Courtesy of GENERAL MOTORS COMPANY

4. Remove the bearing inserts (1) from the bed plate (2).
5. Clean the oil, sludge, and carbon.
6. Inspect the oil passages for obstructions.
7. Inspect the threads.
8. Inspect the bearing journals and the thrust surfaces for the following conditions:
 - Cracks
 - Chips
 - Gouges
 - Roughness
 - Grooves
 - Overheating (discoloration)
9. Inspect the corresponding bearing inserts for imbedded foreign material. If foreign material exists find the cause and repair it.

NOTE: Replace the crankshaft if cracks, severe gouges or burned spots are found. Slight roughness may be removed with a fine polishing cloth soaked in clean engine oil. Burrs may be removed with a fine oil stone.

10. Measure the crankshaft journals. Use a micrometer or dial indicator to measure the taper and runout. Note the result for the later selection of bearing inserts. If not within limits the crankshaft must be replaced.

Note the location of the main bearing high spots. If they are not in line, the crankshaft is bent and must be replaced.

ENGINE BLOCK DISASSEMBLE

Fig. 78: Locating Block Plugs
Courtesy of GENERAL MOTORS COMPANY

1. Remove the engine block coolant drain plug.
2. Remove the oil flow check valve.
3. Remove the rear oil passage plugs (3).
4. Remove the 3 oil passage plugs on each side of the block (2).
5. Remove the 2 water passage plugs on the top of the block (1).
6. Remove the 2 front oil passage plugs.

Fig. 79: Knock Sensor
Courtesy of GENERAL MOTORS COMPANY

7. Remove the knock sensor (1) and bolt.

Fig. 80: Oil Pressure Switch

Courtesy of GENERAL MOTORS COMPANY

8. Remove the oil pressure switch (2).
9. Remove the crankshaft position (CKP) sensor (1) and bolt.

Fig. 81: Piston Oil Nozzle Assembly
Courtesy of GENERAL MOTORS COMPANY

10. If equipped, loosen the piston oil nozzle assembly (1) bolt and remove the piston oil nozzle assembly.

ENGINE BLOCK CLEANING AND INSPECTION

Special Tools

- **EN-8087** Cylinder Bore Gauge
- **GE-7872** Magnetic Base Dial Indicator

For equivalent regional tools, refer to **Special Tools** .

Fig. 82: Clean Sealing Material From Gasket Mating Surfaces With A Suitable Tool
Courtesy of GENERAL MOTORS COMPANY

1. Clean the sealing material from the gasket mating surfaces (2) with a suitable tool (1).
2. Clean the engine block and lower crankcase in a cleaning tank with solvent appropriate for aluminum.
3. Flush the engine block with clean water or steam.
4. Clean the oil passages.
5. Clean the blind holes.
6. Inspect the cylinder bores for glazing. If the bore is glazed but otherwise serviceable, refer to Deglazing Procedure in **Cylinder Boring and Honing (LEA, or LUK)**.
7. Spray the cylinder bores and the machined surfaces with engine oil.
8. Inspect the threaded holes. Clean the threaded holes with a rifle brush. If necessary, drill out the holes and install thread inserts. Refer to **Thread Repair**.

Fig. 83: Use A Straight Edge And Feeler Gage To Check Deck Surface For Flatness
Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not attempt to machine the lower crankcase to engine block surfaces.

9. Use a straight edge (1) and a feeler gauge (2) to check the deck surface for flatness. Carefully machine minor irregularities. Replace the block if more than 0.254 mm (0.010 in) must be removed.
10. Inspect the oil pan rail for nicks. Inspect the front cover attaching area for nicks. Use a flat mill file to remove any nicks.

Fig. 84: Clean Sealing Material From Gasket Mating Surfaces On Lower Crankcase Engine Block Side With Suitable Tool

Courtesy of GENERAL MOTORS COMPANY

11. Clean the sealing material from the gasket mating surfaces on the lower crankcase engine block side with a suitable tool (1).

Fig. 85: Clean Sealing Material From Gasket Mating Surfaces On Lower Crankcase Oil Pan Side With Suitable Tool

Courtesy of GENERAL MOTORS COMPANY

12. Clean the sealing material from the gasket mating surfaces on the lower crankcase oil pan side with a suitable tool (1).

Fig. 86: Inspect The Mating Surfaces Of The Transmission Face
Courtesy of GENERAL MOTORS COMPANY

13. Inspect the mating surfaces of the transmission face.

CAUTION: A broken flywheel may result if the transmission case mating surface is not flat.

14. Use the following procedure in order to measure the engine block flange runout at the mounting bolt hole bosses:
 1. Temporarily install the crankshaft and upper bearings. Measure the crankshaft flange runout using the **GE-7872** dial indicator (1)
 2. Hold the gauge plate flat against the crankshaft flange.
 3. Place the dial indicator stem on the transmission mounting bolt hole boss. Set the indicator to 0.
 4. Record the readings obtained from all of the bolt hole bosses. The measurements should not vary more than 0.203 mm (0.008 in).
 5. Recheck the crankshaft flange runout if the readings vary more than 0.203 mm (0.008 in).
 6. Remove the crankshaft and bearings.

Fig. 87: Measuring Bearing Bore
Courtesy of GENERAL MOTORS COMPANY

15. Install the bed plate and bolts. Tighten the bed plate bolts to specification.
16. Inspect the crankshaft main bearing bores. Use the **EN-8087** gauge (1) to measure the bearing bore concentricity and alignment. Refer to **Engine Mechanical Specifications (LEA, or LUK)** .
17. Replace the engine block and bed plate if the crankshaft bearing bores are out of specification.
18. Remove the bed plate.

Measuring Cylinder Bore Diameter

Fig. 88: Measuring Cylinder Bore
Courtesy of GENERAL MOTORS COMPANY

1. Measure the cylinder bore diameter 37 mm (1.457 in) from the deck face using the **EN-8087** gauge.
2. Compare your results with the **Engine Mechanical Specifications (LEA, or LUK)** , . If the cylinder diameter exceeds the specifications, the cylinder block may be oversized to 0.25 mm (0.010 in). There is only one size of oversized pistons and rings available for service. Refer to **Cylinder Boring and Honing (LEA, or LUK)**.

Measuring Cylinder Bore Taper

Fig. 89: Measuring Head Gasket Dimensions
Courtesy of GENERAL MOTORS COMPANY

1. Measure the cylinder bore along the thrust surfaces, perpendicular to the crankshaft centerline, at 13 mm (0.510 in) below the deck surface (1) and record your measurement.
2. Measure the cylinder bore along the thrust surfaces, perpendicular to the crankshaft centerline, at 100 mm (3.938 in) below the deck surface (2) and record your measurement.
3. Calculate the difference between the 2 measurements. The result will be the cylinder taper.
4. Compare your results with the **Engine Mechanical Specifications (LEA, or LUK)** . If the cylinders exceed the specifications, the cylinder block may be oversized to 0.25 mm (0.010 in). There is only one size of oversized pistons and rings available for service. Refer to **Cylinder Boring and Honing (LEA, or LUK)**.

Measuring Cylinder Bore Out-of-Round

Fig. 90: Measuring Head Gasket Dimensions
Courtesy of GENERAL MOTORS COMPANY

1. Measure both the thrust and non-thrust cylinder diameter at 13 mm (0.510 in) below the deck surface (1). Record your measurements.
2. Calculate the difference between the 2 measurements. The result will indicate out-of-round at the upper end of the cylinder.
3. Measure both the thrust and non-thrust cylinder diameter at 100 mm (3.938 in) below the deck surface (2). Record your measurements.
4. Calculate the difference between the 2 measurements. The result will indicate out-of-round at the lower end of the cylinder.
5. Compare your results with the **Engine Mechanical Specifications (LEA, or LUK)** . If the cylinders exceed these specifications, the cylinder block may be oversized to 0.25 mm (0.010 in). There is only one size of oversized pistons and rings available for service. Refer to **Cylinder Boring and Honing (LEA, or LUK)**.

CYLINDER BORING AND HONING (LEA, OR LUK)

Boring Procedure

1. Measure all pistons with a micrometer to determine the cylinder bore diameter. Refer to **Engine Block Cleaning and Inspection**.
2. Before you use any type of boring bar, use a fine file and clean the top of the cylinder block, removing any dirt or burrs. If you do not check the cylinder block, the boring bar may be improperly positioned or tilted and the cylinder bore could be bored at an incorrect angle.
3. Carefully follow the instructions furnished by the manufacturer regarding use of the equipment.
4. When you bore the cylinders, ensure all the crankshaft bearing caps are in place. Tighten the crankshaft bearing caps to the proper torque in order to avoid distortion of the cylinder bores during final assembly.
5. When you take the final cut with a boring bar, leave 0.03 mm (0.001 in) on the cylinder bore diameter for the finish honing and fit of the piston.

Honing Procedure

NOTE: **Fine vertical scratches made by the ring ends do not, by themselves, cause excessive oil consumption. Do not hone the cylinder in order to remove these scratches.**

1. When honing the cylinders, follow the manufacturer's recommendations for equipment use, cleaning, and lubrication. Use only clean, sharp stones of the proper grade for the amount of material you remove. Dull, dirty stones cut unevenly and generate excessive heat. Do not hone to final clearance with a coarse or medium-grade stone. Leave sufficient metal so that all stone marks may be removed with fine-grade stones. Perform final honing with a fine-grade stone, honing the cylinder to the proper clearance.

NOTE: **All measurements of the piston or the cylinder bore should be made with the components at normal room temperature.**

2. During the honing operation, thoroughly clean the cylinder bore. Repeatedly check the cylinder bore for fit with the selected piston.
3. When honing a cylinder for fit to an oversize piston, first perform the preliminary honing with a 100-grit stone.

NOTE: **A 240-grit stone is preferred for final honing. If a 240-grit stone is not available, a 220-grit stone may be used as a substitute.**

4. Perform final cylinder honing with a 240-grit stone and obtain a 45 degree cross hatch pattern.
5. The finish marks should be clean but not sharp. The finish marks should also be free from imbedded particles and torn or folded metal.
6. By measuring the selected piston at the sizing point and by adding the average of the clearance specification, you can determine the final cylinder honing dimension required.
7. After final honing and before the piston is checked for fit, clean the cylinder bores with hot water and detergent. Scrub the bores with a stiff bristle brush and rinse the bores thoroughly with hot water. Do not

allow any abrasive material to remain in the cylinder bores. This abrasive material may cause premature wear of the new piston rings and the cylinder bores. Abrasive material will also contaminate the engine oil and may cause premature wear of the bearings. After washing the cylinder bore, dry the bore with a clean rag.

8. Perform final measurements of the piston and the cylinder bore.
9. Permanently mark the top of the piston for the specific cylinder to which it has been fitted.
10. Apply clean engine oil to each cylinder bore in order to prevent rusting.

Deglazing Procedure

1. If the bore is glazed but otherwise serviceable, lightly break the glaze with a hone. Replace the piston rings. Refer to **Piston, Connecting Rod, and Bearing Installation (LEA, or LUK)**.

NOTE: **A 240-grit stone is preferred for final honing. If a 240-grit stone is not available, a 220-grit stone may be used as a substitute.**

2. Using a ball type or self centering honing tool, deglaze the cylinder bore lightly. Deglazing should be done only to remove any deposits that may have formed. Use a 240-grit stone of silicone carbide, or equivalent, material when performing the deglazing procedure.
 1. The honing stones must be clean, sharp, and straight.
 2. Move the hone slowly up and down to produce a 45 degree cross-hatch pattern.
 3. Clean the bore thoroughly with soap and water.
 4. Dry the bore.
 5. Rub clean engine oil in the bore.
 6. Re-measure the bore.
3. If the cylinder bore is out of specification, the cylinder bore may be oversized to 0.25 mm (0.010 in). There is only one size of oversized pistons and rings available for service.
4. If honing is not required, clean the cylinder bores with hot water and detergent. Apply clean engine oil to the bore after washing and drying the bore.

CRANKSHAFT BALANCER CLEANING AND INSPECTION

Fig. 91: Crankshaft Balancer

Courtesy of GENERAL MOTORS COMPANY

1. Clean the crankshaft balancer (1).
2. Clean the belt grooves of all dirt or debris with a wire brush.

WARNING: Refer to Safety Glasses Warning .

3. Dry the crankshaft balancer with compressed air.
4. Inspect the crankshaft balancer for the following:
 - Worn, grooved, or damaged hub seal surface
 - A crankshaft balancer hub seal surface with excessive scoring, grooves, rust or other damage must be replaced.

NOTE: In order for the belt to track properly, the belt grooves should be free of all dirt or debris.

- Dirty or damaged belt grooves

The balancer belt grooves should be free of any nicks, gouges, or other damage that may not allow the belt to track properly.

- Minor imperfections may be removed with a fine file.
- Worn, chunking or deteriorated rubber between the hub and pulley

ENGINE FLYWHEEL CLEANING AND INSPECTION

Fig. 92: View Of Flywheel

Courtesy of GENERAL MOTORS COMPANY

1. Clean the flywheel in solvent.

WARNING: Refer to Safety Glasses Warning .

2. Dry the flywheel with compressed air.
3. Inspect the flywheel for the following:
 - Damaged ring gear teeth
 - Stress cracks around the flywheel-to-crankshaft bolt hole locations
 - Weight saving holes

CRANKSHAFT AND BEARING CLEANING AND INSPECTION

Special Tools

GE-7872 Magnetic Base Dial Indicator Set

For equivalent regional tools, refer to **Special Tools** .

Fig. 93: Clean Crankshaft With Solvent
Courtesy of GENERAL MOTORS COMPANY

NOTE: Use care when handling the crankshaft. Avoid damage to the bearing surfaces or the lobes of the crankshaft position reluctor ring. Damage to the teeth of the crankshaft position reluctor ring may affect on-board diagnostic (OBD) II system performance.

1. Clean the crankshaft (1) with solvent.
2. Thoroughly clean all oil passages and inspect for restrictions or burrs.

WARNING: Refer to Safety Glasses Warning .

3. Dry the crankshaft with compressed air.

NOTE: Reluctor ring teeth should not have imperfections on the rising or falling edges.

Imperfections of the reluctor ring teeth may effect OBD II system performance.

4. Perform a visual inspection of the crankshaft for damage.

Fig. 94: View of Crankshaft Position Reluctor Ring
Courtesy of GENERAL MOTORS COMPANY

5. The crankshaft position reluctor ring (1) may be replaced if damaged. Tighten the crankshaft position reluctor ring bolts to 15 N.m (11 lb ft).

Fig. 95: Identifying Different Crankshaft Journal Wear Patterns
Courtesy of GENERAL MOTORS COMPANY

6. Inspect the crankshaft journals for wear (1). The journals should be smooth, with no signs of scoring, wear, or damage.
7. Inspect the crankshaft journals for grooves or scoring (2).
8. Inspect the crankshaft journals for scratches or wear (3).
9. Inspect the crankshaft journals for pitting or imbedded bearing material (4).

Fig. 96: Measure Crankshaft Journals For Out-Of-Round
Courtesy of GENERAL MOTORS COMPANY

10. Measure the crankshaft journals (1) for out-of-round.
11. Measure the crankshaft journals for taper.

Fig. 97: Measuring The Crankshaft Runout
Courtesy of GENERAL MOTORS COMPANY

12. Measure the crankshaft runout.

Using wooden V-blocks, support the crankshaft on the front and rear journals.

13. Use the **GE-7872** indicator (1) in order to measure the crankshaft runout at the front and rear intermediate journals.
14. Use the **GE-7872** indicator in order to measure the runout of the crankshaft rear flange.
15. Replace the crankshaft if the measurements are not within specifications.

Fig. 98: Identifying Crankshaft Bearings For Craters Or Pockets
Courtesy of GENERAL MOTORS COMPANY

NOTE: Crankshaft bearings **MUST** be separated, marked, or organized in a way to ensure installation to their original location and position, when suitable for use.

16. Inspect crankshaft bearings for craters or pockets (1). Flattened sections on the bearing halves also indicate fatigue.
17. Inspect the crankshaft bearings for excessive scoring or discoloration (2).
18. Inspect the crankshaft bearings for dirt or debris imbedded into the bearing material.
19. Inspect the crankshaft bearings for improper seating indicated by bright, polished sections of the bearing (3).

If the lower half of the bearing is worn or damaged, both upper and lower halves should be replaced.

Generally, if the lower half is suitable for use, the upper half should also be suitable for use.

PISTON AND CONNECTING ROD DISASSEMBLE

Special Tools

EN-46745 Piston Pin Retainer Remover and Installer

For equivalent regional tools, refer to **Special Tools** .

Fig. 99: Identifying Piston Rings

Courtesy of GENERAL MOTORS COMPANY

WARNING: Handle the piston carefully. Worn piston rings are sharp and may cause bodily injury.

1. Disassemble the piston rings (1, 2, 3, 4, 5). Use a suitable tool to expand the rings. The piston rings must not be reused.

Fig. 100: View of Piston Pin Retainers
Courtesy of GENERAL MOTORS COMPANY

NOTE: Two retainers hold the piston pins in place. No special tools are required to remove the piston pins. Ensure that the piston pin is not damaged. Do not reuse the retainers.

2. Remove the piston pin retainers using the **EN-46745** remover (1).

Fig. 101: Identifying Piston Pin And Connecting Rod
Courtesy of GENERAL MOTORS COMPANY

3. Remove the piston pin (1) and the connecting rod (3) from the piston (2).

PISTON, CONNECTING ROD, AND BEARING CLEANING AND INSPECTION

Connecting Rod Measurement

Fig. 102: Connecting Rod
Courtesy of GENERAL MOTORS COMPANY

1. Clean the connecting rods (1) in solvent and dry with compressed air.
2. Inspect the connecting rods for the following:
 - Signs of being twisted, bent, nicked, or cracked
 - Scratches or abrasion on the rod bearing seating surface
3. If the connecting rod bores contain minor scratches or abrasions, clean the bores in a circular direction with a light emery paper. DO NOT scrape the rod or rod cap.
4. If the beam of the rod is scratched or has other damage replace the connecting rod.
5. Measure the piston pin to connecting rod bore using the following procedure:
 1. Using an outside micrometer, take two measurements of the piston pin in the area of the connecting rod contact.
 2. Using an inside micrometer, measure the connecting rod piston pin bore.
 3. Subtract the piston pin diameter from the piston pin bore diameter.
 4. The clearance should not be more than 0.021 mm (0.0008 in).

6. If there is excessive clearance, replace the piston pin.
7. If there is still excessive clearance, replace the connecting rod.

Piston Measurement

Fig. 103: Identifying Piston Damage Inspection Areas
Courtesy of GENERAL MOTORS COMPANY

1. Clean the piston skirts and the pins with a cleaning solvent. DO NOT wire brush any part of the piston.
2. Clean the piston ring grooves with a groove cleaner. Make sure oil ring holes and slots are clean.
3. Inspect the pistons for the following conditions:
 - Cracked ring lands, skirts, or pin bosses
 - Ring grooves for nicks, burrs that may cause binding
 - Warped or worn ring lands
 - Eroded areas at the top of the piston (1)
 - Scuffed or damaged skirts (2)

- Worn piston pin bores (3)
4. Replace pistons that show any signs or damage or excessive wear.
 5. Measure the piston pin bore to piston pin clearances using the following procedure:
 1. Piston pin bores and pins must be free of varnish or scuffing.
 2. Use an outside micrometer to measure the piston pin in the piston contact areas.
 3. Using an inside micrometer, measure the piston pin bore.
 4. Subtract the measurement of the piston pin bore from the piston pin. The clearance should be within 0.002-0.012 mm (0.00007-0.00047 in).
 5. If the clearance is excessive, determine which component is out of specification.

Fig. 104: Measuring Piston Ring End Gap
Courtesy of GENERAL MOTORS COMPANY

6. Measure the piston ring end gap using the following procedure:
 1. Place the piston ring in the area of the bore where the piston ring will travel (approximately 25 mm or 1 inch down from the deck surface). Be sure the ring is square with the cylinder bore by

positioning the ring with the piston head.

2. Measure the end gap of the piston ring with feeler gauges (1). Compare the measurements with those provided below:
 - The top compression ring end gap should be 0.20-0.40 mm (0.0060-0.015 in).
 - The second compression ring end gap should be 0.35-0.55 mm (0.0137-0.0216 in).
 - The oil ring end gap should be 0.25-0.76 mm (0.0098-0.029 in).
3. If the clearance exceeds the provided specifications, the piston rings must be replaced.
4. Repeat the procedure for all the piston rings.

Fig. 105: Measuring Piston Ring Side Clearance
Courtesy of GENERAL MOTORS COMPANY

7. Measure the piston ring side clearance using the following procedure:
 1. Roll the piston ring entirely around the piston ring groove. If any binding is caused by a distorted piston ring, replace the ring.
 2. With the piston ring on the piston, use feeler gauges (1) to check clearance at multiple locations.

3. The clearance between the surface of the top piston ring and the ring land should be no greater than 0.075 mm (0.0030 in).
4. If the clearance is greater than specifications, replace the piston ring.
5. If the new ring does not reduce the top ring side clearance to 0.075 mm (0.0030 in) or less, install a new piston.
8. The top compression ring may be installed with either side up. There is a locating dimple on the 2nd compression ring near the end for identification of the top side. Install the 2nd compression ring with the dimple facing up.
9. The clearance between the surface of the second piston ring and the ring land should be no greater than 0.069 mm (0.0026 in).
10. If the new ring does not reduce the clearance to 0.069 mm (0.0026 in) or less, install a new piston.

Fig. 106: Measuring Piston Width
Courtesy of GENERAL MOTORS COMPANY

11. Measure piston width using the following procedure:

1. Using an outside micrometer (2), measure the width of the piston 14.5 mm (0.570 in) above the bottom of the piston skirt at the thrust surface perpendicular to the centerline of the piston pin.
 2. Compare the measurement of the piston to its original cylinder by subtracting the piston width from the cylinder diameter.
 3. The proper clearance specification for the piston is 0.010-0.041 mm (0.0006-0.0016 in).
12. If the clearance obtained through measurement is greater than these specifications and the cylinder bores are within specification, replace the piston (1).

Piston Selection

Fig. 107: Measuring Cylinder Bore
Courtesy of GENERAL MOTORS COMPANY

NOTE: Measurements of all components should be taken with the components at normal room temperature.

For proper piston fit, the engine block cylinder bores must not have excessive wear or taper.

A used piston and pin set may be reinstalled if, after cleaning and inspection, they are within specifications.

1. Inspect the engine block cylinder bore. Refer to **Engine Block Cleaning and Inspection**.
2. Inspect the piston and the piston pin.
3. Use a bore gauge (1) and measure the cylinder bore diameter. Measure at a point 64 mm (2.5 in) from the top of the cylinder bore.

Fig. 108: Measuring Bore Gauge
Courtesy of GENERAL MOTORS COMPANY

4. Measure the bore gauge with a micrometer (1) and record the reading.

Fig. 109: Measuring Piston Width
Courtesy of GENERAL MOTORS COMPANY

5. With a micrometer (2) or caliper at a right angle to the piston (1), measure the piston 14 mm (0.570 in) from the bottom of the skirt.
6. Subtract the piston diameter from the cylinder bore diameter in order to determine piston-to-bore clearance.
7. For proper piston-to-bore clearance. Refer to **Engine Mechanical Specifications (LEA, or LUK)** .
8. If the proper clearance cannot be obtained, select another piston and measure for the clearances.
9. If the proper fit cannot be obtained, hone the cylinder bore or replace the cylinder block.
10. When the piston-to-cylinder bore clearance is within specifications, mark the top of the piston using a permanent marker for installation to the proper cylinder. Refer to **Separating Parts** .

PISTON AND CONNECTING ROD ASSEMBLE

Special Tools

EN-46745 Piston Pin Retainer Remover and Installer

For equivalent regional tools, refer to **Special Tools** .

Fig. 110: Locating "Cast Boss" On Underside of Piston
Courtesy of GENERAL MOTORS COMPANY

- NOTE:** Install the piston onto the connecting rod with the arrow on top of the piston toward the front oriented toward the front of the engine.
- NOTE:** The cast boss (1) can be in either or both locations depending on displacement.

1. The cast boss (1), on the underside of the piston, must go to the rear of the block.

Fig. 111: Identifying Cast Mark

Courtesy of GENERAL MOTORS COMPANY

2. The larger feature (1), at the split line located on one side of the connecting rod, must go to the front of the block.

Fig. 112: View of Connecting Rod and Piston
Courtesy of GENERAL MOTORS COMPANY

3. Assemble the connecting rod (2) and the piston (1).

Fig. 113: View of Piston Pin Retainers
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Install the piston pin retainers correctly in the retaining groove during assembly in order to avoid engine damage.

4. Use the following procedure to assemble the piston pin and the retainer:
 1. Coat the piston pin with oil.
 2. Install one side of one piston pin retainer into the retaining groove using **EN-46745** installer. Rotate the retainer until it is fully seated in the groove.
 3. Install the connecting rod and the piston pin.

Push the piston pin until it bottoms in the previously installed retainer.

4. Install the second piston pin retainer, using **EN-46745** installer (1) .
5. Ensure that the piston moves freely.

Fig. 114: Identifying Piston Rings

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Use a piston ring expander to install the piston rings. The rings may be damaged if expanded more than necessary.

5. Install the following components of the oil control ring assembly (bottom ring):
 1. The expander (5)
 2. The lower oil control ring (4)
 3. The upper control ring (3)
6. Install the lower compression ring (2). Place the manufacturer's mark facing up.
7. Install the upper compression ring (1).

CAMSHAFT CLEANING AND INSPECTION (LEA, OR LUK)

Fig. 115: Camshaft Cover And Camshafts
Courtesy of GENERAL MOTORS COMPANY

1. Inspect the camshaft journals and lobes for wear or scoring.
2. Inspect the camshaft sprocket alignment notch for damage.
3. Inspect the camshaft cover (1) for damage or loose oil control baffles.
4. Clean the camshaft cover.
5. Wash the camshafts (2, 3) in solvent.
6. Oil the camshafts.
7. Inspect the camshaft cover for cracks or other signs of damage.

CAMSHAFT TIMING CHAIN AND SPROCKET CLEANING AND INSPECTION

Fig. 116: Timing Chain Guides

Courtesy of GENERAL MOTORS COMPANY

1. Inspect the timing chain guides (1, 4, 6) for cracking or wear.
2. Replace the timing chain guides if wear exceeds 1.12 mm (0.045 in) depth on the chain guide surface.
3. Inspect the timing chain tensioner shoe for wear.
4. Replace the timing chain tensioner shoe if wear exceeds 1.12 mm (0.045 in) depth on the chain guide surface.
5. Inspect the timing chain (2) and actuators (3, 8) for wear.
6. Inspect the camshaft actuator faces for signs of movement.
7. Inspect the camshaft actuator teeth and chain for signs of excessive wear, chipping, or seizure of the timing chain links.
8. Inspect the oil nozzle body (5) for collapse or cracks at the bolt boss. Discard and replace the oil nozzle body if it is damaged.
9. Verify oil nozzle oil flow with compressed air.
10. Inspect the timing chain tensioner (7) for the scoring or free movement.
11. Inspect the timing chain tensioner washer and O-ring for damage. If damaged, replace the timing chain tensioner.

BALANCE SHAFT CLEANING AND INSPECTION

Fig. 117: Balance Shafts

Courtesy of GENERAL MOTORS COMPANY

1. Clean the balance shafts (1) in solvent.
2. Inspect the bearing surfaces on the balance shafts for scoring or unusual wear.

NOTE: Do not remove the balance shaft drive sprockets.

3. Inspect the balance shaft drive sprockets for wear, damage, or missing teeth.
4. Measure the rear bearing journals on the balance shafts, the journals should be 36.723-36.743 mm (1.4458-1.4466 in) in diameter.
5. Measure the front bearing journals on the balance shafts, the front bearing journals should be 20.020-20.000 mm (0.7881-0.7874 in) in diameter.
6. When the balance shafts have been installed in the engine block, check for smooth rotation, sticking, binding, or roughness.

WATER PUMP AND BALANCE SHAFT CHAIN AND SPROCKET CLEANING AND INSPECTION

Fig. 118: Water Pump, Balance Shaft Chain And Sprocket
Courtesy of GENERAL MOTORS COMPANY

1. Inspect the balance shaft drive chain guides (3, 5, 8) for cracking or wear.
2. Replace the balance shaft drive chain guides if wear exceeds 1.12 mm (0.045 in) depth on the chain guide surface.
3. Inspect the balance shaft drive chain tensioner guide shoe for wear.

Replace the balance shaft drive chain tensioner guide shoe if wear exceeds 1.12 mm (0.045 in) depth on the chain guide surface.

4. Inspect the balance shaft drive chain (7) and sprockets (2, 4) for wear.
5. Inspect the crankshaft sprocket (6) faces for signs of movement.
6. Inspect the alignment notch in the balance shaft for cracking or damage.
7. Inspect the water pump (1), crankshaft, and balance shaft sprocket teeth and chain for signs of excessive wear, chipping, or seizure of the balance shaft drive chain links.
8. Inspect the timing chain tensioner (9) for damage or wear.

CYLINDER HEAD DISASSEMBLE (LEA, OR LUK)

Special Tools

- **EN-8062** Valve Spring Compressor
- **EN-36017** Valve Seal Remover
- **EN-43963** Valve Spring Compressor (off car)

For equivalent regional tools, refer to **Special Tools** .

Fig. 119: Identifying the Coolant Air Bleed Hose Fitting
Courtesy of GENERAL MOTORS COMPANY

1. Remove the coolant air bleed hose fitting (1).

Fig. 120: Intake Camshaft Position Sensor
Courtesy of GENERAL MOTORS COMPANY

2. Remove the intake camshaft position sensor (1) and bolt.

Fig. 121: Valve Train Components
Courtesy of GENERAL MOTORS COMPANY

WARNING: Compressed valve springs have high tension against the valve spring compressor. Valve springs that are not properly compressed by or released from the valve spring compressor can be ejected from the valve spring compressor with intense force. Use care when compressing or releasing the valve spring with the valve spring compressor and when removing or installing the valve stem keys. Failing to use care may cause personal injury.

CAUTION: Do not compress the valve springs to less than 24.0 mm (0.943 in). Contact between the valve spring retainer and the valve stem oil seal can cause potential valve stem oil seal damage.

NOTE: Ensure that the valve train components are kept together and identified in order for proper installation in their original position.

3. Perform the following procedure to remove the valve keys, springs, and retainers:
 1. Using the **EN-8062** compressor and the **EN-43963** compressor , compress the valve spring.

2. Remove the valve keys.
3. Slowly release the **EN-8062** compressor and the **EN-43963** compressor from the valve spring assembly.
4. Remove the retainer.

Fig. 122: Valve Springs
Courtesy of GENERAL MOTORS COMPANY

4. Remove the springs.

Fig. 123: Valve Guides

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Do not damage the valve guide. Remove any burrs that have formed at the key groove by chamfering the valve stem with an oil stone or a file.

5. Using **EN-36017** remover , remove the valve seals. Discard the seals, do not reuse.

Fig. 124: Valves

Courtesy of GENERAL MOTORS COMPANY

6. Remove the valves.

Fig. 125: Cylinder Head Plugs
Courtesy of GENERAL MOTORS COMPANY

7. Remove the cylinder head plugs.

CYLINDER HEAD CLEANING AND INSPECTION (LEA, OR LUK)

Special Tools

- **EN 22738-B** Valve Spring Tester
- **EN-28410** Gasket Remover
- **GE 7872** Magnetic Base Dial Indicator

For equivalent regional tools, refer to **Special Tools** .

Valve Cleaning and Inspection

Fig. 126: Valve Inspection Areas

Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not use a wire brush on any part of the valve stem.

NOTE: Do not grind or condition the intake valve. If the intake valve is out of specification, replace the valve.

1. Clean the valves of carbon, oil and varnish. Use a soft bristle wire brush to clean any carbon build-up from the valve head. Varnish can be removed by soaking in Parts Immersion Solvent. Refer to **Adhesives, Fluids, Lubricants, and Sealers** .
2. Clean the valve guides.
3. Inspect the valve stem for pitting or wear (4).
4. Inspect the valve key groove for chipping or wear (5). Replace the valve if chipped or worn.
5. Inspect the valve face for burning or cracking (1). If pieces are broken off, inspect the corresponding piston and cylinder head area for damage.
6. Inspect the valve stem for burrs and scratches. Burrs and minor scratches may be removed with an oil

stone.

7. Inspect the valve stem for straightness (3) and the valve head for bending or distortion using V blocks. Bent or distorted valves must be replaced.
8. Clean the deposits from the valve face. Inspect the valve face for grooving.
9. Replace the valve if the face is grooved. Valve faces cannot be machined. If worn, or damaged, the valves must be replaced.
10. Replace the valve if the valve head O.D. and chamfer (2) is worn or out of specification. Refer to **Valve and Seat Grinding**.
11. The valves may be lightly lapped to the valve seats.
12. Replace the valve if the valve tip (6) is worn.
13. If no apparent wear, pitting, grooving, or distortion is present, perform the valve measurement and reconditioning procedure to verify valve specification. Refer to **Valve and Seat Grinding**.

Valve Guide Measurement

Fig. 127: Inspecting For Excessive Valve Stem To Guide Clearance
Courtesy of GENERAL MOTORS COMPANY

1. Measure the valve stem (1)-to-guide (2) clearance. Excessive valve stem-to-guide clearance may cause an excessive oil consumption and may also cause a valve to break. Insufficient clearance will result in noisy and sticky functioning of the valve and will disturb the engine assembly smoothness.
2. Clamp the **GE 7872** dial indicator to the cylinder head at the camshaft cover rail.
3. Locate the dial indicator so that the movement of the valve stem from side to side, crossways to the cylinder head, will cause a direct movement of the indicator stem. The dial indicator stem must contact the side of the valve stem just above the valve guide.
4. Drop the valve head about 0.064 mm (0.0025 in) off the valve seat.
5. Use light pressure when moving the valve stem from side to side in order to obtain a clearance reading. Refer to **Engine Mechanical Specifications (LEA, or LUK)** for proper clearance.

NOTE: **Valve guide wear at the bottom 10 mm (0.390 in) of the valve guide is not significant to normal operation.**

6. If the clearance for the valve is greater than specifications and a new standard diameter valve stem will not bring the clearance within specifications, replace the cylinder head.

Valve Spring Cleaning and Inspection

1. Clean the valve springs in solvent.

WARNING: Refer to Safety Glasses Warning .

2. Dry the valve springs with compressed air.
3. Inspect the valve springs for broken coils or coil ends.

Fig. 128: Measuring Valve Spring Tension
Courtesy of GENERAL MOTORS COMPANY

4. Measure the valve spring tension using the **EN 22738-B** tester. Refer to **Engine Mechanical Specifications (LEA, or LUK)**
5. If low valve spring load is found, replace the valve springs. **DO NOT** use shims to increase spring load. The use of shims can cause the valve spring to bottom out before the camshaft lobe is at peak lift.

Valve Rocker Arm Cleaning and Inspection

Fig. 129: Inspecting Valve Rocker Arms
Courtesy of GENERAL MOTORS COMPANY

1. Inspect the camshaft follower roller (1) for the following:
 - Flat spots
 - Excessive scoring and pitting
 - Ensure the roller spins freely
2. Inspect the camshaft follower valve tip area (2).
3. Inspect the camshaft follower stationary hydraulic lash adjuster (SHLA) pivot area (3).
4. Replace the camshaft follower or followers as necessary.

Cylinder Head and Gasket Surface Cleaning and Inspection

Fig. 130: Spark Plugs

Courtesy of GENERAL MOTORS COMPANY

1. Remove the spark plugs.
2. Inspect the cylinder head gasket and mating surfaces for leaks, corrosion and blow-by. If the gasket has failed, use the following faults to determine the cause:
 1. Improper installation
 2. Loose or warped cylinder head
 3. Missing, off location or not fully seated dowel pins
 4. Corrosion in the seal area around the coolant passages
 5. Chips or debris in the cylinder head bolt holes
 6. Bolt holes in the cylinder block not drilled or tapped deep enough

Fig. 131: Locating Combustion Chambers
Courtesy of GENERAL MOTORS COMPANY

3. Inspect the cylinder head gasket surface.
 - Cylinder head may be reused if corrosion is found only outside a 4 mm (0.375 in) band around each combustion chamber (1).
 - Replace the cylinder head if the area between the valve seats is cracked (2).
 - Replace the cylinder head if corrosion has been found inside a 4 mm (0.375 in) band around each combustion chamber (3).
4. Clean the cylinder head bolts.

NOTE: **Do not use a wire brush on any gasket sealing surface.**

5. Remove the sealant from the rear cap mating surface with **EN-28410** remover. Care must be used to avoid gouging or scraping the sealing surfaces.

6. Clean the cylinder head. Remove all varnish, soot and carbon to the bare metal.
7. Clean the valve guides.
8. Clean the threaded holes. Use a nylon bristle brush.
9. Clean the remains of the sealer from the plug holes.
10. Inspect the cylinder head bolts for damaged threads or stretching and damaged heads caused by improper use of tools.
11. Replace all suspect bolts.
12. Inspect the cylinder head for cracks. Check between the valve seats and in the exhaust ports.

NOTE: Do not attempt to weld the cylinder head, replace it.

13. Inspect the cylinder head deck for corrosion, sand inclusions and blow holes.

Fig. 132: Checking Cylinder Head Deck Surface For Flatness
Courtesy of GENERAL MOTORS COMPANY

14. Using a straight edge (1) and feeler gauge (2), inspect the cylinder head deck surface for flatness. Refer to **Engine Mechanical Specifications (LEA, or LUK)** . If the cylinder head is out of specification, replace the cylinder head. Do not machine the cylinder head.
15. Inspect all the threaded holes for damage. Threads may be reconditioned with thread inserts.
16. Inspect the sealing surfaces.

Fig. 133: Cylinder Head Plugs

Courtesy of GENERAL MOTORS COMPANY

17. Inspect the cylinder head plugs and verify the oil orifice is clear and free of debris.

Fig. 134: Bearing Caps

Courtesy of GENERAL MOTORS COMPANY

18. Clean the sealant from the rear cap mating surface with **EN-28410** remover. Care must be used to avoid gouging or scraping the sealing surfaces.
19. Inspect the intake camshaft bearing rear cap (1) for damage.
20. Inspect the rear bearing mating surfaces for damage.
21. Inspect the camshaft bearing caps (2) for damage.
22. Inspect the camshaft front bearing caps (3) for damage.

Fig. 135: Spark Plugs

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Component Fastener Tightening Caution .

23. Install the spark plugs. Tighten the plugs to 20 N.m (15 lb ft).

VALVE AND SEAT GRINDING

Valve Measurement and Reconditioning Overview

- Proper valve service is critical to engine performance. Therefore, all detailed measurement procedures must be followed to identify components that are out of specification.
- If the measurement procedures reveal that the valve or valve seat must be reconditioned, it is critical to perform the measurement procedures after reconditioning.

Valve Seat Width Measurement Procedure

Fig. 136: Checking Valve Seat Width
Courtesy of GENERAL MOTORS COMPANY

1. Measure the valve seat width in the cylinder head using a proper scale.

Fig. 137: Valve Face Seat width

Courtesy of GENERAL MOTORS COMPANY

2. Measure the seat width (b) on the valve face (1) using a proper scale.

NOTE: The seat contact area must be at least 0.5 mm (0.020 in) from the outer diameter, margin (a), of the valve. If the contact area is too close to the margins, the seat must be reconditioned to move the contact area away from the margin.

3. Compare your measurements with the specifications listed in Engine Mechanical Specifications (LEA, or LUK).
4. If the seat widths are acceptable, check the valve seat roundness using the Valve Seat Roundness Measurement Procedure.
5. If the seat width is not acceptable, you must grind the valve seat using the Valve and Seat Reconditioning Procedure to bring the width back into specification. Proper valve seat width is critical to providing the correct amount of valve heat dissipation.

Valve Seat Roundness Measurement Procedure

1. Measure the valve seat roundness using a dial indicator attached to a tapered pilot installed in the guide. The pilot should have a slight bind when installed in the guide.

CAUTION: The correct size pilot must be used. Do not use adjustable diameter pilots. Adjustable pilots may damage the valve guides.

2. Compare your measurements with the specifications listed in Engine Mechanical Specifications (LEA, or LUK).
3. If the valve seat exceeds the roundness specification, you must grind the valve and valve seat using the Valve and Seat Reconditioning Procedure.
4. If new valves are being used, the valve seat roundness must be within 0.05 mm (0.002 in).

Valve Head O.D. and Chamfer Measurement Procedure

Fig. 138: View Of Valve Head O.D. & Chamfer
Courtesy of GENERAL MOTORS COMPANY

1. Measure the valve head O.D. and chamfer (a) using an appropriate scale. Refer to **Engine Mechanical Specifications (LEA, or LUK)** .
2. If the valve head O.D. and chamfer is within specification, test the valve (1) for seat concentricity using the Valve-to-Seat Concentricity Measurement Procedure. Reinspect the valve head O.D. and chamfer after completing the concentricity measurement if valve seat reconditioning is performed.

Valve-to-Seat Concentricity Measurement Procedure

NOTE:

- Checking the valve-to-seat concentricity determines whether the valve and seat are sealing properly.
- You must measure the valve face and the valve seat to ensure proper valve sealing.

Fig. 139: Inspecting Valve Face
Courtesy of GENERAL MOTORS COMPANY

1. Coat the valve face (3) lightly with blue dye (1).
2. Install the valve in the cylinder head.

3. Turn the valve against the seat with enough pressure to wear off the dye.
4. Remove the valve from the cylinder head.
5. Inspect the valve face.
 - If the valve face is concentric, providing a proper seal, with the valve stem, a continuous mark (2) will be made around the entire face.

NOTE: **The wear mark MUST be at least 0.5 mm (0.020 in) from the outer diameter, the margin (a), of the valve. If the wear mark is too close to the margin, the seat must be reconditioned to move the contact area away from the margin.**

NOTE: **Do not grind or condition the intake valve. If the intake valve is out of specification, replace the valve.**

- If the face is not concentric with the stem, the mark will NOT be continuous around the valve face. The valve should be refaced or replaced and the seat must be reconditioned using the Valve and Seat Reconditioning Procedure.

Valve and Seat Reconditioning Procedure

Fig. 140: Valve Seating Surface Angle
Courtesy of GENERAL MOTORS COMPANY

NOTE:

- If the valve seat width, roundness or concentricity is beyond specifications, you must grind the seats in order to ensure proper heat dissipation and prevent the build up of carbon on the seats.
- It is necessary to reface the valve if seat reconditioning is required unless a new valve is used.

1. Grind the valve seating surface (a) to the proper angle specification (2) listed in **Engine Mechanical Specifications (LEA, or LUK)** .
2. Grind the valve relief surface to the proper angle specification (1) listed in **Engine Mechanical Specifications (LEA, or LUK)** , to correctly position the valve seating surface (a) to the valve.
3. Grind the valve undercut surface to the proper angle specification (3) listed in **Engine Mechanical Specifications (LEA, or LUK)** , to narrow the valve seating surface width (a) to the specifications listed in **Engine Mechanical Specifications (LEA, or LUK)** .

NOTE: **Do not grind or condition the intake valve. If the intake valve seat has been reconditioned, replace the corresponding intake valve.**

4. Replace the intake valve if it is out of specification. Refer to **Engine Mechanical Specifications (LEA, or LUK)** .
5. If the original exhaust valve is being used, grind the valve to the specifications listed in **Engine Mechanical Specifications (LEA, or LUK)** . Measure the valve head O.D. and chamfer again after grinding using the Valve Head O.D. and Chamfer Measurement Procedure. Replace the exhaust valve if it is out of specification. New valves do not require grinding.
6. When grinding the valves and seats, grind off as little material as possible. Cutting valve seat results in lowering the valve spring pressure.
7. Install the valve in the cylinder head.
 - If you are using refaced exhaust valves, lap the valves into the seats with a fine grinding compound. The refacing and reseating operations should leave the refinished surfaces smooth and true so that minimal lapping is required. Excessive lapping will groove the valve face and prevent a good seat when hot.
 - Be sure to clean any remaining lapping compound from the valve and seat with solvent and compressed air prior to final assembly.
8. After obtaining the proper valve seat width in the cylinder head, you must re-measure the valve stem height using the Valve Stem Height Measurement Procedure.
9. If the valve stem height is acceptable, test the seats for concentricity using the Valve-to-Seat Concentricity Measurement Procedure.

Valve Stem Height Measurement Procedure

Fig. 141: Valve Stem Height Measurement
Courtesy of GENERAL MOTORS COMPANY

NOTE: To determine the valve stem height measurement, measure from the valve spring seat to the valve spring retainer.

1. Install the valve (1) into the valve guide in the cylinder head (2).
2. Ensure the valve is seated to the cylinder head valve seat.
3. Install the valve stem oil seal.
4. Install the valve spring retainer and valve stem locks.
5. Measure the distance (a) between the valve seal lip to the bottom of the valve spring retainer. Refer to **Engine Mechanical Specifications (LEA, or LUK)** .
6. If the maximum height specification is exceeded, a new valve should be installed and the valve stem height re-measured.

CAUTION: DO NOT grind the valve stem tip. The tip of the valve is hardened and grinding the tip will eliminate the hardened surface causing

premature wear and possible engine damage.

CAUTION: DO NOT use shims in order to adjust valve stem height. The use of shims will cause the valve spring to bottom out before the camshaft lobe is at peak lift and engine damage could result.

7. If the valve stem height still exceeds the maximum height specification, the cylinder head must be replaced.

CYLINDER HEAD ASSEMBLY (LEA, OR LUK)

Special Tools

- **EN-8062** Valve Spring Compressor
- **EN-9666** Valve Spring Tester
- **EN-43963** Valve Spring Compressor (off car)

For equivalent regional tools, refer to **Special Tools** .

Fig. 142: Cylinder Head Plugs
Courtesy of GENERAL MOTORS COMPANY

CAUTION: In order to avoid damage, install the spark plugs after the cylinder head has been installed on the engine.

CAUTION: Refer to Component Fastener Tightening Caution .

1. Install NEW cylinder head plugs. Coat the plugs with sealer. Refer to Adhesives, Fluids, Lubricants, and Sealers .
2. Inspect the valve springs for the following conditions:
 - Expanded height
 - Unparallel spring ends
 - Spring tension using **EN-9666** tester
 - Any distorted springs should be replaced

Fig. 143: Applying Prussian Blue
Courtesy of GENERAL MOTORS COMPANY

3. Inspect the valves and the valve seats. Refer to Valve and Seat Grinding.

Fig. 144: View of Valves

Courtesy of GENERAL MOTORS COMPANY

4. Install the valves (1). Replace the valves, if required.

Fig. 145: View of Valve Seals

Courtesy of GENERAL MOTORS COMPANY

NOTE: Always use NEW valve stem oil seals when assembling the cylinder head.

5. Install the NEW valve seals (1). Fully seat the seals on the valve guides.

Fig. 146: View of Valve Springs
Courtesy of GENERAL MOTORS COMPANY

6. Install the springs (1).

Fig. 147: View of Valve Keys and Retainer
Courtesy of GENERAL MOTORS COMPANY

WARNING: Compressed valve springs have high tension against the valve spring compressor. Valve springs that are not properly compressed by or released from the valve spring compressor can be ejected from the valve spring compressor with intense force. Use care when compressing or releasing the valve spring with the valve spring compressor and when removing or installing the valve stem keys. Failing to use care may cause personal injury.

CAUTION: Do not compress the valve springs to less than 24.0 mm (0.943 in). Contact between the valve spring retainer and the valve stem oil seal can cause potential valve stem oil seal damage.

7. Install the retainers and keys using the following procedure:
 1. Install the retainer (2).
 2. Using the **EN-8062** compressor and the **EN-43963** compressor , compress the valve spring.
 3. Install the valve keys (1).

4. Slowly release the **EN-8062** compressor and the **EN-43963** compressor (off car) from the valve/spring assembly.
5. Inspect for proper valve key seating.

Fig. 148: Intake Camshaft Position Sensor
Courtesy of GENERAL MOTORS COMPANY

8. Lubricate the camshaft position sensor O-ring with clean engine oil.

CAUTION: Refer to Fastener Caution .

9. Install the intake camshaft position sensor (1) and bolt. Tighten the bolt to 10 N.m (89 lb in).

Fig. 149: Identifying the Coolant Air Bleed Hose Fitting
Courtesy of GENERAL MOTORS COMPANY

10. Install the cylinder head air bleed tube (1) and tighten the tube to 15 N.m (11 lb ft).

OIL PUMP DISASSEMBLE

Fig. 150: Pressure Relief Valve
Courtesy of GENERAL MOTORS COMPANY

1. Remove the pressure relief plug (1), spring (2), and plunger (3).

Fig. 151: Oil Pump Assembly
Courtesy of GENERAL MOTORS COMPANY

2. Remove the oil pump gerotor cover (1) and bolts.
3. Clean all of the parts in cleaning solvent. Remove varnish, sludge and dirt.
4. Inspect the oil pump (2, 3) for wear and scoring. Ensure that all components are within specifications. Refer to **Engine Mechanical Specifications (LEA, or LUK)** .

Replace the front cover (4) and oil pump assembly if it is out of specification or damaged.

OIL PUMP ASSEMBLE

Fig. 152: Oil Pump Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Lubricate all oil pump parts with engine oil.
2. Install the inner gear (2) into the outer gear (3).

NOTE: If gears are improperly installed in the front cover, the gerotor cover will not bolt on.

3. Install the gears together into the front cover (4) with the hub of the center gear facing the front cover.

CAUTION: Refer to Fastener Caution .

4. Install the oil pump gerotor cover (1) and bolts and tighten to 6 N.m (53 lb in).

Fig. 153: Pressure Relief Valve
Courtesy of GENERAL MOTORS COMPANY

5. Install the pressure relief valve plunger (3).
6. Install the pressure relief valve spring (2).
7. Install and tighten the pressure relief valve plug (1) to 40 N.m (30 lb ft).

FUEL RAIL AND INJECTORS CLEANING AND INSPECTION (LEA, OR LUK)

Special Tools

- **EN-49245** Fuel Injector Seal Installer and Sizer
- **EN-49247** Injector Retaining Clip Installer

For equivalent regional tools, refer to **Special Tools** .

Fig. 154: Fuel Injectors And Retainers
Courtesy of GENERAL MOTORS COMPANY

1. Disconnect the electrical connections from the fuel injectors (1).

NOTE: Support the fuel rail along the bottom, indicated by the arrow. Support the fuel injector at the widest point, indicated by the arrow. DO NOT support or hold the fuel injector by the tip or connector when removing the fuel injector retainer.

2. Remove and discard the fuel injector retainer (2).

Fig. 155: Supporting Fuel Injector
Courtesy of GENERAL MOTORS COMPANY

NOTE: Support the fuel injector at the widest point, indicated by the arrow.
 Support the fuel rail at the point indicated by the arrow.

- DO NOT support or hold the fuel injector by the tip or connector
- DO NOT tilt or excessively twist the injector during removal

3. Remove the injectors (1) from the fuel rail by pulling straight out along the fuel injector axis. Slight rotation of the fuel injector is acceptable.

Fig. 156: Fuel Injector Bushing, O-Ring And Spacers
Courtesy of GENERAL MOTORS COMPANY

NOTE: Support the fuel injector at the widest point, and directly behind the bushing location, indicated by the arrows. DO NOT support or hold the fuel injector by the tip or connector when removing the fuel injector bushing.

4. Using a suitable tool, remove the fuel injector bushing (1) by pushing straight off at the bushing tabs, indicated by the arrows. Discard the bushing.
5. Remove and discard the fuel injector O-ring (3) and plastic spacers (2).

Fig. 157: Fuel Injector Seals

Courtesy of GENERAL MOTORS COMPANY

6. Remove and discard the fuel injector seals (1).

Fig. 158: Fuel Rail, Connector And Pressure Sensor
Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not soak or submerge the fuel rail or injectors in solvent.

7. Clean the exterior of the fuel rail (1) and injectors in solvent.
8. Inspect the fuel rail and components for the following conditions:
 - Damage, debris, or restrictions to the fuel rail
 - Damage, debris, or restrictions to the fuel ports in the fuel rail
 - Damage to the mounting area for the fuel rail
 - Damage to the fuel rail mounting bolts
 - Damage to the threads on the fuel rail fuel feed fitting
9. Replace the fuel rail if any damage is found. Do not attempt to repair a fuel rail.

CAUTION: Refer to **Fastener Caution** .

10. Inspect the fuel pressure sensor (3) for damage.
 1. Disconnect the harness connector (2) from the fuel pressure sensor.

2. Remove the fuel pressure sensor. Dry the fuel pressure sensor bore in the fuel rail with a lint free cloth. The bore should be free of fuel, debris, and burrs.
3. Lubricate the fuel rail fuel pressure sensor bore with clean engine oil.
4. Lubricate the threads and sealing area on the fuel pressure sensor with clean engine oil.
5. Install the fuel pressure sensor hand tight.
6. Remove the fuel pressure sensor and re-lubricate the bore, threads, and sealing area.
7. Install the fuel pressure sensor and tighten to 33 N.m (25 lb ft).
8. Connect the harness connector to the fuel pressure sensor.

Fig. 159: Fuel Injector Components

Courtesy of GENERAL MOTORS COMPANY

11. Inspect the fuel injectors for the following conditions:
 - Damage to the fuel injector connector (7)
 - Damage to the fuel injector harness connector
 - Damage to the fuel injector tip (1)
 - Damage to the tolerance ring (2)
12. Replace the fuel injector if any damage is found. Do not attempt to repair a fuel injector.

13. Install a new fuel injector bushing (3) onto the fuel injector. The bushing should seat with a distinct "snap" sound and feel.

NOTE: **DO NOT** reverse the order of the plastic spacers. Identify the correct order in which the new plastic spacers are installed by the color of the spacer.

14. Install the new white plastic spacer (4) on the fuel injector first.
15. Install the new brown plastic spacer (5) second.
16. Lubricate the new O-ring (6) with 5W30 engine oil.
17. Install the O-ring on the injector.

Fig. 160: Fuel Injectors

Courtesy of GENERAL MOTORS COMPANY

NOTE: **The injector must be fully installed and properly aligned with the fuel rail in order to install the retainer.**

18. Install the fuel injectors (1) into the fuel rail.
 - Ensure the fuel injector is fully seated in the fuel rail, and no gaps are present (2).
 - Ensure the injector and fuel rail flanges are aligned (3)

Fig. 161: Retainer Installer

Courtesy of GENERAL MOTORS COMPANY

NOTE: Ensure the retainer is set properly into EN-49247 installer.

- The notch should always face forward (1)
- The retainer should be behind the plate (2)
- The tool windows allow for visual alignment (3)

19. Install the fuel injector retainer onto the **EN-49247** installer.

Fig. 162: Installing Fuel Injector Retainer
Courtesy of GENERAL MOTORS COMPANY

NOTE: Ensure the tool is resting on the flange of the injector bushing (1).

20. Using **EN-49247** installer , install the fuel injector retainer.

Fig. 163: Proper Injector Retainer Installation
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Ensure the fuel injector retainer is properly installed. Failure to completely install the retainers may degrade fuel injection system performance or cause system malfunction.

21. Inspect each installed fuel injector retainer, and ensure the retainer is fully seated on the fuel rail and fuel injector bushing flanges (1). The flanges on each side and at the top of the fuel injector should seat completely into the window on the retainer.

Fig. 164: Fuel Rail Harness Connector
Courtesy of GENERAL MOTORS COMPANY

22. Connect the electrical connection to the fuel rail.
23. Connect the fuel rail harness connectors (1) to the fuel injectors.

Fig. 165: Installing Seals With Long Protector
Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not use any type of lubricant when installing the NEW seals (2) on the fuel injector tip.

24. Install **EN-49245-1** long protector (3) onto the fuel injector tip, covering the first recessed area closest to the tip. Place a NEW seal (2) on **EN-49245-1** long protector.
25. Using **EN-49245-3** pusher (1), install the seal into the second recessed area (4) of the fuel injector.

NOTE: The **EN-49245-4** sizer is two sided, and either direction will size the seal correctly.

26. Compress the seal with your fingers, then resize the seal using the **EN-49245-4** sizer (5).

Fig. 166: Installing Seals With Short Protector
Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not use any type of lubricant when installing the NEW seals (2) on the fuel injector tip.

27. Install **EN-49245-2** short protector (3) onto the fuel injector tip. Place a NEW seal (2) on **EN-49245-2** short protector.
28. Using **EN-49245-3** pusher (1), install the seal into the first recessed area (4) of the fuel injector.

NOTE: The **EN-49245-4** sizer is two sided, and either direction will size the seal correctly.

29. Compress the seal with your fingers, then resize the seal using the **EN-49245-4** sizer (5).

INTAKE MANIFOLD CLEANING AND INSPECTION (LEA, OR LUK)

Fig. 167: Intake Manifold And Intake Manifold Insulator
Courtesy of GENERAL MOTORS COMPANY

1. Clean the intake manifold (1) mating surfaces.
2. Inspect the intake manifold for damage.
3. Inspect the intake manifold for cracks near metallic inserts.
4. Clean and inspect the intake manifold insulator (2) for damage.

Fig. 168: Crankcase Ventilation Passages
Courtesy of GENERAL MOTORS COMPANY

5. Inspect the crankcase ventilation passages (1) in the intake manifold face for blockage.

WARNING: Refer to Safety Glasses Warning .

6. Clean the crankcase ventilation passages with compressed air if necessary. Use a maximum of 172 kPa (25 psi) of air pressure.
7. Replace the intake manifold as necessary.

EXHAUST MANIFOLD CLEANING AND INSPECTION (LEA, OR LUK)

Fig. 169: Exhaust Manifold, Oxygen Sensor And Heat Shield
Courtesy of GENERAL MOTORS COMPANY

NOTE:

- Do not reuse the exhaust manifold-to-cylinder head gaskets. Upon installation of the exhaust manifold, install a NEW gasket. An improperly installed gasket or leaking exhaust system may effect On-Board Diagnostics (OBD) II system performance.
- Remove the oxygen sensor prior to cleaning the manifold. Do not submerge the oxygen sensor in cleaning solvent.

1. Remove the oxygen sensor (3) from the manifold.
2. Clean the exhaust manifold (2) in solvent.

WARNING: Refer to Safety Glasses Warning .

3. Dry the exhaust manifold with compressed air.
4. Inspect the heat shield (1) for damage.

Fig. 170: Measuring Exhaust Manifold Mounting Face
Courtesy of GENERAL MOTORS COMPANY

5. Use a straight edge and a feeler gauge and measure the exhaust manifold mounting face (1) for warpage.

An exhaust manifold face with warpage in excess of 0.25 mm (0.0100 in) may cause an exhaust leak and may effect OBD II system performance. Exhaust manifolds not within specifications must be replaced.

OIL PAN CLEANING AND INSPECTION

Fig. 171: Oil Pan

Courtesy of GENERAL MOTORS COMPANY

1. Clean the oil pan mating surface.
2. Clean the oil pan (1). Remove all the sludge and the oil deposits.
3. Inspect the threads for the engine oil drain plug.
4. Inspect the oil pan for cracking near the pan rail and the transmission mounting points.
5. Inspect the oil pan for cracking resulting from impact or flying road debris.

NOTE: **The oil pan baffle and pickup screen are not removable from the oil pan.**

6. Inspect the oil pan baffle and pickup screen.
7. Repair or replace the oil pan as necessary.

THREAD REPAIR

Special Tools

EN 42385-850 Thread Repair Kit

For equivalent regional tools, refer to **Special Tools** .

General Thread Repair

Fig. 172: View Of Bushing Type Insert & Base Material
Courtesy of GENERAL MOTORS COMPANY

The thread repair process involves a solid, thin walled, self-locking, carbon steel, bushing type insert (1). During the bushing installation process, the driver tool expands the bottom external threads of the insert into the base material (2). This action mechanically locks the insert in place. Also, when installed to the proper depth, the flange of the insert will be seated against the counterbore of the repaired hole.

Fig. 173: Drilling & Tapping Threads
Courtesy of GENERAL MOTORS COMPANY

NOTE: The use of a cutting fluid, WD 40®, or equivalent, is recommended when performing the drilling, counterboring, and tapping procedures. Refer to Adhesives, Fluids, Lubricants, and Sealers .

Driver oil MUST be used on the installer driver tool.

The tool kits are designed for use with either a suitable tap wrench or drill motor.

1. Drill out the threads of the damaged hole (1).
 - M6 inserts require a minimum drill depth of 15 mm (0.59 in).
 - M8 inserts require a minimum drill depth of 20 mm (0.79 in).
 - M10 inserts require a minimum drill depth of 23.5 mm (0.93 in).

WARNING: Refer to Safety Glasses and Compressed Air Warning .

2. Using compressed air, clean out any chips.

Fig. 174: Identifying Tool Used To Counterbore The Hole
Courtesy of GENERAL MOTORS COMPANY

3. Counterbore the hole to the full depth permitted by the tool (1).
4. Using compressed air, clean out any chips.

Fig. 175: Drilling & Tapping Threads
Courtesy of GENERAL MOTORS COMPANY

5. Using a tap wrench (2), tap the threads of the drilled hole.
 - M6 inserts require a minimum tap depth of 15 mm (0.59 in).
 - M8 inserts require a minimum tap depth of 20 mm (0.79 in).
 - M10 inserts require a minimum tap depth of 23.5 mm (0.93 in).

WARNING: Refer to Safety Glasses and Compressed Air Warning .

WARNING: Refer to Cleaning Solvent Warning .

6. Using compressed air, clean out any chips.

7. Spray cleaner into the hole. Refer to Adhesives, Fluids, Lubricants, and Sealers .
8. Using compressed air, clean any cutting oil and chips out of the hole.

Fig. 176: Lubricating Installer Tool Using Driver Oil
Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not allow oil or other foreign material to contact the outside diameter (OD) of the insert.

9. Lubricate the threads of the installer tool (2) with the driver oil (1).

Fig. 177: View of Bushing Type Insert
Courtesy of GENERAL MOTORS COMPANY

10. Install the insert (2) onto the driver tool (1).

Fig. 178: Applying Threadlock To Insert
Courtesy of GENERAL MOTORS COMPANY

11. Apply threadlock LOCTITE™ 277, EN 42385-109 (1) loctite , or equivalent to the insert OD threads (2).

Fig. 179: View Of Insert In Tapped Bolt Hole
Courtesy of GENERAL MOTORS COMPANY

12. Install the insert (2) into the hole.

Install the insert until the flange of the insert contacts the counterbored surface. Continue to rotate the installer tool (1) through the insert.

The installer tool will tighten up before screwing completely through the insert. This is acceptable. You are forming the bottom threads of the insert and mechanically locking the insert to the base material threads.

Fig. 180: View Of Bushing Type Insert & Base Material
Courtesy of GENERAL MOTORS COMPANY

13. Inspect the insert for proper installation into the hole.

A properly installed insert (1) will be either flush or slightly below flush with the surface of the base material (2).

Cylinder Head Bolt Hole Thread Repair

Fig. 181: Identifying Thread Repair Kit Components
Courtesy of GENERAL MOTORS COMPANY

1. The cylinder head bolt hole thread repair kit consists of the following items:

- Drill (1)
- Tap (2)
- Installer (3)
- Sleeve (4)
- Alignment Pin (5)
- Bushing (6)
- Bolts (7)
- Fixture Plate (8)

Fig. 182: Identifying Fixture Plate, Bolts, & Bushing
Courtesy of GENERAL MOTORS COMPANY

WARNING: Refer to Safety Glasses and Compressed Air Warning .

NOTE: The use of a cutting fluid, WD 40®, or equivalent, is recommended when performing the drilling and tapping procedures. Refer to Adhesives, Fluids, Lubricants, and Sealers .

Driver oil **MUST** be used on the installer driver tool.

The tool kits are designed for use with either a suitable tap wrench or drill motor.

2. Install the fixture plate (3), bolts (1), and bushing (2) onto the engine block deck.

Position the fixture plate and bushing over the hole that is to be repaired (4).

Fig. 183: Identifying Alignment Pin
Courtesy of GENERAL MOTORS COMPANY

3. Position the alignment pin (1) through the bushing and into the hole.

4. With the alignment pin in the desired hole, tighten the fixture retaining bolts (2).
5. Remove the alignment pin from the hole.

Fig. 184: View Of Stop Collar & Counterbore Drill
Courtesy of GENERAL MOTORS COMPANY

6. Install the sleeve (2) onto the drill (1), if required.

Fig. 185: Drilling Out Threads Of Damaged Hole
Courtesy of GENERAL MOTORS COMPANY

NOTE: During the reaming process, it is necessary to repeatedly remove the drill and clean the chips from the hole.

7. Drill out the threads of the damaged hole.

Drill the hole until the stop collar of the drill bit or the sleeve contacts the bushing.

WARNING: Refer to Safety Glasses and Compressed Air Warning .

8. Using compressed air, clean out any chips.

Fig. 186: Tapping Threads Of Drilled Hole With Tap Wrench
Courtesy of GENERAL MOTORS COMPANY

9. Using a tap wrench, tap the threads of the drilled hole.

Fig. 187: View Of Fixture Plate, Drill Bushing & Tool Marking
Courtesy of GENERAL MOTORS COMPANY

10. Using a TAP wrench, tap the threads of the drilled hole.

In order to tap the new threads to the proper depth, rotate the tap into the hole until the mark (3) on the tap align with the top of the drill bushing (2).

11. Remove the fixture plate (1), bushing (2), and bolts.

WARNING: Refer to Safety Glasses and Compressed Air Warning .

WARNING: Refer to Cleaning Solvent Warning .

12. Using compressed air, clean out any chips.
13. Spray cleaner into the hole. Refer to **Adhesives, Fluids, Lubricants, and Sealers** .
14. Using compressed air, clean any cutting oil and chips out of the hole.

Fig. 188: Lubricating Installer Tool Using Driver Oil
Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not allow oil or other foreign material to contact the outside diameter (OD) of the insert.

15. Lubricate the threads of the installer tool (2) with the driver oil (1).

Fig. 189: View of Bushing Type Insert
Courtesy of GENERAL MOTORS COMPANY

16. Install the insert (2) onto the driver tool (1).

Fig. 190: Applying Threadlock To Insert
Courtesy of GENERAL MOTORS COMPANY

17. Apply threadlock LOCTITE™ 277, EN 42385-109 loctite (1), or equivalent to the insert OD threads (2).

Fig. 191: Installing & Inserting Driver Into Hole
Courtesy of GENERAL MOTORS COMPANY

18. Install the insert and driver (1) into the hole.

Rotate the driver tool until the mark on the tool aligns with the deck surface of the engine block.

The installer tool will tighten up before screwing completely through the insert. This is acceptable. You are forming the bottom threads of the insert and mechanically locking the insert to the base material threads.

Main Cap Bolt Hole Thread Repair

Fig. 192: Identifying Thread Repair Kit Components
Courtesy of GENERAL MOTORS COMPANY

1. The main cap bolt hole thread repair kit consists of the following items:
 - Drill (1)
 - Tap (2)
 - Installer (3)

- Fixture Plate (4)
- Long Bolts (5)
- Short Bolts (6)
- Alignment Pin (7)
- Bushing (8)

Fig. 193: Identifying Alignment Dowel Pins
Courtesy of GENERAL MOTORS COMPANY

2. Remove the alignment dowel pins from the holes (1-4), if necessary.

Fig. 194: Installing Fixture Plate, Bolt, & Bushing Onto Engine Block
Courtesy of GENERAL MOTORS COMPANY

3. Install the fixture plate, bolt, and bushing, onto the engine block.

Position the fixture plate and bushing over the hole that is to be repaired.

4. Position the alignment pin in the desired hole and tighten the fixture retaining bolts.
5. Drill out the damaged hole.

WARNING: Refer to Safety Glasses and Compressed Air Warning .

6. Using compressed air, clean out any chips.

Fig. 195: View Of Fixture Plate, Drill Bushing & Tool Marking
Courtesy of GENERAL MOTORS COMPANY

7. Using a tap wrench, tap the threads of the drilled hole.

In order to tap the new threads to the proper depth, rotate the tap into the hole until the mark (3) on the tap aligns with the top of the bushing (2).

WARNING: Refer to Safety Glasses and Compressed Air Warning .

WARNING: Refer to Cleaning Solvent Warning .

8. Using compressed air, clean out any chips.
9. Spray cleaner into the hole. Refer to **Adhesives, Fluids, Lubricants, and Sealers** .

10. Using compressed air, clean any cutting oil and chips out of the hole.

Fig. 196: Lubricating Installer Tool Using Driver Oil
Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not allow oil or other foreign material to contact the outside diameter (OD) of the insert.

11. Lubricate the threads of the installer tool (2) with the driver oil (1).

Fig. 197: View of Bushing Type Insert
Courtesy of GENERAL MOTORS COMPANY

12. Install the insert (2) onto the driver tool (1).

Fig. 198: Applying Threadlock To Insert
Courtesy of GENERAL MOTORS COMPANY

13. Apply threadlock LOCTITE™ 277, EN 42385-109 (1), or equivalent to the insert OD threads (2).

Fig. 199: View Of Fixture Plate, Drill Bushing & Tool Marking
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The fixture plate and bushing remains installed onto the engine block during the insert installation procedure.**

14. Install the insert and driver through the bushing (2), fixture plate (1) and into the hole.

Rotate the driver tool until the mark on the tool (3) aligns with the top of the bushing (2).

The installer tool will tighten up before screwing completely through the insert. This is acceptable. You are forming the bottom threads of the insert and mechanically locking the insert to the base material threads.

15. Remove the driver, bushing (2), fixture plate (1), and bolts.

Fig. 200: Identifying Alignment Dowel Pins
Courtesy of GENERAL MOTORS COMPANY

16. Install the alignment dowel pins in holes (1-4), if necessary.

SERVICE PRIOR TO ASSEMBLY

The importance of cleanliness during assembly cannot be overstated. Dirt or debris will cause engine damage. An automobile engine is a combination of many machined, honed, polished and lapped surfaces with tolerances that are measured in ten thousandths of an inch. When any internal engine parts are serviced, care and cleanliness are important. A liberal coating of engine oil should be applied to friction areas during assembly in order to protect and lubricate the surfaces on initial operation. Throughout this section, it should be understood that proper cleaning and protection of machined surfaces and friction areas are part of the repair procedure. This is considered standard shop practice even if not specifically stated.

Lubricate all moving parts with engine oil or a specified assembly lubricant. This will provide lubrication for initial start up.

ENGINE BLOCK ASSEMBLE

Fig. 201: Locating Block Plugs

Courtesy of GENERAL MOTORS COMPANY

1. Apply sealant to all plugs (1, 2, 3) prior to installation. Refer to **Adhesives, Fluids, Lubricants, and Sealers** .
2. Install the drain plug, with sealant, in the water pump.

CAUTION: Refer to Fastener Caution .

3. Install the coolant jacket plugs, with sealant, and tighten to 35 N.m (26 lb ft).
4. Install the rear oil passage plugs, with sealant, and tighten to 60 N.m (44 lb ft).
5. Install the other oil passage plugs, with sealant, and tighten to 35 N.m (26 lb ft).

Fig. 202: Oil Pressure Switch

Courtesy of GENERAL MOTORS COMPANY

6. Lubricate the crankshaft position sensor O-ring with engine oil. Refer to **Adhesives, Fluids, Lubricants, and Sealers** .
7. Install the crankshaft position sensor (1) and bolt and tighten to 10 N.m (89 lb in).
8. Install the oil pressure switch (2) and tighten to 26 N.m (19 lb ft).

Fig. 203: Knock Sensor

Courtesy of GENERAL MOTORS COMPANY

9. Install the knock sensor (1) and bolt and tighten to 25 N.m (18 lb ft).

Fig. 204: Piston Oil Nozzle Assembly
Courtesy of GENERAL MOTORS COMPANY

10. Install the piston oil nozzle assemblies (1), if equipped.
11. Install the piston oil nozzle assembly bolts and tighten to 15 N.m (11 lb ft).

CRANKSHAFT AND BEARING INSTALLATION

Special Tools

- **EN-8087** Cylinder Bore Checking Gauge
- **EN 45059** Angle Meter

For equivalent regional tools, refer to **Special Tools** .

Fig. 205: Measuring Bearing Bore

Courtesy of GENERAL MOTORS COMPANY

NOTE:

- Crankshaft bearings **MUST** be separated, marked, or organized in a way to ensure installation to their original location and position, when suitable for use.
- If crankshaft bearing failure is due to other than normal wear, investigate the cause. Inspect the crankshaft or connecting rod bearing bores.

Inspect the connecting rod bearing bores or crankshaft main bearing bores using the following procedure:

- Tighten the bedplate to specification using the **EN 45059** meter.
- Measure the bearing bore for taper and out-of-round using the **EN-8087** gauge (1).
- No taper or out-of-round should exist.

Bearing Selection

1. Measure the bearing clearance to determine the correct replacement bearing insert size. There are 2 methods to measure bearing clearance. Method A gives more reliable results and is preferred.

- Method A yields measurement from which the bearing clearance can be computed.
- Method B yields the bearing clearance directly. Method B does not give any indication of bearing run-out.

Fig. 206: View of Measuring Crankshaft Bearing Journal Using Method A
 Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not mix inserts of different nominal size in the same bearing bore.

2. To measure bearing clearance using Method A, use the following procedure:
 1. Measure the crankshaft bearing journal diameter with a micrometer (1) in several places, 90 degrees apart. Average the measurements.
 2. Measure the crankshaft bearing journal taper and runout.
 3. Install the lower crankcase and tighten the bearing cap bolts to specification.
 4. Measure bearing inside diameter (ID) in several places 90 degrees apart, average measurements.
 5. Subtract journal measurement from bearing ID measurement to determine clearance.
 6. Determine whether clearance is within specification.
 7. If out of specification, choose different inserts.

8. Measure the connecting rod inside diameter in the same direction as the length of the rod with an inside micrometer.
9. Measure the crankshaft main bearing inside diameter with an inside micrometer.

Fig. 207: Measuring Bearing Clearance Using Method B
Courtesy of GENERAL MOTORS COMPANY

3. To measure bearing clearance using Method B, use the following procedure:
 1. Clean the used bearing inserts.
 2. Install the used bearing inserts.
 3. Place a piece of gaging plastic across the entire bearing width.
 4. Install the bearing caps.

CAUTION: In order to prevent the possibility of cylinder block or crankshaft bearing cap damage, the crankshaft bearing caps are tapped into the cylinder block cavity using a brass, lead, or a leather mallet before the attaching bolts are installed. Do not

use attaching bolts to pull the crankshaft bearing caps into the seats. Failure to use this process may damage a cylinder block or a bearing cap.

5. Install the bearing cap bolts to specification.

NOTE: Do not rotate the crankshaft.

6. Remove the bearing cap, leaving the gauging plastic in place. It does not matter whether the gauging plastic adheres to the journal or to the bearing cap.
7. Measure the gauging plastic at its widest point with the scale (1) printed on the gauging plastic package.
8. Remove the gauging plastic.

LOWER CRANKCASE INSTALLATION

Special Tools

EN 45059 Angle Meter

For equivalent regional tools, refer to **Special Tools** .

Fig. 208: View of Upper Crankshaft Bearings
Courtesy of GENERAL MOTORS COMPANY

NOTE: Crankshaft bearings **MUST** be separated, marked, or organized in a way to ensure installation to their original location and position, when suitable for use.

1. Install the upper crankshaft bearings (1) and lubricate bearing surfaces with engine oil.

Fig. 209: View of Crankshaft
Courtesy of GENERAL MOTORS COMPANY

2. Install the crankshaft (1) on the journals.

Fig. 210: View of Lower Bearing Halves
Courtesy of GENERAL MOTORS COMPANY

3. Install the lower bearing halves (1), without grooves, into the lower crankcase. Apply oil to bearing surfaces.

Fig. 211: View of Bead of Sealer on Bedplate Mating Surface
Courtesy of GENERAL MOTORS COMPANY

NOTE:

- The block assembly surface must be free of contamination prior to applying the sealer.
- Install and align the bedplate to block within 20 minutes of applying the sealer.
- The bedplate must be fastened to final torque specification within 60 minutes of applying the sealer.

4. Apply a 4.25 mm bead of sealer, dimension (a), directly in the groove of the block to bedplate mating surfaces. Refer to **Adhesives, Fluids, Lubricants, and Sealers** .

Fig. 212: View of Lower Crankcase
Courtesy of GENERAL MOTORS COMPANY

5. Install the lower crankcase (1). Tap gently into place with a suitable tool if necessary. Ensure it is aligned properly on the dowels.

Fig. 213: Identifying Crankshaft Bearing Bolt Tightening Sequence
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

6. Install the NEW crankshaft bearing bolts in sequence finger tight.
 1. Tighten the crankshaft bearing bolts in sequence to 20 N.m (15 lb ft).
 2. Tighten the crankshaft bearing bolts in sequence using the **EN 45059** meter an additional 70 degrees.

Fig. 214: Lower Crankcase Perimeter Bolt Tightening Sequence
Courtesy of GENERAL MOTORS COMPANY

7. Tighten the lower crankcase perimeter bolts in sequence to 25 N.m (18 lb ft).

CRANKSHAFT REAR OIL SEAL INSTALLATION

Special Tools

EN-42067 Rear Main Seal Installer

For equivalent regional tools, refer to **Special Tools** .

Fig. 215: Rear Crankshaft Seal And Installer
 Courtesy of GENERAL MOTORS COMPANY

1. Remove excess sealer from seal recess.
2. Lubricate the outside diameter of the new crankshaft seal with clean engine oil.
3. Using the **EN-42067** installer (1), press the new crankshaft seal into the housing. The **EN-42067** installer also establishes the depth of the seal in the crankshaft seal bore.

PISTON, CONNECTING ROD, AND BEARING INSTALLATION (LEA, OR LUK)

NOTE: This procedure is not used in Europe.

Special Tools

- **EN-43966** Connecting Rod Guides
- **EN 45059** Angle Meter
- **EN-47836** Piston Ring Compressor

For equivalent regional tools, refer to **Special Tools** .

Fig. 216: View Of Connecting Rod Guides
Courtesy of GENERAL MOTORS COMPANY

1. Install the connecting rod bearings. Use NEW bearings.
 1. Install the bearing inserts into the connecting rod and the connecting rod cap.
 2. Lubricate the connecting rod bearings with engine oil.
2. Install the **EN-43966** guides (1) into the connecting rod bolt holes. This protects the crankshaft journal during piston and connecting rod installation.
3. Install **EN-47836** compressor , piston, and the connecting rod to the correct bore.
 1. Stagger each piston ring end gap equally around the piston.
 2. Lubricate the piston and the piston rings with engine oil.
 3. Do not disturb the piston ring end gap location.
 4. The piston must be installed so that the mark on the top of the piston faces the front of the engine.
 5. Place the piston in its matching bore.
 6. Tap the piston into its bore with a hammer handle. Guide the connecting rod to the connecting rod journal while tapping the piston into place.
 7. Hold the **EN-47836** compressor against the engine block until all the rings have entered the cylinder bore.

8. Remove the connecting rod guides from the connecting rod bolt holes.

Fig. 217: View of Connecting Rod Cap
Courtesy of GENERAL MOTORS COMPANY

NOTE: Ensure that the connecting rod cap is properly oriented on the connecting rod.

4. Install the connecting rod cap (1).

CAUTION: Refer to Fastener Caution .

5. Install the connecting rod bolts. Always use new bolts. Tighten the connecting rod bolts to 25 N.m (18 lb ft), plus 100 degrees using the **EN 45059** meter.
6. Install the remaining connecting rods and piston assemblies.

Fig. 218: View of Checking Rod Side Clearance With Feeler Gauge
Courtesy of GENERAL MOTORS COMPANY

7. Measure the connecting rod side clearance with a feeler gauge (1).

The correct clearance is 0.07-0.37 mm (0.0027-0.0145 in).

CYLINDER HEAD INSTALLATION (LEA, OR LUK)

Special Tools

EN 45059 Angle Meter

For equivalent regional tools, refer to **Special Tools**

Fig. 219: Cylinder Head

Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not use any sealing material.

1. Install the cylinder head gasket to the block.
2. Install the cylinder head. Ensure the number 1 cylinder is at top dead center (TDC). The key on the crankshaft should be on top in the 12 o'clock position.

Fig. 220: Identifying Cylinder Head Bolt Tightening Sequence
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

NOTE: Always use **NEW** cylinder head bolts.

3. Install the cylinder head bolts.
 1. Tighten the bolts in sequence to 30 N.m (22 lb ft).
 2. Tighten the bolts an additional 155 degrees in sequence using the **EN 45059** meter.

Fig. 221: Locating Front Cylinder Head Bolts
Courtesy of GENERAL MOTORS COMPANY

4. Install the front cylinder head bolts and tighten to 30 N.m (22 lb ft).

INTAKE AND EXHAUST CAMSHAFT, BEARING CAP, AND LASH ADJUSTER INSTALLATION (LEA, OR LUK)

Exhaust Camshaft Installation

Fig. 222: Hydraulic Lash Adjusters
Courtesy of GENERAL MOTORS COMPANY

1. Install the hydraulic lash adjusters into their bores in the cylinder head and lubricate. Refer to **Adhesives, Fluids, Lubricants, and Sealers** .

Fig. 223: Valve Tips
Courtesy of GENERAL MOTORS COMPANY

2. Lubricate the valve tips. Refer to **Adhesives, Fluids, Lubricants, and Sealers** .

Fig. 224: Exhaust Camshaft Roller Finger Followers
Courtesy of GENERAL MOTORS COMPANY

NOTE: Used roller followers must be returned to the original position on the camshaft. If the camshaft is being replaced, the roller followers actuated by the camshaft must also be replaced.

3. Position the roller followers on the tip of the valve stem and on the lash adjuster and lubricate. Refer to **Adhesives, Fluids, Lubricants, and Sealers** .

Fig. 225: Camshaft Notches

Courtesy of GENERAL MOTORS COMPANY

NOTE: The engine is timed top-dead center exhaust stroke.

4. When installing the camshafts, ensure the intake camshaft notch is in the 10 o'clock position (2) and the exhaust camshaft notch is in the 7 o'clock position (1). The number 1 piston should be at top dead center (TDC), crankshaft key at 12 o'clock.

Fig. 226: Intake Camshaft & Caps
Courtesy of GENERAL MOTORS COMPANY

5. Set the exhaust camshaft on top of the roller followers in the camshaft bearing journals and lubricate. Refer to **Adhesives, Fluids, Lubricants, and Sealers** .

Fig. 227: Oil Seals

Courtesy of GENERAL MOTORS COMPANY

6. Rotate the oil seal in the groove of the number one camshaft journal so the split line (1) is at approximately the 12:00 position before installing the camshaft caps.

Fig. 228: Camshaft Notches

Courtesy of GENERAL MOTORS COMPANY

7. Install the exhaust camshaft with the notch on the front (1) at approximately the 7 o'clock position.
8. Install the camshaft caps and hand start the camshaft cap bolts.

CAUTION: Refer to Fastener Caution .

9. Tighten the camshaft cap bolts in increments of 3 turns until they are seated. Tighten the camshaft caps to 10 N.m (89 lb in).

Fig. 229: Exhaust Camshaft Position Actuator Solenoid Valve & Bolt
Courtesy of GENERAL MOTORS COMPANY

10. Install the exhaust camshaft position actuator solenoid valve (2). Tighten the solenoid valve bolt (1) to 10 N.m (89 lb in).

Intake Camshaft Installation

Fig. 230: Hydraulic Lash Adjusters
Courtesy of GENERAL MOTORS COMPANY

1. Install the hydraulic lash adjusters into their bores in the cylinder head.
2. Lubricate the hydraulic lash adjusters. Refer to **Adhesives, Fluids, Lubricants, and Sealers** .

Fig. 231: Valve Tips

Courtesy of GENERAL MOTORS COMPANY

3. Lubricate the valve tips. Refer to Adhesives, Fluids, Lubricants, and Sealers .

Fig. 232: Intake Camshaft Roller Finger Followers
Courtesy of GENERAL MOTORS COMPANY

NOTE: Used roller followers must be returned to the original position on the camshaft. If the camshaft is being replaced, the roller followers actuated by the camshaft must also be replaced.

4. Position the roller followers on the tip of the valve stem and on the lash adjuster. Lubricate roller followers. Refer to **Adhesives, Fluids, Lubricants, and Sealers** .

Fig. 233: Camshaft Notches

Courtesy of GENERAL MOTORS COMPANY

NOTE: The engine is timed top-dead center exhaust stroke.

5. When installing the camshafts, ensure the intake camshaft notch is in the 10 o'clock position (2) and the exhaust camshaft notch is in the 7 o'clock position (1). The number 1 piston should be at top dead center (TDC), crankshaft key at 12 o'clock.

Fig. 234: Intake Camshaft & Caps
Courtesy of GENERAL MOTORS COMPANY

6. Set the intake camshaft on top of the roller followers in the camshaft bearing journals and lubricate. Refer to **Adhesives, Fluids, Lubricants, and Sealers** .

Fig. 235: Oil Seals

Courtesy of GENERAL MOTORS COMPANY

7. Rotate the oil seal in the groove of the number one camshaft journal so the split line (1) is at approximately the 12:00 position before installing the camshaft caps.

Fig. 236: Camshaft Notches

Courtesy of GENERAL MOTORS COMPANY

NOTE: The number 1 cylinder must be at top dead center (TDC), crankshaft keyway at the 12 o'clock position.

8. Install the intake camshaft with the notch on the front at approximately the 10 o'clock position (2).
9. Install the camshaft caps and hand start the camshaft cap bolts.
10. Tighten the camshaft cap bolts in increments of 3 turns until they are seated. Tighten the camshaft caps to 10 N.m (89 lb in).

Fig. 237: Sealer Application Areas
 Courtesy of GENERAL MOTORS COMPANY

- NOTE:** It is critical during installation to ensure the bearing rear cap and cylinder head alignment is correct and the mating surfaces are flush.
- Ensure that all sealing material has been removed from the components, and the sealing surfaces are clean and free of contamination prior to applying the sealer.
 - Install and align the rear cap within 20 minutes of applying the sealer.

- NOTE:** Apply the sealer to all locations centrally locating the bead on the rail.
- Run bead to 5.0 mm, dimension a, as shown.
 - Where the cap ends on the perimeter rail, extend bead approximately 4.0 mm beyond edge of cap.
 - Run bead, dimension c, 32 mm from the edge of the cylinder head as shown.
 - Run beads, dimension b, 20 mm from edge of cylinder head as shown.

11. Apply a 2.5 mm bead of sealer to the cylinder head at the number 6 intake camshaft rear cap mating surface. Refer to **Adhesives, Fluids, Lubricants, and Sealers** .
12. Install the number 6 intake camshaft rear cap.
 1. Tighten the cap bolts evenly to 5 N.m (44 lb in).
 2. Tighten the cap bolts evenly to 10 N.m (89 lb in).
 3. Back the cap bolts out 120 degrees.
 4. Tighten the cap bolts evenly a final pass to 10 N.m (89 lb in).

Fig. 238: Identifying Fuel Pump Roller Lifter Orifice
Courtesy of GENERAL MOTORS COMPANY

13. Remove all excess sealing material from the fuel pump roller lifter bore (1), and ensure the bore is free of debris. Do not allow any excess sealing material to remain within the cylinder head or on any sealing surface.
14. Remove all excess sealing material from the fuel pump assembly sealing surface (2).

Fig. 239: Rear Cylinder Head Cover Plate
Courtesy of GENERAL MOTORS COMPANY

15. Verify the seal on the cylinder head cover plate (1) is intact and in good condition.
16. Ensure that the opening plate sealing surface is clean and free of excess sealing material. Install the rear cylinder head opening plate (1) and tighten the bolts to 10 N.m (89 lb in).

Fig. 240: Intake Camshaft Position Actuator Solenoid Valve & Bolt
Courtesy of GENERAL MOTORS COMPANY

17. Install the intake camshaft position actuator solenoid valve (2). Tighten the solenoid valve bolt (1) to 10 N.m (89 lb in).

BALANCE SHAFT INSTALLATION

NOTE: This procedure is not used in Europe.

Special Tools

EN-43650 Balance Shaft Bushing Remover/Installer

For equivalent regional tools, refer to **Special Tools** .

Fig. 241: Balance Shaft Bushing Remover/Installer
Courtesy of GENERAL MOTORS COMPANY

1. Install the balance shaft bushing using the **EN-43650** installer (1).

Fig. 242: Seat Balance Shaft Bushing Into Bore Using Balance Shaft Bushing Remover/Installer
Courtesy of GENERAL MOTORS COMPANY

2. Seat the balance shaft bushing into the bore using the **EN-43650** installer (1) and a wrench.
3. When the **EN-43650** installer is fully seated in the engine block, remove it with a wrench.

Fig. 243: View of Balance Shaft Bolts
Courtesy of GENERAL MOTORS COMPANY

NOTE: If the balance shafts are not properly timed to the engine, the engine may vibrate or make noise.

4. Place the number one piston at top dead center (TDC).
5. Lubricate the balance shaft lobes with engine oil.
6. Install the balance shafts (1) into their bores.

CAUTION: Refer to Fastener Caution .

7. Install the balance shaft retaining bolts and tighten to 10 N.m (89 lb in).

WATER PUMP INSTALLATION

Prior to installing the water pump, read the entire procedure. Pay special attention to avoid part damage and to ensure proper sealing.

Fig. 244: Water Pump Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Install the water pump assembly (1).
2. Install the water pump bolts. Finger tighten the bolts.

CAUTION: Refer to Fastener Caution .

3. Tighten the water pump bolts to 25 N.m (18 lb ft).
4. Apply sealant to the water pump drain plug. Refer to **Adhesives, Fluids, Lubricants, and Sealers** .
5. Install the water pump drain plug, if necessary. Tighten to 20 N.m (15 lb ft).

Fig. 245: Water Feed Tube And Thermostat Housing
Courtesy of GENERAL MOTORS COMPANY

6. Install the water feed tube (1).
7. Lubricate the feed tube O-ring with antifreeze.
8. Install the water feed tube by twisting and pushing toward the water pump. Take care not to tear or damage the O-ring.
9. Install the thermostat housing (2) to block bolts and stud and tighten to 10 N.m (89 lb in).

Fig. 246: Engine Coolant Temperature Sensor
Courtesy of GENERAL MOTORS COMPANY

10. Install the engine coolant temperature sensor (1) by hand.
11. Tighten the engine coolant temperature sensor and tighten to 20 N.m (15 lb ft).

BALANCE SHAFT TO ENGINE TIMING (LEA, OR LUK)

Fig. 247: Aligning Balance Shaft Drive Chain
 Courtesy of GENERAL MOTORS COMPANY

1. Install the balance shaft drive sprocket.

NOTE: **If the balance shafts are not properly timed to the engine, the engine may vibrate or make noise.**

2. Install the balance shaft drive chain with the colored links lined up on with the marks on the balance shaft drive sprockets and the crankshaft sprocket. There are three colored links on the chain. Two links are of matching colors, and one link is of a unique color. Use the following procedure to line up the links with the sprockets:

Orient the chain so that the colored links are visible.

3. Place the uniquely colored link (1) so that it lines up with the timing mark on the intake side balance shaft sprocket.
4. Working clockwise around the chain, place the first matching colored link (2) in line with the timing mark on the crankshaft drive sprocket, approximately 6 o'clock position on the crank sprocket.
5. Place the chain (3) on the water pump drive sprocket. The alignment is not critical.
6. Align the last matching colored link (4) with the timing mark on the exhaust side balance shaft drive

sprocket.

WATER PUMP AND BALANCE SHAFT CHAIN AND TENSIONER INSTALLATION

Fig. 248: Upper Balance Shaft Drive Chain Guide
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

NOTE: If the balance shafts are not properly timed to the engine, the engine may vibrate and make noise.

1. Install the upper balance shaft chain guide (1) and bolts and tighten to 12 N.m (106 lb in).

Fig. 249: Small Balance Shaft Chain Guide
Courtesy of GENERAL MOTORS COMPANY

2. Install the small balance shaft chain guide (1).
3. Install the balance shaft chain guide bolts and tighten to 12 N.m (106 lb in).

Fig. 250: Adjustable Balance Shaft Drive Chain Guide
Courtesy of GENERAL MOTORS COMPANY

4. Install the adjustable balance shaft drive chain guide (1).
5. Install the adjustable balance shaft drive chain guide bolts and tighten to 10 N.m (89 lb in).

Fig. 251: Timing Chain Tensioner

Courtesy of GENERAL MOTORS COMPANY

6. Reset the timing chain tensioner (1) by performing the following steps:
 1. Turn the tensioner plunger 90 degrees in its bore and compress the plunger.
 2. Turn the tensioner back to the original 12 o'clock position and insert a paper clip through the hole in the plunger body and into the hole in the tensioner plunger.
7. Install the timing chain tensioner.
8. Install the chain tensioner bolts and tighten to 10 N.m (89 lb in).
9. Remove the paper clip from the balance shaft drive chain tensioner.

CAMSHAFT TIMING CHAIN, SPROCKET, AND TENSIONER INSTALLATION (LEA, OR LUK)

Special Tools

- **EN-45027** Tensioner Tool
- **EN 45059** Angle Meter
- **EN-48953** Camshaft Actuator Locking Tool

For equivalent regional tools, refer to **Special Tools** .

Fig. 252: Camshaft Notches

Courtesy of GENERAL MOTORS COMPANY

NOTE: The engine is timed top-dead center exhaust stroke.

1. Ensure the intake camshaft notch is in the 10 o'clock position (2) and the exhaust camshaft notch is in the 7 o'clock position (1). The number 1 piston should be at top dead center (TDC), crankshaft key at 12 o'clock.

Fig. 253: View of Friction Washer and Timing Chain Drive Sprocket
Courtesy of GENERAL MOTORS COMPANY

2. Install a friction washer (1), if equipped.
3. Install the timing chain drive sprocket (3) to the crankshaft with the timing mark (2) in the 5 o'clock position and the front of the sprocket facing out.

NOTE: The outer spacer/washer (1) is in between the crank/balancer pulley and the lower timing gear and may remain in place when the pulley is removed. The spacer/washer (1) has a dot/mark on its surface that may be mistaken for the lower timing mark, and blocks the proper timing mark on the gear from view. The outer spacer/washer (1) must be removed when timing the engine in order to view the correct timing mark on the lower crank gear.

4. Install a second friction washer (1), if equipped.

Fig. 254: Identifying Colored Links On Timing Chain
Courtesy of GENERAL MOTORS COMPANY

NOTE: There are three colored links on the timing chain. Two links are of matching color, and one link is of a unique color. Use the following procedure to line up the links with the actuators. Orient the chain so that the colored links are visible.

5. Assemble the intake camshaft actuator into the timing chain with the timing mark lined up with the uniquely colored link (1).

Fig. 255: Identifying Cylinder Head Opening
Courtesy of GENERAL MOTORS COMPANY

6. Lower the timing chain through the opening in the cylinder head. Use care to ensure that the chain goes around both sides of the cylinder block bosses (1, 2).
7. Install the intake camshaft actuator onto the intake camshaft while aligning the dowel pin into the camshaft slot.

NOTE: Always use NEW actuator bolts.

8. Hand tighten the new intake camshaft actuator bolt.

Fig. 256: Identifying Timing Mark on Crankshaft Sprocket and Lining Up With First Matching Colored Link

Courtesy of GENERAL MOTORS COMPANY

9. Route the timing chain around the crankshaft sprocket and line up the first matching colored link (1) with the timing mark on the crankshaft sprocket, in approximately the 5 o'clock position.

Fig. 257: View of Adjustable Timing Chain Guide Bolt.
Courtesy of GENERAL MOTORS COMPANY

10. Rotate the crankshaft clockwise to remove all chain slack. Do not rotate the intake camshaft.

CAUTION: Refer to Fastener Caution .

11. Install the adjustable timing chain guide (1) down through the opening in the cylinder head and install the adjustable timing chain bolt and tighten to 10 N.m (89 lb in).

Fig. 258: View of Exhaust Camshaft Actuator
Courtesy of GENERAL MOTORS COMPANY

12. Install the exhaust camshaft actuator (1) into the timing chain with the timing mark lined up with the second matching colored link.

Fig. 259: Exploded View of Exhaust Camshaft Actuator
Courtesy of GENERAL MOTORS COMPANY

NOTE: Always install NEW actuator bolts.

13. Install the exhaust camshaft actuator (1) onto the exhaust camshaft, aligning the dowel pin into the camshaft slot.
14. Using a 23-24 mm open end wrench, rotate the exhaust camshaft clockwise until the dowel pin in the camshaft actuator goes into the camshaft slot.

Fig. 260: View of Actuator

Courtesy of GENERAL MOTORS COMPANY

15. When the actuator (1) seats on the cam, tighten the new exhaust camshaft actuator bolt hand tight.
16. Verify that all of the colored links and the appropriate timing marks are still aligned. If they are not, repeat the portion of the procedure necessary to align the timing marks.

Fig. 261: View of Fixed Timing Chain Guide
Courtesy of GENERAL MOTORS COMPANY

17. Install the fixed timing chain guide (1) and bolts and tighten to 12 N.m (106 lb in).

Fig. 262: View of Timing Chain and Tensioner
Courtesy of GENERAL MOTORS COMPANY

18. Install the upper timing chain guide (1) and bolts and tighten to 10 N.m (89 lb in).

Fig. 263: Compressing Timing Chain Tensioner
Courtesy of GENERAL MOTORS COMPANY

19. Reset the timing chain tensioner by performing the following steps:
 1. Remove the snap ring.
 2. Remove the piston assembly from the body of the timing chain tensioner.
 3. Install the **EN-45027-2 (2)** tensioner into a vise.
 4. Install the notch end of the piston assembly into the **EN-45027-2 (2)** tensioner.
 5. Using the **EN-45027-1 (1)** tensioner , turn the ratchet cylinder into the piston.
 6. Reinstall the piston assembly into the body of the tensioner.
 7. Install the snap ring.

Fig. 264: View of Timing Chain Tensioner Seal
Courtesy of GENERAL MOTORS COMPANY

20. Inspect the timing chain tensioner seal for damage. If damaged, replace the seal.
21. Inspect to ensure all dirt and debris is removed from the timing chain tensioner threaded hole in the cylinder head.

NOTE: Ensure the timing chain tensioner seal is centered throughout the torque procedure to eliminate the possibility of an oil leak.

22. Install the timing chain tensioner assembly (1) and tighten to 75 N.m (55 lb ft).

NOTE: The timing chain tensioner is released by compressing it 2 mm (0.079 in), which will release the locking mechanism in the ratchet.

23. The crankshaft balancer must be installed in order to release the tensioner. Refer to **Crankshaft Balancer Installation**.

Fig. 265: View Locking Tool

Courtesy of GENERAL MOTORS COMPANY

24. Install **EN-48953** locking tool (1) and tighten the bolts into the cylinder head to 10 N.m (89 lb in).
25. Using a torque wrench, tighten the intake camshaft actuator bolt to 30 N.m (22 lb ft), plus 100 degrees using the **EN 45059** meter.
26. Using a torque wrench, tighten the exhaust camshaft actuator bolt to 30 N.m (22 lb ft), plus 100 degrees using the **EN 45059** meter.
27. Remove **EN-48953** locking tool.

Fig. 266: View of Timing Chain Oil Nozzle
Courtesy of GENERAL MOTORS COMPANY

28. Install the timing chain oiling nozzle (1) and tighten the bolt to 10 N.m (89 lb in).

Fig. 267: View of timing Chain Guide Bolt Access Hole Plug
Courtesy of GENERAL MOTORS COMPANY

29. Apply sealant to the thread of the timing chain guide bolt access hole plug. Refer to **Adhesives, Fluids, Lubricants, and Sealers** .
30. Install the timing chain guide bolt access hole plug (1) and tighten to 75 N.m (55 lb ft).

CRANKSHAFT FRONT OIL SEAL INSTALLATION

Special Tools

EN-35268-A Camshaft/Front Main Seal Installer

For equivalent regional tools, refer to **Special Tools** .

Fig. 268: Istalling Crankshaft Front Oil Seal
Courtesy of GENERAL MOTORS COMPANY

1. Install the seal (2) into the front cover using the **EN-35268-A** installer (1).
2. Ensure that the engine front cover is properly supported when installing the seal.

ENGINE FRONT COVER AND OIL PUMP INSTALLATION (LUK)

Fig. 269: View Of Engine Front Cover & Gasket
Courtesy of GENERAL MOTORS COMPANY

1. Install the engine front cover (1) with a new gasket (2).

Fig. 270: Engine Front Cover Bolts & Long Water Pump Bolt
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

NOTE: The center bolt (1) should be tightened last.

2. Install the engine front cover bolts and tighten to 25 N.m (18 lb ft).
3. Install the long water pump bolt (1) and tighten to 25 N.m (18 lb ft).

Fig. 271: Drive Belt Tensioner Bracket And Bolts
Courtesy of GENERAL MOTORS COMPANY

4. Install the drive belt tensioner bracket.
5. Install the drive belt tensioner bracket bolts and tighten to 45 N.m (33 lb ft).

Fig. 272: Accessory Drive Belt Tensioner And Bolts
Courtesy of GENERAL MOTORS COMPANY

- NOTE:** The tensioner spring lower shoulder bolt (4) should NEVER be removed when servicing. If the bolt head shows signs of tampering or removal, replace the drive belt tensioner assembly. If the pivot bolt has thread or hex head damage, the drive belt tensioner assembly MUST be replaced with a new assembly, which includes new bolts.
- NOTE:** A new drive belt tensioner assembly will include a shipping clip retaining the tensioner spring. Do NOT remove the shipping clip until the tensioner is properly mounted to the engine and the accessory drive belt is properly routed.
6. Install the drive belt tensioner pivot bolt (2) into the tensioner (1).
 7. Position the accessory drive belt tensioner in place. Install the drive belt tensioner bolts (2, 3).
 8. Tighten the drive belt tensioner bolt (3) to 22 N.m (16 lb ft).

CAUTION: Refer to Drive Belt Tensioner Pivot Bolt Caution .

9. Tighten the drive belt tensioner pivot bolt (2) to 50 N.m (37 lb ft).
10. Tighten the drive belt tensioner pivot bolt a final pass 90 degrees.

ENGINE FRONT COVER AND OIL PUMP INSTALLATION (LEA)

Fig. 273: View Of Engine Front Cover & Gasket
Courtesy of GENERAL MOTORS COMPANY

1. Install the engine front cover (1) with a new gasket (2).

Fig. 274: Engine Front Cover Bolts & Long Water Pump Bolt
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

NOTE: The center bolt (1) should be tightened last.

2. Install the engine front cover bolts and tighten to 25 N.m (18 lb ft).
3. Install the long water pump bolt (1) and tighten to 25 N.m (18 lb ft).

Fig. 275: Accessory Drive Belt Tensioner And Bolt
Courtesy of GENERAL MOTORS COMPANY

4. Install the accessory drive belt tensioner (1).
5. Install the accessory drive belt tensioner bolt and tighten to 45 N.m (33 lb ft).

OIL PAN INSTALLATION

Fig. 276: Identifying Bead of Sealer on Oil Pan
Courtesy of GENERAL MOTORS COMPANY

NOTE:

- The lower crankcase surface must be free of contamination prior to applying the sealer.
- Install and align the oil pan to block within 20 minutes of applying the sealer.
- The oil pan must be fastened to final torque specification within 60 minutes of applying the sealer.

1. Apply a 2.25 mm bead of sealer (1) on the level part of the flange next to the chamfer around the perimeter of the oil pan and the oil suction port opening. Refer to **Adhesives, Fluids, Lubricants, and Sealers** .

Fig. 277: Oil Pan (1)

Courtesy of GENERAL MOTORS COMPANY

2. Install the oil pan (1).

Fig. 278: Identifying Oil Pan Bolts Removal & Tightening Sequence
 Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

3. Install the oil pan bolts and tighten to 25 N.m (18 lb ft) in sequence.

CRANKSHAFT BALANCER INSTALLATION

Special Tools

- **EN-48585** Crankshaft Balancer Guide
- **EN-48953** Camshaft Actuator Locking Tool
- **EN 38122-A** Crankshaft Balancer Holder
- **EN 43653** Flywheel Holding Tool
- **EN 45059** Angle Meter

For equivalent regional tools, refer to Special Tools .

Fig. 279: Identifying Balancer

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Ensure both components are aligned correctly or serious engine damage will occur.

1. Install the **EN 38122-A** holder into the end of the crankshaft.
2. Install the balancer (1) onto the **EN-48585** guide. Use care to properly align the keyway and flats on the balancer with the oil pump drive.

Fig. 280: Crankshaft Balancer Holder
Courtesy of GENERAL MOTORS COMPANY

NOTE: EN 43653 locking tool may be used instead of EN 38122-A holder to prevent crankshaft rotation.

3. Install the EN 38122-A holder (1).

CAUTION: Refer to Fastener Caution .

NOTE: Always install a new crankshaft balancer retaining bolt and washer.

4. Install a new retaining bolt and washer. Use the EN 38122-A holder and a breaker bar to prevent the crankshaft from rotating when tightening the bolt. Tighten the bolt to 150 N.m (111 lb ft) plus 100 degrees using the EN 45059 meter.

Fig. 281: View Locking Tool

Courtesy of GENERAL MOTORS COMPANY

5. Install the **EN-48953** locking tool (1) and tighten the bolts into the cylinder head. Tighten the **EN-48953** locking tool retaining bolts to 10 N.m (89 lb in).
6. Release the timing chain tensioner by applying 45 N.m (33 lb ft) counterclockwise torque to the crankshaft balancer bolt.
7. Remove the **EN-48953** locking tool.

CAMSHAFT COVER INSTALLATION (LEA, OR LUK)

Fig. 282: Camshaft Cover Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Install NEW camshaft cover grommets and camshaft cover bolts if they are serviced with the grommet.
2. Assemble the camshaft cover (1) and a NEW gasket. Ensure that the gasket is located in the retaining groove in the camshaft cover.

CAUTION: Refer to Fastener Caution .

3. Install the cover on the cylinder head and hand start the bolts. Tighten the bolts to 10 N.m (89 lb in).

Fig. 283: Camshaft Housing Cover Insulator
Courtesy of GENERAL MOTORS COMPANY

4. Install the camshaft housing cover insulator (1). Tighten the bolts to 10 N.m (89 lb in).

Fig. 284: Ignition Coil
Courtesy of GENERAL MOTORS COMPANY

5. Inspect the inside of the ignition coil rubber boot for a thin, even coat of grease. If there is no grease present or additional grease is necessary, complete the following procedure:
 1. Apply a thin coating of dielectric grease evenly to the inside of the ignition coil rubber boot, up to a depth of 15 mm from the end of the boot. Refer to **Adhesives, Fluids, Lubricants, and Sealers** .
 2. Remove any excess grease from around the end of the boot, and ensure there is not an excessive amount within the boot.
6. Install the ignition coil (1). Tighten the bolt to 10 N.m (89 lb in).

Fig. 285: Front Lift Bracket

Courtesy of GENERAL MOTORS COMPANY

7. Install the front lift bracket (1).
8. Install the front lift bracket bolts and tighten to 25 N.m (18 lb ft).

Fig. 286: Rear Lift Bracket
Courtesy of GENERAL MOTORS COMPANY

9. Install the rear lift bracket (1).
10. Install the rear lift bracket bolts and tighten to 25 N.m (18 lb ft).

OIL FILTER WITH CAP AND SEAL INSTALLATION

Special Tools

EN-44887 Oil Filter Wrench

For equivalent regional tools, refer to **Special Tools** .

Fig. 287: View of Draining Fluids and Oil Filter
Courtesy of GENERAL MOTORS COMPANY

1. Install a new oil filter (2) on the oil filter cap (1).
2. Lubricate the O-ring on the oil filter cap with 5W30 engine oil.

CAUTION: Refer to Fastener Caution .

3. Use **EN-44887** wrench to install the oil filter cap. Tighten the oil filter cap to 25 N.m (18 lb ft).

FUEL RAIL AND INJECTORS INSTALLATION

Special Tools

EN-47909 Injector Bore and Sleeve Cleaning Kit

For equivalent regional tools, refer to **Special Tools** .

Fig. 288: Fuel Rail

Courtesy of GENERAL MOTORS COMPANY

1. Clean the fuel injector bore in the cylinder head using the **EN-47909** kit.
2. Install the fuel rail (1) with injectors into the cylinder head evenly.
3. Hand tighten the 2 outer fuel rail bolts to seat the injector into the injector bores.

CAUTION: Refer to Fastener Caution .

4. Start and hand tighten the remaining fuel rail bolts. Tighten the bolts in sequence to final torque using the following procedure:
 1. Tighten first pass in sequence to 25 N.m (18 lb ft).
 2. Tighten final pass in sequence to 25 N.m (18 lb ft).
5. Connect the electrical harness to the fuel rail harness connections.

Fig. 289: Fuel Injection Fuel Rail Noise Shield
Courtesy of GENERAL MOTORS COMPANY

6. Install the fuel injection fuel rail noise shield (1).

INTAKE MANIFOLD INSTALLATION

Special Tools

EN-48896 HP Fuel Pump Installation Alignment Gauge

For equivalent regional tools, refer to **Special Tools** .

Fig. 290: Intake Manifold Studs

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

1. Install the intake manifold studs in the manifold face and tighten to 15 N.m (11 lb ft).

Fig. 291: Intake Manifold Retaining Nuts And Bolts
Courtesy of GENERAL MOTORS COMPANY

2. Install the intake manifold (1). Start and hand tighten the intake manifold bolts and nuts.

Fig. 292: Intake Manifold Bolt Tightening Sequence
Courtesy of GENERAL MOTORS COMPANY

3. Tighten the bolts and nuts in sequence to 25 N.m (18 lb ft).

Fig. 293: Fuel Rail Harness Connector Bracket And Intake Manifold Insulator
Courtesy of GENERAL MOTORS COMPANY

4. Install the intake manifold insulator (2).
5. Install the insulator bolt and tighten to 10 N.m (89 lb in).
6. Install the fuel rail harness connector bracket (1) to the intake manifold. Tighten the bracket bolt to 10 N.m (89 lb in).

Fig. 294: Using Alignment Gage
Courtesy of GENERAL MOTORS COMPANY

NOTE: The camshaft must be in the base circle position before the high pressure fuel pump is installed.

7. Use the **EN-48896** alignment gauge (2) to ensure that the camshaft lobe is in the base circle position. At base circle position, the tool will be flush with the head (1).

Fig. 295: Fuel Pump Assembly Components
Courtesy of GENERAL MOTORS COMPANY

8. Lubricate the high pressure fuel pump cylinder head bore with 5W30 engine oil.

NOTE: Ensure that the high pressure fuel pump roller lifter is oriented properly, the camshaft is at base circle, and the number 1 piston is at top dead center (TDC) on the exhaust stroke. The distance from the mounting flange surface to the camshaft at base circle should be 52 mm (2.05 in).

9. Lubricate the high pressure fuel pump roller lifter (1) with 5W30 engine oil and install into the cylinder head bore.
10. Install a NEW fuel pump housing O-ring (2) and gasket (3).

NOTE: Ensure the plastic bolt retainers are installed in the high pressure fuel pump mounting holes before installing.

11. Install the fuel pump assembly (4).
12. Start and hand-tighten the fuel pump assembly bolts evenly. Tighten the fuel pump bolts evenly to 15 N.m (11 lb ft).

Fig. 296: High Pressure Fuel Line

Courtesy of GENERAL MOTORS COMPANY

13. Install and hand-tighten both ends of the NEW high pressure fuel line (1). Tighten the high pressure fuel line fitting nuts to 30 N.m (22 lb ft).

Fig. 297: Fuel Pump Components
Courtesy of GENERAL MOTORS COMPANY

14. Install the fuel pump insulator (2).

NOTE: The low pressure fuel pipe used is model dependent.

15. Install the low pressure fuel pipe assembly (1).

16. Install the fuel pump cover (3) and nut. Tighten the nut to 10 N.m (89 lb in).

17. Install the fuel pump cover bolts. Tighten the bolts to 10 N.m (89 lb in).

Fig. 298: Throttle Body

Courtesy of GENERAL MOTORS COMPANY

18. Install a new throttle body gasket.
19. Install the throttle body (1).
20. Install the throttle body bolts and tighten to 10 N.m (89 lb in).

Fig. 299: EVAP Canister Valve, Tube & MAP Sensor
Courtesy of GENERAL MOTORS COMPANY

21. Install the MAP sensor (3). Tighten the sensor bolt to 4 N.m (35 lb in).
22. Install the EVAP canister valve (2) and tighten to 25 N.m (18 lb ft).
23. Install the EVAP canister valve tube (1).

Fig. 300: Oil Fill Cap Components
Courtesy of GENERAL MOTORS COMPANY

24. Install the O-ring and oil fill tube assembly (3).
25. Install the intake manifold cover (2) onto the camshaft cover ball studs.
26. Install the oil fill cap (1).

EXHAUST MANIFOLD INSTALLATION

Fig. 301: Upper Secondary Air Injection Assembly Studs, Exhaust Manifold Gasket & Studs
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

1. Install NEW exhaust manifold studs (1) and tighten to 10 N.m (89 lb in).
2. Install secondary air injection assembly studs (3, 4) and tighten to 10 N.m (89 lb in), if necessary.
3. Install a NEW exhaust manifold gasket (2).

Fig. 302: Secondary Air Injection Check Valve Pipe Adapter & Mounting Components
Courtesy of GENERAL MOTORS COMPANY

4. Install the secondary air injection check valve pipe adapter (2). Install the nut (3) and tighten to 25 N.m (18 lb ft).
5. Install the stud-bolt (1) and bolt (4). Tighten the stud-bolt and bolt to 10 N.m (89 lb in).

Fig. 303: Secondary Air Injection Check Valve Pipe Adapter And Mounting Components
Courtesy of GENERAL MOTORS COMPANY

6. Install the second secondary air injection check valve pipe adapter (3). Install the bolts (4) and tighten to 10 N.m (89 lb in).
7. Install the secondary air injection check valve bracket (2) and the upper nut (1). Tighten the nut (1) to 25 N.m (18 lb ft).

Fig. 304: Block Heater & Bolt

Courtesy of GENERAL MOTORS COMPANY

8. Install the block heater (1). Tighten the bolt to 10 N.m (89 lb in).

Fig. 305: Exhaust Manifold & Retaining Nuts
Courtesy of GENERAL MOTORS COMPANY

9. Install the exhaust manifold (2) to the cylinder head.
10. Install NEW exhaust manifold to cylinder head retaining nuts (1) finger tight.

Fig. 306: Exhaust Manifold Bolt Tightening Sequence
Courtesy of GENERAL MOTORS COMPANY

11. Tighten the NEW exhaust manifold to cylinder head retaining nuts two passes in sequence:
 1. Tighten first pass in sequence to 14 N.m (124 lb in).
 2. Tighten final pass in sequence to 14 N.m (124 lb in).

Fig. 307: Exhaust Manifold Heat Shield And Bolts
Courtesy of GENERAL MOTORS COMPANY

12. Install the exhaust manifold heat shield (1) and bolts (2). Tighten the bolts to 14 N.m (124 lb in).

Fig. 308: Oxygen Sensor

Courtesy of GENERAL MOTORS COMPANY

13. Coat the threads of the oxygen sensor (1) with antiseize. Refer to **Adhesives, Fluids, Lubricants, and Sealers** .
14. Install the oxygen sensor and tighten to 42 N.m (31 lb ft).

Fig. 309: Secondary Air Injection Check Valves, Bolts And Gaskets
Courtesy of GENERAL MOTORS COMPANY

15. Install a NEW gasket (2) on each of the secondary air injection check valve assemblies (1).
16. Install the secondary air injection check valve assemblies (1) and bolts (3). Tighten the bolts to 25 N.m (18 lb ft).

OIL LEVEL INDICATOR AND TUBE INSTALLATION (LEA, OR LUK)

Fig. 310: Oil Level Indicator Tube Components
 Courtesy of GENERAL MOTORS COMPANY

1. Lubricate the oil level indicator tube O-ring. Refer to **Adhesives, Fluids, Lubricants, and Sealers** .
2. Install the oil level indicator (2) and the oil level indicator tube (1) into the oil pan.

CAUTION: Refer to Fastener Caution .

3. Install the oil level indicator tube bracket bolt (3) to the intake manifold and tighten to 10 N.m (89 lb in).
4. Install the electrical wiring harness to the oil level indicator tube.
5. Install the knock sensor wiring clip (4) into the oil level indicator tube.

ENGINE FLYWHEEL INSTALLATION

Special Tools

- **EN-38122-A** Crankshaft Balancer Holder
- **EN-43653** Flywheel Holding Tool
- **EN-45059** Angle Meter

For equivalent regional tools, refer to Special Tools .

Fig. 311: View Of Flywheel

Courtesy of GENERAL MOTORS COMPANY

1. Install the flywheel.
2. Install NEW bolts.

CAUTION: Refer to Fastener Caution .

NOTE: EN-43653 flywheel holding tool may be used instead of EN-38122-A holder in order to prevent crankshaft rotation.

3. Holding the crankshaft balancer with **EN-38122-A** holder , tighten the bolts evenly. Tighten the bolts to 53 N.m (39 lb ft), plus 25 degrees using the **EN-45059** meter

ENGINE PRELUBING

NOTE: This procedure is not used in Europe.

Special Tools

EN-45299 Engine Preluber

For equivalent regional tools, refer to Special Tools .

Fig. 312: Identifying the M12 x 1.75 Adapter
Courtesy of GENERAL MOTORS COMPANY

NOTE: A constant and continuous flow of clean engine oil is required in order to properly prime the engine. Ensure an approved engine oil is used, as specified in the owners manual.

1. Remove the oil pressure switch.
2. Install the M12 x 1.75 adapter (1) P/N 509376.

Fig. 313: View of Flexible Hose, Adapter and Preluber
Courtesy of GENERAL MOTORS COMPANY

3. Install the flexible hose to the adapter and open the valve.
4. Pump the handle on the **EN-45299** preluber (1) in order to flow a minimum of 1-1.9 liters (1-2 quarts) of engine oil. Observe the flow of engine oil through the flexible hose and into the engine assembly.
5. Close the valve and remove the flexible hose and adapter from the engine.

CAUTION: Refer to Fastener Caution .

6. Install the oil pressure switch to the engine and tighten to 22 N.m (16 lb ft).
7. Top-off the engine oil to the proper level.

ENGINE

Engine Mechanical - 2.4L (LEA LUK) - Repair Instructions - On Vehicle

REPAIR INSTRUCTIONS - ON VEHICLE

INTAKE MANIFOLD COVER REPLACEMENT

Fig. 1: Intake Manifold Cover, Fastener & Oil Cap
Courtesy of GENERAL MOTORS COMPANY

Intake Manifold Cover Replacement

Callout	Component Name
1	Oil Cap
2	Intake Manifold Cover Fastener CAUTION: Refer to Fastener Caution . Tighten 9 N.m (80 lb in)
3	Intake Manifold Cover Procedure Transfer components as necessary.

DRIVE BELT REPLACEMENT (LEA)

Fig. 2: Drive Belt Routing (LEA)

Courtesy of GENERAL MOTORS COMPANY

Drive Belt Replacement (LEA)

Callout	Component Name
Preliminary Procedure	
Remove the Engine Mount. Refer to <u>Engine Mount Replacement</u>	
1	<p>Drive Belt</p> <p>Procedure</p> <ol style="list-style-type: none">1. Use the proper tool to rotate the drive belt tensioner.2. Remove the drive belt from the pulleys and tensioner.
2	<p>Drive Belt Tensioner</p> <p>Procedure</p> <ol style="list-style-type: none">1. Clean and inspect the drive belt surfaces of all the pulleys.2. Inspect the drive belt for correct alignment.

DRIVE BELT REPLACEMENT (LUK)

Special Tools

EN-48932 Hydraulic Belt Tensioner Compressor

For equivalent regional tools, refer to Special Tools .

Removal Procedure

1. Remove the air cleaner assembly. Refer to Air Cleaner Assembly Replacement .

Fig. 3: View Of Tensioner Stop Fastener And Stop
Courtesy of GENERAL MOTORS COMPANY

NOTE: The tensioner stop is critical and must be removed prior to compressing the drive belt tensioner spring.

2. Remove the tensioner stop fastener (1) and stop (2).

Fig. 4: Drive Belt Routing (LUK)

Courtesy of GENERAL MOTORS COMPANY

NOTE: Make sure the EN- 48932 compressor tool is not on the generator bracket and A/C compressor bracket.

3. Install the **EN-48932** compressor (1) to the drive belt tensioner spring.
4. Compress the drive belt tensioner spring fully using the **EN-48932** compressor.
5. Reposition the idler pulley (2) to release tension off the drive belt.
6. Remove the drive belt from under the middle idler pulley.
7. Remove the drive belt (3) from the vehicle.

Installation Procedure

1. With the **EN-48932** compressor still compressing the tensioner spring Install and position the drive belt around all of the pulleys except for the middle idler pulley.

Fig. 5: Drive Belt Routing (LUK)

Courtesy of GENERAL MOTORS COMPANY

2. Rotate pulley (2) clockwise and install the drive belt under the middle idler pulley.
3. Ensure the drive belt tensioner idler pulley is fully seated against the drive belt (3).
4. Loosen the forcing bolt on the **EN-48932** compressor (1) and remove from the drive belt tensioner spring.

NOTE: If tensioner assembly is new, use a 6 point socket on the drive belt tensioner hex boss (1) and rotate hex boss clockwise to release the tension and remove the shipping retainer by hand. Discard the shipping retainer.

5. Ensure that the drive belt tensioner idler is fully seated against the drive belt.

Fig. 6: View Of Tensioner Stop Fastener And Stop
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

NOTE: Make sure the Tensioner Stop locator pin is in the guide hole of the bracket.

6. Install the tension stop (2) and fastener (1), then tighten to 10 (89 lb in).
7. Install the air cleaner assembly. Refer to Air Cleaner Assembly Replacement .

DRIVE BELT TENSIONER REPLACEMENT (LUK)

Special Tools

J-45025 Torque Wrench Adapter

For equivalent regional tools, refer to Special Tools .

Removal Procedure

1. Remove the drive belt. Refer to Drive Belt Replacement (LUK).
2. Remove the right side engine mount. Refer to Engine Mount Replacement.

Fig. 7: Drive Belt Tensioner, Drive Belt Tensioner Spring And Mounting Bolts
Courtesy of GENERAL MOTORS COMPANY

3. Remove the drive belt tensioner bolts (2, 3).
4. Remove the drive belt tensioner (1) with drive belt tensioner bolt (3) from top of vehicle.

Installation Procedure

Fig. 8: Drive Belt Tensioner, Drive Belt Tensioner Spring And Mounting Bolts
Courtesy of GENERAL MOTORS COMPANY

NOTE: Install the accessory drive belt tensioner and bolt as an assembly.

1. Install the lower tensioner pivot bolt (2) into the tensioner (1).
2. Position the tensioner assembly in place.

WARNING: To avoid personal injury, only remove the tensioner shipping clip when the tensioner is properly mounted to the engine and the accessory drive belt is in place and properly routed.

CAUTION: Refer to Fastener Caution .

3. Install the drive belt tensioner bolts (2, 3).

CAUTION: Refer to Drive Belt Tensioner Pivot Bolt Caution .

NOTE: Use J-45025 adapter in combination with a 3/8 drive torque wrench to reach & achieve proper torque on tensioner pivot bolt. Make sure that the torque wrench and the J-45025 adapter are in a straight line to ensure proper torque at the bolt.

4. Tighten the bolts (2, 3) in sequence. Make sure that the torque wrench and J-45025 are in a straight line to ensure proper torque at the bolt.
 1. Tighten the top bolt to 22 N.m (16 lb ft).
 2. Use the **J-45025** adapter , to tighten the tensioner pivot bolt to 42 N.m (31 lb ft).
5. Install the drive belt. Refer to **Drive Belt Replacement (LUK)**.
6. Install the right side engine mount. Refer to **Engine Mount Replacement**.

DRIVE BELT TENSIONER REPLACEMENT (LEA)

Removal Procedure

Fig. 9: Drive Belt Tensioner
Courtesy of GENERAL MOTORS COMPANY

1. Remove the drive belt. Refer to **Drive Belt Replacement (LEA)**

2. Remove the drive belt tensioner bolt.
3. Remove the drive belt tensioner.

Installation Procedure

Fig. 10: Drive Belt Tensioner
Courtesy of GENERAL MOTORS COMPANY

1. Position the drive belt tensioner.

CAUTION: Refer to Fastener Caution .

2. Install the drive belt tensioner bolt and tighten to 45 N.m (33 lb ft).
3. Install the drive belt. Refer to Drive Belt Replacement (LEA).

ENGINE OIL PRESSURE SWITCH REPLACEMENT

Fig. 11: Engine Oil Pressure Switch
 Courtesy of GENERAL MOTORS COMPANY

Engine Oil Pressure Switch Replacement

Callout	Component Name
Preliminary Procedure Remove the starter. Refer to <u>Starter Replacement (LUK)</u> .	
1	Oil Pressure Switch CAUTION: Refer to <u>Fastener Caution</u> . Procedure Disconnect the engine wiring harness electrical connector as necessary. Tighten 22 N.m (16 lb ft)

ENGINE MOUNT INSPECTION

NOTE: Before replacing any engine mount due to suspected fluid loss, verify that the source of the fluid is the engine mount, not the engine or accessories.

1. Install the engine support fixture. Refer to **Engine Support Fixture**.
2. Raise the engine slightly and observe the engine mount. Raising the engine removes the weight from the

engine mount and creates a slight tension on the rubber portion.

3. Replace the engine mount if the engine mount exhibits any of the following conditions:
 - The hard rubber is covered with heat check cracks.
 - The rubber is separated from the metal plate of the engine mount.
 - The rubber is split through the center of the engine mount.
 - The engine mount itself is leaking fluid.
4. For engine mount replacement. Refer to **Engine Mount Replacement**.

ENGINE MOUNT BRACKET REPLACEMENT (LEA)

Fig. 12: Engine Mount Bracket (LEA)
Courtesy of GENERAL MOTORS COMPANY

Engine Mount Bracket Replacement (LEA)

Callout	Component Name
Preliminary Procedure	
Remove the engine mount. Refer to <u>Engine Mount Replacement</u> .	
1	Engine Mount Bracket Fastener
	CAUTION: Refer to <u>Fastener Caution</u> .
	Tighten

	100 N.m (74 lb ft)
2	Engine Mount Bracket Fastener (Qty,2) Tighten 100 N.m (74 lb ft)
3	Engine Mount Bracket

ENGINE MOUNT BRACKET REPLACEMENT (LUK)

Fig. 13: Engine Mount Bracket (LUK)

Courtesy of GENERAL MOTORS COMPANY

Engine Mount Bracket Replacement (LUK)

Callout	Component Name
Preliminary Procedure	
Remove the engine mount. Refer to <u>Engine Mount Replacement</u> .	
1	Engine Mount Bracket Bolt (Qty: 3) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 100 N.m (73 lb ft)
2	Engine Mount Bracket

POWERTRAIN MOUNT BALANCING

NOTE: Follow the balance procedure steps listed below when no starting point has been established such as in a collision repair.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .

Fig. 14: Front Transaxle Mount Through Bolt
Courtesy of GENERAL MOTORS COMPANY

2. Loosen the front transaxle mount through bolt (1) until it is finger tight.

Fig. 15: Rear Transaxle Mount Through Bolt
Courtesy of GENERAL MOTORS COMPANY

3. Loosen the rear transaxle mount (1) through bolt until it is finger tight.
4. Lower the vehicle.

Fig. 16: Supporting Engine/Transmission With Hydraulic Floor Jack
Courtesy of GENERAL MOTORS COMPANY

5. Position two floor jacks with wood blocks under the engine and transaxle in order to support the powertrain assembly.

Fig. 17: Transaxle Bolts

Courtesy of GENERAL MOTORS COMPANY

6. Loosen the transaxle adapter to transaxle bolts (1).

Fig. 18: Engine Mount And Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

7. Loosen the engine mount (1) to bracket bolts (2).
8. Lower the floor jacks in order to allow a 1/4 inch (6 mm) gap between the upper engine mount and engine mount bracket, and also between the transmission and left transmission mount.

Fig. 19: Front And Rear Powertrain Mounts
Courtesy of GENERAL MOTORS COMPANY

9. Check that the front and rear mounts are centered (1) in the mount brackets, adjust if necessary.
10. Tighten the left hand (transaxle side) mount bolts, starting with the bolt nearest to the center of the mount. See the appropriate transmission mount replacement procedure for the fastener tightening specifications.

Fig. 20: Transaxle Bolts

Courtesy of GENERAL MOTORS COMPANY

11. Tighten the right hand (engine side) mount bolts (1), starting with the bolt nearest to the center of the mount. See the appropriate engine mount replacement procedure for the fastener tightening specifications.
12. Remove the floor jacks from under the oil pan and transmission.
13. Raise the vehicle.
14. Shake the powertrain from front to rear and allow the powertrain to settle.

Fig. 21: Rear Transaxle Mount Through Bolt
Courtesy of GENERAL MOTORS COMPANY

NOTE: It is essential that the lower mount through bolts should be as close to centered as possible in the oversized mount insert holes before tightening to specification.

15. Tighten the rear transaxle mount through bolt (1). See the appropriate transmission mount replacement procedure for the fastener tightening specifications.

Fig. 22: Front Transaxle Mount Through Bolt
Courtesy of GENERAL MOTORS COMPANY

16. Tighten the front transaxle mount through bolt (1). See the appropriate transmission mount replacement procedure for the fastener tightening specifications.
17. Lower the vehicle.

POWERTRAIN MOUNT BALANCING - LOWER

NOTE: Follow the balance procedure steps listed below when front or rear mounts through bolts are loosened or removed during a repair procedure.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .

Fig. 23: Front Transaxle Mount Through Bolt
Courtesy of GENERAL MOTORS COMPANY

2. Loosen the front transaxle mount through bolt (1).

Fig. 24: Rear Transaxle Mount Through Bolt
Courtesy of GENERAL MOTORS COMPANY

3. Loosen the rear transaxle mount through bolt (1).
4. Shake the powertrain from front to rear and allow the powertrain to settle.

NOTE: It is essential that the through bolts are as close to centered as possible in the oversized mount insert holes before tightening to specification.

5. Tighten the rear transaxle mount through bolt (1). See the appropriate transmission mount replacement procedure for the fastener tightening specifications.

Fig. 25: Front Transaxle Mount Through Bolt
Courtesy of GENERAL MOTORS COMPANY

6. Tighten the front transaxle mount through bolt (1). See the appropriate transmission mount replacement procedure for the fastener tightening specifications.
7. Lower the vehicle.

ENGINE MOUNT REPLACEMENT

Fig. 26: Engine Mount And Engine Mount Fasteners
 Courtesy of GENERAL MOTORS COMPANY

Engine Mount Replacement

Callout	Component Name
Preliminary Procedures <ol style="list-style-type: none"> 1. Remove the air cleaner assembly. Refer to <u>Air Cleaner Assembly Replacement</u> . 2. Install engine support fixture. Refer to <u>Engine Support Fixture</u>. 3. Prior to removing the mount, mark mount to bracket, mount to body interfaces and fasteners to mount interfaces using a marker for correct positioning during installation. 	
1	Engine Mount Fastener CAUTION: Refer to <u>Fastener Caution</u> . Tighten 62 N.m (46 lb ft)
2	Engine Mount Fastener (Qty: 3) Tighten 62 N.m (46 lb ft)
3	Engine Mount Fastener (Qty: 2) Tighten

	62 N.m (46 lb ft)
4	Engine Mount Procedure Transfer components as necessary.

ENGINE SUPPORT FIXTURE

Special Tools

- **EN-28467-B** Universal Engine Support Fixture
- **EN-28467-500B** Engine Support Fixture
- **EN-43405-10** Engine Support Fixture Adaptor

For equivalent regional tools, refer to **Special Tools** .

1. Remove the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .

Fig. 27: Universal Engine Support Fixture
Courtesy of GENERAL MOTORS COMPANY

2. Assemble the **EN-28467-B** universal engine support fixture to the **EN-43405-1** engine support feet

(passenger side) and **EN-43405-2** engine support feet (drivers side) (1) and place across the engine compartment.

Fig. 28: View Of Engine Support Fixture
Courtesy of GENERAL MOTORS COMPANY

3. From the **EN-28467-500B** universal engine support fixture , install the radiator shelf tube J-28467-2A (1) on top of the strut tower tube J-28467-3 (2) above the engine front (right back) lift hook bracket.
4. Install the round tube of the front support assembly J-28467-4A (3) through the large hole in the radiator shelf tube J-28467-2A.
5. Locate the J-28467-4A front support assembly to the upper tie bar.
6. Install the J-28467-9 7/16 inch x 2.0 inch quick-release pin (4) through the top hole in the J-28467-4A front support assembly.

Fig. 29: View Of Engine Support Fixture & Cross Bracket
Courtesy of GENERAL MOTORS COMPANY

7. Install the J-28467-1A cross bracket assembly (1).
8. Hand tighten the J-28467-1A cross bracket wing nuts (2).

Fig. 30: View Of Lift Hook Assembly
Courtesy of GENERAL MOTORS COMPANY

9. Install the J-28467-7A bolt hook through the J-28467-6A bracket.
10. Install the J-28467-34 lift hook wing nut and washer to the J-28467-7A lift hook.
11. Repeat the previous 2 steps in order to assemble 2 lift hooks and brackets.

Fig. 31: Identifying Engine Support Fixture & Cross Bracket
Courtesy of GENERAL MOTORS COMPANY

12. Install one of the lift hook and bracket assemblies (1) to the engine support fixture long bar (2).
13. Install the other lift hook and bracket assembly (3) to the J-28467-2A radiator shelf tube (4) above the engine front lift bracket.

Fig. 32: Inserting Lift Hook Through Engine Rear Lift Bracket
Courtesy of GENERAL MOTORS COMPANY

14. Install the lift hook J-28467-7A through the engine rear lift bracket (2).

Fig. 33: Inserting Lift Hook Through Engine Front Lift Bracket
Courtesy of GENERAL MOTORS COMPANY

15. Install the lift hook J-28467-7A through the engine front lift bracket.
16. Hand tighten the lift hook wing nuts J-28467-34 in order to remove all slack from the engine support fixture assembly.

OIL LEVEL INDICATOR TUBE REPLACEMENT

Fig. 34: Oil Level Indicator Tube & Bolt
 Courtesy of GENERAL MOTORS COMPANY

Oil Level Indicator Tube Replacement

Callout	Component Name
Preliminary Procedure	
Remove the air cleaner outlet duct. Refer to <u>Air Cleaner Outlet Duct Replacement</u> .	
1	<p>Oil Level Indicator Tube Bolt</p> <p>CAUTION: Refer to <u>Fastener Caution</u> .</p> <p>Tighten 10 N.m (89 lb in)</p>
2	<p>Oil Level Indicator Tube</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Transfer over the oil level indicator. 2. Install NEW oil level indicator tube O-ring seals. 3. Disconnect electrical connector

POSITIVE CRANKCASE VENTILATION HOSE/PIPE/TUBE REPLACEMENT

Fig. 35: Positive Crankcase Ventilation Hose/Pipe/Tube
 Courtesy of GENERAL MOTORS COMPANY

Positive Crankcase Ventilation Hose/Pipe/Tube Replacement

Callout	Component Name
Preliminary Procedure	
Remove intake manifold cover. Refer to <u>Intake Manifold Cover Replacement</u>	
1	Positive Crankcase Ventilation Hose/Pipe/Tube

INTAKE MANIFOLD REPLACEMENT (LEA)

Removal Procedure

1. Recover the A/C system. Refer to **Refrigerant Recovery and Recharging** .
2. Relieve the fuel system pressure. Refer to **Fuel Pressure Relief** .
3. Remove the air cleaner outlet duct. Refer to **Air Cleaner Assembly Replacement** .

Fig. 36: Intake Manifold Cover

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Never attempt to remove the intake manifold from a hot engine, allow the engine to cool to ambient temperature. The intake manifold can be damaged if it is removed when the engine is hot.

4. Remove the intake manifold cover (1). Refer to **Intake Manifold Cover Replacement**

Fig. 37: EVAP Canister Valve, Tube & MAP Sensor
Courtesy of GENERAL MOTORS COMPANY

5. Remove the evaporative (EVAP) emission canister valve tube (1) from the intake manifold and reposition.
6. Remove the MAP sensor (3) electrical connector.

Fig. 38: Throttle Body
Courtesy of GENERAL MOTORS COMPANY

7. Remove the throttle body (1). Refer to **Throttle Body Assembly Replacement** .

Fig. 39: Fuel Pump Components

Courtesy of GENERAL MOTORS COMPANY

8. Remove the fuel pump cover (3) and insulator (2). Refer to **Fuel Pump Cover Replacement** .

NOTE: The low pressure fuel pipe used is model dependent.

9. Disconnect and reposition the low pressure fuel feed pipe from the fuel pump. Refer to **Metal Collar Quick Connect Fitting Service** .

Fig. 40: Fuel Rail Harness Connector Bracket And Intake Manifold Insulator
Courtesy of GENERAL MOTORS COMPANY

10. Remove the fuel rail harness connector bracket bolt (1) and intake manifold insulator bolt.
11. Remove the intake manifold insulator (2).

Fig. 41: Compressor Hose At Compressor
Courtesy of GENERAL MOTORS COMPANY

12. Remove the A/C line nut (1) and line (2) from the compressor and reposition the line to the side.

Fig. 42: Intake Manifold Retaining Nuts And Studs
Courtesy of GENERAL MOTORS COMPANY

NOTE: Removing studs allows the intake manifold to be removed without removing the fuel pump.

13. Remove the intake manifold retaining nuts (1), studs (3), and bolts (2).
14. Remove the intake manifold (1).
15. Disconnect electrical connectors as necessary.
16. Transfer parts as necessary.
17. If reusing the intake manifold, clean and inspect as necessary. Refer to **Intake Manifold Cleaning and Inspection (LEA, or LUK)**.

Installation Procedure

Fig. 43: Intake Manifold Retaining Nuts And Studs
Courtesy of GENERAL MOTORS COMPANY

1. Position the intake manifold (4) and hand start the bolts (2).

CAUTION: Refer to Fastener Caution .

2. Install the intake manifold studs (3) and tighten to 6 N.m (53 lb in).

Fig. 44: Intake Manifold Bolt Tightening Sequence
Courtesy of GENERAL MOTORS COMPANY

3. Tighten the bolts (2) and nuts (1) in sequence to 10 N.m (89 lb in).

Fig. 45: Fuel Rail Harness Connector Bracket And Intake Manifold Insulator
Courtesy of GENERAL MOTORS COMPANY

4. Install the intake manifold insulator (2).
5. Install the insulator bolt and tighten to 10 N.m (89 lb in).
6. Install the fuel rail harness connector bracket (1) to the intake manifold. Tighten the bracket bolt to 10 N.m (89 lb in).

Fig. 46: Compressor Hose At Compressor
Courtesy of GENERAL MOTORS COMPANY

7. Install new seal washers to the compressor hose. Refer to **Air Conditioning System Seal Replacement** .
8. Install the compressor hose (2) to the compressor.
9. Install the compressor hose nut (1) to the compressor and tighten the nut to 22 N.m (16 lb ft).
10. Connect the engine harness electrical connector as necessary.

Fig. 47: Fuel Pump Components

Courtesy of GENERAL MOTORS COMPANY

11. Install the fuel pump insulator (2) and cover (3). Refer to **Fuel Pump Cover Replacement** .

NOTE: The low pressure fuel pipe used is model dependent.

12. Install the low pressure fuel pipe assembly (1).

Fig. 48: Throttle Body
Courtesy of GENERAL MOTORS COMPANY

13. Install a new throttle body gasket.
14. Install the throttle body (1). Refer to **Throttle Body Assembly Replacement** .

Fig. 49: EVAP Canister Valve, Tube & MAP Sensor
Courtesy of GENERAL MOTORS COMPANY

15. Install the EVAP canister valve tube (1).
16. Connect the MAP sensor electrical connector.

Fig. 50: Intake Manifold Cover

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Never attempt to remove the intake manifold from a hot engine, allow the engine to cool to ambient temperature. The intake manifold can be damaged if it is removed when the engine is hot.

17. Install the intake manifold cover (1). Refer to **Intake Manifold Cover Replacement**
18. Recharge the A/C system. Refer to **Refrigerant Recovery and Recharging** .
19. Install the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .

INTAKE MANIFOLD REPLACEMENT (LUK)

Removal Procedure

Fig. 51: Air Cleaner Outlet Duct

Courtesy of GENERAL MOTORS COMPANY

1. Remove the air cleaner outlet duct (2). Refer to **Air Cleaner Outlet Duct Replacement** .

Fig. 52: Intake Manifold Cover

Courtesy of GENERAL MOTORS COMPANY

2. Remove the intake manifold cover (2). Refer to **Intake Manifold Cover Replacement**

Fig. 53: Hose Clamp And Radiator Inlet Hose
Courtesy of GENERAL MOTORS COMPANY

3. Reposition the hose clamp (1) and disconnect the radiator inlet hose (2). Refer to **Radiator Inlet Hose Replacement (LUK)** .

Fig. 54: Starter Generator

Courtesy of GENERAL MOTORS COMPANY

4. Remove the starter generator. Refer to **Starter Generator Replacement**

Fig. 55: Fuel Injector Wiring Harness Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

5. Disconnect the fuel injector wiring harness electrical connector (3) from the engine wiring harness electrical connector.
6. Remove the fuel injector wiring harness fastener (4) from the intake manifold.
7. Disconnect the evaporative emission (EVAP) canister purge tube (1) from the intake manifold. Refer to **Plastic Collar Quick Connect Fitting Service** .
8. Disconnect the MAP sensor connector (2).

Fig. 56: Engine Harness And Vacuum Brake Booster Hose
Courtesy of GENERAL MOTORS COMPANY

9. Disconnect the fuel pump electrical connector (1).
10. Disconnect the engine wiring harness electrical connector (2) from the throttle actuator control (TAC).
11. Reposition the vacuum brake booster hose clamp (3) at the intake manifold.
12. Remove the vacuum brake booster hose (4) from the intake manifold.
13. Reposition the engine harness (5) away from the intake manifold.

Fig. 57: Throttle Body

Courtesy of GENERAL MOTORS COMPANY

14. Remove the throttle body (2). Refer to **Throttle Body Assembly Replacement** .
15. Remove the fastener (3) from the oil level indicator tube and remove the tube. Refer to **Oil Level Indicator Tube Replacement**.

Fig. 58: Fuel Feed Pipe

Courtesy of GENERAL MOTORS COMPANY

16. Remove the fuel feed pipe (2). Refer to **Fuel Feed Pipe Replacement (Engine)** , **Fuel Feed Pipe Replacement (Chassis)** .

Fig. 59: Fuel Pump Cover

Courtesy of GENERAL MOTORS COMPANY

17. Remove the fuel pump cover (1-4). Refer to **Fuel Pump Cover Replacement** .

Fig. 60: Intake Manifold Heat Shield
Courtesy of GENERAL MOTORS COMPANY

18. Remove the intake manifold heat shield (1).

Fig. 61: Intake Manifold Lower Bolts
Courtesy of GENERAL MOTORS COMPANY

19. Remove the intake manifold lower bolts (1).
20. Remove the intake manifold upper nuts (2).
21. Remove the intake manifold (3).

NOTE: **The intake manifold gasket is reusable, only replace the gasket if damage has occurred.**

22. Remove and inspect the intake manifold gasket.

Installation Procedure

Fig. 62: Intake Manifold Lower Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install a NEW intake manifold gasket if necessary, otherwise install the old gasket.
2. Install the intake manifold (3).
3. Install the intake manifold upper nuts (2).

CAUTION: Refer to Fastener Caution .

4. Install the intake manifold lower bolts (1). Tighten the bolts/nuts (1 and 2) to 10 N.m (89 lb in).

Fig. 63: Intake Manifold Heat Shield
Courtesy of GENERAL MOTORS COMPANY

5. Install the intake manifold heat shield (1).

Fig. 64: Fuel Pump Cover

Courtesy of GENERAL MOTORS COMPANY

6. Install the fuel pump cover (1-4). Refer to **Fuel Pump Cover Replacement** .

Fig. 65: Fuel Feed Pipe

Courtesy of GENERAL MOTORS COMPANY

7. Install the fuel feed pipe (2). Refer to **Fuel Feed Pipe Replacement (Engine)** , **Fuel Feed Pipe Replacement (Chassis)** .

Fig. 66: Throttle Body
Courtesy of GENERAL MOTORS COMPANY

8. Install the throttle body (2). Refer to **Throttle Body Assembly Replacement** .
9. Remove the oil level indicator tube. Refer to **Oil Level Indicator Tube Replacement**.

Fig. 67: Engine Harness And Vacuum Brake Booster Hose
Courtesy of GENERAL MOTORS COMPANY

10. Reposition the engine harness (5) across the intake manifold.
11. Connect the engine wiring harness electrical connector (2) to the throttle actuator control (TAC).
12. Connect the vacuum brake booster hose (4) at the intake manifold.
13. Install the brake booster hose clamp (3).
14. Connect the fuel pump electrical connector (1).

Fig. 68: Fuel Injector Wiring Harness Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

15. Connect the fuel injector wiring harness electrical connector (3) to the engine wiring harness electrical connector.
16. Install the fuel injector wiring harness fastener (4) to the intake manifold.
17. Connect the evaporative emission (EVAP) canister purge tube (1) to the intake manifold. Refer to **Plastic Collar Quick Connect Fitting Service** .
18. Connect the MAP sensor connector (2).

Fig. 69: Starter Generator

Courtesy of GENERAL MOTORS COMPANY

19. Install the starter generator. Refer to **Starter Generator Replacement**

Fig. 70: Hose Clamp And Radiator Inlet Hose
Courtesy of GENERAL MOTORS COMPANY

20. Connect the radiator inlet hose (2), reposition the hose clamp (1). Refer to **Radiator Inlet Hose Replacement (LUK)** .

Fig. 71: Intake Manifold Cover

Courtesy of GENERAL MOTORS COMPANY

21. Install the intake manifold cover (2). Refer to **Intake Manifold Cover Replacement**

Fig. 72: Air Cleaner Outlet Duct
Courtesy of GENERAL MOTORS COMPANY

22. Install the air cleaner outlet duct (2). Refer to **Air Cleaner Outlet Duct Replacement** .

CRANKSHAFT BALANCER REPLACEMENT

Special Tools

- **EN-45059** Angle Meter.
- **J-43653** Flywheel Holding Tool.

For equivalent regional tools, refer to **Special Tools** .

Removal Procedure

1. Remove the wheelhouse front liner. Refer to **Front Wheelhouse Front Liner Replacement** .
2. Remove the drive belt. Refer to **Drive Belt Replacement (LEA)**, **Drive Belt Replacement (LUK)**.
3. Remove the starter. Refer to **Starter Replacement (LUK)** .
4. Install the **J-43653** flywheel holding tool in the starter opening.

Fig. 73: Bolt, Washer And Crankshaft Balancer
Courtesy of GENERAL MOTORS COMPANY

5. Remove the crankshaft balancer bolt (1), washer (2), and crankshaft balancer (3). Discard the crankshaft balancer bolt.

Installation Procedure

Fig. 74: Bolt, Washer And Crankshaft Balancer
 Courtesy of GENERAL MOTORS COMPANY

1. Position the crankshaft balancer (3) .

CAUTION: Refer to Fastener Caution .

2. Install a NEW crankshaft balancer bolt (1) and washer (2).

Tighten

1. First Pass 100 (74 lb ft).
2. Final Pass 125 degrees using the **EN-45059** meter.
3. Remove the **J-43653** flywheel holding tool.
4. Install the starter. Refer to **Starter Replacement (LUK)** .
5. Install the drive belt. Refer to **Drive Belt Replacement (LEA)**, **Drive Belt Replacement (LUK)**.
6. Install the wheelhouse front liner. Refer to **Front Wheelhouse Front Liner Replacement** .

WATER PUMP AND BALANCE SHAFT CHAIN CRANKSHAFT SPROCKET REPLACEMENT

Fig. 75: Water Pump and Balance Shaft Chain Crankshaft Sprocket
 Courtesy of GENERAL MOTORS COMPANY

Water Pump and Balance Shaft Chain Crankshaft Sprocket Replacement

Callout	Component Name
Preliminary Procedure Remove the water pump and balancer shaft chain. Refer to <u>Water Pump and Balance Shaft Chain Replacement</u> .	
1	Water Pump and Balance Shaft Chain Crankshaft Sprocket Procedure <ul style="list-style-type: none"> • Pull the water pump and balance shaft chain crankshaft sprocket from the crankshaft. • For installation align the crankshaft sprocket key with the slot in the water pump and balance shaft chain crankshaft sprocket. Slide the gear into place. <p>NOTE: The crankshaft sprocket key is only placed in the recess of the crankshaft. Take care that it does not fall into the oil pan.</p>

CRANKSHAFT FRONT OIL SEAL REPLACEMENT

Fig. 76: Crankshaft Front Oil Seal
 Courtesy of GENERAL MOTORS COMPANY

Crankshaft Front Oil Seal Replacement

Callout	Component Name
Preliminary Procedure	
Remove the crankshaft balancer. Refer to <u>Crankshaft Balancer Replacement</u> .	
1	Crankshaft Front Oil Seal NOTE: Use a flat-bladed tool to remove the seal from the front cover. Special Tools Use EN-35268-A Camshaft/Front Main Seal Installer to install the front crankshaft front oil seal.

ENGINE FRONT COVER REPLACEMENT (LEA)

Removal Procedure

1. Remove the engine mount bracket Refer to **Engine Mount Bracket Replacement (LEA)**.
2. Remove the drive belt tensioner. Refer to **Drive Belt Tensioner Replacement (LEA)**.
3. Remove the crankshaft balancer. Refer to **Crankshaft Balancer Replacement**.

4. Disconnect the oxygen sensor harness from the front cover and reposition.

Fig. 77: Water Pump Bolt

Courtesy of GENERAL MOTORS COMPANY

5. Remove the engine front cover to water pump bolt (1).

Fig. 78: Engine Front Cover Bolts

Courtesy of GENERAL MOTORS COMPANY

6. Raise and suitably support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
7. Remove the engine front cover bolts (1).
8. Remove the engine front cover.

Fig. 79: Engine Front Cover Gasket
Courtesy of GENERAL MOTORS COMPANY

9. Remove and discard the engine front cover gasket (1).

Installation Procedure

Fig. 80: Engine Front Cover Gasket
Courtesy of GENERAL MOTORS COMPANY

1. Install a NEW engine front cover gasket (1) to the dowel pins.
2. Install the engine front cover.

Fig. 81: Engine Front Cover Bolts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

3. Install the engine front cover bolts (1) and tighten to 25 N.m (18 lb ft).
4. Lower the vehicle.

Fig. 82: Water Pump Bolt

Courtesy of GENERAL MOTORS COMPANY

5. Install the engine front cover to water pump bolt (1) and tighten to 25 N.m (18 lb ft).
6. Reposition the oxygen sensor harness to the front cover.
7. Install the crankshaft balancer. Refer to **Crankshaft Balancer Replacement**.
8. Install the drive belt tensioner. Refer to **Drive Belt Tensioner Replacement (LEA)**.
9. Install the engine mount bracket. Refer to **Engine Mount Bracket Replacement (LEA)**.

ENGINE FRONT COVER REPLACEMENT (LUK)

Special Tools

- **J 38122-A** Harmonic Balancer Holder
- **J 45059** Angle Meter

For equivalent regional tools, refer to **Special Tools** .

Removal Procedure

Fig. 83: Air Cleaner Assembly

Courtesy of GENERAL MOTORS COMPANY

1. Remove the air cleaner assembly (1). Refer to **Air Cleaner Assembly Replacement** .

Fig. 84: Drive Belt

Courtesy of GENERAL MOTORS COMPANY

2. Remove the drive belt (1). Refer to **Drive Belt Replacement (LUK)**.
3. Remove the wheelhouse splash shield. Refer to **Front Compartment Splash Shield Replacement** .

Fig. 85: Power Brake Booster Vacuum Rear Pipe Quick Connect And Retainer

8. Install the air cleaner assembly (1). Refer to **Air Cleaner Assembly Replacement** .

CAMSHAFT TIMING CHAIN, SPROCKET, AND TENSIONER REPLACEMENT

Special Tools

- **EN-45027** Tensioner Tool
- **EN-45059** Angle Meter
- **EN-48953** Camshaft Actuator Locking Tool

For equivalent regional tools, refer to **Special Tools**

Removal Procedure

Fig. 97: Upper Timing Chain Guide Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Remove the camshaft cover. Refer to **Camshaft Cover Replacement (LUK)**, **Camshaft Cover Replacement (LEA)**.
2. Remove the number 1 cylinder spark plug. Refer to **Spark Plug Replacement**.
3. Rotate the crankshaft in the engine rotational direction clockwise, until the number 1 piston is at top dead center (TDC) on the exhaust stroke.
4. Remove the engine front cover. Refer to **Engine Front Cover Replacement (LEA)**, **Engine Front Cover Replacement (LUK)**.
5. Remove the upper timing chain guide bolts (1) and guide (2).

Fig. 98: Timing Chain Tensioner

Courtesy of GENERAL MOTORS COMPANY

NOTE: The timing chain tensioner must be removed to unload chain tension before the timing chain is removed. If it is not, the timing chain will become cocked and it will be difficult to remove.

6. Remove the timing chain tensioner (1).

Fig. 99: Exhaust Camshaft Sprocket
Courtesy of GENERAL MOTORS COMPANY

7. Install a 24 mm wrench on the hex on the exhaust camshaft in order to hold the camshaft.
8. Remove and discard the exhaust camshaft actuator bolt (2).
9. Remove the exhaust camshaft actuator (1, 3) from the camshaft and timing chain.

Fig. 100: Timing Chain Tensioner Guide Bolt And Guide
Courtesy of GENERAL MOTORS COMPANY

10. Remove the timing chain tensioner guide bolt (1) and guide (2).

Fig. 101: Fixed Timing Chain Guide Access Plug
Courtesy of GENERAL MOTORS COMPANY

11. Remove the fixed timing chain guide access plug (1).

Fig. 102: Fixed Timing Chain Guide Bolts And Guide
Courtesy of GENERAL MOTORS COMPANY

12. Remove the fixed timing chain guide bolts (1) and guide (2).

Fig. 103: Timing Chain & Camshaft Position Actuator
Courtesy of GENERAL MOTORS COMPANY

13. Install a 24 mm wrench on the hex on the intake camshaft in order to hold the camshaft.
14. Remove and discard the intake camshaft actuator bolt (1).
15. Remove the intake camshaft actuator (3), and the timing chain through the top of the cylinder head.

Fig. 104: View of Friction Washer and Timing Chain Drive Sprocket
Courtesy of GENERAL MOTORS COMPANY

NOTE: Ecotec 4 cylinder engines with SIDI-Direct Injection, the lower timing chain crank gear may be equipped with a second spacing washer installed in front of the lower timing chain crank gear. The outer spacer/washer is in between the crank/balancer pulley and the lower timing gear and may remain in place when the pulley is removed. The spacer/washer has a dot/mark on its surface that may be mistaken for the lower timing mark. If applicable, the washer must be removed in order to view the correct timing mark on the lower crank gear.

16. Remove the outer friction washer (1) if equipped.
17. Ensure the crankshaft gear timing mark (2) is in the 5 o'clock position and crankshaft key is in the 12 o'clock position.
18. Remove the crankshaft sprocket (3).
19. Remove the inner friction washer (1).

Installation Procedure

Fig. 105: Camshaft Notches

Courtesy of GENERAL MOTORS COMPANY

1. When installing the camshafts, ensure the intake camshaft notch is in the 10 o'clock position (2) and the exhaust camshaft notch is in the 7 o'clock position (1). The number 1 piston should be at top dead center (TDC), crankshaft key at 12 o'clock.

Fig. 106: View of Friction Washer and Timing Chain Drive Sprocket
Courtesy of GENERAL MOTORS COMPANY

NOTE: Ecotec 4 cylinder engines with SIDI-Direct Injection, the lower timing chain crank gear may be equipped with a second spacing washer installed in front of the lower timing chain crank gear. The outer spacer/washer is in between the crank/balancer pulley and the lower timing gear and may remain in place when the pulley is removed. The spacer/washer has a dot/mark on its surface that may be mistaken for the lower timing mark. If applicable, the washer must be removed in order to view the correct timing mark on the lower crank gear.

2. Install the inner friction washer (1).
3. Install the crankshaft sprocket with the timing mark (2) is in the 5 o'clock position and facing outward.
4. Install the outer friction washer (1) if equipped.

Fig. 107: Identifying Colored Links On Timing Chain
Courtesy of GENERAL MOTORS COMPANY

NOTE:

- There are 3 colored links on the timing chain. Two links are of matching color, and 1 link is of a unique color. Use the following procedure to line up the links with the actuators. Orient the chain so that the colored links are visible.
 - Always use new actuator bolts.
5. Assemble the intake camshaft actuator into the timing chain with the timing mark lined up with the uniquely colored link (1).

Fig. 108: Identifying Cylinder Head Opening
Courtesy of GENERAL MOTORS COMPANY

6. Lower the timing chain through the opening in the cylinder head. Use care to ensure that the chain goes around both sides of the cylinder block bosses (1, 2).
7. Install the intake camshaft actuator onto the intake camshaft while aligning the dowel pin into the camshaft slot.
8. Hand tighten the new intake camshaft actuator bolt.

Fig. 109: Lining Up First Pink Link With Timing Mark On Crankshaft Sprocket
Courtesy of GENERAL MOTORS COMPANY

9. Route the timing chain around the crankshaft sprocket and line up the first matching colored (1) link with the timing mark on the crankshaft sprocket, in approximately the 5 o'clock position.
10. Install the friction washer, if applicable.

Fig. 110: Adjustable Timing Chain Guide
Courtesy of GENERAL MOTORS COMPANY

11. Rotate the crankshaft clockwise to remove all chain slack. Do not rotate the intake camshaft.

CAUTION: Refer to Fastener Caution .

12. Install the adjustable timing chain guide (2) down through the opening in the cylinder head and install the adjustable timing chain bolt. Tighten the adjustable timing chain guide bolt (1) to 10 N.m (89 lb in).

Fig. 111: Camshaft Actuator

Courtesy of GENERAL MOTORS COMPANY

NOTE: Always install NEW actuator bolts.

13. Install the exhaust camshaft actuator (2) into the timing chain with the timing mark lined up with the second matching colored link.

Fig. 112: Camshaft Slot

Courtesy of GENERAL MOTORS COMPANY

14. Install the exhaust camshaft actuator onto the exhaust camshaft, aligning the dowel pin into the camshaft slot (1).
15. Use 24 mm open ended wrench, rotate the exhaust camshaft approximately 45 degrees until the dowel pin in the camshaft actuator goes into the camshaft slot.
16. When the actuator seats on the cam, tighten the new exhaust camshaft actuator bolt hand tight.

Fig. 113: Colored Links

Courtesy of GENERAL MOTORS COMPANY

17. Verify that all of the colored links (1) and the appropriate timing marks are still aligned. If they are not aligned, repeat the portion of the procedure necessary to align the timing marks.

Fig. 114: Fixed Timing Chain Guide Bolts And Guide
Courtesy of GENERAL MOTORS COMPANY

18. Install the fixed timing chain guide (2) and bolts (1). Tighten the fixed timing chain guide bolts to 12 N.m (106 lb in).

Fig. 115: Upper Timing Chain Guide
Courtesy of GENERAL MOTORS COMPANY

19. Install the upper timing chain guide (2) and bolts (1). Tighten the upper timing chain guide bolts to 10 N.m (89 lb in).

Fig. 116: Compressing Timing Chain Tensioner
Courtesy of GENERAL MOTORS COMPANY

20. Reset the timing chain tensioner by performing the following steps:
 1. Remove the snap ring.
 2. Remove the piston assembly from the body of the timing chain tensioner.
 3. Install the **EN-45027-2** tool (2) into a vise.
 4. Install the notch end of the piston assembly into the **EN-45027-2** tool (2).
 5. Using the **EN-45027-1** tool (1), turn the ratchet cylinder into the piston.
 6. Reinstall the piston assembly into the body of the tensioner.
 7. Install the snap ring.

Fig. 117: Timing Chain Tensioner
Courtesy of GENERAL MOTORS COMPANY

21. Inspect the timing chain tensioner seal for damage. If damaged, replace the seal.
22. Inspect to ensure all dirt and debris is removed from the timing chain tensioner threaded hole in the cylinder head.

NOTE: **Ensure the timing chain tensioner seal is centered throughout the torque procedure to eliminate the possibility of an oil leak.**

23. Install the timing chain tensioner assembly. Tighten the timing chain tensioner (1) to 75 N.m (55 lb ft).
24. The timing chain tensioner is released by compressing it 2 mm (0.079 in), which will release the locking mechanism in the ratchet. To release the timing chain tensioner, use a suitable tool with a rubber tip on the end. Feed the tool down through the cam drive chest to rest on the cam chain. Then give a sharp jolt diagonally downwards to release the tensioner.

Fig. 118: View Locking Tool

Courtesy of GENERAL MOTORS COMPANY

25. Install **EN-48953** locking tool (1) and tighten the bolts into the cylinder head to 10 N.m (89 lb in).
26. Using a torque wrench, tighten the camshaft actuator bolt (2) to 30 N.m (22 lb ft) plus 100 degrees using the **EN-45059** meter.
27. Remove the **EN-48953** locking tool.

Fig. 119: View Of Oil Nozzle & Bolt
Courtesy of GENERAL MOTORS COMPANY

28. Install the timing chain oiling nozzle (2). Tighten the timing chain oiling nozzle bolt (1) to 10 N.m (89 lb in).

Fig. 120: Fixed Timing Chain Guide Access Plug
Courtesy of GENERAL MOTORS COMPANY

29. Apply sealant compound to the thread of the timing chain guide bolt access hole plug. Refer to **Adhesives, Fluids, Lubricants, and Sealers** .
30. Install the timing chain guide bolt access hole plug (1) . Tighten the access hole plug to 90 N.m (66 lb ft).
31. Install the engine front cover. Refer to **Engine Front Cover Replacement (LEA)**, **Engine Front Cover Replacement (LUK)**.
32. Install the camshaft cover. Refer to **Camshaft Cover Replacement (LUK)**, **Camshaft Cover Replacement (LEA)**.
33. Install the number 1 cylinder spark plug. Refer to **Spark Plug Replacement** .

WATER PUMP AND BALANCE SHAFT CHAIN REPLACEMENT

Removal Procedure

1. Remove the camshaft timing chain, sprocket, and tensioner. Refer to **Camshaft Timing Chain, Sprocket, and Tensioner Replacement**.

Fig. 121: Balance Shaft Drive Chain Tensioner
Courtesy of GENERAL MOTORS COMPANY

2. Remove the adjustable balance shaft chain guide bolt and guide

Fig. 122: Small Balance Shaft Drive Chain Guide
Courtesy of GENERAL MOTORS COMPANY

3. Remove the small balance shaft drive chain guide bolts and guide.

Fig. 123: Upper Balance Shaft Drive Chain Guide
Courtesy of GENERAL MOTORS COMPANY

4. Remove the upper balance shaft drive chain guide bolts and guide.

Fig. 124: Balance Shaft Drive Chain
Courtesy of GENERAL MOTORS COMPANY

NOTE: It may ease removal of the balance shaft drive chain to get all the slack in the chain between the crankshaft and water pump sprockets.

5. Remove the balance shaft drive chain (7).
6. Remove the balance shaft drive sprocket.

Installation Procedure

Fig. 125: View Of Intake Side Balance Shaft Sprocket Timing Mark
Courtesy of GENERAL MOTORS COMPANY

NOTE: There are two possible chain configurations for the engine. Both configurations use a unique chain link to line up with the intake side balance shaft sprocket timing mark. The first design uses a unique link color (1). The second design uses a black anodized link (3) with uniquely colored links on either side (2).

1. Determine the configuration of the balance chain.

Fig. 126: Aligning Balance Shaft Drive Chain
 Courtesy of GENERAL MOTORS COMPANY

NOTE: If the balance shafts are not properly timed to the engine, the engine may vibrate or make noise.

2. Install the balance shaft drive sprocket.
3. For the 1st design balance chain, install the balance shaft drive chain with the colored links lined up with the marks on the balance shaft drive sprockets and the crankshaft sprocket. There are three colored links on the chain. Two links are of matching colors, and one link is of a unique color. Use the following procedure to line up the links with the sprockets:
 1. Orient the chain so that the colored links are visible.
 2. Place the uniquely colored link (1) so that it lines up with the timing mark on the intake side balance shaft sprocket.
 3. Working clockwise around the chain, place the first matching colored link (2) in line with the timing mark on the crankshaft drive sprocket, approximately 6 o'clock position on the crank sprocket.
 4. Place the chain (3) on the water pump drive sprocket. The alignment is not critical.
 5. Align the last matching colored link (4) with the timing mark on the exhaust side balance shaft drive sprocket.

4. For the 2nd design balance chain, install the balance shaft drive chain with the black anodized links lined up with the marks on the balance shaft drive sprockets and the crankshaft sprocket. There are three timing links with a black anodized finish on the chain. One black anodized link has uniquely colored links on either side. Use the following procedure to line up the links with the sprockets:
 1. Orient the chain so that the colored links are visible.
 2. Place the black anodized link (1), with uniquely colored links on either side, so that it lines up with the timing mark on the intake side balance shaft sprocket.
 3. Working clockwise around the chain, place the next black anodized link (2) in line with the timing mark on the crankshaft drive sprocket, approximately 6 o'clock position on the crank sprocket.
 4. Place the chain (3) on the water pump drive sprocket. The alignment is not critical.
 5. Align the last black anodized link (4) with the timing mark on the exhaust side balance shaft drive sprocket.

Fig. 127: Upper Balance Shaft Drive Chain Guide
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

5. Install the upper balance shaft drive chain guide and bolts and tighten to 12 (106 lb in).

Fig. 128: Small Balance Shaft Drive Chain Guide
Courtesy of GENERAL MOTORS COMPANY

6. Install the small balance shaft drive chain guide and bolts and tighten to 12 (106 lb in).

Fig. 129: Adjustable Balance Shaft Chain Guide
Courtesy of GENERAL MOTORS COMPANY

7. Install the adjustable balance shaft chain guide and bolt and tighten to 10 (89 lb in).

Fig. 130: Balance Shaft Drive Chain Tensioner
Courtesy of GENERAL MOTORS COMPANY

8. Reset the timing chain tensioner by performing the following steps:
 - Rotate the tensioner plunger 90 degrees in its bore and compress the plunger.
 - Rotate the tensioner back to the original 12 o'clock position and insert a paper clip through the hole in the plunger body and into the hole in the tensioner plunger.
9. Install the balance shaft drive chain tensioner and bolts and tighten to 10 N•m (89 lb in).
10. Remove the paper clip from the balance shaft drive chain tensioner.
11. Install the camshaft timing chain, sprocket, and tensioner. Refer to **Camshaft Timing Chain, Sprocket, and Tensioner Replacement**.

WATER PUMP AND BALANCE SHAFT CHAIN TENSIONER REPLACEMENT

Fig. 131: Water Pump and Balance Shaft Chain Tensioner
 Courtesy of GENERAL MOTORS COMPANY

Water Pump and Balance Shaft Chain Tensioner Replacement

Callout	Component Name
Preliminary Procedure Remove the engine front cover. Refer to <u>Engine Front Cover Replacement (LEA)</u> , <u>Engine Front Cover Replacement (LUK)</u> .	
1	Water Pump and Balancer Shaft Chain Tensioner Fastener (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Procedure <ol style="list-style-type: none"> 1. Rotate the tensioner plunger counterclockwise and push the tensioner pin in the tensioner body. 2. Rotate the tensioner plunger clockwise and secure the tensioner plunger with a positioning pin. Install the tensioner. 3. Remove the positioning pin. Tighten 10 (89 lb in)

CAMSHAFT COVER REPLACEMENT (LUK)

Removal Procedure

1. Remove the air cleaner outlet duct. Refer to [Air Cleaner Outlet Duct Replacement](#) Air Cleaner Outlet Duct Replacement
2. Remove the ignition coils. Refer to [Ignition Coil Replacement](#) Ignition Coil Replacement

Fig. 132: Rear Lift Bracket

Courtesy of GENERAL MOTORS COMPANY

3. Remove the rear lift bracket (1).

Fig. 133: Front Lift Bracket
Courtesy of GENERAL MOTORS COMPANY

4. Remove the front lift bracket (1).

Fig. 134: Evaporative Emission Canister Purge Tube
Courtesy of GENERAL MOTORS COMPANY

5. Remove the evaporative emission canister purge tube (1). Refer to **Plastic Collar Quick Connect Fitting Service** .
6. Disconnect fuel line clip (2).

Fig. 135: Camshaft Housing Cover Insulator
Courtesy of GENERAL MOTORS COMPANY

7. Remove the camshaft housing cover insulator (1).

Fig. 136: Camshaft Cover Bolt

Courtesy of GENERAL MOTORS COMPANY

8. Remove the camshaft cover bolts (1).

Fig. 137: Camshaft Cover And Gasket
Courtesy of GENERAL MOTORS COMPANY

9. Remove the camshaft cover (1) and gasket (2).

Installation Procedure

Fig. 138: Camshaft Cover And Gasket
Courtesy of GENERAL MOTORS COMPANY

1. Assemble the camshaft cover (1) and a NEW gasket (2). Ensure that the gasket is located in the retaining groove in the camshaft cover.

Fig. 139: Camshaft Cover Bolt

Courtesy of GENERAL MOTORS COMPANY

2. Install NEW camshaft cover grommets and camshaft cover bolts (1).
3. Install the cover on the cylinder head and hand start the bolts. Tighten the bolts to 10 N.m (89 lb in).

Fig. 140: Camshaft Housing Cover Insulator
Courtesy of GENERAL MOTORS COMPANY

4. Install the camshaft housing cover insulator (1). Tighten the bolts to 10 N.m (89 lb in).

Fig. 141: Front Lift Bracket

Courtesy of GENERAL MOTORS COMPANY

5. Install the front lift bracket (1).
6. Install the front lift bracket bolts and tighten to 25 N.m (18 lb ft).

Fig. 142: Rear Lift Bracket
Courtesy of GENERAL MOTORS COMPANY

7. Install the rear lift bracket (1).
8. Install the rear lift bracket bolts and tighten to 25 N.m (18 lb ft).

Fig. 143: Evaporative Emission Canister Purge Tube
Courtesy of GENERAL MOTORS COMPANY

9. Install the evaporative emission canister purge tube (1). Refer to **Plastic Collar Quick Connect Fitting Service** .
10. connect the fuel like clip.
11. install the ignition coils. Refer to **Ignition Coil Replacement** Ignition Coil Replacement.
12. Install the air cleaner outlet duct. Refer to **Air Cleaner Outlet Duct Replacement** Air Cleaner Outlet Duct Replacement.

CAMSHAFT COVER REPLACEMENT (LEA)

Fig. 144: Camshaft Cover (LEA)

Courtesy of GENERAL MOTORS COMPANY

Camshaft Cover Replacement (LEA)

Callouts	Component Name
Preliminary Procedures <ol style="list-style-type: none"> 1. Remove the air cleaner outlet duct. Refer to <u>Air Cleaner Outlet Duct Replacement</u> . 2. Remove the ignition coils. Refer to <u>Ignition Coil Replacement</u> . 3. Remove the Camshaft Position Sensor intake. Refer to <u>Camshaft Position Sensor Replacement - Intake</u> 4. Remove the Camshaft Position Sensor Exhaust . Refer to <u>Camshaft Position Sensor Replacement - Exhaust</u> 	
1	Camshaft Cover Fastener (Qty: 11) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 10 N.m (89 lb in)
	Camshaft Cover Procedure

2	<ol style="list-style-type: none"> 1. Do not reuse camshaft gasket. Also use a new gasket when removing or replacing camshaft cover. 2. Remove ignition coil wiring harness clips from the camshaft cover. 3. Remove the fuel line bracket from the camshaft cover. 4. Transfer components as necessary.
---	--

TIMING CHAIN TENSIONER REPLACEMENT

Special Tools

EN-45027 Tensioner Tool

For equivalent regional tools, refer to **Special Tools** .

Removal Procedure

1. Disconnect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .
2. Remove the camshaft cover. Refer to **Camshaft Cover Replacement (LUK)**, **Camshaft Cover Replacement (LEA)**.

Fig. 145: Timing Chain Tensioner
Courtesy of GENERAL MOTORS COMPANY

3. Remove the timing chain tensioner (1).
4. Remove the seal from the tensioner and DISCARD.

Installation Procedure

Fig. 146: Measuring Timing Chain Tensioner Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Inspect the timing chain tensioner. If the timing chain tensioner, O-ring seal, or washer is damaged, replace the timing chain tensioner or O-ring seal as applicable.
2. Measure the timing chain tensioner assembly from end to end. If the timing chain tensioner is to be replaced, a new tensioner should be supplied in the fully compressed non-active state.

A tensioner in the compressed state will measure 72 mm (2.83 in) (a) from end to end. A tensioner in the active state will measure 85 mm (3.35 in) (a) from end to end.

Fig. 147: Compressing Timing Chain Tensioner
Courtesy of GENERAL MOTORS COMPANY

3. If the timing chain tensioner is not in the compressed state, perform the following steps:
 1. Remove the piston assembly from the body of the timing chain tensioner by pulling it out.
 2. Install the **EN-45027-2** retainer (2) into a vise.
 3. Install the notch end of the piston assembly into the **EN-45027-2** retainer (2).
 4. Using the **EN-45027-1** compressor (1), turn the ratchet cylinder into the piston.

Fig. 148: Measuring Timing Chain Tensioner Assembly
Courtesy of GENERAL MOTORS COMPANY

4. Inspect the bore of the tensioner body for dirt, debris, and damage. If any damage appears, replace the tensioner. Clean dirt or debris out with a lint-free cloth.
5. Install the compressed piston assembly back into the timing chain tensioner body until it stops at the bottom of the bore.

Do not compress the piston assembly against the bottom of the bore. If the piston assembly is compressed against the bottom of the bore, it will activate the tensioner, which will then need to be reset again.

6. At this point the tensioner should measure approximately 72 mm (2.83 in) (a) from end to end. If the tensioner does not read 72 mm (2.83 in) (a) from end to end, repeat steps 3-5.

Fig. 149: Identifying Timing Chain Tensioner
Courtesy of GENERAL MOTORS COMPANY

7. Inspect to ensure all dirt and debris is removed from the timing chain tensioner threaded hole in the cylinder head.

CAUTION: Refer to Fastener Caution .

NOTE: **Ensure the timing chain tensioner seal is centered throughout the torque procedure to eliminate the possibility of an oil leak.**

8. Install the timing chain tensioner assembly (1) and tighten the tensioner to 75 N.m (55 lb ft).
9. The timing chain tensioner is released by compressing the tensioner 2 mm (0.079 in) which will release the locking mechanism in the ratchet.

To release the timing chain tensioner, use a suitable tool with a rubber tip on the end. Feed the tool down through the cam drive chest to rest on the cam chain. Then give a sharp jolt diagonally downwards to release the tensioner.

10. Install the camshaft cover. Refer to Camshaft Cover Replacement (LUK), Camshaft Cover Replacement (LEA).
11. Connect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection.

INTAKE CAMSHAFT AND VALVE LIFTER REPLACEMENT

Removal Procedure

1. Remove the intake camshaft position actuator. Refer Camshaft Position Intake Actuator Replacement.

Fig. 150: Intake Camshaft Position Actuator Solenoid Valve & Bolt
Courtesy of GENERAL MOTORS COMPANY

2. Remove the intake camshaft position actuator solenoid valve bolt (1) and valve (2).

Fig. 151: Rear Cylinder Head Cover Plate
Courtesy of GENERAL MOTORS COMPANY

3. Remove the rear cylinder head cover plate (1).
4. Remove the fuel pump. Refer to **Fuel Pump Replacement** .

Fig. 152: Intake Camshaft Bearing Rear Cap Bolts And Cap
Courtesy of GENERAL MOTORS COMPANY

5. Remove the intake camshaft bearing rear cap bolts and cap (2).

NOTE: Remove each bolt on each cap one turn at a time until there is no spring tension pushing on the camshaft.

6. Mark camshaft caps to ensure they are installed in the same position.
7. Remove the intake camshaft cap bolts.
8. Remove the camshaft caps (1).
9. Remove the intake camshaft (3).

Fig. 153: Intake Camshaft Roller Finger Followers
Courtesy of GENERAL MOTORS COMPANY

NOTE: Keep all of the roller finger followers and hydraulic lash adjusters in order so that they can be reinstalled in their respective locations.

10. Remove the intake camshaft roller finger followers.

Fig. 154: Hydraulic Lash Adjusters
Courtesy of GENERAL MOTORS COMPANY

11. Remove the hydraulic lash adjusters.

Installation Procedure

Fig. 155: Hydraulic Lash Adjusters
Courtesy of GENERAL MOTORS COMPANY

1. Install the hydraulic lash adjusters into their bores in the cylinder head.
2. Lubricate the hydraulic lash adjusters. Refer to **Adhesives, Fluids, Lubricants, and Sealers** .

Fig. 156: Valve Tips
Courtesy of GENERAL MOTORS COMPANY

3. Lubricate the valve tips. Refer to Adhesives, Fluids, Lubricants, and Sealers .

Fig. 157: Intake Camshaft Roller Finger Followers
Courtesy of GENERAL MOTORS COMPANY

NOTE: Used roller followers must be returned to the original position on the camshaft. If the camshaft is being replaced, the roller followers actuated by the camshaft must also be replaced.

4. Position the roller followers on the tip of the valve stem and on the lash adjuster. Lubricate roller followers. Refer to **Adhesives, Fluids, Lubricants, and Sealers** .

Fig. 158: Identifying Proper Exhaust/Intake Camshaft Alignment positions
Courtesy of GENERAL MOTORS COMPANY

NOTE: If equipped with the following engine; LE5, LE9, LAT, LNF, LDK, LHU, LTD, LBN, ensure the intake camshaft notch is in the 5 o'clock position and the exhaust camshaft notch is in the 7 o'clock position.

5. Ensure the intake camshaft notch is in the 5 o'clock position (2) and the exhaust camshaft notch is in the 7 o'clock position (1). The number 1 piston should be at top dead center (TDC), crankshaft key at 12 o'clock.

Fig. 159: Camshaft Notches

Courtesy of GENERAL MOTORS COMPANY

NOTE: If equipped with following engine; LEA, LUK, ensure the intake camshaft notch is in the 10 o'clock position and the exhaust camshaft notch is in the 7 o'clock position.

6. Ensure the intake camshaft notch is in the 10 o'clock position (2) and the exhaust camshaft notch is in the 7 o'clock position (1). The number 1 piston should be at top dead center (TDC), crankshaft key at 12 o'clock.

Fig. 160: Intake Camshaft & Caps
Courtesy of GENERAL MOTORS COMPANY

7. Set the intake camshaft on top of the roller followers in the camshaft bearing journals and lubricate. Refer to **Adhesives, Fluids, Lubricants, and Sealers** .

Fig. 161: Oil Seals

Courtesy of GENERAL MOTORS COMPANY

8. Rotate the oil seal in the groove of the number one camshaft journal so the split line (1) is at approximately the 12:00 position before installing the camshaft caps.

Fig. 162: Camshaft Notches

Courtesy of GENERAL MOTORS COMPANY

NOTE: The number 1 cylinder must be at top dead center (TDC), crankshaft keyway at the 12 o'clock position.

9. Install the intake camshaft with the notch on the front at approximately the 10 o'clock position (2).
10. Install the camshaft caps and hand start the camshaft cap bolts.

CAUTION: Refer to Fastener Caution .

11. Tighten the camshaft cap bolts in increments of 3 turns until they are seated. Tighten the camshaft caps to 10 N.m (89 lb in).

Fig. 163: Sealer Application Areas
 Courtesy of GENERAL MOTORS COMPANY

- NOTE:** It is critical during installation to ensure the bearing rear cap and cylinder head alignment is correct and the mating surfaces are flush.
- Ensure that all sealing material has been removed from the components, and the sealing surfaces are clean and free of contamination prior to applying the sealer.
 - Install and align the rear cap within 20 minutes of applying the sealer.

- NOTE:** Apply the sealer to all locations centrally locating the bead on the rail.
- Run bead to 5.0 mm, dimension a, as shown.
 - Where the cap ends on the perimeter rail, extend bead approximately 4.0 mm beyond edge of cap.
 - Run bead, dimension c, 32 mm from the edge of the cylinder head as shown.
 - Run beads, dimension b, 20 mm from edge of cylinder head as shown.

12. Apply a 2.5 mm bead of sealer to the cylinder head at the number 6 intake camshaft rear cap mating surface. Refer to **Adhesives, Fluids, Lubricants, and Sealers** .
13. Install the number 6 intake camshaft rear cap.
 1. Tighten the cap bolts evenly to 5 N.m (44 lb in).
 2. Tighten the cap bolts evenly to 10 N.m (89 lb in).
 3. Back the cap bolts out 120 degrees.
 4. Tighten the cap bolts evenly a final pass to 10 N.m (89 lb in).

Fig. 164: Identifying Fuel Pump Roller Lifter Orifice
Courtesy of GENERAL MOTORS COMPANY

14. Remove all excess sealing material from the fuel pump roller lifter bore (1), and ensure the bore is free of debris. Do not allow any excess sealing material to remain within the cylinder head or on any sealing surface.
15. Remove all excess sealing material from the fuel pump assembly sealing surface (2).
16. Install the fuel pump. Refer to **Fuel Pump Replacement** .

Fig. 165: Rear Cylinder Head Cover Plate
Courtesy of GENERAL MOTORS COMPANY

17. Verify the seal on the cylinder head cover plate (1) is intact and in good condition.
18. Ensure that the opening plate sealing surface is clean and free of excess sealing material. Install the rear cylinder head opening plate (1) and tighten the bolts to 10 N.m (89 lb in).

Fig. 166: Intake Camshaft Position Actuator Solenoid Valve & Bolt
Courtesy of GENERAL MOTORS COMPANY

19. Install the intake camshaft position actuator solenoid valve (2). Tighten the solenoid valve bolt (1) to 10 N.m (89 lb in).
20. Install the intake camshaft position actuator. Refer **Camshaft Position Intake Actuator Replacement**.

EXHAUST CAMSHAFT AND VALVE LIFTER REPLACEMENT

Removal Procedure

1. Remove the exhaust camshaft position actuator. Refer to **Camshaft Position Exhaust Actuator Replacement**.

Fig. 167: Exhaust Camshaft Position Actuator Solenoid Valve & Bolt
Courtesy of GENERAL MOTORS COMPANY

2. Remove the exhaust camshaft position actuator solenoid valve bolt (1) and valve (2).

Fig. 168: Exhaust Camshaft & Caps
Courtesy of GENERAL MOTORS COMPANY

NOTE: Remove each bolt on each cap one turn at a time until there is no spring tension pushing on the camshaft.

3. Mark camshaft caps to ensure they are installed in the same position.
4. Remove the exhaust camshaft cap bolts.
5. Remove the camshaft caps ensuring they are marked and refitted in same position on assembly.
6. Remove the exhaust camshaft.

Fig. 169: Exhaust Camshaft Roller Finger Followers
Courtesy of GENERAL MOTORS COMPANY

NOTE: Keep all of the roller finger followers and hydraulic lash adjusters in order so that they can be reinstalled in their respective locations.

7. Remove the exhaust camshaft roller finger followers.

Fig. 170: Hydraulic Lash Adjusters
Courtesy of GENERAL MOTORS COMPANY

8. Remove the hydraulic lash adjusters.

Installation Procedure

Fig. 171: Hydraulic Lash Adjusters
Courtesy of GENERAL MOTORS COMPANY

1. Install the hydraulic lash adjusters into their bores in the cylinder head and lubricate. Refer to **Adhesives, Fluids, Lubricants, and Sealers** .

Fig. 172: Valve Tips

Courtesy of GENERAL MOTORS COMPANY

2. Lubricate the valve tips. Refer to Adhesives, Fluids, Lubricants, and Sealers .

Fig. 173: Exhaust Camshaft Roller Finger Followers
Courtesy of GENERAL MOTORS COMPANY

NOTE: Used roller followers must be returned to the original position on the camshaft. If the camshaft is being replaced, the roller followers actuated by the camshaft must also be replaced.

3. Position the roller followers on the tip of the valve stem and on the lash adjuster and lubricate. Refer to **Adhesives, Fluids, Lubricants, and Sealers** .

Fig. 174: Identifying Proper Exhaust/Intake Camshaft Alignment positions
Courtesy of GENERAL MOTORS COMPANY

NOTE: If equipped with the following engine; LE5, LE9, LAT, LNF, LDK, LHU, LTD, LBN, ensure the intake camshaft notch is in the 5 o'clock position and the exhaust camshaft notch is in the 7 o'clock position.

4. Ensure the intake camshaft notch is in the 5 o'clock position (2) and the exhaust camshaft notch is in the 7 o'clock position (1). The number 1 piston should be at top dead center (TDC), crankshaft key at 12 o'clock.

Fig. 175: Camshaft Notches

Courtesy of GENERAL MOTORS COMPANY

NOTE: If equipped with following engine; LEA, LUK, ensure the intake camshaft notch is in the 10 o'clock position and the exhaust camshaft notch is in the 7 o'clock position.

5. Ensure the intake camshaft notch is in the 10 o'clock position (2) and the exhaust camshaft notch is in the 7 o'clock position (1). The number 1 piston should be at top dead center (TDC), crankshaft key at 12 o'clock.

Fig. 176: Intake Camshaft & Caps
Courtesy of GENERAL MOTORS COMPANY

6. Set the exhaust camshaft on top of the roller followers in the camshaft bearing journals and lubricate. Refer to **Adhesives, Fluids, Lubricants, and Sealers** .

Fig. 177: Oil Seals

Courtesy of GENERAL MOTORS COMPANY

7. Rotate the oil seal in the groove of the number one camshaft journal so the split line (1) is at approximately the 12:00 position before installing the camshaft caps.

Fig. 178: Camshaft Notches

Courtesy of GENERAL MOTORS COMPANY

8. Install the exhaust camshaft with the notch on the front (1) at approximately the 7 o'clock position.
9. Install the camshaft caps and hand start the camshaft cap bolts.

CAUTION: Refer to Fastener Caution .

10. Tighten the camshaft cap bolts in increments of 3 turns until they are seated. Tighten the camshaft caps to 10 N.m (89 lb in).

Fig. 179: Exhaust Camshaft Position Actuator Solenoid Valve & Bolt
Courtesy of GENERAL MOTORS COMPANY

11. Install the exhaust camshaft position actuator solenoid valve (2). Tighten the solenoid valve bolt (1) to 10 N.m (89 lb in).
12. Install the exhaust camshaft position actuator. Refer to **Camshaft Position Exhaust Actuator Replacement**.

CAMSHAFT POSITION INTAKE ACTUATOR REPLACEMENT

Special Tools

- **EN-45059** Angle Meter
- **EN-48749** Timing Chain Retention Tool Kit
- **EN-48953** Camshaft Actuator Locking Tool

For equivalent regional tools, refer to **Special Tools** .

Removal Procedure

1. Remove the camshaft cover. Refer to **Camshaft Cover Replacement (LUK)**, **Camshaft Cover**

Replacement (LEA).

2. Remove the spark plugs. Refer to **Spark Plug Replacement** .

Fig. 180: Loosening/Tightening Camshaft Actuator Retainer Bolts
Courtesy of GENERAL MOTORS COMPANY

3. Rotate the crankshaft clockwise and install the **EN-48953** retention tool (1).

CAUTION: Refer to **Fastener Caution** .

4. Install the camshaft actuator retainer bolts and tighten to 10 N.m (89 lb in).
5. Loosen, but DO NOT remove the intake camshaft actuator bolt.
6. Remove the **EN-48953** locking tool (1).
7. Clean the timing chain and gears with solvent.

NOTE: **Ensure the timing chain and the camshaft position actuators are marked for proper assembly.**

8. Mark the intake and exhaust camshaft actuators and the respective locations on the timing chain.

Fig. 181: Upper Timing Chain Guide
Courtesy of GENERAL MOTORS COMPANY

9. Remove the upper timing chain guide bolts (1) and guide (2).

Fig. 182: Timing Chain Tensioner
Courtesy of GENERAL MOTORS COMPANY

10. Remove the timing chain tensioner (1).

Fig. 183: View Of Timing Chain & Chain Retention Tool
Courtesy of GENERAL MOTORS COMPANY

NOTE:

- The intake camshaft actuator should not rotate during the removal or installation.
- Ensure the tips of the tool are fully engaged into the timing chain. The retention tool rod can be used on the back side of the chain to ensure the teeth from the retention tool are engaged.

11. Install the **EN-48749** retention tool (1) to the intake side of the timing chain.

Fig. 184: Identifying Timing Chain & Chain Retention Tool
Courtesy of GENERAL MOTORS COMPANY

12. Install the **EN-48749** retention tool (1) to the exhaust side of the timing chain.

Fig. 185: Timing Chain & Camshaft Position Actuator
Courtesy of GENERAL MOTORS COMPANY

13. Remove and discard the intake camshaft actuator bolt (1).
14. Rotate the exhaust camshaft clockwise slightly to take the tension off of the timing chain on the intake actuator.
15. Remove the intake camshaft actuator (3) from the camshaft while also removing the actuator from the timing chain.

Installation Procedure

Fig. 186: Timing Chain & Camshaft Position Actuator
Courtesy of GENERAL MOTORS COMPANY

NOTE: Ensure that the alignment mark made previously on the intake camshaft actuator is still aligned properly with the mark on the timing chain.

1. Install the timing chain onto the intake camshaft actuator.
2. Align the intake camshaft actuator alignment mark made previously with the timing chain mark and install the actuator onto the camshaft rotating the exhaust camshaft clockwise, if required.
3. Install a NEW intake camshaft actuator bolt (1) until snug.

Fig. 187: View Of Timing Chain & Chain Retention Tool
Courtesy of GENERAL MOTORS COMPANY

4. Remove the timing chain retention tool (1) from the intake side of the timing chain.

Fig. 188: Identifying Timing Chain & Chain Retention Tool
Courtesy of GENERAL MOTORS COMPANY

NOTE: Ensure that the alignment mark previously on the intake camshaft actuator is still aligned properly with the timing chain. If the mark made previously on the intake camshaft actuator is not aligned properly, refer to Camshaft Timing Chain, Sprocket, and Tensioner Replacement.

5. Remove the timing chain retention tool (1) from the exhaust side of the timing chain.

NOTE: Failure to reset the tensioner will allow the tensioner to over extend, limiting the timing chain life.

6. Reset and install the timing chain tensioner. Refer to Timing Chain Tensioner Replacement.

Fig. 189: Loosening/Tightening Camshaft Actuator Retainer Bolts
Courtesy of GENERAL MOTORS COMPANY

7. Install the **EN-48953** retention tool (1) .
8. Install the camshaft actuator retainer bolts and tighten to 10 N.m (89 lb in).
9. Tighten the NEW camshaft actuator bolt to 30 N.m (22 lb ft) plus an additional 100 degrees using the **EN-45059** meter.

NOTE: **You must have the EN-48953 retention tool installed to perform this procedure.**

10. To release the tensioner apply a counterclockwise rotational torque to the crankshaft balancer bolt of 45 N.m (33 lb ft).
11. Remove the **EN-48953** retention tool (1).

Fig. 190: Upper Timing Chain Guide
Courtesy of GENERAL MOTORS COMPANY

12. Install the upper timing chain guide (2) and bolts (1) and tighten to 10 N.m (89 lb in).
13. Install the spark plugs. Refer to **Spark Plug Replacement** .
14. Install the camshaft cover. Refer to **Camshaft Cover Replacement (LUK)**, **Camshaft Cover Replacement (LEA)**.

CAMSHAFT POSITION EXHAUST ACTUATOR REPLACEMENT

Special Tools

- **EN-45059** Angle Meter
- **EN-48749** Timing Chain Retention Tool Kit
- **EN-48953** Camshaft Actuator Locking Tool

For equivalent regional tools, refer to **Special Tools** .

Removal Procedure

1. Remove the camshaft cover. Refer to **Camshaft Cover Replacement (LUK)**, **Camshaft Cover**

Replacement (LEA).

2. Remove the spark plugs. Refer to **Spark Plug Replacement** .

Fig. 191: View of Camshaft Actuator Retainer
Courtesy of GENERAL MOTORS COMPANY

3. Rotate the crankshaft clockwise and install the **EN-48953** locking tool (1).

CAUTION: Refer to **Fastener Caution** .

4. Install the camshaft actuator retainer bolts and tighten to 10 N.m (89 lb in).
5. Loosen, but do not remove the exhaust camshaft actuator bolt.
6. Remove the **EN-48953** locking tool (1).
7. Clean the timing chain and gears with solvent.

NOTE: **Ensure the timing chain and the camshaft position actuators are marked for proper assembly.**

8. Mark the intake and exhaust camshaft actuators and the respective locations on the timing chain.

Fig. 192: Upper Timing Chain Guide
Courtesy of GENERAL MOTORS COMPANY

9. Remove the upper timing chain guide bolts (1) and guide (2).

Fig. 193: Timing Chain Tensioner
Courtesy of GENERAL MOTORS COMPANY

10. Remove the timing chain tensioner (1).

Fig. 194: Identifying Timing Chain & Chain Retention Tool
Courtesy of GENERAL MOTORS COMPANY

NOTE:

- The camshaft actuators should not rotate during the removal or installation.
- Ensure the tips of the EN-48749 retention tool are fully engaged into the timing chain. The retention tool rod can be used on the back side of the chain to ensure the teeth from the retention tool are engaged.

11. Install the **EN-48749** retention tool (1) to the exhaust side of the timing chain.

Fig. 195: Exhaust Camshaft Sprocket
Courtesy of GENERAL MOTORS COMPANY

12. Remove and discard the exhaust camshaft actuator bolt (2).
13. Remove the exhaust camshaft actuator (3) from the camshaft while also removing the actuator from the timing chain.

Installation Procedure

Fig. 196: Exhaust Camshaft Sprocket
Courtesy of GENERAL MOTORS COMPANY

NOTE:

- Ensure that the alignment mark made previously on the intake camshaft actuator is still aligned properly with the mark on the timing chain.
- The exhaust camshaft may need to be rotated clockwise to fully set the camshaft actuator.

1. Install the timing chain onto the exhaust camshaft actuator.
2. Align the exhaust camshaft actuator alignment mark made previously with the timing chain mark and install the actuator onto the camshaft.
3. Install a NEW exhaust camshaft actuator bolt (2) until snug.

Fig. 197: Identifying Timing Chain & Chain Retention Tool
Courtesy of GENERAL MOTORS COMPANY

NOTE: Ensure that the alignment mark previously on the exhaust camshaft actuator is still aligned properly with the timing chain. If the mark made previously on the intake camshaft actuator is not aligned properly, refer to Camshaft Timing Chain, Sprocket, and Tensioner Replacement.

4. Remove the **EN-48749** retention tool (1) from the exhaust side of the timing chain.

NOTE: Failure to reset the tensioner will allow the tensioner to over extend, limiting the timing chain life.

5. Reset and install the timing chain tensioner. Refer to Timing Chain Tensioner Replacement.

Fig. 198: View of Camshaft Actuator Retainer
Courtesy of GENERAL MOTORS COMPANY

6. Install the **EN-48953** locking tool (1).
7. Install the camshaft actuator retainer bolts and tighten 10 N.m (89 lb in).
8. Tighten the NEW camshaft actuator bolt to 30 N.m (22 lb ft) plus an additional 100 degrees using the **EN-45059** meter.

NOTE: **You must have the EN-48953 locking tool installed to perform this procedure.**

9. To release the tensioner apply a counterclockwise rotational torque to the crankshaft balancer bolt of 45 N.m (33 lb ft).

Fig. 199: Loosening/Tightening Camshaft Actuator Retainer Bolts
Courtesy of GENERAL MOTORS COMPANY

10. Remove the camshaft actuator retainer **EN-48953** locking tool (1).

Fig. 200: Upper Timing Chain Guide
 Courtesy of GENERAL MOTORS COMPANY

11. Install the upper timing chain guide (2) and bolts (1) and tighten to 10 N.m (89 lb in).
12. Install the camshaft cover. Refer to Camshaft Cover Replacement (LUK), Camshaft Cover Replacement (LEA).
13. Install the spark plugs. Refer to Spark Plug Replacement .

VALVE STEM OIL SEAL AND VALVE SPRING REPLACEMENT

Special Tools

- **EN-36017** Valve Guide Seal Remover
- **EN-43649** Valve Spring Compressor
- **EN-43649-10** Valve Spring Compressor Adaptor Set
- **EN-43653** Flywheel Holding Tool

For equivalent regional tools refer to Special Tools .

Removal Procedure

NOTE: This procedure is not used in Brazil.

NOTE: Prevent the crankshaft from rotating clockwise or counterclockwise before using compressed air in the cylinder. Rotation of the crankshaft may cause damage to EN-43653 holding tool.

1. If equipped, with a manual transmission leave the transmission in first gear with the vehicle on the ground and the parking brake set.
2. If equipped, with an automatic transmission, remove the starter. Refer to **Starter Replacement (LUK)** .
3. Install **EN-43653** holding tool.
4. Remove the camshaft. Refer to **Intake Camshaft and Valve Lifter Replacement**, or **Exhaust Camshaft and Valve Lifter Replacement**.

Fig. 201: Identifying Camshaft Roller Followers
Courtesy of GENERAL MOTORS COMPANY

5. Remove the camshaft roller followers (1).

Fig. 202: View Of Valve Spring Compressor Adaptor Set
Courtesy of GENERAL MOTORS COMPANY

6. Install the **EN-43649-10** adaptor set (1) to the front and rear of the cylinder head.
7. Install the cross bars and locks (2) of the **EN-43649** compressor to the valve spring compressor adaptors.
8. Remove the spark plugs. Refer to **Spark Plug Replacement** .
9. Install an air hose adapter into the spark plug hole.
10. Attach an air hose to the adapter and pressurize the cylinder to 690 kPa (100 psi).
11. Compress the valve spring using the valve spring compressor (3).

Fig. 203: View Of Valve Spring, Keepers & Retainer
Courtesy of GENERAL MOTORS COMPANY

12. Remove the valve spring keepers (1).
13. Remove the valve spring (3) and retainer (2).

Fig. 204: View Of Valve Guide Seal Remover/Installer
Courtesy of GENERAL MOTORS COMPANY

14. Use the **EN-36017** seal remover (1) to remove the valve seal.

Installation Procedure

Fig. 205: View Of Valve Guide Seal Remover/Installer
Courtesy of GENERAL MOTORS COMPANY

1. Using the **EN-36017** seal remover (1) install the NEW valve seal. Fully seat the seal onto the valve guide.

Fig. 206: View Of Valve Spring, Keepers & Retainer
Courtesy of GENERAL MOTORS COMPANY

2. Install the valve spring (3) and retainer (2).
3. Compress the valve spring using the valve spring compressor.
4. Install the valve spring keepers (1).
5. Disconnect the air hose and air hose adapter.

Fig. 207: Cylinder Head Valve Spring Compressor
Courtesy of GENERAL MOTORS COMPANY

6. Remove the **EN-43649** compressor and **EN-43649-10** adaptor set from the cylinder head.
7. Install the spark plugs. Refer to **Spark Plug Replacement** .

Fig. 208: Identifying Camshaft Roller Followers
Courtesy of GENERAL MOTORS COMPANY

8. Install the camshaft roller followers.
9. Install the camshaft. Refer to **Intake Camshaft and Valve Lifter Replacement**, or **Exhaust Camshaft and Valve Lifter Replacement**.
10. If used, remove the **EN-43653** holding tool.
11. If removed, install the starter. Refer to **Starter Replacement (LUK)** .

CYLINDER HEAD REPLACEMENT

Special Tools

- **EN-45059** Angle Meter
- **EN-48749** Timing Chain Retention Tool Kit
- **EN-48953** Camshaft Actuator Locking Tool

For equivalent regional tools, refer to **Special Tools** .

Removal Procedure

1. Drain the cooling system. Refer to Cooling System Draining and Filling (Static Fill) , Cooling System Draining and Filling (GE 47716) .

Fig. 209: Radiator Inlet Hose Clamp
Courtesy of GENERAL MOTORS COMPANY

2. Reposition the radiator inlet hose clamp (1) .
3. Remove the radiator inlet hose from the cylinder head (2).
4. Remove the exhaust manifold. Refer to Exhaust Manifold Replacement (LUK) , Exhaust Manifold Replacement (LTG) .
5. Remove the intake manifold. Refer to Intake Manifold Replacement (LEA), Intake Manifold Replacement (LUK).
6. Remove the fuel pump. Refer to Fuel Pump Replacement .
7. Remove the radiator surge tank air bleed hose from the cylinder head.
8. Disconnect all electrical connectors as necessary.
9. Remove the camshaft cover. Refer to Camshaft Cover Replacement (LUK), Camshaft Cover Replacement (LEA).
10. Remove the purge solenoid and bracket. Refer to Evaporative Emission Canister Purge Solenoid Valve Replacement .

Fig. 210: Upper Timing Chain Guide Bolts And Guide
Courtesy of GENERAL MOTORS COMPANY

11. Remove the upper timing chain guide bolts (1) and guide (2).

Fig. 211: Loosening/Tightening Camshaft Actuator Retainer Bolts
 Courtesy of GENERAL MOTORS COMPANY

NOTE:

- If the intake camshaft actuator is moving independently of the camshaft, this means the camshaft is not locked to the actuator. Rotate the camshaft counterclockwise while the holding tool is installed and this will lock the camshaft to the actuator.
- Ensure the timing chain and the camshaft position actuators are marked for proper assembly.

12. Rotate the intake camshaft clockwise and install the **EN-48953** locking tool (1) to the actuators.

CAUTION: Refer to Fastener Caution .

13. Install the camshaft actuator retainer bolts and tighten to 10 N.m (89 lb in).
14. Clean the timing chain and gears with solvent.
15. Mark the timing gear sprockets and the timing chain. It is recommended that the paint marks are located in the 12 o'clock position.

16. Use a 24 mm wrench on the hex flats of the camshaft to prevent camshaft rotation.
17. Loosen, but do not remove the intake and exhaust camshaft actuator bolts.
18. Remove the **EN-48953** locking tool.

Fig. 212: Timing Chain Tensioner
Courtesy of GENERAL MOTORS COMPANY

19. Remove the timing chain tensioner (1).

Fig. 213: View Of Timing Chain & Chain Retention Tool
Courtesy of GENERAL MOTORS COMPANY

NOTE: Ensure the tips of the EN-48749 retention tool are fully engaged into the timing chain. The retention tool rod can be used on the back side of the chain to ensure the teeth from the retention tool are engaged.

20. Install the **EN-48749** retention tool (1) to the intake side of the timing chain.

Fig. 214: View Of Timing Chain Retention Tool
Courtesy of GENERAL MOTORS COMPANY

NOTE: The camshaft actuators should not rotate during the removal of installation.

21. Install the **EN-48749** retention tool (1) to the exhaust side of the timing chain.

Fig. 215: Exhaust Camshaft Actuator Bolt
Courtesy of GENERAL MOTORS COMPANY

22. Remove and discard the exhaust camshaft actuator bolt (2).
23. Remove the exhaust camshaft actuator (3) from the camshaft while also removing the actuator from the timing chain.

Fig. 216: Intake Camshaft Actuator Bolt
Courtesy of GENERAL MOTORS COMPANY

24. Remove and discard the intake camshaft actuator bolt (1).
25. Remove the intake camshaft actuator (2) from the camshaft while also removing the actuator from the timing chain.

Fig. 217: Aligning Marks On Cylinder Head In Relationship To Camshaft Actuator Notches
Courtesy of GENERAL MOTORS COMPANY

26. Mark the cylinder head (1) in relationship to the camshaft actuator notch is on the camshaft (2).

Fig. 218: Fixed Timing Chain Guide Access Plug
Courtesy of GENERAL MOTORS COMPANY

27. Remove the fixed timing chain guide access plug (1).
28. Remove the fixed guide upper bolt.

Fig. 219: View Of Rubber Band To Pull Guides Together
Courtesy of GENERAL MOTORS COMPANY

NOTE: The threaded rod from the timing chain retention tool can be used to help feed the rubber band around the chain guides.

29. Install a rubber band (1) around the top of the upper timing chain guides (2) in order to pull the guides together.

Fig. 220: Cylinder Head-To-Block Bolt Removal Sequence
Courtesy of GENERAL MOTORS COMPANY

30. Remove the cylinder head bolts in the sequence shown. Discard the bolts.

Fig. 221: Cylinder Head

Courtesy of GENERAL MOTORS COMPANY

31. Remove the cylinder head (1).
32. Remove the cylinder head gasket (2).
33. Clean all of the gasket surfaces.
34. Use the following steps when cleaning the cylinder head and cylinder block surfaces:
 - Use a razor blade gasket scraper to clean the cylinder head and cylinder block gasket surfaces. Do not scratch or gouge either surface.

NOTE: **DO NOT use any other method or technique to clean these gasket surfaces.**

- Use a NEW razor blade on the cylinder head and a NEW blade on the cylinder block.

NOTE: **Be careful not to gouge or scratch the gasket surfaces. DO NOT gouge or scrape the combustion chamber surfaces. The feel of the gasket surface is important, not the appearance. There will be indentations from the gasket left in the cylinder head after all of the gasket material is removed. These small indentations will be filled in**

by the NEW gasket.

- Hold the razor blade as parallel to the gasket surface as possible.
35. Clean the old sealer/lube and any dirt from around the bolt holes.

NOTE: DO NOT use a tap to clean the cylinder head bolt holes.

36. Clean the bolts holes with a nylon bristle brush.
37. When cleaning the cylinder head bolt holes use suitable commercial spray liquid solvent and compressed air from an extended-tip blow gun in order to reach the bottom of the holes.
38. If replacing the cylinder head, transfer all parts as necessary.

Installation Procedure

Fig. 222: Cylinder Head Gasket

Courtesy of GENERAL MOTORS COMPANY

NOTE: DO NOT use any sealing material.

1. Install the cylinder head gasket (3).

2. Install the cylinder head (2).
3. Install NEW cylinder head bolts (1).

Fig. 223: Identifying Cylinder Head Bolt Tightening Sequence
Courtesy of GENERAL MOTORS COMPANY

4. Install and tighten the cylinder head bolts in the sequence shown. Tighten the bolts to 30 N.m (22 lb ft) plus an additional 155 degrees using the **EN-45059** meter.

Fig. 224: Locating Front Cylinder Head Bolts
Courtesy of GENERAL MOTORS COMPANY

5. Install the NEW front cylinder head bolts and tighten to 35 N.m (26 lb ft).

Fig. 225: Aligning Marks On Cylinder Head In Relationship To Camshaft Actuator Notches
Courtesy of GENERAL MOTORS COMPANY

6. Ensure the cylinder head (1) and the camshaft (2) are correctly aligned.

Fig. 226: View Of Rubber Band To Pull Guides Together
Courtesy of GENERAL MOTORS COMPANY

7. Remove the rubber band (1) from around the top of the upper timing chain guides (2).
8. Install the fixed guide bolt into the cylinder bolt and tighten to 12 N.m (106 lb in).

Fig. 227: Fixed Timing Chain Guide Access Plug
Courtesy of GENERAL MOTORS COMPANY

9. Apply sealant compound to thread and install the timing chain guide bolt access hole plug (1). Refer to **Adhesives, Fluids, Lubricants, and Sealers**
10. Install the fixed timing chain guide access plug. Tighten the chain guide plug to 90 N.m (59 lb ft).

Fig. 228: Intake Camshaft Actuator Bolt
Courtesy of GENERAL MOTORS COMPANY

NOTE: Ensure that the alignment mark made previously on the exhaust camshaft actuator is still aligned properly with the mark on the timing chain.

11. Install the timing chain onto the intake camshaft actuator (2).
12. Align the intake camshaft actuator alignment mark made previously with the timing chain mark and install the actuator onto the camshaft.
13. Install a NEW intake camshaft actuator bolt (1) until snug.

Fig. 229: View Of Timing Chain & Chain Retention Tool
Courtesy of GENERAL MOTORS COMPANY

14. Remove the **EN-48749** retention tool (1) from the intake side of the timing chain.

Fig. 230: Exhaust Camshaft Actuator Bolt
Courtesy of GENERAL MOTORS COMPANY

NOTE: Ensure that the alignment mark made previously on the intake camshaft actuator is still aligned properly with the mark on the timing chain.

15. Install the timing chain onto the exhaust camshaft actuator (3).
16. Align the exhaust camshaft actuator alignment mark made previously with the timing chain mark and install the actuator onto the camshaft.
17. Install a NEW exhaust camshaft actuator bolt (2) until snug.

Fig. 231: View Of Timing Chain Retention Tool
Courtesy of GENERAL MOTORS COMPANY

18. Remove the **EN-48749** retention tool (1) from the exhaust side of the timing chain.
19. Reset and install the timing chain tensioner. Refer to **Timing Chain Tensioner Replacement**

Fig. 232: Loosening/Tightening Camshaft Actuator Retainer Bolts
Courtesy of GENERAL MOTORS COMPANY

20. Install the **EN-48953** locking tool (1) to the actuators.
21. Install the camshaft actuator locking tool bolts and tighten to 10 N.m (89 lb in).
22. Release the tensioner by applying a counterclockwise torque on the harmonic balancer bolt and tighten the bolt to 45 N.m (33 lb ft).
23. Tighten the NEW camshaft actuator bolt to 85 N.m (63 lb ft), plus an additional 30 degrees using the **EN-45059** meter.
24. Remove the camshaft actuator locking tool, **EN-48953** locking tool.

Fig. 233: Upper Timing Chain Guide Bolts And Guide
Courtesy of GENERAL MOTORS COMPANY

25. Install the upper timing chain guide bolts (1) and guide (2). Tighten the bolts to 10 N.m (89 lb in).
26. Install the camshaft cover. Refer to **Camshaft Cover Replacement (LUK)**, **Camshaft Cover Replacement (LEA)**
27. Install the fuel pump. Refer to **Fuel Pump Replacement** .
28. Install the purge solenoid and bracket. Refer to **Evaporative Emission Canister Purge Solenoid Valve Replacement** .
29. Connect all electrical connectors as necessary.
30. Install the radiator surge tank air bleed hose to the cylinder head.
31. Position the radiator surge tank air bleed hose clamp.
32. Install the exhaust manifold. Refer to **Exhaust Manifold Replacement (LUK)** .
33. Install the intake manifold. Refer to **Intake Manifold Replacement (LEA)**, **Intake Manifold Replacement (LUK)**.

Fig. 234: Radiator Inlet Hose Clamp
Courtesy of GENERAL MOTORS COMPANY

34. Install the radiator inlet hose to the cylinder head (2).
35. Position the radiator inlet hose clamp (1) .
36. Fill the cooling system. Refer to **Cooling System Draining and Filling (Static Fill)** , **Cooling System Draining and Filling (GE 47716)** .

OIL PAN REPLACEMENT (LEA)

Removal Procedure

1. Remove the drive belt. Refer to **Drive Belt Replacement (LEA)**.
2. Remove the oil level indicator tube. Refer to **Oil Level Indicator Tube Replacement**.
3. Remove the drivetrain and front suspension frame . Refer to **Drivetrain and Front Suspension Frame Replacement** .

Fig. 235: A/C Compressor Bolts And Nut
Courtesy of GENERAL MOTORS COMPANY

4. Loosen the (A/C) compressor nut (1).
5. Loosen the (A/C) compressor bolt (2).
6. Remove the lower A/C compressor bolt (3).

Fig. 236: Engine Oil Drain Plug And Seal
Courtesy of GENERAL MOTORS COMPANY

7. Place a suitable drain pan under the oil pan drain plug.
8. Remove the oil pan drain plug (1).
9. Drain the engine oil.
10. Install a new oil pan plug gasket (2).

CAUTION: Refer to Fastener Caution .

11. Install the oil pan drain plug (1) and tighten to 25 N.m (18 lb ft)

Fig. 237: Oil Pan To Transaxle Bolts
Courtesy of GENERAL MOTORS COMPANY

12. Remove the oil pan to transaxle bolts (1).

Fig. 238: Oil Pan Bolts
Courtesy of GENERAL MOTORS COMPANY

13. Remove the oil pan bolts (1).
14. Remove the oil pan. (2).
15. Remove any old oil pan sealant

Installation Procedure

Fig. 239: Identifying Bead of Sealer on Oil Pan
Courtesy of GENERAL MOTORS COMPANY

NOTE: The lower crankcase surface must be free of contamination prior to applying the sealer.

NOTE: Install and align the oil pan to block within 20 minutes of applying the sealer.

NOTE: The oil pan must be fastened to final torque specification within 60 minutes of applying the sealer.

1. Apply a 2.3 mm bead of sealer (1) on the level part of the flange next to the chamfer around the perimeter of the oil pan and the oil suction port opening. Refer to Adhesives, Fluids, Lubricants, and Sealers .

Fig. 240: Oil Pan Bolts
Courtesy of GENERAL MOTORS COMPANY

2. Install the oil pan (2).
3. Install the oil pan bolts (1).

Fig. 241: Identifying Oil Pan Bolts Removal & Tightening Sequence
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

4. Tighten the oil pan bolts in the sequence shown to 25 N.m (18 lb ft).

Fig. 242: Oil Pan To Transaxle Bolts
Courtesy of GENERAL MOTORS COMPANY

5. Install the oil pan to transaxle bolts (1) and tighten to 75 N.m (55 lb ft).

Fig. 243: A/C Compressor Bolts And Nut
Courtesy of GENERAL MOTORS COMPANY

6. Install the A/C Compressor bolts (2) and (3) and nut (1) and tighten bolt to 20 N.m (15 lb ft)
7. Install the drivetrain and front suspension frame . Refer to **Drivetrain and Front Suspension Frame Replacement** .
8. Install the oil level indicator tube. Refer to **Engine Mechanical Specifications (LEA, or LUK)** .
9. Install the drive belt. Refer to **Drive Belt Replacement (LEA)**.
10. Fill the engine oil to the proper level. Refer to **Engine Oil and Oil Filter Replacement**

OIL PAN REPLACEMENT (LUK)

Removal Procedure

Fig. 244: Drive Belt

Courtesy of GENERAL MOTORS COMPANY

1. Remove the drive belt. Refer to **Drive Belt Replacement (LUK)**.
2. Remove the oil level indicator tube. Refer to **Oil Level Indicator Tube Replacement**.

NOTE: The support fixture bar must be installed to provide enough access to remove and properly tighten the oil pan bolts.

3. Install the engine support fixture. Refer to **Engine Support Fixture**.

Fig. 245: Engine Mount

Courtesy of GENERAL MOTORS COMPANY

4. Remove engine mount (4). Refer to **Engine Mount Replacement**.
5. Using the engine support fixture, raise the engine approximately 76 mm (3 in).
6. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .

Fig. 246: Air Conditioning (A/C) Compressor Bolts
Courtesy of GENERAL MOTORS COMPANY

7. Loosen the upper air conditioning (A/C) compressor bolts (1).
8. Remove the lower A/C compressor nut and stud (2).

Fig. 247: Oil Pan Drain Plug

Courtesy of GENERAL MOTORS COMPANY

9. Place a suitable drain pan under the oil pan drain plug (1).
10. Remove the oil pan drain plug.
11. Drain the engine oil.
12. Reinstall the oil pan drain plug until snug.

Fig. 248: Bolts And Secondary Air Injection Pump
Courtesy of GENERAL MOTORS COMPANY

13. Remove the bolts (1) retaining the secondary air injection pump (2) to the oil pan.
14. Tie the secondary air injection pump out of the way of the oil pan.

Fig. 249: Identifying Oil Pan Bolts
Courtesy of GENERAL MOTORS COMPANY

15. Remove the 4 oil pan to transaxle bolts.
16. Remove the oil pan bolts.

Fig. 250: Identifying Oil Pan

Courtesy of GENERAL MOTORS COMPANY

17. Remove the oil pan
18. Remove any old oil pan sealant (1).

Installation Procedure

Fig. 251: Identifying Oil Pan

Courtesy of GENERAL MOTORS COMPANY

1. Ensure that the oil pan and the sealing surface on the lower crankcase are free of all oil and debris.
2. Apply a 2 mm bead of sealant (1) around the perimeter of the oil pan and the oil suction port opening. DO NOT over apply the sealant. More than a 2 mm bead is not required. Refer to **Adhesives, Fluids, Lubricants, and Sealers** .
3. Install the oil pan.

Fig. 252: Identifying Oil Pan Bolts
Courtesy of GENERAL MOTORS COMPANY

4. Install the oil pan bolts.

CAUTION: Refer to Fastener Caution .

5. Install the 4 oil pan to transaxle bolts and tighten to 75 N.m (55 lb ft).

Fig. 253: Identifying Oil Pan Bolts Removal & Tightening Sequence
Courtesy of GENERAL MOTORS COMPANY

6. Tighten the oil pan bolts in the sequence shown to 25 N.m (18 lb ft).

Fig. 254: Bolts And Secondary Air Injection Pump
Courtesy of GENERAL MOTORS COMPANY

7. Position the secondary air injection pump (2) to the oil pan.
8. Install the injection pump bolts (1) and tighten to 25 N.m (18 lb ft).
9. Lower the vehicle.
10. Using the engine support fixture, lower the engine.

Fig. 255: Engine Mount

Courtesy of GENERAL MOTORS COMPANY

11. Install the engine mount. Refer to **Engine Mount Replacement**.
12. Remove the engine support fixture.
13. Install the oil level indicator tube. Refer to **Oil Level Indicator Tube Replacement**.

Fig. 256: Drive Belt

Courtesy of GENERAL MOTORS COMPANY

14. Install the drive belt. Refer to **Drive Belt Replacement (LUK)**.
15. Fill the engine oil to the proper level.

ENGINE FLYWHEEL REPLACEMENT

Fig. 257: Engine Flywheel Components
 Courtesy of GENERAL MOTORS COMPANY

Engine Flywheel Replacement

Callout	Component Name
Preliminary Procedure Remove the transmission. Refer to Transmission Replacement .	
Special Tools J-38122-A Crankshaft Balancer Holder. For equivalent regional tools. Refer to Special Tools .	
1	Engine Flywheel Fastener (Qty: 6) CAUTION: Refer to Fastener Caution . Tighten <ul style="list-style-type: none"> • 53 N.m (39 lb ft) • Tighten the bolt an additional 2 degrees.
2	Engine Flywheel Plate
	Engine Flywheel Procedure Inspect the engine flywheel for the following:

3

1. Stress cracks around the engine flywheel .
2. Cracks at welded areas that retain the ring gear onto the engine flywheel.
3. Damaged or missing ring gear teeth.
4. Do not attempt to repair the welded areas that retain the ring gear to the engine flywheel.

CRANKSHAFT REAR OIL SEAL REPLACEMENT

Special Tools

EN-42067 Rear Main Seal Installer

For equivalent regional tools, refer to **Special Tools** .

Removal Procedure

1. Remove the flywheel. Refer to **Engine Flywheel Replacement**

Fig. 258: Crankshaft Rear Oil Seal
Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not damage the outside diameter of the crankshaft or chamber with any tool.

2. Use a suitable tool to remove the crankshaft rear oil seal (1).

Installation Procedure

Fig. 259: Crankshaft Rear Oil Seal
Courtesy of GENERAL MOTORS COMPANY

1. Using the (2) **EN-42067** installer , install a NEW crankshaft real oil seal (1).
2. Install the flywheel. Refer to **Engine Flywheel Replacement**.

ENGINE REPLACEMENT (LUK)

Special Tools

- **BO-38185** Hose Clamp Pliers.
- **J-39580** Engine Support Table.

For equivalent regional tools, refer to **Special Tools** .

Removal Procedure

1. Disconnect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection .
2. Recover the refrigerant system. Refer to Refrigerant Recovery and Recharging .
3. Drain the cooling system. Refer to Cooling System Draining and Filling (Static Fill) , Cooling System Draining and Filling (GE 47716) .
4. Drain the engine oil. Refer to Engine Oil and Oil Filter Replacement.
5. Relieve the fuel system pressure. Refer to Fuel Pressure Relief .

Fig. 260: Intake Manifold Cover

Courtesy of GENERAL MOTORS COMPANY

6. Remove the intake manifold cover (1). Refer to Intake Manifold Cover Replacement.

Fig. 261: Air Cleaner Outlet Duct Assembly
Courtesy of GENERAL MOTORS COMPANY

7. Remove the air cleaner outlet duct assembly (1). Refer to **Air Cleaner Outlet Duct Replacement** .

Fig. 262: Air Cleaner Assembly

Courtesy of GENERAL MOTORS COMPANY

8. Remove the air cleaner assembly (1). Refer to **Air Cleaner Assembly Replacement** .

Fig. 263: Evaporative Emission (EVAP) Line Quick Connect Fitting
Courtesy of GENERAL MOTORS COMPANY

9. Disconnect the evaporative emission (EVAP) line quick connect fitting (1) from the EVAP purge solenoid. Refer to **Plastic Collar Quick Connect Fitting Service** .

Fig. 264: Clamp And Power Brake Booster Vacuum Pipe
Courtesy of GENERAL MOTORS COMPANY

10. Release the clamp (1) and remove the power brake booster vacuum pipe (2) from the intake manifold vacuum port.
11. Release the power brake booster vacuum pipe from the routing clips and remove the vacuum pipe.

Fig. 265: Fuel Feed Line

Courtesy of GENERAL MOTORS COMPANY

12. Disconnect the fuel feed line (1). Refer to **Metal Collar Quick Connect Fitting Service** .

Fig. 266: Radiator Surge Tank Inlet Hose
Courtesy of GENERAL MOTORS COMPANY

13. Remove the radiator surge tank inlet hose (1). Refer to **Radiator Surge Tank Inlet Hose Replacement (LEA)**.

Fig. 267: Radiator Inlet Hose

Courtesy of GENERAL MOTORS COMPANY

14. Remove the radiator inlet hose (1). Refer to **Radiator Inlet Hose Replacement (LUK)** .
15. Remove the radiator outlet hose. Refer to **Radiator Outlet Hose Replacement (LUK)** .

Fig. 268: Radiator Surge Tank

Courtesy of GENERAL MOTORS COMPANY

16. Remove the radiator surge tank (1). Refer to **Radiator Surge Tank Replacement (LUK)** .

Fig. 269: Heater Inlet Hose

Courtesy of GENERAL MOTORS COMPANY

17. Disconnect the heater inlet hose (1). Refer to **Heater Inlet Hose Replacement (LUK)** .

Fig. 270: Heater Outlet Hose

Courtesy of GENERAL MOTORS COMPANY

18. Disconnect the heater outlet hose (1). Refer to **Heater Outlet Hose Replacement (LUK)** .

Fig. 271: Evaporator Outlet Hose And Nut
Courtesy of GENERAL MOTORS COMPANY

19. Remove the A/C compressor hose to evaporator outlet hose nut (1).
20. Disconnect the A/C compressor hose to evaporator outlet hose (2).

Fig. 272: Identifying Cooler Inlet & Outlet Hoses
Courtesy of GENERAL MOTORS COMPANY

21. Remove the transmission fluid cooler inlet (1) and outlet (5) hoses from the retainer (2) on the control valve body cover.
22. Remove the transmission fluid cooler inlet hose nut (3) from the transmission.
23. Remove the transmission fluid cooler inlet hose (1) from the transmission.
24. Remove the transmission fluid cooler outlet hose nut (4) from the transmission.
25. Remove the transmission fluid cooler outlet hose (5) from the transmission.
26. Plug and/or cap the hose and transmission to prevent contamination.
27. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
28. Remove the front bumper fascia. Refer to **Front Bumper Fascia Replacement** .
29. Remove the exhaust front pipe. Refer to **Exhaust Front Pipe Replacement (LUK)** .

Fig. 273: Frame Reinforcements Bracket And Bolts
Courtesy of GENERAL MOTORS COMPANY

30. Remove the frame reinforcements bracket bolts (1) and (2).
31. Remove the frame reinforcements bracket (3).
32. Remove the starter. Refer to **Starter Replacement (LUK)** .

Fig. 274: Steering Linkage Outer Tie Rod Nut And Tie Rod
Courtesy of GENERAL MOTORS COMPANY

33. Remove the steering linkage outer tie rod nut (1) and tie rod (2). Refer to **Steering Linkage Outer Tie Rod Replacement** .

Fig. 275: Stabilizer Link And Strut Nut
Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not allow the stabilizer link ball stud to rotate while removing the link nut.

34. Remove the nut (1) and separate the stabilizer link from the strut assembly. Refer to **Stabilizer Shaft Link Replacement (GNA, GNB)** .

Fig. 276: Steering Knuckle To Strut Bolts And Nuts
Courtesy of GENERAL MOTORS COMPANY

35. Remove the steering knuckle to strut bolts (1) and nuts (2). Refer to **Strut Assembly Removal and Installation (GNB)** , **Strut Assembly Removal and Installation (GNA)** .

Fig. 277: Identifying Starter Bolts
Courtesy of GENERAL MOTORS COMPANY

36. Mark the relationship of the flywheel to the torque converter for reassembly.
37. Remove the torque converter to flywheel bolt (1).

Fig. 278: Lower Transmission Bolts
Courtesy of GENERAL MOTORS COMPANY

38. Remove the lower transmission bolts (1).

NOTE: Blocks of wood can be used between the front of the frame and the oil pan to table in order to level the powertrain during the removal.

39. Position a engine support table under the powertrain assembly.

Fig. 279: Frame Bolts
Courtesy of GENERAL MOTORS COMPANY

40. Remove the frame bolts (1).
41. Lower the vehicle on the engine support table.

Fig. 280: Transmission Mount Bolts
Courtesy of GENERAL MOTORS COMPANY

42. Remove the transmission mount bolts (1).

Fig. 281: Engine Mount Bolts

Courtesy of GENERAL MOTORS COMPANY

43. Remove the engine mount bolts (1).
44. Disconnect electrical connector as necessary.
45. Disconnect coolant hoses as necessary.

NOTE: **When lowering the engine/transaxle assembly, verify all brake lines, shiftier cables and other components are free during removal**

46. Lower the engine table and raise the body on the hoist until the engine/transaxle and cradle are free from the vehicle.

Fig. 282: Transmission Brace

Courtesy of GENERAL MOTORS COMPANY

47. Remove the transmission brace (1).

Fig. 283: Lower Trans Bolts

Courtesy of GENERAL MOTORS COMPANY

48. Remove the lower trans bolts (1).

Fig. 284: Upper Transmission Bolts
Courtesy of GENERAL MOTORS COMPANY

49. Remove the upper transmission bolts (1).
50. Separate the engine from the transmission.
51. Install the engine to a suitable engine stand.

Installation Procedure

1. Remove the engine from the engine stand.
2. Install the transmission to the engine.

Fig. 285: Upper Transmission Bolts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

3. Install the upper transmission bolts (1) and tighten to 75 (55 lb ft).

Fig. 286: Lower Trans Bolts

Courtesy of GENERAL MOTORS COMPANY

4. Install the upper transmission bolts (1) and tighten to 75 (55 lb ft).

Fig. 287: Transmission Brace

Courtesy of GENERAL MOTORS COMPANY

5. Install the transmission brace (1) and tighten to 58 (43 lb ft).
6. Slowly lower the body onto the powertrain.

Fig. 288: Transmission Mount Bolts
Courtesy of GENERAL MOTORS COMPANY

7. Install the NEW left transmission mount to transmission bolts (1) and tighten to 50 (37 lb ft).

Fig. 289: Engine Mount Bolts

Courtesy of GENERAL MOTORS COMPANY

8. Install the NEW right side engine mount bolts (1) and tighten to 62 (46 lb ft).

Fig. 290: Frame Bolts

Courtesy of GENERAL MOTORS COMPANY

9. Install the frame retaining bolts (1) then tighten the bolts to 160 (118 lb ft)

Fig. 291: Lower Transmission Bolts

Courtesy of GENERAL MOTORS COMPANY

10. Install the lower transmission bolts (1) and tighten to 75 (55 lb ft).

Fig. 292: Identifying Starter Bolts

Courtesy of GENERAL MOTORS COMPANY

11. Install the torque converter to flywheel bolts (1) and tighten to 62 (46 lb ft)
12. Install the starter. Refer to **Starter Replacement (LUK)** .
13. Install the exhaust front pipe. Refer to **Exhaust Front Pipe Replacement (LUK)** .

Fig. 293: Frame Reinforcements Bracket And Bolts
Courtesy of GENERAL MOTORS COMPANY

14. Install the frame reinforcements bracket (3) then tighten the bolts (1) and (2) to 42 (31 lb ft).

Fig. 294: Steering Knuckle To Strut Bolts And Nuts
Courtesy of GENERAL MOTORS COMPANY

15. Install the NEW strut to the steering knuckle using new bolts (1) and nuts (2) and tighten to 185 (136 lb ft).
16. Inspect the stabilizer link seals for damage and replace the link as necessary.

Fig. 295: Stabilizer Link And Strut Nut
Courtesy of GENERAL MOTORS COMPANY

NOTE: Use the proper size allen wrench to keep the stabilizer link ball stud from rotate while installing the nut.

17. Install the stabilizer link to the strut nut (1) and tighten to 65 (48 lb ft)

Fig. 296: Steering Linkage Outer Tie Rod Nut And Tie Rod
Courtesy of GENERAL MOTORS COMPANY

18. Install the steering linkage outer tie rod (2). Refer to **Steering Linkage Outer Tie Rod Replacement**
19. Install the front bumper fascia. Refer to **Front Bumper Fascia Replacement** .

Fig. 297: Evaporator Outlet Hose And Nut
Courtesy of GENERAL MOTORS COMPANY

20. Install the air conditioning compressor and condenser hose (2). Refer to **Air Conditioning Compressor and Condenser Hose Replacement (LUK)** .

Fig. 298: Heater Outlet Hose

Courtesy of GENERAL MOTORS COMPANY

21. Connect the heater outlet hose (1). Refer to **Heater Outlet Hose Replacement (LUK)** .

Fig. 299: Heater Inlet Hose

Courtesy of GENERAL MOTORS COMPANY

22. Connect the heater inlet hose (1). Refer to **Heater Inlet Hose Replacement (LUK)** .

Fig. 300: Radiator Surge Tank

Courtesy of GENERAL MOTORS COMPANY

23. Install the radiator surge tank (1). Refer to **Radiator Surge Tank Replacement (LUK)** .

Fig. 301: Radiator Inlet Hose

Courtesy of GENERAL MOTORS COMPANY

24. Install the radiator inlet hose (1). Refer to **Radiator Inlet Hose Replacement (LUK)** .
25. Install radiator outlet hose. Refer to **Radiator Outlet Hose Replacement (LUK)** .

Fig. 302: Fuel Feed Line

Courtesy of GENERAL MOTORS COMPANY

26. Install the fuel feed line (1).

Fig. 303: Evaporative Emission (EVAP) Line Quick Connect Fitting
Courtesy of GENERAL MOTORS COMPANY

27. Connect the EVAP pipe (1).

Fig. 304: Air Cleaner Assembly

Courtesy of GENERAL MOTORS COMPANY

28. Install the air cleaner assembly (1). Refer to **Air Cleaner Assembly Replacement**

Fig. 305: Air Cleaner Outlet Duct Assembly
Courtesy of GENERAL MOTORS COMPANY

29. Install the air cleaner outlet duct assembly (1). Refer to **Air Cleaner Outlet Duct Replacement** .

Fig. 306: Intake Manifold Cover

Courtesy of GENERAL MOTORS COMPANY

30. Install the intake manifold cover (1). Refer to **Intake Manifold Cover Replacement**.
31. Fill the engine oil. Refer to **Engine Oil and Oil Filter Replacement**.
32. Fill the cooling system. Refer to **Cooling System Draining and Filling (Static Fill)** , **Cooling System Draining and Filling (GE 47716)** .
33. Refill the refrigerant system. Refer to **Refrigerant Recovery and Recharging** .
34. Connect the negative battery cable. Refer to **Battery Negative Cable Disconnection and Connection** .

ENGINE REPLACEMENT (LEA)

Removal Procedure

1. Relieve the fuel system pressure. Refer to **Fuel Pressure Relief** .
2. Remove the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .
3. Disconnect the fuel feed pipe quick connect fitting at the fuel rail. Refer to **Metal Collar Quick Connect Fitting Service** .
4. Disconnect the evaporative emission (EVAP) line quick connect fitting from the EVAP purge solenoid. Refer to **Plastic Collar Quick Connect Fitting Service** .

5. Remove the fuel feed pipe clip from the fuel line bracket.
6. Remove the transaxle shift cable clip from the fuel line bracket.
7. Remove the battery tray. Refer to **Battery Tray Replacement** .
8. Remove the vacuum brake booster hose from the intake manifold.
9. Remove the coolant recovery inlet pipe clip from the fuel rail.
10. Remove the coolant recovery inlet hose from the cylinder head.
11. Remove the radiator inlet hose from the cylinder head.
12. Remove the radiator outlet hose. Refer to **Radiator Outlet Hose Replacement (LEA)** .

Fig. 307: Inlet Hoses

Courtesy of GENERAL MOTORS COMPANY

13. Remove the heater inlet hose (2) from the thermostat housing.
14. Remove the coolant recovery reservoir/heater inlet hose (4) from the thermostat housing.
15. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
16. Drain the engine oil. Refer to **Engine Oil and Oil Filter Replacement**.
17. Disconnect the engine wiring harness electrical connector from the air conditioning (A/C) compressor.

Fig. 308: Compressor Bolts

Courtesy of GENERAL MOTORS COMPANY

18. Unbolt the A/C compressor and reposition out of the way.
19. Remove the positive battery cable from the starter motor.
20. Disconnect the generator electrical connectors.
21. Lower the vehicle.

Fig. 309: Transaxle Shift Cable And Range Select Lever
Courtesy of GENERAL MOTORS COMPANY

22. Remove the transaxle shift cable from the range select lever.
23. Release the shift control cable retaining clip and remove the cable from the shift control cable bracket.

Fig. 310: View Of Cooling Module Secured To Upper Body Structure
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The radiator/condenser/fan assembly will stay in the vehicle during engine removal.**

24. Using long tie straps, secure the radiator/condenser/fan assembly to the radiator support.
25. Raise the vehicle.
26. Remove the front wheels and tires. Refer to **Tire and Wheel Removal and Installation** .
27. Remove the front wheelhouse panel. .
28. Drain the transaxle fluid.
29. Remove the catalytic converter. .

Fig. 311: View Of Intermediate Shaft To Steering Gear Pinch Bolt
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Secure the steering wheel in the straight forward position before separating the intermediate shaft from the steering gear, or damage to the SIR coil will occur.**

30. Remove the intermediate to steering gear pinch bolt and disconnect the intermediate shaft from the steering gear. Discard the pinch bolt.
31. Separate the tie rods from the steering knuckles. .
32. Remove the wheel drive shafts. .
33. Lower the vehicle.

Fig. 312: Engine Mount To Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

34. Remove the engine mount to bracket bolts (1).

Fig. 313: Transaxle Mount To Transaxle Bolts
Courtesy of GENERAL MOTORS COMPANY

35. Remove the transaxle mount to transaxle bolts.
36. Raise the vehicle.

Fig. 314: Raising Powertrain Assembly Into Position
Courtesy of GENERAL MOTORS COMPANY

NOTE: During the powertrain removal support the vehicle body by placing a jack at the rear of the vehicle.

37. Position a engine support table under the powertrain assembly.

NOTE: Blocks of wood can be used between the front of the frame and the oil pan to table in order to level the powertrain during the removal.

38. With the table positioned, fully raise the table to contact the powertrain assembly.
39. Remove the frame to body bolts. Discard the bolts.

NOTE: When lowering the engine/transaxle assembly, verify all brake lines, shiftier cables and other components are free during removal.

40. Lower the engine table and raise the body on the hoist until the engine/transaxle and frame are free from the vehicle.
41. Disconnect the engine wiring harness electrical connectors as necessary.

Fig. 315: Identifying Starter Motor Bolts & Starter
Courtesy of GENERAL MOTORS COMPANY

42. Remove the starter motor bolts and starter.

Fig. 316: Torque Converter To Flexplate Bolts
Courtesy of GENERAL MOTORS COMPANY

43. Remove the torque converter to flexplate bolts (1).
44. Install a suitable lifting device to the engine.

Fig. 317: Transaxle And Transaxle Mounting Bolts
Courtesy of GENERAL MOTORS COMPANY

45. Remove the transaxle bolts (2) from the engine.
46. Separate the engine from the transaxle (1).
47. Install the engine to a suitable engine stand.

Installation Procedure

Fig. 318: Transaxle And Transaxle Mounting Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install a suitable lifting device to the engine.
2. Using the lifting device, position and install the engine to the transaxle (1).

CAUTION: Refer to Fastener Caution .

3. Install the transaxle bolts (2) to the engine and tighten to 75 N.m (55 lb ft).

Fig. 319: Torque Converter To Flexplate Bolts
Courtesy of GENERAL MOTORS COMPANY

4. Install the torque converter to flexplate bolts (1) and tighten to 60 N.m (44 lb ft).
5. Remove the engine lifting device.

Fig. 320: Identifying Starter Motor Bolts & Starter
Courtesy of GENERAL MOTORS COMPANY

6. Install the starter motor and bolts and tighten to 53 N.m (39 lb ft).
7. Connect the engine wiring harness electrical connectors as necessary.

Fig. 321: Raising Powertrain Assembly Into Position
Courtesy of GENERAL MOTORS COMPANY

8. Position the powertrain and support table under the vehicle.
9. Raise the powertrain into position under the vehicle.
10. With the table positioned, if required, lower the vehicle over the powertrain.
11. Align the lower radiator pins with the frame. Ensure all hoses and electrical harnesses are correctly routed and free from the loading path of the powertrain.
12. Install the NEW frame to body bolts and tighten to 155 N.m (114 lb ft).
13. Lower the vehicle.

Fig. 322: Transaxle Mount To Transaxle Bolts
Courtesy of GENERAL MOTORS COMPANY

14. Install the transaxle mount to transaxle bolts and tighten to 55 N.m (41 lb ft).

Fig. 323: Engine Mount To Bracket Bolts
Courtesy of GENERAL MOTORS COMPANY

NOTE: The engine mount to bracket bolts must be hand started. Do not pry the engine mount to align the holes.

15. Install the engine mount to bracket bolts (1) and tighten to 50 N.m (37 lb ft).
16. Raise and support the vehicle.
17. Install the wheel drive shafts.

Fig. 324: View Of Tie Rod, Knuckle & Tapered Ball Stud
Courtesy of GENERAL MOTORS COMPANY

18. Connect the outer tie rods to the steering knuckles.

Fig. 325: View Of Intermediate Shaft To Steering Gear Pinch Bolt
Courtesy of GENERAL MOTORS COMPANY

19. Position the intermediate shaft to the steering gear and install a NEW pinch bolt and tighten to 34 N.m (25 lb ft).
20. Install the catalytic converter. .
21. Install the front wheelhouse panel. .
22. Install the front wheels and tires. Refer to **Tire and Wheel Removal and Installation** .
23. Lower the vehicle.

Fig. 326: View Of Cooling Module Secured To Upper Body Structure
Courtesy of GENERAL MOTORS COMPANY

24. Unsecure and position the radiator/condenser/fan assembly.

Fig. 327: Transaxle Shift Cable And Range Select Lever
Courtesy of GENERAL MOTORS COMPANY

25. Install the shift control cable to the shift control cable bracket and engage the shift control cable retaining clip.
26. Install the transaxle shift cable to the range select lever.
27. Raise and support the vehicle.
28. Connect the generator electrical connectors.
29. Install the positive battery cable to the starter motor, tighten to 9 N.m (80 lb in)

Fig. 328: Compressor Bolts

Courtesy of GENERAL MOTORS COMPANY

30. Position the A/C compressor and install the bolts and tighten to 50 N.m (37 lb ft).
31. Connect the engine wiring harness electrical connector to the A/C compressor.
32. Lower the vehicle.
33. Install the coolant recovery reservoir/heater inlet hose to the thermostat housing.
34. Install the heater inlet hose to the thermostat housing.
35. Install the radiator inlet hose from the cylinder head.
36. Install the radiator outlet hose. Refer to **Radiator Outlet Hose Replacement (LEA)** .
37. Position and install the coolant recovery inlet hose to the cylinder head.
38. Install the coolant recovery inlet pipe clip to the fuel rail.
39. Position and install the vacuum brake booster hose to the intake manifold.
40. Install the battery tray. Refer to **Battery Tray Replacement** .
41. Install the transaxle shift cable clip to the fuel line bracket.
42. Install the fuel feed pipe clip to the fuel line bracket.
43. Connect the EVAP line quick connect fitting to the EVAP purge solenoid. Refer to **Plastic Collar Quick Connect Fitting Service** .

44. Connect the fuel feed pipe quick connect fitting at the fuel rail. Refer to **Metal Collar Quick Connect Fitting Service** .
45. Install the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .
46. Fill the transaxle with fluid. Refer to **Transmission Fluid Level and Condition Check** .
47. Refill the engine with oil. Refer to **Engine Oil and Oil Filter Replacement**.
48. Perform the CKP system variation learn procedure. Refer to **Control Module References** .
49. Start the engine and allow the engine to run, inspect for leaks. Correct as necessary.

ENGINE OIL AND OIL FILTER REPLACEMENT

Special Tools

EN-44887 Oil Filter Wrench

For equivalent regional tools, refer to **Special Tools**

Removal Procedure

1. Place a collecting pan underneath the oil filter.

Fig. 329: View of Draining Fluids and Oil Filter
Courtesy of GENERAL MOTORS COMPANY

2. Use EN-44887 wrench to remove the oil filter cap (1) and seal .

CAUTION: This engine uses a special high performance oil filter. Use of any other filter may lead to filter failure and/or severe engine damage.

3. Remove and properly dispose of the oil filter insert (2).
4. Raise the vehicle. Refer to **Lifting and Jacking the Vehicle** .
5. Place a collecting pan underneath the oil drain plug .

Fig. 330: Engine Oil Drain Plug And Seal
Courtesy of GENERAL MOTORS COMPANY

6. Remove the oil drain plug (1) and seal (2).

Installation Procedure

1. Clean the oil drain plug thread and the thread in the oil pan.

Fig. 331: Engine Oil Drain Plug And Seal
Courtesy of GENERAL MOTORS COMPANY

2. Install a seal (2) to the oil drain plug (1).

CAUTION: Refer to Fastener Caution .

3. Install the oil drain plug to the oil pan and tighten to 25 N.m (18 lb ft).
4. Lower the vehicle.

Fig. 332: View of Draining Fluids and Oil Filter
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Over torquing the oil filter cap may cause damage to the oil filter cap resulting in an oil leak.

NOTE: Coat the oil filter seal with NEW engine oil.

5. Use **EN-44887** wrench to Install a NEW oil filter (2) and a NEW seal and tighten the oil filter cap (1) to 22 N.m (16 lb ft).

CAUTION: Using engine oils of any viscosity other than those viscosities recommended could result in engine damage.

NOTE:

- Use specified volume of engine oil with the specified viscosity class.
- Start the engine and allow it to run until the oil pressure control indicator goes off.
- Inspect the engine oil level.

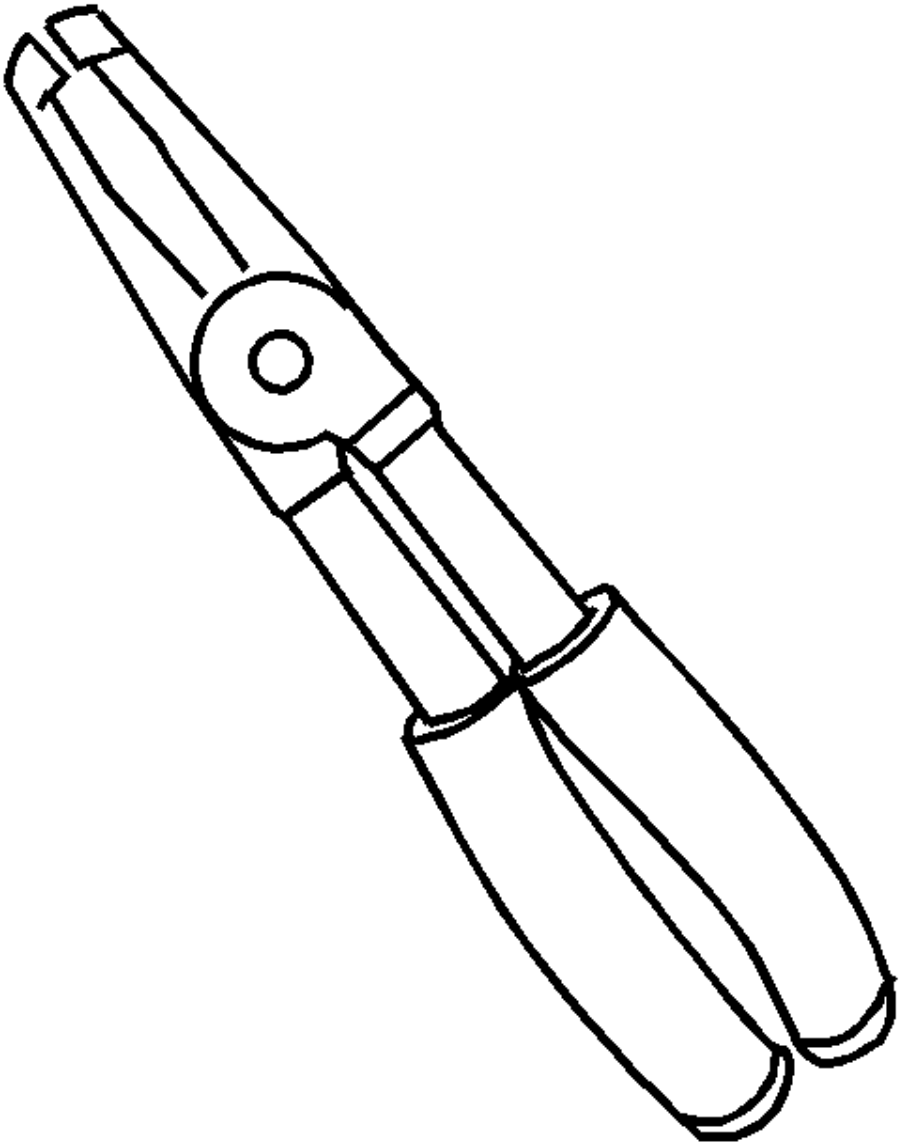

6. Fill in NEW engine oil. Refer to **Engine Mechanical Specifications (LEA, or LUK)** .
7. Reset the service interval indicator.

FASTENER TIGHTENING SPECIFICATIONS (LEA, OR LUK)

Fastener Tightening Specifications (LAF, LEA, or LUK)

Application	Specification	
	Metric	English
A/C Compressor to Block Bolt	22 N.m	16 lb ft
Air Pump Assembly Bolt	22 N.m	16 lb ft
Balance Shaft Bearing Carrier to Block Bolt	10 N.m	89 lb in
Balance Shaft Chain Guide Bolt, Adjustable	10 N.m	89 lb in
Balance Shaft Chain Guide Bolt, Fixed	12 N.m	106 lb in
Balance Shaft Chain Tensioner	10 N.m	89 lb in
Block Core Plug	35 N.m	26 lb ft
Block Heater Bolt	10 N.m	89 lb in
Cam Cover to Cylinder Head Bolt	10 N.m	89 lb in
Cam Cover to Ground Cable Bolt	10 N.m	89 lb in
Cam Cover to Ground Cable Stud	10 N.m	89 lb in
Camshaft		
• Camshaft Bearing Cap Bolt	10 N.m	89 lb in
• Camshaft Position Actuator Solenoid Valve Bolt	10 N.m	89 lb in
• Camshaft Position Sensor Bolt	10 N.m	89 lb in
• Exhaust Camshaft Position Actuator - First Pass	30 N.m	22 lb ft
• Exhaust Camshaft Position Actuator - Final Pass	100 degrees	
• Intake Camshaft Position Actuator - First Pass	30 N.m	22 lb ft
• Intake Camshaft Position Actuator - Final Pass	100 degrees	
• Intake Camshaft Rear Cap Bolt	10 N.m	89 lb in
Connecting Rod Bolt		
• First Pass	25 N.m	18 lb ft
• Final Pass	100 degrees	
Crankshaft Balancer Bolt		
• First Pass	150 N.m	111 lb ft
• Final Pass	100 degrees	
Crankshaft Position Reluctor Ring	15 N.m	11 lb ft
Crankshaft Position Sensor Bolt	10 N.m	89 lb in

Cylinder Head Bolt		
• First Pass	30 N.m	22 lb ft
• Final Pass	155 degrees	
Cylinder Head Front Chaincase Bolt	35 N.m	26 lb ft
Cylinder Head Oil Gallery Plug	35 N.m	26 lb ft
Drive Belt Tensioner Bolt (LAF, LEA)	45 N.m	33 lb ft
Drive Belt Tensioner Bolt (LUK) - OFF Vehicle		
• First Pass	50 N.m	37 lb ft
• Final Pass	90 degrees	
Drive Belt Tensioner Bolt (LUK) - ON Vehicle - Use J 45025 Belt Tensioner Wrench in combination with a 3/8 drive torque wrench	42 N.m	31 lb ft
Engine Block Oil Gallery Plug	60 N.m	44 lb ft
Engine Coolant Air Bleed Fitting	15 N.m	11 lb ft
Engine Coolant Temperature Sensor	20 N.m	15 lb ft
Engine Lift Bracket Bolt, Front	25 N.m	18 lb ft
Engine Lift Bracket Bolt, Rear	25 N.m	18 lb ft
Engine Lift Bracket Stud	25 N.m	18 lb ft
Engine Mount Bracket to Body Bolts	62 N.m	46 lb ft
Engine Mount Bracket to Engine Bolts	100 N.m	74 lb ft
Engine to Transmission Bolts	75 N.m	55 lb ft
EVAP Canister Valve Bolt	25 N.m	18 lb ft
Exhaust Manifold Heat Shield Bolt	9 N.m	80 lb in
Exhaust Manifold to Cylinder Head Nut - 2 passes	14 N.m	124 lb in
Exhaust Manifold to Cylinder Head Stud	15 N.m	11 lb ft
Flywheel Bolt - Automatic Transmission		
• First Pass	53 N.m	39 lb ft
• Final Pass	25 degrees	
Front Cover to Block Bolt	25 N.m	18 lb ft
Front Lift Bracket Bolt	25 N.m	18 lb ft
Fuel Feed Intermediate Pipe	30 N.m	22 lb ft
Fuel Pipe Bracket Bolt	10 N.m	89 lb in
Fuel Pump Cover Bolt	10 N.m	89 lb in
Fuel Pump Cover Nut	10 N.m	89 lb in
Fuel Rail Assembly Bolt	25 N.m	18 lb ft
Fuel Rail Harness Connector Bracket Bolt	10 N.m	89 lb in
Generator to Block Bolt	23 N.m	17 lb ft
Generator Wiring Harness Nut	20 N.m	15 lb ft
Ignition Coil Bolt	10 N.m	89 lb in
Intake Manifold Insulator Bolt	10 N.m	89 lb in

Intake Manifold to Cylinder Head Bolt	25 N.m	18 lb ft
Intake Manifold to Cylinder Head Nut	25 N.m	18 lb ft
Intake Manifold to Cylinder Head Stud	15 N.m	11 lb ft
Knock Sensor Bolt	25 N.m	18 lb ft
Lower Crankcase Bolts		
• Crankshaft Bearings - Lower Crankcase to Block - Bedplate		
• First Pass	20 N.m	15 lb ft
• Final Pass	70 Degrees	
• Lower Crankcase Perimeter Bolt	25 N.m	18 lb ft
Manifold Absolute Pressure (MAP) Sensor Bolt	4 N.m	35 lb in
Oil Filter Cap	25 N.m	18 lb ft
Oil Gallery Gerotor Cover - Rear Bolt	6 N.m	53 lb in
Oil Level Indicator Tube to Intake Manifold Bolt	10 N.m	89 lb in
Oil Pan Baffle	14 N.m	124 lb in
Oil Pan Drain Plug	25 N.m	18 lb ft
Oil Pan to Block Bolts	25 N.m	18 lb ft
Oil Pressure Switch	26 N.m	19 lb ft
Oil Pump Cover Bolt	6 N.m	53 lb in
Oil Pump Pressure Relief Valve Plug	40 N.m	30 lb ft
Oxygen Sensor	42 N.m	31 lb ft
Piston Oil Nozzle Assembly	15 N.m	11 lb ft
Secondary Air Injection Assembly to Secondary Air Injection Pipe Assembly Bolt	10 N.m	89 lb in
Secondary Air Injection Pipe Assembly to Cylinder Head Bolt	10 N.m	89 lb in
Secondary Air Injection Assembly to Cylinder Head Bolt	22Y	16 lb ft
Secondary Air Injection Assembly Stud	10 N.m	89 lb in
Secondary Air Injection Assembly Nut	22Y	16 lb ft
Spark Plug	20 N.m	15 lb ft
Thermostat Housing to Block Bolts	10 N.m	89 lb in
Throttle Body Bolt	10 N.m	89 lb in
Throttle Body Nut	10 N.m	89 lb in
Throttle Body Stud	6 N.m	53 lb in
Timing Chain Guide Bolt, Adjustable	10 N.m	89 lb in
Timing Chain Guide Bolt, Fixed	12 N.m	106 lb in
Timing Chain Guide Bolt, Upper	10 N.m	89 lb in
Timing Chain Guide Bolt Access Hole Plug	75 N.m	55 lb ft
Timing Chain Oil Nozzle Bolt	10 N.m	89 lb in
Timing Chain Tensioner	75 N.m	55 lb ft
Transmission to Engine Brace Bolts	50 N.m	37 lb ft

Transmission Torque Converter to Flywheel Bolt	62 N.m	46 lb ft
Vent Tube to Cylinder Head	15 N.m	11 lb ft
Water Jacket Drain Plug	20 N.m	15 lb ft
Water Pipe Support Bracket Bolt	10 N.m	89 lb in
Water Pump Access Cover Bolt	10 N.m	89 lb in
Water Pump/Balance Shaft Chain Tensioner Bolt	10 N.m	89 lb in
Water Pump Bolts	25 N.m	18 lb ft
Water Pump Cover Stud	10 N.m	89 lb in
Water Pump Sprocket Bolt	10 N.m	89 lb in

GENERAL INFORMATION

Engine Overhaul Procedures

*** PLEASE READ THIS FIRST ***

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

DESCRIPTION

Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of cleaning, inspection, and assembly processes are included.

ENGINE IDENTIFICATION

Engine may be identified from Vehicle Identification Number (VIN) stamped on a metal tab. Metal tab may be located in different locations depending on manufacturer. Engine identification number or serial number is located on cylinder block. Location varies with each manufacturer.

INSPECTION PROCEDURES

*** PLEASE READ THIS FIRST ***

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

GENERAL

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes

of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Engine components must be inspected to meet manufacturer's specifications and tolerances during overhaul. Proper dimensions and tolerances must be met to obtain proper performance and maximum engine life.

Micrometers, depth gauges and dial indicator are used for checking tolerances during engine overhaul. Magnaflux, Magnaglo, dye-check, ultrasonic and x-ray inspection procedures are used for parts inspection.

MAGNETIC PARTICLE INSPECTION

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Magnaflux & Magnaglo

Magnaflux is an inspection technique used to locate material flaws and stress cracks. Component is subjected to a strong magnetic field. Entire component or a localized area can be magnetized. Component is coated with either a wet or dry material that contains fine magnetic particles.

Cracks which are outlined by the particles cause an interruption of magnetic field. Dry powder method of Magnaflux can be used in normal lighting and crack appears as a bright line.

Fluorescent liquid is used along with a Black light in the Magnaglo Magnaflux system. Darkened room is required for this procedure. The crack will appear as a glowing line. Complete demagnetizing of component upon completion is required on both procedures. Magnetic particle inspection applies to ferrous materials only.

PENETRANT INSPECTION

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Zyglo

The Zyglo process coats material with a fluorescent dye penetrant. Component is often warmed to expand cracks that will be penetrated by the dye. Using darkened room and Black light, component is inspected for cracks. Crack will glow brightly.

Developing solution is often used to enhance results. Parts made of any material, such as aluminum cylinder heads or plastics, may be tested using this process.

Dye Check

Penetrating dye is sprayed on the previously cleaned component. Dye is left on component for 5-45 minutes, depending upon material density. Component is then wiped clean and sprayed with a developing solution. Surface cracks will show up as a bright line.

ULTRASONIC INSPECTION

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

If an expensive part is suspected of internal cracking, ultrasonic testing is used. Sound waves are used for component inspection.

X-RAY INSPECTION

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

This form of inspection is used on highly stressed components. X-ray inspection may be used to detect internal and external flaws in any material.

PRESSURE TESTING

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen

to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Cylinder heads can be tested for cracks using a pressure tester. Pressure testing is performed by plugging all but one of the holes of cylinder head and injecting air or water into the open passage.

Leaks are indicated by the appearance of wet or damp areas when using water. When air is used, it is necessary to spray the head surface with a soap solution. Bubbles will indicate a leak. Cylinder head may also be submerged in water heated to specified temperature to check for cracks created during heat expansion.

CLEANING PROCEDURES

*** PLEASE READ THIS FIRST ***

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

GENERAL

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

All components of an engine do not have the same cleaning requirements. Physical methods include bead blasting and manual removal. Chemical methods include solvent blast, solvent tank, hot tank, cold tank and steam cleaning of components.

BEAD BLASTING

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen

to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Manual removal of deposits may be required prior to bead blasting, followed by some other cleaning method. Carbon, paint and rust may be removed using bead blasting method. Components must be free of oil and grease prior to bead blasting. Beads will stick to grease or oil soaked areas causing area not to be cleaned.

Use air pressure to remove all trapped residual beads from component after cleaning. After cleaning internal engine parts made of aluminum, wash thoroughly with hot soapy water. Component must be thoroughly cleaned as glass beads will enter engine oil resulting in bearing damage.

CHEMICAL CLEANING

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Solvent tank is used for cleaning oily residue from components. Solvent blasting sprays solvent through a siphon gun using compressed air.

The hot tank, using heated caustic solvents, is used for cleaning ferrous materials only. DO NOT clean aluminum parts such as cylinder heads, bearings or other soft metals using the hot tank. After cleaning, flush parts with hot water.

A non-ferrous part will be ruined and caustic solution will be diluted if placed in the hot tank. Always use eye protection and gloves when using the hot tank.

Use of a cold tank is for cleaning aluminum cylinder heads, carburetors and other soft metals. A less caustic and unheated solution is used. Parts may be left in the tank for several hours without damage. After cleaning, flush parts with hot water.

Steam cleaning, with boiling hot water sprayed at high pressure, is recommended as the final cleaning process when using either hot or cold tank cleaning.

COMPONENT CLEANING

*** PLEASE READ THIS FIRST ***

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

SHEET METAL PARTS

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

Examples of sheet metal parts are rocker covers, front and side covers, oil pan and bellhousing dust cover. Glass bead blasting or hot tank may be used for cleaning.

Ensure all mating surfaces are flat. Deformed surfaces should be straightened. Check all sheet metal parts for cracks and dents.

INTAKE & EXHAUST MANIFOLDS

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

Using solvent cleaning or bead blasting, clean manifolds for inspection. If intake manifold has an exhaust crossover, all carbon deposits must be removed. Inspect manifolds for cracks, burned or eroded areas, corrosion and damage to fasteners.

Exhaust heat and products of combustion cause threads of fasteners to corrode. Replace studs and bolts as necessary. On "V" type intake manifolds, sheet metal oil shield must be removed for proper cleaning and inspection. Ensure all manifold parting surfaces are flat and free of burrs.

CYLINDER HEAD REPLACEMENT

*** PLEASE READ THIS FIRST ***

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

REMOVAL

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Remove intake and exhaust manifolds and valve cover. Cylinder head and camshaft carrier bolts (if equipped) should be removed only when engine is cold. On many aluminum cylinder heads, removal while hot will cause cylinder head warpage. Mark rocker arm or overhead cam components for location.

Remove rocker arm components or overhead cam components. Components must be installed in original location. Individual design rocker arms may utilize shafts, ball-type pedestal mounts or no rocker arms. For all design types, wire components together and identify according to corresponding valve. Remove cylinder head bolts. Note length and location. Some applications require cylinder head bolts be removed in proper sequence to prevent cylinder head damage. See **Fig. 1**. Remove cylinder head.

INSTALLATION

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Ensure all surfaces and head bolts are clean. Check that head bolt holes of cylinder block are clean and dry to prevent block damage when bolts are tightened. Clean threads with tap to ensure accurate bolt torque.

Install head gasket on cylinder block. Some manufacturers may recommend sealant be applied to head gasket prior to installation. Note that all holes are aligned. Some gasket applications may be marked so that certain area faces upward. Install cylinder head using care not to damage head gasket. Ensure cylinder head is fully seated on cylinder block.

Some applications require head bolts be coated with sealant prior to installation. This is done if head bolts are exposed to coolant passages. Some applications require head bolts be coated with light coat of engine oil.

Install head bolts. Head bolts should be tightened in proper steps and sequence to specification. See **Fig. 1**. Install remaining components. Tighten all bolts to specification. Adjust valves if required. See VALVE ADJUSTMENT.

NOTE: Some manufacturers require that head bolts be retightened after specified amount of operation. This must be done to prevent head gasket failure.

Fig. 1: Typical Cylinder Head Tightening or Loosening Sequence

VALVE ADJUSTMENT

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Engine specifications will indicate valve train clearance and temperature at which adjustment is to be made on most models. In most cases, adjustment will be made with a cold engine. In some cases, both a cold and a hot clearance will be given for maintenance convenience.

On some models, adjustment is not required. Rocker arms are tightened to specification and valve lash is automatically set. On some models with push rod actuated valve train, adjustment is made at push rod end of rocker arm while other models do not require adjustment.

Clearance will be checked between tip of rocker arm and tip of valve stem in proper sequence using a feeler gauge. Adjustment is made by rotating adjusting screw until proper clearance is obtained. Lock nut is then tightened. Engine will be rotated to obtain all valve adjustments to manufacturer's specifications.

Some models require hydraulic lifter to be bled down and clearance measured. Push rods of different length can be used to obtain proper clearance. Clearance will be checked between tip of rocker arm and tip of valve stem in proper sequence using a feeler gauge.

Overhead cam engines designed without rocker arms actuate valves directly on a cam follower. A hardened, removable disc is installed between the cam lobe and lifter. Clearance will be checked between cam heel and adjusting disc in proper sequence using a feeler gauge. Engine will be rotated to obtain all valve adjustments.

On overhead cam engines designed with rocker arms, adjustment is made at valve end of rocker arm. Ensure valve to be adjusted is riding on heel of cam on all engines. Clearance will be checked between tip of rocker arm and tip of valve stem in proper sequence using a feeler gauge. Adjustment is made by rotating adjusting screw until proper clearance is obtained. Lock nut is then tightened. Engine will be rotated to obtain all valve adjustments to manufacturer's specifications.

CYLINDER HEAD OVERHAUL

*** PLEASE READ THIS FIRST ***

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

CYLINDER HEAD DISASSEMBLY

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES

section for complete overhaul procedures and specifications for the vehicle being repaired.

Mark valves for location. Using valve spring compressor, compress valve springs. Remove valve locks. Carefully release spring compressor. Remove retainer or rotator, valve spring, spring seat and valve. See **Fig. 2**.

Fig. 2: Exploded View of Valve Assemblies

CYLINDER HEAD CLEANING & INSPECTION

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Clean cylinder head and valve components using approved cleaning methods. Inspect cylinder head for cracks, damage or warped gasket surface. Place straightedge across gasket surface. Determine clearance at center of straightedge. Measure across both diagonals, longitudinal center line and across cylinder head at several points. See **Fig. 3**.

On cast iron cylinder heads, if warpage exceeds .003" (.08 mm) in a 6" span, or .006" (.15 mm) over total length, cylinder head must be resurfaced. On most aluminum cylinder heads, if warpage exceeds .002" (.05 mm) in any area, cylinder head must be resurfaced. Warpage specification may vary by manufacturer. If warpage exceeds specification on some cylinder heads, cylinder head must be replaced.

Cylinder head thickness should be measured to determine amount of material which can be removed before replacement is required. Cylinder head thickness must not be less than the manufacturer's specification.

If cylinder head required resurfacing, it may not align properly with intake manifold. On "V" type engines, misalignment is corrected by machining intake manifold surface that contacts cylinder head. Cylinder head may be machined on surface that contacts intake manifold. Using oil stone, remove burrs or scratches from all sealing surfaces.

Fig. 3: Checking Cylinder Head for Warpage

VALVE SPRINGS

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

Inspect valve springs for corroded or pitted valve spring surfaces which may lead to breakage. Polished spring ends caused by a rotating spring indicate that spring surge has occurred. Replace springs showing evidence of these conditions.

Inspect valve springs for squareness using a 90-degree straightedge. See **Fig. 4**. Replace valve spring if out-of-square exceeds manufacturer's specification.

Fig. 4: Checking Valve Spring Squareness

Using vernier caliper, measure free length of all valve springs. Replace springs if not within specification. Using valve spring tester, test valve spring pressure at installed and compressed heights. See **Fig. 5**.

Usually compressed height is installed height minus valve lift. Replace valve spring if not within specification. It is recommended to replace all valve springs when overhauling cylinder head. Valve springs may need to be installed with color coded end or small coils at specified area according to manufacturer.

Fig. 5: Checking Valve Spring Pressure

VALVE GUIDE

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

Measuring Valve Guide Clearance

Check valve stem-to-guide clearance. Ensure valve stem diameter is within specification. Install valve in valve guide. Install dial indicator assembly on cylinder head with tip resting against valve stem just above valve

guide. See **Fig. 6**.

95J12996

Fig. 6: Measuring Valve Stem-to-Guide Clearance

Lower valve approximately 1/16" below valve seat. Push valve stem against valve guide as far as possible. Adjust dial indicator to zero. Push valve stem in opposite direction and note reading. Clearance must be within specification.

If valve guide clearance exceeds specification, valves with oversize stems may be used and valve guides are reamed to larger size or valve guide must be replaced. On some applications, a false guide is installed, then reamed to proper specification. Valve guide reamer set is used to ream valve guide to obtain proper clearance for new valve.

Reaming Valve Guide

Select proper reamer for size of valve stem. Reamer must be of proper length to provide clean cut through entire length of valve guide. Install reamer in valve guide and rotate to cut valve guide. See **Fig. 7**.

95A12997

Fig. 7: Reaming Valve Guides

Replacing Valve Guide

Replace valve guide if clearance exceeds specification. Valve guides are either pressed, hammered or shrunk in place, depending upon cylinder head design and type of metal used.

Remove valve guide from cylinder head by pressing or tapping on a stepped drift. See **Fig. 8**. Once valve guide is installed, distance from cylinder head to top of valve guide must be checked. This distance must be within specification.

Aluminum heads are often heated before installing valve guide. Valve guide is sometimes cooled in dry ice prior to installation. Combination of a heated cylinder head and cooled valve guide ensures a tight guide fit upon assembly. The new guide must be reamed to specification.

Fig. 8: Typical Valve Guide Remover & Installer

VALVES & VALVE SEATS

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Valve Grinding

Valve stem O.D. should be measured in several areas to indicate amount of wear. Replace valve if not within specification. Valve margin area should be measured to ensure that valve can be ground. See **Fig. 9**.

If valve margin is less than specification, the valves will be burned. Valve must be replaced. Due to minimum margin dimensions during manufacture, some new type valves cannot be reground. Some manufacturers use stellite coated valves that must NOT be machined. Valves can only be lapped into valve seat.

CAUTION: Some valves are sodium filled. Extreme care must be used when disposing of damaged or worn sodium-filled valves.

95C12999

Fig. 9: Measuring Valve Head Margin

Resurface valve to proper angle specification using valve grinding machine. Follow manufacturer's instructions for valve grinding machine. Specifications may indicate a different valve face angle than seat angle. Measure valve margin after grinding. Replace valve if not within specification. Valve stem tip can be refinished using valve grinding machine.

Valve Lapping

During valve lapping of recently designed valves, be sure to follow manufacturer's recommendations. Surface hardening and materials used with some valves do not permit lapping. Lapping process will remove excessive amounts of the hardened surface.

Valve lapping is done to ensure adequate sealing between valve face and seat. Use either a hand drill or lapping stick with suction cup attached.

Moisten and attach suction cup to valve. Lubricate valve stem and guide. Apply a thin coat of fine valve grinding compound between valve and seat. Rotate lapping tool between the palms or with hand drill.

Lift valve upward off the seat and change position often. This is done to prevent grooving of valve seat. Lap valve until a smooth polished seat is obtained. Thoroughly clean grinding compound from components. Valve-to-valve seat concentricity should be checked. See **VALVE SEAT CONCENTRICITY**.

CAUTION: Valve guides must be in good condition and free of carbon deposits prior to valve seat grinding. Some engines contain an induction hardened valve seat. Excessive material removal will damage valve seats.

Valve Seat Grinding

Select coarse stone of correct size and angle for seat to be ground. Ensure stone is true and has a smooth surface. Select correct size pilot for valve guide dimension. Install pilot in valve guide. Lightly lubricate pilot shaft. Install stone on pilot. Move stone off and on the seat approximately 2 times per second during grinding operation.

Select a fine stone to finish grinding operation. Various angle grinding stones are used to center and narrow the valve seat as required. See **Fig. 10**.

Fig. 10: Adjusting Valve Seat Width

Valve Seat Replacement

Replacement of valve seat inserts is done by cutting out the old insert and machining an oversize insert bore. Replacement oversize insert is usually cooled and the cylinder head is sometimes warmed. Valve seat is pressed into the head. This operation requires specialized machine shop equipment.

Valve Seat Concentricity

Using dial gauge, install gauge pilot in valve guide. Position gauge arm on the valve seat. Adjust dial indicator to zero. Rotate arm 360 degrees and note reading. Runout should not exceed specification.

To check valve-to-valve seat concentricity, coat valve face lightly with Prussian Blue dye. Install valve and rotate it on valve seat. If pattern is even and entire seat is coated at valve contact point, valve is concentric with the valve seat.

CYLINDER HEAD REASSEMBLY

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Valve Stem Installed Height

Valve stem installed height must be checked when new valves are installed or when valves or valve seats have been ground. Install valve in valve guide. Measure distance from tip of valve stem to spring seat. See **Fig. 11**. Distance must be within specification to allow sufficient clearance for valve operation.

Remove valve and grind valve stem tip if height exceeds specification. Valve tips are surface hardened. DO NOT remove more than .010" (.25 mm) from tip. Chamfer sharp edge of reground valve tip. Recheck valve stem installed height.

95I13001

Fig. 11: Measuring Valve Stem Installed Height

VALVE STEM OIL SEALS

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Valve stem oil seals must be installed on valve stem. See **Fig. 2**. Seals are needed due to pressure differential at the ends of valve guides. Atmospheric pressure above intake guide, combined with manifold vacuum below guide, causes oil to be drawn into the cylinder.

Exhaust guides also have pressure differential created by exhaust gas flowing past the guide, creating a low pressure area. This low pressure area draws oil into the exhaust system.

Some manufacturers require that special color code or specified height valve stem oil seal be installed in

designated area.

Replacement (On-Vehicle)

Mark rocker arm or overhead cam components for location. Remove rocker arm components or overhead cam components. Components must be installed in original location. Remove spark plugs. Valve stem oil seals may be replaced by holding valves against seats using air pressure.

Air pressure must be installed in cylinder using an adapter for spark plug hole. An adapter can be constructed by welding air hose connection to spark plug body with porcelain removed.

Rotate engine until piston is at top of stroke. Install adapter in spark plug hole. Apply a minimum of 140 psi (9.8 kg/cm²) line pressure to adapter. Air pressure should hold valve closed. If air pressure does not hold valve closed, check for damaged or bent valve. Cylinder head must be removed for service.

Using valve spring compressor, compress valve springs. Remove valve locks. Carefully release spring compressor. Remove retainer or rotator and valve spring. Remove valve stem oil seal.

If oversize valves have been installed, oversize oil seals must be used. Coat valve stem with engine oil. Install protective sleeve over end of valve stem. Install new oil seal over valve stem and seat on valve guide. Remove protective sleeve. Install spring seat, valve spring and retainer or rotator. Compress spring and install valve locks. Remove spring compressor. Ensure valve locks are fully seated.

Install rocker arms or overhead cam components. Tighten all bolts to specification. Adjust valves if required. Remove adapter. Install spark plugs, valve cover and gasket.

VALVE SPRING INSTALLED HEIGHT

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Valve spring installed height should be checked during reassembly. Measure height from lower edge of valve spring to the upper edge. DO NOT include valve spring seat or retainer. Distance must be within specification. If valves and/or seats have been ground, a valve spring shim may be required to correct spring height. See **Fig. 12**.

Fig. 12: Measuring Valve Spring Installed Height

ROCKER ARMS & ASSEMBLIES

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Rocker Studs

Rocker studs are either threaded or pressed in place. Threaded studs are removed by locking 2 nuts on the stud. Unscrew the stud by turning the jam nut. Coat new stud threads with Loctite and install. Tighten to specification.

Pressed-in stud can be removed using a stud puller. Ream stud bore to proper specification and press in a new oversize stud. Pressed-in studs are often replaced by cutting threads in the stud bore to accept a threaded stud.

Rocker Arms & Shafts

Mark rocker arms for location. Remove rocker arm retaining bolts. Remove rocker arms. Inspect rocker arms, shafts, bushings and pivot balls (if equipped) for excessive wear. Inspect rocker arms for wear in valve stem

contact area. Measure rocker arm bushing I.D. Replace bushings if excessively worn.

The rocker arm valve stem contact point may be reground, using special fixture for valve grinding machine. Remove minimum amount of material as possible. Ensure all oil passages are clear. Install rocker arm components in original location. Ensure rocker arm is properly seated in push rod. Tighten bolts to specification. Adjust valves if required. See **VALVE ADJUSTMENT**.

PUSH RODS

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Remove rocker arms. Mark push rods for location. Remove push rods. Push rods can be steel or aluminum, solid or hollow. Hollow push rods must be internally cleaned to ensure oil passage to rocker arms is cleaned. Check push rods for damage, such as loose ends on steel tipped aluminum types.

Check push rod for straightness. Roll push rod on a flat surface. Using feeler gauge, check clearance at center. Replace push rod if bent. The push rod can also be supported at each end and rotated. A dial indicator is used to detect a bent area in the push rod.

Lubricate ends of push rod and install push rod in original location. Ensure push rod is properly seated in lifter. Install rocker arm. Tighten bolts to specification. Adjust valves if required. See **VALVE ADJUSTMENT**.

LIFTERS

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Hydraulic Lifters

Before replacing a hydraulic lifter for noisy operation, ensure noise is not caused by worn rocker arms or valve tips. Also ensure sufficient oil pressure exists. Hydraulic lifters must be installed in original location. Remove rocker arm assembly and push rod. Mark components for location. Some applications require intake manifold, cylinder head or lifter cover removal. Remove lifter retainer plate (if used). To remove lifters, use a hydraulic lifter remover or magnet. Different type lifters are used. See **Fig. 13**.

On sticking lifters, disassemble and clean lifter. DO NOT mix lifter components or positions. Parts are select-fitted and are not interchangeable. Inspect all components for wear. Note amount of wear in lifter body-to-camshaft contact area. Surface must have smooth and convex contact face. If wear is apparent, carefully inspect cam lobe.

Inspect push rod contact area and lifter body for scoring or signs of wear. If body is scored, inspect lifter bore for damage and lack of lubrication. On roller type lifters, inspect roller for flaking, pitting, loss of needle bearings and roughness during rotation.

Measure lifter body O.D. in several areas. Measure lifter bore I.D. Ensure components or oil clearance is within specification. Some models offer oversize lifters. Replace lifter if damaged.

If lifter check valve is not operating, obstructions may be preventing it from closing or valve spring may be broken. Clean or replace components as necessary.

Check plunger operation. Plunger should drop to bottom of the body by its own weight when assembled dry. If plunger is not free, soak lifter in solvent to dissolve deposits.

Lifter leak-down test can be performed on lifter. Lifter must be filled with special test oil. New lifters contain special test oil. Using lifter leak-down tester, perform leak-down test following manufacturer's instructions. If leak-down time is not within specifications, replace lifter assembly.

Lifters should be soaked in clean engine oil several hours prior to installation. Coat lifter base, roller (if equipped) and lifter body with ample amount of Molykote or camshaft lubricant. See **Fig. 13**. Install lifter in original location. Install remaining components. Valve lash adjustment is not required on most hydraulic lifters. Preload of hydraulic lifter is automatic. Some models may require adjustment.

NOTE: **Some manufacturers require that a crankcase conditioner be added to engine oil and engine operated for specified amount of time to aid in lifter break-in procedure if new lifters or camshaft are installed.**

FLAT LIFTER

95G14643

ROLLER LIFTER

Fig. 13: Typical Hydraulic Valve Lifter Assemblies

Mechanical Lifters

Lifter assemblies must be installed in original locations. Remove rocker arm assembly and push rod. Mark components for location. Some applications require intake manifold or lifter cover removal. Remove lifter retainer plate (if used). To remove lifters, use lifter remover or magnet.

Inspect push rod contact area and lifter body for scoring or signs of wear. If body is scored, inspect lifter bore for damage and lack of lubrication. Note amount of wear in lifter body-to-camshaft contact area. Surface must have smooth and convex contact face. If wear is apparent, carefully inspect cam lobe.

Coat lifter base, roller (if equipped) and lifter body with ample amount of Molykote or camshaft lubricant. Install lifter in original location. Install remaining components. Tighten bolts to specification. Adjust valves. See [VALVE ADJUSTMENT](#).

PISTONS, CONNECTING RODS & BEARINGS

*** PLEASE READ THIS FIRST ***

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

RIDGE REMOVAL

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

Ridge in cylinder wall must be removed prior to piston removal. Failure to remove ridge prior to removing pistons will cause piston damage in piston ring lands or grooves.

With piston at bottom dead center, place rag in bore to trap metal chips. Install ridge reamer in cylinder bore. Adjust ridge reamer using manufacturer's instructions. Remove ridge using ridge reamer. DO NOT remove an excessive amount of material. Ensure ridge is completely removed.

PISTON & CONNECTING ROD REMOVAL

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Note top of piston. Some pistons may contain a notch, arrow or be marked FRONT. Piston must be installed in proper direction to prevent damage with valve operation.

Check that connecting rod and cap are numbered for cylinder location and which side of cylinder block the number faces. Proper cap and connecting rod must be installed together. Connecting rod cap must be installed on connecting rod in proper direction to ensure bearing lock procedure. Mark connecting rod and cap if necessary. Pistons must be installed in original location.

Remove cap retaining nuts or bolts. Remove bearing cap. Install tubing protectors on connecting rod bolts. This protects cylinder walls from scoring during removal. Ensure proper removal of ridge. Push piston and connecting rod from cylinder. Connecting rod boss can be tapped with a wooden dowel or hammer handle to aid in removal.

PISTON & CONNECTING ROD

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Disassembly

Using ring expander, remove piston rings. Remove piston pin retaining rings (if equipped). Note direction of piston installation on connecting rod. On pressed type piston pins, special fixtures and procedures according to manufacturer must be used to remove piston pins. Follow manufacturer's recommendations to avoid piston distortion or breakage.

Cleaning

Remove all carbon and varnish from piston. Pistons and connecting rods may be cleaned in cold type chemical tank. Using ring groove cleaner, clean all deposits from ring grooves. Ensure all deposits are cleaned from ring grooves to prevent ring breakage or sticking. DO NOT attempt to clean pistons with wire brush.

Inspection

Inspect pistons for nicks, scoring, cracks or damage in ring areas. Connecting rod should be checked for cracks using Magnaflux procedure. Piston diameter must be measured in manufacturer's specified area.

Using telescopic gauge and micrometer, measure piston pin bore of piston in 2 areas, 90 degrees apart. This is

done to check diameter and out-of-round.

Install proper bearing cap on connecting rod. Ensure bearing cap is installed in proper location. Tighten bolts or nuts to specification. Using inside micrometer, measure inside diameter in 2 areas, 90 degrees apart.

Connecting rod I.D. and out-of-round must be within specification. Measure piston pin bore I.D. and piston pin O.D. All components must be within specification. Subtract piston pin diameter from piston pin bore in piston and connecting rod to determine proper fit.

Connecting rod length must be measured from center of crankshaft journal inside diameter to center of piston pin bushing using proper caliper. Connecting rods must be the same length. Connecting rods should be checked on an alignment fixture for bent or twisted condition. Replace all components which are damaged or not within specification.

PISTON & CYLINDER BORE FIT

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Ensure cylinder is checked for taper, out-of-round and properly honed prior to checking piston and cylinder bore fit. See **CYLINDER BLOCK**. Using dial bore gauge, measure cylinder bore.

Measure piston skirt diameter at 90 degree angle to piston pin at specified area by manufacturer. Subtract piston diameter from cylinder bore diameter to determine piston-to-cylinder clearance. Clearance must be within specification. Mark piston for proper cylinder location.

ASSEMBLING PISTON & CONNECTING ROD

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Install piston on connecting rod for corresponding cylinder. Ensure reference marking on top of piston corresponds with connecting rod and cap number. See **Fig. 14**.

Lubricate piston pin and install in connecting rod. Ensure piston pin retainers are fully seated (if equipped). On

pressed type piston pins, follow manufacturer's recommended procedure to avoid distortion or breakage.

Fig. 14: Installing Typical Piston Pin

CHECKING PISTON RING CLEARANCES

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Piston rings must be checked for side clearance and end gap. To check end gap, install piston ring in cylinder in which it is to be installed. Using an inverted piston, push ring to bottom of cylinder in smallest cylinder diameter.

Using feeler gauge, check ring end gap. See **Fig. 15**. Piston ring end gap must be within specification. Ring breakage will occur if insufficient ring end gap exists.

Some manufacturers permit correcting insufficient ring end gap by using a fine file while other manufacturers recommend using another ring set. Mark rings for proper cylinder installation after checking end gap.

Fig. 15: Checking Piston Ring End Gap

For checking side clearance, install rings on piston. Using feeler gauge, measure clearance between piston ring and piston ring land. Check side clearance in several areas around piston. Side clearance must be within specification.

If side clearance is excessive, piston ring grooves can be machined to accept oversize piston rings (if available). Normal practice is to replace piston.

PISTON & CONNECTING ROD INSTALLATION

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes

of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.**

Cylinders must be honed prior to piston installation. See **CYLINDER HONING** under **CYLINDER BLOCK**.

Install upper connecting rod bearings. Lubricate upper bearings with engine oil. Install lower bearings in rod caps. Ensure bearing tabs are properly seated. Position piston ring gaps according to manufacturer's recommendations. See **Fig. 16**. Lubricate pistons, rings and cylinder walls.

Fig. 16: Positioning Typical Piston Ring End Gap

Install ring compressor. Use care not to rotate piston rings. Compress rings with ring compressor. Install plastic tubing protectors over connecting rod bolts. Install piston and connecting rod assembly. Ensure piston notch, arrow or FRONT mark is toward front of engine. See **Fig. 17**.

Fig. 17: Installing Piston & Connecting Rod Assembly

Carefully tap piston into cylinder until rod bearing is seated on crankshaft journal. Remove protectors. Install rod cap and bearing. Lightly tighten connecting rod bolts. Repeat procedure for remaining cylinders. Check bearing clearance. See **MAIN & CONNECTING ROD BEARING CLEARANCE**.

Once clearance is checked, lubricate journals and bearings. Install bearing caps. Ensure marks are aligned on connecting rod and cap. Tighten rod nuts or bolts to specification. Ensure rod moves freely on crankshaft. Check connecting rod side clearance. See **CONNECTING ROD SIDE CLEARANCE**.

CONNECTING ROD SIDE CLEARANCE

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen

to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Position connecting rod toward one side of crankshaft as far as possible. Using feeler gauge, measure clearance between side of connecting rod and crankshaft. See **Fig. 18**. Clearance must be within specification.

Check for improper bearing installation, wrong bearing cap or insufficient bearing clearance if side clearance is insufficient. Connecting rod may require machining to obtain proper clearance. Excessive clearance usually indicates excessive wear at crankshaft. Crankshaft must be repaired or replaced.

Fig. 18: Measuring Connecting Rod Side Clearance

MAIN & CONNECTING ROD BEARING CLEARANCE

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Plastigage Method

Plastigage method may be used to determine bearing clearance. Plastigage can be used with an engine in service or during reassembly. Plastigage material is oil soluble.

Ensure journals and bearings are free of oil or solvent. Oil or solvent will dissolve material and false reading will be obtained. Install small piece of Plastigage along full length of bearing journal. Install bearing cap in original location. Tighten bolts to specification.

CAUTION: DO NOT rotate crankshaft while Plastigage is installed. Bearing clearance will not be obtained if crankshaft is rotated.

Remove bearing cap. Compare Plastigage width with scale on Plastigage container to determine bearing clearance. See **Fig. 19**. Rotate crankshaft 90 degrees. Repeat procedure. This is done to check journal eccentricity. This procedure can be used to check oil clearance on both connecting rod and main bearings.

95C14649

Fig. 19: Measuring Bearing Clearance

Micrometer & Telescopic Gauge Method

A micrometer is used to determine journal diameter, taper and out-of-round dimensions of the crankshaft. See **CLEANING & INSPECTION** under CRANKSHAFT & MAIN BEARINGS in this article.

With crankshaft removed, install bearings and caps in original location on cylinder block. Tighten bolts to specification. On connecting rods, install bearings and caps on connecting rods. Install proper connecting rod cap on corresponding rod. Ensure bearing cap is installed in original location. Tighten bolts to specification.

Using a telescopic gauge and micrometer or inside micrometer, measure inside diameter of connecting rod and main bearings bores. Subtract each crankshaft journal diameter from the corresponding inside bearing bore diameter. This is the bearing clearance.

CRANKSHAFT & MAIN BEARINGS

*** PLEASE READ THIS FIRST ***

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

REMOVAL

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

Ensure all main bearing caps are marked for location on cylinder block. Some main bearing caps have an arrow stamped on them. The arrow must face timing belt or timing chain end of engine. Remove main bearing cap bolts. Remove main bearing caps. Carefully remove crankshaft. Use care not to bind crankshaft in cylinder block during removal.

CLEANING & INSPECTION

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Thoroughly clean crankshaft using solvent. Dry with compressed air. Ensure all oil passages are clear and free of sludge, rust, dirt and metal chips.

Inspect crankshaft for scoring and nicks. Inspect crankshaft for cracks using Magnaflux procedure. Inspect rear seal area for grooving or damage. Inspect bolt hole threads for damage. If pilot bearing or bushing is used, check pilot bearing or bushing fit in crankshaft. Inspect crankshaft gear for damaged or cracked teeth. Replace gear if damaged. Ensure oil passage plugs are tight (if equipped).

Using micrometer, measure all journals in 4 areas to determine journal taper, out-of-round and undersize. See **Fig. 20**. Some crankshafts can be reground to the next largest undersize, depending on the amount of wear or damage. Crankshafts with rolled fillet cannot be reground and must be replaced.

A - B = Vertical Taper
C - D = Horizontal Taper
A - C & B - D = Out-Of-Round

Check For Out-Of-Round At Each End Of Journal

95G14650

Fig. 20: Measuring Crankshaft Journals

Crankshaft journal runout should be checked. Install crankshaft in "V" blocks or bench center. Position dial indicator with tip resting on the main bearing journal area. See **Fig. 21**. Rotate crankshaft and note reading. Journal runout must not exceed specification. Repeat procedure on all main bearing journals. Crankshaft must be replaced if runout exceeds specification.

Fig. 21: Measuring Crankshaft Main Bearing Journal Runout

INSTALLATION

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Install upper main bearing in cylinder block. Ensure lock tab is properly located in cylinder block. Install bearings in main bearing caps. Ensure all oil passages are aligned. Install rear seal (if removed).

Ensure crankshaft journals are clean. Lubricate upper main bearings with clean engine oil. Carefully install crankshaft. Check each main bearing clearance using Plastigage method. See **MAIN & CONNECTING ROD BEARING CLEARANCE**.

Once clearance is checked, lubricate lower main bearing and journals. Install main bearing caps in original location. Install rear seal in rear main bearing cap (if removed). Some rear main bearing caps require sealant to be applied in corners to prevent oil leakage.

Install and tighten all bolts except thrust bearing cap to specification. Tighten thrust bearing cap bolts finger tight only. Some models require that thrust bearing be aligned. On most applications, crankshaft must be moved rearward then forward. Procedure may vary with manufacturer. Thrust bearing cap is then tightened to specification. Ensure crankshaft rotates freely. Crankshaft end play should be checked. See **CRANKSHAFT END PLAY**.

CRANKSHAFT END PLAY

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Dial Indicator Method

Crankshaft end play can be checked using dial indicator. Mount dial indicator on rear of cylinder block. Position dial indicator tip against rear of crankshaft. Ensure tip is resting against flat surface.

Pry crankshaft rearward. Adjust dial indicator to zero. Pry crankshaft forward and note reading. Crankshaft end play must be within specification. If end play is not within specification, check for faulty thrust bearing installation or worn crankshaft. Some applications offer oversize thrust bearings.

Feeler Gauge Method

Crankshaft end play can be checked using feeler gauge. Pry crankshaft rearward. Pry crankshaft forward. Using feeler gauge, measure clearance between crankshaft and thrust bearing surface. See **Fig. 22**.

95114652

Fig. 22: Checking Crankshaft End Play

Crankshaft end play must be within specification. If end play is not within specification, check for faulty thrust bearing installation or worn crankshaft. Some applications offer oversize thrust bearings.

CYLINDER BLOCK

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

Block Cleaning

Only cast cylinder blocks should be hot tank cleaned. Aluminum cylinder blocks should be cleaned using cold tank method. Cylinder block is cleaned in order to remove carbon deposits, gasket residue and water jacket

scale. Remove oil gallery plugs, freeze plugs and cam bearings before cleaning block.

Block Inspection

Visually inspect the block. Check suspected areas for cracks using the Dye Penetrant inspection method. Block may be checked for cracks using the Magnaflux method.

Cracks are most commonly found at the bottom of cylinders, main bearing saddles, near expansion plugs and between cylinders and water jackets. Inspect lifter bores for damage. Inspect all head bolt holes for damaged threads. Threads should be cleaned using tap to ensure proper head bolt torque. Consult machine shop concerning possible welding and machining (if required).

Cylinder Bore Inspection

Inspect bore for scoring or roughness. Cylinder bore is dimensionally checked for out-of-round and taper using dial bore gauge. For determining out-of-round, measure cylinder parallel and perpendicular to the block center line. Difference in the 2 readings is the bore out-of-round. Cylinder bore must be checked at top, middle and bottom of piston travel area.

Bore taper is obtained by measuring bore at the top and bottom. If wear has exceeded allowable limits, block must be honed or bored to next available oversize piston dimension.

Cylinder Honing

Cylinder must be properly honed to allow new piston rings to properly seat. Cross-hatching at correct angle and depth is critical to lubrication of cylinder walls and pistons.

A flexible drive hone and power drill are commonly used. Drive hone must be lubricated during operation. Mix equal parts of kerosene and SAE 20W engine oil for lubrication.

Apply lubrication to cylinder wall. Operate cylinder hone from top to bottom of cylinder using even strokes to produce 45 degree cross-hatch pattern on the cylinder wall. DO NOT allow cylinder hone to extend below cylinder during operation.

Recheck bore dimension after final honing. Wash cylinder wall with hot soapy water to remove abrasive particles. Blow dry with compressed air. Coat cleaned cylinder walls with lubricating oil.

Deck Warpage

Check deck for damage or warped gasket surface. Place a straightedge across gasket surface of the deck. Using feeler gauge, measure clearance at center of straightedge. Measure across width and length of cylinder block at several points.

If warpage exceeds specifications, deck must be resurfaced. If warpage exceeds manufacturer's maximum tolerance for material removal, replace block.

NOTE: **Some manufacturers recommend that a total amount of material (cylinder head and cylinder block) can only be removed before components must be replaced.**

Deck Height

Distance from crankshaft center line to block deck is called the deck height. Measure and record front and rear main journals of crankshaft. To compute this distance, install crankshaft and retain with center main bearing and cap only. Measure distance from crankshaft journal to block deck, parallel to cylinder center line.

Add one half of main bearing journal diameter to distance from crankshaft journal to block deck. This dimension should be checked at front and rear of cylinder block. Both readings should be the same.

If difference exceeds specification, cylinder block must be repaired or replaced. Deck height and warpage should be corrected at the same time.

Main Bearing Bore & Alignment

For checking main bearing bore, remove all bearings from cylinder block and main bearing caps. Install main bearing caps in original location. Tighten bolts to specification. Using inside micrometer, measure main bearing bore in 2 areas 90 degrees apart. Determine bore size and out-of-round. If diameter is not within specification, block must be align-bored.

For checking alignment, place a straightedge along center line of main bearing saddles. Check for clearance between straightedge and main bearing saddles. Block must be align-bored if clearance exists.

Expansion Plug Removal

Drill hole in center of expansion plug. Remove with screwdriver or punch. Use care not to damage sealing surface.

Expansion Plug Installation

Ensure sealing surface is free of burrs. Coat expansion plug with sealer. Using wooden dowel or pipe of slightly smaller diameter, install expansion plug. Ensure expansion plug is evenly located.

Oil Gallery Plug Removal

Remove threaded oil gallery plugs using appropriate wrench. Soft press-in plugs are removed by drilling into plug and installing a sheet metal screw. Remove plug with slide hammer or pliers.

Oil Gallery Plug Installation

Ensure threads or sealing surface is clean. Coat threaded oil gallery plugs with sealer and install. Replacement soft press-in plugs are installed with a hammer and drift.

CAMSHAFT

*** PLEASE READ THIS FIRST ***

NOTE: **Examples used in this article are general in nature and do not necessarily relate**

to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

CLEANING & INSPECTION

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Clean camshaft with solvent. Ensure all oil passages are clear. Inspect cam lobes and bearing journals for pitting, flaking or scoring. Using micrometer, measure bearing journal O.D.

Support camshaft at each end with "V" blocks. Position dial indicator with tip resting on center bearing journal. Rotate camshaft and note camshaft runout reading. If reading exceeds specification, replace camshaft.

Check cam lobe lift by measuring base circle of camshaft using micrometer. Measure again at 90-degree angle to tip of cam lobe. Cam lift can be determined by subtracting base circle diameter from tip of cam lobe measurement.

Different lift dimensions are given for intake and exhaust cam lobes. Reading must be within specification. Replace camshaft if cam lobes or bearing journals are not within specification.

Inspect camshaft gear for chipped, eroded or damaged teeth. Replace gear if damaged. On camshafts using thrust plate, measure distance between thrust plate and camshaft shoulder. Replace thrust plate if not within specification.

CAMSHAFT BEARINGS

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Removal & Installation

Remove camshaft rear plug. Camshaft bearing remover is assembled with shoulder resting against bearing to be removed according to manufacturer's instructions. Tighten puller nut until bearing is removed. Remove remaining bearings, leaving front and rear bearings until last. These bearings act as a guide for camshaft bearing remover.

To install new bearings, puller is rearranged to pull bearings toward the center of block. Ensure all lubrication passages of bearing are aligned with cylinder block. Coat new camshaft rear plug with sealant. Install camshaft rear plug. Ensure plug is even in cylinder block.

CAMSHAFT INSTALLATION

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Lubricate bearing surfaces and cam lobes with ample amount of Molykote or camshaft lubricant. Carefully install camshaft. Use care not to damage bearing journals during installation. Install thrust plate retaining bolts (if equipped). Tighten bolts to specification. On overhead camshafts, install bearing caps in original location. Tighten bolts to specification. On all applications, check camshaft end play.

CAMSHAFT END PLAY

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Using dial indicator, check camshaft end play. Position dial indicator on front of engine block or cylinder head. Position indicator tip against camshaft. Push camshaft toward rear of cylinder head or engine and adjust indicator to zero.

Move camshaft forward and note reading. Camshaft end play must be within specification. End play may be adjusted by relocating gear, shimming thrust plate or replacing thrust plate depending on each manufacturer.

TIMING CHAINS & BELTS

*** PLEASE READ THIS FIRST ***

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

TIMING CHAINS

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

Timing chains will stretch during operation. Limits are placed upon amount of stretch before replacement is required. Timing chain stretch will alter ignition timing and valve timing.

To check timing chain stretch, rotate crankshaft to eliminate slack from one side of timing chain. Mark reference point on cylinder block. Rotate crankshaft in opposite direction to eliminate slack from remaining side of timing chain. Force other side of chain outward and measure distance between reference point and timing chain. See **Fig. 23**. Replace timing chain and gears if not within specification.

Fig. 23: Measuring Timing Chain Stretch

Timing chains must be installed so timing marks on camshaft gear and crankshaft gear are aligned according to manufacturer. See **Fig. 24**.

Fig. 24: Typical Gear Timing Mark Alignment

TIMING BELTS

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Cogged tooth belts are commonly used on overhead cam engines. Inspect belt teeth for rounded corners or cracking. Replace belt if it is cracked, damaged, missing teeth or oil soaked.

Used timing belt must be installed in original direction of rotation. Inspect all sprocket teeth for wear. Replace all worn sprockets. Sprockets are marked for timing purposes. Engine is positioned so that crankshaft sprocket mark will be upward. Camshaft sprocket is aligned with reference mark on cylinder head or timing belt cover and then timing belt can be installed. See **Fig. 25**.

Fig. 25: Typical Camshaft Belt Sprocket Alignment

TENSION ADJUSTMENT

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

If guide rails are used with spring loaded tensioners, ensure at least half of original rail thickness remains. Spring loaded tensioner should be inspected for damage.

Ensure all timing marks are aligned. Adjust belt tension using manufacturer's recommendations. Belt tension may require checking using tension gauge. See **Fig. 26**.

Fig. 26: Adjusting Typical Timing Belt Tension

TIMING GEARS

*** PLEASE READ THIS FIRST ***

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

TIMING GEAR BACKLASH & RUNOUT

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

On engines where camshaft gear operates directly on crankshaft gear, gear backlash and runout must be checked. To check backlash, install dial indicator with tip resting on tooth of camshaft gear. Rotate camshaft gear as far as possible. Adjust indicator to zero. Rotate camshaft gear in opposite direction as far as possible and note reading.

To determine timing gear runout, mount dial indicator with tip resting on face edge of camshaft gear. Adjust indicator to zero. Rotate camshaft gear 360 degrees and note reading. If backlash or runout exceeds specification, replace camshaft and/or crankshaft gear.

REAR MAIN OIL SEAL INSTALLATION

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

One-Piece Type Seal

For one-piece type oil seal installation, coat block contact surface of seal with sealer if seal is not factory coated. Ensure seal surface is free of burrs. Lubricate seal lip with engine oil and press seal into place using proper oil seal installer. See **Fig. 27**.

Fig. 27: Installing Typical One-Piece Oil Seal

Rope Type Seal

For rope type rear main oil seal installation, press seal lightly into seat area. Using seal installer, fully seat seal in bearing cap or cylinder block.

Trim seal ends even with cylinder block parting surface. Some applications require sealer to be applied on main bearing cap before installing. See **Fig. 28**.

Fig. 28: Installing Typical Rope Seal

Split-Rubber Type Seal

Follow manufacturer's procedures when installing split-rubber type rear main oil seals. Installation procedures vary with manufacturer and engine type. See **Fig. 29**.

Fig. 29: Installing Typical Split-Rubber Seal

OIL PUMP

*** PLEASE READ THIS FIRST ***

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

ROTOR TYPE

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.**

Mark oil pump rotor locations before removing. See **Fig. 30**. Remove outer rotor and measure thickness and diameter. Measure inner rotor thickness. Inspect shaft for scoring or wear. Inspect rotors for pitting or damage. Inspect cover for grooving or wear. Replace worn or damaged components.

Measure outer rotor-to-body clearance. Replace pump assembly if clearance exceeds specification. Measure clearance between rotors. See **Fig. 31**. Replace shaft and both rotors if clearance exceeds specification.

Install rotors in pump body. Position straightedge across pump body. Using feeler gauge, measure clearance between rotors and straightedge. Pump cover wear is measured using a straightedge and feeler gauge. Replace pump if clearance exceeds specification.

Fig. 30: Typical Rotor Type Oil Pump

Fig. 31: Measuring Rotor Clearance

GEAR TYPE

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.**

Mark oil pump gear location before removing. See **Fig. 32**. Remove gears from pump body. Inspect gears for pitting or damage. Inspect cover for grooving or wear. Measure gear diameter and length. Measure gear housing cavity depth and diameter. See **Fig. 33**. Replace worn or damaged components.

Pump cover wear is measured using a straightedge and feeler gauge. Replace pump or components if warpage or wear exceeds specification, or mating surface of pump cover is scratched or grooved.

Fig. 32: Typical Gear Type Oil Pump

95B14663

Fig. 33: Measuring Oil Pump Gear Cavity

BREAK-IN PROCEDURE

*** PLEASE READ THIS FIRST ***

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

ENGINE PRE-OILING

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Pre-oil engine prior to operation to prevent engine damage. Lightly oiled oil pump will cavitate unless oil pump cavities are filled with engine oil or petroleum jelly.

Engine pre-oiling can be done using pressure oiler (if available). Connect pressure oiler to cylinder block oil passage such as oil pressure sending unit. Operate pressure oiler long enough to ensure correct amount of oil has filled crankcase. Check oil level while pre-oiling.

If pressure oiler is not available, disconnect ignition system. Remove oil pressure sending unit and replace with oil pressure test gauge. Using starter motor, rotate engine starter until gauge shows normal oil pressure for several seconds. DO NOT crank engine for more than 30 seconds to avoid starter motor damage. Ensure oil pressure has reached the most distant point from the oil pump.

NOTE: If new lifters or camshaft are installed, some manufacturers require that a crankcase conditioner be added to engine oil. The engine should be operated for specified amount of time to aid in lifter break-in procedure.

INITIAL START-UP

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Start engine and operate engine at low speed while checking for coolant, fuel and oil leaks. Stop engine. Recheck coolant and oil level. Adjust if necessary.

CAMSHAFT

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Break-in procedure is required when new or reground camshaft has been installed. Operate and maintain engine speed between 1500-2500 RPM for approximately 30 minutes. Procedure may vary due to manufacturer's recommendations.

PISTON RINGS

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Piston rings require a break-in procedure to ensure seating of rings to cylinder walls. Serious damage may occur to rings if correct procedures are not followed.

Extremely high piston ring temperatures are obtained during break-in process. If rings are exposed to excessively high RPM or high cylinder pressures, ring damage can occur. Follow piston ring manufacturer's recommended break-in procedure.

FINAL ADJUSTMENTS

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Check or adjust ignition timing and dwell (if applicable). Adjust valves (if necessary). Adjust idle speed and mixture. Retighten cylinder heads (if required). If cylinder head or block is aluminum, retighten bolts when engine is cold. Follow the engine manufacturer's recommended break-in procedure and maintenance schedule for new engines.

NOTE: Some manufacturers require that head bolts be retightened after specified amount of operation. This must be done to prevent head gasket failure.

GENERAL INFORMATION

Engine Performance Diagnostic Routine Outline

*** PLEASE READ THIS FIRST ***

NOTE: This article is generic in nature and all information does not apply to all vehicles. For vehicle specific information, see the appropriate articles in the **ENGINE PERFORMANCE** category.

WHERE DOES DRIVEABILITY DIAGNOSIS START?

PERFORM BASIC INSPECTION

NOTE: This article is generic in nature and all information does not apply to all vehicles. For vehicle specific information, see the appropriate articles in the **ENGINE PERFORMANCE** category.

1. Verify Customer Complaint
2. Check for Relevant Technical Service Bulletins (TSBs)
3. Perform Visual Inspection (**See Basic Diagnostic Procedures**)
4. Test Engine Sub-Systems (**See Basic Diagnostic Procedures**)
 - Mechanical Condition (Compression)
 - Ignition Output
 - Fuel Delivery
5. Check Air Induction System For Leaks
6. Check & Adjust Basic Engine Settings(**See On-Vehicle Adjustments**)
 - Ignition Timing
 - Idle Speed

CHECK FOR TROUBLE CODES

NOTE: This article is generic in nature and all information does not apply to all vehicles. For vehicle specific information, see the appropriate articles in the **ENGINE PERFORMANCE** category.

1. Check for Diagnostic Trouble Codes (DTCs).(See **Self-Diagnostics**)
2. Repair cause of DTCs.
3. Clear PCM memory and repeat self-test.

DIAGNOSE SYMPTOM

NOTE: This article is generic in nature and all information does not apply to all vehicles. For vehicle specific information, see the appropriate articles in the **ENGINE PERFORMANCE** category.

1. If no self-diagnostics available, or no trouble codes present, identify symptom.
2. See trouble shooting procedure to identify problem. (See **Trouble Shooting - No Codes**)

TEST SYSTEM

NOTE: This article is generic in nature and all information does not apply to all vehicles. For vehicle specific information, see the appropriate articles in the **ENGINE PERFORMANCE** category.

1. Perform required tests. (See **Systems & Component Testing**)
2. Verify complaint is repaired.

ACCESSORIES & EQUIPMENT

Exterior Trim

SPECIFICATIONS

FASTENER TIGHTENING SPECIFICATIONS

Application	Specification	
	Metric	English
Front Side Door Window Frame Rear Cover Fastener	2	18 lb ft
Rear Side Door Window Frame Front Cover Fastener	2	18 lb ft

REPAIR INSTRUCTIONS

BODY PANEL PAINT PROTECTOR REPLACEMENT (VGC)

1. The paint protective film and vehicle surface temperature should be 13-32°C (55-90°F) for best results.
2. Automatic car washes should be avoided for at least 24 hours after the paint protective film application.
3. Wipe the vehicle surface with isopropyl alcohol or flash naptha at the application area.
4. Dry the surface with a clean lint-free cloth.
5. Create a mixture of 25 percent isopropyl alcohol and 75 percent water and two drops of baby shampoo per 16 oz of fluid mixture.
6. Remove the backing liner from the protective film patch.
7. Use the solution to liberally spray the adhesive side of the protective patch, the mounting location along with your hands.
8. Position the paint protective film patch to the desired location on the vehicle.
9. Spray the surface of the film with the alcohol, water and soap solution.
10. Using a dampened squeegee, start at the center of the protective patch, working outward in order to remove the air and solution from under the protective patch.
11. Release any air bubbles with a pin.
12. Dry the surface with a clean, lint-free cotton cloth.

REAR CLOSURE CENTER APPLIQUE REPLACEMENT

Fig. 1: Rear Closure Center Applique

 Courtesy of GENERAL MOTORS COMPANY

Front Grille Emblem/Nameplate Replacement

Callout	Component Name
Preliminary Procedure	
Remove the front bumper fascia. Refer to <u>Front Bumper Fascia Replacement</u> .	
1	Front Grille Emblem Procedure Using a suitable flat bladed tool release the 4 locking tabs and pull the front grille emblem forward.

FRONT GRILLE REPLACEMENT

Fig. 8: Front Grille
Courtesy of GENERAL MOTORS COMPANY

Front Grille Replacement

Callout	Component Name
Preliminary Procedure Remove the front bumper fascia. Refer to <u>Front Bumper Fascia Replacement</u> .	
1	Radiator Upper Grille Procedure Release the locking tabs from the front grille and pull from the front bumper fascia.

FRONT LOWER GRILLE REPLACEMENT

Fig. 9: Front Lower Grille

Courtesy of GENERAL MOTORS COMPANY

Front Lower Grille Replacement

Callout	Component Name
Preliminary Procedure	
Remove the front bumper fascia. Refer to <u>Front Bumper Fascia Replacement</u> .	
1	Front Lower Grille Procedure Release the locking tabs on the front lower grille and pull from the front bumper fascia.

FRONT BUMPER FASCIA OUTER INSERT MOLDING REPLACEMENT (GS)

Fig. 10: Front Bumper Fascia Outer Insert Molding (GS)

Courtesy of GENERAL MOTORS COMPANY

Front Bumper Fascia Outer Insert Molding Replacement (GS)

Callout	Component Name
Preliminary Procedure	
Remove the front bumper fascia. Refer to <u>Front Bumper Fascia Replacement</u> .	
1	Front Bumper Fascia Outer Insert Molding Procedure Release the locking tabs on the front bumper fascia outer insert molding and pull from the front bumper fascia.

FRONT BUMPER FASCIA OUTER INSERT MOLDING REPLACEMENT

Fig. 11: Front Bumper Fascia Outer Insert Molding
Courtesy of GENERAL MOTORS COMPANY

Front Bumper Fascia Outer Insert Molding Replacement

Callout	Component Name
Preliminary Procedure Remove the front bumper fascia outer insert. Refer to <u>Front Bumper Fascia Outer Insert Replacement.</u>	
1	Front Bumper Fascia Outer Insert Molding CAUTION: Refer to <u>Exterior Trim Emblem Removal Caution .</u> Procedure Release the 6 locking tabs on the front bumper fascia outer insert molding and pull from the front bumper fascia outer insert.

FRONT BUMPER FASCIA UPPER MOLDING REPLACEMENT

Fig. 12: Front Bumper Fascia Upper Molding
 Courtesy of GENERAL MOTORS COMPANY

Front Bumper Fascia Upper Molding Replacement

Callout	Component Name
Preliminary Procedure Remove the front bumper fascia. Refer to Front Bumper Fascia Replacement .	
1	Front Bumper Fascia Upper Molding Procedure Release the locking tabs on the front bumper fascia upper molding and pull from the front bumper fascia.

ROCKER PANEL MOLDING REPLACEMENT

Fig. 13: Rocker Panel Molding & Mounting Components
 Courtesy of GENERAL MOTORS COMPANY

Rocker Panel Molding Replacement

Callout	Component Name
1	Rocker Panel Finish Panel Rivet (Qty: 5) CAUTION: Refer to <u>Eye Protection Warning</u> . CAUTION: Refer to <u>Fastener Caution</u> .
2	Rocker Panel Molding Bracket (Qty: 5)
3	Rocker Panel Molding Bolt (Qty: 5) CAUTION: Refer to <u>Fastener Caution</u> .
	Rocker Panel Molding Procedure 1. The part and surface should be 21°C (70°F) prior to installation. The vehicle should remain 21°C (70°F) for one hour after assembly to allow adhesive to develop sufficient bond strength.

4

2. Using a heat gun in a circular motion, warm the rocker panel molding in order to help remove the adhesive.
3. From the bottom edge firmly pull out and up to remove the rocker panel molding from the rocker panel. Use a flat bladed plastic tool to assist in removal.
4. Clean and prime the rocker panel and the new rocker panel molding with a suitable cleaner and primer before installing.
5. Use an appropriate tape to hold rocker panel molding in position while adhesive cures.

REAR END SPOILER REPLACEMENT

Fig. 14: Rear End Spoiler

Rear End Spoiler Replacement

Callout	Component Name
	Rear End Spoiler
	Procedure <ol style="list-style-type: none"> 1. The part and surface should be 21°C (70°F) prior to installation. The vehicle should remain 21°C (70°F) for one hour after assembly to allow adhesive to develop sufficient bond strength. 2. Outline the rear end spoiler with masking tape for alignment when reinstalling.

1	<ol style="list-style-type: none"> 3. Use a heat gun in a circular motion to remove the rear end spoiler. Use a flat bladed plastic tool to assist in removal. 4. Clean any left over adhesive residue with a 50/50 mixture by volume of isopropyl alcohol and clean drinkable water. Wipe the surface dry with a clean lint-free towel. 5. When removing protective liners from the adhesive tape, be careful not to touch tape with hands and do not allow tape to come in contact with dirt or any foreign matter prior to adhesion. 6. Using the palm of the hand apply equal pressure to the rear end spoiler to ensure full adhesion to the rear compartment lid.

DESCRIPTION AND OPERATION

ADHESIVE RETAINED MOLDING AND EMBLEM DESCRIPTION

CAUTION: Use of harsh chemicals when cleaning can damage exterior lamps. Suggested cleaners are a mild soap and water, or Varnish Makers and Painters (VM&P) Naptha. VM&P Naptha is a specific type of naptha and should not be substituted by any other naptha.

The following components are attached to the body panels with adhesive tape.

The name plates.

In order to ensure a good replacement of new or old moldings, emblems and name plates, take the following precautions:

- Warm the panel surface to between 21-32°C (70-90°F).
- Clean the panels.
- Remove any wax or oily film.

The following methods for attachment are listed:

Replacement nameplates.

WATER MANAGEMENT DESCRIPTION AND OPERATION

Plenum Water Flow Direction and Cleaning

Fig. 15: Plenum Water Flow Direction
 Courtesy of GENERAL MOTORS COMPANY

A large percentage of water will flow off the windshield area into the plenum chamber drain system and then down the outside on the plenum to the underside of the vehicle. To ensure that the plenum chamber water management system performs properly, the plenum water deflector, plenum chamber, and drains must not be blocked with debris.

In the graphic the arrows show the water flow direction in the plenum chamber and drains system.

Plenum Chamber and Drain Valve-Cleaning

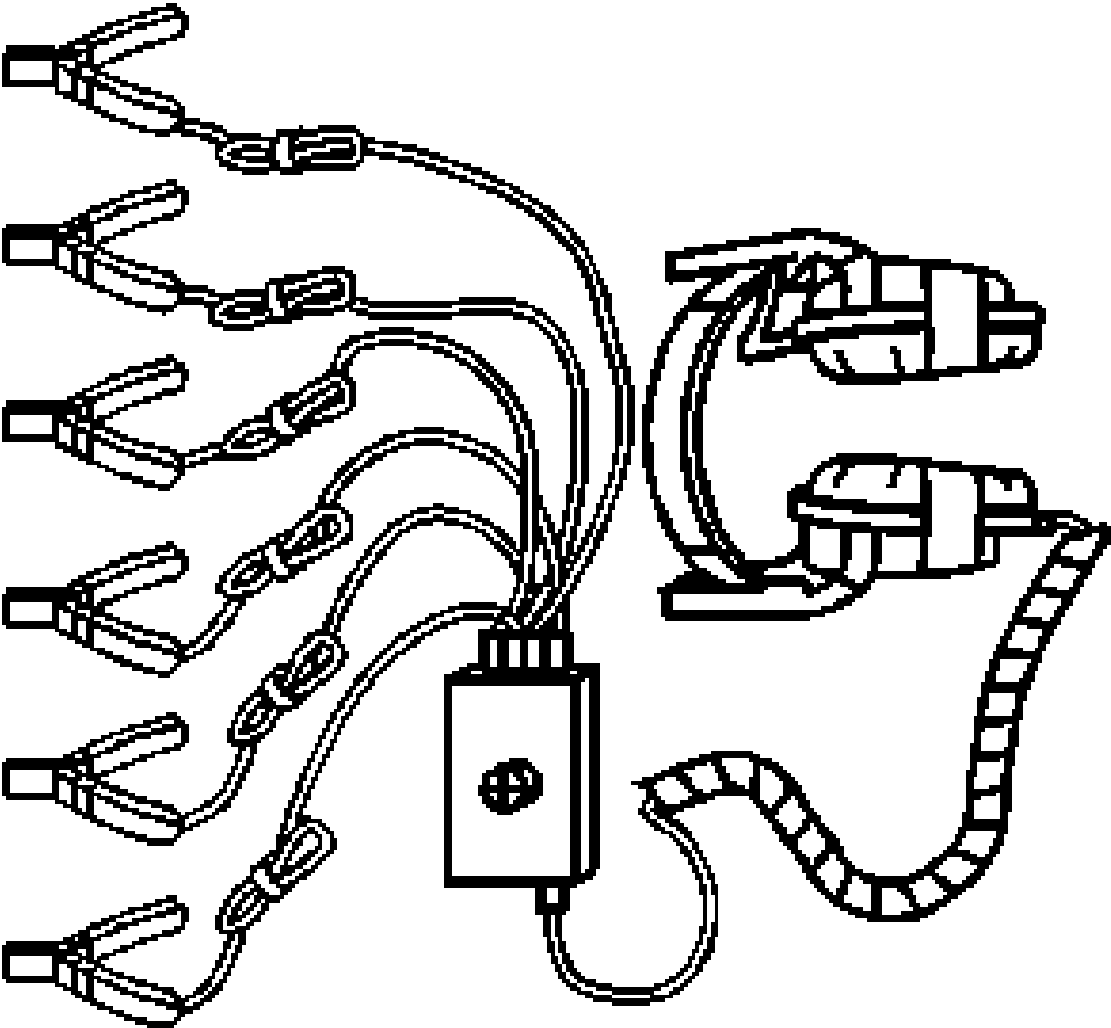

The plenum chamber is located in front of the windshield and below the plenum water deflector.

1. Remove the air inlet panel. Refer to [**Air Inlet Grille Panel Replacement**](#) .
2. Clean the plenum chamber, drains and the plenum water deflector of debris blockage.
3. Flush the plenum chamber, drains and the plenum water deflector with clean water.
4. Install the air inlet panel. Refer to [**Air Inlet Grille Panel Replacement**](#) .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control	B0283 02	B0283 05	B0283 05	-
Ground	-	B0283 05	-	-

Circuit/System Description

When the rear defogger switch is pressed, the HVAC control module will supply voltage to the relay coil. Battery positive voltage is supplied at all times to the relay switched input and the relay coil is always grounded. This allows battery positive voltage from the relay switched input to flow through the switch contacts and out the relay switched output to the rear window defogger grid.

Conditions for Running the DTC

Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

B0283 02

The HVAC control module detects a short to ground in the relay coil control circuit.

B0283 05

The HVAC control module detects a short to voltage or an open/high resistance in the relay coil control circuit or an open/high resistance in the relay coil ground circuit

Action Taken When the DTC Sets

B0283 02

The rear window defogger will be inoperative.

B0283 05

The rear window defogger will be inoperative or continuously active depending upon the fault.

Conditions for Clearing the DTC

- The DTC will be current for as long as the fault is present.
- When the fault is no longer present, the DTC will be a history DTC.
- A history DTC will clear after 50 ignition cycles.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Engine Running.
2. Verify the E18 Rear Defogger Grid turns ON and OFF when commanding the Rear Defogger On and Off with a scan tool.
 - **If the E18 Rear Defogger Grid does not turn ON or OFF**

Refer to Circuit/System Testing

- **If the E18 Rear Defogger Grid turns ON and OFF**

3. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the KR5 Rear Defogger Relay. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal 85 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Connect a test lamp between the control circuit terminal 86 and the ground circuit terminal 85, Engine Running.
4. Verify the test lamp turns ON and OFF when commanding the Rear Defogger On and Off with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the K33 HVAC Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K33 HVAC Control Module.
 - **If the test lamp is always ON**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the K33 HVAC Control Module, Engine Running.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K33 HVAC Control Module.
 - **If the test lamp turns ON and OFF**
5. Test or replace the KR5 Rear Defogger Relay.

Component Testing

Relay Test

1. Ignition OFF, disconnect the KR5 Rear Defogger Relay.
2. Test for 60-180 ohms between terminals 85 and 86.
 - **If less than 60 ohms or greater than 180 ohms**

Replace the KR5 Rear Defogger Relay.

- **If between 60-180 ohms**

3. Test for infinite resistance between the terminals listed below:

- 30 and 86
- 30 and 87
- 30 and 85
- 85 and 87

- **If less than infinite resistance**

Replace the KR5 Rear Defogger Relay.

- **If infinite resistance**

4. Install a 3 A fused jumper wire between relay terminal 85 and 12 V. Install a jumper wire between relay terminal 86 and ground.

5. Test for less than 2 ohms between terminals 30 and 87.

- **If 2 ohms or greater**

Replace the KR5 Rear Defogger Relay.

- **If less than 2 ohms**

6. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Relay Replacement (Within an Electrical Center)** , **Relay Replacement (Attached to Wire Harness)**
- **Control Module References** for HVAC control module replacement, setup and programming

DTC B316B, B317A, B318A, OR B319A: REAR DEFROST CIRCUIT

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Driver Window Motor Control	B316B 02	1	1	-
Passenger Window Motor Control	B317A 02	2	2	-
1. Driver Window Malfunction 2. Passenger Window Malfunction				

Circuit/System Description

The driver and passenger window motors supply 12V signal circuits to their respective window switches, when a window switch has been activated, a switch closes providing a ground to the appropriate signal circuit causing the voltage to drop to 0V. The window motor will detect the voltage drop in the signal circuit and will command the window to move in the desired direction.

The driver window master control switch also contains control switches for the passenger, left rear and right rear window functions. When a window switch is pressed, a serial data message is sent to the body control module (BCM). The BCM examines the request and checks for messages from other power window motors that may prohibit window movement. If no prohibitive messages have been received, the BCM will send a serial data message to the passenger window motor or to the appropriate rear window switch which will perform the command as requested.

Conditions for Running the DTC

Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

B316B 00

The BCM has detected a control switch on the driver window master switch has been active for greater than 60 seconds.

B316B 02

The driver window motor has detected the driver window master switch is active for greater than 60 seconds.

B317A 02

The passenger window motor has detected the passenger window switch is active for greater than 60 seconds.

B318A 02

The BCM has detected the left rear window switch is active for greater than 60 seconds

B319A 02

The BCM has detected the right rear window switch is active for greater than 60 seconds

B316B 39

The driver window motor has detected an internal failure within the driver window switch

B317A 39

The passenger window motor has detected an internal failure within the passenger window switch

B318A 39

The BCM has detected an internal failure within the left rear window switch

B319A 39

The BCM has detected an internal failure within the right rear window switch

Action Taken When the DTC Sets

The affected power window will malfunction.

Conditions for Clearing the DTC**B316B 00, B316B 02, B317A 02, B318A 02, B319A 02**

- The DTC will be current for as long as the fault is present.
- The DTC will change from current to history when the fault is no longer present.
- A history DTC will clear after 100 consecutive ignition cycles if the condition for the malfunction is no longer present.

B316B 39, B317A 39, B318A 39, B319A 39

If the DTC is current, the affected window switch must be replaced before the DTC can be cleared.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool parameters listed below change when pressing and pulling the switches for the passenger, left rear and right rear window on the driver window master control;
 - Left Rear Main Control Down Switch - Inactive and Active
 - Left Rear Main Control Express Switch - Inactive and Active
 - Left Rear Main Control Up Switch - Inactive and Active
 - Right Rear Main Control Down Switch - Inactive and Active
 - Right Rear Main Control Express Switch - Inactive and Active
 - Right Rear Main Control Up Switch - Inactive and Active
 - Front Passenger Main Control Down Switch - Inactive and Active
 - Front Passenger Main Control Express Switch - Inactive and Active
 - Front Passenger Main Control Up Switch - Inactive and Active
 - **If any parameter does not change**

Replace the S79D Window Switch-Driver.

- **If the parameters change**

3. Verify the scan tool parameters listed below change when pressing and pulling the driver window control switch on the driver window master control:

- Driver Window Main Control Down Switch - Inactive and Active
- Driver Window Main Control Up Switch - Inactive and Active
- Driver Window Main Control Express Down Switch - Inactive and Active
- Driver Window Main Control Express Up Switch - Inactive and Active

- **If any parameter does not change**

Refer to Circuit/System Testing - Driver Window Switch Malfunction.

- **If all the parameters change**

4. Verify the scan tool Passenger Window Switch at Door parameters change to Inactive, Up, Express Up, Down, Express Down when pressing and pulling the S79P Window Switch-Passenger.

- **If any parameter does not change**

Refer to Circuit/System Testing - Passenger Window Switch Malfunction.

- **If all the parameters change**

5. Verify the scan tool parameters listed below change when pressing and pulling the S79LR Window Switch-Left Rear and the S79RR Window Switch-Right Rear.

- Left Rear Window Switch at Door - Inactive, Up, Express Up, Down, Express Down
- Right Rear Window Switch at Door - Inactive, Up, Express Up, Down, Express Down

- **If any parameter does not change**

Test or replace the appropriate S79 Window Switch-Rear.

- **If all the parameters change**

6. All OK.

Circuit/System Testing

Driver Window Switch Malfunction

1. Ignition OFF, disconnect the harness connector at the S79D Window Switch-Driver, ignition ON
2. Verify the scan tool Driver Window Main Control Down Switch parameter is Inactive.

- **If not Inactive**

1. Ignition OFF, disconnect the harness connector at the M74D Window Motor-Driver.
2. Test for infinite resistance between the signal circuit terminal 3 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the M74D Window Motor-Driver.

- **If Inactive**

3. Install a 3 A fused jumper wire between the signal circuit terminal 3 and ground.
4. Verify the scan tool Driver Window Main Control Down Switch parameter is Active
 - **If not Active**
 1. Ignition OFF, remove the 3 A fused jumper wire, disconnect the harness connector at the M74D Window Motor-Driver, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Ignition OFF, test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the M74D Window Motor-Driver.
 - **If Active**
5. Verify the scan tool Driver Window Main Control Up Switch parameter is Inactive.
 - **If not Inactive**
 1. Ignition OFF, disconnect the harness connector at the M74D Window Motor-Driver.
 2. Test for infinite resistance between the signal circuit terminal 6 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the M74D Window Motor-Driver.
 - **If Inactive**
6. Install a 3 A fused jumper wire between the signal circuit terminal 6 and ground.
7. Verify the scan tool Driver Window Main Control Up Switch parameter is Active
 - **If not Active**
 1. Ignition OFF, remove the 3 A fused jumper wire, disconnect the harness connector at the M74D Window Motor-Driver, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Ignition OFF, test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the M74D Window Motor-Driver.
 - **If Active**
8. Verify the scan tool Driver Window Main Control Express Switch parameter is Inactive.
 - **If not Inactive**
 1. Ignition OFF, disconnect the harness connector at the M74D Window Motor-Driver.
 2. Test for infinite resistance between the signal circuit terminal 2 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the M74D Window Motor-Driver.
 - **If Inactive**

9. Install a 3 A fused jumper wire between the signal circuit terminal 2 and ground.
10. Verify the scan tool Driver Window Main Control Express Switch parameter is Active
 - **If not Active**
 1. Ignition OFF, remove the 3 A fused jumper wire, disconnect the harness connector at the M74D Window Motor-Driver, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Ignition OFF, test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the M74D Window Motor-Driver.
 - **If Active**
11. Test or replace the S79D Window Switch-Driver.

Passenger Window Switch Malfunction

1. Ignition OFF, disconnect the harness connector at the S79P Window Switch-Passenger, ignition ON
2. Verify the appropriate scan tool Passenger Window Switch at Door parameter is Inactive.
 - **If not Inactive**
 1. Ignition OFF, disconnect the harness connector at the M74P Window Motor-Passenger.
 2. Test for infinite resistance between the signal circuit terminal listed below and ground:
 - S79P Window Switch-Passenger - signal circuit terminal 7
 - S79P Window Switch-Passenger - signal circuit terminal 8
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the M74P Window Motor-Passenger.
 - **If Inactive**
3. Install a 3 A fused jumper wire between the signal circuit terminal 8 and ground:
4. Verify the scan tool Passenger Window Switch at Door parameter is Up
 - **If Inactive**
 1. Ignition OFF, remove the 3 A fused jumper wire, disconnect the harness connector at the M74P Window Motor-Passenger, ignition ON.
 2. Test for less than 1 V between the circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Ignition OFF, test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the M74P Window Motor-Passenger.
 - **If Up**
5. Install a 3 A fused jumper wire between the signal circuit terminal 7 and ground.

6. Verify the scan tool Passenger Window Switch at Door parameter is Down
 - **If Inactive**
 1. Ignition OFF, remove the 3 A fused jumper wire, disconnect the harness connector at the M74P Window Motor-Passenger, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Ignition OFF, test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the M74P Window Motor-Passenger.
 - **If Down**
7. Test for greater than 10 V between the signal circuit terminal 6 and ground
 - **If less than 10 V**
 1. Ignition OFF, disconnect the harness connector at the M74P Window Motor-Passenger.
 2. Test for infinite resistance between the signal circuit 5 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance on the circuit.
 - If less than 2 ohms, replace the M74P Window Motor-Passenger.
 - **If greater than 10 V**
8. Test or replace the S79P Window Switch-Passenger.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Front Side Door Window Switch Replacement**
- **Rear Side Door Window Switch Replacement**
- **Front Side Door Window Regulator Motor Replacement**

DTC B3205 OR B3210: WINDOW MOTOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B3205

Driver Window Motor

DTC B3210

Passenger Window Motor

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

The body control module (BCM) monitors, receives and transmits serial data messages to the driver and passenger window motors. When a window switch has been activated on the driver window switch, a signal is sent to the BCM which sends a signal to the appropriate window motor and the window motor will move in the direction commanded.

Conditions for Running the DTC

- The ignition switch is in the ON position.
- Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

B3205 00, B3210 00

The BCM has detected that the compatibility code stored in the affected window motor does not match the compatibility code stored in the BCM.

B3205 39, B3210 39

An internal malfunction has been detected by the BCM in the power window motor while commanding the window UP or DOWN.

B3205 42, B3210 42

The BCM will automatically attempt to download the calibration program into the appropriate window motor (As will occur when the window motor has been replaced), if the first calibration program fails to load, the BCM will attempt to download the calibration program a second time. If this download fails, the BCM will set appropriate DTC.

B3205 4B, B3210 4B

The BCM detects that a window motor is "not normalized" which will occur under the following conditions:

- When the battery has been disconnected
- When the battery has been replaced

- When the door wiring harness has been disconnected
- When the window motor has been disconnected.

Action Taken When the DTC Sets

B3205 00, B3205 39, B3205 42, B3210 00, B3210 39, B3210 42

The affected motor will be inoperative.

B3205 4B, B3210 4B

The affected motor will not perform the express up or express down functions and the driver information center will display Open, then Close Driver Window or will display Open, then Close Passenger Window.

Conditions for Clearing the DTC

B3205 00, B3210 00

Installing a compatible window motor for that specific make and model vehicle.

B3205 39, B3210 39

The appropriate window motor must be replaced before the DTC can be cleared.

B3205 42, B3210 42

The appropriate window motor must be replaced before the DTC can be cleared.

B3205 4B, B3210 4B

The appropriate window motor must be normalized before the DTC can be cleared.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the driver and passenger functions while commanding the Driver Window Motor or Passenger Window Motor Up and Down with a scan tool.
 - **If the Up and Down does not work**

Replace the appropriate M74 Window Motor .
 - **If the Up and Down works**
3. Verify the driver and passenger window performs the Express Up and Express Down functions with the driver window switch.
 - **If a window does not Express Up and Express Down**

Normalize the window motor, refer to **Window Motor Programming - Express Function**.
 - **If the window performs the Express Up and Express Down functions**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Front Side Door Window Regulator Replacement

SYMPTOMS - FIXED AND MOVEABLE WINDOWS

Important Preliminary Checks Before Starting:

1. Perform the **Diagnostic System Check - Vehicle** before using the symptom tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data link.
2. Review the power window system operation or rear window defogger system operation in order to familiarize yourself with the system functions. Refer to the following:

- **Rear Window Defogger Description and Operation**
- **Power Windows Description and Operation**

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the rear window defogger. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

NOTE:

- **Inspect for proper installation of electrical components if an intermittent condition exists. Inspect for aftermarket theft deterrent devices, lights, and cellular phones. Ensure that no aftermarket equipment is connected to the class 2 circuit. If you can not locate an intermittent condition, a cellular phone signal may cause the condition. Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to Testing for Intermittent Conditions and Poor Connections .**
- **The problem may or may not turn ON the SERVICE VEHICLE SOON indicator or store a DTC. Do not use the symptom tables to diagnose intermittent conditions. The malfunction must be present in order to locate the problem.**

Poor electrical connections or wiring cause most intermittent conditions. Perform a careful visual/physical check for the following conditions:

- Poor mating of the connector halves or a terminal not fully seated in the connector body
- An improperly formed or damaged terminal
- Reform or replace connector terminals in the problem circuit in order to ensure proper contact tension.
- Poor terminal to wire connection requires removing the terminal from the connector body in order to perform the check.

Use a scan tool in order to help detect intermittent conditions. The scan tool has several features that can be used to locate an intermittent condition. The snapshot feature can capture and store data parameters within the scan tool when the malfunction occurs. This information can then be reviewed in order to see what caused the malfunction.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Rear Window Defogger Malfunction**
- **Power Windows Malfunction**

DEFOGGER GRID LINES DIAGNOSIS

NOTE: If it has been observed during use that a grid line is inoperative, the following procedure can be used to find the break. If none of the grid lines is operating, a full system diagnosis should be completed before attempting to test the grid lines

NOTE: Lightly touch the grid lines when testing with the test lamp. If the test lamp point is scraped through the grid line it can cause an open in the circuit

1. Engine running, command the Rear Defogger ON with a scan tool.
2. Verify that a test lamp illuminates between each rear window defogger grid line and ground. The test lamp should be off when testing at the ground side of the grid and get brighter as the test lamp moves closer to the voltage supply side of the grid. The test lamp should be dim when testing each grid line in the middle

- **If the test lamp remains bright at the middle of the grid line.**

The grid line is open between the test point and the ground side of the grid.

Replace the rear window

- **If the test lamp remains off at the middle of the grid line.**

The grid line is open between the test point and the voltage supply side of the grid.

Replace the rear window

- **If the test lamp remains dim at the middle of each grid line.**

3. All OK

REAR WINDOW DEFOGGER MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Relay B+	1	1	-	-
Relay Control	B0283 02	B0283 05	B0283 05	-
Rear Defogger Grid Control	1	1	2	-

Relay Ground	-	B0283 05	-	-
Rear Defogger Grid Ground	-	1	-	-
1. Rear Defogger Inoperative 2. Rear Defogger Always ON				

Circuit/System Description

When the HVAC control module receives a rear window defog request from the HVAC controls, the HVAC control module will supply voltage to the relay coil. Battery positive voltage is supplied at all times to the relay switched input and the relay coil is always grounded. This allows battery positive voltage from the relay switched input through the switch contacts and out the relay switched output to the rear window defogger grid.

Diagnostic Aids

The rear window defogger indicator will still function when the rear defogger switch is pressed, but any of the following conditions may cause the rear window defogger grid not to function:

- The battery state of charge is out of range causing the HVAC control module to suspend the rear window defogger operation.
- The Remote Start Enable ambient temperature is greater than 5°C (40°F).

- **Wiring Repairs**

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Engine running.
2. Verify the scan tool Rear Defogger Switch parameter changes between On and Off when pressing the rear window defogger switch.
 - **If the parameter does not change between On and Off**

Replace the A26 HVAC Controls.
 - **If the parameter changes between On and Off**
3. Verify the E18 Rear Defogger Grid turns ON and OFF when commanding the Rear Defogger On and Off with a scan tool.
 - **If the E18 Rear Defogger Grid does not turn ON and OFF**

Refer to Circuit/System Testing
 - **If the E18 Rear Defogger Grid turns ON and OFF**
4. Verify the rear defogger indicator turns ON and OFF when pressing the rear window defogger switch.
 - **If the rear defogger indicator does not turn ON and OFF**

Replace the A26 HVAC Controls.
 - **If the rear defogger indicator turns ON and OFF**
5. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the KR5 Rear Defogger Relay. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal 85 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Engine Running.
4. Verify a test lamp illuminates between the B+ circuit terminal 30 and ground.
 - **If the test lamp does not illuminate**
 - Replace the X50A Fuse Block-Underhood
 - **If the test lamp illuminates**
5. Connect a test lamp between the control circuit terminal 86 and the ground circuit terminal 85.

6. Verify the test lamp turns ON and OFF when commanding the Rear Defogger On and Off with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the K33 HVAC Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K33 HVAC Control Module.
 - **If the test lamp is always ON**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the K33 HVAC Control Module, ignition ON.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K33 HVAC Control Module.
 - **If the test lamp turns ON and OFF**
7. Verify that a test lamp does not illuminate between the control circuit terminal 87 and ground.
 - **If the test lamp illuminates**

Repair the short to voltage on the control circuit

- **If the test lamp does not illuminate**
8. Ignition OFF and all vehicle systems OFF, disconnect the X2 harness connector at the E18 Rear Defogger Grid. It may take up to 2 minutes for all vehicle systems to power down.
 9. Test for less than 10 ohms between the ground circuit terminal A and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
 10. Connect the X2 harness connector at the E18 Rear Defogger Grid.
 11. Ignition ON, connect a 40 A fused jumper wire between the B+ circuit terminal 30 and the control circuit terminal 87.
 12. Verify the E18 Rear Defogger Grid is activated.
 - **If the E18 Rear Defogger Grid does not activate**
 1. Ignition OFF, remove the fused jumper wire, disconnect the X1 harness connector at the E18 Rear Defogger Grid.

2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the E18 Rear Defogger Grid.
 - **If the E18 Rear Defogger Grid activates**
13. Test or replace the KR5 Rear Defogger Relay.

Component Testing

Relay Test

1. Ignition OFF, disconnect the KR5 Rear Defogger Relay.
2. Test for 60-180 ohms between terminals 85 and 86.
 - **If less than 60 ohms or greater than 180 ohms**

Replace the KR5 Rear Defogger Relay.
 - **If between 60-180 ohms**
3. Test for infinite resistance between the terminals listed below:
 - 30 and 86
 - 30 and 87
 - 30 and 85
 - 85 and 87
 - **If less than infinite resistance**

Replace the KR5 Rear Defogger Relay.
 - **If infinite resistance**
4. Install a 3 A fused jumper wire between relay terminal 85 and 12 V. Install a jumper wire between relay terminal 86 and ground.
5. Test for less than 2 ohms between terminals 30 and 87.
 - **If 2 ohms or greater**

Replace the KR5 Rear Defogger Relay.
 - **If less than 2 ohms**
6. All OK

Rear Defogger Grid Test

NOTE: **Lightly touch the grid lines when testing with the test lamp. If the test lamp point is scraped through the grid line it can cause an open in the circuit**

1. Engine running, command the Rear Defogger ON with a scan tool.
2. Verify that a test lamp illuminates between each rear window defogger grid line and ground. The test lamp should be off when testing at the ground side of the grid and get brighter as the test lamp moves closer to the voltage supply side of the grid. The test lamp should be dim when testing each grid line in the middle

- **If the test lamp remains bright at the middle of the grid line.**

The grid line is open between the test point and the ground side of the grid.

Replace the rear window

- **If the test lamp remains off at the middle of the grid line.**

The grid line is open between the test point and the voltage supply side of the grid.

Replace the rear window

- **If the test lamp remains dim at the middle of each grid line.**

3. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Rear Window Replacement**
- **Relay Replacement (Within an Electrical Center)** , **Relay Replacement (Attached to Wire Harness)**
- **Control Module References** for HVAC control module and HVAC controls replacement, setup, and programming

POWER WINDOWS MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Right Rear Window Motor Control	4	4	4	-
1. Driver Window Motor Inoperative 2. Passenger Window Motor Inoperative 3. Left Rear Window Inoperative 4. Right Rear Window Inoperative				

Circuit/System Description

The driver and passenger window motors supply 12V signal circuits to their respective window switches, when a window switch has been activated, a switch closes providing a ground to the appropriate signal circuit causing the voltage to drop to 0V. The window motor will detect the voltage drop in the signal circuit and will command the window to move in the desired direction.

The driver window master control switch also contains control switches for the passenger, left rear and right rear window functions. When a window switch is pressed, a serial data message is sent to the body control module (BCM). The BCM examines the request and checks for messages from other power window motors that may prohibit window movement. If no prohibitive messages have been received, the BCM will send a serial data message to the passenger window motor or to the appropriate rear window switch which will perform the command as requested.

Diagnostic Aids

The loss of the express up and express down functions for the driver and passenger windows may have occurred for the following reasons:

- The battery was disconnected
- The battery was replaced
- A door wiring harness was disconnected
- A window motor was disconnected or replaced

The window motors will need to be normalized in order to restore the express functions, refer to **Window Motor Programming - Express Function** for the proper procedure.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the driver window moves while commanding the window UP and DOWN with a scan tool.
 - **If the window does not move UP and DOWN as commanded**

Refer to Circuit/System Testing - Driver/Passenger Window Motor Malfunction.

- **If the window moves UP and DOWN as commanded**
3. Verify the driver window moves while commanding the window UP, express UP, DOWN and express DOWN with the S79D Window Switch-Driver.

- **If the driver window does not move UP or DOWN as commanded**

Refer to Circuit/System Testing - Driver Window Switch Malfunction.

- **If the driver window does not express UP or express DOWN**

Normalize the driver window motor, refer to **Window Motor Programming - Express Function.**

- **If after normalization, the driver window does not express UP or express DOWN**

Refer to Circuit/System Testing - Driver Window Switch Malfunction.

- **If the driver window moves UP, express UP, DOWN and express DOWN as commanded**
4. Verify the scan tool parameters listed below change when pressing and pulling the switches for the passenger, left rear and right rear window on the driver window master control;

- Left Rear Main Control Down Switch - Inactive and Active
- Left Rear Main Control Express Switch - Inactive and Active
- Left Rear Main Control Up Switch - Inactive and Active
- Right Rear Main Control Down Switch - Inactive and Active
- Right Rear Main Control Express Switch - Inactive and Active
- Right Rear Main Control Up Switch - Inactive and Active
- Front Passenger Main Control Down Switch - Inactive and Active
- Front Passenger Main Control Express Switch - Inactive and Active
- Front Passenger Main Control Up Switch - Inactive and Active
- **If the parameters do not change**

Refer to Circuit/System Testing - Driver Window Switch Malfunction.

- **If the parameters changes**

5. Verify the scan tool Child Security Lockout Switch parameter changes between Inactive and Active when pressing the window lockout switch on the S79D Window Switch-Driver.

- **If the parameters do not change**

Refer to **Power Door Child Lock Malfunction**

- **If the parameters changes**

6. Verify the lockout indicator turns ON and OFF when commanding the Child Security Lock Indicator ON and OFF with a scan tool.

- **If the indicator does not turn ON and OFF**

Replace the S79D Window Switch-Driver.

- **If the indicator turns ON and OFF**

7. Verify the passenger window moves while commanding the Passenger Window Motor Up and Down with a scan tool.

- **If the passenger window does not move UP and DOWN as commanded**

Refer to Circuit/System Testing - Driver/Passenger Window Motor Malfunction.

- **If the window moves UP and DOWN as commanded**

8. Verify the passenger window moves while commanding the window UP, express UP, DOWN and express DOWN with the S79P Window Switch-Passenger.

- **If the passenger window does not move UP or DOWN as commanded**

Refer to Circuit/System Testing - Passenger Window Switch Malfunction.

- **If the passenger window does not express UP or express DOWN**

Normalize the passenger window motor, refer to **Window Motor Programming - Express Function.**

- **If after normalization, the passenger window does not express UP or express DOWN**

Refer to Circuit/System Testing - Passenger Window Switch Malfunction.

- **If the passenger window moves UP, express UP, DOWN and express DOWN as commanded**

9. Verify the left rear and right rear window moves while commanding the window UP and DOWN with a scan tool.

- **If a rear window does not move UP and DOWN as commanded**

Refer to Circuit/System Testing - Rear Power Window Inoperative.

- **If the rear window moves UP and DOWN as commanded**

10. Command the rear window lockout by pressing the window lockout switch on the S79D Window Switch-Driver.

11. Verify the left rear and right rear window does not move while commanding the window UP and DOWN with the S79LR Window Switch-Left Rear and S79RR Window Switch-Right Rear.

- **If a rear window moves UP and DOWN as commanded**

Refer to **Power Door Child Lock Malfunction** .

- **If the rear windows do not move UP and DOWN**

12. All OK.

Circuit/System Testing

Driver/Passenger Window Motor Malfunction

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the appropriate driver or passenger M74 Window Motor. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal 1 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Ignition ON.
4. Verify a test lamp illuminates between the B+ circuit terminal 2 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the M74 Window Motor.
 - **If the test lamp illuminates**
5. Test or replace the M74 Window Motor.

Driver Window Switch Malfunction

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S79D Window Switch-Driver. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal 1 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
- 3. Ignition ON.
- 4. Verify a test lamp illuminates between the B+ circuit terminal 4 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the S79D Window Switch-Driver.
 - **If the test lamp illuminates**
- 5. Verify the scan tool Driver Window Main Control Down Switch parameter is Inactive.
 - **If not Inactive**
 1. Ignition OFF, disconnect the harness connector at the M74D Window Motor-Driver.
 2. Test for infinite resistance between the S79D Window Switch-Driver signal circuit terminal 3 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the M74D Window Motor-Driver.
 - **If Inactive**
- 6. Install a 3 A fused jumper wire between the signal circuit terminal 3 and the ground circuit terminal 1.
- 7. Verify the scan tool Driver Window Main Control Down Switch parameter is Active
 - **If not Active**
 1. Ignition OFF, remove the 3 A fused jumper wire, disconnect the harness connector at the M74D Window Motor-Driver, ignition ON.
 2. Test for less than 1 V between the S79D Window Switch-Driver signal circuit terminal 3 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the M74D Window Motor-Driver.
 - **If Active**
- 8. Verify the scan tool Driver Window Main Control Up Switch parameter is Inactive.

- **If not Inactive**

1. Ignition OFF, disconnect the harness connector at the M74D Window Motor-Driver.
2. Test for infinite resistance between the S79D Window Switch-Driver signal circuit terminal 6 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the M74D Window Motor-Driver.

- **If Inactive**

9. Install a 3 A fused jumper wire between the signal circuit terminal 6 and the ground circuit terminal 1.
10. Verify the scan tool Driver Window Main Control Up Switch parameter is Active

- **If not Active**

1. Ignition OFF, remove the 3 A fused jumper wire, disconnect the harness connector at the M74D Window Motor-Driver, ignition ON.
2. Test for less than 1 V between the S79D Window Switch-Driver signal circuit 6 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the M74D Window Motor-Driver.

- **If Active**

11. Verify the scan tool Driver Window Main Control Express Switch parameter is Inactive.

- **If not Inactive**

1. Ignition OFF, disconnect the harness connector at the M74D Window Motor-Driver.
2. Test for infinite resistance between the S79D Window Switch-Driver signal circuit terminal 2 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the M74D Window Motor-Driver.

- **If Inactive**

12. Install a 3 A fused jumper wire between the signal circuit terminal 2 and the ground circuit terminal 1.

13. Verify the scan tool Driver Window Main Control Express Switch parameter is Active

- **If not Active**

1. Ignition OFF, remove the 3 A fused jumper wire, disconnect the harness connector at the M74D Window Motor-Driver, ignition ON.
2. Test for less than 1 V between the S79D Window Switch-Driver signal circuit 2 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the M74D Window Motor-Driver.

- **If Active**

14. Test or replace the S79D Window Switch-Driver.

Passenger Window Switch Malfunction

1. Ignition OFF, and all vehicle systems OFF, disconnect the harness connector at the S79P Window Switch-Passenger. It may take up to 2 minutes for all vehicle systems to power down
2. Test for less than 10 ohms between the ground circuit terminal 1 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Ignition ON.
4. Verify the scan tool Passenger Window Switch at Door parameter is Inactive.
 - **If not Inactive**
 1. Ignition OFF, disconnect the harness connector at the M74P Window Motor-Passenger
 2. Test for infinite resistance between the signal circuit terminal listed below and ground:
 - S79P Window Switch-Passenger - signal circuit terminal 7
 - S79P Window Switch-Passenger - signal circuit terminal 8
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the M74P Window Motor-Passenger.
 - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 8 and ground.
6. Verify the scan tool Passenger Window Switch at Door parameter is Up
 - **If not Up**
 1. Ignition OFF, remove the fused jumper wire, disconnect the harness connector at the M74P Window Motor-Passenger, ignition ON.
 2. Test for less than 1 V between the S79P Window Switch-Passenger signal circuit terminal 8 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Ignition OFF, test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the M74P Window Motor-Passenger.
 - **If Up**
7. Install a 3 A fused jumper wire between the signal circuit terminal 7 and ground.
8. Verify the scan tool Passenger Window Switch at Door parameter is Down

- **If not Down**

1. Ignition OFF, remove the fused jumper wire, disconnect the harness connector at the M74P Window Motor-Passenger, ignition ON.
2. Test for less than 1 V between the S79P Window Switch-Passenger signal circuit terminal 7 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
3. Ignition OFF, test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the M74P Window Motor-Passenger.

- **If Down**

9. Test for greater than 10 V between the signal circuit terminal 6 and ground

- **If less than 10 V**

1. Ignition OFF, disconnect the harness connector at the M74P Window Motor-Passenger.
2. Test for infinite resistance between the S79P Window Switch-Passenger signal circuit 6 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance on the circuit.
 - If less than 2 ohms, replace the M74P Window Motor-Passenger.

- **If greater than 10 V**

10. Test or replace the S79P Window Switch-Passenger.

Rear Power Window Inoperative

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the appropriate S79 Window Switch-Rear. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal 5 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Ignition ON.
4. Verify a test lamp illuminates between the B+ circuit terminal 8.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.

2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
1. Ignition OFF.
2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the S79 Window Switch-Rear
 - **If the test lamp illuminates**
5. Ignition OFF, connect the harness connector at the S79 Window Switch-Rear and disconnect the harness connector at the M74 Window Motor-Rear.
6. Test for less than 5 ohms between the control circuit terminal 1 and ground.
 - **If 5 ohms or greater**
 - 1. Ignition OFF, disconnect the harness connector at the S79 Window Switch-Rear.
 - 2. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the S79 Window Switch-Rear.
 - **If less than 5 ohms**
7. Test for less than 5 ohms between the control circuit terminal 2 and ground.
 - **If 5 ohms or greater**
 - 1. Ignition OFF, disconnect the harness connector at the S79 Window Switch-Rear.
 - 2. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the S79 Window Switch-Rear.
 - **If less than 5 ohms**
8. Connect a test lamp between the control circuit terminal 1 and control circuit terminal 2, ignition ON.
9. Verify the test lamp turns ON when commanding the UP and DOWN states with the S79 Window Switch-Rear.
 - **If the test lamp is always OFF**
 - 1. Ignition OFF, disconnect the harness connector at the S79 Window Switch-Rear.
 - 2. Test for infinite resistance between each control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 - 3. Test for less than 2 ohms in each control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the S79 Window Switch-Rear.
 - **If the test lamp is always ON**
 - 1. Ignition OFF, disconnect the harness connector at the S79 Window Switch-Rear, ignition ON.

2. Test for less than 1 V between each control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the S79 Window Switch-Rear.

- **If the test lamp turns ON and OFF**

10. Test or replace the M74 Window Motor-Rear.

Component Testing

Rear Window Motor

1. Ignition OFF, disconnect the harness connector at the appropriate M74 Window Motor-Rear.
2. Install a 25 A fused jumper wire between one of the control terminals and 12 V. Momentarily install a jumper wire between the other control terminal and ground. Reverse the jumper wires at least two times, the M74 Window Motor-Rear should perform the UP and DOWN functions.

- **If the M74 Window Motor-Rear does not perform the UP and DOWN functions**

Replace the M74 Window Motor-Rear.

- **If the M74 Window Motor-Rear performs the UP and DOWN functions**

3. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Front Side Door Window Switch Replacement**
- **Rear Side Door Window Switch Replacement**
- **Front Side Door Window Regulator Motor Replacement**
- **Rear Side Door Window Regulator Motor Replacement**

SIDE DOOR WINDOW MECHANICAL DIAGNOSIS

Side Door Window Mechanical Diagnosis

Cause	Correction
DEFINITION: A mechanical condition that requires a correction for proper operation of the side door window.	
Refer to <u>Symptoms - Fixed and Moveable Windows</u> prior to beginning this table.	
Intermittent Operation	Check proper glass alignment/attachment and door seal installation.
	Check switch and switch bezel to see if sticking.
	Check wire harness for pinched/shorted wire.
	THIS STEP APPLIES TO ALL TWO PIN MOTOR CONNECTORS ONLY. Perform electrical diagnostics, by first applying 12 volt power supply to the regulator motor to verify motor function.
	Check proper glass alignment/attachment.

Glass Binds	Check for defective seal and/or proper seal installation.
	Check for debris in glass run channel.
	Check for glass run channel position.
Regulator/Glass Rattles	Check for loose fasteners and retorque if required.
	Check that the glass is in the channel and reinstall if not positioned correctly.
Noisy Operation	Check for other components in the glass path such as wire harness, impact foam, lock rods, or cables.
	Check for proper glass alignment/attachment and door seal installation.
Windnoise	Check seals, mirror patch, and glass alignment.
False glass reversal, the glass goes down unexpectedly.	Check seals, reinitialize the glass and/or realign the glass.
	Check for debris in the glass run channel.

REPAIR INSTRUCTIONS

WINDSHIELD REPLACEMENT

Special Tools

- **BO-24402-A** Glass Sealant Remover (Cold Knife)
- **BO-39032** Stationary Glass Removal Tool
- Use an adhesive that is approved by GM

For equivalent regional tools, refer to **Special Tools**.

NOTE: Before cutting out a stationary window, apply a double layer of masking tape around the perimeter of the painted surfaces and the interior trim.

1. Open the hood.
2. Remove the windshield wiper arms and blades. Refer to **Windshield Wiper Arm Replacement** .
3. Remove the air inlet grille panel. Refer to **Air Inlet Grille Panel Replacement** .
4. Remove the windshield garnish moldings. Refer to **Windshield Side Garnish Molding Replacement** .
5. Remove the inside rearview mirror. Refer to **Inside Rearview Mirror Replacement** .
6. Remove the inside moisture and temperature sensor. Refer to **Inside Air Moisture and Windshield Temperature Sensor Replacement (ASV)** , **Inside Air Moisture and Windshield Temperature Sensor Replacement (ASV UFL)** .
7. Remove the remote control door lock receiver. Refer to **Remote Control Door Lock Receiver Replacement** .

WARNING: If broken glass falls into the defroster outlets, it can be blown into the passenger compartment and cause personal injury.

8. Cover to protect the following parts from broken glass:

- Upper dash pad
- Defroster outlets and A/C outlets
- Seats and carpeting

Fig. 8: Separating Urethane Adhesive From Window

Courtesy of GENERAL MOTORS COMPANY

WARNING: Refer to Glass and Sheet Metal Handling Warning .

NOTE: Keep the cutting edge of the tool against the window. Use care Not to damage the window corner retainers. If the window retainers get cut off when removing the window it will be necessary to tape the window in place when installing.

9. This will allow the urethane adhesive to be separated from the window.

- Leave a base of urethane on the pinchweld flange.
- The only suitable lubrication is clear water.

- **BO-24402-A** Glass Sealant Remover (Cold Knife)
- **BO-39032** Stationary Glass Removal Tool

Fig. 9: Separating Bottom Of Window
Courtesy of GENERAL MOTORS COMPANY

10. Remove the bottom of the windshield from the urethane adhesive using a long utility knife or similar tool. Keep the cutting edge of the utility knife against the glass. Do this from inside the vehicle.

Fig. 10: Removing/Installing Windshield
Courtesy of GENERAL MOTORS COMPANY

11. Remove the windshield (1) from the vehicle with the aid of an assistant (2).

Installation Procedure

1. Install the windshield into the opening. Refer to **Adhesive Installation of Windshields**.
2. Install the air inlet grille panel. Refer to **Air Inlet Grille Panel Replacement**
3. Install the windshield wipers arms and blades. Refer to **Windshield Wiper Arm Replacement**
4. Install the windshield garnish molding. Refer to **Windshield Side Garnish Molding Replacement** .
5. Install the inside rearview mirror. Refer to **Inside Rearview Mirror Replacement** .
6. Install the remote control door lock receiver. Refer to **Remote Control Door Lock Receiver Replacement** .
7. Install the inside ambient air temperature and moisture sensor. Refer to **Inside Air Moisture and Windshield Temperature Sensor Replacement (ASV)** , **Inside Air Moisture and Windshield Temperature Sensor Replacement (ASV UFL)** .

8. Remove the double layer of masking tape around the perimeter of the painted surfaces and the interior trim.
9. Close the hood.

FRONT SIDE DOOR WINDOW ADJUSTMENT

Causes of Slow Moving Window

Fig. 11: Internal Detail For Front Door Window Adjustment
Courtesy of GENERAL MOTORS COMPANY

WARNING: Disconnect the power window switch when working inside the driver door. When operated, the Express Up/Down Feature allows the door window to move very quickly, without stopping, which could cause personal injury.

NOTE: Owners may comment that the windows operate slowly when going up or down.

1. Listed below are conditions that may cause a slow moving window.

- The window run channel outboard lip at the rearview mirror is rolled over or the window run channel outboard lip at the rear of door frame (2).
 - The window is not seated in the run channel.
 - The window is misaligned in the opening.
 - The regulator is misaligned causing misalignment of the window .
 - Inspect the power window motor for being loose.
2. After inspecting the conditions above, do the following:

Remove the front door trim panel.

3. Remove the water deflector.
4. Ensure that the window guide is fully seated and clipped.
5. Ensure that the window is fully seated into the window guide run channel.
6. Inspect the window for equal distance between the front and rear run channels.

Adjustment Procedure

1. Inspect for the following conditions before making adjustments.
 - Using a flat-bladed tool, straighten the run channel lip by pulling it out to its correct position.
 - Use a flat-bladed tool to push the run channel rearward to seat it in the door frame.
 - Inspect the window guide retainer to window for the proper alignment to the slots in the window.
 - Inspect the window to be straight up and down position.

Fig. 12: Window Regulator
Courtesy of GENERAL MOTORS COMPANY

- Loosen the fasteners that attach the window regulator (1) to the inner door panel, in the specified sequence (2, 3, 4).

CAUTION: Refer to Fastener Caution .

2. Tighten the fasteners that attach the front side door window regulator (1) to the inner door panel in the specified sequence (2, 3, 4) to 10 N.m (89 lb in).
3. Inspect the window for proper operation.
4. Install the water deflector.
5. Install the front door trim panel.

FRONT SIDE DOOR WINDOW REPLACEMENT

Fig. 13: Front Side Door Window & Retainers
 Courtesy of GENERAL MOTORS COMPANY

Front Side Door Window Replacement

Callout	Component Name
WARNING: Disconnect the power window switch when working inside the driver door. When operated, the Express Up/Down Feature allows the door window to move very quickly, without stopping, which could cause personal injury.	
CAUTION: Refer to <u>Paint Damage Caution</u> .	
Preliminary Procedure <ol style="list-style-type: none"> 1. Remove the front side door trim panel. Refer to <u>Front Side Door Trim Panel Replacement</u> . 2. Remove the front side door inner sealing strip. Refer to <u>Front Side Door Window Inner Sealing Strip Replacement</u>. 3. Remove the front side door window weatherstrip. Refer to <u>Front Side Door Window Weatherstrip Replacement</u>. 	
	Front Side Door Window Guide Retainer Clip (Qty: 2)
	Procedures <ol style="list-style-type: none"> 1. Apply masking tape to the outer applique and frame.

1	<ol style="list-style-type: none"> Position the window approximately half way down in the door. Remove the front door water deflector. Push inward on the window guide retainer clip, lift upward on the window until it releases from the retaining clip on the left and right side. Tilt the window downward in the front, pull up on the back of the window and pull it out from the frame.
2	<p>Front Side Door Window</p> <p>Procedures</p> <ol style="list-style-type: none"> Window motor relearn procedure. Window regulator motor programming and set-up. Refer to <u>Window Motor Programming - Express Function</u> <p>NOTE: Inspect the window for proper operation before installing the trim panel.</p>

REAR SIDE DOOR WINDOW ADJUSTMENT

Causes of Slow Moving Window

NOTE: Owners may comment that the windows operate slowly when going up or down.

- Listed below are conditions that may cause a slow moving window:
 - The window run channel outboard lip at the rear of door frame.
 - The window is not seated in the run channel.
 - The window is misaligned in the opening.
 - The regulator is misaligned causing misalignment of the window .
- After inspecting the conditions above, do the following:
 - Remove the rear door trim panel.
 - Remove the water deflector.
 - Ensure that the window guide is fully seated and clipped.

Ensure that the window is fully seated in the window guide run channel.

- Inspect the window for equal distance between the front and rear run channels.
- Inspect the power window motor for being loose.
- Inspect the window for alignment.

Adjustment Procedure

- Remove the rear side door trim panel.

Fig. 14: Window Regulator

Courtesy of GENERAL MOTORS COMPANY

2. Inspect for the following conditions before making adjustments:
 - Using a flat-bladed tool, straighten the run channel lip by pulling it out to its correct position.
 - Use a flat-bladed tool to push the run channel rearward to seat it in the door frame.
 - Inspect the window guide channel to window fasteners to ensure that they are in the proper slots and the window is not tilted forward.
 - Inspect the window to be straight up and down position.
 - Loosen the fasteners that attach the window regulator (1) to the inner door panel, in the specified sequence (2, 3, 4).

CAUTION: Refer to Fastener Caution .

3. Loosen the fasteners that attach the rear side door window regulator (1) to the inner door panel in the specified sequence (2, 3, 4).

Tighten the fasteners to 10 N.m (89 lb in).

4. Inspect the window for proper operation.
5. Install the water deflector.
6. Install the rear door trim panel.

REAR SIDE DOOR WINDOW REPLACEMENT

Fig. 15: Rear Side Door Window, Retainer & Tabs
 Courtesy of GENERAL MOTORS COMPANY

Rear Side Door Window Replacement

Callout	Component Name
CAUTION: Refer to <u>Paint Damage Caution</u> .	
Preliminary Procedure <ol style="list-style-type: none"> 1. Remove the rear side door trim panel. Refer to <u>Rear Side Door Trim Panel Replacement</u> . 2. Remove the rear side door stationary window. Refer to <u>Rear Side Door Stationary Window Replacement</u>. 	
	Rear Side Door Window Guide Retainer Tabs
	Procedures <ol style="list-style-type: none"> 1. Apply masking tape to the outer applique and frame.

1	<ol style="list-style-type: none"> 2. Raise the window. 3. Remove the rear side door water deflector. 4. Remove the energy absorber retainers and energy absorber from the door. 5. Loosen the rear side door window run channel guide fastener. 6. Position the window half way down or enough in order to gain access through the inner panel. 7. Install a suitable tool in the center of the center guide retainer, push inward to release the tabs.
2	Rear Side Door Window Guide Retainer Procedures Separate the window guide retainer in half.
3	Rear Side Door Window Guide Procedures Lift upward on the window until it released from the guide.
4	Rear Side Door Window Procedures After replacing the window it will be necessary to reprogram. Refer to <u>Control Module References</u> . NOTE: Inspect the window for proper operation before install the trim panel.

REAR SIDE DOOR STATIONARY WINDOW REPLACEMENT

Fig. 16: Rear Side Door Window Weatherstrip & Fasteners
 Courtesy of GENERAL MOTORS COMPANY

Rear Side Door Stationary Window Replacement

Callout	Component Name
CAUTION: Refer to <u>Paint Damage Caution</u> .	
Preliminary Procedure Remove the rear side door trim panel. Refer to <u>Rear Side Door Trim Panel Replacement</u> .	
1	Rear Side Door Stationary Window Rear Channel Fastener (Qty: 2)
2	Rear Side Door Stationary Window Rear Channel Fastener CAUTION: Refer to <u>Fastener Caution</u> . Procedures 1. Apply masking tape to the outer applique and frame. 2. Lower the window. 3. Remove the rear side door water deflector. Tighten 10 N.m (89 lb in)
3	Rear Side Door Stationary Window NOTE: When replacing the rear side door window weatherstrip it is necessary to transfer the rear side door stationary window.

REAR WINDOW REPLACEMENT

Special Tools

- **BO-24402-A** Glass Sealant Remover (Cold Knife)
- **BO-39032** Stationary Glass Removal Tool
- Use an adhesive that is approved by GM

For equivalent regional tools, refer to **Special Tools**

Removal Procedure

WARNING: If a window is cracked but still intact, crisscross the window with

masking tape in order to reduce the risk of damage or personal injury.

NOTE: Before cutting out a stationary window, apply a double layer of masking tape around the perimeter of the painted surfaces and inner trim.

1. Open the rear compartment lid.

Fig. 17: Locating Rear Window Defogger Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

2. Disconnect the rear window defogger electrical connectors.
3. Disconnect the OnStar® antenna, if equipped.
4. Disconnect the rear window radio antenna connector.

WARNING: If broken glass falls into the defroster outlets, it can be blown into the passenger compartment and cause personal injury.

5. Cover to protect the following parts from broken glass:
 - Upper dash pad

- Defroster outlets and A/C outlets
- Seats and carpeting

WARNING: Refer to Glass and Sheet Metal Handling Warning .

NOTE: Keep the cutting edge of the tool against the window. Use care Not to damage the window corner retainers. If the window retainers get cut off when removing the window it will be necessary to tape the window in place when installing.

6. This will allow the urethane adhesive to be separated from the window.
 - Leave a base of urethane on the pinchweld flange.
 - The only suitable lubrication is clear water.
 - **BO-24402-A** Glass Sealant Remover (Cold Knife).
 - **BO-39032** Stationary Glass Removal Tool.

Fig. 18: Removing/Installing Rear Window
Courtesy of GENERAL MOTORS COMPANY

7. With the aid of an assistant lift the rear window from the opening.

Installation Procedure

1. Install the rear window into the opening. Refer to **Adhesive Installation of Rear Windows**.
2. Connect the rear window defogger electrical connectors.
3. Install the rear window radio antenna connector.
4. Connect the OnStar® antenna, if equipped.

Check the radio and OnStar® system to verify reception.

5. Close the rear compartment lid.
6. Remove the double layer of masking tape around the perimeter of the painted surfaces and the interior trim.

FRONT SIDE DOOR WINDOW SWITCH REPLACEMENT

Fig. 19: Front Side Door Window Switch Bezel & Retainer
Courtesy of GENERAL MOTORS COMPANY

Front Side Door Window Switch Replacement

Callout	Component Name
Preliminary Procedure	
Remove the front side door trim panel. Refer to <u>Front Side Door Trim Panel Replacement</u> .	

1	Front Side Door Window Switch Retainer Procedure Use a small flat-bladed tool to release the retainer from the rear side of the front side door trim panel.
2	Front Side Door Window Switch Procedure Separate the switch and bezel, if necessary.

REAR SIDE DOOR WINDOW SWITCH REPLACEMENT

Fig. 20: Rear Side Door Window Switch
Courtesy of GENERAL MOTORS COMPANY

Rear Side Door Window Switch Replacement

Callout	Component Name
Preliminary Procedure Remove the rear side door trim panel. Refer to <u>Rear Side Door Trim Panel Replacement</u> .	
1	Rear Side Door Switch Retainer TIP: Use a small flat-bladed tool to release the retainer from the rear side door switch.
2	Rear Side Door Switch Procedure Disconnect the electrical connector.

FRONT SIDE DOOR WINDOW REGULATOR REPLACEMENT

Fig. 21: Front Side Door Window Regulator & Fasteners
 Courtesy of GENERAL MOTORS COMPANY

Front Side Door Window Regulator Replacement

Callout	Component Name
WARNING: Disconnect the power window switch when working inside the driver door. When operated, the Express Up/Down Feature allows the door window to move very quickly, without stopping, which could cause personal injury.	
Preliminary Procedure Remove the water deflector. Refer to <u>Front Side Door Water Deflector Replacement</u>	
1	Front Side Door Window Regulator Fasteners (Qty: 5) CAUTION: Refer to <u>Fastener Caution</u> . Procedures <ol style="list-style-type: none"> 1. Release the 2 window fasteners. 2. After detaching window from regulator, manually move window to the full up position and tape to frame. Tighten

	10 N.m (89 lb in)
2	Front Side Door Window Regulator Procedures 1. Disconnect the front side door window regulator electrical connector. 2. Window regulator motor programming and set-up. Refer to <u>Control Module References</u> . 3. Inspect the door window for proper operation before installing the door trim panel.

WINDOW MOTOR PROGRAMMING - EXPRESS FUNCTION

Window Motor Normalized Procedure

A window motor that has not been normalized will no longer perform the express up and express down functions, this may occur during the following conditions:

- When a window motor has been disconnected or replaced
- When a door harness has been disconnected
- When the battery has been disconnected or replaced

NOTE: When DTC B3205 4B & 3210 4B are set, the following warnings will be displayed on the driver information center:

Open, then Close Driver Window

Open, then Close Passenger Window

These warnings will clear once the windows have been "Normalized" and the respective DTC will clear.

To normalize the window motor, follow these steps:

NOTE: The doors must be completely closed prior to normalizing the windows, a door that is open or ajar may cause the power window to function abnormally or to become inoperative while performing the normalizing procedure. If this occurs, verify that the door is completely closed then repeat the normalizing procedure.

NOTE: For vehicles equipped with a folding convertible top, the top must be closed and firmly latched prior to normalizing the windows.

1. Ignition ON.
2. Starting with the window completely UP, press and hold the power window switch until the window is fully open and continue holding the switch down for approximately 5 seconds after the window is

completely open.

3. Pull the power window switch up until the window is fully closed and continue holding the switch up for approximately 5 seconds after the window is completely closed.

The window should now be normalized and the window should perform the express up and express down functions.

Window Motor Relearn Procedure

A relearn procedure may need to be performed for any Local Interconnect Network (LIN) window motor for the following conditions:

- When the window glass is out of alignment
- When the window glass has been replaced
- When the door has been replaced
- When the window regulator has been replaced

NOTE: Prior to performing the relearn procedure the vehicle must have all 4 wheels properly inflated and mounted, the vehicle must be sitting on a level surface and all doors must be completely closed and for vehicles equipped with a folding convertible top, the top must be closed and firmly latched..

To relearn the window motor, follow these steps:

1. Ignition ON.
2. With a scan tool, select Module Diagnosis, Body Control Module, Configuration/Reset Functions and then select the appropriate Clear Window Learn Values for the window motor requiring the relearn procedure.
3. After the learn procedure, exit the scan tool learn procedure completely, the power window cannot be normalized and will not function until you exit the program.
4. Starting with the window completely UP, press and hold the power window switch until the window is fully open and continue holding the switch down for approximately 5 seconds after the window is completely open.
5. Pull the power window switch up until the window is fully closed and continue holding the switch up for approximately 5 seconds after the window is completely closed.

The window is now reprogrammed.

FRONT SIDE DOOR WINDOW REGULATOR MOTOR REPLACEMENT

Fig. 22: Front Side Door Window Regulator Motor & Fasteners
 Courtesy of GENERAL MOTORS COMPANY

Front Side Door Window Regulator Motor Replacement

Callout	Component Name
Preliminary Procedure Remove the front side door window regulator. Refer to Front Side Door Window Regulator Replacement .	
1	Front Side Door Window Regulator Motor Fasteners (Qty: 3) CAUTION: Refer to Fastener Caution . Tighten 10 N.m (89 lb in)
2	Front Side Door Window Regulator Motor Procedure Inspect the door window for proper operation before installing the door trim panel.

REAR SIDE DOOR WINDOW REGULATOR REPLACEMENT

Fig. 23: Rear Side Door Window Regulator & Fasteners
 Courtesy of GENERAL MOTORS COMPANY

Rear Side Door Window Regulator Replacement

Callout	Component Name
WARNING: Disconnect the power window switch when working inside the driver door. When operated, the Express Up/Down Feature allows the door window to move very quickly, without stopping, which could cause personal injury.	
Preliminary Procedures <ol style="list-style-type: none"> 1. Remove the rear side door trim panel. Refer to <u>Rear Side Door Trim Panel Replacement</u> . 2. Release the door window from the guide retaining clips. Refer to <u>Rear Side Door Window Replacement</u> 	
1	Rear Side Door Window Regulator Fasteners (Qty: 3) CAUTION: Refer to <u>Fastener Caution</u> . Procedure After detaching window from regulator, manually move window to full up position and securely tape the window to the door frame. Tighten

	10 N.m (89 lb in)
	Rear Side Door Window Regulator
2	Procedures <ol style="list-style-type: none"> 1. Disconnect the electrical connector. 2. Transfer all parts as necessary. TIP: Inspect the window for proper operation, adjust if necessary.

REAR SIDE DOOR WINDOW REGULATOR MOTOR REPLACEMENT

Fig. 24: View Of Rear Side Door Window Regulator Motor & Bolts
 Courtesy of GENERAL MOTORS COMPANY

Rear Side Door Window Regulator Motor Replacement

Callout	Component Name
Preliminary Procedures <ol style="list-style-type: none"> 1. Remove the rear side door trim panel. Refer to <u>Rear Side Door Trim Panel Replacement</u> . 2. Remove the rear side door window regulator. Refer to <u>Rear Side Door Window Regulator Replacement</u>. 	
	Rear Side Door Window Regulator Motor Fasteners (Qty: 3)

1	CAUTION: Refer to <u>Fastener Caution</u> . Tighten 10 N.m (89 lb in)
2	Rear Side Door Window Regulator Motor Procedure <ol style="list-style-type: none"> 1. Disconnect the electrical connector. 2. Transfer all parts as necessary. TIP: Inspect the window for proper operation.

FRONT SIDE DOOR WINDOW OUTER SEALING STRIP REPLACEMENT

Fig. 25: Front Side Door Window Belt Reveal Molding
 Courtesy of GENERAL MOTORS COMPANY

Front Side Door Window Outer Sealing Strip Replacement

Callout	Component Name
Preliminary Procedure	

Remove the outside rearview mirror. Refer to **Outside Rearview Mirror Replacement** .

1	Front Side Door Window Outer Sealing Strip TIP: Use a small flat-bladed tool to lift the front side door window outer sealing strip up to remove it from the door flange.
---	---

FRONT SIDE DOOR WINDOW INNER SEALING STRIP REPLACEMENT

Fig. 26: Front Side Door Window Inner Sealing Strip

Courtesy of GENERAL MOTORS COMPANY

Front Side Door Window Inner Sealing Strip Replacement

Callout	Component Name
Preliminary Procedure	
1. Remove the front side door trim panel. Refer to <u>Front Side Door Trim Panel Replacement</u>	
2. Remove the front side door window frame garnish molding. Refer to <u>Front Side Door Window Frame Garnish Molding Replacement</u>	
1	Front Side Door Window Inner Sealing Strip Procedure Pull the sealing strip up and away from the door flange to remove.

REAR SIDE DOOR WINDOW INNER SEALING STRIP REPLACEMENT

Fig. 27: Rear Side Door Window Inner Sealing Strip
 Courtesy of GENERAL MOTORS COMPANY

Rear Side Door Window Inner Sealing Strip Replacement

Callout	Component Name
Preliminary Procedures	
Remove the rear side door trim panel. Refer to <u>Rear Side Door Trim Panel Replacement</u> .	
1	Rear Side Door Window Inner Strip
	Procedures
	<ol style="list-style-type: none"> 1. Lift the rear side door window inner strip off the pinch-weld flange. 2. Press firmly to insert the rear side door window inner strip back on the door flange.
TIP: Inspect the window for proper operation.	

REAR SIDE DOOR WINDOW OUTER SEALING STRIP REPLACEMENT

Courtesy of GENERAL MOTORS COMPANY

Rear Side Door Window Outer Sealing Strip Replacement

Callout	Component Name
1	Rear Side Door Window Outer Sealing Strip TIP: Using a small flat-bladed tool, lift the sealing strip up to remove it from the door flange.

FRONT SIDE DOOR WINDOW WEATHERSTRIP REPLACEMENT

Fig. 29: Front Side Door Window Weatherstrip
 Courtesy of GENERAL MOTORS COMPANY

Front Side Door Window Weatherstrip Replacement

Callout	Component Name
Preliminary Procedure <ol style="list-style-type: none"> 1. Remove the front side door trim panel. Refer to <u>Front Side Door Trim Panel Replacement</u> . 2. Remove the front side door window outer sealing strip. Refer to <u>Front Side Door Window Outer Sealing Strip Replacement</u>. 3. Remove the front side door window frame garnish molding. Refer to <u>Front Side Door Window Frame Garnish Molding Replacement</u> . 4. Remove the front side door window frame rear cover. Refer to <u>Front Side Door Window Frame Rear Cover Replacement</u> . 	
1	Front Side Door Window Weatherstrip Procedure <ol style="list-style-type: none"> 1. Refit corner retainers. 2. Pull the front side door window weatherstrip from the window frame to remove.

ADHESIVE INSTALLATION OF WINDSHIELDS

WARNING: Refer to **Glass and Sheet Metal Handling Warning** .

1. Use a urethane adhesive systems which meet GM Specification GM 3651G.

NOTE: Remove all but approximately 2 mm (3/64 in) of the existing bead of urethane adhesive from the pinch-weld flange.

2. Remove all mounds or loose pieces of urethane adhesive from the pinch-weld area.
3. If the original window is being reused, remove all but a thin film of the existing urethane adhesive from the window surface by using a clean utility knife or razor blade scraper.
4. Inspect for any of the following problems in order to help prevent future breakage of the window:
 - High weld
 - Solder spots
 - Hardened sealer
 - Any other obstruction or irregularity in the pinch-weld flange

NOTE: If corrosion of the pinch-weld flange is present or if sheet metal repairs or replacements are required, the pinch-weld flange must be refinished in order to restore the bonding area strength. If paint repairs are required, mask the flange bonding area prior to applying the color coat in order to provide a clean primer only surface. Materials such as BASF DE15®, DuPont 2610®, Sherwin-Williams PSE 4600 and NP70® and Martin-Semour 5120 and 5130® PPG DP90LF SPIES/HECKER 3688/8590 - 3688/5150 - 4070/5090 STANDOX 11158/13320 - 14653/14980 products are approved for this application.

5. After repairing the opening as indicated, perform the following steps:
 1. Remove all traces of broken glass from the outer cowl panel, seats, floor, and defroster ducts.
 2. Clean around the edge of the inside surface of the window with a 50/50 mixture of isopropyl alcohol and water by volume on a dampened lint free cloth.

WARNING: Refer to Window Retention Warning .

6. Verify all primers and urethane adhesive are within expiration dates.

Fig. 30: Applying Pinch-Weld Primer
Courtesy of GENERAL MOTORS COMPANY

WARNING: Failure to prep the area prior to the application of primer may cause insufficient bonding of urethane adhesive. Insufficient bonding of urethane adhesive may allow unrestrained occupants to be ejected from the vehicle resulting in personal injury.

NOTE: Do not apply the black #3 primer to the existing bead (1) of the urethane adhesive on the pinch-weld flange. Apply the primer only to nicks, scratches, or the primed surfaces.

7. Shake the pinch-weld primer black #3 for at least 1 minute.
8. Use a new dauber in order to apply the primer to the surface of the pinch-weld flange (1).
9. Allow the pinch-weld primer to dry for approximately 10 minutes.

Fig. 31: Removing/Installing Windshield
Courtesy of GENERAL MOTORS COMPANY

10. With the aid of an assistant, dry fit the window (1) to the opening in order to determine the correct position.

Fig. 32: Identifying Locator Slots On Upper Pinch-Weld Flange
Courtesy of GENERAL MOTORS COMPANY

11. If equipped, ensure that the windshield locator pins are positioned into the locator slots on the upper pinch-weld flange.

Fig. 33: Aligning Tape Lines On Window To Body
Courtesy of GENERAL MOTORS COMPANY

12. Use masking tape in order to mark the locations (1) of the window (2) in the opening.
13. Cut the masking tape in the center and remove the window from the opening.

Fig. 34: Applying Glass Prep
Courtesy of GENERAL MOTORS COMPANY

NOTE: Use care when applying glass prep clear #1 on the window. This primer dries almost instantly, and may stain the viewing area of the window if not applied evenly.

14. Use a new dauber in order to apply glass prep clear #1 to the area approximately 18 mm (0.71 in) around the entire perimeter of the window inner surface.

Immediately wipe the glass primed area using a clean, lint-free cloth.

Fig. 35: Applying Glass Prep
Courtesy of GENERAL MOTORS COMPANY

15. Apply a second coat of the glass prep clear #1 to the same area of the glass.

Fig. 36: Applying Glass Primer
Courtesy of GENERAL MOTORS COMPANY

NOTE: The glass primer black #2 is effective up to 8 hours after applying it to the glass. The primed surface of the glass must be kept clean.

16. Shake the glass primer black #2 for at least 1 minute.
17. Use a new dauber in order to apply the glass primer black #2 to the same areas (2) that glass prep clear #1 was applied.
18. Allow the glass primer to dry for approximately 10 minutes.

Fig. 37: View Of Modified Applicator Nozzle
Courtesy of GENERAL MOTORS COMPANY

19. Cut the applicator nozzle in order to provide a minimum urethane bead of 8 mm (0.31 in) wide and 16 mm (0.63 in) high.

Fig. 38: Applying Continuous Bead Of Urethane Adhesive
Courtesy of GENERAL MOTORS COMPANY

20. Use a cartridge-type caulking gun in order to apply a smooth, continuous bead of urethane adhesive.

Fig. 39: Applying Urethane Adhesive To Inner Surface Of Window
Courtesy of GENERAL MOTORS COMPANY

21. Use the edge of the window as a guide for the nozzle in order to apply the urethane adhesive (1) to the inner surface of the window (3).

Fig. 40: Removing/Installing Windshield
Courtesy of GENERAL MOTORS COMPANY

22. With the aid of an assistant, place the window (1) in the opening.

Fig. 41: Aligning Tape Lines On Window To Body
Courtesy of GENERAL MOTORS COMPANY

23. Align the masking tape (1) lines on the window (2) and the body.

Fig. 42: Pressing Window Into Place
Courtesy of GENERAL MOTORS COMPANY

NOTE: To prevent damage to the window due to objects impacting an exposed edge, upon installation, the window must rest 1 mm (0.04 in) below the surface of the sheet metal.

24. Press firmly around the entire periphery of the windshield in order to wet-out the urethane bead.
25. Tape the window to the body in order to minimize movement until the urethane adhesive cures.

Fig. 43: Cleaning Excess Urethane Adhesive From Body
Courtesy of GENERAL MOTORS COMPANY

26. Clean any excess urethane adhesive from the body.

Fig. 44: Performing Water Hose Test
Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not direct a hard stream of high pressure water to the freshly applied urethane adhesive.

27. Use a soft spray of warm water in order to immediately water test the window.
28. Inspect the window for leaks.
29. If any leaks are found, use a plastic paddle in order to apply extra urethane adhesive at the leak point.
30. Retest the window for leaks.

WARNING: Insufficient curing of urethane adhesive may allow unrestrained occupants to be ejected from the vehicle resulting in personal injury.

- For the moisture-curing type of urethane adhesive, allow a minimum of 6 hours at 21°C (70°F) or greater and with at least

30 percent relative humidity. Allow at least 24 hours for the complete curing of the urethane adhesive.

- **For the chemical-curing type of urethane adhesive, allow a minimum of 1 hour .**

Do NOT physically disturb the repair area until after these minimum times have elapsed.

31. Maintain the following conditions in order to properly cure the urethane adhesive:
 - Partially lower a door window in order to prevent pressure buildups when closing doors before the urethane adhesive cures.
 - Do not drive the vehicle until the urethane adhesive is cured. Refer to the above curing times.
 - Do not use compressed air in order to dry the urethane adhesive.
32. Complete the window installation.

ADHESIVE INSTALLATION OF REAR WINDOWS

WARNING: Refer to Glass and Sheet Metal Handling Warning .

1. Use a urethane adhesive systems which meet GM Specification GM 3651G.

NOTE: Remove all but approximately 2 mm (3/64 in) of the existing bead of urethane adhesive from the pinch-weld flange.

2. Remove all mounds or loose pieces of urethane adhesive from the pinch-weld area.
3. If the original window is being reused, remove all but a thin film of the existing urethane adhesive from the window surface by using a clean utility knife or razor blade scraper.
4. Inspect for any of the following problems in order to help prevent future breakage of the window:
 - High weld
 - Solder spots
 - Hardened sealer
 - Any other obstruction or irregularity in the pinch-weld flange

NOTE: If corrosion of the pinch-weld flange is present or if sheet metal repairs or replacements are required, the pinch-weld flange must be refinished in order to restore the bonding area strength. If paint repairs are required, mask the flange bonding area prior to applying the color coat in order to provide a clean primer only surface. Materials such as BASF DE15®, DuPont 2610®, Sherwin-Williams PSE 4600 and NP70® and Martin-Semour 5120 and 5130® PPG DP90LF SPIES/HECKER 3688/8590 - 3688/5150 - 4070/5090 STANDOX 11158/13320 - 14653/14980 products are approved for this application.

5. After repairing the opening as indicated, perform the following steps:
 1. Remove all traces of broken glass from the outer cowl panel, seats, floor and defroster ducts.
 2. Clean around the edge of the inside surface of the window with a 50/50 mixture of isopropyl alcohol and water by volume on a dampened lint free cloth.

WARNING: Refer to Window Retention Warning .

6. Verify all primers and urethane adhesive are within expiration dates.

Fig. 45: Applying Pinch-Weld Primer
Courtesy of GENERAL MOTORS COMPANY

WARNING: Failure to prep the area prior to the application of primer may cause insufficient bonding of urethane adhesive. Insufficient bonding of urethane adhesive may allow unrestrained occupants to be ejected from the vehicle resulting in personal injury.

NOTE: Do not apply the black #3 primer to the existing bead (1) of the urethane adhesive on the pinch-weld flange. Apply the primer only to nicks, scratches or the primed surfaces.

7. Shake the pinch-weld primer black #3 for at least 1 minute.
8. Use a new dauber in order to apply the primer to the surface of the pinch-weld flange (2).
9. Allow the pinch-weld primer to dry for approximately 10 minutes.

Fig. 46: Installing Rear Window
Courtesy of GENERAL MOTORS COMPANY

10. With the aid of an assistant, dry fit the window (2) to the opening in order to determine the correct position.
11. Ensure that the locator pins (1) are positioned into the locator slots on the upper pinch-weld flange.

Fig. 47: Aligning Tape Lines On Window To Body
Courtesy of GENERAL MOTORS COMPANY

12. Use masking tape (1) to mark the locations of the window (2) in the opening.
13. Cut the masking in the center and remove the window from the opening.

Fig. 48: Applying Glass Prep
Courtesy of GENERAL MOTORS COMPANY

NOTE: Use care when applying glass prep clear #1 on the window. This primer dries almost instantly, and may stain the viewing area of the window if not applied evenly.

14. Use a new dauber in order to apply glass prep clear #1 to the area approximately 18 mm (0.71 in) around the entire perimeter of the window inner surface.

Immediately wipe the glass primed area using a clean, lint-free cloth.

Fig. 49: Applying Glass Prep

NOTE: Do not direct a hard stream of high pressure water to the freshly applied urethane adhesive.

27. Use a soft spray of warm water in order to immediately water test the window.
28. Inspect the window for leaks.
29. If any leaks are found, use a plastic paddle in order to apply extra urethane adhesive at the leak point.
30. Retest the window for leaks.

WARNING: Insufficient curing of urethane adhesive may allow unrestrained occupants to be ejected from the vehicle resulting in personal injury.

- For the moisture-curing type of urethane adhesive, allow a minimum of 6 hours at 21°C (70°F) or greater and with at least

30 percent relative humidity. Allow at least 24 hours for the complete curing of the urethane adhesive.

- **For the chemical-curing type of urethane adhesive, allow a minimum of 1 hour .**

Do NOT physically disturb the repair area until after these minimum times have elapsed.

31. Maintain the following conditions in order to properly cure the urethane adhesive:

- Partially lower a door window in order to prevent pressure buildups when closing doors before the urethane adhesive cures.
- Do not drive the vehicle until the urethane adhesive is cured. Refer to the above curing times.
- Do not use compressed air in order to dry the urethane adhesive.

32. Complete the window installation.

DESCRIPTION AND OPERATION

FULL-CUT METHOD DESCRIPTION

NOTE:

- **If corrosion of the pinch-weld flange is present, or if sheet metal repairs or replacements are required, refinish the pinch-weld flange in order to present a clean, primer-only surface.**
- **If paint repairs are required, mask the flange bonding area, prior to applying the color coat, in order to provide a clean, primer-only surface.**
- **Appropriate materials for these primer applications are typically 2 component catalyzed products. Use materials such as BASF DE15®, DuPont 2610®, Sherwin-Williams PSE 4600 and NP70® and Martin-Semour 5120 ,5130® , PPG DP90LF SPIES/HECKER 3688/8590 - 3688/5150 - 4070/5090 STANDOX 11158/13320 - 14653/14980 products are approved for this application. Follow the manufacturer's directions for the mix, the application, and the drying times.**
- **After repairing the opening as indicated, shake the pinch-weld primer black #3 well. Using a new dauber, apply the primer to the primed surface of the flange in the bonding area. Allow the primer to dry for 10 minutes.**

Use only the full cut method, also known in the field as full strip method, when installing windows.

This method includes the following:

- The replacement of a majority of the urethane adhesive bead. Remove all but approximately 2 mm (3/64 in) of the existing bead of urethane adhesive from the pinch-weld flange.
- Apply pinch-weld primer to any exposed painted areas on the pinch-weld flange.

No mounds or loose pieces of urethane adhesive should remain on the pinch-weld flange. Do not remove all

traces of urethane adhesive.

POWER WINDOWS DESCRIPTION AND OPERATION

Power Windows System Components

The power window system consists of the following components:

- Driver window switch
- Passenger window switch
- Left rear window switch
- Right rear window switch
- Window motors in each of the doors
- 30A Fuse
- Body control module (BCM)

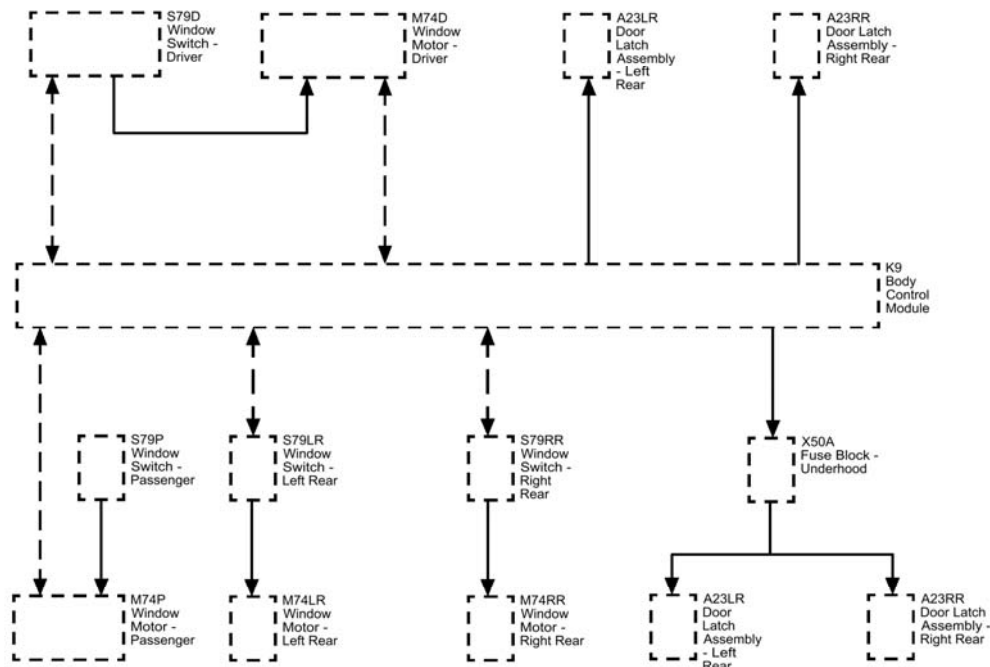

Fig. 59: Power Windows System Block Diagram

Courtesy of GENERAL MOTORS COMPANY

Driver and Passenger Express Up and Express Down Window Motors

The driver and passenger doors contains a window motor is smart motor that will detect excessive resistance while performing the express up function and automatically reverse direction to prevent injury to any occupants that may become trapped between the closing window and the door frame. The automatic reverse safety feature can be overridden by pulling and holding the window switch.

The logic circuit within the window motor monitors the up, down and express signal circuits which are normally equal to B+ voltage. When a switch is used on the window switch, the contacts close causing a voltage drop within the appropriate signal circuit. The window motor will detect the voltage drop and will command the window to move in the direction requested.

The driver window switch communicates to the BCM by a serial data circuit. When the driver wishes to control the passenger window, the driver will use the appropriate switch on the driver window switch. When this switch is used, a serial data message is sent to the BCM requesting the passenger window motor command, the BCM will then send a serial data message to the passenger window motor which will then move in the direction requested.

Left Rear, Right Rear Express Down Only Power Window Motors

For the right rear and left rear doors, when their window switch is pressed in the down position, battery positive voltage is applied to their respective window motor control circuit and ground to the other window motor control circuit causing that window to open. When the individual window switch is pulled in the up position, voltage and ground is applied to the window motor in the opposite direction causing that window to close. The return path to ground is supplied through the inactive control circuit being normally grounded through the window switch.

Each rear window switch communicates to the BCM by a serial data circuit. When the driver wishes to control the left rear or right rear window, the driver will use the appropriate switch on the driver window switch. When this switch is used, a serial data message is sent to the BCM requesting a window motor command, the BCM will then send a serial data message to the appropriate rear door window switch which will then command that window to move in the direction requested.

Rear Window and Rear Door Lockout Operation

The operator has the option to disable the rear window switches and the interior rear door handles to prevent the unauthorized opening of the rear door doors and windows while still retaining normal driver and passenger door window and handle functions. The driver door window switch has a lockout switch that will disable the interior rear door handles and the local rear window switches. The rear door latches contain switches that are open when the rear doors are unlocked and closed when the rear doors are locked. The operator will first lock all the doors by pressing the central door lock switch. When the lockout switch is pressed, the BCM will confirm that the rear doors have been locked, if the rear doors are locked the BCM will then command the child lockout latches and will also send a disable command to the local rear window switches. The driver and passenger doors will still function normally by pressing the central door lock switch which will unlock the doors but the child lockout latches will continue to disable the interior rear door handles. Pressing the lockout switch again will signal a command to the BCM to unlatch the rear doors, restore normal interior rear door handle functions and

restore normal function of the rear window switches.

If the lockout indicator flashes while commanding the lockout system, indicates that the BCM has detected a fault in the system and that one or both interior rear door handles are not locked out and/or the local rear window switches are not locked out.

REAR WINDOW DEFOGGER DESCRIPTION AND OPERATION

Rear Window Defogger System Components

The rear window defogger system consists of the following components:

- HVAC Control Module
- HVAC Controls
- Rear Defogger Relay
- Rear Defogger Grid
- Driver Outside Rearview Mirror
- Passenger Outside Rearview Mirror
- 40A Fuse

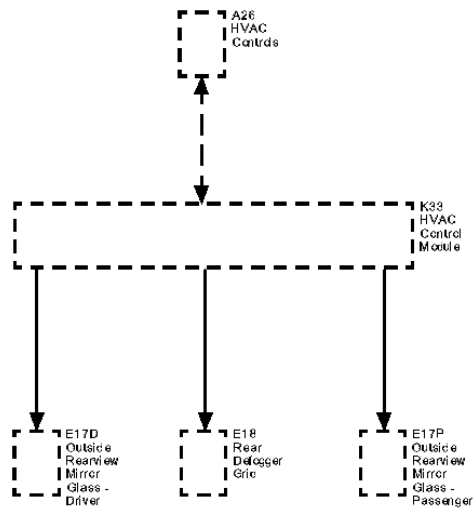

Fig. 60: Rear Window Defogger System Diagram
 Courtesy of GENERAL MOTORS COMPANY

Rear Window Defogger Operation

The rear defog control system utilizes a single zone backlight design, driven with a single relay configuration. Additionally, up to two outside rear view mirrors can be heated if required. A switch for the customer to control the system is provided within the HVAC controls. Also included in the HVAC controls is an indicator to inform the customer with the current state of the system. The system is only operational when engine is running or during remote start.

Pressing the heated rear window switch causes the HVAC controls to send a serial data message to the HVAC control module requesting rear window defog operation. The HVAC control module upon receipt of the serial data message will provide voltage to the coil side of the rear defogger relay, this will energize the relay causing the relay switch contacts to close allowing B+ voltage to flow through the rear defogger grid control circuit to the rear defogger grid.

When the rear heated window switch is pressed and the engine is running, the rear defog control system will remain active for 10 minutes. After the initial cycle has lapsed, pressing the switch again will continue rear

window defogger operation, but the cycle will only last 5 minutes. The rear defog control system will function continuously if the vehicle speed is greater than 70 kilometers per hour (45 mph).

Heated Mirrors

The heated mirrors are also controlled through the rear defogger relay. Whenever the rear window defogger is turned on battery voltage is supplied to the mirror heater elements through the left and right mirror heater element control circuits.

STATIONARY WINDOW DESCRIPTION

Most stationary windows, specifically windshields, are retained to the body with adhesive which adheres the window to the body, increasing structural integrity. The reinstallation of the windows with adhesive requires complete replacement of the adhesive bead, and is known as the full cut method. All stationary windows must use a adhesive systems which meet GM Specification GMW-15672.

URETHANE ADHESIVE DESCRIPTION

For replacement of any adhesive-installed window, use the full cut method only.

Use an adhesive that is approved by GM, Specification GMW-15672.

Use these materials based on specific manufacturer. Do NOT intermix primers or adhesives from one manufacturer to another.

Always follow the system manufacturers instructions for application, handling, and curing.

		United States	Canada
GM Vehicle Care Odor Eliminator	Fluids	88861431	88861436

REPAIR INSTRUCTIONS

ELIMINATING UNWANTED ODORS IN VEHICLES

GM Vehicle Care Odor Eliminator, Refer to **Adhesives, Fluids, Lubricants, and Sealers** , may control or eliminate odors in the interior and luggage compartment areas of GM vehicles. This non-toxic, biodegradable, odorless product has been shown to greatly reduce or remove the following types of odor:

- Objectionable smells of mold and mildew resulting from vehicle water leaks
- Customer created odors, such as smoke

You may safely use GM Vehicle Care Odor Eliminator on fabrics, vinyl, leather, carpet, and sound deadening materials. You may also induce this product into HVAC modules and instrument panel ducts for the control of non-bacterial related odors.

NOTE: **This product leaves no residual scent and should not be used as an air freshener.**

This product may result in the permanent elimination of an odor and may be preferable to customers whose allergies make them sensitive to perfumes. This product may effectively remove odors when directly contacting the odor source. In cases such as water leaks, use this product with diagnostic procedures to first eliminate the primary cause of the odor. Then use further applications on the residual odor to permanently correct the vehicle condition.

How to Use this Product

- Spray GM Vehicle Care Odor Eliminator directly or as an additive with carpet shampoo in steam cleaners.
- Do not use on any interior surface that plain water would deteriorate, because this product will have the same effect. Also avoid letting this product come into contact with vinegar or any acidic substance. Acid-based products will hamper the effectiveness of GM Vehicle Care Odor Eliminator.
- Complete 8 page treatment sheets are enclosed within each case of GM Vehicle Care Odor Eliminator.

These treatment instructions range from simple vehicle odor elimination to full step by step procedures for odor removal from water leaks. If lost, contact your dealership to get a replacement set.

- Instructions and cautions are printed on the bottle, but additional help is available. If you encounter a persistent or recurring odor, you may call the dealership to obtain additional information and usage suggestions.

FLOOR CARPET DRYING

If the carpet or the pad or insulator is wet, use the following criteria for drying or for replacing the components:

- For a 1-piece carpet assembly bonded to a cotton or a fiber padding, replace the entire assembly.
- For a 2-piece carpet assembly with a cotton or a fiber padding, replace the padding only. While the carpet is out of the vehicle, dry the carpet using the method described below.
- For a 1-piece carpet assembly bonded to a foam padding or attached to a synthetic padding, dry the carpet using the method described below.
- For a 2-piece carpet assembly with a synthetic padding, dry the assembly using the method described below.

Drying Method

1. If you observe puddles of liquid on the carpet face, use a wet vacuum to remove the excess moisture.
2. Blot the face of the carpet with a towel in order to absorb as much moisture as possible.
3. Point a fan at the affected area and air dry the carpet.

Callout	Component Name
Preliminary Procedures	
1. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u>	
2. If equipped with AWD, remove the drivetrain and front suspension frame transmission protector. Refer to <u>Drivetrain and Front Suspension Frame Transmission Protector Replacement (AWD)</u> .	
1	Front Compartment Splash Shield Retainer (Qty 2)
2	CAUTION: Refer to <u>Fastener Caution</u> .
	Front Compartment Splash Shield Fastener (Qty 3) Tighten: 3 (27 lb in)
3	Front Compartment Splash Shield

DRIVETRAIN AND FRONT SUSPENSION FRAME TRANSMISSION PROTECTOR REPLACEMENT (AWD)

Fig. 2: Drivetrain and Front Suspension Frame Transmission Protector (AWD)
 Courtesy of GENERAL MOTORS COMPANY

Drivetrain and Front Suspension Frame Transmission Protector Replacement (AWD)

Callout	Component Name
Preliminary Procedures	
Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> .	
1	CAUTION: Refer to <u>Fastener Caution</u> . Drivetrain and Front Suspension Frame Transmission Protector Fastener (Qty: 2) Tighten: 35 (26 lb ft)
2	Drivetrain and Front Suspension Frame Transmission Protector (Qty: 2)

UNDERBODY FRONT AIR DEFLECTOR REPLACEMENT - LEFT SIDE

Fig. 3: Underbody Front Air Deflector - Left Side
 Courtesy of GENERAL MOTORS COMPANY

Underbody Front Air Deflector Replacement - Left Side

Callout	Component Name
WARNING: Do not use a service jack to lift this vehicle. Lifting the vehicle with a jack could cause the vehicle to slip off the jack and roll; this could cause injury or death.	
Preliminary Procedures <ol style="list-style-type: none"> 1. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Remove rear air deflector replacement left side. Refer to <u>Underbody Rear Air Deflector Replacement - Left Side (HP6)</u>. 	
1	Underbody Front Air Deflector Fastener (Qty: 6) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 2.5 N.m (22 lb in)
2	Underbody Left Front Air Deflector Fastener (Qty: 2)
3	Underbody Left Front Air Deflector

UNDERBODY FRONT AIR DEFLECTOR REPLACEMENT - RIGHT SIDE

Fig. 4: Underbody Front Air Deflector - Right Side
Courtesy of GENERAL MOTORS COMPANY

Underbody Front Air Deflector Replacement - Right Side

Callout	Component Name
WARNING: Do not use a service jack to lift this vehicle. Lifting the vehicle with a jack could cause the vehicle to slip off the jack and roll; this could cause injury or death.	
Preliminary Procedure <ol style="list-style-type: none">1. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> .2. Remove rear air deflector replacement right side. Refer to <u>Underbody Rear Air Deflector Replacement - Right Side (HP6)</u>.	
1	Underbody Front Air Deflector Fastener (Qty: 8) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 2.5 N.m (22 lb in)

UNDERBODY REAR AIR DEFLECTOR REPLACEMENT - LEFT SIDE (HP6)

Fig. 5: Underbody Rear Air Deflector - Left Side (HP6)

Courtesy of GENERAL MOTORS COMPANY

Underbody Rear Air Deflector Replacement - Left Side (HP6)

Callout	Component Name
Preliminary Procedures	
Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> .	
1	Underbody Rear Air Deflector Fasteners (Qty: 3) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 3 (27 lb in)
2	Underbody Rear Air Deflector Retainers (Qty: 2)
3	Underbody Rear Air Deflector - Left Side

UNDERBODY REAR AIR DEFLECTOR REPLACEMENT - RIGHT SIDE (HP6)

Fig. 6: Underbody Rear Air Deflector - Right Side (HP6)
 Courtesy of GENERAL MOTORS COMPANY

Underbody Rear Air Deflector Replacement - Right Side (HP6)

Callout	Component Name
Preliminary Procedures	
Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> .	
1	Underbody Rear Air Deflector Fasteners (Qty: 3) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 3 (27 lb in)
2	Underbody Rear Air Deflector Fasteners (Qty: 7) Tighten 3 (27 lb in)
3	Underbody Rear Air Deflector - Right Side

DRIVETRAIN AND FRONT SUSPENSION FRAME REPLACEMENT

Removal Procedure

NOTE: Vehicle alignment is not required if the cradle is being lowered or dropped

to perform another procedure. Only align id replacing the cradle with a **NEW** part and transferring components.

1. Install the engine support fixture. Refer to **Engine Support Fixture** .
2. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
3. Remove the front wheels. Refer to **Tire and Wheel Removal and Installation** .
4. Remove the front fascia. Refer to **Front Bumper Fascia Replacement** .

Fig. 7: Tying Radiator, Air Conditioning Condenser And Fan Module Assembly To Upper Radiator Support

Courtesy of GENERAL MOTORS COMPANY

5. Tie the radiator, air conditioning condenser, and fan module assembly to the upper radiator support to keep the assembly with the vehicle when the frame is lowered.
6. Disconnect the left and right stabilizer links from the strut assemblies. Refer to **Stabilizer Shaft Link Replacement (GNA, GNB)** .
7. Disconnect the tie rod ends from the steering knuckles. Refer to **Steering Linkage Outer Tie Rod Replacement** .
8. Remove the two steering gear retaining fasteners. Refer to **Electric Belt Drive Rack and Pinion Steering Gear Replacement (FWD, LTG, MR6, NJ2)** , **Electric Belt Drive Rack and Pinion Steering Gear Replacement (AWD, LTG, M7U, NJ2)** , for EPS steering or **Electric Dual Pinion Rack and**

Pinion Steering Gear Replacement (FWD, LUK, MHH, NJ1) , **Electric Dual Pinion Rack and Pinion Steering Gear Replacement (FWD, LTG, M7U, NJ1)** for rack and pinion steering.

9. Using mechanics wire suspend the steering gear from the powertrain.
10. Remove the front exhaust pipe. Refer to **Exhaust Front Pipe Replacement (LTG)** , **Exhaust Front Pipe Replacement (LUK)** , **Exhaust Front Pipe Replacement (LTG AWD)** .
11. If equipped with AWD, remove the propeller shaft. Refer to **Propeller Shaft Replacement** .

Fig. 8: Identifying Front Transmission Mount Through Bolt
Courtesy of GENERAL MOTORS COMPANY

12. Remove the front transmission mount through bolt (1).

Fig. 9: Transaxle Mount Components

Courtesy of GENERAL MOTORS COMPANY

13. Remove the rear transmission mount fasteners (3, 4).
14. Separate the lower ball joints from the steering knuckles (1). Refer to **Lower Control Arm Replacement (GNA)** , **Lower Control Arm Replacement (GNB)** .

Fig. 10: Electrical Harness And Power Steering Cooler Line Clips
Courtesy of GENERAL MOTORS COMPANY

15. Remove the electrical harness and the power steering cooler line from the clips in the frame (2).
16. Mark the location of the frame using spray paint for correct positioning during installation.
17. Carefully lower the vehicle until the frame contacts the support table.

Fig. 11: Frame And Mounting Hardware
Courtesy of GENERAL MOTORS COMPANY

18. Remove the reinforcement bolts (2). DISCARD the bolts.
19. Remove the rear frame to body bolts (3).
20. Remove the reinforcements (1) from the vehicle.
21. Remove the front frame-to-body bolts (4).
22. Carefully raise the vehicle to separate the frame from the body.

NOTE: Do not separate the stabilizer bar bracket from the insulator and stabilizer bar when transferring parts.

23. If replacing the frame, transfer components as necessary.

Installation Procedure

1. Carefully lower the vehicle until contacts the frame assembly and is correctly positioned within the spray painted areas.

Fig. 12: Frame And Mounting Hardware
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

2. Install the frame retaining fasteners (3, 4) and tighten to 160 (118 lb ft).
3. Install NEW frame reinforcement fasteners (2) and tighten to 60 N.m (31 lb ft) plus 30 degrees.

Fig. 13: Identifying Front Transmission Mount Through Bolt
Courtesy of GENERAL MOTORS COMPANY

4. Install the front transmission mount through bolt (1) and tighten to 100 (74 lb ft).

Fig. 14: Transaxle Mount Components
Courtesy of GENERAL MOTORS COMPANY

5. Install the rear transmission mount fastener (3) and tighten to 62 (46 lb ft).
6. Install the rear transmission mount fasteners (4) and tighten to 100 (74 lb ft).
7. Remove the mechanics wire and install the steering gear with NEW fasteners and tighten to 110 N.m (81 lb ft) plus 150 degrees, plus 15 degrees.

Fig. 15: Electrical Harness And Power Steering Cooler Line Clips
Courtesy of GENERAL MOTORS COMPANY

8. Install the electrical harness and the power steering cooler line to the clips in the frame (2).
9. Connect the ball joint studs to the steering knuckles (1). Refer to **Lower Control Arm Replacement (GNA)** , **Lower Control Arm Replacement (GNB)** .
10. Untie the radiator, air conditioning condenser, and fan module assembly from the upper radiator support.
11. Connect the left and right stabilizer links to the strut assemblies. Refer to **Stabilizer Shaft Link Replacement (GNA, GNB)** .
12. Connect the tie rod ends to the steering knuckles. Refer to **Steering Linkage Outer Tie Rod Replacement** .
13. Install the front exhaust pipe. Refer to **Exhaust Front Pipe Replacement (LTG)** , **Exhaust Front Pipe Replacement (LUK)** , **Exhaust Front Pipe Replacement (LTG AWD)** .
14. If equipped with AWD, install the propeller shaft. Refer to **Propeller Shaft Replacement** .
15. Remove the engine support fixture.
16. Install the front fascia. Refer to **Front Bumper Fascia Replacement** .
17. Install the front wheels. Refer to **Tire and Wheel Removal and Installation** .
18. Lower the vehicle.
19. Check the wheel alignment if replacing the drivetrain and front suspension frame. Refer to **FRONT CAMBER ADJUSTMENT (GNB)** or **FRONT CAMBER ADJUSTMENT (GNA) Wheel Alignment**

- Steering Wheel Angle and/or Front Toe Adjustment .

REAR SUSPENSION SUPPORT REPLACEMENT (GNC)

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Remove the rear tire and wheel assemblies. Refer to **Tire and Wheel Removal and Installation** .
3. Remove the rear muffler assembly. Refer to **Exhaust Muffler Replacement (Dual)** , **Exhaust Muffler Replacement (Single)** .
4. Disconnect the stabilizer shaft from stabilizer shaft links. Refer to **Stabilizer Shaft Replacement (GNC)** .
5. Remove the park brake cables from the support. Refer to **Parking Brake Rear Cable Replacement** .
6. Remove the lower control arms from the vehicle. Refer to **Rear Axle Lower Control Arm Replacement (GNC)** .
7. Remove the adjust links from the from the vehicle. Refer to **Adjust Link Replacement (GNC)** .
8. Remove the upper control arm inner fasteners. Refer to **Rear Axle Upper Control Arm Replacement (GNC)** .
9. Position a transmission jack under the rear support and firmly secure the support to the jack with straps.
10. Mark the location of the frame using spray paint for correct positioning during installation.

Fig. 16: Identifying Support Assembly To Body Bolts (Sedan/Coupe)
Courtesy of GENERAL MOTORS COMPANY

11. Remove the support fastener and discard them.
12. With the aid of an assistant, lower the support from the transmission jack stand.
13. Remove the stabilizer shaft from the rear support.

Installation Procedure

NOTE: When transferring any suspension components, refer to each suspension component replacement procedure for the proper torque specifications.

1. Install the stabilizer shaft assembly on to the support. Refer to **Stabilizer Shaft Replacement (GNC)** .
2. With the aid of an assistant, position the rear support onto the transmission jack and firmly secure the support to the jack with straps.
3. Carefully lower the vehicle until contacts the frame assembly and is correctly positioned within the spray painted areas.

Fig. 17: Identifying Support Assembly To Body Bolts (Sedan/Coupe)
 Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

4. Install the NEW support fastener and tighten to 90 N.m (66 lb ft).
5. Tighten the support fastener an additional 120 degrees .
6. Remove the transmission jack stand.
7. Install the upper control arm inner fasteners. Refer to Rear Axle Upper Control Arm Replacement (GNC) .
8. Install the adjust links to the support. Refer to Adjust Link Replacement (GNC) .
9. Install the lower control arms. Refer to Rear Axle Lower Control Arm Replacement (GNC) .
10. Install the park brake cables to the rear support. Refer to Parking Brake Rear Cable Replacement .
11. Install the rear muffler assembly. Refer to Exhaust Muffler Replacement (Dual) , Exhaust Muffler Replacement (Single)
12. Connect the stabilizer shaft links to the stabilizer shaft. Refer to Stabilizer Shaft Replacement (GNC) .
13. Install the rear tire and wheel assemblies. Refer to Tire and Wheel Removal and Installation .

14. Lower the vehicle.
15. Realign the rear suspension. Refer to Wheel Alignment Measurement .

REAR SUSPENSION SUPPORT REPLACEMENT (GNE)

Removal Procedure

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove the tires and wheels. Refer to Tire and Wheel Removal and Installation .
3. Remove the exhaust muffler. Refer to Exhaust Muffler Replacement (Dual) , Exhaust Muffler Replacement (Single) .
4. Remove the park brake cables from the support. Refer to Parking Brake Rear Cable Replacement .
5. Remove the shock absorber lower fastener. Refer to Shock Absorber Replacement (GNE) .
6. Remove the rear wheel hub brackets. Refer to Rear Wheel Hub Bracket Replacement .
7. Remove the lower control arms from the vehicle. Refer to Rear Axle Lower Control Arm Replacement (GNE) .
8. Remove the upper control arms from the vehicle. Refer to Rear Axle Upper Control Arm Replacement (GNE) .

Fig. 18: Reinforcement Arm Bolts
Courtesy of GENERAL MOTORS COMPANY

9. Remove reinforcement arm bolts (1) to body.
10. Remove the outer fastener adjustment links. Refer to **Adjust Link Replacement (GNE)** .
11. Remove the rear wheel drive shafts. Refer to **Rear Wheel Drive Shaft Replacement** .
12. Remove the differential carrier assembly. Refer to **Differential Carrier Assembly Replacement** .
13. Position a transmission jack under the rear support and firmly secure the support to the jack with straps.
14. Mark the location of the frame using spray paint for correct positioning during installation.

Fig. 19: Rear Support To Body Bolts
Courtesy of GENERAL MOTORS COMPANY

15. Remove the 4 rear support to body bolts (1).
16. Remove the rear support assembly from the vehicle.
17. Remove the inner fastener from adjustments links. Refer to **Adjust Link Replacement (GNE)** .
18. With the aid of an assistant, remove the rear support from the transmission jack and place it on the floor.

Installation Procedure

NOTE: When transferring any suspension components, refer to each suspension component replacement procedure for the proper torque specifications.

1. With the aid of an assistant, position the rear support onto the transmission jack and firmly secure the support to the jack with straps.
2. Install the inner fastener to adjustments links. Refer to **Adjust Link Replacement (GNE)** .
3. Carefully lower the vehicle until contacts the frame assembly and is correctly positioned within the spray painted areas.

Fig. 20: Rear Support To Body Bolts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to **Fastener Caution** .

4. Install 4 NEW rear support to body bolts (1) and tighten to:
 - First Pass: 90 N.m (66 lb ft)
 - Second Pass: plus 180 degrees
 - Final Pass: plus 15 degrees
5. Install the differential. Refer to **Differential Carrier Assembly Replacement** .
6. Install the rear wheel drive shafts. Refer to **Rear Wheel Drive Shaft Replacement** .
7. Install the outer fastener adjustment links. Refer to **Adjust Link Replacement (GNE)** .

Fig. 21: Reinforcement Arm Bolts

Courtesy of GENERAL MOTORS COMPANY

8. Install NEW reinforcements arm bolts (1) to body and tighten to:
 - First Pass: 150 N.m (111 lb ft)
 - Second Pass: plus 30 degrees
 - Final Pass: plus 15 degrees
9. Install the upper control arms. Refer to **Rear Axle Upper Control Arm Replacement (GNE)** .
10. Install the lower control arms. Refer to **Rear Axle Lower Control Arm Replacement (GNE)** .
11. Install the rear wheel hub brackets. Refer to **Rear Wheel Hub Bracket Replacement** .
12. Install the shock absorber lower fastener. Refer to **Shock Absorber Replacement (GNE)** .
13. Install the park brake cable. Refer to **Parking Brake Rear Cable Replacement** .
14. Install the exhaust muffler. Refer to **Exhaust Muffler Replacement (Dual)** , **Exhaust Muffler Replacement (Single)** .
15. Install the tires and wheels. Refer to **Tire and Wheel Removal and Installation** .
16. Check the rear alignment. Refer to **Wheel Alignment Measurement** .

REAR SUSPENSION SUPPORT BUSHING REPLACEMENT (GNC)

Special Tools

- **CH-48377** Remover/Installer
- **CH-49233** Bushing Tool
- **CH-50196** Bushing Installer
- **DT-49126-10** Bushing Remov and Install Kit

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Remove the tires and wheels. Refer to **Tire and Wheel Removal and Installation** .
3. Remove the exhaust muffler. Refer to **Exhaust Muffler Replacement (Dual)** , **Exhaust Muffler Replacement (Single)** .
4. Remove shock absorber lower fastener. Refer to **Shock Absorber Replacement (GNC)** .
5. Remove rear springs. Refer to **Rear Spring, Insulator, and Jounce Bumper Replacement** .
6. Disconnect the electrical connection.

Fig. 22: Reinforcement Arm Bolts
Courtesy of GENERAL MOTORS COMPANY

7. Remove reinforcement arm bolts (1) to body.
8. Remove the propeller shaft. Refer to **Propeller Shaft Replacement** .

9. Position a transmission jack under the rear support and firmly secure the support to the jack with straps.
10. Mark up support position to body with spray paint.

Fig. 23: Rear Support To Body Bolts
Courtesy of GENERAL MOTORS COMPANY

11. Remove the 4 rear support to body bolts (1).
12. Remove the rear support assembly from the vehicle.
13. With the aid of an assistant, remove the rear support from the transmission jack and place it on the floor.
14. Remove the washers from the front bushings.

Fig. 24: Rubber Bushing

Courtesy of GENERAL MOTORS COMPANY

15. Drill through rubber bushings with drill 8 mm. See diagram.

Fig. 25: Removing Bushings

Courtesy of GENERAL MOTORS COMPANY

16. Remove the bushings by placing **CH-48377-1** drift mandrel between bushings and wall of rear axle and drift out.

Installation Procedure

NOTE: When transferring any suspension components, refer to each suspension component replacement procedure for the proper torque specifications.

Fig. 26: Locating Front Bushings

Courtesy of GENERAL MOTORS COMPANY

1. Locate the front bushings as shown in the picture.

Fig. 27: Rear Bushing

Courtesy of GENERAL MOTORS COMPANY

NOTE: The bushing can be damaged if it is pressed to deep. The bushing should be pressed so that the flange on the bushing is resting on the rear suspension support.

2. Position the rear bushings in the frame.

Fig. 28: Removing/Installing Bushings
Courtesy of GENERAL MOTORS COMPANY

NOTE: Apply a small amount of silicone grease on the bushing prior to installing.

3. Use the **DT-49126-10** tool (1), **CH-50196** tool (3) and the **CH-49233** tool (2), install the bushing.
4. With the aid of an assistant, position the rear support onto the transmission jack and firmly secure the support to the jack with straps.
5. Position the rear support assembly to the vehicle.

Fig. 29: Rear Support To Body Bolts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

6. Install 4 NEW rear support to body bolts (1).

Tighten

Tighten to 90 N.m (66 lb ft) + 180 degrees + 15 degrees.

7. Connect the electrical connection.
8. Install rear springs. Refer to Rear Spring, Insulator, and Jounce Bumper Replacement .
9. Install the propeller shaft. Refer to Propeller Shaft Replacement .

Fig. 30: Reinforcement Arm Bolts

Courtesy of GENERAL MOTORS COMPANY

10. Install NEW reinforcements arm bolts (1) to body.

Tighten

Tighten the bolts to 150 N.m (111 lb ft) + 30 degrees + 15 degrees.

11. Install shock absorber lower fastener. Refer to **Shock Absorber Replacement (GNC)** .
12. Install the exhaust muffler. Refer to **Exhaust Muffler Replacement (Dual)** , **Exhaust Muffler Replacement (Single)** .
13. Install the tires and wheels. Refer to **Tire and Wheel Removal and Installation** .
14. Lower the vehicle.
15. Check the rear alignment. Refer to **Wheel Alignment Measurement** .

DRIVETRAIN AND FRONT SUSPENSION FRAME INSULATOR REPLACEMENT

Special Tools

- **J-45296-1** Frame Insulator Remover and Installer
- **J-45725-2** Bushing Replacer

For equivalent regional tools, refer to **Special Tools**.

Removal Procedure

1. Separate the frame from the body approximately 70 mm. Refer to **Drivetrain and Front Suspension Frame Replacement**.

Fig. 31: Removing/Installing Bushings
Courtesy of GENERAL MOTORS COMPANY

2. Remove the bushings using **J-45296-1** remover and installer and **J-45725-2** replacer (2) .

Installation Procedure

Fig. 32: Locating Front Bushing

Courtesy of GENERAL MOTORS COMPANY

1. Locate the front bushings as shown.

Fig. 33: Removing/Installing Bushings
Courtesy of GENERAL MOTORS COMPANY

2. Install the bushings using **J-45296-1** remover and installer and **J-45725-2** replacer (2).
3. Install the frame to the body. Refer to **Drivetrain and Front Suspension Frame Replacement**.

FRONT WHEELHOUSE FRONT LINER REPLACEMENT

Fig. 34: Front Wheelhouse Front Liner & Mounting Components
 Courtesy of GENERAL MOTORS COMPANY

Front Wheelhouse Front Liner Replacement

Callout	Component Name
Preliminary Procedure Remove the tire and wheel. Refer to <u>Tire and Wheel Removal and Installation</u> .	
1	Front Wheelhouse Front Liner Fastener (Qty: 3)
2	Front Wheelhouse Front Liner Retainer (Qty: 4) Procedure Use a BO-569-A lifter to aid in the removal of the front wheelhouse front liner. Special Tools BO-569-A Plug Lifter For equivalent regional tools, refer to <u>Special Tools</u> .
3	Front Wheelhouse Front Liner

FRONT WHEELHOUSE REAR LINER REPLACEMENT

Fig. 35: Front Wheelhouse Rear Liner & Retainers
 Courtesy of GENERAL MOTORS COMPANY

Front Wheelhouse Rear Liner Replacement

Callout	Component Name
Preliminary Procedure Remove the tire and wheel. Refer to <u>Tire and Wheel Removal and Installation</u> .	
1	Front Wheelhouse Rear Liner Retainer (Qty: 5) Procedure Use a BO-569-A lifter to aid in the removal of the front wheelhouse rear liner. Special Tools BO-569-A Plug Lifter For equivalent regional tools, refer to <u>Special Tools</u> .
2	Front Wheelhouse Rear Liner

REAR WHEELHOUSE LINER REPLACEMENT

Fig. 36: Rear Wheelhouse Panel Liner & Mounting Components
 Courtesy of GENERAL MOTORS COMPANY

Rear Wheelhouse Liner Replacement

Callout	Component Name
Preliminary Procedure	
Remove the tire and wheel assembly. Refer to <u>Tire and Wheel Removal and Installation</u> .	
1	Rear Wheelhouse Liner Panel Retainer
2	Rear Wheelhouse Liner Panel Fastener (Qty: 4) CAUTION: Refer to <u>Fastener Caution</u> .
3	Rear Wheelhouse Liner Panel Retainer
4	Rear Wheelhouse Liner Panel Fastener (Qty: 3)
5	Rear Wheelhouse Liner Panel

1. Use NEW fastener.		

REPAIR INSTRUCTIONS

STABILIZER SHAFT REPLACEMENT (GNA, GNB)

Fig. 1: Stabilizer Shaft & Clamp Bolts (GNA, GNB)
 Courtesy of GENERAL MOTORS COMPANY

Stabilizer Shaft Replacement (GNA, GNB)

Callout	Component Name
Preliminary Procedure <ol style="list-style-type: none"> 1. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Remove the tire and wheel assemblies. Refer to <u>Tire and Wheel Removal and Installation</u> . 3. Disconnect the stabilizer shaft links from the stabilizer shaft. Refer to <u>Stabilizer Shaft Link Replacement (GNA, GNB)</u>. 4. Lower the rear of the drivetrain and front suspension frame to gain enough clearance to remove the stabilizer shaft. Refer to <u>Drivetrain and Front Suspension Frame Replacement</u> . 	
1	Stabilizer Shaft Insulator Clamp Bolt (Qty: 4) CAUTION: Refer to <u>Fastener Caution</u> . CAUTION: This vehicle is equipped with torque-to-yield or single use fasteners. Install a NEW torque-to-yield or single use fastener when installing this component. Failure to replace the torque-to-yield or single use fastener could cause damage to the vehicle or component.

	Procedure Remove and discard the bolts. DO NOT reuse, replace with NEW only. Tighten 22 N.m (16 lb ft) + 30 degrees
2	Stabilizer Shaft

STABILIZER SHAFT LINK REPLACEMENT (GNA, GNB)

Fig. 2: Stabilizer Shaft Link (GNA, GNB)
 Courtesy of GENERAL MOTORS COMPANY

Stabilizer Shaft Link Replacement (GNA, GNB)

Callout	Component Name
Preliminary Procedure	
1. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Remove the tire and wheel assembly. Refer to <u>Tire and Wheel Removal and Installation</u> . 3. Disconnect any harnesses or retainers secured to the stabilizer shaft link. Note any attaching points to aid in installation.	
1	Stabilizer Shaft Link Nut (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> .

	Tighten 65 N.m (48 lb ft)
2	Stabilizer Shaft Link

STABILIZER SHAFT INSULATOR REPLACEMENT

The stabilizer shaft insulator is not serviced separately, but with the stabilizer shaft. For the stabilizer shaft replacement, refer to **Stabilizer Shaft Replacement (GNA, GNB)**.

FRONT WHEEL BEARING AND HUB REPLACEMENT (GNB)

Fig. 3: Front Wheel Bearing And Hub Assembly, Front Brake Shield & Bolts (GNB)
 Courtesy of GENERAL MOTORS COMPANY

Front Wheel Bearing and Hub Replacement (GNB)

Callout	Component Name
Preliminary Procedure <ol style="list-style-type: none"> 1. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Remove the front suspension strut yoke. Refer to <u>Front Suspension Strut Yoke Replacement (GNB)</u>. 	
1	Front Wheel Bearing and Hub Assembly Bolt (Qty: 3) CAUTION: Refer to <u>Fastener Caution</u> . CAUTION: This vehicle is equipped with torque-to-yield or single use fasteners. Install a NEW torque-to-yield or single use fastener when installing this component. Failure to replace the torque-to-yield or single use fastener could cause damage to the vehicle or

	component. Procedure Remove and discard the bolts. DO NOT re-use, replace with NEW only. Tighten 100 N.m (74 lb ft) + 60 degrees
2	Front Brake Shield
3	Front Wheel Bearing and Hub Assembly

FRONT WHEEL BEARING AND HUB REPLACEMENT (GNA)

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Remove the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
3. Disconnect the front wheel drive shaft from the front wheel bearing and hub assembly. Refer to **Front Wheel Drive Shaft Replacement - Left Side** , or **Front Wheel Drive Shaft Replacement - Right Side** .
4. Remove the front brake rotor. Refer to **Front Brake Rotor Replacement (J60, J61)** , **Front Brake Rotor Replacement (J64)** .
5. Remove the front wheel speed sensor. Refer to **Front Wheel Speed Sensor Replacement (Without F45)** , **Front Wheel Speed Sensor Replacement (With F45)** .

Fig. 4: Front Wheel Bearing And Hub Assembly
Courtesy of GENERAL MOTORS COMPANY

6. Remove the front wheel bearing and hub assembly bolts (1).

Fig. 5: Front Wheel Bearing And Hub Assembly And Front Brake Shield
Courtesy of GENERAL MOTORS COMPANY

7. Remove the front wheel bearing and hub assembly (1) and front brake shield (2) from the steering knuckle.

Installation Procedure

Fig. 6: Front Wheel Bearing And Hub Assembly And Front Brake Shield
Courtesy of GENERAL MOTORS COMPANY

1. Position the front brake shield (2) and wheel bearing and hub assembly (1) on the steering knuckle.

Fig. 7: Front Wheel Bearing And Hub Assembly
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

2. Install the front wheel bearing and hub assembly bolts (1) and tighten to 100 N.m (74 lb ft) + 75 degrees.
3. Install the front wheel speed sensor. Refer to Front Wheel Speed Sensor Replacement (Without F45) , Front Wheel Speed Sensor Replacement (With F45) .
4. Install the front brake rotor. Refer to Front Brake Rotor Replacement (J60, J61) , Front Brake Rotor Replacement (J64) .
5. Connect the front wheel drive shaft to the front wheel bearing and hub assembly. Refer to Front Wheel Drive Shaft Replacement - Left Side , or Front Wheel Drive Shaft Replacement - Right Side .
6. Install the tire and wheel assembly. Refer to Tire and Wheel Removal and Installation .

STEERING KNUCKLE REPLACEMENT (GNA)

Fig. 8: Steering Knuckle (GNA)

Courtesy of GENERAL MOTORS COMPANY

Steering Knuckle Replacement (GNA)

Callout	Component Name
Preliminary Procedures <ol style="list-style-type: none"> 1. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Remove the tire and wheel assembly. Refer to <u>Tire and Wheel Removal and Installation</u> . 3. Remove the front wheel bearing and hub assembly. Refer to <u>Front Wheel Bearing and Hub Replacement (GNA)</u>. 	
1	Steering Knuckle CAUTION: Do not pry in such a way that the ball joint seal is contacted. Damage to the seal may result. <ol style="list-style-type: none"> 1. Disconnect the steering linkage outer tie rod from the steering knuckle. Refer to <u>Steering Linkage Outer Tie Rod Replacement</u> . 2. Disconnect the strut assembly from the steering knuckle. Refer to <u>Strut Assembly Removal and Installation (GNA)</u>. 3. Disconnect the lower control arm from the steering knuckle. Refer to <u>Lower Control Arm Replacement (GNA)</u>.

STEERING KNUCKLE REPLACEMENT (GNB)

Removal Procedure

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove the front suspension strut yoke. Refer to Front Suspension Strut Yoke Replacement (GNB).
3. Remove the front wheel bearing and hub assembly. Refer to Front Wheel Bearing and Hub Replacement (GNB).

Fig. 9: King Pin Bushing Nuts

Courtesy of GENERAL MOTORS COMPANY

4. Loosen the steering knuckle king pin bushing nuts (1) until they are even with the steering knuckle king pin bushing studs or two or three threads of each nut are exposed.
5. Use a hammer and brass punch to drive both of the steering knuckle king pin bushing studs partially inward to release the knurls from the steering knuckle king pin bushing.
6. Completely remove the steering knuckle king pin bushing nuts.
7. Disconnect the steering knuckle upper ball stud from the steering knuckle. Refer to Steering Knuckle Upper Ball Stud Replacement (GNB).

Fig. 10: Steering Knuckle

Courtesy of GENERAL MOTORS COMPANY

8. Remove the steering knuckle (1) from the front suspension strut yoke.

Installation Procedure

Fig. 11: Steering Knuckle

Courtesy of GENERAL MOTORS COMPANY

NOTE: Ensure the steering knuckle upper ball stud is properly aligned in the steering knuckle.

1. Position the steering knuckle (1) in the front suspension strut yoke.
2. Connect the steering knuckle upper ball stud to the steering knuckle. Refer to **Steering Knuckle Upper Ball Stud Replacement (GNB)**.

Fig. 12: King Pin Bushing Nuts

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

NOTE: The steering knuckle king pin bushing nuts should be tightened in small increments to ensure the steering knuckle king pin bushing bolts are drawn into the front suspension strut yoke correctly.

3. Tighten the steering knuckle king pin bushing nuts (1) in small, equal increments to 70 N.m (52 lb ft).
4. Install the front wheel bearing and hub assembly. Refer to Front Wheel Bearing and Hub Replacement (GNB).
5. Install the front suspension strut yoke. Refer to Front Suspension Strut Yoke Replacement (GNB).

STEERING KNUCKLE UPPER BALL STUD REPLACEMENT (GNB)

Fig. 13: Steering Knuckle Upper Ball Stud (GNB)

Courtesy of GENERAL MOTORS COMPANY

Steering Knuckle Upper Ball Stud Replacement (GNB)

Callout	Component Name
Preliminary Procedure	
<ol style="list-style-type: none"> 1. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Remove the front suspension strut yoke. Refer to <u>Front Suspension Strut Yoke Replacement (GNB)</u>. 	
1	<p>Steering Knuckle Camber Adjust Nut (Qty: 2)</p> <p>CAUTION: Refer to <u>Fastener Caution</u> .</p> <p>NOTE:</p> <ul style="list-style-type: none"> • The steering knuckle camber adjust nuts are two different sizes. Note the position of the nuts prior to removing or replacing them. • Do not completely tighten the steering knuckle camber adjust nuts during installation. Tighten the nuts to specification after the front suspension alignment is completed. <p>Tighten</p> <ul style="list-style-type: none"> • Upper Nut to 70 (52 lb ft) + 60 degrees • Lower Nut to 115 (85 lb ft) + 45 degrees
2	Steering Knuckle Camber Adjust Washer
3	Steering Knuckle Camber Adjust Bolt
4	Steering Knuckle Bolt
	Steering Knuckle Nut

5	<p>Procedure Use a suitable tool to hold the steering knuckle upper ball stud while removing the steering knuckle nut.</p> <p>Tighten 45 (33 lb ft) + 45 degrees</p>
6	<p>Steering Knuckle Upper Ball Joint</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Use the CH-43631 separator to remove the steering knuckle upper ball joint from the steering knuckle. 2. Align the front suspension. Refer to <u>Wheel Alignment Specifications</u> . <p>Special Tools CH-43631 Ball Joint Separator For regional equivalent tools, refer to <u>Special Tools</u>.</p>

LOWER CONTROL ARM REPLACEMENT (GNA)

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Remove the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
3. Disconnect any harnesses or retainers secured to the lower control arm. Note any attaching points to aid in installation.

Fig. 14: Steering Knuckle

Courtesy of GENERAL MOTORS COMPANY

4. Remove the steering knuckle nut (1) and bolt (2). Discard the bolt.

NOTE: Always use the appropriate tools to pry open the pinch joint on the steering knuckle at the lower control arm ball joint.

5. Pry open the pinch joint to separate the lower control arm ball joint from the steering knuckle.
6. Support the lower control arm with a jackstand or other suitable tool.

Fig. 15: Front Lower Control Arm
Courtesy of GENERAL MOTORS COMPANY

NOTE: The steering knuckle is not shown for clarity only. It is not necessary to remove the steering knuckle to service the lower control arm.

7. Remove the front lower control arm front nut (1) and bolt (2). Discard the bolt.

Fig. 16: Front Lower Control Arm
Courtesy of GENERAL MOTORS COMPANY

NOTE: The steering knuckle is not shown for clarity only. It is not necessary to remove the steering knuckle to service the lower control arm.

8. Remove the front lower control arm rear nuts (1) and bolts (2). Discard the bolts.
9. Remove the lower control arm (3) from the vehicle.
10. Transfer components as necessary.

Installation Procedure

Fig. 17: Front Lower Control Arm
Courtesy of GENERAL MOTORS COMPANY

1. Support the lower control arm (3) with a jackstand or other suitable tool and position the control arm on the vehicle.
2. Start the NEW front lower control arm rear bolts (2) and OLD nuts (1) by hand. Do not tighten.

Fig. 18: Front Lower Control Arm
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

CAUTION: This vehicle is equipped with torque-to-yield or single use fasteners. Install a NEW torque-to-yield or single use fastener when installing this component. Failure to replace the torque-to-yield or single use fastener could cause damage to the vehicle or component.

3. Install the OLD front lower control arm front nut (1) and NEW bolt (2) and tighten the bolt to 100 N.m (74 lb ft) + 90 degrees.

Fig. 19: Front Lower Control Arm
Courtesy of GENERAL MOTORS COMPANY

4. Tighten the NEW front lower control arm rear bolts (2) to 100 N.m (74 lb ft) + 90 degrees.
5. Connect the lower control arm ball joint to the steering knuckle.

Fig. 20: Steering Knuckle

Courtesy of GENERAL MOTORS COMPANY

6. Install the NEW steering knuckle bolt (2) and OLD steering knuckle nut (1).
7. Tighten the OLD steering knuckle nut (1) to 50 N.m (37 lb ft).
8. After the initial tightening, loosen the steering knuckle nut (1) 120 degrees.
9. After loosening the steering knuckle nut (1), tighten the nut to 50 N.m (37 lb ft) + 45 degrees.
10. Connect any harnesses or retainers previously disconnected from the lower control arm.
11. Install the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
12. After repairs, verify the front wheel alignment and adjust if necessary. Refer to **Wheel Alignment Measurement** .

LOWER CONTROL ARM REPLACEMENT (GNB)

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Remove the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
3. If equipped, disconnect the electronic suspension front position sensor from the lower control arm.
4. Disconnect any harnesses or retainers secured to the front lower control arm. Note any attaching points to

aid in installation.

Fig. 21: Front Lower Control Arm Nut And Bolt
Courtesy of GENERAL MOTORS COMPANY

5. Remove the front lower control arm rear nuts (1) and bolts (2). Discard the nuts and bolts.

Fig. 22: Front Lower Control Arm, Nuts And Bolts
Courtesy of GENERAL MOTORS COMPANY

6. Remove the steering knuckle nut (3) and bolt (1). Discard the nut and bolt.
7. Remove the steering knuckle bolt (1) at the front lower control arm. Discard the bolt.
8. Remove the front lower control arm front nut (4) and rear nut. Discard the nuts.
9. Remove the front lower control arm front bolts (5). Discard the bolts.
10. Remove the front lower control arm (2) from the vehicle.

Installation Procedure

Fig. 23: Front Lower Control Arm, Nuts And Bolts
 Courtesy of GENERAL MOTORS COMPANY

1. Position the front lower control arm (2) on the vehicle.

CAUTION: Refer to Fastener Caution .

CAUTION: This vehicle is equipped with torque-to-yield or single use fasteners. Install a NEW torque-to-yield or single use fastener when installing this component. Failure to replace the torque-to-yield or single use fastener could cause damage to the vehicle or component.

NOTE:

- Install all of the front lower control arm bolts before tightening to hold the front lower control arm in place.
- Use a suitable support to bring the front lower control arm and suspension up to proper trim height before proceeding to apply final

torque.

2. Install the NEW front lower control arm front bolt (5) and NEW front lower control arm front nut (4) and tighten the bolt to 100 N.m (74 lb ft) + 90 degrees.
3. Install the NEW steering knuckle bolt (1) and NEW steering knuckle nut (3) and tighten the nut to 115 N.m (85 lb ft) + 120 degrees.

Fig. 24: Front Lower Control Arm Nut And Bolt
Courtesy of GENERAL MOTORS COMPANY

4. Install the NEW front lower control arm rear bolts (2) and NEW front lower control arm rear nuts (1) and tighten the bolts to 100 N.m (74 lb ft) + 90 degrees.
5. Connect any harnesses or retainers previously disconnected from the front lower control arm.
6. If equipped, connect the electronic suspension front position sensor to the lower control arm.
7. Install the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .

FRONT LOWER CONTROL ARM REAR BUSHING REPLACEMENT (GNA, GNB)

Fig. 25: Front Lower Control Arm Rear Bushing & Bolt (GNA, GNB)
 Courtesy of GENERAL MOTORS COMPANY

Front Lower Control Arm Rear Bushing Replacement (GNA, GNB)

Callout	Component Name
Preliminary Procedure <ol style="list-style-type: none"> 1. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Remove the tire and wheel assembly. Refer to <u>Tire and Wheel Removal and Installation</u> . 3. Remove the lower control arm. Refer to <u>Lower Control Arm Replacement (GNA)</u>, <u>Lower Control Arm Replacement (GNB)</u>. 	
1	Front Lower Control Arm Rear Bushing Bolt CAUTION: Refer to <u>Fastener Caution</u> . CAUTION: This vehicle is equipped with torque-to-yield or single use fasteners. Install a NEW torque-to-yield or single use fastener when installing this component. Failure to replace the torque-to-yield or single use fastener could cause damage to the vehicle or component. Procedure Discard the bolt. DO NOT re-use, replace with NEW.

	NOTE: Tighten the bolt with the vehicle at ride height. Tighten 55 N.m (41 lb ft) + 100 degrees
2	Front Lower Control Arm Rear Bushing

WHEEL STUD REPLACEMENT

Special Tools

CH-43631 Ball Joint Separator

For equivalent regional tools, refer to **Special Tools**.

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Remove the front wheel bearing and hub assembly. Refer to **Front Wheel Bearing and Hub Replacement (GNB)**, **Front Wheel Bearing and Hub Replacement (GNA)**.

Fig. 26: Removing Wheel Stud

Courtesy of GENERAL MOTORS COMPANY

3. Use the **CH-43631** separator (1) to remove the wheel stud (2) from the front wheel bearing and hub assembly. Discard the stud.

Installation Procedure

Fig. 27: Installing Wheel Stud

Courtesy of GENERAL MOTORS COMPANY

1. Position the NEW wheel stud (1) in the front wheel bearing and hub assembly.
2. Install flat washers (2) and an old wheel nut (3) on the wheel stud.
3. Use a suitable tool to prevent the flange on the front wheel bearing and hub assembly from turning.
4. Tighten the wheel nut until the wheel stud is firmly seated.
5. Remove the wheel nut and flat washers.
6. Install the front wheel bearing and hub assembly. Refer to **Front Wheel Bearing and Hub Replacement (GNB)**, **Front Wheel Bearing and Hub Replacement (GNA)**.

STRUT AND SHOCK ABSORBER INSPECTION

NOTE: The strut assembly **DOES NOT** have to be removed from the vehicle to perform the following inspection procedure.

NOTE: A light film of oil on the top portion of the strut is normal. **DO NOT** replace the strut for this condition.

Fig. 28: Illustrating Of Strut Conditions
Courtesy of **GENERAL MOTORS COMPANY**

Condition 1

Oil or fluid residue only on the bottom of the strut tube or on other strut components and not originating from the shaft seal, is not a strut related problem. **DO NOT** replace the strut, look for other external leaks.

Condition 2

Light film/residue on the strut tube, but not on the spring seat and originating from the shaft seal, is a **NORMAL** condition. **DO NOT** replace the strut.

Condition 3

Oil drip or trail down the strut tube and originating from the shaft seal, is an **ABNORMAL** condition. Replace the strut.

Condition 4

Extreme wet film of oil covering the strut tube and pooling in the spring seat and originating from the shaft seal, is an **ABNORMAL** condition. Replace the strut.

Inspection

1. Verify the customer's concern is present. If the concern is present, continue to the next step. If the concern

is not present, then the vehicle is operating normally.

NOTE: **The strut assembly DOES NOT have to be removed from the vehicle to perform the following inspection procedure.**

2. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
3. Visually inspect each of the shock absorbers or struts for external fluid leaks. Refer to the following conditions 1, 2 , 3 , and 4 for visual inspection.
 - If conditions 1 or 2 are found, continue to step 4.
 - If conditions 3 or 4 are found, replace strut. Refer to Strut Replacement.
4. If equipped with electronic suspension control system, ensure that the system is working properly. Refer to Diagnostic Starting Point-Electronic Suspension Control.
5. Use your hands in order to lift up and push down on each corner of the vehicle 3 times. Remove your hands from the vehicle. If the corner motion exceeds 2 cycles, replace the strut. If the strut does not exceed 2 cycles, NO repair is necessary.

STRUT ASSEMBLY REMOVAL AND INSTALLATION (GNB)

Special Tools

CH-49375 Spanner

For equivalent regional tools, refer to **Special Tools**.

Removal Procedure

1. Remove the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
2. Disconnect the front wheel drive shaft from the steering knuckle. Refer to **Front Wheel Drive Shaft Replacement - Left Side** , or **Front Wheel Drive Shaft Replacement - Right Side** .
3. Remove the front brake rotor. Refer to **Front Brake Rotor Replacement (J60, J61)** , **Front Brake Rotor Replacement (J64)** .
4. Disconnect the steering linkage outer tie rod from the steering knuckle. Refer to **Steering Linkage Outer Tie Rod Replacement** .
5. Disconnect the stabilizer shaft link from the strut assembly. Refer to **Stabilizer Shaft Link Replacement (GNA, GNB)**.
6. Remove the front brake hose from the bracket on the strut assembly.
7. Remove the front wheel speed sensor from the steering knuckle. Refer to **Front Wheel Speed Sensor Replacement (Without F45)** , **Front Wheel Speed Sensor Replacement (With F45)** .
8. Disconnect the lower control arm from the steering knuckle. Refer to **Lower Control Arm Replacement (GNB)**.

Fig. 29: Front Suspension Strut Mount
Courtesy of GENERAL MOTORS COMPANY

9. Lower the vehicle and remove the front suspension strut mount nut cap (1).
10. Use the **CH-49375** spanner to remove the front suspension strut mount nut (2).
11. Remove the front suspension strut bumper stop (3).
12. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .

Fig. 30: Front Suspension Strut Assembly
Courtesy of GENERAL MOTORS COMPANY

13. Remove the strut assembly (1) and front suspension strut yoke from the vehicle.

Fig. 31: Front Shock Assembly

Courtesy of GENERAL MOTORS COMPANY

14. Remove the front suspension strut yoke nut (1).
15. Remove the bracket (2) and front suspension strut yoke bolt (3).
16. Separate the strut assembly (4) from the front suspension strut yoke.

Installation Procedure

Fig. 32: Front Shock Assembly

Courtesy of GENERAL MOTORS COMPANY

1. Install the strut assembly (4) in the front suspension strut yoke.

CAUTION: Be sure to orient the bolt so the head of the bolt is forward in vehicle and the nut is rearward in the vehicle. Failure to orient the bolt and nut correctly may cause the bolt to come into contact with the brake hose causing premature wear of the hose.

2. Install the bracket (2) and front suspension strut yoke bolt (3).

CAUTION: Refer to Fastener Caution .

3. Install the front suspension strut yoke nut (1) and tighten to 70 (52 lb ft).

Fig. 33: Front Suspension Strut Assembly
Courtesy of GENERAL MOTORS COMPANY

4. Install the strut assembly (1) and front suspension strut yoke on the vehicle.

Fig. 34: Front Suspension Strut Bumper Stop
 Courtesy of GENERAL MOTORS COMPANY

5. Lower the vehicle and position the front suspension strut bumper stop (3) on the strut assembly tower.

NOTE: Do not tighten the front suspension strut mount nut to specification until the vehicle is completely on the ground.

6. Start the front suspension strut mount nut (2) by hand but do not tighten to specification.
7. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
8. Connect the lower control arm to the steering knuckle. Refer to **Lower Control Arm Replacement (GNB)**.
9. Install the front wheel speed sensor in the steering knuckle. Refer to **Front Wheel Speed Sensor Replacement (Without F45)** , **Front Wheel Speed Sensor Replacement (With F45)** .
10. Install the front brake rotor. Refer to **Front Brake Rotor Replacement (J60, J61)** , **Front Brake Rotor Replacement (J64)** .
11. Install the front brake hose in the bracket on the strut assembly.
12. Connect the stabilizer shaft link to the strut assembly. Refer to **Stabilizer Shaft Link Replacement (GNA, GNB)**.
13. Connect the steering linkage outer tie rod to the steering knuckle. Refer to **Steering Linkage Outer Tie**

Rod Replacement

14. Connect the front wheel drive shaft to the steering knuckle. Refer to **Front Wheel Drive Shaft Replacement - Left Side** , or **Front Wheel Drive Shaft Replacement - Right Side** .
15. Install the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
16. Lower the vehicle until the vehicle is resting fully on the ground.

Fig. 35: Front Suspension Strut Bumper Stop
Courtesy of GENERAL MOTORS COMPANY

17. Use the **CH-49375** spanner to install the front suspension strut mount nut (2) and tighten to 55 (41 lb ft).
18. Install the front suspension strut mount nut cap (1).
19. Measure and adjust the front wheel alignment specifications. Refer to **Wheel Alignment Specifications** .

STRUT ASSEMBLY REMOVAL AND INSTALLATION (GNA)

Special Tools

CH-49375 Spanner

For equivalent regional tools, refer to **Special Tools**.

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Remove the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
3. Disconnect the stabilizer shaft link from the strut assembly. Refer to **Stabilizer Shaft Link Replacement (GNA, GNB)**.
4. Remove the front brake hose from the bracket on the strut assembly.
5. Remove the front wheel speed sensor from the steering knuckle. Refer to **Front Wheel Speed Sensor Replacement (Without F45)** , **Front Wheel Speed Sensor Replacement (With F45)** .

Fig. 36: Front Suspension Strut Mount
Courtesy of GENERAL MOTORS COMPANY

6. Lower the vehicle and remove the front suspension strut mount nut cap (1).
7. Use the **CH-49375** spanner to remove the front suspension strut mount nut (2).
8. Remove the front suspension strut bumper stop (3).
9. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .

Fig. 37: Strut Assembly, Steering Knuckle & Nuts
Courtesy of GENERAL MOTORS COMPANY

10. Remove the steering knuckle nuts (1) and bolts (2) from the strut assembly (3) and steering knuckle. DISCARD the bolts.
11. Separate the strut assembly (3) from the steering knuckle and remove from the vehicle.

Installation Procedure

Fig. 38: Strut Assembly, Steering Knuckle & Nuts
Courtesy of GENERAL MOTORS COMPANY

1. Position the strut assembly (3) on the vehicle.
2. Start the NEW steering knuckle bolts (2) and nuts (1) by hand but do not tighten.

Fig. 39: Front Suspension Strut Bumper Stop
Courtesy of GENERAL MOTORS COMPANY

3. Lower the vehicle and position the front suspension strut bumper stop (3) on the strut assembly tower.

NOTE: Do not tighten the front suspension strut mount nut to specification until the vehicle is completely on the ground.

4. Start the front suspension strut mount nut (2) by hand but do not tighten to specification.
5. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .

Fig. 40: Strut Assembly, Steering Knuckle & Nuts
 Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

CAUTION: This vehicle is equipped with torque-to-yield or single use fasteners. Install a NEW torque-to-yield or single use fastener when installing this component. Failure to replace the torque-to-yield or single use fastener could cause damage to the vehicle or component.

6. Tighten the steering knuckle nuts (1) to 85 (63 lb ft) + 60 degrees.
7. Connect the stabilizer shaft link to the strut assembly. Refer to Stabilizer Shaft Link Replacement (GNA, GNB).
8. Install the front wheel speed sensor in the steering knuckle. Refer to Front Wheel Speed Sensor Replacement (Without F45) , Front Wheel Speed Sensor Replacement (With F45) .
9. Install the front brake hose in the bracket on the strut assembly.
10. Install the tire and wheel assembly. Refer to Tire and Wheel Removal and Installation .
11. Lower the vehicle until the vehicle is resting fully on the ground.

Fig. 41: Front Suspension Strut Mount
 Courtesy of GENERAL MOTORS COMPANY

12. Use the **CH-49375** spanner to install the front suspension strut mount nut (2) and tighten to 55 (41 lb ft).
13. Install the front suspension strut mount nut cap (1).

FRONT SUSPENSION STRUT YOKE REPLACEMENT (GNB)

Fig. 42: Front Suspension Strut Yoke
 Courtesy of GENERAL MOTORS COMPANY

Front Suspension Strut Yoke Replacement (GNB)

Callout	Component Name
Preliminary Procedure <ol style="list-style-type: none"> 1. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Remove the tire and wheel assembly. Refer to <u>Tire and Wheel Removal and Installation</u> . 3. Disconnect the steering linkage outer tie rod from the steering knuckle. Refer to <u>Steering Linkage Outer Tie Rod Replacement</u> . 4. Disconnect the front wheel drive shaft from the front wheel bearing and hub assembly. Refer to <u>Front Wheel Drive Shaft Replacement - Left Side</u> , or <u>Front Wheel Drive Shaft Replacement - Right Side</u> . 5. Remove the front brake rotor from the steering knuckle. Refer to <u>Front Brake Rotor Replacement (J60, J61)</u> , <u>Front Brake Rotor Replacement (J64)</u> . 	
1	Front Suspension Strut Yoke Procedure <ol style="list-style-type: none"> 1. If equipped, disconnect the electronic front suspension wiring harness from the strut assembly. 2. Remove the front wheel speed sensor from the steering knuckle. Refer to <u>Front Wheel Speed Sensor Replacement (Without F45)</u> , <u>Front Wheel Speed Sensor Replacement (With F45)</u> . 3. Disconnect the strut assembly from the front suspension strut yoke. Refer to <u>Strut Assembly Removal and Installation (GNB)</u>. 4. Disconnect the lower control arm from the steering knuckle. Refer to <u>Lower Control Arm Replacement (GNB)</u>. 5. Support the lower control arm with a jackstand. 6. If servicing the front suspension strut yoke, remove the steering knuckle. Refer to <u>Steering Knuckle Replacement (GNB)</u>, and <u>Steering Knuckle Upper Ball Stud Replacement (GNB)</u>.

SUSPENSION STRUT DISPOSAL

WARNING: Use the proper eye protection when drilling to prevent metal chips from causing physical injury.

Fig. 43: Drilling Hole In Strut At Center Of End Cap

Courtesy of GENERAL MOTORS COMPANY

1. Clamp the strut in a vise horizontally with the rod (1) completely extended.
2. Drill a hole in the strut at the center of the end cap (3) using a 5 mm (3/16 in) drill bit. Gas or a gas/oil mixture will exhaust when the drill bit penetrates the strut. Use shop towels in order to contain the escaping oil.
3. Remove the strut from the vise.
4. Hold the strut over a drain pan vertically with the hole down.
5. Move the rod (1) in and out of the tube (2) to completely drain the oil from the strut.

STRUT, STRUT COMPONENT, OR SPRING REPLACEMENT (GNA, GNB)

Fig. 44: Strut Components And Spring

Courtesy of GENERAL MOTORS COMPANY

Strut, Strut Component, or Spring Replacement (GNA, GNB)

Callout	Component Name
<p>WARNING:</p> <p>To prevent personal injury and/or component damage, use the proper tools to support and compress the coil spring prior to removal of the strut shaft nut when removing the coil spring. The coil spring is under extreme pressure and can become a projectile should the spring separate from the strut before all of the tension is relieved.</p> <p>Preliminary Procedure</p>	

1. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Remove the strut assembly. Refer to <u>Strut Assembly Removal and Installation (GNB)</u> , <u>Strut Assembly Removal and Installation (GNA)</u> .	
1	<p>Front Suspension Strut Nut</p> <p>CAUTION: Refer to <u>Fastener Caution</u> .</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. 8	Front Coil Spring Lower Insulator
9	Front Suspension Strut

DESCRIPTION AND OPERATION

GENERAL DESCRIPTION (GNB)

HiPerStrut Front Suspension:

The front suspension has 2 primary purposes:

- Isolate the driver from irregularities in the road surface.
- Define the ride and handling characteristics of the vehicle.

The front suspension absorbs the impact of the tires travelling over irregular road surfaces and dissipates this energy throughout the suspension system. This process isolates the vehicle occupants from the road surface. The rate at which the suspension dissipates the energy and the amount of energy that is absorbed is how the suspension defines the vehicles ride characteristics. Ride characteristics are controlled by the Electronic Suspension Control system. The Electronic Suspension Control system individually controls the damping force of each of the 4 shock absorbers. The suspension system must allow for the vertical movement of the tire and wheel assembly as the vehicle travels over irregular road surfaces while maintaining the tire's horizontal relationship to the road.

This requires that the steering knuckle be suspended between a lower control arm via the yoke assembly to the strut assembly. The lower control arm outermost point is attached to the yoke assembly and then through the king pin bushing to the steering knuckle. The innermost end of the control arm attached at 2 points to the vehicle frame through semi-rigid bushings. The upper portion of the steering knuckle is attached to the yoke assembly via a ball stud. The yoke assembly then connects to the strut assembly and vehicle body by way of an upper bushing. The steering knuckle is allowed to travel up and down independent of the vehicle body structure and frame.

This up and down motion of the steering knuckle as the vehicle travels over bumps is absorbed predominantly by the coil spring. This spring is retained under tension over the strut assembly. A strut is used in conjunction with this system in order to dampen out the oscillations of the coil spring. The strut is filled with oil and has a moveable shaft that connects to a piston inside the strut. Valves inside the shock absorber offer resistance to oil flow and consequently inhibit rapid movement of the piston and shaft. Each end of the shock absorber is connected in such a fashion to utilize this recoil action of a spring alone. Each end of the strut is designed as the connection point of the suspension system to the vehicle and acts as the coil spring seat. This allows the strut to utilize the dampening action to reduce the recoil of a spring alone. The lower control arm is allowed to pivot at the vehicle frame in a vertical fashion. The ball joint allows the steering knuckle to maintain the perpendicular relationship to the road surface.

Front suspensions systems utilize a stabilizer shaft. The stabilizer bar connects between the left and right strut assemblies through the stabilizer link and stabilizer shaft insulators. This bar controls the amount of independent movement of the suspension when the vehicle turns. Limiting the independent movement defines the vehicles handling characteristics on turns.

The advantage of the HiPerStrut front suspension (GNB) over the McPherson-type wheel suspension is less spindle length which leads to:

- Reduced smooth road shake
- Less torque steer

- Increased cornering power, no camber loss during cornering
- Robustness against wheel imbalance

All in all the HiPerStrut design provides improved ride and handling performance with a premium steering feel.

The design enables bigger wheels.

The design allows camber adjustment with screws on the steering knuckle upper ball stud.

4	Spindle Length
5	Lower Body Attachment (Same Points)

GENERAL DESCRIPTION (GNA)

The front suspension has 2 primary purposes:

- Isolate the driver from irregularities in the road surface.

- Define the ride and handling characteristics of the vehicle.

The front suspension absorbs the impact of the tires travelling over irregular road surfaces and dissipates this energy throughout the suspension system. This process isolates the vehicle occupants from the road surface. The rate at which the suspension dissipates the energy and the amount of energy that is absorbed is how the suspension defines the vehicles ride characteristics. Ride characteristics are designed into the suspension system and are not adjustable. The ride characteristics are mentioned in this description in order to aid in the understanding of the functions of the suspension system. The suspension system must allow for the vertical movement of the tire and wheel assembly as the vehicle travels over irregular road surfaces while maintaining the tire's horizontal relationship to the road.

This requires that the steering knuckle be suspended between a lower control arm and a strut assembly. The lower control arm attaches from the steering knuckle at the outermost point of the control arm. The attachment is through a ball and socket type joint. The innermost end of the control arm attached at 2 points to the vehicle frame through semi-rigid bushings. The upper portion of the steering knuckle is attached to a strut assembly. The strut assembly then connects to the vehicle body by way of an upper bearing. The steering knuckle is allowed to travel up and down independent of the vehicle body structure and frame.

This up and down motion of the steering knuckle as the vehicle travels over bumps is absorbed predominantly by the coil spring. This spring is retained under tension over the strut assembly. A strut is used in conjunction with this system in order to dampen out the oscillations of the coil spring. A strut is a basic hydraulic cylinder. The strut is filled with oil and has a moveable shaft that connects to a piston inside the strut. Valves inside the shock absorber offer resistance to oil flow and consequently inhibit rapid movement of the piston and shaft. Each end of the shock absorber is connected in such a fashion to utilize this recoil action of a spring alone. Each end of the strut is designed as the connection point of the suspension system to the vehicle and acts as the coil spring seat. This allows the strut to utilize the dampening action to reduce the recoil of a spring alone. The lower control arm is allowed to pivot at the vehicle frame in a vertical fashion. The ball joint allows the steering knuckle to maintain the perpendicular relationship to the road surface.

Front suspensions systems utilize a stabilizer shaft. The stabilizer bar connects between the left and right lower control arm assemblies through the stabilizer link and stabilizer shaft insulators. This bar controls the amount of independent movement of the suspension when the vehicle turns. Limiting the independent movement defines the vehicles handling characteristics on turns.

GENERAL INFORMATION

General Cooling System Service

*** PLEASE READ THIS FIRST ***

This article is generic in nature and all information does not apply to all vehicles including those without a liquid cooling system. For vehicle specific information, see the appropriate articles in the ENGINE category.

DESCRIPTION

The liquid cooling system consists of a radiator, water pump, thermostat, electric or belt-driven cooling fan, pressure cap, heater, and various connecting hoses and cooling passages in the engine block and cylinder head.

MAINTENANCE

DRAINING

Remove radiator cap and open heater control valve to maximum heat position. Open drain cocks or remove plugs in bottom of radiator and engine block. In-line engines usually have one plug or drain cock, while "V" type engines have 2, one in each bank of cylinders.

FLUSHING

CAUTION: Some manufacturers use an aluminum and plastic radiator. Flushing solution must be compatible with aluminum.

Radiator

Connect flushing gun to water outlet of radiator. Disconnect water inlet hose. To prevent flooding engine, use a hose connected to radiator inlet. Use air in short bursts to prevent damage to radiator. Continue flushing until water runs clear.

Engine Block

To flush engine, remove thermostat. Connect flushing gun to water outlet of radiator. Use air in short bursts to prevent damage to radiator. Continue flushing until water runs clear.

REFILLING

To prevent air from being trapped in engine block, engine should be running when refilling cooling system. After system is full, continue running engine until thermostat is open, then recheck fill level. Do not overfill system.

TESTING

THERMOSTAT

1. Remove and inspect thermostat for corrosion and proper seating of valve. If okay, suspend thermostat and thermometer in a 50/50 mixture of coolant and water. See **Fig. 1**. DO NOT allow thermostat or thermometer to touch bottom or container. Heat water until thermostat begins to open.
2. Read temperature on thermometer. This is the initial opening temperature and should be within specification. Continue heating water until thermostat is fully open and note temperature. This is the fully open temperature. If either reading is not to specification, replace thermostat.

95B14671

Fig. 1: Testing Thermostat in Coolant/Water Solution

PRESSURE TESTING

A pressure tester is used to check both radiator cap and complete cooling system. Follow pressure tester manufacturer instructions and test components as follows:

Radiator Cap

Visually inspect radiator cap. If cap looks okay, connect pressure tester to cap. See **Fig. 2**. Pressurize tester to full radiator cap specification. Replace cap if it fails to hold pressure.

95C14672

Fig. 2: Pressure Testing Radiator Cap

Cooling System

1. Turn ignition off and allow engine to cool. Ensure radiator is filled to correct level. Remove cap and attach pressure tester to radiator. Pressurize tester to full radiator rating specification.
2. If pressure drops, check for external leaks. If no leaks are found, start engine and allow to idle. If pressure builds up immediately, check cylinder head and block for cracks. If pressure does not build up immediately, go to next step.

CAUTION: DO NOT allow excess pressure to build in cooling system or damage may result.

3. Using pressure tester, pump cooling system up to pressure specified on radiator cap. If pump gauge pointer vibrates, compression or combustion leak into cooling system is indicated. Isolate leak by shorting each spark plug wire to cylinder block. Gauge pointer vibration will stop or decrease when leaking cylinder is shorted.

ACRONYMS AND UNITS

Acronyms

Acronym	Meaning	Definition
2WD	Two-Wheel Drive	Indicates that a vehicle has 2 driven wheels OR that a 4WD vehicle uses only 2 wheels for propulsion. So it can be the description of a vehicle configuration OR the operational mode of the drivetrain.
4WD	Four-Wheel Drive	Four-wheeled vehicle with a drivetrain that allows all four wheels to receive power from the engine simultaneously which provides better control on various surfaces. Can be used to describe the configuration of the vehicle OR as the operational mode of the drivetrain. 4WD vehicles usually can turn 2 wheels off to be in a 2WD mode. See also AWD.
A/C	Air Conditioning	The cooling and dehumidification of indoor air for thermal comfort.
A/D	Analog to Digital	Used in context of converting electrical analog signals to digital signals.
ABS	Antilock Braking System	System on motor vehicles which prevents the wheels from locking while braking which helps the driver maintain control in heavy braking conditions.
AC	Alternating Current	An electrical current whose magnitude and direction vary cyclically.
AM	Amplitude Modulation	Method of impressing data onto an alternating-current (AC) carrier waveform.
APP	Accelerator Pedal Position	A pedal that controls the throttle valve.
		All-wheel-drive systems are designed to function on

AWD	All-Wheel Drive	all types of surfaces, both on- and off-road, and most of them cannot be switched off. This can also be called full-time four wheel drive. See also 4WD.
AWG	American Wire Gauge	American wire gauge is a standardized wire gauge system used since 1857 predominantly in the United States for the diameters of round, solid, nonferrous, electrically conducting wire. E.g. a wire of AWG10 has a diameter of 2.588mm, AWG20 corresponds to a diameter of 0.812mm.
B+	Battery Positive Voltage	The electrical potential on the positive terminal of the battery.
BARO	Barometric Pressure	Atmospheric pressure as measured by a barometer.
BCM	Body Control Module	This module supplies vehicle occupants with visual and audible information and controls various vehicle functions,
BECM	Battery Energy Control Module	Control module used to regulate the battery voltage.
BPP	Brake Pedal Position	Position of the foot pedal that moves a piston in the master brake cylinder.
CAN	Controller Area Network	Serial data connection between control modules by Bosch
CCM	Chassis Control Module	The module that controls various vehicle functions on the Chassis, like Engine/Trans Mount, Active Grille Air Shutter, Load Leveling, etc...
CD	Compact Disc	A small optical disk on which data such as music, text, or graphic images is digitally encoded.
CNG	Compressed Natural Gas	This a substitute for gasoline or diesel fuel. It is made by compressing natural gas (which is mainly composed by methane (CH ₄), in a percentage range of 70% to 98%)
CO	Carbon Monoxide	This is a product of the incomplete combustion of carbon-containing compounds, at room temperature this is a gas. It consists of one carbon atom covalently bonded to one oxygen atom.
CO ₂	Carbon Dioxide	Chemical compound composed of two oxygen atoms covalently bonded to a single carbon atom.
CPA	Connector Position Assurance	Part of an electrical connector that prevents the connector from moving out of its socket. Usually needs to be pressed to unlock the connector when disconnecting it.
CPP	Clutch Pedal Position	A lever operated with the foot that controls the coupling that connects or disconnects driving and driven parts of a driving mechanism.
CV	Constant Velocity	Used in conjunction with CV joints, which connect two shafts at an angle while both shafts always have the same rotational speed without variations.

CVT	Continuously Variable Transmission	A transmission in which the ratio of the rotational speeds of two shafts, as the input shaft and output shaft of a vehicle or other machine, can be varied continuously within a given range, providing an infinite number of possible ratios which improves fuel economy.
D	Drive	D on the transmission gear selector lever.
DAB	Digital Audio Broadcast	Technology for broadcasting of audio using digital radio (carries information via digital signal) transmission.
DC	Direct Current	Continuous current, constant flow of electric charge.
DLC	Data Link Connector	This is an electronic connector typically located underneath the driver's side dashboard, just above the pedals. The connector has 16 pins.
DMM	Digital Multimeter	Electronic measuring instrument that combines several functions in one unit. The most basic instruments include an ammeter, voltmeter, and ohmmeter.
DOHC	Dual Overhead Camshaft	Dual overhead camshafts (DOHC) are higher performance engines, they produce more power, and can run at higher speeds because they allow an engine to have four valves per cylinder. Each camshaft operates two of the valves, one camshaft handles the intake valves, and one handles the exhaust valves
DPF	Diesel Particulate Filter	Device designed to remove diesel particulate matter or soot from the exhaust gas of a diesel engine.
DRL	Daytime Running Lamps	White lights mounted on the front of an automobile that automatically switch on when the key is turned and are intended for daytime use, to increase the visibility of the automobile.
DSCC	Distance Sensing Cruise Control	A type of cruise control that automatically maintains the distance between vehicles.
DSP	Digital Signal Processor	A specialized microprocessor designed specifically for digital signal processing, generally in real-time computing.
DTC	Diagnostic Trouble Code	An electronic signal stored in an automotive computer, indicating the presence of a fault detected by that computer.
DVD	DVD	A popular optical disc storage media format the size of a CD. Used mainly for movies but also for data. DVD has no spelled out version (officially it does not mean Digital Video Disc or Digital Versatile Disc, it just means DVD).
EBCM	Electronic Brake Control Module	This module contains a microprocessor and software for antilock braking system operation.

ECM	Engine Control Module	This electronic module works with a vehicle's sensors and engine control devices to insure that the engine operates at maximum efficiency and performance. It performs three vital functions. Receives electronic signals from engine sensors. Analyzes the data and makes an engine performance decision (based on the pre-set parameters within the unit). Sends an "output command" to an actuator that adjusts engine performance.
ECT	Engine Coolant Temperature	A measure of how hot or cold the fluid which flows through the engine in order to prevent its overheating, transferring the heat produced by the device to other devices that utilize or dissipate it.
EEPROM	Electrically Erasable Programmable Read-Only Memory	A non-volatile storage chip used in computers and other devices to store small amounts of volatile data, e.g. calibration tables or device configuration.
EGR	Exhaust Gas Recirculation	Is an NOx (nitrogen oxide and nitrogen dioxide) reduction technique used in most gasoline and diesel engines. EGR works by recirculating a portion of an engine's exhaust gas back to the engine cylinders.
EMI	Electromagnetic Interference	Electromagnetic interference (also called radio frequency interference) is a disturbance that affects an electrical circuit due to either electromagnetic conduction or electromagnetic radiation emitted from an external source.
ESD	Electrostatic Discharge	The sudden and momentary electric current that flows between two objects at different electrical potentials.
EV	Electric Vehicle	A category of vehicles that only have an electric drive system.
EVAP	Evaporative Emission	A system that controls the fuel fumes in the fuel tank.
FM	Frequency Modulation	In telecommunication this is a way to convey information over a carrier wave by varying its frequency.
FWD	Front-Wheel Drive	A form of engine/transmission layout used in motor vehicles, where the engine drives the front wheels only.
GMLAN	General Motors Local Area Network	A local-area network is a computer network covering a small geographic area, like a home or vehicle. This specific type of LAN connects several controllers inside the vehicle and was developed by General Motors.
GPS	Global Positioning System	Satellite-based navigation system made up of a network of 24 satellites placed into orbit by the U.S. Department of Defense.
GSM	Global System for Mobile Communications	Globally accepted standard for digital cellular communication.

GVW	Gross Vehicle Weight	Maximum total weight of a road vehicle or trailer that is loaded, including the weight of the vehicle itself plus fuel, passengers, cargo, and trailer tongue weight.
HD	Heavy Duty	Robust design to accommodate large work loads.
HID	High Intensity Discharge	A type of light that produces a bright light by using gas filled bulbs. (gas is usually mercury, metal halide, and high-pressure sodium) Uses very little battery power and is a very "cool" light.
HO2S	Heated Oxygen Sensor	Heated oxygen sensors have an internal heater circuit that brings the sensor up to operating temperature more quickly than an unheated sensor. An oxygen sensor must be hot (about 600-650°F) before it will generate a voltage signal. The hot exhaust from the engine will provide enough heat to bring an O2 sensor up to operating temperature.
HVAC	Heating Ventilation Air Conditioning	This system is sometimes referred to as climate control. Ventilation air ducts installed throughout a vehicle that supply conditioned air to a room through rectangular or round outlet vents.
I ² C	Inter-Integrated Circuit	Serial data connection between Integrated Circuits (microchips) inside a control module invented by Phillips
IAT	Intake Air Temperature	Temperature of the air entering intake air flow system of the engine.
ICE	Internal Combustion Engine	An engine in which the combustion of fuel and an oxidizer (typically air) occurs in a confined space called a combustion chamber.
ID	Identification	Number or Code that identifies a component or control module. Can be written on the part or be transmitted on a bus or via radio.
ISP	Internet Service Provider	A company that furnishes corporations and individual consumers with various services, mainly access to the Internet.
ISS	Input Shaft Speed	Rotational speed of the input shaft of a transmission.
LAN	Local Area Network	Standard network connection PC's.
LCD	Liquid Crystal Display	A thin, flat display device made up of any number of color or monochrome pixels arrayed in front of a light source or reflector.
LED	Light Emitting Diode	Small light bulbs that fit easily into an electrical circuit they do not have a filament that will burn out, and they do not get especially hot. They are illuminated solely by the movement of electrons in a semiconductor material.
LIN	Local Interconnect Network	Computer networking bus system used within automotive network architectures. Similar to CAN,

		but cheaper and less powerful.
LPG	Liquefied Petroleum Gas	A mixture of mainly propane and butane, produced commercially and stored under pressure to keep it in a liquid state.
MAF	Mass Air Flow	The amount of air drawn into the engine
MAP	Manifold Absolute Pressure	Pressure in the engine intake system after the throttle valve referenced to a perfect vacuum.
MDI	Multiple Diagnostics Interface	A device used by GM dealers that enables a PC to communicate with the control modules in a vehicle.
MIL	Malfunction Indicator Lamp	An indicator of the internal status of a car engine.
MOST	Media Oriented Systems Transport	Serial communication bus to transmit audio and video information.
N	Neutral	A state of the transmission in which it is not engaged.
NiMH	Nickel Metal Hydride	A type of rechargeable battery that uses a hydrogen absorbing alloy for the negative electrode.
NOx	Nitrogen Oxides	Refers to any of the following oxygen compounds of nitrogen or a mixture of them. Nitric Oxide, Nitrogen dioxide, Nitrous Oxide, Dinitrogen trioxide, Dinitrogen tetroxide, Dinitrogen pentoxide.
O2	Oxygen	A colorless, odorless, tasteless, gaseous chemical element with the chemical symbol O and atomic number 8.
O2S	Oxygen Sensor	An electronic device that measures the proportion of oxygen (O2) in the gas or liquid being analyzed.
OBD	On-Board Diagnostic	A generic term referring to a vehicle's self-diagnostic and reporting capability.
OEM	Original Equipment Manufacturer	A producer that provides a product to its customers, who proceed to modify or bundle it before distributing it to their customers.
OSS	Output Shaft Speed	Rotational speed of the output shaft of a transmission.
P	Park	A state in which the transmission is set so one can leave the vehicle.
PCB	Printed Circuit Board	A thin plate on which chips and other electronic components are placed.
PCM	Powertrain Control Module	A control module that features the functions of both, the engine and the transmission control module.
PCMCIA	Personal Computer Memory Card Industry Association	An international standards body and trade association with over 100 member companies that was founded in 1989 to establish standards for Integrated Circuit cards and to promote interchangeability among mobile computers where ruggedness, low power, and small size were critical.
PIN	Personal Identification Number	A secret numeric password shared between a user and a system that can be used to authenticate the user to the system.

PPE	Personal Protective Equipment	Protective clothing, helmets, goggles, or other garment designed to protect the wearer's body from injury.
PRNDL	Park, Reverse, Neutral, Drive, Low	Park, Reverse, Neutral, Drive, Low (automatic transmission positions).
PTC	Positive Temperature Coefficient	Refers to materials that experience an increase in electrical resistance when their temperature is raised.
PTO	Power Take-Off	A splined driveshaft, usually on a tractor or truck that can be used to provide power to an attachment or separate machine. This mechanism allows implements to draw energy from the tractor's engine.
PVC	Polyvinyl Chloride	A thermoplastic copolymer.
PWM	Pulse Width Modulation	Square shaped type of signal that carries the information in the ratio between on and off times.
R	Reverse	Rearward: directed or moving toward the rear;
RAM	Random Access Memory	A type of computer data storage. It today takes the form of integrated circuits that allow the stored data to be accessed in any order.
RCT	Radiator Coolant Temperature	This is the heat intensity of the radiator coolant measured in degrees. The radiator is a part of the cooling system that removes the engine heat. Coolant is a mixture of water and antifreeze (ethylene glycol) which lowers the freezing point of the water in the coolant system, this fluid also picks up heat from the engine and transfers it to the air.
RDS	Radio Data System	A standard from the European Broadcasting Union for sending small amounts of digital information using conventional FM radio broadcasts.
RF	Radio Frequency	A frequency or rate of oscillation within the range of about 3 Hz and 300 GHz. This range corresponds to frequency of alternating current electrical signals used to produce and detect radio waves.
ROM	Read-Only Memory	A class of storage media used in computers and other electronic devices. Data stored in ROM cannot be modified.
RPO	Regular Production Option	A three digit/letter code given to parts, assemblies, and systems originally installed on the vehicle. These RPO codes designate options and are assigned by General Motors.
RSA	Rear Seat Audio	An auxiliary set of controls that operate the main audio system from the rear seat. Rear passengers can also operate a different media source than the front passengers.
RWD	Rear-Wheel Drive	A common engine/transmission layout in which the engine is in the front of the vehicle, but the front mid-engine, rear mid-engine and rear engine layouts are

		also used.
SCV	Speed Controlled Volume	The volume control is set for a desired sound level in the vehicle as the vehicle increases its speed, the sound level is adjusted.
SDM	Sensing and Diagnostic Module	The name given to air bag modules used in General Motors vehicles.
SIM	Subscriber Identity Module	Part of a removable smart card Integrated Circuit Card. This is used for mobile cellular telephone devices such as mobile computers and mobile phones. SIM cards securely store the service-subscriber key used to identify a subscriber. The SIM card allows users to change phones by simply removing the SIM card from one mobile phone and inserting it into another mobile phone or broadband telephony device.
SIR	Supplemental Inflatable Restraint	Technical term for the air bag. Air bag is a stretchable membrane, which inflates during an automobile accident to provide cushioning to the passenger's head and torso to prevent injury to the passengers.
SPI	Serial Peripheral Interface	This is an interface that enables the serial (one bit at a time) exchange of data between two devices. An SPI operates in full duplex mode. This means that data can be transferred in both directions at the same time. It is a standard bus technology like CAN or I2C.
SPS	Service Programming System	System that enables repair facilities to update the software in control modules.
SUV	Sport Utility Vehicle	A passenger vehicle which combines the towing capacity of a pickup truck with the passenger-carrying space of a minivan.
SVS	Service Vehicle Soon	Indicator lamp or symbol for a malfunction related to a vehicle component or system.
TA	Traffic Announcement	Message spoken on radio regarding the movement of vehicles or pedestrians through an area or along a route. The buttons on radios that enable this announcements are also often labeled TA.
TAC	Throttle Actuator Control	A motor which moves the engine throttle plate or valve, controlled by the engine control module. A throttle plate limits the amount of air entering a internal combustion gasoline engine.
TAP	Transmission Adaptive Pressure	The transmission control module learns each component's characteristics and adjusts fluid pressure accordingly.
TCC	Torque Converter Clutch	Resides in a torque converter to connect an engine to an automatic transmission. The clutch is applied when conditions are correct to achieve a 1:1 ratio of engine crankshaft to transmission input shaft.
		A module that controls electronic automatic

TCM	Transmission Control Module	transmissions. It uses sensors from the vehicle as well as data provided by the Engine Control Module to calculate how and when to change gears in the vehicle for optimum performance, fuel economy and shift quality.
TDC	Top Dead Center	The piston is in its highest position relative to the combustion chamber.
TIS	Techline Information System	The PC-based global dealership diagnostic software that provides the technician the ability to reference the most recent service information via the service department's computer.
TPA	Terminal Position Assurance	An additional locking mechanism inside an electric connector that holds the pins in place.
TV	Television	A telecommunication system for broadcasting and receiving moving pictures and sound over a distance.
USB	Universal Serial Bus	A type of communication bus connection between a computer and a peripheral device.
VCI	Vehicle Communications Interface	A diagnostic tool that communicates to modules of multiple communication protocols in a vehicle by converting vehicle serial data into PC serial data communication.
VIN	Vehicle Identification Number	Used by manufacturers to uniquely identify motor vehicles using 17 characters.
VSCM	Vehicle Stability Control Module	This module uses information from several sensors to detect a loss of vehicle traction, then works with the antilock brake system to apply individual brakes to help keep the vehicle on its intended path.
VSS	Vehicle Speed Sensor	Sends data regarding how fast the car is traveling at the moment of driving. It is designed to be able to record the rate at which the vehicle's crankshaft is spinning.
WOT	Wide Open Throttle	When the throttle blade or valve is at its maximum open position, allowing maximum air to enter an internal combustion gasoline engine.
WLAN	Wireless Local Area Network	Standard to transmit digital data via radio frequency.
XM	XM (Satellite Radio)	XM Satellite Radio Holdings (XM) is one of two satellite radio services in the United States and Canada. XM provides pay-for-service radio, analogous to cable television. Its service includes 73 different music channels, 39 news, sports, talk, and entertainment channels, 21 regional traffic and weather channels and 23 play-by-play sports channels (2008).
XML	Extensible Markup Language	A markup language that defines a set of rules for encoding documents in a format that is both human-readable and machine-readable.

kg	Kilogram	Weight

CUSTOMER CONCERN VERIFICATION SHEETS

The GM Customer Concern Verification Sheets have been designed to improve communications between the service customer and the technician. The more clearly the technician understands the concern and its symptoms, the more likely the concern will be fixed right the first time.

The GM-wide Customer Concern Verification Sheets are available in DealerWorld. The Customer Concern Verification Sheets may be printed and reproduced locally.

TRAINING

Dealers

All U.S. GM Dealers participating in the Center of Learning / GM Service Technical College (STC) Programs can enroll through the Center of Learning website at <https://www.centerlearning.com>. Within the website, there are individual training paths that are designed to assist in planning the training needs for each individual and their job role. Dealers who have questions about Center of Learning Training should contact the Center of Learning help desk at 1-888-748-2687. The help desk is available Monday through Friday, 8:00 am - 9:00 pm Eastern Standard Time, excluding holidays. For GM Access support, contact the GM Access Help Desk at 1-888-337-1010.

Fleets

GM Fleet customers with GM Warranty In-Shop agreements are able to participate in service technical training through the Center of Learning/GM Service Technical College (STC).

Assistance for GM fleet registered customers using GM STC training is provided by the Center of Learning help desk at 1-888-748-2687. The help desk is available Monday through Friday, 8:00 am-9:00 pm Eastern Standard Time, excluding holidays. For GM Access support, contact the GM Access Help Desk at 1-888-337-1010.

Most GM STC course materials have associated charges.

To purchase authentic GM STC Training Materials, contact the GM Training Materials Headquarters at 1-800-393-4831.

Non-GM Dealer Technicians

Technician training for non-GM dealers is available through ACDelco. This training is for ACDelco PSC and Fleet program members employed in the automotive or truck service industry.

ACDelco courses are available at approved GM STC Training Centers. Availability and schedules can be obtained by calling 1-800-825-5886 (prompt 1) or contact us via the web at www.acdelcotechconnect.com and select the Training tab. Seminars are also offered through the ACDelco Warehouse Distribution channel. Contact your Local ACDelco representative or distributor directly for more information.

VEHICLE, ENGINE AND TRANSMISSION ID AND VIN LOCATION, DERIVATIVE AND USAGE

Fig. 2: Locating Vehicle Identification Number (VIN) Plate
Courtesy of GENERAL MOTORS COMPANY

The vehicle identification number (VIN) plate is the legal identifier of the vehicle. The VIN plate is located on the upper left corner of the instrument panel (I/P) and can be seen through the windshield from the outside of the vehicle:

Vehicle, Engine and Transmission ID and VIN Location, Derivative and Usage

Position	Definition	Character	Description
1	Region of Build	2	Canada

VEHICLE CERTIFICATION, TIRE PLACARD, ANTI-THEFT, AND SERVICE PARTS ID LABEL

Fig. 3: Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label
Courtesy of GENERAL MOTORS COMPANY

Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label

Callout	Description
Vehicle Certification Label	
The vehicle certification label is located on the left hand side of the B pillar and displays the following assessments:	
<ul style="list-style-type: none">• Gross Vehicle Weight Rating (GVWR)• Gross Axle Weight Rating (GAWR), front and rear• The gross vehicle weight (GVW) is the weight of the vehicle and everything it carries. The gross vehicle weight must not exceed the Gross Vehicle Weight Rating. Include the following items when figuring the GVW:<ul style="list-style-type: none">○ The base vehicle weight (factory weight)○ The weight of all vehicles accessories○ The weight of the driver and the passengers○ The weight of the cargo	

1	Name of Manufacturer
2	Gross Vehicle Weight Rating
3	Gross Axle Weight Rating (Front, Rear)
4	Canadian Safety Mark (w/RPO Z49)
5	Certification Statement
6	Vehicle Class Type (Pass Car, etc.)
7	Vehicle Identification Number
8	Date of Manufacture (Mo/Yr)
Tire Placard	
The tire placard label is located on the forward portion of the center pillar and displays the following assessments:	
9	Specified Occupant Seating Positions
10	Maximum Vehicle Capacity Weight
11	Tire Pressure, Front, Rear, and Spare (Cold)
12	Original Equipment Tire Size
Service Parts ID Label	
The vehicle service parts identification label is located in the rear compartment attached to the left side of the spare tire well. The label is use to help identify the vehicle original parts and options.	
13	Vehicle Identification Number
14	Engineering Model Number (Vehicle Division, Line, and Body Style)
15	Interior Trim Level and Decor
16	Exterior (Paint Color) WA Number
17	Paint Technology
18	Special Order Paint Colors and Numbers
19	Vehicle Option Content
Anti-Theft Label	
20	<p>The Federal law requires that General Motors label certain body parts on this vehicle with the VIN. The purpose of the law is to reduce the number of motor vehicle thefts by helping in the tracing and recovery of parts from stolen vehicles.</p> <p>Labels are permanently affixed to an interior surface of the part. The label on the replacement part contains the letter R, the manufacturer's logo, and the DOT symbol.</p> <p>The anti-theft label must be covered before any painting, rustproofing procedures, and uncovered after the procedures. Failure to follow the precautionary steps may result in liability for violation of the Federal Vehicle Theft Prevention Standard and possible suspicion to the owner that the part was stolen.</p>

RPO CODE LIST

The following table provides the description of the Regular Production Option (RPO) codes that are available on the vehicle. The vehicle's RPO list is printed on the Service Parts Identification Label.

RPO	Description
01A	TRIM COLOR SEAT - JET BLACK VAR 1

01B	TRIM COLOR SEAT - LT NEUTRAL
05E	TRIM COLOR SEAT - SADDLE UP
1AB	TRIM COLOR DR PANEL - JET BLACK

GNA	CHASSIS EQUIP FRONT - STRUT ASM
GNB	CHASSIS EQUIP FRONT - STRUT ASM, PERFORMANCE
GNC	CHASSIS EQUIP REAR - REAR AXLE, 4-LINK
GNE	CHASSIS EQUIP REAR - REAR AXLE, H-ARM
GWT	PRIMARY COLOR - EXTERIOR, CHAMPAGNE SILVER MET (102V)
GXH	PRIMARY COLOR - BERLIN BLUE MET (122V)
GY6	RATIO - TRANSAXLE FINAL DRIVE 3.76
HP6	HYBRID PROPULSION - ELECTRIC, PARALLEL, 14KW CONTINUOUS POWER
I14	ENGINEERING YEAR - 2014
IO5	RADIO - INFOTAINMENT SYSTEM - UPLEVEL HMI, ENHANCED CONNECTIVITY
IO6	RADIO - INFOTAINMENT SYSTEM - UPLEVEL HMI, ENHANCED CONNECTIVITY, EMBEDDED NAVIGATION
J60	BRAKE SYSTEM - POWER, FRT AND RR DISC, ABS, 16"
J61	BRAKE SYSTEM - POWER, FRT AND RR DISC, ABS, 17"
J64	BRAKE SYSTEM - POWER, FRT AND RR DISC, ABS, 18+
J71	BRAKE PARKING - POWER OPERATED
JF5	PEDALS - SPORTY, ALLOY
JJ2	BRAKE LINING - BRAKE NOISE AND DUST PERFORMANCE
K05	HEATER ENG - BLOCK
K09	GENERATOR - 120 AMP
K34	CRUISE CONTROL - AUTOMATIC, ELECTRONIC
KA1	HEATER SEAT FRT - DRVR AND PASS
KB5	CONTROL - ECM GRADE BRAKING

KC5	RECEPTACLE - ELECTRICAL, ACCESSORY
KD4	RECEPTACLE - ELECTRICAL, FRT CONSOLE
KG4	GENERATOR - 150 AMP
KG8	GENERATOR - 130 AMP
KI6	RECEPTACLE - ELECTRICAL, FRT CONSOLE RR 110 VOLT
KOT	CONTROL - CONSOLE, INFOTAINMENT, REDUNDANT CONTROLS, TOUCH PAD
KSG	CRUISE CONTROL - AUTOMATIC, ADAPTIVE, WITH STOP/GO
KTI	KIT, TIRE - INFLATOR
KY2	GENERATOR - HYBRID MOTOR, BAS+, 120 AMP
LEA	ENGINE - GAS, 4 CYL, 2.4L, SIDI, DOHC, E85 MAX, ALUM, GM
LHD	VEHICLE DRIVE - LEFTHAND DRIVE
LTG	ENGINE - GAS, 4 CYL, 2.0L, SIDI, L4, ALUM DOHC, VVT, DCVCP, TURBO, E0-E100, ALUM
LUK	ENGINE - GAS, 4 CYL, 2.4L, DI, ALUM, DOHC, BAS, ECOTEC
M7U	TRANSMISSION - AUTO 6 SPD, 6T70, AWD, GEN 2
M7W	TRANSMISSION - AUTO 6 SPD, 6T70, FWD, GEN 2
MAH	MARKETING AREA - US, PUERTO RICO/USVI
MBC	MARKETING AREA - CANADA
MCR	RECEPTACLE - MEMORY CARD
MCX	MARKETING AREA - MEXICO
MDE	MOLDING B/S UPPER - BRIGHT, WINDOW ALL AROUND
MDJ	MOLDING B/S UPPER - SATIN CHROME, WINDOW ALL AROUND
MH8	TRANSMISSION - AUTO 6 SPD, HMD, X23F
MHH	TRANSMISSION - AUTO 6 SPD, HMD, GM, BAS+, 6T40, HYBRID, FWD
MR6	TRANSMISSION - MAN 6 SPD, OPEL, 83MM, 3.92 1ST, 0.62 6TH (F40 WR), REDUCE HELIX
MWN	TAILPIPE - DUAL, INTEGRATED IN FASCIA
N34	STEERING WHEEL - LEATHER, 3 SPOKES
N37	STEERING COLUMN - TILT, TELESCOPING
N55	STEERING WHEEL - LEATHER, 3 SPOKES, SPORT, ERGONOMIC
NCG	LOCK - ELECTRICAL CHILD LOCK SYSTEM (REAR DOOR LATCH)
NE1	CERTIFICATION - EMISSION, GEOGRAPHICALLY RESTRICTED REGISTRATION FOR VEHICLES UP TO 14,000 LBS GVW (USE 2003 MDL YR
NJ1	STEERING - POWER, NON-VARIABLE RATIO, ELECTRIC
NJ2	STEERING - ELECTRIC, BELT DRIVE
NT7	EMISSION SYSTEM - FEDERAL, TIER 2
NU5	EMISSION SYSTEM - CALIFORNIA, BIN 4
NU6	EMISSION SYSTEM - CALIFORNIA, PZEV
OSH	PLANT CODE - OSHAWA 1, ONT, CANADA
PXR	WHEEL - 18 X 8.0, J, ALUMINUM, DESIGN 15

ZAM	TIRE SPARE - T125/80R16 SL 97M BW SPR

FASTENERS (BASE)

Metric Fasteners

This vehicle provides fastener dimensions using the metric system. Most metric fasteners are approximate in diameter to equivalent English fasteners. Make replacements using fasteners of the same nominal diameter, thread pitch, and strength.

A number marking identifies the OE metric fasteners except cross-recess head screws. The number also indicates the strength of the fastener material. A Posidrive® or Type 1A cross-recess identifies a metric cross-recess screw. For best results, use a Type 1A cross-recess screwdriver, or equivalent, in Posidrive® recess head screws.

GM Engineering Standards and North American Industries have adopted a portion of the ISO-defined standard metric fastener sizes. The purpose was to reduce the number of fastener sizes used while retaining the best thread qualities in each thread size. For example, the metric M6.0 X 1 screw, with nearly the same diameter and 25.4 threads per inch replaced the English 1/4-20 and 1/4-28 screws. The thread pitch is midway between the English coarse and fine thread pitches.

Fastener Strength Identification

Fig. 4: Identifying Fastener Strength Marks
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	English Bolt, Grade 2 (Strength Class)
2	English Bolt, Grade 5 (Strength Class)
3	English Bolt, Grade 7 (Strength Class)
4	English Bolt, Grade 8 (Strength Class)
5	Metric Nut, Strength Class 9
6	Metric Bolts, Strength Class Increases as Numbers Increase

The most commonly used metric fastener strength property classes are 9.8 and 10.9. The class identification is embossed on the head of each bolt. The English, inch strength classes range from grade 2 to grade 8. Radial lines are embossed on the head of each bolt in order to identify the strength class. The number of lines on the head of the bolt is 2 lines less than the actual grade. For example, a grade 8 bolt will have 6 radial lines on the bolt head. Some metric nuts are marked with a single digit strength identification number on the nut face.

The correct fasteners are available through GM SPO. Many metric fasteners available in the aftermarket parts channels are designed to metric standards of countries other than the United States, and may exhibit the following:

- Lower strength
- No numbered head marking system
- Wrong thread pitch

The metric fasteners on GM products are designed to new, international standards. The following are the common sizes and pitches, except for special applications:

- M6.0 X 1
- M8 X 1.25
- M10 X 1.5
- M12 X 1.75
- M14 X 2.00
- M16 X 2.00

Prevailing Torque Fasteners

Prevailing torque fasteners create a thread interface between the fastener and the fastener counterpart in order to prevent the fastener from loosening.

All Metal Prevailing Torque Fasteners

These fasteners accomplish the thread interface by a designed distortion or deformation in the fastener.

Nylon Interface Prevailing Torque Fasteners

These fasteners accomplish the thread interface by the presence of a nylon material on the fastener threads.

Adhesive Coated Fasteners

These fasteners accomplish the thread interface by the presence of a thread-locking compound on the fastener threads. Refer to the appropriate repair procedure in order to determine if the fastener may be reused and the applicable thread-locking compound to apply to the fastener.

Callout	Component Name
1	Prevailing Torque Nut, Center Lock Type
2	Prevailing Torque Nut, Top Lock Type
3	Prevailing Torque Nut, Nylon Patch Type
4	Prevailing Torque Nut, Nylon Washer Insert Type
5	Prevailing Torque Nut, Nylon Insert Type
6	Prevailing Torque Bolt, Dry Adhesive Coating Type
7	Prevailing Torque Bolt, Thread Profile Deformed Type
8	Prevailing Torque Bolt, Nylon Strip Type
9	Prevailing Torque Bolt, Out-of-Round Thread Area Type

A prevailing torque fastener may be reused ONLY if:

- The fastener and the fastener counterpart are clean and not damaged
- There is no rust on the fastener
- The fastener develops the specified minimum torque against its counterpart prior to the fastener seating

THREAD INSERTS

General Purpose Thread Repair Kits.

These kits are available commercially.

Repair Procedure

Fig. 6: Drilling & Tapping Damaged Threads
Courtesy of GENERAL MOTORS COMPANY

WARNING: Refer to Safety Glasses Warning .

NOTE: Refer to the thread repair kit manufacturer's instructions regarding the size of the drill and tap to use.

Avoid any buildup of chips. Back out the tap every few turns and remove the chips.

1. Determine the size, the pitch, and the depth of the damaged thread. If necessary, adjust the stop collars on the cutting tool and tap to the required depth.
2. Drill out the damaged threads. Clean out any chips.
3. Lubricate the tap with light engine oil. Tap the hole. Clean the threads.

Fig. 7: View Of Thread Insert

Courtesy of GENERAL MOTORS COMPANY

4. Thread the thread insert onto the mandrel of the installer. Engage the tang of the insert onto the end of the mandrel.

NOTE: **The insert should be flush to one turn below the surface.**

5. Lubricate the insert with light engine oil, except when installing in aluminum and install the insert.
6. If the tang of the insert does not break off when backing out the installer, break the tang off with a drift.

DOOR LOCK AND IGNITION LOCK FOLDING KEY BLADE REMOVAL AND INSTALLATION

Special Tools

BO-51098 Flip Key Blade Fixture

For equivalent region tools, refer to **Special Tools**.

Fig. 8: Remote Keyless Entry (RKE) Transmitter Assembly
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Failure to properly support the Remote Keyless Entry (RKE) transmitter assembly while replacing the key blade may cause internal damage to the transmitter assembly.

1. Insert the RKE transmitter in the fixture as shown.

Fig. 9: Flip Key Blade Fixture & Transmitter Assembly
Courtesy of GENERAL MOTORS COMPANY

NOTE: It may be necessary to dress the pin drift on a grinder to maintain the diameter in order to drive the pin through the housing.

2. Using the **BO-51098** fixture , drive the retention pin from the transmitter assembly as shown.

Fig. 10: Transmitter Assembly & Key Blade
Courtesy of GENERAL MOTORS COMPANY

3. Remove the key blade from the transmitter assembly.
4. Install the coded blank into the transmitter assembly, insure the indentation on the key blade faces the retention pin.

Fig. 11: Inserting Transmitter Pin
Courtesy of GENERAL MOTORS COMPANY

NOTE: Use caution not to damage the surface, chrome plating, in the following steps.

5. Using needle nose pliers, insert the pin half way into the transmitter assembly.

Fig. 12: Flip Key Blade Fixture
Courtesy of GENERAL MOTORS COMPANY

6. Using the **BO-51098** fixture , drive the roll pin flush to the surface.

FRONT SIDE DOOR LOCK CYLINDER CODING (FREE WHEELING)

Special Tools

BO-49753 Assembly Tool

Fig. 13: Identifying Lock Components
 Courtesy of GENERAL MOTORS COMPANY

The door lock cylinder uses 8 of the 8 cut positions. The tumbler positions are staggered from side to side, 4 on one side and 4 on the other, are not self-retaining, and are not snap in.

NOTE: All lock cylinders for side milled keys have right and left tumblers. The location of the tooth of the tumbler determines whether it is right or left.

Illustrations in this procedure show the right tumblers on the top and the left tumblers on the bottom. All tumblers are marked 1R, 1L, 2R, or 2L. The number being cut depth and the letter meaning right or left.

1. Hold the door lock cylinder (1) so the side with the 4 tumbler spring pockets faces up, pocket nearest to the cylinder head.
2. Insert the tumbler springs (2) into the 4 spring pockets. This side uses left tumblers.
3. Install the tumbler (3) for key cut position one in the slot nearest to the front of the lock cylinder. Install the remaining tumblers, key cut positions 3, 5, and 7, following the key code and same process. Press the tumblers in place until they are secure.
4. Check the correct loading of the tumblers by inserting the key into the cylinder. All tumblers should be flush with the lock cylinder body.
5. Turn the cylinder so the side with the 4 tumbler spring wells faces up. This side uses right tumblers.
6. Insert the tumbler springs into the 4 spring pockets.
7. The first tumbler closest to the front of the lock cylinder to be loaded will be the second key cut position, the second number in the key code. Install the remaining tumblers for the key cut positions 4, 6, and 8. Press the tumblers in place until they are secure.
8. Check the correct loading of the tumblers by inserting the key into the cylinder. All tumblers should be flush with the lock cylinder body.
9. Insert the key and lightly lubricate the cylinder body diameter and tumbler surfaces and a small amount in the head of the cylinder using the supplied grease.
10. Insert the sleeve (4) onto the cylinder assembly.
11. Insert the clutch (5) and driver (6) onto the cylinder (1).

Fig. 14: Loading Cylinder Into Special Tool
Courtesy of GENERAL MOTORS COMPANY

12. Load the cylinder into the **BO-49753** assembly tool so that the clutch (1) indexes with the notch in the opening of the tool (2).

Fig. 15: Loading Assembly Tool Into Vice
Courtesy of GENERAL MOTORS COMPANY

13. Load the assembly tool with the lock cylinder into a vice and tighten the vice ONLY enough to hold the tool and lock the cylinder in place.

Fig. 16: Identifying Lock Components
Courtesy of GENERAL MOTORS COMPANY

14. Insert the roll pin (7) into the driver (6) and install it using a 1/16 inch pin punch.
15. Insert the buffer (8) in the case (9), verify the buffer is properly seated.
16. Install the free wheel pin (11) in the sleeve (4) and clutch (5) and insert the assembly into the case (9).
17. With the lock cylinder assembly installed in the case (9), install the retainer (10) and stake the retainer in place using a small punch and hammer to peen the case material onto the exposed ends of the installed

retainer (10).

18. Insert the key into the lock and function the lock to check for proper assembly and smooth operation.

FRONT SIDE DOOR LOCK CYLINDER CODING (NON FREE WHEELING)

Fig. 17: Door Lock Cylinder Components (Non-Free Wheeling)
 Courtesy of GENERAL MOTORS COMPANY

The door lock cylinder uses 8 of the 8 cut positions. The tumbler positions are staggered from side to side, 4 on

one side and 4 on the other, are not self-retaining, and are not snap in.

NOTE: All lock cylinders for side milled keys have right and left tumblers. The location of the tooth of the tumbler determines whether it is right or left. Illustrations in this procedure show the right tumblers on the top and the left tumblers on the bottom. All tumblers are marked 1R, 1L, 2R, or 2L. The number being cut depth and the letter meaning right or left.

1. Hold the door lock cylinder (1) so the side with the 4 tumbler spring pockets faces up, pocket nearest to the cylinder head.
2. Insert the tumbler springs (2) into the 4 spring pockets. This side uses left tumblers.
3. Install the tumbler (3) for key cut position one in the slot nearest to the front of the lock cylinder. Install the remaining tumblers, key cut positions 3, 5, and 7, following the key code and same process. Press the tumblers in place until they are secure.
4. Check the correct loading of the tumblers by inserting the key into the cylinder. All tumblers should be flush with the lock cylinder body.
5. Turn the cylinder so the side with the 4 tumbler spring wells faces up. This side uses right tumblers.
6. Insert the tumbler springs into the 4 spring pockets.
7. The first tumbler closest to the front of the lock cylinder to be loaded will be the second key cut position, the second number in the key code. Install the remaining tumblers for the key cut positions 4, 6, and 8. Press the tumblers in place until they are secure.
8. Check the correct loading of the tumblers by inserting the key into the cylinder. All tumblers should be flush with the lock cylinder body.
9. Insert the key and lightly lubricate the cylinder body diameter and tumbler surfaces and a small amount in the head of the cylinder using the supplied grease.
10. Insert the sleeve (4) onto the cylinder assembly.
11. Insert the assembly into the case (5).
12. With the lock cylinder assembly installed in the case (5), install the retainer (6) and stake the retainer in place using a small punch and hammer to peen the case material onto the exposed ends of the installed retainer (6).
13. Insert the key into the lock and function the lock to check for proper assembly and smooth operation.

LOCK CYLINDER CODING - IGNITION

Fig. 18: Lock Cylinder Components - Ignition
 Courtesy of GENERAL MOTORS COMPANY

The ignition lock cylinder uses 8 key cut positions, 1-8. The ignition cylinder tumblers (3) are located on alternate sides of the cylinder (5). They are not snap-in and are not self-retaining. It follows the key code with

the first tumbler being the first depth of the key code, closest to the head of the key.

NOTE: All lock cylinders for side milled keys have right and left tumblers. The location of the tooth of the tumbler determines whether it is right or left. Illustrations in this procedure show the right tumblers on the top and the left tumblers on the bottom. All tumblers are marked 1R, 1L, 2R, or 2L. The number being cut depth and the letter meaning right or left.

1. Hold the ignition cylinder assembly (5) so the side with the tumbler spring pocket located closest to the head of the cylinder is facing up.
2. Insert the tumbler spring (7) into each of the 4 spring pockets of the cylinder assembly. This side of the cylinder used left tumblers.
3. The first tumbler (3) to be loaded will be the first key cut position, which is the first number in the key code. Install the tumbler in the slot over the spring. Install the remaining right tumblers following the key code and same process, pressing the tumblers in place until they are secure.
4. Rotate the cylinder assembly. Insert the tumbler spring into each of the spring pockets of the cylinder assembly. This side of the cylinder used right tumblers.
5. The first tumbler (3) to be loaded will be the second key cut position, the second number in the key code. Install the first tumbler in the slot over the spring. Install the remaining left tumblers following the key code and same process, pressing the tumblers in place until they are secure.
6. Inspect for correct loading of the tumblers by inserting the key into the cylinder. All tumblers should drop flush with the lock cylinder body diameter.
7. With the key in the cylinder assembly insert the round connector (6), insert the retainer spring (2) in the retainer slot located in the cylinder assembly. Insert the retainer (1) lining it up in the slot over the spring. Depress the retainer and hold.
8. Insert the cylinder into the sleeve (4) as shown in the print. Make sure the actuator stays located properly in the cylinder.
9. When the key is removed, the lock should stay together.
10. Lightly lubricate the outside surface in the tumbler area of in the lock body and down the key slot using the provided grease. Insert and extract the key 5 times to lubricate the keyway.
11. Insert the key and function the lock 3 times to distribute the grease inside the sleeve.
12. Verify the key position for inserting the lock into the column.

LIFTING AND JACKING THE VEHICLE

NOTE: The use of a LOW PROFILE LIFT ARMS SYSTEM may be required to avoid unwanted contact with the vehicle's body and structure depending on lifting equipment used. Refer to the manufacture's recommendation for their applications of low profile lift arms system for their lifting equipment.

Fig. 19: Lifting and Jacking Vehicle
Courtesy of GENERAL MOTORS COMPANY

WARNING: To avoid any vehicle damage, serious personal injury or death when major components are removed from the vehicle and the vehicle is supported by a hoist, support the vehicle with jack stands at the opposite end from which the components are being removed and strap the vehicle to the hoist.

WARNING: To avoid any vehicle damage, serious personal injury or death, always use the jackstands to support the vehicle when lifting the vehicle with a jack.

CAUTION: Perform the following steps before beginning any vehicle lifting or jacking procedure:

- Remove or secure all of the vehicle contents in order to avoid any shifting or any movement that may occur during the vehicle lifting or jacking procedure.
- The lifting equipment or the jacking equipment weight rating must meet or exceed the weight of the vehicle and any vehicle contents.
- The lifting equipment or the jacking equipment must meet the operational standards of the lifting equipment or jacking equipment manufacturer.

- Perform the vehicle lifting or jacking procedure on a clean, hard, dry, level surface.
- Perform the vehicle lifting or jacking procedure only at the identified lift points. DO NOT allow the lifting equipment or jacking equipment to contact any other vehicle components.

Failure to perform the previous steps could result in damage to the lifting equipment or the jacking equipment, the vehicle, and/or the vehicle contents.

Vehicle Lifting- Frame Contact Lift

Front Lift Pads

When lifting the vehicle with a frame-contact lift, place the front lift pads on the rocker outer panel weld flange, as shown.

Rear Lift Pads

When lifting the vehicle with a frame-contact lift, place the rear lift pads on the rocker outer panel weld flange, as shown.

Vehicle Jacking

CAUTION: When you are jacking the vehicle at the front locations, be certain that the jack or the jack lift pad does not contact the front fascia, front fascia air dam, or the front fenders. If such contact occurs, vehicle damage may result. When jacking at selected front locations additional clearance may be required for the jacking points.

NOTE: When you are lifting a vehicle with a service jack, block the wheels at the opposite end from which you are lifting. Use jack stands to provide additional support.

Front of Vehicle

When using a service jack under the front of the vehicle use one of the following locations:

Place the service jack pad in the same location as shown for the front lift pads.

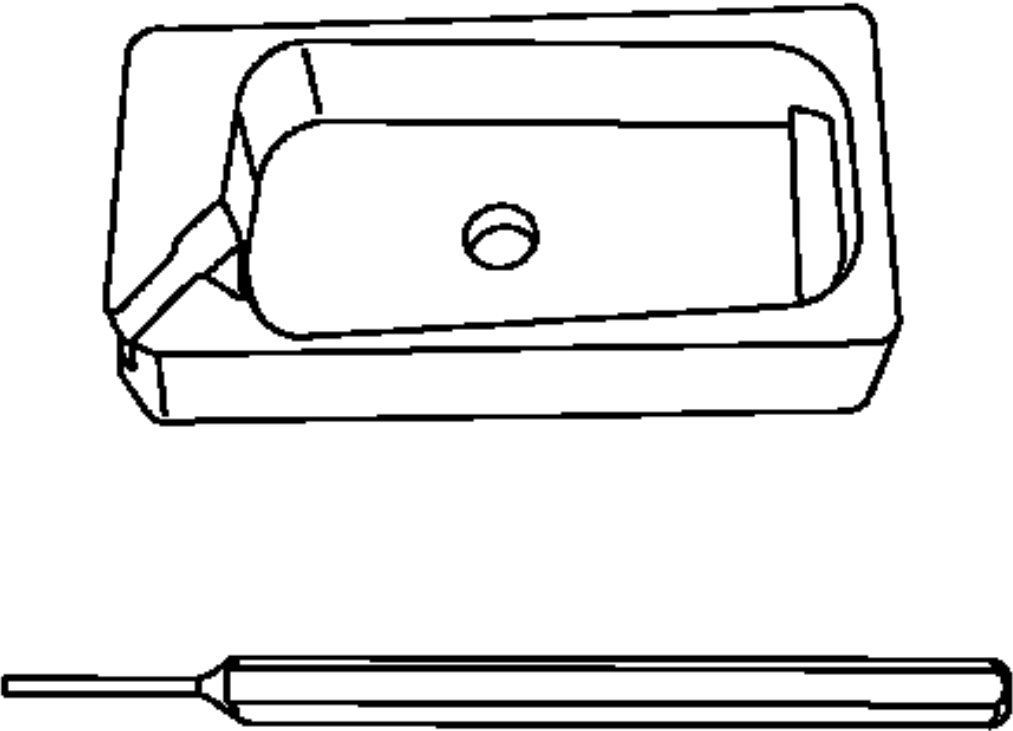

Rear of Vehicle

NOTE: Place jackstands **ONLY** under strong and stable vehicle structures.

Place the service jack pad in the same location as shown for the rear lift pads.

SPECIAL TOOLS AND EQUIPMENT

SPECIAL TOOLS

Illustration	Tool Number/ Description
 <p>The illustration shows two items. The top item is a rectangular flip key blade fixture, labeled BO-51098. It has a central circular hole and a small tab on the right side. The bottom item is a long, thin key blade with a pointed tip.</p>	<p>BO-51098 Flip Key Blade Fixture</p>

REFRIGERANT SYSTEM SPECIFICATIONS

Refrigerant System Specifications

Application	Specification	
	Metric	English
Abrupt Refrigerant Loss	60 ml ¹	2.0 oz ¹
PAG Oil GM P/N 12378526 for United States PAG Oil GM P/N 88900060 for Canada		
Compressor Replacement		
NOTE:		

Compressor failure can occur if the oil removed during refrigerant recovery is not replaced.

The service compressor is shipped with 74 ml² (2.5 oz²) or 40 ml² (1.4 oz²) of PAG oil. Refer to the oil balance instructions for information regarding the specific service compressor oil charge.

Condenser Replacement	30 ml ²	1.0 oz ²
Evaporator Replacement	90 ml ²	3.0 oz ²
Any Line Set (Hose/Tube or Tube Assembly) Replacement	30 ml ²	1.0 oz ²
• Total System PAG Oil Capacity	110.0 ml	3.7 oz
R-134a		
• Refrigerant Charge -LEA/LUK	0.68 kg	1.50 lb
• Refrigerant Charge - LTG	0.60 kg	1.30 lb

¹ Abrupt refrigerant loss due to large leak, hose rupture, collision, or pressure relief valve opening. Conditions that allow the refrigerant to seep or bleed off over time do not cause this oil loss. Upon replacement of a component that caused a large refrigerant loss, also add the required amount of oil for the particular component.

² If more than the specified amount of PAG oil was drained from a component, add the amount drained.

DIAGNOSTIC INFORMATION AND PROCEDURES

LEAK TESTING

Special Tools

- **GE-39400-A** Halogen Leak Detector
- **GE-41447** R-134A A/C Tracer Dye-Box of 24
- **GE-42220** Universal 12V Leak Detection Lamp
- **GE-43872** Fluorescent Dye Cleaner
- **GE-46297** A/C Dye Injector Kit
- **GE-46297-12** Replacement Dye Cartridges

For equivalent regional tools. Refer to **Special Tools** .

Refrigerant Leak Testing

NOTE: **General Motors vehicles are now manufactured with fluorescent dye installed directly into the air conditioning (A/C) system.**

The fluorescent dye mixes and flows with the polyalkylene glycol (PAG) oil throughout the refrigerant system.

Verifying some passive leaks may require using the **GE-39400-A** Halogen Leak Detector , even though the A/C system contains fluorescent dye.

The only time that adding additional fluorescent dye is required is after flushing the A/C system.

Fluorescent Leak Detector

Fluorescent dye will assist in locating any leaks in the A/C system.

NOTE: PAG oil is water soluble.

- Condensation on the evaporator core or the refrigerant lines may wash the PAG oil and fluorescent dye away from the actual leak. Condensation may also carry dye through the HVAC module drain.
- Leaks in the A/C system will be indicated in a light green or yellow color when using the leak detection lamp.

Use the leak detection lamp in the following areas:

- All fittings or connections that use seal washers or O-rings
- All of the A/C components
- The A/C compressor shaft seal
- The A/C hoses and pressure switches
- The HVAC module drain tube, if the evaporator core is suspected of leaking
- The service port sealing caps

The sealing cap is the primary seal for the service ports.

- Follow the instructions supplied with the **GE-42220** Universal 12V Leak Detection Lamp.
- To prevent false diagnosis in the future, thoroughly clean the residual dye from any area where leaks were found. Use a rag and the approved **GE-43872** Fluorescent Dye Cleaner.

Fluorescent Dye Injection

NOTE: Use only fluorescent dye approved by General Motors.

- **GE-41447 R-134A A/C Tracer Dye-Box of 24 can be poured directly into a removed A/C component.**
- **GE-46297-12 Replacement Dye Cartridges is injected into the low side port using GE-46297 A/C Dye Injector Kit.**
- Not all of the fluorescent dyes are compatible with PAG oil. Some types of dye decrease the oil viscosity or may chemically react with the oil.
- R-134A leak detection dye requires time to work. Depending upon the leak rate, a leak may not become visible for between 15 minutes and 7 days.

NOTE: Do NOT overcharge the A/C system with dye. Use only one 7.39 ml (0.25 oz) charge.

- To prevent false diagnosis, thoroughly clean any residual dye from the service port with a rag and the approved fluorescent dye cleaner **GE-43872** Fluorescent Dye Cleaner.

Halogen Leak Detector

WARNING: Do not operate the detector in a combustible atmosphere since its sensor operates at high temperatures or personal injury and/or damage to the equipment may result.

Ensure that the vehicle has at least 0.45 kg (1 lb) of refrigerant in the A/C refrigeration system in order to perform a leak test. Refer to **Refrigerant Recovery and Recharging** for recharging the A/C system.

NOTE: Halogen leak detectors are sensitive to the following items:

- Windshield washing solutions
- Many solvents and cleaners
- Some adhesives used in the vehicle

Clean and dry all surfaces in order to prevent a false warning. Liquids will damage the detector.

NOTE: Follow a continuous path in order to ensure that you will not miss any possible leaks. Test all areas of the system for leaks.

Follow the instructions supplied with the **GE-39400-A** Halogen Leak Detector.

AIR CONDITIONING (A/C) SYSTEM PERFORMANCE TEST

This test measures the operating efficiency of the A/C system under the following conditions:

- The current ambient air temperature
- The current relative humidity
- The high side pressure of the A/C system
- The low side pressure of the A/C system
- The temperature of the air being discharged into the passenger compartment

Test Description

The numbers below refer to the step numbers on the diagnostic table.

1

This step determines if the A/C system has at least the minimum refrigerant charge required to operate the system without damage.

2

This step measures the performance of the A/C system.

3

This step is to allow for vehicle variations as well as high ambient temperatures.

Air Conditioning (A/C) System Performance Test

Step	Action	Values	Yes	No
NOTE: <ul style="list-style-type: none"> • The ambient air temperature must be at least 16°C (60°F). • Do not induce additional air flow across the front of the vehicle during the test. • If you were sent here from a DTC diagnostic table, clear the DTC upon completion of this test. 				
1	<ol style="list-style-type: none"> 1. Park the vehicle inside or in the shade. 2. Open the windows in order to ventilate the interior of the vehicle. 3. If the A/C system was operating, allow the A/C system to equalize for about 2 minutes. 4. Turn OFF the ignition. 5. Install the J 43600 ACR 2000 Air Conditioning Service Center. 6. Record the ambient air temperature displayed on the J 43600 ACR 2000 Air Conditioning Service Center. 7. Record the low and high side STATIC pressure readings. <p>Are both the low side and high side pressures within the specified value?</p>	<p>More than 16°C (60°F) - 345 kPa (50 psi)</p> <p>More than 24°C (75°F) - 483 kPa (70 psi)</p> <p>More than 33°C (90°F) - 690 kPa (100 psi)</p>	Go to Step 2	Go to <u>Leak Testing</u>
	<p>NOTE: Record the relative humidity and the ambient air temperature at the time of the test.</p> <ol style="list-style-type: none"> 1. Close the vehicle doors and windows. 2. Open the drivers door window 12.7-15.2 cm (5-6 in). 3. Select the following HVAC control settings: <ul style="list-style-type: none"> • The A/C is ON. • The coldest temperature setting 			

2	<ul style="list-style-type: none"> • The maximum blower speed • Recirculation mode • The instrument panel (I/P) panel outlet mode • All I/P panel outlets are OPEN. <p>4. Install the temperature probes of the J 43600 ACR 2000 Air Conditioning Service Center in the left and right center panel air outlets.</p> <p>5. Apply the parking brake.</p> <p>6. Place the transaxle/transmission in one of the following positions:</p> <ul style="list-style-type: none"> • PARK (Automatic) • NEUTRAL (Manual) <p>7. Start the engine and warm to operating temperature.</p> <p>8. Operate the A/C system for 5 minutes.</p> <p>9. Inspect A/C components for the following conditions:</p> <ul style="list-style-type: none"> • Abnormal frost areas • Unusual noises <p>NOTE: Press the RESET button, before using the print function of the J 43600 ACR 2000 Air Conditioning Service Center.</p> <p>10. Print the following information:</p> <ul style="list-style-type: none"> • The panel outlet air temperatures • The low-side pressure • The high-side pressure <p>11. Compare the low and high side pressures and the panel output temperatures to the A/C Performance Table below.</p> <p>Does all the data recorded fall within the specified ranges of the A/C Performance Table below?</p>	-	Go to Step 5	Go to Step 3
	<p>If the pressures and temperatures recorded do not fall within the specified ranges:</p> <p>1. Continue to operate the A/C system for an</p>			

3	<p>additional 5 minutes.</p> <p>2. RESET the J 43600 ACR 2000 Air Conditioning Service Center and record the pressures and temperatures again.</p> <p>3. Compare the low and high side pressures and the panel output temperature to the table below.</p>	-		
	Does all the data recorded fall within the specified ranges of the table below?			
4	<p>Perform the necessary repairs. Refer to <u>A/C Diagnostics Chart</u>.</p> <p>Is the action complete?</p>	-	Go to Step 5	-
5	<p>Operate the system in order to verify the test results.</p> <p>Did you find the same results?</p>	-	System OK	Go to <u>Symptoms - HVAC Systems - Automatic</u>

A/C Performance Table

Ambient Temperature	Relative Humidity	Low Side Service Port Pressure	High Side Service Port Pressure	Maximum Left Center Discharge Air Temperature
13-18°C (55-65°F)	0-100%	151-220 kPa (22-32 psi)	950-1102 kPa (138-160 psi)	8°C (45°F)
19-24°C (66-75°F)	Below 40%	151-248 kPa (22-36 psi)	1178-1378 kPa (171-200 psi)	8°C (46°F)
	Above 40%	165-268 kPa (24-39 psi)	1109-1336 kPa (161-194 psi)	12°C (52°F)
25-29°C (76-85°F)	Below 35%	192-275 kPa (28-40 psi)	1329-1543 kPa (193-224 psi)	12°C (52°F)
	35-50%	199-289 kPa (29-42 psi)	13209-1543 kPa (190-224 psi)	13°C (54°F)
	Above 50%	213-310 kPa (31-45 psi)	1288-1543 kPa (187-224 psi)	14°C (57°F)
30-35°C (86-95°F)	Below 30%	227-316 kPa (33-46 psi)	1460-1722 kPa (212-250 psi)	14°C (57°F)
	30-50%	234-330 kPa (34-48 psi)	1460-1743 kPa (212-253 psi)	15°C (59°F)
	Above 50%	248-351 kPa (36-51 psi)	1460-1777 kPa (212-258 psi)	18°C (63°F)
36-41°C (96-105°F)	Below 20%	261-351 kPa (38-51 psi)	1619-1880 kPa (235-273 psi)	18°C (63°F)
	20-40%	268-365 kPa (39-53 psi)	1632-1922 kPa (237-279 psi)	18°C (64°F)

	Above 40%	282-378 kPa (41-55 psi)	1646-1970 kPa (239-286 psi)	19°C (66°F)
42-46°C (106-115°F)	Below 20%	303-378 kPa (44-55 psi)	1770-2011 kPa (257-292 psi)	20°C (68°F)
	Above 20%	310-399 kPa (45-58 psi)	1798-2080 kPa (261-302 psi)	22°C (70°F)
47-49°C (116-120°F)	Below 30%	344-427 kPa (50-62 psi)	1929-2197 kPa (280-319 psi)	24°C (75°F)

A/C DIAGNOSTICS CHART

A/C Diagnostics Chart

Low Side Gauge Reading	High Side Gauge Reading	Potential Causes
Low	Low	Low Refrigerant Charge
		Restriction between Compressor and High Side port
	Low/Normal	Evaporator Freezing
	High	Restriction between the Low Side and High Side ports or Restricted TXV/Orifice Tube
		Compressor Stuck at Maximum Displacement
High	Low	Compressor has Low Displacement or Internal Malfunction
		Malfunctioning Cooling Fans
	High	Refrigerant Overcharge
		Restriction between the Low Side Port and Compressor Inlet
		Restricted Condenser Air Flow
		Expansion Device Stuck Open
		Air in A/C System
Normal/High	Normal/High	Refrigerant Contamination
		PAG or POE Oil Overcharge

HEATING PERFORMANCE DIAGNOSTIC

Heating Performance Diagnostic

Step	Action	Yes	No
1	Were you sent here from Symptoms or another diagnostic table?	Go to Step 2	Go to Symptoms - HVAC Systems - Automatic
2	1. Start the engine. 2. Allow the engine to idle.		

	Does the engine reach a normal operating temperature?	Go to Step 3	Go to Step 9
3	<p>WARNING: Refer to <u>Moving Parts and Hot Surfaces Warning</u> .</p> <ol style="list-style-type: none"> 1. Allow the engine to idle. 2. Select the FLOOR mode. 3. Select the minimum blower speed. 4. Select the warmest temperature setting. 5. Feel the temperature of the inlet and outlet heater hoses at the heater core. <p>Does the inlet heater hose feel warmer than the outlet heater hose?</p>	Go to Step 7	Go to Step 4
4	<ol style="list-style-type: none"> 1. Install a thermometer into the center I/P PANEL air outlet. 2. Secure a thermometer to the heater core outlet hose. 3. Select the PANEL mode. 4. Select the maximum blower speed. 5. Select the warmest temperature setting. 6. Record the temperature at the following locations: <ul style="list-style-type: none"> • The center I/P PANEL air outlet • The heater core outlet hose 7. Compare the recorded temperatures. <p>Are the 2 temperature readings about equal?</p>	Go to Step 5	Go to Step 6
5	<ol style="list-style-type: none"> 1. Inspect and repair the following areas of the vehicle for cold air leaks: <ul style="list-style-type: none"> • The cowl • The recirculation door • The HVAC module case 2. Perform the necessary repairs. <p>Are the repairs complete?</p>	Go to Step 10	-
6	<ol style="list-style-type: none"> 1. Inspect the temperature door operation. Refer to <u>Diagnostic System Check - Vehicle</u> . 2. Perform any necessary repairs. <p>Are the repairs complete?</p>	Go to Step 10	-

7	<ol style="list-style-type: none"> 1. Turn OFF the engine. 2. Backflush the heater core. 3. Start the engine. 4. Select the FLOOR mode. 5. Select the minimum blower speed. 6. Select the warmest temperature setting. 7. Feel the temperature of the inlet and outlet heater hoses at the heater core. <p>Does the inlet heater hose feel warmer than the outlet heater hose?</p>	Go to Step 8	Go to Step 10
8	<p>Replace the heater core. Refer to <u>Heater Core Replacement (LHD)</u>.</p> <p>Is the repair complete?</p>	Go to Step 10	-
9	<p>Repair the low engine temperature concern. Refer to <u>Engine Fails To Reach Normal Operating Temperature</u>.</p> <p>Is the repair complete?</p>	Go to Step 10	-
10	<p>Operate the system in order to verify the repair.</p> <p>Did you find and correct the condition?</p>	System OK	Go to Step 2

DEFROSTING INSUFFICIENT

Defrosting Insufficient

Step	Action	Yes	No
DEFINITION: Time required to defrost the windshield is longer than normal.			
1	Were you sent here from Symptoms or another diagnostic table?	Go to Step 2	Go to <u>Symptoms - HVAC Systems - Automatic</u>
2	<ol style="list-style-type: none"> 1. Start the engine. 2. Select the DEFROST mode. 3. Select the maximum blower speed. <p>Does sufficient air flow from the defroster outlets?</p>	Go to Step 3	Go to Step 10
3	<p>Measure the engine operating temperature.</p> <p>Does engine reach a normal operating temperature?</p>	Go to Step 4	Go to Step 8
4	<ol style="list-style-type: none"> 1. Select the minimum blower speed. 2. Select the maximum temperature setting. <p>WARNING: Refer to <u>Moving Parts and Hot Surfaces Warning</u>.</p>		

	3. Feel the temperature of the inlet and outlet hoses at the heater core. Does the inlet hose feel warmer than the outlet hose?	Go to Step 11	Go to Step 5
5	Test the operation of the A/C compressor clutch. Does the A/C compressor clutch engage?	Go to Step 7	Go to Step 6
6	Repair the A/C compressor clutch. Refer to <u>Air Conditioning Compressor Replacement (LUK)</u> , <u>Air Conditioning Compressor Replacement (LTG)</u> , <u>Air Conditioning Compressor Replacement (LEA)</u> . Is the repair complete?	Go to Step 14	-
7	Perform the A/C system performance test. Refer to <u>Air Conditioning (A/C) System Performance Test</u> . Is the A/C system operating within the specifications?	Go to Step 9	Go to Step 12
8	Repair the low engine temperature concern. Refer to <u>Engine Fails To Reach Normal Operating Temperature</u> . Is the repair complete?	Go to Step 14	-
9	Inspect for correct operation of the recirculation door. Is the recirculation door operating correctly?	Go to Step 14	Go to Step 13
10	Repair the air delivery concern. Is the repair complete?	Go to Step 14	-
11	Repair the heating concern. Refer to Air Temperature Malfunction . Is the repair complete?	Go to Step 14	-
12	Repair the A/C performance concern. Refer to <u>Air Conditioning (A/C) System Performance Test</u> . Is the repair complete?	Go to Step 14	-
13	Repair the recirculation door concern. Is the repair complete?	Go to Step 14	-
14	Operate the system in order to verify the repair. Did you find and correct the problem?	System OK	Go to Step 2

NOISE DIAGNOSIS - BLOWER MOTOR

Noise Diagnosis - Blower Motor

Step	Action	Yes	No
DEFINITION: Noise originating from the blower motor.			
1	Were you sent here from Symptoms or another diagnostic table?	Go to Step 2	Go to <u>Symptoms - HVAC Systems - Automatic</u>
2	Inspect the air inlet grille for debris. Is debris present?	Go to Step 8	Go to Step 3
	1. Sit inside the vehicle.		

3	<ol style="list-style-type: none"> 2. Close the vehicle doors and windows. 3. Turn ON the ignition, with the engine OFF. 4. Cycle the blower motor through all of the speeds and modes in order to determine where and when the noise occurs. <p>Is a noise evident during the blower operation?</p>	Go to Step 4	Go to Step 11
4	<p>Inspect for excessive vibration at each blower motor speed by feeling the blower case.</p> <p>Is excess vibration present?</p>	Go to Step 6	Go to Step 5
5	<p>Listen to the blower motor at each speed.</p> <p>Is the blower motor making a squeaking or chirping noise?</p>	Go to Step 9	Go to Step 11
6	<ol style="list-style-type: none"> 1. Remove the blower motor. Refer to <u>Blower Motor Replacement</u>. 2. Inspect the blower motor impeller for deposits of foreign material. 3. Inspect the blower motor for deposits of foreign material. <p>Did you find any foreign material on the blower motor or blower motor impeller?</p>	Go to Step 8	Go to Step 7
7	<p>Inspect the blower motor for the following conditions:</p> <ul style="list-style-type: none"> • Cracked blades • A loose impeller retainer • Improper impeller alignment <p>Did you find any of these conditions?</p>	Go to Step 9	Go to Step 10
8	<p>Remove the foreign material.</p> <p>Is the action complete?</p>	Go to Step 10	-
9	<p>Replace the blower motor. Refer to <u>Blower Motor Replacement</u>.</p> <p>Is the repair complete?</p>	Go to Step 11	-
10	<p>Install the blower motor. Refer to <u>Blower Motor Replacement</u>.</p> <p>Is the action complete?</p>	Go to Step 11	-
11	<p>Operate the system in order to verify the repair.</p> <p>Did you find and correct the condition?</p>	System OK	Go to Step 2

AIR CONDITIONING COMPRESSOR OIL DIAGNOSIS

Air Conditioning Compressor Oil Diagnosis

Condition	Corrective Action
NOTE: To avoid repeat compressor failure, always inspect the condition of the refrigerant oil and take the appropriate corrective action before installing the replacement compressor.	
Clean Oil no debris present	No corrective action necessary.
Clean Oil with debris present	<ul style="list-style-type: none"> • Replace desiccant or component containing the desiccant. • Replace desiccant filter if applicable. • Remove and inspect high pressure side filter (if applicable). • Remove, inspect, clean, or replace orifice tube (if applicable). • If the system has a front orifice tube and is equipped with a filter in the rear auxiliary line, remove, inspect, clean, or replace the filter.
Dark brown/black and/or pungent/unusual odor with no debris present	<ul style="list-style-type: none"> • Replace desiccant or component containing the desiccant. • Replace desiccant filter if applicable. • Flush refrigerant system.
Dark brown/black and/or pungent/unusual odor with debris present	<ul style="list-style-type: none"> • Replace desiccant or component containing the desiccant. • Replace desiccant filter if applicable. • Flush refrigerant system. • Remove and inspect high pressure side filter (if applicable). • Remove, inspect, clean, or replace orifice tube (if applicable). • If the system has a front orifice tube and is equipped with a filter in the rear auxiliary line, remove, inspect, clean, or replace the filter.
Oil Overcharge	Flush refrigerant system.
Refrigerant Contamination	Flush refrigerant system.
Hybrid Polyolester Refrigerant Oil (POE) Contamination	<ul style="list-style-type: none"> • Flush refrigerant system. • Replace desiccant or component containing the desiccant. • Replace desiccant filter if applicable.

NOISE DIAGNOSIS - AIR CONDITIONING (A/C) SYSTEM

Noise Diagnosis - Air Conditioning (A/C) System

Step	Action	Yes	No
DEFINITION: Noise originating from the A/C compressor, drive belt, or the A/C lines.			
1	Were you sent here from Symptoms or another diagnostic table?	Go to Step 2	Go to <u>Symptoms - HVAC Systems - Automatic</u>
	1. A/C system noises can be generally categorized into 3 areas: <ul style="list-style-type: none"> • Screeching, squealing, chirping noises 		

2	<ul style="list-style-type: none"> • Moaning noises • Vibration/rattle noises <ol style="list-style-type: none"> 2. Start the engine. 3. Ensure that the A/C is ON. <p>Is a screeching, squealing noise heard when the A/C is engaged?</p>	Go to Step 3	Go to Step 9
3	<p>With the engine OFF, inspect the drive belt for excessive wear. Refer to the appropriate procedure: <u>Drive Belt Falls Off and Excessive Wear Diagnosis</u> , for the 2.4 engine or <u>DRIVE BELT FALLS OFF AND EXCESSIVE WEAR DIAGNOSIS</u> for the 2.0 engine.</p> <p>Is the drive belt excessively worn?</p>	Go to Step 18	Go to Step 4
4	<p>Inspect the drive belt tension. Refer to the appropriate procedure: <u>Drive Belt Tensioner Diagnosis</u> , for the 2.4 engine or <u>DRIVE BELT TENSIONER DIAGNOSIS</u> for the 2.0 engine.</p> <p>Is the drive belt tension correct?</p>	Go to Step 5	Go to Step 19
5	<p>Inspect the drive belt for excessive oil coverage.</p> <p>Is the drive belt covered with oil?</p>	Go to Step 17	Go to Step 6
6	<ol style="list-style-type: none"> 1. Start the engine. 2. Ensure that the A/C is ON. 3. Inspect the compressor and the clutch. <p>Is the A/C compressor locked up?</p>	Go to Step 24	Go to Step 7
7	<p>Is the A/C compressor clutch slipping?</p>	Go to Step 23	Go to Step 8
8	<p>WARNING: Refer to <u>Moving Parts and Hot Surfaces Warning</u> .</p> <p>Using a stethoscope, listen to the A/C compressor for any abnormal noises. Is the compressor causing an abnormal noise?</p>	Go to Step 15	Go to Step 10
9	<p>Does a moaning noise exist when the A/C clutch is engaged?</p>	Go to Step 10	Go to Step 12
10	<p>Listen to the A/C compressor components and mounting for noise concerns using a stethoscope. Are any of these components loose, damaged, or excessively worn?</p>	Go to Step 20	Go to Step 11
	<ol style="list-style-type: none"> 1. Idle the engine. 2. Engage the A/C compressor clutch. 3. Using a stethoscope, move around the entire 		

11	refrigerant plumbing system. Listening for any abnormal noises caused by a component of the A/C system touching another component. Are any of the A/C components grounding out and causing a vibration noise?	Go to Step 22	Go to Step 13
12	Does a vibration or rattle noise exist when the A/C clutch is engaged?	Go to Step 13	Go to Step 14
13	Does the noise stop when the A/C clutch is disengaged?	Go to Step 15	Go to Step 25
14	1. Idle the engine in PARK with the A/C compressor clutch engaged. 2. Using a stethoscope, move around the entire A/C system testing for any abnormal noises caused by a component. Do any of the A/C components cause an abnormal noise?	Go to Step 21	Go to Step 25
15	Verify that the A/C system is properly charged. Refer to Refrigerant System Specifications . Is the A/C system properly charged?	Go to Step 26	Go to Step 16
16	Recharge the A/C system to specification. Refer to Refrigerant Recovery and Recharging . Is the abnormal compressor noise still present?	Go to Step 24	Go to Step 26
17	Repair the oil leak. Refer to the appropriate procedure: Oil Leak Diagnosis , for the 2.4 engine or OIL LEAK DIAGNOSIS for the 2.0 engine. Is the repair complete?	Go to Step 18	-
18	Replace the drive belt. Refer to the appropriate procedure: Drive Belt Replacement (LEA) , Drive Belt Replacement (LUK) , for the 2.4 engine or DRIVE BELT REPLACEMENT for the 2.0 engine. Is the replacement complete?	Go to Step 26	-
19	Replace the drive belt tensioner. Refer to the appropriate procedure: Is the replacement complete? Drive Belt Tensioner Replacement (LUK) , Drive Belt Tensioner Replacement (LEA) , for the 2.4 engine or DRIVE BELT TENSIONER REPLACEMENT for the 2.0 engine.	Go to Step 26	-
20	Repair or replace the A/C compressor mounting component. Is the repair complete?	Go to Step 26	-
21	Repair or replace the component which is causing the moaning concern as needed. Is the repair complete?	Go to Step 26	-

22	Correctly route or insulate the A/C component. Is the repair complete?	Go to Step 26	-
23	Replace the A/C compressor clutch. Refer to <u>Air Conditioning Compressor Replacement (LUK)</u> , <u>Air Conditioning Compressor Replacement (LTG)</u> , <u>Air Conditioning Compressor Replacement (LEA)</u> . Is the repair complete?	Go to Step 26	-
24	Replace the A/C compressor. Refer to <u>Air Conditioning Compressor Replacement (LUK)</u> , <u>Air Conditioning Compressor Replacement (LTG)</u> , <u>Air Conditioning Compressor Replacement (LEA)</u> . Is the repair complete?	Go to Step 26	-
25	The concern may be caused by an engine related component. Refer to <u>Vibration Analysis - Engine</u> . Did you find and correct the condition?	Go to Step 26	-
26	Operate the system in order to verify the repair. Did you find and correct the condition?	System OK	Go to Step 2

NOISE DIAGNOSIS - HVAC MODULE

Noise Diagnosis - HVAC Module

Step	Action	Yes	No
DEFINITION: Noise originating from the HVAC module.			
1	Were you sent here from Symptoms or another diagnostic table?	Go to Step 2	Go to <u>Symptoms - HVAC Systems - Automatic</u>
2	<ol style="list-style-type: none"> Start the engine. Cycle through all of the following: <ul style="list-style-type: none"> Blower motor speeds HVAC modes Temperature control settings Determine the type of noise: <ul style="list-style-type: none"> Scrape, pop Tick/click, chirp or groaning Air rush/whistle <p>Is a scrape or pop noise evident when selecting modes or temperature settings?</p>	Go to Step 6	Go to Step 3
3	Is a tick/click, chirping, groaning or scraping noise present, but decreases as blower motor speed is decreased?	Go to Step 6	Go to Step 4
4	Is an air rush/whistle noise evident in all modes but not all temperature settings?	Go to Step 6	Go to Step 5

5	Is an air rush/whistle noise evident only in defrost or floor mode?	Go to Step 6	Go to Step 6
6	Remove the instrument panel (I/P) carrier. Refer to <u>Instrument Panel Tie Bar Replacement</u> . Is the action complete?	Go to Step 7	-
7	<ul style="list-style-type: none"> Inspect the air flow doors for proper operation. Inspect the ducts for obstructions or foreign materials. Were any of these conditions found?	Go to Step 10	Go to Step 8
8	Inspect the mode and temperature doors and seals for warping or cracking. Are the doors in normal condition?	Go to Step 11	Go to Step 9
9	Replace the appropriate door and/or seals. Is the repair complete?	Go to Step 11	-
10	Remove any obstructions or foreign material found. Is the action complete?	Go to Step 11	-
11	Install the I/P carrier. Refer to <u>Instrument Panel Tie Bar Replacement</u> . Is the action complete?	Go to Step 12	-
12	Operate the system to verify the repair. Did you find and correct the condition?	System OK	Go to Step 2

ODOR DIAGNOSIS

Odor Diagnosis

Step	Action	Yes	No
DEFINITION: Odor originating or noticed through the HVAC system.			
1	Were you sent here from Symptoms or another diagnostic table?	Go to Step 2	Go to <u>Symptoms - HVAC Systems - Automatic</u>
2	<ol style="list-style-type: none"> Sit inside the vehicle. Close all of the doors and windows. Start the engine. Allow the engine idle at normal operating temperature. Select the maximum blower speed. Select the PANEL air outlet mode. Select the coldest temperature setting. Cycle through all of the blower speeds, modes and temperatures to define what type of odor is present. <ul style="list-style-type: none"> Musty smell 		

	<ul style="list-style-type: none"> • Coolant smell • Oil smell 		
	Does the odor have a musty smell?	Go to Step 3	Go to Step 8
3	Inspect the HVAC filter and the air inlet grille for debris. Is debris present?	Go to Step 4	Go to Step 5
4	Remove any debris. Is the action complete?	Go to Step 15	-
5	Inspect for wet carpeting. Is the carpet wet?	Go to Step 6	Go to Step 8
6	Inspect for the following conditions: <ul style="list-style-type: none"> • Water leaks around the windshield • Blockage of the HVAC module drain • Leaks around the door seals Is a leak present?	Go to Step 7	Go to Step 15
7	Repair the leak as necessary. Is the repair complete?	Go to Step 15	-
8	Does the odor have a coolant smell?	Go to Step 9	Go to Step 12
9	Inspect the cooling system for leaks. Refer to <u>Loss of Coolant</u> . Is a leak present?	Go to Step 10	Go to Step 12
10	Inspect for coolant leaking inside the vehicle or for a film build-up on the windshield. Is the condition present?	Go to Step 11	Go to Step 15
11	Inspect and if necessary replace the heater core. Refer to <u>Heater Core Replacement (LHD)</u> . Is the repair complete?	Go to Step 15	-
12	Does the odor have an oily smell?	Go to Step 13	Go to Step 15
13	1. Inspect the engine compartment for any leaks. Refer to the following procedures: <ul style="list-style-type: none"> • <u>Cooling System Leak Testing</u> for 2.0L or for 2.4L • <u>Fluid Leak Diagnosis (Non Hybrid)</u> , <u>Fluid Leak Diagnosis (Hybrid)</u> 2. Repair any oil leaks.		-
	Is the repair complete?	Go to Step 15	
	A musty odor can be caused by mold or mildew build-up on the evaporator or the heater core or		

14	inside of the HVAC module. Refer to <u>Odor Correction</u> . Is the action complete?	Go to Step 15	-
15	Operate the system in order to verify the repair. Did you find and correct the condition?	System OK	Go to Step 2

REPAIR INSTRUCTIONS

ODOR CORRECTION

Eliminating Air Conditioning Odor

Odors may be emitted from the air conditioning system primarily at start up in hot, humid climates. The following conditions may cause the odor:

- Debris is present in the HVAC module.
- Microbial growth on the evaporator core

When the blower motor fan is turned on, the microbial growth may release an unpleasant musty odor into the passenger compartment. To remove odors of this type, the microbial growth must be eliminated. Perform the following procedure:

Deodorize the evaporator core using Deodorizing Aerosol Kit.

Perform the following steps in order to deodorize the A/C system:

1. Ensure that the plenum that draws outside air into the HVAC module is clear of debris.
2. Disable the A/C compressor clutch operation by disconnecting the clutch coil electrical connector.
3. Dry the evaporator core by performing the following steps:
 1. Start the engine.
 2. Select the maximum temperature setting.
 3. Select the recirculation mode.
 4. Run the blower motor on high for 10 minutes.
4. Locate an area in the air conditioning duct between the blower motor and the evaporator core downstream of the blower motor.
5. Drill a 3.175 mm (0.125 in) hole where the hole will not interfere with or damage the following components:
 - The blower motor
 - The evaporator core
 - Any other operating part the of system
6. Wear safety goggles and latex gloves in order to perform the following actions:
 1. Select the maximum blower speed.
 2. Insert the deodorizer extension tube into the hole to the mark on the extension tube.

3. Use short spray bursts and vary the direction of spray for a 2-3 minute period of time.
7. Shut the engine OFF. Allow the vehicle to sit for 3-5 minutes.
8. Seal the 3.175 mm (0.125 in) hole with body sealer or RTV gasket compound.
9. Start the engine.
10. Operate the blower motor on high for 15-20 minutes to dry.
11. Reconnect the A/C compressor clutch coil electrical connector.
12. Verify proper clutch operation.
13. Using the scan tool enable the afterblow. Refer to **Heating, Ventilation and Air Conditioning Control Module Scan Tool Information** .

REFRIGERANT RECOVERY AND RECHARGING

WARNING: To prevent personal injury, avoid breathing A/C Refrigerant and lubricant vapor or mist. Work in a well ventilated area. To remove refrigerant from the A/C System, use service equipment designed for recovery that is certified to meet the requirements of the appropriate SAE Standards. If an accidental system discharge occurs, ventilate the work area before continuing service. Additional health and safety information may be obtained from the refrigerant, refrigerant recovery, and lubricant manufacturers.

WARNING: For personal protection, goggles and lint-free gloves should be worn and a clean cloth wrapped around fittings, valves, and connections when doing work that includes opening the refrigerant system. If refrigerant comes in contact with any part of the body severe frostbite and personal injury can result. The exposed area should be flushed immediately with cold water and prompt medical help should be obtained.

CAUTION: You must replace the desiccant if the A/C refrigerant system has been open to atmosphere for more than four hours, or if the A/C refrigerant oil has been contaminated. Failure to replace the desiccant will result in damage to the A/C refrigerant system.

CAUTION: To avoid system damage use only R-134a dedicated tools when servicing the A/C system.

CAUTION: R-134a is the only approved refrigerant for use in this vehicle. The use of any other refrigerant may result in poor system performance or component failure.

CAUTION: Use only Polyalkylene Glycol Synthetic Refrigerant Oil (PAG) for internal circulation through the R-134a A/C system and only 525 viscosity mineral oil on fitting threads and O-rings. If lubricants other than those specified

are used, compressor failure and/or fitting seizure may result.

CAUTION: R-12 refrigerant and R-134a refrigerant must never be mixed, even in the smallest of amounts, as they are incompatible with each other. If the refrigerants are mixed, compressor failure is likely to occur. Refer to the manufacturer instructions included with the service equipment before servicing.

The A/C service station is a complete air conditioning service center for refrigerant. The service station recovers, recycles, evacuates and recharges A/C refrigerant quickly, accurately and automatically. The unit has a display screen that contains the function controls and displays prompts that will lead the technician through the recover, recycle, evacuate and recharge operations. A/C refrigerant is recovered into and charged out of an internal storage vessel.

The A/C service station has a built in A/C refrigerant identifier that will test for contamination, prior to recovery and will notify the technician if there are foreign gases present in the A/C system. If foreign gases are present, the station will not recover the refrigerant from the A/C system.

For information on the actual equipment, please refer to the manual of the equipment in question.

Always recharge the A/C System with the proper amount of refrigerant. Refer to **Refrigerant System Specifications** for the correct amount.

A/C Refrigerant System Oil Charge Replenishing

If oil was removed from the A/C system during the recovery process or due to component replacement, the oil must be replenished. Oil can be injected into a charged system. For the proper quantities of oil to add to the A/C refrigerant system, refer to **Refrigerant System Specifications**.

FLUSHING

NOTE: This procedure is not used in Europe.

Special Tools

- **GE-8800** ACR 2000 Air Conditioning Service Center
- **GE-41447** Leak Detection Dye
- **GE-42220** Universal 12V Leak Detection Lamp
- **GE-45268** Flush Adapter Kit

For equivalent regional tools. Refer to **Special Tools** .

NOTE: Flushing with the GE-8800 ACR 2000 Air Conditioning Service Center is not intended to remove metal from the A/C system.

Flushing is intended to remove the following:

- Contaminated polyalkylene glycol (PAG) oil
- Desiccant, following a desiccant bag failure
- Overcharge of PAG oil
- Refrigerant contamination

NOTE: Warmer engine or ambient temperature decreases the refrigerant recovery time during the A/C flush procedure.

1. Recover the refrigerant. Refer to **Refrigerant Recovery and Recharging**.
2. Remove the thermal expansion valve (TXV). Refer to **Air Conditioning Evaporator Thermal Expansion Valve Replacement**.
3. Install the stud for the **GE-45268** Flush Adapter Kit onto the J 45268-115.
4. Install the J 45268-115 in place of the TXV.

CAUTION: Refer to **Fastener Caution** .

5. Install the TXV mounting bolts.

Tighten

Tighten the bolts to 7 N.m (62 lb in).

6. Connect the evaporator line to the J 45268-115.
7. Install the TXV block fitting nut.

Tighten

Tighten the bolts to 17 N.m (12.5 lb ft).

8. Remove the A/C compressor. Refer to **Air Conditioning Compressor Replacement (LUK)**, **Air Conditioning Compressor Replacement (LTG)**, **Air Conditioning Compressor Replacement (LEA)**.
9. Install J 45268-10 to the A/C compressor hose assembly.
10. Install the nut and bolt from the **J 45268** Flush Adapter Kit to the J 45268-10 and compressor hose assembly.

Tighten

Tighten the bolts to 17 N.m (12.5 lb ft).

11. Forward flow refrigerant flushing is recommended for contaminated refrigerant or PAG oil.

Perform the following procedure:

Fig. 1: View Of A/C Filter & Check Valve
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The filter inside GE 45268-1 is serviceable. Remove and discard the check valve from the filter.**

1. Service the filter with ACDelco P/N GF 470, before each flush.
2. Install the port plugs GE 45268-9 onto the GE 45268-10.
3. Install the fitting GE 45268-7 onto the GE 45268-10.
4. Install the fitting GE 45268-8 onto the GE 45268-10.
5. Connect GE 45268-1 flush filter to the suction port of GE 45268-7 flush adapter.
6. Connect the blue hose from the **GE-8800** ACR 2000 Air Conditioning Service Center to the GE 45268-1 flush filter adapter.
7. Connect the red hose from the **GE-8800** ACR 2000 Air Conditioning Service Center to the GE 45268-8 flush adapter.

12. Reverse flow refrigerant flush is recommended for desiccant bag failure. Replace the A/C condenser when the A/C flush is complete and perform the following procedure:

NOTE: The filter inside GE 45268-1 is serviceable. Remove and discard the check valve from the filter.

1. Service the filter with ACDelco P/N GF 470, before each flush.
2. Install the port plugs GE 45268-9 onto the GE 45268-10.
3. Install the fitting GE 45268-7 onto the GE 45268-10.
4. Install the fitting GE 45268-8 onto the GE 45268-10.
5. Connect GE 45268-1 flush filter to the discharge port of GE 45268-7 flush adapter.
6. Connect the blue hose from **GE-8800** ACR 2000 Air Conditioning Service Center to the GE 45268-1 flush filter adapter.
7. Connect the red hose from **GE-8800** ACR 2000 Air Conditioning Service Center to the GE 45268-8 flush adapter.

NOTE: Close the valve on the external refrigerant tank, before starting the flush process.

13. Flush the A/C system. Follow the instructions supplied with the **GE-8800** ACR 2000 Air Conditioning Service Center.
14. Disconnect the red hose on the **GE-8800** ACR 2000 Air Conditioning Service Center from the GE 45268-10.
15. Disconnect the blue hose on the **GE-8800** ACR 2000 Air Conditioning Service Center from the GE 45268-1.
16. Remove GE 45268-1 from the GE 45268-10.
17. Remove the GE 45268-10 from the A/C compressor hose assembly.

NOTE: The A/C system must be replenished with the correct amount of PAG oil.

Flushing will remove all the PAG oil from the A/C system.

18. If you will reinstall the removed A/C compressor, perform the following procedure:
 1. Remove the A/C compressor drain plug.
 2. Drain the PAG oil from the A/C compressor. Rotate the compressor input shaft to assist in draining the PAG oil from the compressor.
 3. Install the A/C compressor drain plug.

Tighten

Tighten the drain plug to 16 N.m (12 lb ft).

4. Add the total system capacity of PAG oil to the A/C compressor. Refer to **Refrigerant System**

Specifications.

19. If you will replace the A/C compressor after flushing the system, perform the following procedure:
 1. Determine if the new service compressor is shipped with PAG oil. Refer to the **Refrigerant System Specifications.**
 2. If the service compressor is shipped with PAG oil, DO NOT drain the new PAG oil from the compressor.
 3. Deduct the amount of PAG oil shipped with the service compressor from the amount of PAG oil listed in the capacities table. Refer to **Refrigerant System Specifications.**
 4. Add the calculated amount to the compressor, as needed.

NOTE: **Flushing will remove the fluorescent leak detection dye from the A/C system.**

20. Add one bottle of **GE-41447** Leak Detection Dye directly to the A/C Compressor.
21. Install the A/C compressor. Refer to **Air Conditioning Compressor Replacement (LUK), Air Conditioning Compressor Replacement (LTG), Air Conditioning Compressor Replacement (LEA).**
22. Remove GE 45268-115.
23. Inspect the TXV for debris. Clean or replace as needed.
24. Install the TXV. Refer to **Air Conditioning Evaporator Thermal Expansion Valve Replacement.**
25. Evacuate and recharge the A/C system. Refer to **Refrigerant Recovery and Recharging.**
26. Leak test the fittings using **GE-42220** Universal 12V Leak Detection Lamp.

AIR CONDITIONING COMPRESSOR OIL BALANCING

Draining Procedure

NOTE: **Drain and measure as much of the refrigerant oil as possible from the rear head ports of the REMOVED compressor.**

1. Drain the refrigerant oil from the crankcase and rear head ports into a clean, graduated container.

Fig. 2: Draining A/C Refrigerant Oil From Compressor
Courtesy of GENERAL MOTORS COMPANY

2. Rotate the compressor shaft to assist in draining the compressor.
3. Measure and record the amount of oil drained from the removed compressor.

This measurement will be used during installation of the replacement compressor.

4. Inspect oil drained from removed compressor. Refer to **Air Conditioning Compressor Oil Diagnosis**.
5. Properly discard the used refrigerant oil.
6. Clean the graduated cylinder.

NOTE: **Drain and measure as much of the refrigerant oil as possible from the rear head ports of the NEW compressor.**

7. Remove the drain bolt and drain the refrigerant oil from the crankcase and rear head ports into a clean, graduated container.
8. Rotate the compressor shaft to assist in draining the compressor.

Balancing Procedure

Fig. 3: Draining A/C Refrigerant Oil From Compressor
Courtesy of GENERAL MOTORS COMPANY

NOTE: The refrigerant oil in the A/C system must be balanced during compressor replacement.

The replacement compressor is shipped with a service charge of 74 ml (2.5 fl. oz) or 40 ml (1.4 fl. oz) of refrigerant oil.

1. Refer to the amount of refrigerant oil recorded during the compressor removal.
2. If the amount of oil recorded from the removed compressor is less than or equal to the service charge of oil in the new compressor, add back the full amount of the new PAG oil back into the new compressor through the compressor suction port.
3. If the amount of oil recorded from the removed compressor is greater than the service charge of oil in the new compressor, add back the full new PAG oil back into the new compressor and supplement with new PAG to the new compressor through the compressor suction port.

4. Rotate the clutch driver three times to lubricate the internal compressor components.

NOTE: If additional A/C components are replaced during compressor replacement, add the PAG oil directly to the A/C compressor to compensate the A/C system.

5. If necessary, refer to Refrigerant System Specifications.

AIR CONDITIONING COMPRESSOR REPLACEMENT (LUK)

Fig. 4: Air Conditioning Compressor (LUK)
Courtesy of GENERAL MOTORS COMPANY

Air Conditioning Compressor Replacement (LUK)

Callout	Component Name
Preliminary Procedures	
1.	Recover the refrigerant. Refer to <u>Refrigerant Recovery and Recharging</u> .
2.	Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> .
3.	Remove the drive belt. Refer to <u>Drive Belt Replacement (LUK)</u> .
4.	Disconnect the air conditioning (A/C) compressor electrical connector.
5.	Remove the air conditioning compressor and condenser hose from the compressor. Refer to <u>Air Conditioning Compressor and Condenser Hose Replacement (LUK)</u> .
6.	Remove the lower drive belt tensioner bolt and loosen the upper bolt to pivot the belt tensioner out

of the way. Refer to **Drive Belt Tensioner Replacement (LUK)** .

7. Remove the secondary air injection pump assembly, if equipped. Refer to **Secondary Air Injection Pump Replacement (LEA, LUK)** .

1	<p>A/C Compressor Bolt (Qty: 2)</p> <p>CAUTION: Refer to <u>Fastener Caution</u> .</p> <p>NOTE: Tighten the air conditioning compressor mounting fasteners in sequence.</p> <p>Tighten 22 (16 lb ft)</p>
2	<p>A/C Compressor Nut</p> <p>Tighten 22 (16 lb ft)</p>
3	<p>A/C Compressor Stud</p> <p>Tighten 9 (80 lb in)</p>
4	<p>A/C Compressor</p> <p>Procedure</p> <ol style="list-style-type: none">1. Remove the air conditioning compressor assembly from the vehicle.2. Remove and discard sealing washers, replace with NEW only. Refer to <u>Air Conditioning System Seal Replacement</u>.3. When replacing the A/C compressor, balance the compressor oil. Refer to <u>Air Conditioning Compressor Oil Balancing</u>.

AIR CONDITIONING COMPRESSOR REPLACEMENT (LTG)

Fig. 5: Air Conditioning Compressor (LTG)
 Courtesy of GENERAL MOTORS COMPANY

Air Conditioning Compressor Replacement (LTG)

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none"> 1. Recover the refrigerant. Refer to <u>Refrigerant Recovery and Recharging</u>. 2. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u>. 3. Remove the drive belt. Refer to <u>Drive Belt Replacement</u>. 4. Remove the air conditioning compressor hose from the compressor. Refer to <u>Air Conditioning Compressor Hose Replacement (LTG)</u>. 5. Remove the right front compartment splash shield. Refer to <u>Front Compartment Splash Shield Replacement</u>. 6. Remove the right front wheelhouse liner. Refer to <u>Front Wheelhouse Front Liner Replacement</u>. 7. Remove the air conditioning compressor heat shield. Refer to <u>Air Conditioning Compressor Heat Shield Replacement (LTG)</u>. 8. Disconnect the air conditioning compressor electrical connector. 	
	Air Conditioning Compressor Bolt (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> .

1	<p>NOTE: Tighten the air conditioning compressor mounting fasteners in sequence.</p> <p>Tighten 22 (12 lb ft)</p>
2	<p>Air Conditioning Compressor Nut Tighten 22 (12 lb ft)</p>
3	<p>Air Conditioning Compressor Stud Tighten 9 (80 lb in)</p>

2	A/C Compressor Heat Shield

AIR CONDITIONING SYSTEM SEAL REPLACEMENT

Removal Procedure

1. Disassemble the A/C refrigerant components. Refer to the appropriate repair procedure.

NOTE: Cap or tape the open A/C refrigerant components immediately to prevent system contamination.

2. Cap or tape the A/C refrigerant components.

Fig. 11: Sealing Washer

Courtesy of GENERAL MOTORS COMPANY

3. Remove the sealing washer (1) from the A/C refrigerant component.
4. Inspect the seal washer for signs of damage to help determine the root cause of the failure.
5. Inspect the A/C refrigerant components for damage or burrs. Repair if necessary.

NOTE: DO NOT reuse sealing washer.

6. DISCARD the sealing washer.

Installation Procedure

NOTE: Flat washer type seals do not require lubrication.

1. Inspect the new sealing washer for any signs of cracks, cuts, or damage.

Do not use a damaged sealing washer.

2. Remove the cap or tape from the A/C refrigerant components.

Fig. 12: Identifying Proper Seating Of A/C Refrigerant O-Ring
Courtesy of GENERAL MOTORS COMPANY

3. Using a lint-free clean, dry cloth, clean the sealing surfaces of the A/C refrigerant components.
4. Carefully install the NEW sealing washer (1) onto the A/C refrigerant component.

The sealing washer (1) must completely bottom against the surface of the fitting.

NOTE: After tightening the A/C components, there should be a slight sealing gap of approximately 1.2 mm (3/64 in) between the A/C line and the A/C component.

5. Assemble the remaining A/C refrigerant components. Refer to the appropriate repair procedure.

AIR CONDITIONING O-RING SEAL REPLACEMENT

Removal Procedure

1. Disassemble the A/C refrigerant components. Refer to the appropriate repair procedure

NOTE: Cap or tape the open A/C refrigerant components immediately to prevent system contamination.

2. Cap or tape the A/C refrigerant components.

Fig. 13: O-ring seal

Courtesy of GENERAL MOTORS COMPANY

3. Remove the O-ring seal (1) from the A/C refrigerant component.
4. Inspect the O-ring seal for signs of damage to help determine the root cause of the failure.
5. Inspect the A/C refrigerant components for damage or burrs. Repair if necessary.
6. DISCARD the O-ring seal.

Installation Procedure

1. Inspect the new O-ring seal for any sign of cracks, cuts, or damage.
2. Remove the cap or tape from the A/C refrigerant components.
3. Using a lint-free clean, dry cloth, carefully clean the sealing surfaces of the A/C refrigerant components.

NOTE: **DO NOT allow any of the mineral base 525 viscosity refrigerant oil on the new O-ring seal to enter the refrigerant system.**

4. Lightly coat the new O-ring seal with mineral base 525 viscosity refrigerant oil.

NOTE: **DO NOT reuse O-ring seals.**

5. Carefully slide the NEW O-ring seal (1) onto the A/C refrigerant component.

Fig. 14: Identifying Good & Bad Sealing Washer Positions
Courtesy of GENERAL MOTORS COMPANY

6. The O-ring seal (1) must be fully seated.
7. Assemble the A/C components.

Refer to the appropriate repair procedure.

AIR CONDITIONING COMPRESSOR HOSE REPLACEMENT (LTG)

Removal Procedure

1. Recover the refrigerant. Refer to **Refrigerant Recovery and Recharging**.
2. Remove the air cleaner outlet duct. Refer to **Air Cleaner Outlet Duct Replacement**.
3. Remove the front bumper fascia assembly. Refer to **Front Bumper Fascia Replacement**.
4. Remove the charge air cooler inlet air tube. Refer to **Charge Air Cooler Inlet Air Tube Replacement**

Fig. 15: Air Conditioning Compressor Hose Assembly
Courtesy of GENERAL MOTORS COMPANY

5. Remove the air conditioning compressor hose assembly nut (1) from the evaporator hose assembly. **Air Conditioning Compressor Hose Replacement (LTG)**.
6. Remove the air conditioning compressor hose assembly (2) from the evaporator hose assembly.

7. Remove and discard the old sealing washers (3).

Fig. 16: Air Conditioning Compressor Hose Assembly Bolt
Courtesy of GENERAL MOTORS COMPANY

8. Remove air conditioning compressor hose assembly bolt (1) from the air conditioning compressor.
9. Remove air conditioning compressor hose assembly (2) from the air conditioning compressor.
10. Remove and discard the old sealing washers (3).

Fig. 17: Air Conditioning Compressor Hose Assembly Nut
Courtesy of GENERAL MOTORS COMPANY

11. Remove air conditioning compressor hose assembly nut (1) from the air conditioning condenser.
12. Remove air conditioning compressor hose assembly (2) from air conditioning condenser.
13. Remove and discard the old sealing washers (3).

Fig. 18: Air Conditioning Compressor Hose Assembly
Courtesy of GENERAL MOTORS COMPANY

14. Remove air conditioning compressor hose assembly (1) from the vehicle.
15. Transfer all required parts

Installation Procedure

1. Install air conditioning compressor hose assembly into the vehicle.

Fig. 19: Air Conditioning Compressor Hose Assembly Nut
Courtesy of GENERAL MOTORS COMPANY

2. Install NEW air conditioning sealing washer (3) to the air conditioning compressor hose assembly (2).
3. Install the air conditioning compressor hose assembly (2) to the air conditioning condenser assembly.

CAUTION: Refer to Fastener Caution .

4. Install the air conditioning compressor hose assembly nut (1) and tighten the nut to 22 N.m (16 lb ft).

Fig. 20: Air Conditioning Compressor Hose Assembly Bolt
Courtesy of GENERAL MOTORS COMPANY

5. Install NEW air conditioning sealing washers (3) to the air conditioning compressor hose assembly.
6. Install the air conditioning compressor hose assembly (2) to the air conditioning compressor assembly.
7. Install the air conditioning compressor hose assembly bolt (1) and tighten the bolt to 22 N.m (16 lb ft).

Fig. 21: Air Conditioning Compressor Hose Assembly
Courtesy of GENERAL MOTORS COMPANY

8. Install NEW air conditioning sealing washer (3) to the air conditioning compressor hose assembly (2).
9. Install the air conditioning compressor hose assembly (2) to the evaporator hose assembly.
10. Install the air compressor hose assembly nut (1) and tighten the nut to 22 N.m (16 lb ft).
11. Install the charge air cooler inlet air tube. Refer to **Charge Air Cooler Inlet Air Tube Replacement**
12. Install the front bumper fascia assembly. Refer to **Front Bumper Fascia Replacement** .
13. Install the air cleaner outlet duct. Refer to **Air Cleaner Outlet Duct Replacement** .
14. Evacuate and recharge the refrigerant system. Refer to **Refrigerant Recovery and Recharging**.

AIR CONDITIONING COMPRESSOR AND CONDENSER HOSE REPLACEMENT (LUK)

Fig. 22: Air Conditioning Compressor & Condenser Hose
 Courtesy of GENERAL MOTORS COMPANY

Air Conditioning Compressor and Condenser Hose Replacement (LUK)

Callout	Component Name
Preliminary Procedures	
1. Disconnect the negative battery cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> . 2. Remove the air cleaner outlet duct assembly, if non-turbo equipped. Refer to <u>Air Cleaner Outlet Duct Replacement</u> . 3. Recover the refrigerant. Refer to <u>Refrigerant Recovery and Recharging</u> . 4. Remove the front bumper fascia assembly. Refer to <u>Front Bumper Fascia Replacement</u> .	
1	A/C Compressor and Condenser Hose Nut CAUTION: Refer to <u>Fastener Caution</u> . Procedure Remove and discard sealing washer. Refer to <u>Air Conditioning System Seal Replacement</u> . Tighten 20 N.m (15 lb ft)
	A/C Compressor and Condenser Hose Nut

2	Procedure Remove and discard sealing washer. Refer to <u>Air Conditioning System Seal Replacement.</u> Tighten 20 N.m (15 lb ft)
3	A/C Compressor and Condenser Hose Bolt Procedure Remove and discard sealing washer. Refer to <u>Air Conditioning System Seal Replacement.</u> Tighten 20 N.m (15 lb ft)
4	A/C Compressor and Condenser Hose

AIR CONDITIONING EVAPORATOR HOSE ASSEMBLY REPLACEMENT (LUK)

Fig. 23: Air Conditioning Evaporator Hose Assembly
Courtesy of GENERAL MOTORS COMPANY

Air Conditioning Evaporator Hose Assembly Replacement (LUK)

Callout	Component Name
Preliminary Procedures <ol style="list-style-type: none"> 1. Recover the refrigerant. Refer to <u>Refrigerant Recovery and Recharging.</u> 2. Remove the front bumper fascia assembly. Refer to <u>Front Bumper Fascia Replacement .</u> 3. Remove the Headlamp-Right Side. Refer to <u>Headlamp Replacement .</u> 4. Remove the Engine Mount. Refer to <u>Engine Mount Replacement ,</u> or <u>Engine Mount</u> 	

Replacement .

5. Remove the A/C Compressor and Condenser Hose from the A/C Evaporator Hose. Refer to **Air Conditioning Compressor and Condenser Hose Replacement (LUK)**.

1	A/C Evaporator Hose Fastener CAUTION: Refer to <u>Fastener Caution</u> . Tighten 20 N.m (15 lb ft)
2	A/C Evaporator Hose Stud Bolt Tighten 15 N.m (11 lb in)
3	A/C Evaporator Hose Assembly Procedure 1. Remove the A/C Evaporator hose from the thermal expansion valve (TXV). 2. Remove and discard sealing washer. Refer to <u>Air Conditioning System Seal Replacement</u> .
4	A/C Evaporator Hose Fastener Procedure Remove the A/C Evaporator Hose from the A/C Condenser and cap hose. Tighten 20 N.m (15 lb ft)
5	Sealing Washer Procedure Remove and discard sealing washer. Refer to <u>Air Conditioning System Seal Replacement</u> .
6	Air Conditioning Evaporator Hose Assembly Procedure 1. Release the A/C Evaporator Hose from the attaching clips. 2. When the installation is postponed, close the off lines and connections.

AIR CONDITIONING EVAPORATOR HOSE ASSEMBLY REPLACEMENT (LTG)

Removal Procedure

1. Remove the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .
2. Remove the air cleaner outlet duct. Refer to **Air Cleaner Outlet Duct Replacement** .
3. Recover the refrigerant from the air conditioning system. Refer to **Refrigerant Recovery and Recharging**.
4. Remove the right engine mount. Refer to **Engine Mount Replacement** .

5. Remove the front bumper fascia assembly. Refer to **Front Bumper Fascia Replacement** .

Fig. 24: Air Conditioning Compressor Hose Assembly
Courtesy of GENERAL MOTORS COMPANY

6. Remove the air conditioning compressor hose assembly nut (1) from the evaporator hose assembly (2).
7. Remove the air conditioning compressor hose assembly (2) from the evaporator hose assembly and reposition out of the way.
8. Remove and discard the old sealing washers (3) and replace with NEW sealing washers.

Fig. 25: Conditioning Evaporator Hose Assembly
Courtesy of GENERAL MOTORS COMPANY

9. Remove the air conditioning evaporator hose assembly nut (1) at condenser.
10. Remove the air conditioning evaporator hose assembly (2) from condenser.
11. Remove and discard the old sealing washers (3) and replace with NEW sealing washers.

Fig. 26: Air Conditioning Evaporator Hose Assembly & Retaining Fasteners
Courtesy of GENERAL MOTORS COMPANY

12. Remove the air conditioning evaporator hose assembly retaining fasteners (1) from the front suspension strut housing.
13. Remove the air conditioning evaporator hose assembly (2) from the front suspension strut housing.

Fig. 27: Air Conditioning Evaporator Hose Assembly Nut
Courtesy of GENERAL MOTORS COMPANY

14. Remove the air conditioning evaporator hose assembly nut (1) at thermal expansion valve.
15. Remove the air conditioning evaporator hose assembly (2) from thermal expansion valve.
16. Remove and discard the old sealing washers (3) and replace with NEW sealing washers.
17. Remove the air conditioning evaporator hose from the retainers.

Fig. 28: Air Conditioning Evaporator Hose Assembly
Courtesy of GENERAL MOTORS COMPANY

18. Remove the air conditioning evaporator hose assembly (1) from vehicle.

Installation Procedure

Fig. 29: Air Conditioning Evaporator Hose Assembly Nut
Courtesy of GENERAL MOTORS COMPANY

1. Install NEW sealing washers (3) to the air conditioning evaporator hose assembly (2). Refer to **Air Conditioning System Seal Replacement**.
2. Install the air conditioning evaporator hose assembly (2) to the vehicle.
3. Install the air conditioning evaporator hose (2) to the retainers.
4. Install the air conditioning evaporator hose assembly (2) to the thermal expansion valve.

CAUTION: Refer to Fastener Caution .

5. Install the air conditioning evaporator hose assembly nut (1) at thermal expansion valve and tighten to 22 N.m (16 lb ft).

Fig. 30: Air Conditioning Evaporator Hose Assembly & Retaining Fasteners
Courtesy of GENERAL MOTORS COMPANY

6. Install the air conditioning evaporator hose assembly (2) to the front suspension strut housing.
7. Install the air conditioning compressor hose retaining fasteners (1) to the front suspension strut housing and tighten to 9 (80 lb in).

Fig. 31: Conditioning Evaporator Hose Assembly
Courtesy of GENERAL MOTORS COMPANY

8. Install NEW sealing washers (3) to the air conditioning evaporator hose assembly (2). Refer to **Air Conditioning System Seal Replacement**.
9. Install the air conditioning evaporator hose assembly (2) to the condenser.
10. Install the air conditioning evaporator hose assembly nut (1) at condenser and tighten to 22 N.m (16 lb ft).

Fig. 32: Air Conditioning Compressor Hose Assembly
Courtesy of GENERAL MOTORS COMPANY

11. Install NEW sealing washers (3) to the air conditioning compressor hose assembly (2). Refer to **Air Conditioning System Seal Replacement**.
12. Install the air conditioning compressor hose assembly (2) to the evaporator hose assembly.
13. Install the air conditioning compressor hose assembly nut (1) to the evaporator hose and tighten to 22 N.m (16 lb ft).
14. Install the front bumper fascia assembly. Refer to **Front Bumper Fascia Replacement**.
15. Install the right engine mount. Refer to **Engine Mount Replacement**.
16. Install the air cleaner outlet duct. Refer to **Air Cleaner Outlet Duct Replacement**.
17. Install the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement**.
18. Evacuate and charge the air conditioning system. Refer to **Refrigerant Recovery and Recharging**.

AIR CONDITIONING REFRIGERANT DESICCANT REPLACEMENT (LTG)

Fig. 33: Air Conditioning Refrigerant Desiccant (LTG)
 Courtesy of GENERAL MOTORS COMPANY

Air Conditioning Refrigerant Desiccant Replacement (LTG)

Callout	Component Name
Preliminary Procedure	
1. Recover the refrigerant. Refer to <u>Refrigerant Recovery and Recharging</u> . 2. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> .	
1	Receiver and Dehydrator Plug CAUTION: Refer to <u>Fastener Caution</u> . Tighten 12 (9 lb ft)
2	Receiver and Dehydrator O-ring (Qty: 2)
3	Air Conditioning Refrigerant Filter
4	Air Conditioning Refrigerant Desiccant

RECEIVER AND DEHYDRATOR REPLACEMENT

Fig. 34: Receiver And Dehydrator
 Courtesy of GENERAL MOTORS COMPANY

Receiver and Dehydrator Replacement

Callout	Component Name
Preliminary Procedures <ol style="list-style-type: none"> 1. Recover the refrigerant from the air conditioning system. Refer to <u>Refrigerant Recovery and Recharging</u>. 2. Support the left side of the condenser and radiator assembly with mechanics wire or equivalent. 3. Remove the left radiator support bracket. Refer to <u>Radiator Support Bracket Replacement (LUK)</u>. 	
1	Receiver and Dehydrator Plug CAUTION: Refer to <u>Fastener Caution</u> . Tighten 12 (9 lb ft)
2	Receiver and Dehydrator O-Ring
3	A/C Refrigerant Filter
4	A/C Refrigerant Dryer

AIR CONDITIONING EVAPORATOR THERMAL EXPANSION VALVE REPLACEMENT

Fig. 35: Air Conditioning Evaporator Thermal Expansion Valve Components
Courtesy of GENERAL MOTORS COMPANY

Air Conditioning Evaporator Thermal Expansion Valve Replacement

Callout	Component Name
Preliminary Procedures <ol style="list-style-type: none"> 1. Recover the refrigerant. Refer to <u>Refrigerant Recovery and Recharging</u>. 2. Unclip and reposition the brake and fuel lines aside to gain access to the thermal expansion valve (TXV). 3. Remove the air conditioning evaporator hose assembly from the TXV only. Refer to <u>Air Conditioning Evaporator Hose Assembly Replacement (LUK)</u>, <u>Air Conditioning Evaporator Hose Assembly Replacement (LTG)</u>. 	
1	A/C Compressor Tube Assembly Nut CAUTION: Refer to <u>Fastener Caution</u> . Tighten 22 N.m (16 lb ft)
	Sealing Washer (Qty: 4)

2	Procedure Use new sealing washer. Refer to <u>Air Conditioning System Seal Replacement</u> .
3	Thermal Expansion Valve Bolt (Qty: 2) Tighten 7 N.m (62 lb in)
4	Air Conditioning Evaporator Thermal Expansion Valve (TXV)

AIR CONDITIONING (A/C) REFRIGERANT PRESSURE SENSOR REPLACEMENT

Fig. 36: Air Conditioning (A/C) Refrigerant Pressure Sensor (LUK)
Courtesy of GENERAL MOTORS COMPANY

Air Conditioning (A/C) Refrigerant Pressure Sensor Replacement

Callout	Component Name
Preliminary Procedures	
Remove the front bumper fascia assembly. Refer to <u>Front Bumper Fascia Replacement</u>	
1	<p>Air Conditioning (AC) Refrigerant Pressure Sensor</p> <p>CAUTION: Refer to <u>Fastener Caution</u> .</p> <p>Procedure</p> <p>1. Disconnect the electrical connector from A/C refrigerant pressure sensor.</p>

2. Remove the A/C refrigerant pressure sensor from the A/C condenser.
3. Remove and discard the O-ring. Refer to **Air Conditioning O-Ring Seal Replacement**

Tighten

7.4 N.m(66 lb in)

AIR CONDITIONING CONDENSER REPLACEMENT (LTG)

Fig. 37: Air Conditioning Condenser (LTG)

Courtesy of GENERAL MOTORS COMPANY

Air Conditioning Condenser Replacement (LTG)

Callout	Component Name
Preliminary Procedure	
1.	Recover the refrigerant. Refer to <u>Refrigerant Recovery and Recharging</u> .
2.	Remove the front bumper impact bar. Refer to <u>Front Bumper Impact Bar Replacement</u> .
3.	Remove the radiator air upper baffle and deflector. Refer to <u>Radiator Air Upper Baffle and Deflector Replacement (LTG)</u> .
4.	Remove the left and right radiator air side baffle and deflectors. <u>Radiator Air Side Baffle and Deflector Replacement (Right LUK)</u> .
5.	Remove the air compressor hose assembly from the condenser and position out of the way. Refer

to Air Conditioning Compressor Hose Replacement (LTG).

6. Remove the air conditioning evaporator hose assembly from the condenser and position out of the way. Refer to Air Conditioning Evaporator Hose Assembly Replacement (LTG).

1	Air Conditioning Condenser Assembly Procedure Transfer all necessary components.
---	---

AIR CONDITIONING CONDENSER REPLACEMENT (LUK)

Fig. 38: Air Conditioning Condenser (LUK)
Courtesy of GENERAL MOTORS COMPANY

Air Conditioning Condenser Replacement (LUK)

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none">1. Recover the refrigerant. Refer to <u>Refrigerant Recovery and Recharging</u>.2. Remove the front fascia. Refer to <u>Front Bumper Fascia Replacement</u>.3. Remove the AC Compressor and Condenser Hose from condenser assembly. Refer to <u>Air Conditioning Compressor and Condenser Hose Replacement (LUK)</u>.4. Remove the AC Evaporator Hose from condenser. Refer to <u>Air Conditioning Evaporator Hose Assembly Replacement (LUK)</u>.5. Remove the AC refrigerant pressure sensor. Refer to <u>Air Conditioning (A/C) Refrigerant Pressure Sensor Replacement</u>.	

6. Support the radiator and condenser assembly, then remove the radiator support brackets. Refer to **Radiator Support Bracket Replacement (LUK)** .

Air Conditioning Condenser Assembly

NOTE:

Remove the condenser assembly from below.

1

Procedure

1. Lower the radiator and condenser assembly enough to access condenser assembly retainers.
2. Release the 2 condenser assembly retainers.

HEATER AND AIR CONDITIONING EVAPORATOR AND BLOWER MODULE REMOVAL AND INSTALLATION

Fig. 39: Heater And Air Conditioning Evaporator & Blower Module

Courtesy of GENERAL MOTORS COMPANY

Heater and Air Conditioning Evaporator and Blower Module Removal and Installation

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none"> 1. Recover the refrigerant. Refer to <u>Refrigerant Recovery and Recharging</u>. 	

2. Remove the heater inlet hose from the heater core tube. Refer to **Heater Inlet Hose Replacement (LUK)**, **Heater Inlet Hose Replacement (LTG)**, **Heater Inlet Hose Replacement (LEA)**.
3. Remove the heater outlet hose from the heater core tube. Refer to **Heater Outlet Hose Replacement (LUK)**, **Heater Outlet Hose Replacement (LTG)**, **Heater Outlet Hose Replacement (LEA)**.
4. Remove the evaporator hose assembly from the thermal expansion valve. Refer to **Air Conditioning Evaporator Thermal Expansion Valve Replacement**.
5. Remove the Air Inlet Grille Panel Water Deflector . Refer to **Air Inlet Grille Panel Water Deflector Replacement** .
6. Remove the instrument panel assembly. Refer to **Instrument Panel Assembly Replacement** .
7. Remove the instrument panel tie bar. Refer to **Instrument Panel Tie Bar Replacement** .

1	Heater and Air Conditioning Evaporator and Blower Module Procedure With the aid of an assistant, remove the heater and air conditioning evaporator and blower module from the vehicle.
---	---

HEATER AND AIR CONDITIONING EVAPORATOR AND BLOWER UPPER CASE REPLACEMENT

Fig. 40: Heater & Air Conditioning Evaporator & Blower Upper Case
Courtesy of GENERAL MOTORS COMPANY

Heater and Air Conditioning Evaporator and Blower Upper Case Replacement

Call out	Component Name
----------	----------------

Preliminary Procedure

Remove the heater and air conditioning evaporator and blower lower case. Refer to **Heater and Air Conditioning Evaporator and Blower Lower Case Replacement**.

1	Air Conditioning Evaporator Assembly
2	Heater and Air Conditioning Evaporator and Blower Upper Case

HEATER AND AIR CONDITIONING EVAPORATOR AND BLOWER LOWER CASE REPLACEMENT

Fig. 41: Heater & Air Conditioning Evaporator & Blower Lower Case
Courtesy of GENERAL MOTORS COMPANY

Heater and Air Conditioning Evaporator and Blower Lower Case Replacement

Call out	Component Name
Preliminary Procedures	
1. Disconnect the negative battery cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> .	
2. Remove the air inlet housing. Refer to <u>Air Inlet Housing Replacement</u> .	
3. Remove the heater core assembly. Refer to <u>Heater Core Replacement (LHD)</u> .	
4. Remove the heater and air conditioning evaporator and blower control module. Refer to <u>Heater and Blower and Air Conditioning Control Module Replacement</u> .	
	Heater and Air Conditioning Evaporator and Blower Lower Case Fastener (Qty: 7)

1	CAUTION: Refer to <u>Fastener Caution</u> .
2	Heater and Air Conditioning Evaporator and Blower Lower Case Procedures <ol style="list-style-type: none"> 1. Transfer the blower motor assembly. Refer to <u>Blower Motor Replacement</u>. 2. Transfer the components as necessary.

AIR CONDITIONING EVAPORATOR CORE REPLACEMENT

Fig. 42: Air Conditioning Evaporator
Courtesy of GENERAL MOTORS COMPANY

Air Conditioning Evaporator Core Replacement

Call out	Component Name
Preliminary Procedure Remove the heater and air conditioning evaporator and blower lower case. Refer to <u>Heater and Air Conditioning Evaporator and Blower Lower Case Replacement</u> .	
1	Air Conditioning Evaporator Assembly

AIR CONDITIONING EVAPORATOR AND BLOWER MODULE DRAIN HOSE REPLACEMENT

Fig. 43: Air Conditioning Evaporator and Blower Module Drain Hose
Courtesy of GENERAL MOTORS COMPANY

Air Conditioning Evaporator and Blower Module Drain Hose Replacement

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none"> 1. Remove instrument panel compartment. Refer to <u>Instrument Panel Compartment Replacement</u> . 2. Remove the front floor console extension panel. Refer to <u>Front Floor Console Extension Panel Replacement</u> . 3. Remove the instrument panel (I/P) lower extension side trim panel. Refer to <u>Instrument Panel Lower Extension Side Trim Panel Replacement</u> . 4. Remove the floor air outlet duct. Refer to <u>Floor Air Outlet Duct Replacement - Right Side</u>. 	
1	Air Conditioning Evaporator and Blower Module Drain Hose Procedure <ol style="list-style-type: none"> 1. Loosen the carpet in the area of the front floor console. 2. Release and pull off the drain hose from the HVAC module assembly, and remove the drain fitting grommet from the front floor panel.

HEATER INLET HOSE REPLACEMENT (LUK)

Fig. 44: Heater Inlet Hose, Clamp & Quick Disconnect (LUK)
 Courtesy of GENERAL MOTORS COMPANY

Heater Inlet Hose Replacement (LUK)

Callout	Component Name
Preliminary Procedures	
1. Drain the cooling system. Refer to <u>Cooling System Draining and Filling (Static Fill)</u> , <u>Cooling System Draining and Filling (GE 47716)</u> . 2. Remove the intake manifold cover. Refer to <u>Intake Manifold Cover Replacement</u> .	
1	Heater Inlet Hose Quick Disconnect Procedure Release the clip and remove the heater inlet hose from the heater core tube.
2	Heater Inlet Hose Clamp Procedure Reposition the heater inlet hose clamp using BO-38185 pliers. Special Tools BO-38185 Hose Clamp Pliers For equivalent regional tools, refer to <u>Special Tools</u> .
3	Heater Inlet Hose

HEATER INLET HOSE REPLACEMENT (LTG)

Fig. 45: Heater Inlet Hose (LTG)

Courtesy of GENERAL MOTORS COMPANY

Heater Inlet Hose Replacement (LTG)

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none"> 1. Drain the cooling system. Refer to Cooling System Draining and Filling (Static Fill) , Cooling System Draining and Filling (GE 47716) . 2. Remove the engine control module. Refer to Engine Control Module Replacement . 	
1	Heater Inlet Hose Quick Connect Retainer
2	Heater Inlet Hose Clamp Procedure Reposition the heater inlet hose clamp using the BO-38185 hose clamp pliers. Special Tools BO-38185 Hose Clamp Pliers For equivalent regional tools. Refer to Special Tools .
3	Heater Inlet Hose Procedure <ol style="list-style-type: none"> 1. Fill the cooling system to the proper level. Refer to Cooling System Draining and Filling (Static Fill) , Cooling System Draining and Filling (GE 47716) . 2. Inspect the cooling system for leaks. Refer to Cooling System Leak Testing .

HEATER INLET HOSE REPLACEMENT (LEA)

Fig. 46: Heater Inlet Hose, Clamp & Disconnect (LEA)
Courtesy of GENERAL MOTORS COMPANY

Heater Inlet Hose Replacement (LEA)

Callout	Component Name
Preliminary Procedures	
1. Drain the cooling system. Refer to Cooling System Draining and Filling (Static Fill) , Cooling System Draining and Filling (GE 47716) .	
2. Remove the intake manifold cover. Refer to Intake Manifold Cover Replacement .	
1	Heater Inlet Hose Quick Disconnect Procedure Release the clip and remove the heater inlet hose from the heater core tube.
2	Heater Inlet Hose Clamp Procedure Reposition the heater inlet hose clamp using J 38185 pliers. Special Tools J 38185 Hose Clamp Pliers For equivalent regional tools, refer to Special Tools .
3	Heater Inlet Hose

HEATER OUTLET HOSE REPLACEMENT (LUK)

Fig. 47: Heater Outlet Hose & Quick Disconnect (LUK)
 Courtesy of GENERAL MOTORS COMPANY

Heater Outlet Hose Replacement (LUK)

Callout	Component Name
Preliminary Procedures	
1. Drain the cooling system. Refer to <u>Cooling System Draining and Filling (Static Fill)</u> , <u>Cooling System Draining and Filling (GE 47716)</u> . 2. Remove the intake manifold cover. Refer to <u>Intake Manifold Cover Replacement</u> .	
1	Heater Outlet Hose Quick Disconnect Procedure Release the clips and remove the heater outlet hose from the heater core tube.
2	Heater Outlet Hose

HEATER OUTLET HOSE REPLACEMENT (LTG)

Fig. 48: Heater Outlet Hose (LTG)

Courtesy of GENERAL MOTORS COMPANY

Heater Outlet Hose Replacement (LTG)

Callout	Component Name
Preliminary Procedure <ol style="list-style-type: none"> 1. Remove the engine control module. Refer to <u>Engine Control Module Replacement</u> . 2. Drain the cooling system. Refer to <u>Cooling System Draining and Filling (Static Fill)</u> , <u>Cooling System Draining and Filling (GE 47716)</u> . 	
1	Heater Outlet Hose Connector Retaining Clip
2	Heater Outlet Hose Clamp (Qty: 2) Procedure Reposition the heater outlet hose clamps using the BO-38185 hose clamp pliers. Special Tools BO-38185 Hose Clamp Pliers For equivalent regional tools, refer to <u>Special Tools</u> .
3	Heater Outlet Hose Procedure <ol style="list-style-type: none"> 1. Fill the cooling system to the proper level. Refer to <u>Cooling System Draining and Filling (Static Fill)</u> , <u>Cooling System Draining and Filling (GE 47716)</u> . 2. Inspect the cooling system for leaks. Refer to <u>Cooling System Leak Testing</u> .

HEATER OUTLET HOSE REPLACEMENT (LEA)

Fig. 49: Heater Outlet Hose, Clamp & Quick Disconnect (LEA)
Courtesy of GENERAL MOTORS COMPANY

Heater Outlet Hose Replacement (LEA)

Callout	Component Name
Preliminary Procedures	
1. Drain the cooling system. Refer to Cooling System Draining and Filling (Static Fill) , Cooling System Draining and Filling (GE 47716) .	
2. Remove the intake manifold cover. Refer to Intake Manifold Cover Replacement .	
1	Heater Outlet Hose Quick Disconnect Procedure Release the clip and remove the heater outlet hose from the heater core tube.
2	Heater Outlet Hose Clamp Procedure Reposition the heater outlet hose clamp using J 38185 pliers. Special Tools J 38185 Hose Clamp Pliers For equivalent regional tools, refer to Special Tools .
3	Heater Outlet Hose

HEATER CORE OUTLET TUBE REPLACEMENT

Fig. 50: Heater Core Outlet Tube & Mounting Components
 Courtesy of GENERAL MOTORS COMPANY

Heater Core Outlet Tube Replacement

Callout	Component Name
Preliminary Procedure Remove the heater and air conditioning evaporator case. Refer to <u>Heater and Air Conditioning Evaporator and Blower Module Removal and Installation</u> .	
1	Bracket Heater Core Outlet Tube Bolt CAUTION: Refer to <u>Fastener Caution</u> . Tighten 2.5 N.m (23 lb in)
2	Heater Core Outlet Tube Brace
3	Heater Core Outlet Tube Clamp
4	Heater Core Outlet Tube

HEATER CORE INLET TUBE REPLACEMENT

Fig. 51: Heater Core Inlet Tube & Mounting Components
 Courtesy of GENERAL MOTORS COMPANY

Heater Core Inlet Tube Replacement

Callout	Component Name
Preliminary Procedure Remove the heater and air conditioning evaporator case. Refer to <u>Heater and Air Conditioning Evaporator and Blower Module Removal and Installation</u> .	
1	Bracket Heater Core Inlet Tube Bolt CAUTION: Refer to <u>Fastener Caution</u> . Tighten 2.5 N.m (23 lb in)
2	Heater Core Outlet Tube Brace
3	Heater Core Outlet Tube Clamp
4	Heater Core Outlet Tube

PASSENGER COMPARTMENT AIR FILTER REPLACEMENT

Fig. 52: Passenger Compartment Air Filter (Front)
 Courtesy of GENERAL MOTORS COMPANY

Passenger Compartment Air Filter Replacement

Callout	Component Name
Preliminary Procedure	
1. Remove instrument panel outer trim cover. Refer to <u>Instrument Panel Outer Trim Cover Replacement - Right Side</u> . 2. Remove instrument panel compartment. Refer to <u>Instrument Panel Compartment Replacement</u> .	
1	Passenger Compartment Air Filter Service Lid Retainer (Qty: 3) Procedure Release the retainer and open the service lid.
2	Passenger Compartment Air Filter

AIR INLET HOUSING REPLACEMENT

Fig. 53: Air Inlet Housing & Fasteners
 Courtesy of GENERAL MOTORS COMPANY

Air Inlet Housing Replacement

Call out	Component Name
Preliminary Procedures	
1. Remove the heater and air conditioning evaporator and blower module assembly. Refer to <u>Heater and Air Conditioning Evaporator and Blower Module Removal and Installation</u> . 2. Disconnect the electrical connectors as necessary.	
1	Air Inlet Housing Fastener (Qty: 4) CAUTION: Refer to <u>Fastener Caution</u> .
2	Air Inlet Housing Assembly Procedure Transfer all part as necessary.

BLOWER MOTOR REPLACEMENT

Fig. 54: Blower Motor & Fasteners
 Courtesy of GENERAL MOTORS COMPANY

Blower Motor Replacement

Callout	Component Name
Preliminary Procedures	
1. Remove the floor air outlet duct. Refer to <u>Floor Air Outlet Duct Replacement - Right Side.</u> 2. Disconnect the blower motor electrical connector.	
1	Blower Motor Fastener (Qty: 3)
2	Blower Motor

SIDE WINDOW DEFOGGER OUTLET GRILLE REPLACEMENT - LEFT SIDE

Fig. 55: Side Window Defogger Outlet Grille - Left Side
Courtesy of GENERAL MOTORS COMPANY

Side Window Defogger Outlet Grille Replacement - Left Side

Callout	Component Name
1	Side Window Defogger Outlet Grille Replacement TIP: Use a flat-bladed plastic trim tool in order to release the left side window defogger outlet grille.

SIDE WINDOW DEFOGGER OUTLET GRILLE REPLACEMENT - RIGHT SIDE

Fig. 56: Side Window Defogger Outlet Grille - Right Side
Courtesy of GENERAL MOTORS COMPANY

Side Window Defogger Outlet Grille Replacement - Right Side

Callout	Component Name
1	Side Window Defogger Outlet Grille Replacement TIP: Use a flat-bladed plastic trim tool in order to release the right side window defogger outlet grille.

AIR DISTRIBUTOR CASE REPLACEMENT

Fig. 57: Air Distributor Case
 Courtesy of GENERAL MOTORS COMPANY

Air Distributor Case Replacement

Call out	Component Name
1	Heater and Air Conditioning Evaporator and Blower Upper Case Refer to <u>Heater and Air Conditioning Evaporator and Blower Upper Case Replacement.</u>
2	Air Distributor Case Procedure <ol style="list-style-type: none"> 1. Remove the right side temperature actuator. Refer to <u>Temperature Valve Actuator Replacement - Right Side</u> . 2. Remove the left side temperature actuator. Refer to <u>Temperature Valve Actuator Replacement - Left Side (Left Hand Drive)</u> . 3. Remove the mode control cam actuator. Refer to <u>Mode Control Cam Actuator Replacement (Left Hand Drive)</u> . 4. Transfer the components as necessary.

INSTRUMENT PANEL OUTER AIR OUTLET DEFLECTOR REPLACEMENT - LEFT SIDE

Fig. 58: Instrument Panel Outer Air Outlet Deflector - Left Side
Courtesy of GENERAL MOTORS COMPANY

Instrument Panel Outer Air Outlet Deflector Replacement - Left Side

Callout	Component Name
Preliminary Procedure Remove the instrument panel outer trim cover. Lower center trim panel. Refer to <u>Instrument Panel Outer Trim Cover Replacement - Left Side</u> .	
1	Instrument Panel Outer Air Outlet Deflector Procedure Push out the air outlet deflector housing from behind.

INSTRUMENT PANEL OUTER AIR OUTLET DEFLECTOR REPLACEMENT - RIGHT SIDE

Fig. 59: Instrument Panel Outer Air Outlet Deflector - Right Side
 Courtesy of GENERAL MOTORS COMPANY

Instrument Panel Outer Air Outlet Deflector Replacement - Right Side

Callout	Component Name
Preliminary Procedure Remove the instrument panel outer trim cover. Lower center trim panel. Refer to <u>Instrument Panel Outer Trim Cover Replacement - Right Side</u> .	
1	Instrument Panel Outer Air Outlet Deflector Procedure Push out the air outlet deflector housing from behind.

RADIO COOLING DUCT REPLACEMENT

Fig. 60: Radio Cooling Duct
 Courtesy of GENERAL MOTORS COMPANY

Radio Cooling Duct Replacement

Callout	Component Name
Preliminary Procedures	
1. Remove the instrument panel lower trim panel- left side. Refer to <u>Instrument Panel Lower Trim Panel Replacement - Left Side</u> . 2. Remove the floor air outlet duct- left side. Refer to <u>Floor Air Outlet Duct Replacement - Left Side</u> .	
1	Radio Cooling Duct Procedure Pull off the radio cooling duct from the HVAC module and release the duct from the I/P center reinforcement.

FRONT FLOOR CONSOLE FRONT AIR DUCT REPLACEMENT

Fig. 61: Front Floor Console Front Air Duct
 Courtesy of GENERAL MOTORS COMPANY

Front Floor Console Front Air Duct Replacement

Callout	Component Name
Preliminary Procedure	
Remove the front floor console assembly. Refer to <u>Front Floor Console Replacement</u> .	
1	Front Floor Console Front Air Duct

FRONT FLOOR CONSOLE REAR AIR DUCT REPLACEMENT

Fig. 62: Front Floor Console Rear Air Duct & Fasteners
 Courtesy of GENERAL MOTORS COMPANY

Front Floor Console Rear Air Duct Replacement

Callout	Component Name
Preliminary Procedures	
1. Remove the front floor console. Refer to <u>Front Floor Console Replacement</u> 2. Remove the front floor console rear cover. Refer to <u>Front Floor Console Rear Cover Replacement</u>	
1	Front Floor Console Rear Air Duct Fastener (Qty: 3)
2	Front Floor Console Rear Air Duct

FRONT FLOOR CONSOLE REAR AIR OUTLET DEFLECTOR HOUSING REPLACEMENT

Fig. 63: Front Floor Console Rear Air Outlet Deflector Housing & Retainers
 Courtesy of GENERAL MOTORS COMPANY

Front Floor Console Rear Air Outlet Deflector Housing Replacement

Callout	Component Name
1	Front Floor Console Rear Air Outlet Deflector Housing Retainer (Qty: 4) TIP: Use a flat-bladed plastic trim tool to release the rear air outlet deflector housing assembly from the front floor console.
2	Front Floor Console Rear Air Outlet Deflector Housing

INSTRUMENT PANEL OUTER AIR OUTLET DUCT REPLACEMENT

Fig. 64: Instrument Panel Outer Air Outlet Duct & Fasteners
 Courtesy of GENERAL MOTORS COMPANY

Instrument Panel Outer Air Outlet Duct Replacement

Callout	Component Name
Preliminary Procedure	
Remove the instrument panel assembly. Refer to <u>Instrument Panel Assembly Replacement</u> .	
1	Instrument Panel Outer Air Outlet Duct Fastener (Qty: 5)
2	Instrument Panel Outer Air Outlet Duct

INSTRUMENT PANEL CENTER AIR OUTLET DEFLECTOR HOUSING REPLACEMENT

Fig. 65: Instrument Panel Center Air Outlet Deflector Housing & Fasteners
 Courtesy of GENERAL MOTORS COMPANY

Instrument Panel Center Air Outlet Deflector Housing Replacement

Callout	Component Name
Preliminary Procedure	
Remove the instrument panel (I/P) upper center trim panel. Refer to <u>Instrument Panel Upper Center Trim Panel Replacement</u> .	
1	Instrument Panel Center Air Outlet Deflector Housing Fastener (Qty: 4)
2	Instrument Panel Center Air Outlet Deflector Housing

WINDSHIELD DEFROSTER NOZZLE DUCT REPLACEMENT

Fig. 66: Windshield Defroster Nozzle Duct
 Courtesy of GENERAL MOTORS COMPANY

Windshield Defroster Nozzle Duct Replacement

Callout	Component Name
Preliminary Procedure	
Remove the instrument panel assembly. Refer to <u>Instrument Panel Assembly Replacement</u> .	
1	Windshield Defroster Nozzle Duct NOTE: Release tabs on the windshield defroster nozzle duct.

FLOOR AIR OUTLET DUCT REPLACEMENT - LEFT SIDE

Fig. 67: Floor Air Outlet Duct - Left Side
 Courtesy of GENERAL MOTORS COMPANY

Floor Air Outlet Duct Replacement - Left Side

Callout	Component Name
Preliminary Procedures	
1.	Remove the instrument panel (I/P) lower trim panel - left side. Refer to <u>Instrument Panel Lower Trim Panel Replacement - Left Side</u> .
2.	Remove the I/P lower trim panel insulator. Refer to <u>Instrument Panel Lower Trim Panel Insulator Replacement</u> .
1	Floor Air Outlet Duct Retainer
2	Floor Air Outlet Duct

FLOOR AIR OUTLET DUCT REPLACEMENT - RIGHT SIDE

Fig. 68: Floor Air Outlet Duct - Right Side
 Courtesy of GENERAL MOTORS COMPANY

Floor Air Outlet Duct Replacement - Right Side

Callout	Component Name
Preliminary Procedures	
Remove instrument panel compartment. Refer to <u>Instrument Panel Compartment Replacement</u> .	
1	Floor Air Outlet Duct Fastener
2	Floor Air Outlet Duct

FLOOR REAR AIR OUTLET DUCT REPLACEMENT - LEFT SIDE

Fig. 69: Floor Rear Air Outlet Duct - Left Side
 Courtesy of GENERAL MOTORS COMPANY

Floor Rear Air Outlet Duct Replacement - Left Side

Callout	Component Name
Preliminary Procedure	
Remove the Front Floor Panel Carpet. Refer to Front Floor Panel Carpet Replacement .	
1	Floor Rear Air Outlet Duct Procedures <ol style="list-style-type: none"> 1. Remove the Floor Rear Air Outlet Duct from the retainer and the Heater Air Conditioning Evaporator and Blower Module. 2. Remove the Floor Rear Air Outlet Duct from vehicle.

FLOOR REAR AIR OUTLET DUCT REPLACEMENT - RIGHT SIDE

Fig. 70: Floor Rear Air Outlet Duct - Right Side
 Courtesy of GENERAL MOTORS COMPANY

Floor Rear Air Outlet Duct Replacement - Right Side

Callout	Component Name
Preliminary Procedure	
Remove the front floor panel carpet. Refer to <u>Front Floor Panel Carpet Replacement</u> .	
1	Floor Rear Air Outlet Duct
	Procedure
	<ol style="list-style-type: none"> 1. Remove the floor rear air outlet duct from the retainer and the heater air conditioning evaporator and blower module. 2. Remove the floor rear air outlet duct from vehicle.

HEATER AND AIR CONDITIONING REMOTE CONTROL REPLACEMENT

Fig. 71: Heater and Air Conditioning Remote Control
 Courtesy of GENERAL MOTORS COMPANY

Heater and Air Conditioning Remote Control Replacement

Callout	Component Name
Preliminary Procedure Remove the instrument panel upper center trim panel. Refer to <u>Instrument Panel Upper Center Trim Panel Replacement</u> .	
1	Heater And Air Conditioning Remote Control Module Procedures <ol style="list-style-type: none"> 1. Disconnect the heater and air conditioning remote control module connectors. 2. Perform the HVAC system control module programming and setup procedure. Refer to <u>HVAC System Control Module Programming and Setup</u> . 3. Perform the actuator re-calibration procedure. Refer to <u>Actuator Recalibration</u> .

HEATER CORE REPLACEMENT (LHD)

Fig. 72: Heater Core (LHD)

Courtesy of GENERAL MOTORS COMPANY

Heater Core Replacement (LHD)

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none"> 1. Remove the heater inlet hose from the heater core tube. Refer to <u>Heater Inlet Hose Replacement (LUK)</u>, <u>Heater Inlet Hose Replacement (LTG)</u>, <u>Heater Inlet Hose Replacement (LEA)</u>. 2. Remove the heater outlet hose from the heater core tube. Refer to <u>Heater Outlet Hose Replacement (LUK)</u>, <u>Heater Outlet Hose Replacement (LTG)</u>, <u>Heater Outlet Hose Replacement (LEA)</u>. 3. Remove the left side console extension. Refer to <u>Front Floor Console Extension Panel Replacement</u>. 4. Place a protective mat over the carpet. 	
1	Heater Core Tube Clamp (Qty: 2) Procedure Loosen the carpet in the area of the heater core.
2	Heater Core Tube Assembly Procedure Before disconnecting the heater core tubes from the heater core, place a small drain pan under the heater core tubes to capture any coolant drainage.
3	Heater Core Tube Seal (Qty: 2)
4	Heater Core Bracket Fastener

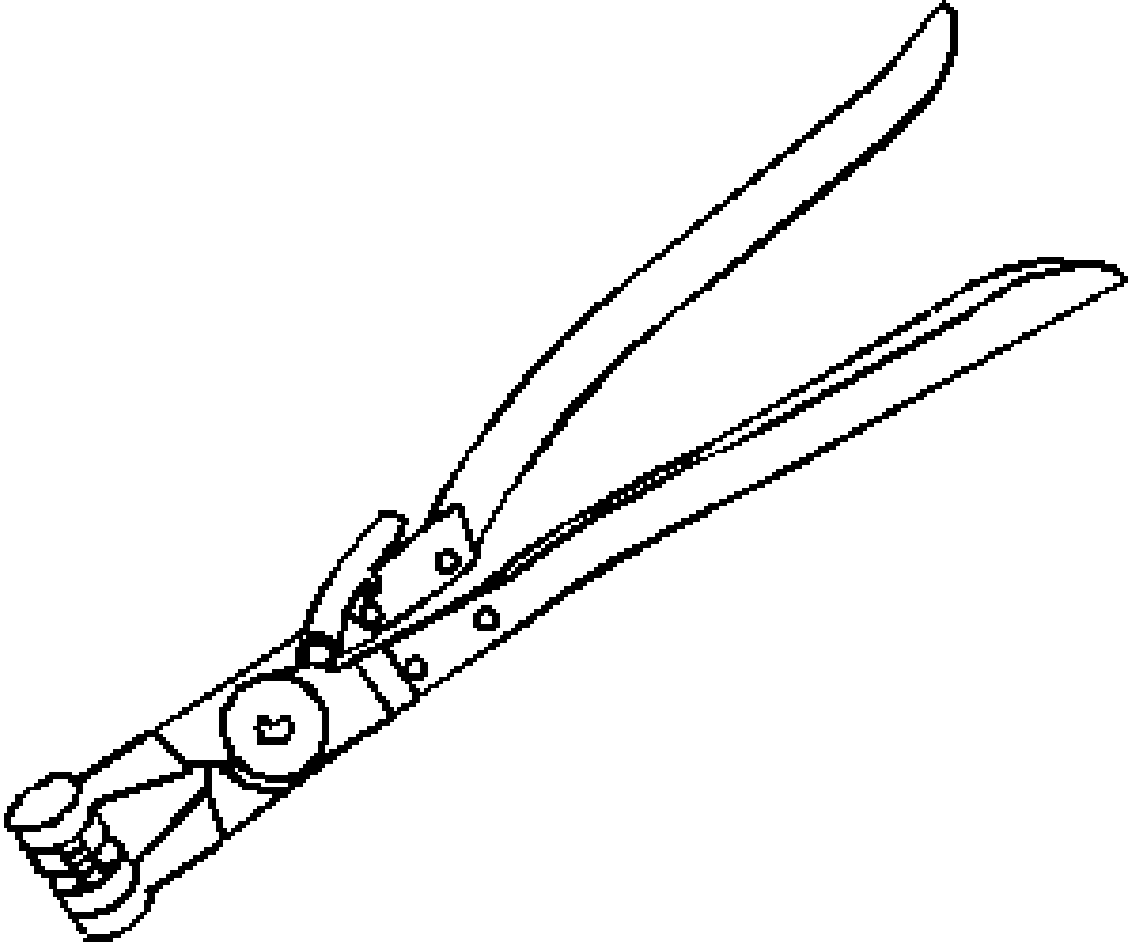

5

Heater Core

Procedure

Pull out the heater core.

DIAGNOSTIC INFORMATION AND PROCEDURES

DIAGNOSTIC CODE INDEX

DIAGNOSTIC CODE INDEX

DTC	Description
<u>DTC B2750</u>	DTC B2750 01 Horn Relay Secondary Circuit Short to Battery DTC B2750 02 Horn Relay Secondary Circuit Short to Ground DTC B2750 04 Horn Relay Secondary Circuit Open

DTC B2750: HORN RELAY SECONDARY CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B2750 01

Horn Relay Secondary Circuit Short to Battery

DTC B2750 02

Horn Relay Secondary Circuit Short to Ground

DTC B2750 04

Horn Relay Secondary Circuit Open

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control	B2750 02	B2750 04	B2750 01	-

Circuit/System Description

The Body Control Module provides a ground for the Horn PCB relay within the underhood fuse block. The underhood fuse block will then provide B+ voltage to the horn control circuit, sounding the horn.

Conditions for Running the DTC

When the horn output is actively being requested by the Body Control Module

Conditions for Setting the DTC

B2750 01

The Body Control Module detects a short to voltage in the horn relay control circuit.

B2750 02

The Body Control Module detects a short to ground in the horn relay control circuit.

B2750 04

The Body Control Module detects an open/high resistance in the horn relay control circuit.

Action Taken When the DTC Sets

B2750 01, B2750 04

The horn will be inoperative.

B2750 02

The horn will sound continuously until the horn is disconnected or when the horn overheats and becomes inoperative.

Conditions for Clearing the DTC

- The DTC clears when the fault is no longer detected.
- The current DTC will become history when the request for the output is removed.
- The history DTC will clear after 50 consecutive fault-free ignition cycles have occurred.

- **Wiring Repairs**

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the P13 Horn Assembly turns On and Off when commanding the Horn Relay On and Off with a scan tool.
 - **If the P13 Horn Assembly does not turn On and Off**

Refer to Circuit/System Testing.
 - **If the P13 Horn Assembly turns On and Off**
3. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the X1 harness connector at the X50A Fuse Block-Underhood, ignition ON.
2. Verify the P13 Horn Assembly is not activated.
 - **If the P13 Horn Assembly is activated**
 1. Ignition OFF, disconnect the harness connector at the P13 Horn Assembly, ignition ON.
 2. Test for less than 1 V between the control circuit terminal 2 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, test or replace the P13 Horn Assembly.
 - **If the P13 Horn Assembly is not activated**
3. Connect a 15A fused jumper wire between the control circuit terminal 11 and B+.
4. Verify the P13 Horn Assembly activates.
 - **If the P13 Horn Assembly does not activate**
 1. Ignition OFF, remove the jumper wire, disconnect the harness connector at the P13 Horn Assembly, ignition ON.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than Infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, test or replace the P13 Horn Assembly.
- **If the P13 Horn Assembly activates**
- 5. Ignition OFF, connect the X1 harness connector at the X50A Fuse Block-Underhood. Disconnect the X5 harness connector at the K9 Body Control Module, ignition ON.
- 6. Verify the P13 Horn Assembly is not activated.
 - **If the P13 Horn Assembly is activated**
 1. Ignition OFF, disconnect the X2 harness connector at the X50A Fuse Block-Underhood.
 2. Test for infinite resistance between the control circuit terminal 19 X5 at the K9 Body Control Module and ground.
 - If less than Infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, test or replace the X50A Fuse Block-Underhood.
 - **If the P13 Horn Assembly is not activated**
- 7. Connect a 3 A fused jumper wire between the control circuit terminal 19 and ground.
- 8. Verify the P13 Horn Assembly activates.
 - **If the P13 Horn Assembly does not activate**
 1. Ignition OFF, remove the jumper wire, disconnect the X2 harness connector at the X50A Fuse Block-Underhood, ignition ON.
 2. Test for less than 1 V between the control circuit terminal 19 X5 at the K9 Body Control Module and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the X50A Fuse Block-Underhood.
 - **If the P13 Horn Assembly activates**
- 9. Replace the K9 Body Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Fuse Block Replacement**
- **Control Module References** for Body Control Module replacement, programming and setup

SYMPTOMS - HORNS

IMPORTANT: The following steps must be completed before using the symptom tables:

1. Perform **Diagnostic System Check - Vehicle** , before using the symptom tables in order to verify that all of the following are true:
 - There are no DTCs set

- The control modules can communicate via the serial data link
2. Review the system operation in order to familiarize yourself with the system functions. Refer to Horns System Description and Operation.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the horn system. Refer to Checking Aftermarket Accessories.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.
- Perform the following if a horn buzzes or has a harsh tone.
 - Inspect for debris in the joint where the horn fastens to the vehicle.
 - Test the torque of the horn mounting hardware. The horn mounting hardware should be tightened to a torque of 10 N.m (7 lb ft).

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to Testing for Intermittent Conditions and Poor Connections.

Symptom List

Refer to a symptom diagnostic procedure Horns Malfunction in order to diagnose the symptom.

HORNS MALFUNCTION

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Horn Switch Signal	1	2	2	-
Horn Relay Control	B2750 02	B2750 04	B2750 01	-
Horn Assembly Control	2	2	1	-
Horn Assembly Ground	-	2	-	-
Horn Switch Ground	-	2	-	-
1. Horn Always On 2. Horn Inoperative				

Circuit/System Description

The body control module monitors the horn switch signal circuit, when the horn pad is pressed, the body control module detects the drop in the horn switch signal circuit and provides a ground for the Horn printed circuit board relay within the underhood fuse block. The underhood fuse block will then provide B+ voltage to the horn control circuit, sounding the horns

Diagnostic Aids

OnStar® RemoteLink™ applications or "apps" downloads are available to owners of certain mobile devices. Unwanted or inadvertent horn activations have been associated with these applications to which the customer may be unaware. Contact the GM Technical Assistance Center regarding information on a remedy for this situation.

A short to ground in the horn relay control circuit or a short to voltage in the horn control circuit will cause the horns to sound continuously until the horns overheat and become inoperative.

Rotate the steering wheel while pressing the horn pad to identify intermittent and poor connections within the steering column.

If diagnosing a Horn- Poor Tone condition, inspect the following:

- Debris or water in the horn assembly
- Proper horn mounting hardware torque-Refer to **Fastener Tightening Specifications**.
- Debris in the joint where the horns attach to the vehicle
- Debris in direct contact with the horn
- Vehicle components vibrating while the horn is sounding

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Horn Switch parameter changes between Active and Inactive when pressing and releasing the horn pad.
 - **If the parameter does not change**
Refer to Circuit/System Testing - Horn Switch Malfunction.
 - **If the parameter changes**
3. Verify the P13 Horn Assembly turns ON and OFF and emit a clear and even tone when commanding the Horn Relay On and Off with a scan tool.
 - **If the P13 Horn Assembly does not turn ON and OFF**
Refer to Circuit/System Testing - Horns or Horn Command Malfunction.
 - **If the sound emitted is not clear and even**
Refer to Circuit/System Testing - Horn - Poor Tone.
 - **If the P13 Horn Assembly turns ON and OFF and emit a even and clear tone**
4. All OK.

Circuit/System Testing

Horn Switch Malfunction

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S33 Horn Switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal A and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Ignition ON.

4. Verify the scan tool Horn Switch parameter is Inactive.
 - **If not Inactive**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit terminal B and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal B and the ground circuit terminal A.
6. Verify the scan tool Horn Switch parameter is Active.
 - **If not Active**
 1. Ignition OFF, remove the 3 A fused jumper wire, disconnect the harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If Active**
7. Test or replace the S33 Horn Switch.

Horns or Horn Command Malfunction

1. Ignition OFF, and all vehicle systems OFF. Disconnect the harness connector at the P13 Horn Assembly. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 1 ohms between the ground circuit terminal 1 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Connect a test lamp between the control circuit terminal 2 and ground, ignition ON.
4. Verify the test lamp does not turn ON and OFF when commanding the Horn Relay On and Off with a scan tool.
 - **If the test lamp turns ON and OFF**

Test or replace the P13 Horn Assembly.
 - **If the test lamp does not turn ON and OFF**

5. Ignition OFF, connect the harness connector at the P13 Horn Assembly. Disconnect the X1 harness connector at the X50A Fuse Block-Underhood, ignition ON.
6. Verify the P13 Horn Assembly is not activated.
 - **If the P13 Horn Assembly is activated**
 1. Ignition OFF, disconnect the harness connector at the P13 Horn Assembly, ignition ON.
 2. Test for less than 1 V between the control circuit terminal 2 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, test or replace the P13 Horn Assembly.
 - **If the P13 Horn Assembly is not activated**
7. Connect a 15 A fused jumper wire between the control circuit terminal 11 and B+.
8. Verify the P13 Horn Assembly activates.
 - **If the P13 Horn Assembly does not activate**
 1. Ignition OFF, remove the jumper wire, disconnect the harness connector at the P13 Horn Assembly, ignition ON.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than Infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the P13 Horn Assembly.
 - **If the P13 Horn Assembly activates**
9. Ignition OFF, connect the X1 harness connector at the X50A Fuse Block-Underhood. Disconnect the X5 harness connector at the K9 Body Control Module, ignition ON.
10. Verify the P13 Horn Assembly is not activated.
 - **If the P13 Horn Assembly is activated**
 1. Ignition OFF, disconnect the X2 harness connector at the X50A Fuse Block-Underhood.
 2. Test for infinite resistance between the X50A Fuse Block-Underhood control circuit terminal 25 and ground.
 - If less than Infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, test or replace the X50A Fuse Block-Underhood.
 - **If the P13 Horn Assembly is not activated**
11. Connect a 3 A fused jumper wire between the control circuit terminal 19 and ground.
12. Verify the P13 Horn Assembly activates.
 - **If the P13 Horn Assembly does not activate**
 1. Ignition OFF, remove the jumper wire, disconnect the X2 harness connector at the X50A Fuse Block-Underhood, ignition ON.
 2. Test for less than 1 V between the X50A Fuse Block-Underhood control circuit terminal 25 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.

- If less than 1 V
- 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the X50A Fuse Block-Underhood.
- **If the P13 Horn Assembly activates**
- 13. Replace the K9 Body Control Module.

Horn - Poor Tone

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the P13 Horn Assembly. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 1 ohms between the ground circuit terminal 1 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the high resistance in the circuit.
 - If less than 2 ohms, repair high resistance in the ground connection.
 - **If less than 10 ohms**
3. Ignition OFF, disconnect the X1 harness connector at the X50A Fuse Block-Underhood.
4. Test for less than 2 ohms between the P13 Horn Assembly control circuit terminal 2 and the X50A Fuse Block-Underhood control circuit terminal 11 X1.
 - **If 2 ohms or greater**

Repair the high resistance in the control circuit.
 - **If less than 2 ohms**
5. Test or replace the P13 Horn Assembly.

Component Testing

Horn Test

1. Ignition OFF, disconnect the harness connector at the P13 Horn Assembly.
2. Install a 15 A fused jumper wire between the control terminal 2 and 12 V. Install a jumper wire between the ground terminal 1 and ground.
3. Verify the P13 Horn Assembly turns ON and OFF
 - **If the P13 Horn Assembly does not turn ON and OFF**

Replace the P13 Horn Assembly.
 - **If the P13 Horn Assembly turns ON and OFF**
4. All OK

Horn Switch

1. Ignition OFF, disconnect the harness connector at the S33 Horn Switch.
2. Test for infinite resistance between the signal terminal B and the ground terminal A with the switch in the open position.

- **If less than infinite resistance**

Replace the S33 Horn Switch.

- **If infinite resistance**

3. Test for less than 3 ohms between the signal terminal B and the ground terminal A with the switch in the closed position.

- **If 3 ohms or greater**

Replace the S33 Horn Switch.

- **If less than 3 ohms**

4. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Steering Wheel Horn Switch Replacement**
- **Horn Replacement**
- **Underhood Electrical Center or Junction Block Replacement**
- **Control Module References** for body control module replacement, programming and setup

REPAIR INSTRUCTIONS

HORN REPLACEMENT

Fig. 2: Horns

Courtesy of GENERAL MOTORS COMPANY

Horn Replacement

Callout	Component Name
Preliminary Procedure Remove the front bumper fascia. Refer to Front Bumper Fascia Replacement .	
1	Horn Fastener (Qty: 2) CAUTION: Refer to Fastener Caution . Tighten 17 N.m (13 lb ft)
2	Horn Procedure Disconnect the electrical connectors.

STEERING WHEEL HORN SWITCH REPLACEMENT

Fig. 3: Steering Wheel Horn Switch Components
 Courtesy of GENERAL MOTORS COMPANY

Steering Wheel Horn Switch Replacement

Callout	Component Name
Preliminary Procedure Remove the inflatable restraint steering wheel module. Refer to Airbag Steering Wheel Module Replacement .	
1	Steering Wheel Horn Switch Fastener (Qty: 2) CAUTION: Refer to Fastener Caution . Tighten 10.2 N.m (89 lb in)
2	Steering Wheel Horn Switch Fastener With Spring Tighten 10.2 N.m (89 lb in)
3	Steering Wheel Horn Switch Procedure 1. Disconnect the steering wheel control switches electrical connectors.

2. Disconnect Steering Wheel Horn Switch electrical connector.

DESCRIPTION AND OPERATION

HORNS SYSTEM DESCRIPTION AND OPERATION

System Description

The horn system consists of the following components:

- HORN fuse
- Horn relay
- Horn switch
- Horn assembly
- Body control module (BCM)

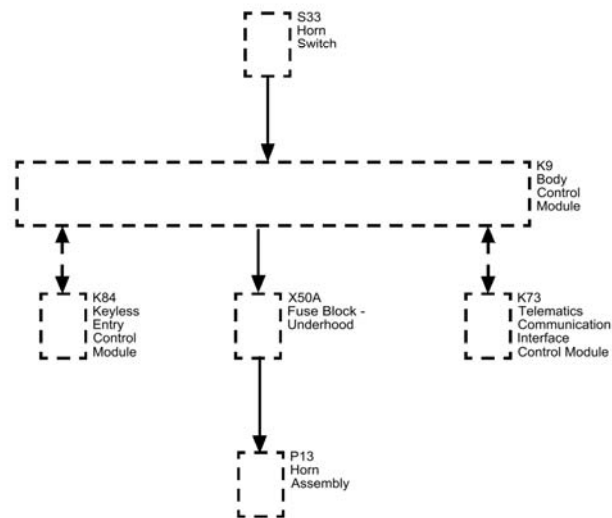

Fig. 4: Horns System Description Chart
Courtesy of GENERAL MOTORS COMPANY

System Operation

The vehicle horn system is activated under the following conditions:

- When the horn switch is depressed

- The BCM commands the horns ON under any of the following conditions:
 - When the content theft deterrent system detects a vehicle intrusion-For further information refer to **Theft Systems Description and Operation** .
 - When the panic button is depressed on the remote control door lock transmitter-For further information refer to **Keyless Entry System Description and Operation (without BTM)** , **Keyless Entry System Description and Operation (with BTM)** .
 - When the keyless entry system is used to lock the vehicle, a horn chirp may sound to notify the driver that the vehicle has been locked. The notification feature may be enabled or disabled through personalization. For further information refer to **Keyless Entry System Description and Operation (without BTM)** , **Keyless Entry System Description and Operation (with BTM)** .
 - When the OnStar® system is used to sound the horns if equipped-For further information, refer to **OnStar Description and Operation** .

Circuit Operation

Battery positive voltage is applied at all times to the horn relay coil and the horn relay switch. Pressing either of the horn switches applies ground to the horn relay control circuit. The BCM may also apply ground to the horn relay control circuit as described above. When the horn relay control circuit is grounded, the horn relay is energized and battery positive voltage is applied to the horns through the horn control circuit. The horns sound as long as ground is applied to the horn relay control circuit.

ELECTRICAL

Wiring Systems and Power Management - Wiring Schematic Diagrams - How to Use Electrical Schematics

SCHEMATIC WIRING DIAGRAMS

HOW TO USE ELECTRICAL SCHEMATICS

Information Overview

The following explains some of the key parts of the GM wiring diagrams. Included are:

- Color Abbreviations
- Electronic Delivery Navigation Features

Color Abbreviations

The following sequence is used when depicting wire colors:

1. Color modifier of the wire, such as light or dark (if applicable)
2. Primary color of the wire
3. Secondary color of the wire (tracer/stripe)

Wire insulation and connector body colors in schematic information are abbreviated with a two character code as listed below.

Abbreviation	Color	Abbreviation	Color
AM	Amber	OG	Orange
BARE	Bare	PK	Pink
BG	Beige	PU	Purple
BK	Black	RD	Red
BN	Brown	RU	Rust
BU	Blue	SR	Silver
CL	Clear	TL	Teal
CR	Cream	TN	Tan
CU	Curry	TQ	Turquoise
GD	Gold	VT	Violet
GN	Green	WH	White
GY	Gray	YE	Yellow
NA	Natural	-	-
Color Modifiers			
L	Light	D	Dark

Additionally, industry standard cable types are not identified by color, but are listed by cable type as follows:

Abbreviation	Cable Type
COAX	Coax Cable
FW	Flat Wire
HDMI	High Definition Multimedia Interface
TWINAX	Twinax Cable
USB	Universal Serial Bus

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	B0163 02	B0163 05	B0163 05	1
Low Reference	-	B0163 05, B0183 05	-	-
1. HVAC Malfunction				

Circuit/System Description

The ambient light/sunload sensor integrates the sunload sensor and passenger compartment temperature sensor.

The solar sensor is connected to ground and to a 5 V voltage supply from the HVAC control module. As the sunload increases, the sensor signal voltage also increases. The signal varies between 1.4-4.5 V and is provided to the HVAC control module.

The passenger compartment temperature sensor is a negative temperature coefficient thermistor. A signal and low reference circuit enables the sensor to operate. As the air temperature increases, the sensor resistance decreases. The sensor signal varies between 0-5 V.

Bright or high intensity light causes the vehicles interior temperature to increase. The HVAC system compensates for the increased temperature by diverting additional cool air into the vehicle.

Conditions for Running the DTC

- Ignition ON
- The HVAC control module is ON.

Conditions for Setting the DTC

The HVAC control module detects the sensor signal out of range. The signal voltage is less than 0.1 V or greater than 4.9 V for more than 50 ms.

Action Taken When the DTC Sets

The system operates using a default value.

Conditions for Clearing the DTC

The sensor signal is within specified range between 0.1-4.9 V.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the B10B Ambient Light/Sunload Sensor. It may take up to 10 min for all vehicle systems to power down.

NOTE: **The scan tool must be disconnected from the vehicle before performing the next test.**

2. Test for less than 10 ohms between the low reference circuit terminal 6 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF, disconnect the harness connector at the K33 HVAC Control Module.
 2. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K33 HVAC Control Module.
 - **If less than 10 ohms**
3. Ignition ON.
4. Verify the scan tool Passenger Compartment Air Temperature (Unfiltered) parameter is less than -37°C (-

35°F).

- **If -37°C (-35°F) or greater**

1. Ignition OFF, disconnect the harness connector at the K33 HVAC Control Module.
2. Test for infinite resistance between the signal circuit terminal 3 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K33 HVAC Control Module.

- **If less than -37°C (-35°F)**

5. Install a 3 A fused jumper wire between the signal circuit terminal 3 and the low reference circuit terminal 6.
6. Verify the scan tool parameter Passenger Compartment Air Temperature (Unfiltered) parameter is greater than 113°C (235°F).
 - **If 113°C (235°F) or less**
 1. Ignition OFF, remove the jumper wire and disconnect the harness connector at the K33 HVAC Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Ignition OFF.
 4. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K33 HVAC Control Module.
 - **If greater than 113°C (235°F)**
7. Test or replace the B10B Ambient Light/Sunload Sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Circuit/System Description

The air temperature sensors are a 2-wire negative temperature coefficient thermistor. The vehicle uses the following air temperature sensors:

- Air temperature sensor - left upper
- Air temperature sensor - left lower
- Air temperature sensor - right upper
- Air temperature sensor - right lower
- A/C evaporator temperature sensor

This sensor operates using signal and low reference circuits. As the air temperature surrounding the sensor increases, the sensor resistance decreases. The sensor is capable of reading temperatures ranging from -40 to +115°C (-40 to +240°F), with a signal voltage between 0-5 V. If the HVAC control module detects a malfunctioning sensor the software uses a default air temperature value. The default action ensures that the HVAC system can adjust the inside air temperature near the desired temperature until the condition is corrected.

Conditions for Running the DTC

- Ignition ON.
- The HVAC control module is ON.

Conditions for Setting the DTC

The HVAC control module detects the sensor signal out of range. The signal voltage is less than 0.1 V or greater than 4.9 V for more than 50 ms.

Action Taken When the DTC Sets

The system operates using a default value.

Conditions for Clearing the DTC

The sensor signal is within specified range between 0.1-4.9 V.

Circuit/System Verification

1. Ignition ON.
2. Verify the appropriate temperature sensor has a parameter displayed in HVAC scan tool information.
 - **If there is no scan tool parameter**

Refer to Circuit/System Testing - Without Scan Tool Support.

- **If there is a scan tool parameter**
3. Refer to Circuit/System Testing - With Scan Tool Support

Circuit/System Testing

With Scan Tool Support

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the appropriate temperature sensor. It may take up to 10 min for all vehicle systems to power down.
2. Test for less than 10 ohms between the low reference circuit terminal B and ground.

- **If 10 ohms or greater**
 1. Ignition OFF, disconnect the harness connector at the K33 HVAC Control Module.
 2. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K33 HVAC Control Module.
- **If less than 10 ohms**
- 3. Ignition ON.
- 4. Verify the appropriate scan tool temperature sensor parameter is less than -37°C (-35°F)
 - **If greater than -37°C (-35°F)**
 1. Ignition OFF, disconnect the harness connector at the K33 HVAC Control Module.
 2. Test for infinite resistance between the signal circuit terminal A and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K33 HVAC Control Module.
 - **If -37°C (-35°F) or less**
- 5. Install a 3 A fused jumper wire between the signal circuit terminal A and the low reference circuit terminal B.
- 6. Verify the scan tool temperature sensor parameter is greater than 110°C (230°F).
 - **If less than 110°C (230°F)**
 1. Ignition OFF, remove the jumper wire and disconnect the harness connector at the K33 HVAC Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 - 3. Ignition OFF
 - 4. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K33 HVAC Control Module.
 - **If 110°C (230°F) or greater**
- 7. Test or replace the temperature sensor.

Without Scan Tool Support

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the appropriate temperature sensor. It may take up to 10 min for all vehicle systems to power down.
2. Test for less than 10 ohms between the low reference circuit terminal B and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF, disconnect the harness connector at the K33 HVAC Control Module.
 2. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, replace the K33 HVAC Control Module.
- **If less than 10 ohms**
- 3. Test for 4.8-5.2 V between the signal circuit terminal A and ground.
 - **If less than 4.8 V**
 1. Ignition OFF, disconnect the harness connector at the K33 HVAC Control Module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K33 HVAC Control Module.
 - **If greater than 5.2 V**
 1. Ignition OFF, disconnect the harness connector at the K33 HVAC Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K33 HVAC Control Module.
 - **If between 4.8-5.2 V**
- 4. Test or replace the temperature sensor.
- 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
- 6. Verify the DTC does not set.
 - **If the DTC sets**

Replace the K33 HVAC Control Module.
 - **If the DTC does not set**
- 7. All OK

Circuit/System Description

The ambient light/sunload sensor integrates the sunload sensor and passenger compartment temperature sensor.

The solar sensor is connected to ground and to a 5 V reference voltage through the HVAC control module. As the sunload increases, the sensor signal voltage also increases. The signal varies between 1.4-4.5 V and is provided to the HVAC control module.

The passenger compartment temperature sensor is a negative temperature coefficient thermistor. A signal and low reference circuit enables the sensor to operate. As the air temperature increases, the sensor resistance decreases. The sensor signal varies between 0-5 V.

Bright or high intensity light causes the vehicles interior temperature to increase. The HVAC system compensates for the increased temperature by diverting additional cool air into the vehicle.

Conditions for Running the DTC

- Ignition ON
- The HVAC Control Module is ON.

Conditions for Setting the DTC

B0183 02

The input signal is out of range. The voltage is less than 0.1 V.

B0183 05

The input signal is out of range. The voltage is greater than 4.9 V.

Action Taken When the DTC Sets

- The system will use the last valid values as default.
- If no value is read at the time of fault, the HVAC control module uses 0 W/m² as intensity.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Control	B0193 06	B0193 06	B0193 01	-
Ground	-	B0193 06	-	-

Circuit/System Description

The blower motor control module is an interface between the HVAC control module and the blower motor. The blower motor control module has 4 circuits: a B+ input, a signal input from the HVAC module, a B+ output to the blower motor, and a low side pulse width modulation (PWM) output. The HVAC control module provides a low side (PWM) signal to the blower motor control module in order to request the blower motor speed. The blower motor control module grounds the blower motor using a low side PWM signal in order to vary the blower motor speed.

Conditions for Running the DTC

- Ignition ON.
- The HVAC control module is ON.

Conditions for Setting the DTC

B0193 01

The voltage at the HVAC control module output to the blower motor control module is always high.

B0193 06

The voltage at the HVAC control module output to the blower motor control module is always low or fluctuating.

Action Taken When the DTC Sets

The blower motor is inoperative.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Diagnostic Aids

Inspect the motor shaft for rust or other foreign material which may prohibit proper motor operation.

If the motor operates properly please reinstall it and check for Preliminary Information or Technical Service Bulletins.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the X1 harness connector at the K8 Blower Motor Control Module. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal 5 and ground.
 - **If 10 ohms or greater**

1. Ignition OFF.
2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Ignition ON.
4. Verify a test lamp illuminates between the B+ circuit terminal 6 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF, remove the test lamp.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF, remove the test lamp.
 2. Test for infinite resistance between the B+ circuit terminal 6 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Disconnect the X2 harness connector at the K8 Blower Motor Control Module and disconnect the harness connector at the M8 Blower Motor.
 4. Test for infinite resistance between the M8 Blower Motor B+ circuit terminal B and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, test or replace the M8 Blower Motor.
 - **If the test lamp illuminates**
5. Remove the test lamp.
6. Verify the resistance between the control circuit terminal 3 and ground varies from 500 ohms to 230K ohms while changing blower speeds.
 - **If the resistance does not change from 500 ohms to 230K ohms**
 1. Ignition OFF, disconnect the X2 harness connector at the K33 HVAC Control Module, ignition ON.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance.
 4. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms replace the K33 HVAC Control Module.

- **If the resistance does change from 500 ohms to 230K ohms**
- 7. Ignition OFF, connect the X1 harness connector at the K8 Blower Motor Control Module and disconnect the harness connector at the M8 Blower Motor, ignition ON and blower ON.
- 8. Verify a test lamp illuminates between the B+ terminal B and ground.
 - **If the test lamp does not illuminate**
 1. Ignition OFF, disconnect the X2 harness connector at the K8 Blower Motor Control Module.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms replace the K8 Blower Motor Control Module.
 - **If the test lamp illuminates**
- 9. Connect a test lamp between the B+ circuit terminal B and control circuit terminal A, ignition ON.

NOTE: **Once the highest fan speed is reached the test lamp may not decrease intensity with a commanded decrease in fan speed, and in order to perform the test again you must first move the fan speed command back to low then OFF.**

10. Verify the test lamp becomes progressively brighter as the blower speed is increased and progressively dimmer as the blower speed is decreased.
 - **If the test lamp does not illuminate**
 1. Ignition OFF, remove the test lamp and disconnect the X2 harness connector at the K8 Blower Motor Control Module, ignition ON.
 2. Test for less than 1 V between the control circuit terminal 2 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms replace the K8 Blower Motor Control Module.
 - **If the test lamp illuminates, but does not change in brightness**
 1. Ignition OFF, remove the test lamp and disconnect the X2 harness connector at the K8 Blower Motor Control Module.
 2. Test for infinite resistance between the control circuit terminal 2 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K8 Blower Motor Control Module.
 - **If the test lamp changes in brightness as the blower speed is changed**
11. Test or replace the M8 Blower Motor.

1. HVAC Malfunction				

Circuit/System Description

Stepper motors are used for temperature regulation, air distribution control and recirculation door control.

With the switches and dials on the HVAC controls, air temperature door position, mode door position and recirculation door position can be selected. The selected values are passed to the HVAC control module via serial data. The HVAC control module supplies a 12 V control voltage to the stepper motors and energizes the 4 stepper motor coils with a pulsed ground signal. The stepper motors move the appropriate doors into the calculated positions, in order to reach the desired positions.

Conditions for Running the DTC

- Ignition ON.
- The HVAC control module is ON.

Conditions for Setting the DTC

B023A 02

The stepper motors supply output is shorted to ground.

B0223 01, B022A 01, B0233 01, B023A 01, B0408 01 or B0418 01

At least one control circuits of the appropriate stepper motor is shorted to voltage when motor starts moving. Faults are not detected when motor is already running or target position is already reached.

B0223 06, B022A 06, B0233 06, B0233 06, B0408 06 or B0418 06

At least one control circuits of the appropriate stepper motor is shorted to ground or open when motor starts moving. Faults are not detected when motor is already running or target position is already reached.

Action Taken When the DTC Sets

B023A

- The affected output will be switched off for hardware protection.
- All stepper motors are deactivated.

B0223, B022A, B0233, B0408 or B0418,

- The affected output will be switched off for hardware protection.
- The affected stepper motor is deactivated.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Circuit/System Verification

1. Perform the Actuator Recalibration procedure.
2. Verify the concern or DTC has been corrected.
 - **If the concern or DTC has not been corrected**
 1. Verify DTC B023A is not set.
 - If DTC B023A is set

Refer to Circuit/System Testing - DTC B023A.
 - If DTC B023A is not set

Refer to Circuit/System Testing - DTC B0223, B022A, B0233, B0408 or B0418.
 - **If the concern or DTC has been corrected**
3. All OK.

Circuit/System Testing

DTC B023A

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the components listed below. It may take up to 2 min for all vehicle systems to power down.
 - M4 Air Inlet Door Actuator
 - M37 Mode Door Actuator
 - M46 Air Recirculation Door Actuator
 - M6L Air Temperature Door Actuator - Left
 - M6R Air Temperature Door Actuator - Right
2. Disconnect the X3 and X4 harness connectors at the K33 HVAC Control Module.
3. Test for infinite resistance between the K33 HVAC Control Module 12 V reference circuit terminal 15 X3 and ground.
 - **If less than infinite resistance**

Repair the short to ground on the circuit.
 - **If infinite resistance**
4. Ignition ON.
5. Test for less than 1 V between the K33 HVAC Control Module 12 V reference circuit terminal 15 X3 and ground.
 - **If 1 V or greater**

Repair the short to voltage on the circuit.
 - **If less than 1 V**
6. Connect the X3 and X4 harness connectors at the K33 HVAC Control Module, ignition ON.
7. Clear all DTCs.
8. Verify DTC B023A is not set.
 - **If the DTC is set.**

Replace the K33 HVAC Control Module.
 - **If the DTC is not set.**
9. Verify DTC B023A does not set after connecting each of the components listed below one at a time and operating them through their full range.
 - M4 Air Inlet Door Actuator
 - M37 Mode Door Actuator
 - M46 Air Recirculation Door Actuator
 - M6L Air Temperature Door Actuator - Left
 - M6R Air Temperature Door Actuator - Right

- **If the DTC sets**

Replace the component that was connected immediately before the DTC set.

- **If the DTC does not set**

10. All OK.

DTC B0223, B022A, B0233, B0408 or B0418

1. Ignition OFF, disconnect the harness connector at the appropriate door actuator, ignition ON.
2. Verify a test lamp flashes when connected between the 12 V reference circuit terminal 2 and ground.
 - **If the test lamp does not flash**
 1. Ignition OFF, remove the test lamp and disconnect the harness connector at the K33 HVAC Control Module.
 2. Test for less than 2 ohms in the 12 V control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K33 HVAC Control Module.
 - **If the test lamp flashes**
3. Connect a test lamp between each control circuit listed below and B+.
 - Control Circuit - terminal 1
 - Control Circuit - terminal 3
 - Control Circuit - terminal 4
 - Control Circuit - terminal 6
4. Command the appropriate door actuator in both directions.
5. Verify the test lamp turns ON and then OFF during at least one of the directional commands.
 - **If the test lamp is always ON**
 1. Ignition OFF, remove the test lamp and disconnect the harness connector at the K33 HVAC Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K33 HVAC Control Module.
 - **If the test lamp is always OFF**
 1. Ignition OFF, remove the test lamp and disconnect the harness connector at the K33 HVAC Control Module, ignition ON.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Ignition OFF
 4. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, replace the K33 HVAC Control Module.
 - **If the test lamp turns ON and then OFF**
6. Replace the door actuator.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC B269A, B269C, OR B269D: HEATER COOLANT PUMP

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B269A

Heater Coolant Pump Control Circuit Open

DTC B269C

Heater Coolant Pump Control Circuit Low

DTC B269D

Heater Coolant Pump Control Circuit High

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Relay Coil Control	B269C	B269A	B269D	-

Circuit/System Description

The primary purpose of the heater core coolant pump is to circulate engine coolant through the HVAC heater core when heat is required in the cabin for comfort. This normally happens when the vehicle is in an Auto Stop and the mechanical pump is not spinning. If the HVAC control module has determined heat is needed for the cabin, a request is sent via serial data to the engine control module to turn the pump ON. The engine control module controls the auxiliary coolant pump relay via the heater core coolant pump relay control circuit. The

heater core coolant pump relay supplies voltage to the heater core coolant pump.

Conditions for Running the DTC

- The 12 V battery voltage is greater than or equal to 9 V.
- The auxiliary heater coolant pump enable is commanded.

Conditions for Setting the DTC

The engine control module detects the auxiliary heater coolant pump relay enable circuit is open, shorted to voltage or shorted to ground.

Action Taken When the DTC Sets

DTCs B269A, B269C, and B269D are type B DTCs.

Conditions for Clearing the DTC

DTCs B269A, B269C, and B269D are type B DTCs.

Circuit/System Testing

1. Ignition OFF, disconnect the KR33 Auxiliary Heater Coolant Pump Relay, ignition ON.
2. Verify a test lamp illuminates between the B+ circuit terminal 30 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF, remove the test lamp.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF, remove the test lamp.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance,
 3. Test for greater than 5 ohms between the control circuit terminal 87 and ground.
 - If less than 5 ohms, repair the short to ground on the circuit.
 - If greater than 5 ohms, test or replace the KR33 Auxiliary Heater Coolant Pump Relay.
 - **If the test lamp illuminates**
3. Verify a test lamp illuminates between the B+ circuit terminal 86 and ground.
 - **If the test lamp does not illuminate**
 1. Ignition OFF, remove the test lamp.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - **If the test lamp illuminates**
4. Connect a test lamp between the B+ circuit terminal 86 and the control circuit terminal 85.
5. Verify the test lamp turns ON and OFF when commanding the Engine Control Module Heater Coolant Pump On and Off with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, remove the test lamp, disconnect the X2 harness connector at the K20 Engine Control Module, ignition ON.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Ignition OFF
 4. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K20 Engine Control Module.
 - **If the test lamp is always ON**
 1. Ignition OFF, remove the test lamp, disconnect the X2 harness connector at the K20 Engine Control Module.

2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K20 Engine Control Module.
 - **If the test lamp turns ON and OFF**
6. Verify a test lamp does not illuminate between the control circuit terminal 87 and ground.
 - **If the test lamp illuminates**

Repair the short to voltage on the circuit.
 - **If the test lamp does not illuminate**
7. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the G17 Heater Coolant Pump. It may take up to 2 min for all systems to power down.
8. Test for less than 10 ohms between the G17 Heater Coolant Pump ground circuit terminal 1 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
9. Connect the harness connector at the G17 Heater Coolant Pump.
10. Ignition ON, connect a 5 A fused jumper wire between the B+ circuit terminal 30 and the control circuit terminal 87.
11. Verify the G17 Heater Coolant Pump is activated.
 - **If the G17 Heater Coolant Pump does not activate**
 1. Ignition OFF, remove the jumper wire.
 2. Test for less than 2 ohms in the control circuit terminal 87 end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the G17 Heater Coolant Pump.
 - **If the G17 Heater Coolant Pump activates**
12. Test or replace the KR33 Auxiliary Heater Coolant Pump Relay.

Component Testing

Relay Test

1. Ignition OFF, disconnect the KR33 Auxiliary Heater Coolant Pump Relay.
2. Test for 60-180 ohms between terminals 85 and 86.
 - **If less than 60 ohms or greater than 180 ohms**

Replace the KR33 Auxiliary Heater Coolant Pump Relay.

- **If between 60-180 ohms**

3. Test for infinite resistance between the terminals listed below:

- 30 and 86
- 30 and 87
- 30 and 85
- 85 and 87

- **If less than infinite resistance**

Replace the KR33 Auxiliary Heater Coolant Pump Relay.

- **If infinite resistance**

4. Install a 10 A fused jumper wire between relay terminal 86 and 12 V. Install a jumper wire between relay terminal 85 and ground.

5. Test for less than 2 ohms between terminals 30 and 87.

- **If 2 ohms or greater**

Replace the KR33 Auxiliary Heater Coolant Pump Relay.

- **If less than 2 ohms**

6. All OK.

Repair Instructions

DTC B393B: AIR CONDITIONING COMPRESSOR VALVE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B393B 04

Air Conditioning Compressor Valve Control Circuit Open

DTC B393B 0B

Air Conditioning Compressor Valve Control Circuit High Current

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	B393B 0B	B393B 04	-	-
Control Circuit	B393B 04	B393B 04	B393B 0B	-

Circuit/System Description

This A/C system uses a conventional clutch to engage and mechanically turn the compressor and a variable displacement solenoid valve to alter the amount of displacement created by the turning of the compressor. The HVAC control module provides both battery voltage and a pulse width modulated ground to the variable displacement solenoid valve. When the A/C switch is pressed, the HVAC control module grounds the variable displacement solenoid using a low side (PWM) signal in order to determine the amount of compressor displacement. The performance of the A/C compressor is based on adjusted interior temperature and engine load.

Conditions for Running the DTC

- Ignition ON.
- The HVAC control module is ON.

Conditions for Setting the DTC

B393B 04

A PWM greater than 10% is sent but no current is read back.

B393B 0B

Measured current is above threshold of 815 mA.

Action Taken When the DTC Sets

B393B 04

The A/C compressor is disabled.

B393B 0B

- The A/C compressor is disabled.
- Output will be switched off for hardware protection.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the Q46 A/C Compressor Solenoid Valve, ignition ON.
2. Verify a test lamp illuminates between the B+ circuit terminal 2 and ground.
 - **If the test lamp does not illuminate**
 1. Ignition OFF, remove the test lamp and disconnect the harness connectors at the K33 HVAC Control Module.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance.
 3. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K33 HVAC Control Module.
 - **If the test lamp illuminates**
3. Ignition OFF, connect a test lamp between the control circuit terminal 1 and the B+ circuit terminal 2, ignition ON.
4. Verify the test lamp turns ON and OFF when commanding the Q46 A/C Compressor Refrigerant

Solenoid Valve On and Off with a scan tool.

- **If the test lamp is always OFF**

1. Ignition OFF, remove the test lamp and disconnect the harness connector at the K33 HVAC Control Module, ignition ON.
2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
3. Ignition OFF.
4. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K33 HVAC Control Module.

- **If the test lamp is always ON**

1. Ignition OFF, remove the test lamp and disconnect the harness connectors at the K33 HVAC Control Module.
2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K33 HVAC Control Module.

- **If the test lamp turns ON and OFF**

5. Test or replace the G1 A/C Compressor.

Component Testing

A/C Compressor Solenoid Valve Test

1. Ignition OFF, disconnect the harness connector at the Q46 A/C Compressor Solenoid Valve.
2. Test for 7-15 ohms between B+ terminal 2 and control terminal 1.
 - **If less than 7 ohms or greater than 15 ohms**

Replace the G1 A/C Compressor.

- **If between 7-15 ohms**

3. Test for infinite resistance between each terminal and the Q46 A/C Compressor Solenoid Valve housing/case.
 - **If less than infinite resistance**

Replace the G1 A/C Compressor.

- **If infinite resistance**

4. All OK.

DTC P0532 OR P0533: AIR CONDITIONING (A/C) REFRIGERANT PRESSURE SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of the diagnostic category.

DTC Descriptors

DTC P0532

Air Conditioning (A/C) Refrigerant Pressure Sensor Circuit Low Voltage

DTC P0533

Air Conditioning (A/C) Refrigerant Pressure Sensor Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
5 V Reference	P0532, P0641	P0532	P0533	-
Signal	P0532	P0532	P0533	-
Low Reference	-	P0533	-	-

Circuit/System Description

The engine control module (ECM) monitors the high side refrigerant pressure through the A/C refrigerant pressure sensor. The ECM supplies a 5 V reference and a low reference to the sensor. Changes in the A/C refrigerant pressure cause the sensor signal to the ECM to vary. When the pressure is high, the signal voltage is high. When the pressure is low, the signal voltage is low. The ECM may use this information to turn the cooling fans on as well as to monitor clutch engagement. The HVAC module will receive the A/C refrigerant pressure information from the ECM via serial data.

Conditions for Running the DTC

- Engine is running.
- Any of the conditions for setting the DTC are met for 15 s.
- Battery voltage is between 11-18 V.

Conditions for Setting the DTC

P0532

The ECM detects that the A/C pressure is less than 1 psi (0.25 V).

P0533

The ECM detects that the A/C pressure is more than 428 psi (4.92 V).

Action Taken When the DTC Sets

- The A/C compressor is disabled.
- The ECM will illuminate the malfunction indicator lamp (MIL).

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Diagnostic Aids

A malfunction within the refrigerant system causing high pressure can cause this DTC to set.

Circuit/System Verification

1. Ignition ON
2. Verify the scan tool engine control module A/C High Side Pressure Sensor parameter is between 6.8 kPa (1 psi) and 2950 kPa (428 psi).
 - **If not between 6.8 kPa (1 psi) and 2950 kPa (428 psi)**

Refer to Circuit/System Testing

- **If between 6.8 kPa (1 psi) and 2950 kPa (428 psi)**
3. All OK

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the B1 A/C Refrigerant Pressure Sensor. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 ohms between the low reference circuit terminal 1 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
 2. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K20 Engine Control Module.
 - **If less than 10 ohms**
3. Ignition ON.
4. Test for 4.8-5.2 V between the 5 V reference circuit terminal 2 and ground.
 - **If less than 4.8 V**
 1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
 2. Test for infinite resistance between the 5 V reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the 5 V reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K20 Engine Control Module.
 - **If greater than 5.2 V**
 1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module, ignition ON.
 2. Test for less than 1 V between the 5 V reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.

- If less than 1 V, replace the K20 Engine Control Module.
- **If between 4.8-5.2 V**
- 5. Verify the scan tool ECM A/C High Side Pressure Sensor parameter is less than .25 V.
 - **If .25 V or greater**
 1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal 3 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 Engine Control Module.
 - **If less than .25 V**
- 6. Install a 3 A fused jumper wire between the signal circuit terminal 3 and the 5 V reference circuit terminal 2.
- 7. Verify the scan tool ECM A/C High Side Pressure Sensor parameter is greater than 4.8 V.
 - **If 4.8 V or less**
 1. Ignition OFF, remove the jumper wire, disconnect the harness connector at the K20 Engine Control Module.
 2. Test for infinite resistance between the signal circuit terminal 3 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K20 Engine Control Module.
 - **If greater than 4.8 V**
- 8. Test or replace the B1 A/C Refrigerant Pressure Sensor.

DTC P0647

Air Conditioning (A/C) Compressor Clutch Relay Control Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Relay Coil Ignition	P0645	P0645	-	-
Relay Switch B+	1	1	-	-
Relay Coil Control	P0646	P0645	P0647	-
Relay Switch Control	1	1	1	-
Ground	-	1	-	-
1. A/C Compressor Malfunction				

Circuit/System Description

When the A/C switch is pressed, the HVAC control module sends an A/C request message to the engine control module (ECM) via serial data. The ECM then grounds the A/C compressor clutch relay coil control circuit, closing the relay contacts. The closed relay contacts provide voltage to the compressor clutch causing it to engage.

Conditions for Running the DTC

- Engine is running.
- The HVAC control module is ON.
- The A/C switch is active.

Conditions for Setting the DTC

P0645 or P0646

The ECM detects a short to ground or an open at the A/C compressor clutch relay control circuit.

P0647

The ECM detects a short to voltage at the A/C compressor clutch relay control circuit.

Action Taken When the DTC Sets

P0645 or P0646

The A/C compressor is inoperative or always active. The A/C compressor solenoid is commanded to 0% displacement. This causes warm air from the ducts, even with unwanted clutch engagement.

P0647

The A/C compressor is inoperative.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Circuit/System Testing

1. Ignition OFF, disconnect the KR29 A/C Compressor Clutch Relay, ignition ON.

2. Verify a test lamp illuminates between the B+ circuit terminal 30 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF, remove the test lamp.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF, remove the test lamp.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Disconnect the harness connector at the Q2 A/C Compressor Clutch.
 4. Test for infinite resistance between the control circuit terminal 87 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, test or replace the Q2 A/C Compressor Clutch.
 - **If the test lamp illuminates**
 - 3. Ignition ON.
 - 4. Verify a test lamp illuminates between the ignition circuit terminal 86 and ground.
 - **If the test lamp does not illuminate**

Refer to **Power Mode Mismatch** .

- **If the test lamp illuminates**
5. Connect a test lamp between the ignition circuit terminal 86 and the control circuit terminal 85.
 6. Verify the test lamp turns ON and OFF when commanding the ECM A/C Compressor Clutch Relay On and Off with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, remove the test lamp and disconnect the harness connector at the K20 Engine Control Module, ignition ON.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Ignition OFF.
 4. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K20 Engine Control Module.
 - **If the test lamp is always ON**
 1. Ignition OFF, remove the test lamp and disconnect the harness connector at the K20 Engine Control Module.

2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K20 Engine Control Module.
 - **If the test lamp turns ON and OFF**
7. Verify a test lamp does not illuminate between the control circuit terminal 87 and ground.
 - **If the test lamp illuminates**

Repair the short to voltage on the circuit.
 - **If the test lamp does not illuminate**
8. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the Q2 A/C Compressor Clutch. It may take up to 2 min for all vehicle systems to power down.
9. Test for less than 10 ohms between the ground circuit terminal 1 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
10. Connect the harness connector at the Q2 A/C Compressor Clutch.
11. Ignition ON, connect a 10 A fused jumper wire between the B+ circuit terminal 30 and the control circuit terminal 87.
12. Verify the Q2 A/C Compressor Clutch is engaged.
 - **If the Q2 A/C Compressor Clutch does not engage**
 1. Ignition OFF, disconnect the harness connector at the Q2 A/C Compressor Clutch.
 2. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the Q2 A/C Compressor Clutch.
 - **If the Q2 A/C Compressor Clutch is engaged**
13. Test or replace the KR29 A/C Compressor Clutch Relay.

Component Testing

1. Ignition OFF, disconnect the KR29 A/C Compressor Clutch Relay.
2. Test for 60-180 ohms between terminals 85 and 86.
 - **If not between 60-180 ohms**

Replace the KR29 A/C Compressor Clutch Relay.
 - **If between 60-180 ohms**

3. Test for infinite resistance between the terminals listed below:

- 30 and 86
- 30 and 87
- 30 and 85
- 85 and 87
- **If less than infinite resistance**

Replace the KR29 A/C Compressor Clutch Relay.

- **If infinite resistance**

4. Install a 15 A fused jumper wire between terminal 86 and 12 V. Install a jumper wire between terminal 85 and ground.

5. Test for less than 2 ohms between terminals 30 and 87.

- **If 2 ohms or greater**

Replace the KR29 A/C Compressor Clutch Relay.

- **If less than 2 ohms**

6. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **HVAC Component Replacement Reference**
- **Control Module References** for engine control module replacement, programming and setup

SYMPTOMS - HVAC SYSTEMS - AUTOMATIC

NOTE: **The following steps must be completed before using the symptom tables:**

1. Perform the **Diagnostic System Check - Vehicle** before using the HVAC System Malfunction procedure in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to **Automatic HVAC Description and Operation**.

Visual/Physical Inspection

NOTE: **Shutting one or more outlets may adversely affect the Automatic HVAC system by producing erroneous duct air temperature sensor readings in the duct connecting to the closed outlet. Where possible, always operate**

the Automatic HVAC system with all outlets open.

- Inspect for aftermarket devices which may affect the operation of the HVAC System. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which may cause the symptom.
- Verify the A/C compressor turns freely and is not seized.
- Verify that the customer is using the correct key to enable personalization and is not inadvertently activating auxiliary HVAC controls.
- The A/C compressor will not operate in cold outside air temperatures.
- The following conditions may cause window fogging:
 - Wet carpet or mats
 - High humidity
 - Interior water leak
 - Blocked A/C evaporator drain tube
 - Maximum passenger capacity
 - Blocked body pressure relief valves
- Inspect the air distribution system for causes of reduced air flow:
 - Obstructed or dirty passenger compartment air filter, if equipped
 - Blocked or damaged air inlet or outlet vents

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to **HVAC System Malfunction** in order to diagnose the symptom.

HVAC SYSTEM MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Aids

Check the following mechanical fault sources:

- Air distribution box

- Air distribution hoses/air distribution ducts

Special Tools

J43600 ACR Air Conditioning Service Center

Circuit/System Verification

NOTE: Check for bulletins before proceeding.

1. Ignition ON.
2. Verify every applicable scan tool Switch parameter changes when pressing the appropriate switch on the A26 HVAC Controls.
 - **If any parameter does not change**
 Replace the A26 HVAC Controls.
 - **If all parameters change**
3. Verify the blower motor operates properly with the blower motor switch in each speed position.
 - **If the blower motor does not operate in each speed position**

Refer to **DTC B0193**.

- **If the blower motor operates properly in each speed position**
- 4. Verify the HVAC doors listed below move when pressing the appropriate switch.
 - Driver Temperature
 - Passenger Temperature
 - Mode
 - Recirculation
 - Air Inlet
- **If any HVAC door does not move**

Refer to **DTC B0223, B022A, B0233, B023A, B0408, or B0418**.

- **If all HVAC doors move**
- 5. Install the **J43600** ACR Air Conditioning Service Center.
- 6. Verify the high side pressure reading on the Air Conditioning Service Center is within 10% of the scan tool ECM A/C High Side Pressure Sensor parameter.
 - **If the reading is not within 10%**

Refer to **DTC P0532 or P0533**.

- **If the reading is within 10%**
- 7. Verify the A/C High Side Pressure Sensor parameter is between 269-2929 kPa (39-425 PSI).
 - **If the reading is not between 269-2929 kPa (39-425 PSI)**

Refer to **Air Conditioning (A/C) System Performance Test** .

- **If the reading is between 269-2929 kPa (39-425 PSI)**
- 8. Verify the scan tool parameters listed below are within 10% of ambient temperature.
 - Lower Left Duct Air Temperature Sensor
 - Upper Left Duct Air Temperature Sensor
 - Lower Right Duct Air Temperature Sensor
 - Upper Right Duct Air Temperature Sensor
 - A/C Evaporator Temperature Sensor
- **If not within 10% of ambient temperature**

Refer to **DTC B0173, B0178, B0509, B0514 or B3933**.

- **If within 10% of ambient temperature**
- 9. Verify the scan tool parameters listed below are within 10% of actual conditions.
 - Passenger Compartment Humidity
 - Passenger Compartment Humidity Sensor Temperature

- Passenger Compartment Windshield Temperature
- **If not within 10% of actual conditions**

Refer to **DTC B0173, B0178, B0509, B0514 or B3933: Duct Air Temperature Sensor/Evaporator Temperature Sensor.**

- **If within 10% of actual conditions**

10. Engine ON, A/C system ON.

11. Verify cool air flows from the ducts with the temperature control in the coldest position.

- **If the air is not cool**

1. Verify the Q2 A/C Compressor Clutch is engaged.

- If the Q2 A/C Compressor Clutch is not engaged, refer to **Air Conditioning Compressor Malfunction.**
- If the Q2 A/C Compressor Clutch is engaged, refer to **Air Conditioning (A/C) System Performance Test** , and **DTC B393B.**

- **If the air is cool**

12. Verify warm air flows from the ducts with the temperature control in the warmest position.

- **If the air is not warm**

Refer to **Heating Performance Diagnostic** .

- **If the air is warm**

13. Engine OFF, ignition ON.

14. Verify the scan tool Sunload parameter changes while covering the B10B Ambient Light/Sunload Sensor with a shop towel and changes when shining a bright light on it.

- **If the Sunload parameter does not change**

Refer to **DTC B0163: Passenger Compartment Temperature Sensor, DTC B0183: Solar Load Sensor** or **DTC B1405 (WITH REAR PARK ASSIST): CONTROL MODULE VOLTAGE REFERENCE OUTPUT 2** , **DTC B1405 (WITH FRONT AND REAR PARK ASSIST): CONTROL MODULE VOLTAGE REFERENCE OUTPUT 2** .

- **If the Sunload parameter changes**

15. Verify the actual inside air temperature, using a thermometer, is less than 3°C (5°F) difference from the scan tool Inside Passenger Compartment Air Temp. Sensor parameter.

- **If greater than a 3°C (5°F) difference**

Refer to **DTC B0163: Passenger Compartment Temperature Sensor, DTC B0183: Solar Load Sensor** or **DTC B1405 (WITH REAR PARK ASSIST): CONTROL MODULE VOLTAGE REFERENCE OUTPUT 2** , **DTC B1405 (WITH FRONT AND REAR PARK ASSIST): CONTROL MODULE VOLTAGE REFERENCE OUTPUT 2** .

- **If less than a 3°C (5°F) difference**

16. Verify the vehicle is equipped with RPO code HP6.

- **If the vehicle is not equipped with RPO code HP6.**

Refer to step 18.

- **If the vehicle is equipped with RPO code HP6.**

17. Verify the G17 Heater Coolant Pump turns On and Off when commanded with a scan tool.

- **If the G17 Heater Coolant Pump does not turn On and Off**

Refer to **DTC B269A, B269C, or B269D.**

- **If the G17 Heater Coolant Pump does turn On and Off**

18. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **HVAC Component Replacement Reference**
- **Control Module References** for HVAC control module replacement, programming and setup

AIR CONDITIONING COMPRESSOR MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The A/C compressor uses a conventional belt driven magnetic clutch to engage and mechanically turn the compressor. When the A/C switch is pressed, the HVAC control module sends an A/C request message to the ECM via serial data. If specific criteria is met, the ECM then grounds the A/C compressor clutch relay control circuit, which will switch the A/C compressor clutch relay. With the relay contacts closed, battery voltage is supplied to the permanently grounded A/C compressor clutch. The A/C compressor clutch will then be activated.

This A/C system utilizes a variable displacement solenoid valve to alter the amount of displacement created by the turning of the compressor. The HVAC control module provides both battery voltage and a pulse width modulated ground to the variable displacement solenoid valve. When the A/C switch is pressed, the HVAC control module grounds the variable displacement solenoid using a (PWM) signal in order to determine the amount of compressor displacement. The performance of the A/C compressor is regulated based on the adjusted interior temperature.

Diagnostic Aids

The following conditions must be met in order to turn on the A/C compressor:

- Battery voltage is between 9-18 V.
- Engine coolant temperature is less than 124°C (255°F).
- Engine speed is greater than 600 RPM.
- Engine speed is less than 5 500 RPM.
- A/C high side pressure is between 269-2 929 kPa (39-425 PSI).
- Throttle position is less than 100%.
- Evaporator temperature is greater than 3°C (38°F).
- ECM does not detect excessive torque load.
- ECM does not detect insufficient idle quality.
- The ambient temperature sensor senses above 1°C (34°F).
- Blower motor is ON.

Control Module References for scan tool information

Circuit/System Verification

NOTE: Refer to **HVAC System Malfunction** before performing this procedure.

1. Ignition ON, press and release the A/C Switch.

2. Verify the HVAC control module scan tool A/C Switch parameter changes between Active and Inactive.

- **If the parameter does not change**

Replace the A26 HVAC Controls.

- **If the parameter changes**

3. Set A/C system to coolest setting with blower ON.

4. Press and release the A/C switch several times.

5. Verify the ECM scan tool A/C Request Signal parameter changes between Active and Inactive.

- **If the parameter does not change**

Replace the K33 HVAC Control Module.

- **If the parameter changes**

6. Verify the A/C compressor clutch engages when commanding the ECM A/C Relay output function On and Off with a scan tool.

- **If the A/C compressor clutch does not engage**

Refer to **DTC P0645, P0646, or P0647**

- **If the A/C compressor clutch engages**

7. Engine ON.

8. Verify the HVAC control module scan tool A/C Compressor Refrigerant Solenoid Valve Command parameter changes with varying cooling loads.

- **If the parameter does not change**

Refer to **DTC B393B**

- **If the parameter does change**

9. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **HVAC Component Replacement Reference**

AFTERBLOW ENABLING

The afterblow mode can be enabled using the scan tool. The afterblow mode allows the blower motor to operate after the engine has been turned off. This operation of the blower motor dries the evaporator core, which reduces the amount of microbial growth which can create undesirable odors.

Use the following procedure in order to enable the afterblow mode:

1. Connect the Scan Tool.
2. Turn ON the ignition, with the engine OFF.
3. Build the vehicle with the scan tool.
4. Select Module Diagnosis.
5. Select Remote Heater and Air Conditioning Control Module.
6. Select Configuration/Reset Functions.
7. Select HVAC Afterblow Configuration.

When afterblow has been enabled by the scan tool the blower motor will operate at 68% blower speed, following the sequence below up to 5 times. This could last up to an hour:

1. The blower motor will be OFF for 7-11 minutes.
2. The blower motor will RUN for 25-30 seconds.

The following conditions must be met for the HVAC module to operate the afterblow:

- The engine must be turned off for at least 30 min.
- The outside air temperature must be at least 21°C (70°F).
- The A/C compressor must have operated for more than 2 minutes before shut down during the latest key cycle.
- The system voltage must be at least 12 V.

ACTUATOR RECALIBRATION

HVAC Control Module Replacement

When replacing or disconnecting the HVAC control module, it will be necessary to perform a recalibration process. When installing or reconnecting the HVAC control module, be sure to perform the following:

Preferred Method (with Scan Tool)

NOTE: **Do not adjust any controls on the HVAC control module while the HVAC control module is self-calibrating. If interrupted, improper HVAC performance will result.**

1. Ignition OFF.
2. Disconnect the scan tool.
3. Install/connect the HVAC control module.
4. Connect all previously disconnected components.
5. Start the vehicle.
6. With the scan tool, initiate the HVAC Actuators Learn feature of the HVAC control module Special

Functions menu.

7. Operate system and verify that no DTCs have set as current DTCs.
8. If DTC B101E 4B is set after attempting the actuator recalibration procedure, perform the following:
 1. Verify which actuator does not have a scan tool learn status parameter status of complete.
 2. Verify the unlearned actuator is physically rotating - A common cause of DTC B101E 4B is an actuator that is electrically OK but fails to physically rotate (e.g. stripped gears).
 3. If the unlearned actuator is not physically rotating, replace the actuator, otherwise replace the HVAC control module.

Alternate Method (without Scan Tool)

NOTE: Do not adjust any controls on the HVAC control module while the HVAC control module is self-calibrating. If interrupted, improper HVAC performance will result.

1. Clear all DTCs.
2. Ignition OFF.
3. Install/connect the HVAC control module.
4. Connect all previously disconnected components.
5. Remove the HVAC control module fuse for a minimum of 10 s.
6. Install the HVAC control module fuse.
7. Start the vehicle.
8. Wait 40 s for the HVAC control module to self-calibrate.

Actuator Replacement

When replacing an HVAC actuator it will be necessary to allow the HVAC control module to perform a recalibration process. When installing an HVAC actuator be sure to perform one of the following:

Preferred Method (with Scan Tool)

NOTE: Do not adjust any controls on the HVAC control module while the HVAC control module is self-calibrating. If interrupted, improper HVAC performance will result.

1. Clear all DTCs.
2. Ignition OFF.
3. Install the HVAC actuator.
4. Connect all previously disconnected components.
5. Start the vehicle.
6. With the scan tool, initiate the HVAC Actuators Relearn feature of the HVAC control module Special Functions menu.

7. Operate system and verify that no DTCs have set as current DTCs.
8. If DTC B101E 4B is set after attempting the actuator recalibration procedure, perform the following:
 1. Verify which actuator does not have a scan tool learn status parameter status of complete.
 2. Verify the unlearned actuator is physically rotating - A common cause of DTC B101E 4B is an actuator that is electrically OK but fails to physically rotate (e.g. stripped gears).
 3. If the unlearned actuator is not physically rotating, replace the actuator, otherwise replace the HVAC control module.

Alternate Method (without Scan Tool)

NOTE: **Do not adjust any controls on the HVAC control module while the HVAC control module is self-calibrating. If interrupted, improper HVAC performance will result.**

1. Clear all DTCs.
2. Ignition OFF.
3. Install the HVAC actuator.
4. Connect all previously disconnected components.
5. Remove the HVAC control module fuse for a minimum of 10 s.
6. Install the HVAC control module fuse.
7. Start the vehicle.
8. Wait 40 s for the HVAC control module to self-calibrate.

REPAIR INSTRUCTIONS

HEATER AND AIR CONDITIONING CONTROL REPLACEMENT

Fig. 8: Heater and Air Conditioning Control
 Courtesy of GENERAL MOTORS COMPANY

Heater and Air Conditioning Control Replacement

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none"> 1. Disconnect the negative battery cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> . 2. Remove the instrument panel lower center trim panel. Refer to <u>Instrument Panel Lower Center Trim Panel Replacement</u> . 3. Remove the radio control bracket. Refer to 	
1	Heater and Air Conditioning Control Procedure <ol style="list-style-type: none"> 1. Disconnect the heater and air conditioning control electrical connector. 2. Use a flat-bladed plastic trim tool, to remove the heater and air conditioning control from the instrument panel lower center trim panel. 3. For programming and set up information, refer to <u>Control Module References</u> .

AIR CONDITIONING MODULE WIRING HARNESS REPLACEMENT

Fig. 9: Air Conditioning Module Wiring Harness
 Courtesy of GENERAL MOTORS COMPANY

Air Conditioning Module Wiring Harness Replacement

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none"> 1. Remove the heater and air conditioning remote control. Refer to <u>Heater and Air Conditioning Remote Control Replacement</u> . 2. Remove the instrument panel lower center trim panel. Refer to <u>Instrument Panel Lower Center Trim Panel Replacement</u> . 3. Remove the instrument panel lower extension side trim panel. Refer to <u>Instrument Panel Lower Extension Side Trim Panel Replacement</u> . 4. Remove the instrument panel lower trim panel - left side. Refer to <u>Instrument Panel Lower Trim Panel Replacement - Left Side</u> . 5. Remove the instrument cluster. Refer to <u>Instrument Cluster Replacement</u> . 	
	Air Conditioning Module Wiring Harness
1	Procedures <ol style="list-style-type: none"> 1. Disconnect the electrical connections from the actuators and the temperature sensors. 2. Maneuver the air conditioning module wiring harness out from behind the drive side of instrument panel assembly.

HEATER AND BLOWER AND AIR CONDITIONING CONTROL MODULE REPLACEMENT

Fig. 10: Heater And Blower & Air Conditioning Control Module With Fasteners
Courtesy of GENERAL MOTORS COMPANY

Heater and Blower and Air Conditioning Control Module Replacement

Callout	Component Name
Preliminary Procedure	
1. Remove the instrument panel compartment. Refer to <u>Instrument Panel Compartment Replacement</u> .	
2. Remove the floor air outlet duct. Refer to <u>Floor Air Outlet Duct Replacement - Right Side</u> .	
3. Disconnect the heater and blower and air conditioning control module electrical connectors.	
1	Heater and Blower and Air Conditioning Control Module Fastener (Qty: 2)
2	Heater and Blower and Air Conditioning Control Module

MODE VALVE LEVER REPLACEMENT

Fig. 11: Mode Valve Lever
 Courtesy of GENERAL MOTORS COMPANY

Mode Valve Lever Replacement

Callout	Component Name
Preliminary Procedures	
1. Remove the mode control cam actuator. Refer to <u>Mode Control Cam Actuator Replacement (Left Hand Drive)</u> . 2. Remove the instrument cluster. Refer to <u>Instrument Cluster Replacement</u> . 3. Remove the mode control cam. Refer to <u>Mode Control Cam Replacement</u> .	
1	Mode Valve Lever Procedure Move the valve to the middle position and mark the position of the mode valve lever notch to the mode valve gear. TIP: Use the indentation for the correct positioning of the lever arms.

MODE VALVE GEAR REPLACEMENT

Fig. 12: Mode Valve Gear And Lever
 Courtesy of GENERAL MOTORS COMPANY

Mode Valve Gear Replacement

Callout	Component Name
Preliminary Procedures <ol style="list-style-type: none"> 1. Remove the mode control cam actuator. Refer to <u>Mode Control Cam Actuator Replacement (Left Hand Drive)</u>. 2. Remove the instrument cluster. Refer to <u>Instrument Cluster Replacement</u>. 3. Remove the mode control cam. Refer to <u>Mode Control Cam Replacement</u>. 	
1	Mode Valve Lever Procedure <ol style="list-style-type: none"> 1. Move the valve to the middle position and mark the position of the mode valve lever notch to the mode valve gear. 2. Remove the mode valve lever.
2	Mode Valve Gear Procedure Release and remove the mode valve gear. <ol style="list-style-type: none"> 1. When replacing the valve gear, transfer the mark to the new part. 2. The mode valve gear can only be fitted in one position.

3. Use the indentation for the correct positioning of the lever arms.

AIR INLET VALVE ACTUATOR REPLACEMENT (LEFT HAND DRIVE AND CJ2)

Fig. 13: Air Inlet Valve Actuator (CJ2)
Courtesy of GENERAL MOTORS COMPANY

Air Inlet Valve Actuator Replacement (Left Hand Drive and CJ2)

Call out	Component Name
Preliminary Procedures	
<ol style="list-style-type: none"> 1. Disconnect the negative battery cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> . 2. Remove the air inlet housing assembly. Refer to <u>Air Inlet Housing Replacement</u> . 	
1	Air Inlet Valve Actuator Fastener (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> .
2	Air Inlet Valve Actuator Procedure Disconnect the air inlet valve actuator electrical connector. NOTE: The actuator is self-calibrating when connecting the battery.

INSIDE AIR VALVE ACTUATOR REPLACEMENT

Fig. 14: Inside Air Valve Actuator (CJ2)
Courtesy of GENERAL MOTORS COMPANY

Inside Air Valve Actuator Replacement

Call out	Component Name
Preliminary Procedures	
1. Disconnect the negative battery cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> .	
2. Remove air inlet housing assembly. Refer to <u>Air Inlet Housing Replacement</u> .	
1	Inside Air Valve Actuator Fastener (Qty: 2)
2	Inside Air Valve Actuator Procedure Disconnect the inside air valve actuator electrical connector. NOTE: The actuator is self-calibrating when connecting the battery

MODE CONTROL CAM ACTUATOR REPLACEMENT (LEFT HAND DRIVE)

Fig. 15: Mode Control Cam Actuator & Fasteners (Left Hand Drive)
 Courtesy of GENERAL MOTORS COMPANY

Mode Control Cam Actuator Replacement (Left Hand Drive)

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none"> 1. Disconnect the negative battery cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> . 2. Remove the instrument panel lower trim panel - left side. Refer to <u>Instrument Panel Lower Trim Panel Replacement - Left Side</u> . 3. Remove the floor air outlet duct - left side. Refer to <u>Floor Air Outlet Duct Replacement - Left Side</u> . 	
1	Mode Control Cam Actuator Fastener (Qty: 2) Procedure Disconnect the mode control cam actuator electrical connector.
2	Mode Control Cam Actuator TIP: The actuator is self-calibrating when connecting the battery.

MODE CONTROL CAM REPLACEMENT

Fig. 16: Mode Control Cam
 Courtesy of GENERAL MOTORS COMPANY

Mode Control Cam Replacement

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none"> 1. Remove the instrument panel lower trim panel - driver side. Refer to <u>Instrument Panel Lower Trim Panel Replacement - Left Side</u> . 2. Remove the floor air outlet duct - driver side. Refer to <u>Floor Air Outlet Duct Replacement - Left Side</u> . 3. Remove the mode control cam actuator. Refer to <u>Mode Control Cam Actuator Replacement (Left Hand Drive)</u>. 	
1	Mode Control Cam Procedure <ol style="list-style-type: none"> 1. Release and pull off the control cam. 2. The mode control cam can only be fitted in one position.

TEMPERATURE VALVE ACTUATOR REPLACEMENT - RIGHT SIDE

Fig. 17: Temperature Valve Actuator - Right Side
 Courtesy of GENERAL MOTORS COMPANY

Temperature Valve Actuator Replacement - Right Side

Callout	Component Name
Preliminary Procedures <ol style="list-style-type: none"> 1. Disconnect the negative battery cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> . 2. Remove instrument panel compartment. Refer to <u>Instrument Panel Compartment Replacement</u> . 3. Remove the floor air outlet duct - right side. Refer to <u>Floor Air Outlet Duct Replacement - Right Side</u> . 	
1	Temperature Valve Actuator Fastener (Qty: 2) Procedure Disconnect the temperature actuator electrical connector.
2	Temperature Valve Actuator TIP: Actuator is self-calibrating when connecting the battery.

TEMPERATURE VALVE ACTUATOR REPLACEMENT - LEFT SIDE (LEFT HAND DRIVE)

Fig. 18: Temperature Valve Actuator - Left Side

Callout	Component Name
1	Windshield Defroster Nozzle Grille Retainer (Qty: 8) Procedure Disconnect the electrical connector. TIP: Use a flat-bladed plastic trim tool to aid in the removal of the windshield defroster nozzle grille.
2	Sun Load Temperature and Headlamp Automatic Control Ambient Light Sensor

DESCRIPTION AND OPERATION

AUTOMATIC HVAC DESCRIPTION AND OPERATION

The air temperature and the air delivery description and operation are divided into eight areas:

- HVAC Control Components
- Air Speed
- Air Delivery
- Heating and A/C Operation
- Recirculation Operation
- Automatic Operation

- Engine Coolant
- A/C Cycle

HVAC Control Components

HVAC Controls

The HVAC controls contains all switches, which are required to control the functions of HVAC and serve as interface between the operator and the HVAC control module. The selected values are passed to the HVAC control module via LIN-Bus.

HVAC Control Module

The HVAC control module is a GMLAN device that interfaces between the operator and the HVAC system to maintain and control desired air temperature and air distribution settings. The battery positive voltage circuit provides power that the HVAC control module uses for keep alive memory. If the battery positive voltage circuit loses power, all HVAC DTCs and settings will be erased from keep alive memory. The body control module (BCM), which is the vehicle mode master, provides a device ON-Signal. The HVAC control module provides blower, air delivery mode and air temperature settings.

The HVAC control module supports the following features:

Feature	Availability
Afterblow	Available if reprogrammed by the technician
Personalization	Yes
Actuator Calibration	Yes

Mode Actuator

The mode actuator is a 5-wire stepper motor. The HVAC control module supplies a 12 V reference voltage to the stepper motor and energizes the 4 stepper motor coils with a pulsed ground signal. The stepper motor puts the mode flap into the calculated position in order to reach the selected position. The null point of the stepper motor will be calibrated, if the stepper motor is new. When the stepper motor is calibrated, the HVAC control module can drive the applicable coil to reach exactly the desired position of the flap.

Air Temperature Actuators

The interior temperature can be selected separately for the driver and passenger. For this purpose, two stepper motors are used that regulates two mixed air flaps independently of each other. The air temperature actuators are 5-wire stepper motors. The HVAC control module supplies a 12 V reference voltage to each stepper motor and energizes the 4 stepper motor coils with a pulsed ground signal. The left air temperature actuator moves the left mixed air flap into the calculated position, in order to reach the selected temperature of the left temperature switch. The right air temperature actuator puts the right mixed air flap into the calculated position, in order to reach the selected temperature of the right temperature switch. The null point of the stepper motor will be calibrated, if the stepper motor is new. When the stepper motor is calibrated, the HVAC control module can drive the applicable coil to reach exactly the desired position of the flap.

Recirculation Actuator

The recirculation actuator is a 5-wire stepper motor. The HVAC control module supplies a 12 V reference voltage to the stepper motor and energizes the 4 stepper motor coils with a pulsed ground signal. The stepper motor puts the recirculation flap into the calculated position in order to reach the desired position. The null point of the stepper motor will be calibrated, if the stepper motor is new. When the stepper motor is calibrated, the HVAC control module can drive the applicable coil to reach exactly the desired position of the flap.

Air Inlet Actuator

The air inlet actuator is a 5-wire stepper motor. The HVAC control module supplies a 12 V reference voltage to the stepper motor and energizes the 4 stepper motor coils with a pulsed ground signal. The stepper motor moves the air inlet flap into the calculated position, in order to reach the selected position. The null point of the stepper motor will be calibrated, if the stepper motor is new. When the stepper motor is calibrated, the HVAC control module can drive the applicable coil to reach exactly the desired position of the flap.

Blower Motor Control Module

The blower motor control module controls the speed of the blower motor by increasing or decreasing the voltage drop on the ground side of the blower motor. The HVAC control module provides a low side pulse width modulation (PWM) signal to the blower motor control module via the blower motor speed control circuit. As the requested blower speed increases, the HVAC control module increases the amount of time that the speed signal is modulated to ground. As the requested blower speed decreases, the HVAC control module decreases the amount of time that the signal is modulated to ground.

Air Quality Sensor

The HVAC control module detects exhaust gas by an air quality sensor. The air quality sensor is a 3-wire sensor with an ignition voltage circuit, a ground circuit and a signal circuit. The HVAC control module evaluates the information of the air quality sensor and closes the recirculation flap, while in automatic mode, as soon as the concentration of pollutants exceeds a predefined value.

Duct Temperature Sensors

The air temperature sensors are 2-wire negative temperature co-efficient thermistors. The sensors operate within a temperature range of -40 to +85°C (-40 to +185°F). The sensors are installed in the air distribution ducts and measure the temperature of the air that streams from the ducts. The HVAC control module uses these values to calculate the mixed air flap position.

Evaporator Temperature Sensor

The evaporator temperature sensor is a 2-wire negative temperature co-efficient thermistor. The sensor operates within a temperature range of -40 to +85°C (-40 to +185°F). The sensor is installed at the evaporator and measures its temperature. If the temperature drops under 3°C (38°F), the compressor will be switched off in order to prevent a frozen evaporator.

A/C Refrigerant Pressure Sensor

The A/C refrigerant pressure sensor is a 3-wire piezoelectric pressure transducer. A 5 V reference voltage, low reference, and signal circuits enable the sensor to operate. The A/C pressure signal can be between 0.2-4.8 V. When the A/C refrigerant pressure is low, the signal value is near 0 V. When the A/C refrigerant pressure is high, the signal value is near 5 V. The engine control module (ECM) converts the voltage signal to a pressure value. When pressure is too high or too low, the ECM will not allow the A/C compressor clutch to engage.

A/C Compressor

The A/C compressor is constantly belt driven. The performance of the A/C compressor is regulated per a lifting magnet in the A/C compressor. The HVAC control module supplies battery voltage to the A/C compressor. When the A/C switch is pressed, the HVAC control module provides a pulse width modulation (PWM) signal to the A/C compressor in order to command the performance of the A/C compressor. The performance of the A/C compressor is regulated according to adjusted interior temperature on the basis of characteristic lines. Therefore the HVAC control module grounds the A/C compressor with the PWM signal.

Ambient Light/Sunload Sensor

The ambient light/sunload sensor includes the sunload sensor and passenger compartment temperature sensor.

This sensor assembly provides information about:

- Sun heat intensity
- Elevation
- Azimuth
- Passenger compartment temperature

The sunload sensor is connected to ground and to a 12 V clocked power supply through the HVAC control module. This clocked power supply is to power the sensor electronics and to work as a clock generator to the sunload sensor micro controller. The sensor uses a pulse signal for data identification and transferring the sun intensity measurement. At each positive transition from the clocked supply input, the sunload sensor micro controller will shift channels enabling new intensity measurement on the signal output to the HVAC control module. The signal voltage varies between 0-4 V.

The passenger compartment temperature sensor is a negative temperature co-efficient thermistor. A signal and low reference circuit enables the sensor to operate. As the air temperature increases, the sensor resistance decreases. The sensor signal varies between 0-5 V.

Bright or high intensity light causes the vehicles interior temperature to increase. The HVAC system compensates for the increased temperature by diverting additional cool air into the vehicle.

Heater Core Coolant Pump

The primary purpose of the heater core coolant pump is to circulate engine coolant through the HVAC heater core when heat is required in the cabin for comfort. This normally happens when the vehicle is in an Auto Stop and the mechanical pump is not spinning. If the HVAC control module has determined heat is needed for the cabin, a request is sent via serial data to the engine control module to turn the pump ON. The engine control module controls the auxiliary coolant pump relay via the heater core coolant pump relay control circuit. The

heater core coolant pump relay supplies voltage to the heater core coolant pump.

Air Speed

The blower control switch is part of the HVAC controls. The selected value of the blower switch position is sent to the HVAC control module via LIN-Bus.

The blower motor control module is an interface between HVAC control module and blower motor. The blower motor control module regulates supply voltage and ground circuits to blower motor. The HVAC control module provides a PWM signal to the blower motor control module in order to command the desired blower motor speed. The blower motor control module supplies battery voltage to the blower motor and uses the blower motor ground as a low side control to adjust the blower motor speed. The voltage amounts between 2-13 V and changes linear to the height of the PWM signal.

Air Delivery

The HVAC control module controls the distribution of air by the use of recirculation and mode actuator. The modes that may be selected are:

- Defrost
- Defog
- Panel
- Floor

The desired air distribution mode can be selected with the air distribution switches at the HVAC controls. The HVAC controls delivers the values to the HVAC control module via LIN-Bus. The HVAC control module controls the air distribution actuator so that it drives the flap to the calculated position. Depending on the position of the flap, air is distributed through various ducts leading to the outlets in the dash. Turning the mode flap to the defrost position, the HVAC control module will move the recirculation actuator to outside air, reducing window fogging. When defrost is selected, the blower motor will be activated, regardless of the coolant temperature. The HVAC control module enables a high volume of air delivered to the front defrost vents. A/C is available in all modes.

The rear window defogger does not affect the HVAC system.

Heating and A/C Operation

The purpose of the heating and A/C system is to provide heated and cooled air to the interior of the vehicle. The A/C system will also remove humidity from the interior and reduce windshield fogging. Regardless of the temperature setting, the following can affect the rate that the HVAC system can achieve the desired temperature:

- Recirculation actuator setting
- Difference between inside and desired temperature
- Blower motor speed setting
- Mode setting

When the A/C switch or the AUTO switch is pressed, the HVAC controls send a signal to the HVAC control module via LIN-Bus. The HVAC control module evaluates this signal and sends an A/C request signal to the ECM via CAN-Bus. The ECM checks all preconditions before releasing and if all conditions are met sends a release signal back to the HVAC control module. The A/C compressor is activated by the HVAC control module. The HVAC control module supplies battery voltage to the A/C compressor. When the A/C switch is pressed, the HVAC control module provides a pulse width modulation (PWM) signal to the A/C compressor in order to command the performance of the A/C compressor. The performance of the A/C compressor is regulated according to adjusted interior temperature on the basis of characteristic lines. Therefore the HVAC control module grounds the A/C compressor with the PWM signal.

The following conditions must be met in order to activate the A/C compressor:

- Battery voltage is between 9-18 V
- Engine coolant temperature is less than 124°C (255°F)
- Engine speed is greater than 600 RPM
- Engine speed is less than 5 500 RPM
- A/C high side pressure is between 269-2 929 kPa (39-425 PSI)
- Throttle position is less than 100%
- Evaporator temperature is greater than 3°C (38°F)
- ECM does not detect immoderate torque load
- ECM does not detect insufficient idle quality
- The ambient temperature is above 1°C (34°F)

The sensor information is used by the ECM to determine the following:

- The A/C high side pressure
- An A/C system load on the engine
- An immoderate A/C high side pressure
- The heat load at the A/C condenser

The air streams into the passenger compartment through the heater core and the evaporator core. The air temperature actuator drives the mixed air flap to induce the airflow. If the interior temperature should be increased, the mixed air flap is put into the position in which more air streams through the heater core. If the interior temperature should be decreased, the mixed air flap is put into the position in which more air streams through the evaporator core.

Recirculation Operation

The recirculation switch is integrated into the HVAC controls. The selected recirculation switch position is sent to the HVAC control module via LIN-Bus. The HVAC control module controls the air intake through the air inlet actuator and recirculation actuator. In the recirculation mode the air inlet flap closes and the recirculation flap opens in order to circulate the air within the vehicle. In fresh air mode the air inlet flap opens and the recirculation flap is closed again in order to route outside air into the vehicle. Recirculation is only available if the defrost mode is not active. When the defrost mode is active, the recirculation actuator opens the recirculation flap and the air inlet actuator opens the air inlet flap and outside air is circulated to the windshield

to reduce fogging.

The HVAC control module evaluates the information of the air quality sensor and closes the recirculation flap while in the automatic mode as soon as the concentration of pollutants exceeds a predefined value.

Automatic Operation

In automatic operation, the HVAC control module maintains the comfort level inside of the vehicle by controlling the A/C compressor clutch, the blower motor, the air temperature actuators, mode actuator and recirculation actuator.

To put the HVAC system in automatic mode, the following is required:

1. The auto switch must be activated.
2. The air temperature switch must be in any other position than full hot or full cold position.

Once the desired temperature is reached, the blower motor, mode, recirculation and temperature actuators automatically adjust to maintain the temperature selected. The HVAC control module performs the following functions to maintain the desired air temperature:

- Monitors the following sensors:
 - Ambient air temperature sensor
 - Lower left air temperature sensor
 - Lower right air temperature sensor
 - Upper left air temperature sensor
 - Upper right air temperature sensor
 - Ambient light/sunload sensor
 - Air quality sensor
- Regulate blower motor speed
- Position the air temperature actuators
- Position the mode actuator
- Position the recirculation actuator
- Position the air inlet actuator
- Request A/C operation
- Control of the A/C compressor

When the warmest position is selected in automatic operation the blower speed will increase gradually until the vehicle reaches normal operating temperature. When normal operating temperature is reached the blower stays on high speed and the air temperature actuators stays in the full heat position.

When the coldest position is selected in automatic operation the blower stays on high and the air temperature actuators stay in full cold position. The mode actuator remains in the panel position and the recirculation actuator will remain in the recirculation position.

Under cold ambient temperatures, the automatic HVAC system provides heat in the most efficient manner. The operator can select an extreme temperature setting but the system will not warm the vehicle any faster. Under warm ambient temperatures, the automatic HVAC system also provides air conditioning in the most efficient manner. Selecting an extreme cool temperature will not cool the vehicle any faster.

The HVAC control module evaluates the information of the air quality sensor and closes the recirculation flap while in the automatic mode, as soon as the concentration of pollutants exceeds a predefined value.

Engine Coolant

Engine coolant is the essential element of the heating system. The thermostat controls the normal engine operating coolant temperature. The thermostat also creates a restriction for the cooling system that promotes a positive coolant flow and helps prevent cavitation.

Coolant enters the heater core through the inlet heater hose, in a pressurized state. The heater core is located inside the HVAC module. The ambient air drawn through the HVAC module absorbs the heat of the coolant flowing through the heater core. Heated air is distributed to the passenger compartment, through the HVAC module, for passenger comfort. Opening or closing the air temperature flap controls the amount of heat delivered to the passenger compartment. The coolant exits the heater core through the return heater hose and recirculates back to the engine cooling system.

A/C Cycle

Refrigerant is the key element in an air conditioning system. R-134a is presently the only Environmental Protection Agency approved refrigerant for automotive use. R-134a is a very low temperature gas that can transfer the undesirable heat and moisture from the passenger compartment to the outside air.

The compressor builds pressure on the vapor refrigerant. Compressing the refrigerant also adds heat to the refrigerant. The refrigerant is discharged from the compressor, through the discharge hose, and forced to flow to the condenser and then through the balance of the A/C system. The A/C system is mechanically protected with the use of a high pressure relief valve. If the A/C refrigerant pressure sensor fails or if the refrigerant system becomes restricted and refrigerant pressure continued to rise, the high pressure relief will pop open and release refrigerant from the system.

Compressed refrigerant enters the condenser in a high temperature, high pressure vapor state. As the refrigerant flows through the condenser, the heat of the refrigerant is transferred to the ambient air passing through the condenser. Cooling the refrigerant causes the refrigerant to condense and change from a vapor to a liquid state.

The condenser is located in front of the radiator for maximum heat transfer. The condenser is made of aluminum tubing and aluminum cooling fins, which allows rapid heat transfer for the refrigerant. The semi-cooled liquid refrigerant exits the condenser and flows to the Receiver/Dehydrator(R/D).

The R/D contains desiccant that absorbs moisture that may be in the refrigerant system. The R/D also acts as a storage vessel to ensure that a steady flow of liquid reaches the Thermal Expansion Valve. The refrigerant exits the R/D and flows through the liquid line to the Thermal Expansion Valve.

The Thermal Expansion Valve is located at the front of dash and attaches to the evaporator inlet and outlet pipes. The Thermal Expansion Valve is the dividing point for the high and the low pressure sides of the A/C

system. As the refrigerant passes through the Thermal Expansion Valve, the pressure on the refrigerant is lowered. The Thermal Expansion Valve also meters the amount of liquid refrigerant that can flow into the evaporator.

Refrigerant exiting the Thermal Expansion Valve flows into the evaporator core in a low pressure, liquid state. Ambient air is drawn through the HVAC module and passes through the evaporator core. Warm and moist air will cause the liquid refrigerant boil inside of the evaporator core. The boiling refrigerant absorbs heat from the ambient air and draws moisture onto the evaporator. The refrigerant exits the evaporator through the suction line and back to the A/C compressor, in a vapor state, and completing the A/C cycle of heat removal. At the A/C compressor, the refrigerant is compressed again and the cycle of heat removal is repeated.

The conditioned air is distributed through the HVAC module for passenger comfort. The heat and moisture removed from the passenger compartment will also change form, or condense, and is discharged from the HVAC module as water.

Circuit/System Description

The generator control module also called the starter generator control module is comprised of the following three control modules; the hybrid powertrain control module, 14 volt power module and the drive motor control module. These three control modules are non serviceable and are part of the generator control module.

The brake pedal position (BPP) sensor is used to sense the action of the driver application of the brake pedal. The BPP sensor provides an analog voltage signal that will increase as the brake pedal is applied. The BPP sensor contains two independent sensor assemblies. The hybrid powertrain control module located in the generator control module, and the body control module are connected to their respective sensor assembly. Each module provides a low reference signal and a 5-volt reference voltage to their respective BPP sensor. The hybrid powertrain control module also monitors the PRNDL state for inferred brake pedal application when transitioning in and out of the Park position.

Conditions for Running the DTC

- Ignition voltage must be greater than 10 V.
- Drive motor control and hybrid powertrain control module are awake.

P057B

- Vehicle speed is greater than 5 km/h (3 mph).
- Transmission is not in Park.
- Accelerator pedal position less than 5 percent.
- DTCs P0722, P0723, P077C, P077D, U0101, U0073, P182E, P1915, P2122, P2123, P2127, P2128 or P2138 not set.

Conditions for Setting the DTC

DTC P057B

The hybrid powertrain control module detects no change in brake pedal position after brake applied.

DTC P057C

- The hybrid powertrain control module detects a short to voltage in the BPP sensor 5 V reference circuit.
- The hybrid powertrain control module detects a short to ground or an open/high resistance in the BPP sensor 5 V reference circuit.
- The hybrid powertrain control module detects a short to ground or an open/high resistance in the BPP sensor signal circuit.

DTC P057D

- The hybrid powertrain control module detects a short to voltage in the BPP sensor signal circuit.
- The hybrid powertrain control module detects an open/high resistance in the BPP sensor low reference circuit.

DTC P057E

The hybrid powertrain control module detects the BPP sensor signal is changing faster than possible under normal operating conditions.

Actions Taken When the DTC Sets

- The hybrid powertrain control module disables the following functions: Autostop, Autostart, and Regenerative Braking.
- DTC P057B is a type A DTC.
- DTCs P057C-P057E are type B DTCs.

Conditions for Clearing the DTC

- DTC P057B is a type A DTC.
- DTCs P057C-P057E are type B DTCs.

Diagnostic Aids

P057B

Inspect the connector at the Brake Pedal Position sensor for a high resistance connection.

Circuit/System Testing

DTC P057C and P057D

1. Verify that DTC P0562 or P0563 is not set.
 - If DTC P0562 or P0563 is set, refer to DTC B1325, B1330, B1420, B1424, B1517, C0800, C0895, C0899, C0900, C12E1, C12E2, P0560, P0562, or P0563 for Hybrid (HP6).
2. Ignition OFF, disconnect the harness connector at the B22 brake pedal position sensor.
3. Ignition ON, verify that a test lamp illuminates between B+ and the low reference circuit terminal 5.
 - If the test lamp does not illuminate, test the low reference circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K59 starter generator control module.

4. Ignition ON, test for 4.8-5.2 V between the 5 V reference circuit terminal 6 and ground.
 - If less than the specified range, test the 5 V reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K59 starter generator control module.
 - If greater than the specified range, test the 5 V reference circuit for a short to voltage. If the circuit tests normal, replace the K59 starter generator control module.
5. Test for less than 0.3 V between the signal circuit terminal 4 and ground.
 - If greater than the specified range, test the signal circuit for a short to voltage. If the circuit tests normal, replace the K59 starter generator control module.
6. Test for 4.8-5.2 V between the 5 V reference circuit terminal 6 and the signal circuit terminal 4.
 - If less than the specified range, test the signal circuit for an open/high resistance. If the circuit tests normal, replace the K59 starter generator control module.
7. Ignition OFF, disconnect the X2 harness connector at the K59 starter generator control module.
8. Test for infinite resistance between the signal circuit terminal 4 and ground.
 - If less than the specified range, test the signal circuit for a short to ground.
9. If all circuits test normal, replace the B22 brake pedal position sensor.

DTC P057B

Operate the vehicle within the Conditions for Running and Setting the DTC and verify the DTC does not reset.

- If DTC P057B resets as current, replace the B22 brake pedal position sensor.

DTC P057E

1. Replace the brake pedal position sensor.
2. Perform the brake pedal position sensor calibration procedure. Refer to **Brake Pedal Position Sensor Calibration**.
3. Operate the vehicle within the Conditions for Running and Setting the DTC and verify the DTC does not reset.
 - If DTC P057E resets as current, replace the K59 starter generator control module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Brake Pedal Position Sensor Calibration**
- **Brake Pedal Position Sensor Replacement**
- **Control Module References** for Generator Control Module, also called the Starter Generator Control Module, replacement, programming and setup

DTC P0601-P0604, P0606, P061B, P062F, OR P262B (HYBRID POWERTRAIN CONTROL MODULE): CONTROL MODULE MEMORY

Circuit/System Description

The starter/generator control module, often referred to as the generator control module, is comprised of the following three control modules; the hybrid powertrain control module, 14 volt power module and the drive motor control module. These three control modules are non-serviceable parts of the starter/generator control module. This is an internal fault detection of the starter/generator control module and no external circuits are involved.

Conditions for Running the DTC

- The ignition is ON.
- The system voltage is greater than 9.5V.

Conditions for Setting the DTC

The control module has detected an internal malfunction.

P0602

A service module has been installed but not yet programmed.

Action Taken When the DTC Sets

- DTCs P0601-P0604, P0606, P061B, and P062F are Type A DTCs.
- DTC P262B is a Type B DTC.

P0601, P0602, P0604, P0606, P061B, and P262B

The hybrid powertrain control module requests the high voltage contactor relay open.

Conditions for Clearing the DTC

- DTCs P0601-P0604, P0606, P061B, and P062F are Type A DTCs.
- DTC P262B is a Type B DTC.

Diagnostic Aids

DTC P0606 may cause DTCs U0073, U0074, U0293, U1817 to set.

Circuit/System Verification

1. Verify DTC P0562 is not set.

- **If DTC is set**

Refer to **DTC B1325, B1330, B1420, B1424, B1517, C0800, C0895, C0899, C0900, C12E1, C12E2, P0560, P0562, or P0563** .

- **If the DTC does not set**

2. Verify P0601-P0604, P0606, P061B, P062F, or P262B is not set.

- **If any of the DTCs are set**

1. Program the K59 Starter/Generator Control Module.
2. Verify the DTC does not set.
 - If the DTC sets, replace the K59 Starter/Generator Control Module.
 - If the DTC does not set
3. All OK.

- **If none of the DTCs are set**

3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for K59 Starter/Generator Control Module, often referred to as the Generator Control Module, replacement, programming and setup.

DTC P0697: 5V REFERENCE 3 CIRCUIT

Diagnostic Instructions

- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0697

5V Reference 3 Circuit

Circuit/System Description

The generator control module also called the starter generator control module is comprised of the following three control modules; the hybrid powertrain control module, 14 volt power module and the drive motor control module. These three control modules are non serviceable and are part of the generator control module.

The hybrid powertrain control module has three internal 5 V reference circuits. Each internal reference circuit provides a 5 V reference for one or more sensors. A short to ground or short to voltage on one external 5 V

reference circuit can affect all components connected to the same internal 5 V reference circuit.

Conditions for Running the DTC

- Ignition is on.
- Ignition voltage is greater than 10 V.

Conditions for Setting the DTC

The hybrid powertrain control module detects a voltage out of range on the 5 V reference 3 circuit for greater than 5 seconds.

Action Taken When the DTC Sets

DTC P0697 is a Type B DTC.

Conditions for Clearing the DTC

DTC P0697 is a Type B DTC.

Diagnostic Aids

The 5 V reference 3 circuit provides 5 V to internal circuitry contained in the generator control module.

Motor Temperature Signal	215°C (419°F)	-40°C (-40°F)	Sensor Damage Possible
Motor Temperature Sensor Low Reference	-	-40°C (-40°F)	-

Circuit/System Description

The generator control module also called the starter generator control module is comprised of the following three control modules; the hybrid powertrain control module, 14 volt power module and the drive motor control module. These three control modules are non serviceable and are part of the generator control module.

The motor temperature sensor is a non-serviceable part of the starter generator assembly, often referred to as the drive motor assembly. The motor temperature sensor is a thermistor, or a resistor that changes value when the temperature changes. The motor temperature sensor is located in the stator. The sensor has a negative-temperature coefficient. This means that as the temperature increases, the resistance decreases, and as the temperature decreases, the resistance increases. The motor control module supplies a 5 V reference signal to the sensor and measures the voltage drop in the circuit. When the motor is cold, the sensor resistance is high. As the motor temperature increases, the resistance of the sensor decreases, which lowers the signal voltage.

Conditions for Running the DTC

P0A2B

- DTC P0A2B, P0A2C, P0A2D, P0A2F, P0AEE, P0AEF, P0AF0, P1A71, P1A72, P1A73, P1A90, P1A91, P1A92, P0C11, or P262B is not set.
- The Engine off time is greater than 8 hours.
- The Ignition is ON.
- Ignition voltage is between 9-16V.

P0A2C

The drive motor control module and the hybrid powertrain control module are awake.

P0A2D

Vehicle has been driven with starter generator torque greater than 10 N.m (89 lb in) for at least 90 seconds.

Conditions for Setting the DTC

P0A2B

The Motor temperature is more than 25°C (45°F) greater than the average of the 14 volt power module temperature sensors and the power inverter module temperature.

P0A2C

Motor temperature sensor signal is greater than 215°C (419°F) for 1 second.

P0A2D

Motor temperature sensor signal is less than -40°C (-40°F) for 1 second after a warm up condition when drive motor generator torque is greater than 10 N.m (89 lb in) for 90 seconds.

Action Taken When the DTC Sets

DTCs P0A2B-P0A2D are Type B DTCs.

Conditions for Clearing the DTC

DTCs P0A2B-P0A2D are Type B DTCs.

Diagnostic Aids

The motor temperature sensor can be damaged by excessive electric current. Test the sensor for an open condition whenever a short to voltage condition is observed.

Circuit/System Verification

P0A2B-P0A2D

1. Allow the vehicle to cool to ambient temperature by leaving the ignition OFF for at least 8 hours.
2. Ignition ON, observe the motor temperature scan tool parameters.

The temperature parameter should be within 25°C (45°F) of ambient temperature.

Circuit/System Testing

1. Ignition OFF, disconnect the starter generator X1 harness connector from the A15 starter generator.
2. Ignition ON, test the harness side for less than 12 ohms between the low reference circuit terminal 7 and

ground.

- If greater than the specified range, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the K59 starter generator control module.
- 3. Ignition ON, verify the scan tool motor temperature sensor parameter is -40°C (-40°F).
 - If more than the specified value, test the motor temperature sensor signal circuit for a short to ground. If the circuit tests normal, replace the K59 starter generator control module.
- 4. Install a 3-amp fused jumper wire between the signal circuit X1 terminal 8 and the low reference circuit X1 terminal 7 at the A15 starter generator. Verify the scan tool motor temperature sensor parameter is greater than 214°C (417°F):

NOTE: If a short to voltage is found, test the motor temperature sensor for an open circuit or physical damage.

- If less than the specified value, test the signal circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the K59 starter generator control module.
- 5. Ignition OFF, measure and record the resistance between the sensor signal and low reference terminals. Compare the actual sensor and circuit resistance to the expected sensor resistance. Refer to **Temperature Versus Resistance**.
 - If the resistance is not near the expected value, replace the A15 starter generator.

- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0A2F

Drive Motor High Temperature

Circuit/System Description

The generator control module also called the starter generator control module is comprised of the following

three control modules; the hybrid powertrain control module, 14 volt power module and the drive motor control module. These three control modules are non serviceable and are part of the generator control module.

The starter generator is also referred to as the drive motor. The drive motor temperature sensor is a variable resistor that measures the temperature of the drive motor stator windings. The hybrid powertrain control module supplies 5 V to the signal circuit and a ground for the low reference circuit. The drive motor temperature sensor resistance changes with drive motor coolant temperature. As the temperature decreases, the sensor resistance increases. As the temperature increases, the sensor resistance decreases. The hybrid powertrain control module monitors the drive motor temperature sensor to determine the temperature of the drive motor.

Conditions for Running the DTC

- DTC P0A2B, P0A2C, and P0A2D is not set.
- The drive motor control module and hybrid powertrain control module are awake.

Conditions for Setting the DTC

The motor temperature sensor is greater than 165°C (329°F) for 5 seconds.

Action Taken When the DTC Sets

- DTC P0A2F is a Type B DTC.
- The hybrid powertrain control module system starts to reduce the maximum torque beginning at 155°C (311°F) down to 0 N.m as the drive motor stator temperature approaches 165°C (329°F).

Conditions for Clearing the DTC

DTC P0A2F is a Type B DTC.

Diagnostic Aids

- Ask about the customer's driving habits, trailer towing, etc.
- Ensure the engine cooling system is functioning normally.
- Ensure the starter generator cooling system is functioning normally.

* Represents a differential circuit consisting of a pair of wires. See Circuit/System Description and schematic for detailed description.				

Circuit/System Description

The generator control module also called the starter generator control module is comprised of the following three control modules; the hybrid powertrain control module, 14 volt power module and the drive motor control module. These three control modules are non serviceable and are part of the generator control module.

The generator control module monitors the angular position, speed and direction of the starter generator rotor based upon the signals of the resolver-type motor position sensor. The position sensor contains a drive coil, two driven coils, and an irregular shaped metallic rotor. The metallic rotor is mechanically attached to the shaft of the starter generator.

At ignition ON, an AC voltage, 10 kHz excitation signal is output to the drive coil. The drive coil excitation signal creates a magnetic field surrounding the two driven coils and the irregular shaped rotor. The generator control module then monitors the two driven coil circuits for a return signal. The position of the irregular metallic rotor causes the magnetically-induced return signals of the driven coils to vary in size and shape. A comparison of the two driven coils signals allows the generator control module to determine the exact position, speed and direction of the starter generator rotor. The position sensor is a non-serviceable part of the starter generator.

Conditions for Running the DTC

- Ignition voltage is greater than 9.5V.
- The drive motor control module and hybrid powertrain control module are awake.

Conditions for Setting the DTC

P0A3F

Sin or Cos signal is less than 2.3V.

P0A40

Sin or Cos signal is greater than 4V.

P0C52

Drive Motor Position Sensor Circuit 1 reference voltage is less than 0.5 V.

P0C53

Drive Motor Position Sensor Circuit 1 reference voltage is greater than 4.5 V.

P0C5C

Drive Motor Position Sensor Circuit 2 reference voltage is less than 0.5 V.

P0C5D

Drive Motor Position Sensor Circuit 2 reference voltage is greater than 4.5 V.

P1B03

The generator control module tracking error is greater than 5 degrees.

Action Taken When the DTC Sets

- DTCs P0A3F, P0A40, P0C52, P0C53, P0C5C, P0C5D, and P1B03 are Type B DTCs.
- Starter generator operation is disabled.
- Autostop operation is disabled.
- Autostart operation is disabled.
- 14 volt power module remains active until hybrid battery power is depleted, or 14 volt power module power limits are exceeded, after which the high voltage contactor's relay is opened.

Conditions for Clearing the DTC

DTCs P0A3F, P0A40, P0C52, P0C53, P0C5C, P0C5D, and P1B03 are Type B DTCs.

Diagnostic Aids

- The starter generator position sensor circuits operate at very low current. These circuits are susceptible to moisture intrusion, coolant contamination, corrosion, and terminal damage. Extreme care must be taken when removing the starter generator, probing terminals and manipulating harnesses. Poor terminal connections can result in intermittent operation.
- If the customer comments that the problem occurs only during moist environmental conditions: rain, snow, vehicle wash, etc., inspect the sensor wiring and seals for signs of water intrusion.
- The sensor and reference circuit loops are a twisted pair with each pair covered in a grounded foil shield.
- The shield circuits are grounded inside the drive motor control module. Improperly grounded shield circuits may cause inaccurate sensor signals.

Circuit/System Testing

NOTE: You must perform the Component Testing before proceeding with Circuit/System Testing.

1. Ignition OFF, disconnect the X1 harness connector at the A15 Starter Generator.
2. Ignition ON.
3. Test for 1.7-3.2 V between the signal circuit terminals listed below and ground:
 - Signal (S1) circuit terminal 1
 - Signal (S3) circuit terminal 5
 - Signal (S2) circuit terminal 6
 - Signal (S4) circuit terminal 2
 - **If less than 1.7 V**
1. Vehicle OFF, disconnect the X1 harness connector at the K59 Starter Generator Control Module.

NOTE: The following test must be performed at the K59 Starter Generator Control Module end of the wiring harness.

2. Test for infinite resistance between the appropriate signal circuit and the ground circuit listed below:
 - Signal (S1) circuit terminal 10 and ground circuit terminal 2
 - Signal (S3) circuit terminal 11 and ground circuit terminal 2
 - Signal (S2) circuit terminal 8 and ground circuit terminal 1
 - Signal (S4) circuit terminal 9 and ground circuit terminal 1
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for infinite resistance between the signal circuit and chassis ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
4. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K59 Starter Generator Control Module.
 - **If greater than 3.2 V**
1. Ignition OFF, disconnect the X1 harness connector at the K59 Starter Generator Control Module, Ignition ON.
2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K59 Starter Generator Control Module.
 - **If between 1.7-3.2 V**
4. Test for 6.5-8.5 V between the reference circuit terminals listed below and ground:

- Reference terminal 3
- Reference terminal 4
- **If less than 6.5 V**

1. Ignition OFF, disconnect the X1 harness connector at the K59 Starter Generator Control Module.

NOTE: The following test must be performed at the K59 Starter Generator Control Module end of the wiring harness.

2. Test for infinite resistance between the reference circuit and the following ground paths:

- Chassis ground
- Ground circuit terminal 13
- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Test for less than 2 ohms in the reference circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.
- If less than 2 ohms, replace the K59 Starter Generator Control Module.

- **If greater than 8.5 V**

1. Ignition OFF, disconnect the X1 harness connector at the K59 Starter Generator Control Module, Ignition ON.

2. Test for less than 1 V DC between the reference circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V, replace the K59 Starter Generator Control Module.

- **If between 6.5-8.5 V**

5. Verify DTC P0A3F, P0A40, P0C52, P0C53, P0C5C, P0C5D, or P1B03 is not set.

- **If any of the DTCs are set**

1. Program the K59 Starter Generator Control Module.

2. Verify the DTC does not set.

- If the DTC sets, replace the K59 Starter Generator Control Module.
- If the DTC does not set

3. All OK.

- **If none of the DTCs are set**

6. All OK.

Component Testing

NOTE: If moist environmental conditions: rain, snow, vehicle wash, etc. are present please refer to the appropriate Diagnostic Aids section above before doing component tests.

1. Ignition OFF, disconnect the X1 harness connector at the A15 Starter Generator.

2. Test for 10-35 ohms between the reference terminal 3 and the reference terminal 4.

- **If not within the specified range**

Replace the A15 Starter Generator.

- **If within the specified range**

3. Test for 30-60 ohms between the signal (S1) terminal 1 and the signal (S3) terminal 5.

- **If not within the specified range**

Replace the A15 Starter Generator.

- **If within the specified range**

4. Test for 30-60 ohms between the signal (S4) terminal 2 and the signal (S2) terminal 6.

- **If not within the specified range**

Replace the A15 Starter Generator.

- **If within the specified range**

5. Test for greater than 10,000 ohms between the terminals listed below and A15 Starter Generator case:

- Signal (S1) terminal 1
- Signal (S4) terminal 2
- Reference terminal 3
- Reference terminal 4
- Signal (S3) terminal 5
- Signal (S2) terminal 6
- **If less than 10,000 ohms**

Replace the A15 Starter Generator.

- **If 10,000 ohms or greater**

6. Test for infinite resistance between the terminals listed below:

- Terminals 1 and 3
- Terminals 1 and 2
- Terminals 2 and 3
- **If less than infinite resistance**

Replace the A15 Starter Generator.

- **If infinite resistance**

7. Refer to Circuit/System Testing.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Starter Generator Replacement**
- **Control Module References** for K59 Starter Generator Control Module, often referred to as Generator Control Module, replacement, programming and setup

DTC P0A78: DRIVE MOTOR INVERTER PERFORMANCE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0A78

Drive Motor Inverter Performance

Circuit/System Description

The generator control module also called the starter generator control module is comprised of the following three control modules; the hybrid powertrain control module, 14 volt power module and the drive motor control module. These three control modules are non serviceable and are part of the generator control module.

The drive motor control module operates the starter generator, also referred to as the drive motor, based upon hybrid powertrain control module commands. The drive motor control module controls the speed and output torque of the starter generator through the sequencing actuation of high current switching transistors called insulated gate bipolar transistors. Each insulated gate bipolar transistor assembly is monitored for fault conditions. The motor control module is part of the generator control module and is not serviced separately.

Conditions for Running the DTC

The high voltage contactor relay is closed.

Conditions for Setting the DTC

The drive motor control module detects excessive current flow through the switched portion of the insulated gate bipolar transistor.

Action Taken When the DTC Sets

- DTC P0A78 is a Type B DTC.
- The hybrid powertrain control module opens the high voltage contactor relay.

Conditions for Clearing the DTC

DTC P0A78 is a Type B DTC.

Circuit/System Verification

If the DTC is set, clear DTC; Turn the ignition OFF for 2 minutes. Turn the ignition ON, Operate vehicle within conditions for running and setting DTC. If the DTC resets, go to Circuit/System Testing.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.

- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Perform the **High Voltage Disabling** procedure.
2. Remove the 3-phase cables from the K59 starter generator control module.
3. Test for infinite resistance between the 3-Phase cable terminals listed below and ground for each phase of the drive motor generator battery cable:
 - X8 phase U terminal
 - X7 phase V terminal
 - X6 phase W terminal
 - If less than infinite resistance, test each phase of the drive motor generator battery cable for a short to ground. If the cables test normal, replace the A15 starter generator.
4. Disconnect the 3-phase cables from the A15 starter generator.
5. Test for infinite resistance between the 3-Phase circuits listed below for each phase of the Drive Motor Generator Battery Cable:
 - Phase U and phase V
 - Phase V and phase W
 - Phase W and phase U
 - If less than infinite resistance, replace the Drive Motor Generator Battery Cable.
6. Replace the A15 starter generator and retest for the DTC. If the DTC resets, replace the K59 starter generator control module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Starter Generator Replacement** for starter generator replacement.
- **Drive Motor Generator Battery Cable Replacement** for 3-Phase Cable Assembly replacement.
- **Control Module References** for Generator Control Module, also called the Starter Generator Control Module, replacement, programming and setup.

DTC P0A88 OR P0A89: POWER MODULE INPUT CURRENT SENSOR: 14V POWER MODULE INPUT CURRENT SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.

- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0A88

14V Power Module Input Current Sensor Circuit Low Current

DTC P0A89

14V Power Module Input Current Sensor Circuit High Current

Circuit/System Description

The generator control module also called the starter generator control module is comprised of the following three control modules; the hybrid powertrain control module, 14 volt power module and the drive motor control module. These three control modules are non serviceable and are part of the generator control module.

The 14V power module has 2 current sensors, one for input and one for output current measurements. This diagnostic checks the input current sensor. These current sensors are internal to the 14V power module and are not serviced separately from the generator control module.

Conditions for Running the DTC

- The ignition is ON.
- 14V Power Module Status is Normal.
- Ignition voltage is between 9-16V.

Conditions for Setting the DTC

P0A88

14 volt power module input current is Less than 0.5 amp for greater than 2 seconds.

P0A89

14 volt power module input current is greater than 22.5 amps for greater than 2 seconds.

Action Taken When the DTC Sets

- DTCs P0A88 and P0A89 are Type B DTCs.
- Autostop disabled.
- Autostart disabled.
- Power regeneration disabled.

Conditions for Clearing the DTC

DTCs P0A88 and P0A89 are Type B DTCs.

DTC P0A8D OR P0A8E: 14V POWER MODULE SYSTEM VOLTAGE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0A8D

14V Power Module System Voltage Low Voltage

DTC P0A8E

14V Power Module System Voltage High Voltage

Circuit/System Description

The generator control module also called the starter generator control module is comprised of the following three control modules; the hybrid powertrain control module, 14 volt power module and the drive motor control module. These three control modules are non serviceable and are part of the generator control module.

The 14V power module has a voltage sensor that constantly monitors system output voltage. This diagnostic is intended to check the output voltage sensor's signal voltage, not the 12V system voltage. This sensor is internal to the 14V power module and is not serviced separately from the generator control module.

Conditions for Running the DTC

- The ignition is ON.
- 14V Power Module Status parameter is Normal.
- Ignition voltage is between 9-16V.

Conditions for Setting the DTC

P0A8D

14V Power Module output voltage sensor value is less than 1 volt for greater than 2 seconds.

P0A8E

14V Power Module output voltage sensor value is greater than 20 volts for greater than 2 seconds.

Action Taken When the DTC Sets

DTCs P0A8D and P0A8E are Type B DTCs.

P0A8E

The charging system light will illuminate, and Service Battery Charging System will display on the Driver Information Center.

Conditions for Clearing the DTC

DTCs P0A8D and P0A8E are Type B DTCs.

P0A8D

14V Power Module output voltage sensor value is greater than 1.5 volts.

P0A8E

14V Power Module output voltage sensor value is less than 19.5 volts.

Diagnostic Aids

This DTC may set due to an open 175 amp fuse in the X50A fuse block-underhood.

Circuit/System Verification

P0A8E

If the DTC is set, replace the K59 starter generator control module.

P0A8D

1. Ignition OFF, measure and record the battery voltage at the C1 12V battery terminals. The battery voltage should stabilize between 12.4 and 12.8 V within a few minutes of turning the ignition OFF.
 - If not within the specified range, refer to **Battery Inspection/Test** for Hybrid (HP6).
2. Ignition ON, observe the scan tool Ignition 1 Signal parameter in the 14V Power Module data list. The parameter should be within 4.5 volts of the Low Voltage Circuit Voltage measured at the C1 12V battery.
 - If the voltage is not within the specified range, check the ignition circuit to the K59 starter generator control module for high resistance.
3. Remove the B+ terminal at the K59 starter generator control module.
4. Connect a test lamp between C1 12-volt positive battery post and the K59 starter generator control module terminal at the module.
5. Ignition ON, observe the scan tool parameter Low-Voltage Circuit Voltage in the 14V Power Module data list. The parameter should be within 0.5 volt of the actual 12-volt battery voltage.
 - If the voltage is not within the specified range, replace the K59 starter generator control module.
6. Ignition OFF, remove the positive connection at the C1 12-volt battery.
7. Measure the resistance of the 14 V Power Module positive harness between the X10 connector at the K59 starter generator control module and the X50A Fuse block-Underhood connection.
 - If the resistance is greater than 1.0 ohms, repair the open/high resistance condition in the 12-volt

circuit.

- If the resistance is less than 1.0 ohms, Test the 175 amp fuse in the X50A fuse block-underhood. If the fuse tests good, replace the K59 starter generator control module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for Generator Control Module, also called Starter Generator Control Module, replacement, programming and setup.

DTC P0A8F: 14V POWER MODULE SYSTEM VOLTAGE PERFORMANCE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0A8F

14V Power Module System Voltage Performance

Circuit/System Description

The generator control module also called the starter generator control module is comprised of the following three control modules; the hybrid powertrain control module, 14 volt power module and the drive motor control module. These three control modules are non serviceable and are part of the generator control module.

The 14V power module has a voltage sensor that constantly monitors system output voltage. This diagnostic is designed to test the performance of the voltage sensor. This sensor is internal to the 14V power module and is not serviced separately from the generator control module.

Conditions for Running the DTC

- The ignition is ON.
- 14V Power Module Status parameter is Normal.
- Ignition voltage is between 9-16V.

Conditions for Setting the DTC

P0A8F

The difference between the Low Voltage Circuit Voltage and the ignition voltage value is greater than 4.5 volts for greater than 4 seconds.

Action Taken When the DTC Sets

- The charging system light will illuminate, and Service Battery Charging System will display on the Driver Information Center.
- DTC P0A8F is a Type B DTC.

Conditions for Clearing the DTC

DTC P0A8F is a Type B DTC.

Diagnostic Aids

- This DTC may set due to low 12 V system voltage.
- This DTC may set due to voltage stress to the underhood 175A fuse and junction block.

Circuit/System Verification

1. Ignition OFF, measure and record the battery voltage at the C1 12V battery terminals. The battery voltage should stabilize between 12.4 and 12.8 V within a few minutes of turning the ignition OFF.
 - If not within the specified range, refer to **Battery Inspection/Test** for Hybrid (HP6).
2. Ignition ON, observe the scan tool Ignition 1 Signal parameter in the 14V Power Module data list. The parameter should be within 4.5 volts of the Low Voltage Circuit Voltage measured at the C1 12V battery.
 - If the voltage is not within the specified range, check the ignition circuit to the K59 starter generator control module for high resistance.

Circuit/System Testing

1. Remove the generator control module cable cover. Refer to **Generator Control Module Cable Cover Replacement**.
2. Remove the X10 B+ cable at the K59 starter generator control module, and tape the cable ring terminal.

3. Connect a 3A fused jumper wire between C1 12-volt positive battery post and the K59 starter generator control module X10 B+ terminal.
4. Connect C1 12V battery negative terminal.
5. Ignition ON, observe the scan tool parameter Low-Voltage Circuit Voltage in the 14V Power Module data list. The parameter should be within 0.5 volt of the actual 12-volt battery voltage.
 - If the voltage is not within the specified range, replace the K59 starter generator control module.
6. Ignition OFF, remove the 3A fused jumper wire at the C1 12-volt battery.
7. Disconnect the C1 12V battery positive terminal and measure the resistance of the 14 V Power Module positive harness between the X10 connector at the K59 starter generator control module and the C1 12V battery positive terminal.
 - If the resistance is greater than 1.0 ohms, repair the high resistance condition in the 12-volt circuit.
 - If the resistance is less than 1.0 ohms, replace the K59 starter generator control module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for Generator Control Module, also called the Starter Generator Control Module, replacement, programming and setup.

DTC P0A90: DRIVE MOTOR PERFORMANCE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0A90

Drive Motor Performance

Circuit/System Description

The generator control module also called the starter generator control module is comprised of the following three control modules; the hybrid powertrain control module, 14 volt power module and the drive motor control module. These three control modules are non serviceable and are part of the generator control module.

The eAssist hybrid system has a starter generator also called a drive motor. The starter generator is mounted to the front of the engine and is mechanically connected to the crankshaft pulley by a serpentine belt.

The hybrid powertrain control module receives an engine RPM signal over serial data and compares that value to the starter generator rpm received from the drive motor control module. The hybrid powertrain control

module uses a ratio of these two speeds to determine if the drive belt is missing or slipping.

Conditions for Running the DTC

- Engine is running.
- The system voltage is at least 9.5 V.
- DTCs P0A3F, P0A40, P0B03, P0B0D, P0335, P0336, P0C19 or P1E0A are not set.

Conditions for Setting the DTC

The hybrid powertrain control module detects a speed difference between the engine and the starter generator of greater than 1000 rpm.

OR

The hybrid powertrain control module detects a speed difference between the engine and the starter generator of greater than 500 rpm multiple times on two consecutive ignition cycles with a Engine Off time of 30 minutes between key cycles.

Action Taken When the DTC Sets

DTC P0A90 is a Type A DTC.

Conditions for Clearing the DTC

- DTC P0A90 is a Type A DTC.
- The hybrid powertrain control module detects a speed difference between the engine and the starter generator of less than 500 rpm.

Diagnostic Aids

- The ratio between the crankshaft and the drive motor speeds is 2.3 to 1. When using a scan tool to determine belt slip the engine (crankshaft) RPM value must be multiplied by 2.3 to approximate the starter generator speed.
- Inspect the drive belt for cracks and oil contamination.
- Test drive the vehicle through the different modes of operation, performing Autostop and Autostart cycles. Accelerate up to 50 mph and brake moderately, and listen for any audible belt squeal. If drive belt noise is noticed check the drive belt tensioner assembly for proper operation and installation.

Reference Information

Description and Operation

- **Starter Generator Description and Operation**

Circuit/System Testing

1. If drive belt noise was noticed on an AutoStart, refer to **Drive Belt Tensioner Diagnosis** .
2. Inspect the drive belt for cracks, wear and contamination.
 - o If the belt is not OK, replace the drive belt.
3. If the DTC resets, replace the A15 starter generator.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Starter Generator Replacement**
- **Drive Belt Replacement (LEA)** , **Drive Belt Replacement (LUK)**
- **Drive Belt Tensioner Replacement (LUK)** , **Drive Belt Tensioner Replacement (LEA)**

DTC P0AB9: HYBRID/EV SYSTEM PERFORMANCE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0AB9

Hybrid/EV System Performance

Circuit/System Description

The generator control module also called the starter generator control module is comprised of the following three control modules; the hybrid powertrain control module, 14 volt power module and the drive motor control module. These three control modules are non serviceable and are part of the generator control module.

The eAssist hybrid system has the ability to crank and start the engine using two different methods. The first method is a conventional 12 volt system. On every initial start up the conventional 12 volt starter and 12 volt battery are used to crank and start the engine.

The second starting method uses both the 115 Volt generator control and battery assembly, also called the hybrid EV battery pack, and the starter generator, also called the drive motor. The drive motor is a 3 phase AC induction machine. This device not only serves as a 115-volt AC generator, it is also used to provide engine

power assist and to start the engine when in auto-stop mode. If the system is in the auto-stop mode and fails to restart with the drive motor, the 12 volt conventional starter will automatically be engaged to start the engine.

The drive motor can quickly rotate the engine to operating speed (800 RPM). The hybrid powertrain control module can detect a condition where the engine is stalling and command the drive motor to rotate the engine to prevent a stall.

Conditions for Running the DTC

Engine Running.

Conditions for Setting the DTC

The hybrid powertrain control module detects that engine speed has fallen below a specific minimum speed indicating the engine has stalled.

Action Taken When the DTC Sets

DTC P0AB9 is a Type C DTC.

Conditions for Clearing the DTC

- DTC P0AB9 is a Type C DTC.
- Engine restarts with key cycle.

Diagnostic Aids

Any condition that causes the engine to stall and/or not start may set this DTC. Possible conditions include:

- Fuel conditions such as low level, low pressure, or contamination.
- Engine conditions such as low compression.
- Restricted exhaust or air intake systems.

Always inspect for DTCs that would cause an engine stall and/or no start condition.

This DTC may set if the vehicle is powered off while driving.

Circuit/System Verification

1. Verify that no other DTCs are set.
 - If other DTCs are set, diagnose them first. Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .
2. Start the engine. The engine should start and run.
 - If the engine fails to start, or stalls, diagnose the engine system. Refer to **Engine Cranks But Does Not Run** .
3. If the DTC is set, and the engine is running smoothly, program the K59 starter generator control module.
 - If the DTC resets, replace the K59 starter generator control module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for Generator Control Module, also called Starter Generator Control Module, replacement, programming and setup.

DTC P0AEE, P0AEF, OR P0AF0: DRIVE MOTOR INVERTER TEMPERATURE SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0AEE

Drive Motor Inverter Temperature Sensor Performance

DTC P0AEF

Drive Motor Inverter Temperature Sensor Circuit Low Voltage

DTC P0AF0

Drive Motor Inverter Temperature Sensor Circuit High Voltage

Circuit/System Description

The generator control module also called the starter generator control module is comprised of the following three control modules; the hybrid powertrain control module, 14 volt power module and the drive motor control

module. These three control modules are non serviceable and are part of the generator control module.

This is an internal fault detection of the generator control module. This fault is handled inside the generator control module and no external circuits are involved.

Conditions for Running the DTC

- DTCs P1A90, P1A91, P1A92, P1A71, P1A72, P1A73, P0A2B, P0A2C, P0A2D, P0A2F, P0AEE, P0AEF, P0AF0, P0C11 and P262B are not set.
- Ignition voltage is between 9-16V.
- The drive motor control module and the hybrid powertrain control module are awake.

P0AEE

The engine OFF time is greater than 8 hours.

Conditions for Setting the DTC

P0AEE

The temperature average of the drive motor temperature sensor and 14V power module temperature sensors 1 and 2 are 20°C (36°F) different from the Phase U DC/AC Inverter Temperature value.

P0AEF

The inverter phase temperature sensor 1 is greater than 150°C (302°F) for 3 seconds.

P0AF0

The inverter phase temperature sensor 1 is less than -70°C (-94°F) for 3 seconds.

Action Taken When the DTC Sets

- DTCs P0AEE, P0AEF, and P0AF0 are Type B DTCs.
- The power inverter module limits the maximum torque of the starter generator to 10.8 N.m (95.6 lb in).
- Autostop will be disabled.

Conditions for Clearing the DTC

DTCs P0AEE, P0AEF, and P0AF0 are Type B DTCs.

Component Ground	-	***	-
* Auxiliary Transmission Fluid Pump - always On ** Will open the fuse *** Auxiliary Transmission Fluid Pump - inoperative			

Circuit/System Description

The generator control module also called the starter generator control module is comprised of the following three control modules; the hybrid powertrain control module, 14 volt power module and the drive motor control module. These three control modules are non serviceable and are part of the generator control module.

The transmission fluid pump - auxiliary is used to maintain transmission fluid line pressure to the transmission during Autostop mode. The transmission fluid pump - auxiliary is externally mounted to the transmission case assembly. The hybrid powertrain control module controls the auxiliary pump by providing the ground path to the transmission pump relay - auxiliary coil control circuit.

Conditions for Running the DTC

Ignition voltage is greater than 9 V.

Conditions for Setting the DTC

The generator control module detects an invalid voltage on the auxiliary transmission fluid pump relay control circuit for greater than 1 second.

Action Taken When the DTC Sets

- DTC P0B09 is a type B DTC.
- Autostop is disabled.

Conditions for Clearing the DTC

DTC P0B09 is a type B DTC.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the auxiliary transmission fluid pump relay turns on and off/clicks when commanding the auxiliary transmission fluid pump relay ON and OFF with a scan tool.
 - **If the relay does not click**

Refer to Circuit/System Testing.

- **If the relay clicks**

All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the KR86 Transmission Fluid Pump Relay - Auxiliary, Ignition ON.
2. Verify a test lamp illuminates between the ignition circuit terminal 86 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ignition circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the ignition circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, test or replace the KR86 Transmission Fluid Pump Relay - Auxiliary.
- **If the test lamp illuminates**
- 3. Connect a test lamp between the ignition circuit terminal 86 and the control circuit terminal 85.
- 4. Verify the test lamp turns ON and OFF when commanding the Auxiliary Transmission Pump Relay ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 - 1. Ignition OFF, disconnect the X2 harness connector at the K59 starter generator control module, ignition ON.
 - 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 - 3. Ignition OFF.
 - 4. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K59 starter generator control module.
 - **If the test lamp is always ON**
 - 1. Ignition OFF, disconnect the harness connector at the K59 starter generator control module.
 - 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K59 starter generator control module.
 - **If the test lamp turns ON and OFF**
- 5. Replace the K59 starter generator control module.

Component Testing

1. Ignition OFF, disconnect the KR86 Transmission Fluid Pump Relay - Auxiliary.
2. Test for 85-130 ohms between terminals 85 and 86.
 - **If less than 85 ohms or greater than 130 ohms**
 - Replace the relay.
 - **If between 85-130 ohms**
3. Test for infinite resistance between the terminals listed below:
 - 30 and 86
 - 30 and 87
 - 30 and 85
 - 85 and 87
 - **If less than infinite resistance**

Replace the relay.

- **If infinite resistance**

4. Install a 3 A fused jumper wire between relay terminal 85 and 12 volts. Install a jumper wire between relay terminal 86 and ground.
5. Test for less than 2 ohms between terminals 30 and 87.

- **If 2 ohms or greater**

Replace the relay.

- **If less than 2 ohms**

6. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Relay Replacement (Within an Electrical Center)** , **Relay Replacement (Attached to Wire Harness)** for Transmission Fluid Pump Relay - Auxiliary replacement, Within an Electrical Center
- **Control Module References** for Generator Control Module, also called the Starter Generator Control Module, replacement, programming and setup.

Circuit/System Description

The generator control module also called the starter generator control module is comprised of the following three control modules; the hybrid powertrain control module, 14 volt power module and the drive motor control module. These three control modules are non serviceable and are part of the generator control module.

This is an internal fault detection of the generator control module. This fault is handled inside the generator control module and no external circuits are involved.

Conditions for Running the DTC

The control module runs the program to detect an internal fault when the drive motor control module is awake and the engine is off.

Conditions for Setting the DTC

- The control module has detected an internal malfunction.
- The motor phase U current is greater than 440 amps or less than -440 amps.
- The motor phase W current is greater than 440 amps or less than -440 amps.

Action Taken When the DTC Sets

- DTCs P0BE6, P0BE7, P0BE8, P0BEE, P0BEF, and P0BF0 are Type B DTCs.
- The generator control module operates in a reduced power mode.
- Regenerative braking torque is reduced.
- Autostop and electric power assist are disabled.

Conditions for Clearing the DTC

DTCs P0BE6, P0BE7, P0BE8, P0BEE, P0BEF, and P0BF0 are Type B DTCs.

- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0BFD

Drive Motor Phase U-V-W Not Plausible

Circuit/System Description

The generator control module also called the starter generator control module is comprised of the following three control modules; the hybrid powertrain control module, 14 volt power module and the drive motor control module. These three control modules are non serviceable and are part of the generator control module.

The drive motor control module operates the starter generator, also referred to as the drive motor, based upon hybrid powertrain control module commands. The drive motor control module controls the speed and output torque of the starter generator through the sequencing actuation of high current switching transistors called insulated gate bipolar transistors. The starter generator operates utilizing 3-phase alternating current (AC) electricity. Each insulated gate bipolar transistors operates a single phase of the starter generator. Each phase is

individually identified as U, V and W. The drive motor control module monitors the current of phase U and W. The drive motor control module uses logic to calculate phase V current values. This information is used in order to detect over current conditions.

Because all starter generator phase circuits are electrically joined together, they should each flow about the same amount of current. The drive motor control module performs a mathematical calculation to verify that the phase current sensors are accurate. If the current sensors indicate about the same amount of phase current, the sum of the calculation should be near zero. If the currents are not similar, this DTC will set.

Conditions for Running the DTC

- The ignition is ON.
- The high voltage contactor relay is closed.
- DTCs P0BE6, POBE7, POBE8, P0BEE, POBEF, or P0BF0 are not set.

Conditions for Setting the DTC

The sum of the 3 phase current calculations is greater than 40 A.

Action Taken When the DTC Sets

- DTC P0BFD is a Type B DTC.
- The generator control module operates in a reduced power mode.
- Regeneration is limited.
- Autostop and electric assist is disabled.

Conditions for Clearing the DTC

DTC P0BFD is a Type B DTC.

Diagnostic Aids

The 14V power module remains active.

Circuit/System Verification

If the DTC is set, clear DTC; Turn the ignition OFF for 2 minutes. Turn the ignition ON, Operate vehicle within conditions for running and setting DTC. If the DTC resets, go to Circuit/System Testing.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Perform the **High Voltage Disabling** procedure.
2. Remove the 3-phase cables from the K59 generator control module.
3. Test for infinite resistance between each of the 3-phase circuit terminals listed below and ground:
 - X8 phase U terminal
 - X7 phase V terminal
 - X6 phase W terminal
 - If not the specified value, disconnect the 3-phase cables from the A15 starter generator, and test the AC circuits for a short to ground. If the circuit tests normal, replace the A15 starter generator.
 - Replace the K59 starter generator control module. If the DTC resets replace the A15 starter

generator.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Starter Generator Replacement**
- **Drive Motor Generator Battery Cable Replacement** for 3-Phase Cable Assembly replacement
- **Control Module References** for Generator Control Module, also called the Starter Generator Control Module, replacement, programming and setup.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Perform the **High Voltage Disabling** procedure.
2. Remove the 3-phase cable assembly from the K59 starter generator control module.
3. Test for less than 0.5 ohms at each phase by measuring between the following circuits at the cable with a DMM:
 - Phase U and phase V
 - Phase U and phase W
 - Phase V and phase W
 - **If within the specified value**
4. Inspect the 3-phase drive motor generator battery cable terminal fasteners at the K59 starter generator

control module.

- **If any fasteners were loose and no arc-flash damage is present**

Torque the fasteners and re-assemble the vehicle. Retest for the DTC.

- **If any fasteners were loose and arc-flash damage is present**

Replace the K59 starter generator control module assembly and the 3-phase drive motor generator battery cable assembly.

- **If not within the specified value**

5. Disconnect the 3-phase drive motor generator battery cable assembly from the A15 starter generator. Test each cable for continuity from the starter generator connection terminal to the K59 starter generator control module connection terminal.

- **If you measure greater than 0.5 ohms**

Replace the 3-phase drive motor generator battery cable assembly.

6. Replace the A15 starter generator and retest for the DTC. If the DTC resets, replace the K59 starter generator control module.

DTC Descriptor

DTC P0C11

Drive Motor Inverter Phase U High Temperature

Circuit/System Description

The generator control module also called the starter generator control module is comprised of the following three control modules; the hybrid powertrain control module, 14 volt power module and the drive motor control module. These three control modules are non serviceable and are part of the generator control module.

The drive motor control module operates the starter generator, also referred to as the drive motor, based upon hybrid powertrain control module commands. The drive motor control module controls the speed and output torque of the drive motor through the sequencing actuation of high current switching transistors called insulated gate bipolar transistors. The drive motor operates utilizing 3 phase AC. Each insulated gate bipolar transistor operates a single phase of the drive motor. Each phase is individually identified as U, V and W. The drive motor control module monitors the temperature of the switching transistors in order to detect inverter module overtemperature conditions. The generator control module is air cooled.

Conditions for Running the DTC

- The drive motor control module and hybrid powertrain control module are awake.
- DTC P0AEE, P0AF0, and P0AEF are not set.

Conditions for Setting the DTC

The Phase U DC/AC Inverter Temperature 1 is greater than 118°C (245°F) for 5 seconds.

Action Taken When the DTC Sets

- DTC P0C11 is a Type B DTC.
- The hybrid powertrain control module system starts to reduce the maximum torque beginning at 110°C (230°F) linearly down to 0 N.m(0 lb in) as the drive motor stator temperature approaches 120°C (248°F).

Conditions for Clearing the DTC

DTC P0C11 is a Type B DTC.

DTC Descriptor

DTC P0C19

Drive Motor Torque Delivered Performance

Circuit/System Description

The generator control module also called the starter generator control module is comprised of the following three control modules; the hybrid powertrain control module, 14 volt power module and the drive motor control module. These three control modules are non serviceable and are part of the generator control module.

The starter generator also called the drive motor is controlled by the drive motor control module. The drive motor control module constantly monitors the requested torque and the delivered torque of the drive motor.

Conditions for Running the DTC

- DTCs P0BFD, P0BE6, P0BE7, P0BE8, P0BEE, P0BEF, P0BF0, P1AE8, P1AE9, P1AEC, P1B0D, P0C52, P0C53, P0C5C, P0C5D, P0A3F, P1B03 and P0A40 are not set
- Drive motor is commanded to develop torque.

Conditions for Setting the DTC

The drive motor control module has detected that the difference between drive motor torque commanded and delivered is greater than 36 N.m (27 lb ft).

Action Taken When the DTC Sets

- DTC P0C19 is a Type B DTC.
- Commanded motor torque is limited to below 36 N.m (27 lb ft).

Conditions for Clearing the DTC

DTC P0C19 is a Type B DTC.

Diagnostic Aids

- Seized or binding engine
- Seized or binding accessory drive belt
- Seized or binding starter generator

Circuit/System Verification

1. Start the engine. DTC P0C19 should not be set.
2. Verify DTC P0A90 is not set.
 - If the DTC is set, refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .
3. Verify the engine or AC compressor is not seized or binding.
 - If the engine is seized or binding, refer to **Symptoms - Engine Mechanical** .
 - If the AC Compressor is seized or binding, refer to **Noise Diagnosis - Air Conditioning (A/C) System** .
4. Verify the A15 starter generator is not seized or binding.
5. If DTC P0C19 is set, replace the A15 starter generator.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Starter Generator Replacement for starter generator replacement.

DTC P0C76: HYBRID/EV BATTERY SYSTEM HIGH VOLTAGE PRESENT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.

- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0C76

Hybrid/EV Battery System High Voltage Present

Circuit/System Description

The generator control module also called the starter generator control module is comprised of the following three control modules; the hybrid powertrain control module, 14 volt power module and the drive motor control module. These three control modules are non serviceable and are part of the generator control module.

The generator control and battery module assembly contains a high voltage contactor. The high voltage contactor allows the high voltage DC batteries to be connected to the vehicle and safely contain the high voltage DC within the generator control and battery module assembly. The high voltage contactor is connected in series with the positive side of the DC voltage potential of the high voltage battery. The hybrid powertrain control module supplies ground to the control circuit of the high voltage contactor to close.

Conditions for Running the DTC

High Voltage Contactor Relay is commanded open.

Conditions for Setting the DTC

The high voltage circuit is greater than 65 V for 6.5 seconds after the contactor has been commanded open.

Action Taken When the DTC Sets

- DTC P0C76 is a Type A DTC.
- A clear DTC command will not clear this DTC or the Action Taken.

Conditions for Clearing the DTC

DTC P0C76 is a Type A DTC.

Diagnostic Aids

- A clear DTC command will not clear this DTC or the Action Taken.
- The DTC may set due to a low 12V battery condition.

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Circuit/System Verification

1. Connect charger to 12V Battery.
2. Ignition ON, perform the hybrid powertrain control module scan tool Clear DTC output control. Cycle the ignition twice.
3. Refer to **Hybrid\EV Battery Voltage Present** . If the contactors test normal, replace the K59 starter generator control module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for Generator Control Module, also called Starter Generator Control Module, replacement, programming and setup.

DTC P0C9E OR P0C9F: POWER MODULE OUTPUT CURRENT SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0C9E

14V Power Module Output Current Sensor Circuit Low Current

DTC P0C9F

14V Power Module Output Current Sensor Circuit High Current

Circuit/System Description

The generator control module also called the starter generator control module is comprised of the following

three control modules; the hybrid powertrain control module, 14 volt power module and the drive motor control module. These three control modules are non serviceable and are part of the generator control module.

The 14V power module has 2 current sensors, one for input and one for output current measurements. This diagnostic checks the output current sensor. These current sensors are internal to the 14V power module and are not serviced separately from the generator control module.

Conditions for Running the DTC

- Ignition is ON.
- 14V Power Module Status parameter is Normal.
- Ignition voltage is between 9-16V.

Conditions for Setting the DTC

P0C9E

Low Voltage Circuit Current is less than 2 amps for greater than 2 seconds.

P0C9F

Low Voltage Circuit Current is greater than 123 amps for greater than 2 seconds.

Action Taken When the DTC Sets

DTCs P0C9E and P0C9F are Type B DTCs.

P0C9F

- The 14V power module stops supplying power to the 12V system.
- The charge indicator will illuminate.

Conditions for Clearing the DTC

DTCs P0C9E and P0C9F are Type B DTCs.

- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0CA2

14V Power Module Step Down Voltage Performance

Circuit/System Description

The generator control module also called the starter generator control module is comprised of the following three control modules; the hybrid powertrain control module, 14 volt power module and the drive motor control module. These three control modules are non serviceable and are part of the generator control module.

The 14V power module has switching transistors that allows it to convert high voltage from the Hybrid Battery to 12 volts. This diagnostic is designed to test for an electrical short in the MOSFET transistors. The transistors are internal to the 14V power module and cannot be serviced separately from the generator control module.

Conditions for Running the DTC

The ignition is ON and the 14V Power Module is enabled.

Conditions for Setting the DTC

The 14 V Power Module has detected a transistor failure for 25 mS.

Action Taken When the DTC Sets

- The 14V power module stops supplying power to the 12V system.
- The charging system light will illuminate, and Service Battery Charging System will display on the Driver Information Center.
- DTC P0CA2 is a Type A DTC.

Conditions for Clearing the DTC

- DTC P0CA2 is a Type A DTC.
- 14 V Power Module detects no transistor failures for 5 seconds.

Circuit/System Verification

If the DTC is set, program the K59 Starter Generator Control Module. If the DTC resets, go to Circuit/System Testing.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.

- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Perform the **High Voltage Disabling** procedure.
2. Remove the 3-phase cables from the K59 starter generator control module.
3. Test for infinite resistance between the 3-Phase cable terminals listed below and ground for each phase of the drive motor generator battery cable:
 - X8 Phase U terminal
 - X7 Phase V terminal
 - X6 Phase W terminal
 - If less than infinite resistance, test each phase of the drive motor generator battery cable for a short to ground. If the cables test normal, replace the A15 starter generator.
4. Retest for the DTC. If the DTC resets, replace the K59 starter generator control module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for Generator Control Module, also called Starter Generator Control Module, replacement, programming and setup.

DTC P0CC5: 14V POWER MODULE INPUT-OUTPUT CURRENT SENSORS NOT PLAUSIBLE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0CC5

14V Power Module Input-Output Current Sensors Not Plausible

Circuit/System Description

The generator control module also called the starter generator control module is comprised of the following three control modules; the hybrid powertrain control module, 14 volt power module and the drive motor control module. These three control modules are non serviceable and are part of the generator control module.

The 14V power module has 2 internal current sensors, one for input and one for output current measurements. The 14 volt power module monitors both input and output current, and then makes a correlation between them. This diagnostic will check range performance malfunctions of one or both of the current sensors. These current sensors are internal to the 14V power module and are not serviced separately from the generator control module.

Conditions for Running the DTC

- Ignition is ON.
- Ignition voltage is between 9-16V.

Conditions for Setting the DTC

The difference between the calculated input power and calculated output power of the two current sensors is greater than 0.4 kW for greater than 4 seconds.

Action Taken When the DTC Sets

DTC P0CC5 is a Type B DTC.

Conditions for Clearing the DTC

DTC P0CC5 is a Type B DTC.

- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P15F0

Engine Torque Delivered Signal Message Counter Incorrect

Circuit/System Description

The generator control module also called the starter generator control module is comprised of the following three control modules; the hybrid powertrain control module, 14 volt power module and the drive motor control module. These three control modules are non serviceable and are part of the generator control module.

This diagnostic applies to internal microprocessor integrity conditions within the hybrid powertrain control module. This is an internal fault detection of the hybrid powertrain control module and no external circuits are involved.

Conditions for Running the DTC

- Ignition is ON.
- The system voltage is greater than 9.5 V.

Conditions for Setting the DTC

The control module has detected an internal malfunction.

Action Taken When the DTC Sets

- DTC P15F0 is a Type A DTC.
- The hybrid powertrain control module opens the high voltage contactor relay.

Conditions for Clearing the DTC

DTC P15F0 is a Type A DTC.

DTC Descriptor

DTC P16F3

Control Module Redundant Memory Performance

Circuit/System Description

The generator control module also called the starter generator control module is comprised of the following

three control modules; the hybrid powertrain control module, 14 volt power module and the drive motor control module. These three control modules are non serviceable and are part of the generator control module.

This is an internal fault detection of the hybrid powertrain control module and no external circuits are involved.

Conditions for Running the DTC

- The system voltage is greater than 9.5 V.
- Ignition is ON.

Conditions for Setting the DTC

The control module has detected that the redundant data does not match the primary data.

Action Taken When the DTC Sets

- DTC P16F3 is a Type A DTC.
- The hybrid powertrain control module opens the high voltage contactor relay.

Conditions for Clearing the DTC

DTC P16F3 is a Type A DTC.

DTC P1A56: HYBRID/EV SYSTEM VOLTAGE DISCHARGE CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P1A56

Hybrid/EV System Voltage Discharge Circuit

Circuit/System Description

The generator control module also called the starter generator control module is comprised of the following three control modules; the hybrid powertrain control module, 14 volt power module and the drive motor control module. These three control modules are non serviceable and are part of the generator control module.

The generator control module contains DC high voltage capacitors and a resistor circuit intended to discharge the electrical energy stored within those capacitors. Whenever the high voltage contactors are opened, the hybrid powertrain control module connects the internal resistor circuit across the capacitor circuit. The level of the high voltage is monitored by the hybrid powertrain control module before and after the resistor circuit has been connected. If the voltage level remains high for too long, the hybrid powertrain control module sets this DTC and then commands the motor control module to connect the drive motor generator 3 phase circuits across the DC high voltage positive and negative circuits thereby discharging the capacitors.

Conditions for Running the DTC

High Voltage Contactors are commanded Open.

Conditions for Setting the DTC

Within 300 milliseconds after commanding contactors open, the high voltage bus voltage fails to decrease by at least 18 V.

Or

Within 300 milliseconds after commanding contactors open, the high voltage bus voltage is greater than 60 V.

Or

The active bus discharge circuit status is disabled.

Action Taken When the DTC Sets

- DTC P1A56 is a Type B DTC.
- The drive motor control module is commanded to discharge the capacitor through the drive motor generator 3 phase stator circuits.

Conditions for Clearing the DTC

DTC P1A56 is a Type B DTC.

Diagnostic Aids

A high-pitched whine may emanate from the drive motor whenever the HV DC capacitance is discharged through the drive motor stator circuits.

DTC P1A6F: DRIVE MOTOR NO CRANK AT RESTART

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P1A6F

Drive Motor No Crank at Restart

Circuit/System Description

The generator control module also called the starter generator control module is comprised of the following three control modules; the hybrid powertrain control module, 14 volt power module and the drive motor control module. These three control modules are non serviceable and are part of the generator control module.

The eAssist hybrid system has the ability to crank and start the engine using two different methods. The first method is a conventional 12 volt system. On every initial start up the conventional 12 volt starter and 12 volt battery are used to crank and start the engine.

The second starting method uses the 115 Volt generator control and battery assembly also called the hybrid battery and the starter generator also called the drive motor. The drive motor is a 3 phase AC induction machine. This device not only serves as a 115-volt AC generator, it is also used to provide engine power assist and to start the engine when in auto-stop mode. If the system is in the auto-stop mode and fails to restart with the drive motor, the 12 volt conventional starter will automatically be engaged to start the engine.

Conditions for Running the DTC

Ignition is ON and the vehicle is in autostop.

Conditions for Setting the DTC

The hybrid powertrain control module detects that an autostart failed to take place successfully.

Action Taken When the DTC Sets

- DTC P1A6F is a Type B DTC.
- The 12 V starter will be engaged to start the engine and autostop will be disabled.

Conditions for Clearing the DTC

DTC P1A6F is a Type B DTC.

Diagnostic Aids

A slipping drive motor belt can cause belt noise on an AutoStart, inspect the drive belt tensioner assembly for proper operation and installation.

DTC Descriptor

DTC P1A71

14V Power Module Temperature Sensor 2 Performance

DTC P1A72

14V Power Module Temperature Sensor 2 Circuit Low Voltage

DTC P1A73

14V Power Module Temperature Sensor 2 Circuit High Voltage

Circuit/System Description

The generator control module also called the starter generator control module is comprised of the following three control modules; the hybrid powertrain control module, 14 volt power module and the drive motor control module. These three control modules are non serviceable and are part of the generator control module.

The 14V power module constantly monitors its temperature to protect against overheat conditions. The module also monitors the performance of the temperature sensors to assure they are working properly. These sensors are internal to the 14V power module and are not serviced separately from the generator control module.

Conditions for Running the DTC

- The Ignition is ON.
- Ignition voltage is between 9-16V.

P1A71

- DTCs P1A90, P1A91, P1A92, P1A71, P1A72, P1A73, P0A2B, P0A2C, P0A2D, P0A2F, P0AEE, P0AEF, P0AF0, P0C11, and P262B are not set.
- Ignition must be off for 8 hours or more.

Conditions for Setting the DTC

P1A71

14V Power Module Temperature Sensor 2 has a value of 20°C greater than the average value of 14V Power Module Temperature Sensor 1, Motor Generator Unit Temperature, and the Inverter Temperature for greater than 4 seconds.

P1A72

14V Power Module Temperature Sensor 2 is greater than 145°C (293°F) for greater than 4 seconds.

P1A73

14V Power Module Temperature Sensor 2 is less than -65°C (-85°F) for greater than 4 seconds.

Action Taken When the DTC Sets

- DTCs P1A71, P1A72, or P1A73 are Type B DTCs.
- The 14V power module stops supplying power to the 12V system.
- The charging system light will illuminate, and Service Battery Charging System will display on the Driver Information Center.

Conditions for Clearing the DTC

DTCs P1A71, P1A72, or P1A73 are Type B DTCs.

P1A72

14V Power Module Temperature Sensor 2 is less than 140°C (284°F).

P1A73

14V Power Module Temperature Sensor 2 is greater than -60°C (-76°F).

Diagnostic Aids

Verify 14V Power Module Temperature Sensor 2 reads between -59°C (-74°F) and +139°C (+282°F) and is within 20°C (36°F) of the average of 14V Power Module Temperature Sensor 1, Drive Motor Temperature, and 14V Power Module Temperature Sensor 2 after ignition has been off for 8 hours.

- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P1ADE

Drive Motor Control Module System Voltage Low Voltage

DTC P1ADF

Drive Motor Control Module System Voltage High Voltage

Circuit/System Description

The generator control module also called the starter generator control module is comprised of the following three control modules; the hybrid powertrain control module, 14 volt power module and the drive motor control module. These three control modules are non serviceable and are part of the generator control module.

The drive motor control module operates the starter generator based upon hybrid powertrain control module information.

The vehicle control modules or sensors monitor the system voltage to verify the system voltage is within the normal operating range.

Conditions for Running the DTC

The Ignition is ON.

Conditions for Setting the DTC

P1ADE

Drive motor control module ignition voltage is less than or equal to 10 V for 6 seconds.

P1ADF

Drive motor control module ignition voltage is greater than 18 Volts for 5 seconds.

Action Taken When the DTC Sets

DTCs P1ADE and P1ADF are Type C DTCs.

P1ADE

The hybrid powertrain control module opens the high voltage contactor relay.

Conditions for Clearing the DTC

DTCs P1ADE and P1ADF are Type C DTCs.

Diagnostic Aids

- A high or low voltage DTC set

Or

Voltage value in multiple modules/sensors indicates a concern in the charging system.

- A battery charger or vehicle jump start may have set DTC P1ADF.

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Circuit/System Verification

1. Ignition OFF, measure and record the battery voltage at the C1 12V battery terminals. The battery voltage should stabilize between 12.4 and 12.8 V within a few minutes of turning the ignition OFF.
 - If not within the specified range, refer to **Battery Inspection/Test** for Hybrid (HP6).
2. Engine running, accessories OFF, measure and record the battery voltage at the C1 12V battery terminals. The voltage should be at least 1 V greater than the voltage measured in step 1 but less than 15 V.
 - If not within the specified range, refer to **Charging System Test** for Hybrid (HP6).
3. Observe the drive motor control module ignition 1 signal voltage parameter with a scan tool. The voltage readings should be within 1 V of the 12V battery voltage.

Circuit/System Testing

NOTE: Use the schematic to identify the following:

- Control modules the vehicle is equipped with
- The control modules ground, B+, and ignition circuit terminal IDs and connectors

1. Ignition OFF, disconnect the harness connectors at the K59 starter generator control module.

NOTE: Some control module ground circuits may require up to 20 minutes to achieve a resistance reading of less than 10 ohms. In most cases the readings will drop below 20 ohms within 1 minute indicating the control modules are going to sleep.

2. Ignition OFF, scan tool disconnected, open and close the driver door and wait 1 minute. Test for less than 10 ohms between each ground circuit terminal at the K59 starter generator control module harness and ground.
 - If greater than the specified range, test the ground circuit for an open/high resistance.
3. Test for 10-18V between each B+ circuit terminal at the K59 starter generator control module harness and ground.
 - If less than the specified range, test the B+ circuit for a short to ground or an open/high resistance.

NOTE: If less than the specified range, test the B+ circuit for a short to ground or an open/high resistance.

4. Ignition ON, test for 10-18 V between each ignition circuit terminal and ground.
 - If less than the specified range, test the ignition circuit for a short to ground or an open/high resistance.
5. If all circuits test normal, replace the K59 starter generator control module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for Generator Control Module, also called the Starter Generator Control Module, replacement, programming and setup.

DTC P1AE8 OR P1AE9: DRIVE MOTOR CONTROL MODULE HYBRID/EV BATTERY VOLTAGE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P1AE8

Drive Motor Control Module Hybrid/EV Battery Voltage Sense Circuit Low Voltage

DTC P1AE9

Drive Motor Control Module Hybrid/EV Battery Voltage Sense Circuit High Voltage

Circuit/System Description

The generator control module also called the starter generator control module is comprised of the following three control modules; the hybrid powertrain control module, 14 volt power module and the drive motor control module. These three control modules are non serviceable and are part of the generator control module.

The drive motor control module operates the starter generator based upon generator control module commands. The hybrid powertrain control module is able to detect out of range low or out of range high conditions on the high voltage sensor circuit.

Conditions for Running the DTC

- The Ignition is ON.
- The high voltage contactor relay is closed.

Conditions for Setting the DTC

P1AE8

With the hybrid/EV battery system contactor closed, the starter generator control module detects high voltage sensor voltage less than 30V.

P1AE9

The drive motor control module detects high voltage sensor voltage greater than 190V.

Action Taken When the DTC Sets

- DTCs P1AE8 and P1AE9 are Type B DTCs.
- The hybrid powertrain control module opens the high voltage contactor relay.
- The battery indicator light will illuminate.

Conditions for Clearing the DTC

DTCs P1AE8 and P1AE9 are Type B DTCs.

DTC P1AEC OR P1AEE: DRIVE MOTOR CONTROL MODULE HYBRID/EV BATTERY SYSTEM VOLTAGE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P1AEC

Drive Motor Control Module Hybrid/EV Battery System Voltage

DTC P1AEE

Drive Motor Control Module Hybrid/EV Battery System Voltage High Voltage

Circuit/System Description

The generator control module also called the starter generator control module is comprised of the following three control modules; the hybrid powertrain control module, 14 volt power module and the drive motor control module. These three control modules are non serviceable and are part of the generator control module.

The drive motor control module operates the starter generator based upon generator control module commands. The hybrid powertrain control module monitors the high voltage measurement and then will broadcast the high voltage measurement over serial data.

P1AEC

The drive motor control module compares the values in order to verify the hybrid battery high voltage measurement is accurate.

P1AEE

The hybrid powertrain control module monitors for high voltage that is greater than the system allows during normal operation.

Conditions for Running the DTC

P1AEC

DTC P1AE8 or P1AE9 is not set,

AND

High voltage is available and valid,

AND

Ignition is On,

AND

The high voltage contactor relays are closed.

P1AEE

Ignition voltage is greater than 7V.

Conditions for Setting the DTC

P1AEC

The difference between high voltage sensed and high voltage battery voltage measured is greater than 15V,

AND

The difference between high voltage sensed and the sum of the mid-pack voltages is greater than 10V.

P1AEE

The high voltage sensor voltage is greater than 150V,

OR

Hardware Overvoltage is detected.

Action Taken When the DTC Sets

- DTCs P1AEC and P1AEE are Type B DTCs.
- The hybrid powertrain control module opens the high voltage contactor relay.

Conditions for Clearing the DTC

DTCs P1AEC and P1AEE are Type B DTCs.

Diagnostic Aids

Conditions such as loss of battery energy control module power or ground or removal of the high voltage manual disconnect while the vehicle was driving could create a voltage surge that may set DTC P1AEE. History DTC P1AEE may indicate that the high voltage contactor relays opened while large current flow was present.

1. Verify that DTCs P0ABB, P0ABC, or P0ABD is not set.
 - If any of the DTCs are set, refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .
2. If the DTC is set, program the K59 starter generator control module. If the DTC resets, replace the K59 starter generator control module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for Generator Control Module, also called the Starter Generator Control Module, replacement, programming and setup.

DTC P1AF0: DRIVE MOTOR CONTROL MODULE HYBRID/EV BATTERY VOLTAGE SYSTEM ISOLATION LOST

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P1AF0

Drive Motor Control Module Hybrid/EV Battery Voltage System Isolation Lost

Circuit/System Description

The vehicle is equipped with a high voltage isolation monitor feature. The purpose of the isolation monitor is to test the resistance between the high voltage positive and negative direct current (DC) bus and chassis ground. The isolation monitoring system measures the resistance between the high voltage system and chassis ground in the following way: The isolation monitoring system measures voltage potential difference between the positive battery mid pack voltage and chassis ground as well as the voltage difference between negative battery mid

pack voltage and chassis ground. These voltage values are used by the Starter/Generator Control Module to calculate a resistance value between the high voltage bus and the chassis ground. If this resistance value is too low, a high voltage isolation fault has occurred.

Conditions for Running the DTC

- Internal battery voltage sensor value is greater than 100 V
- None of the following DTCs are set: P0AA8, P0AAA, P1AE8, P1AE9, P1AEC, P1E0D, P1E10, P1E11, P1E13, P1E14

Conditions for Setting the DTC

The calculated resistance between the high voltage DC systems and vehicle chassis ground less than 225.6K ohms

Action Taken When the DTC Sets

- DTC P1AF0 is a type B DTC.
- If the DTC sets while there is a loss of communication with the sensing and diagnostic module (SDM), the Starter/Generator Control Module will record the fault as a crash event and the DTC will become latched.

Conditions for Clearing the DTC

- DTC P1AF0 is a type B DTC.
- If the DTC is set as a latched DTC, the crash event must be cleared before the DTC will clear.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

WARNING: The eAssist battery pack assembly will utilize an exchange program. Please consult the most recent revision of bulletin/PI# PIC5520, available in Service Information (SI), for a list of approved eAssist battery pack assembly service procedures. Components that may be removed and serviced without exchanging the complete battery pack assembly are identified in the bulletin/PI. Please contact the GM Technical Assistance Center (1-877-446-8227) if you have any questions.

NOTE: In High Voltage Disabling , perform the disabling procedure for servicing components within the A4 Hybrid/EV Battery Pack. The C4A Hybrid/EV Battery Section 1 and C4B Hybrid/EV Battery Section 2 will be disconnected as part of the disabling procedure.

1. Ignition OFF, disable high voltage at the A4 Hybrid/EV Battery Pack. Refer to High Voltage Disabling .
2. Disconnect the U, V, and W three phase lugs at the K59 Starter/Generator Control Module.

NOTE: The following continuity tests must be performed using the EL-50772 insulation multimeter. Select the Isolation test setting, then select the 500 V range.

3. Test for greater than 400K ohms between the terminals listed below and chassis ground with the **EL-50772** insulation multimeter set on the Isolation test setting:
 - 3 phase cable terminal U - cable side lug
 - 3 phase cable terminal V - cable side lug
 - 3 phase cable terminal W - cable side lug
 - **If 400K ohms or less**
 1. Disconnect the U, V, and W three phase lugs at the A15 Starter/Generator.
 2. Test for greater than 400K ohms between the U, V, and W three phase studs at the A15 Starter/Generator and chassis ground with the **EL-50772** insulation multimeter set on the Isolation test setting.
 - If 400K ohms or less, replace the A15 Starter/Generator.
 - If greater than 400K ohms
 3. Replace the high voltage 3 phase cables.
 - **If greater than 400K ohms**

NOTE: The following continuity tests must be performed using the EL-50772 insulation multimeter. Select the Isolation test setting, then select the 500 V range.

4. Test for greater than 400K ohms between the terminals listed below and chassis ground with the **EL-50772** insulation multimeter set on the Isolation test setting:
 - 3 phase terminal U - K59 Starter/Generator Control Module stud
 - 3 phase terminal V - K59 Starter/Generator Control Module stud

- 3 phase terminal W - K59 Starter/Generator Control Module stud
 - **If 400K ohms or less**
- 1. Disconnect and remove the two wiring junction blocks from the A4 Hybrid/EV Battery Pack.
- 2. Test for greater than 400K ohms between the U, V, and W three phase studs at the K59 Starter/Generator Control Module and chassis ground with the **EL-50772** insulation multimeter set on the Isolation test setting.
 - If 400K ohms or less, replace the K59 Starter/Generator Control Module.
 - If greater than 400K ohms
- 3. Replace the two wiring junction blocks.
 - **If greater than 400K ohms**
- 5. Replace the C4A Hybrid/EV Battery Section 1 and C4B Hybrid/EV Battery Section 2.

DTC P1AF4 OR P1AF5: DRIVE MOTOR CONTROL MODULE HYBRID/EV BATTERY VOLTAGE ISOLATION SENSING CIRCUIT 1

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this repair.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P1AF4

Drive Motor Control Module Hybrid/EV Battery Voltage Isolation Sensing Circuit 1 Low Voltage

DTC P1AF5

Drive Motor Control Module Hybrid/EV Battery Voltage Isolation Sensing Circuit 1 High Voltage

Circuit/System Description

The vehicle is equipped with a high voltage isolation monitor feature. The purpose of the isolation monitor is to test the resistance between the high voltage positive and negative direct current (DC) bus and chassis ground.

The isolation monitoring system measures the resistance between the high voltage system and chassis ground in the following way. The Starter/Generator Control Module places an AC signal on the high voltage system and monitors its amplitude. A reduced amplitude return signal indicates a loss of resistance to chassis ground. This isolation monitor method is sometimes referred to as the active isolation monitor.

Conditions for Running the DTC

P1AF4

- Power mode is RUN or CRANK.
- Contactors are closed.

P1AF5

Power mode is RUN or CRANK.

Conditions for Setting the DTC

P1AF4

The positive mid-pack voltage is less than 5 V.

P1AF5

The positive mid-pack voltage minus the high voltage is greater than 10 V.

Action Taken When the DTC Sets

DTCs P1AF4 and P1AF5 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P1AF4 and P1AF5 are Type B DTCs.

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P1B0D

Drive Motor Control Module Drive Motor Overspeed

Circuit/System Description

The generator control module also called the starter generator control module is comprised of the following three control modules; the hybrid powertrain control module, 14 volt power module and the drive motor control module. These three control modules are non serviceable and are part of the generator control module.

The drive motor position sensor is monitored by the generator control module. The generator control module monitors the angular position, speed and direction of the starter generator based upon the signals of the resolver-type position sensor. The position sensor allows the drive motor control module to determine the exact position and speed of the starter generator.

Conditions for Running the DTC

The drive motor control module and hybrid powertrain control module are awake.

Conditions for Setting the DTC

Starter generator speed is greater than 18,000 RPM.

Action Taken When the DTC Sets

- DTC P1B0D is a Type B DTC.
- The hybrid powertrain control module opens the high voltage contactor relay.
- The battery indicator light will illuminate.

Conditions for Clearing the DTC

DTC P1B0D is a Type B DTC.

- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P1B41

Drive Motor Control Module Hybrid/EV Battery Voltage Isolation Sensing Performance

Circuit/System Description

The vehicle is equipped with a high voltage isolation sensor rationality or performance fault detection. The purpose of the isolation voltage sensor monitor is to test the rationality between the sum of the high voltage positive and negative current sensed voltages against the high voltage sensed value and also against the high voltage value from the battery pack energy control module. This is part of the passive isolation monitor.

Conditions for Running the DTC

Main contactor is commanded closed.

Conditions for Setting the DTC

All the following conditions exist:

- The mid-pack positive voltage minus the mid-pack negative voltage minus the high voltage battery voltage is greater than 15 V and the mid-pack positive voltage minus the mid-pack negative voltage minus the high voltage is greater than 10 V

- The mid-pack positive voltage minus the mid-pack negative voltage minus the high voltage is greater than 10 V

Action Taken When the DTC Sets

DTC P1B41 is a type B DTC.

Conditions for Clearing the DTC

DTC P1B41 is a type B DTC.

Circuit/System Verification

Program the K59 starter generator control module. If the DTC resets replace the K59 starter generator control module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for Generator Control Module, also called the Starter Generator Control Module, replacement, programming and setup.

DTC P1E3B: DRIVE MOTOR ROTOR HIGH TEMPERATURE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P1E3B

Drive Motor Rotor High Temperature

Circuit/System Description

The generator control module also called the starter generator control module is comprised of the following three control modules; the hybrid powertrain control module, 14 volt power module and the drive motor control module. These three control modules are non serviceable and are part of the generator control module.

The starter generator is also referred to as the drive motor. The drive motor temperature sensor is a variable resistor that measures the temperature of the drive motor stator windings. The hybrid powertrain control module supplies 5 V to the signal circuit and a ground for the low reference circuit. The hybrid powertrain control module calculates a value to estimate the drive motor rotor temperature. The hybrid powertrain control module uses the stator temperature, drive motor current, and commanded motor torque in order to calculate the value for the drive motor rotor temperature.

Conditions for Running the DTC

The drive motor control module and hybrid powertrain control module are awake.

Conditions for Setting the DTC

- DTCs P0A3F, P1A40, P1B03, P1B0D, P0C52, P0C53, P0C5C, P0C5D, P1AE8, P1AE9, P1AEC, P0BFD, P0BE6, P0BE7, P0BE8, P0BEE, P0BEF, and P0BF0 are not set.
- The motor rotor temperature calculation is greater than 197°C (387°F) for 8 seconds and has not fallen below 194°C (381°F).

Action Taken When the DTC Sets

- DTC P1E3B is a Type B DTC.
- The hybrid powertrain control module system starts to reduce the maximum torque beginning at 180°C (356°F) down to 0 NM as the calculated drive motor rotor temperature approaches 200°C (392°F).

Conditions for Clearing the DTC

DTC P1E3B is a Type B DTC.

Diagnostic Aids

- Ask about the customer's driving habits, trailer towing, etc.
- Ensure the engine cooling system is functioning normally.
- The drive motor stator temperature should be within 60°C (140°F) of the motor calculated rotor temperature.

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Check the cooling system for the correct amount of coolant. Refer to **Cooling System Draining and Filling (Static Fill)** , **Cooling System Draining and Filling (GE 47716)** .
2. Verify that DTC P0A2C, P0CC1-P0CC4 is not set.
 - If DTC is set, refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .
3. Start the engine and observe the scan tool motor A calculated rotor temperature parameter. The reading should be less than 180°C (356°F). If greater than the specified value, check the cooling system and pump for proper operation. If there is coolant and flow then monitor the calculated rotor temperature and verify that it drops below 180°C (356°F). If the temperature does not drop below 180°C (356°F) then reprogram the K59 starter generator control module. If the DTC resets, replace the K59 starter generator control module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for Generator Control Module, also called the Starter Generator Control Module, replacement, programming and setup.

DTC P1E3C: DRIVE MOTOR ROTOR HIGH TEMPERATURE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P1E3C

Control Module Calculated Hybrid/EV Battery Performance

Circuit/System Description

The generator control module also called the starter generator control module is comprised of the following three control modules; the hybrid powertrain control module, 14 volt power module and the drive motor control module. These three control modules are non serviceable and are part of the generator control module.

The hybrid powertrain control module performs internal calculations multiple times and compares the results of these calculations to verify proper operation of the internal controller memory. The result of these calculations is a voltage value. This voltage value is an internal value and cannot be measured externally. This fault is handled inside the generator control module and no external circuits are involved.

Conditions for Running the DTC

- The 12 V battery voltage is greater than 9 V.
- The drive motor control module and the hybrid powertrain control module are awake.

Conditions for Setting the DTC

If the results of these calculations differ by more than one volt.

Action Taken When the DTC Sets

- DTC P1E3C is a type A DTC.
- The high voltage contactor relay will be opened.

Conditions for Clearing the DTC

DTC P1E3C is a type A DTC.

IGN	0 volts	0 volts	B+

Circuit/System Description

The generator control module also called the starter generator control module is comprised of the following three control modules; the hybrid powertrain control module, 14 volt power module and the drive motor control module. These three control modules are non serviceable and are part of the generator control module.

The hybrid powertrain control module monitors the system voltage on the ignition voltage circuit.

Conditions for Running the DTC

The generator control module is communicating on the serial data circuits.

P2534

Ignition is ON.

P2535

Ignition is OFF.

Conditions for Setting the DTC

P2535

The hybrid powertrain control module detects greater than 5 volts on the ignition voltage circuit at the generator control module when not enabled for greater than 10 seconds.

P2534

The hybrid powertrain control module detects less than 2 volts on the ignition voltage circuit at the generator control module for greater than 10 seconds.

Action Taken When the DTC Sets

DTCs P2534 and P2535 are Type A DTCs.

Conditions for Clearing the DTC

DTCs P2534 and P2535 are Type A DTCs.

Diagnostic Aids

- Verify the charging system is functioning correctly.
- If the run crank circuit is shorted to voltage, the engine will continue to run with the ignition in the OFF position.

Component Ground	-	***	-
* Auxiliary Transmission Fluid Pump - always On			
** The fuse opens			
*** Auxiliary Transmission Fluid Pump - inoperative			

Circuit/System Description

The generator control module also called the starter generator control module is comprised of the following three control modules; the hybrid powertrain control module, 14 volt power module and the drive motor control module. These three control modules are non serviceable and are part of the generator control module.

The transmission fluid pump - auxiliary is used to maintain transmission fluid line pressure to the transmission during Autostop mode. The transmission fluid pump - auxiliary is externally mounted to the transmission case assembly. The hybrid powertrain control module controls the auxiliary pump by providing the ground path to the transmission pump relay - auxiliary coil control circuit.

Conditions for Running the DTC

- The Ignition is ON.
- The system voltage is between 9.0 and 32.0 V.

Condition 1

The vehicle is in autostop mode.

Condition 2

- All conditions allowing an autostop have been met.
- A/C compressor ON.

Conditions for Setting the DTC

Condition 1

The calculated transmission slip speed is greater than 150 RPM during a vehicle launch from autostart mode, 7 consecutive times in the same key cycle.

Condition 2

The 14 volt power module output current does not increase by 100 watts or more when the auxiliary transmission fluid pump is commanded ON by the hybrid powertrain control module.

OR

The 14 volt power module output current does not decrease by greater than 250 watts when the auxiliary transmission fluid pump is commanded OFF by the hybrid powertrain control module.

Action Taken When the DTC Sets

- The hybrid powertrain control module disables the Autostop mode.
- DTC P2797 is a Type B DTC.

Conditions for Clearing the DTC

DTC P2797 is a Type B DTC.

Diagnostic Aids

Driving a vehicle with an auxiliary transmission fluid pump failure that causes low or no pressure will cause a harsh transmission engagement on vehicle launch from an autostop.

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Circuit/System Verification

1. Verify that no other hybrid powertrain or transmission control module DTC is set.
 - **If any hybrid powertrain or transmission control module DTC is set**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

2. Perform the **Transmission Fluid Level and Condition Check** to verify correct fluid level and condition.
3. Ignition ON.
4. Verify the auxiliary transmission fluid pump turns ON and OFF when commanding the auxiliary transmission fluid pump relay ON and OFF with a scan tool.
 - **If the pump does not operate**

Refer to Circuit/System Testing.

- **If the pump operates**

All OK. Refer to transmission **Line Pressure Check (Non Hybrid)** , **Line Pressure Check (Hybrid)** .

Circuit/System Testing

1. Ignition OFF, disconnect the KR86 transmission fluid pump relay - auxiliary, Ignition ON.
2. Verify a test lamp illuminates between the B+ circuit terminal 30 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**

1. Ignition OFF.
2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Disconnect the X1 harness connector at the G5 Transmission Fluid Pump - Auxiliary, test for infinite resistance between the switched control circuit terminal 1 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the G5 Transmission Fluid Pump - Auxiliary.
 - **If the test lamp illuminates**
3. Ignition OFF and all vehicle systems OFF, disconnect the X1 harness connector at the G5 Transmission Fluid Pump - Auxiliary. It may take up to 2 minutes for all vehicle systems to power down.
4. Test for less than 10 ohms between the G5 Transmission Fluid Pump - Auxiliary ground circuit X1 terminal 2 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
5. Connect the harness connector at the G5 Transmission Fluid Pump - Auxiliary.
6. Connect a 30 A fused jumper wire between the B+ circuit terminal 30 and the switch control circuit terminal 87. Ignition ON.
7. Verify the G5 Transmission Fluid Pump - Auxiliary is ON.
 - **If the Pump is not ON**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the switch control circuit terminal 87 end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the G5 Transmission Fluid Pump - Auxiliary.
 - **If the Pump is ON**
8. Test or replace the KR86 Transmission Fluid Pump Relay - Auxiliary.
 - **If the DTC resets**
9. Refer to transmission **Line Pressure Check (Non Hybrid)** , **Line Pressure Check (Hybrid)** .

Component Testing

1. Ignition OFF, disconnect the KR86 Transmission Fluid Pump Relay - Auxiliary.
2. Test for 85-130 ohms between terminals 85 and 86.
 - **If less than 85 ohms or greater than 130 ohms**

Replace the relay.

- **If between 85-130 ohms**

3. Test for infinite resistance between the terminals listed below:

- 30 and 86
- 30 and 87
- 30 and 85
- 85 and 87

- **If less than infinite resistance**

Replace the relay.

- **If infinite resistance**

4. Install a 3 A fused jumper wire between relay terminal 85 and 12 volts. Install a jumper wire between relay terminal 86 and ground.

5. Test for less than 2 ohms between terminals 30 and 87.

- **If 2 ohms or greater**

Replace the relay.

- **If less than 2 ohms**

6. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Auxiliary Fluid Pump Removal (Hybrid)**
- **Relay Replacement (Within an Electrical Center)** , **Relay Replacement (Attached to Wire Harness)** , Within an Electrical Center, for Transmission Fluid Pump Relay - Auxiliary replacement.

SYMPTOMS - HYBRID CONTROLS

NOTE: **The following steps must be completed before using the symptom tables.**

1. Perform the **Diagnostic System Check - Vehicle** before using the symptom tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions.

Refer to the following procedures:

- **Generator Control Module Description and Operation**
- **High Voltage Monitoring Systems Description**

- **Hybrid Modes of Operation Description**
- **Starter Generator Description and Operation**
- **Transmission General Description**

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the Hybrid System. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

DC Power Conversion Test

DC POWER CONVERSION TEST

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The generator control module also called the starter generator control module is comprised of the following three control modules; the hybrid powertrain control module, 14 volt power module and the drive motor control module. These three control modules are non serviceable and are part of the generator control module.

The 14 volt power module supplies the energy that flows between the high voltage (115V) direct current (DC) and low voltage (14V) DC to charge the 12V battery and power accessories. The 14V power module receives a wake-up signal from the hybrid powertrain control module when the ignition is switched to On. After a successful initialization, the 14V power module receives an enable command from the hybrid powertrain control module to begin power conversion.

Diagnostic Aids

A poor connection at the B+ terminal of the 14V power module or open 300 Amp Mega-Fuse in the engine compartment, will prevent the 14V power module from operating.

Circuit/System Verification

1. Ignition OFF, measure and record the battery voltage at the C1 12V battery terminals. The battery voltage should stabilize between 12.4 and 12.8 V within a few minutes of turning the ignition OFF.
 - If not within the specified range, refer to Battery Inspection/Test
2. Start and idle the engine, accessories OFF, measure and record the battery voltage at the battery terminals. The voltage should be at least 1 V greater than the voltage measured in step 1 but less than 15 V.
 - If not within the specified range, refer to Circuit/System Testing.

Circuit/System Testing

1. Ignition ON, verify that no K1 14V power module or B18 battery current sensor DTCs are set that would cause a charging system concern.
 - If DTCs are set, refer to Diagnostic Trouble Code (DTC) List - Vehicle .
2. Ignition OFF, measure the voltage across the battery terminals. The voltage should read 12.4 V or greater at room temperature.
 - If not within the specified range, refer to Battery Inspection/Test
3. Connect a carbon pile tester to the C1 battery.
4. Start and idle the engine, turn all accessories off. Observe the voltage reading on the tester. The voltage should read between 12.6-15.5V.
5. Adjust the carbon pile tester so that the 12V current on the 14V power module data list is reading 120 amps. The voltage reading should remain between 12.6-15.5V.

- If not within the specified value, replace the K1 14V power module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

Removal Procedure

WARNING: Ensure all High Voltage safety procedures are followed. Failure to follow the procedure exactly as written may result in serious injury or death.

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.

- Visually and functionally inspect the gloves before use.
- Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

1. Drain the cooling system. Refer to Cooling System Draining and Filling (Static Fill) , Cooling System Draining and Filling (GE 47716) .
2. Disable the high voltage system. Refer to High Voltage Disabling .
3. Remove the air cleaner assembly. Refer to Air Cleaner Assembly Replacement .
4. Reposition the secondary air injection pump inlet hose, if equipped. Refer to Secondary Air Injection Pump Inlet Hose Replacement (LEA, LUK) .

Fig. 4: Radiator Inlet Hose, Bracket & Bolt

11. Remove the drive belt tensioner stop bolt (1) and the drive belt tensioner stop (2).

Fig. 10: Special Compressor Tool

Courtesy of GENERAL MOTORS COMPANY

NOTE: Make sure the EN-48932 compressor tool is not on the Generator bracket and A/C Compressor bracket.

12. Install the **EN-48932** compressor tool (2) to the drive belt tensioner spring.
13. Tighten the nut (1) on the **EN-48932** compressor tool (2) until the tensioner spring reaches its internal stop.

NOTE: Try not to remove the drive belt from the other pulleys.

14. Release the tension from the other drive belt tensioner and remove the drive belt from the starter generator pulley.

Fig. 11: Stud/Nut
Courtesy of GENERAL MOTORS COMPANY

NOTE: If stud is seized, place 2 nuts on the end of the stud and remove with a socket.

15. Remove the stud/nut (1) from the starter generator.
16. Raise the vehicle.
17. Remove the starter generator bolts (2).
18. Remove the starter generator (3).

Installation Procedure

Fig. 12: Stud/Nut
Courtesy of GENERAL MOTORS COMPANY

1. Position the starter generator to the engine.

CAUTION: Refer to Fastener Caution .

2. For ease of service, replace the stud (1) with a new starter generator lower bolt (2) from the parts catalog and apply medium LOCTITE to the bolt. Tighten to 58 N.m (41 lb ft).
3. Install the starter generator lower bolts (2) and tighten to 58 N.m (41 lb ft).

Fig. 13: Special Compressor Tool
Courtesy of GENERAL MOTORS COMPANY

4. Remove the belt from the middle idler.
5. Install the drive belt onto the starter generator pulley.
6. Rotate the tensioner pulley clockwise and then install the belt around the middle idler.
7. Remove the **EN-48932** compressor tool (2) from the drive belt tensioner spring.

Fig. 14: Drive Belt Tensioner Stop Bolt
Courtesy of GENERAL MOTORS COMPANY

NOTE: Make sure the drive belt tensioner stop pin is aligned with the hole in the Generator and A/C Compressor bracket.

8. Install the drive belt tensioner stop bolt (1) and the drive belt tensioner stop. Tighten to 9 N.m (80 lb in).

Fig. 15: Drive Motor Generator Battery Connector
Courtesy of GENERAL MOTORS COMPANY

NOTE: Verify the connector is free of contamination prior to engagement.

9. Install the starter generator battery connector (1).

Fig. 16: Starter Generator

Courtesy of GENERAL MOTORS COMPANY

NOTE: Be sure the drive motor generator battery cable cover is fully seated against the drive motor generator battery cable housing prior to installing and fastening the nuts. This will ensure proper alignment and engagement of HVIL terminals.

10. Install the drive motor generator battery cable to the starter generator assembly and tighten the nuts (1) to 9 N.m (80 lb in).

Fig. 17: Generator Starter Cover Nuts
Courtesy of GENERAL MOTORS COMPANY

11. Install the drive motor generator battery cable cover nuts (1) and the drive motor generator battery cable cover (2). Tighten to 9 N.m (80 lb in).

Fig. 18: Starter Generator Hoses

Courtesy of GENERAL MOTORS COMPANY

12. Install the starter generator hoses and clamps (1).

Fig. 19: Radiator Inlet Hose, Bracket & Bolt
Courtesy of GENERAL MOTORS COMPANY

13. Install the radiator inlet hose (3), the radiator inlet hose clamps (2) and tighten the bracket bolt (1) to 9 N.m (80 lb in).
14. Install the secondary air injection pump inlet PCV pipe, if equipped. Refer to **Secondary Air Injection Pump Inlet Hose Replacement (LEA, LUK)** .
15. Install the air cleaner assembly. Refer to **Air Cleaner Assembly Replacement** .
16. Fill the cooling system. Refer to **Cooling System Draining and Filling (Static Fill)** , **Cooling System Draining and Filling (GE 47716)** .
17. Enable the high voltage system. Refer to **High Voltage Enabling** .

DESCRIPTION AND OPERATION

STARTER GENERATOR DESCRIPTION AND OPERATION

Location

The starter generator, also referred to as the drive motor, is located in the engine compartment. The drive motor is mounted to the front of the engine in place of the alternator, directly above the air conditioning compressor. The drive motor is connected to the crankshaft pulley using a specially designed serpentine belt and drive belt

tensioner.

Operating Functions

The drive motor is a 3 phase AC induction machine. This device not only serves as a 115-volt AC generator, it is also used to provide engine power assist and to start the engine when in auto-stop mode. The 115-volt AC current flows between the drive motor and the generator control module, also referred to as the starter generator control module, through a three phase cable assembly.

As a generator, the drive motor provides up to 15 kW of AC power to the drive motor control module.

As a motor, the drive motor provides up to 11 kW of electric power assistance and engine starting. The motor receives three phase AC power from the drive motor control module which is internal and part of the generator control module.

The drive motor has 2 internal sensors that are not serviceable, the drive motor position sensor and the drive motor temperature sensor.

The ratio between the drive motor pulley and the crankshaft pulley is 2.38 to 1. The generator control module is capable of checking the integrity of the drive motor belt by receiving an engine RPM input from the ECM over serial data and comparing that against the drive motor speed input signal from the drive motor position sensor.

ELECTROMAGNETIC COMPATIBILITY DESCRIPTION

Overview

Vehicles are typically subject to certain legal requirements that limit the amount of electromagnetic interference (EMI) that can be generated by the vehicles electronic devices. Additionally, the electronic devices within the vehicle must be able to withstand a certain amount of EMI without effecting their operation. EMI is generated whenever electrical current flows through a circuit. The amount of EMI generated is usually dependent upon the amount of current flow and the switching frequency of current flow through the circuit. The EMI requirements are generally referred to as electromagnetic compatibility.

There are many ways of ensuring the vehicle meets electromagnetic compatibility requirements. These include:

- Adding capacitors and resistors to certain electrical circuits
- Regulating the frequency at which a component operates
- Shielding wires, cables and components

Circuit Design

The generator control module, often referred to as the drive motor control module, and the 14V power module each contain filter capacitors connected to the high voltage circuits. These capacitors are necessary to reduce the voltage spikes that occur as a result of the switching of current. Reducing voltage spikes reduces EMI. The switching frequency of the current is also closely regulated. Too high of a frequency can cause an increase in EMI generation.

Wiring/Cable Design

Different types of wire/cable shielding methods are utilized in the vehicle. Common types of shielding include twisted-pair and internal braid or foil. Twisted pair is typically used in circuits such as serial data circuits. The wire pair is twisted together at a particular turns-per-length ratio. Shielded cable is utilized for all other circuits requiring either protection from external EMI or to reduce EMI radiation of the cable itself into other nearby components or circuits.

High Voltage Cable

Drive Motor Generator Battery 3 Phase Cable Assembly

The high voltage cables utilize internal braid shielding. Typically, both ends of the internal braid shield are attached to chassis ground. All of the shielded high voltage cables are grounded at their cable end attachment points.

Low and Intermediate Voltage Wiring

The drive motor position sensor and temperature sensor circuits utilize internal foil shielding.

Component Shielding

Certain components utilize their structure to effectively shield EMI. Metal covers, chassis grounded metal cases and electro-magnetically conductive gaskets may all be part of a component's electromagnetic compatibility design.

Shielding Loss

A loss of proper shielding may result in poor AM band radio reception and/or incorrect sensor circuit readings depending upon the location of the shield loss. Damage that has penetrated to the insulated conductor of high voltage cables is not repairable. Certain Low and Intermediate voltage shielded wiring harnesses may be repairable. Refer to **Wiring Repairs** , and **Splicing Twisted or Shielded Cable** .

GENERATOR CONTROL MODULE DESCRIPTION AND OPERATION

Overview

The generator control module is also referred to as the starter generator control module. The generator control module is located in the generator control and battery module assembly which is located in the trunk directly behind the rear seat.

The generator control module is comprised of the following control modules:

- Hybrid powertrain control module
- 14 volt power module
- Drive motor control module

The generator control module functions as an inverter, inverting high voltage direct current (DC) electrical

energy to 3 phase alternating current (AC) electrical energy and vice versa. The generator control module also functions as a DC to DC converter, converting high voltage DC to 14 volts DC. The generator control module is located in the generator control and battery module assembly. The generator control and battery module assembly is air cooled.

High Voltage Circuits

Direct Current (DC)

The generator control module is connected to the positive and negative terminals of the high voltage, (DC) generator battery assembly. Both of the negative and positive high voltage DC battery poles are isolated from the vehicle chassis. The positive high voltage DC cable is switched ON or OFF by a high voltage, high current contactor relay contained within the generator control and battery module assembly. All high voltage DC negative and positive DC cables are orange in color to alert the technician to the potential presence of high voltage.

Three Phase Alternating Current (AC)

Three individual cables connect each phase of the drive motor to the generator control module. Each individually shielded cable is orange in color to alert the technician to the potential presence of high voltage. These three cables are routed from engine compartment to the rear of the vehicle in a single conduit.

Low Voltage Circuits

The 14V power module is an electronic device that converts high voltage (115V) DC to low voltage (14V) DC for operation of all low voltage modules and to charge the 12 volt accessory battery. The 14 volt power module is not serviced separately and is part of the generator control module.

Low Voltage (12V) Direct Current

Low voltage (12V) cables on the hybrid vehicle do not require unique coloring or servicing procedures.

Hybrid Powertrain Control Module

Location

The hybrid powertrain control module is a non-serviceable, flash-programmable micro-processor that is part of the generator control module.

Operating Functions

The hybrid powertrain control module is the main controller of powertrain operation. The hybrid powertrain control module determines when to perform normal operating modes such as auto stop, launch assist mode, and regenerative braking. The hybrid powertrain control module also operates in conjunction with the battery energy control module to determine when to enable and disable the DC high voltage circuits. The motor control module operates the drive motor based upon hybrid powertrain control module commands.

Communication and Hosted Diagnostics

The hybrid powertrain control module is the host controller for DTC and scan tool parameter information for the following control modules:

- 14V power module
- Drive motor control module
- Battery energy control module

These modules diagnose their own operation and determine when a fault condition is present. The 14V power module communicates diagnostic status to the hybrid powertrain control module over serial data.

The drive motor control module and the hybrid powertrain control module exchange information and commands on a serial peripheral interface bus internal communication circuit as well as the hi-speed serial data communication circuit.

In the event the battery energy control module (BECM) communicates a fault condition, the hybrid powertrain control module will determine if one or more operating modes are affected and notify the vehicle operator by requesting the MIL illuminate and/or by displaying a message in the Driver Information Center. In addition, the hybrid powertrain control module will store the associated DTC information for retrieval by a scan tool. Some hosted modules may require an ignition cycle to clear certain DTCs from the hybrid powertrain control module.

Circuit Inputs

In addition to data parameters, the hybrid powertrain control module directly monitors the following signal circuits:

- Engine crankshaft position sensor signal (via serial data message from ECM - not direct)
- High voltage interlock circuit
- Brake Pedal Position
- Drive Motor Temperature (via motor control module)
- Drive Motor Position (via motor control module)
- Hood switch
- Various internal signals (temps, etc.)

Circuit Outputs

In addition to control through other controllers, the hybrid powertrain control module directly controls:

- Cooling Fan
- Auxiliary Transmission fluid pump
- Drive Motor
- Drive Motor Cooling pump

Drive Motor Control Module

Location

The drive motor control module is a flash-programmable micro-processor. The drive motor control module is non serviceable and is part of the generator control module.

Operating Functions

The drive motor control module's main function is to monitor the drive motor input/output circuits and to control the insulated gate bipolar transistors that control the drive motor by inverting the high voltage DC electrical energy to 3 phase AC electrical energy and vice versa.

Communication and Hosted Diagnostics

The hybrid powertrain control module communicates with the drive motor control module using an internal serial data circuit. The drive motor control module does not store its own diagnostic trouble code (DTC) information. The hybrid powertrain control module will store the drive motor control module associated DTC information for retrieval by a scan tool. The scan tool can communicate directly with the drive motor control module in order to retrieve data parameters only.

Circuit Inputs

In addition to data parameters, the drive motor control module monitors the drive motor for:

- Voltage
- Current
- Speed and direction
- Temperature

Additionally, the drive motor control module monitors the insulated gate bipolar transistor components for temperature and proper operation. Some of the drive motor control modules operation data is shared with the hybrid powertrain control module.

Circuit Outputs

The drive motor control module controls the insulated gate bipolar transistor driver board which is located in the drive motor control module, that in-turn controls the drive motor. The drive motor is controlled by the 3-phase alternating current (AC). Three cables connect the drive motor to the drive motor control module which is part of the generator control module.

14 Volt Power Module

Location

The 14 volt power module is a non-serviceable device that is part of the generator control module.

Operating Functions

The 14V power module is the device which converts high voltage (115V) DC to low voltage (12V) DC for accessory electrical operation and to charge the 12 volt accessory battery. The 14 volt power module will

typically charge the 12 volt system at approximately 14.5 volts with a max power output of 1600 watts. The 14 volt power module is not programmable.

HIGH VOLTAGE MONITORING SYSTEMS DESCRIPTION

The hybrid system monitors several high voltage components for attempted access. Additionally, a minimum amount of isolation resistance is maintained at all times between both negative and positive poles of the hybrid battery and the vehicle chassis. The drive motor control module monitors the hybrid system for access and loss of isolation detection.

High Voltage Interlock Circuit

The High Voltage Interlock Circuit is a wire loop that passes through certain high voltage components. The high voltage interlock circuit is used to determine if access to high voltage components is being attempted. The opening of these high voltage components causes the high voltage interlock circuit to open. The hybrid system may react to the loss of high voltage interlock circuit continuity by opening the high voltage contactor relay and discharging the high voltage capacitors. The high voltage interlock circuit signal is generated by the drive motor control module. The high voltage interlock circuit status is monitored by the drive motor control module, the hybrid powertrain control module, and the drive motor control module.

High Voltage DC Chassis Isolation

The hybrid system monitors the electrical potential between high voltage and the vehicle chassis. High voltage should always be isolated from the vehicle chassis by a certain amount of resistance to avoid the potential for a life threatening current path. In the event that a high voltage leak path is detected to the vehicle chassis, the hybrid system will set a diagnostic trouble code (DTC). High voltage DC chassis isolation is monitored by the generator control module.

Testing for loss of isolation requires special tools and procedures. Because of the high voltages present in the hybrid system, a loss of isolation may occur due to insulation breakdown. Insulation breakdown typically occurs only when high voltages and/or current is present. Conditions such as insulation breakdown cannot be diagnosed with a typical DMM because high voltage is not used by the DMM when measuring resistance.

HYBRID MODES OF OPERATION DESCRIPTION

Automatic Engine Start/Stop

WARNING: Exiting the vehicle without first shifting into P (Park) may cause the vehicle to move. You or others may be injured. Because the vehicle has the automatic engine start/stop feature, the vehicle's engine might seem to be shut off; however, once the brake pedal is released, the engine will start up again.

Shift to P (Park) and turn the ignition to LOCK/OFF, before exiting the vehicle.

Vehicles with eAssist have an automatic (auto) engine start/stop feature. After the engine has started and reached operating temperature the auto stop feature may cause the engine to turn off when brakes are applied

and the vehicle has come to a complete stop. When the brake is released or the accelerator pedal applied, the engine will start. The engine will continue to run until the next auto stop or until the ignition switch is turned OFF.

AUTO STOP on the tachometer signifies that the engine is in auto stop mode. When the vehicle is turned off, the tachometer will move to OFF. If the driver door is opened while in auto stop mode, a chime will sound.

To restart the engine during auto stop, release the brake pedal or press the accelerator pedal. The engine starts immediately. The engine continues to run until the next stop.

There are several conditions which may prevent an auto stop or cause an auto start.

The Engine Will Remain Running When:

- The engine, transmission, or hybrid battery is not warmed up.
- The outside temperature is less than -15°C (5°F).
- The air conditioning or defrost system requires the A/C compressor to maintain vehicle comfort.
- The shift lever is in any position other than DRIVE.
- The hybrid battery pack charge is low.
- The 12-volt vehicle battery charge is low, or loads are high.
- The hood is not fully closed.

The Engine Will Restart When:

- The brake pedal is released.
- The accelerator pedal is applied.
- Shifting out of D (Drive) to any other gear.
- If the eco air conditioning button is selected, the duration of the auto stop will mainly depend on the outside temperature along with some other factors. This economy mode improves fuel economy by limiting the effects of the air conditioning. The warmer it is outside, the shorter the time before the engine is restarted to provide cabin cooling.
- The climate control system is turned from off to normal air conditioning or defrost.
- The engine is required to run for either heater or climate control performance.
- The hybrid battery pack charge is low and requires recharging.
- Auto stop time is greater than two minutes.

Regenerative Braking

Regenerative braking takes some of the energy from the moving vehicle and turns it into electrical energy. This energy is then used to charge the vehicle's hybrid battery system, which increases fuel efficiency.

The torque converter stays locked allowing the drive motor to be coupled to the wheels (through engine and trans) to recharge the hybrid batteries via regenerative braking.

The system works whenever you take your foot off the accelerator pedal while the vehicle is moving in a forward gear. This causes the vehicle to slow down more quickly. It may feel like the brake pedal is being pressed, even when it is not. When the brake pedal is depressed the system will deliver a higher percent of regenerative energy to the hybrid battery system than when in coast down.

Electric Power Assist

Significant internal transmission changes to clutch controls and hardware provide reduced spin losses while improving shift quality. The added electric power provided by the eAssist system allows for higher gearing to improve steady state efficiency without impacting acceleration performance or driveability. The system's capability of providing up to 11 kW of electric power assist at cruising speeds allows the driver to accelerate lightly, ascend mild grades without the transmission downshifting and helps performance during wide open throttle maneuvers.

Torque Smoothing

While not unique to the eAssist hybrid vehicle, expanded operational range is possible because the drive motor can react quickly to smooth driveline disturbances that would otherwise be objectionable.

Deceleration Fuel Cut-Off

When the driver releases the accelerator pedal, air flow into the engine is reduced. The ECM monitors the corresponding changes in the throttle position, MAP, and MAF. The ECM shuts OFF fuel completely if the deceleration is very rapid, or for long periods, such as closed-throttle coast-down. The fuel shuts OFF in order to prevent damage to the catalytic converter and saves fuel by not running the engine. This mode is activated quickly and for a longer duration in the eAssist hybrid vehicle.

While in deceleration fuel cut-off mode, the torque converter stays locked allowing the drive motor to be coupled to the wheels (through engine and trans) to recharge the hybrid batteries via regenerative braking. The drive motor can also quickly react to help smooth driveline disturbances (downshifts), or provide assist for a smooth take off when the accelerator is depressed. If the vehicle is brought to a complete stop the drive motor spins the engine bringing it to a smooth stop and is properly positioned for a smooth restart.

Circuit/System Description

The Battery Energy Control Module monitors an inlet air temperature sensor that is located at the inlet of the Hybrid/EV Battery Pack. This temperature sensor is a variable resistor that measures the air temperature of the incoming air which is used to heat and cool the Hybrid/EV Battery Sections and the internal electronics of the Starter/Generator Control Module. The Battery Energy Control Module supplies 5 V to the signal circuit and a ground for the low reference circuit. The inlet air temperature sensor resistance changes with temperature of the incoming inlet air. As the temperature decreases, the sensor resistance increases. As the temperature increases, the sensor resistance decreases. The Starter/Generator Control Module will control the Hybrid/EV Battery Pack Cooling Fan based on the inlet air temperature and hybrid/EV battery temperature sensors.

The Starter/Generator Control Module performs a rationality diagnostic that compares the air Inlet temperature sensor output signal to the average battery temperature of the six battery cell temperature sensors. This diagnostic gets one chance to run during a drive cycle after a specific vehicle off time.

Conditions for Running the DTC

P0AAD

- Ignition is RUN or CRANK
- Starter/generator control module off time is greater than six hours
- Starter/generator control module off time is not faulted (Starter/Generator Control Module internal clock diagnostic)
- None of the following DTCs are set: P0AAE, P0AAF, P0A9C, P0A9D, P0A9E, P0AC6, P0AC7, P0AC8, P0ACB, P0ACC, P0ACD, P0AEA, P0AEB, P0BC3, P0BC4, P0BC5, P0C34, P0C35, P0C36, P262B, U0100, U182A

P0AAE and P0AAF

- Ignition OFF
- The 12 V battery voltage is greater than 8.8 V.
- DTC P1A5D is not set

Conditions for Setting the DTC

P0AAD

The air inlet temperature is more than 10°C (18°F) higher or lower than the average battery cell temperature

P0AAE

The air temperature sensor signal is greater than 87°C (188.6°F)

P0AAF

The air temperature sensor signal is less than -39°C (-38.2°F)

Action Taken When the DTC Sets

DTCs P0AAD, P0AAE, and P0AAF are type B DTCs

Conditions for Clearing the DTC

DTCs P0AAD, P0AAE, and P0AAF are type B DTCs

Circuit/System Verification

1. Ignition ON
2. Verify the scan tool Battery Energy Control Module Hybrid Battery Inlet Air Temperature parameter is between -39° and 60°C (-38.2 and 140°F).
 - **If not between -39° and 60°C (-38.2 and 140°F)**

Refer to Circuit/System Testing.

- **If between -39° and 60°C (-38.2 and 140°F)**
3. Verify the scan tool Battery Energy Control Module Hybrid Battery Inlet Air Temperature parameter is within 10°C (18°F) of the average battery cell temperature.
 - **If not within 10°C (18°F) of the average battery cell temperature**

Refer to Circuit/System Testing.

- **If within 10°C (18°F) of the average battery cell temperature.**
4. All OK.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters

(50 feet) of the vehicle, either indoors or outdoors.

- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

WARNING: The eAssist battery pack assembly will utilize an exchange program. Please consult the most recent revision of bulletin/PI# PIC5520, available in Service Information (SI), for a list of approved eAssist battery pack assembly service procedures. Components that may be removed and serviced without exchanging the complete battery pack assembly are identified in the bulletin/PI. Please contact the GM Technical Assistance Center (1-877-446-8227) if you have any questions.

NOTE: In High Voltage Disabling , perform the disabling procedure for servicing components within the A4 Hybrid/EV Battery Pack. The C4A Hybrid/EV Battery Section 1 and C4B Hybrid/EV Battery Section 2 will be disconnected as part of the disabling procedure.

1. Ignition OFF, disable the high voltage at the A4 Hybrid/EV Battery Pack. Refer to High Voltage Disabling .
2. Connect the X1, X2, and X3 harness connectors at the K59 Starter/Generator Control Module.
3. Disconnect the X2 harness connector at the K16 Battery Energy Control Module.
4. Test for 8-13k ohms at 19-24°C (66.2-75.2°F) between the signal circuit terminal 3 and the low reference circuit terminal 8.
 - **If not between 8-13k ohms**

Replace the C4A Hybrid/EV Battery Section 1 and C4B Hybrid/EV Battery Section 2.

- **If between 8-13k ohms**

5. Replace the K16 Battery Energy Control Module.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Generator Battery Replacement
- Control Module References for Battery Energy Control Module replacement, programming, and setup

Circuit/System Description

Six temperature sensors are used to monitor the battery temperature. The battery temperature sensors are located in the battery sections. Two of the temperature sensors are located on the top of the battery section and the remaining four are located on the bottom of the section. The temperature sensor is a variable resistor that measures the temperature of the battery cell group. The Battery Energy Control Module supplies 5 V to the signal circuit and a ground for the low reference circuit. The battery temperature sensor resistance changes with battery temperature. As the temperature decreases, the sensor resistance increases. As the temperature increases, the sensor resistance decreases.

Conditions for Running the DTC

- The Starter/Generator Control Module and Battery Energy Control Module are awake and communicating
- None of the following DTCs are set: P0A9C, P0A9D, P0A9E, P0AC6, P0AC7, P0AC8, P0ACB, P0ACC, P0ACD, P0AE9, P0AEA, P0AEB, P0B45, P0B46, P0B47, P0B48, P0B4F, P0B50, P0B51, P0B52,

Circuit/System Verification

1. Visually inspect the inlet and outlet of the Hybrid/EV Battery Pack Cooling Fan ducts.
2. Verify the inlet and outlet are free of any debris or obstructions that will limit airflow through the duct.
 - **If any debris or obstructions are found**

Remove the obstruction to allow proper airflow and allow the Hybrid/EV Battery Pack to cool before retesting.

- **If no debris or obstructions are found**

3. Verify the Hybrid/EV Battery Pack Cooling Fan ducts are properly secured and are not crimped, crushed, or deformed in a manner that will limit airflow through the duct.
 - **If the ducts are unsecured or damaged**

Repair or replace as necessary and allow the Hybrid/EV Battery Pack to cool before retesting.

- **If the ducts are properly secured and undamaged**

4. Ignition ON.
5. Verify the scan tool Battery Energy Control Module Battery Temperature parameters are all be between -39° and 60°C (-38.2 and 140°F).
 - **If not between -39° and 60°C (-38.2 and 140°F)**

Refer to Circuit/System Testing.

- **If between -39° and 60°C (-38.2 and 140°F)**

6. All OK.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

WARNING: The eAssist battery pack assembly will utilize an exchange program. Please consult the most recent revision of bulletin/PI# PIC5520, available in Service Information (SI), for a list of approved eAssist battery pack assembly service procedures. Components that may be removed and serviced without exchanging the complete battery pack assembly are identified in the bulletin/PI. Please contact the GM Technical Assistance Center (1-877-446-8227) if you have any questions.

NOTE: In High Voltage Disabling , perform the disabling procedure for servicing components within the A4 Hybrid/EV Battery Pack. The C4A Hybrid/EV Battery Section 1 and C4B Hybrid/EV Battery Section 2 will be disconnected as part of the disabling procedure.

1. Ignition OFF, disable the high voltage at the A4 Hybrid/EV Battery Pack. Refer to High Voltage Disabling .
2. Connect the X1, X2, and X3 harness connectors at the K59 Starter/Generator Control Module.
3. Determine which battery temperature sensor is not between -39° and 60°C (-38.2 and 140°F) by observing the scan tool Battery Energy Control Module Battery Temperature parameters.
4. Disconnect the X2 and X3 harness connectors at the K16 Battery Energy Control Module.
5. Test for 8-13k ohms at 19-24°C (66.2-75.2°F) between the appropriate temperature sensor signal circuit terminal and the low reference circuit terminal listed below:
 - Temperature sensor 1 - Signal circuit terminal 2 X2 and low reference circuit terminal 7 X2
 - Temperature sensor 2 - Signal circuit terminal 1 X2 and low reference circuit terminal 6 X2
 - Temperature sensor 3 - Signal circuit terminal 4 X2 and low reference circuit terminal 9 X2
 - Temperature sensor 4 - Signal circuit terminal 2 X3 and low reference circuit terminal 7 X3
 - Temperature sensor 5 - Signal circuit terminal 1 X3 and low reference circuit terminal 6 X3
 - Temperature sensor 6 - Signal circuit terminal 4 X3 and low reference circuit terminal 9 X3
 - **If not between 8-13k ohms**

Replace the C4A Hybrid/EV Battery Section 1 and C4B Hybrid/EV Battery Section 2.

- **If between 8-13k ohms**

6. Replace the K16 Battery Energy Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Generator Battery Replacement**
- **Control Module References** for Battery Energy Control Module replacement, programming, and setup

Circuit/System Description

The hybrid/EV battery pack cooling fan draws air through the hybrid/EV battery pack to control the temperature of the hybrid/EV battery pack. To operate, the cooling fan receives an enable signal from the starter/generator control module. The enable control is controlled by a discrete high side driver in the starter/generator control module. When the enable control circuit is high, the fan will be enabled. The fan speed is controlled by a fan control circuit from the starter/generator control module, by changing the duty cycle. Maximum fan speed is 3900 RPM. Hybrid/EV battery pack cooling fan enable circuit open and short to voltage diagnostics run continuously until hybrid/EV battery pack cooling fan is enabled to run while short to ground runs after it is enabled to run. These diagnostics detect and report a failure of the fan enable circuits.

Conditions for Running the DTC

P0A81, P0A84, or P0A85

- Ignition is RUN or CRANK
- The hybrid/EV battery pack cooling fan is enabled

P0BC8

- Ignition is RUN or CRANK
- The hybrid/EV battery pack cooling fan is enabled
- 12 V battery voltage is greater than 10 V
- The hybrid/EV battery pack cooling fan is commanded between 11-90%
- The hybrid/EV battery pack cooling fan enable delay timer is greater than 9 s

- DTC P0A84, P0A85, P0BC9, P0BCA, P0C32, P0D65, or P0D66 is not set

P0BC9 or P0BCA

- Ignition is RUN or CRANK
- The hybrid/EV battery pack cooling fan is enabled
- 12 V battery voltage is greater than 10 V
- The hybrid/EV battery pack cooling fan is commanded between 11-90%
- The hybrid/EV battery pack cooling fan enable delay timer is greater than 9 s

P0D64 or P0D66

- Ignition is RUN or CRANK
- The hybrid/EV battery pack cooling fan is not enabled

P0D65

- Ignition is RUN or CRANK
- The hybrid/EV battery pack cooling fan is enabled

Conditions for Setting the DTC

P0A81

An open is detected on the hybrid/EV battery pack cooling fan speed control circuit

P0A84

A short to ground is detected on the hybrid/EV battery pack cooling fan speed control circuit

P0A85

A short to voltage is detected on the hybrid/EV battery pack cooling fan speed control circuit

P0BC8

There is a excessive difference between the commanded hybrid/EV battery pack cooling fan speed and the hybrid/EV battery pack cooling fan speed feedback signal

P0BC9

The hybrid/EV battery pack cooling fan speed feedback signal is less than 8 Hz

P0BCA

The hybrid/EV battery pack cooling fan speed feedback signal is greater than 280 Hz

P0D64

An open is detected on the hybrid/EV battery pack cooling fan enable control circuit

P0D65

A short to ground is detected on the hybrid/EV battery pack cooling fan enable control circuit

P0D66

A short to voltage is detected on the hybrid/EV battery pack cooling fan enable control circuit

Action Taken When the DTC Sets

DTCs P0A81, P0A84, P0A85, P0BC8, P0BC9, P0BCA, P0D64, P0D65, and P0D66 are type B DTCs

Conditions for Clearing the DTC

DTCs P0A81, P0A84, P0A85, P0BC8, P0BC9, P0BCA, P0D64, P0D65, and P0D66 are type B DTCs

Circuit/System Verification

1. Verify the actual G14 Hybrid/EV Battery Pack Cooling Fan speed increases and decreases when commanding the Hybrid/EV Battery Pack Cooling Fan with a scan tool.
 - **If the fan speed does not increase and decrease as commanded**

Refer to Circuit/System Testing.
 - **If the fan speed increases and decreases as commanded**
2. Verify the scan tool Hybrid Powertrain Control Module 14V Power Module Fan Speed parameter increases and decreases when commanding the Hybrid/EV Battery Pack Cooling Fan with a scan tool.
 - **If the parameter does not increase and decrease as commanded**

Refer to Circuit/System Testing.
 - **If the parameter increases and decreases as commanded**
3. All OK.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters

(50 feet) of the vehicle, either indoors or outdoors.

- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

WARNING: The eAssist battery pack assembly will utilize an exchange program. Please consult the most recent revision of bulletin/PI# PIC5520, available in Service Information (SI), for a list of approved eAssist battery pack assembly service procedures. Components that may be removed and serviced without exchanging the complete battery pack assembly are identified in the bulletin/PI. Please contact the GM Technical Assistance Center (1-877-446-8227) if you have any questions.

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the G14 Hybrid/EV Battery Pack Cooling Fan. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal 1 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms between the ground circuit terminal 1 and ground.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Ignition ON.
4. Verify a test lamp illuminates between the B+ circuit terminal 5 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the G14 Hybrid/EV Battery Pack Cooling Fan.
 - **If the test lamp illuminates**
5. Connect a test lamp between the control circuit terminal 4 and ground.

6. Verify the test lamp turns ON when commanding the Hybrid/EV Battery Pack Cooling Fan with a scan tool and OFF when releasing the control.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X3 harness connector at the K59 Starter/Generator Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. . Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit
 - If less than 2 ohms, replace the K59 Starter/Generator Control Module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X3 harness connector at the K59 Starter/Generator Control Module.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, test the control circuit for a short to voltage.
 - If less than 1 V, replace the K59 Starter/Generator Control Module.
 - **If the test lamp turns ON and OFF**
7. Test for 4.8-5.2 V between the signal circuit terminal 2 and ground.
 - **If less than 4.8 V**
 1. Ignition OFF, disconnect the X3 harness connector at the K59 Starter/Generator Control Module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. . Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit
 - If less than 2 ohms, replace the K59 Starter/Generator Control Module.
 - **If greater than 5.2 V**
 1. Ignition OFF, disconnect the X3 harness connector at the K59 Starter/Generator Control Module.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, test the signal circuit for a short to voltage.
 - If less than 1 V, replace the K59 Starter/Generator Control Module.
 - **If between 4.8-5.2 V**
8. Connect a 3 A fused jumper wire to the signal circuit terminal 2.
9. Verify the scan tool Hybrid Powertrain Control Module 14V Power Module Fan Speed parameter is greater than 0 RPM while rapidly tapping the jumper wire to ground.
 - **If 0 RPM**

Replace the K59 Starter/Generator Control Module
 - **If greater than 0 RPM**

10. Connect a test lamp between the signal circuit terminal 3 and B+.
11. Verify the test lamp becomes progressively dimmer as the fan speed is increased and progressively brighter as the fan speed is decreased when commanding the Hybrid/EV Battery Pack Cooling Fan with a scan tool.
 - **If the test lamp does not illuminate**
 1. Ignition OFF, disconnect the X3 harness connector at the K59 Starter/Generator Control Module.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, test the signal circuit for a short to voltage.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit
 - If less than 2 ohms, replace the K59 Starter/Generator Control Module.
 - **If the test lamp illuminates, but does not change in brightness**
 1. Ignition OFF, disconnect the X3 harness connector at the K59 Starter/Generator Control Module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K59 Starter/Generator Control Module.
 - **If the test lamp brightness changes as commanded**
12. Test or replace the G14 Hybrid/EV Battery Pack Cooling Fan.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Circuit/System Description

Six temperature sensors are used to monitor the battery temperature. The battery temperature sensors are located in the battery sections. Two of the temperature sensors are located on the top of the battery section and the remaining four are located on the bottom of the section. The temperature sensor is a variable resistor that measures the temperature of the battery cell group. The battery energy control module supplies 5 V to the signal circuit and a ground for the low reference circuit. The battery temperature sensor resistance changes with battery temperature. As the temperature decreases, the sensor resistance increases. As the temperature increases,

the sensor resistance decreases.

Conditions for Running the DTC

P0A9C, P0AC6, P0ACB, P0AE9, P0BC3, and P0C34

- Battery energy control module is awake and communicating
- None of the following DTCs are set: P0A9D, P0A9E, P0AC7, P0AC8, P0ACC, P0ACD, P0AEA, P0AEB, P0B45, P0B46, P0B47, P0B48, P0B4F, P0BC4, P0BC5, P0C35, P0C63, or P1A5D

P0A9D, P0A9E, P0AC7, P0AC8, P0ACC, P0ACD, P0AEA, P0AEB, P0BC4, P0BC5, P0C35, and P0C36

- The 12 V battery voltage is greater than 8.8 V
- Battery energy control module is awake and communicating
- DTC P1A5D is not set

Conditions for Setting the DTC

P0A9C, P0AC6, P0ACB, P0AE9, P0BC3, and P0C34

The difference between a single battery temperature sensor and an average of the other battery temperature sensors is greater than 25°C (45°F)

P0A9D, P0AC7, P0ACC, P0AEA, P0BC4, and P0C35

The hybrid battery temperature sensor is greater than 87°C (188.2°F)

P0A9E, P0AC8, P0ACD, P0AEB, P0BC5, and P0C36

The hybrid battery temperature sensor is less than -39°C (-38.2°F)

Action Taken When the DTC Sets

DTCs P0A9C, P0A9D, P0A9E, P0AC6, P0AC7, P0AC8, P0ACB, P0ACC, P0ACD, P0AE9, P0AEA, P0AEB, P0BC3, P0BC4, P0BC5, P0C34, P0C35, and P0C36 are type B DTCs

3. All OK.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection

Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
 - **Visually and functionally inspect the gloves before use.**
 - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

WARNING: The eAssist battery pack assembly will utilize an exchange program. Please consult the most recent revision of bulletin/PI# PIC5520, available in Service Information (SI), for a list of approved eAssist battery pack assembly service procedures. Components that may be removed and serviced without exchanging the complete battery pack assembly are identified in the bulletin/PI. Please contact the GM Technical Assistance Center (1-877-446-8227) if you have any questions.

NOTE: In High Voltage Disabling , perform the disabling procedure for servicing components within the A4 Hybrid/EV Battery Pack. The C4A Hybrid/EV Battery Section 1 and C4B Hybrid/EV Battery Section 2 will be disconnected as part of the disabling procedure.

1. Ignition OFF, disable the high voltage at the A4 Hybrid/EV Battery Pack. Refer to **High Voltage Disabling** .
2. Determine which battery temperature sensor is not between -39° and 60°C (-38.2 and 140°F) by observing the scan tool Battery Energy Control Module Battery Temperature parameters.
3. Disconnect the X2 and X3 harness connectors at the K16 Battery Energy Control Module.
4. Test for 8-13k ohms at 19-24°C (66.2-75.2°F) between the appropriate temperature sensor signal circuit terminal and the low reference circuit terminal listed below:

- Temperature sensor 1 - Signal circuit terminal 2 X2 and low reference circuit terminal 7 X2
- Temperature sensor 2 - Signal circuit terminal 1 X2 and low reference circuit terminal 6 X2
- Temperature sensor 3 - Signal circuit terminal 4 X2 and low reference circuit terminal 9 X2
- Temperature sensor 4 - Signal circuit terminal 2 X3 and low reference circuit terminal 7 X3
- Temperature sensor 5 - Signal circuit terminal 1 X3 and low reference circuit terminal 6 X3
- Temperature sensor 6 - Signal circuit terminal 4 X3 and low reference circuit terminal 9 X3
- **If not between 8-13k ohms**

Replace the C4A Hybrid/EV Battery Section 1 and C4B Hybrid/EV Battery Section 2.

- **If between 8-13k ohms**

5. Replace the K16 Battery Energy Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Generator Battery Replacement**
- **Control Module References** for battery energy control module replacement, programming, and setup.

DTC P0C32: HYBRID/EV BATTERY PACK COOLING SYSTEM PERFORMANCE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0C32

Hybrid/EV Battery Pack Cooling System Performance

Circuit/System Description

The Hybrid/EV Battery Pack Cooling Fan draws air through the Hybrid/EV Battery Pack to control the temperature of the Hybrid/EV Battery Pack. To operate, the cooling fan receives an enable signal from the Starter/Generator Control Module. The enable control is controlled by a discrete high side driver in the Starter/Generator Control Module. When the enable control circuit is high, the fan will be enabled. The fan speed is controlled by a fan control circuit in the Starter/Generator Control Module, by changing the duty cycle. Maximum fan speed is 3900 RPM.

The Hybrid/EV Battery Pack cooling system consists of the Hybrid/EV Battery Pack Cooling Fan pulling air through a set of porous ducts within the Hybrid/EV Battery Pack. These ducts direct air through the Hybrid/EV

Battery Sections and under the Starter/Generator Control Module, where the air passes by various heat sinks and cavities to cool the internal electronic components. The performance diagnostic for the hybrid battery pack cooling fan is a functional check for the fan. The fan control feature uses the outcome of this diagnostic to take emissions related remedial actions. The Hybrid/EV Battery Pack cooling system performance diagnostic determines if the cooling system is providing the expected amount of conditioning. The Hybrid/EV Battery Pack Cooling Fan not spinning at the commanded speed or a blocked duct are examples of conditions of reduced performance.

The Starter/Generator Control Module uses a temperature model to predict the temperature of the 14 volt power module, an internal electronic component of the Starter/Generator Control Module. The Starter/Generator Control Module compares this predicted temperature to the 14 volt power module temperature sensor 1. With the Hybrid/EV Battery Pack Cooling Fan operating, the predicted 14 volt power module temperature and the 14 volt power module temperature sensor 1 should be nearly the same.

Conditions for Running the DTC

- Ignition is RUN or CRANK
- No power mode DTCs are set
- None of the following DTCs are set: P0A81, P0A84, P0A85, P0A88, P0A89, P0AAD, P0AAE, P0AAF, P0D64, P0D65, P0D66, P1A90, P1A92, P1AE8, P1AE9, P1AEC, U182A
- Hybrid battery pack temperature is greater than -10°C (14°F)
- The battery pack inlet temperature sensor is greater than -10°C (14°F)
- The battery pack cooling fan speed is greater than 29%
- 14 volt power module power is greater than 0.1 Kwatt
- The number of non-faulted battery cell temperature sensors is greater than 4
- Propulsion system is active for a minimum of 150 seconds
- Within the past 180 seconds, the 14 volt power module power has not changed more than 0.6 Kwatts over a time of 30 seconds

Conditions for Setting the DTC

The predicted temperature of the Hybrid/EV Battery Pack is more than 15°C (27°F) higher or lower than the actual measured 14 volt power module temperature sensor 1

Action Taken When the DTC Sets

DTC P0C32 is a type B DTC

Conditions for Clearing the DTC

DTC P0C32 is a type B DTC

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following

Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
 - **Visually and functionally inspect the gloves before use.**
 - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

WARNING: The eAssist battery pack assembly will utilize an exchange program. Please consult the most recent revision of bulletin/PI# PIC5520, available in Service Information (SI), for a list of approved eAssist battery pack assembly service procedures. Components that may be removed and serviced without exchanging the complete battery pack assembly are identified in the bulletin/PI. Please contact the GM Technical Assistance Center (1-877-446-8227) if you have any questions.

1. Visually inspect the inlet and outlet of the Hybrid/EV Battery Pack Cooling Fan ducts.
2. Verify the inlet and outlet are free of any debris or obstructions that will limit airflow through the duct.
 - **If any debris or obstructions are found**

Remove the obstruction to allow proper airflow and allow the Hybrid/EV Battery Pack to cool before retesting.

- **If no debris or obstructions are found**

3. Verify the Hybrid/EV Battery Pack Cooling Fan ducts are properly secured and are not crimped, crushed, or deformed in a manner that will limit airflow through the duct.
 - **If the ducts are unsecured or damaged**

Repair or replace as necessary and allow the Hybrid/EV Battery Pack to cool before retesting.

- **If the ducts are properly secured and undamaged**

4. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the G14 Hybrid/EV Battery Pack Cooling Fan. It may take up to 2 minutes for all vehicle systems to power down.
5. Test for less than 10 ohms between the ground circuit terminal 1 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms between the ground circuit terminal 1 and ground.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, repair the open/high resistance in the ground connection.
- **If less than 10 ohms**
- 6. Ignition ON.
- 7. Verify a test lamp illuminates between the B+ circuit terminal 5 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the G14 Hybrid/EV Battery Pack Cooling Fan.
 - **If the test lamp illuminates**
- 8. Verify that the Hybrid/EV Battery Pack Cooling Fan speed increases and decreases as the Hybrid Battery Fan Speed is commanded from 10%-90% with a scan tool.
 - **If the fan speed does not change**

Replace the G14 Hybrid/EV Battery Pack Cooling Fan.
 - **If the fan speed changes**
- 9. Monitor the airflow at the intake duct and outlet duct while commanding the Hybrid Battery Fan Speed from 10%-90% with a scan tool. The actual airflow should increase as the fan speed is increased.
 - **If the airflow does not increase**
 1. Ignition OFF, disable the high voltage at the A4 Hybrid/EV Battery Pack. Refer to **High Voltage Disabling**.
 2. Remove any debris or obstructions that may limit airflow in the cooling ducts through the A4 Hybrid/EV Battery Pack and the heat sink under the K59 Starter/Generator Control Module.
 - **If the airflow increases**
- 10. Verify the scan tool Battery Energy Control Module Battery Temperature parameters are all between -39° and 60°C (-38.2 and 140°F).
 - **If not between -39° and 60°C (-38.2 and 140°F)**

Replace the C4A Hybrid/EV Battery Section 1 and C4B Hybrid/EV Battery Section 2.
 - **If between -39° and 60°C (-38.2 and 140°F)**
- 11. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Generator Battery Replacement**
- **Drive Motor Battery Cooling Blower Outlet Duct Replacement**
- **Drive Motor Battery Cooling Air Outlet Duct Replacement**
- **Drive Motor Battery Cooling Air Inlet Upper Duct Replacement**
- **Drive Motor Battery Cooling Blower Replacement**
- **Control Module References** for Starter/Generator Control Module replacement, programming, and setup

DTC P0CC1-P0CC4: GENERATOR CONTROL MODULE COOLANT PUMP MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Component Ground	-	1	-	-
1. Starter/generator control module coolant pump inoperative				

2. Starter/generator control module coolant pump always on

Circuit/System Description

The Starter/Generator Control Module coolant pump is a single speed ON/OFF pump that circulates coolant through the auxiliary radiator and the starter/generator to control the temperature of the starter/generator. The starter/generator cooling system is separate from the engine cooling system and does not share any coolant or components. The Starter/Generator Control Module coolant pump is controlled by the starter/generator coolant pump relay. This relay is a printed circuit board relay and integrated as part of the underhood fuse block. The relay switch and coil both receive B+. The Starter/Generator Control Module controls the relay coil by applying ground to the coil control circuit. With the coil grounded, the relay switch is closed and voltage is sent to the Starter/Generator Control Module coolant pump, which will begin circulating coolant.

The Starter/Generator Control Module uses the exponentially weighted moving average to calculate temperature fluctuations in the starter/generator cooling system. In addition, this diagnostic compares the temperature rate of change by a slope calculation within a set time when the Starter/Generator Control Module coolant pump turns ON. This diagnostic runs once after pump turns ON. If the temperature changes over time too quickly, the Starter/Generator Control Module will indicate a fault.

Conditions for Running the DTC

P0CC1 or P0CC3

- Ignition is RUN or CRANK
- Starter/generator control module coolant pump control is inactive

P0CC2

- Ignition is RUN or CRANK
- 12 V battery voltage is greater than 10 V
- Starter/generator control module coolant pump control is active
- DTC P0A2B, P0A2C, P0A2D, P0CC1, P0CC3, P0CC4, P0CBD, P0CBE, or P0CBF is not set
- The predicted difference between the coolant temperature in the starter/generator and the coolant temperature as measured by the hybrid electronics coolant temperature sensor is greater than 17°C (31°F)

P0CC4

- Ignition is RUN or CRANK
- Starter/generator control module coolant pump control is active

Conditions for Setting the DTC

P0CC1

An open is detected on the starter/generator coolant pump relay control circuit.

P0CC2

The coolant temperature is 0.25°C/s greater than the maximum cooling system performance temperature.

P0CC3

A short to ground is detected on the starter/generator coolant pump relay control circuit.

P0CC4

A short to voltage is detected on the starter/generator coolant pump relay control circuit.

Action Taken When the DTC Sets

DTCs P0CC1, P0CC2, P0CC3, and P0CC4 are type B DTCs

Conditions for Clearing the DTC

DTCs P0CC1, P0CC2, P0CC3, and P0CC4 are type B DTCs

Special Tools

EL-48900 HEV Safety Kit

For equivalent regional tools, refer to **Special Tools** .

Circuit/System Verification

1. Verify the coolant level of the starter/generator cooling system is normal.

- **If the coolant level is low**

Inspect the starter/generator cooling system for any leaks.

- **If the coolant level is normal**

2. Verify the starter/generator cooling system auxiliary radiator is clear of any debris, bent fins, or other damage which may inhibit airflow.

- **If debris are found**

Clean the auxiliary radiator.

- **If damage is found**

Replace the auxiliary radiator.

- **If the coolant level is normal**

3. Verify the starter/generator cooling system hoses are properly routed and are not kinked.

- **If any hoses are improperly routed or kinked**

Remove and properly route the hose.

- **If all hoses are routed properly and are not kinked**

4. Ignition ON.

5. Verify the G43 Starter/Generator Coolant Pump turns ON and OFF when commanding the Motor Coolant Pump Relay Enable ON and OFF with a scan tool. The G22 Starter/Generator Control Module coolant pump will make an audible noise during operation.

- **If the G43 Starter/Generator Coolant Pump does not turn ON and OFF**

Refer to Circuit/System Testing.

- **If the G43 Starter/Generator Coolant Pump turns ON and OFF**

6. All OK.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

WARNING: The eAssist battery pack assembly will utilize an exchange program. Please consult the most recent revision of bulletin/PI# PIC5520, available in Service Information (SI), for a list of approved eAssist battery pack assembly service procedures. Components that may be removed and serviced without exchanging the complete battery pack assembly are identified in the bulletin/PI. Please contact the GM Technical Assistance Center (1-877-446-8227) if you have any questions.

1. Ignition OFF, disconnect the X2 harness connector at the K50A Fuse Block - Underhood.
2. Connect a test lamp between the control circuit terminal 11 and B+, ignition ON.
3. Verify the test lamp turns ON and OFF when commanding the Motor Coolant Pump Relay Enable ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the harness connector at the K59 Starter/Generator Control Module, ignition ON.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V

3. Ignition OFF.
4. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K59 Starter/Generator Control Module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the harness connector at the K59 Starter/Generator Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K59 Starter/Generator Control Module.
 - **If the test lamp turns ON and OFF**
4. Ignition OFF and all vehicle systems OFF, connect the X2 harness connector at the K50A Fuse Block - Underhood. Disconnect the harness connector at the G43 Starter/Generator Coolant Pump. It may take up to 2 minutes for all vehicle systems to power down.
5. Test for less than 10 ohms between the ground circuit terminal 2 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
6. Connect a test lamp between the control circuit terminal 1 and ground.
7. Verify the test lamp turns ON and OFF when commanding the Motor Coolant Pump Relay Enable ON and OFF with a scan tool.
 - **If the test lamp is always OFF and the circuit fuse is good**
 1. Ignition OFF, disconnect the X2 harness connector at the X50A Fuse Block - Underhood.
 2. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the X50A Fuse Block - Underhood.
 - **If the test lamp is always OFF and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, test or replace the G43 Starter/Generator Coolant Pump.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X2 harness connector at the X50A Fuse Block - Underhood, ignition ON.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.

- If less than 1 V, replace the X50A Fuse Block - Underhood.
 - **If the test lamp turns ON and OFF**
8. Test or replace the G43 Starter/Generator Coolant Pump.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	P0CBE	P0CBF	P0CBF	P0CBD
Low Reference	-	P0CBF	-	-

Circuit/System Description

The hybrid electronics coolant temperature sensor is a variable resistor that measures the temperature of the starter/generator coolant. The Starter/Generator Control Module supplies 5 V to the signal circuit and a ground for the low reference circuit. The hybrid electronics coolant temperature sensor resistance changes with starter/generator coolant temperature. As the temperature decreases, the sensor resistance increases. As the

temperature increases, the sensor resistance decreases. The Starter/Generator Control Module monitors the hybrid electronics coolant temperature sensor to determine the temperature of the starter/generator coolant. As the coolant temperature changes, the Starter/Generator Control Module will turn the Starter/Generator Control Module coolant pump ON or OFF to accommodate the starter/generator cooling requirements.

The Starter/Generator Control Module performs a rationality diagnostic that compares the hybrid electronics coolant temperature sensor signal to the average temperature of the starter/generator stator, engine intake air temperature, and transmission fluid temperature. This diagnostic gets one chance to run during a drive cycle after a specific vehicle OFF time.

Conditions for Running the DTC

P0CBD

- Ignition is RUN or CRANK
- Engine off time is greater than six hours
- Starter/generator control module internal clock diagnostic is not faulted
- None of the following DTCs are set: P0111, P0112, P0113, P0114, P0711, P0712, P0713, P0A2B, P0A2C, P0A2D, P0CBF, POCBE, P262B, U0100, U0101

P0CBE or P0CBF

- Ignition is RUN or CRANK
- Starter/generator control module internal coolant temperature monitoring and diagnostics are enabled

Conditions for Setting the DTC

P0CBD

The hybrid electronics coolant temperature sensor is more than 25°C (45°F) higher or lower than the average temperature of the starter/generator stator, engine intake air temperature, and transmission fluid temperature.

P0CBE

The drive motor coolant temperature sensor resistance is less than 100.7 ohms.

P0CBF

The drive motor coolant temperature sensor resistance is greater than 176,962 ohms.

Action Taken When the DTC Sets

DTC P0CBD-P0CBF are type B DTCs

Conditions for Clearing the DTC

DTC P0CBD-P0CBF are type B DTCs

Circuit/System Verification

1. Verify the coolant level of the starter/generator cooling system is normal.
 - **If the coolant level is low**

Inspect the starter/generator cooling system for any leaks.

- **If the coolant level is normal**
2. Verify the starter/generator cooling system auxiliary radiator is clear of any debris, bent fins, or other damage which may inhibit airflow.
 - **If debris are found**

Clean the auxiliary radiator.

- **If damage is found**

Replace the auxiliary radiator.

- **If no damage or debris are found**

3. Verify the starter/generator cooling system hoses are properly routed and are not kinked.

- **If any hoses are improperly routed or kinked**

Removed and properly route the hose.

- **If all hoses are routed properly and are not kinked**

4. Ignition ON.

5. Verify the scan tool Motor A Coolant Temperature Sensor parameter is between -40°C and 85°C.

- **If not between -40°C and 85°C**

Refer to Circuit/System Testing.

- **If between -40°C and 85°C**

6. All OK.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.

- **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

WARNING: The eAssist battery pack assembly will utilize an exchange program. Please consult the most recent revision of bulletin/PI# PIC5520, available in Service Information (SI), for a list of approved eAssist battery pack assembly service procedures. Components that may be removed and serviced without exchanging the complete battery pack assembly are identified in the bulletin/PI. Please contact the GM Technical Assistance Center (1-877-446-8227) if you have any questions.

1. Ignition OFF, disconnect the harness connector at the B235 Starter/Generator Coolant Temperature Sensor.
2. Test for less than 10 ohms between the low reference circuit terminal B and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF, disconnect the X3 harness connector at the K59 Starter/Generator Control Module.
 2. Test for less than 2 ohms between the low reference circuit terminal B and ground.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K59 Starter/Generator Control Module.
 - **If less than 10 ohms**
3. Ignition ON.
4. Test for 4.8-5.2 V between the signal circuit terminal A and ground.
 - **If less than 4.8 V**
 1. Ignition OFF, disconnect the X3 harness connector at the K59 Starter/Generator Control Module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. . Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit
 - If less than 2 ohms, replace the K59 Starter/Generator Control Module.
 - **If greater than 5.2 V**
 1. Ignition OFF, disconnect the X3 harness connector at the K59 Starter/Generator Control Module.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, test the signal circuit for a short to voltage.
 - If less than 1 V, replace the K59 Starter/Generator Control Module.
 - **If between 4.8-5.2 V**
5. Test or replace the B235 Starter/Generator Coolant Temperature Sensor.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Auxiliary Radiator Replacement - Hybrid/EV battery pack coolant temperature sensor 1 replacement
- Control Module References for Starter/Generator Control Module replacement, programming, and setup

REPAIR INSTRUCTIONS

COOLANT RECOVERY RESERVOIR BRACKET REPLACEMENT

Fig. 3: Coolant Recovery Reservoir Bracket
Courtesy of GENERAL MOTORS COMPANY

Coolant Recovery Reservoir Bracket Replacement

Callout	Component Name
Preliminary Procedure Remove the drive motor battery cool air separator from the bracket without disconnecting any hoses. Refer to <u>Drive Motor Battery Coolant/Air Separator Replacement</u> .	
1	Coolant Recovery Reservoir Fastener CAUTION: Refer to <u>Fastener Caution</u> .

	Tighten 4 (35 lb in)
2	Coolant Recovery Reservoir Bracket

AUXILIARY RADIATOR REPLACEMENT

Fig. 4: Auxiliary Radiator & Fasteners

BATTERY COOLING AIR INLET DUCT REPLACEMENT

Removal Procedure

1. Disable the hybrid battery. Refer to High Voltage Disabling .

Fig. 25: Battery Cooling Air Inlet Duct And Retainers
Courtesy of GENERAL MOTORS COMPANY

2. Remove the drive motor battery cooling air inlet upper duct retainers (1). Refer to **Drive Motor Battery Cooling Air Inlet Upper Duct Replacement**.

Fig. 26: Battery Cooling Air Inlet Ducts
Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not insert fingers into the vent area.

3. Detach the battery cooling air inlet ducts (1) by using a suitable pry tool on the outside.

Installation Procedure

Fig. 27: Battery Cooling Air Inlet Ducts
Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not insert fingers into the vent area.

1. Attach the battery cooling air inlet ducts (1) into the slotted receivers.

Fig. 28: Battery Cooling Air Inlet Duct And Retainers
 Courtesy of GENERAL MOTORS COMPANY

NOTE: Make sure the duct is flush against the cover.

2. Install the drive motor battery cooling air inlet upper duct into the slots with the retainers (1). Refer to **Drive Motor Battery Cooling Air Inlet Upper Duct Replacement**.
3. Enable the hybrid battery. Refer to **High Voltage Enabling** .

DESCRIPTION AND OPERATION

HYBRID COOLING SYSTEM DESCRIPTION AND OPERATION

Hybrid/EV Battery Pack Cooling

Within the Hybrid/EV Battery Pack, the Hybrid/EV Battery Section 1, Hybrid/EV Battery Section 2, and Starter/Generator Control Module are air cooled. Air is drawn in by the Hybrid/EV Battery Pack Cooling Fan from the vehicle's passenger compartment. This air travels through a series of ducts into the Hybrid/EV Battery Pack. Once inside the Hybrid/EV Battery Pack, the air travels through the Hybrid/EV Battery Section 1 and Hybrid/EV Battery Section 2. The internal battery cells of the Hybrid/EV Battery Section 1 and Hybrid/EV Battery Section 2 are arranged in a staggered manner that allows maximum cooling as air travels through the

battery sections. The air is then drawn under the Starter/Generator Control Module. The underside of the Starter/Generator Control Module have a series of heat sinks that allowing cooling of the internal electronics and capacitors. Air exits the Hybrid/EV Battery Pack through a duct and is drawn through the Hybrid/EV Battery Pack Cooling Fan. From the fan, air is exhausted into the vehicle's rear compartment through a series of ducts.

The cooling needs of the Hybrid/EV Battery Pack is determined through the use of a series of temperature sensors. Six temperature sensors are used to monitor the temperature of the Hybrid/EV Battery Section 1 and Hybrid/EV Battery Section 2 cell groups. The Starter/Generator Control Module commands the Hybrid/EV Battery Pack Cooling Fan to provide more or less air as the battery temperature increases or decreases. A single temperature sensor is used to monitor the air temperature of the incoming cooling air.

The Hybrid/EV Battery Pack cooling system contains the following serviceable components:

- Hybrid/EV Battery Pack Case
- Hybrid/EV Battery Section 1
- Hybrid/EV Battery Section 2
- Battery Energy Control Module
- Starter/Generator Control Module
- Hybrid/EV Battery Pack Cooling Fan

Hybrid/EV Battery Pack

The Hybrid/EV Battery Pack is integral to the Hybrid/EV Battery Pack cooling system. Foam gaskets are adhered to the metal battery pack tray. This seals the underside of the Starter/Generator Control Module to ensure proper airflow under the control module for cooling purposes. The Hybrid/EV Battery Pack case cover also provides a mounting surface for the Hybrid/EV Battery Pack Cooling Fan and has openings where the plastic vents are allowed to pass into the Hybrid/EV Battery Pack to direct air through components which require cooling.

Hybrid/EV Battery Section 1 and Hybrid/EV Battery Section 2

The hybrid battery sections are air cooled. Each battery case has an air inlet and an air outlet. Air is drawn through the battery case to cool the individual cells. Six temperature sensors are used to monitor the battery temperature. The battery temperature sensors are located in the battery sections. Two of the temperature sensors are located on the top of the battery section and the remaining four are located on the bottom of the section. The temperature sensor is a variable resistor that measures the temperature of the battery cell group.

Battery Energy Control Module

The battery energy control module measures critical temperatures within the two battery sections and at the Hybrid/EV Battery Section 1 air inlet. Six temperature sensors are used to monitor the battery temperature. The battery temperature sensors are located in the battery sections. Two of the temperature sensors are located on the top of the battery section and the remaining four are located on the bottom of the section. The temperature sensor is a variable resistor that measures the temperature of the battery cell group. The battery energy control module supplies 5 V to the signal circuit and a ground for the low reference circuit. The battery temperature

sensor resistance changes with battery temperature. As the temperature decreases, the sensor resistance increases. As the temperature increases, the sensor resistance decreases. The air inlet temperature sensor operates in much the same way, except that it measures the temperature of the incoming air used to cool the Hybrid/EV Battery Pack at the Hybrid/EV Battery Section 1 air inlet. None of the temperature sensors or the temperature sensor harness is serviceable. They are all serviced as part of the battery sections.

Starter/Generator Control Module

The Starter/Generator Control Module uses temperature information from the battery energy control module to control the Hybrid/EV Battery Pack Cooling Fan and increase or decrease the cooling capacity. As battery cell temperature increases, the start/generator control module will command the Hybrid/EV Battery Pack Cooling Fan speed to increase, increasing the air flow through the Hybrid/EV Battery Pack. The Starter/Generator Control Module may also command the fan on in low ambient temperatures to aid in the warming of the battery cells. If the ambient temperature of the air in the passenger compartment, where the cooling air is drawn from, is warmer than the battery cell temperatures, it may be used to help warm the cells more quickly. The Starter/Generator Control Module will use the air inlet temperature sensor to determine the temperature of the incoming air.

Hybrid/EV Battery Pack Cooling Fan

The Hybrid/EV Battery Pack Cooling Fan draws air through the Hybrid/EV Battery Pack to control the temperature of the Hybrid/EV Battery Section 1, Hybrid/EV Battery Section 2, and Starter/Generator Control Module. To operate, the cooling fan receives an enable signal from the Starter/Generator Control Module. The enable control is controlled by a discrete high side driver in the Starter/Generator Control Module. When the enable control circuit is high, the fan will be enabled. The fan speed is controlled by a pulsed high side driver in the Starter/Generator Control Module. The greater the duty cycle on the fan speed signal circuit, the higher the fan speed. Maximum fan speed is 3900 RPM. The Hybrid/EV Battery Pack Cooling Fan provides a low-side drive, pulse-width modulated feedback signal to the Starter/Generator Control Module. During normal operation, this feedback signal provides fan speed information. The Hybrid/EV Battery Pack Cooling Fan has limited self-diagnostic capability. If the fan determines there is an internal fault, it will provide this information on the feedback circuit.

Starter/Generator Cooling

The starter/generator is liquid cooling using a stand-alone cooling system that is separate from the engine's cooling system.

The starter/generator cooling system contains the following serviceable components:

- Starter/Generator Control Module
- Starter/Generator Coolant Temperature Sensor
- Starter/Generator Coolant Pump

Starter/Generator Control Module

The Starter/Generator Control Module monitors the starter/generator coolant temperature sensor. When the coolant temperature indicates that starter/generator cooling is required, the Starter/Generator Control Module

commands the starter/generator coolant pump on. The Starter/Generator Control Module provides ground to the starter/generator coolant pump relay coil through a dedicated low side driver. The will cause the starter/generator coolant pump relay switch to closed, providing B+ to the starter/generator coolant pump.

Starter/Generator Coolant Temperature Sensor

The starter/generator coolant temperature sensor is a variable resistor that measures the temperature of the starter/generator coolant. The Starter/Generator Control Module supplies 5 V to the signal circuit and a ground for the low reference circuit. The starter/generator coolant temperature sensor resistance changes with starter/generator coolant temperature. As the temperature decreases, the sensor resistance increases. As the temperature increases, the sensor resistance decreases. The Starter/Generator Control Module monitors the starter/generator coolant temperature sensor to determine the temperature of the starter/generator coolant. As the coolant temperature changes, the Starter/Generator Control Module will turn the starter/generator coolant pump on or off to accommodate the starter/generator cooling requirements.

Starter/Generator Coolant Pump

The drive motor coolant pump is a single speed ON/OFF pump that circulates coolant through the starter/generator radiator and the starter/generator to control the temperature of the starter/generator.

DIAGNOSTIC INFORMATION AND PROCEDURES

HIGH VOLTAGE SAFETY

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters

(50 feet) of the vehicle, either indoors or outdoors.

- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

WARNING: High voltage circuits should only be tested using a digital multimeter (DMM) and test leads with at least a CAT III rating, such as the J 39200-A Digital Multimeter. Failure to follow the procedures may result in serious injury or death.

WARNING: This vehicle is equipped with a high voltage battery that is completely isolated from the chassis ground. Never utilize AC powered test equipment to probe the high voltage system. Serious injury, death and component damage could occur if the high voltage system is grounded through the electric utility.

Failure to follow the procedure exactly as written may result in serious injury or death.

Special Tools

EL-48900 HEV Safety Kit

For equivalent regional tools, refer to **Special Tools**.

Precautions when Performing Service or Inspections

- Always verify that the high voltage has been disabled before working on or around high voltage components, wires, cables, or harnesses.
- Remove all metal objects such as rings and watches.
- The **EL-48900** HEV safety kit contains safety cones. Place the safety cones around the vehicle to alert other technicians that you are working on the high voltage system.
- Remove all vehicle keys and secure in a location outside the vehicle. If the vehicle is equipped with push button start, the keys must remain at least 3 meters (15 feet) from the vehicle.
- Ensure that the manual service disconnect lever is secured in the open position with a zip tie.
- Always wear certified and tested high voltage insulation gloves when inspecting or testing any high voltage wires and components.
- Use the "One Hand" rule:
 - Work with only one hand whenever possible.

- Keep the other hand behind your back.
- DO NOT carry any metal objects such as a mechanical pencil or a measuring tape that could fall and cause a short circuit.
- After removing any high voltage wires, protect and insulate the terminal ends immediately with UL® Listed or equivalent insulation tape rated at a minimum of 600 V.
- Always tighten the high voltage terminal fasteners to the specified torque. Insufficient or excessive torque will cause malfunctions or damage.
- After finishing work on the high voltage systems and before closing the manual service disconnect lever, inspect for the following:
 - Verify high voltage system integrity and that all connectors are installed.
 - Verify that all tools or loose components have been removed.

Labels for Components, Wire Harness, and Connectors

The wire harnesses and cables for high voltage circuits are encased in an orange colored covering. In addition, the high voltage energy storage device (battery) is affixed with a RED DANGER label and other high voltage components (e.g. Starter/Generator) are affixed with ORANGE WARNING labels.

High Voltage Insulation Glove Inspection Procedure

Fig. 4: Glove Inspection Procedure
Courtesy of GENERAL MOTORS COMPANY

The following procedure visually and functionally inspects the insulation gloves to be used while performing service on high voltage systems. This inspection procedure should be performed prior to any procedure that requires the use of class "0" insulation gloves rated at 1000 V.

1. Remove glove from leather protector.
2. Inflate glove and seal opening. Pinch the opening closed tightly to prevent any air loss.
3. Press glove to increase pressure.
4. Inspect for any of the following conditions:
 - Pin holes
 - Air leaks
 - Wear, tears, or abrasions
 - Damp or wet material
 - Certified up-to-date
 - If any of the above conditions exist, do not use the gloves.

HIGH VOLTAGE DISABLING

WARNING: Ensure all High Voltage safety procedures are followed. Failure to follow the procedure exactly as written may result in serious injury or death.

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.

- **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

Servicing the A4 Hybrid/EV Battery Pack, A15 Starter/Generator, High Voltage 3-Phase Cables, and General Vehicle Servicing

This disabling procedure should only be used when service is being performed on components that are located outside of the A4 Hybrid/EV Battery Pack, such as the A15 Starter/Generator and high voltage 3-phase cables, or when the A4 Hybrid/EV Battery Pack is being replaced as a complete assembly. This procedure will only verify that high voltage has been removed from locations outside the A4 Hybrid/EV Battery Pack. If testing or replacement requires disassembling the A4 Hybrid/EV Battery Pack and accessing any components within, Servicing Any Internal Components Within the A4 Hybrid/EV Battery Pack, located below, must be used. The Servicing Any Internal Components Within the A4 Hybrid/EV Battery Pack procedure must be used because of the constant presence of high voltage when the A4 Hybrid/EV Battery Pack is disassembled.

1. Review the high voltage safety information. Refer to **High Voltage Safety**.
2. Disconnect and remove any 12 V battery chargers.
3. Turn the ignition OFF and wait 5 minutes to allow the high voltage capacitors to discharge.
4. Remove all vehicle keys and secure in a location outside the vehicle. If the vehicle is equipped with push button start, the keys must remain at least 3 meters (10 feet) away from the vehicle.
5. Disconnect the 12 V battery. Refer to **Battery Negative Cable Disconnection and Connection** .
6. Lower the rear seatback and reposition the trunk liner to gain access to the A4 Hybrid/EV Battery Pack.

Fig. 5: Blue Connector Position Assurance
Courtesy of GENERAL MOTORS COMPANY

7. Disengage the blue connector position assurance (1) from the high voltage interlock switch by pulling the CPA straight out. Do not fully remove the CPA from the switch or damage to the CPA will result.

Fig. 6: Blue Connector Position Assurance
Courtesy of GENERAL MOTORS COMPANY

8. Depress the tab on the high voltage interlock switch and slide the interlock switch toward the left side of the vehicle (2).

Fig. 7: Blue Connector Position Assurance
Courtesy of GENERAL MOTORS COMPANY

9. Flip the S15 Hybrid/EV Battery Pack High Voltage Manual Disconnect Lever, located on the A4 Hybrid/EV Battery Pack, toward the right side of the vehicle and secure in the open position with a zip tie (3).

WARNING: Wear high voltage insulation gloves with leather protectors until it has been determined that a high voltage exposure risk is no longer present. Failure to follow the procedures exactly as written may result in serious injury or death.

NOTE: Repeated removal of the cover during service may cause the cover spacers to become loose and eventually separate from the cover. Take care when removing the cover so that none of these potentially loose spacers fall into an inaccessible location.

10. Remove the F102 Hybrid/EV Battery Pack Cable Cover from the A4 Hybrid/EV Battery Pack.

NOTE: A 9 V DC battery can be used to test the DMM.

11. Test the DMM by measuring a 12 V battery. The reading on the DMM should accurately reflect the battery voltage.

- **If the DMM does not properly measure a 12 V battery**

Repair or replace the DMM.

- **If the DMM properly measures a 12 V battery**

Fig. 8: Phase Terminal V, U And W

Courtesy of GENERAL MOTORS COMPANY

12. Verify that the voltage has been disabled at the energy storage system. Using the DMM on the DC voltage scale, test for less than 3 V at the following points:

- High voltage 3-Phase terminal V to vehicle chassis ground
- High voltage 3-Phase terminal W to vehicle chassis ground
- High voltage 3-Phase terminal U to vehicle chassis ground
- High voltage 3-Phase terminal U to High voltage 3-Phase terminal V
- High voltage 3-Phase terminal V to High voltage 3-Phase terminal W
- High voltage 3-Phase terminal W to High voltage 3-Phase terminal U

- **If 3 V or greater**

A contactor is stuck closed or a loss of isolation has occurred within the A4 Hybrid/EV Battery Pack. Refer to **Hybrid\EV Battery Voltage Present**.

- **If less than 3 V**

NOTE: A 9 V DC battery can be used to test the DMM.

13. Test the DMM by measuring a 12 V battery. The reading on the DMM should accurately reflect the battery voltage.

- **If the DMM does not properly measure a 12 V battery**

Repair or replace the DMM and perform Step 11 again.

- **If the DMM properly measures a 12 V battery**

14. If all the test results were less than 3 V, the A4 Hybrid/EV Battery Pack, A15 Starter/Generator, high voltage 3-phase cables, or general vehicle can now be serviced.

Servicing Any Internal Components Within the A4 Hybrid/EV Battery Pack

This disabling procedure should be used when any service is being performed on components that are internal to the A4 Hybrid/EV Battery Pack, such as the K59 Starter/Generator Control Module and K16 Battery Energy Control Module. If a diagnostic instructs to perform any testing or replacement of components within the A4 Hybrid/EV Battery Pack, this procedure must be used. This procedure will completely disconnect and isolate the C4A Hybrid/EV Battery Section 1 and C4B Hybrid/EV Battery Section 2 from the vehicle, allowing testing or replacement to occur in a safer environment.

1. Review the high voltage safety information. Refer to **High Voltage Safety**.
2. Disconnect and remove any 12 V battery chargers.
3. Turn the ignition OFF and wait 5 minutes to allow the high voltage capacitors to discharge.
4. Remove all vehicle keys and secure in a location outside the vehicle. If the vehicle is equipped with push button start, the keys must remain at least 3 meters (10 feet) away from the vehicle.
5. Disconnect the 12 V battery. Refer to **Battery Negative Cable Disconnection and Connection** .
6. Lower the rear seatback and reposition the trunk liner to gain access to the A4 Hybrid/EV Battery Pack.

Fig. 9: Blue Connector Position Assurance
Courtesy of GENERAL MOTORS COMPANY

7. Disengage the blue connector position assurance (1) from the high voltage interlock switch by pulling the CPA straight out. Do not fully remove the CPA from the switch or damage to the CPA will result.

Fig. 10: Blue Connector Position Assurance
Courtesy of GENERAL MOTORS COMPANY

8. Depress the tab on the high voltage interlock switch and slide the interlock switch (2) toward the left side of the vehicle.

Fig. 11: Blue Connector Position Assurance
Courtesy of GENERAL MOTORS COMPANY

9. Flip the S15 Hybrid/EV Battery Pack High Voltage Manual Disconnect Lever, located on the A4 Hybrid/EV Battery Pack, toward the right side of the vehicle and secure in the open position with a zip tie (3).

WARNING: Wear high voltage insulation gloves with leather protectors until it has been determined that a high voltage exposure risk is no longer present. Failure to follow the procedures exactly as written may result in serious injury or death.

NOTE: Repeated removal of the cover during service may cause the cover spacers to become loose and eventually separate from the cover. Take care when removing the cover so that none of these potentially loose spacers fall into an inaccessible location.

10. Remove the F102 Hybrid/EV Battery Pack Cable Cover from the A4 Hybrid/EV Battery Pack.

NOTE: A 9 V DC battery can be used to test the DMM.

11. Test the DMM by measuring a 12 V battery. The reading on the DMM should accurately reflect the battery voltage.

- If the DMM does not properly measure a 12 V battery

Repair or replace the DMM.

- If the DMM properly measures a 12 V battery

Fig. 12: Phase Terminal V, U And W

Courtesy of GENERAL MOTORS COMPANY

12. Verify that the voltage has been disabled at the energy storage system. Using the DMM on the DC voltage scale, test for less than 3 V at the following points:

- High voltage 3-Phase terminal V to vehicle chassis ground
- High voltage 3-Phase terminal W to vehicle chassis ground
- High voltage 3-Phase terminal U to vehicle chassis ground
- High voltage 3-Phase terminal U to High voltage 3-Phase terminal V
- High voltage 3-Phase terminal V to High voltage 3-Phase terminal W
- High voltage 3-Phase terminal W to High voltage 3-Phase terminal U

- **If 3 V or greater**

A contactor is stuck closed or a loss of isolation has occurred within the A4 Hybrid/EV Battery Pack. Refer to **Hybrid\EV Battery Voltage Present**.

- **If less than 3 V**

NOTE: **A 9 V DC battery can be used to test the DMM.**

13. Test the DMM by measuring a 12 V battery. The reading on the DMM should accurately reflect the battery voltage.

- **If the DMM does not properly measure a 12 V battery**

Repair or replace the DMM and perform Step 11 again.

- **If the DMM properly measures a 12 V battery**

WARNING: High voltage insulation gloves with leather protectors **MUST** be worn at all times when the A4 hybrid/EV battery pack cover has been removed. When testing within the A4 hybrid/EV battery pack, 60 V **WILL** be present. If the S15 hybrid/EV battery pack high voltage manual disconnect lever is compromised and stuck closed, 120 V **WILL** be present. Failure to follow the procedures exactly as written may result in serious injury or death.

14. Remove the A4 Hybrid/EV Battery Pack cover. Refer to **Generator Control Module Cover Replacement**.

Fig. 13: High Voltage DC Terminal
Courtesy of GENERAL MOTORS COMPANY

15. Verify that the S15 Hybrid/EV Battery Pack High Voltage Manual Disconnect Lever is functioning properly. Using the DMM on the DC voltage scale, test for less than 3 V between the High Voltage DC terminal (1) and the High Voltage DC terminal (2).

- **If 3 V or greater**

The S15 Hybrid/EV Battery Pack High Voltage Manual Disconnect Lever is stuck closed. Replace the S15 Hybrid/EV Battery Pack High Voltage Manual Disconnect Lever immediately after completing this disabling procedure.

- **If less than 3 V**

WARNING: High voltage insulation gloves with leather protectors **MUST** be worn at all times when the A4 hybrid/EV battery pack cover has been removed. 120 V **WILL** be present at the battery terminals. Failure to follow the procedures exactly as written may result in serious injury or death.

16. Flip open the orange battery terminal covers at the C4A Hybrid/EV Battery Section 1 and C4B

Hybrid/EV Battery Section 2.

Fig. 14: C4A Hybrid/EV Battery Section And Battery Terminals
Courtesy of GENERAL MOTORS COMPANY

17. Disconnect the battery terminals at the C4A Hybrid/EV Battery Section 1 and C4B Hybrid/EV Battery Section 2 in the order specified in the above graphic.
18. Remove the high voltage cables from the battery terminals and close the battery terminal covers, with the cables on the outside of the closed terminal covers.
19. Tape the battery terminal covers closed with UL® listed, or equivalent, insulation tape rated at a minimum of 600 V.

NOTE: A 9 V DC battery can be used to test the DMM.

20. Test the DMM by measuring a 12 V battery. The reading on the DMM should accurately reflect the battery voltage.
 - If the DMM does not properly measure a 12 V battery

Repair or replace the DMM and perform the disabling procedure again.
 - If the DMM properly measures a 12 V battery

21. Test for less than 1 ohms across the 125 A fuse located under the clear cover in the S15 Hybrid/EV Battery Pack High Voltage Manual Disconnect Lever.

- **If 1 ohms or greater**

The 125 A fuse is open. If the fuse is open, verify the S15 Hybrid/EV Battery Pack High Voltage Manual Disconnect Lever is also open by testing for infinite resistance across the switch terminals. Replace the fuse after high voltage testing is complete and a system repair has been made. Torque fasteners to 9 Y (80 lb in).

- **If less than 1 ohms**

22. With the high voltage cables disconnected and the battery terminal covers secured, the K59 Starter/Generator Control Module, K16 Battery Energy Control Module, S15 Hybrid/EV Battery Pack High Voltage Manual Disconnect Lever, KR38 Main Contactor, R25 Hybrid/EV Battery Pre-Charge Resistor, KR134 Pre-Charge Contactor, B30 Hybrid/EV Battery Pack Current Sensor, C4A Hybrid/EV Battery Section 1, C4B Hybrid/EV Battery Section 2, and any components within the A4 Hybrid/EV Battery Pack can now be serviced.

HIGH VOLTAGE ENABLING

WARNING: Ensure all High Voltage safety procedures are followed. Failure to follow the procedure exactly as written may result in serious injury or death.

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether

the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

Review the high voltage safety information prior to performing the High Voltage Enabling procedure. Refer to **High Voltage Safety**.

1. Verify that the 12 V battery is disconnected.

- **If the 12 V battery is connected**

Disconnect the 12 V battery. Refer to **Battery Negative Cable Disconnection and Connection** .

- **If the 12 V battery is disconnected**

NOTE: **Always tighten the high voltage fasteners to the specified torque.
Insufficient or excessive torque will cause malfunctions or damage.**

2. After completing testing or any repairs on the high voltage systems and before closing the S15 Hybrid/EV Battery Pack High Voltage Manual Disconnect Lever, inspect for the following:
 - Verify that all tools and loose components have been removed from the A4 Hybrid/EV Battery Pack area and all items are accounted for.
 - Verify high voltage system integrity and that all connectors are installed.
 - Install any components or connectors that have been removed or replaced during diagnosis.

WARNING: High voltage insulation gloves with leather protectors **MUST** be worn at all times when the A4 hybrid/EV battery pack cover has been removed. When testing within the A4 hybrid/EV battery pack, 60 V **WILL** be present. If the S15 hybrid/EV battery pack high voltage manual disconnect lever is compromised and stuck closed, 120 V **WILL** be present. Failure to follow the procedures exactly as written may result in serious injury or death.

Fig. 15: C4A Hybrid/EV Battery And C4B Hybrid/EV Battery Section
Courtesy of GENERAL MOTORS COMPANY

3. If the battery terminals at the C4A Hybrid/EV Battery Section 1 and C4B Hybrid/EV Battery Section 2 have been removed, reconnect the high voltage battery cables in the order shown above and close the battery terminal covers. Torque fasteners to 9 Y (80 lb in).
4. If the A4 Hybrid/EV Battery Pack cover has been removed, reinstall the cover. Refer to **Generator Control Module Cover Replacement**.
5. Connect the U, V, and W 3-phase cables. Torque fasteners to 9 Y (80 lb in).
6. Connect the 12 V battery cable at the K59 Starter/Generator Control Module. Torque fastener to 9 Y (80 lb in).

NOTE:

- Ensure that all of the cover spacers are properly located behind each bolt hole in the cover. These spacers may become loose or separated from the cover during repeated servicing.
- Do not overtighten the F102 Hybrid/EV Battery Pack Cable Cover fasteners. Overtightening may cause the cover spacers to deform and become loose, possibly separating from the cover the next time the cover is removed.

7. Install the F102 Hybrid/EV Battery Pack Cable Cover. Torque fastener to 9 Y (80 lb in).

Fig. 16: S15 hybrid/EV Battery Pack High Voltage Manual Disconnect Lever
Courtesy of GENERAL MOTORS COMPANY

8. Push in the red safety plunger and flip the S15 Hybrid/EV Battery Pack High Voltage Manual Disconnect Lever (1) to the closed position.
9. Slide the interconnect switch (2) to the closed position and push in the blue CPA (3).
10. Connect the 12 V battery. Refer to **Battery Negative Cable Disconnection and Connection** , . If a control module has been replaced, it should be programmed now. Refer to **Control Module References** .
11. Start the engine, then turn the ignition OFF.
12. Ignition ON, clear all DTC Information with a scan tool.
13. Ignition OFF, wait 2 minutes, ignition ON.
14. Verify no DTCs are set.
 - If any DTCs are set

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- If no DTCs are set

15. Start and idle the engine for 2 minutes.
16. Ignition OFF, wait 5 minutes, ignition ON.
17. Verify that the following DTCs have Ran Since Code Clear and have not set:
 - Contactor DTCs P0ADB, P0ADC, P0AE6, or P0AE7
 - Discharge and Pre-charge DTCs P0C77 or P0AFB.
 - High voltage loss of isolation DTCs P0AA6 or P1AF0
 - **If any of the DTCs are set**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If any of the DTCs have not Ran Since Code Clear**

Review and operate the vehicle according to the DTC Conditions for Running and ensure the DTCs run and pass.

- **If all the DTCs have Ran Since Code Clear and are not set**

18. All OK.

DIAGNOSTIC CODE INDEX

DTC P0641: 5V REFERENCE 1 CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0641

5V Reference 1 Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
5 V Reference	P0641, P057C, P1B3F	P1B3F	P0641, P1B40	-
Signal	P1B3F	P1B3F	P1B40	-

Circuit/System Description

The high voltage interlock circuits are utilized to verify high voltage component integrity. The high voltage interlock circuits are two circuit loops that passes through certain high voltage components. The high voltage interlock circuits are used to determine if access to high voltage components is being attempted. The opening of these high voltage components causes high voltage interlock circuit to open. The Starter/Generator Control Module monitors both the high voltage interlock 5 V reference circuit voltage and the high voltage interlock

signal circuit voltage in order to detect circuit faults. When the Starter/Generator Control Module detects a loss of high voltage interlock circuit voltage, the high voltage contactors are commanded open.

The service cover for the Starter/Generator and the service cover for the Hybrid/EV Battery Pack each contain a high voltage interlock switch. When either cover is removed, the Starter/Generator Control Module will respond by opening the high voltage contacts. The 5 V reference circuits and signal circuits for each of the two high voltage interlock loops are completely separate from one another and are monitored as two separate loops, with each setting a specific DTC to indicate a circuit fault. The 5 V reference circuit that feeds the high voltage interlock switch on the Starter/Generator also supplies the 5 V reference to the Brake Pedal Position Sensor.

Conditions for Running the DTC

Ignition voltage is greater than 10 V

Conditions for Setting the DTC

Voltage on the 5 V reference circuit 1 is less than 4.39 V or greater than 5.43 V

Action Taken When the DTC Sets

DTCs P0641 is a type A DTC

Conditions for Clearing the DTC

DTCs P0641 is a type A DTC

Diagnostic Aids

- When a circuit fault is detected on the high voltage interlock loop that feeds the Starter/Generator and the vehicle hood is opened, the Starter/Generator Control Module will respond by turning off inverter switching. This will prevent the Starter/Generator from charging the Hybrid/EV Battery Pack and supplying voltage to the Starter/Generator Control Module 12 V output. Operating in this manner will cause an eventual discharge of both the high voltage Hybrid/EV Battery Pack and the 12 V battery.
- Because the 5 V reference circuit also supplies voltage to the brake pedal position sensor, a circuit fault on the high voltage interlock loop that feeds the Starter/Generator will also cause hybrid functions that rely on the brake pedal position, such as auto-stop and regenerative braking, to be disabled.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V

with leather protectors.

- Visually and functionally inspect the gloves before use.
- Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

WARNING: The eAssist battery pack assembly will utilize an exchange program. Please consult the most recent revision of bulletin/PI# PIC5520, available in Service Information (SI), for a list of approved eAssist battery pack assembly service procedures. Components that may be removed and serviced without exchanging the complete battery pack assembly are identified in the bulletin/PI. Please contact the GM Technical Assistance Center (1-877-446-8227) if you have any questions.

1. Ignition OFF, disconnect the harness connector at the B22 Brake Pedal Position Sensor and disconnect the X1 harness connector at the A15 Starter/Generator, ignition ON.
2. Test for 4.3-5.5 V between the A15 Starter/Generator 5 V reference circuit terminal 12 X1 and ground.
 - **If less than 4.3 V**
 1. Ignition OFF, disconnect the X2 harness connector at the K59 Starter/Generator Control Module.
 2. Test for infinite resistance between the A15 Starter/Generator 5 V reference circuit terminal 12 X1 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for infinite resistance between the B22 Brake Pedal Position Sensor 5 V reference circuit terminal 6 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 4. Test for less than 2 ohms in the A15 Starter/Generator 5 V reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K59 Starter/Generator Control Module.
 - **If greater than 5.5 V**
 1. Ignition OFF, disconnect the X2 harness connector at the K59 Starter/Generator Control Module.
 2. Test for less than 1 V between the A15 Starter/Generator 5 V reference circuit terminal 12 X1 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 1 V between the B22 Brake Pedal Position Sensor 5 V reference circuit terminal 6 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.

- If less than 1 V, replace the K59 Starter/Generator Control Module.
- **If between 4.3-5.5 V**
- 3. Ignition OFF, connect the harness connector at the A15 Starter/Generator, ignition ON.
- 4. Verify DTC P0641 does not set while operating the vehicle within the conditions for running the DTC.
 - **If the DTC sets**

Replace the A15 Starter/Generator.

- **If the DTC does not set**
- 5. Test or replace the B22 Brake Pedal Position Sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Starter Generator Replacement**
- **Brake Pedal Position Sensor Replacement**
- **Control Module References** for Starter/Generator Control Module replacement, programming, and setup

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.

- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

WARNING: The eAssist battery pack assembly will utilize an exchange program. Please consult the most recent revision of bulletin/PI# PIC5520, available in Service Information (SI), for a list of approved eAssist battery pack assembly service procedures. Components that may be removed and serviced without exchanging the complete battery pack assembly are identified in the bulletin/PI. Please contact the GM Technical Assistance Center (1-877-446-8227) if you have any questions.

1. Ignition OFF, disable high voltage at the A4 Hybrid/EV Battery Pack. Refer to **High Voltage Disabling**.
2. Connect the X1, X2, and X3 harness connectors at the K59 Starter/Generator Control Module.
3. Connect the 12 V battery, ignition ON.

NOTE: Testing is performed at the interlock connector that the F102 Hybrid/EV Battery Pack Cable Cover secures to. The F102 Hybrid/EV Battery Pack Cable Cover was removed as part of the high voltage disabling procedure.

4. Test for 4.8-5.2 V between the 5 V reference circuit terminal A and ground.
 - **If less than 4.8 V**
 1. Ignition OFF, disable high voltage at the C4A Hybrid/EV Battery Section 1 and C4B Hybrid/EV Battery Section 2. Refer to **High Voltage Disabling**. Perform the disabling procedure for servicing components within the A4 Hybrid/EV Battery Pack. This will allow for safe access to the X4 harness connector, which is located under the A4 Hybrid/EV Battery Pack cover.
 2. Disconnect the X4 harness connector at the K59 Starter/Generator Control Module.
 3. Test for infinite resistance between the 5 V reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 4. Test for less than 2 ohms in the 5 V reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K59 Starter/Generator Control Module.
 - **If greater than 5.2 V**
 1. Ignition OFF, disable high voltage at the C4A Hybrid/EV Battery Section 1 and C4B Hybrid/EV Battery Section 2. Refer to **High Voltage Disabling**. Perform the disabling procedure for servicing components within the A4 Hybrid/EV Battery Pack. This will allow for safe access to the X4

- harness connector, which is located under the A4 Hybrid/EV Battery Pack cover.
2. Disconnect the X4 harness connector at the K59 Starter/Generator Control Module.
 3. Test for less than 1 V between the 5 V reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K59 Starter/Generator Control Module.
 - **If between 4.8-5.2 V**
 5. Verify DTC P0A0D is not set.
 - **If the DTC is set**
 1. Ignition OFF, disable high voltage at the C4A Hybrid/EV Battery Section 1 and C4B Hybrid/EV Battery Section 2. Refer to **High Voltage Disabling**. Perform the disabling procedure for servicing components within the A4 Hybrid/EV Battery Pack. This will allow for safe access to the X4 harness connector, which is located under the A4 Hybrid/EV Battery Pack cover.
 2. Disconnect the X4 harness connector at the K59 Starter/Generator Control Module.
 3. Test for less than 1 V between the signal circuit terminal B and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K59 Starter/Generator Control Module.
 - **If the DTC is not set**
 6. Ignition OFF, connect a 3 A fused jumper wire between the 5 V reference circuit terminal A and the signal circuit terminal B, ignition ON.
 7. Verify DTC P0A0C is not set.
 - **If the DTC is set**
 1. Ignition OFF, disable high voltage at the C4A Hybrid/EV Battery Section 1 and C4B Hybrid/EV Battery Section 2. Refer to **High Voltage Disabling**. Perform the disabling procedure for servicing components within the A4 Hybrid/EV Battery Pack. This will allow for safe access to the X4 harness connector, which is located under the A4 Hybrid/EV Battery Pack cover.
 2. Disconnect the X4 harness connector at the K59 Starter/Generator Control Module.
 3. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 4. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K59 Starter/Generator Control Module.
 - **If the DTC is not set**
 8. Test or replace the F102 Hybrid/EV Battery Pack Cable Cover.

Component Testing

1. Ignition OFF, disable high voltage at the A4 Hybrid/EV Battery Pack. Refer to **High Voltage Disabling**.

NOTE:

- The high voltage interlock switch is part of the F102 Hybrid/EV

Battery Pack Cable Cover, which was removed as part of the High Voltage Disabling procedure.

- **Slightly flexing the switch while performing the measurement may assist in identifying a damaged switch.**

2. Test for 2.850k to 3.150k ohms between the high voltage interlock switch terminal A and terminal B.
 - **If not between 2.850k and 3.150k ohms**

Replace the F102 Hybrid/EV Battery Pack Cable Cover.

- **If between 2.850k and 3.150k ohms**

3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Generator Control Module Cable Cover Replacement**
- **Battery Energy Control Module Wiring Harness Replacement (BDU,BECM and BPIM), Battery Energy Control Module Wiring Harness Replacement (HV Measuring Harness 1 and 2)**
- **Control Module References** for starter/generator control module replacement, programming, and setup

DTC P0A1F, P1A01, P1A05, P1A06, OR P1A5C: BATTERY ENERGY CONTROL MODULE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0A1F

Battery Energy Control Module Performance

DTC P1A01

Battery Energy Control Module Long Term Memory Performance

DTC P1A05

Battery Energy Control Module Random Access Memory

DTC P1A06

Battery Energy Control Module Read Only Memory

DTC P1A5C

Battery Energy Control Module Main Processor Performance

Circuit/System Description

The Battery Energy Control Module performs various internal fault detection test to determine if a software or hardware concern exists within the module. No external circuits are involved.

Conditions for Running the DTC

P0A1F, P1A01, P1A05, P1A06

12 V battery voltage is greater than 8.8 V.

P1A5C

- Ignition ON
- 12 V battery voltage is greater than 8.8 V.

Conditions for Setting the DTC

An internal fault is detected in the Battery Energy Control Module.

Action Taken When the DTC Sets

No action is taken.

Conditions for Clearing the DTC

No internal faults are detected in the Battery Energy Control Module.

Circuit/System Verification

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether

the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

WARNING: The eAssist battery pack assembly will utilize an exchange program. Please consult the most recent revision of bulletin/PI# PIC5520, available in Service Information (SI), for a list of approved eAssist battery pack assembly service procedures. Components that may be removed and serviced without exchanging the complete battery pack assembly are identified in the bulletin/PI. Please contact the GM Technical Assistance Center (1-877-446-8227) if you have any questions.

1. Ignition ON.
2. Verify DTC P1A01, P1A05, P1A06, or P1A5C is not set.
 - If any of the DTCs are set

Replace the K16 Battery Energy Control Module

- If none of the DTCs are set
3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC P0A80: REPLACE HYBRID/EV BATTERY PACK

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0A80

Replace Hybrid/EV Battery Pack

Circuit/System Description

The Starter/Generator Control Module monitors the internal battery resistance of the battery pack as a means to determine if the battery has reached its end of life.

Conditions for Running the DTC

- Average battery temperature is greater than -10° C.
- Battery state estimator mode is active.
- Battery state of charge is great than 10%, but less than 90%.
- None of the following DTCs are set: P0A9C, P0A9D, P0A9E, P0AC6, P0AC7, P0AC8, P0ACB, P0ACC, P0ACD, P0AE9, P0AEA, P0AEB, P0B45, P0B46, P0B47, P0B48, P0B4F, P0B50, P0B51, P0B52, P0B63, P0B64, P0B65, P0B66, P0B95, P0B96, P0B97, P0B98, P0B9F, P0BA0, P0BA1, P0BA2, P0BC3, P0BC4, P0BC5, P0C34, P0C35, P0C36, P1ASD, or P1A5D.

Conditions for Setting the DTC

The battery pack internal resistance is greater than the end of life battery pack resistance.

Action Taken When the DTC Sets

DTC P0A80 is a type A DTC.

Conditions for Clearing the DTC

DTC P0A80 is a type A DTC.

Replace the C4A Hybrid/EV Battery Section 1 and C4B Hybrid/EV Battery Section 2.

- **If the DTC is not set**
3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Generator Battery Replacement

DTC P0AA6: HYBRID/EV BATTERY VOLTAGE SYSTEM ISOLATION LOST

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0AA6

Hybrid/EV Battery Voltage System Isolation Lost

Circuit/System Description

The vehicle is equipped with a high voltage isolation monitor feature. The purpose of the isolation monitor is to test the resistance between the high voltage positive and negative direct current (DC) bus and chassis ground. The isolation monitoring system measures the resistance between the high voltage system and chassis ground in the following way. The isolation monitoring system measures voltage potential difference between the positive battery mid pack voltage and chassis ground as well as the voltage difference between negative battery mid pack voltage and chassis ground. These voltage values are used by the Starter/Generator Control Module to calculate a resistance value between the high voltage bus and the chassis ground. If this resistance value is too low, a high voltage isolation fault has occurred.

Conditions for Running the DTC

- Engine idling
- Contactors are closed

Conditions for Setting the DTC

Active isolation resistance is less than 150 kohms

OR

Case isolation resistance is less than 300 kohms

Action Taken When the DTC Sets

- DTC P0AA6 is a type A DTC.
- If the DTC sets while there is a loss of communication with the Inflatable Restraint Sensing and Diagnostic Module, the Starter/Generator Control Module will record the fault as a crash event and the DTC will become latched.

Conditions for Clearing the DTC

- DTC P0AA6 is a type A DTC.
- If the DTC is set as a latched DTC, the crash event must be cleared before the DTC will clear.

Circuit/System Verification

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

WARNING: The eAssist battery pack assembly will utilize an exchange program. Please consult the most recent revision of bulletin/PI# PIC5520, available in Service Information (SI), for a list of approved eAssist battery pack assembly service procedures. Components that may be removed and serviced without exchanging the complete battery pack assembly are identified in the bulletin/PI. Please contact the GM Technical Assistance Center (1-877-446-8227) if you have any questions.

NOTE: In High Voltage Disabling, perform the disabling procedure for servicing components within the energy storage system. The C4A Hybrid/EV Battery

Section 1 and C4B Hybrid/EV Battery Section 2 will be disconnected as part of the disabling procedure.

1. Ignition OFF, disable high voltage at the A4 Hybrid/EV Battery Pack. Refer to **High Voltage Disabling**.
2. Disconnect the U, V, and W three phase lugs at the K59 Starter/Generator Control Module.

NOTE: **The following continuity tests must be performed using the EL-50772 Insulation Multimeter. Select the Isolation test setting, then select the 500 V range.**

3. Test for greater than 400K ohms between the terminals listed below and chassis ground with the **EL-50772** Insulation Multimeter set on the Isolation test setting:
 - 3 phase cable terminal U - cable side lug
 - 3 phase cable terminal V - cable side lug
 - 3 phase cable terminal W - cable side lug
 - **If 400K ohms or less**
 1. Disconnect the U, V, and W three phase lugs at the A15 Starter/Generator.
 2. Test for greater than 400K ohms between the U, V, and W three phase studs at the A15 Starter/Generator and chassis ground with the **EL-50772** Insulation Multimeter set on the Isolation test setting.
 - If 400K ohms or less, replace the A15 Starter/Generator.
 - If greater than 400K ohms
 3. Replace the high voltage 3 phase cables.
 - **If greater than 400K ohms**

NOTE: **The following continuity tests must be performed using the EL-50772 Insulation Multimeter. Select the Isolation test setting, then select the 500 V range.**

4. Test for greater than 400K ohms between the terminals listed below and chassis ground with the **EL-50772** Insulation Multimeter set on the Isolation test setting:
 - 3 phase terminal U - K59 Starter/Generator Control Module stud
 - 3 phase terminal V - K59 Starter/Generator Control Module stud
 - 3 phase terminal W - K59 Starter/Generator Control Module stud
 - **If 400K ohms or less**
 1. Disconnect and remove the two wiring junction blocks from the A4 Hybrid/EV Battery Pack.
 2. Test for greater than 400K ohms between the U, V, and W three phase studs at the K59 Starter/Generator Control Module and chassis ground with the **EL-50772** Insulation Multimeter set on the Isolation test setting.
 - If 400K ohms or less, replace the K59 Starter/Generator Control Module.
 - If greater than 400K ohms

3. Replace the two wiring junction blocks.
 - **If greater than 400K ohms**
5. Replace the C4A Hybrid/EV Battery Section 1 and C4B Hybrid/EV Battery Section 2.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Drive Motor Generator Battery Cable Replacement**
- **Starter Generator Replacement**
- **Generator Battery Replacement**
- **Drive Motor Battery Wire Junction Block Relay Replacement**
- **Control Module References** for Starter/Generator Control Module replacement, programming, and setup

DTC P0AA8-P0AAA: HYBRID/EV BATTERY VOLTAGE ISOLATION SENSING

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0AA8

Hybrid/EV Battery Voltage Isolation Sensing Performance

DTC P0AA9

Hybrid/EV Battery Voltage Isolation Sensing Circuit 1 Low Voltage

DTC P0AAA

Hybrid/EV Battery Voltage Isolation Sensing Circuit 1 High Voltage

Circuit/System Description

The vehicle is equipped with a high voltage isolation monitor feature. The purpose of the isolation monitor is to test the resistance between the high voltage positive and negative direct current (DC) bus and chassis ground. The isolation monitoring system measures the resistance between the high voltage system and chassis ground in the following way. The isolation monitoring system measures voltage potential difference between the positive battery mid pack voltage and chassis ground as well as the voltage difference between negative battery mid pack voltage and chassis ground. These voltage values are used by the starter/generator control module to calculate a resistance value between the high voltage bus and the chassis ground. If this resistance value is too

low, a high voltage isolation fault has occurred.

Conditions for Running the DTC

P0AA8

- Power mode is RUN or CRANK.
- The starter/generator control module internal voltage sensor has no reported faults.
- None of the following DTCs are set: P0AA9, P0AAA, P1E0C, or P1E0D.

P0AA9

- Power mode is RUN or CRANK.
- Contactors are closed.

P0AAA

- Power mode is RUN or CRANK.
- None of the following DTCs are set: P0AA9, P0AAA, P1E0C, or P1E0D.

Conditions for Setting the DTC

P0AA8

The difference between the voltage measured at the starter/generator control module internal motor control processor and the sum of the mid-pack voltage positive sensor value and mid-pack voltage negative sensor value is greater than 15 V.

P0AA9

Voltage measured at the negative mid-pack voltage sensor is less than 5 V.

P0AAA

The difference between the voltage measured at the negative mid-pack voltage sensor and the starter/generator control module internal motor control processor high voltage value is greater than 15 V.

Action Taken When the DTC Sets

- DTCs P0AA8-P0AAA are type B DTCs.
- If the DTC sets while there is a loss of communication with the inflatable restraint sensing and diagnostic module (SDM), the starter/generator control module will record the fault as a crash event and the DTC will become latched.

Conditions for Clearing the DTC

- DTCs P0AA8-P0AAA are type B DTCs.
- If the DTC is set as a latched DTC, the crash event must be cleared before the DTC will clear.

DTC P0ABB, P0ABC, OR P0ABD: HYBRID/EV BATTERY VOLTAGE SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0ABB

Hybrid/EV Battery Voltage Sensor Performance

DTC P0ABC

Hybrid/EV Battery Voltage Sensor Circuit Low Voltage

DTC P0ABD

Hybrid/EV Battery Voltage Sensor Circuit High Voltage

Circuit/System Description

The Hybrid/EV Battery Pack contains a total of 32 cell groups in the Hybrid/EV Battery Pack assembly. These cell groups are electrically connected in series. Each individual cell group is rated at 3.7 V, for a nominal system voltage of 118 V DC. The battery cells are grouped together into two sections, each with 16 cell groups.

The Battery Energy Control Module monitors the voltage of the 32 battery cell groups. A voltage sense circuit is attached to each individual cell group. Each of these circuits terminate at a connector located on the top surface of the battery section. A serviceable auxiliary battery wiring harness connectors the voltage sense circuits to the Battery Energy Control Module, located directly above the Hybrid/EV Battery Pack. The Battery Energy Control Module also monitors the Hybrid/EV Battery Pack voltage in it's entirety. The Battery Energy Control Module compares the voltage of the entire pack to that of the sum of the voltages measures at each cell.

Diagnostics and system status are communicated from the Battery Energy Control Module to Hybrid Powertrain Control Module through serial data.

Conditions for Running the DTC

P0ABB

None of the following DTCs are set: P0ABC, P0ABD, P0B3D, P0B42, P0B47, P0B4C, P0B51, P0B56, P0B5B, P0B60, P0B65, P0B6A, P0B6F, P0B74, P0B79, P0B7E, P0B83, P0B88, P0B8D, P0B92, P0B97, P0B9C, P0BA1, P0BA6, P0BAB, P0BB0, P0BB5, P0BBA, P1B17, P1B1A, P1B1D, P1B20, P1B23, P1B26, P0B3E, P0B43, P0B48, P0B4D, P0B52, P0B57, P0B5C, P0B61, P0B66, P0B6B, P0B70, P0B75, P0B7A, P0B7F, P0B84, P0B89, P0B8E, P0B93, P0B98, P0B9D, P0BA2, P0BA7, P0BAC, P0BB1, P0BB6, P0BBB, P1B18, P1B1B, P1B1E, P1B21, P1B24, P1B27, P0B3B, P0B40, P0B45, P0B4A, P0B4F, P0B54, P0B59, P0B5E, P0B63, P0B68, P0B6D, P0B72, P0B77, P0B7C, P0B81, P0B86, P0B8B, P0B90, P0B95, P0B9A, P0B9F,

P0BA4, P0BA9, P0BAE, P0BB3, P0BB8, P1B28, P1B29, P1B2A, P1B2B, P1B2C, P1B2D, P0B3C, P0B41, P0B46, P0B4B, P0B50, P0B55, P0B5A, P0B5F, P0B64, P0B69, P0B6E, P0B73, P0B78, P0B7D, P0B82, P0B87, P0B8C, P0B91, P0B96, P0B9B, P0BA0, P0BA5, P0BAA, P0BAF, P0BB4, P0BB9, P1B16, P1B19, P1B1C, P1B1F, P1B22, P1B25.

P0ABC or P0ABD

- Battery voltage is greater than 9.6 V.
- Battery energy control module is awake and communicating.

Conditions for Setting the DTC

P0ABB

The calculated battery pack voltage based on the average cell voltage values is more than 5.49 V different than the actual measured battery pack voltage.

P0ABC

The battery pack voltage is less than 30 V.

P0ABD

The battery pack voltage is greater than 190 V.

Action Taken When the DTC Sets

- DTCs P0ABB, P0ABC, and P0ABD are type B DTCs.
- The vehicle operates in a low battery mode with the high voltage contactors closed, but no hybrid functions will occur.

Conditions for Clearing the DTC

DTCs P0ABB, P0ABC, and P0ABD are type B DTCs.

Diagnostic Aids

Opening the service disconnect without first disconnecting the 12 V battery or reconnecting the 12 V battery while the service disconnect is open may result in the setting of DTC P0ABB or P0ABC. Due to the nature of the Hybrid/EV Battery Pack design, the vehicle's 12 V electrical system will continue to discharge the high voltage battery, even though the service disconnect is open. This will eventually lower the voltage of the Hybrid/EV Battery Pack and set DTC P0ABB or P0ABC. If this occurs, close the service disconnect and operate the vehicle as normal. The Hybrid/EV Battery Pack will be charged and the voltage will return to normal.

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
 - **Visually and functionally inspect the gloves before use.**
 - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

WARNING: The eAssist battery pack assembly will utilize an exchange program. Please consult the most recent revision of bulletin/PI# PIC5520, available in Service Information (SI), for a list of approved eAssist battery pack assembly service procedures. Components that may be removed and serviced without exchanging the complete battery pack assembly are identified in the bulletin/PI. Please contact the GM Technical Assistance Center (1-877-446-8227) if you have any questions.

1. Ignition ON.
2. Verify the 12 V battery is not connected while the service disconnect is open.
 - **If the 12 V battery is connected and the service disconnect is open**

It is normal to set DTC P0ABB or P0ABC when the service disconnect is open and the 12 V battery is connected. After service is complete, return the vehicle to its normal state, close the service disconnect, connect the 12 V battery, and clear all DTCs.

- **If the 12 V battery is connected and the service disconnect is closed**
3. Verify DTC P0ABB, P0ABC, or P0ABD is not set.
 - **If any of the DTCs are set**

NOTE: In High Voltage Disabling, perform the disabling procedure for servicing components within the A4 Hybrid/EV Battery Pack. The C4A Hybrid/EV Battery Section 1 and C4B Hybrid/EV Battery Section 2 will be disconnected as part of the disabling procedure.

1. Ignition OFF, disable high voltage at the A4 Hybrid/EV Battery Pack. Refer to High Voltage Disabling.
2. Verify the Battery Energy Control Module high voltage measuring harness is not cut, chafed, or otherwise damaged.

- If the harness is damaged, replace the harness.
- If the harness is not damaged
- 3. Replace the K16 Battery Energy Control Module
 - **If none of the DTCs are set**
- 4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Battery Energy Control Module Wiring Harness Replacement (BDU,BECM and BPIM), Battery Energy Control Module Wiring Harness Replacement (HV Measuring Harness 1 and 2)**
- **Control Module References** for Battery Energy Control Module replacement, programming, and setup

DTC P0AC1, P0AC2, P1A07, OR P1EBA: HYBRID/EV BATTERY CURRENT SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0AC1

Hybrid/EV Battery Current Sensor Circuit Low Voltage

DTC P0AC2

Hybrid/EV Battery Current Sensor Circuit High Voltage

DTC P1A07

Battery Energy Control Module 5V Reference Circuit

DTC P1EBA

Hybrid/EV Battery Current Sensor Exceeded Learning Limit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
5 V Reference	P1A07	P0AC2	P1A07	-

Signal	P0AC1	P0AC2	P1A07	-
Low Reference	-	P0AC2	-	-

Circuit/System Description

The Battery Energy Control Module uses a single battery current sensor to determine the current flow out of the Hybrid/EV Battery Pack. The Battery Energy Control Module applies 5 volts and provides a low reference to power the sensor. Current measurement is communicated to the Battery Energy Control Module via a signal circuit.

Conditions for Running the DTC

P0AC1, P0AC2

- 12 V battery voltage is greater than 8.8 V
- Battery energy control module is awake and communicating
- DTC P1A07 is not set.

P1A07

- 12 V battery voltage is greater than 8.8 V
- Battery energy control module is awake and communicating

P1EBA

- 12 V battery voltage is greater than 8.8 V
- Battery energy control module is awake and communicating
- Contactors are open
- DTC P1A07 is not set.

Conditions for Setting the DTC

P0AC1

Current sensor signal voltage is less than 0.2 V

P0AC2

Current sensor signal voltage is greater than 4.8 V

P1A07

- Current sensor 5 volt reference voltage is greater than 5.2 V
- Current sensor 5 volt reference voltage is less than 4.8 V

P1EBA

- Current sensor value is more than 2.43 V greater than sensor offset upper limit
- Current sensor value is more than 2.57 V less than sensor offset lower limit

Action Taken When the DTC Sets

DTC P0AC1, P0AC2, P1A07, and P1EBA are type B DTCs

Conditions for Clearing the DTC

DTC P0AC1, P0AC2, P1A07, and P1EBA are type B DTCs

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Hybrid/EV Battery Pack Low Resolution Current Sensor parameter is between 85 A and -85 A and varies as the vehicle is driven.
 - **If not between 85 A and -85 A or does not vary**

Refer to Circuit/System Testing.

- **If between 85 A and -85 A and varies**
3. All OK.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

WARNING: The eAssist battery pack assembly will utilize an exchange program. Please consult the most recent revision of bulletin/PI# PIC5520, available in Service Information (SI), for a list of approved eAssist battery pack

assembly service procedures. Components that may be removed and serviced without exchanging the complete battery pack assembly are identified in the bulletin/PI. Please contact the GM Technical Assistance Center (1-877-446-8227) if you have any questions.

NOTE: In High Voltage Disabling , perform the disabling procedure for servicing components within the A4 Hybrid/EV Battery Pack. The C4A Hybrid/EV Battery Section 1 and C4B Hybrid/EV Battery Section 2 will be disconnected as part of the disabling procedure.

1. Ignition OFF, disable high voltage at the A4 Hybrid/EV Battery Pack. Refer to High Voltage Disabling.
2. Connect the X1, X2, and X3 harness connectors at the K59 Starter/Generator Control Module.
3. Connect the 12 V battery.
4. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the B30 Hybrid/EV Battery Pack Current Sensor. It may take up to 2 min for all vehicle systems to power down.
5. Test for less than 10 ohms between the low reference circuit terminal 3 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF, disconnect the harness connector at the K16 Battery Energy Control Module.
 2. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K16 Battery Energy Control Module.
 - **If less than 10 ohms**
6. Ignition ON.
7. Test for 4.8-5.2 V between the 5 V reference circuit terminal 2 and ground.
 - **If less than 4.8 V**
 1. Ignition OFF, disconnect the harness connector at the K16 Battery Energy Control Module.
 2. Test for infinite resistance between the 5 V reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the 5 V reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K16 Battery Energy Control Module.
 - **If greater than 5.2 V**
 1. Ignition OFF, disconnect the harness connector at the K16 Battery Energy Control Module, ignition ON.
 2. Test for less than 1 V between the 5 V reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K16 Battery Energy Control Module.
 - **If between 4.8-5.2 V**
8. Verify the scan tool Hybrid/EV Battery Pack Low Resolution Current Sensor parameter is greater than 25

A.

- **If 25 A or less**

1. Ignition OFF, disconnect the harness connector at the K16 Battery Energy Control Module.
2. Test for infinite resistance between the signal circuit terminal 4 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K16 Battery Energy Control Module.

- **If greater than 50 A**

9. Install a 3 A fused jumper wire between the signal circuit terminal 4 and the low reference circuit terminal 3.
10. Verify the scan tool Hybrid/EV Battery Pack Low Resolution Current Sensor parameter is less than -25 A.

- **If -25 A or greater**

1. Ignition OFF, disconnect the harness connector at the K16 Battery Energy Control Module, ignition ON.
2. Test for less than 1 V between the signal circuit terminal 4 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
3. Ignition ON.
4. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K16 Battery Energy Control Module.

- **If less than -25 A**

11. Test or replace the B30 Hybrid/EV Battery Pack Current Sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Battery Energy Control Module Wiring Harness Replacement (BDU,BECM and BPIM), Battery Energy Control Module Wiring Harness Replacement (HV Measuring Harness 1 and 2)**

*Fuse F23UA open; no communication with starter generator control module **The starter generator control module cannot control the contactor to disable high voltage ***The starter generator control module cannot control the contactor to enable high voltage				

Circuit/System Description

The hybrid battery system voltage is controlled by two high voltage contactors. The high voltage contactors allow the high voltage DC batteries to be connected to the vehicle or safely contain the high voltage DC within the Hybrid/EV Battery Pack assembly. Of the two contactors, one is a pre-charge contactor and the other is the primary contactor. The two contactors are closed in a specific sequence by the Starter/Generator Control Module. The pre-charge contactor is closed first. This causes high voltage to flow through the pre-charge resistor, allowing system voltage to build slowly. Once the system voltage has raised and stabilized, the primary contactor is closed. Both contactors are controlled by the Starter/Generator Control Module. The Starter/Generator Control Module supplies B+ to each contactor at all times. When the contactors are to be closed, the Starter/Generator Control Module will provide a ground to the contactor through a low side driver.

Conditions for Running the DTC

The 12 V battery voltage is greater than 6.0 V

Conditions for Setting the DTC

P0ADB

- An open is detected on the primary contactor control circuit when the contactor control is commanded ON and measured resistance is greater than 200K ohms
- A short to voltage is detected on the primary contactor control circuit when the contactor control is commanded ON and current sense feedback is less than 0.5 A

P0ADC

A short to ground is detected on the primary contactor control circuit when the contactor control is commanded OFF and current sense feedback is less than 0.5 A

Action Taken When the DTC Sets

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

WARNING: The eAssist battery pack assembly will utilize an exchange program. Please consult the most recent revision of bulletin/PI# PIC5520, available in Service Information (SI), for a list of approved eAssist battery pack assembly service procedures. Components that may be removed and serviced without exchanging the complete battery pack assembly are identified in the bulletin/PI. Please contact the GM Technical Assistance Center (1-877-446-8227) if you have any questions.

NOTE: In High Voltage Disabling , perform the disabling procedure for servicing components within the A4 Hybrid/EV Battery Pack. The C4A Hybrid/EV Battery Section 1 and C4B Hybrid/EV Battery Section 2 will be disconnected as part of the disabling procedure.

1. Ignition OFF, disable high voltage at the A4 Hybrid/EV Battery Pack. Refer to High Voltage Disabling.
2. Connect the X1, X2, and X3 harness connectors at the K59 Starter/Generator Control Module.
3. Connect the 12 V battery.
4. Disconnect the X1 harness connector at the KR38 Main Contactor, ignition ON.
5. Verify a test lamp illuminates between the B+ circuit terminal 1 and ground.
 - **If the test lamp does not illuminate**
 1. Ignition OFF, disconnect the harness connector at the K59 Starter/Generator Control Module.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K59 Starter/Generator Control Module.
 - **If the test lamp illuminates**
6. Ignition OFF, connect the harness connector at the KR38 Main Contactor. Disconnect the X4 harness connector at the K59 Starter/Generator Control Module, ignition ON.
7. Test for less than 1 V between the control circuit terminal 5 and ground.
 - **If 1 V or greater**
 1. Ignition OFF, disconnect the X1 harness connector at the KR38 Main Contactor.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the KR38 Main Contactor.
 - **If less than 1 V**
8. Ignition OFF.
9. Test for infinite resistance between the control circuit terminal 5 and ground.
 - **If less than infinite resistance**
 1. Ignition OFF, disconnect the X1 harness connector at the KR38 Main Contactor.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, test or replace the KR38 Main Contactor.
 - **If infinite resistance**
10. Test for 20-40 ohms between the B+ circuit terminal 4 and the control circuit terminal 5.
 - **If not between 20-40 ohms**
 1. Ignition OFF, disconnect the X1 harness connector at the KR38 Main Contactor.
 2. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the KR38 Main Contactor.

- **If between 20-40 ohms**

11. Replace the K59 Starter/Generator Control Module.

DTC P0AF8: HYBRID/EV SYSTEM VOLTAGE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0AF8

Hybrid/EV System Voltage

Circuit/System Description

As a means to verify the Battery Energy Control Module's voltage measuring ability, the Battery Energy Control Module compares it's own measurement of the Hybrid/EV Battery Pack voltage to that measured internally at the Starter/Generator Control Module when the contactors are closed. This provides a second source of the Battery Energy Control Module's Hybrid/EV Battery Pack voltage rationality.

Conditions for Running the DTC

- Main contactor is closed
- None of the following DTCs are set: P0ABB, P0ABC, P0ABD, P1A5D, U182A

Conditions for Setting the DTC

The difference between the high voltage battery voltage measured at the Battery Energy Control Module and the voltage measured at the motor controller, internal to the Starter/Generator Control Module, is greater than 5.77 V.

Action Taken When the DTC Sets

- DTC P0AF8 is a type B DTC
- The vehicle operates in a low battery mode with the high voltage contactors closed, but no hybrid functions will occur

Conditions for Clearing the DTC

DTC P0AF8 is a type B DTC

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

WARNING: The eAssist battery pack assembly will utilize an exchange program. Please consult the most recent revision of bulletin/PI# PIC5520, available in Service Information (SI), for a list of approved eAssist battery pack assembly service procedures. Components that may be removed and serviced without exchanging the complete battery pack assembly are identified in the bulletin/PI. Please contact the GM Technical Assistance Center (1-877-446-8227) if you have any questions.

1. Verify no other DTCs are set in the in the K59 Starter/Generator Control Module.
 - If other DTCs are set

Refer to Diagnostic Trouble Code (DTC) List - Vehicle .

- **If no other DTCs are set**
- 2. Ignition ON, observe and record the 32 scan tool Hybrid Battery Cell Voltage parameters. Add the values together to calculate Hybrid/EV Battery Pack voltage based on the cell voltages.
- 3. Verify the calculated Hybrid/EV Battery Pack voltage from step 2 is within 5.77 V of the scan tool High Voltage Battery Voltage parameter.
 - **If not within 5.77 V**

NOTE: In High Voltage Disabling , perform the disabling procedure for servicing components within the A4 Hybrid/EV Battery Pack. The C4A Hybrid/EV Battery Section 1 and C4B Hybrid/EV Battery Section 2 will be disconnected as part of the disabling procedure.

1. Ignition OFF, disable high voltage at the A4 Hybrid/EV Battery Pack. Refer to High Voltage Disabling.
2. Verify the Battery Energy Control Module high voltage measuring harness is not cut, chafed, or otherwise damaged.
 - If the harness is damaged, replace the harness.
 - If the harness is not damaged
3. Replace the K16 Battery Energy Control Module
 - **If within 5.77 V**
4. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptors

DTC P0AFA

Hybrid/EV Battery System Voltage Low Voltage

DTC P0AFB

Hybrid/EV Battery System Voltage High Voltage

Circuit/System Description

The hybrid/EV battery pack contains a total of 32 cells. These cells are electrically connected in series. Each individual cell is rated at 3.7 V, for a nominal system voltage of 118 V DC. The battery cells are grouped together into two sections, each with 16 cells.

The battery energy control module monitors the voltage of the 32 battery cells. A voltage sense circuit is attached to each individual cell. Each of these circuits terminate at a connector located on the top surface of the battery section. A serviceable high voltage measuring harness connects the voltage sense circuits to the battery energy control module, located directly above the hybrid battery section 1 and hybrid battery section 2. The battery energy control module also monitors the hybrid/EV battery pack voltage in its entirety. The battery energy control module compares the voltage of the entire pack to that of the sum of the voltages measures at each cell.

Conditions for Running the DTC

None of the following DTCs are set: P0ABB, P0ABC, P0ABD, P0AF8, P1A5D, U182A

OR

None of the following DTCs are set: P0B3B, P0B3C, P0B3D, P0B3E, P0B40, P0B41, P0B42, P0B43, P0B45, P0B46, P0B47, P0B48, P0B4A, P0B4B, P0B4C, P0B4D, P0B4F, P0B50, P0B51, P0B52, P0B54, P0B55, P0B56, P0B57, P0B59, P0B5A, P0B5B, P0B5C, P0B5E, P0B5F, P0B60, P0B61, P0B63, P0B64, P0B65, P0B66, P0B68, P0B69, P0B6A, P0B6B, P0B6D, P0B6E, P0B6F, P0B70, P0B72, P0B73, P0B74, P0B75, P0B77, P0B78, P0B79, P0B7A, P0B7C, P0B7D, P0B7E, P0B7F, P0B81, P0B82, P0B83, P0B84, P0B86, P0B87, P0B88, P0B89, P0B8B, P0B8C, P0B8D, P0B8E, P0B90, P0B91, P0B92, P0B93, P0B95, P0B96, P0B97, P0B98, P0B9A, P0B9B, P0B9C, P0B9D, P0B9F, P0BA0, P0BA1, P0BA2, P0BA4, P0BA5, P0BA6, P0BA7, P0BA9, P0BAA, P0BAB, P0BAC, P0BAE, P0BAF, P0BB0, P0BB1, P0BB3, P0BB4, P0BB5, P0BB6, P0BB8, P0BB9, P0BBA, P0BBB, P1B16, P1B17, P1B18, P1B19, P1B1A, P1B1B, P1B1C, P1B1D, P1B1E, P1B1F, P1B20, P1B21, P1B22, P1B23, P1B24, P1B25, P1B26, P1B27, P1B28, P1B29, P1B2A, P1B2B, P1B2C, P1B2D

Conditions for Setting the DTC

DTC P0AFA

Battery pack voltage is less than 61.91 V.

OR

Any individual cell voltage is less than 1.93 V.

DTC P0AFB

Battery pack voltage is greater than 136.49 V.

OR

Any individual cell voltage is greater than 4.26 V.

Action Taken When the DTC Sets

- DTCs P0AFA and P0AFB are type B DTCs.
- The vehicle operates without any hybrid functions with the high voltage contactors open, but it will continue to charge the 12V battery with the starter/generator acting as a conventional generator.

Conditions for Clearing the DTC

- DTCs P0AFA and P0AFB are type B DTCs.
- DTCs P0AFA and P0AFB are secure DTCs. The Clear Secured High Voltage DTCs procedure must be performed to prevent resetting the DTC.

Diagnostic Aids

The following two tables should be used to determine the switch setting when using the **EL-48571-30** High Voltage Battery Pin Out Box.

Battery Cells (1-16)		
Connector X5		
Switch Designation	Switch Position	Battery Cell

Special Tools

- **EL-48571-30** High Voltage Battery Pin Out Box
- **EL-48900** HEV Safety Kit

For equivalent regional tools, refer to **Special Tools**.

Circuit/System Verification

1. Ignition ON.
2. Verify that each of the scan tool Hybrid Battery Cell Voltage 1-32 parameters are between 3.0-4.1 V and all parameters are within 0.1 V of each other.
 - **If any parameter is not between 3.0-4.1 V or is not within 0.1 V of the others**

Refer to Circuit/System Testing.

- **If all parameter are between 3.0-4.1 V and are within 0.1 V of each other**

3. All OK.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.

- **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

WARNING: The eAssist battery pack assembly will utilize an exchange program. Please consult the most recent revision of bulletin/PI# PIC5520, available in Service Information (SI), for a list of approved eAssist battery pack assembly service procedures. Components that may be removed and serviced without exchanging the complete battery pack assembly are identified in the bulletin/PI. Please contact the GM Technical Assistance Center (1-877-446-8227) if you have any questions.

NOTE: In High Voltage Disabling , perform the disabling procedure for servicing components within the A4 Hybrid/EV Battery Pack. The C4A Hybrid/EV Battery Section 1 and C4B Hybrid/EV Battery Section 2 will be disconnected as part of the disabling procedure.

1. Ignition OFF, disable high voltage at the A4 Hybrid/EV Battery Pack. Refer to High Voltage Disabling.
2. Disconnect the X4 and X5 harness connectors at the K16 Battery Energy Control Module .
3. Connect the **EL-48571-30** High Voltage Battery Pin Out Box to the appropriate K16 Battery Energy Control Module harness connector.
4. Insert the DMM probes into the EL-48571-30 test cavities.

NOTE:

- **The DMM must be set to the DC voltage setting.**
- **Not all 24 switch positions of the EL-48571-30 will be used.**

5. Measure and record the voltage of each of the cells by cycling the EL-48571-30 through each of the 16 switch positions.
6. Verify that each cell voltage reading is 3.0-4.1 V and all cell voltage readings are within 0.1 V of each other.
 - **If any parameter is not between 3.0-4.1 V or is not within 0.1 V of the others**
 1. Inspect the appropriate voltage signal circuit and low reference circuit for a short to ground or an open/high resistance.
 - If a short to ground or an open/high resistance is found, replace the appropriate K16 Battery Energy Control Module high voltage measuring harness.
 - If a short to ground or an open/high resistance is not found
 2. Replace the C4A Hybrid/EV Battery Section 1, C4B Hybrid/EV Battery Section 2, and K16 Battery Energy Control Module.
 - **If all parameter are between 3.0-4.1 V and are within 0.1 V of each other**
7. Replace the K16 Battery Energy Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Generator Battery Replacement**
- **Battery Energy Control Module Wiring Harness Replacement (BDU,BECM and BPIM), Battery Energy Control Module Wiring Harness Replacement (HV Measuring Harness 1 and 2)**
- **Control Module References** for battery energy control module replacement, programming, and setup.

Circuit/System Description

The hybrid/EV battery pack contains a total of 32 cell groups in the hybrid/EV battery pack assembly. These cell groups are electrically connected in series. Each individual cell group is rated at 3.7 V, for a nominal system voltage of 118 V DC. The battery cells are grouped together into two sections, each with 16 cell groups.

The battery energy control module monitors the voltage of the 32 battery cell groups. A voltage sense circuit is attached to each individual cell group. Each of these circuits terminate at a connector located on the top surface of the battery section. A serviceable auxiliary battery wiring harness connectors the voltage sense circuits to the battery energy control module, located directly above the hybrid/EV battery pack.

Diagnostics and system status are communicated from the battery energy control module to hybrid powertrain control module through serial data.

Conditions for Running the DTC

DTC P0B3B, P0B40, P0B45, P0B4A, P0B4F, P0B54, P0B59, P0B5E, P0B63, P0B68, P0B6D, P0B72, P0B77, P0B7C, P0B81, P0B86, P0B88, P0B90, P0B95, P0B9A, P0B9F, P0BA4, P0BA9, P0BAE, P0BB3, P0BB8, P1B28, P1B29, P1B2A, P1B2B, P1B2C, P1B2D

- 12 V battery voltage is greater than 9 V.
- None of the following DTCs are set: P0B3D, P0B42, P0B47, P0B4C, P0B51, P0B56, P0B5B, P0B60, P0B65, P0B6A, P0B6F, P0B74, P0B79, P0B7E, P0B83, P0B88, P0B8D, P0B92, P0B97, P0B9C, P0BA1, P0BA6, P0BAB, P0BB0, P0BB5, P0BBA, P1B17, P1B1A, P1B1D, P1B20, P1B23, P1B26, P1B33, P1B34, P1B35, P1B36, P1B37, P1B38, P1B39

DTC P0B3C, P0B41, P0B46, P0B4B, P0B50, P0B55, P0B5A, P0B5F, P0B64, P0B69, P0B6E, P0B73, P0B78, P0B7D, P0B82, P0B87, P0B8C, P0B91, P0B96, P0B9B, P0BA0, P0BA5, P0BAA, P0BAF, P0BB4, P0BB9, P1B16, P1B19, P1B1C, P1B1F, P1B22, P1B25

All of the following conditions exist:

- Average cell voltage movement is greater than 0.045 V.
- DTC U182A is not set.

DTC P0B3D, P0B3E, P0B42, P0B43, P0B47, P0B48, P0B4C, P0B4D, P0B51, P0B52, P0B56, P0B57, P0B5B, P0B5C, P0B60, P0B61, P0B65, P0B66, P0B6A, P0B6B, P0B6F, P0B70, P0B74, P0B75, P0B79, P0B7A, P0B7E, P0B7F, P0B83, P0B84, P0B88, P0B89, P0B8D, P0B8E, P0B92, P0B93, P0B97, P0B98, P0B9C, P0B9D, P0BA1, P0BA2, P0BA6, P0BA7, P0BAB, P0BAC, P0BB0, P0BB1, P0BB5, P0BB6, P0BBA, P0BBB, P1B17, P1B18, P1B1A, P1A1B, P1B1D, P1B1E, P1B20, P1B21, P1B23, P1B24, P1B26, P1B27

- 12 V battery voltage is greater than 9 V.
- The battery energy control module is awake and communicating.
- None of the following DTCs are set: P1B34, P1B35, P1B36, P1B37, P1B38, P1B39

P1B3D, P1B3E

- 12 V battery voltage is greater than 8.8 V.
- None of the following DTCs are running: P1EAA, P1EAC.
- None of the following DTCs are set: P1B34, P1B35, P1B36, P1B37, P1B38, P1B39

Conditions for Setting the DTC

DTC P0B3B, P0B40, P0B45, P0B4A, P0B4F, P0B54, P0B59, P0B5E, P0B63, P0B68, P0B6D, P0B72, P0B77, P0B7C, P0B81, P0B86, P0B88, P0B90, P0B95, P0B9A, P0B9F, P0BA4, P0BA9, P0BAE, P0BB3, P0BB8, P1B28, P1B29, P1B2A, P1B2B, P1B2C, P1B2D

The appropriate battery voltage sense circuit is open.

DTC P0B3C, P0B41, P0B46, P0B4B, P0B50, P0B55, P0B5A, P0B5F, P0B64, P0B69, P0B6E, P0B73, P0B78, P0B7D, P0B82, P0B87, P0B8C, P0B91, P0B96, P0B9B, P0BA0, P0BA5, P0BAA, P0BAF, P0BB4, P0BB9, P1B16, P1B19, P1B1C, P1B1F, P1B22, P1B25

Measured individual battery cell voltage movement is not in the same direction as the average battery cell voltage movement.

P0B3D, P0B42, P0B47, P0B4C, P0B51, P0B56, P0B5B, P0B60, P0B65, P0B6A, P0B6F, P0B74, P0B79, P0B7E, P0B83, P0B88, P0B8D, P0B92, P0B97, P0B9C, P0BA1, P0BA6, P0BAB, P0BB0, P0BB5, P0BBA, P1B17, P1B1A, P1B1D, P1B20, P1B23, P1B26

Measured individual battery cell voltage is less than 1.4 V.

P0B3E, P0B43, P0B48, P0B4D, P0B52, P0B57, P0B5C, P0B61, P0B66, P0B6B, P0B70, P0B75, P0B7A, P0B7F, P0B84, P0B89, P0B8E, P0B93, P0B98, P0B9D, P0BA2, P0BA7, P0BAC, P0BB1, P0BB6, P0BBB, P1B18, P1B1B, P1B1E, P1B21, P1B24, P1B27

Measured individual battery cell voltage is greater than 4.65 V.

P1B3D

Cell sense voltage is less than 1.4 V.

AND

Battery 16 cell voltage change is greater than 0.5 V over a 200ms sample time.

P1B3E

Cell sense voltage is less than 1.4 V.

AND

Battery 32 cell voltage change is greater than 0.5 V over a 200ms sample time.

Action Taken When the DTC Sets

- DTC P0B3B-P0BBB, P1B16-1B2D, P1B3D, and P1B3E are type B DTCs.
- The vehicle operates in a low battery mode with the high voltage contactors closed, but no hybrid functions will occur.

Conditions for Clearing the DTC

DTC P0B3B-P0BBB, P1B16-1B2D, P1B3D, and P1B3E are type B DTCs.

Diagnostic Aids

The following two tables should be used to determine the switch setting when using the **EL-48571-30** High Voltage Battery Pin Out Box.

For equivalent regional tools, refer to **Special Tools**.

Circuit/System Verification

1. Ignition ON.
2. Verify that each of the scan tool Hybrid Battery Cell Voltage 1-32 parameters are between 3.0-4.1 V and all parameters are within 0.1 V of each other.
 - **If any parameter is not between 3.0-4.1 V or is not within 0.1 V of the others**

Refer to Circuit/System Testing.

- **If all parameter are between 3.0-4.1 V and are within 0.1 V of each other**

3. All OK.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**

- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

WARNING: The eAssist battery pack assembly will utilize an exchange program. Please consult the most recent revision of bulletin/PI# PIC5520, available in Service Information (SI), for a list of approved eAssist battery pack assembly service procedures. Components that may be removed and serviced without exchanging the complete battery pack assembly are identified in the bulletin/PI. Please contact the GM Technical Assistance Center (1-877-446-8227) if you have any questions.

NOTE: In High Voltage Disabling, perform the disabling procedure for servicing components within the A4 Hybrid/EV Battery Pack. The C4A Hybrid/EV Battery Section 1 and C4B Hybrid/EV Battery Section 2 will be disconnected as part of the disabling procedure.

1. Ignition OFF, disable high voltage at the A4 Hybrid/EV Battery Pack. Refer to High Voltage Disabling.
2. Disconnect the X4 and X5 harness connectors K16 Battery Energy Control Module.
3. Connect the **EL-48571-30** High Voltage Battery Pin Out Box to the appropriate K16 Battery Energy Control Module harness connector.
4. Insert the DMM probes into the EL-48571-30 test cavities.

NOTE:

- **The DMM must be set to the DC voltage setting.**
- **Not all 24 switch positions of the EL-48571-30 will be used.**

5. Measure and record the voltage of each of the cells by cycling the EL-48571-30 through each of the 16 switch positions.
 6. Verify that each cell voltage reading is 3.0-4.1 V and all cell voltage readings are within 0.1 V of each other.
 - **If any parameter is not between 3.0-4.1 V or is not within 0.1 V of the others**
1. Inspect the appropriate voltage signal circuit and low reference circuit for a short to ground or an open/high resistance.
 - If a short to ground or an open/high resistance is found, replace the appropriate K16 Battery Energy Control Module high voltage measuring harness.
 - If a short to ground or an open/high resistance is not found
 2. Replace the C4A Hybrid/EV Battery Section 1 and C4B Hybrid/EV Battery Section 2.

- If all parameter are between 3.0-4.1 V and are within 0.1 V of each other

7. Replace the K16 Battery Energy Control Module.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Generator Battery Replacement
- Battery Energy Control Module Wiring Harness Replacement (BDU,BECM and BPIM), Battery Energy Control Module Wiring Harness Replacement (HV Measuring Harness 1 and 2)
- Control Module References for battery energy control module replacement, programming, and setup.

DTC P0BBE: HYBRID/EV BATTERY PACK VOLTAGE

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC P0BBE

Hybrid/EV Battery Pack Voltage

Circuit/System Description

The hybrid/EV battery pack contains a total of 32 cell groups in the hybrid/EV battery pack assembly. These cell groups are electrically connected in series. Each individual cell group is rated at 3.7 V, for a nominal system voltage of 118 V DC. The battery cells are grouped together into two sections, each with 16 cell groups.

The battery energy control module monitors the voltage of the 32 battery cell groups. A voltage sense circuit is attached to each individual cell group. Each of these circuits terminate at a connector located on the top surface of the battery section. A serviceable auxiliary battery wiring harness connectors the voltage sense circuits to the battery energy control module, located directly above the hybrid/EV battery pack.

Conditions for Running the DTC

None of the following DTCs are set: P0B3B, P0B3C, P0B3D, P0B3E, P0B40, P0B41, P0B42, P0B43, P0B45, P0B46, P0B47, P0B48, P0B4A, P0B4B, P0B4C, P0B4D, P0B4F, P0B50, P0B51, P0B52, P0B54, P0B55, P0B56, P0B57, P0B59, P0B5A, P0B5B, P0B5C, P0B5E, P0B5F, P0B60, P0B61, P0B63, P0B64, P0B65, P0B66, P0B68, P0B69, P0B6A, P0B6B, P0B6D, P0B6E, P0B6F, P0B70, P0B72, P0B73, P0B74, P0B75, P0B77, P0B78, P0B79, P0B7A, P0B7C, P0B7D, P0B7E, P0B7F, P0B81, P0B82, P0B83, P0B84, P0B86, P0B87, P0B88, P0B89, P0B8B, P0B8C, P0B8D, P0B8E, P0B90, P0B91, P0B92, P0B93, P0B95, P0B96, P0B97, P0B98, P0B9A, P0B9B, P0B9C, P0B9D, P0B9F, P0BA0, P0BA1, P0BA2, P0BA4, P0BA5, P0BA6,

P0BA7, P0BA9, P0BAA, P0BAB, P0BAC, P0BAE, P0BAF, P0BB0, P0BB1, P0BB3, P0BB4, P0BB5, P0BB6, P0BB8, P0BB9, P0BBA, P0BBB, P1B16, P1B17, P1B18, P1B19, P1B1A, P1B1B, P1B1C, P1B1D, P1B1E, P1B1F, P1B20, P1B21, P1B22, P1B23, P1B24, P1B25, P1B26, P1B27, P1B28, P1B29, P1B2A, P1B2B, P1B2C, P1B2D

Conditions for Setting the DTC

The maximum cell voltage and minimum cell voltage differ by more than 0.3 V.

Action Taken When the DTC Sets

- DTC P0BBE is a type B DTC.
- The vehicle operates in a low battery mode with the high voltage contactors closed, but no hybrid functions will occur.

Conditions for Clearing the DTC

DTC P0BBE is a type B DTC.

Diagnostic Aids

The following two tables should be used to determine the switch setting when using the **EL-48571-30** High Voltage Battery Pin Out Box.

Battery Cells (1-16)		
Connector X5		
Switch Designation	Switch Position	Battery Cell
A	1	16
A	2	15
A	3	14
A	4	13
A	5	12

Circuit/System Verification

1. Ignition ON.
2. Verify that each of the scan tool Hybrid Battery Cell Voltage 1-32 parameters are between 3.0-4.1 V and all parameters are within 0.1 V of each other.
 - **If any parameter is not between 3.0-4.1 V or is not within 0.1 V of the others**

Refer to Circuit/System Testing.

- **If all parameter are between 3.0-4.1 V and are within 0.1 V of each other**
3. All OK.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.

- **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

WARNING: The eAssist battery pack assembly will utilize an exchange program. Please consult the most recent revision of bulletin/PI# PIC5520, available in Service Information (SI), for a list of approved eAssist battery pack assembly service procedures. Components that may be removed and serviced without exchanging the complete battery pack assembly are identified in the bulletin/PI. Please contact the GM Technical Assistance Center (1-877-446-8227) if you have any questions.

NOTE: In High Voltage Disabling, perform the disabling procedure for servicing components within the A4 Hybrid/EV Battery Pack. The C4A Hybrid/EV Battery Section 1 and C4B Hybrid/EV Battery Section 2 will be disconnected as part of the disabling procedure.

1. Ignition OFF, disable high voltage at the A4 Hybrid/EV Battery Pack. Refer to High Voltage Disabling.
2. Disconnect the X4 and X5 harness connectors K16 Battery Energy Control Module.
3. Connect the **EL-48571-30** High Voltage Battery Pin Out Box to the appropriate K16 Battery Energy Control Module harness connector.
4. Insert the DMM probes into the EL-48571-30 test cavities.

NOTE:

- **The DMM must be set to the DC voltage setting.**
- **Not all 24 switch positions of the EL-48571-30 will be used.**

5. Measure and record the voltage of each of the cells by cycling the EL-48571-30 through each of the 16 switch positions.
6. Verify that each cell voltage reading is 3.0-4.1 V and all cell voltage readings are within 0.1 V of each other.
 - **If any parameter is not between 3.0-4.1 V or is not within 0.1 V of the others**
 1. Inspect the appropriate voltage signal circuit and low reference circuit for a short to ground or an open/high resistance.
 - If a short to ground or an open/high resistance is found, replace the appropriate K16 Battery Energy Control Module high voltage measuring harness.
 - If a short to ground or an open/high resistance is not found
 2. Replace the C4A Hybrid/EV Battery Section 1 and C4B Hybrid/EV Battery Section 2.
 - **If all parameter are between 3.0-4.1 V and are within 0.1 V of each other**
7. Replace the K16 Battery Energy Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Generator Battery Replacement**
- **Battery Energy Control Module Wiring Harness Replacement (BDU,BECM and BPIM), Battery Energy Control Module Wiring Harness Replacement (HV Measuring Harness 1 and 2)**
- **Control Module References** for battery energy control module replacement, programming, and setup.

DTC P0C77 OR P0C78: HYBRID/EV BATTERY SYSTEM PRECHARGE TIME

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0C77

Hybrid/EV Battery System Precharge Time Too Short

DTC P0C78

Hybrid/EV Battery System Precharge Time Too Long

Circuit/System Description

The hybrid battery system voltage is controlled by two high voltage contactors. The high voltage contactors allow the high voltage DC batteries to be connected to the vehicle or safely contain the high voltage DC within the Hybrid/EV Battery Pack assembly. Of the two contactors, one is a pre-charge contactor and the other is the primary contactor. The two contactors are closed in a specific sequence by the Starter/Generator Control Module. The pre-charge contactor is closed first. This causes high voltage to flow through the pre-charge resistor, allowing system voltage to build slowly. Once the system voltage has raised and stabilized, the primary contactor is closed. Both contactors are controlled by the Starter/Generator Control Module. The Starter/Generator Control Module supplies B+ to each contactor at all times. When the contactors are to be closed, the Starter/Generator Control Module will provide a ground to the contactor through a low side driver.

Conditions for Running the DTC

P0C77

- No faults are set against the battery current sensor
- No faults are set against the internal bus voltage sensor
- Bus voltage is less than 50% before the start of precharge

P0C78

- No faults are set against the battery current sensor
- No faults are set against the internal battery voltage sensor
- No faults are set against the internal bus voltage sensor

Conditions for Setting the DTC

P0C77

Bus voltage is greater than 95% in less than 75 ms after the start of precharge

P0C78

Bus voltage has not reached 95% in less than 1 second after the start of precharge

OR

Battery current is greater than 5 A for longer than 100 ms after the start of precharge

Action Taken When the DTC Sets

DTCs P0C77 and P0C78 are type B DTCs

Conditions for Clearing the DTC

DTCs P0C77 and P0C78 are type B DTCs

Diagnostic Aids

Some conditions than may cause a too long pre-charge are:

- Pre-charge contactor that is inoperative and does not close
- Excessive resistance in the closed contacts of the pre-charge contactor
- Excessive resistance in the pre-charge resistor
- An open or excessive resistance in any of the high voltage (orange) circuits or terminal supplying voltage to the pre-charge resistor and contactor

Some conditions than may cause a too short pre-charge are:

- Primary contactor or pre-charge contractor stuck in the closed position
- Primary contactor control circuit shorted to ground, causing the primary contactor to remain closed even when not commanded closed by the Starter/Generator Control Module
- Too little resistance in the pre-charge resistor

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following

Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
 - **Visually and functionally inspect the gloves before use.**
 - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

WARNING: The eAssist battery pack assembly will utilize an exchange program. Please consult the most recent revision of bulletin/PI# PIC5520, available in Service Information (SI), for a list of approved eAssist battery pack assembly service procedures. Components that may be removed and serviced without exchanging the complete battery pack assembly are identified in the bulletin/PI. Please contact the GM Technical Assistance Center (1-877-446-8227) if you have any questions.

NOTE: In High Voltage Disabling , perform the disabling procedure for servicing components within the A4 Hybrid/EV Battery Pack. The C4A Hybrid/EV Battery Section 1 and C4B Hybrid/EV Battery Section 2 will be disconnected as part of the disabling procedure.

1. Ignition OFF, disable high voltage at the A4 Hybrid/EV Battery Pack. Refer to High Voltage Disabling.
2. Connect the X1, X2, and X3 harness connectors at the K59 Starter/Generator Control Module.
3. Disconnect the X1 and X2 harness connectors at the KR134 Pre-Charge Contactor.
4. Connect the 12 V battery, ignition ON.
5. Verify a test lamp illuminates between the B+ circuit terminal A X1 and ground.
 - **If the test lamp does not illuminate**
 1. Ignition OFF, disconnect the harness connector at the K59 Starter/Generator Control Module.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K59 Starter/Generator Control Module.
 - **If the test lamp illuminates**
6. Test for less than 1 V between the control circuit terminal A X2 and ground.
 - **If 1 V or greater**
 1. Ignition OFF, disconnect the X4 harness connector at the K59 Starter/Generator Control Module.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.

- If less than 1 V, replace the K59 Starter/Generator Control Module.
 - **If less than 1 V**
7. Install a 10 A fused jumper wire between the B+ terminal A X1 and 12 V. Install a jumper wire between the control terminal A X2 and ground.

NOTE: **This step checks the resistance of the closed contactor. Excessive resistance in the closed contacts may cause a slow pre-charge. To verify the resistance, the contactor must be closed. To close the contactor, all terminals at the contactor must be removed and the contactor B+ and control circuits jumpered to B+ and ground. This will close the contacts and allow the resistance of the contacts to be measured.**

8. Test for less than 2 ohms between the high voltage terminals of the closed KR134 Pre-Charge Contactor.
- **If 2 ohms or greater**

Replace the KR134 Pre-Charge Contactor.

- **If less than 2 ohms**
9. Ignition OFF, connect the X1 and X2 harness connectors at the KR134 Pre-Charge Contactor. Disconnect the X4 harness connector at the K59 Starter/Generator Control Module.
10. Test for infinite resistance between the control circuit terminal 6 and ground.
- **If less than infinite resistance**
 - 1. Ignition OFF, disconnect the X2 harness connector at the KR134 Pre-Charge Contactor
 - 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, test or replace the KR134 Pre-Charge Contactor.
 - **If infinite resistance**
11. Test for 90-115 ohms between the B+ circuit terminal 4 and the control circuit terminal 6.
- **If not between 90-115 ohms**
 - 1. Ignition OFF, disconnect the X2 harness connector at the KR134 Pre-Charge Contactor.
 - 2. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the KR134 Pre-Charge Contactor.
 - **If between 90-115 ohms**
12. Test for infinite resistance between the control circuit terminal 5 and ground.
- **If less than infinite resistance**
 - 1. Ignition OFF, disconnect the X1 harness connector at the KR38 Main Contactor.
 - 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, test or replace the KR38 Main Contactor.

- **If infinite resistance**

13. Test for infinite resistance between the high voltage terminals of the open KR38 Main Contactor.

- **If not infinite resistance**

Replace the KR38 Main Contactor.

- **If infinite resistance**

14. Test for 5-10 ohms between the R25 Hybrid/EV Battery Pre-Charge Resistor terminals.

- **If not between 5-10 ohms**

Replace the R25 Hybrid/EV Battery Pre-Charge Resistor.

- **If between 5-10 ohms**

15. Test each of the high voltage circuits and terminals supplying the R25 Hybrid/EV Battery Pre-Charge Resistor and KR134 Pre-Charge Contactor for less than 2 ohms end to end.

- **If 2 ohms or greater**

Replace the appropriate harness.

- **If less than 2 ohms**

16. Replace the K59 Starter/Generator Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC P1A0C: BATTERY ENERGY CONTROL MODULE SYSTEM VOLTAGE LOW VOLTAGE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P1A0C

Battery Energy Control Module System Voltage Low Voltage

Circuit/System Description

The Battery Energy Control Module is the interface and controller for the Hybrid/EV Battery Pack. The Battery

Energy Control Module monitors and balances the cell voltages and also monitors the cell temperatures.

Conditions for Running the DTC

Battery energy control module is awake and communicating.

Conditions for Setting the DTC

12 V battery voltage is less than 8.8 V.

Action Taken When the DTC Sets

- DTCs P1A0C is a type C DTC.
- 12 V battery voltage is greater than 8.8 V.

Conditions for Clearing the DTC

DTCs P1A0C is a type C DTC.

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

WARNING: The eAssist battery pack assembly will utilize an exchange program. Please consult the most recent revision of bulletin/PI# PIC5520, available in Service Information (SI), for a list of approved eAssist battery pack assembly service procedures. Components that may be removed and serviced without exchanging the complete battery pack assembly are identified in the bulletin/PI. Please contact the GM Technical Assistance Center (1-877-446-8227) if you have any questions.

1. Ignition ON.
2. Verify that DTC P1A0C is not set.
 - If the DTC is set

Test and inspect the 12 V battery. Refer to **Battery Inspection/Test** .

- If the DTC is not set

3. All OK.

DTC P1A5D: BATTERY ENERGY CONTROL MODULE 5V REFERENCE 2 CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P1A5D

Battery Energy Control Module 5V Reference 2 Circuit

Circuit/System Description

The Hybrid/EV Battery Pack has 6 battery temperature sensors. The battery temperature sensors are located on the top of the batteries. The temperature sensor is a variable resistor that measures the temperature of the battery cell group. The Battery Energy Control Module supplies 5 V to the signal circuit and a ground for the low reference circuit. The battery temperature sensor resistance changes with battery temperature. As the temperature decreases, the sensor resistance increases. As the temperature increases, the sensor resistance decreases. The Battery Energy Control Module uses the battery temperature sensors to determine the temperature of the Hybrid/EV Battery Pack assembly. The Hybrid Powertrain Control Module will control the Hybrid/EV Battery Pack cooling fan based on the Hybrid/EV Battery Pack temperature.

Conditions for Running the DTC

- Battery voltage is greater than 8.8 V
- Battery energy control module is awake and communicating

Conditions for Setting the DTC

- Temperature sensor 5 volt reference voltage is greater than 5.15 V
- Temperature sensor 5 volt reference voltage is less than 4.85 V

Action Taken When the DTC Sets

DTC P1A5D is a type A DTC

Conditions for Clearing the DTC

DTC P1A5D is a type A DTC

DTC P1A5E OR P1A5F: BATTERY ENERGY CONTROL MODULE IGNITION ON/START SWITCH

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P1A5E

Battery Energy Control Module Ignition On/Start Switch Circuit Low Voltage

DTC P1A5F

Battery Energy Control Module Ignition On/Start Switch Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	P1A5E, P0AC4, P2534	P1A5E, P0AC4	P1A5F, P0AC4, P2535	-

Circuit/System Description

The RUN/CRANK relay applies ignition voltage to the ignition 1 circuit when the ignition is in the RUN or CRANK position. The ignition 1 circuit supplies ignition voltage to the Starter/Generator Control Module. The ignition 1 circuit also continues through the Starter/Generator Control Module in a pass-thru manner and continues to the Battery Energy Control Module. The Battery Energy Control Module also monitors the power mode message which is broadcast via serial data and compares the power mode message to the actual power mode as indicated by voltage on the ignition 1 circuit.

Controlled by the Body Control Module (BCM), the accessory wakeup circuit supplies voltage to the Starter/Generator Control Module as a means to wake the control module and initiate serial data communications. Like the ignition 1 circuit, the accessory wakeup circuit continues through the Starter/Generator Control Module in a pass-thru manner and continues to the Battery Energy Control Module.

Conditions for Running the DTC

- 12 V battery voltage is greater than 8.86 V
- Battery energy control module is awake and communicating
- Serial data indicates the power mode is RUN/CRANK
- DTC U180B is not set

Conditions for Setting the DTC

The power mode message received via serial data does not match the power mode indicated by the status of the ignition 1 circuit.

Action Taken When the DTC Sets

DTC P1A5E and P1A5F are type B DTCs

Conditions for Clearing the DTC

DTC P1A5E and P1A5F are type B DTCs

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Hybrid Powertrain Control Module Ignition 1 parameter is 0 V with the ignition OFF

and B+ with the ignition ON.

- **If not 0 V with the ignition OFF and B+ with the ignition ON**

Refer to Circuit/System Testing.

- **If 0 V with the ignition OFF and B+ with the ignition ON**

3. Verify the scan tool Battery Energy Control Module Power Mode parameter matches the actual vehicle power mode as the ignition is turned ON and OFF.

- **If the parameter does not match the actual power mode**

Refer to Circuit/System Testing.

- **If the parameter matches the actual power mode**

4. All OK.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

WARNING: The eAssist battery pack assembly will utilize an exchange program.

Please consult the most recent revision of bulletin/PI# PIC5520, available in Service Information (SI), for a list of approved eAssist battery pack assembly service procedures. Components that may be removed and serviced without exchanging the complete battery pack assembly are identified in the bulletin/PI. Please contact the GM Technical Assistance Center (1-877-446-8227) if you have any questions.

1. Ignition OFF, disconnect the X3 harness connector at the K59 Starter/Generator Control Module.
2. Verify a test lamp does not illuminate between the ignition circuit terminal 10 and ground.
 - **If the test lamp illuminates**
 1. Disconnect the X2 harness connector at the X50A Fuse Block - Underhood.
 2. Test for less than 1 V between the ignition circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, refer to **Power Mode Mismatch** .
 - **If the test lamp does not illuminate**
3. Ignition ON.
4. Verify a test lamp illuminates between the ignition circuit terminal 10 and ground.
 - **If the test lamp does not illuminate**
 1. Disconnect the X2 harness connector at the X50A Fuse Block - Underhood.
 2. Test for infinite resistance between the ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the ignition circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, refer to **Power Mode Mismatch** .
 - **If the test lamp illuminates**
5. Connect the X3 harness connector at the K59 Starter/Generator Control Module.

NOTE: In **High Voltage Disabling** , perform the disabling procedure for servicing components within the A4 Hybrid/EV Battery Pack. The C4A Hybrid/EV Battery Section 1 and C4B Hybrid/EV Battery Section 2 will be disconnected as part of the disabling procedure.

6. Ignition OFF, disable high voltage at the A4 Hybrid/EV Battery Pack. Refer to **High Voltage Disabling**.
7. Connect the X1, X2, and X3 harness connectors at the K59 Starter/Generator Control Module.
8. Disconnect the X1 harness connector at the K16 Battery Energy Control Module.
9. Connect the 12 V battery.
10. Verify a test lamp does not illuminate between the ignition circuit terminal 9 and ground.
 - **If the test lamp illuminates**
 1. Disconnect the X4 harness connector at the K59 Starter/Generator Control Module.

2. Test for less than 1 V between the ignition circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K59 Starter/Generator Control Module.
 - **If the test lamp does not illuminate**
11. Ignition ON.
12. Verify a test lamp illuminates between the ignition circuit terminal 9 and ground.
 - **If the test lamp does not illuminate**
 1. Disconnect the X4 harness connector at the K59 Starter/Generator Control Module.
 2. Test for infinite resistance between the ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the ignition circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K59 Starter/Generator Control Module.
 - **If the test lamp illuminates**
13. Replace the K16 Battery Energy Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for Battery Energy Control Module or Starter/Generator Control Module replacement, programming, and setup

DTC P1A60: BATTERY ENERGY CONTROL MODULE IGNITION ACCESSORY SWITCH CIRCUIT LOW VOLTAGE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P1A60

Battery Energy Control Module Ignition Accessory Switch Circuit Low Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance

Ignition	P1A60	P1A60	-	-
----------	-------	-------	---	---

Circuit/System Description

The ignition main relay applies ignition voltage to the ignition circuit when the ignition is in the RUN or CRANK position. The ignition circuit supplies ignition voltage to the starter/generator control module. The ignition circuit also continues through the starter/generator control module in a pass-thru manner and continues to the battery energy control module. The battery energy control module also monitors the power mode message which is broadcast via serial data and compares the power mode message to the actual power mode as indicated by voltage on the ignition circuit.

Controlled by the body control module (BCM), the accessory wakeup circuit supplies voltage to the starter/generator control module as a means to wake the control module and initiate serial data communications. Like the ignition circuit, the accessory wakeup circuit continues through the starter/generator control module in a pass-thru manner and continues to the battery energy control module.

Conditions for Running the DTC

- Battery voltage is greater than 9.6 V
- Battery energy control module is awake and communicating
- Serial data indicates the power mode is RUN/CRANK
- Propulsion system is active

Conditions for Setting the DTC

The accessory wakeup serial data circuit is not active

Action Taken When the DTC Sets

DTC P1A60 is a type B DTC

Conditions for Clearing the DTC

DTC P1A60 is a type B DTC

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and

personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

WARNING: The eAssist battery pack assembly will utilize an exchange program. Please consult the most recent revision of bulletin/PI# PIC5520, available in Service Information (SI), for a list of approved eAssist battery pack assembly service procedures. Components that may be removed and serviced without exchanging the complete battery pack assembly are identified in the bulletin/PI. Please contact the GM Technical Assistance Center (1-877-446-8227) if you have any questions.

NOTE: In High Voltage Disabling , perform the disabling procedure for servicing components within the A4 Hybrid/EV Battery Pack. The C4A Hybrid/EV Battery Section 1 and C4B Hybrid/EV Battery Section 2 will be disconnected as part of the disabling procedure.

1. Ignition OFF, disable high voltage at the A4 Hybrid/EV Battery Pack. Refer to High Voltage Disabling.
2. Connect the X1, X2, and X3 harness connectors at the K59 Starter/Generator Control Module.
3. Disconnect the X1 harness connector at the K16 Battery Energy Control Module.
4. Connect the 12 V battery, ignition ON.
5. Verify a test lamp illuminates between the ignition circuit terminal 20 and ground.
 - **If the test lamp does not illuminate**
 1. Ignition OFF, disconnect the X4 harness connector at the K59 Starter/Generator Control Module.
 2. Test for infinite resistance between the ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the ignition circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, replace the K59 Starter/Generator Control Module.
 - **If the test lamp illuminates**
6. Replace the K16 Battery Energy Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for battery energy control module or starter/generator control module replacement, programming, and setup

DTC P1B11: DRIVE MOTOR CONTROL MODULE HYBRID/EV AC VOLTAGE SYSTEM ISOLATION LOST

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P1B11

Drive Motor Control Module Hybrid/EV AC Voltage System Isolation Lost

Circuit/System Description

The vehicle is equipped with a high voltage isolation monitor feature. The purpose of the isolation monitor is to test the resistance between the high voltage positive and negative direct current (DC) bus and chassis ground. The isolation monitoring system measures the resistance between the high voltage system and chassis ground in the following way. The isolation monitoring system measures voltage potential difference between the positive battery mid pack voltage and chassis ground as well as the voltage difference between negative battery mid pack voltage and chassis ground. These voltage values are used by the starter/generator control module to calculate a resistance value between the high voltage bus and the chassis ground. If this resistance value is too low, a high voltage isolation fault has occurred.

Conditions for Running the DTC

This DTC runs at all times.

Conditions for Setting the DTC

The starter/generator control module detects an AC voltage short to chassis ground.

Action Taken When the DTC Sets

- DTC P1B11 is a type A DTC.
- If the DTC sets while there is a loss of communication with the inflatable restraint sensing and diagnostic module, the starter/generator control module will record the fault as a crash event and the DTC will become latched.

Conditions for Clearing the DTC

- DTC P1B11 is a type A DTC.
- If the DTC is set as a latched DTC, the crash event must be cleared before the DTC will clear.

Diagnostic Aids

For intermittent concerns, drive the vehicle while monitoring the scan tool Drive Motor Control Module Negative Supply Isolation Voltage parameter and the scan tool Drive Motor Control Module Positive Supply Isolation Voltage parameter using the Graphical Data Display function of the scan tool. An intermittent loss of isolation will result in a large spike in the graph. This spike will correspond with the setting of the DTC. If normal isolation testing reveals no isolation faults and testing indicates an intermittent isolation fault while driving the vehicle, replace the A15 Starter/Generator.

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

WARNING: The eAssist battery pack assembly will utilize an exchange program. Please consult the most recent revision of bulletin/PI# PIC5520, available in Service Information (SI), for a list of approved eAssist battery pack assembly service procedures. Components that may be removed and serviced without exchanging the complete battery pack assembly are identified in the bulletin/PI. Please contact the GM Technical Assistance Center (1-877-446-8227) if you have any questions.

NOTE: In High Voltage Disabling, perform the disabling procedure for servicing components within the energy storage system. The C4A Hybrid/EV Battery Section 1 and C4B Hybrid/EV Battery Section 2 will be disconnected as part of the disabling procedure.

1. Ignition OFF, disable high voltage at the A4 Hybrid/EV Battery Pack. Refer to High Voltage Disabling.
2. Disconnect the U, V, and W three phase lugs at the K59 Starter/Generator Control Module.

NOTE: The following continuity tests must be performed using the EL-50772 Insulation Multimeter. Select the Isolation test setting, then select the 500 V range.

3. Test for greater than 400K ohms between the terminals listed below and chassis ground with the **EL-50772** Insulation Multimeter set on the Isolation test setting:
 - 3 phase cable terminal U - cable side lug
 - 3 phase cable terminal V - cable side lug
 - 3 phase cable terminal W - cable side lug
 - **If 400K ohms or less**
 1. Disconnect the U, V, and W three phase lugs at the A15 Starter/Generator.
 2. Test for greater than 400K ohms between the U, V, and W three phase studs at the A15 Starter/Generator and chassis ground with the **EL-50772** Insulation Multimeter set on the Isolation test setting.
 - If 400K ohms or less, replace the A15 Starter/Generator.
 - If greater than 400K ohms
 3. Replace the high voltage 3 phase cables.
 - **If greater than 400K ohms**

NOTE: The following continuity tests must be performed using the EL-50772 Insulation Multimeter. Select the Isolation test setting, then select the 500 V range.

4. Test for greater than 400K ohms between the terminals listed below and chassis ground with the **EL-50772** Insulation Multimeter set on the Isolation test setting:
 - 3 phase terminal U - K59 Starter/Generator Control Module stud
 - 3 phase terminal V - K59 Starter/Generator Control Module stud
 - 3 phase terminal W - K59 Starter/Generator Control Module stud
 - **If 400K ohms or less**
 1. Disconnect and remove the two wiring junction blocks from the A4 Hybrid/EV Battery Pack.
 2. Test for greater than 400K ohms between the U, V, and W three phase studs at the K59 Starter/Generator Control Module and chassis ground with the **EL-50772** Insulation Multimeter set on the Isolation test setting.
 - If 400K ohms or less, replace the K59 Starter/Generator Control Module.

- If greater than 400K ohms
- 3. Replace the two wiring junction blocks.
 - **If greater than 400K ohms**
- 5. Replace the A15 Starter/Generator.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Drive Motor Generator Battery Cable Replacement**
- **Starter Generator Replacement**
- **Generator Battery Replacement**
- **Drive Motor Battery Wire Junction Block Relay Replacement**
- **Control Module References** for starter/generator control module replacement, programming, and setup

DTC P1B33-P1B39: BATTERY ENERGY CONTROL MODULE HYBRID/EV BATTERY VOLTAGE BALANCE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

Battery Energy Control Module Hybrid/EV Battery Voltage Balance Processor 4 Performance

DTC P1B38

Battery Energy Control Module Hybrid/EV Battery Voltage Balance Processor 5 Performance

DTC P1B39

Battery Energy Control Module Hybrid/EV Battery Voltage Balance Processor 6 Performance

Circuit/System Description

The Hybrid/EV Battery Pack contains a total of 32 cell groups in the Hybrid/EV Battery Pack assembly. These cell groups are electrically connected in series. Each individual cell group is rated at 3.7 V, for a nominal system voltage of 118 V DC. The battery cells are grouped together into two sections, each with 16 cell groups.

The Battery Energy Control Module monitors the voltage of the 32 battery cell groups. A voltage sense circuit is attached to each individual cell group. Each of these circuits terminate at a connector located on the top surface of the battery section. A serviceable auxiliary battery wiring harness connectors the voltage sense circuits to the Battery Energy Control Module, located directly above the Hybrid/EV Battery Pack.

To ensure proper battery function and lengthen battery life, the Battery Energy Control Module balances the voltage of the cells so that each cells maintains the same voltage level. The Battery Energy Control Module uses internal voltage gates to transfer voltage from cells with a higher voltage level to those cells with a lower voltage level. To maintain a similar state of charge on the cell groups, the Starter/Generator Control Module monitors the cell voltages and determines which cells need energy removed in order to maintain the cells at a similar state of charge. A resistor wired in parallel with the cell and a transistor switch in series with the resistor internal to the Battery Energy Control Module. The Starter/Generator Control Module sends a command to the Battery Energy Control Module to begin cell balancing.

Conditions for Running the DTC

DTC P1B33

- Battery voltage is greater than 8.8 V.
- Battery energy control module is awake and communicating.
- Internal cell balancing is not in progress.

DTC P1B34, P1B35, P1B36, P1B37, P1B38, P1B39

- Battery voltage is greater than 9.6 V.
- Battery energy control module is awake and communicating.

Conditions for Setting the DTC

DTC P1B33

The balancing switch status does not equal the balancing switch command.

DTC P1B34, P1B35, P1B36, P1B37, P1B38, P1B39

An internal communication fault has occurred within the Battery Energy Control Module.

Action Taken When the DTC Sets

- DTCs P1B33, P1B34, P1B35, P1B36, P1B37, P1B38, and P1B39 are type B DTCs.
- The vehicle operates in a low battery mode with the high voltage contactors closed, but no hybrid functions will occur.

Conditions for Clearing the DTC

DTCs P1B33, P1B34, P1B35, P1B36, P1B37, P1B38, and P1B39 are type B DTCs.

DTC P1B3F OR P1B40: HIGH VOLTAGE SYSTEM INTERLOCK CIRCUIT 2

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P1B3F

High Voltage System Interlock Circuit 2 Low Voltage

DTC P1B40

High Voltage System Interlock Circuit 2 High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
5 V Reference	P0641, P057C, P1B3F	P1B3F	P0641, P1B40	-
Signal	P1B3F	P1B3F	P1B40	-

Circuit/System Description

The high voltage interlock circuits are utilized to verify high voltage component integrity. The high voltage interlock circuits are two circuit loops that pass through certain high voltage components. The high voltage interlock circuits are used to determine if access to high voltage components is being attempted. The opening of these high voltage components causes the high voltage interlock circuit to open. The Starter/Generator Control Module monitors both the high voltage interlock 5 V reference circuit voltage and the high voltage interlock signal circuit voltage in order to detect circuit faults. When the Starter/Generator Control Module detects a loss of high voltage interlock circuit voltage, the high voltage contactors are commanded open.

The service cover for the Starter/Generator and the service cover for the Hybrid/EV Battery Pack each contain a high voltage interlock switch. When either cover is removed, the starter/generator control module will respond by opening the high voltage contacts. The 5 V reference circuits and signal circuits for each of the two high voltage interlock loops are completely separate from one another and are monitored as two separate loops, with each setting a specific DTC to indicate a circuit fault. The 5 V reference circuit that feeds the high voltage interlock switch on the Starter/Generator also supplies the 5 V reference to the brake pedal position sensor.

Conditions for Running the DTC

The Starter/Generator Control Module is awake and communicating

Conditions for Setting the DTC

DTC P1B3F

Voltage on the high voltage interlock signal circuit is less than 0.5 V

DTC P1B40

Voltage on the high voltage interlock signal circuit is greater than 4.5 V

Action Taken When the DTC Sets

DTCs P1B3F and P1B40 are type B DTCs

Conditions for Clearing the DTC

DTCs P1B3F and P1B40 are type B DTCs

Diagnostic Aids

- When a circuit fault is detected on the high voltage interlock loop that feeds the Starter/Generator and the vehicle hood is opened, the Starter/Generator Control Module will respond by turning off inverter switching. This will prevent the Starter/Generator from charging the Hybrid/EV Battery Pack and supplying voltage to the Starter/Generator Control Module 12 V output. Operating in this manner will cause an eventual discharge of both the high voltage battery pack and the 12 V battery.
- Because the 5 V reference circuit also supplies voltage to the brake pedal position sensor, a circuit fault on the high voltage interlock loop that feeds the Starter/Generator will also cause hybrid functions that rely on the brake pedal position, such as auto-stop and regenerative braking, to be disabled.

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

WARNING: The eAssist battery pack assembly will utilize an exchange program. Please consult the most recent revision of bulletin/PI# PIC5520, available in Service Information (SI), for a list of approved eAssist battery pack assembly service procedures. Components that may be removed and serviced without exchanging the complete battery pack assembly are identified in the bulletin/PI. Please contact the GM Technical Assistance Center (1-877-446-8227) if you have any questions.

1. Ignition OFF, disconnect the X2 harness connector at the K59 Starter/Generator Control Module, ignition ON.
2. Test for less than 1 V between the following circuit terminals and ground:
 - 5 V Reference circuit terminal 2
 - Signal circuit terminal 1
 - **If 1 V or greater**
1. Disconnect the harness connector at the A15 Starter/Generator.
2. Test for less than 1 V between the following circuit terminals and ground:

- K59 Starter/Generator Control Module 5 V reference circuit terminal 2 X2
- K59 Starter/Generator Control Module signal circuit terminal 1 X2
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
- 3. Replace the A15 Start/Generator.
 - **If less than 1 V**
- 3. Ignition OFF.
- 4. Test for infinite resistance between the following circuit terminals and ground:
 - 5 V Reference circuit terminal 2
 - Signal circuit terminal 1
 - **If less than infinite resistance**
- 1. Disconnect the harness connector at the A15 Starter/Generator.
- 2. Test for infinite resistance between the following circuit terminals and ground:
 - K59 Starter/Generator Control Module 5 V reference circuit terminal 2 X2
 - K59 Starter/Generator Control Module signal circuit terminal 1 X2
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
- 3. Disable high voltage at the A4 Hybrid/EV Battery Pack. Refer to **High Voltage Disabling**.
- 4. Remove the A15 Starter/Generator battery cable access cover.

NOTE: **The 5 V reference and signal circuits pass through the A15 Starter/Generator and the A15 Starter/Generator battery cable block before connecting to a resistor located in the A15 Start/Generator battery cable access cover.**

- 5. Verify the terminal integrity of the 5 V reference and signal circuits as they pass through the A15 Starter/Generator and the A15 Starter/Generator battery cable block. Verify none of these terminals are not damaged in a manner that would cause them to be shorted to ground.
 - If any of the terminals are damaged, repair or replace the appropriate component as necessary.
 - If none of the terminals are damaged.
- 6. Replace the A15 Start/Generator.
 - **If infinite resistance**
- 5. Test for 2.5k - 3.5k ohms between the 5 V reference circuit terminal 2 and the signal circuit terminal 1.
 - **If less than 2.5k ohms**
- 1. Disconnect the harness connector at the A15 Starter/Generator.
- 2. Test for infinite resistance between the K59 Starter/Generator Control Module 5 V reference circuit terminal 2 and the K59 Starter/Generator Control Module signal circuit terminal 1.
 - If less than infinite resistance, repair the shorted together circuits.
 - If infinite resistance

3. Connect the harness connector at the A15 Starter/Generator.
4. Disable high voltage at the A4 Hybrid/EV Battery Pack. Refer to **High Voltage Disabling**.
5. Remove the A15 Starter/Generator battery cable access cover,
6. Test for infinite resistance between the K59 Starter/Generator Control Module 5 V reference circuit terminal 2 and the K59 Starter/Generator Control Module signal circuit terminal 1.
 - If less than infinite resistance, verify the terminal integrity of the 5 V reference and signal circuits as they pass through the A15 Starter/Generator and the A15 Starter/Generator battery cable block. Verify these terminals are not damaged in a manner that would cause them to be shorted to together.
 - If infinite resistance
7. Test the A15 Starter/Generator battery cable access cover. Refer to Component Testing.
 - If the A15 Starter/Generator battery cable access cover does not pass the Component Test, replace the A15 Starter/Generator battery cable access cover.
 - If the A15 Starter/Generator battery cable access cover passes the Component Test
8. Replace the A15 Starter/Generator.
 - **If greater than 3.5k ohms**
1. Disconnect the harness connector at the A15 Starter/Generator.
2. Test for infinite resistance between the K59 Starter/Generator Control Module 5 V reference circuit terminal 2 and the K59 Starter/Generator Control Module signal circuit terminal 1.
 - If less than infinite resistance, repair the shorted together circuits.
 - If infinite resistance
3. Test for less than 2 ohms between the following circuit terminals:
 - K59 Starter/Generator Control Module 5 V reference circuit terminal 2 X2 and the A15 Start/Generator 5 V reference circuit terminal 12
 - K59 Starter/Generator Control Module signal circuit terminal 1 X2 and the A15 Start/Generator signal circuit terminal 11
 - If 2 ohms or greater, repair the open circuit.
 - If less than 2 ohms
4. Connect the harness connector at the A15 Starter/Generator.
5. Disable high voltage at the A4 Hybrid/EV Battery Pack. Refer to **High Voltage Disabling**.
6. Remove the A15 Starter/Generator battery cable access cover.
7. Test the A15 Starter/Generator battery cable access cover. Refer to Component Testing.
 - If the A15 Starter/Generator battery cable access cover does not pass the Component Test, replace the A15 Starter/Generator battery cable access cover.
 - If the A15 Starter/Generator battery cable access cover passes the Component Test

NOTE: **The 5 V reference and signal circuits pass through the A15 Starter/Generator and the A15 Starter/Generator battery cable block before connecting to a resistor located in the A15 Start/Generator battery cable access cover.**

8. Verify the terminal integrity of the 5 V reference and signal circuits as they pass through the A15 Starter/Generator and the A15 Starter/Generator battery cable block. Verify none of these terminals are not damaged in a manner that would cause them to be open.
 - If any of the terminals are damaged, repair or replace the appropriate component as necessary.
 - If none of the terminals are damaged
9. Replace the A15 Starter/Generator.
 - **If between 2.5k - 3.5k ohms**
6. Test or replace the K59 Starter/Generator Control Module

Component Testing

1. Ignition OFF, disable high voltage at the A4 Hybrid/EV Battery Pack. Refer to **High Voltage Disabling**.
2. Remove the A15 Starter/Generator battery cable access cover.
3. Test for 2.5k-3.5k ohms between the A15 Starter/Generator battery cable access cover high voltage interlock 5 V reference terminal and the A15 Starter/Generator battery cable access cover high voltage interlock signal terminal.
 - **If not between 2.5k-3.5k ohms**

Replace the A15 Starter/Generator battery cable access cover

- **If between 2.5k-3.5k ohms**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Starter Generator Replacement**
- **Control Module References** for Starter/Generator Control Module replacement, programming, and setup

DTC P1E0C OR P1E0D: HYBRID/EV BATTERY VOLTAGE ISOLATION SENSING CIRCUIT 2

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P1E0C

Hybrid/EV Battery Voltage Isolation Sensing Circuit 2 Low Voltage

DTC P1E0D

Hybrid/EV Battery Voltage Isolation Sensing Circuit 2 High Voltage

Circuit/System Description

The vehicle is equipped with a high voltage isolation monitor feature. The purpose of the isolation monitor is to test the resistance between the high voltage positive and negative direct current (DC) bus and chassis ground. The isolation monitoring system measures the resistance between the high voltage system and chassis ground in the following way. The isolation monitoring system measures voltage potential difference between the positive battery mid pack voltage and chassis ground as well as the voltage difference between negative battery mid pack voltage and chassis ground. These voltage values are used by the Starter/Generator Control Module to calculate a resistance value between the high voltage bus and the chassis ground. If this resistance value is too low, a high voltage isolation fault has occurred.

Conditions for Running the DTC

P1E0C

- Power mode is RUN or CRANK.
- Contactors are closed.

P1E0D

- Power mode is RUN or CRANK.
- The Starter/Generator Control Module internal voltage sensor has no reported faults.

Conditions for Setting the DTC

P1E0C

Voltage measured at the negative mid-pack voltage sensor is less than 5 V.

P1E0D

The difference between the voltage measured at the negative mid-pack voltage sensor and the Starter/Generator Control Module internal motor control processor high voltage value is greater than 15 V.

Action Taken When the DTC Sets

- DTCs P1E0C and P1E0D are type B DTCs.
- If the DTC sets while there is a loss of communication with the Inflatable Restraint Sensing and Diagnostic Module (SDM), the Starter/Generator Control Module will record the fault as a crash event and the DTC will become latched.

Conditions for Clearing the DTC

- DTCs P1E0C and P1E0D are type B DTCs.
- If the DTC is set as a latched DTC, the crash event must be cleared before the DTC will clear.

DTC Descriptors

DTC P1E0F

Hybrid/EV Battery Voltage Isolation High Resolution Sensing Circuit 1 Low Voltage

DTC P1E10

Hybrid/EV Battery Voltage Isolation High Resolution Sensing Circuit 1 High Voltage

DTC P1E11

Hybrid/EV Battery Voltage Isolation High Resolution Sensing Circuit 1 Performance

Circuit/System Description

The vehicle is equipped with a high voltage isolation monitor feature. The purpose of the isolation monitor is to test the resistance between the high voltage positive and negative direct current (DC) bus and chassis ground. The isolation monitoring system measures the resistance between the high voltage system and chassis ground in the following way. The isolation monitoring system measures voltage potential difference between the positive battery mid pack voltage and chassis ground as well as the voltage difference between negative battery mid pack voltage and chassis ground. These voltage values are used by the Starter/Generator Control Module to calculate a resistance value between the high voltage bus and the chassis ground. If this resistance value is too low, a high voltage isolation fault has occurred.

Conditions for Running the DTC

P1E0F

- Power mode is RUN or CRANK.
- Contactors are closed.

P1E10

- Power mode is RUN or CRANK.
- The Starter/Generator Control Module internal voltage sensor has no reported faults.
- Mid-pack voltage positive sensor is less than 7.5 V.
- DTC P0AAA is not set.

P1E11

- Mid-pack voltage positive sensor is less than 7.5 V.
- DTC P1E0F or P1E10 is not set.

Conditions for Setting the DTC

P1E0F

Voltage measured at the positive mid-pack high resolution voltage sensor is less than 3 V.

P1E10

The difference between the voltage measured at the positive mid-pack high resolution voltage sensor and the Starter/Generator Control Module internal motor control processor high voltage value is greater than 5 V.

P1E11

The difference between the mid-pack voltage positive sensor and the positive mid-pack high resolution voltage sensor is greater than 3 V.

Action Taken When the DTC Sets

- DTCs P1E0F-P1E11 are type B DTCs.
- If the DTC sets while there is a loss of communication with the Inflatable Restraint Sensing and Diagnostic Module (SDM), the Starter/Generator Control Module will record the fault as a crash event and the DTC will become latched.

Conditions for Clearing the DTC

- DTCs P1E0F-P1E11 are type B DTCs.
- If the DTC is set as a latched DTC, the crash event must be cleared before the DTC will clear.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

WARNING: The eAssist battery pack assembly will utilize an exchange program. Please consult the most recent revision of bulletin/PI# PIC5520, available in Service Information (SI), for a list of approved eAssist battery pack assembly service procedures. Components that may be removed and serviced without exchanging the complete battery pack assembly are identified in the bulletin/PI. Please contact the GM Technical Assistance Center (1-877-446-8227) if you have any questions.

NOTE: In High Voltage Disabling, perform the disabling procedure for servicing components within the energy storage system. The C4A Hybrid/EV Battery Section 1 and C4B Hybrid/EV Battery Section 2 will be disconnected as part of the disabling procedure. .

1. Ignition OFF, disable high voltage at the A4 Hybrid/EV Battery Pack. Refer to High Voltage Disabling.
2. Disconnect the U, V, and W three phase lugs at the K59 Starter/Generator Control Module.

NOTE: The following continuity tests must be performed using the **EL-50772 Insulation Multimeter**. Select the Isolation test setting, then select the 500 V range.

3. Test for greater than 400K ohms between the terminals listed below and chassis ground with the **EL-50772** Insulation Multimeter set on the Isolation test setting:
 - 3 phase cable terminal U - cable side lug
 - 3 phase cable terminal V - cable side lug
 - 3 phase cable terminal W - cable side lug
 - **If 400K ohms or less**
 1. Disconnect the U, V, and W three phase lugs at the A15 Starter/Generator.
 2. Test for greater than 400K ohms between the U, V, and W three phase studs at the A15 Starter/Generator and chassis ground with the **EL-50772** Insulation Multimeter set on the Isolation test setting.
 - If 400K ohms or less, replace the A15 Starter/Generator.
 - If greater than 400K ohms
 3. Replace the high voltage 3 phase cables.
 - **If greater than 400K ohms**

NOTE: The following continuity tests must be performed using the **EL-50772 Insulation Multimeter**. Select the Isolation test setting, then select the 500 V range.

4. Test for greater than 400K ohms between the terminals listed below and chassis ground with the **EL-50772** Insulation Multimeter set on the Isolation test setting:
 - 3 phase terminal U - K59 Starter/Generator Control Module stud
 - 3 phase terminal V - K59 Starter/Generator Control Module stud
 - 3 phase terminal W - K59 Starter/Generator Control Module stud
 - **If 400K ohms or less**
 1. Disconnect and remove the two wiring junction blocks from the A4 Hybrid/EV Battery Pack.
 2. Test for greater than 400K ohms between the U, V, and W three phase studs at the K59 Starter/Generator Control Module and chassis ground with the **EL-50772** Insulation Multimeter set on the Isolation test setting.
 - If 400K ohms or less, replace the K59 Starter/Generator Control Module.
 - If greater than 400K ohms
 3. Replace the two wiring junction blocks.
 - **If greater than 400K ohms**
5. Replace the C4A Hybrid/EV Battery Section 1 and C4B Hybrid/EV Battery Section 2.

- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P1E3D

Control Module Calculated Hybrid/EV Battery Performance

Circuit/System Description

As a means of checking microprocessor integrity, the Starter/Generator Control Module calculates and compares voltage at various locations within itself. The Starter/Generator Control Module calculates three separate voltage values, representing voltage measured at different locations within the Hybrid/EV Battery Pack. The Starter/Generator Control Module performs these calculations at different locations within the microprocessor. As an indicator of microprocessor integrity, the voltage calculations should all be the same.

Conditions for Running the DTC

This DTC runs continuously.

Conditions for Setting the DTC

The difference between the calculated voltages is greater than 1 V.

Action Taken When the DTC Sets

- DTC P1E3D is a type A DTC.
- The high voltage contactors open and hybrid functions are disabled.
- 12 V output from the Starter/Generator Control Module is maintained.

Conditions for Clearing the DTC

DTC P1E3D is a type A DTC.

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P1EAA

Hybrid/EV Battery Voltage Balance Processor Multiplexer Performance

Circuit/System Description

The Hybrid/EV Battery Pack contains a total of 32 cell groups in the Hybrid/EV Battery Pack assembly. These cell groups are electrically connected in series. Each individual cell group is rated at 3.7 V, for a nominal system voltage of 118 V DC. The battery cells are grouped together into two sections, each with 16 cell groups.

The Battery Energy Control Module monitors the voltage of the 32 battery cell groups. A voltage sense circuit is attached to each individual cell group. Each of these circuits terminate at a connector located on the top surface of the battery section. A serviceable auxiliary battery wiring harness connectors the voltage sense circuits to the Battery Energy Control Module, located directly above the Hybrid/EV Battery Pack.

To ensure proper battery function and lengthen battery life, the battery energy control processor balances the voltage of the cells so that each cells maintains the same voltage level. The Battery Energy Control Module uses internal voltage gates to transfer voltage from cells with a higher voltage level to those cells with a lower voltage level. This voltage balancing is an internal function to the Battery Energy Control Module.

The cell voltages are read through multiplexer circuits which take the voltages from multiple battery cells and supplies them to one single analog to digital converter. To determine if the multiplexer is operating correctly, the balancing gates are operated by the Battery Energy Control Module one at a time, shifting each cell voltage while the balance gate is on. This cell voltage pattern is analyzed by the Starter/Generator Control Module to determine if there is a cell voltage multiplexer malfunction.

Conditions for Running the DTC

- Ignition mode transitions from RUN or CRANK to OFF.
- Contactor status is open.
- Propulsion system active while contactors are open for greater than 2.5 seconds is not true.
- DTC U182A is not set.

Conditions for Setting the DTC

- The balance process did not occur at ignition OFF.
- The balance process occurred at any time other than ignition OFF.
- The cell voltage movement during the balance process is more than 0.1 V from the expected voltage movement.

Action Taken When the DTC Sets

- DTC P1EAA is a type A DTC.
- The vehicle operates in a low battery mode with the high voltage contactors closed, but no hybrid functions will occur.

Conditions for Clearing the DTC

DTC P1EAA is a type A DTC.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

WARNING: The eAssist battery pack assembly will utilize an exchange program. Please consult the most recent revision of bulletin/PI# PIC5520, available in Service Information (SI), for a list of approved eAssist battery pack assembly service procedures. Components that may be removed and serviced without exchanging the complete battery pack assembly are identified in the bulletin/PI. Please contact the GM Technical Assistance Center (1-877-446-8227) if you have any questions.

1. Verify no communication DTCs are set in the K59 Starter/Generator Control Module.
 - If any communication DTCs are set in the K59 Starter/Generator Control Module

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- If no communication DTCs are set in the K59 Starter/Generator Control Module

2. Verify DTC P1A5E or P1A5F are not set.

- If DTC P1A5E or P1A5F is set

Refer to **DTC P1A5E or P1A5F**.

- If DTC P1A5E and P1A5F are not set

3. Verify DTC P1A60 is not set.

- If DTC P1A60 is set

Refer to **DTC P1A60**.

- If DTC P1A60 is not set

4. Verify DTC P1EAA or P1EAC is not set as current.

- If DTC P1EAA or P1EAC is set as current

Replace the K16 Battery Energy Control Module.

NOTE: DTC P1EAA or P1EAC may be difficult to reproduce and no repair should be made unless the DTC is set as current. Operate the vehicle within the Conditions for Running the DTC when attempting to reproduce the DTC.

- If DTC P1EAA or P1EAC is not set or is set as history

5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for Battery Energy Control Module replacement, programming, and setup

DTC P1EAB: BATTERY ENERGY CONTROL MODULE HYBRID/EV BATTERY CELL HIGH VOLTAGE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P1EAB

Battery Energy Control Module Hybrid/EV Battery Cell High Voltage

Circuit/System Description

The Hybrid/EV Battery Pack contains a total of 32 cell groups in the Hybrid/EV Battery Pack assembly. These cell groups are electrically connected in series. Each individual cell group is rated at 3.7 V, for a nominal system voltage of 118 V DC. The battery cells are grouped together into two sections, each with 16 cell groups.

The Battery Energy Control Module monitors the voltage of the 32 battery cell groups. A voltage sense circuit is attached to each individual cell group. Each of these circuits terminate at a connector located on the top surface of the battery section. A serviceable auxiliary battery wiring harness connectors the voltage sense circuits to the Battery Energy Control Module, located directly above the Hybrid/EV Battery Pack.

The Battery Energy Control Module also monitors the cell voltage with internal hardware that is independent from the normal cell voltage path. This alternate method produces a true and false signal that indicates whether or not any cell voltage is too high. This signal is encoded and transmitted via serial data to the Starter/Generator Control Module.

Conditions for Running the DTC

The DTC monitor runs at all times, except when the control module self test is running or DTC P1EAC or U182A is set.

Conditions for Setting the DTC

Battery cell voltage is greater than 4.35 V

Action Taken When the DTC Sets

- DTC P1EAB is a type A DTC
- The vehicle operates without any hybrid functions with the high voltage contactors open, but it will continue to charge the 12V battery with the starter/generator acting as a conventional generator.

Conditions for Clearing the DTC

- DTC P1EAB is a type A DTC
- DTC P1EAB is a secure DTC. The **Clear Secured High Voltage DTCs** procedure must be performed to prevent resetting the DTC.

Circuit/System Verification

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

WARNING: The eAssist battery pack assembly will utilize an exchange program. Please consult the most recent revision of bulletin/PI# PIC5520, available in Service Information (SI), for a list of approved eAssist battery pack

assembly service procedures. Components that may be removed and serviced without exchanging the complete battery pack assembly are identified in the bulletin/PI. Please contact the GM Technical Assistance Center (1-877-446-8227) if you have any questions.

1. Ignition ON.
2. Verify DTC P1B34, P1B35, P1B36, P1B37, P1B38, or P1B39 is not set.

- **If any of the DTCs are set**

Refer to **DTC P1B33-P1B39**, . After the repair is complete, the **Clear Secured High Voltage DTCs** procedure must be performed to clear the secured DTC P1EAB.

- **If none of the DTCs are set**

3. Verify DTC P0B3B-P0BBB or P1B16-P1B2D is not set.

- **If any of the DTCs are set**

Refer to **DTC P0B3B-P0BBB, P1B16-P1B2D, P1B3D, or P1B3E**, . After the repair is complete, the **Clear Secured High Voltage DTCs** procedure must be performed to clear the secured DTC P1EAB.

- **If none of the DTCs are set**

4. Verify DTC P1EAB is not set.

- **If the DTC is set and any scan tool Hybrid/EV Battery voltage parameter is greater than 4.35 V**

Replace the C4A Hybrid/EV Battery Section 1 and C4B Hybrid/EV Battery Section 2. After the repair is complete, the **Clear Secured High Voltage DTCs** procedure must be performed to clear the secured DTC P1EAB.

- **If the DTC is set and all the scan tool Hybrid/EV Battery voltage parameters are 4.35 V or less**

1. Program the K16 Battery Energy Control Module.
2. Clear any DTCs. It may be necessary to perform the **Clear Secured High Voltage DTCs** procedure to clear any secured DTCs.
3. Operate the vehicle within the Conditions for Running the DTC.
4. Verify the DTC does not set.
 - If the DTC sets, replace the K16 Battery Energy Control Module.
 - If the DTC does not set

5. All OK.

- **If the DTC is not set**

5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Generator Battery Replacement**

DTC P1EAC: HYBRID/EV BATTERY CELL OVERVOLTAGE SIGNAL CIRCUIT PERFORMANCE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P1EAC

Hybrid/EV Battery Cell Overvoltage Signal Circuit Performance

Circuit/System Description

The 2nd protection is a redundant method to monitor cell group overvoltage. The battery energy control modules independently reads and tests each cell group and communicates this to the hybrid powertrain control module. The hybrid powertrain control module diagnoses this message to determine when a cell group overvoltage condition exists.

The battery energy control module diagnoses the function of the redundant monitor, once, every power down cycle. When run/crank input signal transitions low and after a calibrated delay, the battery energy control module informs the hybrid powertrain control module, via serial data, that it is about to run the diagnostics on the 2nd protection circuit. The battery energy control module then proceeds to run the check on the serial data cell overvoltage true or false message. If any pulses are missing from the serial data message, the starter/generator control module will report this as a fault.

Conditions for Running the DTC

- Ignition mode transitions from RUN or CRANK to OFF.
- 2nd protection fault test bit is active.
- No faults are set that would cause the contactors to become open when propulsion is active.
- DTC U182A is not set.

Conditions for Setting the DTC

- The test active bit is active for 12 seconds.

OR

- The test active bit does not transition to active.

OR

- The enumerated results does not match the expected result or not enough "True" responses are received.

Action Taken When the DTC Sets

- DTC P1EAC is a type A DTC.
- The vehicle operates in a low battery mode with the high voltage contactors closed, but no hybrid functions will occur.

Conditions for Clearing the DTC

DTC P1EAC is a type A DTC.

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

WARNING: The eAssist battery pack assembly will utilize an exchange program. Please consult the most recent revision of bulletin/PI# PIC5520, available in Service Information (SI), for a list of approved eAssist battery pack assembly service procedures. Components that may be removed and serviced without exchanging the complete battery pack assembly are identified in the bulletin/PI. Please contact the GM Technical Assistance Center (1-877-446-8227) if you have any questions.

1. Verify no communication DTCs are set in the K59 Starter/Generator Control Module.
 - If any communication DTCs are set in the K59 Starter/Generator Control Module

Refer to Diagnostic Trouble Code (DTC) List - Vehicle .

- If no communication DTCs are set in the K59 Starter/Generator Control Module

2. Verify DTC P1A5E or P1A5F are not set.

- If DTC P1A5E or P1A5F is set

Refer to **DTC P1A5E or P1A5F**.

- If DTC P1A5E and P1A5F are not set

3. Verify DTC P1A60 is not set.

- If DTC P1A60 is set

Refer to **DTC P1A60**.

- If DTC P1A60 is not set

4. Verify DTC P1EAA or P1EAC is not set as current.

- If DTC P1EAA or P1EAC is set as current

Replace the K16 Battery Energy Control Module.

NOTE: DTC P1EAA or P1EAC may be difficult to reproduce and no repair should be made unless the DTC is set as current. Operate the vehicle within the Conditions for Running the DTC when attempting to reproduce the DTC.

- If DTC P1EAA or P1EAC is not set or is set as history

5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for battery energy control module replacement, programming, and setup

DTC P1EC0: HYBRID/EV BATTERY SYSTEM CONTACTOR(S) STUCK OPEN

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P1EC0

Hybrid/EV Battery System Contactor(s) Stuck Open

Circuit/System Description

At times, it may be necessary to disconnect high voltage from the vehicle, both during normal operation and when a system fault is identified. The Starter/Generator Control Module controls the Main Contactor and pre-charge contactor to disconnect and connect high voltage from the vehicle. The high voltage contactors are switches that are controlled much like a relay. To disable high voltage from the vehicle, the main and pre-charge contactors are commanded open. This will open the contactors and physically disconnect the hybrid/EV battery positive cable. To connect high voltage to the vehicle, first the pre-charge contactor is closed. With the pre-charge contactor closed, current flows through the pre-charge resistor. This allows high voltage to slowly build in the system, as the resistor decreases current flow. Once high voltage is brought up through the pre-charge contactor, the Main Contactor is close and high voltage is active. If the high voltage builds too quickly or too slowly, the Starter/Generator Control Module will set a fault.

If a system fault occurs that does not allow the contactors to open, the Starter/Generator Control Module will be unable to disconnect high voltage from the vehicle. In instances such as this, the manual disconnect lever will disconnect high voltage from the vehicle when servicing.

Conditions for Running the DTC

Contactors are commanded closed

Conditions for Setting the DTC

The Starter/Generator Control Module does not detect high voltage after the contactors have been commanded closed.

Action Taken When the DTC Sets

DTC P1EC0 is a type A DTC.

Conditions for Clearing the DTC

DTC P1EC0 is a type A DTC.

Diagnostic Aids

- This diagnostic is used when high voltage has not been disabled when the contactors have been commanded closed. This indicates that one or both contactors are stuck open. The High Voltage Disabling procedure should still be completed, using the procedure for Servicing Any Internal Components Within the A4 Hybrid/EV Battery Pack. This will disconnect the battery terminals at the C4A Hybrid/EV Battery Section 1 and C4B Hybrid/EV Battery Section 2 and limit high voltage exposure when performing diagnosis.
- Be sure to check for any DTCs that may be set. These DTCs may lead to the cause of the stuck contactors and DTC diagnosis should be performed before enabling high voltage. This will help ensure a repeat fault with the contactors does not occur. After diagnosis any DTCs, return to this procedure to test and repair any contactor that may be mechanically stuck open.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
 - **Visually and functionally inspect the gloves before use.**
 - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

WARNING: The eAssist battery pack assembly will utilize an exchange program. Please consult the most recent revision of bulletin/PI# PIC5520, available in Service Information (SI), for a list of approved eAssist battery pack assembly service procedures. Components that may be removed and serviced without exchanging the complete battery pack assembly are identified in the bulletin/PI. Please contact the GM Technical Assistance Center (1-877-446-8227) if you have any questions.

NOTE: In High Voltage Disabling, perform the disabling procedure for servicing components within the energy storage system. The C4A Hybrid/EV Battery Section 1 and C4B Hybrid/EV Battery Section 2 will be disconnected as part of the disabling procedure.

1. Ignition OFF, disable high voltage at the A4 Hybrid/EV Battery Pack. Refer to High Voltage Disabling.
2. Connect the X1, X2, and X3 harness connectors at the K59 Starter/Generator Control Module.
3. Verify DTC P0ADB, P0ADC, P0AE6, or P0AE7 is not set.
 - **If any of the DTCs are set**

Refer to Diagnostic Trouble Code (DTC) List - Vehicle .

- **If none of the DTCs are set**

NOTE: The following steps will test the KR38 Main Contactor, KR134 Pre-Charge Contactor, and the S15 Manual Service Disconnect as a type of component test. These components must be removed from the A4 Hybrid/EV Battery Pack to ensure proper test results.

4. Remove the KR38 Main Contactor, KR134 Pre-Charge Contactor, and the S15 Manual Service Disconnect from the A4 Hybrid/EV Battery Pack.

5. Install a 10 A fused jumper wire between the KR38 Main Contactor B+ terminal 1 X1 and 12 V. Install a jumper wire between the KR38 Main Contactor control terminal 2 X1 and ground.
6. Test for less than 10 ohms between the high voltage terminals at the KR38 Main Contactor.

- **If 10 ohms or greater**

The KR38 Main Contactor is stuck in the open position. Replace the KR38 Main Contactor.

- **If less than 10 ohms**

7. Install a 10 A fused jumper wire between the KR134 Pre-Charge Contactor B+ terminal A X1 and 12 V. Install a jumper wire between the KR134 Pre-Charge Contactor control terminal A X2 and ground.
8. Test for less than 10 ohms between the high voltage terminals at the KR134 Pre-Charge Contactor.

- **If 10 ohms or greater**

The KR134 Pre-Charge Contactor is stuck in the open position. Replace the KR134 Pre-Charge Contactor.

- **If less than 10 ohms**

9. Test for less than 10 ohms between the high voltage terminals at the S15 Manual Service Disconnect with the lever in the closed position.

- **If 10 ohms or greater**

The S15 Manual Service Disconnect is stuck in the open position. Replace the S15 Manual Service Disconnect.

- **If less than 10 ohms**

10. Replace the K59 Starter/Generator Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for Starter/Generator Control Module replacement, programming, and setup.

LOSS OF ISOLATION IN THE HIGH VOLTAGE SYSTEM

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The vehicle is equipped with a high voltage isolation monitor feature. The purpose of the isolation monitor is to test the resistance between the high voltage positive and negative direct current (DC) bus and chassis ground.

The isolation monitoring system measures the resistance between the high voltage system and chassis ground.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

WARNING: The eAssist battery pack assembly will utilize an exchange program. Please consult the most recent revision of bulletin/PI# PIC5520, available in Service Information (SI), for a list of approved eAssist battery pack assembly service procedures. Components that may be removed and serviced without exchanging the complete battery pack assembly are identified in the bulletin/PI. Please contact the GM Technical Assistance Center (1-877-446-8227) if you have any questions.

NOTE: In High Voltage Disabling, perform the disabling procedure for servicing components within the energy storage system. The C4A Hybrid/EV Battery Section 1 and C4B Hybrid/EV Battery Section 2 will be disconnected as part of the disabling procedure.

1. Ignition OFF, disable high voltage at the A4 Hybrid/EV Battery Pack. Refer to High Voltage Disabling.
2. Disconnect the U, V, and W three phase lugs at the K59 Starter/Generator Control Module.

NOTE: The following continuity tests must be performed using the EL-50772 Insulation Multimeter. Select the Isolation test setting, then select the 500 V range.

3. Test for greater than 400K ohms between the terminals listed below and chassis ground with the EL-50772 Insulation Multimeter set on the Isolation test setting:
 - 3 phase cable terminal U - cable side lug
 - 3 phase cable terminal V - cable side lug

- 3 phase cable terminal W - cable side lug
- **If 400K ohms or less**
- 1. Disconnect the U, V, and W three phase lugs at the A15 Starter/Generator.
- 2. Test for greater than 400K ohms between the U, V, and W three phase studs at the A15 Starter/Generator and chassis ground with the **EL-50772** Insulation Multimeter set on the Isolation test setting.
 - If 400K ohms or less, replace the A15 Starter/Generator.
 - If greater than 400K ohms
- 3. Replace the high voltage 3 phase cables.
 - **If greater than 400K ohms**

NOTE: **The following continuity tests must be performed using the EL-50772 Insulation Multimeter. Select the Isolation test setting, then select the 500 V range.**

4. Test for greater than 400K ohms between the terminals listed below and chassis ground with the **EL-50772** Insulation Multimeter set on the Isolation test setting:
 - 3 phase terminal U - K59 Starter/Generator Control Module stud
 - 3 phase terminal V - K59 Starter/Generator Control Module stud
 - 3 phase terminal W - K59 Starter/Generator Control Module stud
 - **If 400K ohms or less**
 - 1. Disconnect and remove the two wiring junction blocks from the A4 Hybrid/EV Battery Pack.
 - 2. Test for greater than 400K ohms between the U, V, and W three phase studs at the K59 Starter/Generator Control Module and chassis ground with the **EL-50772** Insulation Multimeter set on the Isolation test setting.
 - If 400K ohms or less, replace the K59 Starter/Generator Control Module.
 - If greater than 400K ohms
 - 3. Replace the two wiring junction blocks.
 - **If greater than 400K ohms**
5. Replace the C4A Hybrid/EV Battery Section 1 and C4B Hybrid/EV Battery Section 2.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

HYBRID\EV BATTERY VOLTAGE PRESENT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

At times, it may be necessary to disconnect high voltage from the vehicle, both during normal operation and when a system fault is identified. The starter/generator control module controls the Main Contactor and pre-charge contactor to disconnect and connect high voltage from the vehicle. The high voltage contactors are switches that are controlled much like a relay. To disable high voltage from the vehicle, the main and pre-charge contactors are commanded open. This will open the contactors and physically disconnect the hybrid/EV battery positive cable. To connect high voltage to the vehicle, first the pre-charge contactor is closed. With the pre-charge contactor closed, current flows through the pre-charge resistor. This allows high voltage to slowly build in the system, as the resistor decreases current flow. Once high voltage is brought up through the pre-charge contactor, the Main Contactor is close and high voltage is active. If the high voltage builds too quickly or too slowly, the starter/generator control module will set a fault.

If a system fault occurs that does not allow the contactors to open, the starter/generator control module will be unable to disconnect high voltage from the vehicle. In instances such as this, the manual disconnect lever will disconnect high voltage from the vehicle when servicing.

Diagnostic Aids

- This diagnostic is used when high voltage has not been disabled after following the High Voltage Disabling procedure. This indicates that one or both contactors are stuck closed and the manual service disconnect is also stuck closed. The High Voltage Disabling procedure should still be completed, using the procedure for Servicing Any Internal Components Within the A4 Hybrid/EV Battery Pack. This will disconnect the battery terminals at the C4A Hybrid/EV Battery Section 1 and C4B Hybrid/EV Battery Section 2 and limit high voltage exposure when performing diagnosis.
- Be sure to check for any DTCs that may be set. These DTCs may lead to the cause of the stuck contactors and DTC diagnosis should be performed before enabling high voltage. This will help ensure a repeat fault with the contactors does not occur. After diagnosis any DTCs, return to this procedure to test and repair any contactor that may be mechanically stuck closed.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.

- Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

WARNING: The eAssist battery pack assembly will utilize an exchange program. Please consult the most recent revision of bulletin/PI# PIC5520, available in Service Information (SI), for a list of approved eAssist battery pack assembly service procedures. Components that may be removed and serviced without exchanging the complete battery pack assembly are identified in the bulletin/PI. Please contact the GM Technical Assistance Center (1-877-446-8227) if you have any questions.

NOTE: In High Voltage Disabling, perform the disabling procedure for servicing components within the energy storage system. The C4A Hybrid/EV Battery Section 1 and C4B Hybrid/EV Battery Section 2 will be disconnected as part of the disabling procedure.

1. Ignition OFF, disable high voltage at the A4 Hybrid/EV Battery Pack. Refer to High Voltage Disabling.
2. Verify no high voltage system DTCs are set.
 - If any high voltage system DTCs are set

Refer to Diagnostic Trouble Code (DTC) List - Vehicle .

- If no high voltage system DTCs are set
3. Test for infinite resistance between the high voltage terminals at the KR38 Main Contactor.
 - If not infinite resistance

The KR38 Main Contactor is stuck in the closed position. Replace the KR38 Main Contactor.

- If infinite resistance
4. Test for infinite resistance between the high voltage terminals at the KR134 Pre-Charge Contactor.
 - If not infinite resistance

The KR134 Pre-Charge Contactor is stuck in the closed position. Replace the KR134 Pre-Charge Contactor.

- If infinite resistance
5. Test for infinite resistance between the high voltage terminals at the S15 Hybrid/EV Battery Pack high voltage manual disconnect lever.
 - If not infinite resistance

The S15 Hybrid/EV Battery Pack high voltage manual disconnect lever is stuck in the closed

position. Replace the S15 Hybrid/EV Battery Pack high voltage manual disconnect lever.

- **If infinite resistance**

6. Replace the K59 Starter/Generator Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for starter/generator control module replacement, programming, and setup

REPAIR INSTRUCTIONS

HIGH VOLTAGE SYSTEM INSPECTION

A complete inspection of the high voltage system and components must be performed if the vehicle has been involved in a collision.

Vehicle Collision Detection

As a safety precaution, the Starter/Generator Control Module monitors the collision event messages from the Inflatable Restraint Sensing and Diagnostic Module (SDM). This message is broadcast by the SDM via serial data to inform various control module that a collision event has occurred so they can take appropriate action. This message does not indicate the severity of the collision, nor does it indicate that airbag deployment has been commanded.

If a collision event message is received by the Starter/Generator Control Module, it will enter a collision event detected state and respond by opening the high voltage contactors. This will help isolate the high voltage battery from the rest of the vehicle and reduce the possibility of a compromised high voltage system creating a hazard.

If the Starter/Generator Control Module has entered the collision event detected state, the high voltage system inspection procedure must be performed to ensure the high voltage system has not been compromised. If compromised, any necessary repairs should be made. The collision event detected condition will remain active until cleared using the **Clear Secured High Voltage DTCs**.

Special Tools

EL-48900 HEV Safety Kit

For equivalent regional tools, refer to **Special Tools**.

Inspection Procedure

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

WARNING: High voltage circuits should only be tested using a digital multimeter (DMM) and test leads with at least a CAT III rating, such as the J 39200-A Digital Multimeter. Failure to follow the procedures may result in serious injury or death.

WARNING: The eAssist battery pack assembly will utilize an exchange program. Please consult the most recent revision of bulletin/PI# PIC5520, available in Service Information (SI), for a list of approved eAssist battery pack assembly service procedures. Components that may be removed and serviced without exchanging the complete battery pack assembly are identified in the bulletin/PI. Please contact the GM Technical Assistance Center (1-877-446-8227) if you have any questions.

1. Ignition OFF, perform a visual inspection of the following high voltage components listed. Remove any trim covers, carpet, or shields to gain access. DO NOT remove the metal A4 Hybrid/EV Battery Pack cover. Inspect the assembly and verify there are no case cracks, dents, pinched, cut or frayed high voltage cables, low voltage cables, or other physical damage.
 - A4 Hybrid/EV Battery Pack
 - A15 Starter/Generator
 - G14 Hybrid/EV Battery Pack Cooling Fan
 - G14 Hybrid/EV Battery Pack Cooling Fan inlet and outlet ducts for proper positioning to the A4 Hybrid/EV Battery Pack. Refer to Drive Motor Battery Cooling Air Inlet Upper Duct

Replacement , **Drive Motor Battery Cooling Blower Outlet Duct Replacement** , and **Drive Motor Battery Cooling Air Outlet Duct Replacement** for proper duct installation and routing.

- High voltage cables between the K59 Starter/Generator Control Module and the A15 Starter/Generator
- **If any damage is found**

Ignition OFF, disable high voltage at the A4 Hybrid/EV Battery Pack. Refer to **High Voltage Disabling**, . If vehicle damage does not allow for access to the S15 Hybrid/EV Battery Pack high voltage manual disconnect lever, disconnect the 12V battery and remove the damaged portion of the vehicle until the S15 Hybrid/EV Battery Pack high voltage manual disconnect lever can be accessed and the **High Voltage Disabling** procedure can be completed. Replace any components and cables that have been identified as damaged. Continue to step 2 after repairs have been completed.

- **If no damage is found**

2. Enable high voltage at the A4 Hybrid/EV Battery Pack. Refer to **High Voltage Enabling**.
3. Ignition ON.
4. Verify no DTCs are set.

- **If any DTCs are set**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If no DTCs are set**

5. Clear the Crash Event Detected disable condition after all damaged high voltage components have been replaced. Refer to **Clear Secured High Voltage DTCs**.
6. Perform the required body repairs using the approved service procedures.

BATTERY ENERGY CONTROL MODULE REPLACEMENT

Removal Procedure

WARNING: Ensure all High Voltage safety procedures are followed. Failure to follow the procedure exactly as written may result in serious injury or death.

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.

- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

1. Disable the hybrid battery. Refer to High Voltage Disabling.

13. Remove the generator control and battery module mounting bolts (1).

Fig. 31: Protective Cloth Over Trunk-To-Rear Bumper Area
Courtesy of GENERAL MOTORS COMPANY

14. Place a protective cloth over the trunk-to-rear bumper area.

NOTE: Do not insert fingers into vent area of the generator control and battery module while rotating.

15. With assistance, use gloves to slide the generator control and battery module (1) into the trunk area.

Fig. 32: Battery Pack Lifting Adapter Center Eye Bolt
Courtesy of GENERAL MOTORS COMPANY

16. Using the **EL-48264** battery pack lifting adapter center the eye bolt (2) on the generator control and battery module and insert the hooks (1) into the generator control and battery module holes.
17. Attach a portable lift to the center eye bolt (2) of the battery pack lifting adapter.

Fig. 33: Generator Control And Battery Module
Courtesy of GENERAL MOTORS COMPANY

18. Remove the generator control and battery module (2) from the rear trunk area.

Installation Procedure

Fig. 34: Generator Control And Battery Module
Courtesy of GENERAL MOTORS COMPANY

1. Install the generator control and battery module (2) in through the trunk opening.

Fig. 35: Generator Control And Battery Module Vent Tube
Courtesy of GENERAL MOTORS COMPANY

2. Slide the generator control and battery module into position and install the vent tube (1) into the floor.
3. Remove the **EL-48264** battery pack lifting adapter.

Fig. 36: Generator Control And Battery Module Mounting Bolts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

4. Install the generator control and battery module into position and tighten the mounting bolts (1) to 22 N.m (16 lb ft).

Fig. 37: Body Harness Connectors
Courtesy of GENERAL MOTORS COMPANY

5. Install the body harness connectors (1).

Fig. 38: Battery Cooling Air Inlet Duct And Retainers
Courtesy of GENERAL MOTORS COMPANY

NOTE: Make sure the duct is flush against the seal for efficient generator control and battery module cooling.

6. Install the drive motor battery cooling air inlet lower duct retainers (1).

Fig. 39: Drive Motor Battery Cooling Blower Assembly
Courtesy of GENERAL MOTORS COMPANY

7. Install the drive motor generator bracket and drive motor battery cooling blower (2). Tighten the fasteners (1) to 9 N.m (80 lb in).

Fig. 40: Drive Motor Battery Cooling Blower Outlet Upper Duct Fasteners
Courtesy of GENERAL MOTORS COMPANY

NOTE: Make sure the duct is flush against the seal for efficient generator control and battery module cooling.

8. Install the drive motor battery cooling blower outlet upper duct (2) and tighten the fasteners to 9 N.m (80 lb in).

Fig. 41: High Voltage 3-phase Cable
 Courtesy of GENERAL MOTORS COMPANY

9. Install the high voltage 3-phase cable (2) to the generator control and battery module. Tighten the nuts (1) to 9 N.m (80 lb in).
10. Install the 12V cable (3) to the generator control and battery module. Tighten the nut (4) to 9 N.m (80 lb in).
11. Install both rear compartment floor panels. Refer to **Rear Compartment Floor Panel Trim Replacement (with Battery Cover, HP6)** , **Rear Compartment Floor Panel Trim Replacement (with Blower Cover, HP6)** .
12. Install the rear end trim finish panels. Refer to **Rear End Trim Finish Panel Replacement** .
13. Enable the high voltage battery. Refer to **High Voltage Enabling**.
14. Program the generator control module, if replaced. Refer to **Control Module References** .
15. Program the battery energy control module, if replaced. Refer to **Battery Energy Control Module Programming and Setup** .

DRIVE MOTOR GENERATOR BATTERY CABLE REPLACEMENT

Removal Procedure

WARNING: Ensure all High Voltage safety procedures are followed. Failure to follow the procedure exactly as written may result in serious injury or death.

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

1. Ignition OFF, disable the high voltage at the A4 hybrid battery pack. Refer to **High Voltage Disabling**.
2. Remove the fuel tank. Refer to **Fuel Tank Replacement**.
3. Remove the left front underbody air deflector. Refer to **Underbody Front Air Deflector Replacement - Left Side**.
4. Remove the left front frame reinforcement. Refer to **Drivetrain and Front Suspension Frame Replacement**.

Fig. 42: High Voltage 3-phase Cable
Courtesy of GENERAL MOTORS COMPANY

5. Remove the high voltage 3-phase cable terminal nuts (1) and the 12V terminal branch nut (4).
6. Remove the high voltage cable (2) and the 12V cable (3) from the generator battery.

Fig. 43: Drive Motor Generator Cable
Courtesy of GENERAL MOTORS COMPANY

7. Remove the drive motor generator battery bracket nuts (1) and the cable retainer nut (2).
8. Pull the drive motor generator cable (3) through the grommet opening.

Fig. 44: Drive Motor Generator Retainer Nut
Courtesy of GENERAL MOTORS COMPANY

9. Remove the drive motor generator retainer nut (1) and bolt (2).

NOTE: Replace the fasteners (3) if re-using the drive motor generator battery cable.

10. Detach the drive motor generator battery cable fasteners (3).

Fig. 45: Drive Motor Generator Battery Fastener Bolts
Courtesy of GENERAL MOTORS COMPANY

11. Remove the drive motor generator battery fastener bolts (1).

Fig. 46: Drive Motor Generator Battery Cable Retainer Nut
Courtesy of GENERAL MOTORS COMPANY

12. Within the rear engine compartment, remove the drive motor generator battery cable retainer nut (1).

Fig. 47: Drive Motor Generator Battery Cable Retainers
Courtesy of GENERAL MOTORS COMPANY

NOTE: Replace the retainers (1) if re-using the drive motor generator battery cable.

13. Disconnect the drive motor generator battery cable retainers (1) and the battery tray cable clip (2).

Fig. 48: Drive Motor Generator Battery Cable Terminal
Courtesy of GENERAL MOTORS COMPANY

14. Remove the drive motor generator battery cable terminal (1) , from the underhood fuse block.

Fig. 49: Generator Starter Cover Nuts
Courtesy of GENERAL MOTORS COMPANY

15. Remove the generator starter cover nuts (1) and remove the cover (2).

Fig. 50: Starter Generator

Courtesy of GENERAL MOTORS COMPANY

16. Remove the bolts (1) and detach the drive motor generator battery cable from the generator starter.

Fig. 51: Drive Motor Generator Battery Cable
Courtesy of GENERAL MOTORS COMPANY

17. Detach the retainers (1) holding the drive motor generator battery cable to the fuel pump cover and the heater outlet bracket.

NOTE: **Replace the retainers (1) if re-using the drive motor generator battery cable.**

18. Remove the drive motor generator battery cable from the vehicle.

Installation Procedure

Fig. 52: Drive Motor Generator Cable
Courtesy of GENERAL MOTORS COMPANY

1. Starting at the rear of the vehicle, feed the drive motor generator battery cable through the opening in the floor.

CAUTION: Refer to Fastener Caution .

2. Position the pass-through grommet seal and bracket. Tighten the bracket nuts (1) to 22 N.m (16 lb ft).
3. Tighten the retainer nut (2) to 22 N.m (16 lb ft).

Fig. 53: High Voltage 3-phase Cable
Courtesy of GENERAL MOTORS COMPANY

4. Install the high voltage 3-phase branch terminals (2) to the generator battery. Tighten the nuts (1) to 9 N.m (80 lb in).
5. Install the 12V cable (3) and tighten the nut (4) to 9 N.m (80 lb in).

Fig. 54: Drive Motor Generator Retainer Nut
Courtesy of GENERAL MOTORS COMPANY

6. At the left rear frame rail, attach the drive motor generator battery cable to the frame with NEW fasteners (3).
7. Install the retainer nut (1) and bolt (2) to the underbody. Tighten to 22 N.m (16 lb ft).

Fig. 55: Drive Motor Generator Battery Fastener Bolts
Courtesy of GENERAL MOTORS COMPANY

8. Working towards the front of the vehicle, attach the drive motor generator battery cable to the underbody. Tighten the nuts (1) to 22 N.m (16 lb ft).

Fig. 56: Drive Motor Generator Battery Cable Retainer Nut
Courtesy of GENERAL MOTORS COMPANY

9. Feed the drive motor generator battery cable into the engine compartment and install to the plenum. Tighten the nut (1) to 22 N.m (16 lb ft).

Fig. 57: Drive Motor Generator Battery Cable Retainers
Courtesy of GENERAL MOTORS COMPANY

10. Install the drive motor generator battery 12V branch, to the left front frame rail, with NEW fasteners (1).
11. Secure the cable to the battery tray with clip (2).

Fig. 58: Drive Motor Generator Battery Cable Terminal
Courtesy of GENERAL MOTORS COMPANY

12. Install the 12V terminal (1) to the underhood fuse block and tighten the nut to 9 N.m (80 lb in).

Fig. 59: Drive Motor Generator Battery Cable
Courtesy of GENERAL MOTORS COMPANY

13. Fasten the drive motor generator battery cable to the heater outlet bracket and fuel pump cover with NEW fasteners (1).

Fig. 60: Starter Generator

Courtesy of GENERAL MOTORS COMPANY

NOTE: Be sure the drive motor generator battery cable cover is fully seated against the drive motor generator battery cable housing prior to installing and fastening the nuts. This will ensure proper alignment and engagement of HVIL terminals.

14. Position the drive motor generator battery cable to the starter generator assembly studs. Tighten the bolts (1) to 9 N.m (80 lb in).

Fig. 61: Generator Starter Cover Nuts
Courtesy of GENERAL MOTORS COMPANY

15. Install the cover (2) and tighten the nuts (1) to 9 N.m (80 lb in).
16. Install the left front frame reinforcement. Refer to **Drivetrain and Front Suspension Frame Replacement** .
17. Install the left front underbody air deflector. Refer to **Underbody Front Air Deflector Replacement - Left Side** .
18. Install the fuel tank. Refer to **Fuel Tank Replacement** .
19. Enable the high voltage system. Refer to **High Voltage Enabling**.

BATTERY ENERGY CONTROL MODULE WIRING HARNESS REPLACEMENT (HV MEASURING HARNESS 1 AND 2)

Removal Procedure

WARNING: Ensure all High Voltage safety procedures are followed. Failure to follow the procedure exactly as written may result in serious injury or death.

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

1. Ignition OFF, disable the high voltage at the A4 hybrid battery pack. Refer to **High Voltage Disabling**.

Fig. 62: Identifying Connectors Sequence
Courtesy of GENERAL MOTORS COMPANY

2. Disconnect the following connectors, in the above graphic sequence shown, from the battery energy control module.

Fig. 63: Battery Energy Control Module Right Side Harness
Courtesy of GENERAL MOTORS COMPANY

3. Remove the battery energy control module right side harness (1) and the left side harness (2).

Installation Procedure

Fig. 64: Battery Energy Control Module Right Side Harness
Courtesy of GENERAL MOTORS COMPANY

1. Install the right side battery energy control module harness (1) and the left side harness (2), into the harness conduit.

Fig. 65: Battery Energy Control Module Connector Sequence
Courtesy of GENERAL MOTORS COMPANY

2. Connect the battery energy control module connectors in the above graphic sequence.
3. Enable the hybrid battery. Refer to **High Voltage Enabling**.

BATTERY ENERGY CONTROL MODULE WIRING HARNESS REPLACEMENT (BDU,BECM AND BPIM)

Removal Procedure

WARNING: Ensure all High Voltage safety procedures are followed. Failure to follow the procedure exactly as written may result in serious injury or death.

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

1. Ignition OFF, disable the high voltage at the A4 hybrid battery pack. Refer to **High Voltage Disabling**.

Fig. 66: Cut-Off Switch Fastener

Courtesy of GENERAL MOTORS COMPANY

2. Remove the cut-off switch fastener (1) and the cut-off switch (2) from the battery energy control module wiring junction block.
3. Remove the current sensor connector (3); the pre-charge contacts (4) and the contactor connector (5).

Fig. 67: Generator Control Module Connector
Courtesy of GENERAL MOTORS COMPANY

4. Remove the generator control module connector (1).

Fig. 68: Battery Energy Control Module
Courtesy of GENERAL MOTORS COMPANY

5. Remove the connector (1) from the battery energy control module.

Fig. 69: Battery Energy Control Harness
Courtesy of GENERAL MOTORS COMPANY

6. Remove the battery energy control harness (1).

Installation Procedure

Fig. 70: Cut-Off Switch Fastener
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

1. Install the cut-off switch (2) to the battery energy control module wiring harness junction block and tighten the fasteners (1) to 4 N.m (35 lb in).
2. Connect the following to the generator battery disconnect relay block:
 - Current Sensor Connector (3).
 - Pre-Charge Contacts (4).
 - Contactor Connector (5).

Fig. 71: Generator Control Module Connector
Courtesy of GENERAL MOTORS COMPANY

3. Install the connector (1) to the generator control module.

Fig. 72: Battery Energy Control Module
Courtesy of GENERAL MOTORS COMPANY

4. Install the connector (1) to the battery energy control module.
5. Enable the hybrid battery. Refer to **High Voltage Enabling**.

GENERATOR BATTERY REPLACEMENT

Removal Procedure

WARNING: Ensure all High Voltage safety procedures are followed. Failure to follow the procedure exactly as written may result in serious injury or death.

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

1. Disable the hybrid battery. Refer to **High Voltage Disabling**.
2. Remove the battery energy control module. Refer to **Battery Energy Control Module Replacement**.
3. Remove the battery energy control module wiring harness - BDU, BECM and BPIM. Refer to **Battery Energy Control Module Wiring Harness Replacement (BDU,BECM and BPIM)**, **Battery Energy Control Module Wiring Harness Replacement (HV Measuring Harness 1 and 2)**.

Fig. 73: Generator Battery Fasteners
Courtesy of GENERAL MOTORS COMPANY

NOTE: Remember the location of fastener (1) as not to interfere with the installation of the generator control and battery module cover.

4. Remove the generator battery fasteners (1) and (2).

Fig. 74: Mounting Location Fastener
Courtesy of GENERAL MOTORS COMPANY

NOTE: Remember the location of fastener (1) as not to interfere with the installation of the generator control and battery module cover.

5. Remove the fasteners (1) and (2).
6. Remove the mounting location fastener (3).

Fig. 75: Generator Battery

Courtesy of GENERAL MOTORS COMPANY

NOTE: Use high voltage protective gloves.

7. Slide the generator battery (1) in the direction shown.

Fig. 76: Intermediate Duct Seals

Courtesy of GENERAL MOTORS COMPANY

8. With the help of a second technician, lift the generator battery (1) into the rear compartment area.
9. Inspect the intermediate duct seals (2) and replace if damaged.

Installation Procedure

Fig. 77: Intermediate Duct Seals

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

1. With the help of a technician, install the generator battery (1) to the mounting studs.

Fig. 78: Mounting Location Fastener
Courtesy of GENERAL MOTORS COMPANY

2. Slide the generator battery towards the intermediate duct seals and install the locating fastener (3). Tighten the fastener (3) to 22 N.m (16 lb ft).
3. Install the generator battery fastener (2) and tighten to 22 N.m (16 lb ft).
4. Install the generator battery fasteners (2) and tighten to 22 N.m (16 lb ft).

Fig. 79: Generator Battery Fasteners
 Courtesy of GENERAL MOTORS COMPANY

5. Install the generator battery fasteners (1) and tighten to 22 N.m (16 lb ft).
6. Install the generator battery fasteners (2) and tighten to 22 N.m (16 lb ft).
7. Install the battery energy control module. Refer to **Battery Energy Control Module Replacement**.
8. Install the battery energy control module harness - BDU, BECM and BPIM. Refer to **Battery Energy Control Module Wiring Harness Replacement (BDU, BECM and BPIM)**, **Battery Energy Control Module Wiring Harness Replacement (HV Measuring Harness 1 and 2)**.
9. Enable the hybrid battery. Refer to **High Voltage Enabling**.

BATTERY VENT TUBE REPLACEMENT

Removal Procedure

For equivalent regional tools , refer to **Special Tools**.

1. Remove the rear compartment floor panel with battery cover. Refer to **Rear Compartment Floor Panel Trim Replacement (with Battery Cover, HP6)** , **Rear Compartment Floor Panel Trim Replacement (with Blower Cover, HP6)** .

Fig. 80: Battery Vent Tube

Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not bend or disfigure the battery vent tube.

NOTE: Battery vent tube and rear compartment grommet are replaced as an assembly.

2. Remove the battery vent tube (1) with the rear compartment grommet (2).

Installation Procedure

Fig. 81: Battery Vent Tube

Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not bend or disfigure the battery vent tube.

NOTE: Battery vent tube and rear compartment grommet are replaced as an assembly.

1. Install the battery vent tube (1) with the rear compartment grommet (2).
2. Install the rear compartment floor panel with battery cover. Refer to **Rear Compartment Floor Panel Trim Replacement (with Battery Cover, HP6)** , **Rear Compartment Floor Panel Trim Replacement (with Blower Cover, HP6)** .

DRIVE MOTOR BATTERY WIRE JUNCTION BLOCK RELAY REPLACEMENT

Removal Procedure

WARNING: Ensure all High Voltage safety procedures are followed. Failure to follow the procedure exactly as written may result in serious injury or death.

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

1. Ignition OFF, disable the high voltage at the A4 hybrid battery pack. Refer to **High Voltage Disabling**.

Fig. 82: High Voltage Fasteners And Cables
Courtesy of GENERAL MOTORS COMPANY

2. Remove the high voltage fasteners (1) and the high voltage cables (2) from the battery energy control module wiring junction block.

Fig. 83: Cut-Off Switch Fastener
Courtesy of GENERAL MOTORS COMPANY

3. Remove the cut-off switch fastener (1) and set aside the cut-off switch (2).

Fig. 84: Generator Battery Disconnect Relay Fasteners
Courtesy of GENERAL MOTORS COMPANY

4. Remove the battery energy control module wiring junction block fasteners (1) and remove the battery energy control module wiring junction block (2).

Installation Procedure

Fig. 85: Generator Battery Disconnect Relay Fasteners
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

1. Install the battery energy control module wiring junction block (2) to the generator control module and tighten the fasteners (1) to 9 N.m (80 lb in).

Fig. 86: Cut-Off Switch Fastener
Courtesy of GENERAL MOTORS COMPANY

2. Install the cut-off switch (2) to the drive motor battery junction block relay and tighten the fastener (1) to 4 N.m (35 lb in).

Fig. 87: High Voltage Fasteners And Cables
Courtesy of GENERAL MOTORS COMPANY

3. Install the high voltage cables (2) to the battery energy control module wiring junction block and tighten the fasteners (1) to 9 N.m (80 lb in).
4. Enable the hybrid battery. Refer to **High Voltage Enabling**.

BATTERY ENERGY CONTROL MODULE WIRING JUNCTION BLOCK REPLACEMENT

Removal Procedure

WARNING: Ensure all High Voltage safety procedures are followed. Failure to follow the procedure exactly as written may result in serious injury or death.

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

1. Ignition OFF, disable the high voltage at the A4 hybrid battery pack. Refer to **High Voltage Disabling**.

Fig. 88: High Voltage Battery Cables-To-Batteries Fasteners
Courtesy of GENERAL MOTORS COMPANY

2. Remove the fasteners (3) retaining the high voltage battery cables to the batteries.
3. Disengage the cable retaining clip (1) and reposition the high voltage cables.
4. Remove the fasteners (2) retaining the junction block to the generator control module.

Fig. 89: Cut-Off Switch Fastener

 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

Preliminary Procedure

1. Remove the generator battery. Refer to **Generator Battery Replacement**.
2. Remove the generator control module. Refer to **Generator Control Module Replacement**.

1	Drive Motor Generator Control Module Cable Tray Fasteners (Qty: 4) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 22 N.m (16 lb ft).
2	Drive Motor Generator Control Module Cable Tray NOTE: Replace the drive motor generator control module seal.

GENERATOR CONTROL MODULE REPLACEMENT

Removal Procedure

WARNING: Ensure all High Voltage safety procedures are followed. Failure to follow the procedure exactly as written may result in serious injury or death.

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

1. Ignition OFF, disable the high voltage at the A4 hybrid battery pack. Refer to High Voltage Disabling, for Servicing Internal Components within the A4 Hybrid/EV Battery Pack **High Voltage Disabling**.

Fig. 97: Generator Control Module Connector
Courtesy of GENERAL MOTORS COMPANY

2. Disconnect the generator control module X4 connector (1).

Fig. 98: Drive Motor Battery Wire Junction Block Relay
Courtesy of GENERAL MOTORS COMPANY

3. Remove the fasteners (1) securing the battery energy control module wiring junction block assembly (2), to the top of the generator control module.
4. Remove the fasteners (3), securing the drive motor battery wire junction block relay assembly (4), to the top of the generator control module.

Fig. 99: High Voltage Bus Fasteners
Courtesy of GENERAL MOTORS COMPANY

5. Remove the high voltage bus fasteners (1) from the drive motor battery wiring junction block relay assembly (2).

Fig. 100: Drive Motor Battery Wire Junction Block Relay
Courtesy of GENERAL MOTORS COMPANY

6. Lift the drive motor battery wire junction block relay (2) and the battery energy control module wiring junction block (1) with the harness attached, and place on top of the battery energy control module (3).

Fig. 101: Generator Control Module
Courtesy of GENERAL MOTORS COMPANY

7. Remove the generator control module mounting fasteners (1) and (2).
8. Remove the generator control module (3) from the support tray.

Installation Procedure

1. Inspect the foam seals for tears and leak paths, to ensure they will not compromise the internal air flow through the generator control module assembly.

Fig. 102: Generator Control Module
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

NOTE: Do not slide the generator control module on the foam seals as the seals may become damaged.

2. Install the generator control module (3) to the support tray studs. Tighten the fastener (1) to 9 N.m (80 lb in).
3. Tighten the remaining fasteners (2) to 9 N.m (80 lb in).

Fig. 103: Drive Motor Battery Wire Junction Block Relay
Courtesy of GENERAL MOTORS COMPANY

4. Place the drive motor battery wire junction block relay (2) and the battery energy control module wiring junction block (1), on top of the generator control module.

Fig. 104: High Voltage Bus Fasteners

Courtesy of GENERAL MOTORS COMPANY

5. Install the high voltage bus fasteners (1) to the drive motor battery wiring junction block relay assembly (2) and tighten to 9 N.m (80 lb in).

Fig. 105: Drive Motor Battery Wire Junction Block Relay
Courtesy of GENERAL MOTORS COMPANY

6. Install the battery energy control module wiring junction block fasteners (1) and tighten to 9 N.m (80 lb in).
7. Install the drive motor battery wiring junction block relay fasteners (3) and tighten to 9 N.m (80 lb in).

Fig. 106: Generator Control Module Connector
Courtesy of GENERAL MOTORS COMPANY

8. Connect the generator control module X4 connector (1).
9. Enable the high voltage at the A4 hybrid battery pack. Refer to **High Voltage Enabling**.
10. Program the generator control module. Refer to **Control Module References** .

GENERATOR CONTROL MODULE COVER REPLACEMENT

Removal Procedure

WARNING: Ensure all High Voltage safety procedures are followed. Failure to follow the procedure exactly as written may result in serious injury or death.

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

1. Remove both rear compartment floor panels. Refer to Rear Compartment Floor Panel Trim Replacement (with Battery Cover, HP6) , Rear Compartment Floor Panel Trim Replacement (with Blower Cover, HP6) .
2. Remove the drive motor battery cooling blower outlet duct. Refer to Drive Motor Battery Cooling Blower Outlet Duct Replacement .

Fig. 107: Drive Motor Battery Cooling Blower Outlet Duct Fastener
Courtesy of GENERAL MOTORS COMPANY

3. Remove the upper fasteners (1) on the generator control module cooling air outlet duct.

Fig. 108: Generator Control Module Cooling Air Outlet Duct And Tighten Fasteners
Courtesy of GENERAL MOTORS COMPANY

4. Remove the lower fasteners (1) holding the generator control module and remove the cooling air outlet duct.

Fig. 109: Drive Motor Battery Cooling Blower Assembly
Courtesy of GENERAL MOTORS COMPANY

5. Disconnect and unclip the drive motor battery cooling blower electrical harness.
6. Remove the drive motor battery cooling blower and bracket fasteners (1).
7. Remove the drive motor battery cooling blower and bracket (2) as an assembly.
8. If the hybrid battery has not been disabled in a previous step, disable the hybrid battery. Refer to high voltage disabling for servicing any internal components within the A4 Hybrid/EV Battery Pack. **High Voltage Disabling.**

Fig. 110: Body Harness Connectors
Courtesy of GENERAL MOTORS COMPANY

9. Remove the body harness connectors (1) from the generator control and battery module.

Fig. 111: High Voltage 3-phase Cable
Courtesy of GENERAL MOTORS COMPANY

10. Remove the high voltage 3-phase cable terminal nuts (1) and the 12V terminal branch nut (4).
11. Remove the high voltage cable (2) and the 12V cable (3) from the generator control and battery module.

Fig. 112: Battery Cooling Air Inlet Duct And Retainers
Courtesy of GENERAL MOTORS COMPANY

12. Detach the drive motor battery cooling air inlet upper duct retainers (1).

Fig. 113: Generator Control Module Cover Fasteners
Courtesy of GENERAL MOTORS COMPANY

13. Remove the generator control module cover fasteners (1).
14. Remove the generator control module cover fastener (2) and remove the generator control module cover (3).
15. If servicing components internal to the A4 Hybrid/EV Battery Pack, continue with the high voltage disabling procedure. Refer to high voltage disabling for servicing any internal components within the A4 Hybrid/EV Battery Pack. **High Voltage Disabling.**

Installation Procedure

Fig. 114: Generator Control Module Cover Fasteners
Courtesy of GENERAL MOTORS COMPANY

1. Install the generator control module cover (3).
2. Install the generator control module cover fasteners (1) and tighten to 9 N.m (80 lb in).
3. Install the generator control module cover fastener (2) and tighten to 9 N.m (80 lb in).

Fig. 115: Drive Motor Battery Cooling Blower Assembly
Courtesy of GENERAL MOTORS COMPANY

4. Install the drive motor battery cooling blower motor and bracket (2). Tighten the fasteners (1) to 9 N.m (80 lb in).

Fig. 116: Drive Motor Battery Cooling Blower Outlet Duct Fastener
Courtesy of GENERAL MOTORS COMPANY

5. Install the generator control module air outlet duct (2) and tighten the upper fasteners (1) to 9 N.m (80 lb in).

Fig. 117: Generator Control Module Cooling Air Outlet Duct And Tighten Fasteners
Courtesy of GENERAL MOTORS COMPANY

6. Install the lower generator control module cooling air outlet duct lower fasteners (1) and tighten to 9 N.m (80 lb in).

Fig. 118: High Voltage 3-phase Cable
Courtesy of GENERAL MOTORS COMPANY

7. Install the high voltage 3-phase cable (2) to the generator control and battery module. Tighten the nuts (1) to 9 N.m (80 lb in).
8. Install the 12V cable (3) to the generator control and battery module. Tighten the nut (4) to 9 N.m (80 lb in).

Fig. 119: Body Harness Connectors
Courtesy of GENERAL MOTORS COMPANY

9. Install the body harness connectors (1).

Fig. 120: Battery Cooling Air Inlet Duct And Retainers
Courtesy of GENERAL MOTORS COMPANY

10. Install the drive motor battery cooling air inlet lower duct.

Fig. 121: Intermediate Duct Retainers
Courtesy of GENERAL MOTORS COMPANY

NOTE: Make sure the duct is flush against the seal for efficient generator control and battery module cooling.

11. Install the drive motor battery cooling blower outlet duct (1). Refer to **Drive Motor Battery Cooling Blower Outlet Duct Replacement** .
12. Enable the hybrid battery. Refer to **High Voltage Enabling**.

GENERATOR CONTROL MODULE CABLE COVER REPLACEMENT

2. Remove the high voltage cable fastener (1) and the high voltage cable (2), from the generator battery disconnect relay junction block (3).

Installation Procedure

Fig. 127: High Voltage Cable, Fasteners And Junction Block
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

1. Install the the high voltage cable (2), to the generator battery disconnect relay junction block (3) and tighten the fastener (1) to 9 N.m (80 lb in).
2. Enable the hybrid battery. Refer to High Voltage Enabling.

GENERATOR BATTERY CONTROL WIRING HARNESS REPLACEMENT (GENERATOR BATTERY DISCON RELAY TO B2)

Removal Procedure

WARNING: Ensure all High Voltage safety procedures are followed. Failure to follow the procedure exactly as written may result in serious injury or death.

WARNING: Always perform the High Voltage Disabling procedure prior to

servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

1. Disable the hybrid battery. Refer to **High Voltage Disabling**.
2. Remove the generator control module cover. Refer to **Generator Control Module Cover Replacement**.

Fig. 128: High Voltage Cable Fasteners
Courtesy of GENERAL MOTORS COMPANY

3. Remove the high voltage cable fastener (1) from the generator battery disconnect relay junction block-to-B2.
4. Remove the high voltage cable (2).

Installation Procedure

Fig. 129: High Voltage Cable Fasteners
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

1. Install the high voltage cable (2) to the generator battery disconnect relay junction block and tighten the fasteners (1) to 9 N.m (80 lb in).
2. Install the generator control module cover. Refer to Generator Control Module Cover Replacement.
3. Enable the hybrid battery. Refer to High Voltage Enabling.

GENERATOR BATTERY FUSE REPLACEMENT

Removal Procedure

WARNING: Ensure all High Voltage safety procedures are followed. Failure to follow the procedure exactly as written may result in serious injury or death.

WARNING: Always perform the High Voltage Disabling procedure prior to

servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

Failure to follow the procedures may result in serious injury or death.

Preliminary Procedure Remove the generator control and battery module. Refer to **Generator Control and Battery Module Replacement and Shipping Preparation**.

1	Battery Auxiliary Tray Fasteners (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 22 N.m (16 lb ft).
2	Battery Auxiliary Tray Fasteners (Qty: 4) Tighten 58 N.m (43 lb ft).
3	Battery Auxiliary Tray

CLEAR SECURED HIGH VOLTAGE DTCS

The Clear Secured High Voltage DTCs procedure must be completed when a latched DTC is set, a vehicle crash event has been detected, or when the Starter/Generator Control Module has been replaced.

Clearing DTCs After a Vehicle Crash Event

NOTE: **Before clearing any DTCs after a vehicle crash event, inspect and ensure the high voltage system integrity has not been compromised during the crash event. Refer to High Voltage System Inspection.**

1. Connect a scan tool to the vehicle.
2. Ignition ON, select Clear Secured High Voltage DTCs in the Hybrid Powertrain Control Module Control Functions list.
3. Select Hybrid Powertrain Control Module.

NOTE: **A command reject may appear on the scan tool after the first Clear Secured High Voltage DTCs request. If this occurs, ignore this command reject and continue to the next step.**

4. Follow the scan tool directions to complete the procedure.
5. When complete, exit out of the Clear Secured High Voltage DTCs menu.

6. Ignition OFF and all vehicle systems OFF. It may take up to 2 min for all vehicle systems to power down.
7. Ignition ON, select Clear Secured High Voltage DTCs in the Hybrid Powertrain Control Module Control Functions list.
8. Select Battery Energy Control Module.
9. Follow the scan tool directions to complete the procedure.
10. When complete, exit out of the Clear Secured High Voltage DTCs menu.
11. Ignition OFF and all vehicle systems OFF. It may take up to 2 min for all vehicle systems to power down.
12. Ignition ON, select Clear Secured High Voltage DTCs in the Hybrid Powertrain Control Module Control Functions list.
13. Select Hybrid Powertrain Control Module.

NOTE: **A command reject may appear on the scan tool after the first Clear Secured High Voltage DTCs request. If this occurs, ignore this command reject and continue to the next step.**

14. Follow the scan tool directions to complete the procedure.
15. When complete, exit out of the Clear Secured High Voltage DTCs menu.
16. Ignition OFF and all vehicle systems OFF. It may take up to 2 min for all vehicle systems to power down.
17. Ignition ON, clear any DTCs that may be set.

Clearing High Voltage DTCs

1. Connect a scan tool to the vehicle.
2. Ignition ON, select Clear Secured High Voltage DTCs in the Hybrid Powertrain Control Module Control Functions list.
3. Select Battery Energy Control Module.
4. Follow the scan tool directions to complete the procedure.
5. Clear any DTCs that may be set.
6. Ignition OFF and all vehicle systems OFF. Wait 2 min.
7. Ignition ON, clear any DTCs that may be set.

DESCRIPTION AND OPERATION

DRIVE MOTOR BATTERY SYSTEM DESCRIPTION

The hybrid energy storage system uses a number of modules and components to store electricity for use by the eAssist system. The hybrid energy storage system stores 115 V DC in two lithium-ion battery sections. Current flows from the battery sections through a series of contactors and a service disconnect. This allows the system to control the disconnect of high voltage from the vehicle and also creates a redundant disconnect to ensure voltage is disabled when servicing high voltage components. To ensure optimum life of the lithium-ion batteries, the hybrid energy storage system monitors the state of charge of each battery cell. The system will equalize the state of charge of each cell through a balancing process. The hybrid energy storage system is also responsible for monitoring and controlling the charging and the discharging of the high voltage battery.

The high voltage battery is charged during normal vehicle driving. During normal operation, the high voltage battery is kept at or near an optimum level of charge. In some case, such as the installation of a replacement high voltage battery, the battery state of charge may be low and require charging before the eAssist system functions begin to operate normally. To charge the battery, drive the vehicle or allow the vehicle to idle with the transmission in Park or Neutral. To decrease charging time, raise the engine speed to 2,500 - 3,000 RPM with the transmission in Neutral. This will increase the charging rate and decrease charging time.

The primary component of the hybrid energy storage system is the Hybrid/EV Battery Pack. The Hybrid/EV Battery Pack is a modular battery pack assembly that not only contains the lithium-ion battery sections, but also many of the control modules and components used by the eAssist system.

The Hybrid/EV Battery Pack contains the following serviceable components:

- Hybrid/EV Battery Section 1
- Hybrid/EV Battery Section 2
- Battery Energy Control Module
- Starter/Generator Control Module
- Main Contactor - located in the generator battery disconnect relay assembly
- Pre-Charge Contactor - located in the generator battery disconnect relay assembly
- Hybrid/EV Battery Pre-Charge Resistor - located in the generator battery disconnect relay assembly
- Hybrid/EV Battery Pack Current Sensor - located in the generator battery disconnect relay assembly
- Hybrid/EV Battery Pack High Voltage Manual Disconnect Lever - located in the battery energy control module wiring junction block assembly
- Generator Battery Fuse - located in the battery energy control module wiring junction block assembly
- High Voltage Interlock Switch

Hybrid/EV Battery Pack

The Hybrid/EV Battery Pack is located in the rear compartment of the vehicle, directly behind the rear passenger seat, and serves as a modular assembly to contain many of the eAssist control modules and system components. The Hybrid/EV Battery Pack may also be referred to as the following names:

- Energy Storage System
- Power Pack
- Generator Control and Battery Module Assembly

The Hybrid/EV Battery Pack first consists of a metal tray that is fixed to the vehicle floor. This provides a strong mount for other components to secure to. Within the Hybrid/EV Battery Pack, the hybrid/EV battery section 1 and hybrid/EV battery section 2 are located nearest to the left side of the vehicle. Directly above the battery sections is the battery energy control module. To the right of the battery sections and nearest to the right side of the vehicle is the Starter/Generator Control Module. Above the Starter/Generator Control Module is the generator battery disconnect relay assembly and battery energy control module wiring junction block assembly. A case cover is secured over the top of all components, effectively creating the Hybrid/EV Battery Pack and preventing access to any high voltage components without first disabling the high voltage system.

The Hybrid/EV Battery Pack is also integral to the hybrid/EV cooling system. Foam gaskets are adhered to the metal battery pack tray. This seals the underside of the Starter/Generator Control Module to ensure proper airflow under the control module for cooling purposes. The Hybrid/EV Battery Pack case cover also provides a mounting surface for the Hybrid/EV Battery Pack Cooling Fan and has openings where the plastic vents are allowed to pass into the Hybrid/EV Battery Pack to direct air through components which require cooling.

Hybrid/EV Battery Section 1 and Hybrid/EV Battery Section 2

The hybrid/EV battery section 1 and hybrid/EV battery section 2 are a pair of lithium-ion batteries connected in series to make up the 115 V DC battery. The two sections are diagnosed and serviced as a single battery assembly. The individual battery sections are not serviced separately.

The hybrid battery contains a total of 32 cell groups, with each section containing 16 cells that are connected in series using internal bus bars. The two battery sections are externally connected in series using high voltage cable. Each individual cell group is rated at 3.7 V, for a nominal system voltage of 118 V DC.

The hybrid battery sections are air cooled. Each battery case has an air inlet and an air outlet. Air is drawn through the battery case to cool the individual cells. Attached to each case is a vent tube. In the event of a damaged or ruptured battery, any outgassing will be vented to the outside of the vehicle.

A voltage sense circuit is attached to each individual cell. Each of these circuits terminate at a connector located on the top surface of the battery section. A serviceable auxiliary battery wiring harness connects the voltage sense circuits to the battery energy control module, located directly above the battery sections. The sensor itself is a part of the battery cell and is not serviceable.

Battery Energy Control Module

The battery energy control module is located directly above the hybrid/EV battery section 1 and hybrid/EV battery section 2. The module is responsible for monitoring the hybrid/EV battery section 1 and hybrid/EV battery section 2 parameters and reporting this to the Starter/Generator Control Module. The battery energy control module may also be referred to as the following names:

- BECM
- Voltage Current Temperature Module
- Voltage Temperature Interface Module (VTIM)

The battery energy control module monitors the voltage of each battery cell section. A voltage sense circuit is attached to each individual cell group. Each of these circuits terminate at a connector located on the top surface of the battery section. A serviceable auxiliary battery wiring harness connects the voltage sense circuits to the battery energy control module, located directly above the battery sections. The sensor itself is a part of the battery cell and is not serviceable.

The battery energy control module also measures critical temperatures within the two battery sections and at the hybrid/EV battery section 1 air inlet. Six temperature sensors are used to monitor the battery temperature. The battery temperature sensors are located in the battery sections. Two of the temperature sensors are located on the top of the battery section and the remaining four are located on the bottom of the section. The temperature sensor is a variable resistor that measures the temperature of the battery cell group. The battery energy control

module supplies 5 V to the signal circuit and a ground for the low reference circuit. The battery temperature sensor resistance changes with battery temperature. As the temperature decreases, the sensor resistance increases. As the temperature increases, the sensor resistance decreases. The air inlet temperature sensor operates in much the same way, except that it measures the temperature of the incoming air used to cool the Hybrid/EV Battery Pack at the hybrid/EV battery section 1 air inlet. None of the temperature sensors or the temperature sensor harness is serviceable. They are all serviced as part of the battery sections.

The battery energy control module is responsible for the cell balancing process. During operation, individual cells may charge or discharge at different rates. To ensure proper battery health and optimal life, these voltages are balanced, with energy from a higher voltage cell being transferred to a lower voltage cell. This keeps the voltage consistent between all 32 cell groups. Cell balancing is an internal process of the battery energy control module. Internal gates allow energy to flow between cells using the same circuits that are used to monitor cell voltage.

Starter/Generator Control Module

The Starter/Generator Control Module is a multifunction module that is involved in many eAssist system operations. The Starter/Generator Control Module contains two internal microprocessors: a battery control processor and a motor control processor. The battery control processor is responsible for the following:

- Communicating with the battery energy control module to determine the status of the high voltage battery
- Controlling the battery and Starter/Generator cooling systems
- Controlling the main and pre-charge contactors
- Monitoring the high voltage interlock loops
- Monitoring for isolation faults
- Supplying 12 V to the vehicle

Internal to the Starter/Generator Control Module, the motor control processor is responsible for propulsion activities and the 14 V control module is responsible for maintaining 12 V to the vehicle. The Starter/Generator Control Module may also be referred to as the following names:

- SGCM
- Hybrid Powertrain Control Module (HPCM)
- Accessory Power Module (APM)
- Battery Power Inverter Module (BPIM)
- Power Inverter Module (PIM)

Hybrid/EV Battery Control

The Starter/Generator Control Module interfaces with the battery energy control module to determine the status of the battery voltage and battery temperature. The Starter/Generator Control Module uses voltage information from the battery energy control module to make decisions about the battery state of health, how the battery should be charged or discharged, and when to initiate cell balancing.

Hybrid/EV Battery and Starter/Generator Cooling

The Starter/Generator Control Module uses temperature information from the battery energy control module to control the Hybrid/EV Battery Pack Cooling Fan. The Starter/Generator Control Module also monitors the Starter/Generator coolant temperature sensor and will control the Starter/Generator coolant pump relay, which controls the Starter/Generator coolant pump.

High Voltage Contactors

At times, it may be necessary to disconnect high voltage from the vehicle, both during normal operation and when a system fault is identified. The Starter/Generator Control Module controls the main contactor and pre-charge contactor to disconnect and connect high voltage from the vehicle.

High Voltage Interlock

The high voltage interlock is a fail-safe to disable high voltage when the Starter/Generator Control Module identifies that a high voltage area has been accessed. The Hybrid/EV Battery Pack has a high voltage interlock switch located on the service access cover. The Starter/Generator also has a high voltage interlock switch on the access cover. When either cover is removed, the interlock loop is opened. The Starter/Generator Control Module will open the contactors to prevent technician contact with high voltage.

High Voltage Isolation

The Starter/Generator Control Module monitors the electrical potential between high voltage and the vehicle chassis. High voltage should always be isolated from the vehicle chassis by a certain amount of resistance to avoid the potential for a life threatening current path. In the event that a high voltage leak path is detected to the vehicle chassis, the Starter/Generator Control Module will set a DTC and open the contactors to remove high voltage.

Testing for loss of isolation requires special tools and procedures. Because of the high voltages present in the hybrid system, a loss of isolation may occur due to insulation breakdown. Insulation breakdown typically occurs only when high voltage is present. Conditions such as insulation breakdown cannot be diagnosed with a typical DMM because high voltage is not used by the DMM when measuring resistance.

12 V Output

The Starter/Generator Control Module essentially takes the place of the generator on a traditional vehicle. The Starter/Generator Control Module converts high voltage DC to a 12 V DC for accessory electrical operation and to charge the 12 V battery.

Main Contactor, Pre-Charge Contactor, and Pre-Charge Resistor

The high voltage contactors are switches that are controlled like a relay. To disable high voltage from the vehicle, the main and pre-charge contactors are commanded open. This will open the contactors and physically disconnect the hybrid/EV battery positive cable. To connect high voltage to the vehicle, first the pre-charge contactor is closed. With the pre-charge contactor closed, current flows through the pre-charge resistor. This allows high voltage to slowly build in the system. Once high voltage is brought up through the pre-charge contactor, the main contactor is closed and high voltage is active. If the high voltage builds too quickly or too slowly, the Starter/Generator Control Module will set a fault.

Both the main contactor and the pre-charge contactor are controlled in a similar manner. B+ is applied at all times to each contactor. Each contactor is controlled by an independent low side driver in the Starter/Generator Control Module. When the Starter/Generator Control Module commands the contactor closed, ground is applied to the contactor through the low side driver and the contactor is closed.

Both contactors and the pre-charge resistor are located in the generator battery disconnect relay assembly. The generator battery disconnect relay assembly is a plastic tray that is secured to the top of the Starter/Generator Control Module. The generator battery disconnect relay assembly also contains the Hybrid/EV Battery Pack current sensor and a series of bus bars and cables that electrically connect the hybrid/EV battery to the Starter/Generator Control Module.

Hybrid/EV Battery Pack Current Sensor

The Hybrid/EV Battery Pack current sensor is a three-wire hall effect sensor that measures current flow from the hybrid/EV battery. The battery energy control module applies 5 volt and provides a low reference to power the sensor. Current measurement is communicated to the battery energy control module via a signal circuit.

The Hybrid/EV Battery Pack current sensor is located in the generator battery disconnect relay assembly. The generator battery disconnect relay assembly is a plastic tray that is secured to the top of the Starter/Generator Control Module. The generator battery disconnect relay assembly also contains the high voltage contactors, pre-charge resistor, and a series of bus bars and cables that electrically connect the hybrid/EV battery to the Starter/Generator Control Module. The Hybrid/EV Battery Pack current sensor monitors current on the hybrid/EV battery negative bus bar.

Hybrid/EV Battery Pack High Voltage Manual Disconnect Lever and Generator Battery Fuse

The Hybrid/EV Battery Pack high voltage manual disconnect lever provides a redundant method to disconnect high voltage from vehicle when performing service on the system. With the switch open, high voltage is physically disconnected from the hybrid/EV battery positive cable. Together with the high voltage interlock and the high voltage contactors, the manual disconnect provides a means of disconnecting high voltage at two points in the system. This provides a double-layer of protection.

The generator battery fuse is a 125 A fuse to prevent an overcurrent condition in the 115 V DC system.

The Hybrid/EV Battery Pack high voltage manual disconnect lever and generator battery fuse are located in the battery energy control module wiring junction block assembly. The battery energy control module wiring junction block assembly is a plastic tray that is secured to the top of the Starter/Generator Control Module.

High Voltage Interlock Switch

The high voltage system uses two high voltage interlock switches to indicate that an area of the vehicle that contains a high voltage connection has been exposed. These locations are at the Starter/Generator and the Hybrid/EV Battery Pack. The two interlock switches are completely separate and are not tied together.

The Starter/Generator Control Module applies a constant 5 V reference to the high voltage interlock switch and monitors the voltage. Each high voltage interlock switch contains a resistor. With the high voltage interlock connected, the 5 V reference voltage travels through the resistor and is reduced by a specific amount. This indicates that the high voltage interlock switch is closed and no circuit faults have occurred. If the high voltage

interlock switch is removed or a circuit fault occurs, the voltage will change and the Starter/Generator Control Module will open the contactors.

The Hybrid/EV Battery Pack high voltage interlock switch is part of the Hybrid/EV Battery Pack cable cover. When the cover is removed, the high voltage interlock switch is also removed. To remove the cover, the Hybrid/EV Battery Pack high voltage manual disconnect lever must also be opened, providing a second means of disconnecting high voltage.

The Starter/Generator high voltage interlock switch is part of the Starter/Generator cable cover. When the cover is removed, the high voltage interlock switch is also removed.

Vehicle Collision Detection

As a safety precaution, the Starter/Generator Control Module monitors the collision event messages from the Inflatable Restraint Sensing and Diagnostic Module (SDM). This message is broadcast by the SDM via serial data to inform various control module that a collision event has occurred so they can take appropriate action. This message does not indicate the severity of the collision, nor does it indicate that airbag deployment has been commanded.

If a collision event message is received by the Starter/Generator Control Module, it will enter a collision event detected state and respond by opening the high voltage contactors. This will help isolate the high voltage battery from the rest of the vehicle and reduce the possibility of a compromised high voltage system creating a hazard.

If the Starter/Generator Control Module has entered the collision event detected state, the **High Voltage System Inspection**, procedure must be performed to ensure the high voltage system has not been compromised. If compromised, any necessary repairs should be made. The collision event detected condition will remain active until cleared using the **Clear Secured High Voltage DTCs**.

DTC C0267: LOW BRAKE FLUID INDICATED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.

- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C0267

Low Brake Fluid Indicated

For symptom byte information refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	-	C0267 00	-	-
Ground	-	C0267 00	-	-

Circuit/System Description

The brake fluid level switch monitors the level of the brake fluid in the brake fluid reservoir. When the electronic brake control module sees low brake fluid level, the DTC is set.

Conditions for Running the DTC

Ignition ON.

Conditions for Setting the DTC

Low brake fluid level is detected for 8 s.

Action Taken When the DTC Sets

- The electronic brake control module disables the traction control and stability control for the duration of the ignition cycle.
- The traction control/stability control-active indicator turns ON.
- The brake warning indicator turns ON.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Circuit/System Verification

1. Verify that the brake is above minimum level.
 - **If low**

Refer to **Brake Fluid Loss**.

- **If above minimum level**

Refer to Circuit/System Testing.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the B20 Brake Fluid Level Switch. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal 2 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Ignition ON.
4. Verify the scan tool Brake Fluid Level Sensor parameter is Low.
 - **If the parameter is not Low**

1. Ignition OFF, disconnect the harness connector at the K17 Electronic Brake Control Module.
2. Test for infinite resistance between the signal circuit terminal 1 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K17 Electronic Brake Control Module.
- **If the parameter is Low**
5. Install a 3 A fused jumper wire between the signal circuit terminal 1 and ground.
6. Verify the scan tool Brake Fluid Level Sensor parameter is Ok.
 - **If the parameter is not Ok**
 1. Ignition OFF, disconnect the harness connector at the K17 Electronic Brake Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V.
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K17 Electronic Brake Control Module.
 - **If the parameter is Ok**
7. Test or replace the B20 Brake Fluid Level Switch.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Control Module References** for electronic brake control module replacement, programming and setup.

DTC C0273: BRAKE FLUID LEVEL SWITCH CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C0273

Brake Fluid Level Switch Circuit

For symptom byte information refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	C0267 00	C0273 05	C0273 05	-
Ground	-	C0273 05	-	-

Circuit/System Description

The brake fluid level switch monitors the level of the brake fluid in the brake fluid reservoir. When the electronic brake control module sees the brake fluid level switch input open, the DTC is set.

Conditions for Running the DTC

Ignition ON.

Conditions for Setting the DTC

A open or short to battery is detected on the signal circuit.

Action Taken When the DTC Sets

- The brake warning indicator turns ON.
- ABS indicator turns ON.
- Traction control indicator turns ON.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

DTC C027B: BRAKE BOOSTER ELECTRIC VACUUM PUMP

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC C027B 00

Brake Booster Electric Vacuum Pump

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Vacuum Pump Relay B+	-	-	-	-
Vacuum Pump Relay Control	C027B 00	C027B 00	C027B 00	-
Vacuum Pump Relay Ground	-	-	-	-

Circuit/System Description

The brake booster vacuum sensor measures the vacuum in the brake booster assembly. The electronic brake control module supplies a 5 V reference and a low reference circuit to the brake booster vacuum sensor. The vacuum sensor supplies a voltage signal in relation to the pressure in the brake booster to the electronic brake control module. When the vacuum within the system becomes weak, the electronic brake control module turns ON the brake booster pump motor by providing battery voltage to the brake booster pump motor relay. The relay activates and supplies ground to the brake booster pump motor.

Conditions for Running the DTC

Ignition ON.

Conditions for Setting the DTC

A short to ground, short to voltage or open/high resistance is detected on the control circuit.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Circuit/System Verification

1. Verify that the brake booster vacuum system has no damage, leakage or incorrect installation.
 - **If damage, leakage or incorrect installation is found**

Refer to **Brake Assist System Diagnosis**

- **If no damage, leakage or incorrect installation is found**
2. Ignition ON.
3. Verify the brake booster pump motor turns ON and OFF when commanding the brake booster electric vacuum pump ON and OFF with a scan tool.
 - **If the brake booster pump motor does not turn ON and OFF**

Refer to Circuit/System Testing.

- **If the brake booster pump motor turn ON and OFF**
4. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the X1 harness connector at the KR14 Brake Booster Pump Motor Relay. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal 1 and ground.
 - **If 10 ohms or greater**
 1. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Ignition ON.
4. Verify that a test lamp illuminates between the B+ circuit terminal 5 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the M9 Brake Booster Pump Motor.
 - **If the test lamp illuminates**
5. Connect a test lamp between the control circuit terminal 2 and ground.
6. Verify the test lamp turns ON and OFF when commanding the brake booster electric vacuum pump ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the harness connector at the K17 Electronic Brake Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K17 Electronic Brake Control Module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the harness connector at the K17 Electronic Brake Control Module, ignition ON.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.

- If less than 1 V, replace the K17 Electronic Brake Control Module.
 - **If the test lamp turns ON and OFF**
7. Replace the KR14 Brake Booster Pump Motor Relay.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Power Brake Booster Pump Replacement (LTG)**, **Power Brake Booster Pump Replacement (LUK)**
- **Control Module References** for electronic brake control module replacement, programming and setup.

DTC C0299: BRAKE BOOSTER LARGE VACUUM LEAK DETECTED TOO MANY TRANSITIONS

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C0299 56

Brake Booster Large Vacuum Leak Detected Too Many Transitions

Circuit/System Description

The brake booster vacuum sensor measures the vacuum in the brake booster assembly. The electronic brake control module supplies a 5 V reference and a low reference circuit to the brake booster vacuum sensor. The vacuum sensor supplies a voltage signal in relation to the pressure in the brake booster to the electronic brake control module.

Conditions for Running the DTC

Ignition ON.

Conditions for Setting the DTC

The EBCM detected a too low vacuum in the brake booster assembly for 120 s.

Action Taken When the DTC Sets

The brake warning indicator turns ON.

Conditions for Clearing the DTC

- A current DTC clears when the diagnostic runs and passes.

- The electronic brake control module will turn OFF the indicator in the next ignition cycle.

1. Ignition ON.
2. Verify that DTC C1100 is not set.
 - **If the DTC is set**

Refer to **DTC C025E: Brake Booster Vacuum Sensor Circuit.**

- **If the DTC is not set**
3. Verify that the brake booster vacuum system has no damage, leakage or incorrect installation.
 - **If damage, leakage or incorrect installation is found**

Refer to **Brake Assist System Diagnosis.**

- **If the inspection is OK**
4. Replace the B19B Brake Booster Vacuum Sensor.
5. Verify the DTC does not set while operating the vehicle under the Conditions for Running the DTC.
 - **If the DTC sets**

Replace the K17 Electronic Brake Control Module.

- **If the DTC does not set**

6. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for Electronic Brake Control Module replacement, programming and setup.

DTC C025E: BRAKE BOOSTER VACUUM SENSOR CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C025E

Brake Booster Vacuum Sensor Circuit

For symptom byte information refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
5V Reference	C025E 00	C025E 06	C025E 00	-
Sensor Signal	C025E 06	C025E 06	C025E 01	C025E 1F, C025E 5A
Low Reference	-	C025E 01	-	-

Circuit/System Description

The brake booster vacuum sensor monitors the pressure in the brake booster. The electronic brake control module supplies a 5 V reference and a low reference circuit to the brake booster vacuum sensor. The vacuum sensor supplies a voltage signal in relation to the pressure in the brake booster to the electronic brake control module.

Conditions for Running the DTC

C025E 00, C025E 01, C025E 06, C025E 1F

Ignition ON

C025E 5A

- Ignition ON.
- Brakes are not applied.

Conditions for Setting the DTC

C025E 00

- A short to ground is detected on the 5V reference circuit.
- A short to voltage is detected on the 5V reference circuit.

C025E 01

- A short to voltage is detected on the signal circuit.
- An open/high resistance is detected on the low reference circuit.

C025E 06

- An open/high is detected on the signal circuit.
- A short to ground is detected on the signal circuit.
- An open/high is detected on the 5V reference circuit.

C025E 1F

The vacuum sensor signal is erratic.

C025E 5A

The vacuum sensor signal is not plausible.

Action Taken When the DTC Sets

Service Brake Assist message is displayed on the driver information center

Conditions for Clearing the DTC

The DTC clears when the diagnostic runs and passes

Circuit/System Verification

1. Verify that the brake booster vacuum system has no damage, leakage or incorrect installation.
 - **If damage, leakage or incorrect installation is found**

Refer to **Brake Assist System Diagnosis**

- **If no damage, leakage or incorrect installation is found**
2. Refer to Circuit/System Testing.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the B19B Brake Booster Vacuum Sensor. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 ohms between the low reference circuit terminal 2 and ground.
 - **If 10 ohms or greater**
 1. Disconnect the harness connector at the K17 Electronic Brake Control Module.
 2. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K17 Electronic Brake Control Module.
 - **If less than 10 ohms**

3. Ignition ON.
4. Test for 4.8-5.2 V between the 5 V reference circuit terminal 3 and ground.
 - **If less than 4.8 V**
 1. Ignition OFF, disconnect the harness connector at the K17 Electronic Brake Control Module.
 2. Test for infinite resistance between the 5 V reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the 5 V reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K17 Electronic Brake Control Module.
 - **If greater than 5.2 V**
 1. Ignition OFF, disconnect the harness connector at the K17 Electronic Brake Control Module, ignition ON.
 2. Test for less than 1 V between the 5 V reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K17 Electronic Brake Control Module.
 - **If between 4.8-5.2 V**
5. Ignition OFF, disconnect the harness connector at the K17 Electronic Brake Control Module, Ignition ON.
6. Test for less than 1 V between the B19B Brake Booster Vacuum Sensor signal circuit terminal 1 and ground.
 - **If greater than 1 V**

Repair the short to voltage on the circuit.
 - **If less than 1 V**
7. Ignition OFF.
8. Test for infinite resistance between the B19B Brake Booster Vacuum Sensor signal circuit terminal 1 and ground.
 - **If less than infinite resistance**

Repair the short to ground on the circuit.
 - **If infinite resistance**
9. Test for less than 2 ohms between the B19B Brake Booster Vacuum Sensor signal circuit terminal 1 and the K17 Electronic Brake Control Module signal circuit terminal 34.
 - **If 2 ohms or greater**

Repair the open/high resistance in the circuit.
 - **If less than 2 ohms**

10. Test or replace the B19B Brake Booster Vacuum Sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Power Brake Booster Vacuum Sensor Replacement**
- **Control Module References** for electronic brake control module replacement, programming and setup

BRAKE BOOSTER PUMP MOTOR MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Brake Booster Pump Motor Control	2	2	1	-
Brake Booster Pump Motor Ground	1	2	-	-
1. Brake Booster Pump Motor Always ON 2. Brake Booster Pump Motor Always OFF				

Circuit/System Description

The brake booster vacuum sensor measures the vacuum in the brake booster assembly. The electronic brake control module supplies a 5 V reference and a low reference circuit to the brake booster vacuum sensor. The vacuum sensor supplies a voltage signal in relation to the pressure in the brake booster to the electronic brake control module. When the vacuum within the system becomes weak, the electronic brake control module turns ON the brake booster pump motor by providing battery voltage to the brake booster pump motor relay. The relay activates and supplies ground to the brake booster pump motor.

Scan Tool Reference

Control Module References

Circuit/System Verification

1. Ignition ON.
2. Verify that DTC C025E is not set.
 - **If the DTC is set**

Refer to **DTC C025E**.

- **If the DTC is not set**

3. Verify the brake booster pump motor turns ON and OFF when commanding the Brake Booster Electric Vacuum Pump On and Off with a scan tool.
 - **If the brake booster pump motor does not turn ON and OFF**

Refer to Circuit/System Testing.

- **If the brake booster pump motor turn ON and OFF**

4. Verify that the brake booster vacuum system has no damage, leakage or incorrect installation.
 - **If damage, leakage or incorrect installation is found**

Refer to **Brake Assist System Diagnosis**.

- **If the inspection is OK**

5. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the X1 harness connector at the KR14 Brake Booster Pump Motor Relay. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal 1 and ground.
 - **If 10 ohms or greater**
 1. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Ignition ON.
4. Verify that a test lamp illuminates between the B+ circuit terminal 5 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the M9 Brake Booster Pump Motor.
 - **If the test lamp illuminates**
5. Connect a test lamp between the control circuit terminal 2 and ground.
6. Verify the test lamp turns ON and OFF when commanding the Brake Booster Electric Vacuum Pump On and Off with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the harness connector at the K17 Electronic Brake Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K17 Electronic Brake Control Module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the harness connector at the K17 Electronic Brake Control Module,

ignition ON.

2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K17 Electronic Brake Control Module.

- **If the test lamp turns ON and OFF**

7. Ignition OFF, connect the X1 harness connector at the KR14 Brake Booster Pump Motor Relay. Disconnect the X2 harness connector at the KR14 Brake Booster Pump Motor Relay.
8. Connect a test lamp between the ground circuit terminal 2 and the B+ circuit terminal 1 at the KR14 Brake Booster Pump Motor Relay, ignition ON.
9. Verify the test lamp turns ON and OFF when commanding the Brake Booster Electric Vacuum Pump On and Off with a scan tool.
 - **If the test lamp does not turn ON and OFF**

Replace the KR14 Brake Booster Pump Motor Relay.

- **If the test lamp turns ON and OFF**

10. Install a 30 A fused jumper wire between the M9 Brake Booster Pump Motor terminal 1 and B+. Install a jumper wire between the M9 Brake Booster Pump Motor terminal 2 and ground.
11. Verify the M9 Brake Booster Pump Motor activates.
 - **If the brake booster pump motor does not activate**

Replace the M9 Brake Booster Pump Motor.

- **If the brake booster pump motor activates**

12. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Power Brake Booster Pump Replacement (LTG), Power Brake Booster Pump Replacement (LUK)**
- **Relay Replacement (Within an Electrical Center) , Relay Replacement (Attached to Wire Harness)**
- **Control Module References** for Electronic Brake Control Module replacement, programming and setup.

BRAKE WARNING INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	C0267	1	1	-
Ground	-	1	-	-
1. Brake Warning Indicator Malfunction				

Circuit/System Description

The electronic brake control module monitors the brake fluid level in the brake fluid reservoir. When the fluid within the brake fluid reservoir is below the MIN level, contacts within the brake fluid level switch closes causing the voltage within the signal circuit to drop. The electronic brake control module will detect the voltage drop and will send a serial data message to the instrument cluster commanding the brake warning indicator to illuminate.

Description and Operation

Brake Warning System Description and Operation

Electrical Information Reference

- **Circuit Testing**
- **Connector Repairs**
- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Verify that the brake fluid has the proper level. The fluid level should be above minimum level.
 - **If low**

Refer to **Brake Fluid Loss**.

- **If above minimum level**
- 2. Ignition ON.
- 3. Verify the scan tool Brake Fluid Level Sensor parameter. The reading should be Ok.

- **If the parameter is Low**

Refer to Circuit/System Testing

- **If the parameter is Ok**

- 4. Verify the brake warning indicator turns ON and OFF, when commanding the instrument cluster All Indicators ON and OFF with a scan tool.
- **If the brake warning indicator does not turn ON and OFF**

Replace the P16 Instrument Cluster.

- **If the brake warning indicator turns ON and OFF**

- 5. All OK.

Circuit/System Testing

- 1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the B20 Brake Fluid Level Switch. It may take up to 2 min for all vehicle systems to power down.
- 2. Test for less than 10 ohms between the ground circuit terminal 2 and ground.
 - **If 10 ohms or greater**
 - 1. Ignition OFF.
 - 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
- 3. Ignition ON.
- 4. Verify the scan tool Brake Fluid Level Sensor parameter is Low.
 - **If the parameter is not Low**
 - 1. Ignition OFF, disconnect the harness connector at the K17 Electronic Brake Control Module.
 - 2. Test for infinite resistance between the signal circuit terminal 1 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K17 Electronic Brake Control Module.
 - **If the parameter is Low**
- 5. Install a 3 A fused jumper wire between the signal circuit terminal 1 and ground.
- 6. Verify the scan tool Brake Fluid Level Sensor parameter is Ok.
 - **If the parameter is Low**
 - 1. Ignition OFF, disconnect the harness connector at the K17 Electronic Brake Control Module, ignition ON.

2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V.
3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K17 Electronic Brake Control Module.
 - **If the parameter is Ok**
7. Test or replace the B20 Brake Fluid Level Switch.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Brake Fluid Level Indicator Switch Replacement**
- **Control Module References** for electronic brake control module and instrument cluster replacement, programming and setup.

BRAKE PULSATION

Brake Pulsation

Step	Action	Yes	No
DEFINITION: Fluctuation or pulsation is felt through the brake pedal, steering wheel, seat, floor, and/or in the vehicle ONLY when braking.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to <u>Diagnostic Starting Point - Vehicle</u>
2	1. Inspect the disc brake system for the following conditions. <ul style="list-style-type: none"> • Excessive thickness variation of rotor friction surfaces • Excessive assembled lateral runout (LRO) of rotor friction surfaces • Hard spots, heat checks, bluing discoloration of rotor friction surfaces; possibly due to brake drag • Excessive corrosion of rotor friction surfaces; including red, gray or black oxidation • Loose, damaged or missing caliper or lining hardware • Bent or damaged caliper or mounting component 		

	<ul style="list-style-type: none"> Excessive LRO of wheel hub/axle flange; due to damage and/or loose or excessively worn bearings <p>2. Adjust, repair or replace components as necessary. Refer to <u>Disc Brake System Diagnosis</u>.</p> <p>Did you find and correct a condition?</p>	Go to Step 3	Go to <u>Diagnostic Starting Point - Vehicle</u>
3	<p>1. Install or connect components that were removed or disconnected during diagnosis.</p> <p>2. Road test the vehicle in order to confirm proper operation. Refer to <u>Brake System Vehicle Road Test</u>.</p> <p>Is the condition still present?</p>	Go to Step 2	System OK

BRAKE SYSTEM NOISE

Brake System Noise

Step	Action	Yes	No
DEFINITION: Vehicle exhibits abnormal noise when braking; vehicle may exhibit abnormal noise during motion just after brake pedal release.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to <u>Diagnostic Starting Point - Vehicle</u>
2	<p>1. Inspect the disc brake system for the following conditions.</p> <ul style="list-style-type: none"> Lining wear indicator contact with rotor Debris trapped between rotor and splash shield or backing plate; and/or debris trapped between rotor and linings Contaminated linings Aftermarket linings Glazed linings Distorted, cracked or damaged linings Excessively worn linings Damaged or excessively worn caliper hardware and/or lining hardware Incorrectly installed, loose or missing caliper hardware and/or lining hardware Lack of lubrication or excessive corrosion on metal to metal contact surfaces 		

	<ul style="list-style-type: none"> • Bent or damaged splash shield or backing plate • Hard spots, heat checks, blueing discoloration of rotor friction surfaces • Glazed rotor friction surfaces • Bent or damaged caliper or mounting component <p>2. Adjust, repair or replace components as necessary. Refer to <u>Disc Brake System Diagnosis</u>.</p>		
	Did you find and correct a condition?	Go to Step 6	Go to Step 3
3	<p>1. Inspect the brake assist system for the following conditions.</p> <ul style="list-style-type: none"> • Lack of lubrication or excessively worn pushrod or pedal pivots or pivot bushings • Bent or damaged pedal pushrod, pedal, or pedal bracket • Damaged or improperly operating vacuum booster and/or check valve, if equipped <p>2. Adjust, repair or replace components as necessary.</p>		
	Did you find and correct a condition?	Go to Step 6	Go to Step 4
4	<p>1. Inspect the hydraulic brake system for the following conditions.</p> <ul style="list-style-type: none"> • Improper operation of caliper pistons • Contaminated brake fluid <p>2. Adjust, repair or replace components as necessary. Refer to <u>Hydraulic Brake System Diagnosis</u>.</p>		
	Did you find and correct a condition?	Go to Step 6	Go to Step 5
5	<p>Inspect the park brake system for proper operation.</p> <p>Did you find and correct a condition?</p>	Go to Step 6	Go to <u>Diagnostic Starting Point - Vehicle</u>

	Is the condition still present?	Go to Step 2	System OK

BRAKING ACTION UNEVEN - PULLS TO ONE SIDE

Test Description

The numbers below refer to the step numbers on the diagnostic table.

4

Suspension components that are not operating properly may cause a disturbance to the vehicle during application of the brake system.

5

Steering components that are not operating properly may cause a disturbance to the vehicle during application of the brake system.

Braking Action Uneven - Pulls to One Side

Step	Action	Yes	No
DEFINITION: Vehicle pulls to one side only when braking.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to <u>Diagnostic Starting Point - Vehicle</u>
2	<ol style="list-style-type: none">Inspect the hydraulic brake system for the following conditions.<ul style="list-style-type: none">Kinked, pinched or damaged brake pipe or flexible brake hoseSticking or improperly operating caliper pistonBrake fluid leakAdjust, repair or replace components as necessary. 	Is the condition still present?	Go to Step 2	System OK

BRAKING ACTION UNEVEN - FRONT TO REAR

Test Descriptions

The number below refers to the step number on the diagnostic table.

4

Suspension components that are not operating properly may cause a disturbance to the vehicle during application of the brake system.

Braking Action Uneven - Front to Rear

Step	Action	Yes	No
DEFINITION: Braking action or stopping force sensitive or grabbing and/or more pronounced at the front or at the rear axle. Sensitive or grabbing brakes: Excessive brake jump-in force relative to brake pedal input.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to Diagnostic Starting Point - Vehicle
2	<ol style="list-style-type: none">1. Inspect the hydraulic brake system for the following conditions:<ul style="list-style-type: none">• Improper operation of caliper pistons• Kinked, pinched or damaged brake pipe or flexible brake hose• Brake fluid leak2. Adjust, repair or replace components as necessary. Refer to <u>Hydraulic Brake System Diagnosis</u>.		
	Did you find and correct a condition?	Go to Step 5	Go to Step 3
3	<ol style="list-style-type: none">1. Inspect the disc brake system for the following conditions:<ul style="list-style-type: none">• Contaminated linings• Glazed linings• Distorted, cracked or damaged linings• Excessively worn linings• Aftermarket linings• Damaged or excessively worn caliper hardware and/or lining hardware• Hard spots, heat checks, blueing discoloration of rotor friction surfaces• Glazed rotor friction surfaces2. Adjust, repair or replace components as necessary. Refer to <u>Disc Brake System Diagnosis</u>.		
	Did you find and correct a condition?	Go to Step 5	Go to Step 4

4	<ol style="list-style-type: none"> Inspect the suspension system for the following conditions: <ul style="list-style-type: none"> Loose suspension component connections Excessively worn or damaged suspension components Adjust, repair or replace components as necessary. 5	<ol style="list-style-type: none"> Install or connect components that were removed or disconnected during diagnosis. Road test the vehicle in order to confirm proper operation. Refer to <u>Brake System Vehicle Road Test</u>. 		
	Is the condition still present?	Go to Step 2	System OK

BRAKE PEDAL EXCESSIVE TRAVEL

Brake Pedal Excessive Travel

Step	Action	Yes	No
DEFINITION: Brake pedal travels further than expected to obtain firm pedal and/or firm pedal cannot be obtained, pedal fades away, or pedal is spongy.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to <u>Diagnostic Starting Point - Vehicle</u>
2	<p>Inspect the travel and feel of brake pedal applies. Perform the following:</p> <ol style="list-style-type: none"> Apply the brake pedal several times to fully deplete the power reserve. With power reserve depleted, apply the brake pedal with light, steady pressure and hold for 15 seconds. Observe pedal travel and feel. Apply the brake pedal with light, steady pressure, then without pumping the pedal, reduce pressure and reapply pressure several times. Observe pedal travel and feel for each apply. Apply the brake pedal slowly, then release and apply the pedal quickly. Observe pedal travel and feel for each apply. 		-

	Did you complete the brake pedal travel and feel inspections?	Go to Step 3	
3	<ol style="list-style-type: none"> Inspect the hydraulic brake system for the conditions listed, based on the following symptoms observed during the pedal travel and feel inspections: <ul style="list-style-type: none"> Pedal feel was spongy <ul style="list-style-type: none"> Air in hydraulic system External brake fluid leaks Soft, weak or damaged hydraulic hoses; expanding under pressure Pedal fell away and/or traveled to or almost to floor <ul style="list-style-type: none"> External brake fluid leaks Poor brake fluid quality; low boiling point Internal brake fluid leaks; improperly functioning master cylinder Pedal was somewhat firm then dropped slightly, or pedal rose with successive applies, or pedal travel was different between slow and quick applies <ul style="list-style-type: none"> Internal brake fluid leaks; improperly functioning master cylinder Poor brake fluid quality; low boiling point Pedal returned to rest slowly after any of the applies <ul style="list-style-type: none"> Internally damaged flexible brake hoses; hindering fluid return Binding caliper pistons Internal brake fluid leaks; improperly functioning master cylinder Repair or replace components as necessary. Refer to <u>Hydraulic Brake System Diagnosis</u>. Re-inspect brake pedal apply travel and feel. 		
	Did you find and correct a condition?	Go to Step 8	Go to Step 4
	<ol style="list-style-type: none"> Inspect the disc brake system for the following conditions: <ul style="list-style-type: none"> Cracked, excessively worn or damaged linings 		

4	<ul style="list-style-type: none"> • Cracked, excessively worn or damaged rotors • Improperly operating, binding or damaged caliper hardware and/or lining hardware • Loose or missing caliper hardware and/or lining hardware • Excessive assembled lateral runout (LRO) of rotor friction surfaces • Bent or damaged caliper or mounting component <p>2. Adjust, repair or replace components as necessary. Refer to <u>Disc Brake System Diagnosis</u>.</p> <p>3. Re-inspect brake pedal apply travel and feel.</p> <p>Did you find and correct a condition?</p>	Go to Step 8	Go to Step 5
5	<p>Inspect for proper brake pedal travel. Refer to <u>Brake Pedal Travel Measurement and Inspection</u>.</p> <p>Is the brake pedal travel distance within the acceptable limits?</p>	Go to Step 7	Go to Step 6
6	<ol style="list-style-type: none"> 1. Inspect for worn, missing, misaligned, bent or damaged brake pedal system components. 2. Inspect the brake pedal bushings for binding, excessive wear and/or damage and inspect the brake pedal for a misaligned, bent, and/or damaged condition. 3. Replace the brake pedal system components that are worn, missing, misaligned, bent or damaged. <p>Did you find and replace any worn, missing, misaligned, bent or damaged brake pedal system components?</p>	Go to Step 8	Go to Step 7
7	<ol style="list-style-type: none"> 1. Inspect the brake assist system for the following conditions: <ul style="list-style-type: none"> • Vacuum leaks and/or improperly operating check valve, if equipped with vacuum assist • Damaged or improperly operating brake booster assembly 2. Adjust, repair or replace components as necessary. <p>Did you find and correct a condition?</p>	Go to Step 8	Go to <u>Diagnostic Starting Point - Vehicle</u>
8	<ol style="list-style-type: none"> 1. Install or connect components that were removed or disconnected during diagnosis. 2. Road test the vehicle in order to confirm proper operation. Refer to <u>Brake System Vehicle Road</u> 		

<u>Test.</u>		
Is the condition still present?	Go to Step 2	System OK

BRAKE PEDAL EXCESSIVE EFFORT

Brake Pedal Excessive Effort

Step	Action	Yes	No
DEFINITION: Brake pedal requires an increased amount of input from the driver to obtain good braking action and/or stopping distance is increased.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to <u>Diagnostic Starting Point - Vehicle</u>
2	<ol style="list-style-type: none"> Inspect the brake assist system for the following conditions: <ul style="list-style-type: none"> Vacuum leaks, if equipped with vacuum power assist Lack of lubrication, binding or excessively worn pushrod or pedal pivots or pivot bushings Bent or damaged pedal pushrod, pedal, or pedal bracket Damaged or improperly operating brake booster assembly Adjust, repair or replace components as necessary. <p>Did you find and correct a condition?</p>	Go to Step 5	Go to Step 3
3	<ol style="list-style-type: none"> Inspect the hydraulic brake system for the following conditions: <ul style="list-style-type: none"> Binding caliper pistons Internally damaged flexible brake hoses; hindering fluid flow Kinked or damaged flexible brake hoses and/or pipes Internal brake fluid leaks; improperly operating master cylinder Poor brake fluid quality; low boiling point Adjust, repair or replace components as necessary. Refer to <u>Hydraulic Brake System Diagnosis</u>. <p>Did you find and correct a condition?</p>	Go to Step 5	Go to Step 4

4	<ol style="list-style-type: none"> Inspect the disc brake system for the following conditions: <ul style="list-style-type: none"> Excessively worn linings Glazed linings Cracked, distorted or damaged linings Contaminated linings Binding, damaged or excessively worn caliper hardware and/or lining hardware Lack of lubrication or excessive corrosion on metal to metal contact surfaces Excessively worn or corroded rotor friction surfaces Glazed rotor friction surfaces Hard spots, heat checks, blueing discoloration of rotor friction surfaces Adjust, repair or replace components as necessary. Refer to <u>Disc Brake System Diagnosis</u>. <p>Did you find and correct a condition?</p>	Go to Step 5	Go to <u>Diagnostic Starting Point - Vehicle</u>
5	<ol style="list-style-type: none"> Install or connect components that were removed or disconnected during diagnosis. Road test the vehicle in order to confirm proper operation. Refer to <u>Brake System Vehicle Road Test</u>. <p>Is the condition still present?</p>	Go to Step 2	System OK

BRAKES DRAG

Brakes Drag

Step	Action	Yes	No
DEFINITION: Brake system does not fully release or has delayed release; vehicle motion may be hindered by brake system without applying brakes.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to <u>Diagnostic Starting Point - Vehicle</u>
2	Is the vehicle equipped with an adjustable stop lamp switch and/or an adjustable cruise control release switch?	Go to Step 3	Go to Step 7
	<ol style="list-style-type: none"> Inspect the stop lamp switch for proper adjustment to ensure that the brake pedal is fully releasing. 		

3	<p>2. Inspect the cruise control release switch, if equipped, for proper adjustment to ensure that the brake pedal is fully releasing.</p> <p>Did you find and correct a condition?</p>	Go to Step 11	Go to Step 7
4	<p>Inspect the park brake system for proper operation.</p> <p>Did you find and correct a condition?</p>	Go to Step 11	Go to Step 5
5	<p>1. Inspect the disc brake system for the following conditions:</p> <ul style="list-style-type: none"> • Binding, incorrectly installed or missing caliper hardware and/or lining hardware- Ensure free movement of linings and of caliper, if equipped with sliding type caliper • Lack of lubrication or excessive corrosion on metal to metal contact surfaces • Distorted or damaged linings • Damaged or excessively worn caliper hardware and/or lining hardware • Bent or damaged caliper or mounting component <p>2. Adjust, repair or replace components as necessary. Refer to <u>Disc Brake System Diagnosis</u>.</p> <p>Did you find and correct a condition?</p>	Go to Step 11	Go to Step 6
6	<p>1. Separate the brake booster pushrod from the brake pedal.</p> <p>2. Inspect the brake corners to determine if the brake drag condition is still present.</p> <p>Do the brake corners still exhibit the brake drag condition?</p>	Go to Step 8	Go to Step 7
7	<p>1. Inspect the pushrod for improper positioning and/or damage. Correctly position or replace the pushrod if necessary.</p> <p>2. Inspect the brake pedal assembly for damage and replace if necessary.</p> <p>Did you complete the repair or replacement?</p>	Go to Step 11	-
	<p>1. For vacuum boost systems, disconnect the vacuum check valve from the booster to relieve vacuum reserve.</p> <p>2. Separate the master cylinder from the brake</p>		

8	<p>booster. Do not disconnect any brake pipes.</p> <p>3. Inspect the brake corners to determine if the brake drag condition is still present.</p> <p>Do the brake corners still exhibit the brake drag condition?</p>	Go to Step 10	Go to Step 9
9	<p>Replace the brake booster assembly.</p> <p>Did you complete the replacement?</p>	Go to Step 11	-
10	<p>1. Inspect the hydraulic brake system for the following conditions.</p> <ul style="list-style-type: none"> • Improper operation of caliper pistons • Contaminated brake fluid • Internally damaged flexible brake hoses; hindering brake release • Damaged or improperly operating master cylinder <p>2. Adjust, repair or replace components as necessary. Refer to <u>Hydraulic Brake System Diagnosis</u>.</p> <p>Did you find and correct a condition?</p>	Go to Step 11	Go to <u>Diagnostic Starting Point - Vehicle</u>
11	<p>1. Install or connect components that were removed or disconnected during diagnosis.</p> <p>2. Road test the vehicle in order to confirm proper operation. Refer to <u>Brake System Vehicle Road Test</u>.</p> <p>Is the condition still present?</p>	Go to Step 2	System OK

BRAKE SYSTEM SLOW RELEASE

Brake System Slow Release

Step	Action	Yes	No
DEFINITION: Brake system releases and returns to rest slowly; vehicle motion is hindered by brake system briefly after release of brake pedal.			
1	<p>Were you sent here from the Hydraulic Brake Symptom table?</p>	Go to Step 2	Go to <u>Diagnostic Starting Point - Vehicle</u>
	<p>1. Inspect the hydraulic brake system for the following conditions:</p> <ul style="list-style-type: none"> • Improper operation of caliper pistons • Internally damaged flexible brake hoses; hindering brake release 		

2	<ul style="list-style-type: none"> • Contaminated brake fluid • Damaged or improperly operating master cylinder <p>2. Adjust, repair or replace components as necessary. Refer to <u>Hydraulic Brake System Diagnosis</u>.</p> <p>Did you find and correct a condition?</p>	Go to Step 5	Go to Step 3
3	<p>1. Inspect the brake assist system for the following conditions:</p> <ul style="list-style-type: none"> • Binding, bent or damaged pedal pushrod, pedal, or pedal bracket • Damaged or improperly operating vacuum booster, if equipped • Damaged or improperly operating hydraulic booster, if equipped <p>2. Adjust, repair or replace components as necessary.</p> <p>Did you find and correct a condition?</p>	Go to Step 5	Go to Step 4
4	<p>1. Inspect the disc brake system for the following conditions:</p> <ul style="list-style-type: none"> • Damaged or excessively worn caliper hardware and/or lining hardware • Distorted or damaged linings • Lack of lubrication or excessive corrosion on metal to metal contact surfaces • Bent or damaged caliper or mounting component <p>2. Adjust, repair or replace components as necessary. Refer to <u>Disc Brake System Diagnosis</u>.</p> <p>Did you find and correct a condition?</p>	Go to Step 5	Go to Diagnostic Starting Point - Vehicle
5	<p>1. Install or connect components that were removed or disconnected during diagnosis.</p> <p>2. Road test the vehicle in order to confirm proper operation. Refer to <u>Brake System Vehicle Road Test</u>.</p> <p>Is the condition still present?</p>	Go to Step 2	System OK

BRAKE FLUID LOSS

Brake Fluid Loss

Step	Action	Yes	No
DEFINITION: Brake fluid level is low not related to lining wear.			
1	Were you sent here from the Hydraulic Brake Symptom table?	Go to Step 2	Go to <u>Diagnostic Starting Point - Vehicle</u>
2	<ol style="list-style-type: none"> Inspect the following hydraulic brake system components for brake fluid leaks: <ul style="list-style-type: none"> Flexible brake hose connections; threaded and bolted Flexible brake hose crimp joints Brake pipe fittings Caliper piston seals Master cylinder reservoir Master cylinder reservoir low pressure hose, if equipped Repair or replace components as necessary. Refer to <u>Hydraulic Brake System Diagnosis</u>. <p>Did you find and correct a condition?</p>	Go to Step 6	Go to Step 3
3	Is the vehicle equipped with a vacuum brake booster?	Go to Step 4	Go to Step 6
4	<ol style="list-style-type: none"> Disconnect the vacuum check valve from the booster to relieve vacuum reserve. Separate the master cylinder from the vacuum brake booster. Do not disconnect any brake pipes. Inspect the rear of the master cylinder for a brake fluid leak. Inspect for brake fluid in the vacuum brake booster. <p>Did you find a brake fluid leak?</p>	Go to Step 5	Go to <u>Diagnostic Starting Point - Vehicle</u>
5	<p>Replace the brake master cylinder and the vacuum brake booster.</p> <p>Did you complete the replacement?</p>	Go to Step 6	-
6	<ol style="list-style-type: none"> Install or connect components that were removed or disconnected during diagnosis. Road test the vehicle to confirm proper operation. Refer to <u>Brake System Vehicle Road Test</u>. <p>Is the condition still present?</p>	Go to Step 2	System OK

DISC BRAKE SYSTEM DIAGNOSIS

Test Description

The numbers below refer to the step numbers on the diagnostic table:

9

Lubricant leaks from non-brake system components may come in contact with and contaminate brake system components.

10

Lubricant leaks from non-brake system components may come in contact with and contaminate brake system components.

12

Disc brake rotor shields/backing plates that come in contact with disc brake rotors may cause brake system noise.

15

Disc brake rotor thickness variation that exceeds the maximum acceptable level can cause brake pulsation.

19

Disc brake rotor thickness variation that exceeds the maximum acceptable level can cause brake pulsation.

22

Disc brake rotor assembled lateral runout (LRO) that exceeds the maximum acceptable level can lead to thickness variation.

Disc Brake System Diagnosis

Step	Action	Yes	No
DEFINITION: This diagnostic table is designed to diagnose ONLY the components of the DISC brake system in order to determine if the DISC brake system is operating properly. You will be directed by the appropriate Symptom table to go to other brake system diagnostic tables as appropriate.			
1	Were you sent here from a Brake Symptom table?	Go to Step 2	Go to <u>Diagnostic Starting Point - Vehicle</u>
	Visually inspect the disc brake pads for the following conditions: Refer to <u>Brake Pad Inspection</u> . <ul style="list-style-type: none">• Lining thickness below specifications		

2	<ul style="list-style-type: none"> • Uneven and/or abnormal wear - edge-to-edge and/or side-to-side • Looseness or damage - including pad hardware • Evidence of contamination from an external substance <p>Did you find any conditions to indicate a concern with any of the front and/or rear disc brake pads?</p>	Go to Step 3	Go to Step 12
3	Are any of the front and/or rear disc brake pads contaminated?	Go to Step 8	Go to Step 4
4	Are any of the front and/or rear disc brake pads worn unevenly?	Go to Step 7	Go to Step 5
5	Are any of the front and/or rear disc brake pads and/or pad hardware loose or damaged?	Go to Step 7	Go to Step 6
6	<ol style="list-style-type: none"> 1. Remove and inspect the worn disc brake pads for glazing, looseness, heat spots or damage. 2. Replace the worn disc brake pads as a complete axle set. Refer to <u>Front Disc Brake Pads Replacement (J60, J61)</u> , <u>Front Disc Brake Pads Replacement (J64)</u> , and/or <u>Rear Disc Brake Pads Replacement</u> . <p>Did you complete the inspection and replacement?</p>	Go to Step 12	-
	<p>CAUTION:</p> <p>Support the brake caliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the caliper in this manner will cause the flexible brake hose to bear the weight of the caliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.</p> <p>NOTE:</p> <p>Do NOT disconnect the hydraulic brake flex hoses from the calipers.</p> <ol style="list-style-type: none"> 1. Remove the front and/or rear disc brake calipers, as appropriate, from the mounting brackets or from the suspension knuckles and support the calipers. Refer to <u>Front Brake Caliper Replacement (J60, J61)</u> , <u>Front Brake Caliper Replacement (J64)</u> , and/or <u>Rear Brake Caliper Replacement</u> . 		

7	<p>2. Inspect the disc brake caliper mounting bracket and the mounting/sliding hardware for the following conditions:</p> <p>Refer to <u>Front Disc Brake Mounting and Hardware Inspection</u> , and/or <u>Rear Disc Brake Mounting and Hardware Inspection</u> .</p> <ul style="list-style-type: none"> • Binding or seized hardware • Worn, damaged or missing hardware components • Loose, bent, cracked, or damaged caliper mounting bracket <p>3. Replace components as required. Refer to the following procedures, as required:</p> <ul style="list-style-type: none"> • <u>Front Brake Caliper Bracket Replacement</u> • <u>Rear Brake Caliper Bracket Replacement</u> <p>4. Replace the unevenly-worn, loose or damaged disc brake pads as a complete axle set. Refer to <u>Front Disc Brake Pads Replacement (J60, J61)</u> , <u>Front Disc Brake Pads Replacement (J64)</u> , and/or <u>Rear Disc Brake Pads Replacement</u> .</p> <p>Did you complete the inspection and replacement?</p>		-
8	<p>1. Inspect the disc brake calipers, brake hoses and brake pipes for evidence of an external brake fluid leak.</p> <p>2. Replace any components found to be leaking brake fluid. Refer to the following procedures as required:</p> <ul style="list-style-type: none"> • <u>Front Brake Caliper Replacement (J60, J61)</u> , <u>Front Brake Caliper Replacement (J64)</u> • <u>Rear Brake Caliper Replacement</u> • <u>Front Brake Hose Replacement (J60, J61)</u>, <u>Front Brake Hose Replacement (J64)</u> • <u>Rear Brake Hose Replacement</u> • <u>Brake Pipe Replacement</u> <p>Did you find and correct the source of the leak causing</p>		

	contamination of the pads?	Go to Step 11	Go to Step 9
9	<ol style="list-style-type: none"> 1. Inspect the wheel drive shaft outer seals for damage and evidence of a grease leak. 2. Replace any wheel drive shaft seal that is found to be leaking grease which may be the source of the contamination to the pads. <p>Did you find and correct the source of the leak causing contamination of the pads?</p>	Go to Step 11	Go to Step 10
10	<ol style="list-style-type: none"> 1. Inspect the automatic transmission cooling system lines, if equipped, for damage and evidence of an external fluid leak which may be the source of the contamination to the pads. 2. Inspect the power steering system hoses for damage and evidence of an external fluid leak which may be the source of the contamination to the pads. 3. Replace any components found to be leaking fluid which may be the source of the contamination to the pads. <p>Did you find and correct the source of the leak causing contamination of the pads?</p>	Go to Step 11	-
	<ol style="list-style-type: none"> 1. Clean the remaining disc brake system components to remove any traces of the contaminant. <p>CAUTION: Support the brake caliper with heavy mechanic wire, or equivalent, whenever it is separated from its mount and the hydraulic flexible brake hose is still connected. Failure to support the caliper in this manner will cause the flexible brake hose to bear the weight of the caliper, which may cause damage to the brake hose and in turn may cause a brake fluid leak.</p> <p>NOTE: Do NOT disconnect the hydraulic brake flex hoses from the calipers.</p> <ol style="list-style-type: none"> 2. Remove the front and/or rear disc brake calipers, as appropriate, from the mounting brackets and support the calipers. Refer to <u>Front Brake Caliper Replacement (J60, J61)</u> , <u>Front Brake</u> 		

11	<p><u>Caliper Replacement (J64)</u> , and/or <u>Rear Brake Caliper Replacement</u> .</p> <p>3. Inspect the disc brake caliper mounting/sliding hardware for the following conditions:</p> <p><u>Front Disc Brake Mounting and Hardware Inspection</u> , and/or <u>Rear Disc Brake Mounting and Hardware Inspection</u> .</p> <ul style="list-style-type: none"> • Binding or seized hardware • Distorted, worn, damaged or missing hardware components <p>4. Replace the caliper mounting/sliding hardware components as required.</p> <p>5. Replace the contaminated disc brake pads as a complete axle set. Refer to <u>Front Disc Brake Pads Replacement (J60, J61)</u> , <u>Front Disc Brake Pads Replacement (J64)</u> , and/or <u>Rear Disc Brake Pads Replacement</u> .</p> <p>Did you complete the cleaning, inspection and replacement?</p>	Go to Step 12	-
12	<p>Visually inspect each of the rear disc brake rotor shields/backing plates, if equipped, for evidence of contact with the brake rotors.</p> <p>Are any of the brake rotor shields/backing plates contacting the brake rotors?</p>	Go to Step 13	Go to Step 14
13	<p>Repair or replace the disc brake rotor shields/backing plates as required. Refer to <u>Front Brake Shield Replacement</u> , or <u>Rear Brake Shield Replacement</u> .</p> <p>Did you complete the repair or replacement?</p>	Go to Step 14	-
14	<p>1. Check the thickness of each of the disc brake rotors.</p> <p>NOTE: Make the following determination AND ANSWER the question INDIVIDUALLY for EACH rotor.</p> <p>2. Make a determination for each brake rotor if the rotor can be REFINISHED and REMAIN ABOVE the minimum requirements.</p> <p>Refer to <u>Brake Rotor Thickness Measurement</u> .Does the disc brake rotor meet the minimum requirements for REFINISHING?</p>	Go to Step 15	Go to Step 18

15	<p>NOTE: Perform the following inspection AND ANSWER the question INDIVIDUALLY for EACH rotor.</p> <p>Inspect each of the disc brake rotors for thickness variation that exceeds the maximum acceptable level. Refer to <u>Brake Rotor Thickness Variation Measurement</u> .Does the brake rotor exhibit thickness variation that exceeds the maximum acceptable level?</p>	Go to Step 17	Go to Step 16
16	<p>1. Inspect each of the disc brake rotors for the following surface and wear conditions:</p> <p>Refer to <u>Brake Rotor Surface and Wear Inspection</u> .</p> <ul style="list-style-type: none"> • Heavy rust and/or pitting • Cracks and/or heat spots • Excessive blueing discoloration • Deep or excessive scoring beyond maximum acceptable level <p>NOTE: Make the following determination AND ANSWER the question INDIVIDUALLY for EACH rotor.</p> <p>2. Make a determination for each brake rotor if the rotor requires refinishing based upon the results of the inspection.</p> <p>If the brake rotor exhibits any of the conditions listed previously, it requires refinishing.</p> <p>Does the brake rotor require REFINISHING?</p>	Go to Step 17	Go to Step 22
17	<p>1. Refinish the brake rotor. Refer to <u>Brake Rotor Refinishing</u> .</p> <p>2. Inspect the brake rotor thickness. Refer to <u>Brake Rotor Thickness Measurement</u> .</p> <p>Were you able to REFINISH the brake rotor within the minimum requirements?</p>	Go to Step 22	Go to Step 21
18	Is the brake rotor at or below the DISCARD requirements?	Go to Step 21	Go to Step 19
	NOTE:		

19	<p>Perform the following inspection AND ANSWER the question INDIVIDUALLY for EACH rotor.</p> <p>Inspect each of the disc brake rotors for thickness variation that exceeds the maximum acceptable level. Refer to <u>Brake Rotor Thickness Variation Measurement</u> .Does the brake rotor exhibit thickness variation that exceeds the maximum acceptable level?</p>	Go to Step 21	Go to Step 20
20	<p>1. Inspect each of the disc brake rotors for the following surface and wear conditions:</p> <p>Refer to <u>Brake Rotor Surface and Wear Inspection</u> .</p> <ul style="list-style-type: none"> • Heavy rust and/or pitting • Cracks and/or heat spots • Excessive blueing discoloration • Deep or excessive scoring beyond maximum acceptable level <p>NOTE: Make the following determination AND ANSWER the question INDIVIDUALLY for EACH rotor.</p> <p>2. Make a determination for each brake rotor if the rotor requires replacement based upon the results of the inspection.</p> <p>If the brake rotor exhibits any of the conditions listed previously, it requires replacement.</p> <p>Does the brake rotor require REPLACEMENT?</p>	Go to Step 21	Go to Step 22
21	<p>NOTE: Whenever a brake rotor is replaced, the assembled lateral runout (LRO) of the rotor must be measured to ensure optimum performance of the disc brakes.</p> <p>Replace the brake rotor. Refer to <u>Front Brake Rotor Replacement (J60, J61)</u> , <u>Front Brake Rotor Replacement (J64)</u> , or <u>Rear Brake Rotor Replacement</u> .Did you complete the replacement?</p>	Go to Step 24	-
	<p>NOTE: Perform the following inspection AND ANSWER the question INDIVIDUALLY for EACH rotor.</p>		

22	Inspect each of the disc brake rotors for assembled LRO that exceeds the maximum acceptable level. Refer to <u>Brake Rotor Assembled Lateral Runout Measurement</u> .Does the brake rotor exhibit assembled LRO that exceeds the maximum acceptable level?	Go to Step 23	Go to Step 24
23	Correct the LRO for each brake rotor that was determined to have LRO exceeding the maximum acceptable level. Refer to <u>Brake Rotor Assembled Lateral Runout Measurement</u> . Did you complete the operation?	Go to Step 24	-
24	Install or connect components that were removed or disconnected during diagnosis. Did you complete the operation?	Disc Brake System OK Return to Symptom Table	-

HYDRAULIC BRAKE SYSTEM DIAGNOSIS

Hydraulic Brake System Diagnosis

Step	Action	Yes	No
DEFINITION: This diagnostic table is designed to diagnose ONLY the components of the hydraulic brake system in order to determine if the hydraulic brake system is operating properly. You will be directed by the appropriate Symptom table to go to other brake system diagnostic tables as appropriate.			
1	Were you sent here from a Brake Symptom table?	Go to Step 2	Go to <u>Diagnostic Starting Point - Vehicle</u>
2	Inspect and adjust the brake fluid level in the brake master cylinder. Was the brake fluid level low?	Go to Step 3	Go to Step 4
3	<ol style="list-style-type: none"> Inspect the brake fluid for the following conditions, indicating brake fluid contamination: <ul style="list-style-type: none"> Fluid separation, indicating 2 types of fluid are present <ul style="list-style-type: none"> Swirled appearance-Oil-based substance Layered appearance-Silicone-based substance Fluid discoloration <ul style="list-style-type: none"> Cloudy appearance-Moisture Dark appearance/suspended particles in fluid-Dirt, rust, corrosion, brake dust Inspect the master cylinder reservoir cap diaphragm and the reservoir-to-master cylinder grommets for swelling, indicating fluid contamination. <p>Do any of the above conditions exist?</p>	Go to Step 5	Go to Step 6

4	<ol style="list-style-type: none"> 1. Inspect the brake fluid for the following conditions, indicating brake fluid contamination: <ul style="list-style-type: none"> • Fluid separation, indicating 2 types of fluid are present <ul style="list-style-type: none"> ○ Swirled appearance- Oil-based substance ○ Layered appearance -Silicone-based substance • Fluid discoloration <ul style="list-style-type: none"> ○ Cloudy appearance-Moisture ○ Dark appearance/suspended particles in fluid-Dirt, rust, corrosion, brake dust 2. Inspect the master cylinder reservoir cap diaphragm and the reservoir-to-master cylinder grommets for swelling, indicating fluid contamination. <p>Do any of the above conditions exist?</p>	Go to Step 5	Go to Step 12
5	<ol style="list-style-type: none"> 1. Flush the hydraulic brake system. 2. If the brake fluid WAS contaminated with an oil-based or a silicone-based fluid, indicated by fluid separation and/or a swollen master cylinder reservoir cap diaphragm and/or swollen reservoir-to-master cylinder grommets, perform the following steps. Refer to the procedures indicated. <ol style="list-style-type: none"> 1. Remove ALL of the following components listed. Each component contains internal rubber seals/linings which have been contaminated. 2. Clean out the hydraulic brake pipes using denatured alcohol, or equivalent. 3. Dry the brake pipes using non-lubricated, filtered air. 4. Repair or replace ALL of the following components listed. Each component contains internal rubber seals/linings which have been contaminated. <ul style="list-style-type: none"> • <u>Master Cylinder Replacement (LEA, LUK) or Master Cylinder Replacement (LTG)</u> • <u>Master Cylinder Reservoir Replacement</u> • Replace the brake master cylinder reservoir cap diaphragm. 		-

	<ul style="list-style-type: none"> • <u>Front Brake Hose Replacement (J60, J61), Front Brake Hose Replacement (J64)</u> • <u>Rear Brake Hose Replacement</u> • Inspect front caliper. • Inspect rear caliper. <p>3. If the brake fluid was NOT contaminated with an oil-based fluid, but WAS contaminated with water or dirt, rust, corrosion, and/or brake dust, replace the brake master cylinder reservoir cap diaphragm which may have allowed moisture or dirt to enter the system.</p> <p>4. Refill and bleed the hydraulic brake system. Refer to <u>Hydraulic Brake System Bleeding (Manual), Hydraulic Brake System Bleeding (Pressure)</u>.</p> <p>Did you complete the operation and any required repairs and/or replacements?</p>		
6	<p>1. Inspect the following hydraulic brake system components for external fluid leaks Repair or replace any of the components found to be leaking brake fluid. Refer to the appropriate procedures:</p> <ul style="list-style-type: none"> • <u>Master Cylinder Replacement (LEA, LUK) or Master Cylinder Replacement (LTG)</u> • Brake master cylinder reservoir cap diaphragm • <u>Front Brake Hose Replacement (J60, J61), Front Brake Hose Replacement (J64)</u> • <u>Rear Brake Hose Replacement</u> • <u>Brake Pipe Replacement</u> • Inspect front caliper. • Inspect rear calliper. <p>2. If you repaired or replaced any of the brake system components listed, bleed the hydraulic brake system. Refer to <u>Hydraulic Brake System Bleeding (Manual), Hydraulic Brake System Bleeding (Pressure)</u>. While bleeding the hydraulic brake system, observe for the following conditions:</p> <ul style="list-style-type: none"> • The presence of air in the system at a bleeder valve location other than at the repair location, except if the brake master cylinder was replaced • An unrestricted and even flow of brake fluid per axle during the bleeding procedure 		

Go to **Step 9**

	Did you find and correct a condition?	Go to Step 7	Go to Step 12
7	Was there air in the system at a bleeder valve location other than at the repair location, except if the brake master cylinder was replaced?	Go to Step 18	Go to Step 8
8	Was the flow of brake fluid unrestricted and even per axle during the bleeding procedure?	Go to Step 9	Go to Step 10
9	Inspect the hydraulic function of the brake calipers for proper operation. Refer to <u>Hydraulic Brake Component Operation Visual Inspection</u> . Was the hydraulic function of the brake calipers operating properly?	Go to Step 20	Go to Step 14
10	Was the flow of brake fluid restricted or uneven through front axle hydraulic components during the bleeding procedure?	Go to Step 13	Go to Step 11
11	Was the flow of brake fluid restricted or uneven through rear axle hydraulic components during the bleeding procedure?	Go to Step 17	-
12	Inspect the hydraulic function of the brake calipers for proper operation. Refer to <u>Hydraulic Brake Component Operation Visual Inspection</u> . Was the hydraulic function of the brake calipers operating properly?	Go to Step 15	Go to Step 13
13	Determine if the brake caliper is restricting the flow of brake fluid and/or not operating properly: <ol style="list-style-type: none"> 1. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Remove the tire and wheel assemblies. Refer to <u>Tire and Wheel Removal and Installation</u> . 3. Open the suspected caliper bleeder valve. 4. Using a large C-clamp, compress the caliper piston and observe for an unrestricted flow of brake fluid and for free movement of the caliper piston. 5. Close the caliper bleeder valve. Was the flow of brake fluid unrestricted and did the caliper piston move freely?	Go to Step 17	Go to Step 14
14	Repair or replace any brake caliper that was not operating properly. Refer to the appropriate procedure. <ul style="list-style-type: none"> • <u>Front Brake Caliper Replacement (J60, J61)</u> , <u>Front Brake Caliper Replacement (J64)</u> • <u>Rear Brake Caliper Replacement</u> 		-

	Did you complete the repair and/or replacement?	Go to Step 20	
15	Bleed the hydraulic brake system to observe for the presence of air in the system and to observe for an unrestricted and even flow of brake fluid per axle during the bleeding procedure. Refer to <u>Hydraulic Brake System Bleeding (Manual)</u> , <u>Hydraulic Brake System Bleeding (Pressure)</u> . Was there air in the system?	Go to Step 18	Go to Step 16
16	Was the flow of brake fluid unrestricted and even per axle during the bleeding procedure?	Go to Step 20	Go to Step 17
17	<ol style="list-style-type: none"> 1. Inspect the hydraulic brake pipes and flexible brake hoses for signs of a fluid restriction; such as being bent, kinked, pinched or damaged. Refer to <u>Brake Pipe and Hose Inspection</u>. 2. Replace any of the hydraulic brake pipes and/or flexible brake hoses found to be bent, kinked, pinched, or damaged. Refer to the following procedures as necessary: <ul style="list-style-type: none"> • <u>Front Brake Hose Replacement (J60, J61)</u>, <u>Front Brake Hose Replacement (J64)</u> • <u>Rear Brake Hose Replacement</u> • <u>Brake Pipe Replacement</u> 3. If none of the hydraulic brake pipes or flexible brake hoses were visibly bent, kinked, pinched, or damaged, replace the hydraulic brake flex hose at the restricted location. Did you find and correct a condition?	Go to Step 20	Go to Step 18
18	<ol style="list-style-type: none"> 1. Inspect the hydraulic brake system components for brake fluid seepage at a seal and/or fitting location, which may have drawn air into the system. 2. Inspect the hydraulic brake system components for evidence of a recent repair, which may have introduced air into the system. 3. Repair or replace any of the components found to be installed incorrectly or seeping brake fluid. Did you find and correct a condition?	Go to Step 20	Go to Step 19
19	<ol style="list-style-type: none"> 1. Inspect the brake master cylinder for internal fluid leaks. Refer to <u>Brake System Internal Leak Test</u>. 2. Repair or replace the brake master cylinder if it is found to be leaking brake fluid internally. Refer to <u>Master Cylinder Replacement (LEA, LUK)</u> or 		

	<u>Master Cylinder Replacement (LTG).</u>		Return to Symptom Table
	Did you find and correct a condition?	Go to Step 20	
20	Install or connect components that were removed or disconnected during diagnosis. Did you complete the operation?	Hydraulic Brake System OK Return to Symptom Table	-

BRAKE ASSIST SYSTEM DIAGNOSIS

Brake Assist System Diagnosis

Step	Action	Yes	No
DEFINITION: This diagnostic table is designed to diagnose ONLY the components of the brake ASSIST system in order to determine if the brake ASSIST system is operating properly. You will be directed by the appropriate Symptom table to go to other brake system diagnostic tables as appropriate.			
1	Were you sent here from a Brake Symptom table?	Go to Step 3	Go to Step 2
2	Were you sent here directly from an electrical diagnostic to investigate vacuum as a possible concern?	Go to Step 5	Go to <u>Diagnostic Starting Point - Vehicle</u>
3	Inspect for proper brake pedal travel. Refer to <u>Brake Pedal Travel Measurement and Inspection.</u> Is the brake pedal travel distance within the acceptable limits?	Go to Step 5	Go to Step 4
4	1. Inspect for worn, missing, misaligned, bent or damaged brake pedal system components. <ul style="list-style-type: none"> Inspect the brake pedal for a misaligned, bent and/or damaged condition. Inspect the brake pedal bushings for excessive wear and/or damage. 2. Replace the brake pedal system components that are worn, missing, misaligned, bent or damaged. Did you find and replace any worn, missing, misaligned, bent or damaged brake pedal system components?	Go to Step 5	Go to <u>Hydraulic Brake System Diagnosis</u> to check for internal and external fluid leaks and air in the hydraulic brake system
5	Check the engine vacuum source that supplies vacuum to the vacuum brake booster. Refer to <u>Brake System Vacuum Source Test.</u> Is the vacuum reading within the acceptable limits?	Go to Step 6	Go to Engine Controls Diagnostics Information to check for vacuum issues, including vacuum pump operation, if equipped
6	Does the condition occur during cold start-up conditions?	Go to Step 7	Go to Step 8

7	Check engine vacuum, and vacuum pump operation, if equipped, under the same cold start-up conditions. Refer to Engine Controls Diagnostics. Did you find and correct a condition?	Go to Step 22	Go to Step 9
8	During the vacuum source test, did the vacuum booster check valve operate properly?	Go to Step 10	Go to Step 9
9	Replace the vacuum booster check valve. Refer to <u>Power Brake Booster Vacuum Sensor Replacement</u> , or <u>Power Brake Booster Vacuum Pipe Replacement (LUK)</u> , <u>Power Brake Booster Vacuum Pipe Replacement (LTG)</u> . Did you complete the replacement?	Go to Step 10	-
10	If equipped with a booster mounted separate vacuum sensor, inspect the vacuum sensor grommet for cracks, cuts, dry-rot, or damage. Does the vacuum sensor grommet exhibit any of the conditions listed?	Go to Step 11	Go to Step 12
11	Replace the vacuum sensor grommet. Did you complete the replacement?	Go to Step 12	-
12	<ol style="list-style-type: none"> 1. If the vehicle is equipped with a vacuum sensor, install a scan tool. 2. Using the Data Display function, determine if brake booster vacuum sensor data is available within either the chassis brake controls area or the powertrain engine controls area. <p>Is vacuum sensor data available through the scan tool?</p>	Go to Step 13	Go to Step 16
13	<p>Perform the vacuum booster leak-down test using a scan tool:</p> <ol style="list-style-type: none"> 1. Release the brake pedal. 2. Accelerate the engine to approximately 3000 RPM, then release the throttle. Wait 2-3 seconds and repeat once. 3. Turn the ignition OFF. 4. Turn the ignition ON. Do not start the engine. 5. Observe and record the vacuum sensor reading on the scan tool over a period of 60 seconds. <p>NOTE: Vacuum readings will decrease by approximately 2.7 kPa (0.8 Hg) for every 305 m (1000 ft) of elevation above sea level.</p>		

	<p>6. Determine the rate of vacuum leak.</p> <p>Specification</p> <p>Maximum allowable vacuum leak rate: 10 kPa (3 in Hg) in 60 seconds</p> <p>Was the rate of vacuum leak within the specified allowable range?</p>	Go to Step 18	Go to Step 14
14	<ol style="list-style-type: none"> 1. Deplete the vacuum reserve by pressing the brake pedal several times, or by removing the vacuum booster check valve. 2. Separate the master cylinder from the vacuum brake booster. Do not disconnect any brake pipes. Refer to <u>Master Cylinder Replacement (LEA, LUK)</u> or <u>Master Cylinder Replacement (LTG)</u>. 3. If equipped with a vacuum seal on the rear of the master cylinder, inspect the seal for damage and correct positioning on the master cylinder. Replace the vacuum seal as necessary. 4. Carefully reinstall the master cylinder to the brake booster. Refer to <u>Master Cylinder Replacement (LEA, LUK)</u> or <u>Master Cylinder Replacement (LTG)</u>. <p>Did you complete the operation?</p>	Go to Step 15	-
15	<p>Perform the vacuum booster leak-down test using a scan tool:</p> <ol style="list-style-type: none"> 1. Release the brake pedal. 2. Accelerate the engine to approximately 3000 RPM, then release the throttle. Wait 2-3 seconds and repeat once. 3. Turn the ignition OFF. 4. Turn the ignition ON. Do not start the engine. 5. Observe and record the vacuum sensor reading on the scan tool over a period of 60 seconds. <p>NOTE: Vacuum readings will decrease by approximately 2.7 kPa (0.8 Hg) for every 305 m (1000 ft) of elevation above sea level.</p>		

	<p>6. Determine the rate of vacuum leak.</p> <p>Specification</p> <p>Maximum allowable vacuum leak rate: 10 kPa (3 in Hg) in 60 seconds</p> <p>Was the rate of vacuum leak within the specified allowable range?</p>	Go to Step 22	Go to Step 21
16	<p>1. Separate the master cylinder from the vacuum brake booster. Do not disconnect any brake pipes. Before removing the master cylinder, first deplete the vacuum by removing the check valve or applying the brake pedal several times. Refer to <u>Master Cylinder Replacement (LEA, LUK)</u> or <u>Master Cylinder Replacement (LTG)</u>.</p> <p>2. If equipped with a vacuum seal on the rear of the master cylinder, inspect the seal for damage and correct positioning on the master cylinder.</p> <p>3. If equipped with a vacuum seal that is part of the booster, inspect the seal for damage.</p> <p>Does the vacuum seal exhibit any of the conditions listed?</p>	Go to Step 17	Go to Step 18
17	<p>1. If equipped with a vacuum seal on the rear of the master cylinder, replace the vacuum seal as necessary. Ensure the seal is positioned correctly during installation.</p> <p>2. If equipped with a vacuum seal that requires replacement and which is part of the booster, the booster assembly must be replaced.</p> <p>3. Carefully reinstall the master cylinder to the brake booster. Refer to <u>Master Cylinder Replacement (LEA, LUK)</u> or <u>Master Cylinder Replacement (LTG)</u>.</p> <p>Did you complete the replacement?</p>	Go to Step 18	-
	<p>Perform the vacuum boost functional test:</p> <p>1. If still separated, reinstall the master cylinder to the booster. Refer to <u>Master Cylinder Replacement (LEA, LUK)</u> or <u>Master Cylinder Replacement (LTG)</u>.</p>		

18	<p>2. If the engine was started after reinstalling the master cylinder to the booster, perform the following:</p> <p>With the engine OFF, depress the brake pedal several times to deplete the vacuum reserve.</p> <p>3. Depress and maintain moderate foot pressure on the brake pedal.</p> <p>4. Start the engine and observe pedal operation.</p> <p>5. Observe for audible vacuum leaks.</p> <p>The brake pedal should fall slightly, then hold.</p> <p>Is there an audible vacuum leak coming from the brake pedal area?</p>	Go to Step 21	Go to Step 19
19	<p>Did the brake pedal fall slightly after the engine was started, then hold?</p>	Go to Step 20	Go to Step 21
20	<p>Perform the vacuum booster leak-down test:</p> <ol style="list-style-type: none"> 1. Release the brake pedal. 2. Accelerate the engine to approximately 3000 RPM, then release the throttle. Wait 2-3 seconds and repeat once. 3. Turn the ignition OFF. 4. Wait 60 seconds. 5. Depress the brake pedal 2 times to check for vacuum booster available vacuum reserve. Observe pedal effort. <ul style="list-style-type: none"> • Both pedal applies should be assisted • The amount of assist could diminish slightly with the second apply <p>Were both pedal applies power assisted?</p>	Go to Step 22	Go to Step 21
21	<p>Replace the vacuum brake booster. Refer to <u>Power Vacuum Brake Booster Replacement</u>.</p> <p>Did you complete the replacement?</p>	Go to Step 22	-
22	<p>Install or connect any components that were removed or disconnected during diagnosis.</p> <p>Did you complete the operation?</p>	Brake Assist System OK Return to Symptom Table	-

BRAKE SYSTEM VEHICLE ROAD TEST

Preliminary Inspections

1. Visually inspect easily accessible brake system components for obvious damage and/or leaks which may indicate that the vehicle should not be driven until further inspections have been completed.
2. Inspect the brake master cylinder reservoir fluid level and adjust only if necessary for brake system road testing.
3. Inspect the tire inflation pressures and adjust as necessary.
4. Inspect the tire tread patterns to ensure that they are the same or very similar, especially per axle.
5. Ensure that the vehicle is not loaded unevenly prior to brake system road testing.

Road Testing Procedure

WARNING: Road test a vehicle under safe conditions and while obeying all traffic laws. Do not attempt any maneuvers that could jeopardize vehicle control. Failure to adhere to these precautions could lead to serious personal injury and vehicle damage.

1. Start the engine and allow it to idle.
2. Check to see if the brake system warning lamp remains illuminated.
3. If the brake system warning lamp remains illuminated, DO NOT proceed to test drive the vehicle until it is diagnosed and repaired. Refer to **Diagnostic Starting Point - Vehicle** .
4. Select a smooth, dry, clean and level road or large lot that is as free of traffic and obstacles as possible for brake system low speed road testing.
5. With the transmission in PARK, lightly apply the brake pedal. Observe both the pedal feel and the pedal travel.
6. If the brake pedal travel was excessive, DO NOT drive the vehicle until it is repaired.
7. If the brake pedal travel was not excessive, proceed to step 8.
8. Release and apply the brakes.
9. While continuing to apply the brakes, shift the transmission into DRIVE, release the brakes and allow the engine to idle the vehicle away from the stopped position. Observe for a slow release of the brake system.
10. With the aid of an assistant to observe the vehicle's performance from outside of the vehicle, drive the vehicle at a low speed and lightly apply the brakes while driving past the assistant. Have the assistant observe for brake system noise from the side of the vehicle closest to them, while you observe both the pedal effort and the pedal travel.
11. If the brake pedal apply effort was excessive, or the pedal travel was excessive, DO NOT continue to test drive the vehicle until it is repaired.
12. If the brake pedal apply effort was not excessive and the pedal travel was not excessive, proceed to step 13.
13. Drive the vehicle in the opposite direction, at the same low speed and lightly apply the brakes while driving past the assistant. Have the assistant observe for brake system noise from the side of the vehicle closest to him.

14. Drive the vehicle at a low speed and shift the transmission into NEUTRAL without applying the brakes. Observe for a rapid deceleration in vehicle speed, indicating possible brake drag.
15. Select a smooth, dry, clean and level road that is as free of heavy traffic as possible for brake system moderate speed road testing.
16. Drive the vehicle at a moderate speed. Observe for a pull and/or incorrect tracking of the vehicle without the brakes applied.
17. While continuing to drive the vehicle at a moderate speed, perform several light applies of the brakes. Observe the pedal effort and the pedal travel, observe for brake system noise, pulsation and/or brake drag.
18. If the brake pedal apply effort was excessive, or the pedal travel was excessive, DO NOT continue to test drive the vehicle until it is repaired.
19. If the brake pedal apply effort was not excessive and the pedal travel was not excessive, proceed to step 20.
20. While continuing to drive the vehicle at a moderate speed, perform several moderate applies of the brakes. Observe the pedal effort and the pedal travel, observe for brake system pulsation and/or uneven braking action - either side to side, or front to rear.

A small amount of vehicle front end dip is expected during a moderate apply of the brakes.

21. If the brake pedal apply effort was excessive, or the pedal travel was excessive, DO NOT continue to test drive the vehicle until it is repaired.

BRAKE PEDAL TRAVEL MEASUREMENT AND INSPECTION

Special Tools

CH-28662 Brake Pedal Effort Gauge

For equivalent regional tools, refer to **Special Tools**.

1. With the ignition OFF and the brakes cool, apply the brakes 3-5 times, or until the brake pedal becomes firm, in order to deplete the brake booster power reserve.
2. Install the **CH-28662** Brake Pedal Effort Gauge to the brake pedal.

Fig. 3: Measuring Brake Pedal Travel
Courtesy of GENERAL MOTORS COMPANY

3. Measure and record the distance (1) from the brake pedal to the rim of the steering wheel; note the points of measurement.
4. Apply and maintain the brakes with 450 N (101 lb) of force to the brake pedal, as indicated on the brake pedal effort gauge.
5. While maintaining 450 N (101 lb) of force to the brake pedal, measure and record the distance (2) from the same point on the brake pedal to the same point on the rim of the steering wheel.
6. Release the brakes and repeat steps 4 and 5 to obtain a second measurement. After obtaining a second measurement, proceed to step 7.
7. Average the first and second measurements recorded during the two applies of the brakes.
8. Subtract the initial measurement, unapplied (1), from the averaged, applied measurement (2) to obtain the brake pedal travel distance.

Specification

Maximum brake pedal travel (measured with the ignition OFF, brake booster power assist depleted, and the brakes cool): 48-58 mm (1.89-2.28 in).

BRAKE SYSTEM VACUUM SOURCE TEST

NOTE:

- Engine temperature, accessory load, and elevation level will affect engine vacuum.
- Vacuum readings will decrease by approximately 2.7 kPa (0.8 in Hg) for every 305 m (1000 ft) of elevation above sea level.

1. Disconnect the engine vacuum hose from the vacuum brake booster check valve or brake booster vacuum sensor, if equipped.
2. Install a vacuum gauge to the engine vacuum hose.
3. Start the engine and allow the engine to idle until normal operating temperatures are reached.
4. With the vehicle in PARK, the engine idling, and the air conditioning (A/C) system OFF, check to see if the engine vacuum reading is within the specified normal engine vacuum range.

Specification

- Engine Driven Mechanical Vacuum Pump: 90-95 kPa (27-28 in Hg)
 - Electric Vacuum Pump: 40-70 kPa (12-21 in Hg)
5. Turn the ignition OFF.
 6. If the engine vacuum reading is within the specified normal range, proceed to step 10.
 7. If the engine vacuum reading is NOT within the specified normal range, inspect the engine vacuum hose for the following conditions:
 - Loose connection to the engine
 - Collapse, deformation or contamination
 - Cracks, cuts, dry-rot
 8. If any of these conditions were found with the engine vacuum hose, replace the hose, then repeat steps 2-4.
 9. If none of these conditions were found with the engine vacuum hose, then there is an engine vacuum source problem, check the engine vacuum system.
 10. Remove the vacuum brake booster check valve or the brake booster vacuum sensor, if equipped, from the power vacuum brake booster.
 11. Install the check valve or brake booster vacuum sensor, if equipped, to the engine vacuum hose.
 12. Install the vacuum gauge to the check valve or brake booster vacuum sensor, if equipped.
 13. Start the engine and allow the engine to idle in PARK with the A/C system OFF, until normal operating temperatures are reached.
 14. Turn the ignition OFF.
 15. Ensure the engine vacuum reading is maintained within the specified normal engine vacuum range.

Specification

- Engine Driven Mechanical Vacuum Pump: 90-95 kPa (27-28 in Hg)
 - Electric Vacuum Pump: 40-70 kPa (12-21 in Hg)
16. If the engine vacuum reading is maintained within the specified normal range, proceed to step 18.

17. If the engine vacuum reading is NOT maintained within the specified normal range, replace the brake booster check valve or brake booster vacuum sensor, if equipped, then repeat steps 11-15.
18. Inspect the brake booster check valve grommet for the following conditions:
 - Loose connection to the vacuum brake booster
 - Deformation or contamination
 - Cracks, cuts, dry-rot
19. If any of these conditions were found with the check valve grommet, replace the grommet.

BRAKE SYSTEM EXTERNAL LEAK INSPECTION

WARNING: Refer to Brake Fluid Irritant Warning .

CAUTION: Refer to Brake Fluid Effects on Paint and Electrical Components Caution .

1. In order to inspect for external brake fluid leaks, first check the fluid level in the master cylinder.

While a slight brake fluid level drop can be considered a normal condition due to brake lining wear, a very low level may indicate a brake fluid leak in the hydraulic system.

2. If the fluid level is abnormally low, adjust the brake fluid level.
3. Start the engine and allow it to idle.
4. Apply constant, moderate foot pressure to the brake pedal.

If the brake pedal gradually falls away while under foot pressure, there may be a brake fluid leak.

5. Turn OFF the ignition.
6. Visually inspect the following brake system components for brake fluid leaks, excessive corrosion, and damage. Give particular attention to all brake pipe and flexible hose connections to ensure that there are not any slight brake fluid leaks - even though the brake pedal may feel firm and hold steady:
 - Master cylinder brake pipe fittings
 - All brake pipe connections
 - Brake pipes
 - Brake hoses and connections
 - Brake calipers and/or wheel cylinders, if equipped
7. While slight dampness around the master cylinder reservoir can be considered acceptable, brake fluid leaking from any of the brake system components requires immediate attention. If any of these components exhibit signs of brake fluid leakage, repair or replace those components. After the repair or replacement, reinspect the hydraulic brake system to assure proper function.

BRAKE SYSTEM INTERNAL LEAK TEST

WARNING: Refer to Brake Fluid Irritant Warning .

CAUTION: Refer to Brake Fluid Effects on Paint and Electrical Components Caution .

1. Start the engine and allow it to idle.
2. Apply light, steady pressure to the brake pedal. Observe both the brake pedal feel and travel.
3. Release the brakes and turn OFF the ignition.
4. If the brake pedal apply felt spongy, but the brake pedal travel was not excessive, perform the following steps:
 1. Inspect the brake system for external leaks. Refer to Brake System External Leak Inspection.
 2. Pressure bleed the brake system in order to purge any air that may be trapped in the system. Refer to Hydraulic Brake System Bleeding (Manual), Hydraulic Brake System Bleeding (Pressure).

Fig. 4: Identifying Brake Master Cylinder (Cross Sectional View)

Courtesy of GENERAL MOTORS COMPANY

5. If the brake pedal apply did not feel spongy, but the brake pedal travel was excessive, perform the following steps:
 1. Loosen the master cylinder-to-brake power booster mounting nuts.
 2. Carefully pull the master cylinder away from the brake power booster just enough to inspect the mounting surface of the master cylinder.
 3. Inspect the master cylinder mounting surface at the primary piston (2) for brake fluid leaks.
6. If the master cylinder exhibits any leakage around the primary piston (2), then the primary piston primary seal (4) and/or secondary seal (3) is leaking and the master cylinder requires overhaul or replacement.
7. If the master cylinder primary piston (2) does not exhibit any leakage, pressure bleed the brake system. Refer to **Hydraulic Brake System Bleeding (Manual)**, **Hydraulic Brake System Bleeding (Pressure)**.
8. If the brake pedal apply did not feel spongy, and the brake pedal travel was initially steady and not excessive, but then gradually fell, then the master cylinder requires overhaul or replacement due to an internal leak past the secondary piston (1) from the secondary piston primary seal (6) or secondary seal (5).

HYDRAULIC BRAKE COMPONENT OPERATION VISUAL INSPECTION

Fig. 5: Identifying Brake Caliper/Pad Inspection Areas
 Courtesy of GENERAL MOTORS COMPANY

WARNING: Refer to Brake Fluid Irritant Warning .

CAUTION: Refer to Brake Fluid Effects on Paint and Electrical Components Caution .

1. With the tire and wheel assemblies removed and the brake rotors retained by wheel lug nuts, visually inspect the caliper piston dust boot (2) sealing area to ensure that there are no brake fluid leaks.
2. If any evidence of a brake fluid leak is present, the brake caliper requires overhaul or replacement.
3. While the brake system is at rest (4), observe the position of the caliper piston (1) in relation to the caliper housing.
4. Have an assistant apply and release the brake pedal several times while you observe the operation of the hydraulic brake caliper.
 1. Observe the caliper piston (1) for unrestricted and even movement during each apply of the brake system (5).
 2. Observe the caliper piston (1) for an unrestricted and even return motion during each release of the brake system (6).
5. If the caliper piston (1) did not exhibit unrestricted and even movement during brake system apply and/or release, the piston square seal (3) may be worn or damaged and the caliper may require overhaul or replacement.

BRAKE PIPE AND HOSE INSPECTION

WARNING: Refer to Brake Fluid Irritant Warning .

CAUTION: Refer to Brake Fluid Effects on Paint and Electrical Components Caution .

1. Visually inspect all of the brake pipes for the following conditions:
 - Kinks, improper routing, missing or damaged retainers
 - Leaking fittings, excessive corrosion
2. If any of the brake pipes exhibited any of the conditions listed, then the identified pipe, or pipes, require replacement.
3. Ensure that the vehicle axles are properly supported at ride height in order to maintain the proper relationship of the flexible brake hoses to the chassis.

Fig. 6: Identifying Flexible Brake Hose Failure Conditions
Courtesy of GENERAL MOTORS COMPANY

4. Visually inspect all of the flexible brake hoses for the following conditions:
 - Kinks (1), improper routing, twists, chafing, missing or damaged retainers
 - Leaking connections, cracking, dry-rot, blisters, bulges
5. If any of the flexible brake hoses exhibited any of the conditions listed, then the identified flexible brake hose, or hoses require replacement.
6. Squeeze the flexible brake hoses with firm finger pressure to check for soft spots (2), indicating an internal restriction. Check the entire length of each flexible brake hose.
7. If any of the flexible brake hoses were found to have soft spots (2), then the identified flexible brake hose, or hoses require replacement.

REPAIR INSTRUCTIONS

MASTER CYLINDER RESERVOIR FILLING

WARNING: Refer to Brake Fluid Irritant Warning .

CAUTION: Refer to Brake Fluid Effects on Paint and Electrical Components Caution .

1. Visually inspect the brake fluid level through the brake master cylinder reservoir.
2. If the brake fluid level is at or below the half-full point during routine fluid checks, the brake system should be inspected for wear and possible brake fluid leaks.
3. If the brake fluid level is at or below the half-full point during routine fluid checks, and an inspection of the brake system did not reveal wear or brake fluid leaks, the brake fluid may be topped-off up to the maximum-fill level.
4. If brake system service was just completed, the brake fluid may be topped-off up to the maximum-fill level.
5. If the brake fluid level is above the half-full point, adding brake fluid is not recommended under normal conditions.
6. If brake fluid is to be added to the master cylinder reservoir, clean the outside of the reservoir on and around the reservoir cap prior to removing the cap and diaphragm. Use only GM approved brake fluid from a clean, sealed brake fluid container.

MASTER CYLINDER RESERVOIR REPLACEMENT

Removal Procedure

WARNING: Refer to Brake Fluid Irritant Warning .

CAUTION: Refer to Brake Fluid Effects on Paint and Electrical Components Caution .

1. Using a suitable tool, remove and properly discard the brake fluid from the master cylinder reservoir.
2. Disconnect the brake fluid level indicator switch electrical connector.

Fig. 7: Master Cylinder Reservoir Bolt
Courtesy of GENERAL MOTORS COMPANY

3. Remove the master cylinder reservoir bolt (1).

Fig. 8: View Of Master Cylinder Reservoir
Courtesy of GENERAL MOTORS COMPANY

4. Lift the master cylinder reservoir (1) upward to release the reservoir from the reservoir seals and the master cylinder.

Fig. 9: Master Cylinder Reservoir Seals
Courtesy of GENERAL MOTORS COMPANY

5. Remove the 2 master cylinder reservoir seals (1).

Installation Procedure

1. Lubricate the master cylinder reservoir seals with GM approved brake fluid from a clean, sealed, brake fluid container.

Fig. 10: Master Cylinder Reservoir Seals
Courtesy of GENERAL MOTORS COMPANY

NOTE: Ensure the reservoir seals are fully seated in the master cylinder.

2. Install the 2 master cylinder reservoir seals (1).

Fig. 11: View Of Master Cylinder Reservoir
Courtesy of GENERAL MOTORS COMPANY

NOTE: Ensure the master cylinder reservoir is fully seated in the master cylinder.

3. Firmly and squarely press the master cylinder reservoir (1) into the master cylinder.

Fig. 12: Master Cylinder Reservoir Bolt
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

4. Install the master cylinder reservoir bolt (1) and tighten to 4 N.m (35 lb in).
5. Connect the brake fluid level indicator switch electrical connector.
6. Fill the master cylinder reservoir. Refer to Master Cylinder Reservoir Filling.

MASTER CYLINDER REPLACEMENT (LEA, LUK)

Removal Procedure

WARNING: Refer to Brake Fluid Irritant Warning .

CAUTION: Refer to Brake Fluid Effects on Paint and Electrical Components Caution .

1. Turn the ignition switch to the OFF position.
2. Apply and release the brake pedal several times until the brake pedal becomes firm to deplete the power vacuum brake booster vacuum reserve.
3. Remove the intake manifold cover, if necessary. Refer to **Intake Manifold Cover Replacement** for the 2.4L engine.
4. Using a suitable tool, remove and properly dispose of the brake fluid from the master cylinder reservoir.
5. Without draining the coolant and without disconnecting the hoses, remove and position aside the radiator surge tank. Refer to **Radiator Surge Tank Replacement (LUK)** .
6. If equipped with the manual transmission, disconnect the clutch master cylinder reservoir hose. Refer to **Clutch Master Cylinder Reservoir Hose Replacement** .
7. Disconnect the brake fluid level indicator switch electrical connector.

Fig. 13: Master Cylinder Primary And Secondary Brake Pipe Fittings
Courtesy of GENERAL MOTORS COMPANY

8. Disconnect the master cylinder primary brake pipe fitting (1).
9. Cap the brake pipe fitting to prevent brake fluid loss and contamination.
10. Disconnect the master cylinder secondary brake pipe fitting (2).
11. Cap the brake pipe fitting to prevent brake fluid loss and contamination.

Fig. 14: Master Cylinder Nuts

Courtesy of GENERAL MOTORS COMPANY

12. Remove the master cylinder nuts (1).

Fig. 15: Master Cylinder & O-Ring Seal
Courtesy of GENERAL MOTORS COMPANY

13. Remove the master cylinder (1).
14. Remove the master cylinder O-ring seal (2).

Installation Procedure

1. If installing a new master cylinder, bench bleed the master cylinder. Refer to **Master Cylinder Bench Bleeding**.

Fig. 16: Master Cylinder & O-Ring Seal
Courtesy of GENERAL MOTORS COMPANY

NOTE: Ensure the O-ring seal is properly seated in the groove in the master cylinder body and is not distorted.

2. Install the master cylinder (1) and master cylinder O-ring seal (2).

Fig. 17: Master Cylinder Nuts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

3. Install the master cylinder nuts (1) and tighten to 50 N.m (37 lb ft).

Fig. 18: Master Cylinder Primary And Secondary Brake Pipe Fittings
Courtesy of GENERAL MOTORS COMPANY

4. Connect the master cylinder primary brake pipe fitting (1) and tighten to 18 N.m (13 lb ft).
5. Connect the master cylinder secondary brake pipe fitting (2) and tighten to 18 N.m (13 lb ft).
6. Connect the brake fluid level indicator switch electrical connector.
7. If equipped with the manual transmission, connect the clutch master cylinder reservoir hose. Refer to **Clutch Master Cylinder Reservoir Hose Replacement** .
8. Install the radiator surge tank. Refer to **Radiator Surge Tank Replacement (LUK)** .
9. Bleed the hydraulic brake system. Refer to **Hydraulic Brake System Bleeding (Manual)**, **Hydraulic Brake System Bleeding (Pressure)**.
10. Install the intake manifold cover, if removed. Refer to **Intake Manifold Cover Replacement** for the 2.4L engine.

MASTER CYLINDER REPLACEMENT (LTG)

Removal Procedure

WARNING: Refer to **Brake Fluid Irritant Warning** .

CAUTION: Refer to Brake Fluid Effects on Paint and Electrical Components Caution .

1. Turn the ignition switch to the OFF position.
2. Apply and release the brake pedal several times until the brake pedal becomes firm to deplete the power vacuum brake booster vacuum reserve.
3. Remove the intake manifold cover, if necessary. Refer to **INTAKE MANIFOLD COVER REPLACEMENT** for the 2.0L engine.
4. Using a suitable tool, remove and properly dispose of the brake fluid from the master cylinder reservoir.
5. Without draining the coolant and without disconnecting the hoses, remove and position aside the radiator surge tank. Refer to **RADIATOR SURGE TANK REPLACEMENT (LTG)**
6. If equipped with the manual transmission, disconnect the clutch master cylinder reservoir hose. Refer to **Clutch Master Cylinder Reservoir Hose Replacement** .
7. Disconnect the brake fluid level indicator switch electrical connector.

Fig. 19: Master Cylinder Primary And Secondary Brake Pipe Fittings
Courtesy of GENERAL MOTORS COMPANY

8. Disconnect the master cylinder primary brake pipe fitting (1).

9. Cap the brake pipe fitting to prevent brake fluid loss and contamination.
10. Disconnect the master cylinder secondary brake pipe fitting (2).
11. Cap the brake pipe fitting to prevent brake fluid loss and contamination.

Fig. 20: Master Cylinder Nuts
Courtesy of GENERAL MOTORS COMPANY

12. Remove the master cylinder nuts (1).

Fig. 21: Master Cylinder & O-Ring Seal
Courtesy of GENERAL MOTORS COMPANY

13. Remove the master cylinder (1).
14. Remove the master cylinder O-ring seal (2).

Installation Procedure

1. If installing a new master cylinder, bench bleed the master cylinder. Refer to **Master Cylinder Bench Bleeding**.

Fig. 22: Master Cylinder & O-Ring Seal
Courtesy of GENERAL MOTORS COMPANY

NOTE: Ensure the O-ring seal is properly seated in the groove in the master cylinder body and is not distorted.

2. Install the master cylinder (1) and master cylinder O-ring seal (2).

CAUTION: Refer to Fastener Caution .

Fig. 23: Master Cylinder Nuts

Courtesy of GENERAL MOTORS COMPANY

3. Install the master cylinder nuts (1) and tighten to 50 N.m (37 lb ft).

Fig. 24: Master Cylinder Primary And Secondary Brake Pipe Fittings
Courtesy of GENERAL MOTORS COMPANY

4. Connect the master cylinder primary brake pipe fitting (1) and tighten to 18 N.m (13 lb ft).
5. Connect the master cylinder secondary brake pipe fitting (2) and tighten to 18 N.m (13 lb ft).
6. Connect the brake fluid level indicator switch electrical connector.
7. If equipped with the manual transmission, connect the clutch master cylinder reservoir hose. Refer to **Clutch Master Cylinder Reservoir Hose Replacement** .
8. Install the radiator surge tank. Refer to **RADIATOR SURGE TANK REPLACEMENT (LTG)**
9. Bleed the hydraulic brake system. Refer to **Hydraulic Brake System Bleeding (Manual)**, **Hydraulic Brake System Bleeding (Pressure)**.
10. Install the intake manifold cover, if removed. Refer to **INTAKE MANIFOLD COVER REPLACEMENT** for the 2.0L engine.

MASTER CYLINDER BENCH BLEEDING

Fig. 25: Bleeding Master Cylinder
Courtesy of GENERAL MOTORS COMPANY

WARNING: Refer to Brake Fluid Irritant Warning .

CAUTION: Refer to Brake Fluid Effects on Paint and Electrical Components
Caution .

1. Secure the mounting flange of the brake master cylinder in a bench vise so that the rear of the primary piston is accessible.
2. Remove the master cylinder reservoir cap and diaphragm.
3. Install suitable fittings to the master cylinder ports that match the type of flare seat required and also provide for hose attachment.
4. Install transparent hoses to the fittings installed to the master cylinder ports, then route the hoses into the master cylinder reservoir.

5. Fill the master cylinder reservoir to at least the half-way point with GM approved brake fluid from a clean, sealed brake fluid container. Refer to **Master Cylinder Reservoir Filling**.
6. Ensure that the ends of the transparent hoses running into the master cylinder reservoir are fully submerged in the brake fluid.
7. Using a smooth, round-ended tool, depress and release the primary piston as far as it will travel, a depth of about 25 mm (1 in), several times. Observe the flow of fluid coming from the ports.

As air is bled from the primary and secondary pistons, the effort required to depress the primary piston will increase and the amount of travel will decrease.

8. Continue to depress and release the primary piston until fluid flows freely from the ports with no evidence of air bubbles.
9. Remove the transparent hoses from the master cylinder reservoir.
10. Install the master cylinder reservoir cap and diaphragm.
11. Remove the fittings with the transparent hoses from the master cylinder ports. Wrap the master cylinder with a clean shop cloth to prevent brake fluid spills.
12. Remove the master cylinder from the vise.

BRAKE FLUID LEVEL INDICATOR SWITCH REPLACEMENT

Fig. 26: Brake Fluid Level Indicator Switch
Courtesy of GENERAL MOTORS COMPANY

Brake Fluid Level Indicator Switch Replacement

Callout	Component Name
1	Brake Fluid Level Indicator Switch
	Procedure <ul style="list-style-type: none"> • Disconnect the electrical connector. • Turn the indicator switch clockwise to release.

BRAKE AND ACCELERATOR PEDAL ASSEMBLY REPLACEMENT

Removal Procedure

1. Remove the instrument panel tie bar. Refer to **Instrument Panel Tie Bar Replacement**
2. Disconnect the accelerator pedal position sensor electrical connector.
3. Remove the brake pedal position sensor. Refer to **Brake Pedal Position Sensor Replacement**

Fig. 27: Brake Pedal

Courtesy of GENERAL MOTORS COMPANY

4. Pull the brake pedal (1) rearward to release the power vacuum brake booster pushrod retainer.

NOTE: Do not reuse the power vacuum brake booster pushrod retainer.

5. Remove and discard the power vacuum brake booster pushrod retainer.
6. Remove the power vacuum brake booster. Refer to **Power Vacuum Brake Booster Replacement**

Fig. 28: Brake Pedal Assembly And Nuts
Courtesy of GENERAL MOTORS COMPANY

7. Remove the brake pedal assembly nuts (1).
8. Remove the brake pedal assembly.

Installation Procedure

1. Install the brake pedal assembly.

Fig. 29: Brake Pedal Assembly And Nuts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution

2. Install the brake pedal assembly nuts (1) and tighten to 22 N.m (16 lb ft).
3. Install the power vacuum brake booster. Refer to **Power Vacuum Brake Booster Replacement**

Fig. 30: Brake Pedal

Courtesy of GENERAL MOTORS COMPANY

NOTE: Install a new power vacuum brake booster pushrod retainer.

4. Install a new power vacuum brake booster pushrod retainer to the power vacuum brake booster pushrod.

NOTE: Ensure the power vacuum brake booster pushrod retainer is fully seated in the brake pedal arm.

5. Install the power vacuum brake booster pushrod retainer to the brake pedal (1).
6. Install the brake pedal position sensor. Refer to **Brake Pedal Position Sensor Replacement**
7. Connect the accelerator pedal position sensor electrical connector.
8. Install the instrument panel tie bar. Refer to **Instrument Panel Tie Bar Replacement**

BRAKE PRESSURE MODULATOR VALVE PRIMARY PIPE REPLACEMENT (LEFT HAND DRIVE)

Fig. 31: Brake Pressure Modulator Valve Primary Pipe (Left Hand Drive)
 Courtesy of GENERAL MOTORS COMPANY

Brake Pressure Modulator Valve Primary Pipe Replacement (Left Hand Drive)

Callout	Component Name
WARNING: Refer to <u>Brake Fluid Irritant Warning</u> .	
Preliminary Procedures Remove the surge tank. Refer to <u>Radiator Surge Tank Replacement (LUK)</u> , <u>Radiator Surge Tank Replacement (LTG)</u> .	
1	Brake Pipe Fitting CAUTION: Refer to <u>Fastener Caution</u> . Procedure Cap the brake pipe fitting to prevent brake fluid loss and contamination. Tighten 18 N.m (13 lb ft)
2	Brake Pressure Modulator Valve Primary Pipe Procedure Bleed the hydraulic brake system. Refer to <u>Hydraulic Brake System Bleeding (Manual)</u> , <u>Hydraulic Brake System Bleeding (Pressure)</u> .

BRAKE PRESSURE MODULATOR VALVE SECONDARY PIPE REPLACEMENT (LEFT HAND DRIVE)

Fig. 32: Brake Pressure Modulator Valve Secondary Pipe (Left Hand Drive)
Courtesy of GENERAL MOTORS COMPANY

Brake Pressure Modulator Valve Secondary Pipe Replacement (Left Hand Drive)

BRAKE PIPE REPLACEMENT

Special Tools

CH-45405 Brake Pipe Flaring Tool Kit

For equivalent regional tools, refer to Special Tools.

Fig. 33: Sectioning Brake Pipe Using Pipe Cutter
Courtesy of GENERAL MOTORS COMPANY

WARNING: Refer to Brake Fluid Irritant Warning .

WARNING: Always use double walled steel brake pipe when replacing brake

pipes. The use of any other pipe is not recommended and may cause brake system failure. Carefully route and retain replacement brake pipes. Always use the correct fasteners and the original location for replacement brake pipes. Failure to properly route and retain brake pipes may cause damage to the brake pipes and cause brake system failure.

CAUTION: Refer to Brake Fluid Effects on Paint and Electrical Components Caution .

NOTE: When servicing the brake pipes, note the following:

- **If sectioning the brake pipe, use replacement pipe of the same type and outside diameter.**
- **Use fittings of the appropriate size and type.**
- **Only create flares of the same type or design as originally equipped on the vehicle.**

1. Inspect the area of brake pipe to be repaired or replaced.
2. Release the brake pipe to be replaced from the retainers, as required.
3. Select an appropriate location to section the brake pipe, if necessary.
 - Allow adequate clearance in order to maneuver the **CH-45405** Brake Pipe Flaring Tool Kit.
 - Avoid sectioning the brake pipe at bends or mounting points.
4. Using a string or wire, measure the length of the pipe to be replaced including all pipe bends.
5. Add to the measurement taken the appropriate additional length required for each flare to be created.

Specification

- 6.35 mm (0.250 in) for 4.76 mm (3/16 in) diameter pipe
- 9.50 mm (0.374 in) for 6.35 mm (1/4 in) diameter pipe
- 12.67 mm (0.499 in) for 7.94 mm (5/16 in) diameter pipe

NOTE: Ensure that the brake pipe end to be flared is cut at a square, 90 degree angle to the pipe length.

6. Using the pipe cutter included in the **CH-45405** Brake Pipe Flaring Tool Kit , carefully cut the brake pipe squarely to the measured length.
7. Remove the sectioned brake pipe from the vehicle.
8. Select the appropriate size of brake pipe and tube nuts, as necessary. The brake pipe outside diameter determines brake pipe size.

Fig. 34: Stripping Nylon Coating From Brake Pipe Ends
Courtesy of GENERAL MOTORS COMPANY

9. Strip the nylon coating from the brake pipe end to be flared, if necessary.
 - Select the appropriate blade on the coating stripping tool included in the **CH-45405** Brake Pipe Flaring Tool Kit , by unthreading the blade block from the stripping tool and installing the block with the desired blade facing the tool rollers.

Specification

- 6.35 mm (0.250 in) blade for 4.76 mm (3/16 in) diameter pipe
- 9.50 mm (0.374 in) blade for 6.35 mm (1/4 in) and 7.94 mm (5/16 in) diameter pipe
- Insert the brake pipe end to be flared into the stripping tool to the depth of the ledge on the tool rollers.
- While holding the brake pipe firmly against the stripping tool roller ledges, rotate the thumbwheel of the tool until the blade contacts the brake pipe coated surface.

NOTE: **Do not gouge the metal surface of the brake pipe.**

- Rotate the stripping tool in a clockwise direction, ensuring that the brake pipe end remains against the tool roller ledges.
- After each successive revolution of the stripping tool, carefully rotate the thumbwheel of the tool clockwise, in order to continue stripping the coating from the brake pipe until the metal pipe surface is exposed.
- Loosen the thumbwheel of the tool and remove the brake pipe.

NOTE: **Ensure that all loose remnants of the nylon coating have been removed from the brake pipe.**

- Inspect the stripped end of the brake pipe to ensure that the proper amount of coating has been removed.

Specification

- 6.35 mm (0.250 in) for 4.76 mm (3/16 in) diameter pipe
- 9.50 mm (0.374 in) for 6.35 mm (1/4 in) and 7.94 mm (5/16 in) diameter pipe

Fig. 35: Chamfering Pipe Using De-Burring Tool
Courtesy of GENERAL MOTORS COMPANY

10. Chamfer the inside and outside diameter of the pipe with the de-burring tool included in the **CH-45405** Brake Pipe Flaring Tool Kit.
11. Install the tube nuts on the brake pipe, noting their orientation.
12. Clean the brake pipe and the **CH-45405** Brake Pipe Flaring Tool Kit of lubricant, contaminants, and debris.

Fig. 36: Installing Die Halves Into Die Cage
Courtesy of GENERAL MOTORS COMPANY

13. Loosen the die clamping screw of the **CH-45405** Brake Pipe Flaring Tool Kit.
14. Select the corresponding die set and install the die halves into the die cage with the full, flat face of one die facing the clamping screw, and the counterbores of both dies facing the forming ram.

Fig. 37: View Of Clamping Screw & Unused Die
Courtesy of GENERAL MOTORS COMPANY

15. Place the flat face of an unused die (1) against the die halves in the clamping cage and hold firmly against the counterbored face of the dies.
16. Insert the prepared end of the pipe to be flared through the back of the dies until the pipe is seated against the flat surface of the unused die (1).
17. Remove the unused die (1).
18. Ensure that the rear of both dies are seated firmly against the enclosed end of the die cage.
19. Firmly hand tighten the clamping screw (2) against the dies.

Fig. 38: Rotating J 45405 To Bottom Against Die Cage
Courtesy of GENERAL MOTORS COMPANY

20. Select the appropriate forming mandrel and place into the forming ram.
21. Rotate the hydraulic fluid control valve clockwise to the closed position.
22. Rotate the body of the **CH-45405** Brake Pipe Flaring Tool Kit until it bottoms against the die cage.

Fig. 39: Bottoming Forming Mandrel Against Clamping Dies Using Pipe Flaring Tool
Courtesy of GENERAL MOTORS COMPANY

23. While guiding the forming mandrel into the exposed end of pipe to be flared, operate the lever of the **CH-45405** Pipe Flaring Tool Kit until the forming mandrel bottoms against the clamping dies.
24. Rotate the hydraulic fluid control valve counterclockwise to the open position to allow the hydraulic forming ram to retract.

Fig. 40: Using Pipe Flaring Tool
Courtesy of GENERAL MOTORS COMPANY

25. Insert the finishing cone into the forming ram.
26. Rotate the hydraulic fluid control valve clockwise to the closed position.
27. Rotate the body of the **CH-45405** Brake Pipe Flaring Tool Kit until it bottoms against the die cage.
28. While guiding the finishing cone into the exposed end of pipe to be flared, operate the lever of the **CH-45405** Brake Pipe Flaring Tool Kit until the finishing cone bottoms against the dies.
29. Rotate the hydraulic fluid control valve counterclockwise to the open position to allow the hydraulic forming ram to retract.
30. Loosen the die clamping screw and remove the dies and pipe.
31. If necessary, lightly tap the dies until the die halves separate.

Fig. 41: Identifying Correct Brake Pipe Flare Shape & Diameter
Courtesy of GENERAL MOTORS COMPANY

32. Inspect the brake pipe flare for correct shape and diameter (a).

Specification

- 6.74-7.10 mm (0.265-0.279 in) flare diameter for 4.76 mm (3/16 in) diameter pipe
 - 8.57-9.27 mm (0.344-0.358 in) flare diameter for 6.35 mm (1/4 in) diameter pipe
 - 10.42-10.79 mm (0.410-0.425 in) flare diameter for 7.94 mm (5/16 in) diameter pipe
33. If necessary, using the removed section of brake pipe as a template, shape the new pipe with a suitable brake pipe bending tool.

NOTE: **When installing the pipe, maintain a clearance of 19 mm (3/4 in) from all moving or vibrating components.**

34. Install the pipe to the vehicle with the appropriate brake pipe unions, as required.
35. If previously released, secure the brake pipe to the retainers.

36. Bleed the hydraulic brake system. Refer to **Hydraulic Brake System Bleeding (Manual)**, **Hydraulic Brake System Bleeding (Pressure)**.
37. With the aid of an assistant, inspect the brake pipe flares for leaks by starting the engine and applying the brakes.

FRONT BRAKE PIPE REPLACEMENT - RIGHT SIDE

Fig. 42: Front Brake Pipe - Right Side
Courtesy of GENERAL MOTORS COMPANY

Front Brake Pipe Replacement - Right Side

Callout	Component Name
WARNING: Refer to <u>Brake Fluid Irritant Warning</u> .	
Preliminary Procedures	
1. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Remove the tire and wheel assembly. Refer to <u>Tire and Wheel Removal and Installation</u> . 3. Remove the surge tank. Refer to <u>Radiator Surge Tank Replacement (LUK)</u> , <u>Radiator Surge Tank Replacement (LTG)</u> . 4. Move the air cleaner assembly to make space.	
	Front Brake Pipe Fitting

	CAUTION: Refer to <u>Fastener Caution</u> .
1	Procedure Cap the brake pipe fitting to prevent brake fluid loss and contamination. Tighten 18 N.m (13 lb ft)
2	Brake Pipe Clip (Qty: 3)
3	Front Brake Pipe Fitting Procedure Cap the brake pipe fitting to prevent brake fluid loss and contamination. Tighten 18 N.m (13 lb ft)
4	Front Brake Pipe Procedure Bleed the hydraulic brake system. Refer to <u>Hydraulic Brake System Bleeding (Manual)</u> , <u>Hydraulic Brake System Bleeding (Pressure)</u> .

FRONT BRAKE PIPE REPLACEMENT - LEFT SIDE

 Courtesy of GENERAL MOTORS COMPANY

Front Brake Hose Replacement (J60, J61)

Callout	Component Name
WARNING: Refer to <u>Brake Fluid Irritant Warning</u> .	
WARNING: Refer to <u>Brake Dust Warning</u> .	
Preliminary Procedures	
1. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Remove the tire and wheel assembly. Refer to <u>Tire and Wheel Removal and Installation</u> .	
1	Brake Pipe Fitting CAUTION: Refer to <u>Fastener Caution</u> . Procedure Cap the brake pipe fitting to prevent brake fluid loss and contamination. Tighten

	18 N.m (13 lb ft)
2	Brake Hose Fitting Bolt Tighten 40 N.m (30 lb ft)
3	Brake Hose Fitting Gasket (Qty: 2) Procedure Install new brake hose fitting gaskets.
4	Front Brake Hose Procedure Bleed the hydraulic brake system. Refer to <u>Hydraulic Brake System Bleeding (Manual)</u> , <u>Hydraulic Brake System Bleeding (Pressure)</u> .

FRONT BRAKE HOSE REPLACEMENT (J64)

Removal Procedure

WARNING: Refer to Brake Dust Warning .

WARNING: Refer to Brake Fluid Irritant Warning .

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove the tire and wheel assembly. Refer to Tire and Wheel Removal and Installation .

Fig. 45: Brake Pipe Fitting

Courtesy of GENERAL MOTORS COMPANY

3. Disconnect the brake pipe fitting (1) from the brake hose.
4. Cap the brake pipe fitting to prevent brake fluid loss and contamination.
5. Remove the brake hose retaining clip.

Fig. 46: Front Strut Assembly Pinch Bolt
Courtesy of GENERAL MOTORS COMPANY

6. Remove the front strut assembly pinch bolt (1) from the steering knuckle and brake hose bracket.

Fig. 47: Brake Hose Fitting Bolt
Courtesy of GENERAL MOTORS COMPANY

7. Remove the brake hose fitting bolt (1).

NOTE: Do not reuse the brake hose fitting gaskets.

8. Remove and discard the brake hose fitting gaskets (2) from the brake hose fitting (3).
9. Remove the brake hose.

Installation Procedure

1. Install the brake hose.

Fig. 48: Brake Hose Fitting Bolt
Courtesy of GENERAL MOTORS COMPANY

2. Assemble the brake hose fitting bolt (1), with new brake hose fitting gaskets (2) to the brake hose fitting (3).

CAUTION: Refer to Fastener Caution .

3. Install the brake hose assembly to the brake caliper and tighten the brake hose fitting bolt to 40 N.m (30 lb ft).

Fig. 49: Front Strut Assembly Pinch Bolt
Courtesy of GENERAL MOTORS COMPANY

4. Install the front strut assembly pinch bolt (1) to the steering knuckle and brake hose bracket. Refer to **Strut Assembly Removal and Installation (GNB)** , **Strut Assembly Removal and Installation (GNA)** .
5. Install the front brake hose to the wheelhouse bracket.
6. Install the brake hose retaining clip.

Fig. 50: Brake Pipe Fitting

Courtesy of GENERAL MOTORS COMPANY

7. Connect the brake pipe fitting (1) to the brake hose.
8. Tighten the brake pipe fitting to 18 N.m (13 lb ft).
9. Bleed the hydraulic brake system. Refer to **Hydraulic Brake System Bleeding (Manual)**, **Hydraulic Brake System Bleeding (Pressure)**.
10. Install the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .

REAR BRAKE HOSE REPLACEMENT

Fig. 51: Rear Brake Hose & Mounting Components

Rear Brake Hose Replacement

Callout	Component Name
WARNING: Refer to <u>Brake Fluid Irritant Warning</u> .	
WARNING: Refer to <u>Brake Dust Warning</u> .	
Preliminary Procedures <ol style="list-style-type: none"> 1. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Remove the tire and wheel. Refer to <u>Tire and Wheel Removal and Installation</u> . 	
1	Brake Pipe Fitting CAUTION: Refer to <u>Fastener Caution</u> . Procedure Cap the brake pipe fitting to prevent brake fluid loss and contamination. Tighten

	18 N.m (13 lb ft)
2	Brake Hose Retainer
3	Brake Hose Fitting Bolt Tighten 40 N.m (30 lb ft)
4	Brake Hose Fitting Gasket (Qty: 2) Procedure Install new brake hose fitting gaskets.
5	Rear Brake Hose Procedure Bleed the hydraulic brake system. Refer to <u>Hydraulic Brake System Bleeding (Manual)</u> , <u>Hydraulic Brake System Bleeding (Pressure)</u> .

HYDRAULIC BRAKE SYSTEM BLEEDING (MANUAL)

WARNING: Refer to Brake Fluid Irritant Warning .

CAUTION: Refer to Brake Fluid Effects on Paint and Electrical Components Caution .

CAUTION: Only use products that comply with GM specifications and check manufacturer information respectively. We recommend the use of GM genuine products. Instructions must be followed at all times. The use of any type of fluid other than the recommended type of brake fluid, may cause contamination which could result in damage to the internal rubber seals and/or rubber linings of hydraulic brake system components.

If hydraulic components were serviced on only one wheel hydraulic circuit, perform the following procedure.

Bleeding a Single Hydraulic Brake Circuit

1. With the ignition OFF and the brakes cool, apply the brakes 3-5 times, or until the brake pedal effort increases significantly, in order to deplete the brake booster power reserve.
2. Place a clean shop cloth beneath the brake master cylinder to catch brake fluid spills.
3. Clean the outside of the reservoir on and around the reservoir cap prior to removing the cap and diaphragm.
4. Fill the brake master cylinder reservoir to the maximum-full level with GM approved brake fluid from a clean, sealed brake fluid container. Add brake fluid as needed to ensure that the brake master cylinder reservoir remains at least half-full throughout the bleed procedure. The reservoir cap must be installed at all times except when filling the reservoir. Refer to Fluid and Lubricant Recommendations .
5. Install a proper box-end wrench onto the wheel hydraulic circuit bleeder valve which has been serviced.
6. Install a transparent hose over the end of the bleeder valve.

7. Submerge the open end of the transparent hose into a transparent container partially filled with brake fluid from a clean, sealed brake fluid container.
8. Have an assistant slowly press the brake pedal fully and maintain steady pressure on the pedal.
9. Loosen the bleeder valve to purge air from the wheel hydraulic circuit.
10. Tighten the bleeder valve, then have the assistant slowly release the brake pedal.
11. Wait 15 seconds, then repeat steps 8-10 until all air is purged from the wheel hydraulic circuit.
12. After all air has been purged from the hydraulic circuit, tighten the bleeder valve and install the dust cap.
13. Fill the brake master cylinder reservoir to the maximum-fill level with GM approved brake fluid from a clean, sealed brake fluid container.
14. Slowly press and release the brake pedal. Observe the brake pedal feel.
15. If the brake pedal feels spongy, perform the Bleeding the Complete Brake Hydraulic System procedure:
16. Turn the ignition key ON, with the engine OFF. Check to see if the brake system warning lamp remains illuminated.

NOTE: DO NOT allow the vehicle to be driven until it is diagnosed and repaired.

17. If the brake system warning lamp remains illuminated, refer to **Diagnostic Starting Point - Vehicle** .

Bleeding the Complete Brake Hydraulic System

1. With the ignition OFF and the brakes cool, apply the brakes 3-5 times, or until the brake pedal effort increases significantly, in order to deplete the brake booster power reserve.
2. Place a clean shop cloth beneath the brake master cylinder to catch brake fluid spills.
3. Clean the outside of the reservoir on and around the reservoir cap prior to removing the cap and diaphragm.
4. Fill the brake master cylinder reservoir to the maximum-full level with GM approved brake fluid from a clean, sealed brake fluid container. Add brake fluid as needed to ensure that the brake master cylinder reservoir remains at least half-full throughout the bleed procedure. The reservoir cap must be installed at all times except when filling the reservoir. Refer to **Fluid and Lubricant Recommendations** .
5. If the master cylinder was replaced, the master cylinder must be bench bled. Refer to **Master Cylinder Bench Bleeding**.
6. If the brake pipes have been removed from the master cylinder, the following steps must be performed.
 1. With the rear brake pipe installed securely to the master cylinder, loosen and separate the front brake pipe fitting from the front port of the brake master cylinder.
 2. Allow a small amount of brake fluid to gravity bleed from the open port of the master cylinder. Capture and properly dispose of the brake fluid in an approved container.
 3. Install the front brake pipe fitting to the front port of the brake master cylinder and tighten the fitting. Refer to **Fastener Tightening Specifications**.
 4. Have an assistant slowly press the brake pedal fully and maintain steady pressure on the pedal.
 5. Loosen the front brake pipe fitting from the front port of the brake master cylinder to purge air from the master cylinder port.
 6. Tighten the front brake pipe fitting, then have the assistant slowly release the brake pedal.

7. Wait 15 seconds, then repeat steps 6.4-6.6 until all air is purged from the front brake pipe fitting of the front port of the master cylinder.
 8. After all air is purged from the front port of the brake master cylinder, tighten the front master cylinder brake pipe fitting. Refer to **Fastener Tightening Specifications**.
 9. With the front brake pipe fitting installed securely to the front port of the brake master cylinder, loosen and separate the rear brake pipe fitting from the rear port of the brake master cylinder.
 10. Repeat steps 6.2-6.7 for the rear port of the brake master cylinder.
 11. After all air is purged from the rear port of the brake master cylinder, tighten the rear master cylinder brake pipe fitting. Refer to **Fastener Tightening Specifications**.
 12. Slowly press and release the brake pedal. Observe the brake pedal feel.
 13. If the brake pedal feels spongy, proceed to step 7.
 14. If the brake pedal feels firm, proceed to step 24.
7. If the brake pipes have been removed from the brake pressure modulator valve (BPMV) assembly, if equipped, or the brake proportion valve assembly, if equipped, air must be purged from each port of the respective assembly beginning with the feed pipes from the master cylinder.
1. Loosen and separate one of the master cylinder brake pipe fittings from the inlet port of the assembly to be bled.
 2. Allow a small amount of brake fluid to gravity bleed from the open port of the assembly. Capture and properly dispose of the brake fluid in an approved container.
 3. Install the brake pipe fitting and to the inlet port of the assembly and tighten securely.
 4. Have an assistant slowly press the brake pedal fully and maintain steady pressure on the pedal.
 5. Loosen the same brake pipe fitting to purge air from the open port of the assembly.
 6. Tighten the brake pipe fitting, then have the assistant slowly release the brake pedal.
 7. Wait 15 seconds, then repeat steps 7.4-7.6 until all air is purged from the brake pipe fitting of the assembly.
 8. Repeat steps 7.1-7.7 for all of the remaining ports of the assembly.
 9. After bleeding each port of the assembly, tighten all of the brake pipe fittings on the assembly. Refer to **Fastener Tightening Specifications**.
 10. Fill the master cylinder reservoir to the maximum-full level with GM approved brake fluid from a clean, sealed brake fluid container.
 11. Slowly press and release the brake pedal. Observe the brake pedal feel.
 12. If the brake pedal feels spongy, proceed to step 8.
 13. If the brake pedal feels firm, proceed to step 24.
8. Install a proper box-end wrench onto the RIGHT REAR wheel hydraulic circuit bleeder valve.
9. Install a transparent hose over the end of the bleeder valve.
10. Submerge the open end of the transparent hose into a transparent container partially filled with GM approved brake fluid from a clean, sealed brake fluid container.
11. Have an assistant slowly press the brake pedal fully and maintain steady pressure on the brake pedal.
12. Loosen the bleeder valve to purge air from the wheel hydraulic circuit.
13. Tighten the bleeder valve, then have the assistant slowly release the brake pedal.

14. Wait 15 seconds, then repeat steps 11-13 until all air is purged from the wheel hydraulic circuit.
15. Tighten the RIGHT REAR hydraulic wheel circuit bleeder valve securely.
16. Install a proper box-end wrench onto the LEFT REAR wheel hydraulic circuit bleeder valve, then repeat steps 9-14..
17. Install a proper box-end wrench onto the RIGHT FRONT wheel hydraulic circuit bleeder valve, then repeat steps 9-14..
18. Install a proper box-end wrench onto the LEFT FRONT wheel hydraulic circuit bleeder valve, then repeat steps 9-14..
19. After completing the final wheel hydraulic circuit bleeding procedure, tighten all of the wheel hydraulic circuit bleeder valves and install the bleeder valve dust caps.
20. Fill the master cylinder reservoir to the maximum-full level with GM approved brake fluid from a clean, sealed brake fluid container.
21. Slowly press and release the brake pedal. Observe the brake pedal feel.
22. If the brake pedal feels spongy, perform the following procedure.
 1. If equipped with antilock brakes, install a scan tool and perform the **Antilock Brake System Automated Bleed** to remove air which may be trapped in the BPMV.
 2. Inspect the hydraulic brake system for external leaks. Refer to **Brake System External Leak Inspection**.
 3. Repeat the Bleeding the Complete Brake Hydraulic System procedure.
23. If the brake pedal still feels spongy, pressure bleed the hydraulic brake system. Refer to **Hydraulic Brake System Bleeding (Manual)**, **Hydraulic Brake System Bleeding (Pressure)**
24. Turn the ignition switch ON with the engine OFF. Check to see if the brake system warning lamp remains illuminated.

NOTE: **DO NOT allow the vehicle to be driven until the brake system is diagnosed and repaired.**

25. If the brake system warning lamp remains illuminated, refer to **Diagnostic Starting Point - Vehicle** .

HYDRAULIC BRAKE SYSTEM BLEEDING (PRESSURE)

WARNING: Refer to **Brake Fluid Irritant Warning** .

CAUTION: Refer to **Brake Fluid Effects on Paint and Electrical Components Caution** .

CAUTION: Only use products that comply with GM specifications and check manufacturer information respectively. We recommend the use of GM genuine products. Instructions must be followed at all times. The use of any type of fluid other than the recommended type of brake fluid, may cause contamination which could result in damage to the internal rubber

seals and/or rubber linings of hydraulic brake system components.

If hydraulic components were serviced on only one wheel hydraulic circuit, perform the following procedure.

Bleeding a Single Hydraulic Brake Circuit

1. With the ignition OFF and the brakes cool, apply the brakes 3-5 times, or until the brake pedal effort increases significantly, in order to deplete the brake booster power reserve.
2. Place a clean shop cloth beneath the brake master cylinder to catch brake fluid spills.
3. Clean the outside of the reservoir on and around the reservoir cap prior to removing the cap and diaphragm.
4. Fill the brake master cylinder reservoir to the maximum-full level with GM approved brake fluid from a clean, sealed brake fluid container. Refer to **Fluid and Lubricant Recommendations** .

NOTE: **The pressure bleeding equipment must be the diaphragm type. The rubber diaphragm between the air supply and the brake fluid prevents air, moisture, oil, and other contaminants from entering the hydraulic system.**

5. Following the brake pressure bleeder manufacturer's instructions, fill the brake pressure bleeder with GM approved brake fluid from a clean, sealed brake fluid container.
6. Install the appropriate master cylinder reservoir adapter and connect the brake pressure bleeder.
7. Charge the brake pressure bleeder air tank to 170-200 kPa/1.7-2.0 bar (25-30 psi), or as recommended by the brake pressure bleeder manufacturer's instructions.
8. Open the brake pressure bleeder fluid tank valve to allow pressurized brake fluid to enter the brake hydraulic system.

NOTE: **Any brake fluid leaks identified require repair prior to completing this procedure.**

9. Wait approximately 30 seconds, then inspect the entire hydraulic brake system for external brake fluid leaks.
10. Install a proper box-end wrench onto the wheel hydraulic circuit bleeder valve which has been serviced.
11. Install a transparent hose over the end of the bleeder valve.
12. Submerge the open end of the transparent hose into a transparent container partially filled with brake fluid from a clean, sealed brake fluid container.
13. Loosen the bleeder valve to purge air from the wheel hydraulic circuit.
14. Allow fluid to flow until air bubbles stop flowing from the bleeder.
15. After all air has been purged from the hydraulic circuit, tighten the bleeder valve and install the dust cap.

NOTE: **The brake reservoir may have residual pressure after the bleeding operation is complete. Wrap a clean shop towel around the bleeder adapter and all hose connections before disconnecting the pressure bleeding equipment to prevent brake fluid from contacting and damaging**

vehicle components and painted surfaces.

16. Close the brake pressure bleeder fluid tank valve then disconnect the brake pressure bleeder from the master cylinder reservoir bleeder adapter.
17. Remove the master cylinder reservoir bleeder adapter from the master cylinder reservoir.
18. Fill the brake master cylinder reservoir to the maximum-fill level with GM approved brake fluid from a clean, sealed brake fluid container.
19. Slowly press and release the brake pedal. Observe the brake pedal feel.
20. If the brake pedal feels spongy, perform the Bleeding the Complete Brake Hydraulic System procedure:
21. Turn the ignition key ON, with the engine OFF. Check to see if the brake system warning lamp remains illuminated.

NOTE: DO NOT allow the vehicle to be driven until it is diagnosed and repaired.

22. If the brake system warning lamp remains illuminated, refer to **Diagnostic Starting Point - Vehicle** .

Bleeding the Complete Brake Hydraulic System

1. With the ignition OFF and the brakes cool, apply the brakes 3-5 times, or until the brake pedal effort increases significantly, in order to deplete the brake booster power reserve.
2. Place a clean shop cloth beneath the brake master cylinder to catch brake fluid spills.
3. Clean the outside of the reservoir on and around the reservoir cap prior to removing the cap and diaphragm.
4. Fill the brake master cylinder reservoir to the maximum-full level with GM approved brake fluid from a clean, sealed brake fluid container. Refer to **Fluid and Lubricant Recommendations** .
5. If the master cylinder was replaced, the master cylinder must be bench bled. Refer to **Master Cylinder Bench Bleeding**.
6. If the brake pipes have been removed from the master cylinder, the following steps must be performed.
 1. With the rear brake pipe installed securely to the master cylinder, loosen and separate the front brake pipe fitting from the front port of the brake master cylinder.
 2. Allow a small amount of brake fluid to gravity bleed from the open port of the master cylinder. Capture and properly dispose of the brake fluid in an approved container.
 3. Install the front brake pipe fitting to the front port of the brake master cylinder and tighten the fitting.
 4. Have an assistant slowly press the brake pedal fully and maintain steady pressure on the pedal.
 5. Loosen the front brake pipe fitting from the front port of the brake master cylinder to purge air from the master cylinder port.
 6. Tighten the front brake pipe fitting, then have the assistant slowly release the brake pedal.
 7. Wait 15 seconds, then repeat steps 6.4-6.6 until all air is purged from the front brake pipe fitting of the front port of the master cylinder.
 8. After all air is purged from the front port of the brake master cylinder, tighten the front master cylinder brake pipe fitting. Refer to **Fastener Tightening Specifications**.

9. With the front brake pipe fitting installed securely to the front port of the brake master cylinder, loosen and separate the rear brake pipe fitting from the rear port of the brake master cylinder.
 10. Repeat steps 6.2-6.7 for the rear port of the brake master cylinder.
 11. After all air is purged from the rear port of the brake master cylinder, tighten the rear master cylinder brake pipe fitting. Refer to **Fastener Tightening Specifications**.
 12. Slowly press and release the brake pedal. Observe the brake pedal feel.
 13. If the brake pedal feels spongy, proceed to step 7.
 14. If the brake pedal feels firm, proceed to step 24.
7. If the brake pipes have been removed from the brake pressure modulator valve (BPMV) assembly, if equipped, or the brake proportion valve assembly, if equipped, air must be purged from each port of the respective assembly beginning with the feed pipes from the master cylinder.
1. Loosen and separate one of the master cylinder brake pipe fittings from the inlet port of the assembly to be bled.
 2. Allow a small amount of brake fluid to gravity bleed from the open port of the assembly. Capture and properly dispose of the brake fluid in an approved container.
 3. Install the brake pipe fitting and to the inlet port of the assembly and tighten securely.
 4. Have an assistant slowly press the brake pedal fully and maintain steady pressure on the pedal.
 5. Loosen the same brake pipe fitting to purge air from the open port of the assembly.
 6. Tighten the brake pipe fitting, then have the assistant slowly release the brake pedal.
 7. Wait 15 seconds, then repeat steps 7.4-7.6 until all air is purged from the brake pipe fitting of the assembly.
 8. Repeat steps 7.1-7.7 for all of the remaining ports of the assembly.
 9. After bleeding each port of the assembly, tighten all of the brake pipe fittings on the assembly. Refer to **Fastener Tightening Specifications**.
 10. Fill the master cylinder reservoir to the maximum-full level with GM approved brake fluid from a clean, sealed brake fluid container.
 11. Slowly press and release the brake pedal. Observe the brake pedal feel.
 12. If the brake pedal feels spongy, proceed to step 8.
 13. If the brake pedal feels firm, proceed to step 24.

NOTE: **The pressure bleeding equipment must be the diaphragm type. The rubber diaphragm between the air supply and the brake fluid prevents air, moisture, oil, and other contaminants from entering the hydraulic system.**

8. Following the brake pressure bleeder manufacturer's instructions, fill the brake pressure bleeder with GM approved brake fluid from a clean, sealed brake fluid container.
9. Install the appropriate master cylinder reservoir adapter and connect the brake pressure bleeder.
10. Charge the brake pressure bleeder air tank to 170-200 kPa/1.7-2.0 bar (25-30 psi), or as recommended by the brake pressure bleeder manufacturer's instructions.
11. Open the brake pressure bleeder fluid tank valve to allow pressurized brake fluid to enter the brake hydraulic system.

NOTE: **Any brake fluid leaks identified require repair prior to completing this procedure.**

12. Wait approximately 30 seconds, then inspect the entire hydraulic brake system for external brake fluid leaks.
13. Install a proper box-end wrench onto the RIGHT REAR wheel hydraulic circuit bleeder valve.
14. Install a transparent hose over the end of the bleeder valve.
15. Submerge the open end of the transparent hose into a transparent container partially filled with GM approved brake fluid from a clean, sealed brake fluid container.
16. Have an assistant slowly press the brake pedal fully and maintain steady pressure on the brake pedal.
17. Loosen the bleeder valve to purge air from the wheel hydraulic circuit.
18. Tighten the bleeder valve, then have the assistant slowly release the brake pedal.
19. Wait 15 seconds, then repeat steps 11-13 until all air is purged from the wheel hydraulic circuit.
20. Tighten the RIGHT REAR hydraulic wheel circuit bleeder valve securely.
21. Install a proper box-end wrench onto the LEFT REAR wheel hydraulic circuit bleeder valve, then repeat steps 9-14.
22. Install a proper box-end wrench onto the RIGHT FRONT wheel hydraulic circuit bleeder valve, then repeat steps 9-14.
23. Install a proper box-end wrench onto the LEFT FRONT wheel hydraulic circuit bleeder valve, then repeat steps 9-14.
24. After completing the final wheel hydraulic circuit bleeding procedure, tighten all of the wheel hydraulic circuit bleeder valves and install the bleeder valve dust caps.
25. Close the brake pressure bleeder fluid tank valve.

NOTE: **The brake reservoir may have residual pressure after the bleeding operation is complete. Wrap a clean shop towel around the bleeder adapter and all hose connections before disconnecting the pressure bleeding equipment to prevent brake fluid from contacting and damaging vehicle components and painted surfaces.**

26. Remove the brake pressure bleeding equipment from the vehicle.
27. Fill the brake master cylinder reservoir to the maximum-full level with GM approved brake fluid from a clean, sealed brake fluid container. Refer to **Fluid and Lubricant Recommendations** .
28. Slowly press and release the brake pedal. Observe the brake pedal feel.
29. If the brake pedal feels spongy, perform the following procedure.
 1. If equipped with antilock brakes, install a scan tool and perform the **Antilock Brake System Automated Bleed** to remove air which may be trapped in the BPMV.
 2. Inspect the hydraulic brake system for external leaks. Refer to **Brake System External Leak Inspection**.
 3. Repeat the Bleeding the Complete Brake Hydraulic System procedure.
30. If the brake pedal still feels spongy, pressure bleed the hydraulic brake system. Refer to **Hydraulic Brake System Bleeding (Manual)**, **Hydraulic Brake System Bleeding (Pressure)** .

31. Turn the ignition switch ON with the engine OFF. Check to see if the brake system warning lamp remains illuminated.

NOTE: **DO NOT allow the vehicle to be driven until the brake system is diagnosed and repaired.**

32. If the brake system warning lamp remains illuminated, refer to **Diagnostic Starting Point - Vehicle** .

HYDRAULIC BRAKE SYSTEM FLUSHING

WARNING: Refer to **Brake Fluid Irritant Warning** .

CAUTION: Refer to **Brake Fluid Effects on Paint and Electrical Components Caution** .

CAUTION: Only use products that comply with GM specifications and check manufacturer information respectively. We recommend the use of GM genuine products. Instructions must be followed at all times. The use of any type of fluid other than the recommended type of brake fluid, may cause contamination which could result in damage to the internal rubber seals and/or rubber linings of hydraulic brake system components.

1. Inspect the brake fluid for the following conditions, indicating brake fluid contamination:
 - Fluid separation, indicating 2 types of fluid are present; a substance other than the recommended brake fluid has been introduced into the brake hydraulic system
 - Swirled appearance-oil-based substance
 - Layered appearance- silicone-based substance
 - Fluid discoloration, indicating the presence of moisture or particles that have been introduced into the brake hydraulic system
 - Cloudy appearance - moisture
 - Dark appearance/suspended particles in fluid - dirt, rust, corrosion, brake dust
2. Inspect the master cylinder reservoir cap diaphragm and the reservoir-to-master cylinder grommets for swelling, indicating brake fluid contamination.
3. If the brake fluid WAS contaminated with an oil-based or a silicone-based substance, indicated by fluid separation and/or a swollen master cylinder reservoir cap diaphragm and/or swollen reservoir-to-master cylinder grommets, perform the following:
 1. Remove ALL of the following components listed from the vehicle. Each component contains internal rubber seals/linings which have been contaminated by the contaminated brake fluid in the brake hydraulic system.

Refer to the procedures indicated:

- **Master Cylinder Replacement (LEA, LUK)** or **Master Cylinder Replacement (LTG)**
 - **Front Brake Hose Replacement (J60, J61)**, **Front Brake Hose Replacement (J64)**
 - **Rear Brake Hose Replacement**
 - **Front Brake Caliper Replacement (J60, J61)** , **Front Brake Caliper Replacement (J64)**
 - **Rear Brake Caliper Replacement**
 - **Electronic Brake and Traction Control Module with Brake Pressure Modulator Valve Replacement**
2. Clean out all the hydraulic brake pipes using denatured alcohol, or equivalent.
 3. Dry the brake pipes using non-lubricated, filtered air.
 4. Repair or replace ALL of the following components listed and install them to the vehicle. Each component contains internal rubber seals/linings which have been contaminated by the contaminated brake fluid in the brake hydraulic system.

Refer to the procedures indicated:

- **Master Cylinder Replacement (LEA, LUK)** or **Master Cylinder Replacement (LTG)** -
Also perform the following:

Clean the brake master cylinder reservoir using denatured alcohol, or equivalent, then dry the reservoir using non-lubricated, filtered air. Inspect the reservoir for cracks and/or damage and replace if necessary. Refer to **Master Cylinder Reservoir Replacement**.

Replace the brake master cylinder reservoir cap diaphragm.

- **Front Brake Hose Replacement (J60, J61)**, **Front Brake Hose Replacement (J64)**
 - **Rear Brake Hose Replacement**
 - **Front Brake Caliper Replacement (J60, J61)** , **Front Brake Caliper Replacement (J64)**
 - **Rear Brake Caliper Replacement**
 - **Electronic Brake and Traction Control Module with Brake Pressure Modulator Valve Replacement**
4. If the brake fluid was NOT contaminated with an oil-based or a silicone-based substance, but WAS contaminated with water or dirt, rust, corrosion, and/or brake dust, replace the brake master cylinder reservoir cap diaphragm which may have allowed the moisture or particles to enter the hydraulic system.
 5. Fill the brake master cylinder reservoir to the maximum-fill level with GM approved brake fluid from a clean, sealed brake fluid container. Refer to **Fluid and Lubricant Recommendations** .
 6. Pressure bleed the hydraulic brake system; begin the procedure with the pressure bleeder reservoir filled to the maximum-fill level with the correct brake fluid as indicated. Refer to **Hydraulic Brake System Bleeding (Manual)**, **Hydraulic Brake System Bleeding (Pressure)**.

POWER VACUUM BRAKE BOOSTER REPLACEMENT

Removal Procedure

1. With the engine OFF, apply and release the brake pedal several times until the pedal becomes firm to deplete the power vacuum brake booster vacuum reserve.
2. Without draining the coolant and without disconnecting the hoses, remove and position aside the radiator surge tank. Refer to **Radiator Surge Tank Replacement (LUK)** , **Radiator Surge Tank Replacement (LTG)** .
3. Disconnect the brake pedal position sensor electrical connector. Refer to **Brake Pedal Position Sensor Replacement** .

Fig. 52: Brake Pedal
Courtesy of GENERAL MOTORS COMPANY

4. Release the brake pedal (1) from the power vacuum brake booster pushrod by lifting the pedal upward.

NOTE: **Do not reuse the brake pedal retainer.**

5. Remove and discard the brake pedal retainer.
6. Disconnect the power vacuum brake booster vacuum sensor electrical connector.

Fig. 53: Power Brake Booster Vacuum Rear Pipe
Courtesy of GENERAL MOTORS COMPANY

7. Release the power brake booster vacuum inlet pipe from the retainers (1) on the dash panel.

Fig. 54: Power Brake Booster Vacuum Sensor
Courtesy of GENERAL MOTORS COMPANY

8. Remove the power brake booster vacuum sensor (1) from the power vacuum brake booster and position aside.
9. Disconnect the brake fluid level indicator switch electrical connector.
10. Remove the electronic brake and traction control module (EBTCM). Refer to **Electronic Brake and Traction Control Module with Brake Pressure Modulator Valve Replacement** .

Fig. 55: Master Cylinder Nuts

Courtesy of GENERAL MOTORS COMPANY

11. Remove the master cylinder nuts (1).

Fig. 56: Master Cylinder

Courtesy of GENERAL MOTORS COMPANY

12. Remove the master cylinder (1).
13. Inspect the master cylinder O-ring seal for damage and replace, if necessary.

Fig. 57: Power Vacuum Brake Booster Bolts
Courtesy of GENERAL MOTORS COMPANY

14. Completely loosen the power vacuum brake booster bolts (1).

Fig. 58: Power Vacuum Brake Booster
Courtesy of GENERAL MOTORS COMPANY

15. Remove the power vacuum brake booster (1).
16. Inspect the power vacuum brake booster gasket (2) for damage and replace, if necessary.

Installation Procedure

Fig. 59: Power Vacuum Brake Booster
Courtesy of GENERAL MOTORS COMPANY

1. Install the power vacuum brake booster (1) and gasket (2).

Fig. 60: Power Vacuum Brake Booster Bolts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

NOTE: Do not over tighten the power vacuum brake booster bolts. If the power vacuum brake booster bolts are over tightened, the brake pedal may remain applied after a high pressure brake pedal application.

2. Install the power vacuum brake booster bolts (1) and tighten to 19 N.m (14 lb ft).

Fig. 61: Master Cylinder

Courtesy of GENERAL MOTORS COMPANY

3. Install the master cylinder (1) to the power vacuum brake booster.

Fig. 62: Master Cylinder Nuts

Courtesy of GENERAL MOTORS COMPANY

4. Install the master cylinder nuts (1) and tighten to 50 N.m (37 lb ft).
5. Connect the brake fluid level indicator switch electrical connector.
6. Install the EBTCM. Refer to **Electronic Brake and Traction Control Module with Brake Pressure Modulator Valve Replacement** .

Fig. 63: Power Brake Booster Vacuum Sensor
Courtesy of GENERAL MOTORS COMPANY

NOTE: A small amount of denatured alcohol may be used as a lubricant to assist the installation of the power brake booster vacuum sensor.

7. Install the power brake booster vacuum sensor (1) to the power vacuum brake booster.

Fig. 64: Power Brake Booster Vacuum Rear Pipe
Courtesy of GENERAL MOTORS COMPANY

8. Install the power brake booster vacuum inlet pipe to the retainers (1) on the dash panel.
9. Connect the power vacuum brake booster vacuum sensor electrical connector.

Fig. 65: Brake Pedal

Courtesy of GENERAL MOTORS COMPANY

NOTE: Install a new power vacuum brake booster pushrod retainer.

10. Install a new power vacuum brake booster pushrod retainer to the power vacuum brake booster pushrod.

NOTE: Ensure the power vacuum brake booster pushrod retainer is fully seated in the brake pedal arm.

11. Connect the power vacuum brake booster pushrod retainer (1) to the brake pedal.
12. Connect the brake pedal position sensor electrical connector. Refer to **Brake Pedal Position Sensor Replacement** .
13. Install the radiator surge tank. Refer to **Radiator Surge Tank Replacement (LUK)** , **Radiator Surge Tank Replacement (LTG)** .

POWER BRAKE BOOSTER VACUUM SENSOR REPLACEMENT

Removal Procedure

1. Apply the brake pedal several times until the brake pedal becomes firm to deplete the power vacuum

brake booster vacuum reserve.

2. Disconnect the power brake booster vacuum sensor electrical connector.

Fig. 66: Power Brake Booster Vacuum Rear Pipe
Courtesy of GENERAL MOTORS COMPANY

3. Release the power brake booster vacuum rear pipe from the clips (1) on the vehicle front of dash.

Fig. 67: Power Brake Booster Vacuum Sensor
Courtesy of GENERAL MOTORS COMPANY

4. Remove the power brake booster vacuum sensor (1) from the power vacuum brake booster.

Fig. 68: Power Brake Booster Vacuum Rear Pipe Hose
Courtesy of GENERAL MOTORS COMPANY

5. Release the clamps and remove the power brake booster vacuum rear pipe hose (1) from the power brake booster vacuum sensor (2) and the power vacuum brake booster.

Installation Procedure

Fig. 69: Power Brake Booster Vacuum Rear Pipe Hose
Courtesy of GENERAL MOTORS COMPANY

1. Install the power brake booster vacuum rear pipe hose (1) to the power brake booster vacuum rear pipe and secure the clamp.
2. Install the power brake booster vacuum sensor (2) to the power brake booster vacuum rear pipe and secure the clamp.

Fig. 70: Power Brake Booster Vacuum Sensor
Courtesy of GENERAL MOTORS COMPANY

3. Install the power brake booster vacuum sensor (1) to the power vacuum brake booster.

Fig. 71: Power Brake Booster Vacuum Rear Pipe
Courtesy of GENERAL MOTORS COMPANY

4. Install the power brake booster vacuum rear pipe to the clips (1) on the vehicle front of dash.
5. Connect the power brake booster vacuum sensor electrical connector.

POWER BRAKE BOOSTER VACUUM PIPE REPLACEMENT (LTG)

Removal Procedure

1. With the engine OFF, apply and release the brake pedal several times until the brake pedal becomes firm to deplete the power vacuum brake booster vacuum reserve.

Fig. 72: Power Brake Booster Vacuum Pipe Quick Connection
Courtesy of GENERAL MOTORS COMPANY

2. Release the power brake booster vacuum pipe quick connect (1) from the power brake booster pump.
3. Remove the power brake booster vacuum pipe (2) by releasing the power brake booster vacuum rear pipe quick connect.

Fig. 73: Power Brake Booster Vacuum Pipe Clamp
Courtesy of GENERAL MOTORS COMPANY

4. Remove and discard the power brake booster vacuum pipe clamp (1).
5. Remove the power brake booster vacuum pipe hose (2) from the vacuum port on the intake manifold.
6. Release the power brake booster vacuum pipe (3) from the retainer on the charge air cooler intake pipe.
7. Remove the power brake booster vacuum pipe assembly.

Installation Procedure

Fig. 74: Power Brake Booster Vacuum Pipe Clamp
Courtesy of GENERAL MOTORS COMPANY

1. Install a new power brake booster vacuum pipe clamp (1) to the power brake booster vacuum pipe hose (2).
2. Install the power brake booster vacuum pipe hose to the vacuum port on the intake manifold.
3. Secure the power brake booster vacuum pipe clamp.
4. Install the power brake booster vacuum pipe (3) to the retainer on the charge air cooler intake pipe.

Fig. 75: Power Brake Booster Vacuum Pipe Quick Connection
Courtesy of GENERAL MOTORS COMPANY

5. Install the power brake booster vacuum pipe quick connect (1) to the power brake booster pump.
6. Install the power brake booster vacuum pipe (2) to the power brake booster vacuum rear pipe quick connect.

POWER BRAKE BOOSTER VACUUM PIPE REPLACEMENT (LUK)

Removal Procedure

1. Turn the engine OFF.

Fig. 76: Power Brake Booster Vacuum Pipe Quick Connect
Courtesy of GENERAL MOTORS COMPANY

2. Apply and release the brake pedal several times until the pedal becomes firm to deplete the power vacuum brake booster vacuum reserve.
3. Remove the air cleaner outlet duct. Refer to **Air Cleaner Outlet Duct Replacement** .
4. Disconnect the power brake booster vacuum pipe quick connect (1).

Fig. 77: Power Brake Booster Vacuum Pipe Clips
Courtesy of GENERAL MOTORS COMPANY

5. Release the power brake booster vacuum pipe clips (1).

Fig. 78: Power Brake Booster Vacuum Pipe And Clamp
Courtesy of GENERAL MOTORS COMPANY

6. Release the clamp (1) and remove the power brake booster vacuum pipe (2) from the intake manifold vacuum port.

Installation Procedure

Fig. 79: Power Brake Booster Vacuum Pipe And Clamp
Courtesy of GENERAL MOTORS COMPANY

1. Install the clamp (1) and install the power brake booster vacuum pipe (2) to the intake manifold vacuum port.

Fig. 80: Power Brake Booster Vacuum Pipe Clips
Courtesy of GENERAL MOTORS COMPANY

2. Install the power brake booster vacuum pipe to the clips (1).

Fig. 81: Power Brake Booster Vacuum Pipe Quick Connect
Courtesy of GENERAL MOTORS COMPANY

3. Connect the power brake booster vacuum pipe quick connect (1).
4. Install the air cleaner outlet duct. Refer to **Air Cleaner Outlet Duct Replacement** .

POWER BRAKE BOOSTER VACUUM REAR PIPE REPLACEMENT (LTG)

Removal Procedure

1. With the engine OFF, apply and release the brake pedal several times until the brake pedal becomes firm to deplete the power vacuum brake booster vacuum reserve.

Fig. 82: Power Brake Booster Vacuum Rear Pipe Vacuum Check Valve
Courtesy of GENERAL MOTORS COMPANY

2. Release the power brake booster vacuum rear pipe (1) from the retainer.
3. Remove the power brake booster vacuum rear pipe vacuum check valve (2) from the power vacuum brake booster.
4. Release the power brake booster vacuum rear pipe quick connect and disconnect the power brake booster vacuum pipe (3).
5. Remove the power brake booster vacuum rear pipe assembly.

Installation Procedure

Fig. 83: Power Brake Booster Vacuum Rear Pipe Vacuum Check Valve
Courtesy of GENERAL MOTORS COMPANY

1. Install the power brake booster vacuum rear pipe (1) to the retainer.
2. Install the power brake booster vacuum rear pipe vacuum check valve (2) to the power vacuum brake booster.
3. Connect the power brake booster vacuum rear pipe quick connect to the power brake booster vacuum pipe (3).

POWER BRAKE BOOSTER VACUUM REAR PIPE REPLACEMENT (LUK)

Removal Procedure

1. Turn the ignition OFF.
2. Apply the brake pedal several times until the brake pedal becomes firm to deplete the power vacuum brake booster vacuum reserve.

Fig. 84: Power Brake Booster Vacuum Pipe Quick Connect
Courtesy of GENERAL MOTORS COMPANY

3. Disconnect the power brake booster vacuum pipe quick connect (1).

Fig. 85: Power Brake Booster Vacuum Rear Pipe Retainer & Sensor
Courtesy of GENERAL MOTORS COMPANY

4. Disconnect the power brake booster vacuum sensor electrical connector.
5. Release the power brake booster vacuum rear pipe from the retainer (1) on the dash panel.
6. Remove the power brake booster vacuum rear pipe vacuum sensor and check valve (2) from the power vacuum brake booster.

Fig. 86: Power Brake Booster Vacuum Rear Pipe Retainers
Courtesy of GENERAL MOTORS COMPANY

7. Remove the power brake booster vacuum rear pipe from the retainers (1) on the dash panel.
8. Release the power brake booster vacuum rear pipe from the retainer (2) on the right front brake pipe.
9. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
10. Remove the right front wheelhouse front liner. Refer to **Front Wheelhouse Front Liner Replacement** .

Fig. 87: Power Brake Booster Vacuum Rear Pipe Quick Connect And Retainer
Courtesy of GENERAL MOTORS COMPANY

11. Release the power brake booster vacuum rear pipe retainer (1) from the power brake booster pump bracket.
12. Disconnect the power brake booster vacuum rear pipe quick connect (2).
13. Remove the power brake booster vacuum rear pipe from the vehicle.

Installation Procedure

Fig. 88: Power Brake Booster Vacuum Rear Pipe Quick Connect And Retainer
Courtesy of GENERAL MOTORS COMPANY

1. Position the power brake booster vacuum rear pipe to the vehicle.
2. Install the power brake booster vacuum rear pipe retainer (1) to the power brake booster pump bracket.
3. Connect the power brake booster vacuum rear pipe quick connect (2).
4. Install the right front wheelhouse front liner. Refer to **Front Wheelhouse Front Liner Replacement** .

Fig. 89: Power Brake Booster Vacuum Rear Pipe Retainers
Courtesy of GENERAL MOTORS COMPANY

5. Install the power brake booster vacuum rear pipe to the retainers (1) on the dash panel.
6. Install the power brake booster vacuum rear pipe to the retainer (2) on the right front brake pipe.

Fig. 90: Power Brake Booster Vacuum Rear Pipe Retainer & Sensor
Courtesy of GENERAL MOTORS COMPANY

7. Install the power brake booster vacuum rear pipe to the retainer (1) on the dash panel.
8. Install the power brake booster vacuum rear pipe vacuum sensor and check valve (2) to the power vacuum brake booster.
9. Connect the power brake booster vacuum sensor electrical connector.

Fig. 91: Power Brake Booster Vacuum Pipe Quick Connect
Courtesy of GENERAL MOTORS COMPANY

10. Connect the power brake booster vacuum pipe quick connect (1).

POWER BRAKE BOOSTER PUMP REPLACEMENT (LTG)

Removal Procedure

1. With the engine OFF, apply and release the brake pedal several times until the brake pedal becomes firm to deplete the power vacuum brake booster vacuum reserve.

Fig. 92: Power Brake Booster Vacuum Pipe Quick Connection
Courtesy of GENERAL MOTORS COMPANY

2. Release the power brake booster vacuum pipe quick connect (1) from the power brake booster pump.
3. Remove the power brake booster vacuum pipe (2) by releasing the power brake booster vacuum rear pipe quick connect.
4. Release the power brake booster vacuum pipe from the retainer on the charge air cooler intake pipe.
5. Position the power brake booster vacuum pipe aside.

Fig. 93: Power Brake Booster Pump Bolts
Courtesy of GENERAL MOTORS COMPANY

6. Remove the power brake booster pump bolts (1).

Fig. 94: Power Brake Booster Pump
Courtesy of GENERAL MOTORS COMPANY

7. Remove the power brake booster pump (1).
8. Inspect the power brake booster pump seal for damage and replace, if necessary.

Installation Procedure

1. Install the power brake booster pump seal to the power brake booster pump.

Fig. 95: Power Brake Booster Pump
Courtesy of GENERAL MOTORS COMPANY

2. Align the power brake booster pump drive to the camshaft and install the power brake booster pump (1).

Fig. 96: Power Brake Booster Pump Bolts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

3. Install the power brake booster pump bolts (1) and tighten to 25 N.m (18 lb ft).

Fig. 97: Power Brake Booster Vacuum Pipe Quick Connection
Courtesy of GENERAL MOTORS COMPANY

4. Connect the power brake booster vacuum pipe quick connect (1) to the power brake booster pump.
5. Connect the power brake booster vacuum pipe (2) to the power brake booster vacuum rear pipe quick connect.
6. Install the power brake booster vacuum pipe to the retainer on the charge air cooler intake pipe.

POWER BRAKE BOOSTER PUMP REPLACEMENT (LUK)

DESCRIPTION AND OPERATION

BRAKE ASSIST SYSTEM DESCRIPTION AND OPERATION

System Component Description

The brake assist system consists of the following:

Brake Pedal

Multiplies the braking effort applied by the driver.

Brake Pedal Pushrod

Transfers multiplied input force received from the brake pedal to the vacuum brake booster.

Vacuum Brake Booster

Uses source vacuum to decrease effort required by the driver when applying the brakes.

Vacuum Brake Booster Control Valve

Regulates the vacuum/atmospheric pressure within the vacuum brake booster. The calibration of the control valve gives more powerful vacuum assistance during low brake pedal pressure.

Vacuum Source

The source vacuum is either derived from the intake manifold or delivered from a pump, mechanically or electrically driven. For further information refer to **Brake Booster Vacuum Assist Description and Operation**.

Vacuum Source Delivery System

Enables delivery and retention of source vacuum for vacuum brake booster.

System Operation

Brake system input force from the driver is multiplied by the brake pedal and transferred by the pedal pushrod to the hydraulic brake master cylinder. Effort required to apply the brake system is reduced by the operation of the vacuum brake booster.

At rest, source vacuum is applied to both sides of each of the diaphragms in the dual booster. Return springs maintain the booster in a rest position.

When brake system force is applied, vacuum to the rear of the diaphragms is cut off, and air at atmospheric pressure is admitted in its place. The vacuum acts to pull the diaphragms forward, while the atmospheric pressure acts to push from behind. As a result, the amount of effort required by the driver is reduced. When input force is removed, vacuum again replaces atmospheric pressure within the vacuum power brake booster to help return the booster to rest. Return springs maintain the system in a rest position.

BRAKE BOOSTER VACUUM ASSIST DESCRIPTION AND OPERATION

System Component Description

Hydraulic Brakes Block Diagram

Fig. 99: Hydraulic Brake Block Diagram
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
HW	Hard-Wired
HW	Hard-Wired
B19B	B19B Brake Booster Vacuum Sensor
K17	K17 Electronic Brake Control Module
M9	M9 Brake Booster Pump Motor

The Brake Booster Vacuum Assist system consists of the following:

Brake Booster Auxiliary Vacuum Pump

The Brake Booster Vacuum Pump is a secondary vacuum supply to the brake booster used to maintain sufficient vacuum for brake assist.

Brake Booster Vacuum Sensor

The vacuum sensor is used to measure the level of vacuum available in the brake booster. The Electronic Brake Control Module supplies a 5 V reference and a low reference circuit to the brake booster vacuum sensor. The vacuum sensor is located in the brake booster or vacuum hose. The Brake Booster Vacuum Sensor supplies a voltage signal in relation to the pressure in the brake booster to the Electronic Brake Control Module.

Electronic Brake Control Module

The Electronic Brake Control Module monitors the vacuum in the brake booster using the Brake Booster Vacuum Sensor. When the vacuum within the system drops the Electronic Brake Control Module turns ON the Brake Booster Auxiliary Vacuum Pump.

Vacuum Brake Booster

When brake system input force is applied, air at atmospheric pressure is admitted to the rear of both vacuum diaphragms, providing a decrease in brake pedal effort required. When input force is removed, vacuum replaces the atmospheric pressure within the booster. The booster uses source vacuum to decrease the effort required by driver when applying the brake.

Vacuum Source

Vacuum is supplied by the engine vacuum or by the Brake Booster Auxiliary Vacuum Pump.

System Operation

The pump can be switched on and off by the Electronic Brake Control Module based on the required vacuum. Pressure variations during braking can be measured, and the pump can be activated to generate additional vacuum if required to increase the braking force.

BRAKE WARNING SYSTEM DESCRIPTION AND OPERATION

Brake Warning Indicator

Brake Warning Block Diagram

Fig. 100: Brake Warning Block Diagram
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
HW	Hard-Wired
DA	Serial Data
P16	P16 Instrument Cluster
B20	B20 Brake Fluid Level Switch
K17	K17 Electronic Brake Control Module

The instrument cluster turns the brake warning indicator ON when the following occurs:

- The instrument cluster performs the bulb check. The brake warning indicator illuminates for 5 s.
- When the electronic brake control module (EBCM) detects low brake fluid level it sets DTC C0267 and sends a serial data message to the instrument cluster, which will illuminate the red brake indicator.

Driver Information Center Messages

When the electronic brake control module (EBCM) detects low brake fluid level it sets DTC C0267 and sends a serial data message to the Driver Information Center , which will display Brake Fluid Low message.

HYDRAULIC BRAKE SYSTEM DESCRIPTION AND OPERATION

System Component Description

The hydraulic brake system consists of the following:

Hydraulic Brake Master Cylinder Fluid Reservoir

Contains supply of brake fluid for the hydraulic brake system.

Hydraulic Brake Master Cylinder

Converts mechanical input force into hydraulic output pressure.
Hydraulic output pressure is distributed from the master cylinder through 2 hydraulic circuits, supplying diagonally-opposed wheel apply circuits.

Hydraulic Brake Pressure Balance Control System

Regulates brake fluid pressure delivered to hydraulic brake wheel circuits, in order to control the distribution of braking force.
Pressure balance control is achieved through dynamic rear proportioning (DRP), which is a function of the ABS modulator.

Hydraulic Brake Pipes and Flexible Brake Hoses

Carries brake fluid to and from hydraulic brake system components.

Hydraulic Brake Wheel Apply Components

Converts hydraulic input pressure into mechanical output force.

System Operation

Mechanical force is converted into hydraulic pressure by the master cylinder, regulated to meet braking system demands by the pressure balance control system, and delivered to the hydraulic brake wheel circuits by the pipes and flexible hoses. The wheel apply components then convert the hydraulic pressure back into mechanical force which presses linings against rotating brake system components.

DTC B2955 (WITH BTM): SECURITY SENSOR DATA CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B2955

Security Sensor Data Circuit

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	B2955 00	B2955 00	-	-
Serial Data	B2955 00	B2955 00	B2955 00	B2955 00
Low Reference	-	B2955 00	-	-

Circuit/System Description

When a keyless entry transmitter is inserted into the transmitter pocket/slot and the ignition mode switch is

pressed, the transponder embedded in the transmitter is energized by the immobilizer antenna exciter coil. The transponder transmits a signal to the body control module (BCM). The BCM then compares this value to a value stored in memory. If the value is correct, the BCM will send the prerelease password via the serial data circuit to the engine control module (ECM). If the learned key code does not match or a transponder value is not received, the BCM will send the start disable password to the ECM.

Conditions for Running the DTC

Ignition is in the Accessory or Run position.

Conditions for Setting the DTC

The BCM detects a circuit fault on the immobilizer antenna circuits.

Action Taken When the DTC Sets

- Vehicle starting will be disabled.
- The security indicator in the instrument cluster will be illuminated. A service message will be displayed in the driver information center.

Conditions for Clearing the DTC

- A current DTC will be cleared when the condition for setting the DTC are no longer present.
- A history DTC will be cleared after 100 malfunction-free ignition cycles.

Control Module References for scan tool information

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the K89 Immobilizer Control Module. It may take up to 2 min for all vehicle systems to power down.
2. Verify a test lamp illuminates between the low reference circuit terminal 1 and B+.
 - **If the test lamp does not illuminate**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If the test lamp illuminates**
3. Ignition ON.

NOTE: In some instances, the K9 Body Control Module may only apply voltage for 3 s immediately after the ignition is turned ON. It may be necessary to monitor the DMM while turning the ignition ON to observe the voltage.

4. Test for greater than 9 V between the ignition circuit terminal 3 and ground.
 - **If 9 V or less**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the ignition circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If greater than 9 V**
5. Ignition ON.
6. Test for 10-13 V between the serial data circuit terminal 2 and ground.
 - **If less than 10 V**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the serial data circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the serial data circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If greater than 13 V**

1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module, ignition ON.
2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If between 10-13 V**
7. Replace the K89 Immobilizer Control Module.
8. Verify DTC B2955 does not set while operating the vehicle under the conditions for running the DTC.
 - **If DTC B2955 is set**

Replace the K9 Body Control Module.

 - **If DTC B2955 is not set**
9. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for body control module or immobilizer control module replacement, programming, and setup

DTC B2955 (WITHOUT BTM): SECURITY SENSOR DATA CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B2955

 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If the test lamp illuminates**
3. Ignition ON.

NOTE: In some instances, the K9 Body Control Module may only apply voltage for 3 s immediately after the ignition is turned ON. It may be necessary to monitor the DMM while turning the ignition ON to observe the voltage.

4. Test for greater than 9 V between the B+ circuit terminal 3 and ground.
 - **If 9 V or less**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If greater than 9 V**
5. Test for greater than 4 V between the serial data circuit terminal 2 and ground.
 - **If 4 V or less**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the serial data circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance

3. Test for less than 2 ohms in the serial data circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, replace the K9 Body Control Module.

- **If greater than 4 V**

6. Ignition OFF, disconnect the X3 harness connector at the K9 Body Control Module, ignition ON.

7. Test for less than 1 V between the K89 Immobilizer Control Module serial data circuit terminal 2 and ground.

- **If 1 V or greater**

Repair the short to voltage on the circuit.

- **If less than 1 V**

8. Replace the K89 Immobilizer Control Module.

9. Verify DTC B2955 does not set while operating the vehicle under the conditions for running the DTC.

- **If DTC B2955 is set**

Replace the K9 Body Control Module.

- **If DTC B2955 is not set**

10. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for body control module or immobilizer control module replacement, programming, and setup.

DTC B302A: MOBILE TELEPHONE COMMUNICATIONS INTERFACE REQUESTED IMMOBILIZATION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B302A

Mobile Telephone Communications Interface Requested Immobilization

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

As part of the vehicle telematics enhanced services, a request may be sent to the body control module (BCM) to disable vehicle starting. If a valid message is received by the BCM requesting that starting be disabled, the start enable message will not be sent to the engine control module (ECM).

Conditions for Running the DTC

The BCM continuously monitors for this DTC.

Conditions for Setting the DTC

A start disable message has been received from the telematics module.

Action Taken When the DTC Sets

Vehicle starting will be suspended and the security indicator will be illuminated.

Conditions for Clearing the DTC

- A current DTC will clear when the telematics start disable request is no longer received.
- A history DTC will clear after 100 ignition cycles in which the telematic start disable request is not seen.

Diagnostic Aids

- DTC B302A is only an indicator that a start disable request has been received from the vehicle telematics system and does not indicate a fault in the immobilizer or telematics system.
- To remove the start disable request, the vehicle account must be updated with the OnStar stolen vehicle team. This will require that a law enforcement agency or the customer contact OnStar to indicate that the vehicle has been successfully and safely recovered.
- If the OnStar system has been disabled or damaged during a theft attempt, the system will not be able to communicate and the start disable request will not be removed. OnStar must be functioning properly for the start disable request to be removed.

- **Connector Repairs**
- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Verify the OnStar system is not damaged and is operating properly, with no DTCs set.
 - **If the OnStar system is damaged, inoperative, or any OnStar DTCs are set**

These concerns must be corrected before the start disable can be removed.
 - **If the OnStar system is not damaged and is operating properly**
2. Press the blue OnStar button and ask the advisor to be transferred to the stolen vehicle team to verify the vehicle account has been updated.
3. Verify that OnStar is aware the vehicle has been recovered and that the vehicle account has been updated.
 - **If OnStar has not been notified that the vehicle has been recovered**

Contact the customer and advise them that for security purposes, they must contact OnStar and the law enforcement agency to update the vehicle account.

- **If the account has been properly updated**
4. Once the vehicle account has been updated and the start disable request has been removed, DTC B302A will transition to a history DTC. Clear the history DTC.

DTC B3031: SECURITY CONTROLLER IN LEARN MODE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B3031

Security Controller In Learn Mode

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

When learning a coded key, the body control module (BCM) is placed in learn mode. DTC B3031 will set automatically as an indicator that the system is in learn mode and not as a fault indicator. Once the coded key is learned, learn mode will be exited and the DTC cleared. If the BCM does not exit learn mode, DTC B3031 will remain current and indicate a fault. The instrument cluster security indicator will illuminate and the driver information center will display a message.

Conditions for Running the DTC

The immobilizer system is the learn coded keys state.

Conditions for Setting the DTC

The DTC will set any time the BCM enters the learn coded keys state.

Action Taken When the DTC Sets

The security indicator will illuminate. The driver information center will display a message.

Conditions for Clearing the DTC

- A current DTC B3031 will be cleared upon the successful exit of learn mode.
- A history DTC will be cleared after 100 malfunction-free ignition cycles.

Circuit/System Verification

1. Verify all available keys are correct for the vehicle. This can be accomplished by comparing the part number that is laser etched on the key to the part number listed in the parts catalog.
 - **If a key is not correct**

Replace the key
 - **If all keys are correct**
2. Perform the Replacing Keys procedure. Refer to **Key with Integrated Transmitter Programming (with BTM), Key with Integrated Transmitter Programming (without BTM)**.
3. Verify the K9 Body Control Module learns the vehicle key and exits the learn coded key state. The scan tool Master Keys Learned parameter should increment to 1.
 - **If the K9 Body Control Module does not exit the learn coded key state after the programming attempt**

Replace the K9 Body Control Module
 - **If the K9 Body Control Module exits the learn coded key state after the programming attempt**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for body control module replacement, programming, and setup.

DTC B3055: NO TRANSPONDER MODULATION OR NO TRANSPONDER

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B3055

No Transponder Modulation or No Transponder

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

Without BTM and/or ATH/ATS

When an ignition key is inserted into the ignition lock cylinder and the ignition is switched ON, the transponder embedded in the key is energized by the exciter coil surrounding the ignition lock cylinder. The transponder transmits a signal to the immobilizer control module. The immobilizer control module translates this signal to a serial data message which is sent to the body control module (BCM). The BCM then compares this value to a value stored in memory. If the value is correct, the BCM will send the prerelease password via the serial data circuit to the engine control module (ECM). If the learned key code does not match or a transponder value is not received, the BCM will send the start disable password to the ECM.

With BTM and/or ATH/ATS

When a ignition key is inserted into the key pocket/slot and the ignition mode switch is pressed, the transponder embedded in the key is energized by the immobilizer antenna exciter coil. The transponder transmits a signal to the immobilizer control module. The immobilizer control module translates this signal to a serial data message which is sent to the body control module (BCM). The BCM then compares this value to a value stored in memory. If the value is correct, the BCM will send the prerelease password via the serial data circuit to the engine control module (ECM). If the learned key code does not match or a transponder value is not received, the BCM will send the start disable password to the ECM.

Conditions for Running the DTC

Ignition is in the Accessory or Run position.

Conditions for Setting the DTC

The BCM is unable to measure the ignition key transponder value.

Action Taken When the DTC Sets

- Vehicle starting will be disabled.
- The security indicator will illuminate. A service message will be displayed in the driver information center.

Conditions for Clearing the DTC

- A current DTC will be cleared when the BCM detects a valid transponder value from the ignition key.
- A history DTC will be cleared after 100 malfunction-free ignition cycles.

Diagnostic Aids

- Because DTC B3055 may be caused by a malfunctioning vehicle key, it is necessary to have all available vehicle keys at the time of diagnosis. A possible scenario would be a customer leaving the vehicle with a spare key during the service visit, but the key which they use everyday, not the spare key, is the cause of

the DTC. Not having all available keys in this instance would result in the customer concern not being duplicate or a misdiagnosis.

- Ensure that the immobilizer control module is properly installed and fully seated. An audible and/or tactile click will indicate that the immobilizer control module is fully seated. To ensure proper transponder communication, the key must be in a specific location in relation to the immobilizer control module. If the immobilizer control module is not fully seated, transponder communication may not occur and DTC B3055 will set.
- For vehicle without BTM and/or ATH/ATS, verify the customer is not attempting to turn the ignition with the vehicle key partially folded. To ensure proper transponder communication, the key must be in a specific location in relation to the immobilizer control module. Attempting to start the vehicle with the key in the ignition and partially folded will result in no transponder communication and DTC B3055 will set.

Circuit/System Verification

Without BTM and/or ATH/ATS

1. Ignition ON.
2. Verify that DTC B1370, B1380, or B1441 is not set.
 - **If any of the DTCs are set**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If none of the DTCs are set**

3. Verify the scan tool body control module Accessory parameter changes between Active and Inactive when turning the ignition ON and OFF.

- **If the parameter does not change**

Refer to **Vehicle Will Not Change Power Mode** .

- **If the parameter changes**

4. Verify all available keys are correct for the vehicle. This can be accomplished by comparing the part number that is laser etched on the key to the part number listed in the parts catalog.

- **If a key is not correct**

Replace the appropriate key.

- **If all keys are correct**

5. Verify that DTC B3055 does not set while attempting to start the vehicle with each available key.

- **If DTC B3055 sets when attempting to start the vehicle with only one of the available keys**

Replace the appropriate key.

- **If DTC B3055 sets when attempting to start the vehicle with all of the available keys**

Replace the K89 Immobilizer Control Module.

- **If DTC B3055 does not set**

6. All OK.

With BTM and/or ATH/ATS

1. Ignition ON.
2. Verify that DTC B1370, B1380, or B1441 is not set.

- **If any of the DTCs are set**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If none of the DTCs are set**

3. Verify the scan tool body control module Accessory parameter changes between Active and Inactive when turning the ignition ON and OFF.

- **If the parameter does not change**

Refer to **Power Mode Mismatch** .

- **If the parameter changes**

4. Verify all available keys are correct for the vehicle. This can be accomplished by comparing the part number that is laser etched on the key to the part number listed in the parts catalog.

- **If a key is not correct**

Replace the appropriate key.

- **If all keys are correct**

5. Remove the battery from each of the available vehicle keys.
6. Verify that DTC B3055 does not set while attempting to start the vehicle with each available key. To start the vehicle with the key battery removed, the key must be placed in the key pocket/slot.
 - **If DTC B3055 sets when attempting to start the vehicle with only one of the available keys**

Replace the appropriate key.

- **If DTC B3055 sets when attempting to start the vehicle with all of the available keys**

Replace the K89 Immobilizer Control Module.

- **If DTC B3055 does not set**

7. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for immobilizer control module replacement, programming, and setup.

DTC B305C: IMMOBILIZER TRANSPONDER OF WRONG TYPE PROGRAMMED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B305C

Immobilizer Transponder of Wrong Type Programmed

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

Without BTM and/or ATH/ATS

When an ignition key is inserted into the ignition lock cylinder and the ignition is switched ON, the transponder embedded in the key is energized by the exciter coil surrounding the ignition lock cylinder. The transponder transmits a signal to the immobilizer control module. The immobilizer control module translates this signal to a serial data message which is sent to the body control module (BCM). The BCM then compares this value to a value stored in memory. If the value is correct, the BCM will send the prerelease password via the serial data circuit to the engine control module (ECM). If the learned key code does not match or a transponder value is not received, the BCM will send the start disable password to the ECM.

With BTM and/or ATH/ATS

When a ignition key is inserted into the key pocket/slot and the ignition mode switch is pressed, the transponder embedded in the key is energized by the immobilizer antenna exciter coil. The transponder transmits a signal to the immobilizer control module. The immobilizer control module translates this signal to a serial data message which is sent to the body control module (BCM). The BCM then compares this value to a value stored in memory. If the value is correct, the BCM will send the prerelease password via the serial data circuit to the engine control module (ECM). If the learned key code does not match or a transponder value is not received, the BCM will send the start disable password to the ECM.

Conditions for Running the DTC

- Ignition is in the Accessory or Run position
- Battery voltage is greater than 9 volts
- Transponder authentication has occurred

Conditions for Setting the DTC

- The programed transponder type does not match the equipped system on the vehicle.
- A transponder used for vehicles without BTM and/or ATH/ATS has been programmed to a vehicle with BTM and/or ATH/ATS.
- A transponder used for vehicles with BTM and/or ATH/ATS has been programmed to a vehicle without BTM and/or ATH/ATS.

Action Taken When the DTC Sets

No action is taken.

Conditions for Clearing the DTC

- A current DTC will be cleared when the BCM detects a programed transponder type that matches the equipped system on the vehicle.
- A history DTC will be cleared after 100 malfunction-free ignition cycles.

DTC B3060: UNPROGRAMMED TRANSPONDER IDENTIFICATION CODE RECEIVED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.

- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B3060

Unprogrammed Transponder Identification Code Received

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

Without BTM and/or ATH/ATS

When an ignition key is inserted into the ignition lock cylinder and the ignition is switched ON, the transponder embedded in the key is energized by the exciter coil surrounding the ignition lock cylinder. The transponder transmits a signal to the body control module (BCM). The BCM then compares this value to a value stored in memory. If the value is correct, the BCM will send the prerelease password via the serial data circuit to the engine control module (ECM). If the learned key code does not match or a transponder value is not received, the BCM will send the start disable password to the ECM.

With BTM and/or ATH/ATS

When a keyless entry transmitter is inserted into the transmitter pocket/slot and the ignition mode switch is pressed, the transponder embedded in the transmitter is energized by the immobilizer antenna exciter coil. The transponder transmits a signal to the body control module (BCM). The BCM then compares this value to a value stored in memory. If the value is correct, the BCM will send the prerelease password via the serial data circuit to the engine control module (ECM). If the learned key code does not match or a transponder value is not received, the BCM will send the start disable password to the ECM.

Conditions for Running the DTC

Ignition is in the Accessory or Run position.

Conditions for Setting the DTC

The transponder value measured by the BCM is incorrect or not learned to the vehicle.

Action Taken When the DTC Sets

- Vehicle starting will be disabled.
- The security indicator in the instrument cluster will be illuminated. The driver information center will display a service message.

Conditions for Clearing the DTC

- A current DTC will be cleared when the BCM detects a valid transponder value from the ignition key.
- A history DTC will be cleared after 100 malfunction-free ignition cycles.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Perform the Replacing Keys procedure. Refer to **Key with Integrated Transmitter Programming (with BTM), Key with Integrated Transmitter Programming (without BTM)**.
2. Verify the K9 Body Control Module learns the vehicle key. The scan tool Master Keys Learned parameter should increment to indicate another key has been learned.
 - **If the BCM does not learn the key**

Replace the key.
 - **If the BCM learns the key**
3. All OK.

DTC B389A: ENVIRONMENT IDENTIFICATION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B389A

Environment Identification

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

When certain modules are programmed and configured during installation, the module learns a specific environment identifier which is unique to the vehicle. The environment identifier is used to prevent the swapping modules between vehicles. The body control module (BCM) is the keeper of the environment identifier. The Instrument Cluster, Electronic Brake Control Module, HVAC Control Module, Inflatable Restraint Sensing and Diagnostic Module, engine control module (ECM), and Steering Column Lock Module (if equipped) each learn the environment identifier during their configuration process. During vehicle operation, the BCM sends the immobilizer identifier as a challenge and each module responds to the challenge by sending the environment identifier back to the BCM. If the BCM sends an incorrect immobilizer identifier or a specific number of incorrect environment identifiers are received, vehicle starting is disabled.

Conditions for Running the DTC

Ignition is in the ACCESSORY or RUN position.

Conditions for Setting the DTC

An incorrect immobilizer identifier was broadcast by the BCM.

Action Taken When the DTC Sets

- The security indicator in the instrument cluster will illuminate.
- Vehicle starting will be disabled.

Conditions for Clearing the DTC

A current DTC will be cleared when the BCM broadcasts a correct immobilizer identifier.

Diagnostic Aids

If BCM programming is not completed after BCM replacement, the immobilizer identifier will not be learned. If DTC B389A sets immediately after the replacement and programming of a BCM, perform the programming procedure again.

Circuit/System Verification

1. Verify DTC B389A did not set immediately following the replacement and programming of the K9 Body Control Module.
 - **If the DTC set immediately after the replacement and programming of the K9 Body Control Module**

The immobilizer learn procedure was not properly completed. Perform the BCM immobilizer learn using the body control module IMMO Function with Existing Transponder or Remote Key in SPS. Refer to **Immobilizer System Component Programming (with BTM)**, **Immobilizer System Component Programming (without BTM)**.
 - **If the DTC did not set immediately after the replacement and programming of the K9 Body Control Module**
2. Verify DTC B3902 is not set in any of the control modules listed below:
 - K20 Engine Control Module
 - K36 Inflatable Restraint Sensing and Diagnostic Module
 - K17 Electronic Brake Control Module
 - K33 HVAC Control Module
 - P16 Instrument Cluster

- K60 Steering Column Lock Module (if equipped)
- **If DTC B3902 is set in any of the modules**

Refer to **DTC B3902**.

- **If DTC B3902 is not set in any of the modules**
3. Perform the K9 Body Control Module immobilizer learn using body control module IMMO Function with Existing Transponder or Remote Key in SPS. Refer to **Immobilizer System Component Programming (with BTM)**, **Immobilizer System Component Programming (without BTM)**.
 4. Verify DTC B389A does not set after programming.
 - **If the DTC sets after programming**

Replace the K9 Body Control Module.

- **If the DTC does not set after programming**
5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for body control module replacement, programming, and setup.

DTC B3902: INCORRECT IMMOBILIZER IDENTIFIER RECEIVED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B3902

Incorrect Immobilizer Identifier Received

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

When certain modules are programmed and configured during installation, the module learns a specific environment identifier which is unique to the vehicle. The environment identifier is used to prevent the swapping modules between vehicles. The body control module (BCM) is the keeper of the environment identifier. The Instrument Cluster, Electronic Brake Control Module, HVAC Control Module, Inflatable Restraint Sensing and Diagnostic Module, engine control module (ECM), and Steering Column Lock Module

(if equipped) each learn the environment identifier during their configuration process. During vehicle operation, the BCM sends the immobilizer identifier as a challenge and each module responds to the challenge by sending the environment identifier back to the BCM. If the BCM sends an incorrect immobilizer identifier or a specific number of incorrect environment identifiers are received, vehicle starting is disabled.

Conditions for Running the DTC

Ignition is in the ACCESSORY or RUN position.

Conditions for Setting the DTC

The control module's environment identifier does not match the environment identifier stored by the BCM.

Action Taken When the DTC Sets

- The security indicator in the instrument cluster will illuminate.
- Vehicle starting will be disabled.

Conditions for Clearing the DTC

A current DTC will be cleared when the module learns a correct environment identifier.

DTC B3935: TRANSPONDER AUTHENTICATION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B3935

Transponder Authentication

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

Without BTM and/or ATH/ATS

When an ignition key is inserted into the ignition lock cylinder and the ignition is switched ON, the transponder embedded in the key is energized by the exciter coil surrounding the ignition lock cylinder. The transponder transmits a signal to the immobilizer control module. The immobilizer control module translates this signal to a serial data message which is sent to the body control module (BCM). The BCM then compares this value to a value stored in memory. If the value is correct, the BCM will send the prerelease password via the serial data circuit to the engine control module (ECM). If the learned key code does not match or a transponder value is not received, the BCM will send the start disable password to the ECM.

With BTM and/or ATH/ATS

When a ignition key is inserted into the key pocket/slot and the ignition mode switch is pressed, the transponder embedded in the key is energized by the immobilizer antenna exciter coil. The transponder transmits a signal to the immobilizer control module. The immobilizer control module translates this signal to a serial data message which is sent to the body control module (BCM). The BCM then compares this value to a value stored in memory. If the value is correct, the BCM will send the prerelease password via the serial data circuit to the engine control module (ECM). If the learned key code does not match or a transponder value is not received, the BCM will send the start disable password to the ECM.

Conditions for Running the DTC

- Ignition is in the Accessory or Run position.
- A valid transponder value has been read.

Conditions for Setting the DTC

The transponder calculation of the challenge from the BCM does not match the BCM calculation.

Action Taken When the DTC Sets

- Vehicle starting will be disabled.
- The security indicator will illuminate. The driver information center will display a service message.

Conditions for Clearing the DTC

- A current DTC will be cleared when a valid transponder value has been read and authenticated.
- A history DTC will be cleared after 100 malfunction-free ignition cycles.

DTC B3976: UNCONFIGURED TRANSPONDER

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B3976

Unconfigured Transponder

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

Without BTM and/or ATH/ATS

When an ignition key is inserted into the ignition lock cylinder and the ignition is switched ON, the transponder embedded in the key is energized by the exciter coil surrounding the ignition lock cylinder. The transponder

transmits a signal to the immobilizer control module. The immobilizer control module translates this signal to a serial data message which is sent to the body control module (BCM). The BCM then compares this value to a value stored in memory. If the value is correct, the BCM will send the prerelease password via the serial data circuit to the engine control module (ECM). If the learned key code does not match or a transponder value is not received, the BCM will send the start disable password to the ECM.

With BTM and/or ATH/ATS

When a ignition key is inserted into the key pocket/slot and the ignition mode switch is pressed, the transponder embedded in the key is energized by the immobilizer antenna exciter coil. The transponder transmits a signal to the immobilizer control module. The immobilizer control module translates this signal to a serial data message which is sent to the body control module (BCM). The BCM then compares this value to a value stored in memory. If the value is correct, the BCM will send the prerelease password via the serial data circuit to the engine control module (ECM). If the learned key code does not match or a transponder value is not received, the BCM will send the start disable password to the ECM.

Conditions for Running the DTC

- Ignition is in the Accessory or Run position.
- The BCM is in the learn coded key state.

Conditions for Setting the DTC

The BCM has determined the current key is not configured as a proper vehicle key.

Action Taken When the DTC Sets

- Vehicle starting will be disabled.
- The security indicator in the instrument cluster will be illuminated. A service message will be displayed in the driver information center.

Conditions for Clearing the DTC

- A current DTC will be cleared when the BCM detects a properly configured vehicle key.
- A history DTC will be cleared after 100 malfunction-free ignition cycles.

2. All OK.

DTC B3984: DEVICE 1 ENVIRONMENT IDENTIFIER NOT PROGRAMMABLE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B3984

Device 1 Environment Identifier Not Programmable

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

When certain modules are programmed and configured during installation, the module learns a specific environment identifier which is unique to the vehicle. The environment identifier is used to prevent the swapping modules between vehicles. The body control module (BCM) is the keeper of the environment identifier. The instrument cluster, electronic brake control module, HVAC control module, inflatable restraint sensing and diagnostic module, engine control module (ECM), and steering column lock module (if equipped)

each learn the environment identifier during their configuration process. During vehicle operation, the BCM sends the immobilizer identifier as a challenge and each module responds to the challenge by sending the environment identifier back to the BCM. If the BCM sends an incorrect immobilizer identifier or a specific number of incorrect environment identifiers are received, vehicle starting is disabled.

Conditions for Running the DTC

Ignition is in the ACCESSORY or RUN position.

Conditions for Setting the DTC

An incorrect environment identifier is programmed or no environment identifier is programmed.

Action Taken When the DTC Sets

- The security indicator in the instrument cluster will illuminate.
- Vehicle starting will be disabled.

Conditions for Clearing the DTC

A current DTC will be cleared when the module learns a correct environment identifier.

DTC P0513: IMMOBILIZER KEY INCORRECT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0513

Immobilizer Key Incorrect

Circuit/System Description

The body control module (BCM) sends the pre-release information to the engine control module (ECM) via the serial data circuit. The ECM then sends a challenge to the BCM. Both the ECM and BCM perform a calculation on this challenge. If the calculated response from the BCM equals the calculation performed by the ECM, the ECM will allow vehicle starting.

Conditions for Running the DTC

Ignition is in the ACCESSORY or RUN position.

Conditions for Setting the DTC

The calculated response from the BCM does not equal the calculation performed by the ECM.

Action Taken When the DTC Sets

- The security indicator in the instrument cluster will illuminate.
- Vehicle starting will be disabled.

Conditions for Clearing the DTC

- A current DTC will be cleared when a valid calculation is received.
- A history DTC will be cleared after 40 malfunction-free ignition cycles.

Diagnostic Aids

DTC P0513 may be caused by a loose connection or intermittent poor continuity on the ECM ground or at the negative battery cable. Be sure to check the ECM ground(s) and negative battery cable if normal system diagnosis does not correct the concern.

Circuit/System Verification

1. Verify there are no immobilizer DTCs set in the K9 Body Control Module.
 - **If any immobilizer DTCs are set in the K9 Body Control Module**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If no immobilizer DTCs are set in the K9 Body Control Module**

2. Perform the K9 Body Control Module immobilizer learn using the body control module IMMO Function with Existing Transponder or Remote Key in SPS. Refer to **Immobilizer System Component Programming (with BTM)**, **Immobilizer System Component Programming (without BTM)**.
3. Verify the engine starts after the K9 Body Control Module completes the learn procedure.
 - **If the engine does not start**

Perform the K20 Engine Control Module immobilizer learn using the engine control module IMMO Learn in SPS. Refer to **Immobilizer System Component Programming (with BTM)**, **Immobilizer System Component Programming (without BTM)**.

- **If the engine starts**

4. All OK.

DTC P0633: IMMOBILIZER KEY NOT PROGRAMMED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0633

Immobilizer Key Not Programmed

Circuit/System Description

When learning the immobilizer data, as well as the challenge and response sequence, the engine control module (ECM) is placed in learn mode. DTC P0633 will set automatically as an indicator that the system is in learn mode and not as a fault indicator. Once the immobilizer data and challenge/response are learned, learn mode will be exited when the engine is successfully started. If the ECM does not exit learn mode, DTC P0633 will remain current and indicate a fault.

Conditions for Running the DTC

The ECM is in learn mode.

Conditions for Setting the DTC

DTC P0633 will set any time the ECM enters learn mode.

Action Taken When the DTC Sets

The security indicator in the instrument cluster will illuminate.

Conditions for Clearing the DTC

- A current DTC will be cleared upon a successful engine start after exit of learn mode.
- A history DTC will be cleared after 100 malfunction-free ignition cycles.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

NOTE: DTC P0633 will clear upon a successful engine start. Any malfunction that will cause a no-start condition will prevent DTC P0633 from clearing. Prior to diagnosing DTC P0633, ensure that all power moding and engine control systems are operating properly and all conditions that may cause a no-start have been corrected. Do not replace the K20 Engine Control Module. Replacing the K20 Engine Control Module will not correct the no-start condition.

1. Verify there are no immobilizer DTCs set in the K9 Body Control Module.
 - If any immobilizer DTCs are set in the K9 Body Control Module

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If no immobilizer DTCs are set in the K9 Body Control Module**
- 2. Perform the K20 Engine Control Module immobilizer learn using the engine control module IMMO Learn in SPS. Refer to **Immobilizer System Component Programming (with BTM)**, **Immobilizer System Component Programming (without BTM)**.
- 3. Verify the engine starts after the K20 Engine Control Module completes the learn procedure.
 - **If the engine does not start**

An undiagnosed no-start condition exists. Refer to the appropriate subsection and diagnostic to correct the no-start condition.

- **If the engine starts**
4. All OK.

DTC P162B: REMOTE VEHICLE SPEED LIMITING SIGNAL MESSAGE COUNTER INCORRECT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P162B

Remote Vehicle Speed Limiting Signal Message Counter Incorrect

Circuit/System Description

When a remote slow-down request is sent from OnStar, the vehicle communication interface control module sends a serial data message to the engine control module (ECM) indicating that reduced vehicle speed has been requested. Once the request is active, the ECM begins reducing engine torque to match the requested vehicle speed and the REDUCED ENGINE POWER message is displayed.

Conditions for Running the DTC

- The engine run time is greater than 5 s
- A remote slow-down request is sent from OnStar

Conditions for Setting the DTC

- The VIN embedded in the slow-down request does not match the VIN stored in the ECM.
- The rolling code counter embedded in the slow-down request does not increment for ten consecutive messages.

Action Taken When the DTC Sets
