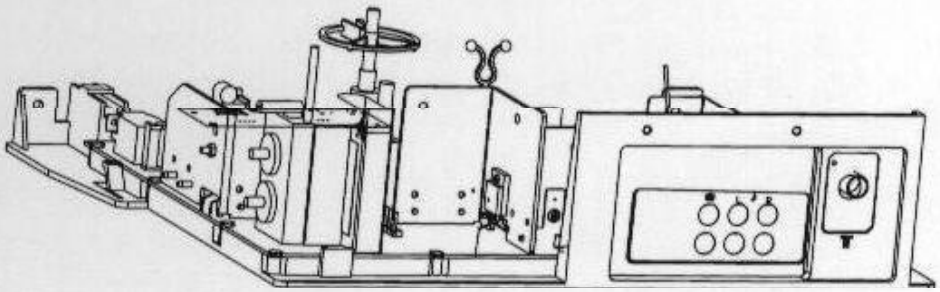
COLOR TELEVISION

SERVICE MANUAL

MODEL NO.: AT1302

CHASSIS NO.: CN-12C



CONTENTS

SAFETY INSTRUCTIONS

WARNING: BEFORE SERVICING THIS CHASSIS, READ THE "X-RAY RADIATION PRECAUTION", "SAFETY PRECAUTION"AND "PRODUCT SAFETY NOTICE"INSTRUCTIONS BELOW.

X-RAY RADIATION PRECAUTION

1. The EHT must be checked every time the TV is serviced to ensure that the CRT does not emit X-ray radiation as result of excessive EHT voltage. The nominal EHT for this TV is 27.5KV at zero beam current (minimum brightness) operating at AC 120V. The maximum EHT voltage permissible in any operating circumstances must not exceed 30KV. When checking the EHT, use the High Voltage Check procedure in this manual using an accurate EHT voltmeter.
2. The only source of X-RAY in this TV is the CRT. To prevent X-ray radiation, the replacement CRT must be identical to the original fitted as specified in the parts list.
3. Some components used in this TV have safety related characteristics preventing the CRT from emitting X-ray radiation. For continued safety, replacement component should be made after referring the PRODUCT SAFETY NOTICE below.

SAFETY PRECAUTION

1. The TV has a nominal working EHT voltage of 27.5KV. Extreme caution should be exercised when working on the TV with the back removed.

1) Do not attempt to service this TV if you are not conversant with the precautions and procedures for working on high voltage equipment.

2) When handling or working on the CRT, always discharge the anode to the TV chassis before removing the anode cap in case of electric shock.

3) The CRT, if broken, will violently expel glass fragments. Use shatterproof goggles and take extreme care while handling.

4) Do not hold the CRT by the neck as this is a very dangerous practice.

2. It is essential that to maintain the safety of the customer all power cord forms be replaced exactly as supplied from factory.
3. Voltage exists between the hot and cold ground when the TV is in operation. Install a suitable isolating transformer of beyond rated overall power when servicing or connecting any test equipment for the sake of safety.
4. Replace blown fuses within the TV with the fuse specified in the parts list.
5. When replacing wires or components to terminals or tags, wind the leads around the terminal before soldering. When replacing safety components identified by the international hazard symbols in the circuit diagram and parts list, it must be the company-approved type and must be mounted as the original.
6. Keep wires away from high temperature components.

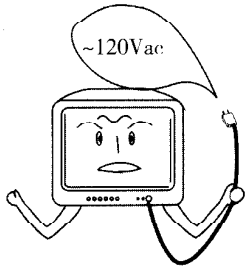
SAFETY INSTRUCTIONS (continued)

PRODUCT SAFETY NOTICE

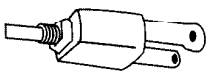
Many electrical and mechanical components in this chassis have special safety-related characteristics. These characteristics are often passed unnoticed by a visual inspection and the X-ray radiation protection afforded by them cannot necessarily be obtained by using replacements rated at higher voltages or wattage, etc. Components which have these special safety characteristics in this manual and its supplements are identified by the international hazard symbols in the circuit diagram and parts list. Before replacing any of these components read the parts list in this manual carefully. Substitute replacement components which do not have the same safety characteristics as specified in the parts list may create X-ray radiation.

PRECAUTIONS

Power Sources-The TV set should be operated only from the type of power source indicated on the TV set or as indicated in the Service Manual. If you are not sure of the type of power supply in your home, consult your sales person or your local power company. For TV sets designed to operate from battery power, or other sources, refer to the operating instructions.

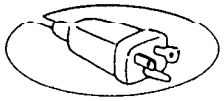


Grounding or Polarization-Do not defeat the safety purpose of the polarized or grounding-type plug. A polarized plug has two blades with one wider than the other. A grounding-type plug has two blades and a third grounding prong. The wide blade or the third prong is provided for your safety. If the provided plug does not fit into your outlet, consult an electrician for replacement of the obsolete outlet.

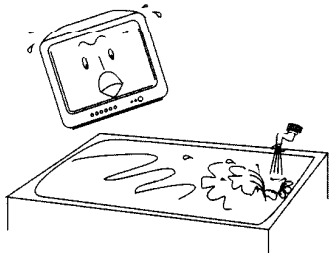


Wide blade
Lame large
Cuchilla ancha

Alternate Warnings-A three wire grounding type plug-a plug having a third (grounding) pin. This plug will only fit into grounding type power outlet.



Water and Moisture Warnings-Do not use the TV set near water-for example, near a bath tub, wash bowl, kitchen sink, or laundry tub; in a wet basement; or near a swimming pool; and the like. The TV set shall not be exposed to dripping or splashing and no objects filled with liquids, such as vases, shall be placed on the TV set.



Ventilation-Slots and openings in the cabinet are provided for ventilation and to ensure reliable operation of the TV set and to protect it from overheating, and these openings must not be blocked or covered. The openings should never be blocked by placing the TV set on a bed, sofa, rug, or other similar surface. This TV set should not be placed in a built-in installation such as a bookcase or rack unless proper ventilation is provided or the manufacturer's instructions have been adhered to.

SPECIFICATIONS

Television system:	NTSC-M
Channel coverage:	VHF 2~13
	UHF 14~69
	CABLE TV:MID BAND (A-8~A-1, A~I)
	SUPER BAND (J~W)
	HYPER BAND (AA~ZZ, AAA, BBB)
	ULTRA BAND (65~94, 100~125)
Channels preset:	181
Antenna input:	75Ω (unbalanced)
Picture tube:	Effective screen dimensions: 280mm×210mm (11.02×8.27 in.) (Approx.)
Audio output:	1W×2 (THD≤7%)
Power source:	~120Vac 60Hz
Weight:	11.5kg (25.3 lbs) (Approx.)
Dimensions(W/H/D):	373×356×370mm (14.69×14.02×14.57 in.) (Approx.)
Packing dimensions(W/H/D):	450×425×425mm (17.72×16.73×16.73 in.) (Approx.)
Rated power consumption:	~70W

KEY ICS AND ASSEMBLIES

Table 1 Key ICs and Assemblies

Serial No.	Position No.	Model No.	Function Description
1	N101	LA76814	Small signal processor
2	N301	LA7840	Vertical output circuit
3	N503	L7805	Tri terminal regulator
4	N181	LA4225	Sound power amplifier
5	D701	LC86F3248A	Microcontroller
6	D702	ST24C04	EEPROM
7	U101	TDQ-6F2M	Tuner

SIGNAL PROCESS AND SYSTEM BLOCK DIAGRAMS

CN-12C chassis comprises a LA76814 (N101) small signal processor, LA4225 (N181) sound power amplifier, LA7840 (N301) vertical output circuit, TV/Video switch circuit, LC86F3248A (D701) microcontroller, AT24C08 (D702) EEPROM and discrete components including a horizontal output circuit, video amplifier and power circuit as shown in Fig.1. The following give descriptions of signal flow process of AT1302 according to different channels in the LA76814 small signal processor.

1. Common Channel

The common channel includes a tuner, IF filter circuit, PIF amplifying circuit and audio/video separating circuit.

In accordance with Fig.1 and the circuit diagram, the RF TV signal received by the antenna is tuned, high-frequency amplified and converted in U101 tuner to develop a PIF signal (38MHz) and SIF signal (33.5MHz). Then the two signals are sent to Z101 surface acoustic wave filter for IF filtering after IF amplified by V101 pre-PIF amplifier and compensating insertion loss of the SAW filter and to the PIF amplifier through N101's Pin5 and Pin6.

In N101, the IF signal is separated out a video signal as well as a second SIF signal (4.5MHz) after multipolar amplified by the IF amplifier through PLL video detecting (see Block Diagram of LA76814). After externally connecting Pin48 and Pin49 of N101 to L201 tuning loop of VCO phase-locked loop, and Pin47, Pin50 to the low-pass filter of phase-locked loop APC formed of C239, C242, C244, R219 and R220, video signals are separated from the two generated signals by the inner trap and output in two ways. One set is output from N101's Pin46 to Pin44 after divided by R221 and R223 and coupled by C248. Another set is output from N101's Pin52 to the audio channel. So TV signal processing in common channel has been completed.

An AGC circuit is also set in the common channel to ensure the TV normal operation even with too strong or too weak signal reception. Externally connect N101's Pin3 to C204 filter capacitor of IFAGC and Pin4 to the output terminal of RFAGC. RFAGC control voltage is sent to the AGC terminal of U101 tuner to control gain of HF amplifier.

A set of carrier frequency signal (38MHz) is also output from VCO of the PLL video detecting circuit to the AFT circuit by which AFT voltage is generated and output from N101's Pin10 to Pin14 of D701 microcontroller, used for auto program and fine tune of tuner.

2. Sound IF Circuit (See System Block Diagram of LA76814)

The second SIF FM signal output from N101's Pin52 is filtered out part of video signals by the T high pass filter comprising C240, C238 and L287, then buffer amplified by the V231 emitter follower, coupled by C235, finally sent into the audio channel in N101 through N101's Pin54.

The Second SIF signal in N101 is further separated out through the band pass filtering, then audio signal is generated from the FM signals after through amplitude-limited amplifying, PLL discrimination and output in two ways after low-pass filtered by the deemphasis circuit: In one way the signal is output from N101's Pin2; in another way, the signal is switched over with external audio signal input from N101's Pin51 through volume control and audio amplifying, then output from N101's Pin1 (suitable for AT1302 due to no volume control in the sound power amplifier). Externally connect N101's Pin53 to the APC low pass filter comprising C234, C236 and R217 of the PLL discriminator , and Pin2 to the C202 deemphasis capacitor. Audio signal from N101's Pin2 can be output from the A-OUT (audio output) ter-

SIGNAL PROCESS AND SYSTEM BLOCK DIAGRAMS (continued)

minals after amplified by V802 and V803 and coupled by C803.

The TV audio signal output from N101's Pin1 is coupled by C161 to N181 sound power amplifier.

3. TV/Video Switch Circuit

The TV/Video switch circuit mainly includes the switch circuit in N101. TV video signal from N101's Pin46 is sent to N101's Pin44 and video signal from the front-set or rear-set AV terminals sent to N101's Pin42 after coupled by C802. Two sets of video signals are sent into the luminance channel, chroma channel and sync separator respectively through switchover of the inner switch circuit . In addition, the switched video signal is output from N101's Pin40 to the V-OUT (video output) terminals through V801 emitter follower or D701's Pin19 .

The audio signal input from the front-set or rear-set AV terminals is sent to N101's Pin51 after coupled by C801 and C808 and output from N101's Pin1 to the sound power amplifier after switched over with the TV audio signal from the sound demodulator in N101 and volume-controlled.

4. Sound Power Amplifier

The sound power amplifier is formed of a LA4225 (N181). The audio signal from N101's Pin1 is input to N181's Pin1 after coupled by C161, C183 and divided by R161, R185 and is output from N181's Pin4 through OTL power amplifying, driving the speakers to output sound.

V183 and V185 are formed into a mute control circuit. When Pin2 of the D701 microcontroller outputs high level, V183 and V185 saturate and conduct. AC short-circuit audio signal input to N181's Pin1, thus mute control completed.

5. Video Signal Processor

The video signal processor incorporates a luminance channel, chroma channel and video amplifier. The luminance channel, all in LA76814, mainly includes a clamping circuit, video switch circuit, chroma trap, luminance delay, peaking coring circuit, black level stretcher, contrast control circuit and luminance control circuit. The chroma channel, all in LA76814, mainly includes an ACC circuit, killer identification circuit, sub-carrier restorer, NTSC color difference demodulator, color difference switch, 1H baseband delay line, color difference matrix, primary color matrix and RGB circuit, all of which are controlled by the I^2C bus.

Two sets of video signals input from N101's Pin44 and Pin42 are output in two ways after through clamp DC level restoration and switchover of the video switch circuit: One set of signal is filtered out a chroma signal by the color band pass filter and sent into the chroma channel; another set is filtered out a luminance signal by the color trap and sent into the luminance channel and sync separator.

In luminance channel, the luminance signal is sent to the primary matrix circuit through delay and definition control. Externally connect Pin45 of N101 to the filter formed of C246 and R225 in the black level detector.

Through ACC amplifying and NTSC color difference demodulation, the chroma signal in the chroma channel is restored to two color difference signals: R-Y and B-Y, which are sent to the color difference matrix to restore to a G-Y color difference signal through 1H baseband delay. Then the three kinds of color difference signals are sent into the primary color matrix together with the luminance signal to restore to three primary color signals: R, G, B. Externally connect N101's Pin 35 to the C260 filter capacitor in the auto killer circuit, Pin36 to the filter incorporating C254, C256 and R235 in the APC sub-

SIGNAL PROCESS AND SYSTEM BLOCK DIAGRAMS (continued)

carrier restorer, Pin38 to the G201 3.58MHz crystal oscillator in the sub-carrier restorer, Pin39 to the C274 filter capacitor in the ACC circuit respectively. When N101's Pin17 outputs high level, three primary colors signals output from the short matrix circuit mix with the character primary colors input from Pin14, Pin15 and Pin16 of N101, which then are output from Pin19, Pin20 and Pin21 of N101 through white balance calibration to the video amplifier to drive the CRT to display pictures.

The video amplifier incorporates discrete components, including V901, V902 and V903 video amplifying transistors, a DC bias regulator incorporating V905, D904, D905, R909, R910, R911 and R912 and bleeding power-off spot killer incorporating V904, D906, C906, C907 and R913.

6. Scan Circuit

The scan circuit includes a scan previous stage circuit, vertical output circuit and horizontal output circuit. The scan previous stage located in LA76814, a dividing scan circuit, comprises a horizontal oscillator, horizontal divider, AFC1, AFC2, phase shifter, line drive, field divider, sawtooth former, line/field sync.

The horizontal oscillator in N101 is a 4MHz ($256f_H$) voltage-controlled oscillator whose free oscillating frequency is controlled by the R245 resistor externally connected to Pin29 by means of the bus data adjustment. To reach horizontal sync, the AFC1 phase discriminator controls the voltage-controlled oscillator. After the AFC1 comparing frequency and phase of the horizontal frequency pulse output from the horizontal divider to those of the horizontal sync pulse from the sync separator, two error voltages directly proportional to pulse phase difference are generated to control sync of the voltage-controlled oscillator. Externally connect N101's Pin26 to AFC1's low pass filter comprising C228, C230 and R211.

4MHz oscillating pulse strictly locked by the AFC1 outputs a horizontal frequency pulse signal to the horizontal phase shifter controlled by the AFC2 phase discriminator after divided by the horizontal divider. After the AFC2 comparing the horizontal frequency signal (used as a reference signal) output from the horizontal divider to horizontal flyback pulse input from Pin28, an error voltage directly proportional to the phase difference is generated to control phase shift capacity of the phase shifter and perform calibration of horizontal center.

After properly amplified through calibration of the horizontal center, the horizontal frequency pulse is output from N101's Pin27 to V431 line drive for pulse amplifying and shaping. After coupled by T401 line drive transformer, amplified and controlled by the horizontal output circuit, horizontal sawtooth current is generated in the horizontal deflection yoke, finally a scan field changing vertically is formed to control the electronic beams in CRT and complete horizontal scan. In the horizontal output stage, V432 is a horizontal output transistor including a damping diode, C435, C436 and C437 are flyback capacitors, T432 is a flyback transformer, C442 is a S correction capacitor, L441 is a horizontal linearity inductor coil, L442 is a horizontal amplitude inductor coil and H-DY is a horizontal deflection yoke.

During normal operation, the horizontal output circuit also develops horizontal flyback pulse with amplitude of nearly 1KV, which is voltage-dropped by T432 flyback transformer in two ways. In one way, T432's Pin10 outputs filament voltage. Later the flyback pulse is processed into high voltage, focus voltage, screen voltage through step-up, high-voltage pulse rectifying and filtering. All of the four voltages are supplied to the CRT. In another way, the horizontal flyback pulse output from Pin1 of T432 is process into +190V DC voltage for the video amplifier after pulse-rectified by VD555A and filtered by C555A. T432's Pin3 outputs the dropped horizontal flyback pulse to N101's Pin28 (one way) and

SIGNAL PROCESS AND SYSTEM BLOCK DIAGRAMS (continued)

D701's Pin21 (another way). Externally connect T432's Pin7 to C422, R424, R423, VD405, VD403 and C444 in ABL circuit.

In N101, horizontal frequency pulse signal output from the horizontal divider is also sent into the vertical divider to develop a vertical frequency pulse signal through vertical division. To reach vertical sync, the vertical divider is also controlled by vertical sync pulse output from the sync separator. The vertical frequency pulse signal is sent to the sawtooth former for sawtooth transformation to develop vertical sawtooth voltage which is output from N101's Pin23 to the vertical output stage circuit. Externally connect N101's Pin24 to C220 and C222 filter capacitors of the ALC circuit.

The horizontal output stage consists of a LA7840 (N301). Vertical sawtooth voltage from N101's Pin23 is input from N301's Pin5 to Pin2 through power amplification, and then sent to the vertical deflection yoke to develop vertical frequency sawtooth current. By this means, a scan magnetic field changing horizontally is formed to control electronic beams in the CRT and complete vertical scan. N301's Pin4 functions as an in-phase input terminal for the vertical output stage. This TV is equipped with a DC bias circuit incorporating R301, R323 and C321 to regulate the operation point. N301's Pin6 functions as a +25V supply voltage input terminal, Pin3 as a +50V pump supply voltage input terminal, and Pin7 as a vertical flyback pulse output terminal. C301, C304, C306, R304, R305, R307, R313 and R314 are formed into a vertical DC/AC negative feedback circuit, of which DC negative feedback is used for regulating the operation point and AC negative feedback for improving vertical linearity.

Refer to Fig. 2 about the block diagram for CN-12C chassis supply voltage system and Fig. 3 about the block diagram for the remote control structure.

IC DATA AND WAVEFORMS OF KEY POINTS

LA76814 Small Signal Processing IC

1. Introduction of LA76814 IC

LA7684 is a NTSC-M only system color TV specific monolithic IC developed by SANYO Co., which is controlled by Inter IC Bus. LA76814 includes a IF processing circuit, a luminance and chroma signal processing circuit, horizontal/frame scanning small signal processing circuit etc. It has following features.

*Number of external component adjustments reduced by the use of an I²C bus and by reducing the number of on-board rheostats.

An I²C bus is used for controlling this IC, and this allows the number of adjustment that require trimmers on the printed circuit board to be reduced.

*Number of adjustments reduced by the adoption of adjustment-free technology. The VCO coil adjustment and the AFT coil adjustment are now handled by adjustment-free technology.

*Number of external components reduced by the adoption of circuit technologies.

-S-TRAP, S-BPF

The sound trap and sound bandpass filter circuits, which were previously implemented using external components, are now provided on chip.

-Horizontal oscillator element

The horizontal oscillator element, which was previously an external component is now provided on chip.

-Single crystal operation provided by DDS technology

The functions of the two or three crystal oscillator elements previously required for color demodulation can now be handled by a single crystal oscillator element due to the adoption of DDS technology.

LA4425 (N181)

W Power Amplifier with Very Few External Parts for Car Radio and Car Stereo

1. Features

- The world's first power anplifier with very few extemal parts.

  The smallest package in the industry

  →[SIP-5H(TO-126 type)]

  Only two external parts

  →[Only I/O coupling capacitors]

- Almost no evaluation, adjustment and check as a power IC required

  →[Simplified control]

- Wide operation supply range

  →5 to 16 V.

- On-chip protection:

  Overvoltage protection

  Thermal Protection

  Output D.C. short protection

- On-chip pop noise reducing circuit

2. Sample Application Circuit

LC86F3248A (D701)

8-Bit Single Chip Microcontroller

1. Overview

The LC863264/56/48/40A are 8-bit single chip microcontrollers with the following on-chip functional blocks:

-CPU: Operable at a minimum bus cycle time of 0.42μs
-On-chip ROM capacity
Program ROM: 64K/56K/48K/40K bytes
CGROM: 16K bytes
-On-chip RAM capacity: 640 bytes
-OSD RAM: 352×9 bits
-Closed-Caption TV controller and the on-screen display controller
-Closed-Caption data slicer
-Four channels×8-bit AD Converter
-Three channels×7-bit PWM
-Two 16-bit timer/counters, 14-bit base timer
-8-bit synchronous serial interface circuit
-IIC-bus compliant serial interface circuit (Multi-master type)
-ROM correction function
-16-source 10-vectored interrupt system
-Integrated system clock generator and display clock generator
Only one X'tal oscillator (32.768kHz) for PLL reference is used for both generators
TV control and the Closed Caption function

All of the above functions are fabricated on a single chip.

2. Terminal Assignment Layout

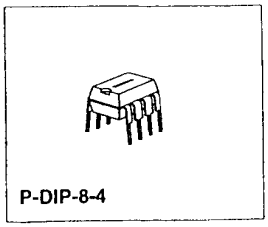
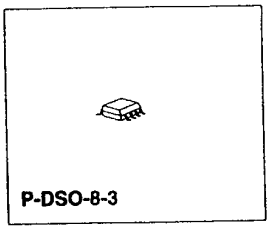
ST24C04 (D702) EEPROM

1. Features

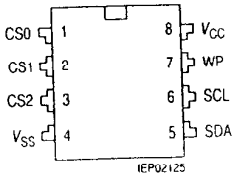
- ·Data EEPROM internally organized as 512 bytes and 32 pages×16 bytes
- ·Page protection mode, flexible page-by-page hardware write protection
- -Additional protection EEPROM of 32 bits, 1 bit per data page
- -Protection setting for each data page by writing its protection bit
- -Protection management without switching WP pin
- ·Low power CMOS
- ·Vcc=2.7 to 5.5V operation
- ·Two wire serial interface bus, I²C-Bus compatible
- ·Filtered inputs for noise suppression with Schmitt trigger
- ·Clock frequency up to 400 kHz
- ·High programming flexibility
- -Internal programming voltage
- -Self timed programming cycle including erase
- -Byte-write and page-write programming, between 1 and 16 bytes
- -Typical programming time 6 ms(<10ms) for up to 16 bytes
- ·High reliability
- -Endurance 10^6 cycles[1)]
- -Data retention 40 years[1)]
- -ESD protection 4000 V on all pins
- ·8 pin DIP/DSO packages
- ·Available for extended temperature ranges
- -Industrial: -40℃ to +85℃
- -Automotive: -40℃ to +125℃





2. Pin Configuration

P-DIP-8-4



P-DSO-8-3

IC DATA AND WAVEFORMS OF KEY POINTS (continued)

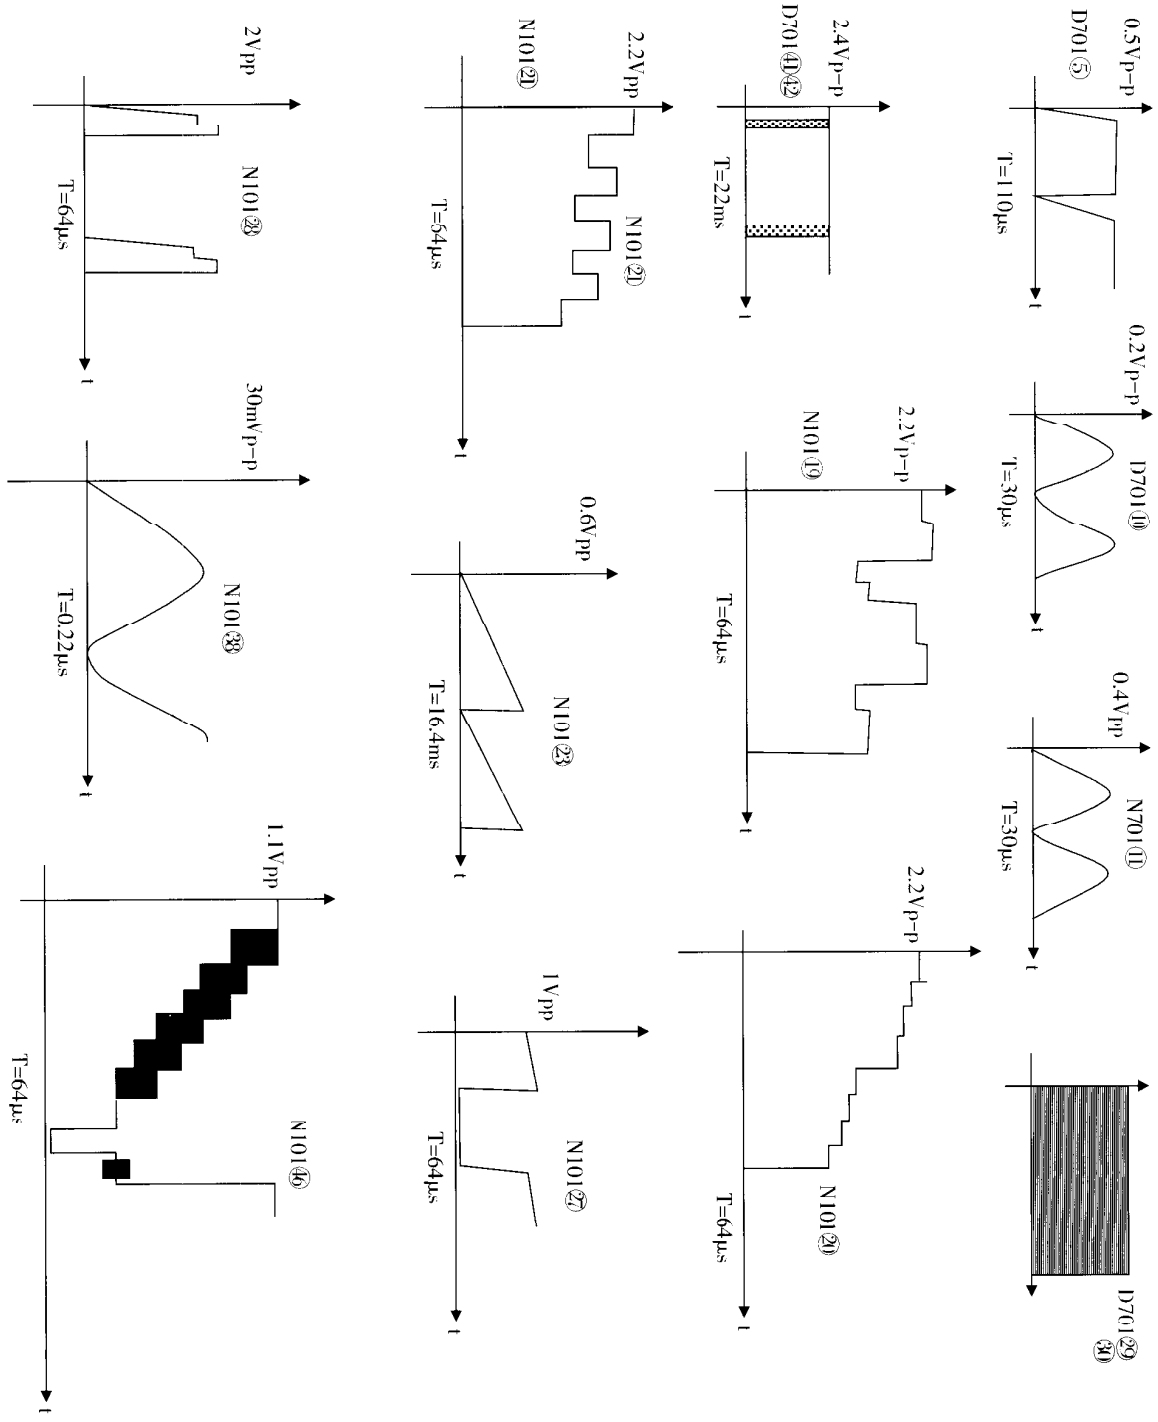
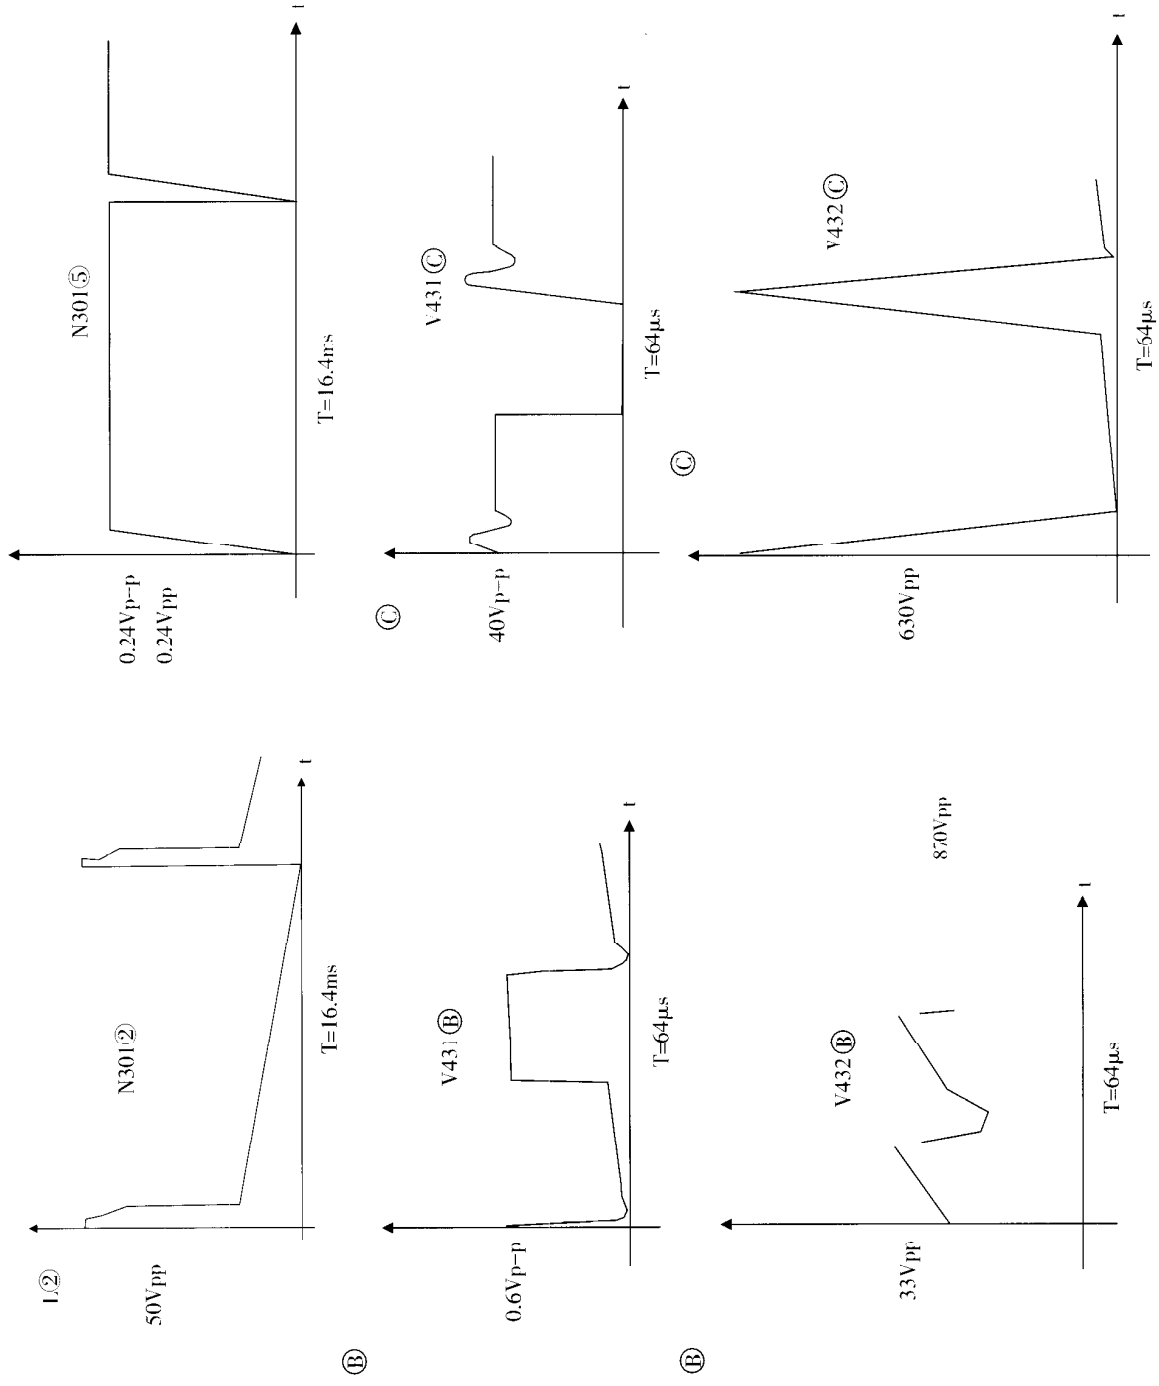
Waveforms of Key Points



IC DATA AND WAVEFORMS OF KEY POINTS (continued)



CIRCUIT ADJUSTMENTS

1. General Description

All adjustments are thoroughly checked and corrected before the TV outgoing. Therefore the TV should operate normally and deliver proper colour pictures upon installation. However, several minor adjustments may be required depending on the particular location where the TV is operated. This TV is shipped completely in carton. Carefully take out the TV from the carton and remove all packing materials. Connect the power cord into a 120V AC, 60Hz two-pin power outlet. Turn on the TV. Check and adjust all the customer controls such as brightness, contrast and colour to obtain natural colour pictures.

2. Automatic Degaussing

A degaussing coil is mounted around the CRT so that external degaussing after moving the TV is generally unnecessary, providing it is properly degaussed upon installation. The degaussing coil operates in about 1 second after power on. If the set is moved or faced to a different direction, the power switch must be switched off for at least 30 minutes in order that the automatic degaussing circuit operates properly. Should the chassis or parts of the cabinet become magnetized to cause poor colour purity, use an external-degaussing coil. Slowly move the degaussing coil around the screen, the sides and front of the TV and slowly withdraw the coil to a distance of about 2m before unplug it. If colour shading still exists, perform the Colour Purity Adjustment and Convergence Adjustment procedures.

3. Supply Voltage Adjustment

Caution: +B voltage has close relation to high voltage. To avoid X-ray radiation, +B voltage should be +130V.

1) Set RP551 to the mechanical center and AC power supply to 120±2V.
2) Connect a digital voltmeter to two pins of C561, and then turn on the TV.
3) Receive Philips test pattern signals.
4) Adjust RV801 to make the voltmeter read 130±1V.

4. High Voltage Inspection

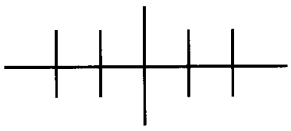
Caution: No high voltage adjustment should be done in the chassis.

1) Connect a precise high voltmeter to the second anode of the CRT.
2) Turn on the TV and set the brightness and contrast to minimum (i.e. set beam current of the CRT to zero).
3) The high voltage tested should be 21±1.2KV.
4) Set the brightness to minimum or maximum, and ensure high voltage not beyond limitation of 23KV in any case.

CIRCUIT ADJUSTMENTS (continued)

5. Focus Adjustment

1) Use the remote control to set the contrast to maximum and the brightness, chroma to medium.
2) Set H. V. lines near Philips pattern center to thinnest with the FCB on the FBT. After finishing adjustment, ensure that no poor focusing exists near the center or around of the frame.



Before Adjusting

After Adjusting

SET–UP ADJUSTMENTS

- The following adjustments should be made when a complete realignment is required or a new CRT is installed. Perform the adjustments in order as follows.

1. Colour purity
2. Convergence
3. White Balance

Note:

The purity/convergence magnet assembly and rubber wedges need mechanical positioning. Refer to Fig. 9.

1. Colour Purity Adjustment

Note:

Before attempting any purity adjustment, the TV should be operated for at least 15 minutes.

1) Demagnetize the CRT and cabinet using a degaussing coil.
2) Set the brightness and contrast to maximum.
3) Receive the green raster test signals.
4) Loosen the clamp screw holding the deflection yoke and slide it backward or forward to display vertical green belt (zone) on the screen.
5) Remove the rubber wedge.
6) Rotate and spread the tabs of the purity magnet around the neck of the CRT until the green belt is on the centre of the screen.
7) Slowly move the deflection yoke forward or backward until a uniform green screen is obtained. Tighten the clamp screw of the yoke temporarily.
8) Check purity of the red and blue raster.

SET-UP ADJUSTMENTS (continued)

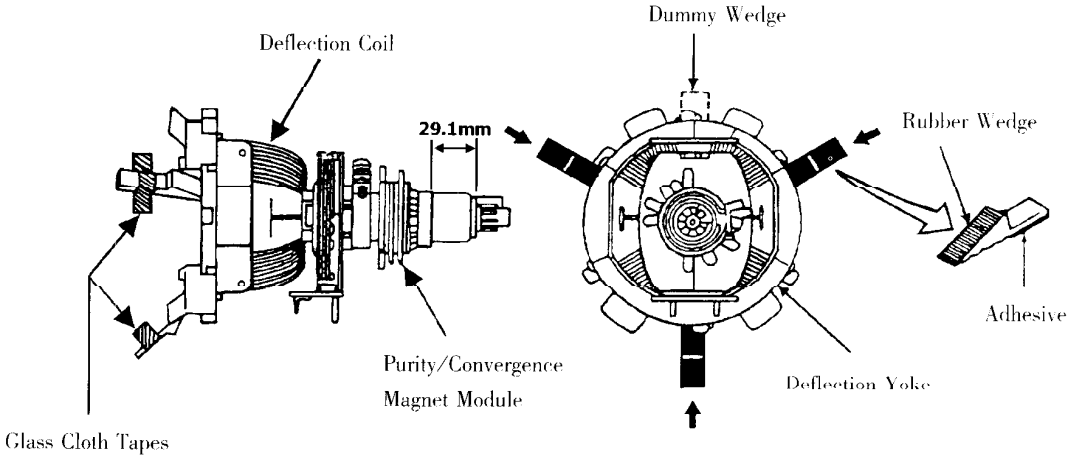


Fig. 9

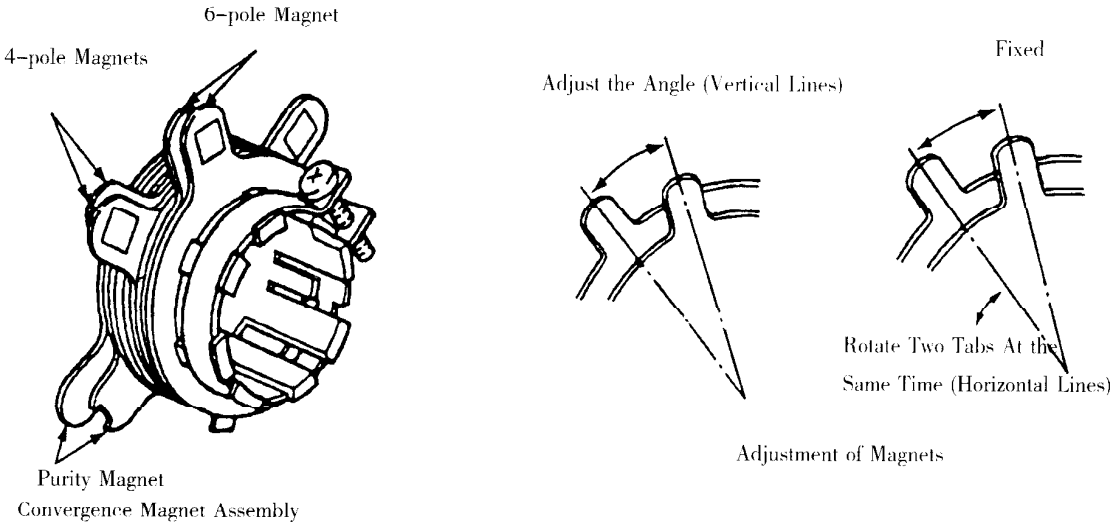

Fig. 10

2. Convergence Adjustment

Note:

Before attempting any convergence adjustment, the TV should be operated for at least 15 minutes.

- Center convergence adjustment

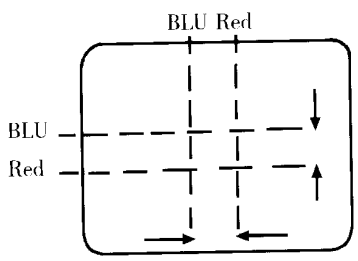
1) Receive the grille test pattern signals.
2) Set the brightness and contrast propely.
3) Adjust two tabs of the 4-pole magnet to change the angle between them and red and blue vertical lines are superimposed on the center area of the screen.
4) Turn both tabs at the same time keeping the angle constant to superimpose red and blue horizontal lines on the center of the screen.
5) Adjust two tabs of 6-pole magnet to superimpose red/blue line and green line. Adjusting the angle affects the vertical lines and rotating both magnets affects the horizontal lines.

SET-UP ADJUSTMENTS (continued)

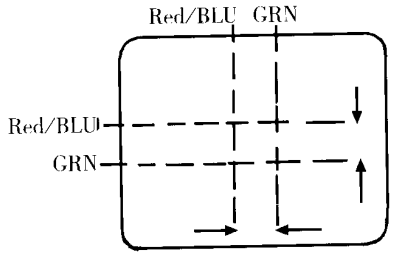
6) Repeat steps 3)~5) keeping in mind red, green and blue movement. 4-pole magnet and 6-pole magnet interact each other, resulting in complicating and dot movement.

• Circumference convergence adjustment

1) Loosen the clamping screw of the defection yoke slightly to allow it to tilt.
2) Temporarily put a wedge as shown in Fig. 9. (Do not remove cover paper on adhesive part of the wedge.)
3) Tilt front of the deflection yoke up or down to obtain better convergence in circumference.
   Push the mounted wedge into the space between the CRT and yoke to fix the yoke temporarily.
4) Put other wedge into bottom space and remove the cover paper to stick.
5) Tilt front of the deflection yoke right or left to obtain better convergence in circumference.
6) Keep the deflection yoke position and put another wedge in either upper space. Remove cover paper and stick the wedge on the CRT to fix the yoke.
7) Detach the temporarily mounted wedge and put it in another upper space. Stick it on the CRT to fix the yoke.
8) After fixing three wedges, recheck overall convergence.
   Tighten the screw firmly to fix the yoke and check if the yoke is fixed.
9) Stick three adhesive tapes on wedges as shown in Fig. 9.

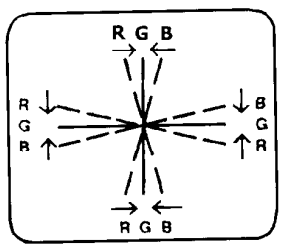


4 pole Magnet Movement



6-pole Magnet Movement

Center Convergence by Convergence Magnets



Incline the Yoke up (or down)

SERVICE MODE AND BUS DATA

1. How to Enter the Service Mode with the Remote Control

1) Decrease volume to 0.

2) Press the MUTE button on the remote control and VIDEO button on the TV at the same time.

3) Adjust the TV with the MENU SELECT buttons on the remote control.

4) Press the ⏻ button on the remote control to quit the Service mode.

2. Bus Data

Notes:

① The data sheet may differ dependent on different models.

② The data sheet may differ dependent on different CRTs for the same model.

3. Service Mode Adjustment

1) Sub-brightness

a) Receive colour signals.

b) Set the contrast to maximum and brightness to medium.

c) Set the chroma to medium.

Enter the TV to the Service mode. Select "SUB-BRIGHT" by pressing the ←/→ buttons on the remote control, and set the data to 31 by pressing the data adjustment buttons. Operate the TV for 5 minutes in the mode.

d) Adjust the sub-bright data until blurry picture does not appear on the high bright area of the screen and too dim picture not on the low-bright area.

e) Set the contrast and brightness to maximum or minimum, and then test normal picture alternation.

f) If the picture does not become dark when the contrast and brightness are set to minimum, or not become bright when set to maximum, then adjust the sub-bright data to get normal picture.

SERVICE MODE AND BUS DATA (continued)

2) White balance adjustment

a) Turn on the TV and preheat it for over 7 minutes.

b) Use the remote control to set the contrast to maximum and the brightness to medium. Set the chroma to minimum.

c) Enter the TV to the Service mode, and set the following data without changing other items.

R-DRIVE····· 90
G-DRIVE····· 15
B-DRIVE····· 90

d) Pull out the external antenna and press the MUTE button once on the remote control until a right horizontal line appears on the screen. Adjust the R-DRV data to get 160V±0.5 green gun voltage across the CRT RGB PCB.

e) Adjust the G-DRV and B-DRV data according to Step 4 so that the bright horizontal line turns to yellow, then to white.

3) Horizontal centering adjustment

Enter the TV to the Service mode and receive Philips test pattern signals. Select "H.PH/60H" by pressing the ←/→ buttons on the remote control, and adjust horizontal picture position in the centre of screen by pressing the data adjustment buttons.

4) Vertical centering adjustment

Enter the TV to the Service mode and receive Philips test pattern signals. Select "V.POS/60H" by pressing the ←/→ buttons on the remote control, and adjust vertical picture position in the centre of screen by pressing the data adjustment buttons.

5) Vertical amplitude adjustment

Enter the TV to the Service mode and receive grille test pattern signals. Select "V.SIZE" by pressing the ←/→ buttons on the remote control, and adjust vertical amplitude by pressing the data adjustment buttons so that vertical amplitude is not enough. Continue to adjust vertical amplitude by pressing the data adjustment button until the first bar on grille signals touches edge of the screen.

PARTS LIST (continued)

Position	Parts	Type
W904	Jumper	20mm
		Parts on AV PCB
XS803	AV terminals	AV-1-3PF
		Other Parts
VE901	14" CRT	37SX110Y22-DC05
XS501	Power cord	RVVZ-2U2M-C2143-TJC1-3Y
XS502	Degaussing coil	XC-14E1(JU4.759.003)
B301	Electric speaker	YDT57-A1-5W-16Ω
B302	Electric speaker	YDT57-A1-5W-16Ω
		If using BMCC CRT, remove the following parts from
		the parts list when using Rainbow CRT.
		Remove the following parts from the main PCB.
RF481	Fuse resistor	RF10-1W-1.8ΩJ
C436	Ceramic capacitor	CT81-2KV-10c-2B4-470PFK
C435	Polypropylene capacitor	CBB81-1.6KV-7200PFJ
L441	Horizontal linearity inductor	HXT39
T432	FBT	BSC60T(JUB4.799.012)
		Remove the following parts from the CRT RGB PCB.
GZ01	GZS CRT socket	GZS10-2-DD
R920	Jumper	20mm
W904	Jumper	20mm
		Remove other parts.
VE901	14" CRT	37SX110Y22-DC05
		If using BMCC CRT, add the following parts to
		the parts list when using Rainbow CRT.
		Add the following parts to the main PCB.
RF481	Fuse resistor	RF10-1W-3.9ΩJ
C435	Polypropylene capacitor	CBB81-1.6KV-6200PFJ
L441	Horizontal linearity inductor	HXT65
T432	FBT	BSC60T2(JUB4.799.012-1)
		Add the following parts to the CRT RGB PCB.
GZ01	GZS CRT socket	GZS8-6-4-2
W980	Jumper	10mm
R920	Jumper	17.5mm
W904	Jumper	17.5mm
		Add other parts.
VE901	14" CRT	A34JQQ90X94
