- ECM ignores all reduced vehicle speed request messages from the vehicle communication interface module.
- The ECM stores DTC P162B in history.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear after 40 malfunction-free ignition cycles have occurred.

Circuit/System Verification

1. Perform the Stolen Vehicle Slow-Down Clear procedure with the scan tool.
2. Verify DTC P162B is not set.
 - **If DTC P162B is set**
 1. Replace the K73 Telematics Communication Interface Control Module.
 2. Verify the DTC does not set while operating the vehicle within the Conditions for Running the DTC.
 - If the DTC sets, replace the K20 Engine Control Module.

- If the DTC does not set
- 3. All OK.

- **If DTC P162B is not set**

- 3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for telematics communication interface control module or engine control module replacement, programming, and setup

DTC P1631: IMMOBILIZER FUEL ENABLE SIGNAL NOT CORRECT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P1631

Immobilizer Fuel Enable Signal Not Correct

Circuit/System Description

The body control module (BCM) sends the pre-release information to the engine control module (ECM) via the serial data circuit. The ECM then sends a challenge to the BCM. Both the ECM and BCM perform a calculation on this challenge. If the calculated response from the BCM equals the calculation performed by the ECM, the ECM will allow vehicle starting. The BCM follows this action by sending the remaining immobilizer data to the ECM. If the immobilizer data sent by the BCM matches that stored by the ECM, the ECM will allow the engine to remain running.

Conditions for Running the DTC

Ignition is in the ACCESSORY or RUN position.

Conditions for Setting the DTC

The ECM receives incorrect immobilizer data from the BCM.

Action Taken When the DTC Sets

- The security indicator in the instrument cluster will illuminate.

- Vehicle starting will be disabled.

Conditions for Clearing the DTC

- A current DTC will be cleared when correct immobilizer data is received.
- A history DTC will be cleared after 40 malfunction-free ignition cycles.

Circuit/System Verification

1. Verify there are no immobilizer DTCs set in the K9 Body Control Module.
 - **If any immobilizer DTCs are set in the K9 Body Control Module**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .
 - **If no immobilizer DTCs are set in the K9 Body Control Module**
2. Perform the K9 Body Control Module immobilizer learn using the body control module IMMO Function with Existing Transponder or Remote Key in SPS. Refer to **Immobilizer System Component Programming (with BTM)**, **Immobilizer System Component Programming (without BTM)**.
3. Verify the engine starts after the K9 Body Control Module completes the learn procedure.
 - **If the engine does not start**

Perform the K20 Engine Control Module immobilizer learn using the engine control module IMMO Learn in SPS. Refer to **Immobilizer System Component Programming (with BTM)**, **Immobilizer System Component Programming (without BTM)**.

- If the engine starts

4. All OK.

DTC P1649: IMMOBILIZER SECURITY CODE NOT PROGRAMMED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P1649

Immobilizer Security Code Not Programmed

Circuit/System Description

When learning the security code, as well as the challenge and response sequence, the engine control module (ECM) is placed in learn mode. Once the security code and challenge/response are learned, learn mode will be exited when the engine is successfully started.

Conditions for Running the DTC

The ECM is in learn mode.

Conditions for Setting the DTC

The ECM has not learned a security code.

Action Taken When the DTC Sets

The security indicator in the instrument cluster will illuminate.

Conditions for Clearing the DTC

- A current DTC will be cleared upon a successful engine start after exit of learn mode.
- A history DTC will be cleared after 100 malfunction-free ignition cycles.

SYMPTOMS - IMMOBILIZER

IMPORTANT: The following steps must be completed before using the symptom tables.

1. Perform the **Diagnostic System Check - Vehicle** before using the symptom tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data links.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to **Immobilizer Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the systems. Refer to **Checking Aftermarket Accessories**.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections**.

Symptom List

Refer to **OnStar Stolen Vehicle Slowdown Active** to diagnose the symptom.

ONSTAR STOLEN VEHICLE SLOWDOWN ACTIVE

Diagnostic Instructions

NOTE: This procedure is not used in Brazil.

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

When a remote slow-down request is sent from OnStar, the Telematics Communication Interface Control Module sends a serial data message to the engine control module (ECM) indicating that reduced vehicle speed has been requested. Once the request is active, the ECM begins reducing engine torque to match requested vehicle speed and the REDUCED ENGINE POWER message is displayed.

Circuit/System Verification

1. Verify the vehicle is not in the OnStar initiated Stolen Vehicle Slowdown mode. This can be accomplished by verifying the scan tool Telematics Enhanced Service Immobilization parameter is No.
 - **If the scan tool Telematics Enhanced Service Immobilization parameter is Yes**
 1. Perform the Remote Vehicle Speed Limiting Reset procedure with the scan tool.
 2. Press the blue OnStar button and inform the advisor that you need to be transferred to the stolen vehicle team to update the vehicle account.
 - **If the scan tool BCM Telematics Enhanced Service Immobilization parameter is No**
2. All OK.

REPAIR INSTRUCTIONS

THEFT DETERRENT MODULE REPLACEMENT (WITHOUT BTM)

Fig. 2: Theft Deterrent Module & Fasteners (Without BTM)
 Courtesy of GENERAL MOTORS COMPANY

Theft Deterrent Module Replacement (Without BTM)

Callout	Component Name
Preliminary Procedure	
Remove the lower steering column trim cover. Refer to <u>Steering Column Trim Cover Replacement</u> .	
1	Theft Deterrent Module Fastener (Qty: 2) Procedure Disconnect the electrical connector.
2	Theft Deterrent Module Procedure Release the theft deterrent module from the ignition switch.

THEFT DETERRENT MODULE REPLACEMENT (WITH BTM)

Fig. 3: Theft Deterrent Module (With BTM)
 Courtesy of GENERAL MOTORS COMPANY

Theft Deterrent Module Replacement (With BTM)

Callout	Component Name
Preliminary Procedures	
1. Remove the front floor console. Refer to <u>Front Floor Console Replacement</u> . 2. Remove the front floor console cup holder. Refer to <u>Front Floor Console Cup Holder Replacement</u> .	
1	Theft Deterrent Module Fastener (Qty: 2)
2	Theft Deterrent Module Assembly
	Procedure 1. Disconnect the electrical connector. 2. Program the theft deterrent control module after replacement. Refer to <u>Control Module References</u> .

IMMOBILIZER SYSTEM COMPONENT PROGRAMMING (WITH BTM)

This procedure will learn the immobilizer function and require greater than 15 minutes to complete. If the battery voltage is low, charge the battery before proceeding with the learn. If the body control module (BCM) or engine control module (ECM) have been replaced, they must be programmed before performing this learn procedure.

Depending on the immobilizer function being learned or the component replaced, different learn functions are required to be performed. These learn functions are as follows:

Immobilizer System Component Programming (with BTM)

Function name on SPS tool:	Function description:	When the function should be used:	Notes:
Body Control Module IMMO Function with Existing Transponder or Remote Key	The BCM will relearn the immobilizer passwords and data while reusing the existing vehicle keys	The BCM has been replaced and the existing vehicle keys are being reused or a diagnostic has instructed to perform the learn	-
Body Control Module IMMO Function with New Transponder or Remote Key	The BCM will relearn the immobilizer passwords and data while using new vehicle keys	The BCM has been replaced and new vehicle keys are being reused	-
Engine Control Module IMMO Learn	The ECM will relearn the immobilizer passwords and data	The ECM has been replaced or a diagnostic has instructed to perform the learn	-
Engine Control Module and Body Control Module IMMO Learn	The ECM and BCM will learn new immobilizer passwords and data	Both the ECM and BCM have been replaced (this selection will REQUIRE new vehicle keys be used)	Because both the ECM and BCM have been replaced and are learning new immobilizer passwords and data, all vehicle keys must also be replaced
Program Transponder or Remote Key (Add)	A new vehicle key will learn the immobilizer passwords and data	A new vehicle key is being added (does not affect other vehicle keys)	This function may not be available in all sales regions
Program Transponder or Remote Key (Delete)	All existing vehicle keys will be invalidated and any desired keys are relearned	All vehicle keys are desired to be invalidated and certain keys relearned or a diagnostic has instructed to perform the learn	This procedure may be used if a customer has had their keys lost or stolen and wishes to invalidate the keys, making them unable to start the vehicle

1. Connect a scan tool to the vehicle and access SPS.
2. Turn ON the ignition, with the engine OFF.
3. Ensure that all power consuming devices are turned OFF on the vehicle.
4. Select SPS application and follow the on-screen instructions.
5. Select Reprogram ECU.
6. Select IMMO Immobilizer Learn - Setup.

7. Select the appropriate programming function based on the component that was replaced or is being programmed. Refer to the table at the top of this document for assistance in choosing the correct programming function.

NOTE:

- **At multiple times during the learn procedure, SPS will instruct you to turn the ignition to the run position. Make sure the vehicle is actually in the run mode before continuing on the SPS terminal. If the ignition is not in the run mode, the learn procedure will fail. To verify the vehicle is in Run mode, verify the green LED is illuminated on the ignition mode switch.**
- **The key pocket is located inside the center console storage area, under the cup holder. To access the pocket, remove the rubber cup holder liner. Place the key into the pocket with the buttons facing up.**

8. Follow the on-screen instructions.

NOTE:

If the programming does not complete or hangs during the programming operation, refer to Unable to Complete Programming below.

9. After programming all keys "Programming Complete" is displayed.
10. Press and hold the ignition mode switch for 15 seconds.
11. Press the lock and unlock button on each transmitter that was programmed. This will awaken each transmitter and allow passive and active keyless entry functions to be established.
12. With a scan tool, clear any DTCs.
13. Verify each key is operating properly. Operate each of the keyless entry functions using the buttons on the transmitter and then start the vehicle. When verifying operation, make sure that no other keys are near the vehicle.

Unable to Complete Programming

When attempting to program immobilizer components, various conditions may prevent the programming operation from completing. These conditions may be caused by normal system operation, a system malfunction, or an external influence. Common symptoms of a incomplete programming is receiving an error message during the attempt or having the SPS application become unresponsive.

- DTCs are set in the body control module (BCM)

The immobilizer system is a function of the BCM software. If immobilizer DTCs are set in the BCM, such as DTC B2955, a fault has been identified in the immobilizer system. If this is not corrected before attempting to program components, the programming may not complete. Correct all immobilizer DTCs before attempting to program any immobilizer components.

- The key has been programmed to another vehicle or is not the correct type for the vehicle

A key can only be programmed to a single vehicle. Once a key is programming to a vehicle, it is paired

for the life of the key. The key can be learned to the same vehicle again and again, but it is not able to be programmed to a different vehicle.

Many vehicle are available with both a base keyless entry system and an optional passive entry system. These keys typically look identical but cannot be substituted for one another. To verify the key is correct, compare the part number that is etched on the key to the part number identified in the parts catalog. The key should be correct for the system installed in the vehicle.

- The theft deterrent module is not properly secured or the key is not properly positioned in the pocket/slot.

A theft deterrent module that is not fully seated or is otherwise not properly secured may prevent a coupling between the transponder located in the key and the theft deterrent module. Being out of place by as little as 1 mm may prevent programming from completing. Make sure the theft deterrent module is properly installed and fully seated in it's clip.

The key should be positioned in the proper orientation so that it lays flat in the pocket. If a large key ring or other item attached to the key prevents the key from laying flat, remove the key ring.

To determine if the theft deterrent module is properly secured, remove the battery from the key and place the key into the pocket/slot. Attempt to change the vehicle mode by pressing the vehicle ON/OFF switch. The vehicle should change modes. If the NO REMOTE DETECTED message is displayed on the DIC, the theft deterrent module may not be properly secured.

- External interference is interrupting the programming operation

External RF interference and EMI may interrupt the low frequency coupling between the key and theft deterrent module. This interference may come from many different locations. Devices plugged into the vehicle power outlets such as cell phone chargers, laptop computers, GPS devices, etc. may cause interference. Vehicle location may also cause interference. Locations near airports and military installations may causer interference. Remove all customer installed devices and, if necessary, move the vehicle if interference is suspected.

IMMOBILIZER SYSTEM COMPONENT PROGRAMMING (WITHOUT BTM)

This procedure will learn the immobilizer function. If the battery voltage is low, charge the battery before proceeding with the learn. If the body control module (BCM) or engine control module (ECM) have been replaced, they must be programmed before performing this learn procedure.

Depending on the immobilizer function being learned or the component replaced, different learn functions are required to be performed. These learn functions are as follows:

Immobilizer System Component Programming (without BTM)

Function name on SPS tool:	Function description:	When the function should be used:	Notes:
Body Control Module IMMO Function with	The BCM will relearn the immobilizer passwords	The BCM has been replaced and the existing vehicle keys are being	-

Existing Transponder or Remote Key	and data while reusing the existing vehicle keys	reused or a diagnostic has instructed to perform the learn	
Body Control Module IMMO Function with New Transponder or Remote Key	The BCM will relearn the immobilizer passwords and data while using new vehicle keys	The BCM has been replaced and new vehicle keys are being reused	-
Engine Control Module IMMO Learn	The ECM will relearn the immobilizer passwords and data	The ECM has been replaced or a diagnostic has instructed to perform the learn	-
Engine Control Module and Body Control Module IMMO Learn	The ECM and BCM will learn new immobilizer passwords and data	Both the ECM and BCM have been replaced (this selection will REQUIRE new vehicle keys be used)	Because both the ECM and BCM have been replaced and are learning new immobilizer passwords and data, all vehicle keys must also be replaced
Program Transponder or Remote Key (Add)	A new vehicle key will learn the immobilizer passwords and data	A new vehicle key is being added (does not affect other vehicle keys)	This function may not be available in all sales regions. Refer to the SPS application to determine if a particular vehicle is able to add keys using this method.
Program Transponder or Remote Key (Delete)	All existing vehicle keys will be invalidated and any desired keys are relearned	All vehicle keys are desired to be invalidated and certain keys relearned or a diagnostic has instructed to perform the learn	This procedure may be used if a customer has had their keys lost or stolen and wishes to invalidate the keys, making them unable to start the vehicle

1. Connect a scan tool to the vehicle and access SPS.
2. Turn ON the ignition, with the engine OFF.
3. Ensure that all power consuming devices are turned OFF on the vehicle.
4. Select SPS application and follow the on-screen instructions.
5. Select Reprogram ECU.
6. Select IMMO Immobilizer Learn - Setup.
7. Select the appropriate programming function based on the component that was replaced or is being programmed. Refer to the table at the top of this document for assistance in choosing the correct programming function.
8. Follow the on-screen instructions.
9. After programming all keys "Programming Complete" is displayed.

10. Press the lock and unlock button on each transmitter that was programmed. This will awaken each transmitter and allow keyless entry functions to be established.
11. With a scan tool, clear any DTCs.
12. Verify each key is operating properly. Operate each of the keyless entry functions using the buttons on the transmitter and then start the vehicle. When verifying operation, make sure that no other keys are near the vehicle.

KEY WITH INTEGRATED TRANSMITTER PROGRAMMING (WITH BTM)

Keys can be programming in various ways using the procedures outlined below. Using the Replacing Keys procedure will first erase all the known keys from the vehicle. Any existing keys and any new keys will then be programmed. This procedure should be used any time a key is required to be unlearned or erased from a vehicle. If a new key is being learned to a vehicle to replace a damaged, inoperative, missing, or stolen key, the Replacing Keys procedure must be used. This ensures that the old key cannot be used to access or start the vehicle after programming.

The Adding Keys procedure does not erase any keys prior to programming. The procedure will simply program the key into the next available slot. The Adding Keys procedure should only be used when adding an additional keys to the vehicle. The Adding Keys procedure should never be used to program a key to a vehicle that is having a key replaced, regardless of the cause for the replacement.

Replacing Keys (Without SPS)

NOTE:

- **This procedure will unlearn all previously learned keys. All keys that are to be programmed must be with the vehicle.**
- **A total of eight keys maybe be learned to a single vehicle.**
- **This procedure will only learn the vehicle key information. This procedure will not learn any immobilizer information between the body control module (BCM) and engine control module (ECM).**
- **This procedure may be used with or without existing learned keys being present. If existing keys are present, keep the keys away from the vicinity of the vehicle. Failure to keep learned keys away from the vehicle will result in the learn changing to the Adding Keys procedure.**
- **The keys to be learned must duplicate the mechanical cut of the current key.**

1. Insert the mechanical key of the new key into the key lock cylinder located on the outside of the driver door and turn the key to the unlock position five times within ten seconds. The Driver Information Center (DIC) will display Remote Learn Pending, Please Wait.
2. After ten minutes, the DIC will display Press Engine Start Button To Learn. Press the ignition mode switch. The DIC will again display Remote Learn Pending, Please Wait.
3. Repeat Step 2 two additional times, for a total of thirty minutes. All previously known keys have now been unlearned. Remaining keys can be learned during the next steps. The DIC display will now display Ready For Remote # 1.

NOTE: The key pocket is located inside the center console storage area, under the cup holder. To access the pocket, remove the rubber cup holder liner. Place the key into the pocket with the buttons facing up.

4. Place the new key into the key pocket.

NOTE: If the programming does not complete or hangs during the programming operation, refer to Unable to Complete Programming below.

5. Press the ignition mode switch. When the key is learned the DIC will indicate that it is ready to program the next key.
6. Remove the key from the key pocket and press the unlock button. To program additional keys, repeat Steps 4 through 6.
7. When all additional keys are programmed, press and hold the ignition mode switch for 5 seconds to exit programming mode.

Replacing Keys (With SPS)

NOTE:

- This procedure will unlearn all previously learned keys. All keys that are to be programmed must be with the vehicle.
- This procedure may be used with or without existing learned keys being present. If no existing keys are available, this procedure must be used.
- A total of eight keys maybe be learned to a single vehicle.
- This procedure will only learn the vehicle key information. This procedure will not learn any immobilizer information between the body control module (BCM) and engine control module (ECM).
- If the battery voltage is low, charge the battery before continuing with the procedure.

1. Connect a scan tool to the vehicle and access SPS.
2. Ensure that all power consuming devices are turned OFF on the vehicle.
3. Select the SPS application and follow the on-screen instructions.
4. Select Reprogram ECU.
5. Select IMMO Immobilizer Learn - Setup.
6. Select the Program Transponder or Remote Key (Delete) function.

NOTE:

- At multiple times during the learn procedure, SPS will instruct you to turn the ignition to the run position. Make sure the vehicle is actually in the run mode before continuing on the SPS terminal. If the ignition is not in the run mode, the learn procedure will fail.
- The key pocket is located inside the center console storage area, under the cup holder. To access the pocket, remove the rubber cup holder liner. Place the key into the pocket with the buttons facing up.

7. Follow the on-screen instructions.

NOTE: If the programming does not complete or hangs during the programming operation, refer to Unable to Complete Programming below.

8. After programming all keys, Programming Complete, is displayed.
9. Press and hold the ignition mode switch for 15 seconds.
10. Press the lock and unlock button on each key that was programmed. This will awaken each key and allow passive and active keyless entry functions to be established.
11. With a scan tool, clear any DTCs.
12. Verify each key is operating properly. Operate each of the keyless entry functions using the buttons on the key and then start the vehicle. When verifying operation, make sure that no other keys are near the vehicle.

Adding Keys (Without SPS)

- NOTE:**
- To initiate, this procedure requires that 1 learned key be available.
 - A total of eight keys maybe be learned to a single vehicle.
 - This procedure adds keys only. The procedure does not erase previously learned keys.
 - The keys to be learned must duplicate the mechanical cut of the current key.

1. Place the recognized key(s) in the vehicle cupholder.
2. Insert the mechanical key of the new key into the key lock cylinder located on the outside of the driver door and turn the key to the unlock position five times within ten seconds. The Driver Information Center (DIC) will display Ready For Remote #2, 3, 4 or 5.

NOTE: The key pocket is located inside the center console storage area, under the cup holder. To access the pocket, remove the rubber cup holder liner. Place the key into the pocket with the buttons facing up.

3. Place the new key into the key pocket.

NOTE: If the programming does not complete or hangs during the programming operation, refer to Unable to Complete Programming below.

4. Press the ignition mode switch. When the key is learned the DIC will indicate that it is ready to program the next key.
5. Remove the key from the key pocket and press the unlock button. To program additional keys, repeat Steps 3 through 5.
6. When all additional keys are programmed, press and hold the ignition mode switch for 5 seconds to exit programming mode.

Adding Keys (With SPS)

NOTE:

- This procedure may be used with or without existing learned keys being present. If no existing keys are available, this procedure must be used.
- A total of eight keys maybe be learned to a single vehicle.
- This procedure will only learn the vehicle key information.
- If the battery voltage is low, charge the battery before continuing with the procedure.

1. Connect a scan tool to the vehicle and access SPS. .
2. Ensure that all power consuming devices are turned OFF on the vehicle.
3. Select the SPS application and follow the on-screen instructions.
4. Select Reprogram ECU.
5. Select IMMO Immobilizer Learn - Setup.
6. Select the Program Transponder or Remote Key (Add) function.

NOTE:

- At multiple times during the learn procedure, SPS will instruct you to turn the ignition to the run position. Make sure the vehicle is actually in the run mode before continuing on the SPS terminal. If the ignition is not in the run mode, the learn procedure will fail.
- The key pocket is located inside the center console storage area, under the cup holder. To access the pocket, remove the rubber cup holder liner. Place the key into the pocket with the buttons facing up.

7. Follow the on-screen instructions.

NOTE:

If the programming does not complete or hangs during the programming operation, refer to Unable to Complete Programming below.

8. After programming all keys, Programming Complete, is displayed.
9. Press and hold the ignition mode switch for 15 seconds.
10. Press the lock and unlock button on each key that was programmed. This will awaken each key and allow passive and active keyless entry functions to be established.
11. With a scan tool, clear any DTCs.
12. Verify each key is operating properly. Operate each of the keyless entry functions using the buttons on the key and then start the vehicle. When verifying operation, make sure that no other keys are near the vehicle.

Unable to Complete Programming

When attempting to program immobilizer components, various conditions may prevent the programming operation from completing. These conditions may be caused by normal system operation, a system malfunction, or an external influence. Common symptoms of a incomplete programming is receiving an error message during

the attempt or having the SPS application become unresponsive.

- DTCs are set in the body control module (BCM)

The immobilizer system is a function of the BCM software. If immobilizer DTCs are set in the BCM, such as DTC B2955, a fault has been identified in the immobilizer system. If this is not corrected before attempting to program components, the programming may not complete. Correct all immobilizer DTCs before attempting to program any immobilizer components.

- The key has been programmed to another vehicle or is not the correct type for the vehicle

A key can only be programmed to a single vehicle. Once a key is programming to a vehicle, it is paired for the life of the key. The key can be learned to the same vehicle again and again, but it is not able to be programmed to a different vehicle.

Many vehicle are available with both a base keyless entry system and an optional passive entry system. These keys typically look identical but cannot be substituted for one another. To verify the key is correct, compare the part number that is etched on the key to the part number identified in the parts catalog. The key should be correct for the system installed in the vehicle.

- The theft deterrent module is not properly secured or the key is not properly positioned in the pocket/slot.

A theft deterrent module that is not fully seated or is otherwise not properly secured may prevent a coupling between the transponder located in the key and the theft deterrent module. Being out of place by as little as 1 mm may prevent programming from completing. Make sure the theft deterrent module is properly installed and fully seated in it's clip.

The key should be positioned in the proper orientation so that it lays flat in the pocket. If a large key ring or other item attached to the key prevents the key from laying flat, remove the key ring.

To determine if the theft deterrent module is properly secured, remove the battery from the key and place the key into the pocket/slot. Attempt to change the vehicle mode by pressing the vehicle ON/OFF switch. The vehicle should change modes. If the NO REMOTE DETECTED message is displayed on the DIC, the theft deterrent module may not be properly secured.

- External interference is interrupting the programming operation

External RF interference and EMI may interrupt the low frequency coupling between the key and theft deterrent module. This interference may come from many different locations. Devices plugged into the vehicle power outlets such as cell phone chargers, laptop computers, GPS devices, etc. may cause interference. Vehicle location may also cause interference. Locations near airports and military installations may causer interference. Remove all customer installed devices and, if necessary, move the vehicle if interference is suspected.

KEY WITH INTEGRATED TRANSMITTER PROGRAMMING (WITHOUT BTM)

Keys can be programming in various ways using the procedures outlined below. Using the Replacing Keys procedures will first erase all the known keys from the vehicle. Any existing keys and any new keys will then

be programmed. This procedure should be used any time a key is required to be unlearned or erased from a vehicle. If a new key is being learned to a vehicle to replace a damaged, inoperative, or stolen key, the Replacing Keys procedure must be used. This ensures that the old key cannot be used to access or start the vehicle after programming.

The Adding Keys procedure does not erase any keys prior to programming. The procedure will simply program the key into the next available slot. The Adding Keys procedure should only be used when adding an additional key to the vehicle. The Adding Keys procedure should never be used to program a key to a vehicle that is having a key replaced, regardless of the cause for the replacement.

Replacing Keys (With SPS)

NOTE:

- **This procedure may be used with or without existing learned keys being present.**
- **A total of eight keys maybe be learned to a single vehicle.**
- **This procedure will only learn the vehicle key information. This procedure will not learn any immobilizer information between the body control module (BCM) and engine control module (ECM).**
- **If the battery voltage is low, charge the battery before continuing with the procedure.**

1. Connect a scan tool to the vehicle and access SPS.
2. Ensure that all power consuming devices are turned OFF on the vehicle.
3. Select the SPS application and follow the on-screen instructions.
4. Select Reprogram ECU.
5. Select IMMO Immobilizer Learn - Setup.
6. Select the Program Transponder or Remote Key (Delete) function.
7. Follow the on-screen instructions.
8. After programming all keys, "Programming Complete" is displayed.
9. Press the lock and unlock button on each key that was programmed. This will awaken each key and allow keyless entry functions to be established.
10. With a scan tool, clear any DTCs.
11. Verify each key is operating properly. Operate each of the keyless entry functions using the buttons on the key and then start the vehicle. When verifying operation, make sure that no other keys are near the vehicle.

Replacing Keys (Without SPS) - United States only

NOTE:

- **This procedure should be used without existing learned keys being present.**
- **A total of eight keys maybe be learned to a single vehicle.**
- **This procedure will only learn the vehicle key information. This procedure will not learn any immobilizer information between the body control**

module (BCM) and engine control module (ECM).

- **If the battery voltage is low, charge the battery before continuing with the procedure.**

1. With an unlearned master vehicle key, turn ON the ignition, with the engine OFF.
2. Observe the security indicator, after approximately 10 min the indicator will turn off.
3. Turn OFF the ignition and wait 5 s.
4. Repeat steps 1 - 3 two more times for a total of 3 cycles or 30 min.

NOTE: **The body control module learns the key transponder information upon the ignition transition from OFF to ON. You must turn the ignition OFF before attempting to start the vehicle.**

5. Start the vehicle. The vehicle has now learned the key transponder information.
6. Additional keys may be learned using the Adding Keys procedure.
7. Clear all DTCs.

Adding Keys (Without SPS) - North America, except Canada

- NOTE:**
- **To initiate, this procedure requires that 1 learned key be available.**
 - **A total of eight keys maybe be learned to a single vehicle.**
 - **This procedure adds keys only. The procedure does not erase previously learned keys.**
 - **The keys to be learned must duplicate the mechanical cut of the current key.**

1. With a previously learned key, turn the ignition ON.
2. Turn the ignition OFF and remove the key.
3. Within 10 seconds of turning OFF the ignition, insert the key to be learned and turn ON the ignition. The vehicle has now learned the new key and key.

Adding Keys (Without SPS) - Canada, Europe, South America, Asia, and Middle East

- NOTE:**
- **To initiate, this procedure requires that 2 learned key be available.**
 - **A total of eight keys maybe be learned to a single vehicle.**
 - **This procedure adds keys only. The procedure does not erase previously learned keys.**
 - **The keys to be learned must duplicate the mechanical cut of the current key.**

1. With a previously learned key, turn the ignition ON.
2. Turn the ignition OFF and remove the key.

3. With a second previously learned key, turn the ignition ON.
4. Turn the ignition OFF and remove the key.
5. Within 10 seconds of turning OFF the ignition, insert the key to be learned and turn ON the ignition. The vehicle has now learned the new key and key.

Adding Keys (With SPS) - North America

NOTE:

- **This procedure may be used with or without existing learned keys being present.**
- **A total of eight keys maybe be learned to a single vehicle.**
- **This procedure will only learn the vehicle key information. This procedure will not learn any immobilizer information between the body control module (BCM) and engine control module (ECM).**
- **If the battery voltage is low, charge the battery before continuing with the procedure.**

1. Connect a scan tool to the vehicle and access SPS.
2. Ensure that all power consuming devices are turned OFF on the vehicle.
3. Select the SPS application and follow the on-screen instructions.
4. Select Reprogram ECU.
5. Select IMMO Immobilizer Learn - Setup.
6. Select the Program Transponder or Remote Key (Add) function.
7. Follow the on-screen instructions.
8. After programming all keys, "Programming Complete" is displayed.
9. Press the lock and unlock button on each key that was programmed. This will awaken each key and allow keyless entry functions to be established.
10. With a scan tool, clear any DTCs.
11. Verify each key is operating properly. Operate each of the keyless entry functions using the buttons on the key and then start the vehicle. When verifying operation, make sure that no other keys are near the vehicle.

DESCRIPTION AND OPERATION

IMMOBILIZER DESCRIPTION AND OPERATION

Without BTM

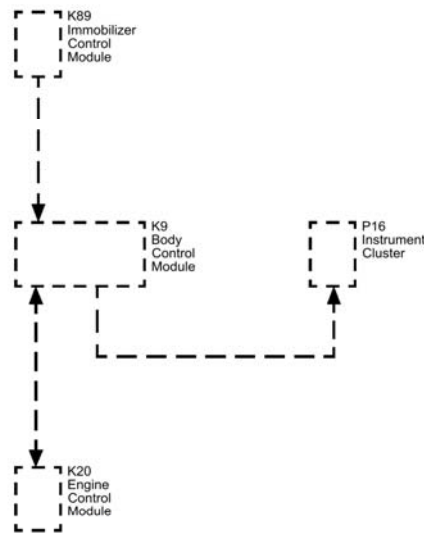

Fig. 4: Immobilizer Diagram Without BTM
 Courtesy of GENERAL MOTORS COMPANY

The immobilizer system functions are provided by the Immobilizer Control Module, the Body Control Module (BCM) and the Engine Control Module (ECM), as well as any modules which store and report the environment identifier.

When an ignition key is inserted into the ignition lock cylinder and the ignition is turned ON, the transponder in the key is energized by the immobilizer coil surrounding the ignition lock cylinder. This immobilizer coil is part of the Immobilizer Control Module. The transponder transmits a signal that contains its unique value, which is received by the BCM through the Immobilizer Control Module. The BCM then compares this value to a value stored in memory. The BCM also monitors various control modules to determine if the stored environment identifiers match.

If both the environment identifier and the value received from the transponder match, the BCM will send the prerelease password via serial data to the ECM. If the encrypted code's unique value is incorrect or the environment identifier does not match, the BCM will send the fuel disable message to the ECM.

When the ECM receives the BCM prerelease password, the ECM will challenge the password. The ECM sends this challenge to the BCM via serial data. Both the ECM and BCM perform a calculation on this challenge. If the BCM calculated response to the challenge equals the calculation performed by the ECM, the ECM will allow vehicle starting.

The components of the immobilizer system are as follows:

- BCM

- ECM
- Immobilizer Control Module
- Ignition key
- Security indicator
- Various control modules which store and report the environment identifier

With BTM

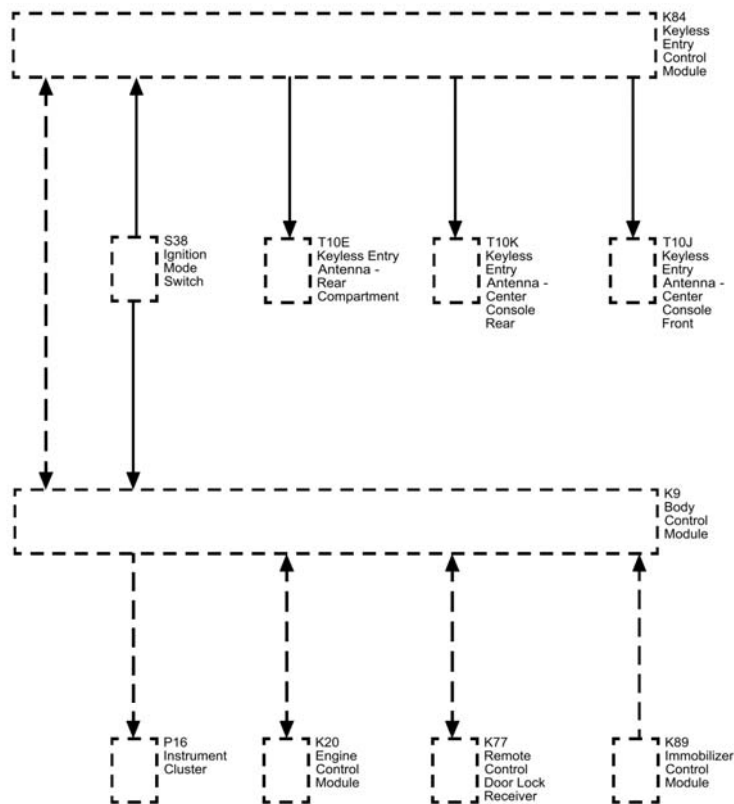

Fig. 5: Immobilizer Diagram With BTM
 Courtesy of GENERAL MOTORS COMPANY

The immobilizer system functions are provided by the Keyless Entry Control Module, the Remote Control Door Lock Receiver, the Immobilizer Control Module, the Body Control Module (BCM) and the Engine Control Module (ECM), as well as any control modules which store and report the environment identifier. The Keyless Entry Control Module uses low frequency antennas in three different locations on the vehicle to determine the location of the transmitter. Multiple antenna are used to ensure complete coverage of the vehicle interior and rear compartment.

When the vehicle ON/OFF switch is pressed, the low frequency antennas emit a challenge to the keyless entry transmitter. The transmitter receives this challenge and emits its response as an RF message. The transmitter transmits a signal that contains its unique value, which is received by the BCM through the Remote Control Door Lock Receiver. The BCM then compares this value to a value stored in memory. The BCM also monitors various control modules to determine if the stored environment identifiers match.

If both the environment identifier and the value received from the transponder match, the BCM will send the prerelease password via serial data to the ECM. If the encrypted code's unique value is incorrect or the environment identifier does not match, the BCM will send the fuel disable message to the ECM.

When the ECM receives the BCM prerelease password, the ECM will challenge the password. The ECM sends this challenge to the BCM via serial data. Both the ECM and BCM perform a calculation on this challenge. If the BCM calculated response to the challenge equals the calculation performed by the ECM, the ECM will allow vehicle starting.

If RF communication is interrupted, a "No Remote Detected" message will be displayed on the DIC. In these cases, the transmitter can be placed in the transmitter slot/slot. The Immobilizer Control Module is located in the immediate vicinity of the transmitter pocket/slot. Placing the transmitter in the pocket/slot will create a low powered coupling between the transmitter and Immobilizer Control Module, allowing communications to occur and enabling vehicle starting.

The components of the immobilizer system are as follows:

- BCM
- ECM
- Remote Control Door Lock Receiver
- Immobilizer Control Module
- Low frequency antenna
- Ignition key/Keyless entry transmitter
- Security indicator
- Various control modules which store and report the environment identifier

Body Control Module (BCM)

The immobilizer system is an integral part of the BCM and is controlled internally within the BCM. The BCM can learn up to 8 keys (transponder values).

The BCM uses the following inputs:

- Environment identifier exchange with various modules
- Encrypted code from the vehicle key, received by the Immobilizer Control Module
- Encrypted code from the vehicle key, received by the Remote Control Door Lock Receiver (with BTM)

The BCM uses the following outputs:

- Prerelease password communication with ECM
- Challenge/response with ECM

When a transponder value is received by the BCM, the BCM will compare this value to the learned key code stored in memory. The BCM then performs one of the following functions:

- If the encrypted code value matches the values stored in the BCM memory, the BCM will send the prerelease password to the ECM via serial data.
- If the encrypted code unique value does not match the value stored in the BCM, the BCM will send the start disable message to the ECM via serial data.
- If the BCM is unable to measure the ignition key encrypted code value, the BCM will not send any messages to the ECM.

Engine Control Module (ECM)

When the ECM receives the BCM prerelease password, the ECM will challenge the password. The ECM sends this challenge to the BCM via the serial data circuit. Both the ECM and BCM perform a calculation on this challenge. If the calculated response from the BCM equals the calculation performed by the ECM, the ECM will allow vehicle starting.

The ECM will disable vehicle starting if any of the following immobilization conditions occur:

- The prerelease password is invalid.
- The start disable password is sent by the BCM.
- No passwords are received. There is no communication with the BCM.
- The BCM calculated response to the challenge does not equal the calculation performed by the ECM.

Immobilizer Control Module

The Immobilizer Control Module contains an immobilizer coil which surrounds the ignition cylinder (without BTM) or is located near the transmitter pocket/slot (with BTM). The coil passively powers the transponder located in the ignition key. When powered, the key transmits its unique value to the Immobilizer Control Module, which is then relayed to the BCM via a LIN serial data circuit. The Immobilizer Control Module also receives B+ and ground from the BCM.

The Immobilizer Control Module is used to:

1. Learn keys
2. To start vehicle with or without RF interference
3. To start vehicle when key battery is dead

Keyless Entry Control Module (with BTM)

The Keyless Entry Control Module uses low frequency antennas in three different locations on the vehicle to determine the location of the transmitter. Multiple antenna are used to ensure complete coverage of the vehicle

interior and rear compartment. The Keyless Entry Control Module monitors the ignition mode switch. When the ignition mode is changed, the Keyless Entry Control Module will command, or "ping", the low frequency antenna.

Low Frequency Antenna (with BTM)

When commanded, or "pinged", the low frequency antenna broadcast a challenge to the keyless entry transmitter. Because of the low power of the antenna, this challenge is only broadcast in an approximate three meter range of the antenna. Multiple antenna are used to ensure complete coverage of the vehicle interior and rear compartment.

Remote Control Door Lock Receiver (with BTM)

When the keyless entry transmitter is challenged by a low frequency antenna, it responds by emitting a response as an RF message. The transmitter transmits a signal that contains its unique value, which is received by the Remote Control Door Lock Receiver. The Remote Control Door Lock Receiver relays this information to the BCM via a discreet serial data circuit.

Ignition Key or Keyless Entry Transmitter

Each ignition key or keyless entry transmitter contains a transponder with a unique encrypted value. The transponder's encrypted value is fixed and unable to be changed. The immobilizer system uses the ignition key transponder value to determine if a valid ignition key is being used to start the vehicle.

Environment Identifier

Various modules throughout the vehicle learn a specific environment identifier during the module programming process. The environment identifier is learned by each individual module and matches the environment identifier stored in the BCM. Prior to starting after a battery disconnect, each of the modules which store an environment identifier will compare their identifier to that of the identifier stored in the BCM. If all the identifiers match, the engine starting process will continue. If the environment identifiers do not match, engine starting will be disabled.

Security Indicator

The BCM will command the Instrument Cluster to illuminate the security indicator when the ignition key is in the ON position to indicate a fault has occurred within the immobilizer system and when the engine starting is disabled.

REMOTE VEHICLE SPEED LIMITING DESCRIPTION AND OPERATION

Certain vehicles equipped with OnStar® now have an additional feature that allows for remote limiting of the vehicle's speed. This OnStar® feature is called Stolen Vehicle Slow-Down and is now part of the OnStar® Stolen Vehicle Assistance service. This feature, when used in conjunction with local law enforcement and strict guidelines at the OnStar® Call Center, will slow the vehicle by interacting with the engine control system.

When the engine control system receives a valid request from the OnStar® telematics communications interface module, it will enter into a reduced engine power/vehicle speed limiting mode, which will decelerate the

vehicle. Once the request is active the engine control module begins reducing engine torque to match requested vehicle speed and a REDUCED ENGINE POWER indication is displayed. No DTCs will be set during this process.

ACCESSORIES & EQUIPMENT

Instrument Panel and Console Trim

SPECIFICATIONS

FASTENER TIGHTENING SPECIFICATIONS

Fastener Tightening Specifications

Application	Specification	
	Metric	English
Front Floor Console Cup Holder Fastener	1.2 N.m	11 lb in

REPAIR INSTRUCTIONS

INSTRUMENT PANEL LOWER TRIM PANEL INSULATOR REPLACEMENT

Fig. 1: Instrument Panel Lower Trim Panel Insulator
 Courtesy of GENERAL MOTORS COMPANY

Instrument Panel Lower Trim Panel Insulator Replacement

Callout	Component Name
1	Instrument Panel Lower Trim Panel Insulator Push-Pin Fasteners (Qty: 2)
2	Instrument Panel Lower Trim Panel Insulator Procedures <ol style="list-style-type: none"> 1. Flex the insulator panel enough to manipulate it out from beneath the instrument panel assembly. 2. Disconnect the electrical connections, if applicable. 3. When replacing the instrument panel lower trim panel insulator, transfer all necessary components.

INSTRUMENT PANEL LOWER EXTENSION COMPARTMENT PANEL REPLACEMENT

Fig. 2: Instrument Panel Lower Extension Compartment Panel
Courtesy of GENERAL MOTORS COMPANY

Instrument Panel Lower Extension Compartment Panel Replacement

Callout	Component Name
1	Instrument Panel Lower Extension Compartment Panel Retainer (Qty: 3)
2	Instrument Panel Lower Extension Compartment Panel Procedures <ol style="list-style-type: none"> 1. Disconnect electrical connections, if applicable. 2. When replacing the instrument panel lower extension compartment panel, transfer all necessary components.

INSTRUMENT PANEL COMPARTMENT LAMP SWITCH ACTUATOR REPLACEMENT

Fig. 3: Instrument Panel Compartment Lamp Switch Actuator
 Courtesy of GENERAL MOTORS COMPANY

Instrument Panel Compartment Lamp Switch Actuator Replacement

Callout	Component Name
Preliminary Procedures	
1. Remove the instrument panel compartment lamp. Refer to <u>Instrument Panel Compartment Lamp Replacement</u> 2. Remove the instrument panel compartment. Refer to <u>Instrument Panel Compartment Replacement</u>	
1	Instrument Panel Compartment Lamp Switch Actuator Procedure Push in the retainers to release the lamp switch actuator from the instrument panel compartment.

INSTRUMENT PANEL OUTER COMPARTMENT REPLACEMENT

Fig. 4: Instrument Panel Outer Compartment
 Courtesy of GENERAL MOTORS COMPANY

Instrument Panel Outer Compartment Replacement

Callout	Component Name
1	Instrument Panel Outer Compartment Procedures <ol style="list-style-type: none"> 1. Use an appropriate tool in order to release the tabs allowing the compartment to open past the stops. 2. Unsnap the compartment from the instrument panel lower trim panel.

INSTRUMENT PANEL ACCESSORY TRIM PLATE REPLACEMENT

Fig. 5: Instrument Panel Accessory Trim Plate
 Courtesy of GENERAL MOTORS COMPANY

Instrument Panel Accessory Trim Plate Replacement

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none"> 1. Remove the instrument panel upper center trim panel. Refer to <u>Instrument Panel Upper Center Trim Panel Replacement</u>. 2. Remove the driver and passenger side instrument panel center upper molding. Refer to <u>Instrument Panel Center Upper Molding Replacement (Driver Side)</u>, <u>Instrument Panel Center Upper Molding Replacement (Passenger Side)</u>. 	
1	Instrument Panel Accessory Trim Plate Procedures <ol style="list-style-type: none"> 1. Disconnect the electrical connections. 2. When replacing the instrument panel accessory trim plate, transfer all necessary components,

INSTRUMENT PANEL UPPER MOLDING REPLACEMENT

Fig. 6: Instrument Panel Upper Molding
 Courtesy of GENERAL MOTORS COMPANY

Instrument Panel Upper Molding Replacement

Callout	Component Name
1	Instrument Panel Upper Molding - Left Procedure Use a flat-bladed plastic trim tool to release the instrument panel upper molding from the instrument panel.
2	Instrument Panel Upper Molding - Right Procedure Use a flat-bladed plastic trim tool to release the instrument panel upper molding from the instrument panel.

INSTRUMENT PANEL CENTER UPPER MOLDING REPLACEMENT (DRIVER SIDE)

Fig. 7: Instrument Panel Center Upper Molding (Driver Side)
 Courtesy of GENERAL MOTORS COMPANY

Instrument Panel Center Upper Molding Replacement (Driver Side)

Callout	Component Name
Preliminary Procedure Remove the instrument panel center compartment. Refer to <u>Instrument Panel Center Compartment Replacement</u> .	
1	Instrument Panel Center Upper Molding - Driver Side Procedure Use a flat-bladed plastic trim tool from above to release the instrument panel center upper molding from the instrument panel.

INSTRUMENT PANEL CENTER UPPER MOLDING REPLACEMENT (PASSENGER SIDE)

Fig. 8: Instrument Panel Center Upper Molding (Passenger Side)
 Courtesy of GENERAL MOTORS COMPANY

Instrument Panel Center Upper Molding Replacement (Passenger Side)

Callout	Component Name
Preliminary Procedure Remove the instrument panel center compartment. Refer to <u>Instrument Panel Center Compartment Replacement</u> .	
1	Instrument Panel Center Upper Molding - Passenger Side Procedure Use a flat-bladed plastic trim tool from above to release the instrument panel center upper molding from the instrument panel.

INSTRUMENT PANEL UPPER CENTER TRIM PANEL REPLACEMENT

Fig. 9: Instrument Panel Upper Center Trim Panel
 Courtesy of GENERAL MOTORS COMPANY

Instrument Panel Upper Center Trim Panel Replacement

Callout	Component Name
1	Instrument Panel Upper Center Trim Panel Procedure <ol style="list-style-type: none"> 1. Use a flat-bladed plastic trim tool in order to release the retaining clips securing the instrument panel upper center trim panel to the instrument panel. Start to release the center trim panel in the lower outer area. 2. Disconnect the electrical connections. 3. When replacing the instrument panel upper center trim panel, transfer all necessary parts.

INSTRUMENT PANEL CLUSTER TRIM PLATE REPLACEMENT

Removal Procedure

1. Remove the instrument cluster. Refer to **Instrument Cluster Replacement** .

Fig. 10: Instrument Cluster Locking Tab
Courtesy of GENERAL MOTORS COMPANY

2. Release the locking tab from the instrument cluster.

Fig. 11: Instrument Cluster Side Locking Tab
Courtesy of GENERAL MOTORS COMPANY

3. Release the locking tab from both sides of the instrument cluster.

Fig. 12: Instrument Cluster Bottom Tab
Courtesy of GENERAL MOTORS COMPANY

4. Release the tab from the bottom of the instrument cluster.

Fig. 13: Instrument Cluster Top Tabs
Courtesy of GENERAL MOTORS COMPANY

5. Release the tabs from the top of the instrument cluster.

Fig. 14: Instrument Panel Cluster Trim Plate
Courtesy of GENERAL MOTORS COMPANY

6. Remove the instrument panel cluster trim plate (1) from the instrument cluster.

Installation Procedure

Fig. 15: Instrument Panel Cluster Trim Plate
Courtesy of GENERAL MOTORS COMPANY

1. Install the instrument panel cluster trim plate (1) to the instrument cluster.
2. Install the instrument cluster. Refer to **Instrument Cluster Replacement** .

INSTRUMENT PANEL OUTER TRIM COVER REPLACEMENT - RIGHT SIDE

Fig. 16: Instrument Panel Outer Trim Cover - Right Side
 Courtesy of GENERAL MOTORS COMPANY

Instrument Panel Outer Trim Cover Replacement - Right Side

Callout	Component Name
1	Instrument Panel Outer Trim Cover
Procedure Use a flat-bladed plastic trim tool to aid in the removal of the outer trim cover.	

INSTRUMENT PANEL OUTER TRIM COVER REPLACEMENT - LEFT SIDE

Refer to <u>Front Floor Console Replacement</u>. 8. Remove the steering column trim covers. Refer to <u>Steering Column Trim Cover Replacement</u> . 9. Remove the instrument cluster. Refer to <u>Instrument Cluster Replacement</u> . 10. Remove both windshield side garnish moldings. Refer to <u>Windshield Side Garnish Molding</u> 	

<u>Replacement .</u>	
1	Instrument Panel Assembly Fastener (Qty: 7) CAUTION: Refer to <u>Fastener Caution .</u> Tighten 9 N.m (80 lb in)
2	Instrument Panel Assembly Procedures <ol style="list-style-type: none"> 1. Disconnect the wiring harness from the I/P assembly. 2. With the aid of an assistant, remove the I/P assembly from the vehicle. 3. If replacing the I/P assembly, transfer all necessary components.

INSTRUMENT PANEL TIE BAR REPLACEMENT

Fig. 28: Instrument Panel Tie Bar & Fasteners
Courtesy of GENERAL MOTORS COMPANY

Instrument Panel Tie Bar Replacement

Callout	Component Name

Preliminary Procedures

1. Remove the instrument panel (I/P) assembly. Refer to **Instrument Panel Assembly Replacement**.
2. Remove both front and rear side door sill trim plates. Refer to **Front and Rear Side Door Sill Trim Plate Replacement**.
3. Remove the steering column. Refer to **Steering Column Replacement**.
4. Remove the body control module bracket. Refer to **Body Control Module Bracket Replacement**.
5. Remove the fasteners securing the brake and accelerator pedal assembly to the tie bar. Refer to **Brake and Accelerator Pedal Assembly Replacement**.
6. Remove the instrument panel electrical center from the tie bar.

1	<p>Instrument Panel Tie Bar Assembly Fastener (Qty: 6)</p> <p>CAUTION: Refer to <u>Fastener Caution</u>.</p> <p>Tighten 22 N.m (16 lb ft)</p>
2	<p>Heater and Air Conditioning Evaporator and Blower Module Fastener (Qty: 3)</p> <p>Procedure Release the heater and air conditioning evaporator and blower module from the I/P tie bar and secure the module at the body.</p> <p>Tighten 5 N.m (44 lb in)</p>
3	<p>Instrument Panel Tie Bar Assembly</p> <p>Procedures</p> <ol style="list-style-type: none">1. Remove the hood release handle.2. Note location and routing of the I/P wiring harness prior to removal of the I/P tie bar assembly to ensure proper reinstallation.3. Disconnect the wiring harness from the I/P tie bar assembly.4. With the aid of an assistant, remove the I/P tie bar assembly from the vehicle.5. If replacing the I/P tie bar assembly, transfer all necessary components.

FRONT FLOOR CONSOLE WIRING HARNESS REPLACEMENT

Fig. 29: Front Floor Console Wiring Harness
 Courtesy of GENERAL MOTORS COMPANY

Front Floor Console Wiring Harness Replacement

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none"> 1. Remove the front floor console. Refer to <u>Front Floor Console Replacement</u>. 2. Remove the front floor console rear cover. Refer to <u>Front Floor Console Rear Cover Replacement</u>. 3. Remove the front floor upper console trim plate. Refer to <u>Front Floor Upper Console Trim Plate Replacement</u>. 4. Remove the front floor console side covers. 	
1	Front Floor Console Wiring Harness Procedure <ol style="list-style-type: none"> 1. Release the front floor console wiring harness from the lower console. 2. When replacing the front floor console wiring harness, compare the wiring harnesses and transfer all necessary attaching parts.

FRONT FLOOR CONSOLE COVER REPLACEMENT

Fig. 30: Front Floor Console Cover & Retainers
 Courtesy of GENERAL MOTORS COMPANY

Front Floor Console Cover Replacement

Callout	Component Name
Preliminary Procedures	
1. Remove both front floor console extension panels. Refer to <u>Front Floor Console Extension Panel Replacement</u> . 2. Remove instrument panel center compartment. Refer to <u>Instrument Panel Center Compartment Replacement</u> . 3. Loosen the front floor console. Refer to <u>Front Floor Console Replacement</u>	
1	Front Floor Console Cover Retainer (Qty: 4) Procedure Use a flat-bladed plastic trim tool to release the front floor console cover from the front floor upper console trim plate.
2	Front Floor Console Cover

FRONT FLOOR CONSOLE FRONT INSERT REPLACEMENT

Fig. 31: Front Floor Console Side Cover
 Courtesy of GENERAL MOTORS COMPANY

Front Floor Console Front Insert Replacement

Callout	Component Name
Preliminary Procedures	
1. Remove the front floor console. Refer to Front Floor Console Replacement . 2. Remove the front floor upper console trim plate. Refer to Front Floor Upper Console Trim Plate Replacement .	
1	Front Floor Console Front Insert Procedure Release the front floor console front insert from the lower console.

FRONT FLOOR CONSOLE CUP HOLDER REPLACEMENT

Fig. 32: Front Floor Console Cup Holder And Fasteners
 Courtesy of GENERAL MOTORS COMPANY

Front Floor Console Cup Holder Replacement

Callout	Component Name
Preliminary Procedure Remove the front floor upper console trim plate. Refer to <u>Front Floor Upper Console Trim Plate Replacement</u> .	
1	Front Floor Console Cup Holder Fastener (Qty: 6) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 1.2 (11 lb in)
2	Front Floor Console Cup Holder Procedure When replacing the front floor console cup holder, transfer all necessary components.

FRONT FLOOR CONSOLE ACCESSORY SWITCH MOUNT PLATE REPLACEMENT

Fig. 33: Front Floor Console Front Compartment
 Courtesy of GENERAL MOTORS COMPANY

Front Floor Console Accessory Switch Mount Plate Replacement

Callout	Component Name
1	Front Floor Console Accessory Switch Mount Plate Procedure <ol style="list-style-type: none"> 1. Use a flat-bladed plastic trim tool in order to release the retaining clips securing the plate to the front floor console assembly. 2. Disconnect the electrical connector. 3. Transfer components as necessary.

FRONT FLOOR CONSOLE COMPARTMENT REPLACEMENT

Fig. 34: Front Floor Console Compartment And Fasteners

Front Floor Console Compartment Replacement

Callout	Component Name
Preliminary Procedure	
Remove the front floor upper console trim plate. Refer to <u>Front Floor Upper Console Trim Plate Replacement</u> .	
1	Front Floor Console Compartment Fastener (Qty: 4)
2	Front Floor Console Compartment

FRONT FLOOR UPPER CONSOLE TRIM PLATE REPLACEMENT

Fig. 35: Front Floor Upper Console Trim Plate
 Courtesy of GENERAL MOTORS COMPANY

Front Floor Upper Console Trim Plate Replacement

Callout	Component Name
Preliminary Procedure	
Remove the front floor console. Refer to Front Floor Console Replacement .	
1	Front Floor Upper Console Trim Plate Assembly
	Procedure
	1. Release the upper console trim plate from the front floor lower console.
	2. Disconnect the electrical connections.
	3. When replacing the front floor upper console trim plate, transfer all necessary parts.

FRONT FLOOR CONSOLE TRANSMISSION SHIFT OPENING BEZEL REPLACEMENT

Fig. 36: Front Floor Console Transmission Shift Opening Bezel
 Courtesy of GENERAL MOTORS COMPANY

Front Floor Console Transmission Shift Opening Bezel Replacement

Callout	Component Name
1	Front Floor Console Transmission Shift Opening Bezel Procedure Open the ashtray housing and pull off the shift opening bezel from the upper console trim plate. TIP: Use a flat-bladed plastic trim tool in order to release the front floor console transmission shift opening bezel from the front floor upper console trim plate.

FRONT FLOOR CONSOLE EXTENSION PANEL REPLACEMENT

Fig. 37: Front Floor Console Extension Panel
 Courtesy of GENERAL MOTORS COMPANY

Front Floor Console Extension Panel Replacement

Callout	Component Name
1	Front Floor Console Extension Panel Procedure Grasp the extension panel and pull outward disengaging the retainer clips securing the panel to the front floor console.

FRONT FLOOR CONSOLE REPLACEMENT

Fig. 38: Front Floor Console And Fasteners
 Courtesy of GENERAL MOTORS COMPANY

Front Floor Console Replacement

Callout	Component Name
Preliminary Procedures	
1. Remove the transmission control lever boot. Refer to <u>Transmission Control Lever Boot Replacement</u> . 2. Remove the front floor console extension panels. Refer to <u>Front Floor Console Extension Panel Replacement</u> . 3. Remove the instrument panel center compartment. Refer to <u>Instrument Panel Center Compartment Replacement</u> .	
1	Front Floor Console Fastener (Qty: 6) CAUTION: Refer to <u>Fastener Caution</u> . Procedure Move the front seats forward or backward in order to access the fasteners for removal. Tighten 2.5 (22 lb in)
	Front Floor Console Assembly

2

Procedures

1. Disconnect the electrical connections.
2. When replacing the front floor console assembly, transfer all necessary components.

FRONT FLOOR LOWER CONSOLE REPLACEMENT

Fig. 39: Exploded View Of Front Floor Lower Console
Courtesy of GENERAL MOTORS COMPANY

Front Floor Lower Console Replacement

Callout	Component Name
Preliminary Procedures	
1.	Remove the front floor console. Refer to <u>Front Floor Console Replacement</u> .
2.	Remove the front floor upper console trim plate. Refer to <u>Front Floor Upper Console Trim Plate Replacement</u> .
3.	Remove the front floor console side covers.
4.	Remove the front floor console rear air duct. Refer to <u>Front Floor Console Rear Air Duct Replacement</u> .
5.	Remove the front floor console armrest. Refer to <u>Front Floor Console Armrest Replacement</u> .
6.	Remove the front floor console wiring harness. Refer to <u>Front Floor Console Wiring Harness Replacement</u> .

1	Front Floor Lower Console Procedure When replacing the front floor lower console, transfer all necessary components.
---	--

FRONT FLOOR CONSOLE ARMREST REPLACEMENT

Fig. 40: Front Floor Console Armrest & Pins
 Courtesy of GENERAL MOTORS COMPANY

Front Floor Console Armrest Replacement

Callout	Component Name
Preliminary Procedure	
Remove the front floor console rear cover. Refer to Front Floor Console Rear Cover Replacement .	
1	Front Floor Console Armrest Assembly Pin (Qty: 2)
2	Front Floor Console Armrest Procedure Release the front floor console armrest from the armrest dampener.

FRONT FLOOR CONSOLE REAR COVER REPLACEMENT

Fig. 41: Front Floor Console Rear Cover
 Courtesy of GENERAL MOTORS COMPANY

Front Floor Console Rear Cover Replacement

Callout	Component Name
Preliminary Procedure Remove front floor console rear air outlet deflector housing. Refer to <u>Front Floor Console Rear Air Outlet Deflector Housing Replacement</u> .	
1	Front Floor Console Rear Cover Procedure <ol style="list-style-type: none"> 1. Release the front floor console rear cover. 2. Disconnect the electrical connectors.

ROOF CONSOLE REPLACEMENT

Fig. 42: Roof Console

Courtesy of GENERAL MOTORS COMPANY

Roof Console Replacement

Callout	Component Name
1	<p>Roof Console Assembly</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Use a flat-bladed plastic trim tool to release the 6 retainers securing the roof console to the headliner. 2. Disconnect the electrical connections. 3. When replacing the roof console assembly, transfer all necessary components.

REPAIR INSTRUCTIONS

FRONT SIDE DOOR PULL HANDLE COVER REPLACEMENT

Fig. 1: Front Side Door Pull Handle Cover
 Courtesy of GENERAL MOTORS COMPANY

Front Side Door Pull Handle Cover Replacement

Callout	Component Name
1	Front Side Door Pull Handle Cover TIP: Use a small flat-bladed tool to release the front side door handle cover.

REAR SIDE DOOR PULL HANDLE COVER REPLACEMENT

Fig. 2: Rear Side Door Pull Handle Cover
 Courtesy of GENERAL MOTORS COMPANY

Rear Side Door Pull Handle Cover Replacement

Callout	Component Name
1	Rear Side Door Pull Handle Cover TIP: Use a small flat-bladed tool to release the rear side door handle cover.

FRONT SIDE DOOR OUTSIDE REARVIEW MIRROR FILLER REPLACEMENT

Fig. 3: Front Side Door Outside Rearview Mirror Filler
Courtesy of GENERAL MOTORS COMPANY

Front Side Door Outside Rearview Mirror Filler Replacement

Callout	Component Name
1	Front Side Door Outside Rearview Mirror Filler Procedure Disconnect the electrical connector. TIP: Use a small flat-bladed tool to remove the front side door outside rearview mirror filler.

FRONT SIDE DOOR TRIM PANEL REPLACEMENT

Removal Procedure

1. Remove the front side door outside rearview mirror filler. Refer to **Front Side Door Outside Rearview Mirror Filler Replacement**.

Fig. 4: Front Side Door Handle Cover
Courtesy of GENERAL MOTORS COMPANY

2. Use a small flat bladed tool in the corner (1) to release the front side door handle cover.

3. Remove the front side door handle cover (2).

Fig. 5: Front Side Door Pull Handle Cover
Courtesy of GENERAL MOTORS COMPANY

4. Use a small flat bladed tool to release the front side door pull handle cover in the area (1).
5. Remove the front side door pull handle cover (2).

Fig. 6: Front Side Door Trim Panel Fasteners
Courtesy of GENERAL MOTORS COMPANY

6. Remove the three front side door trim panel fasteners (1).

Fig. 7: Front Side Door Trim Panel Retainers
Courtesy of GENERAL MOTORS COMPANY

NOTE: Put the window downwards to make the removal easier.

Note the number and locations of the retainers for installation of the front side door trim panel.

7. Release the 8 front side door trim panel retainers (1). Start releasing front side door trim panel retainer at the bottom.
8. Release the door lock retainer cable to disengage.
9. Disconnect the electrical connector.
10. Remove the front side door trim panel (2).

Installation Procedure

Fig. 8: Front Side Door Trim Panel Retainers
Courtesy of GENERAL MOTORS COMPANY

NOTE: Use new retainer (1) before installing the front side door trim panel.

1. Install the front side door trim panel (2). Use five new blue retainers and three new green retainers.
2. Connect the electrical connector.
3. Install the door lock retainer cable to engage.

Fig. 9: Front Side Door Trim Panel Fasteners
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

4. Install the three front side door trim panel fasteners (1).

Fig. 10: Front Side Door Handle Cover
Courtesy of GENERAL MOTORS COMPANY

5. Install the front side door handle cover (1).
6. Install the front side door pull handle cover (2).
7. Install the front side door outside rearview mirror filler. Refer to **Front Side Door Outside Rearview Mirror Filler Replacement**.

REAR SIDE DOOR TRIM PANEL REPLACEMENT

Removal Procedure

Fig. 11: Rear Side Door Handle Cover
Courtesy of GENERAL MOTORS COMPANY

1. Use a small flat bladed tool in the corner (1) to release the rear side door handle cover.

2. Remove the rear side door handle cover (2).

Fig. 12: Rear Side Door Pull Handle Cover
Courtesy of GENERAL MOTORS COMPANY

3. Use a small flat bladed tool to release the rear side door pull handle cover in the area (1).
4. Remove the rear side door pull handle cover (2).

Fig. 13: Rear Side Door Handle Cover Fasteners
Courtesy of GENERAL MOTORS COMPANY

5. Remove the 3 rear side door handle cover fasteners (1).

Fig. 14: Rear Side Door Trim Panel
Courtesy of GENERAL MOTORS COMPANY

NOTE: Put the window downwards to make the removal easier.

Note the number and locations of the retainers for installation of the rear side door trim panel.

6. Release the 6 rear side door trim panel retainers (1). Start releasing rear side door trim panel retainer at the bottom.
7. Release the door lock retainer cable to disengage.
8. Disconnect the electrical connector.
9. Remove the rear side door trim panel (2).

Installation Procedure

Fig. 15: Rear Side Door Trim Panel
Courtesy of GENERAL MOTORS COMPANY

NOTE: Use new retainer (1) before installing the rear side door trim panel.

1. Install the rear side door trim panel (2). Use 4 new blue retainers and 2 new green retainers.
2. Connect the electrical connector.
3. Install the door lock retainer cable to engage.

Fig. 16: Rear Side Door Handle Cover Fasteners
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

4. Install the 3 rear side door trim panel fasteners (1).

Fig. 17: Rear Side Door Handle And Pull Handle Covers
Courtesy of GENERAL MOTORS COMPANY

5. Install the rear side door handle cover (1).
6. Install the rear side door pull handle cover (2).

FRONT SIDE DOOR WATER DEFLECTOR REPLACEMENT

Fig. 18: Front Side Door Water Deflector
 Courtesy of GENERAL MOTORS COMPANY

Front Side Door Water Deflector Replacement

Callout	Component Name
Preliminary Procedure	
Remove the front side door trim panel. Refer to Front Side Door Trim Panel Replacement .	
1	Front Side Door Water Deflector Procedure Guide electrical connectors and door lock cable through the water deflector while removing it from the door.

REAR SIDE DOOR WATER DEFLECTOR REPLACEMENT

Fig. 19: Rear Side Door Water Deflector
 Courtesy of GENERAL MOTORS COMPANY

Rear Side Door Water Deflector Replacement

Callout	Component Name
Preliminary Procedure	
Remove the rear door trim panel. Refer to <u>Rear Side Door Trim Panel Replacement</u>	
1	Rear Side Door Water Deflector TIP: Guide electrical connectors and door lock cable through the rear side door water deflector while removing it from the door.

FRONT SIDE DOOR WINDOW FRAME GARNISH MOLDING REPLACEMENT

Fig. 20: Front Side Door Window Frame Garnish Molding & Retainers
 Courtesy of GENERAL MOTORS COMPANY

Front Side Door Window Frame Garnish Molding Replacement

Callout	Component Name
Preliminary Procedure Remove the front side door trim panel. Refer to Front Side Door Trim Panel Replacement .	
1	Front Side Door Window Frame Garnish Molding Retainer (Qty: 2) Procedure Pull the inner front side door window frame garnish molding away from the inner window flange to remove.
2	Front Side Door Window Frame Garnish Molding Procedure When installing the new front side door window frame garnish molding, start at the upper inside corner of the door frame.

REAR SIDE DOOR WINDOW FRAME GARNISH MOLDING REPLACEMENT

Fig. 21: Rear Side Door Window Frame Garnish Molding
 Courtesy of GENERAL MOTORS COMPANY

Rear Side Door Window Frame Garnish Molding Replacement

Callout	Component Name
Preliminary Procedure	
Remove the rear side door trim panel. Refer to <u>Rear Side Door Trim Panel Replacement</u> .	
1	Rear Side Door Window Frame Garnish Molding Fastener (Qty: 2)
2	Rear Side Door Window Frame Garnish Molding Procedure <ol style="list-style-type: none"> 1. Pull the inner rear side door window frame garnish molding away from the inner window flange to remove. 2. When installing the new rear side door window frame garnish molding, start at the upper inside corner of the door frame.

FRONT AND REAR SIDE DOOR SILL TRIM PLATE REPLACEMENT

Fig. 22: Front and Rear Side Door Sill Trim Plate & Retainers
 Courtesy of GENERAL MOTORS COMPANY

Front and Rear Side Door Sill Trim Plate Replacement

Callout	Component Name
Preliminary Procedure	
Remove the driver or passenger front seat. Refer to <u>Driver or Passenger Seat Removal and Installation (Oshawa 2/4/6-Way Hybrid, 6-Way Sport)</u> .	
1	Front and Rear Side Door Sill Trim Plate Retainer (Qty: 6)
2	Front and Rear Side Door Sill Trim Plate
	Procedure
	<ol style="list-style-type: none"> 1. Use a small flat-bladed tool to carefully disengage 3 integral clips that mate the center pillar lower trim panel to the front and rear side door sill trim plate. 2. Disconnect the electrical connector.

REAR COMPARTMENT SIDE TRIM PANEL REPLACEMENT (HP6, LEFT SIDE)

Fig. 23: Rear Compartment Side Trim Panel (HP6, Left Side)

Courtesy of GENERAL MOTORS COMPANY

Rear Compartment Side Trim Panel Replacement (HP6, Left Side)

Callout	Component Name
Preliminary Procedure	
<ol style="list-style-type: none"> 1. Remove the rear compartment floor panel trim (with battery cover, HP6) Refer to <u>Rear Compartment Floor Panel Trim Replacement (with Battery Cover, HP6)</u>, <u>Rear Compartment Floor Panel Trim Replacement (with Blower Cover, HP6)</u>. 2. Fold down rear seat to access retainer. 	
1	Rear Compartment Side Trim Panel Retainer (Qty: 4)
2	Rear Compartment Side Trim Panel Assembly

REAR COMPARTMENT SIDE TRIM PANEL REPLACEMENT (HP6, RIGHT SIDE)

Fig. 24: Rear Compartment Side Trim Panel (HP6, Right Side)
 Courtesy of GENERAL MOTORS COMPANY

Rear Compartment Side Trim Panel Replacement (HP6, Right Side)

Callout	Component Name
Preliminary Procedure Remove the rear compartment floor panel trim (with blower cover,HP6). Refer to <u>Rear Compartment Floor Panel Trim Replacement (with Battery Cover, HP6)</u> , <u>Rear Compartment Floor Panel Trim Replacement (with Blower Cover, HP6)</u> .	
1	Rear Compartment Side Trim Panel Retainer (Qty: 5)
2	Rear Compartment Side Trim Panel Assembly

REAR COMPARTMENT SIDE TRIM PANEL REPLACEMENT (WITHOUT HP6)

Fig. 25: Rear Compartment Side Trim Panel & Retainers (without HP6)
 Courtesy of GENERAL MOTORS COMPANY

Rear Compartment Side Trim Panel Replacement (without HP6)

Callout	Component Name
Preliminary Procedures	
1. Fold down rear seat to access retainer.	
2. Remove the rear end trim finish panel. Refer to <u>Rear End Trim Finish Panel Replacement</u> .	
1	Rear Compartment Side Trim Panel Retainer (Qty: 3)
2	Rear Compartment Side Trim Panel

ROOF RAIL FRONT ASSIST HANDLE REPLACEMENT

Fig. 26: Roof Rail Front Assist Handle & Fasteners
 Courtesy of GENERAL MOTORS COMPANY

Roof Rail Front Assist Handle Replacement

Callout	Component Name
1	Roof Rail Front Assist Handle Fastener (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Procedure 1. Fold the assist handle downward and hold. 2. Use a small flat-bladed tool to release the cover to access the fastener.
2	Roof Rail Front Assist Handle

INSIDE REARVIEW MIRROR MOUNT PLATE COVER REPLACEMENT

Fig. 27: Inside Rearview Mirror Mount Plate Cover & Retainers
 Courtesy of GENERAL MOTORS COMPANY

Inside Rearview Mirror Mount Plate Cover Replacement

Callout	Component Name
1	Inside Rearview Mirror Mount Plate Cover Retainer (Qty: 4) TIP: Use a small flat-bladed tool to release the locking retainer from the inside rearview mirror mount plate cover, left and right side.
2	Inside Rearview Mirror Mount Plate Cover

SUNSHADE REPLACEMENT

Fig. 28: Sunshade & Fasteners
 Courtesy of GENERAL MOTORS COMPANY

Sunshade Replacement

Callout	Component Name
Preliminary Procedure Lower the front of the headlining trim panel to access the sunshade electrical connector, if necessary. Refer to <u>Headlining Trim Panel Replacement (With Sunroof)</u> , <u>Headlining Trim Panel Replacement (Without Sunroof)</u> .	
1	Sunshade Support Fastener Cover
2	Sunshade Fastener (Qty: 3) CAUTION: Refer to <u>Fastener Caution</u> .
3	Sunshade Assembly Procedure 1. Disconnect the electrical connector. 2. Remove the sunshade anchor from the roof by unsnapping, if needed.

SUNSHADE SUPPORT REPLACEMENT

Fig. 29: Sunshade Support & Fastener
Courtesy of GENERAL MOTORS COMPANY

Sunshade Support Replacement

Callout	Component Name
1	Sunshade Support Fastener CAUTION: Refer to <u>Fastener Caution</u> . Procedure Pull cover downward to access fastener.
2	Sunshade Support

THEFT DETERRENT SENSOR OPENING TRIM PLATE REPLACEMENT

Fig. 30: Theft Deterrent Sensor Opening Trim Plate
 Courtesy of GENERAL MOTORS COMPANY

Theft Deterrent Sensor Opening Trim Plate Replacement

Callout	Component Name
1	Theft Deterrent Sensor Opening Molding Procedure Carefully use a flat bladed tool, and release the retainer from the theft deterrent sensor opening molding to the roof console.

WINDSHIELD SIDE GARNISH MOLDING REPLACEMENT

Removal Procedure

CAUTION: If a vehicle is equipped with a head curtain inflator module ensure that the inflator module and tether are undamaged. If tether or curtain airbag are damaged in any way, they must be replaced.

CAUTION: Use care when working around the head curtain inflator module. Sharp tools may puncture the curtain airbag. If the head curtain inflator module is damaged in any way, it must be replaced.

1. Disable the SIR system. Refer to **SIR Disabling and Enabling** .

Fig. 31: Upper Side Of The Windshield Side Garnish Molding
Courtesy of GENERAL MOTORS COMPANY

2. First release the upper side of the windshield side garnish molding (1).

Fig. 32: Pulling Upper Side Of The Windshield Side Garnish Molding
Courtesy of GENERAL MOTORS COMPANY

3. Pull and release gently the upper side of the windshield side garnish molding (2) .
4. Cut the retainer at the cutline (3).

Fig. 33: Windshield Side Garnish Molding Retainer
Courtesy of GENERAL MOTORS COMPANY

5. Remove the rest of the windshield side garnish molding retainer (1) by releasing the clip (3) and sliding the retainer (1) upward out of the windshield side garnish molding (2).

NOTE: **Take care not to drop any portion of the retaining clip into the bodyside hinge pillar. This could cause an irreversible rattle condition.**

6. Remove the windshield side garnish molding retainer (4) out of the body hinge pillar inner panel by doing the following:
 1. Remove the retainer (4) from the bodyside.
 2. Slide a small flat-bladed tool on the outboard side to disengage the center retainer (5), maintain pressure on the tab.
 3. Slide another small flat-bladed tool on the opposite side of the retainer to depress the outer tabs (6), maintain pressure on the tabs.
 4. Rotate the retainer out parallel to the upper reinforcement body hinge pillar.

Installation Procedure

Fig. 34: Windshield Side Garnish Molding Retainer Clips
Courtesy of GENERAL MOTORS COMPANY

NOTE: Use a new windshield side garnish molding clip each time the molding is removed.

1. Install the new windshield side garnish molding retainer (1) at the windshield side garnish molding.
2. Install the new windshield side garnish molding clip (3) to the windshield side garnish molding (2).

Fig. 35: Positioning Windshield Side Garnish Molding
Courtesy of GENERAL MOTORS COMPANY

3. Position the windshield side garnish molding (4) with the aid of the guide retainer (2).
4. Clip in the lower windshield side garnish molding retainer (3).
5. Push gently the upper side of the windshield side garnish molding to the body hinge pillar panel.
6. The windshield side garnish molding retainer (1) has to be in correct position to audible engage when connecting to the body hinge pillar panel.

CENTER PILLAR UPPER GARNISH MOLDING REPLACEMENT

Fig. 36: Center Pillar Upper Garnish Molding
 Courtesy of GENERAL MOTORS COMPANY

Center Pillar Upper Garnish Molding Replacement

Callout	Component Name
Preliminary Procedure Remove the front and rear side door sill trim plate. Refer to <u>Front and Rear Side Door Sill Trim Plate Replacement</u> .	
1	Center Pillar Upper Garnish Molding Procedure <ol style="list-style-type: none"> 1. Remove the center pillar upper and lower garnish molding assembly as one piece. 2. Release the locking retainer on the rear side of the center pillar upper garnish molding to separate the upper from the lower.

CENTER PILLAR LOWER TRIM PANEL REPLACEMENT

Fig. 37: Center Pillar Lower Trim Panel & Retainers
 Courtesy of GENERAL MOTORS COMPANY

Center Pillar Lower Trim Panel Replacement

Callout	Component Name
Preliminary Procedures	
1. Remove the front and rear side door sill trim plate. Refer to <u>Front and Rear Side Door Sill Trim Plate Replacement</u> . 2. Move seat to full forward position.	
1	Center Pillar Lower Trim Panel Retainer (Qty: 3) Procedure <ol style="list-style-type: none"> 1. Remove the center pillar upper and lower garnish molding assembly as one piece. 2. Release the locking retainer on the rear side of the center pillar upper garnish molding to separate the upper from the lower.
2	Center Pillar Lower Trim Panel

BODY LOCK PILLAR UPPER TRIM PANEL REPLACEMENT (SEDAN)

Fig. 38: Body Lock Pillar Upper Trim Panel (Sedan)
 Courtesy of GENERAL MOTORS COMPANY

Body Lock Pillar Upper Trim Panel Replacement (Sedan)

Callout	Component Name
Preliminary Procedure Disable the SIR system. Refer to <u>SIR Disabling and Enabling</u> .	
1	Body Lock Pillar Upper Trim Panel Retainer TIP: Use a small flat-bladed tool to release the retainer from the body lock pillar upper trim panel.
2	Body Lock Pillar Upper Trim Panel

REAR WINDOW PANEL STOWAGE COMPARTMENT COVER REPLACEMENT (WITH HP6)

Fig. 39: Rear Window Panel Stowage Compartment Cover (with HP6)
Courtesy of GENERAL MOTORS COMPANY

Rear Window Panel Stowage Compartment Cover Replacement (with HP6)

Callout	Component Name
Preliminary Procedures	
Remove the rear window panel trim. Refer to Rear Window Panel Trim Replacement (with HP6) .	
1	Rear Window Panel Stowage Compartment Cover Retainers (Qty: 3) Procedure Use a trim removal tool to aid in the removal of the retainers.
2	Rear Window Panel Stowage Compartment Cover Retainers (Qty: 4) Procedures <ol style="list-style-type: none"> 1. Open rear compartment lid to access retainers. 2. Use a trim removal tool to aid in the removal of the retainers.
3	Rear Window Panel Stowage Compartment Cover Procedure Disconnect electrical connector.

REAR WINDOW PANEL TRIM REPLACEMENT (WITH HP6)

Fig. 40: Rear Window Panel Trim (with HP6)
Courtesy of GENERAL MOTORS COMPANY

Rear Window Panel Trim Replacement (with HP6)

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none"> 1. Fold down the rear seat back cushions. 2. Remove the rear seat back cushion bolsters. Refer to <u>Rear Seat Back Bolster Replacement</u> . 	
1	Rear Window Panel Trim Retainer (Qty: 3)
2	Rear Window Panel Trim Assembly Procedure <ol style="list-style-type: none"> 1. Remove the seat belt guides and slide the belt through the slots in the panel. 2. Disconnect the electrical connector. 3. When replacing the rear window panel trim assembly, transfer all necessary components.

REAR WINDOW PANEL TRIM REPLACEMENT (WITHOUT HP6)

Fig. 41: Rear Window Panel Trim (without HP6)
 Courtesy of GENERAL MOTORS COMPANY

Rear Window Panel Trim Replacement (without HP6)

Callout	Component Name
Preliminary Procedures	
1. Fold the rear seat back forward to gain access to the retainers. 2. Remove the body lock pillar upper trim panel. Refer to <u>Body Lock Pillar Upper Trim Panel Replacement (Sedan)</u> .	
1	Rear Window Trim Finish Panel Retainer (Qty: 3)
2	Rear Window Trim Finish Panel Assembly
Procedure Disconnect the electrical connector.	

REAR END TRIM FINISH PANEL REPLACEMENT

Fig. 42: Rear End Trim Finish Panel & Retainers
 Courtesy of GENERAL MOTORS COMPANY

Rear End Trim Finish Panel Replacement

Callout	Component Name
1	Rear End Trim Finish Panel Retainer (Qty: 8)
2	Rear End Trim Finish Panel NOTE: Rear end sill plate seats over D-rings.

REAR COMPARTMENT FLOOR PANEL TRIM REPLACEMENT (WITH BLOWER COVER, HP6)

Fig. 43: Rear Compartment Floor Panel Trim (with Blower Cover, HP6)

Courtesy of GENERAL MOTORS COMPANY

Rear Compartment Floor Panel Trim Replacement (with Blower Cover, HP6)

Callout	Component Name
1	<p>Rear Compartment Side Trim Panel (Push-In) Retainer (Qty: 4)</p> <p>Procedure Pull the rear seat back cushion latch release located on the top of the rear seat back cushion, and fold the rear seat back cushion forward to access two of the (Push-in) retainers. The other two can be accessed thru the rear compartment.</p> <p>NOTE: When reinstalling lower interior push-in retainer, lift seat 40-45 degrees above flat to gain sufficient hand room to get retainer seated.</p>
2	Rear Compartment Floor Panel Trim Assembly (with Blower Cover, HP6)

REAR COMPARTMENT FLOOR PANEL TRIM REPLACEMENT (WITH BATTERY COVER, HP6)

Fig. 44: Rear Compartment Floor Panel Trim (with Battery Cover, HP6)

Courtesy of GENERAL MOTORS COMPANY

Rear Compartment Floor Panel Trim Replacement (with Battery Cover, HP6)

Callout	Component Name
Preliminary Procedure Remove the rear compartment floor panel trim (with blower cover,HP6). Refer to <u>Rear Compartment Floor Panel Trim Replacement (with Battery Cover, HP6).</u>	
1	Rear Compartment Side Trim Panel (Push-In) Retainer Procedure Pull the rear seat back cushion latch release located on the top of the rear seat back cushion, and fold the rear seat back cushion forward to access the rear compartment side trim panel (Push-In) retainer.
2	Rear Compartment Floor Panel Trim Assembly (with Battery Cover, HP6)

REAR COMPARTMENT LID INNER PANEL TRIM REPLACEMENT

Fig. 45: Rear Compartment Lid Inner Panel Trim & Retainers
 Courtesy of GENERAL MOTORS COMPANY

Rear Compartment Lid Inner Panel Trim Replacement

Callout	Component Name
Preliminary Procedure Remove the rear compartment lid latch cover. Refer to <u>Rear Compartment Lid Latch Cover Replacement</u> .	
1	Rear Compartment Lid Inner Panel Trim Retainer (Qty: 9)
2	Rear Compartment Lid Inner Panel Trim
Procedure Disengage the pull handle from the compartment lid, transfer handle if necessary.	

REAR COMPARTMENT LID LATCH COVER REPLACEMENT

Fig. 46: Rear Compartment Lid Latch Cover
Courtesy of GENERAL MOTORS COMPANY

Rear Compartment Lid Latch Cover Replacement

Callout	Component Name
1	Rear Compartment Lid Latch Cover TIP: Use a small flat-bladed tool to pull and release the rear compartment lid latch cover.

QUARTER OUTER PANEL PRESSURE RELIEF VALVE REPLACEMENT

Fig. 47: Quarter Outer Panel Pressure Relief Valve
 Courtesy of GENERAL MOTORS COMPANY

Quarter Outer Panel Pressure Relief Valve Replacement

Callout	Component Name
Preliminary Procedures	
1. Remove the rear bumper fascia. Refer to <u>Rear Bumper Fascia Replacement</u> .	
2. Reposition any wiring to gain access to pressure relief valve.	
1	Pressure Relief Valve

DTC B3101: KEYLESS ENTRY DATA LINK CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B3101

Keyless Entry Data Link Circuit

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	B3101 00	B3101 00	-	-
Serial Data - Enable Line	B3101 00	B3101 00	B3101 00	B3101 00
Serial Data - Receive	B3101 00	B3101 00	B3101 00	B3101 00
Low Reference	-	B3101 00	-	-

Circuit/System Description

The body control module communicates with the remote control door lock receiver through the keyless entry serial data circuits. When any button on the keyless entry transmitter is pressed, the transmitter sends a signal to the remote control door lock receiver. The remote control door lock receiver sends a function request to the body control module, depending on which button is pressed on the transmitter. The body control module receives the message and performs the appropriate function.

Conditions for Running the DTC

The body control module monitors for this DTC at all times.

Conditions for Setting the DTC

No response is received from the remote control door lock receiver after the body control module requests information from or sends configuration commands to the remote control door lock receiver.

Action Taken When the DTC Sets

In the case of power loss, the remote control door lock receiver is disabled for 65 s. Otherwise no action is taken.

Conditions for Clearing the DTC

- A current DTC will clear when the fault is no longer present.
- A history DTC will clear after 40 consecutive ignition cycles without a fault present.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, scan tool disconnected, disconnect the harness connector at the K77 Remote Control Door Lock Receiver. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 30 ohms between the low reference circuit terminal 1 and ground.
 - **If 30 ohms or greater**

1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
2. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If less than 30 ohms**
3. Ignition ON.
4. Test for greater than 11.5 V between the B+ circuit terminal 4 and ground.
 - **If 11.5 V or less**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If Infinite resistance.
 3. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If greater than 11.5 V**
 - 5. Test for 1-6 V between the serial data circuit terminal 2 and ground.
 - **If less than 1 V**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the serial data circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the serial data circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If greater than 6 V**
 1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the serial data circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If between 3-6 V**
 6. Ignition OFF, disconnect the X1 and X2 harness connectors at the K9 Body Control Module, ignition ON.
 7. Test for less than 1 V between the K9 Body Control Module serial data circuit terminal 26 X1 and ground.
 - **If 1 V or greater**

Repair the short to voltage on the circuit.

- **If less than 1 V**

8. Ignition OFF.

9. Test for infinite resistance between the K9 Body Control Module serial data circuit terminal 26 X1 and ground.

- **If less than infinite resistance**

Repair the short to ground on the circuit.

- **If infinite resistance**

10. Test for less than 2 ohms between the K9 Body Control Module serial data circuit terminal 26 X1 and the K77 Remote Control Door Lock Receiver serial data circuit terminal 3.

- **If 2 ohms or greater**

Repair the open/high resistance in the circuit.

- **If less than 2 ohms**

11. Replace the K77 Remote Control Door Lock Receiver.

12. Verify DTC B3101 does not set while operating the vehicle under the conditions for running the DTC.

- **If the DTC sets**

Replace the K9 Body Control Module

- **If the DTC does not set**

13. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for body control module or remote control door lock receiver replacement, programming, and setup.

DTC B3105: KEYLESS ENTRY TRANSMITTERS

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B3105

Keyless Entry Transmitters

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

The body control module monitors the number of keyless entry transmitters programmed. Until at least one transmitter is programmed, the body control module determines a malfunction condition exists.

Conditions for Running the DTC

The body control module has been set up without transmitters being programmed.

Conditions for Setting the DTC

No keyless entry transmitter programmed to the body control module.

Action Taken When the DTC Sets

The keyless entry system is inoperative.

Conditions for Clearing the DTC

A current DTC is cleared when at least one transmitter has been programmed to the body control module.

Circuit/System Verification

1. Verify that the transmitter is a correct transmitter for the vehicle. This can be accomplished by comparing the part number printed on the transmitter to the appropriate part number in the parts catalog.

- **If the transmitter is incorrect**

Replace the transmitter.

- **If the transmitter is correct**

2. Program the transmitter. Refer to **Key with Integrated Transmitter Programming (with BTM)** , **Key with Integrated Transmitter Programming (without BTM)** .

3. Verify the transmitter has successfully completed the programming procedure.

- **If the transmitter does not program successfully**

Replace the transmitter.

- **If the transmitter programs successfully**

4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC B3106: KEYLESS ENTRY DATA LINK

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B3106

Keyless Entry Data Link

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

The body control module communicates with the remote control door lock receiver through the keyless entry serial data circuits. When any button on the keyless entry transmitter is pressed, the transmitter sends a signal to the remote control door lock receiver. The remote control door lock receiver sends a function request to the body control module, depending on which button is pressed on the transmitter. The body control module receives the message and performs the appropriate function.

Conditions for Running the DTC

A keyless transmitter button is pressed.

Conditions for Setting the DTC

The transmitter that is sending a signal to the remote control door lock receiver is different from those transmitters stored in the body control module.

Action Taken When the DTC Sets

No action is taken.

Conditions for Clearing the DTC

- A current DTC will clear when the fault is no longer present and the ignition switch is cycled.
- A history DTC will clear after 40 consecutive ignition cycles without a fault present.

Keyless Entry Transmitter 3 Battery

DTC B3112

Keyless Entry Transmitter 4 Battery

DTC B3113

Keyless Entry Transmitter 5 Battery

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

With each press of a keyless entry transmitter button, a message containing the current battery state of the transmitter is sent to the remote control door lock receiver, along with the commanded keyless entry function. The remote control door lock receiver sends this to the body control module to perform the requested function.

Conditions for Running the DTC

A keyless transmitter button is pressed.

Conditions for Setting the DTC

Three consecutive low battery signals are received from the same transmitter.

Action Taken When the DTC Sets

The keyless entry system is inoperative.

Conditions for Clearing the DTC

The DTC is cleared when a normal transmitter voltage signal is received from the transmitter that set the DTC.

 - If the DTC does not set
 3. All OK.
 - **If none of the DTCs are set**
2. All OK.

DTC B3119: KEYLESS ENTRY ANTENNA 1

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B3119

Keyless Entry Antenna 1

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance

Keyless Entry Antenna Signal - Driver Door	B3119 02	B3119 05	B3119 05	-
Keyless Entry Antenna Low Reference - Driver Door	B3119 02	B3119 05	B3119 05	-

Circuit/System Description

The driver door handle antenna is located in the driver door handle assembly and is used to establish low frequency communications with the keyless entry transmitter. As a vehicle with locked doors is approached with a keyless entry transmitter and the exterior door handle button is pressed, the keyless entry control module communicates with the driver door handle keyless entry antenna.

Conditions for Running the DTC

The exterior driver door handle button is pressed within 15 min of last door closing.

Conditions for Setting the DTC

B3119 02

The keyless entry control module detects a short to ground on the driver door keyless entry antenna signal circuit.

B3119 05

The keyless entry control module detects a short to voltage or an open on the driver door keyless entry antenna signal circuit.

Action Taken When the DTC Sets

Doors will not unlock/lock when the driver exterior door handle button is pressed.

Conditions for Clearing the DTC

- A current DTC will clear when the conditions for setting the DTC are no longer present.
- A history DTC will clear after 40 malfunction-free ignition cycles.

Circuit/System Verification

1. Ignition ON.
2. Verify DTC B3122, B3123, or B3124 is not set.
 - **If any of the DTCs are set**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If none of the DTCs are set**
3. Refer to Circuit/System Testing.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the T10M Keyless Entry Antenna - Driver Door Handle, ignition ON.
2. Test for less than 1 V between the signal circuit terminal 1 and ground.
 - **If 1 V or greater**
 1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K84 Keyless Entry Control Module.
 - **If less than 1 V**

NOTE: When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.

3. Ignition OFF, install a DMM between the signal circuit terminal 1 and ground. Set the DMM to capture DC voltage using the MIN MAX function. Turn off autorange and manually set the DMM range to 000.0 V.
4. Lock the vehicle doors using the keyless entry transmitter. Activate the antenna by pressing the exterior door handle button.
5. Verify the MAX voltage captured by the DMM is greater than 1 V.
 - **If 1 V or less**
 1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K84 Keyless Entry Control Module.
 - **If greater than 1 V**
6. Test for less than 1 V between the low reference circuit terminal 2 and ground.
 - **If 1 V or greater**
 1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module, ignition ON.
 2. Test for less than 1 V between the low reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K84 Keyless Entry Control Module.
 - **If less than 1 V**

NOTE: **When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.**

7. Install a DMM between the signal circuit terminal 1 and the low reference circuit terminal 2. Set the DMM to capture DC voltage using the MIN MAX function. Turn off autorange and manually set the DMM range to 000.0 V.
8. Lock the vehicle doors using the keyless entry transmitter. Activate the antenna by pressing the exterior door handle button.
9. Verify the MAX voltage captured by the DMM is greater than 1 V.
 - **If 1 V or less**
 1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module.
 2. Test for infinite resistance between the low reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the low reference circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.
- If less than 2 ohms, replace the K84 Keyless Entry Control Module.

○ **If greater than 1 V**

10. Replace the T10M Keyless Entry Antenna - Driver Door Handle.
11. Lock the vehicle doors using the keyless entry transmitter. Activate the antenna by pressing the exterior door handle button.
12. Verify DTC B3119 is not set.
 - **If DTC B3119 is set**

Replace the K84 Keyless Entry Control Module.

○ **If DTC B3119 is not set**

13. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Keyless Entry Antenna Signal - Passenger Door	B3120 02	B3120 05	B3120 05	-
Keyless Entry Antenna Low Reference - Passenger Door	B3120 02	B3120 05	B3120 05	-

Circuit/System Description

The passenger front door handle antenna is located in the passenger front door handle assembly and is used to establish low frequency communications with the keyless entry transmitter. As a vehicle with locked doors is approached with a keyless entry transmitter and the exterior door handle button is pressed, the keyless entry control module communicates with the passenger front door handle keyless entry antenna.

Conditions for Running the DTC

The exterior door handle button in the passenger front door handle is pressed within 15 min of the last change of door ajar status for any door.

Conditions for Setting the DTC

B3120 02

The keyless entry control module detects a short to ground on the passenger front door keyless entry antenna signal circuit.

B3120 05

The keyless entry control module detects a short to B+ or an open on the passenger front door keyless entry antenna signal circuit.

Action Taken When the DTC Sets

Doors will not unlock/unlock when the passenger exterior door handle button is pressed.

Conditions for Clearing the DTC

- A current DTC will clear when the conditions for setting the DTC are no longer present.
- A history DTC will clear after 40 malfunction-free ignition cycles.

- **Wiring Repairs**

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify that DTC B3122, B3123, or B3124 is not set.
 - **If any of the DTCs are set**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If none of the DTCs are set**
3. Refer to Circuit/System Testing.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the T10N Keyless Entry Antenna - Passenger Door Handle, ignition ON.
2. Test for less than 1 V between the signal circuit terminal 1 and ground.
 - **If 1 V or greater**
 1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K84 Keyless Entry Control Module.
 - **If less than 1 V**

NOTE: **When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and**

manually set the DMM range to 000.0 V.

3. Ignition OFF, install a DMM between the signal circuit terminal 1 and ground. Set the DMM to capture DC voltage using the MIN MAX function. Turn off autorange and manually set the DMM range to 000.0 V.
4. Lock the vehicle doors using the keyless entry transmitter. Activate the antenna by pressing the exterior door handle button.
5. Verify the MAX voltage captured by the DMM is greater than 1 V.
 - **If 1 V or less**
 1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K84 Keyless Entry Control Module.
 - **If greater than 1 V**
6. Test for less than 1 V between the low reference circuit terminal 2 and ground.
 - **If 1 V or greater**
 1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module, ignition ON.
 2. Test for less than 1 V between the low reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K84 Keyless Entry Control Module.
 - **If less than 1 V**

NOTE: **When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.**

7. Install a DMM between the signal circuit terminal 1 and the low reference circuit terminal 2. Set the DMM to capture DC voltage using the MIN MAX function. Turn off autorange and manually set the DMM range to 000.0 V.
8. Lock the vehicle doors using the keyless entry transmitter. Activate the antenna by pressing the exterior door handle button.
9. Verify the MAX voltage captured by the DMM is greater than 1 V.
 - **If 1 V or less**
 1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module.
 2. Test for infinite resistance between the low reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance
- 3. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K84 Keyless Entry Control Module.
 - **If greater than 1 V**
- 10. Replace the T10N Keyless Entry Antenna - Passenger Door Handle.
- 11. Lock the vehicle doors using the keyless entry transmitter. Activate the antenna by pressing the exterior door handle button.
- 12. Verify DTC B3120 is not set.
 - **If DTC B3120 is set**

Replace the K84 Keyless Entry Control Module.

 - **If DTC B3120 is not set**
- 13. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Front Side Door Outside Handle Bracket Replacement (Base)**
- **Control Module References** for keyless entry control module replacement, programming, and setup

DTC B3121: KEYLESS ENTRY ANTENNA 3

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B3121

Keyless Entry Antenna 3

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Keyless Entry Antenna Signal -				

Rear Fascia	B3121 02	B3121 05	B3121 05	-
Keyless Entry Antenna Low Reference - Rear Fascia	B3121 02	B3121 05	B3121 05	-

Circuit/System Description

The rear fascia antenna is located in the rear fascia assembly and is used to establish low frequency communications with the keyless entry transmitter. As a vehicle with locked doors is approached with a keyless entry transmitter and the exterior rear closure touch pad is pressed, the keyless entry control module communicates with the rear fascia keyless entry antenna .

Conditions for Running the DTC

- The rear closure touch pad is pressed.
- The scan tool activates a device control function to simulate the above action.

Conditions for Setting the DTC

B3121 02

The keyless entry control module detects a short to ground on the rear fascia keyless entry antenna signal circuit.

B3121 05

The keyless entry control module detects a short to B+ or an open on the rear fascia keyless entry antenna signal circuit.

Action Taken When the DTC Sets

Rear closure will not open when rear closure touch pad is pressed.

Conditions for Clearing the DTC

- A current DTC will clear when the conditions for setting the DTC are no longer present.
- A history DTC will clear after 40 malfunction-free ignition cycles.

3. Refer to Circuit/System Testing.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the T10G Keyless Entry Antenna - Rear Fascia , ignition ON.
2. Test for less than 1 V between the signal circuit terminal 1 and ground.
 - **If 1 V or greater**
 1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K84 Keyless Entry Control Module.
 - **If less than 1 V**

NOTE: When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.

3. Ignition OFF, install a DMM between the signal circuit terminal 1 and ground. Set the DMM to capture DC voltage using the MIN MAX function. Turn off autorange and manually set the DMM range to 000.0 V.
4. Lock the vehicle doors using the keyless entry transmitter. Activate the antenna by pressing the rear closure touch pad.
5. Verify the MAX voltage captured by the DMM is greater than 1 V.
 - **If 1 V or less**
 1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K84 Keyless Entry Control Module.
 - **If greater than 1 V**
6. Test for less than 1 V between the low reference circuit terminal 2 and ground.
 - **If 1 V or greater**
 1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module, ignition ON.
 2. Test for less than 1 V between the low reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K84 Keyless Entry Control Module.
 - **If less than 1 V**

NOTE: **When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.**

7. Install a DMM between the signal circuit terminal 1 and the low reference circuit terminal 2. Set the DMM to capture DC voltage using the MIN MAX function. Turn off autorange and manually set the DMM range to 000.0 V.
8. Lock the vehicle doors using the keyless entry transmitter. Activate the antenna by pressing the rear closure touch pad.
9. Verify the MAX voltage captured by the DMM is greater than 1 V.
 - **If 1 V or less**
 1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module.
 2. Test for infinite resistance between the low reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the low reference circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.
- If less than 2 ohms, replace the K84 Keyless Entry Control Module.

○ **If greater than 1 V**

10. Replace the T10G Keyless Entry Antenna - Rear Fascia .
11. Lock the vehicle doors using the keyless entry transmitter. Activate the antenna by pressing the rear closure touch pad.
12. Verify DTC B3121 is not set.
 - **If DTC B3121 is set**

Replace the K84 Keyless Entry Control Module.

○ **If DTC B3121 is not set**

13. All OK.

DTC B3122: KEYLESS ENTRY ANTENNA 4

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B3122

Keyless Entry Antenna 4

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Keyless Entry Antenna Signal - Center Console Front	B3122 02	B3122 05	B3122 05	-
Keyless Entry Antenna Low				

Reference - Center Console Front	B3122 02	B3122 05	B3122 05	-
----------------------------------	----------	----------	----------	---

Circuit/System Description

The front center console antenna is located in front of the center console assembly and is used to establish low frequency communications with the keyless entry transmitter. When the driver attempts to change the ignition status of the vehicle, the keyless entry control module communicates with the front center console antenna.

Conditions for Running the DTC

Pressing the ignition mode switch.

Conditions for Setting the DTC

B3122 02

The keyless entry control module detects a short to ground on the front center console keyless entry antenna signal circuit.

B3122 05

The keyless entry control module detects a short to B+ or an open on the front center console keyless entry antenna signal circuit.

Action Taken When the DTC Sets

Vehicle will not detect the transmitter in some locations inside the vehicle. If the transmitter is not detected then vehicle will not change ignition modes when ignition mode switch is pressed.

Conditions for Clearing the DTC

- A current DTC will clear when the conditions for setting the DTC are no longer present.
- A history DTC will clear after 40 malfunction-free ignition cycles.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the T10J Keyless Entry Antenna - Center Console Front, ignition ON.
2. Test for less than 1 V between the signal circuit terminal 1 and ground.
 - **If 1 V or greater**
 1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K84 Keyless Entry Control Module.
 - **If less than 1 V**

NOTE: When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.

3. Ignition OFF, install a DMM between the signal circuit terminal 1 and ground. Set the DMM to capture DC voltage using the MIN MAX function. Turn off autorange and manually set the DMM range to 000.0 V.
4. Activate the antenna by pressing the ignition mode switch.
5. Verify the MAX voltage captured by the DMM is greater than 1 V.
 - **If 1 V or less**
 1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the signal circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.
- If less than 2 ohms, replace the K84 Keyless Entry Control Module.

- **If greater than 1 V**

6. Test for less than 1 V between the low reference circuit terminal 2 and ground.

- **If 1 V or greater**

1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module, ignition ON.
2. Test for less than 1 V between the low reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K84 Keyless Entry Control Module.

- **If less than 1 V**

NOTE: When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.

7. Install a DMM between the signal circuit terminal 1 and the low reference circuit terminal 2. Set the DMM to capture DC voltage using the MIN MAX function. Turn off autorange and manually set the DMM range to 000.0 V.

8. Activate the antenna by pressing the ignition mode switch.

9. Verify the MAX voltage captured by the DMM is greater than 1 V.

- **If 1 V or less**

1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module.
2. Test for infinite resistance between the low reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K84 Keyless Entry Control Module.

- **If greater than 1 V**

10. Replace the T10J Keyless Entry Antenna - Center Console Front.

11. Activate the antenna by pressing the ignition mode switch.

12. Verify DTC B3122 is not set.

- **If DTC B3122 is set**

Replace the K84 Keyless Entry Control Module.

- **If DTC B3122 is not set**

13. All OK.

Repair Instructions

DTC B3123: KEYLESS ENTRY ANTENNA 5

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B3123

Keyless Entry Antenna 5

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Keyless Entry Antenna Signal - Center Console Rear	B3123 02	B3123 05	B3123 05	-
Keyless Entry Antenna Low Reference - Center Console Rear	B3123 02	B3123 05	B3123 05	-

Circuit/System Description

The rear center console antenna is located in rear of the center console assembly and is used to establish low frequency communications with the keyless entry transmitter. When the driver attempts to change the ignition status of the vehicle, the keyless entry control module communicates with the rear center console antenna.

Conditions for Running the DTC

Pressing the ignition mode switch.

Conditions for Setting the DTC

B3123 02

The keyless entry control module detects a short to ground on the rear center console keyless entry antenna signal circuit.

B3123 05

The keyless entry control module detects a short to B+ or an open on the rear center console keyless entry antenna signal circuit.

Action Taken When the DTC Sets

Vehicle will not detect the transmitter in some locations inside the vehicle. If the transmitter is not detected then vehicle will not change ignition modes when ignition mode switch is pressed.

Conditions for Clearing the DTC

- A current DTC will clear when the conditions for setting the DTC are no longer present.
- A history DTC will clear after 40 malfunction-free ignition cycles.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the T10K Keyless Entry Antenna - Center Console

Rear, ignition ON.

2. Test for less than 1 V between the signal circuit terminal 1 and ground.
 - **If 1 V or greater**
 1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K84 Keyless Entry Control Module.
 - **If less than 1 V**

NOTE: When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.

3. Ignition OFF, install a DMM between the signal circuit terminal 1 and ground. Set the DMM to capture DC voltage using the MIN MAX function. Turn off autorange and manually set the DMM range to 000.0 V.
4. Activate the antenna by pressing the ignition mode switch.
5. Verify the MAX voltage captured by the DMM is greater than 1 V.
 - **If 1 V or less**
 1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K84 Keyless Entry Control Module.
 - **If greater than 1 V**
6. Test for less than 1 V between the low reference circuit terminal 2 and ground.
 - **If 1 V or greater**
 1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module, ignition ON.
 2. Test for less than 1 V between the low reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K84 Keyless Entry Control Module.
 - **If less than 1 V**

NOTE: When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.

7. Install a DMM between the signal circuit terminal 1 and the low reference circuit terminal 2. Set the DMM to capture DC voltage using the MIN MAX function. Turn off autorange and manually set the DMM range to 000.0 V.
8. Activate the antenna by pressing the ignition mode switch.
9. Verify the MAX voltage captured by the DMM is greater than 1 V.
 - **If 1 V or less**
 1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module.
 2. Test for infinite resistance between the low reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K84 Keyless Entry Control Module.
 - **If greater than 1 V**
10. Replace the T10K Keyless Entry Antenna - Center Console Rear.
11. Activate the antenna by pressing the ignition mode switch.
12. Verify DTC B3123 is not set.
 - **If DTC B3123 is set**

Replace the K84 Keyless Entry Control Module.
 - **If DTC B3123 is not set**
13. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC B3124: KEYLESS ENTRY ANTENNA 6

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B3124

Keyless Entry Antenna 6 Short to Ground

DTC B3124

Keyless Entry Antenna 6 High Voltage/Open

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Keyless Entry Antenna Signal - Rear Compartment	B3124 02	B3124 05	B3124 05	-
Keyless Entry Antenna Low Reference - Rear Compartment	B3124 02	B3124 05	B3124 05	-

Circuit/System Description

The rear compartment antenna is located on the rear compartment floor near the seat back, centered, and is used to establish low frequency communications with the keyless entry transmitter. When the driver attempts to change the ignition status of the vehicle, the keyless entry control module communicates with the rear compartment antenna.

Conditions for Running the DTC

Pressing the ignition mode switch.

Conditions for Setting the DTC

B3124 02

The keyless entry control module detects a short to ground on the rear compartment keyless entry antenna signal circuit.

B3124 05

The keyless entry control module detects a short to B+ or an open on the rear compartment keyless entry antenna signal circuit.

Action Taken When the DTC Sets

Vehicle will not detect the transmitter in some locations inside the vehicle. If the transmitter is not detected then vehicle will not change ignition modes when ignition mode switch is pressed.

Conditions for Clearing the DTC

- A current DTC will clear when the conditions for setting the DTC are no longer present.
- A history DTC will clear after 40 malfunction-free ignition cycles.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the T10E Keyless Entry Antenna - Rear Compartment, ignition ON.
2. Test for less than 1 V between the signal circuit terminal 1 and ground.
 - **If 1 V or greater**
 1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K84 Keyless Entry Control Module.
 - **If less than 1 V**

NOTE: When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and

manually set the DMM range to 000.0 V.

3. Ignition OFF, install a DMM between the signal circuit terminal 1 and ground. Set the DMM to capture DC voltage using the MIN MAX function. Turn off autorange and manually set the DMM range to 000.0 V.
4. Activate the antenna by pressing the ignition mode switch.
5. Verify the MAX voltage captured by the DMM is greater than 1 V.
 - **If 1 V or less**
 1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K84 Keyless Entry Control Module.
 - **If greater than 1 V**
6. Test for less than 1 V between the low reference circuit terminal 2 and ground.
 - **If 1 V or greater**
 1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module, ignition ON.
 2. Test for less than 1 V between the low reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K84 Keyless Entry Control Module.
 - **If less than 1 V**

NOTE: **When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.**

7. Install a DMM between the signal circuit terminal 1 and the low reference circuit terminal 2. Set the DMM to capture DC voltage using the MIN MAX function. Turn off autorange and manually set the DMM range to 000.0 V.
8. Activate the antenna by pressing the ignition mode switch.
9. Verify the MAX voltage captured by the DMM is greater than 1 V.
 - **If 1 V or less**
 1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module.
 2. Test for infinite resistance between the low reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the low reference circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.
- If less than 2 ohms, replace the K84 Keyless Entry Control Module.

○ **If greater than 1 V**

10. Replace the T10E Keyless Entry Antenna - Rear Compartment.
11. Activate the antenna by pressing the ignition mode switch.
12. Verify DTC B3124 is not set.

○ **If DTC B3124 is set**

Replace the K84 Keyless Entry Control Module.

○ **If DTC B3124 is not set**

13. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Ignition Lock Key Transmitter Antenna Replacement - Rear Compartment**
- **Control Module References** for keyless entry control module replacement, programming, and setup

SYMPTOMS - REMOTE FUNCTIONS

NOTE: **The following steps must be completed before using the symptom tables.**

1. Perform **Diagnostic System Check - Vehicle** before using the Symptom Tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to **Keyless Entry System Description and Operation (without BTM)**, **Keyless Entry System Description and Operation (with BTM)**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the Keyless Entry System. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections, wiring, terminals, connectors, poor voltage and ground connections, temperature sensitivity, electromagnetic interference, electrical noise and/or incorrect control module installed may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Garage Door Opener Malfunction**
- **No Remote Detected**
- **Keyless Entry System Malfunction (Active), Keyless Entry System Malfunction (Passive)**

GARAGE DOOR OPENER MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	1	1	-	-
Ground	-	1	-	-
1. Universal Home Remote Malfunction				

Circuit/System Description

The universal home remote is a transmitter operating between 288 and 434 MHz. The universal home remote has three buttons that may be programmed for individual transmitter/receiver combinations to control up to three garage doors, security gates, lighting systems, etc. Each button represents a unique transmitter code section, which operates independently of the other buttons, and may be considered a separate transmitter.

- **Wiring Repairs**

Special Tools

EL 41540 Universal Home Remote Tester

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the S25 Garage Door Opener.
2. Test for less than 10 ohms between the ground circuit terminal 3 and ground.

- **If 10 ohms or greater**

Test for less than 2 ohms in the ground circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.
- If less than 2 ohms, repair the open/high resistance in the ground connection.
- **If less than 10 ohms**

3. Ignition ON.
4. Verify a test lamp illuminates between the B+ circuit terminal 1 and ground.

- **If the test lamp does not illuminate and the circuit fuse is good**

1. Ignition OFF.
2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Ignition OFF.
2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the S25 Garage Door Opener.

- **If the test lamp illuminates**

5. Verify the LED on the S25 Garage Door Opener illuminates or flashes when each button on the S25 Garage Door Opener is pressed.

- **If the LED does not illuminate or flash when each button is pressed**

Replace the S25 Garage Door Opener.

- **If the LED illuminates or flashes when each button is pressed**

NOTE: This step will clear any learned transmitters from the S25 Garage Door Opener. This will require reprogramming by the customer to reestablish universal home remote functionality.

6. Press and hold the two outer buttons on the S25 Garage Door Opener for greater than 30 s. The LED on the S25 Garage Door Opener will illuminate for 20 s, then begin to flash quickly for another 10 s. When the LED stops flashing, the system has been cleared and placed into default mode.
7. Place the **EL 41540** Universal Home Remote Tester so that it is adjacent to the S25 Garage Door Opener.
8. Verify the appropriate **EL 41540** Universal Home Remote Tester Indicator Lights illuminate when each button on S25 Garage Door Opener the is pressed, one at a time

- **If the tester does not respond to each button press**

Replace the S25 Garage Door Opener.

- **If the tester responds to each button press**

9. Using the Hand Held Transmitter from the **EL 41540** Universal Home Remote Tester kit, program a single button on the S25 Garage Door Opener. Refer to the instructions provided with the **EL 41540** Universal Home Remote Tester for programming instructions.

NOTE: When performing step 10, press the button that was programmed in step 9.

10. Verify the Programmed indicator on the **EL 41540** Universal Home Remote Tester illuminates when the programmed button on the S25 Garage Door Opener is pressed.

- **If the Programmed indicator does not illuminate when the programmed button is pressed**

Replace the S25 Garage Door Opener.

- **If the Programmed indicator illuminates when the programmed button is pressed**

11. Instruct the customer to program the S25 Garage Door Opener to their device. Refer to the vehicle owners manual. If further malfunction occurs, a possible rolling code or incompatibility with the S25 Garage Door Opener will prevent programming.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for garage door opener replacement, programming, and setup

NO REMOTE DETECTED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.

- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Keyless Entry Antenna Signal - Center Console Front	B3122 02	B3122 05	B3122 05	-
Keyless Entry Antenna Low Reference - Center Console Front	B3122 02	B3122 05	B3122 05	-
Keyless Entry Antenna Signal - Center Console Rear	B3123 02	B3123 05	B3123 05	-
Keyless Entry Antenna Low Reference - Center Console Rear	B3123 02	B3123 05	B3123 05	-
Keyless Entry Antenna Signal - Rear Compartment	B3124 02	B3124 05	B3124 05	-
Keyless Entry Antenna Low Reference - Rear Compartment	B3124 02	B3124 05	B3124 05	-

Circuit/System Description

When a transmitter authentication is requested, the front console, rear console, and rear compartment antennas simultaneously broadcast a challenge within the passenger compartment to the transmitter. If the response from the transmitter via radio frequency (RF) is a valid response, the body control module (BCM) determines there is a transmitter within the vehicle. If no response is received, the BCM determines that no transmitter is in the vehicle, and NO REMOTE DETECTED will be displayed on the DIC.

Diagnostic Aids

A low transmitter battery or radio frequency (RF) interference from aftermarket devices such as 2-way radios, power inverters, cellular phone chargers, computers, 12 V power outlet USB converters, etc. may cause a system malfunction. High RF traffic areas, such as gas stations which use pay-at-the-pump RF transponders, may also cause interference that could lead to a malfunction.

Conditions caused by external influences such as these are considered to be normal. Following this diagnostic will not diagnose an RF interference condition. If RF interference is suspected, question the customer about the conditions or location where the NO REMOTE DETECTED condition occurs.

- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

NOTE: This condition may be caused by low vehicle battery voltage. If the battery is not sufficiently charged (above 10 volts), the system will have difficulties detecting the transmitter and the NO REMOTE DETECTED message will be displayed. Correct the low battery voltage condition to eliminate this condition.

1. Verify that DTC B3119, B3120, B3121, B3122, B3123, or B3124 is not set.

- **If any of the DTCs are set**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If none of the DTCs are set**

2. Lock the vehicle using the keyless entry transmitter.
3. Verify that each door unlocks and opens by approaching the vehicle with a valid transmitter and operating their respective exterior door handle button.
 - **If both doors do not unlock/unlatch and open**

Refer to **Keyless Entry System Malfunction (Active), Keyless Entry System Malfunction (Passive)**.

- **If both doors unlock/unlatch and open**

4. Verify the vehicle starts with the transmitter located in the key pocket/slot.
 - **If the vehicle does not start**

Perform the **Key with Integrated Transmitter Programming (with BTM)** , **Key with Integrated Transmitter Programming (without BTM)** procedure.

- **If the vehicle starts**

5. Verify the NO REMOTE DETECTED message is not displayed on the DIC while attempting to start the vehicle, placing the keyless entry transmitter in various locations within the vehicle interior at each start attempt. The vehicle should start.

- **If the NO REMOTE DETECTED message is displayed at any time**

Refer to Circuit/System Testing.

- **If the NO REMOTE DETECTED message is not displayed and the vehicle starts**

6. Inspect for any sources of RF interference such as cell phone chargers, power supplies, etc. that would interrupt transmitter and antenna communication. If inspection does not reveal any items causing RF interference, discuss with the customer the conditions or location where the NO REMOTE DETECTED condition occurs. Discuss any devices that are normally kept in the vehicle, such as a laptop or cell phone charger, which may have been removed when the vehicle was brought in for service. It may be necessary to explain to the customer how RF interference degrades the performance of the system.

Circuit/System Testing

NOTE: To determine the appropriate T10 Keyless Entry Antenna to disconnect and diagnose, place the transmitter in various location within the vehicle's interior and attempt to start. The location of the transmitter when the NO REMOTE DETECTED message occurs will correspond with the T10 Keyless Entry Antenna that requires diagnosis.

1. Ignition OFF, disconnect the harness connector at the appropriate T10 Keyless Entry Antenna, ignition ON.
2. Test for less than 1 V between the signal circuit terminal 1 and ground.
 - **If 1 V or greater**
 1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K84 Keyless Entry Control Module.
 - **If less than 1 V**

NOTE: When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.

3. Ignition OFF, install a DMM between the signal circuit terminal 1 and ground. Set the DMM to capture DC voltage using the MIN MAX function.
4. Activate the antenna by pressing the ignition mode switch.
5. Verify the MAX voltage captured by the DMM is greater than 1 V.

- **If 1 V or less**
 1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K84 Keyless Entry Control Module.
- **If greater than 1 V**
- 6. Test for less than 1 V between the low reference circuit terminal 2 and ground.
 - **If 1 V or greater**
 1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module, ignition ON.
 2. Test for less than 1 V between the low reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K84 Keyless Entry Control Module.
 - **If less than 1 V**

NOTE: When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.

7. Install a DMM between the signal circuit terminal 1 and the low reference circuit terminal 2. Set the DMM to capture DC voltage using the MIN MAX function.
8. Activate the antenna by pressing the ignition mode switch.
9. Verify the MAX voltage captured by the DMM is greater than 1 V.
 - **If 1 V or less**
 1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module.
 2. Test for infinite resistance between the low reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K84 Keyless Entry Control Module.
 - **If greater than 1 V**
10. Replace the appropriate T10 Keyless Entry Antenna.
11. Activate the antenna by pressing the ignition mode switch.
12. Verify the NO REMOTE DETECTED message is not displayed and the vehicle starts.
 - **If the NO REMOTE DETECTED message is displayed and the vehicle does not start**

Replace the K84 Keyless Entry Control Module.

- **If the NO REMOTE DETECTED message is not displayed and the vehicle starts**

13. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

KEYLESS ENTRY SYSTEM MALFUNCTION (ACTIVE)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The keyless entry transmitter is part of the vehicle key. The keyless entry system will unlock the vehicle doors or open/unlock the rear compartment when a corresponding button on the keyless entry transmitter is pressed. This is accomplished by the keyless entry transmitter sending a radio frequency to the remote control door lock receiver, which then sends the signal to the body control module (BCM). The BCM interprets the signal and activates the requested function. A low transmitter battery or radio frequency (RF) interference from aftermarket devices such as 2-way radios, power inverters, cellular phone chargers, computers, etc. may cause a system malfunction. High RF traffic areas, such as gas stations which use pay-at-the-pump RF transponders, may also cause interference that could lead to a malfunction.

Diagnostic Aids

- Unwanted or inadvertent door lock/unlock activation may be requested by the OnStar® Remote Link app. It is possible that a customer may be unaware of account usage, result in an unwanted or phantom door lock/unlock. If normal system diagnosis does results in an inability to verify the customer's concern, contact Technical Assistance Center (TAC).
- If available, the EL 43241 Keyless Entry Tester may be used to diagnose a low transmitter battery or a malfunctioning transmitter. To test, place the transmitter on the test pad of the EL 43241 and press each transmitter button one at a time, holding each button for three seconds. If the green light on the tester does not illuminate and a tone does not sound, first replace the transmitter battery and retest. If the malfunction continues after replacing the transmitter battery, replace the transmitter.
- When using the EL 43241 Keyless Entry Tester, first inspect the keyless entry transmitter part number to determine that it is the correct model for the vehicle. An incorrect part number transmitter may pass the

test, but it will not activate the keyless entry system.

- When the vehicle key is in the ignition, the keyless entry functions are disabled from all keyless entry transmitters.

Keyless Entry Antenna Low Reference - Rear Fascia	B3121 02	B3121 05	B3121 05	-

Circuit/System Description

The keyless entry antennas are used as short range low frequency transmitters. As a vehicle with locked doors is approached with a keyless entry transmitter and the exterior door handle button/rear closure touch pad is pressed, the keyless entry antenna broadcasts a challenge to the transmitter in an approximate one meter range. If the response from the transmitter via radio frequency (RF) is valid, the locked door will be passively unlocked/unlatched and allow the door to be opened. A low transmitter battery or radio frequency (RF) interference from aftermarket devices such as 2-way radios, power inverters, cellular phone chargers, computers, etc. may cause a system malfunction. High RF traffic areas, such as gas stations which use pay-at-the-pump RF transponders, may also cause interference that could lead to a malfunction.

Diagnostic Aids

Unwanted or inadvertent door lock/unlock activation may be requested by the OnStar® Remote Link app. It is possible that a customer may be unaware of account usage, result in an unwanted or phantom door lock/unlock. Circuit/System Verification

1. Ignition ON.
2. Verify that DTC B3119, B3120, or B3121 is not set.
 - **If any of the DTCs are set**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If none of the DTCs are set**
3. Verify that the vehicle key is correct for the vehicle. This can be accomplished by comparing the part number printed on the key to the appropriate part number in the parts catalog.
 - **If the vehicle key is incorrect**

Replace the vehicle key.

 - **If the vehicle key is correct**
 4. Verify the scan tool Exterior Driver Door Handle Switch, Exterior Passenger Door Handle Switch, and Trunk Lid Exterior Unlatch Switch parameters change between Active and Inactive while operating their respective exterior door handle button/rear closure touch pad.
 - **If any of the parameters does not change**

Refer to **Exterior Door Handle Switch Malfunction** .

- **If all of the parameters change**
5. Lock the vehicle using the keyless entry transmitter.
 6. Verify that each door and the rear compartment unlocks and opens by approaching the vehicle with a valid transmitter and operating their respective exterior door handle button/rear closure touch pad.
 - **If both doors and the rear compartment do not unlock/unlatch and open**

Refer to Passive Transmitter Malfunction in Circuit/System Testing.

- **If only one door or the rear compartment does not unlock/unlatch and open**

Refer to Antenna Circuit Malfunction in Circuit/System Testing.

- **If both doors and the rear compartment unlocks/unlatches and opens**
7. All OK.

Circuit/System Testing

Passive Transmitter Malfunction

1. Lock the vehicle using the keyless entry transmitter.
2. Verify that each door and rear compartment unlocks and opens by approaching the vehicle with a valid transmitter and operating their exterior door handle button/rear closure touch pad.
 - **If both doors and the rear compartment do not unlock/unlatch and open**
 1. Replace the transmitter battery.
 2. Lock the vehicle using the keyless entry transmitter.
 3. Verify that each door and rear compartment unlocks and opens by approaching the vehicle with a valid transmitter and operating their respective release handle/touch pad.
 - If both doors and the rear compartment do not unlock/unlatch and open, replace the vehicle key.
 - If both doors and the rear compartment unlock/unlatch and open
 - 4. All OK.
 - **If both doors and the rear compartment unlock/unlatch and open**
3. The concern may be caused by temporary RF interference. Discuss the conditions in which the concern occurs with the customer. RF interference from aftermarket devices such as 2-way radios, power inverters, cellular phone chargers, computers, etc. may cause a system malfunction. High RF traffic areas, such as gas stations which use pay-at-the-pump RF transponders, may also cause interference that could lead to a malfunction.

Antenna Circuit Malfunction

1. Ignition OFF, disconnect the harness connector at the inoperative T10 Keyless Entry Antenna, ignition ON.
2. Test for less than 1 V between the signal circuit terminal 1 and ground.
 - **If 1 V or greater**
 1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K84 Keyless Entry Control Module.
 - **If less than 1 V**

NOTE: When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.

3. Ignition OFF, install a DMM between the signal circuit terminal 1 and ground. Set the DMM to capture DC voltage using the MIN MAX function. Turn off autorange and manually set the DMM range to 000.0 V.
4. Lock the vehicle doors using the keyless entry transmitter. Activate the antenna by operating the appropriate exterior door handle button/rear closure touch pad.

5. Verify the MAX voltage captured by the DMM is greater than 1 V.
 - **If 1 V or less**
 1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K84 Keyless Entry Control Module.
 - **If greater than 1 V**
6. Test for less than 1 V between the low reference circuit terminal 2 and ground.
 - **If 1 V or greater**
 1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module, ignition ON.
 2. Test for less than 1 V between the low reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K84 Keyless Entry Control Module.
 - **If less than 1 V**

NOTE: **When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.**

7. Install a DMM between the signal circuit terminal 1 and the low reference circuit terminal 2. Set the DMM to capture DC voltage using the MIN MAX function. Turn off autorange and manually set the DMM range to 000.0 V.
8. Lock the vehicle doors using the keyless entry transmitter. Activate the antenna by operating the appropriate exterior door handle button/rear closure touch pad.
9. Verify the MAX voltage captured by the DMM is greater than 1 V.
 - **If 1 V or less**
 1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module.
 2. Test for infinite resistance between the low reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K84 Keyless Entry Control Module.
 - **If greater than 1V**
10. Replace the appropriate T10 Keyless Entry Antenna.

11. Lock the vehicle doors using the keyless entry transmitter. Activate the antenna by operating the appropriate exterior door handle button/rear closure touch pad.
12. Verify that the door/rear compartment unlocks and opens when the exterior door handle button/rear closure touch pad is operated.

- **If the door/rear compartment does not unlock and open**

Replace the K84 Keyless Entry Control Module.

- **If the door/rear compartment unlocks and opens**

13. All OK.

REMOTE VEHICLE START MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of each diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

Remote vehicle start begins as a radio frequency message received by the body control module (BCM) from a keyless entry transmitter. The BCM monitors system conditions such as content theft deterrent, hood ajar status, and body DTCs to determine if a remote vehicle start event will occur. If conditions are determined to be acceptable, the remote vehicle start message is sent to the engine control module (ECM). The ECM monitors system conditions such as engine control parameters and vehicle theft deterrent to determine if engine starting will be allowed. If conditions are acceptable, the ECM will initiate engine starting. During the engine run time in a remote vehicle start attempt, before the operator enters the vehicle, the ECM may discontinue engine operation if system conditions require it or a message is received from the BCM requesting the engine be turned OFF.

Diagnostic Aids

- Unwanted or inadvertent door lock/unlock activation may be requested by the OnStar® Remote Link application. It is possible that a customer may be unaware of account usage, resulting in an unwanted or phantom door lock/unlock. If normal system diagnosis results in an inability to verify the customer's

concern, contact Technical Assistance Center (TAC).

- If the vehicle has a current DTC that illuminates the malfunction indicator lamp (MIL), the cause of the DTC must be diagnosed before proceeding with the Remote Vehicle Start Inoperative diagnostic.
- Only the first and second vehicle transmitters are able to control the remote vehicle start function.
- The remote vehicle start system will not operate if any of the following conditions are present:
 - A current vehicle DTC that illuminates the malfunction indicator lamp (MIL)
 - The vehicle is in valet mode
 - More than 2 remote starts have been attempted
 - The hazard switch is in the ON position
 - A current hazard switch DTC is set
 - The vehicle hood is ajar
 - A current hood ajar DTC is set
 - Incorrect BCM software is installed and vehicle start is not enabled
 - The content theft deterrent system detects an alarm trigger
 - Excessive engine RPM
 - Excessive coolant temperature
 - Accelerator pedal position greater than 0 percent
 - Vehicle not in park
 - Vehicle theft deterrent malfunction
 - A current automatic transmission shift lock control system DTC is set
 - A vehicle speed sensor signal is detected by the ECM

Preliminary Procedure	
Remove the garage door opener transmitter. Refer to <u>Garage Door Opener Transmitter Replacement.</u>	
1	Garage Door Opener Transmitter Pushbutton

DESCRIPTION AND OPERATION

GARAGE DOOR OPENER DESCRIPTION AND OPERATION

The garage door opener is fixed and rolling code capable. Rolling code is a system that allows the code that the customers receiver receives from the garage door opener to change every time the garage door opener is used within operating range of the receiver. Rolling code programming requires the customer to push a learn/program button on the garage door opener receiver at their home. This button is usually located on the receiver unit under a cover (light cover) on one end of the unit. The customer must follow the garage door opener manufacturers instructions to program/learn the receiver to accept the Universal Home Remote System as an authorized opener for their unit . When the receiver and the garage door opener are initially programmed together, a code is established and a new code is created for every new transmission. The software in the receiver recognizes the garage door opener and accepts the new code.

The garage door opener is compatible with most, but not all types and brands of transmitters.

The garage door opener is a transmitter operating between 288-434 MHz. The power and range of the transmitter is limited to comply with laws governing the generation of radio frequency interference. The transmitter is programmed by the user to accept the signal generated by the user's transmitters.

The garage door opener has 3 buttons that may be programmed for individual transmitter/receiver combinations to control up to 3 garage door openers, security gates, lighting systems, etc. Each button represents a transmitter code section of the transmitter, which operates separately from any other button, and may be considered a separate transmitter. Operation consists of simply pressing a button to activate the corresponding transmitter.

KEYLESS ENTRY SYSTEM DESCRIPTION AND OPERATION (WITHOUT BTM)

The keyless entry system is a vehicle entry device. The keyless entry system is used in conjunction with the door locks to unlock the vehicle. Keyless entry will lock/unlock the vehicle doors or open the rear compartment lid when a corresponding button on the keyless entry transmitter is pressed. This is accomplished by the transmitter sending a radio frequency to the remote control door lock receiver antenna that has a direct link to the body control module (BCM). The BCM interprets the signal and activates the requested function or request the appropriate control module to activate the function via a serial data message. A low transmitter battery or radio frequency interference from aftermarket devices, such as 2-way radios, power inverters, computers, etc., may cause a system malfunction. High radio frequency traffic areas, such as gas stations that use pay-at-the-pump radio frequency transponders, may also cause interference that could lead to a malfunction. Keyless entry allows you to operate the following features:

- Door lock/unlock
- Liftgate lock/unlock, if equipped
- Trunk release, if equipped
- Power liftgate, if equipped
- Panic alarm/vehicle locator
- Remote vehicle starting, if equipped

The keyless entry system has the following components:

- Keyless entry transmitters
- Body control module
- Remote control door lock receiver

Keyless Entry Transmitters

NOTE: When the vehicle key is in the ignition, keyless entry functions from all keyless entry transmitter are disabled.

The keyless entry transmitters are used to perform various entry functions while away from the immediate area of the vehicle. Keyless entry functions may work at up to 20 m (65 ft) away from the vehicle. Ambient conditions may affect the performance of the keyless entry transmitter and reduce the range at which keyless entry functions operate. Up to eight transmitters may be programmed to a single vehicle. The keyless entry transmitter is an integral part of the vehicle key.

OnStar® Remote Link (if equipped)

A vehicle operator may have the ability to perform some of the keyless entry functions using applications on personal devices such as a smart phone. Unwanted or inadvertent door lock/unlock activation may be requested by the OnStar® Remote Link application. It is possible that a customer may be unaware of account usage, resulting in an unwanted or phantom door lock/unlock. If normal system diagnosis results in an inability to verify the customer's concern, contact Technical Assistance Center (TAC).

Body Control Module (BCM)

The BCM is a multifunction module that operates the keyless entry system. When a radio frequency message is received from a keyless entry transmitter, the BCM interprets this signal and performs the specific function, i.e. door lock, door unlock, or vehicle locate.

Remote Control Door Lock Receiver

The remote control door lock receiver acts as an antenna for the keyless entry system and communicates with the BCM through a dedicated serial data link. When a button is pressed on a keyless entry transmitter, the remote control door lock receiver receives this signal and sends the request to the BCM. The BCM interprets the signal and performs the specific function, i.e. door lock, door unlock, or vehicle locate.

Unlock Doors

Momentarily press the transmitter UNLOCK button in order to perform the following functions:

- Unlock only the driver door or all doors and liftgate (if equipped); this is customized through the DIC.
- Illuminate the interior lamps for a determined length of time or until the ignition is turned ON.
- Flash the exterior lights; this is customized through the DIC.
- Disarm the content theft deterrent system, if equipped.
- Deactivate the content theft deterrent system when in the alarm mode.

Lock All Doors

Press the transmitter LOCK button to perform the following functions:

- Lock all vehicle doors.
- Immediately turn OFF the interior lamps.
- Flash the exterior lights and/or sound the horn; this is customized through the DIC.
- Arm the content theft deterrent system.

Trunk Release, if equipped

Press the trunk release button on the transmitter to open the trunk.

Power Liftgate, if equipped

Press and hold the power liftgate button to perform the following functions:

- Open or close the liftgate using the power liftgate function.
- Flash the tail lamps.
- Sound the interior power liftgate chime.

Vehicle Locator/Panic Alarm

A single press of the panic button performs the following functions. Some functions may be dependent on personalization settings:

- Pulse the horn three times.
- Flash the exterior lamps three times.

A press and hold of the panic button performs the following functions:

- Illuminate the interior lamps.
- Pulse the horn and flash the exterior lamps for 30 seconds or until the following conditions occur:
 - The panic button is pressed.
 - The ignition switch is turned to the RUN position with a valid key.

Remote Vehicle Start, if equipped

The remote vehicle start function allows engine starting while not in the vehicle. It also allows the vehicle HVAC system and other vehicle systems to enable, providing a comfortable vehicle upon entry. The remote vehicle start sequence begins by pressing and releasing the lock button and then pressing and holding the remote vehicle start buttons on the keyless entry transmitter. The turn signal lamps will illuminate to indicate the vehicle has received the remote start request. Each time a remote vehicle start is performed, the vehicle doors are locked, however they may then be unlocked/locked with the transmitter at any time. Only the first and second vehicle transmitters are able to control the remote vehicle start function. Any additional remote transmitters programmed to the vehicle will perform all other remote functions. Once activated, the engine is allowed to run for 10 minutes. The remote vehicle start time may be extended by an additional 10 minutes by again pressing and releasing the lock button and then pressing and holding the remote vehicle start buttons on the transmitter. This feature is called a remote vehicle start continue and allows a maximum of 20 minutes of engine running. If the remote vehicle start continue is performed at 7 minutes into the initial 10 minute time-out, a total of 17 minutes of engine running would occur. The remote vehicle start event may be suspended at any time by pressing only the remote vehicle start button on the transmitter or by entering the vehicle and turning ON the hazard lamps.

In between ignition cycles, only two remote vehicle start events may occur or be attempted. Once two events or attempts have been made, future remote vehicle start events will be suspended until the vehicle is started using the ignition.

Enable/Disable Remote Vehicle Start

Using the driver information center, remote vehicle start may be enabled or disabled as a part of vehicle

personalization. Refer to the vehicle owners manual for more information.

Hood Ajar Switch

The hood switch provides status of the hood to the BCM for remote vehicle start purposes. The switch is integrated into the hood latch assembly.

Remote Vehicle Start Circuit Description

The BCM receives a signal from the keyless entry transmitter indicating a remote vehicle start request. A message is then sent to the BCM which determines if a crank request message will be sent to the ECM to allow engine starting. To determine if conditions are correct for a remote vehicle start event, the BCM will ensure the following conditions are met:

- A valid hood ajar switch closed signal is present.
- The doors are locked.
- The hazard switch is OFF.
- The vehicle power mode is correct.
- No content theft deterrent alarm triggers are present.

When the BCM determines all conditions meet those required for a remote vehicle start event, a message is sent via serial data to the ECM. The ECM relies on the remote vehicle start message from the BCM to enable remote vehicle start when the crank request signal is received. If the ECM does not receive a valid remote vehicle start message, it will not attempt to start the engine. While the ECM is in remote vehicle start mode it will suspend engine operation if any of the following additional conditions occur:

- Vehicle speed is greater than 0
- Transmission is not in PARK
- Excessive engine coolant temperature
- Low oil pressure
- The malfunction indicator lamp (MIL) is commanded ON
- Engine crank time is greater than 30 seconds
- Excessive engine speed
- Accelerator pedal position too high
- Remote start timer equals 0
- Immobilizer system indicates tamper

Keyless Entry Personalization

Vehicle lock/unlock functions and remote vehicle start settings may be personalized. For functional descriptions and personalization instructions, refer to the vehicle owners manual.

Keyless Entry System Description and Operation - Active

The keyless entry system is a vehicle entry device. The keyless entry system is used in conjunction with the door locks to unlock the vehicle. Keyless entry will lock/unlock a door or open the rear compartment lid when a corresponding button on the keyless entry transmitter is pressed. This is accomplished by the transmitter sending a radio frequency to the remote control door lock receiver antenna that has a direct link to the body control module (BCM). The BCM interprets the signal and activates the requested function or requests the appropriate ECU to activate the function via a serial data message. A low transmitter battery or radio frequency interference from aftermarket devices, such as 2-way radios, power inverters, computers, 12 V power outlet USB adapters, etc., may cause a system malfunction. High radio frequency traffic areas, such as gas stations that use pay-at-the-pump radio frequency transponders, may also cause interference that could lead to a malfunction. Keyless entry allows you to operate the following features:

- Door lock/unlock
- Rear compartment lid release
- Illuminated entry lamps
- Panic alarm/vehicle locator
- Remote vehicle start
- Automatic window express down, if equipped. Automatic window express up, if equipped

Keyless Entry System Description and Operation - Passive

Passive keyless entry allows entry to a locked vehicle without pressing any buttons on the keyless entry transmitter. You must only have the transmitter with you. The passive entry system use low frequency antennas in several different areas on the vehicle to determine the location of the transmitter. When passively opening a locked door or the rear compartment, you must have a programmed transmitter with you in your pocket, purse, or briefcase within a one meter range.

When an exterior door handle button is pressed or the rear compartment touch pad is pressed, the BCM sends a serial data message to the keyless entry control module directing the keyless entry control module to send a low frequency challenge from the keyless entry antenna to the keyless entry transmitter. Because of the low frequency, communication range is limited. The antenna will emit the challenge in a one meter range. The transmitter must be within this range to receive the challenge. The transmitter receives this challenge and emits its response as an RF message, which is received by the remote control door lock receiver. If the response is correct, entry into the vehicle will be allowed.

As a customer convenience feature, the keyless entry system will notify the driver if the transmitter has been left in the vehicle after exiting by chirping the vehicle horn three times. This may be turned off using vehicle personalization. Also, if the transmitter is left in the vehicle after the central door lock switch has been used to lock the vehicle, the driver door will remain unlocked after exiting the vehicle. This is intended to prevent locking the transmitter in the vehicle and being unable to access it.

Keyless Entry System Description and Operation - Keyless Start

The keyless start portion of the keyless entry system allows vehicle starting, having only the transmitter as your key. The keyless start system uses low frequency antennas in three different locations on the vehicle to determine the location of the transmitter. Multiple antennas are used to ensure complete coverage of the vehicle interior and rear compartment. When using the keyless start system, a programmed transmitter must be in the vehicle's interior, in the driver's pocket, purse, or briefcase.

When the ignition mode switch is pressed, the low frequency antennas emit a challenge to the keyless entry transmitter. The transmitter receives this challenge and emits its response as an RF message, which is received by the remote control door lock receiver. If the response is correct, vehicle starting will be allowed. If RF communication is interrupted, a "No Remote Detected" message will be displayed on the DIC. In these cases, the transmitter can be placed in the transmitter pocket located in the center console, under the cupholder. The immobilizer antenna coil is located directly beneath the transmitter pocket. Placing the transmitter in the pocket will create a low powered coupling between the transmitter and immobilizer antenna, allowing communications to occur and enabling vehicle starting.

The keyless entry system has the following components:

- Keyless entry integrated key/transmitter
- Driver and front passenger door antennas (part of the door handle assembly)
- Driver and front passenger door handle switches (part of the door handle assembly)
- Rear fascia antenna
- Front console antenna
- Rear console antenna
- Trunk antenna (rear compartment)
- Body control module (BCM)
- Keyless entry control module
- Immobilizer antenna coil assembly
- Remote control door lock receiver

Keyless Entry Transmitters

By operating any of the exterior door handle buttons, a nearby transmitter is challenged by a keyless entry antenna. The transmitter will send an RF response to the remote control door lock receiver, which communicates with the BCM. The BCM will interpret this communication and either allow entry into the vehicle or deny it.

Door Antennas

The keyless entry door antennas are used to transmit low frequency communications to the keyless entry transmitters.

The keyless entry door antennas are located in the left front and right front exterior door handle bracket. The antennas are serviced as part of the door handle assembly. The antennas are controlled by the keyless entry control module. When the exterior door handle button is pressed, the respective antenna will send out a challenge to the keyless entry transmitter, which begins the passive entry communications.

Rear Fascia Antenna

The rear fascia antenna is used to transmit low frequency communication to the keyless entry transmitters for entry to rear compartment.

The rear fascia antenna is located behind the rear fascia. The antenna is controlled by the keyless entry control module. When the rear compartment touch pad is pressed, the antenna sends out a challenge to the keyless entry transmitter, which begins the passive entry communications.

Front Console Passive (Instrument Panel) Antenna

This antenna is located in the lower instrument panel near the front of the center console.

The front console antenna is used for vehicle starting functions. When the ignition mode switch is pressed, the antenna is energized or "pinged". This emits a low frequency challenge signal that is received by the keyless entry transmitter. The transmitter will then reply to this challenge with a response and, if correct, vehicle starting will occur.

Rear Console Antenna

This antenna is located in the rear of the center console.

The rear console antenna is used for vehicle starting functions. When the ignition mode switch is pressed, the antenna is energized or "pinged". This emits a low frequency challenge signal that is received by the keyless entry transmitter. The transmitter will then reply to this challenge with a response and, if correct, vehicle starting will occur.

Rear Compartment Antenna

This antenna is located in the center of the rear compartment metal floor pan, near the seatback.

The rear compartment antenna is used for vehicle starting functions. When the ignition mode switch is pressed, the antenna is energized or "pinged". This emits a low frequency challenge signal that is received by the keyless entry transmitter. The transmitter will then reply to this challenge with a response and, if correct, vehicle starting will occur.

Immobilizer Antenna Coil Assembly

The immobilizer coil assembly is located in the center console, directly beneath the transmitter pocket. If the transmitter battery is dead, weak, or the RF signal is being interrupted, the transmitter may be placed in the pocket to create a low powered coupling between the transmitter and immobilizer antenna, allowing communications to occur and enabling vehicle starting.

The immobilizer antenna coil is controlled by the BCM. The immobilizer control module is also active when learning vehicle keys.

Keyless Entry Control Module

The keyless entry control module is a multi-function module which performs the following keyless entry system functions:

- Activating vehicle antennas for passive keyless entry functions
- Activating vehicle antennas for keyless start functions
- Backup control for the ECM accessory wakeup and the run/crank relay
- If equipped, controls the electronic steering column lock
- Receiver of the exterior door handle switch inputs and door open switch (not the door ajar switch)
- Ignition mode switch monitoring

OnStar® Remote Link (if equipped)

A vehicle operator may have the ability to perform some of the keyless entry functions using applications on personal devices such as but not limited to smart phones. A condition may appear as if there is a malfunction in the vehicle. If it is suspected that this may be the case contact Technical Assistance if a condition cannot be determined through normal vehicle diagnostics.

Body Control Module (BCM)

The BCM is a multi-function module that performs the following functions:

- Receive and authenticate active transmitter and keyless start signals from the remote control door lock receiver
- Determines the functionality requested by the transmitter signal
- Performs the function requested by the transmitter signal

Unlock Driver Door Only - Active

Momentarily press the transmitter UNLOCK button in order to perform the following functions:

- Unlock only the driver door
- Illuminate the interior lamps for a determined length of time, or until the ignition is turned ON
- Flash the exterior lights, if enabled through personalization
- Disarm the Content Theft Deterrent (CTD) system
- Deactivate the CTD system when in the alarm mode

Unlock All Doors - Second Operation - Active

Momentarily press the transmitter UNLOCK button a second time, within 5 seconds of the first press, to perform the following function:

Unlock the remaining doors

Unlock Driver Door Only - Passive

If enabled through personalization, approach the driver door with a valid keyless entry transmitter and press the door handle button to perform the following functions:

- Unlock and open only the driver door
- Disarm the CTD system, if equipped
- Deactivate the CTD system when in the alarm mode

Unlock All Doors - Passive

Approach any non driver door (front or rear) or, if enabled through personalization, the driver door with a valid keyless entry transmitter and press the door handle button to perform the following functions:

- Unlock all vehicle doors
- Disarm the CTD system, if equipped
- Deactivate the CTD system when in the alarm mode

Lock All Doors - Active

Press the transmitter LOCK button to perform the following functions:

- Lock all vehicle doors
- Immediately turn off the interior lamps
- Flash the exterior lights, if enabled through personalization
- Chirp the horn, if enabled through personalization
- Arm the CTD system

Lock All Doors - Passive

Exit the vehicle (with ignition off) with the keyless entry transmitter to automatically perform the following

functions, if equipped.

- Lock all vehicle doors after a delay
- Flash the exterior lights, if enabled through personalization
- Chirp horn, if enabled through personalization
- Arm the CTD system

When all doors are closed, they can also be locked from the exterior by pressing a front door handle button while having a valid transmitter within range.

If more than one keyless entry transmitter is within a vehicle and the Keyless Entry System detects that one or more transmitters have been left in the vehicle after vehicle is locked, any transmitter left within the vehicle will be temporarily deactivated until:

- A button on the deactivated key fob is pressed (will only activate the fob whose button is pressed)
- A passive unlock of vehicle occurs
- Change in power mode occurs

Rear Compartment Lid Release - Active

If the vehicle transaxle is in PARK or NEUTRAL and the ignition is in the OFF position, a single press of the transmitter rear compartment release button will open the rear compartment lid.

Rear Compartment Lid Release - Passive

Approach the rear of the vehicle with a valid keyless entry transmitter. Press the rear compartment lid release touch pad. The rear compartment lid will open.

If vehicle is not equipped with trunk antenna, a keyless entry transmitter left inside the truck will allow the trunk to be reopened at any time. This feature will not allow a customer to lock the transmitter in the trunk.

If vehicle has a trunk antenna and one or more transmitters are left in the trunk or interior of the vehicle, those transmitter(s) will be deactivated when the vehicle becomes locked.

Vehicle Locator/Panic Alarm/Active

A single press of the panic button performs the following functions. Some functions may be dependent on personalization settings:

- Pulses the horn three times
- Flashes the exterior lamps three times

A press and hold of the panic button performs the following functions:

- A press and hold of the panic button performs the following functions:
- Pulses the horn and flashes the parking lamps for 30 second or until the following conditions occur:

- The panic button is pressed
- The ignition switch is turned to the RUN position with a valid key

Remote Vehicle Start/Active

The remote vehicle start function allows engine starting while not in the vehicle. It also allows the vehicle HVAC system and other vehicle systems to enable, providing a comfortable vehicle upon entry. The remote vehicle start sequence begins by pressing and releasing the lock button and then pressing and holding the remote vehicle start buttons on the keyless entry transmitter. The turn signal lamps will illuminate to indicate the vehicle has received the remote start request. Each time a remote vehicle start is performed, the vehicle doors are locked, however they may then be unlocked/locked with the transmitter at any time. Only the first and second vehicle transmitters are able to control the remote vehicle start function. Any additional remote transmitters programmed to the vehicle will perform all other remote functions. Once activated, the engine is allowed to run for 10 minutes. The remote vehicle start time may be extended by an additional 10 minutes by again pressing and releasing the lock button and then pressing and holding the remote vehicle start buttons on the transmitter. This feature is called a remote vehicle start continue and allows a maximum of 20 minutes of engine running. If the remote vehicle start continue is performed at 7 minutes into the initial 10 minute time-out, a total of 17 minutes of engine running would occur. The remote vehicle start event may be suspended at any time by pressing only the remote vehicle start button on the transmitter or by entering the vehicle and turning ON the hazard lamps.

In between ignition cycles, only two remote vehicle start events may occur or be attempted. Once two events or attempts have been made, future remote vehicle start events will be suspended until the vehicle is started using the ignition.

Enable/Disable Remote Vehicle Start/Active

Using the driver information center, remote vehicle start may be enabled or disabled as a part of vehicle personalization. Refer to the vehicle owners manual for more information.

Hood Ajar Switch/Active

The hood switch provides status of the hood to the BCM for remote vehicle start purposes. The switch is integrated into the hood latch assembly. The hood ajar switch provides 2 separate inputs to the BCM. These separate inputs allow the BCM to actively monitor for a hood ajar switch fault.

Remote Vehicle Start Circuit Description/Active

The BCM receives a signal from the keyless entry transmitter indicating a remote vehicle start request. The BCM uses the following inputs to verify the system is ready for a remote vehicle start event:

- Vehicle is not in valet mode
- All vehicle doors are closed
- Rear compartment lid is not ajar
- The hood is closed
- The doors are locked

- The hazard switch is OFF
- Battery reconnect has not occurred
- Vehicle power mode is correct

When the BCM determines all conditions meet those required for a remote vehicle start event, a message is sent via serial data to the ECM. The ECM relies on the remote vehicle start message from the BCM to enable remote vehicle start when the crank request signal is received. If the ECM does not receive a valid remote vehicle start message, it will not ground the control circuit of the crank relay and start the engine. While the ECM is in remote vehicle start mode it will cut fuel to the engine if any of the following additional conditions occur:

- Vehicle speed is greater than 0
- Transmission is not in P
- Excessive engine coolant temperature
- Low oil pressure
- The malfunction indicator lamp (MIL) is commanded ON
- Engine crank time is greater than 30 seconds
- Excessive engine speed
- Accelerator pedal position too high
- Remote start timer equals 0
- Immobilizer system indicates a theft attempt

Keyless Entry Personalization

Vehicle lock/unlock functions and remote vehicle start settings may be personalized for the vehicle. For functional descriptions and programming instructions, refer to the vehicle owners manual.

ACCESSORIES & EQUIPMENT

Lighting - Description and Operation

DESCRIPTION AND OPERATION

EXTERIOR LIGHTING SYSTEMS DESCRIPTION AND OPERATION

Exterior Lamps

The exterior lighting system consist of the following lamps:

- Headlamps
- Daytime running lamps (DRL)
- Front fog lamps
- Park, tail, license and marker lamps
- Turn signal lamps
- Hazard warning lamps
- Stop lamps
- Backup lamps

Low Beam Headlamps

The headlamps consist of 2 interchangeable single filament bulbs on each side of the vehicle which provide high and low beams. The lower bulb in the headlamp is the high beam and the upper bulb is the low beam.

The headlamps may be turned ON in 3 different ways:

- When the headlamp switch is placed in the ON position, for normal operation.
- When the headlamp switch is placed in the AUTOMATIC LIGHT position, for automatic lamp control.
- When the headlamp switch is placed in the AUTOMATIC LIGHT position, with the windshield wipers ON in daylight conditions, after a 6 s delay.

The body control module (BCM) controls the headlamps based on the inputs explained above. When a low beam request is received, the BCM applies B+ to both low beam headlamps through the left low beam and right low beam control circuits, illuminating the low beam headlamps.

Automatic Lamp Control

Automatic Light is switched ON as default. It can be switched OFF by turning the headlamp switch to OFF position. It will be switched ON again by doing so again. Automatic Light is only available if a rain sensor or rain/light sensor module is installed in the car. The rain/light sensor module will send the actual ambient light state (day/night) to the BCM. If Automatic Light is enabled, BCM will react on the message received from the rain/light sensor module by switching ON/OFF low beams.

Flash to Pass

When the low beam headlamps are on and the turn signal/multifunction switch is momentarily placed in the flash to pass position, ground is applied to the turn signal/multifunction switch. The turn signal/multifunction switch applies ground to the BCM through the flash to pass switch signal circuit. The BCM then applies ground to the high beam relay control circuit. This energizes the high beam relay, closing the switch side contacts of the high beam relay, applying battery voltage to the left and right high beam fuses. Battery voltage is applied from the high beam fuses through the high beam voltage supply circuit to the high beam headlamp assemblies. This causes the high beam headlamps to illuminate at full brightness momentarily or until the flash to pass switch is released.

Daytime Running Lamps

The DRL bulbs are combined with the park lamps. One filament is for the DRL and one for the park lamps. The DRL will operate when the following conditions are met:

1. Engine is running.
2. Headlamp switch in AUTOMATIC LIGHT position.
3. The high and low beam headlamps are OFF.

By turning the headlamp switch in the OFF position the automatic light function and the DRL will be deactivated.

The ambient light sensor is used to monitor outside lighting conditions. The ambient light sensor provides a voltage signal that will vary between 0.2-4.9 V depending on outside lighting conditions. The HVAC control module provides a low reference ground and 5 V reference signals to the ambient light sensor. The BCM monitors the ambient light sensor signal circuit to determine if outside lighting conditions are correct for either DRL or low beam when the headlamp switch is in the AUTOMATIC LIGHT position. In daylight conditions, the BCM will command the DRL ON by applying battery voltage to the left and right DRL lamps. Any function or condition that turns on the headlamps will cancel DRL operation.

Front Fog Lamps

The front fog lamp relay is supplied with battery voltage at all times. The front fog lamp switch signal circuit is grounded momentarily by pressing the front fog lamp switch. The body control module (BCM) energizes the front fog lamp relay by applying ground to the front fog lamp relay control circuit. When the front fog lamp relay is energized, the relay switch contacts close and battery voltage is applied through the front fog lamp fuse to the front fog lamp supply voltage circuit which illuminates the front fog lamps.

Park, Tail, License and Marker Lamps

The rear tail, stop, and turn signal functions are performed by light emitting diodes (LED) in the tail lamp assemblies. The rear side marker lamps uses LEDs and are part of the tail lamp assemblies which wraps around the corner of the vehicle. The front park and side marker lamps are part of the front headlamp assembly. The front side markers uses LEDs the front position lamps use an incandescent bulb. The BCM sends out a PWM signal to illuminate all park, tail, license, and marker lamps as soon when the headlamp switch is placed in the PARK LAMP or HEADLAMP position or anytime the headlights are requested. The park lamps are also turned on with the front fog lamps.

Turn Signal Lamps

Ground is applied at all times to the turn signal/multifunction switch. The turn signal lamps may only be activated with the ignition switch in the ON or START position. When the turn signal/multifunction switch is placed in either the TURN RIGHT or TURN LEFT position, ground is applied to the BCM through either the right turn or left turn signal switch signal circuit. The BCM then applies a pulsating voltage to the front and rear turn signal lamps through their respective voltage supply circuits. When a turn signal request is received by the BCM, a serial data message is sent to the instrument cluster requesting the respective turn signal indicator be pulsed ON and OFF.

Hazard Flasher Lamps

The hazard flashers may be activated in any power mode. The hazard switch is permanently grounded. When the hazard switch is placed in the ON position, ground is applied through the hazard switch signal circuit to the BCM. The BCM supplies battery voltage to all turn signal lamps in an ON and OFF duty cycle. When the hazard switch is activated, the BCM sends a serial data message to the instrument cluster requesting both turn signal indicators to be cycled ON and OFF.

Stop Lamps

NOTE: Brake system does not use a brake switch, stoplight switch or brakelight switch. System uses a Brake Pedal Position Sensor to control these functions.

The brake pedal position (BPP) sensor is used to sense the action of the driver application of the brake pedal. The BPP sensor provides an analog voltage signal that will increase as the brake pedal is applied. The BCM provides a low reference signal and a 5 V reference voltage to the BPP sensor. When the variable signal reaches a voltage threshold indicating the brakes have been applied, the BCM will apply battery voltage to the stop lamp control circuit and center high mounted stop lamp control circuit. When the control circuit is energized the stop lamps are illuminated.

Backup Lamps

When the transmission is placed in the reverse position, the engine control module (ECM) sends a serial data message to the BCM. The message indicates that the gear selector is in the reverse position. The BCM applies battery voltage to the backup lamps. The backup lamps are permanently grounded. Once the driver moves the gear selector out of the reverse position, a message is sent by the ECM via serial data requesting the BCM to remove battery voltage from the backup lamp control circuit.

Battery Run Down Protection/Inadvertent Power

To provide battery run down protection, the exterior lamps will be deactivated automatically under certain conditions. The BCM monitors the state of the headlamp switch. If the park or headlamp switch is ON when the ignition switch is placed in either the CRANK or RUN position and then placed in the OFF position, the BCM initiates a 10 min timer. At the end of the 10 min, the BCM will turn OFF the control power output to the park and headlamp relay coils, deactivating the exterior lamps. This feature will be cancelled if any power mode other than OFF becomes active. The BCM will disable battery run down protection if any of the following conditions exist. The park or headlamp switch is placed in the ON to OFF position, and back to the ON position during battery run down protection. The BCM determined that the park or headlamp switch was not active when

the ignition was turned OFF.

INTERIOR LIGHTING SYSTEMS DESCRIPTION AND OPERATION

Interior Lamps

The interior lamps consist of 2 groups, those which can dim from the instrument panel cluster lamps dimmer switch and those that can not dim.

Courtesy/Illuminated Entry Lamps

The following lamps may be manually turned ON by placing the interior lamp switch in the ON position, or by opening a door while the switch is in the AUTO position.

- The dome lamp
- The liftgate lamps
- Courtesy lamps

The courtesy lamp supply voltage circuit of the body control module (BCM) supplies battery positive voltage to the dome lamp, the liftgate lamps and courtesy lamps. When any door is opened, the door jamb switch contacts close providing a door open input to the BCM. The BCM then provides a B+ to the interior lamps with the switch in the AUTO position. The interior lamps receive a ground when the switch is in the ON position.

NOTE: If the liftgate is opened after all the modules go to sleep, the dome light will not come on. The liftgate ajar switch input to the BCM will not wake up the BCM once it has gone to sleep, so the dome light will not come on. Once the BCM gets an input to wake it up, from remote keyless entry or a door handle, the dome light will turn on when the liftgate is opened.

If the driver inadvertently leaves any interior lamp ON, the BCM will turn it OFF after a 20 min time-out.

The courtesy lamps will turn OFF immediately if the ignition switch is turned to the ON position or approximately 20 s after all doors are closed.

Keyless Entry Interior Illumination

When the BCM receives a door unlock command from the remote keyless entry transmitter, the BCM will flash the park lamps several times, illuminate the courtesy and park lamps, and illuminate the low beam headlamps at low intensity. The lamps will remain on until the ignition key is turned from the OFF position, a keyless entry transmitter door lock command is received, or after an approximate 20 s delay.

Interior Lamps Dimming

This group includes lamps which may dim. This group may use a combination of vacuum fluorescent illumination, LEDs and incandescent lamps.

- HVAC control module, head assembly

- Rear HVAC control module, head assembly
- Radio
- Rear seat audio
- The instrument panel cluster
- The PRNDL lamp, with the exception of the current gear select position
- Power window switches
- Various switches

When the ignition switch is turned to the ON position, the vacuum fluorescent display, radio, turns ON at maximum brightness. When the park lamps or low beams are ON, all incandescent back lighting turn ON at the dimming level indicated by the instrument panel cluster dimmer switch. At the same time all fluorescent display displays dim to match the indicated dimming level. When the headlamp switch is placed in the PARK or in HEADLAMPS position, the headlamp switch supplies an input signal to the BCM. The BCM then supplies voltage to the instrument panel cluster dimmer switch through the dimming control circuit. The setting of the instrument panel cluster dimmer switch determines the amount of voltage that the instrument panel cluster dimmer switch supplies to the BCM. The BCM then sends a PWM voltage to all the interior lamps. All the fluorescent display and incandescent back lighting lamps are provided a specific voltage.

NOTE: **For vehicles which are equipped with automatic light function, the interior backlighting can only be dimmed when the ambient light sensor detects night conditions.**

When the headlight switch is turned to the park lamp or headlamp position, all incandescent back lighting turn ON at the dimming level indicated by the instrument panel cluster dimmer switch. When the instrument panel cluster dimmer switch is moved from minimum to maximum, all fluorescent display displays, as well as all incandescent back lighting respond from minimum intensity to maximum brightness in response to the instrument panel cluster dimmer switch.

Inadvertent Power

The BCM used in this vehicle controls the lighting system through circuits that enable the interior lamps. The BCM opens these enabling circuits shortly after the ignition switch is turned OFF with no lamp switch activity. If the ignition switch is turned to any position other than OFF, or if a lamp switch is activated during this period, the timer will reset itself.

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Hazard Switch LED Backlighting Control	B096A 02	B096A 01, B096A 04	1	-
Multifunction Switch 1 - Instrument Panel Ground	-	B096A 01, B096A 04	-	-
1. Hazard Lamps Malfunction				

Circuit/System Description

The instrument panel dimmer switch controls are located on the headlamp switch assembly and are used to increase and decrease the brightness of the interior backlighting components. When the instrument panel dimmer switch is placed in a desired brightness position, the body control module (BCM) receives a signal from the instrument panel dimmer switch and responds by applying a pulse width modulated (PWM) voltage to the hazard warning switch LED backlighting control circuit illuminating the LED to the desired level of brightness.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Park lamps ON.

Conditions for Setting the DTC

DTC B096A 01

- The BCM detects an open/high resistance in the hazard warning switch LED backlighting control circuit.
- The BCM detects an open/high resistance in the hazard warning switch ground circuit.

DTC B096A 02

The BCM detects a short to ground in the hazard warning switch LED backlighting control circuit.

DTC B096A 04

- The BCM detects an open/high resistance in the hazard warning switch LED backlighting control circuit.
- The BCM detects an open/high resistance in the hazard warning switch ground circuit.

Actions Taken When the DTC Sets

The hazard warning switch LED backlighting will not illuminate.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Circuit/System Testing

1. Ignition OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connector at the S48C multifunction switch 1 - instrument panel. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 15 ohms between the ground circuit terminal 7 and ground.
 - **If 15 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 15 ohms**
3. Connect a test lamp between the control circuit terminal 5 and ground, ignition ON.
4. Verify the test lamp turns ON and OFF when commanding the Hazard Lamps Switch Backlight ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 body control module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 body control module, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 body control module.
 - **If the test lamp turns ON and OFF**
5. Test or replace the S48C multifunction switch 1 - instrument panel.

1. Interior Backlighting Malfunction				

Circuit/System Description

The instrument panel dimmer switch is used to increase and decrease the brightness of the interior backlighting components. The instrument panel dimmer switch provides a voltage signal to the body control module (BCM) that will increase as the brightness of the lights are increased and decrease as the brightness of the lights are decreased. The BCM provides B+ and a low reference signal to the instrument panel dimmer switch. When the instrument panel dimmer switch is placed in the desired position, the dimmed voltage setting is applied from the instrument panel dimmer switch through the instrument panel dimmer switch signal circuit to the BCM. The BCM interprets the signal and applies a pulse width modulated (PWM) voltage through the LED dimming control circuits illuminating the interior backlighting to the requested level of brightness.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Park Lamps ON.

Conditions for Setting the DTC

DTC B1405 03, B1529 03, or B257B 03

- The BCM detects a short to ground or an open/high resistance in the instrument panel dimmer switch B+ circuit.
- The BCM detects a short to ground or an open/high resistance in the instrument panel dimmer switch signal circuit.

DTC B257B 07

The BCM detects a short to voltage in the instrument panel dimmer switch signal circuit.

Actions Taken When the DTC Sets

The BCM will not dim any interior backlighting. All interior backlighting will default to the level selected prior to the fault being present.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

1. Adaptive Forward Lighting Malfunction				

Circuit/System Description

Battery positive voltage is applied to the headlamp control module at all times. The headlamp control module has a normal operational voltage range of about 12.5-16 V and is only fully functional with the ignition switch is in the RUN position and the headlamp switch in the AUTOMATIC LIGHT position. The communications enable signal from the body control module (BCM) wakes the headlamp control module microprocessor. The headlamp control module receives serial data messages from the engine control module (ECM), transmission control module (TCM), electronic brake control module (EBCM), and BCM with information regarding power mode, speed, steering angle, transmission gear selection, and headlamp switch status. The headlamp control module calculates the headlamp angle and sends commands to the left and right adaptive forward lighting system headlamp actuators. The headlamp actuators drive the headlamps to the position commanded by the headlamp control module. The headlamp control module monitors the headlamp actuator motor control circuits for proper circuit continuity and for shorts to ground or voltage. If a malfunction is detected, a DTC will be stored in memory and the driver will be notified with a message displayed over the driver information center located on the instrument cluster.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.

- Ignition ON.
- Headlamps ON.

Conditions for Setting the DTC

DTC B1461 00

The headlamp leveling control module detects an internal malfunction in the left headlamp adaptive actuator.

DTC B1462 00

The headlamp leveling control module detects an internal malfunction in the right headlamp adaptive actuator.

Actions Taken When the DTC Sets

- When DTC B1461 or DTC B1462 sets, the headlamp leveling control module will attempt to return the lamps to a nominal position and disable all requests to all headlamp actuators.
- The instrument cluster will display AFL Malfunction - Contact Service.
- On vehicles equipped with both AFL and headlamp leveling, the headlamp leveling system will be disabled.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists and the ignition is cycled.
- A history DTC will clear once 50 consecutive malfunction-free ignition cycles have occurred.

Circuit/System Testing

1. Ignition OFF, exterior lamps OFF, disconnect the harness connector at the appropriate E13 headlamp.
2. Test for less than 5 ohms between the appropriate ground circuit terminal listed below and ground.
 - E13L headlamp - left terminal 8 with A1LL
 - E13R headlamp - right terminal 8 with A1LL
 - E13L headlamp - left terminal 7 with A1SL
 - E13R headlamp - right terminal 7 with A1SL
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
3. Ignition ON.
4. Verify a test lamp illuminates between the appropriate B+ circuit terminal listed below and ground.
 - E13L headlamp - left terminal 6 with A1LL
 - E13R headlamp - right terminal 6 with A1LL
 - E13L headlamp - left terminal 8 with A1SL
 - E13R headlamp - right terminal 8 with A1SL
 - **If the test lamp does not illuminate**
 1. Ignition OFF, disconnect the X2 harness connector at the X50A fuse block - underhood.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the X50A fuse block - underhood.
 - **If the test lamp illuminates**
5. Test or replace the K26 headlamp control module.
6. Ignition ON.
7. Verify the appropriate headlamp operates to the LEFT and RIGHT positions when commanding the appropriate Headlamp Horizontal Motor control LEFT and RIGHT with a scan tool.
 - If the appropriate headlamp does not operate LEFT and RIGHT, test or replace the appropriate headlamp assembly.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Headlamp Replacement**
- **Front Compartment Fuse Block Housing Replacement**
- **Control Module References** for headlamp control module replacement, programming, and setup

DTC B1480

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B1480 02

Battery Rundown Protection Circuit Short to Ground

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Courtesy Lamps Control - Terminal 2 X7	B1480 02	1	1	-
Dome Lamps Control	B2615 02	2	2	-
Dome/Reading Lamps - Overhead Console Ground	-	1, 2	-	-
Dome/Reading Lamps - Rear Ground	-	1, 2	-	-
Instrument Panel Compartment Lamp Ground	-	1	-	-
Sunshade Mirror Lamp - Left Ground	-	1	-	-
Sunshade Mirror Lamp - Right Ground	-	1	-	-
1. Courtesy Lamps Malfunction 2. Dome Lamps Malfunction				

Circuit/System Description

The body control module (BCM) supplies battery voltage to the front and rear reading lamps, left and right

sunshade lamps, center console compartment lamp, and instrument panel compartment lamp via the courtesy lamp control circuit. When the instrument panel compartment or a sunshade mirror is opened, the switch contacts close allowing battery voltage to flow illuminating the respective lamps. The front and rear reading lamps are controlled by individual switches that are activated by the operator when additional cabin lighting is required. In the event that any of these courtesy lamps were to remain illuminated for more than 10 minutes with the ignition switch in the OFF position and no doors opened, the BCM will deactivate the courtesy lamp control circuit to prevent total battery discharge.

Conditions for Running the DTC

Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

The BCM detects a short to ground in the courtesy lamps control circuit.

Actions Taken When the DTC Sets

The BCM will disable the circuit and all lamps controlled by the courtesy lamp control circuit will be inoperative.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Control Module References for scan tool information

Circuit/System Testing

1. Ignition OFF, exterior lamps OFF, disconnect the harness connectors at the components listed below.
 - E27 instrument panel compartment lamp
 - E31L sunshade - left
 - E31R sunshade - right
 - E37D dome/reading lamps - overhead console
 - E37R dome/reading lamps - rear
2. Connect a test lamp between the appropriate control circuit terminal listed below and ground.
 - E27 instrument panel compartment lamp terminal 1
 - E31L sunshade mirror lamp - left terminal A
 - E31R sunshade mirror lamp - right terminal A
 - E37D dome/reading lamps - overhead console terminal 1
 - E37R dome/reading lamps - rear terminal 1
3. Verify the test lamp turns ON and OFF when commanding the Inadvertent Load ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X7 harness connector at the K9 body control module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X7 harness connector at the K9 body control module, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 body control module.
 - **If the test lamp turns ON and OFF**
4. Test or replace the appropriate courtesy lamp.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Sunshade Replacement**

- **Instrument Panel Compartment Lamp Replacement**
- **Dome and Reading Lamp Replacement**
- **Control Module References** for BCM replacement, programming, and setup

Front Fog Lamp Control	1	1	1	-
Front Fog Lamp Ground - Left	-	1	-	-
Front Fog Lamp Ground - Right	-	1	-	-
1. Front Fog Lamps Malfunction				

Circuit/System Description

The front fog lamp switch is an input to the body control module (BCM) and is contained in the headlamp switch assembly. The BCM supplies voltage to the front fog lamp switch via the front fog lamp and instrument

panel dimmer switch B+ circuit. When the front fog lamp switch is pressed, voltage from the B+ circuit is pulled down through the front fog lamp switch resistor. The front fog lamp resistor is part of the resistor ladder that also provides the dimming signals for the instrument panel dimmer switches. The BCM receives the voltage signal through the front fog lamp and instrument panel dimmer switch signal circuit.

The front fog lamp relay is supplied with battery voltage at all times. The front fog lamp switch signal circuit is grounded momentarily by pressing the front fog lamp switch. The body control module (BCM) energizes the front fog lamp relay by applying ground to the front fog lamp relay control circuit. When the front fog lamp relay is energized, the relay switch contacts close and battery voltage is applied through the FRT FOG fuse to the front fog lamp control circuit which illuminates the front fog lamps.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Front fog lamps ON.

Conditions for Setting the DTC

DTC B2530 01

The BCM detects a short to voltage in the front fog lamp relay control circuit for 5 seconds or greater.

DTC B2530 02

The BCM detects a short to ground in the front fog lamp relay control circuit.

DTC B2530 04

The BCM detects an open in the front fog lamp relay control circuit.

Actions Taken When the DTC Sets

DTC B2530 01 and B2530 04

The front fog lamps will not operate when the park lamps are ON and the front fog lamp switch is active.

DTC B2530 02

The front fog lamps always ON.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Circuit/System Testing

1. Ignition OFF, disconnect the X5 harness connector at the K9 body control module, ignition ON.
2. Verify a test lamp illuminates between the control circuit terminal 10 and ground.
 - **If the test lamp does not illuminate**
 1. Ignition OFF, disconnect the X2 harness connector at the X50A fuse block - underhood.
 2. Test for infinite resistance between the control circuit terminal and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the X50A fuse block - underhood.
 - **If the test lamp illuminates**
3. Ignition OFF, connect a 3 A fused jumper between the control circuit terminal 10 and ground.
4. Remove the F48UA fuse at the X50A fuse block - underhood, ignition ON.
5. Verify a test lamp illuminates between the F48UA fuse B+ switch control terminal and ground.
 - **If the test lamp does not illuminate**
 1. Ignition OFF, disconnect the X2 harness connector at the X50A fuse block - underhood, ignition ON.

2. Test for less than 1 V between the control circuit terminal 10 and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V, replace the X50A fuse block - underhood.

○ **If the test lamp illuminates**

6. Test or replace the K9 body control module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Backup Lamp Ground - Left	-	1	-	-
Backup Lamp Ground - Right	-	1	-	-
1. Backup Lamps Malfunction				

Circuit/System Description

Automatic Transmission

With the engine running and the transmission in the reverse position, the transmission control module (TCM) sends a serial data message to the body control module (BCM). The message indicates that the gear selector is in the reverse position. The BCM applies battery voltage to the backup lamps control circuit illuminating the backup lamps. Once the driver moves the gear selector out of the reverse position, a message is sent by the TCM via serial data requesting the BCM to remove battery voltage from the backup lamps control circuit. The engine must be running for the backup lamps to operate.

Manual Transmission

The engine control module (ECM) provides a signal circuit to the backup lamp switch which is permanently grounded. With the engine running and the transmission in the reverse position, the backup lamp switch signal circuit is pulled low and the ECM responds by sending a serial data message to the body control module (BCM). The message indicates that the gear selector is in the reverse position. The BCM applies battery voltage to the backup lamps control circuit illuminating the backup lamps. Once the driver moves the gear selector out of the reverse position, a message is sent by the ECM via serial data requesting the BCM to remove battery voltage from the backup lamps control circuit. The engine must be running for the backup lamps to operate.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Engine RUNNING.
- Transmission placed in REVERSE gear.

Conditions for Setting the DTC

DTC B2545 01

The BCM detects a short to voltage in the backup lamps control circuit.

DTC B2545 02

The BCM detects a short to ground in the backup lamps control circuit.

DTC B2545 04

The BCM detects an open/high resistance in the backup lamps control circuit.

Actions Taken When the DTC Sets

DTC B2545 02 and B2545 04

The backup lamps will not operate.

DTC B2545 01

The backup lamps are always ON.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Circuit/System Testing

1. Ignition OFF, disconnect the X5 harness connector at the K9 Body Control Module, ignition ON.
2. Verify a test lamp illuminates between the B+ circuit terminal 4 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.

2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
1. Ignition OFF.
2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If the test lamp illuminates**
3. Ignition OFF, connect the X5 harness connector at the K9 Body Control Module.
4. Ignition OFF, exterior lamps OFF, trunk latch latched, remove the appropriate E5 Backup Lamp at the appropriate E42 Tail Lamp Assembly.
5. Test for less than 5 ohms between the ground circuit at the socket terminal and ground.
 - **If 5 ohms or greater**
 - 1. Ignition OFF.
 - 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
6. Connect a test lamp between the control circuit at the socket terminal and ground, ignition ON.
7. Verify the test lamp turns ON and OFF when commanding the Backup Lamps ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 - 1. Ignition OFF, disconnect the X7 harness connector at the K9 Body Control Module.
 - 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 - 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 - 1. Ignition OFF, disconnect the X7 harness connector at the K9 Body Control Module, ignition ON.
 - 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
8. Test or replace the appropriate E5 Backup Lamp.

Passenger Compartment Lamp Control 2 Circuit Short to Ground

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Flood Lamp Control - Terminal 23 X1	B255D 02	1	1	-
Flood Lamp - Driver Door Pocket Ground	-	1	-	-
Flood Lamp - Passenger Door Pocket Ground	-	1	-	-
1. Interior Accent Lighting Malfunction				

Circuit/System Description

The body control module (BCM) supplies battery voltage to front door flood lamps via the flood lamp control circuit. When a door is opened the BCM applies battery voltage to the flood lamp control circuit illuminating the driver and passenger door pocket flood lamps. The flood lamps will remain illuminated until all doors are closed and the ignition is OFF.

Conditions for Running the DTC

Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

The BCM detects a short to ground in the flood lamp control circuit terminal 23 X1

Actions Taken When the DTC Sets

The BCM will disable the flood lamp control circuit.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Trunk Lamp Control Circuit Short to Ground

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
F24DA Fuse B+	1	1	-	-
Rear Compartment Courtesy Lamp Control	B2570 02	1	1	-
Rear Compartment Courtesy Lamp Ground	-	1	-	-

1. Rear Compartment Lamp Malfunction

Circuit/System Description

The body control module (BCM) applies battery voltage to the rear compartment courtesy lamp through the rear compartment lamp control circuit. When the BCM receives a rear compartment lid open input from the rear compartment lid latch, the BCM applies battery voltage to the rear compartment lamp control circuit illuminating the rear compartment courtesy lamp. In the event that the rear compartment lamp were to remain illuminated for more than 10 minutes with the ignition switch in the OFF position and no doors opened, the BCM will deactivate the rear compartment lamp control circuit to prevent total battery discharge.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Rear compartment OPEN.

Conditions for Setting the DTC

The BCM detects a short to ground on the rear compartment courtesy lamp control circuit.

Actions Taken When the DTC Sets

The rear compartment lamp is inoperative.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

1. Headlamps Malfunction				

Circuit/System Description

With the headlamp switch in the ON position, the headlamp switch headlamp ON signal circuit is grounded through the headlamp switch. The body control module (BCM) responds by applying battery positive voltage to the left and right low beam headlamp control circuits illuminating the low beam headlamps.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Low beam headlamps ON.

Conditions for Setting the DTC

DTC B2575 01 and B2575 04

- The BCM detects an open/high resistance in the left low beam headlamp control circuit.
- The BCM detects a short to ground or an open/high resistance in the F8DA fuse B+ circuit.

DTC B2575 02

The BCM detects a short to ground in the left low beam headlamp control circuit.

DTC B2699 01 and B2699 04

- The BCM detects an open/high resistance in the right low beam headlamp control circuit.
- The BCM detects a short to ground or an open/high resistance in the F9DA fuse B+ circuit.

DTC B2699 02

The BCM detects a short to ground in the right low beam headlamp control circuit.

Actions Taken When the DTC Sets

- When DTC B2575 sets, the left low beam headlamp will be inoperative.
- When DTC B2699 sets, the right low beam headlamp will be inoperative.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.

- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Circuit/System Testing

DTC B2575

1. Ignition OFF, disconnect the X1 harness connector at the K9 body control module, ignition ON.
2. Verify a test lamp illuminates between the B+ circuit terminal 3 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF, remove the F8DA fuse at the X51A fuse block - instrument panel.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF, remove the F8DA fuse at the X51A fuse block - instrument panel.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance, replace the K9 body control module.
 - **If the test lamp illuminates**
 - 3. Ignition OFF, connect the X1 harness connector at the K9 body control module.
 - 4. Install the F8DA fuse.
 - 5. Ignition OFF, exterior lamps OFF, disconnect the harness connector at the E4G headlamp - left low beam.
 - 6. Test for less than 5 ohms between the ground circuit terminal B and ground.
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
 - 7. Connect a test lamp between the control circuit terminal A and ground, ignition ON.
 - 8. Verify the test lamp turns ON and OFF when commanding the Left Low Beam/Daytime Running Lamp ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X4 harness connector at the K9 body control module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X4 harness connector at the K9 body control module, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 body control module.
 - **If the test lamp turns ON and OFF**
9. Test or replace the E4G headlamp - left low beam.

DTC B2699

1. Ignition OFF, disconnect the X1 harness connector at the K9 body control module, ignition ON.
2. Verify a test lamp illuminates between the B+ circuit terminal 2 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF, remove the F9DA fuse at the X51A fuse block - instrument panel.
 2. Test for less than 2 ohms in the B+ circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.
- If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
- **If the test lamp does not illuminate and the circuit fuse is open**
- 1. Ignition OFF, remove the F9DA fuse at the X51A fuse block - instrument panel.
- 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 body control module.
- **If the test lamp illuminates**
- 3. Ignition OFF, connect the X1 harness connector at the K9 body control module.
- 4. Install the F9DA fuse.
- 5. Ignition OFF, exterior lamps OFF, disconnect the harness connector at the E4H headlamp - right low beam.
- 6. Test for less than 5 ohms between the ground circuit terminal B and ground.
 - **If 5 ohms or greater**
 - 1. Ignition OFF.
 - 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
- 7. Connect a test lamp between the control circuit terminal A and ground, ignition ON.
- 8. Verify the test lamp turns ON and OFF when commanding the Right Low Beam/Daytime Running Lamp ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 - 1. Ignition OFF, disconnect the X4 harness connector at the K9 body control module.
 - 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 - 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If the test lamp is always ON**
 - 1. Ignition OFF, disconnect the X4 harness connector at the K9 body control module, ignition ON.
 - 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 body control module.
 - **If the test lamp turns ON and OFF**
- 9. Test or replace the E4H headlamp - right low beam.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Headlamp Replacement**

DTC B257A

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B257A 00

Headlamp Switch Input Signals Correlation Malfunction

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Headlamp Switch Park Lamps ON Signal	2	B257A 00	2	-
Headlamp Switch Headlamps OFF Signal	B257A 00	1	1	-
Headlamp Switch Headlamps ON Signal	B257A 00	1	1	-
Headlamp Switch Ground	-	1	-	-
1. Headlamps Malfunction 2. Park, License, and/or Tail Lamps Malfunction				

Circuit/System Description

For headlamp operation, the body control module (BCM) monitors three signal circuits from the headlamp switch. When the headlamp switch is in the AUTO position, the three signal circuits are unaffected and the BCM relies on the ambient light sensor input to turn the headlamps and daytime running lamps (DRLs) ON and OFF. When the headlamp switch is placed in the OFF position, the headlamp switch headlamps OFF signal circuit is grounded, indicating to the BCM that the exterior lamps should be turned OFF. With the headlamp switch in the PARK LAMPS position, the headlamp switch park lamps ON signal circuit is grounded, indicating that the park lamps have been requested. When the headlamp switch is in the HEADLAMP position, both the headlamp switch park lamps ON signal circuit and the headlamp switch headlamps ON signal circuit

are grounded. The BCM responds by commanding the park lamps and headlamps ON.

Conditions for Running the DTC

Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

- The BCM detects an open/high resistance in the headlamp switch park lamps ON signal circuit.
- The BCM detects a short to ground in the headlamp switch headlamps ON signal circuit.
- The BCM detects a short to ground in the headlamp switch headlamps OFF signal circuit.

Actions Taken When the DTC Sets

- When DTC B257A 00 is present on the headlamp switch headlamps OFF signal circuit, the low beam headlamps are always ON in the AUTO position. The headlamp switch operates in all positions other than AUTO. The AUTO headlamp defeat is inoperative.
- When DTC B257A 00 is present on the headlamp switch headlamps ON signal circuit, the low beam headlamps are always ON. The BCM disregards all headlamp switch inputs.
- When DTC B257A 00 is present on the headlamp switch park lamps ON signal circuit, the park lamps and low beam headlamps are inoperative in the PARK and HEAD positions. Headlamps and park lamps operate in AUTO position.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Testing

1. Ignition OFF, all doors closed, all accessories OFF, disconnect the harness connector at the S30 headlamp switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 15 ohms between the ground circuit terminal 6 and ground.
 - **If 15 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 15 ohms**
3. Ignition ON.
4. Verify the scan tool Automatic Headlamps Disable Switch parameter is Inactive.
 - **If not Inactive**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 body control module.
 2. Test for infinite resistance between the signal circuit terminal 5 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 body control module.
 - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 5 and the ground circuit terminal 6.
6. Verify the scan tool Automatic Headlamps Disable Switch parameter is Active.
 - **If not Active**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 body control module, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal 5 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If Active**
7. Verify the scan tool Park Lamps Switch parameter is Inactive.
 - **If not Inactive**

1. Ignition OFF, disconnect the X1 harness connector at the K9 body control module.
2. Test for infinite resistance between the signal circuit terminal 3 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 body control module.
- **If Inactive**
8. Install a 3 A fused jumper wire between the signal circuit terminal 3 and the ground circuit terminal 6.
9. Verify the scan tool Park Lamps Switch parameter is Active.
 - **If not Active**
 - 1. Ignition OFF, disconnect the X1 harness connector at the K9 body control module, ignition ON.
 - 2. Test for less than 1 V between the signal circuit terminal 3 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 - 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If Active**
10. Verify the scan tool Headlamps On Switch parameter is Inactive.
 - **If not Inactive**
 - 1. Ignition OFF, disconnect the X1 harness connector at the K9 body control module.
 - 2. Test for infinite resistance between the signal circuit terminal 4 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 body control module.
 - **If Inactive**
11. Install a 3 A fused jumper wire between the signal circuit terminal 4 and the ground circuit terminal 6.
12. Verify the scan tool Headlamps On Switch parameter is Active.
 - **If not Active**
 - 1. Ignition OFF, disconnect the X1 harness connector at the K9 body control module, ignition ON.
 - 2. Test for less than 1 V between the signal circuit terminal 4 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 - 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If Active**
13. Test or replace the S30 headlamp switch.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Control Module References** for BCM replacement, programming, and setup

DTC B257C OR B257D

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B257C 00

Left Headlamp Assembly Malfunction

DTC B257D 00

Right Headlamp Assembly Malfunction

Circuit/System Description

The headlamp leveling control module calculates the headlamp angle and sends commands to the left and right adaptive forward lighting system headlamp actuators. The headlamp actuators drive the headlamps to the position commanded by the headlamp leveling control module. The headlamp leveling control module monitors the headlamp actuator motor control circuits for proper circuit continuity and for shorts to ground or voltage. If a malfunction is detected, a DTC will be stored in memory and the driver will be notified with a "Service AFL Lamp" message displayed over the driver information center located on the instrument cluster.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Engine RUNNING.
- Headlamps ON.

Conditions for Setting the DTC

DTC B257C 00

The headlamp leveling control module receives a serial data message from the left headlamp internal logic module that an internal headlamp malfunction has occurred.

DTC B257D 00

The headlamp leveling control module receives a serial data message from the right headlamp internal logic module that an internal headlamp malfunction has occurred.

Actions Taken When the DTC Sets

- The headlamp leveling control module disables the AFL system.
- The driver information center (DIC) will display AFL Lamps Need Service.
- On vehicles equipped with both AFL and headlamp leveling, the headlamp leveling system will remain active.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 50 consecutive malfunction-free ignition cycles have occurred.

Diagnostic Aids

DTC B257C and B257D will set when there is an internal malfunction within the left or right headlamp assemblies. No parts are serviceable within the headlamp assemblies so complete headlamp assembly replacement is necessary.

High Beam Headlamp Control - Right	1	1	1	-
Headlamp Ground - Left	-	1	-	-
Headlamp Ground - Right	-	1	-	-
1. Headlamps Malfunction				

Circuit/System Description

The high beam and flash to pass functions are contained within the turn signal/multifunction switch. The BCM provides the turn signal/multifunction switch with two signal circuits, the high beam signal circuit and the flash to pass signal circuit. When the low beam headlamps are ON and the turn signal/multifunction switch is placed in the high beam position, ground is applied to the BCM through the high beam signal circuit. The BCM responds to the high beam request by applying ground to the high beam relay control circuit which energizes the high beam relay. With the high beam relay energized, the switch contacts close allowing battery voltage to flow through the high beam fuses to the high beam control circuits illuminating the high beam headlamps.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- High beam headlamps ON.

Conditions for Setting the DTC

DTC B2580 01

The BCM detects a short to voltage in the headlamp high beam relay control circuit.

DTC B2580 02

The BCM detects a short to ground in the headlamp high beam relay control circuit.

DTC B2580 04

The BCM detects an open in the headlamp high beam relay control circuit.

Actions Taken When the DTC Sets

The high beam headlamps and flash to pass will not operate.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

1. Park, License, and/or Tail Lamps Malfunction 2. Park Lamp Switch Malfunction				

Circuit/System Description

When the headlamp switch is placed in the HEAD or PARK position, ground is applied to the park lamp switch ON signal circuit to the body control module (BCM). The BCM responds by applying voltage to the park lamps, tail lamps, and license lamps control circuits illuminating the park, tail, and license lamps.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Park lamps ON.

Conditions for Setting the DTC

DTC B2585 01 and B2585 04

- The BCM detects a short to voltage or an open/high resistance in the left park lamps control circuit.
- The BCM detects a short to ground or an open/high resistance in the F3DA fuse B+ circuit.

DTC B2585 02

The BCM detects a short to ground in the left park lamps control circuit.

DTC B3867 01 and B3867 04

- The BCM detects a short to voltage or an open/high resistance in the right park lamps control circuit.
- The BCM detects a short to ground or an open/high resistance in the F24DA fuse B+ circuit.

DTC B3867 02

The BCM detects a short to ground in the right park lamps control circuit.

Actions Taken When the DTC Sets

DTC B2585 01

The left park lamps are always ON.

DTC B2585 02 and B2585 04

The left park lamps are always OFF.

DTC B3867 01

The right park lamps are always ON.

DTC B3867 02 and B3867 04

The right park lamps are always OFF.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Circuit/System Testing

DTC B2585

1. Ignition OFF, disconnect the X2 harness connector at the K9 body control module, ignition ON.
2. Verify a test lamp illuminates between the B+ circuit terminal 3 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 body control module.
 - **If the test lamp illuminates**
3. Ignition OFF, connect the X2 harness connector at the K9 body control module.
4. Ignition OFF, exterior lamps OFF, disconnect the harness connector at the appropriate left park lamp.
5. Test for less than 5 ohms between the appropriate ground circuit terminal listed below and ground.

- E4N park/turn signal lamp - left terminal 2 (with T4A)
 - E2LF side marker lamp - left front terminal 1 (with T4A)
 - E13L headlamp - left terminal 1 (with T4F)
 - E5AK tail lamp - left outer terminal 3
 - E5G tail lamp - left inner terminal 2
 - **If 5 ohms or greater**
1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
6. Connect a test lamp between the appropriate control circuit terminal listed below and ground, ignition ON.
 - E4N park/turn signal lamp - left terminal 3 (with T4A)
 - E2LF side marker lamp - left front terminal 2 (with T4A)
 - E13L headlamp - left terminal 7 (with T4F)
 - E5AK tail lamp - left outer terminal 1
 - E5G tail lamp - left inner terminal 3
 7. Verify the test lamp turns ON and OFF when commanding the Left Park Lamps ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X4 harness connector at the K9 body control module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X4 harness connector at the K9 body control module, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 body control module.
 - **If the test lamp turns ON and OFF**
 8. Test or replace the appropriate left park lamp.

DTC B3867

1. Ignition OFF, disconnect the X1 harness connector at the K9 body control module, ignition ON.

2. Verify a test lamp illuminates between the B+ circuit terminal 4 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 body control module.
 - **If the test lamp illuminates**
 - 3. Ignition OFF, connect the X1 harness connector at the K9 body control module.
 - 4. Ignition OFF, exterior lamps OFF, disconnect the harness connector at the appropriate right park lamp.
 - 5. Test for less than 5 ohms between the appropriate ground circuit terminal listed below and ground.
 - E4P park/turn signal lamp - right terminal 2 (with T4A)
 - E2RF side marker lamp - right front terminal 1 (with T4A)
 - E13R headlamp - right terminal 1 (with T4F)
 - E5AL tail lamp - right outer terminal 3
 - E5H tail lamp - right inner terminal 2
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
 - 6. Connect a test lamp between the appropriate control circuit terminal listed below and ground, ignition ON.
 - E4P park/turn signal lamp - right terminal 3 (with T4A)
 - E2RF side marker lamp - right front terminal 2 (with T4A)
 - E13R headlamp - right terminal 7 (with T4F)
 - E5AL tail lamp - right outer terminal 1
 - E5H tail lamp - right inner terminal 3
 - 7. Verify the test lamp turns ON and OFF when commanding the Right Park Lamps ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X4 harness connector at the K9 body control module.
 2. Test for infinite resistance between the control circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance
- 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If the test lamp is always ON**
 - 1. Ignition OFF, disconnect the X4 harness connector at the K9 body control module, ignition ON.
 - 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 body control module.
 - **If the test lamp turns ON and OFF**
- 8. Test or replace the appropriate right park lamp.

Low Beam Headlamp Control - Right	1	1	1	-
Headlamp Ground - Left	-	1	-	-
Headlamp Ground - Right	-	1	-	-
1. Headlamps Malfunction				

Circuit/System Description

With the headlamp switch in the ON position, the headlamp switch headlamp ON signal circuit is grounded through the headlamp switch. The body control module (BCM) responds by applying ground to the low beam relay control circuit which energizes the low beam relay. With the low beam relay energized, the switch contacts close allowing battery voltage to flow through the low beam fuses to the low beam control circuits illuminating the low beam headlamps.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Low beam headlamps ON.

Conditions for Setting the DTC

DTC B258A 01

The BCM detects a short to voltage in the headlamp low beam relay control circuit.

DTC B258A 02

The BCM detects a short to ground in the headlamp low beam relay control circuit.

DTC B258A 04

The BCM detects an open in the headlamp low beam relay control circuit.

Actions Taken When the DTC Sets

DTC B258A 01 or B258A 04

The low beam headlamps will not operate.

DTC B258A 02

The low beam headlamps will always be ON.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Control Module References for scan tool information

Circuit/System Testing

1. Ignition OFF, disconnect the KR49 headlamp low beam relay.
2. Connect a test lamp between the control circuit terminal 85 and B+, ignition ON.
3. Verify the test lamp turns ON and OFF when commanding the Low Beams ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X5 harness connector at the K9 body control module, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.

- If less than 1 V
- 3. Ignition OFF.
- 4. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X5 harness connector at the K9 body control module.
 2. Test for infinite resistance between the control circuit terminal and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 body control module.
 - **If the test lamp turns ON and OFF**
 4. Test or replace the KR49 headlamp low beam relay.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

1. Daytime Running Lamps Malfunction				

Circuit/System Description

The ambient light sensor is used to monitor outside lighting conditions. The body control module (BCM) provides a 5-volt reference signal to the ambient light sensor. Depending on outside lighting conditions, the ambient light sensor provides a voltage signal to the BCM that will vary between 0.2 and 4.9 volts. The BCM monitors the ambient light sensor signal circuit to determine if outside lighting conditions are correct for either daytime running lights (DRL) or automatic headlamp system control when the headlamp switch is in the AUTO position. In daylight conditions, the BCM will command the DRLs. Any function or condition that turns on the headlamps will cancel DRL operation.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Headlamp switch in AUTO position.

Conditions for Setting the DTC

DTC B259A 01

The BCM detects a short to voltage in the left cornering lamp control circuit.

DTC B259B 01

The BCM detects a short to voltage in the right cornering lamp control circuit.

Actions Taken When the DTC Sets

- When DTC B259A sets, the left cornering lamp will be inoperative.
- When DTC B259B sets, the right cornering lamp will be inoperative.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Circuit/System Testing

1. Ignition OFF, exterior lamps OFF, remove the appropriate E4 Cornering Lamp bulb.
2. Test for less than 10 ohms between the ground circuit terminal 1 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Connect a test lamp between the control circuit terminal 9 and ground, ignition ON.
4. Verify the test lamp turns ON and OFF when commanding the appropriate Cornering Lamp ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X2 harness connector at the K26 Headlamp Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.
- If less than 2 ohms, replace the K26 Headlamp Control Module.
- **If the test lamp is always ON**
- 1. Ignition OFF, disconnect the X2 harness connector at the K26 Headlamp Control Module, ignition ON.
- 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K26 Headlamp Control Module.
- **If the test lamp turns ON and OFF**
- 5. Test or replace the appropriate E4 Cornering Lamp bulb.

Circuit/System Description

The ambient light sensor is used to monitor outside lighting conditions. The body control module (BCM) provides a 5-volt reference signal to the ambient light sensor. Depending on outside lighting conditions, the ambient light sensor provides a voltage signal to the BCM that will vary between 0.2 and 4.9 volts. The BCM monitors the ambient light sensor signal circuit to determine if outside lighting conditions are correct for either daytime running lights (DRL) or automatic headlamp system control when the headlamp switch is in the AUTO position. In daylight conditions, the BCM will command the DRLs. Any function or condition that turns on the headlamps will cancel DRL operation.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Headlamp switch in AUTO position.

Conditions for Setting the DTC

DTC B2600 01

The BCM detects a short to voltage in the left DRL control circuit.

DTC B2600 02

The BCM detects a short to ground in the left DRL control circuit.

DTC B2600 04

The BCM detects an open/high resistance in the left DRL control circuit.

DTC B2605 01

The BCM detects a short to voltage in the right DRL control circuit.

DTC B2605 02

The BCM detects a short to ground in the right DRL control circuit.

DTC B2605 04

The BCM detects an open/high resistance in the right DRL control circuit.

Actions Taken When the DTC Sets

- When DTC B2600 sets, the left DRL will be inoperative.
- When DTC B2605 sets, the right DRL will be inoperative.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

1. Interior Backlighting Malfunction				

Circuit/System Description

The instrument panel dimmer switch is used to increase and decrease the brightness of the interior backlighting components. The instrument panel dimmer switch provides a voltage signal to the body control module (BCM) that will increase as the brightness of the lights are increased and decrease as the brightness of the lights are decreased. The BCM provides a low reference signal and a B+ reference circuit to the instrument panel dimmer switch. When the instrument panel dimmer switch is placed in the desired position, the dimmed voltage setting is applied from the instrument panel dimmer switch through the instrument panel dimmer switch signal circuit to the BCM. The BCM interprets the signal and applies a pulse width modulated (PWM) voltage through the LED dimming control circuits illuminating the interior backlighting to the requested level of brightness.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Park lamps ON.

Conditions for Setting the DTC

The BCM detects a short to ground in the LED backlight dimming control circuit terminal 8 X2 or terminal 9 X7.

Actions Taken When the DTC Sets

The BCM will disable the LED backlight dimming control circuits.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Circuit/System Testing

NOTE: Each component with backlighting may need to be disconnected to isolate a short to voltage or short to ground. Use the schematics to identify the following:

- Backlighting components the vehicle is equipped with
- Each component's control and ground circuit terminals
- Component locations on the backlighting control circuit

1. Ignition OFF, all doors closed, all accessories OFF, disconnect the harness connector at the component with inoperative backlighting. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 15 ohms between the appropriate ground circuit terminal and ground.
 - **If 15 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 15 ohms**

3. Connect a test lamp between the appropriate control circuit terminal and ground.
4. Verify the test lamp turns ON and OFF when commanding the LED Backlight Dimming ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the appropriate harness connector listed below at the K9 body control module.
 - X2
 - X7
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the appropriate harness connector listed below at the K9 body control module, ignition ON.
 - X2
 - X7
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 body control module.
 - **If the test lamp turns ON and OFF**
 - 5. Test or replace the component with inoperative backlighting.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Instrument Panel Courtesy Lamp - Left Ground	-	1	-	-
Instrument Panel Courtesy Lamp - Right Ground	-	1	-	-
1. Dome Lamps Malfunction				

Circuit/System Description

The dome lamp switch has 3 positions: DOOR, OFF, and ON. The ON position provides a ground for continuous operation and the dome/courtesy lamps will remain illuminated until the switch is placed in either the DOOR or OFF position. When in the DOOR position, the dome lamps operation is controlled by the body control module (BCM). When any door is opened, the door ajar switch contacts close and the BCM receives a door-open input. The BCM illuminates the dome lamps, door courtesy lamps, and instrument panel courtesy lamps when any door is opened or a door lock/unlock request is activated with the key fob. After all doors have been closed, the dome lamps, door courtesy lamps, and instrument panel courtesy lamps will remain illuminated approximately 3 seconds after the last door closes. When the driver places the dome lamp switch in the OFF position, the dome/courtesy lamps will be disabled. In the event that the dome/courtesy lamps were to remain

illuminated for more than 10 minutes with the ignition switch in the OFF position and no doors opened, the BCM will deactivate the dome/courtesy lamps control circuit to prevent total battery discharge.

Conditions for Running the DTC

Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

The BCM detects a short to ground in the dome lamps control circuit.

Actions Taken When the DTC Sets

The BCM will disable the dome lamps control circuit.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Circuit/System Testing

NOTE: Each component on the control circuit may need to be disconnected to isolate a short to voltage or short to ground. Use the schematics to identify the following:

- Lighting components the vehicle is equipped with
- Each component's control and ground circuit terminals
- Component locations on the backlighting control circuit

1. Ignition OFF, disconnect the X5 harness connector at the K9 Body Control Module, ignition ON.
2. Verify a test lamp illuminates between the B+ circuit terminal 4 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If the test lamp illuminates**
3. Ignition OFF, connect the X5 harness connector at the K9 Body Control Module.
4. Ignition OFF, all doors closed, all accessories OFF, disconnect the harness connectors at the components listed below.
 - E37D dome/reading lamps - overhead console
 - E37R dome/reading lamps - rear
 - E8D door courtesy lamp - driver
 - E8P door courtesy lamp - passenger
 - E8J instrument panel courtesy lamp - left
 - E8K instrument panel courtesy lamp - right
5. Test for less than 10 ohms between the appropriate ground circuit terminal listed below and ground.
 - E37D dome/reading lamps - overhead console terminal 6
 - E37R dome/reading lamps - rear terminal 6
 - E8D door courtesy lamp - driver terminal 2
 - E8P door courtesy lamp - passenger terminal 2
 - E8J instrument panel courtesy lamp - left terminal 2
 - E8K instrument panel courtesy lamp - right terminal 2
 - **If 10 ohms or greater**
 1. Ignition OFF.

2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
6. Connect a test lamp between the appropriate control circuit terminal listed below and ground.
 - E37D dome/reading lamps - overhead console terminal 2
 - E37R dome/reading lamps - rear terminal 2
 - E8D door courtesy lamp - driver terminal 1
 - E8P door courtesy lamp - passenger terminal 1
 - E8J instrument panel courtesy lamp - left terminal 1
 - E8K instrument panel courtesy lamp - right terminal 1
7. Verify the test lamp turns ON and OFF when commanding the Courtesy Lamps ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X2 harness connector at the K9 body control module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X2 harness connector at the K9 body control module, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 body control module.
 - **If the test lamp turns ON and OFF**
 - 8. Test or replace the appropriate dome/courtesy lamp.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

1. Daytime Running Lamps Malfunction				

Circuit/System Description

The ambient light sensor is used to monitor outside lighting conditions. The body control module (BCM) provides a 5-volt reference signal to the ambient light sensor. Depending on outside lighting conditions, the ambient light sensor provides a voltage signal to the BCM that will vary between 0.2 and 4.9 volts. The BCM monitors the ambient light sensor signal circuit to determine if outside lighting conditions are correct for either daytime running lights (DRL) or automatic headlamp system control when the headlamp switch is in the AUTO position. In daylight conditions, the BCM will command the DRLs ON by applying voltage to the DRL control circuits illuminating the DRLs. Any function or condition that turns on the headlamps will cancel DRL operation.

Conditions for Running the DTC

Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

DTC B2645 03

The BCM detects a short to ground in the ambient light sensor signal circuit.

DTC B2645 07

- The BCM detects a short to voltage or an open/high resistance in the ambient light sensor signal circuit.
- The BCM detects an open/high resistance in the ambient light sensor low reference circuit.

Actions Taken When the DTC Sets

- Automatic headlamp system and daytime running lamps are inoperative.
- The BCM defaults to low light status and commands the low beam headlamps ON.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Circuit/System Testing

1. Ignition OFF, scan tool disconnected, all doors closed, all accessories OFF, open and close drivers door, disconnect the harness connector at the B10B ambient light/sunload sensor. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 15 ohms between the low reference circuit terminal 6 and ground.
 - **If 15 ohms or greater**
 1. Ignition OFF, disconnect the X2 harness connector at the K33 HVAC control module.
 2. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K33 HVAC control module.
 - **If less than 15 ohms**
3. Ignition ON.
4. Verify the scan tool Ambient Light Sensor parameter is greater than 4.65 V.
 - **If 4.65 V or less**
 1. Ignition OFF, disconnect the X2 harness connector at the K9 body control module.
 2. Test for infinite resistance between the signal circuit terminal 5 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 body control module.
 - **If greater than 4.65 V**
5. Install a 3 A fused jumper wire between the signal circuit terminal 5 and the low reference circuit

terminal 6.

6. Verify the scan tool Ambient Light Sensor parameter is less than 0.196 V.
 - **If 0.196 V or greater**
 1. Ignition OFF, disconnect the X2 harness connector at the K9 body control module, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal 5 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If less than 0.196 V**
7. Test or replace the B10B ambient light/sunload sensor.

1. Headlamp Leveling Malfunction				

Circuit/System Description

Each headlamp assembly contains a headlamp leveling motor that is controlled by the headlamp control module. The front and rear suspension position sensors provide the headlamp control module with suspension position information. Each sensor receives a 5-volt reference, signal, and low reference circuits from the headlamp control module. The sensors are connected to the control arms of the front and rear suspension. As the

vehicle travels, the suspension compresses and rebounds moving the suspension position sensor arms. This causes the signal output of the sensor to change. The headlamp control module compares the information from both suspension position sensors and adjusts the headlamp leveling as needed.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Engine RUNNING.
- Headlamps ON.

Conditions for Setting the DTC

DTC B3410 01

The headlamp control module detects a short to voltage in the front suspension position sensor signal circuit.

DTC B3410 06

The headlamp control module detects a short to ground or an open/high resistance in the front suspension position sensor signal circuit.

DTC B3420 01

The headlamp control module detects a short to voltage in the rear suspension position sensor signal circuit.

DTC B3420 06

The headlamp control module detects a short to ground or an open/high resistance in the rear suspension position sensor signal circuit.

Actions Taken When the DTC Sets

- The headlamp control module disables the headlamp leveling system.
- The driver information center (DIC) will display AFL Lamps Need Service.
- On vehicles equipped with both AFL and headlamp leveling, the AFL system will remain active.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 50 consecutive malfunction-free ignition cycles have occurred.

1. Headlamp Leveling Malfunction				

Circuit/System Description

Each headlamp assembly contains a headlamp leveling actuator that is controlled by the headlamp leveling control module. The front and rear suspension position sensors provide the headlamp leveling control with suspension position information. Each sensor receives a 5 V reference, signal, and low reference circuits from the headlamp leveling control module. The sensors are connected to the control arms of the front and rear suspension. As the vehicle travels, the suspension compresses and rebounds moving the suspension position sensor arms. This causes the signal output of the sensor to change. The headlamp leveling control module compares the information from both suspension position sensors and adjusts the headlamp leveling as needed. The headlamp leveling control module communicates with the left and right headlamp leveling actuators via the LIN serial data circuit.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Ignition ON.
- Headlamps ON.

Conditions for Setting the DTC

DTC B3435 00

- The headlamp leveling control module detects a short to ground or an open/high resistance in the left headlamp leveling actuator LIN bus circuit.
- The headlamp leveling control module detects an open/high resistance in the left headlamp leveling actuator ground circuit.

DTC B3435 03

- The headlamp leveling control module detects a short to ground or an open/high resistance in the left headlamp leveling actuator B+ circuit.
- The headlamp leveling control module detects an open/high resistance in the left headlamp leveling actuator ground circuit.

DTC B3440 00

- The headlamp leveling control module detects a short to ground or an open/high resistance in the right

headlamp leveling actuator LIN bus circuit.

- The headlamp leveling control module detects an open/high resistance in the right headlamp leveling actuator ground circuit.

DTC B3440 03

- The headlamp leveling control module detects a short to ground or an open/high resistance in the right headlamp leveling actuator B+ circuit.
- The headlamp leveling control module detects an open/high resistance in the right headlamp leveling actuator ground circuit.

Actions Taken When the DTC Sets

- When DTC B3435 or DTC B3440 sets, the headlamp leveling control module will attempt to return the lamps to a nominal position and disable all requests to all headlamp actuators.
- The instrument cluster will display Headlamp Leveling Malfunction - Contact Service.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists and the ignition is cycled.
- A history DTC will clear once 50 consecutive malfunction-free ignition cycles have occurred.

Circuit/System Testing

1. Ignition OFF, exterior lamps OFF, disconnect the harness connector at the appropriate E13 headlamp.
2. Test for less than 5 ohms between the appropriate ground circuit terminal listed below and ground.
 - E13L headlamp - left terminal 8 with A1LL
 - E13R headlamp - right terminal 8 with A1LL
 - E13L headlamp - left terminal 7 with A1SL
 - E13R headlamp - right terminal 7 with A1SL
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
3. Ignition ON.
4. Verify a test lamp illuminates between the appropriate B+ circuit terminal listed below and ground.
 - E13L headlamp - left terminal 6 with A1LL
 - E13R headlamp - right terminal 6 with A1LL
 - E13L headlamp - left terminal 8 with A1SL
 - E13R headlamp - right terminal 8 with A1SL
 - **If the test lamp does not illuminate**
 1. Ignition OFF, disconnect the X2 harness connector at the X50A fuse block - underhood.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the X50A fuse block - underhood.
 - **If the test lamp illuminates**
5. Test or replace the K26 headlamp control module.
6. Ignition ON.
7. Verify the appropriate headlamp operates to the UP and DOWN positions when commanding the DHL Motor Control UP and DOWN with a scan tool.
 - If the appropriate headlamp does not operate UP and DOWN, test or replace the appropriate headlamp assembly.

DTC Descriptor

DTC B3596 00

Hazard Lamps Request Circuit Malfunction

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Hazard Warning Switch Signal	1	1	1	B3596 00
Hazard Warning Switch LED Backlighting Control	2	2	2	-
Hazard Warning Switch Ground	-	1	-	-
1. Hazard Lamps Malfunction 2. Hazard Warning Switch Backlighting Malfunction				

Circuit/System Description

The hazard flashers may be activated in any power mode. The hazard warning switch signal circuit is momentarily grounded when the hazard warning switch is pressed. The body control module (BCM) responds to the hazard warning switch signal input by supplying battery voltage to all four turn signal lamps in an ON and OFF duty cycle. When the hazard warning switch is activated, the BCM sends a serial data message to the instrument cluster requesting both turn signal indicators to be cycled ON and OFF.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Hazard lamps ON.

Conditions for Setting the DTC

The hazard warning switch input is Active for longer than 60 seconds.

Actions Taken When the DTC Sets

The hazard lamps are inoperative.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Circuit/System Testing

1. Ignition OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connector at the S48C multifunction switch 1 - instrument panel. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 15 ohms between the ground circuit terminal 7 and ground.
 - **If 15 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 15 ohms**

3. Ignition ON.
4. Verify the scan tool Hazard Lamps Switch parameter is Inactive.
 - **If not Inactive**
 1. Ignition OFF, disconnect the X2 harness connector at the K9 body control module.
 2. Test for infinite resistance between the signal circuit terminal 10 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 body control module.
 - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 10 and ground.
6. Verify the scan tool Hazard Lamps Switch parameter is Active.
 - **If not Active**
 1. Ignition OFF, disconnect the X2 harness connector at the K9 body control module, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal 10 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If Active**
7. Test or replace the S48C multifunction switch 1 - instrument panel.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **INSTRUMENT PANEL UPPER CENTER TRIM PANEL REPLACEMENT** center trim panel

DTC Descriptor

DTC B3650 08

High Beam Request Signal Circuit Performance - Signal Invalid

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Headlamp Switch Headlamps OFF Signal	B257A 00	1	1	-
Headlamp Switch Headlamps ON Signal	B257A 00	1	1	-
Headlamp Switch Park Lamps ON Signal	2	B257A 00	2	-
Turn Signal/Multifunction Switch Flash To Pass Signal	B3806 00	1	1	-
Turn Signal/Multifunction Switch High Beam Signal	B3650 08	1	1	-
Headlamp Switch Ground	-	1	-	-
Turn Signal/Multifunction Switch Ground	-	1	-	-
1. Headlamps Malfunction 2. Park, License, and/or Tail Lamps Malfunction				

Circuit/System Description

When the low beam headlamps are on and the turn signal/multifunction switch is placed in the high beam position, ground is applied to the body control module (BCM) through the high beam signal circuit. The BCM responds to the high beam request by applying ground to the high beam relay control circuit which energizes the high beam relay. With the high beam relay energized, the switch contacts close allowing battery voltage to flow through the high beam fuses to the high beam control circuits illuminating the high beam headlamps.

Conditions for Running the DTC

Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

The BCM detects a short to ground in the turn signal/multifunction switch high beam signal circuit.

Actions Taken When the DTC Sets

The high beam headlamps will not operate.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Testing

1. Ignition OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connector at the S78 turn signal/multifunction switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 15 ohms between the ground circuit terminal 3 and ground.
 - **If 15 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 15 ohms**
3. Ignition ON.
4. Verify the scan tool High Beam Select Switch parameter is Inactive.
 - **If not Inactive**
 1. Ignition OFF, disconnect the X3 harness connector at the K9 body control module.
 2. Test for infinite resistance between the signal circuit terminal 2 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 body control module.
 - **If Inactive**

5. Install a 3 A fused jumper wire between the signal circuit terminal 2 and the ground circuit terminal 3.
6. Verify the scan tool High Beam Select Switch parameter is Active.
 - **If not Active**
 1. Ignition OFF, disconnect the X3 harness connector at the K9 body control module, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal 2 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If Active**
7. Test or replace the S78 turn signal/multifunction switch.

Headlamp Switch Ground	-	1	-	-
Turn Signal/Multifunction Switch Ground	-	1	-	-
1. Headlamps Malfunction 2. Park, License, and/or Tail Lamps Malfunction				

Circuit/System Description

When the turn signal/multifunction switch is momentarily placed in the flash to pass position, ground is applied to the body control module (BCM) through the flash to pass signal circuit. The BCM responds to the flash to pass request by applying ground to the high beam relay control circuit which energizes the high beam relay. With the high beam relay energized, the switch contacts close allowing battery voltage to flow through the high beam fuses to the high beam control circuits illuminating the high beam headlamps. The high beam headlamps will only illuminate for as long as the flash to pass switch is activated.

Conditions for Running the DTC

Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

The BCM detects a short to ground in the turn signal/multifunction switch flash to pass signal circuit.

Actions Taken When the DTC Sets

The high beam lamps and the high beam indicator on the instrument panel cluster (IPC) are always ON.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Right	-	04	-	-
License Plate Lamp Ground - Left	-	B3883 01, B3883 04	-	-

Circuit/System Description

When the headlamp switch is placed in the HEAD or PARK position, ground is applied to the park lamp switch ON signal circuit to the body control module (BCM). The BCM responds by applying voltage to the park lamps, tail lamps, and license lamps control circuits illuminating the park, tail, and license lamps.

Conditions for Running the DTC

Battery voltage must be between 9-16 V.

DTC B3883 01

Headlamp switch in OFF position.

DTC B3883 02 or B3883 04

Headlamp switch in PARK or ON positions.

Conditions for Setting the DTC

DTC B3883 01

- The BCM detects a short to voltage in the license lamps control circuit.
- The BCM detects an open/high resistance in the license lamps ground circuit.
- The BCM detects a short to ground or an open/high resistance in the F23DA fuse B+ circuit.

DTC B3883 02

The BCM detects a short to ground in the license lamps control circuit.

DTC B3883 04

- The BCM detects an open/high resistance in the license lamps control circuit.
- The BCM detects an open/high resistance in the license lamps ground circuit.
- The BCM detects a short to ground or an open/high resistance in the F23DA fuse B+ circuit.

Actions Taken When the DTC Sets

DTC B3883 01

License lamps always ON.

DTC B3883 02 or B3883 04

License lamps inoperative.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Control Module References for scan tool information

Circuit/System Testing

1. Ignition OFF, disconnect the X2 harness connector at the K9 body control module, ignition ON.
2. Verify a test lamp illuminates between the B+ circuit terminal 1 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**

1. Ignition OFF.
2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 body control module.
 - **If the test lamp illuminates**
3. Ignition OFF, connect the X2 harness connector at the K9 body control module.
4. Ignition OFF, exterior lamps OFF, trunk latch latched, remove both E7 license plate lamp bulbs.
5. Test for less than 5 ohms between each ground circuit terminal 2 and ground.
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
6. Connect a test lamp between the E7L license plate lamp - left control circuit terminal 1 and ground, ignition ON.
7. Verify the test lamp turns ON and OFF when commanding the License Plate Lamps ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X4 harness connector at the K9 body control module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X4 harness connector at the K9 body control module, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 body control module.
 - **If the test lamp turns ON and OFF**
8. Ignition OFF.
9. Connect a test lamp between the E7R license plate lamp - right control circuit terminal 1 and ground, ignition ON.
10. Verify the test lamp turns ON and OFF when commanding the License Plate Lamps ON and OFF with a scan tool.
 - **If the test lamp is always OFF**

1. Ignition OFF, disconnect the X4 harness connector at the K9 body control module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - **If the test lamp turns ON and OFF**
11. Test or replace the appropriate E7 license plate lamp bulb.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Turn Signal/Multifunction Switch Ground	-	1	-	-
1. Turn Signal Lamps and/or Indicators Malfunction				

Circuit/System Description

Ground is applied at all times to the turn signal/multifunction switch. The turn signal lamps may only be activated with the ignition switch in the ON or START positions. When the turn signal/multifunction switch is placed in either the turn right or turn left position, ground is applied to the body control module (BCM) through

either the right turn or left turn signal switch signal circuit. The BCM responds to the turn signal switch input by applying a pulsating voltage to the front and rear turn signal lamps through their respective control circuits. When a turn signal request is received by the BCM, a serial data message is sent to the instrument cluster requesting the respective turn signal indicator be pulsed ON and OFF.

Conditions for Running the DTC

Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

DTC B3948 01 and B3948 04

- The BCM detects an open/high resistance in the left front turn signal control circuit.
- The BCM detects an open/high resistance in the left front turn signal ground circuit.

DTC B3948 02

The BCM detects a short to ground in the left front turn signal control circuit.

DTC B3949 01 and B3949 04

- The BCM detects an open/high resistance in the right front turn signal control circuit.
- The BCM detects an open/high resistance in the right front turn signal ground circuit.

DTC B3949 02

The BCM detects a short to ground in the right front turn signal control circuit.

Actions Taken When the DTC Sets

DTC B3948

- The left front turn signal is inoperative.
- The left turn signal indicator on the instrument cluster flashes rapidly.

DTC B3949

- The right front turn signal is inoperative.
- The right turn signal indicator on the instrument cluster flashes rapidly.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Diagnostic Aids

When testing at the front turn signal lamp bulb socket, make sure all measurements and test lamp connections are in the correct terminal location and do not come in contact with each other during testing.

Circuit/System Testing

DTC B3948

1. Ignition OFF, exterior lamps OFF, disconnect the harness connector at the appropriate turn signal lamp - left.
2. Test for less than 5 ohms between the appropriate ground circuit terminal listed below and ground.
 - E4LF Turn Signal Lamp - left Front socket terminal
 - E4N Park/Turn Signal Lamp - Left terminal 2 (with T4A)
 - A9A Outside Rearview Mirror - Driver terminal 4
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, repair the open/high resistance in the ground connection.
- **If less than 5 ohms**
- 3. Connect a test lamp between the appropriate control circuit terminal listed below and ground, ignition ON.
 - E4LF Turn Signal Lamp - left Front socket terminal
 - E4N Park/Turn Signal Lamp - Left terminal 1 (with T4A)
 - A9A Outside Rearview Mirror - Driver terminal 16
- 4. Verify the test lamp turns ON and OFF when commanding the Left Front Turn Signal Lamp ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X5 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X5 harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
- 5. Test or replace the appropriate turn signal lamp - left.

DTC B3949

1. Ignition OFF, exterior lamps OFF, disconnect the harness connector at the appropriate turn signal lamp - right.
2. Test for less than 5 ohms between the appropriate ground circuit terminal listed below and ground.
 - E4RF Turn Signal Lamp - Right Front socket terminal
 - E4P Park/Turn Signal Lamp - Right terminal 2 (with T4A)
 - A9A Outside Rearview Mirror - Passenger terminal 4
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**

3. Connect a test lamp between the appropriate control circuit terminal listed below and ground, ignition ON.
 - E4RF Turn Signal Lamp - Right Front socket terminal
 - E4P Park/Turn Signal Lamp - Right terminal 1 (with T4A)
 - A9A Outside Rearview Mirror - Passenger terminal 16
4. Verify the test lamp turns ON and OFF when commanding the Right Front Turn Signal Lamp ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X4 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X4 harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
5. Test or replace the appropriate turn signal lamp - right.

1. Turn Signal Lamps and/or Indicators Malfunction				

Circuit/System Description

Ground is applied at all times to the turn signal/multifunction switch. The turn signal lamps may only be activated with the ignition switch in the ON or START positions. When the turn signal/multifunction switch is placed in either the turn right or turn left position, ground is applied to the body control module (BCM) through either the right turn or left turn signal switch signal circuit. The BCM responds to the turn signal switch input by applying a pulsating voltage to the front and rear turn signal lamps through their respective control circuits. When a turn signal request is received by the BCM, a serial data message is sent to the instrument cluster requesting the respective turn signal indicator be pulsed ON and OFF.

Conditions for Running the DTC

Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

DTC B3950 01 or B3950 04

- The BCM detects a short to ground or an open/high resistance in the F32UA fuse B+ circuit.
- The BCM detects an open/high resistance in the left rear turn signal control circuit.
- The BCM detects an open/high resistance in the left rear turn signal ground circuit.

DTC B3950 02

The BCM detects a short to ground in the left rear turn signal control circuit.

DTC B3951 01 or B3951 04

- The BCM detects a short to ground or an open/high resistance in the F2DA fuse B+ circuit.
- The BCM detects an open/high resistance in the right rear turn signal control circuit.
- The BCM detects an open/high resistance in the right rear turn signal ground circuit.

DTC B3951 02

The BCM detects a short to ground in the right rear turn signal control circuit.

Actions Taken When the DTC Sets

DTC B3950

- The left rear turn signal is inoperative.
- The "Check Left Rear Turn Signal Lamp" message is displayed on the driver information center (DIC) display.
- The left turn signal indicator on the instrument cluster flashes rapidly.

DTC B3951

- The right rear turn signal is inoperative.
- The "Check Right Rear Turn Signal Lamp" message is displayed on the driver information center (DIC) display.
- The right turn signal indicator on the instrument cluster flashes rapidly.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Diagnostic Aids

When testing at the rear turn signal lamp bulb socket, make sure all measurements and test lamp connections are in the correct terminal location and do not come in contact with each other during testing.

Circuit/System Testing

DTC B3950

1. Ignition OFF, disconnect the X5 harness connector at the K9 body control module, ignition ON.
2. Verify a test lamp illuminates between the B+ circuit terminal 4 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 body control module.
 - **If the test lamp illuminates**
3. Ignition OFF, connect the X5 harness connector at the K9 body control module.
4. Ignition OFF, exterior lamps OFF, remove the E5AM stop/turn signal lamp bulb - left.
5. Test for less than 5 ohms between the ground circuit terminal 3 and ground.
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
6. Connect a test lamp between the control circuit terminal 2 and ground, ignition ON.
7. Verify the test lamp turns ON and OFF when commanding the Left Rear Turn Signal/Brake Lamp ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X5 harness connector at the K9 body control module.
 2. Test for infinite resistance between the control circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance
- 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If the test lamp is always ON**
 - 1. Ignition OFF, disconnect the X5 harness connector at the K9 body control module, ignition ON.
 - 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 body control module.
 - **If the test lamp turns ON and OFF**
- 8. Test or replace the E5AM stop/turn signal lamp bulb - left.

DTC B3951

1. Ignition OFF, disconnect the X5 harness connector at the K9 body control module, ignition ON.
2. Verify a test lamp illuminates between the B+ circuit terminal 3 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 - 1. Ignition OFF.
 - 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 - 1. Ignition OFF.
 - 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 body control module.
 - **If the test lamp illuminates**
3. Ignition OFF, connect the X5 harness connector at the K9 body control module.
4. Ignition OFF, exterior lamps OFF, remove the E5AN stop/turn signal lamp bulb - right.
5. Test for less than 5 ohms between the ground circuit terminal 3 and ground.
 - **If 5 ohms or greater**
 - 1. Ignition OFF.
 - 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
6. Connect a test lamp between the control circuit terminal 2 and ground, ignition ON.

7. Verify the test lamp turns ON and OFF when commanding the Right Rear Turn Signal/Brake Lamp ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X4 harness connector at the K9 body control module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X4 harness connector at the K9 body control module, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 body control module.
 - **If the test lamp turns ON and OFF**
8. Test or replace the E5AN stop/turn signal lamp bulb - right.

Backup Lamp Switch Ground	-	1	-	-
Backup Lamp Ground - Left	-	1	-	-
Backup Lamp Ground - Right	-	1	-	-
1. Backup Lamps Malfunction				

Circuit/System Description

The engine control module (ECM) provides a signal circuit to the backup lamp switch which is permanently grounded. With the engine running and the transmission in the reverse position, the backup lamp switch signal circuit is pulled low and the ECM responds by sending a serial data message to the body control module (BCM). The message indicates that the gear selector is in the reverse position. The BCM applies battery voltage to the backup lamps control circuit illuminating the backup lamps. Once the driver moves the gear selector out of the reverse position, a message is sent by the ECM via serial data requesting the BCM to remove battery voltage from the backup lamps control circuit. The engine must be running for the backup lamps to operate.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Engine ON.

Conditions for Setting the DTC

The ECM detects a stuck backup lamp switch.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- A history DTC will clear once 50 malfunction-free ignition cycles have occurred.

Circuit/System Testing

Backup Lamp Switch Malfunction

1. Ignition OFF, exterior lamps OFF, all doors closed, disconnect the harness connector at the B16 backup lamp switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 5 ohms between the ground circuit terminal 2 and ground.
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
3. Ignition ON.
4. Verify the scan tool Reverse Position Switch parameter is Off.
 - **If not Off**
 1. Ignition OFF, disconnect the X2 harness connector at the K20 engine control module.
 2. Test for infinite resistance between the signal circuit terminal 1 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K20 engine control module.
 - **If Off**
5. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the ground circuit terminal 2.
6. Verify the scan tool Reverse Position Switch parameter is On.
 - **If not On**
 1. Ignition OFF, disconnect the X2 harness connector at the K20 engine control module, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal 1 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V

3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K20 engine control module.

- **If On**

7. Test or replace the B16 backup lamp switch.

1. Stop Lamps Malfunction 2. Center High Mounted Stop Lamp Malfunction				

Circuit/System Description

The brake pedal position (BPP) sensor is used to sense the action of the driver application of the brake pedal. The brake pedal position sensor provides an analog voltage signal that will increase as the brake pedal is applied. The body control module provides a low reference signal and a 5 V reference voltage to the brake pedal position sensor. When the variable signal reaches a voltage threshold indicating the brakes have been applied, the BCM will apply battery voltage to the left and right stop lamp control circuits as well as the center high mounted stop lamp (CHMSL) control circuit illuminating the left and right stop lamps and the CHMSL.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Brakes APPLIED.

Conditions for Setting the DTC

DTC C0277 06

- The BCM detects a short to ground or an open/high resistance in the BPP sensor 5 V reference circuit.
- The BCM detects a short to ground or an open/high resistance in the BPP sensor signal circuit.

DTC C0277 07

- The BCM detects a short to voltage in the BPP sensor 5 V reference circuit.
- The BCM detects a short to voltage in the BPP sensor signal circuit.
- The BCM detects an open/high resistance in the BPP sensor low reference circuit.

DTC C0277 09

The BCM detects the BPP sensor signal is changing faster than possible under normal operating conditions.

DTC C0277 4B

The DTC will set when the BPP sensor home position is not learned.

DTC C0890 03

The BCM detects a short to ground in the BPP sensor 5 V reference circuit.

DTC C0890 07

- The BCM detects a short to voltage in the BPP sensor 5 V reference circuit.
- The BCM detects a short to voltage in the BPP sensor low reference circuit.

Actions Taken When the DTC Sets

- The Traction Control indicator is commanded ON.
- For DTC C0277 4B, the stop lamps may not activate at the expected brake pedal positions.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- For DTC C0277 07 the ignition must be cycled before the code can be cleared.
- For DTC C0277 4B a successful brake pedal position sensor calibration has been performed.
- A history DTC will clear once 50 malfunction-free ignition cycles have occurred.
- A DTC will not clear the current status until the next ignition cycle.

Circuit/System Testing

DTC C0277 or C0890

1. Ignition OFF, disconnect the harness connector at the B22 brake pedal position sensor, ignition ON.
2. Verify a test lamp illuminates between the appropriate low reference circuit terminal listed below and B+.
 - Terminal 1 - without MR6
 - Terminal C - with MR6
 - **If the test lamp does not illuminate**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 body control module.
 2. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If the test lamp illuminates**
3. Ignition ON.
4. Test for 4.8-5.2 V between the appropriate 5 V reference circuit terminal listed below and ground.
 - Terminal 2 - without MR6
 - Terminal A - with MR6
 - **If less than 4.8 V**
 1. Ignition OFF, disconnect the X2 harness connector at the K9 body control module.
 2. Test for infinite resistance between the 5 V reference circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
- 3. Test for less than 2 ohms in the 5 V reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If greater than 5.2 V**
- 1. Ignition OFF, disconnect the X2 harness connector at the K9 body control module, ignition ON.
- 2. Test for less than 1 V between the 5 V reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 body control module.
 - **If between 4.8-5.2 V**
- 5. Verify the scan tool Brake Pedal Applied parameter is Inactive.
 - **If not Inactive**
- 1. Ignition OFF, disconnect the X2 harness connector at the K9 body control module, ignition ON.
- 2. Test for less than 1 V between the signal circuit terminal 3 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 body control module.
 - **If Inactive**
- 6. Install a 3 A fused jumper wire between the appropriate 5 V reference and signal circuit terminals listed below.
 - 5 V reference terminal 2 and signal terminal 3 - without MR6
 - 5 V reference terminal A and signal terminal B - with MR6
- 7. Verify the scan tool Brake Pedal Applied parameter is Active.
 - **If not Active**
- 1. Ignition OFF, disconnect the X2 harness connector at the K9 body control module.
- 2. Test for infinite resistance between the signal circuit terminal 3 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
- 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If Active**
- 8. Test or replace the B22 brake pedal position sensor.

DTC C0277 4B

1. Verify DTC C0277 4B is not set.
 - **If DTC C0277 4B is set**
1. Ignition ON

2. Perform the BPP sensor recalibration procedure for the K9 body control module. Refer to **Brake Pedal Position Sensor Calibration**.
 3. Verify the DTC does not reset while operating the vehicle under the conditions for setting the DTC.
 - If the DTC resets, replace the B22 brake pedal position sensor.
 - If the DTC does not reset
 4. All OK.
 - **If DTC C0277 4B is not set**
2. All OK.

DTC C0277 09

1. Verify DTC C0277 09 is not set.
 - **If DTC C0277 09 is set**
 1. Replace the B22 brake pedal position sensor.
 2. Perform the BPP sensor recalibration procedure for the K9 body control module. Refer to **Brake Pedal Position Sensor Calibration**.
 3. Verify the DTC does not reset while operating the vehicle under the conditions for running the DTC.
 - If the DTC resets, replace the K9 body control module.
 - If the DTC does not reset
 4. All OK.
 - **If DTC C0277 09 is not set**
2. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Brake Pedal Position Sensor Replacement**
- **Brake Pedal Position Sensor Calibration**
- **Control Module References** for BCM replacement, programming, and setup

DTC C0297

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C0297 02

Brake Applied Output Circuit Short to Ground

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Brake Applied Signal	C0297 02	C0297 02	1	-
1. Cruise Control Malfunction				

Circuit/System Description

The brake pedal position sensor is used to sense the action of the driver application of the brake pedal. The brake pedal position sensor provides an analog voltage signal that will increase as the brake pedal is applied. The body control module (BCM) provides a low reference signal and a 5 V reference voltage to the brake pedal position sensor. When the variable signal reaches a voltage threshold indicating the brakes have been applied, the BCM will apply battery voltage to the right and left stop lamp control circuits, engine control module (ECM), and center high mounted stop lamp control circuit.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Brakes APPLIED.

Conditions for Setting the DTC

The BCM detects a short to ground or an open/high resistance on the brake applied signal circuit.

Actions Taken When the DTC Sets

The cruise control system is disabled.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 50 consecutive malfunction-free ignition cycles have occurred.

SYMPTOMS - LIGHTING

NOTE: **The following steps must be completed before using a symptom table.**

- Perform the **Diagnostic System Check - Vehicle** before using a symptom table in order to verify that all of the following conditions are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data link.
- Review the system description and operation in order to familiarize yourself with the system functions. Refer to the following:
 - **Exterior Lighting Systems Description and Operation**
 - **Interior Lighting Systems Description and Operation**

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the lighting system. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Thoroughly inspect the wiring and connectors. An incomplete inspection of the wiring and connectors may result in misdiagnosis causing part replacement with the reappearance of the malfunction. If an intermittent malfunction exists, refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Backup Lamps Malfunction (Automatic Transmission), Backup Lamps Malfunction (Manual Transmission)**
- **Courtesy Lamps Malfunction**
- **Daytime Running Lamps Malfunction**
- **Dome Lamps Malfunction**
- **Front Fog Lamps Malfunction**
- **Hazard Lamps Malfunction**
- **Headlamps Malfunction**
- **Interior Accent Lighting Malfunction**
- **Interior Backlighting Malfunction**
- **Park, License, and/or Tail Lamps Malfunction**

- **Rear Compartment Lamp Malfunction**
- **Stop Lamps Malfunction**
- **Turn Signal Lamps and/or Indicators Malfunction**

BACKUP LAMPS MALFUNCTION (AUTOMATIC TRANSMISSION)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
F32DA Fuse B+	1	1	-	-
Backup Lamps Control	B2545 02	B2545 04	B2545 01	-
Backup Lamp Ground - Left	-	1	-	-
Backup Lamp Ground - Right	-	1	-	-
1. Backup Lamps Malfunction				

Circuit/System Description

With the engine running and the transmission in the reverse position, the transmission control module (TCM) sends a serial data message to the body control module (BCM). The message indicates that the gear selector is in the reverse position. The BCM applies battery voltage to the backup lamps control circuit illuminating the backup lamps. Once the driver moves the gear selector out of the reverse position, a message is sent by the TCM via serial data requesting the BCM to remove battery voltage from the backup lamps control circuit. The engine must be running for the backup lamps to operate.

Diagnostic Aids

When testing at the backup lamp bulb socket, make sure all measurements and test lamp connections are in the correct terminal location and do not come in contact with each other during testing.

Circuit/System Testing

1. Ignition OFF, disconnect the X5 harness connector at the K9 Body Control Module, ignition ON.
2. Verify a test lamp illuminates between the B+ circuit terminal 4 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If the test lamp illuminates**
3. Ignition OFF, connect the X5 harness connector at the K9 Body Control Module.
4. Ignition OFF, exterior lamps OFF, trunk latch latched, remove the appropriate E5 Backup Lamp at the appropriate E42 Tail Lamp Sssembly.
5. Test for less than 5 ohms between the ground circuit at the socket terminal and ground.
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.

- **If less than 5 ohms**
- 6. Connect a test lamp between the control circuit at the socket terminal and ground, ignition ON.
- 7. Verify the test lamp turns ON and OFF when commanding the Backup Lamps ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X7 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X7 harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
- 8. Test or replace the appropriate E5 Backup Lamp.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Tail Lamp Replacement**
- **Tail Lamp Bulb Replacement**
- **Control Module References** for BCM replacement, programming, and setup

BACKUP LAMPS MALFUNCTION (MANUAL TRANSMISSION)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.

1. Backup Lamps Malfunction				

Circuit/System Description

The engine control module (ECM) provides a signal circuit to the backup lamp switch which is permanently grounded. With the engine running and the transmission in the reverse position, the backup lamp switch signal circuit is pulled low and the ECM responds by sending a serial data message to the body control module (BCM). The message indicates that the gear selector is in the reverse position. The BCM applies battery voltage to the backup lamps control circuit illuminating the backup lamps. Once the driver moves the gear selector out of the reverse position, a message is sent by the ECM via serial data requesting the BCM to remove battery voltage from the backup lamps control circuit. The engine must be running for the backup lamps to operate.

Diagnostic Aids

When testing at the backup lamp bulb socket, make sure all measurements and test lamp connections are in the correct terminal location and do not come in contact with each other during testing.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Engine ON.
2. Verify the scan tool Reverse Position Switch parameter changes between ON and OFF while shifting the vehicle between the neutral and reverse gears.

- **If the parameter does not change**

Refer to Backup Lamp Switch Malfunction.

- **If the parameter changes**

3. Verify the backup lamps turn ON and OFF when commanding the Backup Lamps ON and OFF with a scan tool.

- **If the backup lamps do not turn ON and OFF**

Refer to Backup Lamps Malfunction.

- **If the backup lamps turn ON and OFF**

4. All OK.

Circuit/System Testing

Backup Lamp Switch Malfunction

1. Ignition OFF, exterior lamps OFF, all doors closed, disconnect the harness connector at the B16 Backup Lamp Switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 5 ohms between the ground circuit terminal 2 and ground.

- **If 5 ohms or greater**

1. Ignition OFF.

2. Test for less than 2 ohms in the ground circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, repair the open/high resistance in the ground connection.

- **If less than 5 ohms**

3. Ignition ON.

4. Verify the scan tool Reverse Position Switch parameter is Off.

- **If not Off**

1. Ignition OFF, disconnect the X2 harness connector at the K20 Engine Control Module.

2. Test for infinite resistance between the signal circuit terminal 1 and ground.

- If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance, replace the K20 Engine Control Module.

- **If Off**

5. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the ground circuit terminal 2.
6. Verify the scan tool Reverse Position Switch parameter is On.

- **If not On**

1. Ignition OFF, disconnect the X2 harness connector at the K20 Engine Control Module, ignition ON.
2. Test for less than 1 V between the signal circuit terminal 1 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K20 Engine Control Module.

- **If On**

7. Test or replace the B16 Backup Lamp Switch.

Backup Lamps Malfunction

1. Ignition OFF, disconnect the X5 harness connector at the K9 Body Control Module, ignition ON.
2. Verify a test lamp illuminates between the B+ circuit terminal 4 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If the test lamp illuminates**
3. Ignition OFF, connect the X5 harness connector at the K9 Body Control Module.
4. Ignition OFF, exterior lamps OFF, trunk latch latched, remove the appropriate E5 Backup Lamp at the appropriate E42 Tail Lamp Assembly.
5. Test for less than 5 ohms between the ground circuit at the socket terminal and ground.
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.

- **If less than 5 ohms**
- 6. Connect a test lamp between the control circuit at the socket terminal and ground, ignition ON.
- 7. Verify the test lamp turns ON and OFF when commanding the Backup Lamps ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X7 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X7 harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
- 8. Test or replace the appropriate E5 Backup Lamp.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Sunshade Mirror Lamp - Left Ground	-	1	-	-
Sunshade Mirror Lamp - Right Ground	-	1	-	-
1. Courtesy Lamps Malfunction 2. Dome Lamps Malfunction				

Circuit/System Description

The body control module (BCM) supplies battery voltage to the front and rear reading lamps, left and right sunshade lamps, center console compartment lamp, and instrument panel compartment lamp via the courtesy lamp control circuit. When the instrument panel compartment or a sunshade mirror is opened, the switch contacts close allowing battery voltage to flow illuminating the respective lamps. The front and rear reading lamps are controlled by individual switches that are activated by the operator when additional cabin lighting is required. In the event that any of these courtesy lamps were to remain illuminated for more than 10 minutes with the ignition switch in the OFF position and no doors opened, the BCM will deactivate the courtesy lamp control circuit to prevent total battery discharge.

Circuit/System Testing

1. Ignition OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connector at the inoperative courtesy lamp. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the appropriate ground circuit terminal listed below and ground.
 - E27 instrument panel compartment lamp terminal 2
 - E31L sunshade mirror lamp - left terminal B
 - E31R sunshade mirror lamp - right terminal B
 - E37D dome/reading lamps - overhead console terminal 6
 - E37R dome/reading lamps - rear terminal 6
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Connect a test lamp between the appropriate control circuit terminal listed below and ground.
 - E27 instrument panel compartment lamp terminal 1
 - E31L sunshade mirror lamp - left terminal A
 - E31R sunshade mirror lamp - right terminal A
 - E37D dome/reading lamps - overhead console terminal 1
 - E37R dome/reading lamps - rear terminal 1
4. Verify the test lamp turns ON and OFF when commanding the Inadvertent Load ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X7 harness connector at the K9 body control module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X7 harness connector at the K9 body control module, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V, replace the K9 body control module.
- **If the test lamp turns ON and OFF**

5. Test or replace the appropriate courtesy lamp.

1. Daytime Running Lamps Malfunction				

Circuit/System Description

The ambient light sensor is used to monitor outside lighting conditions. The body control module (BCM)

provides a 5-volt reference signal to the ambient light sensor. Depending on outside lighting conditions, the ambient light sensor provides a voltage signal to the BCM that will vary between 0.2 and 4.9 volts. The BCM monitors the ambient light sensor signal circuit to determine if outside lighting conditions are correct for either daytime running lights (DRL) or automatic headlamp system control when the headlamp switch is in the AUTO position. In daylight conditions, the BCM will command the DRLs ON by applying voltage to the DRL control circuits illuminating the DRLs. Any function or condition that turns on the headlamps will cancel DRL operation.

Circuit/System Verification

1. Ignition ON.
2. Verify the left daytime running lamp turns ON and OFF while commanding the Left Front Park Lamp/Daytime Running Lamp ON and OFF with a scan tool.

- **If the left daytime running lamp does not turn ON and OFF**

Refer to Daytime Running Lamps Malfunction.

- **If the left daytime running lamp turns ON and OFF**

3. Verify the right daytime running lamp turns ON and OFF while commanding the Right Front Park Lamp/Daytime Running Lamp ON and OFF with a scan tool.

- **If the right daytime running lamp does not turn ON and OFF**

Refer to Daytime Running Lamps Malfunction.

- **If the right daytime running lamp turns ON and OFF**

4. Refer to Ambient Light Sensor Malfunction.

Circuit/System Testing

Daytime Running Lamps Malfunction

1. Ignition OFF, exterior lamps OFF, disconnect the harness connector at the appropriate E13 headlamp.
2. Test for less than 5 ohms between the ground circuit terminal 1 and ground.
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
3. Connect a test lamp between the control circuit terminal 4 and ground, ignition ON.
4. Verify the test lamp turns ON and OFF when commanding the appropriate Front Park Lamp/Daytime Running Lamp ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X4 harness connector at the K9 body control module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X4 harness connector at the K9 body control module, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 body control module.
 - **If the test lamp turns ON and OFF**
5. Test or replace the appropriate E13 headlamp.

Ambient Light Sensor Malfunction

1. Ignition OFF, scan tool disconnected, all doors closed, all accessories OFF, open and close drivers door,

disconnect the harness connector at the B10B ambient light/sunload sensor. It may take up to 2 minutes for all vehicle systems to power down.

2. Test for less than 15 ohms between the low reference circuit terminal 6 and ground.
 - **If 15 ohms or greater**
 1. Ignition OFF, disconnect the X2 harness connector at the K33 HVAC control module.
 2. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K33 HVAC control module.
 - **If less than 15 ohms**
3. Ignition ON.
4. Verify the scan tool Ambient Light Sensor parameter is greater than 4.65 V.
 - **If 4.65 V or less**
 1. Ignition OFF, disconnect the X2 harness connector at the K9 body control module.
 2. Test for infinite resistance between the signal circuit terminal 5 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 body control module.
 - **If greater than 4.65 V**
5. Install a 3 A fused jumper wire between the signal circuit terminal 5 and the low reference circuit terminal 6.
6. Verify the scan tool Ambient Light Sensor parameter is less than 0.196 V.
 - **If 0.196 V or greater**
 1. Ignition OFF, disconnect the X2 harness connector at the K9 body control module, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal 5 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If less than 0.196 V**
7. Test or replace the B10B ambient light/sunload sensor.

Instrument Panel Courtesy Lamp - Left Ground	-	1	-	-
Instrument Panel Courtesy Lamp - Right Ground	-	1	-	-
1. Dome Lamps Malfunction 2. Dome Lamp Switch Malfunction				

Circuit/System Description

The dome lamp switch has 3 positions: DOOR, OFF, and ON. The ON position provides a ground for continuous operation and the dome/courtesy lamps will remain illuminated until the switch is placed in either the DOOR or OFF position. When in the DOOR position, the dome lamps operation is controlled by the body control module (BCM). When any door is opened, the door ajar switch contacts close and the BCM receives a door-open input. The BCM illuminates the dome lamps, door courtesy lamps, and instrument panel courtesy lamps when any door is opened or a door lock/unlock request is activated with the key fob. After all doors have been closed, the dome lamps, door courtesy lamps, and instrument panel courtesy lamps will remain illuminated approximately 3 seconds after the last door closes. When the driver places the dome lamp switch in the OFF position, the dome/courtesy lamps will be disabled. In the event that the dome/courtesy lamps were to remain illuminated for more than 10 minutes with the ignition switch in the OFF position and no doors opened, the BCM will deactivate the dome/courtesy lamps control circuit to prevent total battery discharge.

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Door Ajar Sw. parameter changes between Active and Inactive while opening and closing each vehicle door.
 - **If the parameter does not change**

Refer to **Door Ajar Indicator Malfunction** .
 - **If the parameter changes**
3. Verify the scan tool Interior/Courtesy Lighting Master Switch parameter changes between Door, On, and Cancel while placing the dome lamp switch in the Door, On, and Cancel positions.
 - **If the parameter does not change**

Refer to Dome Lamp Switch Malfunction.
 - **If the parameter changes**
4. Verify the dome/courtesy lamps turn ON and OFF while commanding the Courtesy Lamps ON and OFF with a scan tool.
 - **If the dome/courtesy lamps do not turn ON and OFF**

Refer to Dome/Courtesy Lamps Malfunction.
 - **If the dome/courtesy lamps turn ON and OFF**

5. All OK.

Circuit/System Testing

Dome Lamp Switch Malfunction

1. Ignition OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connector at the E37D dome/reading lamps - overhead console. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal 6 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Ignition ON.
4. Verify the scan tool Interior/Courtesy Lighting Master Switch parameter is Door.
 - **If Cancel**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 body control module.
 2. Test for infinite resistance between the signal circuit terminal 4 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 body control module.
 - **If On**
 1. Ignition OFF, disconnect the X7 harness connector at the K9 body control module.
 2. Test for infinite resistance between the signal circuit terminal 5 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 body control module.
 - **If Door**
5. Install a 3 A fused jumper wire between the signal circuit terminal 4 and the ground circuit terminal 6.
6. Verify the scan tool Interior/Courtesy Lighting Master Switch parameter is Cancel.
 - **If not Cancel**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 body control module, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal 4 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.

- **If Cancel**

7. Install a 3 A fused jumper wire between the signal circuit terminal 5 and the ground circuit terminal 6.
8. Verify the scan tool Interior/Courtesy Lighting Master Switch parameter is On.

- **If not On**

1. Ignition OFF, disconnect the X7 harness connector at the K9 body control module, ignition ON.
2. Test for less than 1 V between the signal circuit terminal 5 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.

- **If On**

9. Test or replace the E37D dome/reading lamps - overhead console.

Dome/Courtesy Lamps Malfunction

NOTE: Each component on the control circuit may need to be disconnected to isolate a short to voltage or short to ground. Use the schematics to identify the following:

- Lighting components the vehicle is equipped with
- Each component's control and ground circuit terminals
- Component locations on the backlighting control circuit

1. Ignition OFF, all doors closed, all accessories OFF, disconnect the harness connectors at the components listed below.
 - E37D dome/reading lamps - overhead console
 - E37R dome/reading lamps - rear
 - E8D door courtesy lamp - driver
 - E8P door courtesy lamp - passenger
 - E8J instrument panel courtesy lamp - left
 - E8K instrument panel courtesy lamp - right
2. Test for less than 10 ohms between the appropriate ground circuit terminal listed below and ground.
 - E37D dome/reading lamps - overhead console terminal 6
 - E37R dome/reading lamps - rear terminal 6
 - E8D door courtesy lamp - driver terminal 2
 - E8P door courtesy lamp - passenger terminal 2
 - E8J instrument panel courtesy lamp - left terminal 2
 - E8K instrument panel courtesy lamp - right terminal 2

- **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
- 3. Connect a test lamp between the appropriate control circuit terminal listed below and ground.
 - E37D dome/reading lamps - overhead console terminal 2
 - E37R dome/reading lamps - rear terminal 2
 - E8D door courtesy lamp - driver terminal 1
 - E8P door courtesy lamp - passenger terminal 1
 - E8J instrument panel courtesy lamp - left terminal 1
 - E8K instrument panel courtesy lamp - right terminal 1
- 4. Verify the test lamp turns ON and OFF when commanding the Courtesy Lamps ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X2 harness connector at the K9 body control module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X2 harness connector at the K9 body control module, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 body control module.
 - **If the test lamp turns ON and OFF**
- 5. Test or replace the appropriate dome/courtesy lamp.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Dome and Reading Lamp Replacement**
- **Front Floor Flood Lamp Replacement**
- **Front Side Door Courtesy Lamp Lens Replacement**

Front Fog Lamp Control	1	1	1	-
Front Fog Lamp Ground - Left	-	1	-	-
Front Fog Lamp Ground - Right	-	1	-	-
1. Front Fog Lamps Malfunction				

Circuit/System Description

The front fog lamp switch is an input to the body control module (BCM) and is contained in the headlamp switch assembly. The BCM supplies voltage to the front fog lamp switch via the front fog lamp and instrument panel dimmer switch B+ circuit. When the front fog lamp switch is pressed, voltage from the B+ circuit is pulled down through the front fog lamp switch resistor. The front fog lamp resistor is part of the resistor ladder that also provides the dimming signals for the instrument panel dimmer switches. The BCM receives the voltage signal through the front fog lamp and instrument panel dimmer switch signal circuit.

The front fog lamp relay is supplied with battery voltage at all times. The front fog lamp switch signal circuit is grounded momentarily by pressing the front fog lamp switch. The body control module (BCM) energizes the front fog lamp relay by applying ground to the front fog lamp relay control circuit. When the front fog lamp relay is energized, the relay switch contacts close and battery voltage is applied through the FRT FOG fuse to the front fog lamp control circuit which illuminates the front fog lamps.

4. Verify the front fog lamp indicator on the instrument cluster turns ON and OFF while commanding the front fog lamps ON and OFF with the front fog lamp switch.
 - **If the front fog lamp indicator does not turn ON and OFF**

Refer to Front Fog Lamp Indicator Malfunction.
 - **If the front fog lamp indicator turns ON and OFF**
5. All OK.

Circuit/System Testing

Front Fog Lamp Switch Malfunction

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S30 headlamp switch, ignition ON.
2. Test for B+ between the B+ circuit terminal 1 and ground.
 - **If less than B+**
 1. Ignition OFF, disconnect the X3 harness connector at the K9 body control module.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If B+**
3. Verify the scan tool LED Backlight Dimming Command parameter is greater than 40%.
 - **If 40% or less**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 body control module, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal 12 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 body control module.
 - **If greater than 40%**
4. Install a 3 A fused jumper wire between the signal circuit terminal 12 and the B+ circuit terminal 1.
5. Verify the scan tool LED Backlight Dimming Command parameter is less than 30%.
 - **If 30% or greater**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 body control module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If less than 30%**
6. Test or replace the S30 headlamp switch.

Front Fog Lamps Malfunction

1. Ignition OFF, disconnect the X2 harness connector at the X50A fuse block - underhood.
2. Connect a test lamp between the control circuit terminal 19 and B+, ignition ON.
3. Verify the test lamp turns ON and OFF when commanding the Front Fog Lamps ON and OFF with a scan

tool.

- **If the test lamp is always OFF**

1. Ignition OFF, disconnect the X5 harness connector at the K9 body control module, ignition ON.
2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
3. Ignition OFF.
4. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.

- **If the test lamp is always ON**

1. Ignition OFF, disconnect the X5 harness connector at the K9 body control module.
2. Test for infinite resistance between the control circuit terminal and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 body control module.

- **If the test lamp turns ON and OFF**

4. Ignition OFF, connect the X2 harness connector at the X50A fuse block - underhood.
5. Ignition OFF, exterior lamps OFF, disconnect the harness connector at the appropriate E29 fog lamp.
6. Test for less than 5 ohms between the ground circuit terminal 2 and ground.

- **If 5 ohms or greater**

1. Ignition OFF.
2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.

- **If less than 5 ohms**

7. Connect a test lamp between the control circuit terminal 1 and ground, ignition ON.
8. Verify the test lamp turns ON and OFF when commanding the Front Fog Lamps ON and OFF with a scan tool.

- **If the test lamp is always OFF**

1. Ignition OFF, disconnect the X1 harness connector at the X50A fuse block - underhood.
2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the X50A fuse block - underhood.

- **If the test lamp is always ON**

1. Ignition OFF, disconnect the X1 harness connector at the X50A fuse block - underhood, ignition

ON.

2. Test for less than 1 V between the control circuit terminal and ground.

- If 1 V or greater, repair the short to voltage on the circuit.

- If less than 1 V, replace the X50A fuse block - underhood.

- **If the test lamp turns ON and OFF**

9. Test or replace the appropriate E29 fog lamp.

Front Fog Lamp Indicator Malfunction

1. Ignition ON.

2. Verify the front fog lamp indicator turns ON and OFF when commanding the Instrument Cluster All Indicators Test ON and OFF with a scan tool.

- **If the front fog lamp indicator is always OFF or remains ON**

Replace the P16 instrument cluster.

- **If the front fog lamp indicator turns ON and OFF**

3. Replace the K9 body control module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Headlamp Switch Replacement**

- **Front Fog Lamp Replacement**

- **Front Fog Lamp Bulb Replacement**

- **Underhood Electrical Center or Junction Block Replacement**

- **Control Module References** for BCM or Instrument Cluster replacement, programming, and setup

HAZARD LAMPS MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.

- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.

- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Hazard Warning Switch Signal	1	1	1	B3596 00
Hazard Warning Switch LED	2	2	2	-

Backlighting Control				
Hazard Warning Switch Ground	-	1	-	-
1. Hazard Lamps Malfunction 2. Hazard Warning Switch Backlighting Malfunction				

Circuit/System Description

The hazard flashers may be activated in any power mode. The hazard warning switch signal circuit is momentarily grounded when the hazard warning switch is pressed. The body control module (BCM) responds to the hazard warning switch signal input by supplying battery voltage to all four turn signal lamps in an ON and OFF duty cycle. When the hazard warning switch is activated, the BCM sends a serial data message to the instrument cluster requesting both turn signal indicators to be cycled ON and OFF.

The instrument panel dimmer switch controls are located on the headlamp switch assembly and are used to increase and decrease the brightness of the interior backlighting components. When the instrument panel dimmer switch is placed in a desired brightness position, the body control module (BCM) receives a signal from the instrument panel dimmer switch and responds by applying a pulse width modulated (PWM) voltage to the hazard warning switch LED backlighting control circuit illuminating the LED to the desired level of brightness.

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Hazard Lamps Switch parameter changes between Active and Inactive while commanding the hazard lamps ON and OFF with the hazard warning switch.
 - **If the parameter does not change**

Refer to Hazard Warning Switch Malfunction.
 - **If the parameter changes**
3. Verify all left and right turn signal lamps turn ON and OFF while commanding the hazard lamps ON and OFF with the hazard warning switch.
 - **If all turn signal lamps do not turn ON and OFF**

Refer to **Turn Signal Lamps and/or Indicators Malfunction**
 - **If all turn signal lamps turn ON and OFF**
4. Verify the hazard warning switch backlighting turns ON and OFF while commanding the Hazard Lamps Switch Backlight ON and OFF with a scan tool.
 - **If the hazard warning switch backlighting does not turn ON and OFF**

Refer to Hazard Warning Switch Backlighting Malfunction.
 - **If the hazard warning switch backlighting turns ON and OFF**
5. All OK.

Circuit/System Testing

Hazard Warning Switch Malfunction

1. Ignition OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connector at the S48C multifunction switch 1 - instrument panel. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 15 ohms between the ground circuit terminal 7 and ground.
 - **If 15 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 15 ohms**
3. Ignition ON.
4. Verify the scan tool Hazard Lamps Switch parameter is Inactive.
 - **If not Inactive**
 1. Ignition OFF, disconnect the X2 harness connector at the K9 body control module.

2. Test for infinite resistance between the signal circuit terminal 10 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 body control module.
 - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 10 and ground.
6. Verify the scan tool Hazard Lamps Switch parameter is Active.
 - **If not Active**
 1. Ignition OFF, disconnect the X2 harness connector at the K9 body control module, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal 10 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If Active**
7. Test or replace the S48C multifunction switch 1 - instrument panel.

Hazard Warning Switch Backlighting Malfunction

1. Ignition OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connector at the S48C multifunction switch 1 - instrument panel. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 15 ohms between the ground circuit terminal 7 and ground.
 - **If 15 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 15 ohms**
3. Connect a test lamp between the control circuit terminal 5 and ground, ignition ON.
4. Verify the test lamp turns ON and OFF when commanding the Hazard Lamps Switch Backlight ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 body control module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, replace the K9 body control module.
- **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 body control module, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 body control module.
- **If the test lamp turns ON and OFF**
- 5. Test or replace the S48C multifunction switch 1 - instrument panel.

Circuit/System Description

Low Beams - with T4A

The body control module (BCM) monitors three signal circuits from the headlamp switch. When the headlamp switch is in the AUTO position, all three signal circuits are open. When placed in the AUTO position, the BCM monitors inputs from the ambient light sensor to determine if headlamps are required or if daytime running lamps will be activated based on outside lighting conditions. When the headlamp switch is placed in the OFF position, the headlamp switch headlamps OFF signal circuit is grounded, indicating to the BCM that the exterior lamps should be turned OFF. With the headlamp switch in the PARK position, the headlamp switch park lamps ON signal circuit is grounded, indicating that the park lamps have been requested. When the headlamp switch is placed in the HEADLAMP position, both the headlamp switch park lamps ON signal circuit and the headlamp switch headlamps ON signal circuit are grounded. The BCM responds to the inputs by illuminating the park lamps and headlamps. When the low beam headlamps are requested, the BCM applies B+ to both low beam headlamp control circuits illuminating the low beam headlamps.

Low Beams - with T4F

The body control module (BCM) monitors three signal circuits from the headlamp switch. When the headlamp switch is in the AUTO position, all three signal circuits are open. When placed in the AUTO position, the BCM monitors inputs from the ambient light sensor to determine if headlamps are required or if daytime running lamps will be activated based on outside lighting conditions. When the headlamp switch is placed in the OFF

position, the headlamp switch headlamps OFF signal circuit is grounded, indicating to the BCM that the exterior lamps should be turned OFF. With the headlamp switch in the PARK position, the headlamp switch park lamps ON signal circuit is grounded, indicating that the park lamps have been requested. When the headlamp switch is placed in the HEADLAMP position, both the headlamp switch park lamps ON signal circuit and the headlamp switch headlamps ON signal circuit are grounded. The BCM responds to the low beam request by applying ground to the low beam relay control circuit which energizes the low beam relay. With the low beam relay energized, the switch contacts close allowing battery voltage to flow through the low beam fuses to the low beam control circuits illuminating the low beam headlamps.

The high beam and flash to pass functions are contained within the turn signal/multifunction switch. The BCM provides the turn signal/multifunction switch with two signal circuits, the high beam signal circuit and the flash to pass signal circuit. When the low beam headlamps are ON and the turn signal/multifunction switch is placed in the high beam position, ground is applied to the BCM through the high beam signal circuit. The BCM responds to the high beam request by applying ground to the high beam relay control circuit which energizes the high beam relay. With the high beam relay energized, the switch contacts close allowing battery voltage to flow through the high beam fuses to the high beam control circuits illuminating the high beam headlamps.

When the turn signal/multifunction switch is momentarily placed in the flash to pass position, ground is applied to the BCM through the flash to pass signal circuit. The BCM responds by applying ground to the high beam relay control circuit which energizes the high beam relay illuminating the high beams for a brief moment or until the flash to pass switch is released.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Headlamps On Switch parameter changes between Active and Inactive while commanding the headlamp ON and OFF with headlamp switch.
 - **If the parameter does not change**

Refer to Headlamp Switch Malfunction.
 - **If the parameter changes**
3. Verify the scan tool Automatic Headlamps Disable Switch parameter changes between Active and Inactive while commanding the automatic lamp control ON and OFF with the turn signal/multifunction switch.
 - **If the parameter does not change**

Refer to Headlamp Switch Malfunction.
 - **If the parameter changes**
4. Verify the scan tool Headlamps Flash Switch parameter changes between Active and Inactive while commanding the flash to pass ON and OFF with the turn signal/multifunction switch.
 - **If the parameter does not change**

Refer to Turn Signal/Multifunction Switch Malfunction.
 - **If the parameter changes**
5. Verify the scan tool High Beam Select Switch parameter changes between Active and Inactive while commanding the high beams ON and OFF with the turn signal/multifunction switch.
 - **If the parameter does not change**

Refer to Turn Signal/Multifunction Switch Malfunction.
 - **If the parameter changes**
6. Verify the left low beam headlamp turns ON and OFF when commanding the Left Headlamp Low Beam ON and OFF with a scan tool.
 - **If the left low beam/daytime running lamp does not turn ON and OFF**

Refer to Headlamps Malfunction - Low Beam.
 - **If the left low beam/daytime running lamp turns ON and OFF**
7. Verify the right low beam headlamp turns ON and OFF when commanding the Right Headlamp Low Beam ON and OFF with a scan tool.
 - **If the right low beam/daytime running lamp does not turn ON and OFF**

Refer to Headlamps Malfunction - Low Beam.

- **If the right low beam/daytime running lamp turns ON and OFF**

8. Verify the high beams turn ON and OFF when commanding the High Beams ON and OFF with a scan tool.

- **If the high beams do not turn ON and OFF**

Refer to Headlamps Malfunction - High Beam.

- **If the high beams turn ON and OFF**

9. Verify the high beam indicator on the instrument cluster turns ON and OFF while commanding the All Indicators Test ON and OFF with a scan tool.

- **If the high beam indicator does not turn ON and OFF**

Refer to High Beam Indicator Malfunction.

- **If the high beam indicator turns ON and OFF**

10. All OK.

Circuit/System Testing

Headlamp Switch Malfunction

1. Ignition OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connector at the S30 Headlamp Switch. It may take up to 2 minutes for all vehicle systems to power down.

2. Test for less than 15 ohms between the ground circuit terminal 6 and ground.

- **If 15 ohms or greater**

1. Ignition OFF.

2. Test for less than 2 ohms in the ground circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, repair the open/high resistance in the ground connection.

- **If less than 15 ohms**

3. Ignition ON.

4. Verify the scan tool Automatic Headlamps Disable Switch parameter is Inactive.

- **If not Inactive**

1. Ignition OFF, disconnect the X1 harness connector at the K9 Body Control Module.

2. Test for infinite resistance between the signal circuit terminal 5 and ground.

- If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance, replace the K9 Body Control Module.

- **If Inactive**

5. Install a 3 A fused jumper wire between the signal circuit terminal 5 and the ground circuit terminal 6.

6. Verify the scan tool Automatic Headlamps Disable Switch parameter is Active.

- **If not Active**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal 5 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
- **If Active**
- 7. Verify the scan tool Park Lamps Switch parameter is Inactive.
 - **If not Inactive**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit terminal 3 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If Inactive**
- 8. Install a 3 A fused jumper wire between the signal circuit terminal 3 and the ground circuit terminal 6.
- 9. Verify the scan tool Park Lamps Switch parameter is Active.
 - **If not Active**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal 3 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If Active**
- 10. Verify the scan tool Headlamps On Switch parameter is Inactive.
 - **If not Inactive**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit terminal 4 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If Inactive**
- 11. Install a 3 A fused jumper wire between the signal circuit terminal 4 and the ground circuit terminal 6.
- 12. Verify the scan tool Headlamps On Switch parameter is Active.
 - **If not Active**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 Body Control Module, ignition ON.

2. Test for less than 1 V between the signal circuit terminal 4 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
- **If Active**
13. Test or replace the S30 Headlamp Switch.

Turn Signal/Multifunction Switch Malfunction

1. Ignition OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connector at the S78 Turn Signal/Multifunction Switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 15 ohms between the ground circuit terminal 3 and ground.
 - **If 15 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 15 ohms**
3. Ignition ON.
4. Verify the scan tool High Beam Select Switch parameter is Inactive.
 - **If not Inactive**
 1. Ignition OFF, disconnect the X3 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit terminal 2 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 2 and the ground circuit terminal 3.
6. Verify the scan tool High Beam Select Switch parameter is Active.
 - **If not Active**
 1. Ignition OFF, disconnect the X3 harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal 2 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.

- **If Active**
- 7. Verify the scan tool Headlamps Flash Switch parameter is Inactive.
 - **If not Inactive**
 1. Ignition OFF, disconnect the X3 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit terminal 4 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If Inactive**
- 8. Install a 3 A fused jumper wire between the signal circuit terminal 4 and the ground circuit terminal 3.
- 9. Verify the scan tool Headlamps Flash Switch parameter is Active.
 - **If not Active**
 1. Ignition OFF, disconnect the X3 harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal 4 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If Active**
- 10. Test or replace the S78 Turn Signal/Multifunction Switch.

Headlamps Malfunction - Low Beam (with T4A)

1. Ignition OFF, exterior lamps OFF, disconnect the harness connector at the appropriate E4 Headlamp - Low Beam.
2. Test for less than 5 ohms between the ground circuit terminal B and ground.
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
3. Connect a test lamp between the control circuit terminal A and ground, ignition ON.
4. Verify the test lamp turns ON and OFF when commanding the appropriate Headlamp Low Beam ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X4 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance
- 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 - 1. Ignition OFF, disconnect the X4 harness connector at the K9 Body Control Module, ignition ON.
 - 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
- 5. Test or replace the appropriate E4 Headlamp - Low Beam.

Headlamps Malfunction - Low Beam (with T4F)

1. Ignition OFF, disconnect the KR49 Headlamp Low Beam Relay, ignition ON
2. Verify a test lamp illuminates between the B+ circuit terminal 86 and ground.
 - **If the test lamp does not illuminate**
 - Replace the X50A Fuse Block - Underhood.
 - **If the test lamp illuminates**
3. Verify a test lamp illuminates between the B+ circuit terminal 30 and ground.
 - **If the test lamp does not illuminate**
 - Replace the X50A Fuse Block - Underhood.
 - **If the test lamp illuminates**
4. Connect a test lamp between the control circuit terminal 85 and B+, ignition ON.
5. Verify the test lamp turns ON and OFF when commanding the Low Beams Lamps ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 - 1. Ignition OFF, disconnect the X5 harness connector at the K9 Body Control Module, ignition ON.
 - 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 - 3. Ignition OFF.
 - 4. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If the test lamp is always ON**

1. Ignition OFF, disconnect the X5 harness connector at the K9 Body Control Module.
2. Test for infinite resistance between the control circuit terminal and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 body control module.
 - **If the test lamp turns ON and OFF**
6. Ignition OFF, exterior lamps OFF, connect the KR49 Headlamp Low Beam Relay.
7. Disconnect the harness connector at the appropriate E13 headlamp.
8. Test for less than 5 ohms between the ground circuit terminal 10 and ground.
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
9. Connect a test lamp between the control circuit terminal 3 and ground, ignition ON.
10. Verify the test lamp turns ON and OFF when commanding the Low Beam Lamps ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X1 harness connector at the X50A Fuse Block - Underhood.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the KR49 Headlamp Low Beam Relay.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X1 harness connector at the X50A Fuse Block - Underhood, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the KR49 Headlamp Low Beam Relay.
 - **If the test lamp turns ON and OFF**
 - 11. Ignition OFF, replace the appropriate T7 Headlamp Ballast.
 - 12. Ignition ON, verify the appropriate low beam headlamp illuminates when commanded ON with the headlamp switch.
 - **If the low beam headlamp does not illuminate**
 1. Replace the appropriate E4 Headlamp - Low Beam bulb.
 - **If the low beam headlamp illuminates**

13. All OK.

Headlamps Malfunction - High Beam

1. Ignition OFF, disconnect the X5 harness connector at the K9 Body Control Module, ignition ON.
2. Verify a test lamp illuminates between the control circuit terminal 18 and ground.
 - **If the test lamp does not illuminate**
 1. Ignition OFF, disconnect the X2 harness connector at the X50A Fuse Block - Underhood.
 2. Test for infinite resistance between the control circuit terminal and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the X50A Fuse Block - Underhood.
 - **If the test lamp illuminates**
3. Ignition OFF, connect a 3 A fused jumper between the control circuit terminal 18 and ground.
4. Remove the left high beam fuse (F38UA) at the X50A Fuse Block - Underhood, ignition ON.
5. Verify a test lamp illuminates between the left high beam fuse (F38UA) B+ switch control terminal and ground.
 - **If the test lamp does not illuminate**
 1. Ignition OFF, disconnect the X1 harness connector at the X50A Fuse Block - Underhood, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the X50A Fuse Block - Underhood.
 - **If the test lamp illuminates**
6. Ignition OFF, connect the X5 harness connector at the K9 Body Control Module.
7. Install the left high beam fuse (F38UA) at the X50A Fuse Block - Underhood.
8. Ignition OFF, exterior lamps OFF, disconnect the harness connector at the appropriate headlamp - high beam.
9. Test for less than 5 ohms between the appropriate ground circuit terminal listed below and ground.
 - E4 HighBeam Headlamp - terminal 2 (T4A)
 - M28 High Beam Headlamp Solenoid Actuator - terminal 1 (T4F)
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 15 ohms**

10. Connect a test lamp between the appropriate control circuit terminal listed below and ground, ignition ON.
 - E4 HighBeam Headlamp - terminal 1 (T4A)
 - M28 High Beam Headlamp Solenoid Actuator - terminal 2 (T4F)
11. Verify the test lamp turns ON and OFF when commanding the High Beams ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X1 harness connector at the X50A Fuse Block - Underhood.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X1 harness connector at the X50A Fuse Block - Underhood, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
12. Test or replace the appropriate headlamp - high beam.

High Beam Indicator Malfunction

1. Ignition ON.
2. Verify the high beam indicator turns ON and OFF when commanding the Instrument Cluster All Indicators Test ON and OFF with a scan tool.
 - **If the high beam indicator is always OFF or remains ON**

Replace the P16 Instrument Cluster.
 - **If the high beam indicator turns ON and OFF**
3. Replace the K9 Body Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Headlamp Ballast Replacement**
- **Headlamp Switch Replacement**

- **Headlamp Replacement**
- **Headlamp Bulb Replacement**
- **Relay Replacement (Within an Electrical Center) , Relay Replacement (Attached to Wire Harness)**
- **TURN SIGNAL SWITCH REPLACEMENT**
- **Fuse Block Replacement**
- **Control Module References** for BCM or Instrument Cluster replacement, programming, and setup

HEADLAMP LEVELING MALFUNCTION (AUTOMATIC)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

1. Headlamp Leveling Malfunction				

Circuit/System Description

Each headlamp assembly contains a headlamp leveling actuator that is controlled by the headlamp leveling control module. The front and rear suspension position sensors provide the headlamp leveling control with suspension position information. Each sensor receives a 5 V reference, signal, and low reference circuits from the headlamp leveling control module. The sensors are connected to the control arms of the front and rear suspension. As the vehicle travels, the suspension compresses and rebounds moving the suspension position sensor arms. This causes the signal output of the sensor to change. The headlamp leveling control module compares the information from both suspension position sensors and adjusts the headlamp leveling as needed. The headlamp leveling control module communicates with the left and right headlamp leveling actuators via the LIN serial data circuit.

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Front Leveling Position Sensor Voltage parameter is between 0.5 and 4.9 V.
 - **If the parameter is not between 0.5 and 4.9 V**

Refer to Headlamp Leveling Sensor Malfunction.
 - **If the parameter is between 0.5 and 4.9 V**
3. Verify the scan tool Rear Leveling Position Sensor Voltage parameter is between 0.5 and 4.9 V.
 - **If the parameter is not between 0.5 and 4.9 V**

Refer to Headlamp Leveling Sensor Malfunction.
 - **If the parameter is between 0.5 and 4.9 V**
4. Verify the left and right headlamps operate to the UP and DOWN positions when commanding the DHL Motor Control UP and DOWN with a scan tool.
 - **If the left and right headlamps do not operate UP and DOWN**

Refer to Headlamp Leveling Actuator Malfunction
 - **If the left and right headlamps operate UP and DOWN**
5. All OK.

Circuit/System Testing

Headlamp Leveling Actuator Malfunction

1. Ignition OFF, exterior lamps OFF, disconnect the harness connector at the appropriate E13 Headlamp Assembly.
2. Test for less than 5 ohms between the appropriate ground circuit terminal listed below and ground.
 - E13LA Headlamp Assembly - left terminal 8 with A1LL
 - E13RA Headlamp Assembly - right terminal 8 with A1LL
 - E13LA Headlamp Assembly - left terminal 7 with A1SL
 - E13RA Headlamp Assembly - right terminal 7 with A1SL
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
3. Ignition ON.
4. Verify a test lamp illuminates between the appropriate B+ circuit terminal listed below and ground.
 - E13LA Headlamp Assembly - left terminal 6 with A1LL

- E13RA Headlamp Assembly - right terminal 6 with A1LL
- E13LA Headlamp Assembly - left terminal 8 with A1SL
- E13RA Headlamp Assembly - right terminal 8 with A1SL
- **If the test lamp does not illuminate**
 1. Ignition OFF, disconnect the X2 harness connector at the X50A Fuse Block - Underhood.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the X50A Fuse Block - Underhood.
 - **If the test lamp illuminates**
- 5. Test or replace the K26 Headlamp Control Module.
- 6. Ignition ON.
- 7. Verify the appropriate headlamp operates to the UP and DOWN positions when commanding the DHL Motor Control UP and DOWN with a scan tool.
 - If the appropriate headlamp does not operate UP and DOWN, test or replace the appropriate headlamp assembly.

Headlamp Leveling Sensor Malfunction

1. Ignition OFF, disconnect the harness connector at the appropriate B51 Suspension Height Sensor, ignition ON.
2. Verify a test lamp illuminates between the low reference circuit terminal 2 and B+.
 - **If the test lamp does not illuminate**
 1. Ignition OFF, disconnect the harness connector at the K26 Headlamp Control Module.
 2. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K26 Headlamp Control Module.
 - **If the test lamp illuminates**
3. Ignition ON.
4. Test for 4.8-5.2 V between the 5 V reference circuit terminal 1 and ground.
 - **If less than 4.8 V**
 1. Ignition OFF, disconnect the harness connector at the K26 Headlamp Control Module.
 2. Test for infinite resistance between the 5 V reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the 5 V reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, replace the K26 Headlamp Control Module.
- **If greater than 5.2 V**
- 1. Ignition OFF, disconnect the harness connector at the K26 Headlamp Control Module, ignition ON.
- 2. Test for less than 1 V between the 5 V reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K26 Headlamp Control Module.
- **If between 4.8-5.2 V**
- 5. Verify the appropriate scan tool Leveling Position Sensor parameter is less than 1 V.
 - **If 1 V or greater**
 - 1. Ignition OFF, disconnect the harness connector at the K26 Headlamp Control Module, ignition ON.
 - 2. Test for less than 1 V between the signal circuit terminal 3 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K26 Headlamp Control Module.
 - **If less than 1 V**
- 6. Install a 3 A fused jumper wire between the 5-volt reference circuit terminal 1 and the signal circuit terminal 3.
- 7. Engine RUNNING, verify the appropriate scan tool Leveling Position Sensor parameter is greater than 4.8 V.
 - **If less than 4.8 V**
 - 1. Ignition OFF, disconnect the harness connector at the K26 Headlamp Control Module.
 - 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 - 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K26 Headlamp Control Module.
 - **If 4.8 V or greater**
- 8. Test or replace the appropriate B51 Suspension Height Sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **HEADLAMP LEVELING FRONT SUSPENSION HEIGHT SENSOR REPLACEMENT**
- **HEADLAMP LEVELING REAR SUSPENSION HEIGHT SENSOR REPLACEMENT**
- **Control Module References** for headlamp control module replacement, programming, and setup

INTERIOR ACCENT LIGHTING MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Flood Lamp Control - Terminal 23 X1	B255D 02	1	1	-
Flood Lamp - Driver Door Pocket Ground	-	1	-	-
Flood Lamp - Passenger Door Pocket Ground	-	1	-	-
1. Interior Accent Lighting Malfunction				

Circuit/System Description

The body control module (BCM) supplies battery voltage to front door flood lamps via the flood lamp control circuit. When a door is opened the BCM applies battery voltage to the flood lamp control circuit illuminating the driver and passenger door pocket flood lamps. The flood lamps will remain illuminated until all doors are closed and the ignition is OFF.

Circuit/System Testing

1. Ignition OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connector at the appropriate E55 flood lamp. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 15 ohms between the ground circuit terminal 2 and ground.
 - **If 15 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 15 ohms**
3. Connect a test lamp between the control circuit terminal 1 and ground.
4. Verify the test lamp turns ON and OFF when commanding the Accent Lighting ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 body control module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 body control module, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 body control module.
 - **If the test lamp turns ON and OFF**
5. Test or replace the appropriate E55 flood lamp.

1. Dimmer Switch Malfunction 2. Interior Backlighting Malfunction				

Circuit/System Description

The instrument panel dimmer switch is used to increase and decrease the brightness of the interior backlighting components. The instrument panel dimmer switch provides a voltage signal to the body control module (BCM) that will increase as the brightness of the lights are increased and decrease as the brightness of the lights are decreased. The BCM provides a low reference signal and a B+ reference circuit to the instrument panel dimmer switch. When the instrument panel dimmer switch is placed in the desired position, the dimmed voltage setting is applied from the instrument panel dimmer switch through the instrument panel dimmer switch signal circuit to the BCM. The BCM interprets the signal and applies a pulse width modulated (PWM) voltage through the LED dimming control circuits illuminating the interior backlighting to the requested level of brightness.

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool LED Backlight Dimming Command parameter changes between a high percentage to a low percentage while operating the dimmer switch from high to low.

- **If the parameter does not change**

Refer to Dimmer Switch Malfunction.

- **If the parameter changes**

3. Verify all backlighting components turn ON and OFF while commanding the LED Backlight Dimming ON and OFF with a scan tool.

- **If all backlighting components do not turn ON and OFF**

Refer to Interior Backlighting Malfunction.

- **If all backlighting components turn ON and OFF**

4. All OK.

Circuit/System Testing

Dimmer Switch Malfunction

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S30 Headlamp Switch, ignition ON.
2. Test for B+ between the B+ circuit terminal 1 and ground.
 - **If less than B+**
 1. Ignition OFF, disconnect the X3 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
 - **If B+**
3. Verify a test lamp does not illuminate between the B+ circuit terminal 1 and the signal circuit terminal 12.
 - **If the test lamp illuminates**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If the test lamp does not illuminate**
4. Test for B+ between the B+ circuit terminal 1 and the signal circuit terminal 12.
 - **If less than B+**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal 12 and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V
- 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.
- **If B+**
- 5. Test or replace the S30 Headlamp Switch.

Interior Backlighting Malfunction

NOTE: Each component with backlighting may need to be disconnected to isolate a short to voltage or short to ground. Use the schematics to identify the following:

- Backlighting components the vehicle is equipped with
- Each component's control and ground circuit terminals
- Component locations on the backlighting control circuit

1. Ignition OFF, all doors closed, all accessories OFF, disconnect the harness connector at the component with inoperative backlighting. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 15 ohms between the appropriate ground circuit terminal and ground.
 - **If 15 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 15 ohms**
3. Connect a test lamp between the appropriate control circuit terminal and ground.
4. Verify the test lamp turns ON and OFF when commanding the LED Backlight Dimming ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the appropriate harness connector listed below at the K9 body control module.
 - X2
 - X7
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, replace the K9 body control module.
- **If the test lamp is always ON**
- 1. Ignition OFF, disconnect the appropriate harness connector listed below at the K9 body control module, ignition ON.
 - X2
 - X7
- 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 body control module.
- **If the test lamp turns ON and OFF**
- 5. Test or replace the component with inoperative backlighting.

2. Verify the scan tool Park Lamp Switch parameter changes between Active and Inactive while commanding the park lamps ON and OFF with the turn signal/multifunction switch.
 - **If the parameter does not change**

Refer to Headlamp Switch Malfunction.
 - **If the parameter changes**
3. Verify the left park lamps turn ON and OFF when commanding the Left Park Lamps ON and OFF with a scan tool.
 - **If the left park lamps do not turn ON and OFF**

Refer to Park Lamps Malfunction.
 - **If the left park lamps turn ON and OFF**
4. Verify the right park lamps turn ON and OFF when commanding the Right Park Lamps ON and OFF with a scan tool.
 - **If the right park lamps do not turn ON and OFF**

Refer to Park Lamps Malfunction.
 - **If the right park lamps turn ON and OFF**
5. Verify the license plate lamps turn ON and OFF when commanding the License Plate Lamps ON and OFF with a scan tool.
 - **If the license plate lamps do not turn ON and OFF**

Refer to License Plate Lamps Malfunction.
 - **If the license plate lamps turn ON and OFF**
6. All OK.

Circuit/System Testing

Headlamp Switch Malfunction

1. Ignition OFF, all doors closed, all accessories OFF, disconnect the harness connector at the S30 headlamp switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 15 ohms between the ground circuit terminal 6 and ground.
 - **If 15 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 15 ohms**
3. Ignition ON.
4. Verify the scan tool Park Lamps Switch parameter is Inactive.
 - **If not Inactive**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 body control module.
 2. Test for infinite resistance between the signal circuit terminal 3 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 body control module.
 - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 3 and the ground circuit terminal 6.
6. Verify the scan tool Park Lamps Switch parameter is Active.
 - **If not Active**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 body control module, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal 3 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If Active**
7. Test or replace the S30 headlamp switch.

Park Lamps Malfunction

1. Ignition OFF, exterior lamps OFF, trunk latch latched, disconnect the harness connector at the inoperative park/marker/tail lamp.
2. Test for less than 5 ohms between the appropriate ground circuit terminal listed below and ground.
 - E4N park/turn signal lamp - left terminal 2 (with T4A)
 - E2LF side marker lamp - left front terminal 1 (with T4A)
 - E13L headlamp - left terminal 1 (with T4F)
 - E5AK tail lamp - left outer terminal 3

- E5G tail lamp - left inner terminal 2
 - E4P park/turn signal lamp - right terminal 2 (with T4A)
 - E2RF side marker lamp - right front terminal 1 (with T4A)
 - E13R headlamp - right terminal 1 (with T4F)
 - E5AL tail lamp - right outer terminal 3
 - E5H tail lamp - right inner terminal 2
 - **If 5 ohms or greater**
1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
3. Connect a test lamp between the appropriate control circuit terminal listed below and ground, ignition ON.
 - E4N park/turn signal lamp - left terminal 3 (with T4A)
 - E2LF side marker lamp - left front terminal 2 (with T4A)
 - E13L headlamp - left terminal 7 (with T4F)
 - E5AK tail lamp - left outer terminal 1
 - E5G tail lamp - left inner terminal 3
 - E4P park/turn signal lamp - right terminal 3 (with T4A)
 - E2RF side marker lamp - right front terminal 2 (with T4A)
 - E13R headlamp - right terminal 7 (with T4F)
 - E5AL tail lamp - right outer terminal 1
 - E5H tail lamp - right inner terminal 3
 4. Verify the test lamp turns ON and OFF when commanding the appropriate Park Lamps ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X4 harness connector at the K9 body control module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X4 harness connector at the K9 body control module, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.

- If less than 1 V, replace the K9 body control module.
 - **If the test lamp turns ON and OFF**
5. Test or replace the appropriate park/marker/tail lamp.

License Plate Lamps Malfunction

1. Ignition OFF, exterior lamps OFF, remove both E7 license plate lamp bulbs.
2. Test for less than 5 ohms between the ground circuit terminal 2 and ground.
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
3. Connect a test lamp between the license plate lamp - left control circuit terminal 1 and ground, ignition ON.
4. Verify the test lamp turns ON and OFF when commanding the License Plate Lamps ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X4 harness connector at the K9 body control module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the X4 harness connector at the K9 body control module, ignition ON.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 body control module.
 - **If the test lamp turns ON and OFF**
5. Connect a test lamp between the license plate lamp - right control circuit terminal 1 and ground, ignition ON.
6. Verify the test lamp turns ON and OFF when commanding the License Plate Lamps ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the X4 harness connector at the K9 body control module.
 2. Test for infinite resistance between the control circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance
- 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If the test lamp turns ON and OFF**
- 7. Test or replace the appropriate E7 license plate lamp bulb.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Headlamp Switch Replacement**
- **Headlamp Replacement**
- **Rear License Plate Lamp Replacement**
- **Tail Lamp Replacement**
- **Tail Lamp Bulb Replacement**
- **Rear License Plate Lamp Bulb Replacement**
- **Control Module References** for BCM replacement, programming, and setup

REAR COMPARTMENT LAMP MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance

Rear Compartment Courtesy Lamp Control	B2570 02	1	1	-
Rear Compartment Courtesy Lamp Ground	-	1	-	-
1. Rear Compartment Lamp Malfunction				

Circuit/System Description

The body control module (BCM) applies battery voltage to the rear compartment courtesy lamp through the rear compartment lamp control circuit. When the BCM receives a rear compartment lid open input from the rear

compartment lid latch, the BCM applies battery voltage to the rear compartment lamp control circuit illuminating the rear compartment courtesy lamp. In the event that the rear compartment lamp were to remain illuminated for more than 10 minutes with the ignition switch in the OFF position and no doors opened, the BCM will deactivate the rear compartment lamp control circuit to prevent total battery discharge.

Circuit/System Testing

1. Ignition OFF, exterior lamps OFF, trunk latch latched, disconnect the harness connector at the E8S rear compartment courtesy lamp.
2. Test for less than 5 ohms between the ground circuit terminal 2 and ground.
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
3. Connect a test lamp between the control circuit terminal 1 and ground, ignition ON.
4. Verify the test lamp turns ON and OFF when commanding the Trunk Lamp ON and OFF with a scan tool.

- **If the test lamp is always OFF**

1. Ignition OFF, disconnect the X7 harness connector at the K9 body control module.
2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.

- **If the test lamp is always ON**

1. Ignition OFF, disconnect the X7 harness connector at the K9 body control module, ignition ON.
2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 body control module.

- **If the test lamp turns ON and OFF**

5. Test or replace the E8S rear compartment courtesy lamp.

1. Stop Lamps Malfunction 2. Center High Mounted Stop Lamp Malfunction				

Circuit/System Description

The brake pedal position (BPP) sensor is used to sense the action of the driver application of the brake pedal. The brake pedal position sensor provides an analog voltage signal that will increase as the brake pedal is applied. The body control module provides a low reference signal and a 5 V reference voltage to the brake pedal position sensor. When the variable signal reaches a voltage threshold indicating the brakes have been applied, the BCM will apply battery voltage to the left and right stop lamp control circuits as well as the center high mounted stop lamp (CHMSL) control circuit illuminating the left and right stop lamps and the CHMSL.

Diagnostic Aids

When testing at the rear turn signal lamp bulb socket, make sure all measurements and test lamp connections are in the correct terminal location and do not come in contact with each other during testing.

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Brake Pedal Applied parameter changes between Active and Inactive while pressing and releasing the brake pedal.
 - **If the parameter does not change**

Refer to Brake Pedal Position Sensor Malfunction.
 - **If the parameter changes**
3. Verify the left brake lamp turns ON and OFF when commanding the Left Rear Turn Signal/Brake Lamp ON and OFF with a scan tool.
 - **If the left brake lamp does not turn ON and OFF**

Refer to Stop Lamps Malfunction.
 - **If the left brake lamp turns ON and OFF**
4. Verify the right brake lamp turns ON and OFF when commanding the Right Rear Turn Signal/Brake Lamp ON and OFF with a scan tool.
 - **If the right brake lamp does not turn ON and OFF**

Refer to Stop Lamps Malfunction.
 - **If the right brake lamp turns ON and OFF**
5. Verify the center high mounted stop lamp turns ON and OFF when commanding the Center Brake Lamp ON and OFF with a scan tool.
 - **If the center high mounted stop does not turn ON and OFF**

Refer to Center High Mount Stop Lamp Malfunction.
 - **If the center high mounted stop turns ON and OFF**
6. All OK.

Circuit/System Testing

Brake Pedal Position Sensor Malfunction

1. Ignition OFF, disconnect the harness connector at the B22 Brake Pedal Position Sensor, ignition ON.
2. Test for less than 1 V between the appropriate low reference circuit terminal listed below and ground.
 - Terminal 1 without MR6
 - Terminal C with MR6
 - **If 1 V or greater**
 1. Ignition OFF, disconnect the X1 harness connector at the K9 Body Control Module, ignition ON.
 2. Test for less than 1 V between the low reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If less than 1 V**
3. Test or replace the B22 Brake Pedal Position Sensor.

Stop Lamps Malfunction

1. Ignition OFF, exterior lamps OFF, remove the appropriate E5 Stop/Turn Signal Lamp.
2. Test for less than 10 ohms between the ground circuit terminal 3 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Connect a test lamp between the control circuit terminal 2 and ground, ignition ON.
4. Verify the test lamp turns ON and OFF when commanding the appropriate Rear Turn Signal/Brake Lamp ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the appropriate harness connector listed below at the K9 Body Control Module.
 - X5 left stop lamp
 - X4 right stop lamp
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.

- **If the test lamp is always ON**

1. Ignition OFF, disconnect the appropriate harness connector listed below at the K9 Body Control Module, ignition ON.
 - X5 left stop lamp
 - X4 right stop lamp
2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.

- **If the test lamp turns ON and OFF**

5. Test or replace the appropriate E5 Stop/Turn Signal Lamp.

Center High Mount Stop Lamp Malfunction

1. Ignition OFF, exterior lamps OFF, trunk latch latched, disconnect the harness connector at the E6 Center High Mounted Stop Lamp.
2. Test for less than 10 ohms between the ground circuit terminal 1 and ground.

- **If 10 ohms or greater**

1. Ignition OFF.
2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.

- **If less than 10 ohms**

3. Connect a test lamp between the control circuit terminal 2 and ground, ignition ON.
4. Verify the test lamp turns ON and OFF when commanding the Center Brake Lamp ON and OFF with a scan tool.

- **If the test lamp is always OFF**

1. Ignition OFF, disconnect the X4 harness connector at the K9 Body Control Module.
2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.

- **If the test lamp is always ON**

1. Ignition OFF, disconnect the X4 harness connector at the K9 Body Control Module, ignition ON.
2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.

- **If the test lamp turns ON and OFF**

5. Test or replace the E6 Center High Mounted Stop Lamp.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **High Mount Stop Lamp Replacement**
- **Tail Lamp Replacement**
- **Tail Lamp Bulb Replacement**
- **Brake Pedal Position Sensor Replacement**
- **Brake Pedal Position Sensor Calibration**
- **Control Module References** for BCM replacement, programming, and setup

TURN SIGNAL LAMPS AND/OR INDICATORS MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.

1. Turn Signal Lamps and/or Indicators Malfunction 2. Turn Signal/Multifunction Switch Malfunction				

Circuit/System Description

Ground is applied at all times to the turn signal/multifunction switch. The turn signal lamps may only be activated with the ignition switch in the ON or START positions. When the turn signal/multifunction switch is placed in either the turn right or turn left position, ground is applied to the body control module (BCM) through either the right turn or left turn signal switch signal circuit. The BCM responds to the turn signal switch input by applying a pulsating voltage to the front and rear turn signal lamps through their respective control circuits. When a turn signal request is received by the BCM, a serial data message is sent to the instrument cluster requesting the respective turn signal indicator be pulsed ON and OFF.

Diagnostic Aids

When testing at the rear turn signal lamp bulb socket, make sure all measurements and test lamp connections are in the correct terminal location and do not come in contact with each other during testing.

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Right Turn Signal Switch and Left Turn Signal Switch parameters change between Active and Inactive while cycling the turn signal switch between the right and left positions.
 - **If the parameters do not change**

Refer to Turn Signal/Multifunction Switch Malfunction.

- **If the parameters change**
3. Verify the left front turn signal lamps turn ON and OFF while commanding the Left Front Turn Signal Lamp ON and OFF with a scan tool.
 - **If the left front turn signal lamps do not turn ON and OFF**

Refer to Turn Signal Lamps Malfunction.

- **If the left front turn signal lamps turn ON and OFF**
4. Verify the right front turn signal lamps turn ON and OFF while commanding the Right Front Turn Signal Lamp ON and OFF with a scan tool.
 - **If the right front turn signal lamps do not turn ON and OFF**

Refer to Turn Signal Lamps Malfunction.

- **If the right front turn signal lamps turn ON and OFF**
5. Verify the left rear turn signal lamp turns ON and OFF while commanding the Left Rear Turn Signal/Brake Lamp ON and OFF with a scan tool.
 - **If the left rear turn signal lamp does not turn ON and OFF**

Refer to Turn Signal Lamps Malfunction.

- **If the left rear turn signal lamp turns ON and OFF**
6. Verify the right rear turn signal lamp turns ON and OFF while commanding the Right Rear Turn Signal/Brake Lamp ON and OFF with a scan tool.
 - **If the right rear turn signal lamp does not turn ON and OFF**

Refer to Turn Signal Lamps Malfunction.

- **If the right rear turn signal lamp turns ON and OFF**

7. Verify the left and right turn signal indicators turn ON and OFF while commanding the All Indicators Test ON and OFF with a scan tool.

- **If the left or right turn signal indicators do not turn ON and OFF**

Refer to Turn Signal Indicators Malfunction.

- **If the left and right turn signal indicators turn ON and OFF**

8. All OK.

Circuit/System Testing

Turn Signal/Multifunction Switch Malfunction

1. Ignition OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connector at the S78 turn signal/multifunction switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 15 ohms between the ground circuit terminal 3 and ground.
 - **If 15 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 15 ohms**
3. Ignition ON.
4. Verify the scan tool Left Turn Signal Switch parameter is Inactive.
 - **If not Inactive**
 1. Ignition OFF, disconnect the X3 harness connector at the K9 body control module.
 2. Test for infinite resistance between the signal circuit terminal 1 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 body control module.
 - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the ground circuit terminal 3.
6. Verify the scan tool Left Turn Signal Switch parameter is Active.
 - **If not Active**
 1. Ignition OFF, disconnect the X3 harness connector at the K9 body control module, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal 1 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, replace the K9 body control module.
 - **If Active**
- 7. Verify the scan tool Right Turn Signal Switch parameter is Inactive.
 - **If not Inactive**
 1. Ignition OFF, disconnect the X3 harness connector at the K9 body control module.
 2. Test for infinite resistance between the signal circuit terminal 7 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 body control module.
 - **If Inactive**
- 8. Install a 3 A fused jumper wire between the signal circuit terminal 7 and the ground circuit terminal 3.
- 9. Verify the scan tool Right Turn Signal Switch parameter is Active.
 - **If not Active**
 1. Ignition OFF, disconnect the X3 harness connector at the K9 body control module, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal 7 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If Active**
- 10. Test or replace the S78 turn signal/multifunction switch.

Turn Signal Lamps Malfunction

1. Ignition OFF, exterior lamps OFF, disconnect the harness connector at the appropriate turn signal lamp.
2. Test for less than 5 ohms between the appropriate ground circuit terminal listed below and ground.
 - E4LF park/turn signal lamp - left socket terminal
 - E4N park/turn signal lamp - left terminal 2 (with T4A)
 - A9A outside rearview mirror - driver terminal 4
 - E5AM stop/turn signal lamp bulb - left terminal 3
 - E4RF park/turn signal lamp - right socket terminal
 - E4P park/turn signal lamp - right terminal 2 (with T4A)
 - A9A outside rearview mirror - passenger terminal 4
 - E5AN stop/turn signal lamp bulb - right terminal 3
 - **If 5 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 5 ohms**
3. Connect a test lamp between the appropriate control circuit terminal listed below and ground.
 - E4LF park/turn signal lamp - left socket terminal
 - E4N park/turn signal lamp - left terminal 1 (with T4A)
 - A9A outside rearview mirror - driver terminal 16
 - E5AM stop/turn signal lamp bulb - left terminal 2
 - E4RF park/turn signal lamp - right socket terminal
 - E4P park/turn signal lamp - right terminal 1 (with T4A)
 - A9A outside rearview mirror - passenger terminal 16
 - E5AN stop/turn signal lamp bulb - right terminal 2
 4. Verify the test lamp turns ON and OFF when commanding the appropriate Turn Signal Lamp ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the appropriate harness connector listed below at the K9 body control module.
 - X4 right turn signals
 - X5 left turn signals
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 body control module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the appropriate harness connector listed below at the K9 body control module, ignition ON.
 - X4 right turn signals
 - X5 left turn signals
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 body control module.
 - **If the test lamp turns ON and OFF**
 5. Test or replace the appropriate turn signal lamp.

Turn Signal Indicators Malfunction

1. Ignition ON.
2. Verify the left and right turn signal indicators turn ON and OFF while commanding the All Indicators

Test ON and OFF with a scan tool.

- **If the left or right turn signal indicators are always OFF or remain ON**

Replace the P16 instrument cluster.

- **If the left and right turn signal indicators turn ON and OFF**

3. Replace the K9 body control module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Headlamp Replacement**
- **Tail Lamp Replacement**
- **Tail Lamp Bulb Replacement**
- **TURN SIGNAL SWITCH REPLACEMENT**
- **Front Turn Signal Lamp Bulb Replacement**
- **Control Module References** for BCM or Instrument Cluster replacement, programming, and setup

REPAIR INSTRUCTIONS

BRAKE PEDAL POSITION SENSOR CALIBRATION

NOTE: Brake system does not use a brake switch, stoplight switch or brakelight switch. System uses a Brake Pedal Position Sensor to control these functions.

Calibration Criteria

NOTE: Do not apply the brake pedal during the brake pedal position sensor calibration procedure. Any movement of the brake pedal during this procedure will cause the calibration procedure to fail. If this occurs, the brake pedal position sensor calibration must be repeated.

Brake pedal position sensor calibration must be performed after the brake pedal position sensor, body control module (BCM), or engine control module (ECM) have been serviced. The calibration procedure will set the brake pedal position sensor home value. This value is used by the BCM and ECM to determine the action of the driver applying the brake system and to provide this information to the vehicle subsystems via serial data.

Calibration Procedure

1. Apply the parking brake.
2. Ignition ON, engine OFF, place the transmission in the PARK position for automatic transmission or NEUTRAL position for manual transmission.
3. Install a scan tool.
4. Clear all DTCs before proceeding.
5. Navigate to the Configuration/Reset Functions menu of the BCM.
6. Select the Brake Pedal Position Sensor Learn procedure and follow the directions displayed on the screen.
7. Navigate to the Configuration/Reset Functions menu of the ECM.
8. Select the Learn Functions menu.
9. Select the Brake Pedal Position Sensor Learn procedure and follow the directions displayed on the screen.

BRAKE PEDAL POSITION SENSOR REPLACEMENT

NOTE: Brake system does not use a brake switch, stoplight switch or brakelight switch. System uses a Brake Pedal Position Sensor to control these functions.

Fig. 1: Brake Pedal Position Sensor
 Courtesy of GENERAL MOTORS COMPANY

Brake Pedal Position Sensor Replacement

Callout	Component Name
Preliminary Procedure Remove the instrument panel lower trim panel insulator. Refer to <u>Instrument Panel Lower Trim Panel Insulator Replacement</u> .	
1	Brake Pedal Position Sensor Bolt CAUTION: Refer to <u>Fastener Caution</u> . Tighten 2 N.m (18 lb in)
2	Brake Pedal Position Sensor Procedure <ol style="list-style-type: none"> 1. Disconnect the electrical connector. 2. Calibrate the brake pedal position sensor. Refer to <u>Brake Pedal Position Sensor Calibration</u>.

HEADLAMP SWITCH REPLACEMENT

Fig. 2: Headlamp Switch

Courtesy of GENERAL MOTORS COMPANY

Headlamp Switch Replacement

Callout	Component Name
Preliminary Procedure Remove the instrument panel headlamp switch molding. Refer to <u>Headlamp Switch Molding Replacement</u> .	
1	Headlamp Switch Procedure Disconnect the electrical connector. TIP: Use a flat-bladed plastic trim tool in order to release the retaining clips.

HEADLAMP AUTOMATIC CONTROL AMBIENT LIGHT SENSOR REPLACEMENT

Fig. 3: Headlamp Automatic Control Ambient Light Sensor
 Courtesy of GENERAL MOTORS COMPANY

Headlamp Automatic Control Ambient Light Sensor Replacement

Callout	Component Name
1	Windshield Defroster Nozzle Grille Retainer (Qty: 8) Procedure Disconnect the electrical connections. TIP: Use a flat-bladed plastic trim tool to aid in the removal of the windshield defroster nozzle grille.
2	Headlamp Automatic Control Ambient Light Sensor

WINDSHIELD OUTSIDE MOISTURE AND HEADLAMP AUTOMATIC CONTROL AMBIENT LIGHT SENSOR REPLACEMENT

Fig. 4: Windshield Outside Moisture and Headlamp Automatic Control Ambient Light Sensor
 Courtesy of GENERAL MOTORS COMPANY

Windshield Outside Moisture and Headlamp Automatic Control Ambient Light Sensor Replacement

Callout	Component Name
Preliminary Procedure Remove the inside rearview mirror mount plate cover. Refer to <u>Inside Rearview Mirror Mount Plate Cover Replacement</u>	
1	Windshield Outside Moisture and Headlamp Automatic Control Ambient Light Sensor Retainer TIP: Use a small flat-bladed tool to release the locking retainer on the windshield outside moisture and headlamp automatic control ambient light sensor and push the cap upwards.
2	Windshield Outside Moisture and Headlamp Automatic Control Ambient Light Sensor

READING LAMP BULB REPLACEMENT

Fig. 5: Reading Lamp Bulb

Courtesy of GENERAL MOTORS COMPANY

Reading Lamp Bulb Replacement

Callout	Component Name
1	Dome and Reading Lamp Lens TIP: Carefully use a flat-bladed tool, and release the tabs retaining the dome and reading lamp lens to the reading lamp.
2	Reading Lamp Bulb CAUTION: Refer to <u>Avoid Touching the Bulb Caution</u> TIP: Service the bulb, as needed.

READING LAMP REPLACEMENT

Fig. 6: Reading Lamp
 Courtesy of GENERAL MOTORS COMPANY

Reading Lamp Replacement

Callout	Component Name
1	Reading Lamp Procedure Disconnect the electrical connector. TIP: Carefully use a flat-bladed tool, release the retainer from the reading lamp to the headliner.

DOMES AND READING LAMP REPLACEMENT

Fig. 7: Dome and Reading Lamp
 Courtesy of GENERAL MOTORS COMPANY

Dome and Reading Lamp Replacement

Callout	Component Name
Preliminary Procedure Remove the roof console reading lamp bezel.	
1	Dome and Reading Lamp TIP: Carefully use a flat-bladed tool to release the retainer from the dome and reading lamp to the roof console.

DOMES AND READING LAMP LENS REPLACEMENT

Fig. 8: Dome and Reading Lamp Lens
 Courtesy of GENERAL MOTORS COMPANY

Dome and Reading Lamp Lens Replacement

Callout	Component Name
Preliminary Procedure	
Remove the roof console reading lamp bezel.	
1	Dome and Reading Lamp Lens TIP: Carefully use a flat-bladed tool to release the retainer from the dome and reading lamp lens to the dome and reading lamp.

FRONT SIDE DOOR COURTESY LAMP LENS REPLACEMENT

Fig. 9: Front Side Door Courtesy Lamp Lens
 Courtesy of GENERAL MOTORS COMPANY

Front Side Door Courtesy Lamp Lens Replacement

Callout	Component Name
1	Front Side Door Courtesy Lamp Lens Procedure <ol style="list-style-type: none"> 1. Release and pull off the front side door courtesy lamp lens. 2. Disconnect the electrical connector. TIP: Carefully use a flat-bladed tool, and release the compartment lamp.

FRONT FLOOR FLOOD LAMP REPLACEMENT

Fig. 10: Front Floor Flood Lamp
 Courtesy of GENERAL MOTORS COMPANY

Front Floor Flood Lamp Replacement

Callout	Component Name
1	Front Floor Flood Lamp Retainer TIP: Use a small flat-bladed tool to pull the right side down out from the front and rear side door sill trim plate opening.
2	Front Floor Flood Lamp Procedure Disconnect the front floor flood lamp electrical connector.

INSTRUMENT PANEL COMPARTMENT LAMP REPLACEMENT

Fig. 11: Instrument Panel Compartment Lamp
 Courtesy of GENERAL MOTORS COMPANY

Instrument Panel Compartment Lamp Replacement

Callout	Component Name
1	<p>Instrument Panel Compartment Lamp</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Release and pull off the instrument panel compartment lamp. 2. Disconnect the electrical connector. <p>TIP: Carefully use a flat-bladed tool, and release the compartment lamp from the instrument panel compartment.</p>

DOMELAMP BULB REPLACEMENT

Fig. 12: Dome Lamp Bulb
 Courtesy of GENERAL MOTORS COMPANY

Dome Lamp Bulb Replacement

Callout	Component Name
1	Dome and Reading Lamp Lens TIP: Use a small flat-bladed tool to remove the dome and reading lamp lens.
2	Dome Lamp Bulb CAUTION: Refer to <u>Avoid Touching the Bulb Caution</u> . TIP: Service the bulb, as needed.

FRONT SIDE DOOR SILL COURTESY LAMP REPLACEMENT

Fig. 13: Front Side Door Sill Courtesy Lamp
Courtesy of GENERAL MOTORS COMPANY

Front Side Door Sill Courtesy Lamp Replacement

Callout	Component Name
1	Front Side Door Sill Courtesy Lamp Retainer TIP: Use a small flat-bladed tool to pull the right side down out from the front side door trim panel opening.
2	Front Side Door Sill Courtesy Lamp Procedure Disconnect the front side door sill courtesy lamp electrical connector.

HEADLAMP REPLACEMENT

Fig. 14: Headlamp

Courtesy of GENERAL MOTORS COMPANY

Headlamp Replacement

Callout	Component Name
Preliminary Procedure Remove the front bumper fascia. Refer to Front Bumper Fascia Replacement .	
1	Headlamp Bolt CAUTION: Refer to Fastener Caution .
2	Headlamp Bolt (Qty: 3) CAUTION: Refer to Fastener Caution . Tighten 2.5 N.m(22 lb in)
3	Headlamp Procedure 1. Disconnect the electrical wiring harness and remove the headlamp.

2. Aim the headlamp after replacement. Refer to **Headlamp Aiming**.

HEADLAMP BALLAST REPLACEMENT

Fig. 15: Headlamp Ballast
Courtesy of GENERAL MOTORS COMPANY

Headlamp Ballast Replacement

Callout	Component Name
Preliminary Procedure Remove the headlamp. Refer to Headlamp Replacement .	
1	Headlamp Ballast Bolt (Qty: 2) CAUTION: Refer to Fastener Caution .
2	Headlamp Ballast

HEADLAMP BULB REPLACEMENT

Fig. 16: Headlamp Bulb
 Courtesy of GENERAL MOTORS COMPANY

Headlamp Bulb Replacement

Callout	Component Name
Preliminary Procedure	
Open and support the hood.	
1	Headlamp Opening Cover
2	Headlamp Bulb WARNING: Refer to <u>Halogen Bulb Warning</u> . Procedure 1. Disconnect the electrical connector. 2. Turn the headlamp bulb a quarter turn counterclockwise and pull from the headlamp.

HEADLAMP BRACKET REPLACEMENT

Fig. 17: Headlamp Bracket
 Courtesy of GENERAL MOTORS COMPANY

Headlamp Bracket Replacement

Callout	Component Name
Preliminary Procedure	
Remove the front bumper fascia. Refer to Front Bumper Fascia Replacement .	
1	Headlamp Bracket Fastener (Qty: 2) Procedure Hand tighten the fasteners only.
2	Headlamp Bracket

HEADLAMP AIMING

Aiming Headlamps (Visual Aim)

NOTE: Some state and local laws specify requirements for headlamp aim. All of these laws must be complied with when performing any headlamp aiming operations.

Headlamp aim should be checked:

- When a new headlamp capsule is installed.
- If service or repairs to the front end area have (or may have) disturbed the headlamps or their mounting.
- Suspension components have been replaced or repaired.

- The area will consist of a level surface large enough to allow for a vehicle and an additional 7.62 m (25 ft) measured from face of lamps to the front of the aiming screen.
- The screen will be 1.52 m (5 ft) high x 3.66 m (12 ft) wide with a matte white surface well shaded from extraneous light, and properly adjusted to the floor on which the vehicle stands. Provisions may be made for moving the screen so it can be aligned parallel with the vehicle.
- The screen shall be provided with a fixed vertical centerline, 2 laterally adjustable vertical tapes, and 1 vertically adjustable horizontal tape.
- If a regular commercial aiming screen is not available, the screen may consist of a vertical wall having a clear uninterrupted area approximately 1.83 m (6 ft) high and 3.66 m (12 ft) wide. The surface should be finished with a washable non-gloss white paint.

Fig. 18: Headlamp Aiming/Adjusting
 Courtesy of GENERAL MOTORS COMPANY

- After the aiming screen has been set up in its permanent location, it is necessary to paint a reference line on the floor directly under the lens of the lamps to indicate the proper location of the headlamps when they are being aimed:
 - Distance between headlamps (1)
 - Center line of screen (2)

- Adjustable vertical pointer (3)
- Adjustable horizontal tape (4)
- Diagram of light screen (5)
- Vertical center line ahead of right headlamp pointer position (6)
- 7.62 m (25 ft) (7)
- Car centerline axis (8)

Prior to aiming the headlamps, the following steps must be taken:

1. Remove any snow, ice or mud from the vehicle.
2. The vehicle must have a full tank of gas.
3. Stop all other work on the vehicle.
4. If any service has been performed on the vehicle, make sure that all of the components are back in their original place.
5. The vehicle must be on a level surface.

Fig. 19: Aligning Left Tires With Reference Line
 Courtesy of GENERAL MOTORS COMPANY

6. The vehicle left tires must be aligned with the reference line extending from the screen with the headlamps aligned with the vertical reference line (2).
7. Do not load any cargo in the vehicle.
8. The vehicle must contain 1 person or 72.56 kg (160 lb) on the driver's seat.
9. Inflate the tires to the proper pressure.
10. Simulate the vehicle loads if the intended use of the vehicle is for hauling heavy loads or towing a trailer.
11. Rock the vehicle in order to stabilize the suspension.
12. Turn ON the headlamps to low beam and observe the left and the top edges of the high intensity zone on the screen. The edges of the high intensity zone should fall within the specifications.

Headlamp Aiming Procedure

1. Open the hood.

Fig. 20: Measuring Distance Between Headlamps Face & Aiming Screen
Courtesy of GENERAL MOTORS COMPANY

2. Measure from the floor to the center of the headlamp bulb, some headlamps have an aim dot marked on the headlamp lens.
3. At the screen, measure from the floor and place the horizontal tape at the measured distance.
4. Measure from the reference line on the floor to the left headlamp bulb centerline.
5. At the screen, measure from the reference line and place the vertical tape at the measured distance.
6. Measure from the reference line on the floor to the right headlamp bulb centerline.
7. At the screen, measure from the reference line and place the vertical tape at the measured distance.

NOTE: **Do not cover the headlamp, this may cause excessive heat build up.**

Fig. 21: Identifying Right Side Low Beam Proper Screen Positioning
Courtesy of GENERAL MOTORS COMPANY

8. Turn on the low beam headlamps and block the light from projecting onto the screen from the passenger side headlamp.

NOTE: **Horizontal headlamp adjustment does not exist.**

9. Adjust the vertical aim of the headlamps to the specifications required by the state and the local authorities, or as shown in step number 8.
10. Rotate the headlamp adjuster to change the vertical aim of the headlamp.
11. Repeat the aiming procedure for the passenger side headlamp while blocking the light from projecting onto the screen from the driver side headlamp.
12. Close the hood.

HEADLAMP LEVELING FRONT SUSPENSION HEIGHT SENSOR REPLACEMENT

Fig. 22: Headlamp Leveling Front Suspension Height Sensor
Courtesy of GENERAL MOTORS COMPANY

Headlamp Leveling Front Suspension Height Sensor Replacement

Callout	Component Name
Preliminary Procedure Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> .	
1	Headlamp Leveling Front Suspension Height Sensor Fastener (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> .

	Tighten 5 N.m (44 lb in)
2	Headlamp Leveling Front Suspension Height Sensor Procedure <ol style="list-style-type: none"> 1. Disconnect the electrical connector. 2. Set up and program the headlamp control module. Refer to <u>Control Module References</u> .

HEADLAMP LEVELING REAR SUSPENSION HEIGHT SENSOR REPLACEMENT

Courtesy of GENERAL MOTORS COMPANY

Headlamp Leveling Rear Suspension Height Sensor Replacement

Callout	Component Name
Preliminary Procedure Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> .	
1	Headlamp Leveling Rear Suspension Height Sensor Fastener (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> .

	<p>Tighten 5 N.m (44 lb in)</p>
2	<p>Headlamp Leveling Rear Suspension Height Sensor</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Disconnect the electrical connector. 2. Set up and program the headlamp control module. Refer to <u>Control Module References</u> .

HEADLAMP CONTROL MODULE REPLACEMENT

Fig. 24: Headlamp Control Module
Courtesy of GENERAL MOTORS COMPANY

Headlamp Control Module Replacement

Callout	Component Name
Preliminary Procedures	
	<ol style="list-style-type: none"> 1. Remove the instrument panel lower trim pad cover. Refer to <u>Instrument Panel Lower Trim Panel Insulator Replacement</u> . 2. Remove the body control module. Refer to <u>Body Control Module Replacement (Left Hand Drive)</u> .

	Headlamp Control Module
	Procedure
1	<ol style="list-style-type: none"> 1. Disconnect the electrical connectors. 2. Remove the headlamp control module. 3. Set up and program the headlamp control module. Refer to <u>Control Module References</u> .

FRONT FOG LAMP REPLACEMENT

Fig. 25: Front Fog Lamp
 Courtesy of GENERAL MOTORS COMPANY

Front Fog Lamp Replacement

Callout	Component Name
Preliminary Procedure Remove the front bumper fascia outer insert. Refer to <u>Front Bumper Fascia Outer Insert Replacement</u> .	
1	Front Fog Lamp Bolt (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> .
	Front Fog Lamp

Procedure	
2	<ol style="list-style-type: none"> 1. Disconnect the electrical connector. 2. Pull the front fog lamp straight forward from the front bumper fascia. 3. Aim the front fog lamp after replacement. Refer to <u>Fog Lamp Aiming</u>.

FRONT FOG LAMP BULB REPLACEMENT

Fig. 26: Front Fog Lamp Bulb
 Courtesy of GENERAL MOTORS COMPANY

Front Fog Lamp Bulb Replacement

Callout	Component Name
Preliminary Procedure Raise the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> .	
1	Front Fog Lamp Bulb Procedure <ol style="list-style-type: none"> 1. Disconnect the electrical connector 2. Rotate the front fog lamp bulb counterclockwise and pull straight back to remove from the front fog lamp.

FOG LAMP AIMING

Adjustment Procedure

Proper road illumination and safety require the fog lamps to be aimed. The front fog lamp aim should be checked when a new front fog lamp assembly is installed, or if any service repairs have been performed to the vehicle which disturb the front fog lamp mounting or the vehicle ride height.

There are no horizontal adjustments for aiming the front fog lamp assemblies on this vehicle.

Fig. 27: Fog Lamp Aiming

Courtesy of GENERAL MOTORS COMPANY

1. To ensure accurate vertical front fog lamp aiming, first perform the following steps to prepare the vehicle.
 - Make sure that all the components are in place on the vehicle, the tires are properly inflated, and there is not any mud or snow clinging to the vehicle.
 - Stop all other operations of work on the vehicle.
 - Make sure the fuel level is 1/2 full or more.
 - Jounce the vehicle to settle the suspension.
 - Place the vehicle on a level surface 7.6 m (25 ft) from the target screen.
 - Measure the distance from the floor to the center of the fog lamp (5).
 - Using this measurement, mark the horizontal centerline of the fog lamp (1) on the target screen

directly in front of the vehicle.

- Start the vehicle in order to level the electronic suspension.
 - Turn off the vehicle.
2. Turn the front fog lamps ON.
 3. Turn the adjusting screw located on the exterior lower outer insert molding assembly, bottom corner of the fog lamp projector and adjust the fog lamp projector aim beam.
 4. Adjust the fog lamp up or down until the top edge of the high intensity zone on the screen is 102 mm (4 in) below the horizontal centerline.
 5. Turn OFF the front fog lamps.

FRONT TURN SIGNAL LAMP BULB REPLACEMENT

Fig. 28: Front Turn Signal Lamp Bulb
Courtesy of GENERAL MOTORS COMPANY

Front Turn Signal Lamp Bulb Replacement

Callout	Component Name
Preliminary Procedure Open and support the hood.	
1	Front Turn Signal Lamp Bulb Socket Procedure Turn the front turn signal lamp bulb socket counterclockwise and pull from the headlamp.
2	Front Turn Signal Lamp Bulb Procedure

Pull the front turn signal lamp bulb straight out of the front turn signal lamp bulb socket.

HIGH MOUNT STOP LAMP REPLACEMENT

Fig. 29: High Mount Stop Lamp
Courtesy of GENERAL MOTORS COMPANY

High Mount Stop Lamp Replacement

Callout	Component Name
Preliminary Procedure Remove the rear compartment lid inner panel trim. Refer to <u>Rear Compartment Lid Inner Panel Trim Replacement</u> .	
1	High Mount Stop Lamp Fastener (Qty: 4) Procedure Press screwdriver onto the screw and unfasten it with about 4-5 rotations still pressing the screwdriver onto the screw. After that, push back the clip. To make sure the screw does not fall into the trunk lid, use a magnetic screwdriver.
2	High Mount Stop Lamp Procedure <ol style="list-style-type: none">1. Disconnect the electrical connector at the high mount stop lamp.2. Use a small flat-bladed tool to release the high mount stop lamp locking retainer starting at the left or right side of the lid compartment.

3. Use new seal.
4. Reinstall clips and screws. Hand tighten only, no torque required.
5. Insert lamp and press in place until all retainers are engaged.

REAR LICENSE PLATE LAMP REPLACEMENT

Fig. 30: Rear License Plate Lamp
 Courtesy of GENERAL MOTORS COMPANY

Rear License Plate Lamp Replacement

Callout	Component Name
1	Rear License Plate Lamp Tap TIP: Using a small flat-bladed tool, pull the right side down out from the rear bumper opening.
2	Rear License Plate Lamp Procedure Disconnect the rear license lamp electrical connector.

REAR LICENSE PLATE LAMP BULB REPLACEMENT

Fig. 31: Rear License Plate Lamp Bulb
 Courtesy of GENERAL MOTORS COMPANY

Rear License Plate Lamp Bulb Replacement

Callout	Component Name
1	Rear License Lamp Retainer TIP: Using a small flat-bladed tool, pull the right side down out from the rear bumper fascia opening.
2	Rear License Lamp Socket TIP: Rotate the lamp socket counter clock wise and remove.
3	Rear License Lamp Bulb CAUTION: Refer to <u>Avoid Touching the Bulb Caution</u> . TIP: Service the bulb, as needed.

TAIL LAMP REPLACEMENT

Fig. 32: Tail Lamp
 Courtesy of GENERAL MOTORS COMPANY

Tail Lamp Replacement

Callout	Component Name
Preliminary Procedure Remove the rear compartment side trim panel. Refer to <u>Rear Compartment Side Trim Panel Replacement (without HP6)</u> , <u>Rear Compartment Side Trim Panel Replacement (HP6, Left Side)</u> , <u>Rear Compartment Side Trim Panel Replacement (HP6, Right Side)</u> .	
1	Tail Lamp Nut (Qty: 3) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 2.5 N.m(22 lb in)
2	Tail Lamp Procedure 1. Grasp the most forward edge and firmly pull up to release the retainer. 2. Disconnect the electrical connector and remove the tail lamp from vehicle.

TAIL LAMP BULB REPLACEMENT

Fig. 33: Tail Lamp Bulb
 Courtesy of GENERAL MOTORS COMPANY

Tail Lamp Bulb Replacement

Callout	Component Name
Preliminary Procedure	
Remove the tail lamp. Refer to <u>Tail Lamp Replacement</u> .	
1	Tail Lamp Harness Socket Fastener (Qty: 6)
2	Tail Lamp Bulb CAUTION: Refer to <u>Avoid Touching the Bulb Caution</u> . Procedure 1. Service the bulb, as needed. 2. Pull the bulb straight from the lamp harness socket.

REAR COMPARTMENT COURTESY LAMP REPLACEMENT

Fig. 34: Rear Compartment Courtesy Lamp
 Courtesy of GENERAL MOTORS COMPANY

Rear Compartment Courtesy Lamp Replacement

Callout	Component Name
1	Rear Compartment Courtesy Lamp Procedure <ol style="list-style-type: none"> 1. Release and pull off the rear compartment courtesy lamp. 2. Disconnect the electrical connector. TIP: Carefully use a flat-bladed tool, and release the compartment lamp.

General Information

Maintenance and Lubrication

SPECIFICATIONS

APPROXIMATE FLUID CAPACITIES

The following approximate capacities are given in US English and metric conversions. See **Fluid and Lubricant Recommendations** for more information. All capacities are approximate. When adding, be sure to fill to the approximate level as recommended in this manual. Recheck fluid level after filling.

Approximate Fluid Capacities

Application	Specification	
	Metric	English
Cooling System		
• 2.0L L4 Engine	7.8 liters	8.2 quarts
• 2.4L L4 Engine	9.6 liters	10.1 quarts
Engine Oil with Filter		
• 2.0L L4 Engine	6.0 liters	6.3 quarts
• 2.4L L4 Engine	4.7 liters	5.0 quarts
Fuel Tank		
2.0L, 2.4L L4 Engine with NU5 and NT7 Emissions	70.4 liters	18.6 gallons
2.4L L4 Engine with NU6 Emissions	59.8 liters	15.8 gallons
Transmission Fluid (Drain and Refill)		
• 2.0L L4 Engine, 6-Speed Automatic	6.7 liters	7.1 quarts
• 2.4L L4 Engine, 6-Speed Automatic	8.4 liters	8.9 quarts
• Manual Transmission F40	1.6 liters	1.7 quarts
Transfer Case	0.65 liter	0.687 quart

FLUID AND LUBRICANT RECOMMENDATIONS

Fluid and Lubricant Recommendations

Usage	Fluid/Lubricant
Engine Oil	Use only engine oil licensed to the dexos1 specification, or equivalent, of the proper SAE viscosity grade. ACDelco dexos1 Synthetic Blend is recommended.
Engine Coolant	Always use the pre-mixed 50/50 mixture of deionized water and DEX-COOL Coolant available at your dealer.
Hydraulic Brake/Clutch System	DOT 3 Hydraulic Brake Fluid GM P/N 19299818 (Canadian P/N 19299819)
	Automotive windshield washer fluid that meets regional freeze protection

Windshield Washer	requirements.
Hydraulic Power Steering System	DEXRON®-VI Automatic Transmission Fluid.
Automatic Transmission	DEXRON®-VI Automatic Transmission Fluid.
Manual Transmission	Manual Transmission Fluid GM P/N 19259104 (Canadian P/N 19259105)
Key Lock Cylinders	Multi-Purpose Lubricant, Superlube GM P/N 12346241 (Canadian P/N 10953474)
Hood Latch Assembly, Secondary Latch, Pivots, Spring Anchor, and Release Pawl	Lubriplate Lubricant Aerosol GM P/N 89021668 (Canadian P/N 89021674) or lubricant meeting requirements of NLGI #2, Category LB or GC-LB
Hood and Door Hinges	Multi-Purpose Lubricant, Superlube GM P/N 12346241 (Canadian P/N 10953474)
Weather-strip Conditioning	Weather-strip Lubricant GM P/N 3634770 (Canadian P/N 10953518) or Dielectric Silicone Grease GM P/N 12345579 (Canadian P/N 10953481)

MAINTENANCE ITEMS

The Normal Maintenance Replacement Parts information will only be found in the Owner's Manual. Refer to the Maintenance Schedule subsection of the Owner's Manual.

You may be able to use the Search information function using the words Replacement Parts.

MAINTENANCE

MAINTENANCE SCHEDULE

The Maintenance Schedule information will only be found in the Owner's Manual.

Refer to the Maintenance Schedule subsection of the Owner's Manual, or you may be able to use the Search information function using the words Scheduled Maintenance.

GM OIL LIFE SYSTEM RESETTNG

The vehicle has a computer system that has a CHANGE ENGINE OIL light indicating when to change the engine oil and filter. This is based on engine revolutions and engine temperature, and not on mileage. Based on driving conditions, the mileage at which an oil change will be indicated can vary considerably. For the oil life system to work properly, the system must be reset every time the oil is changed. When the system has calculated that oil life has been diminished, it will indicate that an oil change is necessary. The CHANGE ENGINE OIL light will come on. The oil must be changed as soon as possible. It is possible that, if the vehicle is driven under the best conditions, the oil life system may not indicate that an oil change is necessary for over a year. However, the engine oil and filter must be changed at least once a year and at that time the system must be reset. If the system is ever reset accidentally, the oil must be changes at 5,000 km (3,000 miles) since the last oil change. Remember to reset the oil life system whenever the oil and filter are changed.

To reset the OIL LIFE SYSTEM do the following:

1. Display OIL LIFE RESET on the driver information center (DIC).
2. Press and hold the ENTER button for at least one second. An ACKNOWLEDGED display message will appear for 3 seconds or until the next button is pressed. This will tell you the system has been reset.
3. Turn the key OFF. If the CHANGE ENGINE OIL light comes back on and stays on when you start the vehicle, the engine oil life system has not been reset. Repeat the procedure.

REMINDER INDICATOR RESET PROCEDURES

CHANGE TRANS FLUID MESSAGE

NOTE: To determine the appropriate reset procedure, refer to CHANGE TRANS FLUID MESSAGE RESET INDEX. Only the vehicles listed in this index have a **CHANGE TRANS FLUID MESSAGE** reset.

CHANGE TRANS FLUID MESSAGE RESET INDEX

Model & Year	Reset Procedure
Aurora	
1995-99	<u>Change Trans Fluid Message Reset - Procedure 4</u>
Concours	
1994-98	<u>Change Trans Fluid Message Reset - Procedure 1</u>
1999	<u>Change Trans Fluid Message Reset - Procedure 2</u>

1998-04	<u>Change Trans Fluid Message Reset - Procedure 2</u>
Eldorado	
1992-98	<u>Change Trans Fluid Message Reset - Procedure 1</u>
1999-00	<u>Change Trans Fluid Message Reset - Procedure 2</u>
2001-02	<u>Change Trans Fluid Message Reset - Procedure 1</u>
Seville	
1992-97	<u>Change Trans Fluid Message Reset - Procedure 1</u>
1998-04	<u>Change Trans Fluid Message Reset - Procedure 2</u>
SRX	
2004	<u>Change Trans Fluid Message Reset - Procedure 2</u>

CHANGE TRANS FLUID MESSAGE RESET - PROCEDURE 1

This message will appear on the Driver Information Center (DIC) when transaxle fluid change is due. Change fluid in both the oil pan and side cover.

1. To reset display, turn ignition ON with engine OFF.
2. On the climate control panel, press and hold OFF and REAR DEFOG buttons until TRANS FLUID RESET message appears in DIC (about 5-20 seconds).

CHANGE TRANS FLUID MESSAGE RESET - PROCEDURE 2

The CHANGE TRANS FLUID message will appear on the Driver Information Center (DIC) when transaxle fluid change is due. Percentage of transaxle fluid life remaining may be checked at any time by pressing INFO button several times until TRANS FLUID LIFE message appears.

1. To reset display, turn ignition key ON with engine OFF.
2. Press the INFO button until TRANS FLUID LIFE message appears.
3. Press and hold INFO RESET button until display shows 100 percent TRANS FLUID LIFE. Transaxle fluid life index is now reset.

CHANGE TRANS FLUID MESSAGE RESET - PROCEDURE 3

Resetting With Base Audio System

Press CLR button located to the right of the DIC display to acknowledge the CHANGE TRANS FLUID message. This will clear the message from the display and reset it. To reset transmission fluid life indicator, press up or down arrow on INFO button located to the right of the DIC display to access the DIC menu. Once percentage TRANS FLUID LIFE menu item is highlighted, press and hold CLR button. Percentage will return to 100, and transmission fluid life indicator will be reset. Repeat if percentage does not return to 100.

Resetting With Navigation System

Press multifunction button located to the right of the DIC display, next to the OK prompt to acknowledge the CHANGE TRANS FLUID message. This will clear the message form the display and reset it. To reset transmission fluid life indicator, turn system on by pressing PWR/VOL knob once. PWR/VOL knob is located to the lower left of the DIC display. Press INFO button located to the left of the DIC display to access the VEHICLE INFO menu. Turn TUNE/SEL knob located to the lower right of the DIC display until TRANS FLUID LIFE is highlighted. Press knob once to select it. Once percentage TRANS FLUID LIFE is displayed, press multifunction button next to the RESET prompt in the upper right corner of the display. Percentage will return to 100, and transmission fluid life indicator will be reset. Repeat if percentage does not return to 100.

CHANGE TRANS FLUID MESSAGE RESET - PROCEDURE 4

1. The Driver Information Center (DIC) displays estimated percentage of the remaining useful life of transaxle fluid. When remaining fluid life is 0 percent, the display will show CHANGE TRNS FLUID NOW. After changing transaxle fluid, reset oil life display.
2. To reset the display, turn ignition on with engine off. Press ENG button to select the TRNS FLUID LIFE percentage display. Then, press and hold in RESET for at least 5 seconds.
3. The word RESET will appear. Then, TRNS FLUID 100 will be displayed.

CHECK ENGINE LIGHT

NOTE: To determine the appropriate reset procedure, refer to CHECK ENGINE LIGHT RESET INDEX. Only vehicles listed in this index have a check engine light reset.

CHECK ENGINE LIGHT RESET INDEX

Model & Year	Reset Procedure
--------------	-----------------

CHECK ENGINE LIGHT RESET - PROCEDURE 1**Federal Emissions**

1. CHECK ENGINE light functions as a service reminder indicator and emission system service. CHECK ENGINE light will come on each 50,000 miles (PCV and EGR), each 80,000 miles (oxygen sensor) and each 100,000 miles (charcoal canister) to indicate needed emission system service.
2. After servicing and/or replacing components, reset CHECK ENGINE light by sliding cancel switch to its opposite position. See **CHECK ENGINE LIGHT RESET SWITCH LOCATION (GEO TRACKER)** for switch location.

CHECK ENGINE LIGHT RESET SWITCH LOCATION (GEO TRACKER)

Application	Location
1989-91	Behind Access Panel, Directly Below Steering Column
1992-94	(1) Behind Instrument Panel, Next To Left Speaker
(1) See Fig. 1 .	

G50F12299

Fig. 1: Check Engine Light Reset Switch Location (1992-94 Geo Tracker - Federal Emissions)
Courtesy of GENERAL MOTORS CORP.

California Emissions

CHECK ENGINE light indicates when it is necessary to have emission system serviced, regardless of mileage. CHECK ENGINE light comes on briefly when starting as a bulb check. If light does not come on or stays on constantly, repair as necessary.

FUEL FILTER LIFE

NOTE: To determine the appropriate reset procedure, refer to Fuel Filter Life Reset Index. Only vehicles listed in this index have a fuel filter life reset.

FUEL FILTER LIFE RESET INDEX

Application	Reset Procedure
Some Models	<u>Fuel Filter Life Reset - Procedure 1</u>

NOTE: ALWAYS reset the FUEL FILTER LIFE system (if equipped) after a fuel filter change.

"FUEL FILTER LIFE" message will appear when a reset is performed either by using the steering wheel controls or performing manual reset procedure.

FUEL FILTER LIFE RESET - PROCEDURE 1

1. On vehicles with steering wheel controls, press and hold the select button for 5 seconds while the FUEL FILTER LIFE message is displayed. This message will appear on the Driver Information Center (DIC) for 10 seconds.
2. On vehicles without steering wheel controls, go to next step.
3. Without pressing the pedals, turn the ignition key to the ON position, engine off. Wait 5 seconds.
4. Completely depress the brake and accelerator pedals simultaneously and hold for 10 seconds. The system is now reset. Turn ignition key OFF.
5. On all vehicles, the next time engine is started, the message will no longer be displayed.

OIL CHANGE REMINDER

NOTE: Most 1981-88 General Motors vehicles do not use a Service Reminder Indicator (SRI).

NOTE: To determine the appropriate reset procedure, refer to Oil Change Reminders Reset Index. Only vehicles listed in this index have an oil change reminder reset.

OIL CHANGE REMINDER RESET - PROCEDURE 1

1. The CHANGE OIL (or CHANGE ENGINE OIL) message is displayed when its time to change engine oil, usually between 3000 and 7500 miles since last oil change.
2. To reset the oil life monitor, turn the ignition switch to RUN position, with engine off. Press the TRIP/OIL RESET button on the instrument panel for 12 seconds. The OIL CHANGE light will start to flash to confirm that system is reset (on some models a chime will also sound). Reset is complete when OIL CHANGE light goes out.

OIL CHANGE REMINDER RESET - PROCEDURE 2

Engine oil life monitor calculates engine oil temperature and RPM. It indicates when the engine oil is nearly worn out. A CHANGE OIL light on the instrument cluster is illuminated when it is time to change the engine oil. To reset CHANGE OIL light:

1. Remove IP fuse block cover (cover can be seen when driver's door is open).
2. Turn ignition ON, engine OFF.
3. Press OIL RESET button and hold for 5 seconds.
4. If Oil Life light does not reset, repeat procedure with ignition OFF.

OIL CHANGE REMINDER RESET - PROCEDURE 3

Engine oil life monitor calculates engine oil temperature and RPM. It indicates when the engine oil is nearly worn out. A CHANGE OIL light on the instrument cluster is illuminated when it is time to change the engine oil.

1. To reset oil life monitor and turn off CHANGE OIL light, turn ignition switch to ON position with engine off.
2. Depress accelerator pedal to wide open throttle 3 times within 5 seconds. This throttle signal will inform the PCM to reset the oil life monitor and turn off the light. If light does not turn off, turn ignition off and repeat procedure.

OIL CHANGE REMINDER RESET - PROCEDURE 4

When the system has calculated that oil life has been diminished, it will indicate that an oil change is necessary. A CHANGE ENGINE OIL SOON message will come on. Change the engine oil as soon as possible within the next 600 miles (1,000 km). It is possible that, if driving under the best conditions, the oil life system may not indicate that an oil change is necessary for over a year. However, the engine oil and filter must be changed at least once a year and at this time the system must be reset.

Reset Procedure

1. Turn the ignition key to RUN with the engine OFF.
2. Press the INFO and RESET buttons on the Driver Information Center (DIC) at the same time to enter the personalization menu.
3. Press the INFO button to scroll through the available personalization menu modes until the DIC display shows OIL-LIFE RESET.
4. Press the INFO and RESET buttons at the same time for one second and release.
5. Press and hold the reset button until the DIC display shows ACKNOWLEDGED. This will tell you the system has been reset.
6. Turn the key to LOCK/OFF.

Alternate Method (Some Models)

1. Turn the ignition key to RUN with the engine off.
2. Fully press the release the accelerator pedal 3 times within 5 seconds. Several beeps sound. This confirms the oil life system has been reset.
3. If the CHANGE/OIL message comes back on when you start the engine, the engine oil life system has not been reset. Repeat the procedure.

OIL CHANGE REMINDER RESET - PROCEDURE 5

Engine oil life monitor calculates engine oil temperature and RPM. It indicates when the oil is nearly worn out. A CHANGE OIL light on left side of instrument cluster is illuminated when it is time to change oil. To reset oil life monitor:

1. Turn ignition on.
2. Depress ENG MET button on trip monitor and release.
3. Within 5 seconds, depress and release ENG MET button again.
4. Within 5 seconds, depress and hold the ENG MET or GAUGES button again. The CHANGE OIL light should flash.
5. Depress and hold the RANGE or GAUGES button until the CHANGE OIL light stops flashing and goes out. When the light goes out, the engine oil life monitor is reset. This should take about 10 seconds.

NOTE: If the light does not reset, turn ignition off and repeat the procedure.

OIL CHANGE REMINDER RESET - PROCEDURE 6

The Driver Information Center (DIC) will display a CHANGE OIL message when an oil change is due. The instrument cluster may also have a CHANGE OIL light. To reset the oil life monitor:

Reset Procedure

1. Turn ignition switch to RUN position, with engine off.
2. Press the TRIP (on some models SELECT or SET/RESET) button, located on the DIC, until the OIL LIFE display appears. Message will display percentage of oil life remaining.

NOTE: On models without DIC buttons, use the TRIP/ODOMETER reset stem.

3. Press and hold SET/RESET button (on some models, the check-symbol button) on DIC for at least 5 seconds. The message will change to indicate that the Oil Life has been reset. On some models, 3 chimes will also sound.
4. Turn ignition off.
5. Turn the key to OFF. If the light or message comes back on when you start your vehicle, the oil life system has not reset. Repeat the procedure.

NOTE: On some models, if oil life system does not reset, try turning ignition OFF after displaying oil life message. Then press and hold reset button.

Alternate Method (Some Models)

1. Turn the ignition key to RUN with the engine off.
2. Fully press the release the accelerator pedal 3 times within 5 seconds. Several beeps sound. This confirms the oil life system has been reset.
3. If the CHANGE/OIL message comes back on when you start the engine, the engine oil life system has not been reset. Repeat the procedure.

OIL CHANGE REMINDER RESET - PROCEDURE 7

When the system has calculated that oil life has been diminished, it indicates that an oil change is necessary. A

CHANGE ENGINE OIL SOON message in the DIC comes on. Reset the system whenever the engine oil is changed so that the system can calculate the next engine oil change. To reset the system:

1. Press the up or down arrow to scroll the DIC to show OIL LIFE.
2. Once the XXX% ENGINE OIL LIFE menu item is highlighted, press and hold the RESET button until the percentage shows 100%

OIL CHANGE REMINDER RESET - PROCEDURE 8

The CHANGE ENGINE OIL message is displayed when its time to change engine oil, usually between 3000 and 7500 miles since last oil change. The oil change interval is not based on mileage, but on engine revolutions and engine operating temperature.

1. There are 2 ways to reset the engine oil life monitor. To reset the engine oil life monitor using the accelerator pedal, go to step 4. To reset the engine oil life monitor using the radio, turn the radio off. Turn ignition to ACC or ON, with the engine off. Press and hold the DISP (on some models, TUNE DISP) button (or knob) on the radio for at least 5 seconds until SETTINGS is displayed.
2. Press the SEEK (on some models, SEEK PTYPE or SEEK PSCAN) up or down arrow to scroll through the main menu. Scroll until OIL LIFE appears on the display. Press the PREV or NEXT button to enter the sub-menu. RESET will be displayed.
3. Press the DISP/TUNE DISP button to reset. A chime will sound to verify the new setting and DONE will be displayed for one second. Once the message indicator has been reset, scroll through the menu until EXIT appears on the display. Press the DISP/TUNE DISP button to exit the program. A chime will sound to verify the exit.
4. To reset the engine oil life monitor using the accelerator pedal, turn ignition on with engine off. Fully depress and release the accelerator pedal slowly 3 times within 5 seconds. If CHANGE ENGINE OIL light flashes, oil life monitor is reset. If the CHANGE ENGINE OIL light comes back on and stays on, oil life monitor has not reset. Repeat reset procedure.

OIL CHANGE REMINDER RESET - PROCEDURE 9

When the system has calculated that oil life has been diminished, it will indicate that an oil change is necessary. A CHANGE message will come on. Change the engine oil as soon as possible within the next 600 miles (1000 km). It is possible that, if driving under the best conditions, the oil life may not indicate that an oil change is necessary for over a year. However, the engine oil and filter must be changed at least once a year and at this time the system must be reset.

To reset the Engine Oil Life System, do the following:

1. Press and hold the TRIP button on the steering wheel while turning on the ignition. Do not start the engine.
2. The instrument panel cluster will prompt to clear the service code.
3. Release the button.
4. Press and hold ENTER Switch on the left side of the steering wheel for approximately one second.
5. Turn off the ignition.

If the CHANGE ENGINE OIL SOON message comes back on when you start the vehicle, the engine oil life system has not reset. Repeat the procedure.

OIL CHANGE REMINDER RESET - PROCEDURE 10

1. Turn ignition ON, with engine off.
2. Press and release reset stem on instrument panel while OIL LIFE message is displayed.
3. Once the alternating OIL LIFE and RESET messages appear, press and hold stem in until several beeps will sound. This confirms that oil life system has been reset. Turn ignition off or full LOCK position. If CHANGE OIL messages comes back after starting engine, repeat reset procedure.

OIL CHANGE REMINDER RESET - PROCEDURE 11

Reset Procedure

If vehicle is equipped with a Driver Information Center (DIC), reset oil life monitor by pressing the Driver Information Center SELECT button for 5 seconds while ENGINE OIL LIFE is displayed.

Alternate Method

To reset the oil life monitor, turn ignition switch to ON or RUN position with engine off. Depress accelerator pedal slowly to wide open throttle 3 times within 5 seconds. If CHANGE ENG OIL light flashes for 5 seconds, oil life monitor is reset. If the CHANGE ENG OIL light does not flash, oil life monitor has not reset. Repeat this step.

OIL CHANGE REMINDER RESET - PROCEDURE 12

1. CHANGE OIL SOON light will come on when engine oil has broken down enough to require changing. After changing oil, reset oil life display.
2. To reset light, turn ignition on. Open glove box to access oil reset button. Press and hold oil reset button in glove box for at least 5 seconds, but not longer than 60 seconds. The CHANGE OIL SOON light will flash 4 times to indicate light has been reset.

OIL CHANGE REMINDER RESET - PROCEDURE 13

GM Oil Life System calculates when to change your engine oil and filter based on vehicle use. Anytime oil is changed, reset the system so it can calculate when the next oil change is required. If a situation occurs where you change your oil prior to a Change Oil Soon message being turned on, reset the system. After changing the engine oil, reset the system.

1. Display OIL LIFE RESET on the DIC.
2. Press and hold ENTER button for at least one second. An ACKNOWLEDGED display message will appear for 3 seconds or until the next button is pressed. This will tell you the system has been reset.
3. Turn key to OFF.
4. If Change Oil Soon message comes back on when you start your vehicle, engine oil life system has not reset. Repeat the procedure.

OIL CHANGE REMINDER RESET - PROCEDURE 14

1. To display this light, press the GAGE INFO or GAGES button on the Driver Information Center (DIC). When oil life index is less than 10 percent, display will show OIL LIFE INDEX CHANGE OIL. After changing oil, reset system.
2. To reset light, display OIL LIFE INDEX. Hold RESET button for more than 5 seconds. After reset, oil life will change to 100 percent.

OIL CHANGE REMINDER RESET - PROCEDURE 15

1. CHANGE OIL SOON light will come on when engine oil has broken down enough to require changing. After changing oil, reset oil life display.
2. To reset light, locate reset button hole under the dash near passenger door. Use a pencil or similar object to push and hold button (inside hole) for 5 seconds. The CHANGE OIL SOON light will flash 4 times to indicate light has been reset.

OIL CHANGE REMINDER RESET - PROCEDURE 16

Vehicles WITHOUT Driver Information Center (DIC) Buttons

1. Turn the ignition to ON/RUN, with the engine off. The vehicle must be in P (Park) to access this display. Press the trip odometer reset stem until OIL LIFE REMAINING displays.
2. Press and hold the trip odometer reset stem until OIL LIFE REMAINING shows "100%." Three chimes sound and the CHANGE ENGINE OIL SOON message goes off.
3. Turn the key to LOCK/OFF. If the CHANGE ENGINE OIL SOON message comes back on when the vehicle is started, the engine oil life system has not been reset. Repeat the procedure.

Vehicles WITH Driver Information Center (DIC) Buttons

1. Turn the ignition to ON/RUN position, with the engine off.
2. Press the VEHICLE INFORMATION BUTTON (i) until OIL LIFE REMAINING displays.
3. Press and hold the SET/RESET button (check-mark symbol) until "100%" is displayed. Three chimes sound (on some models) and the CHANGE ENGINE OIL SOON message goes off.
4. Turn ignition to LOCK/OFF position. If the CHANGE ENGINE OIL SOON message comes back on when engine is started, repeat reset procedure.

OIL CHANGE REMINDER RESET - PROCEDURE 17

Reset Procedure

1. Turn the ignition to ON, with the engine off.
2. Press the MODE button until the Driver Information Center (DIC) reads OIL LIFE LEFT/HOLD SET TO RESET.
3. Press and hold the SET button until 100% is displayed. You will hear three chimes and the CHANGE ENGINE OIL message will go off. Turn the key to OFF.

4. If the CHANGE ENGINE OIL message comes back on when engine is started, the engine oil life system has not reset. Repeat the procedure.

Alternate Method (Some Models)

1. Turn the ignition key to RUN with the engine off.
2. Fully press the release the accelerator pedal 3 times within 5 seconds. Several beeps sound. This confirms the oil life system has been reset.
3. If the CHANGE/OIL message comes back on when you start the engine, the engine oil life system has not been reset. Repeat the procedure.

OIL CHANGE REMINDER RESET - PROCEDURE 18

When the system has calculated that oil life has been diminished, it will indicate that an oil change is necessary. A CHANGE ENGINE OIL message or light will come on. Change the engine oil as soon as possible within the next 600 miles (1 000 km). It is possible that, if driving under the best conditions, the oil life system may not indicate that an oil change is necessary for over a year. However, the engine oil and filter must be changed at least once a year and at this time the system must be reset.

NOTE: **Be careful not to reset the oil life display accidentally at any time other than after the oil is changed. It cannot be reset accurately until the next oil change.**

Vehicles with Driver Information Center (DIC)

1. Turn the ignition to ON/RUN with the engine off.
2. Press the DIC MENU button on the turn signal lever to enter the Vehicle Information Menu. Use the thumbwheel to scroll through the menu items until you reach REMAINING OIL LIFE. See **Fig. 2**.
3. Press the SET/CLR button (on some models, the check-symbol button) while the oil life display is active. After a few seconds, there will be a single chime (on some models) and the oil life will be reset to 100%.
4. Turn the ignition to LOCK/OFF.

The system is reset when the CHANGE OIL message is off and the REMAINING OIL LIFE 100% message is displayed.

NOTE: **If the CHANGE OIL message comes back on or Code 82 DIC message comes on when the vehicle is started, the engine oil life system has not been reset. Repeat the procedure.**

Fig. 2: Identifying DIC Controls (Turn Signal Lever)
 Courtesy of GENERAL MOTORS CORP.

Vehicles without DIC (Some Models)

1. With the engine OFF, turn the ignition key to RUN.
2. Fully press and release the accelerator pedal slowly three times within five seconds.
3. Turn the key to OFF, then start the vehicle.

Reset Using Diagnostic Scan Tool (Some Models)

1. Turn on ignition.
2. Connect scan tool.
3. Select Module Diagnosis.
4. Select Engine Control Module.
5. Select Configuration/Reset function.
6. Select Engine Oil System Reset.
7. Push Enter button to run function.
8. Confirm Executed successfully.
9. Turn ignition off and confirm.
10. Turn ignition on and confirm.

OIL CHANGE REMINDER RESET - PROCEDURE 19

1. The Driver Information Center (DIC) will display remaining oil life as a percentage estimate of the useful life of oil.
2. When remaining oil life is 10 percent or less, the system will display CHANGE OIL SOON. When oil life expires, display will show CHANGE ENGINE OIL. After changing oil, reset oil life display.
3. To reset oil life display, press INFORMATION (or INFORMATION SKIP) button to display OIL LIFE LEFT. Press and hold RESET (or RESET NO) button until 100 OIL LIFE LEFT (0.0 OIL LIFE LEFT on some early models) is displayed.

OIL CHANGE REMINDER RESET - PROCEDURE 20

With Base Audio System

Press up or down arrow on the INFO button located to right of Driver Information Center (DIC) display to access DIC menu. Once 100 percent ENGINE OIL LIFE menu item is highlighted, press and hold the CLR button. Percentage will return to 100 and oil life indicator will be reset. Repeat procedure if the percentage does not return to 100.

With Navigation System

Turn the system on by pressing PWR/VOL knob once. PWR/VOL knob is located to lower left of DIC display. Press INFO button located to left of the display to access Vehicle Information menu. Turn TUNE/SEL knob located to lower right of the display until ENGINE OIL LIFE is highlighted. Press TUNE/SEL knob once to select it. When 100 percent Engine Oil Life is displayed, press multifunction button next to reset prompt in upper right corner of the display. Percentage will return to 100 and the oil life indicator will be reset. Repeat procedure if the percentage does not return to 100.

OIL CHANGE REMINDER RESET - PROCEDURE 21

1. Use the SELECT knob to select OIL LIFE on the DIC menu.
2. Press SELECT to start the OIL LIFE reset procedure.
3. The DIC menu will display "Are you sure that you want to reset?" Use SELECT to choose YES to reset oil life or NO to exit and return to the previous menu.
4. If YES is selected, the DIC menu will display RESET OIL LIFE for a short time and then 100% OIL LIFE will be display when OIL LIFE is successfully reset.

OIL CHANGE REMINDER RESET - PROCEDURE 22

With Base Audio System

1. Press the CLR button located to the right of the driver information center (DIC) display to acknowledge the Change Engine Oil message. This will clear the message from the display and reset it.
2. Press the up or down arrow on the INFO button located to the right of the Driver Information Center (DIC) display to access the DIC menu.
3. Once 100% ENGINE OIL LIFE menu item is highlighted, press and hold the CLR button. The percentage will return to 100 and the oil life indicator will be reset. Repeat the steps if the percentage does not return to 100.
4. Turn OFF the key. If the Change Engine Oil message comes back on when you start the vehicle, the engine oil life system has not reset. Repeat the procedure.

Without DIC

1. With the engine OFF, turn the ignition key to RUN.
2. Fully press and release the accelerator pedal slowly three times within five seconds.
3. Turn the key to OFF, then start the vehicle.

With Navigation System

1. Press the multifunction button, next to the OK prompt in the upper right of the display to acknowledge the Change Engine Oil message. This will clear the message from the display and reset it.
2. Turn the system on by pressing the PWR/VOL knob once. The PWR/VOL knob is located to the lower left of the driver information center (DIC) display.
3. Press the INFO button located to the left of the display to access the Vehicle Information menu.
4. Turn the TUNE/SEL knob located to the lower right of the display until Engine Oil Life is highlighted. Press the knob once to select it.
5. Once the 100% Engine Oil Life is displayed, press the multifunction button next to the Reset prompt in the upper right corner of the display. The percentage will return to 100 and the oil life indicator will be reset. Repeat the steps if the percentage does not return to 100.
6. Turn OFF the key. If the Change Engine Oil message comes back on when you start the vehicle, the engine oil life system has not reset. Repeat the procedure.

OIL CHANGE REMINDER RESET - PROCEDURE 23

1. An OIL LIFE INDEX is one of the displays on Driver Information Center (DIC). It will display remaining oil life as a percentage estimate of the useful life of oil.
2. It will show 100 percent when the system is reset. When the oil life is 0 percent, the display will show CHANGE ENGINE OIL. After changing oil, reset oil life display.
3. To reset service reminder on 1989 models, press RANGE button until OIL LIFE INDEX appears on display. Depress and hold in AVG ECON and RANGE buttons for more than 5 seconds or until 100 is displayed. This will reset remaining oil life to 100 percent.
4. On 1990-93 models, press RANGE button until OIL LIFE INDEX appears on DIC display. Depress and hold in AVG SPEED and RANGE buttons for more than 5 seconds or until 100 is displayed. This will reset remaining oil life to 100 percent.

OIL CHANGE REMINDER RESET - PROCEDURE 24

1. An OIL LIFE INDEX is one of 4 displays on Driver Information Center (DIC). It will display remaining oil life as a percentage estimate of the useful life of oil.
2. Display will show 100 percent when the system is reset. When remaining oil life is 10 percent or less, the system will display CHANGE OIL SOON. When the oil life expires, the display will show CHANGE ENGINE OIL. After changing oil, reset oil life display.
3. To reset oil life display, press ENG DATA button until OIL LIFE INDEX appears on DIC display. Depress and hold in ENG DATA and RANGE buttons until 100 is displayed. This will reset remaining oil life to 100 percent.

OIL CHANGE REMINDER RESET - PROCEDURE 25

1. An OIL LIFE INDEX is one of the displays on Driver Information Center (DIC). It will display remaining oil life as a estimated percentage of the useful life of oil.
2. It will show 100 percent when the system is reset. When the oil life is 0 percent, the display will show CHANGE ENGINE OIL. After performing necessary services, reset service reminder.

3. To reset service reminder, turn ignition to on position. Do not start engine. Depress and hold RANGE and FUEL USED buttons until OIL LIFE INDEX appears on DIC display. Depress and hold RANGE and RESET buttons for 5-60 seconds.
4. When CHANGE OIL SOON light flashes 4 times, remaining oil life index is reset to 100 percent. If CHANGE OIL SOON comes on and stays on for 5 seconds, display did not reset. Repeat step 3.

OIL CHANGE REMINDER RESET - PROCEDURE 26

1. Oil change reminder display on the Driver Information Center (DIC) is similar to 1990-91 models, but reset procedures are different. After changing oil, reset oil life display.
2. To reset, press INFORMATION button to display OIL LIFE INDEX. Press and hold STORE/RECALL button until 100 is displayed. This will reset oil life display to 100 percent.

OIL CHANGE REMINDER RESET - PROCEDURE 27

1. The Driver Information Center (DIC) displays estimated percentage of the remaining useful life of engine oil or transaxle fluid. When remaining oil or fluid life is 0 percent, the display will show CHANGE OIL NOW or CHANGE TRNS FLUID NOW. After changing engine oil or transaxle fluid, reset oil life display.
2. To reset the display, turn ignition on with engine off. Press ENG button to select the OIL LIFE or TRNS FLUID LIFE percentage display. Then, press and hold in RESET for at least 5 seconds.
3. The word RESET will appear. Then, OIL LIFE 100 or TRNS FLUID 100 will be displayed.

OIL CHANGE REMINDER RESET - PROCEDURE 28

1. An oil change reminder displays estimated percentage of the remaining useful life of the oil. When engine is started, a tone will sound and approximate distance to next oil change will be displayed.
2. When remaining oil life is 10 percent or less, the system will calculate distance to next oil change. When the oil life is 0 percent, the display will show CHANGE OIL NOW. After changing oil, reset oil life display.
3. To reset the display, press and hold in OIL button to select the oil life display. Then, press and hold in RESET and OIL buttons for at least 5 seconds. This will reset oil life display to 100 percent.

OIL CHANGE REMINDER RESET - PROCEDURE 29

1. To reset the display, press and release the TEST button.
2. Press and release the OIL button.
3. Press and hold the RESET button for at least 7 seconds. This will reset oil life display to 100 percent.

OIL CHANGE REMINDER RESET - PROCEDURE 30

1. To reset the display, press and release RESET button on Driver Information Center (DIC).
2. Press SEL button (with down arrow) to select OIL.
3. Press SEL button (with left and right arrows) to display oil life.

4. Press and hold RESET button for about 5 seconds.
5. A reset message will display, then oil life will display 100 percent.

OIL CHANGE REMINDER RESET - PROCEDURE 31

With Information Center Display

OIL LIFE INDEX is one of 4 engine data displays used on models with Information Center display. It will display remaining oil life as estimated percentage of the useful life of oil. It will show 100 percent when the system is reset. After changing oil, reset oil life display.

1. To reset the display, press ENG DATA button (1989-90) or OPTIONS button (1991-92) until oil life index is displayed.
2. Then, press and hold in ENG DATA and GAGE buttons (1989) or RESET/ENTER button (1990-92) for at least 5 seconds. This will reset remaining oil life to 100 percent.

With Visual Information Center

OIL LIFE is one of the displays used on models with a Visual Information Center (VIC). It will display data regarding previous oil change. A bar graph display shows full when oil is changed. Bar graph will go down as vehicle is driven and oil ages. When bar graph reaches CHANGE OIL mark, oil should be changed. After changing oil, reset oil life display.

1. To reset the display, press INFO hard key and then OIL LIFE soft key to display oil life index.
2. Press RESET soft key.
3. A reset confirmation page will appear and ask if oil has been changed. Press YES soft key to reset bar graph, and update last oil change date and mileage information.

OIL CHANGE REMINDER RESET - PROCEDURE 32

When the system has calculated that oil life has been diminished, it will indicate that an oil change is necessary. A CHANGE ENGINE OIL SOON message will come on. Change the engine oil as soon as possible within the next 600 miles (1000 km). It is possible that, if driving under the best conditions, the oil life system may not indicate that an oil change is necessary for over a year. However, the engine oil and filter must be changed at least once a year and at this time the system must be reset.

To reset the Engine Oil Life System, do the following:

1. With the CHANGE OIL SOON message displayed, press any of the three driver information center (DIC) buttons to clear the CHANGE OIL SOON message.
2. Display OIL LIFE RESET on the DIC.
3. Press and hold the ENTER button for at least one second. An ACKNOWLEDGED display message will appear for three seconds or until the next button is pressed. This will tell you the system has reset.
4. Turn the ignition to OFF.

If the CHANGE ENGINE OIL message comes back on when you start the vehicle the Engine Oil Life System

has not reset. Repeat the procedure.

OIL CHANGE REMINDER RESET - PROCEDURE 33

This vehicle has a computer system that indicates when to change the engine oil and filter. This is based on a combination of factors which include engine revolutions, engine temperature, and miles driven. Based on driving conditions, the mileage at which an oil change is indicated can vary considerably. For the oil life system to work properly, the system must be reset every time the oil is changed. To reset the system:

Reset Procedure

- 1. Using the DIC controls on the right side of the steering wheel, display REMAINING OIL LIFE on the driver information center (DIC).
- 2. Press SEL on the DIC controls and hold SEL down for a few seconds to clear the CHANGE ENGINE OIL SOON message and reset the oil life at 100%.

NOTE: Be careful not to reset the oil life display accidentally at any time other than after the oil is changed. It cannot be reset accurately until the next oil change.

Alternate Method (Some Models)

- 1. Turn the ignition key to RUN with the engine off.
- 2. Fully press the release the accelerator pedal 3 times within 5 seconds. Several beeps sound. This confirms the oil life system has been reset.
- 3. If the CHANGE/OIL message comes back on when you start the engine, the engine oil life system has not been reset. Repeat the procedure.

OXYGEN SENSOR REMINDER FLAG

NOTE: To determine the appropriate reset procedure, refer to OXYGEN SENSOR REMINDER FLAG RESET. Only vehicles listed in this index have an oxygen sensor reminder flag reset.

OXYGEN SENSOR REMINDER FLAG RESET INDEX

Model & Year	Reset Procedure
Some Models	
1980	<u>Oxygen Sensor Reminder Flag - Procedure 1</u>

OXYGEN SENSOR REMINDER FLAG - PROCEDURE 1

- 1. Every 30,000 miles, a reminder flag appears in speedometer face, indicating service of oxygen sensor is necessary. See **Fig. 3**. Inspect and service oxygen sensor as necessary and reset flag.
- 2. To reset flag, remove instrument panel trim plate. Remove instrument cluster lens. Using pointed tool, apply light downward pressure on notches of flag until it is reset. An alignment mark will appear in left

center of odometer window when flag is fully reset.

Fig. 3: Resetting Reminder Flag
Courtesy of GENERAL MOTORS CORP.

OXYGEN SENSOR WARNING LIGHT

NOTE: To determine the appropriate reset procedure, refer to OXYGEN SENSOR WARNING LIGHT RESET INDEX. Only vehicles listed in this index have an oxygen sensor warning light reset.

OXYGEN SENSOR WARNING LIGHT RESET INDEX

Model & Year	Reset Procedure
Sprint	
1985-86	<u>Oxygen Sensor Warning Light Reset - Procedure 1</u>

OXYGEN SENSOR WARNING LIGHT RESET - PROCEDURE 1

At 30,000 mile intervals, a SENSOR light in dash will start flashing, indicating oxygen sensor needs replacement. To reset mileage counter (after sensor replacement), locate SENSOR light cancel switch on right side of fuse box. Return cancel switch to OFF position. Start engine to ensure light remains off.

SERVICE REMINDER MESSAGE

NOTE: To determine the appropriate reset procedure, refer to Service Reminder Reset

Index. Only vehicles listed in this index have a Service Reminder reset.

SERVICE REMINDER RESET INDEX

Model & Year	Reset Procedure
6000 STE	
1987-89	<u>Service Reminder Message Reset - Procedure 1</u>
Bonneville	
1988-91	<u>Service Reminder Message Reset - Procedure 1</u>
Caprice	
2011	<u>Service Reminder Message Reset - Procedure 2</u>

SERVICE REMINDER MESSAGE RESET - PROCEDURE 1

The SERVICE REMINDER message light is used on models with a Driver Information Center (DIC). After performing necessary services, reset service reminder light.

1. To reset service reminder, push DIC button until desired service item is displayed.
2. Press and hold down the DIC button. With button pressed, the distance display will decrease in increments of 500 miles.
3. Release button when desired distance is displayed on the DIC.

SERVICE REMINDER MESSAGE RESET - PROCEDURE 2

The displayed service reminder is reset using a scan tool or by the following procedure:

1. Turn the ignition to the OFF position.
2. Press and hold the TRIP button.
3. Turn the ignition to the ON position.
4. Release the TRIP button.
5. Once in the Service Reset screen, press and hold the ENTER switch for 3-5 seconds. A confirmation beep will sound upon reset.
6. Turn the ignition to the OFF position.

NOTE: If the service reminder comes back on when you start the vehicle, the Service Reminder Display has not reset. Repeat the procedure.

TIRE PRESSURE MONITOR SYSTEM (TPMS)

NOTE: To determine the appropriate reset procedure, refer to **TPMS RESET INDEX**. Only vehicles listed in this index have a TPMS reset.

(1) This is an Indirect TPM System. A tire sensor activation tool is not required for this procedure.		
(2) A tire sensor activation tool cannot be used for this procedure.		

TPMS RESET - PROCEDURE 1

NOTE: When the wheels have been rotated, or a tire pressure sensor or EGM/LGM has been replaced, retrain tire pressure sensors.

NOTE: The DIC will display the "SERVICE TIRE MONITOR" message if one or more of the tire pressure sensors has malfunctioned or if all of the sensors have not been programmed successfully. If, after the relearn procedure, the warning indicators are still on, there is a problem in the TPM system.

NOTE: If this procedure is performed following replacement and reprogramming of the Liftgate Module (LGM), DIC may display a low tire pressure fault and all tire pressures read 0 psi. If this problem occurs, see appropriate manufacturer service information.

NOTE: The TPM system will cancel the learn mode if more than 2 minutes have passed and no sensors have been learned, or if the system has been in learn mode for more than 5 minutes. If the learn mode is canceled before any sensor has been learned, the EGM/LGM will remember all current sensor IDs and their locations. As soon as the first sensor ID code is learned, all other IDs are erased from the EGM/LGM's memory. On models that display the individual tire pressure on DIC, updated tire pressures will not be displayed until EGM/LGM receives 2 more valid transmissions from each sensor.

NOTE: Before proceeding with the steps below, ensure that no other sensor learn procedure is being performed simultaneously, or that tire pressures are not being adjusted on a TPM equipped vehicle within close proximity.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Turn ignition ON with engine OFF. Apply parking brake.

NOTE: If Learn Mode cannot be enabled, TPM system is not enabled in EGM/LGM. See appropriate manufacturer service information.

3. To enable Learn Mode, turn headlight switch from OFF to parking lamps 4 times within 4 seconds. A double horn chirp will sound and the low tire pressure indicator will begin to flash to indicate the learn mode has been enabled.
4. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
5. After horn chirp has sounded, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
6. After left rear sensor has been learned, turn ignition switch to OFF position to exit Learn Mode.
7. Test drive the vehicle above 25 mph for at least 2 minutes before viewing tire pressures on DIC.

TPMS RESET - PROCEDURE 2

NOTE: If a tire pressure sensor or the Remote Control Door Lock Receiver (RCDLR) is replaced, or if wheels have been rotated, tire pressure sensor must be retrained.

NOTE: When the tire pressure warning light illuminates and warning message appears on DIC, immediately check air pressure of all tires and adjust to the specified pressure. If warning indicators are still on or display shows dashes instead of a value, there is a problem in the TPM system. See appropriate manufacturer service information.

NOTE: Under the following conditions, the TPM system may not function properly:

- If one or more of the tire pressure sensors are missing or inoperable.
- A compact spare tire is used.

NOTE: If a tire pressure sensor or the Remote Control Door Lock Receiver (RCDLR) is replaced, or if wheels have been rotated, tire pressure sensor must be retrained.

NOTE: The relearn procedure must be completed within 15 minutes from when the vehicle is stationary after being driven at 20 mph (32 km/h), or greater, for 10 seconds.

NOTE: The learn mode will cancel if the ignition is cycled to OFF or if more than 2 minutes has elapsed for any sensor that has not been learned. If the learn mode is cancelled before the first sensor is learned, the original sensor IDs will be maintained. If the learn mode is canceled after the first sensor is learned, the following will occur:

- All stored sensor IDs will be invalidated in the RCDLR memory.
- If equipped, the DIC will display dashes instead of tire pressures.
- DTC C0775 will be set.

These conditions will now require the learn procedure to be repeated for the system to function properly.

IMPORTANT: Ensure that no other learn procedure is being performed simultaneously or that tire pressures are not being adjusted on another TPM equipped vehicle within close proximity. Stray signals from other TPM equipped vehicles just driving by can be inadvertently learned. If any random horn chirps are heard from the vehicle while performing the learn procedure, most likely a stray sensor has been learned and the procedure will need to be cancelled and repeated. Under these circumstances, performing the TPM Learn Procedure away from other vehicles would be highly recommended. In the event a particular sensor activation does not cause the horn to chirp, it may be necessary to rotate the wheel valve stem to a different position due to the sensor signal is being blocked by another component.

1. Turn ignition switch to ACC position. Apply parking brake.
2. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
3. To enable Learn Mode:
 - On vehicles equipped with keyless entry, simultaneously press the keyless entry transmitters lock and unlock buttons until a double horn chirp sounds indicating the Learn Mode has been enabled. On vehicles with DIC, a TIRE LEARN message may be displayed. The left front turn signal will

also be illuminated.

- On vehicles not equipped with keyless entry, press and release the driver information center (DIC) INFO button until the TIRE LEARN message appears on the DIC display. Press and hold the SET/RESET button until a double horn chirp sounds indicating the Learn Mode has been enabled. The left front turn signal will also be illuminated.

4. Ignition ON.
5. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
6. After horn chirp has sounded, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
7. After left rear sensor has been learned, turn ignition switch to OFF position to exit Learn Mode.

TPMS RESET - PROCEDURE 3

NOTE: If a tire pressure sensor or the Remote Control Door Lock Receiver (RCDLR) is replaced, or if wheels have been rotated, tire pressure sensor must be relearned.

NOTE: When the tire pressure warning light illuminates and warning message appears on DIC, immediately check air pressure of all tires and adjust to the specified pressure. If warning indicators are still on or display shows dashes instead of a value, there is a problem in the TPM system. See appropriate manufacturer service information.

NOTE: In vehicles without the "UH3" option, each turn signal will illuminate one at a time indicating which location is to be learn.

NOTE: The TPM system will cancel the learn mode if more than 2 minutes have passed and no sensors have been learned, or if the ignition switch is turn to the OFF position. If the learn mode is canceled before the first ID is learned, the RCDLR will remember all previously stored IDs and their locations. As soon as the first sensor ID is learned, all other IDs are erased from the RCDLR's memory. If the learn mode is canceled after the first ID is learned, the RCDLR will store the IDs as invalid and the DIC will display dashes instead of tire pressures.

NOTE: Before proceeding with the registration procedure, ensure that no other sensor learn procedure is being performed simultaneously, or that no tire pressures are being adjusted on another TPM equipped vehicle within close proximity.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Turn ignition switch to ACC position. Apply parking brake.
3. Simultaneously press the keyless entry transmitter's lock and unlock buttons until a double horn chirp sounds, indicating the Learn Mode has been enabled.

NOTE: The left front turn signal will also illuminate to indicate the learn mode has been enabled.

4. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
5. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
6. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

TPMS RESET - PROCEDURE 4

NOTE: If the wheels have been rotated, or tire pressure sensor or Remote Control Door Lock Receiver (RCDLR) is replaced, the TPM system needs to relearn tire pressure sensor IDs.

NOTE: When the tire pressure warning light illuminates and warning message appears on DIC, immediately check air pressure of all tires and adjust to the specified pressure. If warning indicators are still on, there is a problem in the TPM system. See appropriate manufacturer service information.

NOTE: The TPM system will cancel Learn Mode if ignition is turned off, if more than 1 or 2 minutes has passed and no sensors have been learned, vehicle battery voltage is less than 8 volts, all 4 sensors have been learned, or if the RCDLR has been in Learn Mode for more than 5 minutes. If Learn Mode is cancelled before any IDs are learned, the RCDLR will remember all previously stored IDs and their locations. As soon as the first sensor ID is learned, all other IDs are erased from the RCDLR's memory.

NOTE: Before proceeding with the registration procedure, ensure that no other sensor learn procedure is being performed simultaneously, or that no tire pressures are being adjusted on another TPM equipped vehicle within close proximity.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Turn ignition ON with engine OFF.

NOTE: If the TPM Learn Mode cannot be enabled, ensure the TPM option is enabled in the RCDLR. See appropriate manufacturer service information.

3. Simultaneously press the keyless entry transmitter's lock and unlock buttons until a horn chirp sounds, indicating Learn Mode has been enabled.

NOTE: If a horn chirp does not sound after 15 seconds, remove, then re-apply TPM sensor relearn magnet.

4. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
5. After the horn chirp sounds, proceed to the next 3 sensors in the following order: right front, right rear, then left rear.
6. After the left rear sensor ID is learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn the ignition switch to OFF position to exit Learn Mode.

TPMS RESET - PROCEDURE 5

NOTE: If the wheels have been rotated, or tire pressure sensor or Remote Control Door Lock Receiver (RCDLR) is replaced, the TPM system needs to relearn tire pressure sensor IDs.

NOTE: When the tire pressure warning light illuminates and warning message appears on DIC, immediately check air pressure of all tires and adjust to the specified pressure. If warning indicators are still on, there is a problem in the TPM system. See appropriate manufacturer service information.

NOTE: The TPM system will cancel Learn Mode if ignition is turned off, if more than 1 or 2 minutes has passed and no sensors have been learned, vehicle battery voltage is less than 8 volts, all 4 sensors have been learned, or if the RCDLR has been in Learn Mode for more than 5 minutes. If Learn Mode is cancelled before any IDs are learned, the RCDLR will remember all previously stored IDs and their locations. As soon as the first sensor ID is learned, all other IDs are erased from the RCDLR's memory.

NOTE: Before proceeding with the registration procedure, ensure that no other sensor learn procedure is being performed simultaneously, or that no tire pressures are being adjusted on another TPM equipped vehicle within close proximity.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Turn ignition ON with engine OFF.
3. Simultaneously press the keyless entry transmitter's lock and unlock buttons until a horn chirp sounds, indicating Learn Mode has been enabled.
4. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
5. After the horn chirp sounds, proceed to the next 3 sensors in the following order: right front, right rear, then left rear.
6. After the left rear sensor ID is learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn the ignition switch to OFF position to exit Learn Mode.

TPMS RESET - PROCEDURE 6

NOTE: If the wheels have been rotated, or tire pressure sensor or Remote Control Door

Lock Receiver (RCDLR) is replaced, the TPM system needs to relearn tire pressure sensor IDs.

NOTE: When the tire pressure warning light illuminates and warning message appears on DIC, immediately check air pressure of all tires and adjust to the specified pressure. If warning indicators are still on, there is a problem in the TPM system. See appropriate manufacturer service information.

NOTE: The TPM system will cancel Learn Mode if ignition is turned off, if more than 1 or 2 minutes has passed and no sensors have been learned, vehicle battery voltage is less than 8 volts, all 4 sensors have been learned, or if the RCDLR has been in Learn Mode for more than 5 minutes. If Learn Mode is cancelled before any IDs are learned, the RCDLR will remember all previously stored IDs and their locations. As soon as the first sensor ID is learned, all other IDs are erased from the RCDLR's memory.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Turn ignition ON with engine OFF.
3. Press RESET button on DIC in order to clear any warning messages.
4. Press and release OPTIONS button until display is blank.
5. Press and hold RESET button for 3 seconds.

NOTE: If the DIC does not display "TIRE TRAINING" message, ensure TPM option is enabled in the RCDLR. See appropriate manufacturer service information.

6. Press and release OPTIONS button until "TIRE TRAINING" is displayed.
7. Press and release RESET button. The DIC should display "LEARN L FRONT TIRE", verifying Learn Mode has been enabled.
8. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
9. After the horn chirp sounds, proceed to the next 3 sensors in the following order: right front, right rear, then left rear.
10. Turn the ignition switch to OFF position to exit the learn mode.

TPMS RESET - PROCEDURE 7

NOTE: An OEM scan tool or Pressure Increase/Decrease Method is used to perform this procedure.

NOTE: Before proceeding with this process, ensure that no other learn procedure is being performed simultaneously or that tire pressures are not being adjusted on another TPM equipped vehicle within close proximity. Stray signals from

other TPM equipped vehicles just driving by can be inadvertently learned. If any random horn chirps are heard from the vehicle while performing the learn procedure, most likely a stray sensor has been learned and the procedure will need to be cancelled and repeated. Under these circumstances, performing the TPM Learn Procedure away from other vehicles would be highly recommended. In the event a particular sensor activation does not cause the horn to chirp, it may be necessary to rotate the wheel valve stem to a different position due to the sensor signal is being blocked by another component.

1. Ignition ON with engine OFF, apply the parking brake.
2. Using a scan tool, initiate the TPM Learn Mode.
3. Perform the procedure by following the menu selections. A double horn chirp will sound and the IPC tire pressure monitor indicator warning lamp icon will flash indicating Learn Mode is enabled.
4. Starting with the left front tire, active the sensors by one of the following methods:
 - Hold the antenna of the scan tool, aimed upward, against the tire sidewall close to the wheel rim at the valve stem location. Press and release the activate button and wait for a horn chirp. Once the horn chirp has sounded, the sensor information is learned.
 - Increase/decrease the tire pressure for 8-10 seconds then wait for a horn chirp. The horn chirp may occur before or up to 30 seconds after the 8-10 second pressure increase/decrease time period has been reached. Once the horn chirp has sounded, the sensor information has been learned.
5. After the horn chirp has sounded, repeat step 4 for the remaining 3 sensors in the following order: Right front, Right rear, Left rear.
6. After the left rear sensor is learned, a double horn chirp will sound indicating all sensor IDs have been learned and the tire pressure module will exit the Learn mode turning OFF the IPC tire pressure monitor warning indicator lamp icon.
7. Ignition OFF, adjust all tires to the recommended pressures. Refer to the tire placard label.

TPMS RESET - PROCEDURE 8

Automatic Sensor Learn Process

Each TPMS sensor has a unique identification code. The identification code needs to be matched to a new tire/wheel position after rotating the tires or replacing one or more of the TPMS sensors. When a tire is installed, the vehicle must be stationary for about 20 minutes before the system recalculates. The following relearn process takes up to 10 minutes, driving at a minimum speed of 12 mph (19 km/h). A dash (-) or pressure value will display in the DIC. A warning message displays in the DIC if a problem occurs during the relearn process.

TPMS RESET - PROCEDURE 9

NOTE: If a tire pressure sensor or the Remote Control Door Lock Receiver (RCDLR) is replaced, or if wheels have been rotated, tire pressure sensor must be relearned.

NOTE: When the tire pressure warning light illuminates and warning message appears

on DIC, immediately check air pressure of all tires and adjust to the specified pressure. If warning indicators are still on or display shows dashes instead of a value, there is a problem in the TPM system. See appropriate manufacturer service information.

NOTE: The TPM system will cancel the learn mode if more than 2 minutes have passed and no sensors have been learned, or if the ignition switch is turned to the OFF position. If the learn mode is canceled before the first ID is learned, the RCDLR will remember all previously stored IDs and their locations. As soon as the first sensor ID is learned, all other IDs are erased from the RCDLR's memory. If the learn mode is canceled after the first ID is learned, the RCDLR will store the IDs as invalid and the DIC will display dashes instead of tire pressures.

NOTE: Before proceeding with the registration procedure, ensure that no other sensor learn procedure is being performed simultaneously, or that no tire pressures are being adjusted on another TPM equipped vehicle within close proximity.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Turn ignition switch to RUN position. Apply parking brake.
3. Simultaneously press the keyless entry transmitter's lock and unlock buttons until a double horn chirp sounds, indicating the Learn Mode has been enabled.
4. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
5. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
6. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

TPMS RESET - PROCEDURE 10

NOTE: If a tire pressure sensor or the Remote Control Door Lock Receiver (RCDLR) is replaced, or if wheels have been rotated, tire pressure sensor must be relearned.

NOTE: When the tire pressure warning light illuminates and warning message appears on DIC, immediately check air pressure of all tires and adjust to the specified pressure. If warning indicators are still on or display shows dashes instead of a value, there is a problem in the TPM system. See appropriate manufacturer service information.

NOTE: The TPM system will cancel the learn mode if more than 2 minutes have passed and no sensors have been learned, or if the ignition switch is turned to the OFF position. If the learn mode is canceled before the first ID is learned, the RCDLR will remember all previously stored IDs and their locations. As soon as the first

sensor ID is learned, all other IDs are erased from the RCDLR's memory. If the learn mode is canceled after the first ID is learned, the RCDLR will store the IDs as invalid and the DIC will display dashes instead of tire pressures.

NOTE: Before proceeding with the registration procedure, ensure that no other sensor learn procedure is being performed simultaneously, or that no tire pressures are being adjusted on another TPM equipped vehicle within close proximity.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Depending on ignition type:
 - With standard ignition switch, place the switch in the RUN position.
 - With electronic keyless ignition, place the switch in the ACC position.
3. Simultaneously press the keyless entry transmitter's lock and unlock buttons until a double horn chirp sounds, indicating the Learn Mode has been enabled.
4. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
5. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
6. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

TPMS RESET - PROCEDURE 11

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Place the vehicle power mode in ON/RUN/START.
4. Make sure the Tire Pressure info display option is turned on. The info displays on the DIC can be turned on and off through the Settings menu.
5. Use the five-way DIC control on the right side of the steering wheel to scroll to the Tire Pressure screen under the DIC info page.
6. Press and hold the SEL button located in the center of the five-way DIC control. The horn sounds twice to signal the receiver is in relearn mode and the TIRE LEARNING ACTIVE message displays on the DIC screen
7. Start with the driver side front tire. Place a tire sensor activation tool against the tire sidewall, near the valve stem. Then press the button to activate the TPMS sensor. A horn chirp confirms that the sensor identification code has been matched to this tire and wheel position.
8. After horn chirp has sounded, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
9. After left rear sensor has been learned, the horn sounds two times to indicate the sensor identification code has been matched to the driver side rear tire, and the TPMS sensor matching process is no longer active. The TIRE LEARNING ACTIVE message on the DIC display screen goes off.
10. Press STOP to turn the ignition off.

TPMS RESET - PROCEDURE 12

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Turn the ignition to ON/RUN with the engine off.
4. Use the MENU button (center console) to select the Vehicle Information Menu in the Driver Information Center (DIC). Use the arrow keys to scroll to the Tire Pressure screen
5. Press the SET/CLR button to begin the sensor matching process. A message requesting acceptance of the process should display.
6. Press the SET/CLR button again to confirm the selection. The horn sounds twice to signal the receiver is in relearn mode and the TIRE LEARNING ACTIVE message displays on the DIC screen.
7. Start with the driver side front tire. Place a tire sensor activation tool against the tire sidewall, near the valve stem. Then press the button to activate the TPMS sensor. A horn chirp confirms that the sensor identification code has been matched to this tire and wheel position.
8. After horn chirp has sounded, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
9. After left rear sensor has been learned, the horn sounds two times to indicate the sensor identification code has been matched to the driver side rear tire, and the TPMS sensor matching process is no longer active. The TIRE LEARNING ACTIVE message on the DIC display screen goes off.
10. Turn the ignition to LOCK/OFF.

TPMS RESET - PROCEDURE 13

LOW TIRE PRESSURE light comes on if air pressure in one tire drops to 12 psi (kPa) less than the other 3 tires, if tires are rotated, if tire(s) are repaired or replaced, if air pressure is adjusted or when vehicle battery is disconnected. Light will stay on until ignition is turned off or RESET button is pressed. Check and adjust air pressure in all 4 tires before resetting system.

1. There are 2 ways to reset the tire inflation monitor. To reset the tire inflation monitor using the exterior or interior lamp controls, go to step 4. To reset tire inflation monitor using the radio, turn the radio off. Turn ignition to ACC or ON, with the engine OFF. Press and hold the TUNE DISP button on the radio for at least 5 seconds until settings is displayed.
2. To scroll through the main menu:
 - On Impala, press the SEEK PTYPE up or down arrow.
 - On Monte Carlo, press the SEEK PSCAN up or down arrow.On all models, scroll until TIRE MON appears on the display. Press the 1 PREV or 2 NEXT button to enter the sub-menu. RESET will be displayed.
3. Press the TUNE DISP button to reset. A chime will sound to verify the new setting and DONE will be displayed for one second. Once the message has been reset, scroll through the menu until EXIT appears on the display. Press the TUNE DISP button to exit the program. A chime will sound to verify the exit.
4. Reset the tire inflation monitor:
 - On Impala, using the interior lighting controls, turn the switch from OFF to ON position 3 times with ignition switch in ON position.

- On Monte Carlo, using the exterior lighting controls, turn the switch from OFF to parking lamps 3 times with ignition switch in ON position.

TPMS RESET - PROCEDURE 14

NOTE: There are 3 different ways to reset the Tire Pressure Monitor (TPM) system. After resetting, the TPM system requires up to 30 minutes of straight line driving in each of the 3 speed ranges to complete the calibration process.

Using Exterior Lamp Switch

1. Adjust all tire pressures to the recommended kPa/psi.
2. Turn ignition ON with engine OFF.
3. Cycle the exterior lamp switch from OFF to parking lamps 3 times within 5 seconds.
4. Use the scan tool in order to clear the TPM DTC.

Using RDS Radio, If Equipped

1. Adjust all tire pressures to the recommended kPa/psi.
2. Turn the ignition to ACC or ON, with the engine OFF.
3. Turn the radio OFF.
4. Press and hold the DISP button until SETTINGS is displayed.
5. Press the SEEK up or down arrows until TIRE MON is displayed.
6. Press the PREV or NEXT button to enter the sub-menu. RESET will be displayed.
7. Press the DISP button, A chime will sound and DONE will be displayed.
8. Scroll until EXIT is displayed.
9. Press the DISP button to exit the TPM reset mode. A chime will sound to verify exit.
10. Use the scan tool in order to clear the TPM DTC.

Using Scan Tool

1. Adjust all tire pressures to the recommended kPa/psi.
2. Install the scan tool.
3. Turn ignition ON with engine OFF.
4. With the scan tool select Special Functions.
5. Select TIM Reset.
6. Press the Reset soft key.
7. Use the scan tool in order to clear the TPM DTC.

TPMS RESET - PROCEDURE 15

CHECK TIRE PRESSURE or TIRE PRESS message will come on if air pressure in one tire is lower than the

other 3 tires, if tires are rotated, if tire(s) are repaired or replaced, or if air pressure is adjusted. Message will stay on until system is recalibrated. Check and adjust air pressure in all 4 tires before recalibrating system.

NOTE: If vehicle is equipped with Systems Monitor, go to step 2.

1. To recalibrate vehicle equipped with Driver Information Center (DIC), turn ignition ON with engine OFF. Using the MODE and SELECT button on DIC, change display until TIRE PRESSURE appears. Press and hold RESET button for 5 seconds. TIRE PRESSURE RESET should now appear on display. If TIRE PRESSURE RESET does not appear on display after 5 seconds, repair system as necessary. Using a scan tool, clear TPM DTC.
2. To recalibrate vehicle equipped with Systems Monitor, turn ignition ON with engine OFF. Press and hold TIRE PRESS RESET button for 5 seconds. TIRE PRESS light on the Systems Monitor should begin to flash. Release the TIRE PRESS RESET button. TIRE PRESS light should go out and system is now reset. If TIRE PRESS light does not begin to flash after 5 seconds, repair system as necessary. Using a scan tool, clear TPM DTC.

TPMS RESET - PROCEDURE 16

CHECK TIRE PRESSURE light comes on if air pressure in one tire drops to 12 psi (kPa) less than the other 3 tires, if tires are rotated, if tire(s) are repaired or replaced, or if air pressure is adjusted. Light will stay on until ignition is turned off or RESET button is pressed. Check and adjust air pressure in all 4 tires before resetting system.

1. To reset tire inflation monitor, turn ignition ON with engine OFF. Press and release the RESET button. RESET button is located inside of driver's side instrument panel fuse block (left end of instrument panel). The CHANGE OIL indicator light will begin to flash.
2. Press and release the RESET button again. The CHANGE OIL indicator light will turn off, and the CHECK TIRE PRESSURE indicator light will begin to flash. While the CHECK TIRE PRESSURE indicator light is flashing, press and hold the RESET button until the chime sounds indicating system is reset. If CHECK TIRE PRESSURE light does not go out, repeat reset procedure. If system still will not reset, repair system as necessary.

TPMS RESET - PROCEDURE 17

NOTE: When a spare tire is mounted, a wheel is replaced or rotated, or tire pressure has been adjusted, TPM system will need to be recalibrated.

NOTE: When the low tire pressure warning messages appear, immediately check air pressure of all tires and adjust to the specified pressure. If warning messages are still displayed, there is a malfunction in the TPM system. See appropriate manufacturer service information.

NOTE: Under the following conditions, the system may not function properly:

- **More than one tire is low.**

- Only one tire is replaced with a new tire during service.
- Vehicle is moving faster than 65 mph (105 km/h).
- The system is not yet calibrated.
- Tire treadwear is uneven.
- Compact spare tire is installed.
- Tire chains are being used.
- Vehicle is being driven on a rough or frozen road.
- If ABS warning light is on.

CAUTION: DO NOT recalibrate TPM system until all problems are fixed and tire pressure in all 4 tires has been adjusted. If recalibration is done when tire pressures are incorrect, TPM system will not work properly and may not set an alert when a tire pressure is low or high.

NOTE: There are 2 ways to recalibrate the Tire Pressure Monitor (TPM) system:

- *Using DIC Reset Button* (if no scan tool is available)
- *Using Scan Tool* (if an OBD-II compatible scan tool is available).

Using DIC Reset Button

1. Turn ignition switch to OFF position.
2. Ensure all tire pressures are adjusted to the pressure recommended on tire pressure label.
3. Turn ignition ON with engine OFF.
4. Press SELECT right arrow button until "GAGE" is displayed.
5. Press SELECT down arrow button until "TIRE PRESSURE" is displayed.
6. Press and hold RESET button until "TIRE PRESSURE RESET" is displayed.
7. Release RESET button. DIC should display "TIRE PRESSURE NORMAL".
8. After resetting, the TPM system requires up to 30 minutes of straight line driving in each of the following speed ranges to complete calibration process:
 - 15-40 mph (24-64 km/h).
 - 40-70 mph (64-113 km/h).
 - 70-90 mph (113-145 km/h).

NOTE: The EBCM learns tire pressure calibration for each speed range independently. In Monitor Mode 1, EBCM has only partially learned tire pressure calibration for speed range and has limited detection capability for a tire pressure condition. In Monitor Mode 2, EBCM has fully learned tire pressure calibration for speed range and has full detection capability for a tire pressure condition.

NOTE: Learning process does not need to be completed during a single trip.

Using Scan Tool

1. Turn ignition switch to OFF position.
2. Ensure all tire pressures are adjusted to the pressure recommended on tire pressure label.
3. Connect scan tool. Turn ignition ON with engine OFF.
4. Using scan tool, select "SPECIAL FUNCTIONS".
5. Select "TIRE PRESSURE RESET".
6. Press RESET soft key. A "TIRE PRESSURE NORMAL" message should appear on display.
7. If necessary, use scan tool to clear any TPM Diagnostic Trouble Codes (DTCs).
8. After resetting, the TPM system requires up to 30 minutes of straight line driving in each of the following speed ranges to complete calibration process:
 - 15-40 mph (24-64 km/h).
 - 40-70 mph (64-113 km/h).
 - 70-90 mph (113-145 km/h).

NOTE: The EBCM learns tire pressure calibration for each speed range independently. In Monitor Mode 1, EBCM has only partially learned tire pressure calibration for speed range and has limited detection capability for a tire pressure condition. In Monitor Mode 2, EBCM has fully learned tire pressure calibration for speed range and has full detection capability for a tire pressure condition.

NOTE: Learning process does not need to be completed during a single trip.

TPMS RESET - PROCEDURE 18

The Tire Pressure Monitor (TPM) system alerts the driver when a large change in the pressure of one tire exists, while the vehicle is being driven. The TPM system uses the Electronic Brake Control Module (EBCM), ABS wheel speed sensor inputs, class 2 serial data circuit, and the Driver Information Center (DIC) to perform the system functions. The EBCM contains software to calculate relative tire pressure differences. The software requires approximately 30 minutes of straight line driving in 3 different speed ranges to complete the calibration process to have full capability for detecting a tire pressure condition. The speed ranges are 15-40 mph, 40-70 mph and 70-90 mph.

1. LOW TIRE PRESSURE light comes on if air pressure in one tire drops to 12 psi less than the other 3 tires, if tires are rotated, if tire(s) are repaired or replaced, if air pressure is adjusted or if vehicle battery is disconnected. Light will stay on until ignition is turned off or RESET button is pressed. Check and adjust air pressure in all 4 tires before resetting system.
2. To reset tire inflation monitor, turn ignition ON with engine OFF. Press and release the RESET button. RESET button is located inside of driver's side instrument panel fuse block (left end of instrument panel). The CHANGE OIL indicator light will begin to flash.
3. Press and release the RESET button again. The CHANGE OIL indicator light will turn off, and the LOW

TIRE PRESSURE indicator light will begin to flash. While the LOW TIRE PRESSURE indicator light is flashing, press and hold the RESET button until the chime sounds indicating system is reset. If the LOW TIRE PRESSURE indicator light does not go out, repeat reset procedure. If system still will not reset, repair system as necessary.

TPMS RESET - PROCEDURE 19

NOTE: After resetting, the tire pressure monitoring (TPM) system requires 60 minutes or more of driving at a speed of 30 km/h (19 mph) or above to complete the calibration process to have full capability for detecting a tire pressure condition.

1. Adjust all tire pressures to the recommended kPa/psi.
2. Turn ignition ON with engine OFF.
3. Press and hold the tire pressure warning reset switch until the tire pressure warning indicator blinks 3 times at one second intervals.
4. If the tire pressure warning indicator does not blink, repeat the procedure starting at step 2.
5. Drive the vehicle for 60 minutes or more at a speed of 30 km/h (19 mph).
6. Verify the system has initialized. Turn ignition ON with engine OFF and observe the tire pressure warning indicator.
 - System Initialized: light on for 3 seconds.
 - System not initialized: light on for 4 seconds.

TPMS RESET - PROCEDURE 20

NOTE: When a spare tire is mounted, a wheel is replaced or rotated, or tire pressure has been adjusted, TPM system will need to be recalibrated.

CAUTION: DO NOT recalibrate TPM system until all problems are fixed and tire pressure in all 4 tires has been adjusted. If recalibration is done when tire pressures are incorrect, TPM system will not work properly and may not set an alert when a tire pressure is low or high.

NOTE: When the tire pressure warning message appears on DIC, immediately check air pressure of all tires and adjust to the specified pressure. If warning message is still displayed, there is a malfunction in the TPM system. See appropriate manufacturer service information.

NOTE: Under the following conditions, the system may not function properly:

- More than one tire is low.
- Vehicle is moving faster than 65 mph (105 km/h).
- The system is not yet calibrated.

- Tire treadwear is uneven.
- Compact spare tire is installed.
- Tire chains are being used.
- Vehicle is being driven on a rough or frozen road.
- If ABS warning light is on.

NOTE: There are 2 ways to recalibrate the Tire Pressure Monitor (TPM) system:

- *Using DIC Reset Button* (if no scan tool is available)
- *Using Scan Tool* (if an OBD-II compatible scan tool is available).

Using DIC Reset Button

1. Turn ignition switch to OFF position.
2. Ensure all tire pressures are adjusted to the pressure recommended on tire pressure label.
3. Turn ignition ON with engine OFF.
4. Press and hold appropriate button (located on left side of steering column) until "TIRE PRESSURE" message appears on display:
 - 1997-99 models: Press and hold GAGES button
 - 2000-05 models: Press and hold GAGES INFO button
5. Press and hold RESET button for 5 seconds. After 5 seconds, "TIRE PRESSURE RESET" message should appear on display.
6. Release RESET button. A "TIRE PRESSURE NORMAL" message should appear on display.
7. After resetting, the TPM system requires up to 30 minutes of straight line driving in each of the following speed ranges to complete calibration process:
 - 15-40 mph (24-64 km/h).
 - 40-70 mph (64-113 km/h).
 - 70-90 mph (113-145 km/h).

NOTE: The EBCM learns tire pressure calibration for each speed range independently. In Monitor Mode 1, EBCM has only partially learned tire pressure calibration for speed range and has limited detection capability for a tire pressure condition. In Monitor Mode 2, EBCM has fully learned tire pressure calibration for speed range and has full detection capability for a tire pressure condition.

NOTE: Learning process does not need to be completed during a single trip.

Using Scan Tool

1. Turn ignition switch to OFF position.
2. Ensure all tire pressures are adjusted to the pressure recommended on tire pressure label.

3. Connect scan tool. Turn ignition ON with engine OFF.
4. Using scan tool, select SPECIAL FUNCTIONS.
5. Select TIM RESET.
6. Press RESET soft key. A "TIRE PRESSURE NORMAL" message should appear on display.
7. If necessary, use scan tool to clear any TPM Diagnostic Trouble Codes (DTCs).
8. After resetting, the TPM system requires up to 30 minutes of straight line driving in each of the following speed ranges to complete calibration process:
 - 15-40 mph (24-64 km/h).
 - 40-70 mph (64-113 km/h).
 - 70-90 mph (113-145 km/h).

NOTE: The EBCM learns tire pressure calibration for each speed range independently. In Monitor Mode 1, EBCM has only partially learned tire pressure calibration for speed range and has limited detection capability for a tire pressure condition. In Monitor Mode 2, EBCM has fully learned tire pressure calibration for speed range and has full detection capability for a tire pressure condition.

NOTE: Learning process does not need to be completed during a single trip.

TPMS RESET - PROCEDURE 21

Using Reset Button (1999-05 Models)

1. Adjust all tire pressures to the recommended Psi (kPa). See vehicle's Loading Information Label for recommended tire pressure. Turn ignition ON with engine OFF.
2. Press and hold the red RESET button located in the passenger side instrument panel fuse block.
3. The LOW TIRE indicator will flash 3 times, then turn off.
4. Use scan tool to clear the TPM DTC.

Using Scan Tool (2003-05 Models)

1. Adjust all tire pressures to the recommended Psi (kPa). See vehicle's Loading Information Label for recommended tire pressure. Turn ignition ON with engine OFF.
2. Install scan tool. Turn ignition ON with engine OFF.
3. With scan tool, select Special Functions.
4. Select TIM Reset.
5. Press Reset soft key.
6. LOW TIRE indicator will flash 3 times, then turn OFF.
7. Clear the TPM DTC.

TPMS RESET - PROCEDURE 22

NOTE: When a spare tire is mounted, a wheel is replaced or rotated, or tire pressure has been adjusted, TPM system will need to be recalibrated.

CAUTION: DO NOT recalibrate TPM system until all problems are fixed and tire pressure in all 4 tires has been adjusted. If recalibration is done when tire pressures are incorrect, TPM system will not work properly and may not set an alert when a tire pressure is low or high.

1. Turn ignition switch to OFF position.
2. Ensure all tire pressures are adjusted to the pressure recommended on tire pressure label.
3. Turn ignition ON with engine OFF.
4. Press and hold the MODE button until DIC display reads "LOW TIRE PRESSURE HOLD SET TO RESET".
5. Press and hold SET button chime sounds and "TIRE PRESSURE RESET" is displayed and a chime sounds 3 times.
6. Release SET button and DIC will display "TIRE PRESSURE NORMAL".

NOTE: If low tire pressure warning message is still set, TPM system has not reset. Repeat procedure. If it does not work after two tries, refer to appropriate service information.

7. After resetting, the TPM system requires up to 5 miles of driving in each of the following speed ranges to complete the calibration process:
 - 25-40 mph (40-64 km/h).
 - 40-60 mph (65-96 km/h).
 - 60-85 mph (96-136 km/h).

NOTE: Learning process does not need to be completed during a single trip.

TPMS RESET - PROCEDURE 23

1. Check and adjust air pressure in all 4 tires before resetting system. Refer to tire placard located on the inside edge of the driver's door. Turn ignition ON, with engine OFF.
2. Press the MODE button on the Driver Information System until LOW TIRE PRESSURE HOLD SET TO RESET is displayed.
3. Press and hold the SET button until a chime sounds and TIRE PRESSURE RESET is displayed and a chime sounds 3 times.
4. Release the SET button and TIRE PRESSURE NORMAL will be displayed.

TPMS RESET - PROCEDURE 24

NOTE: When a spare tire is mounted, a wheel is replaced or rotated, or tire pressure has been adjusted, TPM system will need to be recalibrated.

CAUTION: DO NOT recalibrate TPM system until all problems are fixed and tire pressure in all 4 tires has been adjusted. If recalibration is done when tire pressures are incorrect, TPM system will not work properly and may not set an alert when a tire pressure is low or high.

1. Turn ignition switch to OFF position.
2. Ensure all tire pressures are adjusted to the pressure recommended on tire pressure label.
3. Turn ignition ON with engine OFF.
4. Press and hold the MODE button until DIC display reads "LOW TIRE PRESSURE HOLD SET TO RESET".
5. Press and hold SET button until a chime sounds and "TIRE PRESSURE RESET" is displayed.
6. System will now sound a chime 3 times, and DIC will display "TIRE PRESSURE NORMAL".

NOTE: If low tire pressure warning message is still set, TPM system has not reset. Repeat procedure.

7. After resetting, the TPM system requires up to 5 miles (8 km) of flat, smooth road, straight line driving in each of the 4 speed ranges (about 10-20 minutes in each range) to complete the calibration process:
 - 19-40 mph (31-65 km/h).
 - 40-59 mph (65-95 km/h).
 - 59-74.5 mph (95-120 km/h).
 - 74.5-90 mph (120-145 km/h).

NOTE: The EBCM learns tire pressure calibration for each speed range independently. In Calibration Mode, EBCM has only partially learned tire pressure calibration for speed range and has limited detection capability for a tire pressure condition. In Detection Mode, EBCM has fully learned tire pressure calibration for speed range and has full detection capability for a tire pressure condition.

NOTE: Learning process does not need to be completed during a single trip.

TPMS RESET - PROCEDURE 25

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Turn the ignition to ON/ RUN with the engine OFF or place the vehicle power mode in ON/ RUN/ START. See **Fig. 4**.
4. Use the MENU button to select the VEHICLE INFORMATION MENU in the Driver Information Center (DIC). See **Fig. 5**.
5. Use the thumbwheel (or up and down arrows) to scroll to the TIRE PRESSURE MENU item screen.
6. Press the SET/CLR button to begin the sensor matching process. A message requesting acceptance of the

process should display.

7. Press the SET/CLR button again to confirm the selection. The horn sounds twice to signal the receiver is in relearn mode and the TIRE LEARNING ACTIVE message displays on the DIC screen.
8. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
9. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
10. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

Ignition Positions

Keyless Access

Pressing the button cycles it through three modes: ACC/ACCESSORY, ON/RUN/START, and Stopping the Engine/OFF.

Key Access

The ignition switch has four different positions.

Fig. 4: Ignition Positions (Key & Keyless)

Fig. 5: Identifying DIC Controls (Turn Signal Lever)

Courtesy of GENERAL MOTORS CORP.

TPMS RESET - PROCEDURE 26

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Turn the ignition to ON/RUN with the engine OFF.
4. Up-level Driver Information Center (DIC) Only: Make sure the TIRE PRESSURE INFO page option is turned on. The info pages on the DIC can be turned on and off through the SETTINGS menu.
5. If the vehicle has an up-level DIC, use the DIC controls (arrow buttons) on the right side of the steering wheel to scroll to the TIRE PRESSURE screen under the DIC info page. If the vehicle has a base-level DIC, use the TRIP ODOMETER RESET stem to scroll to the TIRE PRESSURE screen.
6. If the vehicle has an up-level DIC, press and hold the SET/RESET button (check-mark symbol) located in the center of the DIC controls. If the vehicle has a base-level DIC, press and hold the TRIP ODOMETER RESET stem for about five seconds. A message asking if the process should begin should appear. Select YES and press the TRIP ODOMETER RESET stem to confirm the selection.
7. The horn sounds twice to signal the receiver is in relearn mode and the TIRE LEARNING ACTIVE message displays on the DIC screen.
8. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
9. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
10. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

TPMS RESET - PROCEDURE 27

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Turn ignition switch to ON/RUN position, with engine OFF.
3. Simultaneously press the keyless entry transmitter's lock and unlock buttons until a horn chirp sounds, indicating Learn Mode has been enabled. The TIRE LEARNING ACTIVE message displays on the DIC screen.

NOTE: If the vehicle does not have RKE, press the Driver Information Center (DIC) vehicle information button until the PRESS (check mark symbol) TO RELEARN TIRE POSITIONS message displays. The horn sounds twice to signal the receiver is in relearn mode and TIRE LEARNING ACTIVE message displays on the DIC screen. If the vehicle does not have RKE or DIC buttons, press the trip odometer reset stem on the instrument cluster until the PRESS (check mark symbol) TO RELEARN TIRE POSITIONS message displays. The horn sounds twice to signal the receiver is in relearn mode and TIRE LEARNING ACTIVE message displays on the DIC screen.

4. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
5. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
6. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

TPMS RESET - PROCEDURE 28

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Turn the ignition to ON/ RUN with the engine OFF or place the vehicle power mode in ON/ RUN/ START. See **Fig. 4**.
4. Make sure the Tire Pressure info page option is turned on. The info pages on the Driver Information Center (DIC) can be turned on and off through the Settings menu.
5. Use the DIC controls on the right side of the steering wheel to scroll to the Tire Pressure screen under the DIC info page.
6. Press and hold the SET/RESET button (check mark symbol) located in the center of the DIC controls.
7. The horn sounds twice to signal the receiver is in relearn mode and the TIRE LEARNING ACTIVE message displays on the DIC screen.
8. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
9. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
10. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

TPMS RESET - PROCEDURE 29

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Turn the ignition to ON/RUN with the engine OFF.
4. Press the MENU button once on the Driver Information Center (DIC).
5. Press the up or down arrow button until the Tire Learn screen is displayed.
6. Press and hold the SET/CLR button to begin the sensor matching process.
7. The horn sounds twice to signal the receiver is in relearn mode and the TIRE LEARNING ACTIVE message displays on the DIC screen.
8. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
9. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
10. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have

been learned. Turn ignition switch to OFF position to exit Learn Mode.

TPMS RESET - PROCEDURE 30

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Put the vehicle in ON/ RUN and place the vehicle in P (Park).
4. If the Driver Information Center (DIC) display is minimized, press the SELECT knob to maximize it.
5. Use the SELECT knob to scroll to the Tire Pressure display screen.
6. Press and hold the SELECT knob for five seconds to begin the sensor matching process. A message displays confirming to begin the process.
7. Use the SELECT knob to select YES with the highlighted selection, and press the SELECT knob again to confirm the selection.
8. The horn sounds twice to signal the receiver is in relearn mode and the TIRE LEARNING ACTIVE message displays on the DIC screen.
9. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
10. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
11. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

TPMS RESET - PROCEDURE 31

NOTE: **You have two minutes to match the first tire/wheel position, and five minutes overall to match all four tire/wheel positions. If it takes longer, the matching process stops and must be restarted.**

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Turn the ignition to ON/RUN with the engine off.
4. Enter the learn sequence from the TPM Learn screen, located under the Customization Menu in the instrument panel cluster. Press SRCE button until you see Customize Options and then press ENTER (left pointing arrow). Move the thumbwheel up or down to scroll through the available options. Press ENTER to select an item. To exit the current menu, or go back, use the thumbwheel to select BACK (left arrow) at the top of the screen and then press ENTER.
5. Start with the driver side front tire. The driver side front indicator lamp also comes on to indicate that corner's sensor is ready to be learned. Place a tire sensor activation tool against the tire sidewall, near the valve stem. Then press the button to activate the TPMS sensor. A horn chirp confirms that the sensor identification code has been matched to this tire and wheel position
6. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
7. After the driver side rear TPMS sensor has been learned the horn chirps two times. The driver side rear

indicator lamp turns off and the TPMS sensor matching process is done. Turn the ignition switch to LOCK/OFF.

Circuit/System Description

The vehicle speed sensor (VSS) is a 3 wire sensor. The engine control module (ECM) provides a 5 volt reference circuit, low reference circuit and a signal circuit to the VSS. The VSS is a Hall Effect type sensor that produces a square wave output signal to the ECM. As vehicle speed increases, the output frequency of the VSS signal increases. The ECM converts the square wave output signal into vehicle speed shown as km/h (MPH). The ECM supplies the VSS signal to other control modules on the vehicle through the serial data communications line.

Conditions for Running the DTC

P0502

- DTC P0101, P0102, P0103, P0106, P0107, P0108, P0300, P0301, P0302, P0303, P0304, P0305, P0306, or P0503 is not set.
- Ignition voltage is between 11-32 V.
- Throttle position is 8 % or greater.
- Engine speed is between 1,500-6,500 RPM.

P0503

- Ignition voltage is between 11-32 V.
- Engine speed is between 200-7,500 RPM for 5 s or greater.
- VSS signal is 200 RPM or greater for 2 s or greater.
- Change in VSS signal is 150 RPM or less for 2 s or greater.

Conditions for Setting the DTC

P0502

VSS signal is less than 60 RPM for 4.5 s.

P0503

Change in VSS signal is 350 RPM or greater for 3.3 s.

Action Taken When the DTC Sets

P0502 and P0503 are Type B DTCs.

Conditions for Clearing the DTC

P0502 and P0503 are Type B DTCs.

Diagnostic Aids

The battery must be fully charged. Refer to **Battery Inspection/Test** .

K20 Engine Control Module: Scan Tool Information

Special Tools

J-38522-A Vehicle Signal Generator

For equivalent regional tools, refer to **Special Tools**.

Circuit/System Verification

CAUTION: Support the lower control arms in the normal horizontal position in order to avoid damage to the drive axles. Do not operate the vehicle in gear with the wheels hanging down at full travel.

1. Raise and support the drive wheels in a horizontal position.
2. Start and idle the engine.
3. Place the transmission in second gear and release the clutch pedal.

4. Verify the scan tool Vehicle Speed Sensor parameter increases as the drive wheel speed increases.

- **If the Vehicle Speed Sensor parameter does not increase**

Refer to Circuit/System Testing.

- **If the Vehicle Speed Sensor parameter does increase**

5. Operate the vehicle within the conditions for running the DTC to verify the DTC does not set. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records.

- **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

6. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF. Disconnect the harness connector at the B115 Vehicle Speed Sensor. It may take up to 2 minutes for all vehicle systems to power down.

2. Test for less than 10 ohms between the low reference circuit terminal 2 and ground.

- **If 10 ohms or greater**

1. Disconnect the X2 harness connector at the K20 Engine Control Module.

2. Test for less than 2 ohms in the circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, replace the K20 Engine Control Module.

- **If less than 10 ohms**

3. Ignition ON.

4. Test for 4.8-5.2 V between the 5 V reference circuit terminal 1 and ground.

- **If less than 4.8 V**

1. Ignition OFF, disconnect the X2 harness connector at the K20 Engine Control Module.

2. Test for infinite resistance between the 5 V reference circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance

3. Test for less than 2 ohms in the 5 V reference circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, replace the K20 Engine Control Module.

- **If greater than 5.2 V**

1. Ignition OFF, disconnect the X2 harness connector at the K20 Engine Control Module, Ignition ON.

2. Test for less than 1 V between the 5 V reference circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.

- If less than 1 V, replace the K20 Engine Control Module.
- **If between 4.8-5.2 V**
- 5. Ignition OFF, connect the test leads of the J-38522-A vehicle signal generator as follows:
 - Red test lead to the signal circuit terminal 3 at the B115 Vehicle Speed Sensor wire harness connector.
 - Black test lead to ground at the transmission case.
 - Double black power and ground lead wire to B+ and ground.
- 6. Set and adjust the J-38522-A vehicle signal generator to the following switch positions:
 - Signal switch to 5 V.
 - Frequency switch to 600 Hz.
 - Duty cycle switch to 50% or normal position.
- 7. Ignition ON.
- 8. Verify the scan tool Vehicle Speed Sensor parameter displays between 41-51 km/h (25-32 mph).
 - **If the vehicle speed sensor parameter is not within the specified range**
 1. Ignition OFF, disconnect the X2 harness connector at the K20 Engine Control Module.
 2. Test for infinite resistance between the signal circuit terminal 3 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K20 Engine Control Module.
 - **If the vehicle speed sensor parameter is within the specified range**
- 9. Replace the B115 Vehicle Speed Sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Vehicle Speed Sensor Replacement**
- **Control Module References** for ECM replacement, programming and setup.

DTC P0806-P0808: CLUTCH PEDAL POSITION (CPP) SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Low Reference	-	0%	-

Circuit/System Description

The clutch pedal position (CPP) sensor is a three wire sensor, connected to a 5 V reference circuit, a low

reference circuit, and a signal circuit. The engine control module supplies 5 V to the CPP sensor, and also provides a sensor ground path on the low reference circuit. The CPP sensor sends a voltage signal to the ECM on the signal circuit. The voltage on the signal circuit will vary from a voltage near 4 V when the clutch pedal is released, to a voltage near 1 V when the clutch pedal is applied.

Conditions for Running the DTC

P0806

- DTC P0335, P0336, P0502, P0503, P0807, or P0808 is not set.
- The vehicle speed is greater than 8 kmh (5 mph).
- The ignition is ON.

P0807 and P0808

- DTC P0651 is not set.
- The system voltage is more than 9 V.
- The ignition is ON.

Conditions for Setting the DTC

P0806

The CPP sensor is stuck in range.

P0807

The CPP sensor voltage is less than 0.1 V for more than 1 s.

P0808

The CPP sensor voltage is more than 5.2 V for more than 1 s.

Action Taken When the DTC Sets

DTC P0806 - P0808 are Type A DTCs.

Conditions for Clearing the DTC

DTC P0806 - P0808 are Type A DTCs.

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

K20 Engine Control Module: Scan Tool Information for scan tool information

Circuit/System Verification

1. If DTC P0651 or P080A is set, refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .
2. Ignition ON.
3. Verify the scan tool CPP Sensor percent parameter varies from 0% when the clutch pedal is released, to 100% when the clutch pedal is in the apply position.
 - **If the percentage does not vary from 0% to 100%**

Refer to Circuit/System Testing.

- **If the percentage varies from 0% to 100%**
4. Operate the vehicle within the conditions for running the DTC to verify the DTC does not set. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
 - **If the DTC sets**

Refer to Circuit/System Testing.

 - **If the DTC does not set**
 5. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector of the B25B Clutch Pedal Position Sensor.
2. Test for less than 5 ohms between the low reference circuit terminal C and ground:
 - **If 5 ohms or greater**
 1. Disconnect the X1 harness connector at the K20 Engine Control Module.
 2. Test for less than 2 ohms in the circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K20 Engine Control Module.
 - **If less than 5 ohms**
3. Ignition ON.
4. Test for 4.8-5.2 V between the 5 V reference circuit terminal A and ground:
 - **If less than 4.8 V**
 1. Ignition OFF, disconnect the X1 harness connector at the K20 Engine Control Module.
 2. Test for infinite resistance between the 5 V reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the 5 V reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K20 Engine Control Module.
 - **If greater than 5.2 V**
 1. Ignition OFF, disconnect the X1 harness connector at the K20 Engine Control Module.
 2. Test for less than 1 V between the 5 V reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 Engine Control Module.
 - **If between 4.8-5.2 V**
5. Verify the scan tool CPP Sensor voltage parameter is less than 0.1 V.
 - **If 0.1 V or greater**
 1. Ignition OFF, disconnect the X1 harness connector at the K20 Engine Control Module, Ignition ON.
 2. Test for less than 1 V between the signal circuit terminal B and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 Engine Control Module.
 - **If less than 0.1 V**
6. Install a 3 A fused jumper wire between the signal circuit terminal B and the 5 V reference circuit terminal C.
7. Verify the scan tool CPP Sensor voltage parameter is greater than 4.9 V.
 - **If 4.9 V or less**
 1. Ignition OFF, remove the jumper wire, disconnect the X1 harness connector at the K20 Engine Control Module.

2. Test for infinite resistance between the signal circuit terminal B and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms , replace the K20 Engine Control Module.
 - **If greater than 4.9 V**
8. Test or replace the B25B Clutch Pedal Position Sensor.

Component Testing

Static Test

1. Ignition OFF, disconnect the harness connector of the B25B Clutch Pedal Position Sensor.
2. Measure the resistance between the signal terminal B and the low reference terminal C at the B25B Clutch Pedal Position Sensor. Depress the clutch pedal through the entire range. The resistance should vary from low to high and vice versa without any spikes or dropouts.
 - **If the resistance is erratic with spikes or dropouts**

Replace the B25B Clutch Pedal Position Sensor.
 - **If the resistance is not erratic without spikes or dropouts**
3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Clutch Pedal Position Sensor Replacement**
- **Control Module References** for ECM replacement, programming and setup.

DTC P080A: CLUTCH PEDAL POSITION (CPP) NOT LEARNED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P080A

Clutch Pedal Position (CPP) Not Learned

Circuit/System Description

The clutch pedal position (CPP) is a 3-wire sensor, connected to a 5 V reference circuit, a low reference circuit, and a signal circuit. The engine control module supplies 5 V to the CPP sensor, and also provides a sensor ground path on the low reference circuit. The CPP sensor sends a voltage signal to the ECM on the signal circuit. The voltage on the signal circuit will vary from a voltage near 5 V when the clutch pedal is released to a voltage less than or equal to 1.5 V when the clutch pedal is applied.

Conditions for Running the DTC

Clutch pedal fully applied.

Conditions for Setting the DTC

Clutch pedal position not learned.

Action Taken When the DTC Sets

P080A is a Type A DTC.

Conditions for Clearing the DTC

P080A is a Type A DTC.

Circuit/System Verification

Perform the clutch pedal position sensor learn procedure.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Clutch Pedal Position Sensor Learn**
- **Control Module References** for replacement, programming and setup.

CLUTCH PEDAL POSITION SENSOR LEARN

NOTE: The clutch pedal position (CPP) sensor learn procedure is required when the following service procedures have been performed regardless of whether DTC P080A is set:

- An engine control module (ECM) replacement
- A CPP sensor replacement
- Any repairs which affect the CPP sensor relationship

1. Install a scan tool.
2. Monitor the ECM for DTCs with a scan tool. If other DTCs are set, except DTC P080A, refer to **Diagnostic Trouble Code (DTC) List - Vehicle** for the applicable DTC that set.
3. With a scan tool, select Clutch Pedal Position Learn under Module Setup in Manual Transmission, and perform the following instructions displayed on the scan tool screen.

NOTE: The CPP sensor learn procedure cannot be performed more than once per ignition cycle. The clutch pedal needs to be fully depressed and held steady throughout this procedure in order to perform a correct learning.

4. The scan tool will display under CPP Learn Status: Not Learned, In Process, Complete, Fail - Low Volt, Fail - High Volt, or Fail Moving. The scan tool will display under CPP Learn Status Complete if the process was successful.
5. If the scan tool indicates that DTC P080A ran and passed this ignition the CPP sensor learn procedure is complete. If the scan tool indicates DTC P080A failed or did not run this ignition, refer to **DTC P080A**, . If any other DTC is set, refer to **Diagnostic Trouble Code (DTC) List - Vehicle** for the applicable DTC.
6. Turn OFF the ignition for 30 s after the learn procedure has successfully completed in order to store the CPP sensor variation values in ECM history.

Transmission Fluid Drain and Fill

Callout	Component Name
Preliminary Procedure	
Remove the battery tray. Refer to Battery Tray Replacement .	

1	<p>Transmission Filler Plug</p> <p>CAUTION: Refer to <u>Fastener Caution</u> .</p> <p>NOTE: A NEW filler plug must be installed.</p> <p>Tighten 30 (22 lb ft)</p>
2	<p>Transmission Drain Plug</p> <p>WARNING: When the transmission is at operating temperatures, take necessary precautions when removing the check/fill plug, to avoid being burned by draining fluid.</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Place pan under transmission to collect fluid. 2. Allow transmission fluid to drain out for approximately 10 minutes. <p>NOTE: A NEW drain plug must be installed.</p> <p>Tighten 30 (22 lb ft)</p>
3	<p>Transmission Fluid</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. On FWD vehicles, fill the transmission with 2.2 liters of transmission fluid, a residue of approximately 0.2 liters remains in the transmission. For recommended fluid, refer to <u>Adhesives, Fluids, Lubricants, and Sealers</u>. 2. On AWD vehicles, fill the transmission with 1,6 liters of transmission fluid, a residue of approximately 0.2 liters remains in the transmission. For recommended fluid, refer to <u>Adhesives, Fluids, Lubricants, and Sealers</u> <p>NOTE: If a new transmission is installed during servicing, this must be filled with 1.8 liters of transmission fluid because the new transmissions are already filled with 0.68 liters of transmission fluid from the factory.</p>

TRANSMISSION CONTROL LEVER BOOT REPLACEMENT

The transmission control lever boot and shift knob are replaced as an assembly. To remove the assembly refer to Transmission Control Lever Knob Replacement.

TRANSMISSION CONTROL LEVER KNOB REPLACEMENT

Removal Procedure

NOTE: The control lever knob and boot are replaced as an assembly.

1. Remove transmission control lever boot from front floor console, gently pulling boot frame on front side upwards.

Fig. 7: Transmission Control Lever Retainer Ring
Courtesy of GENERAL MOTORS COMPANY

2. Slide transmission control lever boot upwards.
3. Press in on the 2 tabs shown by the arrows.
4. Slide the blue lock ring (1) upward to release the retainers on the knurled shaft.
5. Remove the knob from the shifter by pulling up to release the knob from the knurled shaft.
6. Pull trigger (2) upwards.
7. Remove the reverse block out boot assembly from the shifter.

Fig. 8: Pull Latch

Courtesy of GENERAL MOTORS COMPANY

8. Press pull latch (1) in direction of arrows.
9. Remove reverse gear block (2) from transmission shifter boot assembly.

Installation Procedure

Fig. 9: Reverse Gear Block & Hook
Courtesy of GENERAL MOTORS COMPANY

1. Install reverse gear block (2) to transmission control lever knob.
2. Let the hook (1) engage hearable (arrow).

Fig. 10: Transmission Control Lever Retainer Ring & Trigger
Courtesy of GENERAL MOTORS COMPANY

3. Install transmission control lever knob.
4. Push trigger (2) upwards.
5. Press the transmission control lever knob during installation completely down.
6. Clip transmission control lever boot into front floor console.

SHIFT CONTROL LEVER REPLACEMENT

Removal Procedure

1. Remove the front floor console. Refer to **Front Floor Console Replacement** .

Fig. 11: Selector Lever Cable, Adjust Locks And Transmission Control Lever Housing
Courtesy of GENERAL MOTORS COMPANY

2. Unlock shift lever and selector lever cable adjust locks (2).
3. Clip shift lever and selector lever cable (3) out of transmission control lever housing (1).

Fig. 12: Transmission Control Lever And Bolts
Courtesy of GENERAL MOTORS COMPANY

4. Remove the four transmission control lever fasteners (1).
5. Remove transmission control lever (2).

Installation Procedure

Fig. 13: Transmission Control Lever And Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install NEW transmission control lever (2).

CAUTION: Refer to Fastener Caution in the Preface section.

2. Install the four transmission control lever fasteners (1) and tighten to 8 N.m (71 lb in).

Fig. 14: Selector Lever Cable, Adjust Locks And Transmission Control Lever Housing
 Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not lock yet.

3. Slide shift lever and selector lever cable into shift lever and selector lever cable adjust locks (2).
4. Clip shift lever and selector lever cable (3) into transmission control lever housing (1).
5. Adjust shift lever and selector lever cable. Refer to Manual Transmission Shift Lever Cable Adjustment.
6. Install the front floor console. Refer to Front Floor Console Replacement .

MANUAL TRANSMISSION SHIFT LEVER AND SELECTOR LEVER CABLE ADJUSTMENT

Special Tools

DT-527-A Adjuster or 5mm drill bit

For equivalent regional tools, refer to Special Tools.

NOTE: Not using the specified tools may lead to shift system mis-adjustment.

1. Shift transmission into NEUTRAL.
2. Remove the front floor console cover. Refer to Front Floor Console Replacement .

Fig. 15: Cable Lock Adjusters & Sliding Ring
Courtesy of GENERAL MOTORS COMPANY

3. Unlock the cable lock adjusters (2), by pushing back the spring force loaded black sliding ring (1) until self-locking. One for each cable.

NOTE: **The driver side slider ring can be accessed through side panel of console using a suitable tool.**

4. Slide transmission control lever boot upwards.

Fig. 16: Control Lever Retaining Ring & Latches
Courtesy of GENERAL MOTORS COMPANY

5. Disengage control lever retaining ring by pressing both latches (3) while sliding up retaining ring (1) until loose.
6. Lock the position of the shift control lever by rotating the reverse lockout device with the following instructions:

Fig. 17: Transmission Control Lever Knob
Courtesy of GENERAL MOTORS COMPANY

1. Slide up shift control lever until almost removed.
 2. Rotate complete shift control lever assembly 180 degrees so the reverse inhibitor button on lever is facing toward the rear.
 3. Secure integral pins (2) on reverse lockout device in holes located on shifter base (3) by pushing downward on device until seated.
7. Remove engine control module from battery tray and lay aside.

Fig. 18: Transmission Control Housing
Courtesy of GENERAL MOTORS COMPANY

NOTE: The hole of the transmission gear control (2) must be aligned to the hole in the base so the pin (1) can pass thru both. The transmission gear control will be locked in the 1-2 neutral position.

8. Lock the transmission gear control (2) with DT-527-A pin (1) or 5mm drill bit.

Fig. 19: Cable Lock Adjusters & Sliding Ring
Courtesy of GENERAL MOTORS COMPANY

NOTE:

- During this procedure **DO NOT** touch or preload the fixed shift lever as this may cause mis-adjustment to the shift system.
- The lock adjuster on the driver side is accessed through the hole (3) at top of shift housing using an adequate tool.
- When locking the adjuster locks (1) a defined snap noise should be audible, a snap effect should be felt.

9. Secure lock adjusters (2), by pushing down the lock tab. One lock adjuster for each cable.

Fig. 20: Transmission Control Lever Retainer Ring & Trigger
 Courtesy of GENERAL MOTORS COMPANY

10. Reposition the reverse lockout device with the following instructions:
 1. Push down on tab (2) and pull up on device to release from installed position.
 2. Slide up shift control lever until almost removed.
 3. Rotate complete shift control lever assembly 180 degrees so the reverse inhibitor button on lever is facing toward the front.
 4. Push down on reverse lock out device until fully seated.
 5. Push down retaining ring (1) until it snaps into position until fully seated.
11. Remove the DT-527-A adjuster or 5mm drill bit from the transmission gear control.
12. Check correct shifting function.
13. If necessary repeat adjusting procedure.
14. Install the front floor console cover. Refer to **Front Floor Console Replacement** .
15. Install the engine control module.

TRANSMISSION CONTROL (TRANSMISSION SHIFT LEVER) REPLACEMENT

Removal Procedure

1. Remove the front floor console. Refer to Front Floor Console Replacement .

Fig. 21: Selector Lever Cable, Adjust Locks And Transmission Control Lever Housing
Courtesy of GENERAL MOTORS COMPANY

2. Unlock shift lever and selector lever cable adjust locks (2).
3. Clip shift lever and selector lever cable (3) out of transmission control lever housing (1).

Fig. 22: Transmission Control Lever And Bolts
Courtesy of GENERAL MOTORS COMPANY

4. Remove the four transmission control lever fasteners (1).
5. Remove the transmission control (2).

Installation Procedure

Fig. 23: Transmission Control Lever And Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install the NEW transmission control (2).

CAUTION: Refer to Fastener Caution .

2. Install the four transmission control lever fasteners (1) and tighten to 8 N.m (71 lb in).

Fig. 24: Selector Lever Cable, Adjust Locks And Transmission Control Lever Housing
 Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not lock yet.

3. Slide shift lever and selector lever cable into shift lever and selector lever cable adjust locks (2).
4. Clip shift lever and selector lever cable (3) into transmission control lever housing (1).
5. Adjust shift lever and selector lever cable.
6. Install the front floor console. Refer to **Front Floor Console Replacement** .

MANUAL TRANSMISSION SHIFT LEVER CABLE REPLACEMENT

Removal Procedure

1. Remove the battery tray. Refer to **Battery Tray Replacement** .

Fig. 25: Selector Lever Cable, Bracket And Transmission Control Housing
Courtesy of GENERAL MOTORS COMPANY

2. Remove shift lever and selector lever cable (2) from transmission control housing (3).
3. Remove shift lever and selector lever cable from shift lever and selector lever cable bracket (1) by pushing back locking rings in counterclockwise direction.

Fig. 26: Shift Lever And Selector Lever Cable
Courtesy of GENERAL MOTORS COMPANY

4. Remove shift lever and selector lever cable (3) from bulkhead.
5. Remove the front floor console. Refer to **Front Floor Console Replacement** .

Fig. 27: Selector Lever Cable, Adjust Locks And Transmission Control Lever Housing
Courtesy of GENERAL MOTORS COMPANY

6. Unlock shift lever and selector lever cable adjust locks (2).
7. Clip shift lever and selector lever cable (3) out of transmission control lever housing (1).

Installation Procedure

Fig. 28: Selector Lever Cable, Adjust Locks And Transmission Control Lever Housing
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Do not lock yet.**

1. Slide shift lever and selector lever cable into shift lever and selector lever cable adjust locks (2).
2. Clip shift lever and selector lever cable (3) into transmission control lever housing (1).
3. Install shift lever and selector lever cable from inside the vehicle.

Fig. 29: Shift Lever And Selector Lever Cable
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Install the guide with the white marking upwards to the bulkhead. Do not cross the cables.**

4. Install shift lever and selector lever cable (3) to bulkhead.
5. Check for correct fit.

Fig. 30: Selector Lever Cable, Bracket And Transmission Control Housing
Courtesy of GENERAL MOTORS COMPANY

6. Install shift lever and selector lever cable (2) to shift lever and selector lever cable bracket (1).
7. Install shift lever and selector lever cable to transmission control housing (3).
8. Install the battery tray. Refer to **Battery Tray Replacement** .
9. Adjust shift lever and selector lever cable. Refer to **Manual Transmission Shift Lever Cable Adjustment**.
10. Install the front floor console. Refer to **Front Floor Console Replacement** .

MANUAL TRANSMISSION SHIFT LEVER AND SELECTOR LEVER CABLE REPLACEMENT

Removal Procedure

1. Remove the battery tray. Refer to **Battery Tray Replacement** .

Fig. 31: Shift Lever And Selector Lever Cable
Courtesy of GENERAL MOTORS COMPANY

2. Remove the shift lever and selector lever cable (2) from the transmission control housing (3).
3. Remove the shift lever and selector lever cable from the shift lever and selector lever cable bracket (1) by pushing back locking rings in counter driving direction.

Fig. 32: Selector Lever Cable

Courtesy of GENERAL MOTORS COMPANY

4. Remove the shift lever and selector lever cable grommet (1) from the bulkhead.
5. Remove the front floor console. Refer to **Front Floor Console Replacement** .

Fig. 33: Selector Lever Cable, Adjust Locks And Transmission Control Lever Housing
Courtesy of GENERAL MOTORS COMPANY

6. Unlock the shift lever and selector lever cable adjust locks (2).
7. Clip the shift lever and selector lever cable (3) out of the transmission control lever housing (1).

Installation Procedure

Fig. 34: Selector Lever Cable, Adjust Locks And Transmission Control Lever Housing
Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not lock yet.

1. Slide the shift lever and selector lever cable into the shift lever and selector lever cable adjust locks (2).
2. Clip the shift lever and selector lever cable (3) into the transmission control lever housing (1).
3. Install shift lever and selector lever cable from inside the vehicle.

Fig. 35: Selector Lever Cable

Courtesy of GENERAL MOTORS COMPANY

NOTE: **Install the guide with the white marking upwards to the bulkhead. Do not cross the cables.**

4. Install the shift lever and selector lever cable grommet (1) to the bulkhead.
5. Check for correct fit.

Fig. 36: Shift Lever And Selector Lever Cable
 Courtesy of GENERAL MOTORS COMPANY

6. Install the shift lever and selector lever cable (2) to the shift lever and selector lever cable bracket (1).
7. Install the shift lever and selector lever cable to the transmission control housing (3).
8. Install the battery tray. Refer to **Battery Tray Replacement** .
9. Adjust the shift lever and selector lever cable. Refer to **Manual Transmission Shift Lever and Selector Lever Cable Adjustment**.
10. Install the front floor console. Refer to **Front Floor Console Replacement** .

MANUAL TRANSMISSION SHIFT LEVER CABLE ADJUSTMENT

Special Tools

DT-527-A Adjuster

For equivalent regional tools, refer to **Special Tools**.

Removal Procedure

1. Shift transmission into NEUTRAL.
2. Remove the front floor console. Refer to **Front Floor Console Replacement** .

Fig. 37: Shift Lever And Selector Lever Cable Adjust Locks
Courtesy of GENERAL MOTORS COMPANY

3. Unlock shift lever and selector lever cable adjust locks (1), by pushing back the spring force loaded black sliding ring until self-locking.
4. Unlock the left cable trough the opening at the housing (arrow) using a suitable tool.
5. Remove transmission control lever boot. Refer to **Transmission Control Lever Boot Replacement**.

Fig. 38: Reverse Blocker Assembly, Pins & Holes
Courtesy of GENERAL MOTORS COMPANY

6. Turn transmission reverse blocker assembly (1) 180 degrees and install to transmission control lever.
7. Push the 2 pins (2) into the 2 holes (3).
8. Remove engine control module from battery tray and lay aside.

Fig. 39: Transmission Control Housing
Courtesy of GENERAL MOTORS COMPANY

9. Block transmission control housing (2) using **DT-527-A** adjuster (1) or equivalent.

Installation Procedure

Fig. 40: Shift Lever And Selector Lever Cable Adjust Locks
Courtesy of GENERAL MOTORS COMPANY

NOTE: When locking the adjuster locks (1) a defined snap noise should be audible / a snap effect should be felt.

1. Lock shift lever and selector lever cable adjust locks.
2. Lock shift lever and selector lever cable adjust locks (1), by pushing down the two blue locking pieces **WITHOUT** touching/preloading the fixed shift lever.
3. Install transmission control lever knob.

Turn the transmission control lever knob back 180 degrees.

4. Remove **DT-527-A** adjuster from transmission control housing.
5. Check correct shifting function.
6. If necessary repeat adjusting procedure.
7. Install the front floor console. Refer to **Front Floor Console Replacement** .

VEHICLE SPEED SENSOR REPLACEMENT

Fig. 41: Vehicle Speed Sensor & Bolt
 Courtesy of GENERAL MOTORS COMPANY

Vehicle Speed Sensor Replacement

Callout	Component Name
Preliminary Procedures <ol style="list-style-type: none"> 1. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Remove the left front wheel. Refer to <u>Tire and Wheel Removal and Installation</u> . 3. Disconnect the vehicle speed sensor electrical connector. 	
1	Vehicle Speed Sensor Bolt CAUTION: Refer to <u>Fastener Caution</u> . Tighten 8 (71 lb in)
2	Vehicle Speed Sensor

BACKUP LAMP SWITCH REPLACEMENT

Fig. 42: Backup Lamp Switch & Seal Ring
 Courtesy of GENERAL MOTORS COMPANY

Backup Lamp Switch Replacement

Callout	Component Name
1	Backup Lamp Switch Procedure <ol style="list-style-type: none"> 1. Remove the electrical connector. 2. Install NEW seal ring. Tighten 25 (18 lb ft)
2	Seal Ring

SHIFT CONTROL HOUSING REPLACEMENT

Fig. 43: Shift Control Housing & Fasteners
 Courtesy of GENERAL MOTORS COMPANY

Shift Control Housing Replacement

Callout	Component Name
Preliminary Procedures <ol style="list-style-type: none"> 1. Remove the battery and battery tray. Refer to Battery Tray Replacement . 2. Remove the brake pressure modulator. Refer to Electronic Brake and Traction Control Module with Brake Pressure Modulator Valve Replacement . 3. Remove the manual transmission shift lever and selector lever cable from the shift control housing. Refer to Manual Transmission Shift Lever and Selector Lever Cable Replacement. 4. Lock the transmission control housing with DT-527-A adjuster or equivalent. 	
Special Tools DT-527-A AdjusterFor equivalent regional tools, refer to Special Tools .	
1	Shift Control Housing Fastener (Qty: 2) CAUTION: Refer to Fastener Caution . Tighten 26 (19 lb ft)
	Shift Control Housing

Procedure

1. Detach the cables from the shift linkage lever.
2. Remove the shift cables.
3. Install a NEW seal.
4. After installation, adjust the manual transmission shift lever cable. Refer to **Manual Transmission Shift Lever and Selector Lever Cable Adjustment**.

NOTE:

Shift transmission into NEUTRAL.

TRANSMISSION FRONT MOUNT REPLACEMENT

Fig. 44: Transmission Front Mount & Fasteners
Courtesy of GENERAL MOTORS COMPANY

Transmission Front Mount Replacement

Callout	Component Name
WARNING: To avoid any vehicle damage, serious personal injury or death when major components are removed from the vehicle and the vehicle is supported by a hoist, support the vehicle with jack stands at the opposite end from which the components are being removed and strap the vehicle to the hoist.	
WARNING:	

Refer to Safety Glasses Warning .

CAUTION:

In order to avoid oil pan damage and possible engine failure, insert a block of wood that spans the width of the oil pan bottom between the oil pan and the jack support.

Preliminary Procedure

1. Raise and suitably support the vehicle. Refer to Lifting and Jacking the Vehicle .

1	Transmission Mount to Frame Through Bolt CAUTION: Refer to <u>Fastener Caution</u> . Tighten 100 N.m (74 lb ft)
2	Transmission Front Mount Fastener (Qty: 2) Tighten 100 N.m (74 lb ft)
3	Transmission Front Mount Procedure Support the transmission.

TRANSMISSION REAR MOUNT REPLACEMENT

Fig. 45: Transmission Rear Mount & Fasteners
 Courtesy of GENERAL MOTORS COMPANY

Transmission Rear Mount Replacement

Callout	Component Name
WARNING: To avoid any vehicle damage, serious personal injury or death when major components are removed from the vehicle and the vehicle is supported by a hoist, support the vehicle with jack stands at the opposite end from which the components are being removed and strap the vehicle to the hoist.	
WARNING: Refer to <u>Safety Glasses Warning</u> .	
CAUTION: In order to avoid oil pan damage and possible engine failure, insert a block of wood that spans the width of the oil pan bottom between the oil pan and the jack support.	
Preliminary Procedures	
1. Raise and suitably support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> .	
2. Remove the transmission rear mount bracket. Refer to <u>Transmission Mount Bracket Replacement - Rear</u> .	
3. Reposition the steering gear if equipped with electric power steering, NJ0 or NJ1. Refer to <u>STEERING GEAR REPLACEMENT</u> .	

1	Transmission Rear Mount Fastener (Qty: 2)
	CAUTION: Refer to <u>Fastener Caution</u> .
	NOTE: Use NEW bolts only.
	Tighten 100 (74 lb ft) plus 120-130 degrees
2	Transmission Rear Mount Procedure Support the transmission before removing the transmission rear mount.

TRANSMISSION MOUNT REPLACEMENT - LEFT SIDE

Fig. 46: Transmission Mount & Fasteners - Left Side
Courtesy of GENERAL MOTORS COMPANY

Transmission Mount Replacement - Left Side

Callout	Component Name
WARNING: Refer to <u>Safety Glasses Warning</u> .	

Preliminary Procedure Remove the transmission mount bracket. Refer to **Transmission Mount Bracket Replacement - Left Side.**

1	Transmission Mount Fastener (Qty: 4) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 22 N.m (16 lb ft)
2	Transmission Mount

TRANSMISSION REAR MOUNT BRACKET REPLACEMENT

Fig. 47: Transmission Rear Mount Bracket & Fasteners
 Courtesy of GENERAL MOTORS COMPANY

Transmission Rear Mount Bracket Replacement

Callout	Component Name
WARNING: To avoid any vehicle damage, serious personal injury or death when major components are removed from the vehicle and the vehicle is supported by a hoist, support the vehicle with jack stands at the opposite end from which the components are being removed and strap the vehicle to the hoist.	

WARNING:

Refer to Safety Glasses Warning .

CAUTION:

In order to avoid oil pan damage and possible engine failure, insert a block of wood that spans the width of the oil pan bottom between the oil pan and the jack support.

Preliminary Procedure Raise and suitably support the vehicle. Refer to Lifting and Jacking the Vehicle .

1	Transmission Rear Mount Bracket Fastener (Qty: 4) CAUTION: Refer to <u>Fastener Caution</u> . Procedure Support the transmission. Tighten 100 (74 lb ft)
2	Transmission Rear Mount Bracket

TRANSMISSION MOUNT BRACKET REPLACEMENT - REAR

 Courtesy of GENERAL MOTORS COMPANY

Transmission Mount Bracket Replacement - Left Side

Callout	Component Name
WARNING: Refer to <u>Safety Glasses Warning</u> .	
Preliminary Procedures	
1. Install the engine support fixture. Refer to <u>ENGINE SUPPORT FIXTURE</u> , for the 2.0L engine. 2. Remove the battery tray. Refer to <u>Battery Tray Replacement</u> .	
1	Transmission Mount Bracket to Mount Fastener (Qty: 3) CAUTION: Refer to <u>Fastener Caution</u> . Procedure Install NEW bolts. Tighten 50 (37 lb ft) + 60 degrees + 15 degrees
2	Transmission Mount Bracket Fastener (Qty: 3) Tighten

	100 (74 lb ft)
3	Transmission Mount Bracket NOTE: Adjust support fixture as necessary to allow bracket removal.

FRONT WHEEL DRIVE SHAFT SEAL REPLACEMENT - LEFT SIDE

Fig. 50: Front Wheel Drive Shaft Seal - Left Side
 Courtesy of GENERAL MOTORS COMPANY

Front Wheel Drive Shaft Seal Replacement - Left Side

Callout	Component Name
WARNING: To avoid any vehicle damage, serious personal injury or death when major components are removed from the vehicle and the vehicle is supported by a hoist, support the vehicle with jack stands at the opposite end from which the components are being removed and strap the vehicle to the hoist.	
WARNING: Refer to <u>Safety Glasses Warning</u> .	
Preliminary Procedures	
1. Raise and suitably support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> .	

2. Remove the front wheel drive shaft from the transmission. Refer to **Front Wheel Drive Shaft Replacement - Left Side** .
3. Place a drain pan underneath to collect transmission fluid.

Front Wheel Drive Shaft Seal

Procedure

1. Remove drive axle shaft seal ring with **DT-586** hammer and **DT-7004** hook.
2. Coat new axle shaft seal ring with transmission fluid.
3. Install the drive axle shaft seal ring flush into transmission with **DT-519** installer.
4. Check transmission fluid level. Refer to **Transmission Fluid Drain and Fill**.

1

Special Tools

- **DT-519** Seal Installer
- **DT-586** Slide Hammer
- **DT-7004** Remover Hook

For equivalent regional tools, refer to **Special Tools**.

Courtesy of GENERAL MOTORS COMPANY

Front Wheel Drive Shaft Seal Replacement - Right Side

Callout	Component Name
<p>WARNING:</p> <p>To avoid any vehicle damage, serious personal injury or death when major components are removed from the vehicle and the vehicle is supported by a hoist, support the vehicle with jack stands at the opposite end from which the components are being removed and strap the vehicle to the hoist.</p> <p>WARNING:</p> <p>Refer to <u>Safety Glasses Warning</u> .</p> <p>Preliminary Procedures</p> <ol style="list-style-type: none">1. Raise and suitably support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> .2. Remove the intermediate shaft. Refer to <u>Front Wheel Drive Intermediate Shaft Replacement (with MR6)</u> , <u>Front Wheel Drive Intermediate Shaft Replacement (with MHH, MHK or MDK)</u> .3. Place a drain pan underneath to collect transmission fluid.	
1	<p>Front Wheel Drive Shaft Seal</p> <p>Procedure</p> <ol style="list-style-type: none">1. Remove drive axle shaft seal ring with DT-7004 hook and DT-586 hammer.2. Coat new axle shaft seal ring with transmission fluid.3. Install the drive axle shaft seal ring flush into transmission with DT-519 installer.4. Check transmission fluid level. Refer to <u>Transmission Fluid Drain and Fill</u>. <p>Special Tools</p> <ul style="list-style-type: none">• DT-519 Seal Installer• DT-586 Slide Hammer• DT-7004 Remover Hook <p>For equivalent regional tools, refer to <u>Special Tools</u>.</p>

TRANSMISSION REPLACEMENT

Special Tools

DT-48783 Special Socket

For equivalent regional tools, refer to Special Tools.

Removal Procedure

1. Remove the battery tray. Refer to **Battery Tray Replacement** .
2. Remove the shift lever cable from the selector on the transmission. Refer to **Manual Transmission Shift Lever Cable Replacement**.
3. Remove the clutch actuator cylinder hose. Refer to **Clutch Actuator Cylinder Pipe Replacement** .
4. Remove the fasteners and brackets for the wiring harness on the transmission.
5. Remove the connector to the reverse light switch. Refer to **Backup Lamp Switch Replacement**.

Fig. 52: Upper Transmission Fasteners
Courtesy of GENERAL MOTORS COMPANY

6. Remove upper transmission fasteners (1) using the **DT-48783** special socket or equivalent E-Torx socket.
7. Remove the starter motor. Refer to **Starter Replacement (LUK)** , **Starter Replacement (LTG)** .
8. Install the engine support fixture. Refer to **ENGINE SUPPORT FIXTURE** for the 2.0L engine.
9. Remove the subframe. Refer to **Drivetrain and Front Suspension Frame Replacement** .
10. Remove the catalytic converter. Refer to **Catalytic Converter Replacement (LTG)** .
11. Remove the rear transmission bracket. Refer to **Transmission Rear Mount Bracket Replacement**.
12. Remove the transmission front mount. Refer to **Transmission Front Mount Replacement**.
13. Drain the transmission fluid. Refer to **Transmission Fluid Drain and Fill**.

14. Pull out the left drive shaft from the transmission. Refer to **Front Wheel Drive Shaft Replacement - Left Side**.
15. Pull out the right drive shaft from the intermediate shaft and remove the intermediate shaft. Refer to **Front Wheel Drive Intermediate Shaft Replacement (with MR6)**, **Front Wheel Drive Intermediate Shaft Replacement (with MHH, MHK or MDK)**.
16. Lower the vehicle.
17. Remove the fasteners to the transmission bracket left side. Refer to **Transmission Mount Bracket Replacement - Left Side**.
18. Lower the engine enough with support fixture to access the transmission.
19. Raise the vehicle.
20. Place an appropriate transmission jack under the vehicle and support the transmission.

Fig. 53: Lower Transmission Fasteners
Courtesy of GENERAL MOTORS COMPANY

21. Remove the lower transmission fasteners (1).

Fig. 54: View Of Lower Transmission Fasteners
Courtesy of GENERAL MOTORS COMPANY

22. Remove lower transmission fasteners (1).
23. Separate the transmission from the engine.
24. Lower the transmission away from the vehicle. With assistance, place transmission in suitable work area.

Installation Procedure

1. Lubricate input shaft splines and the two guiding sleeves.
2. Place the transmission to the engine support fixture.
3. Attach transmission to the engine.

Fig. 55: Lower Transmission Fasteners
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

4. Install the transmission fasteners.
 - Tighten the fastener (1) to 60 (44 lb ft).
 - Tighten the fastener (2) to 40 (30 lb ft).

Fig. 56: View Of Lower Transmission Fasteners
Courtesy of GENERAL MOTORS COMPANY

5. Install the transmission fasteners.
 - Tighten the fastener (1) to 60 (44 lb ft).
 - Tighten the fastener (2) to 40 (30 lb ft).
6. Install the starter motor. Refer to **Starter Replacement (LTG)** .
7. Lower the vehicle.
8. Raise the engine to the correct level with the engine support fixture.
9. Install the fasteners to the transmission bracket left side. Refer to **Transmission Mount Bracket Replacement - Left Side.**
10. Remove the engine support fixture.
11. Install the ground cable and the upper fasteners to the starter motor. Refer to **Starter Replacement (LTG)** .
12. Raise the vehicle.
13. Install the rear transmission bracket. Refer to **Transmission Rear Mount Bracket Replacement.**
14. Install the transmission front mount. Refer to **Transmission Front Mount Replacement.**
15. Install the intermediate shaft. Refer to **Front Wheel Drive Intermediate Shaft Replacement (with MR6)** , **Front Wheel Drive Intermediate Shaft Replacement (with MHH, MHK or MDK)** .
16. Install the left drive shaft to the transmission. Refer to **Front Wheel Drive Shaft Replacement - Left**

Side .

17. Install the catalytic converter. Refer to **Catalytic Converter Replacement (LTG) .**
18. Install the subframe. Refer to **Drivetrain and Front Suspension Frame Replacement .**
19. Fill up the transmission fluid. Refer to **Transmission Fluid Drain and Fill.**
20. Install the clutch actuator cylinder hose. Refer to **Clutch Actuator Cylinder Pipe Replacement .**

Fig. 57: Upper Transmission Fasteners
Courtesy of GENERAL MOTORS COMPANY

21. Install the upper transmission fasteners (1) using the **DT-48783** special socket. Tighten the fasteners to 60 (44 lb ft).
22. Install the shift lever cable to the selector on the transmission. Refer to **Manual Transmission Shift Lever Cable Replacement.**
23. Install the fasteners and brackets for the wiring harness to the transmission.
24. Install the connector to the reverse light switch.
25. Install the battery tray. Refer to **Battery Tray Replacement .**

DESCRIPTION AND OPERATION

TRANSMISSION SYSTEM DESCRIPTION AND OPERATION

The F40-6 is a 6-speed manual transmission. This manual transmission is an all-synchromesh 3-shaft transmission.

Fig. 58: Manual Transmission
Courtesy of GENERAL MOTORS COMPANY

This 3-shaft transmission has the following advantages:

- Compact construction
- Improved smooth-running performance
- Better shift quality
- High torque transmission

Location of the Shafts and the Differential in the Transmission Housing

Fig. 59: Transmission Housing Components
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Input shaft
2	Upper main shaft
3	Differential gear
4	Lower main shaft

In this transmission angular cone bearings are used for all shafts. These bearings require a certain amount of play and pretension. The required amount of bearing play and pretension is achieved at the production stage by using shims under the angular cone bearing in the transmission housing.

Location of the Shafts and the Differential

This diagram shows the location of the respective shafts and differential gear.

Fig. 60: Location Of Shafts & Differential
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Input shaft
2	Upper main shaft
3	Lower main shaft
4	Differential gear

Location of the Gear Wheels

This diagram shows the location of the gear wheels on the respective shaft.

Fig. 61: Location Of Gear Wheels
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Reverse gear wheel - Upper Main Shaft
2	3rd gear wheel - Upper Main Shaft
3	4th gear wheel - Upper Main Shaft
4	6th gear wheel - Input Shaft with 1st/Reverse Gear and 2nd Gear
5	4th gear wheel - Input Shaft with 1st/Reverse Gear and 2nd Gear
6	3rd/5th gear wheel - Input Shaft with 1st/Reverse Gear and 2nd Gear
7	6th gear wheel - Lower Main Shaft
8	5th gear wheel - Lower Main Shaft
9	2nd gear wheel - Lower Main Shaft
10	1st gear wheel - Lower Main Shaft

Particular benefits of this 3-shaft transmission are that gear wheel for 3rd gear is also used for 5th gear and that 1st gear wheel is used for reversal of the rotating direction for reverse gear.

Power Flow in the Individual Gears

The following diagrams show the flow of power in the individual gears.

1st Gear

Fig. 62: 1st Gear
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	1st gear power flow

2nd Gear

Fig. 63: 2nd Gear
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	2nd gear power flow

3rd Gear

Fig. 64: 3rd Gear
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	3rd gear power flow

4th Gear

Fig. 65: 4th Gear
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	4th gear power flow

5th Gear

Fig. 66: 5th Gear
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	5th gear power flow

6th Gear

Fig. 67: 6th Gear
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	6th gear power flow

Reverse Gear

Fig. 68: Reverse Gear
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Reverse gear power flow

Transmission Shift Linkage

Fig. 69: Reverse Gear
Courtesy of GENERAL MOTORS COMPANY

The gears of the F40-6 transmission will be shifted via a cable linkage system.

TRANSMISSION IDENTIFICATION INFORMATION

Fig. 70: Transmission Identification
 Courtesy of GENERAL MOTORS COMPANY

The code for the F40-6 transmission is located at the front of the transmission housing.

- Manufacturing plant (1)
- Last two digits of year (example 02 = 2002) (2)
- Serial number (3)
- Alpha code (4)

K111	Fuel Pump Driver Control Module	LTG/LAF/LDK	In luggage compartment, right rear, behind trim	<u>Luggage Compartment Components</u>	<u>K111 Fuel Pump Driver Module (LTG/LAF/LDK)</u>

			panel, mounted to inboard side of bracket		
KR14	Brake Booster Pump Motor Relay	-	In the right front wheel well, mounted to the frame, forward of the axle shaft	-	<ul style="list-style-type: none"> • <u>KR14 Brake I Pump Motor] (LUK/LAF/L</u> • <u>KR14 Brake I Pump Motor]</u>
KR38	Main Contactor	HP6	In the luggage compartment, part of the starter/generator control module	-	<u>KR38 Main Contac</u>
M4	Air Inlet Door Actuator	CJ2	In the passenger compartment, mounted to the HVAC module, at top right	<u>HVAC Module Components</u>	<u>M4 Air Inlet Door A (CJ2)</u>
M6	Air Temperature Door Actuator	C67	In the passenger compartment, mounted to the HVAC module	-	<u>M6 Air Temperatur Actuator (C67)</u>
M6L	Air Temperature Door Actuator - Left	CJ2	In the passenger compartment, mounted to the HVAC module, at left	<u>HVAC Module Components</u>	<u>M6L Air Temperatu Actuator - Left (CJ</u>
M6R	Air Temperature Door Actuator - Right	CJ2	In the passenger compartment, mounted to the HVAC module, at center	<u>HVAC Module Components</u>	<u>M6R Air Temperatu Actuator - Right (C</u>
M7	Transmission Shift Lock Control Solenoid Actuator	MDK, MH8, MHH or MHK	In the passenger compartment, center, in the floor console, part of the transmission shift lever	<u>Automatic Transmission Shifter Components (MDK, MH8, MHH, or MHK)</u>	<u>M7 Transmission Sl Control Solenoid Ac (MDK, MH8, MHH</u>
M8	Blower Motor	-	In the passenger compartment, mounted to HVAC module, in passenger foot well	<u>HVAC Module Components</u>	<u>M8 BLOWER MO</u>

M9	Brake Booster Pump Motor	-	In the right front wheel well, mounted to the frame, forward of the axle shaft	<u>Radiator Support Components</u>	-
M27	Fuel Door Unlatch Actuator	-	At the rear of vehicle, mounted to backside of fuel door	-	<u>M27 Fuel Door Unlatch Actuator CZ2</u>
M28L	High Beam Solenoid Actuator - Left	T4F	At the left front of vehicle, within the headlamp assembly - left	-	-
M28R	High Beam Solenoid Actuator - Right	T4F	At the right front of vehicle, within the headlamp assembly - right	-	-
M37	Mode Door Actuator	-	In the passenger compartment, mounted to the HVAC module, at left upper	<u>HVAC Module Components</u>	<u>M37 Mode Door Actuator</u>
M40	Rear Compartment Lid Latch	-	At the rear of vehicle, mounted to backside of rear compartment lid	<u>Rear of Vehicle Components</u>	<u>M40 Rear Compartment Latch</u>
M46	Air Recirculation Door Actuator	-	In the passenger compartment, mounted to the HVAC module, at top right	<u>HVAC Module Components</u>	<u>M46 Air Recirculation Door Actuator</u>
M50D	Seat Front Vertical Motor - Driver	-	In the passenger compartment, mounted to the bottom of the driver seat at front	<ul style="list-style-type: none"> • <u>Bottom of Driver Seat Components (except A45)</u> • <u>Bottom of the Driver Seat Components (with A45)</u> 	<u>M50D Seat Front Vertical Motor - Driver</u>
			In the passenger	<ul style="list-style-type: none"> • <u>Bottom of Passenger Seat</u> 	

M50P	Seat Front Vertical Motor - Passenger	AG2	compartment, mounted to the bottom of the passenger seat at front	<u>Components (1 of 2)</u> <ul style="list-style-type: none"> • <u>Bottom of the Passenger Seat Components (2 of 2)</u> 	<u>M50P Seat Front Vertical Motor - Passenger (AG2)</u>
M51D	Seat Horizontal Motor - Driver	-	In the passenger compartment, mounted to the bottom of the driver seat at middle	<ul style="list-style-type: none"> • <u>Bottom of Driver Seat Components (except A45)</u> • <u>Bottom of the Driver Seat Components (with A45)</u> 	<u>M51D Seat Horizontal Motor - Driver</u>
M51P	Seat Horizontal Motor - Passenger	AG2	In the passenger compartment, mounted to the bottom of the passenger seat at middle	<ul style="list-style-type: none"> • <u>Bottom of Passenger Seat Components (1 of 2)</u> • <u>Bottom of the Passenger Seat Components (2 of 2)</u> 	<u>M51P Seat Horizontal Motor - Passenger (AG2)</u>
M55D	Seat Rear Vertical Motor - Driver	-	In the passenger compartment, mounted to the bottom of the driver seat, forward of middle	<ul style="list-style-type: none"> • <u>Bottom of Driver Seat Components (except A45)</u> • <u>Bottom of the Driver Seat Components (with A45)</u> 	<u>M55D Seat Rear Vertical Motor - Driver</u>
M55P	Seat Rear Vertical Motor - Passenger	AG2	In the passenger compartment, mounted to the bottom of the passenger seat, forward of middle	<ul style="list-style-type: none"> • <u>Bottom of Passenger Seat Components (1 of 2)</u> • <u>Bottom of the Passenger Seat Components (2 of 2)</u> 	<u>M55P Seat Rear Vertical Motor - Passenger (AG2)</u>
M56D	Seat Recline Motor - Driver	-	In the passenger compartment, mounted the driver seat back frame inboard side	<u>Rear of Driver Seat Components</u>	<u>M56D Seat Recline Motor - Driver</u>
			In the passenger compartment,		

M56P	Seat Recline Motor - Passenger	AG2	mounted the passenger seat back frame inboard side	<u>Rear of Passenger Seat Components</u>	<u>M56P Seat Recline] Passenger (AG2)</u>
M64	Starter Motor	-	In the engine compartment, mounted to the front of block below the oil filter housing	<ul style="list-style-type: none"> • <u>Front of Engine Components (LHU)</u> • <u>Left Front of Engine Components (LUK 1 of 2)</u> • <u>Engine Components - Front (LAF 1 of 2)</u> • <u>Engine Components - Front (LDK)</u> • <u>Engine Components - Front (LTD)</u> • <u>Engine Components - Rear (LLU)</u> 	<ul style="list-style-type: none"> • <u>M64 Starter M</u> • <u>M64 Starter M (LLU)</u> • <u>M64 Starter M</u> • <u>M64 Starter M (Positive Batt</u> • <u>(LAF)</u> • <u>M64 Starter M (Generator H</u> • <u>(LAF)</u>
M69	Sunroof Motor	CF5	In the passenger compartment, mounted to roof above overhead console	<u>Inside of Roof and Windshield Components</u>	<u>M69 Sunroof Motor</u>
M72	Variable Power Steering Solenoid Valve	NV7 or NXC	In the engine compartment, mounted to the steering rack	-	<u>M72 Variable Power Solenoid Valve (NV</u>
M72	Variable Effort Steering Actuator	-	On the power steering assembly	-	<u>M72 VARIABLE PO STEERING SOLEN VALVE (NV7 OR N</u>
M73A	Seat Blower Motor - Driver Back	-	In the driver seat back	-	<u>M73A Seat Blower] Driver Back (KU1)</u>
M73B	Seat Blower Motor - Passenger Back	-	In the passenger seat back	-	<u>M73B Seat Blower] Passenger Back (KU</u>
M73C	Seat Blower Motor - Driver Cushion	-	Under the driver seat	-	<u>M73C Seat Blower] Driver Cushion (KU</u>
M73D	Seat Blower Motor - Passenger Cushion	-	Under the passenger seat cushion	-	<u>M73D Seat Blower] Passenger Cushion]</u>
			Inside the		

M74D	Window Motor - Driver	-	driver door, at center, mounted to window regulator	<u>Driver Door Components</u>	<u>M74D Window Mot</u>
M74LR	Window Motor - Left Rear	-	Inside the left rear door, at center, mounted to window regulator	<u>Left Rear Door Components</u>	<ul style="list-style-type: none"> • <u>M74LR Wind Left Rear (AF CZ2)</u> • <u>M74LR Wind Left Rear (AF</u> • <u>M74LR Wind Left Rear (CZ</u>
M74P	Window Motor - Passenger	-	Inside the passenger door, at center, mounted to window regulator	<u>Passenger Door Components</u>	<ul style="list-style-type: none"> • <u>M74P Window Passenger (AF</u> • <u>M74P Window Passenger (AF</u>
M74RR	Window Motor - Right Rear	-	Inside the right rear door, at center, mounted to window regulator	<u>Right Rear Door Components</u>	<ul style="list-style-type: none"> • <u>M74RR Wind Right Rear (A CZ2)</u> • <u>M74RR Wind Right Rear (A</u> • <u>M74RR Wind Right Rear (C AEQ)</u>
M75	Windshield Wiper Motor	-	In the engine compartment, at the rear, left of center under cowl	<u>Left Side of Engine Compartment Components</u>	<u>M75 WINDSHIELD MOTOR</u>
M77D	Outside Rearview Mirror Motor - Driver	-	On the outside of the driver door, part of the outside rearview mirror - driver, behind glass, at front	<u>Driver Door Components</u>	<u>M77D Outside Rear Motor - Driver</u>
M77P	Outside Rearview Mirror Motor - Passenger	-	On the outside of the passenger door, part of the outside rearview mirror - passenger, behind glass, at front	<u>Passenger Door Components</u>	<u>M77P Outside Rear Motor - Passenger</u>

M93	Key Capture Solenoid Actuator	MDK, MH8, MHH or MHK without BTM	In the passenger compartment, part of the ignition switch, mounted to steering column	<u>Steering Column and Wheel Components</u>	<u>M93 Key Capture S Actuator (MDK, M MHK without BTM</u>
M97	Fuel Door Lock Actuator	-	At the rear of vehicle, mounted to backside of body near fuel door	<u>Rear of Vehicle Components</u>	<u>M97 Fuel Door Loc</u>
P2	Transmission Shift Lever Position Indicator	MDK, MH8, MHH or MHK	In the passenger compartment, at the front of the floor console surrounding the shift lever	<u>Instrument Panel and Floor Console Components</u>	<u>P2 Transmission Sh Position Indicator (MHH or MHK)</u>
P9	Driver Information Center Display	-	In the passenger compartment, part of the instrument cluster, at center	<u>Instrument Panel and Floor Console Components</u>	-
P13	Horn Assembly	-	In the left front wheel well forward of the washer fluid reservoir	<u>Radiator Support Components</u>	<u>P13 Horn Assembly</u>
P16	Instrument Cluster	-	In the passenger compartment, mounted to the driver side of instrument panel, forward of the steering wheel	<ul style="list-style-type: none"> • <u>Instrument Panel and Floor Console Components</u> • <u>Behind Upper Left Side of Instrument Panel Components</u> 	<u>P16 Instrument Clu</u>
P17	Info Display Module	-	In the passenger compartment, mounted to the instrument panel, between the center HVAC outlets	<u>Instrument Panel and Floor Console Components</u>	<ul style="list-style-type: none"> • <u>P17 Info Disp X1</u> • <u>P17 Info Disp X2 (UDY)</u> • <u>P17 Info Disp X2 (UTY)</u> • <u>P17 Info Disp (UDK/UDN)</u>
			In the passenger		

P19AA	Speaker - Right Subwoofer	UQA	compartment, mounted to shelf rearward of rear seats on right side	<u>Rear of Passenger Compartment Components</u>	<u>P19AA Speaker - Right Subwoofer</u>
P19AD	Speaker - Left Surround	UQS	In the rear compartment	-	<u>P19AD Speaker - Left Surround (UQS)</u>
P19AE	Speaker - Right Surround	UQS	In the rear compartment	-	<u>P19AE Speaker - Right Surround (UQS)</u>
P19AG	Speaker - Left Front Door	-	Inside the driver door, at front lower, behind trim panel	<u>Driver Door Components</u>	<u>P19AG Speaker - Left Front Door</u>
P19AH	Speaker - Right Front Door	-	Inside the passenger door, at front lower, behind trim panel	<u>Passenger Door Components</u>	<ul style="list-style-type: none"> • <u>P19AH Speaker - Right Front Door (UQA/UQS)</u> • <u>P19AH Speaker - Right Front Door (UQS)</u> • <u>P19AH Speaker - Right Front Door (UQA)</u>
P19AL	Speaker - Left Rear Door	-	Inside the left rear door, at front lower, behind trim panel	<u>Left Rear Door Components</u>	<u>P19AL Speaker - Left Rear Door</u>
P19AM	Speaker - Right Rear Door	-	Inside the right rear door, at front lower, behind trim panel	<u>Right Rear Door Components</u>	<u>P19AM Speaker - Right Rear Door</u>
P19B	Speaker - Center Instrument Panel	-	In the passenger compartment, mounted to the upper center instrument panel behind grille	<u>Instrument Panel and Floor Console Components</u>	<ul style="list-style-type: none"> • <u>P19B Speaker - Center Instrument Panel (UQA/UQS)</u> • <u>P19B Speaker - Center Instrument Panel (UQS)</u>
P19H	Speaker - Left Front Tweeter	-	Inside the driver door, at front upper	<u>Driver Door Components</u>	<u>P19H Speaker - Left Front Tweeter</u>
P19N	Speaker - Left Subwoofer	UQA	In the passenger compartment, mounted to shelf rearward of rear seats on	<u>Rear of Passenger Compartment Components</u>	<u>P19N Speaker - Left Subwoofer (UQA/UQS)</u>

			left side		
P19V	Speaker - Right Front Tweeter	-	Inside the passenger door, at front upper	<u>Passenger Door Components</u>	<u>P19V Speaker - Right Front Tweeter</u>
Q2	A/C Compressor Clutch	-	In the engine compartment, on the right side of the engine, lower position	<ul style="list-style-type: none"> • <u>Left Front of Engine Components (LUK 1 of 2)</u> • <u>Engine Components - Front (LAF 1 of 2)</u> • <u>Engine Components - Front (LTD)</u> • <u>Engine Components - Front (LLU)</u> 	<ul style="list-style-type: none"> • <u>Q2 A/C Compressor Clutch (LUK/)</u> • <u>Q2 A/C Compressor Clutch (LDK/)</u> • <u>Q2 A/C Compressor Clutch (LTD/)</u>

SCHEMATIC AND ROUTING DIAGRAMS

MASTER ELECTRICAL SCHEMATIC ICONS

Master Electrical Schematic Icons

Icon	Icon Definition
	<p>WARNING:</p> <p>When performing service on or near the SIR components or the SIR wiring, the SIR system must be disabled. Refer to SIR Disabling and Enabling . Failure to observe the correct procedure could cause deployment of the SIR components, personal injury, or unnecessary SIR system repairs.</p>
	<p>WARNING:</p> <p>The high intensity discharge system produces high voltage and current. To reduce the risk of severe shocks and burns:</p> <ul style="list-style-type: none">• Never open the high intensity discharge system ballast or the arc tube assembly starter.

- Never probe between the high intensity discharge system ballast output connector and the arc tube assembly.

WARNING:

To help avoid personal injury, always treat the accessory power receptacle, accessory DC/AC power inverter module, AC circuit wires, and connectors as if AC high-voltage is present.

NOTE:

Twisted wires provide an effective shield that helps protect sensitive electronic components from electrical interference.

In order to prevent electrical interference from degrading the performance of the connected components, you must maintain the proper specification when making any repairs to the twisted wires shown :

- The wires must be twisted a minimum of 10 turns per 31 cm (12 in) as measured anywhere along the length of the wires.
- The outside diameter of the twisted wires must not exceed 6.0 mm (0.25 in).

NOTE:

This fuse position is used for diagnostic purposes only, vehicle should not be equipped with a fuse in this position

DIAGNOSTIC INFORMATION AND PROCEDURES

DIAGNOSTIC CODE INDEX

DIAGNOSTIC CODE INDEX

DTC	Description
DTC B154A or B154B	DTC B154A 39 Driver Mirror Internal Malfunction DTC B154B 39 Passenger Mirror Internal Malfunction

DTC B154A OR B154B: MIRROR INTERNAL MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B154A 39

Driver Mirror Internal Malfunction

DTC B154B 39

Passenger Mirror Internal Malfunction

Circuit/System Description

The outside mirror switch and passenger window switch are on a serial data circuit with the memory seat module as the master. The mirror select and directional control switches are inputs to the memory seat module through the serial data circuit. When the memory seat module receives switch inputs from the outside mirror switch, mirror output commands are sent to the appropriate switch through the serial data circuit. The outside mirror switch and passenger window switch control the left and right outside rear view mirrors through bi-directional motor control circuits. The motor control circuits are floating while in an inactive state and the switches will apply power and ground to the control circuits as necessary to move the mirror in the commanded direction.

Mirror position is determined by both horizontal and vertical position sensors in each of the power mirrors. The outside mirror switch and passenger window switch supply a 5 V reference, low reference, and horizontal and vertical position signal circuits to these sensors. The signal circuits are referenced from 5 V by the switches and the signal circuit voltage levels represent the mirror positions. The mirror positions are sent to the memory seat module through the serial data circuit where they are stored for memory mirror operation. When the memory seat module receives a memory recall command, the memory seat module will send the go to position commands to the outside mirror switch and passenger window switch. The switches will then drive the appropriate mirror motors to the commanded position sensor settings.

Conditions for Running the DTC

Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

B154A 39

An internal malfunction has been detected by the outside rearview mirror switch while commanding the driver outside rearview mirror UP, DOWN, LEFT or RIGHT.

B154B 39

An internal malfunction has been detected by the outside rearview mirror switch while commanding the passenger outside rearview mirror UP, DOWN, LEFT or RIGHT.

Action Taken When the DTC Sets

The affected outside rearview mirror will be inoperative.

Conditions for Clearing the DTC

B154A 39

The driver outside rearview mirror must be replaced before the DTC can be cleared.

B154B 39

The passenger outside rearview mirror must be replaced before the DTC can be cleared.

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the A9A Outside Rearview Mirror-Driver moves when commanding the Driver Mirror Horizontal Movement Right/Left and Driver Mirror Vertical Movement Up/Down with a scan tool.
 - **If the A9A Outside Rearview Mirror-Driver does not move RIGHT or LEFT or UP or DOWN**

Replace the M77D Outside Rearview Mirror Motor-Driver.

- **If the A9A Outside Rearview Mirror-Driver moves RIGHT, LEFT, UP and DOWN**
3. Verify the A9B Outside Rearview Mirror-Passenger moves when commanding the Passenger Mirror

Horizontal Movement Right/Left and Passenger Mirror Vertical Movement Up/Down with a scan tool.

- If the A9B Outside Rearview Mirror-Passenger does not move RIGHT or LEFT or UP or DOWN

Replace the M77P Outside Rearview Mirror Motor-Passenger.

- If the A9B Outside Rearview Mirror-Passenger moves RIGHT, LEFT, UP and DOWN

4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Outside Rearview Mirror Inner Actuator Replacement .

SYMPTOMS - MIRRORS

NOTE: The following steps must be completed before using the symptom tables.

1. Perform the **Diagnostic System Check - Vehicle** before using the Symptom Tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to the following system descriptions:
 - **Outside Mirror Description and Operation (Without A45), Outside Mirror Description and Operation (With A45)**
 - **Automatic Day-Night Mirror Description and Operation**

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the system. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Heated Mirrors Malfunction**
- **Automatic Day-Night Mirrors Malfunction**
- **Power Mirror Malfunction (Without A45), Power Mirror Malfunction (With A45)**

HEATED MIRRORS MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Heated Mirror Element Control	1	1	2	-
Ground	-	1	-	-
1. Heated Mirror Inoperative 2. Heated Mirror Always On				

Circuit/System Description

The rear defogger relay supplies voltage to the outside rearview mirror heater elements based on the current state of the rear window defogger. The relay supplies B+ through the driver/passenger mirror heating element control circuit when a request is received.

Electrical Information Reference

- **Circuit Testing**

- **Connector Repairs**
- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Engine running.
2. Verify the E18 Rear Defogger Grid turns ON and OFF when commanding the Rear Defogger On and Off with a scan tool.
 - **If the E18 Rear Defogger Grid does not turn ON and OFF**

Refer to **Rear Window Defogger Malfunction** .

- **If the E18 Rear Defogger Grid turns ON and OFF**
3. Verify the E17D Outside Rearview Mirror Glass-Driver and the E17P Outside Rearview Mirror Glass-Passenger become warm when commanding the Rear Defogger On with a scan tool.
 - **If the E17D Outside Rearview Mirror Glass-Driver and the E17P Outside Rearview Mirror Glass-Passenger do not become warm**

Refer to Circuit/System Testing.

- **If both E17D Outside Rearview Mirror Glass-Driver and the E17P Outside Rearview Mirror Glass-Passenger become warm**
4. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the X1 and X2 harness connector at the appropriate E17 Outside Rearview Mirror Glass. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal A X2 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Connect a test lamp between the control circuit terminal A X1 and ground.
4. Engine running.
5. Verify the test lamp turns ON and OFF when commanding the Rear Defogger On and Off with a scan

tool.

- **If the lamp is always ON**

1. Ignition OFF, disconnect the X2 harness connector at X50A Fuse Block - Underhood, ignition ON.
2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, refer to **Rear Window Defogger Malfunction** .

- **If the lamp is always OFF**

1. Ignition OFF, disconnect the harness connector at X50A Fuse Block - Underhood, ignition ON.
2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms refer to **Rear Window Defogger Malfunction** .

- **If the lamp turns on and off**

6. Replace the E17 Outside Rearview Mirror Glass.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Outside Rearview Mirror Glass Replacement

|--|

Circuit/System Description

The inside rearview mirror uses 2 photocell sensors. One sensor is the rear light sensor, located on the face side of the mirror, facing the rear of the vehicle. The rear light sensor is used to determine light conditions present at the mirror face. The other sensor is the front light sensor, located on the backside of the mirror, facing the front of the vehicle. The front light sensor is used to determine the exterior light conditions at the front of the vehicle. With a low exterior light condition detected by the front light sensor and a high light condition from the rear light sensor, the inside rearview mirror will automatically darken the face of the inside rearview mirror and the driver outside rearview mirror. The inside rearview mirror provides a signal circuit and a low reference circuit to the driver mirror face to darken the mirror when needed.

With the gear selector lever in the REVERSE position and the engine running, backup lamp control voltage is supplied as an input to the inside rearview mirror. The mirror monitors this input to disable the automatic day-night feature. This allows the driver to see objects in the mirror clearly when backing up, regardless of the rear light sensor status.

Circuit/System Verification

1. Ignition ON.
2. Cover the windshield with a blanket or other suitable item.
3. Verify the A10 Inside Rearview Mirror face dims when shining a bright light into the rear light sensor
 - **If the A10 Inside Rearview Mirror does not dim**

Refer to Circuit/System Testing - Inside Review Mirror Dimming Inoperative
 - **If the A10 Inside Rearview Mirror dims**
4. Verify the A10 Inside Rearview Mirror face transitions from dim to bright while commanding the Backup Lamps Active and Inactive with a scan tool.
 - **If the A10 Inside Rearview Mirror does not transition between dim and bright.**

Refer to Circuit/System Testing - Day-Night Disable Malfunction
 - **If the A10 Inside Rearview Mirror transitions between bright and dim states**
5. Verify the A9A Outside Rearview Mirror-Driver face dims when shining a bright light into the rear light sensor.
 - **If the A9A Outside Rearview Mirror-Driver does not dim**

Refer to Outside Rearview Mirror Dimming Malfunction.
 - **If the A9A Outside Rearview Mirror-Driver dims**
6. Verify the A9A Outside Rearview Mirror-Driver face transitions from dim to bright while commanding the Backup Lamps Active and Inactive with a scan tool.
 - **If the A9A Outside Rearview Mirror-Driver does not transition between bright and dim states**

Refer to Outside Rearview Mirror Dimming Malfunction.
 - **If the A9A Outside Rearview Mirror-Driver transitions between bright and dim states**
7. All OK.

Circuit/System Testing

Inside Review Mirror Dimming Inoperative

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the A10 Inside Rearview Mirror. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal 5 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF, remove the test lamp.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, repair the open/high resistance in the ground connection.
- **If less than 10 ohms**
- 3. Ignition ON.
- 4. Verify a test lamp illuminates between the ignition circuit terminal 2 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF, remove the test lamp.
 2. Test for less than 2 ohms in the ignition circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF, remove the test lamp.
 2. Test for infinite resistance between the ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the A10 Inside Rearview Mirror
 - **If the test lamp illuminates**
- 5. Replace the A10 Inside Rearview Mirror.

Day-Night Disable Malfunction

1. Ignition OFF, disconnect the harness connector at the A10 Inside Rearview Mirror. Ignition ON
2. Connect a test lamp between the control circuit terminal 1 and ground
3. Verify the test lamp turns ON and OFF while commanding the Backup Lamps Active and Inactive with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit terminal 1 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, refer to **Backup Lamps Malfunction (Automatic Transmission)** , **Backup Lamps Malfunction (Manual Transmission)** .
 - **If the test lamp is always ON**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module, ignition ON.

2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, refer to **Backup Lamps Malfunction (Automatic Transmission)** , **Backup Lamps Malfunction (Manual Transmission)**
 - **If the test lamp turns ON and OFF**
4. Replace the A10 Inside Rearview Mirror.

Outside Rearview Mirror Dimming Malfunction

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the A9A Outside Rearview Mirror-Driver. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the low reference circuit terminal 16 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF, disconnect the harness connector at the A10 Inside Rearview Mirror.
 2. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the A10 Inside Rearview Mirror.
 - **If less than 10 ohms**
3. Ignition ON.
4. Test for less than 1 V between the control circuit terminal 2 and ground.
 - **If 1 V or greater**
 1. Ignition OFF, disconnect the harness connector at the A10 Inside Rearview Mirror, ignition ON.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V replace the A10 Inside Rearview Mirror.
 - **If less than 1 V**
5. Ignition ON, headlamps ON, vehicle in PARK, cover the front light sensor with a towel or other suitable item. Shine a flashlight at the rear light sensor.
6. Test for greater than 1 V between the control circuit terminal 2 and ground.
 - **If 1 V or less**
 1. Ignition OFF, disconnect the harness connector at the A10 Inside Rearview Mirror, ignition ON.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the A10 Inside Rearview Mirror.
 - **If greater than 1 V**
7. Test or replace A9A Outside Rearview Mirror-Driver.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Inside Rearview Mirror Replacement**
- **Outside Rearview Mirror Glass Replacement**

POWER MIRROR MALFUNCTION (WITHOUT A45)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category

1. Both Outside Power Mirrors Inoperative 2. Driver Outside Power Mirror Malfunction 3. Passenger Outside Power Mirror Malfunction				

Circuit/System Description

The outside rearview mirror switch controls the outside rearview mirrors based on the position of the mirror selector switch and which movement position is selected. The outside rearview mirror switch has four positions: up, down, left, and right. B+ is applied to the switch from the power mirror fuse and when a movement position switch is selected, voltage is sent to the commanded mirror via a mirror control circuit. The opposite mirror control circuit acts as a ground circuit for the bi-directional mirror motor. Ground is the applied through the switch.

- **Wiring Repairs**

Circuit/System Verification

1. Verify the mirror glass of the A9A Outside Rearview Mirror-Driver and the A9B Outside Rearview Mirror-Passenger move UP, DOWN, LEFT and RIGHT with the S52 Outside Rearview Mirror Switch.
 - **If both outside mirror glasses do not move**

Refer to Circuit/System Testing - Both Outside Rearview Mirrors Inoperative.
 - **If the driver outside mirror glass does not move UP, DOWN, LEFT or RIGHT**

Refer to Circuit/System Testing - Driver Outside Mirror Movement Malfunction.
 - **If the passenger outside mirror glass does not move UP, DOWN, LEFT or RIGHT**

Refer to Circuit/System Testing - Passenger Outside Mirror Movement Malfunction.
 - **If the mirror glass of the A9A Outside Rearview Mirror-Driver and the A9B Outside Rearview Mirror-Passenger move UP, DOWN, LEFT and RIGHT**
2. All OK.

Circuit/System Testing

Both Outside Rearview Mirrors Inoperative

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S52 Outside Rearview Mirror Switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal 5 and ground.

- **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
- **If less than 10 ohms**
- 3. Verify a test lamp illuminates between the B+ circuit terminal 4 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for infinite resistance between each of the control circuit terminals listed below and ground:
 - Control circuit terminal 1
 - Control circuit terminal 2
 - Control circuit terminal 3
 - Control circuit terminal 7
 - Control circuit terminal 8
 - Control circuit terminal 9
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the appropriate M77 Outside Rearview Mirror Motor.
 - **If the test lamp illuminates**
- 4. Test or replace the S52 Outside Rearview Mirror Switch.

Driver Outside Mirror Movement Malfunction

1. Ignition OFF, disconnect the X510 inline harness connector at the A9A Outside Rearview Mirror-Driver. Ignition ON
2. Connect a test lamp between the control circuit terminal 8 and control circuit terminal 2.
3. Verify the test lamp turns ON when commanding the UP and DOWN states with the S52 Outside Rearview Mirror Switch.
 - **If the test lamp remains OFF during either of the commands**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S52 Outside Rearview Mirror Switch.

2. Test for infinite resistance between each control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 ohms in each control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the S52 Outside Rearview Mirror Switch.
 - **If the test lamp is always ON**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S52 Outside Rearview Mirror Switch, ignition ON.
 2. Test for less than 1 V between each control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, test or replace the S52 Outside Rearview Mirror Switch
 - **If the test lamp turns ON during each of the commands**
4. Connect a test lamp between the control circuit terminal 8 and control circuit terminal 7.
5. Verify the test lamp turns ON when commanding the LEFT and RIGHT states with the S52 Outside Rearview Mirror Switch.
 - **If the test lamp remains OFF during either of the commands**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S52 Outside Rearview Mirror Switch.
 2. Test for infinite resistance between each control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in each control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the S52 Outside Rearview Mirror Switch.
 - **If the test lamp is always ON**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S52 Outside Rearview Mirror Switch, ignition ON.
 2. Test for less than 1 V between each control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, test or replace the S52 Outside Rearview Mirror Switch
 - **If the test lamp turns ON during each of the commands**
6. Test or replace the M77D Outside Rearview Mirror Motor-Driver.

Passenger Outside Mirror Movement Malfunction

1. Ignition OFF, disconnect the X610 inline harness connector at the A9B Outside Rearview Mirror-Passenger. Ignition ON
2. Connect a test lamp between the control circuit terminal 8 and control circuit terminal 2.

3. Verify the test lamp turns ON when commanding the UP and DOWN states with the S52 Outside Rearview Mirror Switch.
 - **If the test lamp remains OFF during either of the commands**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S52 Outside Rearview Mirror Switch.
 2. Test for infinite resistance between each control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in each control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the S52 Outside Rearview Mirror Switch.
 - **If the test lamp is always ON**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S52 Outside Rearview Mirror Switch, ignition ON.
 2. Test for less than 1 V between each control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, test or replace the S52 Outside Rearview Mirror Switch
 - **If the test lamp turns ON during each of the commands**
4. Connect a test lamp between the control circuit terminal 8 and control circuit terminal 7.
5. Verify the test lamp turns ON when commanding the LEFT and RIGHT states with the S52 Outside Rearview Mirror Switch.
 - **If the test lamp remains OFF during either of the commands**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S52 Outside Rearview Mirror Switch.
 2. Test for infinite resistance between each control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in each control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the S52 Outside Rearview Mirror Switch.
 - **If the test lamp is always ON**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S52 Outside Rearview Mirror Switch, ignition ON.
 2. Test for less than 1 V between each control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, test or replace the S52 Outside Rearview Mirror Switch
 - **If the test lamp turns ON during each of the commands**
6. Test or replace the M77P Outside Rearview Mirror Motor-Passenger.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Outside Rearview Mirror Inner Actuator Replacement**
- **Outside Rearview Mirror Remote Control Switch Replacement**

POWER MIRROR MALFUNCTION (WITH A45)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.

Circuit/System Description

The outside mirror switch and passenger window switch are on a serial data circuit with the memory seat module as the master. The mirror select and directional control switches are inputs to the memory seat module through the serial data circuit. When the memory seat module receives switch inputs from the outside mirror switch, mirror output commands are sent to the appropriate switch through the serial data circuit. The outside mirror switch and passenger window switch control the left and right outside rear view mirrors through bi-directional motor control circuits. The motor control circuits are floating while in an inactive state and the switches will apply power and ground to the control circuits as necessary to move the mirror in the commanded direction.

Mirror position is determined by both horizontal and vertical position sensors in each of the power mirrors. The outside mirror switch and passenger window switch supply a 5 V reference, low reference, and horizontal and vertical position signal circuits to these sensors. The signal circuits are referenced from 5 V by the switches and the signal circuit voltage levels represent the mirror positions. The mirror positions are sent to the memory seat module through the serial data circuit where they are stored for memory mirror operation. When the memory seat module receives a memory recall command, the memory seat module will send the go to position commands to the outside mirror switch and passenger window switch. The switches will then drive the appropriate mirror motors to the commanded position sensor settings.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Mirror Select Switch parameter changes from None to Left and Right when cycling the S52 Outside Rearview Mirror Switch.

- **If the parameter does not change**

Refer to Circuit/System Testing - Outside Rearview Mirror Switch Malfunction.

- **If the parameter changes**

3. Verify the scan tool Mirror Direction Switch parameter changes from Inactive to Up, Down, Right and Left when cycling the S52 Outside Rearview Mirror Switch.

- **If the parameter does not change**

Refer to Circuit/System Testing - Outside Rearview Mirror Switch Malfunction.

- **If the parameter changes**

4. Verify the A9A Outside Rearview Mirror-Driver moves when commanding the Driver Mirror Horizontal Movement Right/Left and Driver Mirror Vertical Movement Up/Down with a scan tool.

- **If the A9A Outside Rearview Mirror-Driver does not move RIGHT or LEFT or UP or DOWN**

Refer to Circuit/System Testing - Driver Outside Mirror Movement Malfunction.

- **If the A9A Outside Rearview Mirror-Driver moves RIGHT, LEFT, UP and DOWN**

5. Verify the scan tool Driver Mirror Vertical Position parameters are between 0.2-4.8 V and change when commanding the Driver Mirror Vertical Movement Up/Down with a scan tool.

- **If not between 0.2-4.8 V or does not change**

Refer to Circuit/System Testing - Driver Mirror Position Sensor Circuit Test.

- **If between 0.2-4.8 V and changes**

6. Verify the scan tool Driver Mirror Horizontal Position parameters are between 0.2-4.8 V and change when commanding the Driver Mirror Horizontal Movement Right/Left with a scan tool.

- **If not between 0.2-4.8 V or does not change**

Refer to Circuit/System Testing - Driver Mirror Position Sensor Circuit Test.

- **If between 0.2-4.8 V and changes**

7. Verify the A9B Outside Rearview Mirror-Passenger moves when commanding the Passenger Mirror Horizontal Movement Right/Left and Passenger Mirror Vertical Movement Up/Down with a scan tool.

- **If the A9B Outside Rearview Mirror-Passenger does not move RIGHT or LEFT or UP or DOWN**

Refer to Circuit/System Testing - Passenger Outside Mirror Movement Malfunction.

- **If the A9B Outside Rearview Mirror-Passenger moves RIGHT, LEFT, UP and DOWN**

8. Verify the scan tool Passenger Mirror Vertical Position parameters are between 0.2-4.8 V and change while commanding the Passenger Mirror Horizontal Movement Right/Left with a scan tool.

- **If not between 0.2-4.8 V or does not change**

Refer to Circuit/System Testing - Passenger Mirror Position Sensor Circuit Test.

- **If between 0.2-4.8 V and changes**

9. Verify the scan tool Passenger Mirror Horizontal Position parameters are between 0.2-4.8 V and change while commanding the Passenger Mirror Vertical Movement Up/Down with a scan tool.

- **If not between 0.2-4.8 V or does not change**

Refer to Circuit/System Testing - Passenger Mirror Position Sensor Circuit Test.

- **If between 0.2-4.8 V and changes**

10. All OK.

Circuit/System Testing

Outside Rearview Mirror Switch Malfunction

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S52 Outside Rearview Mirror Switch. It may take up to 2 minutes for all vehicle systems to power down.

2. Test for less than 10 ohms between the ground circuit terminal 5 and ground.

- **If 10 ohms or greater**

1. Ignition OFF.

2. Test for less than 2 ohms in the ground circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, repair the open/high resistance in the ground connection.

- **If less than 10 ohms**

3. Verify a test lamp illuminates between the B+ circuit terminal 4 and ground.

- **If the test lamp does not illuminate and the circuit fuse is good**

1. Ignition OFF, remove the test lamp.

2. Test for less than 2 ohms in the ignition circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Ignition OFF, remove the test lamp.

2. Test for infinite resistance between the B+ circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance
- 3. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the S52 Outside Rearview Mirror Switch
- **If the test lamp illuminates**
- 4. Test or replace the S52 Outside Rearview Mirror Switch.

Driver Outside Mirror Movement Malfunction

1. Ignition OFF, disconnect the harness connector at the A9A Outside Rearview Mirror-Driver. Ignition ON
2. Connect a test lamp between the control circuit terminal 8 and control circuit terminal 2.
3. Verify the test lamp turns ON when commanding the Up and Down states with a scan tool.
 - **If the test lamp remains OFF during either of the commands**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S52 Outside Rearview Mirror Switch.
 2. Test for infinite resistance between each control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in each control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the S52 Outside Rearview Mirror Switch.
 - **If the test lamp is always ON**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S52 Outside Rearview Mirror Switch, ignition ON.
 2. Test for less than 1 V between each control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the S52 Outside Rearview Mirror Switch
 - **If the test lamp turns ON during each of the commands**
4. Connect a test lamp between the control circuit terminal 7 and control circuit terminal 8.
5. Verify the test lamp turns ON when commanding the Left and Right states with a scan tool.
 - **If the test lamp remains OFF during either of the commands**
 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S52 Outside Rearview Mirror Switch.
 2. Test for infinite resistance between each control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in each control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the S52 Outside Rearview Mirror Switch.

- **If the test lamp is always ON**
- 1. Ignition OFF, remove the test lamp, disconnect the harness connector at the S52 Outside Rearview Mirror Switch, ignition ON.
- 2. Test for less than 1 V between each control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the S52 Outside Rearview Mirror Switch
- **If the test lamp turns ON during each of the commands**
- 6. Test or replace the M77D Outside Rearview Mirror Motor-Driver.

Driver Mirror Position Sensor Circuit Test

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the A9A Outside Rearview Mirror-Driver. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the low reference circuit terminal 18 and ground.
 - **If 10 ohms or greater**
 - 1. Ignition OFF, disconnect the harness connector at the S52 Outside Rearview Mirror Switch.
 - 2. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the S52 Outside Rearview Mirror Switch.
 - **If less than 10 ohms**
3. Ignition ON.
4. Test for 4.8-5.2 V between the 5 V reference circuit terminal 3 and ground.
 - **If less than 4.8 V**
 - 1. Ignition OFF, disconnect the harness connector at the S52 Outside Rearview Mirror Switch.
 - 2. Test for infinite resistance between the 5 V reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 - 3. Test for less than 2 ohms in the 5 V reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the S52 Outside Rearview Mirror Switch.
 - **If greater than 5.2 V**
 - 1. Ignition OFF, disconnect the harness connector at the S52 Outside Rearview Mirror Switch, ignition ON.
 - 2. Test for less than 1 V between the 5 V reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the S52 Outside Rearview Mirror Switch.
 - **If between 4.8-5.2 V**
5. Verify the scan tool Driver Mirror Vertical Position parameter is less than 4.6 V.
 - **If 4.6 V or greater**

1. Ignition OFF, disconnect the harness connector at the S52 Outside Rearview Mirror Switch, ignition ON.
2. Test for less than 1 V between the signal circuit terminal 1 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the S52 Outside Rearview Mirror Switch.
- **If less than 4.6 V**
6. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the 5 V reference circuit terminal 3.
7. Verify the scan tool Driver Mirror Vertical Position or the parameter is greater than 0.6 V.
 - **If 0.6 V or less**
 1. Ignition OFF, remove the jumper wire, disconnect the harness connector at the S52 Outside Rearview Mirror Switch.
 2. Test for infinite resistance between the signal circuit terminal 1 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the S52 Outside Rearview Mirror Switch.
 - **If greater than 0.6 V**
8. Verify the scan tool Driver Mirror Horizontal Position parameter is less than 4.6 V.
 - **If 4.6 V or greater**
 1. Ignition OFF, disconnect the harness connector at the S52 Outside Rearview Mirror Switch, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal 5 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the S52 Outside Rearview Mirror Switch.
 - **If less than 4.6 V**
9. Install a 3 A fused jumper wire between the signal circuit terminal 5 and the 5 V reference circuit terminal 1.
10. Verify the scan tool Driver Mirror Horizontal Position or the parameter is greater than 0.6 V.
 - **If 0.6 V or less**
 1. Ignition OFF, remove the jumper wire, disconnect the harness connector at the S52 Outside Rearview Mirror Switch.
 2. Test for infinite resistance between the signal circuit terminal 1 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the S52 Outside Rearview Mirror Switch.

- **If greater than 0.6 V**

11. Test or replace the M77D Outside Rearview Mirror Motor-Driver.

Passenger Outside Mirror Movement Malfunction

1. Ignition OFF, disconnect the harness connector at the A9B Outside Rearview Mirror-Passenger. Ignition ON
2. Connect a test lamp between the control circuit terminal 8 and control circuit terminal 2.
3. Verify the test lamp turns ON when commanding the Up and Down states with a scan tool.
 - **If the test lamp remains OFF during either of the commands**
 1. Ignition OFF, remove the test lamp, disconnect the X2 harness connector at the S79P Window Switch-Passenger.
 2. Test for infinite resistance between each control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in each control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the S79P Window Switch-Passenger.
 - **If the test lamp is always ON**
 1. Ignition OFF, remove the test lamp, disconnect the X2 harness connector at the S79P Window Switch-Passenger, ignition ON.
 2. Test for less than 1 V between each control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the S79P Window Switch-Passenger
 - **If the test lamp turns ON during each of the commands**
4. Connect a test lamp between the control circuit terminal 7 and control circuit terminal 8.
5. Verify the test lamp turns ON when commanding the Left and Right states with a scan tool.
 - **If the test lamp remains OFF during either of the commands**
 1. Ignition OFF, remove the test lamp, disconnect the X2 harness connector at the S79P Window Switch-Passenger.
 2. Test for infinite resistance between each control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in each control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the S79P Window Switch-Passenger.
 - **If the test lamp is always ON**
 1. Ignition OFF, remove the test lamp, disconnect the X2 harness connector at the S79P Window Switch-Passenger, ignition ON.

2. Test for less than 1 V between each control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the S79P Window Switch-Passenger
 - **If the test lamp turns ON during each of the commands**
6. Test or replace the M77P Outside Rearview Mirror Motor-Passenger.

Passenger Mirror Position Sensor Circuit Test

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the A9B Outside Rearview Mirror-Passenger. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the low reference circuit terminal 18 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF, disconnect the X2 harness connector at the S79P Window Switch-Passenger.
 2. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the S79P Window Switch-Passenger.
 - **If less than 10 ohms**
3. Ignition ON.
4. Test for 4.8-5.2 V between the 5 V reference circuit terminal 3 and ground.
 - **If less than 4.8 V**
 1. Ignition OFF, disconnect the X2 harness connector at the S79P Window Switch-Passenger.
 2. Test for infinite resistance between the 5 V reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the 5 V reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the S79P Window Switch-Passenger.
 - **If greater than 5.2 V**
 1. Ignition OFF, disconnect the X2 harness connector at the S79P Window Switch-Passenger, ignition ON.
 2. Test for less than 1 V between the 5 V reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the S79P Window Switch-Passenger.
 - **If between 4.8-5.2 V**
5. Verify the scan tool Passenger Mirror Vertical Position parameter is less than 4.6 V.
 - **If 4.6 V or greater**
 1. Ignition OFF, disconnect the X2 harness connector at the S79P Window Switch-Passenger, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal 1 and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the S79P Window Switch-Passenger.
 - **If less than 4.6 V**
- 6. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the 5 V reference circuit terminal 3.
- 7. Verify the scan tool Passenger Mirror Vertical Position or the parameter is greater than 0.6 V.
 - **If 0.6 V or less**
 1. Ignition OFF, remove the jumper wire, disconnect the X2 harness connector at the S79P Window Switch-Passenger.
 2. Test for infinite resistance between the signal circuit terminal 1 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the S79P Window Switch-Passenger.
 - **If greater than 0.6 V**
- 8. Verify the scan tool Passenger Mirror Horizontal Position parameter is less than 4.6 V.
 - **If 4.6 V or greater**
 1. Ignition OFF, disconnect the X2 harness connector at the S79P Window Switch-Passenger, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal 5 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the S79P Window Switch-Passenger.
 - **If less than 4.6 V**
- 9. Install a 3 A fused jumper wire between the signal circuit terminal 5 and the 5 V reference circuit terminal 3.
- 10. Verify the scan tool Passenger Mirror Horizontal Position or the parameter is greater than 0.6 V.
 - **If 0.6 V or less**
 1. Ignition OFF, remove the jumper wire, disconnect the X2 harness connector at the S79P Window Switch-Passenger.
 2. Test for infinite resistance between the signal circuit terminal 5 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the S79P Window Switch-Passenger.
 - **If greater than 0.6 V**
- 11. Test or replace the M77P Outside Rearview Mirror Motor-Passenger.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Outside Rearview Mirror Inner Actuator Replacement**
- **Outside Rearview Mirror Remote Control Switch Replacement**
- **Front Side Door Window Switch Replacement**

POWER MIRROR TILT INOPERATIVE IN REVERSE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The outside mirror switch and passenger window switch are on a serial data circuit with the memory seat module as the master. The mirror select and directional control switches are inputs to the memory seat module through the serial data circuit. When the memory seat module receives switch inputs from the outside mirror switch, mirror output commands are sent to the appropriate switch through the serial data circuit. The outside mirror switch and passenger window switch control the left and right outside rear view mirrors through bi-directional motor control circuits. The motor control circuits are floating while in an inactive state and the switches will apply power and ground to the control circuits as necessary to move the mirror in the commanded direction.

Mirror position is determined by both horizontal and vertical position sensors in each of the power mirrors. The outside mirror switch and passenger window switch supply a 5 V reference, low reference, and horizontal and vertical position signal circuits to these sensors. The signal circuits are referenced from 5 V by the switches and the signal circuit voltage levels represent the mirror positions. The mirror positions are sent to the memory seat module through the serial data circuit where they are stored for memory mirror operation. When the memory seat module receives a memory recall command, the memory seat module will send the go to position commands to the outside mirror switch and passenger window switch. The switches will then drive the appropriate mirror motors to the commanded position sensor settings.

Diagnostic Aids

Not all vehicles have the Park Tilt Mirror feature, verify that the Park Tilt Mirrors option is available in the DIC Vehicle Customization Feature Setting Menu before attempting diagnosis.

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the park assist option is activated in the driver information center (DIC).
3. Select the driver outside mirror on S52 Outside Rearview Mirror Switch.
4. Verify mirror functions properly when operating the S52 Outside Rearview Mirror Switch in UP/DOWN and LEFT/RIGHT positions.

- **If the mirror does not function properly**

Refer to **Power Mirror Malfunction (Without A45), Power Mirror Malfunction (With A45)**.

- **If the mirror functions properly**

5. Select the passenger outside mirror on S52 Outside Rearview Mirror Switch.
6. Verify mirror functions properly when operating the S52 Outside Rearview Mirror Switch in UP/DOWN and LEFT/RIGHT positions. .

- **If the mirror does not function properly**

Refer to **Power Mirror Malfunction (Without A45), Power Mirror Malfunction (With A45)**.

- **If the mirror functions properly**

7. Operate the memory 1 and 2 recall switches on S47D Seat Memory Switch - Driver.
8. Verify the outside rearview mirrors adjust to the stored memory positions.

- **If the mirrors do not adjust to the stored positions**

Refer to **Power Mirror Malfunction (Without A45)**, **Power Mirror Malfunction (With A45)**.

- **If the mirrors adjust to the stored positions**

9. Park brake on, vehicle running, shift the vehicle in REVERSE.

10. Verify that the outside rearview mirrors tilt.

- **If the driver outside mirror does not tilt**

1. Ignition OFF.

2. Replace the S52 Outside Rearview Mirror Switch.

3. Park brake on, vehicle running, shift the vehicle in REVERSE.

4. Verify the driver mirror tilts.

- If the mirror does not tilt, replace the K40 Memory Seat Module.

- If the mirror tilts

5. All OK.

- **If the passenger outside mirror does not tilt**

1. Ignition OFF.

2. Replace the S79P Passenger Window Switch.

3. Park brake on, vehicle running, shift the vehicle in REVERSE.

4. Verify the driver mirror tilts.

- If the mirror does not tilt, replace the K40 Memory Seat Control Module.

- If the mirror tilts

5. All OK.

- **If the mirrors tilt**

11. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Front Side Door Window Switch Replacement**

REPAIR INSTRUCTIONS

OUTSIDE REARVIEW MIRROR REPLACEMENT

Fig. 9: Outside Rearview Mirror & Fasteners
 Courtesy of GENERAL MOTORS COMPANY

Outside Rearview Mirror Replacement

Callout	Component Name
Preliminary Procedure Remove the front side door trim panel. Refer to Front Side Door Trim Panel Replacement .	
1	Outside Rearview Mirror Fastener (Qty: 3) CAUTION: Refer to Fastener Caution . Procedure Disconnect the mirror electrical connector. Tighten 9 N.m (80 lb in)
2	Outside Rearview Mirror Assembly TIP: The mirror assembly must be ordered and assembled prior to being installed to the vehicle.

OUTSIDE REARVIEW MIRROR REMOTE CONTROL SWITCH REPLACEMENT

Fig. 10: Outside Rearview Mirror Remote Control Switch
 Courtesy of GENERAL MOTORS COMPANY

Outside Rearview Mirror Remote Control Switch Replacement

Callout	Component Name
Preliminary Procedure	
Remove the front side door trim panel. Refer to <u>Front Side Door Trim Panel Replacement</u> .	
1	Outside Remote Control Rearview Mirror Switch Procedure <ol style="list-style-type: none"> 1. Disconnect the electrical connector. 2. Release tabs on switch to remove from the trim panel.

OUTSIDE REARVIEW MIRROR INNER ACTUATOR REPLACEMENT

Fig. 11: Outside Rearview Mirror Inner Actuator & Fasteners
 Courtesy of GENERAL MOTORS COMPANY

Outside Rearview Mirror Inner Actuator Replacement

Callout	Component Name
Preliminary Procedure	
Remove the outside rearview mirror glass. Refer to <u>Outside Rearview Mirror Glass Replacement</u> .	
1	Outside Rearview Mirror Inner Actuator Fastener (Qty: 3) CAUTION: Refer to <u>Fastener Caution</u> . Procedure Disconnect the mirror electrical connector.
2	Outside Rearview Mirror Inner Actuator

OUTSIDE REARVIEW MIRROR GLASS REPLACEMENT

Fig. 12: Outside Rearview Mirror Glass
 Courtesy of GENERAL MOTORS COMPANY

Outside Rearview Mirror Glass Replacement

Callout	Component Name
1	<p>Outside Rearview Mirror Glass</p> <p>WARNING: Refer to <u>Glass and Sheet Metal Handling Warning</u> .</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Release the outside rearview mirror glass backing from the mirror housing by releasing the retaining tabs with an appropriate hook tool and pulling outward. 2. Disconnect the power wire harness electrical connector.

OUTSIDE REARVIEW MIRROR HOUSING REPLACEMENT

Fig. 13: Outside Rearview Mirror Housing
Courtesy of GENERAL MOTORS COMPANY

Outside Rearview Mirror Housing Replacement

Callout	Component Name
1	Outside Rearview Mirror Housing TIP: Use a small flat-bladed tool to release the outside rearview mirror housing.

INSIDE REARVIEW MIRROR REPLACEMENT

Fig. 14: Inside Rearview Mirror & Fastener
 Courtesy of GENERAL MOTORS COMPANY

Inside Rearview Mirror Replacement

Callout	Component Name
Preliminary Procedure Remove the inside rearview mirror mount plate cover. Refer to <u>Inside Rearview Mirror Mount Plate Cover Replacement</u> .	
1	Inside Rearview Mirror Fastener CAUTION: Refer to <u>Fastener Caution</u> . Tighten 2 (18 lb in)
2	Inside Rearview Mirror Procedure <ol style="list-style-type: none"> 1. Disconnect the electrical connector. 2. With both hands on the mirror, rock it from side to side while sliding upward, this will assist in the releasing of the mirror from the mounting tab.

INSIDE REARVIEW MIRROR BRACKET INSTALLATION

NOTE: If the windshield is equipped with a blackout area around the mirror base bracket Care Must be used not to cut or scrape the blackout .

Fig. 15: Identifying Mirror Mounting Base Location
Courtesy of GENERAL MOTORS COMPANY

1. Determine the location of the mirror mounting base by marking the outside/inside of the windshield with a wax pencil where the base was previously located. If it is not clear where the base was located, use the following steps to determine where the base should be installed:
 1. Using a measuring tape, measure the distance between the windshield pillars at the windshield blackout line.
 2. Using a marking pencil, halfway between the windshield pillars, draw a centerline (1) on the windshield from the roof panel to the windshield base.
 3. Draw a perpendicular line intersecting the centerline (2) at that location.

The bottom center of the mirror mounting base will be at the intersection of these lines.

NOTE: Clean the inside windshield glass and the mounting surface of the mirror mounting base thoroughly with a clean cloth saturated with naphtha or a

50/50 mixture by volume of clean water and isopropyl alcohol.

2. Clean the inside windshield glass thoroughly to remove all old adhesive.

NOTE: If reinstalling the original mounting base, place the mirror mounting base in a suitable holding device, such as a vice.

3. Clean mirror mounting base thoroughly to remove all of the old adhesive.

Fig. 16: Applying Adhesive To Mirror Base & Window
Courtesy of GENERAL MOTORS COMPANY

4. Using the Inside Mirror Adhesive Kit , or equivalent to apply a small amount of activator to the mounting surface of the mirror mounting base. Refer to Adhesives, Fluids, Lubricants, and Sealers.
5. Apply a small amount of activator to the windshield where the mounting base is to be installed.
6. Allow the activator to dry 5 minutes.

NOTE: Do not touch the mounting surface of the mirror mounting base or the glass.

7. Apply 1 drop of adhesive to the center of the mirror mounting base.

Fig. 17: Installing Mirror Mounting Base
Courtesy of GENERAL MOTORS COMPANY

8. Immediately apply the mounting base to the windshield, ensuring that the mounting base aligns correctly to the marks made on the outside of the windshield.
9. Hold the mounting base firmly in place for 1 minute.
10. Allow the adhesive to set for 15 minutes before installing the rearview mirror.
11. Clean the wax pencil lines from the exterior surface of the glass.
12. Install the mirror to the mirror mounting base. Refer to **Inside Rearview Mirror Replacement**.

DESCRIPTION AND OPERATION

AUTOMATIC DAY-NIGHT MIRROR DESCRIPTION AND OPERATION

Inside Rearview Mirror with the Automatic Day-Night Feature System Operation

The inside rearview mirror uses 2 photocell sensors. One sensor is the headlight sensor, located on the face side

of the mirror. The headlight sensor is used to determine light conditions present at the mirror face. The other sensor is the ambient light sensor, located on the rear of the mirror or windshield side. The ambient light sensor is used to determine the exterior light conditions. With a low exterior light condition detected, and a high light condition from behind the car, at the headlight sensor, the inside rearview mirror will automatically darken the face of the mirror.

In the daytime, the mirror is in a normal state because of the high exterior light condition that is indicated by the ambient light sensor. With the gear selector lever in the REVERSE position and the engine running, backup lamp supply voltage is supplied as an input to the inside rearview mirror. The mirror monitors this input to disable the automatic day-night feature. This allows the driver to see objects in the mirror clearly when backing up, even during the night.

Driver Outside Rearview Mirror with Automatic Day-Night System Operation (If Equipped)

The automatic day-night feature of the driver outside rearview mirror is controlled by the inside rearview mirror. The inside rearview mirror supplies control and low reference to the driver outside rearview mirror. At night, with the automatic day-night feature enabled, the driver outside rearview mirror will automatically darken with the inside rearview mirror to reduce glare from headlamps behind the vehicle.

OUTSIDE MIRROR DESCRIPTION AND OPERATION (WITHOUT A45)

Power Mirror System Components

The power mirror system consists of the following components:

- Mirror direction switch - Controls the left, right, up and down movements of the mirrors
- Mirror select switch - Allows the operator to select the mirror to be moved
- Left outside mirror - Contains both the horizontal and vertical mirror motors
- Right outside mirror - Contains both the horizontal and vertical mirror motors

Each of the outside power mirrors contains 2 motors. The up-down motor operates the vertical directions and the left-right motor operates the horizontal directions. Each of the power mirror motors are internally circuit breaker protected.

Fig. 18: Power Mirror System Diagram (Without A45)
Courtesy of GENERAL MOTORS COMPANY

Power Mirror System Controls

The outside mirror switch incorporates a mirror select switch and a 4 position mirror direction switch.

The mirror select switch allows the driver to select the mirror to be moved by turning the switch to L position enabling the left outside mirror or turning the switch to R position enabling the right outside mirror.

The mirror direction switch is a 4 position switch that allows the operator to move the selected mirror up, down, left or right.

Power Mirror System Operation

The outside mirror switch receives power through the battery positive voltage circuit from the underhood fuse block. The outside mirror switch also receives a constant ground.

The 4 positions of the direction switch have multiple switch contacts. When not in use, the directional contacts are isolated from any circuit. Each of the contacts are connected to opposing sides of the appropriate mirror motors through the selector switch. The selector switch interrupts or completes these circuits depending on the position of the selector switch, L or R.

If the mirror select switch is placed in the L position and the up switch is pressed, battery voltage will be supplied to the driver outside mirror vertical motor through the driver mirror motor up control circuit and return to the mirror switch through the driver mirror motor left/down control circuit, then to ground and the mirror will

move up. If the down switch is pressed, the driver mirror motor left/down control circuit supplies battery voltage and the driver mirror motor up control circuit completes the path to the mirror switch, then to ground and the mirror will move down.

The remainder of the mirror functions operate in the same manner as described above. Placing the mirror control switch in opposing positions, left/right or up/down, will reverse the voltage polarity to the mirror motor, utilizing the same circuits and the mirror will move accordingly.

Heated Mirrors

The heated mirrors are controlled through the rear defog relay. Whenever the rear window defogger is turned ON, battery voltage is supplied to the mirror heater elements through the left and right mirror heater element control circuits.

OUTSIDE MIRROR DESCRIPTION AND OPERATION (WITH A45)

Power Mirror System Components

The power mirror system consists of the following components:

- Memory Seat Control Module
- Outside Rearview Mirror Switch
- Passenger Window Switch
- Driver Outside Rearview Mirror
- Passenger Outside Rearview Mirror

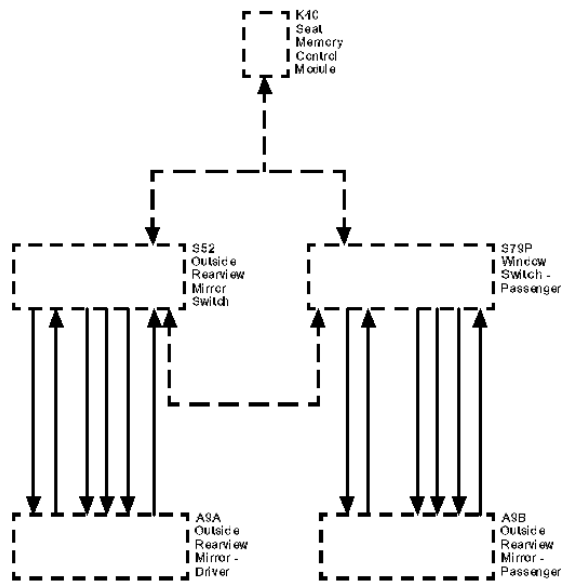

Fig. 19: Power Mirror System Diagram (With A45)
Courtesy of GENERAL MOTORS COMPANY

Power Mirror System Controls

The outside mirror switch and passenger window switch are on a serial data circuit with the memory seat module as the master. The mirror select and directional control switches are inputs to the memory seat module through the serial data circuit. When the memory seat module receives switch inputs from the outside mirror switch, mirror output commands are sent to the appropriate switch through the serial data circuit. The outside mirror switch and passenger window switch control the left and right outside rear view mirrors through bi-directional motor control circuits. The motor control circuits are floating while in an inactive state and the switches will apply power and ground to the control circuits as necessary to move the mirror in the commanded direction.

Mirror position is determined by both horizontal and vertical position sensors in each of the power mirrors. The outside mirror switch and passenger window switch supply a 5 V reference, low reference, and horizontal and vertical position signal circuits to these sensors. The signal circuits are referenced from 5 V by the switches and the signal circuit voltage levels represent the mirror positions. The mirror positions are sent to the memory seat module through the serial data circuit where they are stored for memory mirror operation. When the memory

seat module receives a memory recall command, the memory seat module will send the go to position commands to the outside mirror switch and passenger window switch. The switches will then drive the appropriate mirror motors to the commanded position sensor settings.

Folding Mirrors

The mirror select and fold/unfold switches are inputs to the memory seat module through a serial data circuit. When the memory seat module receives a fold/unfold signal from the outside mirror switch the memory seat module will send a fold/unfold command to the outside mirror switch and passenger window switch. The switches will fold or unfold the mirrors depending on their current state. The outside mirror switch and passenger window switch control the fold/unfold motors through bi-directional control circuits.

This function can also be achieved through the Comfort Open/Close function. If enabled through personalization, the Comfort Open will retract the mirrors and Comfort Close will fold the mirrors.

Heated Mirrors

The heated mirrors are controlled through the rear defog relay. Whenever the rear window defogger is turned on battery voltage is supplied to the mirror heater elements through the left and right mirror heater element control circuits.

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B094C

Right Side Object Detection Control Module

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

B218R Side Object Sensor Module - Right communicates on a private communication data bus with the B218L Side Object Sensor Module - Left. The B218L Side Object Sensor Module - Left is the master and can set this code if the B218R Side Object Sensor Module - Right determines it has an internal fault. DTC U18A6 will set if the left module is unable to communicate with the right side module.

Conditions for Running the DTC

Ignition ON.

Conditions for Setting the DTC

The B218R Side Object Sensor Module - Right has detected an internal malfunction.

Action Taken When the DTC Sets

- The side object sensor system is disabled..
- The DIC will display "Service Side Detection System".

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the control module ignition cycle counter reaches the reset threshold of 40, without a repeat of the malfunction.

Diagnostic Aids

- The modules are not identical and cannot be swapped from side to side.
- This DTC may be stored as a history DTC without affecting the operation of the B218R Side Object Sensor Module - Right.
- Do not replace B218R Side Object Sensor Module - Right based only on DTC B094C being set in history.
- If DTC B094C is set as current, replace the B218R Side Object Sensor Module - Right.
- B218R Side Object Sensor Module - Right communicates on a private communication data bus with the B218L Side Object Sensor Module - Left. If programming is needed for module replacement, you must program B218L Side Object Sensor Module - Left which will then in turn program B218R Side Object Sensor Module - Right.

Circuit/System Description

The object sensors are 3-wire sensors that are used to determine the distance between the vehicle and an object

of interest. The front and rear parking assist control module supplies 8 V to the object sensors via the 8 V reference circuit and provides ground via the low reference circuit. The front and rear parking assist control module triggers the sensors in a sequential loop. After each sensor transmits, the front and rear parking assist control module uses the sensor echo received through the signal circuit to calculate the distance and position of an object.

Conditions for Running the DTC

- Ignition ON
- The park assist is activated. The activation takes place through putting in the reverse gear or through operating the park assist switch.

Conditions for Setting the DTC

B0954 01, B0955 01, B0956 01, or B0957 01

The front and rear parking assist control module has detected the voltage at the sensor circuit is greater than 11.5 V or the object sensor is not grounded.

B0954 06, B0955 06, B0956 06, or B0957 06

The front and rear parking assist control module has detected the voltage at the sensor circuit is less than 0.5 V.

B0954 08, B0955 08, B0956 08, or B0957 08

The front and rear parking assist control module has received an invalid signal.

B0954 21, B0955 21, B0956 21, or B0957 21

The object sensor determines no change in the position of an object while the vehicle is in motion.

B0954 3A, B0955 3A, B0956 3A, or B0957 3A

The front and rear parking assist control module determines the wrong sensor type is installed.

Action Taken When the DTC Sets

- The parking assist is disabled.
- The driver information center displays SERVICE PARK ASSIST.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Circuit/System Verification

1. Ignition ON.
2. Verify that DTC B1405 is not set.
 - **If the DTC is set**

Refer to **DTC B1405 (with rear park assist), DTC B1405 (with front and rear park assist)**

- **If the DTC is not set**
3. Verify that DTC B0954 01, B0955 01, B0956 01, B0957 01 B0954 21, B0955 21, B0956 21 or B0957 21 is not set.
 - **If the DTC is set**
 1. Verify the B78 Front Object Sensors are not contaminated with snow, mud, dirt, slush, or ice.
 - If contaminated, clean sensor.
 - If there is no contamination
 2. Refer to Circuit/System Testing.
 - **If the DTC is not set**

4. Verify that DTC B0954 3A, B0955 3A, B0956 3A or B0957 3A is not set.

- **If the DTC is set**

Replace the B78 Front Object Sensor with the correct sensor type.

- **If the DTC is not set**

5. Ignition ON, transmission in REVERSE.
6. Verify the scan tool Parking Assist System Status parameter displays Enabled.

- **If the Parking Assist System displays Disabled**

Refer to Circuit/System Testing.

- **If the Parking Assist System displays Enabled**

7. All OK.

Circuit/System Testing

1. Ignition OFF, scan tool disconnected, disconnect the harness at the appropriate B78 Front Object Sensor. It may take up to 2 min for all vehicle systems to power down.

2. Test for less than 10 ohms between the low reference circuit terminal 2 and ground.

- **If 10 ohms or greater**

1. Ignition OFF, disconnect the harness connector X3 at the K41 Front and Rear Parking Assist Control Module.

2. Test for less than 2 ohms in the low reference circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms replace the K41 Front and Rear Parking Assist Control Module.

- **If less than 10 ohms**

3. Ignition ON.

4. Test for 7.5-9.5 V between the 8 V reference circuit terminal 1 and ground.

- **If less than 7.5 V**

1. Ignition OFF, disconnect the harness connector at the K41 Front and Rear Parking Assist Control Module.

2. Test for infinite resistance between the 8 V reference circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance

3. Test for less than 2 ohms in the 8 V reference circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, replace the K41 Front and Rear Parking Assist Control Module.

- **If greater than 9.5 V**

1. Ignition OFF, disconnect the harness connector at the K41 Front and Rear Parking Assist Control Module, ignition ON.

2. Test for less than 1 V between the 8 V reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K41 Front and Rear Parking Assist Control Module.
 - **If between 7.5-9.5 V**
5. Ignition OFF, remove appropriate B78 Front Object Sensor and switch locations with another properly operating sensor. Connect harness connector at both sensors. Ignition ON.
6. Verify the DTC is set for the new location in which the malfunctioning sensor is installed.
 - **If DTC set for the new location**

Replace the malfunctioning B78 Front Object Sensor.
 - **If DTC set for the original location**
 - 1. Ignition OFF, disconnect the harness connector at the K41 Front and Rear Parking Assist Control Module, ignition ON.
 - 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 - 3. Ignition OFF.
 - 4. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 - 5. Test for less than 2 ohms in the circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K41 Front and Rear Parking Assist Control Module.
 - **If no DTC set**
7. All OK.

Circuit/System Description

The object sensors are 3-wire sensors that are used to determine the distance between the vehicle and an object of interest. The rear parking assist control module supplies 8 V to the object sensors via the 8 V reference circuit and provides ground via the low reference circuit. The rear parking assist control module triggers the sensors in a sequential loop. After each sensor transmits, the rear parking assist control module uses the sensor

echo received through the signal circuit to calculate the distance and position of an object.

Conditions for Running the DTC

- Ignition ON
- The parking assist is activated. The activation takes place through putting in the reverse gear.

Conditions for Setting the DTC

B0958 01, B0959 01, B0960 01, or B0961 01

The rear parking assist control module has detected the voltage at the sensor circuit is greater than 11.5 V or the object sensor is not grounded.

B0958 06, B0959 06, B0960 06, or B0961 06

The rear parking assist control module has detected the voltage at the sensor circuit less than 0.5 V.

B0958 08, B0959 08, B0960 08, or B0961 08

The rear parking assist control module has received an invalid signal.

B0958 21, B0959 21, B0960 21, or B0961 21

The object sensor determines no change in the position of an object while the vehicle is in motion.

B0958 3A, B0959 3A, B0960 3A, or B0961 3A

The rear parking assist control module determines the wrong sensor type is installed.

Action Taken When the DTC Sets

- The parking assist is disabled.
- The driver information center displays SERVICE PARK ASSIST.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Circuit/System Verification

1. Ignition ON.
2. Verify that DTC B1405 is not set.
 - **If the DTC is set**

Refer to **DTC B1405 (with rear park assist), DTC B1405 (with front and rear park assist)**

- **If the DTC is not set**
3. Verify that DTC B0958 01, B0959 01, B0960 01 or B0961 01 is not set.
 - **If the DTC is set**

Check the appropriate sensor for contamination with mud. If no contamination is diagnosed, refer to Circuit/System Testing.

- **If the DTC is not set**
4. Verify that DTC B0958 21, B0959 21, B0960 21 or B0961 21 is not set.
 - **If the DTC is set**

Check the appropriate sensor for contamination with mud, ice or snow. If no contamination is diagnosed, replace the sensor.

- **If the DTC is not set**

5. Verify that DTC B0958 3A, B0959 3A, B0960 3A or B0961 3A is not set.

- **If the DTC is set**

Replace the appropriate sensor with a sensor of correct sensor type.

- **If the DTC is not set**

6. Ignition ON, transmission in REVERSE.

7. Verify the scan tool Parking Assist System Status parameter displays Enabled.

- **If the Parking Assist System displays Disabled**

Refer to Circuit/System Testing.

- **If the Parking Assist System displays Enabled**

8. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the appropriate B78 Rear Object Sensor. It may take up to 2 minutes for all vehicle systems to power down.

2. Test for less than 10 ohms between the low reference circuit terminal 2 and ground.

- **If 10 ohms or greater**

1. Ignition OFF, disconnect the harness connector X2 at the K41R Rear Parking Assist Control Module.

2. Test for less than 2 ohms in the low reference circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms replace the K41R Rear Parking Assist Control Module.

- **If less than 10 ohms**

3. Ignition ON.

4. Test for 7.5-9.5 V between the 8 V reference circuit terminal 1 and ground.

- **If less than 7.5 V**

1. Ignition OFF, disconnect the harness connector at the K41R Rear Parking Assist Control Module.

2. Test for infinite resistance between the 8 V reference circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance

3. Test for less than 2 ohms in the 8 V reference circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, replace the K41R Rear Parking Assist Control Module.

- **If greater than 9.5 V**

1. Ignition OFF, disconnect the harness connector at the K41R Rear Parking Assist Control Module, ignition ON.

2. Test for less than 1 V between the 8 V reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K41R Rear Parking Assist Control Module.
 - **If between 7.5-9.5 V**
5. Ignition OFF, remove the appropriate B78 Rear Object Sensor and switch locations with another properly operating sensor. Connect harness connector at both sensors. Ignition ON.
6. Verify the DTC is set for the new location in which the malfunctioning sensor is installed.
 - **If DTC set for the new location**

Replace the malfunctioning B78 Rear Object Sensor.
 - **If DTC set for the original location**
 - 1. Ignition OFF, disconnect the harness connector at the K41R Rear Parking Assist Control Module, ignition ON.
 - 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 - 3. Ignition OFF.
 - 4. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 - 5. Test for less than 2 ohms in the circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K41R Rear Parking Assist Control Module.
 - **If no DTC set**
7. All OK.

DTC Descriptor

DTC B0967 02

Parking Assist On/Off Switch Circuit Short to Ground

DTC B0968 01

Parking Assist On/Off Switch Indicator Circuit Short to Battery

DTC B0968 06

Parking Assist On/Off Switch Indicator Circuit Low Voltage/Open

Circuit/System Description

The parking assist can be activated/deactivated by pressing the parking assist switch. By engaging the reverse gear the parking assist can also be activated. By subsequently pressing the parking assist switch the parking assist can be disabled again.

The indicator in the parking assist switch shows the status of the parking assist. If the lamp is ON, the parking assist is activated.

Conditions for Running the DTC

- Ignition ON
- The parking assist is activated. The activation takes place by putting in the reverse gear or by pressing the parking assist switch.

Conditions for Setting the DTC

B0967 02

The parking assist control module has detected a short to ground.

B0968 01

The parking assist control module has detected a short to battery.

B0968 06

The parking assist control module has detected a short to ground or open.

Action Taken When the DTC Sets

- The parking assist is disabled.
- The driver information center displays SERVICE PARK ASSIST.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Circuit/System Verification

1. Ignition ON.
2. Verify that DTC B0967 02 is not set.
 - **If the DTC is set**

Refer to Parking Assist Switch Malfunction.
 - **If the DTC is not set**
3. Verify that B0968 01 or B0968 06 is not set.
 - **If the DTC is set**

Refer to Parking Assist Switch Indicator Malfunction.

- **If the DTC is not set**

4. Activate and deactivate the parking assist switch and verify the scan tool Park Assist Switch parameter changes between Active and Inactive.

- **If the Parking Assist Switch parameter does not change between Active and Inactive**

Refer to Circuit/System Testing.

- **If the Parking Assist Switch parameter changes between Active and Inactive**

5. All OK.

Circuit/System Testing

Parking Assist Switch Malfunction

1. Ignition OFF, disconnect the harness connector at the S48D Multifunction Switch 2 - Instrument Panel.
2. Test for less than 10 ohms between the S48D Multifunction Switch 2 - Instrument Panel terminal 1 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the ground circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Connect a test lamp between the control circuit terminal 5 and ground circuit terminal 1.
4. Verify the test lamp turns On and Off when commanding the Parking Assist Switch On and Off with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the harness connector at the K41R Rear Parking Assist Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground in the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K41R Rear Parking Assist Control Module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the harness connector at the K41R Rear Parking Assist Control Module, ignition ON.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit

- If less than 1 V, replace the K41R Rear Parking Assist Control Module.
 - **If the test lamp turns ON and OFF**
5. All OK.

Parking Assist Switch Indicator Malfunction

1. Ignition OFF, disconnect the harness connector at the S48D Multifunction Switch 2 - Instrument Panel.
2. Test for less than 10 ohms between the S48D Multifunction Switch 2 - Instrument Panel terminal 1 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Connect a test lamp between the voltage circuit terminal 6 and ground circuit terminal 1.
4. Verify the test lamp turns ON and OFF when Commanding the Parking Assist Switch On and Off with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the harness connector at the K41R Rear Parking Assist Control Module.
 2. Test for infinite resistance between the voltage circuit and ground.
 - If less than infinite resistance, repair the short to ground in the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K41R Rear Parking Assist Control Module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the harness connector at the K41R Rear Parking Assist Control Module, ignition ON.
 2. Test for less than 1 V between the voltage circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K41R Rear Parking Assist Control Module.
 - **If the test lamp turns ON and OFF**
5. All OK.

DTC B0987: VEHICLE DIRECTION CAMERA INDICATOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B0987 01

Vehicle Direction Camera Indicator Circuit Short to Battery.

DTC B0987 06

Vehicle Direction Camera Indicator Circuit Low Voltage/Open

Circuit/System Description

The lane departure warning is enabled and disabled through a switch located in the instrument panel. When the switch is pressed once, the vehicle direction camera control module disable or enable the lane departure warning. When the lane departure warning system is enabled the vehicle direction camera control module will illuminate the indicator in the switch.

Conditions for Running the DTC

Ignition ON.

Conditions for Setting the DTC

B0987 01

The vehicle direction camera control module detects a short to voltage in the control circuit.

B0987 06

The vehicle direction camera control module detects a short to ground or an open/high resistance in the control circuit.

Action Taken When the DTC Sets

Lane departure warning is disabled.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

- **Wiring Repairs**

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the DTC B356A is not set.
 - **If the DTC is set**

Refer to **DTC B356A**
 - **If the DTC is not set**
3. Verify the scan tool Vehicle Direction Camera Indicator Status parameter changes between ON and OFF when pressing and releasing the lane departure warning switch.
 - **If the parameter does not change between ON and OFF**

Refer to Circuit/System Testing.

- **If the parameter changes between ON and OFF**

4. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Disconnect the harness connector at the S48D Multifunction Switch 2 - Instrument Panel.
2. Test for less than 10 ohms between the ground circuit terminal 1 at the S48D Multifunction Switch 2 - Instrument Panel and ground.
 - **If 10 ohms or greater**
 1. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Disconnect the harness connector at the K109 Vehicle Camera Module.
4. Ignition ON, test for less than 1 V between the control circuit terminal 4 at the S48D Multifunction Switch 2 - Instrument Panel and ground.
 - **If 1 V or greater**

Repair the short to voltage on the circuit.

- **If less than 1 V**

5. Ignition OFF.
6. Test for less than 2 ohms in the control circuit end to end.
 - **If 2 ohms or greater**

Repair the open/high resistance in the circuit.

- **If less than 2 ohms**

7. Test for infinite resistance between the control circuit terminal 4 and ground.
 - **If less than infinite resistance**

Repair the short to ground on the circuit.

- **If infinite resistance**

8. Replace the K109 Vehicle Camera Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair

- **Control Module References** for Front View Camera Module replacement, programming and setup.

DTC B1011: SYSTEM DISABLED INFORMATION STORED MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B1011 00

System Disabled Information Stored Malfunction

Circuit/System Description

The frontview camera module permanently monitors the serial data bus for error messages. When a malfunction is detected by the frontview camera module, the system will be disabled and an error message will be stored in the frontview camera module disable history buffer which is used to store information about the front camera features that are disabled.

Conditions for Running the DTC

- Ignition ON
- Frontview camera enabled

Conditions for Setting the DTC

The frontview camera module detects a malfunction.

Action Taken When the DTC Sets

- The frontview camera module is disabled.
- The frontview camera module disable history buffer stores information why the system was disabled.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Diagnostic Aids

The frontview camera module disable history buffers are used to store information about the frontview camera module features that are disabled. The buffers will only update if the disable condition changes.

Example: If the data received from the steering wheel angle sensor is Invalid across many ignition cycles then it

will only appear in 1 history buffer and not all history buffers. If this condition is the current reason why the frontview camera module is disabled then it will be set in frontview camera module disable history buffer 1. If a new reason occurs, such as vehicle speed validity is invalid, then the invalid steering wheel angle sensor fault will shift into disable history buffer 2 and vehicle speed validity invalid will be in disable history buffer 1. Since there are only 4 disable history buffers, the invalid steering wheel angle sensor will age out if 4 other disable reasons occur since the last invalid steering wheel angle sensor event occurred. Frontview camera module disable history buffer 1 contains the current reason that one of the frontview camera module features is disabled.

The frontview camera module disable history buffers can display the following values:

- Lane Departure Warning Indicator Malfunction
- Lane Departure Warning Switch Malfunction
- Camera Obstructed
- Accelerator Pedal Position Out of Range
- Driven Wheel Speed Signal Invalid
- Non-Driven Wheel Speed Signal Invalid
- Brake Pedal Moderate Travel Signal Invalid
- Brake Pedal Initial Travel Position Achieved
- Lost Communication with Steering Wheel Angle Sensor Module
- Invalid Data Received From Steering Wheel Angle Sensor Module
- Forward Collision Alert Switch Malfunction
- Clutch Pedal Position (CPP) Sensor Performance
- Clutch Pedal Position (CPP) Sensor Performance
- Transmission Gear Engaged
- Acceleration Sensor Longitudinal Signal
- Invalid Data Received From Yaw Rate Sensor Module
- Power Mode Controlled by Backup Device
- System Power Mode
- Overvoltage
- Undervoltage
- Undefined

Circuit/System Verification

NOTE: Do not replace K109 Frontview Camera Module for this DTC. DTC B1011 is an information DTC.

1. Ignition ON.
2. Verify no other DTC is set except for DTC B1011.
 - If any other DTCs are set

Diagnose those first. Refer to Diagnostic Trouble Code (DTC) List - Vehicle .

- If no other DTCs are set

NOTE: When referring to Frontview Camera Disable History, some items such as Non-Driven Wheel Speed Signal Invalid and Driven Wheel Speed Signal Invalid may routinely be stored without B1011 being set. If B1011 has not set, disregard any information stored in the buffers as it is not indicative of a problem.

3. Refer to Diagnostic Aids and Frontview Camera Disable History for what caused B1011 to set. Diagnose the system that set the malfunction.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

DTC B1015: VEHICLE IDENTIFICATION NUMBER INFORMATION MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B1015 00

Vehicle Identification Number Information Malfunction

Circuit/System Description

When the ignition is turned ON, the parking assist control module and the frontview camera module receives the vehicle identification number (VIN) from the body control module. The modules will compare the VIN received to the VIN stored in memory.

Conditions for Running the DTC

Ignition voltage is between 9-16 V.

Conditions for Setting the DTC

The stored VIN does not match the received VIN.

Action Taken When the DTC Sets

- The parking assist system or the lane departure warning system is disabled.
- The driver information center displays SERVICE PARK ASSIST or SERVICE FRONT CAMERA.

Conditions for Clearing the DTC

The stored VIN matches the VIN stored in the body control module.

Right Rear Corner Object Sensor Signal	B0961 06	B0961 06	B0961 01	B0961 08, B0961 21
Object Sensor Low Reference	-	B0958 06, B0959 06, B0960 06, B0961 06	-	-

Circuit/System Description

The object sensors are 3-wire sensors that are used to determine the distance between the vehicle and an object

of interest. The parking assist control module supplies 8 V to the object sensors via the object sensor supply voltage circuit and provides ground via the object sensor low reference circuit. The parking assist control module triggers the sensors in a sequential loop. After each sensor transmits, the parking assist control module uses the sensor echo received through the object sensor signal circuit to calculate the distance and position of an object.

Conditions for Running the DTC

- Ignition ON
- Transmission in REVERSE

Conditions for Setting the DTC

B1405 02

The parking assist control module has detected the object sensor supply voltage circuit is shorted to ground.

B1405 03

The parking assist control module has detected the object sensor supply voltage circuit is less than 7.2 V.

B1405 07

The parking assist control module has detected the object sensor supply voltage circuit is greater than 9.2 V.

Action Taken When the DTC Sets

- The parking assist is disabled.
- The driver information center displays SERVICE PARK ASSIST.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Circuit/System Verification

1. Ignition ON.
2. Verify the transmission is in REVERSE.
 - **If the transmission not in REVERSE**

Refer to **DTC B2545**

- **If the transmission is in REVERSE**
3. Verify the scan tool Park Assist Sensor Reference Voltage is between 7.2-9.2 V.
 - **If not between 7.2-9.2 V**

Refer to Circuit/System Testing.

- **If is between 7.2-9.2 V**
4. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at each of the object sensors, ignition On, transmission in REVERSE
2. Test for 7.2-9.2 V between the object sensor reference circuit terminal 1 at all B78 Rear Object Sensor harness connectors and ground.
 - **If less than 7.2 V**
 1. Ignition OFF, disconnect the harness connector at the K41R Rear Parking Assist Control Module.
 2. Test for infinite resistance between the 8 V reference circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance
- 3. Test for less than 2 ohms in the 8 V reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K41R Rear Parking Assist Control Module.
 - **If greater than 9.2 V**
- 1. Disconnect the harness connector X 2 at the K41R Rear Parking Assist Control Module, ignition ON.
- 2. Test for less than 1 V between the 8 V supply voltage circuit and ground.
 - If 1 V or greater, repair the short to voltage in the circuit.
 - If less than 1 V, replace the K41R Rear Parking Assist Control Module.
 - **If between 7.2-9.2 V**
- 3. All OK.

DTC B356A: VEHICLE DIRECTION WARNING SWITCH

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B356A 02

Vehicle Direction Warning Switch Circuit Short to Ground

DTC B356A 05

Vehicle Direction Warning Switch Circuit Short to Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Vehicle Direction Warning Switch Signal Circuit	B356A 02	1	B356A 05	-
Vehicle Direction Warning Switch Ground Circuit	-	1	1	-
1. Vehicle direction warning system inoperative				

Circuit/System Description

The lane departure warning is enabled and disabled through a switch located in the instrument panel. When the switch is pressed once, the vehicle direction camera control module disables or enables the lane departure warning. When the lane departure warning system is enabled the vehicle direction camera control module will illuminate the indicator in the switch.

Conditions for Running the DTC

Ignition ON.

Conditions for Setting the DTC

DTC B356A 02

The front view camera module has detected a short to ground for more than 10 s.

DTC B356A 05

The front view camera module has detected a short to voltage for more than 10 s.

Action Taken When the DTC Sets

- Lane departure warning is disabled.
- Lane Departure Unavailable is displayed on the driver information center.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Vehicle Direction Warning Switch Status parameter changes between On and Off while cycling the vehicle direction warning switch.

- **If the parameter does not change**

Refer to Circuit/System Testing.

- **If the parameter changes**

3. All OK.

Circuit/System Testing

1. Ignition OFF.
2. Remove the ignition key, open the driver door, disconnect the scan tool, all vehicle systems OFF, this may take up to 2 min.
3. Disconnect the harness connector at the S48D Multifunction Switch 2 - Instrument Panel.
4. Test for less than 10 ohms between the ground circuit terminal 1 and ground.

- **If 10 ohms or greater**

1. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.

- **If less than 10 ohms**

5. Ignition ON.
6. Verify the scan tool Vehicle Direction Warning Switch Status parameter is Off.
 - **If not Off**
 1. Ignition OFF, disconnect the harness connector at the K109 Vehicle Camera Module.
 2. Test for infinite resistance between the signal circuit terminal 4 at the S48D Multifunction Switch 2 - Instrument Panel and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K109 Vehicle Camera Module.
 - **If Off**
7. Disconnect the harness connector at the K109 Vehicle Camera Module.
8. Install a 3 A fused jumper wire between the signal circuit terminal 4 and ground circuit terminal 1.
9. Verify within 10 s the scan tool Vehicle Direction Warning Switch Status parameter is On.
 - **If not On**
 1. Test for less than 1 V between the signal circuit terminal 4 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V.
 2. Test for less than 2 ohms in the signal circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.
- If less than 2 ohms, replace the K109 Vehicle Camera Module.
- **If On**

10. Replace the S48D Multifunction Switch 2 - Instrument Panel.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Control Module References** for Front View Camera Module replacement, programming and setup.

DTC P15F6: FRONT OBJECT DETECTION CONTROL MODULE TORQUE REQUEST SIGNAL MESSAGE COUNTER INCORRECT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P15F6

Front Object Detection Control Module Torque Request Signal Message Counter Incorrect

Circuit/System Description

The cruise control vehicle distance sensor module is constantly sending a serial data message to the engine control module requesting engine speed or torque reduction. The engine control module sets DTC P15F6 when it detects a discrepancy in the structure of the message causing the integrity of the message to be questioned. An intermittent fault in the serial data circuits will cause the engine control module to set DTC P15F6.

Conditions for Running the DTC

Engine running.

Conditions for Setting the DTC

The engine control module detects that the engine speed and torque modification messages from the cruise control vehicle distance sensor module are either corrupted or intermittently missing.

Action Taken When the DTC Sets

- The cruise control vehicle distance sensor module sends a serial data message to display the appropriate indicator message

- The cruise control vehicle distance sensor module features are unavailable.

Conditions for Clearing the DTC

- The condition for the DTC is no longer present.
- The engine control module clears the history DTC when a current DTC is not detected in 40 consecutive drive cycles.

Diagnostic Aid

This is an informational DTC set by the engine control module. It is set to provide an indication that the cruise control vehicle distance sensor module will not be able to perform as intended. Diagnose any other DTCs first.

NOTE: During normal diagnostic and/or repair verification technicians may find that a "Service Adaptive Cruise Control" message may be displayed by the cruise control vehicle distance sensor module. Do not replace the cruise control vehicle distance sensor module for this condition.

If the Service Driver Assist System message is on with no DTCs set, perform the following steps:

1. Remove the key from the ignition, open and close the driver's door to turn off retained accessory power, and wait 60 seconds.
2. Ignition ON, if the Service Driver Assist message is still present, operate the vehicle at speeds greater than 15 km/h (10 mph) to complete the self test. The cruise control vehicle distance sensor module should request the message to turn OFF.
3. If the telltales remain ON with no DTCs set after the drive cycle, disconnect the battery for at least 60 seconds then reconnect the battery.
4. Operate the vehicle at speeds greater than 40 km/h (25 mph), the cruise control vehicle distance sensor module should request all telltale indicators to turn OFF.

Circuit/System Verification

- NOTE:**
- **DTC P15F6 is an informational DTC.**
 - **Diagnose all other K20 Engine Control Module DTCs prior to DTC P15F6.**

1. Verify there are no other K20 Engine Control Module or communication DTCs set.
 - **If a DTC is set**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle**

- **If a DTC is not set**
2. Complete the diagnosis by looking for an intermittent serial data circuit fault. Refer to **Scan Tool Does Not Communicate with High Speed GMLAN Device** .
 - **If an intermittent serial data circuit fault is found**

Repair as necessary.

- **If an intermittent serial circuit fault is not found**
3. Clear DTCs and operate the vehicle in the conditions that the customer experienced.
 4. Verify DTC P15F6 does not set.
 - **If the DTC sets**

Replace B129 Cruise Control Vehicle Distance Sensor Module

- **If the DTC does not set**
5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for cruise control vehicle distance sensor module replacement, programming, and setup.

SYMPTOMS - OBJECT DETECTION

NOTE: **The following steps must be completed before using the symptom tables:**

1. Perform the **Diagnostic System Check - Vehicle** before using the Symptom Tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control module can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to **Object Detection Description and Operation (with Lane Departure Warning, UFL)**, **Object Detection Description and Operation (with Forward Collision Alert, UEU)**, **Object Detection Description and Operation (with Rearview Camera, UVC)**, **Object Detection Description and Operation (with Side Blind Zone, UFT)**, **Object Detection Description and Operation (with Lane Change Assist, UKC)**, **Object Detection Description and Operation (with Rear Cross Traffic Alert, UFG)**, **Object Detection Description and Operation (with Front and Rear Park Assist, UD5)**, **Object Detection Description and Operation (with Rear Park Assist, UD7)**.

Visual/Physical Inspection

- Inspect for aftermarket devices which may affect the operation of the system. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which may cause the symptom.
- This system can use various sensors that need to be clean in order to function properly. Make sure to check the following sensors for obstructions:
 - Parking assist sensors located in the rear bumper cover

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

- **Parking Assist System Malfunction**

FORWARD COLLISION ALERT SYSTEM MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.

- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Forward Collision Alert Indicators Ignition	-	1	-	-
Forward Collision Alert Switch Signal	P0580, P0592	P0592	P0593	-
Forward Collision Alert Switch Dimming Control	P155A	P0580	-	-
Forward Collision Alert Indicators Control	2	1	1	-
Forward Collision Alert Indicators Ground	-	1	-	-
1. Forward Collision Alert Indicators inoperable 2. Forward Collision Alert Indicators on all the time				

Circuit/System Description

The forward collision alert system is controlled by the frontview camera module mounted on the windshield. The system is designed to detect vehicles directly ahead, within a distance of approximately 60 meters (197 ft). The forward collision alert system operates at speeds above 40 km/h (25 mph). When the system detects a vehicle in the path ahead, the green vehicle ahead alert indicator in the driver information center is illuminated. When approaching another vehicle too rapidly, the collision alert symbol will flash and the radio will beep or the haptic seat will pulse, depending on user configuration. The red collision alert display will stay continuously illuminated if the vehicle ahead remains much too close. These actions are requested by the frontview camera module via serial data. The forward collision alert switch is part of the left steering wheel controls and is used to adjust the timing sensitivity of the front collision alert system.

Diagnostic Aids

Certain factors will affect the operation of the forward collision alert system. Forward collision alert is intended to detect vehicles. It is not intended to warn the driver of any objects that are not detected as a vehicle such as pedestrians, animals, signs, guard rails, bridges, construction barrels or other stationary or slow moving objects. In few cases the camera may inadvertently detect a vehicle that is not in the path ahead, or the system may occasionally provide unrealistic alerts. This could occur with a turning vehicle ahead, guard rails, traffic signs, or other stationary objects. This is normal operation, the vehicle does not need service. When the system is operating properly, the green vehicle ahead alert indicator will illuminate on the vehicle direction display when the system detects a vehicle in the path ahead. This indicates that all of the required operating conditions are met. The green vehicle ahead alert indicator will not appear when the system is having difficulty seeing other vehicles on the road. This can occur if the front view camera is blocked with mud, dirt, snow, ice, slush, if the windshield is damaged, or when weather limits visibility, such as while driving in fog, rain, or snow conditions. This is normal operation, the vehicle does not need service.

Additionally, the Front View Camera Disable History can give useful hints about what affected the operation of the forward collision alert system. For the Front View Camera Disable History, refer to **DTC B1011**.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

NOTE: Refer to Diagnostic Aids before performing Circuit/System Verification.

1. Ignition ON.
2. Verify the scan tool Forward Collision Alert Function Status parameter is not Malfunction.
 - **If the parameter is Malfunction**

Refer to Circuit/System Testing - Frontview Camera Module Malfunction

- **If parameter is not Malfunction**
3. Verify the forward collision alert indicators illuminate momentarily when turning ignition OFF and then

ON.

- **If the indicators do not illuminate**

Refer to Circuit/System Testing - Forward Collision Alert Indicator Malfunction

- **If the indicators illuminate**

4. Verify the driver information center forward collision alert distance indicator toggles between far, medium, near and off.

- **If the setting does not change**

Refer to Circuit/System Testing - Forward Collision Alert Switch Malfunction.

- **If the setting changes**

5. Verify the area of the K109 Frontview Camera Module is not contaminated.

- **If contaminated**

Clean the windshield

- **If not contaminated**

6. All OK.

Circuit/System Testing

NOTE: **Perform the Circuit/System Verification before proceeding with Circuit/System Testing.**

Frontview Camera Module Malfunction

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the K109 Frontview Camera Module. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal 1 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Verify a test lamp illuminates between the B+ circuit terminal 3 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
- **If the test lamp does not illuminate and the circuit fuse is open**
- 1. Ignition OFF.
- 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K109 Frontview Camera Module.
- **If the test lamp illuminates**
- 4. Replace the K109 Frontview Camera Module.

Forward Collision Alert Indicator Malfunction

1. Ignition OFF, and all vehicle systems OFF, disconnect the harness connector at the P43 Collision Alert Indicators. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal 4 and ground.
 - **If 10 ohms or greater**
 - 1. Ignition OFF.
 - 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Ignition ON.
4. Verify a test lamp illuminates between the ignition circuit terminal 1 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 - 1. Ignition OFF.
 - 2. Test for less than 2 ohms in the ignition circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 - 1. Ignition OFF.
 - 2. Test for infinite resistance between the ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the P43 Collision Alert Indicators.
 - **If the test lamp illuminates**
5. Connect a test lamp between the control circuit terminal 2 and the ignition circuit terminal 1.
6. Verify the test lamp turns ON and OFF when commanding the Instrument Cluster All Indicators ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 - 1. Ignition OFF, disconnect the harness connector at the P16 Instrument Cluster, ignition ON.
 - 2. Test for less than 1 V between the control circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V
- 3. Ignition OFF.
- 4. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the P16 Instrument Cluster.
 - **If the test lamp is always ON**
- 1. Ignition OFF, disconnect the harness connector at the P16 Instrument Cluster.
- 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the P16 Instrument Cluster.
 - **If the test lamp turns ON and OFF**
- 7. Test or replace the P43 Collision Alert Indicators.

Forward Collision Alert Switch Malfunction

1. Ignition OFF, disconnect the harness connector at the S70L Steering Wheel Controls Switch - Left, ignition ON.
2. Verify a test lamp illuminates between the ignition circuit terminal 1 and ground.
 - **If test lamp does not illuminate and the circuit fuse is good**
1. Ignition OFF.
2. Test for less than 2 ohms in the Ignition circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
1. Ignition OFF.
2. Test for infinite resistance between the Ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the S70L Steering Wheel Controls Switch - Left.
 - **If the test lamp illuminates**
3. Ignition OFF, connect the harness connector at the S70L Steering Wheel Controls Switch - Left, disconnect the X3 harness connector at the K9 Body Control Module, ignition ON.
4. Test for less than 1 V between the signal circuit terminals listed below and ground:
 - Terminal 4
 - Terminal 16
 - **If 1 V or greater**

Repair the short to voltage on the signal circuit.

 - **If less than 1 V**

5. Ignition OFF.

6. Test for infinite resistance between the signal circuit terminals listed below and ground:

- Terminal 4
- Terminal 16
- **If less than infinite resistance**

Repair the short to ground on the signal circuit.

- **If infinite resistance**

7. Disconnect the harness connector at the S70L Steering Wheel Controls Switch - Left.

8. Test for less than 5 ohms between the circuit terminals listed below:

- S70L Steering Wheel Controls Switch - Left terminal 1 and K9 Body Control Module terminal 4.
- S70L Steering Wheel Controls Switch - Left terminal 2 and K9 Body Control Module terminal 16.
- **If greater than 5 ohms**

Repair the open/high resistance in the circuit.

- **If less than 5 ohms**

9. Test or replace the S70L Steering Wheel Controls Switch - Left.

Component Testing

Forward Collision Alert Switch

Static Test

1. Ignition OFF, disconnect the harness connector at the S70L Steering Wheel Controls Switch - Left.
2. Test for 6.1k-7.5k ohms between the control terminal 1 and the signal circuit terminal 2.

- **If not between 6.1k-7.5k ohms**

Replace the S70L Steering Wheel Controls Switch - Left.

- **If between 6.1k-7.5k ohms**

3. Test for 1.6k-2.1k ohms between the control terminal 1 and the signal circuit terminal 2 while pressing the switch.

- **If not between 1.6k-2.1k ohms**

Replace the S70L Steering Wheel Controls Switch - Left.

- **If between 1.6k-2.1k ohms**

4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Cruise Control Switch Replacement (Grand Sport)** , **Cruise Control Switch Replacement (Except Grand Sport)** - Steering Wheel Controls Switch - Left replacement.
- **Control Module References** for Frontview Camera Module replacement, programming and setup

PARKING ASSIST SYSTEM MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The ultrasonic parking assist system is designed to identify and notify the driver of an object in the vehicle's path when moving reverse at speeds of less than 8 km/h (5 MPH). The distance and location of the object is determined by 4 object sensors, located in the rear bumper. The parking assist system will notify the driver using an audible signal through the radio.

Diagnostic Aids

For Symptom Byte 21 the module only run diagnostic when the vehicle is driven greater than 40 km/h (25 MPH). Therefore, even with clean sensor with no obstruction (i.e. snow or ice melted off) drive the vehicle greater than 40 km/h (25 MPH).

The following is a list of reasons this failure type byte 21 might have set:

- One or more of the sensors may be blocked by snow, mud, ice, or other debris. This might happen after going through a car wash in cold weather.
- Silicone insulator surrounding sensor maybe missing, cut, or twisted.
- Improperly installed sensor, sensor maybe be crooked due to a tight wire harness.
- One or more of the sensors may be scratched or the paint maybe chipped.
- Excessive paint thickness on a sensor may cause an excessive sensor ring time. When replacing or refinishing a sensor, do not apply an excessive amount of paint or clear coat.

Scan Tool Reference

Control Module References for scan tool information.

Circuit/System Verification

1. Ignition ON.
2. Verify the park assist system is enabled through the parking assist switch.
 - **If the park assist system is manually disabled, enable the system.**

Refer to the vehicle owners manual for instructions on enabling the system.

 - **If the park assist system does not manually change**
3. Verify the scan tool Park Assist Switch parameter while pressing and releasing the parking assist switch. The parameter should change between Active and Inactive.
 - **If the parameter does not change between Active and Inactive**

Refer to Parking Assist Switch Circuit Malfunction.

 - **If the parameter changes between Active and Inactive**
4. Command the Park Assist Switch LED output control On and Off with the scan tool. The parking assist switch indicator should turn On and Off when changing between the commanded states.
 - **If the indicator does not turn ON and OFF**

Refer to Parking Assist Switch Indicator Circuit Malfunction.

 - **If the indicator does turn ON and OFF**
5. Transmission in reverse, verify the Engine Control Module (ECM) scan tool Reverse Position Switch

parameter is Active.

- **If the parameter is not Active**

Refer to **Backup Lamps Malfunction (Automatic Transmission)** , **Backup Lamps Malfunction (Manual Transmission)** .

- **If the parameter is Active**

6. Transmission in REVERSE, verify the scan tool Park Assist System Status parameter displays Enable.

- **If the parameter is not Enabled**

Refer to Diagnostic Aids to determine the cause of the inhibit.

- **If the parameter is Enabled**

7. All OK.

Circuit/System Testing

Parking Assist Switch Circuit Malfunction

1. Ignition OFF, disconnect the harness connector at the S48D Multifunction Switch 2 - Instrument Panel.

2. Test for less than 10 ohms between the ground circuit terminal 1 and ground.

- **If 10 ohms or greater**

1. Ignition OFF.

2. Test for less than 2 ohms in the ground circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, repair the open/high resistance in the ground connection.

- **If less than 10 ohms**

3. Ignition ON.

4. Verify the scan tool Parking Assist Switch Status parameter is inactive.

- **If not Inactive**

1. Ignition OFF, disconnect the harness connector at the K41R Rear Parking Assist Control Module.

2. Test for infinite resistance between the control circuit terminal 5 and ground.

- If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance, replace the K41R Rear Parking Assist Control Module.

- **If Inactive**

5. Test for less than 1 V between the control circuit terminal 5 and ground.

- **If 1 V or greater**

Repair the short to voltage on the circuit.

- **If less than 1 V**

6. Connect a test lamp between the control circuit terminal 5 and the ground circuit terminal 1.

7. Verify that a test lamp turns On and Off when Commanding the Parking Assist Switch On and Off with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the harness connector at the K41R Rear Parking Assist Control Module
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground in the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K41R Rear Parking Assist Control Module.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the harness connector at the K41R Rear Parking Assist Control Module, ignition ON.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K41R Rear Parking Assist Control Module
 - **If the test lamp turns ON and OFF**
8. All OK.

Parking Assist Switch Indicator Circuit Malfunction

1. Ignition OFF, disconnect the harness connector at the S48D Multifunction Switch 2 - Instrument Panel, Ignition ON.
2. Test for greater than 11 V between the terminal 3 and ground.
 - **If less than 11 V**

Test the voltage circuit for a short to ground or an open/high resistance.
 - **If greater than 11 V**
3. Command the Park Assist Switch LED output control ON with the scan tool. Test for greater than 11 V between the ignition circuit terminal 3 and the signal circuit terminal 5.
 - **If less than 11 V**

Test the signal circuit for an open/high resistance.
 - **If greater than 11 V**
4. Command the Park Assist Switch Indicator Off with the scan tool.
5. Test for less than 1 V between the terminal 6 and ground.
 - **If 1 V or greater**

Test the signal circuit for a short to voltage.

6. If all circuits test normal, replace the S48D Multifunction Switch 2 - Instrument Panel.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Control Module References** for parking assist control module replacement, programming, and setup

REAR VISION CAMERA SYSTEM MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

When the transmission is placed into REVERSE, a 12 V signal is sent to the rearview camera indicating that camera operation is requested. Ignition voltage and ground are supplied to the rearview camera. The rearview camera sends video information to the radio through a video signal + and a video signal - circuit. A grounded shielding also wraps the video signal circuits to reduce electronic interference which may degrade the video signal and cause a distorted or otherwise degraded image.

Diagnostic Aids

A poor video image can be caused by ice, snow, and mud build-up on the lens of the rearview camera. Also, extreme lighting conditions can affect performance, such as operating in the dark or with bright sunlight shining on the camera. Extreme high or low temperatures can also affect the image quality. An open in the shield of the video signal circuit can also cause a distorted screen.

Circuit/System Verification

1. Ignition ON.
2. Verify that DTC B2545 is not set.
 - **If the DTC is set**
3. Verify the rearview camera there is no debris on the lens and that the bezel or bezel seal is not damaged.
 - **If debris are found on the lens**

Refer to **DTC B2545** .

Clean the lens. If the lens, bezel, or bezel seal are damaged, replace as necessary.

- **If no debris on the lens**
4. Ignition ON, transmission in REVERSE.
 5. Verify the backup lamps are On.
 - **If the backup lamps are not ON**
- Refer to **Backup Lamps Malfunction (Automatic Transmission)** , **Backup Lamps Malfunction (Manual Transmission)** .

- **If the backup lamps are ON**
6. Engine running, transmission in REVERSE.
 7. Verify a clear rear vision image is displayed on the radio.
 - **If a clear image is not displayed**

Refer to Circuit/System Testing.

- **If a clear image is displayed**
8. All OK.

Circuit/System Testing

NOTE: **Circuit/System Verification must be performed before Circuit/System Testing.**

1. Ignition OFF, disconnect the harness connector at the B87 Rearview Camera.
2. Test for less than 10 ohms between the ground circuit terminal 5 and ground.
 - **If 10 ohms or greater**

Test for less than 2 ohms in the ground circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Ignition ON.
 4. Verify a test lamp illuminates between the ignition circuit terminal 6 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ignition circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is OK and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, test or replace the KR74 Ignition Run Relay.
 - **If the test lamp illuminates**
 5. Engine running, park brake applied, transmission in REVERSE.
 6. Test for greater than 11 V between the control circuit terminal 3 and ground.
 - **If less than 11 V**
 1. Ignition OFF, disconnect the X7 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.

- **If greater than 11 V**

7. Ignition OFF, disconnect the X4 harness connector at the A11 Radio, ignition ON.

8. Test for less than 1 V between the signal circuit terminal listed below and ground:

- Signal (+) circuit terminal 1 at the B87 Rearview Camera.
- Signal (-) circuit terminal 4 at the B87 Rearview Camera.

- **If 1 V or greater**

Repair the short to voltage on the circuit.

- **If less than 1 V**

9. Test for infinite resistance between the signal circuit terminal listed below and ground:

- Signal (+) circuit terminal 1 at the B87 Rearview Camera.
- Signal (-) circuit terminal 4 at the B87 Rearview Camera.

- **If less than infinite resistance**

Repair the short to ground on the circuit.

- **If infinite resistance**

10. Test for less than 2 ohms in the signal (+) circuit end to end.

- **If 2 ohms or greater**

Repair the open/high resistance in the circuit.

- **If less than 2 ohms**

11. Test for less than 2 ohms in the signal (-) circuit end to end.

- **If 2 ohms or greater**

Test the signal circuit for an open/high resistance.

- **If less than 2 ohms**

12. Replace the B87 Rearview Camera.

13. Engine running, transmission in REVERSE, verify a clear rear vision image is displayed on the A11 Radio.

- **If a clear rear vision image is not displayed on the A11 Radio**

Replace the A11 Radio.

- **If a clear rear vision image displayed on the A11 Radio**

14. All Ok.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Control Module References** for body control module or radio replacement, programming and setup.

SIDE BLIND SPOT ALERT SYSTEM MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Side Object Sensor - Right, Right Indicator Control Circuit	B094C 39, 3	1	2	-
1. Side blind zone alert malfunction 2. Side blind zone alert Indicator on all the time 3. Opposite side blind zone alert indicator flashes rapidly				

Circuit/System Description

The side object sensor modules are located on each side of the vehicle behind the rear fascia and are not directly visible from outside the vehicle. The sensors use radar to determine the presence of objects nearby. The left side object sensor is the master that communicates on serial data. There is a private communication network between the left and right sensors. The scan tool can communicate only with the left sensor.

Side blind zone alert is active when the vehicle is out of park or the parking brake is off on manual transmission vehicles. If a vehicle is detected in the side blind zone, the warning symbols will turn illuminate on the appropriate side. The warning symbols will vary brightness based on the ambient light conditions.

When an object is detected in the left side blind zone, the side object sensor module sends a message to the right sensor through serial data. The right sensor then supplies voltage to illuminate the visual indicator on the left side outside rear view mirror. When an object is detected in the right side blind zone, the right side object sensor will supply a voltage to illuminate the visual indicator on the right side outside rear view mirror. Each sensor is supplied B+ and ground. Ground is provided through the outside rearview mirror harness.

Diagnostic Aids

- When the ignition is turned on, or the engine is started, both outside rearview mirror displays will briefly come on to indicate that the system is operating.
- The conditions for disabling the side blind zone alert system are captured by DTCs. The drivers information center will display Service Side Detection System if one of the sensors has failed.
- The side blind zone system will be disabled if the driver has selected the Off mode through vehicle personalization menus. The selected mode is retained over ignition cycles. A driver information center message stating that the side blind zone system is off shall be displayed and the outside mirror indicators will be OFF.
- The side blind zone may be temporarily unavailable if a blockage condition exists (i.e. mud/snow buildup in front of the sensor). A driver information message "Side Detection System Unavailable" will be displayed. The side blind zone system transitions back to the normal operating state when the blockage is removed. Bumper sticks, fascia damage, labels, and heavy rain storms may also cause this condition. The blockage determination is performed with the vehicle in a drive gear.
- Because the sensors are NOT identical, they must NOT be swapped from one side of the vehicle to the other in an attempt to isolate a concern. Sensors should also NOT be swapped from one vehicle to another.
- The side blind zone system is designed to ignore stationary objects; however, the system may occasionally detect guard rails, signs, trees, shrubs, or other stationary objects as an object in the blind zone. This is normal system operation and does not require service.
- The side blind zone system may indicate an object in the blind zone if a trailer is attached to the vehicle, or a bicycle or object is extending out to either side of the vehicle. This is normal operation and does not require service.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool can communicate with the left side object sensor.
 - **If the scan tool can not communicate with the left side object sensor**

Refer to Circuit/System Testing - Left Side Object Sensor Malfunction.

- **If the scan tool can communicate with the left side object sensor**
3. Verify DTC U18A6 is not present
 - **If DTC U18A6 is present**

Diagnose this DTC first. Refer to Diagnostic Trouble Code List.

- **If DTC U18A6 is not present**
4. Ignition OFF, ignition ON.
 5. Verify that both side blind zone alert system indicators located in the outside rearview mirrors briefly turn ON and then turn OFF during the system self test.

- **If both side blind zone alert indicators do not briefly turn ON and OFF**

1. Verify the system is enabled
 - If disabled, refer to diagnostic aids for cause of disable.
 - If enabled, refer to Circuit/System Testing - Side Object Indicator Malfunction.
- **If only one indicator does not briefly illuminate during the self test**

Refer to Circuit/System Testing - Side Object Indicator Malfunction.

- **If both side blind zone alert indicators briefly turn ON and OFF**
6. All OK.

Circuit/System Testing

Left Side Object Sensor Malfunction

1. Ignition OFF and all vehicle systems OFF. Disconnect the harness connector at the B218L Side Object Sensor Module - Left. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 ohms between ground circuit terminal 7 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Verify a test lamp illuminates between the B+ circuit terminal 8 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition Off.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the B218L Side Object Sensor Module - Left.
 - **If the test lamp illuminates**
4. Ignition OFF and all vehicle systems OFF. Disconnect the It may take up to 2 minutes for all vehicle systems to power down.
5. Test for less than 2 ohms between the serial data circuit terminal 1 and the DLC terminal 1.
 - **If 2 ohms or greater**

Repair the open/high resistance in the circuit.
 - **If less than 2 ohms**
6. Replace B218L Side Object Sensor Module - Left.

Side Object Indicator Malfunction

1. Ignition OFF and all vehicle systems OFF, remove the appropriate outside rearview mirror glass and disconnect the P43 Side Object Detection Indicator connector. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal and ground.

- **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
- **If less than 10 ohms**
- 3. Ignition ON, connect a test lamp between the control circuit terminal and the ground circuit terminal.
- 4. Verify the test lamp turns ON and OFF when commanding the Object Detection Alert Indicators ON and OFF with a scan tool.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the harness connector at the B218R Side Object Sensor Module - Right.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the B218R Side Object Sensor Module - Right.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the harness connector at the B218R Side Object Sensor Module - Right, ignition ON.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the B218R Side Object Sensor Module - Right.
 - **If the test lamp turns ON and OFF**
- 5. Test or replace the appropriate A9 Outside Rearview Mirror Glass.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

LANE DEPARTURE WARNING SYSTEM MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Lane Departure Warning Switch Ignition Circuit	-	2	-	-
Lane Departure Warning Switch Signal Circuit	B356A 02	1	B356A 05	-
Lane Departure Warning Switch Indicator Control Circuit	-	B0987 06	B0987 01	-
Lane Departure Warning Switch Ground Circuit	-	1	1	-
1. Lane Departure Warning Inoperative. 2. Lane Departure Warning Switch Illumination Inoperative.				

Circuit/System Description

The lane departure warning is controlled by the frontview camera module mounted on the windshield. The lane departure warning is enabled and disabled through a switch located at the instrument panel. When enabled, the vehicle direction camera control module will illuminate the indicator located in the switch.

When the system is operating and can detect the lane markings, the vehicle direction camera control module will request via serial data communications that the instrument cluster illuminate the green lane departure ready-to-assist indicator. If the frontview camera module detects that the vehicle has crossed a lane marking without the turn signal being used, the module will request that the instrument cluster flash the yellow lane departure warning indicator. An audible warning will also sound three times when the yellow instrument cluster indicator is flashing.

Diagnostic Aids

Certain factors will affect the operation of the lane departure warning system. When the system is operating properly, the green lane departure indicator will illuminate on the instrument cluster. This indicates that all of the required operating conditions to permit lane departure warning have been met. The green lane departure indicator will not appear when the system is having difficulty seeing the lines on the road or if the view of the camera on the windshield is blocked with mud, dirt, snow, ice, or slush, if the windshield is damaged, or when weather limits visibility, such as while driving in fog, rain, or snow conditions. This is normal operation, the vehicle does not need service. Additionally, lane departure warnings may occasionally occur in a properly operating vehicle due to tar marks, shadows, cracks in the road, or other road imperfections. This is normal system operation and the vehicle does not require service. The driver information center may also display LANE DEPARTURE SYSTEM UNAVAILABLE due to the temporary conditions listed above.

- **If the parameter changes between On and Off**

6. All OK.

Circuit/System Testing

Lane Departure Warning Switch Circuit Malfunction

1. Ignition OFF, disconnect the harness connector at the S48D Multifunction Switch - Instrument Panel.
2. Test for less than 10 ohms between the ground circuit terminal 1 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the ground circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Ignition ON.
4. Verify the scan tool Lane Departure Warning Switch parameter is Off.
 - **If not Off**
 1. Ignition OFF, disconnect the harness connector at the K109 Vehicle Camera Module.
 2. Test for infinite resistance between the signal circuit terminal 4 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K109 Vehicle Camera Module.
 - **If Off**
5. Install a 3 A fused jumper wire between the signal circuit terminal 4 and ground.
6. Verify the scan tool Lane Departure Warning Switch parameter is On.
 - **If not On**
 1. Ignition OFF, disconnect the harness connector at the K109 Vehicle Camera Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V.
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K109 Vehicle Camera Module.

- **If On**

7. Test or replace the S48D Multifunction Switch - Instrument Panel.

Lane Departure Warning Switch Indicator Circuit Malfunction

1. Ignition OFF, disconnect the harness connector at the S48D Multifunction Switch - Instrument Panel.
2. Test for less than 10 ohms between the low control circuit terminal 8 and ground.

- **If 10 ohms or greater**

1. Ignition OFF.
2. Test for less than 2 ohms in the low control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K109 Vehicle Camera Module.

- **If less than 10 ohms**

3. Ignition ON, test for 4.8-5.2 V between the voltage circuit terminal 3 and ground.

- **If less than 4.8 V**

1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
2. Test for infinite resistance between the voltage circuit and ground.
 - If less than infinite resistance, repair the short to ground in the circuit.
 - If infinite resistance
3. Test for less than 2 ohms in the voltage circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.

- **If greater than 5.2 V**

1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module, ignition ON.
2. Test for less than 1 V between the voltage circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.

- **If between 4.8-5.2 V**

4. Test or replace the S48D Multifunction Switch - Instrument Panel.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for Frontview Camera Module replacement, programming and setup

REPAIR INSTRUCTIONS

FORWARD RANGE RADAR MODULE REPLACEMENT

Removal Procedure

CAUTION: Always use care when handling the forward range radar module and bracket. Improper handling can cause damage to the module or bracket and affect the functionality of the system.

1. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection .
2. Remove the front bumper fascia. Refer to Front Bumper Fascia Replacement .

Fig. 6: Forward Range Radar Module
Courtesy of GENERAL MOTORS COMPANY

3. Disconnect the forward range radar module wiring harness plug (2) from the forward range radar module (1).

Fig. 7: Lower Ball Socket

Courtesy of GENERAL MOTORS COMPANY

NOTE: Remove the forward range radar module beginning with the lower ball socket (4).

NOTE: ONLY lift at the shown positions.

4. Carefully lift the forward range radar module away from the bracket by using a plastic tool at the positions (1, 2) and (3) successively as shown in the graphic.

Fig. 8: Forward Range Radar Module And Bracket
Courtesy of GENERAL MOTORS COMPANY

5. Carefully remove the forward range radar module (2) from the forward range radar module bracket (1).

Installation Procedure

1. If the forward range radar bracket is deformed, replace the bracket. Refer to **Forward Range Radar Bracket Replacement**.

Fig. 9: Forward Range Radar Module
Courtesy of GENERAL MOTORS COMPANY

NOTE: Install the forward range radar module beginning with the 2 upper ball sockets and finishing with the ball socket (4). Apply a counterpressure to the opposite side of the bracket to prevent deformation of the bracket.

2. Carefully press the forward range radar module (3) to the forward range radar module bracket (1) and check for proper seat.
3. Connect the forward range radar module wiring harness plug (2).
4. Connect the battery negative cable. Refer to **Battery Negative Cable Disconnection and Connection** .
5. Execute the vertical alignment of the forward range radar module. Refer to **Forward Range Radar Module Alignment**.
6. Install the front bumper fascia. Refer to **Front Bumper Fascia Replacement** .

NOTE: The front bumper fascia must be installed, before continuing with the horizontal alignment.

7. For programming and set up, refer to **Control Module References** .

FORWARD RANGE RADAR MODULE ALIGNMENT

CAUTION: Always use care when handling the forward range radar module and bracket. Improper handling can cause damage to the module or bracket and affect the functionality of the system.

1. Inspect the forward range radar module for damage. Refer to Forward Range Radar Module Inspection.

Fig. 10: Verifying Level Surface

Courtesy of GENERAL MOTORS COMPANY

2. The alignment of the forward range radar module is performed under the following vehicle conditions:
 - With an empty vehicle:
 - There shall not be any person in the vehicle
 - Specific equipment can remain in the vehicle
 - Luggage must not exceed 5 kg (11 lb)
 - The vehicle must stand on a flat surface. The level of the ground must not vary by more than $\pm 7\text{mm/m}$. This corresponds to 0.4 degrees, using a water bubble level. (1) as shown in graphic.
 - Vehicle tires must have specified air pressure.

Fig. 11: Aligning Forward Range Radar Module Vertically
Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not press the water bubble level too tight against the face of the module.

3. Use a water bubble level (2) to align the forward range radar module vertically as shown in the graphic.

NOTE: The water bubble level must have an accuracy of ± 0.5 degrees (9 mm/m).

NOTE: The vertical position of forward range radar module is 90 degrees.

4. Turn the screw (1) until the water bubble level has a value of 90 degrees.

FORWARD RANGE RADAR MODULE INSPECTION

Fig. 12: Forward Range Radar Module
Courtesy of GENERAL MOTORS COMPANY

1. CONTROL MODULE DTC CHECK - Using a scan tool, perform the Vehicle DTC Information function-Verify there are no current control module DTCs set. If any DTC is set, refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .
2. Inspect the forward range radar module (4) for vertical alignment. Refer to **Forward Range Radar Module Alignment**.
3. Check the 3 ball sockets (5) for fixed seating. If the ball sockets are damaged replace the ball sockets.
4. Inspect all studs (1) for proper seat. If damaged, replace the bracket. Refer to **Forward Range Radar Bracket Replacement**.
5. Inspect the forward range radar module bracket (2) for paint cracks and deformations. Do NOT repair any cracks or misalignments. If damaged, replace the bracket. Refer to **Forward Range Radar Bracket Replacement**.
6. Inspect the wiring harness plug (3) and the terminal of the forward range radar module for any damage.

FORWARD RANGE RADAR BRACKET REPLACEMENT

Rear Object Alarm Control Module Replacement

Callout	Component Name
Preliminary Procedure Remove the rear compartment side trim panel. Refer to <u>Rear Compartment Side Trim Panel Replacement (without HP6)</u> , <u>Rear Compartment Side Trim Panel Replacement (HP6, Left Side)</u> , <u>Rear Compartment Side Trim Panel Replacement (HP6, Right Side)</u> .	
1	Rear Object Alarm Module Assembly Procedure <ol style="list-style-type: none">1. Disconnect the electrical connectors.2. Release the locking retainer from the front and rear object alarm module bracket.3. For programming and set up, refer to <u>Control Module References</u> .

SIDE OBJECT SENSING ALERT MODULE REPLACEMENT

Fig. 15: Side Object Sensing Alert Module
 Courtesy of GENERAL MOTORS COMPANY

Side Object Sensing Alert Module Replacement

Callout	Component Name
Preliminary Procedure Remove the rear bumper fascia. Refer to <u>Rear Bumper Fascia Replacement</u> .	
1	Side Object Sensing Alert Module Bolt (Qty: 3) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 2.5 (22 lb in)
2	Side Object Sensing Alert Module Procedure Disconnect the side object sensing alert module electrical connector.

REAR PARKING ASSIST ALARM SENSOR REPLACEMENT

Fig. 16: Rear Object Sensor & Retainers
 Courtesy of GENERAL MOTORS COMPANY

Rear Parking Assist Alarm Sensor Replacement

Callout	Component Name
Preliminary Procedure Remove the rear bumper fascia. Refer to <u>Rear Bumper Fascia Replacement</u> .	
1	Rear Object Sensor Retainer (Qty: 2) Procedure <ol style="list-style-type: none"> 1. Disconnect the rear object sensor electrical connector. 2. Release the locking retainer from the rear object sensor support.
2	Rear Object Sensor

FRONT VIEW CAMERA REPLACEMENT

Fig. 17: Front View Camera
 Courtesy of GENERAL MOTORS COMPANY

Front View Camera Replacement

Callout	Component Name
Preliminary Procedure Remove the windshield multifunction sensor mounting bracket cover Refer to <u>Windshield Multifunction Sensor Mount Bracket Cover Replacement</u> .	
1	Front View Camera Procedure <ol style="list-style-type: none"> 1. Gently depress top center tab on bracket to release camera. 2. Disconnect the electrical connector. 3. Program and calibrate the front view camera. For programming and set up, refer to <u>Front View Camera Module Calibration</u>.

FRONT VIEW CAMERA MODULE CALIBRATION

The calibration procedure will start automatically after SPS programming is complete. During this time the Lane Departure Warning amber indicator will illuminate.

Calibration

The calibration process for the front view camera system is necessary when a front view camera module is

replaced by a new one. This process shall not be required when only replacing the windshield and the front view camera module has been mounted again properly. This process shall be completed within 3-5 minutes when the correct driving conditions are met. If conditions are not met correct, the front view camera module shall continuously run the service point calibration until successfully completed. This process shall work across ignition cycles and shall not be required to be re-initialized at start up. If the Lane Departure Warning Switch is pressed during calibration, the indicator will flash momentarily and then stay out - this is normal operation.

To calibrate the front camera, operate the vehicle in the following conditions until the calibration is complete:

- Clean windshield.
- Avoid lane changes.
- Maintain vehicle speeds between 56-90 km/h (35-56 MPH).
- Ensure the road contains visible references (well defined lane markings, curbs, etc.).

Once the procedure is complete, the amber indicator will turn off. Shortly after the green ready to assist light should turn on as long as all conditions are met for normal operation. The system is then ready to assist.

If Slow to Calibrate

One or more of the following conditions may increase the length of time required to complete the self-calibration procedure:

- Heavy traffic
- Stop and go traffic
- Mountain roads
- Curves in roadway
- Poor contrast lane markings
- Botts' Dots type lane markings
- Operating the vehicle speed is greater than 90 km/h (56 MPH)
- Driving through snow or fog, or driving directly into the sun
- Camera not properly installed. Verify it is snapped into tabs and is secure. Refer to **Front View Camera Replacement** .

No Calibration

Conditions that will prevent completion of the self-calibration procedure:

- Dirty windshield glass or obstruction on windshield
- Operating the vehicle with speed less than 56 km/h (35 MPH)
- No visible lane markings
- Severe weather where lane markings cannot be seen
- Camera not properly installed. Verify it is snapped into tabs and is secure. Refer to **Front View Camera Replacement** .

DESCRIPTION AND OPERATION

OBJECT DETECTION DESCRIPTION AND OPERATION (WITH LANE DEPARTURE WARNING, UFL)

The lane departure warning system is a convenience feature of the front view camera that issues a warning when the system detects that the vehicle has unintentionally crossed a lane marking. The front view camera is located behind the windshield, looking out at the road ahead and detecting any lane markings. When the vehicle unintentionally leaves a detected lane, a visual and audible alert is given to the driver.

The lane departure warning system is made up of the following components:

- Front view camera module
- Lane departure warning switch
- Instrument cluster / Vehicle Direction Display
- Radio

Front View Camera Module

The camera detects visual queues such as lane markings. When it is determined that the vehicle has unintentionally moved outside of the lane, a visual and audible warning is given to the driver. The front view camera module receives an input from the lane departure warning switch and controls the lane departure warning switch indicator output. The front view camera module also communicates via serial data with the instrument cluster and radio to request visual and audible alerts.

Lane Departure Warning Switch

The lane departure warning switch provides an input to the front view camera module to turn the lane departure warning system ON and OFF. The front view camera module provides a signal voltage to the normally open momentary switch. When the switch is pressed, the signal circuit is pulled to ground, indicating to the front view camera module that the system has been requested to turn ON or OFF. The lane departure warning switch also contains the lane departure warning switch indicator, which is controlled by the front view camera module to indicate the ON and OFF status of the lane departure warning system. When the system has been enabled by the lane departure warning switch, the front view camera module applies ground to the switch indicator and illuminates the LED. The location of the lane departure warning switch can vary with different vehicles. For the exact location please refer to the user's manual.

Instrument Cluster

The vehicle direction display contains green and amber lane departure warning indicators. These indicate to the driver the current status of the lane departure warning system and are controlled via serial data by the front view camera module. When the vehicle speed is above 56 km/h (35 MPH) and the system has detected the required lane markings and is ready to assist, the green indicator will be illuminated on the vehicle direction display. If the vehicle has unintentionally left the lane, the amber indicator will flash.

Radio

The radio controls the audible alert for the lane departure warning. If the vehicle has unintentionally left the lane, the radio will command three beeps as an audible alert to the driver.

Lane Departure Warning Operation

System operation can be describe by the following modes:

- **Off State:** The system has been turned off by the driver, using the lane departure warning switch. The lane departure warning indicator will not be illuminated.
- **Not Ready To Assist:** The system is enabled and the lane departure warning indicator is illuminated, but not ready to assist when any of the following conditions is true:
 - Vehicle speed is less than 56 km/h (35 MPH). The system is designed to function at speeds greater than 56 km/h (35 MPH).
 - The system cannot detect lane markings. This may be because there are no lane markings, as on a country road or that the lane markings cannot be determined due to snow, rain, or other driving conditions.
 - The windshield area in front of the camera or the camera lens is blocked by fog, dirt, damage to the windshield or other elements that may prevent the camera from detecting lane markings.
- **Ready To Assist:** The system is enabled and ready to warn of the unintentional lane crossing. The system is ready to assist when the green lane departure warning indicator is illuminated on the vehicle direction display.

Lane Crossing Alerts

- When one of the following conditions are met, the system will not give alerts:
 - The correct turn signal is activated. An activated turn signal is interpreted as an intentional lane crossing.
 - The operator makes an intentional steering maneuver.
 - The operator makes an intentional accelerating maneuver.
 - The operator makes an intentional braking maneuver.
- Lane crossing alert consists of the following:
 - Three chimes are activated through the radio.
 - The amber lane departure warning indicator will flash.

Lane Departure Warning System Driver Information Center Messages

The front view camera module can command the driver information center to display the various messages to alert the driver of a system concern or status information. For detailed information about the possible messages please refer to the user's manual.

OBJECT DETECTION DESCRIPTION AND OPERATION (WITH FORWARD COLLISION ALERT, UEU)

The forward collision alert system is a convenience feature of the front view camera that issues a warning to the driver when a potential collision risk exists. The front view camera is located behind the windshield, looking

out at the road ahead and detecting vehicles directly ahead, within a distance of approximately 60 meters (197 ft). The forward collision alert system is always active and operates at speeds above 40 kph (25 mph). When the system detects a vehicle in the path ahead, the green vehicle ahead indicator in the vehicle direction display is illuminated. When approaching another vehicle too rapidly, the collision alert symbol will flash in the vehicle direction display. Simultaneously an audible alert sounds. Forward collision alert does not warn the driver of any objects that are not detected as a vehicle, like e.g. pedestrians, animals, signs, guard rails, bridges, construction barrels or other stationary or slow moving objects. The forward collision alert timing sensitivity to control the distance to the vehicle ahead can be set using the forward collision alert switch in the left steering wheel controls.

In some cases the camera may detect a vehicle that is not in the path ahead, or the system may occasionally provide unrealistic alerts. This could respond to a turning vehicle ahead, guard rails, traffic signs, or other stationary objects. This is normal operation, the vehicle does not need service. Forward collision alert may sometimes set unnecessary alerts to turning vehicles, vehicles in other lanes, objects that are not vehicles, or shadows. These alerts are normal operation and the vehicle does not need service.

The forward collision alert system is made up of the following components:

- Front view camera module
- Forward collision alert switch
- Instrument cluster / Vehicle direction display
- Radio

Front View Camera Module

The camera detects vehicles in front of the host vehicle. The front view camera module requests the green vehicle ahead alert indicator in the vehicle direction display ON via serial data when the front view camera system has detected a vehicle in the driving path ahead. The front view camera module also communicates via serial data with the driver information center and the radio to request visual and audible alerts.

- Lane departure warning system unavailable
- Forward collision alert OFF
- Service front camera

Forward Collision Alert Switch

The forward collision alert switch provides an input to the front view camera module to select the alert timing sensitivity when approaching another vehicle too rapidly. The front view camera module provides a signal voltage to the normally open switch. When the switch is pressed, the signal circuit is pulled to ground, indicating to the front view camera module that the system has been requested to change the alert timing sensitivity. The first button press shows the current alert timing setting on the driver information center. With every button press, the alert timing sensitivity is changed. The current alert timing setting will be maintained until it is changed. The preset alert timing setting is displayed in the top line of the driver information center. The position of the forward collision alert switch can vary with different vehicles. For the exact position please refer to the user's manual.

Instrument Cluster

The Vehicle direction display contains the green vehicle ahead indicator, which indicates to the driver that the Front View Camera system has detected a vehicle in the driving path ahead and is controlled via serial data. When approaching another vehicle too rapidly, the collision alert symbol will flash in the Vehicle direction display. The red Front collision alert display will stay continuously illuminated if the vehicle ahead remains much too close.

Radio

The radio controls the audible alert for the forward collision alert system. If the host vehicle is approaching another vehicle too rapidly, the radio will command an audible alert to the driver.

Forward Collision Alert System Driver Information Center Messages

The front view camera module can command the driver information center to display the various messages to alert the driver of a system concern or status information. For detailed information about the possible messages please refer to the user's manual.

OBJECT DETECTION DESCRIPTION AND OPERATION (WITH REARVIEW CAMERA, UVC)

Rear Vision Camera System Operation

The rear vision camera system consists of a video camera located at the rear of the vehicle and the navigation radio.

When the transmission is placed into REVERSE, a 12 volt signal is sent to the rear vision camera by the body control module (BCM). This signal indicates to the camera that the vehicle is in reverse and image display is requested. The rear vision camera receives ignition voltage and a constant ground to power the camera. Video signal + and video signal - circuits carry the video image from the rear vision camera to the navigation radio. Additionally, the video signal circuits are shielded to prevent any interference which may lead to a loss of video signal resolution and a degraded video image. The shield is provided a ground path by the rear vision camera.

The following conditions may cause a degraded rear vision camera image:

- Ice, snow, or mud has built up on the rear vision camera
- Dark conditions
- Extreme light conditions, such as glare from the sun or the headlights of another vehicle
- Damage to the rear of the vehicle
- Extreme high temperatures or extreme temperature changes

If a malfunction is detected in the system, Service Rear Vision Camera may be displayed on the navigation radio as an indicator to the customer that a problem exists that requires service.

A11	A11 Radio
A9A	A9A Outside Rearview Mirror - Driver
A9B	A9B Outside Rearview Mirror - Passenger

The side blind zone alert system is a feature that utilizes two side object sensor modules to provide enhanced customer convenience by sensing and reporting to the driver that an object is present in one of the driver's side blind zones. This is communicated to the driver by illuminating an icon on the left or right side view mirror, depending on what side of the vehicle the object is detected. This lane change assist system is radar based system in which the sensors transmit and receives energy that is reflected from external objects and used to determine if that object is an object of interest. Although this system is intended to help drivers avoid lane change crashes, it does not replace driver vision and therefore should be considered a lane change aid.

Side Blind Zone Alert System Components

The side blind zone alert system is made up of the following components:

- Left side object sensor module
- Right side object sensor module
- Driver outside rearview mirror
- Passenger outside rearview mirror

Side Object Sensor Modules

The side object sensor modules are located on each side of the vehicle behind the rear fascia and are not directly visible from outside the vehicle. The sensors use radar to determine the presence of objects nearby. The left side object sensor is the master that communicates on serial data. There is a private communication network between the left and right sensors. The scan tool is able to communicate only with the left sensor.

When an object is detected in the left side blind zone, the side object sensor module sends a message to the right sensor through serial data. The right sensor then supplies voltage to illuminate the visual indicator on the left side outside rear view mirror. When an object is detected in the right side blind zone, the right side object sensor will supply a voltage to illuminate the visual indicator on the right side outside rear view mirror. Each sensor is supplied B+ and ground.

Outside Rearview Mirrors

The outside rearview mirrors contain an icon that is backlit with high intensity, amber-colored LED's located on the mirror surface. The display brightness adapts to day/night conditions. The side blind zone alert indicator icon in the left or right outside rearview mirror is illuminated if the left or right side object sensor module detects a vehicle in the side blind zone to inform the driver that there is a vehicle driving in the blind zone.

Side Blind Zone Alert Operation

The side blind zone alert system shall detect and report "objects of interest" on either side of the vehicle, within a specified "blind spot" zone. The system is designed to alert the driver, with a visual display placed on the side view mirror, to the presence of objects of interest that may not be visible in the inside rearview mirror and outside rear view mirrors. Although this system is intended to help drivers avoid lane change crashes, it does not replace driver vision and therefore should be considered a lane change aid. Even with the side blind zone alert system, the driver must check carefully for objects outside of the reporting zone before changing lanes. In the event that the system senses a malfunction through its diagnostic routines, the system will be disabled and the driver will be visually notified.

When the vehicle is started, both outside mirror displays will briefly come on to indicate that the system is operating. The warning symbols will vary brightness based on the ambient light conditions. Side blind zone alert is active when the vehicle is out of park or the parking brake is off on manual transmission vehicles. When the system detects a vehicle in the side blind zone while driving forward, an amber warning symbol will light up in the appropriate outside mirror. This indicates that it may be unsafe to change lanes. If the driver then activates the turn signal, the amber warning symbol starts flashing as an extra warning not to change lanes.

The system is designed to detect objects of interest as small as a 125cc motorcycle with rider. The detection zone starts at the outside rearview mirror and extends out to 3.5 m (11 ft) at the back corner of the vehicle and

5m (16 ft) behind the vehicle at a height of 0.5 m (1.5 ft) to 2.0 m (6 ft) above the ground. The side blind zone system does not detect stationary objects such as guardrails, posts, curbs, walls, berms, bridges, or parked vehicles.

If the vehicle is towing a trailer or has an object such as a bicycle rack attached to the rear of the vehicle, the side blind zone system may not function properly and the indicators may illuminate intermittently or remain illuminated all the time. The driver information center may display "SIDE DETECTION SYSTEM UNAVAILABLE".

Foul weather may affect the operation of the side blind zone system. Occasional missed alerts can occur under normal circumstances and will increase in wet conditions. The number of missed alerts will increase with increased rainfall or road spray. Heavy rainfall, as well as mud, dirt, snow, ice, or slush build-up on the rear fascia, can completely disable the system. The warning symbols will vary brightness based on the ambient light conditions.

Side Blind Zone Alert Driver Information Center Messages

SIDE BLIND ZONE ALERT OFF

This message indicates that the system has been disabled through the driver information center. Refer to the vehicle owners manual for instructions on how to set personalization options on the driver information center.

SERVICE SIDE DETECTION SYSTEM

This message indicates that the system requires service. When the message is displayed, the indicators may remain illuminated at all times, notifying the driver that the side blind zone system should not be relied upon when changing lanes. Check vehicle for DTCs to determine the cause of this notification.

SIDE DETECTION SYSTEM UNAVAILABLE

This message indicates that the system has been temporarily disabled because the sensor is blocked or can otherwise not accurately detect vehicles or objects. Verify there is no damage to rear fascia or there are any bumper stickers that may interfere with the radar signals. Ask the customer if any of the following circumstances were present when the system became unavailable: towing a trailer, having a bike rack attached, mud, dirt, snow, ice, or slush build-up on the rear fascia, heavy rainfall, or excessive road spray.

OBJECT DETECTION DESCRIPTION AND OPERATION (WITH LANE CHANGE ASSIST, UKC)

A9A	A9A Outside Rearview Mirror - Driver
A9B	A9B Outside Rearview Mirror - Passenger

The lane change alert system is an advanced side blind zone alert feature that utilizes the side object sensor modules that are also used for rear cross traffic alert. The lane change alert system is designed to provide enhanced customer convenience by sensing and reporting to the driver that an object is present in one of the driver's side blind zones, or that a highway licensable vehicle is rapidly approaching the vehicle in one of the adjacent lanes. This is communicated to the driver by illuminating an icon on the left or right side view mirror, depending on what side of the vehicle the object is detected. The lane change alert system is radar based system in which the sensors transmit and receives energy that is reflected from external objects and used to determine if that object is an object of interest. Although this system is intended to help drivers avoid lane change crashes, it does not replace driver vision and therefore should be considered a lane change aid.

Lane Change Alert System Components

The lane change alert system is made up of the following components:

- Side object sensor module - left
- Side object sensor module - right
- Driver outside rearview mirror
- Passenger outside rearview mirror

Side Object Sensor Modules

The side object sensor modules are located on each side of the vehicle behind the rear fascia and are not directly visible from outside the vehicle. The sensors use radar to determine the presence of objects nearby. The left side object sensor is the master that communicates on serial data. There is a private communication network between the left and right sensors. The scan tool is able to communicate only with the left sensor.

When an object is detected in the left side blind zone or approaching in the left side lane change alert zone, the side object sensor module sends a message to the right sensor through serial data. The right sensor then supplies voltage to illuminate the visual indicator on the left side outside rear view mirror. When an object is detected in the right side blind zone or approaching in the right side lane change alert area, the right side object sensor will supply a voltage to illuminate the visual indicator on the right side outside rear view mirror. Each sensor is supplied B+ and ground.

Outside Rearview Mirrors

The outside rearview mirrors contain an icon that is backlit with high intensity, amber-colored LED's located on the mirror surface. The display brightness adapts to day/night conditions. The side blind zone alert indicator icon in the left or right outside rearview mirror is illuminated if the left or right side object sensor module detects a vehicle in the side blind zone or approaching in the lane change alert area to inform the driver that it may not be safe to change lanes.

Lane Change Alert Operation

The lane change alert system shall detect and report "objects of interest" in the driver's blind zone, or approaching on either side of the vehicle, within a specified lane change zone. The system is designed to alert the driver, with a visual display placed on the side view mirror, to the presence of objects of interest that may not be visible in the inside rearview mirror and outside rear view mirrors. Although this system is intended to help drivers avoid lane change crashes, it does not replace driver vision and therefore should be considered a lane change aid. Even with the lane change alert system, the driver must check carefully for objects outside of the reporting zone before changing lanes. In the event that the system senses a malfunction through its diagnostic routines, the system will be disabled and the driver will be visually notified.

When the vehicle is started, both outside mirror displays will briefly come on to indicate that the system is operating. The warning symbols will vary brightness based on the ambient light conditions. Lane change alert is active when the vehicle is out of park or the parking brake is off on manual transmission vehicles. When the system detects a vehicle in the side blind zone or approaching in the lane change alert zone while driving forward, an amber warning symbol will light up in the appropriate outside mirror. This indicates that it may be

unsafe to change lanes. If the driver then activates the turn signal, the amber warning symbol starts flashing as an extra warning not to change lanes.

The system is designed to detect objects of interest as small as a 125cc motorcycle with rider. The detection zone starts at the outside rearview mirror and extends out to 3.5 m (11 ft) at the back corner of the vehicle and 70m (230 ft) behind the vehicle at a height of 0.5 m (1.5 ft) to 2.0 m (6 ft) above the ground. The side blind zone system does not detect stationary objects such as guardrails, posts, curbs, walls, berms, bridges, or parked vehicles.

If the vehicle is towing a trailer or has an object such as a bicycle rack attached to the rear of the vehicle, the lane change alert system may not function properly and the indicators may illuminate intermittently or remain illuminated all the time. The driver information center may display "SIDE DETECTION SYSTEM UNAVAILABLE".

Foul weather may affect the operation of the lane change alert system. Occasional missed alerts can occur under normal circumstances and will increase in wet conditions. The number of missed alerts will increase with increased rainfall or road spray. Heavy rainfall, as well as mud, dirt, snow, ice, or slush build-up on the rear fascia, can completely disable the system. The warning symbols will vary brightness based on the ambient light conditions.

Lane Change Alert Driver Information Center Messages

LANE CHANGE ALERT OFF

This message indicates that the system has been disabled through the driver information center. Refer to the vehicle owners manual for instructions on how to set personalization options on the driver information center.

SERVICE SIDE DETECTION SYSTEM

This message indicates that the system requires service. When the message is displayed, the indicators may remain illuminated at all times, notifying the driver that the side blind zone system should not be relied upon when changing lanes. Check vehicle for DTCs to determine the cause of this notification.

SIDE DETECTION SYSTEM TEMPORARILY UNAVAILABLE

This message indicates that the system has been temporarily disabled because the sensor is blocked or can otherwise not accurately detect vehicles or objects. Verify there is no damage to rear fascia or there are any bumper stickers that may interfere with the radar signals. Ask the customer if any of the following circumstances were present when the system became unavailable: towing a trailer, having a bike rack attached, mud, dirt, snow, ice, or slush build-up on the rear fascia, heavy rainfall, or excessive road spray.

OBJECT DETECTION DESCRIPTION AND OPERATION (WITH REAR CROSS TRAFFIC ALERT, UFG)

Rear Cross Traffic Alert Block Diagram

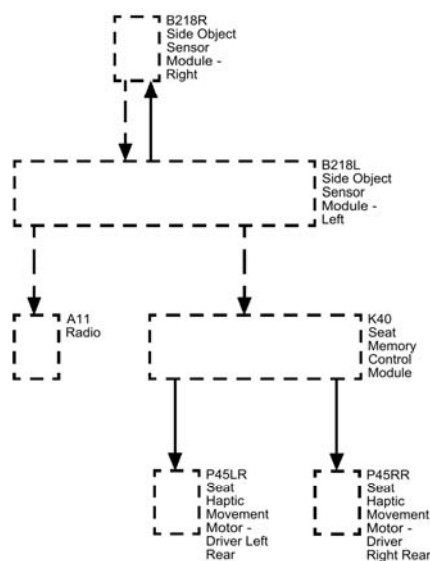

Fig. 20: Rear Cross Traffic Alert Block Diagram
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
HW	Hard-Wired
DA	Serial Data
DB	Serial Data - GMLAN Low Speed
DB	Serial Data - GMLAN Low Speed
HW	Hard-Wired
HW	Hard-Wired
B218R	B218R Side Object Sensor Module - Right

A11	A11 Radio
K40	K40 Seat Memory Control Module
P45LR	Seat Haptic Movement Motor - Driver Left Rear
P45RR	Seat Haptic Movement Motor - Driver Right Rear

The rear cross traffic alert system is a feature that utilized two side object sensor modules to provide enhanced customer convenience while backing up by sensing and providing warnings to the driver on impending rear cross traffic. The rear cross traffic alert system is designed to detect and track objects of interest within a specified coverage zone behind the vehicle. The system is designed to alert the driver, with a visual display and either an audible sound or a haptic warning, if equipped and enabled, to the presence of objects of interest that may cause a collision with the host vehicle. Although the system is intended to assist drivers in backing up, it

does not replace driver's vision. The driver is responsible to check carefully for objects outside of the coverage zone (e.g., a fast approaching vehicle) for a safe backing maneuver.

Rear Cross Traffic Alert System Components

The side blind zone alert system is made up of the following components:

- Left side object sensor module
- Right side object sensor module
- Visual Display Icons located on the infotainment display screen
- Audio system chime
- Haptic safety seat (if equipped)

Side Object Sensor Modules

The side object sensor modules are located on each side of the vehicle behind the rear fascia and are not directly visible from outside the vehicle. The sensors use radar to determine the presence of objects nearby. The left side object sensor is the master that communicates on serial data. There is a private communication network between the left and right sensors. The scan tool is able to communicate only with the left sensor.

When an object is detected in the left rear cross traffic zone, the side object sensor module sends a serial data message to the human interface module and memory seat module to provide alerts. Each sensor is supplied B+ and ground.

Display Icons

The rear cross traffic alert system visual alert display consists of two visual icons, one on each side of the display screen of the rearview camera display, that are used to alert the driver on rear cross traffic from each side of the host vehicle respectively. In addition to visual indicators, the audio system will beep (if enabled) and the haptic safety seat will vibrate (if equipped and enabled). Refer to owner's manual for vehicle customization.

Audio or Haptic Notification

The alert output type can be driver selected to either audio or haptic. The chime location will be left rear for left rear cross traffic alert and right rear for right rear cross traffic alert. The haptic seat system response will be to generate 3 repetitions of haptic vibration in the left rear area of the seat for left cross traffic alert and right rear area of the seat for right cross traffic alert. If there is a problem with the haptic seats, the audio chime will be substituted.

Rear Cross Traffic Alert Operation

The rear cross traffic alert system is designed to detect objects of interest as small as a 125cc motorcycle with rider. The detection zone extends approximately 30m (99 ft) from the rear corner of the car and covers an area from behind the vehicle to 125 degrees towards the front at a height of 0.45m (1.5 ft) to 2m (6.5 ft) above ground. The system operates when vehicle speed is 10 kph (6 mph) or less and is designed to detect objects moving at speeds up to 36 kph (22 mph).

When the vehicle is backing up, the side object sensors receive energy that is reflected from external objects and determine if the objects are objects of interest or not. The system may at times detect pedestrians, shopping carts, or similar moving objects. This is normal and should not be considered as a false alert or problem with the system. The rear cross traffic alert system will estimate vehicle travel trajectory and use the information in conjunction with object travel trajectory information to determine if there is a potential collision between the vehicle and the object of interest. The rear cross traffic alert function will only alert on objects of interest that pose a potential collision with the host vehicle. The system is not designed to provide an alert to objects that have no potential collision with vehicle. In addition, the system will not alert to stationary objects such as signs, parked cars, etc.

If the vehicle is towing a trailer or has an object such as a bicycle rack attached to the rear of the vehicle, the rear cross traffic alert system may not function properly.

Foul weather may affect the operation of the rear cross traffic alert system. Occasional missed alerts can occur under normal circumstances and will increase in wet conditions. The number of missed alerts will increase with increased rainfall or road spray. Heavy rainfall, as well as mud, dirt, snow, ice, or slush build-up on the rear fascia, can completely disable the system.

Rear Cross Traffic Alert Driver Information Center Messages

REAR CROSS TRAFFIC ALERT OFF

This message indicates that the system has been disabled through the driver information center. Refer to the vehicle owners manual for instructions on how to set personalization options on the driver information center.

SERVICE SIDE DETECTION SYSTEM

This message indicates that the system requires service. Since the side object sensors are also used for side blind zone alert and/or lane change alert, these feature will also be inoperative. Check vehicle for DTCs to determine the cause of this notification.

SIDE DETECTION SYSTEM TEMPORARILY UNAVAILABLE

This message indicates that the system has been temporarily disabled because the sensors are blocked or can otherwise not accurately detect vehicles or objects. Verify there is no damage to rear fascia or there are any bumper stickers that may interfere with the radar signals. Ask the customer if any of the following circumstances that present when the system became unavailable: mud, dirt, snow, ice, or slush build-up on the rear fascia, heavy rainfall, or excessive road spray.

OBJECT DETECTION DESCRIPTION AND OPERATION (WITH FRONT AND REAR PARK ASSIST, UD5)

The parking assist system is designed to identify and notify the driver of an object in the vehicle path when moving forward or reversing at speeds of less than 8 km/h (5 MPH). The distance and location of the object is determined by 8 object sensors: 4 located in the rear bumper and 4 located in the front bumper. The parking assist system will notify the driver using an audible beep signal through the radio.

The parking assist system is made up of the following components:

- Front and rear parking assist control module
- Front object alarm sensors
- Rear object alarm sensors
- Parking assist switch
- Parking assist switch indicator

Front and Rear Parking Assist Control Module

The front and rear parking assist control module provides a reference voltage and a low reference to the 8 object alarm sensors. The front and rear parking assist control module receives individual signals from each of the 8 sensors and determines the location and distance of an object based on these inputs. When an object is detected, the front and rear parking assist control module will send a data message via CAN-Bus to the radio requesting an audible alert.

Object Alarm Sensors

The object alarm sensors are located in the front and rear bumpers of the vehicle. The sensors are used to determine the distance between an object and the bumper. Each sensor emits an ultrasonic frequency which is reflected off any object located in front of or behind the vehicle. These reflections are received by the sensors. The time difference between the emission of the frequency and when the reflection is received is known as sensor echo time, it is used to determine the distance to the object. The sensors report this information to the front and rear parking assist control module.

Parking Assist Switch

The parking assist can be enabled and disabled by pressing the parking assist switch. By engaging the reverse gear the parking assist can also be activated. By subsequently pressing the parking assist switch the parking assist can be disabled again.

Parking Assist Switch Indicator

The indicator in the parking assist switch shows the status of the parking assist. If the lamp is ON, the parking assist is enabled.

Parking Assist Operation

When an object is within the measuring range of the sensor, the ultrasonic pulse is reflected and is received by the sending or a neighboring sensor. The sensor converts this signal into a voltage signal and sends this signal to the parking assist control module. The front and rear parking assist control module evaluates the received sensor signals. As soon as an object is within the measuring range, the front and rear parking assist control module sends a message via CAN-Bus to the radio in order to give out the acoustic distance signal.

The parking assist system can detect objects greater than 7.6 cm (3 in) wide and 25.4 cm (10 in) tall. The system cannot detect objects below the bumper, underneath the vehicle. If an object is detected, one of the following will occur:

- The measuring range of the front object alarm sensors is between 30-120 cm (11.8-47.2 in). From a distance of 120 cm (47.2 in), the acoustic signal is active. The frequency of the beep sound increases with decreasing distance. From a distance less than 30 cm (11.8 in), the sound becomes continuous.
- The measuring range of the rear object alarm sensors is between 30-250 cm (11.8-98.4 in). From a distance of 250 cm (98.4 in), the acoustic signal is active. The frequency of the beep sound increases with decreasing distance. From a distance less than 30 cm (11.8 in), the sound becomes continuous.

The parking assist can be activated and deactivated by pressing the parking assist switch. When REVERSE gear is selected, park assist automatically is engaged for both front and rear sensors. When the vehicle is put into DRIVE from REVERSE the front assist sensors will be active up to speeds of 8 km/h (5 MPH) to assist with parking maneuvers. Once the vehicle is above 8 km/h (5 MPH) the front sensors are disabled and will not be re-enabled until either REVERSE gear is selected or the parking assist switch is pressed to activate the system. Once the parking assist switch is pressed during a key cycle the front sensors become active at speeds under 8 km/h (5 MPH). If the park assist switch is pressed again in the same key cycle the message "Park Assist Off" will be displayed in the driver information center if the vehicle speed is under 8 km/h (5 MPH) and front sensors detect an object within 120 cm (47.2 in). The LED indicator on the parking assist switch provides the ON/OFF state of the system. If the indicator is ON, the system is active and ready to assist.

The front and rear parking assist control module carries out a self test and monitors the sensors for electrical and mechanical faults. Monitored is the power supply of each sensor and the sensor signals, which need to alter when the vehicle moves. If this is not the case, the sensor is acoustically blocked or faulty. Mud, ice and snow may cause obstruction of the function of the sensors. Besides that the front and rear parking assist control module checks whether the correct type of sensor is installed. If any of these tests fails, a DTC with corresponding symptom is set, the parking assist is deactivated and the parking assist indicator in the instrument panel cluster is activated.

Parking Assist System Driver Information Center Messages

SERVICE PARK ASSIST

The driver information center displays SERVICE PARK ASSIST when the front and rear parking assist control module detects a malfunction in the parking assist system and the system is disabled. The driver information center also displays SERVICE PARK ASSIST when a loss of communication occurs with the front and rear parking assist control module.

PARK ASSIST OFF

The PARK ASSIST OFF message is displayed in the driver information center when the parking assist system is disabled due to conditions that disable or inhibit the system. The front and rear parking assist control module requests the driver information center display PARK ASSIST OFF when it detects that one of the following conditions:

- The parking assist system is manually disabled using the parking assist switch.
- An object is attached to the rear of the vehicle, such as a trailer, bicycle rack, trailer hitch receiver, or tow bar. Also, an object extending beyond a lowered tailgate will disable the system.
- The parking assist sensors are covered by snow, mud, dirt, slush, or ice.
- The vehicle bumper is damaged.

- Excessive paint thickness on a replacement parking assist sensor.
- The parking assist sensors are disrupted by vibrations, like those caused by a large nearby vehicle or from heavy equipment such as a jackhammer.

OBJECT DETECTION DESCRIPTION AND OPERATION (WITH REAR PARK ASSIST, UD7)

The ultrasonic parking assist system is designed to identify and notify the driver of an object in the vehicle's path when reversing at speeds of less than 8 km/h (5 MPH). The distance and location of the object is determined by 4 object sensors located in the rear bumper. The parking assist system will notify the driver using an audible beep signal through the radio.

The parking assist system is made up of the following components:

- Parking assist control module
- Rear object alarm sensors
- Parking assist switch
- Parking assist switch indicator

Parking Assist Control Module

The parking assist control module provides an 8 V reference and a low reference to the four object alarm sensors. The parking assist control module receives individual signals from each of the four sensors and determines the location and distance of an object based on these inputs. When an object is detected, the parking assist control module will send a data message via CAN-Bus to the radio requesting an audible alert.

Rear Object Alarm Sensors

The object alarm sensors are located in the rear bumper of the vehicle. The sensors are used to determine the distance between an object and the bumper. Each sensor emits an ultrasonic frequency which is reflected off any object located behind the vehicle. These reflections are received by the sensors. The time difference between the emission of the frequency and when the reflection is received is known as sensor echo time, it is used to determine the distance to the object. The sensors report this information to the parking assist control module.

Parking Assist Switch

The parking assist can be activated and deactivated by pressing the parking assist switch. By engaging the reverse gear the parking assist can also be activated. By subsequently pressing the parking assist switch the parking assist can be disabled again.

Parking Assist Switch Indicator

The indicator in the parking assist switch shows the status of the parking assist. If the lamp is ON, the parking assist is activated.

Rear Parking Assist Operation

When an object is within the measuring range of the sensor, the ultrasonic pulse is reflected and is received by the sending or a neighboring sensor. The sensor converts this signal into a voltage signal and sends this signal to the parking assist control module. The parking assist control module evaluates the received sensor signals. As soon as an object is within the measuring range, the parking assist control module sends a message to the radio in order to give out the acoustic distance signal. If an object is detected within 2.5 m (8 ft) away from the rear bumper, there will be an audible beep out of the speakers. As the vehicle gets closer to an object, the time between the beeps becomes shorter. If the vehicle stops and there is an object within 2.5 m (8 ft) away from the rear bumper the beeping will stop after 5 s. When the distance between the object and the vehicle starts to decrease again the beeping will start again. From a distance less than 30 cm (9.84 in), the sound becomes continuous.

The rear parking assist system can detect objects greater than 7.6 cm (3 in) wide and 25.4 cm (10 in) tall. The system cannot detect objects below the bumper, underneath the vehicle.

The parking assist can be activated and deactivated by pressing the parking assist switch. By engaging the reverse gear the parking assist can also be activated. By subsequently pressing the parking assist switch the parking assist can be disabled again.

The parking assist control module carries out a self test and monitors the sensors for electrical and mechanical faults. Monitored is the power supply of each sensor and the sensor signals, which need to alter when the vehicle moves. If this is not the case, the sensor is acoustically blocked or faulty. Mud, ice and snow may cause obstruction of the function of the sensors. Besides that the parking assist control module checks whether the correct type of sensor is installed. If any of these tests fails, a DTC with corresponding symptom is set, the parking assist is deactivated and the parking assist control module will send a serial data message to display the SERVICE PARK ASSIST message on the driver information center.

Rear Parking Assist System Driver Information Center Messages

SERVICE PARK ASSIST

The driver information center displays SERVICE PARK ASSIST when the parking assist control module detects a malfunction in the rear parking assist system and the system is disabled. The driver information center also displays SERVICE PARK ASSIST when a loss of communication occurs with the parking assist control module.

PARK ASSIST OFF

The PARK ASSIST OFF message is displayed in the driver information center when the parking assist system is disabled due to conditions that disable or inhibit the system. The parking assist control module requests the driver information center display PARK ASSIST OFF when it detects that one of the following conditions:

- The rear parking assist system is manually disabled by the vehicle operator through the parking assist switch or audio system personalization menu.
- An object is attached to the rear of the vehicle, such as a trailer, bicycle rack, trailer hitch receiver, or tow bar. Also, an object extending beyond a lowered endgate will disable the system.
- The parking assist sensors are covered by snow, mud, dirt, slush, or ice.
- The vehicle bumper is damaged.

- Excessive paint thickness on a replacement parking assist sensor.
- The parking assist sensors are disrupted by vibrations, like those caused by a large nearby vehicle or from heavy equipment such as a jackhammer.

INTRODUCTION

BASECOAT/CLEARCOAT PAINT SYSTEMS

WARNING: Exposure to isocyanates during paint preparation and application processes can cause severe breathing problems. Read and follow all of the instructions from the manufacturers of painting materials, equipment, and protective gear.

All paint finish repairs of rigid exterior surfaces must meet GM standards. Refer to the latest revision of the GM

Approved Refinish Materials book to identify the paint systems you may use that have been engineered to meet GM standards. The GM Approved Refinish Materials book supplies all approved products, including volatile organic compound (VOC) compliant regulations recommended by the individual manufacturer, and detailed procedures for materials used in their paint system.

The latest revision of the GM Approved Refinish Materials booklet is located on the Genuine GM Parts website at www.genuinegmparts.com.

ANTI-CORROSION TREATMENT AND REPAIR

WARNING: When applying sound deadeners, or anti-corrosion materials due care and preventative measures must be exercised to prevent any material from being sprayed into door and quarter panel mechanisms such as door locks, window run channels, window regulators and seat belt retractors, as well as any moving or rotating mechanical or suspension parts on the underbody, particularly the parking brake cable. After material application, be sure that all body drain holes are open. Improper application may increase chance of corrosion damage or limit the operation of moving parts, resulting in personal injury.

Any procedure that disturbs these special treatments, such as panel replacement or collision damage repair operations, may leave the metal unprotected and result in corrosion. Proper recoating of these surfaces with service-type anti-corrosion material is essential.

After repair and/or replacement parts are installed, all accessible bare metal surfaces must be treated with metal conditioner and reprimed. Refer to the GM Approved Refinish Materials book which identifies the paint systems you may use.

The latest revision of the GM Approved Refinish Materials booklet is located on the GM Genuine Parts website at www.genuinegmparts.com.

After a collision, some vehicle structure areas such as frame rails, cross-members and rocker panel sections may need to be repaired. In most cases, the anti-corrosion materials need to be removed to perform these repairs. These materials are classified into two types: Closed Cavity coatings and Undercoat coatings. The primary difference is the way the products set up or "dry". Both are intended to protect the surface they are applied to from corrosion caused by water, salt water or Magnesium Chloride blended de-icing compounds used to thaw icy winter roads. They also can provide a measure of sound deadening.

The Closed Cavity coatings remain sticky to the touch and will seep into seams initially and over extended periods of time. Closed Cavity coatings provide the best corrosion protection inside of rocker panel sections, pillar sections, frame rails, cross-members, doors, rear compartment lids and closed areas of hoods - anywhere that is concealed or closed off to exterior surfaces.

The Undercoat coatings are "dry to the touch" and offer the best corrosion protection and sound deadening for floor pans, wheelhouses, inside rear compartment and underhood areas - anywhere the coated surface is exposed.

Below is a listing of Undercoat coatings and Closed Cavity coatings that GM believes to be reliable. While others may exist, we have found these products, or equivalents to them, can be used with satisfactory results. Always use these products according to their manufacturer's recommendations.

Undercoating and Closed Cavity Coatings

The following products are available from *Automotive International/Valugard. Contact them at 1-800-543-7156, or at www.valugard.net

Stock number	Type	Description
VG-104	WAX/SOLVENT BASED UNDERCOAT	Traditional Wax/Solvent based Undercoating available in aerosol or spray gun canister Meets OE specifications for corrosion resistance
VG-076M	HYBRID (SOLV./WATER) UNDERCOAT	Meets OE specifications for corrosion resistance
VG-140	WATER BASED UNDERCOAT	Meets OE specifications for corrosion resistance
VG-101	WAX BASED CLOSED CAVITY COATING	Meets OE specifications for corrosion resistance
VG-UCG	CANISTER UNDERCOATING GUN	High quality undercoating gun uses canister packaging of undercoating
VG-CRG	CANISTER CLOSED CAVITY COATING GUN	High quality closed cavity coating gun uses canister packaging of coating and comes with 30 in inner panel application tube with nozzle

The following products are available through your local *3M® distributor. Information about 3M® product retailers in your area may be obtained at 1-866-364-3577 or at www.mmm.com/automotive.

Stock number	Type	Description
08804	No Cleanup Water-Based Undercoating - Black	Coarse texture SBR rubber and acrylic applied with 3M No-Cleanup Gun 08801
08964	No Cleanup Undercoating - Black	Smooth texture SBR rubber applied with 3M No-Cleanup Gun 08801
08881	16 oz aerosol Undercoating	Calcium Carbonate and asphalt based undercoating
08882	17 oz aerosol Underseal™ Undercoating - Black	Rubber based, paintable undercoating
08883	19.7 oz aerosol Rubberized Undercoating - Black	Synthetic polymer based undercoating
08891	Rust Fighter - 1 Amber Closed Cavity Coating - quart canister	Synthetic Resin remains tacky seeps into crevices; Applied with 3M Applicator Gun 08997 and Application Wand 08998
08892	Rust Fighter - 1 Amber Closed Cavity Coating - 24 oz aerosol	Synthetic Resin remains tacky seeps into crevices; aerosol can
08801	No Cleanup Undercoating Gun	-

The following products are available from *Crest Industries, Inc. at 1-800-822-4100 or www.crestauto.com.

Stock number	Type	Description
AH-C	HONEY COAT/WAX BASED CLOSED CAVITY COATING	16.5 OZ AEROSOL CAN AMBER COLORED SEEPS INTO CREVICES AND REMAINS PLIABLE 36 in spray wand with 360 degree nozzle available (WA-HC)
BZ-BAC BZ-BACB	AMBER COAT/WAX BASED CLOSED CAVITY COATING	GALLON - AMBER COLORED (BZ-BAC) OR BLACK (BZ-BACB) SEEPS INTO CREVICES AND REMAINS PLIABLE APPLIED WITH WZ-GRP GUN AND SIPHON HOSE Flexible spray wand also available (WA-ND)
AC-R	RUBBER COAT/RUBBER BASED UNDERCOATING, PAINTABLE	17.75 OZ AEROSOL
AR-C	SUPER RUBBER COAT/LOW V.O.C. RUBBER BASED UNDERCOATING, PAINTABLE	17.75 OZ AEROSOL
BA-C	AUTO COAT/RUBBER BASED UNDERCOATING, PAINTABLE	28.7 FL OZ CONE-TOP CAN AND GALLON APPLIED WITH GU-C UNDERCOATING GUN
GU-C	UNDERCOATING GUN	ATTACHES TO BA-C CONE-TOP CAN
WZ-GRP	GUN AND SIPHON HOSE	USED WITH BZ-BAC AND BZ-BACB
WA-ND	FLEXIBLE SPRAY WAND	USED WITH WZ-GRP

The following products are available from *Kent Automotive. Contact them at 1-888-YES-KENT (888-937-5368) or at www.kent-automotive.com.

Stock number	Type	Description
P60305	Wax Based Inner Panel Rustproofer - CLOSED CAVITY COATING	24 oz Aerosol (can apply with 36 in wand and 360 degree nozzle kit)
KT14912	Rubber Guard Low VOC Rubber Based Undercoating	24 oz Aerosol (can apply with 36 in wand and 360 degree nozzle kit)
KT14725	Aerosol Extension Wand Kit	36 in wand and 360 degree nozzle
KT14796	Rubber Guard Low VOC Rubber Based Undercoating	QUART - Applied with undercoating gun
P30025	Siphon Feed Gun	-
P86079	360 Degree Wand for siphon feed gun	-

Weld Thru Coating

Part Number	Description
4353	Weld-Through Primer

*We believe these sources and their products to be reliable. There may be additional manufacturers of such material. General Motors does not endorse, indicate any preference for or assume any responsibility for the

products from these firms or for any such items which may be available from other sources.

Seam Sealers

Sealers are intended to prevent water and dust from entering the vehicle and also are anti-corrosion barriers. Sealers are applied to such areas as rear compartment lid hem flanges, wheelhouse, quarter outer, floor, cowl, roof, and various other panel to panel attaching points. The originally sealed joints are obvious and any damage to these sealed locations should be corrected by resealing. Attaching points of new replacement panels should be resealed. Replacement lids and doors will also require sealing in the hem flange areas.

Flanged joints, overlap joints, and seams should be sealed using a quality sealer of medium-bodied consistency. The sealer used must retain its flexible characteristics after curing and be paintable.

Open joints which require bridging of the sealer in order to close a gap should be sealed using a heavy-bodied caulking material. Follow the label directions for the material selected.

Color application may be required in order to restore repaired areas such as hood, fenders, doors, quarters, lid, roof, engine compartment, underbody, and inner panels to original appearance. When this is necessary, conventional refinishing preparation, undercoat buildup, and color application techniques should be followed.

Deadener materials, spray-on type, are used on various metal panels in order to provide corrosion resistance and joint sealing. They control the general noise level inside the passenger area of the vehicle. When deadeners are disturbed because of damage, are removed during repair operations, or a new replacement panel is installed, the deadener material must be replaced by a service equivalent material. The application pattern and location of deadener materials can be determined by observing the original production installation.

Cleaning of the interior and underbody panel surfaces is necessary when original galvanized or other anti-corrosion materials have been burned off during welding or heating operations. Removal of the residue from burning will require additional care in such areas as interior surfaces of box-type construction and when configurations of the metal panels limit access to interior surfaces.

PAINT IDENTIFICATION

WARNING: Exposure to isocyanates during paint preparation and application processes can cause severe breathing problems. Read and follow all of the instructions from the manufacturers of painting materials, equipment, and protective gear.

NOTE: Always refer to the GM Approved Refinish Materials book . This book identifies the paint systems you may use.

The latest revision of the GM Approved Refinish Materials booklet is located on the Goodwrench website at www.gmgoodwrench.com.

Use the service parts identification label to identify the type of paint technology, paint codes, trim level, and any special order paint colors on the vehicle. Refer to **Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label** .

REPAIR INSTRUCTIONS

CLEARCOAT REPAIR WITHOUT REPAINTING

Repair Procedure

1. Thoroughly wash the repair area with Liquid Wash and Wax GM P/N 1052870 or the equivalent.
2. Environmental damage may be corrected. Refer to **Environmental Fallout (Acid Rain)**, or **Rail Dust Damage Repair**.

IMPORTANT: Follow all of the instructions from the manufacturer of the polishing material.

3. Use a paint gauge before, during, and after sanding and/or polishing, to avoid removing too much clearcoat. Refer to **Paint Gauges**.

ENVIRONMENTAL FALLOUT (ACID RAIN)

CAUTION: Refer to Clearcoat/Ultraviolet Screeners Caution .

NOTE: Always refer to the manufacturer's packaged instructions for the detailed procedures of materials used for compounding and/or polishing.

Since the severity of the condition varies from area to area, proper diagnosis of the contamination extent is critical to the success of the repairs. Perform the diagnosis under high intensity fluorescent lighting on the horizontal surfaces (hood, roof panel, rear compartment lid), after the surfaces have been properly cleaned by washing the vehicle with GM Wash and Wax GM P/N 1237841 (Canadian P/N 10953203), or equivalent.

There are 3 basic types of acid rain damage:

Surface Level Contamination

May be repaired by simply washing the vehicle, cleaning the surface with a silicone wax and grease remover, neutralizing acidic residue, and finesse polishing-Refer to Surface Level Contamination Repair.

Clearcoat Etching

Slight etching is still noticeable after the above washing and finesse polishing procedure. Refer to Slight Clearcoat Damage - Wet Sanding, Finesse Polishing.

Basecoat Etching

Severe etching beyond the clearcoat into the basecoat in the affected areas will require refinishing. Refer to **Basecoat/Clearcoat Paint Systems**.

Surface Level Contamination Repair

1. Thoroughly wash and dry the contaminated area with GM Wash and Wax GM P/N 1237841 (Canadian P/N 10953203), or equivalent.
2. Clean the affected area with silicone, wax and grease remover.
3. Remove and neutralize acidic residue by cleaning the contaminated areas with a mixture of baking soda and water (1 tablespoon of baking soda per 1 liter or 1 quart of water). Rinse thoroughly and dry the panel completely.
4. Apply finesse-type polish with a foam panel. If damage has been repaired, remove any swirl marks with a dual action orbital polisher and foam pad. Refer to **Clearcoat Repair Specifications - 3M Products**.
5. If some damage remains, refer to Slight Clearcoat Damage - Wet Sanding, Finesse Polishing.

Slight Clearcoat Damage - Wet Sanding, Finesse Polishing

1. Select a small contaminated test area.
2. Film thickness should be taken prior to the sanding and polishing. Refer to **Paint Gauges**.
3. Wet sand and finesse polish the contaminated test area. Refer to **Clearcoat Repair Specifications - 3M Products**. If during the polishing you suspect or observe that etching has penetrated into the basecoat, too much clearcoat has been removed during sanding, or base color is transferred to the polishing pad during polishing, then the affected areas will require refinishing. Refer to **Basecoat/Clearcoat Paint Systems**.

PAINT GAUGES

Paint thickness gauges measure the total thickness of the vehicle finish. It is important to accurately measure the thickness of the finish on each vehicle as the thickness of the finish will vary on each vehicle. Use a paint gauge before the sanding process in order to accurately measure how much finish there is to remove before, during, and after the sanding process. Paint gauges range from magnetic pull type to sophisticated electronic types, and are available from a variety of sources. The older magnetic type gauges, at best have a 5 percent accuracy range and are not sensitive enough to detect removal of 0.02 mm 0.5 mil (0.0005 in) clearcoat. The newer type magnetic gauges have improved accuracy ranges. Most gauges are confined to checking either ferrous metal, steel, non-ferrous metal, or aluminum panel. At this time, there are no viable gauges for reading film thickness on composite (SCM doors, RIM fenders) panels. The more sophisticated (ETG) electronic paint thickness gauges digital type gauges are able to read film thickness on both ferrous and non-ferrous metal panel. Digital ETG gauges may have an accuracy range of 1 percent and include thickness standards for recalibration. The following paint thickness gauges are available. Call 1-800-GM-TOOLS for information:

Paint Thickness Gauges

- 147-5437-ETG Standard model
- 147-5437-ETG-P Standard model with print option
- 147-5437-N-ETG-N Non-ferrous model for aluminum panels
- 147-5437-NP-ETG-NP Non-ferrous model with print option
- 147-54437-SD-ETG Steel and aluminum gauge

CLEARCOAT THICKNESS

The clearcoat on the vehicle is typically 0.059-0.078 mm (1.5-2 mils [0.0015-0.0020 in]) thick. The clearcoat contains ultraviolet screeners. Removing more than 0.5 mils (0.019 in) of the clearcoat may result in early paint failure.

RAIL DUST DAMAGE REPAIR

WARNING: Refer to Eye Protection Warning .

NOTE: If rail dust has penetrated into the basecoat, the panel requires refinishing. Ensure all the rail dust has been removed prior to refinishing or the rust spots will return.

Rail dust damage comes from the tiny iron particles produced from the friction between the train wheels and the track. It can also be deposited on vehicles if stored near any operation producing iron dust (i.e., steel ore yards). This dust can either lay on top of, or embed into the paint surface. It is usually diagnosed as bumps in the paint surface or rust colored spots in the paint.

1. Move the vehicle to a cool shaded area and ensure the vehicle surfaces are cool during the removal process.
2. Thoroughly wash the repair area with Liquid Wash and Wax GM P/N 1052870, or equivalent.
3. Wipe the area dry.
4. Clean the affected area with silicone, wax and grease remover.
5. Perform the removal process according to the manufacturer's directions of the type of repair material used (Gel Type Oxalic Acid or Clay Type Non-Acid Based). If, upon inspection, some particles are still present, the process may be repeated. If the damage has been repaired, complete the repair to the entire panel.
6. Polish the entire panel after the removal process. Refer to Clearcoat Repair Specifications - 3M Products. If small pits remain in the clearcoat after all of the damage has been repaired, refer to Clearcoat Repair without Repainting.

GENERAL INFORMATION

Parasitic Load Explanation & Test Procedures

*** PLEASE READ THIS FIRST ***

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.

GENERAL INFORMATION

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.

The term Parasitic Load refers to electrical devices that continue to use or draw current after the ignition switch is turned to OFF position. This small amount of continuous battery draw is expressed in milliamps (mA). On Chrysler vehicles, a typical Parasitic Load should be no more than 30 milliamps (0.030 amps). On Ford Motor Co. and General Motors vehicles produced after 1980, a typical Parasitic Load should be no more than 50 milliamps (0.050 amps).

Vehicles produced since 1980 have memory devices that draw current with ignition off for as long as 20 minutes before shutting down the Parasitic Drain. When Parasitic Load exceeds normal specifications, the vehicle may exhibit dead battery and no-start condition.

Follow test procedure for checking Parasitic Loads to completion. A brief overview of a suggested test procedure is included along with some typical Parasitic Load specifications. Refer to GENERAL MOTORS PARASITIC LOAD TABLE chart.

TESTING FOR PARASITIC LOAD

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.

CAUTION: Always turn ignition off when connecting or disconnecting battery cables, battery chargers or jumper cables. **DO NOT** turn test switch to OFF position (which causes current to run through ammeter or vehicle electrical system).

NOTE: Memory functions of various accessories must be reset after the battery is reconnected.

The battery circuit must be opened to connect test switch (shunt) and ammeter into the circuit. When a battery

cable is removed, timer circuits within the vehicle computer are interrupted and immediately begin to discharge. If in doubt about the condition of the ammeter fuse, test it with an ohmmeter prior to beginning test. An open fuse will show the same reading (00.00) as no parasitic drain. Begin test sequence with the meter installed and on the 10-amp scale. Select lower scale to read parasitic draw.

CHRYSLER IGNITION OFF DRAW (IOD) TEST

To test for excessive IOD, verify that all electrical accessories are OFF. Turn off all lights, remove ignition key, and close all doors and decklid. If the vehicle is equipped with electronic accessories (illuminated entry, automatic load leveler, body computer, or high line radio), allow the system to automatically shut off (time out), up to 3 minutes.

1. Raise the hood and disconnect both battery cables, negative first.

CAUTION: IOD greater than 3 amps may damage milliammeter.

2. Reconnect the negative cable and connect a typical 12-volt test light (low wattage bulb) between the positive cable clamp and the positive battery post. Remove the engine compartment lamp bulb. If the test light does not light, proceed to step 3. If the test light does light, proceed to step 4. The test light will indicate IOD greater than 3 amps. After higher amperage IOD has been corrected, proceed to step 3.
3. With 12-volt test light still connected (not lit), connect an ammeter (milliampere scale) between the positive cable clamp and the positive battery post, disconnect test light, refer to instructions provided with ammeter being used. A reading of 30 milliamperes or less indicates normal electrical draw. If ammeter reads more than 30 milliamperes, excessive IOD must be corrected.
4. Locate the fuse panel and remove fuses or circuit breakers one at a time, and observe ammeter after each fuse or circuit breaker is removed. If test light goes out and the reading drops below 30 milliamperes when a certain fuse or circuit breaker is removed, that circuit may have a defect.
5. If IOD is detected after all fuses and circuit breakers have been removed, disconnect the 60-way connector at the Single Module Engine Control (SMEC), located outboard of the battery.
6. If excessive IOD is detected after all fused circuits and SMEC have been verified, disconnect the B+ terminal from the alternator. If reading drops below 30 milliamperes, reinstall all fuses and circuit breakers, reconnect B+ terminal at alternator, reconnect battery, and perform alternator diagnostics.
7. Install engine compartment lamp bulb.

TEST PROCEDURE USING TEST SWITCH

1. Turn ignition off. Remove negative battery terminal cable. Install Disconnect Tool (J-38758) test switch male end to negative battery cable. Turn test switch knob to OFF position (current through meter). Install negative battery cable to the female end of test switch.
2. Turn test switch knob to ON position (current through switch). Road test vehicle with vehicle accessories on (radio, air conditioner, etc). After road test, turn ignition switch to LOCKED position and remove key. Connect ammeter terminals to test switch terminals. See **Fig. 1**. Select 10-amp scale.
3. Turn off all electrical accessories. Turn off interior lights, underhood lamp, trunk light, illuminated entry, etc. To avoid damaging ammeter or obtaining a false meter reading, all accessories must be off before

turning test switch knob to OFF position.

4. Turn test switch knob to OFF position to allow current to flow through ammeter. If meter reads wrong polarity, turn test switch to ON position and reverse leads. Turn test switch to OFF position. Observe current reading. If reading is less than 2 amps, turn test switch to ON position to keep electrical circuits powered-up.
5. Select low amp scale. Switch lead to the correct meter position. Turn test switch to OFF position and compare results to normal current draw. See **GENERAL MOTORS PARASITIC LOAD TABLE (MILLIAMPS)**. If current draw is unusually high for the vehicle's overall electrical system, remove system fuses one at a time until current draw returns to normal.
6. Turn test switch to ON position each time door is opened or fuse is removed. Turn switch to OFF position to read current draw value through meter. When the cause of excessive current drain has been located and repaired, remove test switch and reconnect negative battery cable to the negative battery terminal.

INTERMITTENT PARASITIC LOAD PROBLEMS

Intermittent parasitic load can occur because of a memory device that does not power down with ignition off. With an intermittent parasitic load, battery draw can be greater than 1.0 amp.

To find an intermittent problem requires that an ammeter and Disconnect Tool (J-38758) test switch be connected and left in the circuit. See **Fig. 1**. Road test vehicle. After road test, turn ignition off and remove key.

Monitor the milliamps scale for 15-20 minutes after ignition is turned off. This allows monitoring memory devices to determine if they time out and stop drawing memory current. The test switch is needed to protect ammeter when the vehicle is started.

Park Brake Solenoid Actuator Circuit Performance - Signal Invalid

Circuit/System Description

The parking brake control module has an internal motor, apply actuator, release actuator, and temperature sensor. The parking brake control module also contains the logic for applying and releasing the parking brake when commanded by the park brake control switch. When the parking brake control module receives a signal from the switch, the internal circuit board temperature is checked to verify it is within operating range before the control module performs the requested operation.

The parking brake control module will diagnose the internal park brake motor circuit to verify it is functioning properly. The park brake motor circuit is used to command motor operation, apply and release tension on the parking brake cable, which will apply and release the parking brake. The park brake will self diagnose the internal park brake motor circuit. This circuit is used to drive the motor, which pulls on the park brake cable, ultimately applying and releasing the park brake.

The parking brake control module contains an internal park brake motor position sensor which monitors the park brake motor position. The parking brake control module contains an internal park brake solenoid actuator, and performs diagnostics on the solenoid actuator circuitry to verify it is functioning properly.

Conditions for Running the DTC

- Ignition OFF, ACCESSORY, or RUN mode.
- Battery voltage is between 9 - 16 V

Conditions for Setting the DTC

DTC C028A

The parking brake control module detects an internal motor malfunction.

DTC C028B

The parking brake control module detects an internal motor position sensor signal malfunction.

DTC C028F

The parking brake control module detects an internal park brake solenoid malfunction.

Action Taken When the DTC Sets

DTC C028A

- The parking brake is disabled.
- A message and/or a warning indicator may be displayed.

DTC C028B

- The parking brake is disabled, one release allowed.
- A message and/or a warning indicator may be displayed.

OR

- The parking brake functionality is degraded.
- A message and/or a warning indicator may be displayed.

DTC C028F

- The parking brake is disabled, one release allowed.
- A message and/or a warning indicator may be displayed.

Conditions for Clearing the DTC

- The parking brake control module will clear the DTC after 40 consecutive ignition on/off cycles with at least one test pass in each ignition cycle and no test fail result.
- The condition for the DTC is no longer present.

Circuit/System Verification

1. Ignition ON.
2. Verify that DTC C028A, C028B, or C028F is not set.
 - **If any of the DTCs are set**
 1. Program the K83 Parking Brake Control Module. Refer to **Electronic Parking Brake Control Module Programming and Setup** .
 2. Ignition ON.
 3. Apply and release the park brake.
 4. Verify the DTC is not set.

- If the DTC is set, replace the K83 Parking Brake Control Module.
- If the DTC is not set
- 5. All OK.
 - **If none of the DTC are set**
- 3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Diagnostic Procedure Instructions** provide an overview of each diagnostic category.

DTC Descriptors

DTC C027D 64

Park Brake Slip Detected

DTC C028D 00

Replace Park Brake Pad

Circuit/System Description

The parking brake control module has an internal motor, apply actuator, release actuator, and temperature sensor. The parking brake control module also contains the logic for applying and releasing the park brake when commanded by the park brake control switch. When the parking brake control module receives a signal from the switch, the internal circuit board temperature is checked to verify it is within operating range before the parking brake control module performs the requested operation. The parking brake control module checks for rear wheel speeds after applying the parking brake to check for mechanical faults.

Conditions for Running the DTC

Ignition OFF, ACCESSORY, or RUN mode.

Conditions for Setting the DTC

C027D 64

The parking brake control module has detected wheel speed on the rear wheels with the parking brake applied.

C028D 00

The parking brake control module has an internal counter which keeps track of dynamic applies. When the counter reaches the threshold value this DTC will set.

Action Taken When the DTC Sets

A message and/or a warning indicator may be displayed.

Conditions for Clearing the DTC

- The parking brake control module will clear the DTC after 100 consecutive ignition on/off cycles with at least one test pass in each ignition cycle and no test fail result.
- Adjust or replace the park brake pads.

Circuit/System Description

The parking brake control module has an internal motor, apply actuator, release actuator, and temperature sensor. The parking brake control module also contains the logic for applying and releasing the parking brake when commanded by the park brake control switch. The parking brake control module will perform diagnostics on the park brake control switch and its wiring harness to verify it is functioning properly. When the parking brake control module receives a signal from the switch the internal circuit board temperature is checked to verify it is within operating range before the control module performs the requested operation.

The park brake switch control diagnostic checks for failure conditions in the park brake switch and associated wiring into the parking brake control module.

Conditions for Running the DTC

Ignition OFF, ACCESSORY, or RUN mode.

Conditions for Setting the DTC

The parking brake control module detects a short to battery, short to ground, open circuit, or an internal parking brake switch malfunction. The parking brake control module detects the apply or release button was activated for more than 90 seconds.

Action Taken When the DTC Sets

- The parking brake is disabled.
- A message and/or a warning indicator may be displayed.

Conditions for Clearing the DTC

- The parking brake control module will clear the DTC after 40 consecutive ignition on/off cycles with at least one test pass in each ignition cycle and no test fail result.
- The condition for the DTC is no longer present.
- The park brake control switch button is INACTIVE using the scan tool without the switch being activated.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Park Brake Status parameter changes between Released and Apply while pressing and releasing the S91 park brake control switch.

- **If the parameter does not change**

Refer to Circuit/System Test.

- **If the parameter changes**

3. All OK.

Circuit/System Test

C0293 01, C0293 02, C0293 04 or C0293 06

1. Ignition OFF, disconnect the harness connector at the K83 Parking Brake Control Module.
2. Test for less than 10 ohms between the ground circuit terminal H and ground.

- **If 10 ohms or greater**

1. Ignition OFF.
2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.

- **If less than 10 ohms**

3. Ignition ON.

4. Verify a test lamp illuminates between the B+ circuit terminal A and ground.

- **If the test lamp does not illuminate and the circuit fuse is good**

1. Ignition OFF.
2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Ignition OFF.
2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K83 Parking Brake Control Module.

- **If the test lamp illuminates**

5. Verify a test lamp illuminates between the ignition circuit terminal P and ground.

- **If the test lamp does not illuminate and the circuit fuse is good**

1. Ignition OFF.
2. Test for less than 2 ohms in the ignition circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.

- If less than 2 ohms, verify the fuse is OK and there is voltage at the fuse. Refer to **Power Mode Mismatch**

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Ignition OFF.
2. Test for infinite resistance between the ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K83 Parking Brake Control Module.

- **If the test lamp illuminates**

6. Test for less than 1 V between the circuit terminals listed below and ground;
 - Terminal B
 - Terminal C
 - Terminal D
 - Terminal N
 - Terminal R
 - Terminal S
- **If 1 V or greater**

Repair the short to voltage on the circuit.

- **If less than 1 V**

7. Ignition OFF.
8. Test for infinite resistance between the circuit terminals listed below and ground;
 - Terminal B
 - Terminal C
 - Terminal D
 - Terminal N
 - Terminal R
 - Terminal S
- **If less than infinite resistance**

Repair the short to ground on the circuit.

- **If infinite resistance**

9. Test for less than 5 ohms between the circuit terminal D and the circuit terminal R.
 - **If 5 ohms or greater**
1. Ignition OFF, disconnect the harness connector at the S91 Park Brake Control Switch.
2. Test for less than 2 ohms in the circuits end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the S91 Park Brake Control Switch.

- **If less than 5 ohms**
- 10. Test for less than 5 ohms between the circuit terminal B and the circuit terminal S.
 - **If 5 ohms or greater**
 1. Ignition OFF, disconnect the harness connector at the S91 Park Brake Control Switch.
 2. Test for less than 2 ohms in the signal circuit terminal B end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the S91 Park Brake Control Switch.
 - **If less than 5 ohms**
- 11. Test for less than 5 ohms between the circuit terminal C and the circuit terminal N.
 - **If 5 ohms or greater**
 1. Ignition OFF, disconnect the harness connector at the S91 Park Brake Control Switch.
 2. Test for less than 2 ohms in the circuits end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the S91 Park Brake Control Switch.
 - **If less than 5 ohms**
- 12. Test for less than 5 ohms between the circuit terminal N and the circuit terminal R while closing the switch.
 - **If 5 ohms or greater**

Replace the S91 Park Brake Control Switch.
 - **If less than 5 ohms**
- 13. Test for less than 5 ohms between the circuit terminal N and the circuit terminal S while closing the switch.
 - **If 5 ohms or greater**

Replace the S91 Park Brake Control Switch.
 - **If less than 5 ohms**
- 14. Replace the K83 Parking Brake Control Module.

C0293 00 or C0293 08

1. Ignition ON.
2. Verify no additional DTCs are set in other control modules.
 - **If additional DTCs are set**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle**

- **If no additional DTCs are set**
3. Verify DTC C0293 00 or C0293 08 is not set.

- **If DTC C0293 00 or C0293 08 is set**

1. Ignition OFF, remove the parking brake control module fuse and reinstall, ignition ON.
2. Verify DTC C0293 00 or C0293 08 is not set.

- If the DTC is set,

replace the K83 Parking Brake Control Module.

- If the DTC is not set

3. All OK.

- **If DTC C0293 00 or C0293 08 is not set**

4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Parking Brake Actuator Switch Replacement**
- **Control Module References** for parking brake control module replacement, programming and setup

Circuit/System Description

The parking brake control module has an internal motor, apply actuator, release actuator, and temperature sensor. The parking brake control module also contains the logic for applying and releasing the parking brake when commanded by the park brake control switch. When the parking brake control module receives a signal from the switch, the internal circuit board temperature is checked to verify it is within operating range before the control module performs the requested operation.

Conditions for Running the DTC

Ignition OFF, ACCESSORY, or RUN mode.

Conditions for Setting the DTC

The parking brake control module detects a short to battery, short to ground, open circuit, or an internal parking brake switch malfunction. The parking brake control module detects the apply or release button was activated for more than 90 seconds.

Action Taken When the DTC Sets

A message and/or a warning indicator may be displayed.

Conditions for Clearing the DTC

- The parking brake control module will clear the DTC after 40 consecutive ignition on/off cycles with at least one test pass in each ignition cycle and no test fail result.
- The condition for the DTC is no longer present.
- The park brake control switch button is INACTIVE using the scan tool without the switch being activated.

Diagnostic Aids

Check if the park brake control switch is stuck in the apply or release position which may cause the DTC to set.

Action Taken When the DTC Sets

C0558 55

- The parking brake is disabled, switch command will not be accepted.
- A message and/or a warning indicator may be displayed.

C0558 5A

- The parking brake is disabled, one release allowed.
- A message and/or a warning indicator may be displayed.

OR

- The parking brake functionality is degraded.
- A message and/or a warning indicator may be displayed.

Conditions for Clearing the DTC

- The parking brake control module will clear the DTC after 40 consecutive ignition on/off cycles with at least one test pass in each ignition cycle and no test fail result.
- Calibrate the parking brake control module after mechanical repairs are made.

Diagnostic Aids

- Verify the parking brake control module software and calibrations are the newest available versions.
- Verify the parking brake cable and related hardware is not broken, seized or pinched.

DTC C0561 71

System Disabled Information Stored Invalid Data

Circuit/System Description

The parking brake control module has an internal motor, apply actuator, release actuator, and temperature sensor. The parking brake control module also contains the logic for applying and releasing the parking brake when commanded by the park brake control switch. When the parking brake control module receives a signal from the switch, the internal circuit board temperature is checked to verify it is within operating range before the control module performs the requested operation. The parking brake module will verify it has a valid signal from other modules before it performs the requested operation.

Conditions for Running the DTC

- Ignition OFF, ACCESSORY, or RUN mode.
- Battery voltage is between 9-16V.

Conditions for Setting the DTC

The parking brake control module receives an invalid serial data message or does not receive a serial data message from another module.

Action Taken When the DTC Sets

- A message and/or a warning indicator may be displayed.
- The parking brake functionality is degraded.

Conditions for Clearing the DTC

- The parking brake control module will clear the DTC after 40 consecutive ignition on/off cycles with at least one test pass in each ignition cycle and no test fail result.
- The parking brake control module receives valid signals from other modules.

DTC C0574: PRINTED CIRCUIT BOARD TEMPERATURE SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provide an overview of each diagnostic category.

DTC Descriptors

DTC C0574 00

Printed Circuit Board Temperature Sensor Malfunction

DTC C0574 01

Printed Circuit Board Temperature Sensor Short to Battery

DTC C0574 02

Printed Circuit Board Temperature Sensor Short to Ground

DTC C0574 54

Printed Circuit Board Temperature Sensor High

Circuit/System Description

The parking brake control module has an internal motor, apply actuator, release actuator, and temperature sensor. The parking brake control module also contains the logic for applying and releasing the parking brake when commanded by the park brake control switch. When the parking brake control module receives a signal from the switch, the internal circuit board temperature is checked to verify it is within operating range before the control module performs the requested operation.

Conditions for Running the DTC

Ignition OFF, ACCESSORY, or RUN mode.

Conditions for Setting the DTC

C0574 01 or C0574 02

The parking brake control module detects a short to battery or a short to ground.

C0574 00 or C0574 54

The parking brake control module has detected an internal temperature that is above the allowed value.

Action Taken When the DTC Sets

- A message and/or a warning indicator may be displayed.
- The park brake is disabled, one release allowed.

Conditions for Clearing the DTC

- The parking brake control module clears the history DTC when a current DTC is not detected in 40 ignition cycles.
- The parking brake control module is replaced or the internal temperature drops below the allowed temperature.

Diagnostic Aids

- Check for debris on the parking brake control module which may cause the module to overheat.
- Diagnose all other parking brake control module system related faults before performing this diagnostic. Other faults may cause the circuit board to overheat. Do not attempt to apply the park brake.

Electronic Parking Brake Control Module Replacement

Callout	Component Name
Preliminary Procedures	
1.	Block the drive wheels.

2. Disable the electronic parking brake cable adjuster. Refer to **Parking Brake Cable Adjuster Disabling**.
3. Turn the ignition to the OFF position.
4. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle**.
5. Remove the left rear tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation**.
6. Remove the left rear wheelhouse panel liner. Refer to **Rear Wheelhouse Liner Replacement**.

1	<p>Electronic Parking Brake Rear Cable Nut</p> <p>CAUTION: Refer to <u>Fastener Caution</u>.</p> <p>Tighten 6 N.m (53 lb in)</p>
2	Electronic Parking Brake Rear Cable Clip
3	<p>Electronic Parking Brake Control Module Nut (Qty: 3)</p> <p>Tighten 10 N.m (89 lb in)</p>
4	<p>Electronic Parking Brake Control Module</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Disconnect the electrical connector. <p>NOTE: To ensure proper operation, the electronic parking brake control module must be programmed after replacement.</p> <ol style="list-style-type: none"> 2. After the installation is complete, program the electronic parking brake control module. Refer to <u>Electronic Parking Brake Control Module Programming and Setup</u>. 3. After the installation is complete, enable the electronic parking brake cable adjuster. Refer to <u>Parking Brake Cable Adjuster Enabling</u>.

PARKING BRAKE REAR CABLE REPLACEMENT

Removal Procedure

WARNING: Refer to **Brake Dust Warning**.

1. Disable the parking brake cable adjuster. Refer to **Parking Brake Cable Adjuster Disabling**.
2. Turn the ignition to the OFF position.

3. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
4. Remove the left rear wheelhouse liner. Refer to Rear Wheelhouse Liner Replacement .

CAUTION: Refer to Fastener Caution .

8. Install the rear parking brake cable nut (1) to the electronic parking brake control module and tighten to 6 N.m (53 lb in).
9. Install the left rear wheelhouse liner. Refer to Rear Wheelhouse Liner Replacement .
10. Enable the parking brake cable adjuster. Refer to Parking Brake Cable Adjuster Enabling.

PARKING BRAKE CABLE ADJUSTER DISABLING

The park brake cable tension is controlled by the electronic park brake (EPB) module. Tension can be fully released from the park brake cables to allow for service of the park brake system. Perform one of the following three methods to fully release cable tension.

Electronic Parking Brake Cable Tension Release

With Scan Tool - Preferred Method

1. Block the drive wheels.
2. Install a scan tool to the vehicle.
3. Turn the ignition switch to the ON/RUN position with the engine OFF.
4. Select Control Functions from the electronic parking brake control module menu.
5. Follow the instructions on the scan tool.

Without Scan Tool - Optional Method

1. Block the drive wheels.
2. Turn the ignition switch to the ON/RUN position with the engine OFF.
3. Place the automatic transmission in PARK or manual transmission in NEUTRAL, as equipped.
4. Apply and hold the brake pedal. The brake pedal must remain applied throughout the park brake cable tension release process.
5. Press and hold down the electronic park brake (EPB) switch approximately 5 seconds.
6. Observe the PARK BRAKE lamp on the instrument cluster.
7. When the PARK BRAKE lamp flashes, release then immediately press and release the EPB switch.

The parking brake cable tension is fully released.

8. Release the brake pedal.

Manual Parking Brake Cable Tension Release

In the event the above methods to release the parking brake cable tension are unsuccessful, the following procedure may be necessary to release the parking brake cable tension.

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Remove the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
3. Remove the left rear wheelhouse panel liner. Refer to **Rear Wheelhouse Liner Replacement** .

Fig. 19: Protective Plug
Courtesy of GENERAL MOTORS COMPANY

NOTE: The protective plug for the manual release is located near the electrical connector.

4. Remove the protective plug (1) from the EPB manual release.

NOTE: Do NOT use power tools to rotate the manual release mechanism. Use of power tools can damage the EPB module gear drive mechanism.

5. Using an appropriate square-drive tool, rotate the mechanism clockwise until the tension is fully released from the parking brake cables.

Up to 50 cycles may be required until the parking brake cable tension is fully released.

6. Install the protective plug to the EPB module.

PARKING BRAKE CABLE ADJUSTER ENABLING

The park brake cable tension is controlled by the electronic park brake (EPB) module. Cable tension needs to be

set and the EPB module needs to be calibrated following the cable tension disabling procedure. Perform one of the following two methods to fully restore cable tension.

Electronic Parking Brake Cable Tensioning

With Scan Tool - Preferred Method

1. Block the drive wheels.
2. Install a scan tool to the vehicle.
3. Turn the ignition switch to the ON/RUN position with the engine OFF.
4. Select Configuration/Reset Functions from the electronic parking brake control module menu.
5. Perform the Parking Brake Calibration procedure.

Without Scan Tool - Optional Method

1. Block the drive wheels.
2. Turn the ignition switch to the ON/RUN position with the engine OFF.
3. Apply the brake pedal.
4. Place the automatic transmission in PARK or manual transmission in NEUTRAL, as equipped.
5. Momentarily lift then release the EPB switch to apply the EPB.
6. Momentarily press down then release the EPB switch to release the EPB.
7. Repeat step 5 and 6 to cycle the EPB on then off an additional 4 times.
8. The EPB module will be calibrated and proper tension will be applied to the parking brake cables.

PARKING BRAKE ACTUATOR SWITCH REPLACEMENT

Fig. 20: Parking Brake Actuator Switch
 Courtesy of GENERAL MOTORS COMPANY

Parking Brake Actuator Switch Replacement

Callout	Component Name
Preliminary Procedure	
Remove the front floor console front compartment. Refer to .	
1	Parking Brake Actuator Switch Procedure Disconnect electrical connector.

DESCRIPTION AND OPERATION

ELECTRONIC PARKING BRAKE CONTROL MODULE DESCRIPTION

Vehicles with the electric parking brake have a switch in the center console, which takes the place of the manual parking brake system, the foot pedal and release handle. In case of insufficient electrical power, the electric parking brake cannot be applied or released.

Parking Brake Control Module

The parking brake control module has an internal motor, apply actuator, release actuator, and temperature sensor. The parking brake control module also contains the logic for applying and releasing the parking brake when commanded by the park brake control switch. When the parking brake control module receives a signal from the switch the internal circuit board temperature is checked to verify it is within operating range before the

control module performs the requested operation.

Electric Parking Brake Apply

The electric parking brake can be applied any time the vehicle is stopped or in motion. The electric parking brake is applied by momentarily lifting up on the park brake control switch. The red park brake light will momentarily flash while the parking brake is being applied. Once fully applied, the red park brake light will turn on. If the electric parking brake is applied while the vehicle is in motion, a chime will sound, and the message "Release Park Brake Switch" will be displayed.

If the red park brake light is flashing, the electric parking brake is only partially applied or released, or there is a problem with the electric parking brake. The message "Service Park Brake" will be displayed.

Electric Parking Brake Release

To release the electric parking brake, turn the ignition switch to the ON or RUN position, apply and hold the brake pedal, and push down momentarily on the park brake control switch. When the electric parking brake is released the red park brake light turns off.

The electric parking brake can be used to prevent roll back for vehicles with a manual transmission taking off on a hill. In a situation where no roll back is desired, an applied electric parking brake will allow both feet to be used for the clutch and accelerator pedals in preparation for starting the vehicle moving in the intended direction. In this situation, perform the normal clutch and accelerator actions required to begin moving the vehicle. There is no need to push the switch to release the electric parking brake. To disable this feature lift and hold the park brake control switch while the vehicle is in motion, this will keep the electric parking brake applied.

ACCESSORIES & EQUIPMENT

Plastic Panel Information and Repair

SPECIFICATIONS

FLEXIBLE PLASTIC PART REPAIR MATERIALS

Product- 88861039, *88861040, High Strength Plastic Repair 50 ml

Components- 12 cartridges with 2 mixers each

Structural and Cosmetic

Recommended Repair Material

Product	Components	Recommended Repair Material	Work Time 70°F	Handling Strength at 70°F
88861039 *88861040 High Strength Plastic Repair 50 ml	12 cartridges with 2 mixers each	Structural and cosmetic bonding and repairing of all flexible plastics. Requires GM P/N 12378462 on TPO plastics. Will also bond e-coated/primed metals.	90 seconds	10 minutes
* TPO, TEO, (Polyolefin Plastics) require the application of polyolefin adhesive primer before the GM P/N 88861039 repair compound is applied.				

Working Time

Product	Adhesive Sandability at 70°F	Part Paintability at 70°F	Adhesive Full Cure at 70°F	Program
88861039 *88861040 High Strength Plastic Repair 50 ml	20 minutes	30 minutes	24 hours	Bumper covers, emblems, door trims, exterior and interior repairs*
* TPO, TEO, (Polyolefin Plastics) require the application of polyolefin adhesive primer before the GM P/N 88861039 repair compound is applied.				

RIGID PLASTIC PART REPAIR MATERIALS

Rigid Plastic Part Repair Materials

Thermoset Plastic Type	Type of Repair	Recommended Repair Material	Availability
Sheet metal compound		GM Goodwrench® Structural Bonding Epoxy (GM P/N 12345726 or	GM Dealer

(SMC), RIM rigid plastic parts	Cosmetic filling	equivalent)	
		Sikkens Polystop LP™ or equivalent polyester repair putty	Refer to a local paint supplier
Most rigid plastic parts	Cosmetic repair, adhesive bonding	GM Goodwrench® Structural Bonding Epoxy (GM P/N 12345726 or equivalent)	GM Dealer
		Lord Fusor® SMC Body Panel Repair Adhesive or equivalent	Refer to local paint supplier
Most rigid plastic parts	Adhesive bonding	GM Goodwrench® Structural Bonding Epoxy (GM P/N 12345726 or equivalent)	GM Dealer
		Dynatron Dyna-Weld Plio Grip® or equivalent (OE structural adhesive)	Refer to local paint supplier
Most rigid plastic parts	Adhesive structural* bonding	GM Goodwrench® Structural Bonding Epoxy (GM P/N 12345726 or equivalent)	GM Dealer
Most rigid plastic parts	Adhesive bonding Structural bonding	Ashland Pliogrip® 7773B-3-minute Ashland Pliogrip® 7779B-10-minute Ashland Pliogrip® 7770B-35-minute	Supplied by Crest Industries 1-800-822-4100 fax 1-800-344-4461
SRIM most rigid plastic parts	Cosmetic repair, adhesive bonding	GM Goodwrench® SRIM™ repair kit (GM P/N 12378523) or SIA™ Adhesives, INC. SRIM™ repair kit P/N 30208030001 adhesive 200ML TUBES P/N 30208020001 50ML TUBES P/N 30208010001	SIA Adhesives, INC. customer service 1-330-374-2468
* Structural adhesive bonding may require the use of a pneumatic applicator, A8-37479-1A, or equivalent, to speed the application of the GM P/N 12345726 epoxy.			Kent-Moore 1-800-GM-TOOLS

REPAIR INSTRUCTIONS

GENERAL PLASTIC REPAIR

WARNING: In order to reduce the risk of personal injury when exposed to toxic fumes

while grinding, cutting, or applying repair material on any type of sheet molded compound or RIM rigid plastic, observe the following guidelines:

- **Work in a properly ventilated area**
- **Apply protective cream to any exposed skin**
- **Remove any mixture that comes into contact with skin**
- **Wash skin with cold water to remove glass and resin dust**
- **Use a sander with a vacuum attachment**
- **Follow the repair material manufacturer's instructions**

Also, always wear the following:

- **An approved respirator, or air supplied respirator**
- **Eye protection**
- **Rubber gloves**
- **Earplugs**
- **Protective clothing**

The following procedures should be followed when repairing all types of thermoset plastic:

- Follow the manufacturer's application and curing recommendations.
- Do not intermix systems. Use the supplies and the repair materials from the same manufacturer.
- Clean the inner and outer surfaces of the repair area with a soap impregnated scouring pad in order to remove any dirt or mold release agent.
- Clean the area with a wax and grease remover, using only enough of the remover to dampen a cloth. Allow the panel to dry thoroughly.
- Remove the surface finish from the area to be repaired. Adhesives are designed to adhere to the plastic substrate, not the finish.
- Prime a metal surface before applying the repair material.
- Inspect the rear side of the work area before making repairs in order to avoid possible damage to wires, motors, etc.

DESCRIPTION AND OPERATION

HOW TO IDENTIFY PLASTIC PARTS

Fig. 1: Identifying SAE Code

Courtesy of GENERAL MOTORS COMPANY

Plastic parts can be identified by the SAE code, which is usually found on the rear of the part, and/or by the characteristics of the plastic. Knowing the type of plastic aids in selecting the proper repair materials and in selecting the proper repair procedure.

Look for the SAE code stamped into the part.

Code Found

Match the code to those in the plastic identification chart to determine whether the plastic is thermoplastic or thermoset plastic, and whether the plastic is rigid or flexible. Refer to **Plastic Identification and Refinishing Systems**.

No Code Found

WARNING: Do NOT use a plastic burn test to distinguish the type of plastic. The burn

test produces vapors which are harmful.

Perform one or both of the following tests to determine if the part is thermoplastic polyolefin or thermoset non-polyolefin.

Float Test

1. Cut a shaving of plastic from the back of the part.

The shaving should be free of mold release agents and paint.

2. Place the shaving in a container of water.
 - Thermoplastic polyolefin floats.
 - Thermoset non-polyolefin sinks.

Abrasion Test

- Sand a spot near the damaged area with Grade 36 Roloc Disc.
- Thermoplastic polyolefin material melts or frays when sanded.
- Thermoset non-polyolefin material sands cleanly.

Thermoplastic and thermoset plastics can be either rigid or flexible. Thermoplastic plastic parts are best repaired with a hot iron plastic material-feed welder, but are usually replaced. Thermoset plastic can be repaired with epoxy or other more rigid 2 package repair material.

- For rigid thermoset repair materials, refer to **Rigid Plastic Part Repair Materials**.
- For flexible thermoset repair materials, refer to **Flexible Plastic Part Repair Materials**.
- For general repair instructions, refer to **General Plastic Repair**.

PLASTIC IDENTIFICATION AND REFINISHING SYSTEMS

Plastic Identification and Refinishing Systems

Identifying Symbol- Old Symbol in ()s	Chemical Composition or Plastic Family Name	Typical Area(s) Where Part is Used	Examples of Common / Trade Names	Type of Plastic
ABS	Acrylonitrile / Butadiene-Styrene	Armrest Support, Console, IPC, Steering Column Bracket / Jacket, Trim Molding	ABS, Absafil, Magnum, Cycolac, Dyel, Kralastic, Lustran	Thermoplastic
ABS + PC	Acrylonitrile / Butadiene-Styrene + Polycarbonate	Instrument Panel, IPC	Bayblend, Cycoloy, KHA, Pulse	Rigid
ABS / PVC	ABS/Vinyl (Soft)	Head Rest Cover, Instrument Panel Pad, Trim	ABS Vinyl	Flexible, Vinyl

		Molding / Panel		
EPDM	Ethylene Propylene Diene Monomer	Body Panel, Bumper Impact Strip	EPDM, Nordel	Rigid
EVA (EVAC)	Ethylene / Vinyl Acetate	Head Rest Cover, Misc Soft Trim	Elvax, Microthane	Flexible
PA	Polyamide	Headlamp Bezels, Quarter Panel Extensions, Exterior Finish Trim Panels	Nylon, Capron, Zytel, Rilsan, Minion, Vydine, Welland	Rigid
PA, PAG, PAGG	Polyamide	Exterior Finish Trim Panel, Headlamp Bezel, Quarter Panel Extension	Capron, Minlon, Nylon, Rilsan, Vydine, Wellamid, Zytel	Rigid, Thermoset
PA + PPE	Polymide + Polyphenylene Ether	Exterior Trim, Fender	GTX	Rigid, Thermoset
PBT + TEEE (PBTP + EEBC)	Polybutylene, Terephthalate + Ether, Ester Block Compound	Fascia, Rocker Panel Molding	Bexloy M	Rigid
PC	Polycarbonate	Interior Rigid / Hard Trim Panel, Valance Panel	Calibre, Lexan, Merlon, Makrolon	Rigid, Thermoset
PC + PETP	Polycarbonate + Polybutylene, Terephthalate	Bumper Fascia	Macroblend, Valox, Xenoy	Flexible, Thermoset
PE	Polyethylene	Fuel Tank Shield, Inner Fender Panel, Interior Trim Panel, Seat Belt Cover, Spoiler, Valance	Alathon, Dylan, Foriflex, Hi-fax, Hosalen, Marlex, Paxon	Rigid, Thermoplastic
PF	Phenol Formaldehyde	Ashtray	Amberol, Bakelite, Durez, Genal, Phenolic, Plyophen, Resinox	Rigid, Thermoset
PP	Polypropylene	Bumper Fascia, Cowl Panel, Deflector Panel, Door Panel, Inner Fender, Interior Molding, Kick Panel, Load Floor, Radiator Shroud, Wheel Cover	Azdel, Daplen, Escorene, Marlex, Novolen, Oleflo, Profax, Tenite	Flexible, Thermoplastic
PPE (PPO)	Polyphenylene Ether	Bezels, Chromed Plastic, Headlamp	Noryl, Oleflo, Prevex	Rigid, Thermoset

		Door, Ornaments		
PS	Polystyrene	Dash Panel, Door Panel	Durathon, Dylan, Lustrex, Polystyrol, Styron	Flexible, Soft
PUR	Polyurethane, Thermoset (Unsaturated)	Bumper Fascia, Filler Panel, Front/Rear Body Panel, Pickup Box	Bayflex, Castethane, RIM, RRIM, SRIM	Thermoset
PVC	Polyvinyl Chloride (Vinyl)	Interior Soft Trim, I/P Skins, Roof Cover	Geon, Pliovic, Unichem, Vinoflex, Vinyl, Vinylite	Flexible, Vinyl
SAN (SA)	Styrene Acrylonitrile	Center Console, Glove Box Door, Interior Trim Panel	Foracryl, Lustran, Tyril	Rigid
TEO (EP, EPM, TPO)	Ethylene / Propylene (Rubber)	Air Dam, Bumper Fascia, Valance Panel	EPI, EPII, TPO, TPR (Thermoplastic Rubber)	Flexible, Thermoplastic
TPO	Thermal Plastic Oletin	Bumper Covers	TPO	Flexible Thermoplastic
TPU (TPUR)	Polyurethane, Polyolefin	Bumper Fascia, Gravel Deflector, Soft Filler Panel, Window Molding	Estane, Pellethane, Roylar, Toxin	Flexible, Thermoplastic
UP	Polyester / Thermoset	Air Scoop, Air Spoiler, Fascia Extension, Hood, Instrument Housing, Rear Compartment Lid, Roof, Ventilation Grid	Fiberglass, Premiglass, Selectron, SMC, Vibrinmat	Rigid, Thermoset
For symbols not listed in this table, contact the Society of Automotive Engineers, 400 Commonwealth Drive, Warrendale, PA 15096-0001.

DIAGNOSTIC INFORMATION AND PROCEDURES

SYMPTOMS - POWER OUTLETS

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Visual/Physical Inspection

- Inspect for aftermarket devices which can affect the operation of the power outlets. Refer to **Checking Aftermarket Accessories**
- Inspect the accessible system components or the visible system components for obvious damage or for obvious conditions which can cause the symptom.

Intermittent

Electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent**

Conditions and Poor Connections

Symptom List

Refer to **Power Outlet Receptacle Malfunction (110V)**, **Power Outlet Receptacle Malfunction (12V)** in order to diagnose the system.

POWER OUTLET RECEPTACLE MALFUNCTION (110V)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	1	1	-	-
Ignition	1	1	-	-
AC Terminal 2	1	1	1	-
AC Terminal 7	1	1	1	-
Signal	1	1	2	-
Ground	-	1	-	-
1. Accessory DC/AC Power Inverter Module Always OFF				
2. Accessory DC/AC Power Inverter Module Always ON				

Circuit/System Description

The accessory DC/AC power inverter module converts 12 V direct current (DC) battery voltage to 110-120 V alternating current (AC) in order to operate AC powered devices. The accessory DC/AC power inverter module provides up to 150 watts of power. The accessory DC/AC power inverter module is connected to a chassis ground circuit and receives fuse protected battery voltage.

The accessory power receptacle has an internal switch, that detects when an AC powered device is plugged into the receptacle. When the ignition is ON and an AC powered device is plugged into the accessory power receptacle, the normally open switch in the accessory power receptacle, closes. When the accessory DC/AC power inverter module detects the voltage from the accessory power receptacle switch, the inverter module begins to supply 110-120 V AC to the accessory power receptacle - 110V AC after a 1.5 s delay.

- **Wiring Repairs**

Circuit/System Verification

1. Ignition ON.
2. Connect an AC powered device to the X81 Accessory Power Receptacle - 110V AC.
3. Verify the T1 Accessory DC/AC Power Inverter Module is turned ON and the device works as expected.
 - **If the device is not powered**

Refer to Circuit/System Testing.

- **If the device is powered**
4. All OK.

Circuit/System Testing

WARNING: To help avoid personal injury, always treat the accessory power receptacle, accessory DC/AC power inverter module, AC circuit wires, and connectors as if AC high-voltage is present.

1. Ignition OFF, scan tool disconnected, ignition key removed. Wait for 2 min. Nothing plugged into the X81 Accessory Power Receptacle - 110V AC, disconnect the harness connector at the T1 Accessory DC/AC Power Inverter Module.
2. Test for less than 10 ohms between the ground circuit terminal 11 and ground.
 - **If greater than 10 ohms**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**

3. Verify that a test lamp illuminates between the B+ circuit terminal 6 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If greater than 2 ohms, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the B+ circuit terminal 6 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the T1 Accessory DC/AC Power Inverter Module.
 - **If the test lamp illuminates**
4. Test for less than 1 V between the signal circuit terminal 12 and ground.
 - **If greater than 1 V**

Repair the short to voltage in the signal circuit.
 - **If less than 1 V**
5. Test for infinite resistance between the signal circuit terminal 12 and ground.
 - **If less than infinite resistance**

Repair the short to ground in the signal circuit.
 - **If infinite resistance**
6. Test for less than 1 V between the AC circuit terminals listed below and ground.
 - AC Terminal 2
 - AC Terminal 7
 - **If greater than 1 V**

Repair the short to voltage in the AC circuit.
 - **If less than 1 V**
7. Test for infinite resistance between the AC circuit terminals listed below and ground:
 - AC Terminal 2
 - AC Terminal 7
 - **If less than infinite resistance**

Repair the short to ground in the AC circuit.
 - **If infinite resistance**
8. Disconnect X1 and X2 harness connectors at the X81 Accessory Power Receptacle - 110V.

9. Test for less than 2 ohms between the AC circuit terminals listed below:

- X81 Accessory Power Receptacle - 110V AC terminal 3 X1 and the T1 Accessory DC/AC Power Inverter Module terminal 2.
- X81 Accessory Power Receptacle - 110V AC terminal 3 X2 and the T1 Accessory DC/AC Power Inverter Module terminal 7.
- **If greater than 2 ohms**

Repair the open/high resistance in the AC circuit.

- **If less than 2 ohms**

10. Ignition ON.

11. Verify that a test lamp illuminates between the ignition voltage circuit terminal 1 X1 and ground.

- **If the test lamp does not illuminate**

1. Ignition OFF, disconnect the X4 harness connector at the K9 Body Control Module.
2. Test for infinite resistance between the control circuit terminal 12 X4 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K9 Body Control Module.

- **If the test lamp illuminates**

12. Ignition OFF, connect all harness connectors at the X81 Accessory Power Receptacle - 110V AC. Connect a 110 V extension cord without a connected device to the X81 Accessory Power Receptacle - 110V AC, ignition ON.

13. Verify that a test lamp illuminates between the T1 Accessory DC/AC Power Inverter Module signal circuit terminal 12 and ground.

- **If the test lamp does not illuminate**

1. Ignition OFF.
2. Test for less than 2 ohms in the signal circuit end to end.
 - If greater than 2 ohms, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the X81 Accessory Power Receptacle - 110V AC.

- **If the test lamp illuminates**

14. Test or replace the T1 Accessory DC/AC Power Inverter Module.

Component Testing

Accessory Power Outlet 110V AC

1. Ignition OFF, remove the X81 Accessory Power Receptacle - 110V AC.
2. Test for infinite resistance between terminal 3 X2 and terminal 3 X1.
 - **If less than infinite resistance**

Replace X81 Accessory Power Receptacle - 110V AC.

3. Test for less than 2 ohms between the following terminals:

- The terminal 3 X2 and the applicable receptacle terminal
- The terminal 3 X1 and the applicable receptacle terminal
- **If greater than the 2 ohms**

Replace the X81 Accessory Power Receptacle - 110V AC.

4. Test for infinite resistance between terminal 1 X1 and terminal 1 X2.

- **If less than the specified range**

Replace X81 Accessory Power Receptacle - 110V AC.

- **If infinite resistance**

5. Connect a 110 V extension cord without a connected device to the X81 Accessory Power Receptacle - 110V AC.

6. Test for less than 5 ohms between terminal 1 X1 and terminal 1 X2.

- **If greater than the 5 ohms**

Replace the X81 Accessory Power Receptacle - 110V AC.

- **If less than 5 ohms**

7. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Accessory AC and DC Power Control Module Replacement

POWER OUTLET RECEPTACLE MALFUNCTION (12V)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	1	1	-	-

Ground	-	1	1	-
1. Accessory Power Receptacle Malfunction				

Circuit/System Description

The vehicle is fitted with a 12 V accessory power receptacle. The accessory power outlets are controlled by an ignition operated relay. The accessory power receptacle is operational when the ignition is turned to either the On or the Accessories positions.

Diagnostic Aids

It may be helpful to discuss with the customer the usage of any device that may have drawn too much current and caused an open fuse.

Circuit/System Verification

1. Ignition ON, connect an appropriate device to the X80 Accessory Power Receptacle.
2. Verify the device is powered by the X80 Accessory Power Receptacle.
 - **If the device is not powered**

Refer to Circuit/System Testing

- **If the device is powered**
3. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the appropriate X80 Accessory Power Receptacle. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal C and ground.
 - **If greater than 10 ohms**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Ignition ON.
4. Verify that a test lamp illuminates between the control circuit terminal A and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the control circuit end to end.
 - If greater than 2 ohms, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse. Refer to **Retained Accessory Power Malfunction** .
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the control circuit terminal A and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the appropriate X80 Accessory Power Receptacle.
 - **If the test lamp illuminates**
5. Test or replace the X80 Accessory Power Receptacle.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Accessory Power Receptacle Replacement.

REPAIR INSTRUCTIONS

120-Volt Accessory Power Receptacle Replacement

Callout	Component Name
Preliminary Procedure Remove the front floor console rear cover panel. Refer to <u>Front Floor Console Rear Cover Replacement</u> .	
1	Accessory Power Receptacle Assembly Procedure Push in the 4 tabs to release the accessory power receptacle from the rear console trim plate.

ACCESSORY POWER RECEPTACLE REPLACEMENT

Special Tools

EL 42059 Cigar Lighter Socket Remover

For equivalent regional tools, refer to **Special Tools**.

Removal Procedure

Fig. 6: View Of Cigar Lighter Socket/Accessory Power Outlet
Courtesy of GENERAL MOTORS COMPANY

1. Remove the auxiliary power outlet fuse from the fuse block.
2. Remove the receptacle:
 1. Look into the receptacle. There are two 3 mm (0.11 in) tab windows 12 mm (0.47 in) from the front of the receptacle. The **EL 42059** Remover pushes the plastic latches from these tab windows and the receptacle can be pulled straight out.
 2. Place one side of the "T" portion of the **EL 42059** Remover into the tab window. The **EL 42059** Remover will not fit straight into the receptacle. Angle the **EL 42059** Remover slightly for insertion into the receptacle.
 3. Insert the other side of the "T" into the opposite tab window.

You must move the **EL 42059** Remover handle toward horizontal to engage the other tab window.

4. Use the **EL 42059** Remover to pull the receptacle straight out.

Fig. 7: Removing Cigar Housing Using Grinding Tool
Courtesy of GENERAL MOTORS COMPANY

3. If **EL 42059** Remover tool fails to release the lighter socket from the retainer, perform the following alternate method:
 1. Insert a small grinding tool with a cutoff wheel into the socket.
 2. Remove the plastic latches in the 3 mm (0.11 in) square windows.
 3. Use the **EL 42059** Remover as directed above to remove the socket.

Installation Procedure

Fig. 8: View Of Receptacle Tabs & Retainer Slots
Courtesy of GENERAL MOTORS COMPANY

1. Route the connector through the retainer. Align the accessory power receptacle retainer to the slot in the opening.
2. Install the retainer by pressing into place fully seated.
3. Connect the electrical connector to the receptacle.
4. Align the tabs on the receptacle to the slots in the retainer. Install the accessory power receptacle by pressing into place until fully seated.
5. Install the accessory power receptacle fuse.

DESCRIPTION AND OPERATION

POWER OUTLETS DESCRIPTION AND OPERATION

12 Volt Power Outlet Receptacle Description and Operation

The 12 V accessory power receptacles are supplied with power by the accessory relay.

The vehicle is fitted with a cigarette lighter and/or with a 12 V accessory power receptacle. The cigarette lighter and accessory power outlets are controlled by an ignition operated relay. The accessory power receptacle and cigarette lighter are operational when the ignition is turned to either the On or the Accessories positions. To operate the cigarette lighter, press in the lighter knob. When the element is hot, the lighter automatically pops out and is ready for use.

110 Volt Power Outlet Receptacle System Description

Power Outlets Block Diagram

Fig. 9: Power Outlets Block Diagram
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
HW	Hard-Wired
T1	T1 Accessory DC/AC Power Inverter Module
X81	X81 Accessory Power Receptacle - 110V AC

The alternating current (AC) accessory power outlet system consists of the accessory DC/AC power inverter module and the accessory power receptacle - 110 V AC. The accessory DC/AC power inverter module converts 12 V direct current (DC) battery power to 110 V at 60 Hertz (Hz) AC power to operate AC powered devices. The accessory DC/AC power inverter module provides up to 150 watts of power. The accessory power receptacle - 110 V AC provides the usual connection for AC powered devices.

110 Volt Power Outlet Receptacle System Operation

The accessory DC/AC power inverter module receives fuse protected battery voltage and is connected to the 12 V electrical system ground. The accessory power receptacle - 110 V AC has an internal switch, that detects when an AC powered device is plugged into the outlet. When the ignition is ON, and an AC powered device is plugged into the accessory power receptacle - 110 V AC, the normally open switch in the accessory power receptacle - 110 V AC, closes. When the accessory DC/AC power inverter module detects the voltage from the accessory power receptacle - 110 V AC switch, the inverter module begins to supply 110 V AC to the accessory power receptacle - 110 V AC after a 1.5 s delay. The accessory AC power system is protected against circuit

overload and circuit shorts to ground.

110 Volt Power Outlet Receptacle Isolation Fault Protection

The accessory DC/AC power inverter module contains a ground fault circuit interrupter (GFCI). GFCI monitors the 110 V circuit for a short to vehicle chassis ground. If a 110 V AC short to ground is detected, the accessory DC/AC power inverter module will turn OFF. The module remains OFF, until the AC powered device is unplugged from the outlet, and then plugged into the outlet after a 3 s delay.

110 Volt Power Outlet Receptacle Overload Shutdown

The accessory DC/AC power inverter module will turn OFF if the current in the 110 V circuit is greater than 3.8 A for 1 s , or 2.5 A for 10 s . The module will turn ON again, when the AC powered device is unplugged from the outlet, and then plugged into the outlet after a 3 s delay.

110 Volt Power Outlet Receptacle Internal Shutdown

The accessory DC/AC power inverter module will turn OFF if the B+ supply voltage is greater than 16.5 V or less than 11 V. The module will also turn OFF if the device temperature is greater than 85°C (185°F). The module will turn ON again, after the shutdown condition is corrected, and the AC powered device is unplugged from the outlet, and then plugged into the outlet.

1. Power seat inoperative				

Circuit/System Description

The seat memory control module supplies a reference voltage to each signal circuit of the driver seat adjuster switch. When the power seat switches are pressed, the appropriate signal circuit from the seat memory control

module is pulled low through the switch contacts indicating the power seat command. The seat memory control module then commands the driver seat to move in response to the switch signals.

Conditions for Running the DTC

- DTC B1325 must not be present.
- Module battery voltage must be between 9-16 V.

Conditions for Setting the DTC

- If a seat switch circuit is active in one direction and the switch for the opposite direction is pressed, this DTC will set.
- A short to ground on a switch signal circuit.

Action Taken When the DTC Sets

- A motor output driven in response to a switch considered failed, is deactivated for both directions.
- All memory recall commands are ignored.
- The seat memory control module will respond to any other switch signal that has not set a DTC.

Conditions for Clearing the DTC

- The current DTC will clear and set the code to history, when the fault is no longer present and the ignition is cycled OFF then back to ACC or RUN.
- The history DTC will clear after 40 consecutive fault-free ignition cycles have occurred.

Diagnostic Aids

- If one of the switch signal circuits is shorted to ground, multiple codes will set.
- If a switch is stuck in one direction and the switch is pressed in the opposite direction, a single code will set.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool seat switch parameters listed below change between Inactive and Forward/Rearward or UP/Down when pressing the appropriate seat directional switch.
 - Driver Seat Cushion Front Vertical Switch
 - Driver Seat Cushion Rear Vertical Switch
 - Driver Seat Horizontal Switch
 - Driver Seat Back Switch
 - **If the parameter does not change**

Refer to Circuit/System Testing.
 - **If the parameter changes**
3. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the S64D Driver Seat Adjuster Switch, Ignition ON.
2. Verify that all scan tool driver seat switch parameters listed below are Inactive:
 - Driver Seat Cushion Front Vertical Switch
 - Driver Seat Cushion Rear Vertical Switch
 - Driver Seat Horizontal Switch
 - Driver Seat Back Switch
 - **If not Inactive**
 1. Ignition OFF, disconnect the harness connector at the K40 Seat Memory Control Module.
 2. Test for infinite resistance between the appropriate signal circuit terminal listed below and ground:
 - Front vertical upward switch terminal A
 - Front vertical downward switch terminal K
 - Rear vertical upward switch terminal F
 - Rear vertical downward switch terminal J

- Horizontal forward switch terminal D
 - Horizontal rearward switch terminal C
 - Recline forward switch terminal H
 - Recline rearward switch terminal G
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K40 Seat Memory Control Module.
 - **If Inactive**
3. Install a 3 A fused jumper wire between the appropriate signal circuit terminal listed below and the ground circuit terminal E.
 - Front vertical upward switch terminal A
 - Front vertical downward switch terminal K
 - Rear vertical upward switch terminal F
 - Rear vertical downward switch terminal J
 - Horizontal forward switch terminal D
 - Horizontal rearward switch terminal C
 - Recline forward switch terminal H
 - Recline rearward switch terminal G
 4. Verify the scan tool seat switch parameter is Forward/Rearward or UP/Down.
 - **If not Forward/Rearward or UP/Down**
 1. Ignition OFF, disconnect the harness connector at the K40 Seat Memory Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Ignition OFF.
 4. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K40 Seat Memory Control Module.
 - **If Forward/Rearward or UP/Down**
 5. Test or replace the S64D Driver Seat Adjuster Switch.

Component Testing

Seat Adjuster Switch Test

1. Ignition OFF, disconnect the harness connector at the S64D Driver Seat Adjuster Switch.
2. Test for infinite resistance between the ground terminal E and each signal terminal with the switch in the open position.
 - **If less than infinite resistance**

Replace the S64D Driver Seat Adjuster Switch.

- **If infinite resistance**

3. Test for less than 2 ohms between the ground terminal E and each signal terminal with the appropriate switch in the closed position.

- **If 2 ohms or greater**

Replace the S64D Driver Seat Adjuster Switch.

- **If less than 2 ohms**

4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Driver or Passenger Seat Adjuster Switch Replacement (Driver/Passenger Seat 4-Way Hybrid)**
- **Control Module References** for K40 Seat Memory Control Module replacement, programming and setup

DTC B1825, B2355, B2365, OR B2375: DRIVER SEAT POSITION SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit Description

The seat memory control module monitors the position of the seat motors by using hall effect position sensors which are an internal part of each motor. The module supplies each sensor with a 12 V reference circuit and a low side signal circuit. During seat motor operation, the hall effect position sensor provides a determined number of pulse signals for every revolution of the motor shaft. The scan tool displays these pulse signals as counts that range from 0-65,535. The module counts the feedback pulses from each sensor to determine seat position and end of travel limits for each of the seat motors. High scan tool count values indicate forward or upward seat positions while low count values indicate rearward or downward seat positions.

Conditions for Running the DTC

- DTC B1325 must not be present.

- Module battery voltage must be between 9-16 V.

Conditions for Setting the DTC

The seat memory control module does not detect position sensor movement or pulse signals while the adjuster motor is active. The following conditions will set this DTC:

B1825 01, B2355 01, B2365 01, or B2375 01

The seat memory control module detects a voltage greater than 5 V on the sensor signal circuit.

B1825 06, B2355 06, B2365 06, or B2375 06

The seat memory control module detects a short to ground or an open on the sensor signal circuit.

Action Taken When the DTC Sets

- With a short to ground or an open circuit, the seat memory control module disables the memory recall and easy exit/entry action commands of the motor monitored by the sensor. The motor will respond to manual position commands.
- With a short to battery voltage, the seat memory control module disables the memory recall and easy exit/entry action commands for all four seat motors. The motors will respond to manual position commands.

Conditions for Clearing the DTC

- The current DTC clears when the fault is no longer present and the power mode changes to OFF then back to ACC or RUN.
- The history DTC will clear after 40 consecutive fault-free ignition cycles have occurred.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the appropriate driver seat motor listed below for which the DTC set:
 - M50D Seat Front Vertical Motor
 - M55D Seat Rear Vertical Motor
 - M51D Seat Horizontal Motor
 - M56D Seat Back Recline Motor
2. Ignition ON.
3. Test for greater than 10.8 V between the 12 V reference circuit terminal 4 and ground.
 - **If 10.8 V or less**
 1. Ignition OFF, disconnect the X1 harness connector at the K40 Seat Memory Control Module.
 2. Test for infinite resistance between the 12 V reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the 12 V reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K40 Seat Memory Control Module.
 - **If greater than 10.8 V**
4. Test for 0.3-2 V between the signal circuit terminal 2 and ground.
 - **If 0.3 V or less**
 1. Ignition OFF, disconnect the X1 harness connector at the K40 Seat Memory Control Module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K40 Seat Memory Control Module.
 - **If greater than 2 V**
 1. Ignition OFF, disconnect the X1 harness connector at the K40 Seat Memory Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V, replace the K40 Seat Memory Control Module.

- **If between 0.3-2 V**

5. Test or replace the seat motor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Front Seat Tilt Adjuster Actuator Replacement (Driver/Passenger Seat 8-Way Power)**
- **Front Seat Adjuster Actuator Replacement (8-Way Power)**
- **Front Seat Recliner Actuator Motor Replacement (Driver or Passenger Seat 8-Way Power)**
- **Control Module References** for K40 Seat Memory Control Module replacement, programming and setup

DTC B3920: DRIVER SEAT MOTORS GROUP 1

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Driver Seat Recline Motor Rearward Control	B3920 02	B3920 0B	1	B3920 01	B3920 42
1. Power seat motor inoperative					

Circuit/System Description

The seat memory control module controls the seat motors via half bridges that are connected to power rails internal to the module. The seat memory control module connects all of the motor control circuits on each power rail to a common reference point whenever they are not in operation. This reference point is biased to approximately 2.5 V. The seat memory control module checks to see if this reference voltage is shorted to ground or battery before enabling any seat motor.

When a power seat switch is pressed or when a memory recall is requested, each seat motor receives battery voltage and ground from the seat memory control module via the motor control circuits. All motors are reversible, so the direction the motor rotates depends on which control circuit voltage is applied and which control circuit ground is applied. When the switch is operated in the opposite direction, the module reverses the polarity and applies voltage and ground to the opposite circuits to move the seat in the opposite direction.

Conditions for Running the DTC

- DTC B1325 must not be present.
- Module battery voltage must be between 9-16 V.

Conditions for Setting the DTC

B3920 00

Current out of the module does not match the current returning to the module from 1.5-5 A.

B3920 01

The voltage on any power rail 1 motor control circuit exceeds 2.78 V for 100 ms.

B3920 02

The voltage on any power rail 1 motor control circuit is below 1.47 V for 100 ms.

B3920 42

This DTC will set if the module calibration is not programmed.

B3920 0B

The differential current measured through the high and low side of the power rail is within tolerance of each other, but the absolute current or an over-current has exceeded the maximum value.

Action Taken When the DTC Sets

The seat memory control module will not allow operation of any motor on the power rail for which the DTC was set.

Conditions for Clearing the DTC

- The current DTC clears when the fault is no longer present and the power mode changes to OFF then back to ACC or RUN.
- The history DTC will clear after 40 consecutive fault-free ignition cycles have occurred.

Circuit/System Testing

B3920 01 or B3920 02

1. Ignition OFF, disconnect the X4 and X5 harness connectors at the K40 Seat Memory Control Module.
2. Test for infinite resistance between the control circuit terminals listed below and ground:

- M50D front vertical motor up control terminal 7 X4
- M50D front vertical motor down control terminal 8 X4
- M55D rear vertical motor up control terminal 4 X5
- M55D rear vertical motor down control terminal 3 X5
- M51D horizontal motor forward control terminal 2 X5
- M51D horizontal motor rearward control terminal 1 X5
- M56D recline motor forward control terminal 5 X5
- M56D recline motor rearward control terminal 6 X5
- **If less than infinite resistance**

Repair the short to ground on the circuit.

- **If infinite resistance**

3. Ignition ON.
4. Test for less than 1 V between the control circuit terminals listed below and ground:

- M50D front vertical motor up control terminal 7 X4
- M50D front vertical motor down control terminal 8 X4
- M55D rear vertical motor up control terminal 4 X5
- M55D rear vertical motor down control terminal 3 X5
- M51D horizontal motor forward control terminal 2 X5
- M51D horizontal motor rearward control terminal 1 X5
- M56D recline motor forward control terminal 5 X5
- M56D recline motor rearward control terminal 6 X5
- **If 1 V or greater**

Repair the short to voltage on the circuit.

- **If less than 1 V**

5. Replace the K40 Seat Memory Control Module.

B3920 00 or B3920 0B

1. Ignition ON.
2. Clear the current and history DTC.
3. Determine which motor set this DTC by operating the driver seat motors listed below one at a time in both directions. Check for the DTC to set between each motor test.
 - M50D Seat Front Vertical Motor
 - M55D Seat Rear Vertical Motor
 - M51D Seat Horizontal Motor
 - M56D Seat Back Recline Motor
4. Ignition OFF, disconnect the harness connector at the seat motor for which the DTC set, ignition ON.
5. Clear the DTC.
6. Verify that DTC B3920 00 or B3920 0B does not set while operating the seat motor adjuster switch in both directions.
 - **If DTC B3920 00 or B3920 0B sets**
 1. Test for infinite resistance between control circuit terminal 1 and control circuit terminal 5.
 - If less than infinite resistance, repair the short between the circuits.
 - If infinite resistance
 2. Test for less than 2 ohms between the control circuit terminals listed below end to end:
 - Terminal 1
 - Terminal 5
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the seat motor.
 - **If DTC B3920 00 or B3920 0B does not set**
7. Replace the seat motor.

B3920 42

1. Ignition ON.
2. Verify the DTC is not set.
 - **If the DTC is set**

Replace the K40 Seat Memory Control Module.

- **If the DTC is not set**
3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Front Seat Tilt Adjuster Actuator Replacement (Driver/Passenger Seat 8-Way Power)**
- **Front Seat Adjuster Actuator Replacement (8-Way Power)**
- **Front Seat Recliner Actuator Motor Replacement (Driver or Passenger Seat 8-Way Power)**
- **Control Module References** for K40 Seat Memory Control Module replacement, programming and setup

SYMPTOMS - POWER SEATS

NOTE: The following steps must be completed before using the symptom tables.

1. Perform the **Diagnostic System Check - Vehicle** before using the Symptom Tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to the following system descriptions:
 - **Lumbar Support Description and Operation**
 - **Memory Seats Description and Operation**
 - **Power Seats System Description and Operation**

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the system. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Lumbar Support Malfunction**
- **Memory Seat Feature Malfunction**
- **Power Seat Malfunction (Without Memory A45), Power Seat Malfunction (With Memory A45)**

LUMBAR SUPPORT MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Seat Lumbar Support Switch B+	1	1	-	-
Seat Horizontal Lumbar Deflate Signal	1	2, 3	5	-

Seat Vertical Lumbar Deflate Signal	1	2, 3	5	-
Seat Vertical Lumbar Inflate Signal	1	2	4	-
Seat Lumbar Support Pump Control	1	1	4	-
Seat Lumbar Support Pump Ground	-	1	-	-
Seat Lumbar Adjuster Valve Assembly Ground	-	1	-	-
1. The seat lumbar support is inoperative 2. The upper lumbar support is inoperative 3. The lower lumbar support is inoperative 4. The lumbar adjuster pump is always ON 5. The lumbar support will not inflate				

Circuit/System Description

Battery voltage is supplied at all times to the driver and passenger seat lumbar support switches through a 15 A fuse located in the underhood fuse block. When a lumbar switch is pressed to inflate the lumbar support, battery voltage is applied through the switch contacts and the inflate signal circuit to the seat lumbar adjuster valve assembly. In response to this signal, the lumbar adjuster valve assembly energizes its internal inflate solenoid and applies battery voltage through the lumbar support pump control circuit to the pump to inflate the appropriate support bladder until the switch is released. When the switch is pressed to deflate the lumbar support, battery voltage is applied through the switch contacts and the deflate signal circuit to the seat lumbar adjuster valve assembly. The lumbar adjuster valve assembly energizes its internal deflate solenoid and air is released from the bladder until the switch is released.

- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Circuit/System Verification

1. Ignition ON.
2. Verify the lumbar support pump turns ON when the lumbar support switch is pressed in the FORWARD direction. The upper and lower lumbar support bladders should inflate until the bladders are 100% inflated or the switch is released.
 - **If the bladders do not inflate**

Refer to Circuit/System Testing

 - **If the bladders inflate**
3. Verify the upper and lower lumbar support bladders deflate when the lumbar REARWARD switch is pressed. The bladders should deflate until the bladders are 100% deflated or the switch is released.
 - **If the bladders do not deflate**

Refer to Circuit/System Testing

 - **If the bladders deflate**
4. Verify the lumbar support pump turns ON and the upper lumbar support bladder starts to inflate when the lumbar switch is pressed in the UP direction. If the lower bladder is inflated it will deflate while the upper bladder inflates until the upper bladder is 100% inflated or switch is released.
 - **If the pump does not turn ON or the upper bladder does not inflate**

Refer to Circuit/System Testing

 - **If the pump turns ON and the upper bladder inflates**
5. Verify the upper lumbar bladder starts to deflate while the lower lumbar bladder starts to inflate while the lumbar switch is pressed in the DOWN direction. The upper bladder should deflate until it is 100%

deflated and the lower bladder should inflate until it is 100% inflated or the switch is released.

- **If the upper bladder does not deflate or the lower bladder does not inflate**

Refer to Circuit/System Testing

- **If the upper bladder deflates and the lower bladder inflates**

6. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the appropriate S65 Seat Lumbar Support Switch, ignition ON.
2. Verify a test lamp illuminates between the B+ circuit terminal G and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Ignition OFF.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for greater than 10 ohms between each signal circuit listed below and ground:
 - Lumbar signal circuit terminal A
 - Lumbar signal circuit terminal B
 - Lumbar signal circuit terminal C
 - Lumbar signal circuit terminal F
 - If 10 ohms or less, disconnect the harness connector at the Q51 Seat Lumbar Support Valve Assembly and retest to verify if the short is in the circuit or the component.
 - If greater than 10 ohms, test or replace the S65 Seat Lumbar Support Switch.
 - **If the test lamp illuminates**
3. Ignition OFF, connect the harness connector at the S65 Seat Lumbar Support Switch and disconnect the harness connector at the Q51 Seat Lumbar Support Valve Assembly.
4. Test for less than 10 ohms between the ground circuit terminal 5 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.

- **If less than 10 ohms**
5. Ignition ON.
 6. Verify a test lamp turns ON and OFF between each signal circuit listed below and ground when pressing and releasing the S65 Seat Lumbar Support Switch in the appropriate direction.
 - Lumbar up switch signal terminal 1
 - Lumbar rearward switch signal terminal 2
 - Lumbar down switch signal terminal 3
 - Lumbar forward switch signal terminal 4
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the harness connector at the S65 Seat Lumbar Support Switch.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than Infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the S65 Seat Lumbar Support Switch.
 - **If the test lamp is always ON**
 1. Ignition OFF, disconnect the harness connector at the S65 Seat Lumbar Support Switch, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the S65 Seat Lumbar Support Switch.
 - **If the test lamp turns ON and OFF**
 - 7. Ignition OFF, connect the harness connector at the Q51 Seat Lumbar Support Valve Assembly and disconnect the harness connector at the A14 Seat Lumbar Support Pump.
 - 8. Test for less than 10 ohms between the ground circuit terminal 3 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance the ground connection.
 - **If less than 10 ohms**
 - 9. Connect a test lamp between the control circuit terminal 1 and ground, ignition ON.
 - 10. Verify the test lamp turns ON and OFF when commanding the A14 Seat Lumbar Support Pump ON and OFF by pressing and releasing the lumbar support switch in either the UP or FORWARD direction.
 - **If the test lamp is always OFF**
 1. Ignition OFF, disconnect the harness connector at the Q51 Seat Lumbar Support Valve Assembly.
 2. Test for infinite resistance between the control circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance
- 3. Test for less than 2 ohms in the control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the Q51 Seat Lumbar Support Valve Assembly.
 - **If the test lamp is always ON**
- 1. Ignition OFF, disconnect the harness connector at the Q51 Seat Lumbar Support Valve Assembly, ignition ON.
- 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the Q51 Seat Lumbar Support Valve Assembly,
 - **If the test lamp turns ON and OFF**
- 11. Test or replace the A14 Seat Lumbar Support Pump.

Component Testing

Lumbar Support Switch

1. Ignition OFF, disconnect the harness connector at the appropriate S65 Seat Lumbar Support Switch.
2. Test for infinite resistance between the B+ terminal G and each signal terminal with the switch in the open position.
 - **If less than infinite resistance**

Replace the S65 Seat Lumbar Support Switch.

 - **If infinite resistance**
3. Test for less than 2 ohms between the B+ terminal G and each signal terminal with the appropriate switch in the closed position.
 - **If 2 ohms or greater**

Replace the S65 Seat Lumbar Support Switch.

 - **If less than 2 ohms**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Driver or Passenger Seat Lumbar Control Switch Replacement (Driver/Passenger Seat 6-Way Hybrid)**
- **Driver or Passenger Seat Lumbar Support Replacement (Driver/Passenger Seat Electric Lumbar) , Driver or Passenger Seat Lumbar Support Replacement (Driver/Passenger Seat Manual Lumbar)**

MEMORY SEAT FEATURE MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Memory Set Switch Signal	1	1	-	-
Memory Switch Signal	1	1	1	-
Driver Seat Memory Switch Low Reference	-	1	-	-
1. Memory seat feature inoperative				

Circuit/System Description

Low reference is supplied to the driver seat memory switch from the seat memory control module. When a memory switch is pressed, the signal circuit from the seat memory control module is pulled low through the switch contacts and series of resistors indicating the memory recall request. In response to this signal, the seat memory control module commands the appropriate seat motors to move to the pre-recorded seat positions stored in memory.

Diagnostic Aids

The seat memory control module must be awake when measuring voltage from either one of the memory seat switch signal circuits. Voltage readings of 0.0 V or 5 V are possible if the module is not fully awake and result in misdiagnosing the circuit.

Circuit/System Verification

1. Ignition ON.
2. Verify that all manual driver power seat functions operate when being controlled by the power seat adjuster switches.
 - **If any seat function does not operate**

Refer to **Power Seat Malfunction (Without Memory A45)**, **Power Seat Malfunction (With Memory A45)**.

- **If all seat functions operate**
3. Verify that the memory recall personalization option is ON. Refer to the owners manual.
 - **If the memory recall personalization option is not ON**

Turn ON the option, refer to the Owners Manual.

- **If the memory recall personalization option is ON**
4. Refer to Circuit/System Testing.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the S47D Driver Seat Memory Switch.
2. Test for less than 10 ohms between the low reference circuit terminal 5 and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF, disconnect the X3 harness connector at the K40 Seat Memory Control Module.
 2. Test for less than 2 ohms in the low reference circuit end to end
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K40 Seat Memory Control Module.
 - **If less than 10 ohms**
3. Ignition ON, press a power seat switch in order to wake up the K40 Seat Memory Control Module.
4. Test for 9 V or greater between each signal circuit terminal listed below and ground:
 - Memory set switch signal terminal 1

- Memory switch signal terminal 6
 - **If less than 9 V**
- 1. Ignition OFF, disconnect the X2 harness connector at the K40 Seat Memory Control Module.
- 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
- 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K40 Seat Memory Control Module.
- **If 9 V or greater**
- 5. Ignition OFF, disconnect the X2 harness connector at the K40 Seat Memory Control Module, ignition ON.
- 6. Test for less than 1 V between each signal circuit terminal listed below and ground:
 - Memory set switch signal terminal 1
 - Memory switch signal terminal 6
 - **If 1 V or greater**

Repair the short to voltage on the circuit.

 - **If less than 1 V**
- 7. Test or replace the S47D Driver Seat Memory Switch.

Component Testing

Driver Seat Memory Switch

1. Ignition OFF, disconnect the harness connector at the S47D Driver Seat Memory Switch.
2. Test for infinite resistance between each signal terminal listed below and the low reference terminal 5 with the switch in the open position.
 - Terminal 1
 - Terminal 6
 - **If less than infinite resistance**

Replace the S47D Driver Seat Memory Switch.

 - **If infinite resistance**
3. Test for less than 2 ohms between the signal terminal 1 and the low reference terminal 5 while pressing the memory MEM button.
 - **If 2 ohms or greater**

Replace the S47D Driver Seat Memory Switch.

- **If less than 2 ohms**

4. Test for 570-698 ohms between the signal terminal 6 and the low reference terminal 5 while pressing the memory 1 button.

- **If not between 570-698 ohms**

Replace the S47D Driver Seat Memory Switch.

- **If between 570-698 ohms**

5. Test for 1800-2209 ohms between the signal terminal 6 and the low reference terminal 5 while pressing the memory 2 button.

- **If not between 1800-2209 ohms**

Replace the S47D Driver Seat Memory Switch.

- **If between 1800-2209 ohms**

6. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Control Module References** for K40 Seat Memory Control Module replacement, programming and setup

POWER SEAT MALFUNCTION (WITHOUT MEMORY A45)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Recline Motor Rearward Control	1	1	-	-
Ground	-	1	-	-
1. Power seat inoperative				

Circuit/System Description

The driver seat without memory and the passenger seat are completely controlled through their respective seat adjuster switches. Battery voltage is supplied at all times to the switch through a circuit breaker located in the instrument panel fuse block. When the seat switches are in an inactive state, the switch contacts are closed to the switch ground circuit.

All seat motors are reversible. For example, when the seat horizontal forward switch is pressed to move the entire seat forward, battery voltage is applied through the switch contacts and the seat horizontal motor forward control circuit to the motor. With the horizontal motor rearward switch contacts closed to the switch ground circuit, the motor runs in order to drive the entire seat forward until the switch is released. Moving the entire seat rearward works similarly to moving the entire seat forward, except that battery voltage and ground are applied on opposite circuits causing the motor to run in the opposite direction. All seat motors are powered this way.

Description and Operation

Power Seats System Description and Operation

Electrical Information Reference

- **Circuit Testing**
- **Connector Repairs**
- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Circuit/System Verification

1. Verify the appropriate driver or passenger seat directional motors listed below operate while operating the seat switches in both directions.
 - M51 Horizontal Motor
 - M50 Front Vertical Motor
 - M55 Rear Vertical Motor
 - M56 Recline Motor
 - **If all seat motors do not operate**

Refer to Circuit/System Testing - Seat Adjuster Switch Circuit Test.

- **If 1 or more seat motors operate**

Refer to Circuit/System Testing - Seat Motor Circuit Test.

- **If all seat motors operate**

2. All OK.

Circuit/System Testing

Seat Adjuster Switch Circuit Test

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S64D Driver Seat Adjuster Switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal B and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Ignition ON.
4. Verify a test lamp illuminates between the B+ circuit terminal E and ground.
 - **If the test lamp does not illuminate**
 1. Ignition OFF
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the circuit breaker is not open and there is voltage at the circuit breaker.
 - **If the test lamp illuminates**
5. Test or replace the S64 Seat Adjuster Switch.

Seat Motor Circuit Test

1. Ignition OFF, disconnect the harness connector at the appropriate seat motor listed below:
 - M50 Front Vertical Motor
 - M55 Rear Vertical Motor
 - M51 Horizontal Motor
 - M56 Recline Motor
2. Connect a test lamp between control circuit terminal 1 and control circuit terminal 5, ignition ON.
3. Verify the test lamp illuminates when commanding the seat motor Up and Down or Forward and Rearward using the S64 Seat Adjuster Switch.
 - **If the test lamp does not illuminate during either of the commands**
 1. Ignition OFF, disconnect the harness connector at the S64 Seat Adjuster Switch.
 2. Test for less than 2 ohms in each control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the S64 Seat Adjuster Switch
 - **If the test lamp illuminates during each of the commands**
4. Test or replace the seat motor.

Component Testing

Seat Adjuster Switch Test

1. Ignition OFF, disconnect the harness connector at the S64 Seat Adjuster Switch.
2. Test for infinite resistance between the B+ terminal and each control terminal with the switch in the open position.
 - **If less than infinite resistance**

Replace the S64 Seat Adjuster Switch.
 - **If infinite resistance**
3. Test for less than 2 ohms between the B+ terminal and each control terminal with the appropriate switch in the closed position.
 - **If 2 ohms or greater**

Replace the S64 Seat Adjuster Switch.
 - **If less than 2 ohms**
4. Test for less than 2 ohms between the ground terminal and each control terminal with the switch in the open position.
 - **If 2 ohms or greater**

Replace the S64 Seat Adjuster Switch.

- If less than 2 ohms

5. All OK.

Seat Motor

1. Ignition OFF, disconnect the harness connector at the appropriate seat motor listed below:

- M50 Front Vertical Motor
- M55 Rear Vertical Motor
- M51 Horizontal Motor
- M56 Recline Motor

NOTE: When performing the following tests, make sure that the seat is not already in the position the test is attempting to produce.

2. Install a 30 A fused jumper wire between control terminal 1 and 12 V.

3. Momentarily install a jumper wire between control terminal 5 and ground. The seat motor should momentarily perform the appropriate FORWARD/ REARWARD/ UP/ DOWN function.

- If the motor does not perform the FORWARD/ REARWARD/ UP/ DOWN function

Replace the motor.

- If the motor performs the FORWARD/ REARWARD/ UP/ DOWN function

4. Reverse the jumper wires; the motor should perform FORWARD/ REARWARD/ UP/ DOWN function.

- If the motor does not perform the FORWARD/ REARWARD/ UP/ DOWN function

Replace the motor.

- If the motor performs the FORWARD/ REARWARD/ UP/ DOWN function

5. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Driver or Passenger Seat Adjuster Switch Replacement (Driver/Passenger Seat 4-Way Hybrid)
- Front Seat Adjuster Motor Replacement (Driver or Passenger Seat 8-Way Power)
- Front Seat Recliner Actuator Motor Replacement (Driver or Passenger Seat 8-Way Power)

POWER SEAT MALFUNCTION (WITH MEMORY A45)

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.

- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Seat Memory Control Module Ground Terminal 6 X4	-	1, 2	-	-
1. Power seat and memory functions inoperative 2. Scan Tool Does Not Communicate with Low Speed GMLAN Device 3. Heated seats are inoperative				

Circuit/System Description

Battery voltage is supplied at all times to the seat memory control module through a 25 A fuse located in the I/P fuse block. This voltage is used by the module for logic power. Battery positive voltage is also supplied at all times to the seat memory control module through a 25 A circuit breaker. This voltage is connected to a power rail internal to the seat memory control module and is used to drive the power seat motors and the seat heater elements on vehicles equipped with heated seats. Each seat motor is controlled by the seat memory control module through 2 motor control circuits. The seat memory control module connects all motor control circuits on the power rail to a common reference point whenever they are not in operation. This reference point is biased to approximately 2.5 V. The seat memory control module checks to see if the reference voltage is shorted to ground or battery before enabling any of the seat motors.

All motors are reversible. For example, when the seat switch is operated to move the entire seat forward, the switch signal circuit from the seat memory control module is pulled low indicating the entire seat forward command. In response to this signal, the seat memory control module applies battery voltage through the driver seat horizontal motor forward control circuit and ground through the driver seat horizontal motor rearward control circuit to the motor. The motor runs to drive the entire seat forward until the switch is released. Moving the entire seat rearward works similarly to moving the entire seat forward, except that battery positive voltage and ground are applied on the opposite circuits causing the motor to run in the opposite direction.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool seat switch parameters listed below change between Inactive and Forward/Rearward or Up/Down when pressing the appropriate switch.
 - Driver Seat Horizontal Switch
 - Driver Seat Cushion Front Vertical Switch
 - Driver Seat Cushion Rear Vertical Switch
 - Driver Seat Back Switch
 - **If the parameter does not change**

Refer to Circuit/System Testing - Driver Seat Adjuster Switch Circuit Test.

- **If the parameter changes**
3. Verify the seat directional motors listed below operate while operating the appropriate driver seat switches in both directions.
 - M51D Seat Horizontal Motor
 - M50D Seat Front Vertical Motor
 - M55D Seat Rear Vertical Motor
 - M56D Seat Recline Motor
 - **If any seat motor does not operate**

Refer to Circuit/System Testing - Seat Motor Control Circuit Test.

- **If all seat motors operate**
4. All OK.

Circuit/System Testing

Driver Seat Adjuster Switch Circuit Test

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the S64D Driver Seat Adjuster Switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the ground circuit terminal E and ground.
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Verify that all scan tool driver seat switch parameters listed below are Inactive:
 - Driver Seat Cushion Front Vertical Switch
 - Driver Seat Cushion Rear Vertical Switch
 - Driver Seat Horizontal Switch
 - Driver Seat Back Switch
 - **If not Inactive**
 1. Ignition OFF, disconnect the harness connector at the K40 Seat Memory Control Module.
 2. Test for infinite resistance between the appropriate signal circuit terminal listed below and ground:
 - Front vertical upward switch terminal A
 - Front vertical downward switch terminal K
 - Rear vertical upward switch terminal F
 - Rear vertical downward switch terminal J
 - Horizontal forward switch terminal D
 - Horizontal rearward switch terminal C
 - Recline forward switch terminal H
 - Recline rearward switch terminal G
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K40 Seat Memory Control Module.
 - **If Inactive**
 4. Install a 3 A fused jumper wire between the appropriate signal circuit terminal listed below and the ground circuit terminal B.
 - Front vertical upward switch terminal A
 - Front vertical downward switch terminal K
 - Rear vertical upward switch terminal F
 - Rear vertical downward switch terminal J
 - Horizontal forward switch terminal D
 - Horizontal rearward switch terminal C
 - Recline forward switch terminal H
 - Recline rearward switch terminal G
 5. Verify the scan tool seat switch parameter is Forward/Rearward or UP/Down.
 - **If not Forward/Rearward or UP/Down**
 1. Ignition OFF, disconnect the harness connector at the K40 Seat Memory Control Module, ignition ON.
 2. Test for less than 1 V between the signal circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.

- If less than 1 V
- 3. Ignition OFF.
- 4. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K40 Seat Memory Control Module.
- **If Forward/Rearward or UP/Down**
- 6. Test or replace the S64D Driver Seat Adjuster Switch.

Seat Motor Control Circuit Test

1. Ignition OFF, disconnect the X4 harness connector at the K40 Seat Memory Control Module.
2. Test for less than 10 ohms between each ground circuit terminal listed below and ground:
 - Terminal 3
 - Terminal 6
 - **If 10 ohms or greater**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the ground circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
3. Ignition ON.
4. Verify that a test lamp illuminates between the B+ circuit terminal 5 and ground.
 - **If the test lamp does not illuminate.**
 1. Ignition OFF.
 2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the circuit breaker is OK and there is voltage at the circuit breaker.
 - **If the test lamp illuminates.**
5. Ignition OFF, connect the X4 harness connector at the K40 Seat Memory Control Module and disconnect the harness connector at the appropriate seat motor listed below:
 - M51D Seat Horizontal Motor
 - M50D Seat Front Vertical Motor
 - M55D Seat Rear Vertical Motor
 - M56D Seat Recline Motor
6. Connect a test lamp between control circuit terminal 1 and control circuit terminal 5, ignition ON.

NOTE: **Once a seat motor is commanded On using the scan tool, the seat function may not work using the seat adjuster switch until you back out of the scan tool Control Functions menu.**

7. Verify the test lamp illuminates when commanding the seat motor in the Up/Down or Forward/Rearward states with a scan tool.
 - **If the test lamp does not illuminate during either of the commands**
 1. Ignition OFF, disconnect the X4 harness connector at the K40 Seat Memory Control Module.
 2. Test for infinite resistance between each control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in each control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K40 Seat Memory Control Module.
 - **If the test lamp illuminates during each of the commands**
8. Test or replace the seat motor.

Component Testing

Seat Adjuster Switch Test

1. Ignition OFF, disconnect the harness connector at the S64D Driver Seat Adjuster Switch.
2. Test for infinite resistance between the ground terminal B and each signal terminal with the switch in the open position.
 - **If less than infinite resistance**

Replace the S64D Driver Seat Adjuster Switch.
 - **If infinite resistance**
3. Test for less than 2 ohms between the ground terminal B and each signal terminal with the appropriate switch in the closed position.
 - **If 2 ohms or greater**

Replace the S64D Driver Seat Adjuster Switch.
 - **If less than 2 ohms**
4. All OK.

Seat Motor

1. Ignition OFF, disconnect the harness connector at the appropriate seat motor listed below:
 - M51D Seat Horizontal Motor
 - M50D Seat Front Vertical Motor
 - M55D Seat Rear Vertical Motor
 - M56D Seat Recline Motor

NOTE: When performing the following tests, make sure that the seat is not already in the position the test is attempting to produce.

2. Install a 30 A fused jumper wire between control terminal 1 and 12 V.
3. Momentarily install a jumper wire between control terminal 5 and ground. The seat motor should momentarily perform the appropriate FORWARD/ REARWARD/ UP/ DOWN function.
 - **If the motor does not perform the FORWARD/ REARWARD/ UP/ DOWN function**

Replace the motor.
 - **If the motor performs the FORWARD/ REARWARD/ UP/ DOWN function**
4. Reverse the jumper wires; the motor should perform FORWARD/ REARWARD/ UP/ DOWN function.
 - **If the motor does not perform the FORWARD/ REARWARD/ UP/ DOWN function**

Replace the motor.
 - **If the motor performs the FORWARD/ REARWARD/ UP/ DOWN function**
5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Driver or Passenger Seat Adjuster Switch Replacement (Driver/Passenger Seat 4-Way Hybrid)**
- **Front Seat Adjuster Motor Replacement (Driver or Passenger Seat 8-Way Power)**
- **Front Seat Recliner Actuator Motor Replacement (Driver or Passenger Seat 8-Way Power)**
- **Control Module References** for K40 Seat Memory Control Module replacement, programming and setup

REPAIR INSTRUCTIONS

DRIVER OR PASSENGER SEAT ADJUSTER SWITCH REPLACEMENT (DRIVER/PASSENGER SEAT 4-WAY HYBRID)

Fig. 8: Driver Or Passenger Seat Adjuster Switch

Front Seat Recliner Actuator Motor Replacement (Driver or Passenger Seat 8-Way Power)

Callout	Component Name
Preliminary Procedures	
1.	SIR disabling and enabling. Refer to <u>SIR Disabling and Enabling</u> .
2.	Disconnect the negative battery cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> .
3.	Remove driver or passenger seat replacement. Refer to <u>Driver or Passenger Seat Removal and Installation</u> .
4.	Remove driver or passenger seat adjuster handle. Refer to <u>Driver or Passenger Seat Adjuster Handle Replacement (2/4/6-Way Hybrid, 6-Way Hybrid Sport)</u> .
5.	Remove driver or passenger seat adjuster finish cover. Refer to <u>Driver or Passenger Seat Adjuster Finish Cover Replacement (8-Way-Power)</u> .
6.	Remove driver or passenger seat inner recliner finish cover. Refer to <u>Driver or Passenger Seat Inner Recliner Finish Cover Replacement (2/4/6-Way Hybrid, 6-Way Hybrid Sport)</u> .
7.	Remove front seat head restraint. Refer to <u>Driver or Passenger Seat Head Restraint Replacement (without AHS)</u> .
8.	Remove front seat head restraint guide bezel. Refer to <u>Front Seat Head Restraint Guide Bezel Replacement (2/4/6-Way Hybrid, 6-Way Hybrid Sport)</u> , <u>Front Seat Head Restraint Guide Bezel Replacement (8-Way Power)</u> .
9.	Remove front seat back cushion pad. Refer to <u>Front Seat Back Pad Replacement (2/4/6-Way</u>

Hybrid, 6-Way Hybrid Sport) , Front Seat Back Pad Replacement (8-Way Power) .

10. Remove front seat head restraint adjust rod guide. Refer to **Front Seat Head Restraint Guide Replacement** .

1	Front Seat Recliner Rod Jam Nut TIP: Replace with new rod jam nut.
2	Recliner Rod Procedure Gently tap the recliner rod outward until the rod is free of the recliner motor.
3	Front Seat Recliner Actuator Motor Fastener CAUTION: Refer to <u>Fastener Caution</u> . Procedure Disconnect the electric connector. Tighten 6 N.m (53 lb in)
4	Front Seat Recliner Actuator Motor

DESCRIPTION AND OPERATION

LUMBAR SUPPORT DESCRIPTION AND OPERATION

Lumbar Support Components

The driver and front passenger pneumatic lumbar support system each consist of the following components:

- Seat Lumbar support switch
- Seat lumbar adjuster valve assembly
- Seat lumbar support pump

If equipped, the passenger seat block diagram is identical to the driver seat.

Lumbar Block Diagram

Fig. 16: Lumbar Block Diagram
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
HW	Hard-Wired
HW	Hard-Wired
S65D	S65D Seat Lumbar Support Switch - Driver
Q51D	Q51D Seat Lumbar Support Valve Assembly - Driver
A14D	A14D Seat Lumbar Support Pump - Driver

Circuit Description

Battery voltage is supplied at all times to the seat lumbar support valve assembly through a 25 A circuit breaker located in the instrument panel fuse block. The lumbar support valve assembly supplies a reference voltage to each signal circuit of the lumbar switch. When a lumbar switch is pressed to inflate the lumbar support, the signal circuit from the lumbar support valve assembly is pulled low through the switch contacts indicating the lumbar support command. The lumbar support valve assembly energizes its internal inflate solenoid and applies ground through the seat lumbar support pump control circuit to the pump. The pump runs to inflate the appropriate lumbar bladder until the switch is released. When the switch is pressed to deflate the lumbar support, the signal circuit is pulled low through the switch contacts and the deflate signal circuit to the lumbar support valve assembly. The lumbar support valve assembly energizes its internal deflate solenoid and air is released from the bladder until the switch is released.

Description of Operation

The following describes the lumbar support operation and how the lumbar adjuster valve assembly responds to each of the lumbar support switch inputs:

- When the lumbar support switch pressed in the FORWARD direction, the lumbar adjuster valve assembly will command the lumbar support pump ON and the upper and lower lumbar support bladders should inflate until the bladders are 100% inflated or the switch is released.
- When pressing the lumbar support switch in the REARWARD direction, the lumbar adjuster valve assembly will slowly deflate the upper and lower lumbar support bladders until the switch is released or both bladders are 100% deflated.
- When the lumbar support switch is pressed in the UP direction, the lumbar adjuster valve assembly will slowly inflate the upper lumbar support bladder until the switch is released or the bladder is 100% inflated.
- When the lumbar support switch is pressed in the DOWN direction, the lumbar adjuster valve assembly will slowly deflate the upper lumbar bladder while it inflates the lower lumbar bladder. The lumbar adjuster valve assembly will continue this operation until the switch is released or the upper lumbar bladder is 100% deflated and the lower lumbar bladder is 100% inflated.

MEMORY SEATS DESCRIPTION AND OPERATION

Memory Seat System Components

The seat memory system consists of the following components:

- Driver seat adjuster switch
- Driver seat memory switch
- Seat memory control module
- Seat horizontal motor/sensor
- Seat front vertical motor/sensor
- Seat rear vertical motor/sensor
- Seat back recline motor/sensor

Driver Seat Personalization Option

The seat memory control module will not perform remote memory recall and driver seat easy exit functions unless these personalization options are activated in the audio system, refer to Vehicle Personalization in the Owners Manual. The audio system reports the vehicle personalization option settings to the seat memory

control module as well as other receiving modules via GMLAN message each time the ignition switch is cycled to the ON position. The seat memory control module will then store the seat personalization option settings and examine them before making a memory seat adjustment. The seat personalization option settings stored within the seat memory control module will not change until the memory recall option setting in the audio system is changed and the ignition switch is cycled to the ON position.

Driver Seat Adjuster Switch

The seat memory control module supplies a low current voltage to each signal circuit of the seat adjuster switch. When the seat switches are pressed, the appropriate signal circuit from the seat memory control module is pulled low through the switch contacts indicating the power seat command. The seat memory control module then commands the driver seat to move in response to the switch signals.

Seat Motors

There are 4 motors that move the position of the seat. These are the seat horizontal motor, front vertical motor, rear vertical motor and the seat back recline motor. The horizontal motor moves the entire seat forward and rearward. Both vertical motors run simultaneously when the seat switch is operated in order to move the entire seat up and down. Or they can be selected independently to vertically tilt the front or rear of the seat up and down. The recline motor moves the angle of the seat back forward or rearward.

The seat memory control module controls all seat motors via half bridges that are connected to a single power rail internal to the module. The module connects all motor outputs on the power rail to a common reference point whenever they are not in operation. This reference point is biased to approximately 2.5 V. The seat memory control module checks to see if this reference voltage is shorted to ground or battery before enabling any seat motor. All seat motors operate independently of each other. Each motor contains a electronic circuit breaker (PTC), which will reset only after voltage has been removed from the motor.

All seat motors are reversible. For example, when the seat switch is pressed to move the entire seat forward, ground is applied through the switch contacts and seat horizontal forward switch signal circuit to the seat memory control module. In response to this signal, the seat memory control module applies battery voltage through the driver seat horizontal motor forward control circuit and ground through the driver seat horizontal motor rearward control circuit to the motor. The motor runs in order to drive the entire seat forward. Moving the entire seat rearward works similarly to moving the entire seat forward, except that battery voltage and ground are applied on the opposite circuits causing the motor to run in the opposite direction. All of the seat motors are powered this way.

Seat Position Sensors

The seat motors are equipped with 2 wire hall effect type position sensors internal to the motor. The sensors are monitored by the seat memory control module and are used to determine seat positions when storing or recalling memory settings. The seat memory control module supplies the sensors with a common 12 V reference circuit and separate signal circuits. During seat motor operation, the hall effect position sensor provides a determined number of pulse signals for every revolution of the motor shaft. These pulse signals (Counts) range from 0 - 65,535. High scan tool count values indicate forward or upward seat positions while low count values indicate rearward or downward seat positions.

Memory Functions

Memory recalls via the memory switch require the driver to press and hold the memory button until the seat reaches its memory position.

Ground from the seat memory control module is supplied at all times through the low reference circuit to the driver seat memory switch. The module also supplies memory set and memory recall signal circuits to the seat memory switch. When a memory recall switch is pressed, the signal circuit from the seat memory control module is pulled low through the switch contacts and a series of resistors indicating the memory recall request. In response to this signal, the seat memory control module commands the appropriate seat motors to move to the pre-recorded seat positions stored in memory.

There are two methods to save and recall memory positions for the driver seat and outside rearview mirrors (also adjustable pedals and power tilt/telescoping steering column if equipped). The first method to save and recall memory positions is by using the memory set buttons, the second method is by using the key fob.

Unique memory positions may be saved for up to 5 drivers. Two unique memory positions can be saved via memory recall switches 1 and 2. To save memory positions for driver 1:

- Adjust the driver seat and the exterior mirrors (also adjustable pedals and power column if equipped) to the desired position.
- Simultaneously press and hold the memory recall switch MEM button and button 1 until a signal chime sounds indicating the memory position is saved for driver 1.

A second seating position for driver 2 may be programmed by repeating the above steps and pressing memory button 2. There is no correlation between fob 1 and memory button 1 or fob 2 and memory button 2. The positions stored for each of the memory recall buttons can be recalled by pressing and holding the memory recall button until the memory controlled devices reach their saved position.

In addition to the two memory recall switch positions, three remote memory recall positions for Drivers 1, 2, and 3 may be saved. Drivers 1 and 2 will each have a unique set of remote memory recall positions saved for key fob ID's 1 and 2. A third unique set of positions for Driver 3 may also be saved for all additional key fobs 3 through 8. Key fob ID's 3 through 8 will be recognized by the Seat Memory Control Module as key fob ID 3. Key fob ID 3 will share the same set of saved positions but will be unique from key fob IDs 1 and 2.

NOTE: The key fob memory recall positions are not tied to the positions stored to the memory seat recall switches.

Key fobs 1, 2 and 3 (up to 3 unique sets of positions) can be saved by:

- Press Unlock on the desired key fob
- Place the ignition in the ON position
- Adjust seat and mirrors to desired positions
- Turn the ignition OFF

Keyless Entry and Memory Recall Personalization

When a keyless entry transmitter is used in order to unlock the vehicle's doors, the body control module

communicates the unlock command and which driver performed the command to the seat memory control module via a serial data message. Vehicle lock/unlock functions and memory recall settings may be personalized. For functional descriptions and personalization instructions, refer to the vehicle owners manual.

POWER SEATS SYSTEM DESCRIPTION AND OPERATION

The driver and passenger 8-way power seat systems each consist of the following components:

- Seat adjuster switch
- Seat horizontal motor
- Seat front vertical motor
- Seat rear vertical motor
- Seat recline motor

The 2-way power seat system consists of a seat adjuster switch and a seat vertical motor.

NOTE: **If equipped, the passenger seat block diagram is identical to the driver seat.**

Power Seat Block Diagram

Fig. 18: Power Seat Block Diagram

Callout	Component Name
HW	Hard-Wired
HW	Hard-Wired
HW	Hard-Wired
HW	Hard-Wired
S64D	S64D Seat Adjuster Switch - Driver
M56D	M56D Seat Recline Motor - Driver
M51D	M51D Seat Horizontal Motor - Driver
M55D	M55D Seat Rear Vertical Motor - Driver
M50D	M50D Seat Front Vertical Motor - Driver

Seat Motors

All of the seat motors operate independently of each other. Each motor contains an electronic circuit breaker

(PTC) that opens in the event of a circuit overload and will reset only after voltage has been removed from the circuit. There are four seat position motors and one lumbar motor. These are the horizontal motor, front vertical motor, rear vertical motor, and the seat back recline motor. The seat horizontal motor moves the entire seat forward and rearward. The seat vertical motors may operate independently to tilt the front or rear of the seat cushion up or down. Both motors can also run simultaneously to move the entire seat up or down. The recline motor moves the angle of the seat back forward or rearward.

Seat Operation

The seat switches provide both power and ground to the selected seat motors.

All seat motors are reversible. For example, when the seat horizontal forward switch is pressed to move the entire seat forward, ground is applied through the switch contacts and the seat horizontal motor forward control circuit to the motor. With the horizontal motor rearward switch contacts closed to the switch B+ circuit, the motor runs in order to drive the entire seat forward until the switch is released. Moving the entire seat rearward works similarly to moving the entire seat forward, except that battery voltage and ground are applied on opposite circuits causing the motor to run in the opposite direction. All seat motors are powered this way.

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C005B 00

Power Steering Softstops Learn

Circuit/System Description

If the power steering power pack is replaced, the calibration needs to be learned to the new power steering power pack using a scan tool. The power steering control module will set a DTC, if the required parameters are not learned.

Conditions for Running the DTC

Ignition Switch in OFF, ACCESSORY or ON position, power steering control module in communications mode.

Conditions for Setting the DTC

The soft endstop is not learned by the new power steering control module.

Action Taken When the DTC Sets

DTC C005B is stored in memory.

Conditions for Clearing the DTC

The software endstops need to be learned to the new power steering control module using a scan tool, performing the Configuration/Reset functions Power Steering Softstops Reset and Power Steering Softstops Learn.

DTC C0176: CONTROL MODULE TEMPERATURE SENSOR HIGH TEMPERATURE (NJ1)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.

- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C0176 54

Control Module Temperature Sensor High Temperature

Circuit/System Description

The power steering control module monitors the temperature of the Power Steering System. The power steering control module uses voltage, current levels and input from an internal temperature sensor to calculate an estimated system temperature. If the power steering control module detects a high system temperature event is occurring, the amount of assist is decreased to reduce system temperature, in effort to prevent thermal damage to the power steering components.

Conditions for Running the DTC

- Ignition ON, engine Running.
- Power steering system voltage is 9-16 volts.
- Repetitive steering input applied.

Conditions for Setting the DTC

The power steering control module detects a high system temperature.

Action Taken When the DTC Sets

- DTC C0176 54 is stored in memory.
- Steering assist is reduced.

Conditions for Clearing the DTC

- A current DTC will clear on the next malfunction-free ignition cycle.
- A history DTC will clear after 40 consecutive malfunction-free ignition cycles.

Diagnostic Aids

- DTC C0176 54 does not indicate that a malfunction has occurred. Rather that the power steering control module had to limit current to the power steering motor to avoid thermal damage to the power steering system components. Discuss with the customer about driving conditions when the steering assist was reduced.
- Ensure that no steering components down stream of the power steering column assembly, such as ball joints, tie rod ends, universal joints, or the steering gear assembly, are mechanically binding.

Circuit/System Verification

1. Verify that the DTC sets outside of the conditions for running and setting. Since most occurrences of this DTC are caused by excessive driver inputs, review with the customer the conditions under which the DTC set.
 - **If the DTC did not set outside of the conditions for running and setting**
 1. Ignition ON.
 2. Operate the vehicle within the conditions that the customer experienced, avoiding excessive inputs, and verify the DTC does not reset.
 - If the DTC is set
 1. Verify that no steering components down stream of the power steering column assembly are mechanically binding. Refer to **Steering Effort Hard or Too Easy in One or Both Directions**
 - If steering components are mechanically binding, replace the mechanically binding steering components.
 - If no steering components are mechanically binding, replace the Steering Gear.
 - If the DTC is not set
3. All OK.
 - **If the DTC set outside of the conditions for running and setting**
2. All OK. The power steering is operating as designed.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC C044A: STEERING SYSTEM ENGINE SPEED SIGNAL CIRCUIT INVALID DATA (NJ1)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C044A 71

Steering System Engine Speed Signal Circuit Invalid Data

Circuit/System Description

The power steering control module receives the engine speed signal from the engine control module.

Conditions for Running the DTC

The ignition is ON.

Conditions for Setting the DTC

The power steering control module detects a invalid engine speed signal on the CAN Bus.

Action Taken When the DTC Sets

- DTC C044A is stored in memory.
- The driver information center displays the SERVICE POWER STEERING warning message.

Conditions for Clearing the DTC

- A current DTC will clear on the next malfunction-free ignition cycle.
- A history DTC will clear after 40 consecutive malfunction-free ignition cycles.

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC C0450 01

Steering Assist Control Actuator Circuit Short to Battery

DTC C0450 02

Steering Assist Control Actuator Circuit Short to Ground

DTC C0450 04

Steering Assist Control Actuator Circuit Open

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Variable Effort Steering Actuator Control Circuit 1	C0450 02	C0450 04	C0450 01	-
Variable Effort Steering Actuator Control Circuit 2	C0450 02	C0450 04	C0450 01	-

Circuit/System Description

The actuator is a variable electromagnetic actuator, which consists of one multiple-pole ring-style permanent magnet, with a pole piece, and an electromagnetic coil assembly. By commanding currents between -3 to +3 A through the coils the steering effort will be adapted accordingly.

Conditions for Running the DTC

- System voltage between 9-16 V
- Engine running

Conditions for Setting the DTC

The variable effort steering detects a short to battery, short to ground or an open circuit in the actuator circuits.

C0450 01

If the coil feedback voltage is measured greater than 8 V during the initialization of the module, the DTC will be set.

C0450 02

If the coil feedback voltage is measured less than 3.4 V during the initialization of the module, the DTC will be set.

C0450 04

If the coil current is measured to be less/greater than 1.0 A from the commanded current, the DTC will be set.

Action Taken When the DTC Sets

- DTC C0450 is stored in memory.
- The fault lamp illuminates or the driver information center displays the service power steering message.
- The variable effort steering module goes in to shutdown mode.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present and the DTC is cleared with a scan tool.
- The variable effort steering automatically clears the history DTC when a current DTC is not detected in 40 consecutive communication wake-up enable cycles.

Circuit/System Testing

1. Ignition OFF, disconnect the X115 harness connector at the M72 variable power steering solenoid valve.
2. Test for less than 10 ohms between the low reference circuit terminal B and ground.

- **If greater than the specified range**

1. Disconnect the harness connector at the K43 Power Steering Control Module.
2. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K43 Power Steering Control Module.

- **If within the specified range**

3. Test for less than 1 V between the signal circuit terminal A and ground.

- **If greater than the specified range**

Repair the short to voltage on the circuit.

- **If within the specified range**

4. Ignition ON, test for B+ between the signal circuit terminal A and ground.

- **If less than B+**

1. Disconnect the harness connector at the K43 Power Steering Control Module.
2. Test for infinite resistance between the signal circuit terminal A and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance

3. Test for less than 2 ohms in the low reference circuit end to end.

- If 2 ohms or greater, repair the open/high resistance in the circuit.
- If less than 2 ohms, replace the K43 Power Steering Control Module.

- **If B+**

5. Test for 1.6-3.1 ohms between control terminal A and control terminal B of the harness connector at the M72 variable power steering solenoid valve.

- **If not within the specified range**

Replace the M72 variable power steering solenoid valve.

- **If within the specified range**

6. Test for infinite resistance between each terminal and the M72 variable power steering solenoid valve housing case.

- **If less than infinite resistance**

Replace the M72 variable power steering solenoid valve.

- **If infinite resistance**

7. Replace the K43 Power Steering Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC C0475 00

Electric Steering Motor Circuit Malfunction

DTC C0475 59

Electric Steering Motor Circuit Protection Time-Out

Circuit/System Description

C0475 00

The power steering control module continuously monitors the voltage and current levels being commanded to the 3-phase steering assist motor. The power steering control module compares the desired and actual current levels to detect malfunctions in the internal power steering assist motor circuits.

C0475 59

The power steering control module continuously monitors the thermal cycle counter of the steering gear. If the thermal cycle counter exceeds the maximum allowable limit, the steering gear has reached the end of its predetermined lifecycle and must be replaced.

Conditions for Running the DTC

The ignition is ON.

Conditions for Setting the DTC

C0475 00

The power steering control module detects a short to ground, short to voltage, or an open/high resistance on any of the internal power steering assist motor circuits.

C0475 59

The power steering control module detects the thermal cycle counter has exceeded the maximum allowable limit indicating that the whole steering gear system must be replaced.

Action Taken When the DTC Sets

- The DTC is stored in memory.

- The driver information center displays the SERVICE POWER STEERING warning message.
- No steering assist.

Conditions for Clearing the DTC

C0475 00

- A current DTC will clear on the next malfunction free ignition cycle.
- A history DTC will clear after 40 consecutive malfunction free ignition cycles.

C0475 59

This DTC cannot be cleared. The power steering system must be replaced.

Circuit/System Verification

C0475 00

1. Ignition OFF, disconnect the X2 harness connector at the K43 Power Steering Control Module.
2. Test for less than 10 ohms between the ground circuit terminal 2 and ground.

- **If greater than the specified range**

Repair the open/high resistance in the ground circuit.

- **If within the specified range**

3. Verify that a test lamp illuminates between the B+ circuit terminal 1 and ground.

- **If the test lamp does not illuminate**

1. Test for infinite resistance between the B+ circuit terminal 1 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
2. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K43 Power Steering Control Module.

- **If the test lamp does illuminate**

4. Replace the K43 Power Steering Control Module.

C0475 59

1. Verify that DTC C0475 59 is not set.

- **If the DTC is set**

Replace the M38 Power Steering Motor.

- **If the DTC is not set**

2. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Power Steering Assist Motor Replacement (NJ1), Power Steering Assist Motor Replacement (NJ2)**

DTC Descriptor

DTC C047A

Electric Steering Motor Position Sensor Circuit

Circuit/System Description

The power steering control module continuously monitors the motor position sensor voltage signals. The voltage signals of the motor position sensor and the digital torque sensor index current signal are both processed by the power steering control module to detect and calculate the steering wheel angle.

Conditions for Running the DTC

The vehicle is ON or in SERVICE MODE.

Conditions for Setting the DTC

The power steering control module detects a short to ground, short to voltage, or an open/high resistance on any of the internal motor position sensor circuits, or a plausibility error as a result of a mismatch between the steering angle data from the internal steering angle sensor in the gear versus the external steering angle sensor data on the steering column.

Action Taken When the DTC Sets

- No steering assist.
- The driver information center displays the SERVICE POWER STEERING warning message.

Conditions for Clearing the DTC

- A current DTC will clear on the next malfunction-free ignition cycle.
- A history DTC will clear after 40 consecutive malfunction-free ignition cycles.

Diagnostics Aids

A communication error between the Electronic Brake Control Module and Power Steering Control Module can cause DTC C047A to set in history and display Service Power Steering warning message. Do not replace the steering gear or power steering control module if DTC C047A is set in history. If DTC C047A is current, follow the Circuit/System Testing for proper diagnosis.

Circuit/System Verification

1. Ignition ON.
2. With a scan tool, verify that DTC C0710 71 is not set.
 - **If DTC C0710 71 is set**

Refer to Anitlock Brake System Diagnostic Information and Procedures.

- **If DTC C0710 71 is not set**
3. With a scan tool verify that DTC C047A is not set.
 - If the DTC is set

Refer to Circuit/System Testing below.

- If the DTC is not set
4. All OK.

Circuit/System Testing

1. Verify that the connector at the B137 Power Steering Shaft Torque Sensor is not damaged or have water intrusion/corrosion.
 - **The B137 Power Steering Shaft Torque Sensor connector is not OK**

Replace the steering gear.

- **The B137 Power Steering Shaft Torque Sensor connector is OK**
2. With a scan tool perform the Power Steering Control Module Calibration procedure Steering Angle Sensor Centering and Software Endstop Learning. Refer to **Power Steering Control Module Calibration (NJ1)**.
 3. Verify that DTC C047A does not set.

- If the DTC does set

Replace the K43 Power Steering Control Module.

- If the DTC does not set

4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Electric Dual Pinion Rack and Pinion Steering Gear Replacement (FWD, LUK, MHH, NJ1),
Electric Dual Pinion Rack and Pinion Steering Gear Replacement (AWD, LTG, M7U, NJ1)**

DTC C0544: STEERING WHEEL ANGLE SENSOR (NJ1)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C0544 5A

Steering Wheel Angle Sensor Signal Not Plausible

Circuit/System Description

The power steering control module continuously monitors the steering wheel angle sensor. The steering wheel angle sensor indicates the direction in which the driver intends to go.

The power steering control module has a center detection algorithm that compares the reading of the steering angle sensor to the direction based on other vehicle sensors that the vehicle is travelling to determine if the steering angle reading is plausible.

Conditions for Running the DTC

Ignition ON.

Conditions for Setting the DTC

The power steering control module detects a not plausible signal from the steering wheel angle sensor.

The power steering control module detected that the steering angle sensor reading and the direction of the

vehicle exceeds 329 degrees.

Action Taken When the DTC Sets

- DTC C0544 is stored in memory.
- The driver information center displays the SERVICE POWER STEERING warning message.

Conditions for Clearing the DTC

A history DTC will clear after 40 consecutive malfunction free ignition cycles.

- **Wiring Repairs**

Scan Tool Reference

Control Module References for scan tool information.

Circuit/System Verification

1. Ignition ON.
2. Verify that no other DTCs are set except for C0544.
 - **If any other DTCs are set**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle**

- **If no other DTCs are set**

NOTE: Wheel misalignment can cause incorrect Steering Wheel Angle parameter reading.

3. With a scan tool, verify that the Steering Wheel Angle parameter is zero degrees or near zero degrees with the front tire/wheels in the straight ahead position.
 - If the Steering Wheel Angle parameter is not zero degrees or near zero degrees
 1. Perform the Power Steering Control Module Calibration. Refer to **Power Steering Control Module Calibration (NJ1)**
 2. Verify that DTC C0544 is not set.
 - If the DTC is set, replace the K43 Power Steering Control Module.
 - If the DTC is not set
 3. All OK.
 - If the Steering Wheel Angle parameter is zero degrees or near zero degrees
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for power steering control module replacement, programming and setup.

DTC C0545: STEERING WHEEL TORQUE SENSOR (NJ1)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C0545 00

Steering Wheel Torque Sensor Malfunction

Circuit/System Description

The power steering control module continuously monitors the digital torque sensor's torque and index current signals. As the steering wheel is turned and torsional twist is applied to the steering shaft, the steering input and output shafts are monitored via the torque signal circuit and then processed by the power steering control module to calculate the steering torque.

Conditions for Running the DTC

The ignition is ON.

Conditions for Setting the DTC

The power steering control module detects a short to ground, short to voltage, or an open/high resistance on any of the torque sensor circuits.

Action Taken When the DTC Sets

- DTC C0545 is stored in memory.
- The driver information center displays the SERVICE POWER STEERING warning message.
- No steering assist.

Conditions for Clearing the DTC

- A current DTC will clear on the next malfunction-free ignition cycle.
- A history DTC will clear after 40 consecutive malfunction-free ignition cycles.

Circuit/System Verification

1. Verify that DTC C0545 is not set.
 - **If the DTC is set**

Replace the M38 Power Steering Motor.

- **If the DTC is not set**

2. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Power Steering Assist Motor Replacement (NJ1)**
- **Control Module References** for power steering control module replacement, programming and setup.

DTC C055C: STEERING GEAR PERFORMANCE (NJ1)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C055C 00

Steering Gear Performance Malfunction

DTC C055C 64

Steering Gear Performance Slip Detected

Circuit/System Description

The power steering control module continuously verifies the mechanical friction of the steering gear. If the friction is too high the clutch between motor and rack slips and the internal angle is not longer valid.

Conditions for Running the DTC

Ignition ON.

Conditions for Setting the DTC

The DTC is set when the mechanical friction of the steering gear is too high.

Action Taken When the DTC Sets

- DTC C055C is stored in memory.
- No steering assist.

Conditions for Clearing the DTC

A history DTC will clear after 40 consecutive malfunction free ignition cycles.

Diagnostic Aids

Ensure that no steering components down stream of the power steering column assembly, such as ball joints, tie rod ends, universal joints, or the steering gear assembly, are mechanically binding.

DTC C0565: VEHICLE IDENTIFICATION NUMBER NOT PLAUSIBLE (NJ1)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C0565 5A

Vehicle Identification Number Not Plausible

Circuit/System Description

The vehicle identification number (VIN) is programmed into the power steering control module during initial programming of the module.

Conditions for Running the DTC

Ignition ON

Conditions for Setting the DTC

The power steering control module is not properly programmed.

Action Taken When the DTC Sets

- DTC C0565 is stored in memory.
- The driver information center displays the SERVICE POWER STEERING warning message.

Conditions for Clearing the DTC

- A current DTC will clear on the next malfunction-free ignition cycle.
- A history DTC will clear after 40 consecutive malfunction-free ignition cycles.

Diagnostic Aids

A newly replaced power steering control module can set one or more DTC on its initial ignition ON cycle.

DTC C0569: SYSTEM CONFIGURATION INCORRECT COMPONENT INSTALLED (NJ1)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C0569 3A

System Configuration Incorrect Component Installed

Circuit/System Description

The power steering control module continuously monitors the thermal cycle counter of the steering gear. If the power steering control module is replaced, the thermal cycle counter value needs to be transferred from the existing power steering control module over to the new power steering control module using the SPS Electric Power Steering Setup Procedure.

Conditions for Running the DTC

The ignition is ON.

Conditions for Setting the DTC

The thermal cycle counter value does not meet the system requirement.

Action Taken When the DTC Sets

- DTC C0569 is stored in memory.
- The driver information center displays the SERVICE POWER STEERING warning message.
- No Steering assist.

Conditions for Clearing the DTC

- A current DTC will clear on the next malfunction free ignition cycle.
- A history DTC will clear after 40 consecutive malfunction free ignition cycles.

DTC C0710 (NJ1, NJ2, NV7): STEERING POSITION SIGNAL INVALID DATA

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.

- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C0710 71

Steering Position Signal Invalid Data

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
CAN Bus High Serial Data	U0073, U0100, U0101, U0125, U0126, U0140	U0073, U0100, U0101, U0125, U0126, U0140	U0073, U0100, U0101, U0125, U0126, U0140	C0710 5A, C0710 71
CAN Bus Low Serial Data	U0073, U0100, U0101, U0125, U0126, U0140	U0073, U0100, U0101, U0125, U0126, U0140	U0073, U0100, U0101, U0125, U0126, U0140	C0710 5A, C0710 71

Circuit/System Description

The power steering control module monitors the steering angle sensor signal via the GMLAN serial data circuit. The power steering control module utilizes this signal to determine a center point for Active Return and Soft End Stops. Upon detecting an invalid steering angle sensor signal, the power steering control module will disable Active Return and Soft End Stops, then set a DTC.

NOTE: To most drivers the loss of Active Return and Soft End Stops may not be noticeable as there is no visual indicator activated on the instrument cluster or driver information display.

There is no diagnosable cause with the power steering control module when this DTC is set, DO NOT REPLACE POWER STEERING CONTROL MODULE OR STEERING GEAR DUE TO THIS DTC.

For diagnosis of an invalid steering angle sensor signal, refer to **DTC C0460 or C0710** .

Conditions for Running the DTC

Ignition ON

Conditions for Setting the DTC

The power steering control module has received one of the following serial data messages listed below from the external steering angle sensor.

- Steering angle range is exceeded

- Steering angle sensor is not calibrated
- Steering angle sensor is initialized
- Steering angle sensor message: Roll Counter is INVALID
- Steering angle sensor message: Present Bit is FALSE (not common)
- Steering angle sensor message: Error Flag is set to TRUE

Action Taken When the DTC Sets

- The electronic brake control module disables the stability control for the duration of the ignition cycle.
- Active Return and Software End Stops are deactivated.

Conditions for Clearing the DTC

- A current DTC clears when the diagnostic runs and passes.
- When the steering angle sensor signal becomes valid, the fault will set to History and can be cleared with a scan tool.

Diagnostic Aids

The car should not pull in either direction causing the steering wheel to be OFF center while driving straight ahead on a level surface.

Circuit/System Verification

1. Ignition ON.
2. With a scan tool, verify that DTC C0710 71 is not set.
 - **If DTC C0710 71 is set**

Refer to **DTC C0460 or C0710** in Antilock Brake System Diagnostic Information and Procedures.

- **If DTC C0710 71 is not set**
3. All OK.

SYMPTOMS - POWER STEERING SYSTEM

NOTE: Review the system description and operation in order to familiarize yourself with the system functions. Refer to **Power Steering System Description and Operation (Hydraulic Power Steering)**, **Power Steering System Description and Operation (Electronic Power Steering)**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the power steering system.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Rattle, Clunk, or Shudder Noise from the Power Steering System**
- **Whine or Growl Noise from the Power Steering System**
- **Increase in Effort While Turning Steering Wheel**
- **Poor Return of Steering Wheel**
- **Steering Wheel Surges/Jerks While Turning**
- **Steering Wheel Kickback**
- **Steering Effort Hard or Too Easy in One or Both Directions**

RATTLE, CLUNK, OR SHUDDER NOISE FROM THE POWER STEERING SYSTEM

Rattle, Clunk, or Shudder Noise from the Power Steering System

Step	Action	Yes	No
1	Did you review the Power Steering System Description and Operation and perform the necessary inspections?	Go to Step 2	Go to <u>Symptoms - Steering Wheel and Column</u>
	Verify a rattle noise is present by driving the vehicle		

2	on a rough road. Verify a clunk noise is present by turning the steering wheel to the left and to the right several times with the key in the ON position. Is a rattle or a clunk noise present?	Go to Step 3	System OK
3	Inspect the steering gear for the proper installation. Is the steering gear installation incorrect?	Go to Step 6	Go to Step 4
4	Inspect the intermediate steering shaft. Is the intermediate steering shaft worn?	Go to Step 8	Go to Step 5
5	Inspect the front suspension. Refer to Noise Diagnosis - Front Suspension . Is the front suspension worn?	Go to Step 7	Go to Step 3
6	Install the steering gear correctly. Refer to Electric Dual Pinion Rack and Pinion Steering Gear Replacement (FWD, LUK, MHH, NJ1) , Electric Dual Pinion Rack and Pinion Steering Gear Replacement (AWD, LTG, M7U, NJ1) , or Electric Belt Drive Rack and Pinion Steering Gear Replacement (FWD, LTG, MR6, NJ2) , Electric Belt Drive Rack and Pinion Steering Gear Replacement (AWD, LTG, M7U, NJ2) . Did you complete the repair?	Go to Step 9	-
7	Replace the worn front suspension component that is causing the noise. Did you complete the repair?	Go to Step 9	-
8	Replace the intermediate steering shaft. Refer to Intermediate Steering Shaft Replacement . Did you complete the repair?	Go to Step 9	-
9	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

WHINE OR GROWL NOISE FROM THE POWER STEERING SYSTEM

Special Tools

CH-39570 Chassis Ear

For equivalent regional tools, refer to **Special Tools**.

Whine or Growl Noise from the Power Steering System

Step	Action	Yes	No
1	Did you review the Power Steering System Description and Operation and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Power Steering System
2	Verify that a whine or growl noise is present. Is a whine or growl noise present?	Go to Step 3	System OK
	Inspect the power steering gear for looseness and/or		

3	worn bushings. Is the steering gear loose or are the bushings worn?	Go to Step 6	Go to Step 4
4	Inspect the power steering motor for a whine or growl noise using the CH-39570 ear. Is the noise present at the power steering motor?	Go to Step 7	Go to Step 5
5	Inspect the power steering gear for a whine or growl noise using the CH-39570 ear. Is the noise present at the power steering gear?	Go to Step 8	Go to Step 3
6	Tighten the power steering gear fasteners or replace the power steering gear due to worn bushings. Refer to <u>Electric Dual Pinion Rack and Pinion Steering Gear Replacement (FWD, LUK, MHH, NJ1)</u> , <u>Electric Dual Pinion Rack and Pinion Steering Gear Replacement (AWD, LTG, M7U, NJ1)</u> , or <u>Electric Belt Drive Rack and Pinion Steering Gear Replacement (FWD, LTG, MR6, NJ2)</u> , <u>Electric Belt Drive Rack and Pinion Steering Gear Replacement (AWD, LTG, M7U, NJ2)</u> . Did you complete the repair?	Go to Step 9	-
7	If equipped with an electric dual pinion rack and pinion steering gear, replace the electric power steering assist motor control. Refer to <u>Power Steering Assist Motor Replacement (NJ1)</u> , <u>Power Steering Assist Motor Replacement (NJ2)</u> . If equipped with an electric belt drive rack and pinion steering gear, replace the power steering gear. Refer to <u>Electric Belt Drive Rack and Pinion Steering Gear Replacement (FWD, LTG, MR6, NJ2)</u> , <u>Electric Belt Drive Rack and Pinion Steering Gear Replacement (AWD, LTG, M7U, NJ2)</u> . Did you complete the repair?	Go to Step 9	-
8	Replace the power steering gear. Refer to <u>Electric Dual Pinion Rack and Pinion Steering Gear Replacement (FWD, LUK, MHH, NJ1)</u> , <u>Electric Dual Pinion Rack and Pinion Steering Gear Replacement (AWD, LTG, M7U, NJ1)</u> , or <u>Electric Belt Drive Rack and Pinion Steering Gear Replacement (FWD, LTG, MR6, NJ2)</u> , <u>Electric Belt Drive Rack and Pinion Steering Gear Replacement (AWD, LTG, M7U, NJ2)</u> . Did you complete the repair?	Go to Step 9	-
9	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

INCREASE IN EFFORT WHILE TURNING STEERING WHEEL

Increase in Effort While Turning Steering Wheel

Step	Action	Yes	No
1	Did you review the Power Steering System Description and Operation and perform the necessary inspections?	Go to Step 2	Go to <u>Symptoms - Power Steering System</u>
2	Verify that the steering wheel surges or jerks while turning. Does the steering wheel surge or jerk while turning?	Go to Step 3	System OK
3	Inspect the front suspension for worn or binding components. Did you find and correct the condition?	Go to Step 15	Go to Step 4
4	1. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Inspect the steering linkage outer tie rod for wear or a binding condition. Is the steering linkage outer tie rod worn or binding?	Go to Step 10	Go to Step 5
5	Inspect the intermediate shaft for wear or a binding condition. Is the intermediate shaft worn or binding?	Go to Step 11	Go to Step 6
6	Inspect the steering gear for wear or a binding condition. Is the steering gear worn or binding?	Go to Step 12	Go to Step 7
7	Inspect the steering column for wear or a binding condition. Is the steering column worn or binding?	Go to Step 13	Go to Step 8
8	Inspect the power steering assist motor for an indication of excessive heat. Does the power steering assist motor appear to be overheated?	Go to Step 9	Go to Step 14
9	NOTE: Do not perform excessive parking lot maneuvers during testing. Excessive parking lot maneuvers can cause the power steering motor to heat up. Allow the power steering motor to cool and retest the system.Did you correct the condition?	Go to Step 15	Go to Step 14
10	Replace the steering linkage outer tie rod. Refer to <u>Steering Linkage Outer Tie Rod Replacement</u> . Did you complete the repair?	Go to Step 15	-
11	Replace the intermediate shaft. Refer to <u>Intermediate Steering Shaft Replacement</u> . Did you complete the repair?	Go to Step 15	-
	Replace the steering gear. Refer to <u>Electric Dual Pinion Rack and Pinion Steering Gear</u>		

12	<u>Replacement (FWD, LUK, MHH, NJ1), Electric Dual Pinion Rack and Pinion Steering Gear Replacement (AWD, LTG, M7U, NJ1), or Electric Belt Drive Rack and Pinion Steering Gear Replacement (FWD, LTG, MR6, NJ2), Electric Belt Drive Rack and Pinion Steering Gear Replacement (AWD, LTG, M7U, NJ2).</u> Did you complete the repair?	Go to Step 15	-
13	Replace the steering column. Refer to <u>Steering Column Replacement</u> . Did you complete the repair?	Go to Step 15	-
14	If equipped with an electric dual pinion rack and pinion steering gear, replace the electric power steering assist motor control. Refer to <u>Power Steering Assist Motor Replacement (NJ1), Power Steering Assist Motor Replacement (NJ2).</u> If equipped with an electric belt drive rack and pinion steering gear, replace the power steering gear. Refer to <u>Electric Belt Drive Rack and Pinion Steering Gear Replacement (FWD, LTG, MR6, NJ2), Electric Belt Drive Rack and Pinion Steering Gear Replacement (AWD, LTG, M7U, NJ2).</u> Did you complete the repair?	Go to Step 15	-
15	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

POOR RETURN OF STEERING WHEEL

Poor Return of Steering Wheel

Step	Action	Yes	No
DEFINITION: After completing a turn, extra steering input is required for the steering wheel to return to center.			
1	Did you review the General Description and perform the necessary inspections?	Go to Step 2	Go to <u>Power Steering System Description and Operation (Hydraulic Power Steering), Power Steering System Description and Operation (Electronic Power Steering)</u>
2	Verify that poor return of the steering wheel is present.		

	Does the system operate normally?	System OK	Go to Step 3
3	<ol style="list-style-type: none"> 1. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Lubricate the tie rod ends and ball joints, if applicable. 3. Inspect the suspension system for worn or damaged components. 4. Repair as necessary. 		
	Did you find and correct the condition?	Go to Step 12	Go to Step 4
4	<ol style="list-style-type: none"> 1. Rotate the steering wheel ONE revolution in both directions. 2. Rotate the steering wheel back to the original position. 		
	Was the steering wheel abnormally difficult to rotate in either direction?	Go to Step 5	Go to Step 10
5	<p>NOTE: Position the wheels straight ahead. Do NOT rotate the steering wheel more than one complete revolution from center.</p> <ol style="list-style-type: none"> 1. Disconnect the intermediate shaft from the steering column. 2. Note the position of the steering wheel and rotate the steering wheel ONE revolution in both directions. 3. Rotate the steering wheel back to the original position. 		
	Was the steering wheel abnormally difficult to rotate in either direction?	Go to Step 11	Go to Step 6
6	<p>Inspect the intermediate shaft for stiff or loose joints. Repair or replace as necessary.</p> <p>Did you find and complete the repair?</p>	Go to Step 12	Go to Step 7
7	<ol style="list-style-type: none"> 1. Remove the front tire and wheel assemblies. Refer to <u>Tire and Wheel Removal and Installation</u> . 2. Disconnect both outer tie rod ends from the steering knuckles. 3. Use your hands in order to move the tie rod end studs. 4. If abnormally difficult to move, replace the tie 		

	rod end. Did you find and complete the repair?	Go to Step 12	Go to Step 8
8	1. Use your hands to rotate the steering knuckle inboard and outboard in order to inspect for a binding strut bearings, ball joints, or axle. 2. Repair or replace any abnormally stiff or loose components. Did you find and complete the repair?	Go to Step 12	Go to Step 9
9	Inspect for binding in the steering gear. If a binding is present repair or replace the steering gear. Did you find and complete the repair?	Go to Step 12	Go to Step 10
10	Inspect the wheel alignment and adjust as necessary. Refer to <u>Wheel Alignment Measurement</u> . Did you find and complete the repair?	Go to Step 12	-
11	Inspect the steering column for a binding. If a binding is present, repair or replace the steering column as necessary. Did you find and complete the repair?	Go to Step 12	-
12	Operate the system in order to verify the repair. Did you correct the condition?	System OK	-

STEERING WHEEL SURGES/JERKS WHILE TURNING

Special Tools

CH-39570 Chassis Ear

For equivalent regional tools, refer to **Special Tools**.

Steering Wheel Surges/Jerks While Turning

Step	Action	Yes	No
1	Did you review the Power Steering System Description and Operation and perform the necessary inspections?	Go to Step 2	Go to <u>Symptoms - Power Steering System</u>
2	Verify that a whine or growl noise is present. Is a whine or growl noise present?	Go to Step 3	System OK
3	Inspect the power steering gear for looseness and/or worn bushings. Is the steering gear loose or are the bushings worn?	Go to Step 6	Go to Step 4
4	Inspect the power steering motor for a whine or growl noise using the CH-39570 ear. Is the noise present at the power steering motor?	Go to Step 7	Go to Step 5
	Inspect the power steering gear for a whine or growl		

5	noise using the CH-39570 ear. Is the noise present at the power steering gear?	Go to Step 8	Go to Step 3
6	Tighten the power steering gear fasteners or replace the power steering gear due to worn bushings. Refer to <u>Electric Dual Pinion Rack and Pinion Steering Gear Replacement (FWD, LUK, MHH, NJ1)</u> , <u>Electric Dual Pinion Rack and Pinion Steering Gear Replacement (AWD, LTG, M7U, NJ1)</u> , or <u>Electric Belt Drive Rack and Pinion Steering Gear Replacement (FWD, LTG, MR6, NJ2)</u> , <u>Electric Belt Drive Rack and Pinion Steering Gear Replacement (AWD, LTG, M7U, NJ2)</u> . Did you complete the repair?	Go to Step 9	-
7	If equipped with an electric dual pinion rack and pinion steering gear, replace the electric power steering assist motor control. Refer to <u>Power Steering Assist Motor Replacement (NJ1)</u> , <u>Power Steering Assist Motor Replacement (NJ2)</u> . If equipped with an electric belt drive rack and pinion steering gear, replace the power steering gear. Refer to <u>Electric Belt Drive Rack and Pinion Steering Gear Replacement (FWD, LTG, MR6, NJ2)</u> , <u>Electric Belt Drive Rack and Pinion Steering Gear Replacement (AWD, LTG, M7U, NJ2)</u> . Did you complete the repair?	Go to Step 9	-
8	Replace the power steering gear. Refer to <u>Electric Dual Pinion Rack and Pinion Steering Gear Replacement (FWD, LUK, MHH, NJ1)</u> , <u>Electric Dual Pinion Rack and Pinion Steering Gear Replacement (AWD, LTG, M7U, NJ1)</u> , or <u>Electric Belt Drive Rack and Pinion Steering Gear Replacement (FWD, LTG, MR6, NJ2)</u> , <u>Electric Belt Drive Rack and Pinion Steering Gear Replacement (AWD, LTG, M7U, NJ2)</u> . Did you complete the repair?	Go to Step 9	-
9	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

STEERING WHEEL KICKBACK

Steering Wheel Kickback

Condition	Action
The steering column mounting bolts are loose.	Tighten the pivot bolt and the mounting bolts to specification.
The steering gear is loosely mounted.	Tighten the steering gear mounting bolts to

	specification.
The steering linkage tie rods are loose or damaged.	Inspect the steering linkage tie rods. If necessary, replace the steering linkage tie rods. Refer to <u>Steering Linkage Outer Tie Rod Replacement</u> , or to <u>Steering Linkage Inner Tie Rod Replacement (NJ2)</u> , <u>Steering Linkage Inner Tie Rod Replacement (NJ1)</u> .

STEERING EFFORT HARD OR TOO EASY IN ONE OR BOTH DIRECTIONS

Steering Effort Hard or Too Easy in One or Both Directions

Condition	Action
The battery power is low.	Ensure proper battery voltage.
The intermediate shaft dash seal is binding.	Adjust the dash seal or replace the intermediate shaft if necessary. Refer to <u>Intermediate Steering Shaft Replacement</u> .
The intermediate shaft joints are loose or worn.	Inspect the joints and the pinch bolts for damage, and replace the intermediate shaft if necessary. Refer to <u>Intermediate Steering Shaft Replacement</u> .
The steering gear is binding.	If necessary, inspect and replace the steering gear. Refer to <u>Electric Dual Pinion Rack and Pinion Steering Gear Replacement (FWD, LUK, MHH, NJ1)</u> , <u>Electric Dual Pinion Rack and Pinion Steering Gear Replacement (AWD, LTG, M7U, NJ1)</u> , or <u>Electric Belt Drive Rack and Pinion Steering Gear Replacement (FWD, LTG, MR6, NJ2)</u> , <u>Electric Belt Drive Rack and Pinion Steering Gear Replacement (AWD, LTG, M7U, NJ2)</u> .
The upper steering shaft is bent.	If necessary, replace the steering column. Refer to <u>Steering Column Replacement</u> .
The connectors to the assist motor are damaged or disconnected.	Verify the connectors are properly connected. Verify the connectors are not damaged. If the connectors are damaged, replace the connectors.
The sensor wire is damaged.	Replace the steering gear. Refer to <u>Electric Dual Pinion Rack and Pinion Steering Gear Replacement (FWD, LUK, MHH, NJ1)</u> , <u>Electric Dual Pinion Rack and Pinion Steering Gear Replacement (AWD, LTG, M7U, NJ1)</u> , or <u>Electric Belt Drive Rack and Pinion Steering Gear Replacement (FWD, LTG, MR6, NJ2)</u> , <u>Electric Belt Drive Rack and Pinion Steering Gear Replacement (AWD, LTG, M7U, NJ2)</u> .
The controller is malfunctioning.	Confirm the DTC. If equipped with an electric dual pinion rack and pinion steering gear, replace the electric power

	steering assist motor control. Refer to <u>Power Steering Assist Motor Replacement (NJ1)</u> , <u>Power Steering Assist Motor Replacement (NJ2)</u> . If equipped with an electric belt drive rack and pinion steering gear, replace the power steering gear. Refer to <u>Electric Belt Drive Rack and Pinion Steering Gear Replacement (FWD, LTG, MR6, NJ2)</u> , <u>Electric Belt Drive Rack and Pinion Steering Gear Replacement (AWD, LTG, M7U, NJ2)</u> .
The motor shaft is binding.	Confirm the DTC. If equipped with an electric dual pinion rack and pinion steering gear, replace the electric power steering assist motor control. Refer to <u>Power Steering Assist Motor Replacement (NJ1)</u> , <u>Power Steering Assist Motor Replacement (NJ2)</u> . If equipped with an electric belt drive rack and pinion steering gear, replace the power steering gear. Refer to <u>Electric Belt Drive Rack and Pinion Steering Gear Replacement (FWD, LTG, MR6, NJ2)</u> , <u>Electric Belt Drive Rack and Pinion Steering Gear Replacement (AWD, LTG, M7U, NJ2)</u> .

REPAIR INSTRUCTIONS

STEERING LINKAGE INNER TIE ROD INSPECTION

Special Tools

GE-8001 Dial Indicator Set

For equivalent regional tools, refer to **Special Tools**.

NOTE: This inspection procedure does not supersede local government required inspections that have more stringent requirements.

1. Turn the ignition key to the ON position with the engine OFF.

Fig. 3: Measuring Lash Between Inner Tie Rod & Steering Gear Housing
Courtesy of GENERAL MOTORS COMPANY

2. With the aid of an assistant, turn the steering wheel to the full stop position and hold the steering wheel in

that position until the test is complete. Part of the steering linkage inner tie rod (2) being tested should be inside the steering gear housing. The inner tie rod housing (1) being tested should be inside the steering gear housing and seated against the steering stop.

3. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
4. If there is not a good location for the **GE-8001** dial indicator pointer at the steering gear housing, install a large worm gear hose clamp (3) to the steering gear housing over the larger steering gear boot clamp and align the clamp so that the screw can be a location for the **GE-8001** dial indicator pointer.
5. Install the **GE-8001** dial indicator between the inner tie rod and the steering gear housing or the worm gear clamp in such a way as to measure the lash between the inner tie rod and the steering gear housing. The lash between the inner tie rod and the steering gear housing is equal to the lash between the inner tie rod and the inner tie rod housing because the inner tie rod housing is inside the steering gear housing during this procedure.

Fig. 4: Identifying Tire Grasping Positions
Courtesy of GENERAL MOTORS COMPANY

NOTE: Only move the tire enough to feel any lash between the inner tie rod and the inner tie rod housing without moving the steering gear rack.

6. Grasping the tire at the 3 o'clock (2) and 9 o'clock (1) positions, gently push in on one side of the tire in order to remove any lash.
7. Zero the **GE-8001** dial indicator.
8. On the same side of the tire previously pushed in, gently pull out and measure the lash.
9. Record the measurement shown on the **GE-8001** dial indicator.
10. If the measured value exceeds 0.5 mm (0.02 in), replace the inner tie rod. Refer to **Steering Linkage Inner Tie Rod Replacement (NJ2)**, **Steering Linkage Inner Tie Rod Replacement (NJ1)**.
11. Repeat the procedure for the other side.

STEERING LINKAGE OUTER TIE ROD INSPECTION

Special Tools

GE-8001 Dial Indicator Set

For equivalent regional tools, refer to **Special Tools**.

NOTE: **This inspection procedure does not supersede local government required inspections that have more stringent requirements.**

1. Inspect the outer tie rod seal. If the outer tie rod seal is torn, replace the outer tie rod. Refer to **Steering Linkage Outer Tie Rod Replacement**.
2. Raise the side of the vehicle being inspected with a floor jack while maintaining contact between the opposite wheel and the shop floor. Support the lower control arm with a floor jack stand as far outboard as possible and remove the floor jack. Refer to **Lifting and Jacking the Vehicle**.

Fig. 5: Measuring Outer Tie Rod Lash
Courtesy of GENERAL MOTORS COMPANY

3. Install the **GE-8001** dial indicator between the outer tie rod and the steering knuckle as shown in the graphic. Note that the tire and wheel assembly is shown removed only for clarification of the **GE-8001** dial indicator position.

Fig. 6: Identifying Tire Grasping Positions
Courtesy of GENERAL MOTORS COMPANY

4. Grasping the tire at the 3 o'clock (2) and 9 o'clock (1) positions, gently push in on one side of the tire to remove any lash.
5. Zero the **GE-8001** dial indicator.
6. On the same side of the tire previously pushed inwards, gently pull outwards and measure the lash.
7. Record the measurement shown on the **GE-8001** dial indicator.
8. If the measured value exceeds 0.5 mm (0.02 in), replace the outer tie rod. Refer to **Steering Linkage Outer Tie Rod Replacement**.
9. Repeat the procedure for the other side.

STEERING LINKAGE OUTER TIE ROD REPLACEMENT

Fig. 7: Steering Linkage Outer Tie Rod And Nuts
 Courtesy of GENERAL MOTORS COMPANY

Steering Linkage Outer Tie Rod Replacement

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none"> 1. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Remove the front tire and wheel assembly. Refer to <u>Tire and Wheel Removal and Installation</u> . 	
1	<p>Steering Linkage Outer Tie Rod Nut</p> <p>CAUTION: Refer to <u>Fastener Caution</u> .</p> <p>CAUTION: This vehicle is equipped with torque-to-yield or single use fasteners. Install a NEW torque-to-yield or single use fastener when installing this component. Failure to replace the torque-to-yield or single use fastener could cause damage to the vehicle or component.</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Remove the steering linkage outer tie rod nut. Discard the nut. 2. Install a NEW steering linkage outer tie rod nut.

	<p>Tighten 35 N.m (26 lb ft) + 30 degrees</p>
2	<p>Steering Linkage Inner Tie Rod Nut</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Place match marks on the steering linkage inner tie rod nut and the steering linkage inner tie rod. 2. During installation, align the match marks. 3. Do not tighten the nut during installation. Tighten the nut after adjusting the front toe. <p>Tighten 60 N.m (44 lb ft)</p>
3	<p>Steering Linkage Outer Tie Rod</p> <p>CAUTION: Do not free the ball stud by using a pickle fork or a wedge-type tool. Damage to the seal or bushing may result.</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Use the CH-161-B puller to disconnect the steering linkage outer tie rod from the steering knuckle. 2. Clean the tapered surface of the steering knuckle. 3. Inspect the steering linkage inner tie rod for bent or damaged threads. Repair or replace the tie rod if needed. Refer to <u>Steering Linkage Inner Tie Rod Replacement (NJ2)</u>, <u>Steering Linkage Inner Tie Rod Replacement (NJ1)</u>. 4. If equipped with electronic power steering, perform the software end stop learning procedure. Refer to <u>Power Steering Control Module Calibration (NJ1)</u>. 5. After the installation is complete, measure and adjust the front toe. Refer to <u>Wheel Alignment - Steering Wheel Angle and/or Front Toe Adjustment</u> . <p>Special Tools CH-161-B Bearing Puller For equivalent regional tools, refer to <u>Special Tools</u>.</p>

STEERING GEAR BOOT REPLACEMENT (NJ2)

Fig. 8: Steering Gear Boot & Mounting Components
 Courtesy of GENERAL MOTORS COMPANY

Steering Gear Boot Replacement (NJ2)

Callout	Component Name
Preliminary Procedures	
1. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Remove the steering linkage outer tie rod. Refer to <u>Steering Linkage Outer Tie Rod Replacement</u> .	
1	Steering Linkage Inner Tie Rod Nut
2	Steering Gear Boot Outer Clamp
3	Steering Gear Boot Inner Clamp
	Procedure
	1. Cut the steering gear boot inner clamp. Discard the clamp. 2. Use the CH-22610 pliers to install a NEW steering gear boot inner clamp.
	Special Tools CH-22610 Pliers For equivalent regional tools, refer to <u>Special Tools</u> .
	Steering Gear Boot

	Procedure
4	<ol style="list-style-type: none"> 1. After removing the steering gear boot, inspect the steering linkage inner tie rod for evidence of corrosion or contamination. If none is evident, continue with the repair. If corrosion or contamination is evident, replace the steering gear. Refer to <u>Electric Belt Drive Rack and Pinion Steering Gear Replacement (FWD, LTG, MR6, NJ2)</u>, <u>Electric Belt Drive Rack and Pinion Steering Gear Replacement (AWD, LTG, M7U, NJ2)</u>. 2. Apply a small amount of Lithium Grease or equivalent to the inside of both ends of the steering gear boot. Refer to <u>Adhesives, Fluids, Lubricants, and Sealers</u>. 3. Install the steering gear boot and ensure the boot is seated in the assembly groove of the steering gear before installing the steering gear boot clamps.
5	Steering Gear Boot Seal

STEERING GEAR BOOT REPLACEMENT (NJ1)

Callout	Component Name
Preliminary Procedure	
Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> .	
1	Steering Gear Heat Shield Fastener (Qty: 3) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 9 N.m (80 lb in)
2	Steering Gear Heat Shield

ELECTRIC BELT DRIVE RACK AND PINION STEERING GEAR REPLACEMENT (FWD, LTG, MR6, NJ2)

Removal Procedure

CAUTION: Electrostatic discharge (ESD) can damage many solid-state electrical components. ESD susceptible components may or may not be labeled with the ESD symbol. Handle all electrical components

carefully. Use the following precautions in order to avoid ESD damage:

- Touch a metal ground point in order to remove your body's static charge before servicing any electronic component; especially after sliding across the vehicle seat.
- Do not touch exposed terminals. Terminals may connect to circuits susceptible the ESD damage.
- Do not allow tools to contact exposed terminals when servicing connectors.
- Do not remove components from their protective packaging until required to do so.
- Avoid the following actions unless required by the diagnostic procedure:
 - Jumpering or grounding of the components or connectors.
 - Connecting test equipment probes to components or connectors. Connect the ground lead first when using test probes.
- Ground the protective packaging of any component before opening. Do not rest solid-state components on metal workbenches, or on top of TVs, radios, or other electrical devices.

CAUTION: With wheels of the vehicle facing straight ahead, secure the steering wheel utilizing steering column anti-rotation pin, steering column lock, or a strap to prevent rotation. Locking of the steering column will prevent damage and a possible malfunction of the SIR system. The steering wheel must be secured in position before disconnecting the following components:

- The steering column
- The intermediate shaft(s)
- The steering gear

After disconnecting these components, do not rotate the steering wheel or move the front tires and wheels. Failure to follow this procedure may cause the SIR coil assembly to become un-centered and cause possible damage to the SIR coil. If you think the SIR coil has become un-centered, refer to your specific SIR coil's centering procedure to re-center SIR Coil.

1. Lock the steering column in the straight-ahead position.
2. Disconnect the intermediate steering shaft from the steering gear and remove the front dash seal from the steering gear input shaft. Refer to **Intermediate Steering Shaft Replacement** .

3. Install the engine support fixture. Refer to **Engine Support Fixture** .
4. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
5. Disconnect the steering linkage outer tie rods from the steering knuckles. Refer to **Steering Linkage Outer Tie Rod Replacement**.
6. Disconnect the stabilizer shaft links from the stabilizer shaft. Refer to **Stabilizer Shaft Link Replacement (GNA Standard Strut, GNB Performance Struts)** .
7. Disconnect the lower control arms from the steering knuckles. Refer to **Lower Control Arm Replacement (GNA Standard Strut)** , **Lower Control Arm Replacement (GNB Performance Struts)** .
8. Remove the steering gear heat shield. Refer to **Steering Gear Heat Shield Replacement (NJ2)**.
9. Disconnect the electrical connector on the steering gear and disconnect the wiring harness clip from the steering gear housing.

NOTE: **Wiring harness routing is critical. Note the exact routing of the steering gear wiring harness before repositioning it.**

10. Remove the wiring harness bracket bolts from the steering gear. Leave the bracket attached to the wiring harness and position it out of the way.
11. Remove the through bolts for the front and rear transmission mounts. Refer to **Transmission Front Mount Replacement** , and **Transmission Rear Mount Bracket Replacement** .
12. Position adjustable jackstands underneath the left and right sides of the rear of the drivetrain and front suspension frame.
13. Lower the vehicle until the drivetrain and front suspension frame is resting lightly on the jackstands.
14. Remove the exhaust front pipe. Refer to **Exhaust Front Pipe Replacement (LTG)** , **Exhaust Front Pipe Replacement (LUK)** .
15. Loosen the drivetrain and front suspension frame front bolts. Refer to **Drivetrain and Front Suspension Frame Replacement** .
16. Raise the vehicle while the drivetrain and front suspension frame rests on the jackstands. Do not allow the gap between the body and rear of the frame to exceed a maximum of 50 mm (2 in).
17. Finish removing the stabilizer shaft. Refer to **Stabilizer Shaft Replacement (GNA Standard Strut, GNB Performance Struts)** .

Fig. 12: Steering Gear Nuts, Washers And Bolts
Courtesy of GENERAL MOTORS COMPANY

18. Remove the steering gear nuts (1), washers (2) and bolts (3) from the steering gear (4). Discard the nuts and bolts.
19. Remove the electric belt drive rack and pinion steering gear (4) from the left side of the vehicle.
20. Transfer components as necessary.

Installation Procedure

Fig. 13: Steering Gear Nuts, Washers And Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Position the electric belt drive rack and pinion steering gear (4) on the drivetrain and front suspension frame through the left side of the vehicle.

CAUTION: Refer to Fastener Caution .

CAUTION: This vehicle is equipped with torque-to-yield or single use fasteners. Install a NEW torque-to-yield or single use fastener when installing this component. Failure to replace the torque-to-yield or single use fastener could cause damage to the vehicle or component.

NOTE: Start all bolts by hand before tightening.

2. Install the NEW steering gear bolts (3), washers (2) and NEW nuts (1) and tighten the bolts (3) to 110 N.m (81 lb ft) + 150 degrees.
3. Install the stabilizer shaft onto the drivetrain and front suspension frame. Refer to Stabilizer Shaft Replacement (GNA Standard Strut, GNB Performance Struts) .

4. Lower the vehicle until the gap between the drivetrain and front suspension frame and body is approximately 12 mm (0.5 in).
5. Install the exhaust front pipe. Refer to **Exhaust Front Pipe Replacement (LTG)** , **Exhaust Front Pipe Replacement (LUK)** .
6. Tighten the drivetrain and front suspension frame front bolts. Refer to **Drivetrain and Front Suspension Frame Replacement** .
7. Remove the jackstands from underneath the vehicle.
8. Install the through bolts for the front and rear transmission mounts. Refer to **Transmission Front Mount Replacement** , and **Transmission Rear Mount Bracket Replacement** .

NOTE: **Wiring harness routing is critical. When installing, route the wiring harness in the exact same location it was moved from during the removal procedure.**

9. Route the steering gear wiring harness in the position it was in before removal.
10. Tighten the steering gear wiring harness bracket bolts to 9 N.m (80 lb in).
11. Connect the electrical connector on the steering gear and connect the wiring harness clip on the steering gear housing.
12. Install the steering gear heat shield. Refer to **Steering Gear Heat Shield Replacement (NJ2)**, **Steering Gear Heat Shield Replacement (NJ1)**.
13. Connect the lower control arms to the steering knuckles. Refer to **Lower Control Arm Replacement (GNA Standard Strut)** , **Lower Control Arm Replacement (GNB Performance Struts)** .
14. Connect the stabilizer shaft links to the stabilizer shaft. Refer to **Stabilizer Shaft Link Replacement (GNA, GNB Performance Struts)** .
15. Connect the steering linkage outer tie rods to the steering knuckles. Refer to **Steering Linkage Outer Tie Rod Replacement**.
16. Remove the engine support fixture. Refer to **Engine Support Fixture** .
17. Install the front dash seal on the steering gear input shaft and connect the intermediate steering shaft to the steering gear. Refer to **Intermediate Steering Shaft Replacement** .
18. Program the power steering control module. Refer to **Power Steering Control Module Programming and Setup** .
19. Measure and adjust the front toe. Refer to **Wheel Alignment - Steering Wheel Angle and/or Front Toe Adjustment** .

ELECTRIC BELT DRIVE RACK AND PINION STEERING GEAR REPLACEMENT (AWD, LTG, M7U, NJ2)

Removal Procedure

CAUTION: Electrostatic discharge (ESD) can damage many solid-state electrical components. ESD susceptible components may or may not be labeled with the ESD symbol. Handle all electrical components carefully. Use the following precautions in order to avoid ESD

damage:

- Touch a metal ground point in order to remove your body's static charge before servicing any electronic component; especially after sliding across the vehicle seat.
- Do not touch exposed terminals. Terminals may connect to circuits susceptible the ESD damage.
- Do not allow tools to contact exposed terminals when servicing connectors.
- Do not remove components from their protective packaging until required to do so.
- Avoid the following actions unless required by the diagnostic procedure:
 - Jumpering or grounding of the components or connectors.
 - Connecting test equipment probes to components or connectors. Connect the ground lead first when using test probes.
- Ground the protective packaging of any component before opening. Do not rest solid-state components on metal workbenches, or on top of TVs, radios, or other electrical devices.

CAUTION: With wheels of the vehicle facing straight ahead, secure the steering wheel utilizing steering column anti-rotation pin, steering column lock, or a strap to prevent rotation. Locking of the steering column will prevent damage and a possible malfunction of the SIR system. The steering wheel must be secured in position before disconnecting the following components:

- The steering column
- The intermediate shaft(s)
- The steering gear

After disconnecting these components, do not rotate the steering wheel or move the front tires and wheels. Failure to follow this procedure may cause the SIR coil assembly to become un-centered and cause possible damage to the SIR coil. If you think the SIR coil has become un-centered, refer to your specific SIR coil's centering procedure to re-center SIR Coil.

1. Lock the steering column in the straight-ahead position.
2. Disconnect the intermediate steering shaft from the steering gear and remove the front dash seal from the steering gear input shaft. Refer to **Intermediate Steering Shaft Replacement** .
3. Install the engine support fixture. Refer to **Engine Support Fixture** .

4. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
5. Disconnect the steering linkage outer tie rods from the steering knuckles. Refer to **Steering Linkage Outer Tie Rod Replacement**.
6. Disconnect the stabilizer shaft links from the stabilizer shaft. Refer to **Stabilizer Shaft Link Replacement (GNA, GNB Performance Struts)** .
7. Disconnect the lower control arms from the steering knuckles. Refer to **Lower Control Arm Replacement (GNA)** , **Lower Control Arm Replacement (GNB Performance Struts)** .
8. Remove the steering gear heat shield. Refer to **Steering Gear Heat Shield Replacement (NJ2)**.
9. Disconnect the electrical connector on the steering gear and disconnect the wiring harness clip from the steering gear housing.

NOTE: **Wiring harness routing is critical. Note the exact routing of the steering gear wiring harness before repositioning it.**

10. Remove the wiring harness bracket bolts from the steering gear. Leave the bracket attached to the wiring harness and position it out of the way.
11. Remove the through bolts for the front and rear transmission mounts. Refer to **Transmission Front Mount Replacement** , and **Transmission Rear Mount Replacement (AWD)** , **Transmission Rear Mount Replacement (FWD)** .
12. Remove the propeller shaft. Refer to **Propeller Shaft Replacement** .
13. Remove the exhaust front pipe. Refer to **Exhaust Front Pipe Replacement (LUK)** , **Exhaust Front Pipe Replacement (LTG AWD)** .
14. Position adjustable jackstands underneath the left and right sides of the rear of the drivetrain and front suspension frame.
15. Lower the vehicle until the drivetrain and front suspension frame is resting lightly on the jackstands.

Fig. 14: Front Suspension Frame Rear Bolts, Reinforcements & Bolts
Courtesy of GENERAL MOTORS COMPANY

16. Remove the drivetrain and front suspension frame rear bolts (1), reinforcement bolts (2) and reinforcements (3).
17. Loosen the drivetrain and front suspension frame front bolts. Refer to **Drivetrain and Front Suspension Frame Replacement**.
18. Raise the vehicle while the drivetrain and front suspension frame rests on the jackstands. Do not allow the gap between the body and rear of the frame to exceed a maximum of 50 mm (2 in).
19. Finish removing the stabilizer shaft. Refer to **Stabilizer Shaft Replacement (GNA, GNB Performance Struts)**.

Fig. 15: Steering Gear Nuts, Washers And Bolts
Courtesy of GENERAL MOTORS COMPANY

20. Remove the steering gear nuts (1), washers (2) and bolts (3) from the steering gear (4). Discard the nuts and bolts.
21. Remove the electric belt drive rack and pinion steering gear (4) from the left side of the vehicle.
22. Transfer components as necessary.

Installation Procedure

Fig. 16: Steering Gear Nuts, Washers And Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Position the electric belt drive rack and pinion steering gear (4) on the drivetrain and front suspension frame through the left side of the vehicle.

CAUTION: Refer to Fastener Caution .

CAUTION: This vehicle is equipped with torque-to-yield or single use fasteners. Install a NEW torque-to-yield or single use fastener when installing this component. Failure to replace the torque-to-yield or single use fastener could cause damage to the vehicle or component.

NOTE: Start all bolts by hand before tightening.

2. Install the NEW steering gear bolts (3), washers (2) and NEW nuts (1) and tighten the bolts (3) to 110 N.m (81 lb ft) + 150 degrees.
3. Install the stabilizer shaft onto the drivetrain and front suspension frame. Refer to Stabilizer Shaft Replacement (GNA, GNB Performance Struts) .

4. Lower the vehicle until the gap between the drivetrain and front suspension frame and body is approximately 12 mm (0.5 in).

Fig. 17: Front Suspension Frame Rear Bolts, Reinforcements & Bolts
Courtesy of GENERAL MOTORS COMPANY

5. Install the drivetrain and front suspension frame reinforcements (3), reinforcement bolts (2) and rear bolts (1).
6. Tighten the drivetrain and front suspension frame rear bolts (1) to 160 N.m (118 lb ft).
7. Tighten the drivetrain and front suspension frame reinforcement bolts (2) to 60 N.m (44 lb ft) + 30 degrees.
8. Tighten the drivetrain and front suspension frame front bolts. Refer to **Drivetrain and Front Suspension Frame Replacement** .
9. Remove the jackstands from underneath the vehicle.
10. Install the exhaust front pipe. Refer to **Exhaust Front Pipe Replacement (LUK)** , **Exhaust Front Pipe Replacement (LTG AWD)** .
11. Install the propeller shaft. Refer to **Propeller Shaft Replacement** .
12. Install the through bolts for the front and rear transmission mounts. Refer to **Transmission Front Mount Replacement** , and **Transmission Rear Mount Replacement (AWD)** .

NOTE: **Wiring harness routing is critical. When installing, route the wiring harness in the exact same location it was moved from during the removal procedure.**

13. Route the steering gear wiring harness in the position it was in before removal.
14. Tighten the steering gear wiring harness bracket bolts to 9 N.m (80 lb in).
15. Connect the electrical connector on the steering gear and connect the wiring harness clip on the steering gear housing.
16. Install the steering gear heat shield. Refer to **Steering Gear Heat Shield Replacement (NJ2)**.
17. Connect the lower control arms to the steering knuckles. Refer to **Lower Control Arm Replacement (GNA)** , **Lower Control Arm Replacement (GNB Performance Struts)** .
18. Connect the stabilizer shaft links to the stabilizer shaft. Refer to **Stabilizer Shaft Link Replacement (GNA, GNB Performance Struts)** .
19. Connect the steering linkage outer tie rods to the steering knuckles. Refer to **Steering Linkage Outer Tie Rod Replacement**.
20. Remove the engine support fixture. Refer to **Engine Support Fixture** .
21. Install the front dash seal on the steering gear input shaft and connect the intermediate steering shaft to the steering gear. Refer to **Intermediate Steering Shaft Replacement** .
22. Program the power steering control module. Refer to **Power Steering Control Module Programming and Setup** .
23. Measure and adjust the front toe. Refer to **Wheel Alignment - Steering Wheel Angle and/or Front Toe Adjustment** .

ELECTRIC DUAL PINION RACK AND PINION STEERING GEAR REPLACEMENT (FWD, LUK, MHH, NJ1)

Removal Procedure

CAUTION: Electrostatic discharge (ESD) can damage many solid-state electrical components. ESD susceptible components may or may not be labeled with the ESD symbol. Handle all electrical components carefully. Use the following precautions in order to avoid ESD damage:

- Touch a metal ground point in order to remove your body's static charge before servicing any electronic component; especially after sliding across the vehicle seat.
- Do not touch exposed terminals. Terminals may connect to circuits susceptible the ESD damage.
- Do not allow tools to contact exposed terminals when servicing connectors.
- Do not remove components from their protective packaging until required to do so.

- **Avoid the following actions unless required by the diagnostic procedure:**
 - **Jumpering or grounding of the components or connectors.**
 - **Connecting test equipment probes to components or connectors. Connect the ground lead first when using test probes.**
- **Ground the protective packaging of any component before opening. Do not rest solid-state components on metal workbenches, or on top of TVs, radios, or other electrical devices.**

CAUTION: With wheels of the vehicle facing straight ahead, secure the steering wheel utilizing steering column anti-rotation pin, steering column lock, or a strap to prevent rotation. Locking of the steering column will prevent damage and a possible malfunction of the SIR system. The steering wheel must be secured in position before disconnecting the following components:

- **The steering column**
- **The intermediate shaft(s)**
- **The steering gear**

After disconnecting these components, do not rotate the steering wheel or move the front tires and wheels. Failure to follow this procedure may cause the SIR coil assembly to become un-centered and cause possible damage to the SIR coil. If you think the SIR coil has become un-centered, refer to your specific SIR coil's centering procedure to re-center SIR Coil.

1. Lock the steering column in the straight-ahead position.
2. Disconnect the intermediate steering shaft from the steering gear and remove the front dash seal from the steering gear input shaft. Refer to **Intermediate Steering Shaft Replacement** .
3. Install the engine support fixture. Refer to **Engine Support Fixture** .
4. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
5. Disconnect the steering linkage outer tie rods from the steering knuckles. Refer to **Steering Linkage Outer Tie Rod Replacement**.
6. Disconnect the stabilizer shaft links from the stabilizer shaft. Refer to **Stabilizer Shaft Link Replacement (GNA Standard Strut, GNB Performance Struts)** .
7. Disconnect the lower control arms from the steering knuckles. Refer to **Lower Control Arm Replacement (GNA Standard Strut)** , **Lower Control Arm Replacement (GNB Performance Struts)** .
8. Remove the steering gear heat shield. Refer to **Steering Gear Heat Shield Replacement (NJ1)**.
9. Disconnect the electrical connector on the steering gear and disconnect the wiring harness clip from the

steering gear housing.

NOTE: **Wiring harness routing is critical. Note the exact routing of the steering gear wiring harness before repositioning it.**

10. Remove the wiring harness bracket bolts from the steering gear. Leave the bracket attached to the wiring harness and position it out of the way.
11. Remove the through bolts for the front and rear transmission mounts. Refer to **Transmission Front Mount Replacement** , and **Transmission Rear Mount Replacement** .
12. Position adjustable jackstands underneath the left and right sides of the rear of the drivetrain and front suspension frame.
13. Lower the vehicle until the drivetrain and front suspension frame is resting lightly on the jackstands.
14. Remove the exhaust front pipe. Refer to **Exhaust Front Pipe Replacement (LTG)** , **Exhaust Front Pipe Replacement (LUK)** .
15. Loosen the drivetrain and front suspension frame front bolts. Refer to **Drivetrain and Front Suspension Frame Replacement** .
16. Raise the vehicle while the drivetrain and front suspension frame rests on the jackstands. Do not allow the gap between the body and rear of the frame to exceed a maximum of 50 mm (2 in).
17. Finish removing the stabilizer shaft. Refer to **Stabilizer Shaft Replacement (GNA Standard Strut, GNB Performance Struts)** .

Fig. 18: Power Steering Gear Components
Courtesy of GENERAL MOTORS COMPANY

18. Remove the steering gear nuts (1), washers (2) and bolts (3) from the steering gear (4). Discard the nuts and bolts.
19. Remove the electric dual pinion rack and pinion steering gear (4) from the left side of the vehicle.
20. Transfer components as necessary.

Installation Procedure

Fig. 19: Power Steering Gear Components
 Courtesy of GENERAL MOTORS COMPANY

1. Position the electric dual pinion rack and pinion steering gear (4) on the front suspension frame through the left side of the vehicle.

CAUTION: Refer to Fastener Caution .

CAUTION: This vehicle is equipped with torque-to-yield or single use fasteners. Install a NEW torque-to-yield or single use fastener when installing this component. Failure to replace the torque-to-yield or single use fastener could cause damage to the vehicle or component.

NOTE: Start all bolts by hand before tightening.

2. Install the NEW steering gear bolts (3), washers (2) and NEW nuts (1) and tighten the bolts (3) to 110 N.m (81 lb ft) + 150 degrees.
3. Install the stabilizer shaft onto the drivetrain and front suspension frame. Refer to Stabilizer Shaft Replacement (GNA Standard Strut, GNB Performance Struts) .

4. Lower the vehicle until the gap between the drivetrain and front suspension frame and body is approximately 12 mm (0.5 in).
5. Install the exhaust front pipe. Refer to **Exhaust Front Pipe Replacement (LTG)** , **Exhaust Front Pipe Replacement (LUK)** .
6. Tighten the drivetrain and front suspension frame front bolts. Refer to **Drivetrain and Front Suspension Frame Replacement** .
7. Remove the jackstands from underneath the vehicle.
8. Install the through bolts for the front and rear transmission mounts. Refer to **Transmission Front Mount Replacement** , and **Transmission Rear Mount Replacement** .

NOTE: **Wiring harness routing is critical. When installing, route the wiring harness in the exact same location it was moved from during the removal procedure.**

9. Route the steering gear wiring harness in the position it was in before removal.
10. Tighten the steering gear wiring harness bracket bolts to 9 N.m (80 lb in).
11. Connect the electrical connector on the steering gear and connect the wiring harness clip on the steering gear housing.
12. Install the steering gear heat shield. Refer to **Steering Gear Heat Shield Replacement (NJ1)**.
13. Connect the lower control arms to the steering knuckles. Refer to **Lower Control Arm Replacement (GNA Standard Strut)** , **Lower Control Arm Replacement (GNB Performance Struts)** .
14. Connect the stabilizer shaft links to the stabilizer shaft. Refer to **Stabilizer Shaft Link Replacement (GNA Standard Strut, GNB Performance Struts)** .
15. Connect the steering linkage outer tie rods to the steering knuckles. Refer to **Steering Linkage Outer Tie Rod Replacement**.
16. Remove the engine support fixture. Refer to **Engine Support Fixture** .
17. Install the front dash seal on the steering gear input shaft and connect the intermediate steering shaft to the steering gear. Refer to **Intermediate Steering Shaft Replacement** .
18. Program the power steering control module. Refer to **Power Steering Control Module Programming and Setup** .
19. Measure and adjust the front toe. Refer to **Wheel Alignment - Steering Wheel Angle and/or Front Toe Adjustment** .

ELECTRIC DUAL PINION RACK AND PINION STEERING GEAR REPLACEMENT (AWD, LTG, M7U, NJ1)

Removal Procedure

CAUTION: Electrostatic discharge (ESD) can damage many solid-state electrical components. ESD susceptible components may or may not be labeled with the ESD symbol. Handle all electrical components carefully. Use the following precautions in order to avoid ESD damage:

- Touch a metal ground point in order to remove your body's static charge before servicing any electronic component; especially after sliding across the vehicle seat.
- Do not touch exposed terminals. Terminals may connect to circuits susceptible the ESD damage.
- Do not allow tools to contact exposed terminals when servicing connectors.
- Do not remove components from their protective packaging until required to do so.
- Avoid the following actions unless required by the diagnostic procedure:
 - Jumpering or grounding of the components or connectors.
 - Connecting test equipment probes to components or connectors. Connect the ground lead first when using test probes.
- Ground the protective packaging of any component before opening. Do not rest solid-state components on metal workbenches, or on top of TVs, radios, or other electrical devices.

CAUTION: With wheels of the vehicle facing straight ahead, secure the steering wheel utilizing steering column anti-rotation pin, steering column lock, or a strap to prevent rotation. Locking of the steering column will prevent damage and a possible malfunction of the SIR system. The steering wheel must be secured in position before disconnecting the following components:

- The steering column
- The intermediate shaft(s)
- The steering gear

After disconnecting these components, do not rotate the steering wheel or move the front tires and wheels. Failure to follow this procedure may cause the SIR coil assembly to become un-centered and cause possible damage to the SIR coil. If you think the SIR coil has become un-centered, refer to your specific SIR coil's centering procedure to re-center SIR Coil.

1. Lock the steering column in the straight-ahead position.
2. Disconnect the intermediate steering shaft from the steering gear and remove the front dash seal from the steering gear input shaft. Refer to **Intermediate Steering Shaft Replacement** .
3. Install the engine support fixture. Refer to **Engine Support Fixture** .
4. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .

5. Disconnect the steering linkage outer tie rods from the steering knuckles. Refer to **Steering Linkage Outer Tie Rod Replacement**.
6. Disconnect the stabilizer shaft links from the stabilizer shaft. Refer to **Stabilizer Shaft Link Replacement (GNA Standard Strut, GNB Performance Struts)** .
7. Disconnect the lower control arms from the steering knuckles. Refer to **Lower Control Arm Replacement (GNA Standard Strut)** , **Lower Control Arm Replacement (GNB Performance Struts)** .
8. Remove the steering gear heat shield. Refer to **Steering Gear Heat Shield Replacement (NJ2)**, **Steering Gear Heat Shield Replacement (NJ1)**.
9. Disconnect the electrical connector on the steering gear and disconnect the wiring harness clip from the steering gear housing.

NOTE: **Wiring harness routing is critical. Note the exact routing of the steering gear wiring harness before repositioning it.**

10. Remove the wiring harness bracket bolts from the steering gear. Leave the bracket attached to the wiring harness and position it out of the way.
11. Remove the through bolts for the front and rear transmission mounts. Refer to **Transmission Front Mount Replacement** , and **Transmission Rear Mount Replacement (AWD)** .
12. Position adjustable jackstands underneath the left and right sides of the rear of the drivetrain and front suspension frame.
13. Lower the vehicle until the drivetrain and front suspension frame is resting lightly on the jackstands.
14. Remove the exhaust front pipe. Refer to **Exhaust Front Pipe Replacement (LUK)** , **Exhaust Front Pipe Replacement (LTG AWD)** .
15. Loosen the drivetrain and front suspension frame front bolts. Refer to **Drivetrain and Front Suspension Frame Replacement** .
16. Raise the vehicle while the drivetrain and front suspension frame rests on the jackstands. Do not allow the gap between the body and rear of the frame to exceed a maximum of 50 mm (2 in).
17. Finish removing the stabilizer shaft. Refer to **Stabilizer Shaft Replacement (GNA Standard Strut, GNB Performance Struts)** .

Fig. 20: Power Steering Gear Components
Courtesy of GENERAL MOTORS COMPANY

18. Remove the steering gear nuts (1), washers (2) and bolts (3) from the steering gear (4). Discard the nuts and bolts.
19. Remove the steering gear (4) from the left side of the vehicle.
20. Transfer components as necessary.

Installation Procedure

Fig. 21: Power Steering Gear Components
 Courtesy of GENERAL MOTORS COMPANY

1. Position the steering gear (4) on the front suspension frame through the left side of the vehicle.

CAUTION: Refer to Fastener Caution .

CAUTION: This vehicle is equipped with torque-to-yield or single use fasteners. Install a NEW torque-to-yield or single use fastener when installing this component. Failure to replace the torque-to-yield or single use fastener could cause damage to the vehicle or component.

NOTE: Start all bolts by hand before tightening.

2. Install the NEW steering gear bolts (3), washers (2) and NEW nuts (1) and tighten the bolts (3) to 110 N.m (81 lb ft) + 150 degrees.
3. Install the stabilizer shaft onto the drivetrain and front suspension frame. Refer to Stabilizer Shaft Replacement (GNA Standard Strut, GNB Performance Struts) .
4. Lower the vehicle until the gap between the drivetrain and front suspension frame and body is

approximately 12 mm (0.5 in).

5. Install the exhaust front pipe. Refer to **Exhaust Front Pipe Replacement (LUK)** , **Exhaust Front Pipe Replacement (LTG AWD)** .
6. Tighten the drivetrain and front suspension frame front bolts. Refer to **Drivetrain and Front Suspension Frame Replacement** .
7. Remove the jackstands from underneath the vehicle.
8. Install the through bolts for the front and rear transmission mounts. Refer to **Transmission Front Mount Replacement** , and **Transmission Rear Mount Replacement (AWD)** .

NOTE: **Wiring harness routing is critical. When installing, route the wiring harness in the exact same location it was moved from during the removal procedure.**

9. Route the steering gear wiring harness in the position it was in before removal.
10. Tighten the steering gear wiring harness bracket bolts to 9 N.m (80 lb in).
11. Connect the electrical connector on the steering gear and connect the wiring harness clip on the steering gear housing.
12. Install the steering gear heat shield. Refer to **Steering Gear Heat Shield Replacement (NJ1)**.
13. Connect the lower control arms to the steering knuckles. Refer to **Lower Control Arm Replacement (GNA Standard Strut)** , **Lower Control Arm Replacement (GNB Performance Struts)** .
14. Connect the stabilizer shaft links to the stabilizer shaft. Refer to **Stabilizer Shaft Link Replacement (GNA Standard Strut, GNB Performance Struts)** .
15. Connect the steering linkage outer tie rods to the steering knuckles. Refer to **Steering Linkage Outer Tie Rod Replacement**.
16. Remove the engine support fixture. Refer to **Engine Support Fixture** .
17. Install the front dash seal on the steering gear input shaft and connect the intermediate steering shaft to the steering gear. Refer to **Intermediate Steering Shaft Replacement** .
18. Program the power steering control module. Refer to **Power Steering Control Module Programming and Setup** .
19. Measure and adjust the front toe. Refer to **Wheel Alignment - Steering Wheel Angle and/or Front Toe Adjustment** .

STEERING LINKAGE INNER TIE ROD REPLACEMENT (NJ2)

Fig. 22: Steering Linkage Inner Tie Rod (NJ2)

Courtesy of GENERAL MOTORS COMPANY

Steering Linkage Inner Tie Rod Replacement (NJ2)

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none"> 1. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Remove the steering gear boot. Refer to <u>Steering Gear Boot Replacement (NJ2)</u>. 3. After removing the steering gear boot, inspect the steering linkage inner tie rod for evidence of corrosion or contamination. If none is evident, continue with the repair. If corrosion or contamination is evident, replace the steering gear. Refer to <u>Electric Belt Drive Rack and Pinion Steering Gear Replacement (FWD, LTG, MR6, NJ2)</u>, <u>Electric Belt Drive Rack and Pinion Steering Gear Replacement (AWD, LTG, M7U, NJ2)</u>. 	
	Steering Linkage Inner Tie Rod CAUTION: Refer to <u>Component Fastener Tightening Caution</u> . NOTE: The appropriate flats on the steering gear rack are only present on the driver side of the vehicle. If the passenger side steering linkage inner tie rod must be replaced then the steering gear boot must be removed from the driver side as well in order to hold the steering gear rack from rotating. Replacing the passenger side steering linkage inner tie rod will require two people, one to hold the steering gear rack and one to install the

steering linkage inner tie rod.

Procedure

1

1. Place a wrench on the flats of the steering linkage inner tie rod housing.
2. Rotate the steering linkage inner tie rod housing counterclockwise to remove the steering linkage inner tie rod from the steering gear rack.
3. Rotate the steering linkage inner tie rod housing clockwise to install the steering linkage inner tie rod to the steering gear rack. Use the **CH-6321** wrench and a torque wrench to tighten the steering linkage inner tie rod to specification.
4. Measure and adjust the front toe. Refer to Wheel Alignment - Steering Wheel Angle and/or Front Toe Adjustment .

Tighten

100 N.m (74 lb ft)

Special Tools

CH-6321 Tie Rod Wrench

For equivalent regional tools, refer to Special Tools.

STEERING LINKAGE INNER TIE ROD REPLACEMENT (NJ1)

Refer to <u>Wheel Alignment - Steering Wheel Angle and/or Front Toe Adjustment</u> . <p>NOTE: A 2.5 mm shim is used for vehicles with wheels up to 18 inches and a 5.6 mm shim is used for vehicles with 19 inch and 20 inch wheels.</p> <p>Tighten 100 N.m (74 lb ft)</p> <p>Special Tools CH-6321 Tie Rod Wrench For equivalent regional tools, refer to <u>Special Tools</u>.</p>

STEERING GEAR DRIVE COUPLING REPLACEMENT (NJ1)

Fig. 24: Steering Gear Drive Coupling
 Courtesy of GENERAL MOTORS COMPANY

Steering Gear Drive Coupling Replacement (NJ1 Only)

Callout	Component Name
Preliminary Procedure	
Remove the power steering assist motor. Refer to <u>Power Steering Assist Motor Replacement (NJ1)</u> .	
1	Steering Gear Drive Coupling NOTE: The steering gear drive coupling connects the power steering assist motor to the steering gear.

POWER STEERING ASSIST MOTOR REPLACEMENT (NJ1)

Fig. 25: Power Steering Assist Motor & Bolts (NJ1)
 Courtesy of GENERAL MOTORS COMPANY

Power Steering Assist Motor Replacement (NJ1)

Callout	Component Name
<p>CAUTION: Electrostatic discharge (ESD) can damage many solid-state electrical components. ESD susceptible components may or may not be labeled with the ESD symbol. Handle all electrical components carefully. Use the following precautions in order to avoid ESD damage:</p> <ul style="list-style-type: none"> • Touch a metal ground point in order to remove your body's static charge before servicing any electronic component; especially after sliding across the vehicle seat. • Do not touch exposed terminals. Terminals may connect to circuits susceptible the ESD damage. • Do not allow tools to contact exposed terminals when servicing connectors. • Do not remove components from their protective packaging until required to do so. • Avoid the following actions unless required by the diagnostic procedure: <ul style="list-style-type: none"> ○ Jumpering or grounding of the components or connectors. ○ Connecting test equipment probes to components or connectors. Connect the ground lead first when using test probes. • Ground the protective packaging of any component before opening. Do not rest solid-state components on metal workbenches, or on top of TVs, radios, or other electrical devices. 	
Preliminary Procedures	

1. Perform the strategy based diagnosis. Performing the strategy based diagnostics includes reviewing related bulletins, preliminary information and diagnostics. Refer to **Strategy Based Diagnosis** .
2. Capture the key cycle count from the old steering gear control module. If the key cycle count from the old module is not captured, it will not be possible to flash the new module. Refer to **Power Steering Control Module Programming and Setup** .
3. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
4. Remove the steering gear. Refer to **Electric Dual Pinion Rack and Pinion Steering Gear Replacement (FWD, LUK, MHH, NJ1)**, **Electric Dual Pinion Rack and Pinion Steering Gear Replacement (AWD, LTG, M7U, NJ1)**.

1

Power Steering Assist Motor Bolt (Qty: 3)

WARNING:

This component is equipped with torque-to-yield fasteners. Install a NEW torque-to-yield fastener when installing this component. Failure to replace the torque-to-yield fastener could cause bodily injury and damage to the vehicle or component.

CAUTION:

Refer to Fastener Caution .

Procedure

1. Remove the power steering assist motor bolts. DISCARD the bolts.
2. Install the NEW power steering assist motor bolts.

Tighten

8 (71 lb in)

2

Power Steering Assist Motor

Procedure

1. Remove the O-ring from the steering gear housing. DISCARD the O-ring.
2. Inspect the assist motor shaft and inside of the steering gear housing for signs of water intrusion or corrosion. If no signs of water intrusion or corrosion are present proceed to the next step. If signs of water intrusion or corrosion are present then replace the steering gear. Refer to **Electric Dual Pinion Rack and Pinion Steering Gear Replacement (FWD, LUK, MHH, NJ1)**, **Electric Dual Pinion Rack and Pinion Steering Gear Replacement (AWD, LTG, M7U, NJ1)**.
3. Install a NEW O-ring around the steering gear housing.
4. Install the steering gear drive coupling to the assist motor armature.
5. Align the steering gear drive coupling on the assist motor armature to the steering gear.
6. Align the NEW power steering assist motor bolts to the steering gear while pressing the assist motor over the steering gear housing O-ring.

7. After installation is complete, transfer the key cycle count from the OLD steering gear control module to the NEW steering gear control module. Refer to **Power Steering Control Module Programming and Setup** .

NOTE:

Inspection of the steering gear assist motor shaft and the inside of the steering gear housing is required to ensure there are no signs of water intrusion or corrosion which may cause premature motor failure. If signs of water intrusion or corrosion are present the steering gear must be replaced.

POWER STEERING ASSIST MOTOR REPLACEMENT (NJ2)

Special Tools

GE-50576-A Belt Tension Sonic Gauge

For equivalent regional tools, refer to **Special Tools** .

Removal Procedure

CAUTION: Electrostatic discharge (ESD) can damage many solid-state electrical components. ESD susceptible components may or may not be labeled with the ESD symbol. Handle all electrical components carefully. Use the following precautions in order to avoid ESD damage:

- Touch a metal ground point in order to remove your body's static charge before servicing any electronic component; especially after sliding across the vehicle seat.
- Do not touch exposed terminals. Terminals may connect to circuits susceptible the ESD damage.
- Do not allow tools to contact exposed terminals when servicing connectors.
- Do not remove components from their protective packaging until required to do so.
- Avoid the following actions unless required by the diagnostic procedure:
 - Jumpering or grounding of the components or connectors.
 - Connecting test equipment probes to components or connectors. Connect the ground lead first when using test probes.
- Ground the protective packaging of any component before opening. Do not rest solid-state components on metal workbenches, or on top of TVs, radios, or other electrical devices.

CAUTION: During removal and installation, the electric belt drive rack and pinion steering gear is extremely susceptible to damage. Dropping or prying on the electric belt drive motor controller module and/or electric belt drive rack and pinion steering gear may cause damage. If damage occurs, the electric belt drive motor controller module and/or electric belt drive rack and pinion steering gear will need to be replaced.

CAUTION: Care must be taken during removal and installation of the electric belt drive rack and pinion steering gear to not hit or break the electric belt drive motor controller module or module harness connectors. If the module or connectors are damaged, the electric belt drive motor controller module will need to be replaced.

1. Remove the electric belt drive rack and pinion steering gear from the vehicle. Refer to **Electric Belt Drive Rack and Pinion Steering Gear Replacement (FWD, LTG, MR6, NJ2)**, **Electric Belt Drive Rack and Pinion Steering Gear Replacement (AWD, LTG, M7U, NJ2)**.

NOTE: The torque sensor wiring harness is not repairable. Do not attempt to repair the harness under any circumstances. If the harness is damaged then the steering gear must be replaced.

NOTE: When installing the steering gear into a vise and clamping on the barrel of the housing, be careful not to pinch the torque sensor wire harness. If available, use soft jaw vise.

2. Place the steering gear in a vise.

NOTE: After the steering gear has been centered, do not allow the gear to move off the center position.

3. Rotate the input shaft to center the rack in its travel. Measure the outer tie rod to housing to verify the center of travel.
4. Remove the RH inner tie rod. Refer to **Steering Linkage Inner Tie Rod Replacement (NJ2)**.

Fig. 26: Torque Sensor Wire Harness Connecto
Courtesy of GENERAL MOTORS COMPANY

5. Clean any dirt from the torque sensor wire harness connector (1) area and disconnect the connector from the power steering assist motor controller module.

Fig. 27: Steering Gear

Courtesy of GENERAL MOTORS COMPANY

6. Using the appropriate cleaning materials, remove any dirt and debris from the steering gear where the housing will be separated (1) and where the power steering assist motor assembly connects to the steering gear (2). This will ensure that no contaminants enter the steering gear when the housing is separated.

Fig. 28: Steering Gear Housing Bolts
Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not loosen the belt drive motor controller module pivot bolt at this time.
If bolt is loosened you will not be able to record the belt tension.

7. Remove the steering gear housing bolts (1).

Fig. 29: Outboard Steering Gear Housing
Courtesy of GENERAL MOTORS COMPANY

NOTE: Carefully slide the boot down the inner tie rod, so that the boot does not collapse and roll up.

8. Separate the steering gear housing by using a rubber mallet to tap on the outboard steering gear housing (1) to release the dowel pins and remove the outboard steering gear housing from the steering gear housing.
9. Inspect inside the steering gear housing for contamination and the belt for damage. If there is contamination in the steering gear housing or the belt is damaged, replace the steering gear. Refer to **Electric Belt Drive Rack and Pinion Steering Gear Replacement (FWD, LTG, MR6, NJ2)**, **Electric Belt Drive Rack and Pinion Steering Gear Replacement (AWD, LTG, M7U, NJ2)**.

Fig. 30: Power Steering Assist Motor Assembly Pivot Bolt
Courtesy of GENERAL MOTORS COMPANY

10. Remove the power steering assist motor assembly pivot bolt (1).

Fig. 31: Power Steering Assist Motor
Courtesy of GENERAL MOTORS COMPANY

11. Rotate the power steering assist motor assembly (1) to remove the belt tension.
12. Pull the power steering assist motor assembly (1) toward the input shaft until it is released from the steering gear housing to release the belt from the pulley and remove the power steering assist motor assembly.
13. Remove the belt from the steering gear and discard.
14. Install a rag over the large rack pulley to prevent dirt and debris from falling into the steering gear housing.

Installation Procedure

1. Use a clean shop rag to clean the power steering assist motor assembly mating surface on the steering gear housing so it is free of old grease or loose particles

Fig. 32: Power Steering Assist Motor And O Ring
Courtesy of GENERAL MOTORS COMPANY

2. Install the new o-ring seal (1) to the power steering assist motor assembly (2).
3. Add a light film of lithium grease around the nose of the power steering assist motor assembly.
4. Install the NEW belt to the steering gear housing large pulley.

Fig. 33: Power Steering Assist Motor
Courtesy of GENERAL MOTORS COMPANY

NOTE: Ensure that care is taken not to pinch or roll the o-ring while installing power steering assist motor assembly to gear housing.

NOTE: Before adding tension to the belt, ensure that the belt is centered on the large pulley.

5. While being careful not to allow the belt to come into contact with the grease inside of the steering gear housing, install the power steering assist motor assembly (1) to the steering gear housing and place the belt on the power steering assist motor assembly pulley.
6. Rotate the power steering assist motor assembly (1) clockwise in the steering gear housing, while making sure the screw holes and slotted holes are aligned properly.

Fig. 34: Power Steering Assist Motor Assembly Pivot Bolt
Courtesy of GENERAL MOTORS COMPANY

7. Install the NEW belt pivot bolt (1) and hand tighten, ensuring that the electric power steering motor control module can still rotate.
8. Install wrench to the steering gear input shaft and rotate input shaft 90 degrees in both directions to seat belt. Ensure that the steering gear input shaft is returned to the center position.

NOTE: Care should be taken clamping on the power steering assist motor assembly so as not to damage the power steering assist motor assembly cover or connector headers.

9. Install a suitable clamp or add 5 washers to the lower bolt so the power steering assist motor assembly can be drawn into the gear housing. This will ensure that the power steering assist motor assembly is flush with the steering gear steering gear housing.

Fig. 35: Belt Tension Sonic Gauge
Courtesy of GENERAL MOTORS COMPANY

10. Tension the belt in the following manner:
 1. Install the **GE-50576-A** gauge (1) on the steering gear housing and position the microphone 1/4 inch away from the edge of the belt.
 2. Using an allen wrench or your finger, strum the belt in the center between the two pulleys and record the measurement. Perform this step 3 times to get an average HZ reading.
 3. If the average reading is at 300 Hz to 330 Hz, continue to next step. If reading is below or above the allowable specification, rotate the power steering assist motor assembly slightly (clockwise to tighten and counter clockwise to loosen) and take another set of readings. Repeat this step until belt is tightened to the specified range and then tighten pivot bolt.
11. Tighten the power steering assist motor assembly pivot bolt to 22 (16 lb ft) and recheck belt tension using **GE-50576-A** gauge. If the reading is not 300 Hz - 330 Hz, loosen the power steering assist motor assembly pivot bolt and readjust the belt tension. Refer to the belt tension steps above. If within range continue to next step.
12. Remove the clamp or bolt and washers holding the power steering assist motor assembly to the steering gear housing.
13. With a clean rag, clean the steering gear housing mating surfaces between the pinion and outboard housings so they are free of loose particles.

14. Remove the rag that you installed to cover the large rack pulley and do not allow any loose particles to fall into the gear housing.

Fig. 36: Outboard Steering Gear Housing Seal
Courtesy of GENERAL MOTORS COMPANY

15. Inspect the outboard steering gear housing seal (1) for damage. If damaged replace the seal.
16. Ensure that the steering gear housing seal is in position and that both the dowel pins (2) are secure.

Fig. 37: Steering Gear Housing

Courtesy of GENERAL MOTORS COMPANY

17. Install the steering gear housing (1) to the steering gear assembly.

Fig. 38: Steering Gear Housing Bolts
Courtesy of GENERAL MOTORS COMPANY

18. Install the NEW steering gear housing bolts (1) and hand tighten.

Fig. 39: Steering Gear Housing Bolt Tightening Sequence
Courtesy of GENERAL MOTORS COMPANY

19. Tighten the steering gear housing fasteners in the following sequence:
 1. Tighten M6 bolts (1) to 10 (7 lb ft).
 2. Tighten M8 bolts (2) to 22 (16 lb ft).

Fig. 40: Torque Sensor Wire Harness Connecto
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Ensure the torque sensor wiring harness is fully connected and seated to the electric power steering motor controller module. If the harness connector is not fully engaged, damage to the module will occur when the key is turned on and replacement of the module will be necessary.

NOTE: The torque sensor wiring harness is not repairable. Do not attempt to repair the harness under any circumstances. If the harness is damaged then the steering gear must be replaced.

20. Install the torque sensor wire connector (1) to the power steering assist motor controller module. Ensure the sensor wire connector lock is engaged.
21. Install the RH inner tie rod. Refer to **Steering Linkage Inner Tie Rod Replacement (NJ2)**.
22. Remove the belt drive rack and pinion steering gear from vise.

CAUTION: During removal and installation, the electric belt drive rack and pinion steering gear is extremely susceptible to damage. Dropping or

prying on the electric belt drive motor controller module and/or electric belt drive rack and pinion steering gear may cause damage. If damage occurs, the electric belt drive motor controller module and/or electric belt drive rack and pinion steering gear will need to be replaced.

CAUTION: Care must be taken during removal and installation of the electric belt drive rack and pinion steering gear to not hit or break the electric belt drive motor controller module or module harness connectors. If the module or connectors are damaged, the electric belt drive motor controller module will need to be replaced.

23. Install the steering gear to the vehicle. Refer to Electric Belt Drive Rack and Pinion Steering Gear Replacement (FWD, LTG, MR6, NJ2), Electric Belt Drive Rack and Pinion Steering Gear Replacement (AWD, LTG, M7U, NJ2).
24. Perform the power steering control module setup procedure. Refer to Power Steering Control Module Programming and Setup .

POWER STEERING CONTROL MODULE CALIBRATION (NJ1)

Steering Angle Sensor Centering and Software Endstop Learning

WARNING: An inaccurate or not centered steering angle sensor could limit the operation of the electric power steering (EPS) and result in personal injury.

Centering of the steering angle sensor and software endstop learning might be required after certain service procedures are performed. Some of these procedures are as follows:

- Steering angle sensor replacement
- Steering gear replacement
- Power steering assist motor replacement
- Steering column replacement
- Steering linkage inner tie rod replacement
- Steering linkage outer tie rod replacement

NOTE: It is necessary to perform the steering angle sensor centering BEFORE the software endstop learning.

Steering Angle Sensor Centering

For electronic power steering equipped vehicles WITH electronic stability control program and EXTERNAL Steering Angle Sensor, refer to Steering Angle Sensor Centering .

The centering procedure of the internal steering angle sensor (w/o electronic stability program) can be

completed with the following steps:

Conditions: Front axle measured and set, engine running, vehicle speed 0 km/h (0 MPH), internal steering angle sensor is activated.

1. Using the steering wheel, align the front wheels in the center forward position.
2. Using a scan tool, perform the Configuration/Reset Functions, Steering Wheel Angle Sensor Centering procedure.
3. Steer from the center position slowly 90° to the left.
4. Steer slowly back to the center position and then slowly 90° to the right.
5. Steer slowly back to the center position.
6. Perform the steering movements again.
7. Centering procedure is completed.

Software Endstop Learning

The software endstop learning procedure can be completed with the following steps:

Conditions: Front axle measured and set, vehicle speed 0 km/h (0 MPH), internal steering angle sensor is calibrated or external steering angle sensor sends a valid CAN signal.

1. Using a scan tool, perform the Configuration/Reset Functions, Power Steering Softstops Reset procedure and follow the on-screen instructions.
2. Using a scan tool, perform the Configuration/Reset Functions, Power Steering Softstops Learn procedure and follow the on-screen instructions.
3. Software endstop learning procedure is completed.

DESCRIPTION AND OPERATION

POWER STEERING SYSTEM DESCRIPTION AND OPERATION (HYDRAULIC POWER STEERING)

The hydraulic power steering pump is a constant displacement vane-type pump that provides hydraulic pressure and flow for the power steering gear. The hydraulic power steering pumps are either belt-driven or direct-drive, cam-driven.

The power steering fluid reservoir holds the power steering fluid and may be integral with the power steering pump or remotely located. The following locations are typical locations for the remote reservoir:

- Mounted to the front of the dash panel
- Mounted to the inner fender
- Mounted to a bracket on the engine

The 2 basic types of power steering gears are listed below:

- A recirculating ball system
- A rack and pinion system

In the recirculating ball system, a worm gear converts steering wheel movement to movement of a sector shaft. A pitman arm attached to the bottom of the sector shaft actually moves one tie rod and an intermediate rod move the other tie rod.

In the rack and pinion system, the rack and the pinion are the 2 components that convert steering wheel rotation to lateral movement. The steering shaft is attached to the pinion in the steering gear. The pinion rotates with the steering wheel. Gear teeth on the pinion mesh with the gear teeth on the rack. The rotating pinion moves the rack from side to side. The lateral action of the rack pushes and pulls the tie rods in order to change the direction of the vehicle's front wheels.

The power steering pressure hose connects the power steering pump union fitting to the power steering gear and allows pressurized power steering fluid to flow from the pump to the gear.

The power steering return hose returns fluid from the power steering gear back to the power steering fluid reservoir. The power steering return line may contain an integral fin-type or line-type power steering fluid cooler.

In a typical power steering system, a pump generates hydraulic pressure, causing fluid to flow, via the pressure hose, to the steering gear valve assembly. The steering gear valve assembly regulates the incoming fluid to the right and left chambers in order to assist in right and left turns.

Turning the steering wheel activates the valve assembly, which applies greater fluid pressure and flow to one side of the steering gear piston, and lower pressure and flow to the other side of the piston. The pressure assists the movement of the gear piston. Tie rods transfer this force to the front wheels, which turn the vehicle right or left.

POWER STEERING SYSTEM DESCRIPTION AND OPERATION (ELECTRONIC POWER STEERING)

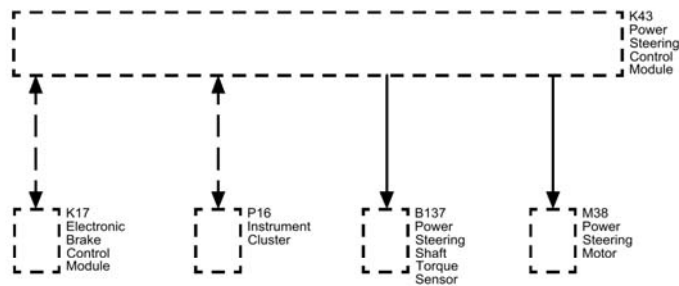

Fig. 41: Power Steering System Diagram

Courtesy of GENERAL MOTORS COMPANY

The power steering system consists of the following components:

- The power steering control module
- The power steering motor
- The power steering motor rotational sensor
- The torque sensor
- The steering gear (rack and dual pinion)

The rack and dual pinion electric power steering system reduces the amount of effort needed to steer the vehicle utilizing the power steering control module to control the power steering motor to maneuver the steering gear. The power steering control module also uses a combination of the torque sensor, motor rotational sensor, battery voltage circuit and GMLAN serial data circuit to perform the system functions. The power steering control module monitors vehicle speed and engine speed from the engine control module via the GMLAN serial data circuit to determine the amount of steering assist needed to steer the vehicle. At low speeds more assist is provided for easy turning during parking maneuvers. At higher speeds less assist is provided for improved road feel and directional stability.

The power steering control module uses a combination of the torque sensor, motor rotational sensor, vehicle speed, and calculated system temperature inputs to determine the amount of assist needed. The power steering control module continuously monitors the digital torque sensor's torque and index current signals. As the steering wheel is turned and torsional twist is applied to the steering shaft, the steering input and output shafts are monitored via the torque signal circuit and then processed by the power steering control module to calculate

the steering torque. The voltage signals of the motor position sensor and the digital torque sensor's index current signal are both processed by the power steering control module to detect and calculate the steering wheel angle.

The power steering control module responds to the change in the digital torque sensor signals as well as the motor rotational sensor's voltage signals by commanding current to the power steering motor. The power steering control module controls the pulse width modulated motor drive circuit to drive the 3-phase motor. The power steering control module and motor assembly is attached to the base of the steering gear housing and assists the steering gear pinion to maneuver the rack from left to right according to turning the steering wheel.

The power steering control module has the ability to calculate an internal system temperature to protect the power steering system from damage caused by high temperature. To reduce a high system temperature, the power steering control module will reduce the amount of current commanded to the power steering motor, which reduces the amount of steering assist. The power steering control module has the ability to detect malfunctions within the electric power steering system. Any malfunction detected that disables steering assist will cause the SERVICE POWER STEERING message to be displayed on the driver information center.

REPAIR INSTRUCTIONS

AUDIO AMPLIFIER PROGRAMMING AND SETUP

NOTE:

- DO NOT program a control module unless directed to by a service procedure or a service bulletin. If the ECU is not properly configured with the correct calibration software, the ECU will not control all of the vehicle features properly.
- Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or ECU damage may occur.
- Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. Install the EL-49642 SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. DO NOT connect a battery charger.
- Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, etc.
- During the programming procedure, follow the SPS prompts for the correct ignition switch position.

- **Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.**

Reference Information

Special Tools

EL-49642 SPS Programming Support Tool

For equivalent regional tools, refer to **Special Tools**.

Replace and Program Control Module or Reprogram Control Module

To program a replacement or an existing control module, perform the following procedure:

1. Install the **EL-49642** SPS Programming Support Tool.
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select T3 Audio Amplifier - Programming and follow the on-screen instructions.
4. At the end of programming, choose the "Clear DTCs" function on the SPS screen.

Unsuccessful Programming Recovery

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. Ignition ON. Ensure the control module, DLC and programming tool connections are secure and the SPS software is up to date.
2. Verify the control module can be reprogrammed.
 - **If the control module cannot be reprogrammed**
 1. Ignition OFF for one minute, ignition ON.
 2. Verify the control module can be reprogrammed.
 - If the control module cannot be reprogrammed, replace the control module.
 - If the control module can be reprogrammed.
 3. All OK.
 - **If the control module can be reprogrammed**
3. All OK.

BATTERY ENERGY CONTROL MODULE PROGRAMMING AND SETUP

NOTE:

- **DO NOT** program a control module unless directed to by a service procedure or a service bulletin. If the ECU is not properly configured with the correct calibration software, the ECU will not control all of the vehicle features properly.

- **Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or ECU damage may occur.**
- **Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. Install the EL-49642 SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. DO NOT connect a battery charger.**
- **Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.**
- **During the programming procedure, follow the SPS prompts for the correct ignition switch position.**
- **Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.**

Diagnostic Aids

Replace and Program ECU or Reprogram ECU

To program a replacement or an existing ECU, perform the following procedure:

1. Install the **EL-49642** SPS programming support tool.
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select Battery Energy Control Module - Programming and follow the on-screen instructions.
4. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.

Unsuccessful Programming Recovery

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. **DO NOT** turn the ignition OFF. Ensure that all ECU, DLC and programming tool connections are secure and the TIS terminal operating software is up to date.
2. Attempt to reprogram the ECU.
3. If the ECU can still not be programmed, turn the ignition OFF for at least one minute.
4. Turn the ignition ON and attempt to reprogram the ECU. The ECU should program.
 - If the ECU still cannot be programmed, replace the ECU.

BODY CONTROL MODULE PROGRAMMING AND SETUP

NOTE:

- **DO NOT** program a control module unless directed to by a service

procedure or a service bulletin. If the control module is not properly configured with the correct calibration software, the control module will not control all of the vehicle features properly.

- Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or control module damage may occur.
- Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. When required install the EL-49642 SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. DO NOT connect a battery charger.
- Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.
- During the programming procedure, follow the SPS prompts for the correct ignition switch position.
- Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.

Reference Information

Special Tools

- **EL-49642** SPS Programming Support Tool
- **EL-46079** Tire Pressure Monitor Diagnostic Tool

For equivalent regional tools, refer to **Special Tools**.

Replace and Program Control Module

To program a replacement K9 Body Control Module (BCM), perform the following procedure:

1. Install **EL-49642** SPS programming support tool.

NOTE: Make sure the vehicle ignition switch state is in appropriate position for the following step.

- For Key Ignition System, begin with the ignition in the RUN position.
- For Push Button Start System, begin with the vehicle in vehicle OFF power mode. The Service Programming System will power mode the vehicle.

2. Access the Service Programming System (SPS) and follow the on-screen instructions.

3. On the SPS Supported Controllers screen, select K9 Body Control Module - Programming and follow the on-screen instructions.
4. Perform the following for the appropriate ignition type prior to proceeding with the next step:
 - Key Ignition System: Key in the ignition and any additional keys must be away from the vehicle at least 3 m.
 - Push Button Start System: Keyless entry transmitter must be in the programming pocket. Refer to the owner manual for the exact pocket location. All additional transmitters must be away from the vehicle at least 3 m.

NOTE: **The following programming step may take between 10-12 min and progress will appear to have stopped during this process. This is a normal security timer response and a restart should not be performed. If the DTC B389A set immediately after programming a replacement BCM, the Immobilizer Learn procedure was not properly completed. The Immobilizer Learn procedure needs to be performed again.**

5. On the SPS Supported Controllers screen, select IMMO Immobilizer Learn - Setup. On the next screen, select Body Control Module IMMO Learn with Existing Transponder or Remote Key and follow the on-screen instructions. When Immobilizer Learn is complete, press the Unlock button on the keyless entry transmitter to allow the keyless entry transmitter to exit the Immobilizer Learn mode.

NOTE: **When performing the Tire Pressure Monitor Sensor Learn during BCM setup, the EL-46079 tire pressure monitor diagnostic tool must be used to activate each tire pressure sensor for vehicles with UJM.**

- **For Key Ignition System, begin with the ignition in the RUN position.**
- **For Push Button Start System, begin with the vehicle in vehicle ON power mode.**

6. On the SPS Supported Controllers screen, select K9 Body Control Module - Setup (or K9 Body Control Module - Configuration & Setup) and follow the on-screen instructions.
7. Check the driver information center display for additional messages regarding further calibration instructions. If there are no additional driver information center instructions present, programming is complete.
8. At the end of programming, choose the "Clear DTCs" function on the SPS screen.
9. If ABS, Traction Control and/or Stabilitrak indicators are ON and DTC C0161 is set in the K17 Electronic Brake Control Module after performing BCM programming and setup, do the following:
 1. Disconnect the scan tool from the X84 Data Link Connector.
 2. Ignition OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from the vehicle. It may take up to 2 min to power down.
 3. Ignition ON, verify DTC C0161 is in history. If not, repeat the above step to make sure the vehicle is in sleep mode.
 4. Use the scan tool to clear the DTCs.

Reprogram Control Module

To program an existing K9 Body Control Module, perform the following procedure:

1. Install **EL-49642** SPS programming support tool.

NOTE: **Make sure the vehicle ignition switch state is in appropriate position for the following step.**

- **For Key Ignition System, begin with the ignition in the RUN position.**
- **For Push Button Start System, begin with the vehicle in vehicle ON power mode.**

2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select K9 Body Control Module - Programming and follow the on-screen instructions.

NOTE: **When performing the Tire Pressure Monitor Sensor Learn during BCM setup, the EL-46079 tire pressure monitor diagnostic tool must be used to activate each tire pressure sensor for vehicles with UJM.**

4. On the SPS Supported Controllers screen, select K9 Body Control Module - Setup (or K9 Body Control Module - Configuration & Setup) and follow the on-screen instructions.
5. Check the driver information center display for additional messages regarding further calibration instructions. If there are no additional driver information center instructions present, programming is complete.
6. At the end of programming, choose the "Clear DTCs" function on the SPS screen.
7. If ABS, Traction Control and/or Stabilitrak indicators are ON and DTC C0161 is set in the K17 Electronic Brake Control Module after performing BCM programming and setup, do the following:
 1. Disconnect the scan tool from the X84 Data Link Connector.
 2. Ignition OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from the vehicle. It may take up to 2 min to power down.
 3. Ignition ON, verify DTC C0161 is in history. If not, repeat the above step to make sure the vehicle is in sleep mode.
 4. Use the scan tool to clear the DTCs.

Unsuccessful Programming Recovery

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. Ignition ON. Ensure the control module, DLC and programming tool connections are secure and the SPS software is up to date.
2. Verify the control module can be reprogrammed.
 - **If the control module cannot be reprogrammed**

1. Ignition OFF for one minute, ignition ON.
2. Verify the control module can be reprogrammed.
 - If the control module cannot be reprogrammed, replace the control module.
 - If the control module can be reprogrammed.
3. All OK.
 - **If the control module can be reprogrammed**
3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for Control Module replacement, programming and setup

CHASSIS CONTROL MODULE PROGRAMMING AND SETUP

NOTE:

- **DO NOT** program a control module unless directed to by a service procedure or a service bulletin. If the control module is not properly configured with the correct calibration software, the control module will not control all of the vehicle features properly.
- Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or control module damage may occur.
- Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. When required install the EL-49642 SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. **DO NOT** connect a battery charger.
- Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.
- During the programming procedure, follow the SPS prompts for the correct ignition switch position.
- Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.

Special Tools

EL-49642 SPS Programming Support Tool

For equivalent regional tools, refer to **Special Tools**.

Replace and Program Control Module or Reprogram Control Module

To program a replacement or an existing control module, perform the following procedure:

1. Install **EL-49642** SPS Programming Support Tool.
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select K38 Chassis Control Module - Programming and follow the on-screen instructions.
4. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.

Unsuccessful Programming Recovery

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. Ignition ON. Ensure the control module, DLC and programming tool connections are secure and the SPS software is up to date.
2. Verify the control module can be reprogrammed.
 - **If the control module cannot be reprogrammed**
 1. Ignition OFF for one minute, ignition ON.
 2. Verify the control module can be reprogrammed.
 - If the control module cannot be reprogrammed, replace the control module.
 - If the control module can be reprogrammed.
 3. All OK.
 - **If the control module can be reprogrammed**
3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for Control Module replacement, programming and setup

COMMUNICATION INTERFACE MODULE PROGRAMMING AND SETUP

NOTE:

- **DO NOT** program a control module unless directed to by a service procedure or a service bulletin. If the control module is not properly configured with the correct calibration software, the control module will not control all of the vehicle features properly.
- Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or control module damage may occur.

- **Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. When required install the EL-49642 SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. DO NOT connect a battery charger.**
- **Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.**
- **During the programming procedure, follow the SPS prompts for the correct ignition switch position.**
- **Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.**

Diagnostic Aids

- It is critical to use the service replacement Communication Interface Module only in the vehicle for which it was ordered.
- Failure to perform the following procedures will result in a red LED, DTC(s) being set, and limited or incomplete OnStar® services.
- An OnStar® button press to the OnStar® call center is not required to complete the procedure.
- It may take up to 24 hours for OnStar® service to become fully activated after performing the procedures.
- Perform the following procedure only once. Repeat attempts of the procedure may result in a delay of the activation process.
- To fully activate an OnStar® module, both the setup and activation request procedures must be completed on all vehicles with and without an active OnStar® subscription to insure the unit has been setup properly for the vehicle it has been installed into and also to update the OnStar® with the correct unit information.
- To initialize the Turn-by-Turn feature, the vehicle must first be driven In open sky condition at speeds greater than 10 mph (16 kph) or more for a minimum of 5 miles (8 km) , and perform at least 2 left and 2 right 90 degree turns coming to complete stops prior to each turn.
- On vehicles up fitted with TTY capabilities, it is necessary to perform a power cycle of the OnStar® Interface Module (OTIM), and toggle the TTY mode after completing the Communication Interface Module installation and setup procedures.

Reference Information

Special Tools

EL-49642 SPS Programming Support Tool

For equivalent regional tools, refer to **Special Tools**.

Replace and Program Control Module or Reprogram Control Module

To program a replacement or an existing control module, perform the following procedure:

1. Install **EL-49642** SPS programming support tool .
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select ONSU Onstar® Module Setup and Service Activation and follow the on-screen instructions.
4. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.
5. The default language for the new Communication Interface Module is English. To change to an alternate language, access the scan tool.
6. Inform the customer that it may take up to 24 hours for the OnStar® service to become fully activated.

Unsuccessful Programming Recovery

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. Ignition ON. Ensure the control module, DLC and programming tool connections are secure and the SPS software is up to date.
2. Verify the control module can be reprogrammed.
 - **If the control module cannot be reprogrammed**
 1. Ignition OFF for one minute, ignition ON.
 2. Verify the control module can be reprogrammed.
 - If the control module cannot be reprogrammed, replace the control module.
 - If the control module can be reprogrammed.
 3. All OK.
 - **If the control module can be reprogrammed**
3. All OK.

CONTROL SOLENOID VALVE AND TRANSMISSION CONTROL MODULE ASSEMBLY PROGRAMMING AND SETUP (6T70)

NOTE:

- **DO NOT** program a control module unless directed to by a service procedure or a service bulletin. If the control module is not properly configured with the correct calibration software, the control module will not control all of the vehicle features properly.
- **Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or control module damage may occur.**
- **Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. When required, install the EL-49642 SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. DO NOT connect a battery charger.**

- Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.
- During the programming procedure, follow the SPS prompts for the correct ignition switch position.
- Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.

Reference Information

Special Tools

EL-49642 SPS Programming Support Tool

For equivalent regional tools, refer to **Special Tools**.

Replace and Program Control Module

To program a replacement transmission control module (TCM), perform the following procedure:

1. Install **EL-49642** SPS Programming Support Tool.
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select Transmission Control Module - Programming and follow the on-screen instructions.
4. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.
5. With a scan tool, perform the Reset Transmission Adapts. Refer to **Reset Transmission Adapts** .

Reprogram Control Module

To reprogram an existing TCM, perform the following procedure:

1. Access the Service Programming System (SPS) and follow the on-screen instructions.
2. On the SPS Supported Controllers screen, select Transmission Control Module - Programming and follow the on-screen instructions.
3. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.
4. With a scan tool, perform the Reset Transmission Adapts. Refer to **Reset Transmission Adapts** .

Unsuccessful Programming Recovery

In the event of an interrupted or unsuccessful programming event, perform the following:

1. Ignition ON. Ensure the control module, DLC and programming tool connections are secure and the SPS software is up to date.
2. Verify the control module can be reprogrammed.

- **If the control module cannot be reprogrammed**

1. Ignition OFF for one minute, ignition ON.
2. Verify the control module can be reprogrammed.
 - If the control module cannot be reprogrammed, replace the control module.
 - If the control module can be reprogrammed.

3. All OK.

- **If the control module can be reprogrammed**

3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for control module replacement, programming, and setup.

CONTROL SOLENOID VALVE AND TRANSMISSION CONTROL MODULE ASSEMBLY PROGRAMMING AND SETUP (6T40)

The following service procedures require either a programming or a setup event be performed for a complete repair. The transmission control module (TCM) is part of the control solenoid valve assembly, and is not serviced separately.

Transmission Control Module (TCM) Replacement

If the TCM is replaced, the following procedures must be performed:

1. TCM Reprogramming
2. The Transmission Adaptive Values Learn. Refer to **Transmission Adaptive Values Learn** .

TCM Reprogramming

NOTE:

- **Use a scan tool to view and record the Transmission Control Module - End Model Part Number in the original TCM prior to starting the TCM reprogramming procedure.**
- **In some cases, the TCM and ECM may have to be reprogrammed. When a selection for TCM Transmission Control Module - Programming is not available, select SEQ Programming Sequence ECM/TCM (Automatic Transmission Only).**

1. If the TCM needs to be reprogrammed. Refer to **Service Programming System (SPS)**.
2. Perform the Transmission Adaptive Values Learn. Refer to **Transmission Adaptive Values Learn** .

NOTE: **After programming, perform the following to avoid future misdiagnosis:**

1. Turn the ignition OFF for 30 seconds.
2. Turn the ignition ON with the engine OFF.
3. Use the scan tool in order to retrieve history DTCs from all modules.
4. Clear all history DTCs.

Setup for Component Replacement

The replacement of some components will require a setup procedure for complete repair.

If any of the following components are replaced, the **Transmission Adaptive Values Learn** procedure must be performed:

- Transmission replacement
- Any internal transmission repair
- Any speed sensor

Refer to **Transmission Adaptive Values Learn** .

DISTANCE SENSING CRUISE CONTROL MODULE PROGRAMMING AND SETUP

The following service procedures require either a programming or a setup event performed for a complete repair.

Distance Sensing Cruise Control Module Replacement

If the cruise control vehicle distance sensor module needs to be replaced, the following procedures must be performed:

1. Replace the K14 Distance Sensing Cruise Control Module. Refer to **Forward Range Radar Module Replacement**
2. Align the K14 Distance Sensing Cruise Control Module. Refer to **Forward Range Radar Module Alignment**
3. Connect a scan tool to the vehicle and access SPS. Refer to **Service Programming System (SPS)**.
4. Perform the SPS function Distance Sensing Cruise Control Module - Programming and follow the on-screen instructions.
5. Perform the SPS function Distance Sensing Cruise Control Module - Configuration and follow the on-screen instructions.
6. DTC C056E with failure type byte 4B will set as a result of the programming event.
7. Perform the Distance Sensing Cruise Control Module learn procedure. Refer to **Distance Sensing Cruise Control Module Learn Procedure**
8. Clear DTCs after completing the programming procedure.

Cruise Control Vehicle Distance Sensor Module Reprogramming

Do not reprogram the cruise control vehicle distance sensor module, unless directed by a service procedure, or a service bulletin.

1. Connect a scan tool to the vehicle and access SPS. Refer to **Service Programming System (SPS)**.
2. Perform the SPS function Distance Sensing Cruise Control Module - Programming and follow the on-screen instructions.
3. Perform the SPS function Distance Sensing Cruise Control Module - Configuration and follow the on-screen instructions.
4. DTC C056E with failure type byte 4B will set as a result of the programming event.
5. Perform the Distance Sensing Cruise Control Module learn procedure. Refer to **Distance Sensing Cruise Control Module Learn Procedure**
6. Clear DTCs after completing the programming procedure.

Setup for Bracket Replacement

1. Align the K14 Distance Sensing Cruise Control Module. Refer to **Forward Range Radar Module Alignment**.
2. Perform the Distance Sensing Cruise Control Module learn procedure. Refer to **Distance Sensing Cruise Control Module Learn Procedure**.

ELECTRONIC BRAKE CONTROL MODULE PROGRAMMING AND SETUP

NOTE:

- **DO NOT** program a control module unless directed to by a service procedure or a service bulletin. If the control module is not properly configured with the correct calibration software, the control module will not control all of the vehicle features properly.
- Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or control module damage may occur.
- Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. When required install the EL-49642 SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. **DO NOT** connect a battery charger.
- Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.
- During the programming procedure, follow the SPS prompts for the correct ignition switch position.
- Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.

Replace and Program Control Module or Reprogram Control Module

To program a replacement or an existing control module, perform the following procedure:

1. Access the Service Programming System (SPS) and follow the on-screen instructions.
2. On the SPS Supported Controllers screen, select K17 Electronic Brake Control Module - Programming and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select K17 Electronic Brake Control Module - Setup and follow the on-screen instructions.
4. On the SPS Supported Controllers screen, select K17 Electronic Brake Control Module - Configuration and follow the on-screen instructions.
5. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.
6. With a scan tool, perform the Brake Pressure Sensor Calibration. Refer to **Brake Pressure Modulator Valve Pressure Sensor Calibration** .
7. With a scan tool, perform the Steering Wheel Angle Sensor Learn. Refer to **Steering Angle Sensor Centering** .

Unsuccessful Programming Recovery

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. Ignition ON. Ensure the control module, DLC and programming tool connections are secure and the SPS software is up to date.
2. Verify the control module can be reprogrammed.
 - **If the control module cannot be reprogrammed**
 1. Ignition OFF for one minute, ignition ON.
 2. Verify the control module can be reprogrammed.
 - If the control module cannot be reprogrammed, replace the control module.
 - If the control module can be reprogrammed.
 3. All OK.
 - **If the control module can be reprogrammed**
3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for Control Module replacement, programming and setup

ELECTRONIC PARKING BRAKE CONTROL MODULE PROGRAMMING AND SETUP

If the electronic parking brake control module is replaced, the following procedures must be performed:

Refer to **Service Programming System (SPS)**.

Calibration with Scan Tool

NOTE: **Verify the rear brakes are clear of any obstacles before starting the calibration procedure. During the procedure the rear brakes will cycle several times, stay clear of all moving parts until the process is complete.**

Perform the Parking Brake Calibration procedure in Module Setup.

Calibration without Scan Tool

1. Ignition ON, apply and hold the brake pedal.
2. Push and hold the electric parking brake switch down for 5-6 seconds.
3. Release the electric parking brake switch.
4. Momentarily push the electric parking brake switch down.
5. Remove the EPB MODULE fuse and reinstall.
6. Apply the electric parking brake.
7. Release the electric parking brake.

ELECTRONIC SUSPENSION CONTROL MODULE PROGRAMMING AND SETUP

The suspension control module must be programmed with the proper calibration software. The module stores and utilizes this information however if it is not properly configured with the correct calibration software, the suspension control module will not control all of the vehicle features properly.

Ensure that the following conditions exist in order to prepare for suspension control module programming:

1. The battery is fully charged.
2. The MDI data link connectors are secure.
3. The scan tool is loaded with the most current software version.
4. All disconnected modules and devices are reconnected securely.
5. This entire procedure has been reviewed before proceeding.

Do not reprogram the suspension control module unless directed by a service procedure or a service bulletin.

Suspension Control Module Programming

To program and setup an existing or new replacement suspension control module, perform the following procedure:

1. With a scan tool, access the Service Programming System (SPS) and follow the on-screen instructions. Refer to **Service Programming System (SPS)**.
2. On the SPS Supported Controllers screen, select ESCM Electronic Suspension Control Module - Programming and follow the on-screen instructions.

If the suspension control module fails to accept the program, verify all scan tool and suspension control module connections are secure.

NOTE: After programming is completed, perform the following to avoid future misdiagnosis:

1. Turn the ignition OFF for 10 seconds.
2. Open and close the door.
3. Connect the scan tool to the data link connector.
4. Ignition ON, engine OFF.
5. With a scan tool, clear all DTCs from all modules.

K20 ENGINE CONTROL MODULE: PROGRAMMING AND SETUP

Special Tools

EL-49642 SPS Programming Support Tool

For equivalent regional tools, refer to **Special Tools**.

NOTE:

- **DO NOT** program a control module unless directed to by a service procedure or a service bulletin. If the control module is not properly configured with the correct calibration software, the control module will not control all of the vehicle features properly.
- Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or control module damage may occur.
- Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. When required install the EL-49642 SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. **DO NOT** connect a battery charger.
- Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.
- During the programming procedure, follow the SPS prompts for the correct ignition switch position.
- Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.
- Note the engine oil life remaining percentage.

Replace and Program Control Module

To program a replacement K20 Engine Control Module (ECM), perform the following procedure:

1. Install **EL-49642** SPS programming support tool.
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. Before removing the old control module, perform the SPS function Prepare Control Module for Removal, if available.

NOTE: **The Prepare Control Module for Removal function can only be performed when communication with the old control module is still possible.**

4. Replace the ECM.
5. Perform the SPS function K20 Engine Control Module - Programming and follow the on-screen instructions.
6. Clear the DTCs after completing the Programming procedure.
7. Perform the SPS function Immobilizer Learn and follow the on-screen instructions. Refer to **Immobilizer System Component Programming (with BTM)** , **Immobilizer System Component Programming (without BTM)** .
8. Perform the SPS function K20 Engine Control Module - Configuration & Setup and follow the on-screen instructions.
9. Clear DTCs after completing the Configuration & Setup procedure.

Reprogram Control Module

To reprogram an existing K20 Engine Control Module, perform the following procedure:

1. Install **EL-49642** SPS programming support tool.
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. Clear DTCs after completing the Programming procedure.
4. Perform the SPS Function Immobilizer Learn and follow the on-screen instructions. Refer to **Immobilizer System Component Programming (with BTM)** , **Immobilizer System Component Programming (without BTM)** .
5. Perform the SPS function Engine Control Module - Configuration & Setup and follow the on-screen instructions, if available.
6. Clear DTCs after completing the Configuration & Setup procedure.

Unsuccessful Programming Recovery

In the event of an interrupted or unsuccessful programming event, perform the following:

1. Ignition ON. Ensure the control module, DLC, and programming tool connections are secure and the SPS software is up to date.
2. Verify the control module can be reprogrammed.
 - **If the control module cannot be reprogrammed**

1. Ignition OFF for one minute, ignition ON.
2. Verify the control module can be reprogrammed.
 - If the control module cannot be reprogrammed, replace the K20 Engine Control Module.
 - **If the control module can be reprogrammed**
3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for ECM replacement, programming and setup.

FRONT AND REAR PARKING ASSIST CONTROL MODULE PROGRAMMING AND SETUP

There is no setup procedure that needs to be performed for the Object Alarm Module on this vehicle.

FRONT VIEW CAMERA MODULE PROGRAMMING AND SETUP

NOTE:

- **DO NOT** program a control module unless directed to by a service procedure or a service bulletin. If the control module is not properly configured with the correct calibration software, the control module will not control all of the vehicle features properly.
- Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or control module damage may occur.
- Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. When required install the EL-49642 SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. **DO NOT** connect a battery charger.
- Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.
- During the programming procedure, follow the SPS prompts for the correct ignition switch position.
- Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.

Replace and Program Control Module or Reprogram Control Module

Do not reprogram the frontview camera module, unless directed by a service procedure, or a service bulletin.

To program a replacement or an existing frontview camera module, perform the following procedure:

1. Access the Service Programming System (SPS) and follow the on-screen instructions.
2. On the SPS Supported Controllers screen, select frontview camera module - Programming and follow the on-screen instructions.
3. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.
4. With a scan tool, perform the frontview camera module calibration. Refer to **Front View Camera Module Calibration**.

Unsuccessful Programming Recovery

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. Ignition ON. Ensure the frontview camera module, DLC and programming tool connections are secure and the SPS software is up to date.
2. Verify the frontview camera module can be reprogrammed.
 - **If the frontview camera module cannot be reprogrammed**
 1. Ignition OFF for one minute, ignition ON.
 2. Verify the frontview camera module can be reprogrammed.
 - If the frontview camera module cannot be reprogrammed, replace the frontview camera module.
 - If the frontview camera module can be reprogrammed.
 3. All OK.
 - **If the frontview camera module can be reprogrammed**
3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for frontview camera module replacement, programming and setup.

GARAGE DOOR OPENER PROGRAMMING AND SETUP

Replace and Program ECU or Reprogram ECU

This ECU does not require SPS programming but does require the following setup procedures after a new ECU is installed:

The customer must learn the device they wish to control. This must be done at the device (garage door opener, electric gate, etc.) and cannot be performed at a dealership. Refer to the vehicle owner's manual for programming instructions.

GENERATOR CONTROL MODULE PROGRAMMING AND SETUP

Special Tools

EL-49642 SPS Programming Support Tool

For equivalent regional tools, refer to Special Tools.

NOTE:

- **DO NOT** program a control module unless directed to by a service procedure or a service bulletin. If the ECU is not properly configured with the correct calibration software, the ECU will not control all of the vehicle features properly.
- Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or ECU damage may occur.
- Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. Install the EL-49642 SPS programming support tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. **DO NOT** connect a battery charger.
- Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.
- During the programming procedure, follow the SPS prompts for the correct ignition switch position.
- Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.

Replace and Program ECU or Reprogram ECU

To program a replacement or an existing ECU, perform the following procedure:

1. Install the **EL-49642** SPS programming support tool.
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select Generator Control Module - Programming and follow the on-screen instructions.
4. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.

Unsuccessful Programming Recovery

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. **DO NOT** turn the ignition OFF. Ensure that all ECU, DLC and programming tool connections are secure and the TIS terminal operating software is up to date.
2. Attempt to reprogram the ECU.

3. If the ECU can still not be programmed, turn the ignition OFF for at least 1 minute.
4. Turn the ignition ON and attempt to reprogram the ECU. The ECU should program.
 - If the ECU still cannot be programmed, replace the ECU.

HEADLAMP CONTROL MODULE PROGRAMMING AND SETUP

NOTE:

- **DO NOT program a control module unless directed to by a service procedure or a service bulletin. If the control module is not properly configured with the correct calibration software, the control module will not control all of the vehicle features properly.**
- **Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or control module damage may occur.**
- **Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. When required install the EL-49642 SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. DO NOT connect a battery charger.**
- **Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.**
- **During the programming procedure, follow the SPS prompts for the correct ignition switch position.**
- **Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.**

Replace and Program Control Module or Reprogram Control Module

This control module does not require SPS programming but does require the following setup procedures after a new control module is installed:

To program a replacement or an existing control module, perform the following procedure:

1. Install a scan tool.
2. Clear all DTC's before proceeding.
3. Select Module Diagnostics.
4. Select Headlamp Control Module.
5. Select Configuration/Reset Functions.
6. Select Headlamp Leveling Sensor Learn and follow the on-screen instructions.

Unsuccessful Programming Recovery

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. Ignition ON. Ensure the control module, DLC and programming tool connections are secure.
2. Verify the control module can be reprogrammed.
 - **If the control module cannot be reprogrammed**
 1. Ignition OFF for one minute, ignition ON.
 2. Verify the control module can be reprogrammed.
 - If the control module cannot be reprogrammed, replace the control module.
 - If the control module can be reprogrammed.
 3. All OK.
 - **If the control module can be reprogrammed**
3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for Control Module replacement, programming and setup

HEATED SEAT CONTROL MODULE PROGRAMMING AND SETUP

The seat heating control module must be programmed with the proper calibration software. The module stores and utilizes this information however if it is not properly configured with the correct calibration software, the seat heating control module will not control all of the vehicle features properly.

Ensure that the following conditions exist in order to prepare for seat heating control module programming:

1. The battery is fully charged.
2. The MDI data link connectors are secure.
3. The scan tool is loaded with the most current software version.
4. All disconnected modules and devices are reconnected securely.
5. This entire procedure has been reviewed before proceeding.

Do not reprogram the seat heating control module unless directed by a service procedure or a service bulletin.

Seat Heating Control Module Programming

To program and setup an existing or new replacement seat heating control module, perform the following procedure:

1. Access the Service Programming System (SPS) and follow the on-screen instructions. Refer to **Service Programming System (SPS)**.
2. On the SPS Supported Controllers screen, select HVSMF Front Seat Heating Control Module - Programming and follow the on-screen instructions.

If the HVSMF Front Seat Heating Control Module fails to accept the program, verify all scan tool and seat heating control module connections are secure.

NOTE: After programming is completed, perform the following to avoid future misdiagnosis:

1. Turn the ignition OFF for 10 seconds.
2. Open and close the door.
3. Connect the scan tool to the data link connector.
4. Ignition ON, engine OFF.
5. Clear all DTCs from all modules.

HUMAN MACHINE INTERFACE CONTROL MODULE PROGRAMMING AND SETUP

- NOTE:**
- **DO NOT** program a control module unless directed to by a service procedure or a service bulletin. If the control module is not properly configured with the correct calibration software, the control module will not control all of the vehicle features properly.
 - Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or control module damage may occur.
 - Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. Install the EL-49642 SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. **DO NOT** connect a battery charger.
 - Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.
 - During the programming procedure, follow the SPS prompts for the correct ignition switch position.
 - Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.

Diagnostic Aids

- During programming you may be required to select multiple calibrations dependent upon vehicle equipment. Have the vehicle build/RPO information available during the following procedure to ensure the correct calibrations are selected.
- Dependant upon the current software level of the module, or the release of updates, USB programming may not be required when replacing/reprogramming the control module. If USB files for the application are not available via SPS, or have not been received from General Motors in another manner of

distribution, the USB update process will not need to be performed.

Reference Information

Special Tools

EL-49642 SPS Programming Support Tool

For equivalent regional tools, refer to **Special Tools**.

Replace and Program Control Module

To program a replacement control module, perform the following procedure:

NOTE: **The vehicle must remain in PARK during the programming procedure.**

1. Install the **EL-49642** SPS Programming Support Tool.
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select K74 Human Machine Interface Control Module - Programming and follow the on-screen instructions.

NOTE: **If using a pre-configured USB drive supplied by General Motors, proceed to step 8.**

4. Connect a USB drive to the computer.
5. Access the Service Programming System (SPS) and follow the on-screen instructions.
6. On the SPS Supported Controllers screen, select K74 Human Machine Interface Control Module - USB File Transfer.

NOTE: **All existing files on the USB drive will be erased when the new files are copied.**

7. Upon completion of the file transfer, remove the USB drive from the computer.
8. Ignition ON, infotainment system ON.
9. Connect the USB drive to the USB port in the vehicle.
10. The infotainment system will recognize that update files are available. Follow the infotainment display on-screen instructions and select Update when prompted. Programming will take several minutes.
11. Upon completion of programming, remove the USB drive. Follow the infotainment display on-screen instructions.
12. At the end of programming, choose the "Clear DTCs" function on the SPS screen.
13. Ignition OFF, Retained Accessory Power (RAP) OFF, remove the key fob from range of the vehicle, and let the vehicle sit for five minutes. Retest system operation to verify the repair.

Reprogram Control Module

To program an existing control module, perform the following procedure:

NOTE: **The vehicle must remain in PARK during the programming procedure.**

1. Install the **EL-49642** SPS Programming Support Tool.

NOTE: **If using a pre-configured USB drive supplied by General Motors, proceed to step 6.**

2. Connect a USB drive to the computer.
3. Access the Service Programming System (SPS) and follow the on-screen instructions.
4. On the SPS Supported Controllers screen, select K74 Human Machine Interface Control Module - USB File Transfer.

NOTE:

- **If there are no files available for USB transfer via SPS, proceed to step 10.**
- **All existing files on the USB drive will be erased when the new files are copied.**

5. Upon completion of the file transfer, remove the USB drive from the computer.
6. Ignition ON, infotainment system ON.
7. Connect the USB drive to the USB port in the vehicle.
8. The infotainment system will recognize that update files are available. Follow the infotainment display on-screen instructions and select Update when prompted. Programming will take several minutes.
9. Upon completion of programming, remove the USB drive. Follow the infotainment display on-screen instructions.
10. Access the Service Programming System (SPS) and follow the on-screen instructions.
11. On the SPS Supported Controllers screen, select K74 Human Machine Interface Control Module - Programming and follow the on-screen instructions.
12. At the end of programming, choose the "Clear DTCs" function on the SPS screen.
13. Ignition OFF, Retained Accessory Power (RAP) OFF, remove the key fob from range of the vehicle, and let the vehicle sit for five minutes. Retest system operation to verify the repair.

Unsuccessful Programming Recovery

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. Ignition ON. Ensure the control module, DLC and programming tool connections are secure and the SPS software is up to date.
2. Verify the control module can be reprogrammed.
 - **If the control module cannot be reprogrammed**
 1. Ignition OFF for one minute, ignition ON.

2. Verify the control module can be reprogrammed.
 - If the control module cannot be reprogrammed, replace the control module.
 - If the control module can be reprogrammed.

3. All OK.

- **If the control module can be reprogrammed**

3. All OK.

HVAC SYSTEM CONTROL MODULE PROGRAMMING AND SETUP

NOTE:

- **DO NOT** program a control module unless directed to by a service procedure or a service bulletin. If the control module is not properly configured with the correct calibration software, the control module will not control all of the vehicle features properly.
- Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or control module damage may occur.
- Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. When required install the EL-49642 SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. **DO NOT** connect a battery charger.
- Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.
- During the programming procedure, follow the SPS prompts for the correct ignition switch position.
- Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.

Reference Information

Special Tools

EL-49642 SPS Programming Support Tool

For equivalent regional tools, refer to **Special Tools**.

Replace and Program Control Module or Reprogram Control Module

To program a replacement or an existing control module, perform the following procedure:

1. Install **EL-49642** SPS Programming Support Tool.

2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select HVAC Control Module - Programming and follow the on-screen instructions.
4. On the SPS Supported Controllers screen, select HVAC Control Module - Setup and follow the on-screen instructions.
5. On the SPS Supported Controllers screen, select HVAC Control Module - Configuration and follow the on-screen instructions.
6. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.
7. With a scan tool, perform the Actuator Recalibration Function. Refer to **Actuator Recalibration** .

Unsuccessful Programming Recovery

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. Ignition ON. Ensure the control module, DLC and programming tool connections are secure and the SPS software is up to date.
2. Verify the control module can be reprogrammed.
 - **If the control module cannot be reprogrammed**
 1. Ignition OFF for one minute, ignition ON.
 2. Verify the control module can be reprogrammed.
 - If the control module cannot be reprogrammed, replace the control module.
 - If the control module can be reprogrammed.
 3. All OK.
 - **If the control module can be reprogrammed**
3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for Control Module replacement, programming and setup

IMMOBILIZER CONTROL MODULE PROGRAMMING AND SETUP

Replace and Program ECU or Reprogram ECU

This ECU does not require SPS programming or any setup procedures.

INFLATABLE RESTRAINT SENSING AND DIAGNOSTIC MODULE PROGRAMMING AND SETUP

The inflatable restraint sensing and diagnostic module (SDM) must be programmed with the proper calibration software. The module stores and utilizes this information however if it is not properly configured with the correct calibration software, the SDM will not control all of the vehicle features properly.

Ensure that the following conditions exist in order to prepare for SDM programming:

1. The battery is fully charged.
2. The MDI data link connectors are secure.
3. The scan tool is loaded with the most current software version.
4. All disconnected modules and devices are reconnected securely.
5. This entire procedure has been reviewed before proceeding.

Do not reprogram the SDM unless directed by a service procedure or a service bulletin.

NOTE:

- **The air bag indicator light may remain ON after the body control module (BCM), or SDM is replaced, and during the programming procedure for the BCM until after the procedure is completed. When installing a new SDM, there may be several DTCs set prior to programming. Once programmed, these DTCs should be in history and can be cleared.**
- **Failure to complete the following Setup procedure may cause DTC B1001 to be set in the SDM.**

The following service procedures require either a programming or a setup event performed for a complete repair:

Sensing and Diagnostic Module Replacement and/or Programming

If the inflatable restraint sensing and diagnostic module needs to be replaced and/or reprogrammed, the following procedures must be performed:

1. Access SPS. Refer to **Service Programming System (SPS)**.
2. Perform the SPS function Inflatable Restraint Sensing and Diagnostic Module Programming and follow the on-screen instructions.
3. Perform the SPS function Inflatable Restraint Sensing and Diagnostic Module Setup and follow the on-screen instructions.
4. Clear DTCs after completing the programming procedure.

If the control module fails to program, proceed as follows:

1. Ensure the DLC and Accessory Power Module connections are good.
2. Inspect the Techline equipment for the latest software version.
3. Attempt to program the SDM. If the SDM still cannot be programmed properly, replace the SDM.

INSTRUMENT CLUSTER PROGRAMMING AND SETUP

Special Tools

EL-49642 SPS Programming Support Tool

For equivalent regional tools, refer to Special Tools.

NOTE:

- **DO NOT** program a control module unless directed to by a service procedure or a service bulletin. If the ECU is not properly configured with the correct calibration software, the ECU will not control all of the vehicle features properly.
- Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or ECU damage may occur.
- Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. Install the EL-49642 SPS programming support tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. **DO NOT** connect a battery charger.
- Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.
- During the programming procedure, follow the SPS prompts for the correct ignition switch position.
- Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.

Diagnostic Aids

The programming steps in the Service Programming System (SPS) screens may not be in functional order. Be sure to follow the programming steps in the order listed below.

Replace and Program ECU

To program a replacement or an existing ECU, perform the following procedure:

1. Install **EL-49642** SPS programming support tool.
2. Access the Service Programming System (SPS) and follow the on-screen instructions.

NOTE: **The USB File Transfer procedure is performed after the new Instrument Cluster is installed in the vehicle.**

3. On the SPS Supported Controllers screen, select Instrument Cluster - USB File Transfer and follow the on-screen instructions.
4. On the SPS Supported Controllers screen, select Instrument Cluster - Programming and follow the on-screen instructions.
5. On the SPS Supported Controllers screen, select Instrument Cluster - Setup and Configuration and follow the on-screen instructions.

6. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.

Reprogram ECU

To program a replacement or an existing ECU, perform the following procedure:

1. Install **EL-49642** SPS programming support tool.
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select Instrument Cluster - USB File Transfer and follow the on-screen instructions.
4. On the SPS Supported Controllers screen, select Instrument Cluster - Programming and follow the on-screen instructions.
5. On the SPS Supported Controllers screen, select Instrument Cluster - Setup and Configuration and follow the on-screen instructions.
6. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.

Unsuccessful Programming Recovery

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. DO NOT turn the ignition OFF. Ensure that all ECU, DLC and programming tool connections are secure and the TIS terminal operating software is up to date.
2. Attempt to reprogram the ECU.
3. If the ECU can still not be programmed, turn the ignition OFF for at least one minute.
4. Turn the ignition ON and attempt to reprogram the ECU. The ECU should program.
 - o If the ECU still cannot be programmed, replace the ECU.

KEYLESS ENTRY CONTROL MODULE PROGRAMMING AND SETUP

Special Tools

EL-49642 SPS Programming Support Tool

For equivalent regional tools, refer to **Special Tools**.

NOTE:

- **DO NOT** program a control module unless directed to by a service procedure or a service bulletin. If the ECU is not properly configured with the correct calibration software, the ECU will not control all of the vehicle features properly.
- Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or ECU damage may occur.
- Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. Install

the **EL-49642 SPS programming support tool** to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. **DO NOT** connect a battery charger.

- Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.
- During the programming procedure, follow the SPS prompts for the correct ignition switch position.
- Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.

Replace and Program ECU or Reprogram ECU

To program a replacement or an existing ECU, perform the following procedure:

1. Install **EL-49642** SPS programming support tool.
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select Keyless Entry Control Module - Programming and follow the on-screen instructions.
4. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.

Unsuccessful Programming Recovery

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. DO NOT turn the ignition OFF. Ensure that all ECU, DLC and programming tool connections are secure and the TIS terminal operating software is up to date.
2. Attempt to reprogram the ECU.
3. If the ECU can still not be programmed, turn the ignition OFF for at least one minute.
4. Turn the ignition ON and attempt to reprogram the ECU. The ECU should program.
 - If the ECU still cannot be programmed, replace the ECU.

MEMORY SEAT CONTROL MODULE PROGRAMMING AND SETUP

The seat memory control module must be programmed with the proper calibration software. The module stores and utilizes this information however if it is not properly configured with the correct calibration software, the seat memory control module will not control all of the vehicle features properly.

Ensure that the following conditions exist in order to prepare for seat memory control module programming:

1. The battery is fully charged.
2. The MDI data link connectors are secure.
3. The scan tool is loaded with the most current software version.

4. All disconnected modules and devices are reconnected securely.
5. This entire procedure has been reviewed before proceeding.

Do not reprogram the seat memory control module unless directed by a service procedure or a service bulletin.

Seat Memory Control Module Programming

To program and setup an existing or new replacement seat memory control module, perform the following procedure:

1. With a scan tool, access the Service Programming System (SPS) and follow the on-screen instructions. Refer to **Service Programming System (SPS)**.
2. On the SPS Supported Controllers screen, select MSM Memory Seat Control Module - Programming and follow the on-screen instructions.

If the MSM Memory Seat Module fails to accept the program, verify all scan tool and seat memory control module connections are secure.

NOTE: After programming is completed, perform the following to avoid future misdiagnosis:

1. Turn the ignition OFF for 10 seconds.
2. Open and close the door.
3. Connect the scan tool to the data link connector.
4. Ignition ON, engine OFF.
5. With a scan tool, clear all DTC's from all modules.

MEDIA DISC PLAYER PROGRAMMING AND SETUP

- NOTE:**
- DO NOT program a control module unless directed to by a service procedure or a service bulletin. If the control module is not properly configured with the correct calibration software, the control module will not control all of the vehicle features properly.
 - Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or control module damage may occur.
 - Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. When required install the EL-49642 SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. DO NOT connect a battery charger.
 - Turn OFF or disable systems that may put a load on the vehicles battery

such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.

- During the programming procedure, follow the SPS prompts for the correct ignition switch position.
- Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.

Diagnostic Aids

- During programming you may be required to select multiple calibrations dependent upon vehicle equipment. Have the vehicle build/RPO information available during the following procedure to ensure the correct calibrations are selected.
- Dependant upon the current software level of the module, or the release of updates, USB programming may not be required when replacing/reprogramming the control module. If USB files for the application are not available via SPS, or have not been received from General Motors in another manner of distribution, the USB update process will not need to be performed.

Reference Information

Special Tools

EL-49642 SPS Programming Support Tool

For equivalent regional tools, refer to **Special Tools**.

Replace and Program Control Module or Reprogram Control Module

To program a replacement or an existing control module, perform the following procedure:

Without Rear Seat Video Entertainment System

This control module does not require SPS programming or any setup procedures.

With Rear Seat Video Entertainment System

1. Install the **EL-49642** SPS Programming Support Tool.
2. Connect a USB drive to the computer.
3. Access the Service Programming System (SPS) and follow the on-screen instructions.
4. On the SPS Supported Controllers screen, select Media Disc Player - USB File Transfer and follow the on-screen instructions.
5. Upon completion of the file transfer, remove the USB drive from the computer.
6. Ignition ON, infotainment system ON.
7. Connect the USB drive to the USB port in the vehicle.
8. The infotainment system will recognize that update files are available. Follow the infotainment display on-screen instructions and select Update when prompted. Programming will take several minutes.

9. Upon completion of programming, remove the USB drive. Follow the infotainment display on-screen instructions.
10. On the SPS Supported Controllers screen, select Media Disc Player - Programming and follow the on-screen instructions.
11. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.

Unsuccessful Programming Recovery

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. Ignition ON. Ensure the control module, DLC and programming tool connections are secure and the SPS software is up to date.
2. Verify the control module can be reprogrammed.
 - **If the control module cannot be reprogrammed**
 1. Ignition OFF for one minute, ignition ON.
 2. Verify the control module can be reprogrammed.
 - If the control module cannot be reprogrammed, replace the control module.
 - If the control module can be reprogrammed.
 3. All OK.
 - **If the control module can be reprogrammed**
3. All OK.

PASSENGER PRESENCE SYSTEM PROGRAMMING AND SETUP

When the passenger presence system is replaced or serviced, perform the rezeroing procedure for the passenger presence system. Refer to **Passenger Presence System Rezeroing** for the rezeroing procedure.

POWER STEERING CONTROL MODULE PROGRAMMING AND SETUP

The following service procedures require either a programming or a setup event performed for a complete repair.

The electronic power steering control module is part of the power steering assist motor assembly and is electronically paired with the steering gear's sensors.

- If the complete steering gear INCLUDING the assist motor assembly was replaced, or for reprogramming of an existing power steering system WITHOUT replacement, refer to the POWER STEERING CONTROL MODULE REPROGRAMMING instructions in this article.
- If ONLY the Power Steering Assist Motor assembly is replaced, follow the POWER STEERING CONTROL MODULE REPLACEMENT instructions.

Replace and Program Control Module

NOTE: During the procedures listed below, critical data is retrieved from vehicle

components and stored in the scan tool computer's hard drive. This data is needed during the programming and setup sequences.

Ensure the same scan tool is used and capable of reading, storing, and writing the vehicle's system data.

1. Access the Service Programming System (SPS) and follow the on-screen instructions.
2. On the SPS Supported Controllers screen, select Electronic Power Steering - Prepare Control Module for Removal and follow the on-screen instructions.
3. Replace the Power Steering Assist Motor containing the Power Steering Control Module. Refer to **Power Steering Assist Motor Replacement (NJ1)** , **Power Steering Assist Motor Replacement (NJ2)** .
4. With the Power Steering Assist Motor replaced and reconnected, on the SPS Supported Controllers screen, select Electronic Power Steering - Programming and follow the on-screen instructions.
5. On the SPS Supported Controllers screen, select Electronic Power Steering - Configuration and follow the on-screen instructions.
6. Ignition OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down.
7. Ignition ON.
8. On the SPS Supported Controllers screen, select Electronic Power Steering - Setup and follow the on-screen instructions.
9. On the SPS Supported Controllers screen, select Electronic Power Steering - Endstop Learning procedure. Refer to **Power Steering Control Module Calibration (NJ1)**
10. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.

Power Steering Control Module Reprogramming

Do not program or reprogram the electronic power steering control module unless directed by a service procedure or a service bulletin.

NOTE: **This procedure applies to reprogramming of the existing steering gear or the initial programming if the complete steering gear assembly including the assist motor was replaced. If only the power steering control module is replaced, follow the Power Steering Control Module Replacement instructions above.**

1. Access the Service Programming System (SPS) and follow the on-screen instructions.
2. On the SPS Supported Controllers screen, select Electronic Power Steering - Programming and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select Electronic Power Steering - Configuration and follow the on-screen instructions.
4. Ignition OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down.
5. Ignition ON.
6. On the SPS Supported Controllers screen, select Electronic Power Steering - Setup and follow the on-

screen instructions.

7. On the SPS Supported Controllers screen, select Electronic Power Steering - Endstop Learning procedure. Refer to **Power Steering Control Module Calibration (NJ1)**
8. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.

Steering Angle Sensor Centering and Software Endstop Learning

For the steering angle sensor centering and software endstop learning, refer to **Power Steering Control Module Calibration (NJ1)** .

Unsuccessful Programming Recovery

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. Ignition ON. Ensure the control module, DLC and programming tool connections are secure and the SPS software is up to date.
2. Verify the control module can be reprogrammed.
 - **If the control module cannot be reprogrammed**
 1. Ignition OFF for one minute, ignition ON.
 2. Verify the control module can be reprogrammed.
 - If the control module cannot be reprogrammed, replace the control module.
 - If the control module can be reprogrammed.
 3. All OK.
 - **If the control module can be reprogrammed**
3. All OK.

RADIO CONTROL PROGRAMMING AND SETUP

NOTE:

- **DO NOT** program a control module unless directed to by a service procedure or a service bulletin. If the control module is not properly configured with the correct calibration software, the control module will not control all of the vehicle features properly.
- Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or control module damage may occur.
- Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. When required install the EL-49642 SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. **DO NOT** connect a battery charger.
- Turn OFF or disable systems that may put a load on the vehicles battery

such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.

- During the programming procedure, follow the SPS prompts for the correct ignition switch position.
- Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.

Reference Information

Special Tools

EL-49642 SPS Programming Support Tool

For equivalent regional tools, refer to **Special Tools**.

Replace Control Module

The replacement control module is fully programmed by the supplier and does not require SPS programming or any setup procedures.

Reprogram Control Module

To reprogram an existing control module, perform the following procedure:

1. Install **EL-49642** SPS Programming Support Tool.
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select A22 Radio Controls - Programming and follow the on-screen instructions.
4. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.

Unsuccessful Programming Recovery

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. Ignition ON. Ensure the control module, DLC and programming tool connections are secure and the SPS software is up to date.
2. Verify the control module can be reprogrammed.
 - **If the control module cannot be reprogrammed**
 1. Ignition OFF for one minute, ignition ON.
 2. Verify the control module can be reprogrammed.
 - If the control module cannot be reprogrammed, replace the control module.
 - If the control module can be reprogrammed.
 - 3. All OK.
 - **If the control module can be reprogrammed**

3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for control module replacement, programming and setup

RADIO PROGRAMMING AND SETUP

NOTE:

- **DO NOT program a control module unless directed to by a service procedure or a service bulletin. If the ECU is not properly configured with the correct calibration software, the ECU will not control all of the vehicle features properly.**
- **Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or ECU damage may occur.**
- **Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. Install the EL-49642 SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. DO NOT connect a battery charger.**
- **Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.**
- **During the programming procedure, follow the SPS prompts for the correct ignition switch position.**
- **Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.**

Diagnostic Aids

- During radio programming you may be required to select multiple calibrations dependant upon vehicle equipment. Have the vehicle build/RPO information available during the following procedure to ensure the correct calibrations are selected.
- The XM satellite radio (if equipped) is integrated into the radio. If XM was activated in the previous radio, the replacement radio will require no additional activation steps. Customer subscription information is transferred to the replacement radio when a replacement radio is ordered.

Reference Information

Special Tools

EL-49642 SPS Programming Support Tool

For equivalent regional tools, refer to **Special Tools**.

Replace and Program Control Module or Reprogram Control Module

To program a replacement or an existing control module, perform the following procedure:

1. Install **EL-49642** SPS Programming Support Tool.
2. Access the Service Programming System (SPS) and follow the on-screen instructions.
3. On the SPS Supported Controllers screen, select A11 Radio - Programming and follow the on-screen instructions.
4. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.

Unsuccessful Programming Recovery

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. Ignition ON. Ensure the control module, DLC and programming tool connections are secure and the SPS software is up to date.
2. Verify the control module can be reprogrammed.
 - **If the control module cannot be reprogrammed**
 1. Ignition OFF for one minute, ignition ON.
 2. Verify the control module can be reprogrammed.
 - If the control module cannot be reprogrammed, replace the control module.
 - If the control module can be reprogrammed.
 3. All OK.
 - **If the control module can be reprogrammed**
3. All OK.

Valet Mode Reset

1. Verify no DTCs are set.
 - **If any DTCs are set**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If no DTCs are set**
2. Select the Radio control function Erase Valet Mode Code with the scan tool.
 3. Select Clear and confirm the selection to erase the code.

REAR DIFFERENTIAL CLUTCH CONTROL MODULE PROGRAMMING AND SETUP

The following service procedures require either a programming or a setup event performed for a complete repair.

Rear Drive Clutch Control Module Replacement

NOTE: **The transfer case solenoid valve and the rear drive clutch control module must always be replaced together due to calibration reasons.**

If the rear drive clutch control module needs to be replaced, the following procedures must be performed:

1. Connect a scan tool to the vehicle and access SPS. Refer to **Service Programming System (SPS)**.
2. Perform the SPS function Rear Differential Clutch Control Module - Programming and follow the on-screen instructions.
3. Perform the SPS function Rear Differential Clutch Control Module - Configuration & Setup and follow the on-screen instructions. On the screen Control Module - Configuration and Setup Function(s), select both ECU Configuration / Reconfiguration and ECU Setup.
4. Clear DTCs after completing the programming procedure.

Rear Drive Clutch Control Module Reprogramming

Do not reprogram the rear drive clutch control module unless directed by a service procedure or a service bulletin.

1. Connect a scan tool to the vehicle and access SPS. Refer to **Service Programming System (SPS)**.
2. Perform the SPS function Rear Differential Clutch Control Module - Programming and follow the on-screen instructions.
3. Clear DTCs after completing the programming procedure.

Component Replacement

The transfer case solenoid valve and the rear drive clutch control module must always be replaced together due to calibration reasons.

REMOTE CONTROL DOOR LOCK RECEIVER PROGRAMMING AND SETUP

Diagnostic Aids

The remote control door lock receiver only functions as an antenna, receiving the signals sent by the keyless entry transmitter and forwarding them to the body control module (BCM). The keyless entry software is contained wholly within the BCM.

Replace and Program ECU or Reprogram ECU

This ECU does not require SPS programming or any setup procedures.

SERVICE PROGRAMMING SYSTEM (SPS)

Special Tools

EL-49642 SPS Programming Support Tool

For equivalent regional tools, refer to **Special Tools**.

For step-by-step control module programming instructions, please refer to the techline information system (TIS) terminal.

Review the information below to ensure proper programming protocol.

NOTE:

- **DO NOT program a control module unless you are directed by a service procedure or you are directed by a General Motors service bulletin. Programming a control module at any other time will not permanently correct a customers concern.**
- **It is essential that the TIS terminal, MDI, and/or Scan Tool, is equipped with the latest software before performing service programming.**
- **Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. When required, install the EL-49642 SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12V jumper or booster pack disconnected from the AC voltage supply. DO NOT connect a battery charger.**
- **Some modules will require additional programming/setup events to be performed before or after programming.**
- **Some vehicles may require the use of a CANDi or MDI module for programming.**
- **Review the appropriate service information for these procedures.**
- **DTCs may set during programming. Clear DTCs after programming is complete.**
- **Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.**

Ensure the following conditions are met before programming a control module:

- **Vehicle system voltage:**
 - There is not a charging system concern. All charging system concerns must be repaired before programming a control module.
 - Battery voltage is greater than 12 volts but less than 16 volts. The battery must be fully charged before programming the control module.
 - Turn OFF or disable any system that may put a load on the vehicles battery, such as the following components:
 - Interior lights
 - Exterior lights including daytime running lights (DRL)-Applying the parking brake, on most vehicles, disables the DRL system

- Heating, ventilation, and air conditioning (HVAC) systems
- Engine cooling fans
- Radio, etc.
- The ignition switch must be in the proper position. SPS prompts you to turn ON the ignition, with the engine OFF. DO NOT change the position of the ignition switch during the programming procedure, unless instructed to do so.
- Make certain all tool connections are secure, including the following components and circuits:
 - Scan Tool
 - The RS-232 communication cable port
 - The connection at the data link connector (DLC)
 - The voltage supply circuits
 - MDI
 - The USB, Ethernet or Wireless communication port
 - The connection at the data link connector (DLC)
- DO NOT disturb the tool harnesses while programming. If an interruption occurs during the programming procedure, programming failure or control module damage may occur.

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. DO NOT turn the ignition OFF. Ensure that all control module and DLC connections are secure and the TIS terminal operating software is up to date.
2. Attempt to reprogram the control module.
3. If the control module can still not be programmed, turn the ignition OFF for at least one minute.
4. Turn the ignition ON and attempt to reprogram the control module. The control module should program.
 - If the control module still cannot be programmed, replace the control module.

After successfully programming the control module, ensure that all post programming procedures are performed; refer to **Control Module References** for the appropriate control module Programming and Setup document for any required procedures.

SIDE OBJECT SENSOR PROGRAMMING AND SETUP

NOTE:

- **DO NOT program a side object sensor - left unless directed to by a service procedure or a service bulletin. If the side object sensor - left is not properly configured with the correct calibration software, the side object sensor - left will not control all of the vehicle features properly.**
- **Ensure the programming tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during programming, programming failure or side object sensor - left damage may occur.**
- **Stable battery voltage is critical during programming. Any fluctuation, spiking, over voltage or loss of voltage will interrupt programming. When**

required install the EL-49642 SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack disconnected from the AC voltage supply. DO NOT connect a battery charger.

- **Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.**
- **During the programming procedure, follow the SPS prompts for the correct ignition switch position.**
- **Clear DTCs after programming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.**

Diagnostic Aids

The B218R Side Object Sensor Module - Right is not programmable separately. This module is programmed by B218L Side Object Sensor Module - Left after it has been programmed. If a right side module is replaced, follow this procedure to update the module.

Replace and Program Control Module or Reprogram Control Module

To program a replacement or an existing B218L Side Object Sensor Module - Left, perform the following procedure:

1. Access the Service Programming System (SPS) and follow the on-screen instructions.
2. On the SPS Supported Controllers screen, select B218L Side Object Sensor Module - Left - Programming and follow the on-screen instructions.
3. At the end of programming, choose the "Clear All DTCs" function on the SPS screen.

Unsuccessful Programming Recovery

In the event of an interrupted or unsuccessful programming event, perform the following steps:

1. Ignition ON. Ensure the B218L Side Object Sensor Module - Left, DLC and programming tool connections are secure and the SPS software is up to date.
2. Verify the B218L Side Object Sensor Module - Left can be reprogrammed.
 - **If the B218L Side Object Sensor Module - Left cannot be reprogrammed**
 1. Ignition OFF for one minute, ignition ON.
 2. Verify the B218L Side Object Sensor Module - Left can be reprogrammed.
 - If the B218L Side Object Sensor Module - Left cannot be reprogrammed, replace the B218L Side Object Sensor Module - Left.
 - If the B218L Side Object Sensor Module - Left can be reprogrammed.
 3. All OK.
 - **If the B218L Side Object Sensor Module - Left can be reprogrammed**
3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for side object sensor module - left replacement, programming and setup.

SUNROOF CONTROL MODULE PROGRAMMING AND SETUP

When replacing the sunroof motor/control module, the sunroof motor/actuator initialization/teach procedure must be followed.

Existing or New Motor

For the sunroof motor/actuator initialization/teach procedure refer to **Sunroof Motor/Actuator Initialization/Teach Process** .

DIAGNOSTIC INFORMATION AND PROCEDURES

PROPELLER SHAFT DIAGNOSIS

Review the propeller shaft system function. Refer to **Propeller Shaft Description and Operation**.

Inspect for loose or missing propeller shaft-to-flange bolts. Tighten or replace as necessary. Refer to **Propeller Shaft Replacement**.

Inspect for loose bracket bolts and damaged rubber bushings. Tighten or replace as necessary. Refer to **Propeller Shaft Replacement**.

The propeller shaft and the joints are not serviceable.

The joint seals should be inspected for the following:

- Tears
- Cracks
- Contamination of the lubricating grease

Carefully pinch the seal and feel for the presence of grit

- Loose or missing seal clamps
- Leakage of lubricating grease from the seals

The joints should be inspected for the following conditions:

- Binding or impeded motion during axial movement of the front and rear joints
- Binding or impeded motion during lateral movement of the rear joint
- Loose or missing crimped-on end caps
- Leakage of lubricating grease from the end caps

The propeller shaft must be replaced if any of the above conditions exist. This will ensure that the propeller shaft continues to operate as intended, and does not damage the other driveline components.

DESCRIPTION AND OPERATION

PROPELLER SHAFT DESCRIPTION AND OPERATION

The function of the propeller shaft is to transfer power from the transfer case to the differential clutch. It consists of three pipe sections, a front Rzeppa joint, two Polhem joints in the center and a rear Rzeppa joint. The

propeller shaft's support bearings are fitted by the Polhem joints. The bearings are mounted in rubber bushings which are fitted in brackets, and these in turn are bolted to the underside of the vehicle. The position of the brackets is very precisely measured during vehicle manufacture. The propeller shaft does not run in a straight line between the transfer case and the differential clutch but is instead gently curved, and this is to avoid vibration.

Front Drive Shaft

The propeller shaft connects into the transfer case pinion with a splines equipped pin which is part of the front drive shaft universal joint. The function of the joint is to handle the difference in angle between pinion and propeller shaft, as well as to be flexible longitudinally.

Support Bearings

Directly after the Polhem joints are the propeller shaft's support bearings, which are the single-row, permanently-lubricated groove ball bearing type. They are fitted in rubber bushings which in turn are fitted in brackets.

The brackets are bolted to the underside of the vehicle and their position is very precisely measured during vehicle manufacture. If the support bearing brackets are fitted incorrectly then vibration will occur.

Rear Drive Shaft

The propeller shaft connects to the differential clutch driver by means of the rear drive shaft universal joint which is bolted to the driver.

The function of the joint is to handle the difference in angle between differential clutch driver and propeller shaft, as well as to be flexible longitudinally. The rear drive shaft universal joint is also a Rzeppa joint and is friction welded to the rear pipe section and constitutes one unit together with the propeller shaft.

Front/Rear Drive Shaft Universal Joint (Rzeppa Joint)

The Rzeppa joint consists of an outer bearing race, which also constitutes the joint's housing. On its inside are 6 semi-spherical grooves. The inner bearing race consists of a cylindrical section, in the periphery of which are 6 semi-spherical grooves. The inner bearing race is fitted inside the outer one and there are 6 steel balls between the grooves. A ball holder is fitted between the outer and inner bearing races. There are steel balls between the bearing races which transfer the movement between outer and inner bearing races.

Center Joints (Polhem Joint)

There are Polhem joints fitted between front and center pipe sections as well as between center and rear pipe sections. Their function is to handle the angle difference between pipe sections. The joints are angled 45 degrees in relation to each other to avoid vibration.

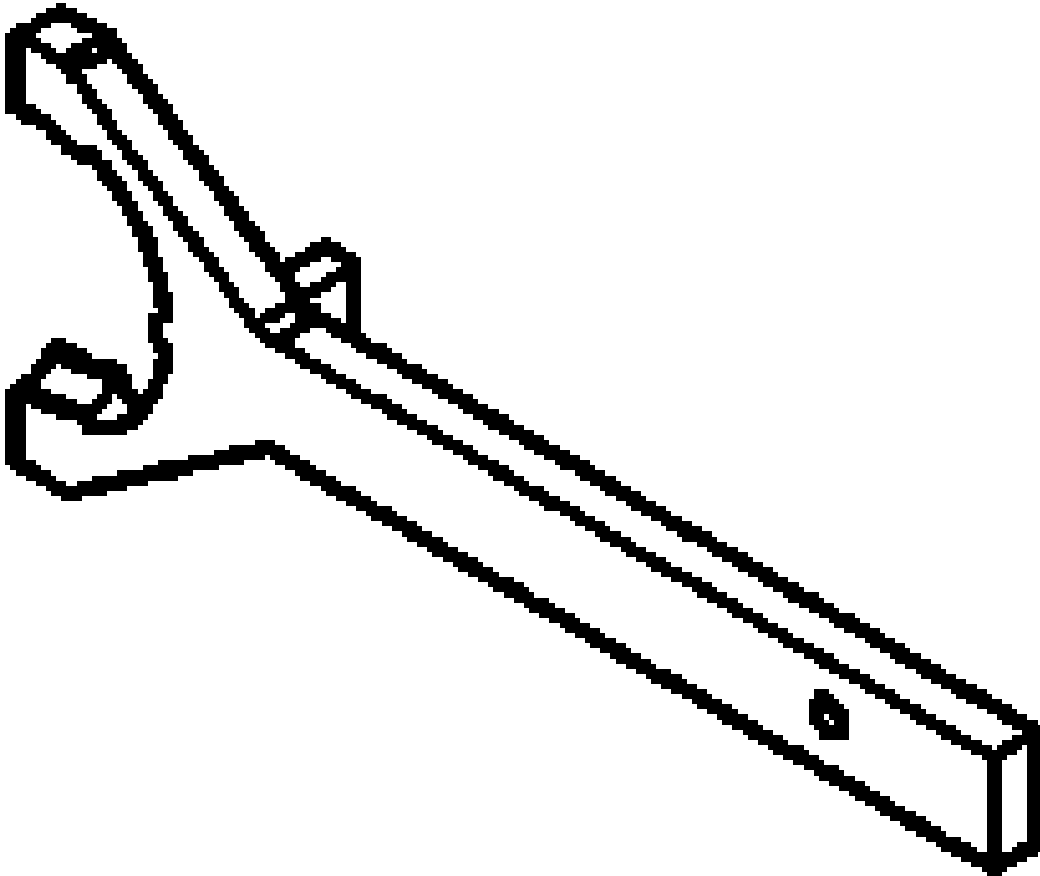

The Polhem joint consists of two forks, produced in forged steel which grip a cross by means of arms. The pins of the cross are mounted in needle bearings in the forks' bearing sleeves. The sleeves are permanently locked in the forks by means of compressive strain.

The bearing sleeves are permanently lubricated with synthetic special grease which contains molybdenum disulphide.

The drive shaft universal joint is friction welded to the relevant pipe section and constitutes one unit together with the propeller shaft.

DTC C0393: REAR DIFFERENTIAL CLUTCH SOLENOID VALVE CONTROL CIRCUIT HIGH CURRENT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C0393 0B

Rear Differential Clutch Solenoid Valve Control Circuit High Current

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control	C0393 0B	1	1	C0393 0B
1. Differential Lock Malfunction				

Circuit/System Description

The rear differential clutch solenoid valve is installed at the rear halfshaft leading to the rear left wheel. The rear differential clutch control module supplies battery voltage to the control circuit and ground to the low reference circuit of the solenoid valve. The solenoid valve is controlled by a pulse width modulation (PWM) signal. The solenoid valve controls the hydraulic pressure to the clutch package of the limited slip differential. The locking level of the limited slip differential depends on the engagement of the clutch package.

Conditions for Running the DTC

The ignition is ON.

Conditions for Setting the DTC

- The rear differential clutch control module detects a short to ground on the high solenoid valve control circuit.
- or
- The rear differential clutch control module detects a current more than 5.7 A.

Action Taken When the DTC Sets

One or more of the following actions may occur:

- All-wheel drive (AWD) is disabled.
- Service AWD is displayed on the driver information center.

Conditions for Clearing the DTC

- The condition for the DTC is no longer present.
- The DTC is not detected in 40 consecutive power cycles.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

Engine running, observe the scan tool Rear Differential Clutch Status parameter. The reading should be NORMAL when stationary.

Circuit/System Testing

1. Ignition OFF, inspect for damage of the wire, the solenoid or the housing.
 - If a damage is visible, replace the appropriate component.
2. Remove the K47 Rear Differential Clutch Control Module .
3. Test for a infinite resistance between the control circuit terminal B X2 and ground.
 - If not within the specified range, test the control circuit for a short to ground. If the circuit tests normal, replace the Q49 Rear Differential Clutch Solenoid Valve.
4. If the circuit tests normal, replace the K47 Rear Differential Clutch Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Limited Slip Differential Clutch Valve Replacement**
- **Control Module References** for rear differential clutch control module replacement, programming and setup

DTC C039F: AWD TORQUE SIGNAL

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C039F 00

AWD Torque Signal

Circuit/System Description

The rear differential clutch control module monitors the amount of torque transferred through the rear axle. If there is a mechanical malfunction that inhibits the torque transfer process the module will then set DTC C039F.

Conditions for Running the DTC

The ignition is ON.

Conditions for Setting the DTC

A mechanical malfunction exists that inhibits the torque transfer process.

Action Taken When the DTC Sets

One or more of the following actions may occur:

- All-wheel drive (AWD) is disabled.
- Service Rear Axle is displayed on the driver information center.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The DTC is not detected in 40 consecutive ignition cycles.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Engine running, observe the scan tool Rear Drive Clutch Status parameter. The scan tool should display TEMPORARILY LIMITED when stationary.
2. Verify that the following DTCs are not set along with DTC C039F:
 - C0402
 - C0403
 - C0406
 - C0407
 - If any of the DTCs listed are set, diagnose those codes first. Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .
3. Ensure that all differential fluid levels are at the proper levels. Refer to **Rear Axle Lubricant Level Inspection**, and **Differential Clutch Oil Inspection**.
 - If a fluid level is below specifications, inspect the rear differential assembly for leaks and repair as necessary. Refill to the proper level, clear codes, and road test. Verify that DTC C039F is not set. If the DTC resets, proceed to Circuit System Testing.

Circuit/System Testing

NOTE: **The rear drive clutch solenoid valve is calibrated with and is part of the rear differential clutch control module. Both components must be replaced as a matched set.**

Verify DTC C039F is not set.

- If the DTC is set, inspect the rear differential assembly for internal or external mechanical damage and repair as necessary. Clear codes and road test. Verify that DTC C039F is not set. If the DTC resets, replace the K47 Rear Differential Clutch Control Module or Q48 Rear Drive Clutch Solenoid Valve.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

Control Module References for rear differential clutch control module replacement, programming and setup

DTC C0402: TRANSFER CASE SOLENOID VALVE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Component	Condition	DTCs
Solenoid Valve	Mechanically Stuck	C0402 61
Solenoid Valve Rear Differential Clutch Control Module	Calibration EEPROM Error	C0402 43
	Calibration not Learned	C0402 4B

Circuit/System Description

The transfer case solenoid valve is installed at the torque transfer device housing . The rear differential clutch control module supplies battery voltage to the control circuit and ground to the low reference circuit of the solenoid valve. The solenoid valve is controlled by a pulse width modulation (PWM) signal. The solenoid valve controls the hydraulic pressure to the clutch package of the torque transfer device. The locking level of the torque transfer device depends on the engagement of the clutch package.

Conditions for Running the DTC

C0402 02, C0402 43 and C0402 4B

- The ignition is ON.
- The circuits are tested during start up of the rear differential clutch control module.

C0402 04

The ignition is ON.

C0402 61

- Engine running.
- Test runs when requested torque is less than 25 N.m (18 lb ft) and the calculated temperature is in the range of 0-90°C (32-194°F).

Conditions for Setting the DTC

C0402 02

A test voltage is applied to the transfer case solenoid valve. An error is detected if the resultant current is greater than the current which corresponds to less than 2 ohms resistance in the solenoid valve.

C0402 04

The measured current diverges from the nominal value with more than 200 mA for more than 100 ms.

C0402 43

The solenoid valve calibration values stored in the rear differential clutch control module EEPROM are invalid or out of bounds.

C0402 4B

There are no solenoid valve calibration values stored in the differential clutch control module EEPROM.

C0402 61

An error is detected if the solenoid valve is not moving fast enough for several times.

Action Taken When the DTC Sets

C0402 02, C0402 04 and C0402 61

One or more of the following actions may occur:

- All-wheel drive (AWD) is disabled.
- Service AWD is displayed on the driver information center.

C0402 43 and C0402 4B

An error record is stored in the rear differential clutch control module. No action will be performed.

Conditions for Clearing the DTC

- The condition for the DTC is no longer present.
- The DTC is not detected in 40 consecutive power cycles.

DTC C0403: AWD OIL FILTER REVERSE VALVE STUCK OPEN

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C0403 62

AWD Oil Filter Reverse Valve Stuck Open

Diagnostic Fault Information

Component	Condition	DTCs
Pump/Oil Filter Reverse Valve	Pump motor is spinning backwards because of clogged filter.	C0403 62

Circuit/System Description

The hydraulic pump delivers both solenoid valves with hydraulic oil pressure, the transfer solenoid valve and if installed the rear differential clutch solenoid valve. The pump is installed in the torque transfer device housing . The pressure of the system is calculated by means of the rear differential clutch control module measuring the motors power consumption. When the pressure reaches approximately 3 200 kPa (464 PSI) the rear differential clutch control module recognizes that the system pressure has been reached. The pump is shut down. If a voltage is detected after the pump is shut down after a certain limit an error is detected. The pump is spinning backwards.

Conditions for Running the DTC

- The ignition is ON.
- Test runs in temperature interval 0-80°C (0-176°F).

Conditions for Setting the DTC

A test voltage is applied to the transfer case solenoid valve. An error is detected if the resultant current is greater than the current which corresponds to less than 2 ohms in the solenoid valve.

Action Taken When the DTC Sets

One or more of the following actions may occur:

- All-wheel drive (AWD) is disabled
- Service AWD is displayed on the driver information center.

Conditions for Clearing the DTC

- The condition for the DTC is no longer present.
- The DTC is not detected in 40 consecutive power cycles.

DTC C0406: TRANSFER CASE SOLENOID VALVE CONTROL CIRCUIT HIGH CURRENT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C0406 0B

Transfer Case Solenoid Valve Control Circuit High Current

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control	C0406 0B	-	-	C0406 0B

Circuit/System Description

The transfer case solenoid valve and the oil pump are installed in the torque transfer device housing of the rear drive module. The rear differential clutch control module supplies battery voltage to the control circuit and ground to the low reference circuit of the solenoid valve and the oil pump motor. The solenoid valve is controlled by a pulse width modulation (PWM) signal. The solenoid valve controls the hydraulic pressure to the clutch package of the torque transfer device. The locking level depends on the engagement of the clutch package. The oil pump motor produces the oil pressure for both oil cycles.

Conditions for Running the DTC

The ignition is ON.

Conditions for Setting the DTC

- The rear differential clutch control module detects a short to ground on the control circuit of the solenoid valve and the oil pump motor.

or

- The rear differential clutch control module detects a current more than 11 A.

Action Taken When the DTC Sets

One or more of the following actions may occur:

- All-wheel drive (AWD) is disabled.
- Service AWD is displayed on the driver information center.

Conditions for Clearing the DTC

- The condition for the DTC is no longer present.
- The DTC is not detected in 40 consecutive power cycles.

Circuit/System Verification

Engine running, observe the scan tool Rear Drive Clutch Status parameter. The reading should be TEMPORARILY LIMITED when stationary.

Circuit/System Testing

1. Ignition OFF, inspect for signs of damage of the K47 Rear Differential Clutch Control Module, the M32 Differential Clutch Pump or the rear drive module housing.
 - If a damage is visible, replace the appropriate component.
2. Remove the K47 Rear Differential Clutch Control Module.
3. Test for infinite resistance between the control circuit terminal C X2 and ground.
 - If less than the specified value, replace the M32 Differential Clutch Pump.
4. Test for infinite resistance between the control terminal 1 X3 at the Q48 Rear Drive Clutch Solenoid Valve and ground.
 - If less than the specified value, replace the Q48 Rear Drive Clutch Solenoid Valve. If the circuits test normal, replace the K47 Rear Differential Clutch Control Module.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control	C0407 02	C0407 04	-	C0407 0B, C0407 64
Low Reference	C0407 02	C0407 04	C0407 04	C0407 02

Component	Condition	DTCs
AWD Oil Pump Motor	Oil leak, oil pump defect	C0407 0B, C0407 64

Circuit/System Description

The oil pump motor is installed in the torque transfer device housing . The rear differential clutch control module supplies battery voltage to the control circuit and ground to the low reference circuit of the oil pump motor. As soon as the engine is started the oil pump motor will be activated. The oil pump is running until the pressure of approximately 3 200 kPa (464 PSI) is reached. The oil pump motor power consumption is the indicator for the oil pressure. The consumption is constant when the full system pressure is reached. The rear differential clutch control module shuts down the pump motor when the full system pressure is reached. Below approximately 2 700 kPa (392 PSI) the pump motor will be restarted.

Conditions for Running the DTC

C0407 02 and C0407 04

- The ignition is ON.
- The oil pump motor voltage is above 4.8 V.

C0407 0B

- The ignition is ON.
- The oil pump motor is running.
- The oil temperature is above 0°C (32°F).

C0407 64

- The ignition is ON.
- The oil pump motor voltage is above 11.5 V.
- The oil temperature is above -20°C (-4°F).

Conditions for Setting the DTC

C0407 02

The oil pump current is more than 9.0 A in 20 consecutive test cycles. The current will be retested every 30 s.

C0407 04

The oil pump current is less than 0.3 A for 30 s.

C0407 0B

The oil pump current is more than 7.0 A for 2 s in 10 consecutive test cycles.

C0407 64

The oil pump current is below a threshold at the end of a pump activation cycle in 30 consecutive test cycles. The measured current is less than 1.5 A from the threshold. The threshold is temperature dependent.

Action Taken When the DTC Sets

C0407 02 and C0407 04

- All-wheel drive (AWD) is disabled.
- Service AWD is displayed on the driver information center.

C0407 0B and C0407 64

An error report entry is stored, no further action is performed.

Conditions for Clearing the DTC

- The condition for the DTC is no longer present.
- The DTC is not detected in 40 consecutive power cycles.

Circuit/System Verification

Engine running, observe the scan tool Rear Differential Clutch Pump Motor Current parameter. The reading should be between 2 500-3 500 mA when the pump is ON.

Circuit/System Testing

1. Ignition OFF, inspect for signs of damage of the wire, the oil pump motor and the housing.
 - If a damage is visible, replace the appropriate component.
2. Replace the M32 Differential Clutch Pump.
3. Ignition ON, verify the DTC does not reset.
 - If the DTC resets, replace the K47 Rear Differential Clutch Control Module.

Component Testing

Static Test

1. Ignition OFF, disconnect the X2 harness connector at the K47 Rear Differential Clutch Control Module.
2. Test for 4-7 ohms between the control circuit terminal C and the low reference circuit terminal D.
 - If not in the specified range, replace the M32 Differential Clutch Pump.

Component	Condition	DTCs
Solenoid Valve	Mechanically Stuck	C0408 61

Circuit/System Description

The rear differential clutch solenoid valve is installed at the rear halfshaft leading to the rear left wheel. The rear differential clutch control module supplies battery voltage to the control circuit and ground to the low reference circuit of the solenoid valve. The solenoid valve is controlled by a pulse width modulation (PWM) signal. The solenoid valve controls the hydraulic pressure to the clutch package of the limited slip differential. The locking level of the limited slip differential depends on the engagement of the clutch package.

Conditions for Running the DTC

C0408 02

- The ignition is ON.
- Vehicle is equipped with electronic limited slip differential.
- The test runs during start up of the rear differential clutch control module.

C0408 04

- The ignition is ON.
- Vehicle is equipped with electronic limited slip differential.
- The test runs with a frequency of 200 Hz.

C0408 61

- Vehicle is equipped with electronic limited slip differential.
- Engine running.
- Test runs when requested torque is less than 25 N.m (18 lb ft) and the calculated temperature is in the range of 0-120°C (32-248°F).

Conditions for Setting the DTC

C0408 02

A test voltage is applied to the rear differential clutch solenoid valve. An error is detected if the resultant current is greater than the current which corresponds to less than 2.1 ohms resistance in the solenoid valve.

C0408 04

The measured current diverges from the nominal value with more than 200 mA for more than 100 ms.

C0408 61

The valve is subjected to a current spike that should move the needle physically. An error is detected if the solenoid valve is not moving fast enough and an error counter reaches a threshold.

Action Taken When the DTC Sets

One or more of the following actions may occur:

- All-wheel drive (AWD) is disabled.
- Service AWD is displayed on the driver information center.

Conditions for Clearing the DTC

- The condition for the DTC is no longer present.
- The DTC is not detected in 40 consecutive power cycles.

Circuit/System Description

A temperature sensor is installed on the circuit board of the rear differential clutch control module. The value from this is used for calculating the board temperature and together with information on prevailing driving conditions the temperature of the fluid in the differential clutch is also calculated.

Conditions for Running the DTC

- The ignition is ON.
- The test runs with a frequency of 50 Hz.

Conditions for Setting the DTC

C0574 02

The analog-digital converter circuit is shorted to ground for more than 3 s.

C0574 04

The analog-digital converter circuit is open for more than 3 s.

C0574 13

The board temperature is greater than 115°C (239°F) for more than 3 s.

C0574 14

The board temperature is less than -40°C (-40°F) for more than 3 s.

Action Taken When the DTC Sets

One or more of the following actions may occur:

- All wheel drive (AWD) is disabled.
- Service AWD is displayed on the driver information center.

Conditions for Clearing the DTC

C0574 02 and C0574 04

- The condition for the DTC is no longer present.
- The circuit is not tested unless power is cycled.

C0574 13 and C0574 14

- The temperature is within the limit for more than 30 s.
- The circuit is tested with a frequency of 50 Hz.

Diagnostic Aids

C0574 13 and C0574 14

The DTCs C0574 13 and C0574 14 indicate that the rear differential clutch control module temperature is out of bounds. This is a temporary fault. The rear differential clutch control module is protected against running during

critical temperatures. As soon as the temperature reaches normal values the actual DTC is cleared.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

Ignition ON, observe the scan tool Rear Differential Clutch Control Module Temperature parameter. The reading should be between -40°C (-40°F) and 115°C (239°F) when stationary.

Circuit/System Testing

C0574 02 and 0574 04

Ignition ON. Verify that DTC C0574 02 or 0574 04 is not set.

- If any of the DTCs are set, replace the K47 Rear Differential Clutch Control Module.

C0574 13 and 0574 14

1. Ignition OFF, wait till the housing and the K47 Rear Differential Clutch Control Module temperatures are adapted to the environment temperature, approximately 0-40°C (32-104°F).
2. Ignition ON, verify that DTC C0574 13 or C0574 14 is not set.

- If any of the DTCs are set, replace the K47 Rear Differential Clutch Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Limited Slip Differential Clutch Valve Replacement**
- **Control Module References**

REPAIR INSTRUCTIONS

REAR DIFFERENTIAL CLUTCH CONTROL MODULE REPLACEMENT

Fig. 2: Rear Differential Clutch Control Module & Components
Courtesy of GENERAL MOTORS COMPANY

Rear Differential Clutch Control Module Replacement

Callout	Component Name
Preliminary Procedures	
Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u>	
1	Protective Cover
2	<p>Differential Clutch Control Module Bolts (Qty: 2)</p> <p>WARNING: The hydraulic pressure in the differential clutch is very high. To prevent personal injury, wait for at least 10 minutes before removing any parts from the differential clutch.</p> <p>CAUTION: Refer to <u>Fastener Caution</u> .</p>

	<p>Procedure DO NOT remove the mounting bolts, leave them attached to the Differential Clutch Control Module.</p> <p>Tighten 6 N.m (53 lb in)</p>
3	<p>Rear Differential Clutch Control Module and Seal</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Disconnect the electrical connector. <p>NOTE: Some oil may leak with the Differential Clutch control Module and valve removed.</p> <ol style="list-style-type: none"> 2. If the Differential Clutch control Module and the valve separate, perform the following: <ol style="list-style-type: none"> 1. Pull the valve straight out of the bore. 2. Assembly the Differential Clutch control Module and the valve prior to the installation of the seal. 3. Install the NEW seal. DO NOT re-use the old seal. 4. Clean the area with a lint free cloth prior to installing the Differential Clutch Control Module and the valve. 3. Program the rear differential clutch control module. Refer to <u>Control Module References</u> .

REAR AXLE LUBRICANT LEVEL INSPECTION

Fig. 3: Rear Axle Lubricant Level
 Courtesy of GENERAL MOTORS COMPANY

Rear Axle Lubricant Level Inspection

Callout	Component Name
Preliminary Procedure <ol style="list-style-type: none"> 1. Raise the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Ensure the vehicle is in level. 3. Inspect the rear axle for leaks. Repair if necessary. 	
1	Lubricant Fill Plug CAUTION: Refer to <u>Fastener Caution</u> . Procedure <ol style="list-style-type: none"> 1. Clean the area around the rear axle fill plug. 2. Add lubricant until the level is even with the bottom edge of the fill plug opening. Use the proper fluid. Refer to <u>Adhesives, Fluids, Lubricants, and Sealers</u>. Tighten 25 N.m (18 lb ft)

DIFFERENTIAL CLUTCH OIL INSPECTION

WARNING: The hydraulic pressure in the differential clutch is very high. To prevent personal injury, wait for at least 10 minutes before removing any parts from the differential clutch.

NOTE: The following steps must be followed to ensure the proper fluid level for the differential clutch fluid.

1. Run the engine at idling speed for 5 minutes to distribute the fluid.
2. In park, cycle throttle to wide open throttle briefly 5 times to cycle solenoids to purge air.
3. Turn the engine off.

NOTE: Ensure that the vehicle is as level as possible.

4. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .

Fig. 4: Identifying Rear Axle Lubricant Fill Plug
Courtesy of GENERAL MOTORS COMPANY

CAUTION: It is very important to observe maximum cleanliness when working

on the differential clutch. Dirt particles can seriously damage the function and service life of the differential clutch.

NOTE: The differential clutch fluid should be level with the top threads of the fill hole.

5. Remove the fill plug (1) and check the differential clutch fluid level.
6. Add the proper differential clutch fluid, if needed. Refer to Adhesives, Fluids, Lubricants, and Sealers, and Differential Clutch Oil Replacement.

CAUTION: Refer to Fastener Caution .

7. Install the fill plug (1) and tighten to 14 (10 lb ft).
8. Install the scan tool.
9. With engine running, observe the scan tool Rear Differential Clutch Pump Motor Current parameter. The parameter display should be between 2500-3500 mA when the pump is on. If the parameter is below 2500 mA, recheck the fluid level.
10. Repeat steps 1-6 to ensure the proper differential clutch fluid level.
11. Remove the supports and lower the vehicle.

DIFFERENTIAL OIL REPLACEMENT

Fig. 5: Rear Axle Lubricant Fill And Drain Plugs
 Courtesy of GENERAL MOTORS COMPANY

Differential Oil Replacement

Callout	Component Name
Preliminary Procedure <ol style="list-style-type: none"> 1. Raise the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Ensure the vehicle is in level. 3. Inspect the rear axle for leaks, repair if necessary. 	
1	Lubricant Fill Plug CAUTION: Refer to <u>Fastener Caution</u> . Procedure <ol style="list-style-type: none"> 1. Clean the area around the rear axle fill plug. 2. Add lubricant until the level is even with the bottom edge of the fill plug opening. Use the proper fluid. Refer to <u>Adhesives, Fluids, Lubricants, and Sealers</u>. NOTE: For vehicles with Limited Slip Differentials: Prior to adding the limited slip axle additive, the bottle MUST be shaken vigorously for at least three minutes to mix the additive thoroughly, then immediately poured into the differential. Tighten 25 N.m(18 lb ft)
2	Lubricant Drain Plug Tighten 25 N.m(18 lb ft)

DIFFERENTIAL CLUTCH OIL REPLACEMENT

Removal Procedure

WARNING: The hydraulic pressure in the differential clutch is very high. To prevent personal injury, wait for at least 10 minutes before removing any parts from the differential clutch.

NOTE: The vehicle should be as level as possible when performing this procedure.

NOTE: To adjust the differential clutch fluid to the proper level without draining,

go to step 12 of installation.

1. Raise the vehicle and support the vehicle. Refer to Lifting and Jacking the Vehicle .

CAUTION: It is very important to observe maximum cleanliness when working on the differential clutch. Dirt particles can seriously damage the function and service life of the differential clutch.

2. Remove the differential clutch cover to drain the differential clutch.

Fig. 6: Differential Clutch Vent Hose And Fitting
Courtesy of GENERAL MOTORS COMPANY

3. Remove the vent hose fitting (2) and the hose (1) from the differential clutch cover.

Installation Procedure

NOTE: Both the fluid level and clutch motor current parameter requirements must be met to ensure the differential is filled to specifications.

1. Install the differential clutch cover.

CAUTION: Refer to Fastener Caution .

NOTE: The following tighten procedure MUST BE PERFORMED TWICE to ensure the proper sealing around the accumulator and the filter.

2. Install the differential cover bolts and tighten to 6 (53 lb in) in a star pattern and repeat this torque sequence twice to ensure proper sealing around the accumulator and the filter.

CAUTION: Fluids for the differential clutch and the rear axle are different. The fluids must never be mixed or interchanged or vehicle damage will result.

3. Fill the differential clutch with 350 ml (12 ounces) of the proper differential fluid through the vent hose fitting hole. Refer to Adhesives, Fluids, Lubricants, and Sealers.
4. Remove the supports and lower the vehicle.
5. To stabilize the oil level, let the vehicle rest for 10 minutes with the ignition off.
6. Start the engine and allow to run for 5 minutes at idle.
7. In park, cycle the throttle to wide open briefly 5 times to cycle solenoids to purge air.
8. Shut the vehicle off.
9. Raise the vehicle.

Fig. 7: Identifying Rear Axle Lubricant Fill Plug
Courtesy of GENERAL MOTORS COMPANY

10. Remove the differential clutch level inspection plug (1).
11. The differential clutch fluid should be level with the bottom of the differential clutch fluid level inspection plug hole.
12. If needed, install the differential clutch level inspection plug and add 50 ml (1.7 ounce) through the vent fitting hole. Repeat step 4 through 11.

Fig. 8: Differential Clutch Vent Hose And Fitting
Courtesy of GENERAL MOTORS COMPANY

13. Install the vent hose fitting (2) and tighten to 14 (10 lb ft).
14. Install then vent hose (1).
15. Lower the vehicle.
16. Install the scan tool.

NOTE: When the clutch pump motor cycles from OFF to ON the current will also cycle from 0 mA to 2500-3500 mA. DTC C0407 64 is set when the pump current is **CONSTANTLY BELOW 2500 mA**.

17. With engine running, observe the scan tool Rear Differential Clutch Pump Motor Current parameter. The parameter display should be between 2500-3500 mA when the pump is on. If the parameter is below 2500 mA, repeat step 12.
18. Once desired parameter is reached check to ensure proper differential clutch fluid level. Remove fluid level inspection plug and allow any excess fluid to drain level with plug opening.

CAUTION: Refer to **Fastener Caution** .

19. Install the fill plug and tighten to 14 (10 lb ft).

DIFFERENTIAL CARRIER BUSHING REPLACEMENT - FRONT

Fig. 9: Identifying Differential Carrier Bushing - Front
Courtesy of GENERAL MOTORS COMPANY

Differential Carrier Bushing Replacement - Front

Callout	Component Name
Preliminary Procedure	
<ol style="list-style-type: none">1. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> .2. Remove the propeller shaft. Refer to <u>Propeller Shaft Replacement</u> .3. Remove the exhaust system. Refer to <u>Exhaust Muffler Replacement (Dual)</u> , <u>Exhaust Muffler Replacement (Single)</u> .	
1	<p>Differential Carrier Bushing - Front (Qty: 2)</p> <p>Procedure</p> <ol style="list-style-type: none">1. Support the rear differential with a hydraulic transmission jack stand.2. Remove the electrical connector from the rear differential clutch control module. Refer to <u>Rear Differential Clutch Control Module Replacement</u>.3. Remove the front and rear differential mounting bolts. Refer to <u>Differential Carrier Assembly Replacement</u>.4. Lower the rear differential until there is enough room to remove the differential carrier bushings5. Using the DT 49126-1 tool and the DT 49126-10 kit , remove the rear differential bushing.6. Position the NEW rear differential bushing with the beveled edges facing the housing (up).

7. Using the **DT 49126-2** tool and the **DT 49126-10** kit , install the NEW rear differential bushing.

Special Tools

- **DT 49126-1** Press Tool
- **DT 49126-2** Press Tool
- **DT 49126-10** Bushing Replacer Hardware Kit

For equivalent regional tools, refer to **Special Tools**.

DIFFERENTIAL CARRIER BUSHING REPLACEMENT - REAR

Fig. 10: Differential Carrier Bushing - Rear
Courtesy of GENERAL MOTORS COMPANY

Differential Carrier Bushing Replacement - Rear

Callout	Component Name
Preliminary Procedure	
Remove the differential carrier assembly. Refer to Differential Carrier Assembly Replacement .	
	Differential Carrier Bushing - Rear (Qty: 2)
Procedure	

1

1. Remove any debris from the area around the rear differential carrier bushing prior to removal.
2. Using the **CH-49158-1** tool and **CH-49158-2** tool , remove the rear differential carrier bushing.
3. Remove any residue from the old bushing before installing the new rear differential bushing.
4. Position the rear differential bushing in the rear support.
5. Using the **CH-49158** tool kit , install the rear differential bushings.

Special Tools**CH-49158** Presstool KitFor equivalent regional tools, refer to **Special Tools**.**REAR AXLE SHAFT SEAL REPLACEMENT - LEFT SIDE****Fig. 11: Rear Axle Shaft Seal - Left Side (Yellow Seal)**

Courtesy of GENERAL MOTORS COMPANY

Rear Axle Shaft Seal Replacement - Left Side

Callout	Component Name
Preliminary Procedure	
Remove the left rear wheel drive shaft. Refer to <u>Rear Wheel Drive Shaft Replacement</u>	
	Rear Axle Shaft Seal

Procedure

1. Using the **GE-23907-1** hammer and the **DT-29369-2** puller , remove the rear axle seal.
2. Using the **DT-48077** installer , install the rear axle seal.
3. Apply a small amount of lubricant to the contact area between the seal and axle. Refer to **Adhesives, Fluids, Lubricants, and Sealers**.
4. Check lubricant level. Refer to **Rear Axle Lubricant Level Inspection** .

1

NOTE:

Remove excess lubricant from the seal.

Special Tools

- **DT-29369-2** Drive Shaft Seal Puller
- **DT-48077** Seal Installer
- **GE-23907-1** Slide Hammer

For equivalent regional tools, refer to **Special Tools**

REAR AXLE SHAFT SEAL REPLACEMENT - RIGHT SIDE

Fig. 12: Rear Axle Shaft Seal - Right Side
 Courtesy of GENERAL MOTORS COMPANY

Rear Axle Shaft Seal Replacement - Right Side

Callout	Component Name
Preliminary Procedure Remove the right rear wheel drive shaft. Refer to <u>Rear Wheel Drive Shaft Replacement</u> .	
1	Rear Axle Shaft Seal Procedure <ol style="list-style-type: none"> Using the GE-23907-1 hammer and the DT-29369-2 puller , remove the rear axle seal. Using the DT-48077 installer , install the rear axle seal. Apply a small amount of lubricant to the contact area between the seal and axle. Refer to <u>Adhesives, Fluids, Lubricants, and Sealers</u>. Check lubricant level. Refer to <u>Rear Axle Lubricant Level Inspection</u> NOTE: Remove excess lubricant from the seal. Special Tools <ul style="list-style-type: none"> DT-29369-2 Drive Shaft Seal Puller DT-48077 Seal Installer GE-23907-1 Slide Hammer For equivalent regional tools, refer to <u>Special Tools</u>

DIFFERENTIAL CARRIER ASSEMBLY REPLACEMENT

Removal Procedure

- Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
- If replacing the rear differential assembly, drain the rear differential fluid. Refer to **Differential Clutch Oil Replacement**, and **Differential Oil Replacement**.
- Remove the propeller shaft assembly. Refer to **Propeller Shaft Replacement** .
- Remove the exhaust muffler assembly. Refer to **Exhaust Muffler Replacement (Dual)** , **Exhaust Muffler Replacement (Single)** .
- Remove the parking brake cables. Refer to **Parking Brake Rear Cable Replacement** .
- Remove the wheel drive shaft. Refer to **Rear Wheel Drive Shaft Replacement** .
- Disconnect the electrical connectors from the rear differential assembly to the chassis.

NOTE: Ensure that the rear differential is securely fastened to the hydraulic jack stand.

8. Support the rear differential assembly with a hydraulic transmission jack.

Fig. 13: Rear Differential Assembly Mounting Bolts
Courtesy of GENERAL MOTORS COMPANY

9. Remove the rear differential assembly mounting bolts (1).

Fig. 14: Identifying Front Differential Mounting Bolts
Courtesy of GENERAL MOTORS COMPANY

10. Remove the front differential mounting bolts (1).

Fig. 15: Rear Differential Assembly
Courtesy of GENERAL MOTORS COMPANY

11. Using the hydraulic jack stand, remove the rear differential assembly (1) from the vehicle.

Installation Procedure

Fig. 16: Rear Differential Assembly

Courtesy of GENERAL MOTORS COMPANY

1. Using the hydraulic jack stand, position the rear differential assembly (1) in the vehicle.

Fig. 17: Identifying Front Differential Mounting Bolts
Courtesy of GENERAL MOTORS COMPANY

2. Clean the bolts and apply thread locker on the threads. Refer to **Adhesives, Fluids, Lubricants, and Sealers**

CAUTION: Refer to **Fastener Caution** .

3. Install the front differential mounting bolts (1) and tighten to:
 - First Pass: 90 (66 lb ft)
 - Final Pass: plus 90 to 105 degrees

Fig. 18: Rear Differential Assembly Mounting Bolts
Courtesy of GENERAL MOTORS COMPANY

4. Install the rear differential assembly mounting bolts (1) and tighten to:
 - First Pass: 90 (66 lb ft)
 - Final Pass: plus 90 to 105 degrees
5. Remove the hydraulic jack stand.
6. Install the wheel drive shafts. Refer to **Rear Wheel Drive Shaft Replacement** .
7. Install the parking brake cable . Refer to **Parking Brake Rear Cable Replacement** .
8. Reconnect the electrical connectors from the rear differential assembly to the chassis.
9. Install the exhaust muffler assembly. Refer to **Exhaust Muffler Replacement (Dual)** , **Exhaust Muffler Replacement (Single)** .
10. Install the propeller shaft assembly. Refer to **Propeller Shaft Replacement** .
11. Check the fluid level of the rear differential assembly. Refer to **Differential Clutch Oil Inspection**, and **Rear Axle Lubricant Level Inspection**.
12. If installing a NEW rear differential assembly, fill with the proper fluid. Refer to **Differential Clutch Oil Replacement**, and **Differential Oil Replacement**.
13. Remove the supports and lower the vehicle.
14. Program the rear differential assembly. Refer to **Control Module References** .

PROPELLER SHAFT FLANGE REPLACEMENT

Fig. 19: View Of Propeller Shaft Flange & Nut
Courtesy of GENERAL MOTORS COMPANY

Propeller Shaft Flange Replacement

Callout	Component Name
Preliminary Procedure Remove the propeller shaft. Refer to Propeller Shaft Replacement .	
1	Propeller Shaft Flange Nut CAUTION: Refer to Fastener Caution . Procedure 1. Using the DT 44873-2 holder and the DT 8614-A holder , remove the propeller shaft flange nut. 2. Using the DT 8614-A holder , install the propeller shaft flange nut. Tighten 100 N.m (74 lb ft) Special Tools <ul style="list-style-type: none">• DT 8614-A Pinion Flange Holder• DT 44873-2 Pinion Flange Holder and Remover Bolts For equivalent regional tools, refer to Special Tools .
	Propeller Shaft Flange

2	<p>Procedure</p> <ol style="list-style-type: none"> 1. Replace the Differential Clutch Seal. Refer to <u>Differential Clutch Seal Replacement (Outer)</u>, <u>Differential Clutch Seal Replacement (Inner)</u>. 2. Inspect the oil level. Refer to <u>Differential Clutch Oil Inspection</u>.

LIMITED SLIP DIFFERENTIAL CLUTCH PIPE CONNECTOR REPLACEMENT

Fig. 20: Limited Slip Differential Clutch Pipe Connectors
 Courtesy of GENERAL MOTORS COMPANY

Limited Slip Differential Clutch Pipe Connector Replacement

Callout	Component Name
<p>CAUTION:</p> <p>It is very important to observe maximum cleanliness when working on the differential clutch. Dirt particles can seriously damage the function and service life of the differential clutch.</p> <p>Preliminary Procedure Remove the rear differential carrier assembly. Refer to <u>Differential Carrier Assembly Replacement</u>.</p>	
	<p>Limited Slip Differential Clutch Pipe Connectors (Qty: 4)</p> <p>WARNING:</p> <p>The hydraulic pressure in the differential clutch is very high. To prevent personal injury, wait for at least 10 minutes before removing any parts from the differential clutch.</p>

1	<p>CAUTION: Refer to <u>Fastener Caution</u> .</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Remove the limited slip differential clutch low pressure pipe, refer to <u>Limited Slip Differential Clutch Low Pressure Pipe Replacement</u>, or limited slip differential clutch high pressure pipe, refer to <u>Limited Slip Differential Clutch High Pressure Pipe Replacement</u>. 2. Check the fluid level of the rear differential clutch. Refer to <u>Differential Clutch Oil Inspection</u>. <p>Tighten 7 N.m (62 lb in)</p>
---	---

LIMITED SLIP DIFFERENTIAL CLUTCH LOW PRESSURE PIPE REPLACEMENT

Fig. 21: View Of Limited Slip Differential Clutch Low Pressure Pipe & Springs
 Courtesy of GENERAL MOTORS COMPANY

Limited Slip Differential Clutch Low Pressure Pipe Replacement

Callout	Component Name
<p>CAUTION: It is very important to observe maximum cleanliness when working on the differential clutch. Dirt particles can seriously damage the function and service life of the differential clutch.</p> <p>Preliminary Procedure Remove the differential carrier assembly. Refer to <u>Differential Carrier Assembly Replacement</u>.</p>	
	<p>Limited Slip Differential Clutch Low Pressure Pipe Spring (Qty: 2)</p> <p>Procedure</p>

1	Using a small pick or flat bladed screwdriver, remove and discard the spring from the connector and replace with NEW. TIP: Ensure that the pipe is fully inserted into the connector before installing the spring.
2	Limited Slip Differential Clutch Low Pressure Pipe WARNING: The hydraulic pressure in the differential clutch is very high. To prevent personal injury, wait for at least 10 minutes before removing any parts from the differential clutch. Procedure Check the fluid level of the rear differential clutch. Refer to <u>Differential Clutch Oil Inspection.</u>

LIMITED SLIP DIFFERENTIAL CLUTCH HIGH PRESSURE PIPE REPLACEMENT

Fig. 22: Limited Slip Differential Clutch High Pressure Pipe & Springs
Courtesy of GENERAL MOTORS COMPANY

Limited Slip Differential Clutch High Pressure Pipe Replacement

Callout	Component Name
CAUTION: It is very important to observe maximum cleanliness when working on the differential clutch. Dirt particles can seriously damage the function and service life of the differential clutch.	
Preliminary Procedure Remove the differential carrier assembly. Refer to <u>Differential Carrier Assembly Replacement.</u>	
1	Limited Slip Differential Clutch High Pressure Pipe Spring (Qty: 2) Procedure Using a small pick or flat bladed screwdriver, remove and discard the spring from the connector and replace with NEW. TIP: Ensure that the pipe is fully inserted into the connector before installing the spring.

2

Limited Slip Differential Clutch High Pressure Pipe

WARNING:

The hydraulic pressure in the differential clutch is very high. To prevent personal injury, wait for at least 10 minutes before removing any parts from the differential clutch.

Procedure

Check the fluid level of the rear differential clutch. Refer to **Differential Clutch Oil Inspection.**

LIMITED SLIP DIFFERENTIAL CLUTCH VALVE REPLACEMENT

Fig. 23: View Of Limited Slip Differential Clutch Valve, Connector & Fasteners
Courtesy of GENERAL MOTORS COMPANY

Limited Slip Differential Clutch Valve Replacement

Callout	Component Name
CAUTION: It is very important to observe maximum cleanliness when working on the differential clutch. Dirt particles can seriously damage the function and service life of the differential clutch.	
Preliminary Procedure Remove the propeller shaft. Refer to <u>Propeller Shaft Replacement</u> .	
1	Differential Clutch Valve Electrical Connector Procedure Lower the rear axle assembly to gain access to the differential clutch valve. Refer to <u>Differential Carrier Assembly Replacement.</u>
	Differential Clutch Valve Fastener (Qty: 2) WARNING: The hydraulic pressure in the differential clutch is very high. To prevent personal injury, wait for at least 10 minutes before removing any parts from the differential clutch.

2	CAUTION: Refer to <u>Fastener Caution</u> . Tighten 3 N.m (27 lb in)
3	Limited Slip Differential Clutch Valve and Gasket Procedure Check the fluid level of the rear differential clutch. Refer to <u>Differential Clutch Oil Inspection</u> . TIP: Preassemble assembly on the bench and use a new gasket. DO NOT reuse the old gasket.

LIMITED SLIP DIFFERENTIAL CLUTCH REPLACEMENT

Fig. 24: View Of Limited Slip Differential Clutch & Bolts
Courtesy of GENERAL MOTORS COMPANY

Limited Slip Differential Clutch Replacement

Callout	Component Name
CAUTION: It is very important to observe maximum cleanliness when working on the differential clutch. Dirt particles can seriously damage the function and service life of the differential clutch.	

Preliminary Procedures

1. Remove the differential carrier assembly. Refer to **Differential Carrier Assembly Replacement**.
2. Drain the rear differential fluid. Refer to **Differential Oil Replacement**.
3. Remove the limited slip differential clutch low pressure pipes. Refer to **Limited Slip Differential Clutch Low Pressure Pipe Replacement**.
4. Remove the limited slip differential clutch high pressure pipes. Refer to **Limited Slip Differential Clutch High Pressure Pipe Replacement**.

1	<p>Limited Slip Differential Clutch Bolt (Qty: 6)</p> <p>WARNING: The hydraulic pressure in the differential clutch is very high. To prevent personal injury, wait for at least 10 minutes before removing any parts from the differential clutch.</p> <p>CAUTION: Refer to <u>Fastener Caution</u> .</p> <p>Procedure Remove the electrical connector for the limited slip differential valve. Tighten 30 N.m(22 lb ft)</p>
2	<p>Limited Slip Differential Clutch</p> <p>Procedure</p> <ol style="list-style-type: none">1. Ensure sealing surface is clean and free of any old seal material and new seal is attached to clutch upon installation.2. Check the fluid level of the rear drive axle. Refer to <u>Differential Clutch Oil Inspection</u>, and <u>Differential Oil Replacement</u>.

DIFFERENTIAL SEAL REPLACEMENT

Fig. 25: Differential Seal And Special Tools
 Courtesy of GENERAL MOTORS COMPANY

Differential Seal Replacement

Callout	Component Name
Preliminary Procedure	
<ol style="list-style-type: none"> 1. Remove the differential carrier assembly. Refer to <u>Differential Carrier Assembly Replacement</u>. 2. Drain the rear axle from oil. Refer to <u>Differential Oil Replacement</u>. 	
1	<p>Differential Seal</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Using DT-49231 remover , tighten the puller bolts properly before removing the seal. 2. Using DT-869-4 installer , install the differential seal. 3. Fill the rear axle to the proper level with new fluid. Refer to <u>Adhesives, Fluids, Lubricants, and Sealers</u>. <p>Special Tools</p> <ul style="list-style-type: none"> • DT-49231 Seal Remover • DT-869-4 Seal Installer

Courtesy of GENERAL MOTORS COMPANY

Differential Clutch Replacement

Callout	Component Name
CAUTION: It is very important to observe maximum cleanliness when working on the differential clutch. Dirt particles can seriously damage the function and service life of the differential clutch.	
Preliminary Procedure Remove the rear differential assembly from the vehicle. Refer to Differential Carrier Assembly Replacement .	
1	Protective Cover
2	Rear Axle Fastener (Qty: 4) WARNING: The hydraulic pressure in the differential clutch is very high. To prevent personal injury, wait for at least 10 minutes before removing any parts from the differential clutch. CAUTION: Refer to Fastener Caution . Tighten 30 N.m (22 lb ft)
	Differential Clutch Procedure

3

1. Remove the limited slip differential clutch pipes, if needed.
 - For the limited slip differential clutch low pressure pipe, refer to **Limited Slip Differential Clutch Low Pressure Pipe Replacement**.
 - For the limited slip differential clutch high pressure pipe, refer to **Limited Slip Differential Clutch High Pressure Pipe Replacement**.
2. Check/fill oil level in the rear differential clutch. Refer to **Differential Clutch Oil Inspection**.
3. Program the rear differential clutch control module. Refer to **Service Programming System (SPS)** .

DIFFERENTIAL CLUTCH PUMP REPLACEMENT

Fig. 27: Identifying Differential Clutch Pump & Components
 Courtesy of GENERAL MOTORS COMPANY

Differential Clutch Pump Replacement

Callout	Component Name
CAUTION: It is very important to observe maximum cleanliness when working on the differential clutch. Dirt particles can seriously damage the function and service life of the differential clutch.	
Preliminary Procedure Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> .	
1	Differential Carrier Splash Guard Shield, If Installed

2	<p>Differential Clutch Pump Bolts</p> <p>CAUTION: Refer to <u>Fastener Caution</u> .</p> <p>Procedure Clean the threads and apply LOCTITE™. Refer to <u>Adhesives, Fluids, Lubricants, and Sealers</u>. Tighten 6 N.m (53 lb in)</p>
3	Differential Clutch Pump O-rings (Qty: 2)
4	<p>Differential Clutch Pump</p> <p>WARNING: The hydraulic pressure in the differential clutch is very high. To prevent personal injury, wait for at least 10 minutes before removing any parts from the differential clutch.</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Remove the electrical connector from the differential clutch pump. 2. Check the fluid level of the differential clutch. Refer to <u>Differential Clutch Oil Inspection</u>. <p>TIP: Approximately 80 ml of oil will drain when the pump is removed.</p>

DIFFERENTIAL CLUTCH SEAL REPLACEMENT (OUTER)

Fig. 28: Identifying Differential Clutch Seal (Outer)
Courtesy of GENERAL MOTORS COMPANY

Differential Clutch Seal Replacement (Outer)

Callous	Component Name
Preliminary Procedure Remove the propeller shaft flange. Refer to Propeller Shaft Flange Replacement .	
1	Differential Clutch Seal
	Procedure 1. Remove the differential clutch seal. 2. Using the DT 49065 installer , install the differential clutch seal. 3. Check lubricant level. Refer to Differential Clutch Oil Inspection .
	Special Tools DT 49065 Seal Installer
	For equivalent regional tools, refer to Special Tools .

DIFFERENTIAL CLUTCH SEAL REPLACEMENT (INNER)

Fig. 29: Locating Differential Seal (Inner)
Courtesy of GENERAL MOTORS COMPANY

Differential Clutch Seal Replacement (Inner)

Callout	Component Name

Preliminary Procedure

Remove the differential clutch. Refer to **Differential Clutch Replacement**.

1	<p>Differential Clutch Seal</p> <p>Procedure</p> <ol style="list-style-type: none">1. Position a wrench cross the differential clutch.2. Using a flat bladed screwdriver, remove the differential clutch seal (1).3. Remove the open end wrench.4. Apply a small amount of lubricant to the seal prior to installing it in the differential clutch. Refer to <u>Adhesives, Fluids, Lubricants, and Sealers</u>.5. Using the DT- 50022 installer and the DT 8092 handle , install the differential clutch seal (1). <p>TIP: The seal shall be flush with the axle.</p> <p>Special Tools</p> <ul style="list-style-type: none">• DT 8092 Universal Handle• DT 50022 Seal Installer <p>For equivalent regional tools, refer to <u>Special Tools</u>.</p>

DIFFERENTIAL CLUTCH OIL FILTER REPLACEMENT

Fig. 30: Differential Clutch Oil Filter & Components
 Courtesy of GENERAL MOTORS COMPANY

Differential Clutch Oil Filter Replacement

Callout	Component Name
Preliminary Procedure	
1. Remove the propeller shaft. Refer to <u>Propeller Shaft Replacement</u> . 2. Lower the differential clutch assembly, just enough to reach the cover. Do not damage the drive shaft universal joints. Refer to <u>Rear Differential Clutch Control Module Replacement</u> .	
1	Differential Clutch Cover Bolts (Qty: 10) WARNING: The hydraulic pressure in the differential clutch is very high. To prevent personal injury, wait for at least 10 minutes before removing any parts from the differential clutch. CAUTION: Refer to <u>Fastener Caution</u> . Tighten 6 N.m (53 lb in)
2	Differential Clutch Cover
	Differential Clutch Gasket

3	Procedure Install a new gasket.
4	Differential Clutch Oil Plug Tighten Tighten 14 N.m (10 lb ft)
5	Differential Clutch Oil Plug Sealing Procedure Use a new sealing.
6	Differential Clutch Oil Filter Procedure Fill new fluid in the differential clutch. Refer to <u>Adhesives, Fluids, Lubricants, and Sealers</u> , and <u>Differential Clutch Oil Replacement</u> .

LIMITED SLIP DIFFERENTIAL DISASSEMBLE

CAUTION: Refer to **Fastener Caution** .

1. Drain the oil from the limited slip differential and fit the drain plug with a new seal and tighten to 25 N.m (18.4 lb ft).
2. Remove the complete unit, differential clutch and limited slip differential. Refer to **Differential Carrier Assembly Replacement**
3. Seal the drive shaft holes in the limited slip differential and clean the housing.
4. Place the unit on its side.

Fig. 31: Identifying Differential Housing Bolts & Right-Hand Limited Slip Differential Housing
Courtesy of GENERAL MOTORS COMPANY

5. Remove the bolts (1).
6. Remove the right-hand limited slip differential housing (2).

LIMITED SLIP DIFFERENTIAL ASSEMBLE

1. Clean sealant from the sealing surfaces and wash with a suitable degreaser. Refer to **Adhesives, Fluids, Lubricants, and Sealers**

Fig. 32: Sealant Bead Application Area
Courtesy of GENERAL MOTORS COMPANY

2. Apply a bead of (1) Sealing adhesive to one sealing surface Refer to **Adhesives, Fluids, Lubricants, and Sealers**

Fig. 33: Identifying Differential Housing Bolts & Right-Hand Limited Slip Differential Housing
 Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution .

3. Fit the right-hand limited slip differential housing (2) using new bolts (1) and tighten to 45 N.m (33 lb ft).
4. Fit Complete unit, differential clutch and limited slip differential. Refer to **Differential Carrier Assembly Replacement**
5. Fill the limited slip differential with oil, using a clean funnel and hose. The oil level should be below the hole. For oil type and volume refer to **Adhesives, Fluids, Lubricants, and Sealers**.
6. Fit the level plug with a new sealing washer and tighten to 25 N.m (18.4 lb ft).

DESCRIPTION AND OPERATION

ALL-WHEEL DRIVE DESCRIPTION AND OPERATION

Components

The all-wheel drive system consists of 5 main components:

- Transfer case
- Propeller shaft
- Differential clutch
- Limited slip differential
- Rear differential clutch control module

Transfer Case

The transfer case is located to the right of the gearbox, to which it is bolted. Its function is to take power from the gearbox and transfer it via a hypoid gear and a propeller shaft to the differential clutch.

Differential Clutch

The function of the differential clutch is to control the torque to the rear wheels. It can be varied between 0-100% drive via a hydraulically controlled multi-disc clutch. The differential clutch is bolted to the limited slip differential with 4 bolts.

Propeller Shaft

The function of the propeller shaft is to transfer power from the transfer case to the differential clutch.

Limited Slip Differential

The limited slip differential, also called rear drive module, is located in the subframe and the drive shafts extend from it to each rear wheel. The limited slip differential consists of a hypoid gear and a differential. The limited slip differential is fully mechanical. The limited slip differential clutch, if installed, is bolted with 6 bolts to the left-hand side of the limited slip differential. Its function is to fully or partly lock the left-hand drive shaft to the differential housing. When this takes place the drive torque can be distributed between the rear wheels. The limited slip differential clutch is a disc type, and it is electro-hydraulically controlled by the rear differential clutch control module via a pressure control valve which is fitted on the limited slip differential clutch housing. The rear differential clutch control module calculates drive torque distribution. There are two variants: with and without limited slip differential clutch for the rear wheels.

Hydraulic Pump

The hydraulic pump consists of an electric motor and a pump housing. It is supplied with power from the rear differential clutch control module. The motor drives a five cylinder axial piston pump in the pump housing which produces an operating pressure of 2 700-3 200 kPa (392-464 PSI). The pressure control valve is electrically controlled and its function is to regulate the hydraulic pressure (0-3 000 kPa (435 PSI)) to the operating piston. It is directly connected to the rear differential clutch control module which supplies it with a pulse width modulated voltage. The rear differential control module activates the output to the hydraulic pump as soon as the following conditions are fulfilled: "ignition ON" and "engine started". The output is active until the calculated pressure is approximately 3 200 kPa (464 PSI). The pressure is calculated by means of the rear differential control module measuring the electric motor power consumption. The higher the pressure, the greater the resistance is for the electric motor to drive the pump itself, and the higher the current becomes. When the system pressure is approximately 3 200 kPa (464 PSI) (fully charged accumulator) the accumulator

piston exposes the unloading holes and the pressure does not increase further. The current to the motor does not increase any further but remains constant. The maximum system pressure is reached, the rear differential control module shuts down the pump. Restart takes place when the calculated pressure is below approximately 2 700 kPa (392 PSI).

Rear Differential Clutch Control Module

The rear differential clutch control module is fitted on the housing. The hydraulic pressure is built up by an electrically driven pump, and is controlled by the rear differential clutch control module via a solenoid valve. By using information on the bus the rear differential clutch control module calculates the drive torque distribution between front and rear axles as well as the distribution between the rear wheels for cars with limited slip differential clutch. The rear differential clutch control module is connected to the vehicle communication bus. The bus messages are used to determine the operating/driving conditions for the vehicle, and accordingly how much drive torque should be transferred to the rear wheels. The rear differential clutch control module and the control valve are calibrated together, they must be replaced together without exception.

The rear differential clutch control module has a monitoring for the bus communication, inputs, outputs, certain mechanical faults and internal control module faults. If relevant control module functions are missing or other mechanical or electrical faults are recognized diagnostic trouble codes are generated.

- Internal signals

The control module has a monitoring for internal control module faults.

- Input signals

The control module has an input for an internal temperature sensor. The temperature sensor is fitted on the rear differential control module circuit board and is monitored for electrical faults. The temperature sensor is also used by the rear differential control module to calculate the current fluid and disc pack temperature in the differential clutch.

- Output signals

The control module has pressure control valve outputs for differential clutch and limited slip differential clutch (if fitted) respectively, as well as for the pump motor. These are monitored for electrical faults.

- Mechanical functions

The control module can diagnose clogged pressure control valves and leaking check valves.

DIFFERENTIAL CARRIER ASSEMBLY DESCRIPTION

General

The differential carrier assembly is located in the rear subframe and the drive shafts extend from it to each respective rear wheel. The final drive gear consists of a hypoid gear and a differential. The assembly is bolted to the subframe with 4 bolts.

The splines-equipped pinion shaft for the final drive gear is directly inserted into the disc cage for the differential.

During manufacture the differential carrier assembly is filled with oil, which then does not require changing. The correct type of oil must be used without exception when filling. The incorrect type of oil may destroy the differential. The differential is fully mechanical.

Housing

Fig. 34: Identifying Differential Carrier Assembly Housing & Bolts
Courtesy of GENERAL MOTORS COMPANY

The differential carrier assembly housing consists of two halves, a right and left-hand half, bolted to each other with 11 bolts. Their relative position is governed by two guide pins. Housing and cover are produced from a high-pressure cast aluminium alloy. A number of reinforcement ribs are fitted in suitable locations to strengthen the housing and cover. The mating face between them is sealed using sealant.

Fig. 35: Locating Differential Carrier Assembly Housing & Seals
Courtesy of GENERAL MOTORS COMPANY

The left-hand half contains pinion, oil level plug, drain plug, air valve, bearing race for the final drive gear's left-hand bearing, stuffing box for sealing at the drive shaft lead-through. If the car is equipped with limited slip differential clutch then it is bolted to the left-hand half of the final drive gear.

Fig. 36: View Of Final Drive Bearings
Courtesy of GENERAL MOTORS COMPANY

The right-hand half contains bearing race for the final drive gear's right-hand bearing as well as stuffing box for sealing at the drive shaft lead-through.

Pinion

Fig. 37: View Of Pinion Gear & Bearings
Courtesy of GENERAL MOTORS COMPANY

The pinion is fitted in the final drive gear's left-hand housing and cannot be replaced. It is mounted with two conical roller bearings, fitted towards each other. The bearing closest to the pinion gear absorbs forces that attempt to press the pinion gear from the crown wheel, while the farther bearing absorbs the forces that attempt to press the pinion gear into the crown wheel. The bearings have the correct preload by means of a nut fitted on the shaft being tightened until the correct bearing preload is obtained.

The pinion gear's gear contact to the crown wheel is governed by shims. A stuffing box in the front edge of the left-hand housing seals against the pinion shaft.

The pinion is matched together with the crown wheel.

Differential, assembly

Fig. 38: Identifying Differential, assembly
Courtesy of GENERAL MOTORS COMPANY

The differential consists of a crown wheel and differential housing with associated gears. It is fitted in the left-hand half of the final drive gear housing. The crown wheel is laser welded to the differential housing.

The differential is made up of a forged housing, two differential gears and two drive shaft gears. The differential gears are mounted on a ground and hardened shaft journal, the ends of which are attached into the differential housing and locked by the crown wheel. The drive shaft gears are internally equipped with splines in which the drive shafts fit. Behind the gears, towards the differential housing, there is a spring-loaded thrust washer which provides the drive shaft gears with the correct gear contact to the differential gears. The drive shafts are mounted directly in the differential housing material, the lead-throughs are equipped with lubricating grooves.

Fig. 39: View Of Differential Unit Components
Courtesy of GENERAL MOTORS COMPANY

The differential unit is mounted in two conical roller bearings. The bearings are given the correct preload at manufacture by means of shims being fitted behind the bearing races in the respective housing.

The function of the differential is to allow the outer wheel to rotate faster than the inner wheel when cornering.

LIMITED SLIP DIFFERENTIAL DESCRIPTION AND OPERATION

The limited slip differential clutch is bolted with 6 bolts to the left-hand side of the differential carrier. Their relative position is governed by 2 guide pins and a flange on the final drive gear.

Its function is to fully or partly lock the left-hand drive shaft to the differential housing. When this takes place wheel torque can be distributed between the rear wheels.

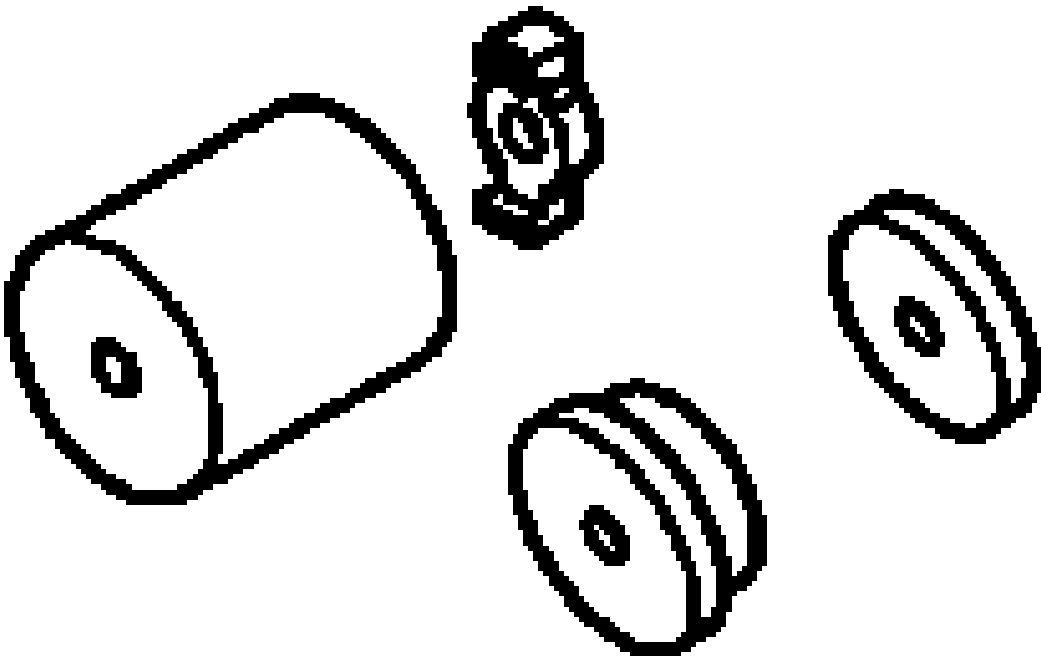

The limited slip differential clutch is a disc type, and it is electro-hydraulically controlled by the rear drive control module (RDCM) via a pressure control valve which is fitted on the limited slip differential clutch housing. The disc pack assembly consists of a hub, smooth steel driven plates with friction material, clutch cage, thrust bearing and journal bearing. The disc pack function is to steplessly distribute the torque between the rear wheels. It consists of 9 driven plates connected to the hub. They are produced in steel and are smooth. Between the smooth steel driven plates are 8 steel discs equipped with friction material.

The disc pack is compressed by means of an operating piston. On the rear of the piston a variable oil pressure (0-30 bar, 0-3000 kPa) acts via the pressure control valve which is controlled by the RDCM.

For cooling and lubrication of the disc pack the hub is equipped with 3 longitudinal oil ducts. They are supplied with oil from a chamber in connection with differential carrier. The oil is led through the ducts to the center of the disc pack and is thrown out through the driven plates when they rotate.

STABILIZER SHAFT REPLACEMENT (GNC)

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Remove the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
3. Remove the rear muffler assembly. Refer to **Exhaust Muffler Replacement (Dual)** , **Exhaust Muffler Replacement (Single)** .
4. Remove the rear suspension control arm bolts from the body. Refer to **Rear Suspension Control Arm Replacement**.
5. Remove the rear spring. Refer to **Rear Spring, Insulator, and Jounce Bumper Replacement**.
6. Remove the park brake cables from the rear suspension support. Refer to **Parking Brake Rear Cable Replacement** .
7. Without disconnecting the hydraulic brake hose from the caliper, remove and support the brake caliper. Refer to **Rear Brake Caliper Replacement** .
8. Remove the lower shock absorber bolts. Refer to **Shock Absorber Replacement (GNC)**.
9. Support and secure adjustable jack stands to the rear support.
10. Mark up support position to body with spray paint.

Fig. 10: Identifying Support Mounting Bolts
Courtesy of GENERAL MOTORS COMPANY

11. Remove the mounting bolts (1) for the support. Refer to **Rear Suspension Support Replacement (GNC)**.
12. Lower the support enough to gain access to the rear stabilizer shaft insulator clamps mounting bolts.

Fig. 11: Stabilizer Shaft & Stabilizer Shaft Link
Courtesy of GENERAL MOTORS COMPANY

13. Remove the stabilizer shaft (1) from the stabilizer shaft link (2). Refer to **Stabilizer Shaft Link Replacement (GNC)**.

Fig. 12: Stabilizer Shaft Assembly

Courtesy of GENERAL MOTORS COMPANY

4. Install the stabilizer shaft (1) to stabilizer shaft link (2). Refer to **Stabilizer Shaft Link Replacement (GNC)**.
5. Raise the rear support back into position.

Fig. 15: Identifying Support Mounting Bolts
 Courtesy of GENERAL MOTORS COMPANY

6. Install the rear support bolts (1). Refer to **Rear Suspension Support Replacement (GNC)** .
7. Install the lower shock absorber mounting bolts. Refer to **Shock Absorber Replacement (GNC)**.
8. Install the rear brake calipers. Refer to **Rear Brake Caliper Replacement** .
9. Install the rear suspension control arm bolts to the body. Refer to **Rear Suspension Control Arm Replacement**.
10. Install the rear springs. Refer to **Rear Spring, Insulator, and Jounce Bumper Replacement**.
11. Remove the adjustable jack stands from the rear support.
12. Install the park brake cables on the rear suspension support. Refer to **Parking Brake Rear Cable Replacement** .
13. Install the rear muffler assembly. Refer to **Exhaust Muffler Replacement (Dual)** , **Exhaust Muffler Replacement (Single)** .
14. Install the tire and wheel assemblies. Refer to **Tire and Wheel Removal and Installation** .
15. Lower the vehicle.

STABILIZER SHAFT REPLACEMENT (GNE)

Fig. 16: Stabilizer Shaft (GNE)
 Courtesy of GENERAL MOTORS COMPANY

Stabilizer Shaft Replacement (GNE)

Callout	Component Name
Preliminary Procedure <ol style="list-style-type: none"> 1. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Remove the tire and wheel assembly. Refer to <u>Tire and Wheel Removal and Installation</u> . 3. Disconnect the stabilizer links from the stabilizer shaft. Refer to <u>Stabilizer Shaft Link Replacement (GNA, GNB)</u> . 	
1	Stabilizer Shaft Insulator Fastener (Qty: 4) Install NEW clamp bolts. CAUTION: Refer to <u>Fastener Caution</u> . Tighten 22 N.m (16 lb ft) + 30 degrees
2	Stabilizer Shaft Bracket (Qty 2)
3	Stabilizer Shaft Procedure Replace insulator if necessary.

STABILIZER SHAFT INSULATOR REPLACEMENT (GNC)

Removal Procedure

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove the tire and wheel assembly. Refer to Tire and Wheel Removal and Installation .
3. Remove the rear muffler assembly. Refer to Exhaust Muffler Replacement (Dual) , Exhaust Muffler Replacement (Single) .
4. Remove the rear suspension control arm bolts from the body. Refer to Rear Suspension Control Arm Replacement.
5. Remove the rear spring. Refer to Rear Spring, Insulator, and Jounce Bumper Replacement.
6. Remove the park brake cables from the rear suspension support. Refer to Parking Brake Rear Cable Replacement .
7. Without disconnecting the hydraulic brake hose from the caliper, remove and support the brake calliper. Refer to Rear Brake Caliper Replacement .
8. Remove the lower shock absorber fasteners. Refer to Shock Absorber Replacement (GNC).
9. Support and secure adjustable jack stands to the rear support.
10. Mark up support position to body with spray paint.

Fig. 17: Identifying Support Mounting Bolts

Courtesy of GENERAL MOTORS COMPANY

11. Remove the mounting bolts (1) for the support. Refer to **Rear Suspension Support Replacement (GNC)**.
12. Lower the support enough to gain access to the rear stabilizer shaft insulator clamps mounting bolts.

Fig. 18: Stabilizer Shaft & Stabilizer Shaft Link
Courtesy of GENERAL MOTORS COMPANY

13. Remove the stabilizer shaft (1) from the stabilizer shaft link (2). Refer to **Stabilizer Shaft Link Replacement (GNC)**.

Fig. 19: Stabilizer Shaft Assembly
Courtesy of GENERAL MOTORS COMPANY

NOTE:

- Change one insulator at the time to ensure the right position and angle.
- DO NOT reuse the bracket bolt. Discard and use NEW bolts only.

14. Remove the bracket bolt (1), the bracket (2) and the insulator (3).

Installation Procedure

Fig. 20: Stabilizer Shaft Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Install the insulator (3), the bracket (2), on the stabilizer shaft (4).

CAUTION: Refer to Fastener Caution .

2. Install the NEW bolts (1) and tighten to:
 - First Pass: 22 N.m(16 lb ft).
 - Final Pass: plus 30 degrees.

Fig. 21: Stabilizer Shaft & Stabilizer Shaft Link
Courtesy of GENERAL MOTORS COMPANY

3. Install the stabilizer shaft (1) to stabilizer shaft link (2). Refer to **Stabilizer Shaft Link Replacement (GNC)**.
4. Raise the rear support back into position.

Fig. 22: Identifying Support Mounting Bolts
 Courtesy of GENERAL MOTORS COMPANY

5. Install the rear support bolts (1). Refer to **Rear Suspension Support Replacement (GNC)** .
6. Install the lower shock absorber mounting bolts. Refer to **Shock Absorber Replacement (GNC)**.
7. Install the rear brake callipers. Refer to **Rear Brake Caliper Replacement** .
8. Install the rear suspension control arm bolts to the body. Refer to **Rear Suspension Control Arm Replacement**.
9. Install the rear springs. Refer to **Rear Spring, Insulator, and Jounce Bumper Replacement**.
10. Remove the adjustable jack stands from the rear support.
11. Install the park brake cables on the rear suspension support. Refer to **Parking Brake Rear Cable Replacement** .
12. Install the rear muffler assembly. Refer to **Exhaust Muffler Replacement (Dual)** , **Exhaust Muffler Replacement (Single)** .
13. Install the tire and wheel assemblies. Refer to **Tire and Wheel Removal and Installation** .
14. Lower the vehicle.

STABILIZER SHAFT INSULATOR REPLACEMENT (GNE)

Fig. 23: Stabilizer Shaft Insulator (GNE)
 Courtesy of GENERAL MOTORS COMPANY

Stabilizer Shaft Insulator Replacement (GNE)

Callout	Component Name
Preliminary Procedure <ol style="list-style-type: none"> 1. Raise and suitably support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Remove the rear tire and wheel assembly. Refer to <u>Tire and Wheel Removal and Installation</u> . 3. Disconnect the stabilizer links from the stabilizer shaft. Refer to <u>Stabilizer Shaft Link Replacement (GNE)</u>. 	
1	Stabilizer Shaft Insulator Fastener (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Procedure Install NEW bolts. Tighten 22 N.m (16 lb ft) + 30 degrees
2	Stabilizer Shaft Bracket Procedure Replace one insulator at a time to ensure the right position and angle.

STABILIZER SHAFT LINK REPLACEMENT (GNC)

Fig. 24: Stabilizer Shaft Link, Nuts & Bolts (GNC)

1. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Remove the tire and wheel assembly. Refer to <u>Tire and Wheel Removal and Installation</u> .	
1	Stabilizer Shaft Link Nut (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 50 N.m(37 lb ft)
2	Stabilizer Shaft Link

STRUT AND SHOCK ABSORBER INSPECTION (SHOCK ABSORBER)

NOTE: The shock absorber assembly **DOES NOT** have to be removed from the vehicle to perform the following inspection procedure.

NOTE: A light film of oil on the top portion of the lower shock absorber tube is normal. DO NOT replace the shock absorber for this condition.

Fig. 26: Identifying Shock Absorber Conditions
Courtesy of GENERAL MOTORS COMPANY

Condition 1

Oil or fluid residue only on the bottom or top of the shock absorber and not originating from the shaft seal, is not a shock absorber related problem. DO NOT replace the shock absorber, look for other external leaks.

Condition 2

Light film/residue on approximately 1/3 (a) or less of the lower shock tube (A) and originating from the shaft seal, is a NORMAL condition. DO NOT replace the shock absorber.

Condition 3

Oil drip or trail down the lower shock tube and originating from the shaft seal, is an ABNORMAL condition. Replace the shock absorber.

Condition 4

An extreme wet film of oil covering more than 1/3 (b) of the lower shock tube and originating from the shaft seal (B), is an ABNORMAL condition. Replace the shock absorber. Refer to **Shock Absorber Replacement (GNC)**, **Shock Absorber Replacement (GNE)**.

Inspection

1. Verify the customer's concern is present. If the concern is present, continue to the next step. If the concern is not present, then the vehicle is operating normally.

NOTE: **The shock absorber assembly DOES NOT have to be removed from the vehicle to perform the following inspection procedure.**

2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
3. Visually inspect each of the shock absorbers for external fluid leaks. Refer to the following conditions 1, 2 , 3 , and 4 for visual inspection.
 - If conditions 1 or 2 are found, continue to step 4.
 - If conditions 3 or 4 are found, replace shock absorber. Refer to Shock Absorber Replacement (GNC), Shock Absorber Replacement (GNE).
4. If equipped with electronic suspension control system, ensure that the system is working properly. Refer to Diagnostic Starting Point - Electronic Suspension Control.
5. Use your hands in order to lift up and push down on each corner of the vehicle 3 times. Remove your hands from the vehicle. If the corner motion exceeds 2 cycles, replace the shock absorber. If the shock absorber does not exceed 2 cycles, NO repair is necessary.

SHOCK ABSORBER REPLACEMENT (GNC)

Fig. 27: Shock Absorber Components (GNC)
Courtesy of GENERAL MOTORS COMPANY

Shock Absorber Replacement (GNC)

Callout	Component Name
Preliminary Procedures 1. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Remove the rear tire and wheel assembly. Refer to <u>Tire and Wheel Removal and Installation</u> . 3. Remove the rear wheelhouse panel liner from the vehicle. Refer to <u>Rear Wheelhouse Liner Replacement</u> .	
1	Rear Shock Absorber Bolts Upper Body (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Procedure Support the lower control arm with a suitable jack stand. Tighten <ul style="list-style-type: none">• First Pass: 100 N.m (74 lb ft)• Second Pass: loosen 120 degrees• Final Pass: 100 N.m (74 lb ft)
2	Rear Shock Absorber Bolt Procedure Remove and discard the bolt. Replace with NEW only. Tighten <ul style="list-style-type: none">• First Pass: 150 N.m (110 lb ft)• Final Pass: plus 60 degrees
3	Shock Absorber Nut CAUTION: Do Not use air tools to remove the upper shock absorber nut. Doing so could damage the shock absorber internally. Tighten 20 N.m (15 lb ft)
4	Rear Shock Absorber Upper Mount Procedure Transfer the upper mount to the new shock absorber.
	Shock Absorber CAUTION: This vehicle is equipped with torque-to-yield or single use fasteners. Install a NEW

5

torque-to-yield or single use fastener when installing this component. Failure to replace the torque-to-yield or single use fastener could cause damage to the vehicle or component.

Procedure

Disconnect any electrical connectors, if equipped.

SHOCK ABSORBER REPLACEMENT (GNE)

Fig. 28: Shock Absorber (GNE)

Courtesy of GENERAL MOTORS COMPANY

Shock Absorber Replacement (GNE)

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none"> 1. Raise and support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> . 2. Remove the rear tire and wheel assembly. Refer to <u>Tire and Wheel Removal and Installation</u> . 3. Remove the rear wheelhouse panel liner from the vehicle. Refer to <u>Rear Wheelhouse Liner Replacement</u> . 	
	Rear Shock Absorber Bolt Upper Body (Qty: 2)
	CAUTION:

1	<p>Refer to <u>Fastener Caution</u> .</p> <p>Procedure Disconnect any electrical connectors if equipped.</p> <p>Tighten 100 N.m (74 lb ft)</p>
2	<p>Rear Shock Absorber Bolt</p> <p>Procedure Remove and discard the bolt. DO NOT reuse, replace with NEW only.</p> <p>Tighten</p> <ul style="list-style-type: none"> • First Pass: 150 N.m (111 lb ft) • Final Pass: plus 60 degrees
3	<p>Shock Absorber</p> <p>CAUTION: This vehicle is equipped with torque-to-yield or single use fasteners. Install a NEW torque-to-yield or single use fastener when installing this component. Failure to replace the torque-to-yield or single use fastener could cause damage to the vehicle or component.</p>

SHOCK ABSORBER DISPOSAL

WARNING: Gas charged shock absorbers contain high pressure gas. Do not remove the snap ring from inside the top of the tube. If the snap ring is removed, the contents of the shock absorber will come out with extreme force which may result in personal injury.

WARNING: To prevent personal injury, wear safety glasses when centerpunching and drilling the shock absorber. Use care not to puncture the shock absorber tube with the centerpunch.

Fig. 29: Drilling Hole In Shock Absorber At Centerpunched Locations

Courtesy of GENERAL MOTORS COMPANY

1. Make an indentation 10 mm (0.4 in) from the bottom of the tube (3) using a centerpunch.
2. Clamp the shock absorber in a vise horizontally with the shock absorber rod (1) completely extended.
3. Drill a hole in the shock absorber at the centerpunch (4) using a 5 mm (3/16 in) drill bit. Gas or a gas/oil mixture will exhaust when the drill bit penetrates the shock absorber. Use shop towels in order to contain the escaping oil.
4. Make an indentation in the middle (2) of the tube (3) with a centerpunch.
5. Drill a second hole in the shock absorber at the centerpunch (2) using a 5 mm (3/16 in) drill bit. Oil will exhaust when the drill bit penetrates the shock absorber. Use shop towels in order to contain the escaping oil.
6. Remove the shock absorber from the vise. Hold the shock absorber over a drain pan horizontally with the holes down. Move the rod (1) in and out of the tube (3) to completely drain the oil from the shock absorber.

REAR SPRING, INSULATOR, AND JOUNCE BUMPER REPLACEMENT

Fig. 30: Rear Spring, Insulator & Jounce Bumper
Courtesy of GENERAL MOTORS COMPANY

Rear Spring, Insulator, and Jounce Bumper Replacement

Callout	Component Name
WARNING: To prevent personal injury and/or component damage, use the proper tools to support the lower	

control arm when removing the coil spring. The coil spring is under extreme pressure and can become a projectile should the spring separate from the lower control arm before all of the tension is relieved.

Preliminary Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
2. Remove the rear tire and wheel. Refer to **Tire and Wheel Removal and Installation** .
3. Remove the rear brake caliper and relocate to the side, if needed. Refer to **Rear Brake Caliper Replacement** .

	Rear Spring
1	Procedure <ol style="list-style-type: none"> 1. Use the proper jack stand to support the lower control arm. 2. Disconnect the lower control arm from the rear wheel hub bracket. Refer to <u>Rear Axle Lower Control Arm Replacement (GNC)</u>, <u>Rear Axle Lower Control Arm Replacement (GNE)</u>.
2	Rear Spring Insulator (Upper)
3	Rear Spring Insulator (Lower)

ADJUST LINK REPLACEMENT (GNC)

Fig. 31: Adjust Link (GNC)

Courtesy of GENERAL MOTORS COMPANY

Adjust Link Replacement (GNC)

Callout	Component Name
Preliminary Procedure Raise and suitably support the vehicle. Refer to <u>Lifting and Jacking the Vehicle</u> .	
1	<p>Rear Suspension Link Inner Nut</p> <p>CAUTION: Refer to <u>Fastener Caution</u> .</p> <p>Procedure Support the adjust link horizontally with a jack before tightening the nut.</p> <p>NOTE: DO NOT torque the nut until all specifications have been checked and/or adjusted. The nut must be tightened at ride height.</p> <p>Tighten</p> <ul style="list-style-type: none">• First Pass: 90 N.m (66 lb ft)• Final Pass: plus 60 degrees <p>Special Tools EN-45059 Angle Meter For equivalent regional tools, refer to <u>Special Tools</u>.</p>
2	Rear Suspension Washer
3	<p>Rear Suspension Link Bolt (Inner)</p> <p>Procedure Remove and discard the bolt. Replace with NEW only.</p>
4	Rear Suspension Link Nut (Outer)
5	<p>Rear Suspension Link Bolt (Outer)</p> <p>Procedure Remove and discard the rear suspension link bolt. Replace with NEW only.</p> <p>Tighten</p> <ul style="list-style-type: none">• First Pass: 115 N.m (85 lb ft)• Final Pass: plus 90 degrees <p>Special Tools EN-45059 Angle Meter</p>

	For equivalent regional tools, refer to Special Tools .
6	Adjust Link Procedure After installation, check the rear alignment. Refer to Wheel Alignment Measurement .

ADJUST LINK REPLACEMENT (GNE)

Fig. 32: Adjust Link (GNE)
 Courtesy of GENERAL MOTORS COMPANY

Adjust Link Replacement (GNE)

Callout	Component Name
Preliminary Procedures	
1. Raise and suitably support the vehicle. Refer to Lifting and Jacking the Vehicle . 2. Remove the rear tire and wheel assembly. Refer to Tire and Wheel Removal and Installation .	
1	Rear Suspension Adjust Link Nut Procedure Remove the nut. Tighten 150 N.m (111 lb ft)
	Rear Suspension Link Inner Bolt CAUTION:

2	<p>Refer to <u>Fastener Caution</u> .</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Lower the fuel tank, if necessary, to get access to rear suspension adjust link bolt. . 2. Remove the bolt .
3	<p>Rear Suspension Link Outer Bolt</p> <p>CAUTION: This vehicle is equipped with torque-to-yield or single use fasteners. Install a NEW torque-to-yield or single use fastener when installing this component. Failure to replace the torque-to-yield or single use fastener could cause damage to the vehicle or component.</p> <p>Procedure Remove and discard the bolt and nut. DO NOT reuse, replace with NEW only.</p> <p>Tighten</p> <ul style="list-style-type: none"> • First Pass: 150 N.m (111 lb ft) • Final Pass: plus 60 degrees
4	<p>Rear Suspension Adjust Link</p> <p>CAUTION: This vehicle is equipped with torque-to-yield or single use fasteners. Install a NEW torque-to-yield or single use fastener when installing this component. Failure to replace the torque-to-yield or single use fastener could cause damage to the vehicle or component.</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Use a proper jack stand to load the knuckle when tightening the fasteners. 2. After installation, check the rear alignment. Refer to <u>Wheel Alignment Measurement</u> .

WHEEL STUD REPLACEMENT

Special Tools

CH-49455 Ball Joint Remover

For equivalent regional tools, refer to **Special Tools**.

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .

2. Remove the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
3. Remove the rear wheel bearing and hub. Refer to **Rear Wheel Bearing and Hub Replacement (GNC)**, **Rear Wheel Bearing and Hub Replacement (GNE)**.

Fig. 33: Removing Wheel Stud From Hub Flange
Courtesy of GENERAL MOTORS COMPANY

4. Use **CH-49455** remover (1) to remove and discard the wheel stud.

Installation Procedure

Fig. 34: Installing Wheel Stud

Courtesy of GENERAL MOTORS COMPANY

1. Install the NEW wheel stud into the wheel bearing hub.
2. Add enough washers (3) in order to draw the stud into the hub.
3. Install the wheel nut (1) with the flat side against the washers.
4. Tighten the wheel nut (1) until the head of the wheel stud is fully seated against the back of the bearing hub flange.
5. Remove the wheel nut (1) and the washers (3).
6. Install the rear wheel bearing and hub. Refer to **Rear Wheel Bearing and Hub Replacement (GNC)**, **Rear Wheel Bearing and Hub Replacement (GNE)**.
7. Install the tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation** .
8. Lower the vehicle.

DESCRIPTION AND OPERATION

REAR SUSPENSION DESCRIPTION AND OPERATION

The rear suspension system on this vehicle is of the independent link type. Rear suspension adjustment is

achieved through adjustable toe links and lower control arms. The rear coil springs are retained between the body and the lower control arm. Rubber insulators isolate the coil spring at both top and bottom. The rear suspension consists of 2 shock absorbers attached to the knuckle and the reinforced body areas.

The rear suspension system performs the following functions:

- Maintains the relationship of the rear axle to the body
- Controls the torque reaction on acceleration and braking

The suspension system consists of the following components:

- Support assembly
- Coil springs and insulators
- Stabilizer shaft, insulators and stabilizer links
- Toe links
- Upper control arms
- Lower control arms
- Trailing arms
- Knuckles
- Wheel bearing/hub
- Shock absorbers

ELECTRICAL

Wiring Systems and Power Management - Repair Instructions

REPAIR INSTRUCTIONS

GMLAN AND MEDIA ORIENTED SYSTEMS TRANSPORT (MOST) WIRING REPAIRS

Special Tools

- **EL-38125-10** Splice Sleeve Crimping Tool
- DuraSeal splice sleeves
- A wire stripping tool

For equivalent regional tools, refer to **Special Tools** .

The DuraSeal splice sleeves have the following 2 critical features:

- A special heat shrink sleeve environmentally seals the splice. The heat shrink sleeve contains a sealing adhesive inside.
- A cross hatched (knurled) core crimp provides necessary contact integrity for the sensitive, low energy circuits.

The GM Local Area Network (GMLAN) System requires special wiring repair procedures due to the sensitive nature of the circuitry. Follow the specific procedures and instructions when working on GMLAN connectors and terminals.

GMLAN Repairs

NOTE: **When making a repair to any GMLAN network, the original wire length after the repair must be the same length as before the repair. If the network is a twisted pair, the twist must be maintained after the repair is completed.**

GMLAN has 2 types of networks, low speed and high speed. Low speed GMLAN has a single wire and works at slow speeds. High speed GMLAN has 2 wires in a twisted pair and works at higher speeds. For more information on GMLAN, refer to **Data Link Communications Description and Operation** .

GMLAN Connector Terminal Repair

NOTE: **A terminated lead can be used to replace damaged connector terminals for both high speed and low speed GMLAN systems. When making a connector terminal repair on a GMLAN high speed system with twisted pair wires, do not untwist the wires more than necessary to make the repair.**

If the individual terminals are damaged on any GMLAN connection, use the appropriate connector repair procedure in order to repair the terminal. Refer to **Connector Repairs** for the appropriate connector repair

procedure.

GMLAN Wire Repair

NOTE: Refer to **Wiring Repairs** in the service information connector end views or the vehicle schematics in order to determine the correct wire size for the circuit you are repairing. You must obtain this information in order to ensure circuit integrity.

If any wire except the pigtail is damaged, repair the wire by splicing in a new section of wire of the same gauge size (0.5 mm^2 , 0.8 mm^2 , 1.0 mm^2 etc.). Use the DuraSeal splice sleeves and **EL-38125-10** tool. For wiring repair, refer to **Splicing Copper Wire Using Splice Sleeves**.

ELECTRONIC SUSPENSION POSITION SENSOR FRONT JUMPER HARNESS DISCONNECTION

Removal Procedure

Fig. 1: Connector Position Assurance (CPA) Clip
Courtesy of GENERAL MOTORS COMPANY

1. Locate the connector position assurance (CPA) clip (1), which is in the locked position.

Fig. 2: Unlocking CPA
Courtesy of GENERAL MOTORS COMPANY

2. Unlock the CPA.

Fig. 3: Locking Part To Right And Disconnect Cable
Courtesy of GENERAL MOTORS COMPANY

3. Twist the locking part to the right and disconnect the cable (2).

Installation Procedure

Fig. 4: Twisting Back Locking Part
Courtesy of GENERAL MOTORS COMPANY

1. Twist back the locking part.
2. Place the CPA in the locked position prior to re-connecting the cable.

INSTRUMENT PANEL WIRING HARNESS FUSE BLOCK DISASSEMBLE

NOTE: To remove wires from the top part using terminal release tools, only steps 1, 3, 8, 9, 10, 11, 12 and 13 are required. Use release tool J-38125-38 for cavities 16-18, 20-34, 37-47.

Fuse Block Disassemble Procedure

Fig. 5: Fuse Block & Locking Arms

Courtesy of GENERAL MOTORS COMPANY

1. Push the locking arms (1) and unlock the fuse block (2).

Fig. 6: Fuse Block In Unlocked Position
Courtesy of GENERAL MOTORS COMPANY

2. Fuse block unlocked.

Fig. 7: Fuse Block & Bracket

Courtesy of GENERAL MOTORS COMPANY

3. Pull out and remove the fuse block from bracket.

Fig. 8: Fuse Block & Brackets

Courtesy of GENERAL MOTORS COMPANY

4. Fuse block after removed from bracket.

Fig. 9: Fuse Block & Relay Protection Cover
Courtesy of GENERAL MOTORS COMPANY

5. Push and open the relay protection cover.

Fig. 10: Fuse Block Micro Relays
Courtesy of GENERAL MOTORS COMPANY

6. Remove micro relays (3x).

Fig. 11: Micro Relays

Courtesy of GENERAL MOTORS COMPANY

7. Fuse block with relays removed.

Fig. 12: Fuse Block Components

Courtesy of GENERAL MOTORS COMPANY

8. Remove mini fuses (22x), J-case fuses (2x), and circuit breakers (2x) from fuse block.

Fig. 13: View Of Fuse Block Components
Courtesy of GENERAL MOTORS COMPANY

9. Fuse block with all fuses and circuit breakers removed.

Fig. 14: Fuse Block Cover

Courtesy of GENERAL MOTORS COMPANY

10. Unlock (6 locking points) and remove bottom protection cover from fuse block.

Fig. 15: Fuse Block Wires & Straps
Courtesy of GENERAL MOTORS COMPANY

11. Remove straps (4x) from wires.

Fig. 16: Fuse Block Locking Arm Components
Courtesy of GENERAL MOTORS COMPANY

12. To place the top part (1) in pre-assembled position, press together locking arms on both sides of the bottom part (2), insert a pry tool into an appropriate hole in the top part and lever the top part upward until it remains in the pre-assembled position. Release the locking arms.

Fig. 17: Fuse Block Tabs

Courtesy of GENERAL MOTORS COMPANY

13. When the top part is in the pre-assembled position (required to release wire terminals), the tabs of the top part are on top of the tabs of the bottom part (left close-up view).

When the top part is in the end-locking position (required after wires are inserted), the tabs of the bottom part are on top of the tabs of the top part (right close-up view).

14. Unlock and remove relay socket from fuse block.

Fig. 19: Fuse Block Relay Socket & Locking Caps
Courtesy of GENERAL MOTORS COMPANY

15. Unlock (6 locking points) and remove locking caps (3x) from relay socket.

Fig. 20: Relay Socket & Locking Caps
Courtesy of GENERAL MOTORS COMPANY

16. Relay socket with locking caps removed.

RELAY REPLACEMENT (ATTACHED TO WIRE HARNESS)

Removal Procedure

Fig. 21: Identifying Relay & Wire Harness Connector
Courtesy of GENERAL MOTORS COMPANY

1. Locate the relay. Refer to the **Master Electrical Component List** to locate the relay in the vehicle.
2. Remove any fasteners which hold the relay in place.
3. Remove any connector position assurance (CPA) devices or secondary locks.

NOTE: **Use care when removing a relay in a wiring harness when the relay is secured by fasteners or tape.**

4. Separate the relay (1) from the wire harness connector (2).

Installation Procedure

Fig. 22: Identifying Relay & Wire Harness Connector
Courtesy of GENERAL MOTORS COMPANY

1. Connect the relay (1) to the wire harness connector (2).
2. Install any connector position assurance (CPA) devices or secondary locks.
3. Install the relay using any fasteners or tape that originally held the relay in place.

RELAY REPLACEMENT (WITHIN AN ELECTRICAL CENTER)

Special Tools

EL-43244 Relay Puller Pliers

Removal Procedure

1. Remove the electrical center cover.

NOTE:

- Always note the orientation of the relay.

- If equipped with a notch style relay; observe the location of the notch on the old relay to verify the new relay is installed with the notch in the same location.
- Ensure that the electrical center is secure, as not to put added stress on the wires or terminals.

2. Locate the relay. Refer to **Electrical Center Identification Views** to locate the electrical center where the relay exists.

Fig. 23: Removing/Installing Relay
Courtesy of GENERAL MOTORS COMPANY

3. Using the EL-43244 (1) position the tool on opposing corners of the relay (2).

CAUTION: Use EL-43244 to pull the relay straight out from the electrical center terminals. The use of pliers or a flat bladed tool could damage the electrical center.

4. Remove the relay (2) from the electrical center.

Installation Procedure

Fig. 24: Removing/Installing Relay
Courtesy of GENERAL MOTORS COMPANY

1. Install the relay (2) in the same position as removed.
2. Install the electrical center cover.

GROUND REPAIR

Electrical Grounds

Proper electrical system function relies on secure, positive, corrosion-free ground connections. Loose, stripped, or corroded connections increase the possibility of improper system function and loss of module communication. These conditions may also lead to unnecessary repairs and component replacements.

In general, electrical ground connections are accomplished using one, or a combination of, three attachment methods:

- Welded M6 stud and nut
- Welded M6 nut and bolt
- Welded M8 nut and bolt

CAUTION: Use GM approved replacement fasteners with conductive finish for electrical ground repair.

Determine which attachment method is used, and carry out the appropriate repair.

M6 Weld Stud Replacement

1. Select a location adjacent the damaged or missing M6 ground stud having 20 mm (0.79 in) clearance behind the panel surface and 20 mm (0.79 in) clearance surrounding the M6 rivet stud flange.
2. Using GM approved residue-free solvent or equivalent, remove any grease from the repair site and allow to dry.

NOTE: Ensure 20 mm (0.79 in) clearance is maintained behind the panel to be drilled.

3. Drill a 10 mm (0.40 in) diameter hole through the panel.
4. Carefully remove paint and primer from the area surrounding the rivet stud flange until bare metal is visible.

CAUTION: Use GM approved replacement fasteners with conductive finish for electrical ground repair.

5. Select a replacement conductive M6 rivet stud. Refer to GM parts catalog for the correct part number and application.
6. Using a rivet stud installer, install the replacement conductive M6 rivet stud.
7. Ensure the new rivet stud is securely fastened, with no detectable movement.

NOTE: The rivet stud and surrounding panel area must be properly refinished prior to the installation of the ground terminal and nut to maintain positive

electrical grounding.

8. Completely wrap the threads of the rivet stud with painters tape or equivalent.
9. Refinish the repair area using an anti-corrosion primer. Refer to **Anti-Corrosion Treatment and Repair** .
10. Allow the refinished repair area to cure sufficiently before removing the protective material applied to the rivet stud threads.
11. Remove the painters tape or equivalent from the rivet stud threads.
12. Using GM approved residue-free solvent or equivalent, thoroughly clean the rivet stud threads to remove any adhesive and allow to dry.
13. Carefully remove any corrosion from the electrical ground wire terminal. Refer to **Testing for Intermittent Conditions and Poor Connections** .
14. Using a small brush, apply Dielectric Lubricant GM P/N 12377900 (Canadian P/N 10953529) to the new conductive M6 rivet stud threads.
15. Install the ground terminal to the new rivet stud.
16. Select a new, conductive M6 nut. Refer to GM parts catalog for the correct part number and application.

CAUTION: Refer to Fastener Caution .

17. Install the M6 nut and tighten to 8 N.m (71 lb in).
18. Check for proper system operation.

M6 Weld Nut

CAUTION: Use GM approved replacement fasteners with conductive finish for electrical ground repair.

1. If the M6 weld nut at the electrical ground location is damaged or stripped, a new, conductive self-threading M7 bolt may be used to secure the ground terminal. Refer to GM parts catalog for the correct part number and application.
2. Using GM approved residue-free solvent or equivalent, remove any grease from the surface surrounding the weld nut and allow to dry.
3. Remove any loose metal particles from the damaged or stripped weld nut with a stiff brush.
4. Using a small brush, apply Dielectric Lubricant GM P/N 12377900 (Canadian P/N 10953529) to the new, conductive, self-threading M7 bolt threads.
5. Carefully remove any corrosion from the electrical ground terminal. Refer to **Testing for Intermittent Conditions and Poor Connections** .
6. Install the electrical ground terminal to the new, conductive M7 bolt.

CAUTION: Refer to Fastener Caution .

7. Install the M7 bolt and tighten to 9 N.m (80 lb in).
8. Check for proper system operation.

M6 Weld Nut (Alternative Repair)

CAUTION: Use GM approved replacement fasteners with conductive finish for electrical ground repair.

1. If the electrical ground location is accessible from both sides of the panel, a conductive M6 bolt and a conductive M6 nut may be used to secure the electrical ground terminal. Refer to GM parts catalog for the correct part number and application.
2. Select a location adjacent the damaged M6 weld nut having 20 mm (0.79) clearance behind the panel surface and 20 mm (0.79) clearance surrounding the new electrical ground site.
3. Using GM approved residue-free solvent or equivalent, remove any grease from the surface surrounding the ground location and allow to dry.

NOTE: Ensure 20 mm (0.79 in) clearance is maintained behind the panel to be drilled.

4. Drill a 10 mm (0.40 in) diameter hole through the panel.
5. Carefully remove paint and primer from the area surrounding the new ground site until bare metal is visible.
6. Using a small brush, apply Dielectric Lubricant GM P/N 12377900 (Canadian P/N 10953529) to the new, conductive M6 bolt threads.
7. Carefully remove any corrosion from the electrical ground terminal. Refer to **Testing for Intermittent Conditions and Poor Connections** .
8. Install the electrical ground terminal and new, conductive M6 bolt to the ground location.

CAUTION: Refer to Fastener Caution .

9. Install the conductive M6 nut and tighten to 8 N.m (71 lb in).

NOTE: The repair area must be properly refinished to maintain positive electrical grounding.

10. Refinish the repair area using an anti-corrosion primer. Refer to **Anti-Corrosion Treatment and Repair** .
11. Check for proper system operation.

M8 Weld Nut

CAUTION: Use GM approved replacement fasteners with conductive finish for electrical ground repair.

1. If the M8 weld nut electrical ground location is accessible from both sides of the panel, a conductive M8 bolt and a conductive M8 nut may be used to secure the ground terminal. Refer to GM parts catalog for the correct part numbers and application.
2. Select a location adjacent to M8 weld nut having 20 mm (0.79 in) clearance behind the panel surface and 20 mm (0.79 in) clearance surrounding the new electrical ground site.
3. Using GM approved residue-free solvent or equivalent, remove any grease from the surface surrounding the ground location and allow to dry.

NOTE: Ensure 20 mm (0.79 in) clearance is maintained behind the panel to be drilled.

4. Drill a 10 mm (0.40 in) diameter hole through the panel.
5. Carefully remove paint and primer from the area surrounding the new ground site until bare metal is visible.
6. Using a small brush, apply Dielectric Lubricant GM P/N 12377900 (Canadian P/N 10953529) to the new, conductive M8 bolt threads.
7. Carefully remove any corrosion from the electrical ground terminal. Refer to **Testing for Intermittent Conditions and Poor Connections** .
8. Install the electrical ground terminal and new, conductive M8 bolt to the ground location.

CAUTION: Refer to Fastener Caution .

9. Install the conductive M8 nut and tighten to 22 N.m (16 lb ft).

NOTE: The repair area must be properly refinished to maintain positive electrical grounding.

10. Refinish the repair area using an anti-corrosion primer. Refer to **Anti-Corrosion Treatment and Repair** .
11. Check for proper system operation.

M8 Weld Nut (Alternative Repair)

CAUTION: Use GM approved replacement fasteners with conductive finish for electrical ground repair.

1. If the M8 weld nut electrical ground location is not accessible from both sides of the panel, a conductive M6 rivet stud and a conductive M6 nut may be used to secure the ground terminal. Refer to GM parts catalog for the correct part numbers and application.

2. Select a location adjacent the damaged M8 weld nut having 20 mm (0.79 in) clearance behind the panel surface and 20 mm (0.79 in) clearance surrounding the new, conductive M6 rivet stud flange.
3. Using GM approved residue-free solvent or equivalent, remove any grease from the repair site and allow to dry.

NOTE: **Ensure 20 mm (0.79 in) clearance is maintained behind the panel to be drilled.**

4. Drill a 10 mm (0.40 in) diameter hole through the panel.
5. Carefully remove paint and primer from the area surrounding the rivet stud flange until bare metal is visible.
6. Using a rivet stud installer, install the replacement conductive M6 rivet stud.
7. Ensure the new rivet stud is securely fastened, with no detectable movement.

NOTE: **The rivet stud and surrounding panel area must be properly refinished prior to the installation of the ground terminal and nut to maintain positive electrical grounding.**

8. Completely wrap the threads of the rivet stud with painters tape or equivalent.
9. Refinish the repair area using an anti-corrosion primer. Refer to **Anti-Corrosion Treatment and Repair**.
10. Allow the refinished repair area to cure sufficiently before removing the protective material applied to the rivet stud threads.
11. Remove the painters tape or equivalent from the rivet stud threads.
12. Using GM approved residue-free solvent or equivalent, thoroughly clean the rivet stud threads to remove any adhesive and allow to dry.
13. Carefully remove any corrosion from the electrical ground wire terminal. Refer to **Testing for Intermittent Conditions and Poor Connections**.
14. Using a small brush, apply Dielectric Lubricant GM P/N 12377900 (Canadian P/N 10953529) to the new conductive M6 rivet stud threads.
15. Install the ground terminal to the new, conductive M6 rivet stud.

CAUTION: Refer to **Fastener Caution**.

16. Install the conductive M6 nut and tighten to 8 N.m (71 lb in).
17. Check for proper system operation.

FUSE BLOCK REPLACEMENT

Fig. 25: Fuse Block Components
 Courtesy of GENERAL MOTORS COMPANY

Fuse Block Replacement

Callout	Component Name
Preliminary Procedures	
1. Disconnect the battery negative cable. Refer to Battery Negative Cable Replacement . 2. Disconnect the battery positive cable. Refer to Battery Positive Cable Replacement .	
1	Front Compartment Fuse Block Positive Cable and Engine Power Supply Cable Nut (Qty: 2) CAUTION: Refer to Fastener Caution . Tighten 12 (106 lb in)
2	Fuse Block Terminal Wiring Harness (Qty: 2) Tighten 4.7 N.m (3.5 lb in)
3	Master Fuse Fuse Block Procedure Remove the master fuse from the battery positive splitter.

4	Fuse Block Procedure Unclip and remove the battery positive splitter housing from the battery.
---	---

FRONT COMPARTMENT FUSE BLOCK FUSE REPLACEMENT (MIDI-FUSE)

Fig. 26: Front Compartment Fuse Block Fuse Components (MIDI-Fuse)
 Courtesy of GENERAL MOTORS COMPANY

Front Compartment Fuse Block Fuse Replacement (MIDI-Fuse)

Callout	Component Name
Preliminary Procedure Disconnect the battery negative cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> .	
1	Fuse Block Fuse Cover
2	Battery Positive Cable and Nut CAUTION: Refer to <u>Fastener Caution</u> . Procedure Disconnect the battery positive cable(s) from the fuse. Tighten 4.7 (42 lb in)

3	Fuse Block Fuse Holder Nut - MIDI-Fuse Tighten 4.7 (42 lb in)
4	Fuse Block Fuse - MIDI-Fuse

FRONT COMPARTMENT FUSE BLOCK HOUSING REPLACEMENT

Fig. 27: Front Compartment Fuse Block Housing, Nut & Plugs
Courtesy of GENERAL MOTORS COMPANY

Front Compartment Fuse Block Housing Replacement

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none"> 1. Disconnect the battery ground cable. Refer to Battery Negative Cable Replacement. 2. Disconnect the battery positive and negative cable. Refer to Battery Positive and Negative Cable Replacement (LUK), Battery Positive and Negative Cable Replacement (LTG). 3. Remove the front compartment fuse block housing cover. Refer to Front Compartment Fuse Block Housing Cover Replacement. 4. Remove the underhood electrical center or junction block. Refer to Underhood Electrical Center or Junction Block Replacement. 	
1	Wiring Harness Plug (Qty: 3) Procedure Release the wiring harness plugs.

2	<p>Front Compartment Fuse Block Housing Nut</p> <p>CAUTION: Refer to <u>Fastener Caution</u> .</p> <p>Tighten 22 N.m (16 lb ft)</p>
3	<p>Front Compartment Fuse Block Housing</p> <p>Procedure Remove the front compartment fuse block housing.</p>

FRONT COMPARTMENT FUSE BLOCK HOUSING COVER REPLACEMENT

Fig. 28: Front Compartment Fuse Block Housing Cover
Courtesy of GENERAL MOTORS COMPANY

Front Compartment Fuse Block Housing Cover Replacement

Callout	Component Name
1	<p>Front Compartment Fuse Block Housing Cover</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Release the front compartment fuse block housing cover on 3 points.

2. Lift the front compartment fuse block housing cover.

UNDERHOOD ELECTRICAL CENTER OR JUNCTION BLOCK REPLACEMENT

Fig. 29: Underhood Electrical Center or Junction Block & Fasteners
Courtesy of GENERAL MOTORS COMPANY

Underhood Electrical Center or Junction Block Replacement

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none">1. Disconnect the battery ground cable. Refer to <u>Battery Negative Cable Replacement</u> .2. Disconnect the battery positive and negative cable. Refer to <u>Battery Positive and Negative Cable Replacement (LUK)</u> , <u>Battery Positive and Negative Cable Replacement (LTG)</u> .3. Remove the front compartment fuse block housing cover. Refer to <u>Front Compartment Fuse Block Housing Cover Replacement</u>.	
	Underhood Electrical Center Fastener (Qty: 3) CAUTION: Refer to <u>Fastener Caution</u> . Procedure <ol style="list-style-type: none">1. Unscrew the underhood electrical center fasteners.

1	<p>Release the bolts far enough so that the wiring harness plug under the electrical center can drop down.</p> <p>2. After installing and tightening the underhood electrical center fasteners, it is necessary to check, if the green indicator rings under the fasteners be flush with the electrical center.</p> <p>Tighten 7.2 N.m (66 lb in)</p>
2	<p>Underhood Electrical Center</p> <p>Procedure</p> <p>1. Release the underhood electrical center.</p> <p>2. Lift underhood electrical center.</p> <p>TIP: When replacing, transfer fuses and relays.</p>

IGNITION LOCK CYLINDER REPLACEMENT

Fig. 30: Ignition Lock Cylinder
Courtesy of GENERAL MOTORS COMPANY

Ignition Lock Cylinder Replacement

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none">1. Disconnect the battery negative cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> .2. Remove the steering column trim covers. Refer to <u>Steering Column Trim Cover Replacement</u> .	
1	<p>Ignition Lock Cylinder</p> <p>Procedure</p> <ol style="list-style-type: none">1. Turn the ignition lock cylinder to the RUN position.2. Insert a pick-type tool into the proper hole on the ignition and start switch housing and press the lock tab on the ignition lock cylinder down while turning the cylinder to the START position.3. Pull the ignition lock cylinder out of the ignition and start switch housing.4. If installing a new ignition lock cylinder then refer to <u>Lock Cylinder Coding - Ignition</u> .

IGNITION AND START SWITCH REPLACEMENT (WITH BTM)

Fig. 31: Ignition And Start Switch (With BTM)

Courtesy of GENERAL MOTORS COMPANY

Ignition and Start Switch Replacement (With BTM)

Callout	Component Name
Preliminary Procedure Remove the instrument panel upper center trim panel. Refer to <u>Instrument Panel Upper Center Trim Panel Replacement</u> .	
1	Ignition and Start Switch 1. Disconnect the electrical connector. 2. Push in the tabs to release the ignition and start switch.

IGNITION AND START SWITCH REPLACEMENT (WITHOUT BTM)

Fig. 32: Ignition And Start Switch (Without BTM)

Courtesy of GENERAL MOTORS COMPANY

Ignition and Start Switch Replacement (Without BTM)

Callout	Component Name
Preliminary Procedure 1. Disconnect the battery negative cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> . 2. Disable the supplemental inflatable restraint (SIR) system. Refer to <u>SIR Disabling and Enabling</u> . 3. Remove the steering column trim covers. Refer to <u>Steering Column Trim Cover Replacement</u> .	
	Ignition and Start Switch Bolt (Qty: 2)

1	CAUTION: Refer to <u>Fastener Caution</u> . Tighten 2 N.m (18 lb in)
2	Ignition and Start Switch Procedure Disconnect the ignition and start switch electrical connector.

IGNITION AND START SWITCH HOUSING REPLACEMENT

Fig. 33: Ignition and Start Switch Housing
Courtesy of GENERAL MOTORS COMPANY

Ignition and Start Switch Housing Replacement

Callout	Component Name
Preliminary Procedure Remove the turn signal switch bracket. Refer to <u>Turn Signal Switch Bracket Replacement (With BTM)</u> , <u>Turn Signal Switch Bracket Replacement (Without BTM)</u> .	
	Ignition and Start Switch Housing Bolt CAUTION: Refer to <u>Fastener Caution</u> .

1	Procedure <ol style="list-style-type: none"> 1. Discard the old ignition and start switch housing bolt. 2. Install the NEW ignition and start switch housing bolt and tighten until the bolt head breaks off.
2	Ignition and Start Switch Housing Strap
3	Ignition and Start Switch Housing Procedure <ol style="list-style-type: none"> 1. Disconnect the electrical connector. 2. Transfer components as necessary.

DIAGNOSTIC INFORMATION AND PROCEDURES

SYMPTOMS - SEAT BELTS

NOTE: Review the seat belt system description and operation in order to familiarize yourself with the system and how it functions. Refer to Seat Belt System Description and Operation.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the seat belt system. Refer to Checking Aftermarket Accessories.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to Testing for Intermittent Conditions and Poor Connections.

Symptom List

Refer to the following symptom diagnostic procedure in order to diagnose the symptom:

- **Seat Belt Indicator Malfunction - Driver**
- **Seat Belt Indicator Malfunction - Passenger**

SEAT BELT INDICATOR MALFUNCTION - DRIVER

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Driver Seat Belt Switch Signal	1	2	2	-
Driver Seat Belt Switch Ground	-	2	-	-
1. Seat Belt Indicator Always Illuminated 2. Seat Belt Indicator Inoperative				

Circuit/System Description

The driver seat belt switch is a 2-wire switch wired to the inflatable restraint sensing and diagnostic module (SDM) using a signal circuit and a low reference circuit. When the seat belt is unbuckled the switch is closed, and when the seat belt is buckled the switch is open. The SDM sends the status of the driver seat belt via serial data to the instrument cluster. After receiving the message, the instrument cluster controls the illumination of the driver seat belt indicator.

- **Wiring Repairs**

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Command the instrument cluster all indicators ON and OFF with a scan tool. The driver seat belt indicator should turn ON and OFF as commanded.
 - **If the driver seat belt indicator does not turn ON and OFF as commanded**

Replace the P16 instrument cluster.

 - **If the driver seat belt indicator does turn ON and OFF as commanded**
2. Monitor the scan tool Driver Seat Belt Switch parameter while buckling and unbuckling the seat belt. The parameter should display Buckled and Unbuckled when changing seat belt states.
 - **If the scan tool Driver Seat Belt Switch parameter does not display Buckled and Unbuckled when changing seat belt states**

Refer to Circuit/System Testing.

 - **If the scan tool Driver Seat Belt Switch parameter does display Buckled and Unbuckled when changing seat belt states**
3. All OK.

Circuit/System Testing

NOTE: When removing connectors inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected component/connector.

- **B88 Seat belt switch**
- **Seat belt switch harness connector**
- **K36 SDM**
- **SDM wiring harness connector**

1. Ignition OFF.
2. Disconnect the harness connector at the B88 seat belt switch.

3. Test for less than 10 ohms between the low reference circuit terminal 1 and ground.
 - **If 10 ohms or greater**
 1. Disconnect the harness connector at the K36 SDM.
 2. Test for less than 2 ohms in each control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K36 SDM.
 - **If less than 10 ohms**
4. Ignition ON.
5. Verify the scan tool Driver Seat Belt Status parameter displays Buckled.
 - **If the scan tool Driver Seat Belt Status parameter does not display Buckled**
 1. Disconnect the harness connector at the K36 SDM.
 2. Test for infinite resistance between the seat belt switch signal circuit terminal 2 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If less than 2 ohms, replace the K36 SDM.
 - **If the scan tool Driver Seat Belt Status parameter does display Buckled**
6. Install a 3 A fused jumper wire between the signal circuit terminal 2 and the low reference circuit terminal 1.
7. Verify the scan tool Driver Seat Belt Status parameter displays Unbuckled.
 - **If the scan tool Driver Seat Belt Status parameter does not display Unbuckled**
 1. Disconnect the harness connector at the K36 SDM.
 2. Ignition ON.
 3. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 4. Test for less than 2 ohms in each circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K36 SDM.
 - **If the scan tool Driver Seat Belt Status parameter does display Unbuckled**
8. Replace the B88 seat belt switch.

Component Testing

1. Ignition OFF.
2. Disconnect the harness connector at the B88 seat belt switch.
3. B88 seat belt switch in the open position.
4. Test for infinite resistance between the signal circuit terminal 2 and the low reference terminal 1 at the B88 seat belt switch.
 - **If there is not infinite resistance**

Replace the B88 seat belt switch.

- **If there is infinite resistance**

5. B88 seat belt switch in the closed position.

6. Test for less than 1 ohms between the signal circuit terminal 2 and the low reference terminal 1 at the B88 seat belt switch.

- **If 1 ohms or greater**

Replace the B88 seat belt switch.

- **If less than 1 ohms**

7. All OK.

Repair Instructions

- Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.
- **Front Seat Belt Buckle Replacement**
- **Control Module References** for SDM and instrument cluster replacement, programming and setup

SEAT BELT INDICATOR MALFUNCTION - PASSENGER

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Switch Signal	1	2	2	-
Indicator Control	2	2	1	-
Switch Ground	-	2	-	-
1. Seat Belt Indicator Always Illuminated 2. Seat Belt Indicator Inoperative				

Circuit/System Description

The passenger seat belt switch supplies a ground to the SDM when the passenger seat belt is unbuckled. When a seat belt is buckled, a switch opens removing the ground to the SDM. The SDM will then supply voltage to the seat belt indicator, in the hazard warning switch, which will then cause that indicator to illuminate.

Diagnostic Aids

Objects on the passenger seat can cause the passenger seat belt reminder to be commanded on. Depending on the sensing technology used, a conductive object (computers, MP3 players, cell phones, diagnostic scan tool,

wires, a hand, etc.) placed on the passenger seat may cause the Passenger Presence Detection Module to command the passenger air bag indicator ON and/or command the passenger seat belt indicator ON. The fasten seat belt chime will also sound.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Monitor the scan tool Passenger Seat Belt Status parameter while buckling and unbuckling the passenger seat belt. The value should display Buckled and Unbuckled when changing seat belt states.
 - **If the scan tool Passenger Seat Belt Status parameter does not display Buckled and Unbuckled when changing seat belt states**

Refer to Seat Belt Switch Malfunction.

 - **If the scan tool Passenger Seat Belt Status parameter does display Buckled and Unbuckled when changing seat belt states**
2. Command the Driver Seat Belt Reminder ON and OFF with a scan tool. The seat belt indicator should turn ON and OFF while changing between the commanded states.
 - **If the driver seat belt indicator does not turn ON and OFF as commanded**

Refer to Seat Belt Indicator Malfunction.

- **If the driver seat belt indicator does turn ON and OFF as commanded**
- 3. All OK.

Circuit/System Testing

Seat Belt Switch Malfunction

1. Ignition OFF. Disconnect the harness connector at the B88P seat belt switch-passenger.
2. Test for less than 10 ohms between the low reference circuit terminal 1 and ground.
 - **If 10 ohms or greater**
 1. Disconnect the X2 harness connector at the K36 SDM.
 2. Test for less than 2 ohms in each control circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K36 SDM.
 - **If less than 10 ohms**
3. Ignition ON.
4. Verify the scan tool Passenger Seat Belt Status parameter listed below is Buckled.
 - **If the scan tool Passenger Seat Belt Status parameter does not display Buckled**
 1. Disconnect the X2 harness connector at the K36 SDM.
 2. Test for infinite resistance between the seat belt switch signal circuit terminal 2 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If less than 2 ohms, replace the K36 SDM.
 - **If the scan tool Passenger Seat Belt Status parameter does display Buckled**
5. Install a 3 A fused jumper wire between the signal circuit terminal 2 and the low reference circuit terminal 1.
6. Verify the scan tool Passenger Seat Belt Status parameter is Unbuckled.
 - **If the scan tool Passenger Seat Belt Status parameter does not display Unbuckled**
 1. Disconnect the X2 harness connector at the K36 SDM. Ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 3. Test for less than 2 ohms in each circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K36 SDM.
 - **If the scan tool Passenger Seat Belt Status parameter does display Unbuckled**
7. Replace the B88P seat belt switch-passenger.

Seat Belt Indicator Malfunction

1. Ignition OFF.
2. Disconnect the harness connector at the S48 multifunction switch 1-instrument panel.

3. Test for less than 10 ohms between the ground circuit terminal 1 and ground.

- **If 10 ohms or greater**

Repair the open/high resistance in the circuit.

- **If less than 10 ohms**

4. Ignition ON. With a scan tool, command the Passenger Seat Belt Reminder Indicator OFF.

5. Test for less than 11 V between the control circuit terminal 4 and ground.

- **If 11 V or greater**

1. Ignition OFF. Disconnect the X1 harness connector at the K36 SDM. Ignition ON.

2. Test for less than 1 V between the control circuit terminal 4 and ground.

- If 1 V or greater, repair the short to voltage on the circuit.

- If less than 1 V, replace the K36 SDM.

- **If less than 11 V**

6. With a scan tool, command the Passenger Seat Belt Reminder Indicator ON.

7. Test for greater than 4 V between the control circuit terminal 4 and ground.

- **If 4 V or less**

1. Ignition OFF. Disconnect the X 1 harness connector at the K36 SDM.

2. Test for infinite resistance between the control circuit terminal 4 and ground.

- If less than infinite resistance, repair the short to ground on the circuit.

3. Test for less than 2 ohms between the control circuit terminal 4 and ground.

- If 2 ohms or greater repair the open/high resistance in the circuit.

- If less than 2 ohms replace the K36 SDM.

- **If greater than 4 V**

8. Replace the S48 multifunction switch 1-instrument panel.

Component Testing

1. Ignition OFF. Disconnect the harness connector at the B88P seat belt switch-passenger. Buckle the passenger seat belt.

2. Test for infinite resistance between the signal circuit terminal 2 and the low reference terminal 1 at the B88P seat belt switch-passenger.

- **If there is not infinite resistance**

Replace the B88P seat belt switch-passenger.

- **If there is infinite resistance**

3. Unbuckle the passenger seat belt.

4. Test for less than 2 ohms between the signal circuit terminal 2 and the low reference terminal 1 at the B88P seat belt switch-passenger.

- **If 2 ohms or greater**

Replace the B88P seat belt switch-passenger.

- If less than 2 ohms

5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Front Seat Belt Buckle Replacement**
- **Control Module References** for the SDM replacement, programming and setup

REPAIR INSTRUCTIONS

REPAIRS AND INSPECTIONS REQUIRED AFTER A COLLISION

WARNING: Restraint systems can be damaged in a collision. To help avoid injury and ensure that all parts in need of replacement are replaced:

- Replace any seat belt system that was in use during the collision serious enough to deploy any automatic restraint device such as air bags and seat belt pretensioners. This not only includes seat belt systems in use by people of adult size, but seat belt systems used to secure child restraints, infant carriers and booster seats, including LATCH system and top tether anchorages.
- Replace any seat belt system that has torn, worn, or damaged components. This not only includes adult seat belt systems, but built-in child restraints and LATCH system components, if any.
- Replace any seat belt system if you observe the words "REPLACE" or "CAUTION", or if a yellow tag is visible. Do not replace a seat belt if only the child seat caution label is visible.
- Replace any seat belt system if you are doubtful about its condition. This not only includes adult seat belt systems, but built-in child restraints, LATCH system components, and any restraint system used to secure infant carriers, child restraints, and booster seats.

Do NOT replace single seat belt system components in vehicles that have been in a collision as described above. Always replace the entire seat belt system with the buckle, guide and retractor assembly, which includes the latch and webbing material.

After a minor collision where no automatic restraint device was deployed, seat belt system replacement may not be necessary, unless some of the parts are torn, worn, or damaged.

SEAT BELT LATCH STOP INSTALLATION

Fig. 2: View Of Seat Belt Latch Stop Components
 Courtesy of GENERAL MOTORS COMPANY

Seat Belt Latch Stop Installation

Callout	Component Name
Preliminary Procedure	
<ol style="list-style-type: none"> 1. Locate the hole in the seat belt webbing where the original seat belt stop button was located. 2. If the original hole in the seat belt webbing is not visible, perform the following: <ul style="list-style-type: none"> • If either the right or left stop button is missing use the opposing seat belt as a reference. • With the opposing seat belt fully stowed, measure the distance between the seat belt lower anchor and the stop button. • Using the measurement obtained above, measure and mark the location of the missing stop button on the center of the seat belt webbing. 3. Ensure the seat belt latch plate is located above the mark or original hole. 	
1	Seat Belt Latch Stop Procedure <ol style="list-style-type: none"> 1. Work the male half of the stop button through the hole in the webbing or at the marked location. 2. Align the female half of the stop button with the male half of the stop button. 3. Snap the two halves together.

- Trim off any excess of the male half of the stop button flush with the female half of the stop button.

TIP: Ensure the male half of the stop button is facing forward in the vehicle in order to ensure the stop button will not snag customers clothing.

FRONT SEAT BELT BUCKLE REPLACEMENT

Fig. 3: Driver Or Passenger Seat Belt Buckle & Fastener
Courtesy of GENERAL MOTORS COMPANY

Front Seat Belt Buckle Replacement

Callout	Component Name
Preliminary Procedure Remove the driver or passenger seat. Refer to <u>Driver or Passenger Seat Removal and Installation (Oshawa 2/4/6-Way Hybrid, 6-Way Sport)</u> .	
1	Driver or Passenger Seat Belt Buckle Fastener CAUTION: Refer to <u>Fastener Caution</u> . Tighten

	45 N.m (33 lb ft)
2	Driver or Passenger Seat Belt Buckle Procedure Disconnect the electrical connector.

REAR SEAT BUCKLE SIDE BELT REPLACEMENT

Fig. 4: Rear Seat Center Shoulder Belt Buckle & Fastener

Restraint System

NOTE: If the vehicle has been in a collision, refer to Repairs and Inspections Required After a Collision for additional information.

The vehicle has front and rear seat belts that are the primary means of occupant restraint. Seat belts help to keep the occupants inside the passenger compartment and to gradually reduce the impact forces during the following events:

- Frontal impact type crashes
- Rear impact type crashes
- Side impact type crashes
- Roll-over type crashes

All seat belt retractors have emergency locks. The retractors remain unlocked during normal operation and under normal driving conditions. The retractors remain unlocked during normal conditions in order to allow free movement of the upper body of each occupant. A pendulum locks the seat belt webbing into position. The pendulum causes a locking bar to engage a cog on the spool of the retractor mechanism when the following conditions occur:

- A rapid extraction of the seat belt webbing from the retractor
- An abrupt change in vehicle speed
- An abrupt change in vehicle direction
- Operation of the vehicle on a steep upgrade
- Operation of the vehicle on a downgrade

The seat belts have an automatic locking (cinch) feature. The cinch feature is activated when the seat belt webbing is completely extended from the retractor. The cinch feature prevents the webbing from extending beyond the position from which it is allowed to retract. Use of the cinch feature is recommended for securing a child seat. The cinch feature may be cancelled by allowing the webbing to wind back completely into the retractor. After the cinch feature is cancelled, the webbing is unlocked. After the cinch feature is cancelled, the webbing will extend from the retractor. This vehicle is also equipped with a supplemental inflatable restraint (SIR) system. Refer to **Supplemental Inflatable Restraint System Description and Operation** .

Front Seat Belt System

The front seat belt system includes a driver and passenger seat belt pretensioner anchor and retractor. The front seat belt buckles include a seat belt switch which controls a reminder lamp.

NOTE: **The front passenger seat is equipped with a passenger presence detection sensor, which detects an occupant. If the passenger presence detection sensor detects an empty front passenger seat, then the passenger fasten safety belt indicator will be disabled.**

- When the driver seat belt is buckled and the ignition switch is turned ON, the reminder lamp will not operate.
- When the passenger seat belt is buckled with an occupant sitting in the passenger front seat, then the ignition switch is turned ON, the reminder lamp, which is located within the hazard warning switch, will not be turned ON.
- When the driver seat belt is not buckled and the ignition switch is in the ON position, the fasten safety belt indicator will turn ON until the driver seat belt is buckled.
- When the passenger seat belt is not buckled with an occupant sitting in the passenger front seat, then the ignition switch is turned ON, the passenger fasten safety belt indicator, which is located within the hazard warning switch, will turn ON until the passenger seat belt is buckled.

Rear Seat Belt System

The Rear Seat Belt System includes the following components:

- The rear seat belt retractor is located at the wheelhouse panel and attached to the floor panel by the rear seat shoulder belt retractor bracket.
- The rear seat belt buckles and the center seat belt buckle are attached to each seat.

Child Seat Restraint System

WARNING: A child in a rear-facing child restraint can be seriously injured if the right-front passengers air bag inflates. This is because the back of a rear-facing child restraint would be very close to the inflating air bag. NEVER use a rear-facing child restraint in this vehicle. If a forward-facing child restraint is suitable for your child, ALWAYS move the front passenger seat as far back as it will go and then install the child restraint. Be sure the child restraint position does not conflict with any additional requirements provided by the manufacturer. For more information, refer to the vehicle owners manual and the instruction that came with the child restraint.

The child seat may only be used in a forward facing seating location. The child seat should be installed and secured according to the manufacturer's directions. If the child seat has a top strap, the seat will need to be anchored. Passengers should not be allowed to sit at locations where the seat belts are being used to secure the child seat.

All vehicles are equipped with a dual-mode type retractor with emergency and automatic locking features. The automatic locking feature is for restraint of a child seat. The child seat can be secured by pulling the seat belt all the way out to lock it. Then tighten the seat belt around the child seat.

If a child seat is to be used in the second seat position, a special dealer-installed anchor must be used in order to anchor the child seat top strap. This only applies to the seats designed with the top strap provision and for the vehicles sold in Canada. In order to ensure the correct top strap angle, the child seat is only to be used at the seating position for which the top strap anchor is installed.

Fasten Safety Belt Indicators

There are 2 fasten safety belt indicators for this vehicle. The driver fasten safety belt reminder is monitored on the instrument cluster and the passenger fasten safety belt reminder is located in the hazard warning switch. The fasten safety belt indicators may only be ON during RUN.

The instrument cluster illuminates the driver fasten safety belt indicator under the following conditions:

- During the bulb check (will flash 20 times and then stay on solid until the driver seat belt is buckled).
- The inflatable restraint sensing and diagnostic module (SDM) sends the status of the driver seat belt to the instrument cluster via a serial data.

The hazard warning switch illuminates the passenger fasten safety belt indicator under the following conditions:

Passenger presence recognizes someone is sitting in the front passenger seat. The SDM controls passenger seat belt indicator in the hazard warning switch through a hard wire circuit. The passenger seat belt indicator will remain on until the passenger seat belt is buckled.

REPAIR INSTRUCTIONS

DRIVER OR PASSENGER SEAT REMOVAL AND INSTALLATION

Fig. 1: Driver or Passenger Seat (2/4/6-Way Hybrid, 6-Way Hybrid Sport)
 Courtesy of GENERAL MOTORS COMPANY

Driver or Passenger Seat Removal and Installation

Callout	Component Name
Preliminary Procedure	
1. SIR Disabling and Enabling. Refer to <u>SIR Disabling and Enabling</u> . 2. Disconnect the negative battery cable. Refer to <u>Battery Negative Cable Disconnection and Connection</u> .	
1	Cap
2	Driver or Passenger Seat Belt Fastener CAUTION: Refer to <u>Fastener Caution</u> . Tighten 5 N.m (44 lb in)
3	Seat Belt Tensioner Cover
4	Driver or Passenger Seat Belt
	Driver or Passenger Seat Fastener (Qty: 2)
Procedure	

5	<ol style="list-style-type: none"> 1. Move front seat high adjuster in middle position. 2. Disconnect the battery. 3. Seat belt release at seat belt tensioner. 4. Disconnect the central wiring harness connector at bottom. 5. Unscrew both fasteners at the rail guide. 6. Remove the front seat out of the vehicle with two persons.
	Tighten 45 N.m (30 lb ft)
6	Driver or Passenger Seat

FRONT SEAT ADJUSTER FRONT SPACER REPLACEMENT

Fig. 2: Front Seat Adjuster Front Spacer
Courtesy of GENERAL MOTORS COMPANY

Front Seat Adjuster Front Spacer Replacement

Callout	Component Name
Preliminary Procedure Remove the driver or passenger seat. Refer to <u>Driver or Passenger Seat Removal and Installation.</u>	
1	Front Seat Adjuster Front Spacer TIP: Use a small commercial screwdriver for clip out the spacer.

FRONT SEAT ADJUSTER KNOB REPLACEMENT (LOWER - 8-WAY-POWER)

Fig. 3: Front Seat Adjuster Knob (Lower - 8-Way-Power)
Courtesy of GENERAL MOTORS COMPANY

Front Seat Adjuster Knob Replacement (Lower - 8-Way-Power)

Callout	Component Name
1	Front Seat Adjuster Knob TIP: Use a small flat-bladed tool to clip out the knob.

DRIVER OR PASSENGER SEAT ADJUSTER HANDLE REPLACEMENT (2/4/6-WAY HYBRID, 6-WAY HYBRID SPORT)

Fig. 4: Driver or Passenger Seat Adjuster Handle
 Courtesy of GENERAL MOTORS COMPANY

Driver or Passenger Seat Adjuster Handle Replacement (2/4/6-Way Hybrid, 6-Way Hybrid Sport)

Callout	Component Name
1	Driver or Passenger Seat Adjuster Handle Fastener CAUTION: Refer to <u>Fastener Caution</u> Procedure For removal of the driver or passenger seat adjuster handle move the front seat full backward. Tighten 3.5 N.m (31 lb in)
2	Driver or Passenger Seat Adjuster Handle

FRONT SEAT ADJUSTER TRACK FINISH COVER REPLACEMENT

Fig. 5: Front Seat Adjuster Track Finish Cover & Fastener
 Courtesy of GENERAL MOTORS COMPANY

Front Seat Adjuster Track Finish Cover Replacement

Callout	Component Name
1	<p>Front Seat Adjuster Track Finish Cover Fastener</p> <p>CAUTION: Refer to <u>Fastener Caution</u> .</p> <p>Tighten 3.5 N.m (31 lb in)</p>
2	<p>Front Seat Adjuster Track Finish Cover</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Move front seat height adjuster into the middle position. 2. Move the driver or passenger seat fully forward. 3. Clip out the front seat adjuster track finish cover at rear. 4. Move the front seat adjuster track finish cover at front. 5. Remove the front seat adjuster track finish cover.

DRIVER OR PASSENGER SEAT HEAD RESTRAINT REPLACEMENT (WITHOUT AHS)

Fig. 6: View Of Driver Or Passenger Seat Head Restraint, Clips & Bezels (Without AHS)
 Courtesy of GENERAL MOTORS COMPANY

Driver or Passenger Seat Head Restraint Replacement (without AHS)

Callout	Component Name
1	Driver or Passenger Seat Head Restraint Bezel (Qty: 2) Procedure 1. Raise the headrest to gain access to the head restraint bezel. 2. Twist the bezel counter clockwise and push the bezel upward on the head restraint shaft.
2	Driver or Passenger Seat Head Restraint Clip (Qty: 2) Procedure Using a suitable pointed or flat bladed tool, push the metal clip forward while pulling upward on the head restraint. TIP: If the clip becomes dislodged, it may be necessary to remove the guides to reset the clips.
3	Driver or Passenger Seat Head Restraint

FRONT SEAT HEAD RESTRAINT GUIDE BEZEL REPLACEMENT (2/4/6-WAY HYBRID, 6-WAY HYBRID SPORT)

Fig. 7: Front Seat Head Restraint Guide Bezel
Courtesy of GENERAL MOTORS COMPANY

Front Seat Head Restraint Guide Bezel Replacement (2/4/6-Way Hybrid, 6-Way Hybrid Sport)

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none"> 1. Remove front seat head restraint. Refer to <u>Driver or Passenger Seat Head Restraint Replacement (without AHS)</u>. 2. Remove front seat head restraint adjust rod guide. Refer to <u>Front Seat Head Restraint Guide Replacement</u>. 	
1	Front Seat Head Restraint Adjust Rod Guide
2	Front Seat Head Restraint Guide Bezel Procedure <ol style="list-style-type: none"> 1. Position front seat head restraint guide bezel. 2. Attach front seat head restraint guide bezel at front seat head restraint adjust rod guide. TIP: After removal of head restraint install both head restraint adjust rod guides.

FRONT SEAT HEAD RESTRAINT GUIDE BEZEL REPLACEMENT (8-WAY POWER)

Fig. 8: Front Seat Head Restraint Guide Bezel (8-Way Power)
 Courtesy of GENERAL MOTORS COMPANY

Front Seat Head Restraint Guide Bezel Replacement (8-Way Power)

Callout	Component Name
Preliminary Procedure Remove the driver or passenger seat head restraint. Refer to <u>Driver or Passenger Seat Head Restraint Replacement (without AHS)</u> .	
1	Front Seat Head Restraint Guide Bezel TIP: Twist the bezel to remove.

FRONT SEAT HEAD RESTRAINT GUIDE REPLACEMENT

Fig. 9: Identifying Front Seat Head Restraint Adjust Rod Guides
 Courtesy of GENERAL MOTORS COMPANY

Front Seat Head Restraint Guide Replacement

Callout	Component Name
Preliminary Procedure	
Remove the driver or passenger seat head restraint. Refer to <u>Driver or Passenger Seat Head Restraint Replacement (without AHS).</u>	
1	Driver or Passenger Seat Head Restraint Adjust Guide (Qty: 2) Procedure Using a suitable flat-bladed tool, slide the tool on the outside of the guide until it finds the slot. Then push the plastic slot inward and pull up upward to remove the guide from the seat back frame.

DRIVER OR PASSENGER SEAT OUTER ADJUSTER FINISH COVER REPLACEMENT (8-WAY POWER)

Fig. 10: Driver Or Passenger Seat Outer Adjuster Finish Cover (8-Way Power)
 Courtesy of GENERAL MOTORS COMPANY

Driver or Passenger Seat Outer Adjuster Finish Cover Replacement (8-Way Power)

Callout	Component Name
1	Driver or Passenger Seat Outer Adjuster Finish Cover Procedure To remove the driver or passenger seat outer adjuster finish cover move the driver or passenger seat full forward and move the high adjuster in middle position.

DRIVER OR PASSENGER SEAT ADJUSTER FINISH COVER REPLACEMENT (8-WAY-POWER)

Fig. 11: Driver or Passenger Seat Adjuster Finish Cover (8-Way-Power)
 Courtesy of GENERAL MOTORS COMPANY

Driver or Passenger Seat Adjuster Finish Cover Replacement (8-Way-Power)

Callout	Component Name
Preliminary Procedures	
1. Open the front door. 2. Release the driver seat retractor side belt. 3. Remove the driver or passenger seat. Refer to <u>Driver or Passenger Seat Removal and Installation</u> . 4. Remove the front seat adjuster and recliner knob. Use a small flat-bladed tool to unclip the adjuster and recliner knob.	
1	Front Seat Adjuster Finish Cover Retainer
2	Front Seat Adjuster Finish Cover Fastener
3	Front Seat Adjuster Finish Cover Retainer Procedure 1. Disengage front retainer. 2. Pull up on the front of cover to disengage the front hook. 3. Carefully pull up on the center of the cover to disengage the center hook.
	Front Seat Adjuster Finish Cover

4	Procedure
	<ol style="list-style-type: none"> 1. Disconnect the electrical connector. 2. Disengage and remove the remainder of the finish cover by pulling the cover upward and outboard away from the seat. <p>NOTE: When reinstalling the finish cover, re-snap the front retainer together around the finish cover retainer rod.</p>

DRIVER OR PASSENGER SEAT ADJUSTER FINISH COVER RETAINER REPLACEMENT (4-WAY HYBRID, 6-WAY HYBRID SPORT)

Fig. 12: Driver or Passenger Seat Adjuster Finish Cover Retainer
Courtesy of GENERAL MOTORS COMPANY

Driver or Passenger Seat Adjuster Finish Cover Retainer Replacement (4-Way Hybrid, 6-Way Hybrid Sport)

Callout	Component Name
Preliminary Procedure Remove the driver or passenger seat adjuster finish cover. Refer to <u>Driver or Passenger Seat Adjuster Finish Cover Replacement (8-Way-Power)</u> .	
	Driver and Passenger Seat Adjuster Finish Cover Retainer (Qty: 2)

CAUTION:
Refer to Fastener Caution .

Procedure

1

1. Move the front seat to the highest position.
2. Clip out the cap of adjuster finish cover at finish cover.
3. Unscrew the fastener of adjuster finish cover at the finish cover.
4. Clip off the adjuster finish cover at finish cover retainer.
5. Clip out the wiring harness connector for the lumbar and high adjuster switch.
6. Unscrew the bolts and remove of front seat adjuster finish cover retainer.

REAR SEAT ARMREST MULTIFUNCTION COMPARTMENT ARMREST REPLACEMENT

Fig. 46: Rear Seat Armrest Multifunction Compartment Armrest
 Courtesy of GENERAL MOTORS COMPANY

Rear Seat Armrest Multifunction Compartment Armrest Replacement

Callout	Component Name
1	<p>Rear Seat Armrest Multifunction Compartment.</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Disengage the pass through door assembly, if equipped. 2. Remove the armrest hinges from the rear seat back cushion panel.

REAR SEAT HEAD RESTRAINT REPLACEMENT

Fig. 47: Rear Seat Head Restraint
 Courtesy of GENERAL MOTORS COMPANY

Rear Seat Head Restraint Replacement

Callout	Component Name
1	Rear Seat Head Restraint Procedure <ol style="list-style-type: none"> 1. Tilt the seat forward to gain space between the head restraint and the roof. 2. Depress the large button on the head restraint guide and raise the head restraint to the full up position. 3. Depress the small button on the opposite head restraint guide and pull upward to remove from the seat.

REAR SEAT HEAD RESTRAINT GUIDE REPLACEMENT

Fig. 48: Rear Seat Head Restraint Guide
 Courtesy of GENERAL MOTORS COMPANY

Rear Seat Head Restraint Guide Replacement

Callout	Component Name
Preliminary Procedure	
Remove the rear seat head restraint. Refer to <u>Rear Seat Head Restraint Replacement</u>.	
1	Rear Seat Head Restraint Guide Procedure Using a suitable flat-bladed tool, slide the tool between the cushion and the guide until you find the slot on the outboard side of the guide. Push inward on the guide slot tab , while pulling upward to remove the guide from the seat back frame.

REAR SEAT BACK BOLSTER REPLACEMENT

Fig. 49: Rear Seat Back Cushion Bolster
 Courtesy of GENERAL MOTORS COMPANY

Rear Seat Back Bolster Replacement

Callout	Component Name
1	<p>Rear Seat Back Cushion Bolster</p> <p>WARNING: Refer to <u>SIR Warning</u> .</p> <p>WARNING: Do not repair or replace the seat stitching or seams in the seat back trim cover with an internal mounted seat side airbag module. Replace the complete seat back trim cover from the OEM. Non-OEM seat stitching may cause improper airbag deployment which could result in personal injury.</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Disable the SIR system. Refer to <u>SIR Disabling and Enabling</u> 2. Pull the upper seat back cushion bolster forward. <p>NOTE: If equipped, fold rear seat back cushion down to gain better access to back of bolster. Use a flat bladed short screw driver to aid in releasing the retainer from the bolster's retaining bar.</p>

3. Pull the seat back cushion bolster up.
4. Disconnect the electrical connector.
5. Remove rear seat back cushion bolster.
6. Remove the rear seat side inflatable module. Refer to **Rear Seat Outboard Seat Back Airbag Replacement** .

REAR SEAT CUSHION FRAME RETAINER REPLACEMENT

Fig. 50: Rear Seat Cushion Frame Retainers
Courtesy of GENERAL MOTORS COMPANY

Rear Seat Cushion Frame Retainer Replacement

Callout	Component Name
Preliminary Procedure Remove rear seat cushion. Refer to <u>Rear Seat Cushion Removal and Installation</u> .	
1	Rear Seat Cushion Frame Retainer Procedure Using a suitable flat-bladed tool, remove the rear seat cushion frame retainer.

REAR SEAT BACK CUSHION PIVOT SUPPORT REPLACEMENT

Fig. 51: Rear Seat Back Cushion Pivot Support, Housing, Spring & Bolt
 Courtesy of GENERAL MOTORS COMPANY

Rear Seat Back Cushion Pivot Support Replacement

Callout	Component Name
Preliminary Procedure Remove the rear seat back cushion. Refer to <u>Rear Seat Back Cushion Removal and Installation (60% Side)</u> , <u>Rear Seat Back Cushion Removal and Installation (40% Side)</u> .	
1	Rear Seat Back Outer Pivot Bolt CAUTION: Refer to <u>Fastener Caution</u> . Tighten 20 N.m (15 lb ft)
2	Rear Seat Back Cushion Pivot Support
3	Rear Seat Back Cushion Outer Pivot Bolt Spring
4	Rear Seat Back Cushion Pivot Support Housing

REAR SEAT CUSHION COVER AND PAD REPLACEMENT

Fig. 52: Rear Seat Cushion Cover And Pad
 Courtesy of GENERAL MOTORS COMPANY

Rear Seat Cushion Cover and Pad Replacement

Callout	Component Name
Preliminary Procedure Remove rear seat cushion. Refer to <u>Rear Seat Cushion Removal and Installation.</u>	
1	Rear Seat Cushion Cover Procedure Remove the hog rings that secure the rear seat cushion cover to the pad. TIP: When installing the rear seat cushion cover, pull the cover tightly in all corners to ensure that no creasing occurs.
2	Rear Seat Cushion Pad

REAR SEAT CUSHION REMOVAL AND INSTALLATION

Fig. 53: Rear Seat Cushion

Courtesy of GENERAL MOTORS COMPANY

Rear Seat Cushion Removal and Installation

Callout	Component Name
1	<p>Rear Seat Cushion</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Pull up on the front of the rear seat to disengage the retainers. 2. Pull out the rear seat of the rear retainer. 3. Remove the rear seat center shoulder belt anchor fastener and route the belt through the seat bottom. 4. Remove the rear seat .

REAR SEAT LATCH REPLACEMENT

Fig. 54: Rear Seat Latch & Fasteners
 Courtesy of GENERAL MOTORS COMPANY

Rear Seat Latch Replacement

Callout	Component Name
Preliminary Procedure Remove the rear seat back cushion cover and pad. Refer to <u>Rear Seat Back Cushion Cover and Pad Replacement (60% Side)</u> , <u>Rear Seat Back Cushion Cover and Pad Replacement (40% Side)</u> .	
1	Rear Seat Latch Fastener (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 45 N.m (33 lb ft)
2	Rear Seat Latch

REAR SEAT BACK CUSHION REMOVAL AND INSTALLATION (60% SIDE)

Fig. 55: Rear Seat Back Cushion (60% Side)
 Courtesy of GENERAL MOTORS COMPANY

Rear Seat Back Cushion Removal and Installation (60% Side)

Callout	Component Name
Preliminary Procedure	
1. Remove the rear seat cushion. Refer to <u>Rear Seat Cushion Removal and Installation</u> . 2. Remove the rear seat center retractor side belt lower fastener. Refer to <u>Rear Seat Center Retractor Side Belt Replacement</u> .	
1	Rear Seat Back Cushion Pivot Support Procedure <ol style="list-style-type: none"> 1. Pull the rear seat back cushion latch release located on the top of the rear seat back cushion, and fold the rear seat back cushion forward. 2. Push in on the rear seat back cushion pivot support, and release from bracket.
2	Rear Seat Back Cushion Procedure <ol style="list-style-type: none"> 1. Pull up on the outer side of the rear seat back cushion and remove the rear seat back cushion from the bracket and hinge. 2. Transfer components as necessary.

REAR SEAT BACK CUSHION REMOVAL AND INSTALLATION (40% SIDE)

REAR SEAT BACK CUSHION PANEL REPLACEMENT (40% SIDE)

Fig. 59: Rear Seat Back Cushion Panel (40% Side)
 Courtesy of GENERAL MOTORS COMPANY

Rear Seat Back Cushion Panel Replacement (40% Side)

Callout	Component Name
Preliminary Procedures	
1. Remove the rear seat back cushion cover and pad. Refer to <u>Rear Seat Back Cushion Cover and Pad Replacement (40% Side)</u> . 2. Remove the rear seat back cushion pivot support. Refer to <u>Rear Seat Back Cushion Pivot Support Replacement</u> . 3. Remove the rear seat latch. Refer to <u>Rear Seat Latch Replacement</u> .	
1	Rear Seat Back Cushion Panel Procedure If replacing the seat back panel, transfer components as necessary.

REAR SEAT BACK CUSHION PANEL REPLACEMENT (60% SIDE)

Fig. 60: Rear Seat Back Cushion Panel (60% Side)
 Courtesy of GENERAL MOTORS COMPANY

Rear Seat Back Cushion Panel Replacement (60% Side)

Callout	Component Name
Preliminary Procedures	
1. Remove the rear seat armrest multifunction compartment. Refer to <u>Rear Seat Armrest Multifunction Compartment Armrest Replacement</u> . 2. Remove the rear seat back cushion cover and pad. Refer to <u>Rear Seat Back Cushion Cover and Pad Replacement (60% Side)</u> . 3. Remove the rear seat back cushion pivot support. Refer to <u>Rear Seat Back Cushion Pivot Support Replacement</u> . 4. Remove the rear seat center retractor side belt. Refer to <u>Rear Seat Center Retractor Side Belt Replacement</u> . 5. Remove the rear seat latch. Refer to <u>Rear Seat Latch Replacement</u> .	
1	Rear Seat Back Cushion Panel Procedure If replacing the seat back panel, transfer components as necessary.

REAR SEAT BACK CUSHION CARPET REPLACEMENT (60% SIDE)

Fig. 61: Rear Seat Back Cushion Carpet (60% Side)
 Courtesy of GENERAL MOTORS COMPANY

Rear Seat Back Cushion Carpet Replacement (60% Side)

Callout	Component Name
	Rear Seat Back Cushion Carpet
1	Procedure <ol style="list-style-type: none"> 1. Fold the rear seat back cushion forward. 2. Disengage the j-channel retainers from the seat back cushion frame. 3. Disengage any retainers holding the carpet around the passthrough panel, if equipped. 4. Remove rear seat back cushion carpet.

REAR SEAT BACK CUSHION CARPET REPLACEMENT (40% SIDE)

Fig. 62: Rear Seat Back Cushion Carpet (40% Side)
Courtesy of GENERAL MOTORS COMPANY

Rear Seat Back Cushion Carpet Replacement (40% Side)

Callout	Component Name
1	<p>Rear Seat Back Cushion Carpet</p> <p>Procedure</p> <ol style="list-style-type: none"> 1. Fold rear seat back cushion forward. 2. Disengage the j-channel retainers from the seat back cushion frame. 3. Disengage any retainers holding the carpet around the passthrough panel, if equipped. 4. Remove rear seat back cushion carpet.

REAR SEAT BACK CUSHION COVER AND PAD REPLACEMENT (60% SIDE)

Fig. 63: Rear Seat Back Cushion Cover And Pad (60% Side)

Courtesy of GENERAL MOTORS COMPANY

Rear Seat Back Cushion Cover and Pad Replacement (60% Side)

Callout	Component Name
Preliminary Procedures	
<ol style="list-style-type: none"> 1. Remove the rear seat back cushion. Refer to <u>Rear Seat Back Cushion Removal and Installation (60% Side)</u>. 2. Remove the rear seat back armrest multifunction compartment. Refer to <u>Rear Seat Armrest Multifunction Compartment Armrest Replacement</u> 3. Remove the rear seat back cushion carpet. Refer to <u>Rear Seat Back Cushion Carpet Replacement (60% Side)</u>. 4. Remove the rear seat head restraint guides. Refer to <u>Rear Seat Head Restraint Guide Replacement</u>. 5. Remove the rear seat shoulder belt opening cover. Refer to <u>Rear Seat Belt Opening Cover Replacement</u>. 6. Remove the rear seat back cushion latch release handle. Refer to <u>Rear Seat Back Cushion Latch Release Handle Replacement</u>. 7. Remove the rear seat armrest frame bracket. 8. Remove the rear compartment access door. 	
1	Rear Seat Back Cushion Cover Procedure Remove the hook and loop fasteners that secure the rear seat back cushion cover to the pad.

REAR SEAT BACK CUSHION COVER AND PAD REPLACEMENT (40% SIDE)

Fig. 64: Rear Seat Back Cushion Cover And Pad (40% Side)

Courtesy of GENERAL MOTORS COMPANY

Rear Seat Back Cushion Cover and Pad Replacement (40% Side)

Callout	Component Name
Preliminary Procedures	
1.	Remove the rear seat back cushion. Refer to <u>Rear Seat Back Cushion Removal and Installation (40% Side)</u> .
2.	Remove the rear seat back cushion carpet. Refer to <u>Rear Seat Back Cushion Carpet Replacement (40% Side)</u> .
3.	Remove the rear seat head restraint guides. Refer to <u>Rear Seat Head Restraint Guide Replacement</u> .
4.	Remove the rear seat back cushion latch release handle. Refer to <u>Rear Seat Back Cushion Latch Release Handle Replacement</u> .
1	Rear Seat Back Cushion Cover Procedure Remove the hook and loop fasteners that secure the rear seat back cushion cover to the pad.
2	Rear Seat Cushion Pad

REAR SEAT BACK CUSHION HINGE REPLACEMENT

1. Power seats inoperative 2. Heated seats inoperative				

Circuit/System Description

The heated seat temperature sensor is located in the seat cushion just under the seat cover with the seat heating element. The seat memory control module supplies a 5 V reference voltage through the temperature sensor signal circuit and a ground through the low reference circuit to the sensor. The module monitors the voltage of the sensor signal circuit to determine the temperature of the seat. The temperature sensor varies in resistance based on the temperature of the heating element causing the signal voltage to change. Once the seat reaches the set temperature, the module will then cycle the control circuit of the heating elements ON and OFF in order to maintain the desired seat temperature based on the feedback voltage from the sensor.

Conditions for Running the DTC

- DTC B1325 must not be present.
- The seat memory control module must be powered.

Conditions for Setting the DTC

B1925 02 or B2170 02

The temperature sensor voltage drops below 0.6 V for more than 1 second.

B1925 05 or B2170 05

The temperature sensor voltage is greater than 5 V for more than 1 second.

Action Taken When the DTC Sets

The heated seat function for the affected seat will be disabled.

Conditions for Clearing the DTC

- The current DTC will clear and set the code to history 3 seconds after the reference voltage returns to normal operating range and the ignition is cycled OFF then back to ACC or RUN.
- The history DTC will clear after 40 consecutive fault-free ignition cycles have occurred.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the appropriate E14B or E14D seat cushion heating element. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 ohms between the low reference circuit terminal 1 and ground.

- **If 10 ohms or greater**
 1. Ignition OFF, disconnect the X3 harness connector at the K40 seat memory control module.
 2. Test for less than 2 ohms in the low reference circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K40 seat memory control module.
- **If less than 10 ohms**
- 3. Ignition ON.
- 4. Test for 4.8-5.2 V between the signal circuit terminal 2 and ground.
 - **If less than 4.8 V**
 1. Ignition OFF, disconnect the X2 harness connector at the K40 seat memory control module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 ohms in the signal circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, replace the K40 seat memory control module.
 - **If greater than 5.2 V**
 1. Ignition OFF, disconnect the X2 harness connector at the K29 seat heating control module, ignition ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K40 seat memory control module.
- **If between 4.8-5.2 V**
- 5. Test or replace the E14 seat cushion heating element.

Component Testing

Seat Cushion Heating Element

1. Ignition OFF, disconnect the harness connector at the appropriate E14B or E14D seat cushion heating element.
2. Test for 500 ohms-300 kohms between the signal circuit terminal 2 and the low reference circuit terminal 1.
 - **If not between 500 ohms-300 kohms**

Replace the E14 seat cushion heating element.
 - **If between 500 ohms-300 kohms**
3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Driver or Passenger Seat Cushion Heater Replacement**
- **Control Module References** for K40 seat memory control module replacement, programming and setup

Circuit/System Description

The heated seat temperature sensor that set this diagnostic trouble code (DTC) is located in the seat cushion just under the seat cover with the seat heating element. The seat heating control module supplies a 5 V reference voltage through the temperature sensor signal circuit and a ground through the low reference circuit to the sensor. The module monitors the voltage of the sensor signal circuit to determine the temperature of the seat. The temperature sensor varies in resistance based on the temperature of the heating element causing the signal voltage to change. Once the seat reaches the set temperature, the module will then cycle the control circuit of the heating elements ON and OFF in order to maintain the desired seat temperature based on the feedback voltage from the sensor.

Conditions for Running the DTC

- DTC B1325 must not be present.
- The seat heating control module must be powered.

Conditions for Setting the DTC

B1925 02 or B2170 02

The temperature sensor voltage drops below 0.6 V for more than 1 second.

B1925 05 or B2170 05

The temperature sensor voltage is greater than 5 V for more than 1 second.

Action Taken When the DTC Sets

The heated seat function for the affected seat will be disabled.

Conditions for Clearing the DTC

- The current DTC will clear and set the code to history 3 seconds after the reference voltage returns to normal operating range and the ignition is cycled OFF then back to ACC or RUN.
- The history DTC will clear after 40 consecutive fault-free ignition cycles have occurred.

1. Power seats inoperative 2. Heated seats inoperative				

Circuit/System Description

The seat memory control module controls seat heating operation for both the driver and front passenger seats. The heating elements are controlled through individual high side and low side control circuits. The low side control circuits for both seats are connected to a common reference point internal to the module. This reference point is biased to approximately 2.5 V. Before the seat memory control module will allow heated seat operation, it checks to see if this biased voltage is shorted to ground or voltage. Once the module verifies that it is not closing to a shorted heating element, it allows for heated seat operation. The module will then continue to monitor the heating elements for a shorted circuit.

Conditions for Running the DTC

The seat memory control module must be powered.

Conditions for Setting the DTC

B2345 13

Any temperature sensor input that remains below 1.5 V for more than 1 second.

Action Taken When the DTC Sets

The heated seat function for both front seats will be disabled.

Conditions for Clearing the DTC

- The current DTC will clear and set the code to history 3 seconds after the reference voltage returns to the normal operating range and the ignition is cycled OFF then back to ACC or RUN.
- The history DTC will clear after 40 consecutive fault-free ignition cycles have occurred.

Circuit/System Testing

1. Ignition OFF, disconnect the X2 and X3 harness connectors at the K40 seat memory control module.
2. Test for greater than 3.0 kohms between the signal and the low reference circuits listed below:
 - E14B driver seat cushion terminal 16 X2 and terminal 12 X3
 - E14D passenger seat cushion terminal 7 X2 and terminal 1 X3
 - **If less than 3.0 kohms**
1. Ignition OFF, disconnect the harness connector at the appropriate E14B or E14D seat cushion

heating element.

2. Test for Infinite resistance between the signal and low reference circuits.
 - If less than infinite resistance, repair the short between the circuits.
 - If infinite resistance, test or replace the E14 seat cushion heating element.
 - **If greater than 3.0 kohms**
3. Replace the K40 seat memory control module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Circuit/System Testing

1. Ignition OFF, disconnect the X2 and X3 harness connectors at the K29 seat heating control module.
2. Test for greater than 3.0 kohms between the signal and the low reference circuit terminals listed below:
 - Driver seat cushion terminal 3 X3 and terminal 13 X2
 - Passenger seat cushion terminal 4 X3 and terminal 14 X2
 - **If less than 3.0 kohms**
 1. Ignition OFF, disconnect the harness connector at the appropriate E14B or E14D seat cushion heating element.
 2. Test for Infinite resistance between the signal and low reference circuits.
 - If less than infinite resistance, repair the short between the circuits.
 - If infinite resistance, test or replace the E14 seat cushion heating element.
 - **If greater than 3.0 kohms**
3. Replace the K29 seat heating control module.

Component Testing

Seat Cushion Heating Element

1. Ignition OFF, disconnect the harness connector at the appropriate E14B or E14D seat cushion heating element.
2. Test for 500 ohms-300 kohms between the signal circuit terminal 4 and the low reference circuit terminal 3.
 - **If not between 500 ohms-300 kohms**

Replace the E14 seat cushion heating element.
 - **If between 500 ohms-300 kohms**

3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

1. Power seats inoperative 2. Heated seats inoperative				

Circuit/System Description

The driver and front passenger heated seats are controlled by the seat memory control module that is located under the driver seat cushion. When the heated seat is active, the module applies power through a common voltage supply circuit to the seat heater elements. The module controls the seat temperature by providing a pulse width modulation (PWM) ground through the seat heater element control circuit to the heater elements. The module then monitors the current flow through the heating elements and the rate of change of the temperature sensor to verify correct heated seat operation.

Conditions for Running the DTC

- DTC B1325 must not be present.
- Engine must be running.
- The seat memory control module must be powered and the heated seat must be enabled.

Conditions for Setting the DTC

B2425 0D or B2430 0D

By measuring current and voltage output to the seat heating elements every 10 seconds, the seat memory control module calculates that the heating element resistance is above the maximum resistance.

B2425 0B, B2425 0E, B2430 0B, or B2430 0E

By measuring current and voltage output to the seat heating elements every 10 seconds, the seat memory control module calculates that the heating element resistance is below the minimum resistance.

Action Taken When the DTC Sets

The heated seat function for the affected seat will be disabled.

Conditions for Clearing the DTC

- The current DTC clears when the malfunction is no longer present, and the power mode changes to OFF then back to ACC or RUN.
- The history DTC will clear after 40 consecutive fault-free ignition cycles have occurred.

Circuit/System Testing

B2425 0B, B2425 0D, or B2425 0E

1. Ignition OFF, disconnect the X4 harness connector at the K40 seat memory control module, ignition ON.
2. Verify a test lamp illuminates between the B+ circuit terminal 5 and ground.

- **If the test lamp does not illuminate**

1. Ignition OFF.
2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the circuit breaker.

- **If the test lamp illuminates**

3. Ignition OFF, connect the X4 harness connector at the K40 seat memory control module and disconnect the harness connector at the E14A seat back heating element.

NOTE: **Element resistance must be measured twice to ensure that all failure conditions are simulated. First with the seat unoccupied, then with the seat occupied.**

4. Test for 0.5-2 ohms between control circuit terminal 1 and control circuit terminal 2.

- **If not between 0.5-2 ohms**

Replace the E14A seat back heating element.

- **If between 0.5-2 ohms**

5. Connect the harness connector at the E14A seat back heating element and disconnect the X3 harness connector at the K40 seat memory control module.
6. Test for 1-5 ohms between control circuit terminal 11 and control circuit terminal 6.

- **If less than 1 ohms**

1. Ignition OFF, disconnect the harness connector at the E14B seat cushion heating element.
2. Test for infinite resistance between the control circuits.
 - If less than infinite resistance, repair the short between the circuits.
 - If infinite resistance, test or replace the E14B seat cushion heating element

- **If greater than 5 ohms**

1. Ignition OFF, disconnect the harness connector at the E14B seat cushion heating element.
2. Test for less than 2 ohms in the control circuits end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the E14B seat cushion heating element.

- **If between 1-5 ohms**

7. Replace the K40 seat memory control module.

B2430 0B, B2430 0D, or B2430 0E

1. Ignition OFF, disconnect the X4 harness connector at the K40 seat memory control module, ignition ON.
2. Verify a test lamp illuminates between the B+ circuit terminal 5 and ground.
 - **If the test lamp does not illuminate**
 - 1. Ignition OFF.

2. Test for less than 2 ohms in the B+ circuit end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, verify the fuse is not open and there is voltage at the circuit breaker.
 - **If the test lamp illuminates**
3. Ignition OFF, connect the X4 harness connector at the K40 seat memory control module and disconnect the harness connector at the E14C seat back heating element.

NOTE: **Element resistance must be measured twice to ensure that all failure conditions are simulated. First with the seat unoccupied, then with the seat occupied.**

4. Test for 0.5-2 ohms between control circuit terminal 1 and control circuit terminal 2.
 - **If not between 0.5-2 ohms**

Replace the E14C seat back heating element.

- **If between 0.5-2 ohms**
5. Connect the harness connector at the E14C seat back heating element and disconnect the X3 harness connector at the K40 seat memory control module.
 6. Test for 1-5 ohms between control circuit terminal 10 and control circuit terminal 4.
 - **If less than 1 ohms**
 1. Ignition OFF, disconnect the harness connector at the E14D seat cushion heating element.
 2. Test for infinite resistance between the control circuits.
 - If less than infinite resistance, repair the short between the circuits.
 - If infinite resistance, test or replace the E14D seat cushion heating element.
 - **If greater than 5 ohms**
 1. Ignition OFF, disconnect the harness connector at the E14D seat cushion heating element.
 2. Test for less than 2 ohms in the control circuits end to end.
 - If 2 ohms or greater, repair the open/high resistance in the circuit.
 - If less than 2 ohms, test or replace the E14D seat cushion heating element.
 - **If between 1-5 ohms**
 7. Replace the K40 seat memory control module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Circuit/System Description

The driver and front passenger heated seats are controlled by the seat heating control module that is located under the driver seat cushion. When the heated seat is active, the module applies power through a common voltage supply circuit to the seat heater elements. The module controls the seat temperature by providing a pulse width modulation (PWM) ground through the seat heater element control circuit to the heater elements. The module then monitors the current flow through the heating elements and the rate of change of the temperature sensor to verify correct heated seat operation.

Conditions for Running the DTC

- DTC B1325 must not be present.
- Engine must be running.
- The seat heating control module must be powered and the heated seat must be enabled.

Conditions for Setting the DTC

B2425 0D or B2430 0D

By measuring current and voltage output to the seat heating elements every 10 seconds, the seat heating control module calculates that the heating element resistance is above the maximum resistance.

B2425 0B, B2425 0E, B2430 0B, or B2430 0E

By measuring current and voltage output to the seat heating elements every 10 seconds, the seat heating control module calculates that the heating element resistance is below the minimum resistance.

Action Taken When the DTC Sets

The heated seat function for the affected seat will be disabled.

Conditions for Clearing the DTC

- The current DTC clears when the malfunction is no longer present, and the power mode changes to OFF then back to ACC or RUN.
- The history DTC will clear after 40 consecutive fault-free ignition cycles have occurred.

Circuit/System Testing

B2425 0B, B2425 0D, or B2425 0E

1. Ignition OFF, disconnect the harness connector at the E14B driver seat cushion heating element.

NOTE: **Element resistance must be measured twice to ensure that all failure conditions are simulated. First with the seat unoccupied, then with the seat occupied.**

If the resistance is measured with the seat still warm or cool, the resistance values will vary. The following resistance values were determined with the seat heater elements at 23°C (73°F).

2. Test for 0.78-1.57 ohms between control circuit terminal 3 and control circuit terminal 4.
 - **If not between 0.78-1.57 ohms**

Replace the E14B driver seat cushion heating element.
 - **If between 0.78-1.57 ohms**
3. Connect the harness connector at the E14B seat cushion heating element and disconnect the harness connector at the E14A driver seat back heating element.
