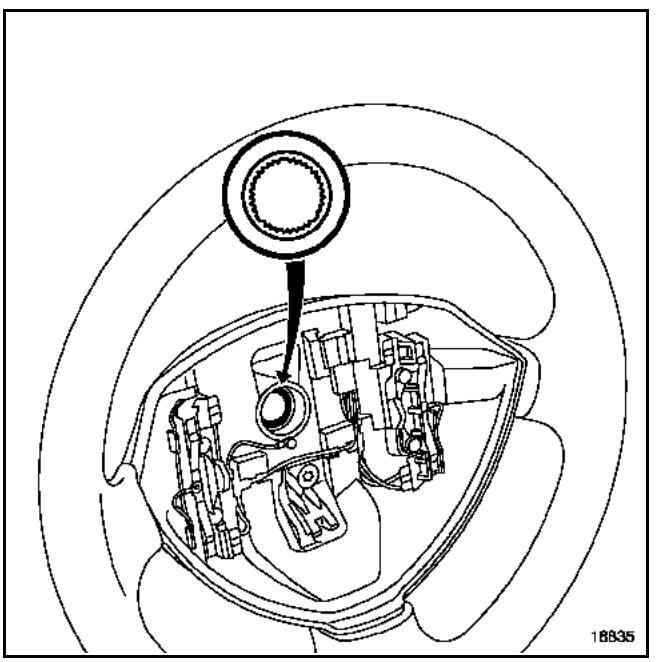
Before refitting the rotary switch, ensure that the wheels are straight.

Features of the steering wheel

IMPORTANT: the splines of the steering wheel include location notches ensuring that the steering wheel can only be fitted one way

The steering wheel should slip freely into the splines.

Be careful not to damage them.



IMPORTANT: the steering wheel bolt should be replaced and tightened to 44 Nm each time the steering wheel is removed.

Features of the air bag

**IMPORTANT: before unlocking the air bag computer, test it with the fault finding tool.
If everything is correct, unlock the computer. If not, refer to the fault finding section.**

GETtheMANUALS.org

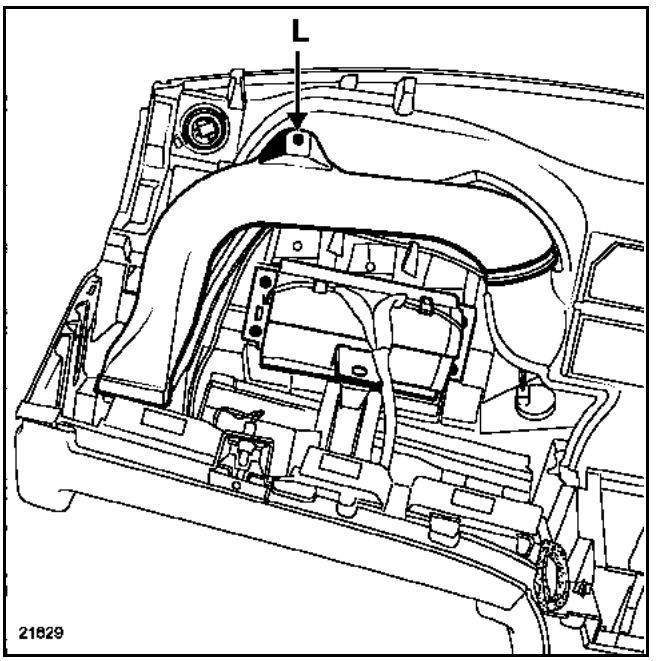
WARNING: If these instructions are not followed the system may not operate normally and could even cause accidental triggering.

When replacing a dash board fitted with a passenger air bag, it is essential to replace the sticker shown above (on the side of the instrument panel).

NOTE: After reconnecting the battery, it may be necessary to do some simple programming which does not require a diagnostic tool:
– setting the time on the clock,
– entering the four figure radio and DVD codes,
– initialising the one touch electric window motor,
– initialising the sun roof.

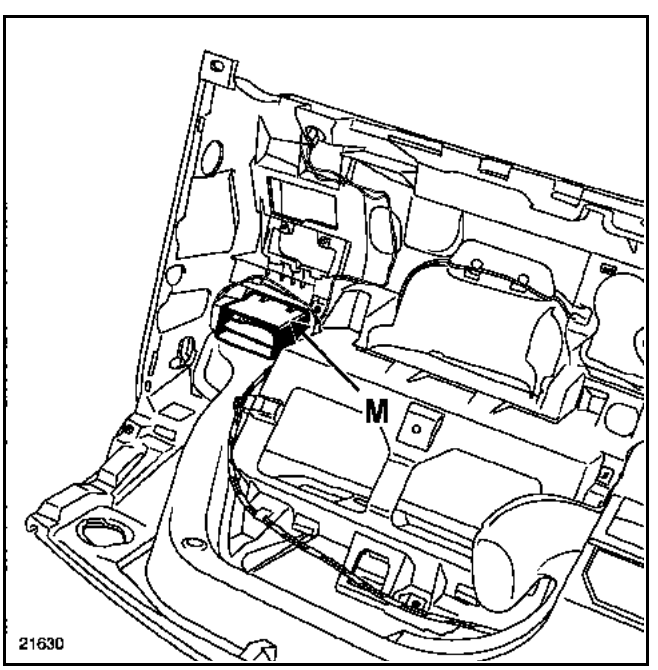
Refer to the programming methods in **section 80.**

DISMANTLING



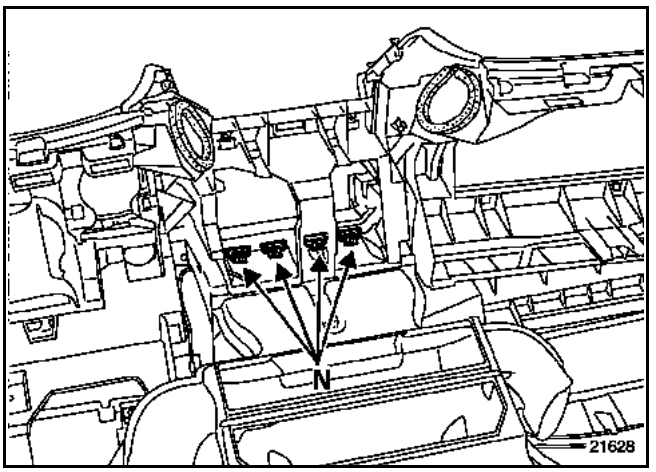
Remove:
– the four passenger air bag mountings,
– the bolts (L) then remove the sleeve,
– the two tweeters.

Tightening torque for the passenger air bag mountings (**8 NM**).

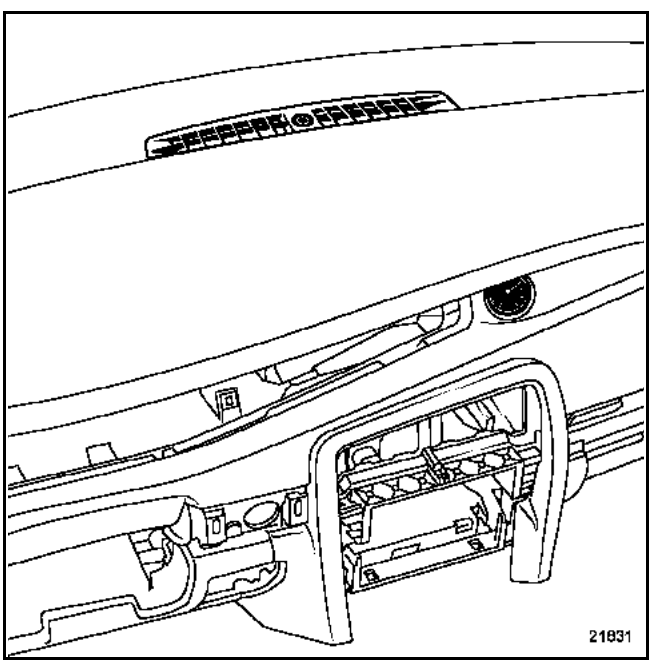


Remove the four clips (M) and remove the side air vent.

GETtheMANUALS.org

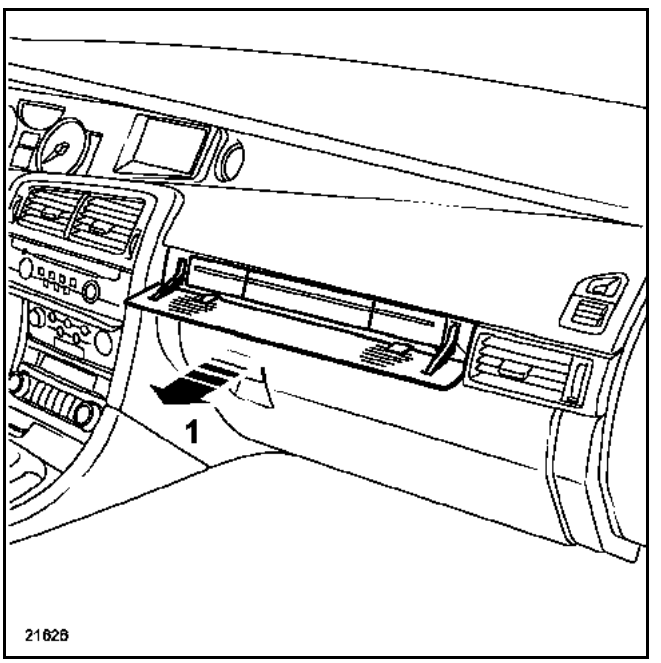


Unclip the clips (N); remove the central air vent.



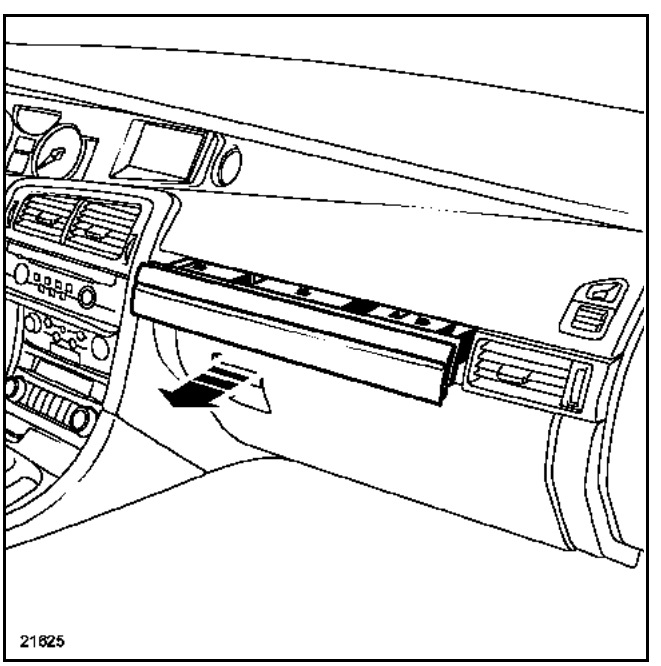
Remove:
– the isolation sensor,
– the clock.

REMOVING THE MONEY POCKET



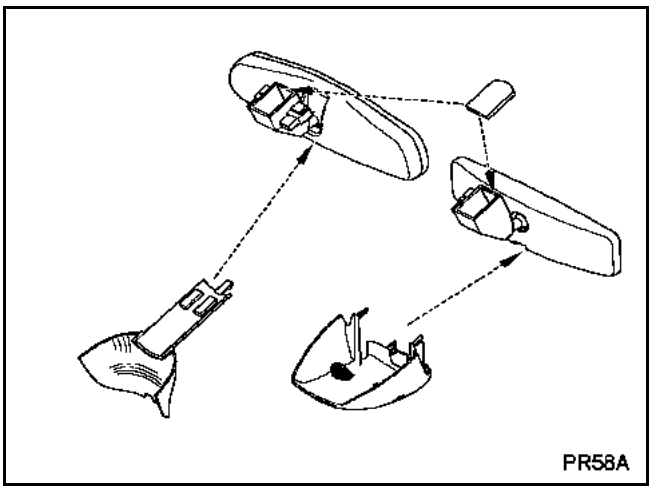
Open the money pocket access flap.

Unclip the money pocket (1) (**partially**).

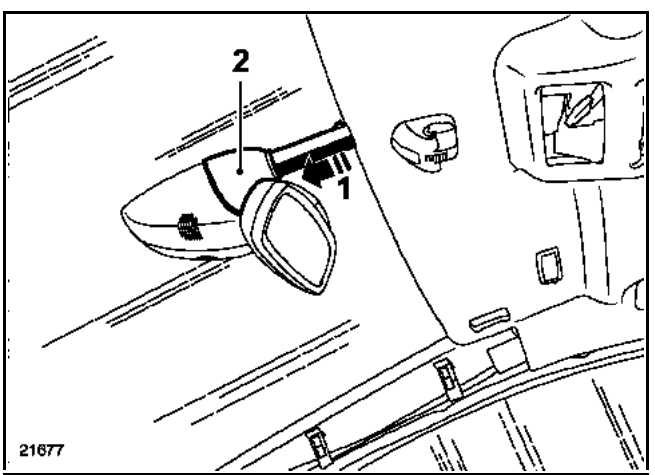


Close the flap and remove the money pocket.

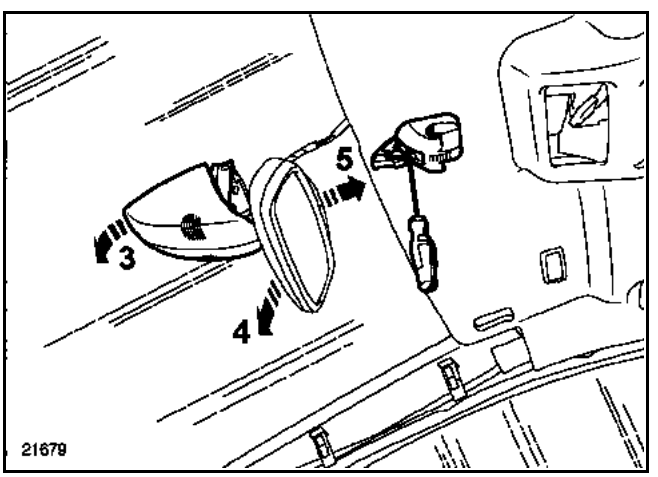
GETtheMANUALS.org



REMOVAL



Release:
– the upper shell casing (1), apply pressure (2), then remove,

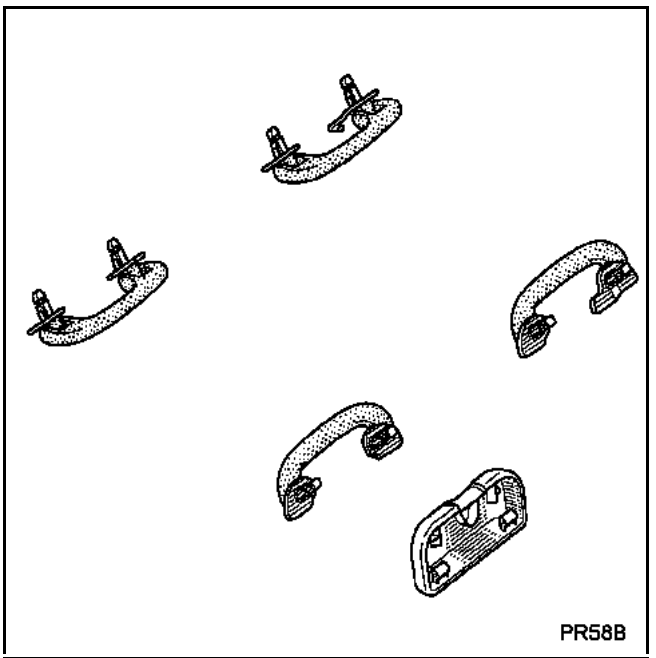


– the lower shell casing (3).

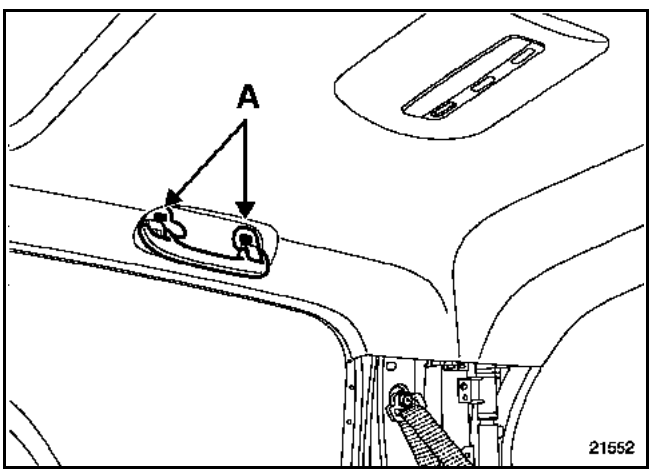
Disconnect the different connectors.

Apply pressure (4) and remove the rear-view mirror (5).

GETtheMANUALS.org



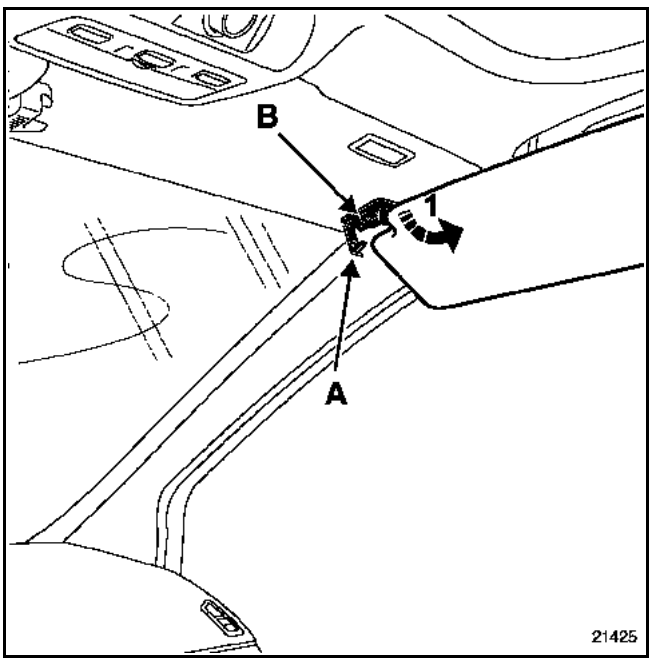
REMOVAL



Using the grab handle removal tool (**Car. 1597**) unclip the two mounting pins (A), then pull it to remove.

GETtheMANUALS.org

REMOVAL



Position the sun visor towards the door.

Unclip:
– the mounting cover (A).
– the clip (B).

Pull the sun visor down towards the windscreen.

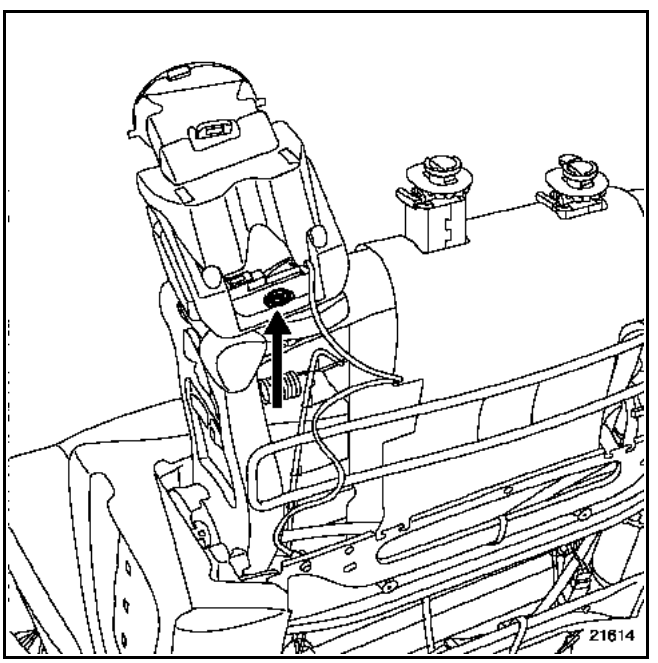
Remove the sun visor (1).

GETtheMANUALS.org

REMOVAL

IMPORTANT: when the seat belt pretensioners are triggered, the front seat belts and pretensioners must always be replaced (if they were being worn at the time). If you have any doubts about whether the seat belt was being worn, you should change it.

Remove:
– the seat (**section 75A.A**),
– the lower seat trim (**section 79A.A**),
– the seatback trim (**section 77A.A**),



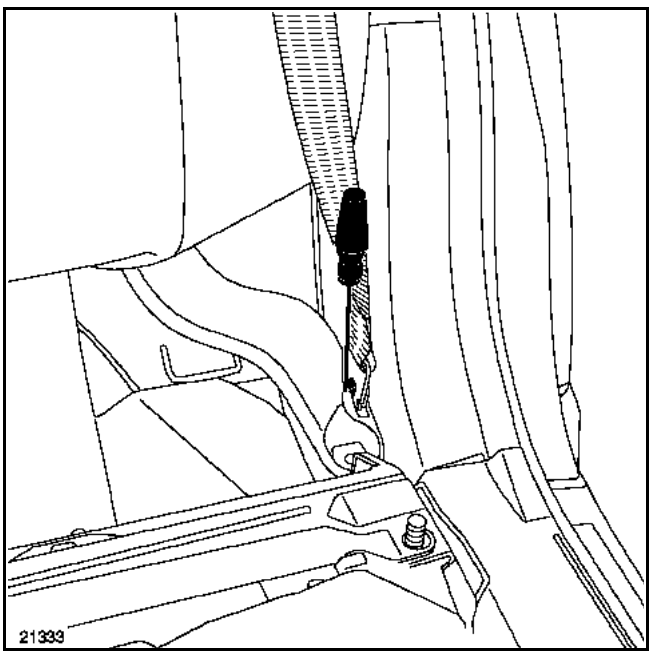
– the mounting bolt, then remove the retractor.

TIGHTENING TORQUES (in Nm)	
Seat belt retractor	**21**
Pretensioners	**21**

GETtheMANUALS.org

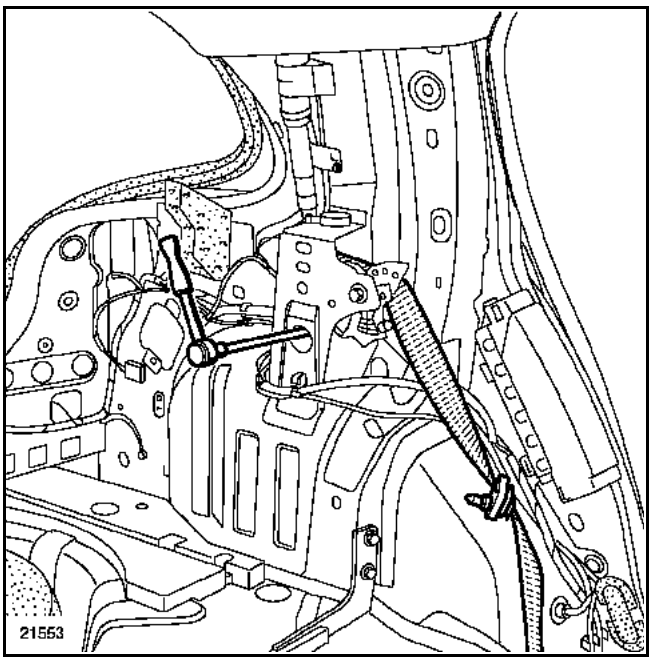
REMOVAL

After removing:
– the upper trim from the bottom of the rear step (**section 71A.F**),
– the rear side window shelf (**section 74A.A**),
– the quarter panel trim (**section 71A.G**),
– the wheel arch trim (**section 71A.I**),

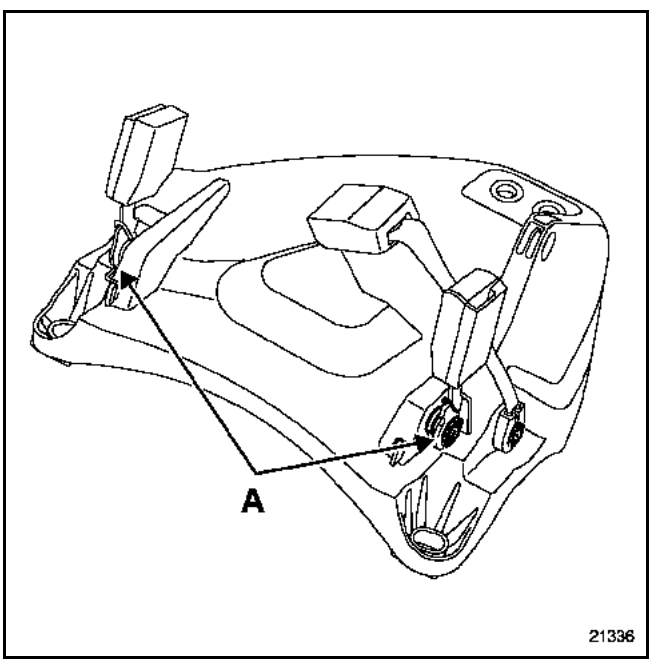


– unclip the seat belt using a small screwdriver.

Remove:
– the upper seat belt mounting (located behind the quarter panel trim) (**21 Nm ± 20%**),



– the retractor mounting, then remove the retractor,



– bolts (A) then release the flexible stalks.

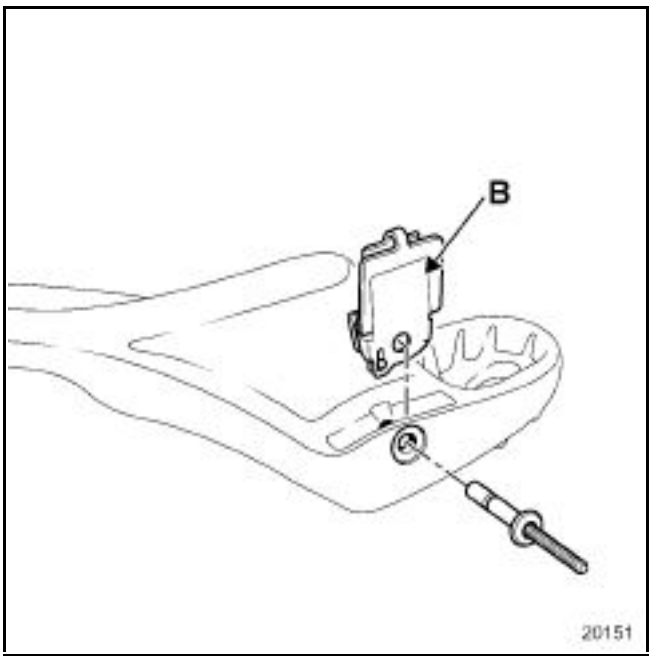
TIGHTENING TORQUES (in Nm)	▽
Seat belt retractor	21 ± 20%
Flexible stalk	21 ± 20%

GETtheMANUALS.org

RAPID CONNECTION

When the seat belt pretensioners are triggered, the rapid connection and rear seat belts must always be replaced, if they were being worn at the time. If you have any doubts about whether the seat belt was being worn, you should change it.

REMOVAL



Grind down the head and drive the rivet out.

REFITTING

Position the connection (B) in its housing
part no.: 82 00 024 242.

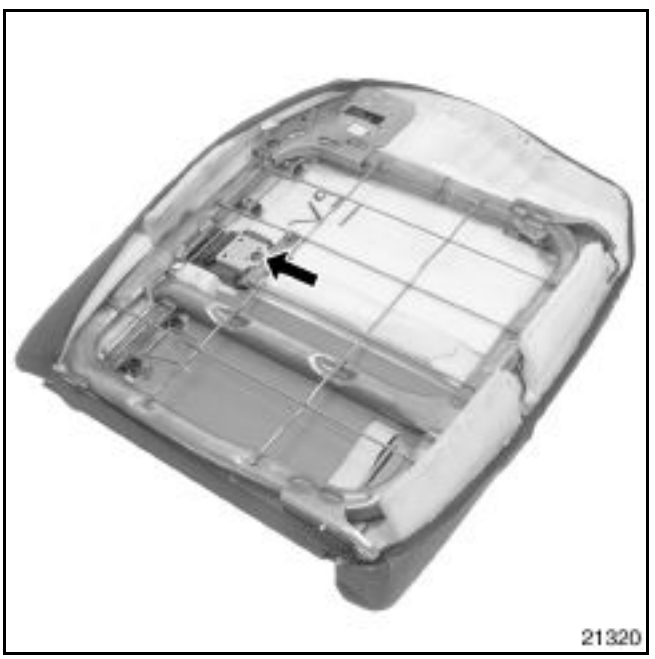
Assemble the connection with the specific rivet
part no.: 77 01 049 320.

GETtheMANUALS.org

REMOVAL

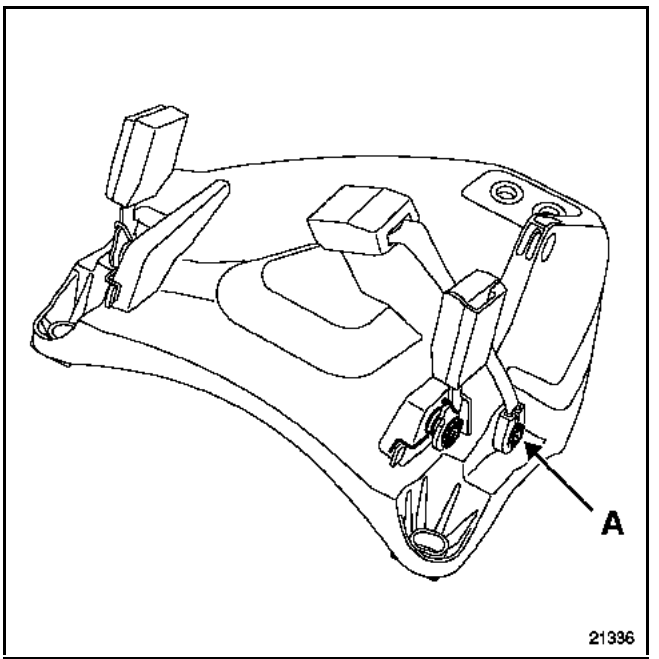
IMPORTANT: when the seat belt pretensioners are triggered, the rear seat belts and pretensioners must always be replaced (if they were being worn at the time).
If you have any doubts about whether the seat belt was being worn, you should change it.

Remove:
– the seatback (**section 76A.B**),
– the seatback trim (**section 78A.B**),



– the retractor mounting, then partially release the retractor, to unclip the seat belt cover from inside.

Remove:
– the seat belt,



– bolt (A) then release the flexible stalk.

TIGHTENING TORQUES (in Nm)	▽
Seat belt retractor	**21**
Flexible stalks	**21**

GETtheMANUALS.org

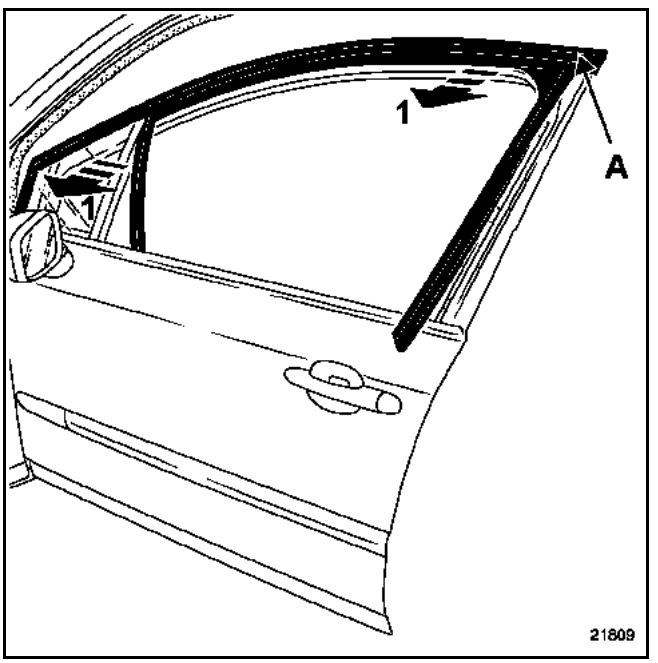
REMOVAL

NOTE: the frame seal and the channels are moulded in one piece.

Remove:
– the door trim (**section 72A.A**);
– the door upright exterior embellishers (**section 56A.C**);
– the door's fixed upright channel (**section 66A.C**).



Carefully extricate the door frame seal (1).

REFITTING

Position and fit the seal in the corner (A).

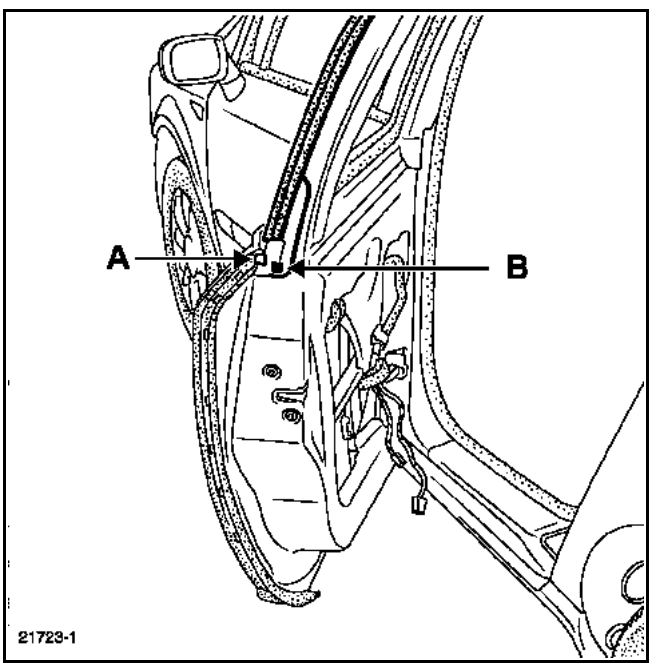
Clip the seal over its entire length.

GETtheMANUALS.org

REMOVAL

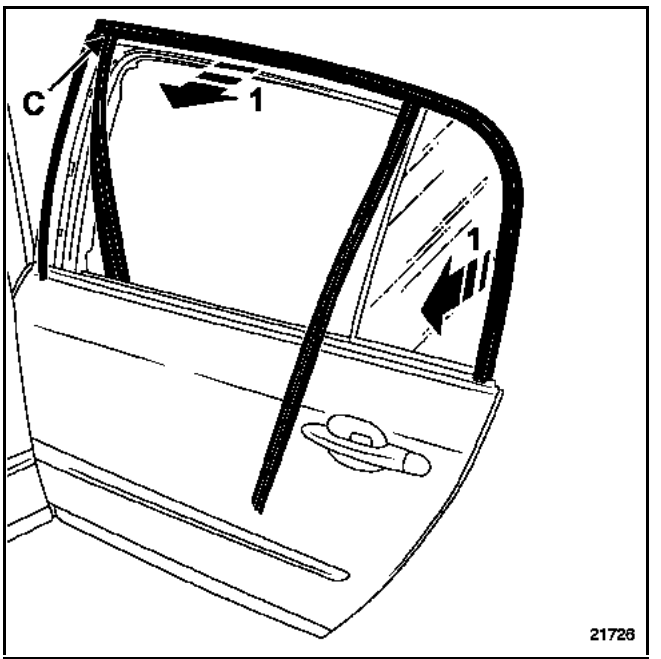
NOTE: the frame seal and the channels are moulded in one piece.

Remove:
– the door trim (**section 72A.B**);
– the door upright exterior embellishers (**section 56A.D**);
– the door's fixed upright channel (**section 66A.D**).



Unclip in the upper section the door panel double seal (A).

Unstick the two-faced adhesive tape (B) (replace two-faced tape when refitting).



Carefully extricate the door frame seal (1).

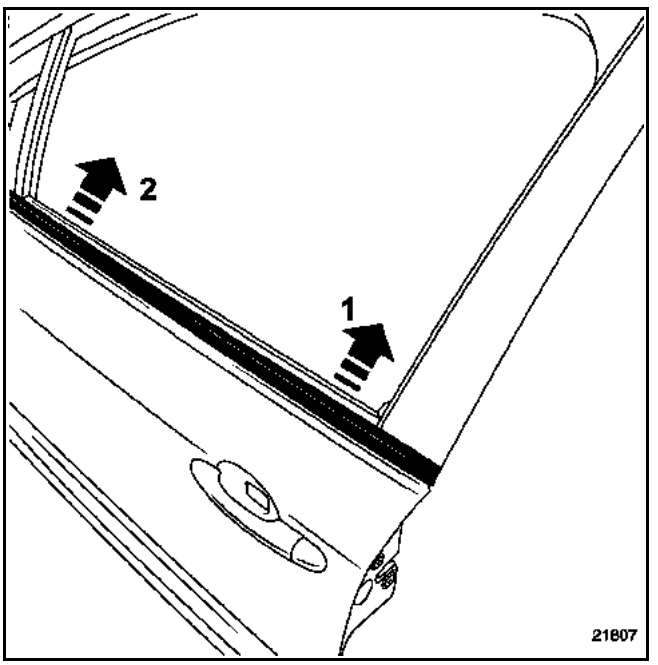
REFITTING

Position and fit the seal in the corner (C).

Clip the seal over its entire length.

GETtheMANUALS.org

REMOVAL



Using tool **Car. 1363** carefully remove the weatherstrip at (1) then (2).

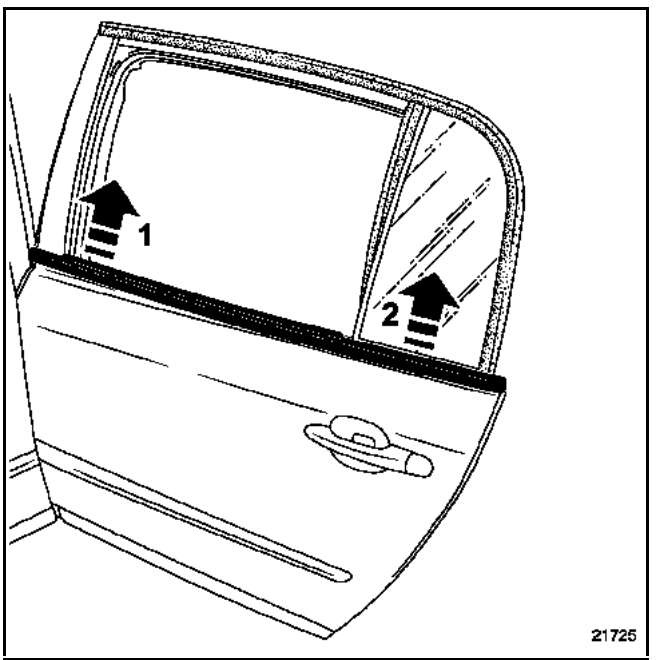
IMPORTANT: the fixed window holds the weatherstrip more securely than the moving window does.

REFITTING

Position the weatherstrip in front of the fixed window and clip it in.

GETtheMANUALS.org

REMOVAL



Using tool **Car. 1363** carefully remove the weatherstrip at (1) and (2).

IMPORTANT: the fixed window holds the weatherstrip more securely than the moving window does.

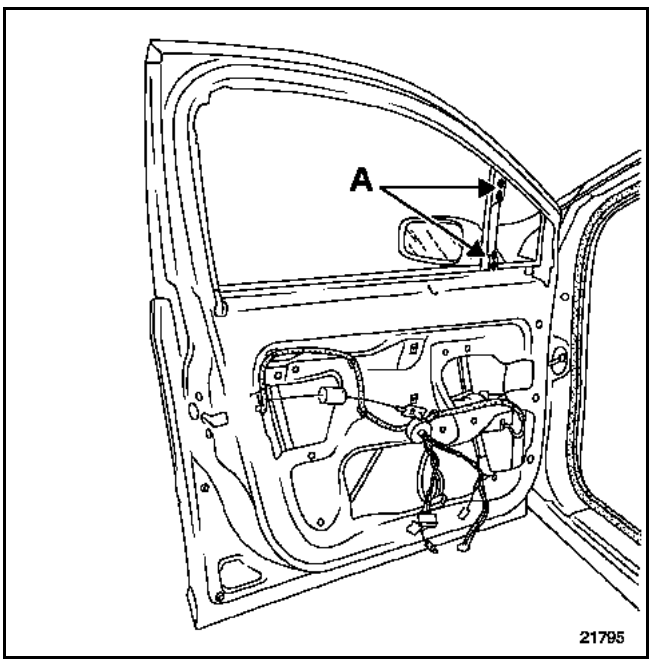
REFITTING

Position the weatherstrip in front of the fixed window and clip it in.

GETtheMANUALS.org

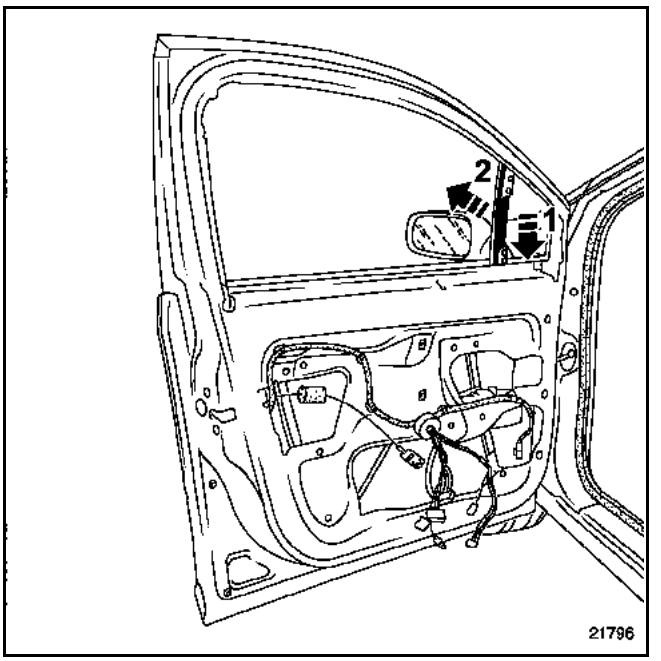
REMOVAL

Remove:
– the door trim (**section 72A.A**),
– the sliding window from the moving slide (**section 54A.B**),
– the interior door weatherstrip.
– the door frame interior trim (**section 72A.C**).



Remove the seal (partially).

Remove bolts (A).



Disconnect the channel at (1) then (2), taking care not to damage the exterior door weatherstrip.

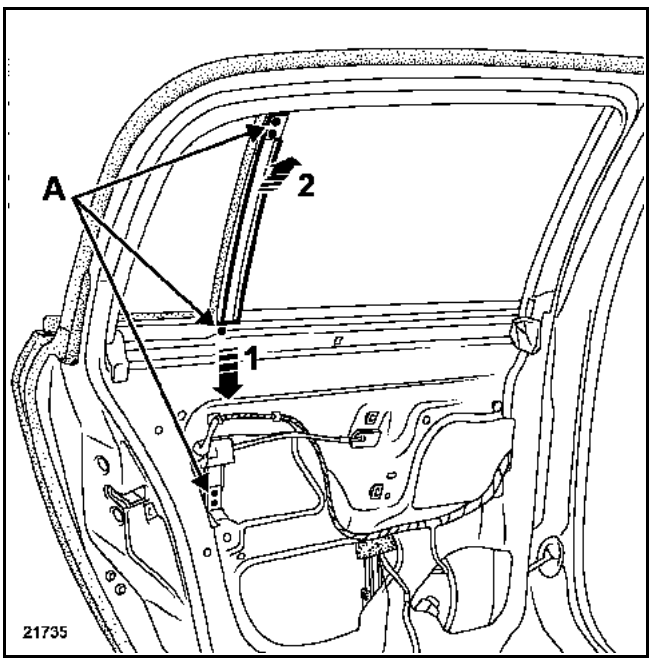
REFITTING

To refit, proceed in the reverse order to removal.

GETtheMANUALS.org

REMOVAL

Remove:
– the door trim (**section 72A.B**),
– the sliding window from the moving slide (**section 54A.C**),
– the interior door weatherstrip.
– the door frame interior trim (**section 72A.D**).



Remove the seal (partially).

Remove bolts (A).

Disconnect the channel at (1) then (2), taking care not to damage the exterior weatherstrip.

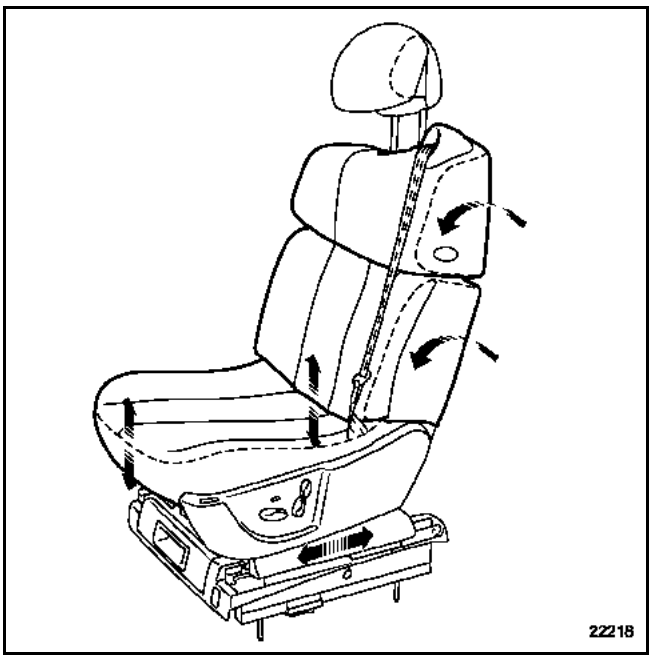
AIR BAG AND PRETENSIONERS

IMPORTANT: all work on the air bag and pretensioner systems must be carried out by qualified personnel who have received the proper training.

IMPORTANT: the pyrotechnic systems (air bags and pretensioners) must not be handled near a source of heat or flame as there is a risk of triggering.

INFORMATION: refer to **section 8** for more detailed information.



IMPORTANT: before removing a seat, lock the computer by means of the diagnostic tool. When this function is activated, all the ignition lines are disabled and the air bag warning light on the instrument panel comes on.

HEAT SHIELDS

Heat shields must be refitted, whether they are for bodywork or mechanical components.

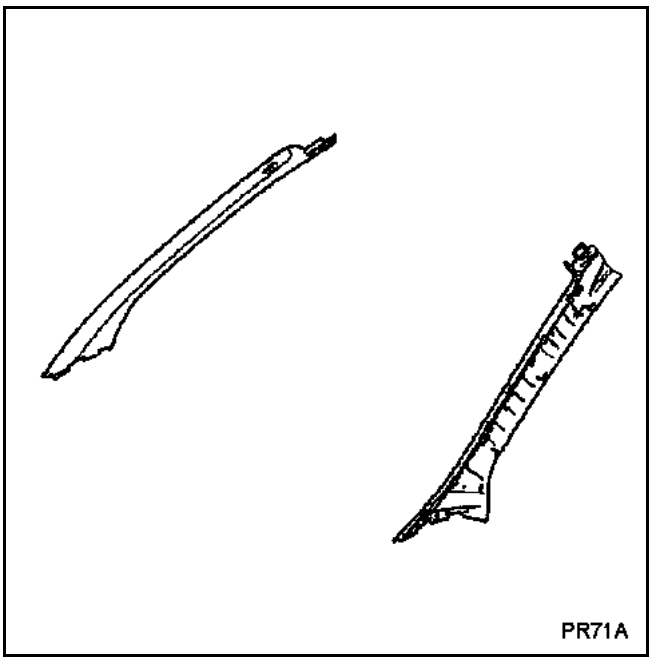
TIGHTENING TORQUES

The recommended tightening torques MUST be observed.

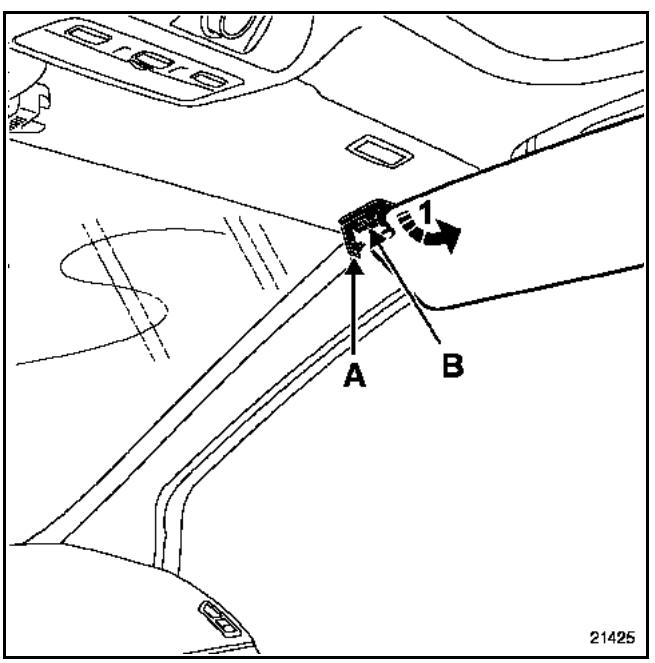
TOOLS AND PRODUCTS

Read the precautions for use of the tools and products with care and observe the safety instructions by using the appropriate protection (gloves, mask, etc.).

GETtheMANUALS.org



REMOVAL

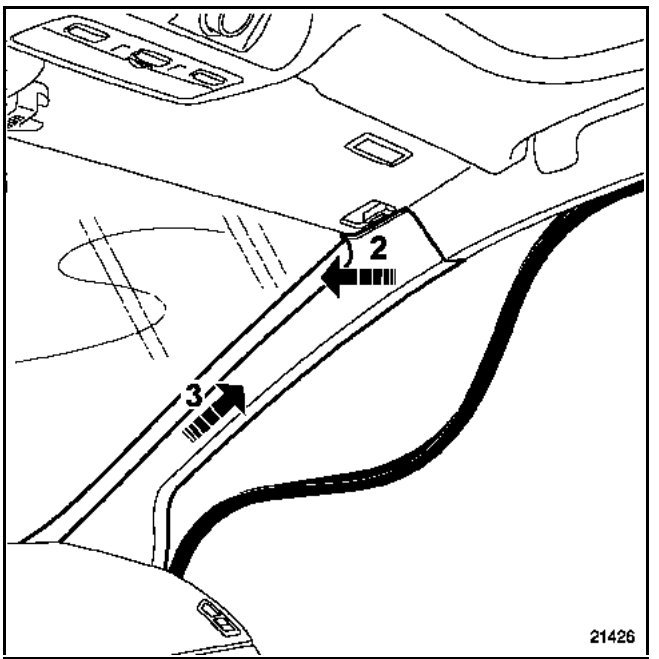


Position the sun visor towards the door.

Unclip:
– mounting cover (A),
– clip (B).

Pull the sun visor down towards the windscreen.

Remove sun visor (1).

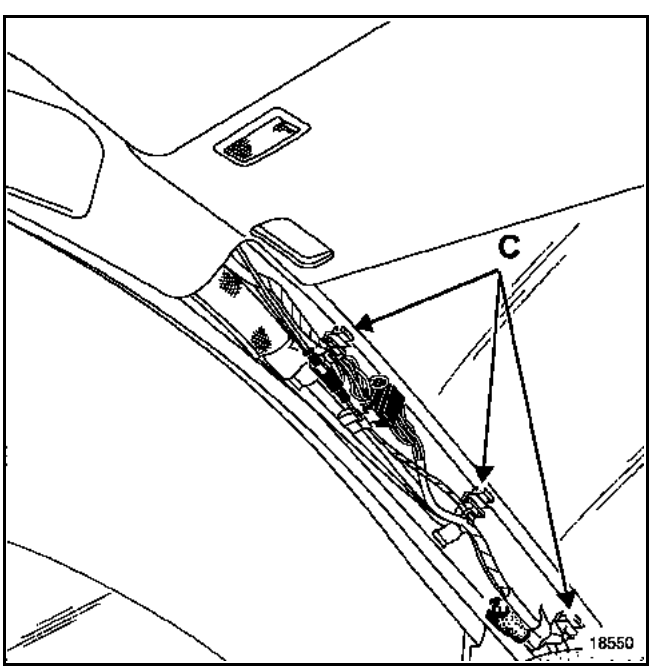


Partially remove the door frame seal.

Unclip the upper section lining (2).

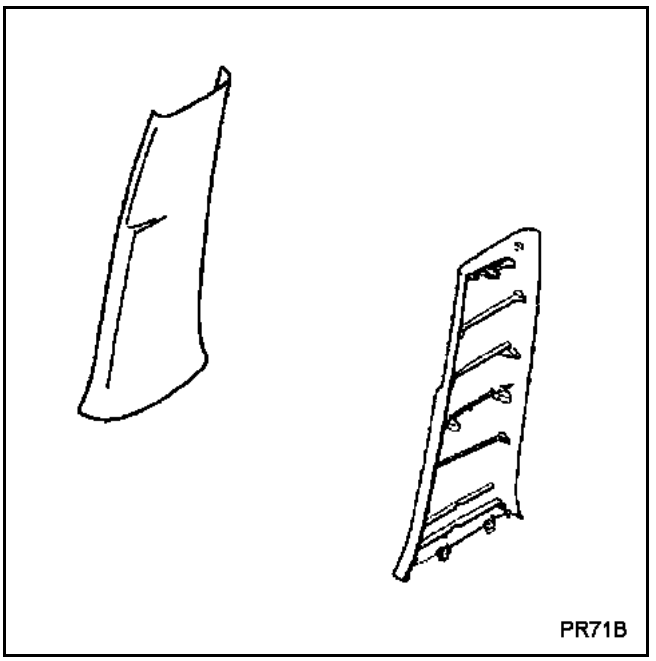
Take out trim (3) keeping the upper section detached.

REFITTING

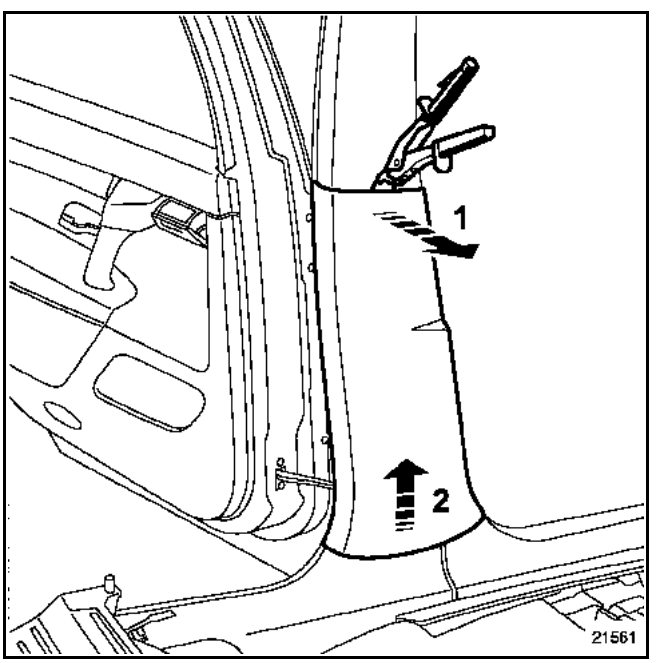


Before refitting, check that the clips (C) are in good condition.

GETtheMANUALS.org



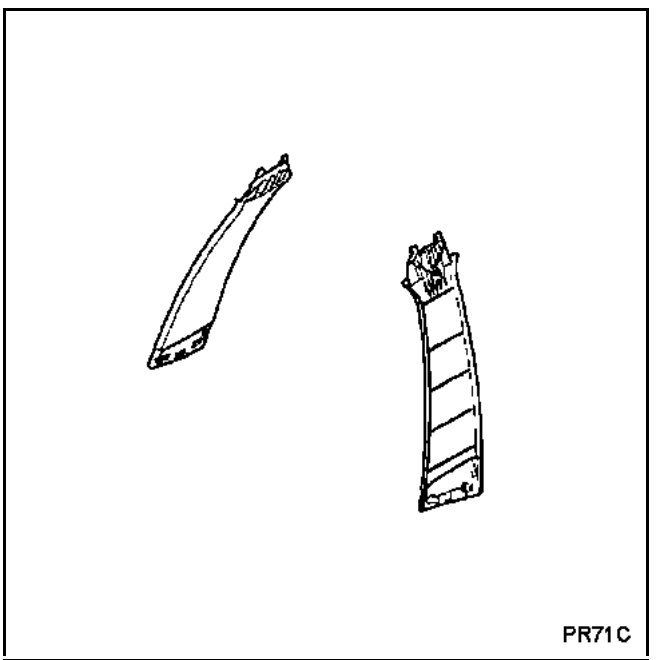
REMOVAL



Unclip upper section lining (1).

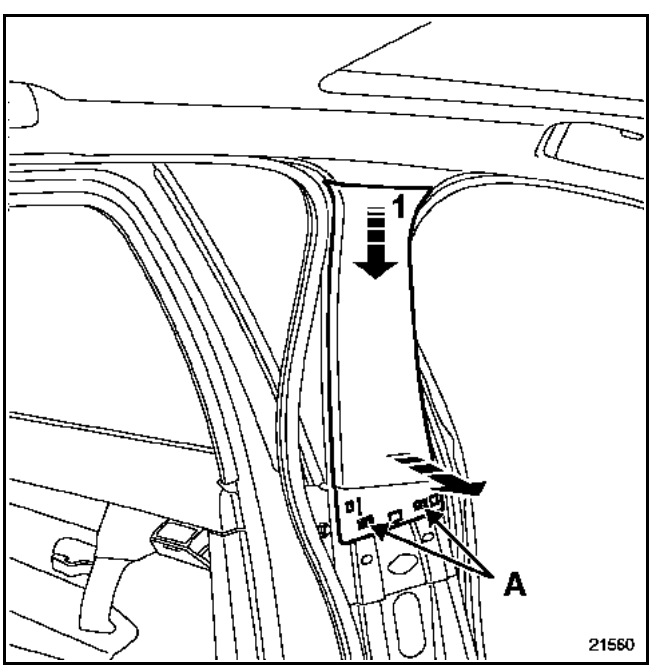
Take out the trim (2).

GETtheMANUALS.org



REMOVAL

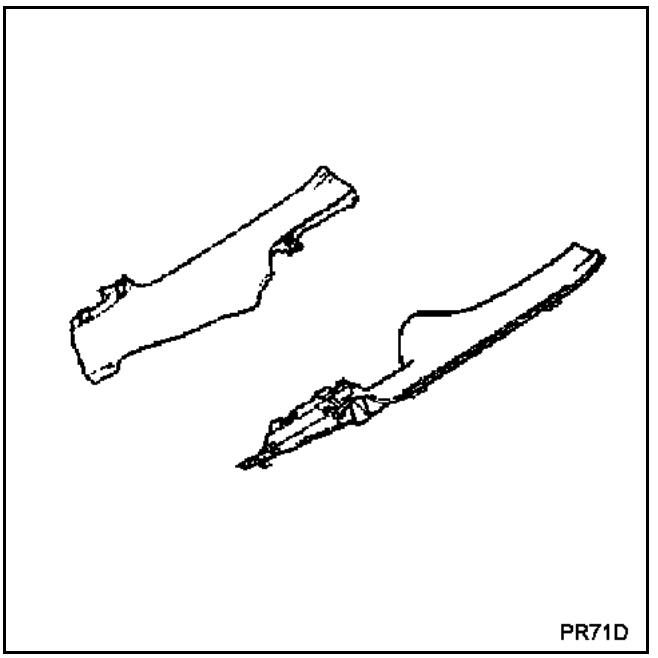
Remove:
– the centre pillar lower trim,
– the door frame seal (partially).



Unclip upper section of trim (A).

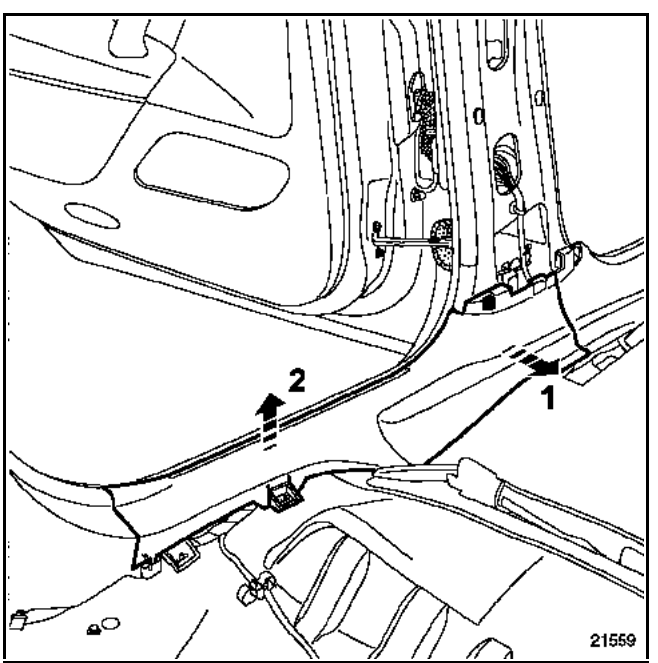
Take out the trim (1).

GETtheMANUALS.org



REMOVAL

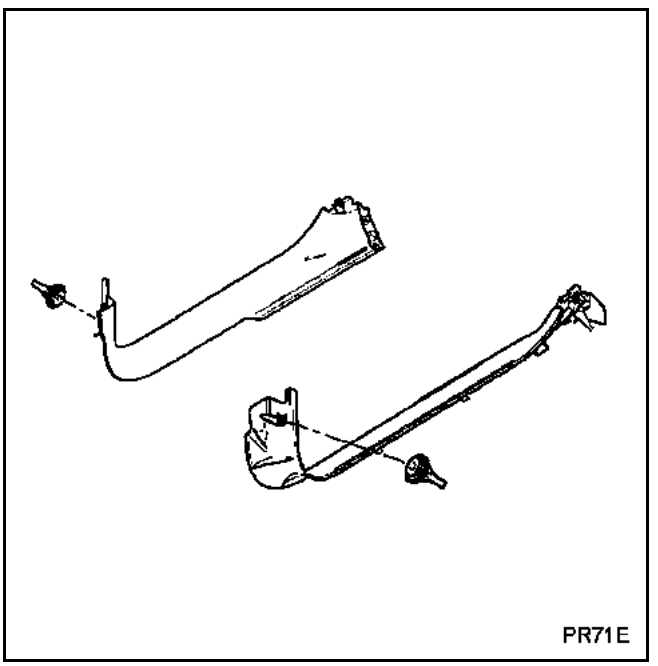
Remove:
– the centre pillar lower trim,
– the rear seat squab,



Move the front seat as far forward as possible.

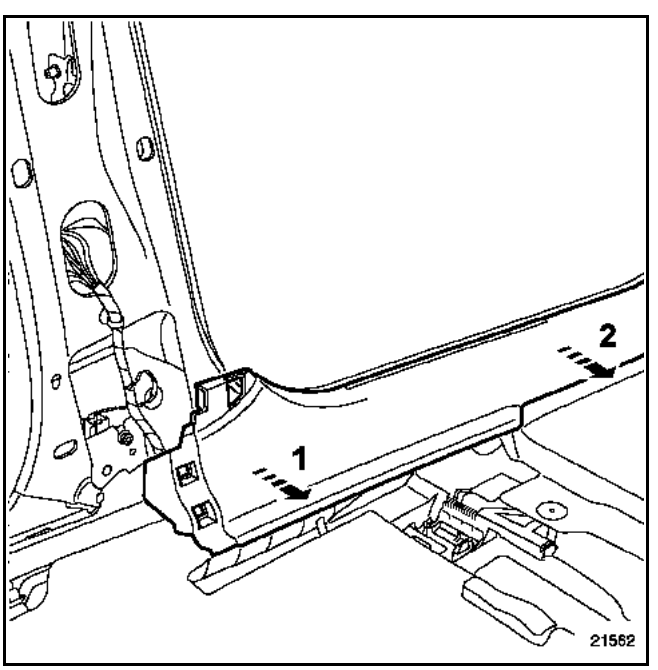
Release:
– the front section of trim (1),
– the trim at (2).

GETtheMANUALS.org



REMOVAL

Remove:
– the b-pillar lining,
– the rear door sill trim (partially).

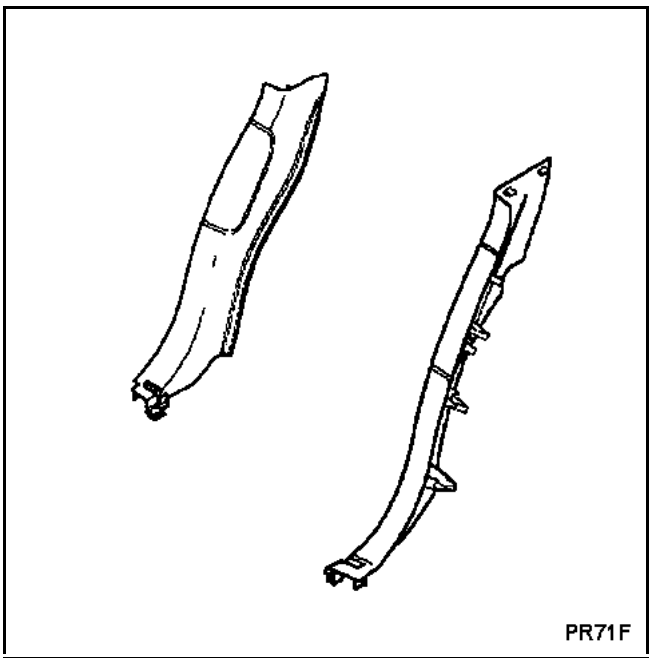


Move the front seat as far back as possible.

Unclip the trim over its entire length (1).

Take out the trim (2).

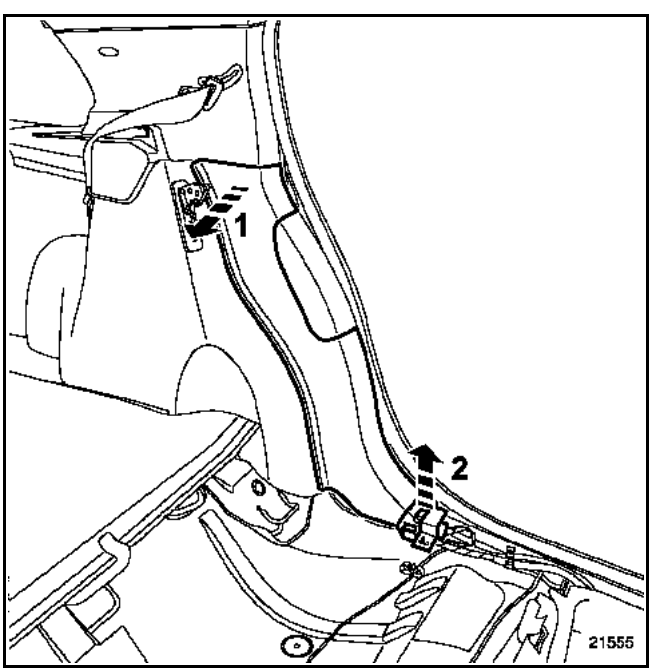
GETtheMANUALS.org



REMOVAL

CAUTION: the rear airbag is located underneath the lining.

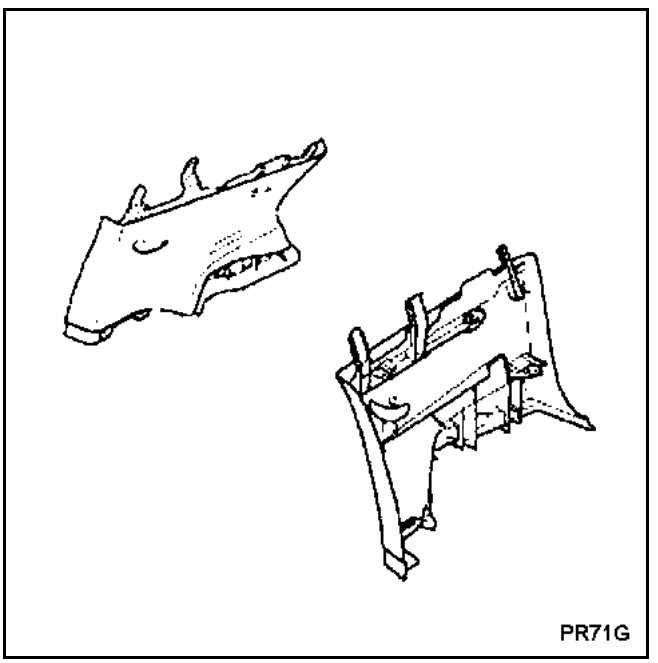
Partially remove the rear door seal trim.



Unclip the trim over its entire length (1).

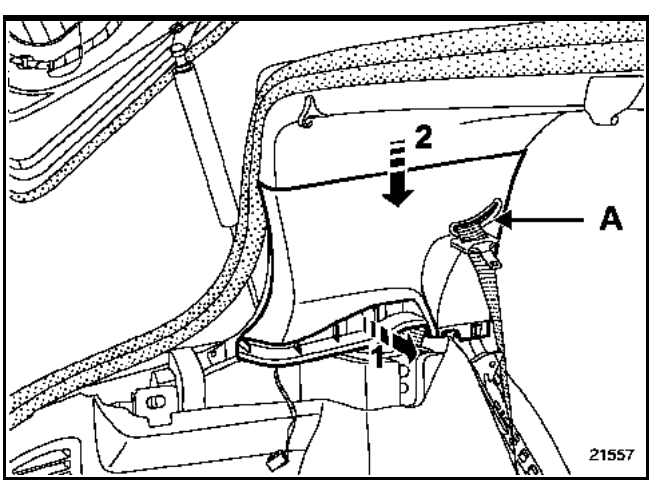
Take out the trim (2).

GETtheMANUALS.org



REMOVAL

Remove:
– the luggage compartment and rear door frame seal (partially),
– the rear parcel shelf,
– the lower sill upper section (partially).



Unclip trim (1).

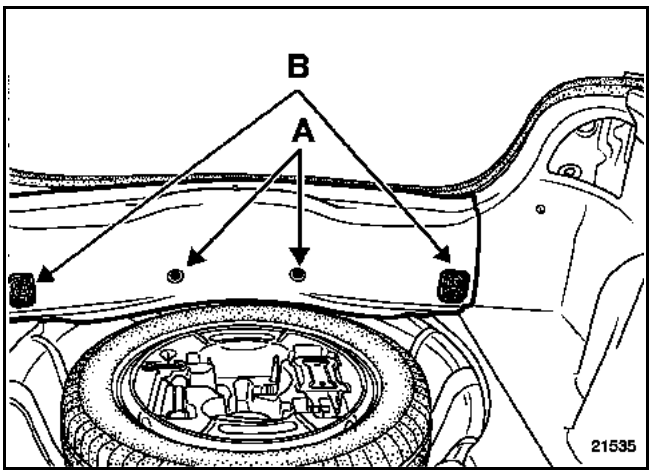
Remove the upper section of trim (2).

Unclip:
– seat belt retractor cover (A),
– the seatbelt up to the seatback to completely remove the trim.

GETtheMANUALS.org

REMOVAL

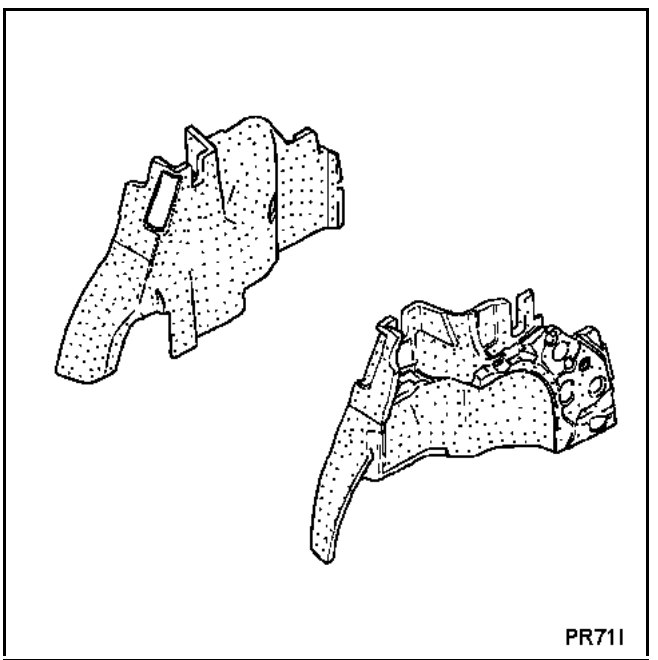
Lift up the boot carpet.



Remove:
– clips (A),
– lashing points (B).

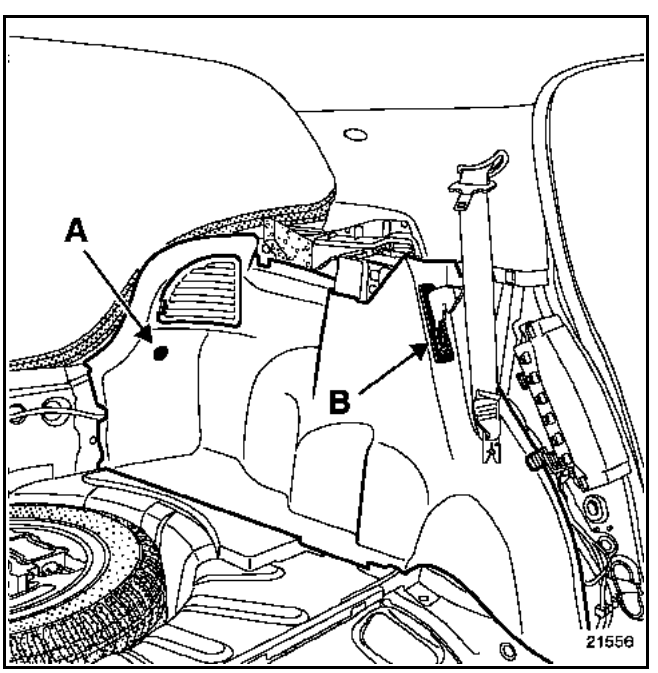
Pull the trim upwards.

GETtheMANUALS.org



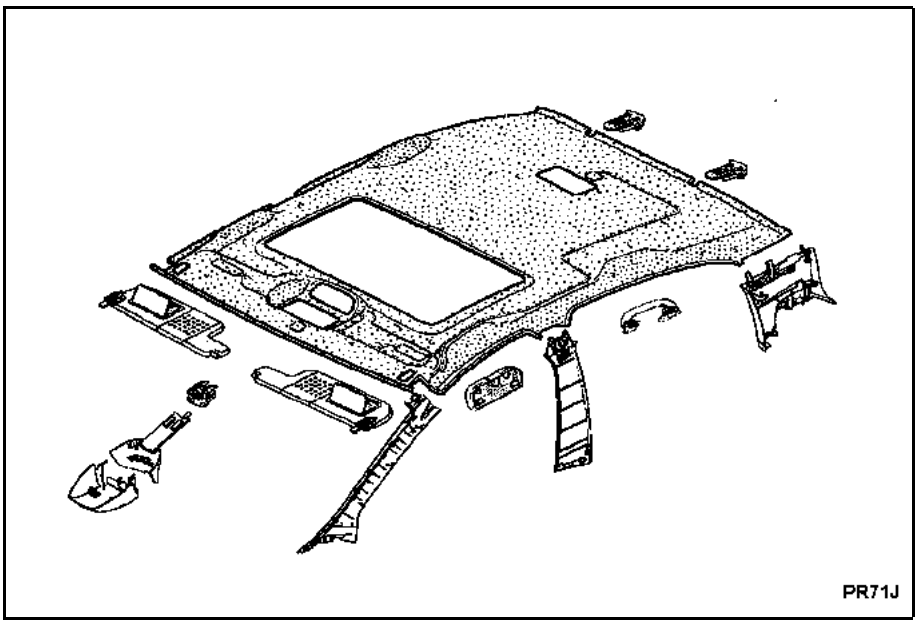
REMOVAL

Remove:
– the luggage compartment seal (partially),
– the rear end panel lining,
– the side rear parcel shelf,
– the boot carpet.
– the rear door seal trim (partially),



– clip (A),
– cover (B),
– the trim.

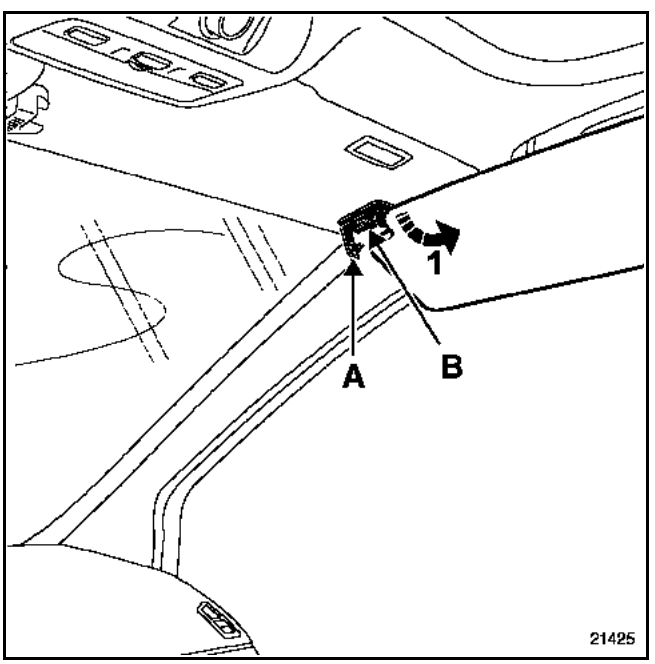
GETtheMANUALS.org



REMOVAL

IMPORTANT: before removing the headlining, it is essential to lock the airbag computer using the diagnostic tool (for instructions, refer to **section 88**).

Remove:
– the luggage compartment door seal (partially),
– the four door frame seals (upper part),
– the rear side parcel shelves (**section 71A.A**),
– the rear quarter panel trims (**section 71A.G**).

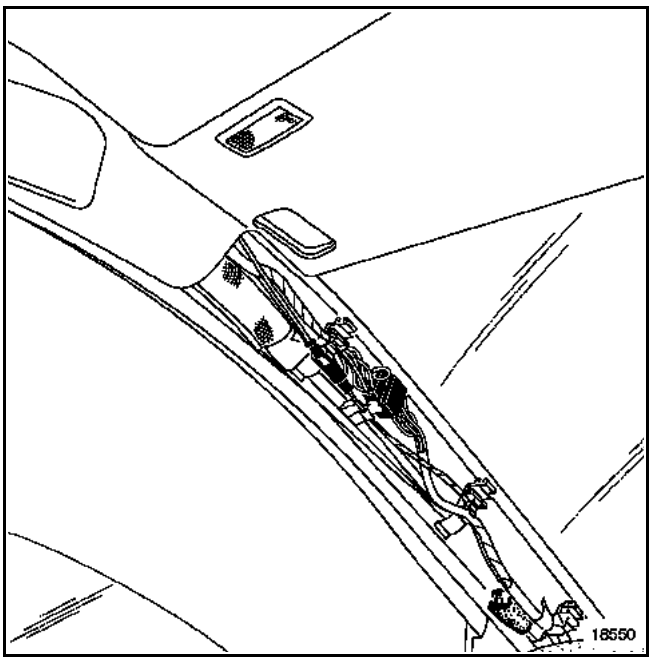


Position the sun visor towards the door.

Unclip:
– cover mounting (A),
– clip (B).

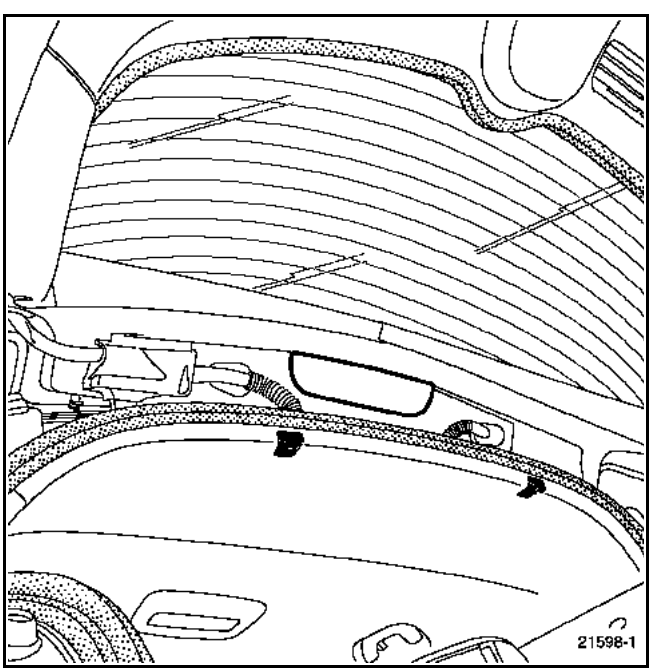
Pull the sun visor down towards the windscreen, then remove it (1).

GETtheMANUALS.org

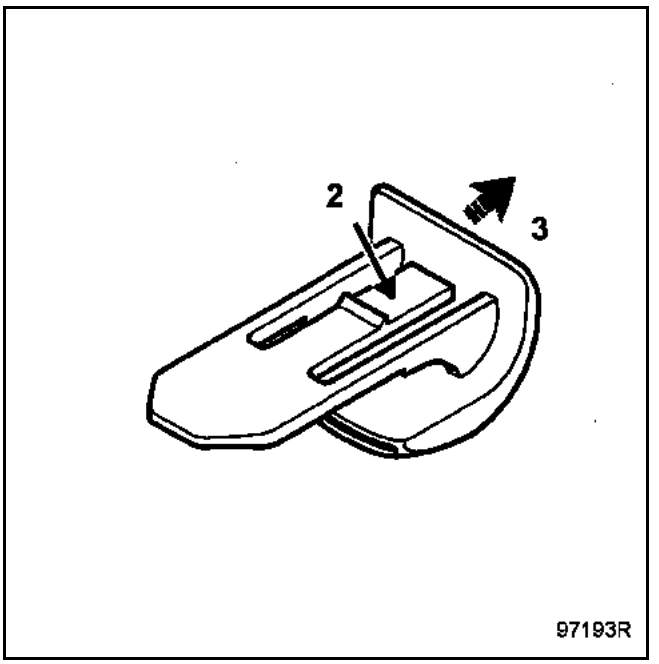


Remove the windscreen pillars (**section 71A.D**).

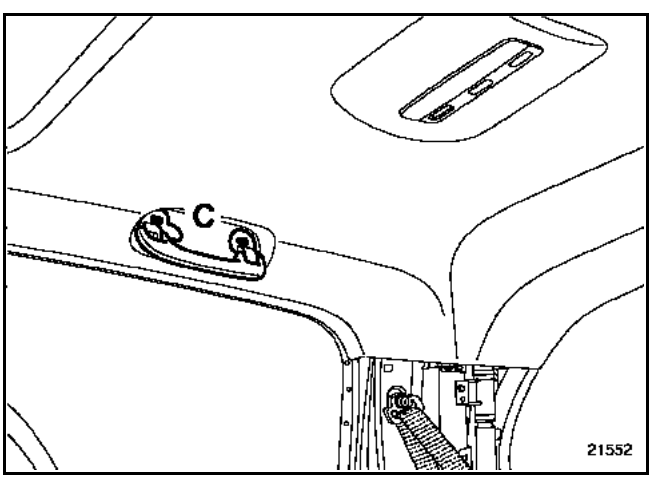
Disconnect the various connectors.



Remove the rear sun visor upper attachments (see below).

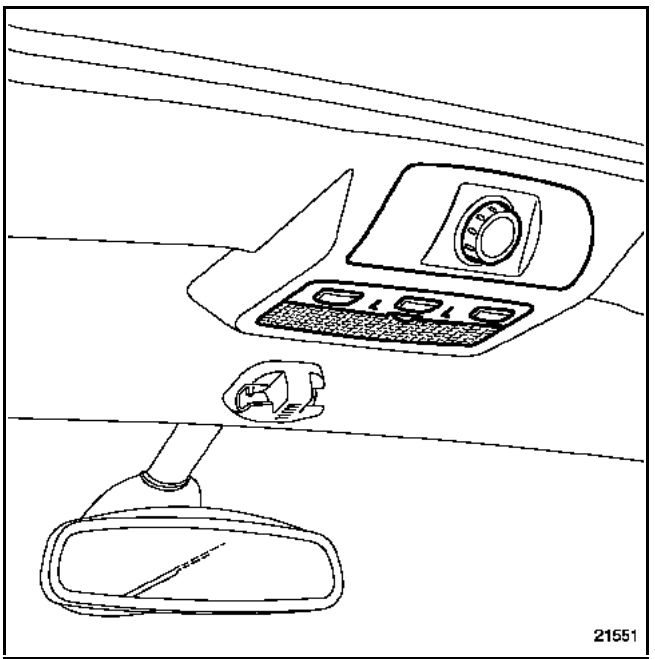


Press clips (2) and release clip (3).



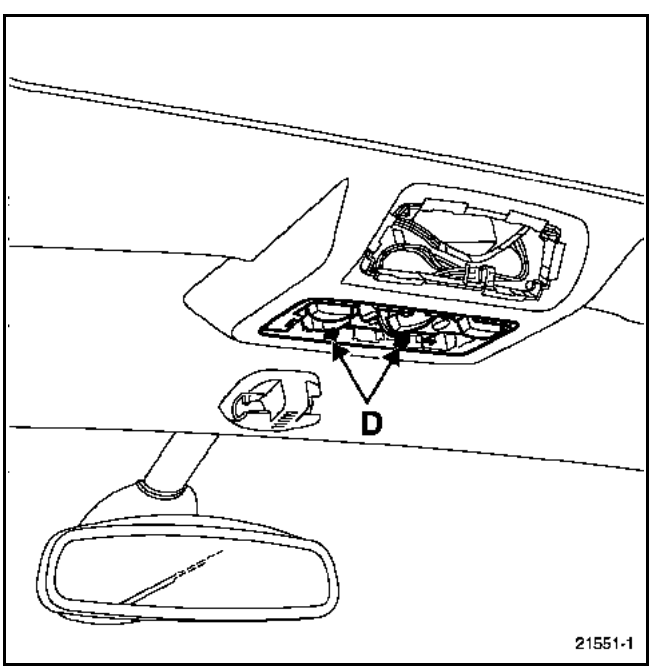
Using the tool **Car. 1597**, unclip the grab handle clips (C).

GETtheMANUALS.org



Remove the sunroof control button (if fitted).

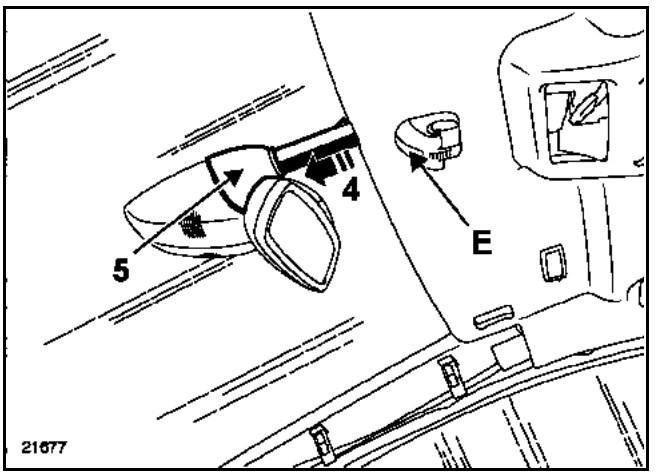
Remove:
– the sun roof frame seal,



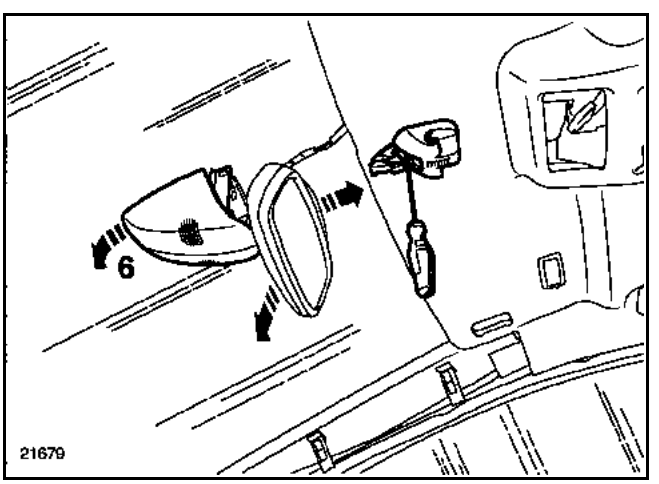
– the interior light cover, to gain access to clips (D).

Disconnect the different connectors.

Remove the interior light.



Release:
– the upper shell casing (4), applying pressure to (5) then remove it,
– mounting cover (E).



Remove lower shell casing (6).

Using a flat screwdriver, remove the sun visor central mounting.

Disconnect the switch connector (if fitted).

GETtheMANUALS.org

The remaining operations require two people.

Recline the seatbacks and from the boot, remove the lining.

REFITTING

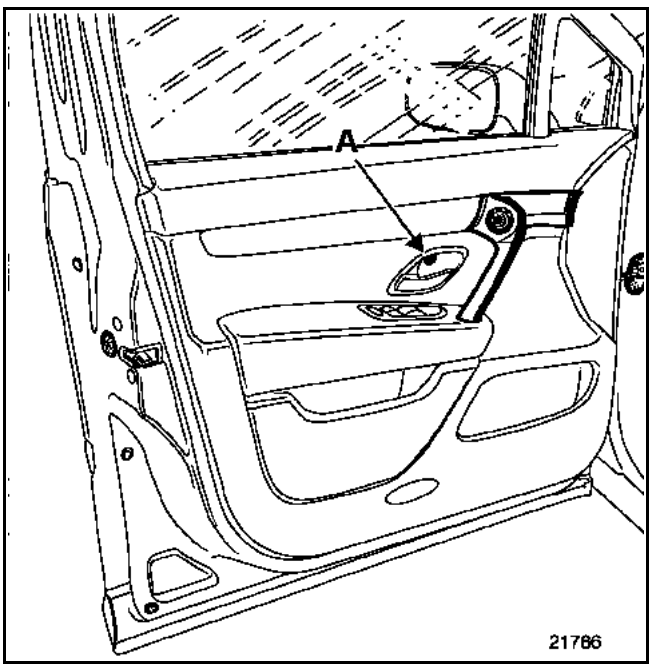
From the boot, fit the headlining, align it by lifting the grab handles.

Complete refitting in reverse order to removal.

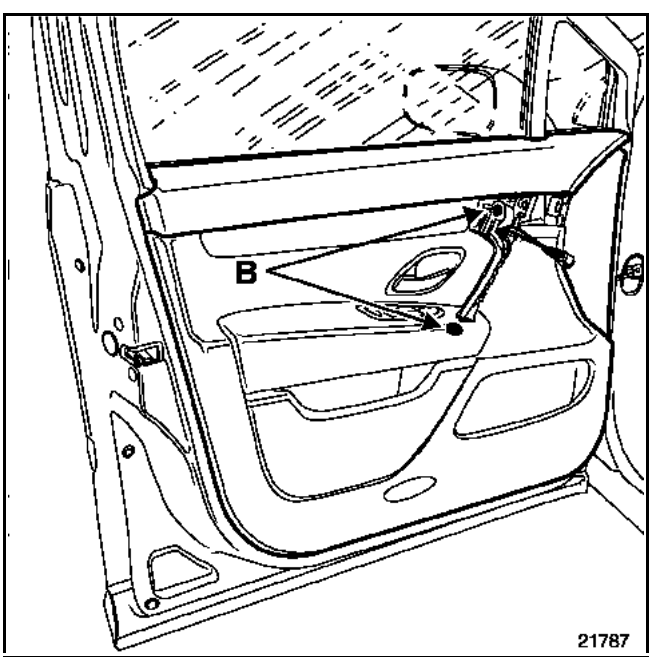
GETtheMANUALS.org

REMOVAL

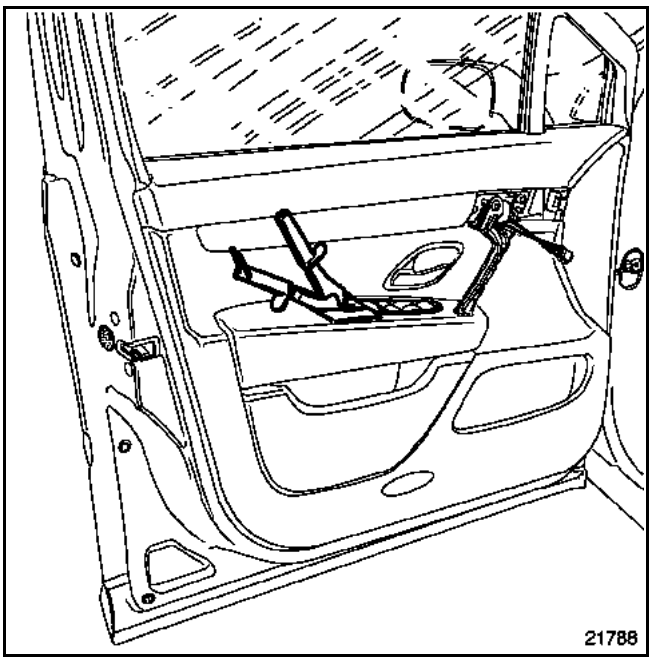
NOTE: removing the speaker grilles entails the removal of the door trim.



Remove:
– the pull handle cover, then disconnect the door mirror control connector,
– the blanking cover and interior opening control mounting bolt (A),



– the two pull handle mounting bolts (B).

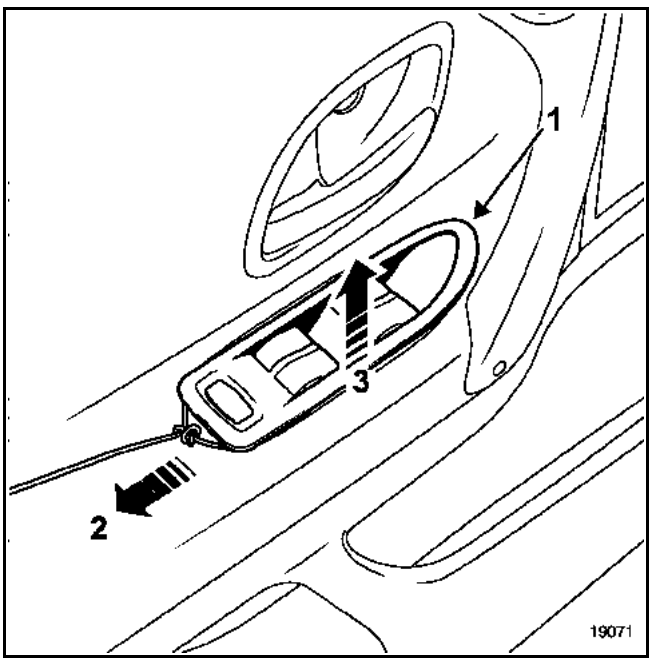


Protect the lining (eg. mastic knife), and unclip the electric window plate (at the rear section) using the unclipping tool, then disconnect the connectors.

Remove the lining panel (nine clips) using the unclipping tool.

GETtheMANUALS.org

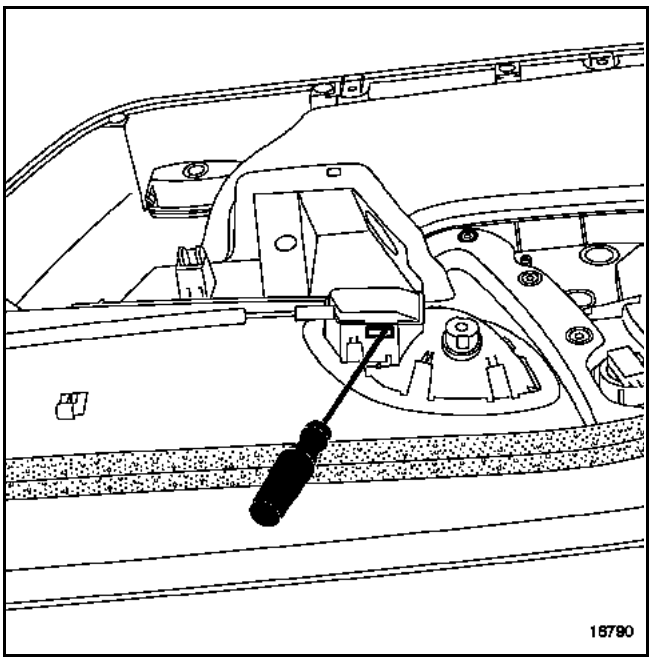
Another procedure for removing the electric window plate



Make a sliding knot at the end of an insulated electric wire of (**3 mm**) then slip the other end of the wire into the knot.

Insert the loop created in (1) between the lining and the lip of the plate, around its entire perimeter.

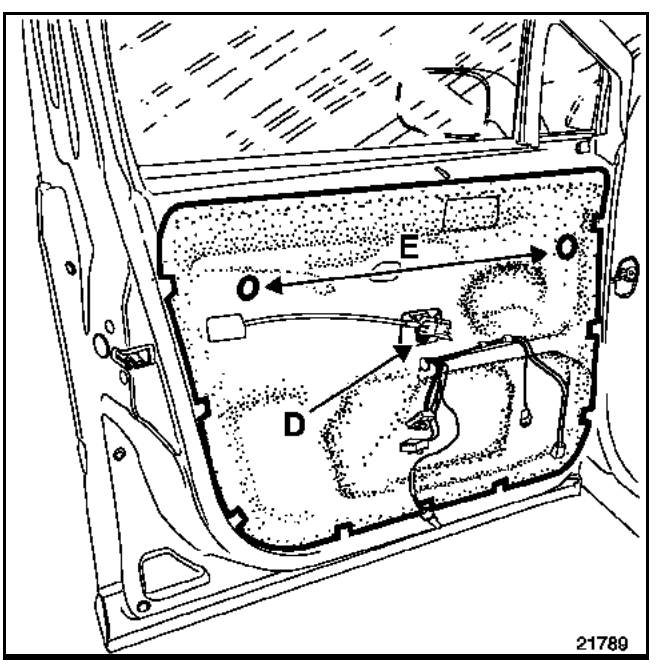
Pull on the end of the wire at (2), simultaneously releasing the plate in the direction of (3) so as to flatten the strips against the plate.



Using a flat screwdriver, unclip the interior opening control cable mounting cover.

Disconnect the speaker and the door light.

Remove:
– the panel,



– screw (D) then remove the bracket for the electric window plate,
– the two guides (E).

Carefully peel off the sealing film.

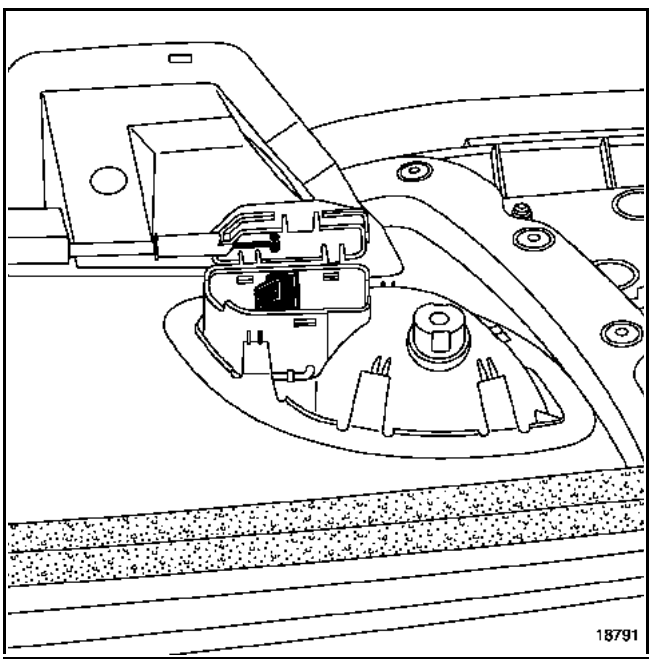
When this is being removed, the sealing mastic must stay on the film.

GETtheMANUALS.org

REFITTING

Take the sealing film and center it using the two guides (E).

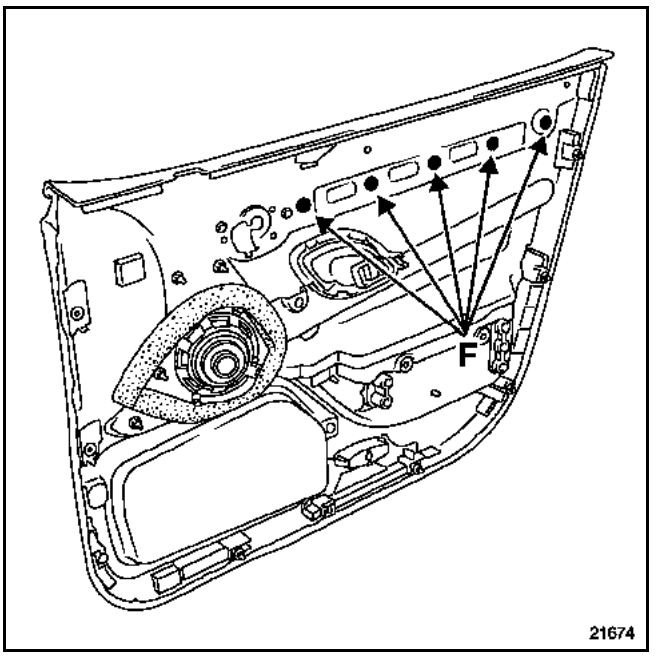
Stick the film down all along its edges.



Keep the interior opening control in the closed position.

Take the cover and cable, position them and clip the assembly in place.

REMOVINGTHE LINING TRIM

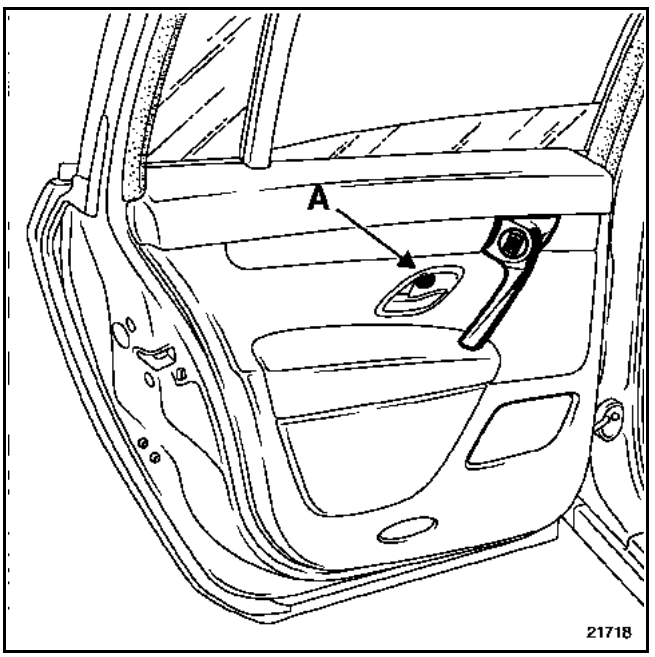


Remove mountings (F) then release the lining trim.

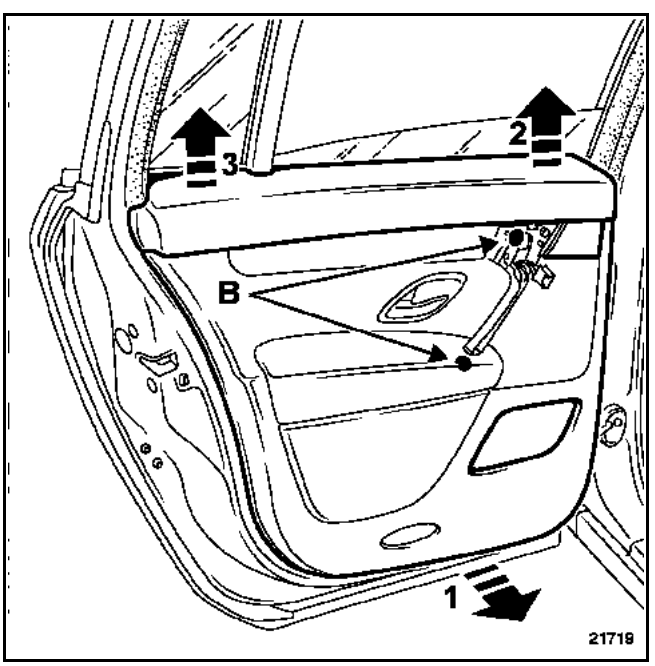
GETtheMANUALS.org

REMOVAL

NOTE: removing the speaker grilles entails the removal of the door trim.



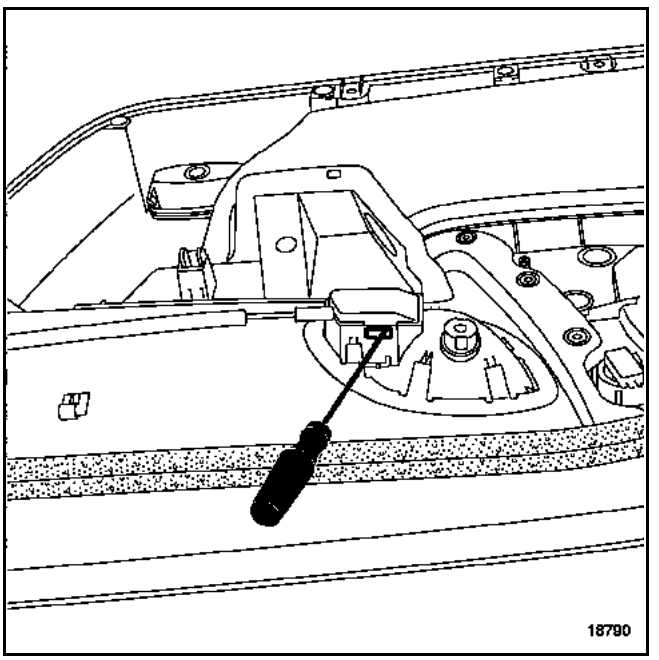
Remove:
– the pull handle cover, then disconnect the window lift control connector,
– the blanking cover and mounting bolt (A) of the interior opening control,



– the two pull handle mounting bolts (B).

Remove lining panel (1) (eight clips) using the unclipping tool.

Partially release the trim at (2) then (3).

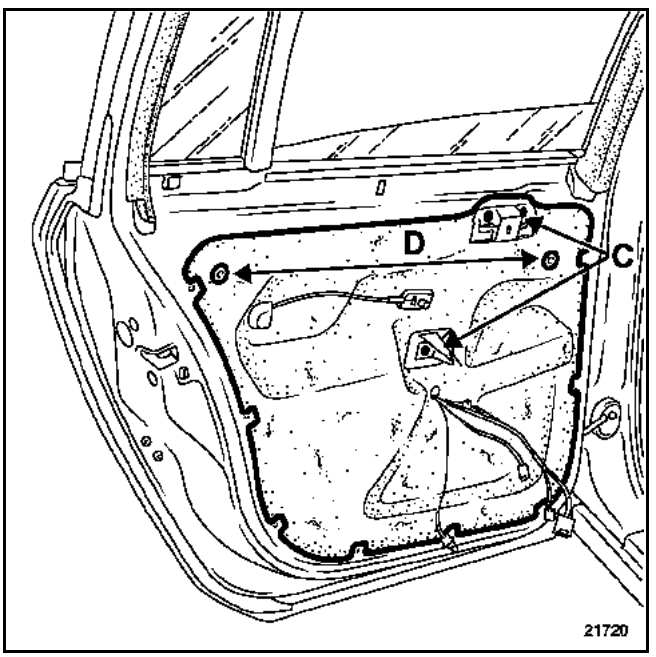


Using a flat screwdriver, unclip the interior opening control cover.

Disconnect the speaker and the door light.

Remove the panel.

GETtheMANUALS.org

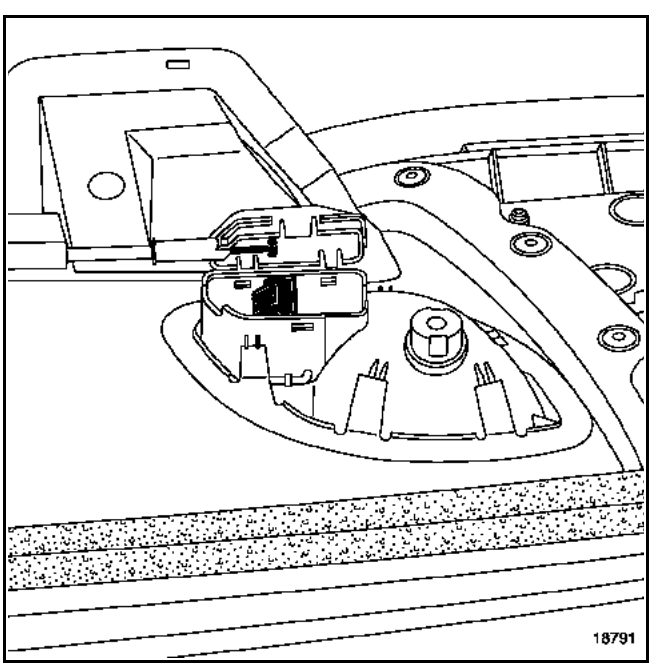


Remove:
– the two brackets (C),
– the two guides (D).

Carefully peel off the sealing film.

The sealing mastic must remain stuck to the film.

REFITTING

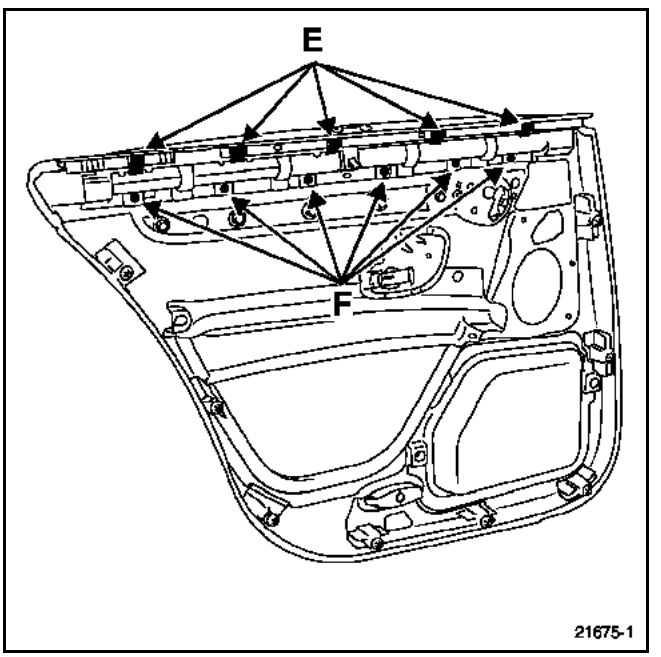


Keep the interior opening control in the closed position.

Take the cover and cable, position them and clip the assembly in place.

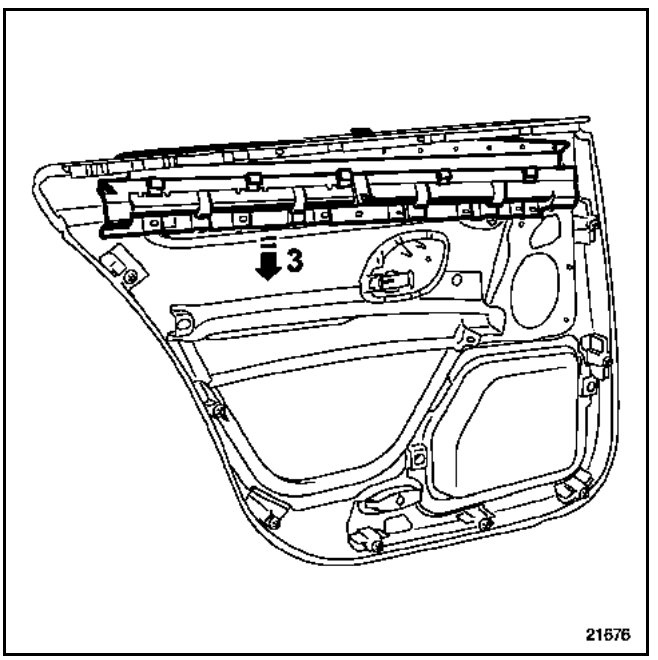
REMOVINGTHE SUN VISOR

NOTE: removing the sun visor entails the removal of the door trim.



Release:
– the five clips (E) (partially),
– the six mountings (F).

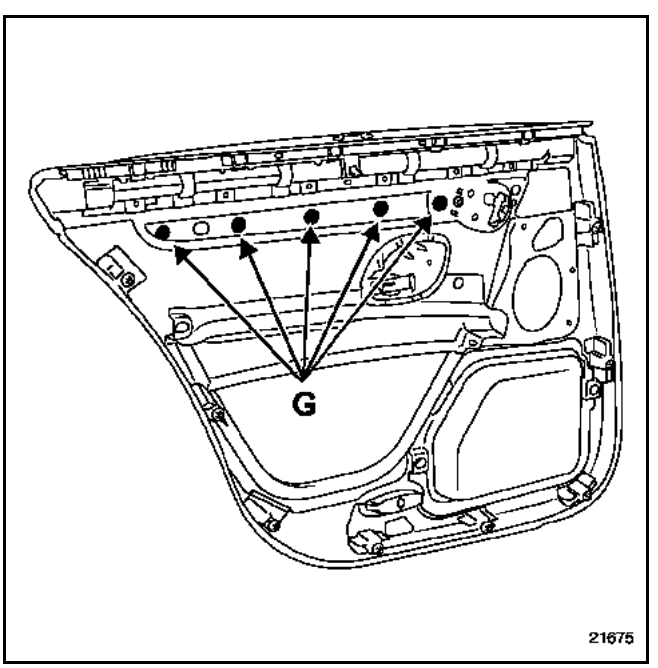
GETtheMANUALS.org



Gently pull the top of the lining away at the top.

Release the sun visor (3).

REMOVING THE LINING TRIM

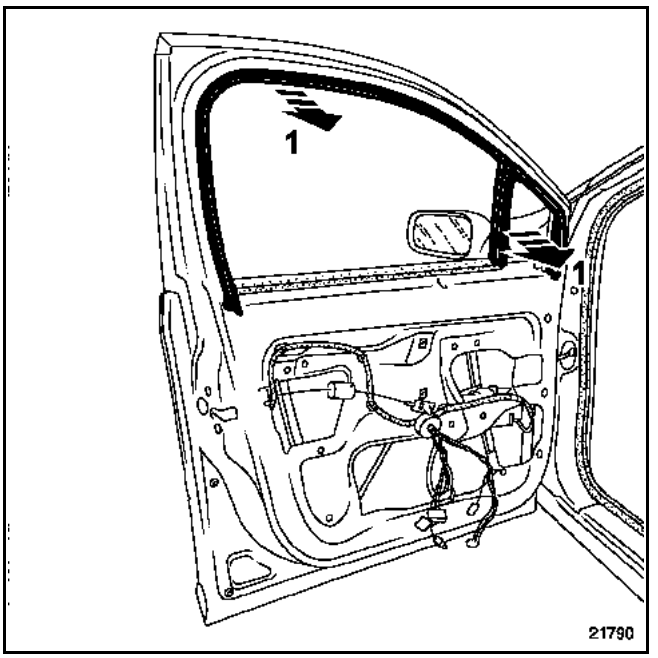


Remove mountings (G) then release the lining trim.

GETtheMANUALS.org

REMOVAL

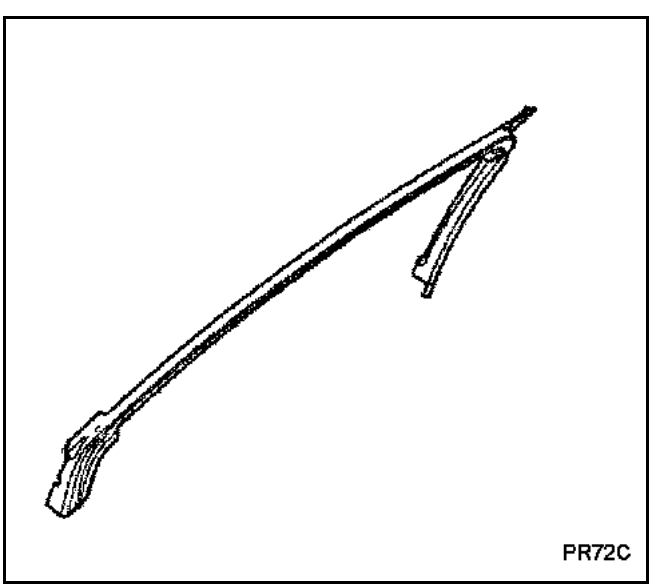
Remove the door trim (**section 72A.A**).



Remove trim (1).

REMOVING THE ADHESIVE TRIM

Remove:
– the door upright exterior embellishers (**section 56A.C**);
– the exterior frame seal (**section 65A.A**).



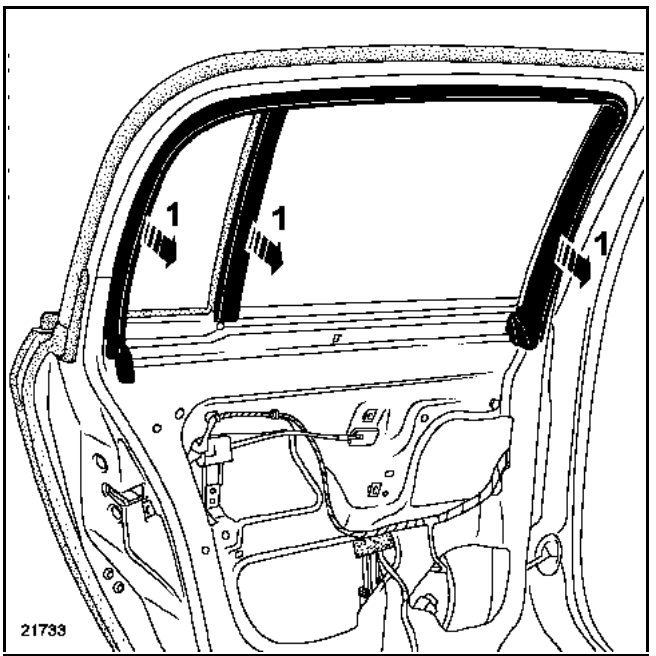
Detach the trim.

NOTE: replace the adhesive trim each time it is removed.

GETtheMANUALS.org

REMOVAL

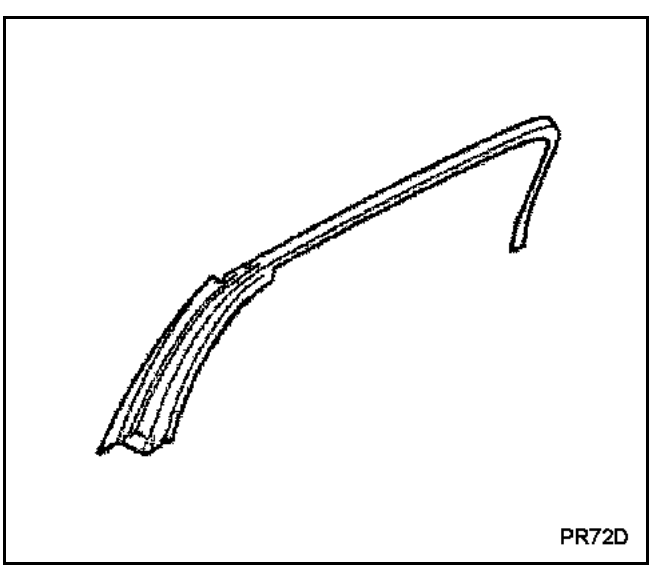
Remove the door trim (**section 72A.B**).



Remove trim (1).

REMOVING THE ADHESIVE TRIM

Remove:
– the door upright exterior embellishers (**section 56A.D**);
– the exterior frame seal (**section 65A.B**).

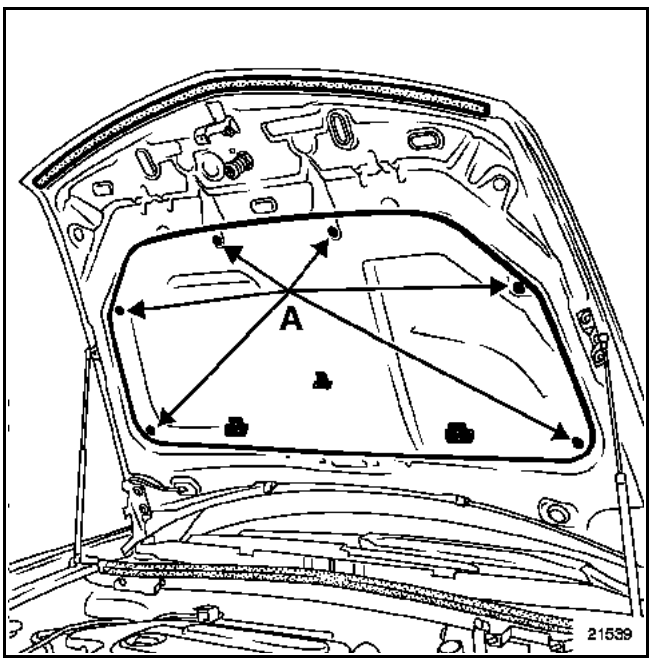


Detach the trim.

NOTE: replace the adhesive trim each time it is removed.

GETtheMANUALS.org

REMOVAL

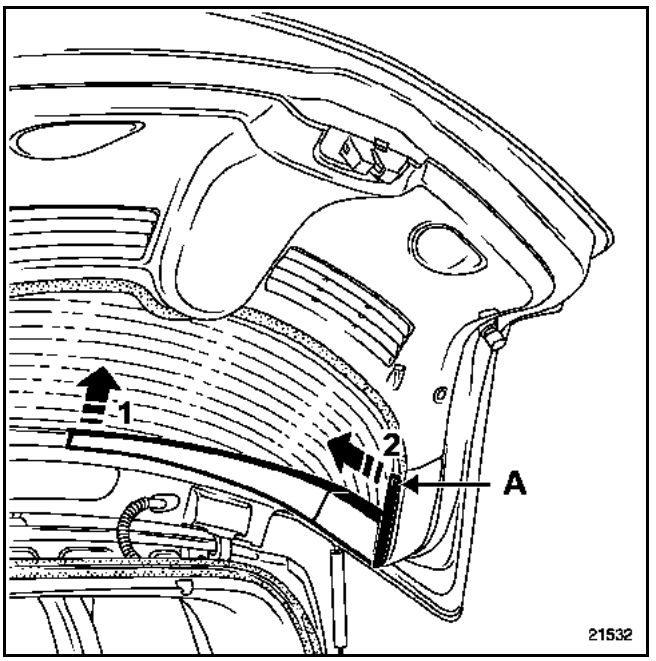


Using a pair of clip removal pliers, unclip retaining clips (A).

Remove the lining.

GETtheMANUALS.org

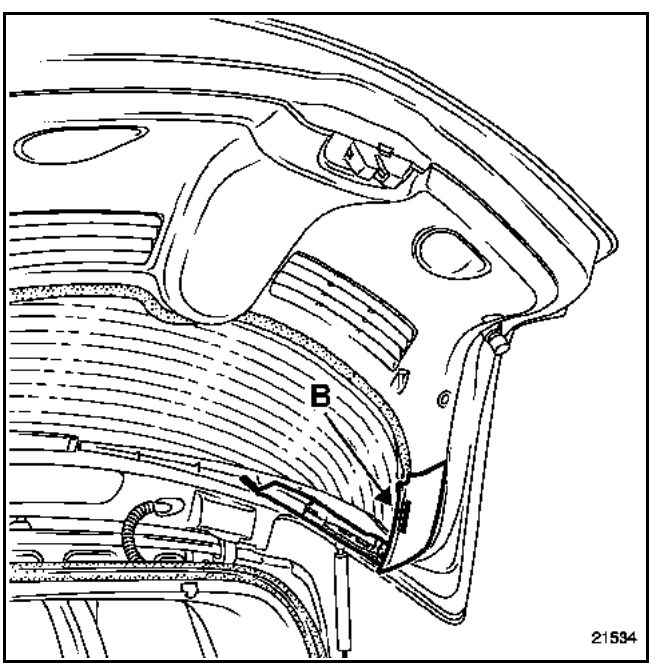
REMOVAL



Remove clip (A).

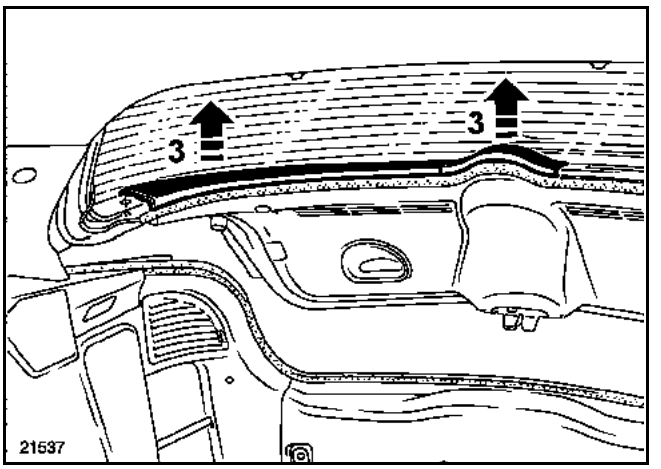
Release the right-hand section of the rear screen trim at (1) then (2).

The removal procedure for the left-hand side is the same.



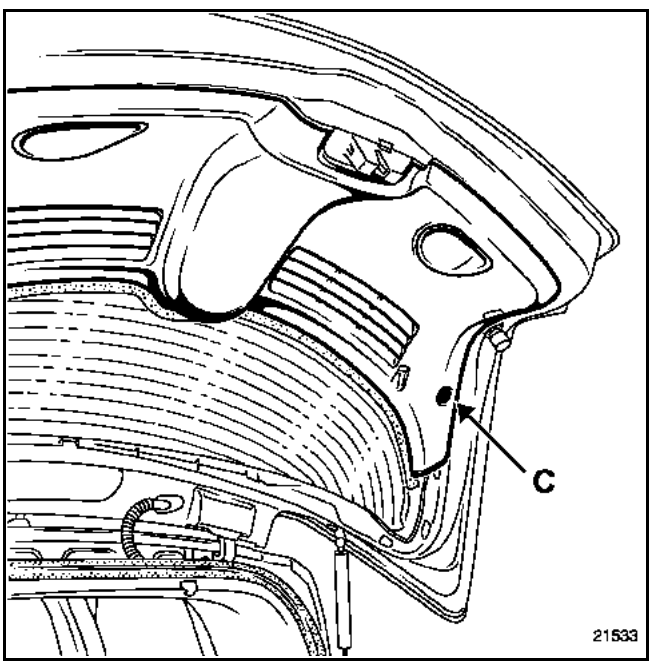
Release clip (B); remove the trim.

The removal procedure for the left-hand side is the same.



Release trim (3).

The removal procedure for the left-hand side is the same.



Release clips (C).

Remove the trim using the clip removal pliers.

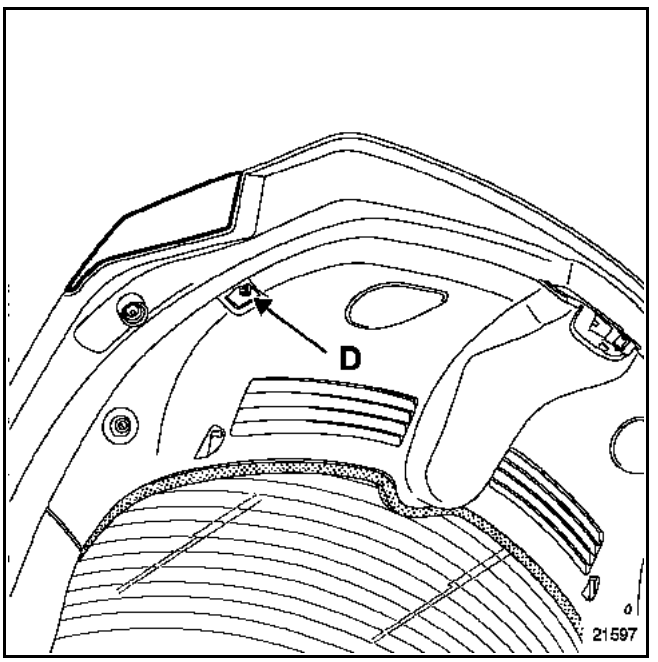
REFITTING

Before refitting the trims, check that the retaining clips are in good condition.

To refit, proceed in the reverse order to removal.

GETtheMANUALS.org

SPECIAL NOTE: for the removal of the rear lights

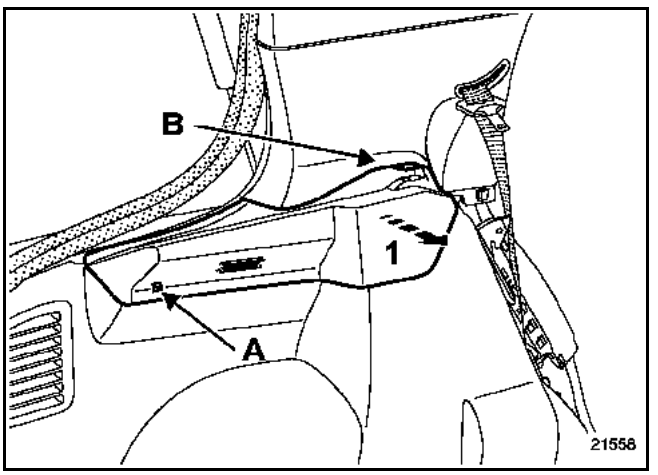


Remove the blanking cover and mounting screw (D).

Release the light and disconnect the connector.

GETtheMANUALS.org

REMOVAL



Partially remove the rear luggage compartment seal.

Fold down the rear seatback.

Remove bolt (A).

Hold rear quarter panel trim (B) in place.

Unclip parcel shelf (1).

Disconnect the boot lighting connector.

GETtheMANUALS.org

IMPORTANT: before removing the seat, lock the computer using the diagnostic tool. When this function is activated, all the ignition lines are inhibited and the air bag warning light on the instrument panel comes on.

IMPORTANT: pyrotechnic systems (air bags and pretensioners) must not be handled near to a heat source or flame - they may be triggered.

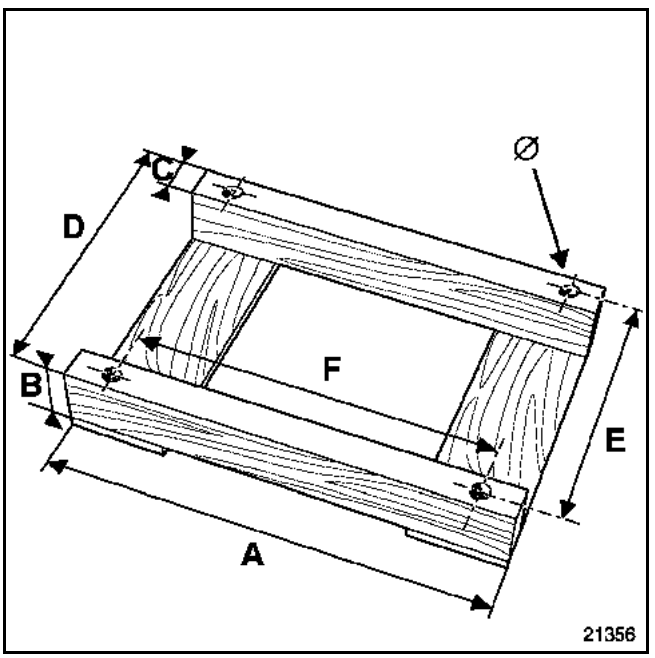
REMOVAL

Put the vehicle on a lift.

Remove the headrest (tilt the seatback slightly).

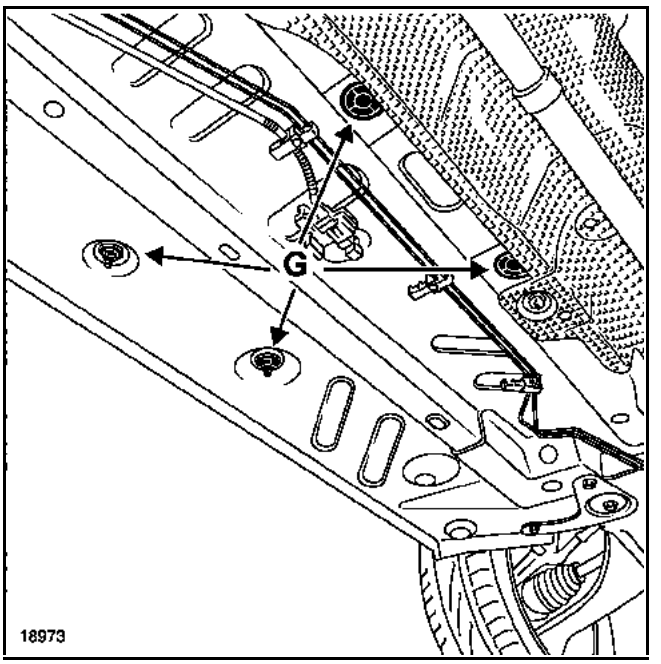
Adjust:
– the seat to the forward position,
– the seat squab to the lowest position.

Protect the lower section of the step and the carpets.



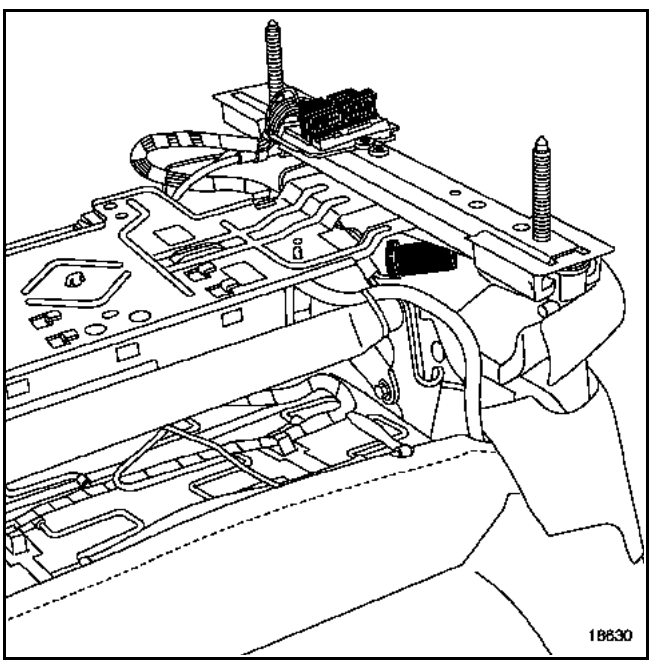
A wooden mounting manufactured in the workshop as shown in the drawing is required for storage and servicing.

A = 550 mm
B = 80 mm
C = 45 mm
D = 390 mm
E = 345 mm
F = 465 mm
∅ = 20 mm



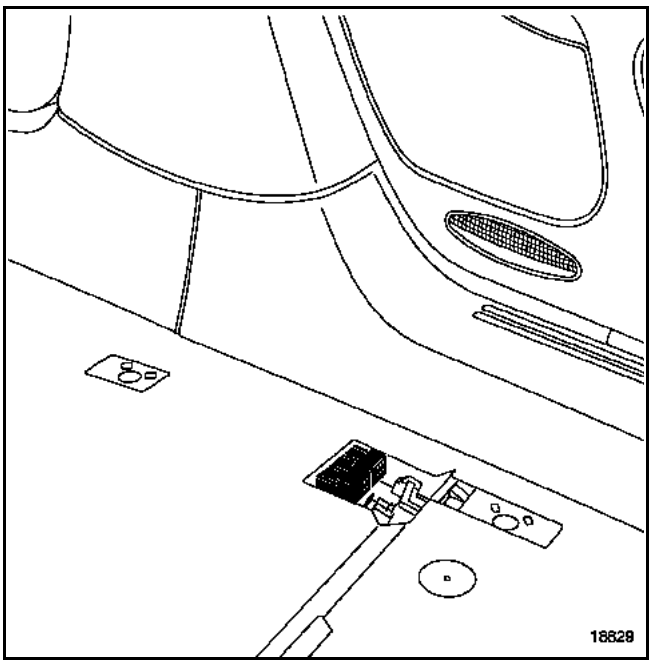
Remove:
– the two blanking covers and the four underbody mountings (G),
– the seat (requires two people).

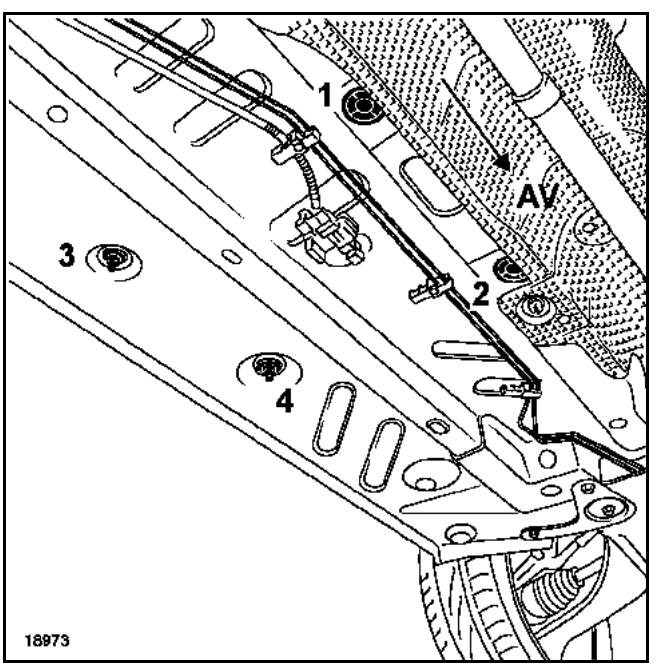
REFITTING (requires two people)



IMPORTANT: before removing the seat, visually check the condition of the connectors on the seat frame and on the body

GETtheMANUALS.org





IMPORTANT: it is crucial to respect the order of tightening of the seat.

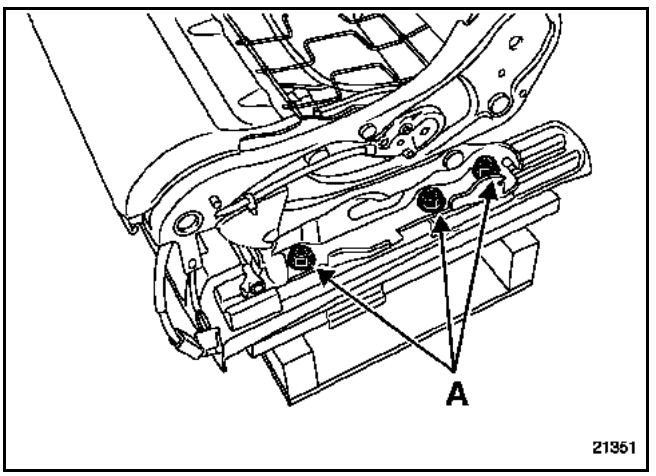
TIGHTENING TORQUE (in N.m)	▽
Front seat mounting nuts	**44**

Unlock the computer using the diagnostic tool and carry out a safety check.

GETtheMANUALS.org

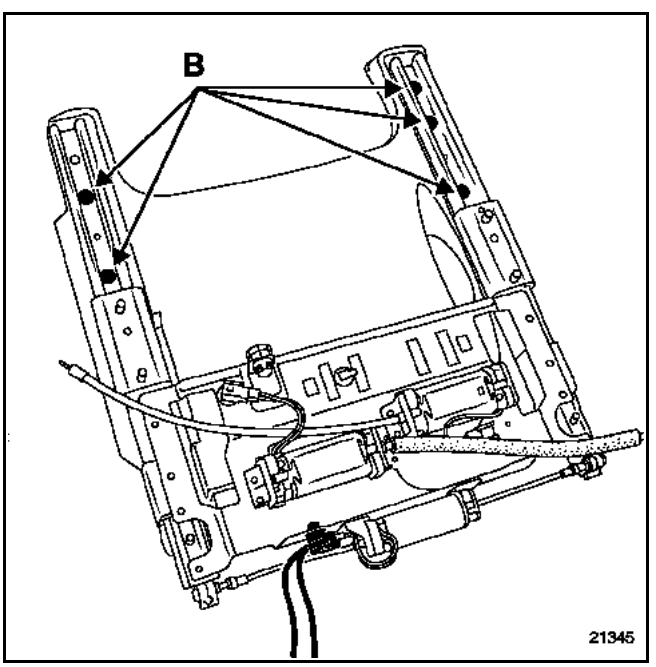
REMOVAL

Remove:
– the whole seat (**section 75A.A**) (respect the safety guidelines),
– the seatback trim (**section 77A.A**),
– the seat squab trim (**section 77A.B**),
– the wiring.

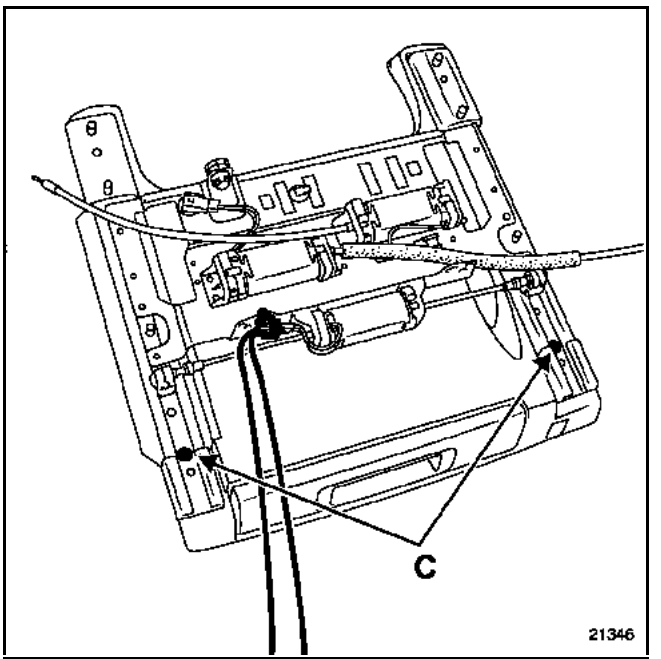


Remove bolts (A) and separate the frames from the runners.

SPECIAL FEATURE OF ELECTRIC VERSION

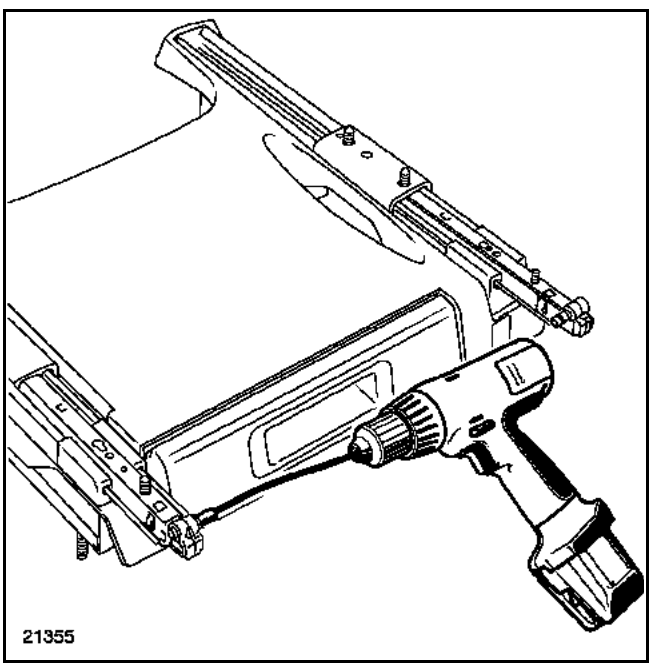


Using a battery and suitable wiring (manufactured in the workshop), activate the motor to move the plate forward and gain access to the bolts (B).



Run the motor to move back the plate and provide access to the bolts (C).

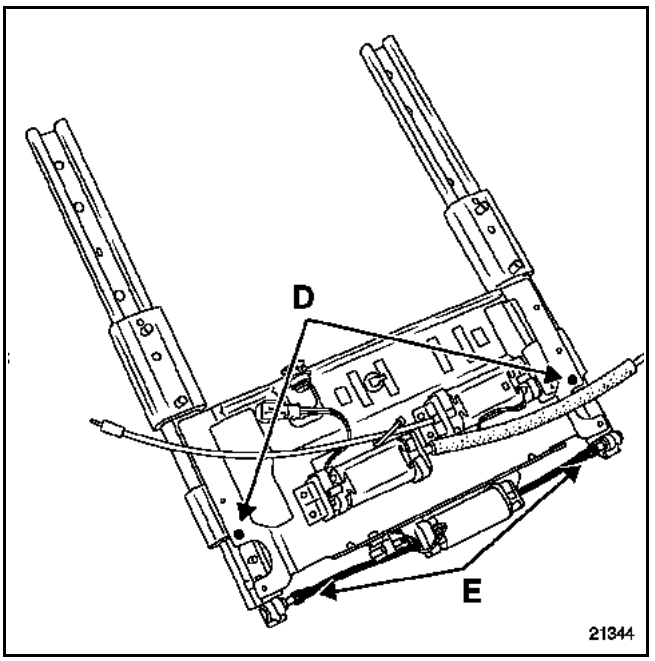
Solution when the runner motor stops working



Move the runners back or forth using a screwdriver and one of the motor cables to access the mountings.

Release the runner-plate assembly.

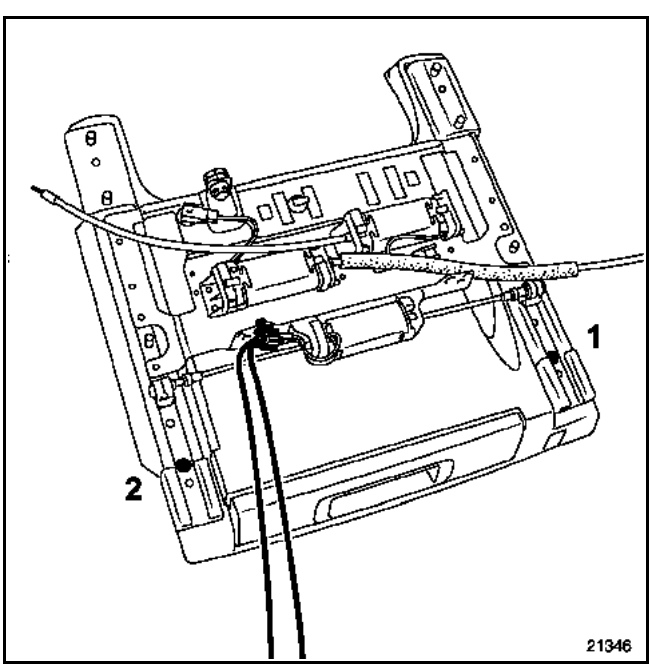
GETtheMANUALS.org



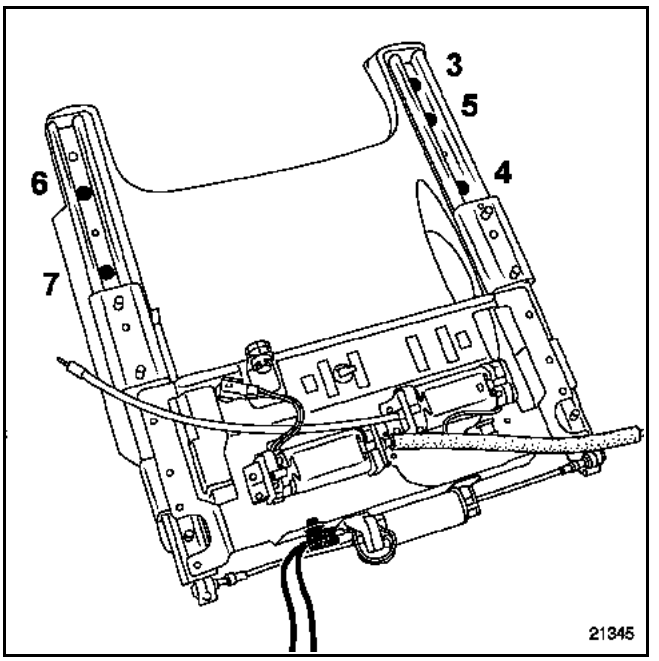
Release:
– the two rivets (D),
– the two guides (E).

REFITTING

IMPORTANT: respect the order of tightening of the runner-podium mountings.



Move the motor plate back and screw on at (1) then (2).



Pull the motor plate as far forwards as possible and follow the order of tightening.

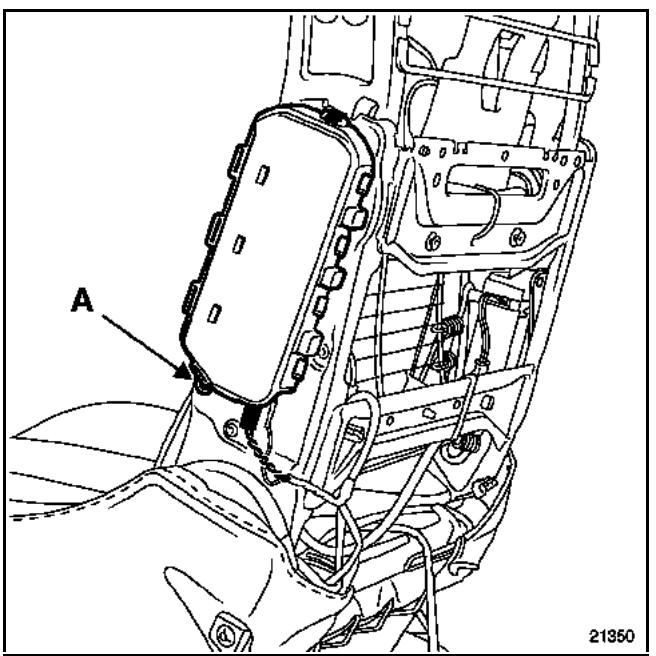
TIGHTENING TORQUES (in N.m)	
Runner-podium mounting nuts	21
Frame-runner mounting nuts	21

GETtheMANUALS.org

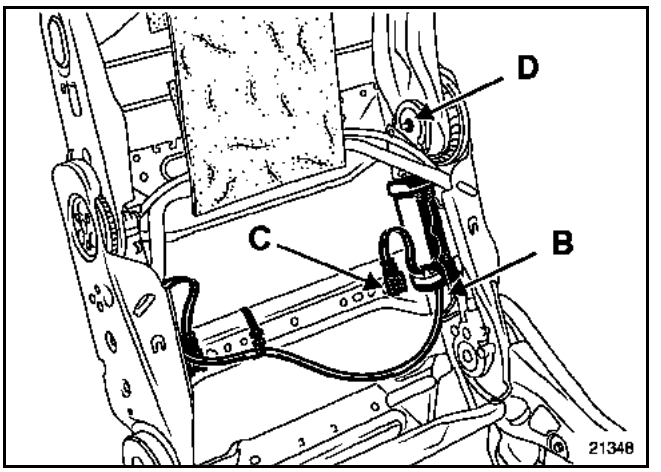
IMPORTANT: before removing the motors, it is advisable to memorize the direction of mounting to avoid reversing the order during refitting (e.g. supply outlet).

REMOVING UPPER AND LOWER SEATBACK MOTORS

Remove:
– the seat (**section 75A.A**) (respect the safety guidelines),
– the seatback trim (**section 77A.A**),

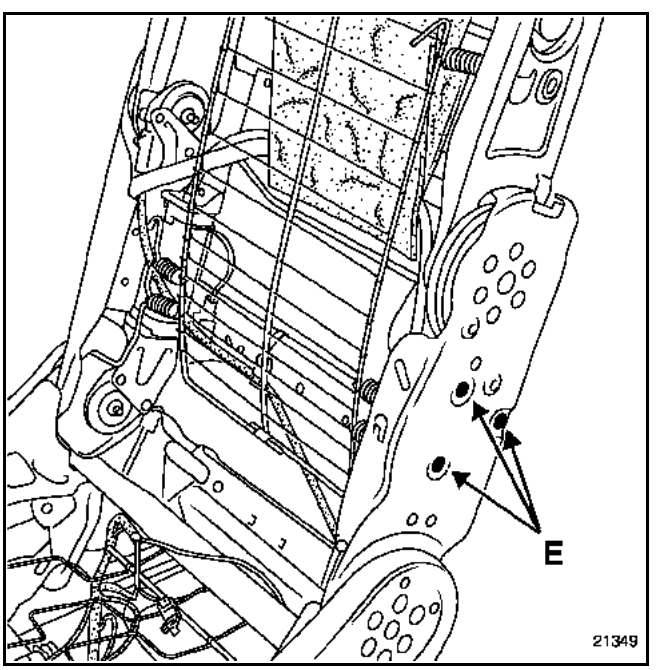


– rivet (A), then release the air bag.



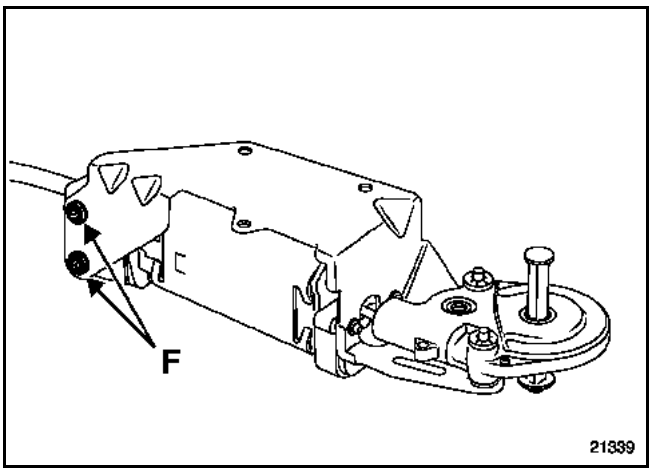
Unclip:
– cover (B),
– the clip connector (C).

Release the washer (D) and remove the axle.



Remove the three rivets (E), then gently release the motor downwards to access the two lower rivets.

GETtheMANUALS.org



Remove the rivets (F); release the motor, then release the mounting.

REFITTING

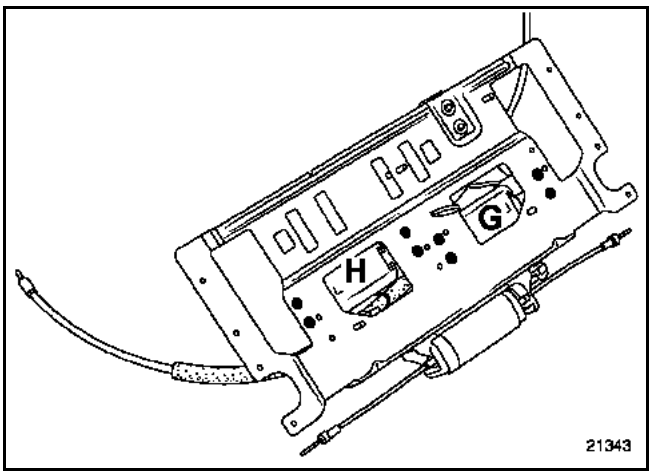
Position the mounting-gearing assembly on the frame, then refit the motor onto the mounting.

NOTE: the rivets (F) must be refitted in reverse order (head side plastic mounting).

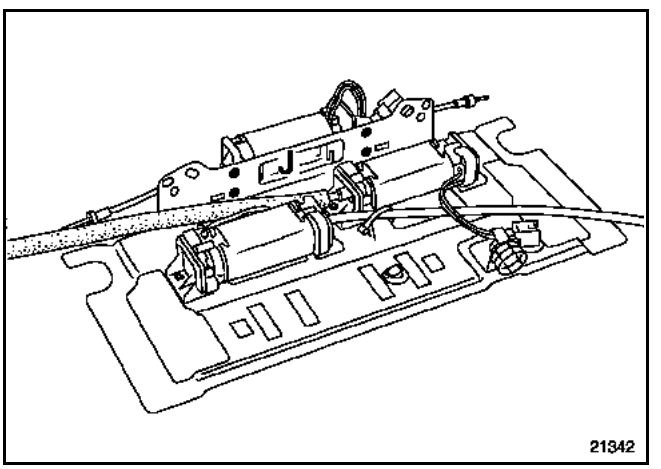
SPECIAL FEATURES OF THE PLATE MOTORS

REMOVAL

Remove:
- the seat **(section 75A.A), (respect the safety guidelines)**,
- the seatback trim (**section 77A**),
- the seat frame (**section 75A.B**),
- the two plate rivets.



- the rivets (G); release the height adjustment motor,
- the rivets (H) and remove the tilt adjustment motor,

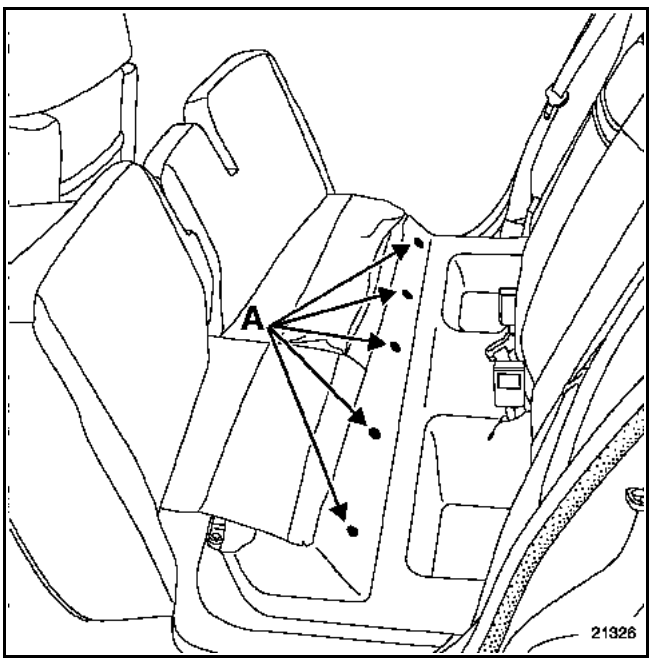


- the rivets (J); release the runner motor.

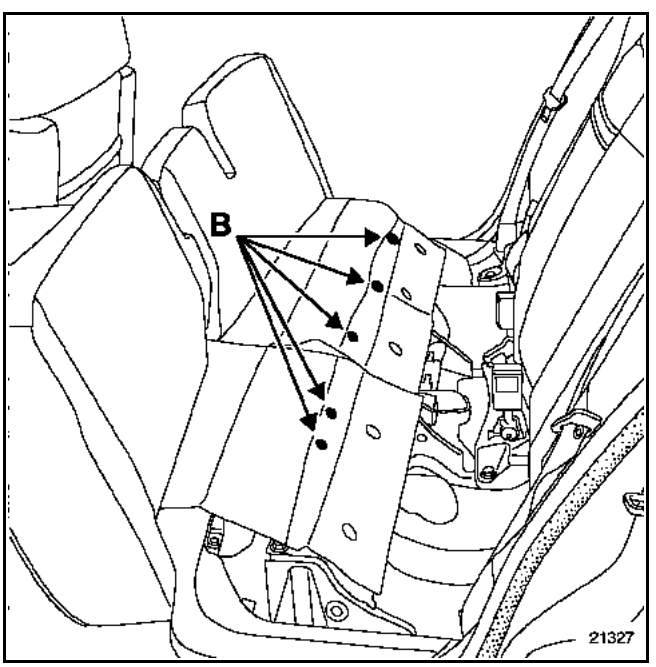
GETtheMANUALS.org

REMOVAL

Tilt the two bench seat cushions.

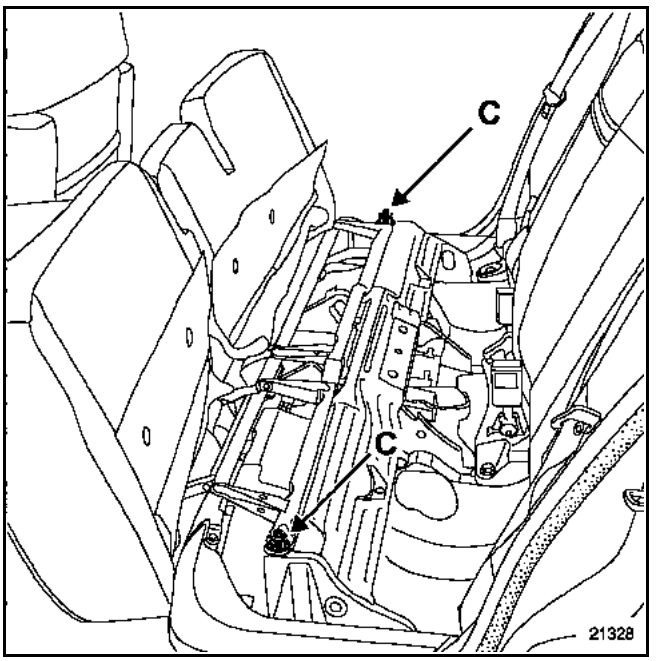


Remove the clips (A) and release the lining.



Remove the clips (B).

Partially release the lining.



Remove the bolts (C) and release the bench seat cushion (**two operators**).

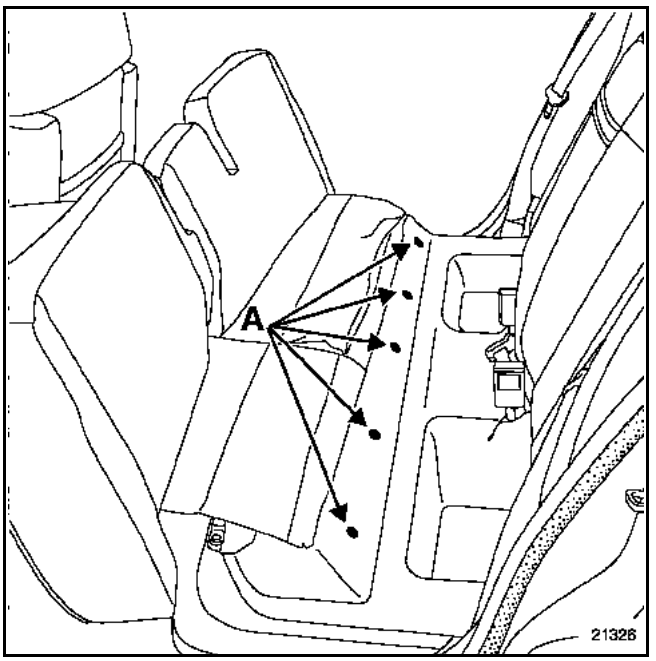
REFITTING (two people)

To refit, proceed in the reverse order of removal.

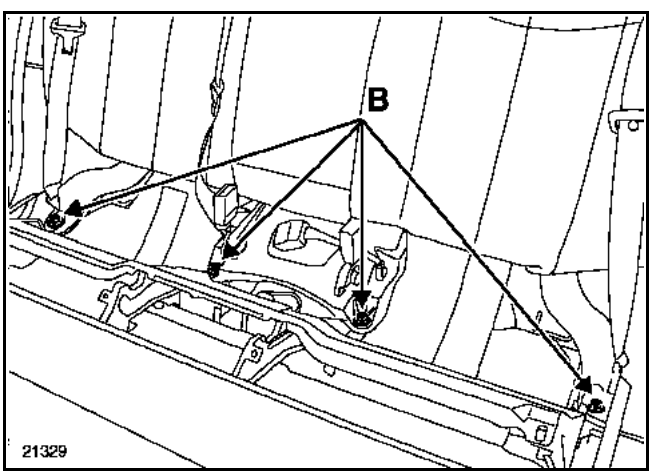
TIGHTENING TORQUE (in N.m)	
Cushion securing nuts	**44**

GETtheMANUALS.org

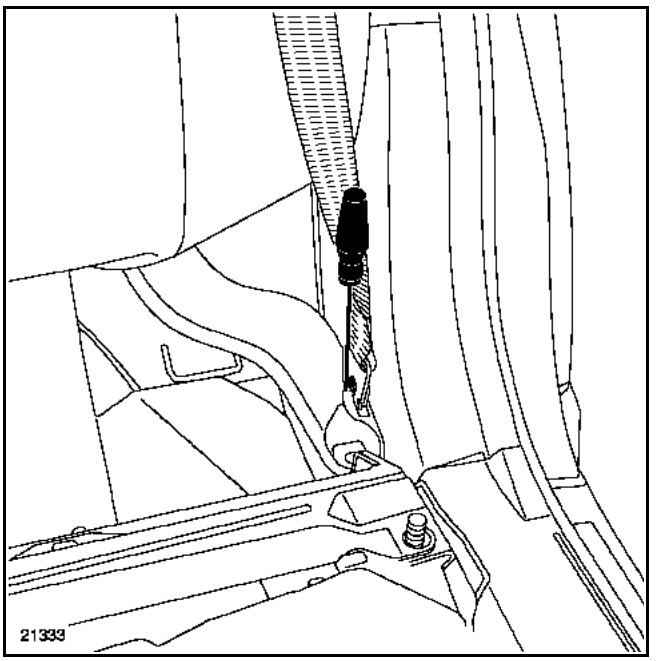
REMOVAL



Remove:
– the clips (A) and release the lining;

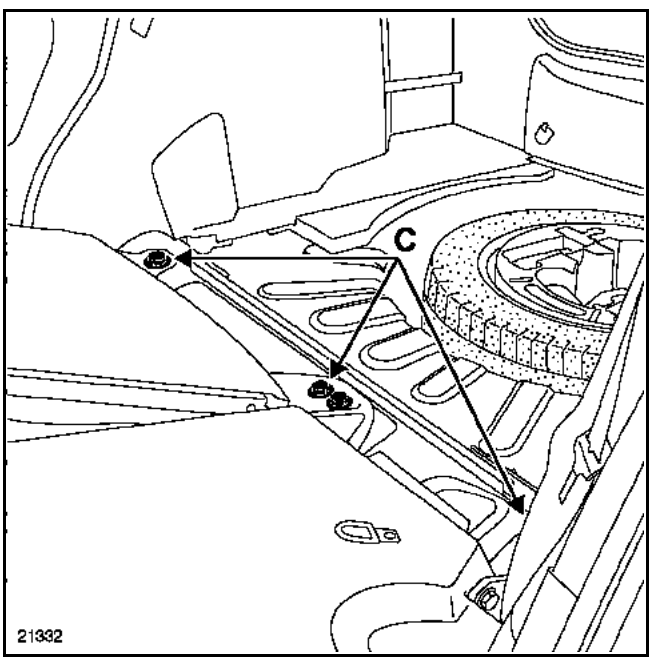


– the mountings (B).



Using a small screwdriver, unclip the seat belts.

Tilt the seatbacks and extricate the boot carpet.



Remove the mountings (C) and withdraw the seatback (**two operators**).

REFITTING (two people)

TIGHTENING TORQUE (in N.m)	
Seatback mountings	**44**

GETtheMANUALS.org

REMOVAL

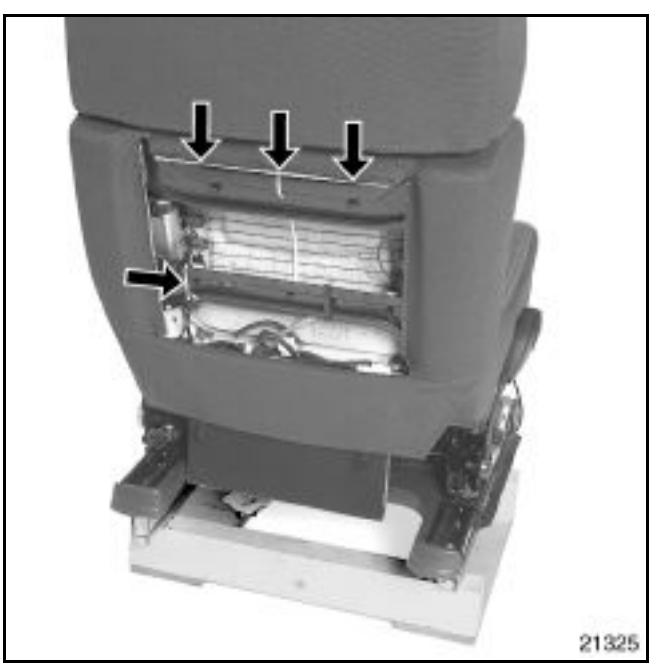
Remove:
– the seat (**section 75A.A**) (**respect the safety guidelines**),
– the lower trim (**section 79A.A**).

Unclip:
– the headrest covers,
– seatbelt cover (A),

– the upper section of the flap.

Release this upwards.

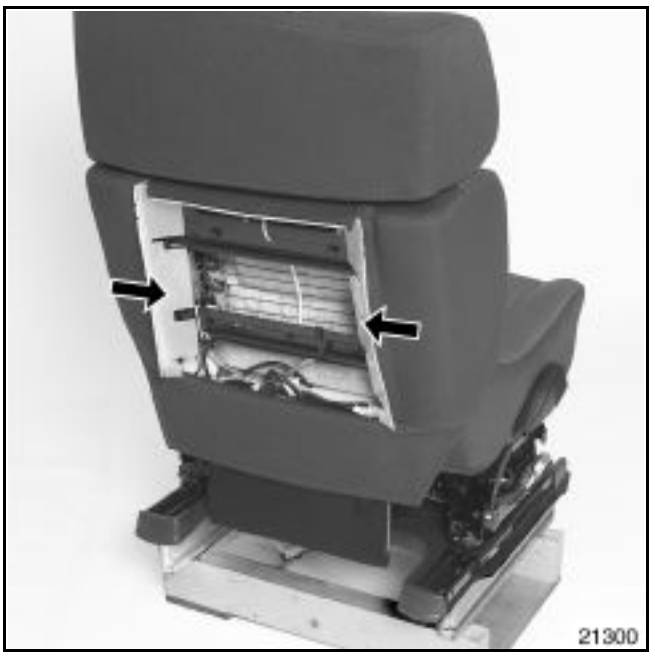
Release:
– the two lower straps,
– the cover retainer profile.



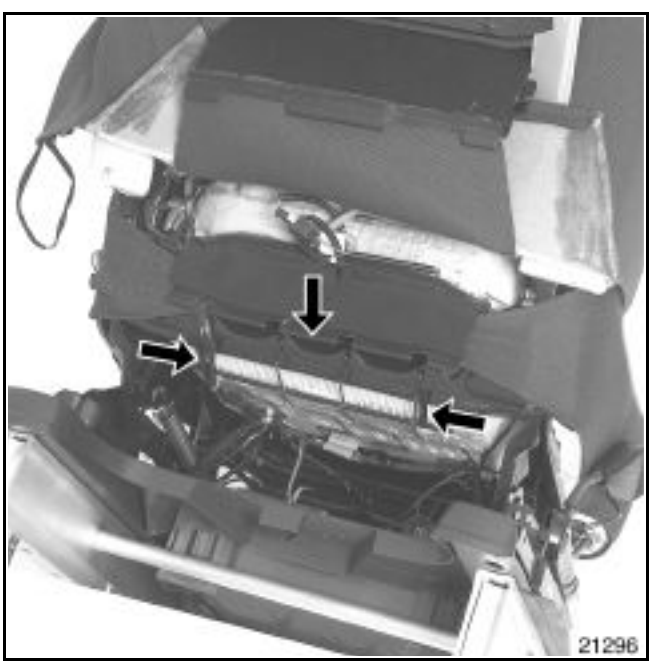
Unclip the three upper clips.

Release the hook.

GETtheMANUALS.org



Release the two side bars at the rear of the frame.



Release:
– the front retainer profile,
– the two lower straps.

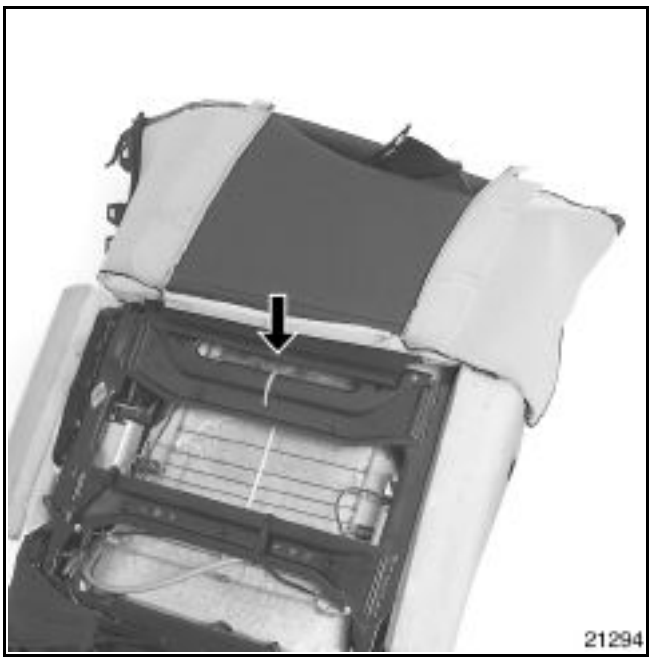
Remove the bolt and the pretensioner connector.

Release this from the seat squab trim.

Unclip the trim by the air bag.

IMPORTANT: release the foam trim, keeping hold of the velcro strips.

GETtheMANUALS.org



Release the profile and the two upper retainer straps.

Release the foam lining assembly from the upper seatback, taking care not to rip the lining around the headrest guides and seat belt retractor.

Release the foam from the lower seatback and the heating layer connector.

REFITTING

IMPORTANT: before refitting the seat trim, check that the velcro strips are securely attached to the lower seatback foam.

Position the lower seatback foam and connect the heating layer.

Turn the trim over and place it on the upper seatback foam, position the foam trim assembly on the frame making sure to thread the seat belt through its hole.

TIGHTENING TORQUE (in Nm)	
Seat belt pretensioner	**21**

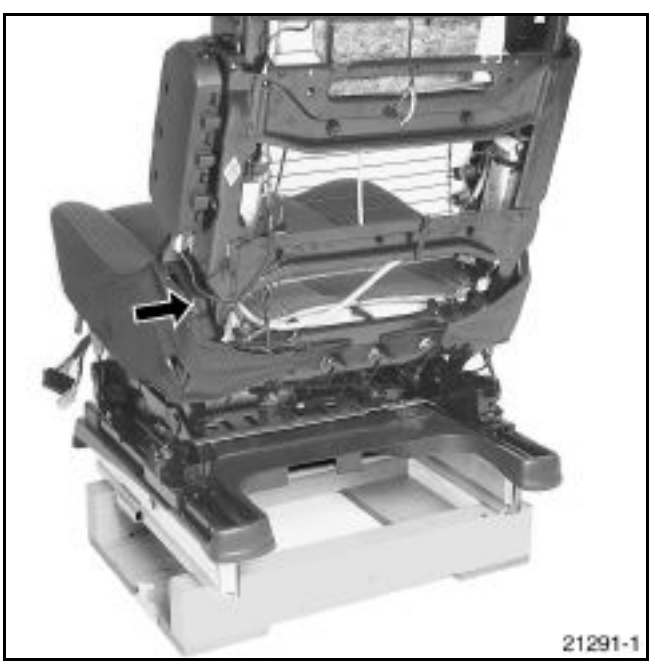
GETtheMANUALS.org

REMOVAL

NOTE: to remove the seat squab trim, the seatback trim must be partially removed.

Remove:
– the seat (**section 75A.A**) (respect the safety guidelines),
– the lower trim (**section 79A.A**),
– the lower seatback trim (**section 77A.A**),
– the seatbelt pretensioner.

Release:
– the two lower straps,



– the side mountings.

remove the upper straps.

Gently pull the lining away.

Release:
– the side mountings,
– the front lower mounting.

Disconnect the heating layer connector.

IMPORTANT: release the foam trim, keeping hold of the velcro strips.

GETtheMANUALS.org

REFITTING

IMPORTANT: before refitting the seat squab trim to the foam, check that the velcro strips are securely attached to the lower seatback foam.

Special notes for refitting the trim to the foam

1 Align the rear section of the trim with the edge of the foam.
2 Attach the velcro side strips (rear section).
3 Fit the trim at the front and side section (keeping hold of the rear section to pull the trim taut).
4 Attach the centre velcro strip.

TIGHTENING TORQUE (in Nm)	
Seat belt pretensioner	21

ADAPTING THE PARTS STORE PART TO REPLACE THE SEAT CUSHION FOAM ON A MANUALLY-ADJUSTING SEAT

When replacing the seat cushion foam of a manually-adjusted seat, trim the foam down following the prepared markings (see illustration above).

GETtheMANUALS.org

REMOVAL

Remove the entire seat squab (**section 76A.A**).

1/3 Seat squab trim

Remove the two clips and unclip the trim.

Unzip the two zip fasteners.

Separate the foam lining from the metal frame.

IMPORTANT: when removing the foam lining, hold the velcro strips.

NOTE: to remove the 2/3 seat squab follow the same procedure for the 1/3 seat squab.

GETtheMANUALS.org

REFITTING

Notes on refitting the trim onto the foam lining

1 Line up the rear section of the trim with the edge of the foam lining.
2 Fasten the velcro side strips (rear section).
3 Cover the front and side of the lining (holding the rear section in order to stretch the trim).
4 Fasten the central velcro strip.

NOTE: the zip fasteners can be closed using the **Car. 1558 tool, (see general notes in section 05B).**

Before removing the trim, check that the velcro strips are fastened securely.

Proceed in the reverse order to removal.

GETtheMANUALS.org

REMOVAL

NOTE: to remove the 2/3 seat squab follow the same procedure for the 1/3 seat squab.

To remove the seatback see (**section 76A.B**).

Partially open the 1/3 trim zip fastener.

Remove the two seatback mountings.

Separate the 1/3 seatback from the 2/3 seatback.

Remove:
– the lock cover,
– the seatback side mounting and support,
– the seatbelt mounting and catches,
– the lashing ring.

Remove the two rivets.

Remove the armrest.

Unclip the seatback unlocking button cover.

Remove the side strip mounting.

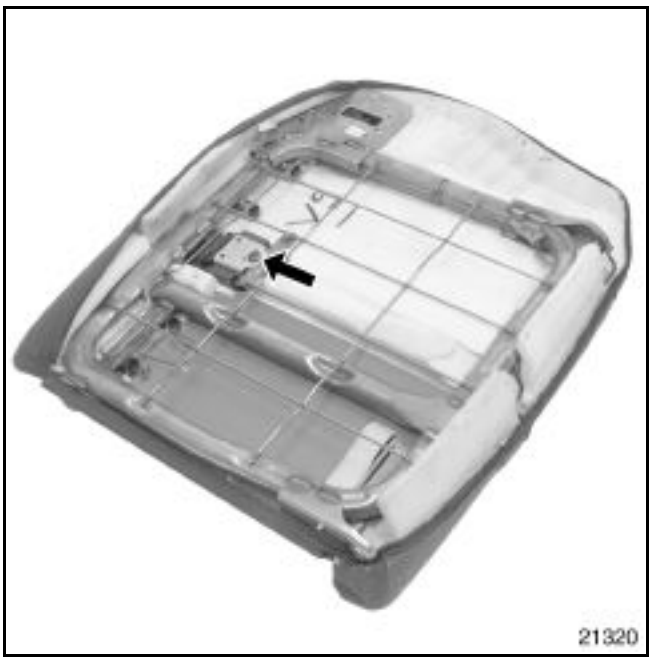
Undo the zip fastener.

Partially remove the trim.

Unclip the five clips on the retaining strip.

Unclip the head restraint guides (from the inside).

GETtheMANUALS.org



Remove the seatbelt inertia reel mounting.

Partially remove the inertia reel.

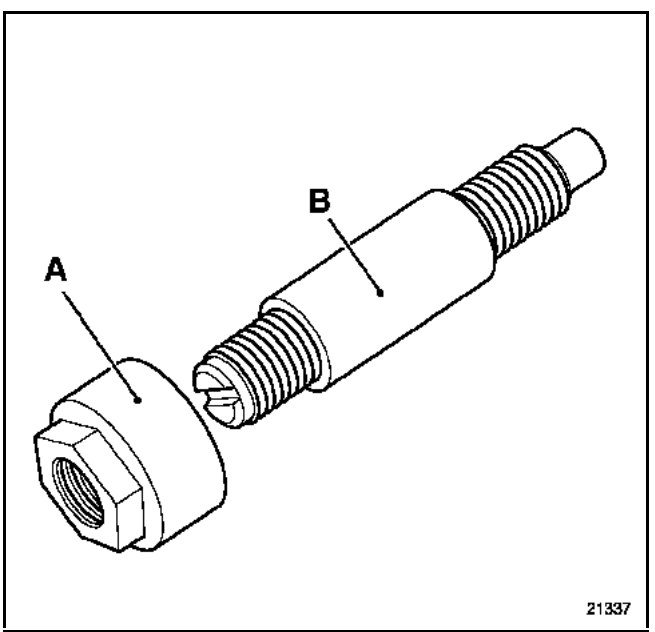
Unclip the seat belt cover (by pressing the two valve rockers on the interior of the seatback).

Remove the foam lining.

SPECIAL INSTRUCTIONS ON REFITTING

NOTE: the zip fasteners can be closed using the **(Car. 1558) tool, (see general notes in section 05B).**

IMPORTANT: close the zip fasteners before assembling the seatbacks.



Before assembling the seatbacks, unscrew nut (A) from shaft (B).

Using a flat screwdriver, position shaft (B) on the metal frame and unscrew 2/3.

Assemble the seatbacks with the central mounting.

Replace the nut.

TIGHTENING TORQUES (in Nm)	▽
Seat belt inertia reel	**21**
Seat belt catches	**21**
Seatback mounting nut	**35**

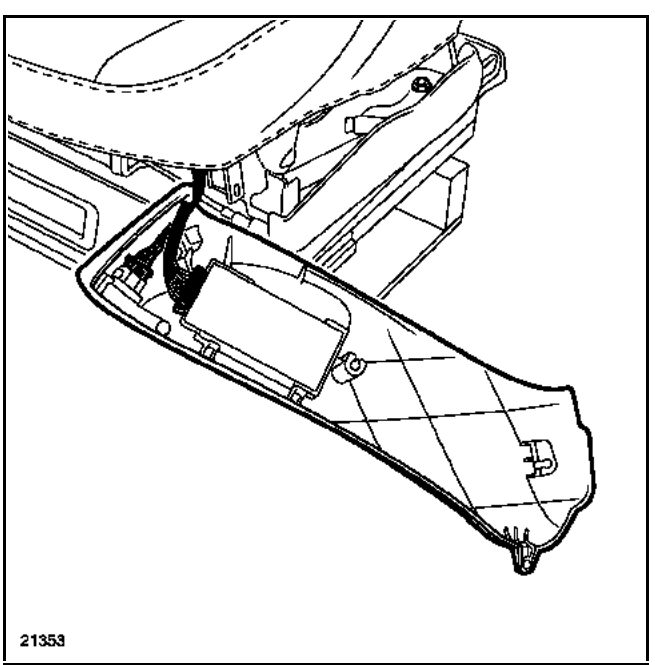
GETtheMANUALS.org

REMOVAL

NOTE: you will need a set of clips to remove the lower trim.

Remove the whole seat (**section 75A.A**) (**follow safety guidelines**).

Remove the two trim mountings, unclip the rear section of the trim and release it towards the front of the vehicle.



Release the two connectors and remove the trim.

Unclip the front section of the trim.

Release the trim towards the rear.

SPECIAL NOTE FOR MANUAL SEAT

Unclip the seat squab adjustment knob.

GETtheMANUALS.org

Remove the trim in the same way as for electric models.

Unclip the seatback adjustment motor control and remove or release the connector.

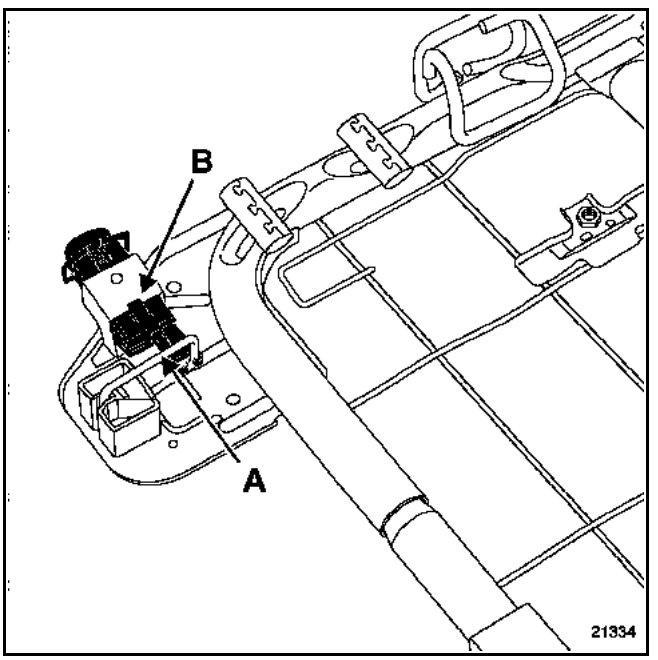
Partially release the seat squab trim.

IMPORTANT: it is essential to change the seat height adjustment mechanism when removing the pumping handle.

GETtheMANUALS.org

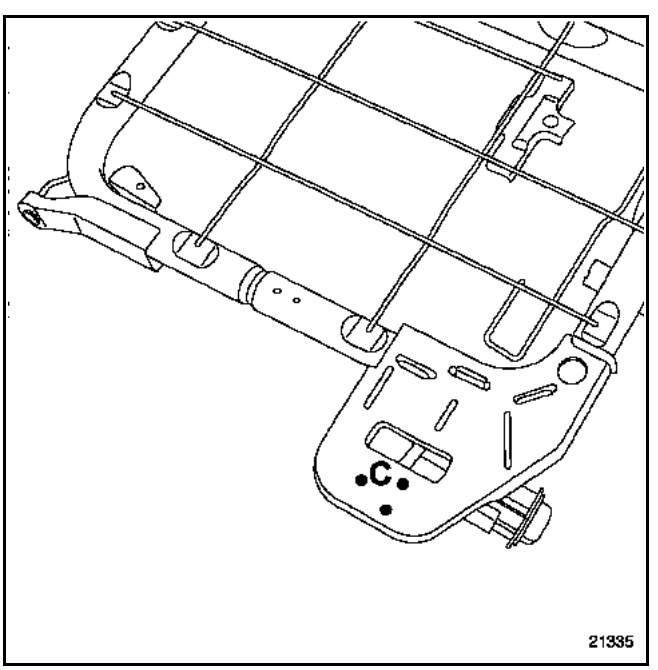
REMOVAL

Remove:
– the seatback (**section 76A**),
– the seatback trim (**section 78A.B**).



Press the unlock button.

Release:
– the locking link (A),
– the clips (B) and remove the push-button.

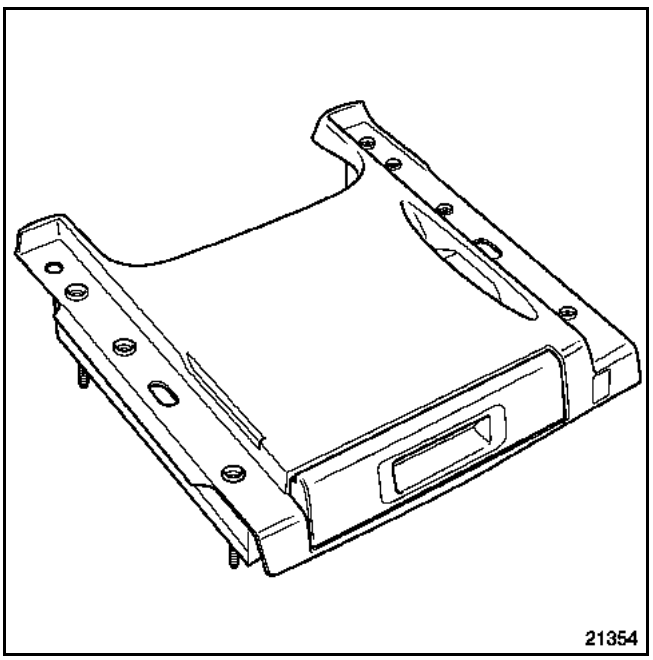


Remove the rivets (C) and the lock.

GETtheMANUALS.org

REMOVAL

Remove:
– the whole seat (**section 75A.A**) (follow the safety guidelines),
– the seatback trim (**section 77A.A**),
– the seat squab trim (**section 77A.B**),
– the runners (**section 75A.B**).



Release the storage compartment.

GETtheMANUALS.org

01E FAULT FINDING INTRODUCTION

General method	01E-1
Functions diagnosed	01E-3
New functions	01E-6

GETtheMANUALS.org

VEHICLE DESCRIPTION

Vel Satis is a fully multiplexed vehicle (with a CAN network linking the majority of the computers).

This technology makes new functions such as the keyless vehicle, the electronic stability program, the cruise control with distance limiter, etc. possible

On the other hand, it involves **significant information exchange** between the various systems.

This means that:

- ***a computer or a function (1) may fail due to a fault in another computer (2).***
- ***a short circuit in the multiplex network could paralyse all the vehicle functions.***
- ***after a repair operation, you must ensure that the system (1) is no longer faulty.***

This section describes:
- **the overall fault finding method,**
- **the functions which are diagnosed,**
- **the main new features of the vehicle.**

GETtheMANUALS.org

NOTES	Once the vehicle has been selected, the tool will only allow you to access **the multiplex network fault finding**. **Once the network diagnostic is completed, you will have access to the fault finding functions for all the vehicle systems.** **ALWAYS REPAIR NETWORK FAULTS BEFORE DIAGNOSING THE COMPUTERS**

TIP	Perform an automatic test on all the systems before selecting a particular function. When you select a system, a help box presents the computers contributing to the function.

Checking faults	Certain computers (for example, injection computers) store parameters when a fault occurs. This allows you to recreate the fault conditions.

Checking correct operation	Check the statuses, parameters and **configurations** using the associated methods.

Certain operating parameters of a system come from other computers via the multiplex network.

For example: the vehicle speed is sent by the ABS and appears in the diagnostics for the injection computers and the variable power assisted steering.

This information appears in a different colour on the diagnostic tools.

Click on this data to run the fault finding for the computer producing it.

AFTER REPAIR	Switch off the ignition, and wait **30 seconds**. Switch on the ignition again and repeat an automatic test of all the computers to ensure that there is no longer a fault.

GETtheMANUALS.org

Fault finding	Warning: if you are unable to diagnose a computer, check the connection between **track 7** of the diagnostic socket and the corresponding diagnostic track in the computer. **Track 15 of the diagnostic socket is no longer used.** Also check the computer supply and conformity.
Parking aid	This is a system which emits an acoustic signal the frequency of which varies as the vehicle approaches an obstacle to its rear. The computer which carries out this function is not on the multiplex network.
Air bag and Pretensioners	Computer present on the multiplex network.
ABS	This function manages both traction control and the electronic stability program (ESP) This computer is present on the multiplex network.
Immobiliser	This function is provided directly by the UCH, the electric steering column lock and the card reader. **Warning:** a fault in this system may make it **impossible to switch on the ignition. This function also includes keyless starting of the vehicle and writing to the RENAULT Card.**
Passenger compartment connection unit	This is the UCH. Fault finding on this computer comprises several diagnostic functions (management of the doors, tyres, engine immobiliser, etc.). This function also includes fault finding on the **wipers and lighting.** This computer is also on the multiplex network.

GETtheMANUALS.org

Automatic transmission	This computer is present on the multiplex network.
Heater	This is a system providing additional heating. It is separate from the air conditioning system. The computer handling this operation is not on the multiplex network.
Climate control	On this vehicle, the air conditioning computer controls the compressor. This computer is present on the multiplex network.
Power assisted steering	This function is managed by the UCH.
Door management	This function is managed by the UCH. It also includes operation authorisation for the electric windows, the sunroof and storage of the driving position. It also handles locking the doors when the vehicle is moving, door locking/unlocking, and interior lighting.
LPG injection	This is handled by a dedicated computer connected to the multiplex network. Warning: there is also a petrol injection computer.

GETtheMANUALS.org

Xenon bulbs	The on-board beam correction computer is used to adjust the angle of the headlights as a function of variations in the vehicle height with respect to the front and rear axles. This computer is not on the multiplex network.
Diesel injection	This function manages the engine and the cruise control and speed limiter functions This computer is present on the multiplex network.
Petrol injection	This function manages the engine and the cruise control and speed limiter functions This computer is present on the multiplex network.
Tyres	This function is managed by the UCH. It involves management of the **tyre pressure monitor.**
Parking brake	There is no longer a handbrake. This function is electronic and manages application and release of the parking brake automatically.
Proximity control	A radar located at the front of the vehicle regulates the speed according to a reference speed and the speed of the vehicle in front.
Instrument panel	This function also controls the voice synthesiser.
WARNING	The driver's position function (seat position storage) is not diagnosed. The voice synthesiser computer is not diagnosed. However, the function is controlled by the instrument panel. The Navigation/Information system is not diagnosed but it does have a test mode which is described in the method. The electric window and sunroof functions are covered by a specific diagnostic method.

GETtheMANUALS.org

Reminder:	This section describes the main computers/systems used by the new functions.

FUNCTION	**Keyless vehicle**

Function to select on the diagnostic tool	**Immobiliser**

Computer responsible for the function	UCH (= Connection Unit) + Fuse and Relay Unit

Computer using the multiplex network

The UCH switches the ignition on and off, operates and turns off the starter motor, controls the locking/unlocking of the steering column, and together with the injection computer, controls immobilisation.
It performs all these operations using **information sent by other computers.**

Computer participating in the function	Petrol or diesel injection

Computer using the multiplex network

– manages the functioning of the engine,
– informs the UCH when diesel preheating has finished,
(the UCH does not authorise starting until preheating has finished),
– informs the UCH of the status of the engine,
(the UCH cuts out the starter when the engine is declared running)
– manages, with the UCH, the coded immobiliser.

Computer participating in the function	Automatic transmission

Computer using the multiplex network

This computer transmits the position of the gear lever.
(the UCH only authorises engine startup in Park or Neutral)

GETtheMANUALS.org

Computer participating in the function	Electric steering column lock. **Computer using the multiplex network**

Its fault finding is also performed by the tool's immobiliser function.

The UCH sends it the locking and unlocking commands via the multiplex network **and** via a dedicated link (supplied by the OFF position of the + contact relay).

The lock may refuse to lock itself, for example if it receives a non-zero vehicle speed or if an air bag problem is detected.

Computer participating in the function	Access card reader

This computer:
- acts as a switch for the card at the half-way and fully-inserted positions,
- carries out the RENAULT Card authentication functions,
- acts as a radiofrequency receiver/transmitter,
- recharges the hands-free RENAULT Card,
- writes the vehicle data to the RENAULT Card,
- locks the card when the engine is running.

For all these actions, the reader obeys the requests made by the UCH.
They communicate via two dedicated connections.

Computer participating in the function	ABS

This computer sends the vehicle speed to the UCH to prevent the engine being shut down while the vehicle is moving
(a short press on the engine stop/start button does not stop the engine when the vehicle is in motion).

GETtheMANUALS.org

FUNCTION	**The Tyre Pressure Monitor**

Function to select on the diagnostic tool	**Tyres**

Computer responsible for the function	Tyre pressure monitoring computer.	**Computer using the multiplex network**

It stores the identification numbers of the valves and their positions on the vehicle, and receives the information sent by the radio receiver.
Warning: there is a receiver for the valves (underneath the vehicle body) and a receiver in the card reader for RENAULT Cards.

Computer participating in the function	UCH	**Computer using the multiplex network**

It informs the instrument panel of the presence of the tyre pressure monitor function.
Fault finding for this UCH function is included in the tyres section.

Computer participating in the function	Instrument panel.	**Computer using the multiplex network**

This displays the pressure of each tyre, among other statuses.

GETtheMANUALS.org

FUNCTION	**Electronic stability program**

Function to select on the diagnostic tool	**ABS, traction control and electronic stability program**

Computer responsible for the function	ABS — **Computer using the multiplex network**

It measures vehicle performance and controls braking and engine torque to correct skidding.

Computer participating in the function	Petrol or diesel injection — **Computer using the multiplex network**

It measures engine torque and sends it to the ABS.
It processes the torque values received from the ABS.

GETtheMANUALS.org

FUNCTION	**The automatic parking brake**

Function to select on the diagnostic tool	**Parking brake**

Computer responsible for the function	Automatic parking brake	**Computer using the multiplex network**

This computer applies and releases the brake according to the position of the driver's control, the incline, the status of the engine, etc.

Computer participating in the function	Petrol or diesel injection	**Computer using the multiplex network**

The injection sends the engine torque.

Computer participating in the function	Automatic transmission or UCH.	**Computer using the multiplex network**

These two computers send the gear engaged signal.

GETtheMANUALS.org

FUNCTION	**Cruise control and distance regulation**

Function to select on the diagnostic tool	**Proximity control**

Computer responsible for the function	Radar — **Computer using the multiplex network**

It measures the speed of the obstacle and adapts the vehicle speed according to the user's instructions.

Computer participating in the function	Petrol or diesel injection — **Computer using the multiplex network**

The injection:
– measures engine torque and sends it to the radar,
– processes the torque values received from the radar,
– also sends the status of the speed regulation controls.
It should be remembered that if the distance regulation function is carried out by the radar, the injection will still carry out the cruise control function.

Computer participating in the function	ABS — **Computer using the multiplex network**

The ABS:
– measures the speed of the vehicle and sends it to the radar,
– processes the braking instructions from the radar.

GETtheMANUALS.org

FUNCTION	**On-Board Diagnostics (emission control)**

Function to select on the diagnostic tool	**Petrol or diesel injection**

Computer responsible for the function	Injection	**Computer using the multiplex network**

The On-Board Diagnostic function is shared by the injection computer and the automatic gearbox computer.
The injection computer decides the emission control diagnostic to be sent to the diagnostic tool.
The emission control faults associated with the automatic gearbox are also accessible to the injection computer.

Computer participating in the function	Automatic gearbox	**Computer using the multiplex network**

This computer can request illumination of the emission control warning light.

GETtheMANUALS.org

FUNCTION	**Air conditioning**

Function to select on the diagnostic tool	**Climate control**

Computer responsible for the function	Climate control	**Computer using the multiplex network**

Climate control:
– controls the climate control compressor,
– processes all the sensor outputs except the engine coolant temperature and the external air temperature.

Computer participating in the function	Petrol or diesel injection	**Computer using the multiplex network**

The injection:
– authorises or inhibits the climate control,
– processes requests for set-point values for the idle speed and startup of the engine cooling fan.

Computer participating in the function	UCH	**Computer using the multiplex network**

The UCH sends the exterior air temperature received
from the radio display or the Central Communication Unit to the air conditioning unit.

GETtheMANUALS.org

FUNCTION	**The voice synthesiser**

Function to select on the diagnostic tool	**Not diagnosed**

Computer responsible for the function	Voice synthesiser	**Computer using the multiplex network**

The voice synthesiser:
– sends messages in the language and at the volume requested via the **instrument panel**,
– mutes the radio while a message is being spoken.
There is no diagnosis of this computer. But the instrument panel must be diagnosed.
Customer complaints are dealt with in the instrument panel section.

Computer participating in the function	Instrument panel	**Computer using the multiplex network**

The instrument panel:
– receives and processes all the fault messages (mainly via the multiplex network).
– processes driver commands (Mute and Repeat).
– sends message requests to the voice synthesiser.
This computer is diagnosed.

GETtheMANUALS.org

FUNCTION	**Storage of the driving position: driver's seat and rear-view mirrors**

Function to select on the diagnostic tool	**Not diagnosed**

Computer responsible for the function	Driver's seat computer for the seat, Front window riser computers for the door mirrors.

The **driver's seat position memory computer** is more or less the same as that in earlier models.
The only difference is that buttons 1, 2 and 3 are no longer present, but the UCH sends the RENAULT Card number via a dedicated link. A position can therefore be stored for each RENAULT Card for the vehicle.

The **front electric window computers** also manage storage of the rear-view mirror positions.

Warning: there are therefore three types of electric window: the simple electric window, the one-touch anti-pinch window **and** the one touch, anti-pinch window which stores the position of the door mirrors.

The two electric window computers in question communicate with each other via a dedicated multiplexed network, which carries the commands for the door mirrors and the electric windows on the driver's door, the RENAULT Card number etc.

Computer participating in the function	The UCH

Computer using the multiplex network

This computer processes the door switches and the switch-on commands.
It is therefore this computer which authorises the operation of the one-touch and the stored position window-risers (via two dedicated links).

It also sends the number of the customer's RENAULT Card.

Fault finding for these links is implemented in the "Management of opening elements and access" function.

AUTOMATIC GEARBOX
Fault finding - Introduction

GETtheMANUALS.org

This document presents the fault finding strategy applicable to all SU1 2001 AUTOMATIC GEARBOX computers - with VDIAG 08 fitted to Vel Satis.

In order to implement fault finding on this system, it is essential to have the following items available:
- **the wiring diagram of the function for the vehicle concerned,**
- **the tools listed in the Special tooling required section.**

GENERAL APPROACH TO FAULT FINDING:

- **Use one of the diagnostic tools to identify the system fitted to the vehicle (to read the computer group, the program number, the Vdiag, etc.).**

- **Locate the Fault finding documents corresponding to the system identified.**

- **Include information contained in the introductory sections.**

- **Read the faults stored in the computer memory and use the Fault interpretation section of the documents. REMINDER: each fault is interpreted for a given type of storage (fault present, fault stored, fault present or stored). The specified checks for dealing with each fault are therefore only to be performed if the fault declared by the diagnostic tool can be identified in the document by its type. The way in which the fault is stored should be considered when using the diagnostic tool after switching the ignition off and on again. If a fault is interpreted when it is declared as stored, the application conditions for the fault finding procedure appear in the Notes box. When these conditions are not satisfied, use the fault finding procedure to check the circuit of the faulty part, since the fault is no longer present on the vehicle. Perform the same operation when a fault is declared as stored by the diagnostic tool but is only interpreted in the documentation as a present fault.**

- **Carry out the conformity check (appearance of possible faults not yet identified by the system's self diagnosis procedure) and implement the relevant fault finding strategies according to the results.**

- **Confirm repair (disappearance of the fault reported by the customer).**

- **Use the fault finding strategies for the Customer complaint if the problem persists.**

Special tooling required for operations on the SU1 2001 automatic gearbox:

- Diagnostic tools (except XR25),
- Multimeter.

GETtheMANUALS.org

DF002 PRESENT	COMPUTER 1.DEF : Internal electronic fault.

NOTES	**Special notes:** make sure that the fault does not appear after the computer has been reprogrammed. If this occurs, carry out the procedure again very carefully.

Replace the automatic gearbox computer if the fault appears during normal use or persists after several reprogramming attempts.

AFTER REPAIR	Clear the computer memories and switch off the ignition. Now road test the vehicle to initialise the auto-adaptatives. Check again using the diagnostic tool.

GETtheMANUALS.org

DF019 STORED	GEARBOX OUTPUT SPEED SENSOR CIRCUIT 1.DEF : Signal absent

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: – the computer fault memory has been cleared, – the ignition has been switched off and on again, – the engine has been started for **3 minutes**. **Special notes:** road test the vehicle in Drive or Reverse if the speed is not resting at zero and faults **DF019** and **DF057** are present at the same time; refer to the information on ABS ECU (speed inconsistency with ABS).

1.DEF

Check the connections on the computer and the speed sensor **2-track** connector.
Ensure the continuity, insulation and absence of interference resistance between:

Computer connector track 22 → **Track 2 of the speed sensor connector**

Computer connector track 37 → **Track 1 of the speed sensor connector**

If the fault persists after these checks, replace the vehicle speed sensor.

AFTER REPAIR	Clear the computer memories, switch off the ignition, then carry out a road test. Check again using the diagnostic tool.

GETtheMANUALS.org

DF023 STORED	GEARBOX OIL TEMPERATURE SENSOR CIRCUIT 1.DEF : Consistency CC.0 : Short circuit to earth CO.1 : Open or short circuit to + 12 V

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: – the computer fault memory has been cleared, – the ignition has been switched off and on again, – the engine has been started and left running for **15 minutes**.

CC.O	***NOTES***	None.

Check the connections on the computer and the connector.
Ensure **the continuity and insulation** from earth and **+ 12 V** of the connections between:

Computer connector track 10 → **Track 1 of the 8-track gearbox connector**
Computer connector track 24 → **Track 5 of the 8-track gearbox connector**

Replace the wiring if necessary.

AFTER REPAIR	Clear the computer memories, switch off the ignition, then carry out a road test. Check again using the diagnostic tool.

GETtheMANUALS.org

DF023 **CONTINUED 1**	

CO.1	***NOTES***	The value **80 ˚C** given by **PR004** is a safety value and not representative of the sensor signal when the fault is present.

Check the connections on the computer and the connector.
Ensure **the continuity and insulation** from earth and **+ 12 V** of the connections between:

Computer connector track 10 → **Track 1 of the 8-track gearbox connector**
Computer connector track 24 → **Track 5 of the 8-track gearbox connector**

Replace the wiring if necessary.

Switch off the ignition, disconnect the **8-track** connector on the automatic gearbox and measure the oil temperature sensor resistance between **tracks 1 and 5** on the sensor side.

If the resistance measured is not approximately:

- **111 ± 6 Ω at 145°C**
- **247 ± 16 Ω at 110°C**
- **6.445 ± 0.645 KΩ at 10°C**
- **44 ± 6 KΩ at - 30°C**

Replace the gearbox oil temperature sensor.

If the sensor resistance is correct, repair or replace the wiring concerned.

AFTER REPAIR	Clear the computer memories, switch off the ignition, then carry out a road test. Check again using the diagnostic tool.

GETtheMANUALS.org

DF023 **CONTINUED 2**	

1.DEF	***NOTES***	The value **80˚C** given by **PR004** is a safety value. Do not take this into account when estimating the oil temperature.

Switch off the ignition, disconnect the **8-track** connector on the automatic gearbox and measure the oil temperature sensor resistance between **tracks 1 and 5** on the sensor side.

If the resistance measured is not approximately:

- **111 ± 6 Ω at 145°C**
- **247 ± 16 Ω at 110°C**
- **6.445 ± 0.645 KΩ at 10°C**
- **44 ± 6 KΩ at - 30°C**

Replace the gearbox oil temperature sensor.

AFTER REPAIR	Clear the computer memories, switch off the ignition, then carry out a road test. Check again using the diagnostic tool.

GETtheMANUALS.org

DF057 STORED	GEARBOX INPUT SPEED SENSOR CIRCUIT 1.DEF : Signal absent

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: – the computer fault memory has been cleared, – the ignition has been switched off and on again, – the engine has been started for **1 minute** in Neutral.
	Special notes: road test the vehicle in Drive or Reverse if the speed is not resting at zero and faults **DF019** and **DF057** are present at the same time; refer to the information on ABS ECU (speed inconsistency with ABS).

1.DEF

Check the connections on the computer and the speed sensor **2-track** connector.
Ensure the insulation, continuity and absence of interference resistance between:

Computer connector track 9 → **Track 2 of the speed sensor connector**
Computer connector track 23 → **Track 1 of the speed sensor connector**

If the fault persists after these checks, replace the vehicle speed sensor.

AFTER REPAIR	Clear the computer memories, switch off the ignition, then carry out a road test. Check again using the diagnostic tool.

GETtheMANUALS.org

DF084 **STORED**	MULTIPLEX NETWORK 1.DEF : Carry out the multiplex network fault finding procedure

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after the engine is started.

Apply the fault finding procedure for the multiplex network.

If the fault persists, replace the computer.

AFTER REPAIR	Clear the computer memories, switch off the ignition, then carry out a road test. Check again using the diagnostic tool.

GETtheMANUALS.org

DF085 STORED	EVS1 SEQUENCE SOLENOID VALVE CIRCUIT CC.0 : Short circuit to earth CO.1 : Open circuit or short circuit to + 12 V

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: – the computer fault memory has been cleared, – the ignition has been switched off and on again, – the engine has been started and running for **3 minutes** in Drive (all the gears must be engaged).

CO.1	***NOTES***	None

Switch off the ignition, disconnect the **8-track** connector under the automatic gearbox and **measure the resistance** of the winding of sequence solenoid valve No.1 between **earth** and **track 3** on the solenoid valve side.

If the resistance measured is not approximately **14 ± 2 Ω at 20°C**, remove the gearbox sump and take the same measurement directly from the solenoid valve. If the resistance is incorrect, replace the solenoid valve. If the resistance is correct, repair or replace the wiring in question.

Check the **continuity** of the connection between **track 2** of the computer connector and **track 3** of the **8-track** connector on the wiring harness side.

Check the **insulation** from **12 volts** of the connection between **tracks 29 and 30** of the computer connector and **track 3** of the **8-track** connector on the wiring harness side.

Repair or replace the automatic gearbox wiring concerned if a fault occurs.

Check the **continuity between earth** and **track 1** of the computer connector.

Check the connections on the automatic gearbox computer and the **8-track** connector.
Carry out the required operations.

If the fault persists after these tests, replace the S1 solenoid valve.

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Finish the operation by checking with the diagnostic tool. Use the actuator sequential command in the **SCENARIO** menu.

GETtheMANUALS.org

DF085 **CONTINUED**	

CC.0	***NOTES***	**Special notes:** None.

Switch off the ignition, disconnect the **8-track** connector under the automatic gearbox and **measure the resistance** of the winding of sequence solenoid valve No.1 between **the earth** and **track 3** on the solenoid valve side.

If the resistance measured is not approximately **14 ± 2 Ω at 20°C**, remove the gearbox sump and take the same measurement directly from the solenoid valve. If the resistance is incorrect, replace the solenoid valve. If the resistance is correct, repair or replace the wiring in question.

Check the **insulation** from earth of the connection between **track 2** of the computer connector and **track 3** of the **8-track** connector on the wiring harness side. Repair or replace the automatic gearbox wiring concerned if a fault occurs.

Check the connections on the automatic gearbox computer and the **8-track** connector.
Carry out the required operations.

If the fault persists after these tests, replace the S1 solenoid valve.

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Finish the operation by checking with the diagnostic tool. Use the actuator sequential command in the **SCENARIO** menu.

GETtheMANUALS.org

DF086 STORED	EVS2 SEQUENCE SOLENOID VALVE CIRCUIT CC.0 : Short circuit to earth CO.1 : Open circuit or short circuit to + 12 V

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: – the computer fault memory has been cleared, – the ignition has been switched off and on again, – the engine has been started and running for **3 minutes** in Drive (all the gears must be engaged).

CO.1	***NOTES***	None

Switch off the ignition, disconnect the **6-track** connector under the automatic gearbox and **measure the resistance** of the winding of sequence solenoid valve No.2 between **the earth** and **track 3** on the solenoid valve side.

If the resistance measured is not approximately **13 ± 2 Ω at 20°C**, remove the gearbox sump and take the same measurement directly from the solenoid valve. If the resistance is incorrect, replace the solenoid valve.

If the resistance is correct, repair or replace the wiring in question.

Check the **continuity** of the connection between **track 16** of the computer connector and **track 3** of the **6-track** connector on the wiring harness side.

Check the **insulation** from **12 volts** of the connection between **tracks 29 and 30** of the computer connector and **track 3** of the **6-track** connector on the wiring harness side.

Repair or replace the automatic gearbox wiring concerned if a fault occurs.

Check for **the continuity** between **the earth** and **track 1** of the computer connector.

Check the connections on the automatic gearbox computer and the **6-track** connector.
Carry out the required operations.

If the fault persists after these tests, replace the S2 solenoid valve.

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Finish the operation by checking with the diagnostic tool. Use the actuator sequential command in the **SCENARIO** menu.

GETtheMANUALS.org

DF086 **CONTINUED**	

CC.0	***NOTES***	**Special notes:** None.

Switch off the ignition, disconnect the **6-track** connector under the automatic gearbox and **measure the resistance** of the winding of sequence solenoid valve No.2 between **the earth** and **track 3** on the solenoid valve side.

If the resistance measured is not approximately **13 ± 2 Ω at 20°C**, remove the gearbox sump and take the same measurement directly from the solenoid valve. If the resistance is incorrect, replace the solenoid valve. If the resistance is correct, repair or replace the wiring in question.

Check the **insulation** from earth of the connection between **track 16** of the computer connector and **track 3** of the **6-track** connector on the wiring harness side. Repair or replace the automatic gearbox wiring concerned if a fault occurs.

Check the connections on the automatic gearbox computer and the **6-track** connector.
Carry out the required operations.

If the fault persists after these tests, replace the S2 solenoid valve.

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Finish the operation by checking with the diagnostic tool. Use the actuator sequential command in the **SCENARIO** menu.

GETtheMANUALS.org

DF087 STORED	EVS3 SEQUENCE SOLENOID VALVE CIRCUIT CC.0 : Short circuit to earth CO.1 : Open circuit or short circuit to + 12 V

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: – the computer fault memory has been cleared, – the ignition has been switched off and on again, – the engine has been started and running for **3 minutes** in Drive (all the gears must be engaged).

CO.1	***NOTES***	None

Switch off the ignition, disconnect the **6-track** connector under the automatic gearbox and **measure the resistance** of the winding of sequence solenoid valve No.3 between **the earth** and **track 6** on the solenoid valve side.

If the resistance measured is not approximately **13 ± 2 Ω at 20°C**, remove the gearbox sump and take the same measurement directly from the solenoid valve. If the resistance is incorrect, replace the solenoid valve.

If the resistance is correct, repair or replace the wiring in question.

Check the **continuity** of the connection between **track 31** of the computer connector and **track 6** of the **6-track** connector on the wiring harness side.

Check the **insulation** from **12 volts** of the connection between **tracks 29 and 30** of the computer connector and **track 6** of the **6-track** connector on the wiring harness side.

Repair or replace the automatic gearbox wiring concerned if a fault occurs.

Check for **continuity** between **the earth** and **track 1** of the computer connector.

Check the connections on the automatic gearbox computer and the **6-track** connector.
Carry out the required operations.

If the fault persists after these tests, replace the S3 solenoid valve.

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Finish the operation by checking with the diagnostic tool. Use the actuator sequential command in the **SCENARIO** menu.

GETtheMANUALS.org

DF087 **CONTINUED**	

CC.0	***NOTES***	**Special notes:** None.

Switch off the ignition, disconnect the **6-track** connector under the automatic gearbox and **measure the resistance** of the winding of sequence solenoid valve No.3 between **the earth** and **track 6** on the solenoid valve side.

If the resistance measured is not approximately **13 ± 2 Ω at 20°C**, remove the gearbox sump and take the same measurement directly from the solenoid valve. If the resistance is incorrect, replace the solenoid valve. If the resistance is correct, repair or replace the wiring in question.

Check the **insulation** from earth of the connection between **track 31** of the computer connector and **track 6** of the **6-track** connector on the wiring harness side. Repair or replace the automatic gearbox wiring concerned if a fault occurs.

Check the connections on the automatic gearbox computer and the **6-track** connector.
Carry out the required operations.

If the fault persists after these tests, replace the S3 solenoid valve.

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Finish the operation by checking with the diagnostic tool. Use the actuator sequential command in the **SCENARIO** menu.

GETtheMANUALS.org

DF088 STORED	EVS5 SEQUENCE SOLENOID VALVE CIRCUIT CC.0 : Short circuit to earth CO.1 : Open circuit or short circuit to + 12 V

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: – the computer fault memory has been cleared, – the ignition has been switched off and on again, – the engine has been started and running for **3 minutes** in Drive (all the gears must be engaged).

CO.1	***NOTES***	None

Switch off the ignition, disconnect the **8-track** connector under the automatic gearbox and **measure the resistance** of the winding of sequence solenoid valve No.5 between **the earth** and **track 8** on the solenoid valve side.

If the resistance measured is not approximately **13 ± 2 Ω at 20°C**, remove the gearbox sump and take the same measurement directly from the solenoid valve. If the resistance is incorrect, replace the solenoid valve.

If the resistance is correct, repair or replace the wiring in question.

Check the **continuity** of the connection between **track 17** of the computer connector and **track 8** of the **8-track** connector on the wiring harness side.

Check the **insulation** from **12 volts** of the connection between **tracks 29 and 30** of the computer connector and **track 8** of the **8-track** connector on the wiring harness side.

Repair or replace the automatic gearbox wiring concerned if a fault occurs.

Check for **continuity** between **the earth** and **track 1** of the computer connector.

Check the connections on the automatic gearbox computer and the **8-track** connector.
Carry out the required operations.

If the fault persists after these tests, replace the S5 solenoid valve.

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Finish the operation by checking with the diagnostic tool. Use the actuator sequential command in the **SCENARIO** menu.

GETtheMANUALS.org

DF088 **CONTINUED**	

CC.0	***NOTES***	**Special notes:** None.

Switch off the ignition, disconnect the **8-track** connector under the automatic gearbox and **measure the resistance** of the winding of sequence solenoid valve No.5 between **the earth** and **track 8** on the solenoid valve side.

If the resistance measured is not approximately **13 ± 2 Ω at 20°C**, remove the gearbox sump and take the same measurement directly from the solenoid valve. If the resistance is incorrect, replace the solenoid valve. If the resistance is correct, repair or replace the wiring in question.

Check the insulation from earth of the connection between **track 17** of the computer connector and **track 8** of the **8-track** connector on the wiring harness side. Repair or replace the automatic gearbox wiring concerned if a fault occurs.

Check the connections on the automatic gearbox computer and the **8-track** connector.
Carry out the required operations.

If the fault persists after these tests, replace the S5 solenoid valve.

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Finish the operation by checking with the diagnostic tool. Use the actuator sequential command in the **SCENARIO** menu.

GETtheMANUALS.org

DF089 PRESENT	EVS4 SEQUENCE SOLENOID VALVE CIRCUIT CC.0 : Short circuit to earth CO.1 : Open circuit or short circuit to + 12 V

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: – the computer fault memory has been cleared, – the ignition has been switched off and on again, – the engine has been started and running for **3 minutes** in Drive (all the gears must be engaged).

CO.1	***NOTES***	None

Switch off the ignition, disconnect the **8-track** connector under the automatic gearbox and **measure the resistance** of the winding of sequence solenoid valve No. 4 between **the earth** and **track 4** on the solenoid valve side.

If the resistance measured is not approximately **13 ± 2 Ω at 20°C**, remove the gearbox sump and take the same measurement directly from the solenoid valve. If the resistance is incorrect, replace the solenoid valve.

If the resistance is correct, repair or replace the wiring in question.

Check the **continuity** of the connection between **track 3** of the computer connector and **track 4** of the **8-track** connector on the wiring harness side.

Check the **insulation** from **12 volts** of the connection between **tracks 29 and 30** of the computer connector and **track 4** of the **8-track** connector on the wiring harness side.

Repair or replace the automatic gearbox wiring concerned if a fault occurs.

Check for **continuity** between **the earth** and **track 1** of the computer connector.

Check the connections on the automatic gearbox computer and the **8-track** connector.
Carry out the required operations.

If the fault persists after these tests, replace the S4 solenoid valve.

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Finish the operation by checking with the diagnostic tool. Use the actuator sequential command in the **SCENARIO** menu.

GETtheMANUALS.org

DF089 **CONTINUED**	

CC.0	***NOTES***	**Special notes:** None.

Switch off the ignition, disconnect the **8-track** connector under the automatic gearbox and **measure the resistance** of the winding of sequence solenoid valve No. 4 between **the earth** and **track 4** on the solenoid valve side.

If the resistance measured is not approximately **13 ± 2 Ω at 20°C**, remove the gearbox sump and take the same measurement directly from the solenoid valve. If the resistance is incorrect, replace the solenoid valve. If the resistance is correct, repair or replace the wiring in question.

Check the **insulation** from earth of the connection between **track 3** of the computer connector and **track 4** of the **8-track** connector on the wiring harness side. Repair or replace the automatic gearbox wiring concerned if a fault occurs.

Check the connections on the automatic gearbox computer and the **8-track** connector.
Carry out the required operations.

If the fault persists after these tests, replace the S4 solenoid valve.

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Finish the operation by checking with the diagnostic tool. Use the actuator sequential command in the **SCENARIO** menu.

GETtheMANUALS.org

DF090 STORED	CONVERTER LOCK-UP SOLENOID VALVE CIRCUIT CC.1 : Short circuit to +12 V CO.0 : Open circuit or short circuit to earth

NOTES	**Conditions for applying the fault finding procedure to stored faults:** The fault is declared present after: – the computer fault memory has been cleared, – the ignition has been switched off and on again, – the engine has been started for **1 minute** in Neutral.

CC.1	***NOTES***	None

Switch off the ignition, disconnect the **6-track** connector under the automatic gearbox and **measure the resistance** of the winding of the lock-up solenoid valve between **track 5** and **track 2** on the solenoid valve side. If the resistance measured is not approximately **5.5 ± 0.5 Ω at 20°C**, remove the gearbox sump and take the same measurement directly from the solenoid valve. If the resistance is incorrect, replace the 3 solenoid valves (LS, LT and lock-up). If the resistance is correct, repair or replace the wiring in question.

Ensure continuity of the connections between:

Computer connector track 6 ⟶ Track 5 of the hydraulic unit 6-track connector.
Computer connector track 18 ⟶ Track 2 of the hydraulic unit 6-track connector.

Also check the insulation between these connections.

Ensure the insulation from **12 V** of the connections between:

Computer connector track 6 ⟶ Track 5 of the hydraulic unit 6-track connector.
Computer connector track 18 ⟶ Track 2 of the hydraulic unit 6-track connector.

Repair or replace the automatic gearbox wiring concerned if a fault occurs.

Check the connections on the automatic gearbox computer and the **6-track** connector.
Carry out the required operations.

If the fault persists after these tests, replace the 3 solenoid valves (lock-up, LS, LT).

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Finish the operation by checking with the diagnostic tool. Use the actuator sequential command in the **SCENARIO** menu.

GETtheMANUALS.org

DF090 **CONTINUED**	

CO.0	***NOTES***	**Special notes:** None.

Switch off the ignition, disconnect the **6-track** connector under the automatic gearbox and **measure the resistance** of the winding of the lock-up solenoid valve between **track 5** and **track 2** on the solenoid valve side. If the resistance measured is not approximately **5.3 ± 0.3 Ω at 20°C**, remove the gearbox sump and perform the same measurement directly from the solenoid valve. If the resistance is incorrect, replace the 3 solenoid valves (LS, LT and lock-up). If the resistance is correct, repair or replace the wiring in question.

Ensure continuity of the connections between:

Computer connector track 6 → Track 5 of the hydraulic unit 6-track connector.
Computer connector track 18 → Track 2 of the hydraulic unit 6-track connector.

Also check the insulation between these connections.

Ensure the insulation against earth of the connections between:

Computer connector track 6 → Track 5 of the hydraulic unit 6-track connector.
Computer connector track 18 → Track 2 of the hydraulic unit 6-track connector.

Repair or replace the automatic gearbox wiring concerned if a fault occurs.

Check the connections on the automatic gearbox computer and the **6-track** connector.
Carry out the required operations.

If the fault persists after these tests, replace the 3 solenoid valves (lock-up, LS, LT).

AFTER REPAIR	Clear the computer memory, switch off the ignition, then carry out a road test. Finish the operation by checking with the diagnostic tool. Use the actuator sequential command in the **SCENARIO** menu.
